17.179 Given these adjustments are funded in large part by holding gains which appear in the revaluation account, it seems reasonable to record the contingencies that they are assumed to cover in the other changes in the volume of assets account except for the price escalation factor which should appear in the revaluation account.

The issue of promotions

17.180 Many defined benefit pension schemes use a formula to set benefits that involves either the final salary or average salary as a key determinant. This implies that any promotion means that the total pension entitlements accrued to date are increased to take account of the new salary level. This is a significant benefit for the individual being promoted but what are the consequences for the employer's pension liabilities?

17.181 The accounting profession uses two actuarial terms that bear on this discussion. The accrued benefit obligation (ABO) records, as it name implies, only the benefits actually accrued to date. It represents the amount the employee could walk away with if he left the firm tomorrow and may be the basis of assessing a person's net worth in the case of a divorce settlement, for example. A projected benefit obligation (PBO) is a more prudent measure of what the eventual level of entitlement is likely to be. For an individual, the PBO makes assumptions about how many future promotions the person is likely to receive and calculates his final salary accordingly. Then, if he has in fact only worked 20 out of an expected 40 years, it halves the final salary and calculates pension entitlement for the individual as if this were his current salary. Where an individual's ABO increases in steps as he is promoted, the PBO increases steadily over time. For the individual, PBO is always higher than ABO until the moment of retirement when the ABO catches up with the PBO.

17.182 It would seem at first sight that the level of pension entitlements for a corporation should be the sum of all the pension entitlements of each of the employees and that therefore the sum of the PBO estimates would be considerably higher than that of the sum of the ABO estimates and would evolve more smoothly over time. However, what is true for the individual is not necessarily true for the cohort of employees. Suppose the employer has five classes of people for whose pensions he is responsible, four grades of employees and one set of retirees, and for simplicity there are the same number of each. Consider the situation where in a year the retirees die; the most senior set of employees retire, the next three sets of employees are all promoted and a new set of employees is recruited at the lowest level. Every current employee is better off after promotion but the overall liability of the employer has not changed. The effect of aggregating ABOs is to smooth the total entitlement and while it will still be lower than the aggregate PBOs, it will not necessarily be more volatile. Indeed it may be more stable.

17.183 While the profile of the ABO of an individual will show step changes when promotions occur, for a cohort of employees, the effect is much smoother. For a cohort of the same age remaining with the corporation for the whole of their working lives, the ABO estimates will be considerably lower than PBO estimates in the early years but the rate of increase of the ABOs will be faster than that of the PBOs so that at the point immediately before retirement, the two sets of estimates will be equal. Merging cohorts of employees with different periods of service with the corporation will bring the ABO estimates for all employees closer to the PBO ones also.

17.184 As long as the grade structure of the corporation stays the same, ABO and PBO will move roughly in step. If the firm expands and takes on many new employees at the lower grades, the PBO will be increase noticeably faster than the ABOs because the PBOs make estimates of how long the

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

new employees will stay and how far they will be promoted while the ABOs record simply the pension accrued in their first year. If the firm decides to downsize and reduces the number of their managerial staff, this will reduce the promotion prospects of the employees and a downward revision in PBO will be necessary. Because ABOs reflect simply the "locked-in" pension, this estimate is not affected.

17.185 The question arises, though, of how to record the impact of promotion on the employee if an ABO recording is used. Any version of treating the increase as a form of compensation of employees or investment income falls back into the assumption that the aggregate of entitlements is the sum of the individual entitlements but without looking at other individual impacts on the aggregates such as when someone leaves and loses pension entitlement because not enough time has been served or when someone dies before retirement age. A simpler and adequate solution is to treat the impact of promotions for the unit as a whole as a price change and record the change in the revaluation account.

Table 17.9:Detailed transactions concerning social insurance

	Table number		Employer	Insurance corporation/ Social insurance fund	Households	Other sectors	Total economy

17.186 If the PBO method of recording entitlements is chosen as the preferred valuation, an adjustment in the other changes in volume of assets account is needed only if the structure of the enterprise changes so the chances of promotion change. On the other hand, the regular estimates of the employer's contributions to social insurance schemes included in compensation of employees will be systematically higher than those made under an ABO regime because the increase in pension entitlement that determines the size of the contributions will be based on a notional salary calculated on a PBO basis rather than the actual one.

3. Transferring pension entitlements

17.187 One characteristic of the changing environment of pensions is the increasing possibility of having "portable pensions". Until recently it was often the case that a person leaving one employer had his pension frozen at that point and had to start a new pension with the new employer. It is becoming more common now for a person moving jobs to be able to convert the pension entitlement with the former employer to one with the new employer. When this happens, the pension entitlement of the household concerned is unaffected but there is a transaction between the two pension funds as the new one assumes the liability of the former. In addition there will be a counterpart transaction in some assets to match these liabilities. If the new employer is running a scheme that is actually unfunded, he may receive cash from the former employer. If this cash is then used by the employer for purposes other than the pension fund, his liability to the fund increases and his use of the cash appears as net borrowing.

17.188 If government assumes the responsibility for pension provision for the employees of a non-government unit through an explicit transaction, a pension liability should be recorded in the balance sheet of government. If the government does not receive matching assets in return, the difference between the increase in the government's liability and the assets received is shown as a capital transfer to the non-government employer. There is further discussion of this type of arrangement in chapter 22.

17.189 Another way in which pension entitlements may be transferred between funds is when one corporation takes over another. If the pension fund is a separate institutional unit, all that changes is control of the pension fund. If there is no separate institutional unit, assuming the takeover does not change the terms of the pension plan for existing participants, the corporation being taken over passes both the pension liabilities and the corresponding assets to the new owner.

4. A note on the tables

17.190 For cross-reference with tables in other chapters, table 17.9 shows the itemized components of transactions pertaining to social and other insurance in tables 17.1 to 17.8 inclusive.

K. The special case of government providing pensions via social security

17.191 In recognition of the fact that social security is normally financed on a pay-as-you-go basis, entitlements accruing under social security (both pensions and other social benefits) are not normally shown in the SNA. If all countries had similar benefits provided under social security and under private schemes, international comparisons would be relatively straightforward. However, as pointed out at the beginning of this part, this is far from being the case and national perceptions of exactly what is covered by social security vary considerably.

17.192 There are two problems with simply suggesting that entitlements from social security should be shown in the SNA. The first is that reliable estimates of the entitlements may not be readily available whereas it is increasingly the case that such estimates exist for private schemes. Secondly, there is an argument that such estimates are of limited usefulness where government has the possibility of changing the basis on which entitlements are determined in order to keep the entitlements within the bounds of what is budgetarily feasible. However, the consequence of simply accepting that entitlements for private schemes are shown and for social security are not is that some countries would include the greater part of pension entitlements in the accounts and some would show almost none.

17.193 In recognition of this dilemma, some flexibility regarding the recording of pension entitlements of unfunded pension schemes sponsored by government for all employees (whether private sector employees or government's own employees) is provided. Given the different institutional arrangements in countries, only some of these pension entitlements may be recorded within the main sequence of accounts (here referred to as the "core accounts"). In addition, however, a further table is to be presented that provides information disclosing the proportion of pension provision covered in the core accounts with some approximate estimates for the remaining schemes. It is a requirement, though, that a set of criteria be provided to explain the distinction between those schemes carried forward to the core accounts and those recorded only in the supplementary table.

17.194 The sort of criteria that might be considered are the following: The closer a government employer pension scheme is to the prevailing social security scheme, the less likely it is to appear in the core accounts; the less the benefits are tailored to the specific characteristics of the individual and the more they are applicable to the population at large, the less likely it is to appear in the core accounts; the greater the ability of government to alter the benefit formula, the less likely it is to appear in the core accounts. However, none of these criteria alone is

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

necessarily decisive in determining whether the scheme is treated in the core accounts or not.

17.195 By making this supplementary table and annotation a standard requirement for international reporting, analysts have the possibility of ensuring that cross country comparisons are not unduly clouded by the institutional variations from country to country. Further work on refining the criteria for the distinction between the pension schemes fully recorded in the core accounts and those where the entitlements are shown only in the supplementary table is to be part of the SNA research agenda.

17.196 The supplementary table is shown in table 17.10. As well as the possibility of including less robust estimates for countries with large social security sectors, the possibility will also exist of working back to a narrower coverage of private pensions for all countries being analysed.

Table 17.10:A supplementary table showing the extent of pension schemes included and excluded from the SNA sequence of accounts

		Liabilities appear in the core national accounts								Liabilities do not appear in the core national accounts	
		Non-general government			General government						
						General government employee defined benefit schemes

	Output										
	Assets held by pension schemes at end-year										

Empty cells show where entries appear in the main ("core") accounts. Black cells show where no entry is appropriate. Grey cells show where information is provided in the supplementary table only.

Row 2 is the sum of rows 2.1 to 2.4

Row 3 is the analogue of employer's imputed contributions in the case where government has assumed the ultimate responsibility for any shortfall in pension provision

Row 5 is the sum of rows 2 and 3 less 4

More information on the components underlying rows 8 and 9 to be shown in a further supplementary table to allow an assessment of the degree of uncertainty in these estimates.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

17.197 As noted above, providing detail on defined contribution schemes is relatively straightforward since full accounts must be available and no actuarial estimation is involved. Most of these are in the corporations sectors (column A) but it is possible that some government employees may be covered by them (column D). All defined contribution pension schemes should be included in the core accounts. Estimates for all defined benefit pension schemes outside social security should also be included (column B).

17.198 Government schemes for their own employees where separate accounting information, distinct from social security, is shown in the main accounts appear in columns E and F. Column E shows schemes managed by an insurance corporation and column F those managed by government itself. Any government schemes for their own employees distinct from social security that do not appear in the main accounts, are shown in column G. The sum of columns E, F and G therefore show the total responsibility of government for pension provision for their own employees. (Column F shows that part of all defined benefit schemes of government that are retained within the government accounts as distinct from being moved into separate units or managed for government by another institutional unit. Column H relates to social security schemes. Column C shows the total of all non-government schemes and column I the total of all schemes including social security.

17.199 For the most part, the beneficiaries of pension schemes are likely to be resident households. In some countries, though, the number of non-resident households receiving pension benefits may be significant. In this case, column J should be added indicating the amount of the total that concerns non-resident households.

17.200 Some of the entries in the rows of columns G and H, specifically the actual contributions made by both employers and employees, appear in the core accounts, even though the entitlements and change in entitlements do not. Other entries in the columns for G and H shown only in the supplementary table are shaded in the table and explained below.

17.201 The imputed contribution by employers for those government schemes for which entitlements appear in column G but not in the core accounts requires special consideration. In the core accounts, this item is calculated, by convention, as equal to the difference between current benefits payable and actual contributions payable (by both employees and employers). In the supplementary table, this is replaced by the amount needed to ensure the total contributions, actual and imputed, by both employers and employees, covers both the increase in pension entitlements from current service and the costs of operating the scheme.

17.202 An item calculated on the same basis in respect of social security is shown in row 3 as “other (actuarial) accumulation of pension entitlements in social security funds”. The distinction from employers’ imputed social contributions is deliberate and is intended to emphasize the probable fragility of these estimates.

17.203 Items for household social contribution supplements and the other changes in entitlements are shown on the same bases as for private schemes.

17.204 Changes in pension entitlements are recorded as transactions in the following cases:

a. If the pension scheme is included in the core accounts, and the employer manager agrees a change in the terms of pension entitlements via negotiation with the affected employees, this change should be recorded as a transaction in the core accounts.

b. If the pension scheme is not recorded in the core accounts, and the employer manager agrees a change in the terms of pension entitlements via negotiation with the affected employees, this change should be recorded as a transaction in the supplementary table.

c. In the case of social security, if changes in entitlements are agreed in parliament, this is also recorded as if it is negotiated.

17.205 Changes in pension entitlements that are imposed without negotiation are recorded as other changes in the volume of assets

17.206 The difference in the type of recording is one of principle but it is recognized that the distinction between what is negotiated and what is imposed without negotiation will be difficult to determine in practice with different situations prevailing in different countries.

Part 3: The treatment of standardized guarantees in the SNA

L. Types of guarantees

17.207 A loan guarantee is normally an arrangement whereby one party, the guarantor, undertakes to a lender that if a borrower defaults, the guarantor will make good the loss the lender would otherwise suffer. Often a fee is payable for the provision of a guarantee though the form of this varies. Sometimes the guarantor will acquire some rights over the defaulting borrower. Similar guarantees may be offered in respect of other financial instruments, including deposits. This section refers to similar guarantees of all financial instruments.

17.208 Guarantees have a significant impact on the behaviour of economic agents, both by influencing their decisions on production, income, investment or saving and by modifying the lending and borrowing conditions on financial markets. Some borrowers might have no access to loans or be willing to make deposits in the absence of guarantees, while others might not benefit from comparatively low interest rates. Guarantees are particularly significant for the general government sector and for the public sector as government activities are often linked to the issuance or activation of guarantees.

17.209 Three classes of guarantees are recognized. No special treatment is proposed for guarantees in the form of manufacturers' warrantees or other form of guarantee. (The cost of replacing defective merchandise is an intermediate cost of the manufacturer.)

17.210 The first class of guarantees is composed of those guarantees provided by means of a financial derivative, such as a credit default swap. These derivatives are actively traded on financial markets. The derivative is based on the risk of default of a reference instrument and so is not actually linked to an individual loan or bond. Incorporating the transactions connected with establishing this sort of financial derivative is discussed in chapter 11.

17.211 The second class of guarantees, standardized guarantees, is composed of the sorts of guarantees that are issued in large numbers, usually for fairly small amounts, along identical lines. There are three parties involved in these arrangements, the debtor, the creditor and the guarantor. Either the debtor or creditor may contract with the guarantor to repay the creditor if the debtor defaults. The classic examples are export credit guarantees and student loan guarantees. Government guarantees of other financial instruments such as loans and some other debt securities in return for a fee are other examples. Here, although it is not possible to establish the likelihood of any one debtor defaulting, it is not only possible but standard practice to estimate how many out of a batch of similar debts will default. If the guarantor is working on purely commercial lines, he will expect all the fees paid, plus the investment income earned on the fees and any reserves, to cover the expected defaults along with the costs and leave a profit. This is exactly the same paradigm as operates for non-life insurance and a similar treatment is adopted for these guarantees, described as "standardized guarantees". This involves including transactions and balance sheet items parallel to those for non-life insurance, including the generation of output and payments of a fee supplement and a service fee by those taking out the guarantees.

17.212 The third class of guarantees, described as one-off guarantees, consists of those where the loan or the security is so particular that it is not possible for the degree of risk associated with the debt to be calculated with any degree of accuracy. In most cases, the granting of a one-off guarantee is considered a contingency and is not recorded as a financial asset/liability. (As an exception, one-off guarantees granted by governments to corporations in certain well-defined financially distressed situations and with a very high likelihood to be called are treated as if these guarantees are called when the financial distress is recognized.) If a fee is charged, this is recorded as a payment for a service at the time of payment. If a call is made under a guarantee, a capital transfer is recorded from the guarantor to the guarantee holder at the time of default or, in cases where the guarantor obtains an effective claim on the guarantee holder, a financial transaction (including increases in equity participation) is recorded.

17.213 Standardized guarantees are to be distinguished from one-off guarantees based on two criteria:

a. They are characterized by often repeated transactions with similar features and pooling of risks;

b. Guarantors are able to estimate the average loss based on available statistics by using a probability-weighted concept.

One-off guarantees are, on the contrary, individual, and guarantors are not able to make a reliable estimate of the risk of calls.

17.214 Financial derivatives are described in chapter 11. The treatment of standardized guarantees follows.

1. Standardized guarantee schemes

17.215 Standardized guarantees may be provided by a financial institution, including but not confined to insurance corporations. They may also be provided by government units. It is possible but unlikely that non-financial corporations may provide these sorts of guarantees; it is most unlikely that they would be provided by any unit to a non-resident unit. As indicated above, standardized guarantee schemes have much in common with non-life insurance. In the general case, similar recording is recommended as described below.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

17.216 When a unit offers standardized guarantees, it accepts fees and incurs liabilities to meet the call on the guarantee. The value of the liabilities in the accounts of the guarantor is equal to the present value of the expected calls under existing guarantees, net of any recoveries the guarantor expects to receive from the defaulting borrowers. The liability is entitled provisions for calls under standardized guarantees.

17.217 A guarantee may cover a multiyear period. A fee may be payable annually or upfront. In principle the fee should represent charges earned in each year the guarantee holds with the liability decreasing as the period gets shorter and so the same sort of recording should be followed here as for annuities with the fee paid earned as the future liability decreases. In practice, some units operating guarantees may have data only on a cash basis. This is inaccurate for an individual guarantee but the nature of the standardized guarantee scheme is that there are many guarantees of the same type, though not all for exactly the same time period nor all starting and finishing on the same dates. Unless there is reason to suppose that there is a major change in the nature of the guarantee holders over time, using cash based data should not introduce significant error.

17.218 Altogether six sets of transactions need to be recorded in respect of standardized guarantee schemes; two relating to the measurement of the production and consumption of the guarantee service, three relating to redistribution and one in the financial account. The value of the output of the activity, the investment income to be attributed to the guarantee holder (whether creditor or debtor) and the value of the service charge are calculated in the manner described above for non-life insurance with the concepts of fees replacing premiums and calls under a standardized guarantee scheme replacing claims.

17.219 The production and consumption transactions are as follows:

a. The output is recorded in the production account of the sector or subsector to which the guarantor belongs.

b. The service may be paid for by either the borrower or the lender of the debt being guaranteed. When non-financial corporations, financial corporations, general government or non-profit institutions pay fees to obtain this sort of guarantee, the fees constitute intermediate consumption, recorded in their production account. Any fees for such guarantees payable by households are part of final consumption expenditure, recorded in the use of income accounts.

17.220 The redistributive transactions cover investment income attributed to guarantee holders in respect of standardized guarantee schemes, net fees, and calls under standardized guarantee schemes.

a. Investment income attributed to guarantee holders in respect of standardized guarantee schemes is recorded as payable by the guarantor. It is recorded as receivable by the unit paying the fee. Both payables and receivables are recorded in the allocation of primary income account.

b. Net fees are calculated as fees receivable plus fee supplements (equal to the investment income attributed to the unit paying the fee for the guarantee) less the value of the services consumed. These net fees are payable by all sectors of the economy and receivable by the sector of the guarantor.

c. Calls under standardized guarantee schemes are payable by the guarantor and receivable by the lender of the debt under guarantee, regardless of whether the fee was paid by the lender or the borrower. Both net fees and calls are recorded in the secondary distribution of income account.

17.221 In the financial account, an entry shows the difference between payment of fees for new guarantees and calls made under existing guarantees.

2. Guarantees provided by government

17.222 Governments often offer guarantees for specific policy purposes. Export credit guarantees are one example. The guarantees may be issued by a government unit that can be treated as a separate institutional unit. When this is so, the normal rules for the allocation of government units to either publicly controlled corporations or as part of general government apply. If a guarantee unit charges fees that are economically significant (in this case this may be equivalent to saying that most of the calls plus the administrative costs are covered by the fees charged), then this is a market activity. It should be treated as a financial corporation and transactions should be recorded as described above. If the fees cover most but not all the costs, the recording is still as above. The loss made by the agency offering the guarantees may be covered by government on a regular or intermittent basis but this is not passed on to those seeking the guarantees as a subsidy. Regular payments are recorded as a subsidy to the agency and intermittent payments, covering cumulated losses, are recorded as capital transfers only when such payments are made.

17.223 In general, when a government unit provides standardized guarantees without fees or at such low rates that the fees are significantly less than the calls and administrative costs, the unit should be treated as a non-market producer within general government. However, if government recognizes the probability of having to finance some of the calls under the guarantee scheme to the extent of including a provision in its accounts, a transfer of this size from government to the units concerned and a liability of this amount (under provisions for calls under standardized guarantees) should be recorded.

3. Balance sheet implications

17.224 Conceptually the total value on the balance sheet of the instruments under guarantee should be reduced by the extent of provisions for standardized guarantees which are estimates of the amount of debt that will be in default. In practice, this amount is not likely to be significant compared with the total value of the instrument concerned.

Part 4: The recording of flows associated with financial assets and liabilities

M. Introduction

17.225 The objective of this part of chapter 17 is to show, for each category of financial assets and liabilities, how and where changes in their values are recorded in the SNA and to show when some part of the transaction relating to a financial instrument is treated not as changing the value of the instrument itself but as a measure of the output of financial institutions. Before describing these flows in detail in the next section, it is helpful first to recall the characteristics of financial institutions, the type of flows that are associated with providing financial services as well as the sort of income and holding gains and losses associated with holding financial assets and liabilities.

1. The characteristics of financial institutions

17.226 Within the SNA, the term corporations is used to describe institutional units providing both financial and non-financial services. These are divided into two institutional

sectors; non-financial corporations and financial corporations. Financial corporations are distinguished from non-financial corporations because they play a particular role in the economy. Some facilitate means of payments between other units thus avoiding the need for barter. Some also provide the means whereby units seeking additional funds to finance capital formation, acquire financial assets or even for consumption can utilize the funding set aside by other units as saving. The equation that investment in capital formation must be equal to saving plus net borrowing from the rest of the world is fundamental to the functioning of the economy, the way financial markets work and so to the accounting system itself.

17.227 When considering the financial sector alone or in connection with other statistics such as monetary and financial statistics, it is usual to speak of financial institutions rather than financial corporations. No change in definition or coverage is implied by this change in terminology. When subsectoring the financial sector, as explained in chapter 4, a distinction is made between those financial corporations that are primarily involved in financial intermediation, which are called financial intermediaries, and other financial institutions.

17.228 Financial intermediation is the activity of matching the needs of borrowers with the desires of lenders. It is carried out by financial institutions preparing alternative sets of conditions under which clients can borrow and lend. These conditions allow for variations in the rate of return that may be expected from an investment with, often, higher returns being less certain than lower returns or involving forgoing access to the funds for a longer period. There are now very many, very diverse ways in which money can be borrowed and lent. The act of financial intermediation is thus one of devising financial instruments that encourage those with savings to commit to lend to the financial institutions on the conditions inherent in the instruments so that the financial institutions can then lend the same funds to others as another set of instruments with different conditions. This activity encompasses financial risk management and liquidity transformation.

17.229 All financial intermediation in the SNA is carried out by financial institutions. However, some corporations in the financial sector are not themselves intermediaries but simply provide services auxiliary to financial intermediation. For example, they may provide advice to clients about the terms available for specific types of borrowing and lending, such as a mortgage broker or provide certain sorts of financial resources such as a foreign exchange bureau that exchanges one currency for another. These are the units described as other financial institutions.

17.230 Financial institutions provide services and charge for them. The ways in which they charge, however, are not always obvious. When a bank offers “free banking” it only signifies that there are no explicit fees, not that there are no implicit fees. Fees may be charged indirectly by means of charging those purchasing a financial asset more than the seller of the same asset receives. For example, dealers in foreign exchange typically buy and sell at different rates; the differences between those rates and the mid-point represent service charges paid by the customers.

17.231 Nor is it only the service charge that may have to be measured indirectly. Bills are an offer of a fixed sum at some time in the future and the promise of this payment is sold at a discount. The increase in value between the buying price and the redemption price is treated as interest in the SNA.

17.232 Nor are the terms in use in the financial markets exactly the terms used in the SNA. For example, the money paid by a bank on a deposit is described as interest by the bank but is not the amount recorded as interest in the SNA because the amount paid by the bank is assumed to be a compound payment representing interest as understood in the SNA less the service charges levied on the depositor for the costs of operating the account. In the SNA, the terms bank interest and SNA interest are used when it is necessary to distinguish the two concepts. Unless it is qualified as bank interest, the term interest in the SNA is to be taken as referring to SNA interest.

2. Charging for financial services

17.233 As noted above, the way in which financial institutions charge for the services they provide is not always as evident as the way in which charges are made for most goods and services. Several kinds of financial institutions do make explicit fees for the services they render. Other financial institutions may make implicit charges, either alone or in conjunction with explicit fees.

17.234 Explicit fees should always be recorded as payable by the unit to whom the services are rendered to the institution performing the service. If the services are rendered to a corporation or to government, the costs will form part of intermediate consumption. If they are rendered to households they will be treated as final consumption unless the financial service is performed in relation to an unincorporated enterprise, including the owning and occupying of a dwelling. Within the SNA, financial services are not incorporated into the value of any financial asset even if their incurrence is necessary for the acquisition of the asset. (This is in contrast with the treatment on non-financial assets where the costs of acquiring the asset are included in the value of the asset appearing on the balance sheet.) Nor do explicit fees affect the value at which transactions in financial assets actually take place in the market.

17.235 Implicit charges for financial services have to be measured indirectly. The charges may be simply the difference between the buying and mid-price and between the mid-price and selling price as in the example of foreign exchange quoted above. (Each service should be calculated at the time of the transaction concerned so that holding gains and losses occurring between the time of the purchase and sale are not treated as services.) Other implicit charges may be combined with other transactions (or other flows) on a particular financial instrument. The service charge associated with borrowing and lending is one such example where it is combined with interest. As noted in chapter 6 when the output of financial services is discussed, ignoring the implicit charges for financial services may lead to understating the output of the industry and sector.

3. Investment income associated with financial instruments

17.236 Most financial instruments give rise to investment income. Debt instruments such as Special Drawing Rights (SDRs) on the IMF, loans, most debt securities, deposits and some unallocated gold accounts where the amount is repaid according to a fixed formula give rise to interest. Equity and investment fund shares give rise to dividends or other distributions from corporate income. As far as possible, there should be no interest arising on other accounts receivable or payable since the amounts outstanding that give rise to interest payments should be classified as loans. In practice this might not always be possible in which case there will be some amounts of interest shown under this instrument also. Except for other accounts receivable or payable, only gold bullion, currency, non-interest bearing deposits, financial derivatives and employee stock options never give rise to investment income.

4. Holding gains and losses on financial instruments

17.237 In the normal course of events, loans and deposits denominated in domestic currency do not give rise to nominal holding gains though there will always be real holding losses for the asset holder in the presence of inflation. Securities denominated in domestic currency where the income is in the form of coupons only may be subject to holding gains and losses. These occur because when the interest rate varies, the present value of the future coupon payments and redemption values change and this is reflected in the market price.

17.238 For equity and investment fund shares other than money market fund shares, nominal holding gains are common and may be substantial. Indeed, the most frequent reason for acquiring these instruments is in order to benefit from the holding gains that arise from holding them.

N. Recording flows in financial instruments

17.239 As explained above, both service charges and investment income flows may be combined with the costs of acquiring and disposing of financial assets and liabilities. This section of the chapter, therefore, examines each class of instrument in turn to identify what flows should be recorded in each case. Explicit fees are not covered in this section since even if they apply, their value is additional to the value at which financial assets change hands. There are thus three types of flows of relevance in this section; the implicit fees made by financial institutions, different income flows and holding gains and losses. A summary of the types of flows that relate to each instrument is given in figure 17.3. Implicit fees are subdivided between those that appear as a margin between the buying and selling price and those that represent a margin on interest paid and received (FISIM). All income flows are investment income and these flows are divided between interest, dividends, withdrawals from quasi-corporations and investment income attributed to investment fund shareholders. Only the instruments relating to insurance, pension and standardized guarantee schemes are excluded as the treatment of these schemes is described in detail in other parts of this chapter.

1. Monetary gold

17.240 Monetary gold (including allocated gold accounts) consists of two subcategories, physical gold bullion and unallocated gold accounts, both of which are held by the monetary authorities (or other units authorized by them) as part of reserves. Although it may not be possible to publish these two subcategories separately for reasons of confidentiality, it is important to understand the different considerations that apply to each of them.

17.241 Gold bullion takes the form of coins, ingots, or bars with a purity of at least 995 parts per thousand. Gold held as a valuable by commercial banks or as inventories by some specialized industries, for example jewellers, may be indistinguishable from gold bullion or may be of a lower quality. Physical gold, excluding gold bullion included in monetary gold, whether gold bullion or not, can be referred to as commodity gold (since it is traded on commodity markets).

17.242 Gold bullion may be sold by one monetary authority to another in another country. In such a case the exchange is recorded as an exchange of financial assets only. In all other cases, the gold is reclassified as commodity gold and thus a valuable held by the monetary authority (and is no longer part of reserves) and is then sold as commodity gold. The reclassification is recorded in the other changes in the volume of assets account as demonetization of gold. If the gold is sold abroad it will feature in exports and imports of the countries concerned. When commodity gold is sold, there may be a trade margin attached to it. When a monetary authority acquires monetary gold a reverse path is followed. The gold is acquired initially as commodity gold either from a domestic unit or from abroad and is subsequently reclassified to monetary gold as monetization in the other changes in the volume of assets account.

17.243 There is no interest earned on gold bullion held as a valuable but it is subject to nominal and real holding gains and losses as the gold price changes. Interest can be payable when one monetary authority lends gold bullion held as reserves to another monetary authority.

17.244 Unallocated gold accounts are treated as foreign currency deposits unless they are held by the monetary authorities as part of foreign reserves. Unlike gold bullion, unallocated gold accounts have counterpart liabilities. Because the unallocated gold accounts classified as monetary gold must be held as part of foreign reserves, the counterpart liability is necessarily held abroad. The counterpart liability will not be treated as part of monetary gold in the counterpart country. (Assets held abroad as part of foreign reserves are generally not identified as such within the liabilities of the

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

partner country.) If a monetary authority acquires an unallocated gold account to be treated as reserves, it is recorded first as an acquisition of a foreign currency deposit and then reclassified to monetary gold as a change of classification in the other changes in the volume of assets account. Removing an unallocated gold account from reserves is recorded as, first, a change in classification from monetary gold to a foreign currency deposit and then as a disposal of the deposit.

17.245 Unallocated gold accounts attract interest and a service charge and are also subject to nominal and real holding gains and losses as the gold price alters.

2. SDRs

17.246 SDRs are allocated to the countries and authorities participating in the SDR Department of the IMF. Countries must be members of the IMF; other participants include a number of central banks, intergovernmental monetary institutions and development institutions. Participants may hold more or fewer SDRs than their allocation as a result of transactions in SDRs between participants. SDRs attract interest but no service charge as interest paid by participants holding more than their allocation exactly matches the interest owing to participants holding less than their allocation. Data on the interest rates payable are available regularly from the IMF. Since the value of the SDR is based on a basket of four key currencies, the value of SDRs is always subject to nominal and real holding gains and losses. From time to time, new allocations of SDRs may be made; when this occurs the allocation is recorded as a transaction.

3. Currency

17.247 Notes and coins are the simplest financial asset to record since for domestic currency, no service charges, investment income or nominal holding gains and losses are recorded. Under inflation, though, the holder of notes and coins suffers real holding losses. The cost of producing the physical notes and coins is recorded as government expenditure and not netted against the receipts from issuing the currency.

17.248 Foreign currency should be recorded in the national balance sheets converted to a value in domestic currency using the exchange rate relevant for the date of the balance sheet. This value is subject to nominal and real holding gains and losses as the exchange rate of the foreign currency relative to domestic currency alters. As noted above, there is usually a service charge associated with acquiring or disposing of foreign currency.

4. Deposits and loans

17.249 In the 1993 SNA, the acronym FISIM (Financial Intermediation Services Indirectly Measured) was used for indirect service charges on deposits and loans, No explicit mention was made of other indirect charges for financial intermediation except in the case of insurance. Although the update recognizes other indirectly measured service charges associated with financial intermediation, it is convenient to continue to use the familiar expression, FISIM, for its traditional meaning, that is, for financial intermediation associated with loans and deposits held with financial intermediaries.

17.250 Paragraphs 6.163 to 6.169 describe the basic principle of FISIM and explain the need to make the distinction, referred to above, between interest as understood by the banks holding deposits and issuing loans and the investment income flows recorded in the SNA. One (or possibly more) reference rate(s) should be applied to the level of loans and deposits to determine the SNA interest flows to be recorded. The difference between these flows and bank interest are recorded as service charges payable to the banks by the units holding the deposits or loans. This applies to both resident and non-resident units and to deposits and loans held with resident and non-resident units. For clarity, the term bank interest is used to indicate the apparent interest as quoted by a financial intermediary to their customer; the term SNA interest is used for the amount recorded in the SNA as interest, that is the level of loans and deposits multiplied by the reference rate chosen. For deposits with banks, the service charge is equal to SNA interest less bank interest; for loans the service charge is equal to bank interest less SNA interest. At a minimum, it is probable that different reference rates should be used for every currency in which non-resident loans and deposits are denominated.

17.251 No exclusion is made for lending of own funds. Although the act of lending, and the charging of SNA interest is not a productive activity, there is a service charge associated with lending. A person borrowing from a bank is unaware whether the amounts borrowed are of intermediated funds or come from the bank's own funds and no difference in the service charges applied should be made. Similarly, if a person borrows from a money lender, there is a service charge payable. (Often, in fact, the service charge is very large, reflecting the much higher risk of default faced by the money lender. A noteworthy feature of some microfinance schemes is that, because defaults are uncommon, the charges are modest.)

17.252 It is not always simple to determine whether positions between banks should be classified as deposits or loans. In a complete flow of funds presentation, this should be resolved but in the absence of a flow of funds analysis, inter-bank positions may be shown under currency and deposits. By convention they are shown under deposits. It is assumed that the inter-bank rate at which banks borrow and lend to one another is usually such as to meet the criteria for a reference rate. (In some cases it may be appropriate to use the inter-bank rate as the reference rate.) For this reason, it may often be appropriate to assume that there is no FISIM associated with inter-bank lending and borrowing within the national economy.

17.253 The outstanding balance on a credit card or on an account with a retailer is often subject to interest. These outstanding balances should be classified as loans, not other accounts receivable or payable. FISIM is calculated on them if the unit providing the loan is classified as a financial institution.

17.254 Repurchase agreements are classified as giving rise to deposits or loans depending on whether they are or are not

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

included in the national measure of broad money. They thus give rise to interest that may have a FISIM component. In addition, they have fees associated with their initiation.

17.255 There are no nominal holding gains and losses on deposits and loans expressed in domestic currency (whether these are held by residents or non-residents). With any inflation at all, there will be real holding losses on assets denominated in domestic currency. There may be nominal and real holding gains and losses on deposits and loans denominated in other currencies or held as unallocated gold accounts (or similar accounts in other precious metals).

17.256 Any charges made by a financial institution for operating a bank account, a fee for cashing a cheque or for withdrawing money from an automatic teller machine are all treated as explicit fees.

17.257 The special case of non-performing loans and how they should be treated in the SNA is discussed in chapter 13.

5. Debt securities

17.258 In terms of recording the associated flows, there are three types of debt securities. The first is where the amount payable at the end of the period for which the security exists is the same as the initial amount paid for the security but there are associated "coupons" that entitle the holder to payments of interest, at fixed or variable rates, at intervals during the life of the instrument. The second type of security is one where no intermediate payments are made but the issue price is lower than the redemption price. The issue price is equal to the redemption price discounted to the date of issue at the appropriate rate of interest that could be earned on a deposit of similar characteristics. The increase in value of the security during its life is treated as interest accruing to the holder of the security that is "reinvested" in the security to increase its value. The third type of security is a hybrid of the two other forms; the initial value is less than the redemption value but there are also attached coupons. In certain circumstances, if the coupons represent a rate of interest higher than that prevailing in the market for similar securities at time of issue, the security may be offered at a price higher than the redemption price.

Service charges associated with securities

17.259 For securities, the interest calculated according to the coupon or as the increase in value of the security is recorded in the SNA as such without adjustment for a service charge. However, there is a service charge associated with the acquisition of a security on initiation and with the disposal and acquisition of a security at any point during its life. These service charges are identified as being the difference between the buying (bid) and selling (ask or offer) price quoted for each security and the mid-price. The bid and offer prices should be those applicable to the individual buyer and seller since these may vary according to the quantity being transacted or other factors.

17.260 Suppose an instrument is bought for 102 and subsequently sold for 118 even though there has been no change in the rate of interest (and hence of the value of the instrument due to holding gains and losses). At first sight, it seems that interest of 16 should be recorded. However, suppose the mid-price on purchase was 100 and on sale was 120. The correct recording would be to show interest of 20 payable by the issuer of the security to the holder with a purchase of services of 4 payable by the holder to the dealer in securities. Ignoring the bid-ask spread understates interest and ignores the services provided by the financial intermediaries that buy and sell securities.

Interest on discounted securities

17.261 There are two ways in which the value of a discounted security can be determined during its life when the prevailing interest rate is different from the rate prevailing when the security was initiated. The debtor approach is the perspective of the unit issuing the security and the creditor approach is the perspective of the unit holding the security. The first option, called the debtor approach, is to continue to use the rate prevailing on initiation throughout the instrument's life. The alternative, the creditor approach, is to use the current rate to estimate the value of interest between any two points in the instrument's life.

17.262 Suppose an instrument is offered at 90 with a redemption value of 100. If the discount (interest) rate does not change during its life, interest will accrue steadily throughout. Suppose, though, that the interest rate falls when the instrument has reached a value of 95. Because the redemption value is now discounted by a smaller factor, the value of the security increases, say to 97. Both the creditor and debtor approach would record interest of 5 in the period before the interest rate fall. Under the creditor approach, this increase in value of 2 from 95 to 97 is treated as a holding gain and only the subsequent rise to the redemption value of 100 is treated as interest. Thus over the whole life of the instrument it has given rise to interest of 8 and a holding gain of 2.

17.263 In the SNA, the debtor approach is used. Under this approach, the interest accruing in the period before the interest rise is still 5 but so is the interest in the period after the interest rate rise. Adding this level of interest to the value of 97 when the rise occurred would give a value of 102 at the redemption date. Since this value is too high, a holding loss of 2 has to be recorded. Thus over the whole life of the instrument there is interest of 10 with an initial holding gain of 2 (when the interest rate changed) offset by the later holding loss of 2. The holding loss occurs steadily over the period between when the holding gain was recorded and the redemption period. The rationale for using the debtor approach is that the debtor, the issuer of the security, is not liable to make the payment until the security matures and from his perspective it is appropriate to treat the total amount of interest as accruing steadily over the life of the security.

Determining interest flows on bills and bonds

Interest on bills and similar instruments

17.264 Bills are short-term securities that give the holder (creditor) the unconditional right to receive a stated fixed sum on a specified date. They are issued and traded in organized

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

markets at a discount that depends on current market short-term interest rates and the time to maturity. Most bills mature after a period ranging from one month to one year.

17.265 As the bill approaches maturity, its market value increases because there is less discounting applied to it. This increase in value, in common with the increase in the value of any asset due to the unwinding of a discount factor, is treated as income in the SNA. For financial assets, the income is recorded as interest.

17.266 Let the price paid for a bill at its time of issue and after excluding the service charge be L; this represents the amount of funds that the purchaser (creditor) provides to the issuer (debtor) and measures the value of the initial liability incurred by the issuer. Let the face value of the bill be F: this represents the sum including the service charge paid to the holder of the bill (the creditor) when it matures. The difference, F-L, or discount on the bill, measures the interest payable over the life of the bill.

17.267 Bills are traded on money markets at values that gradually rise to reflect the interest accruing on the bills as they approach maturity. The increase in the value of a bill due to the accumulation of accrued interest does not constitute a holding gain because it is due to an increase in the principal outstanding and not to a change in the price of the asset.

Interest on bonds and debentures

17.268 Bonds and debentures are long-term securities that give the holder the unconditional right to:

a. A fixed or contractually determined variable money income in the form of coupon payments; or

b. A stated fixed sum on a specified date or dates when the security is redeemed; or

c. Both (a) and (b). Most bonds fall into this category.

17.269 When a bond is issued at a discount, the difference between the face value, or redemption price, and the issue price constitutes interest that accrues over the life of the bond, in the same way as for a bill. However, as accounts are compiled for time periods that are typically much shorter than the life of the bond, the interest must be distributed over those periods. The way in which this may be done is explained below.

Zero-coupon bonds

17.270 Zero-coupon bonds are long-term securities that are similar to bills. They do not entitle their holders to any fixed or variable money income but only to receive a stated fixed sum as repayment of principal and accrued interest on a specified date or dates. When they are issued they are usually sold at a price that is substantially lower than the price at which they are redeemed on maturity. Let *L* equal the issue price and *F* the redemption price, so *F-L* is the value of the interest receivable and payable over the life of the bond. This interest has to be distributed over the years to its maturity. One possible method is to assume that interest at a rate of *r* is credited at the end of each year at an annual rate that is constant over the life of the bond, so that the final value $F=L(1+r)^n$.

17.271 The interest rate, r, is given by the following expression $r=(F/L)^{1/n}-1$ where n is the number of years from the time of issue to maturity. The interest accruing during the course of year t is then given by $rL(1+r)^{t-1}$ where t = 1 at the end of the first year.

17.272 The interest accruing each year is effectively reinvested in the bond by its holder. Thus, counterpart entries equal to the value of the accrued interest must be recorded in the financial account as the acquisition of more bond by the holder (creditor) and as a further issue of more bond by the issuer (debtor).

Other bonds, including deep-discounted bonds

17.273 Most bonds pay a fixed or variable money income and may also be issued at a discount or, possibly, a premium. In such cases, the interest receivable by the holders of the bonds has two components:

a. The amount of the money income receivable from coupon payments each period; plus

b. The amount of interest accruing each period attributable to the difference between the redemption price and the issue price.

The second component is calculated in the same way as for zero-coupon bonds, as described above. In the case of deep-discounted bonds, most of the interest accruing is attributable to the difference between the redemption price and the issue price. At the other extreme, some bonds offer an income stream in perpetuity and are never redeemed.

Index-linked securities

17.274 Index-linked securities are financial instruments for which the amounts of the coupon payments (interest) or the principal outstanding or both are linked to a general price index, a specific price index, the price of a commodity or an exchange rate index. Different treatments are recommended for the recording of transactions depending on the type of index used to uprate the level of principal to which the interest is linked and on the currency in which the interest and principal are denominated.

17.275 The indexation mechanism links the amount to be paid at maturity or coupon payments or both to indicators agreed by the parties. The values of the indicators are not known in advance. For debt securities with indexation of the amount to be paid at maturity, they may be known only at the time of redemption. As a result, interest flows before redemption cannot be determined with certainty. For estimating interest accruals before the values of the reference indicators are known, some proxy measures have to be used. In this regard, it is useful to distinguish the following three arrangements:

a. indexation of coupon payments only with no indexation of amount to be paid at maturity,

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

b. indexation of the amount to be paid at maturity with no indexation of coupon payments, and

c. indexation of both the amount to be paid at maturity and coupon payments.

The principles described below for index-linked debt securities apply to all index-linked debt instruments.

17.276 When only coupon payments are index-linked, the full amount resulting from indexation is treated as interest accruing during the period covered by the coupon. It is most likely that by the time data are compiled for a reporting period, the date for the coupon payment would have been passed and hence the value of the index is known. When the date for the coupon payment has not been passed, the movement in the index during that part of the reporting period covered by the coupon can be used to calculate the interest accrual.

17.277 When the amount to be paid at maturity is index-linked, the calculation of interest accruals becomes uncertain because the redemption value is unknown; in some cases the maturity time may be several years in the future. Two approaches can be followed to determine the interest accrual in each accounting period.

a. Interest accruing in an accounting period due to the indexation of the amount to be paid at maturity may be calculated as the change in the value of this amount outstanding between the end and beginning of the accounting period due to the movement in the relevant index.

b. Interest accruals may be determined by fixing the rate of accrual at the time of issue. Accordingly, interest is the difference between the issue price and the market expectation, at inception, of all payments that the debtor will have to make; this amount is recorded as interest accruing over the life of the instrument. This approach records as income the yield-to-maturity at issuance, which incorporates the results of the indexation that are foreseen at the moment the instrument was created. Any deviation of the underlying index from the originally expected path leads to holding gains or losses which will not normally cancel out over the life of the instrument.

17.278 While the first approach (using the movement in the index) has the advantage of simplicity, interest includes all changes and fluctuations in the value of the amount to be paid at maturity in each accounting period due to the movement in the relevant index. If there is a large fluctuation in the index, this approach may yield negative interest in some periods even though market interest rates at the time of issue and current period may be positive. Also, fluctuations behave like holding gains and losses. The second approach (fixing the rate at the time of issue) avoids such problems, but the actual future cash flows may differ from the initially expected cash flows unless ex ante market expectations are exactly met. This means that interest for the life of the instrument may not be equal to the difference between the issue price and redemption value.

17.279 The first approach works well when a broad-based indexation of the amount to be paid at maturity is used (for example a consumer price index) as such indexation is expected to change relatively smoothly over time. However, the first approach may give counter-intuitive results when the indexation of the amount to be paid at maturity combines motives for both interest income and holding gains (for example, a commodity price, stock prices, or gold prices). Therefore, when indexation includes a holding gain motive, typically indexation based on a single, narrowly defined item, the second approach is preferred, otherwise the first approach should be used for the measurement of interest accrual.

17.280 When both the amount to be paid at maturity and coupon payments are indexed to a broad-based reference item, interest accruals during an accounting period can be calculated by summing two elements: the amount resulting from the indexation of the coupon payment (as described in paragraph 17.276), that is attributable to the accounting period, and the change in the value of the amount outstanding between the end and beginning of the accounting period due to the movement in the relevant index (as described in paragraph 17.277(a)). When both the amount to be paid at maturity and coupon payments are indexed to a narrow index that includes a holding gain motive, interest accruals for any accounting period can be determined by fixing the yield-to-maturity at issuance as explained in paragraph 17.277(b).

17.281 Debt instruments with both the amount to be paid at maturity and coupon payments indexed to foreign currency are treated as though they are denominated in that foreign currency; interest, other economic flows and stock levels for these instruments should be calculated using the same principles that apply to foreign currency denominated instruments. Interest should accrue throughout the period using the foreign currency as the currency of denomination and converted into the domestic currency using mid-point market exchange rates. Similarly, the amount outstanding should be valued using the foreign currency as the unit of account with the end of period exchange rate used to determine the domestic currency value of the entire debt instrument (including any accrued interest) in the international investment position. Changes in market values of debt securities due to exchange rate movements or interest rate changes are treated as revaluations.

17.282 As with other securities, the interest accruing as a result of indexation is effectively reinvested in the security and these additions to the value of the security must be recorded in the financial accounts of the holder and issuer.

6. Equity and investment fund shares

17.283 The financial service charges levied on transactions in equity and investment fund shares are calculated in the same away as for debt securities as the difference between the financial intermediary's selling price and the mid-price and between the mid-price and the intermediary's buying price. They are treated as explicit fees.

17.284 The investment income from corporate equity takes the form of distributed income of corporations. For corporations, the distributed income is in the form of

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

dividends. For quasi-corporations, the investment income is withdrawals from income of quasi-corporations. As noted in chapter 7, dividends or other withdrawals from corporate income are recorded as investment income at the time the shares start to be quoted ex dividend. A different recording is made for extraordinarily large dividends that are out of line with recent experience on the amount of income available for distribution to the owners of the corporation. Any excess distribution is to be recorded as a withdrawal of equity (recorded in the financial account) and not as part of investment income. Chapter 22 discusses the case of exceptional dividends of public corporations.

17.285 For foreign direct investment enterprises, there will also be investment income in the form of reinvested earnings.

17.286 For investment funds, the income element comes in the form of investment income disbursements to collective investment fund shareholders. In the SNA, the full value of the investment income earned is shown as being distributed to the shareholder in the allocation of primary income account with reinvestment recorded in the financial account. However, if an investment fund is also a foreign direct investment enterprise, the reinvested earnings are recorded before the remaining investment income is distributed to investment fund share holders.

17.287 As noted earlier, there may be considerable holding gains and losses, both nominal and real on equity and investment fund shares.

17.288 The entries in the financial accounts relating to acquisitions of equity conceptually contain two distinct types of transactions. One is the exchange of equity and investment fund shares between institutional units. Because the transactions are valued at mid-price, total acquisitions must be equal to total disposals. The net effect, therefore, is to show the change in composition of the holders of shares by institutional sector and with the rest of the world. The second type of transactions included in the financial account is the receipt of any reinvestment of earnings and the counterpart of the outflow recorded under investment income payable by corporations. In calculating the revaluation element between opening and closing balance sheet, care must be taken to exclude the reinvestment of earnings term.

7. Financial derivatives

17.289 Arranging a financial derivative may involve a set-up fee which should be shown as an explicit fee charged by the financial institution concerned and payable by the holder of the financial derivative. For some financial derivatives, especially options based products, a financial institution may act as a market maker and sell the products with a margin between the bid and offer price. This margin is treated as a service charge as with other financial instruments.

17.290 The initial value of a forward-type financial derivative is zero but it acquires a value as soon as there is a change in the circumstances that the financial derivative is designed to provide financial protection against. At this point, a financial asset and matching liability are recognized and recorded as a transaction in financial derivatives in the financial account. Subsequent changes in value are recorded in the revaluation account. If the value becomes negative, it becomes a liability for the holder rather than an asset and an asset rather than a liability for the seller.

17.291 At inception, options have a positive value normally equal to the premium paid to establish them. This is recorded as a transaction in financial derivatives in the financial account. Thereafter, any change in value is recorded in the revaluation account. Options are always an asset for the purchaser and a liability for the seller.

17.292 There is no investment income accruing on a financial derivative.

8. Employee stock options

17.293 As explained in chapter 7, the granting of an employee stock option may form a part of compensation of employees. All issues relating to employee stock options are discussed in part 6 of this chapter.

9. Other accounts receivable or payable

17.294 Other accounts receivable or payable are essentially accrual adjustments typified by trade credit and advances. Trade credit refers to the case where goods and services have been delivered but payment has not yet been received. Advances refer to payment for work-in-progress for which prepayment has been made but the products are not yet delivered. The means of financing payment, such as the use of credit cards, is not included here; the balance on the cards is treated as a loan and payments such as interest or overdue fees are recorded as for loans.

17.295 Other accounts receivable or payable denominated in domestic currency can have no nominal holding gains and losses but may have real ones. Any items denominated in foreign currency may have both nominal and real holding gains and losses.

Part 5: Contracts, leases and licences

O. Introduction

17.296 Many transactions that take place in the economy and are recorded in the SNA are specified in terms of a contract between two institutional units. The majority of contracts are such that one unit provides a good, service or asset to the other unit for an agreed payment at an agreed time (possibly immediately after agreeing on the price). Such contracts may be written and legally binding or may be informal or even only implicit. If a unit accepts the estimate provided by a builder for the cost of specified work, the contract is written and may well be legally binding. If a book is ordered from a bookshop but there is a delay in delivery, there is an informal contract between the book shop and the customer but it is unlikely to be enforceable by either side. Whenever a customer asks how much a given service will cost, whether it is a haircut, the delivery of a heavy product or entry to a cinema, accepting the service at the quoted price is in effect an implicit contract. However, all these contracts are simply agreements about the terms under which goods, services and assets are provided to the customer along with the legal ownership of the item. The only extent to which these contracts feature in the SNA is that they determine the point at which the transaction is to be recorded in the accounts. This is the time at which the ownership of the good, service or asset changes. For services, this is always when the service is delivered and for goods it may coincide with the time of delivery. However, the time of recording is never determined by the time when payment is made. Any difference between the time of payment and time of change of ownership gives rise to an entry in the financial account under other accounts receivable or payable.

17.297 However, there are other contracts and legal agreements variously described as leases and licences (or permits) where the terms of the agreement may affect the time of recording of transactions made under the agreement as well as the classification of payments and the ownership of the item subject to the agreement. The purpose of this part of the chapter is to provide guidance on how transactions made under these more complex arrangements are to be recorded in the SNA.

17.298 The first item for discussion concerns the different sorts of leases recognized in the SNA. The next topic for discussion is the treatment of permits to use natural resources. This is of particular importance when it is government that claims ownership of the resource on behalf of the community at large but can apply to privately owned resources also. This leads naturally into a discussion of the treatment of assets where more than one unit has a claim to ownership, or the benefits of ownership accrue to more than one unit.

17.299 Some contracts are not connected with the use of assets. The first contracts for discussion are licences (or permits) given to undertake particular activities independently of any assets that may be used in the activity. Here there are different treatments when the permits are issued by government and when they are given by other institutional units. The next point for consideration is when a contract can constitute an asset in itself, independently of the subject of the contract. Finally, a number of clarifications are made concerning the timing and nature of payments made under a contract.

P. Leases

17.300 Three types of leases are recognized in the SNA; operating leases, financial leases and resource leases. Each of these leases relates to the use of a non-financial asset. Fundamental to the distinction between the different sorts of leases is the difference between legal and economic ownership. This distinction is elaborated in chapter 3. The legal owner of an asset is the institutional unit entitled in law and sustainable under the law to claim the benefits associated with the asset. By contrast, the economic owner of an asset is entitled to claim the benefits associated with the use of the asset in the course of an economic activity by virtue of accepting the associated risks. The legal owner is often the economic owner also. When they are different, the legal owner has divested itself of the risks in return for agreed payments from the economic owner.

1. Operating leases

17.301 ***An operating lease is one where the legal owner is also the economic owner and accepts the operating risks and receives the economic benefits from the asset by using it in a productive activity.*** One indicator of an operating lease is that it is the responsibility of the legal owner to provide any necessary repair and maintenance of the asset. Under an operating lease the asset remains on the balance sheet of the lessor.

17.302 The payments made under an operating lease are referred to as rentals and are recorded as payments for a service. The character of operating leases may most easily be described in relation to equipment since operating leases often concern vehicles, cranes, drills etc. In general, though, any sort of non-financial asset, an intellectual property product or a non-financial asset may be subject to an operating

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

lease. The service provided by the lessor goes beyond the mere provision of the asset. It includes other elements such as convenience and security, which can be important from the user's point of view. In the case of equipment, the lessor, or owner of the equipment, normally maintains a stock of equipment in good working order that can be hired on demand or at short notice. The lessor must normally be a specialist in the operation of the equipment, a factor that may be important in the case of highly complicated equipment, such as computers, where the lessee and his employees may not have the necessary expertise or facilities to service the equipment properly themselves. The lessor may also undertake to replace the equipment in the event of a serious or prolonged breakdown. In the case of a building, the lessor is responsible for the structural integrity of the building, so would be responsible in the case of damage due to a natural disaster, for example, and is usually responsible for ensuring that elevators, heating and ventilation systems function adequately.

17.303 Operating leasing developed originally to meet the needs of users who require certain types of equipment only intermittently. Many operating leases are still for short periods though the lessee may renew the rental when the period expires and the same user may hire the same piece of equipment on several occasions. However, with the evolution of increasingly complicated types of machinery, especially in the electronics field, the servicing and backup facilities provided by a lessor are important factors that may influence a user to rent. Other factors that may persuade users to rent over long periods rather than purchase are the consequences for the enterprise's balance sheet, cash flow or tax liability.

2. Financial leases

17.304 ***A financial lease is one where the lessor as legal owner of an asset passes the economic ownership to the lessee who then accepts the operating risks and receives the economic benefits from using the asset in a productive activity.*** In return, the lessor accepts another package of risks and rewards from the lessee. It is frequently the case that the lessor, though the legal owner of the asset, never takes physical delivery of the asset but consents to its delivery directly to the lessee. One indicator of a financial lease is that it is the responsibility of the economic owner to provide any necessary repair and maintenance of the asset. Under a financial lease, the legal owner is shown as issuing a loan to the lessee with which the lessee acquires the asset. Thereafter the asset is shown on the balance sheet of the lessee and not the lessor; the corresponding loan is shown as an asset of the lessor and a liability of the lessee. Payments under the financial lease are treated not as rentals but as the payment of interest and repayment of principal. If the lessor is a financial institution, part of the payment is also treated as a service charge (FISIM).

17.305 Very often the nature of the asset subject to a financial lease may be quite distinct from the assets used by the lessor in his productive activity, for example a commercial airliner legally owned by a bank but leased to an airline. It would make no economic sense to show either the aircraft or its consumption of fixed capital in the accounts of the bank or to omit them from the accounts of the airline. The device of a financial lease avoids this undesirable form of recording the ownership of the aircraft and the decline in its value while keeping the net worth of both parties correct throughout the length of the lease.

17.306 It is common for a financial lease to be for the whole of the life of the asset, but this need not necessarily be so. When the lease is for the whole of the life of the asset, the value of the imputed loan will correspond to the present value of the payments to be made under the lease agreement. This value will cover the cost of the asset and include a fee charged by the lessor. Payments made regularly to the lessor should be shown as a payment of interest, possibly a payment for a service and a repayment of capital. If the terms of the agreement do not specify how these three items are to be identified, the repayment of principal should correspond to the decline in the value of the asset (the consumption of fixed capital), the interest payment to the return to capital on the asset and the service charge to the difference between the total amount payable and these two elements.

17.307 When the lease is for less than the whole life of the asset, the value of the loan should still be estimated as the value of the asset plus the value of the service charges to be made under the terms of the lease. At the end of the lease, the asset will appear on the balance sheet of the lessee and its value will be equal to the value of the loan owed to the lessor at that time. At that point the asset could be returned to the lessor to cancel the loan or a new arrangement, including the outright purchase of the asset, may be reached between the lessor and lessee. Because a financial lease requires the lessee to acquire substantively all the risks and rewards associated with the asset, if the lease is for less than the expected life of the asset, the lease usually specifies the value to the lessor at the end of the lease or the terms under which the lease can be renewed. Any variation in the price of the asset from the value in the lease agreement is borne by the lessee.

17.308 Although a financial lease will typically be for several years, the duration of the lease does not determine whether the lease is to be regarded as an operating or financial lease. In some cases a large complex such as an airport or even a building may be leased for short periods, perhaps only one year at a time, but on condition that the lessee takes all responsibility for the asset, including all maintenance and cover for exceptional damage, for example. Even though the lease period is short, and even though the lessor may not be a financial institution, if the lessee must accept all the risks associated with the use of the asset in production as well as the rewards, the lease is treated as a financial and not an operating lease and the asset appears on the balance sheet of the lessee with a corresponding loan extended from the lessor to the lessee.

17.309 As a consequence, any corporation that specializes in this sort of leasing, even though it may be called a property company or aircraft leasing company, should be treated as a financial corporation offering loans to the units leasing assets from them. If the lessor is not a financial corporation, the payments are split into repayments of principal and interest only; if the lessor is a financial corporation, the interest is split into SNA interest and a service charge (FISIM).

3. Resource leases

17.310 ***A resource lease is an agreement whereby the legal owner of a natural resource that the SNA treats as having an infinite life makes it available to a lessee in return for a regular payment recorded as property income and described as rent.*** The resource continues to be recorded on the balance sheet of the lessor even though it is used by the lessee. By convention, no decline in value of a natural resource is recorded in the SNA as a transaction similar to consumption of fixed capital.

17.311 The classic case of an asset subject to a resource lease is land but natural resources are also generally treated in this way. An exception, when a long-term lease of land may be taken as the sale of the land is described in paragraph 17.328.

17.312 Payments due under a resource lease, and only such payments, are recorded as rent in the SNA. There is further discussion of leases on natural resources in the following section.

Q. Licences and permits to use a natural resource

17.313 As noted above, in many countries permits to use natural resources are generally issued by government since government claims ownership of the resources on behalf of the community at large. However, the same treatments apply if the resources are privately owned.

17.314 There are basically three different sets of conditions that may apply to the use of a natural resource. The owner may permit the resource to be used to extinction. The owner may allow the resource to be used for an extended period of time in such a way that in effect the user controls the use of the resource during this time with little if any intervention from the legal owner. The third option is that the owner can extend or withhold permission to continued use of the asset from one year to the next.

17.315 The first option results in the sale (or possibly an expropriation) of the asset. The second option leads to the creation of an asset for the user, distinct from the resource itself but where the value of the resource and the asset allowing use of it are linked. The third option comes back to the treatment of the use as a resource lease. The difference in treatment between the second and third options was articulated in the context of the case of a mobile phone licence and that recommendation (see SNA News and Notes Volume 14, (United Nations, 2002)) is recapitulated before seeing how each of the three options relates to different types of natural resources.

1. The “mobile phone” treatment of licences or permits to use a natural resource

17.316 The case arose in 2000 when the sale of licences to use radio spectra for third generation mobile phones brought a flurry of interest from companies wanting to have exclusive access to the spectra and who in consequence were prepared to bid (often by auction) extremely large sums for the access rights to the spectra.

17.317 Eight conclusions were agreed in respect of the mobile phone licences. Allowing for updated terminology, these were:

a. The spectrum constitutes a natural resource.

b. The licence to use the spectrum constitutes an asset described as a permission to use a natural resource which is a subset of the general asset class of contracts, leases and licences.

c. Typically licence payments are neither taxes nor purchases of the spectrum itself.

d. Land, mineral deposits and the spectrum are similar types of assets and so are leases and licences based on the use of those assets.

e. There is no single, universal and clear-cut criterion to distinguish between rent and asset sale; a range of criteria needs considering.

f. Most cases examined point to treating licence payments as the purchase of an asset, not rent.

g. The value of the licence and the value of the spectrum move symmetrically.

h. Further elaboration will be useful in future.

17.318 The considerations referred to under conclusion (e) were six in number and are reproduced below.

a. *Costs and benefits assumed by licensee:* the more of the risks and benefits associated with the right to use an asset are incurred by the licensee, the more likely the classification of a transaction as the sale of an asset as opposed to rent. Thus, preagreement on the value of payments (whether by lump sum or by instalments) effectively transfers all economic risks and benefits to the licensee and so point to the sale of an asset. If, on the other hand, the value of payment is made contingent on the results from using the licence, risks and benefits are only partially transferred to the licensee and the situation is more readily characterized as payment of rent. In the case of mobile phone licences, the total amount payable has often been pre-agreed. An additional indication of the degree to which commercial risks have been passed to the licensee is to examine the hypothetical case where a licensee goes

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

bankrupt. If, in such a case, the licensor reimburses none of the upfront payment made by the licensee, this would constitute a strong case against a characterization of the transaction as rent, as apparently the licensee has incurred all the commercial risks involved.

b. *Upfront payment or instalment:* as with other indicators, the mode of payment is in itself not conclusive for a characterization as asset or rent payment. Generally, the means of paying for a licence is a financial issue and as such not a relevant factor in determining whether or not it is an asset. However, business practice shows that upfront payments of rent for long periods (15-25 years in the case of mobile phone licences) are highly unusual and this favours an interpretation as sale of an asset.

c. *Length of the licence:* licences granted for long periods suggest a treatment as the sale of an asset, for shorter periods a treatment as payments for rent. The time frame involved in mobile phone licensing (15-25 years) is considered rather unusual as a period for which to conclude a fixed payment of rent and therefore a further indication favouring an interpretation as sale of an asset.

d. *Actual or de facto transferability:* the possibility to sell the licence is a strong indication of ownership and if transferability exists, this is considered a strong condition to characterize the licensing act as the sale of third-party property rights. In practice, mobile phone licences are often transferable either directly (by the enterprise selling the licence to another enterprise) or indirectly (through the enterprise being acquired through a takeover).

e. *Cancellation possibility:* the stronger the restrictions on the issuer's capacity to cancel the licence at its discretion, the stronger the case for treatment as a sale of an asset. Conversely, when licences can easily be cancelled at the discretion of the issuer, ownership over benefits and risks has not been fully transferred to the licensee and the transaction qualifies more readily as rent.

f. *Conception in the business world and international accounting standards:* businesses, in accordance with international accounting standards, often treat a licence to use the spectrum as an asset. Again, in itself this does not lead to treatment as an asset in the national accounts, and there are other areas where companies choose to present figures in their accounts in ways that are not consistent with the national accounts. But the treatment of the acquisition of mobile phone licences as capital investment in company accounts provides an added incentive to treat them in a similar way in the national accounts.

17.319 Not all these considerations have to be satisfied to characterize the licence as a sale of an asset nor does a simple majority of them being satisfied do so. However, in order to qualify as a rental agreement, at least some of the following sorts of conditions should hold.

a. The contract is of *short-term duration*, or renegotiable at short-term intervals. Such contracts do not provide the lessee with a benefit when market prices for the leased asset go up in the way that a fixed, long-term contract would. Such benefits are holding gains that typically accrue to owners of assets.

b. The contract is *non-transferable.* Non-transferability is a strong but not a sufficient criterion for the treatment of licence payments as rent, because, although it precludes the lessee from cashing in on holding gains, it does not preclude the lessee from reaping comparable economic benefits (for example, using the licence in their business).

c. The contract contains *detailed stipulations* on how the lessee should make use of the asset. Such stipulations are often seen in cases of rent of land, in which the owner wishes to retain a control over the usage of the land. In the case of licences, examples of such stipulations would be that the contract states what regions or types of customers should be served, or that it sets limits on the prices that the lessee may charge.

d. The contract includes conditions that give the lessor the *unilateral right to terminate* the lease without compensation, for instance for underuse of the underlying asset by the lessee.

e. The contract requires *payments over the duration of the contract, rather than a large upfront payment.* Although this condition is essentially financial in character and thus cannot be decisive on the type of the lease, it may indicate a degree of control for the lessor to direct the use of the spectrum. The case for a treatment as rent is further supported if the payments are related to the revenue the lessee derives from the licence.

17.320 These two sets of considerations can be seen as a more specific parallel to the distinction of economic ownership from legal ownership used in distinguishing between an operating and financial lease as described above. The conditions for treatment of the payment as the acquisition of an asset and for treatment as payment of rent are indicative rather than prescriptive. A decision on the appropriate treatment when some of the conditions are not met will necessitate consideration of how to record those conditions not met. For example, if on balance the decision is to treat the payment as rent but a large upfront payment was made, this should be treated as a prepayment to be recorded on an accrual basis. However, if the recipient is not willing to consider a refund if the contract is suspended, accrual recording is difficult. This is one reason why upfront payments are often indicative of the sale of an asset rather than the payment of rent.

17.321 The application of these principles to the main forms of natural resources is described below, beginning with radio spectra.

2. Radio spectra

17.322 Payment for a mobile phone licence constitutes the sale of an asset, not payment for rent, when the licensee acquires

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

effective economic ownership rights over the use of the spectrum. To decide whether ownership is effectively transferred or not, the six criteria quoted above are to be considered.

17.323 When sale of an asset applies and when the life span of the licence and of the spectrum coincide, the payment for a licence is treated as the sale of the spectrum itself. The latter situation applies always when licences are granted indefinitely.

17.324 When sale of an asset applies, and when the life span of the licence is different from the life span of the spectrum, the payment for a licence is treated as the sale of a permit to use a natural resource by the legal owner (licensor) to the economic owner (licensee).

17.325 When the licence agreement is treated as the sale of an asset in its own right, its value is established at the time of its sale. It declines with the expiration of the period of validity to fall to a value of zero at the point of the expiry of the licence. Symmetrically, the value of the spectrum to the lessor falls when the licence acquires a value and is progressively re-established as the licence expires. This is consistent with a potential further sale of the right to use the spectrum for another period. This procedure also ensures a neutral effect on the net worth of the overall economy during the life of the licence.

3. Land

17.326 Land may be sold outright when the legal ownership is transferred from one institutional unit to another. (Land may not be recorded as being sold to a non-resident unit. In such cases a notional resident unit is created that holds title to the land; the non-resident unit then owns the equity of the notional resident unit.)

17.327 The type of asset most frequently subject to a resource lease is land. Tenant farmers usually pay regular rent to their landlord. A resource lease on land may be considered as a sale of the land if the lease satisfies most or all of the same criteria as those listed for payments for a mobile phone licence to be considered a sale of an asset. When the land is leased in other circumstances, the payments are recorded as rent under a resource lease agreement.

17.328 In some jurisdictions, the land under buildings remains in the legal ownership of a landlord other than the owner of the buildings. If regular payments are made to the landlord, these are recorded as rent. However, it is sometimes the case that, even though the land legally belongs to another unit, the right to occupy it for an extended period is paid for in a single upfront payment often when the building is acquired. As explained in the previous section, this suggests recording the payment as the acquisition of the asset. In such a case, when the building changes ownership, the purchase price includes an element representing the present value of future rent payments. In such a case, the land is recorded in the SNA as if the ownership is transferred along with the building above the land. If, at the end of the land lease, a further payment is liable for extension of the lease for another long-term period, this should be recorded as capital formation and an acquisition of an asset in a manner similar to costs of ownership transfer on purchase and sale of an asset.

4. Timber

17.329 If a unit is given permission to clear fell an area of natural forest, or to fell at its discretion without any restriction in perpetuity, the payments made to the owner constitute the sale of an asset. (The sale of forested land may be recorded as the sale of the timber and the land separately, depending on the intended use of each.)

17.330 The option to have a lease permitting felling at the lessee's discretion but subject to the restoration of the land, in an acceptable forested state, at some time in the future is improbable. It is more common for timber felling to be allowed under strict limits with a fee payable per unit volume of timber felled (stumpage). The limits are usually such that the harvest of timber is sustainable and so the payments are recorded as rent in the case of a natural forest.

17.331 Forests may also be produced assets, in which case the extraction of timber is treated as the sale of a product.

17.332 Illegal logging across national borders is prevalent in some countries. In such cases the quantity of timber extracted should be recorded as uncompensated seizure of a natural resource or cultivated asset, as the case may be.

5. Fish

17.333 Natural stocks of fish with an economic value are an asset and the same considerations apply to them as to other natural resources. It is not realistic to consider that permission would be given to exhaust fish stocks but illegal fishing may either reduce the stock below the point of sustainability or exhaust them altogether. In these cases, uncompensated seizure of the stock should be recorded.

17.334 Fishing quotas may be allocated in perpetuity or for extended periods to particular institutional units, for example, where fishing is an established way of life and there may be little alternative economic employment. In such circumstances the quotas may be transferable and if so, there may be a well developed market in them. Fishing quotas may therefore be considered as permits to use a natural resource that are transferable. They are thus assets in the SNA.

17.335 An alternative regime is to issue a permit for a strictly limited period of time, less than a year, to a nominated institutional unit, often a non-resident. This is a common practice in some islands in the South Pacific, for example. In these cases the revenue from the licences should be recorded as rent as under a resource lease.

17.336 A licence for recreational fishing has long been considered, by convention, as payment of a tax. This treatment is not changed by the wider considerations for commercial fishing.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

6. Water

17.337 A body of water with an economic value can be sold in its entirety either as part of the land that surrounds it or as a separate entity.

17.338 As is the case for fish, it is unlikely that economic ownership would be ceded under a long lease with no preconditions on the quantity and state in which a similar amount of water should be returned to the owner. However, it is possible that surface water could be leased under a long lease for recreational purposes, say. The treatment of such leases should be as for land.

17.339 Of increasing concern is the extraction of water from water bodies. Regular payments for the extraction of water (as opposed to the delivery of it) should be treated as rent.

7. Mineral resources

17.340 Mineral resources differ from land, timber and fish in that although they also constitute a natural resource, there is no way of using them sustainably. All extraction necessarily reduces the amount of the resource available for the future. This consideration necessitates a slightly different set of recommendations for how transactions relating to their use should be recorded.

17.341 When a unit owning a mineral resource cedes all rights over it to another unit, this constitutes the sale of the resource. Like land, mineral resources can only be owned by resident units; if necessary a notional resident unit must be established to preserve this convention.

17.342 When a unit extracts a mineral resource under an agreement where the payments made each year are dependent on the amount extracted, the payments (sometimes described as royalties) are recorded as rent.

17.343 The owner (in many but not all circumstances government) does not have a productive activity associated with the extraction and yet the wealth represented by the resource declines as extraction takes place. In effect, the wealth is being liquidated with the rent payments covering both a return to the asset and compensation for the decline in wealth. Although the decline in wealth is caused by the extractor, even if the resource were shown on the balance sheet of the extractor, the rundown in wealth would not be reflected in the extractor's production account because it is a non-produced asset and thus not subject to consumption of fixed capital. (The SEEA 2003 describes a form of satellite account where such a deduction from national income can be made for minerals as well as for other natural resources used unsustainably.) For these reasons, simple recording of payments each year from the extractor to the owner as rent and changes in the size and value of the resource as other changes in the asset accounts of the legal owner is recommended.

R. Sharing assets

17.344 There are two ways in which assets may be shared. The asset may be wholly owned by two or more units, each at different points in time. Alternatively, the risks of and benefits from the asset may be shared by two or more units at a single point in time. The two cases require different treatments.

17.345 Within the SNA, even though the asset may be owned by different units at different times, when a balance sheet is drawn up, the whole of the value of the asset is attributed to one unit. For an asset subject to an operating lease, there is no ambiguity. The legal owner is also the economic owner and is the unit that shows the asset on its balance sheet. For an asset subject to a financial lease, the unit showing the asset on its balance sheet is the economic owner. The value of the asset is the present value of the future payments due to the legal owner plus the value of the asset at the end of the lease as specified in the lease agreement. This is consistent with the views that the value of the asset represents the stream of future benefits coming from the asset and the economic owner is the unit entitled to receive these benefits in return for accepting the risks associated with using the asset in production. For an asset subject to a resource lease, the value is shown on the balance sheet of the legal owner.

17.346 When licences to use natural resources such as radio spectra, land, timber and fish satisfy the "mobile phone" criteria, a separate asset, described as a permit to use a natural resource, is established. These assets are part of the subclass of contracts, leases and licences. They are then shown on the balance sheet of the licensee.

17.347 Sharing the risks and rewards of an asset between different units at a point in time is unusual. The most common occurrence is that a single unit undertakes the activity in which the asset is used and that unit shares the returns among the owners in the form of distributed property income. However, occasionally it is possible such a single unit does not exist and it is not meaningful to try to create it statistically. This is most common when the participating units are resident in different economies, as may be the case with an airline, or in the case of some unincorporated joint ventures (UJVs). The terms under which UJVs are established are diverse but one form allows that all members share the assets equally. In such cases, the SNA records the assets shared between the owners in proportion to their ownership shares.

17.348 In some joint ventures, one party may contribute an asset as its share of the costs. If this happens, an injection of capital equal to the value of the asset should be recorded followed by the purchase of the asset in question with the ownership of the asset then shared by all parties to the arrangement.

S. Permits to undertake a specific activity

17.349 In addition to licences and leases to use an asset as described in the previous sections, permission may be granted to engage in a particular activity, quite independently of any assets involved in the activity. Thus permission to extract minerals in return for the payment of rent, for example, is not covered by this type of permit. The permits are not dependent on a qualifying criterion (such as passing an examination to qualify for permission to drive a car) but are designed to limit the number of individual units entitled to engage in the activity. Such permits may be issued by government or by private institutional units and different treatments apply to the two cases.

1. Permits issued by government

17.350 When governments restrict the number of cars entitled to operate as taxis or limit the number of casinos permitted by issuing licences, for example, they are in effect creating monopoly profits for the approved operators and recovering some of the profits as the fee. In the SNA these fees are recorded as taxes, specifically as other taxes on production. This principle applies to all cases where government issues licences to limit the number of units operating in a particular field where the limit is fixed arbitrarily and is not dependent only on qualifying criteria.

17.351 In principle, if the licence is valid for several years, the payment should be recorded on an accrual basis with an other account receivable or payable entry for the amount of the licence fee covering future years. However, if government does not recognize a liability to repay the licensee in the case of a cancellation, the whole of the fee payable is recorded at the time it is paid.

17.352 The incentive to acquire such a licence is that the licensee believes that he will thereby acquire the right to make monopoly profits at least equal to the amount he paid for the licence. This stream of future income is treated as an asset if the licensee can realize this by on-selling the asset. The type of asset is described as a permit to undertake a specific activity. The value of the asset is determined by the value at which it can be sold or, if no such figure is available, is estimated as the present value of the future stream of monopoly profits. If the payment for the licence is being recorded by government on an accrual basis, the licensee has an asset in his balance sheet under accounts receivable or payable equal to the value of the future payments and so the value of the licence itself should cover simply the excess of the monopoly profits over the cost. If the licence is on-sold, the new owner assumes the right to receive a refund from the government if the licence is cancelled as well as the right to earn the monopoly profits. If the licence was recorded as a single tax payment, the value of the asset is determined by the value at which it can be sold or, if no such figure is available, is estimated as the value of all the future monopoly profits without deduction. The asset first appears in the other changes in the volume of assets account and changes in value, both up and down, are recorded in the revaluation account.

An example

17.353 Suppose a unit, A, contracts with government to buy a permit to operate a casino for 3 years at a total cost of 12. He expects to make monopoly profits of 7 per year because the permit excludes many other casinos from operating. The government may or may not be prepared to make a refund if A relinquished the permit. A may utilize the permit for the whole of the 3 years for which it is valid or he may sell it to unit B at the end of year 1. The recordings under these four possibilities are examined below.

Case 1: Government does not offer a refund and A keeps the permit for 3 years

17.354 At the start of year 1, A pays tax of 12 and has an asset worth 21 initially. By the end of the year, the value of the asset has reduced by 7 as an other volume change, because one of the three years for which the permit was initially valid has expired. At this point the asset is contributing 14 to his net worth. By the end of the second year he writes off another 7 as an other volume change, leaving a contribution to net worth of 7. By the end of the third year the asset is worth zero.

Case 2: Government does not offer a refund and A sells the permit to B after one year

17.355 At the start of year 1, A pays tax of 12 and has an asset worth 21 initially. By the end of the year the value of the asset has reduced by 7 as an other volume change, because one of the three years for which the permit was initially valid has expired. At this point he values the asset at 14. However, B is only prepared to pay 13 for the asset and A accepts this. A therefore reduces the value of the asset by 1 as a revaluation change. B then acquires the asset and reduces its value by 6.5 in the other change in volume of assets account in each of the two following years.

Case 3: Government does offer a refund and A keeps the permit for 3 years

17.356 At the start of year 1, A makes a payment of 12 to government but this is recorded as a payment of tax of 4 during the year and at the end of the year government has an account payable to A of 8. The value of the permit to A is only the excess of the monopoly profit over the total amount that A will have to pay to government. This starts at 9 (the difference between 7 and 4 for three years) but by the end of year 1 is worth only 6. At the end of the year A's net worth includes an account receivable from government of 8 and 6 as the remaining value of the permit. The total is 14 as in case 1. During the second year, A's account receivable from government is reduced by 4 which is used to pay the tax due in year 2. In that year the value of the permit also reduced by 3 from 6 to 3. At the end of the year, A's net worth includes an account payable from government of 4 and a permit worth 3, total 7 as in case 1. At the end of year 3, both the account payable and the value of the permit are reduced to zero.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Case 4: Government does offer a refund and A sells the permit to B after one year

17.357 At the start of year 1, A makes a payment of 12 to government but this is recorded as a payment of tax of 4 during the year and at the end of the year government has an account payable to A of 8. The value of the permit to A is only the excess of the monopoly profit over the account payable. This starts at 9 (the difference between 7 and 4 for three years) but by the end of the year is worth only 6. At the end of the year A's net worth includes an account receivable from government of 8 and 6 as the remaining value of the permit. The total is 14 as in case 1. As in case 2, A has to reduce the value of his permit (in this case from 6 to 5) when he appears to sell the asset to B for 13. In fact, the account payable from government of 8 is transferred to B and the asset is sold for 5. B's net worth is unchanged. He has paid A 13 but received the account payable of 8 and an asset valued at 5 in return. In year 2, the account payable is reduced by 4 and a tax payment of 4 is recorded and the permit declines in value from 5 to 2.5.

Government permits as assets

17.358 A permit issued by government to undertake a specific activity may be treated as an asset only when all the following conditions are satisfied:

a. The activity concerned does not utilize an asset belonging to government; if it does the permission to use the asset is treated as an operating lease, a financial lease, a resource lease or possibly the acquisition of an asset representing permission to use the asset at the discretion of the licensee over an extended period;

b. The permit is not issued subject to a qualifying criterion; such permits are treated as either taxes or payments for services;

c. The number of permits is limited and so allows the holder to make monopoly profits when undertaking the activity concerned;

d. The permit holder must be legally and practically able to sell the permit to a third party.

17.359 Even if all these conditions are satisfied, if in practice the permits are not on-sold, it is not relevant to record the permits as assets. If any of the conditions is not satisfied, the payments are treated as taxes without the creation of an asset in the category of contracts, leases and licences. (There may be an account payable as shown in cases 3 and 4 of the example.)

2. Permits issued by other units

17.360 It is less common for units other than government to be able to limit the participation in a given activity. One instance may be when it is either compulsory or desirable to belong to a professional association but in this case there is seldom a limit on numbers participating. Another example could be where the owner of property limits the numbers of units allowed to operate on his property for example a hotel with a policy of only allowing one taxi firm to pick up guests. In these sorts of cases, the permits are treated as payments for services. In principle the payment should be recorded on an accrual basis throughout the period for which the permit is valid. There is no reason in principle why such permits could not be treated as assets if they were marketable though this may not be a common situation.

Non-government permits as assets

17.361 A permit issued by a unit other than government to undertake a specific activity may be treated as an asset only when all the following conditions are satisfied:

a. The activity concerned does not utilize an asset belonging to the permit-issuer; if it does the permission to use the asset is treated as an operating lease, a financial lease or a resource lease;

b. The number of permits is limited and so allows the holder to make monopoly profits when undertaking the activity concerned;

c. The permit holder must be legally and practically able to sell the permit to a third party.

17.362 Even if all these conditions are satisfied, if in practice the permits are not on-sold, it is not relevant to record the permits as assets. If any of the conditions is not satisfied, the payments are recorded as payments for a service.

3. Permits to use natural resources as sinks

17.363 Governments are increasingly turning to the issuing of emission permits as a means of controlling total emissions. These permits do not involve the use of a natural asset (there is no value placed on the atmosphere so it cannot be considered to be an economic asset) and are therefore classified as taxes even though the permitted "activity" is one of creating an externality. It is inherent in the concept that the permits will be tradeable and that there will be an active market in them. The permits therefore constitute assets and should be valued at the market price for which they can be sold.

17.364 The case of payments for discharging water may be considered as an example of the different possible ways of treating the payments.

17.365 If a payment to discharge water is a fine intended to inhibit discharge, it should be treated as a fine.

17.366 If a limited number of permits is issued with the intent to restrict discharges, the payment should be treated as a tax if the medium into which the water is discharged is not regarded as an asset in the SNA.

17.367 If the discharge medium is an asset and the necessary conditions are met concerning the terms on which the discharge is permitted, then the payment for the permit should be treated in the same way as the payment for a licence to use the radio spectrum for mobile phones. If the charge is linked to remedial action, the payment is a payment for a service unless the amount levied is out of all

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

proportion to the costs involved in subsequent water treatment in which case the payment should be treated as a tax.

T. Contracts for future production

17.368 Although human capital is not recognized as an asset in the SNA, there are cases where a contract that entitles the holder to limit the ability of a named individual to work for others may be regarded as an asset. The most prolific and lucrative contracts may be for sports players where, for example, a football club can "sell" a player to another. In fact they are not selling the person, they are selling the exclusive right to have that person work for them. Similar contracts exist for the rights to publish literary works or musical performances. All such contracts are treated as assets of the type entitlement to goods and services on an exclusive basis within the asset class of contracts, leases and licences.

17.369 It is possible to imagine that similar contracts may exist for the production of goods in future. An examination of the practice of purchasing the options of future aircraft production revealed, however, that in this case there is no transferable asset and a change of mind on the part of the potential purchaser or failure to deliver on the part of the supplier is settled by a change in the arrangements between the two parties and does not lead to the sale of the option to a third party. If an instance arises where the option to purchase goods is treated in the same way as a contract for a named individual's performance, the same classification would apply.

U. Leases as assets

17.370 As stated at the beginning of this part, contracts underlie many transactions recorded in the SNA and it is important to understand what the implications are for the time of recording and classification of transactions arising from a contract. It has been noted that permits or licences to use natural resources may constitute an asset as may permits to undertake specific activities and contracts for future production. There is one other condition that may lead to a contract being considered as an asset, which is another circumstance when the contract is transferable to a third party (that is a unit other than the two specified in the original contract).

17.371 Suppose a lease on an apartment agreed some time ago specifies the rental at 100 per month but if the same apartment were to be leased currently it would fetch 120 per month. From the lessor's point of view, the apartment is "encumbered" by the existing lease, that is, it carries a penalty (in this case of 20 per month) because of the existence of the lease. The encumbered value of the apartment is based on the present value of future rental payments taking the existence of the lease into account, that is, the future income stream is 100 for as long as the lease lasts and 120 thereafter (ignoring any allowance for inflation). The unencumbered value of the apartment is a present value based on an income stream of 120 per month from the current period forward. The value to be entered in the landlord's balance sheet is the encumbered value. If he wishes to sell the apartment and the existing tenant had the right to remain at the agreed rental, the encumbered value is all the landlord (lessor) could hope to realize. If he wished to realize the unencumbered value he would have to pay the tenant the difference between the unencumbered value and the encumbered value to be free of the lease. This amount, the encumbrance, can in some circumstances be treated as an asset of the tenant. The circumstances are that it is both legally possible and is practicable for the tenant to sublet the apartment to a third party. Because of the difficulty of identifying when such assets may exist, it is recommended that in practice these assets be recorded only when there is evidence that they have been realized.

17.372 It is possible that the encumbered value of the apartment may be higher than the unencumbered value if rentals have fallen since the lease was agreed. In this case it is the landlord that benefits from the discrepancy between the contract price and the market price because the value of the apartment in his balance sheet is still the encumbered value. If the tenant wishes to cancel the lease, he may have to pay the landlord the difference between the encumbered value and the unencumbered value. Only in the exceptional case where the tenant pays a third party to assume the lease at the price specified in the lease, does this payment represent realizing an asset of negative value to the tenant. Once the lease expires or is cancelled, the value of the apartment returns to its unencumbered value.

17.373 Assets reflecting such third-party property rights are always transitory. They exist only for the length of the lease and where there is a difference between the encumbered and unencumbered values. As each year passes, they reduce in value because the period during which the difference exists is reduced but may increase if the new rental price increases.

17.374 The market price of the rental of an apartment is the price actually paid by the existing tenant. If, in this example, the original tenant remains in situ and pays 100 per month, this is the market price despite the fact that a new lease would fetch a rental of 120. Only if the original tenant sublets the

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

apartment for 120 would the market price be recorded as 120. Of this, 100 will be paid to the landlord and 20 to the original tenant.

17.375 The example above shows when a marketable operating lease may acquire a value as an asset. Permits to use natural resources and contracts for future production may also give rise to these sorts of third-party property rights assets. So may permits to undertake specific activities even though the original payment was treated as a tax if payable to government. Financial leases do not give rise to these sorts of assets. If the value of the asset being leased increases by more than the payments due under the financial lease, the lessee always has the option of selling the asset, repaying the loan and keeping the difference.

Marketable operating leases as assets

17.376 A marketable operating lease may be treated as an asset only when the two following conditions are satisfied:

a. The lease specifies a predetermined price for the use of an asset that differs from the price the asset could be leased for at the current time, and

b. The lessee is able legally and practically to realize this price difference by subcontracting the lease to a third party.

17.377 In practice, it is recommended that such assets should be recorded only when the lessee does actually exercise his right to realize the price difference.

V. Other considerations

1. Time-share arrangements

17.378 One way of sharing an asset offering accommodation is by means of a "time-share" arrangement. The same expression, though, may be used for a number of different arrangements.

17.379 One arrangement is similar to purchasing a house except that "ownership" is restricted to a particular period each year but in perpetuity. Exactly the same physical space is available to the owner each year. Another arrangement guarantees accommodation at a given time each year but not necessarily in the same physical space. Other arrangements consist of buying "points" in a scheme that the owner can use to purchase accommodation at different locations and times subject to availability.

17.380 All time-share arrangements have a unit that is responsible for upkeep, maintenance, insurance and so on but there are variations in whether this unit is the ultimate owner of the complex and the subscribers are lessees or whether the unit acts as agent for the group of owners or subscribers. Similarly there are variations in whether the owner or subscriber may sell or bequeath his ownership to another unit permanently and whether they can sublet occasionally.

17.381 The issue of whether participation in the time-share scheme gives rise to an asset will depend on the answers to these sorts of questions. If the owner has a nominated space, available in perpetuity, is eligible to act as part of the management committee for the scheme, can sell or bequeath the allocation at will, then the holding is most likely to be an asset of the same type as a house. If the owner has a fixed agreement to have some form of accommodation available at a given period for a fixed length of time, it is likely that this represents a prepaid lease but one that could be sublet occasionally or sold for the rest of the period of the lease as a transferable operating lease. A participant in a points-based scheme may have only an account receivable by way of an asset.

17.382 Where time-share arrangements are significant, the conditions pertaining to them should be examined in the light of the general principles described in this section to determine how to record the transactions involved and classify the assets.

2. Lost deposits

17.383 Under any form of contract, it is possible that one party makes a payment and the other does not deliver the goods, services or assets promised in the contract. In many cases this gives rise to an account payable or receivable that the first party may reclaim from the second. In some circumstances this may not be possible. For example, cheap airline tickets are often offered on a non-refundable basis. The fact that prepayments are non-refundable is part of the business plan of the company concerned. Their output should be measured as the value of sales without reduction for the payments by clients who did not avail themselves of the services to which they were entitled. Volume measures of output will depend on the services actually delivered and the impact of the non-refundable deposits will show up as a price effect. It will also be reflected in the consumption expenditure figures of those paying for services they did not in the end take delivery of.

Part 6: Employee stock options

W. Introduction

17.384 A particular form of income in kind is the practice of an employer giving an employee the option to buy stocks (shares) at some future date. The ESO is similar to a financial derivative and the employee may not exercise the option, either because the share price is now lower than the price at which he can exercise the option or because he has left the employ of that employer and so forfeits his option. The following is a description of how stock options are valued, taking into account the probability that not all the options are exercised.

1. Terminology

17.385 Typically an employer informs his employees of the decision to make a stock option available at a given price (the strike price or exercise price) after a certain time under certain conditions (for example, that the employee is still in the enterprise's employ, or conditional on the performance of the enterprise). The time of recording of the employee stock option in the national accounts has to be carefully specified. The "grant date" is when the option is provided to the employee, the "vesting date" is the earliest date when the option can be exercised, the "exercise date" is when the option is actually exercised (or lapses). In some countries the permissible length of time between vesting and exercise date is quite long; in others it is very short.

2. Valuation

17.386 IASB accounting recommendations are that the enterprise derives a fair value for the options at grant date by taking the strike price of the shares at that time multiplied by the number of options expected to be exercisable at vesting date divided by the number of service years expected to be provided until the vesting date. This fair value is applied to the number of service years provided in each year to derive the cost to the firm in the year. The fair value per service year is adjusted if the assumptions about the number of options to be exercised alter.

17.387 In the SNA, if there is neither an observable market price nor an estimate made by the corporation in line with the recommendations just given, the valuation of the options may be estimated using a stock options pricing model. These models aim to capture two effects in the value of the option. The first effect is a projection of the amount by which the market price of the shares in question will exceed the strike price at the vesting date. The second effect allows for the expectation that the price will rise further between the vesting date and exercise date.

3. ESOs as a financial asset

17.388 Before the option is exercised, the arrangement between the employer and employee has the nature of a financial derivative and is shown as such in the financial accounts of both parties. It is sometimes possible for these options to be traded or the employer may buy back the options for cash instead of issuing shares. It is possible that multinational corporations may offer employees in one economy options on shares of their parent company in another country.

4. Recording ESOs in the account of the SNA

17.389 An estimate of the value of the ESO should be made at grant date. This amount should be included as part of compensation of employees spread over the period between the grant date and vesting date, if possible. If this is not possible, the value of the option should be recorded at vesting date.

17.390 The costs of administering ESOs are borne by the employer and are treated as part of intermediate consumption just as any other administrative functions associated with compensation of employees.

17.391 Although the value of the stock option is treated as income, there is no investment income associated with ESOs.

17.392 In the financial account, the acquisition of ESOs by households matches the corresponding part of compensation of employees with a matching liability of the employer.

17.393 In principle, any change in value between the grant date and vesting date should be treated as part of compensation of employees while any change in value between vesting date and exercise date is not treated as compensation of employees but as a holding gain or loss. In practice, it is most unlikely that estimates of the costs of ESOs to the employers are revised between grant date and exercise date. For pragmatic reasons, therefore, the whole of the increase between grant date and exercise date is treated as a holding gain or loss. An increase in value of the share price above the strike price is a holding gain for the employee and a holding loss for the employer and vice versa.

17.394 When an ESO is exercised, the entry in the balance sheet disappears to be replaced by the value of the stocks (shares) acquired. This change in classification takes place via transactions in the financial account and not via the other changes in the volume of assets account.

5. Variations in the use of ESOs

17.395 There are two consequences of the treatment of employee stock options to be incorporated into the accounts on the grounds of consistency. One relates to other means of rewarding employees that are related to shares in the

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

company. The other relates to the use of stock options to meet expenses other than compensation of employees.

17.396 The first consequence is for variations on the basic employee stock option model. A firm may contribute its own shares to the pension fund. This variation is usually called an employee share plan or a stock ownership plan. Under the 1993 SNA, these shares would not have been recognized as claims by households because such funding was not “arm’s length”. With the change to recording pension entitlements rather than the existing assets to meet them, this objection to recording in the same manner as the IASB recommends disappears and should be followed.

17.397 Another variation on the use of stock options to reward employees is the offer to employees to purchase shares at advantageous rates under an employee share (stock) purchase plan. Employees are not obliged to accept the offer, but if they do the discount in the share value should be treated as part of compensation of employment. Similarly, if employees receive a benefit relating to the change in a company’s shares but not shares themselves, this payment should be treated as part of compensation of employees.

17.398 The second consequence is the possibility that the enterprise pays for goods and services by means of stock options as well as offering these as part of the compensation package to employees. When this happens, the value of the stock option should be estimated if at all possible by the value of goods and services received in exchange. If this is not possible, then similar valuation methods should be used as in the case of employee stock options. The options should be recorded as a form of trade credit between the issuers and the supplier of the goods and services in the financial account. Such arrangements are usually referred to as share (stock) appreciation rights. For simplicity within the SNA, the term employee stock options (ESOs) is used to include stock appreciation rights.

Chapter 18: Elaborating and presenting the accounts

A. Introduction

18.1 The preceding chapters explain both the accounting concepts of the SNA and the form of the sequence of accounts. This chapter, and those that follow, describe how to build on this information to use the SNA in a way best suited to serve the needs of users and illustrate the interaction of the SNA with other international statistical standards.

18.2 The present chapter is concerned with a number of issues of particular concern to those responsible for the maintenance of the national accounts data base and the presentation of the accounts in the most suitable form for different sorts of analysis. In particular it addresses:

a. how to deal with revisions and discrepancies in the data and the trade-off between timeliness and accuracy,

b. which accounts to present in volume terms,

c. the role of data more frequent than annual,

d. regional accounts, and

e. what sort of detail might be included in publications.

18.3 Although no table in previous chapters has illustrated it, the prime use of the SNA is in a time series context so that users of the accounts can assess how the economy is evolving and developing over time. National accountants, like other statisticians, are regularly under pressure to produce estimates of the accounts as quickly as possible. Inevitably there is a tension between timeliness and accuracy since more comprehensive and robust data usually take longer to process than short-term indicators. Producing accounts as quickly as possible with the best information available at that time inevitably means that revisions to the initial estimates will be necessary. The publication of revisions to series is not a sign of weakness in the statistical system, rather it should be seen as a sign of the degree of confidence that the statistician has in both the original estimates and the later revisions. Some of the poorest quality national accounts are those that have remained unchanged for many years. Aspects associated with publishing time series, and the need to revise them, are discussed in section B.

18.4 Chapter 15 describes the theory of the price indices that can be used to deflate some aspects of national accounts from current values to estimates in volume terms. Section C describes briefly which parts of the accounts it is useful to express in this way.

18.5 Annual series are adequate to identify long-term shifts in the economy but to assess what is happening in the short term, higher frequency national accounts fill a key role in between short-term indicators and fully elaborated annual accounts. Discussing such accounts requires a manual in itself but an indication of some of the key issues is given in section D.

18.6 Another dimension of the accounts is that of regional accounts, where a region may be either a subdivision of a country or an economic region covering several economies. A brief mention of some aspects of regional accounting is given in section E.

18.7 The SNA is meant to be presented flexibly in order to respond most appropriately to local circumstances. Section F illustrates some ways in which key aspects of the accounts might be presented. It is important to stress that the tables in this section are not intended to be taken as strict guidelines but simply as indications of the sorts of details that might be condensed or expanded in different circumstances in order to highlight different aspects of the economy.

B. Time series, revisions and discrepancies

1. Time series

18.8 The tables in this manual are designed to be expository and therefore feature data only for a single time period. In practice it is time series of the aggregates that explain the movement of economic variables that are of most interest to analysts. The style of tables used in chapters 6 to 13 is well suited to time series presentations since the number of columns may be extended as necessary to accommodate increasingly long time series. For example, instead of one

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

table with one column for each of the five institutional sectors, one for the total economy and one for the rest of the world, it is straightforward to have seven tables, one for each of the columns but for multiple years.

18.9 The length of time series shown will depend on a number of factors. For some purposes, in particular for macroeconomic modelling, as long a run as possible may be interesting and some countries have series going back for over fifty years. However, most printed tables show no more than the ten to fifteen most recent years, with earlier data available only electronically. Usually more attention is given to ensuring the data for the recent past are as complete and accurate as possible with earlier years receiving less detailed attention. It is desirable, however, at a minimum to provide a link to earlier series so the long-term evolution of the economy can be examined.

18.10 There may be factors that imply that long time series are mainly of academic interest. For example, the change from command economy to market economy that took place in eastern Europe in the early 1990s resulted in such a fundamental change in the nature of economic activity that time series for a period from the late 1980s to the early 1990s are of limited analytical interest. In this case the political changes overshadowed the economic consequences. In all countries, the evolution of the economy over a long period in response to innovations in products, marketing mechanisms and changing import patterns means that comparisons over very many years need to be interpreted carefully.

2. Revisions

18.11 One consequence of preparing national accounts on a continuing basis over a number of years is that data sources change and improve. Intermittent sources, such as a survey held only every five years, may become available and indicate that the earlier assumptions based on projecting the previous survey were flawed. In such a case it is not sufficient to simply replace the data for the most recent period (or even from the date of the new survey forward) but to ensure that the whole time series is suitably adjusted in order to portray the best possible evolution of the series in question over as long a period as possible. Failure to do so results in inappropriate discontinuities in the series that can be seriously misleading to analysts unaware that the source of the underlying data has changed.

18.12 This need to revise data brings to the fore the conflict inherent in statistics between making the data as accurate as possible and making them as timely as possible. Users would like data that are both timely and accurate but there are trade-offs between these goals in practice. Each statistical office must make judgements about how to balance these conflicting demands but whatever the ultimate conclusion, time series that are consistent over time and explanations to enable analysts to appreciate the trade-offs the statistical office has to take are essential.

18.13 A set of guidelines on best practice for performing and using the results of revisions analysis and in formulating a revisions policy that effectively supports user needs was prepared by a task force made up of representatives from OECD, Eurostat and several member countries of those organizations. The papers prepared by the task force are available under the title *Guidelines on Revisions Policy and Analysis* (Organisation for Economic Co-operation and Development and Eurostat, 2008).

3. Discrepancies

18.14 Although the SNA ensures there is perfect consistency between the three measures of GDP, this is a conceptual consistency that in general does not emerge naturally from data compilations. This is because of the wide disparity of data sources that must be called on and the fact that any error in any source will lead to a difference between at least two of the GDP measures. In practice it is inevitable that many such data errors will exist and will become apparent in exercises such as the balancing of supply and use tables.

18.15 Just as a statistical office must make choices about the trade-off between timeliness and accuracy, choices must also be made about how to deal with discrepancies. Resources can be invested in improving data surveys, the format of the questionnaire, sampling strategies, processing techniques including the treatment of missing data and so on. However, while ultimately desirable, such an approach is costly and long-term. Even with very sophisticated data collection methods, discrepancies between different estimates will persist due to differences in coverage, valuation and lags in recording. In addition, a statistical office is also dependent to a greater or lesser extent on administrative sources of data and may not be able to ensure these exactly meet the statistician's needs.

18.16 Two approaches are open to a statistical office. The first is to be open about the problem and publish a statistical discrepancy. When this is done, it is usual to attach it to the variant of GDP the office feels is least accurate. The aim is to show users something about the degree of reliability of the published data. For example, the office may feel that the production estimate of GDP is fairly sound but have doubts about some of the expenditure components.

18.17 The alternative is for the office to remove the discrepancy by examining the data in the light of the many accounting constraints in the SNA, making the best judgement possible about where the errors are likely to have arisen and modifying the data accordingly. The supply and use framework, described in chapter 14, is a very powerful tool for doing this sort of work. More information on such balancing techniques can be found in manuals on input-output tables such as those prepared by the UN and Eurostat.

18.18 In practice, some countries may not be able to compile all three measures of GDP. Indeed, it happens that sometimes only the production measure is compiled completely and only certain components of the expenditure measure are available, principally government expenditure, capital formation (perhaps with incomplete information on changes in inventories), exports and imports of goods only. If, in such a case, an estimate of GDP by expenditure is presented where household consumption is derived as a global balancing item, this estimate will cover not only the true but unknown value of household consumption but will also include the net effect of all errors cumulated from all other parts of the estimates.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

18.19 Any errors in the production measure, missing figures for imports and exports of services, or the fact that government expenditure has been recorded on a cash rather than on an accrual basis, will distort the value of household consumption. If, then, the figure for gross operating surplus is derived by subtracting compensation of employees and taxes less subsidies on production from this incorrect figure for GDP, the errors will be carried forward to this aggregate also. The lesson for users looking at accounts with no statistical discrepancy is to be sure to understand how it was eliminated. The lesson for compilers is to study the possibilities of working at more detailed levels to avoid having to make gross assumptions about missing items, especially one as critical to an assessment of living conditions as household consumption.

Discrepancy in net lending or net borrowing

18.20 Often, the compilation process for the financial accounts and balance sheets is sufficiently separate from the rest of the accounts that the figures for net lending or net borrowing derived from each are different in practice even though they are conceptually the same. A discrepancy may indicate an error in the financial account or at any place in the accounts leading up to the balance in the capital account. An examination of the differences sector by sector may help identify the most likely sources of error. For example, a large discrepancy on household net borrowing may mean that some household income is not recorded; a large discrepancy in net lending for non-financial corporations may mean that some expenditure on fixed capital has not been recorded. But each case must be investigated on a case-by-case basis.

C. Accounts in volume terms

18.21 A major purpose in constructing accounts covering a longer period of time is to be able to study the way in which the basic structure of the economy has changed. This can be seen by studying the changing composition of macroeconomic aggregates in current values. To determine growth rates, however, it is necessary to abstract from the effects of price changes. This is done by constructing accounts in volume terms which enable the user to see the changes from one year to the next that would have resulted if there had been no change in prices. Chapter 15 describes in detail the theory and practice underlying the construction of price indices and the construction of volume measures. That chapter also explains the consequences of deriving time series in volume terms using chained indices where some impacts of price changes do affect the volume estimates.

18.22 It is only the elements of the goods and services account and non-financial capital stock for which volume measures are derived. In general, flows of property income, transfers and financial transactions are expressed only in nominal terms. In cases of high inflation, an alternative presentation where even these flows may be adjusted is possible but this is not the norm.

18.23 As well as expressing the elements of the goods and services account in volume terms, the whole supply and use tables can be expressed in volume terms. Compiling such a table ensures not only that goods and services balance when expressed in current values but that the prices used for their deflation are strictly consistent. Conceptually, a production index should be related to a weighted index of the input prices, the weights corresponding to the values of the different input categories. If the prices used to deflate output and those used to deflate intermediate consumption are not consistent, the implicit deflator for value added will be implausible. Discovering such implausibility is an indication that either the current value figures are not well balanced, the prices used are inconsistent or inappropriate, or both.

18.24 It is useful to consider the expenditure components of GDP and the production components of GDP separately first, then to consider the supply and use table and finally the capital stock measures.

1. The expenditure components of GDP

18.25 The measure of GDP easiest to express in volume terms is that of expenditure. As long as appropriate price indices exist, the estimates of household consumption, capital formation, exports and imports can be deflated without much conceptual difficulty. It is desirable to work at as great a degree of detail as possible using the product detail available for each aggregate. Care must be taken, as explained in chapter 15, to ensure that differences in quality are properly accounted for in the price deflators. This is especially important in the case of capital formation where many items such as computers are subject to rapid technological change and many items are customized, for example pieces of heavy machinery built to individual specifications.

18.26 Price indices for services are more difficult to compile than for goods and this is especially so for non-market services. Because the current values of non-market services are usually determined as the sum of costs, the obvious approach is to deflate each of these (including calculating compensation of employees at constant compensation rates). However, this does not allow for any change in the quality of services provided and in particular for the impact of any productivity changes that may have been achieved. In some cases, direct volume measures should be considered as described in the *Handbook on price and volume measures in national accounts* or the handbook *Towards measuring the volume of health and education and services* (Organisation for Economic Co-operation and Development, 2009). Research work is actively in progress to derive volume estimates of output that take account of changes in the quality as well as the quantity of the services provided.

2. The production components of GDP

18.27 Central to the production measure of GDP is value added, the balancing item in the production account. Statements can be found saying that it is not possible to think of a balancing item having price and volume dimensions. To date the most common practice is to deflate the values of output and intermediate consumption independently, industry by industry, and then derive the difference as value added for each industry. (This is known as the double deflation method.) Different price indices are necessary for two reasons. The first is because the goods and services included in intermediate consumption for any industry are not the same as the output of that industry. The second reason is that intermediate inputs are always measured at purchasers' prices whereas output is measured at either basic prices or producers' prices.

18.28 More recently, though, there is increasing interest in trying to associate movements in value added, after price effects have been eliminated, with changes in labour and capital inputs. A description of the different concepts of productivity can be found in *Measuring Productivity: Measurement of Aggregate and Industry-level Productivity Growth (OECD, 2001)*, hereafter referred to simply as *Measuring Productivity*. The manual discusses the question of whether the estimates of the costs of capital and labour exactly exhaust the estimate of value added coming from direct volume estimates, a subject which is taken up in chapter 20 on capital services.

3. Supply and use tables in volume terms

18.29 The rows of a use table show the way in which the total supply of a product is used for intermediate consumption, final consumption, capital formation and exports. This identity must hold in value terms. If the product in question is one where there is an unambiguous measure of quantity, the identity must also hold in volume terms. If the volume figures are derived by deflating the current values, the identity will only hold with certainty if each use category is deflated using a price index that is strictly appropriate to it.

18.30 It is a good practice to compile supply and use tables in both current values and in volume terms at the same time so that the consistency of all the input data, including price indices, can be investigated together.

4. Capital stock

18.31 Derivation of estimates of the consumption of fixed capital requires estimates of capital stock excluding the effects of price changes, even if there is no thought of estimating capital services or productivity measures. The levels of capital stock are typically derived by cumulating capital formation in successive periods and deducting the amount that has been exhausted. It clearly makes no sense to aggregate estimates of capital formation at the prices actually paid since the effect of rising prices (even prices rising only moderately) will be to overstate the amount of "new" capital relative to "old".

18.32 The preferred technique is to estimate all capital still in stock at the price of a single year and then revalue this to the price prevailing when the balance sheet is to be drawn up, typically the first and last day of the accounting period. This should be done at the most detailed level practicable. More on this can also be found in chapter 20.

D. Quarterly and other high frequency accounts

18.33 One response to the demand for timely data is to compile accounts more frequently than annually. In principle, the SNA can be applied to any length of time period but there are some special considerations that need to be respected for high frequency as opposed to annual accounts. A frequent choice for high frequency data is for quarterly accounts. For greater detail on compiling quarterly accounts, see *Quarterly National Accounts Manual: Concepts, Data Sources and Compilation* or the manual *Handbook on Quarterly National Accounts* (Eurostat, 1999). These manuals discuss in detail issues such as using indicators to extrapolate data and benchmarking quarterly estimates to annual data. What follows here is simply an indication of some of the key considerations that apply to quarterly as opposed to annual accounting. Similar considerations apply to other high frequency accounts.

1. Conceptual issues

Time of recording

18.34 The time of recording principle is the same for quarterly national accounts as for annual accounts. The accounts are to be compiled on an accrual basis and not a cash basis. While there will always be amounts accrued but not yet paid or received, the proportion of these amounts, relative to the total flows in the period, will be larger for a shorter period.

Definitions involving a year or more

18.35 The qualifying criterion for a fixed asset is that it should be used in production for more than one year. For simplicity and consistency between quarterly and annual accounts, this period is maintained even for quarterly accounts.

18.36 Similarly the distinction between short-term and long-term in the classification of financial assets remains one year.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Seasonality

18.37 One aspect of quarterly accounts is the effect that arises because patterns of supply and demand may change with the season. For example, more electricity may be used in winter to heat buildings than in summer or, conversely, more may be used in summer to cool them. Many agricultural products are more readily available at one time of year rather than another and thus have lower prices then. For these reasons, although the quarterly accounts should first be compiled using the data as observed, it is desirable to calculate quarterly data on a seasonally adjusted basis in order to study the pattern of evolution of the economy abstracting from seasonal effects.

18.38 Many holidays fall at the same time each year leading to a different number of working days in each quarter. Thus it is common to calculate series adjusted for the number of working days in a period. It is thus desirable to adjust high frequency data for both seasonal and working day effects.

2. Data quality

18.39 When compiling quarterly accounts, it is necessary to compare the availability of quarterly data as compared with annual data. Usually there is more information available annually and it is more comprehensive or otherwise better quality than quarterly data. To the extent this is so, the quarterly accounts may be seen as being provisional in some sense and need to be revised when more reliable annual data become available. Simply benchmarking four quarterly observations to the eventual annual figure, though, may give unexpected and implausible changes from the last revised quarter to the next quarter (a "step") unless techniques are used that address this problem. Most commonly used computer programs available to statistical offices automatically adjust to ensure that no such step results.

18.40 Although it is usual to ensure that the sum of data for the four quarters is equal to the annual figures for data before adjustment, forcing this agreement on seasonally adjusted data may be difficult and thus ill-advised if the step problem just referred to is to be avoided.

18.41 Some data values are never available quarterly and quarterly estimates may need to be made by interpolating and projecting annual information. The use of mathematical techniques for deriving data, however, should be kept to a minimum since these are unlikely to pick up the fluctuations in the economy that quarterly accounts are intended to detect. Data values that have been derived by interpolation and projection are also unlikely to have a strong seasonal component so complete accounts with full seasonal variations may not exist.

Inventories

18.42 One possible exception to the general rule that the quality of annual data is superior to quarterly data concerns the measurement of changes in inventories. The level of inventories at the start and end of the period should be deflated and the change in inventories calculated as the difference. Holding gains (or losses) may occur when goods are held in inventories and the shorter the periods over which estimates of changes in inventories excluding holding gains and losses are made, the better those estimates will usually be. (A parallel case is that of shares, for example, where holding gains are eliminated by using data quoted daily or, in some instances, more frequently.) It is simple to think of the situation where the level of inventories is the same at the same date in successive years (possibly zero) but where there has been considerable movement of goods into and then out of inventory in the intervening period. In such a case, the sum of the quarterly (or even shorter period) estimates of changes in inventories is to be preferred to the annual estimates.

3. Quarterly accounts in volume terms

18.43 Just as the goods and services account in annual accounts can be expressed in volume terms, so can the quarterly goods and services account. Although it is recommended that volume indices be chained, for quarterly accounts it is recommended that volume indices should be chained on only an annual basis to avoid spurious results that could be caused by seasonal effects. The techniques are described in detail in paragraphs 15.45 to 15.50.

4. Coverage of quarterly accounts

18.44 It is possible in principle to compile the whole set of accounts in the SNA, including balance sheets, on a quarterly basis. The most common sets of quarterly accounts, though, are for the goods and services account, the income components of value added, government expenditure, the balance sheet and changes in balance sheets for financial assets and liabilities. The quarterly goods and services account should also be compiled in volume terms.

E. Regional accounts

18.45 Regional accounts are of special importance when there are important disparities between the economic and social development of the various regions of a country.

18.46 A full system of accounts at the regional level implies treating each region as a different economic entity. In this context, transactions with other regions are recorded as if they are external transactions. External transactions of the region have to distinguish between transactions with other regions of the country and transactions with the rest of the world.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

18.47 Three types of institutional units have to be considered in the context of regional accounts.

a. There are regional units, the centre of predominant economic interest of each of which is in one region and most of their activities take place in this region. Among regional units are households, corporations whose establishments are all located in the region, local and state governments, at least part of social security and many NPISHs.

b. There are multiregional units, the centre of predominant economic interest of each of which is in more than one region but does not relate to the country overall. Many corporations and a number of NPISHs are in this situation.

c. A small number of units are national units, which means that their centres of predominant economic interest are not located geographically even in the sense of multiregional location. This is usually the case of central government and may be the case for a small number of corporations (probably public), generally in a monopolistic or quasi-monopolistic situation, such as the national railway corporation or the national electricity corporation.

18.48 Assigning transactions of the regional units to a specific region does not raise any conceptual problem. Assigning the transactions of multiregional units between various regions raises more difficulties. When considering deliveries between units of the same enterprise in different regions, it is necessary to apply the recommendation in paragraph 6.104 about intra-enterprise deliveries. Such deliveries are recorded only when the receiving unit assumes responsibility for making the decisions about the level of supply and prices at which their output is delivered to the market. When this is not the case, the receiving unit is regarded as providing only a processing service to the sending unit.

18.49 Further, some of the transactions of multiregional units simply cannot be allocated between the different regions in which they operate. This is the case for most property income and financial transactions. Thus the only balancing items of multiregional units that can be determined at the regional level are value added and operating surplus. These difficulties are parallel to those that arise when trying to construct accounts for industries where different types of activities are undertaken in separate establishments of the same enterprise.

18.50 Assigning the transactions of national institutional units by region raises even more complex issues to the point where the usefulness of attempting to do so may be questioned. While sales of electricity and railway services or compensation of employees paid by central government may be assigned to regions, interest on the public debt payable by central government or national corporations cannot be geographically located. Consequently, a reasonable solution is to introduce a kind of national "quasi-region", not allocated as such between the regions and being treated as an extra region. This national "quasi-region" may include the head offices of enterprises that have establishments located in, and assigned to, the regions.

18.51 These conceptual difficulties partly explain why no country establishes the complete SNA accounts for every region. In most cases regional accounts are limited to recording production activities (with conceptual problems arising for locating some of them, such as transportation and communication) by industry and more complete accounts for institutional sectors composed of regional units, such as households and local and state government. Establishing accounts for goods and services and input-output tables by region does not raise insoluble conceptual issues, though it involves treating deliveries to and from other regions as exports and imports. However, the practical difficulties of doing so are very considerable in the absence of a sophisticated system of transport statistics.

18.52 It should also be noted that in large countries there may be significant variation in prices of the same products across different regions. A full investigation of the impact of price variation on regional production and expenditure could involve the construction of a type of PPP exercise to be able to estimate the difference in purchasing power in different regions.

Table 18.1:High-level SNA/*ISIC* aggregation (A*10)

	ISIC Rev. 4 sections	Description
1	A	Agriculture, forestry and fishing
2	B, C, D and E	Manufacturing, mining and quarrying and other industry
2a	C	*of which*: manufacturing
3	F	Construction
4	G, H and I	Wholesale and retail trade, transportation and storage, accommodation and food service activities
5	J	Information and communication
6	K	Financial and insurance activities
7	L	Real estate activities
8	M and N	Professional, scientific, technical, administration and support service activities
9	O, P, and Q	Public administration, defence, education, human health and social work activities
10	R, S, T and U	Other services

18.53 Nonetheless, regional accounts, even with the limitations mentioned above, are a very useful tool for economic policy. Partial regional accounts may be inserted in a set of regional statistical indicators on labour participation, unemployment, poverty, etc. The greater the contrast between the regions in a country, the more useful is such a system of regional indicators, including value added per capita, household disposable income and household consumption per capita. It is for countries themselves to devise their own regional accounts and statistical indicators, taking into consideration their specific

Table 18.2: Industry level headings for a country with a large subsistence economy

ISIC, Rev. 4			Description

circumstances, data systems and resources that might be devoted to this work.

18.54 There are two manuals giving more detail on regional accounts; *Regional accounts methods - Gross value-added and gross fixed capital formation by activity Eurostat, 1995)* and *Regional accounts methods – Households Accounts* (Eurostat 1996).

F. Presentational issues

18.55 Although it is possible, as already noted, to introduce more detail into the integrated economic accounts by introducing more columns for subsectors and more rows for disaggregations of transactions, this may quickly result in a very complicated and unmanageable table. For this reason, more detailed analysis of production and transactions in goods and services, financial transactions and detailed balance sheets, as well as analysis by purpose are shown in other types of tables. Some of these alternatives are described in following chapters. This section focuses on the presentation of the main macroeconomic aggregates with supporting detail.

18.56 It is fundamental to an understanding of the SNA to grasp the three different ways of compiling GDP, from the production, expenditure and income approaches. However, the definitions in chapter 16 concentrate on the different types of flows at the most aggregate level to make the distinction between the three approaches as clear as possible. In practice when presenting the results to users, some more detail is necessary. The amount and kind of detail can vary from country to country but there are some broad guidelines that tend to be used by international organizations when producing tables for several countries at the same time.

1. Production measures of GDP

18.57 For the production measure, it is usually appropriate to give some level of industry detail. *ISIC*, Rev. 4 provides a top-level of 21 sections and a second level of 88 divisions. For national accounts summary data presentations, a high-level aggregation of 10 categories and an intermediate-level aggregation of 38 categories have been developed that are suitable for SNA data reporting from a wide range of countries. The structure of these two SNA/*ISIC* aggregations, which are denoted as A*10 and A*38, respectively, is described in more detail in *ISIC*, Rev 4, paragraphs 199 to 212. Table 18.1 shows the high-level (A*10) aggregation of industries.

Key industries

18.58 It is quite common in some countries to show very summary data for a range of industries with a breakdown by agriculture (*ISIC* section A), industry (*ISIC* sections B to F of which manufacturing, *ISIC* section C, is shown separately) and services (*ISIC* sections G to U). In countries where there are a small number of key industries, it may be useful to break some of these headings down further and to merge others. For example, it may be useful for an insight into the working of the economy to distinguish agriculture

Table 18.3: GDP by expenditure

undertaken on a commercial scale to produce cash crops for export from small-scale informal agricultural activities or to distinguish the assembly of electronic goods. Equally in some countries it may be sufficient to merge some service groups. However, it is good practice to follow the basic ordering adopted by *ISIC* whatever the level of detail shown.

18.59 In countries with a large subsistence economy, it may be desirable to show whether the production is monetary or non-monetary. Table 18.2 shows how the main *ISIC* industries can be elaborated to make this distinction. Depending on circumstances, a subset of these headings (or possibly with extra disaggregation if appropriate) may be a useful way to present information on the production activities in a country.

2. Expenditure measures of GDP

18.60 The most aggregate level of the expenditure measure of GDP is household final consumption expenditure, general government final consumption expenditure, gross capital formation, exports of goods and services and imports of goods and services. (Often in such an abbreviated presentation the item for household final consumption expenditure includes that for NPISHs also.) An example of a somewhat more detailed table is shown in table 18.3. The possibility to include details by product or by COICOP groups is shown in the table. Similarly (though not shown), details of products or COPNI, COFOG groups could be included under other headings as appropriate.

3. Income aggregates

18.61 There is much less standardization in the presentation of income measures of GDP. Some presentations concentrate on showing compensation of employees and operating surplus (and mixed income) by the same industry breakdown as is shown for the output measure of GDP. Other presentations give the different components of compensation of employees (wages and salaries, and employers' social contributions), as well as the different types of taxes and subsidies levied on production. As already pointed out, income should, properly speaking, be measured net of consumption of fixed capital and thus show the composition of NDP, not GDP. The size of NNI relative to NDP is also of interest to analysts and should be shown.

18.62 Again national needs should be taken into account when determining the presentation of the accounts. In a country where income in kind or subsistence income is significant, a breakdown of compensation of employees that includes these items should be considered.

4. Accounts in volume terms

18.63 Accounts in volume terms may be presented in a number of ways that are not necessarily mutually exclusive. It is possible to present them in level terms so that for one year (the reference year) the figures in current prices and in volume terms will be identical. A consequence of this is that if, as recommended in the SNA, volume estimates are derived by means of chain-linking, then the aggregates may not be equal to the sum of the components for years other than the reference year. One alternative is to present the volume estimates in index number form. The year that previously was the same in level terms becomes 100 for both the aggregates and the components. This procedure makes changes easier to recognize but users can still calculate the level figures if desired by applying the base year level values to the volume indicators. However, this alternative is inappropriate for aggregates that can take zero or negative values, such as changes in inventories. A third alternative is to show the volume indicators only in terms of growth rates from either the previous year or from a base year. However, rounding problems suggest this may be an additional form of presentation rather than the only one. (See paragraph 15.63 for more on measuring the contributions of chain-linked indices to growth.)

5. Quarterly accounts

18.64 As noted in the discussion on quarterly accounts above, quarterly estimates should be presented on both a seasonally adjusted and an unadjusted basis. Often they will be presented in current prices and as volume series also.

6. Sector accounts

18.65 The rationale for making institutional sectors such an important part of the SNA is the key role that they play in understanding how economic developments affect one or another groups of units in the economy. An account for each sector can be examined on its own, much as is suggested in following chapters, but some features of the accounts are only apparent from a presentation where all the sector accounts are available together. For example, an examination of property income flows shows which sectors pay interest and which receive it, what proportion of dividends are received by pension funds and whether rent is paid predominantly by households or not. The secondary distribution of income account allows a comparison to be made between the amount of current taxes on income, wealth, etc. paid by corporations as compared with households, which sectors pay insurance premiums and which receive the claims and how important other current transfers are in the economy.

18.66 The chapters that discuss the interpretation of the sector accounts also consider matters of presentation as do the chapters showing the links with other statistical systems, notably the links to government finance statistics, external transactions and monetary and financial statistics. In all cases, though, attention should be paid to presenting the accounts in a manner most useful to the readers of the publication for which a presentation is being designed. This may well vary from one type of publication to another and flexibility in approach is essential to enable the readers to make best use of the data being presented.

7. Integrated accumulation accounts

18.67 Chapter 13 explains the articulation of the accumulation accounts for both non-financial and financial assets. The links between opening and closing balance sheets for non-financial assets are essential for the derivation of consumption of fixed capital and for measures of capital services and productivity as explained in chapter 20. Very

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

often, though, the basic data on which such estimates are made are not published on a regular basis or even at all. Despite their obvious importance, even stocks of residential dwellings are not publicly available for more than a handful of countries.

18.68 For financial assets and liabilities, the situation is somewhat better and indeed in some cases the flow data are derived from opening and closing balance sheet data. Although these data are regularly published, when available, the tables are not always linked to the regular national accounts publication and so users are not always aware of the essential connection between the financial part of the accounts and the rest.

Chapter 19: Population and labour inputs

A. Introduction

19.1 Economic activity is essentially human activity and yet the sequence of accounts does not refer to persons except indirectly. All individuals that make up households (the population) are only identified in so far as they engage in consumption expenditure. Those individuals that are employees feature only as the recipients of compensation with no indication about whether there are a few very well paid employees or many very poorly paid (though in fact there are some of each and many in between). The purpose of this chapter is to show how data for population and labour can be used in conjunction with key entries in the sequence of accounts to show how much the average citizen benefits from economic activity and how much the average worker contributes to output. An indication of the first is given by measuring GDP per capita and of the second by estimating labour productivity. As well as being of interest in themselves, these figures are interesting in comparison with similar data in different time periods and in different countries.

19.2 This chapter considers total population, labour inputs and labour productivity only. Chapter 24 considers different types of households. The extension of productivity to include the impact of capital is covered briefly in chapter 20 and more extensively in other publications such as *Measuring Productivity*.

19.3 The SNA requires a definition of population to express GDP and consumption aggregates in per capita terms. In effect, expressing the volume of GDP (or of household final consumption expenditure) in per capita terms "standardizes" the volumes by adjusting for the size of countries based on their populations. Per capita volumes of major aggregates are often used as a measure of the relative standard of living in countries, despite the misgivings of some social analysts about the adequacy of this measure. Even though the per capita volumes of GDP have some shortcomings, it is clear there is a strong correlation between a country's per capita volume of GDP and its standard of living.

19.4 Labour input variables are necessary to examine productivity. Changes in productivity over time are an important indicator of the efficiency of economic production. Likewise, differences in the level of productivity in a country compared with similar countries provide a useful indicator of the relative efficiency of the country's production processes. Productivity can be measured in different ways, with the simplest being labour productivity, typically measured as the volume of GDP per hour worked. More complicated productivity measures, such as multifactor productivity (sometimes called total factor productivity) also require a measure of labour inputs, along with capital inputs, to obtain an overall input measure to divide into the GDP volume.

1. International standards on labour force statistics

19.5 Clearly, if a ratio is to be formed between measures of output and labour input, the concept of labour used must match the coverage of production in the SNA. The relevant standards on the labour force are maintained by the International Labour Organization (ILO). The ILO standards are contained in "resolutions", which are adopted by sessions of the International Conference of Labour Statisticians (ICLS). The resolution of 2008 confirms that the ***economically active population is defined in terms of individuals willing to supply labour to undertake an activity included in the SNA production boundary.***

19.6 Not everyone who is economically active works for a resident institutional unit. It is therefore particularly important that the concept of residence underlying the population estimates be consistent with that for labour force estimates and that the residence of individuals included in employment estimates are consistent with the criterion of resident institutional unit in the SNA.

2. The structure of the chapter

19.7 The topic of population and the derivations of per capita figures for aggregates such as GDP are the subject of section B. Section C starts by describing how the total population can be divided into those in the labour force and those not in the labour force and the adjustments made to population totals to allow for residents working abroad and non-residents working in the national economy. It also describes how various categories of the labour force are defined and discusses some boundary issues.

19.8 Section D discusses how simple head counts of employed persons can be improved for use in productivity measures by different means of standardization. The derivation of labour productivity measures is the topic of section E and the chapter closes with a brief discussion of data sources in section F.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

B. Population

19.9 Annual population estimates derive from less frequent population censuses. Censuses usually count the number of people present on a specified night or the number of people who usually live in a dwelling, even if they are not present when the census is enumerated. However, a census is often conducted only every five or ten years and sometimes less frequently. In years between censuses, updated information on the population of a country is provided by drawing on information on births and deaths and on net migration.

19.10 ***The population of a country is most simply defined as all those persons who are usually resident in the country***. In this definition, the SNA and *BPM6* concept of residence is used, that is persons are resident in the country where they have the strongest links thereby establishing a centre of predominant economic interest. Generally, the criterion would be based on their country of residence for one year or more. In most cases, the concept of residence is straightforward, being based on the dwelling a person occupies on a permanent basis, although there are some borderline cases discussed further in chapter 26.

19.11 Generally, persons who are resident in a country for one year or more, regardless of their citizenship, should be included in the population measure. An exception is foreign diplomatic personnel and defence personnel, together with their families, who should be included as part of the population of their home country. The "one-year rule" means that usual residents who are living abroad for less than one year are included in the population but foreign visitors (for example, holidaymakers) who are in the country for less than one year are excluded from the measured population. Further elaboration on the application on the residence criterion in special cases is given in paragraphs 4.10 to 4.15

1. Per capita estimates of volume growth

19.12 The growth rate in the volume of GDP is one of the key economic indicators provided by the national accounts. Such growth rates can be compared directly between countries because they are expressed in common units (percentage changes) and are not affected by the currency in which the GDP estimates are expressed. However, part of each country's growth in GDP volumes is attributable to changes in population and so it is useful to "standardize" percentage growth rates by calculating per capita growth rates. For example, if a country's population is increasing more rapidly than its GDP volume growth then the per capita output is falling. On the other hand, a country with a very low growth in GDP volume but with a declining population will show an increase in per capita output.

19.13 As noted in the introduction, there are some shortcomings of per capita figures. Just two examples can be given to illustrate this. An economy with larger household sizes may have equivalent benefits from proportionately smaller expenditure on housing and other items covering all household members than a country with smaller household sizes. Giving the same weight to a small child and an adult in a physically demanding job may also give misleading information on the adequacy of food consumption.

19.14 Per capita growth rates in real national income or in real actual consumption generally provide a better measure of the changes in the average "welfare" of a country's population than the changes in GDP volumes. GDP is a measure of production within a country but the inflows or outflows of income from or to the rest of the world can have a significant effect on both the level and growth rates in real national income per capita. Similarly, the level and growth rates in GDP volumes can differ significantly from those in the final consumption of households because of the varying shares across countries of capital formation and net exports within GDP.

2. Absolute levels of GDP per capita

19.15 As described in chapter 15, the International Comparison Program (ICP) makes estimates of absolute levels of GDP and GDP per capita across countries in order to try to establish a relative level of prosperity. These estimates involve measures of GDP, purchasing power parities (PPPs) and the same population estimates previously described as being used for volume growth measures.

C. Measuring the labour force

19.16 Not all individuals included in the population are engaged in production. Some are too young, some too old and some may simply choose not to work. Others may usually work but be temporarily not working because of illness, lack of employment or being on holiday, for example. A first step in moving from population data to data for employment, is thus to define what is meant by the labour force.

19.17 ***The labour force consists of those who are actively prepared to make their labour available during any particular reference period for producing goods and services that are included within the production boundary of the SNA.*** The labour force is further divided into those who are employed and those who are unemployed. Thus the population of the country can be subdivided into three categories; employed, unemployed and not in the labour force. A person's status depends on their activity (or lack of it) during a particular reference period (usually a week).

19.18 Because the labour force is defined with reference to a short period, the number of persons in the labour force at any time may be smaller than the economically active population. For example, seasonal workers may be

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

included in the economically active population but not in the labour force at certain times of year.

19.19 The labour force consists of four groups of persons; residents who are employees of resident institutional units, residents who are employees of non-resident institutional units, unemployed residents and self-employed persons. (A self-employed person is necessarily associated with a resident household. If such a person provides goods and services abroad, these are recorded as exports.) ***Employment in the SNA is defined as all persons, both employees and self-employed persons, engaged in some productive activity that falls within the production boundary of the SNA and that is undertaken by a resident institutional unit.***

1. Employees

19.20 ***Employees are persons who, by agreement, work for a resident institutional unit and receive remuneration for their labour***. Their remuneration is recorded in the SNA as compensation of employees. The relationship of employer to employee exists when there is an agreement, which may be formal or informal, between the employer and a person, normally entered into voluntarily by both parties, whereby the person works for the employer in return for remuneration in cash or in kind. There is no requirement that the employer should declare the agreement to any official authority for the status of employee to apply.

19.21 Employees include but are not confined to the following categories:

a. persons (manual and non-manual workers, management personnel, domestic staff, people carrying out remunerated productive activity under employment programs) engaged by an employer under a contract of employment;

b. civil servants and other government employees whose terms and conditions of employment are laid down by public law;

c. the armed forces, consisting of those who have enlisted for both long and short engagements and also conscripts (including conscripts working for civil purposes);

d. ministers of religion, if they are paid directly by general government or a non-profit institution;

e. owners of corporations and quasi-corporations if they work in these enterprises;

f. students who have a formal commitment whereby they contribute some of their own labour as an input into an enterprise's process of production in return for remuneration and (or) education services;

g. disabled workers, provided that the formal or informal relationship of employer to employee exists;

h. persons employed by temporary employment agencies, who are to be included in the industry of the agency which employs them, and not in the industry of the enterprise for which they actually work.

19.22 An outworker is a person who agrees to work for a particular enterprise or to supply a certain quantity of goods and services to a particular enterprise by prior arrangement or contract with that enterprise, but whose place of work is not within it. An outworker is treated as an employee if there is an explicit agreement that the outworker is remunerated on the basis of the work done, that is the amount of labour contributed as an input into some process of production. There is further discussion of the classification of outworkers in paragraphs 7.34 to 7.38.

19.23 Persons temporarily not at work are also considered as employees provided they have a formal job attachment. This formal attachment should be determined according to one or more of the following criteria:

a. the continued receipt of wage or salary;

b. an assurance of return to work following the end of the contingency, or an agreement as to the date of return;

c. the elapsed duration of absence from the job which, wherever relevant, may be that duration for which workers can receive compensation benefits without obligations to accept other jobs.

Persons included in the above classification are those temporarily not at work because of illness or injury, holiday or vacation, strike or lockout, educational or training leave, parental leave, reduction in economic activity, temporary disorganization or suspension of work due to such reasons as bad weather, mechanical or electrical breakdown, or shortage of raw materials or fuels, or other temporary absence with or without leave. For some purposes, it may be useful to distinguish employees temporarily not at work if this is possible.

19.24 Managers of corporations (or quasi-corporations) are treated in the SNA as employees but the ILO classification regards them as self-employed.

2. Self-employed persons

19.25 ***Self-employed persons are persons who are the sole or joint owners of the unincorporated enterprises in which they work, excluding those unincorporated enterprises that are classified as quasi-corporations.*** Persons who work in unincorporated enterprises are classed as self-employed persons if they are not in paid employment that constitutes their principal source of income; in that latter case, they are classified as employees. They may be temporarily not at work during the reference period for any specific reason. The compensation for self-employment is included in mixed income because it is not possible to observe separately the return to labour from the return to any capital used in the unincorporated enterprise. (For some analytical purposes it may be useful to estimate a breakdown. See paragraphs 20.49 to 20.50)

19.26 Self-employed persons also include the following categories:

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

a. contributing family workers working in unincorporated enterprises;

b. outworkers whose income is a function of the value of the outputs from some process of production for which they are responsible, however much or little work was put in;

c. workers engaged in production undertaken entirely for their own final consumption or own capital formation, either individually or collectively. (An example of the last is communal construction.)

19.27 Contributing family workers are sometimes called unpaid workers but there are other unpaid, or voluntary, workers.

19.28 In ILO statistics, self-employed persons include those working in enterprises that are legally unincorporated even if there is sufficient information available for them to be treated as quasi-corporations in the SNA. In the SNA the remuneration of these people is included in compensation of employees rather than in mixed income. Among others, this may include members of producers' cooperatives.

3. Unemployment

19.29 To complete the picture of the labour force, it is necessary to mention unemployment because the labour force is divided between employed persons (that is, employees plus self-employed persons) plus those who are unemployed. An unemployed person is one who is not an employee or self-employed but available for work and actively seeking work. The concept of unemployed persons is not required in the national accounts because the unemployed do not contribute to production but their numbers are necessary to make the conceptual transition from the employed population to the economically active population.

4. Boundary problems

Jobs and employees

19.30 Individuals may have more than one source of income from employment because they work for more than one employer or, in addition to working for one or more employers, they work on their own account as self-employed. The agreement between an employee and the employer defines a job and each self-employed person has a job. The number of jobs in the economy thus exceeds the number of persons employed to the extent that some employees have more than one job. An individual with more than one job may do these successively as when the person works for part of the week in one job and the rest of the week in another or in parallel as when the person has an evening job as well as a daytime job. In some cases, too, a single job may be shared by two persons.

19.31 Employers may not be aware of, and in any case are not asked to provide information on, secondary jobs undertaken by their employees. When employers supply information on the number of employees, they actually provide information on the number of jobs they provide. Care has to be taken that the number of jobs does not include vacancies when numbers of jobs are used for number of employees. The distinction between number of jobs and number of employees is one issue that has to be carefully addressed in productivity statistics.

Residence

19.32 Population numbers are dependent on the residence of individuals but employees do not have to be resident in the economy where they work. The results of the activity of producer units can be compared with employment only if the latter includes both the residents and the non-residents who work for resident producer units. Employment mainly consists of resident employees working for resident institutional units and self-employed persons. However, it also includes the following categories where there might be a question about whether they are considered resident or not:

a. non-resident border workers (sometimes called frontier workers), that is, persons who cross the border each day to work as employees in the economic territory;

b. non-resident seasonal workers, that is, persons who move into the economic territory and stay there for less than one year in order to work in industries which periodically require additional labour;

c. members of the country's armed forces stationed in the rest of the world;

d. nationals who are on the staff of national scientific bases established outside the geographic territory of the country;

e. nationals who are on the staff of diplomatic missions abroad;

f. members of the crews of fishing boats, other ships, aircraft and floating platforms operated by resident units;

g. employees of general government bodies situated outside the geographic territory, for example embassies;

h. students undertaking employment are included or not according to their classification as resident or non-resident as explained in chapter 26.

19.33 On the other hand, the following residents, though employees, are excluded from employment in residential institutional units (and hence from measures of employment as used in the context of the SNA):

a. residents who are border workers or seasonal workers, that is, who work as employees in another economic territory;

b. nationals who are members of the crews of fishing boats, other ships, aircraft and floating platforms operated by non-resident units;

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

c. residents who are employees of foreign government agencies located on the geographic territory of the country;

d. the personnel of international civilian organizations located within the geographic territory of the country (including local employees directly recruited);

e. members of the armed forces working with international military organizations located on the geographic territory of the country;

f. nationals working in foreign scientific bases established in the economic territory.

19.34 Labour force statistics may be based on either household surveys (when all residents should be covered) or from establishment surveys (when the focus is on employment in resident institutional units). However, some further adjustments are required to ensure the coverage of employment on an SNA basis is complete:

a. conscripted members of the armed forces are generally not included in establishment surveys and may not be captured in household surveys but conscripts are regarded as being employees of general government in the SNA;

b. resident workers living in an institutional household (such as a religious institution or a prison) are generally not included in either household surveys or establishment surveys but the workers are included in SNA employment;

c. resident workers under the age limit defined for measurement of the labour force who work for resident institutional units are included in SNA employment.

5. The non-observed economy

19.35 National accountants are particularly concerned about ensuring that the whole of economic activity within the SNA production boundary is measured comprehensively. This is often referred to as the "exhaustiveness" of the coverage of the national accounts. In practice, it means ensuring that the value of production activities that are illegal or hidden (that is, the "underground economy" or the "hidden economy") as well as those that are simply described as informal is included in the accounts. In principle, for the SNA, the remuneration of all these workers should be included in either compensation of employees or mixed income. Therefore, when looking at comparisons between labour statistics and output, it is important the persons concerned should be included in labour statistics also.

6. Labour in NPISHs

19.36 The output of NPISHs is supplied free or at prices that are not economically significant so it is valued by the costs of production. One of these costs is compensation of employees. It is important that these employees be recorded in the employment measures used in deriving productivity changes. However, NPISHs often have volunteer workers so the treatment of these deserves special attention.

7. Volunteer labour

19.37 A distinction can be made between those who have an agreement to provide labour for token remuneration or only income in kind, those for whom there is explicitly no remuneration and those where there is apparently no remuneration but the workers benefit directly from the output to which they contribute. In ILO statistics, all three types of worker are included in the economically active population as employees.

19.38 In the SNA, the remuneration of those working for token amounts or only income in kind is measured by these costs. No imputation for an additional element of remuneration is included. For example, if doctors or teachers work for only food and lodging, the value of this as income in kind is the only salary imputed to them. Such instances may arise in religious institutions or in the wake of natural disasters. If the unit employing these staff is responsible for whatever little remuneration is received, the staff are classed as employees.

19.39 If staff are purely voluntary, with no remuneration at all, not even in kind, but working within a recognized institutional unit, then these individuals are still regarded as being employed in SNA terms but there is no entry for compensation of employees (or mixed income) for them. (Individuals providing services to groups of other individuals, such as coaching a children's football team, without any associated infrastructure are not regarded as employed but rather engaging in a leisure pursuit, however worthy their efforts might be.)

19.40 If family members contribute to the output of an unincorporated enterprise, the estimate of mixed income is supposed to include an element of remuneration for them and thus they are all treated as being in the economically active population from an SNA point of view. In ILO statistics such workers will not be included in the economically active population if they are under age. (The lower limits for working age will depend on national conditions.)

19.41 By convention, no labour services are attributed to the services provided by owner-occupied dwellings (see paragraphs 24.50 to 24.58). In contrast, if a group of individuals agrees to construct a building or structure, for example a school or a well, these individuals are regarded as being in the labour force and receive mixed income for their efforts. Because it is difficult to value such projects, unless a direct comparison can be made with a similar building, the value of construction should be based on the costs incurred. Labour is a significant input into construction projects, so its value must be included as part of the total costs using wage rates paid for similar kinds of work on local labour markets (see paragraphs 6.127 and 7.30). This income is then used to acquire the result of their efforts which may subsequently be handed over to a third party for maintenance. The latter action is recorded as a capital transfer in kind.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

D. Standardized measures of labour inputs

19.42 A crude estimate of the labour inputs required for productivity measures is provided by the numbers of persons employed. Using this as a starting point, the labour input measures can then be adjusted to provide various degrees of sophistication. Examples in increasing order of being difficult to measure are full-time equivalents, total actual hours worked and quality-adjusted labour inputs based on models. Each of these is discussed in turn below.

1. Employment measured on a full-time equivalent basis

19.43 ***Full-time equivalent employment is the number of full-time equivalent jobs, defined as total hours actually worked by all employed persons divided by the average number of hours actually worked in full-time jobs.***

19.44 The definition does not necessarily describe how the concept is estimated. The method sometimes used, of simply counting all part-time jobs as half a full-time job, is the crudest possible way of making an estimate. Since the length of a full-time job has changed through time and differs between industries, more sophisticated methods are preferred, such as one that establishes the average proportion and average working time of less than full-week, full-time jobs in each job group separately.

19.45 The SNA does not recommend full-time equivalent employment as the preferred measure of labour inputs. However, if the data are good enough to permit an estimation of total hours actually worked, full-time equivalent employment should also appear in association with the national accounts. One reason is that this facilitates international comparisons with countries which can only estimate full-time equivalent employment. However, with the move by the ILO to recommend recording total hours actually worked as the preferred measure of labour input, the use of full-time equivalents is likely to be gradually phased out.

19.46 As just noted, the number of full-time equivalent employees is based on the number of hours worked, on average, in a full-time job. If the number of hours in a full-time job falls because of an increase in annual leave entitlements or public holidays, say, there may be little or no change in full-time equivalents even though the total number of hours actually worked has declined. A similar effect may be caused by an increasing incidence of sick leave. The estimate of the number of hours in a full-time job is therefore adjusted for the average amount of sick leave taken in the reference period as well as for annual leave taken.

2. Hours worked

19.47 Even with such adjustments made to full-time equivalent numbers, the preference is for total hours actually worked to be used in productivity estimates.

19.48 In practice, total hours actually worked and annual (full-time) hours actually worked may have to be estimated. In many countries, especially for monthly paid employee jobs, only normal hours or hours usually worked, any paid overtime, plus annual and holiday leave entitlements can be ascertained. It may be impossible to estimate the deduction to be made for the average level of absence from work due to illness from either total hours actually worked or annual (full-time) hours actually worked. This error will not affect full-time equivalent employment if sickness rates in part-time jobs are the same as in full-time jobs.

19.49 If the reference weeks used in the surveys that provide the data are not fully representative, the best available information on variations throughout the year should be used in estimating data for the year as a whole.

Defining hours actually worked

19.50 For the purposes of the SNA, working time is defined as the time spent in undertaking activities that contribute to the production of goods and services within the SNA production boundary. Seven concepts of working time are defined in the resolution concerning the measurement of working time adopted by the 18th ICLS, in December 2008:

a. hours actually worked,

b. hours paid for,

c. normal hours of work,

d. contractual hours of work,

e. hours usually worked,

f. overtime hours of work and

g. absence from work hours.

19.51 The most important measure for the SNA, and the one most relevant for use in measuring productivity, is hours actually worked. This concept covers

a. direct hours, the time spent carrying out the tasks and duties of a job in any location regardless of the amount of time agreed contractually between employer and employee,

b. related hours, including time on call, travelling on work assignments, training and other tasks itemized in the resolution,

c. down time, covering periods when a person is available for work but cannot because of temporary interruptions of a technical, material or economic nature

d. resting time such as short periods of rest, for refreshment, etc.

19.52 Hours worked excludes

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

a. all types of leave (annual, public holidays, sick leave, parental leave civic duty etc.),

b. commuting time when no productive work is done,

c. education other than training,

d. meal breaks and other longer periods of rest while travelling on business.

19.53 More exhaustive definitions of these criteria can be found in the ICLS resolution.

19.54 The truism, for employee jobs, that hours worked equal hours paid less hours paid but not worked, plus hours worked but not paid, is a useful one, since many establishment surveys record hours paid, not hours worked, so that hours worked have to be estimated for each job group, using whatever information is available about paid leave, etc.

3. Quality-adjusted labour input

19.55 Using total hours actually worked as the input measure for calculating labour productivity changes over time implicitly assumes that each hour worked is of the same quality (that is, there are no differences in the qualifications and skill levels of the labour employed). In other words, each hour worked by a highly skilled person, such as a brain surgeon, is assumed to produce the same quantity and quality of output as each hour worked by an unskilled worker. It is possible to produce a quality-adjusted measure of the labour inputs that takes account of changes in the mix of workers over time by weighting together indicators of quality for different grades of workers. (The term quality-adjusted is used as being parallel to the idea of quality-adjusted price indices but it could also be seen as an adjustment for the change in the composition of the workers involved.)

19.56 The quality indicators used can relate to variables such as academic qualifications, trade qualifications, experience (typically based on age of the worker), industry of employment and so on. The various indicators are weighted together using average hourly wages for a worker falling into each category. The premise behind this approach is that workers are hired only until their marginal price (that is, their wages, including on-costs) is less than the marginal revenue expected to result from their production. The index formula used can be a fixed-weight (Laspeyres) formula or a more sophisticated formula such as the Tornqvist, which takes account of changing weights by using weights from each of the periods in the analysis.

19.57 Calculating a quality-adjusted labour input measure using this approach is very data intensive and only those countries that have highly developed statistical systems are likely to have the detailed data required.

4. Employee labour input at constant compensation

19.58 Total hours actually worked and full-time equivalent employment are both physical measures of labour input. Output too can usually be measured in physical terms, such as tonnes or cubic metres, but this is not done in the national accounts, because the basic value per tonne or cubic metre varies so much between products that these physical measures lack general economic significance. But compensation per hour or per full-time year of work varies enormously too. Physical measures of labour input are only valid if the mix of different kinds of labour is much the same in the different countries or at the different times examined.

19.59 Since output is measured both at current prices and in volume terms, it is natural to do the same with labour inputs as well as with intermediate inputs. However, the remuneration of the self-employed is included in mixed income and cannot be unambiguously identified separately. For this reason, the labour input of employees only is shown at constant compensation.

19.60 The measurement of employee labour inputs at current prices and in volume terms is symmetrical with the measurement of output and subject to the following caveats.

a. Market prices and market compensation are assumed to measure the relative economic importance of different goods, services and jobs; the advantages and disadvantages of this assumption are the same for inputs as for outputs.

b. Though the volume measure and constant compensation concepts are defined as revaluations of quantities at base period prices or compensation levels, they can be estimated in practice as the sum, over all groups, of values at current prices or compensation levels, each divided by an appropriate wage index.

c. These group indices are estimates, calculated for a representative sample of jobs or of goods or services, with weights reflecting the relative importance of each of the subgroups represented by a selected and specified job, or by a selected and specified good or service. In other words, a compensation index is constructed like a price index.

19.61 While the value of employee labour input at constant compensation can be estimated by deflating current values, as mentioned above, the data may also permit the direct approach of multiplying the current number of jobs in each job group by the base-period average annual compensation for jobs in that job group.

E. Estimating labour productivity

1. Labour productivity and MFP

19.62 Volumes of output per hour worked (or per person employed) are described as measures of labour productivity. However, this is a somewhat unsophisticated measure because changes in this measure can reflect a number of factors other than just the number of hours of labour employed. In particular, increases in the amount of capital used can affect this ratio as can changes in the composition of the labour force over time.

19.63 Measures of capital productivity, calculated by dividing the volume of output by an index of capital services provided, suffer from similar drawbacks since they do not capture the effects of the amount of labour employed and the efficiency and composition of the capital inputs.

19.64 A measure that takes account of the contributions of both labour and capital to growth in output is multifactor productivity (MFP), which is sometimes referred to as total factor productivity (TFP). The advantage of using MFP as the measure of productivity is that it includes effects not included in the labour and capital inputs. This topic is discussed further in chapter 20 and in *Measuring Capital.*

19.65 The productivity model can be extended to include other factors such as the energy and materials used in production. This can be extended to producing productivity estimates at the most detailed level of the input-output tables. An example of such work can be found in the EU-KLEMS project. EU-KLEMS was initially a statistical and analytical research project focussing on the analysis of productivity and growth accounting in the European Union at the industry level. More information on it can be found on the project site http://www.euklems.net/. The work is being adopted officially.

2. Employment estimates for productivity estimation

19.66 As explained in section D, neither the number of employees, nor even full-time equivalent employees are ideal measures for use in productivity studies. Total hours actually worked is preferred by many because it is a reasonable compromise between these cruder measures and data-intensive measures that adjust for differences in the qualifications, skill levels and composition of labour.

19.67 Whichever labour measure is used in calculating productivity, it is very important to ensure that the coverage of the labour data is consistent with that of the national accounts. In other words, the labour inputs must be estimated within the same production boundary and using the same criteria for residence that are used in the national accounts. Typically, the topics that cause most difficulty are residence (particularly with border workers), defence force and diplomatic personnel (who are commonly not covered by the labour force surveys often used to provide the basic data) and obtaining details of unpaid hours (for example, unpaid overtime) or of some self employment (for example, contributing family workers).

19.68 Increasingly, analysts are interested in measuring productivity on an industry basis as well as for the economy as a whole. Calculating industry employment and working time by industry adds an additional degree of difficulty to the estimation process. Among other advantages, using hours worked overcomes the problems involved in measuring employment by industry when a worker has two or more jobs, not in the same industry.

19.69 In particular, the national accounting data come from surveys of establishments while the employment estimates are generally obtained using household surveys. It is often difficult to correctly match the data classified by industry from these separate sources. Similar difficulties potentially affect regional estimates, with the concept of residence having to be applied at a regional level rather than at the country level.

19.70 Labour productivity, including industry productivity, and MFP are all valid measures of an economy's performance. From a practical viewpoint, it is important to ensure that the employment and hours worked underlying these sets of estimates are consistent with each other as well as with output measures when calculating the productivity estimates.

3. Data consistency

19.71 Examining the relative productivity performance of different industries is of interest to many analysts. In practice, the labour input estimates for the whole economy can be estimated either "bottom up" or "top down". In the former case, the totals for the economy as a whole will be completely consistent with the industry estimates because they are summed to derive the total labour estimates. However, in the case of a top-down approach, a range of different data sources may be used to obtain the disaggregation by industry. In such cases, it is important to ensure that the sum of the industry estimates is consistent with the national totals.

19.72 Classifying employment by industry is not always straightforward. The main issue is to ensure that the employment estimates for each industry are as consistent as possible with the national accounts values and volumes so that the productivity estimates are reliable. One particular problem that arises is where staff are recruited via an external recruitment agency. Maintaining consistency with the industry output means that employment should be classified to the industry of the establishment that legally employs the workers. In practice, this will be the establishment that pays the employee's wages and any associated social contributions, which will usually be the employment agency and so the employees will be classified to industry class 7491 *Labour recruitment and provision of personnel.* The output of this industry includes the revenue derived from the activity of hiring out staff to those establishments that need the staff; generally, those establishments will be in other industries. The establishments using these staff pay the employment agency and then the employment agency pays the staff so the payments by the "using" establishments will be

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

recorded as part of intermediate input for the using industry.

19.73 Ideally, for productivity purposes both the output attributable to these staff and the hours they work would be recorded in the industry in which they are actually working rather than in the industry "Labour recruitment and provision of personnel". However, in practice, it is unlikely that the data can be collected to enable the output and hours worked to be classified this way. It may be useful for some purposes for the staff hired out by employment agencies to be allocated to the industries that actually use the staff. However, any such allocation should be presented in a supplementary table and not in the main accounts.

4. International comparisons

19.74 Productivity growth is often expressed in percentage terms and comparisons across countries made in terms of these percentages. Assuming similar methods have been used to compile the estimates for the countries being compared, and that they have roughly comparable levels of productivity, this sort of comparison is interesting and much simpler than the alternative of comparing levels. Measuring the relative levels of production (for example, the volume of GDP or of GDP per capita) or productivity between countries is more complicated because it is necessary to convert the national accounts data to a common currency. The best means of doing so is to calculate purchasing power parities (PPPs), which measure the rate of currency conversion that would be required to equalize the prices of a common basket of goods and services between the countries concerned. In practice, PPPs adjust for differences in price levels between countries as well as differences in exchange rates (see section E of chapter 15).

19.75 International comparisons of productivity below the level of GDP, such as by industry, are problematical. PPPs are calculated using the expenditure-based estimates of GDP so there are no PPPs for the individual industries that contribute to GDP. Therefore, it is necessary to make an assumption that the PPP for a single aggregate such as GDP is applicable to all industries. Examining the differences in the PPPs for the various expenditure components shows they can vary significantly so this is unlikely to be a very good assumption. Making robust international comparisons of productivity at disaggregated levels is thus a very demanding exercise.

F. A note on source data

19.76 Broadly speaking, there are three types of data sources for employment data. These might be used singly or in combination especially when the periodicity of each differs. The usual caveats that the quality of a survey depends on the sample size, survey design, response rate and reference period obviously apply to the surveys used for employment data as for other surveys. So do the steps that need to be taken to allow for non-response and misreporting.

19.77 The three data sources are:

a. household surveys, such as a labour force survey;

b. establishment surveys;

c. administrative data (for example, employment associated with a payroll tax).

Population census data may also be available infrequently.

19.78 The employment estimates from a household survey typically count the number of people who have jobs and, perhaps, the number of hours they work. If the labour input measure being used is the number of jobs in the country then the household survey will provide an underestimate to the extent that some people work in more than one job, unless the survey collects information on multiple job holding. On the other hand, if the household survey collects details relating to the hours worked in all the jobs in which each person is employed then it should provide a good estimate of employment for the economy as whole.

19.79 Establishment surveys tend to have some shortcomings when used as a source of employment data. In the first place, it is difficult to ensure that the survey frame on which they are based is completely up to date because of the lags inherent in the sources used to update the frame (for example, registration of new establishments with the appropriate authorities). Even if the lags in updating the survey frame are consistent, their impact on the employment estimates will vary with the peaks and troughs in the business cycle. Secondly, it is often difficult to collect data for self-employed persons, particularly if they are operating an unincorporated establishment. There may be genuine confusion with enterprises regarding casual workers as providers of services rather than employees. Further, there may be some cases of deliberately underreporting the numbers of employees.

19.80 Administrative data provide a useful source of employment data for the national accounts but may need to be used with caution and in connection with other sources. Even when they have reasonably full coverage (for example, establishment tax data) the data may not be available until well after the reference year and provide only a snapshot of employment in that year rather than the average for the year. A source such as payroll tax data is often affected by having exemptions for smaller establishments (including unincorporated enterprises), which reduces the completeness of the data. In such cases, the coverage of establishments is likely to vary by industry because of the concentration of smaller establishments in industries such as agriculture, construction and retailing.

19.81 The problems connected with handling border workers in the national accounts have been described in the section on residence. As far as data sources are concerned, household surveys are likely to include employed persons in the country in which they are surveyed (that is, their country of residence) unless the survey contains specific questions to identify and exclude such workers.

19.82 Employed persons who have more than one job during a reference week can only be classified by industry and by status in employment through the application of some essentially arbitrary criterion as to which of their jobs is the most important one. On the practical plane, while household surveys can provide data about either or both of employed persons and jobs, establishment surveys only provide data about jobs.

Chapter 20: Capital services and the national accounts

A. Introduction

20.1 This chapter differs in content and style from those describing the accounts of the SNA. Its aim is to show how a link can be made between the value of assets used in production and the gross operating surplus generated. This link has been elaborated over a period of about fifty years in a body of knowledge described as the theory of capital services. However, it is only fairly recently that a few statistical offices have incorporated the ideas from the theory into the measurement of stocks of those assets used in production. Because there is evidence that this approach leads to improved measures of capital stock, it is proposed that, for those offices interested, a table supplementary to the standard accounts could be prepared to display the implicit services provided by non-financial assets. The contribution of labour input to production is recognized in compensation of employees. By also associating estimates of capital services with the standard breakdown of value added, the contributions of both labour and capital to production can be portrayed in a form ready for use in the analysis of productivity in a way entirely consistent with the accounts of the SNA.

20.2 The rest of the introduction gives a very general overview of the ideas involved in linking capital services with national accounts. Section B shows how the measurement of capital stock can be aligned with the notion of the efficiency of an asset as well as its price. This is followed by section C showing how to identify flows of capital services within existing entries in the accounts. Section D shows how consideration of the basic link between asset value and contribution to operating surplus can be exploited to determine the appropriate way to account for costs associated with acquiring and disposing of assets and to place a value on assets where limited market price information is available. Finally, section E discusses a possible format for a supplementary table.

1. The basic ideas of capital services

20.3 Non-financial assets give rise to benefits either from being used in production or simply from being held over a period of time. This chapter concerns those non-financial assets that contribute to production and how this contribution is recorded in the accounts. The assets concerned are fixed assets, inventories, natural resources and those contracts. leases and licences used in production. Valuables give rise to benefits derived from holding them as stores of value rather than using them and so are not covered by this chapter.

20.4 Assets appear on the balance sheet of their economic owner and the changes in value between one balance sheet and the next have to be identified and included in the appropriate account. Changes in the value of assets due to changes in absolute or relative prices appear in the revaluation account. Changes due to unexpected events not reflected in transactions appear in the other changes in the volume of assets account. Every other change in value is treated as a transaction and must be recorded elsewhere in the SNA. If the user of the asset is not the legal owner, two sets of transactions are recorded, those giving rise to payments between the user and the owner and those that show the user receiving the benefits of using the asset. These latter are recorded as internal to the user. If the legal owner of the asset is also the user of the asset, only the internal transactions are recorded.

20.5 Assets used in production have to be paid for but the payment is not deducted from the value of production in the period the asset is acquired but is spread over the whole of the period the asset is in use in production. For fixed assets, this gradual payment for an asset is recorded as consumption of fixed capital, which is the decline in the value of the asset due to its use in production. However, assets are not just a charge on production, they also contribute to the profitability of an enterprise by being the source of operating surplus. It has long been commonplace to recognize that operating surplus is the return to capital used in production but an articulation of how this surplus is generated and how it relates to the value of an asset and the way in which this value changes during a period has not previously been included in the SNA. As noted, this articulation is known as the theory of capital services. This terminology sits a bit uncomfortably with national accountants since the services referred to are not the outputs of production in the way that transportation or education services, for example, are. Nevertheless, the terminology is well established and should not in itself give rise to problems as long as it is remembered that capital services are not produced services. Alternatively, capital services can be thought of as simply the term for the way in which the changes in the value of assets used in production are captured in the production account and the balance sheet.

20.6 Much of the impetus for identifying the entries associated with capital services in the national accounts has come from those interested in the analytical uses that can be made of the information, especially for productivity studies. Because much of this work has been undertaken by researchers, it is perhaps inevitable that the rationale and

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

reasoning behind the proposals should have been expressed in a rather academic manner, in particular making extensive use of sometimes rather complex algebra. This chapter takes a different approach. It aims to show that, rather than introducing a new concept into the SNA, capital services can, in theory, be identified within the existing accounts. Further, recognizing this can lead to improvements in the estimates of consumption of fixed capital, which are currently required in the production accounts, and of the values of capital stock, which are required in the balance sheets. The derivation of information analytically useful for productivity studies can thus be seen as a by-product of improved national accounts compilation practices and not an additional exercise. The explanation is done in terms of highly simplified numerical examples but still aims to demonstrate the connection between the concepts referred to in studies referring to capital services and the national accounts approach to the valuation of capital and the derivation of stock levels.

20.7 The explanation given here is to some extent superficial since it is intended to give an overview of the concepts and indicate in general terms why the theory of capital services is relevant to national accountants. For a deeper understanding of the subject, reference should be made to the two OECD manuals on the subject, *Measuring Capital* and *Measuring Productivity* and some of the practical and theoretical work referenced in those manuals.

B. Valuing capital stock

20.8 Estimating the value of capital stock is not a straightforward process. Whereas it is possible to measure all new capital formation undertaken in a year directly and simply aggregate it, estimating the total value of a stock of assets, even of the same basic type, but with differing characteristics and of different ages, is not simple. In theory, if there were perfect second-hand markets for assets of every specification, these observed prices could be used to revalue each asset at the prices prevailing in a given year, but in practice, this sort of information is very seldom available. Thus measures of capital stock must be derived indirectly and this is conventionally done by making assumptions about how the price of an asset declines over time and incorporating this in a model based on the perpetual inventory model (PIM). Basically the PIM writes down the value of all assets existing at the beginning of the year in question by the reduction in their value during the year, eliminates those assets that reach the end of their useful lives in the year and adds the written-down value of assets acquired during the year. This routine is so well established that it is possible to overlook the assumptions it rests on but it is an investigation of these assumptions that reveals the dual benefits of deriving capital service values.

20.9 In the absence of observable prices, the value of an asset may be determined by the present value of its future earnings. Economic theory states that in a well functioning market (suitably defined) even when prices are observable, this identity will hold also. There are thus two sorts of questions that may be posed about the value of an asset; (i) how much would it fetch if sold, and (ii) how much will it contribute to production over its useful life. The first of these is the traditional question asked by national accountants; the second is basic to studies of productivity. However, these two questions are not independent.

1. Knowing the contribution to production

20.10 Suppose an asset will add values of 100, 80, 60, 40 and 20 to production over the next five years. For simplicity assume all products have the same prices and there is no inflation. Assume, further, that the real rate of interest is five per cent per annum for all five years.

20.11 The value of the asset in all five years can be derived using present value techniques as shown in table 20.1. (For simplicity, in this and all the following examples, the values shown are values at the start of the year so that, when discounting, the factor for the whole year is used. This simplification is made only to facilitate exposition; in practice mid-year figures should be used. It should also be noted that the figures in the tables are rounded and therefore may appear not to add exactly. However, a reader who follows the examples in a spreadsheet will achieve exactly the figures shown.)

20.12 The addition to the value of the asset in year 1 from the expected earnings of 80 in year 2 is 76, that is 80 divided by 1.05. (Alternatively, the addition to the value of the asset in year 1 can be viewed as 80 times a discount factor of 0.9524, the reciprocal of 1.05) The addition to the value of the asset in year 2 from earnings in year 3 is 57 (60 divided by 1.05) and in year 1 is 54 (57 divided by 1.05) and so on. When the value of 100 for the earnings in the first year is added to 76, the value of the second year's earnings in the first year, and to 54, the value of the third year's earnings in the first year and to 35 and 16, representing the value of the earnings in years 4 and 5 in the first year, a value of the asset in year 1 of 282 is derived. When the table is complete, the value of the asset in each of the five years is seen to be 282, 191, 116, 59 and 20.

20.13 The decline in value of the asset from year to year can be calculated by deducting each succeeding year's value from the value of the present year. Thus a series of 91, 74, 57, 39 and 20 is derived, a series that sums to 282, the original value of the asset. If the decline in value of the asset (91 in the first year) is deducted from the contribution to production (100 in the first year), the value of income generated in a year results (9 for the first year). To see that this item represents income, consider that the sum of the elements in the first column for years 2 to 5 together (182) represents the value of the same capital stock existing in year 2 but valued in the first year. This value of 182 increases by 9 to 191 between year 1 and year 2. This amount satisfies the criterion for income that it is the amount that the owner of the capital can spend and still be as well off at the end of the period as at the beginning.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Table 20.1:Example of deriving the value of capital stock from knowledge of its contribution to production

Discount rate 5%

	Year 1	Year 2	Year 3	Year 4	Year 5	Sum of 5 years
Contribution to asset value from earnings in :						
Year 1	100					
Year 2	76	80				
Year 3	54	57	60			
Year 4	35	36	38	40		
Year 5	16	17	18	19	20	
Value in year	282	191	116	59	20	
Value index (year on year)	1.00	0.68	0.61	0.51	0.34	
Decline in value	91	74	57	39	20	282
Income	9	6	3	1	0	18

20.14 Over the five-year period, the value of income is equal to the difference between the sum of the diagonal elements (300) less the amount of the decline in value (282), or to put it another way, there is an identity between the value of income the asset yields and the discounting inherent in establishing its current value.

2. Knowing the value at any time

20.15 Now suppose nothing is known about the contribution of the asset to production but the decline in the value of the asset over the five years, due to ageing, is known. If this is postulated in terms of a value index relative to the preceding year's value, and the initial value is known to be 282, then the entries in table 20.2 can be calculated. By design, a value series consistent with the figures in table 20.1 is assumed. Applying the decline in value of 0.68 to the initial value of 282 gives a value of 191 for year 2; applying the value decline of 0.61 to 191 gives 116 for year 3 and so on. (Alternatively a time series of values could be postulated and applied to the initial value.) From this the declines in value of the asset from year to year can be deduced and seen to be identical with those in table 20.1.

Table 20.2:Example of deriving the value of capital stock from knowledge of its decline in price

Discount rate 5%

	Year 1	Year 2	Year 3	Year 4	Year 5	Sum of 5 years
Contribution to asset value from earnings in :						
Year 1	100					
Year 2	76	80				
Year 3	54	57	60			
Year 4	35	36	38	40		
Year 5	16	17	18	19	20	
Value in year	282	191	116	59	20	
Value index (year on year)	1.00	0.68	0.61	0.51	0.34	
Decline in value	91	74	57	39	20	282
Income	9	6	3	1	0	18

20.16 In general this is as far as the PIM goes. Its twofold purpose is to calculate asset values for the balance sheet and the figures for consumption of fixed capital and these requirements are satisfied at this point. But it is in fact possible to go further. The contribution of the asset to production in the final year (20) is the same as the final year's value. If this is discounted by five per cent, the addition to the value of the asset at the start of year 4 is determined to be 19. Given the value of the asset at the start of year 4 is 59, there must be a figure of 40 contributed to production in that year. Extending this, for year 3 the value of 116 must consist of 18 representing the contribution to production in year 5 of 20 discounted twice, 38 representing the value contributed to production in year 4 of 40 discounted once and so by residual the value contributed to production in year 3 must be 60. In this way all the top, triangular, part of the table can be completed and the values of the amounts of income in a year be derived just as in table 20.1.

3. Age-efficiency and age-price profiles

20.17 Although tables 20.1 and 20.2 start from different assumptions, exactly the same complete table results even though they are filled in a different order in the two cases. Table 20.1 starts from assumptions about the declining contribution to production and derives stock values and the decline in value each year. Table 20.2 starts from assumptions about the decline in value of the stock and derives the contribution to production and the decline in value each year. Both techniques give values of stocks to include in the balance sheets and figures of consumption of fixed capital. The assumptions made in the two cases must be consistent. In fact it can be shown that every pattern of decline in the contribution of an asset to production (usually called the age-efficiency profile) corresponds to one and only one pattern of decline in prices (usually called the age-price profile).

20.18 Given this, it would seem possible to take the information in a set of PIM assumptions and simply derive the contributions to production from these. While it is possible to do this, it is generally held to be preferable to start again by postulating a set of age-efficiency profiles. The reason for this can be illustrated by table 20.3.

Table 20.3:Table 20.2 with a slightly different pattern of price decline

Discount rate 5%

	Year 1	Year 2	Year 3	Year 4	Year 5	Sum of 5 years
Contribution to asset value from earnings in :						
Year 1	80					
Year 2	96	101				
Year 3	75	79	83			
Year 4	24	26	27	28		
Year 5	6	6	6	7	7	
Value in year	282	211	116	35	7	
Value index (year on year)	1.00	0.75	0.55	0.30	0.20	
Decline in value	70	95	81	28	7	282
Income	10	6	2	0	0	18

20.19 Table 20.3 again starts from a series of relative price changes as in table 20.2 but these changes are somewhat different. Instead of a series of 1.00, 0.68, 0.61, 0.51 and 0.34, a series of 1.00, 0.75, 0.55, 0.30 and 0.20 is taken. These changes underestimate the rate of decline in value in the second year and assume a faster rate of decline in later years. At first sight they do not seem unreasonable. However, the effect on the contribution to production is considerable and the resulting series of 80, 101, 83, 28 and 7 is quite implausible. What sort of asset would be over twenty per cent more efficient in its second year than in its first and still more efficient in the third year than in the first before declining quickly thereafter? Yet this pattern of flows is still consistent with an initial value of 282, as in table 20.2 and with cumulative declines in value adding to this amount over five years.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

20.20 These are the reasons why it is argued that making assumptions about efficiency decline is likely to lead to superior results for the value of stocks, their decline in value and the income they generate than making assumptions about the rate of price decline. As a further example of why this may also be easier, consider the case of an asset that contributes the same to production, let us say 100, for each of five years and then stops dead, like a light bulb. It is easy to postulate a constant age-efficiency profile but the corresponding age-price profile is much less intuitively obvious and varies according to the discount factor applied.

20.21 However, while there are good reasons for using age-efficiency profiles as the starting point, where actual information is available on age-price profiles, even partial information, it should be confirmed that the selected age-efficiency profile is consistent with the observed age-price movements.

4. The special case of geometrically declining profiles

20.22 A number of patterns can be postulated for either the age-price or age-efficiency profile. These include straight line depreciation and various non-linear forms discussed in *Measuring Capital.* One of particular interest is that where the price declines geometrically, that is each year the price (when adjusted for inflation) is a fixed proportion, f, of the year before. Because such a series converges to, but never actually reaches, zero, it is difficult to portray it in a table such as those shown above but the interesting characteristic can be derived by means of a little very simple algebra.

20.23 It can be seen from the tables above that the value of an asset at the start of any year, V_t, is equal to the capital services to be rendered in that year, a, plus a discount factor, d, times the value of the asset at the start of the next year, V_{t+1}. Thus

$$V_t = a + d\,V_{t+1}.$$

In the case where $V_{t+1} = f\,V_t$, $V_t = a/(1-df)$.

By analogy, if the value of the capital services rendered by the asset in year t=1 is b, $V_{t+1} = b/(1-df)$. But since $V_{t+1} = fV_t$, it follows that b must be equal to af. Thus we have the case that the shape of the age-price profile and the shape of the age-efficiency profile are exactly the same.

20.24 As noted above, there is one and only one age-price profile corresponding to one age-efficiency profile, so it follows that the geometrically declining profile is the only profile that is the same for both the decline in price and in efficiency. One consequence is that figures for capital stock adjusted for the decline in value are equal to those for capital stock adjusted for the decline in efficiency. This property adds to the reasons that can be advanced for choosing this profile to determine the value of capital stock.

5. Practical considerations

20.25 As noted at the outset of this section, there are many simplifications built into the examples presented, made in order to facilitate the explanation of the basic theory behind the idea of capital services to those new to the idea. *Measuring Capital* should be consulted for a more rigorous discussion and for considerations such as the rationale for choosing one age-price (or age-efficiency) profile rather than another, how to estimate life lengths and retirement patterns of assets and the role of expectations in the calculations.

20.26 The manual also discusses the fact that the return to capital must be sufficient to cover taxes levied on the asset in question, a point that is ignored here also in the name of simplification.

20.27 To be precise, a distinction is made between the interest or discount rate, r, usually assumed to be five per cent in this chapter, and the discount factor which is the reciprocal of (1+ r). When r is 5 percent, the discount factor is 95.24 per cent. When the discount factor is 95.0 per cent, the discount rate is 5.26 per cent.

C. Interpreting the flows

20.28 The tables above generate three time series of particular interest. One is the contribution to production of an asset over time, one is the decline in the value of the asset and one is the income generated by the asset. Obviously the middle term corresponds to consumption of fixed capital as normally understood in the SNA. The contribution of capital to production is what is called gross operating surplus and so the third time series, income, corresponds fittingly to net operating surplus. However, these flows can be described by alternative names also. The diagonal element of the tables, showing the contribution to production, is also known as the value of capital services. The income element is the return to capital. The rate of return on capital is the ratio of income to the value of capital. For tables 20.1 and 20.2, the income flow as a proportion of the next year's capital stock value (that part not used in the current year) is also five per cent, the same as the discount rate. The alternative terminologies are illustrated in table 20.4.

1. Capital services and gross operating surplus

20.29 At this point, the national accountant asks how can gross operating surplus be estimated in this way when it is derived as a balancing item in the generation of income account? There are two possible answers to this question. The first answer is that there is not a complete identity with gross operating surplus but the value of capital services is implicitly within it so may be noted as an "of which" item

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

relative to gross operating surplus. Suppose the discount rate chosen is the rate that can be obtained on a bank deposit, say. This determines the amount the user of the asset needs to generate as net operating surplus if the asset is to be cost effective. If the figures for capital services and gross operating surplus are both 100, then the producer has made a reasonable choice of asset; it is earning as much for him as leaving his money in the bank. If he earns a little more than 100, he has done better than leaving the money in the bank. If the national accounts show he has earned 150, say, it may be that the producer has been very lucky indeed, perhaps realizing some monopolistic profits. However, it is also possible that there is some sort of asset he is using that has not been identified in calculating capital services, one possibility being some form of intangible asset. Similarly if the value of gross operating surplus is much lower than the value of capital services estimated, there may be good reason to question the range and valuation of assets assumed to be used in production or the quality of the estimates of gross operating surplus. Thus deriving the value of capital services in this manner is also a valuable tool for checking data quality.

20.30 The alternative to treating capital services as an element of gross operating surplus is to equate gross operating surplus with capital services exactly and to do this by determining a rate of return (discount rate) that brings this about. Many traditional analyses of productivity have used this approach and some cross-country comparisons of productivity depend on this assumption. Other studies, used at the industry level, suggest that the variation in apparent rate of return obtained in this way needs to be used, if at all, with very great caution. There is still robust discussion in academic circles about the preferred way of determining the rate of return, exogenously as described in the preceding paragraph or endogenously as described here. One way of interpreting the difference is to say that using an exogenous rate of return simply confronts the cost of capital (capital services) with the benefits (gross operating surplus); the endogenous rate of return gives a single figure to be contrasted with the yardstick of a "normal" rate of return.

Table 20.4:Capital services and SNA terminology

Discount rate 5%

	Year 1	Year 2	Year 3	Year 4	Year 5	Sum of 5 years
Contribution to asset value from earnings in :	Value of capital services or gross operating surplus					
Year 1	100					
Year 2	76	80				
Year 3	54	57	60			
Year 4	35	36	38	40		
Year 5	16	17	18	19	20	
Value in year	282	191	116	59	20	
Value index (year on year)	1.00	0.68	0.61	0.51	0.34	
Decline in value	91	74	57	39	20	282
	Consumption of fixed capital					
Income	9	6	3	1	0	18
	Return to capital or net operating surplus					

2. Prices and volumes

20.31 An examination of table 20.1, or indeed any of the others, shows that the value of an asset at a point in time, such as the start of a year, can be expressed rather neatly as the sum of the capital services rendered in the year plus the discounted value of the asset at the end of the year. This is the starting point of much of the algebraic elaboration of capital services in the literature, but with one important difference. Whereas most national accountants tend to think first in terms of current price aggregates and later (possibly) a breakdown into a volume aggregate plus a corresponding price, most descriptions of capital services run in the other direction. They assume a volume and develop a theory of the corresponding price (the "user cost"). These could be multiplied together to give a current value but much analysis is done using volume or price information.

20.32 One reason for working this way is that the assumption underlying table 20.1, that the contributions to production over the life of the asset are known, is not often true in practice. What is known, estimated or simply assumed is an *index* of how the efficiency changes over time. Equally the value of the asset assumed known in table 20.2 is only known on an asset-by-asset basis when each is new; all other value figures are estimates for reasons explained above. It is possible to use the identity that the start-of-year value of an asset equals capital services rendered in the year plus the discounted end-of-year value, all expressed in index number form and assuming no inflation, into one that expresses the value of the capital services as dependent on the decline in the value of the asset due to ageing (the depreciation element) and the rate of return (the opportunity cost of money). If the impact of general inflation is now taken into account, the price of the capital services (usually called the user cost) can be expressed as depending on the increase in value of a new asset of the same type, the nominal cost of money and the relative year-on-year decline in value of the asset due to ageing.

20.33 It is also possible then to have different prices for different sorts of assets and look at differential movements between asset prices and the movements in the general level of inflation. (Table 20.1 was based on the very restrictive assumptions of there being neither absolute nor relative price inflation.)

20.34 Another important consideration passed over in the simple numeric tables is the following. For balance sheet data, values at the date the balance sheet is drawn up are needed. For estimates of capital services/gross operating surplus as well as for consumption of fixed capital and income flows, values at average-year prices are needed. In practice, the mid-year observations are often assumed to be close approximations to the annual averages but this is not always so, especially in times of significant inflation.

D. Applying the capital service model

20.35 Once a theoretical link between the content of gross operating surplus and the capital services embodied in an asset used in production is accepted, there are a number of other beneficial implications for the national accounts. These include the question of the use of land in production, the valuation of natural resources, the separation of mixed income into the labour and capital components, the measurement of assets with a residual value, the treatment of costs of ownership transfer on acquisition, the treatment of terminal costs, capital maintenance, the valuation of work in progress on long-term projects, an alternative approach to estimating the imputed rentals of owner-occupied dwellings and the separation of the payments under a financial lease into the element to be regarded as the repayment of principle from the element regarded as interest. Each of these will be explained a little further below.

20.36 Before discussing land and natural resources, it is useful to recall the consequences of an asset being used by a unit not the legal owner of the asset. The important distinction is whether the user does or does not assume the risks associated with its use in production. When the user does not assume the risks, the asset is regarded as being subject to an operational lease. In such a case the payment to use the asset is a rental and forms part of intermediate consumption. The benefits from using the asset in production accrue to the owner in the operating surplus of the production account relating to his leasing activity. (See paragraphs 17.301 to 17.303.)

20.37 When the user does assume the risks associated with the use of the asset in production, the benefits from using the asset in production accrue to the user and appear in his operating surplus. This is true of both produced and non-produced assets. The difference between produced and non-produced assets concerns the type of lease existing between the legal owner and the user and the type of property income paid to the legal owner of the asset.

20.38 In the case of a produced asset, the user of the asset who assumes all risks associated with the asset becomes the economic owner of the asset. The asset appears on the balance sheet of the economic owner. If the legal owner is different, any payment from the economic owner to the legal owner is recorded as property income payable under a financial lease. (See paragraphs 17.304 to 17.309.)

20.39 In the case of a non-produced asset, when the user of the resource and legal owner differ, the asset remains on the balance sheet of the legal owner but a resource lease between the legal owner and user obliges the latter to pay the former property income in the form of rent. (See paragraphs 17.310 to 17.312.)

20.40 For all non-financial assets used in production, the estimation of the value of the capital services associated with the asset allows this to be contrasted with the property income payable for its use to determine whether the use of the asset is cost-effective.

1. Land

20.41 The first and oldest recognized form of non-produced capital is land. Land is special in that, under good management, the value is assumed to remain constant from year to year except for the effects of inflation in land prices. That is to say, there is no depreciation of land and all the contribution to production can be regarded as income. To show how this can be related to the previous examples, Table 20.5 shows part of a corresponding table for land that contributes 20 to production in perpetuity. A full table would have an infinite number of rows and columns. Here only a few are shown and some very simple algebra (with explanation) is used to explain how the totals are reached.

20.42 The value of the first column is the sum of 20, 20 discounted once (the second year's contribution to production discounted once), 20 discounted twice for the third year and so on if not for ever, at least for very many years. With a discount rate of 5 per cent as before, the sum of this column is 420. To see that this is so, consider a simple geometric progression. What is required is the sum of a series that can be written as:

$$S_n=a+ad+ad^2+ad^3+ad^4+ad^5+\ldots+ad^n$$

where a is the return to the asset in every period and d is the discount factor. (As noted earlier. for a discount rate of 5 per cent, the discount factor is 95.24 per cent.) If every term in the equation is multiplied by an extra factor d the result is:

$$dS_n= ad+ad^2+ad^3+ad^4+ad^5+\ldots +ad^{n+1}$$

Subtracting the second expression from the first gives:

$$S_n (1-d) = a (1-d^{n+1})$$

If d is less than unity (as it will be in a discounting framework) and n is very large, that last term becomes insignificant and the sum of the series, S_n, can be determined as a/(1-d). In table 20.5, a is 20 and d is 0.9524, so the sum of the series is 420.

Table 20.5:The case of land

	Discount rate 5%					
	Year 1	Year 2	Year 3	Year 4	Year 5	. . . Year 10 . . .
Contribution to asset value from earnings in :						
Year 1	20					
Year 2	19	20				
Year 3	18	19	20			
Year 4	17	18	19	20		
Year 10	13	14	14	15	16	. . . . . 20 . . .
Year 25	6	7	7	8	8	. . . . . 10 . . .
Year 40	3	3	3	3	4	. . . . . 5 . . .
Value in year	420	420	420	420	420	420
Value index (year on year)	1.00	1.00	1.00	1.00	1.00	. . . . 1.00 . . .
Decline in value	0	0	0	0	0	. . . . . 0 . . .
Income	20	20	20	20	20	. . . . . 20 . . .

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

20.43 However, since each of the columns of the table, though one term shorter than the previous one, is also an infinite series beginning in exactly the same way, the sum of each column is also 420. Thus the decline in value of the land from year to year is zero and the whole of the 20 is not just the contribution to production but also income. In national accounts parlance, the gross and net operating surplus are both 20 and there is no depreciation. Equally the value of the capital service and the return to capital are both 20.

20.44 As noted above, it may seem slightly odd to think of a non-produced asset contributing a "service" since in national accounts services are always produced. This is simply a reflection of the words chosen by economists to describe the contribution of capital to production without connecting the word "service" to the specific interpretation given to it in the SNA. Similarly one may hear compensation of employees described as the cost of labour services.

20.45 Another term used for capital services is economic rent and this initially seems more applicable in the case of land but is also a pitfall. In table 20.5, the economic rent of land is the extent to which the farmer benefits from using the land for agricultural production (20). This rent accrues whether the farmer is farming his own land or is a tenant farmer. The amount that the tenant farmer is due to pay his landlord is what the national accounts show as rent under property income. In the days when a farmer paid his rent as a share of the crop yield, the link was more obvious. What he retained represented enough to cover his costs and the cost of his own (and any hired) labour. In a monetized economy, the rent payable to the landlord is often agreed a very long time in advance. Comparing the rent earned (as operating surplus) with the rent payable as property income shows whether the agreed rent is "fair" or perhaps excessive relative to the farming income.

2. Valuing natural resources

20.46 There is an increasing interest in placing a capital value on natural resources but, since these assets are seldom sold on the market, there has been doubt about how to do this. Looking at the economic rent to be earned by a mineral deposit or a natural forest, for example, is one way to solve the problem.

20.47 Suppose that a mining company knows the size of the deposit being mined, the average rate of extraction and the costs of extraction of one unit. After allowing for all intermediate costs, labour and the cost of fixed assets used, what is left must represent the economic rent of the natural resource. By applying this to the expected future extractions, a stream of future income can be estimated and from this, using the techniques already described, a figure for the value of the stock of the resource at any point in time.

20.48 In fact, the application of the capital service technique goes further than this. In the case of a natural forest, if the rate of regrowth is at least equal to the rate of harvest, then the value of the forest does not decline and the rate of harvest is sustainable. However, in the case of a mineral deposit with no natural renewable capability, then it is possible as before to separate the contribution to production into an element showing the decline in value of the deposit and a residual element. Because this residual amount is consistent with the idea of maintaining the level of wealth intact, it can be regarded as income. Clearly this leads into the area of so-called green accounting and the possibility of allowing for consumption of natural capital as well as consumption of fixed capital in an alternative presentation of national accounts in a satellite account. Indeed, this is the argument developed at greater length and with applications to specific resources in section D of chapter 7 of the *Integrated Environmental and Economic Accounting 2003 (*United Nations, European Commission, International Monetary Fund, Organisation for Economic Cooperation and Development and World Bank, 2003) commonly referred to as the *SEEA.*

3. Mixed income

20.49 When discussing land, above, it was pointed out that the economic rent of the land was the part that was not otherwise accounted for by intermediate consumption, the cost of hired labour and the capital services rendered by fixed assets and the labour cost of the farmer. Very often, it is difficult to put a value on the labour of a self-employed person and so this may be merged with the economic rent on land and the capital services rendered by any fixed assets used and described as mixed income. In principle, though, if a separate estimate of the capital services rendered by fixed assets can be made from information about the services rendered by similar assets in other parts of the economy, then mixed income can be split into its labour and capital components.

20.50 In practice this has often proved difficult since the residual amount for self-employed income may turn out to be very small or even negative. The most obvious cause of this is that the estimates for the capital services are too high. This may be because larger companies are able to make more efficient use of capital, for example using a high value piece of equipment continuously rather than intermittently, or because they actually have other, intangible, assets, which have not been taken into account. This means the capital services for these unmeasured assets are attributed to those that are recognized but this addition is not appropriate for the self-employed worker. Thus the acceptance of the capital services model is unlikely to provide a quick and accurate breakdown of mixed income but it does show the way to probe the data for both large and small enterprises to ensure that capital is being measured comprehensively and consistently.

4. Assets with a residual value

20.51 Very many assets are used by a single owner until they are worn out and worth nothing. However, this is not the case for all assets. Some are disposed of after a few years, perhaps because the cost of regular maintenance is deemed by the current owner to be too high relative to the value the asset contributes to production. Some airlines, for example, may wish to use the fact that they keep up-to-date fleets of aircraft as part of their advertising appeal. In other cases, for example with construction equipment, the original owner may simply have no further use for the asset.

20.52 Table 20.6 shows an example of an asset that is used for only four years and then disposed of for a value of 300.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Again for simplicity it is assumed that the disposal value after four years is known when the asset is acquired. For example, the market in used assets may be sufficient to ensure that the value at any point is equal to the remaining services to be delivered by the asset. Inflation is still assumed to be zero.

20.53 The top, triangular, part of the table shows the normal calculation of the value of the capital services to be rendered in these four years, a value that at the outset is seen to be 1 107. To this the discounted value of the residual value of 300 must be added. This value is 247, making the total value of the asset 1 354. As in the case where an asset is held to exhaustion, the decline in the value of the asset including the residual value is lower year by year than the decline in the capital services to be rendered in these four years because there is an income element coming from the fact that the remaining value increases as the time for disposal of the asset gets closer. The total of the decline in the value of the asset, to be shown as consumption of fixed capital, is 1 054. This value, together with the residual value of 300, is equal to the original value of 1 354. The total income (net operating surplus) is 121, the sum of the income arising from the use in production (68) plus the income arising from the unwinding of the discount factor on the terminal value (53).

Table 20.6: An asset with a residual value

	Discount rate 5%					
	Year 1	Year 2	Year 3	Year 4	Residual value	Sum of 4 years
Contribution to asset value from earnings in :						
Year 1	400					
Year 2	286	300				
Year 3	227	238	250			
Year 4	194	204	214	225		
Value in year	1 107	742	464	225	0	
Decline in value	365	278	239	225		1 107
Income	35	22	11	0		68
Residual value	247	259	272	286	300	
Income	12	13	14	14		53
Joint value	1 354	1 001	736	511	300	
Decline in value	352	265	226	211		1 054
Income	48	35	24	14		121

Table 20.6 illustrates that the cumulative value of the consumption of fixed capital calculated in respect of an asset should be equal to the initial value of the asset, treated as fixed capital formation, less the value to the owner on disposal of the asset. This holds whether the asset passes into use as a fixed asset by another user, is used for another purpose in the same economy or is exported.

5. Costs of ownership transfer on acquisition

20.54 The costs of ownership transfer incurred on acquisition of an asset are treated as fixed capital formation. This assertion is equivalent to assuming that the services rendered by the asset must be sufficient to cover both the costs of the asset and the costs of ownership transfer. Table 20.7 shows an example where costs of 30 are incurred on the acquisition of the asset in table 20.6. In order for the asset to have exactly the same value as before on disposal, 300, the costs of ownership transfer have to be accounted for during the period in which the owner who incurred the costs uses the asset in production. The figures in the triangular part of table 20.7 are added to those in the corresponding part of table 20.6 giving increased value to the asset in each year until the end of year 4, increased consumption of fixed capital and slightly increased income, because the costs of ownership transfer are also viewed as the present value of the extra services required to meet the costs.

20.55 If the costs of ownership transfer were to be attributed to the whole life of the asset and not just that part for which the unit that paid the costs owns the asset, there is a mismatch between the calculated value of the asset and the market value demonstrated in the sale at a value of 300. In such a case, the data have to be brought back into reconciliation by means of an entry in the other changes in the volume of assets account but this means that not all of the costs incurred by the initial owner are shown as a charge against gross value added and so income is over-stated. This may be inevitable when assets are sold unexpectedly but in the case of many vehicles and large mobile construction equipment, the purchaser may well take account of the value to be realized on sale after a given period. When this is so, every effort should be made to take account not only of the residual value but also factor the expected life length into the calculations of the amount of consumption of fixed capital to be attributed to the costs of ownership transfer so there is no residual value of these costs left on disposal.

Table 20.7:Example of costs of ownership transfer on the acquisition of the asset in table 20.6

	Discount rate 5%					
	Year 1	Year 2	Year 3	Year 4		Sum of 4 years
Contribution to asset value from earnings in :						
Year 1	10					
Year 2	9	9				
Year 3	6	7	7			
Year 4	5	5	6	6		
Value in year	30	21	13	6		
Decline in value	9	8	7	6		30
Income	1	1	0	0		2
Residual value	1 384	1 022	749	517	300	
Decline in value	361	273	232	217		1 084
Income	49	36	25	14		123

6. Terminal costs

20.56 Table 20.6 considered the case where an asset had a residual value at the time the current owner disposed of it. It is also possible to have assets that have significantly large costs associated with disposal. Examples include the decommissioning costs of nuclear power stations or oil rigs or the clean-up costs of landfill sites. The following discussion is not meant to downplay the practical difficulty of estimating terminal costs, simply to demonstrate why in principle the existence of terminal costs should reduce the value of the asset throughout its life.

20.57 Terminal costs are similar to capital formation in that they should be covered by income generated during the time the asset is used in production. If this is not done during the asset's life these large costs may be treated as intermediate costs at a time when there is no longer any income being generated from production and so lead to negative value added. Alternatively, they are recorded as capital formation but instead of the costs being recovered from value added, these costs are simply written off in the other changes in the

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

volume of assets account. This procedure omits from the macroeconomic aggregates a legitimate cost to business and so overstates gross and net domestic product over a period of years.

20.58 Table 20.8 shows an example of how terminal costs should be recorded. The data in fact correspond to the numbers in table 20.6 for the contribution to production in each year, but in this case the residual value is negative rather than positive.

20.59 The analysis of the data follows that for table 20.6 exactly. The value of the capital services to be provided by the asset in use is still 1 107. However, since the present value of the terminal cost is -247, the total value of the asset is 860. As before, the cumulated value of consumption of fixed capital, 1 160 is equal to this value less the terminal value of -300. Not only is the value of the asset in each year lower than the value of the use in production, in year 4 the value is actually negative. The rationale of this is that although the asset will yield services of 225 in that year, the impending costs of 300 mean that the owner would not be able to sell the asset; he would in fact have to pay another owner to take over the asset since it would then be the responsibility of the new owner to meet the disposal costs of 300.

Table 20.8:An asset with a terminal cost

Discount rate 5%

	Year 1	Year 2	Year 3	Year 4	Residual value	Sum of 4 years
Contribution to asset value from earnings in :						
Year 1	400					
Year 2	286	300				
Year 3	227	238	250			
Year 4	194	204	214	225		
Value in year	1 107	742	464	225	0	
Decline in value	365	278	239	225		1 107
Income	35	22	11	0		68
Residual value	- 247	- 259	- 272	- 286	- 300	
Income	- 12	- 13	- 14	- 14		- 53
Joint value	860	483	192	- 61	- 300	
Decline in value	377	291	253	239		1 160
Income	23	9	- 3	- 14		15

20.60 Anticipated costs on ownership transfer on disposal of an asset, including legal fees, commission, transport and disassembly, etc., should in principle be treated in the same way as terminal costs.

7. Major repairs and renovations

20.61 Major repairs and renovations that extend the life of an asset are treated as capital formation and the value of the repairs and renovations is added to the value of the asset before the work was undertaken. The example of costs of ownership transfer on acquisition of an asset can be applied directly in this case, excepting only that the costs are incurred in a year other than the year of acquisition. The value of the capital repairs is supposed to be equal to the discounted value of the increased services that the asset will yield, either by increasing the services in each of the remaining years of the initial life length, or extending the life length, or both.

20.62 The value of the capital repairs can be analysed by merging the value with that of the asset in question and reworking all the calculations of the services to be rendered, the income generated and the consumption of fixed capital for the asset and the maintenance taken together. However, as table 20.7 shows, it is also possible to leave the calculations for the asset as they were and simply aggregate them with a separate analysis of the maintenance undertaken as if it related to a wholly new asset.

8. Work-in-progress for long term projects

20.63 Table 20.9 relates to an asset with a final value of 200 that is to be constructed over a period of four years. One possibility is that, assuming no inflation, work in progress of 50 should be recorded in each of the four years. However, consistent with the notion of discounting future income, an alternative view is preferable. Suppose still that there is a discount rate of five per cent. In each year, the value of the completed asset in each of years 1 to 3 will be 172.8, 181.4 and 190.5, each of which will cumulate to a value of 200 after, respectively, three, two or one years accumulation in value of 5 per cent. Dividing each of these by four implies that even if equal amounts of work are put in place in each year, the values to be recorded should be 43.2, 45.4, 47.6 and 50.0. In addition, though, there will be income arising from a return to the work already put in place. This would give a time series for the work put in place and other income of 2.2, 4.5 and 7.1 in each of years two to four giving the value of the partially complete structure as 43.2, 90.7, 142.9 and 200.0. These are the values that a purchaser of the partially completed structure would be willing to pay, given that he would forgo the income from the finished structure for up to three years.

Table 20.9:Valuing work-in-progress spanning several years

Discount rate 5%

	Year 1	Year 2	Year 3	Year 4
Value of final product in each year	172.8	181.4	190.5	200.0
Value of construction activity (one quarter of final value)	43.2	45.4	47.6	50.0
Income accruing on work put in place				
In year 1		2.2	2.3	2.4
In year 2			2.3	2.4
In year 3				2.4
End year value	43.2	90.7	142.9	200.0

9. Owner-occupied dwellings

20.64 The SNA specifies that an imputed rental on owner-occupied housing should be included in the production boundary and form part of household consumption. In a situation where there is either no rental market in such properties or only a very limited one, this is difficult to implement. Cross-country comparisons of the results (as in the International Comparison Program) show that the different techniques used produce highly variable results. Here too, the use of the techniques described in this chapter may be helpful.

20.65 In the example for land, it is possible to deduce a value of 420 for the land that yielded economic rent of 20 every year in perpetuity. While modern houses do not last for ever, if they are assumed to last for, say, fifty years the discount

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

factor applied over this period gives contributions to the value of the asset that are negligible at the end and again it may be supposed that, if the value of the house is 420, then the imputed rental is 20. Given that the market for houses is much better established than for rented housing, this may also provide a source of useful and comparable data for a troublesome area of national accounts. However, this method should be used with caution since houses are often bought in the expectation of making significant real holding gains. It should also be recognized that the rental for a house usually includes land rent.

10. A financial lease

20.66 The process of discounting future income streams to determine present value applies to financial assets as well as to non-financial assets. Consider an agreement with a bank to borrow 1 000 over a period of five years at five per cent interest. The total amount to be paid to the bank will be 1 100 at a rate of 220 per year. But, as table 20.10 shows, each year's payment does not consist of repayment of principal of 200 and interest of 20. Interest is payable on the remaining balance, so is highest in the first year and is zero in the last year. (This is a result of the simplifications used in the chapter. In practice, interest would be charged daily and so even in the last year some interest would be payable. However, the way in which the balance between interest and repayment of principal changes over time as the loan is repaid holds.)

20.67 The arithmetic behind table 20.10 is indistinguishable from any of the other tables in this chapter demonstrating that the same principles hold for valuing financial assets as for non-financial assets. The same methodology that can be used to show how much of the contribution to production is consumption of fixed capital and how much contributes to net operating surplus can also be used to show how much of the payment to the bank is a repayment of capital and how much is interest. Both consumption of fixed capital and a repayment of capital feature in the accumulation accounts as changing the value of the stock of assets. The contributions to net operating surplus and interest are both income flows and are shown in the current accounts.

20.68 This duality is especially important when an asset is acquired under a financial lease. In this case, table 20.10 can be used to show both the change in value of the asset and the change in the loan taken out to pay for it. Cost benefit analyses of the merits of borrowing to acquire assets also depend on this sort of calculation. Unless the asset can contribute at least as much to production as the interest due to the lender, it is not a good investment. Even if a producer has sufficient funds available to purchase an asset without borrowing, it makes sense to undertake such an analysis since the alternative to acquiring the asset is to convert the funds to an asset that will either earn income or appreciate and yield holding gains.

Table 20.10: The case of a financial loan

	Interest rate 5%					
	Year 1	Year 2	Year 3	Year 4	Year 5	Sum of 5 years
Contribution to loan value from payments due in :						
Year 1	220					
Year 2	210	220				
Year 3	200	210	220			
Year 4	190	200	210	220		
Year 5	181	190	200	210	220	
Loan value in year	1000	819	629	430	220	
Repayment of principal	181	190	200	210	220	1000
Interest	39	30	20	10	0	100

E. A supplementary table on capital services

20.69 This section describes a table that could be compiled to compare data coming from the standard national accounts tables for the elements of gross value added with those derived from applying the theory of capital services to the national accounts data on capital stock. Before presenting the table, though, it is appropriate to recall briefly the various simplifying assumptions that underlie the numeric examples in the earlier part of the chapter, assumptions that would be totally inappropriate in serious estimation of capital service flows. The most important are:

a. Somewhat different figures would emerge if any of the tables were to be calculated for the start of year, end of year or mid-year. Mid-year flows need to be discounted by half the annual discount rate to give start of year figures, for example.

b. The assumption that there is no price inflation, either overall or between different assets, is clearly unrealistic. Changes due to price movements need to be separately identified and included in the revaluation account.

c. The general preference for an age-efficiency approach to determine the value of capital stock should not be taken to mean that information on age-price decline, when such exists, is to be ignored. The solution is to find an age-efficiency pattern that matches the observed decline in prices. Where such a match can be made, this may inform the choice of age-efficiency declines where no matching price information is available.

20.70 There is a question about the appropriate level of detail to be used for assets. They are very diverse and even products that appear superficially similar, such as aircraft, may have quite different specifications. This is a problem that must be resolved whatever means of determining a stock figure for assets is used. The final choice may be a source of inaccuracies, or conversely, may lead to extra resource cost for little improvement in the results.

20.71 The first level of detail that might be examined is given in table 20.11. This assumes that information on value added by institutional sector is available. The figures for operating

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

surplus for non-financial and financial corporations may be compared with capital services from fixed assets used by these sectors adjusted as necessary for natural resources and inventories. The figures for general government and NPISHs in the national accounts data and those for capital services data must be equal. This is because by convention no return to capital on assets used in non-market production is included when output is estimated as the sum of costs. Consequently gross operating surplus is equal to the consumption of fixed capital and net operating surplus is zero (possibly excepting small amounts of operating surplus coming from secondary market production). The capital services for household dwellings should match operating surplus for households and the figure for capital services for other household unincorporated enterprises is to be compared with the national accounts figure for mixed income (which should include a labour compensation element also).

Table 20.11:The outline of a possible supplementary table

National accounts data	Total/Gross	Consumption of fixed capital	Net
Gross value added			
Compensation of employees			
Mixed income			
Operating surplus			
Non-financial corporations

Chapter 21: Measuring corporate activity

A. Introduction

21.1 The purpose of this chapter is to discuss aspects particular to corporations in both the financial and non-financial corporation sectors. It begins in section B by discussing the demography of corporations; how they come about, how they disappear and how they merge with one another. The consequences of these actions in the SNA are almost all to do with recording the acquisition of the owner's equity in corporations and in some cases reclassification of assets and liabilities between sectors.

21.2 Section C looks at some subsectoring of corporations and how this can be effectively deployed for analysis.

21.3 Section D considers the relationships between corporations in the domestic economy and in the rest of the world. Much of this section is concerned with aspects of globalization and the derivation of relevant indicators.

21.4 Section E recalls some of the discussion in chapter 20 and looks further at the contribution of assets to production.

21.5 Section F looks at the consequences of financial distress and the implications of remedial action for recording within the SNA.

21.6 The last section, section G, covers a rather different subject and looks at the emergence of commercial accounting standards over the last several years and how the process of developing new standards can be instrumental in helping to develop new approaches within the SNA.

1. A note on terminology

21.7 As explained in section B of chapter 4, the term corporation is used in the SNA to cover a wide variety of legal forms of institutional units. In addition, the expression enterprise is used in connection with production activities. While corporation is normally the term of preference in the SNA, other documents, notably the *BD*, tend to use enterprise in preference to corporation. Further, the register of all enterprises or corporations is usually called a business register, even though "business" is not a term commonly used in national accounts. In this chapter, all three terms are used without implying a difference between them.

B. The demography of corporations

21.8 Maintaining a list of corporations is similar to maintaining a list of all individuals present in the country in that it is necessary to record new corporations as they come into being and to record those that cease to be. A business register normally serves an administrative function in keeping track of the existing businesses in the economy but also serves as the basic sampling frame for surveys directed at businesses. Thus it is normal for a business register to contain information on the activity, size, location, etc. of each business and to note when the main activity of a corporation changes from one type of activity to another. In addition a business register may also include information on the links one corporation may have to other resident and non-resident corporations.

1. The creation of corporations

21.9 Corporations can come into being in a number of ways. One is when what was previously an unincorporated enterprise within the household sector becomes incorporated. (The exact process of incorporation, such as when this may or must happen and how it is effected, will depend on the company law in effect in the country concerned.) When this happens, the assets and liabilities that were previously indistinguishably part of the household are separated off and become those of the corporation. In return for giving up control of these assets, and responsibility for the liabilities, the household acquires equity in the new corporation, initially exactly equal in value to the assets and liabilities transferred to the corporation. Once an enterprise is incorporated, the owning household no longer has a claim on the assets and has no responsibility for the liabilities but instead owns the equity in the corporation.

21.10 An individual may simply decide to set up a business, set up a legal entity and begin operations. Initially, there may be no assets of the entity and no liabilities but as these accrue they belong to the corporation and the owner's equity changes correspondingly. On a larger scale, there

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

may be an agreement between a number of units, one or more of whom propose a business plan and one or more of whom agree to finance the operation. A formal agreement results in which the split of the rewards from the corporation's activity is determined and also the division of the responsibilities. The assets of the new corporation are recorded as being acquired by it and an amount of owner's equity in the corporation incurred as a liability towards the parties supplying the finance is also recorded.

21.11 It is not necessary for the corporation to issue shares for the agreement on the share of the profit arising from the activities of the corporation to be binding. Cooperatives and limited liability partnerships are two examples of units the SNA treats as corporations where the way in which profits are shared between the owners is clear even though there are formally no shares.

21.12 Corporations may also come into being at the initiative of government, an NPISH or a unit in another economy. In addition, a corporation may come into existence by the splitting of a previously existing corporation. This possibility is discussed below under mergers and acquisitions.

2. The dissolution of corporations

21.13 Similarly there are several ways in which corporations may go out of existence. The first is when an entity is wound up after having been declared bankrupt. (The exact process varies from country to country. In some countries a declaration of bankruptcy means the corporation must stop trading immediately and the process of winding up its affairs begins. In other countries, there may be a time lag while the corporation has an opportunity to continue trading while it tries to recover its position and only if this fails is it wound up.) When a corporation is wound up, the receiver (the unit responsible for administering the liquidation of the corporation) sells all of its assets and distributes the proceeds amongst those having a claim on the corporation in a legally predetermined order. The shareholders are always the last to be allocated any proceeds. In the case where the corporation is bankrupt it is quite common that the shareholders receive nothing. Only in very exceptional circumstances will the shareholders have any responsibility to provide funds towards settling other liabilities of the corporation.

21.14 A corporation may be wound up voluntarily by its owners. When this happens the assets are sold and the proceeds are divided amongst the owners according to the shares each has in the corporation. If the corporation is one that had issued shares, it can only be wound up if a clear majority of shareholders agree or if a clear majority of the shares are first acquired by a sufficiently small number of units who can reach agreement to wind up the corporation.

21.15 The acquisition of all shares of a corporation need not be a preliminary to the corporation ceasing to exist; it may simply continue with a smaller number of shareholders or even as a private unlisted corporation. The advantage of remaining incorporated is that there is a limit to the liability of the owners to meet any shortfall on the corporation's balance sheet. Thus even when an individual or group of individuals wants to control the whole of a corporation they may choose simply to make it an unlisted corporation but still one with the limited liability that comes with incorporation.

21.16 A third way in which a corporation may disappear is through it being merged with another corporation, though a merger does not automatically imply the merged corporation disappears. This too is discussed below under mergers and acquisitions.

3. Nationalization and privatization

21.17 The government may decide to take ownership of a corporation for a number of reasons, either because it is felt it is in the public interest for government to control the corporation, in response to financial distress or for other political motivations. When this happens the ownership of the corporation passes to the government, that is the government acquires the equity in the corporation, but the assets of the corporation remain on its balance sheet unless the government decides to nationalize the corporation and disband it at the same time. Often but not always, government may make a payment to the previous owners of the corporation but this may not necessarily correspond to their view of a fair price. Unless the corporation is dissolved, the process of nationalization leads to a change in the ownership of the corporation from private units to the government but the assets and other liabilities of the corporation continue to be owned by the corporation. Owners' equity in the corporation is recorded as a transaction in the financial account. There is also a reclassification of the assets and liabilities of a corporation being nationalized from the national private subsector to the public subsector recorded in the other change in the volume of assets account.

21.18 The government may also decide to privatize a corporation it currently controls. When this happens the most usual mechanism is that its shares are offered to the public either for sale or, in some cases, without charge or perhaps at a price lower than the market would bear. When shares are offered free or at a reduced price, a capital transfer from government to the eventual shareholders needs to be recorded in the accounts as well as the acquisition of shares. As with nationalization, only the equity in the corporation changes hands, not its assets and other liabilities, and the change in ownership of the equity is recorded as a transaction in the financial account. The ownership of the assets and liabilities remains with the corporation but they are reclassified from the public to national private subsector in the other changes in the volume of assets account.

21.19 There is more discussion on nationalization and privatization in chapter 22.

4. Mergers and acquisitions

21.20 The process of corporations merging and de-merging is of interest within an economy but especially interesting when the merger (or de-merger) involves units in different economies. Foreign direct investment can hardly be discussed without considering the subject of mergers and acquisitions. Some of the expressions commonly used in this field are listed below. The descriptions come from the

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

BD but similar concepts appear also in the *BPM6.* (A revised version of the *BD* was released in 2008. It is consistent with both the SNA and *BPM6*.) Elaborating recommendations for the recording of mergers and acquisitions within the SNA is part of the research agenda.

21.21 A *merger* refers to the combination of two or more corporations to share resources in order to achieve common objectives. A merger implies that, as a result of the operation, only one entity will survive and frequently occurs following an acquisition (described below). There are several types of merger possible.

a. A *statutory merger* relates to the business combination where the merged (or target) corporation will cease to exist. The acquiring corporation will assume the assets and liabilities of the merged corporations. In most cases, the owners of merged corporations remain joint owners of the combined corporation.

b. A *subsidiary merger* relates to an operation where the acquired corporation becomes a subsidiary of the parent corporation. In a reverse subsidiary merger, a subsidiary of the acquiring corporation will be merged into the target corporation.

c. *Consolidation* is a type of merger which refers to a business combination whereby two or more corporations join to form an entirely new corporation. All corporations involved in the merger cease to exist and their shareholders become shareholders of the new corporation. The terms consolidation and merger are frequently used interchangeably. However, the distinction between the two is usually in reference to the size of the combining corporations. Consolidation relates to an operation where the combining corporations have similar sizes while merger generally implies significant differences.

d. A *reverse merger* is a deal where the acquiring corporation ceases to exist and merges into the target corporation. If a corporation is eager to get public listing in a short period of time, it can buy a corporation with listed shares and merge into it in order to become a new corporation with tradeable shares.

e. A *merger of equals* is a type of merger where the corporations involved are of similar size.

21.22 An *acquisition* is a transaction between two parties based on terms established by the market where each corporation acts in its own interest. The acquiring corporation achieves control of the target corporation. The target corporation becomes either an associate or a subsidiary or part of a subsidiary of the acquiring corporation.

a. A *takeover* is a form of acquisition where the acquiring corporation is much larger than the target corporation. The term is sometimes used to designate hostile transactions. However, mergers of equals (in size or belonging to the same sector of activity) may also result in a hostile takeover.

b. A *reverse takeover* refers to an operation where the target corporation is bigger than the acquiring corporation.

21.23 A *divestment (de-merger)* refers to the selling of the parts of the corporation due to various reasons:

a. A subsidiary or part of the corporation may no longer be performing well in comparison to its competitors;

b. A subsidiary or a part may be performing well but may not be well positioned within the industry to remain competitive and meet long-term objectives;

c. Strategic priorities of the corporation to remain competitive may change over time and lead to divestments;

d. Loss of managerial control or ineffective management;

e. Too much diversification may create difficulties and thus lead the parent corporations to reduce the diversification of its activities;

f. The parent corporation may have financial difficulties and may need to raise cash;

g. Divestments may be realized as a defence against a hostile takeover.

21.24 Corporate divestments can be conducted in different ways:

a. A *corporate sell-off* is the sale of a subsidiary to buyers that are other corporations in most cases.

b. A *corporate spin-off* occurs when the divested part of a corporation is floated on the stock exchange. The newly floated corporation is separately valued on the stock exchange and is an independent corporation. The shares in the newly listed corporation are distributed to the shareholders of the parent corporations who thereafter own shares in two corporations rather than one.

c. An *equity carve out* is similar to a corporate spin-off but the parent retains the majority control. This form has the advantage of raising cash for the divestor.

d. *Management buy-outs and buy-ins* occur when the buyer is the manager or a group of managers of the corporation that is being sold off.

21.25 In all these cases, transactions in the equity of the two corporations involved need to be recorded in the financial account and, possibly, a change of classification by sector in the other changes in the volume of assets account.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

C. Subsectors

21.26 The subsectoring of the corporations sectors is discussed in chapter 4. It is proposed that there should be a three-way split of corporations between those that are national private corporations, those that are controlled by the government and those that are foreign controlled. Within each of these it is desirable to identify market non-profit institutions (NPIs).

21.27 The reason for identifying NPIs is twofold. In the first place, in order to have a comprehensive picture of NPIs, as described in chapter 23, it is necessary to be able to identify those market NPIs that are assigned to the corporations sector. Identifying them separately may be unexpected to some users, since there is often a misconception that all NPIs are non-market and fall in the NPISH sector. The other reason for identifying NPIs separately is that for some analyses it may be desirable to analyse corporations excluding the NPIs if it is felt that their economic behaviour is significantly different.

21.28 In identifying publicly controlled corporations, there is a question about how to provide long time series if there has been a significant change in the number and type of corporations subject to public control during the period. It is usual to provide a time series that includes only those corporations that were subject to public control at each period in question. Because interest usually focuses on how much of the corporate sector was controlled by the government, and how this has changed over time, this gives an appropriate picture. However, if the intent is to explore the behaviour of the same group of corporations over time a supplementary table may be prepared that takes the current definition of publicly controlled corporations and uses this set of corporations over the time period considered regardless of whether or not they were publicly controlled for the whole of that period.

21.29 Identifying foreign controlled corporations is key to looking at the interaction between the domestic economy and the rest of the world. Exploring this in greater detail is the subject of the following section.

D. Relations between corporations in different economies

21.30 Deregulation of markets, technological innovations and cheaper communication tools have allowed investors to diversify their participation in competitive markets overseas. In consequence, a significant increase in cross-border financial movements including direct investment has become a key factor in international economic integration, more generally referred to as globalization.

21.31 Regular analysis of direct investment trends and developments is an integral part of most macroeconomic and cross-border financial analysis. It is of prime importance to policy analysts to identify the source and destination of these investments. Several indicators based on direct investment statistics facilitate the measurement of the extent and impact of globalization.

1. Foreign direct investment

21.32 Foreign direct investment (FDI) is a key feature of the balance of payments and it is useful to review some of the basic concepts associated with this. Further details can be found in both *BPM6* and the *BD*. In the context of FDI, the term enterprise tends to be used rather than corporation, but as noted in the introduction, no difference of meaning is intended.

21.33 Direct investment statistics embody four distinct statistical accounts:

a. Investment positions,

b. Financial transactions,

c. Associated income flows between enterprises that are related through a direct investment relationship, and

d. Other changes in the value of assets, especially revaluation terms.

21.34 Direct investment is a category of cross-border investment associated with a resident in one economy (*the direct investor*) having control or a significant degree of influence on the management of an enterprise (*the direct investment enterprise*) that is resident in another economy.

21.35 Direct investment may also allow the direct investor to gain access to the economy of the direct investment enterprise which it might otherwise be unable to do. The objectives of direct investors are different from those of portfolio investors who do not have significant influence on the management of the enterprise.

21.36 Direct investment enterprises are corporations which may either be subsidiaries in which over 50 per cent of the voting power is held, or associates in which between 10 per cent and 50 per cent of the voting power is held or they may be quasi-corporations, such as branches, which are effectively 100 per cent owned by their respective parents. Enterprises that have no direct investment influence upon one another (that is the 10 per cent voting power criterion is not met) but are directly or indirectly influenced in the ownership hierarchy by the same enterprise (which must be a direct investor in at least one of them) are described as fellow enterprises.

21.37 Direct investment relationships are identified according to the criteria of the Framework for Direct Investment

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Relationships (FDIR, described in the *BD*), including both direct and indirect relationships, through a chain of ownership. Suppose that corporation A controls corporation B and B controls C then A in effect has control over C also.

2. FDI and globalization

21.38 Direct investment positions show an important class of investment made abroad and received from abroad, divided between equity and debt, at a given reference point in time. FDI positions as a percentage of GDP give one indication of the extent of globalization at that time. These structural indicators demonstrate the interdependence of economies.

21.39 Financial transactions show the net inward and outward investments with assets (acquisitions less disposals or redemptions) and liabilities (incurrence less discharges) presented separately by instrument in any given period. FDI financial transactions expressed as a percentage of GDP provide one indicator of the changes over that period in the degree of globalization of an economy. This indicator provides early information on the relative attractiveness of economies (both domestic and foreign) for new investments after allowing for the withdrawal of investments or disinvestment during the same time period.

21.40 Direct investment income provides information on the earnings of direct investors and of the direct investment enterprises. Direct investment earnings arise (i) from distributed earnings as well as undistributed earnings which are treated as reinvestment of earnings in that enterprise and (ii) from interest on inter-company loans, trade credit and other forms of debt. FDI income flows as a percentage of GDP provide information on the relative importance of the earnings of direct investment in both the reporting economy and abroad.

3. The role of “pass through funds”

21.41 “Pass through funds” or “funds in transit” are funds that pass through an enterprise resident in one economy to an affiliate in another economy, so that the funds do not stay in the economy of the affiliate. These funds are often associated with direct investment. Such flows have little impact on the economy they pass through. While special purpose entities, holding companies and financial institutions that serve other non-financial affiliates are particularly associated with funds in transit, other enterprises may also have pass through funds in direct investment flows.

21.42 Pass through funds are included in direct investment in standard presentations because they are an integral part of a direct investor’s financial transactions and positions with affiliated enterprises. (An exception is made for positions in debt instruments between related financial institutions.) Excluding these funds from direct investment would distort and substantially understate direct investment financial flows and positions at aggregate levels. Further, inclusion of these data in direct investment promotes symmetry and consistency among economies. However, for the economies through which the funds pass, it is useful to identify inflows and outflows not intended for use locally by the entity concerned.

21.43 FDI has a key role to play in development, especially in emerging countries. In order to explore how much of global FDI reaches these countries, and where it originates, a supplementary analysis is useful. Such an analysis identifies the country where the pass through funds originate by identifying the first unit other than a pass through fund in the host or investing economy (in the outward or inward chain) as appropriate.

4. Ultimate investing country

21.44 Presentations of FDI according to the *BD* show the country of the immediate counterparty and the industry of the immediate counterparty for outward FDI. For inward FDI, it is possible to determine not only the immediate counterparty but also the ultimate investor. The ultimate investor for this purpose is the enterprise that has control over the investment decision to have an FDI position in the direct investment enterprise. As such the ultimate investor controls the immediate direct investor. It is identified by proceeding up the immediate direct investors ownership chain through the controlling links (ownership of more than 50 per cent of the voting power) until an enterprise is reached that is not controlled by another enterprise. If there is no enterprise that controls the immediate direct investor, then the direct investor is effectively the ultimate investor in the direct investment enterprise.

21.45 The country in which the ultimate investor is resident is the ultimate investing country in the direct investment enterprise. It is possible that the ultimate investor is a resident of the same economy as the direct investment enterprise. (A controls B controls C. A and C are resident in the same economy but B is resident in another.)

21.46 In order to transform the usual presentation by country to the supplementary ultimate investing country presentation, the entire FDI position that is attributed to the country of residence of the immediate direct investor is allocated to the ultimate investing country. When there is more than one immediate direct investor in a direct investment enterprise, the entire inward FDI position of each immediate direct investor is reallocated to the respective ultimate investing country based on the ultimate controlling parent of each of the immediate direct investors. This method ensures that the levels of direct investment into a country according to the standard presentation and according to the supplementary presentation are the same.

5. Multinational enterprises

21.47 As well as information relating to foreign direct investment where only a 10 per cent voting power is required to identify a foreign direct investor, there is interest in analysing the activities of multinational enterprises (MNEs) where more than 50 per cent of the voting power is held. Thus the MNEs correspond to foreign controlled enterprises in the sense of subsectors in the SNA. (There is a small distinction between the *BD* and *BPM6* and the SNA on the question of control. For the *BD* and in the *BPM6*, the 50 per cent of voting power rule is applied rigidly but the SNA is more flexible. See chapter 4.)

21.48 In addition to statistics on the activities of MNEs, statistics are also available for the wider group of corporations with

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

links in other economies, not just those where there is majority ownership, called foreign affiliates. These statistics are known as Foreign AffiliaTes Statistics (FATS), and are described in *Recommendations Manual on the Production of Foreign AffiliaTes Statistics (FATS)* (Eurostat, 2007) and elaborated in *Measuring Globalisation: Handbook on Economic Globalisation Statistics (Organisation for Economic Co-operation and Development, 2005)*. Work is continuing to ensure the consistency of the various sets of statistics cited in these and other publications on globalization.

6. Outsourcing

21.49 There are two ways in which a corporation A in economy X may have another corporation B in economy Y assemble parts for it. Although the effect appears similar, the consequences for recording in the accounts are quite different. Suppose that A and B are unrelated enterprises, and B contracts to do work for A in return for a fee. (This case is described elsewhere, for example in chapter 28.) In this case there is no recorded transfer of the items from A to B (or X to Y). Only the agreed fee is recorded as a transaction between the two economies.

21.50 However, if A and B both belong to the same group of corporations, then it may be the case that there is a transfer of the risks and rewards of the items on their dispatch from A to B. The question is whether a realistic price is entered for the items in the trade figures for both A (and X) and B (and Y) as the items move internationally. When A and B are related, a practice known as "transfer pricing" is sometimes used. Suppose the tax regime in Y is more liberal than that in X. It may then be the case that A artificially lowers the price of the items dispatched to B in order to minimize profits in X while B records a higher profit subject to the lower tax regime in Y. In principle, international accounting standards and the balance of payments recommendations indicate that items transferring across borders should be valued at "arm's length" prices, that is to say prices that would prevail if there were no relationship between the two corporations involved. Making such an adjustment is not easy but it is in the interests of tax authorities, customs officials and the statistician to see whether appropriate adjustments can be made if the sums involved are significant and adjustments can be made with sufficient reliability.

E. The contribution of assets to production

21.51 Chapter 20 discusses the role of capital services in production and the calculation of multifactor productivity (MFP). The assets to be considered in calculating productivity are those fixed assets that are both owned and used by the enterprise plus any natural resources and other non-produced assets including contracts, leases and licences and possibly marketing assets they both own and use in production. Assets that are not legally owned by the enterprise but are subject to a financial lease are included in the calculations in the same way that they are recorded on the balance sheet of the enterprise. However, assets that are leased under an operating lease agreement are excluded. This may mean two enterprises undertaking similar activities using similar assets may show different productivity figures because one uses assets it owns and the other assets that it leases. An area for supplementary analysis is to consider compiling information on assets according to the using rather than the owning industry and to look at the implications for operating surplus and productivity of the use of leased rather than owned assets.

F. The consequences of financial distress

21.52 Signs that a non-financial corporation is suffering financial distress include the level of profits that it has been generating recently and possibly the level of dividends it is able to offer. It is also probable that it suffers a cash flow problem and is unable to meet its liabilities on a timely basis. Competitors may take the opportunity to launch a takeover bid. However, if no takeover bid is offered the question here is how the corporation may survive at all.

21.53 In a similar way, a financial corporation may suffer financial distress because it has difficulty in raising finance and is unable to service its liabilities. Again this is a circumstance in which a competitor may launch a takeover bid but this may not always be forthcoming.

21.54 If the corporation, whether financial or non-financial, is deemed to be of national importance this may be an instance where government steps in and offers either to take over the corporation, in effect nationalizing it, or may offer a major capital injection in return for a degree of control, possibly full control, of the corporation. The recording of nationalization and capital injections by government as well as of the steps that may be taken under a bailout are discussed in chapter 22.

21.55 Another possibility is that the government offers a guarantee to the creditors of the corporation in distress. The activation of a one-off guarantee is treated in the same way as a debt assumption. The original debt is liquidated and a new debt is created between the guarantor and the creditor. In most instances, the guarantor is deemed to make a capital transfer to the original debtor, unless the guarantor acquires an effective claim on the creditor, in which case it leads to the recognition of a financial asset (a liability of the

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

debtor). The recording of guarantees including those offered by government is discussed in part 3 of chapter 17.

1. Bad debts

21.56 All corporations, but especially financial corporations, may suffer from bad debts and this phenomenon may be particularly acute when other aspects of the economy also exert financial pressure on the corporation. Within the SNA, loans are always recorded as the amount that is due to be repaid to the creditor. In cases where the debtor has a bad credit rating this may overstate the market value of the loan. This is seldom done on a loan by loan basis but is regularly done for classes of loans.

21.57 The SNA identifies a subset of bad debts as non-performing loans. As explained in paragraph 13.66, these are loans whose payments of interest or principal are past due by 90 days or more or interest payments equal to 90 days or more have been capitalized, refinanced, or delayed by agreement, or payments are less than 90 days overdue, but there are other good reasons (such as a debtor filing for bankruptcy) to doubt that payments will be made in full. The SNA recommends that memorandum items be compiled for the accounts showing the nominal and market value of bad loans and the implications for interest flows, the amount of interest accruing on the nominal value, the amount of interest outstanding from previous periods and the amount relating to the current period that is unpaid. The proposed memorandum items are discussed in paragraphs 13.67 to 13.68.

21.58 Elaborating the accounting for assets where the market value suddenly diverges from past trend values and the whole question of when it might be appropriate to define and use "fair values" is one item on the research agenda as explained in annex 4. In addition, circumstances emerging from the credit crisis that emerged in 2008 will continue to be monitored to see if other memorandum items or other steps should be recommended.

2. Concessional lending and debt rescheduling

21.59 There is detailed discussion of government's role in concessional lending and debt rescheduling in section D of chapter 22.

G. Links to commercial accounting

21.60 In recent years, the International Accounting Standards Board (IASB) has become increasingly important as the standard setter for commercial accounting. The IASB promulgates International Financial Reporting Standards (IFRS) and at present more than 100 countries are involved in this process of harmonization. Many large companies, especially multinationals, already apply these international accounting standards.

21.61 The principles underlying the IFRS are in most cases entirely consistent with the principles of the SNA. In particular, it is worth noting that the introduction to the standards explains that economic substance should take precedence over legal form. The IFRS, like the SNA, pays attention not only to the conceptually preferred approach but also practical possibilities.

21.62 The process of developing a new standard is a threefold one. In the first step, a document discussing the arguments for and against a new standard is proposed and it is released with an invitation to comment. Once the comments are received and analysed, if it is decided to proceed, an exposure draft is prepared and posted for global comment. Only if the exposure draft receives substantial favourable comment is a formal standard developed. At each stage, the documentation available discusses the background to the standard as well as its formal wording.

21.63 Since it is inevitable that national accounting information for large companies in particular must be drawn from data compiled according to the international accounting standards, it would be advantageous for the national accounts community to take a greater interest in the three stages of developing international accounting standards and contribute their points of view.

21.64 For multinational enterprises, the standard accounts may be available only for the group as a whole where relationships between enterprises in different countries have been consolidated. In this case, national accountants would need to consult other sources for the required non-consolidated data.

21.65 Two particular areas where the IFRS adopts approaches somewhat different from the SNA are in the area of the recognition of holding gains and losses as income and in the recording of provisions and contingent liabilities. Further examination of the IASB position could be helpful in refining the SNA treatment of these issues, if not by accepting the IASB position entirely, at least by showing a reconciliation between their position and that of the SNA.

21.66 In addition to the IASB that sets standards for private corporations, the International Public Sector Accounting Standards Board (IPSASB) performs a similar function for government bodies. There is reference to the IPSASB in chapter 22.

Chapter 22: The general government and public sectors

A. Introduction

22.1 A major strength of the SNA is the ability to compile accounts for whole sectors, individual units, or some intermediate levels and to aggregate the accounts in different ways. Disaggregating the economy into various sectors and subsectors makes it possible to observe and analyse the interactions between the different parts of the economy for purposes of policymaking. Particular interest is given to the general government sector, as defined in chapter 4 and the public sector, as defined in this chapter. Many of the concepts in this chapter have been described in a number of previous chapters. This chapter aims to bring these together, give some more elaboration on how they might be put into practice and gives a link to other systems of economic statistics particularly aimed at government such as the *GFSM2001*, the *ESA95 Manual on Government Debt and Deficit* (Eurostat, 2002a) and the *External Debt Guide*.

22.2 The powers, motivation and functions of government are different from those of other sectors. Governments use their powers to pass laws affecting the behaviour of other economic units. They are able to redistribute income and wealth largely by means of taxes and social benefits. The accounts for the general government sector show how goods and services provided to the community as a whole or to individual households are financed mainly by revenue raised. The range of goods and services government provides and the prices charged are based on political and social considerations rather than on profit-maximization.

22.3 Fiscal operations are carried out by the government and financed through the budget under the usual budgetary procedures. However, some operations originated by government units may require the intervention of entities which are not ruled by the legal government framework, including public corporations. These actions may be described as quasi-fiscal activities.

22.4 Operations related to privatization and restructuring public corporations, securitization of assets using the intervention of special purpose entities, including those abroad, may be described in this way. Though such operations are not reported in the budget and might escape the usual control procedures, they may have a significant impact on government revenue and expenditure.

22.5 As well as providing services directly, governments often fulfil their public policy objectives through public corporations (for example, railways, airlines, public utilities and public financial corporations). A public corporation may be required to provide services to areas of the economy that would not be covered otherwise by means of subsidized prices. As a result, the public corporation may operate with a reduced profit or at a loss.

22.6 In order to analyse the full impact of government on the economy, therefore, it is useful to form a sector consisting of all the units of general government and all public corporations. This composite sector is referred to as the public sector.

22.7 For the general government and the public sectors, in addition to the usual sequence of accounts of the SNA, the accounts can be presented in a manner that is more suitable for government finance analysts and policymakers. The latter increasingly use aggregates and balancing items defined in terms of the concepts, definitions, classifications and accounting rules of the SNA so that these aggregates can be related to other macroeconomic variables and compared with the same items in other countries. Some of these items, such as saving and net lending or borrowing, are already available in the sequence of accounts. Other items, such as total revenue, total expense and total outlays, the tax burden, the net operating balance and total debt, do not appear as such in the SNA. Aggregates and balancing items of this nature can be used to assess the use of resources to produce individual and collective services, the need to collect taxes and other revenues, the ability of government to borrow and repay debt and the sustainability of the desired level of government operations.

22.8 The present chapter gives an overview of this so-called public finance or government finance presentation of the accounts. In order to derive this presentation, the transactions in the SNA current and capital accounts are rearranged to derive aggregates and balancing items of specific interest to the general government and public sectors. For example, a combination of taxes, user fees and grants from other governments can be aggregated to form total revenue, as the amount available from operations to fund government services.

22.9 Section B summarizes the identification of government units and other units controlled by government units and explains how those units are grouped into sectors in the SNA.

22.10 Section C describes the presentation of government finance statistics.

22.11 Section D addresses a number of accounting issues that are unique to, or exceptionally important for, government.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

22.12 Finally, section E shows how information about the public sector may be prepared in a manner roughly parallel to the government finance statistics presentation described in section D.

1. Data sources

22.13 In practice, macroeconomic accounts can seldom be built up by simply aggregating the relevant microdata. Government is an exception in that the statistics for government units and public corporations are often derived directly from the microdata in government financial accounting databases. As a result, compilers of statistics for the government units and public corporations usually draw more heavily on accounting information than the results of statistical enquiries. In particular, the development in recent years of International Public Sector Accounting Standards by the International Public Sector Accounting Standards Board of the International Federation of Accountants has increased the need for clear guidance on the compilation of government finance statistics so that the detailed accounting data can be transposed correctly into the framework of the SNA. Such guidance is especially important when the government financial accounts are compiled on a cash basis and must be converted to an accrual basis to comply with the accounting basis of the SNA.

2. Consolidation

22.14 As a rule, the entries in the SNA are not consolidated. Consolidation involves the elimination of those transactions or debtor/creditor relationships that occur between two transactors belonging to the same institutional sector or subsector. As stated in chapter 3, however, consolidation may be relevant for the general government sector. For example, information on debt owed by government units to units outside the general government sector may be more relevant than gross figures that include debt owed to other government units. Guidance on consolidation is provided in Section C.

B. Defining the general government and public sectors

22.15 General government units include some NPIs and public enterprises not treated as corporations. The public sector includes general government and public corporations. To identify which NPIs are included in general government, conditions for control by government must be identified. To determine which enterprises are treated as public corporations and which as part of general government, it is necessary to specify conditions for control by government and the concept of economically significant prices.

22.16 In order to identify the units falling in both the general government sector and the public sector, it is helpful to begin by restating the definition of government units given in paragraphs 4.117 to 4.118). The discussion on what is meant by control by government and economically significant prices follows.

1. Government units

22.17 ***Government units are unique kinds of legal entities established by political processes that have legislative, judicial or executive authority over other institutional units within a given area.*** Viewed as institutional units, the principal functions of government are to assume responsibility for the provision of goods and services to the community or to individual households and to finance their provision out of taxation or other incomes, to redistribute income and wealth by means of transfers, and to engage in non-market production. In general terms:

a. A government unit usually has the authority to raise funds by collecting taxes or compulsory transfers from other institutional units. A government unit must have funds of its own either raised by taxing other units or received as transfers from other government units and it must have the authority to disburse some, or all, of such funds in the pursuit of its policy objectives. It must also be able to borrow funds on its own account.

b. Government units typically make three different kinds of final outlays:

- The first group consists of actual or imputed expenditures on the free provision to the community of collective services such as public administration, defence, law enforcement, public health, etc. that are organized collectively by government and financed out of general taxation or other income.

- The second group consists of expenditures on the provision of goods or services free, or at prices that are not economically significant, to individual households. These expenditures are deliberately incurred and financed out of taxation or other income by government in the pursuit of its social or political objectives, even though individuals could be charged according to their usage.

- The third group consists of transfers paid to other institutional units, mostly households, in order to redistribute income or wealth.

22.18 Within a single economy when there are different levels of government at central, state or local levels, there may be many separate government units. Social security funds also constitute government units.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

22.19 In all countries, there is an institutional unit of the general government sector important in terms of size and power, in particular the power to exercise control over many other units. This unit is often referred to as national government and the unit covered by the main budget account. It is a single unit of the central government that encompasses the fundamental activities of the national executive, legislative and judiciary powers. Its revenues as well as its expenses and expenditures are normally regulated and controlled by a Ministry of Finance or its functional equivalent by means of a general budget approved by the legislature. Most of the ministries, departments, agencies, boards, commissions, judicial authorities, legislative bodies and other entities that make up this central government unit are not separate institutional units but are part of this primary central government unit. This is because they generally do not have the authority to own assets, incur liabilities, or engage in transactions in their own right. If there are state or local governments then it is likely that each of these governments will also have a primary government unit that includes the principal executive, legislative and judicial powers.

22.20 In addition, there may be government entities with a separate legal identity and substantial autonomy, including discretion over the volume and composition of their expenses and outlays and a direct source of revenue, such as earmarked taxes. (The terms expense, outlay and revenue are commonly used in the presentation of government accounts. Their definitions and relationship to SNA concepts are covered in section C.) Such entities are often established to carry out specific functions, such as road construction or the non-market production of health or education services. These entities should be treated as separate government units if they maintain full sets of accounts, own goods or assets in their own right, engage in non-market activities for which they are held accountable at law and are able to incur liabilities and enter into contracts in their own right. Such units are often referred to as extrabudgetary units because they have separate budgets and any transfers from the main budget account are supplemented by their own sources of revenue. Budgets vary widely among countries and various terms are often used to describe these units. These units are classified in the general government sector to the extent that they are non-market producers and are controlled by another government unit.

22.21 A social security fund is a particular kind of government unit that is devoted to the operation of one or more social security schemes. A social security fund must satisfy the general requirements of an institutional unit. That is, it must be separately organized from the other activities of government units, hold its assets and liabilities separately and engage in financial transactions on its own account.

22.22 As noted earlier, NPIs that are non-market producers and are controlled by a government are also units of the general government sector. Although they may legally be established to be independent from government, they are considered to be carrying out government policies and are effectively part of government. Governments may choose to use non-profit institutions rather than government agencies to carry out certain government policies because NPIs may be seen as not subject to political pressures. For example, research and development and the setting and maintenance of standards in fields such as health, safety, the environment and education are areas in which NPIs may be more effective than government agencies.

22.23 The case of units engaged in financial activities needs special consideration. As described in paragraph 4.67, a unit set up by government with functions similar to a captive financial institution is treated as an integral part of general government and not as a separate unit if it has no powers to act independently, is restricted in the number of transactions it can engage in, does not carry the risks and rewards associated with the assets and liabilities it holds and is resident in the same economy. If the unit is non-resident, it is treated as a separate unit but the transactions it undertakes as quasi-fiscal operations are reflected in transactions between that unit and the government. In particular, if the non-resident unit borrows abroad, it is regarded as lending the same amount to government and on the same terms.

22.24 At the same time, the general budget of any government level might control market producers satisfying the criteria to be a quasi-corporation as defined below. These units should not be classified in the general government sector, but in the non-financial or financial corporations sector, as appropriate. As public units, they are, however, part of the public sector.

2. NPIs controlled by government

22.25 The criteria for deciding whether an NPI is controlled by government or not is described in paragraph 4.92. They are summarized here for convenience.

22.26 Control of an NPI is defined as the ability to determine the general policy or programme of the NPI. All NPIs allocated to the general government sector should retain their identity as NPIs in statistical records, to facilitate analysis of the complete set of NPIs. To determine if an NPI is controlled by the government, the following five indicators of control should be considered:

a. The appointment of officers;

b. Other provisions of the enabling instrument;

c. Contractual agreements;

d. Degree of financing by government; and

e. Risk exposure.

A single indicator could be sufficient to establish control in some cases but sometimes a number of separate indicators may collectively indicate control. A decision based on the totality of all indicators will necessarily be judgmental in nature but the judgements should be consistent for similar cases.

3. Corporations controlled by government

22.27 To be classified as a public corporation, a corporation must not only be controlled by another public unit, but it also

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

must be a market producer. Control is defined as the ability to determine the general policy or program of an institutional unit. Government is in a position to exercise control over many kinds of units: miscellaneous extrabudgetary agencies, non-profit institutions and corporations (non-financial or financial). The criteria for control of a corporation are described in paragraphs 4.77 to 4.80. The key factors to be considered are

a. Ownership of the majority of the voting interest;

b. Control of the board or other governing body;

c. Control of the appointment and removal of key personnel;

d. Control of key committees of the entity;

e. Golden shares and options**;**

f. Regulation and control;

g. Control by a dominant customer; and

h. Control attached to borrowing from the government.

Although a single indicator could be sufficient to establish control in some cases, in others a number of separate indicators may collectively indicate control. A decision based on the totality of all indicators must necessarily be judgmental in nature, but the judgements should be consistent for similar cases.

4. Economically significant prices

22.28 To be considered as a market producer, a unit must provide all or most of its output to others at prices that are economically significant. ***Economically significant prices are prices that have a significant effect on the amounts that producers are willing to supply and on the amounts purchasers wish to buy. These prices normally result when:***

a. The producer has an incentive to adjust supply either with the goal of making a profit in the long run or, at a minimum, covering capital and other costs; and

b. Consumers have the freedom to purchase or not purchase and make the choice on the basis of the prices charged.

22.29 These conditions usually mean that prices are economically significant if sales cover the majority of the producer's costs and consumers are free to choose whether to buy and how much to buy on the basis of the prices charged. Although there is no prescriptive numerical relationship between the value of output (excluding both taxes and subsidies on products) and the production costs, one would normally expect the value of goods and services sold (the sales) to average at least half of the production costs over a sustained multiyear period.

22.30 Because economic circumstances vary considerably, it may be desirable to accept different thresholds to achieve consistent economic measurement over time, between units and across countries. In principle, the distinction between market and non-market should be made on a case-by-case basis.

22.31 It can be presumed that prices are economically significant when the producers are private corporations. When there is public control, however, the unit's prices may be modified for public policy purposes. This may cause difficulties in determining whether the prices are economically significant. Public corporations are often established to provide goods that the market would not produce in the desired quantities or at the desired prices. Even when the sales of such corporations may cover a large portion of their costs, one can expect that they respond to market forces quite differently than would private corporations.

22.32 It is likely that corporations receiving substantial government financial support, or that enjoy other risk reducing factors such as government guarantees, will act differently from corporations without such advantages because their budget constraints are softer. A non-market producer is a producer that faces a very soft budget constraint so that the producer is not likely to respond to changes in the economic conditions in the same way as market producers.

Suppliers of goods and services to government

22.33 The question arises whether units supplying goods and services to government should be treated as market or non-market producers. The essential question is whether the unit provides the goods and services in competition with private producers and the choice of supplier is based on price. This is true whether the supplier is the only supplier and whether the government is the only customer of the supplier.

Definition of sales and costs

22.34 In order to assess whether a producer is a market producer, it is necessary to carry out a comparison between the receipts from sales and the production costs of the products. Sales are measured before any taxes applicable to the products are added. Sales exclude all payments received from government unless they would be granted to any producer undertaking the same activity. Own account production is not considered as part of sales in this context.

22.35 Production costs are the sum of intermediate consumption, compensation of employees, consumption of fixed capital and [other] taxes on production. Further, if the unit is to be treated as a market producer, a return to capital is included in production costs. Subsidies on production are not deducted.

5. A decision tree for public units

22.36 Figure 22.1 shows the relationship between the general government sector, the public sector and the other main sectors of the domestic economy.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

22.37 As explained in paragraph 4.117, government units are established by political processes and have legislative, judicial or executive authority over other institutional units within a given territory. These units belong to the general government sector and so to the public sector also. In order to determine which other institutional units belong to the general government sector and which to the public sector, the decision tree described in figure 4.1 should be followed, using the following sequential questions:

a. Is the entity of interest an institutional unit? If it is not, but is resident, then it is treated as part of the unit that controls it. If it is not an institutional unit but is non-resident it is treated as a quasi-corporation in the economy in which it is resident.

b. Is the unit a market or non-market producer according to the criteria given immediately above?

c. Is the unit controlled by government or another public corporation?

22.38 The answers to the last two questions lead to allocations to sectors as follows:

a. If the unit is a market producer and not controlled by government it is a part of neither the general government sector nor the public sector.

b. If the unit is a market producer and controlled by government or another public corporation, it is not part of general government but is part of the public sector.

c. If the unit is a non-market producer and controlled by government, it is part of the general government sector and the public sector.

d. If the unit is a non-market producer but not controlled by government, it is treated as an NPISH. It is a part of neither the general government sector nor the public sector.

6. Subsectors of the general government sector

22.39 As described in chapter 4, the general government sector may be subsectored in either of two ways. One method is to have up to three subsectors; one for central government, one for state government and one for local government with social security included at any level where relevant. In some cases there may be only one or two levels of general government; in some cases more levels of government must be accommodated within the three level structure. The other method of subsectoring is to exclude social security funds from each level of government and have a separate subsector for social security funds covering all levels of government. The choice of classification used will depend on whether social security funds are independent of the level of government where they operate or not.

22.40 Greater detail on subsectoring general government is given in section F of chapter 4.

7. Subsectors of the public sector

22.41 It is possible to construct subsectors of the public sector to meet analytical demands. Two methods of subsectoring the public sector may be considered. In the first, the public sector could be divided into the general government sector as one subsector and the aggregate of all public corporations as a second subsector. The public corporations might be further divided into non-financial public corporations, financial public corporations other than the central bank, and the central bank.

22.42 Secondly, the public sector could be divided by level of government in the same way as the general government sector is. In this case, the subsectors would be the central government public sector, the state government public sector and the local government public sector. Each of these subsectors would consist of the corresponding subsector of the general government sector plus all public corporations controlled by a unit of that level of government. If a unit is controlled in part by a unit at one level of government and in part by a unit in another part of government, an allocation must be made to one or the other level of government depending on factors such as the degree of control exercised by each of the controlling units. Social security funds could form a separate subsector or could be combined with each level of government. It should be noted that if there is a separate fund to meet government employee pensions, this fund should be excluded from social security funds.

8. Borderline cases

22.43 Specific guidance on when certain entities created by government units are to be included in the public sector or not is needed. The entities concerned include quasi-corporations, restructuring agencies, special purpose entities, joint ventures and supranational authorities.

Quasi-corporations

22.44 Quasi-corporations are unincorporated enterprises that function as if they were corporations. Quasi-corporations are treated in the SNA as if they were corporations: that is, as institutional units separate from the units to which they legally belong. Thus, quasi-corporations owned by government units are grouped with corporations in the non-financial or financial corporate sectors.

22.45 The intent behind the concept of a quasi-corporation is to separate from their owners those unincorporated enterprises that are sufficiently self-contained and independent of their owners that they behave in the same way as corporations. If they function like corporations, they must keep complete sets of accounts. Indeed, the existence or possibility to construct a complete set of accounts, including balance sheets, for the enterprise is a necessary condition for it to be treated as a separate institutional unit, otherwise it would not be feasible from an accounting point of view to distinguish the quasi-corporation from its owner.

22.46 In order to be treated as a quasi-corporation the government must allow the management of the enterprise considerable discretion not only with respect to the management of the production process but also the use of funds. Government quasi-corporations must be able to maintain their own working balances and business credit and be able to finance some or all of their capital formation out of their own saving, financial assets or borrowing. The ability to distinguish flows of income and capital between quasi-corporations and government implies that, in practice, their operating and financing activities must be separable from government revenue or finance statistics, despite the fact that they are not separate legal entities. The net operating surplus of a government owned quasi-corporation is not a component of government revenue and the accounts for government record only the flows of income and capital between the quasi-corporation and government.

The case of restructuring agencies

22.47 Some public units are involved in the restructuring of corporations, either non-financial or financial. These corporations may or may not be controlled by government. Restructuring agencies may be long-standing public units or agencies created for this special purpose. Government may fund the restructuring in various ways, either directly, through capital injections (capital transfer, loan or acquisition of equity) or indirectly, through granting guarantees. Units such as restructuring agencies have little output so the usual criterion of whether the output is market or non-market in determining when the unit is part of general government is not sufficient. Instead the following propositions should be considered:

a. A unit that serves only government is more likely to be included in general government than one that deals with other units also.

b. A unit that sells financial assets at other than market values is more likely to be in the general government sector than not.

c. A unit that takes on low risk because it acts with strong public financial support and legally or effectively on behalf of the government is likely to be included within general government.

22.48 Restructuring agencies may operate in a number of ways. The following are two frequently-observed examples.

22.49 A restructuring agency may undertake the reorganization of the public sector and the indirect management of privatization. Two cases may be considered:

a. The restructuring unit is a genuine holding company controlling and managing a group of subsidiaries and only a minor part of its activity is dedicated to channelling funds from one subsidiary to another on behalf of the government and for public policy purposes. The unit is classified as a corporation and the transactions made on behalf of the government should be rerouted through the general government.

b. The restructuring unit, whatever its legal status, acts as a direct agent of the government and is not a market producer. Its main function is to redistribute national income and wealth, channelling funds from one unit to the other. The restructuring unit should be classified in the general government sector.

22.50 Another example of a restructuring agency is one mainly concerned with impaired assets, mainly in a context of a banking or other financial crisis. Such a restructuring agency must be analysed according to the degree of risk it assumes, considering the degree of financing of the government. Again, two cases may be considered:

a. The restructuring agency borrows on the market at its own risk to acquire financial or non-financial assets that it actively manages. In this case the unit should be classified as an institution in the financial corporations sector.

b. The restructuring agency deliberately purchases assets at above market prices with direct or indirect financial support from the government. It is primarily engaged in the redistribution of national income (and wealth), does not act independently of government or place itself at risk and therefore should be classified in the general government sector.

Special purpose entities

22.51 Government units are always considered resident because, by definition, the economic territory of a country consists of the geographic territory administered by a government, as well as some territorial enclaves in the rest of the world, used by the government for diplomatic, military, scientific, or other purposes, normally with the formal agreement of the government of the country in which they are physically located. These enclaves are part of the general government sector.

22.52 Some governments may set up special purpose entities (SPEs) for financial convenience, the SPE being involved in fiscal or quasi-fiscal activities (including securitization

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

of assets, borrowing, etc.). Resident SPEs that function in only a passive manner relative to general government and that carry out fiscal activities are not regarded as separate institutional units in the SNA and are treated as part of general government regardless of their legal status. If they act independently, acquire assets and incur liabilities on their own behalf, accepting the associated risk, they are treated as separate institutional units and are classified to sector and industry according to their principal activity.

22.53 Non-resident SPEs are always classified as separate institutional units in the economy where they are established. When such entities are created, care must be taken to reflect faithfully the fiscal activities of the government. All flows and stock positions between the general government and the non-resident SPE should be recorded when they occur in the accounts for general government and the rest of the world.

22.54 A government may create a non-resident SPE to undertake government borrowing or incur government outlays abroad. Even if there are no actual economic flows recorded between the government and the SPE related to these fiscal activities, transactions should be imputed in the accounts of both the government and the rest of the world to reflect the fiscal activities of the government undertaken by the SPE, including borrowing. The special case of securitization units is discussed in section D.

Joint ventures

22.55 Many public units enter into arrangements with private entities or other public units to undertake a variety of activities jointly. The activities could result in market or non-market output. Joint operations can be structured broadly as one of three types: jointly controlled units, referred to here as joint ventures; jointly controlled operations; and jointly controlled assets.

22.56 ***A joint venture involves the establishment of a corporation, partnership or other institutional unit in which each party legally has joint control over the activities of the unit.*** The units operate in the same way as other units except that a legal arrangement between the parties establishes joint control over the unit. As an institutional unit, the joint venture may enter into contracts in its own name and raise finance for its own purposes. A joint venture maintains its own accounting records.

22.57 The principal question to be considered here is whether the effective economic control of the joint venture establishes a public or a private unit. If a joint venture operates as a non-market producer, it must be the case that government is in effective control and it is classified as part of general government.

22.58 If the joint venture is a market producer, it is treated as a public or private corporation according to whether it is or is not controlled by a government unit, using the same indicators as described above. Normally, the percentage of ownership will be sufficient to determine control. If the public and private units own an equal percentage of the joint venture, the other indicators of control must be considered.

22.59 Public units can also enter into joint operating arrangements that do not involve establishing separate institutional units. In this case, there are no units requiring classification, but care must be taken to ensure that the proper ownership of assets is recorded and any sharing arrangements of revenues and expenses are made in accordance with the provisions of the governing contract. For example, two units may agree to be responsible for different stages of a joint production process or one unit may own an asset or a complex of related assets but both units agree to share revenues and expenses.

Supranational authorities

22.60 Some countries may be part of an institutional agreement that involves monetary transfers from the member countries to the associated supranational authority and vice versa. The supranational authority also engages in non-market production. In the national accounts of the member countries, the supranational authorities are non-resident institutional units that are part of the rest of the world and may be classified in a specific subsector of the rest of the world.

22.61 Because the supranational authority is fulfilling the functions of a level of government, it is possible to construct a set of accounts for the authority as if it were a resident unit of the member country even though it remains non-resident. Such an additional account may provide a useful supplement for the analysis of the economic activities of the member countries.

C. The government finance presentation of statistics

1. Introduction

22.62 The sequence of accounts for all institutional units and sectors is described in chapters 6 to 13. For the general government sector and, in some cases, the public sector, experience has shown that an alternative presentation, usually known as a government finance presentation or public finance presentation, of the stocks and flows is better suited to certain analytical requirements. This section gives a very brief overview of the way in which government accounts are presented in, for example, the *GFSM2001*, which should be consulted for further explanation and discussion.

22.63 Basically the government finance presentation consists of transactions that increase net worth leading to an aggregate called revenue and transactions that decrease net worth leading to the aggregate called expense. In addition there are two main balancing items, net operating balance and net

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

lending or net borrowing. Additional accounts can be shown for other economic flows and balance sheets.

22.64 The following section provides general information about the concepts involved in government finance.

2. Revenue

22.65 A revenue transaction is one that increases net worth. In the government finance presentation of the accounts, the concept of revenue is defined to include all resources acquired by government as recorded in the SNA current accounts and capital transfers receivable recorded in the capital account. Specifically, revenue can be determined as follows:

Revenue

equals Taxes,

plus Social contributions,

plus Other current revenue,

plus Capital transfers receivable.

22.66 Government revenue is usually dominated by compulsory levies in the form of taxes and social contributions. For some levels of government, grants (transfers from other government units and international organizations) are a major source of revenue. Other general categories of revenue include property income, sales of goods and services and miscellaneous transfers other than grants.

22.67 Estimating taxes and social contributions can be quite difficult. The problems involved and the recommended solutions are described in section D. Taxes are recorded in several of the accounts in the sequence of accounts. An advantage of the government finance presentation is that all taxes can be presented as one category of revenue, with subclassifications according to the basis on which the tax was levied. In particular, both current and capital taxes can be shown under a single heading.

22.68 Other current revenue covers property income, sales of goods and services, fines, penalties and forfeits, voluntary transfers other than grants and miscellaneous and unidentified revenue. The distribution of goods and services that are not sold at all or sold for prices that are not economically significant does not accord with the general notion of revenue as a transaction that increases net worth. As a result, only actual sales of goods and services or goods and services produced by government but provided as compensation of employees in kind are included in revenue. (The goods and services provided as compensation in kind are treated as revenue because they offset expenditure.)

22.69 Transfers from one government unit to another, often from the central or a state government to a lower level of government, can be quite important sources of government revenue. The government finance presentation allows all of these receipts to be collected into a separate category of revenue, usually labelled grants. Other transfers, including subsidies, normally amount to much less and are reported separately. Property income may or may not be an important source of revenue, but in either case it relates directly to the same category as in the allocation of primary income account.

3. Expense

22.70 An expense transaction is one that decreases net worth. In the government finance presentation of the accounts, the concept of expense is defined to include all uses incurred by government as recorded in the SNA current accounts and capital transfers payable as recorded in the capital account. Specifically, expense can be determined as follows:

Expense

equals Production expenses (compensation of employees, intermediate consumption and consumption of fixed capital),

plus Interest payable,

plus Grants,

plus Social benefits,

plus Other current expenses,

plus Capital transfers payable.

22.71 The government finance presentation as in *GFSM2001*, for example, differs from the sequence of accounts in a number of ways. The absence of a production account in the government finance presentation makes it impossible to show both the cost structure of own account production and its final use. Thus, for instance, the salaries of employees engaged in own account capital formation are directly classified as acquisitions of capital formation and not as compensation of employees. Conversely, the salaries of employees that produce social benefits in kind are recorded as compensation of employees and not again as (part of) expense on social benefits in kind. The government finance presentation uses some labels and definitions that differ from those in the sequence of accounts and also introduces various simplifications. For example, outlays on FISIM and insurance services are not distinguished from interest and net insurance premiums respectively.

22.72 Governments typically produce many services and some goods and then distribute them free or at prices that are not economically significant. In the SNA, the cost of these goods and services is recorded as a use when they are produced and again as a social benefit or final consumption expenditure when they are distributed. To reduce unnecessary duplication, these costs are recorded only as production expenses in the government finance presentation.

22.73 In principle, retirement benefits paid to government employees are considered the liquidation of a liability rather than a payment of a current expense. However, in practice social benefits as reported in government accounts

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

may include retirement benefits paid to government employees. If these transactions in pension liabilities are to be excluded, the contributions must also be excluded from revenue and the item adjustment for changes in pension entitlements excluded from expense.

4. Outlays

22.74 The purchase of a non-financial asset is not an expense because it has no net effect on net worth since it represents the exchange of one type of asset for another or the incurrence of a liability matched by the acquisition of an asset. It is however included in a total called outlays (or sometimes expenditure). Outlays are defined as follows:

Outlays

*equal*s Expense,

plus Acquisitions less disposals of non-financial assets.

The net acquisition of non-financial assets is the sum of the gross capital formation and acquisitions less disposals of non-produced non-financial assets.

5. Net operating balance

22.75 The net operating balance is defined as revenue less expense. It is the balance of all transactions that affect net worth. It is equivalent to the changes in net worth due to saving and capital transfers in the SNA sequence of accounts. It provides a measure of the sustainability of government policies as it represents the resources acquired or consumed by the government's current operations. Specifically:

Net operating balance

equals Revenue,

less Expense.

6. Net lending or net borrowing

22.76 Net lending or net borrowing can be calculated as the net operating balance less the net acquisition of non-financial assets or total revenue less total outlays. It represents the amount the government has available to lend or must borrow to finance its non-financial operations. Specifically:

Net lending or net borrowing

equals Net operating balance,

less Acquisitions less disposals of non-financial assets.

or, alternatively:

Net lending or net borrowing

equals Revenue,

less Outlays.

22.77 Net lending or net borrowing is also the balancing item of the financial account, although in practice a statistical discrepancy could appear as a result of using different sources and of possible errors and omissions.

7. Consolidation

22.78 For analytical purposes, there is often interest in the relationship between net lending or net borrowing and the change in government liabilities. Attention to government liabilities usually centres on the amount owed to non-government units. There may be a substantial amount of liabilities incurred by one government unit and held by a second government unit. The government finance presentation consolidates all flows and stocks within each subsector and sector, and thus all asset and liability positions between units belonging to the same grouping are eliminated. This procedure still allows the separate identification of the debt of the general government sector, the central government subsector and the public sector, which are analytically useful.

22.79 Consolidation is a method of presenting statistics for a set of units as if they constituted a single unit. It involves eliminating transactions and reciprocal stock positions among the units that are being consolidated. Consolidation may be undertaken for any group of units, but it is particularly useful to consolidate the units within the general government sector and its subsectors. For example, assessing the overall impact of government operations on the total economy or the sustainability of government operations is more effective when the transactions between different levels of government are eliminated and only those transactions that are with other sectors or non-residents remain. Consolidation is of particular relevance for transactions such as property income (in particular interest), current and capital transfers and transactions in financial assets and liabilities. For example, the consolidated figures on the ratio of revenue or expense to GDP are more useful for some purposes than the unconsolidated figures.

22.80 In the SNA, consolidation is discouraged. Even in the government finance presentation, where consolidation is often useful, it takes place only within a single account where the matching revenue and expense entries appear. For this reason, consolidation adjustments do not affect balancing items. For example, a grant (or transfer) from a central government to a local government unit is consolidated by eliminating the expense from central government and the revenue from the local government, thus leaving the net operating balance of the general government sector unchanged.

22.81 Conceptually, the nature of consolidation is to eliminate all flows among the consolidated units, but practicality should be kept in mind. For example, it may be argued that transactions in the production account, such as output and intermediate consumption of goods and services, should not be consolidated. The decision about the level of detail employed in consolidation should be based on the policy usefulness of the consolidated data and the relative importance of the various types of transactions or stocks.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

22.82 Within a government finance presentation, the major transactions considered for consolidation, in probable order of importance, are:

a. Current and capital transfers, such as central government grants to lower levels of government;

b. Transactions in financial assets and liabilities, such as loans to other governments for policy purposes, acquisitions of government securities by social security units and debt forgiveness;

c. Interest revenue and expense on intergovernmental holdings of financial assets and liabilities;

d. Acquisitions and disposals of non-financial assets, including intergovernmental transactions in land, buildings and equipment;

e. Taxes paid by one government unit or entity to another;

f. Purchases and sales of goods and services between government units.

22.83 Two types of transactions that appear to take place between two government units are never consolidated because they are re-routed in the SNA to other units. The first is that all employer social contributions, whether paid to social security or to government pension funds, are treated as being paid to the employee as part of compensation and then paid by the employee to the fund. The second is that all taxes withheld by government units from the compensation of their employees, such as pay-as-you-earn (PAYE) taxes, and paid to other governments should be treated as being paid directly by the employees. The government employer is simply the collecting agent in this case for the second government unit. However, taxes on gross payroll and labour force that are not treated as social contributions should be consolidated when they are significant and can be identified.

22.84 Practical difficulties always arise with consolidation. For example, when a transaction to be consolidated is identified in the records of one unit, the corresponding transaction should appear in the accounts of the counterparty, but it may not be recorded there, it may be recorded in a different period, it may be recorded at a different value, or it may be classified as a different type of transaction. Such errors in the strict application of a quadruple accounting system may exist in relation to any transaction but become apparent when consolidation is attempted.

22.85 Even if transactions between the subsectors of government are being consolidated when presenting the accounts for general government as a whole, they should not be eliminated for the accounts of each subsector considered separately.

8. Classification of the functions of government

22.86 A classification of transactions on outlays using the Classification of Functions of Government (COFOG) is integral to the government finance presentation. This classification shows the purpose for which outlays are undertaken. These purposes may differ significantly from the administrative arrangements of governments. For example, an administrative unit responsible for health services may undertake some activities with an educational purpose, such as training of medical professionals. A cross classification of the transactions of government by both economic nature and according to functions, as shown for example in *GFSM2001*, is encouraged.

D. Accounting issues particular to the general government and public sectors

22.87 The accounting rules of the SNA apply to general government and public sectors in the same way that they apply to all other sectors of the economy. However, due to the particular nature of the activities of government units, some additional guidance is useful to assist with the treatment of selected transactions. These topics are grouped under four headings:

a. Clarification of the recording of taxes;

b. Interaction with non-resident government-type authorities (including taxes paid to another authority);

c. Issues related to debt;

d. Interaction with the corporations sectors.

A separate section for each of these headings follows.

1. Clarification of the recording of taxes

Government issued permits

22.88 Taxes are compulsory unrequited payments, in cash or in kind, made by institutional units to the general government exercising its sovereign powers or to a supranational authority. They usually constitute the major part of government revenue, up to 90 per cent in some countries. Taxes are described as unrequited because, in most cases, the government provides nothing commensurate in exchange to the individual unit making the payment. However, there are cases where the government does provide something to the individual unit in return for a payment in the form of the direct granting of a permit or authorization. In this case, the payment is part of a mandatory process that ensures proper recognition of ownership or that activities are performed under the strict authorization by the law. The borderline between when such payments are to be treated as a tax and when as the

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

sale of a service or as the sale of an asset by the government requires additional guidance.

22.89 As noted in chapters 7 and 8 when discussing the difference between a tax and a fee for a service, the borderline is not always clear-cut in practice. The following recommendations apply.

a. The payment is recorded as a tax when a licence or a permit is automatically granted by the government as a mandatory condition to perform an activity or acquire an asset and when the government unit performs little or no work other than a minimum control of the legal capacity of the acquirer to receive the permit (for instance, to confirm the applicant has not been convicted of a crime). The payment of the fee in such a case is not commensurate with the control function that the government exercises.

b. The payment is recorded as the purchase of a service when, for instance, issuing the licence or permit implies a proper regulatory function of the government by exercising control on the activity, checking the competence or qualifications of the persons concerned, etc. In such a case, the payment is taken to be proportion to the costs of producing the service for all or any of the entities benefiting from the services and is borne by those benefiting. Only if the payment is out of proportion to the costs of producing the services, is it treated as a tax.

22.90 Chapter 17 discusses the case of licences issued by government in strictly limited numbers.

a. If the licence is not one to use a natural resource that qualifies as an asset and which the government controls on behalf of the community, then the payment for the licence is a tax. Notwithstanding, if the licence is legally and practically transferable to a third party, it may still be classified as an asset in the category of contracts, leases and licences.

b. When the licence is to make use of a natural resource that qualifies as an asset and which the government controls on behalf of the community, payments for the licence are treated either as the acquisition of an asset in the category of contracts, leases or licences or as the payment of rent. The conditions that need to be considered in deciding between the acquisition of an asset and the payment of rent are described in detail in part 5 of chapter 17.

Permission to use a produced asset owned by government is treated as an operating or financial lease as appropriate.

Accrual recording of taxes

22.91 Like all transactions in the system, government transactions should be recorded on an accrual basis. This is true on both the revenue side (for example, taxes and social contributions) and the expense side (for example, interest charges). Unless both parties to a transaction record their view of the transaction at the same point in time, the accounts do not balance.

22.92 For the government, recording revenue and claims when the underlying event occurs is particularly difficult since government recordings are often on a cash basis. This is especially the case for taxes. Further, when accrued taxes are calculated from assessments of taxes due, there may be a risk of over- or understatement of tax revenue. Since tax revenue is a crucial government finance aggregate, such an error must be avoided.

22.93 As explained in chapter 3, the period of time between the moment a tax or any distributive transaction is recorded as accruing in the non-financial accounts and the moment the payment is actually made is bridged by recording an account receivable or payable in the financial account. In cases where a prepayment covering two or more accounting periods is made to government, an account payable is recorded in the financial account of government for the amounts due in future periods. In effect this is a financial advance made to government by the payee. It is a liability of the government and an asset of the payee. This liability is extinguished as the amounts fall due in future periods.

22.94 The amount of taxes recorded as accruing recognizes that some taxes that may be due in principle are in practice unlikely to be collected. The alternative means of making the necessary adjustments are described in paragraphs 8.58 to 8.59.

Tax credits

22.95 Tax relief can take the form of a tax allowance, an exemption, a deduction or a tax credit. Tax allowances, exemptions and deductions are subtracted from the tax base before the tax liability is computed. A tax credit is an amount subtracted directly from the tax liability due by the beneficiary household or corporation after the liability has been computed. Tax credits can sometimes be payable, in the sense that any amount of the credit that exceeds the tax liability is paid to the beneficiary. In contrast, some tax credits are non-payable (sometimes called wastable) and are limited to the size of the tax liability.

22.96 In *Revenue Statistics* and *GFSM2001*, a tax relief that is embedded in the tax system is recorded as reducing the tax liability of the taxpayer and therefore as reducing government tax revenue. This is the case for tax allowances, exemptions and deductions, since they enter directly into the calculation of the tax liability. This is also the case for non-payable tax credits as their value to the taxpayer is limited to the size of their tax liability. For payable tax credits, only the excess over the corresponding liability, which corresponds to an outlay by government, is shown as an expense.

22.97 In contrast, in the SNA, the total amounts due as payable tax credits should be considered as expense and recorded as such at their total amount. In consequence, tax revenue should be recorded without any deduction for payable tax credits.

22.98 Treating payable tax credits in this way has no impact on the net borrowing or net lending of the general government, but has an impact on both the tax burden and the ratios of public expense or expenditure to GDP. Because of the need to explain differences in presentation between different

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

statistical systems, however, in the SNA the amounts of payable tax credits that are offset against tax liabilities should also be shown.

2. Transactions with other national, international and supranational organizations

22.99 Transactions may occur between government units and either international or supranational organizations, regarded as non-resident units. Even when government acts as the unit channelling funds to or from the non-resident unit, the transactions are recorded as taking place directly with the non-resident unit. Six cases may be considered:

a. *Taxes*: Some taxes on products, such as import duties, excises and value added taxes, might be payable to a supranational organization because they are considered to be levied directly by the supranational organization.

b. *Subsidies*: Any subsidies paid by a supranational organization directly to a resident producer are recorded as payable by the supranational organization rather than a resident government unit.

c. *Current international cooperation:* This consists of current transfers in cash or in kind between the governments of different countries or between governments and international organizations and includes specifically:

· Transfers between governments that are used by the recipients to finance current expenditures, including emergency aid after natural disasters; they include transfers in kind in the form of food, clothing, blankets, medicines, etc.;

· Annual or other regular contributions paid by member governments to international organizations (excluding taxes payable to supranational organizations);

· Payments by governments or international organizations to other governments to cover the salaries of those technical assistance staff who are resident in the country in which they are working and are employed by the host government.

d. *Miscellaneous current transfers:* These consist of payments to international or supranational authorities that are regarded as being compulsory but are not taxes.

e. *Capital transfers:* These include investment grants and other capital transfers, including the counterpart transaction of debt cancellation as a capital transfer payable and the counterpart of debt assumption as a capital transfer receivable.

f. *Financial transactions:* Some financial transactions, usually loans, may be recorded when granted by international organizations (for example, the World Bank and the International Monetary Fund) or granted to other governments.

International membership dues

22.100 In a few cases, membership dues and subscription fees payable to international organizations may not be treated as transfers but as payments for a service, recorded on an accrual basis. Exceptionally, and when there is a possibility even if unlikely, of repayment of the full amount, the payment may represent the acquisition of a financial asset.

International assistance

22.101 International assistance sometimes takes the form of making goods, such as food and clothing or emergency equipment available following a natural disaster. In addition to the goods or services themselves, all costs identifiable with the delivery of the goods or services such as transportation to the foreign country, delivery within that country, the compensation of government employees of the donating country to prepare the shipments or oversee their delivery, insurance and so forth should be included in the value of the transfer to the extent that these costs are met by the donor.

22.102 The prices of the goods or services in the receiving country might be quite different from the prices in the donor country. As a general principle, the value of the donation to the recipient should be regarded as equal to the cost of providing the assistance to the recipient. It follows that the prices of the donor country should be used as a basis for the calculation of the value of the donation.

22.103 When the goods and services and associated delivery charges are donated by government, NPISHs or households, the items are negative final consumption matching a transfer in kind. If the items are provided by corporations, they are recorded as a transfer in cash followed by a purchase of the goods by the recipient. In both cases the items involved are included in exports of the donor country and imports of the recipient country.

3. Debt and related operations

Debt

22.104 Debt is a commonly used concept, defined as a specific subset of liabilities identified according to the types of financial instruments included or excluded. Generally, debt is defined as all liabilities that require payment or payments of interest or principal by the debtor to the creditor at a date or dates in the future. Consequently, all debt instruments are liabilities, but some liabilities such as shares, equity and financial derivatives are not debt. However, due to specific legal, institutional or practical arrangements some other definitions of debt may also exist. It is therefore useful in all cases to clearly identify the definition of debt according to the instruments included.

22.105 Debt operations are often used by government as a means of providing economic aid to other units. The general principle for any cancellation or assumption of debt of one unit by another unit made by mutual agreement is to consider that there is a voluntary transfer of wealth between the two units. This means that the counterpart transaction of

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

the liability assumed or of the claim cancelled is a capital transfer.

Debt reorganization

22.106 There are four main types of debt reorganization:

a. Debt forgiveness. A reduction in the amount of, or the extinguishing of, a debt obligation by the creditor via a contractual arrangement with the debtor.

b. Debt rescheduling or re-financing. A change in the terms and conditions of the amount owed, which may result or not in a reduction in burden in present value terms.

c. Debt conversion. The creditor exchanges the debt claim for something of economic value, other than another debt claim, on the same debtor. This includes debt-for-equity swaps and debt prepayment among other arrangements.

d. Debt assumption and debt payments on behalf of others when a third party is also involved.

Debt forgiveness (or debt cancellation)

22.107 Debt forgiveness is defined as the voluntary cancellation of all or part of a debt obligation within a contractual arrangement between a creditor and a debtor. Debt forgiveness is distinguished from debt write-off by the agreement between the parties and the intention to convey a benefit, rather than unilateral recognition by the creditor that the amount is unlikely to be collected. Debt forgiven may include all or part of the principal outstanding, inclusive of any accrued interest arrears (interest that fell due in the past) and any other interest costs that have accrued. Debt forgiveness does not arise from the cancellation of future interest payments that have not yet fallen due and have not yet accrued.

22.108 Debt forgiveness is recorded as a capital transfer received by the debtor from the creditor at the time specified in the agreement that the debt forgiveness takes effect with a repayment of the debtor's liability in the financial account and a matching receipt by the creditor. In the balance sheet, the debtor's liability and creditor's asset are reduced by the amount of debt that is forgiven. Valuation of the amount of the debt forgiven is at market prices for flows and stocks, except for loans where the nominal value is used.

Debt rescheduling and refinancing

22.109 *Debt rescheduling (or refinancing)* is an agreement to alter the terms and conditions for servicing an existing debt, usually on more favourable terms for the debtor. Debt rescheduling involves rearrangements on the same type of instrument, with the same principal value and the same creditor as with the old debt. Refinancing entails a different debt instrument, generally at a different value and may be with a creditor different than that from the old debt.

22.110 Under both arrangements, the debt instrument that is being rescheduled is considered to be extinguished and replaced by a new debt instrument with the new terms and conditions. If there is a difference in value between the extinguished debt instrument and the new debt instrument, part is a type of debt forgiveness by government and a capital transfer is necessary to account for the difference.

22.111 *Debt rescheduling* is a bilateral arrangement between the debtor and the creditor that constitutes a formal deferment of debt-service payments and the application of new and generally extended maturities. The new terms normally include one or more of the following elements: extending repayment periods, reductions in the contracted interest rate, adding or extending grace periods for the repayment of principal, fixing the exchange rate at favourable levels for foreign currency debt, and rescheduling the payment of arrears, if any.

22.112 The treatment for debt rescheduling is that the existing contract is extinguished and a new contract created. The applicable existing debt is recorded as being repaid and a new debt instrument (or instruments) of the same type and with the same creditor is created with the new terms and conditions.

22.113 The transaction is recorded at the time both parties record the change in terms in their books, and is valued at the value of the new debt.

22.114 *Debt refinancing* involves the replacement of an existing debt instrument or instruments, including any arrears, with a new debt instrument or instruments. It can involve the exchange of the same type of debt instrument (loan for a loan), or different types of debt instruments (loan for a bond). For instance, the public sector may convert various export credit debts into a single loan. Also, debt refinancing can be said to have taken place when a debtor exchanges existing bonds for new bonds through exchange offers given by its creditor (rather than a change in terms and conditions).

22.115 The treatment of debt refinancing transactions is similar to debt rescheduling to the extent that the debt being refinanced is extinguished and replaced with a new financial instrument or instruments. However, unlike in rescheduling, the old debt is extinguished at the value of the new debt instrument except for non-marketable debt owed. The balance sheet reflects the transactions extinguishing the old debt instrument and the creation of the new debt instrument along with any valuation change recorded in the revaluation account.

Debt conversion

22.116 *A debt-for-equity swap* occurs when a creditor agrees to replace a debt owed to it by an equity security. For example, the government may agree with a public enterprise to accept an increase in its equity stake in the public enterprises instead of making a loan. If there is a difference in value between the extinguished debt instrument and the new equity instrument, it is a type of debt forgiveness by government and a capital transfer is necessary to account for the difference.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Debt assumption

22.117 *Debt assumption* occurs when one unit assumes responsibility for another unit's outstanding liability to a creditor. When a government assumes a debt, in most instances the counterpart transaction of the new government liability is a capital transfer in favour of the defaulting debtor. However, if the government acquires an effective legal claim against the defaulting unit and there is a realistic probability that the claim will be paid, the government may record, as the counterpart transaction of its new liability, the acquisition of a financial asset equal to the present value of the amount expected to be received. If this amount is equal to the liability assumed, no further entries are required. If the amount expected to be recovered is less than the liability assumed, the government records a capital transfer for the difference between the liability incurred and any asset acquired. Similarly, if a government has its debt assumed by another government, then it records a capital transfer receivable, a new debt to the assuming government unit, or a combination of the two.

22.118 Debt assumption frequently occurs when a government guarantees a debt of another unit and the guarantee is called (or activated). The treatment of the guarantee itself is described below.

22.119 *Debt payments on behalf of others* are similar to debt assumptions, but the unit making the payments does not assume the entire debt. The transactions recorded are similar to those described under debt forgiveness.

Other issues related to debt re-organization

22.120 *Debt write-offs* refer to unilateral reductions by a creditor in the amount owed to it, usually when a creditor concludes that a debt obligation has no value or a reduced value because part or all of the debt is not going to be paid. Frequently the debtor is bankrupt or has disappeared. An other change in the volume of assets is used to record the write-off. Unlike the cases of debt assumption and debt forgiveness, no capital transfer is recorded and therefore there is no impact on net lending or borrowing of government.

22.121 *Debt arrears* occur when a debtor misses an interest or principal payment. The debt instrument will not normally change, but knowing the amount of debts in arrears can provide important information. When feasible and important, therefore, each category of debt should be divided into those instruments that are in arrears and those not in arrears.

22.122 *Debt defeasance* allows a debtor (whose debts are in the form generally of debt securities and loans) to remove certain liabilities from the balance sheet by pairing irrevocably assets of equal value to the liabilities. Defeasance may be carried out either by placing the paired assets and liabilities in a trust account within the institutional unit concerned, or by transferring the paired assets and liabilities to another institutional unit. In the former case, there are no transactions with respect to defeasance and the assets and liabilities should not be excluded from the balance sheet of the unit. In the latter case, the assets and liabilities in question are moved to the balance sheet of second unit as long as this unit is recognized as an institutional unit in the SNA. Often the unit to which the paired assets and liabilities may be moved is an SPE. The conditions under which an SPE is considered to be an institutional unit are described in paragraphs 4.55 to 4.67. If the SPE is purely passive it is not considered to be an institutional unit and the assets and liabilities concerned do not move off-balance sheet.

22.123 *Debt issued on concessional terms.* There is no precise definition of concessional loans, but it is generally accepted that they occur when units lend to other units and the contractual interest rate is intentionally set below the market interest rate that would otherwise apply. The degree of concessionality can be enhanced with grace periods, frequencies of payments and a maturity period favourable to the debtor. Since the terms of a concessional loan are more favourable to the debtor than market conditions would otherwise permit, concessional loans effectively include a transfer from the creditor to the debtor.

22.124 Loans with concessional interest rates to a foreign government could be seen as providing a current transfer equal to the difference between the actual interest and the market equivalent interest. If such a transfer were recognized, it would usually be recorded as current international cooperation, and the interest recorded would be adjusted by the same amount. However, the means of incorporating the impact within the SNA and international accounts have not been fully developed, although various alternatives have been advanced. Accordingly, until the appropriate treatment of concessional debt is agreed, information on concessional debt should be provided in supplementary tables.

22.125 Further details on the recording of debt operations can be found in *GFSM2001*, the *Manual on Government Debt and Deficit*, the *External Debt Guide* and Appendix 2 of *BPM6.*

Government guarantees

22.126 Three types of guarantees are recognized in the SNA, standardized guarantees, guarantees that meet the definition of a financial derivative and one-off guarantees. The recording of standardized guarantees (for government and other units offering such guarantees) is described in part 3 of chapter 17.

22.127 Guarantees that meet the definition of financial derivatives are those that are actively traded on financial markets, such as credit default swaps. The derivative is based on the risk of default of a reference instrument and so is not actually linked to an individual loan or bond. They have no effect on the net lending or borrowing of government.

22.128 One-off guarantees exist where the conditions of the loan or the security are so particular that it is not possible for the degree of risk associated with the loan to be calculated with any degree of accuracy. In most cases, the granting of a one-off guarantee is considered a contingency and is not recorded as a liability for the guarantor. Payments under a one-off guarantee are recorded when the call on the guarantee is made or when the fact that such a call will be made is very well established. As an exception, one-off guarantees granted by governments to corporations in

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

certain financially distressed situations and with a very high likelihood to be called are treated as if these guarantees were called at inception. A particular case in point is a bailout by government, which is discussed below.

22.129 The activation of a one-off guarantee is treated in the same way as a debt assumption. The original debt is liquidated and a new debt is created between the guarantor and the creditor. In most instances, the guarantor is deemed to make a capital transfer to the original debtor, unless the guarantor acquires an effective claim on the creditor, in which case it leads to the recognition of a financial asset (a liability of the debtor).

22.130 The activation of a guarantee may or may not require repayment of debt at once. The accrual principle for time of recording requires that the total amount of debt assumed is recorded at the time the guarantee is activated and the debt assumed. Repayments of principal by the guarantor (the new debtor) and interest accruals on the assumed debt are recorded as these flows occur.

Securitization

22.131 Securitization occurs when a unit, named the originator, conveys the ownership rights over financial or non-financial assets or the right to receive specific future flows, to another unit, named the securitization unit. In return, the securitization unit pays an amount to the originator from its own source of financing. The securitization unit is often an SPE. The securitization unit obtains its own financing by issuing securities using the assets or rights to future flows transferred by the originator as collateral. Government units have made widespread use of this source of finance.

22.132 The first case involving government to be considered is when the securitization comprises the sale (or the transfer) of an asset. (In the SNA, a stream of future tax receipts is not recognized as a government asset that could be used for securitization.) The key question for how to record the transaction properly is to determine whether the transfer of the asset is a sale of an existing asset to the securitization unit or a way to borrow using possible future flows of revenues as collateral. In order to be treated as a sale, the asset must already appear in the balance sheet of the government and there must be a full change of ownership to the securitization unit as evidenced by the transfer of the risks and rewards linked to the asset. The following factors must also be considered:

a. To be recorded as a sale, the purchase price must be equal to the current market price.

b. If the government, as the originator, guarantees repayment of any debt related to the asset incurred by the securitization unit, it is unlikely that all of the risks associated with the asset have been transferred.

22.133 The second case involving government is the securitization of future revenue flows. In the SNA, a stream of future incomes is not recognized as an asset. In most of these cases, it is not the rights to the income that are used as collateral, but the obligation of the government to use a sufficient amount of the future income to repay the borrowing in full. If more income is earned than is needed to repay the borrowing, the excess is retained by the government. Because receipts of future income are uncertain, “rights” to considerably more income than is necessary to repay the borrowing of the securitization unit are usually used as collateral. The amount received by the government as the originator is treated as borrowing, usually in the form of a loan.

Government assumption of pension liabilities

22.134 On occasion, large one-off transactions may occur between a government and another unit, usually a public corporation, linked to pension reforms or to privatization of public corporations. The goal may be to make a public corporation competitive and financially more attractive by removing existing pension liabilities from the balance sheet of the public corporation. This goal is achieved by the government assuming the liability in question in exchange for a cash payment of the same value. If the cash payment is not equal in value to the liability incurred, a capital transfer is recorded for the difference.

4. Relations of general government with corporations

Earnings from equity investment

22.135 A government unit has a close relationship with any public corporation or quasi-corporation that it controls. Despite this close relationship, flows related to the equity investment between a government unit and its controlled corporation are treated in the same way as flows between any corporation and its owners. An equity investment is the action by economic agents of placing funds at the disposal of corporations. The amounts invested, described as equity capital, are part of the own funds of the corporation and the corporation has a large degree of freedom in the way in which they are used. In return, the owners receive shares or some other form of equity securities. These financial assets represent property rights on corporations and quasi-corporations and entitle the holders to:

a. A share of any dividends (or withdrawals of income from quasi-corporations) paid at the discretion of the corporation but not to a fixed and predetermined income, and

b. A share in the net assets of the corporation in the event of its liquidation.

Dividends versus withdrawal of equity

22.136 It is important to distinguish between the return of the equity investment by the corporation to its owner and the payment of income in the form of dividends. Only regular distributions from the entrepreneurial income are recorded as property income either as dividends or withdrawals of income from quasi-corporations. Large and irregular payments, based on accumulated reserves or sale of assets are recorded as a withdrawal of equity.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Disposal of assets

22.137 The sale of non-financial assets owned by public corporations, such as buildings and land, does not by itself constitute privatization and is recorded in the capital account of the corporations sector as disposals of fixed assets or other non-financial assets. However, if the public corporation sells assets and then surrenders the proceeds of such a sale to general government, this is recorded as a withdrawal of government's equity in the corporation. A withdrawal of equity is also recorded if the public corporation disposes of a financial asset and surrenders the proceeds to government.

Acquisition of equity, capital transfers and subsidies

22.138 Subsidies are current transfers, usually made on a regular basis, from government to corporations designed to influence their levels of production, the prices at which their outputs are sold or the remuneration of the corporations. Payments to public corporations on a large and irregular basis (often called "capital injections" in the media) are not subsidies. They are treated as either a capital transfer or the acquisition of equity:

a. Payments to cover cumulated losses arising as a result of public policy purposes should be recorded as a capital transfer.

b. A payment made in a commercial or competitive context may be treated as an acquisition of equity. This should be limited to cases where the government is acting similarly to a private shareholder in that it has a valid expectation of a cash return in the form of future property income. In this case, the corporation will probably issue new shares to the government and enjoy a large degree of freedom over how the funds provided are used.

Treating the payments as the acquisition of equity depends on evidence of the corporation's profitability and its ability to pay dividends in future.

Privatization

22.139 Privatization is usually understood to consist of the sale of shares or other equity held by government in a public corporation to other units. Often these other units are outside the public sector but they need not be; for example, a public corporation may buy shares in a unit newly separated from government. Such sales are purely financial transactions, recorded in the financial account of the SNA. The assets owned by the public corporation continue to belong to the corporation; it is the ownership of the corporation itself, as represented by the ownership of the equity in it, that changes hands. In effect, the government's claim on the public corporation reduces because government exchanges shares or equity in the public corporation for cash or other financial assets. The cost of any financial services that government must purchase to achieve the sale are treated as an expense that should be recorded as intermediate consumption by general government in the SNA.

22.140 Privatization may be organized in more complicated institutional arrangements. For instance, some or all of the non-financial assets of a public corporation may be sold by a public holding company, or other public agency, controlled by a government and all or part of the proceeds paid to the government. In such cases, the public corporation will record the disposal of non-financial assets in the capital account, while the payment to the government of the proceeds from the sale is recorded as a withdrawal of equity.

22.141 The case where the privatization is arranged via a restructuring agency is discussed in paragraphs 22.47 to 22.50.

Nationalization

22.142 Nationalization is a process whereby government takes control of specific assets or an entire corporation, usually by acquiring the majority or the whole stake in the corporation. The recording of flows differs according to the way the government takes control.

a. *Appropriation or confiscation*: the change in ownership of assets is not the result of a transaction made by mutual agreement. There is no payment to the owners (or the compensation is not commensurate with the fair value of the assets). The difference between the market value of the assets acquired and any compensation provided is recorded as an uncompensated seizure in the other changes in the volume of assets account.

b. *Purchase of shares:* the government buys all or some of the shares in the corporation at a price that is the market price or very close to it. There is usually a legal context for the transaction which ensures that it is made by mutual agreement, even though the former owner may have little choice whether or not to accept the offer, or to negotiate the price. The purchase of shares is a financial transaction recorded in the financial account.

Bailouts

22.143 A bailout is a term meaning a rescue from financial distress. It is often used when a government unit provides either short-term financial assistance to a corporation to help it survive a period of financial difficulty or a more permanent injection of financial resources to help recapitalize the corporation. A bailout may in effect constitute another means of nationalization if the government acquires control of the corporation it is bailing out. Bailouts of financial institutions are particularly noteworthy. Bailouts are likely to involve highly publicized one-time transactions involving large amounts and are therefore easy to identify.

22.144 Intervention of general government may take various forms. For instance:

a. A government might provide equity financing on exceptionally favourable terms.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

b. A government might purchase assets from the enterprise to be assisted for prices greater than their true market value.

c. A government might create a special purpose entity or other type of public body to finance or to manage the sales of assets or liabilities of the enterprise to be assisted.

22.145 In most of these cases, the assistance provided by government to the unit suffering financial distress is recorded as a capital transfer. In determining the magnitude of the capital transfers, the following points need to be taken into account.

a. If the government buys assets from the enterprise to be assisted, the amount paid will normally be more than the true market price of the assets. The purchase of assets other than loans should be recorded at the actual market price and a capital transfer should be recorded for the difference between the market price and the total amount paid.

b. Governments often buy loans from financial institutions during a bailout. Unless a loan becomes tradeable and is traded with established market value, it is always recorded in the SNA at nominal value. Only if a market for the loans develops and the loans are regularly traded there are they reclassified as securities and recorded at market value.

c. When a government buys a loan at nominal value when the fair value is much less, no capital transfer for the difference in value is recorded. However, if there is reliable information that some loans are irrecoverable, their value is reduced to zero as an other volume change in the balance sheet of the corporation and a capital transfer should be recorded from government to the corporation for their former nominal value. If there is some possibility that some part of the loan may be recoverable in the future, the loans are reclassified (at their zero value) from the balance sheet of the corporation to that of the government at the time the capital transfer is recorded. If the value of the loans subsequently increases, this is shown as a revaluation item in the government's balance sheet.

d. As part of a bailout, government may extend the range of guarantees it is prepared to offer. These guarantees should be recorded as described above in paragraphs 22.126 to 22.130 according to whether this is a one-off guarantee or part of a standardized guarantee scheme.

22.146 If a public institutional unit is created by government simply to assume management of the bailout, the unit should be classified in the general government sector. If the new unit has other functions and the bailout is a temporary task, its classification as a government unit or a public corporation is made following the general rules as described in the section above on restructuring agencies. Units that purchase financial assets from distressed financial corporations with the objective of selling them in an orderly manner cannot be considered financial intermediaries. If the unit has been created by government for this specific task, it is classified in the general government sector.

Restructuring, mergers and reclassifications

22.147 When a public corporation is restructured, financial assets and liabilities may appear or disappear reflecting new financial relationships. These changes are recorded as changes in sector classification and structure in the other changes in the volume of assets account. An example of such a restructuring is when a corporation is split into two or more institutional units and new financial assets and liabilities are created.

22.148 The purchase of shares and other equity of a corporation as part of a merger, on the other hand, is to be recorded as a financial transaction between the purchasing corporation and the previous owner.

22.149 Any change in the classification of assets and liabilities not related to restructuring or changes in sector classification is recorded as a change in the classification of assets or liabilities in the other changes in the volume of assets account.

Transactions with the central bank

22.150 It is appropriate to begin by recalling the definition of the central bank and associated explanations from chapter 4. The central bank is the national financial institution that exercises control over key aspects of the financial system. In general, the following financial institutions are classified in this subsector:

a. The national central bank, including where it is part of a system of central banks; and

b. Currency boards or independent currency authorities that issue national currency that is fully backed by foreign exchange reserves.

c. Central monetary agencies of essentially public origin (for example, agencies managing foreign exchange or issuing bank notes and coin) that keep a complete set of accounts but are not classified as part of central government. Supervisory authorities that are separate institutional units are not included with the central bank but are included with financial auxiliaries.

As long as the central bank is a separate institutional unit, it is always allocated to the financial corporations sector even if it is primarily a non-market producer.

22.151 While the bank may be legally independent of government, it is charged with carrying out government policy under the legislation establishing it. The central bank is always treated as being controlled by government and is included in the financial corporations sector as a public corporation. It is the single exception to the rule that a unit whose output is primarily non-market is not to be classified as a corporation.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

22.152 Two types of payments by the central bank to the government require clarification:

a. Payments made on a regular basis, usually in the form of dividends, based on the current activity of the central bank (such as managing foreign exchange reserves). These payments are recorded as dividends so long as they are not abnormally higher than the sum of net interest and net commissions receivable by the bank. Amounts in excess of this sum are to be recorded as a withdrawal of equity.

b. Exceptional payments following sales or revaluation of reserve assets. These payments should be recorded as a withdrawal of equity. The rationale is that these assets are being managed as the economic property of the nation and not of the bank itself. Their valuation affects the equity liability of the central bank and the equity assets of the government. Holding gains on the reserve assets (assets of the central bank) have a counterpart in the equity liability of the central bank and the equity assets of the central government.

22.153 The measurement of output of the central bank is described in paragraphs 6.151to 6.156. As part of government policy, the central bank may pay interest on deposits at artificially high or low rates. The treatment of interest payments in this case is described in paragraphs 7.122 to 7.126

Public-private partnerships

22.154 Public-private partnerships are long-term contracts between two units, whereby one unit acquires or builds an asset or set of assets, operates it for period and then hands the asset over to a second unit. Such arrangements are usually between a private enterprise and government but other combinations are possible, with a public corporation as either party or a private NPI as the second party. These schemes are described variously as Public-Private Partnerships (PPPs), Private Finance Initiatives (PFIs), Build, Own, Operate, Transfer schemes (BOOTs) and so on. The basic principles of all are the same and are treated the same way in the SNA.

22.155 Governments engage in PPPs for a variety of reasons, including the hope that private management may lead to more efficient production and that access to a broader range of financial sources can be obtained. In the contract period the PPP contractor has the economic ownership. Once the contract period is over, the government has both economic and legal ownership. It is not easy to establish which unit is the legal owner of an asset during the contract period or how the implicit transactions when its economic ownership changes should be recorded. There may be an advance agreement on the timing of the transfer of economic ownership part way through the service lives of the assets, under agreed terms that do not reflect market prices of the assets. In consequence, some actual transactions may have to be partitioned to reveal their true economic character.

22.156 PPPs vary greatly. A general description that includes the most common arrangement is as follows. A private enterprise agrees to acquire a complex of fixed assets and then to use those assets together with other production inputs to produce services. Those services may be delivered to the government, either for use as an input to its own production (for example, motor vehicle maintenance services) or for distribution to the public without payment (for example, education services), in which case the government will make periodic payments during the contract period. The private enterprise expects to recover its costs and earn an adequate rate of return on its investment from those payments. Alternatively, the private enterprise may sell the services to the public (for example, a toll road), with the price regulated by the government but set at a level that the private enterprise expects will allow it to recover its costs and earn an adequate rate of return on its investment. At the end of the contract period, the government may gain legal and economic ownership of the assets, possibly without payment. There can be many variations in PPP contracts regarding the disposition of the assets at the end of the contract, the required operation and maintenance of the assets during the contract, the price, quality and volume of services produced and so forth.

22.157 The private enterprise is responsible for acquiring the fixed assets, although the acquisition is often aided by the backing of the government. The contract may require, however, that the assets meet the design, quality and capacity specified by the government, be used in the manner specified by the government to produce the services required by the contract and be maintained in accordance with standards specified by the government. Furthermore, the assets typically have service lives much longer than the contract period so that the government will control the assets, bear the risks and receive the rewards for a major portion of the assets' service lives. Thus, it frequently is not obvious whether the private enterprise or the government controls the assets over their service lives or will bear the majority of the risks and reap the majority of the rewards.

22.158 As with leases, the economic owner of the assets related to a PPP is determined by assessing which unit bears the majority of the risks and which unit is expected to receive a majority of the rewards of the assets. The factors that need to be considered in making this assessment can be broadly divided into two groups, those associated with acquiring the asset and those associated with using it in production. Some of the risks associated with acquiring the asset are:

a. The degree to which the government controls the design, quality, size and maintenance of the assets;

b. Construction risk, which includes the possibility of additional costs resulting from late delivery, not meeting specifications or building codes and environmental and other risks requiring payments to third parties.

Some of the risks associated with using the asset in production are:

a. Supply risk, which covers the degree to which the government is able to control the services produced, the units to which the services are provided and the prices of the services produced;

b. Demand risk, which includes the possibility that the demand for the services, either from government or

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

from the public at large in the case of a paying service is higher or lower than expected;

c. Residual value and obsolescence risk, which includes the risk that the value of the asset will differ from any price agreed for the transfer of the asset to government at the end of the contract period;

d. Availability risk, which includes the possibility of additional costs or the incurrence of penalties because the volume and/or quality of the services do not meet the standards specified in the contract.

22.159 The relative importance of each factor is likely to vary with each PPP. It is not possible to state prescriptive rules that will be applicable to every situation in a satisfactory way. The provisions of each PPP must be evaluated in order to decide which unit is the legal owner.

22.160 Likewise, the complexity and variety of PPP contracts preclude the enumeration of detailed rules governing the transactions to be recorded concerning the control and use of the assets. Instead, all of the facts and circumstances of each contract should be considered and then an accounting treatment should be selected that best brings out the underlying economic relationships. There are, however, a few common difficulties.

22.161 If the private enterprise is assessed as being the legal owner during the contract period and if, as usual, the government obtains legal and economic ownership at the end of the contract without an explicit payment, a transaction must be recorded for the government's acquisition of the assets. One general approach is for the government gradually to build up a financial claim and the private unit gradually to accrue a corresponding liability such that the value of both is expected to be equal to the residual value of the assets at the end of the contract period. Implementing this approach requires existing monetary transactions to be rearranged or new transactions to be constructed using assumptions about expected asset values and interest rates.

22.162 An alternative approach is to record the change of legal and economic ownership as a capital transfer. The capital transfer approach does not reflect the underlying economic reality as well, but data limitations, uncertainty about the expected residual value of the assets and contract provisions allowing various options to be exercised by either party could make recording a capital transfer acceptable on pragmatic grounds.

22.163 If the government is assessed as being the legal owner during the contract period but does not make any explicit payment at the beginning of the contract, a transaction must be imputed to cover the acquisition. The most common suggestion is that the acquisition be made via an imputed financial lease because of the similarity with actual financial leases. The implementation of that choice, however, depends on the specific contract provisions, how they are interpreted and possibly other factors. For example, a loan could be imputed and actual government payments to the private unit, if they exist, could be partitioned so that a portion of each payment represents repayment of the loan. If there are no actual government payments, then non-monetary transactions could be constructed for the loan payments.

E. The public sector presentation of statistics

22.164 As described in section B, the public sector includes all resident institutional units controlled directly or indirectly by resident government units. In other words, the public sector consists of all units of the general government sector plus all resident public corporations.

22.165 Statistics for the public sector can be presented both within the sequence of accounts for institutional units and sectors or within the same government finance framework as described in section C of this chapter, depending on the use to be made of the statistics.

22.166 With either method of presentation, it is useful to show both subsectors of the public sector and the entire public sector, with the total public sector statistics shown both unconsolidated and consolidated. For example, one column might have the statistics for the general government sector, a second column for the aggregate of all public corporations and a third column would have the unconsolidated totals for the entire public sector. Depending on the flows involved, a fourth column could show the amounts to be eliminated by consolidation and a fifth column could show the consolidated totals for the entire public sector.

22.167 Not all flows need to be consolidated for the public sector. Because the public sector is a mixture of market and non-market producers, most components of revenue and expense will have limited economic meaning for the public sector. Elements of the financial account and the balance sheet are the most likely candidates to be consolidated.

22.168 The same balancing items as stressed for the general government sector are likely to be important for the public sector. The public sector net operating balance (or saving in the sequence of accounts) will indicate trends in net worth resulting from the public sector's current operations. This is particularly useful if there are public corporations operating at significant losses.

22.169 Net lending or net borrowing for the total public sector is known as the public sector borrowing requirement. Net lending indicates the net financing supplied to either the rest of the economy or the rest of the world; net borrowing indicates net financing obtained by the public sector from either the rest of the economy or the rest of the world.

22.170 The balance sheet provides information of net worth, determined as the value of total assets less total liabilities,

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

and financial net worth, determined as the difference between the value of total financial assets and the total liabilities. The latter is often cited because of the public sector's influence on the financial system and because it is often difficult to value government-unique non-financial assets.

Chapter 23: Non-profit institutions

A. Introduction

1. Non-profit institutions in the SNA

23.1 Non-profit institutions (NPIs) play a somewhat unusual role in the SNA. Like corporations, some NPIs produce goods and services for sale with the intention to cover costs, that is to say as market production. In common with other market producers, they cannot undertake final consumption. Like government units, some NPIs are non-market producers and make their output available free or at prices that are not economically significant to individual households or the community at large. Some of these non-market NPIs are controlled by government and included in the general government sector but those that are not are grouped in their own sector, the non-profit institutions serving households (NPISHs).

23.2 Most NPIs are separately identified institutional units. That is, they are capable in their own right of owning assets, incurring liabilities and engaging in economic activities and in transactions with other entities. It follows that a complete set of accounts for the unit, including a balance sheet of assets and liabilities, exists or could be constructed if required. In some countries, especially developing countries, an NPI may be an informal entity whose existence is recognized by society but does not have any legal status.

23.3 The distinguishing feature that identifies an NPI is that its status does not permit it to be a source of income, profit or other financial gain for the units that establish, control or finance it. An NPI may make a profit, it may be exempt from taxes, it may have a charitable purpose but none of these are determining characteristics. The only essential criterion for a unit to be treated as an NPI is that it may not be a source of income, profit or financial gain to its owners.

23.4 All NPIs produce goods and services, most often services, intended for consumption by households or by corporations. Some NPIs produce services for corporations typically charging fees (sometimes described as subscriptions) intended to cover costs. They are often set up as associations that provide services exclusively to members. The level of fees charged, the price of membership, typically satisfies the SNA criteria of economically significant prices. For this reason these NPIs are allocated to the corporations sectors. An example of an NPI serving corporations is a trade association.

23.5 An NPI may be controlled by government in that government may appoint its officers and determine the objectives of the institution. It is treated as an institutional unit separate from government because it has independent control of its budget (even if much or all of the funding comes from government) but it is allocated to the general government institutional sector. Such institutions provide individual and collective services. An example is a research institute controlled by government.

23.6 Other NPIs exist to provide goods and services to households either in return for a fee or free. When fees are charged, these may or may not cover a large proportion of the NPI's costs and therefore may or may not be deemed to be economically significant prices. When the fees charged are regarded as being economically significant, the NPIs concerned are treated as providing market services and are allocated to the corporations sectors. Otherwise the NPIs fall into the institutional sector of NPISHs.

23.7 Thus it is possible to categorize NPIs as follows:

a. those providing services to corporations whose output is sold to the corporations concerned and treated as intermediate consumption;

b. those that are controlled by government and provide individual or collective services on a non-market basis;

c. those providing goods and services to households, divided between:

· those that provide goods and services to individual households at economically significant prices;

· those providing services to individual households free or at prices that are not economically significant;

· those that provide collective services free or at prices that are not economically significant.

23.8 Those NPIs that fall under the first bullet point in category (c) are allocated to the corporations sectors and expenditure on their output is treated as final consumption expenditure by households. Those that fall under the second bullet point under (c) are allocated to the NPISH sector and their output is treated as actual final consumption of households delivered as social transfers in kind. Those that fall under the third bullet point under (c) are allocated to the NPISH sector but their output remains as actual final consumption of NPISHs.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

23.9 There are thus a number of sectors where NPIs appear in the SNA; in both the financial and non-financial corporations sectors, in the general government sector and in the separate sector of NPISHs. Subsectors of the first three sectors are established to contain NPIs only. Those NPIs in the corporations sectors may be further subdivided to show those that are foreign controlled, those that are publicly controlled and those that are subject to national private control. The NPIs in the general government sector may be subdivided by level of government; central, state and local government. NPISHs may be divided between those that are foreign controlled and those subject to national private control.

2. The accounting rules for NPIs in the SNA

23.10 The output of NPIs is valued in the same way as for all institutional units. If the unit is a non-market producer, output is valued at the sum of costs, including consumption of fixed capital but excluding a return to capital. If the unit is a market producer, output is measured by sales adjusted for changes in inventories and any production for own capital formation. For some NPIs that cover a large proportion but not all their costs from sales, this will leave the unit with negative operating surplus. This is covered by donations (current transfers).

3. A satellite account for NPIs

23.11 For some time, there has been growing interest in studying the contribution to the economy of institutions such as NPIs because they are seen to constitute a significant presence of growing economic and policy interest. Such institutions are variously referred to as "non-profit", "voluntary", "civil society" or "non-governmental" organizations and collectively as the "third", "voluntary", "non-profit" or "independent" sector. Such institutions attract interest because their operating characteristics are somewhat different from those of other units in the corporations and government sectors. Specifically:

a. They are not permitted to distribute profits;

b. They may produce public goods as well as private goods;

c. They may receive as much or more from current transfers as they receive from selling their output;

d. They may depend on volunteer labour as well as paid labour;

e. Because they cannot pay dividends, they cannot attract equity capital in competition with corporations;

f. They may be eligible for special tax advantages in many countries;

g. They typically have special legal provisions covering the governance, reporting requirements, political participation and so on;

h. Although they provide public goods and services, they do not have the same powers or restrictions as government in deciding what these goods and services should be and how they should be allocated.

23.12 Arising out of this interest, a satellite account for NPIs has been developed as described in the *Handbook on Non-Profit Institutions in the System of National Accounts* (United Nations, 2003). Sections B and C describe the essential features of this satellite account. Section D discusses some other aspects of NPIs that it may be desirable to explore in addition to the satellite account.

B. The units included in the NPI satellite account

23.13 The starting point for the satellite account is to identify the units of interest. As will be seen, the units chosen coincide largely (but not quite entirely) with the units described as NPIs in the SNA. One way of approaching a satellite account, therefore, would be to consider compiling the complete sequence of accounts for a sector made up of the subsectors of NPIs in the non-financial corporations sector, the financial corporations sector, the general government sector and NPISHs. However, because many of those interested in accounts for NPIs only do not come from an SNA background, the handbook starts by identifying characteristics of the units of interest.

1. Determining characteristics of units for the satellite account

23.14 Various alternative concepts have been put forward around which a satellite account for non-profit institutions could be formulated.

23.15 The first of these is the concept of the "social economy" which depicts non-governmental institutions with a social or collective purpose. Typically mutual societies, cooperatives and associations would be included.

23.16 The second concept is of "public benefit" organizations. This typically covers a narrower range of institutions that serve a broad public purpose and excludes institutions that serve only their own members.

23.17 In between these two is the concept of the non-profit sector on the lines initially pioneered by the Johns Hopkins Comparative Non-Profit Sector Project. In this project a definition of the non-profit units was elaborated along structural-operational lines. The requirements for inclusion are the following:

a. organizations should exist as identifiable institutions;

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

b. They should be institutionally separate from government;

c. They do not distribute profits;

d. They are self-governing, that is to say they are not subject to control from other units;

e. Membership of the unit is neither obligatory nor automatic but involves some degree of voluntary participation.

23.18 The main exclusions from the set of NPIs recognized in the SNA are those NPIs allocated to the general government sector because, although they are institutionally separate from government, they are controlled by government units. There are a small number of informal, usually temporary, NPIs that may be excluded also. These are discussed in section D.

2. Examples of units included

23.19 The following are illustrative examples of the kinds of entities that are likely to be found within the "non-profit sector" for the purposes of the NPI satellite account:

a. *Non-profit service providers*, such as hospitals, higher education institutions, day-care centres, schools, social service providers and environmental groups;

b. *Non-governmental organizations* promoting economic development or poverty reduction in less developed areas;

c. *Arts and culture organizations*, including museums, performing arts centres, orchestras, ensembles and historical or literary societies;

d. *Sports clubs* involved in amateur sport, training, physical fitness and competitions;

e. *Advocacy groups* that work to promote civil and other rights, or advocate the social and political interests of general or special constituencies;

f. *Foundations*, that is, entities that have at their disposal assets or an endowment and, using the income generated by those assets, either make grants to other organizations or carry out their own projects and programs;

g. *Community-based or grass-roots associations* that are member-based and offer services to or advocate for members of a particular neighbourhood, community or village;

h. *Political parties* that support the placing of particular candidates into political office;

i. *Social clubs*, including touring clubs and country clubs, that provide services and recreational opportunities to individual members and communities;

j. *Unions, business and professional associations* that promote and safeguard labour, business or professional interests;

k. *Religious congregations*, such as parishes, synagogues, mosques, temples and shrines, which promote religious beliefs and administer religious services and rituals. However, an official state church incorporated into the state administration, particularly one supported by obligatory taxes, would not meet the "institutionally separate from government" criterion and thus would be excluded from the set of NPIs in the satellite account. It should be noted that religious congregations are different from religiously affiliated service agencies in such fields as health, education and social services. Similarly, service organizations related to a state church might still be considered to be within the non-profit sector, as long as they are separate institutional units and meet all the definitional criteria.

Both market and non-market units should be included in each of these categories, so long as the institution concerned is an NPI (and not just an NPISH).

3. Borderline cases

23.20 Certain other types of organizations are likely to occupy a grey area between the non-profit sector and either the corporations or government sectors. Some of those entities will properly belong within the non-profit sector for purposes of the NPI satellite account, while others will not. The following guidelines may be helpful for making those decisions. (Obviously, these guidelines will have to be applied to types of organizations and not on an organization-by-organization basis, but the decision rules can still be instructive.) The guidelines given here are those of the handbook, slightly modified in the light of experience with implementing the accounts. It is proposed that the modifications included here will be incorporated into the next edition of the handbook.

23.21 *Cooperatives* are organizations formed freely by individuals to pursue the economic interests of their members. The basic principles of cooperatives include:

a. democratic control, that is, one person, one vote;

b. shared identity, that is members are both owners and customers; and

c. orientation to provide services to members "at cost".

As with other institutional units, if the articles of association of a cooperative prevent it from distributing its profit, then it will be treated as an NPI; if it can distribute its profit to its members, it is not an NPI (in either the SNA or the satellite account).

23.22 *Mutual societies* include such organizations as mutual savings banks, savings and loan associations, mutual insurance companies, sickness and burial funds. Mutual societies, like cooperatives, are organized by individuals seeking to improve their economic situation through collective activity. They differ from cooperatives, however,

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

in that they are mechanisms for sharing risk, either personal or property, through periodic contributions to a common fund. Normally the depositors in mutual societies formally control their operations.

23.23 Because mutual societies operate in the commercial sphere, they fall in the financial corporations sector. Only if their articles of association prevent them from distributing profits to their owners are they treated as NPIs in the SNA (but still within the financial corporations sector) and included within the NPI sector for the satellite account.

23.24 *Self-help groups* are similar to both cooperatives and mutual societies in that individuals join to accomplish goals of mutual support that would be unattainable on an individual level. They differ from both, however, in that they are not principally engaged in commercial activities. As a general rule, self-help groups should be treated as membership organizations and included within the non-profit sector.

23.25 S*ocial ventures* are enterprises organized for the purpose of employing and training disadvantaged individuals (handicapped, long-term unemployed, etc.) who would otherwise not find employment. The enterprise is considered an NPI unless it generates and distributes its surplus to owners or stockholders.

23.26 *Quasi-non-governmental organizations*, which are found in many European countries and elsewhere, are designed to function at arm's length from government departments, thus avoiding direct political control. To the extent that they are truly self-governing entities, they are appropriately considered part of the non-profit sector, even if they exercise the limited authority delegated to them by government agencies.

23.27 *Universities*, like other institutions, can be either NPIs, public institutions or for-profit corporations. Differentiating NPIs from public institutions is especially difficult since both may receive significant amounts of government support, either directly or indirectly, and since even public institutions may have a significant degree of autonomy. The key, therefore, is whether the institution is clearly self-governing and not part of the government's administrative system. Educational institutions that are NPIs will have their own self-perpetuating boards that can determine all facets of organizational operations, without approval by government officials, and that can cease their operations without the approval of government authorities. Public educational institutions will have boards selected in significant part by government officials or agencies and lack the power to cease operations without an act of the government.

23.28 *Hospitals*, like educational institutions, can also be either NPIs, public institutions or for-profit corporations. The same rules that apply to educational institutions also apply to hospitals.

23.29 *Indigenous or territorial groups*, such as "band councils" in Canada (a form of First Nation government) and peasant or native communities in Peru, are organized around either cultural or ethnic groupings or a particular geographic area, mainly with the purpose of improving the welfare of their members. The difficulty arises when such groups essentially operate as local governments, often making and enforcing their own laws. When that is the case, the groups do not meet the "institutionally separate from government" criterion and fall outside the boundaries of the NPI satellite account.

4. Classification of NPIs

23.30 NPIs can be classified according to the activity they undertake or the purpose for which they are envisaged. In terms of activity, the normal classification to be used would be *ISIC*. Because the detail available in *ISIC*, Rev. 3 for many of the social services covered by NPI was not sufficient, an elaboration of the basic *ISIC* codes was developed for use in conjunction with the NPI satellite account. This classification is known as the International Classification of Non-Profit Organizations (ICNPO). Similarly some elaboration of the classification of NPIs by purpose (COPNI) was developed. In *ISIC*, Rev. 4, however, an alternative aggregation for data reporting for non-profit institutions is given in part four, section D. The twelve main headings of interest are shown in table 23.1.

Table 23.1:ICNPO groups

Group	
1.	Culture and recreation
2.	Education and research
3.	Health
4.	Social services
5.	Environment
6	Development and housing
7.	Law, advocacy and politics
8.	Philanthropic intermediaries and voluntarism promotion
9.	International
10.	Religion
11.	Business and professional associations, unions
12.	Not elsewhere classified

C. Accounts for non-profit institutions in the satellite account

23.31 The first set of accounts prepared in the satellite account corresponds exactly to those in the SNA sequence of accounts. Indeed this can be seen as a simple aggregation across the subsectors for NPIs in the corporations sectors plus NPISHs. NPIs in the general government sector are excluded from the satellite account as noted above.

23.32 The second version of the accounts is to consider those NPIs that provide services at economically significant prices but where the sales of their output bring in revenue that is significant but less than the whole of their costs. Two possible scenarios exist. The first is that the enterprise undertakes different types of activities, some on a market basis and some on a non-market basis but with the market basis activities predominating. Although the two types of activity cannot be allocated to separate institutional units, separate establishments for each can be distinguished. In principle, the production account of the establishments undertaking market activities should be compiled as normal but the production account for the non-market establishments should be based on the sum of costs. The value of this output should be treated as distributed to households as social transfers in kind and added to household actual final consumption.

23.33 The second possibility is that only one sort of activity is undertaken but the sales cover a large part of the costs with the balance being made up of donations. The donations are treated in the SNA as current transfers (any donations designated for capital purposes being treated as capital transfers). The satellite account treats these donations as analogous to subsidies and so measures the value of the output as the total sum of costs. In this case, the excess of output measured in this way over the proceeds from sales is treated as non-market output, social transfers in kind and part of actual consumption of households.

23.34 The third variant on the accounts builds on the second version of the accounts by also including an estimate of the value of volunteer labour used in the NPIs. Volunteer labour constitutes a significant input to many NPIs. If a value is placed on this, it may exceed the value of monetary donations to some NPIs. In the satellite account, it is recommended that the value of voluntary labour is estimated on the basis of the remuneration rates of employees undertaking similar work and not at the opportunity cost of the volunteers.

23.35 Work is proceeding on the measurement of volunteer labour in the context of a satellite account. A draft *Manual on the Measurement of Volunteer Work* (International Labour Organization, forthcoming) was presented to the ICLS in December 2008.

23.36 The cost of the volunteer labour is treated as both part of compensation of employees and as a transfer back from these employees to the NPI where they work. The value of the output of the NPI, and the amount treated as social transfers in kind, is increased over the amount in the second version of the accounts by the estimated value of the volunteer labour.

23.37 The satellite account includes other tables apart from the sequence of accounts. One of these is to show details of revenue received with a breakdown by sector of origin and type of transaction. In particular, it is recommended to distinguish revenue coming from government split between sales and grants, and that coming from the rest of the domestic economy split between private sales and current transfers (donations). Where possible both sales and transfers should be separated into those coming from the domestic economy and from the rest of the world.

23.38 Another table includes information in physical units such as the number of employees, number of volunteers, number of entities and number of members of the organization. In addition some information is given on the financial account and the assets held by the NPI.

23.39 Fully annotated descriptions of the tables are included in the handbook on the satellite account.

D. Other SNA considerations concerning NPIs

1. NPISHs and government

23.40 In some countries, NPISHs take responsibility for the provision of specific services to households that the government does not see as part of its role to provide. In others, especially developing countries, NPISHs may provide services government would like to provide but simply does not have sufficient resources to do so. This becomes very clear following a natural disaster when NPISHs may be very active in relief work.

23.41 Whether the unit undertaking the work is resident or not will depend on the normal rules concerning residence. Quick response actions that do not lead to long-term involvement in the country being assisted will be regarded as non-resident with the production being recorded in the home countries of the units giving assistance and the assistance itself being shown as imports of goods and services funded by transfers. If the assistance extends beyond one year, the unit providing the assistance will be regarded as resident and a unit in the NPISH sector of the country receiving the assistance. In circumstances where international relief is important, it may be helpful to identify NPISHs subject to foreign control separately from other NPISHs and to identify donations from abroad for all NPISHs.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

2. Informal and temporary NPISHs

23.42 Quite frequently, a number of households may get together to pool resources of knowledge and volunteer labour to serve their local community. This could include teaching in informal schools, offering medical assistance or the construction of roads, a well, a school building, etc. When only services are provided on the basis of volunteer labour, no value for the output of the activity is recorded in the SNA.

23.43 When physical structures result, the activity is included in the production boundary. The value of the output is estimated by comparison with similar products elsewhere in the economy or, when it has to be estimated at the sum of costs, an estimate is made for the implicit value of the labour input. This labour input is treated as gross mixed income accruing to households who then are assumed to "purchase" the product. In fact they may then transfer the product to another unit, often government, for maintenance. However, the recommendation in the SNA, as described in paragraph 4.168, is that such organizations should be treated as informal partnerships rather than as NPISHs.

23.44 If a group of households cooperates to produce goods for sale, even if the objective is still to be able to pay for work on a communal asset, this is not treated as a non-profit institution but as an unincorporated enterprise in the household sector.

23.45 Many small groups of individuals or households may exist as a practical means of allocating shared costs. These may be as simple as a "coffee club" at the workplace or may be a more formal arrangement whereby the costs of common services provided to all tenants in a block of flats are shared equitably. Such groups are practical rather than economic. They are not treated as NPIs and their activities are not recorded in the SNA. Such costs as they incur should be recorded as paid by the units to which the costs are eventually allocated.

23.46 In the case of microfinance, the unit providing the service is most likely to be either a corporation or an unincorporated enterprise. Even though the owner of the enterprise may not keep the profits but uses them to generate new loans, this does not automatically make the unit an NPI. The definition of an NPI is not that the owners choose not to withdraw profits but that they are not legally entitled to do so.

23.47 In practice it may be difficult to compile information on informal NPISHs unless the results are sufficiently important to come to general attention.

3. The output of NPISHs

23.48 NPISHs produce goods and services, but typically services, that are provided to individual households free or at prices that are not economically significant. However it is possible conceptually for an NPISH to provide collective services. An example may be a well-financed institution that engages in research and development but makes its results freely available. Such an institution is engaged in non-market production but, because it is not controlled by government, it falls in the NPISH sector. The value of its output is treated as final consumption expenditure and actual final consumption by the NPISH itself.

23.49 The services provided by non-profit institutions serving households are not only very similar to those provided by government. They present much the same difficulties of measuring their output and of selecting suitable price indices for deflating output to volume terms.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Chapter 24: The households sector

A. Introduction

24.1 The economy functions because people want goods and services and are prepared to work to obtain them. At the most basic level there is subsistence activity where people work to grow food to eat. Any sort of development gives opportunities to earn money by working for others and using it to buy goods and services different from those one's labour has created.

24.2 In addition society recognizes that some individuals cannot participate in the economy in this way and so makes transfers available to the young, the old and the sick, for example. Often these transfers are undertaken by government which redistributes income on behalf of the community at large. In addition, transfers may be made by non-profit institutions or by extended family members, or others, based on traditional and cultural norms. Some individuals do not spend all their income but use some to acquire wealth.

24.3 Lastly there is income arising from the ownership of wealth. At its simplest, wealth is due to the accumulation of income earned in earlier periods (possibly generations earlier). Wealth gives rise to income because others wish to make use of it and pay to do so. In the SNA such payments are called property income. Like income, wealth may be transferred from one owner to another.

24.4 The SNA gives a clear and full accounting of all income accruing to households in the period itemized by type of income. It also accounts clearly for how this income is spent on goods and services, transferred to others or used to acquire more wealth. However, while the sequence of accounts ensures that the accounts of all households are balanced it does not show how this balance is achieved for subsets of households.

24.5 This chapter is about how to use information from the SNA on the households sector in conjunction with other data sources to investigate the behaviour of households in greater detail. The focus here is on how income is used, how the patterns of income and use vary across subsectors and about the links between income and wealth at a detailed level. Such a focus is of both analytical and policy interest. It is a quite different view of economic behaviour from the predominant view of the SNA which is how income is generated.

1. Unincorporated enterprises

24.6 All households undertake final consumption and all to a greater or lesser extent undertake accumulation but a household does not necessarily undertake production. To the extent possible, the production activities within households are treated as quasi-corporations, included in one of the corporations sectors and separated from the rest of the household. However, as explained in paragraphs 4.155 to 4.157 a quasi-corporation can only be created when a full set of accounts, including balance sheet entries and information about withdrawals of income from the quasi-corporation, is available. Very frequently, and especially so in the case of a professional working alone, there may be complete information available on the production activities but it may not be possible to separate out other income flows, transfers and financial transactions relating to the production activity from those for the household in general. In this case as well as in ones where even the information on the production activity is incomplete, an unincorporated enterprise remains as part of the household.

24.7 Even when a quasi-corporation can be created and removed from the rest of the household accounts, the household may still include an unincorporated enterprise relating to other activity. For example, within a given household one person may be able to separate off the activities repairing vehicles but another may not be able to separate the activities providing food for sale from the rest of the household activities. Moreover, many households without any other production activities will contain unincorporated enterprises providing housing services from owner-occupied dwellings and from employing domestic staff.

24.8 Just as there may be production undertaken within the households sector, there may be people providing labour to these unincorporated enterprises. Members of the household who work in the unincorporated enterprise are called self-employed and their remuneration is termed mixed income rather than compensation of employees. Individuals who are not members of the household who are employed in an unincorporated enterprise are employees. It is possible but not always likely that the enterprise pays for social security for these people. It is possible but even less likely that the household may offer other social insurance benefits to their employees.

24.9 There is further discussion about employment within households in chapters 19 and 25.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

2. The problems associated with subsectoring households

24.10 The difficulty in disaggregating the households sector arises for a number of reasons.

a. The first is that income is earned by individuals but consumption is undertaken by households.

b. The second is that it is difficult to find a basis for subsectoring households such that the households in each subsector behave in a similar fashion to one another. Even if their income patterns are broadly similar, their expenditure patterns may differ according to the number and age of the members of the households. Grouping by the latter may give no similarity in the level of income.

c. The third reason concerns the source of data on household income and expenditure. Typically, information on corporations comes from establishment surveys and information on government comes from administrative sources. These sources are fairly comprehensive and are in large part the only source, or at least the primary source, for the data to feed into the SNA. Data for households comes from household income and expenditure surveys but these surveys are based on smaller samples, may be less frequent than establishment surveys and the data from them may be difficult to reconcile with the totals for income and expenditure that emerge from the accounting constraints in the SNA.

3. Structure of the chapter

24.11 The households sector may be viewed in a number of different ways depending on whether the interest is primarily on what sort of production households undertake, what sort of income they earn or what patterns of consumption are portrayed. Given these different perspectives, it is not easy to come up with a single definitive set of subsectors for households. The conceptual and practical reasons for the difficulties are reviewed in section B. A review of possible subsectors is given in section C. The next three sections (D, E and F) in turn look at households as producers, households as consumers and household income. The last section, section G looks at household wealth and associated income flows.

B. Household composition and sectoring

1. Definition of a household.

24.12 It is useful to begin by recalling the definition of the household given in paragraphs 4.149 to 4.157. ***A household is defined as a group of persons who share the same living accommodation, who pool some, or all, of their income and wealth and who consume certain types of goods and services collectively, mainly housing and food.*** In general, each member of a household should have some claim upon the collective resources of the household. At least some decisions affecting consumption or other economic activities must be taken for the household as a whole.

24.13 Households often coincide with families, but members of the same household do not necessarily have to belong to the same family so long as there is some sharing of resources and consumption. Households may be of any size and take a wide variety of different forms in different societies or cultures depending on tradition, religion, education, climate, geography, history and other socio-economic factors. The definition of a household that is adopted by survey statisticians familiar with the socio-economic conditions within a given country is likely to approximate closely to the concept of a household as defined in the SNA, although survey statisticians may add more precise, or operational, criteria within a particular country.

24.14 Domestic staff who live on the same premises as their employer do not form part of their employer's household even though they may be provided with accommodation and meals as remuneration in kind. Paid domestic employees have no claim upon the collective resources of their employers' households and the accommodation and food they consume are not included with their employers' consumption. They should therefore be treated as belonging to separate households from their employers.

24.15 Persons living permanently in an institution, or who may be expected to reside in an institution for a very long, or indefinite, period of time are treated as belonging to a single institutional household when they have little or no autonomy of action or decision in economic matters. Some examples of persons belonging to institutional households are the following:

a. Members of religious orders living in monasteries, convents or similar institutions;

b. Long-term patients in hospitals, including mental hospitals;

c. Prisoners serving long sentences;

d. Old persons living permanently in retirement homes.

24.16 On the other hand, persons who enter hospitals, clinics, convalescent homes, religious retreats, or similar institutions for short periods, who attend residential schools, colleges or universities, or who serve short prison sentences should be treated as members of the individual households to which they normally belong.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

2. Residence

24.17 All households are resident in the economy but of increasing interest is the phenomenon of a person abroad, often but not necessarily a family member, who remits significant amounts to the family in the domestic economy. (The same phenomenon also exists within a country, between urban and rural areas, for example.) The aspect of people moving abroad in response to better employment prospects may be seen as another facet of globalization and one that deserves to be monitored.

3. Determining subsectors

24.18 As noted in the introduction, the difficulty in disaggregating the households sector arises for a number of reasons. The first is that income is earned by individuals but consumption is undertaken by households. While all households contain all individuals, it is very difficult to associate particular income recipients with particular household groups. It is possible to have one table showing the types of income earned and the types of individuals receiving them. It is also possible to have a table of types of households and the pattern of household consumption of each. Only in the highly stylized situation of one income earner only per household (and only one source of income) can the type of income be matched with the type of household and even then only if households are categorized according to the type of income. The problem could be compared to that of the supply and use tables but whereas it is possible to establish which industries make which products, there is no natural relationship between individuals as income recipients and the household to which they belong when households are grouped by any criterion other than main income source.

24.19 The problem of trying to link income flows from the SNA with a desirable set of household characteristics is one of the most difficult aspects of building a social accounting matrix. Very often it is necessary to revert to modelling to reconcile income related to individuals to consumption related to households.

24.20 The second problem is related to the homogeneity of households. Various criteria may be used to disaggregate the sector (discussed in section C) but whatever criterion is used it is difficult to assert that the behaviour of the sample is typical of the whole. This is a difficulty not normally encountered in industrial classifications and surveys. For example, if a survey covers 50 per cent of firms in a given industry it is probably reasonable to suppose that the pattern of expenditure is typical of the whole. If an enterprise doubles its turnover, the level of intermediate consumption will probably approximately double but its composition may not alter significantly. Such assumptions are very suspect in the case of household groups. This is another area where it may be difficult to use a social accounting matrix for analysis without having further recourse to modelling, this time to determine how groups of households react to different stimuli.

24.21 The information for the corporations sectors derives from surveys. The household aggregates of income and expenditure are known from the accounting identities in the sequence of accounts. While it is true that information from household surveys may sometimes reveal errors in industry data or vice versa it is more problematical to take information from household surveys on, say, expenditure patterns of one group of households and suppose all other members of the group behave in the same way. For this reason a household income and expenditure survey is often reported as a freestanding exercise and integration with the national accounts totals is not as frequently part of compiling the full set of national accounts as is the case with establishment surveys. In order to explore why this may be so, it is useful to look briefly at some of the problems experienced with household surveys.

4. Household surveys

24.22 Any attempt to disaggregate the households sector is likely to be dependent on a household income and expenditure survey. The conventions adopted by survey statisticians and those of national accountants are not always the same. A household expenditure survey for example may not include estimates of imputed rental of owner-occupied dwellings or own account production. It may measure income after tax and measure expenditure on a cash and not on an accrual basis. Various publications have been prepared to examine such differences and make recommendations on how to reconcile survey data with national accounts requirements. Particularly relevant is the *Final Report and Recommendations of the Expert Group on Household Income Statistics* (Canberra group, 2001) and *Household Income and Expenditure* (International Labour Organization, 2003).

24.23 A major problem with household surveys is that it is very common for respondents to underestimate or underreport their income. This may be deliberate or may simply be a lack of understanding of what should be included or simple forgetfulness.

24.24 Similarly some items of consumption are regularly underreported, most notably expenditure on alcohol and tobacco. On the other hand, consumption of some items is over-reported. For example, if a survey asks for expenditure on durables based on the recall of the respondent of what has been spent over the last two or three years, people often underestimate how long it is since purchases were made and will report more expenditure in this period than has actually been the case. This phenomenon does not only apply to very large items of expenditure; it is reported that household surveys have suggested that the purchase of toothbrushes, for example, is many times higher than in the sales reported by shops.

24.25 The problem of non-response is a concern in household surveys since it is quite likely that some of the households that refuse to respond have income and expenditure patterns that are different from respondents. For example people with incomes arising from illegal activities may be very reluctant to supply information and may choose not to participate in the survey. Similarly it is common for households at the very top and very bottom of the distribution to be omitted from the survey either by design or on the grounds of practicality.

24.26 Household surveys may be designed to investigate particular phenomena that are not necessarily the primary

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

interest for national accounts. For example, they may be restricted to low income earners in urban areas. While this information is highly valuable and useful it is not sufficient to produce aggregate figures for national accounts. Sometimes even if the coverage is more comprehensive, the sample size may not be such as to allow disaggregation along the lines desirable within the national accounts. It is important to realize that a desired pattern of subsectoring should be determined before the survey is undertaken to ensure the desired characteristics will be adequately represented in the survey sample.

C. Subsectoring households

1. The production perspective

24.27 A first consideration is to investigate the possibility of subsectoring households according to their involvement in production. This may be done following the pattern shown in chapter 25 to identify informal and other production activity undertaken by households.

24.28 The first division is to separate institutional households and those households that do encompass an unincorporated enterprise from those that do not. Thereafter it is straightforward to identify those households whose only productive activity is connected with the owner occupation of houses or the employment of domestic staff. The households that are left may be further divided between those that employ staff to work in their unincorporated enterprises and those that do not. As described in the chapter on the informal sector, when proceeding along these lines it is sometimes desirable to identify the type of activity of an unincorporated enterprise, in particular identifying agricultural activity separately from other types of activity.

24.29 Within the SNA, all household enterprises that can be treated as quasi-corporations because they have complete sets of accounts showing their ownership of assets (separately from those of the household to which they belong) and the withdrawal of income to their owners are classified in one of the corporations sectors. The number of household enterprises that can be treated as quasi-corporations, and thus removed from the households sector, varies considerably from country to country depending on the availability of accounting information and the resources available to identify such enterprises and treat them as quasi-corporations.

24.30 Although it is possible to identify households that only have owner-occupied housing as their unincorporated enterprise, in many cases other unincorporated enterprises will undertake owner occupation of their houses as well. While from a production point of view it is possible to separate the different types of production activities, for the institutional unit as a whole it is not possible to make this separation.

24.31 In most countries, many households do not have unincorporated enterprises, so when subsectoring is done according to production undertaken by households, those without unincorporated enterprises are grouped together in a single subsector. The only common factor these households share is that they do not have an unincorporated enterprise. Thus while subsectoring households according to production is useful in some circumstances it has its limitations in terms of identifying the role of different types of households in the economy.

2. The consumption perspective

24.32 It is widely observed that as household income rises so the pattern of consumption changes. The proportion of expenditure devoted to food and other necessities declines as more income is available and is devoted to more luxury goods. Thus one approach to disaggregating households according to consumption patterns is in fact to disaggregate by level of income, assuming this captures the difference in consumption patterns. Studies showing consumption patterns according to income deciles are quite common and give interesting information about how patterns of consumption change as the overall level of income increases.

24.33 The question arises of how household consumption patterns may relate to incomes of individuals. There is no obvious way to identify how recipients of income fall into one or other income decile when these deciles are calculated on a household basis. Households with a high income may result from one very well-paid worker or from a number of middle income earners. Further, although the production account shows total compensation of employees and it may be possible to compare this to the total number of employees, this gives no information about the distribution of income across the labour force in the enterprise.

24.34 Not all income comes from compensation of employees and the effect on total household consumption of other sources of income is equally uncertain.

24.35 Using the level of household income as a proxy for consumption patterns has some significant problems. One possible disaggregation of households where consumption patterns might be significantly different would be according to whether the household includes children and, where it does not, whether the household is relatively young (and may be setting up home for the first time) or relatively old (where expenditure on consumer durables may be lower than for other groups). However, here again there is no easy way to link the source of the income with the type of the household in which the income recipient resides.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

3. The income perspective

24.36 A more promising approach to subsectoring appears to come from considering not the level of income but the type of income. As proposed in chapter 4, the following scheme might be considered.

24.37 Households may be grouped into subsectors according to the nature of their largest source of income. For this purpose, the following types of household income need to be distinguished:

a. Income accruing to the owners of household unincorporated enterprises with paid employees (employers' mixed income);

b. Incomes accruing to the owners of household unincorporated enterprises without paid employees (own-account workers mixed income);

c. Compensation of employees;

d. Property and transfer incomes.

24.38 Households are allocated to subsectors according to which of the four categories of income listed above is the largest for the household as a whole, even if it does not always account for more than half of total household income. When more than one income of a given category is received within the same household, for example, because more than one member of the household earns compensation of employees or because more than one property or transfer income is received, the classification should be based on the total household income within each category. The four subsectors are described as follows:

a. Employers;

b. Own-account workers;

c. Employees;

d. Recipients of property and transfer incomes.

24.39 The fourth subsector, households for which property and transfer incomes make up the largest source of income, constitutes a heterogeneous group and it is recommended that it should be divided into three further subsectors when possible. These subsectors are defined as follows:

· Recipients of property incomes;

· Recipients of pensions;

· Recipients of other transfer incomes.

4. Using a reference person

24.40 Other methods of subsectoring usually require a reference person to be identified for each household. The reference person is not necessarily the person that other members of the household regard as the "head of the household", as the reference person should be decided on grounds of economic importance rather than age or seniority. The reference person should normally be the person with the largest income although the reference person could also be the person who makes the major decisions with regard to the consumption of the household.

24.41 Once a reference person has been identified, it is possible to group households into subsectors on the basis of the reference person's characteristics. For example, subsectors may be defined according to:

a. Occupation of the reference person;

b. Industry, if any, in which the reference person works;

c. Educational attainment of the reference person;

d. Qualifications or skills possessed by the reference person.

5. The consequences of demographic change

24.42 A growing policy interest in some countries is the effect of demographic change on household well-being and the response required by government. For example, in an ageing population, there may be less demand for educational services and more for health services.

24.43 Another concern is whether pension provision is sufficient to ensure that individuals have an adequate level of income in retirement without looking to government for income support. A focus on such issues might suggest subsectoring households according to whether the main income earner is in work, of working age but not in work or in retirement. Again, categorization according to the main income earner will give different results from categorizing income as a whole.

6. Other considerations

24.44 It is possible to consider subsectoring households on quite different grounds. Examples include the number of persons in the household, the region where the household is located, the qualifications or education level of the head of the household, the industry where the head of the household works, whether the household owns property or other assets and so on.

D. Households as producers

1. Households and the informal sector

24.45 In all countries, there are some production activities undertaken by households. Many of these may be described as informal and, as described in chapter 25, measuring the extent of the informal sector and how this changes as the economy develops gives particular insight into the extension of the market economy beyond formal enterprises.

24.46 The difficulty of separating the productive activity of a household from the rest of the institutional unit has been discussed in a number of places in earlier chapters, particularly in chapter 4, and is referred to above in discussion about the subsectors for households. This section therefore discusses only some aspects of those productive activities that inevitably remain within the households sector.

2. Agriculture

24.47 In some countries, subsistence agriculture, or indeed the results of any agricultural production which are used entirely by those responsible for the production, is a very significant part of household consumption and by extension of GDP. In countries where much of the staple food is grown for own consumption, and it is seasonal, it is necessary to consider whether some part of the increase in the value of the crop due to storage is part of production. There are details of how this may be done in the annex to chapter 6.

24.48 It should be recalled that the purchaser's price for agricultural products used for own consumption does not mean the price at the nearest local market which would include transportation costs. The market price is the price that somebody would pay for the crops where they are grown. This is frequently called the farm-gate price.

24.49 In principle, all fruit and vegetables grown for their own use by households with small allotments or large gardens should be included within the production boundary, even in developed countries. In practice it is unlikely to be worth the effort of making estimates unless the amounts involved are significantly large.

3. Housing

24.50 In almost all economies, a large number of households live in dwellings that they own. The size of the rental market may be very small and may be confined to some areas, for example urban areas, which makes it difficult to use market rentals as a means of estimating the services provided by all owner-occupied dwellings. In chapter 20, it is explained that in principle the rent on a capital asset can be calculated by applying a discount factor to the stock of capital at the beginning of a period, so if the value of the house is known, a figure for the services provided can be estimated. However, this approach also is problematic in those circumstances where there are no data on the stock of capital or where there is uncertainty on the rate of return to be estimated. For simple rural dwellings, it may be necessary to calculate the cost of construction and estimate how long the building is usable without major renovation.

24.51 All dwellings require regular maintenance. The production account for an owner-occupied dwelling treats as intermediate consumption only the goods and services necessary to undertake the sort of repairs that are typically the responsibility of the landlord in the case of rented buildings. These may include payment to specialists in the building trade, for example plumbers or painters, and the cost of these specialists will include their compensation of employees. However when work is undertaken by the owner himself only the cost of the materials is included in intermediate consumption with no estimate made for the value of the owner's time spent on repairs. In consequence, there is no compensation of employees appearing in the production account for owner-occupied dwellings. (This may be seen to be a pragmatic convention. If labour costs were to be imputed to the owner undertaking repairs, this would be recorded as income accruing to the household but the income from the rental on the house would be reduced by an exactly offsetting amount.)

24.52 The whole of the imputed rental less actual costs (including costs other than those relating to repairs) incurred is treated as operating surplus of the owner. The accounts for the owner of the building show the whole of the value of the imputed rental as output, any costs incurred as intermediate consumption and the difference as gross operating surplus which is paid to the household in its capacity as the owner of the unincorporated enterprise. In the use of income account, the full value of the rental is shown as consumption of the imputed rental of owner-occupied dwellings.

24.53 When major repairs are undertaken, these are treated as gross fixed capital formation but the same conventions apply concerning the recording of compensation of employees.

24.54 Some houses are owned by households but leased out by them. In this case the rental paid by the tenant is the value of the output of the rental service. The production account for the earning household shows intermediate consumption charged against this output to derive the operating surplus of the activity, which is treated as income to the owning household. In some cases the whole of the intermediate consumption may be a service charge paid to a rental agency. It is conceivable that occasionally the service paid to the rental agency may exceed the rental income so that the rental activity produces a loss. For example, if a house stands empty for a time, there may still be a fee payable to the rental agency. The earning household will often regard this as acceptable because one reason for owning a house to rent is because it is hoped a holding gain will be made on owning the house over a long period.

24.55 By convention, all the value added arising from leasing dwellings is treated as operating surplus, not mixed income.

24.56 Some houses will be owned as second homes either in the same economy or abroad. The same principles apply as in

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

the case of imputed rental of owner-occupied dwellings and rental services activities that come from renting out a house. If the house is in another country, it is treated as belonging to a notional resident unit in that country. The legal owner then has a financial claim on the notional resident unit. The notional resident unit therefore appears to be a direct investment enterprise wholly owned by a non-resident. However, the only asset of the unit is the value of the property and the whole of the operating surplus from renting out the house is treated as being withdrawn from the notional unit and remitted to the owner so there are no retained earnings remaining to be treated as reinvested earnings.

24.57 To the extent that the house abroad is used by nationals of the economy where the legal owner is resident, the rentals should be treated as exports of services from the foreign country and imports of services to the domestic economy. However, the operating surplus of the notional unit is remitted to the owner and appears as a property income outflow from the foreign country and inflow to the domestic economy, offsetting the flows of rental services (at least in part).

24.58 When a house is financed by a mortgage, in principle FISIM charges relating to interest payments on the loan should be treated as part of the intermediate consumption of the production activity associated with renting the property (either for use by the owner or by a tenant). However, it may be difficult to identify FISIM related only to interest on the mortgage and in some cases a loan using the property as collateral may not be used to secure the property for the purpose of having a dwelling available. In practice, if FISIM is not treated as part of the intermediate consumption of the rental activity, the operating surplus from the rental activity will be higher than otherwise but the consumption expenditure of the household will be higher by the same amount.

4. Domestic staff

24.59 Services provided by paid domestic staff are valued at the cost of the compensation of employees paid to those staff but including any income in kind such as free accommodation or free meals as well as any social insurance contributions that may be paid on behalf of the staff. By convention the production account for paid domestic services consists only of this compensation of employees. All of the products used in the performance of domestic services, such as cleaning materials and tools used, are treated as final consumption expenditure of the household.

24.60 Individuals who provide paid domestic services must be members of another household. Payments to children for performing tasks in the house are not treated as the provision of paid domestic services but simply as if the payment were a transfer within the household. On the other hand payments to a child for babysitting a neighbour's children should in principle be treated as domestic services but these may be too small and difficult to measure.

24.61 In practice, some countries may include full-time domestic employees as members of the households, in which case a transfer within the households is recorded, even though transfers within an institutional unit are not normally recorded. This in turn means there is an element of double counting for the household concerned with a payment to the domestic staff and the expenditure by those staff both being included in the household's consumption expenditure.

24.62 In chapter 29 there is discussion of the possibility of extending the production boundary within the context of a satellite account to include all domestic services, including those that are not performed in return for payment.

E. Households as consumers

1. Consumption goods and services provided in kind

24.63 Chapter 9 describes the different concepts of consumption expenditure, actual consumption and the use of consumption goods and services. Within the SNA, only the first two are measured and the difference between them is accounted for by social transfers in kind provided by government and NPISHs to households. In principle it might be interesting to be able to distinguish social transfers in kind provided to children (for example most education), to the elderly (particularly health care) or perhaps on a regional basis. However, there are considerable difficulties in working at this level of detail and so it is probable that such extra detail could be provided only in the context of a satellite account.

24.64 In principle, transfers in kind between households should be recorded in the SNA. However, if there are no subsectors of the households sector, such transfers will not appear in the accounts when they occur between resident households. On the other hand transfers in kind between resident and non-resident households may be quite significant and should be captured through information on remittances in the balance of payments data. Practical considerations are described in *International Transactions in Remittances: Guide for Compilers and Users* (International Monetary Fund, 2008b))

24.65 When there is a significant amount of consumption represented by own account production, income in kind, barter or transfers in kind it would be useful to itemize the distinction between consumption expenditure by households in kind from consumption purchased in the market place.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

2. Expenditure by tourists

24.66 Most data sources for household consumption from the supply side are not able to distinguish whether purchases are made by resident households or by non-resident households. Equally, the same sources will not reveal purchases made abroad by resident households. These two items are often of a sufficiently significant size that it is important that they be estimated both for the impact on the balance of payments and in order to ensure that the supply and use table can be adequately balanced. Further consideration of expenditure by tourists is discussed in chapter 29 in the context of a tourism satellite account.

3. Consumption expenditure by type of product

24.67 Most household surveys itemize consumption according to the purposes it is intended to serve: food, housing, etc. This type of breakdown is the one used in the Classification Of Individual COnsumption by Purpose (COICOP). For inclusion in the supply and use table, and indeed for other analyses, it is useful to prepare a table showing the cross classification of consumption by purpose and by type of product. This is useful not only in terms of providing the information for the supply and use tables but also in examining the information used to compile consumer price indices, which in turn are used to deflate consumption expenditure. If the data permit, it may also be useful to look at the composition of consumption expenditure by type of household with a view to calculating consumer price indices for different groups of households, for example for the elderly or for those with young children.

F. Household income

24.68 It is a well-established phenomenon in all countries that income is distributed unevenly and in a very skewed manner. Very many people have income significantly below the average or median income and very few people have extremely large incomes. A poverty line is sometimes quoted as half the median income but an income of twice the median does not imply great wealth; the wealthiest individuals in an economy may have incomes many times larger than the average or median income.

24.69 The reason that the sequence of accounts is important is that it gives a picture of how income is distributed and redistributed either compulsorily via taxes and benefits or voluntarily via transfers or because of ownership of financial or other assets (property income). In order to examine whether the process of distribution and redistribution of income significantly changes the overall distribution of income in the economy it is necessary to be able to show the flows between different groups of households. As noted in the introduction, it is difficult to allocate income from one particular source to one household group rather than another. This is not straightforward and not a standard part of the SNA. However, it is straightforward to provide more information to analysts on the type of household income than the total contained in the standard sequence of accounts. As far as value added is concerned, it may be possible to distinguish compensation of employees paid by individual industries or perhaps according to level of education or by region. Mixed income can similarly be distinguished. Consumption of fixed capital should be separated between that due to owner-occupied dwellings and that relating to other assets of unincorporated enterprises.

24.70 The standard accounts contain information on transfers in the form of taxes paid and social insurance contributions and benefits split between pensions and other benefits. In some countries it is especially relevant to show personal remittances from abroad to demonstrate the impact on the domestic economy of those with strong ties to economies abroad. For countries with a large migrant population it may be similarly useful to identify the corresponding outflows and their destination.

24.71 Within property income it is useful to distinguish those flows that place resources at the disposal of the recipients from those where the receipts are already precommitted as saving, for example, pension entitlements, property income on life insurance and interest that derives from the increase in the value of bonds. It should be noted that it is particularly useful to identify the withdrawal of income from quasi-corporations if there are many household enterprises treated as quasi-corporations.

24.72 It may be useful to identify and show separately income in kind of all types, such as wages and salaries in kind and transfers in kind, and then derive a total excluding both these and the precommitted saving which might be called discretionary income.

G. Household wealth and associated income flows

1. Household balance sheets

24.73 For many households, their main assets are their land, houses and accumulated pension entitlements. Where they exist, claims on enterprises may also be significant. Investment in financial assets outside pension funds may

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

also be important in some countries. However, set against the assets must be the liabilities of the households, including the loans involved in mortgages and other financial liabilities and, for example, credit card or other debt.

24.74 For households including an unincorporated enterprise other than owner-occupied dwellings, there may be other fixed assets recorded on the balance sheet but these tend to be small relative to housing.

2. Family trusts

24.75 Family trusts are owned by households, though some trusts may be owned by a number of households collectively possibly including non-resident households. Trusts may be set up to protect wealth until a beneficiary comes of age or meets another criterion, they may be set up to preserve family estates and so on. The SNA recommends that trusts should be treated as quasi-corporations and included in the financial corporations sector as captive financial institutions. However the trusts must have liabilities to the beneficiaries sufficient to reduce their net worth to zero. In compiling the balance sheet for the households sector, the value of the assets corresponding to the liabilities due to resident households must be included. Where family trusts are important and when household wealth is the subject of interest, it may be useful to introduce a supplementary heading under other equity owned by households to show the value of trusts separately from the equity of other quasi-corporations such as partnerships.

3. The distribution of wealth

24.76 Increasing interest is being shown in conducting surveys of household wealth along lines similar to surveys of household income and expenditure. Again the interest is to look at a disaggregation of the households sector to discover the composition of household wealth and its relation to household income.

24.77 In general the distribution of wealth is even more strongly skewed than income. A family where the main earners are in mid career may have a comfortable level of income and occupy their own house but still have a considerable mortgage and may not yet have built up significant pension reserves.

4. Pension considerations

24.78 There is a question about whether the rundown of wealth post retirement should be recorded as income or as dis-saving.

24.79 By treating pension schemes as social insurance schemes, pension benefits are shown as current transfers, and thus income, rather than as a run-down of saving. If a pension scheme is not treated in this way, though, there is still income accruing to the pension beneficiary in the form of the property income payable on the pension entitlements. For a defined benefit scheme, this property income represents the unwinding of the discount factor on future entitlements. The decrease in the entitlements is equal to the difference between the benefits payable and this property income, similar to the position for an annuity explained at the end of part 1 of chapter 17.

24.80 To the extent that the value of the pension as a form of wealth is based on the net present value of future income flows, pension receipts can be partitioned into the rundown of savings and income accruing. In cases where there are no pension entitlements, a household with a significant level of financial assets is still likely to receive significant property income, though the mix of property income and holding gains and losses will depend on the investment strategy of the household concerned.

24.81 For a household where one or more of the members is building a pension, significant income will accrue each year but this is not accessible to the household to spend. It must be accumulated to fund future pension entitlements and thus shows as an increase in wealth.

24.82 It is possible to construct an asset account for pension entitlements showing the start of year level of entitlements, increments due to work done in the year, increases due to the fact that retirement has become a year nearer (the unwinding of a discount factor) and other changes such as an allowance for inflation, less decreases due to pension payments or other changes that reduce entitlements.

5. Consumer durables

24.83 Within the SNA, consumer durables are not treated as a form of wealth but as a form of expenditure. However, there may be considerable interest in having a memorandum item in the balance sheets to show the worth of consumer durables. The acquisition of durables may well be cyclical and there is interest in a satellite account that would replace the purchase of consumer durables as current expenditure by figures for the flow of services provided from the same items treated as fixed capital. This is discussed further in chapter 29.

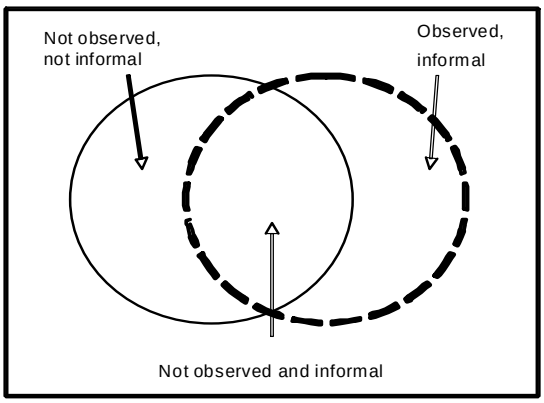
Chapter 25: Informal aspects of the economy

A. Introduction

25.1 No economy is completely regulated and captured perfectly by statistical enquiries. Steps have to be taken, therefore, to attempt to cover unregulated activity and survey imperfections as special exercises. There are two approaches that, although they share a lot of common ground, are directed towards two rather different goals. The first is to ensure that all activities including those that may be described as "hidden" or "underground" are encompassed in measures of total activity. The second is to define what is meant by the subset of economic units that can be considered "informal" and to measure this.

25.2 The rationale for the first activity is obvious; to have a view of the economy as a whole that is as complete as possible and as comparable over time and across countries as possible. The part of the economy difficult to measure has become known as the Non-Observed Economy (NOE) and several publications have been dedicated to measuring it, notably the handbook *Measuring the Non-Observed Economy* (Organisation for Economic Co-operation and Development, International Monetary Fund, International Labour Organisation and CIS STAT (2002). As the techniques in the handbook make clear, a specific measure of the NOE is not important in itself. Attention focuses on ensuring that the measurement of total activity is complete or "exhaustive".

25.3 The second alternative recognizes the analytical importance, especially in developing countries, of being able to measure that part of the economy that reflects the efforts of people without formal jobs to engage in some form of monetary economic activity. This part of the economy has become known as the informal sector. It is by estimating the size of the informal sector that it becomes possible to assess how far the benefits of development reach, for example, people living on the street or in shanty towns. Those supporting the second approach do not deny the importance of the comprehensive measure of the economy but for them this is not sufficient. Despite the difficulty of doing so, attempts must be made to identify and measure an informal sector.



25.4 There is a large overlap between both concerns. However, while the NOE and the informal sector overlap, neither is a complete subset of the other. This can be seen in figure 25.1. The solid circle represents the non-observed economy and the dotted circle the informal sector. Thus the overlap consists of activities that are not observed and undertaken informally but there are some activities that are not observed but are not undertaken informally and some that are undertaken informally but are observed. The relative size of the three segments in figure 25.1 will vary from country to country.

25.5 Efforts to cover the NOE ensure that all enterprises are covered in statistical estimates even if not covered by statistical enquiries. Some of the supplementary estimates may well relate to those activities of household unincorporated enterprises considered to be informal (in this chapter called informal enterprises) but some will relate to large enterprises, not regarded as informal. In addition, the NOE aims to cover misreporting in large enterprises, whether this is inadvertent or deliberate. The NOE thus covers some activity by informal enterprises but also information for some formal enterprises.

25.6 Within the informal sector, some information may be captured statistically. Consider a household that lets rooms to visitors for one or several nights. The activity cannot be treated as a quasi-corporation because it is impossible to make a clear separation of costs from regular household costs and to partition that fraction of the house treated as an asset associated with the letting of rooms from its main function as a family home. However, the value of the letting activity may be captured in a survey directed at tourism activities, for example.

25.7 Other examples might be considered. Street traders or taxidrivers may be both not observed and informal. A vehicle repair shop with 5-10 employees may be formal but too small to be covered by statistical enquiries and therefore not observed. Teaching assistants may be informal but observed. The situation is complicated by the

Figure 25.1:The non-observed economy and the informal sector

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

fact that street traders, taxi drivers, vehicle repair shops and teaching assistants may be formal in some countries and informal in others, just as they may be observed in some and not in others.

25.8 It should be noted that all countries have both non-observed parts of their economies and informal enterprises though the scale of each and the policy interest in identifying the latter may vary.

1. The policy interest in measuring activity undertaken by informal enterprises

25.9 Production in the informal economy appears in different ways in different countries. When the motivation is a pure survival strategy or a desire for flexible work arrangements, it is likely to be encouraged. However, when the motivation is to avoid taxes and regulations, or to engage in illegal activities, efforts are likely to be made to curtail these. Most kinds of production activities may be undertaken by an informal unit. These units may operate without a fixed location, or in homes, small shops or workshops. The activities covered range from street vending, shoe shining and other activities that require little or no capital and skills to activities that involve a certain amount of investment or level of expertise such as tailoring, car repair and professional services. Many informal enterprises are operated by an individual working alone, as a self-employed entrepreneur (own-account worker), or with the help of unpaid family members, while other informal unincorporated enterprises may engage paid workers.

25.10 The size and significance of production undertaken by informal enterprises depends on the social structures, national and local economic regulations, and enforcement efforts of a given country. The level of policy interest varies from country to country depending on the type of activity and magnitude of it. The size, registration and other characteristics of the production units involved are key variables in determining whether to encourage or discourage certain modes of production or enlarge the scope of the formal economy by recognizing units operating below previous thresholds. Specific social support and assistance programmes may be designed and monitored to see how far they support goals such as increased production, job creation and security, poverty reduction and the empowerment of women.

2. Structure of the chapter

25.11 Section B looks at the characteristics of production units to try to identify the characteristics significant for the non-observed economy, the informal sector or both.

25.12 In the context of compiling national accounts, much attention focuses on the non-observed economy. This topic is addressed briefly in section C.

25.13 The International Labour Organization (ILO), in adopting a resolution of the International Conference of Labour Statisticians (ICLS), has been instrumental in establishing a concept of an informal sector to identify a set of production units within the SNA households sector that are particularly relevant for policy analysis and formulation, especially in many developing countries and countries in transition. This work addresses the question of how the market economy is penetrating areas outside the formal parts of the economy. This topic is addressed in sections D and E.

25.14 The ILO work is pragmatic in realizing that it is very difficult to establish a definition of the informal sector that is strictly comparable across countries given the difference in the structure of micro and small enterprises, the national legislation covering registration of enterprises and the labour laws. An Expert Group on Informal Sector Statistics (known as the Delhi Group) was set up in 1997 to address, among other issues, both the conceptual and operational aspects of the ILO definition. Work of the Delhi Group is reported in section F.

25.15 Section G discusses the borderline of units that might be regarded as informal but in practice are not recorded in the households sector, as well as some activities in the households sector that are not regarded as informal. It goes on to indicate how data matching the concepts of the informal sector may be derived from the SNA accounts.

25.16 Section H complements this by discussing some approaches relating to collecting data on activities undertaken by informal enterprises and on informal employment.

25.17 The interest in the informal sector has led to the production of a number of handbooks and studies of current practices. It is impossible to report these in depth in this chapter but section I gives a brief description of some of these and indicates where they may be consulted.

B. Characteristics of units acting informally

25.18 As noted in the introduction, it is not straightforward to define what is meant by the adjective “informal”. Is the description one of the nature of activities, the way in which they are carried out, or the way in which they are captured in statistical enquiries? In order to try to formulate a precise delineation of what is the subject of interest, a number of potential characteristics can be listed of what characteristics the word “informal” might be intended to convey. Although different commentators place more emphasis on some criteria and some on others, there is broad agreement that no single criterion on its own is sufficient to determine what is meant by informal; several criteria must be considered.

25.19 Two questions need to be kept in mind when considering each possible criterion:

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

a. is this really central to the definition of activity undertaken by a unit considered to be an informal enterprise, and

b. is it the basis for reaching a definition that will yield internationally comparable results?

25.20 *Registration*. One interpretation of what is informal is whatever is not registered with some arm of government. The problems with this criterion are obvious. Different countries have different practices on registration. Some may insist that all activities, however small and casual, should be registered; others may be more pragmatic and require activities to be registered only when their turnover exceeds a given amount or when the number of employees exceeds a given number. Further, whatever the official requirements for registration, the degree of compliance with the requirements will vary according to the extent to which they are enforced in practice. A definition of the informal sector based on registration is therefore not going to give international comparability or, possibly, comparability over time within a country if the requirements for registration or degree of compliance with the requirements vary.

25.21 *Legal incorporation*. Closely related to the characteristic of registration is one of legal incorporation. It is the case that all legally incorporated enterprises are treated in the SNA as falling into one of the corporations sectors but these sectors also include quasi-corporations. A quasi-corporation is defined in the SNA as a unit where either a full set of accounts, including the balance sheet, is available or can be drawn up. In this way some units that the owners choose not to incorporate (in many cases quite legitimately) are treated in the SNA as if they are incorporated but having a full set of accounts is a fairly stringent requirement. Some units may have very detailed information about their production activities but not about other accounts. Thus they cannot be treated as quasi-corporations and excluded from the households sector despite appearing to be "formal" in terms of the nature of their activity. Examples where this may happen include doctors, lawyers, engineering consultants and many other professions. In addition to the statistical restriction on treating production activities as if they are undertaken by incorporated units, laws requiring or permitting incorporation vary from country to country thus limiting international comparability.

25.22 *Size*. Faced with this variation of statistical and administrative practices, one possibility for identifying informal enterprises might be to rely simply on the size of the enterprise, defined either in terms of turnover or number of employees. The problem with turnover is again the potential variability across countries and over time. Using a maximum number of employees to identify informal enterprises would result in some units with full accounts, and thus allocated to the corporations sectors, being identified as informal and some units in the households sector without a full set of accounts as formal.

25.23 *Covered by statistical surveys.* The coverage of statistical surveys, particularly establishment surveys, varies considerably from country to country and also from industry to industry within a country. Often small-scale enterprises are excluded because the statistical office considers the cost of collecting information from such units is too expensive considering the proportion of output they account for and the potential for inaccuracies in the reported data. However, there may be a "grossing up" procedure to allow for the non-coverage of the smaller units. In such a case, the production activities of these units are likely to appear attributed to the corporations sectors even though strict conformity with SNA guidelines would place these in the households sector.

25.24 *Borderline of activity*. In chapter 6 there is discussion of the production boundary of the SNA. As noted there, some activities that are economic in nature are excluded from the production boundary, specifically services produced by households for their own consumption other than the services provided by owner-occupied housing and services provided by paid domestic staff. While there is interest in measuring these activities for some forms of analysis, there is agreement that in measuring activity undertaken by informal enterprises the boundary of production in the SNA should be taken as appropriate. However, the services from owner-occupied dwellings are excluded.

25.25 *Illegal activity.* Chapter 6 makes clear that, in principle, the fact that an activity may be illegal is not a reason to exclude it from the production boundary. In some countries, the difficulties of capturing illegal activities may mean that they are either not well covered or deliberately ignored on pragmatic grounds. However, for some countries ignoring the production of drugs, for instance, would seriously underestimate the overall level of economic activity. In general, as discussed further in section C, some illegal activity may be included in the SNA, if only indirectly, and so complete exclusion is impracticable in any case.

25.26 *Location.* Some analysts may be interested mainly in the development of informal enterprises in urban areas, particularly in so-called shanty towns on the outskirts of large conurbations. While the policy implications of such an approach can be appreciated, the role of the informal economy in areas outside the main urban areas is also important and for international comparability, and for comparison over time when internal migration is significant, restricting coverage by location is undesirable.

25.27 *The terms of employment*. Some employees have terms of employment that entitle them to various benefits in addition to their wages and salaries. These benefits typically include paid annual and sick leave and pension entitlement. Even production units offering such terms to some of their workers may also employ people on less generous terms offering no benefits beyond wages and salaries. People who work on their own account (the self-employed) may do so to provide some supplementary income, may do so because they are unable to obtain a job with benefits or may simply choose to do so for a number of reasons, including the flexibility of choosing what they do, for whom and for how long. Many of the latter may work under terms that offer not employment as such but a service contract.

C. The non-observed economy

25.28 At the time the 1993 revision of the SNA started, it was assumed that identifying an informal sector was mainly a problem for developing countries. However, even by the time that revision was complete, it was obvious that the problem affected all economies, whatever their state of development. Within the EU, the need to ensure strict comparability of coverage of the national accounts among member states led to a series of initiatives to ensure the accounts were "exhaustive" (that is, fully comprehensive). Also in the early 1990s as countries in Central and Eastern Europe made the transition to market economies, the need to cover activities outside the scope of previous reporting methods, whether undertaken within formal units or in informal enterprises, became pressing.

25.29 The extent of economic activity missing from statistical data collections and from administrative sources became known as the "non-observed economy". In some countries, the emphasis has been placed not on identifying the non-observed economy as such but simply ensuring that the accounts are fully comprehensive ("exhaustive"), but it is easiest to describe factors affecting exhaustiveness through the notion of the non-observed economy.

25.30 As explained in the introduction, the non-observed economy overlaps with, but is not the same as, the informal sector. As well as attempting to cover activities slipping under the net of statistical collection (sometimes called the "underground" or "hidden" economy), attention was paid to ensuring that reported information was both complete and accurate.

25.31 As noted in chapter 6, the fact that some activities are illegal in themselves or may be carried out illegally does not exclude them from the production boundary. Exercises to measure the non-observed economy should also, in principle, cover such illegal activity. How far this is pursued in practice will depend on assessments of the importance of illegal activities, how it might be done and the resources available.

25.32 Trying to assess the additions to be made to the national accounts for the non-observed economy is not just a question of examining the comprehensiveness and accuracy of statistical enquiries. The process of assembling a set of national accounts, especially when the supply and use framework is used, already casts light on missing information and helps improve the estimates overall. Consider the case of some types of illegal activities. Because avoiding taxes is illegal and tax collection may be pursued more vigorously than statistical reporting, a prostitute may report her (or his) earnings more or less accurately but describe her activity as modelling, acting or any number of other ways. Similarly, while smugglers of cigarettes may not report their activities, the fact that households purchase the cigarettes may be much better documented and thus implicitly the illegal imports are captured in the accounts.

25.33 It has been argued that a completely balanced set of supply and use tables is unlikely to omit any significant activity. While it is possible that something may be omitted, if the tables are to balance, there must be exactly matching omissions in other aspects of the accounts, which is not very likely. However, while the act of balancing the tables may in effect estimate some non-observed activity, it may not be sufficient to capture all of it.

25.34 It should be noted that, again as pointed out in the introduction, concern about the non-observed economy does not lead to a separable measure of it. The example of using the balancing of supply and use tables as a means of ensuring exhaustiveness is an illustration of why this may not be possible.

25.35 Measures of the non-observed economy will overlap with activities undertaken informally but not exactly match them. Elements not observed will include estimates for informal enterprises not covered in statistical enquiries and corrections to some measures of informal enterprises that are captured in statistical enquiries. However, estimates for informal enterprises that are covered in statistical enquiries and are judged to be accurate will be excluded. Nevertheless, many of the techniques used to estimate aspects of the non-observed economy, as described in the manual *Measurement of the Non-Observed Economy: a Handbook* are useful for measuring the informal enterprises also.

D. The informal sector as defined by the ILO

1. The ILO concept of the informal sector

25.36 A major focus of this chapter is to present a concept of an "informal sector" as a subset of household unincorporated enterprises. This is the characterization of the informal sector in the resolution of the 15th ICLS on statistics of employment in the informal sector, which described in detail the definitions used by the ILO, as follows:

(1) The informal sector may be broadly characterized as consisting of units engaged in the production of goods or services with the primary objective of generating employment and incomes to the persons concerned. These units typically operate at a low level of organization, with little or no division between labour and capital as factors of production and on a small scale. Labour relations - where they exist - are based mostly on casual employment, kinship or personal and social relations rather than contractual arrangements with formal guarantees.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

(2) Production units of the informal sector have the characteristic features of household enterprises. The fixed and other assets used do not belong to the production units as such but to their owners. The units as such cannot engage in transactions or enter into contracts with other units, nor incur liabilities, on their own behalf. The owners have to raise the necessary finance at their own risk and are personally liable, without limit, for any debts or obligations incurred in the production process. Expenditure for production is often indistinguishable from household expenditure. Similarly, capital goods such as buildings or vehicles may be used indistinguishably for business and household purposes.

25.37 Although the expression “informal sector” is used in the context of the ILO work, the word sector is used with a different meaning from the SNA sense of a grouping of institutional units. The ILO work focuses only on production activities and does not include the consumption and accumulation activities of the unit.

2. Defining the sector

25.38 In the SNA, household enterprises do not constitute separate legal entities independently of the household members who own them. Fixed capital used in production may also be used for other purposes, for example the premises where the activity is carried out may also be the family home or a vehicle may be used to transport items produced within the household as well as for normal household transport. The items do not belong to the enterprise as such but to the household members. As a result, it may be impossible to compile a complete set of accounts for the household productive activities including the assets, both financial and non-financial, attributable to those activities. It is for this reason, the lack of complete accounts, that the production activity remains within the households sector as an unincorporated enterprise rather than being treated as a quasi-corporation in one of the corporations sectors.

25.39 The ILO concept of the informal sector takes household unincorporated enterprises and further subdivides them into three; one part forming the informal sector, a second part being units treated as formal, because of the numbers of employees or registration, the third part being referred to simply as households. (A note on the different uses of terms such as sector and households follows at the end of this section.)

25.40 The subset of household enterprises treated as belonging to the informal sector have economic objectives, behaviour and a form of organization that sets them apart from other unincorporated enterprises. Specifically, the informal sector is defined according to the types of production the enterprise undertakes, still maintaining the production boundary of the SNA and not extending it to include own-use household services, for example.

Exclusion of units producing purely for own final use

25.41 The first restriction is that at least some of the production must be sold or bartered. Thus some household enterprises that the SNA treats as producing “for own final use” because most of their production is so used are included but those that produce exclusively for own final use are excluded. It follows that the activity of dwelling services produced purely for owner-occupation is thus excluded from the informal sector.

Exclusion of units with formal characteristics

25.42 In addition, the coverage of the informal sector is restricted by using additional criteria of numbers of employees or registration. The minimum number of employees chosen is left to the country to decide based on national circumstances. Only those not registered under specific forms of national legislation (such as commercial laws, tax and social security laws and regulatory laws) should be treated as informal.

Two categories of informal enterprises

25.43 The exclusion of units from the informal sector varies from country to country, depending on the conditions for registration or the minimum number of employees chosen to determine which units are treated as formal. However, the ILO concept of the informal sector is always a subset of

Figure 25.2:Identifying units in the ILO informal sector

</table>

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

household unincorporated enterprises operating within the production boundary of the SNA.

25.44 These units are divided into the following two subsets:

a. *Unincorporated enterprises without employees.* The ILO term for such units is "informal own-account enterprises",

b. *Unincorporated enterprises with employees*. The ILO term for such units is "enterprises of informal employers".

25.45 With these additional criteria, the production unit in the informal sector is defined as a household enterprise with at least some production for sale or barter for which one or more of the criteria of a limited size of employment, the non-registration of the enterprise or its employees are met. The delineation of this set of units in terms of the SNA sectors is shown in figure 25.2.

Exclusions on grounds of activity

25.46 Apart from defining the informal sector, the 15th ICLS recommended the following additional considerations about the scope of the informal sector and its statistical treatment.

a. In principle, all goods and services producing activities are within scope. These might be presented according to the alternative aggregation recommended for the analysis of the activities of the informal sector in *ISIC Rev. 4*. This alternative presentation takes into account that some economic activities such as public administration and defence (*ISIC* 84) are undertaken by units in general government and so cannot qualify as informal sector activities. However, the ICLS recommends that:

· agricultural activities (*ISIC* section A) are measured separately from other economic activities to ensure international comparability and to facilitate the selection and application of appropriate statistical data collection tools and sample design. (Units undertaking only subsistence activity are already excluded as they do not sell any of their output.)

· activities of households as employers of domestic personnel (*ISIC* 97) with households being producers for own final use are outside the scope of the informal sector.

b. Geographical coverage includes both urban and rural areas even if preference may be given initially to informal enterprises operating in urban areas.

c. Outworkers are included if the units for which they work as self-employed persons or as employees are included in the informal sector.

3. Clarifying the use of familiar terminology

Sector

25.47 The term "sector" in the expression "informal sector" does not have the same basis as the usual use of the word sector throughout the SNA. In the SNA, sectors are made up of complete institutional units; in the context of the informal sector only the productive activities are concerned. Thus, for example and importantly, households having no productive activity are simply not considered in the steps to identify those unincorporated enterprises operated by households that are to be included in the informal sector.

Enterprise

25.48 In the SNA, a corporation represents a single enterprise but each such enterprise may consist of a number of establishments. A key difference between an enterprise and an establishment is that a full set of accounts must exist, or could be constructed, for an enterprise but for an establishment a much more restricted set of data is available, typically only information relating to production, number of employees and the capital formation associated with the activity.

25.49 Within a household many different production activities may take place. For none of these individually nor for the total of all activities that cannot be treated as quasi-corporations does a complete set of accounts exist. The SNA usage of "unincorporated enterprise" is taken to mean the totality of all unincorporated activity undertaken by a household even though in a supply and use table, for example, this may be partitioned by types of activity and be grouped with establishments of corporations undertaking the same activity.

25.50 The use of unincorporated enterprise in the ILO description of the informal sector does not correspond to the totality of unincorporated activity of a household but to each activity separately. In SNA terms, the unincorporated enterprise is broken down into a number of unincorporated establishments, some of which may be included in the informal sector and some excluded, even for the same household. Further, the ILO identifies individual members of a household as owning each establishment/enterprise and capable of employing workers. In the SNA, it is the household collectively that is responsible for all activity and for employing workers.

Subsectoring production

25.51 The SNA subdivides production into market production, production for own final use and non-market production. Non-market production is not at issue here, since it is never undertaken by households. However, to meet the ILO guidelines it is necessary to subdivide producers for own final use into those where some of the production is for sale or barter and those where the production is exclusively for own final use. In the case of unincorporated enterprises where only some of the production is sold or bartered, all of the production of the unit of those goods and services is still included in production by the informal sector.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Formal sector, informal sector and households

25.52 The SNA does not use the expression formal sector but it is not difficult to conceive of all units in the corporations sectors, general government and NPISHs as being part of a formal sector as far as production is concerned. Quasi-corporations are included because they are included in the corporations sectors. However, this is not the same as saying that any unit that is not informal is formal, since households with unincorporated enterprises not included in the informal sector are divided between those that are treated as formal (because of size or registration) and the rest that are not treated as informal but are left simply in a group called households.

25.53 The ILO meaning of households is thus quite different from that of the SNA since the SNA includes all the units included under ILO guidelines as informal, plus those units with unincorporated enterprises treated as formal, plus those unincorporated enterprises excluded because they produce exclusively for own final use, plus those households with no unincorporated enterprises plus institutional households.

E. Informal employment

1. Informal employment

25.54 Increasingly it has been realized that production alone is not the only aspect of the economy where a distinction between formal and informal is informative, it is also relevant for employment.

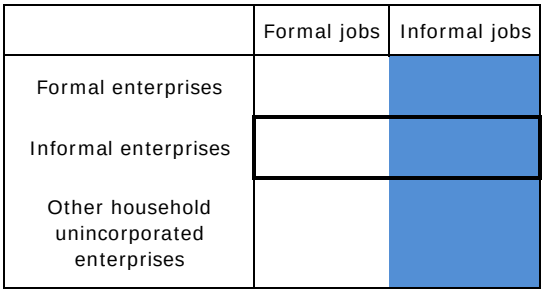
25.55 The ILO defines formal wage employment as employment under terms that bring associated benefits such as paid leave and pension entitlement. The ILO regards all other forms of employment, including self-employment, as informal.

25.56 As noted in section B, it is possible for formal units to have informal employees and it is also possible (though less likely) that units that are classed as informal may have terms of employment for some of their workers that make them formal employees. The extent of informal employment can be seen in the shaded part of figure 25.3.

25.57 As explained in chapter 19, there is a distinction between a job and an employee, one employee being capable of holding several jobs. There are five categories of jobs considered by the ILO. These are:

a. own-account workers (the self-employed in SNA terms),

b. heads of unincorporated enterprises with employees, treated as employers,



c. unpaid family workers contributing labour to the unincorporated enterprise,

d. employees,

e. members of producers' cooperatives.

25.58 Formal enterprises provide informal jobs only as employees or contributing family workers. Informal enterprises may offer any of the five types of informal jobs and also formal jobs. Households (in the ILO sense) provide informal jobs as own-account workers, employees and family workers. Some domestic staff may have formal jobs.

Figure 25.3:Informal employment and employment in the informal sector

2. Employment in the informal sector

25.59 As well as informal employment in total, it is useful to identify the extent of employment in informal enterprises. This excludes informal jobs in formal units, excludes any informal jobs in other household unincorporated enterprises and includes formal jobs in informal enterprises. The ICLS defines the population employed in the informal sector as comprising all persons who, during a given reference period, were employed in at least one informal sector unit, irrespective of their status in employment and whether it was their main or a secondary job. The coverage of employment in the informal sector is indicated by the heavy border in figure 25.3.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

F. Work of the Delhi Group

25.60 In 1997 an expert group on informal sector statistics was set up by the United Nations Statistical Commission as a "city group" and is known as the Delhi Group. One of its objectives was to try to identify internationally comparable data for the informal sector or, at least, a common subset of it.

25.61 The third meeting of the Delhi Group in 1999 proposed a subset of the informal sector that could be defined uniformly across countries, though this subset presently covers only a relatively small part of the informal sector. These recommendations are as follows:

a. All countries should use the criteria of legal organization (unincorporated enterprises), of type of accounts (no complete set of accounts) and of product destination (at least some market output).

b. Specification of the employment size limit of the enterprise in the national definition of the informal sector is left to the country's discretion. For international reporting, however, countries should provide figures separately for enterprises with less than five employees. In the case of multiple-establishment enterprises, the size limit should apply to the largest establishment.

c. Countries using the employment size criterion should provide disaggregated figures for enterprises that are not registered, as well as for enterprises that are registered.

d. Countries using the criterion of non-registration should provide disaggregated figures for enterprises with less than five employees as well as for enterprises with five and more employees.

e. Countries that include agricultural activities should provide figures separately for agricultural and non-agricultural activities.

f. Countries should include persons engaged in professional or technical activities if they meet the criteria of the informal sector definition.

g. Countries should include paid domestic services unless these are provided by employees of the household where the services are rendered.

h. Countries should follow paragraph 18 of the Resolution adopted by the 15th ICLS regarding the treatment of outworkers/home-workers. Countries should provide figures separately for outworkers/home-workers included in the informal sector.

i. Countries covering urban as well as rural areas should provide figures separately for both urban and rural areas.

j. Countries using household surveys or mixed surveys should make an effort to cover not only persons whose main job is in the informal sector, but also those whose main job is in another sector and who have a secondary activity in the informal sector.

25.62 Subsequent work of the Delhi Group examined many studies on national practices in the collection of data on the informal sector to lead up to the provision of a manual on the informal sector and informal employment to be published by the ILO.

G. Deriving data on activities of informal enterprises from the SNA accounts

25.63 In trying to identify activities undertaken by informal enterprises within the national accounts, three steps are necessary. The first is to identify those unincorporated enterprises within the whole of the SNA households sector that are candidates to be included. The second is to consider national practices in establishing the households sector to see if any adjustment to the first step is necessary. The third step is to provide a breakdown by type of activity so that common exclusions according to type of activity can be made.

1. Candidate households

25.64 The households sector includes some institutional units that should be excluded at the outset. These are:

a. Institutional households such as prisons, religious orders and retirement homes;

b. Households with no production activity (that is do not include an unincorporated enterprise);

c. Households whose only activity is the production of services from owner-occupied dwellings, the production of services by employing domestic staff, or both.

25.65 The remaining households all contain some production activity. However, it will include both market production and production for own final use. The ILO guidelines on that part of household activity to be regarded as informal include a concept of market production that does not conform to the SNA category. The ILO treats an enterprise as a market producer if any of the output is sold whereas the SNA requires that most or all of the output be sold. To overcome this difference, it is recommended that a three-way split of production be made:

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

a. market production according to the SNA criterion whereby most or all output is sold,

b. output for own final use where some is sold, and

c. output exclusively for own final use.

The sum of the first two categories then accords with the ILO guidelines for inclusion in the informal sector as market producers though only the first is so regarded in SNA terms.

25.66 The ILO also distinguishes households between those that do not have workers employed on a continuous basis and those that do, as follows:

a. Unincorporated enterprises without employees on a continuing basis,

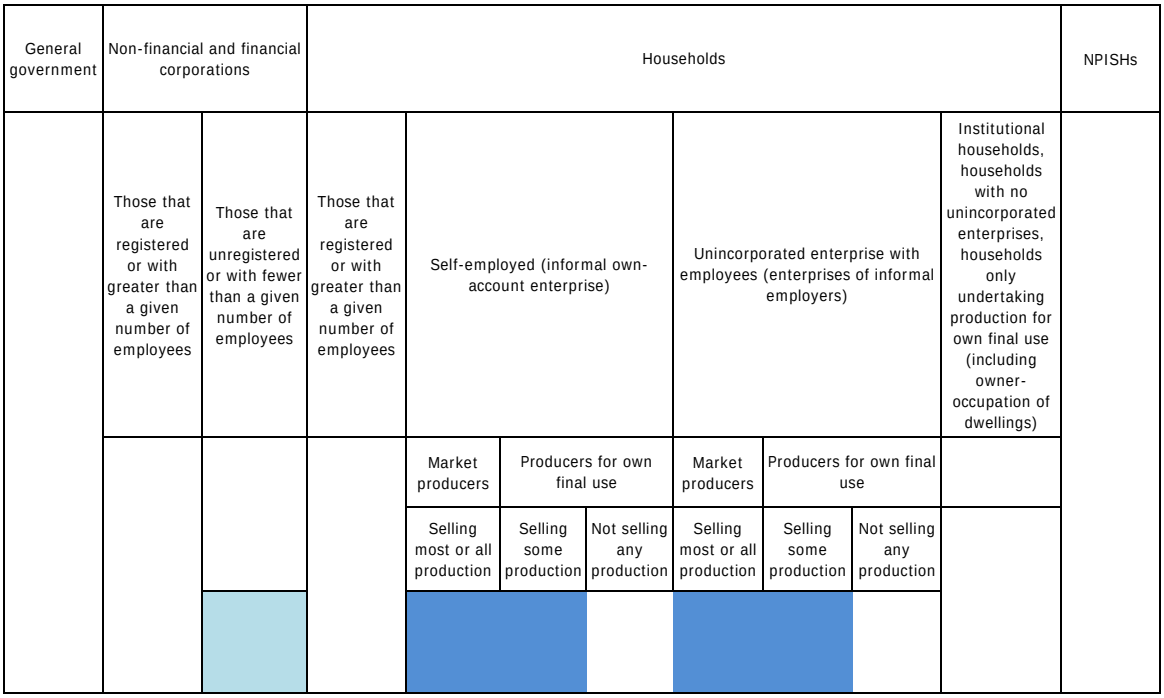
b. Unincorporated enterprises with employees on a continuing basis.

This categorization is combined with the preceding one as indicated in figure 25.4.

2. Adjustments for national practices

25.67 Although the SNA recommends separating NPISHs into a sector separate from households, not all countries do this. If they are not already separated from households, they should be removed at this stage.

25.68 Production units that are not formally incorporated but have complete accounts should be treated as quasi-corporations and excluded from the households sector. If this is not national practice, a further adjustment is necessary to remove them.



25.69 The SNA also recommends that small enterprises without complete sets of accounts should be included in the households sector as unincorporated enterprises. Some countries, however, prepare production estimates by type of activity for inclusion in a supply and use framework without regard to whether a full set of accounts exists. By default, all may be included in the corporations sectors with little production remaining in the households sector apart from the imputed services of owner-occupied dwellings and the services provided by paid domestic staff. It is therefore recommended that estimates for unregistered enterprises with less than five employees be extracted from the figures for the corporations sector to set alongside the figures from the households sector. Similarly any enterprises that are unincorporated but registered should be separately identified.

25.70 Figure 25.4 demonstrates how the potential units for treatment according to the ILO definition of the informal sector relate to the institutional sectors of the SNA. The light shading under corporations indicates that in principle any enterprise that is not registered and has fewer than a given number of employees should be identified if it has been included in corporations. In practice, it may not be possible to separate those that are registered from those that are not.

3. Disaggregation by type of activity

25.71 The third step is to disaggregate the production activities from households, grouped as suggested above, and those extracted from the corporations sectors for small-scale activities according to the type of activity concerned.

Figure 25.4:Identifying units for the ILO informal sector from within the SNA institutional sectors

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Because the separation is initially in terms of units and not activities, there will still be some services from owner-occupied dwellings included and these should be eliminated. If a cross-classification by activity and type of unit is available, a choice can be made about whether to include or exclude an activity where the output is exclusively for own use even when another activity by the same unit includes sales outside the households.

25.72 Some further exclusions may also be made, for example services provided by paid domestic staff and agricultural production.

25.73 The problem remains about how to treat individuals such as the doctors and other professionals discussed earlier where information about their production is available but not a full set of accounts. They thus still represent unincorporated enterprises and are not excluded from the informal sector by reason of registration or number of employees but are not usually thought of as characteristic of part of the informal sector.

25.74 The Delhi group recognizes that such individuals will be part of the informal sector. However, if it is desired either to identify them as a subset or even to exclude them entirely from the informal sector, it is possible that some rules of thumb may be conceived to do so. For example depending on the type of activity, the rates of pay or the duration of the task, but objections to any of these are easy to formulate and implementation would be extremely difficult.

4. Presenting the data on the informal sector and informal employment

25.75 The information relating to activities undertaken informally extends only as far as the production and generation of income account. It is not possible to go farther in the sequence of accounts because of the impossibility of identifying which other income flows, consumption and capital formation relate only to the activity in question rather than to the household to which they belong as a full institutional unit. Thus the informal sector, as explained previously, is not strictly a sector in the SNA sense and so the figures for it cannot be presented in terms of the full sequence of accounts. However, it is recommended that where possible two supplementary tables should be prepared, one covering production and the generation of income and one covering employment.

Production

25.76 It is suggested that the following type of information be provided for each of the shaded areas in table 25.4:

a. Production

· *of which* for own use

b. Intermediate consumption

c. Value added

d. Compensation of employees (for unincorporated enterprises with employees only)

e. Gross mixed income

f. Consumption of fixed capital

g. Net mixed income.

25.77 Further information may also be useful if available. For example, a breakdown of production by type of activity and, possibly, the proportion of the total production in the industry produced by informal enterprises.

25.78 In countries where some small units that might be considered part of the informal sector are covered by establishment surveys and included in the corporations sector, there may be units of interest in the lightly shaded cell in table 25.4. If this is so, and if separate estimates for them can be identified, it would be useful to show these alongside the entries for those units clearly within the households sector.

Employment

25.79 Information on the number of jobs should be presented showing:

a. Employment in the informal sector

· Formal jobs

· Informal jobs

b. Informal employment outside the informal sector

· In the formal sector

· In other household unincorporated enterprises.

25.80 If possible, information on the hours worked in each of these categories would be useful.

H. Approaches to measuring activities undertaken in the informal economy

25.81 It is neither possible nor appropriate to give detailed information in the SNA on survey methodology and questionnaire design. However, it is useful for national accountants to be aware of some of the options that may be available to help in collecting data on production in informal enterprises. More detailed discussion is available

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

in, for example, the manual on *Measuring the Non-Observed Economy*.

25.82 The choice of the appropriate method for measuring the informal sector depends upon how adequately established data collection methods cover the activities of interest. Three main measurement approaches are considered here. The choice between them will depend upon what information is missing from existing collections, the organization of statistical systems, the resources available and user needs.

1. Household surveys

25.83 A household survey (or labour force survey) may provide a means to collect information on production by household enterprises that are not included in the sampling frames used for establishment surveys. It may also be possible to collect data on informal sector employment in household or labour force surveys. Questions seeking this sort of information could be addressed to everyone in the sampled households during the reference period of the survey, irrespective of their status in employment and in respect of their main and secondary jobs since in many countries a large number of informal sector activities are undertaken as secondary jobs. Special questions may be required to identify unpaid work in small family enterprises, activities undertaken by women and children, activities undertaken away from home, undeclared activities and informal sector businesses conducted as secondary jobs. The success of such an approach is dependent on the survey sample including representative geographical areas where household activities take place and informal sector workers live.

25.84 It should be borne in mind, though, that although employees, contributing family workers and proxy respondents may be engaged in household and informal enterprises, they may have limited knowledge of the operations of the enterprises in question and may not be able to respond to such questions.

2. Establishment surveys

25.85 In most cases, an establishment survey can be used to measure activity undertaken by an informal enterprise only when a household establishment survey is carried out just after an economic or establishment census because the sampling frame may not include information, or not up-to-date information on household enterprises.

25.86 Even when an establishment survey is used to measure household production units including those of the informal sector, it should be noted that production units without a fixed location or with unrecognizable business premises are easily omitted in the collection. In addition, double counting of household production may occur if the collections for different types of economic activity are undertaken at different times rather than simultaneously in an integrated design. For example, the manufacturing activity of a household producing goods in a small workshop or at home may be included in one collection round while the retail sales activity undertaken by the same family of those produced goods is measured in another round.

3. Mixed household-enterprise surveys

25.87 One type of mixed household-enterprise survey is designed with enterprise modules attached to existing labour force or other household surveys. Such a survey could cover all household entrepreneurs of the sampled households including informal entrepreneurs (including units operating without fixed premises such as mobile units) and their activities, irrespective of the size of the enterprises, the kind of activity and the type of workplace used and of whether the activities are undertaken as main or secondary jobs.

25.88 Another type of survey, described as a modified mixed household-enterprise survey, is described in *International Recommendations on Industrial Statistics*, (United Nations, 2008.)

25.89 When a mixed household-enterprise survey is used as the preferred method, attention should be paid to the question of whether the sample adequately reflects the geographical distribution of economic activities of household production. It is also necessary to consider how enterprises with production units in more than one location are handled and how duplication of coverage for enterprises that are operated under partnerships may be avoided if the same enterprise is reported by each of its partners who may belong to different households.

I. Guidelines, studies and handbooks on the informal economy

25.90 Since the publication of the *1993 SNA*, significant advances in methodology have taken place in fields related to the informal economy. Also, countries have gained extensive experience in collecting and working with data on the informal sector. These developments, which are highlighted below, suggest that there is a body of work to be taken into account in updating the treatment of the informal sector in the SNA.

- The proceedings and papers of the meetings of the Delhi Group on Informal Sector Statistics, beginning in 1997, contain the results of extensive conceptual and analytical work, including country practices in the area of the informal sector. Various papers of the Expert Group on Informal Sector Statistics (Delhi Group), are can be accessed at http://www.mospi.nic.in/mospi_informal_sector.htm.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

- The handbook *Household Accounting: Experience in Concepts and Compilation, Volume 1: Households Accounts* (United Nations, 2000), the product of a 1997 expert group, contains papers on various aspects of the treatment and measurement of the informal sector. The chapter "The informal sector as part of the households sector" is of particular interest.

- The results of the work started by Eurostat in the mid-1990s and carried out through its Task Force for Accuracy Assessment of Basic Data in European Union member countries and the related pilot tests conducted in candidate countries revealed the extent of exhaustiveness adjustments and their implications for the value of the GDP.

- Research on statistical methods for improving the exhaustiveness of measures of economic production lead to the preparation of the handbook *Measuring the Non-Observed Economy - a Handbook*. The handbook's chapter on informal sector production provides a core definition, clarifies the distinctions between informal sector production and concepts with which it is often confused, and outlines the main methods for measurement.

- The UNECE published a *Guidebook to Statistics of the Hidden Economy* (United Nations Economic Commission for Europe, 1992) and has since carried out three surveys of country practices and published the results. The first was in respect of 1991 and covered nine countries. The results were published as an *Inventory of National Practices in Estimating Hidden and Informal Activities for National Accounts* in 1993. The second survey was in respect of 2001/2 and covered 29 countries. The third survey was carried out for 2005/6 and 45 countries responded. Both the second and third surveys asked for estimates of the size of the non-observed economy as well as elaborating on the methods used. The results of the two surveys are summarized in two editions of *Non-observed Economy in National Accounts - Survey of Country Practices* (United Nations Economic Commission for Europe, 2003 and 2008, respectively).

- There are many ILO documents that elaborate the concepts of informal sector and informal employment. These include the Resolution concerning *Statistics of Employment in the Informal Sector*, (International Labour Office, 1993) adopted by the 15th ICLS and *Guidelines Concerning a Statistical Definition of Informal Employment* (International Labour Office, 2003) adopted by the 17th ICLS. Other useful information can be found in *ILO Compendium of Official Statistics on Employment in the Informal Sector* (Hussmanns and du Jeu, 2002), *Women and Men in the Informal Economy: A Statistical Picture*. (International Labour Office, 2002), *Measuring the Informal Economy: From Employment in the Informal Sector to Informal Employment.* (Hussmanns, 2004), *Measurement of Informal Employment: Recent International Standards*, (Hussmanns, 2005)

- Over the decade, a number of workshops with a focus on the informal sector were held, organized singly or jointly by United Nations Statistics Division, the regional commissions, ILO, and others. The most recent of these were the OECD/UNESCAP/ADB Workshop on Assessing and Improving Statistical Quality: Measuring the Non-observed Economy, held in Bangkok in May 2004 and the Workshop on Household Surveys and the Measurement of the Labour Force with focus on the Informal Economy held for Southern African Development Community countries in Maseru, Lesotho in April 2008.

Chapter 26: The rest of the world accounts and links to the balance of payments

A. Introduction

26.1 This chapter is about the relationship between the rest of the world sector in the SNA and the international accounts as described in *BPM6*. It shows that the two manuals use the same macroeconomic framework, with the international accounts providing additional detail on aspects of particular relevance in international transactions or positions.

1. The rest of the world account in the SNA

26.2 In the SNA, transactions between a resident unit and the rest of the world are recorded as if the units in the rest of the world were another sector of the economy. The production and generation of income accounts relate only to transactions within the national economy but flows in all other accounts potentially have an entry for the rest of the world. These entries are necessary to balance each row of the sequence of accounts but they do not enter the aggregate balancing items. For example, the difference between GDP and GNI derives from transactions for both uses and resources recorded in the allocation of primary income account where the counter-party is a unit in the rest of the world. If the counter-party entries for the rest of the world were also included, there would be no difference between the balancing items.

Current accounts

26.3 Because the rest of the world account is shown in this way, flows to the rest of the world are shown as a use by the rest of the world and flows from the rest of the world as resources. For example, exports are shown as uses of the rest of the world and imports as resources from the rest of the world. Entries for imports and exports form part of the goods and services account in the SNA sequence of accounts.

26.4 As well as entries for imports, exports and the items appearing in the allocation of primary income account, there are potential transactions with the rest of the world to be recorded for all entries in the secondary distribution of income account and for the adjustment item for the net change in pension liabilities appearing in the use of income account.

26.5 There are no entries for the rest of the world account for intermediate or final consumption (or for fixed capital formation) because the use made of the goods and services in another economy is not relevant for the national economy; only the total amount exported is.

26.6 Although balancing items are not calculated in the SNA for the rest of the world account for each individual account, two balancing items relevant to the current accounts are important. The first is the external balance on goods and services, which is the difference between imports and exports. The second is the current external balance which is the sum of all resources coming from the rest of the world less all uses going to the rest of the world, including imports and exports. The current external balance thus shows how far residents call on saving by non-residents.

Accumulation accounts

26.7 In the rest of the world capital account, there is no entry for fixed capital formation, as noted above. It is possible for a transaction to be recorded for a natural resource, for a contract, lease or licence or for goodwill and marketing assets. By their nature, though, and given that land is almost always acquired by a resident unit, such entries will not be common. On the other hand, capital transfers to and from the rest of the world may be quite important.

26.8 The financial account and balance sheets detailing transactions in, and stocks of, financial assets and liabilities where one party is non-resident are viewed as a particularly important part of the rest of the world accounts. Indeed, in *BPM6* more text is devoted to these items than to the items in the current accounts.

26.9 In addition, there are possible entries for other changes in the volume of assets and liabilities and revaluation items for both, relevant to the rest of the world account.

2. The international accounts in *BPM6*

26.10 In the description of the rest of the world accounts above, it was noted that exports, for example, are treated as a use by the rest of the world and imports as a resource from the rest of the world. As its name implies, the rest of the world account is drawn up from the perspective of the rest of the world. *BPM6* looks at the same stocks and flows from the point of view of the domestic economy. Thus the *BPM6* entries are the mirror image of the SNA entries relating to the rest of the world.

26.11 Further, in the context of *BPM6*, stock levels are usually referred to as positions and the balance sheet accounts for all financial assets and liabilities where one party to the

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

arrangement is non-resident is called the international investment position.

26.12 The international accounts for an economy summarize the economic relationships between residents of that economy and the rest of the world. They comprise:

a. the balance of payments, which summarizes transactions between residents and non-residents during a specific time period;

b. the international investment position (IIP), which shows at a point in time the value of: financial assets of residents of an economy that are claims on non-residents or are gold bullion held as reserve assets; and the liabilities of residents of an economy to non-residents; and

c. the other changes in financial assets and liabilities account, a statement that shows other flows, such as valuation changes, which reconcile the balance of payments and IIP for a specific period by showing changes due to economic events other than transactions between residents and non-residents.

These accounts correspond to the transactions, balance sheets and other changes in assets accounts in the SNA, respectively. Note, though, that what appear as assets in the rest of the world account appear as liabilities in the international accounts and vice versa.

3. The structure of the chapter

26.13 Section B of the chapter discusses the accounting rules of the international accounts. These are consistent with the SNA accounting rules and agreement has been reached on when the SNA and when *BPM6* takes the lead in defining the rules to be applied in both contexts. Residence is a case in point where the SNA follows *BPM6*.

26.14 The structure of the international accounts and their relation to similar SNA accounts is the subject of section C.

26.15 A feature of the financial accounts and IIP of the international accounts is the introduction of functional categories that describe the main purpose of financial investment abroad. This is the subject of section D.

26.16 Section E touches on some considerations of particular importance to the international accounts; global imbalances, exceptional financing, debt reorganization, currency unions and currency conversions.

B. Accounting principles

1. Comparison with SNA accounting principles

26.17 Although the SNA works with a quadruple-entry accounting system, the balance of payments has only a double-entry system. When a transaction is undertaken between two resident units, four entries are necessary, for example two showing the exchange of a good and two the exchange of a means of payment. However, when a resident unit carries out a transaction with a non-resident unit, national compilers are unable to verify independently the counterpart entries in the rest of the world. As a result, although in principle the balance of payments is balanced, in practice, there may be an imbalance due to shortcomings in source data and compilation so that there is a mismatch between financial transactions and their counterparts within the domestic economy. This imbalance, a usual feature of published balance of payments data, is labelled net errors and omissions. The balance of payments manuals have traditionally discussed this item, to emphasize that it should be published explicitly, rather than included indistinguishably in other items and that it should be used to indicate possible sources of mismeasurement.

26.18 However, there has been increasing interest in estimates that are derived from counterpart reporting that has better coverage, valuation, etc. As well, there has been much work done on reconciling data from the view of both parties (for example, exports of one country, with the counterpart imports recorded by the partner country) and global totals. Counterparty data are also necessary to prepare consolidated data for a currency or economic union from the data of individual member countries. In effect, all this work is built on the fact that balance of payments statistics effectively become a quadruple-entry system when used at the bilateral or global level.

Valuation

26.19 Valuation principles are the same in the SNA and the international accounts. In both cases, market values are used, with nominal values used for some positions in instruments where market prices are not observable. In the international accounts, the valuation of exports and imports of goods is a special case where a uniform valuation point is used, namely the value at the customs frontier of the exporting economy, that is, the FOB-type valuation (free on board). This treatment brings about consistent valuation between exporter and importer and provides for a consistent basis for measurement in circumstances where the parties may have a wide range of different contractual arrangements, from “ex-works” at one extreme (where the importer is responsible for arranging all transport and insurance) to “delivered duty paid” at the other (where the exporter is responsible for arranging all transport, insurance and any import duties). In international transactions, there may be motivations for under- or over-invoicing in order to evade taxes or exchange controls, so *BPM6* provides guidance on how to develop market-equivalent prices when these cases are identified, and how to make the necessary adjustments needed to other items affected. There is further

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

discussion on the recording of imports and exports in chapters 14 and 28.

Time of recording and change of ownership

26.20 Time of recording and ownership principles are the same in the SNA and the international accounts. In practice, the change of economic ownership of goods is often taken to be when the goods are recorded in customs data. To the extent that there are differences between customs data and actual changes in ownership, such as for items with large values or goods sent on consignment (that is, dispatched before they are sold), adjustments are made.

26.21 There are no longer any exceptions to the recording basis of the change of economic ownership. However, there is a different presentation in the case of merchanting; that is, where an owner buys and resells goods in the same condition without the goods passing through the territory of the owner. In that case, the acquisition of the goods is identified as a change of ownership, but shown as a negative export rather than an import on acquisition of the goods and as a positive export on disposal. If the goods are acquired in one period and not disposed of until a subsequent period, they will appear in changes in inventories of the merchant even though these inventories are held abroad. A consequence of this change in treatment is that in the international accounts, merchanting now appears as transactions in goods where previously it was recorded as a transaction in services.

26.22 The principle of recording imports and exports when change of ownership takes place applies also to items such as high-value capital goods where change of ownership is recorded as work is put in place. (See paragraphs 10.53 and 10.55.)

Netting

26.23 The same rules on netting are applied in *BPM6* as in the SNA. In general, netting is not advised except in the special case of recording transactions in financial assets and liabilities. However, only acquisitions and disposals of the same type of asset (or incurrence and redemption of the same type of liability) are netted. There is no netting of assets against liabilities, even of the same sort of instrument and no netting across different sorts of instruments. Greater detail about netting in respect of financial instruments appears in chapter 3 of *BPM6*, paragraphs 3.109 to 3.121.

2. Units

26.24 The international accounts and the SNA are built on the same definitions of institutional units and residence. Because the international accounts focus on economic relationships between residents and non-residents, more elaboration of borderline cases is provided in *BPM6*.

Economic territory

26.25 The most commonly used concept of economic territory is the area under the effective economic control of a single government. However, currency or economic unions, regions, or the world as a whole may be used, as they may also be a focus for macroeconomic policy or analysis.

26.26 An economic territory includes the land area including islands, airspace, territorial waters and territorial enclaves in the rest of the world (such as embassies, consulates, military bases, scientific stations, information or immigration offices, that have immunity from the laws of the host territory) physically located in other territories. Economic territory has the dimensions of physical location as well as legal jurisdiction, so that corporations created under the law of that jurisdiction are part of that economy. The economic territory also includes special zones, such as free trade zones and offshore financial centres. These are under the control of the government so are part of the economy, even though different regulatory and tax regimes may apply. (However, it may also be useful to show separate data for such zones.) The territory excludes international organizations and enclaves of other governments that are physically located in the territory.

Institutional units

26.27 The concept of an institutional unit is the same in the SNA and *BPM6*. Because of the focus on the national economy, there are some special treatments of units in cross-border situations. As discussed below, in some cases, legal entities are combined into a single institutional unit if they are resident in the same economy, but are not combined if they are resident in different economies. Similarly, a single legal entity may be split when it has substantial operations in two or more economies. As a result of these treatments, the residence of the resulting units concerned becomes more clear-cut and the concept of the economic territory is strengthened.

26.28 As discussed in chapter 4, resident artificial subsidiaries and special purpose entities (SPEs) are combined with their owners into single legal entities. However, a legal entity that is resident in one jurisdiction is never combined with a legal entity resident in another. As a result, SPEs and other similar corporate structures owned by non-residents are considered to be resident of their territory of incorporation, even though most or all of their owners and most or all of their assets are in another economy.

26.29 Similarly, members of a household must all be resident in the same economy. If a person resides in a different economy from the other members of a household, that person is not regarded as a member of that household, even though they may share income and expenses, or hold assets together.

Branches

26.30 A branch is an unincorporated enterprise that belongs to a non-resident unit, known as the parent. It is resident and treated as a quasi-corporation. The identification of branches as separate institutional units requires indications of substantial operations that can be separated from the rest of the entity. A branch is recognized in the following cases:

a. Either a complete set of accounts, including a balance sheet, exists for the branch, or it is possible and

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

meaningful, from both an economic and legal viewpoint, to compile these accounts if required. The availability of separate records indicates that an actual unit exists and makes it practical to prepare statistics.

In addition, one or both of the following factors tend to be present:

b. The branch undertakes or intends to undertake production on a significant scale which is based in a territory other than that of its head office for one year or more:

- if the production process involves physical presence, then the operations should be physically located in that territory;

- if the production does not involve physical presence, such as some cases of banking, insurance, other financial services, ownership of patents, merchanting and "virtual manufacturing", the operations should be recognized as being in the territory by virtue of the registration or legal domicile of those operations in that territory.

c. The branch is recognized as being subject to the income tax system, if any, of the economy in which it is located even if it may have a tax-exempt status.

26.31 The identification of branches has implications for the statistical reporting of both the parent and branch. The operations of the branch should be excluded from the institutional unit of its head office and the delineation of parent and branch should be made consistently in both of the affected economies. A branch may be identified for construction projects or mobile operations such as transport, fishing or consulting. However, if the operations are not substantial enough to identify a branch, they are treated as an export of goods or services from the head office.

26.32 In some cases, preliminary operations related to a future direct investment project prior to incorporation are sufficient evidence of establishing residence that a quasi-corporation is established. For example, licences and legal expenses for a project are shown as being incurred by a quasi-corporation, and are part of direct investment flows into that unit rather than sales of licences to non-residents, or exports of services, respectively, to the head office.

Notional resident units

26.33 When land located in a territory is owned by a non-resident entity, a notional unit that can be treated as resident is identified for statistical purposes as being the owner of the land. This notional resident unit is a kind of quasi-corporation. The notional resident unit treatment is also applied to associated buildings, structures and other improvements on that land, leases of land for long periods, and ownership of natural resources other than land. As a result of this treatment, the non-resident is owner of the notional resident unit, rather than owning the land directly, so there is an equity liability to the non-resident, but the land and other natural resources are always assets of the economy in which they are located. The notional resident unit usually supplies services to its owner, for example accommodation in the case of vacation homes.

26.34 In general, if a non-resident unit has a long-term lease on an immovable asset such as a building, this is associated with it undertaking production in the economy where it is located. If for any reason there is no associated production activity, a notional resident unit is also created to cover such a lease.

Multiterritory enterprises

26.35 A few enterprises operate as a seamless operation over more than one economic territory, typically for cross-border activities such as airlines, shipping lines, hydroelectric schemes on border rivers, pipelines, bridges, tunnels and undersea cables. If possible, separate branches should be identified, but if the entity is run as a single operation with no separate accounts or decision-making for each territory that it operates in, it is not possible to delineate branches. In such cases, because of the central focus on data for each national economy, it is necessary to split the operations between economies. The operations should be prorated according to an appropriate enterprise-specific indicator of the proportions of operations in each territory. The prorating treatment may also be adopted for

Table 26.1:Selected effects of a household's residence status on the statistics of the host economy

Economic flow or position	Resident (for example, long-term guest worker)	Non-resident (for example, short-term guest worker)
Compensation of employees received from enterprises in the reporting economy	Resident-to-resident compensation of employees	Resident-to-non-resident compensation of employees
Personal expenditure in the reporting economy	Resident-to-resident transaction	Exports of services, mainly travel
Transfers to relatives in home economy	Resident-to-non-resident current or capital transfers	Non-resident-to-non-resident transfer (There is often some international financial transaction of the short-term worker returning funds from his host to his home economy, for example via a bank in the host economy)
A resident institutional unit's financial claims on or liabilities to the household	Resident-to-resident financial claim	International financial claim
Land and buildings owned in host economy	Non-financial asset	Non-financial asset and direct investment liability of a notional resident unit
Land and buildings owned in home economy	Direct investment asset in notional resident unit	Not in balance sheet of host economy

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

enterprises in zones subject to joint administration by two or more governments.

3. Residence

26.36 ***The residence of each institutional unit is the economic territory with which it has the strongest connection, expressed as its centre of predominant economic interest.*** An institutional unit is resident in an economic territory when there exists, within the economic territory, some location, dwelling, place of production, or other premises on which or from which the unit engages and intends to continue engaging, either indefinitely or over a finite but long period of time, in economic activities and transactions on a significant scale. The location need not be fixed so long as it remains within the economic territory. Actual or intended location for one year or more is used as an operational definition. While the choice of one year as a specific period is somewhat arbitrary, it is adopted to avoid uncertainty and facilitate international consistency. Most units have strong connections to only one economy but with globalization, a growing number have strong links to two or more economies.

Residence of households

26.37 A household is resident in the economic territory in which household members maintain or intend to maintain a dwelling or succession of dwellings treated and used by members of the household as their principal dwelling. If there is uncertainty about which dwelling is the principal dwelling, it is identified from the length of time spent there, rather than other factors such as cost, size, or length of tenure. Being present for one year or more in a territory or intending to do so is sufficient to qualify as having a principal dwelling there. The implications of the residence of a household for the recording of its flows and stocks are summarized in table 26.1.

26.38 In addition to the general principles, additional guidance in determining the residence of households is given in the following specific cases:

a. *Students*. People who go abroad for full-time study generally continue to be resident in the territory in which they were resident prior to studying abroad. This treatment is adopted even though their course of study may exceed a year. However, students become residents of the territory in which they are studying when they develop an intention to continue their presence in the territory of study after the completion of the studies. Members of the same household who are accompanying dependents of students are also considered to be residents of the same economy as the student.

b. *Patients*. People who go abroad for the purpose of medical treatment maintain their predominant centre of interest in the territory in which they were resident prior to the treatment, even in the rare cases where complex treatments take a year or more. As with students, accompanying dependents are treated in the same way.

c. *Crew of ships etc.* Crew of ships, aircraft, oil rigs, space stations or other similar equipment that operate outside a territory or across several territories are treated as being resident in the territory of their home base. The home base is determined by where they spend most of their time when not undertaking their duties. This location may not be the same as that of the operator of the mobile equipment.

d. *Diplomats, military personnel, etc.* National diplomats, military personnel and other civil servants employed abroad in government enclaves and their households are considered to be residents of the economic territory of the employing government. However, other employees, such as locally recruited staff and international organization staff are resident in the location of their principal dwelling.

e. *Cross-border workers*. There is no special treatment for these workers. The residence of the persons concerned is based on the principal dwelling, rather than the territory of employment, so employees who cross borders to undertake a job still have their residence determined from their principal dwelling.

f. *Refugees*. No special treatment is adopted for refugees, so their residence will change from their home territory if they stay or intend to stay in another economy for a year or more, regardless of their legal status or intention to return.

Table 26.2:Selected effects of the residence status of an enterprise on the statistics of the host economy

Economic flow or position	Resident enterprise (for example, major long-term construction project)	Non-resident enterprise (for example, minor short-term construction project)
Sales by enterprise to residents	Resident-to-resident transaction	Imports of goods and services
Purchases by enterprise from residents	Resident-to-resident transaction	Exports of goods and services
Compensation of employees payable to residents of host economy	Resident-to-resident compensation of employees	Non-resident-to-resident compensation of employees
Compensation of employees payable to residents of home economy	Resident-to-non-resident compensation of employees	Not a transaction of host economy
Net operating surplus	Dividends payable or reinvested earnings	Not a transaction of host economy
Injections of funds by owners	Direct investment liabilities of the reporting economy	Not a transaction of host economy
A resident institutional unit's financial claims on or liabilities to the enterprise	Resident-to-resident financial claims	International financial claims

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

g. *Highly mobile individuals*. Some individuals have close connections with two or more economies. In cases of no principal dwelling, or two or more principal dwellings in different economies, the residence is determined on the basis of the territory in which the predominant amount of time is spent in the year. While these individuals need to be classified as residents of a single economy for statistical purposes, additional information may be needed in recognition of strong ties to another economy.

26.39 When households change their economy of residence, there are changes to the status of the assets they own and liabilities they owe. These changes are recorded as reclassifications through the other changes in volume account. Because of the treatment of having a notional resident unit for ownership of land by non-residents, new notional units may be identified or old ones converted to ownership of the assets as a result of changes in residence of the owners.

Residence of enterprises

26.40 An enterprise is resident in an economic territory when the enterprise is engaged in a significant amount of production of goods or services from a location in the territory. Taxation and other legal requirements tend to result in the use of a separate legal entity for operations in each legal jurisdiction. In addition, a separate institutional unit is identified for statistical purposes where a single legal entity has substantial operations in two or more territories (for example, for branches, land ownership and multiterritory enterprises, as noted above). As a result of splitting such legal entities, the residence of each of the subsequently identified enterprises is usually clear. The implications of the residence of an enterprise for the recording of its flows and stocks are summarized in table 26.2.

26.41 In some cases, the physical location of an enterprise is not sufficient to identify its residence because the enterprise has little or no physical presence, for example its administration is entirely contracted out to other entities. Banking, insurance, investment funds, securitization vehicles and some special purpose entities may operate in this way. Many trusts, corporations, or foundations that hold private wealth also have little or no physical presence. Similarly, with virtual manufacturing, all the physical processes are outsourced to other units. In the absence of any significant physical dimension to an enterprise, its residence is determined according to the economic territory under whose laws the enterprise is incorporated or registered. The incorporation and registration represent a substantial degree of connection to the economy, associated with jurisdiction over the enterprise's existence and operations. In contrast, other connections such as ownership, location of assets, or location of its managers or administrators may be less clear-cut.

26.42 In some rare cases, laws allow enterprises to change their economy of residence, such as within an economic union. In such cases, as for households, a change of residence means that their assets and liabilities change their status through other changes in volumes. More commonly, what is called "corporate migration" involves the conveyance of assets and liabilities from a corporation in one economy to a related entity in another economy recorded as a transaction rather than a change of residence of the entity.

Residence of other entities

26.43 General government includes territorial enclaves, such as embassies, consulates, military bases and other enclaves of foreign governments. However, an entity created by a government under the laws of another jurisdiction is an enterprise resident in the host jurisdiction and not part of the general government sector in either economy.

26.44 International organizations are resident in an economic territory of their own and not of the economy in which they are physically located. An international organization that operates military forces or acts as the interim administration in a territory remains an international organization and is non-resident in that territory, even if it undertakes general government functions there. In cases where these organizations are significant, it may be desirable to identify them separately. Some international organizations cover a group of economies in a particular region, such as with economic or currency unions. If statistics are prepared for that region as a whole, these regional organizations are residents of the region as a whole, even though they are not residents of any member economy.

26.45 A non-profit institution serving households (NPISH) has a centre of economic interest in the economy where the institution is legally created or otherwise officially recognized. When an NPISH is engaged in charity or relief work on an international scale, the foreign operations may be sufficiently substantial to be recognized as branches.

C. A comparison between the international accounts and the SNA rest of the world accounts

26.46 Like the SNA, the international accounts cover accounts for current transactions, accumulation accounts and balance sheets. The transaction accounts are collectively called the balance of payments. An overview of the international accounts presentation (using the SNA numerical example) is given in tables 26.3. The three current accounts are the goods and services account, the primary income account and the secondary income account. The primary income account corresponds to the allocation of primary income accounts in the SNA, the secondary income account to the secondary distribution of income account in the SNA. The income accounts in *BPM6* do not use distribution and redistribution in their titles, since they do not show distribution and redistribution from one party to another,

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

but just show the income from the point of view of one party. Because there is no account corresponding to use of income in the international accounts, the adjustment for the change in pension entitlements term appears as a single item after the secondary income account. (Cross-border pensions are currently minor for most economies.)

26.47 There are no exact parallels in the international accounts for the production account, the generation of income account and use of income account because the international accounts do not describe production, consumption (or capital formation). Products imported and exported are treated as simple transactions in all cases; whether the products will eventually be used for intermediate consumption, final consumption, capital formation, or will be re-exported is unknown in the context of the international transaction. The use made of products is entirely domestic in nature.

26.48 Table 26.3 also shows the restricted form of the capital account in the international accounts and the financial account using the functional classification of financial transactions rather than the instrument classification used in the SNA. Because the functional classification is a grouping of instruments, the two forms of presentation are strictly consistent. The functional classification is described below in section D. (The explanation of the shaded cell for reserves liabilities is explained in section D also.)

1. Goods and services account

26.49 The goods and services account consists only of imports and exports of goods and services because these are the only transactions in goods and services with a cross-border dimension. Goods and services are recorded when there is a change of economic ownership from a unit in one economy to a unit in another country. Although there is usually a

Table 26.3:Overview of the balance of payments

	Credits	Debits	Balance
Current accounts

physical movement of goods when there is a change of ownership, this is not necessarily the case. In the case of merchanting, goods may change ownership and not change location until they are resold to a third party.

26.50 Goods that change location from one economy to another but do not change economic ownership do not appear in imports and exports. Thus goods sent abroad for processing, or returned after processing, do not appear as imports and exports of goods; only the fee agreed for processing appears as a service.

26.51 The balance of payments gives emphasis to the distinction between goods and services. This distinction reflects policy interests, in that there are separate international treaties covering goods and services. It also reflects data issues, in that data on goods are usually obtained from customs sources, while data on services are usually obtained from payments records or surveys.

26.52 The main source of data for goods is international merchandise trade statistics. International standards are given in *International Merchandise Trade Statistics: Concepts and Definitions (IMTS)* (United Nations, 1998). *BPM6* identifies some sources of difference that may occur in some or all countries. It also recommends a standard reconciliation table to assist users in understanding these differences. One major source of difference is that the standards for IMTS use a CIF-type (cost, insurance and freight) valuation for imports, while the balance of payments use a uniform FOB valuation for both exports and imports. It is therefore necessary to exclude freight and insurance costs incurred between the customs frontier of the exporter and the customs frontier of the importer. Because of variations between the FOB-type valuation and actual contractual arrangements, some freight and insurance costs need to be rerouted.

26.53 The change of ownership basis used for the balance of payments means that goods entries will have a time of reporting consistent with the corresponding financial flows. In *BPM6*, there are no longer exceptions to the change of ownership principle. In contrast, IMTS follow the timing of customs processing. While this timing is often an acceptable approximation, adjustments may be needed in some cases, such as goods sent on consignment. In the case of goods sent abroad for processing with no change of ownership, the values of goods movements are included in IMTS, but changes in ownership are the primary presentation in the balance of payments. (However, the values of goods movements are recommended as supplementary items to understand the nature of these arrangements.) Further details of the recording of these processing arrangements are given in chapter 21. Other adjustments to IMTS may be needed to bring estimates into line with the change of economic ownership of goods, either generally or because of the particular coverage of each country. Possible examples include merchanting, non-monetary gold, goods entering or leaving the territory illegally, goods procured in ports by carriers, and goods moving physically but where there has been no change of ownership.

26.54 Re-exports are foreign goods (goods produced in other economies and previously imported with a change of economic ownership) that are exported with no substantial transformation from the state in which they were previously imported. Because re-exported goods are not produced in the economy concerned, they have less connection to the economy than other exports. Economies that are major trans-shipment points and locations of wholesalers often have large values of re-exports. Re-exports increase the figures for both imports and exports and when re-exporting is significant the proportions of imports and exports to economic aggregates are increased also. It is therefore useful to show re-exports separately. Goods that have been imported and are waiting to be re-exported are recorded in inventories of the resident economic owner.

26.55 Goods are presented at an aggregate level in the balance of payments. More detailed commodity breakdowns can be obtained from IMTS data.

26.56 Detail is produced for the following 12 standard components of services:

a. Manufacturing services on physical inputs owned by others;

b. Maintenance and repair services n.i.e.;

c. Transport;

d. Travel;

e. Construction;

f. Insurance and pension services;

g. Financial services;

h. Charges for the use of intellectual property n.i.e.;

i. Telecommunications, computer and information services;

j. Other business services;

k. Personal, cultural and recreational services; and

l. Government goods and services n.i.e.

26.57 Three of the standard components are transactor-based items, that is, they relate to the acquirer or provider, rather than the product itself. These categories are travel, construction and government goods and services n.i.e.

a. Travel covers all goods or services acquired by non-residents during visits whether for own use or to give away. Travel includes goods, local transport, accommodation, meals and other services.

b. Construction covers both the total value of the product delivered by the contractor and any goods and services sourced locally by the contractor that are not recorded in imports and exports of goods.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

c. Government goods and services n.i.e. cover a range of items that cannot be allocated to more specific headings.

Besides the three transactor-based items, the remaining components are product-based, built from the more detailed classes of the *CPC 2*. Additional standards for services trade are shown in the *Manual on Statistics of International Trade in Services (MSITS) (*United Nations, European Commission, International Monetary Fund, Organisation for Economic Co-operation and Development, United Nations Conference on Trade and Development and the World Trade Organization, 2002), which is fully harmonized with the international accounts.

2. The primary income account

26.58 The entries in the primary income account are concerned with compensation of employees and property income, exactly as in the allocation of primary income account in the SNA. Payments of taxes on production by residents and receipts of subsidies by residents from the domestic government are recorded in the generation of income account, an account that does not form part of the balance of payments. Any payments of taxes on production payable by a resident to another government as well as any subsidy receivable by a resident from another government are recorded in the primary income account of the balance of payments. The matching entries for the domestic government are shown in the SNA in the allocation of primary income account and for foreign governments in the rest of the world column of that account and in the primary income account of the balance of payments.

26.59 Rent may arise in cross-border situations, but rarely, because all land is deemed to be owned by residents, if necessary by creating a notional resident unit. An example where rent may be recorded in the international accounts may be short-term fishing rights in territorial waters provided to foreign fishing fleets. It is common in the international accounts to use the term investment income meaning property income excluding rent. Investment income therefore reflects income arising from the ownership of financial assets and the disaggregation of investment income matches that of financial assets and liabilities so that rates of return can be calculated.

26.60 In *BPM6*, interest flows are measured on exactly the same basis as in the SNA with FISIM separated and treated as an import or export of financial services.

Income of direct investment enterprises

26.61 The role of direct investment enterprises is particularly important and reflected in both the flows and positions in the international accounts. There is extended discussion on the identification and role of direct investment enterprises in section D.

26.62 As explained in paragraphs 7.136 to 7.139, in the case of a direct investment enterprise, it is assumed that a proportion of the enterprise's retained earnings is distributed to the direct investor as a form of investment income. The proportion corresponds to the direct investor's holding in the enterprise.

26.63 Retained earnings are equal to the net operating surplus of the enterprise plus all property income earned less all property income payable (before calculating reinvested earnings) plus current transfers receivable less current transfers payable and less the item for the adjustment for the change in pension entitlements. Reinvested earnings accrued from any immediate subsidiaries are included in the property income receivable by the direct investment enterprise.

26.64 Reinvested earnings may be negative, for example where the enterprise makes a loss or where dividends are distributed from holding gains, or in a quarter when an annual dividend is paid. However, if the dividends are disproportionately large relative to recent levels of dividends and earnings, the excess should be recorded as a withdrawal of owner's equity from the corporation as explained in paragraph 7.131.

26.65 For a direct investment enterprise that is 100 per cent owned by a non-resident, reinvested earnings are equal to retained earnings and the saving of the enterprise is exactly zero.

3. Secondary income account

26.66 The entries in the secondary income account are current transfers. The range of entries corresponds exactly to those in the secondary distribution of income account in the SNA. Several of these are particularly important in the international accounts, especially current international cooperation and remittances sent to their home countries by individuals working abroad.

26.67 Cross-border personal transfers are household-to-household transfers and are of interest because they are an important source of international funding for some countries that provide large numbers of long-term workers abroad. Personal transfers include remittances by long-term workers, that is, those who have changed their economy of residence.

26.68 Other workers, such as border and seasonal workers do not change their economy of residence from the home economy. Instead of transfers, the international transactions of these workers include compensation of employees, taxes and travel costs. A supplementary presentation of personal remittances brings together personal transfers with these related items. Personal remittances include personal transfers, compensation of employees less taxes and travel, and capital transfers between households. For further details, see Appendix 5 Remittances in *BPM6*.

26.69 Insurance flows, especially flows relating to reinsurance, can be important internationally. These flows are recorded in the same way as in the SNA, both as regards the separation of a financial service charge and the treatment of direct insurance and reinsurance flows separately and not on a consolidated basis. Detailed information on this separation is given in part 1 of chapter 17.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

4. Balancing items in the current accounts of the international accounts

26.70 The structure of the balancing items in the balance of payments is somewhat different from that in the SNA, in that each account has its own balancing item and another that carries down to the next account. To illustrate, the primary income account has its own balancing item (balance on primary income) and a cumulative balance (balance on goods, services and primary income). The external balance on primary income corresponds to balance of primary incomes and is the item feeding into GNI. The current external balance corresponds to saving by the rest of the world relative to the domestic economy. The balancing items in the *BPM6* structure of accounts are shown in table 16.3, reproduced here for convenience as table 26.4.

5. The capital account

26.71 The elements of the capital account subject to international transactions are more restricted than those covered in the SNA. The entries in the capital account cover acquisitions and disposals of non-produced non-financial assets and capital transfers. There are no transactions recorded as capital formation of produced assets because, as explained earlier, the ultimate use of exports is not a concern for the national economy.

26.72 Like the SNA, net lending or net borrowing is the balancing item for the sum of the current and capital accounts and for the financial account. As in the SNA, it covers all instruments used for providing or acquiring funding, not just lending and borrowing. Conceptually, it has the same value as the national accounts item for the total economy, and the same as the national accounts item for the rest of the world but with the sign reversed.

6. The financial account and IIP

26.73 The financial account of the balance of payments and the IIP are of particular importance because they provide an understanding of international financing as well as of international liquidity and vulnerability. The integrated IIP statement, including the IIP and associated financial and other changes accounts, is shown in Table 26.5. The primary classification is based on functional categories, with additional data on instruments and institutional sectors.

26.74 The functional categories, described in section D, convey more information about the motivation and relationship between the parties, which are of particular interest to international economic analysis. Data by functional category are further subdivided by instrument and institutional sector, which makes it possible to link them to the corresponding SNA and monetary and financial statistics items. The institutional sector classification is the same as in the SNA, although it is usually abbreviated (to five sectors in the standard components). In addition, a supplementary subsector is used for monetary authorities, which is a functional subsector linked to reserve assets. It covers the central bank and any parts of general government or financial corporations other than the central bank that hold reserve assets, so is relevant for countries

Table 26.4: Balancing items in the international accounts in relation to the SNA sequence of accounts

Uses		Resources
Rest of the world	Transactions and balancing items	Rest of the world
	Goods and services account	
	Imports of goods and services	499
540	Exports of goods and services	
- 41	*External balance of goods and services*	
	Primary income account

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

where some or all reserves are held outside the central bank.

26.75 The part of the balance sheets covered in the international accounts is called the IIP. The terminology highlights the specific components of the national balance sheet which are included. The IIP covers only financial assets and liabilities because, to be included in the IIP, there must be a cross-border element. In the case of financial claims, the cross-border element arises when one party is a resident and the other party is a non-resident. In addition, while gold bullion is an asset that has no counterpart liability, it is included in the IIP when held as a reserve asset, because of its role as a means of international payments. However, non-financial assets are excluded as they do not have a counterpart liability or other international aspect.

26.76 The balancing item on the IIP is the net IIP. The net IIP plus non-financial assets in the national balance sheet equal national net worth, because resident-to-resident financial claims net to zero in the national balance sheet.

26.77 The same level of detail is used for investment income and the IIP. As a result, average rates of return can be calculated. Rates of return can be compared over time and for different instruments and maturities. For example, the trends in return on direct investment can be analysed, or the return can be compared with other instruments.

7. The other changes in assets accounts

26.78 International assets and liabilities may be subject to all the possible types of other changes in the volume of assets and liabilities and to revaluation changes.

26.79 Because instruments are often denominated in foreign currencies and analysis of the effect of exchange rate movements is particularly important, there is a breakdown of revaluations into exchange rate changes and other factors.

D. International accounts functional categories

26.80 The international accounts functional categories are the primary classification used for each of investment income, financial transactions and positions in the international accounts. The following five categories are identified:

a. direct investment;

b. portfolio investment;

c. financial derivatives (other than reserves) and employee stock options;

d. other investment; and

e. reserve assets.

26.81 Detailed definitions are given later in this section. The functional categories are built on the classification of

Table 26.5:Overview of Integrated International Investment Position Statement

	Opening position	Transactions (Financial account)	Other changes in the volume of assets	Revaluation	Closing position
Assets (by functional category)					
Direct investment	78	8	0	1	87
Portfolio investment	190	18	0	2	210
Financial derivatives (other than reserves) and ESOs	7	3	0	0	10
Other investment	166	20	0	0	186
Reserve assets	833	8	0	12	853
Total	*1 274*	*57*	*0*	*15*	*1 346*
Liabilities (by functional category)

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

financial instruments discussed in chapters 11 and 13, but with an additional dimension that takes into account some aspects of the relationship between the parties and the motivation for investment. As a result, the different categories exhibit different patterns of behaviour. For example, there is a different type of relationship between the parties for direct investors compared to portfolio investors holding equity. Direct investment is related to control or a significant degree of influence, and tends to be associated with a lasting relationship although it may be short-term. In addition to financial resources, direct investors often supply additional factors such as know-how, technology, management and marketing. As well, related companies are more likely to trade with and lend to each other. In contrast, portfolio investors typically have a smaller role in the decision-making of the enterprise, with potentially important implications for future flows, and for the volatility of the price and volume of positions. Portfolio investment differs from other investment in that it provides a direct way to access financial markets, and so can provide liquidity and flexibility.

26.82 Reserve assets include a range of instruments that are shown under other categories when not owned by monetary authorities or other units authorized by the monetary authorities and sometimes even when held by monetary authorities. However, as reserve assets they are identified as being available to meet international payments financing needs and undertake market intervention to influence the exchange rate.

26.83 The instrument classification alone does not fully reflect these behavioural differences. For example, a loan can appear under direct investment or other investment, but the different nature of the relationship between the parties

Table 26.6: Link between Financial Assets Classification and Functional Categories

means that the risks and motivations behind the transaction tend to differ. A direct investment loan is more likely to be provided and generally involves less vulnerability on the part of the borrowing economy because of the relationship between the parties. Table 26.6 shows the relationship between instruments and functional categories.

1. Direct investment

26.84 ***Direct investment is a category of cross-border investment associated with a resident in one economy having control or a significant degree of influence on the management of an enterprise that is resident in another economy.*** As well as the equity that gives rise to control or influence, direct investment also includes associated debt (except debt between affiliated financial intermediaries).

26.85 Control is determined to exist if the direct investor owns more than 50 per cent of the voting power in the direct investment enterprise. Such an enterprise is called a subsidiary. A significant degree of influence is determined to exist if the direct investor owns from 10 to 50 percent of the voting power in the direct investment enterprise. Such an enterprise is called an associate. In order to achieve bilateral consistency and avoid subjective decisions about actual control or influence, these operational definitions should be used in all cases.

26.86 As well as immediate direct investment relationships, there may be indirect direct investment relationships, as a result of a chain of ownership. In addition, fellow enterprises may be an important part of direct investment. (Fellow enterprises are enterprises that have less than ten per cent equity in each other but which are under the control or influence of the same investor who is a foreign direct investor in at least one of the fellows.) Reverse investment arises when direct investment enterprises invest in their own direct investors but have less than ten per cent of the voting power in the direct investor.

26.87 Direct investment includes debt between the parties as well as equity except in the case of debt positions between related financial institutions. Such debt between related companies may be called inter-company lending. One of the features of a group of direct investment enterprises is that its members are more likely to extend loans and trade credit to each other than are unrelated enterprises.

26.88 Because of the relationship of control or influence, the direct investor's share of retained earnings of a subsidiary or associate is imputed as first being paid out as an income flow and then reinvested as a financial transaction. The income item is called reinvested earnings; the corresponding equal entry in the financial account is called reinvestment of earnings. Reinvested earnings are defined as the direct investor's share in the retained earnings of the enterprise, and so are consistent with the corresponding SNA items. A consequence is that there will be no saving by an enterprise that is 100 per cent foreign owned, because all saving will be attributed to its direct investor.

26.89 Those direct investment enterprises that are controlled by non-residents correspond to the SNA subsectors of foreign-controlled enterprises. However direct investment enterprises include those not subject to control from abroad but still subject to a significant degree of influence. The SNA's foreign-controlled enterprises are limited to inward direct investment, while the international accounts are also concerned with outward direct investment. Reinvested earnings on foreign direct investment in the SNA have the same scope as in the balance of payments (although "foreign" is not used because it is redundant in the context of the international accounts).

26.90 In addition to the statistics on the international financial flows associated with direct investment, information on foreign-controlled enterprises is provided through statistics on the Activities of Multinational Enterprises (AMNE statistics) and the closely related Foreign AffiliaTes Statistics (FATS). These cover items such as exports, imports, domestic sales and domestic purchases of goods and services. They therefore provide a wider picture of the operations of multinational enterprises. Additional information is available in *Recommendations Manual on the Production of Foreign AffiliaTes Statistics*, the *Handbook on Economic Globalisation Indicators* and *MSITS*.

2. Portfolio investment

26.91 ***Portfolio investment is defined as cross-border transactions and positions involving debt or equity securities, other than those included in direct investment or reserve assets***. Securities are instruments designed for convenient negotiability between parties, such as shares, bonds, notes and money market instruments. The negotiability of securities is a way of facilitating trading, allowing them to be held by different parties during their lives. Negotiability allows investors to diversify their portfolios and to withdraw their investment readily.

26.92 Portfolio investment typically depends on organized financial markets and associated bodies such as dealers, exchanges and regulators. In contrast, the parties to direct and other investment instruments usually deal directly with each other. The negotiability of portfolio investment transactions makes them a convenient and flexible investment channel, but also may be associated with volatility.

3. Financial derivatives (other than reserves) and employee stock options

26.93 The definition of the functional category financial derivatives (other than reserves) and employee stock options largely coincides with the corresponding financial instrument class, discussed in chapters 11 and 13. The difference in coverage between the functional category and the financial instrument is that financial derivatives associated with reserve asset management are excluded from the functional category and included in reserve assets. This category is identified separately because it relates to risk transfer, rather than supply of funds or other resources.

4. Other investment

26.94 ***Other investment is a residual category that includes positions and transactions other than those included in direct investment, portfolio investment, financial***

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

derivatives and employee stock options and reserve assets. It includes the remainder of the following financial instruments:

a. other equity;

b. currency and deposits;

c. loans (including use of IMF credit and loans from the IMF);

d. non-life insurance technical reserves, life insurance and annuities entitlements, pension entitlements and provisions for calls under standardized guarantees;

e. trade credit and advances;

f. other accounts receivable/payable; and

g. SDR allocations (SDR holdings are included in reserve assets).

5. Reserve assets

26.95 ***Reserve assets are those external assets that are readily available to and controlled by monetary authorities for meeting balance of payments financing needs, for intervention in exchange markets to affect the currency exchange rate and for other related purposes (such as maintaining confidence in the currency and the economy, and serving as a basis for foreign borrowing). Reserve assets must be denominated and settled in foreign currency.*** Underlying the concept of reserve assets are the notions of "control" and "availability for use" by the monetary authorities.

26.96 In general, only external claims actually owned by the monetary authorities can be classified as reserve assets. Nonetheless, ownership is not the only condition that confers control. In cases where institutional units (other than the monetary authorities) in the reporting economy hold legal title to external foreign currency assets and are permitted to do so only on terms specified by the monetary authorities or only with their express approval, such assets can be considered reserve assets. This is because such assets are under the direct and effective control of the monetary authorities.

26.97 Reserve assets must be readily available in the most unconditional form. A reserve asset is liquid in that the asset can be bought, sold and liquidated for foreign currency (cash) with minimum cost and time, and without unduly affecting the value of the asset. This concept refers to both non-marketable assets, such as demand deposits, and marketable assets, such as securities where there are ready and willing sellers and buyers. In order to be readily available to the authorities to meet balance of payments financing needs and other related purposes under adverse circumstances, reserve assets generally should be of high quality.

26.98 Reserve assets are limited to assets, but a memorandum item is provided for reserve-related liabilities that are included in other functional categories, mainly portfolio and other investment. (This is why the liabilities cell for reserves in table 26.3 is shaded.)

E. Special international accounts considerations

1. Global imbalances

26.99 In recent years, the IMF has done extensive work on global statistical imbalances. By summing data for all economies, global totals can be derived. (Although as a functional category, reserve assets have no counterpart liability, the constituent instruments can be allocated to their counterpart liabilities for an exercise of the type described here.) The extent of actual inconsistency has been used to identify systematic biases that can indicate reporting problems, for example, that services credits have higher coverage than services debits.

2. Exceptional financing

26.100 Exceptional financing brings together financial arrangements made by the authorities to meet balance of payments needs. Exceptional financing therefore identifies transactions according to their motivation. In addition, the incurrence of arrears is included in exceptional financing. Although it is not a transaction, it is an action the monetary authorities may take to manage their payments requirements.

26.101 Exceptional financing is presented in the "analytic" presentation of the balance of payments, as published in the *Balance of Payments Statistics Yearbook* (International Monetary Fund, annual). In this presentation, entries relating to reserves, IMF credit and exceptional financing are presented "below-the-line" while all the other entries, which will require funding, are shown above-the-line. This presentation facilitates analysis of the monetary authorities' international liquidity.

26.102 There is more discussion on exceptional financing in appendix 1 of *BPM6*.

3. Debt instruments

26.103 It is useful to group the different types of debt instruments, because debt instruments have particular implications for international liquidity and risk. Debt instruments are those instruments that require the payment of principal or interest or both at some point(s) in the future. Debt instruments comprise special drawing rights, currency and deposits, debt securities, loans, insurance technical reserves and provision for calls under standardized guarantees, and other

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

accounts receivable/payable. Financial derivatives are not debt instruments, but an overdue obligation on a financial derivative contract is classified as an account payable and thus is included as a debt instrument.

26.104 Debt instruments can be contrasted with equity and investment shares in the nature of the liability and risk. While equity gives a residual claim on the assets of the entity, a debt instrument involves an obligation to pay an amount of principal or interest or both usually according to a predefined formula, which means that the creditor has a more limited risk exposure. In contrast, the return on equity is largely dependent on the economic performance of the issuer, so the holders bear more of the risk. Additional information is provided in the *External Debt Guide*.

26.105 Debt instrument flows and positions are shown divided between long-term and short-term. Primarily, this split is according to their original maturity, that is, the period from issue until contractually scheduled final payment. In addition, because of the international accounts concern with international liquidity issues, liability data can also be prepared on the basis of remaining maturity, that is, the period from the reference date until contractually scheduled final payment, on a supplementary basis.

4. Debt reorganization

26.106 ***Debt reorganization (also referred as debt restructuring) is defined as arrangements involving both the creditor and the debtor (and sometimes third parties) that alter the terms established for servicing an existing debt.*** Governments are often involved in debt reorganization, as a debtor, or a creditor or a guarantor, but debt reorganization can also involve the private sector, such as through debt exchanges. Debt reorganization involves a range of different types of transactions as well as valuation and timing issues.

26.107 The four main types of debt reorganization are:

a. Debt forgiveness; a reduction in the amount of, or the extinguishing of, a debt obligation by the creditor via a contractual arrangement with the debtor;

b. Debt rescheduling or refinancing; a change in the terms and conditions of the amount owed, which may or may not result in a reduction in burden in present value terms;

c. Debt conversion; the creditor exchanges the debt claim for something of economic value, other than another debt claim on the same debtor, such as debt-for-equity swaps, debt-for-real-estate swaps, debt-for-development swaps, debt-for-nature swaps, and for debt prepayments, debt-for-cash; and

d. Debt assumption and debt payments on behalf of others when a third party is also involved.

Debt forgiveness across economies often involves government and there is further guidance on the treatments of these arrangements in chapter 22, *BPM6* and specialized manuals such as the *External Debt Guide*.

26.108 Debt repudiation, write-offs and write-downs of debt on a unilateral basis are not treated as transactions in either the SNA or *BPM6* and so are not considered part of debt reorganization.

5. Regional arrangements, including currency unions

26.109 Regional arrangements include:

a. monetary and currency unions, which provide for a single monetary policy across an area. Some of the same issues apply when one economy unilaterally adopts the currency of another economy, such as with “dollarization”;

b. economic unions, which harmonize certain economic policies to foster greater economic integration; and

c. customs unions, which have common tariff and other trade policies with non-member economies.

BPM6 gives detailed guidance on the treatments of these arrangements. Among the issues that are dealt with are the production of consolidated data for a union as a whole, the treatment of regional organizations, including the central bank, treatment of bank notes in a currency union, and revenue-sharing arrangements in a customs union.

6. Currency conversion, including multiple exchange rates

26.110 Exchange rates must be considered carefully when measuring international transactions and positions, as changes can distort measurement. Flows denominated in a foreign currency are converted to their value in the domestic currency at the rate prevailing when the flows take place, and positions are converted at the rate prevailing on the balance sheet date. The midpoint between the buying and selling rates should be used at the time of transaction (for transactions) and at the close of business on the reference date for positions. The difference between buying/selling prices and midpoint prices represents a service charge and should be recorded as such.

26.111 In principle, the actual exchange rate applicable to each transaction should be used for currency conversion. The use of a daily average exchange rate for daily transactions usually provides a very good approximation. If daily rates cannot be applied, average rates for the shortest period should be used. Some transactions occur on a continuous basis, such as the accrual of interest, over a period of time. For such flows, therefore, an average exchange rate for the period in which the flows occur should be used for currency conversion.

26.112 Under a multiple exchange rate regime, two or more exchange rates are applicable to different categories of transactions; the rates favour some categories and discourage others. Such rates incorporate elements similar to taxes or subsidies. Because the multiple rates influence the values and the undertaking of transactions expressed in domestic currency, net proceeds implicitly accruing to authorities as a result of these transactions are calculated as

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

implicit taxes or subsidies. The amount of the implicit tax or subsidy for each transaction can be calculated as the difference between the value of the transaction in domestic currency at the actual exchange rate applicable and the value of the transaction at a unitary rate that is calculated as a weighted average of all official rates used for external transactions. For conversion of positions of external financial assets and liabilities in a multiple rate system, the actual exchange rate applicable to specific assets or liabilities at the beginning or end of the accounting period is used.

26.113 Parallel (unofficial) or black market rates cannot be ignored in the context of a multiple rate regime and can be treated in different ways. For instance, if there is one official rate and a parallel market rate, the two should be handled separately. Transactions in parallel markets should be converted using the exchange rate applicable in that market. If there are multiple official rates and a parallel rate, the official rates and the parallel rate should be treated as distinct markets in any calculation of a unitary rate. Transactions effected at the parallel rate usually should be separately converted at that rate. However, in some instances, parallel markets may be considered effectively integrated with the official exchange rate regime. Such is the case when most or all transactions in the parallel market are sanctioned by the authorities or when the authorities actively intervene in the market to affect the parallel rate, or do both. In this instance, the calculation of the unitary rate should include both the official and parallel market rates. If only limited transactions in the parallel market are sanctioned by the authorities, the parallel rate should not be included in the calculation of a unitary rate.

Chapter 27: Links to monetary statistics and the flow of funds

A. Introduction

27.1 Chapter 11 describes the financial account of the sequence of accounts of the SNA. It shows transactions in each category of financial assets and liabilities for each of the institutional sectors of the national economy and of the rest of the world.

27.2 As explained when describing the principle of quadruple accounting in both chapter 11 and chapter 4, each transaction leads to two pairs of entries in the SNA accounts. For many transactions, one pair is recorded in one of the non-financial accounts and one pair in the financial account. For others, which are concerned with changing the composition of a portfolio of financial assets and liabilities, both pairs of entries are recorded in the financial account. It is for this reason that only by including the financial account in the sequence of accounts is the full articulation of the accounting system achieved.

27.3 However, the information in the financial account is of analytical and policy interest in its own right and represents an important part of monetary and financial statistics. These statistics are used to monitor the state of the money and other capital markets in particular and as an indicator of the state of the economy in general. For the latter, the link to the rest of the SNA accounts is usually implicit rather than explicit.

27.4 The purpose of this chapter is to give an introduction to the sorts of analyses involved in monetary and financial statistics more generally and to show how the data in the sequence of accounts can be linked to these other presentations. Further detail on monetary and financial statistics can be found in the *MFSM* and its companion *Compilation Guide (*International Monetary Fund (IMF) 2008), the *Manual on Sources and Methods for the Compilation of ESA 95 Financial Accounts (Eurostat, 2002b),* the *Monetary Financial Institutions and Market Statistic Manual* (European Central Bank, 2007) and in *Financial Production, Flows and Stocks in the SNA.* (United Nations and the European Central Bank, forthcoming).

1. Monetary statistics

27.5 Monetary statistics cover the stocks and flows of the assets and liabilities of financial corporations, both within an economy and between units in the economy and units in the rest of the world. However, a more aggregate level of subsectoring is used than in the SNA. Financial corporations are divided into two subsectors only at the highest level, depository corporations and the other financial corporations subsector. The former is then further subsectored into the central bank subsector and the other depository corporations subsector. More information on monetary statistics is given in section B.

2. Financial statistics

27.6 Financial statistics extend the range of monetary statistics to include the stocks and flows of financial assets and liabilities between all sectors of the economy and between the sectors of the economy and the rest of the world.

27.7 The basic accounting rules, concepts of residence, time of recording and the classification of financial assets and liabilities are consistent between the SNA, *BPM6* and *MFSM*. The *MFSM* uses a more aggregate level of sectoring than the SNA but one that is strictly consistent with it.

27.8 Some further aspects of financial statistics building on the classifications used in the financial account are discussed in section C.

3. Flow of Funds

27.9 The flow of funds is a three dimensional presentation of financial statistics where both parties to a transaction as well as the nature of the financial instrument being transacted are elaborated. A similar three dimensional presentation is also presented in respect of the stocks of financial assets and liabilities where the creditor and debtor of each instrument are shown. The flow of funds is discussed in section D.

A. Monetary statistics

1. Defining depository corporations

27.10 Money is very important as a financial variable, but the wide range of ways in which money is defined in different countries precludes a simple definition within the SNA.

27.11 The composition of broad money and other monetary aggregates varies widely among countries and encompasses many classes of deposits and certain categories of short-term securities, particularly negotiable certificates of deposit. In addition, many countries compile a range of money measures, as well as broader liquidity measures. Even within a single country, innovation, deregulation or technical progress may cause definitions of broad money to shift over time in response to changes in financial instruments and the organization of money markets.

27.12 In the *MFSM*, a country-specific concept of broad money as nationally defined is used. Although the specific components of broad money may vary across countries, in all cases the nationally defined concept is used to identify those financial corporations that issue liabilities included in broad money. Such corporations are described as depository corporations.

27.13 The set of nine subsectors of the financial corporations sector described in chapter 4 and listed in table 27.1 is such that it should be possible to identify depository corporations as just defined as a combination of two or more of these subsectors. At a minimum, the group will include the central bank and deposit-taking institutions. In some countries money market funds may also be included because they are considered to be part of broad money.

27.14 Once depository corporations are identified, the three subsectors used for monetary statistics, the central bank subsector, the other depository corporations subsector and the other financial corporations subsector, can be established.

2. Presentation of monetary statistics

27.15 Monetary statistics are presented for all financial corporations, with the following disaggregation:

a. Depository corporations subsector,

- Central bank subsector,
- Other depository corporations subsector,

b. Other financial corporations subsector.

27.16 The instrument classification is the standard one from the financial account, as shown in table 27.2, with possibly some further breakdown according to whether the instrument is denominated in local currency or foreign currency.

27.17 For each instrument, a set of entries equivalent to an asset account is shown, that is:

a. Opening stock,

b. Transactions,

c. Valuation changes,

d. Other changes in volume,

e. Closing stock.

Table 27.1: Subsectors of the financial corporations sector

B. Financial statistics

27.18 As noted in the introduction, financial statistics extend the range of monetary statistics to include the stocks and flows of financial assets and liabilities between all sectors of the economy and between the sectors of the economy and the rest of the world. Financial statistics include the financial account, balance sheets, other changes in assets account and the capital account to the extent that net borrowing or net lending is taken from there. The format used for financial statistics is similar to that used for monetary statistics except that all sectors are covered. In addition, disaggregation of the financial sector into subsectors is common. As indicated, though, the sectors outside the financial corporations sector may be aggregated. It is usual to show general government separately and also the rest of the world. If it is of particular interest, public non-financial corporations may also be shown as a separate sector.

27.19 The classification of financial assets, shown in table 27.2, is based primarily on two kinds of criteria: the liquidity of the asset and the legal characteristics that describe the form of the underlying creditor/debtor relationship. The concept of liquidity embraces other more specific characteristics such as negotiability, transferability, marketability or convertibility. These characteristics play a major role in determining the categories, although they are not separately identified in a systematic way. The classification is designed to facilitate the analysis of transactions of institutional units and is a framework for assessing the sources and uses of financing and degree of liquidity for these units.

27.20 Maturity distinction is recognized as a secondary classification criterion. Short-term is defined for the classification as one year or less, while long-term is defined as more than one year. To monitor possible liquidity risks, it may also be helpful to distinguish those long-term instruments with a remaining maturity of one year or less. (Remaining maturity is the period from the reference date until contractually scheduled final payment.)

27.21 The classification does not contain functional categories, such as direct investment, portfolio investment, and international reserves, which are basic classification criteria for the balance of payments financial account. In view of the importance of these categories, the classification does provide for memorandum items for financial account transactions related to foreign direct investment relationships. This topic is treated in greater detail in chapters 21 and 26.

C. Flow of funds

27.22 The form of table described under the section on monetary statistics shows how the closing stock of a comprehensive set of assets for a particular sector may be analysed by seeing how the opening stock is changed by transactions in the asset, revaluation changes and other changes in the volume of assets to reach the closing stock. This is a particular application of the asset accounts described in chapter 13.

27.23 Another popular form of table is that known as a flow of funds table. This may take one of several forms. The most common presentation consists of an articulation of flows (or stocks) showing for each instrument which sector or subsector is the creditor and which the debtor. Another variation is to combine the elements of the capital and financial accounts to examine all accumulation transactions and not just those concerning financial assets. The rationale for this is that the balancing item on the right-hand side of the financial account should be exactly equal in magnitude but opposite in sign to that on the left-hand side of the capital account. By including the items from the capital account, discrepancies in this account may be revealed by the exercise of completing the flow of funds table, instead of assuming the net lending or net borrowing total is already determined. (This still assumes that saving is determined correctly. The act of balancing the flow of funds table may suggest a re-examination of the current accounts if it is difficult to reconcile the saving figure for a sector with the recorded capital and financial transactions.)

1. Flow accounts

27.24 The financial account, as presented in table 11.1 and repeated for convenience here as table 27.3, records the net acquisition of financial assets and net incurrence of liabilities for all institutional sectors by type of financial asset. For each sector, the financial account shows the liabilities that the sector incurs to mobilize financial resources and the financial assets that the sector acquires. For each financial asset and liability, the financial account shows the effects of transactions on the level of assets acquired by each sector and on the level of liabilities incurred by each sector. This information is very valuable in identifying the financial assets that net borrowing sectors use to finance their deficits and the assets that net lending sectors use to allocate their surpluses. Although the

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

movement of financial flows can be mapped at this level of recording, the question of who is financing whom is not answered. Table 27.3 shows that non-financial corporations incur liabilities predominantly in the form of loans and other equities and investment fund shares. Financial corporations incur net liabilities by using the full range of financial instruments. While the instrument by which the liabilities are incurred is clearly presented in this account, it is not possible to identify the sector that is providing the funds. Similarly, the net acquisition of financial assets can be tracked. Households acquire net financial assets spread across a range of assets, while financial corporations acquire net financial assets mostly in the form of loans and securities. However, it cannot be determined from this level of recording to which sectors the financing is being provided.

27.25 For a full understanding of financial flows and the role they play in the economy, it is often important to know more detailed financial relationships between sectors and the financial assets by which these relationships are carried out. For example, it is useful to show what types of liabilities government is using to finance its deficit and which sectors (or the rest of the world) are providing the financing. For financial corporations (and those supervising them), it is interesting to show not only the composition of financial assets (loans and securities) that they have acquired but also which sectors these are claims upon. In addition, it is often desirable to analyse financial flows between subsectors within a sector (central government financial transactions with local governments or central bank financial transactions with deposit-taking institutions) and across sector boundaries (changes in deposit-taking institutions' claims on public non-financial corporations). Such detailed information is necessary to understand how financing is carried out and how it changes over time.

27.26 This more detailed approach is particularly important in spelling out the role that financial corporations play in financial transactions. Financial corporations often have very small net lending or borrowing balances in comparison with their total transactions in both financial assets and liabilities. This reflects the basic role of financial intermediation of mobilizing financial resources and making them available to other sectors in forms suitable to these sectors through transformation of the maturity of exact form of the assets available. More generally, financial corporations play a major role assisting institutional units to rebalance their portfolios of assets and liabilities taking account of their preferences between investment safety and rate of return, liquidity preference and convenience amid constantly changing market conditions. Thus, financial corporations play a critical role in directing financing flows from net lending sectors to net borrowing sectors and allow lenders to choose their asset instruments and borrowers their forms of indebtedness.

The format of the account

27.27 Table 27.4 facilitates the more detailed financial analysis just described by showing transactions in assets cross-classified by type of asset and by the debtor sector in the first part and the type of liability cross-classified by the creditor sector in a similar, second part. The sectors transacting in assets or liabilities form the columns of the table while the type of asset, disaggregated by sector of debtor, is shown in the rows. It would be conceptually possible to present all the relationships between creditors and debtors in a single table but this would require a table of very many cells, many of which would be blank.

27.28 Table 27.4 is merely illustrative of the type of detail that a country may wish to develop. Initially it may be possible to show columns only for general government, the financial sector and the rest of the world separately from all other sectors, but even at this level if monetary statistics exist, it should be possible to disaggregate the financial sector into three subsectors as described earlier.

27.29 Ultimately it is desirable to show all the institutional sectors of the SNA and possibly subsectors such as central government and publicly controlled corporations.

27.30 The degree of detail shown for the financial instruments will depend on data availability and the relative importance of each. What follows is a list of possible disaggregations.

27.31 Currency and deposits may be distinguished according to currency, transferable deposits and other deposits identifying that part of each that is denominated in

Table 27.3 (cont): The financial account - concise form - changes in liabilities and net worth

Changes in liabilities and net worth

domestic currency or foreign currency and whether the creditor or debtor is a resident or non-resident.

27.32 Debt securities and loans may be divided by maturity (short and long-term) as well as by sector.

27.33 For equity a distinction between resident and non-resident enterprises as well as the distinction between listed, unlisted and other equity may be helpful.

27.34 For insurance, standardized guarantee schemes and for financial derivatives the presentation may be simplified because one party to the transaction must be a financial corporation, either resident or non-resident. For employee stock options, the debtor must be either a financial or non-financial corporation. Most pension schemes are operated by financial corporations but some may be operated by non-financial employers without involving a financial corporation.

27.35 Trade credits and advances may be made by any sector. The claims of pension funds on pension managers may, in principle, relate to any sector but are likely not to involve households. Other accounts receivable or payable may be separated into whether they are with residents or non-residents.

27.36 The form of table 27.4 should be interpreted as a general model, and substantial flexibility should be allowed in specific country circumstances. In many countries, the dimensions of the tables will be severely constrained by data availability. It should also be noted that these tables are extensions of the basic financial account and that the third dimension to the analysis can be added on a selective basis by identifying particular asset or sector (or subsector) relationships for which this level of detail would be useful.

Analytical uses

27.37 A detailed flow of funds table can be used in at least three important areas related to economic policy. Data from these tables can be used in economic analysis and description of activity and trends in current periods. They can be used as an aid to projections in the context of the production of economic plans or to assess the effect of current economic policies, or changes in them, on the future path of the economy. They can also be used in projects that undertake modelling of the economy to study economic behaviour as an aid to the formulation of economic policy. Such studies, of course, would be complementary to similar work on data from other accounts in the SNA. In particular it is useful, when using the flow of funds accounts to facilitate the study of the operation of the financial system in the economy, to relate these transactions to the behaviour of the non-financial economy. Similarly, the flow of funds accounts facilitate study of the process of making the equality between saving and investment, by tracing the channels by which net lending reaches ultimate borrowing, after passing through various financial corporations and assets.

27.38 In the policy area, a few examples will illustrate the usefulness of these tables. Common policy problems faced by many nations include questions such as: How will the central government’s deficit be financed? How will the major non-financial public corporations be financed and by whom? In each of these examples, the provision of answers to the questions requires an impact analysis on various sectors and types of transaction. The articulation of the accounts within the flow of funds facilitates the analysis and provides a framework in which to assess the answers.

27.39 In the area of financial projections, the use of time-series from relevant parts of the flow of funds tables enables an examination for consistency of a number of separately prepared sector or market forecasts, and the implications for future financial transactions of a particular set of assumptions about future events (for example, interest rates, exchange rates, growth, sector surpluses or deficits).

27.40 Other policy areas where these projections and studies can be of assistance are in considering the long-term development of financial markets and institutions in the economy and assessments of the need for new types of assets to satisfy the potential demand of savers and investors requiring access to reliable liquid assets.

2. Stock accounts

27.41 Just as tables like those above can be compiled and very usefully analysed in terms of flows, so it is instructive to compile exactly similar tables in terms of the stocks of financial assets and liabilities. Where flows may be fairly volatile from one period to the next, the level of stocks is likely to be more stable and the degree of fluctuation from the stock level may convey particularly useful additional information.

Chapter 28: Input-output and other matrix-based analyses

A. Introduction

28.1 The purpose of this chapter is to build on the presentation of the supply and use tables in chapter 14 to examine in greater detail the possibilities offered by using a matrix form of presentation of the accounts. As has been noted on a number of occasions, the SNA is intended to offer a degree of flexibility in implementation as long as the inherent accounting rules are observed. The fact that the requirement to balance uses and resources is immediately obvious within a matrix framework makes this a powerful way in which to explore different options while still ensuring the balances are satisfied. One aim of this chapter is to demonstrate the power of a matrix presentation in this way.

1. Input-output tables

28.2 A second aim is to describe the basic ideas of input-output matrices. Supply and use tables are an integral part of the SNA and the process of compiling these tables is a powerful way of ensuring consistency between the various data sources available to the compiler. For many analytical purposes, though, a transformation from a pair of supply and use tables into a single input-output table where row and column totals are equal brings very considerable advantages. Input-output tables cannot be compiled without passing through the supply and use stage (except under very restrictive assumptions). They are therefore analytical constructs that inevitably involve some degree of modelling in their compilation.

28.3 There is a vast literature on the compilation and use of input-output tables and it is impossible in a short chapter to give a full appreciation of the range of complexities of compilation and inventiveness of applications. The chapter aims only to give a feel for the sort of operations necessary to transform supply and use tables into input-output tables and to give some ideas of their possible applications. The *Manual of Supply, Use and Input-Output Tables* and a visit to the web site of the International Input-Output Association (www.iioa.org) are good places to start a more detailed investigation of the potential in this field.

2. Social accounting matrices

28.4 Both the supply and use tables and input-output tables are matrix representations of the goods and services account. It is possible to cast the whole of the sequence of accounts, including the goods and services account, in a matrix format also. Such a matrix is called a social accounting matrix (SAM).

28.5 It is possible to extend and elaborate a SAM by introducing alternative disaggregations of existing flows or new types of flows, just as long as the use and resource of these flows balance in the usual way. This is such a common extension of a SAM that the usual understanding of what a SAM is often goes further than a matrix encompassing the standard sequence of accounts to include extensions, particularly of the household sector.

3. The structure of the chapter

28.6 Chapter 14 describes how the supply and use tables may be used in order to ensure the internal consistency of disparate data sets. Section B of this chapter looks at two particular aspects of the supply and use tables where it may be useful to adopt a different approach to that described in chapter 14. The first of these concerns the treatment of insurance and freight on imported goods and the second concerns the treatment of goods that are processed by a unit that is not the legal owner of them. Section B also discusses how information cross-classified by establishment and industry can be transformed into information relating to institutional sectors.

28.7 Section C is concerned with how a pair of supply and use tables may be transformed into a single symmetric input-output matrix. Each of the supply and use tables shows disaggregation by products and industries. In an input-output table, one of these dimensions is eliminated. Thus a single table may show the relationship between the supply and use of products or alternatively the output of industries and the demand for the output of industries.

28.8 Section D goes on to show how the whole of the accounting system can be represented in matrix form. This is a useful pedagogical tool and may be instructive as a stepping-off point for extensions of the accounts such as social accounting matrices.

B. Flexibility in the supply and use tables

1. The treatment of margins on imports

28.9 In discussing valuation in section B of chapter 14, consideration is given to how transport margins should be incorporated into the accounts and in particular how international transport charges should be recorded. Paragraphs 14.61 to 14.77 explain that the parallel between basic and producer prices does not carry forward simply to a distinction between CIF and FOB-based prices. The distinction depends on whether it is the unit providing the goods or the unit taking delivery of the goods that is responsible for providing the transport and insurance. Paragraph 14.77 ends by discussing briefly the practical problems in deriving the desired valuation from the available data sources. It is reproduced here for convenience.

28.10 It may not be possible to determine from customs declarations which unit is responsible for the transport costs and, even when it is and conceptually the transport costs should be separated from the value of the goods themselves, there may be no information and no resources available to make the separation in practice. In such a case the CIF value of imports may be the only source with a disaggregation by type of good. If the disaggregated CIF figures are used for imports of goods, though, that part of the transport costs and insurance also included in imports of services would be double-counted. In order to avoid this, therefore, an adjustment column is inserted into the supply table. The adjustment column consists of a deduction from the services items for transport and insurance equal to the CIF-to-FOB adjustment for these items with an offsetting global adjustment made to imports of goods. Table 14.4, reproduced here as table 28.1 gives an example of such an adjustment.

Table 28.1:An example of imports entries in the supply table with the global CIF to FOB adjustment

	CIF/FOB adjustment	Goods	Services
Agriculture, forestry and fishery products (0)		37	
Ores and minerals; electricity, gas and water (1)		61	
Manufacturing (2-4)		284	
Construction (5)			
Trade, accommodation, food & beverages; transport services (6)	-6		62
Finance and Insurance (7 less 72-73)	-4		17
Real estate services; and rental and leasing services (72-73)			
Business and production services (8)			5
Community and social services (92-93)			
Other services (94-99)			
Public administration (91)			
CIF/FOB adjustment	10	-10	
Purchases abroad by residents		20	23
Total	0	392	107

28.11 This adjustment column shows the reallocation of service margins from the industries where they are produced (by resident or non-resident producers) to an adjustment row for the CIF/FOB adjustment. In the column for goods, the values given industry by industry include an element of these service margins, but this is deducted on the CIF/FOB adjustment row to leave the total equal to the total of imports FOB. The adjustments in this column are analogous to a similar column that could be shown illustrating the adjustment between purchasers' and basic prices.

28.12 A simpler procedure than that just described, though one not strictly consistent with *BPM6* recommendations, is to ignore the balance of payments division between goods and services and adjust the figures for imports of services by the amount of services provided by non-residents that are included in the detailed figures for imports of goods. This ensures that the total of imports of goods and services agrees with the total in the balance of payments but will not agree with the total of imports of goods FOB and of services shown there. This makes compiling the supply and use tables simpler but means that it is not possible to use imports of goods on a FOB basis to match exports of those goods from other countries. Even in this simpler version, however, the amount of freight and insurance on imports provided by residents must be shown as an export of services.

2. Goods processed by a unit not assuming economic ownership

28.13 A producer may carry out the same activity under quite different economic conditions. Consider farmers growing grain which is milled into flour before use. Suppose one farmer acquires a mill to process his own grain but once this is acquired he may offer to mill grain for others for a fee. The production account for the farmer with a mill will look somewhat different from that for a farmer who does not have a mill but pays the first farmer a fee for milling even though both produce flour for sale.

28.14 In the case of milling the reasons for subcontracting the activity to another may be the availability of suitable fixed capital. Increasingly, however, similar processes are being carried out internationally and in respect of activities more usually associated with manufacturing such as the assembling of component parts. Here the motivation is less one of the availability of capital than of the costs of labour. If the average wages in country X are half of those in country Y, it may be cost-effective for a unit in Y to dispatch the components to a unit in X for assembly and then have the completed product returned to Y or even shipped directly to a final purchaser.

28.15 Previous editions of the SNA have recommended that components for assembly should be recorded as delivered to the unit in country X and that the whole of the value of the completed product should be recorded as output of X and exports from X to Y. This does not match the treatment of grain milling or, for example, repairs to machinery where no such change of ownership of the goods being processed is imputed. Imputing a change of ownership of the parts to be assembled gives rise to significant data compilation problems because the value of the assembled product may be greater than the cost of the components

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

plus the fee to assemble them. The value of the finished product may incorporate the results of research and development of the unit contracting the assembly, for instance. The SNA now recommends that products should only be recorded as being delivered to another unit if there is a change of ownership or, in the case where both producing units belong to the same enterprise, the producing unit taking delivery also assumes responsibility for subsequent risks and rewards of production such as deciding how much to process, what price to charge and when to sell.

28.16 The question arises of how to record the activity of assembling goods to order for another unit in the supply and use tables and the input-output table. The processes of assembly for oneself and for another are physically similar but the economics are different.

28.17 Suppose in year 1 a processing unit converts products only on own account. In year 2 the unit processes the same amount on its own account but also processes a similar amount on behalf of another. Suppose the cost of items processed in year 1 is 90, the cost of associated products needed to assemble them is 10 and the value added is 35. The total value of output is thus 135. In year 2, all other things being equal, intermediate consumption increases by another 10 to 110 and value added to 70 bringing the value of output to 180. The change in the structure of production is difficult to understand in the absence of information on the change in the role of the producer who is operating no longer only on his own behalf but also on behalf of others.

28.18 There are essentially two ways to proceed. The first is to treat processing on own account and on behalf of another as different types of activity and different products. In this way in the second year the producer would have one activity with inputs of 100, value added of 35 and output of 135 as in the first year, plus another activity with inputs of 10, value added 35 and output of 45.

Table 28.2: Options for recording goods not changing economic ownership

	Year 1	Year 2	Option 1		Option 2
Cost of materials	90	90	90		180
Other costs	10	20	10	10	20
Total intermediate consumption	100	110	100	10	200
Value added	35	70	35	35	70
Output	135	180	135	45	270

28.19 The second alternative is to show the intermediate inputs in the second year as 200, value added as 70 and output as 270. Value added is the same under both options and the comparison between the second and the first year makes more sense from a transformation point of view under option 2. However, adding an extra 90 to both output and intermediate consumption is essentially artificial. Further, as noted above, it may be difficult for the processor to put a value on the components he receives and the output he provides to the other unit. The chances are that he only knows that he receives a fee of 45 to cover his incidental expenses of 10 and leave an amount of value added, 35 in this case. These options are shown in table 28.2.

28.20 It should be emphasized that it is option 1 that is the recommendation of the SNA and, for goods sent abroad for processing, *BPM6*. Option 2 is shown as a supplementary presentation that may be adopted for reasons of continuity with past practices. Option 1 more accurately reflects the economic processes taking place while option 2 focuses on the physical transformation process.

28.21 When goods are sent abroad for processing, they are recorded as neither exports of goods by the country holding economic ownership, nor as imports of goods by the processing country in either the SNA or *BPM6*. Similarly, after processing they are recorded neither as exports by the processing country nor as imports of goods by the country of economic ownership. The only item recorded as imports and exports is the fee agreed between the economic owner and the processor.

28.22 The physical flows of the goods will continue to appear in the merchandise trade figures. However, the product code after processing may be different from the code on entry, making it difficult to match the incoming and outgoing flows.

28.23 The presentation of option 2 suggests that the fee can be derived as the difference between the value of the goods on arrival and departure from the processing country but while this may sometimes give a reasonable approximation of the processing fee, there are many reasons why this may not be so.

a. If processing takes any significant amount of time, there may be holding gains and losses affecting the value of the goods. These accrue to the economic owner, not the processor.

b. Goods may be lost or damaged or may simply become obsolete while in process. (This has been observed in the case of electronic components.) These other volume changes also apply to the economic owner and not the processor.

c. The value of the processed goods may be greater than the costs of the components and the processing fee to the extent that the finished product incorporates part of the value of R&D treated as fixed capital formation of the economic owner.

28.24 All these situations reinforce the preference for option 1 over option 2 in table 28.2.

3. Supply and use tables and sector accounts

28.25 As explained in chapter 14, it is possible to derive the three estimates of GDP from a set of supply and use tables. Since these tables can be expressed in volume terms, estimates can also be made of growth rates based on the tables. However, to complete the sequence of accounts, production accounts are needed by institutional sector. To ensure that the supply and use table and the sequence of accounts are perfectly integrated and consistent, it is desirable to take the

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

part of the use table showing intermediate consumption and the components of value added and allocate the columns to institutional sectors.

28.26 The starting point for the compilation is the part of the use table in table 14.12 relating to intermediate consumption and value added. This is shown in a somewhat aggregated form in table 28.3.

28.27 The easiest allocation is for financial corporations since typically such corporations do not undertake secondary activity and other institutional units do not undertake any financial activity. When these conditions prevail, the column for the finance and insurance activity can be taken in its entirety as appropriate for the institutional sector. It is possible that financial corporations may undertake some production for own final use (as capital formation), in which case some part of an appropriate column in the section of table 28.3 relating to own account production should be added. No such adjustment has been made in this example.

28.28 The columns relating to non-market producers must be allocated between general government and NPISHs. In addition, though not in this example, it is possible that either general government or NPISHs may have an establishment undertaking market production. This is how it is possible that non-market producers may have small amounts of operating surplus. It is also possible that both general government and NPISHs may have some production for own final use (as capital formation) but none has been assumed here.

28.29 The last step is to allocate all columns not yet accounted for between non-financial corporations and households. An indication that some part of a market production activity should be allocated to households is the presence of mixed income as part of the value added of the activity. Thus, in this example, some parts of market production of agriculture, manufacturing, construction and trade are attributable to households as well as production for own final use. (As noted in general some of production for own final use will be attributable to other sectors. It is not done so here for reasons of simplicity at such an aggregate level.)

28.30 Once these calculations are complete, table 28.4 results, showing for each sector not just total intermediate consumption but also a product breakdown of this as well as the items for value added.

28.31 The figures shown for intermediate consumption, output and the elements of value added for each institutional

sector are those that appear in the production account and generation of income account in the sequence of accounts.

C. Deriving an input-output table

1. What is an input-output table?

28.32 Essentially an input-output table is derived from a use table where either the columns representing industries in the two left-most quadrants are replaced by products or where the products in the two topmost quadrants are replaced by industries. The resulting intermediate consumption matrix is then square, showing products in both rows and columns or industries in both. In both cases the row totals for the complete matrix match the column totals for the complete matrix, product by product or industry by industry as the case may be. The resulting matrices are therefore referred to as being symmetric.

28.33 The process of replacing the product dimension by an industry one is based on one of several possible models, to be discussed below. This process necessarily means that a symmetric input-output matrix is further removed from basic data sources than a supply and use table and it is therefore useful to review why making this transition is so useful.

28.34 Note that in table 14.12, there is a product for ores and minerals, electricity and water but no column for it. If there is no industry for which this is the principal product, identifying the primary producers rather than the number of products will determine the final size of the symmetric (square) matrix.

Table 28.3 (cont):The use table from table 14.12

	Intermediate consumption of industries (by ISIC categories)									Exports		Final consumption expenditure						Gross capital formation			
	Own final use			Non-market											General government

2. Analytical potential of an input-output matrix

28.35 Such tables have algebraic properties that make them particularly suitable for analyses that enable estimates to be made of the effects of changing relative prices, of labour and capital requirements in the face of changing output levels, of the consequences of changing patterns of demand and so on. They may also be used as the basis for an expanded version that may be used to estimate the demands made by the economy on the environment, for instance.

28.36 As noted in the introduction, there is a vast literature on how to compile and use input-output tables. The purpose of this section is simply to indicate the key aspects of converting a pair of supply and use tables into an input-output table.

28.37 Suppose the entries in the inter-industry matrix are each divided by the figure for output at the bottom of the corresponding column, and the resulting matrix is designated as A; the vector of outputs is written as x and the vector of total final demand is written as y. Then

$$Ax + y = x$$

This can be rewritten as

$$(I-A)\,x = y$$

or

$$x=(I-A)^{-1}y.$$

28.38 The matrix (I-A) is known as the Leontief matrix, after the man who pioneered the use of input-output tables and the matrix $(I-A)^{-1}$ is known as the Leontief inverse. It is the last formulation that gives the analytical power to input-output analysis.

28.39 Suppose there is an increase in demand, for manufactured products, say. Looking at even the supply and use table it can be seen that to increase the output of these goods, more inputs of almost all types of products are needed. This increase in demand for a range of products is called the direct effect of a change in demand. However, the increase in demand in all these products causes a further round of increases in output for all products and this in turn triggers another set of increases in output and so on. Each round of effects is smaller than the last until it eventually becomes insignificant. The total of all second and subsequent round effects is called the indirect effect of a change in demand.

28.40 In terms of the algebra just introduced, the direct effect is equal to Ay, the second round effect to A^2y, the third round effect to A^3y and so on. It can be shown that $(I-A)^{-1}$ can be written as $A+A^2+A^3+A^4$ etc. This is where the power of having a symmetric matrix comes from since A needs to be square for this formulation to work.

28.41 As long as changes in demand, y, are sufficiently small that the average coefficients in A are likely to be good approximations to the new situation, the new level of x can be calculated. The approach breaks down if the changes in demand are so great that significant changes in A are likely to follow and marginal rather than average coefficients are needed.

28.42 The matrix A is also sometimes called a matrix of technological coefficients and can provide insights into the way an economy works. In an economy dominated by primary products with little processing carried out in the domestic economy, there are relatively few significant non-zero elements in A. As the economy develops and processing of primary products becomes more commonplace, A becomes more populated with entries reflecting greater vertical and horizontal integration of activities within the economy. By exploring different industries associated with different stages in the production process it is possible to say where value added is generated. For example, cotton is grown as an agricultural product. It is then subject to separation into lint and seed (ginning), then the lint is converted to yarn and the yarn to fabric. If each of these activities appears in a different industry, it is possible to see where the value added between the growing of the cotton and the eventual fabric in which it is used arises.

3. Secondary products

28.43 An industry classification such as *ISIC* essentially identifies industries in terms of the sorts of goods or services they typically produce. However, there are more products than industries and, for all sorts of reasons, some products may be made in several industries.

28.44 In order to limit the number of products per unit and to allow integration with basic production statistics, the concept of establishment is introduced. In principle, an establishment produces only one product at one location but the SNA recognizes that in practice it is not possible to separate production into such fine detail. Dealing with the fact that many establishments produce more than one product is fundamental to the idea of calculating a symmetric input-output matrix.

28.45 The reason that manipulation of supply and use tables is needed to produce an input-output table is the existence of secondary products. If there were the same number of industries as products, and if each industry only produced one product, the supply table for the domestic economy would be unnecessary; the column totals for industries would be numerically equal to the row totals for products and the inter-industry matrix would be square as originally compiled. As noted elsewhere, the intent behind using establishments rather than enterprises, and working at a fairly detailed level in the supply and use tables, is to get as close to this situation as is reasonably practicable. Inevitably though some secondary production remains.

28.46 There are three types of secondary production

a. Subsidiary products: those that are technologically unrelated to the primary product. Just a few examples include a large retailer with a fleet of trucks used primarily for its own purposes that may occasionally offer transport services to another unit, a farmer who use part of his land as a caravan site, or a mining company that builds access roads and accommodation for its workers.

b. By-products: products that are produced simultaneously with another product but which can be regarded as secondary to that product, for example gas produced by blast furnaces.

c. Joint products: products that are produced simultaneously with another product that cannot be said to be secondary (for example beef and hides).

In order to reduce the supply and use tables to one single input-output matrix two possibilities exist. One is to express the input-output matrix in terms of products only; the other is to express the input-output table in terms of industries.

4. Reallocating secondary products

28.47 There are two basic approaches to eliminating secondary products. Both come from applying information from the use matrix to the supply matrix to reduce it to a purely diagonal one. Once this is done, the supply matrix contains no further useful information and is no longer presented. The transformed use matrix is what is referred to as an input-output matrix.

28.48 In deriving a product by product matrix in the simplest possible way, the final demand quadrant of the use matrix is unaltered. It already expresses demand by product and does not need changing. The intermediate consumption and value added parts of the matrix, though, need to be changed from an industry dimension to a product one. The row totals of the matrix already show the correct product totals so the exercise consists of reallocating entries from one column to another within the given row total. This is called a technology approach. It assumes that the demand for intermediate consumption and labour and capital inputs are determined by the nature of the products made.

28.49 In deriving an industry by industry matrix in the simplest possible way, the value added part of the use matrix is unaltered and because the level of output will not alter, only the composition of intermediate consumption changes, not its total. Thus the exercise is one of reallocating items between rows but not between columns. In contrast to the product by product case, the quadrant relating to final demand will change and will show demand related to the industry supplying the products and not to the products themselves. This is called a sales structure approach. It assumes that as the level of output of an industry changes, the pattern of sales will remain the same.

Table 28.5:A numerical example of reallocating products from construction to manufacturing

Use of products	Manufacturing and other industry	Construction	Manufacturing and other industry	Construction	Manufacturing and other industry	Construction	Manufacturing and other industry	Construction

28.50 Both these assumptions, the technology assumption and the sales structure assumption, are rather simplistic and in practice a more generalized approach may be used but it is helpful first to examine each of the assumptions in a little more detail.

Product by product tables

28.51 There are two ways in which a product by product matrix can be derived. These are:

a. The industry technology assumption where each industry has its own specific means of production irrespective of its product mix.

b. The product technology assumption where each product is produced in its own specific way irrespective of the industry where it is produced.

28.52 It is simplest to explain these by example. In the upper part of table 14.12, the construction industry is shown as producing 6 units (out of 208) of manufacturing products. In the lower part of table 14.12, reproduced as table 28.3, the inputs necessary for manufacturing and for construction are shown. These are reproduced in the first two numeric columns in table 28.5. The next two numeric columns express these in percentage form. Thus, for example, one unit of manufacturing requires 0.038 units of agricultural products, 0.102 units of ores and minerals and so on. Construction uses no agricultural products, 0.005 units of ores and minerals and so on.

28.53 In order to create the product by product matrix, it is necessary to deduct the costs associated with the production of 6 units of manufactured goods from the column for construction and add it to the column for manufacturing. On completion of this exercise for all secondary production, the columns will represent products rather than industries.

Industry technology assumption

28.54 Under the industry technology assumption, the coefficients showing how manufactured products are produced are assumed to depend on the industry they happen to be produced in. Thus to reallocate the 6 units of manufacturing products from the construction industry to a column that will now refer to manufactured products only (ignoring other secondary products for the moment) a set of inputs, derived as 6 times the coefficients for construction is added to the manufacturing column and deducted from the construction column. The results of this are shown in the fifth and sixth numeric columns of table 28.5.

Product technology assumptions

28.55 Under the product technology assumption, the coefficients showing how manufactured products are produced are those of the manufacturing industry regardless of where they are actually produced. In this case, to reallocate the 6 units of manufacturing products from the construction industry a set of inputs derived as 6 times the coefficients for manufacturing is added to the manufacturing column and deducted from the construction column. The results are shown in the seventh and eighth numeric columns of table 28.5.

28.56 It is important to note a problem that arises under this assumption. When the product technology assumption is used, manufactured products produced by the construction industry are assumed to use a small amount of food. However, no agricultural products are actually recorded as being used in the construction industry so deducting these inputs from the recorded entries for construction leads to a negative entry. Negative entries cannot appear under the industry technology assumption. Since negative entries are logically impossible, this is one argument in favour of using the industry assumption rather than the product assumption.

Industry by industry tables

28.57 Just as there are two ways in which a product by product matrix can be derived, there are two ways in which an industry by industry matrix can be derived. These are:

a. The fixed product sales structure where it is assumed the allocation of demand to users depends on the product and not the industry from where it is sold.

b. The fixed industry sales structure where it is assumed that users always demand the same mix of products from an industry.

28.58 Although a table similar to table 28.5 is not presented for the industry by industry tables, its construction is similar and straightforward but would show the entries across the rows of the use tables rather than down the columns.

28.59 In order to create an industry by industry table, it is necessary to move the use of 6 units of manufactured products from the row for the manufacturing to the row for the construction. On completion of this exercise for all secondary production, the rows will represent industries rather than products.

Fixed product sales structure

28.60 In this case, to allocate the 6 units of manufactured goods supplied by the construction industry to the row for construction, a proportion of the row for manufacturing is allocated to the construction row using the proportions in the manufacturing row. It follows that such a matrix will not contain negative entries.

Fixed industry sales structures

28.61 Here the 6 units of manufactured goods supplied by the construction industry are reallocated to the construction row from the manufacturing row using the proportions of the construction row. Such a matrix can contain negative elements.

The choice of approach to be used

28.62 There are four basic choices open to the input-output compiler.

a. A product by product approach using a product technology assumption,

b. A product by product approach using an industry technology assumption,

c. An industry by industry approach assuming a fixed product sales structure,

d. An industry by industry approach assuming a fixed industry sales structure.

Options a and d may result in negative entries; options b and c do not.

28.63 Both product by product and industry by industry tables may be compiled. They serve different analytical functions. For example, to ensure that price indices are strictly consistent, a product by product matrix is to be preferred. For a link to labour market questions, an industry by industry table may be more useful. Although traditionally a lot of interest focused on the product by product tables, this was accompanied in large part by an attention to the underlying technology. Increasingly the economic interaction of different industries has brought more interest in the industry by industry tables.

Hybrid approaches

28.64 In practice, no single method is used on its own. Knowledge of the type of product or industry in question should dictate whether an industry-based conversion procedure or a product-based one is most appropriate. Some secondary products may be dealt with one way and others another despite the fact that, on occasion, negative values may initially appear.

28.65 The extent of variation between the various approaches will depend on a number of factors, including in particular the extent of secondary production in the supply matrix. In general, the greater the degree of disaggregation and thus the less secondary production to be reallocated, the closer the input-output tables will resemble the supply and use tables. Indeed some countries prefer to work with very detailed supply and use tables and not produce symmetric tables at all.

28.66 As an illustration of the differences involved, tables 28.6 and 28.7 show the results of converting the supply and use tables in chapter 14 to, first, a product by product matrix using only the industry technology assumption and then an industry by industry matrix using only the product sales structure.

The database required for the transformation

28.67 The starting point for the production of a symmetric input-output table is a pair of supply and a use tables both at basic prices. Even the calculation of a use table in basic prices is one step away from basic statistics and actual observations, reinforcing the fact that the input-output tables are analytical constructs, not a compilation of directly observed phenomena.

28.68 Further, it is advantageous to separate the use table at basic prices into two, one showing those elements relating to domestic output and the other those elements relating to imports. The statistical requirements for such a separation are demanding but the results allow considerable flexibility in the treatment of imports and permit a clear analysis of the impact of demand on supplies from resident producers and on foreign suppliers.

28.69 The exact manner of dealing with imports is a subject of considerable complexity where a number of options are available also. In some economies, some important products will only be imported and so separating these "non-competing" imports from the rest may be of particular interest.

28.70 Another topic that requires careful consideration is the degree of detail that is desirable for product and industry classifications. This may vary depending on the resources available to the statistical office and the sort of use to be made of the results.

D. Social accounting matrices

1. Expressing the sequence of accounts in matrix form

28.71 The part of the use table relating to the destination of products represents one side of the goods and services account in matrix form. However, it can also be expressed as a series of sub-matrices; one for intermediate consumption, one for final consumption, one for capital formation and one for exports. These sub-elements can be associated with the production account, the use of income account, the capital account and the rest of the world account respectively. Similarly the supply table represents the other side of the goods and services account but can also be written as two sub-matrices, one associated with the production account (output) and one with the rest of the world (imports). By writing the supply table horizontally and the supply table vertically in terms of these sub-matrices and their associated accounts, table 28.8 emerges. The rows and columns labelled E denote the total economy and those labelled R the rest of the world.

28.72 The attraction of this format is that the total across the set of rows for the goods and services account is equal to the total down the columns for the same account. There is no match for the second set of rows for the production account, but it is not difficult to bring this about. The entries for value added can be inserted in a third set of rows with the entries underneath intermediate consumption. In this way the sum down the columns for the production account is then equal to the rows for the same account. But there is now an unmatched third set of rows containing value added. Since value added ultimately carries forward to the allocation of primary income account, the third set of rows can be so labelled as in table 28.9.

28.73 If, to match this third set of rows, a third set of columns is inserted between the production account columns and those for the use of income account, property income can be inserted at the intersection of the third set of rows and columns and a fourth set of rows inserted to show the balance of primary income as it appears in the secondary distribution of income account. Proceeding in this way, successive sets of rows and columns can be introduced until the whole sequence of accounts is covered, as in table 28.10.

28.74 By including the entries for the rest of the world as well as for the total economy, the balancing items from the balance of payments can be shown as, for instance, the -41 in table 28.9.

28.75 It is also possible to extend table 28.10 to show the incorporation of the balance sheets as in table 28.11. For this, a row above the initial table is introduced to show the opening balance sheet and three rows below it. The first of these shows the entries for the other changes in the volume of assets account, the second relates to the revaluation account and the last is the closing balance sheet. Two adjustments also need to be made to table 28.6. The first concerns the item for the consumption of fixed capital, which is transposed from the row for the capital account and column for the production account and placed in the column for the capital account and row for the production account but with a negative sign. The second is to subdivide the capital account with the first set of rows and columns covering all items in the account but the second set covering the product details for gross capital formation and thus forming part of the asset account for non-financial assets.

28.76 Reading down the columns starting with the opening balance sheet entry for fixed assets, for example, this value plus the value of capital formation, less consumption of fixed capital, plus other changes in the volume of assets plus revaluation items is equal to the value on the closing balance sheet. For financial assets less liabilities the matching identity holds.

2. Expanding the matrix

28.77 It is possible to expand and rearrange the rows and columns of the matrix so long as this is done consistently in both dimensions. It is not strictly necessary to adhere to the

Table 28.9:The supply and use table in matrix form

	Goods and services account		Production account		Use of income accounts		Capital accounts		Total
	E	R	E	R	E	R	E	R	
Goods and services account			Intermediate consumption		Final consumption		Gross capital formation		
E	Exports	540	1 883		1 399		414		4 236
R	Imports	499							499

E	3 737								3 737
R									
Primary distribution of income accounts			Value added						
			1 854						
		- 41							
Total	4 236	499	3 737						

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

order of the sequence of accounts or the degree of detail shown there. The transactions to be included can be expanded or contracted as can the sets of institutional units to be identified.

28.78 The example of transposing consumption of fixed capital from being a positive entry on one side of the account to a negative entry on the other demonstrates how the matrix formulation may be used to enhance the articulation of the asset accounts.

28.79 It is also possible to include alternative classifications of key items. For example a row called "human needs" could be included showing how much food, housing etc was needed for each group of households, based on the functional classification of household consumption. In the column for consumption expenditure, the set of needs can be then cross-classified by product and household group.

28.80 A further expansion of the matrix may be to show the from-whom-to-whom details of such flows as property income and transfers.

28.81 The matrix presentation is very powerful in terms of the flexibility it can encompass, and in displaying the interaction of the accounts in a compact and graphic manner. On the other hand, there are disadvantages to the matrix presentation also.

a. Without explanatory text describing each of the main elements, a reader has to have a very good understanding of the SNA to interpret the numeric entries in the table.

b. Such a table always contains lots of white space which means that it is not an effective way of presenting a large amount of data.

In general, the matrix format is best used to explain the structure of the accounts being presented with individual cells, or a combination of cells, following in a more traditional format.

3. Disaggregating households

28.82 Expanding the accounting matrix of the sequence of accounts to incorporate the disaggregation of households is the usual form of a satellite account known as a social accounting matrix (SAM). As such it moves beyond a rigorous accounting structure based on observations to make an allocation of income into household groups possibly based on a household income and expenditure survey. In some cases this is based on a single survey. The problem, as explained in chapter 24 on the household sector, is that income flows in the SNA relate to individuals whether as employees, recipients of property income or transfer recipients while expenditure relates to households. Mapping individuals to households is necessarily difficult and depends to a greater or lesser extent on a set of assumptions. Any analysis of how government policies will affect households and their consumption depends on making such a mapping.

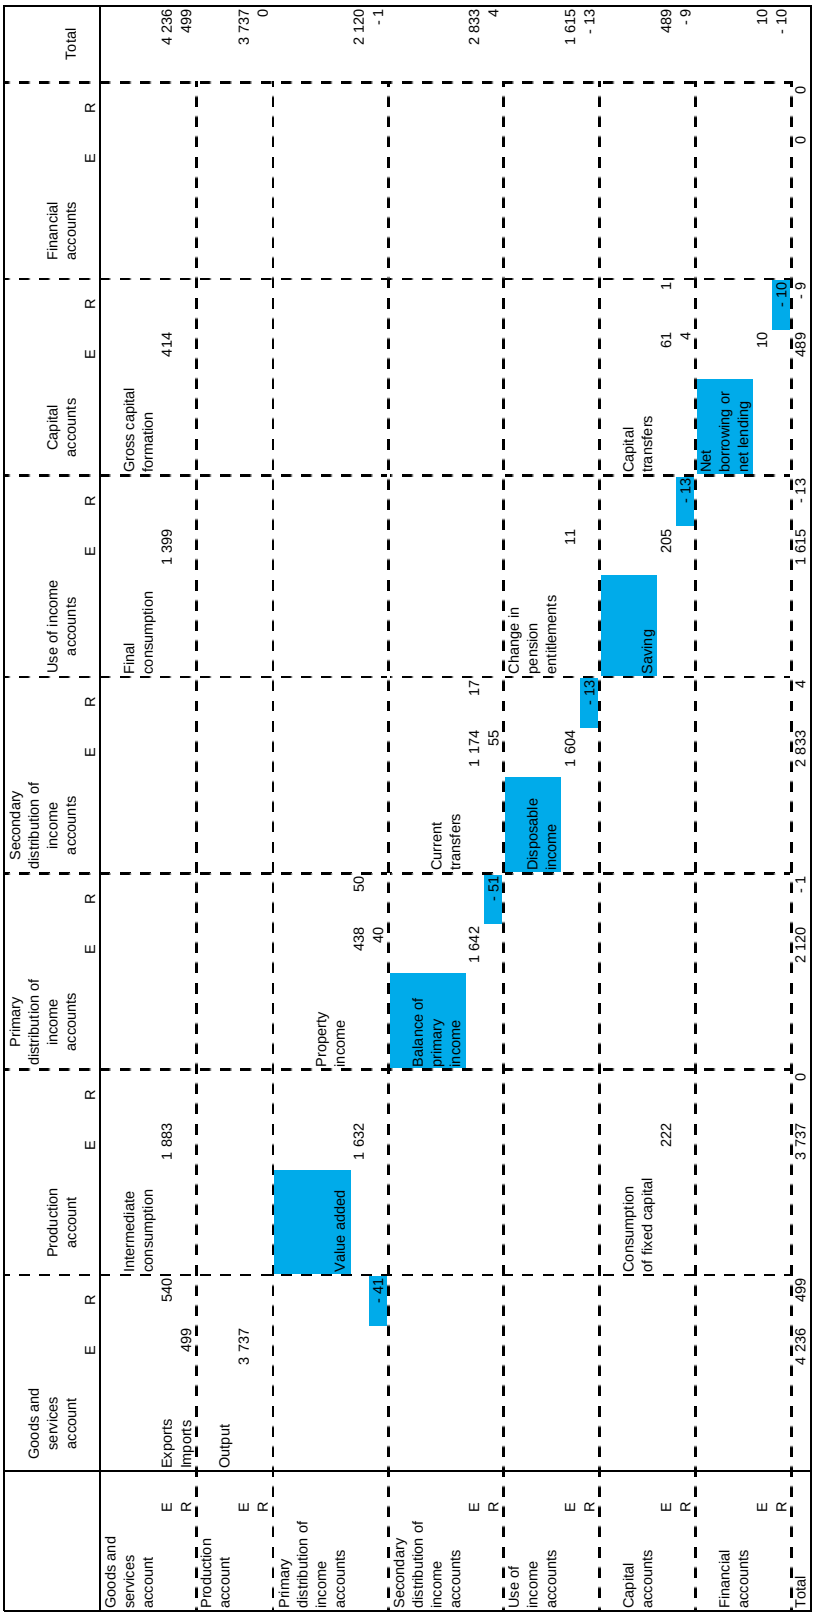
4. A SAM for labour accounts

28.83 One example of where a SAM is useful is in the case of labour accounts, showing the level and composition of employment and unemployment. SAMs have often provided additional information on this issue, via a subdivision of compensation of employees by type of person employed. This subdivision applies to both the use of labour by industry, as shown in the supply and use table, and the supply of labour by socio-economic subgroup, as shown in the allocation of primary income account for households. It implies that the matrix presents not only the supply and use of various products, but also the supply and use of various categories of labour services.

28.84 In order to have a comprehensive picture of the relationship between households and the labour market, the following sets of information are likely to be needed:

a. Various stocks underlying the flows in the SAM, such as size and composition of the population by household group (including the potential labour force) and production capacity by industry;

b. For the self-employed, it may be desirable to have information on the possession of assets (for example, agricultural land, consumer durables) as well as information on financial assets and liabilities;



c. Related non-monetary socio-economic indicators, such as life expectancy, infant mortality, adult literacy, nutrient intake, access to (public) health and education facilities, and housing situation by household group (see *Towards a System of Social and Demographic Statistics* (United Nations, 1975));

d. Some re-routings such as social transfers in kind by groups of households.

28.85 Comparing labour incomes of all employed persons as shown in the SAM, a decomposition of these incomes into full-time equivalent employment and average wage rates, and the potential labour force by type of person and household group (expressed in "full-time" equivalents), yields detailed information on the composition of unemployment and an aggregate indicator ("full-time equivalent unemployment") which is consistent, both conceptually and numerically, with the other macroeconomic indicators; these can also be derived from the SAM framework.

Chapter 29: Satellite accounts and other extensions

A. Introduction

29.1 The sequence of accounts is fully integrated in large part because of the underlying rigour of the accounting system. However, the guidelines given in earlier chapters are not necessarily to be followed without variation. A great strength of the SNA is that its articulation is sufficiently robust that a great deal of flexibility can be applied in its implementation while still remaining integrated, economically complete and internally consistent. The purpose of this chapter is to illustrate some of the ways in which this flexibility can be applied.

1. Functional classifications

29.2 As noted in several earlier chapters, moving away from what is purchased to answer the question of why outlays are incurred adds considerably to the analytical power of the system. One approach to this question is the use of functional classifications of expenditure and outlays. A description of these classifications is given in section B. These functional classifications are central to the SNA and also provide a useful starting point for some types of satellite accounts.

2. Key sector accounts

29.3 Instead of using the product and industry classifications (*CPC* and *ISIC*) in their standard order and at the same level of their hierarchies, it can be very instructive to select a group of products or industries of particular importance to the economy, designated here as a key sector. The choice might be very specific, for example concentrating on a single agricultural crop or mineral output, or may be more general such as all the goods and services primarily serving tourism. In either case, a set of supply and use tables may be compiled concentrating on the key sector and aggregating other products and industries. In some cases, where the activity is undertaken by relatively few, relatively large enterprises, it may be possible to go further and compile a complete sequence of accounts for the key sector also. These approaches are described in section C.

3. Satellite accounts

29.4 A further and more extensive form of flexibility is that of a satellite account. As its name indicates, it is linked to, but distinct from, the central system. Many satellite accounts are possible but, though each is consistent with the central system, they may not always be consistent with each other.

29.5 Broadly speaking, there are two types of satellite accounts. One type involves some rearrangement of central classifications and the possible introduction of complementary elements. Such satellite accounts mostly cover accounts specific to given fields such as education, tourism and environmental protection expenditures and may be seen as an extension of the key sector accounts just referred to. They may involve some differences from the central system, such as an alternative treatment of ancillary activities, but they do not change the underlying concepts of the SNA in a fundamental way. The main reason for developing such a satellite account is that to encompass all the detail for all sectors of interest as part of the standard system would simply overburden it and possibly distract attention from the main features of the accounts as a whole. Many elements shown in a satellite account are invisible in the central accounts. Either they are explicitly estimated in the making of the central accounts, but they are merged for presentation in more aggregated figures, or they are only implicit components of transactions which are estimated globally.

29.6 The second type of satellite analysis is mainly based on concepts that are alternatives to those of the SNA. The sorts of variations in the basic concepts that may be considered are discussed in section D. These include a different production boundary, an enlarged concept of consumption or capital formation, an extension of the scope of assets, and so on. Often a number of alternative concepts may be used at the same time. This second type of analysis may involve, like the first, changes in classifications, but in the second type the main emphasis is on the alternative concepts. Using those alternative concepts may give rise to partial complementary aggregates, the purpose of which is to supplement the central system.

29.7 Section E suggests some sorts of tables that might be useful in the context of a satellite account. Again, flexibility in the presentation of tables is recommended but the subjects of the tables given in section E have proved to be useful in a number of cases.

29.8 The emphasis on the flexibility of the SNA extends to allowing complete flexibility about how many and what sort of satellite or other extended accounts may be developed. Satellite accounts, especially of the second sort, allow experimentation with new concepts and methodologies, with a much wider degree of freedom than is possible within the central system. When a number of countries develop similar satellites, exchanging experience can lead to beneficial refinements and the establishment of

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

international guidelines in a particular topic and ultimately the possibility of changes in the central system itself. Some examples of this sort of research are reported in section F of this chapter.

B. Functional classifications

29.9 The SNA uses special classifications to analyse consumption, or more generally outlays, by different sectors according to the purpose for which the expenditure is undertaken. Such classifications are referred to as functional classifications. The classifications concerned are:

a. Classification Of Individual COnsumption by Purpose (COICOP);

b. Classification Of the Functions Of Government (COFOG);

c. Classification Of the Purposes of Non-profit Institutions serving households (COPNI);

d. Classification of Outlays of Producers by Purpose (COPP).

29.10 Full details of all the classifications can be found in *Classifications of Expenditure According to Purpose* (United Nations, 2000).

29.11 The main purpose of these classifications is to provide statistics which experience has shown to be of general interest for a wide variety of analytical uses. For example, COICOP shows items such as household expenditure on food, health and education services all of which are important indicators of national welfare; COFOG shows government expenditure on health, education, defence and so on and is also used to distinguish between collective services and individual consumption goods and services provided by government; COPP may provide information on the "outsourcing" of business services, that is, on the extent to which producers buy-in catering, cleaning, transport, auditing and other services that were previously carried out as ancillary activities within the enterprise.

29.12 Functional classifications also provide the means to recast key aggregates of the SNA for particular kinds of analyses, some of which are described in later sections of the chapter. For example:

a. It can be argued that, for several analytical purposes, the SNA definition of gross capital formation is too narrow. In studies of the causes of labour productivity, researchers would often like to have a measure of "human capital" which is normally derived from information on past expenditures on education. The four functional classifications each identify expenditures on education and thus it is possible to derive education expenditure incurred by households, government, non-profit institutions and producers;

b. In studies of household expenditure and saving, some researchers have considered expenditures on consumer durables as capital rather than current expenses. COICOP facilitates this by identifying expenditures on durable goods;

c. In studies of the impact of economic growth on the environment, researchers often wish to identify environmental protection expenditure. COFOG and COPP both include this as one of their first level categories.

1. COICOP

29.13 There are 14 main categories in COICOP. The first 12 sum to total individual consumption expenditure of households. The last two identify those parts of consumption expenditure by NPISHs and general government that are treated as social transfers in kind. Together all 14 items represent actual final consumption by households. The 14 categories are as follows:

1. Food and non-alcoholic beverages,
2. Alcoholic beverages, tobacco and narcotics,
3. Clothing and footwear,
4. Housing, water, electricity, gas and other fuels,
5. Furnishings, household equipment and routine household maintenance,
6. Health,
7. Transport,
8. Communication,
9. Recreation and culture,
10. Education,
11. Restaurants and hotels,
12. Miscellaneous goods and services,
13. Individual consumption expenditure of NPISHs,
14. Individual consumption expenditure of general government.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

29.14 Household budget surveys frequently use a classification scheme based on COICOP to collect household expenditure information. This then has to be reallocated to products for use in a supply and use table as discussed in chapters 14 and 28.

2. COFOG

29.15 There are ten main categories of COFOG as follows:

1. General public services,
2. Defence,
3. Public order and safety,
4. Economic affairs,
5. Environmental protection,
6. Housing and community amenities,
7. Health,
8. Recreation, culture and religion,
9. Education,
10. Social protection.

29.16 As noted in chapter 22, COFOG is used in the analysis and presentation of the government finance presentation of statistics.

3. COPNI

29.17 There are seven main categories in COPNI as follows:

1. Housing,
2. Health,
3. Recreation and culture,
4. Education,
5. Social protection,
6. Religion,
7. Political parties, labour and professional organizations.

29.18 This classification is a somewhat reduced version of the classification for all non-profit institutions given in chapter 23.

4. COPP

29.19 There are six main categories in COPP as follows:

1. Outlays on infrastructure,
2. Outlays on research and development,
3. Outlays on environmental protection,
4. Outlays on marketing,
5. Outlays on human resource development,
6. Outlays on current production programmes, administration and management.

29.20 In principle, COPP applies to all producers, whether market or non-market, although not all categories are of equal interest for both kinds of producers. It is probable that, in practice, classification of outlays of producers by purpose will mainly be of interest for classifying transactions of market producers.

C. Satellite accounts for key sector and other special sector accounts

29.21 The sequence of accounts is normally compiled for the whole economy or for all institutional units belonging to the same institutional sector or subsector. Within the supply and use tables, production units may be grouped to show the elements of the production account and generation of income account, even if the production units are not complete institutional units. Although the rows and columns of the supply and use tables often follow *CPC* and *ISIC*, at similar levels of their respective hierarchies, it is quite possible to select a number of industries that are of special interest in a given country. It is common practice to refer to such groupings of industries as “sectors” even though they do not constitute institutional sectors as the term is used in the SNA.

29.22 It can be very useful for economic analysis to identify particular activities that play a key role in the economy’s external transactions. These key activities may include the petroleum sector, mining activities or crops (coffee, for example), when they account for an important part of exports, foreign exchange assets and, very often, government resources.

29.23 The SNA does not try to provide specific and precise criteria for the definition of what identifies a key sector or activity. It is a matter of judgement in a given country, based on economic analysis and economic and social policy requirements. For instance, even a small industry at an infant stage might deserve to be treated as a key activity.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

29.24 The first step in drawing up key sector accounts is to identify the key activities and their corresponding products. This may involve grouping together items shown in different parts of *ISIC* or *CPC*. For example, accounting for oil and natural gas may cover extraction of crude petroleum and natural gas (*ISIC* division 06), manufacture of refined petroleum products (*ISIC* class 1920), transport via pipelines (*ISIC* class 4930), wholesale of solid, liquid and gaseous fuels and related products (*ISIC* class 4661) and retail sale of automobile fuel (*ISIC* class 4730). The extension of the key sector(s) depends on local circumstances; for example, it may be useful for the energy sector to cover petrochemical processing.

29.25 The key products and key industries accounts may be analysed in the context of a supply and use table. Key industries are shown in detail in columns and other industries may be aggregated. In the rows, key products are similarly shown in detail and other products aggregated. Below the supply and use table, extra rows may show labour inputs, gross fixed capital formation and stocks of fixed assets. In the use part of the table, columns for gross fixed capital formation and changes in inventories respectively may be broken down between one or more key sectors or industries and other sectors or industries. In a country where the key activity is carried out by very heterogeneous types of producers, such as small farmers and large plantations owned and operated by corporations, it may be useful to show the two groups of producers separately, as they have wholly different cost structures and behave differently.

29.26 Thereafter, a set of accounts, following the sequence of accounts as far as possible, may be compiled for the key sector. In the case of energy and mining activities, the key sector generally consists of a limited number of large corporations where access to the commercial accounts of the corporations is usually possible. All transactions of the corporations are covered, even when they carry out secondary activities. It is useful to know the nature of the secondary products, but not necessarily their destination.

29.27 When the key sector relates to an agricultural industry or product, such as coffee in certain countries, the situation is more complex. Many producers may be unincorporated enterprises that do not qualify as quasi-corporations. Ideally, the key sector accounts would include a complete set of accounts for the households that carry out these productive activities. Because this may be difficult to do in practice, it may be necessary to show only the accounts and transactions which are most closely linked with the key activity such as the production and generation of income accounts from the one side and main transactions of the capital and financial accounts from the other.

29.28 In many cases, government plays an important role in connection with key activities, either via taxes and property income receipts, regulatory activity or subsidies. Accordingly, the detailed study of transactions between the key sector and general government is very important. The classification of transactions may be extended to identify those flows connected with the key activity, including the relevant taxes on products. These flows may be received by various government agencies, such as ministries for special purposes, universities, funds or special accounts. Similarly, it is very useful for economic analysis to indicate what uses are made by government of these resources, especially in the case when they are routed via a government agency. This calls for a specific analysis by purpose of this part of government expenditure.

29.29 The distinction between public, foreign controlled or national private corporations is fundamental when dealing with a key sector.

29.30 One more step may consist in showing in additional tables the “from-whom-to-whom?” relationship between the key sector and each other sector and the rest of the world.

D. Satellite accounts; options for conceptual variations

29.31 This section looks at some of the options that might be adopted in developing a satellite account of the second type, where some of the basic concepts of the central system are intentionally varied. It is deliberately illustrative rather than exhaustive.

1. Production and products

29.32 Within the production boundary of the central framework of the SNA, producer units are establishments, classified according to their principal economic activity. Such units are classified according to *ISIC*.

29.33 When establishments, and consequently industries, are not homogeneous at a given level of the *ISIC*, they undertake both a principal activity and one or more secondary activities. The output of these secondary activities is identified according to its nature, following a product classification, but the inputs of secondary activities are not separated from those of the principal activities. Ancillary activities, on the other hand, are not analysed and classified according to their own nature and the related products do not appear as autonomous products.

29.34 When examining certain kinds of activity and products, it may be useful not only to separate secondary from principal activity, but also to identify and recognize the ancillary activities in order to obtain a full picture of the inputs corresponding to the activity being examined.

29.35 Consider the example of transportation. The output of transportation activities in the central framework covers only transport services rendered to third parties, whether as a principal or secondary product. Own-account transportation is treated as an ancillary activity; its inputs are unidentified components of the costs of the producing units it serves. To obtain a broader picture of transportation

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

activity, own-account transportation of producing units may be identified and measured.

29.36 In some instances, it may be useful to consider enlarging the production boundary. For instance, to make an overall estimate of the transportation function in an economy, it might be useful to cover transport services rendered by households using their own cars and to try to value the time people spend using transport facilities. Generally speaking, the scope of non-market activities may be extended considerably.

29.37 The process of identifying principal, secondary and ancillary activities works well when the activity in question is identified in one of the standard classifications and so appears in the central framework. However, in some important cases, such as tourism and environmental protection activities, the process of identification is complex because not all the relevant activities and products appear in the central framework classifications. In this case, the use of the word "industry" is not in strict accordance with the normal usage just as "sector" is used in a special sense in the context of key sector accounts.

2. Income

Primary incomes

29.38 When the production boundary is extended, as suggested above, the magnitude of primary incomes is increased, income being imputed for the additional activities which are inserted within the boundary of production.

29.39 In conditions of high inflation, nominal interest may be judged not to be an appropriate measure of the return to lent funds. Nominal interest includes an implicit or explicit component as compensation for the change inflation causes in the real value of monetary assets and liabilities. This component may be analysed as a holding gain for the borrower and a holding loss for the lender, rather than as an element of property income.

Transfers and disposable income

29.40 Several kinds of transfers in addition to those in the central framework may be delineated, if meaningful. Some examples follow.

29.41 Implicit transfers may be made explicit. Implicit transfers change the situation between units without any flow being treated as an imputed transfer in the central framework. For instance, tax benefits refer to the advantages or disadvantages economic units incur as a consequence of tax legislation by reference to an average situation. Another example is the case of non-market services provided free of charge by government units to market producers. In the central framework these services are treated as collective consumption of government. If a further analysis were to treat them as an addition to intermediate consumption of market producers, a counterpart should be introduced, preferably in subsidies on production. This approach may be undertaken systematically to measure all types of transfers between government and particular sectors, such as agriculture. The implicit benefits resulting from tax concessions, equity participation, soft loans, differential exchange rates, differential domestic prices, etc., may then be added to subsidies, other current transfers, or capital transfers embodied in the central framework data.

29.42 Externalities are impacts on third parties that are not accounted for in the value of monetary transactions between two economic units or that result from actions of these units in the absence of any monetary transaction. As such, externalities may give rise to a wide range of implicit transfers. For example, pollution and nuisance created by producers may have negative effects on final consumers. These negative effects might (with difficulty) be estimated and recorded as negative transfers from producers to households. In order to balance these negative transfers, one possibility might be to introduce a concept of production of externalities which would result in an output of negative or positive services and the corresponding final consumption.

29.43 Flows in the other changes in volume of assets account and the revaluation account of the central framework are candidates for enlarged concepts of transfers and disposable income. Uncompensated seizures, for example, could be recorded as a transfer (albeit unwillingly on the part of the former owner). In countries where holding gains or losses on financial assets or liabilities are significant, real holding gains and losses on financial assets and liabilities could be added to disposable income in order to derive a broader measure of income.

3. Uses of goods and services

29.44 The coverage of uses of goods and services, either for intermediate or final consumption or capital formation, obviously changes as a result of enlarging the concept of production. For example, if services rendered to each other by members of the same household were included in production, they would have to be also included in final consumption.

29.45 The borderline between intermediate consumption, final consumption and capital formation may also be modified in various ways. Two often mentioned cases refer to human capital and consumer durables. If at least part of final consumption on education and health were treated as fixed capital formation, the corresponding central framework transactions would be reclassified from consumption to fixed capital formation resulting in human capital assets. As an immediate consequence, the concept of consumption of fixed capital would be extended.

29.46 An alternative to the inclusion of expenditures on consumer durables such as cars and furniture in household final consumption would be to treat them as fixed capital formation. Only that part of the resulting fixed asset estimated as the capital services provided by the durable would then enter final consumption. Strictly speaking, this procedure implies enlarging the concept of production to include household services. (This is one subject discussed further in section E.)

29.47 As a consequence of the changes just considered, the concept of saving would be extended.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

4. Assets and liabilities

29.48 The scope of non-financial assets could be modified as a consequence of extending the concept of production or modifying the borderline between consumption and capital formation, as indicated in the previous paragraphs.

29.49 The scope of financial assets and liabilities could also be broadened by including contingent assets and liabilities in the classification of financial instruments. Further, alternative rules about the valuation of financial assets may be used, for example using fair value estimates instead of market value.

5. Purposes

29.50 Section B describes the functional classifications. In the standard version, headings at a given level are mutually exclusive. For example, teaching in hospitals must be classified as either education or health expenditure but not both. Consequently, for an education or health account, it might be desirable to reclassify a number of transactions. In order to preserve as great a degree of consistency with the central system as possible, any reclassifications should be treated as removing an item from one heading and placing it in another rather than allowing double counting. Double counting would mean that transactions classified by purpose were no longer additive since some of them would appear under two or more headings. However, even without double counting, it should be noted that different satellite accounts, each with a different focus, may not be consistent with respect to other headings. For example, if an education satellite account treats some teaching done in hospitals as education rather than health, the measure of health in that satellite will differ from that in any other satellite where such a displacement has not been made.

6. Aggregates

29.51 A number of the complementary or alternative analyses mentioned above may modify the main aggregates as shown in the central framework either directly or indirectly. Examples of direct modifications are the increase in output and value added when final consumption of household services for own use is included within the boundary of production, or the increase in fixed capital formation if human capital is considered an economic asset. Other aggregates are indirectly modified; saving in the latter case, disposable income in the former.

29.52 In some types of analysis the objective is to focus on one specific field of concern, such as education or tourism. Changes in some concepts and aggregates of the central framework may be introduced, but this is not the primary intention, nor is it intended to give a different picture of the overall economic process.

E. Possible tables for a satellite account

29.53 The previous section described what variations in the basic concepts, accounting rules and classifications of the SNA could be applied in a satellite account. This section suggests some sorts of tables that it might be useful to compile for a satellite account.

1. Scoping a functionally orientated account

29.54 The starting point is to decide which products are of interest and which are the industries involved in their production. The resources devoted to the production of the items include not only current costs but also fixed capital used in production. Once the items are produced, the question arises of how they are used. This leads to requiring information on the following topics:

a. A detailed analysis of the supply and use of the products in question;

b. Information on the fixed capital used in the production process.

29.55 For many items, the units using the products are responsible for bearing the expense of acquiring the product but satellite accounts may frequently be compiled for areas, such as health or education, where there may be an important distinction between who pays for the product and who consumes it.

29.56 In addition, for many products of special interest, there may be particular taxes or subsidies associated with their production or use. Taking these two factors together, therefore, in addition to the items above, the following is required:

c. An analysis of any transfers associated with either production or use.

29.57 It is also useful in many cases to associate non-monetary figures with the monetary ones. This means assembling the following information:

d. Information on employment and the availability of assets.

29.58 Once these four sets of data are assembled, it should be possible to develop a satellite account that covers the analysis of uses of, or benefits from, the expenditure on the items, production including the labour and capital employed, transfers and other ways of financing the uses. All of this can be expressed in value terms and, when relevant, in physical quantities.

2. Determining the products of interest

29.59 For any field of interest, the starting point is to identify the products specific to this field. It is customary, in the context

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

of a satellite account, to identify these as characteristic products and connected products. Characteristic products are those that are typical of the field; for instance, for health, characteristic products are health services, public administration services, education and R&D services in health.

29.60 The second category, connected goods and services, includes products whose uses are interesting because they are clearly covered by the concept of expenditure in a given field, without being typical, either by nature or because they are classified in broader categories of products. In health, for example, transportation of patients may be considered connected services; also pharmaceutical products and other medical goods, such as spectacles, are very often treated as connected goods and services.

29.61 Together characteristic products and connected products are referred to as specific products.

3. Measuring production

29.62 For characteristic products, the satellite account should show the way these goods and services are produced, what kinds of producers are involved, what kinds of labour and fixed capital they use and the efficiency of the production process and, hence, of the allocation of resources.

29.63 For connected products, there is no particular interest in their conditions of production because they are not typical of the field of interest. If the conditions of production are important, then the items should be considered characteristic products and not connected products. For example, pharmaceutical products might be considered characteristic in the account for health of a country in the first stages of developing a domestic industry. The precise borderline between characteristic and connected products depends on the economic organization in a given country and the purpose of a satellite account.

4. Components of uses/national expenditure

29.64 The components of uses or national expenditure are the following:

1. Consumption of specific goods and services,
2. Capital formation in specific goods and services,
3. Fixed capital formation of characteristic activities in non-specific products,
4. Specific current transfers,
5. Specific capital transfers.

Each of these items is discussed below.

Consumption

29.65 Item 1 is consumption of specific goods and services. It covers actual final consumption (as defined in the central framework) and intermediate consumption. Market products, products for own final use and non-market products are distinguished and, for the last-named, individual and collective consumption may be shown separately. Intermediate consumption generally has a broader coverage than in the central framework, as the output of the relevant ancillary activities is identified with intra-establishment deliveries being recorded. As a consequence, it covers (actual) intermediate consumption as defined in the central framework and internal intermediate consumption. In some cases, such as transport services, the last component may be important in size. Sometimes, it could be considered that this internal intermediate consumption should be treated as final consumption and added to actual final consumption, as in the use of ancillary education and health services, thus broadening the scope of household actual final consumption. Alternatively, the scope of consumption may be narrowed, if the use of certain services is treated as fixed capital formation in a satellite account instead of intermediate or final consumption as in the central framework.

Capital formation

29.66 Item 2 is capital formation in specific goods and services. Since, item 2 includes changes in inventories, if appropriate, it may cover work-in-progress in specific services. In an account for culture, for example, there may also be acquisition less disposals of valuables.

29.67 Item 3, fixed capital formation of characteristic activities in non-specific products and their acquisitions less disposals of non-produced non-financial assets is a bit more complex:

a. It does not cover the total fixed capital formation of these activities because that part consisting of specific products is already included in item 2.

b. Only the fixed capital formation of activities whose output consists of characteristic goods and services is covered in item 3. (If the exclusion of capital formation of activities whose output consists of connected goods and services proves important, the products and activities in question may have to be redefined to be characteristic.)

c. An analysis based on establishments may give a broader coverage than normal because they may cover some secondary activities.

d. Item 3 includes acquisitions less disposals of non-produced non-financial assets.

Transfers

29.68 Items 4 and 5, specific current transfers and specific capital transfers, are the most important components of national expenditure in cases such as social protection or development aid. In these fields, items 1 and 2 refer only to the administrative costs, both current and capital, of the agencies managing social protection or international aid. The core of the expenditure consists of transfers.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

29.69 In some situations, there may be subsidies designed to reduce the prices paid by final consumers for certain goods or services, such as food, transport services, or housing services. They are commonly called consumption subsidies. In the central framework, when these goods and services are considered market products, they are included in final consumption at purchasers' prices. In a satellite account there are two options: either consumption (item 1) is valued differently from the central framework in order to include the value of consumption subsidies or consumption is valued as it is in the central framework and specific current transfers (item 4) must include consumption subsidies. Subsidies included in item 4 may also be directed toward reducing the prices of intermediate consumption. Item 4 may also include other subsidies on production.

29.70 In each field a classification of specific transfers has to be established. As it is used for analysing both uses and financing, this classification covers all specific transfers, independently of whether they are counterparts of items 1 to 3 or not.

Total uses and national expenditure

29.71 The total uses of resident units are the sum of the five components above. From this, current uses financed by the rest of the world are deducted to reach national expenditure. National expenditure is thus equal to total uses of resident units financed by resident units. It is desirable if possible to distinguish between current and capital uses financed by the rest of the world.

29.72 National expenditure, as defined above, does not include transactions in financial instruments. However, for certain types of analysis, such as development aid, loans which are given or received at preferential conditions must be accounted for. Benefits or costs resulting from rates of interest lower than the market ones involve implicit transfers as described in chapter 22.

29.73 Uses/national expenditure may be shown by type of products and transfers or by type of purpose (programmes). The main emphasis may be put on one or the other of these two alternatives, or they might be used jointly, depending on the field covered or the aim of the analysis pursued. The approach by programme is particularly relevant in the case of environmental protection or social protection.

5. Users or beneficiaries

29.74 For users or beneficiaries, the terminology used may differ from one satellite account to another. "Users" is more relevant to tourism or housing for example, "beneficiaries" to social protection or development aid. In both cases, the terms refer to who is using the goods and services or benefitting from the transfers involved.

29.75 At the most aggregated level, the classification of users or beneficiaries is simply a rearrangement of the central framework classification of institutional sectors and types of producers, in which the production and consumption aspects are separated. It may be as follows:

a. Market producers;

b. Producers for own final use;

c. Non-market producers;

d. Government as a collective consumer;

e. Households as consumers;

f. Rest of the world.

29.76 Households as consumers are the most important type of users or beneficiaries in many satellite accounts. In order to be useful for social analysis and policy, a further breakdown of households is necessary. For this purpose, one of the sorts of subsectoring of households discussed in chapter 24 could be considered.

6. Financing

29.77 Because users do not always bear the expenses themselves, it may be desirable to try to analyse the units that ultimately bear the expenses. This is more feasible when the field of interest covers complete institutional units than when it concerns establishments (or units of homogeneous production) covering only part of the output of the whole enterprise.

29.78 One way to approach the question of financing is to first establish what types of financing are used and then identify which sorts of units provide each type of financing. The question of "ultimate" bearer of the cost also needs addressing. Some household consumption is provided by government as social transfers in kind, which in turn is largely financed by taxes received by government from households and enterprises. In one sense, therefore, it could be argued that social transfers in kind are ultimately financed by households and enterprises. Some conventions have to be established about how far back down the financing chain to go to determine the "ultimate", or perhaps more correctly the indirect, source of financing.

29.79 Another problem that arises is that, except in cases of transactions in kind, there is no necessary link between one source of funding and one type of expenditure. However, it is convenient to pair various types of financing and expenditure to see how far they correspond, as follows:

a. Intermediate consumption of market producers compared with revenue from sales;

b. Intermediate and final consumption of government compared with taxes;

c. Intermediate and final consumption of NPISHs compared with contributions received;

d. Final consumption expenditure by households compared with compensation of employees and transfers such as pensions.

29.80 Capital formation may be funded in a number of ways; from revenue from sales, from the disposal of assets (including financial assets), from the receipt of a transfer in

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

kind or from borrowing. In the case of capital formation by government, this may be funded by the issue of securities or by capital transfers or loans from the rest of the world.

29.81 The source of financing of transfers depends in large part on the field being studied. If social benefits are included, they should be treated as mainly financed by social contributions from other households. Governments will be the provider of transfers in some cases (including subsidies) and the recipient in others (including taxes).

29.82 In a number of cases, it may be particularly relevant to identify financing from the rest of the world.

7. Production and products

29.83 As with key sector accounts, it will almost always be useful to develop a set of supply and use tables for the characteristic and connected products of interest and the producers of the characteristic products. This may be extended to cover the generation of income account also and non-monetary data concerning employment and indicators of output.

8. Physical data

29.84 Data measured in physical or other non-monetary units should not be considered a secondary part of a satellite account. They are essential components, both for the information they provide directly and in order to analyse the monetary data adequately.

F. Examples of satellite accounts

29.85 As explained in the introduction, there are two types of satellite accounts, serving two different functions. The first type, sometimes called an internal satellite, takes the full set of accounting rules and conventions of the SNA but focuses on a particular aspect of interest by moving away from the standard classifications and hierarchies. Examples are tourism, coffee production and environmental protection expenditure. The second type, called an external satellite, may add non-economic data or vary some of the accounting conventions or both. It is a particularly suitable way to explore new areas in a research context. An example may be the role of volunteer labour in the economy. Some sets of satellite accounts may include features of both internal and external satellites.

29.86 The boundary between satellite accounts and a straightforward elaboration of the SNA or even with other systems is not clear cut. The links to balance of payments and the international accounts as presented in *BPM6*, government finance statistics as in *GFSM2001* or *MFSM* could all be seen as a form of satellite account. The treatment of NPIs in chapter 23 and the informal sector in chapter 25 are clearly satellite accounts. Even the pension table in chapter 17 could be seen as a form of satellite account, even though its compilation is part of the central guidelines of the SNA.

29.87 In this section, some further satellite accounts are described. The descriptions are brief, being intended to give a flavour of the accounts only; references are given for further information. Four areas in total are described. For two of these, the tourism satellite account and the environmental satellite account, the international manuals are now in their second version. The health satellite account is still in a preliminary version but under active revision. The fourth area covers unpaid household production activities. This has been an area of interest for very many years but the difficulties in determining how to measure unpaid activities has so far been a stumbling block in reaching international agreement on how to proceed. Nevertheless, some of the most recent work in this is reviewed for those interested.

29.88 Other satellite accounts have been developed or are under development. Some, such as a satellite investigating productivity across a number of countries reported in *Productivity in the European Union: A Comparative Industry Approach* (EU KLEMS Project, 2003), have been conducted to date as a research exercise. Others, such as accounts for water and forests, have been developed as elaborations of the main environmental satellite account *SEEA* to the point where international guidelines on these are now accepted. Further satellite accounts for agricultural products would be useful for a number of developing countries. Here and elsewhere, as there is agreement on how to compile a new form of satellite account, new international guidelines can be developed. International guidelines on satellite accounts themselves may be subject to revision and may eventually move towards an accepted international standard as is planned for the *SEEA*.

1. Tourism satellite accounts

29.89 The tourism satellite account (*TSA*) is a long established satellite account with more than 70 countries having compiled one at some stage. A manual of international guidelines, known as the 2008 *Tourism Satellite Accounts: Recommended Methodological Framework* (Eurostat, Organisation for Economic Co-operation and Development, World Tourism Organization, United Nations, 2008) updates the first version of 2000. The coverage of second homes and the activity of meetings and conferences are extensions to the *TSA* made in the 2008 update.

29.90 The goal of the tourism satellite account is to provide the following information:

a. Macroeconomic aggregates that describe the size and the economic contribution of tourism such as tourism

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

direct gross value added (TDGVA) and tourism direct gross domestic product (TDGDP), consistent with similar aggregates for the total economy and other productive economic activities and functional areas of interest;

b. Detailed data on tourism consumption, a more extended concept associated with the activity of visitors as consumers, and the description of how this demand is met by domestic supply and imports, integrated within tables derived from supply and use tables that can be compiled both at current values and in volume terms;

c. Detailed production accounts of the tourism industries, including data on employment linkages with other productive economic activities and gross fixed capital formation;

d. A link between economic data and non-monetary information on tourism such as number of trips (or visits), duration of stay, purpose of trip, modes of transport, etc. which are required to specify the characteristics of the economic variables.

Defining visitors and tourists

29.91 At the centre of the *TSA* is the idea of a visitor. A visitor is defined as someone who is outside their usual environment but not employed by an entity resident in the place he is visiting. The usual environment is not identical with country of residence. It refers to the area within which a person is normally to be found. It includes the area around the home and also the place of work. Thus border workers, although they cross a country boundary, are not visitors. Visitors are therefore a subset of travellers.

29.92 Visitors may be divided into two categories: those that are overnight visitors called tourists and those that are same day visitors called excursionists. Further, it is important to divide tourists according to their country of residence into domestic and external tourists. A resident visiting a country abroad is undertaking outbound tourism; a non-resident visiting the domestic economy is undertaking inbound tourism. The total amount of tourism undertaken by residents, known as national tourism, is the sum of domestic tourism (tourism within the domestic economy undertaken by residents) plus outbound tourism. Internal tourism is the sum of domestic tourism plus inbound tourism.

	Within the country	Outside the country	Total
Residents	Domestic tourism	Outbound tourism	National tourism
Non-residents	Inbound tourism		
Total	Internal tourism		

29.93 Tourism is not restricted to activities normally thought of as typical of recreation but includes all activities undertaken by the tourist. Travelling for business or for education or training is included. The purpose of the tourist's visit is categorized according to whether it is personal or business and professional. The personal heading is further divided into eight categories: holidays, leisure and recreation; visiting friends and relatives; education and training; health and medical care; religion or pilgrimages; shopping; transit and other.

Definition and scope of tourism expenditure

29.94 Tourism expenditure is defined as the amount paid for the acquisition of consumption goods and services as well as valuables for own use or to give away after or during tourism trips. It includes expenditures by visitors themselves as well as expenses that are paid for or reimbursed by others.

Definition and scope of tourism consumption

29.95 The concept of tourism consumption goes beyond that of tourism expenditure in that it also includes services associated with occasional accommodation on own account, tourism social transfers in kind and other imputed consumption. While information on tourism expenditure can be obtained by surveys of tourists, the adjustments to tourism consumption have to be estimated from other sources.

29.96 Tourism consumption can be characterized according to where the tourism takes place and whether the tourist is a resident or non-resident in a manner similar to that already described for tourism.

Characteristic products

29.97 The consumption products considered by the *TSA* are divided into tourism characteristic products and other consumption products. Tourism characteristic products are further subdivided into internationally comparable tourism characteristic products and country specific tourism characteristic products. The *TSA* manual includes a list of the first. Other consumption products are divided between tourism connected products and non-tourism related products. Non-consumption products include all products that do not constitute consumption goods and services. These include valuables, tourism gross fixed capital formation and collective consumption. A list of 12 classifications of products and activities characteristic of tourism are given in the *TSA* manual.

Tourism industries

29.98 A tourism industry represents the grouping of those establishments whose main activity corresponds to a characteristic product. Tourism industries cover accommodation for visitors, the food and beverage serving industry, railway, road, water and air passenger transport, transport equipment rental, travel agencies and other reservation service industries, the cultural industry, the sports and recreational industry, the retail trade of country specific tourism characteristic goods and country specific tourism characteristic industries.

Gross operating surplus																									

X does not apply

• • • Means that all tourism industries of the proposed list have to be considered one by one in the enumeration

***** Imports excludes direct purchase of residents abroad

(*) The value of **A. Consumption products**, is net of the gross service charges paid to travel agencies, tour operators and other reservation services.
(**) Includes all other goods and services that circulate in the economy of reference.
(a) If relevant and feasible, countries should separately identify both components ("tourism connected products" and "non-tourism related consumption products"). In both cases, goods and services should be separately identified, if possible (see para. 4.15.).
(b) Goods and services should be separately identified, if possible (see para. 4.16.)
(c) Breakdown should be provided, if possible (see para. 4.17.)
(d) For goods, the tourism share is to be established on the retail trade margin only (see Annex 4)

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

29.99 Based on this information a full set of *TSA* accounts consisting of 10 tables can be compiled. The first three consist of tourism expenditure. Table 4 shows a breakdown between domestic and inbound tourism and the adjustments that need to be made to move from tourism expenditure to tourism consumption. Table 5 shows the supply of the tourism industry. Table 6 is the heart of the *TSA* and shows the main aggregates derived; the aggregates are listed below. Table 7 covers employment. Tables 8 and 9 cover fixed capital and collective consumption. Table 10 covers non-monetary information.

Main aggregates

29.100 The following aggregates are taken to be a set of relevant indicators of the size of tourism in an economy. They include:

a. Internal tourism expenditure;

b. Internal tourism consumption;

c. Gross value added of the tourism industry (GVATI);

d. Tourism direct gross value added (TDGVA);

e. Tourism direct gross domestic product (TDGDP).

29.101 The derivation of these items is shown in table 6 of the *TSA* manual which is included as table 28.1.

2. Environmental accounting

29.102 Environmental accounts aim to reflect within a framework based on the SNA the impacts of using (and sometimes using up) natural resources and the generation of residuals that pollute the air and water. They also identify specific activities undertaken to prevent or combat the environmental impacts of human activity.

29.103 An interim version of *SEEA*, the satellite for Integrated Environmental and Economic Accounts was published in 1993. An updated version was released in 2003. Work is in hand to revise this further with a view to publication in 2012. The goals of the *SEEA* are to assist in:

a. encouraging the adoption of standard classifications in environmental statistics, which extends the value and relevance of existing environmental information;

b. bringing a new dimension to environmental statistics by applying the economic accounting traditions linking stocks and flows;

c. providing a link with the economic information contained within the traditional economic accounts, leading to improvements in the reliability and coherence of both sets of information;

d. identifying use and ownership and hence responsibility for environmental impacts;

e. encouraging the development of comprehensive and consistent data sets over time;

f. facilitating international comparisons.

29.104 As with the SNA, the *SEEA* accounts provide a score-keeping function from which key indicators can be derived and a management function in that they can be used in the analysis of policy options. The accounts provide a sound basis for the calculation of measures which may already be included in sets of sustainable development indicators, but they may also be used to develop new indicators, such as environmentally adjusted macroaggregates which would not otherwise be available.

The different parts of the *SEEA*

29.105 The *SEEA* should be seen as a satellite account to the SNA with features of both internal and external satellites. The full system consists of three main sections, two of which can be implemented more or less independently and a third which is designed to integrate the first two with each other and with the SNA. The three sections consist of:

a. An extended form of supply and use tables capable of incorporating physical data alone or in addition to monetary data;

b. Elaborations of parts of the central framework of the SNA with some extensions; and

c. Consideration of extending the SNA to allow the effects of depletion and degradation to impact the macroaggregates such as GDP.

Physical and hybrid supply and use tables

29.106 Four different types of flows are distinguished in the *SEEA*.

a. ***Products*** are goods and services produced within the economic sphere and used within it, including flows of goods and services between the national economy and the rest of the world.

b. ***Natural resources*** cover mineral and energy resources, soil, water and biological resources.

c. ***Ecosystem inputs*** cover air and the gases necessary for combustion and the water to sustain life.

d. ***Residuals*** are the unintended and undesired outputs from the economy which have zero price and may be recycled or discharged into the environment. “Residuals” is the single word used to cover solid waste, effluents (discharges to water) and emissions (discharges to air).

29.107 The first set of environmental accounts consists of a link to environmental statistics formed by structuring physical environmental data in a supply and use or input-output framework. Physical flow accounts consist of merging accounts for products, natural resources, ecosystem inputs and residuals, each account being expressed in terms of

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

supply to the economy and use by the economy. Purely physical accounts can show the relative importance of different economic activities in terms of their effect on the environment.

29.108 However, the power of this approach comes from being able to draw parallels between the physical and monetary flows to compare and contrast this environmental importance with the corresponding importance of the activities in economic terms. The hybrid supply and use or input-output tables superimpose monetary values for products on their physical equivalents and add the balancing item of value added. Hybrid input-output tables have been successfully used to explore environmental themes such as greenhouse effects or solid waste. Examples can be found in the *SEEA* manual.

29.109 An example of a hybrid *SEEA* input-output table is given in table 29.2.

Identifying environmental aspects of the central framework

29.110 The second strand of the accounting system is to identify precisely those monetary transactions in the SNA that are directly related to the environment. In terms of flows, this concerns environmental taxes, property income and property rights, and environmental protection, natural resource use and management expenditure.

Environmental taxes, property income and property rights

29.111 An environmental tax is one whose tax base is a physical unit (or proxy of it) that has a proven specific negative impact on the environment. Four types of taxes can be considered to be environmental; energy taxes, transport taxes, pollution taxes and resource taxes. As elsewhere in the SNA, care has to be taken to distinguish between taxes and fees for a service. Landfill charges, for example, may fall in the latter category even though levied by government.

29.112 Resource rent on natural assets is shown in the SNA as property income when paid to another unit. As shown in chapter 20, however, it is possible to identify the element of operating surplus corresponding to the resource rent on a natural asset used by the owner also.

29.113 Another aspect of importance for the use of natural resources is the question of permits to use these over an extended period, as discussed in chapter 17. Permits may relate to extraction of natural resources or the use of them as a sink.

A set of accounts for environmental protection expenditure

29.114 A set of environmental protection accounts can be compiled using fairly standard satellite account techniques according to the following steps:

a. Relevant ancillary activities should be treated as secondary products;

b. A set of characteristic products should be identified;

c. Transfers specific to environmental protection need to be identified;

d. National expenditure on environmental protection can be calculated;

e. The sectors financing the expenditure can be identified.

29.115 All these steps are described in detail in the *SEEA* manual. There is discussion there also on a set of characteristic products identified as the "environment industry" for comparable international use. An example of an environmental protection expenditure account is shown in table 29.3.

Asset accounts

29.116 For stocks and changes in stocks, the asset accounts described in chapter 11 are used for natural resources, in both value terms and physical units. In the *SEEA*, asset accounts may be compiled in physical terms for natural resources that have no monetary value and thus do not appear within the SNA asset boundary. For resources such as air and water that may not have a monetary value, nor even a stock value, accounts of changes in physical units may still be useful.

Integrating environmental adjustments in the flow accounts

29.117 The third and last main section of the *SEEA* is the external part of the satellite account. It relaxes the constraint which has been respected in the accounts described so far not to make any fundamental change to the SNA. The idea is simple, to convert hybrid tables to fully monetized tables by placing monetary values on those flows below and to the right of a hybrid table which have so far been expressed in physical terms only. However, although the idea is simple, implementing it is not. This part of the *SEEA* is more experimental and consensus on proposals made so far has not been reached.

Depletion

29.118 Valuing inputs into the economic system is the first and easier step. Since these inputs are incorporated into products which are sold in the market place, in principle it is possible to use direct means to assign a value for them based on market principles. Even within the SNA, such valuations are sometimes made though the results are placed in the other changes in assets account rather than in the flow accounts. Thus another way of looking at the process of incorporating the use of environmental inputs into the system is to relocate some of the other changes in assets items into the accounts portraying transactions. In particular, if an environmental resource is not being used sustainably, an alternative measure of income allowing for the consumption of natural capital as well as consumption

of fixed capital may be considered to take account of the depletion of natural resources.

Defensive expenditure

29.119 Some actions are already taken to limit residuals generation or to mitigate the impact of those which are emitted. These expenditures are sometimes referred to as defensive expenditures. One possible way to adjust the macroeconomic aggregates is to treat this expenditure as capital formation with offsetting depreciation.

Accounting for environmental degradation

29.120 This is the most difficult part of environmental accounting and one where there is still a wide divergence of views. There are two problems raised by the question of how to incorporate the effects of degradation in the SNA. The first is how to place a value on degradation; the second how to locate this valuation in the accounts.

29.121 The variety of approaches advocated can be illustrated briefly in terms of the focus of attention.

29.122 One approach is to focus on maintenance costing. (This is the approach taken in the 1993 version of the *SEEA*.) The object of the exercise is to answer the question: *What would the value of net domestic product have been if hypothetical environmental standards were met using current costs and current technologies?*

29.123 The problem with this approach is that if the question is posed in respect of significant changes in environmental standards, the resultant price rises involved are likely to bring about a change in behaviour that would affect the level of demand for those products. In turn this would show up either as a change in the level of output of those products or a change in the technology of production to reduce dependence on the newly expensive products. Nevertheless, for marginal changes in standards, this technique may be used to give an upper bound on the impact on NDP from moving to more rigorous environmental standards. The aggregates from such an exercise are referred to as "environmentally adjusted".

29.124 A second type of cost-based estimates, known as "greened economy modelling" attempts to resolve the problems raised by maintenance cost approaches for the non-marginal cases of changes in environment standards. They attempt to answer the question: *What level of GDP could be achieved if steps were taken to internalize maintenance costs?*

29.125 A particular application of greened economy models aims not just to determine a set of values for output, demand and so on which satisfy the national accounting balances but to determine levels of output which lead to levels of income that are sustainable over a given time period. It attempts to answer the question: *What level of income and environmental functions can be sustained indefinitely?*

29.126 Damage-based measures derive from the impact of actual residual generation. The biggest impact is on human health. They attempt to answer the question: *What is the impact on the level of NDP of environmental impacts on natural and man-made capital and on human health?*

29.127 "Damage-adjusted income" is thus a first step on the way to converting GDP-type measures to welfare indices but many other aspects of welfare are deliberately ignored.

3. Health satellite accounts

29.128 The health care industry is of significant size and importance in many countries in terms of the number of people employed and level of turnover and is always a matter of significant policy concern. The *System of Health Accounts (SHA)* (Organisation for Economic Co-operation and Development, 2000) builds on experience over the previous 15 years of information being collected on health care data. One of the main purposes of the manual was to provide a framework for analysing health care systems from an economic point of view, consistent with national accounting rules. As part of this, the conceptual links between the SHA and health satellite accounts were examined. The manual is currently in the process of being updated as a joint effort by the OECD, Eurostat and WHO, with a revised version expected about the end of 2010.

29.129 In order to see how a health satellite account can be developed it is useful to begin by looking at the *SHA*. There are four categories of information provided: a functional classification of health care, an analysis of health care provider units, information on expenditure on health care and information about the funding of health care. Each of these is described briefly in turn.

Functional classification of health care

29.130 The activities of health care cover the application of medical, paramedical and nursing knowledge and technology, either by institutions or individuals, in pursuit of the following goals:

a. Promoting health and preventing disease;

b. Curing illness and reducing premature mortality;

c. Caring for persons affected by chronic illness who require nursing care;

d. Caring for persons with health-related impairment, disability and handicaps who require nursing care;

e. Assisting patients to die with dignity;

f. Providing and administering public health;

g. Providing and administering health programmes, health insurance and other funding arrangements.

29.131 Following from this there are three main functional classifications of health care;

a. Personal health care services and goods;

b. Collective health care services;

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

c. Health care related functions.

29.132 Each of these headings is broken down into a number of finer categories. Personal health care distinguishes services of curative care, services of rehabilitative care, services of long-term nursing care, ancillary services to health care and medical goods dispensed to outpatients. Collective health care services are divided between preventive and public health services on the one hand and health administration and health insurance on the other. Health-related functions include capital formation of health care provider institutions, education and training of health personnel, research and development in health, food, hygiene and drinking water control, environmental health, administration and provision of social services in kind to assist those living with disease and impairment, and administration and provision of health-related cash benefits.

Health care provider units

29.133 The providers of health care are divided into the following categories:

a. Hospitals;

b. Nursing and residential care facilities;

c. Providers of ambulatory health care;

d. Retailers and other providers of medical goods;

e. Provision and administration of public health programmes;

f. Health administration and insurance;

g. Other industries (rest of the economy);

h. Rest of the world.

29.134 Each of these providers can be allocated to one or more of the institutional sectors of the SNA.

Expenditure on health care

29.135 Total expenditure on health measures the final use by resident units of health care goods and services plus gross capital formation in health care provider industries (institutions where health care is the predominant activity).

29.136 Expenditure on health can be divided into the following categories;

a. Personal health care services;

b. Medical goods dispensed to outpatients;

c. Total personal expenditure on health;

d. Prevention and public health services;

e. Health administration and health insurance;

f. Total current expenditure on health (the sum of the above);

g. Gross capital formation in health care industries;

h. Total expenditure on health.

29.137 The production boundary of health care services is very close to that of the SNA but with two exceptions. Occupational health care is included within the SHA whereas it is treated as an ancillary service in the SNA. The cash transfers to private households (the caregivers at home) are treated as output of domestic services paid for by the transfers.

Funding of health care

29.138 The funding of health care is divided between that provided by general government, that from the private sector and that from the rest of the world. Within general government a distinction is made between the levels of government and social security funds. Within the private sector a distinction is made between private social insurance, other private insurance, private households, NPISHs and corporations excluding health insurance.

Converting the SHA to health satellite accounts

29.139 The following steps are required in order to translate the economic framework of the SHA into a health satellite account:

a. A comprehensive listing of goods and services considered specific to the production of health care services needs to be determined;

b. The boundary line of production to define total expenditure on health needs to be determined;

c. The activities for which capital formation will be recorded need to be determined;

d. Specific transactions need to be identified;

e. The detailed analysis of transfers as an integral part of health accounting needs to be provided;

f. Ultimate users and ultimate bearers of health expenses need to be identified.

29.140 One of the difficulties with establishing a list of characteristic products is that the *CPC* does not deal with categories of health care services in the detail that is required for health accounts. Therefore a more detailed classification is required. Further, since health care is often a public responsibility information drawn from administrative data is often inadequate to provide the degree of detail that is required for a satellite account.

29.141 Despite these difficulties it is proposed that four additional accounts would extend the SHA into a satellite account for health:

a. Production account and health care value added by the health care industry;

b. Intermediate inputs to the production of health care industries by type of input;

c. Gross capital stock of the health care industry;

d. An input-output table of health care industries.

29.142 Table 29.4 shows indicative supply and use tables that might be drawn up for health care.

4. Unpaid household activity

29.143 This section is not concerned with a normal satellite account. It is difficult to determine products that are characteristic solely of unpaid household activity nor are there agreed standard tables to be produced. However, it is an area of considerable analytical and policy interest and an area where there is considerable research work being undertaken currently. The purpose of this section therefore is simply to report on the approaches being considered and give some indication of where further information on ongoing research may be found.

29.144 It is convenient to separate the consideration into three areas;

a. unpaid household services;

b. a consideration of the treatment of consumer durables;

c. the question of volunteer labour in general.

Unpaid household services

29.145 The question of valuing household services produced for own consumption is interesting in its own right. In addition it is often argued that the growth of GDP in industrialized countries since the end of the Second World War is due in part to the increasing participation in the labour force of the women previously undertaking only household activities. It is often argued that, had household activities been valued, the women's change of occupation would not have led to such large increases in GDP. For long-term analysis therefore, there may be quite considerable interest in placing a value on unpaid household activities.

29.146 There is no ambiguity in the central framework of the SNA; unpaid household services are excluded from the production boundary. However, in a satellite account it is perfectly possible to extend the production boundary so that such services may be included. Even with an extended production boundary, however, it is unlikely that services that cannot be performed by a third party such as eating, sleeping and exercising would be treated as part of the production boundary. Some work has been done to estimate the value of leisure when some of these activities are valued but this is not considered in this section.

29.147 There is fairly widespread agreement that the way in which to start measuring household services for own consumption is by means of measuring the amount of time spent on them. There is increasing interest in conducting time use surveys that make such information available. Time use surveys, however, are not unambiguous. There is the question of multitasking. For example, it is possible for somebody to prepare a meal, keep an eye on a small child and help an older child with their homework all at the same time. Should the total amount of time be divided by three or should each activity count the whole amount of time spent?

29.148 There is a question about the borderline with leisure. Some people would regard gardening as a chore; others may see it as a leisure activity. While looking after children on a full-time basis clearly counts as a household service, does the amount of time grandparents spend with their grandchildren necessarily count as household services or is this a leisure activity?

29.149 There is a question about how to value household activity. One possibility is to have a complete production account and, for example, to consider the food purchased by a household as an input into the preparation of meals. In this way households would consume very few goods directly; many of them would be treated as intermediate consumption to some kind of service output. The alternative, which is usually the approach adopted, is to leave the inputs as household consumption expenditure and simply make separate estimates of the time that has not been previously valued.

29.150 The basic question in valuing the time spent on household services is whether to use the opportunity cost of the person performing the task or a comparator cost. Both of these present difficulties. The opportunity cost seems appealing because application of economic theory suggests that somebody capable of earning more money than the comparator would indeed earn the extra money and pay somebody else to undertake the household tasks. But this is clearly not what happens in practice. Comparator costs may be difficult to come by and may be unrealistic. A professional plumber, for example, may be able to fix a leaking tap in a matter of minutes whereas an amateur may spend an hour over it. If the plumber's wage is applied to the time spent by the amateur, clearly the amount of production estimated will be unrealistically high.

29.151 Various attempts to resolve the question of valuing output can be found in the literature. Examples include *Household Production and Consumption: Proposal for a Methodology of Household Satellite Accounts* (Eurostat, 2003), *Household Production and Consumption in Finland, 2001 - Household Satellite Account* (Statistics Finland and the National Consumer Research Centre, 2006) and *Beyond the Market: Designing Non-market Accounts for the United States* (United States National Research Council, 2005).

Consumer durables

29.152 It is frequently argued that consumer durables should be treated as a form of fixed capital formation by households

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

and not simply as final consumption expenditure. It is true that there is a grey area concerning some household equipment. In some circumstances, the cost of a house may include all kitchen equipment such as cookers, refrigerators and washing machines; in other cases these appliances are treated as consumption expenditure.

29.153 The main reason for excluding consumer durables from the asset boundary is linked to the exclusion of household services. If washing clothes for the household were to be an activity within the production boundary when undertaken by machine, it is not clear why it would be excluded when undertaken by hand.

29.154 Nevertheless there is certainly interest in monitoring the acquisition of consumer durables. The acquisition is often cyclical in nature, although sometimes variation in expenditure may simply follow the introduction of a new product.

29.155 There are two approaches that could be taken in a satellite account. The first is to adopt an alternative treatment for consumer durables at the same time as valuing unpaid household production. The other is to leave unpaid household production excluded from the production boundary but consider replacing consumer durables by an estimate of the services they provide. Treating consumer durables as assets is also of interest in the context of measuring household saving and wealth. Examples of this type of analysis can be found in *Durable Goods and their Effect on Household Saving Ratios in the Euro Area* (Jalava et al, 2006).

Volunteer labour

29.156 The provision of unpaid services to households is excluded from the production boundary. This exclusion applies whether the household being provided with the services is the one to which the volunteer belongs or another.

29.157 If a volunteer is providing services to a non-market producer or to a market NPI, the activity in which they participate is included within the production boundary. However, the value of the services provided appears at cost. This may be strictly zero or it may be nominal, including wages and salaries in kind. For example, religious orders offering health and education services may not pay the individuals providing the services a wage but may provide them with food and accommodation. In principle, these costs should be treated as wages and salaries in kind.

29.158 It is possible for there to be some volunteer labour within government, for example teaching assistants. There may be some unpaid people working in corporations, for example as part of a work experience scheme, but volunteer labour in market NPIs is quite common, for example in a museum or art gallery as guides or custodians.

29.159 Even if the owner of a quasi-corporation or an enterprise does not take his salary, it could be argued that in principle this should be treated as first the receipt of compensation of employees and then an injection of capital of the same amount into the enterprise. It is unlikely to be recorded as such but this case is clearly different in kind from the normal understanding of voluntary labour.

29.160 The question of valuing volunteer labour is the same as that of valuing the time spent on unpaid household activities and the same alternatives are available. If voluntary labour were valued, the following accounting entries would be necessary:

a. compensation of employees of the unit employing the volunteer labour;

b. income for the household to which the volunteer belongs;

c. a transfer of the same amount by the volunteer to the employing unit;

d. final consumption expenditure of the employing unit;

e. almost always social transfers in kind.

This is the same as the way it is recommended that labour inputs to collective construction projects are measured.

29.161 Even in the case of market NPIs, as explained in chapter 23, it is possible that in a satellite context the market NPI could be regarded as undertaking non-market activity also and this would include the activity of volunteers.

Annex 1: The classification hierarchies of the SNA and associated codes

A. Introduction

A1.1 As explained in chapter 2, the accounts of the SNA are built around a small number of conceptual elements, in particular sectors, transactions and classifications of the items subject to transactions and other flows, especially assets and liabilities. For each of these elements, a hierarchical classification exists. Accounts can be compiled at greater or lesser degrees of detail by using higher or lower levels of these hierarchies. In some cases, a full specification requires information about two or even three hierarchies. For example, entries in the accounts typically refer to a sector and a transaction or other flow and may specify what type of product or asset is the subject of the entry.

A1.2 As well as the classification hierarchies of the conceptual elements particular to the SNA, use is also made of other classification systems, including those describing the industrial classification used for production and classifications of goods and services, some of which describe the nature of the items and others that describe the purpose they are intended to serve.

A1.3 Summary accounts are regularly collected by international agencies and to facilitate this, a set of standardized codes is used to identify the items, usually in time series form, that are the subject of data transmission.

A1.4 The purpose of this annex is to provide more information on each of these aspects. Section B lists in full detail the various classification hierarchies of the system. International data collection does not cover all the detail shown but where collection is common and codes are developed, these are shown alongside the entries in the classification.

A1.5 The main international classification systems external to the SNA that are frequently used and referred to are the following:

COFOG, COICOP and COPNI

Publication reference: United Nations. 2000. Classification of expenditure according to purpose: Classification of the functions of government (COFOG), Classification of individual consumption according to purpose (COICOP), Classification of the purposes of nonprofit institutions serving households (COPNI), Classification of the outlays of producers according to purpose (COPP). Department of Economic and Social Affairs, Statistics Division, Statistical papers, Series M, No 84. United Nations, New York.

B. The classification hierarchies of the SNA

A1.6 Four sets of hierarchies are described. The first of these relates to sectors. The second covers transactions and the third covers other flows. The last set relates to stocks. Each set is described in turn in the following sections.

1. Sectors (S codes)

A1.7 The sectoring principles of the SNA are described in chapter 4. The following list brings all the aspects of the potential types of disaggregation together in a comprehensive list. The list is extensive and it is unlikely that all aspects will be covered by any country in all periods as a matter of course. Some of the possible breakdowns may not contain any institutional units and others may contain so few that publication at this degree of detail is not possible. Nevertheless, the full list is shown for the sake of completeness.

A1.8 Some abbreviations, standard within the SNA, are used in detailing sector codes. A special group of units are those known as non-profit institutions, designated as NPIs. Within the corporations sectors, units that are not NPIs are referred to as for-profit institutions, or FPIs. It is worth reiterating that an NPI is not prohibited from making a profit, it is simply prohibited from distributing any profit it makes to its owners. Thus NPIs within the corporations sectors are market producers just as the FPIs are.

A1.9 Not all NPIs are market producers. Those that are not are divided between those controlled by government, where they are still referred to as NPIs, and those not controlled by government. All of these serve households and form a separate sector of their own. They are known as non-profit institutions serving households, or NPISHs.

A1.10 Not all entries in the classification have an assigned code; only those that are regularly used in international transmission programmes.

A1.11 The full list of institutional sectors and subsectors is shown below.

Total economy (S1)

Non-financial corporations (S11)

Non-financial corporations – NPIs
Non-financial corporations – FPIs

Public non-financial corporations
Public non-financial corporations – NPIs
Public non-financial corporations – FPIs
National private non-financial corporations
National private non-financial corporations – NPIs
National private non-financial corporations – FPIs
Foreign controlled non-financial corporations
Foreign controlled non-financial corporations – NPIs
Foreign controlled non-financial corporations – FPIs

Financial corporations (S12)

Central bank (S121)

Deposit-taking corporations, except the central bank (S122)
Deposit-taking corporations – NPIs
Deposit-taking corporations – FPIs
Public deposit-taking corporations
Public deposit-taking corporations – NPIs
Public deposit-taking corporations – FPIs
National private deposit-taking corporations
National private deposit-taking corporations – NPIs
National private deposit-taking corporations – FPIs
Foreign controlled deposit-taking corporations
Foreign controlled deposit-taking corporations – NPIs
Foreign controlled deposit-taking corporations – FPIs

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Money market funds (S123)
Money market funds – NPIs
Money market funds – FPIs
Public money market funds
Public money market funds – NPIs
Public money market funds – FPIs
National private money market funds
National private money market funds – NPIs
National private money market funds – FPIs
Foreign controlled money market funds
Foreign controlled money market funds – NPIs
Foreign controlled money market funds – FPIs

Non-MMF investment funds (S124)
Non-MMF investment funds – NPIs
Non-MMF investment funds – FPIs
Public non-MMF investment funds
Public non-MMF investment funds – NPIs
Public non-MMF investment funds – FPIs
National private non-MMF investment funds
National private non-MMF investment funds – NPIs
National private non-MMF investment funds – FPIs
Foreign controlled non-MMF investment funds
Foreign controlled non-MMF investment funds – NPIs
Foreign controlled non-MMF investment funds – FPIs

Other financial intermediaries, except insurance corporations and pension funds (S125)
Other financial corporations – NPIs
Other financial corporations – FPIs
Public other financial corporations
Public other financial corporations – NPIs
Public other financial corporations – FPIs
National private other financial corporations
National private other financial corporations – NPIs
National private other financial corporations – FPIs
Foreign controlled other financial corporations
Foreign controlled other financial corporations – NPIs
Foreign controlled other financial corporations – FPIs

Financial auxiliaries (S126)
Financial auxiliaries – NPIs
Financial auxiliaries – FPIs
Public financial auxiliaries
Public financial auxiliaries –NPIs
Public financial auxiliaries – FPIs
National private financial auxiliaries
National private financial auxiliaries – NPIs
National private financial auxiliaries – FPIs
Foreign controlled financial auxiliaries
Foreign controlled financial auxiliaries – NPIs
Foreign controlled financial auxiliaries – FPIs

Captive financial institutions and money lenders (S127)
Captive financial institutions – NPIs
Captive financial institutions – FPIs
Public captive financial institutions
Public captive financial institutions – NPIs
Public captive financial institutions – FPIs
National private captive financial institutions
National private captive financial institutions – NPIs
National private captive financial institutions – FPIs
Foreign controlled captive financial institutions
Foreign controlled captive financial institutions – NPIs
Foreign controlled captive financial institutions – FPIs

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Insurance corporations (S128)
Insurance corporations – NPIs
Insurance corporations – FPIs
Public insurance corporations
Public insurance corporations – NPIs
Public insurance corporations – FPIs
National private insurance corporations
National private insurance corporations – NPIs
National private insurance corporations – FPIs
Foreign controlled insurance corporations
Foreign controlled insurance corporations – NPIs
Foreign controlled insurance corporations – FPIs

Pension funds (S129)
Pension funds – NPIs
Pension funds – FPIs
Public pension funds
Public pension funds – NPIs
Public pension funds – FPIs
National private pension funds
National private pension funds – NPIs
National private pension funds – FPIs
Foreign controlled pension funds
Foreign controlled pension funds – NPIs
Foreign controlled pension funds – FPIs

A1.12 General government social security is organized differently in different countries and two coding systems of general government are presented to allow for this. When social security is organized by one unit for all levels of government, total general government consists of four subsectors, one for each level of government and one for the social security unit. When each level of government includes its own social security provision, then there are only three subsectors, one for each level of government including social security provision. The theoretical hierarchical structure for government is as follows.

General government (S13)

General government social security
General government excluding social security
General government non-profit institutions
Central government
Central government social security
Central government excluding social security
Central government non-profit institutions
State government
State government social security
State government excluding social security
State government non-profit institutions
Local government
Local government social security
Local government excluding social security
Local government non-profit institutions

A1.13 In practice, the alternative partial structures, with associated codes, are as follows.

General government (S13)

Social security is one separate institutional unit for all levels of general government

Central government *excluding social security* **(S1311)**
State government *excluding social security* **(S1312)**
Local government *excluding social security* **(S1313)**
General government social security (S1314)

General government (S13)

Social security is not a separate institutional unit but is included at the appropriate levels of general government

Central government *including social security* **(S1321)**
State government *including social security***(S1322)**
Local government *including social security* **(S1323)**

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Households (S14)

Employers (S141)
Own account workers (S142)
Employees (S143)
Recipients of property and transfer income (S144)
Recipients of property income (S1441)
Recipients of pensions (S1442)
Recipients of other transfers (S1443)

Non-profit institutions serving households (S15)

National private
Foreign controlled

Rest of the world (S2)

2. Classifications of transactions

A1.14 The transaction classifications relate to:

a. Products (including produced assets);

b. Non-produced assets;

c. Distributive transactions.

Transactions in products (P codes)

A1.15 Product codes are used to describe the supply and use of goods and services produced within the SNA. All the items listed appear in the goods and services account. In addition, output and intermediate consumption appear in the production account, final and actual consumption expenditure appear in the use of income accounts and capital formation appears in the capital account.

A1.16 All entries in the classification can be further elaborated by applying a second classification to that shown here. For capital formation the asset classification (codes AN1) is used within the accumulation accounts. For output, intermediate consumption and final consumption product codes as in the *CPC* could be used. For final consumption, functional codes could be used, COFOG for government consumption, COICOP for households and COPNI for NPISHs. For imports and exports, either SITC or HS codes could be used.

A1.17 Capital formation and fixed capital formation (as well as some of the balancing items) may be shown either gross or net of consumption of fixed capital. Gross entries are shown with a trailing g, net entries by a trailing n. The qualifier c is used for consumption of fixed capital, the difference between gross and net fixed capital measures.

Output (P1)

Market output (P11)
Output for own final use (P12)
Non-market output (P13)

Intermediate consumption (P2)

Final consumption expenditure (P3)

Individual consumption expenditure (P31)
Collective consumption expenditure (P32)

Actual final consumption (P4)

Actual individual consumption (P41)
Actual collective consumption (P42)

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Capital formation (P5)

Gross fixed capital formation (P51g)
Consumption of fixed capital (-) (P51c)
Consumption of fixed capital on gross operating surplus (-) (P51c1)
Consumption of fixed capital on gross mixed income (-) (P51c2)
Net fixed capital formation (P51n)
Acquisitions less disposals of fixed assets (P511)
Acquisitions of new fixed assets (P5111)
Acquisitions of existing fixed assets (P5112)
Disposals of existing fixed assets (P5113)
Costs of ownership transfer on non-produced assets (P512)
Changes in inventories (P52)
Acquisitions less disposals of valuables (P53)

Exports of goods and services (P6)

Exports of goods (P61)
Exports of services (P62)

Imports of goods and services (P7)

Imports of goods (P71)
Imports of services (P72)

Transactions in non-produced assets (NP codes)

A1.18 Non-produced assets can be the subject of some of the same transactions as products (capital formation, imports and exports). The codes used for transactions in non-produced assets can be further disaggregated if desired by appending the classification of non-produced non-financial assets, AN2.

Acquisitions less disposals of non-produced assets (NP)

Acquisitions less disposals of natural resources (NP1)
Acquisitions less disposals of contracts, leases and licences (NP2)
Purchases less sales of goodwill and marketing assets (NP3)

Distributive transactions (D codes)

A1.19 Distributive transaction codes appear in all the sequence of accounts from the generation of income account up to and including the capital account. As their name implies, they show the impact of distribution and redistribution of income (and saving in the case of capital transfers). For all distributive transactions, the receivable entries for all sectors including the rest of the world must balance the payable entries.

A1.20 Four groups of transactions appear in the generation of income account and the allocation of primary income account. These are compensation of employees, taxes on production and imports, subsidies and property income.

Compensation of employees (D1)

Wages and salaries (D11)
Employers' social contributions (D12)
Employers' actual social contributions (D121)
Employers' actual pension contributions (D1211)
Employers' actual non-pension contributions(D1212)
Employers' imputed social contributions (D122)
Employers' imputed pension contributions (D1221)
Employers' imputed non-pension contributions (D1222)

Taxes on production and imports (D2)

Taxes on products (D21)
Value added type taxes (VAT) (D211)
Taxes and duties on imports excluding VAT (D212)
Import duties (D2121)
Taxes on imports excluding VAT and duties (D2122)

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Export taxes (D213)
Taxes on products except VAT, import and export taxes (D214)
Other taxes on production (D29)

Subsidies (D3)

Subsidies on products (D31)
Import subsidies (D311)
Export subsidies (D312)
Other subsidies on products (D319)
Other subsidies on production (D39)

Property income (D4)

Investment income
Interest (D41)
Distributed income of corporations (D42)
Dividends (D421)
Withdrawals from income of quasi-corporations (D422)
Reinvested earnings on foreign direct investment (D43)
Investment income disbursements (D44)
Investment income attributable to insurance policyholders (D441)
Investment income payable on pension entitlements (D442)
Investment income attributable to collective investment fund share holders (D443)
Rent (D45)

A1.21 Four groups of transactions appear in the secondary distribution of income account. These are current taxes on income, wealth, etc., net social contributions, social benefits and other current transfers. Together they represent all current transfers in the SNA except social transfers in kind.

A1.22 Employers' contributions appear in both the generation of income account and allocation of primary income account as payable by employers and receivable by employees. In the secondary distribution of income account, these amounts are payable by households and receivable by those administering social insurance schemes. In order to show exactly the same value in each case, the deduction of the charge that represents part of the output of the schemes and final consumption of the beneficiary households is also shown in the secondary distribution of income account as a separate item. The item social insurance scheme service charges is thus an adjustment item only and not a distributive transaction in itself.

Current transfers (other than social transfers in kind)

Current taxes on income, wealth, etc. (D5)
Taxes on income (D51)
Other current taxes (D59)

Net social contributions (D61)
Employers' actual social contributions (D611 = D121)
Employers' actual pension contributions (D6111 = D1211)
Employers' actual non-pension contributions (D6112 = D1212)
Employers' imputed social contributions (D612 = D122)
Employers' imputed pension contributions (D6121 = D1221)
Employers' imputed non-pension contributions (D6122 = D1222)
Households' actual social contributions (D613)
Households' actual pension contributions (D6131)
Households' actual non-pension contributions (D6132)
Households' social contribution supplements (D614)
Households' pension contribution supplements (D6141)
Households' non-pension contribution supplements (D6142)
Social insurance scheme service charges(-)

Social benefits other than social transfers in kind (D62)
Social security benefits in cash (D621)
Social security pension benefits (D6211)
Social security non-pension benefits in cash (D6212)
Other social insurance benefits (D622)
Other social insurance pension benefits (D6221)

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Other social insurance non-pension benefits (D6222)
Social assistance benefits in cash (D623)

Other current transfers (D7)
Net non-life insurance premiums (D71)
Net non-life direct insurance premiums (D711)
Net non-life reinsurance premiums (D712)
Non-life insurance claims (D72)
Non-life direct insurance claims (D721)
Non-life reinsurance claims (D722)
Current transfers within general government (D73)
Current international cooperation (D74)
Miscellaneous current transfers (D75)
Current transfers to NPISHs (D751)
Current transfers between resident and non-resident households (D752)
Other miscellaneous current transfers (D759)

A1.23 Transactions concerning social transfers in kind and the adjustment for the change in pension entitlements appear in the redistribution of income in kind account, the use of income account and the use of adjustable disposable income account.

Social transfers in kind (D63)

Social transfers in kind - non-market production (D631)
Social transfers in kind - purchased market production (D632)

Adjustment for the change in pension entitlements (D8)

A1.24 Capital transfers appear in the capital account. By convention, as explained in chapter 10, all capital transfers are shown on the right-hand side of the account, with the payables having a negative sign. The codes for capital transfers, therefore, have either r for receivable or p for payable appended to the basic code.

Capital transfers, receivable (D9r)

Capital taxes (D91r)
Investment grants (D92r)
Other capital transfers (D99r)

Capital transfers, payable (D9p)

Capital taxes (D91p)
Investment grants (D92p)
Other capital transfers (D99p)

Transactions in financial assets and liabilities (F codes))

A1.25 The codes for transactions in financial assets and liabilities follow a slightly different pattern from those used for non-financial assets because there is only one type of transaction shown in the financial account, either acquisition of or disposals of financial assets and liabilities. The hierarchical element comes from itemizing the assets and liabilities concerned. There is a perfect match between the codes used for stock levels (positions) of financial assets and liabilities and the flows in them, except that the stocks have prefix AF and the transactions F.

A1.26 The full list of codes for transactions in financial assets and liabilities is shown below.

Net acquisition of financial assets/Net incurrence of liabilities (F)

Monetary gold and SDRs (F1)

Monetary gold (F11)
SDRs (F12)

Currency and deposits (F2)

Currency (F21)
Transferable deposits (F22)
Inter-bank positions (F221)

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Other transferable deposits (F229)
Other deposits (F29)

Debt securities (F3)

Short-term (F31)
Long-term (F32)

Loans (F4)

Short-term (F41)
Long-term(F42)

Equity and investment fund shares (F5)

Equity (F51)
Listed shares (F511)
Unlisted shares (F512)
Other equity (F519)
Investment fund shares/units (F52)
Money market fund shares/units (F521)
Non-MMF investment fund shares/units (F522)

Insurance, pension and standardized guarantee schemes (F6)

Non-life insurance technical provisions (F61)
Life insurance and annuity entitlements (F62)
Pension entitlements (F63)
Claims of pension funds on pension managers (F64)
Entitlements to non-pension benefits (F65)
Provisions for calls under standardized guarantees (F66)

Financial derivatives and employee stock options (F7)

Financial derivatives (F71)
Options (F711)
Forwards (F712)
Employee stock options (F72)

Other accounts receivable/payable (F8)

Trade credits and advances (F81)
Other accounts receivable/payable (F89)

3. Other flows

A1.27 Other flows comprise the entries appearing in the other changes in assets account and balancing and net worth items.

Entries in the other changes in assets account (K codes)

A1.28 Codes K1 to K6 relate to other flows in the changes in the volume of assets account. K7 codes show the holding gains and losses appearing in the revaluation account.

Economic appearance of assets (K1)

Economic disappearance of non-produced assets (K2)

Depletion of natural resources (K21)
Other economic disappearance of non-produced assets (K22)

Catastrophic losses (K3)

Uncompensated seizures (K4)

Other changes in volume n.e.c. (K5)

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Changes in classification (K6)

Changes in sector classification and structure (K61)
Changes in classification of assets and liabilities (K62)

Nominal holding gains and losses (K7)

Neutral holding gains and losses (K71)
Real holding gains and losses (K72)

Balancing and net worth items (B codes)

A1.29 The balancing items of the current accounts appear with codes B1 to B8. Each of these may be shown gross or net of consumption of fixed capital. To indicate which is the case, g or n is appended to the end of the code.

A1.30 The B10 codes all relate to changes in net worth. Like balancing items, these are accounting constructs derived by deducting entries on one side of the account from the entries on the other. However, while balancing items show the excess of right-hand side entries over those on the left-hand side, net worth items show the excess of entries on the left-hand side of the account over those on the right-hand side.

A1.31 Code B11, external balance of goods and services, is an item from the rest of the world account. It has no direct counterpart in the total economy sectors but added to gross (or net) domestic expenditure for the total economy gives gross (or net) domestic product. Code B12, current external balance, is also from the rest of the world account and is analogous to saving for a domestic sector when the external balance of goods and services is taken in place of value added.

A1.32 Code B90, unlike all the other codes in this section, relates to stock positions and not flows. It shows the value of net worth calculated as the excess of assets over liabilities.

A1.33 The full list of balancing and net worth items is shown below.

Value added, gross / Gross domestic product (B1g)

Operating surplus, gross (B2g)

Mixed income, gross (B3g)

Entrepreneurial income(B4g)

Balance of primary incomes, gross / National income, gross (B5g)

Disposable income, gross (B6g)

Adjusted disposable income, gross (B7g)

Saving, gross (B8g)

Net lending (+) / net borrowing (–) (B9)

Changes in net worth (B10)

Changes in net worth due to saving and capital transfers (B101)
Changes in net worth due to other changes in volume of assets (B102)
Changes in net worth due to nominal holding gains and losses(B103)
Changes in net worth due to neutral holding gains and losses (B1031)
Changes in net worth due to real holding gains and losses (B1032)

External balance of goods and services (B11)

Current external balance (B12)

Net worth (B90)

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

4. Entries related to stocks of assets and liabilities

Balance sheet entries (L codes)

A1.34 For a single balance sheet, as for the financial account, the only codes necessary are those giving the details of assets by type, using AN and AF codes. However, an account can be drawn up showing the stock levels at the start (LS) and end (LE) of a period, and the total changes between them (LX). All three codes need to be qualified by asset types. The LX entries are the sum of the entries of P5, NP, F and K codes for the assets in question for the period covered.

A1.35 From the entries in the opening balance sheet a value of net worth (B90) can be calculated. The difference between this and the value of B90 in the closing balance sheet must be equal to the balance of all the LX codes, which must also be equal to the value for B10.

Opening balance sheet (LS)
Changes in balance sheet (LX)
Closing balance sheet (LE)

Non-financial assets (AN codes)

A1.36 Transactions in non-financial assets are classified by the purpose for which the assets are acquired. All assets serve as a store of value but, with the exception of valuables that are solely a store of value, other non-financial assets are primarily acquired for use in production. The AN codes, given in full below, combine some elements of function with a descriptive code. A desk, for example, could be part of AN113, machinery and equipment, or almost any of the inventory codes or even as a valuable.

A1.37 The classification of non-financial assets is split initially between produced (AN1) and non-produced assets (AN2). The three major subheadings for produced assets are fixed assets (AN11), inventories (AN12) and valuables (AN13). The three major subheadings for non-produced assets are natural resources (AN21), contracts, leases and licences (AN22) and purchases less sales of goodwill and marketing assets (AN23).

A1.38 The entry for costs of ownership transfer on non-produced assets (AN116) is anomalous. The flow exists and is treated as part of fixed capital formation, that is as the acquisition of fixed assets. However, when stock levels are itemized, the value of these costs of ownership transfer is included with the non-produced assets to which they refer and so are not shown separately as part of AN11. The item is included in the full list, shown below, for expository purposes only.

Produced non-financial assets (AN1)

Fixed assets by type of asset (AN11)
Dwellings (AN111)
Other buildings and structures (AN112)
Buildings other than dwellings (AN1121)
Other structures (AN1122)
Land improvements (AN1123)
Machinery and equipment (AN113)
Transport equipment (AN1131)
ICT equipment (AN1132)
Other machinery and equipment(AN1133)
Weapons systems (AN114)
Cultivated biological resources (AN115)
Animal resources yielding repeat products (AN1151)
Tree, crop and plant resources yielding repeat products (AN1152)
(Costs of ownership transfer on non-produced assets (AN116))
Intellectual property products (AN117)
Research and development (AN1171)
Mineral exploration and evaluation (AN1172)
Computer software and databases (AN1173)
Computer software (AN11731)
Databases(AN11732)
Entertainment, literary or artistic originals (AN1174)
Other intellectual property products (AN1179)
Inventories by type of inventory (AN12)
Materials and supplies (AN121)
Work-in-progress (AN122)
Work-in-progress on cultivated biological assets (AN1221)

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Other work-in-progress (AN1222)
Finished goods (AN123)
Military inventories (AN124)
Goods for resale (AN125)
Valuables (AN13)
Precious metals and stones (AN131)
Antiques and other art objects (AN132)
Other valuables (AN133)

Non-produced non-financial assets (AN2)

Natural resources (AN21)
Land (AN211)
Mineral and energy reserves (AN212)
Non-cultivated biological resources (AN213)
Water resources (AN214)
Other natural resources (AN215)
Radio spectra (AN2151)
Other (AN2159)
Contracts, leases and licences (AN22)
Marketable operating leases (AN221)
Permissions to use natural resources (AN222)
Permissions to undertake specific activities (AN223)
Entitlement to future goods and services on an exclusive basis (AN224)
Purchases less sales of goodwill and marketing assets (AN23)

Financial assets (AF codes)

A1.39 As explained in the section on transactions in financial assets and liabilities, conceptually there is a one-to-one match between those F codes and the stock levels or positions (AF codes). In practice, though, balance sheet data may be less detailed and not exist beyond the first-level breakdown, shown below. If desired, however, the AF codes can be disaggregated in line with the detail provided for F codes.

Monetary gold and SDRs (AF1)

Currency and deposits (AF2)

Debt securities (AF3)

Loans (AF4)

Equity and investment fund shares/units (AF5)

Insurance, pension and standardized guarantee schemes (AF6)

Financial derivatives and employee stock options (AF7)

Other accounts receivable/payable (AF8)

C. Supplementary items

A1.40 At various places, mention is made of the possibility of itemizing supplementary or memorandum items. A full list of such suggestions follows with an indication of how supplementary codes may be constructed. A general convention is that a supplementary code begins with X and is linked to the code of a standard item by building on the code of that item.

1. Non-performing loans

A1.41 The following codes apply to stocks and flows of non-performing loans mentioned in chapters 11 and 13. Since loans have the codes AF4 and F4, the supplementary codes begin XAF4 for stocks and XF4 for flows. The codes for stocks are:

XAF4_NNP Loans: nominal value, non-performing

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

XAF4_MNP Loans: market value, non-performing

and the associated flows

XF4_NNP Loans: nominal value, non-performing
XF4_MNP Loans: market value, non-performing

In both sets of codes, the underscore is a placeholder for the detailed codes for loans where relevant, for example, on the balance sheet.

XAF41NNP Short-term loans: nominal value, non-performing
XAF42MNP Long-term loans: market value, non-performing

2. Capital services

A1.42 The following codes apply to capital services described in chapter 20.

XCS	Capital services
XCSC	Capital services – Corporations and general government
P51c1	Consumption of fixed capital
XRC	Return to capital
XOC	Other costs of capital
XCSU	Capital services – Unincorporated enterprises
P51c2	Consumption of fixed capital
XRU	Return to capital
XOU	Other costs of capital

3. Pensions table

A1.43 The following codes apply to the supplementary table described in part 2 of chapter 17. Different codes are proposed for the columns and rows of the table.

Columns

A1.44 In the Column description the letter “W” corresponds to “non-government” and the numbers in these codes refer to the corresponding institutional sectors.

a. Liabilities recorded in the main sequence of accounts

· Schemes where responsibility for the design and implementation lies outside general government

XPC1W Defined contribution schemes
XPB1W Defined benefit schemes
XPCB1W Total

· Schemes where responsibility for the design and implementation lies within general government

XPCG Defined contribution schemes

· General government employee defined benefit schemes

XPBG12 In the financial corporations sector
XPBG13 In the general government sector

b. Liabilities not recorded in the main sequence of accounts

XPBOUT13 In the general government sector
XP1314 Social security pension schemes
XPTOT Total pension schemes
XPTOTNRH Of which: Non-resident households

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Rows

a. Opening balance sheet

XAF63LS	Pension entitlements

b. Transactions

XD61p	Social contributions relating to pension schemes
XD6111	Employer actual social contributions
XD6121	Employer imputed social contributions
XD6131	Household actual social contributions
XD6141	Household social contribution supplements
XD619	Other (actuarial) accumulation of pension entitlements in social security funds
XD62p	Pension benefits
XD8	Adjustment for the change in pension entitlements
XD91	Change in pension entitlements due to transfers of entitlements
XD92	Changes in entitlements due to negotiated changes in scheme structure

c. Other economic flows

XK7	Revaluations
XK5	Other changes in volume

d. Closing balance sheet

XAF63LE	Pension entitlements

e. Related indicators

XP1	Output
XAFN	Assets held by pension schemes at end-year

4. Consumer durables

A1.45 Consumer durables are referred to in chapters 3 and 13. They are coded using X as a prefix plus DHHCE (durable household consumption expenditure) plus a one digit affix for subgroups and two digits for the items. The corresponding COICOP numbers are also provided.

COICOP	SNA codes	
	XDHHCE1	Furniture and household appliances
05.1.1	XDHHCE11	Furniture and furnishings
05.1.2	XDHHCE12	Carpets and other floor coverings
05.3.1	XDHHCE13	Major household appliances whether electric or not
05.5.1	XDHHCE14	Major tools and equipment for house and garden
	XDHHCE2	Personal transport equipment
07.1.1	XDHHCE21	Motor cars
07.1.2	XDHHCE22	Motor cycles
07.1.3	XDHHCE23	Bicycles
07.1.4	XDHHCE24	Animal drawn vehicles
	XDHHCE3	Recreational and entertainment goods
08.2.0	XDHHCE31	Telephone and telefax equipment
09.1.1	XDHHCE32	Equipment for the reception, recording and reproduction of sound and pictures
09.1.2	XDHHCE33	Photographic and cinematographic equipment and optical instruments
09.1.3	XDHHCE34	Information processing equipment
09.2.1	XDHHCE35	Major durables for outdoor recreation
09.2.2	XDHHCE36	Musical instruments and major durables for indoor recreation
	XDHHCE4	Other durable goods
12.3.1	XDHHCE41	Jewellery, clocks and watches
06.1.3	XDHHCE42	Therapeutic medical appliances and equipment

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

5. Foreign direct investment

A1.46 Supplementary items for foreign direct investment (FDI), referred to in, for example, chapters 11 and 13, can be coded with X as prefix plus the F or AF code plus a FDI suffix, for example:

XF42FDI Foreign direct investment transaction in long-term loans

6. Contingent positions

A1.47 Supplementary codes for contingent positions, mentioned in chapters 11 and 12, can be coded with X as prefix plus the AF code plus a CP suffix, for example:

XAF11CP when the pledge of monetized gold may affect its usability as reserve asset

7. Currency and deposits

A1.48 Supplementary items for the classification of national and foreign denominated currency and deposits, as mentioned in chapter 11, can be coded with X as prefix plus the F or AF code plus a suffix NC indicating currency and deposits in national currency or an affix FC with an international currency code indicating currency and deposits in foreign currency, for example:

a. For transactions

XF21LC Local currency notes and coins
XF22FC Deposits in foreign currency

b. For stocks

XAF21LC Local currency notes and coins
XAF22FC Deposits in foreign currency

8. Classification of debt securities according to outstanding maturity

A1.49 Chapter 11 suggests classifying debt securities according to outstanding maturity. This can be achieved by using an X prefix plus the AF code plus a suffix indicating a maturity date, for example:

XAF32Y20 Debt securities maturing in 2020

9. Listed and unlisted debt securities

A1.50 Supplementary items on debt securities can be coded with X as prefix plus the F or AF code plus a 1 for listed and 2 for unlisted, for example:

a. For transactions

XF321 Listed debt securities
XF322 Unlisted debt securities

b. For stocks

XAF321 Listed debt securities
XAF322 Unlisted debt securities shares

10. Long-term loans with outstanding maturity of less than one year and long-term loans secured by a mortgage

A1.51 Long-term loans with outstanding maturity of less than one year and long-term loans secured by mortgage can be coded with X as prefix plus the F of AF code plus an affix L1 indicating outstanding maturity of less than one year and a suffix LM indicating loans secured by a mortgage, for example:

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

a. For transactions

XF42L1 Long-term loans with outstanding maturity of less than one year
XF42LM Long-term loans secured by a mortgage

b. For stocks

XAF42L1 Long-term loans with outstanding maturity of less than one year
XAF42LM Long-term loans secured by a mortgage

11. Listed and unlisted investment shares

A1.52 Listed and unlisted investment fund shares can be coded with X as prefix plus the F or AF code plus 1 for listed and 2 for unlisted, for example:

a. For transactions

XF5291 Listed investment fund shares
XF5292 Unlisted investment fund shares

b. For stocks

XAF5291 Listed investment fund shares
XAF5292 Unlisted investment fund shares

12. Arrears in interest and repayments

A1.53 Arrears in interest and repayments can be coded with X as prefix plus the AF code plus an IA affix for interest arrears and PA affix for repayment arrears, for example:

XAF42IA Interest arrears on long term loans
XAF42PA Repayment arrears on long term loans

13. Personal and total remittances

A1.54 Personal remittances and total remittances between resident and non-resident households, mentioned in chapter 8, can be coded with X as prefix plus the current transfer code plus a suffix PR for personal remittances and TR for total remittances, as follows:

XD5452PR Personal remittances between resident and non-resident households
XD5452TR Total remittances between resident and non-resident households

Annex 2: The sequence of accounts

The production account 562-3
The generation of income account 562-3
The allocation of primary income account 564-5
The entrepreneurial income account 564-5
The allocation of other primary income account 566-7
The secondary distribution of income account 566-7
The use of disposable income account 568-9
The redistribution of income in kind account 568-9
The use of adjusted disposable income account 568-9
The capital account 590-1
The financial account 592-3
The other changes in the volume of assets account 594-5
The revaluation account 596-7
The balance sheets 598-9

Shaded cells are those where the value is determined using the accounting rules of the system;
Cells with a zero entry are those where an entry is possible but in practice it may be negligible.
Blank cells indicate either an entry is not possible or a disaggregation is not provided.

Annex 3: Changes from the 1993 System of National Accounts

A. Introduction

A3.1 The System of National Accounts 2008 (2008 SNA) retains the basic theoretical framework of its predecessor, the System of National Accounts 1993 (*1993 SNA*). However, in line with the mandate of the United Nations Statistical Commission, the 2008 SNA introduces treatments for new aspects of economies that have come into prominence, elaborates on aspects that have increasingly become the focus of analytical attention and clarifies guidance on a wide range of issues. The changes in the 2008 SNA bring the accounts into line with developments in the economic environment, advances in methodological research and needs of users.

A3.2 In sections B through G, the changes in the 2008 SNA are grouped together in six sections. The descriptions given only highlight the main differences between the 1993 and 2008 SNA while refraining from exhaustive descriptions. The discussion of the changes also includes cross-references to the corresponding paragraphs in the chapters. In section H a check-list of changes by chapter is given.

B. Further specifications of statistical units and revisions in institutional sectoring

1. Producer unit undertaking ancillary activities to be recognized as a separate establishment in certain cases

Reference: chapter 5, paragraphs 5.41to 5.42

A3.3 The 2008 SNA recommends that if the activity of a unit undertaking purely ancillary activities is statistically observable, in that separate accounts for the production it undertakes are readily available, or if it is located in a geographically different location from the establishments it serves, it should be recognized as a separate establishment. When such an ancillary establishment is recognized, it is classified according to its own principal activity and seen as producing primary output.

A3.4 The value of output of an ancillary establishment should be derived on a sum of costs basis, including the costs of the capital used by the unit. The output of the ancillary unit is treated as intermediate consumption of the establishments it serves and the output should be allocated across those establishments using an appropriate indicator such as the output, value added or employment. The output is deemed to be market output when the parent enterprise is a market producer or producing for own final use and non-market otherwise. In the latter case, the cost of the capital should not be included in estimating the value of the output.

A3.5 In the *1993 SNA*, a producer unit undertaking purely ancillary activities was always regarded as an integral part of the establishments it served.

2. Artificial subsidiaries not regarded as institutional units unless resident in an economy different from that of their parents

Reference: chapter 4, paragraphs 4.62 to 4.64

A3.6 Ancillary corporations as described in the *1993 SNA* are named as artificial subsidiaries in the 2008 SNA. Artificial subsidiaries are subsidiary corporations wholly owned by the parent corporation and created to provide services to the parent corporation, or other corporations in the same group, often in order to avoid taxes, to minimize liabilities in the event of bankruptcy, or to secure other technical advantages under the tax or corporation legislation in force in a particular country. An artificial subsidiary is not treated as an institutional unit unless it is resident in an economy different from that of its parent.

3. Branch of a non-resident unit recognized as an institutional unit

Reference: chapter 4, paragraph 4.47

A3.7 The *1993 SNA* simply stated that an unincorporated enterprise owned by a non-resident institutional unit should be treated as a notional resident unit in the country where it is located. Such a unit is identified as a branch in the 2008 SNA and treated as an institutional unit. The 2008 SNA specifies indicative criteria to help recognize the branch of a non-resident unit as an institutional unit; namely, the unit engages in significant production of goods and services for

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

a long period of time in that territory and is subject to the income tax laws, if any, of the economy in which it is located even if it may have a tax-exempt status.

4. Residence of multiterritory enterprises clarified

Reference: chapter 4, paragraph 4.13

A3.8 The 2008 SNA provides guidelines for determining the residence of multiterritory enterprises that operate a seamless operation over more than one economic territory. Such enterprises are typically involved in cross-border activities and include shipping lines, airlines, hydroelectric schemes on border rivers, pipelines, bridges, tunnels and undersea cables. When it is not possible to identify a parent or separate branches, it is recommended to prorate the total operations of a multiterritory enterprise by the individual economic territories in which it operates.

A3.9 The *1993 SNA* did not give explicit guidance for determining the residence of multiterritory enterprises.

5. Special purpose entities recognized

Reference: chapter 4, paragraphs 4.55 to 4.58; chapter 22, paragraphs 22.51 to 22.54

A3.10 The 2008 SNA provides guidance on the treatment of units with no employees and no non-financial assets, units known variously as special purpose entities (SPEs) or special purpose vehicles. There is no common definition of an SPE but some of its characteristics are that it has little physical presence, is always related to another corporation, often as a subsidiary, and it is often resident in a territory other than the territory of residence of its parent.

A3.11 Such a unit is treated as an institutional unit and allocated to sector and industry according to its principal activity unless it falls into one of three categories; (a) captive financial institutions, (b) artificial subsidiaries of corporations, and (c) special purpose units of government.

A3.12 The *1993 SNA* did not give explicit guidance for treatment of such units.

6. Holding company allocated to the financial corporations sector

Reference: chapter 4, paragraph 4.54

A3.13 *ISIC Rev. 4*, in section K class 6420, describes a holding company as one that holds the assets of subsidiary corporations but does not undertake any management activities. Such a unit, therefore, produces only a financial service. Accordingly, the 2008 SNA recommends that holding companies should always be allocated to the financial corporations sector and treated as captive financial institutions even if all of their subsidiary corporations are non-financial corporations.

A3.14 The *1993 SNA* recommended that holding companies were to be assigned to the institutional sector in which the main activity of the group of subsidiaries was concentrated. Consequently, they were to be classified as financial corporations only when the main activity of the group of corporations they controlled was financial.

7. Head office to be allocated to the institutional sector of the majority of its subsidiaries

Reference: chapter 4, paragraph 4.53

A3.15 The term "holding company" is sometimes mistakenly used where "head office" is more correct. The activities of a head office, as defined in section M class 7010 of the *ISIC Rev. 4*, includes the overseeing and managing of other units of the enterprise; undertaking the strategic or organizational planning and decision making role of the enterprise; exercising operational control and managing the day-to-day operations of their related units. Such a unit therefore, produces non-financial or financial services depending upon the type of output of its subsidiaries. The 2008 SNA recommends that the head office should be allocated to the non-financial corporations sector unless all or most of its subsidiaries are financial corporations, in which case it is treated by convention as a financial auxiliary in the financial corporations sector.

A3.16 The *1993 SNA* did not give explicit guidance for treatment of head offices.

8. Subsector for non-profit institutions introduced

Reference: chapter 4, paragraphs 4.35, 4.94, 4.103 and 4.128

A3.17 Like the *1993 SNA*, the 2008 SNA assigns non-profit institutions (NPIs) to different institutional sectors, regardless of motivation, tax status, type of employees or the activity they are engaged in. Recognizing the increasing interest in considering the full set of NPIs as evidence of "civil society", the 2008 SNA recommends that NPIs within the corporate and government sectors be identified in distinct subsectors so that supplementary tables summarizing all NPI activities can be separately derived in a straightforward manner as and when required.

9. Definition of financial services enlarged

Reference: chapter 4, paragraph 4.98 and chapter 6, paragraph 6.158

A3.18 The 2008 SNA defines financial services more explicitly than in the *1993 SNA* to ensure that the increase in financial services other than the financial intermediation, specifically financial risk management and liquidity transformation, are captured. Financial services include monitoring services, convenience services, liquidity provision, risk assumption, underwriting and trading services. Chapter 17 gives guidance on when both explicit and implicit financial services should be identified, including margins on foreign exchange dealing and dealing in securities.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

10. Subsectoring of the financial corporation sector revised to reflect new developments in financial services, markets and instruments

Reference: chapter 4, paragraphs 4.98 to 4.116.

A3.19 The 2008 SNA has introduced a slightly more detailed classification of the financial corporations sector to allow more flexibility and better consistency with other monetary and financial statistics systems such as those of the International Monetary Fund and the European Central Bank. The financial corporations sector is divided into nine subsectors (as opposed to five in the *1993 SNA*) according to the activity of the unit in the market and the liquidity of its liabilities. The subsectors are (i) Central Bank, (ii) Deposit-taking corporations except the central bank, (iii) Money market funds (MMFs), (iv) Non-MMF investment funds, (v) Other financial intermediaries except insurance corporations and pension funds, (vi) Financial auxiliaries, (vii) Captive financial institutions and money lenders, (viii) Insurance corporations (ICs) and (ix) Pension funds (PFs).

A3.20 Due to the substantial variations among countries in defining money, the 2008 SNA does not include a definition of money. However, the classification of financial corporations and instruments is designed to be compatible with national money definitions. Because "Money market funds" are separately distinguished, they can be included or excluded as desired.

C. Further specifications of the scope of transactions including the production boundary

1. Research and development is not an ancillary activity

Reference: chapter 6, paragraph 6.207

A3.21 The 2008 SNA does not treat the research and development activity as an ancillary activity. Research and development is creative work undertaken on a systematic basis in order to increase the stock of knowledge, including knowledge of man, culture and society, and enable this stock of knowledge to be used to devise new applications. This does not extend to including human capital as assets within the SNA. It is recommended that a separate establishment should be distinguished for research and development when possible.

A3.22 The 2008 SNA recommends that the output of research and development should be valued at market prices if purchased (outsourced) or at the sum of total production costs plus an appropriate mark-up representing the costs of fixed assets used in production if undertaken on own account. Research and development undertaken by specialized commercial research laboratories or institutes is valued by receipts from sales, contracts, commissions, fees, etc. in the usual way. Research and development undertaken by government units, universities, non-profit research institutes, etc. is non-market production and should be valued on the basis of the total costs incurred excluding a return to capital used.

A3.23 The *1993 SNA* recognized that research and development is undertaken with the objective of improving efficiency or productivity, or deriving other future benefits. However, although these characteristics have the nature of investment activities, research and development was treated as part of intermediate consumption. It was recommended, though, that it should not be treated as an ancillary activity but that a separate establishment should be identified as secondary activity.

2. Method for calculating financial intermediation services indirectly measured (FISIM) refined

Reference: chapter 6, paragraphs 6.163 to 6.165.

A3.24 The method for calculating financial intermediation services indirectly measured, widely known as FISIM, has been refined in the light of experience in implementing the *1993 SNA* recommendations. By convention the 2008 SNA recommends that FISIM applies only to loans and deposits and only when those loans and deposits are provided by, or deposited with, financial institutions. The 2008 SNA calculates the output of FISIM on loans (y_L) and deposits (y_D) only, using a reference rate (rr). Assuming that these loans and deposits attract interest rates of r_L and r_D respectively, the output of FISIM should be calculated according to the formula $(r_L - rr)\, y_L + (rr - r_D)\, y_D$.

A3.25 The method recommended in the 2008 SNA for the calculation of FISIM implies several changes to the *1993 SNA* formula. For financial intermediaries, all loans and deposits are included, not just those made from intermediated funds. The reference rate should contain no service element and reflect the risk and maturity structure of deposits and loans. The rate prevailing for inter-bank borrowing and lending may be a suitable choice as a reference rate. However, different reference rates may be needed for each currency in which loans and deposits are denominated, especially when a non-resident financial institution is involved. For banks within the same economy, there is often little if any service provided in association with banks lending to and borrowing from other banks.

A3.26 The 2008 SNA recommends that the consumption of FISIM should be allocated between users (lenders as well as borrowers) treating the allocated amounts either as intermediate consumption by enterprises or as final consumption or exports.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

A3.27 The *1993 SNA* calculated FISIM as the difference between property income receivable and interest payable. The property income receivable excluded that part which was receivable from investment of own funds. The *1993 SNA* recognized that in practice it may be difficult to find any method of allocating FISIM among different users and, therefore, accepted that some countries may prefer to continue to use the convention whereby the whole of the services are allocated to intermediate consumption of a notional industry. This possibility has been removed in the 2008 SNA.

3. Output of central bank clarified

Reference: chapter 6, paragraphs 6.151 to 6.156; chapter 7, paragraphs 7.122 to 7.126

A3.28 The services produced by the central bank are identified in three broad groups, namely financial intermediation, monetary policy services and supervisory services overseeing financial corporations. The 2008 SNA recommends that separate establishments should be identified for units of the central bank undertaking production of these different services when the level of activity is significant for the accounts as a whole. This facilitates the distinction between the market and non-market output of the central bank. Financial intermediation services represent market production, monetary policy services represent non-market production and borderline cases, such as supervisory services, may be treated as market or non-market services depending on whether explicit fees are charged that are sufficient to cover the costs of providing such services or not.

A3.29 The 2008 SNA provides guidance that non-market activities are to be regarded as acquisition of collective services by general government with a matching transfer from the central bank to the government, so there is no net cost to the government for these services. Market output is provided on an individual basis to all sectors of the economy against payment for the services.

A3.30 In cases when the interest rate set by the central bank is so high or so low as to imply the inclusion of an implicit subsidy or tax, the 2008 SNA recommends that these should be explicitly recorded as such if they are significant. These taxes or subsidies should be shown as receivable by and payable by government but with a matching transfer from the government to the central bank in the case of a tax and a transfer from the central bank to government in the case of a subsidy.

A3.31 The *1993 SNA* recommended that the services of central banks be measured on the basis of receipts from fees, commissions, and financial intermediation services indirectly measured. Application of this method sometimes resulted in unusually large positive or negative estimates of output. For this reason, in 1995 the Inter-Secretariat Working Group on National Accounts (ISWGNA) revised the recommendation for measuring the output of central banks. If the traditional approach consistently leads to inappropriate results, countries may, as a second best option, measure output at cost as in the case for other non-market output. However, the ISWGNA did not provide further guidance on the implications of the cost based valuation on the recording of other transactions in which central banks are involved, such as interest payments and receipts. Neither did it indicate which unit or units use the output of central banks thus valued.

4. Recording of the output of non-life insurance services improved

Reference: chapter 6, paragraphs 6.184 to 6.190 and 6.199; chapter 17, paragraphs 17.13 to 17.42

A3.32 It is recognized that in cases of catastrophic losses the output of the insurance activity estimated using the basic algorithm of the *1993 SNA*, depending on the balance of premiums and claims (on an accrual basis), could be extremely volatile (even negative). The 2008 SNA, therefore recommends that the output of the non-life insurance activity should be calculated using adjusted claims and adjusted premiums supplements. With the application of this method, the net premiums receivable and adjusted claims due may no longer be necessarily equal for each period.

A3.33 The 2008 SNA recommends three approaches for estimating non-life insurance output, namely the "expectation approach", the "accounting approach" and the "cost approach". The expectation approach consists in replicating the *ex ante* model used by insurer corporations to set their premiums, on the basis of their expectations. In accepting risk and setting premiums, insurers consider both their expectation of loss (claims) and of income (premiums and premium supplements). This expected margin (premiums plus expected premium supplements minus expected claims) provides a much better measure of the insurance service than the *1993 SNA* formula applied *ex post*. Ideally, the micro data from the accounts of the insurance corporations could be used for the expectation approach for estimating output of the insurance corporation but this information is seldom available to the statistical organizations. In the absence of such data, the 2008 SNA recommends the application of a statistical technique to simulate this approach by using macrostatistics, and using smoothed past data to forecast the expected claims.

A3.34 Alternatively, an accounting approach may be used whereby output is calculated as: actual premiums earned plus premium supplements less adjusted claims incurred; where adjusted claims are determined by using claims due plus the changes in equalization provisions and, if necessary, changes to own funds.

A3.35 If the necessary accounting data are not available and the historical statistical data are not sufficient to allow use of an expectations approach to estimate the output, the output of non-life insurance may be estimated as the sum of costs (including intermediate costs, labour and capital costs) plus an allowance for "normal profit".

A3.36 For exceptionally large claims, such as those following a catastrophe, the claims may be recorded as capital transfers rather than, as normal, current transfers.

A3.37 The 2008 SNA changes the terminology from "claims due" to "claims incurred".

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

5. Reinsurance similarly treated as direct insurance

Reference: chapter 6, paragraph 6.200; chapter 17, paragraphs 17.56 to 17.65

A3.38 The 2008 SNA recommends that reinsurance should be treated in the same way as direct insurance. The transactions between the direct insurer and the reinsurer are recorded as an entirely separate set of transactions and no consolidation takes place between the transactions of the direct insurer as issuer of policies to its clients on the one hand and the holder of a policy with the reinsurer on the other. The premiums are shown as being first payable to the direct insurer and then a lesser premium is payable to the reinsurer. This non-consolidation is referred to as gross recording on the part of the direct insurer.

A3.39 The services produced by the reinsurance corporation are treated as the intermediate consumption by the direct insurer.

A3.40 In the *1993 SNA* reinsurance transactions were consolidated with those for direct insurance so that the division between direct insurance and reinsurance was not shown.

6. Valuation of output for own final use by households and corporations to include a return to capital

Reference: chapter 6, paragraph 6.125

A3.41 The 2008 SNA recommends that when estimating the value of the output of goods and services produced by households and corporations for own final use, it is appropriate to include a return to capital as part of the sum of costs when this approach is used for estimating output in the absence of comparable market prices. However, no return to capital should be included when production for own final use is undertaken by non-market producers.

A3.42 The *1993 SNA* did not include the return to capital in estimating the output of goods and services produced for own final use by households and corporations when these were estimated as the sum of costs.

D. Extension and further specification of the concepts of assets, capital formation and consumption of fixed capital

1. Change of economic ownership introduced

Reference: chapter 3, paragraphs 3.21, 3.26, 3.169; chapter 10, paragraph 10.5

A3.43 The principle of change of ownership is central to the determination of the timing of recording of transactions in goods, services and financial assets. The term “economic ownership” better reflects the underlying reality economic accounts are attempting to measure. Economic ownership takes account of where the risks and rewards of ownership lie. A change in ownership from an economic point of view means that all risks, rewards, rights and responsibilities of ownership are transferred.

A3.44 The 2008 SNA gives guidance to distinguish between legal ownership and economic ownership and recommends that assets be recorded on the balance sheets of the economic rather than the legal owner. For a non-financial asset, the user and not the legal owner may assume economic ownership if the legal owner agrees that the user is entitled to the benefits deriving from using the asset in production in return for assuming the risks involved. Similarly when products change hands, it is the unit that assumes the risks in the case of destruction, theft, etc. that is the economic owner. Ownership is also associated with assuming risk in the case of financial assets. When the time of recording depends on change of ownership, it is the change of economic ownership that is intended, unless otherwise specified.

A3.45 The *1993 SNA* did not explicitly define ownership. Often it seemed to imply legal ownership, but in some instances it relied on the concept of change of economic ownership when legal ownership remained unchanged.

2. Asset boundary extended to include research and development

Reference: chapter 10, paragraphs 10.103 to 10.105

A3.46 As noted in section C, in the 2008 SNA the activity of research and development is not treated as an ancillary activity. The output of research and development should be capitalized as “intellectual property products” except in cases where it is clear that the activity does not entail any economic benefit to its producer (and hence owner) in which case it is treated as intermediate consumption. With the inclusion of research and development in the asset boundary, the *1993 SNA* asset category of patented entities as a form of non-produced assets disappears and is replaced by research and development under fixed assets.

A3.47 In order to treat R&D in this way, several issues have to be addressed. These include deriving measures of research and development, price indices and service lives. Specific guidelines, together with handbooks on methodology and practice, will provide a useful way of working towards solutions that give the appropriate level of confidence in the resulting measures.

A3.48 Treatment of research and development giving rise to produced assets has removed the *1993 SNA* inconsistency

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

of treating the patented entities as non-produced assets but treating royalty payments as payments for services.

3. Revised classification of assets introduced

Reference: chapter 3, paragraphs 3.5, 3.30 to 3.31, 3.37 to 3.39; chapter 10, paragraph 10.8

A3.49 The definition of asset has been refined in the 2008 SNA, covering the issues such as risk, demonstrable value and constructive obligations. It is defined as a store of value representing a benefit or series of benefits accruing to the economic owner by holding or using the entity over a period of time. It is a means of transferring value from one accounting period to another.

A3.50 With regard to the classification of assets, the 2008 SNA, like its predecessor, distinguishes at the first level of the classification between non-financial assets and financial assets/liabilities. Within non-financial assets, it distinguishes between produced and non-produced assets. Classification of produced and non-produced assets is no longer distinguished between tangible and intangible assets. Non-produced assets in the 2008 SNA are split into three categories, natural resources, contracts leases and licences, and purchase and sale of goodwill and marketing assets.

A3.51 The non-financial assets are classified in the 2008 SNA as follows:

Produced assets
- Fixed assets
  - Dwellings
  - Other buildings and structures
    - Non-residential buildings
    - Other structures
    - Land improvements
  - Machinery and equipment
    - Transport equipment
    - ICT equipment
    - Other machinery and equipment
  - Weapons systems
  - Cultivated biological resources
    - Animal resources yielding repeat products.
    - Tree, crop and plant resources yielding repeat products
  - Costs of ownership transfer on non-produced assets
  - Intellectual property products
    - Research and development
    - Mineral exploration and evaluation
    - Computer software and databases
      - Computer software
      - Databases
    - Entertainment, literary or artistic originals
    - Other intellectual property products
- Inventories
  - Materials and supplies
  - Work in progress
    - Work-in-progress on cultivated biological resources
    - Other work-in-progress
  - Finished goods
  - Military inventories
  - Goods for resale
- Valuables
  - Precious metals and stones
  - Antiques and other art objects
  - Other valuables

Non-produced assets
- Natural resources
  - Land
  - Mineral and energy resources
  - Non-cultivated biological resources
  - Water resources
  - Other natural resources
    - Radio spectra
    - Other
- Contracts, leases and licences
  - Marketable operating leases
  - Permits to use natural resources
  - Permits to undertake specific activities
  - Entitlement to future goods and services on an exclusive basis
- Goodwill and marketing assets

A3.52 In the 2008 SNA assets classification there are several changes within the fixed assets category.

a. Within buildings and structures, a category has been added for land improvements. This replaces the *1993 SNA* term "major improvements to non-produced non-financial assets". The costs of ownership transfer on all land are to be included with land improvements.

b. The information, computer and telecommunications (ICT) equipment has been included as a new category under machinery and equipment.

c. Weapons systems are recognized as produced assets and classified separately.

d. The term "intangible fixed assets" has been renamed as "intellectual property products". The word "products" is included to make clear that it does not include third party rights which are non-produced assets in the SNA.

e. Research and development products are included within intellectual property products. As a result patented entities no longer appear as non-produced assets and are subsumed in research and development.

f. The item "mineral exploration" has been renamed "mineral exploration and evaluation" to emphasize that the coverage conforms to the international accounting standards.

g. Computer software has been modified to include databases; software and databases are two sub-components.

h. The term "other intellectual property products" replaces "other intangible fixed assets".

A3.53 The only change to inventories is to show military inventories separately.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

A3.54 Changes within the non-produced assets category are as follows.

a. The "tangible non-produced assets" of the *1993 SNA* are renamed as "natural resources".

b. Other natural resources such as radio spectra have been added, and the heading "intangible non-produced assets" has been split into two subcategories, "contracts, leases and licences" and "goodwill and marketing assets".

· Contracts, leases and licences are split into four subcategories; marketable operating leases, permissions to use natural resources, permissions to undertake specific activities, and entitlement to future goods and services on an exclusive basis.

· The previous category of purchased goodwill is changed to purchased goodwill and marketing assets with changes in coverage as described below in item 11.

4. Extension of the assets boundary and government gross capital formation to include expenditure on weapons systems

Reference: chapter 10, paragraphs 10.87 and 10.144

A3.55 The military weapons systems comprising vehicles and other equipment such as warships, submarines, military aircraft, tanks, missile carriers and launchers, etc. are used continuously in the production of defence services, even if their peacetime use is simply to provide deterrence. The 2008 SNA, therefore, recommends that military weapons systems should be classified as fixed assets and that the classification of military weapons systems as fixed assets should be based on the same criteria as for other fixed assets; that is, produced assets that are themselves used repeatedly, or continuously, in processes of production for more than one year.

A3.56 Single-use items, such as ammunition, missiles, rockets, bombs, etc., delivered by weapons or weapons systems are treated as military inventories. However, some single-use items, such as certain types of ballistic missiles with a highly destructive capability, may provide an ongoing service of deterrence against aggressors and therefore meet the general criteria for classification as fixed assets.

A3.57 Unlike in the *1993 SNA*, strategic inventories are no longer separated from other inventories of the same type of products.

A3.58 The *1993 SNA* treated as gross fixed capital formation only those expenditures by the military on fixed assets of a kind that could be used for civilian purposes of production. On the other hand, military weapons, and vehicles and equipment whose sole purpose was to launch or deliver such weapons, were not treated as gross fixed capital formation but as intermediate consumption.

5. The asset category "computer software" modified to include databases

Reference: chapter 10, paragraphs 10.110 to 10.114

A3.59 The *1993 SNA* asset category "computer software" has been modified in the 2008 SNA to include databases in the title as "computer software and databases" with a further split between "computer software" and "databases".

A3.60 The 2008 SNA gives explicit guidance for valuation of the computer software and databases purchased from the market or developed in-house. The computer software and databases purchased on the market should be valued at purchasers' prices, while those developed in-house should be valued at their estimated basic price or at their costs of production (including a return to capital for market producers) if it is not possible to estimate the basic price.

A3.61 The 2008 SNA recommends treating all databases holding data with a useful life of more than one year as fixed assets. Both databases created on own account and those for sale should be included if they meet this criterion.

A3.62 In the *1993 SNA* only "large" databases were recognized as assets.

6. Originals and copies recognized as distinct products

Reference: chapter 10, paragraphs 10.100 to 10.101

A3.63 The 2008 SNA provides guidance on the treatment of originals and copies of intellectual property products as distinct products. It recommends that if a copy is sold outright and is expected to be used in production for more than a year then it should be treated as a fixed asset. A copy made available under a licence to use should also be treated as a fixed asset if it will be used in production for a period in excess of one year and the licensee assumes all the risks and rewards of ownership.

A3.64 If the acquisition of a copy with a licence to use is purchased with regular payments over a multiyear contract and the licensee is judged to have acquired economic ownership of the copy, then it should be regarded as the acquisition of an asset. If regular payments are made for a licence to use without a long-term contract, then the payments should be treated as payments for a service of using the copy.

A3.65 If there is a large initial payment followed by a series of smaller payments in succeeding years, the initial payment should be recorded as gross fixed capital formation and the succeeding payments should be treated as payments for a service.

A3.66 If the licence allows the licensee to reproduce the original and subsequently assume responsibility for the distribution, support and maintenance of these copies, then this is described as a licence to reproduce and should be regarded as the sale of part or whole of the original to the unit holding the licence to reproduce.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

A3.67 The *1993 SNA* did not provide guidance on the treatment of originals and copies as distinct products.

7. The concept of capital services introduced

Reference: chapter 20

A3.68 Capital services for assets used in market production were implicitly included within the *1993 SNA* but were not separately identified. Given the importance of identifying them for productivity measurement and other analysis, a new chapter has been added in the 2008 SNA explaining the role of capital services and their appearance in the accounts. Details can be presented in a supplementary table for market producers, bringing into the SNA the advances in research in recent decades in the fields of growth and productivity and helping to satisfy the analytical needs of many users.

8. Treatment of costs of ownership transfer elaborated

Reference: chapter 10, paragraphs 10.48 to 10.52, paragraph 10.97 and paragraphs 10.158 to 10.162

A3.69 Like the *1993 SNA*, the 2008 SNA continues to treat the costs of ownership transfer as fixed capital formation. Costs of ownership transfer on acquisition of an asset should be written off over the period the asset is expected to be held by the purchaser rather than over the whole life of the asset (as was recommended in the *1993 SNA*). Costs of ownership transfer on the disposal of an asset should also be written off over the period the asset is held. Recognizing this recommendation may be difficult to implement when there is no adequate data, the 2008 SNA recommends that these costs should still be recorded as gross fixed capital formation but written off as consumption of fixed capital in the year they are incurred. Installation and de-installation costs should be included in the costs of ownership transfer when they are separately invoiced and in the purchaser's price of the asset otherwise.

A3.70 Terminal costs (for example dismantling costs) should be written off over the whole life of the asset, regardless of the number of owners during the life of the asset. In practice, it may be difficult to predict terminal costs accurately. Any amount not already covered by consumption of fixed capital during the life of the asset is written off at the time the costs are incurred as consumption of fixed capital.

A3.71 In the *1993 SNA*, costs of ownership transfer in acquiring an asset were recommended to be written down over the life of the asset. If the asset was sold before the end of its life, the remaining costs of ownership transfer on acquisition not already written off were written off in the other changes in volume of assets account.

A3.72 The *1993 SNA* was not explicit about the treatment of terminal costs.

9. Mineral exploration and evaluation

Reference: chapter 10, paragraphs 10.106 to 10.108

A3.73 The 2008 SNA maintains the distinction between the act of exploring for mineral resources (treated as a produced asset) and the mineral resources themselves (treated as non-produced assets). The term "mineral exploration" has been renamed as "mineral exploration and evaluation" to match the term used in the International Accounting Standards and has been defined accordingly.

A3.74 The 2008 SNA gives guidance that mineral exploration and evaluation should be valued at market prices if purchased or at the sum of costs plus an appropriate mark-up if undertaken on own account.

A3.75 The 2008 SNA recognizes that because the market price is seldom available for mineral resources, the default valuation is the present value of future receipts of resource rent.

A3.76 Payments by an extractor to the owner of the mineral resources corresponding to a share of the resource rent should be shown as property income even if they are described as taxes and treated as such in a government's own accounts.

A3.77 The *1993 SNA* recommended that when the legal owner of a mineral reserve contracts with another unit to undertake extraction, on pragmatic grounds the resource may continue to be shown on the balance sheet of the legal owner with payments by the extractor to the owner treated as property income.

10. Land improvements

Reference: chapter 10, paragraphs 10.79 to 10.81

A3.78 Land improvements continue to be treated as gross fixed capital formation. The 2008 SNA recommends treating land improvements as a category of fixed assets distinct from the non-produced land asset as it existed before improvement. In cases where it is not possible to separate the value of the land before improvement and the value of those improvements, the land should be allocated to the category that represents the greater part of the value. The costs of ownership transfer on all land are to be included in the land improvements.

A3.79 The *1993 SNA* recorded improvements to land as gross fixed capital formation, but in the balance sheet such improvements were included with land itself.

11. Goodwill and marketing assets

Reference: chapter 10, paragraphs 10.196 to 10.199

A3.80 The 2008 SNA renames "purchased goodwill" as "purchased goodwill and marketing assets". Purchased goodwill and marketing assets continue to be treated as non-produced assets, though at a higher level in the

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

hierarchy than that in *1993 SNA*, specifically at the same level as natural resources and contracts, leases and licences.

A3.81 In the *1993 SNA*, goodwill was recorded only following the takeover of an enterprise. For that reason it was described as "purchased goodwill". Goodwill was not recognized in any other context. The 2008 SNA recognizes that this difference may actually include assets such as mastheads, logos, customer lists and so on which are described collectively as "marketing assets". Exceptionally, identified marketing assets may be sold individually and separately from the whole corporation in which case their sale should also be recorded under this item.

A3.82 The 2008 SNA recommends a consistent approach for calculating the value of the "purchased goodwill and marketing assets" as the excess of the value paid for an enterprise as a going concern over the sum of its assets less the sum of its liabilities, each item of which has been separately identified and valued irrespectively of whether the entity is a listed or unlisted corporation, a quasi-corporation or is unincorporated.

A3.83 In the *1993 SNA*, purchased goodwill was calculated differently depending on whether the business was an unincorporated enterprise or a corporation. For an unincorporated enterprise, purchased goodwill was derived as the excess of the purchase price over the separately identified and valued assets less liabilities. For corporations it was described as the difference between the share price immediately before the sale and the actual sale price per share, multiplied by the number of shares. It did not make any distinction between listed and unlisted corporations in the calculation of purchased goodwill.

12. Water resources treated as an asset in some cases

Reference: chapter 10, paragraph 10.184

A3.84 In the 2008 SNA the definition of water resources has been extended to potentially cover rivers, lakes, artificial reservoirs and other surface catchments in addition to aquifers and other groundwater resources. It consists of surface and groundwater resources used for extraction to the extent that their scarcity leads to the enforcement of ownership or use rights, market valuation and some measure of economic control.

A3.85 The 2008 SNA recommends that water bodies should in principle be valued in a manner parallel to the valuation of mineral resources but with an indication that more pragmatic alternatives may have to be used such as estimates based on access fees.

13. Consumption of fixed capital to be measured at the average prices of the period with respect to a constant-quality price index of the asset concerned

Reference: chapter 10, paragraph 10.156

A3.86 The 2008 SNA recommends that the consumption of fixed capital should be measured at the average prices of the period with respect to a constant-quality price index of the asset concerned.

A3.87 The *1993 SNA* did not give guidance about whether the prices to be used for measurement of the consumption of fixed capital should relate to the general price level or whether they should be asset specific.

14. Definition of cultivated biological resources made symmetric to uncultivated resources

Reference: chapter 10, paragraph 10.88

A3.88 The definition of cultivated biological resources in the 2008 SNA has been clarified making it specific that their natural growth and regeneration are treated as production only in cases where these are under the direct control, responsibility and management of institutional units.

A3.89 Cultivated assets of the *1993 SNA* have been renamed as cultivated biological resources in the 2008 SNA.

15. Intellectual property products introduced

Reference: chapter 10, paragraph 10.98

A3.90 The accounting treatment of assets previously called "intangible produced assets" and now labelled, more descriptively, "intellectual property products" has been clarified and expanded in the 2008 SNA. These assets are further split into research and development; mineral exploration and evaluation; computer software and databases; entertainment, literary or artistic originals; and other intellectual property products.

16. Concept of resource lease for natural resources introduced

Reference: chapter 7, paragraph 7.109

A3.91 The 2008 SNA introduces the concept of a resource lease to cover the situation where the natural resource continues to be shown in the balance sheet of the legal owner even though the lessee is the unit using the resource in production and is thus in effect the economic owner. In return, the lessee makes a regular payment recorded as property income and described as rent. By convention, no decline in the value of a natural resource is recorded in the SNA as a transaction similar to consumption of fixed capital. In the SNA the natural resource is effectively treated as having an infinite life as far as income generation is concerned. A resource lease may apply to any natural resource recognized as an asset in the SNA.

A3.92 The *1993 SNA* did not discuss the concept of a resource lease for natural resources.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

17. Changes in the items appearing in the other changes in the volume of assets account introduced

Reference: chapter 12

A3.93 With a view to giving more structural listing of possible causes for changes in assets other than transactions, the list of items appearing in the other changes in volume of assets account has changed in the 2008 SNA. The other changes in the volume of assets show changes in the assets/ liabilities in seven main categories and some subcategories as follows:

Economic appearance of assets
Economic disappearance of non-produced assets
    Depletion of natural resources
    Other economic disappearance of non-produced assets
Catastrophic losses
Uncompensated seizures
Other changes in volume n.e.c.
Changes in classification
    Changes in sector classification and structure
    Changes in classification of assets and liabilities
Nominal holding gains and losses
    Neutral holding gains and losses
    Real holding gains and losses

E. Further refinement of the treatment and definition of financial instruments and assets

1. Treatment of securities repurchase agreement clarified

Reference: chapter 11, paragraphs 11.74 to 11.77

The 2008 SNA adds explanation of securities repurchase agreement and gold loans and deposits. A securities repurchase agreement (repo) is an arrangement involving the sale of securities or other assets at a specified price with a commitment to repurchase the same or similar assets at a fixed price on a specified future date.

A3.94 The 2008 SNA continues to treat a repo as a collateralized loan and recognizes the possibility of on-selling of securities that have been repoed. In the case of on selling of the repoed security, a negative asset should be recorded for the lender to avoid double-counting.

A3.95 The *1993 SNA* text suggested that on-selling of securities that have been repoed is either not allowed or not practised.

2. Treatment of employee stock options described

Reference: chapter 11, paragraph 11.124; chapter 17, paragraphs 17.384 to 17.398

A3.96 Employee stock options are a common tool used by companies to motivate their employees. An employee stock option is an agreement made on a given date (the "grant" date) under which an employee may purchase a given number of shares of the employer's stock at a stated price (the "strike" price) either at a stated time (the "vesting" date) or within a period of time (the "exercise" period) immediately following the vesting date. The 2008 SNA recommends that transactions in employee stock options should be recorded in the financial account as the counterpart to the element of compensation of employees represented by the value of the stock option. Ideally the value of the option should be spread over the period between the grant date and vesting date; if this is not possible they may be recorded at the vesting date.

A3.97 The *1993 SNA* did not provide guidance on the treatment of employee stock options.

3. Treatment of non-performing loans elaborated

Reference: chapter 11, paragraph 11.129; chapter 13, paragraphs 13.66 to 13.68

A3.98 Guidance on the treatment of impaired (non-performing) loans has been elaborated in the 2008 SNA. It provides a definition of a non-performing loan as a loan on which payments of interest and/or principal are past due by 90 days or more, or interest payments equal to 90 days or more have been capitalized, refinanced, or delayed by agreement, or payments are less than 90 days overdue, but there are other good reasons (such as a debtor filing for bankruptcy) to doubt that payments will be made in full.

A3.99 The 2008 SNA recommends that the non-performing loan should continue to be recorded at nominal value in the main accounts and interest should be shown accruing until a loan is repaid or the principal is written off by mutual agreement. Two memorandum items in respect of non-performing loans are recommended, the nominal value of loans deemed to be non-performing and the market equivalent value of these loans. The closest approximation to market equivalent value is fair or "mark-to-market" value, which is "the value that approximates the value that would arise from a market transaction between two parties". In the absence of fair value data, the memorandum item will have to use a second best approach and show nominal value less expected loan losses. In addition, interest receivable on the non-performing loans should be shown as an "of which" item.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

A3.100 The 2008 SNA recommends that these memorandum items should be standard for the government sector, the financial corporations sector and for the rest of the world.

A3.101 The *1993 SNA* did not give guidance on the criteria to be applied to the recording of non-performing loans.

4. Treatment of guarantees elaborated

Reference: chapter 17, paragraphs 17.207to 17.224

A3.102 The treatment of several classes of guarantees has been clarified in the 2008 SNA. It recognizes three classes of guarantees and provides guidance for their treatment. The first sort of guarantees are those provided by means of a financial derivative, such as a credit default swap. These derivatives are actively traded on financial markets and the derivative presents no new features for the SNA.

A3.103 The second class of guarantees, standardized guarantees, is composed of the sorts of guarantees that are issued in large numbers, usually for fairly small amounts, along identical lines, such as export credit guarantees and student loan guarantees. In this case, although it is not possible to establish the likelihood of any one loan defaulting, it is standard practice to estimate how many out of a batch of similar loans may default. It operates on the same principle as for non-life insurance and should be treated similarly. If the guarantor is part of general government and deliberately sets the fees below the level of expected defaults, a subsidy should be imputed to the guarantee holders.

A3.104 The third class of guarantees, described as one-off guarantees, consists of those where the risk is so particular that it is not possible for the probability of it being called to be estimated with any degree of accuracy. In most cases, the granting of a one-off guarantee is considered a contingency and is not recorded as a financial liability.

A3.105 The initial discussion was in terms of loan guarantees, but the extension of standardized guarantees to other financial instruments in late 2008 suggested generalizing this treatment.

A3.106 The *1993 SNA* treated guarantees as contingent liabilities and thus had no record of the existence of the guarantee until it was activated. Further, it did not provide explicit guidance for the treatment of flows arising at activation.

5. Treatment of index-linked debt securities elaborated

Reference: chapter 17, paragraph 17.274 to 17.282

A3.107 The issue concerns the case where the coupon or principal payments, or both, payable on securities such as bonds are determined by indicators agreed by to the parties, but the values of the indicators are not known when the agreement is made. Under such an arrangement, the amount of the increase in value of the security to be treated as interest cannot be known at the time of issue. The 2008 SNA recommends two approaches to determine the interest accrued in each accounting period.

A3.108 When the coupons are linked to a broad index, the full amounts paid as coupons, after indexation, are accrued as interest. When the value of the principal is index-linked the difference between the eventual redemption price and the issue price is treated as interest accruing over the life of the instrument.

A3.109 If the link is to a narrow index, interest accruals are determined by fixing the rate at which interest accrues at the time of issue. Any deviation of the index from the expected path is treated as holding gains or losses. Because the rate is settled at the time the security is issued, the holding gains and losses will not normally cancel out over the life of the instrument.

A3.110 In the *1993 SNA* the guidance about how transactions relating to index-linked debt securities should be recorded was not precise.

6. Treatment of debt instruments indexed to a foreign currency revised

Reference: chapter 17, paragraph 17.281

A3.111 The 2008 SNA recommends that debt instruments with both principal and coupon payments indexed to a foreign currency should be classified and treated as though the instrument is denominated in that foreign currency.

A3.112 The *1993 SNA* recommended that in the case of debt instruments denominated in a foreign currency, changes in the value of the principal in domestic currency terms that arise from exchange rate variations should be treated as holding gains (non-transactions). However, in the case of debt instruments indexed to a foreign currency, such changes are treated as interest (transactions). The 2008 SNA recommendation removes the anomaly by treating instruments that have economically equivalent characteristics identically.

7. Flexibility on valuation of unlisted equity

Reference: chapter 13, paragraphs 13.69 to 13.70

A3.113 Not all equity is listed and quoted on stock exchanges. This situation often arises for direct investment enterprises, private equity, equity in unlisted and delisted companies, listed but illiquid companies, joint ventures and unincorporated enterprises. The 2008 SNA provides guidance on alternative options of valuing such equity. Some of the alternative recommended options are recent transaction price, net asset value, present value or price to earnings ratios, book values reported by enterprises with macrolevel adjustments by the statistical compiler, own funds at book value and apportioning global value.

A3.114 The *1993 SNA* gave rather restricted guidance on how to value unlisted equity. It recommended that the value of shares in corporations that are not quoted on stock exchanges or otherwise traded regularly should be estimated using the prices of quoted shares that are comparable in earnings and dividend history and prospects, adjusting downward, if necessary, to allow for the inferior marketability or liquidity of unquoted shares.

8. Unallocated gold accounts treated as financial assets and liabilities

Reference: chapter 11, paragraph 11.45

A3.115 The 2008 SNA recommends that the unallocated gold accounts should be treated as financial assets and liabilities and classified with deposits in foreign currency if these deposits denominated in gold are held with non-residents.

9. Definition of monetary gold and gold bullion revised

Reference: chapter 11, paragraph 11.45 and 11.46

A3.116 The definition of monetary gold has changed in the 2008 SNA in order to align with *BPM6*. The change stems from the recognition of allocated and unallocated gold accounts whereby the allocated gold account provides title to the physical gold and the unallocated gold account is a deposit denominated in gold. The latter is treated as foreign currency if held with non-residents. Gold bullion (that is, coins, ingots or bars with a minimum purity of at least 995 parts per thousand) is the only financial asset recognized with no corresponding liability when held as a reserve asset by the monetary authorities. Monetary gold is defined as gold to which the monetary authorities (or others who are subject to the effective control of the monetary authorities) have title and is held as a reserve asset and comprises gold bullion and unallocated gold accounts with non-residents.

A3.117 The *1993 SNA* does not discuss allocated or unallocated metal accounts.

10. Liability in special drawing rights recognized

Reference: chapter 11, paragraphs 11.47 to 11.49

A3.118 The 2008 SNA recommends to treat special drawing rights (SDRs) issued by the International Monetary Fund as being an asset of the country holding the SDR and a claim on the participants in the scheme collectively. Further, it is recommended that the allocation and cancellation of SDRs be recorded as transactions. The asset and liability aspects of SDRs should be recorded separately. As a result of the changed treatment of SDRs, it recommends that monetary gold and SDRs be shown as separate subitems.

A3.119 The *1993 SNA* classified SDRs as assets without corresponding liabilities.

11. Distinction made between deposits and loans

Reference: chapter 11, paragraph 11.56

A3.120 The 2008 SNA continues to distinguish between loans and deposits. With a view to avoiding ambiguity between loans and deposits when both parties to the transaction are banks, it introduces a category “inter-bank positions”.

12. Fees payable on securities lending and gold loans

Reference: chapter 17, paragraph 17.254

A3.121 The 2008 SNA recommends that all fees payable to the owners of securities used for securities lending and to the owners of gold used for gold loans (whether from allocated or non-allocated gold accounts) should be recorded by convention as interest. The interest may have a FISIM component, separately identified, if the unit providing the loan is classified as a financial institution.

A3.122 The *1993 SNA* did not give guidance on the issue of fees payable on securities lending and gold loans.

13. Financial asset classification

Reference: chapter 11

A3.123 To reflect the innovations in the financial market since the adoption of the *1993 SNA*, and to maintain its relevance, the financial asset classification has been changed in the 2008 SNA. The classification of financial assets and liabilities in the 2008 SNA is as follows:

- Monetary gold and SDRs
  - Monetary gold
  - SDRs
- Currency and deposits
  - Currency
  - Transferable deposits
    - Inter-bank positions
    - Other transferable deposits
  - Other deposits
- Debt securities
  - Short-term
  - Long-term
- Loans
  - Short-term
  - Long-term
- Equity and investment fund shares
  - Equity
    - Listed shares
    - Unlisted shares
    - Other equity
  - Investment fund shares/units
    - Money market fund shares/units
    - Other investment fund shares/units
- Insurance, pension and standardized guarantee schemes
  - Non-life insurance technical provisions
  - Life insurance and annuity entitlements
  - Pension entitlements
  - Claims of pension funds on pension managers
  - Entitlements to non-pension benefits
- Financial derivatives and employee stock options
  - Financial derivatives
    - Options
    - Forwards
  - Employee stock options
- Other accounts receivable/payable
  - Trade credits and advances
  - Other accounts receivable/payable

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

A3.124 The 2008 SNA renames "securities other than shares" as "debt securities" and "shares and other equity" as "equity and investment fund shares". The category of financial derivatives introduced in an update to the *1993 SNA* is extended to include employee stock options.

14. Distinction between financial leasing and operating leasing based on economic ownership

Reference: chapter 17, paragraphs 17. 301 to 17.309

A3.125 The 2008 SNA presents an overview setting out the principles of the appropriate treatment of leases and licences. It recognizes the distinction between an operating lease and a financial lease according to whether the lessee is regarded as the economic owner of the asset or not.

A3.126 The distinction between operating leasing and the financial leasing in the *1993 SNA* was interpreted to be based simply on the length of the time of lease.

15. Changes in recommendations for recording pension entitlements

Reference: chapter 17, paragraphs 17. 116 to 17.206

A3.127 The 2008 SNA recognizes that employment-related pension entitlements are contractual engagements, that are expected or likely to be enforceable. They should be recognized as liabilities towards households, irrespectively of whether the necessary assets exist in segregated schemes or not.

A3.128 For pensions provided by government via social security however, countries have some flexibility to deviate from this procedure in the set of standard tables. This is because the division between which pensions are provided by social security and which by other employment-related schemes varies considerably from country to country. However, the full range of information required for a comprehensive analysis of pensions should be provided in a supplementary table that shows the liabilities and associated flows of all private and government pension schemes, whether funded or unfunded and including social security.

A3.129 The *1993 SNA* stated that the actual social contributions by employer and employee in a period should be the amount actually paid into a pension fund. For a defined contribution scheme, this is correct and complete since the eventual payment depends only on the amounts set aside in a pension fund. For a defined benefit scheme, however, there is no guarantee that the amounts set aside will exactly match the liability of the employer to the pension entitlements of employee.

A3.130 The 2008 SNA recommends a number of changes to the *1993 SNA* recommendations in the case of defined benefit schemes:

a. the level of the employer's contribution should be determined by assessing the increase in the net present value of the pension entitlement the employee has earned in the period in question, adding any costs charged by the pension fund for operating the scheme and deducting the amount of any contribution the employee makes;

b. this amount should be determined actuarially, taking into account only the life expectancy of the employee and not any future earnings or the impact of any future pay increases on the ultimate pension benefit;

c. an explicit liability of the pension fund to the employee should be shown in the financial account and balance sheet; and

d. the assets of the fund are then to be regarded as belonging to the fund and not (as stated in the *1993 SNA*) as belonging to the employee.

A3.131 Depending on the relationship between the fund and the employer, any excess of the liabilities over the available assets may represent a claim of the pension fund on the employer (and any excess of the assets over the liabilities a claim by the employer on the pension fund).

A3.132 The 2008 SNA recognizes that there is a cost to administering any pension scheme including non-autonomous schemes and unfunded schemes. In principle, there should be a value of output of the pension fund. This is to be determined on the basis of the sum of costs, and by convention is deemed to be payable by the employees holding the pension entitlements.

A3.133 The 2008 SNA recommends that when an obligation to pay pensions passes from one unit to another, this should be recorded as a transaction in pension liabilities even if neither unit has previously recorded such liabilities.

A3.134 The *1993 SNA* recognized pension obligations on the balance sheet only for funded "private" schemes. Hence, the activities of many pension schemes, such as social security and unfunded employer schemes, did not lead to recognition of financial assets/liabilities. Further, the pension liabilities recognized were limited to the funds available and were not determined by the claims of employees and others on the schemes.

A3.135 The *1993 SNA* treated the activity of non-autonomous pension funds and unfunded pension schemes as ancillary activities where the output was not separately recognized.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

F. Further specifications of the scope of transactions concerning government and public sector

1. The boundary between private/public/ government sectors clarified

Reference: chapter 4, paragraphs 4.25 and 4.77 to 4.80, chapter 22

A3.136 Recognizing the fact that the powers, motivation and functions of government are different from those of other sectors of the economy and that it organizes its operations through different institutional units, the 2008 SNA gives extra guidance for the distinction between general government and public corporations. It provides a decision tree to help clarify the conceptual basis for allocating the institutional units to one of the mutually exclusive institutional sectors and to identify government and other public units.

2. Treatment of restructuring agencies elaborated

Reference: chapter 22, paragraphs 22.47 to 22.50

A3.137 Some public units are involved in the restructuring of corporations that may or may not be controlled by government. Two examples of public restructuring agencies concern (a) the reorganization of the public sector and the indirect management of privatization, and (b) impaired assets, mainly in a context of a banking or other financial crisis. The 2008 SNA provides guidelines for the treatment of restructuring agencies.

A3.138 The *1993 SNA* did not provide guidance for the treatment of restructuring agencies.

3. Treatment of government issued permits clarified

Reference: chapter 22, paragraphs 22.88 to 22.90

A3.139 The 2008 SNA recommends that if a permit issued by the government does not involve the use of an underlying government owned asset, then the payment for the licence is a tax. Notwithstanding, if the licence is legally and practically transferable to a third party, then it acquires the characteristics of an asset and it may be classified as an asset in the category of contracts, leases and licences.

A3.140 When the licence is to make use of a natural resource (including natural resources that qualify as assets and which the government controls on behalf of the community), payments for the licence are treated either as the acquisition of an asset in the category of contracts, leases or licences or as the payment of rent.

4. Exceptional payments from public corporations should be recorded as withdrawals from equity

Reference: chapter 22, paragraphs 22.135

A3.141 The 2008 SNA recommends that exceptional payments from public corporations should be recorded as withdrawals from equity when these are made from accumulated reserves or sales of assets. Only regular distributions from the entrepreneurial income of corporations should be recorded as dividends.

A3.142 The *1993 SNA* guidance in this respect was different for corporations and quasi-corporations in that exceptional payments from a public corporation were recorded as regular payments of dividends while similar payments from public quasi-corporations were recorded as withdrawals from equity.

5. Exceptional payments from government to public quasi-corporations should be treated as capital transfers

Reference: chapter 22, paragraphs 22.138

A3.143 The 2008 SNA recommends that exceptional payments from government to public quasi-corporations to cover accumulated losses should be treated as capital transfers as for public corporations. However, exceptional payments by government to both public corporations and public quasi-corporations should be recorded as additions to equity when they are made with a clear commercial perspective reflected in a valid expectation of a return in the form of property income.

A3.144 In the *1993 SNA*, exceptional payments from government to public corporations were recorded as capital transfers but exceptional payments from government to public quasi-corporations were recorded as additions to equity.

6. Accrual recording of taxes

Reference: chapter 22, paragraphs 22.91 to 22.94

A3.145 The 2008 SNA confirms the accrual basis of recording of taxes. However, it allows some practical flexibility in two cases in order to ensure that uncollectible taxes are not shown as accruing. One of these relates to taxes on income to be recorded when the tax liability is assessed with some measure of certainty rather than when the income is earned. The other refers to taxes arising from activities in the "parallel" economy when the timing of the taxable event is unlikely to be known. In this case also the time of recording should be the time of assessment. The 2008 SNA also gives guidance that in assessing the amount of taxes accruing, care must be taken not to include tax unlikely ever to be collected.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

7. Tax credits

Reference: chapter 22, paragraphs 22.95 to 22.98

A3.146 Tax credits represent tax relief and so reduce the tax liability of the beneficiary. Some tax credits are payable, that is any credit in excess of the tax liability is payable to the beneficiary. Some subsidies or social benefits are made available via the tax system in the form of tax credits, and the incidence of linking payment systems with the tax collection system is increasing. The 2008 SNA recommends that the payable credits should be recorded on a gross basis even though this is counter to the recommendations in *GFSM2001* and *Revenue Statistics*. The presentation should permit the derivation of tax credits on a net basis also.

A3.147 The *1993 SNA* did not give guidance on the treatment of tax credits.

8. Treatment of ownership of fixed assets created through public-private partnerships clarified

Reference: chapter 22, paragraphs 22.154 to 22.163

A3.148 Public-private partnerships (PPPs) are long-term contracts between two units, whereby a private unit acquires or builds an asset or set of assets, operates it for period and then hands the asset over to a unit in the public sector. Such arrangements are usually between a private enterprise and government but other combinations are possible, with a public corporation as either party or a private NPI as the second party. The 2008 SNA provides indicative guidance on the characteristics to be examined to determine whether the private or public partner is the economic (as opposed to legal) owner of the assets in question.

A3.149 The *1993 SNA* did not give guidance on the treatment of public-private partnerships.

9. Taxes on holding gains continue to be shown as current taxes on income and wealth

Reference: chapter 8, paragraph 8.61

A3.150 The 2008 SNA recommends that taxes on holding gains continue to be shown as current taxes on income and wealth even though the tax base (the realized holding gains) is not included in the SNA definition of income. It recommends that where possible and relevant, it should be shown as a separate subcategory.

G. Harmonization between concepts and classifications of the SNA and *BPM6*

1. Centre of predominant economic interest as the basic criterion for determining the residence of the unit

Reference: chapter 4, paragraph 4.10

A3.151 With globalization, an increasing number of institutional units have connections to two or more economies. The 2008 SNA and *BPM6* use the concept of "centre of predominant economic interest" as the basic criterion for determining whether or not an entity is a resident in an economic territory.

A3.152 The *1993 SNA* recommended the centre of economic interest as the criterion to determine the residence of institutional units but did not give guidance on the treatment of the residence of individuals having several international residences where they may remain for short periods.

2. Individuals changing residence

Reference: chapter 26, paragraphs 26.37 to 26.39

A3.153 The 2008 SNA confirms that when persons change their country of residence, there is no change of ownership of the non-financial assets, financial assets and liabilities owned by those persons. All that is required is a reclassification of the appropriate country of residence of the (economic) owner of these items. The changes should be recorded in the other changes in the volume of assets account and not as capital transfers.

A3.154 The *1993 SNA* did not offer specific guidance on the treatment of flows of goods and changes in the financial account arising from a change in residence of individuals.

3. Goods sent abroad for processing are recorded on change of ownership basis

Reference: Chapter 6, paragraphs 6.85 to 6.86 and chapter 14, paragraphs 14.37 to 14.42

A3.155 The 2008 SNA recommends that imports and exports should be recorded on a strict change of ownership basis. That is, flows of goods between the country owning the goods and the country providing the processing services should not be recorded as imports and exports of goods. Instead the fee paid to the processing unit should be recorded as the import of processing services by the country owning the goods and an export of processing services by the country providing it.

A3.156 The same treatment is recommended for recording the goods of one establishment sent for processing to another establishment of the same enterprise within the same economy when the receiving establishment does not take on responsibility for the consequences of the continuation

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

of the production process. In such a case, the only output of the establishment receiving the goods is providing the processing services.

A3.157 The *1993 SNA* treated goods that were sent abroad for processing and then returned to the country from where they were dispatched as undergoing an effective change of ownership. The goods were therefore recorded in exports when they left the first country and again in imports when they returned to the country. The country undertaking the processing was shown as producing goods that were recorded at their full value, even though the processor never had to pay for the value of the goods on entry.

4. Merchanting

Reference: chapter 14, paragraphs 14.73.

A3.158 Merchanting is defined as the purchase of a good by a resident (of the compiling economy) from a non-resident and the subsequent resale of the good to another non-resident, without the good entering the merchant's economy. The 2008 SNA recommends that goods acquired by global manufacturers, wholesalers and retailers and those cases of commodity dealing being settled in the commodity should be recorded as negative exports on acquisition and positive exports on disposal. The difference between the two appears in exports of goods but appears as the production of a service in the merchant's economy, analogous to trade margins applied to domestically traded goods. In the case where goods are acquired in one period and not disposed of until a subsequent period, they should appear in changes in inventories of the merchant even though these inventories are held abroad.

A3.159 The *1993 SNA* did not give guidance on the treatment of merchanting.

H. A check-list of changes in each chapter

1. Introduction

A3.160 The purpose of this section of the chapter is to list the issues affecting each of the chapters of the 2008 SNA relative to the text in the *1993 SNA*. There is no intention to give a detailed list of the impact of these changes, simply to itemize which items affect the previous text.

A3.161 Nothing is shown for chapters 1 and 2. Chapter 1, the introduction, is largely unaffected by the details of the changes. Chapter 2, the overview, effectively includes all of the changes that appear later.

A3.162 Chapters 3 to 13 correspond to chapters of the same number in the *1993 SNA*. Changes to those chapters are presented but not the main thrust of the chapters, assuming this is familiar to readers. Chapters 14 to 29 are reordered or contain new material or both. Lists of changes, where appropriate, and a brief synopsis of the coverage of these chapters are provided.

A3.163 References to chapters and annexes of the *1993 SNA* use Roman numerals, as in that publication. Chapters and annexes referenced by Arabic numerals relate to the 2008 SNA.

Chapter 3: Stocks and flows and accounting rules

- The major issue here is the introduction of the distinction between economic and legal ownership.

Chapter 4: Institutional units and sectors

- The description of residence is not changed in substance but wording has been used so that this concept is described in exactly the same way in the SNA and *BPM6*.
- Figure 4.1 is introduced to show in the form of a flow chart how institutional units are allocated to sectors.
- Both financial and non-financial corporations are now disaggregated to show non-profit institutions as separate subsectors to facilitate the derivation of a satellite account for NPIs.
- A similar distinction is made for general government were NPIs may also be separately identified.
- The text makes clear the difference between a head office and a holding company to clarify the situation where a head office is loosely described as a holding company.
- There is a section on special purpose entities making clear the sorts of considerations that need to be taken into account in order to classify them appropriately.
- The 2008 SNA avoids the expression "ancillary corporation" that was referred to in the *1993 SNA* and was the cause of some confusion.
- There is new text to identify a set of indicators which can be used to determine whether the government controls corporations and non-profit institutions.
- There has been an extension and refinement of the subsectors of financial corporations.
- At the end of the chapter there is a brief reference to central banks of currency boards.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Chapter 5: Enterprises establishments and industries.

- Text referring to enterprises that are horizontally integrated is now consistent with *ISIC* Rev.4.
- On vertically integrated enterprises, the SNA recommends identifying establishments where *ISIC* simply classifies the enterprise as a whole to the principal activity contributing largest share to the value added.
- There is new and more extensive discussion on ancillary activities.

Chapter 6: The production account

- The term “knowledge-capturing products” has been introduced to cover those items that have some of the characteristics of goods and some of the characteristics of services.
- Reference is made to the non-observed economy. There is more extensive discussion on this in chapter 25.
- The text describes the revised treatment of deliveries between establishments of the same enterprise or indeed between different enterprises depending on whether there is a transfer of economic ownership and the degree of risk involved in further processing. (This is the domestic equivalent to goods sent abroad for processing.)
- The three-way distinction of production is now referred to as market production, production for own final use and non-market production.
- When output for own final use for market producers is estimated by the sum of costs it should now include a return to fixed capital.
- There is more discussion on how to measure output that takes a long time to complete.
- There is greater clarification on how to measure storage and how to identify when this is a productive activity rather than a holding gain. This subject is elaborated in an annex to chapter 6.
- There is more extensive discussion on how to measure the output of central banks.
- The treatment of financial services is treated in more detail in chapter 6 and in even greater detail in part 4 of chapter 17. Some of the developments since the publication of the *1993 SNA* on the treatment of financial intermediation service charges indirectly measured (FISIM) have been incorporated in the text.
- Revised text is available on the treatment of insurance taking account of the results of the task force on this subject.
- Similarly there is a revised treatment on reinsurance.
- There is discussion of how the output associated with the issuing of standardized guarantees should be treated.
- Research and development is no longer treated as intermediate consumption but in most cases as fixed capital formation.
- New text is presented on the appropriate treatment on originals and copies following the recommendations or of the Canberra group.
- Weapons systems are a new classification item within gross fixed capital formation.
- In describing consumption of fixed capital it is in now recommended that asset-specific prices should be used rather than a general deflation index to estimate the declining value of assets. The process of estimating consumption of fixed capital should be linked to estimates of capital stock. This subject is taken further in chapter 20.

Chapter 7: The distribution of income accounts

- The entrepreneurial accounts and thus the allocation of other primary income account are now restricted to financial and non-financial corporations.
- References to measures of employment have been updated to include the recommendations of the International Conference of Labour Statisticians (ICLS) that was held in late 2008.
- There are significant changes to the measurement of social contributions. The first of these is that the distinction is made between contributions relating to pensions and those relating to other benefits. Further, the fact that pension entitlements are now recorded in some cases even when there is no fund set aside to meet the needs has consequences for the measurement of social contributions.
- Investment income now includes the earnings on investment funds.
- Within taxes on production, taxi and casino licences are now included.
- Within property income, a new subheading of investment income has been introduced parallel to that used in *BPM6*.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

- The concept of the resource lease is introduced in relation to the payment of rent.
- The possibility of implicit taxes and subsidies being recorded in respect of interest rates charged and paid by central banks is introduced.
- The treatment of super dividends and withdrawals from income for both corporations and quasi-corporations has been rationalized. In connection with this, the term retained earnings has been introduced explicitly for all enterprises.
- The treatment for the investment income deemed payable under pensions is now changed in the case of defined benefit schemes to cover the whole of the increase in the entitlement regardless of whether such income is actually earned by the pension fund unit responsible.

Chapter 8: The redistribution of income accounts

- The changes relating to social contributions mentioned in connection with chapter 7 carry through to chapter 8.
- Within transfers there is explicit mention of household remittances payable to and receivable from individuals working abroad.
- The disaggregation of social transfers in kind has been simplified.

Chapter 9: The use of income accounts

- The distinction between individual and collective services has been changed to follow the changes made to the COFOG classification.
- It has been recognized that it is possible for NPISHs to have collective consumption though no excessive efforts should be made to try to identify such instances.

Chapter 10: The capital account

- Non-produced assets are distinguished into three categories: natural resources; contracts, leases and licences; and purchased goodwill and marketing assets.
- Improvements to land are treated as a fixed asset separately from the natural asset that represents the value of the land in its unchanged state.
- On costs of ownership transfer, there is clarification on the treatment of terminal costs and the time over which consumption of fixed capital of ownership costs should be written down.
- Information, computer and telecommunications equipment is introduced as a new category of gross fixed capital formation.
- Weapons systems are introduced as a new category.
- Intellectual property products are introduced as a new category.
- Research and development is now treated as fixed capital formation in most cases.
- The title for mineral exploration has been changed to include evaluation in line with data availability according to IASB recommendations.
- There has been a change to the software heading that now includes databases explicitly and greater clarification about when databases are included.
- Within inventories, a new category of military inventories is included.
- There is greater clarification on the treatment of contracts, leases and licences and a further explanation of this appears in part 5 of chapter 17.
- There is greater clarification on the measurement and inclusion of purchased goodwill and marketing assets.

Chapter 11: The financial account

- There is a changed treatment of monetary gold and of metal accounts in general.
- Liabilities are now recognized for SDRs.
- Within the new classification of financial assets, a category is introduced for inter-bank positions.
- A revised treatment of index-linked securities when they are linked to a narrow index has been introduced.
- Two items relating to investment funds have been introduced.
- Insurance technical reserves are increased to include pension entitlements even where there is no fund, possible claims on the manager of the pension fund and reserves for standardized guarantees.
- Employee stock options are included in a class along with financial derivatives.
- There are recommended memorandum items in respect of non-performing loans.

Chapter 12: The other changes in assets accounts

- A new classification of all the volume changes is presented each of which can be applied to any class of assets making the transition from one balance sheet to another simpler.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

- It is clarified that the only losses in inventories that appear in the other volume change account are those that are irregular. Even if the losses are very large, if these appear on a regular basis they are to be recorded as withdrawals from inventories.

Chapter 13: The balance sheet

- The concept of an asset account is presented in this chapter. Previously it appeared only in chapter 2.
- There is greater description of the possible ways to establish the valuation of equity.
- The flow of funds analysis has been moved to chapter 27.

Chapter 14: The supply and use tables and goods and services account

- The material here contains some from the previous chapter XV. The rest is covered in chapter 28.
- There is significant reformulation of the text in this chapter.
- There is a greater description of how transport charges are to be recorded in a supply and use table and how they affect producer and purchaser prices.
- The revised treatments for intra-enterprise deliveries and goods sent abroad for processing have major consequences for this chapter.
- There is a description of deflation of supply and use tables.

Chapter 15: Price and volume actions

- In the *1993 SNA*, chapter XVI was concerned with prices and volumes. The present chapter includes significant revisions in the light of the various manuals that have been issued since 1993, those on consumer prices, producer prices, import and export prices and the revised International Comparison Program manuals.
- The chapter includes text on the application of price indices to deflating national accounts.

Chapter 16: Summarizing and integrating the accounts

- This brings into the main run of chapters material previously only appearing in chapter II.

Chapter 17: Cross-cutting and other special issues

- This chapter replaces and extends in both the amount of detail and the range of subjects material included in annexes III and IV of the *1993 SNA*. It provides more detail on issues that were the subject of extensive consideration in the update. These subjects are:

a. insurance, including reinsurance and annuities;

b. social insurance schemes and in particular pensions including a supplementary table;

c. standardized guarantees;

d. financial services, showing where explicit and implicit charges are made on the complete set of financial instruments;

e. contracts, leases and licences, bringing together all aspects of such arrangements;

f. employee stock options.

Chapter 18: Elaborating and presenting the accounts

- Like chapter 16, this is new material about the synthesis of the accounts but concentrates mainly on practical issues.

Chapter 19: Population and labour inputs

- This chapter is based on the previous chapter XVII but is less dependent on flowcharts for explanation of different labour-related concepts.
- The consequences of the ICLS held in late 2008 are incorporated.
- There is a short section on volunteer labour.
- There is discussion of quality-adjusted labour inputs.
- There is a section on labour productivity.

Chapter 20: Capital services and the national accounts

- This is a new chapter in response to one of the items on the research agenda in the *1993 SNA*. It provides a non-technical introduction to the subject of capital services and the link to gross operating surplus. It suggests a supplementary table that may be included on an optional basis.

Chapter 21: Measuring corporate activity

- This is a new chapter discussing subjects such as mergers and acquisitions, globalization, the

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

consequences of financial distress and a link to commercial accounting. The material on mergers and acquisitions is drawn from *The Benchmark Definition of Foreign Direct Investment.*

Chapter 22: The general government and public sectors

- This is a new chapter aimed at providing a link to government finance statistics, debt and deficit procedures and external debt in so far as the public sector is concerned.
- The subject of the public sector was not discussed in the *1993 SNA.*
- More specific information is given on how to determine when government controls corporations and non-profit institutions.
- The concept of economically significant prices is discussed and the definition provided.
- A link is presented to the government finance presentation of accounts.
- The treatment of tax credits is made explicit.
- Debt operations are discussed.
- The recording of government guarantees is discussed.
- There is a discussion of how the relationship between government and corporations should be recorded in the case of financial distress.
- Public-private partnerships are discussed.

Chapter 23: Non-profit institutions

- This also is a new chapter which provides a link between the SNA and the handbook on satellite accounts of the non-profit institutions.

Chapter 24: The household sector

- This provides an elaboration of the question of subsectoring households.
- It discusses some aspects of household production in detail.

Chapter 25: Informal aspects of the economy

- This item was also part of the research agenda of the *1993 SNA.*
- The chapter covers two themes, the non-observed economy and the informal sector. The latter follows the ILO initiative with emphasis on informal employment as well as on production. The subject remains on the research agenda.

Chapter 26: The rest of the world accounts and links to the balance of payments

- This chapter replaces the previous chapter XIV and annex II of the *1993 SNA*. It has been revised to be consistent with *BPM6*. There has been extensive collaboration in the drafting of *BPM6* and the SNA so that in many cases exactly the same wording is used in both manuals.
- *BPM6* introduces a new set of accounts closer to the SNA sequence of accounts making the bridge tables simpler from the SNA perspective.
- The functional categories of *BPM6*, direct investment, portfolio investment, financial derivatives, other investment and reserve assets, are introduced.

Chapter 27: Links to monetary statistics and the flow of funds

- Some of this text was in the previous chapters XI and XII but is expanded to show the connection with monetary and financial statistics.
- The flow of funds accounts are discussed here.

Chapter 28: Input-output and other matrix-based analysis

- This draws on the previous chapter XX and a research agenda item on the matrix presentation. It also draws on material in the Eurostat manual on input-output tables available only in 2008.
- The chapter includes the sector breakdown of the material in the supply and use table in order to provide a link to the sequence of accounts.

Chapter 29: Satellite accounts and other extensions

- The material in this chapter is drawn in part from the previous chapters XVIII, XIX and XXI. It also includes new material on satellite accounts that have been developed or revised since 1993.

2. Annexes and other items

A3.164 Annexes 1 and 2 correspond to the previous annex V.

A3.165 The present annex, annex 3, corresponds with the previous Annex I.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

A3.166 Annex 4 is new and includes information on the research agenda that was included in the front matter of the *1993 SNA*.

A3.167 There is a list of references included in the 2008 SNA; no external references were provided in the *1993 SNA*.

A3.168 The glossary is included with the publication instead of being a separate document.

A3.169 More information on the revision process is available on the United Nations Statistics Division website and further information about developments on the research agenda will be posted there.

Annex 4: Research Agenda

A. Introduction

A4.1 The SNA is designed to give a realistic and compact view of the economy that is suitable for policy and analytical use. As the economy changes and policy and analytical needs evolve, the SNA must be reviewed to see if it is still relevant for these purposes. The most obvious example of a change in economic conditions that provokes a re-assessment of the adequacy of the national accounting framework is the financial crisis that evolved from late 2008 onwards. Luckily, it was possible to make this assessment before this publication was finished and only minor changes were found necessary in addition to those already proposed for the update, in particular the treatment of standardized guarantees. It had originally been proposed that these should apply only to loans; the events of the crisis suggested this should be applied to a wider range of financial instruments.

A4.2 It is unusual for economic perspectives to change so quickly and so dramatically as was the case in 2007-08. However, there are always some emerging features that may cause national accountants to re-assess their current methodology. One example is the introduction of tradable emission permits as one step to combat global warming. How to record transactions in them is not fully addressed in the 2008 SNA, and given their rapid uptake and the large values concerned it is clear that this shortcoming needs to be remedied quickly.

A4.3 While the 2008 SNA addresses some of the issues connected with globalization, such as the changed treatment of goods for processing in response to increased outsourcing of services, it is clear that there may be other aspects of this trend that may lead to a reconsideration of how the phenomenon is reflected in the accounts. One possibility is alternative, supplementary, presentations of multinational enterprises based on alternative definitions of residence and ownership.

A4.4 It is not possible to expect to capture all the issues that will arise even in the near future. The objective of this chapter is to list those that have emerged in the course of the present revision but where more extensive consideration is needed than was possible in the course of the revision. Some may result not in changes to the SNA but simply greater clarification of some points. This list will be kept on the United Nations Statistics Division website and updated as new items emerge and those recommendations on existing items are agreed.

A4.5 In assessing the priority to be given to an item, three questions need to be addressed.

a. How urgent and important is the topic to ensure that the SNA continues to be relevant to the users?

b. How widespread are the consequences of change and how complicated will implementation be?

c. Is the topic completely new or has much of the preparation for considering the item been completed?

The process of selecting items for investigation is one that will involve widespread consultation and involvement of both compilers and users in the review process.

A4.6 All attempts to update the SNA, including the experience of the 1993 and 2008 revisions, show that it is very difficult to update only parts of the system because of the integrated nature of the accounting rules. The list of issues that follows is grouped broadly by subject area but it should be recognized at the outset that each is likely to have consequences beyond the subject heading.

A4.7 The topics identified to date have been grouped into four broad headings. These are:

a. Basic accounting rules;

b. The concept of income;

c. Issues concerning financial instruments;

d. Issues involving non-financial assets.

Each of these is the subject of one of the following sections.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

B. Basic accounting rules

1. The relationship of SNA and IASB

A4.8 The International Accounting Standards Board is an independent, privately funded accounting standard-setter. The Board members come from nine countries and have a variety of functional backgrounds. The IASB is committed to developing, in the public interest, a single set of high quality, understandable and enforceable global accounting standards that require transparent and comparable information in general purpose financial statements.

A4.9 The IASB works with national commercial accounting standard-setters to achieve convergence in accounting standards around the world. Nearly one hundred countries currently require or permit the use of IFRSs (International Financial Reporting Standards) or have a policy of convergence with them. The development of IFRSs reflects the changing needs and circumstances of the global economy in ways that can be directly relevant to the use and requirements of the SNA. The adoption of IFRSs by corporations can have a major impact on corporate accounting and the data available from corporate accounts.

A4.10 The IASB works in a three-stage process to develop a new standard. The first is a draft with an invitation to comment (ITC); the second is an exposure draft (ED) also inviting comment; the third is the new standard. At each stage the background to the issue is clearly explained and the reasons are given for the choice recommended. In both the first two stages comments are invited from any interested party. The development of a regular dialogue between the national accounts community and the IASB would be a way to assure the needs of national accountants were represented to the IASB and national accountants were aware of the possible developments in the data sources. Already during the 2008 revision consultation of IASB standards and their counterpart for public accounting standards (the International Public Sector Accounting Standards Board, IPSASB) has been extremely beneficial. It is therefore desirable that a dialogue be established and maintained with the IASB with a view to amending the SNA to follow new accounting standards when appropriate.

A4.11 One area of developing interest in international accounting, relating back to the question of multinational enterprises, is that of mergers and acquisitions. The text in chapter 21 draws on information in the OECD *Benchmark Definition of Foreign Direct Investment.* IASB work in this area should be monitored to see if these recommendations need amending.

2. Consolidation of enterprise groups

A4.12 Many enterprises operating within an economy are linked with other enterprises by complete or partial common ownership and a shared management structure to form an enterprise group. Enterprises also often share common ownership and management with foreign affiliates. It is common for enterprises within an enterprise group to trade with each other, sometimes exclusively, as when they perform an intermediate stage in a vertically integrated production process, and share the outputs and costs of ancillary production. They may also share the outputs and costs of research and development activities. Given their close ties it may be sometimes desirable to consider an enterprise group as a single entity and to consolidate the accounts of its members. (This is already the practice in some other statistics such as AMNE, FATS and Bank for International Settlements (BIS) consolidated presentations.) Members of an enterprise group are usually engaged in different activities and sometimes in more than one sector, and so consolidation could affect aggregates, such as industry value added, and sectoral balance sheets. It is therefore probable that the most likely way forward would be by way of supplementary tables.

A4.13 Separate consideration needs to be given to the case where some parts of the group are non-resident.

3. Trusts

A4.14 The SNA recommends that trusts be treated as quasi-corporations. In some cases, though, when one is used in effect as an SPE for a corporation, it is not considered to be a separate institutional unit but is merged with its parent, so long as they are both resident in the same economy.

A4.15 No detailed description of trusts is given, though some may be owned by households and NPIs as well as by corporations. Further clarification on the nature of trusts and when their assets should be treated as belonging to separate units and when merged with the assets of their owners would be helpful.

4. Final consumption of corporations

A4.16 In the SNA, no final consumption is recorded for corporations because corporations are not considered to be final users of goods and services, except for capital products which, with the exception of valuables, are acquired for the purpose of production. However, large corporations often undertake sponsorship of cultural and sporting events. To date, the SNA regards the payments involved as a form of advertising but it could be argued that they are a form of individual consumption and could be treated as final consumption expenditure of corporations and social transfers in kind to households. Further, by imposing regulations such as environmental standards, the government may achieve the same effect as if they levied taxes and spent the income on environmental protection, which would be treated as collective consumption. There may thus be instances where it would be more appropriate to record some expenditures by corporations as final consumption.

5. Measuring the output of government services

A4.17 The SNA recommends that the value of non-market production provided without charge, or at prices that are not economically significant, should be estimated as the sum of the costs of production (paragraphs 6.128 to 6.132). The basis for this recommendation is the lack of market

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

prices for non-market production. However, there is continuing research on trying to find alternative ways to measure the output of government.

6. The treatment of social transfers in kind to the rest of the world

A4.18 In the SNA, social transfers in kind only take place between government units, NPISHs and households. Paragraph 8.141 explains that it is assumed that the amount of social transfers in kind payable to the rest of the world are probably negligible and, in any case, are offset by similar benefits receivable from the rest of the world. In some cases, these assumptions may be inappropriate and an explicit way of recording these could be elaborated. Such an elaboration would have to consider the consequences of having a difference between total consumption expenditure and total actual consumption.

7. Output of central banks: taxes and subsidies on interest rates applied by central banks

A4.19 The treatment and measurement of the output of central banks is described in paragraphs 6.150 to 6.151. Three broad groups of financial services are identified: monetary policy services, financial intermediation and borderline cases.

A4.20 One of the borderline cases arises when the financial intermediation of central banks includes policy measures, such as setting interest rates higher or lower than market interest rates. This generates a number of issues. The first is how to measure the output of the central bank, because the use of off-market interest rates by the central bank may cause distortions in measuring its output and value added. The second issue concerns the use of off-market rates which implies that there are flows between the central bank and the counter-party in addition to those concerned with financial intermediation.

8. The treatment of establishments in the SNA

A4.21 At the present there are two reasons to have the concept of establishment within the SNA. The first of these is to provide a link to source information when this is collected on an establishment basis. In cases where basic information is collected on an enterprise basis, this reason disappears. The second reason is for use in input-output tables. Historically, the rationale was to have a unit that related as far as possible to only one activity in only one location so that the link to the physical processes of production was as clear as possible. With the change of emphasis from the physical view of input-output to an economic view, and from product-by-product matrices to industry-by-industry ones, it is less clear that it is essential to retain the concept of establishment in the SNA.

9. The inclusion of international organizations in the SNA

A4.22 In the SNA, international organizations are treated as units that are resident in the rest of the world (paragraphs 4.173 to 4.175). It would in principle be possible to treat international organizations as a standard subset of the rest of the world and indeed to compile a full set of accounts for them.

C. The concept of income

1. Clarification of income concept in the SNA

A4.23 As discussed in paragraph 8.24, the concept of income in the SNA differs from that generally understood in economics. In particular, holding gains and losses are not considered to form part of income in the SNA. It is not only economic theory that treats holding gains and losses as income, but also business accounting standards. The SNA excludes holding gains and losses from production and then extends this to an exclusion from most income flows, though not interest which continues to be recorded in nominal terms. A thorough review of the concept of income in the SNA, including the implications for all property income flows would be beneficial. Some particular aspects are covered in some of the following items.

2. GDP at basic prices

A4.24 Gross domestic product (GDP) is equal to the sum of the gross value added of all the institutional units resident in a territory engaged in production (that is, gross value added at basic prices) plus any taxes, minus any subsidies, on products not included in the value of their outputs. GDP is also equal to the sum of final expenditures minus expenditures on imports by institutional units resident in a territory. The “natural” valuation of the production measure of GDP is basic prices, while the “natural’ valuation of the expenditure measure of GDP is market prices. In the SNA it is the production measure that is adjusted (by adding taxes less subsidies on products) to achieve consistency. Implicit in this is the idea that taxes less subsidies on products are a form of income and not just a form of redistribution of income.

A4.25 If it were decided to value GDP at basic prices then the sequence of accounts would need to be modified, and there are various possibilities as to how this might be done. This might lead to showing the two primary functions of government, production of non-market services and redistribution of national income, separately.

3. The role of taxes in the SNA

A4.26 As just noted, taxes on products are treated as a form of income in the SNA. Most economists, however, tend to regard these as taxes on consumption. This category does

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

not exist in the SNA and nor does consumer subsidies. Taxes on financial transactions (such as taxes on issue, purchase, and sale of securities) are treated as taxes on production even though there is often no service involved. It may be appropriate to review the SNA treatment of all taxes and subsidies to ensure that these accord with users' understanding and need, or if not that the rationale for any differences is made quite explicit and prominent.

4. Life insurance

A4.27 At present in the SNA there is an inconsistency between the treatment of property income accruing to pension beneficiaries under a defined benefit scheme and other forms of life insurance. For the pension beneficiaries, the amount of property income ascribed to them matches the increase in their claims with no reduction of property income made according to whether the source of funding is from holding gains or not. For life insurance policies, insurance companies retain part of the holding gains made on reserves belonging to the policyholders but this retention is not treated as part of the fee charged by insurance companies. Thus there may be an understatement of the output of insurance companies. This question needs addressing and also the appropriate treatment when holding losses occur.

5. Reinvested earnings

A4.28 The SNA recommends that the retained earnings of a foreign direct investment enterprise should be treated as if they were distributed to foreign direct investors in proportion to their ownership of the equity of the enterprise. These earnings are then reinvested by those owners as additions to equity in the financial account. This amount is in addition to any actual distributions made out of the distributable income. This approach is also adopted for the earnings of investment funds.

A4.29 It has been proposed that this treatment could be extended to other types of unit, particularly public corporations. If the attribution of retained earnings to the owners of corporations were adopted, it would mean that dividends would be replaced by reinvested earnings in the allocation of primary income account and this total less dividends actually paid would be shown as additions to (or in some case withdrawals from) equity in the financial account. This would mean that distribution of earnings from corporations was measured on a strict accrual basis but would also mean that the saving of corporations would always be zero. Such a change would have serious implications for interpretation of the accounts since it would be built on a different paradigm from the current treatment of dividends and corporate saving.

6. Accruing interest in the SNA

A4.30 Through the 1990s and into the 2000s a vigorous discussion was conducted among the international statistical community about the appropriate way to record interest on securities such as bonds. Two general approaches were identified in the discussion, the so-called debtor and creditor approaches.

A4.31 The ISWGNA established an Electronic Discussion Group (EDG) in 1999 to obtain the views of a broad group of users and compilers on how macroeconomic statistics should record the accrual of interest on bonds and other tradable debt securities. The moderator of the EDG provided a report in October 2002 that concluded that while the participants to the EDG were strongly divided, the majority were in favour of the debtor approach. The ISWGNA subsequently considered the report and supported its conclusion. It then made a recommendation to the UNSC proposing that the SNA should recommend the debtor approach and the UNSC agreed. The recommendation and descriptions of the two approaches can be found in paragraphs 17.252 to 17.254.

A4.32 Discussion of certain update issues, including the treatment of concessional loans, non-performing loans, interest on index-linked debt securities and interest in arrears, showed that the debtor/creditor debate has implications beyond the recording of interest on securities. A full consideration of the definition of income in the SNA would have to reconsider this issue.

7. Calculation of FISIM

A4.33 The treatment of financial intermediation services indirectly measured (FISIM) is described in paragraphs 6.163 to 6.169. The SNA recommends that FISIM should be calculated with respect to a reference rate that contains no service element and reflects the risk and maturity structure of deposits and loans. Different reference rates may be needed for domestic and foreign financial institutions. The assumption behind the FISIM approach is that it is the service element, and not the interest flows, that reflect varying degrees of risk, with riskier clients paying a higher service charge. This assumption has been queried and is being investigated.

8. High inflation

A4.34 It has long been recognized that high inflation can distort measures of interest, since a portion is required simply to counteract the real holding losses that occur for financial instruments that are not indexed for inflation. By the 1970s, when inflation was an important problem throughout much of the world, the treatment of interest under high inflation was considered an important issue for national accounts. However, contrary guidance is given by Annex B to chapter XIX of the *1993 SNA* and chapter 7 of *Inflation Accounting - A manual on National Accounting under Conditions of High Inflation* (Organisation for Economic Co-operation and Development, 1996). It is therefore recommended that the search for a single universally accepted treatment of interest under high inflation remains on the research agenda.

9. The measurement of neutral and real holding gains and losses

A4.35 The SNA recommends the nominal holding gains and losses recorded in the revaluation account should be decomposed into neutral and real holding gains and losses. In paragraph 12.85, the use of a comprehensive price index covering as wide a range of goods, services and assets as

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

possible is recommended. Some national accountants have suggested that different price indices should be used for different classes of asset. The full impact of this suggestion requires investigation.

10. Income arising from assets

A4.36 The introduction of capital services into the SNA recognizes that part of value added is due to the contribution of fixed assets and other non-financial assets to the income generated by production. A question has been raised about whether some part of value added should also be attributable to the financial resources available to the producer.

11. Income from activities undertaken on an informal basis

A4.37 Establishing the connection between the work on the informal sector and the SNA was an important contribution of the 2008 update to the SNA. Interest in this area continues to attract considerable attention especially in developing countries. It is desirable that there should be continuing involvement of national accountants with the work of the Delhi Group and other initiatives in this field.

D. Issues involving financial instruments

1. Issues arising from a financial crisis

A4.38 As noted in the introduction, a financial crisis provides a crucial test of the robustness of the SNA and the adequacy of its recommendations in situations not encountered since the SNA was first adopted. Until all the consequences of the situation in 2008 are revealed, and indeed thereafter, there will be a need to continue to examine the steps taken in response to the crisis to ensure both the steps and their consequences are adequately captured in the national accounts.

2. Recognition of social security entitlements as liabilities

A4.39 As discussed in part 2 of chapter 17, social security entitlements are not recorded in the main accounts but they are shown in a supplementary table along with the pension entitlements of some other pension schemes managed by general government. Provisional criteria for determining whether the entitlements are shown in the main accounts or only in the supplementary table are described in paragraph 17.187. Work continues to refine these criteria and to find agreed methods to determine the value of these liabilities.

3. Wider use of fair value for loans

A4.40 The SNA recommends that the values of loans to be recorded in the balance sheets of both creditors and debtors should be at nominal value, that is, at the amounts of principal that the debtors are conceptually obliged to pay the creditors when loans mature. However, it is common for the fair value of loans to differ from the nominal value for a number of reasons. At present the SNA recommends memorandum items recording fair values only for loans specifically characterized as non-performing. The possibility of a more extensive use of fair value in place of nominal value could be considered.

4. Provisions

A4.41 In business accounting, there are three degrees of "promises": liabilities, provisions and contingent liabilities. Their definitions are the following.

a. A liability is a present obligation of the entity arising from past events, the settlement of which is expected to result in an outflow from the entity of resources embodying economic benefits or service potential.

b. A provision is a liability of uncertain timing or amount.

c. A contingent liability is a possible obligation that arises from past events and whose existence will be confirmed only by the occurrence or non-occurrence of one or more uncertain future events not wholly within the control of the entity.

A4.42 In the SNA, liabilities and provisions relating to financial instruments are generally recognized in the main accounts only if there is a corresponding financial asset of equal value held by a counter-party. However, it is recommended that certain provisions that do not satisfy this criterion, such as those for non-performing loans, should be recorded as memorandum items. Contingent liabilities are not recognized at all in the core accounts, except in the case of standardized guarantees.

A4.43 The problem is that recognition of a reduction in the value of an asset in the SNA necessarily implies a reduction in the corresponding liability but the asset holder may not wish to reveal to the counter-party the fact that they regard some of the claim as uncollectable. Not doing so however overstates the value of the assets.

5. Debt concessionality

A4.44 Further work is required to clarify whether concessional loans involve a subsidy on any service charge associated with interest payments or a transfer representing the difference between the market rate of interest and the agreed rate. If the latter, the next problem is whether the

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

transfer should be paid period by period on an ongoing basis as a current transfer or as a one-off capital transfer at the time the loan is issued.

6. Equity valuation and its implications

A4.45 At the moment there are a number of alternatives for valuing equity given in the SNA. There is a question about whether more standardized recommendations can be made.

7. Reverse transactions

A4.46 Work on a complex group of transactions known as reverse transactions has been pursued for several years. These transactions take their name from two common characteristics: (i) a commitment to reverse the transaction on a specified future date (or on demand), and (ii) that, although legal ownership is transferred to the purchaser, many of the risks and benefits of ownership remain with the original owner. Reversible transactions include repurchase agreements, securities lending without cash collateral, gold swaps, and gold loans/deposits.

E. Issues involving non-financial assets

1. Tradable emission permits

A4.47 Tradable emission permits are a relatively new phenomenon, but they are gaining rapidly in importance. The full treatment of all types of permits is not explicitly described in the SNA, and in order to remove uncertainty, this shortcoming should be addressed as quickly as possible.

2. Leases to use or exploit natural resources

A4.48 Part 5 of chapter 17 deals with the treatment of licences and permits to use a natural resource. Because the treatment for individual resources was developed independently there are some inconsistent treatments recommended.

A4.49 In the case of a natural resource that has an infinite life and whose use in production does not affect the nature or value of the asset, the owner may allow the resource to be used for an extended period of time in such a way that, in effect, the user controls the use of the resource during this time with little if any intervention from the legal owner. In the case of land, the SNA recommends that the agreement between the owner and the user constitutes a sale of the land. In the case of a lease of the radio spectrum, the SNA recommends that the permission to use the spectrum does not change the ownership of the spectrum but constitutes a non-produced asset under the heading contracts, leases and licences. In the case of permission to use the atmosphere or a water body as an environmental sink, the SNA recommends that the payment be treated as a tax.

A4.50 In the case of a natural resource that is subject to replenishment and which can be used indefinitely providing the use is restricted and the owner extends or withholds permission to continued use of the asset from one year to the next, payments by the user to the owner are recorded as rent. No adjustment is made to the value of rent recorded as to whether the use is in fact sustainable or not. If it were not sustainable, part of the payment should be seen as being compensation for the non-sustainable use.

A4.51 In the case of a natural resource that is not capable of replenishment on a human time-scale and the use in production eventually exhausts it, the owner may permit the resource to be used to extinction. In this case the SNA recommends that economic ownership of the natural resource remains with the lessor while the lessee pays royalties recorded as rent. Only the lessee and not the lessor undertakes production. This means that the reduction in the value of capital due to production is recorded in the balance sheet of the owner as an other change in volume of assets. The link between the rundown in the value of the assets and its use in production is lost. As in the previous case, the fact that part of the rent paid is compensation for the reduction in the value of the asset is not recognized.

3. Broadening the fixed asset boundary to include other intellectual property assets

Innovation

A4.52 The fixed asset boundary of the SNA has been expanded to include the output of research and experimental development (R&D) that meets the general definition of an asset. It is evident that R&D captures part, but not all, of the innovation process. It may exclude many expenditures by the production and engineering departments of an enterprise. These same departments may also be responsible for identifying a potential new product and referring it to the R&D department to develop the science behind it. In addition, an enterprise may incur other expenditures before a new product goes to market. These include market research to determine the demand for a new product and marketing expenditures to promote it.

Marketing assets

A4.53 Marketing assets include brand names, mastheads, trademarks, logos and domain names. Marketing is a key driver of brand value and big corporations invest heavily in building and supporting their brands by advertising, sponsorship and other measures to build a positive image with customers. The SNA treats marketing assets as being non-produced and the expenditures incurred in their creation as intermediate consumption. They appear in the balance sheet only when they are sold. The major reason for not treating marketing assets as fixed assets is due to the difficulty of measuring their value.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Human capital

A4.54 Apart from any staff training required in bringing a new product to market, innovation expenditures are disembodied from the people undertaking the innovation. Therefore they exclude to a large extent the "investment in human capital".

A4.55 Human input is the major input in most production processes, and the value of that input is to a large extent dependent on the knowledge that humans bring to the production process. It is well recognized that an educated population is vital to economic well-being in most countries. Despite the fact that there are major conceptual and practical problems with identifying the value of an educated labour force, there are repeated requests to address this issue within the SNA framework.

4. Costs of ownership transfer of valuables and non-produced assets

A4.56 The SNA draws a distinction between the costs of ownership transfer incurred in acquiring and disposing of non-financial assets on the one hand and financial assets on the other. Costs of ownership transfer incurred on transactions in non-financial assets are recorded as gross fixed capital formation, while costs of ownership transfer incurred on transactions in financial assets are recorded as intermediate consumption. The rationale for the different treatments is that non-financial assets are used in production and the income generated from production needs to be sufficient to cover the costs of using those assets, including costs of ownership transfer. Financial assets are not used in production and are held as stores of value, to earn property income or in the expectation of holding gains. It is also common for the ownership of financial assets and liabilities to change hands rapidly.

A4.57 Valuables are non-financial assets but they are held as stores of value and are not used in production. As such, they have more in common with financial assets than they do with other non-financial assets. Therefore, it is arguable that costs of ownership transfer on valuables should be recorded as intermediate consumption rather than, as at present, fixed capital formation.

A4.58 Costs of ownership transfer on fixed assets are not recorded separately but are added to the price paid by the purchaser and subtracted from the price received by the seller to obtain the acquisition and disposal values, respectively. The costs of ownership transfer on non-produced assets are recorded in a separate category of gross fixed capital formation. An exception is made in the case of land where costs of ownership transfer are treated by convention as land improvements.

A4.59 An overview and rationalization of these practices could be helpful.

5. Distinction between current maintenance and capital repairs

A4.60 The SNA draws a distinction between ordinary maintenance and repairs to fixed assets and major renovations, reconstructions or enlargements (see paragraphs 6.225 to 6.228), but acknowledges that the distinction is not clear-cut. The former are recorded as intermediate consumption and the latter as gross fixed capital formation.

A4.61 Major renovations or enlargements increase the performance or capacity of existing fixed assets or significantly extend the previously expected service life. Ordinary maintenance and repairs are required so that an asset can be utilized over the whole of the service life expected on acquisition. If the owner neglects maintenance and repairs, then the expected service life may be drastically reduced and unforeseen obsolescence must be recorded as an other volume change in the value of the asset.

A4.62 If the requirement for treatment as fixed capital were to prevent a reduction in service life, rather than necessarily extend it, the problem of the borderline between ordinary maintenance and major extensions would disappear and the problem that the consequences of the neglect of maintenance are not reflected in a reduction in net domestic product could be avoided.

6. Treatment of Private-Public Partnerships

A4.63 Public private partnerships (PPPs) are described in chapter 22. Further developments in their treatment in the SNA await the development and adoption of standards under development by the IASB and IPSASB. The ISWGNA is monitoring developments.

7. Transfer of ownership of an asset during its life

A4.64 Both the case where a natural resource is leased for an extended period of time and the case of PPPs are ones where the economic ownership of an asset effectively changes hands part way through its life. The terms of the arrangements are such that recompense from the initial user for the change of ownership to the second user is bundled into the arrangements for payments during the lease. The transfer of the ownership has to be recorded as an other change in the classification of assets and is not reflected in the production or distribution of income accounts. This is a deficiency that could be rectified by some elaboration of the concept of financial leasing.

Glossary

A

Acquisitions of goods and services by institutional units occur when they become the new owners of the goods or when the delivery of services to them is completed. 9.36

Activity see also principal activity, secondary activity, ancillary activity

Actual final consumption measures the amount of consumption goods and services acquired. 9.7

Actual final consumption of general government is measured by the value of the collective consumption services provided to the community, or large sections of the community, by general government. 9.117

Actual final consumption of households is measured by the value of all the individual consumption goods and services acquired by resident households. 9.116

Actual final consumption of NPISHs is measured by the value of the collective consumption services provided to the community, or large sections of the community, by NPISHs. 9.118

Actual premium see premium

Adjusted disposable income is the balancing item in the redistribution of income in kind account. It is derived from the disposable income of an institutional unit or sector by adding the value of the social transfers in kind receivable by that unit or sector and subtracting the value of the social transfers in kind payable by that unit or sector. 8.32

Ancillary activity An ancillary activity is a supporting activity undertaken within an enterprise in order to create the conditions within which the principal or secondary activities can be carried out. 5.36

Animal resources yielding repeat products cover animals whose natural growth and regeneration are under the direct control, responsibility and management of institutional units. 10.92

Asset An asset is a store of value representing a benefit or series of benefits accruing to the economic owner by holding or using the entity over a period of time. It is a means of carrying forward value from one accounting period to another. 3.5, 3.30, 10.8, 11.3

Asset boundary for fixed assets The asset boundary for fixed assets consists of goods and services that are used in production for more than one year. 10.33

Asset-backed securities and collateralized debt obligations are arrangements under which payments of interest and principal are backed by payments on specified assets or income streams. 11.67

B

Balance of primary incomes The balance of primary incomes is defined as the total value of the primary incomes receivable by an institutional unit or sector less the total of the primary incomes payable. 7.18

Balance sheet A balance sheet is a statement, drawn up in respect of a particular point in time, of the values of assets owned and of the liabilities owed by an institutional unit or group of units. 13.2

Balancing item A balancing item is an accounting construct obtained by subtracting the total value of the entries on one side of an account (resources or changes in liabilities) from the total value of the entries on the other side (uses or changes in assets). It cannot be measured independently of the entries in the accounts. As a derived entry, it reflects the application of the general accounting rules to the specific entries on the two sides of the account. 3.9

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Banker's acceptance A banker's acceptance involves the acceptance by a financial corporation, in return for a fee, of a draft or bill of exchange and the unconditional promise to pay a specific amount at a specified date. 11.68

Barter A barter transaction is one where one basket of goods and services is exchanged for another basket of different goods and services without any accompanying monetary payment. 9.49

Basic price The basic price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any tax payable, and plus any subsidy receivable, by the producer as a consequence of its production or sale. It excludes any transport charges invoiced separately by the producer. 6.51

Bills are defined as securities that give the holders the unconditional rights to receive stated fixed sums on a specified date. 11.64

Bonds and debentures are securities that give the holders the unconditional right to fixed payments or contractually determined variable payments, that is, the earning of interest is not dependent on earnings of the debtors. 11.64

Boundary see production boundary, asset boundary

Buildings other than dwellings include whole buildings or parts of buildings not designated as dwellings. Fixtures, facilities and equipment that are integral parts of the structures are included. 10.74

C

Capital taxes consist of taxes levied at irregular and infrequent intervals on the values of the assets or net worth owned by institutional units or on the values of assets transferred between institutional units as a result of legacies, gifts inter vivos or other transfers. 10.207

Capital transfers are unrequited transfers where either the party making the transfer realizes the funds involved by disposing of an asset (other than cash or inventories), relinquishing a financial claim (other than accounts receivable) or the party receiving the transfer is obliged to acquire an asset (other than cash) or both conditions are met. 8.10, 10.19

Captive financial institutions and money lenders consist of institutional units providing financial services, where most of either their assets or liabilities are not transacted on open financial markets. 4.113

Central bank The central bank is the national financial institution that exercises control over key aspects of the financial system. 4.104

Changes in inventories are measured by the value of the entries into inventories less the value of withdrawals and less the value of any recurrent losses of goods held in inventories during the accounting period. 10.118

Changes in net worth due to nominal holding gains/losses is defined as the algebraic sum of the positive or negative nominal holding gains on all the assets and liabilities of an institutional unit. 12.77

Changes in net worth due to saving and capital transfers represent the positive or negative amount available to the unit or sector for the acquisition of non-financial and financial assets. 10.21

Claim A claim (benefit) is the amount payable to the policy holder by the direct insurer or reinsurer in respect of an event covered by the policy occurring in the period for which the policy is valid. 6.187, 17.5

Claims outstanding cover claims that have not been reported, have been reported but are not yet settled or have been both reported and settled but not yet paid. 6.187, 17.5

Collective consumption service A collective consumption service is a service provided simultaneously to all members of the community or to all members of a particular section of the community, such as all households living in a particular region. ... 9.4

Compensation of employees is defined as the total remuneration, in cash or in kind, payable by an enterprise to an employee in return for work done by the latter during the accounting period. 7.5

Computer software consists of computer programs, program descriptions and supporting materials for both systems and applications software. 10.110

Consumer durable A consumer durable is a good that may be used for purposes of consumption repeatedly or continuously over a period of a year or more. 9.42

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Consumption good or service A consumption good or service is defined as a good or service that is used (without further transformation in production as defined in the SNA) by households, NPISHs or government units for the direct satisfaction of individual needs (or wants) or for the collective needs of members of the community. 9.2

Consumption of fixed capital is the decline, during the course of the accounting period, in the current value of the stock of fixed assets owned and used by a producer as a result of physical deterioration, normal obsolescence or normal accidental damage. 6.240, 10.25

Consumption of goods and services is the act of completely using up the goods and services in a process of production or for the direct satisfaction of human needs or wants. 9.39

Consumption The activity of consumption consists of the use of goods and services for the satisfaction of individual or collective human needs or wants. 9.39

Contracts, leases and licences are treated as assets only when both the following conditions are satisfied. The terms of the contract, lease or licence specify a price for the use of an asset or provision of a service that differs from the price that would prevail in the absence of the contract, lease or licence. One party to the contract must be able legally and practically to realize this price difference. 10.16, 10.186

Corporation The term corporation covers legally constituted corporations and also cooperatives, limited liability partnerships, notional resident units and quasi-corporations. 4.7

Costs of ownership transfer The costs of ownership transfer consist of the following kinds of items (i) All professional charges or commissions incurred by both units acquiring or disposing of an asset such as fees paid to lawyers, architects, surveyors, engineers and valuers, and commissions paid to estate agents and auctioneers. (ii) Any trade and transport costs separately invoiced to the purchaser, (iii) All taxes payable by the unit acquiring the asset on the transfer of ownership of the asset. (iv) Any tax payable on the disposal of an asset. (v) Any delivery and installation or disinstallation costs not included in the price of the asset being acquired or disposed of. (vi) Any terminal costs incurred at the end of an asset's life such as those required to render the structure safe or to restore the environment in which it is situated. 10.51

Credit derivatives are financial derivatives whose primary purpose is to trade credit risk. 11.123

Cross-country interest rate swap A cross-currency interest rate swap, sometimes known as a currency swap, involves an exchange of cash flows related to interest payments and an exchange of principal amounts at an agreed exchange rate at the end of the contract. 11.121

Cultivated biological resources cover animal resources yielding repeat products and tree, crop and plant resources yielding repeat products whose natural growth and regeneration is under the direct control, responsibility and management of an institutional unit. 10.88

Currency consists of notes and coins that are of fixed nominal values and are issued or authorized by the central bank or government. 11.52

Current international cooperation consists of current transfers in cash or in kind between the governments of different countries or between governments and international organizations. 8.128

Current taxes on capital consist of taxes that are payable periodically, usually annually, on the property or net wealth of institutional units, excluding taxes on land or other assets owned or rented by enterprises and used by them for production, such taxes being treated as other taxes on production. 8.63

Current taxes on income, wealth, etc. consist mainly of taxes on the incomes of households or profits of corporations and of taxes on wealth that are payable regularly every tax period (as distinct from capital taxes levied infrequently). 8.15

Current transfer A current transfer is a transaction in which one institutional unit provides a good, service or asset to another unit without receiving from the latter any good, service or asset directly in return as counterpart and does not oblige one or both parties to acquire, or dispose of, an asset. 8.10

Current transfers between households consist of all current transfers made, or received, by resident households to or from other resident or non-resident households. 8.133

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Current transfers to NPISHs consist of transfers received by NPISHs from other resident or non-resident institutional units in the form of membership dues, subscriptions, voluntary donations, etc. whether made on a regular or occasional basis. ... 8.132

Current transfers within general government consist of current transfers between different government units. 8.126

D

Databases consist of files of data organized in such a way as to permit resource-effective access and use of the data. 10.112

Debt reorganization (also referred as debt restructuring) is defined as arrangements involving both the creditor and the debtor (and sometimes third parties) that alter the terms established for servicing an existing debt. 26.106

Debt restructuring see debt reorganization

Debt securities are negotiable instruments serving as evidence of a debt. 11.64

Deductible VAT is the VAT payable on purchases of goods or services intended for intermediate consumption, gross fixed capital formation or for resale that a producer is permitted to deduct from his own VAT liability to the government in respect of VAT invoiced to his customers. 6.58

Defined benefit scheme A defined benefit scheme is one where the benefits payable to an employee on retirement are determined by the use of a formula, either alone or as a minimum amount payable. 17.129

Defined contribution scheme A defined contribution scheme is one where the benefits payable to an employee on retirement are defined exclusively in terms of the level of the fund built up from the contributions made over the employee's working life and the increases in value that result from the investment of these funds by the manager of the scheme. 17.128

Deposit-taking corporations except the central bank have financial intermediation as their principal activity. To this end, they have liabilities in the form of deposits or financial instruments (such as short-term certificates of deposit) that are close substitutes for deposits. 4.105

Direct investment is a category of cross-border investment associated with a resident in one economy having control or a significant degree of influence on the management of an enterprise that is resident in another economy. 26.84

Disposable income is the balancing item in the secondary distribution of income account. It is derived from the balance of primary incomes of an institutional unit or sector by adding all current transfers, except social transfers in kind, receivable by that unit or sector and subtracting all current transfers, except social transfers in kind, payable by that unit or sector. ... 8.20

Distributable income of a corporation is equal to entrepreneurial income, plus all current transfers receivable, less all current transfers payable and less the adjustment for the change in pension entitlements relating to the pension scheme of that corporation. 7.131

Dividends are a form of investment income to which shareholders become entitled as a result of placing funds at the disposal of corporations. 7.128

Durable good A durable good is one that may be used repeatedly or continuously over a period of more than a year, assuming a normal or average rate of physical usage. A consumer durable is a good that may be used for purposes of consumption repeatedly or continuously over a period of a year or more. 9.42

Dwellings are buildings, or designated parts of buildings, that are used entirely or primarily as residences, including any associated structures, such as garages, and all permanent fixtures customarily installed in residences. 10.68

E

Economic flows reflect the creation, transformation, exchange, transfer or extinction of economic value. They involve changes in the volume, composition, or value of an institutional unit's assets and liabilities. 3.6

Economic owner The economic owner of entities such as goods and services, natural resources, financial assets and liabilities is the institutional unit entitled to claim the benefits associated with the use of the entity in question in the course of an economic activity by virtue of accepting the associated risks. 3.26

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Economic owner The economic owner of entities such as goods and services, natural resources, financial assets and liabilities is the institutional unit entitled to claim the benefits associated with the use of the entity inquestion in the course of an economic activity by virtue of accepting the associated risks. 10.5

Economically significant prices are prices that have a significant effect on the amounts that producers are willing to supply and on the amounts purchasers wish to buy. These prices normally result when (a) the producer has an incentive to adjust supply either with the goal of making a profit in the long run or, at a minimum, covering capital and other costs and (b) consumers have the freedom to purchase or not purchase and make the choice on the basis of the prices charged. 6.95, 22.28

Employee stock option An employee stock option is an agreement made on a given date (the “grant” date) under which an employee may purchase a given number of shares of the employer’s stock at a stated price (the “strike” price) either at a stated time (the “vesting” date) or within a period of time (the “exercise” period) immediately following the vesting date. 11.125

Employees are persons who, by agreement, work for a resident institutional unit and receive remuneration for their labour. 19.20

Employers’ social contributions are social contributions payable by employers to social security funds or other employment-related social insurance schemes to secure social benefits for their employees. 7.56

Employment is defined as all persons, both employees and self-employed persons, engaged in some productive activity that falls within the production boundary of the SNA. 19.19

Enterprise An enterprise is the view of an institutional unit as a producer of goods and services. 5.1

Entertainment, literary and artistic originals consist of the original films, sound recordings, manuscripts, tapes, models, etc., on which drama performances, radio and television programming, musical performances, sporting events, literary and artistic output, etc., are recorded or embodied. 10.115

Entitlement to future goods and services on an exclusive basis relates to the case where one party which has contracted to purchase goods or services at a fixed price at a time in the future is able to transfer the obligation of the second party to the contract to a third party. 10.195

Equity comprises all instruments and records acknowledging claims on the residual value of a corporation or quasi-corporation after the claims of all creditors have been met. 11.83

ESO see employee stock option

Establishment An establishment is an enterprise, or part of an enterprise, that is situated in a single location and in which only a single productive activity is carried out or in which the principal productive activity accounts for most of the value added. 5.2, 5.14

Existing fixed asset An existing fixed asset is one whose value was included in the stock of fixed capital of at least one producer unit in the domestic economy at some earlier point in time either in the current period or in the immediately previous accounting period. 10.38

Expenditure measure of GDP The expenditure measure of gross domestic product (GDP) is derived as the sum of expenditure on final consumption plus gross capital formation plus exports less imports. 16.47

Expenditures on goods and services are defined as the values of the amounts that buyers pay, or agree to pay, to sellers in exchange for goods or services that sellers provide to them or to other institutional units designated by the buyers. 9.32

Export subsidies consist of all subsidies on goods and services that become payable by government when the goods leave the economic territory or when the services are delivered to non-resident units. 7.103

Export taxes consist of taxes on goods or services that become payable to government when the goods leave the economic territory or when the services are delivered to non-residents. 7.95

F

Final consumption expenditure is the amount of expenditure on consumption goods and services. 9.7

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Final consumption expenditure of households see household final consumption expenditure

Final consumption expenditure of general government see general government final consumption expenditure

Final consumption expenditure of NPISHs consists of the expenditure, including expenditure whose value must be estimated indirectly, incurred by resident NPISHs on individual consumption goods and services and possibly on collective consumption services. 9.115

Financial assets consist of all financial claims, shares or other equity in corporations plus gold bullion held by monetary authorities as a reserve asset. 3.36, 11.8

Financial auxiliaries consist of financial corporations that are principally engaged in activities associated with transactions in financial assets and liabilities or with providing the regulatory context for these transactions but in circumstances that do not involve the auxiliary taking ownership of the financial assets and liabilities being transacted. 4.111

Financial claim A financial claim is the payment or series of payments due to the creditor by the debtor under the terms of a liability. 3.35, 11.7

Financial corporations consist of all resident corporations that are principally engaged in providing financial services, including insurance and pension funding services, to other institutional units. 4.98

Financial derivatives are financial instruments that are linked to a specific financial instrument or indicator or commodity, through which specific financial risks can be traded in financial markets in their own right. 11.111

Financial intermediaries are institutional units that incur liabilities on their own account for the purpose of acquiring financial assets by engaging in financial transactions on the market. 4.101

Fines and penalties are compulsory payments imposed on institutional units by courts of law or quasi-judicial bodies. 8.135

Finished goods consist of goods produced as outputs that their producer does not intend to process further before supplying them to other institutional units. 10.142

Fixed assets are produced assets that are used repeatedly or continuously in production processes for more than one year. 10.11

Foreign exchange swap A foreign exchange swap is a spot sale/purchase of currencies and a simultaneous forward purchase/sale of the same currencies. 11.121

Forward contract A forward contract is an unconditional financial contract that represents an obligation for settlement on a specified date. Futures and other forward contracts are typically, but not always, settled by the payment of cash or the provision of some other financial instrument rather than the actual delivery of the underlying item and therefore are valued and traded separately from the underlying item. 11.120

Forward foreign exchange contract A forward foreign exchange contract involves two counterparties who agree to transact in foreign currencies at an agreed exchange rate in a specified amount at some agreed future date. 11.121

Forward rate agreement A forward rate agreement (FRA) is an arrangement in which two parties, in order to protect themselves against interest rate changes, agree on an interest rate to be paid, at a specified settlement date, on a notional amount of principal that is never exchanged. 11.121

Full-time equivalent employment is the number of full-time equivalent jobs, defined as total hours actually worked by all employed persons divided by the average number of hours actually worked in full-time jobs. 19.43

G

GDP see expenditure measure of GDP, income measure of GDP, production measure of GDP

General government final consumption expenditure consists of expenditure, including expenditure whose value must be estimated indirectly, incurred by general government on both individual consumption goods and services and collective consumption services. 9.114

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

GNI Gross national income (GNI) is defined as GDP plus compensation of employees receivable from abroad plus property income receivable from abroad plus taxes less subsidies on production receivable from abroad less compensation of employees payable abroad less property income payable abroad and less taxes plus subsidies on production payable abroad. 16.54

Goods and services account The goods and services account shows the balance between the total goods and services supplied as resources to the economy as output and imports (including the value of taxes less subsidies on products not already included in the valuation of output) and the use of the same goods and services as intermediate consumption, final consumption, capital formation and exports. 16.27

Goods are physical, produced objects for which a demand exists, over which ownership rights can be established and whose ownership can be transferred from one institutional unit to another by engaging in transactions on markets. 6.15

Goods for resale are goods acquired by enterprises, such as wholesalers or retailers, for the purpose of reselling them to their customers. 10.145

Goodwill and market assets The value of goodwill and marketing assets is defined as the difference between the value paid for an enterprise as a going concern and the sum of its assets less the sum of its liabilities, each item of which has been separately identified and valued. 10.199

Government units are unique kinds of legal entities established by political processes that have legislative, judicial or executive authority over other institutional units within a given area. 4.9

Gross capital formation shows the acquisition less disposal of produced assets for purposes of fixed capital formation, inventories or valuables. 10.24

Gross fixed capital formation in a particular category of fixed asset consists of the value of producers' acquisitions of new and existing products of this type less the value of their disposals of fixed assets of the same type. 10.64

Gross fixed capital formation is measured by the total value of a producer's acquisitions, less disposals, of fixed assets during the accounting period plus certain specified expenditure on services that adds to the value of non-produced assets. 10.32

Gross national income is the aggregate value of the gross balances of primary incomes for all sectors. 7.20

Gross national income see GNI

Gross or net national disposable income may be derived from gross or net national income by adding all current transfers in cash or in kind receivable by resident institutional units from non-resident units and subtracting all current transfers in cash or in kind payable by resident institutional units to non-resident units. 8.26

Gross value added at basic prices is defined as output valued at basic prices less intermediate consumption valued at purchasers' prices. 6.77

Gross value added at producers' prices is defined as output valued at producers' prices less intermediate consumption valued at purchasers' prices. 6.78

Gross value added is the value of output less the value of intermediate consumption. 6.8

H

Horizontal integration A horizontally integrated enterprise is one in which several different kinds of activities that produce different kinds of goods or services for sale on the market are carried out in parallel with each other. 5.21

Household A household is a group of persons who share the same living accommodation, who pool some, or all, of their income and wealth and who consume certain types of goods and services collectively, mainly housing and food. 4.4

Household final consumption expenditure consists of the expenditure, including expenditure whose value must be estimated indirectly, incurred by resident households on individual consumption goods and services, including those sold at prices that are not economically significant and including consumption goods and services acquired abroad. 9.113

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Households' actual social contributions are social contributions payable on their own behalf by employees, self-employed or non-employed persons to social insurance schemes. 8.85

Households' social contribution supplements consist of the property income earned during the accounting period on the stock of pension and non-pension entitlements. 8.86

I

Import duties consist of customs duties, or other import charges, that are payable on goods of a particular type when they enter the economic territory. 7.93

Import subsidies consist of subsidies on goods and services that become payable when the goods cross the frontier of the economic territory or when the services are delivered to resident institutional units. 7.101

Income in kind received by employees is measured by the value of the goods and services provided by employers to their employees in remuneration for work done. 9.51

Income measure of GDP The income measure of gross domestic product (GDP) is derived as compensation of employees plus gross operating surplus plus gross mixed incomes plus taxes less subsidies on both production and imports. 16.48

Index-linked securities are instruments for which either the coupon payments (interest) or the principal or both are linked to an index such as a price index or the price of a commodity. 11.70

Individual consumption good or service An individual consumption good or service is one that is acquired by a household and used to satisfy the needs or wants of members of that household. 9.3

Industry An industry consists of a group of establishments engaged in the same, or similar, kinds of activity. 5.46, 5.2

Information, computer and telecommunications (ICT) equipment consists of devices using electronic controls and also the electronic components forming part of these devices. 10.85

Institutional unit An institutional unit is an economic entity that is capable, in its own right, of owning assets, incurring liabilities and engaging in economic activities and in transactions with other entities. 4.2

Insurance claim see claim

Insurance corporations consist of incorporated, mutual and other entities whose principal function is to provide life, accident, sickness, fire or other forms of insurance to individual institutional units or groups of units or reinsurance services to other insurance corporations. 4.115

Insurance premium, see premium

Intellectual property products are the result of research, development, investigation or innovation leading to knowledge that the developers can market or use to their own benefit in production because use of the knowledge is restricted by means of legal or other protection. 10.98

Interest is a form of income that is receivable by the owners of certain kinds of financial assets, namely deposits, debt securities, loans and (possibly) other accounts receivable for putting the financial asset at the disposal of another institutional unit. 7.113

Interest rate swap An interest rate swap contract involves an exchange of cash flows related to interest payments, or receipts, on a notional amount of principal, which is never exchanged, in one currency over a period of time. 11.121

Intermediate consumption consists of the value of the goods and services consumed as inputs by a process of production, excluding fixed assets whose consumption is recorded as consumption of fixed capital. 6.213

Inventories are produced assets that consist of goods and services, which came into existence in the current period or in an earlier period, and that are held for sale, use in production or other use at a later date. 10.12

Investment funds are collective investment undertakings through which investors pool funds for investment in financial or non-financial assets. 11.94

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Investment grants consist of capital transfers made by governments to other resident or non-resident institutional units to finance all or part of the costs of their acquiring fixed assets. 10.208

Investment income is the income receivable by the owner of a financial asset in return for providing funds to another institutional unit. 7.108

Invoiced VAT is the VAT payable on the sales of a producer. It is shown separately on the invoice that the producer presents to the purchaser. 6.58

J

Joint venture A joint venture involves the establishment of a corporation, partnership or other institutional unit in which each party legally has joint control over the activities of the unit. 22.56

K

Kind-of-activity unit A kind-of-activity unit is an enterprise, or a part of an enterprise, that engages in only one kind of productive activity or in which the principal productive activity accounts for most of the value added. 5.12

L

Labour force The labour force consists of those who are actively prepared to make their labour available during any particular reference period for producing goods and services that are included within the production boundary of the SNA. 19.17

Land consists of the ground, including the soil covering and any associated surface waters, over which ownership rights are enforced and from which economic benefits can be derived by their owners by holding or using them. 10.175

Land improvements are the result of actions that lead to major improvements in the quantity, quality or productivity of land, or prevent its deterioration. 10.79

Lease see financial lease, operational lease, resource lease, contracts, leases and licences, permits

Lease - financial A financial lease is one where the lessor as legal owner of an asset passes the economic ownership to the lessee who then accepts the operating risks and receives the economic benefits from using the asset in a productive activity. 17.304

Legal entity A legal or social entity is one whose existence is recognized by law or society independently of the persons, or other entities, that may own or control it. 4.6

Legal owner The legal owner of entities such as goods and services, natural resources, financial assets and liabilities is the institutional unit entitled in law and sustainable under the law to claim the benefits associated with the entities. 3.21, 10.5

Legally constituted corporation A legally constituted corporation is a legal entity, created for the purpose of producing goods or services for the market, that may be a source of profit or other financial gain to its owner(s). It is collectively owned by shareholders who have the authority to appoint directors responsible for its general management. 4.39

Liability A liability is established when one unit (the debtor) is obliged, under specific circumstances, to provide a payment or series of payments to another unit (the creditor). 3.5, 3.33, 11.5

Life insurance and annuities entitlements show the extent of financial claims policy holders have against an enterprise offering life insurance or providing annuities. 11.106

Licences see Contracts, leases and licences

Life insurance is an activity whereby a policy holder makes regular payments to an insurer in return for which the insurer guarantees to provide the policy holder (or in some cases another nominated person) with an agreed sum, or an annuity, at a given date or earlier if the policy holder dies beforehand. 17.6

Listed shares are equity securities listed on an exchange. 11.86

Loans are financial assets that are created when a creditor lends funds directly to a debtor, and are evidenced by documents that are not

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

negotiable. 11.72

Local unit A local unit is an enterprise, or a part of an enterprise, that engages in productive activity at or from one location. 5.13

M

Machinery and equipment covers transport equipment, machinery for information, communication and telecommunications (ICT) equipment, and other machinery and equipment. 10.82

Market output consists of output intended for sale at economically significant prices. 6.99

Market producers are establishments, all or most of whose output is market production. 6.133

Marketable operating leases are third-party property rights relating to fixed assets. 10.190

Marketing assets consist of items such as brand names, mastheads, trademarks, logos and domain names. 10.198

Materials and supplies consist of all products that an enterprise holds in inventory with the intention of using them as intermediate inputs into production. 10.131

Military inventories consist of single-use items, such as ammunition, missiles, rockets, bombs, etc., delivered by weapons or weapons systems. 10.144

Mineral and energy resources consist of mineral and energy reserves located on or below the earth's surface that are economically exploitable, given current technology and relative prices. 10.179

Mineral exploration and evaluation consists of the value of expenditures on exploration for petroleum and natural gas and for non-petroleum deposits and subsequent evaluation of the discoveries made. 10.106

Miscellaneous current transfers consist of current transfers other than insurance-related premiums and claims, current transfers within general government and current international cooperation. 8.129

Monetary gold is gold to which the monetary authorities (or others who are subject to the effective control of the monetary authorities) have title and that is held as a reserve asset. 11.45

Monetary transaction A monetary transaction is one in which one institutional unit makes a payment (receives a payment) or incurs a liability (receives an asset) stated in units of currency. 3.55

Money market fund shares or units represent a claim on a proportion of the value of an established money market fund. 11.99

Money market funds (MMFs) are collective investment schemes that raise funds by issuing shares or units to the public. The proceeds are invested primarily in money market instruments, MMF shares/units, transferable debt instruments with a residual maturity of not more than one year, bank deposits and instruments that pursue a rate of return that approaches the interest rates of money market instruments. MMF shares can be transferred by cheque or other means of direct third-party payment. 4.107

N

Natural resources consist of naturally occurring resources such as land, water resources, uncultivated forests and deposits of minerals that have an economic value. 10.15

NDP Net domestic product (NDP) is defined as gross domestic product (GDP) less the consumption of fixed capital. 16.52

Net borrowing see net lending

Net lending is defined as the difference between changes in net worth due to saving and capital transfers and net acquisitions of non-financial assets (acquisitions less disposals of non-financial assets, less consumption of fixed capital). If the amount is negative it represents net borrowing. 10.28

Net national disposable income see NNDI

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Net national income see NNI

Net non-life insurance premiums comprise both the actual premiums payable by policyholders to obtain insurance cover during the accounting period (premiums earned) and the premium supplements payable out of the property income attributed to insurance policyholders less the service charges payable to the insurance corporation. 8.117

Net social contributions are the actual or imputed contributions made by households to social insurance schemes to make provision for social benefits to be paid. Fees charged by the administrators of the schemes are excluded from contributions payable. 8.82

Net value added is the value of output less the values of both intermediate consumption and consumption of fixed capital. 6.8

Net worth is defined as the value of all the assets owned by an institutional unit or sector less the value of all its outstanding liabilities. 13.4

Neutral holding gains and losses A neutral holding gain (loss) over a period is the increase (decrease) in the value of an asset that would be required, in the absence of transactions and other changes in the volume of assets, to maintain command over the same amount of goods and services as at the beginning of the period. 12.75

NNDI Net national disposable income (NNDI) is defined as net national income (NNI) plus current transfers receivable from abroad less current transfers payable abroad. 16.57

NNI Net national income (NNI) is defined as gross national income (GNI) less the consumption of fixed capital. 16.55

Nominal holding gain - financial asset The nominal holding gain on a financial asset is the increase in value of the asset, other than transactions in the assets (including the accrual of interest over a period of time) and other changes in the volume of assets. 12.74

Nominal holding gain - liability The nominal holding gain on a liability is the decrease in value of the liability, other than by transactions or by other volume changes. 12.74

Nominal holding gain - non-financial asset The nominal holding gain on a non-financial asset is the value of the benefit accruing to the owner of that asset as a result of a change in its price over a period of time. 12.74

Non-cultivated biological resources consist of animals, birds, fish and plants that yield both once-only and repeat products over which ownership rights are enforced but for which natural growth and/or regeneration is not under the direct control, responsibility and management of institutional units. 10.182

Non-deductible VAT is VAT payable by a purchaser that is not deductible from his own VAT liability, if any. 6.58

Non-financial corporations are corporations whose principal activity is the production of market goods or non-financial services. 4.94

Non-life insurance claims are the amounts payable in settlement of damages that result from an event covered by a non-life insurance policy during the current accounting period. 8.118

Non-life insurance is an activity similar to life insurance except that it covers all other risks, accidents, sickness, fire, etc. 17.6

Non-life insurance technical reserves consist of prepayments of net premiums and reserves to meet outstanding non-life insurance claims. 11.105

Non-market output consists of goods and individual or collective services produced by non-profit institutions serving households (NPISHs) or government that are supplied free, or at prices that are not economically significant, to other institutional units or the community as a whole. 6.128

Non-market producers consist of establishments owned by government units or NPISHs that supply goods or services free, or at prices that are not economically significant, to households or the community as a whole. 6.133

Non-monetary transactions are transactions that are not initially stated in units of currency. 3.75

Non-money-market (MMF) investment funds are collective investment schemes that raise funds by issuing shares or units to the public. The proceeds are invested predominantly in financial assets other than short-term assets and in non-financial assets

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

(usually real estate). 4.108

Non-performing loan A loan is non-performing when payments of interest or principal are past due by 90 days or more, or interest payments equal to 90 days or more have been capitalized, refinanced, or delayed by agreement, or payments are less than 90 days overdue, but there are other good reasons (such as a debtor filing for bankruptcy) to doubt that payments will be made in full. 13.66

Non-produced assets consist of three categories (i) natural resources, (ii) contracts, leases and licences, and (iii) purchased goodwill and marketing assets. 10.14

Non-profit institutions are legal or social entities created for the purpose of producing goods and services but whose status does not permit them to be a source of income, profit or other financial gain for the units that establish, control or finance them. 4.8, 4.83

Non-profit institutions serving households (NPISHs) consist of non-market NPIs that are not controlled by government. 4.93

O

Operating lease An operating lease is one where the legal owner is also the economic owner and accepts the operating risks and receives the economic benefits from the asset by using it in a productive activity. 17.301

Options are contracts that give the purchaser of the option the right, but not the obligation, to buy (a “call” option) or to sell (a “put” option) a particular financial instrument or commodity at a predetermined price (the “strike” price) within a given time span (American option) or on a given date (European option). 11.117

Other buildings and structures comprise non-residential buildings, other structures and land improvements. 10.73

Other capital transfers consist of all capital transfers except capital taxes and investment grants. 10.210

Other current transfers consist of all current transfers between resident institutional units, or between resident and non-resident units, other than current taxes on income, wealth, etc., social contributions and benefits, and social benefits in kind. 8.19

Other deposits comprise all claims, other than transferable deposits, that are represented by evidence of deposit. 11.59

Other employment-related social insurance benefits are social benefits payable by social insurance schemes other than social security to contributors to the schemes, their dependants or survivors. 8.109

Other equity is equity that is not in the form of securities. 11.88

Other financial corporations are institutional units providing financial services, where most of their assets or liabilities are not available on open financial markets. 4.101

Other financial intermediaries except insurance corporations and pension funds consist of financial corporations that are engaged in providing financial services by incurring liabilities, in forms other than currency, deposits or close substitutes for deposits, on their own account for the purpose of acquiring financial assets by engaging in financial transactions on the market. 4.109

Other flows are changes in the value of assets and liabilities that do not result from transactions. 3.7, 3.99

Other intellectual property products include any such products that constitute fixed assets but are not captured as research and development, mineral exploration and evaluation, computer software and databases or entertainment, literary and artistic originals. 10.117

Other investment fund shares or units represent a claim on a proportion of the value of an established investment fund other than a money market fund. 11.100

Other investment is a residual category that includes positions and transactions other than those included in direct investment, portfolio investment, financial derivatives and employee stock options and reserve assets. 26.94

Other machinery and equipment consists of machinery and equipment not elsewhere classified. 10.86

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Other structures include structures other than buildings, including the cost of the streets, sewer, etc. 10.76

Other subsidies on production consist of subsidies except subsidies on products that resident enterprises may receive as a consequence of engaging in production. 7.106

Other subsidies on products consist of subsidies on goods or services produced as the outputs of resident enterprises, or on imports, that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a result of their use for own consumption or own capital formation. 7.105

Other taxes on production consist of all taxes except taxes on products that enterprises incur as a result of engaging in production. 7.97

Other transferable deposits are those where one party or both parties to the transaction, or either the creditor or debtor or both of the positions, is not a bank. 11.58

Other work-in-progress consists of output (other than on cultivated biological resources) that is not yet sufficiently processed to be in a state in which it is normally supplied to other institutional units. 10.141

Output for own final use consists of products retained by the producer for his own use as final consumption or capital formation. 6.114

Output is defined as the goods and services produced by an establishment, excluding the value of any goods and services used in an activity for which the establishment does not assume the risk of using the products in production, and excluding the value of goods and services consumed by the same establishment except for goods and services used for capital formation (fixed capital or changes in inventories) or own final consumption. 6.89

Owner, see legal owner, economic owner

P

Payments of compensation consist of current transfers paid by institutional units to other institutional units in compensation for injury to persons or damage to property caused by the former that are not settled as payments of non-life insurance claims. 8.140

Pension entitlements show the extent of financial claims both existing and future pensioners hold against either their employer or a fund designated by the employer to pay pensions earned as part of a compensation agreement between the employer and employee. 11.107

Pension fund sub-sector The pension fund sub-sector consists of only those social insurance pension funds that are institutional units separate from the units that create them. 4.116

Permit to undertake a specific activity A permit to undertake a specific activity is one where the permits are limited in number and so allow the holders to earn monopoly profits, the monopoly profits do not come from the use of an asset belonging to the permit-issuer, a permit holder is able both legally and practically to sell the permit to a third party. 10.192

Permits to use natural resources are third-party property rights relating to natural resources. 10.191

Permits see also Contracts, leases and licences

Population The population of a country is most simply defined as all those persons who are usually resident in the country. 19.10

Portfolio investment is defined as cross-border transactions and positions involving debt or equity securities, other than those included in direct investment or reserve assets. 26.91

Premium - actual The actual premium is the amount payable to the direct insurer or reinsurer to secure insurance cover for a specific event over a stated time period. 6.186, 17.4

Premium - earned The premium earned is the part of the actual premium that relates to cover provided in the accounting period. 17.5

Premium - net Net premiums are defined as actual premiums plus premium supplements less the insurance service charge payable by the policy holders. 17.35

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Premium - unearned The unearned premium is the amount of the actual premium received that relates to the period past the accounting point. 17.5

Premium earned The premium earned is the part of the actual premium that relates to cover provided in the accounting period. 6.187

Premium see actual premium, premium earned, unearned premium, net premium

Price The price of a good or service is defined as the value of one unit of that good or service. 15.11

Primary incomes are incomes that accrue to institutional units as a consequence of their involvement in processes of production or ownership of assets that may be needed for purposes of production. 7.2

Principal activity The principal activity of a producer unit is the activity whose value added exceeds that of any other activity carried out within the same unit. 5.8

Producer's price The producer's price is the amount receivable by the producer from the purchaser for a unit of a good or service produced as output minus any VAT, or similar deductible tax, invoiced to the purchaser. It excludes any transport charges invoiced separately by the producer. 6.51

Product balance The product balance for any product recognizes that the sum of output at basic prices plus imports plus trade and transport margins plus taxes on products less subsidies on products is equal to the sum of intermediate consumption, final consumption and capital formation, all expressed at purchasers' prices, plus exports. 14.5

Production boundary The production boundary of the SNA includes the following activities (a) The production of all goods or services that are supplied to units other than their producers, or intended to be so supplied, including the production of goods or services used up in the process of producing such goods or services. (b) The own-account production of all goods that are retained by their producers for their own final consumption or gross capital formation. (c) The own-account production of knowledge-capturing products that are retained by their producers for their own final consumption or gross capital formation but excluding (by convention) such products produced by households for their own use. (d) The own-account production of housing services by owner occupiers. (e) The production of domestic and personal services by employing paid domestic staff. 6.27

Production is an activity, carried out under the responsibility, control and management of an institutional unit, that uses inputs of labour, capital, and goods and services to produce outputs of goods and services. 6.2

Production measure of GDP The production measure of gross domestic product (GDP) is derived as the value of output less intermediate consumption plus any taxes less subsidies on products not already included in the value of output. 16.47

Products are goods and services (including knowledge-capturing products) that result from a process of production. 6.14

Property income is the sum of investment income and rent. 7.107

Provisions for calls under standardized guarantees consist of prepayments of net fees and provisions to meet outstanding calls under standardized guarantees. 11.110

Public monuments are identifiable because of particular historical, national, regional, local, religious or symbolic significance. 10.78

Purchased goodwill see goodwill and marketing assets

Purchaser's price The purchaser's price is the amount paid by the purchaser, excluding any VAT or similar tax deductible by the purchaser, in order to take delivery of a unit of a good or service at the time and place required by the purchaser. The purchaser's price of a good includes any transport charges paid separately by the purchaser to take delivery at the required time and place. 6.64

Purchasing power parity A purchasing power parity (PPP) is defined as the number of units of B's currency that are needed in B to purchase the same quantity of individual good or service as one unit of A's currency will purchase in A. 15.199

Q

Quasi-corporation A quasi-corporation is either an unincorporated enterprise owned by a resident institutional unit that has sufficient

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

information to compile a complete set of accounts and is operated as if it were a separate corporation and whose de facto relationship to its owner is that of a corporation to its shareholders, or an unincorporated enterprise owned by a non-resident institutional unit that is deemed to be a resident institutional unit because it engages in a significant amount of production in the economic territory over a long or indefinite period of time. 4.42

Quoted shares see listed shares

R

Real GDI Real gross domestic income (real GDI) measures the purchasing power of the total incomes generated by domestic production. 15.188

Real holding gains and losses A real holding gain (loss) is the amount by which the value of an asset increases (decreases) over the neutral holding gain for the period, in the absence of transactions and other changes in the volume of assets. 12.76

Realized holding gain A holding gain (loss) is realized when an asset that has increased (decreased) in value due to holding gains (losses) since the beginning of the accounting period is sold, redeemed, used or otherwise disposed of, or a liability incorporating a holding gain or loss is repaid. 12.80

Rent is the income receivable by the owner of a natural resource (the lessor or landlord) for putting the natural resource at the disposal of another institutional unit (a lessee or tenant) for use of the natural resource in production. 7.109, 7.154

Rental The rental is the amount payable by the user of a fixed asset to its owner, under an operating lease or similar contract, for the right to use that asset in production for a specified period of time. 6.245

Repo A repo is a securities repurchase agreement where securities are provided for cash with a commitment to repurchase the same or similar securities for cash at a fixed price on a specified future date. 11.74

Research and development consists of the value of expenditures on creative work undertaken on a systematic basis in order to increase the stock of knowledge, including knowledge of man, culture and society, and use of this stock of knowledge to devise new applications. This does not extend to including human capital as assets within the SNA. 10.103

Reserve assets are those external assets that are readily available to and controlled by monetary authorities for meeting balance of payments financing needs, for intervention in exchange markets to affect the currency exchange rate and for other related purposes (such as maintaining confidence in the currency and the economy, and serving as a basis for foreign borrowing). Reserve assets must be denominated and settled in foreign currency. 26.95

Residence The residence of each institutional unit is the economic territory with which it has the strongest connection, in other words, its centre of predominant economic interest. 4.10

Resource lease A resource lease is an agreement whereby the legal owner of a natural resource that the SNA treats as having an infinite life makes it available to a lessee in return for a regular payment recorded as property income and described as rent. 7.109, 17.310

Rest of the world The rest of the world consists of all non-resident institutional units that enter into transactions with resident units, or have other economic links with resident units. 4.172

Retained earnings of a corporation or quasi-corporation are equal to the distributable income less the dividends payable or withdrawal of income from the quasi-corporation respectively. 7.139

S

Saving represents that part of disposable income (adjusted for the change in pension entitlements) that is not spent on final consumption goods and services. 9.28

Secondary activity A secondary activity is an activity carried out within a single producer unit in addition to the principal activity and whose output, like that of the principal activity, must be suitable for delivery outside the producer unit. 5.9

Securities repurchase agreement A securities repurchase agreement is an arrangement involving the provision of securities in exchange for cash with a commitment to repurchase the same or similar securities at a fixed price either on a specified future date

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

(often one or a few days hence, but also further in the future) or with an “open” maturity. 11.74

Self-employed persons are persons who are the sole or joint owners of the unincorporated enterprises in which they work, excluding those unincorporated enterprises that are classified as quasi-corporations. 19.25

Services are the result of a production activity that changes the conditions of the consuming units, or facilitates the exchange of products or financial assets. 6.17

Social assistance benefits in cash are current transfers payable to households by government units or NPISHs to meet the same needs as social insurance benefits but which are not made under a social insurance scheme requiring participation usually by means of social contributions. 8.110

Social benefits are current transfers received by households intended to provide for the needs that arise from certain events or circumstances, for example, sickness, unemployment, retirement, housing, education or family circumstances. 8.17

Social contributions are actual or imputed payments to social insurance schemes to make provision for social insurance benefits to be paid. 8.16

Social entity A legal or social entity is one whose existence is recognized by law or society independently of the persons, or other entities, that may own or control it. 4.6

Social insurance benefit A social insurance benefit is a social benefit payable because the beneficiary participates in a social insurance scheme and the social risk insured against has occurred. 17.89

Social insurance contribution A social insurance contribution is the amount payable to a social insurance scheme in order for a designated beneficiary to be entitled to receive the social benefits covered by the scheme. 17.89

Social insurance scheme A social insurance scheme is an insurance scheme where the following two conditions are satisfied, (a) the benefits received are conditional on participation in the scheme and constitute social benefits as this term is used in the SNA, and (b) at least one of the three conditions following is met. (i) Participation in the scheme is obligatory either by law or under the terms and conditions of employment of an employee, or group of employees. (ii) The scheme is a collective one operated for the benefit of a designated group of workers, whether employed or non-employed, participation being restricted to members of that group. (iii) An employer makes a contribution (actual or imputed) to the scheme on behalf of an employee, whether or not the employee also makes a contribution. 8.65, 17.88

Social security benefits in cash are social insurance benefits payable in cash to households by social security funds. 8.108

Social transfers in kind consist of goods and services provided to households by government and NPISHs either free or at prices that are not economically significant. 8.141

Special Drawing Rights (SDRs) are international reserve assets created by the International Monetary Fund (IMF) and allocated to its members to supplement existing reserve assets. 11.47

Stocks are a position in, or holdings of, assets and liabilities at a point in time. 3.4

Stripped securities are securities that have been transformed from a principal amount with coupon payments into a series of zero-coupon bonds, with a range of maturities matching the coupon payment date(s) and the redemption date of the principal amount(s). 11.69

Subsidies are current unrequited payments that government units, including non-resident government units, make to enterprises on the basis of the levels of their production activities or the quantities or values of the goods or services that they produce, sell or import. 7.98

Subsidy on product A subsidy on a product is a subsidy payable per unit of a good or service. 7.100

Supply table A supply table at purchasers’ prices consists of a rectangular matrix with the rows corresponding to the same groups of products as the matching use tables and columns corresponding to the supply from domestic production valued at basic prices plus columns for imports and the valuation adjustments necessary to have total supply of each 14.13

T

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Taxes and duties on imports consist of taxes on goods and services that become payable at the moment when those goods cross the national or customs frontiers of the economic territory or when those services are delivered by non-resident producers to resident institutional units. 7.90

Taxes are compulsory, unrequited payments, in cash or in kind, made by institutional units to government units. 7.71, 8.52

Taxes less subsidies on production consist of taxes payable or subsidies receivable on goods or services produced as outputs and other taxes or subsidies on production, such as those payable on the labour, machinery, buildings or other assets used in production. 7.5

Taxes on imports, excluding VAT and duties consist of all taxes (except VAT and import duties) as defined in the GFSM/OECD classifications that become payable when goods enter the economic territory or services are delivered by non-residents to residents. 7.94

Taxes on income consist of taxes on incomes, profits and capital gains. 8.61

Taxes on products A tax on a product is a tax that is payable per unit of some good or service. 7.88

Taxes on products, excluding VAT, import and export taxes, consist of taxes on goods and services that become payable as a result of the production, sale, transfer, leasing or delivery of those goods or services, or as a result of their use for own consumption or own capital formation. 7.96

Terms of trade The terms of trade are defined as the ratio of the price of exports to the price of imports. 15.187

Total economy The total economy is defined as the entire set of resident institutional units. 4.23

Trade margin A trade margin is defined as the difference between the actual or imputed price realized on a good purchased for resale and the price that would have to be paid by the distributor to replace the good at the time it is sold or otherwise disposed of. 6.146

Trading gain or loss The trading gain or loss from changes in the terms of trade is the difference between real GDI and GDP in volume terms. 15.188

Transaction A transaction is an economic flow that is an interaction between institutional units by mutual agreement or an action within an institutional unit that it is analytically useful to treat like a transaction, often because the unit is operating in two different capacities. 3.7, 3.51

Transaction, see also monetary transaction, non-monetary transaction

Transfer A transfer is a transaction in which one institutional unit provides a good, service or asset to another unit without receiving from the latter any good, service or asset in return as a direct counterpart. 8.10, 8.34

Transferable deposits comprise all deposits that are exchangeable for bank notes and coins on demand at par and without penalty or restriction and directly usable for making payments by cheque, draft, giro order, direct debit/credit, or other direct payment facility. 11.54

Transport equipment consists of equipment for moving people and objects. 10.84

Tree, crop and plant resources yielding repeat products cover plants whose natural growth and regeneration are under the direct control, responsibility and management of institutional units. 10.95

U

Unearned premium The unearned premium is the amount of the actual premium received that relates to the period past the accounting point. 6.187

Unincorporated enterprise An unincorporated enterprise represents the production activity of a government unit, NPISH or household that cannot be treated as the production activity of a quasi-corporation. 5.1

Unlisted shares are equity securities not listed on an exchange. 11.87

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Unquoted shares see unlisted shares

Unrealized holding gain An unrealized holding gain is one accruing on an asset that is still owned or a liability that is still outstanding at the end of the accounting period. 12.80

Use table A use table at purchasers' prices consists of a set of product balances covering all products available in an economy arranged in the form of a rectangular matrix with the products, valued at purchasers' prices, appearing in the rows and the columns indicating the disposition of the products to various types of uses. 14.13

V

Valuables are produced goods of considerable value that are not used primarily for purposes of production or consumption but are held as stores of value over time. 10.13

Value added tax A value added type tax (VAT) is a tax on goods or services collected in stages by enterprises but that is ultimately charged in full to the final purchasers. 7.89

Vertical integration A vertically integrated enterprise is one in which different stages of production, which are usually carried out by different enterprises, are carried out in succession by different parts of the same enterprise. 5.23

Volume index A volume index is an average of the proportionate changes in the quantities of a specified set of goods or services between two periods of time. 15.13

W

Warrants are tradable instruments giving the holder the right to buy, under specified terms for a specified period of time, from the issuer of the warrant (usually a corporation) a certain number of shares or bonds. 11.119

Water resources consist of surface and groundwater resources used for extraction to the extent that their scarcity leads to the enforcement of ownership and/or use rights, market valuation and some measure of economic control. 10.184

Weapons systems include vehicles and other equipment such as warships, submarines, military aircraft, tanks, missile carriers and launchers, etc. 10.87

Withdrawal of income from a quasi-corporation consists of that part of distributable income that the owner withdraws from the quasi-corporation. 7.133

Work-in-progress consists of output produced by an enterprise that is not yet sufficiently processed to be in a state in which it is normally supplied to other institutional units. 10.134

Work-in-progress on cultivated biological resources consists of output that is not yet sufficiently mature to be in a state in which it is normally supplied to other institutional units. 10.140

Contents

Foreword xix

Preface xxi

Chapters

1. Introduction 1

Purpose of the *Manual* 1

The Evolution of International Statistical Guidelines on GFS 2

History 2

The Update of the *GFSM 2001* 2

Uses of the GFS Framework 3

Structure and Features of the GFS Framework 3

Methodological Differences with the *GFSM 1986* 4

Coverage 5

Basis of Recording Economic Events 5

Valuation 5

Balance Sheets 5

Integration of Flows and Stock Positions 5

The Analytic Framework 5

Harmonization with Other Methodologies 6

Implementation of the GFS Framework 6

Structure of the *Manual* 6

2. Institutional Units and Sectors 8

Introduction 8

Residence 9

Institutional Units 11

Definition of an Institutional Unit 11

Types of Institutional Units 12

Households 12

Legal and social entities 13

Corporations 13

Nonprofit institutions (NPIs) 14

Government units 14

Application of the Definition of an Institutional Unit to Government 15

Institutional Sectors 16

Defining Institutional Sectors 16

Nonfinancial corporations sector 16

Financial corporations sector 17

General government sector 18

Households sector . . . 18
Nonprofit institutions serving households (NPISHs) sector . . . 18
The Use of Subsectors . . . 19
Institutional Coverage and Sectorization of the Public Sector . . . 19
Delineating General Government and Public Corporations . . . 19
The General Government Sector and Its Subsectors . . . 22
Central government . . . 24
State governments . . . 25
Local governments . . . 26
Social security funds . . . 27
The Public Corporations Sector and Its Subsectors . . . 27
The public corporations subsector . . . 27
Government control of corporations . . . 28
Types of public corporations . . . 30
Public nonfinancial corporations subsector . . . 30
Public financial corporations subsector . . . 30
Public deposit-taking corporations . . . 30
The central bank . . . 30
Public deposit-taking corporations except the central bank . . . 30
Other public financial corporations . . . 31
Other groupings of public sector units . . . 31
Decision Tree for Sector Classification of the Public Sector . . . 31
Practical Application of Sector Classification Principles . . . 33
Identifying Quasi-corporations . . . 33
Distinguishing Head Offices and Holding Companies . . . 33
Restructuring Agencies . . . 34
Financial Protection Schemes . . . 35
Special Purpose Entities . . . 35
Joint Ventures . . . 36
Sinking Funds . . . 36
Pension Schemes . . . 37
Provident Funds . . . 37
Sovereign Wealth Funds . . . 37
Market Regulatory Agencies . . . 38
Development Funds and/or Infrastructure Companies or Entities . . . 39

3. Economic Flows, Stock Positions, and Accounting Rules . . . 40
Introduction . . . 40
Economic Flows . . . 40
Transactions . . . 40
Monetary transactions . . . 41
Nonmonetary transactions . . . 42
Two-party nonmonetary transactions . . . 43
Internal transactions . . . 43
Rearrangements of some transactions . . . 43
Rerouting . . . 43
Partitioning . . . 44
Reassignment . . . 44
Other Economic Flows . . . 44
Holding gains and losses . . . 44
Other changes in the volume of assets/liabilities . . . 45

Stock Positions . . . 45
Economic Benefits . . . 45
Ownership . . . 45
Definition of Assets and Liabilities . . . 46
Financial assets and liabilities . . . 46
Nonfinancial assets . . . 47
Accounting Rules . . . 47
Type of Accounting System . . . 47
Time of Recording Flows . . . 48
Alternative recording bases . . . 49
Using the accrual basis of recording in the Statements of Operations and Other Economic Flows, and Balance Sheet of the GFS framework . . . 50
Application of the accrual principles . . . 51
Time of recording and measurement of taxes and other compulsory transfers . . . 51
Time of recording dividends . . . 52
Time of recording transactions in goods, services, and nonfinancial assets . . . 52
Time of recording transactions in financial assets and liabilities . . . 53
Time of recording other economic flows . . . 54
Using the cash basis of recording in the Statement of Sources and Uses of Cash . . . 54
Valuation . . . 55
General rule . . . 55
Valuation of transactions . . . 55
Valuation of stock positions . . . 56
Valuation adjustments in special cases . . . 57
Valuation of other economic flows . . . 59
Holding gains and losses . . . 59
Other changes in the volume of assets . . . 59
Currency . . . 59
Unit of account . . . 59
Currency conversion . . . 60
Domestic and foreign currency . . . 60
Currency of denomination and currency of settlement . . . 60
Derived Measures . . . 60
Netting of Flows and Stock Positions . . . 61
Consolidation . . . 62
Definitions . . . 62
Reasons for consolidation . . . 63
Conceptual guidelines . . . 63
Implementing consolidation . . . 64
Consolidation in other datasets . . . 65
2008 System of National Accounts . . . 65
Financial statements . . . 65

4. The Government Finance Statistics Analytic Framework . . . 66
Introduction . . . 66
Analytic Objectives . . . 67
Construction of the Analytic Framework: Relation to the *GFSM 1986* . . . 67
Components and Concepts of the Analytic Framework . . . 67
The Statement of Operations . . . 69
Revenue and Expense . . . 71

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Transactions in Nonfinancial Assets . . . 71
Transactions in Financial Assets and Liabilities . . . 71
The Statement of Sources and Uses of Cash . . . 73
The Statement of Other Economic Flows . . . 74
The Balance Sheet . . . 75
Assets . . . 75
Liabilities . . . 75
The Statement of Total Changes in Net Worth . . . 76
The Summary Statement of Explicit Contingent Liabilities and Net Implicit Obligations for Future Social Security Benefits . . . 76

Annex: Using GFS for Fiscal Analysis . . . **78**
Introduction . . . 78
Fiscal Indicators Available from the GFS Framework . . . 78
Fiscal Indicators Requiring Additional Data . . . 78

5. Revenue . . . **84**
Defining Revenue . . . 84
Time of Recording and Measurement of Revenue . . . 85
The Classification of Revenue . . . 87
Taxes (11) . . . 87
GFS tax classifications in comparison with other statistical databases . . . 87
Treatment of tax refunds and tax relief . . . 89
Tax attribution . . . 90
Tax categories . . . 91
Taxes on income, profits, and capital gains (111) . . . 91
Taxes on payroll and workforce (112) . . . 92
Taxes on property (113) . . . 93
Taxes on goods and services (114) . . . 94
General taxes on goods and services (1141) . . . 94
Value-added taxes (11411) . . . 95
Sales taxes (11412) . . . 95
Turnover and other general taxes on goods and services (11413) . . . 95
Taxes on financial and capital transactions (11414) . . . 95
Excises (1142) . . . 95
Profits of fiscal monopolies (1143) . . . 95
Taxes on specific services (1144) . . . 96
Taxes on use of goods and on permission to use goods or perform activities (1145) . . . 97
Boundary with administrative fees . . . 97
Boundary with taxes on business activities levied on different bases . . . 98
Boundaries with other tax categories . . . 98
Boundary with the acquisition or use of an asset . . . 98
Other taxes on goods and services (1146) . . . 100
Taxes on international trade and transactions (115) . . . 100
Other taxes (116) . . . 101
Social Contributions [GFS] (12) . . . 102
The boundary between social contributions and other categories of taxes . . . 102
Social security contributions [GFS] (121) . . . 103
Other social contributions [GFS] (122) . . . 103
Grants (13) . . . 103
Other Revenue (14) . . . 105

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Property income [GFS] (141) . . . 105
Interest [GFS] (1411) . . . 105
Dividends (1412) . . . 106
Withdrawals of income from quasi-corporations (1413) . . . 107
Property income from investment income disbursements (1414) . . . 107
Rent (1415) . . . 107
Rent on land . . . 108
Rent on subsoil assets . . . 108
Boundary with rental of produced assets . . . 109
Boundary with taxes . . . 109
Reinvested earnings on foreign direct investment (1416) . . . 109
Sales of goods and services (142) . . . 110
Fines, penalties, and forfeits (143) . . . 111
Transfers not elsewhere classified (144) . . . 111
Premiums, fees, and claims receivable related to nonlife insurance and standardized guarantee schemes (145) . . . 112

6. Expense . . . 114
Defining Expense . . . 114
Time of Recording Expense . . . 114
The Economic Classification of Expense . . . 115
Compensation of Employees [GFS] (21) . . . 115
Wages and salaries [GFS] (211) . . . 116
Wages and salaries in cash [GFS] (2111) . . . 117
Wages and salaries in kind [GFS] (2112) . . . 118
Employers' social contributions [GFS] (212) . . . 119
Actual employers' social contributions [GFS] (2121) . . . 119
Imputed employers' social contributions (2122) . . . 119
Imputed employers' social contributions related to nonpension benefits . . . 119
Imputed employers' social contributions to employment-related pension benefits . . . 120
Use of Goods and Services (22) . . . 120
The boundary between use of goods and services and compensation of employees . . . 121
The boundary between use of goods and services and transfers . . . 122
The boundary between use of goods and services and the acquisition of nonfinancial assets . . . 123
Other boundaries related to use of goods and services . . . 124
Consumption of Fixed Capital [GFS] (23) . . . 124
Interest [GFS] (24) . . . 127
Indexation of the coupon payments only . . . 129
Indexation of the amount to be paid at maturity . . . 129
Subsidies (25) . . . 131
Grants (26) . . . 134
Social Benefits [GFS] (27) . . . 135
Other Expense (28) . . . 137
Property expense other than interest (281) . . . 137
Dividends (2811) . . . 137
Withdrawals of income from quasi-corporations (2812) . . . 138
Property expense for investment income disbursements (2813) . . . 138
Rent (2814) . . . 139
Reinvested earnings on foreign direct investment (2815) . . . 139
Transfers not elsewhere classified (282) . . . 139

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Current transfers not elsewhere classified (2821) . . . 139
Capital transfers not elsewhere classified (2822) . . . 140
Premiums, fees, and claims payable related to nonlife insurance and standardized guarantee schemes (283) . . . 141

Annex: Classification of the Functions of Government . . . **142**
Introduction . . . 142
Structure of COFOG Classifications . . . 142
Uses of COFOG . . . 142
Individual versus Collective Goods and Services . . . 144
Units of Classification . . . 145
Problems in Identifying Functions of Government . . . 145
Shared Expenditure . . . 145
Administrative Expenditure . . . 146
Subsidies . . . 146
Consumption of Fixed Capital . . . 146
Cross-Classification of Expenditure . . . 146
Detailed Classification of the Functions of Government . . . 146
General Public Services . . . 147
Defense . . . 150
Public Order and Safety . . . 150
Economic Affairs . . . 151
Environmental Protection . . . 158
Housing and Community Amenities . . . 160
Health . . . 161
Recreation, Culture, and Religion . . . 164
Education . . . 166
Social Protection . . . 168

7. The Balance Sheet . . . **171**
Introduction . . . 171
Defining Assets and Liabilities . . . 171
Ownership and the Asset Boundary . . . 171
Deriving Definitions for Assets and Liabilities . . . 173
Valuation of Assets and Liabilities . . . 175
Value Observed in Markets . . . 175
Value Obtained by Accumulating and Revaluing Transactions . . . 177
Present Value of Future Returns . . . 177
Classification of Assets and Liabilities . . . 177
Nonfinancial Assets (61) . . . 177
Fixed assets (611) . . . 178
Buildings and structures (6111) . . . 179
Dwellings (61111) . . . 179
Buildings other than dwellings (61112) . . . 180
Other structures (61113) . . . 180
Land improvements (61114) . . . 180
Machinery and equipment (6112) . . . 180
Transport equipment (61121) . . . 181
Machinery and equipment other than transport equipment (61122) . . . 181
Information, computer, and telecommunications equipment (ICT) (611221) . . . 181
Machinery and equipment not elsewhere classified (611222) . . . 181

Foreword

The international financial crisis in recent years, and the associated large fiscal deficits and rising debt levels in many countries, underscored the importance of reliable and timely statistics on the general government and public sectors. These events have shown the importance of internationally comparable data that allow detecting sources of vulnerability early and taking timely corrective measures.

One focus of the IMF's work is on increasing the availability of key economic indicators. The IMF undertakes a range of activities for this purpose, including the IMF Statistics Department's work to prepare manuals describing methodologies that should be used to compile economic and financial statistics. In this regard, I am pleased to introduce the third edition of the *Government Finance Statistics Manual.* This manual takes its place alongside the other manuals prepared by the Statistics Department, including the *Balance of Payments and International Investment Position Manual*, the *Monetary and Financial Statistics Manual, Public Sector Debt Statistics: Guide for Compilers and Users*, and the *Quarterly National Accounts Manual*. Like the other manuals, this manual is harmonized with the *System of National Accounts 2008*.

This manual represents a major step forward in clarifying the standards for compiling and presenting fiscal statistics and strengthens the worldwide effort to improve public sector reporting and transparency. Government finance statistics are a basis for fiscal analysis, and they play a vital role in developing and monitoring sound fiscal programs and in conducting surveillance of economic policies. The Executive Board of the IMF approved the use of the government finance statistics framework as the standard for presenting the Fund's fiscal data. I therefore urge member countries to adopt the guidelines of the manual as the basis for compiling and disseminating government finance statistics, and for reporting this information to the Fund.

This manual has been prepared by the Statistics Department in close consultation with the Government Finance Statistics Advisory Committee, established to provide expert opinions from a broad range of countries and international organizations. The changes to the manual and revised text were posted on the website of the IMF for worldwide comments from compilers and users. The process underlying the revision of the manual demonstrates the spirit of international collaboration and cooperation. I would like to thank all of the experts involved for their invaluable assistance and for their collaborative and cooperative spirit.

Christine Lagarde

Preface

The *Government Finance Statistics Manual 2014* (*GFSM 2014*) is part of a series of international guidelines on statistical methodologies that have been issued by the International Monetary Fund. The *Manual* updates the *Government Finance Statistics Manual 2001*, and is the third edition of guidelines that describe a specialized macroeconomic statistical framework, the government finance statistics (GFS) framework, designed to support fiscal analysis. The *Manual* was produced by the IMF's Statistics Department in fulfillment of its mission to provide strong leadership for the development and application of sound statistical practices, and is published in service of the worldwide trend toward greater accountability and fiscal transparency.

The *Manual* is designed for use by compilers of GFS, fiscal analysts, and other users of fiscal data. It may also be informative to compilers and users of other macroeconomic statistics in understanding the relations between the various sets of macroeconomic statistics, in particular, to compilers of the national accounts who may depend on GFS as an input to their work. The guidelines also explain the relationship of GFS with internationally accepted accounting standards and may therefore be useful for those involved in reforming government accounting systems. The *Manual* is focused, however, on conceptual descriptions of definitions, classifications, and conceptual guidelines for compiling and disseminating GFS, and, as such, it does not describe the methods to be used to compile the statistics.

The *GFSM 2014* is supplemented by practical guidance on the compilation of the statistics provided in *Government Finance Statistics: Compilation Guide for Developing Countries 2011* and *Quarterly Government Finance Statistics: Guide for Compilers and Users*, as well as through technical assistance and training work with individual countries. However, the text of these practical guidelines is not intended to take precedence over the methodological guidance provided in the *Manual*. In addition to this English language version, the *Manual* will be published in Arabic, Chinese, French, Russian, and Spanish.

Fiscal analysis continues to evolve in response to the growing complexity of formulating and evaluating fiscal policies. In particular, globalization increases demands for internationally comparable data, while concerns about the sustainability of fiscal policies increase demands for information on the balance sheets of government and the broader public sector. Moreover, because of the demand for cross-sectoral consistency in macroeconomic data, the concepts and principles set out in the *Manual* are harmonized with those of the *System of National Accounts 2008* (*2008 SNA*) and the sixth edition of the *Balance of Payments and International Investment Position Manual* (*BPM6*). For consistent guidance on debt-related issues, the *GFSM 2014* is also supplemented with the *Public Sector Debt Statistics: A Guide for Compilers and Users* (*PSDS Guide*) and the *External Debt Statistics: Guide for Compilers and Users 2013* (*2013 EDS Guide*).

The *GFSM 2014* recommends disseminating fully integrated flows and stock positions, recorded on an accrual basis, while maintaining cash-flow data to allow an assessment of the liquidity constraints of government. It is recognized that the implementation of the fully integrated system described in the *Manual* will take some time and will need to progress at a pace determined by the differing needs and circumstances of the country involved. In particular, many countries will need to revise their underlying accounting systems to reflect the accrual basis of recording and revised classifications.

Acknowledgments

The preparation of *GFSM 2014* was a complex endeavor involving a number of people with different skills who were able to build on each other's work over an extended period. The *Manual* was produced under the direction of two directors of the Statistics Department: Ms. Adelheid Burgi-Schmelz (2009–2012) and Mr. Louis Marc Ducharme (2013–).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

The work was supervised by Mr. Robert Heath (Deputy Director), Ms. Claudia Dziobek (Chief, Government Finance Division), and Mr. Robert Dippelsman (former Deputy Chief, Government Finance Division), all from the Statistics Department. Ms. Sagé De Clerck (Senior Economist, Government Finance Division, Statistics Department) was the primary drafter and also coordinated and edited contributions to the *Manual*. Many staff in the Government Finance Division contributed to the project, in particular, Mmes. Majdeline El-Rayess, Viera Karolova, Phebby Kufa, and Kara Rideout, and Messrs. Miguel Alves, Alberto Jiménez de Lucio, Gary Jones, Mike Seiferling, Philip Stokoe, Deon Tanzer, and Tobias (Murto) Wickens. Contributions were also made by former staff members and experts in GFS including Mmes. Brigitte Batschi, Paola De Rita, Irina Dubinina, and Betty Gruber, and Messrs. Ismael Ahamdanech-Zarco, Johann Bjorgvinsson, Paul Cotterell, Jean-Pierre Dupuis, Cor Gorter, Carlos Gutierrez, Héctor Hernández, Ciaran Judge, Leonard Haakman, Brooks Robinson, and Vincent Marie. Mmes. Katy Hurston and Sheridan Parsonson supported the preparation of discussion papers and prepared drafts for publication. Current and former staff from other divisions of the Statistics Department also contributed to the project, including the Balance of Payments Division (Ms. Rita Mesias and Mr. Marcelo Dinenzon); Financial Institutions Division (Messrs. Jose Cartas, Thomas Elkjaer, and Richard Walton); and Real Sector Division (Messrs. Manik Shrestha and Daniel Smith).

Current and former staff from other departments of the IMF also contributed to the *Manual*. In particular, collaboration between the IMF's Statistics and Fiscal Affairs Departments is acknowledged. Contributors from the Fiscal Affairs Department included Mmes. Adrienne Cheasty, Chita Marzan, Delphine Moretti, Isabel Rial, and Christine Richmond, and Messrs. Sanjeev Gupta, Richard Hughes, Tim Irwin, Kris Kaufman, Abdul Khan, Geremia Palomba, and Shamsuddin Tareq. Contributors from the Finance Department included Mmes. Sheila Basset, Elena Budras, Mary Hoare, and Jane Mburu, and Messrs. Preet Bhullar, Claudio De Luca, Carlos Janada, and Barry Yuen. A contribution was also received from the Research Department (Mr. Manmohan Singh).

Government Finance Statistics Advisory Committee

The *GFSM 2014* greatly benefited from meetings of the Government Finance Statistics Advisory Committee that were convened in February 2011 and May 2012. The *GFSM 2014* benefited from the discussions, written contributions, and comments of members of the committee and the organizations they represented.

1 Introduction

This chapter describes the purpose and evolution of this Manual, the uses of government finance statistics, the structure of the government finance statistics framework, major methodological changes from the previous editions of this Manual, the implementation of the methodology, and the structure of this Manual.

Purpose of the *Manual*

1.1 The *Government Finance Statistics Manual 2014* (*GFSM 2014*)—the third edition of this *Manual*[1]—describes a specialized macroeconomic statistical framework, the government finance statistics (GFS) framework, designed to support fiscal analysis. The *Manual* (i) provides the economic and statistical reporting principles to be used in compiling the statistics; (ii) describes guidelines for presenting fiscal statistics within an analytic framework that includes appropriate balancing items;[2] and (iii) is harmonized with other macroeconomic statistical guidelines. The *Manual* does not treat systematically the practical aspects of compiling the statistics.[3]

1.2 **Fiscal policy** is the use of the level and composition of the general government and public sectors' spending and revenue—and the related accumulation of government assets and liabilities—to achieve such goals as the stabilization of the economy, the reallocation of resources, and the redistribution of income. The primary purpose of the *GFSM 2014* is to provide a comprehensive conceptual and reporting framework suitable for analyzing and evaluating fiscal policy, especially the performance of the general government sector and the broader public sector of any economy. These concepts of sectors are described in Chapter 2. In short, the **general government sector** consists of resident institutional units that fulfill the functions of government as their primary activity. This sector includes all government units and all nonmarket, nonprofit institutional units (NPIs) that are controlled by government units. The function of government units, broadly described, is to implement public policy through the provision of primarily nonmarket goods and services and the redistribution of income and wealth, with both activities supported mainly by compulsory levies on other sectors. The **public sector** consists of all resident institutional units controlled directly, or indirectly, by resident government units—that is, all units of the general government sector and resident public corporations.

1.3 Fiscal statistics have traditionally been used to analyze the size of government; its contribution to aggregate demand, investment, and saving; the impact of fiscal policy on the economy, including resource use, monetary conditions, and national indebtedness; the tax burden; tariff protection; and the social safety net. In addition, analysts have become increasingly interested in fiscal rules, structural deficits, assessing the effectiveness of spending on poverty alleviation, the sustainability of fiscal policies, net debt, net wealth, and contingent claims against government, including the obligations for social security pensions. See the annex to Chapter 4 for the description of the use of GFS in fiscal analysis.

1.4 The *GFSM 2014* supports the compilation of internationally comparable statistics for the general government sector, the public sector, and their subsectors.

[1] The first edition was published in 1986 with the title *A Manual on Government Finance Statistics*. It is referred to as the *GFSM 1986*. The second edition was published in 2001 with the title *Government Finance Statistics Manual 2001*. It is referred to as the *GFSM 2001*.

[2] Balancing items summarize the net value of the activities covered by a set of reporting entries, such as the net value of total revenue minus total expense. Chapter 4 provides details on the GFS analytic framework and its balancing items.

[3] Guidance on compilation practices can be found in *Government Finance Statistics: Compilation Guide for Developing Countries, 2011, Quarterly Government Finance Statistics: Guide for Compilers and Users*, and other related material.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Public corporations, nonfinancial as well as financial, can carry out government fiscal policies in a variety of ways, and analysis of their fiscal activities frequently requires statistics on all of their activities rather than statistics on specific transactions. Even when statistics are compiled for only the general government sector, some information on public corporations is required. To reflect transactions with public corporations, the change in the level of equity ownership held by units of the general government sector and the exposure to risks associated with guarantees provided to these corporations should be recorded.

1.5 The basic concepts, classifications, and definitions employed in this *Manual* reflect economic principles that should be universally valid regardless of the circumstances in which they are applied. Therefore, the GFS framework is applicable to all types of economies regardless of the institutional or legal structure of a country's government, the sophistication of its statistical development, the financial accounting system of government, or the extent of public ownership of for-profit entities. Nevertheless, the fact that the institutional and economic structures of countries differ greatly means that the various parts of this *Manual* will not be equally relevant.

The Evolution of International Statistical Guidelines on GFS

History

1.6 The evolution of international statistical guidelines for compiling GFS started in the early 1970s, with a draft of *A Manual on Government Finance Statistics*. This draft was circulated in English, Spanish, and French to governments, central banks, central statistical offices, and international organizations for comments, and was also discussed at several regional seminars. Based on comments received and the application of the earlier draft in compiling data for the IMF's *Government Finance Statistics Yearbook*, *A Manual on Government Finance Statistics, 1986* (*GFSM 1986*) was published. The *GFSM 1986* provided guidance to compile GFS but was not directly aligned with other macroeconomic statistics.

1.7 The *Government Finance Statistics Manual 2001* (*GFSM 2001*) updated the internationally recognized guidelines for compiling statistics required for fiscal analysis that were established by the *GFSM 1986*. The revised guidelines were harmonized with the corresponding standards of other internationally recognized macroeconomic statistical guidelines to the extent possible, consistent with the goal of supporting fiscal analysis. Also, the revised guidelines incorporated, for the first time, an integrated balance sheet approach to compiling and presenting GFS.

The Update of the GFSM 2001

1.8 The *GFSM 2014* updates the internationally recognized guidelines for compiling statistics required for fiscal analysis that were established by the *GFSM 2001*. The revised guidelines are harmonized with the updates in other macroeconomic statistical manuals and guides. The other statistical manuals are the overarching *System of National Accounts 2008* (*2008 SNA*)[4] and two specialized manuals: the sixth edition of the *Balance of Payments and International Investment Position Manual* (*BPM6*)[5] and the *Monetary and Financial Statistics Manual* (*MFSM*).[6] The updates to these manuals draw on the text of the *2008 SNA* to avoid an inference that a different meaning is intended.[7] For debt-related issues, the *GFSM 2014* is supplemented with the *Public Sector Debt Statistics: A Guide for Compilers and Users* (*PSDS Guide*) and the *External Debt Statistics: Guide for Compilers and Users, 2013* (*2013 EDS Guide*).

1.9 The revised manuals and guides address important international economic developments in recent years and take into account improved recording and methodological treatments of various types of events. Furthermore, the development of *International Public Sector Accounting Standards* and continued efforts to harmonize statistical reporting and financial reporting have led to additional changes incorporated in the

[4] Commission of the European Communities, International Monetary Fund, Organisation for Economic Co-operation and Development, United Nations, World Bank, *System of National Accounts 2008* (Brussels/Luxembourg, New York, Paris, Washington, 2009).
[5] International Monetary Fund, *Balance of Payments and International Investment Manual, 6th ed.* (Washington, 2009).
[6] *Monetary and Financial Statistics Manual* (Washington, 2000)—revision of the *MFSM, 2000 edition*, to also align with the *2008 SNA*, is pending at the time of publication of *GFSM 2014*.
[7] This manual also draws on United Nations, *Classifications of Expenditure According to Purpose* (New York, 2000) for the *Classification of Functions of Government* introduced in Chapter 6.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

GFSM 2014. The changes incorporated in *GFSM 2014* can broadly be summarized as[8]

- Methodological changes in the *2008 SNA*
- Clarifications of existing methodological guidelines
- Presentational changes
- Editorial changes.

Uses of the GFS Framework

1.10 The GFS framework is designed to provide statistics that enable policymakers and analysts to study developments in the financial operations and financial position of government. GFS also allow an assessment of the liquidity and sustainability of the finances of the general government sector or the public sector in a consistent and systematic manner. The GFS framework can be used to analyze the operations of a specific level of government, transactions between levels of government, and the public sector.

1.11 The GFS framework produces summary information on the overall performance and financial position of the general government or public sector through the use of balancing items, such as the net operating balance, net lending/net borrowing, and the change in net worth. These balancing items are defined and measured within the integrated and comprehensive GFS reporting framework.

1.12 In contrast to summary measures, the detailed data of the GFS framework can be used to examine specific areas of government operations. For example, one might want information about particular forms of taxation, the level of expense incurred on a type of social service, or the amount of government borrowing from deposit-taking corporations.

1.13 The harmonization of the GFS framework with other macroeconomic datasets means that data from GFS can be utilized as source data, or can be combined with data from other datasets to assess general government or public sector developments in relation to the rest of the economy. Similarly, the establishment of internationally recognized statistical guidelines permits GFS to be used in cross-country analyses of government operations and stock positions, such as comparisons of ratios of taxes, expense, or debt to gross domestic product.

Structure and Features of the GFS Framework

1.14 The GFS framework pertains to the general government and public sectors as defined in the *2008 SNA* and Chapter 2 of this *Manual*. These sectors are defined in terms of institutional units, which are economic entities that are capable, in their own right, of owning assets, incurring liabilities, and engaging in economic activities and transactions with other entities.

1.15 Stock positions and economic flows are integrated in the GFS framework and are presented in several statements, as described in Chapter 4. Two types of economic flows are recorded in the GFS framework: transactions and other economic flows.[9] For the most part, transactions are interactions between two institutional units that take place by mutual agreement. The *Statement of Operations* and the *Statement of Sources and Uses of Cash* record the results of all transactions during a reporting period. They are classified as revenue, expense, net investment in nonfinancial assets, net acquisition of financial assets, or net incurrence of liabilities. Transactions that generate revenue or expense result in a change in net worth. All other types of transactions result in equal changes to assets and/or liabilities and do not result in a change to net worth.

1.16 Other economic flows include price changes and a variety of other economic events that affect the holdings of assets and liabilities, such as debt write-offs and catastrophic losses. The *Statement of Other Economic Flows* summarizes these changes in assets, liabilities, and net worth.

1.17 The *Balance Sheet* for the general government or public sector is a statement of the stock positions of nonfinancial and financial assets owned, the stock positions of claims of other units on the general government or public sector in the form of liabilities, and the sector's net worth, equal to the total value of all assets minus the total value of all liabilities.

[8] The major changes are described in more detail in Appendix 1.

[9] Economic flows reflect the creation, transformation, exchange, transfer, or extinction of economic value. Transactions and other economic flows are defined and described in more detail in Chapter 3.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

1.18 In addition to the core statements in the GFS framework, two supplementary statements are included due to their analytic usefulness. To provide a clear statistical explanation of the factors causing changes in net worth, the *Statement of Total Changes in Net Worth* combines the results of the *Statement of Operations* and the *Statement of Other Economic Flows* in one statement.

1.19 Contingencies, such as loan guarantees and implicit guarantees to provide social benefits when various needs arise, can have important economic influences on the general economy but do not result in transactions or other economic flows recorded in the GFS framework until the event or condition referred to actually occurs. A second supplementary statement, the *Summary Statement of Explicit Contingent Liabilities and Net Obligations for Future Social Security Benefits*, summarizes the explicit and some implicit contingent liabilities.

1.20 The comprehensive treatment of transactions and other economic flows in the GFS framework provides a full explanation of the changes between the opening and closing balance sheet stock positions. That is, the stock position of a given type of asset or liability at the beginning of a reporting period plus the changes in that asset or liability indicated by transactions and other economic flows equals the stock position at the end of the period. Such an integrated statistical framework permits the effects of policies and specific economic events to be described and analyzed fully.

1.21 Various classifications are applied to the economic flows and stock positions recorded in the GFS framework. For example, each revenue transaction is classified according to whether it is a tax or another type of revenue; expense transactions are classified by purpose (functional classification) and by economic type (economic classification); assets are classified according to whether they are financial or nonfinancial; and financial assets and liabilities are classified by type of instrument, maturity, and the sector of the unit that issued the asset or that holds the liability.

1.22 Despite harmonization of the GFS framework with the *2008 SNA*, there are differences between the two statistical frameworks because of the different analytic purposes they serve. The most important difference is that the focus of the GFS framework is the impact of economic events on government finances—taxing, spending, borrowing, and lending—while the *2008 SNA* also focuses on the production and consumption of goods and services. As a result, the treatment of government production activities in GFS differs from the treatment of those activities in the *2008 SNA*. Significant differences relate to the treatment of own-account capital formation, and the degree of consolidation. In addition, the recording of pension schemes for government employees may be different from the *2008 SNA* in some circumstances (see Appendix 7 for more details on the relationship between GFS and other macroeconomic statistics).

1.23 In many cases, compiling GFS will be the first step in compiling statistics for the general government sector of the national accounts. For this reason, some data that normally would not appear in a standard GFS presentation should be maintained in underlying source data because they are needed for the national accounts. For example, the detailed classification of subsidies in GFS is based on the nature of the recipient of the subsidy, while classification in the *2008 SNA* is based on whether the subsidy is on a product or production.

1.24 Definitions of concepts in the GFS framework are the same as in the *2008 SNA*, but the coverage of a particular category of transactions may be slightly different. For example, compensation of employees recorded as an expense in GFS does not include the compensation of employees engaged in own-account capital formation, but can be reconciled with compensation of employees in the *2008 SNA* that includes the compensation of all employees. The definition and composition of compensation of employees, however, are identical in both frameworks. To note where the coverage or some other aspect of a concept differs from the same concept in the *2008 SNA*, the indicator "[GFS]" is added after the GFS title and an explanation of the difference is provided.

Methodological Differences with the *GFSM 1986*

1.25 The methodology for compiling GFS described in this *Manual* differs substantially from the methodology of the *GFSM 1986*. The following paragraphs summarize the major differences. Details are provided in Appendix 1.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Coverage

1.26 The coverage of the GFS framework is the general government sector as defined in the *2008 SNA*, which is defined on the basis of institutional units. To capture the fiscal transactions and activities taking place outside the general government sector, the GFS framework should also be used to compile statistics for the public sector and its subsectors. The coverage of the *GFSM 1986* is defined on a functional basis under which general government data include all the relevant transactions of any unit carrying out a function of government. Therefore, some transactions of units of the broader public sector carrying out functions of government are included in general government data, unlike *GFSM 2014*. In addition, some transactions are excluded from general government data in *GFSM 1986* as they relate to production or market trading activities.

Basis of Recording Economic Events

1.27 The GFS framework records economic flows on an accrual basis, which means that flows are recorded at the time economic value is created, transformed, exchanged, transferred, or extinguished. However, the framework also encompasses the traditional cash-based reporting. In the *GFSM 1986*, transactions are recorded only when cash is received or paid.

1.28 Using the accrual basis of recording also means that nonmonetary transactions are fully integrated in the GFS framework. In the *GFSM 1986*, only selected nonmonetary transactions are recorded as memorandum items.

Valuation

1.29 Economic flows as well as assets, liabilities, and net worth are valued at current market prices in the GFS framework. While current market prices are readily available for assets and liabilities that are traded in active markets, valuation according to market-value equivalents is used for valuing assets and liabilities that are not traded in markets, or are traded only infrequently. In the *GFSM 1986*, debt securities are valued at the amount the government is obligated to pay when the debt matures (face value), which may differ from both the nominal value and the current market value.

Balance Sheets

1.30 Complete balance sheets, which include all stock positions of nonfinancial and financial assets, liabilities, and net worth, are included in the GFS framework. The *GFSM 1986* reports only on the stock positions of certain debt liabilities.

Integration of Flows and Stock Positions

1.31 The comprehensive recording of transactions and other economic flows permits a full integration of economic flows and stock positions and the reconciliation of differences between the opening and closing balance sheets. In the *GFSM 1986*, such a reconciliation of the stock positions of the debt liabilities is not possible without collecting additional information.

The Analytic Framework

1.32 In the GFS framework, several balancing items are introduced. The multiple balancing items facilitate analysis of the general government sector or the public sector based on a variety of considerations rather than a single measure. In the *GFSM 1986*, the emphasis of the analytic framework is focused on a single balancing item, the overall deficit/surplus.

1.33 The GFS framework's use of definitions of revenue and expense as transactions that bring about changes in net worth leads to a different treatment of transactions in nonfinancial assets. The *GFSM 1986* treats cash transactions in nonfinancial assets as capital revenue and expenditure, which affected the overall deficit/surplus. In the GFS framework, the difference between revenue and expense is a balancing item, the *net operating balance*, measuring the change in net worth resulting from transactions—it is a sustainability measure before considering the net investment in nonfinancial assets.

1.34 In the GFS framework, all transactions involving the acquisition or disposal of financial assets are treated as financing transactions, and *net lending (+) / net borrowing (–)* is a balancing item calculated as the *net operating balance* minus the *net investment in nonfinancial assets*. *Net lending/net borrowing* is also equal to the *net acquisition of all financial assets* minus the *net incurrence of all liabilities* from transactions. In the *GFSM 1986*, the net acquisition of financial assets for policy purposes is designated as lending minus repayments and treated like expenditure in deriving the overall deficit/surplus. In the *GFSM 2014* framework, the

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

supplementary fiscal indicators include the calculation of an *overall fiscal balance* that treats the net acquisition of selected financial assets similarly to the net acquisition of financial assets for policy purposes in the *GFSM 1986* (see the annex to Chapter 4).

Harmonization with Other Methodologies

1.35 Recognizing the important linkages between GFS and other macroeconomic datasets, this *Manual* is more closely harmonized with the *2008 SNA* and *BPM6* than was the case for the *GFSM 1986*. Where differences exist due to the different analytic purposes of various datasets, guidance is provided on the reconciliation between datasets to ensure consistency (see Appendix 7). Also, recognizing the close relationship that exists between GFS and accruals-based public sector accounting standards, the systematic documentation of similarities and differences between statistical guidelines and accounting standards has informed changes in both. Therefore, the *GFSM 2014* is also more closely harmonized with accounting standards than was the case with the *GFSM 1986* (see Appendix 6).

Implementation of the GFS Framework

1.36 Some countries may be able, at least initially, to compile only a part of the integrated GFS framework. It is not feasible to lay down general priorities for data collection when economic circumstances may vary widely from one country to another. In practice, priorities usually are best established by national authorities that are familiar with the situation, needs, and challenges of their countries.

1.37 It is recognized that the implementation of the fully integrated GFS framework presented in this *Manual* will take some time. In particular, many countries will need to revise their underlying accounting systems to accommodate the accrual basis of reporting and fully reflect the revised classifications of the GFS framework.[10]

1.38 Nonetheless, it is likely that many countries will follow a similar path as they implement the GFS framework. For example, a possible first step on the migration path could be that countries would adopt the classification structure of the *Statement of Operations* or the *Statement of Sources and Uses of Cash* and adjust their cash-based statistics to address known deficiencies, such as by incorporating information on revenue or expense arrears. Another step could be the assembly of balance sheet information on financial assets and liabilities that would allow estimates to be made of the other economic flows as they relate to these financial instruments. A more difficult step is likely to be the collection of a complete set of information about the stock positions of nonfinancial assets held at a given time and their valuation at current market prices. Finally, a fully developed accrual accounting system could be introduced that provides for complete and fully integrated balance sheets to be prepared.

1.39 Good dissemination practices are essential in addition to good data compilation. As well as provision of metadata, aspects of good dissemination practices include a predictable release schedule, readily accessible published data, and identification of internal government access to statistics before public release. In recent years, international guidelines have been developed on good data dissemination practices—namely, the IMF's *General Data Dissemination System, Special Data Dissemination Standard*, and *Special Data Dissemination Standard Plus*.[11]

Structure of the *Manual*

1.40 The remainder of this *Manual* can be divided into two general topics. Chapters 2 through 4 develop the concepts used in the framework, and Chapters 5 through 10 describe the classifications used and the types of economic flows or stock positions included in each classification category.

1.41 Chapter 2 describes the coverage of the general government and public sectors, and their subsectors. Chapter 3 first explains the concepts of transactions, other economic flows, and stock positions of assets and liabilities. It then describes the accounting rules governing their recording, including timing, valuation, and consolidation. Chapter 4 presents the analytic framework, which is the integrated presentation of transactions, other economic flows, and stock

[10] Although the GFS framework uses some accounting terms, it is important to remember that it is a statistical reporting framework that might differ in important ways from the underlying financial accounting system from which most of GFS will be derived (see Appendix 6).

[11] http://dsbb.imf.org.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

positions in a manner that permits the calculation of aggregates and balancing items as summary measures of the activities of the general government and public sectors.

1.42 Chapters 5 through 10 describe the classifications of transactions, other economic flows, and stock positions of assets and liabilities. Chapter 5 is devoted to revenue transactions, which increase net worth. Chapter 6 is devoted to expense transactions, which decrease net worth. Chapter 7 describes the balance sheet and the classification of stock positions of assets and liabilities. Chapter 8 provides a classification of transactions in nonfinancial assets, while Chapter 9 provides a classification of transactions in financial assets and liabilities. Chapter 10 covers other economic flows.

1.43 An annex to Chapter 4 describes the use of GFS to build well-defined indicators for fiscal analysis, while an annex to Chapter 6 describes the *Classification of the Functions of Government* (*COFOG*).

1.44 This *Manual* includes nine appendixes. Appendix 1 lists the methodological changes from the *GFSM 2001* to this *Manual*, and the differences of the *GFSM 2014* framework from the *GFSM 1986*. Appendix 2 describes the various organizational structures used to provide social protection and the associated statistics compiled for the general government and public sectors. Appendix 3 provides guidance on selected public sector debt issues. Appendix 4 covers a description of cross-cutting issues such as the recording of leases, licenses, permits and other contracts, public-private partnerships, and insurance and standardized guarantee schemes. Appendix 5 elaborates on the implications of regional arrangements for GFS compilation. In Appendix 6, a description of the relationship between GFS and *International Public Sector Accounting Standards* is provided, while Appendix 7 describes the relationship between GFS and other macroeconomic statistics. Appendix 8 provides the classification codes used in the GFS framework. Appendix 9 contains a glossary of terms used in the GFS framework.

2 Institutional Units and Sectors

This chapter defines and describes the concepts of residence, institutional units, and sectors, and then uses those concepts to delineate the general government and public sectors, and to discuss practical applications of sector classification principles.

Introduction

2.1 In principle, GFS should cover all entities that materially affect fiscal policies. Normally, fiscal policies are carried out by entities, established by political processes, wholly devoted to the economic functions of government (see paragraph 2.38), such as government ministries or municipal councils. The term "government" is often used as a collective noun for various combinations of entities in a country involved in the functions of government, or reference is made to the various individual governments of a country. For example, a country may have one central government; several state, provincial, or regional governments; and many local governments. Nonprofit institutions under government control may also exist. In addition to those entities, government-owned or controlled enterprises that engage in some commercial activities may be instruments of fiscal policy (see paragraphs 2.104–2.105). These government-owned enterprises, such as the central bank, post office, or railroad, which are often referred to as public corporations, state-owned enterprises, or parastatals in a legal sense, may be part of the general government or public sector, and statistics should be compiled for all of them.

2.2 Determining the coverage of the entities included in GFS requires determining economic territory, using the residence criteria (see paragraph 2.6), before considering two questions. First, what is the statistical unit for which it is feasible and meaningful to collect statistics? Second, which of those statistical units should be included in GFS?

2.3 The statistical unit employed in the institutional sector classification in GFS is the institutional unit, the same unit that is the foundation of the *2008 SNA* and other macroeconomic datasets.[1] This chapter therefore defines (see paragraph 2.22), and describes, types of institutional units (see paragraph 2.26).

2.4 Regarding the coverage of GFS, two principal constructs are used in macroeconomic datasets. First, the general government sector, which is primarily engaged in nonmarket activities, is defined (see paragraph 2.58). Second, the public sector is defined to also capture the market activities and the quasi-fiscal operations of public corporations (see paragraph 2.63) such as the central bank and other public corporations. **Quasi-fiscal operations** are government operations carried out by institutional units other than general government units. These quasi-fiscal operations have the same fiscal policy impact on the economy as those of government units (see paragraph 2.38). A number of subsectors of the general government and public sectors are also defined because of their analytical usefulness.

2.5 The remainder of this chapter defines the concept of residence to delineate an economy, and describes institutional units and the types of institutional units that exist in macroeconomic statistics before defining the institutional sectors. The chapter applies these concepts to delineate the general government sector and the public sector. Finally, a decision tree to assist with the classification of public sector entities and the application of sector classification principles to some examples are discussed.

[1] Maintaining a list or register of these units and their sector classification will ensure consistent classification in all macroeconomic datasets.

Residence

2.6 An **economy** consists of a set of resident institutional units. As is the case for other macroeconomic statistics, the concept of residence is important for determining the coverage of institutional units and the classification of transactions. Also, as described in later chapters (see paragraphs 5.101–5.103, 6.93, and 7.264–7.265), some types of flows and stock positions of assets and liabilities of general government and public sector units are classified in GFS on the basis of the counterparty to a financial instrument, where one of the classification criteria is the residence of the counterparty.

2.7 The **residence** of each institutional unit is the economic territory with which it has the strongest connection (i.e., its center of predominant economic interest).[2] According to international statistical guidelines, residence is not based on nationality or legal criteria, although it may be similar to the concepts of residence used in many countries for exchange control, taxes, or other purposes. Nonresidents are units that are resident in any other economic territory, and for convenience they are referred to as the "rest of the world."

2.8 Economic territory, in its broadest sense, can be any geographic area or jurisdiction for which statistics are required. The most commonly used concept of economic territory is the area under the effective economic control of a single government. The concept of economic territory in GFS is the same as that used in other macroeconomic datasets. The connection of entities to a particular economic territory is determined from aspects such as physical presence and being subject to the jurisdiction of the government of the territory. However, economic territory need not be identical to its physical or political borders, and may be larger or smaller than this, as in a currency or economic union, or as part of an economy, region, or the world as a whole.

2.9 Economic territory includes:

- The land area
- Airspace
- Territorial waters, including areas over which jurisdiction is exercised over fishing rights and rights to fuels or minerals
- In a maritime territory, islands that belong to the territory
- Territorial enclaves in the rest of the world (such as embassies, consulates, military bases, scientific stations, information or immigration offices, aid agencies, central bank representative offices with diplomatic status).

2.10 Territorial enclaves are physically located in other territories and used by governments that own or rent them for diplomatic, military, scientific, or other purposes with the formal agreement of governments of the territories where the land areas are physically located. These areas may be shared with other organizations, but the operations must have a high degree of exemption from local laws to be treated as an enclave. Government operations that are fully subject to the laws of the host economy are not treated as enclaves, but as residents of the host economy. Conversely, the economic territory of a country does not include the territorial enclaves that are physically located within the geographical boundaries of that country that are used by foreign governments or international organizations and are not subject to the laws of that host country.

2.11 Sometimes a government has a separate physical or legal zone that is under its control, but for which, to some degree, separate laws are applied. For example, a free trade zone or offshore financial center may be exempt from certain taxation or other laws. Because of the need to view the whole economy, to have comprehensive global data, and to be compatible with counterpart data, these special zones should always be included in the economic statistics of the economy that exercises control over the separate physical or legal zone.[3]

2.12 An institutional unit has a **center of predominant economic interest** in an economic territory when there exists, within the economic territory, some location, dwelling, place of production, or other premises on which, or from which, the unit engages

[2] Residence is primarily defined in the *BPM6*, paragraphs 4.113–4.144, and also discussed in the *2008 SNA*, paragraphs 4.10–4.15, and Chapter 26.

[3] Where analytically useful, data for these zones could be presented separately, before they are consolidated with those of the remainder of the economy.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

and intends to continue engaging, either indefinitely or over a finite but long period of time, in economic activities and transactions on a significant scale. The location need not be fixed so long as it remains within the economic territory. Actual or intended location for one year or more is used as an operational definition; while the choice of one year as a specific period is somewhat arbitrary, it is adopted to avoid uncertainty and facilitate international consistency.

2.13 A **notional resident** unit is a unit identified for statistical purposes to be the resident owner of immovable assets legally owned by nonresidents. Immovable assets, such as land, other natural resources, buildings, and structures, are always treated as being owned by resident units. If the legal owner of these types of assets is a nonresident, a notional resident unit is created. The notional resident unit is recorded as owning the asset and receiving the rent or rentals that accrue to the asset. The legal owner is deemed to hold equivalent equity in the notional resident unit and then receives income from the notional resident unit in the form of property income paid abroad. If a building or structure is owned in part by a resident unit and in part by one or several nonresidents, there is one notional resident unit established. Each of the owners has a proportionate share of the equity of the notional resident unit. Land and buildings in extraterritorial enclaves of foreign governments (such as embassies, consulates, and military bases) that are subject to the laws of the home territory and not those of the territory where they are physically situated are part of the economic territory of the home economy (home territory).

2.14 On the basis of the definition of residence, all general government units are considered to be residents in their own country regardless of their physical location. Public corporations, however, are considered to be residents of the economies in whose territories they operate. Thus, a general government unit resident in one country can own a corporation resident in a second country. Corporations subject to the control of a government that is resident in a different economy are not classified as public corporations; these are classified as private corporations in the economy in which they are resident. This is because they are not public corporations related to the government of their economy of residence.

2.15 The case of "special purpose entities" (SPEs), "brass plate companies," or "shell companies" requires particular consideration. These entities may have little or no physical presence in the economy in which they are legally constituted or legally domiciled (e.g., registered or licensed), and any substantive work of the entity may be conducted in another economy. In such circumstances, residence is attributed to the economy in which the entity is legally constituted, or in the absence of legal incorporation, is legally domiciled. However, the fiscal activities of nonresident government-controlled SPEs should be reflected in GFS (see paragraphs 2.136–2.139).

2.16 The economic territory of an international organization that has all the essential attributes of an institutional unit (see paragraph 2.22) consists of the territorial enclaves over which it has jurisdiction. International organizations have the following special characteristics:

- The members of an international organization are either national states or other international organizations whose members are national states; they thus derive their authority either directly from the national states that are their members or indirectly from them through other international organizations.
- They are entities established by formal political agreements between their members that have the status of international treaties; their existence is recognized by law in their member countries.
- Because they are established by international agreement, they are accorded sovereign status—that is, international organizations are not subject to the laws or regulations of the country, or countries, in which they are located.
- They are created for various purposes, such as international financial organizations (e.g., the International Monetary Fund, World Bank, and Bank for International Settlements) or to provide nonmarket services of a collective nature for the benefit of their member states (e.g., peacekeeping, health, and governing certain aspects of the economic relationships or integration processes among the region's economies).

As a result, international organizations are not considered residents of any national economy, including the country in which they are located or conduct their affairs.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

2.17 International organizations may be global or regional. Regional organizations arise from regional arrangements such as customs unions, economic unions, and monetary and currency unions.[4] Regional organizations consist of those institutions whose members are governments or monetary authorities[5] of economies that are located in a specific region of the world. They can be financial, such as regional development banks, or nonfinancial, such as entities involved in the governance of economic unions. Regional organizations are not resident units of any country.

2.18 Some regional organizations have been endowed with the authority to raise taxes or other compulsory contributions within the territories of the countries that are members of the organization. These are sometimes described as "supranational authorities." Despite the fact that they fulfill some of the functions of government within each member country, they are not resident units of any country.

2.19 Financial positions between the regional organization and resident institutional units outside the general government or public sectors are not included in the public sector statistics of a member country because these organizations are not residents of that country. When GFS are compiled for regional organizations as if they constituted a separate government, this *Manual* recommends that financial positions be classified according to the member country that is the counterparty to allow individual countries to evaluate the impact of regional organizations on their economy.

2.20 In contrast to regional organizations, which perform governmental functions, there may be regional enterprises that are owned by two or more governments and that operate as market producers. If the enterprise has legal entities or separate branches in each economy in which it operates, then identification of these units and determination of their residence in the host economy of each of the branches are obvious. However, if they operate as a seamless entity in several economies, then the enterprise's operations are prorated between the economies, so that they are included in the public sector statistics in the national economies in which they operate. The procedures should be applied consistently with the recording in other macroeconomic statistics.[6]

2.21 A currency union central bank is an international financial organization that acts as a common central bank for a group of member countries. A currency union central bank is an institutional unit in its own right, owning assets and liabilities on own account, and is nonresident of any currency union member economy but resident in the currency union. Such a bank typically has the headquarters located in one country of the currency union and maintains national offices in each of the member countries to conduct some central bank functions. Each national office acts as the central bank for that country and is treated as a resident institutional unit in that country. The headquarters, however, is an international organization.

Institutional Units[7]

Definition of an Institutional Unit

2.22 An **institutional unit** is an economic entity that is capable, in its own right, of owning assets, incurring liabilities, and engaging in economic activities and in transactions with other entities. Some important features of institutional units are:

- The ability of an institutional unit to own goods or assets in its own right means that it is also able to exchange the ownership of goods or assets in transactions with other institutional units.
- An institutional unit is able to take economic decisions and engage in economic activities for which it is itself held directly responsible and accountable by law.
- An institutional unit is able to incur liabilities on its own behalf, to take on other obligations or future commitments, and to enter into contracts.

[4] The regional central decision-making body in a currency union is usually the currency union central bank (see paragraph 2.21). For a discussion of currency unions and other regional arrangements, see Appendix 5, and the *BPM6*, Appendix 3.

[5] Monetary authorities encompass the central bank (which subsumes other institutional units included in the central bank subsector, such as currency boards) and certain operations usually attributed to the central bank but sometimes carried out by other government institutions or commercial banks, such as government-owned commercial banks.

[6] See the *2008 SNA*, paragraph 4.13, and the *BPM6*, paragraphs 4.41–4.44.

[7] The definitions and descriptions of institutional units are fully consistent with the corresponding definitions and descriptions in the *2008 SNA*, Chapter 4. Hereafter, "unit" is used as a short form for "institutional unit" in some instances.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

- Either a complete set of accounts, including a balance sheet of assets, liabilities, and net worth, exists for an institutional unit, or it would be possible and meaningful, from both an economic and legal viewpoint, to compile a complete set of accounts if they were required.

2.23 Identifying the institutional unit is important for GFS compilation since it allows the sectorization of the economy, the identification of the counterparty to transactions and stock positions, and consolidation.[8] There are several reasons for choosing the institutional unit to work with:

- Statistics for the general government or public sector can be harmonized with the national accounts, balance of payments, international investment position, and monetary and financial statistics because the institutional units and sectors for which statistics are compiled are defined identically (see Appendix 7).
- These institutional units have legal responsibility for their actions, and are centers of decision-making in their own right.
- Statistics can be based on information from entities for which complete sets of accounts can be compiled, including balance sheets.
- The source data required for compiling statistics are usually readily available or can be made available.

2.24 An **establishment** is an enterprise, or part of an enterprise, that is situated in a single location and in which only a single productive activity is carried out or in which the principal productive activity accounts for most of the value added. There is a hierarchical relationship between institutional units and establishments. An institutional unit may contain one or more entire establishment(s), while an establishment can belong to only one institutional unit. The definition of an establishment implies that, at a minimum, complete accounting records about its production activities are available, including the value of its output and the cost of producing that output. An establishment can be an institutional unit if it satisfies the criteria as set out in paragraph 2.22.[9] Identifying establishments may be of particular interest in determining the market production of general government units (see paragraph 2.76).

2.25 An **enterprise** is the view of an institutional unit as a producer of goods and services. The term enterprise may refer to a corporation, a quasi-corporation, a nonprofit institution, or an unincorporated enterprise.[10]

Types of Institutional Units

2.26 In compiling macroeconomic data the classification of an institutional unit is determined by its objectives and functions and cannot always be inferred from its legal status or name. It is therefore necessary to closely examine the objectives and functions of the institutional unit before deciding which type of unit it is.

2.27 There are two main types of institutional units:

- Persons or groups of persons in the form of households
- Legal or social entities.

Households

2.28 A **household** is a group of persons who share the same living accommodation, who pool some, or all, of their income and wealth, and who consume certain types of goods and services collectively, mainly housing and food. A household can be an individual household, or an institutional household. The latter comprises groups of persons staying for a very long or indefinite period of time, or who may be expected to reside for a very long or indefinite period of time in institutions such as hospitals, retirement homes, prisons, or religious communities such as convents, monasteries, and nunneries.

2.29 A household can have one member or could be a multiperson household. In a multiperson household, individual members are not treated as separate institutional units. Many assets are owned, or liabilities incurred, jointly by two or more members of the same household, while some or all of the income received

[8] Consolidation is a method of presenting statistics for a set of institutional units (or entities) as if they constituted a single unit (see paragraphs 3.152–3.168).

[9] If the establishment charges economically significant prices and meets the criteria to be classified as an institutional unit, it would be treated as a quasi-corporation (see paragraph 2.33).

[10] See the *2008 SNA*, paragraphs 5.1–5.2, for a detailed description of enterprises.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

by individual members of the same household may be pooled for the benefit of all members. Moreover, many expenditure decisions, especially those relating to the consumption of food or housing, may be made collectively for the household as a whole. It may be impossible, therefore, to draw up meaningful balance sheets or other accounts for individual members of a multiperson household. For these reasons, the household as a whole rather than the individual persons in it must be treated as the institutional unit.

Legal and social entities

2.30 A **legal or social entity** is one whose existence is recognized by law or society independently of the persons or other entities that may own or control it. Three types of legal or social entities are recognized as institutional units: corporations and nonprofit institutions are primarily created for purposes of production of goods or services; and government units are created by political processes.

Corporations

2.31 Corporations are defined as entities that are capable of generating a profit or other financial gain for their owners, are recognized by law as separate legal entities from their owners, and are set up for purposes of engaging in market production. The key to classifying a unit as a corporation in macroeconomic statistics is not its legal status but rather the economic substance of the nature of the entity. The laws governing the creation, management, and operations of legally constituted corporations and other entities may vary from country to country, so that it is not feasible to provide a legal definition of a corporation that would be universally valid. Therefore, in macroeconomic statistics, the term corporation is not necessarily used in the same way as in the legal sense.[11]

2.32 The key to classifying a unit as a corporation in macroeconomic statistics is the notion of being a market producer (see paragraph 2.65). Of particular importance are the characteristics to produce goods and services for the market at economically significant prices as explained in paragraph 2.66, and the potential to be a source of profit or other financial gain to the owners. Some nonprofit institutions and government units have the legal status of a corporation, but are not considered corporations for the purposes of macroeconomic statistics because they are not market producers. Other nonprofit institutions are legal corporations that produce for the market but they are not allowed to be a source of financial gain to their owners. Conversely, some entities with different legal titles, such as partnerships or a joint-stock company, could be considered corporations for economic statistics when they satisfy the definition of corporations.

2.33 A **quasi-corporation** is either (i) an unincorporated enterprise owned by a resident institutional unit that has sufficient information to compile a complete set of accounts, that is operated as if it were a separate corporation, and whose relationship to its owner is effectively that of a corporation to its shareholders, or (ii) an unincorporated enterprise owned by a nonresident institutional unit that is deemed to be a resident institutional unit because it engages in a significant amount of production in the economic territory over a long or indefinite period of time.[12] These entities are not incorporated or otherwise legally constituted, but function as if they were corporations. They are treated as corporations in GFS (see paragraphs 2.125–2.127).

2.34 An establishment or group of establishments engaged in the same kind of production activities should be treated as a quasi-corporation if the following criteria hold:

- The establishment charges prices for its outputs that are economically significant (see paragraph 2.66).
- The establishment is operated and managed in a similar way to a corporation.
- The establishment has a complete set of accounts, or is able to construct a complete set of accounts, that enable its stock positions and flows to be separately identified and measured.

[11] For a full discussion on the features of corporations, also see the *2008 SNA*, paragraphs 4.38–4.50.

[12] Unincorporated enterprises, such as some post offices or national railways, may exist in government ministries. When these unincorporated enterprises produce goods and services for the market at economically significant prices, and have separate sets of accounts, they are quasi-corporations and classified as part of public corporations. If not, they may be market establishments as discussed in paragraph 2.75.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

2.35 All corporations are part of the nonfinancial corporations sector or the financial corporations sector, depending on the nature of their primary activity. Institutional units that qualify as corporations and are controlled by government units or other public corporations are classified as public corporations (see paragraph 2.104).

Nonprofit institutions (NPIs)

2.36 Nonprofit institutions (NPIs) are legal or social entities created for the purpose of producing or distributing goods and services, but they cannot be a source of income, profit, or other financial gain for the institutional units that establish, control, or finance them. In practice, their productive activities generate either surpluses or deficits, but the surpluses cannot be appropriated by other institutional units. The articles of association by which they are established are drawn up in such a way that the institutional units that control or manage them are not entitled to a share in any profits or other income they generate.

2.37 NPIs may engage in market or nonmarket production, and may be created by households, corporations, or governments (see paragraph 2.83).

- NPIs engaged in market production charge economically significant prices for their services (see paragraph 2.66). Schools, colleges, universities, clinics, hospitals, etc. constituted as NPIs are market producers when they charge fees that are based on the majority of their production costs and that are sufficiently high to have a significant influence on the demand for their services. There are no shareholders with a claim on the profits or equity of the NPI. Because of their status as NPIs, they are also able to raise significant additional funds through donations from persons, corporations, or governments. Nevertheless, NPIs engaged in market production and controlled by government units must be treated as public corporations so long as they produce goods and services for the market at economically significant prices.
- Some market NPIs restrict their activities to serving a particular subset of other market producers. They consist of chambers of commerce, agricultural, manufacturing or trade associations, employers' organizations, research or testing laboratories, or other organizations or institutions that engage in activities that are of common interest or benefit to the group of enterprises that control and finance them. These NPIs are usually financed by contributions or subscriptions from the group of enterprises concerned. Such subscriptions are treated not as transfers but as payments for services rendered, and these NPIs are, therefore, classified as market producers. These market NPIs are, like corporations and quasi-corporations, members of either the nonfinancial corporations sector or the financial corporations sector.
- NPIs that are engaged in nonmarket production and are controlled by government are treated as government units (see paragraph 2.38 and Box 2.1). Therefore, schools, colleges, universities, clinics, hospitals, etc. constituted as NPIs are nonmarket producers when they charge fees that are not economically significant.
- The remaining NPIs, those that produce goods and services but do not sell them at economically significant prices and are not controlled by government, are classified as a special group of units called NPIs serving households.

Government units

2.38 Government units are unique kinds of legal entities established by political processes that have legislative, judicial, or executive authority over other institutional units within a given area. The principal economic functions of government units are to:

- Assume responsibility for the provision of goods and services to the community or individual households primarily on a nonmarket basis
- Redistribute income and wealth by means of transfers
- Engage primarily in nonmarket production[13]
- Finance their activities primarily out of taxation or other compulsory transfers.[14]

[13] The concepts of market and nonmarket producers are described in paragraph 2.65.

[14] The requirement of financing activities by compulsory transfers is necessary to differentiate a government from a nonprofit institution, which may carry out the same functions as a government but obtains its funds from voluntary transfers, property income, or sales. The receipt of compulsory transfers may be indirect. For example, a local government may finance its activities with grants receivable from the central government.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

A government unit may also finance a portion of its activities in a specific period by borrowing or by acquiring funds from sources other than compulsory transfers—for example, interest revenue, incidental sales of goods and services, or the rent of subsoil assets. All government units are part of the general government sector.

Application of the Definition of an Institutional Unit to Government

2.39 Depending on the complexity of a government's organization, the identification of government units may require careful consideration. Ministries, departments, agencies, boards, commissions, judicial authorities, legislative bodies, and other entities that make up a government are not institutional units if they do not have the authority to own assets, incur liabilities, or engage in transactions in their own right. In general, all entities funded by appropriations made in accordance with a budget controlled by the legislature are not separate institutional units and are treated as constituting a single institutional unit.

2.40 The geographic location of a government unit is not always limited to one location within the economic territory—for example, individual ministries or departments of a particular government may be deliberately dispersed throughout the area of the government's jurisdiction. They remain, nevertheless, part of the same institutional unit. Similarly, a given ministry or department may maintain branch offices or agencies in many different locations to meet local needs. These offices and agencies are part of the same institutional unit.

2.41 There may, however, be government entities with a separate legal identity and substantial autonomy, including discretion over the volume and composition of their expenditures and a direct source of revenue, such as earmarked taxes. Such entities are often established to carry out specific functions, such as road construction or the nonmarket production of health or education services. These entities should be treated as separate government units (often referred to as extrabudgetary units) if they satisfy the criteria to be an institutional unit (see paragraphs 2.22 and 2.80).

2.42 Sometimes governments establish legal entities that cannot act independently and are simply a passive holder of assets and liabilities. Such an entity is referred to as an **artificial subsidiary** and is not treated as a separate institutional unit, unless it is resident in an economy different from that of its parent unit (see paragraphs 2.6–2.20). Resident artificial subsidiary entities are classified as components of the level of government that controls them (i.e., as part of their parent unit or extrabudgetary units of the parent unit).

2.43 Government resident artificial subsidiaries are sometimes set up as SPEs. Although these resident artificial subsidiaries are often legally constituted corporations, to the extent that these entities are nonmarket producers and are controlled by another government unit, they should be classified within the general government sector, either as an extrabudgetary government unit, or with the parent government unit that controls the SPE. Resident SPEs acting independently, acquiring assets and incurring liabilities on their own behalf, and accepting the associated risk, are treated as separate institutional units and are classified by sector according to their principal activity. All nonresident SPEs are treated as separate institutional units resident in the economy where they are established, but the fiscal activities they carry out are reflected in the accounts of the government that controls them (see paragraphs 2.136–2.139).

2.44 Another example of a resident artificial subsidiary is where government establishes a central borrowing authority that appears to be a public financial corporation but is in fact part of a general government unit. These central borrowing authorities borrow on the market and then lend only to the parent unit or other general government units. However, because such entities are not treated as separate institutional units, and merely facilitate government borrowing, they should be classified in general government, either as an extrabudgetary unit, or with the government unit that controls the central borrowing authority. Where such a central borrowing authority is created as a resident in an economy different from that of its parent, it should be classified as a captive financial institution (see paragraphs 2.14 and 2.54) in the financial corporation sector of the host economy.

2.45 An **ancillary activity** is a supporting activity providing services within an enterprise in order to create the conditions within which the principal

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

or secondary activities can be carried out.[15] The type of services referred to include keeping records, managing and paying employees, cleaning, maintenance, transportation, and security. An entity undertaking only ancillary activities will, in general, not satisfy the criteria to be an institutional unit.[16]

2.46 Many governments allocate substantial resources to social protection through the provision of social benefits (see paragraphs 6.96–6.105 and Appendix 2), to protect the entire population or specific segments of it against certain social risks. **Social risks** are events or circumstances that may adversely affect the welfare of the households concerned either by imposing additional demands on their resources or by reducing their income. Examples of social benefits are the provision of medical services, unemployment compensation, and social security pensions. Because of the large scale of social protection programs in many countries and the various organizational structures of such programs, Appendix 2 describes the institutional units involved in these programs and their effects on statistics of the general government sector.

2.47 Government usually comprises two or more institutional units, and there normally is one unit that controls the other units. The controlling unit most likely includes the legislature, head of state, and judiciary. In contrast to corporations (see paragraph 2.107), one government unit controls another government unit by appointing its managers and/or determining the laws and regulations that provide its finance rather than through equity ownership. Generally, government units do not issue shares. SPEs, wealth funds, or other entities of government that are legally constituted as corporations but do not satisfy the statistical definition of a corporation should be classified as government units in one of the subsectors of the general government. As a result, a liability for equity and investment fund shares could appear in the consolidated general government's balance sheet (see paragraphs 2.137 and 2.152–2.155).[17]

2.48 Public corporations, in contrast to general government units, are institutional units that are potential sources of financial gains or losses to the government units that own or control them. In some cases, the corporation issues shares, and thus the financial gain or loss is clearly allocated to the shareholders. In other cases, no shares are issued, but it is clear that a specific government unit controls the corporation's activities and is financially responsible for it. In those cases, the responsible government unit also owns equity and investment fund shares (see paragraphs 7.164–7.177).

Institutional Sectors[18]

2.49 An economy can be divided into institutional sectors.[19] It is therefore necessary to define institutional sectors and identify the type of sectors that exist.

Defining Institutional Sectors

2.50 An **institutional sector** groups together similar kinds of institutional units according to their economic objectives, functions, and behavior. Each sector consists of a number of institutional units that are resident in the economy and is intrinsically different from the other sectors. An economy is divided into five mutually exclusive institutional sectors. All resident institutional units are allocated to one of these institutional sectors. The five institutional sectors are:

- Nonfinancial corporations sector
- Financial corporations sector
- General government sector
- Households sector
- Nonprofit institutions serving households sector.

2.51 The relationship between these sectors of the economy and the types of institutional units (discussed in paragraphs 2.26–2.48) is depicted in Figure 2.1.

Nonfinancial corporations sector

2.52 The **nonfinancial corporations sector** consists of resident institutional units that are principally engaged in the production of market goods or

[15] Ancillary activities produce mainly services, but, as exceptions, goods that do not become a physical part of the marketable products produced by an enterprise.
[16] See the *2008 SNA*, paragraphs 5.35–5.45, for more details.
[17] Because of consolidation, GFS are not highly sensitive to the institutional unit borderline among the subsectors of the general government sector, as long as all general government units are fully covered.
[18] The definitions and descriptions of institutional sectors are fully consistent with the corresponding definitions and descriptions in the *2008 SNA*, Chapter 4.
[19] Hereafter, "sector" will often be used as a short form for "institutional sector."

√ Units included in sector

nonfinancial services. The sector includes public and private corporations and is composed of:

- All resident nonfinancial corporations (as defined in paragraphs 2.31–2.32), regardless of the residence of their owners
- The branches of nonresident enterprises that are engaged in nonfinancial production in the economic territory on a long-term basis
- All resident NPIs that are market producers of goods or nonfinancial services.

Financial corporations sector

2.53 The **financial corporations sector** consists of resident corporations that are principally engaged in providing financial services, including insurance and pension fund services, to other institutional units. The production of financial services is the result of financial intermediation, financial risk management, liquidity transformation, or auxiliary financial activities. In addition, the sector includes NPIs engaged in market production of a financial nature, such as those financed by subscriptions from financial enterprises whose role is to promote and serve the interest of those enterprises.

2.54 Financial corporations can be divided into three broad classes: financial intermediaries, financial auxiliaries, and captive financial institutions and money lenders.

- **Financial intermediaries** are institutional units that incur liabilities on their own account for the purpose of acquiring financial assets by engaging in financial transactions on the market. The assets and liabilities of financial intermediaries are transformed or repackaged with respect to maturity, scale, risk, and the like, in the financial intermediation process. The financial intermediation process channels funds between third parties with a surplus of funds and those with a demand for funds. A financial intermediary not only acts as an agent for these other institutional units, but also places itself at risk by acquiring financial assets and incurring liabilities on its own account. Financial intermediation is limited to acquiring assets and incurring liabilities with the general public or specified and relatively large groups thereof. Where the activity is limited to small groups, no intermediation takes place. Financial intermediaries include deposit-taking corporations, insurance corporations, and pension funds.
- **Financial auxiliaries** consist of financial corporations that are principally engaged in activities associated with transactions in financial assets and liabilities or with providing the regulatory context for these transactions but in circumstances that do not involve the auxiliary taking ownership of the financial assets and liabilities being transacted. They include brokers, managers of pension funds, mutual funds, etc. (but not the funds they manage), foreign exchange bureaus, and central supervisory authorities.
- **Captive financial institutions and money lenders** are institutional units providing financial services other than insurance, where most of their assets or liabilities are not available on open financial markets. These entities transact within only a limited group of units (such as with subsidiaries) or subsidiaries of the same holding

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

corporations or entities that provide loans from own funds provided by only one sponsor. Captive insurance is the exception and is classified as an insurance corporation.

2.55 Financial intermediaries can be divided into seven subsectors according to the intermediary's activity in the market and the liquidity of its liabilities. These seven subsectors are: central bank; deposit-taking corporations except the central bank; money market funds; nonmoney market investment funds; other financial intermediaries except insurance corporations and pension funds; insurance corporations; and pension funds.

2.56 As indicated in Figure 2.3 and Table 7.11, in GFS the financial corporations are presented as follows for analytic purposes:

- The central bank
- Deposit-taking corporations except the central bank
- Other financial corporations—including all financial intermediaries except deposit-taking corporations, financial auxiliaries, and captive financial institutions and money lenders.

2.57 The financial corporations sector includes public and private financial corporations comprising:

- All resident financial corporations (as defined in paragraphs 2.31–2.35), regardless of the residence of their shareholders
- The branches of nonresident enterprises (see paragraph 2.20) that are engaged in financial activity in the economic territory on a long-term basis
- All resident NPIs that are market producers of financial services (see paragraph 2.36 – 2.37).

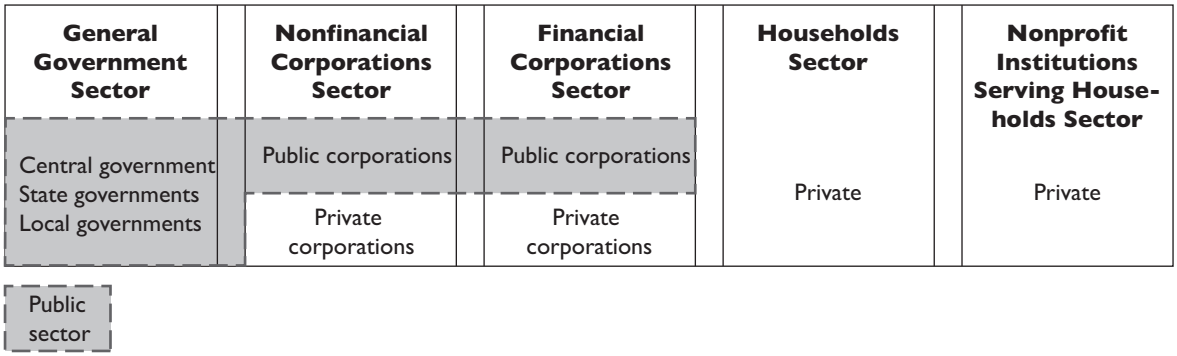
General government sector

2.58 The **general government sector** consists of resident institutional units that fulfill the functions of government as their primary activity. These institutional units perform the principal economic functions of government, as described in paragraph 2.38, in addition to fulfilling their political responsibilities and their role of economic regulator. The general government sector comprises:

- All government units of central, state, provincial, regional, and local government, and social security funds (see paragraphs 2.76–2.103) imposed and controlled by those units
- All nonmarket NPIs that are controlled by government units (see paragraph 2.83).

2.59 The general government sector does not include public corporations, even when all the equity of such corporations is owned by government units, nor quasi-corporations that are owned and controlled by government units. However, unincorporated enterprises owned by government units that are not quasi-corporations remain integral parts of those units and, therefore, must be included in the general government sector.

Households sector



2.60 The **households sector** consists of all resident households (see paragraphs 2.28–2.29). Households may be of any size and take a variety of different forms in different societies or cultures. All physical persons in the economy must belong to one and only one household. Households supply labor, undertake final consumption, and, as entrepreneurs, produce market goods and nonfinancial (and possibly financial) services.

Nonprofit institutions serving households (NPISHs) sector

2.61 The **nonprofit institutions serving households (NPISHs) sector** consists of resident nonmarket nonprofit institutions (NPIs) that are not controlled by government. They provide goods and services to households for free or at prices that are not economically significant. One type of NPISHs is created by associations of persons to provide goods or, more often, services primarily for the benefit of the members themselves. For example, professional or learned societies, political parties, trades unions, consumers' associations, churches or religious societies, and social, cultural, recreational, or sports clubs. They do not include bodies serving similar functions that are controlled by government units. Religious institutions are usually excluded from general government and classified as NPISHs even when mainly financed by government units if this majority financing is not seen as empowering control by government. Political parties in countries with one-party political systems that are controlled by government units by means of providing the necessary finance are included in the general government sector. A second type of NPISHs consists of charities, and relief or aid agencies that are created for philanthropic purposes, while a third type provides collective services, such as research institutions that make their results freely available, environmental groups, etc. By convention, nonmarket NPIs controlled by foreign governments are classified as NPISHs in the host economy.

Figure 2.2 The Public Sector and Its Relation to Other Institutional Sectors of the Economy

The Use of Subsectors

2.62 Each of the sectors of the economy may be divided into subsectors, and the subsectors can be combined in different ways to form other sectors. No single method of combining subsectors may be optimal for all purposes. Dividing the total economy into sectors and subsectors enhances the usefulness of the data for purposes of economic analysis and enables targeted monitoring of particular groups of institutional units for policy purposes. For example, the general government sector can be divided into central, state, and local government subsectors, while social security funds could be presented as a separate subsector or could be included in the subsector that organizes and manages them. The nonfinancial corporations subsector can be divided into public nonfinancial corporations, foreign-controlled nonfinancial corporations, and national private nonfinancial corporations.[20] The division of sectors into subsectors depends upon the type of analysis to be undertaken, the needs of policymakers, the availability of data, the economic circumstances, and the institutional arrangements within a country. Figure 2.2 shows the relationship between the general government sector, the public sector, and the other main sectors of the domestic economy.

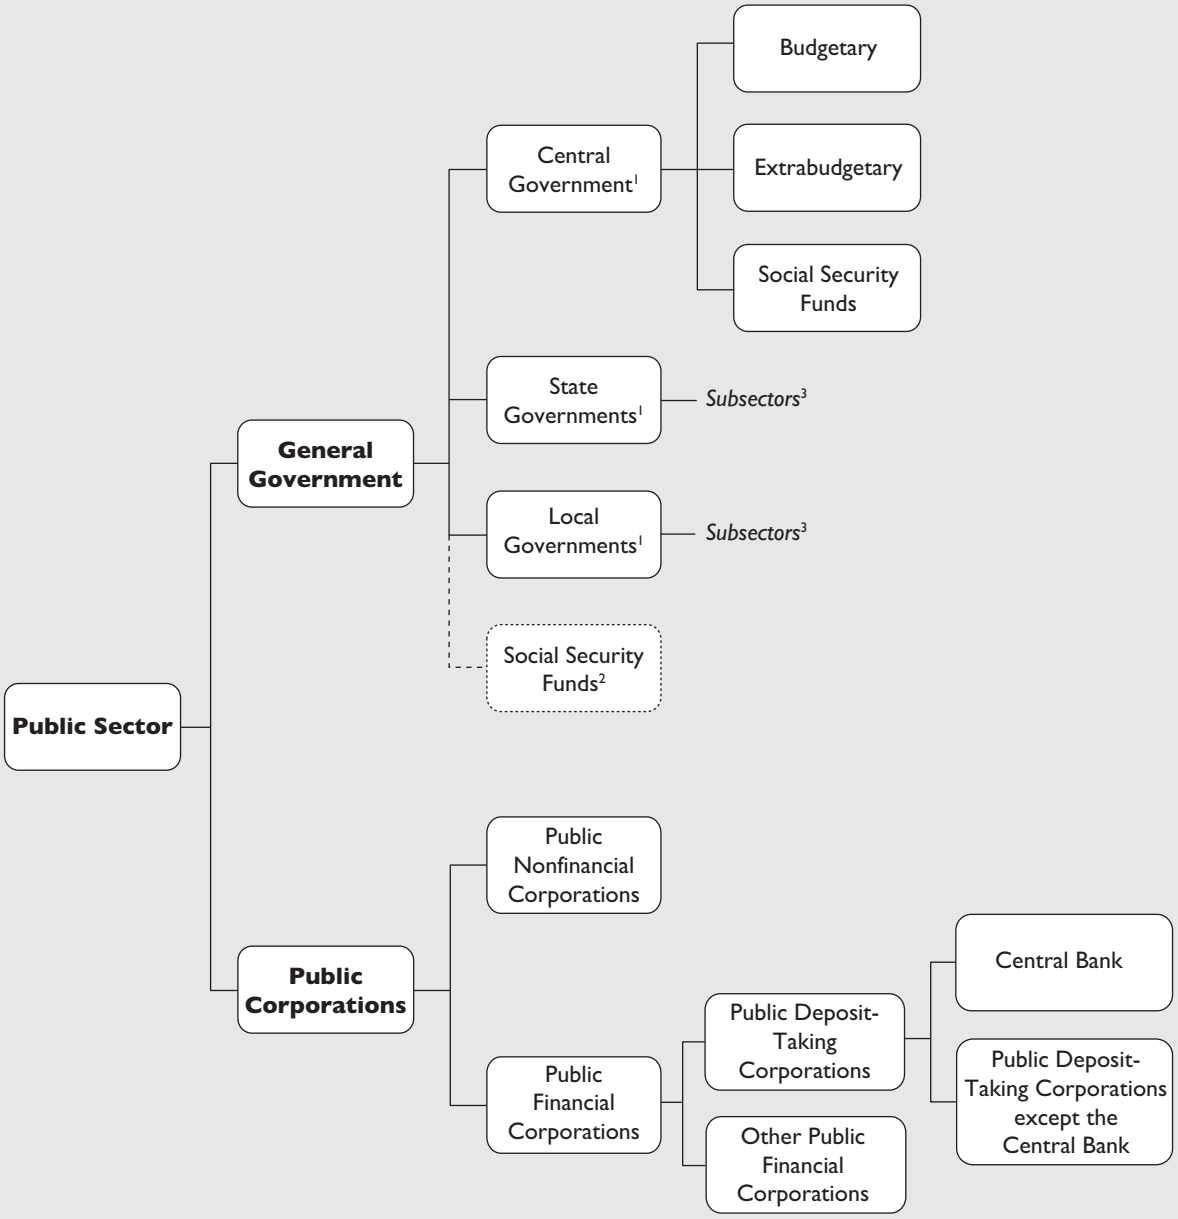
Institutional Coverage and Sectorization of the Public Sector

2.63 The **public sector** consists of all resident institutional units controlled directly, or indirectly, by resident government units—that is, all units of the general government sector and resident public corporations. Figure 2.3 illustrates the main components of the public sector. Statistics should be compiled for the general government and public sectors, as well as for all the subsectors of the general government and the public corporations subsector.

Delineating General Government and Public Corporations

2.64 The general government sector consists of all government units and all resident nonmarket NPIs that are controlled by government units, while the public corporations subsector (see paragraph 2.104) consists of all corporations controlled by government units or other public corporations. General government also includes public enterprises, legally constituted as corporations, but that do not satisfy the statistical criteria to be treated as corporations (see paragraphs 2.31–2.35).[21] To determine which public enterprises are treated as general government units and which as public corporations, it is necessary to delineate nonmarket and market producers .

2.65 A **market producer** is an institutional unit that provides all or most of its output to others at prices that are economically significant. A **nonmarket producer** provides all or most of its output to others for free or at prices that are not economically significant.



2.66 Economically significant prices are prices that have a significant effect on the amounts that producers

[20] Similarly, financial corporations can be divided into public, foreign-controlled, and national private financial corporations.

[21] Public enterprises are often also referred to as state-owned enterprises or parastatals.

Figure 2.3 The Public Sector and Its Main Components

[1]Includes social security funds.
[2]Alternatively, social security funds can be combined into a separate subsector, as shown in the box with dashed lines.
[3]Budgetary units, extrabudgetary units, and social security funds may also exist in state and local governments.

are willing to supply and on the amounts purchasers wish to buy. These prices normally result when:

- The producer has an incentive to adjust supply either with the goal of making a profit in the long run or, at a minimum, covering capital and other costs.
- Consumers have the freedom to purchase or not purchase and make the choice on the basis of the prices charged.

These conditions usually mean that prices are economically significant if sales cover the majority of the

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

producer's costs and consumers are free to choose whether to buy, and how much to buy, on the basis of the prices charged.

2.67 A price is not economically significant when it has little or no influence on how much the producer is prepared to supply and on the quantities demanded. Economically insignificant prices may be charged in order to raise some token revenue and/or reduce, but not eliminate, excessive demand that may occur if goods and services are provided free of charge. An economically insignificant price may be set on administrative, social, or political grounds for goods or services for which the amount to be supplied is fixed.

2.68 It can be presumed that prices are economically significant when the producers are private corporations. When there is public control, however, the unit's prices may be modified for public policy purposes. This may cause difficulties in determining whether the prices charged are economically significant. Public corporations are often established to provide goods and services in larger quantities than a private corporation would provide at the same selling price. Even when the sales of public corporations may cover a large portion of their costs, one can expect that they respond to market forces quite differently than would private corporations.

2.69 Although there is no prescriptive numerical relationship between the value of sales (excluding both taxes and subsidies on products) and the production costs, one would expect the value of the sales by public corporations to average at least half of the production costs over a sustained multiyear period.

2.70 In principle, the distinction between market and nonmarket producers should be made on a case-by-case basis. The classification of a producer as a market or nonmarket producer should be considered over a range of years.[22] Once classified, only if a change in pricing holds for several years or is expected to hold for several years should a reclassification of the entity be considered.

2.71 It is likely that corporations receiving substantial government financial support, or enjoying other risk-reducing factors such as substantial government guarantees, will respond to changes in the economic conditions differently from corporations without such advantages because their budget constraints are softer, and so are more likely to be classified as nonmarket producers.

2.72 The question arises whether government-owned entities supplying goods and services to government should be treated as market or nonmarket producers. The producer of these goods and services is not a market producer if it is a dedicated provider of ancillary services (see paragraph 2.45). These entities will, in general, not satisfy the criteria to be an institutional unit. Similarly, it can often be assumed that the producer is not a market producer if the unit provides the goods and services in the absence of competition[23] with private producers, and when the choice of supplier to government is not based on price. This is true regardless of whether the supplier is the only supplier and whether the government is the only customer of the supplier.

2.73 To assess whether a producer is a market producer, it is necessary to carry out a comparison between the receipts from sales and the production costs of the goods and services sold. Sales are measured before any taxes applicable to the products are added. Sales exclude all payments receivable from government unless they would be granted to any producer undertaking the same activity. Production for own use, known as own-account production, does not generate receipts from sales, and so it is not considered as part of sales in this context.

2.74 Production costs are calculated as the sum of compensation of employees, use of goods and services, consumption of fixed capital, and other taxes on production.[24] These concepts used in the calculation of production costs exclude all costs associated with own-account capital formation. Further, a return to capital is included in production costs if the unit is to be treated as a market producer. Subsidies receivable on production are not deducted from the production costs.

2.75 As a nonmarket producer, a general government institutional unit will have mostly nonmarket establishments (see paragraph 2.24), but it may have

[22] When a newly established unit needs to be classified to a sector, the classification as a market or nonmarket producer should be based on its intent regarding the prices it is to charge for its goods and services.

[23] Prices determined in a competitive market are highly likely to be economically significant prices.

[24] For a detailed breakdown of other taxes on production, see paragraph A7.41 and Table A7.3.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

one or more market establishments.[25] A **market establishment** is an establishment that charges economically significant prices. Where a general government unit sells some of its output at prices that are economically significant, it may be possible to identify market producers. Market establishments within government that satisfy the criteria to be separate institutional units are quasi-corporations (see paragraph 2.22), and are treated in the same way as corporations. The remaining market establishments would remain an integral part of the general government sector.

The General Government Sector and Its Subsectors

2.76 The **general government sector** consists of resident institutional units that fulfill the functions of government as their primary activity. This sector includes all government units and all nonmarket NPIs that are controlled by government units. For analytic purposes, it is often necessary or desirable to disaggregate the general government sector into subsectors.

2.77 Depending on the administrative and legal arrangements, there may be more than one level of government within a country, and statistics should be compiled for each level (also referred to as subsectors). However, because of these different arrangements, international comparison of data for each subsector of general government should be undertaken with some caution. In macroeconomic statistics, provision is made for three subsectors of general government: central, state, and local. Not all countries have all three levels; some may have only a central government or a central government and one level below. Other countries may have more than three levels. In that case, the various units should all be classified as one of the three subsectors suggested here. In addition to levels of government, the existence of social security funds and their role in fiscal policy may require that statistics for all social security funds be compiled as a separate subsector of the general government sector.

2.78 A full classification of the subsectors of the general government would allow for both NPIs and social security funds to be distinguished for each of central, state, and local government subsectors. In practice, though, it is usual to present social security funds in one of two alternative sets of subsectors, as illustrated in Figure 2.3.[26]

- All social security funds could be combined into a separate subsector and all other general government units could be classified according to their level. In that case, the central, state, and local government subsectors would comprise all government units other than social security funds; or
- Social security funds could be classified according to the level of government that organizes and manages them and therefore be combined with the other general government units at the respective subsectors. Thus, the general government would consist of central, state, and local governments, assuming that all three levels of government exist. To facilitate analysis of social security funds as a whole, separate statistics for them may be provided within the statistics for each level of government.

Countries may choose either presentation.

2.79 Classification problems may arise when government operations are carried out by a general government unit jointly accountable to two levels of government.[27] This classification decision may be especially difficult if the agency has its own source of funding, such as earmarked taxes. In some cases, an NPI might be controlled by two or more government units at different levels of government. For example, a state government unit might have the right to appoint the majority of officers managing an NPI but the financing might be provided mainly by the central government. General government units subject to dual control should be classified to the level of government that predominates in terms of control in accordance with all the indicators of control (see Boxes 2.1 and 2.2).

2.80 The central, state, and local government subsectors of general government are each made up of

[25] The *sales of goods and services* (142) include sales of market establishments and sales by nonmarket establishments, and are identified as specific categories of revenue (see paragraphs 5.136–5.141).

[26] The alternative methods of subsector classification are designed to accommodate different analytic needs. The decision as to which method is more appropriate in a given country depends on how significant social security funds are and on the extent to which they are managed independently of the government units with which they are associated.

[27] Also see the discussion on joint ventures in paragraphs 2.140–2.143.

Box 2.1 Government Control of Nonprofit Institutions

Control of an NPI is defined as the ability to determine the general policy or program of the NPI. To determine if an NPI is controlled by the government, the following five indicators of control would be the most important and likely factors to consider:

- The appointment of officers—The government may have the right to appoint the officers managing the NPI under the NPI's constitution, its articles of association, or other enabling instrument.
- Other provisions of the enabling instrument—The enabling instrument may contain provisions other than the appointment of officers that effectively allow the government to determine significant aspects of the general policy or program of the NPI. For example, the enabling instrument may specify or limit the functions, objectives, and other operating aspects of the NPI, thus making the issue of managerial appointments less critical or even irrelevant. The enabling instrument may also give the government the right to remove key personnel or veto proposed appointments, require prior approval of budgets or financial arrangements by the government, or prevent the NPI from changing its constitution, dissolving itself, or terminating its relationship with government without government approval.
- Contractual agreements—The existence of a contractual agreement between a government and an NPI may allow the government to determine key aspects of the NPI's general policy or program. As long as the NPI is ultimately able to determine its policy or program to a significant extent, such as by being able to fail to comply with the contractual agreement and accept the consequences, to change its constitution, or to dissolve itself without requiring government approval other than that required under the general regulations, then it would not be considered controlled by government.
- Degree of financing by government— An NPI that is mainly financed by government may be controlled by that government. Generally, if the NPI remains able to determine its policy or program to a significant extent along the lines mentioned in the previous indicator, then it would not be considered controlled by government.
- Risk exposure—If a government openly allows itself to be exposed to all, or a large proportion of, the financial risks associated with an NPI's activities, then the arrangement constitutes control.

A single indicator could be sufficient to establish control in some cases, but in other cases, a number of separate indicators may collectively indicate control. A decision based on the totality of all indicators will necessarily be judgmental in nature but clearly similar judgments must be made in similar cases.

institutional units. For each of these subsectors, it is often analytically useful to group its entities according to administrative, legislative, or funding arrangements. For example, governments may create specialized boards, commissions, or agencies either as part of their budgetary accounts or as separate units. It may be possible to create subsectors at each level of government based on whether the units in the subsector are financed by the legislative budgets of that level of government or by extrabudgetary sources—that is, distinguishing between budgetary and extrabudgetary units (irrespective of the treatment of social security funds—see paragraph 2.78). The budgetary component may comprise only the main (or general) budget, and the extrabudgetary component the remaining entities that constitute that level of government, excluding social security funds. Such a grouping of the subsectors allows for a more direct comparison between budget data and GFS. Whether units are classified as budgetary or extrabudgetary depends on country circumstances. What is important, though, is full coverage of the general government sector—that is, the statistics compiled for each level of government should cover all units that constitute that subsector of government (central, state, or local).

2.81 In all countries, there is an institutional unit of the general government sector particularly important in terms of size and power, in particular the power to exercise control over many other units and entities. The **budgetary central government** is often a single unit of the central government that encompasses the fundamental activities of the national executive, legislative, and judiciary powers. This component of general government is usually covered by the main (or general) budget. The budgetary central government's revenue and expense are normally regulated and controlled by a ministry of finance, or its functional equivalent, by means of a budget approved by

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

the legislature. Most of the ministries, departments, agencies, boards, commissions, judicial authorities, legislative bodies, and other entities that make up the budgetary central government are not separate institutional units. This is because they generally do not have the authority to own assets, incur liabilities, or engage in transactions in their own right (see paragraph 2.42). The state or local government subsectors each have a budgetary state/local government component that includes the principal executive, legislative, and judicial powers for these levels of government.

2.82 General government entities with individual budgets not fully covered by the main (or general) budget are considered **extrabudgetary**.[28] These entities operate under the authority or control of a central, state, or local government. Extrabudgetary entities may have their own revenue sources, which may be supplemented by grants (transfers) from the general budget or from other sources. Even though their budgets may be subject to approval by the legislature, similar to that of budgetary accounts, they have discretion over the volume and composition of their spending. Such entities may be established to carry out specific government functions, such as road construction, or the nonmarket production of health or education services. Budgetary arrangements vary widely across countries, and various terms are used to describe these entities, but they are often referred to as "extrabudgetary funds" or "decentralized agencies."

2.83 Nonmarket NPIs controlled by government are typically classified as extrabudgetary units when they satisfy the criteria to be an institutional unit. More specifically, they are classified with the level of government that controls them—namely, central, state, or local governments. The most important and likely factors to consider in determining government control of NPIs are discussed in Box 2.1. All NPIs allocated to the general government sector should retain their identity as NPIs in statistical records, to facilitate the analysis of a complete set of NPIs.

2.84 The following sections further define the subsectors of government. These definitions apply whether social security funds are included with the level of government that organizes and manages them, or as a separate subsector of general government.

Central government

2.85 The **central government subsector** consists of the institutional unit(s) of the central government plus those nonmarket NPIs that are controlled by the central government. The political authority of the central government extends over the entire territory of the country. Central government has, therefore, the authority to impose taxes on all resident institutional units and on nonresident units engaged in economic activities within the country. Its political responsibilities include national defense, the maintenance of law and order, and relations with foreign governments. It also seeks to ensure the efficient working of the social and economic system by means of appropriate legislation and/or regulation. It is responsible for providing collective services for the benefit of the community as a whole, and for this purpose incurs expenditure on defense, public administration, etc. In addition, it may incur expenditure on the provision of services, such as education or health, primarily for the benefit of individual households, and it may make transfers to other institutional units, including other levels of government.

2.86 Compiling statistics for the central government is particularly important because of the special impact it has on monetary policy and economic growth. For example, it is mainly through central government finances that fiscal policy impacts on inflationary or deflationary pressures within the economy. It is generally at the central government level alone that a decision-making body can formulate and carry out public policies directed toward nationwide economic objectives. Other levels of government have neither national economic policies as their objective nor the central government's access to central bank credit.

2.87 In most countries, central government is a large and complex subsector. Nonetheless, as described in paragraph 2.80, based on administrative arrangements in a country, it is generally composed of a budgetary central government, extrabudgetary units, and social security funds (unless a separate subsector is used for social security funds, as described in paragraph 2.78).

[28] These entities are institutional units if they satisfy the criteria to be a separate institutional unit (see paragraph 2.22). If an entity does not qualify as a unit, it is considered as part of the unit that controls it.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

2.88 While the central government may also control nonfinancial or financial corporations, these corporations are classified outside of the central (and general) government sector(s), but are part of the public sector. However, if institutional units controlled by central government are legally constituted as corporations but are not market producers, they should be classified as part of the central government sector, not the public corporations sector. Similarly, unincorporated enterprises controlled by central government units that do not satisfy the criteria to be quasi-corporations (see paragraph 2.34) should remain integral parts of those units and, therefore, would be included in the central government subsector.

2.89 In some countries, central government may include units that engage in financial transactions that in other countries would be performed by central banks. In particular, units of central government may be responsible for the issue of currency, the maintenance of international reserves, the operation of exchange stabilization funds, and transactions with the International Monetary Fund. When the units in question remain financially integrated with central government and under the direct control and supervision of central government, they cannot be treated as separate institutional units. Accordingly, these monetary authority functions carried out by central government are recorded in the general government sector and not the financial corporations sector. However, because of the analytic importance of obtaining accounts covering the monetary authorities as a whole, and in order to provide links with other macroeconomic statistics such as the *2008 SNA*, the *BPM6*, and the *MFSM*, it is recommended that the transactions of central government agencies carrying out monetary authority and deposit-taking functions be separately identified, so that they can be combined with those of the central bank and other deposit-taking corporations in special tabulations if desired.

State governments

2.90 State governments consist of institutional units exercising some of the functions of government at a level below that of central government and above that of the government institutional units existing at a local level. State governments are distinguished by the fact that their fiscal authority extends over the largest geographical areas into which the country as a whole may be divided for political or administrative purposes. They are institutional units whose fiscal, legislative, and executive authority extends only to individual "states" into which the country as a whole may be divided. These states may be described by different names in different countries and the subsector may consist of state, provincial, or regional governments. For ease of expression, this level of government will be referred to hereafter as state governments. In many countries, especially smaller countries, state governments may not exist. However, in geographically large countries, especially those that have federal constitutions, considerable powers and responsibilities may be assigned to state governments.

2.91 A state government may consist of many institutional units and usually has the fiscal authority to levy taxes on institutional units that are resident in, or engage in economic activities or transactions within, its area of jurisdiction (but not other areas). It must also be entitled to spend or allocate some, or possibly all, of the taxes or other revenue that it receives according to its own policies, within the general rules of law of the country, although some of the transfers it receives from central government may be tied to certain specified purposes. It should also be able to appoint its own officers, independently of external administrative control. On the other hand, if a regional unit is entirely dependent on funds from central government, and if the central government also determines the ways in which these funds are to be spent at the regional level, it should be treated as an agency of central government for statistical purposes, rather than as a separate level of government.

2.92 In a few countries, more than one level of government exists between the central government and the smallest governmental institutional units at a local level; in such cases, for purposes of sector classification, these intermediate levels of government are grouped with the level of government—either state or local—with which they are most closely associated.

2.93 If a state government exists, then its principal departments and ministries will generally constitute a single institutional unit in a manner similar to the budgetary unit of the central government. In addition, there may be extrabudgetary agencies operating under the authority of a state government with a separate legal identity and enough autonomy to form

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

additional institutional units (see paragraph 2.39). There may also be institutional units whose authority extends over two or more states, but are responsible to the respective state governments. Such units should also be included in the state government subsector.

2.94 State governments may control corporations in the same way as central government. They may also have unincorporated units that engage in market production. Such institutional units should be treated as quasi-corporations in line with the principles in paragraph 2.33. These corporations and quasi-corporations should be classified outside of the state government subsector (and general government sector) as part of public corporations.

Local governments

2.95 Local government units are institutional units whose fiscal, legislative, and executive authority extends over the smallest geographical areas distinguished for administrative and political purposes. The local government subsector consists of local governments that are separate institutional units plus those nonmarket NPIs that are controlled by local governments. The scope of their authority is generally much less than that of central government or state governments, and they may, or may not, be entitled to levy taxes on institutional units resident in their areas. They are often heavily dependent on grants (transfers) from higher levels of government, and they may also act, to some extent, as agents of central or regional governments. They should also be able to appoint their own officers, independently of external administrative control. Even when local governments act as agents of central or state governments to some extent, they can be treated as a separate level of government, provided they are also able to raise and spend some funds on their own initiative and own responsibility.

2.96 Local governments are in closest contact with institutional units occupying their localities. They typically provide a wide range of services to local residents, some of which may be financed out of grants (transfers) from other levels of government. Statistics for the local government subsector may cover a wide variety of governmental units, such as counties, municipalities, cities, towns, townships, boroughs, school districts, and water or sanitation districts. Often, local government units with different functional responsibilities have authority over the same geographic areas. For example, separate government units representing a town, a county, and a school district may have authority over the same area. In addition, two or more contiguous local governments may organize a government unit with regional authority that is accountable to the local governments. Such units should also be included in the local government subsector.

2.97 Some of the most typical functions of local governments provide services for which users' fees are small in relation to the main costs borne by the local government. Local governments are typically involved in:

- Educational establishments
- Hospitals and social welfare establishments, such as kindergartens, nurseries, and welfare homes
- Public sanitation and related entities, such as water purification systems and plants, refuse collection and disposal agencies, cemeteries, and crematoria
- Culture, leisure, and sports facilities, such as theaters, concerts, music halls, museums, art galleries, libraries, parks, and open spaces.

2.98 The same rules governing the treatment of the production of goods and services by central and state government units are applied to local governments. If a market producer can be identified within a local government unit that satisfies the criteria to be a corporations or a quasi-corporation (see paragraph 2.34), it is classified as a public corporation. When market establishments[29] do not satisfy the criteria to be a quasi-corporation, they are included within local government. Units supplying services on a nonmarket basis, such as education or health, remain an integral part of the local government unit that controls them.

2.99 Government units serving both a state government and one or more local governments should be included with the level of government that predominates in its operations and finances. In some countries, more than one level of government exists between the central government and the smallest governmental institutional units at a local level. In such cases, these intermediate levels of government are grouped together with the level of government, either

[29] See paragraph 2.75 for a definition of market establishments.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

state or local, with which they are most closely associated. For some analyses, it may be useful to combine the statistics for state and local governments.

Social security funds

2.100 A **social security fund** is a particular kind of government unit that is devoted to the operation of one or more social security schemes.[30] In macroeconomic statistics, a social security fund is recognized if it meets the criteria to be an institutional unit and if it:

- Is organized and managed separately from the other activities of government units
- Holds its assets and liabilities separately from other government units
- Engages in financial transactions on its own account.

2.101 **Social security schemes** are social insurance schemes covering the community as a whole, or large sections of the community, and are imposed and controlled by government units. **Social insurance schemes** provide social protection and require formal participation by the beneficiaries, evidenced by the payment of contributions (actual or imputed). Participation in social security schemes is therefore also evidenced by the payment of contributions (actual or imputed) by the beneficiaries. These schemes cover a wide variety of programs, providing benefits in cash or in kind for old age, invalidity or death, survivors, sickness and maternity, work-related injury, unemployment, family allowance, health care, etc. There is not necessarily a direct link between the amount of the contributions payable by an individual and the benefits receivable.

2.102 However, not all social security schemes are organized and managed by social security funds; for example, a social security scheme for sickness may be operated by a national health ministry. If there is an autonomous employment-related pension fund (i.e., a separate institutional unit) to provide government employee pensions, this fund should be excluded from social security funds and be classified as a public financial corporation if under control of government, or otherwise as a private financial corporation (see paragraphs A2.47–A2.53). A nonautonomous employment-related pension scheme for government employees that is administered by a social security fund remains part of social security funds. However, if the conditions for participation and benefits payable, as determined by the employment contract, differ from those of the social security scheme for nongovernment employee participants, an employment-related pension scheme exists. GFS recognizes liabilities for employment-related pension entitlements. Therefore, economic flows and stock positions related to this pension scheme should be distinguished within the social security fund (see paragraphs 6.25 and 7.194).

2.103 Consistent with the *2008 SNA*, this *Manual* allows for social security funds to be accommodated in two alternative sets of subsectors of general government, as described in paragraph 2.78.

The Public Corporations Sector and Its Subsectors

The public corporations subsector

2.104 The **public corporations subsector** consists of all resident corporations controlled by government units or by other public corporations. It is possible that some entities that are legally constituted as corporations may not be classified as corporations for statistical purposes if they do not charge economically significant prices. Public corporations may be involved in quasi-fiscal operations (i.e., they carry out government operations at the behest of the government units that control them—see paragraph 2.4). As such, public corporations may exist to serve as an instrument of public (or fiscal) policy for government. Most directly, a public corporation can engage in specific transactions to carry out a government operation, such as lending to particular parties at a lower-than-market interest rate or selling their product, such as electric power, to selected customers at reduced rates. More generally, however, a public corporation can carry out fiscal policy by employing more staff than required, purchasing extra inputs, paying above-market prices for inputs, or selling a large share of its output for prices that are less than what the market price would be if only private producers were involved.

2.105 Public corporations may be created to: generate profits for general government; protect key resources; provide competition where barriers to entry may be large; and provide basic services where costs are prohibitive. These public corporations are often

[30] Appendix 2 provides a detailed description of the nature of social protection, including social security.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

large and/or numerous, and may have a significant economic impact—for example:

- Public corporations may be of significance to government because of the effects their magnitude or strategic position may have on macroeconomic objectives, such as bank credit, aggregate demand, borrowing abroad, and the balance of payments.
- Many public corporations may represent a sizeable investment of national resources, at considerable opportunity costs.
- Public corporations are a potential source of fiscal risk to the extent that their liabilities could be explicitly or implicitly guaranteed by government, or may hold reputational risks for government.
- Public corporations may over time become nonmarket units reclassified to the general government sector and vice versa; compilation of statistics on the public sector avoids the series breaks in general government data that may result from changes in the way they operate.

2.106 Statistics on public corporations are also likely to be needed to compile comprehensive statistics for the general government sector. GFS for the general government sector should reflect all transactions with public corporations, and changes in the net worth of public corporations are reflected in the value of the equity of those corporations owned by general government units. The accounts of public corporations will help explain the source of changes in these assets, and that information will be useful for an analysis of sustainability and other aspects of fiscal policy.

Government control of corporations

2.107 A corporation is a **public corporation** if a government unit, another public corporation, or some combination of government units and public corporations controls the entity. **Control of a corporation** is defined as the ability to determine general corporate policy of the corporation. The expression "general corporate policy" as used here is understood in a broad sense to mean the key financial and operating policies relating to the corporation's strategic objectives as a market producer.

2.108 Because the arrangements for the control of corporations can vary considerably, it is neither desirable nor feasible to prescribe a definitive list of factors to be taken into account. Although a single indicator could be sufficient to establish control, in other cases, a number of separate indicators may collectively indicate control. A decision based on the totality of all indicators must necessarily be judgmental in nature, but clearly similar judgments must be made in similar cases. Box 2.2 presents the most important and likely factors to consider.

2.109 Because governments exercise sovereign powers through legislation, regulations, orders, and other arrangements, care needs to be applied in determining whether the exercise of such powers amounts to a determination of the general corporate policy of a particular corporation, and therefore control of the corporation. Laws and regulations applicable to all units as a class or to a particular industry should not be viewed as amounting to control of these units.

2.110 The ability to determine general corporate policy does not necessarily include the direct control of the day-to-day activities or operations of a particular corporation. The officers of such corporations would normally be expected to manage these in a manner consistent with and in support of the overall objectives of the particular corporation. Nor does the ability to determine the general corporate policy of a corporation include the direct control over any professional, technical, or scientific judgments, as these would normally be viewed as part of the core competence of the corporation itself. For example, the professional or technical judgments exercised by a corporation set up to certify aircraft airworthiness would not be considered controlled with respect to individual approvals and disapprovals. However, its broader operating and financial policies, including the airworthiness criteria, may well be determined by a government unit as part of the corporation's corporate policy.

2.111 Corporations subject to the control of a nonresident government unit (or a nonresident public corporation) are not classified as public corporations in the host economy, but would be part of the private corporations in that economy.[31]

2.112 Quasi-corporations and market NPIs (i.e., NPIs engaging in market production) under the control of government are classified as public corporations.

[31] Also see the discussion of residence in paragraphs 2.6–2.21 of this chapter and definitions of corporations in paragraphs 2.31–2.32.

Box 2.2 Government Control of Corporations

Control of corporations is defined as the ability to determine the general corporate policy of the corporation. To determine if a corporation is controlled by the government, the following eight indicators of control would be the most important and likely factors to consider:

- Ownership of the majority of the voting interest—Owning a majority of shares will normally constitute control when decisions are made on a one-share, one-vote basis. The shares may be held directly or indirectly, and the shares owned by all other public entities should be aggregated. If decisions are not made on a one-share, one-vote basis, the classification should be based on whether the shares owned by other public entities provide a majority voice.
- Control of the board or other governing body—The ability to appoint or remove a majority of the board or other governing body as a result of existing legislation, regulation, contractual, or other arrangements will likely constitute control. Even the right to veto proposed appointments can be seen as a form of control if it influences the choices that can be made. If another body is responsible for appointing the directors, it is necessary to examine its composition for public influence. If a government appoints the first set of directors but does not control the appointment of replacement directors, the body would then be part of the public sector until the initial appointments had expired.
- Control of the appointment and removal of key personnel—If control of the board or other governing body is weak, the appointment of key executives, such as the chief executive, chairperson, and finance director, may be decisive. Nonexecutive directors may also be relevant if they sit on key committees, such as the remuneration committee determining the pay of senior staff.
- Control of key committees of the entity—Subcommittees of the board or other governing body could determine the key operating and financial policies of the entity. Majority public sector membership on these subcommittees could constitute control. Such membership can be established under the constitution or other enabling instrument of the corporation.
- Golden shares and options—A government may own a "golden share," particularly in a corporation that has been privatized. In some cases, this share gives the government some residual rights to protect the interests of the public by, for example, preventing the company selling off some categories of assets or appointing a special director who has strong powers in certain circumstances. A golden share is not of itself indicative of control. If, however, the powers covered by the golden share do confer on the government the ability to determine the general corporate policy of the entity in particular circumstances and those circumstances currently existed, then the entity should be in the public sector from the date in question. The existence of a share purchase option available to a government unit or a public corporation in certain circumstances may also be similar in concept to the golden share arrangement discussed earlier. It is necessary to consider whether, if the circumstance in which the option may be exercised exists, the volume of shares that may be purchased under the option and the consequences of such exercise mean that the government has "the ability to determine the general corporate policy of the entity" by exercising that option. An entity's status in general should be based on the government's existing ability to determine corporate policy exercised under normal conditions rather than in exceptional economic or other circumstances, such as wars, civil disorders, or natural disasters.
- Regulation and control—The borderline between regulation that applies to all entities within a class or industry group and the control of an individual corporation can be difficult to judge. There are many examples of government involvement through regulation, particularly in areas such as monopolies and privatized utilities. It is possible for regulatory involvement to exist in important areas, such as in price setting, without the entity ceding control of its general corporate policy. Choosing to enter into or continue to operate in a highly regulated environment suggests that the entity is not subject to control. When regulation is so tight as to effectively dictate how the entity performs its business, then it could be a form of control. If an entity retains unilateral discretion as to whether it will take funding from, interact commercially with, or otherwise deal with a public sector entity, the entity has the ultimate ability to determine its own corporate policy and is not controlled by the public sector entity.
- Control by a dominant public sector customer or group of public sector customers—If all of the sales of a corporation are to a single public sector customer or a group of public sector customers, there is clear scope for dominant influence. The presence of a minority private sector customer and/or open competition from private producers to supply goods and services to the public sector usually implies an element of independent decision-making by the corporation so that the entity would not be considered controlled. In general, if there is clear evidence that the corporation could not choose to deal with nonpublic sector clients because of the public sector influence, then public control is implied.
- Control attached to borrowing from the government—Lenders often impose controls as conditions of making loans. If the government imposed controls through lending or issuing guarantees that are more than would be typical when a healthy private sector entity borrows from a bank, control may be indicated. Similarly, control may be implied if only the government was prepared to lend to the corporation.

Although a single indicator could be sufficient to establish control, in other cases, a number of separate indicators may collectively indicate control. A decision based on the totality of all indicators must necessarily be judgmental in nature, but clearly similar judgments must be made in similar cases.

Types of public corporations

2.113 Public corporations are classified as nonfinancial or financial corporations, depending on the nature of their primary activity.

Public nonfinancial corporations subsector

2.114 All resident nonfinancial corporations controlled by general government units or other public corporations are part of the **public nonfinancial corporations subsector**. **Nonfinancial corporations** are corporations whose principal activity is the production of market goods or nonfinancial services. Typical examples of public nonfinancial corporations are national airlines, national electricity companies, and national railways, if those entities charge economically significant prices. This category could also include public nonprofit institutions engaging in market production (such as hospitals, schools, or colleges) if they are separate institutional units and charge economically significant prices. However, entities that receive financial aid from government but are not controlled by government are not public corporations, but are classified as private corporations or NPISHs.

Public financial corporations subsector

2.115 All resident financial corporations controlled by general government units or other public corporations are part of the **public financial corporations subsector**. **Financial corporations** are corporations that are principally engaged in providing financial services, including insurance and pension fund services, to other institutional units (see paragraphs 2.53–2.57).

2.116 The financial corporations subsector can further be divided into subsectors according to the financial corporations' activity in the market and the liquidity of its liabilities.[32] However, for GFS purposes, the public financial corporations subsector can broadly be grouped into public deposit-taking corporations (central bank and public deposit-taking corporations except the central bank) and other public financial corporations. Relative to other subsectors of the public sector, public financial corporations may tend to have relatively large values of financial assets and liabilities because of their role in financial intermediation. Accordingly, separate data for public financial corporations may be useful in addition to the data consolidated with other components of the public sector.

Public deposit-taking corporations

2.117 Public deposit-taking corporations are financial corporations controlled by general government units or other public corporations whose principal activity is financial intermediation and who have liabilities in the form of deposits or financial instruments that are close substitutes for deposits. Two types of public deposit-taking corporations can be distinguished: the central bank and public deposit-taking corporations except the central bank.

The central bank

2.118 The **central bank** is the national financial institution that exercises control over key aspects of the financial system. In general, the following financial intermediaries are classified in this subsector:

- The national central bank, including where it is part of a system of central banks[33]
- Currency boards or independent currency authorities that issue national currency that is fully backed by foreign exchange reserves
- Central monetary agencies of essentially public origin (e.g., agencies managing foreign exchange or issuing banknotes and coins) that keep a complete set of accounts but are not classified as part of central government.

2.119 As long as the central bank is a separate institutional unit, it is always part of the financial corporations subsector, even if a case can be made that it is primarily a nonmarket producer. While a central bank may have a high degree of operational independence, it is a public corporation. Supervisory authorities that are mainly engaged in supervision of financial units and are separate institutional units from the central bank are included with financial auxiliaries.

Public deposit-taking corporations except the central bank

2.120 Public deposit-taking corporations except the central bank consist of all resident depository

[32] See paragraphs 2.53–2.57, and in the *2008 SNA*, paragraphs 4.98–4.116, for a detailed breakdown of these subsectors.

[33] In a currency union, in each member economy the monetary authority functions may be carried out by a national (resident) monetary authority (see paragraph 2.21).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

corporations, except the central bank, that are controlled by general government units or other public corporations. Examples are commercial banks, "universal" banks, "all purpose" banks, savings banks, post office giro institutions,[34] post banks, rural credit banks, agricultural credit banks, export-import banks, and specialized banks if they take deposits or issue close substitutes for deposits.

Other public financial corporations

2.121 Other public financial corporations comprise all resident financial corporations, except public deposit-taking corporations, controlled by general government units or other public corporations. This subsector includes units that raise funds in financial markets other than by deposits and use them to acquire financial assets. Examples of units in this subsector are money market funds, nonmoney market investment funds, insurance corporations, pension funds, and other financial intermediaries (except insurance corporations and pension funds). In addition, this subsector includes financial auxiliaries (including supervisory authorities that are separate institutional units), and captive financial institutions and money lenders.

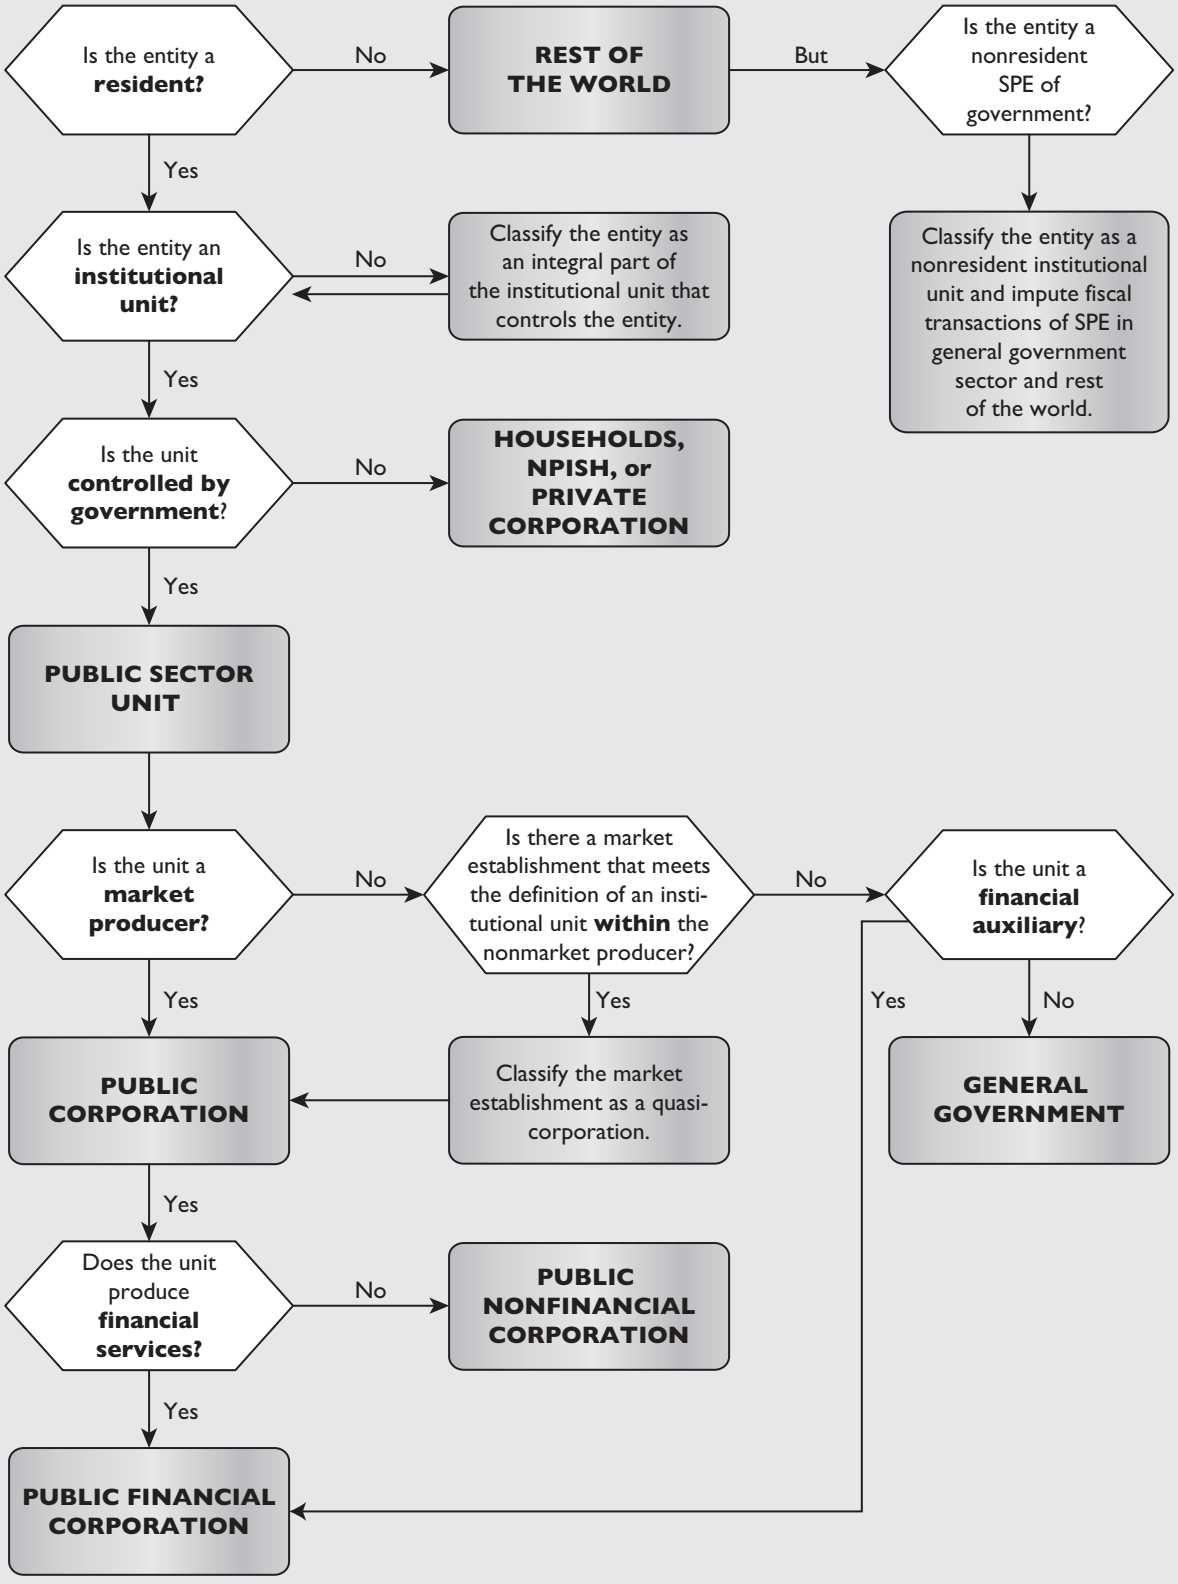
Other groupings of public sector units

2.122 When compiling statistics of public corporations, various groupings—or subsectors of the public sector—may be desirable for analytical purposes. The four groupings of public corporations as illustrated in Figure 2.2 will likely form the foundation from which other groupings can be created. Other possible groupings include:

- The nonfinancial public sector—The general government sector plus public nonfinancial corporations
- The general government sector plus the central bank
- The central government public sector—The central government subsector plus public corporations controlled by the central government.[35]

[34]Giro institutions enable money to be transferred quickly and cheaply between accounts or between financial institutions.
[35]GFS for the central government public sector will be comparable to the consolidated financial statements prepared in accordance with accounting standards for the central government in cases where central government does not control state and local governments.

2.123 The term "sovereign" is often used by financial markets and fiscal analysts in the context of fiscal operations, borrowing, and debt. Unlike groupings of the public sector described earlier, which are based on institutional units, "sovereign" is defined on a functional basis and may be used in varying ways. To avoid confusion and, as a service to users, the presentation of "sovereign statistics" should indicate the institutional coverage of the statistics, and how this relates to the standard definitions of general government and/or public sector statistics.



Decision Tree for Sector Classification of the Public Sector

2.124 Using the concepts of residence, institutional unit, control, and market versus nonmarket producers, the decision tree presented in Figure 2.4 facilitates the appropriate delineation of the public sector. In order to determine which entities belong to the general government sector and which to the public corporations subsector, the decision tree should be followed, using sequential questions:

- Is the entity a resident or a nonresident? Data for nonresident entities are recorded in data for the rest of the world (see paragraph 2.7).
- Is the entity an institutional unit? If it is resident but not an institutional unit, it is treated as an integral part of the institutional unit that controls it. If it satisfies the criteria to be an institutional unit, move on to the next decision point (see paragraph 2.22).
- Is the institutional unit controlled by government or another public corporation? The answer to this question will place the institutional unit in the public or private sector (see Boxes 2.1 and 2.2).
- Is the institutional unit a market or nonmarket producer? The answer to this question will place the institutional unit in the general government sector or the public corporations subsector (see paragraphs 2.65–2.75).
- If the institutional unit is in the general government sector, could any market establishments that satisfy the criteria to be an institutional unit be identified within the general government unit? Such market establishments should be classified as quasi-corporations in the public corporations subsector (see paragraphs 2.33–2.34).

Figure 2.4 Decision Tree for Sector Classification of Public Entities

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

- Is the institutional unit providing financial auxiliary services, such as supervisory authorities of financial intermediaries and financial markets? A positive answer to this question will place the institutional unit in the public financial corporations subsector (see paragraph 2.54).
- Is the public corporation involved in producing financial services? The answer to this question will place the institutional unit in the public financial or public nonfinancial corporations subsector (see paragraphs 2.114–2.121).

Practical Application of Sector Classification Principles

Identifying Quasi-corporations

2.125 Quasi-corporations (as defined in paragraph 2.33) satisfy the criteria to be separate institutional units and function as if they were corporations. They are treated in macroeconomic statistics as if they were corporations—that is, as institutional units separate from the units to which they legally belong. Thus, quasi-corporations owned or controlled by government units are grouped with public corporations in the public nonfinancial or public financial corporations sectors.

2.126 The existence of, or possibility to construct, a complete set of accounts, including balance sheets, for the enterprise is a necessary condition for the entity to be treated as a separate institutional unit. Also, the government must grant management of the enterprise discretion to operate as if it were a separate corporation. In practice this should apply with respect to both the management of the production process and the use of funds, including maintaining their own working balances and business credit, and being able to finance some or all of their capital formation out of their own saving, financial assets, or borrowing. The ability to distinguish flows of income and finance between quasi-corporations and general government units implies that, in practice, their operating and financing activities must be separable from government revenue or financing statistics, despite the fact that they are not separate legal entities.

2.127 Entities such as national railways, port authorities, post offices, government publishing offices, public theaters, museums, swimming pools, hospitals, education centers, and other entities that provide goods and services on a market basis should be treated as public corporations if these units satisfy the criteria to be quasi-corporations. Similar market producers that do not satisfy the requirements to be recognized as quasi-corporations are treated as market establishments integrated with the general government unit that controls them. In cases where government producers of similar goods and services sell their products at nonmarket prices, they remain a part of the nonmarket activities of general government.

Distinguishing Head Offices and Holding Companies

2.128 Large groups of corporations may be created whereby a parent corporation (or government in the case of public corporations) controls several subsidiaries, some of which may control subsidiaries of their own. Each individual corporation that satisfies the criteria to be an institutional unit should be classified as a separate institutional unit, regardless of whether it forms part of a group. The parent corporation in such circumstances is often referred to as a holding company. There are two different types of holding companies:

- The first type is the head office that is actively engaged in production by exercising some aspects of managerial control over its subsidiaries. This class of corporations includes overseeing and managing other units of the company or enterprise; undertaking the strategic or organizational planning and decision-making role of the company or enterprise; exercising operational control; and managing the day-to-day operations of their related units. Such units are allocated to the nonfinancial corporations subsector unless all or most of their subsidiaries are financial corporations, in which case they are treated by convention as financial auxiliaries in the financial corporations sector.
- The second type is a unit that holds the assets of subsidiary corporations but does not undertake any management activities. This class of corporations includes the activities of holding companies—that is, units that hold the assets (owning controlling-levels of equity) of a group of subsidiary corporations and whose principal activity is to own the group. The holding companies in this case do not provide any other service to the enterprises in which the equity is held—

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

that is, they do not administer or manage other units. Such units are allocated to the financial corporations subsector and treated as captive financial institutions even if all the subsidiary corporations are nonfinancial. However, these holding companies should be distinguished from artificial subsidiaries and restructuring agencies (see paragraphs 2.42 and 2.129, respectively).

Restructuring Agencies

2.129 Restructuring agencies are entities set up to sell corporations and other assets, and for the reorganization of companies. They may also serve for defeasance of impaired assets or repayment of liabilities of insolvent entities, often in the context of a banking crisis. These entities are known by various names, such as restructuring corporations, privatization vehicles, asset management companies, liquidation corporations, bridge banks, or bad banks.

2.130 Some institutional units specialize in the restructuring of corporations, either nonfinancial or financial. These corporations may or may not be controlled by government. Restructuring agencies may be long-standing or created for this special purpose. Governments may fund the restructuring operations in various ways, either directly, through capital injections (capital transfer, loan, or acquisition of equity), or indirectly, through granting guarantees. If the restructuring agency is controlled by government or another public corporation, it is classified in the public sector (see Box 2.2). Whether a restructuring unit is part of the general government sector or is a public corporation is determined by whether it is a market or nonmarket producer. Given that the economically significant price criteria may be insufficient for this purpose, the following general criteria should be considered:[36]

- A unit that serves only government, or primarily government, is more likely to be included as a nonmarket producer within the general government sector than one that serves other units as well.
- A unit that sells or buys financial assets at a value other than market values is more likely to be in the general government sector than not.
- A unit that takes on low risks because it acts with strong public financial support and, by law or effectively, on behalf of the government, is likely to be included within the general government sector.

2.131 The following are two frequently observed examples that provide further guidance in the classification of restructuring agencies:

- A restructuring agency may undertake the reorganization of public or private sector entities or the indirect management of privatization. Two cases may be considered:
  - The restructuring unit is a genuine holding company controlling and managing a group of subsidiaries, and only a minor part of its activity is dedicated to channeling funds from one subsidiary to another on behalf of the government and for public policy purposes. This unit is more likely to be a market producer and classified as a financial corporation, and the transactions made on behalf of the government rerouted through the general government unit using the service provided.[37]
  - The restructuring unit, whatever its legal status, acts as a direct agent of the government and is not a market producer. Its main function is to redistribute national income and wealth, channeling funds from one unit to the other. The restructuring unit should be classified in the general government sector.
- Another example of a restructuring agency is one mainly concerned with impaired assets, mainly in the context of a banking or other financial crisis. Such a restructuring agency must be analyzed according to the degree of risk it assumes, considering the degree of financing provided by the government. Again, two cases may be considered:
  - The restructuring agency borrows on the market at its own risk to acquire financial or nonfinancial assets that it actively manages. In this case the unit is more likely to be a market producer and classified as a financial corporation.
  - The restructuring agency deliberately purchases assets at above-market prices with direct or indirect financial support from the government. It is primarily engaged in the redistribution of national income (and wealth), does not act independently

[36] This is because restructuring units have, by nature, little output.

[37] Rerouting is described paragraphs 3.28.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

of government or place itself at risk, and therefore is not a market producer and should be classified in the general government sector.

Financial Protection Schemes

2.132 The financial infrastructure of an economy may include financial protection schemes to protect the assets of financial institutions' clients. These schemes are often referred to as deposit guarantee schemes or deposit insurance schemes. The main types of schemes provide protection of deposits or protect policyholders against failing life and nonlife insurance schemes. These entities are known by various names, but to determine their sector classification, the nature of their activities should be considered on a case-by-case basis.

2.133 A financial protection scheme is classified as part of the general government, a public financial corporation, or a private financial corporation outside the public sector according to the same sectorization principles that apply to any other entity, as described earlier in this chapter (see paragraph 2.124).

2.134 A resident financial protection scheme may or may not satisfy the criteria to be an institutional unit. If it is not an institutional unit, it is treated as an integral part of the institutional unit that controls it.

2.135 If the fees are set by government, or when the government or a public corporation has control over the financial protection scheme through other means, the scheme is to be included in the public sector. The following criteria should be considered in determining whether the scheme is part of the general government sector:

- If fees payable to government for such a protection scheme are compulsory—that is, if beneficiaries cannot opt out of the scheme—the scheme is to be included in general government sector (see paragraph 5.74).
- If fees payable to government are clearly out of proportion to the service provided (fees are not determined based on the associated risks covered), the scheme is to be included in general government sector (see paragraph 5.74).
- If fees payable to government are not set aside in a fund, or can be used for other purposes, the scheme is to be included in general government sector.
- If the fees are proportional to the cost of the service provided, and the scheme is an institutional unit, it is classified as an insurance corporation; operating a fund that functions on insurance rules may indicate proportionality and the existence of a standardized guarantee scheme.

Special Purpose Entities

2.136 While there is no internationally agreed-upon definition of an SPE, some typical features are that it has little physical presence, is related to another corporation or government, and is often resident in a territory other than the territory of residence of its parent unit.[38]

2.137 Governments may set up SPEs for financial convenience. For example, the SPE may be involved in fiscal or quasi-fiscal activities (including securitization of assets, borrowing, etc.). Resident[39] SPEs that function only in a passive manner relative to general government and that carry out fiscal and quasi-fiscal activities do not satisfy the criteria to be institutional units and are therefore not treated as separate institutional units in macroeconomic statistics; they are treated as part of general government regardless of their legal status. Resident SPEs acting independently, acquiring assets and incurring liabilities on their own behalf, accepting the associated risk, are treated as separate institutional units and are classified to a sector according to their principal activity.

2.138 SPEs that are resident in a different country than their controlling government are always classified as separate institutional units in the economy where they are established. When such entities exist, care must be taken to reflect the fiscal activities of government accurately. All flows and stock positions between the general government unit and the nonresident SPE should be recorded in the accounts for general government and the rest of the world when they occur.[40]

2.139 A government may create a nonresident SPE to undertake government borrowing or incur

[38] SPEs are also discussed in the *2008 SNA*, paragraphs 4.55–4.58.
[39] For a definition of resident and nonresident units, see paragraphs 2.6–2.15.
[40] Examples of these imputations are described in the *PSDS Guide*, Box 4.12.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

government outlays abroad for fiscal purposes. Even if there are no actual economic flows recorded between the government and the SPE related to these fiscal activities, flows and stock positions should be imputed in the accounts of both the government and the rest of the world to reflect the fiscal activities of the government undertaken by the SPE.

Joint Ventures

2.140 Many public sector units enter into arrangements with private entities (e.g., a public-private partnership) or other public sector units to undertake a variety of activities jointly. The joint venture could be a market or nonmarket producer. Joint operations can be structured broadly as one of three types: jointly controlled units, referred to here as joint ventures; jointly controlled operations; and jointly controlled assets.

2.141 A **joint venture** involves the establishment of a corporation, partnership, or other institutional unit in which, legally, each party has joint control over the activities of the joint venture unit. The joint venture unit operates in the same way as other units except that a legal arrangement between the parties establishes joint control over the unit. As an institutional unit, the joint venture may enter into contracts in its own name and raise finance for its own purposes. Such a joint venture maintains its own accounting records.

2.142 The participants to a joint venture may be public sector and/or private sector units. To properly decide the sector classification of the joint venture in macroeconomic statistics, it must be determined which unit has economic control of the joint venture. Given the nature of a joint venture (created legally with joint control), the principal question to be considered here is whether the effective economic control of the joint venture establishes a public or a private unit:

- If a joint venture operates as a nonmarket producer, then government is in effective control and it is classified as part of the general government sector.
- If the joint venture is a market producer, it is treated as a public or private corporation according to whether it is controlled by a government unit. Normally, the percentage of ownership will be sufficient to determine control. If the public and private units own an equal percentage of the joint venture, the other indicators of control must be considered (see Box 2.2).

2.143 Joint operating arrangements can be in the form of jointly controlled operations or jointly controlled assets. When public sector units enter into joint operating arrangements without establishing separate institutional units, there are no units requiring classification; however, the recording should reflect the proper economic ownership of assets. Also, any sharing arrangements of revenue and expense should be recorded in accordance with their economic nature as determined by the provisions of the governing contract. For example, two units may agree to be responsible for different stages of a joint production process or one unit may own an asset or a complex of related assets, but both units agree to share revenue and expense.

Sinking Funds

2.144 A sinking fund is a separate account, which may, or may not be an institutional unit. A **sinking fund** is made up of segregated contributions provided by the unit(s) that makes use of the fund (the "parent" unit) for the gradual redemption of the parent unit's debt. A sinking fund may also be established to provide for major repairs or replacements. Aside from eventually extinguishing all government debt in a prudent and orderly manner, sinking funds may be meant to inspire confidence, supporting the market for government securities.

2.145 Public sector sinking funds are classified to sectors according to whether they are separate institutional units[41] and, if so, whether they provide their services at economically significant prices.

- Sinking funds that are separate institutional units and provide services as market producers are classified as public financial corporations.
- Sinking funds that are separate institutional units and provide services as nonmarket producers are classified as general government units. In particular, such sinking funds will be classified as extrabudgetary units of the unit that controls them (e.g., central government).
- Sinking funds that are not separate institutional units are classified with the unit that controls them (i.e., the "parent" unit).

[41] An institutional unit is defined in paragraph 2.22.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

2.146 A variety of practices exist among sinking funds as to both their operation and the degree of control exercised by the "parent" unit (such as government):

- Some sinking funds retire or purchase only the parent unit's securities for which they are established. Such sinking funds are normally not separate institutional units and are classified with the unit that controls them.
- Some sinking funds may have been assigned other responsibilities, such as the conduct of government lending programs or even the collection of earmarked taxes. Such sinking funds are normally not separate institutional units and are classified with the unit that controls them.
- Other sinking funds may purchase and sell securities of other governments or institutions—domestic or external debtors and creditors—usually seeking securities that have similar maturity dates. Such sinking funds may well be institutional units providing services on a market basis and are classified as public financial corporations.

Pension Schemes

2.147 The means by which pensions are provided to persons in retirement varies from country to country. Various types of pensions are provided by public sector units to individuals via social assistance, social security schemes, and employment-related schemes other than social security. Due to the complexities involved in the classification and sectorization of these arrangements, a detailed discussion is provided in Appendix 2.

Provident Funds

2.148 Provident funds are compulsory saving schemes that maintain the integrity of the contributions for individual participants. Some governments create provident funds rather than providing social insurance benefits. Under provident fund arrangements, the compulsory contributions of each participant and of their employer on behalf of each participant are kept in a separate account and could be withdrawn under specified circumstances, such as retirement, unemployment, invalidity, and death. These contributions are then managed and invested to obtain a return for each participant.

2.149 The establishment of a provident fund raises the issue of whether this fund is classified as a social security scheme elsewhere in the general government, as a public corporation, or outside the public sector. Provident fund arrangements as defined in the preceding paragraph are different from social security schemes insofar as for each contributor segregated assets exist and it is not foreseen for government to be able to alter the benefits. These provident funds thus are excluded from social security schemes.

2.150 The classification of a provident fund controlled by government in the general government sector or financial corporations subsector is determined by the same sectorization principles that apply to any other entity, as described earlier in this chapter:

- A resident provident fund controlled by government that satisfies the definition of an institutional unit is classified as a public financial corporation. Individual contributions determine individual benefits, and the entity is involved in financial intermediation by pooling the contributions from many households and investing them on their behalf similar to the case of investment funds and defined-contribution pension funds (see paragraphs 2.53–2.54). Therefore, these units are classified in the public financial corporations subsector as market producers.
- A resident provident fund controlled by government that does not satisfy the criteria to be an institutional unit is classified with the government unit that controls it.

2.151 It is possible that a provident fund may be established in such a way that it includes aspects of a social security scheme (social insurance) as well as aspects of a compulsory saving scheme. In such cases, the fund would be classified according to the scheme that predominates while still applying the sectorization principles outlined in this chapter.

Sovereign Wealth Funds

2.152 Some governments create special purpose government funds, usually called sovereign wealth funds (SWFs).[42] Created and owned by the general government for macroeconomic purposes, **SWFs** hold, manage, or administer assets to achieve financial objectives, and employ a set of investment strategies that include investing in foreign financial assets. The funds are commonly established out of balance of

[42] While these funds may have various names, this section refers to them as "sovereign wealth funds" for ease of reference.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

payments surpluses, official foreign currency operations, the proceeds of privatization, fiscal surpluses, and/or receipts resulting from commodity exports.

2.153 The establishment of an SWF raises the issue of whether this fund is classified as part of the general government, as a public corporation, or outside the public sector. The classification of a sovereign wealth fund controlled by government in the general government sector or financial corporations subsectors is determined by the same sectorization principles that apply to any other entity, as described earlier in this chapter (see paragraph 2.124).

2.154 A resident SWF controlled by government may, or may not satisfy the definition of an institutional unit:

- If the SWF is not an institutional unit, it is classified with the unit that controls it.
- If the resident SWF is an institutional unit, it is classified as:
  - A public financial corporation if it is providing financial services on a market basis
  - A general government unit (an extrabudgetary fund or social security fund[43]) if it satisfies the definition of a government unit (see paragraph 2.38) and is simply a passive holder of assets and liabilities (see paragraph 2.42).

2.155 If the SWF is an entity incorporated abroad or quasi-corporation located abroad, it is classified as a separate institutional unit in the financial corporations subsector of the economy in which the entity is legally constituted, or in the absence of legal incorporation, is legally domiciled. In such circumstances, all general government transactions and stock positions with the SWF should be reflected in the general government account with the rest of the world as the counterparty.

Market Regulatory Agencies

2.156 Market regulatory agencies act on behalf of a government (or a regional organization with governments as its members), and influence the market for specific goods or services directly and/or indirectly. These agencies may influence the market directly by acting as buyers and sellers of the goods or services and may influence the market indirectly through regulations, rulings, compliance laws, or standards, to impact the production, price, and marketing of specific products. The regulations may cover the terms and conditions of supplying the goods and services and in particular the price allowed to be charged and/or to whom the goods and services are distributed. It is most common for a regulatory agency to control agricultural products, monopolistic markets, or, in some cases, natural resources.

2.157 The nature of these market regulatory agencies may differ. The nature of each agency should be investigated to decide the sector classification according to sectorization principles. At one end of the spectrum, some agencies are merely distributing subsidies, while others may have an administrative, advisory, standard or price setting, or collective advertising function. At the other end of the spectrum, the agency may have total control over all aspects of the production and distribution process, including being the only legal buyer/seller of the products.

2.158 Following the residence principle, those market regulatory agencies that meet the definition of an international or regional organization are not included in the statistics of the individual member countries, but their activities should be reflected in regional data (see Appendix 5). By convention, financial regulatory (supervisory) bodies are considered as financial corporations, specifically as financial auxiliaries when they are separate institutional units. For those resident market regulatory agencies involved with nonfinancial goods and services, the following guidance applies:

- Those agencies that do not satisfy the criteria to be an institutional unit remain an integral part of the general government unit that controls them. This would usually be the case for those agencies exclusively or principally involved in the distribution of subsidies on behalf of government.
- Those agencies that satisfy the criteria to be institutional units, and that are mainly nonmarket producers, such as performing some administrative functions, setting standards, or overseeing and regulating the production process, should be classified in the general government sector. Although the agency may have active participation of members from the market it serves, government

[43] SWFs that hold and manage wealth designated to provide social benefits will be included in social security funds.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

control is established by the enabling instruments and nonmarket nature of these entities.

- Those agencies that satisfy the criteria to be an institutional unit and that are mainly a market producer should be classified in the nonfinancial corporations subsector. These market regulatory agencies' sole or principal activity is to buy, hold, and sell the goods or services at economically significant prices..

2.159 Where market regulatory agencies are involved in a mixture of activities, such as distributing subsidies and buying, holding, and selling goods and services, the sector classification may require careful consideration. If it is possible to separately identify a quasi-corporation that is undertaking market activities, it should be classified in the nonfinancial corporations subsector. The nonmarket activities should be classified in the general government sector. If it is not possible to distinguish two institutional units, the majority of the activities of the entity should determine the sector classification.

Development Funds and/or Infrastructure Companies or Entities

2.160 Some governments create special entities/funds to finance and develop the economy in general, develop specific sectors of the economy, or upgrade specific facilities, such as infrastructure. These types of agencies/funds may be involved in various aspects of development, ranging from only providing the finances for development activities to being involved in all aspects of the actual development and construction of the infrastructure or facilities. Various terms, such as "development banks," "investment funds," "fiscal stabilization funds," or "infrastructure companies," are used to describe these agencies. Whatever they are called, the sector classification should be based not on their description but rather on the economic nature of the entities.

2.161 Using the usual criteria (see paragraph 2.22), compilers should determine whether the entity is a separate institutional unit in the public sector, or whether it is not an institutional unit and should be classified as an integral part of the unit that controls it.

2.162 These entities may be established in the legal form of a corporation, but it is necessary to decide whether to classify them as institutional units. The financing arrangements of these entities usually involve the issuance of debt instruments, but could also include some other sources of financing. The customers that they serve, the financing arrangements, and the economic ownership of the assets created by these entities could often be indicative of the risks assumed by these entities, and could help to determine their status as an institutional unit. The following guidance applies:

- If the entity cannot act independently from its parent and is a passive holder of assets and liabilities, it is an artificial subsidiary. If it is a resident unit, it is classified as a component of the level of government that controls it (i.e., as part of the parent unit). These entities are not treated as separate institutional units, unless they are resident in an economy different from that of their parent unit (see paragraphs 2.6–2.15).
- If the entity borrows on the market and then lends only to general government units, it is not involved in financial intermediation and should be regarded as a resident artificial subsidiary (see paragraphs 2.42–2.44).
- If government assumes economic ownership of the nonfinancial assets created, it is an indication that the development fund is just a device to borrow and acquire the assets, and the entity should be treated as a resident artificial subsidiary.
- If these entities meet the definition of an institutional unit (see paragraph 2.22) and are government-controlled market producers of goods or services, they should be classified as a corporation. More specifically, they will be a public financial corporation only if they are involved in providing financial services (see paragraph 2.53).[44] They will be public nonfinancial corporations only if they produce and sell the infrastructure assets at economically significant prices in market transactions.

[44] Providing concessionary loans does not necessarily mean that an institutional unit is not a market producer (e.g., some development banks are providing concessionary loans but are still considered financial intermediaries).

3 Economic Flows, Stock Positions, and Accounting Rules

This chapter describes the economic flows and stock positions of the government finance statistics framework and the accounting rules used to determine all aspects of their recording.

Introduction

3.1 Entries recorded in GFS are either **economic flows** or **stock positions**.[1] Flows are monetary expressions of economic actions and effects of events that result in changes in economic value within a reporting period. Stock positions measure economic value at a point in time. More specifically, stock positions refer to a unit's holdings of assets and liabilities at a specific time and the unit's resulting net worth, equal to total assets minus total liabilities.

3.2 The flows and stock positions recorded in the GFS framework are integrated, which means that all changes in stock positions can be fully explained by the flows. In other words, the following relationship is valid for each stock position:

$$S_0 + F = S_1$$

where S_0 and S_1 represent the values of a specific stock position at the beginning and end of a reporting period, respectively, and F represents the net value of all flows during the period that affected that particular stock. More generally, the value of any stock position held by a unit at a given time is the cumulative value of all flows affecting that stock position that have occurred since the unit first acquired the particular type of asset or liability.

3.3 The GFS framework includes a great diversity of economic flows. This chapter first describes several important characteristics of economic flows that underlie their classification and treatment. It then describes in a general way the accounting rules used for recording these flows and stock positions in GFS. Descriptions of specific categories of flows and stock positions and the application of the general rules to their recording are discussed in Chapters 5 through 10.

Economic Flows

3.4 Economic flows reflect the creation, transformation, exchange, transfer, or extinction of economic value; they involve changes in the volume, composition, or value of a unit's assets, liabilities, and net worth. A flow can be a single event, such as the purchase of goods, or the cumulative value of a set of events occurring during a reporting period, such as the continuous accrual of interest expense on a government bond. All flows are classified as transactions or as other economic flows. The following sections describe these two types of economic flows.

Transactions

3.5 A **transaction** is an economic flow that is an interaction between institutional units by mutual agreement or through the operation of the law, or an action within an institutional unit that is analytically useful to treat like a transaction, often because the unit is operating in two different capacities.[2] This definition of a transaction stipulates that an interaction between institutional units occurs by mutual agreement. Mutual agreement means that there was prior knowledge and consent by the units, but it does not mean that both units entered into the transaction voluntarily. Some transactions, such as the payment of taxes, are imposed by force of law. Although individual units are not free to determine the amount of taxes they pay,

[1] In macroeconomic statistics, the term "flows" will often be used as a short form for "economic flows," and "stocks" will often be used as a short form for "stock positions."

[2] For example, *consumption of fixed capital* (23) and the use of inventories in the production of *goods and services* (22) (see paragraphs 6.27 and 6.53, respectively).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

there is collective recognition and acceptance by the community of the obligation to pay taxes. Thus, payments of taxes are considered transactions despite being compulsory. Similarly, the actions necessary to comply with judicial or administrative decisions may not be undertaken voluntarily, but they are taken with prior knowledge and consent of the parties involved.

3.6 The treatment of some activities in GFS takes a different perspective from the treatment of the same activities in the *2008 SNA*. GFS is focused on the impact of economic events on the finances of government. In contrast, the *2008 SNA* is focused on measuring production, consumption, distribution of income, and investment. Appendix 7 contains a complete description of the implications of these different perspectives. Despite different treatments of some activities, both frameworks include all flows that change stock positions so that all changes in the balance sheet can be explained by the flows.

3.7 Transactions may take on many different forms. In GFS, all transactions are classified according to their economic nature, while transactions in expenditure are also classified according to their functions (see Chapters 5, 6, 8, and the annex to Chapter 6). To give more precision to the classification of transactions, the characteristics of transactions have to be systematically described.

Monetary transactions

3.8 A **monetary transaction** is one in which one institutional unit makes a payment (receives a payment) or incurs a liability (acquires an asset) to (from) another institutional unit stated in units of currency. In GFS, all flows are recorded in monetary terms, but the distinguishing characteristic of a monetary transaction is that the parties to the transaction express their agreement in monetary terms. For example, goods or services are usually purchased or sold at a given number of units of currency per unit of the good or service, social security benefits are often payable in fixed amounts of currency, and taxes receivable are measured and payable in units of currency. All monetary transactions are interactions between two institutional units, recorded as either an *exchange* or a *transfer*.

3.9 An **exchange** is a transaction in which one unit provides a good, service, asset, or labor to a second unit and receives a good, service, asset, or labor of the same value in return.[3] Compensation of employees, purchases of goods and services, the incurrence of interest expense, and the sale of an office building are all exchanges.

3.10 A **transfer** is a transaction in which one institutional unit provides a good, service, or asset to another unit without receiving from the latter any good, service, or asset in return as a direct counterpart. This kind of transaction is also referred to as being unrequited, a "something for nothing" transaction, or a transaction without a quid pro quo. Transfers can also arise where the value provided in return for an item is not economically significant or is much below its value. Typically, general government units engage in a large number of transfers, which may be compulsory or voluntary. Taxes and most social security contributions are compulsory transfers imposed by government units on other units. Subsidies, grants, and social assistance benefits are transfers from general government units to other units. Public corporations are, to a lesser extent, involved in transfers—they may receive subsidies or capital transfers from government and may also be involved in transfers payable resulting from their quasi-fiscal activities.

3.11 Some transactions appear to be exchanges but are actually combinations of an exchange and a transfer. In such cases, the actual transaction should be partitioned and recorded as two transactions, one that is only an exchange and one that is only a transfer. For example, a general government unit might sell an asset at a price that is clearly less than the market value of the asset, or may buy an asset at a price that is clearly above the market value of the asset. The transaction should be divided into an exchange at the asset's market value and a transfer equal in value to the difference between the actual transaction value and the market value (see paragraph 3.107) of the asset.[4]

3.12 Exchange transactions do not include entitlements to collective services or benefits—these are

[3] The term "provides a good, service, asset . . ." is meant to include one unit allowing a second unit to use an asset owned by the first unit or a change in the ownership of an asset. Interest and other property income transactions are exchanges because they are receivable by a unit in return for putting assets at the disposal of another unit.

[4] See paragraph 3.29 for a general statement on partitioning of transactions.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

considered transfers. The amount of collective service or benefit that may eventually be receivable by an individual unit is not proportional to the amount payable. Taxes and nonlife insurance premiums are examples of such transactions classified as transfers due to the collective nature of the benefits (see paragraphs 5.23 and 5.149, respectively).

3.13 Taxes are treated as transfers even though the units making these payments may receive some benefits from services provided by the government unit receiving the taxes. For example, in principle, no one can be excluded from sharing in the benefits provided by collective services such as public safety. In addition, a taxpayer may even be able to consume certain individual services provided by government units. However, it is usually not possible to identify a direct link between the tax payments and the benefits received by individual units. Moreover, the value of the services received by a unit usually bears no relation to the amount of the taxes payable by the same unit.

3.14 Nonlife insurance premiums and claims are also treated as transfers in GFS.[5] This type of premium entitles the units making the payment to benefits only if one of the events specified in the insurance contract occurs. That is, one unit pays a second unit for accepting the risk that a specified event may occur to the first unit. These transactions are considered transfers[6] because in the nature of the insurance business, they distribute income between policyholders to those who claim, as opposed to all policyholders who contribute. There is uncertainty whether the contributing unit will receive any benefits and, if it does receive benefits, they may bear no relation to the amount of the premiums previously paid. Nonlife insurance includes social security schemes and employer social insurance schemes for government employees that do not provide retirement benefits. Thus, social security contributions receivable and social security benefits payable by government units, which are not for employment-related pensions, are treated as transfers in GFS.

3.15 Transfers may be either current or capital. To distinguish current transfers from capital transfers, it is preferable to focus on the special characteristics of capital transfers.

3.16 Capital transfers are transfers in which the ownership of an asset (other than cash or inventories) changes from one party to another, or that oblige one or both parties to acquire or dispose of an asset (other than cash or inventories), or where a liability is forgiven by the creditor. Cash transfers involving disposals of noncash assets (other than inventories) or acquisition of noncash assets (other than inventories) are also capital transfers. A capital transfer results in a commensurate change in the stock position of assets of one or both parties to the transaction. Capital transfers are typically large and infrequent, but capital transfers cannot be defined in terms of size or frequency. A transfer in kind without a charge is a capital transfer when it consists of: the transfer of ownership of a nonfinancial asset (other than inventories); and the forgiveness of a liability by a creditor when no corresponding value is received in return. Major nonrecurrent payments in compensation for accumulated losses or extensive damages or serious injuries not covered by insurance policies are also capital transfers. A transfer of cash is a capital transfer when it is linked to, or conditional on, the acquisition or disposal of an asset by one or both parties to the transaction.

3.17 Current transfers consist of all transfers that are not capital transfers. Current transfers directly affect the level of disposable income and influence the consumption of goods or services. That is, current transfers reduce the income and consumption possibilities of the donor and increase the income and consumption possibilities of the recipient. For example, social benefits, subsidies, and food aid are current transfers.

3.18 It is possible that some cash transfers may be regarded as capital by one party to the transaction and as current by the other party. So that a donor and a recipient do not treat the same transaction differently, a transfer should be classified as capital for both parties even if it involves the acquisition or disposal of an asset, or assets, by only one of the parties. When there is doubt about whether a transfer should be treated as current or capital, it should be treated as a current transfer.

Nonmonetary transactions

3.19 Nonmonetary transactions are transactions that are not initially stated in units of currency. These

[5] The prepayment of a premium is the acquisition of a financial asset by the insured (see paragraph A4.76), which reduces as insurance coverage is provided.

[6] In the *2008 SNA*, nonlife insurance premiums are partitioned into a sale of a service and a transfer. In GFS, the entire premium is considered a transfer (see paragraph 5.149).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

include all transactions that do not involve any cash flows, such as barter, in-kind transactions, and certain internal transactions. They must be assigned a monetary value as GFS record flows and stock positions expressed in monetary terms. The entries therefore represent values that are indirectly measured or otherwise estimated. The values assigned to nonmonetary transactions have a different economic implication than do monetary payments of the same amount, as they are not freely disposable sums of money. Nevertheless, to have a comprehensive and integrated set of accounts, it is necessary to assign the best estimate of market values to the items involved in nonmonetary transactions.

3.20 Nonmonetary transactions can be either two-party transactions or actions within an institutional unit that are used to construct an internal transaction.

Two-party nonmonetary transactions

3.21 These nonmonetary transactions can be exchanges or transfers. Barter, remuneration in kind, and other payments in kind are nonmonetary exchanges. Transfers in kind are nonmonetary transfers.

3.22 In a **barter** transaction, two units exchange goods, services, or assets other than cash of equal value. For example, a government unit may agree to trade a parcel of land in an industrial area to a private corporation for a different parcel of land that the government will use as a national park. Between nations, governments may trade strategic natural resources for another kind of product or service.

3.23 Remuneration in kind occurs when an employee is compensated with goods, services, or assets other than money. Types of compensation that employers commonly provide without charge or at reduced prices to their employees include meals and drinks, uniforms, housing services, transportation services, and child care services (see paragraph 6.17–6.18).

3.24 Payments in kind other than remuneration in kind occur when any of a wide variety of payments is made in the form of goods and services rather than money. A payment to settle a liability can be made in the form of goods, services, or noncash assets rather than money. For example, a government unit may agree to settle a claim for past-due taxes if the taxpayer transfers ownership of land or fixed assets to the government, or inheritance taxes may be payable by making donations of paintings or other valuables to government.

3.25 Transfers in kind may be used to increase efficiency, or to insure that the intended goods and services are consumed. For example, aid after a natural disaster may be delivered faster and be more effective if it is provided in the form of medicine, food, and shelter instead of money. Also, a general government unit might provide medical and educational services in kind to ensure that the need for those services is met.

Internal transactions

3.26 Internal or intra-unit transactions take place when a single unit acts in two different capacities, and it is analytically useful to record this act as a transaction. The choice of which internal actions to treat as transactions is subjective to the purpose of recording these actions. GFS follows the *2008 SNA* by treating consumption of fixed capital as an internal transaction to allow the calculation of the operating costs of government. Similarly, the transfer of materials and supplies from inventories to use of goods and services and other internal changes in inventories are treated as internal transactions (see paragraph 8.46–8.47).[7]

Rearrangements of some transactions

3.27 Some transactions are not recorded in the form in which they appear to take place. Instead, they are modified in macroeconomic statistics to bring out their underlying economic relationships more clearly. There are three kinds of rearrangements employed in GFS: rerouting, partitioning, and reassignment.

Rerouting

3.28 Rerouting records a transaction as taking place through channels that differ from the actual ones, or as taking place in an economic sense when no actual transactions take place. Rerouting is often required when a unit that is a party to a transaction does not appear in the actual accounting records because of

[7] Internal transactions are described in the *2008 SNA*, paragraphs 3.85–3.90. GFS does not record all the internal transactions that relate to production processes.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

administrative arrangements. Two kinds of rerouting occur:

- In the first kind of rerouting, a direct transaction between unit A and unit C is recorded as taking place indirectly through a third unit B. For example, if government employees are enrolled in a social security or retirement scheme, accounting records may show the government unit making contributions directly to the social security fund or retirement scheme on behalf of its employees. However, these contributions are part of the compensation of employees and should be recorded as being paid to the employee. In such a case, it is necessary to reroute the payments so that the government is seen as paying the employees, who then are deemed to make payments of the same amount to the social security or retirement scheme (see paragraph 6.19). As a result of the rerouting, these contributions are included as part of the labor cost of government. Rerouting may also be necessary when recording the distribution of profits of fiscal monopolies (see paragraph 5.68).
- In the second kind of rerouting, a transaction of one kind from unit A to unit B is recorded with a matching transaction of a different kind from unit B to unit A. For example, when a nonresident special purpose entity (SPE) of government borrows abroad for fiscal purposes, transactions should be imputed in the accounts of both the government and the nonresident SPE as if the SPE has extended a loan to government and government has invested the corresponding amount in the SPE (see paragraphs 2.136–2.139). This rearrangement of the transactions reflects government's involvement in the nonresident SPE, which would otherwise not be captured in government accounts.

Partitioning

3.29 Partitioning records a transaction that is a single transaction from the perspective of the parties involved as two or more differently classified transactions. For example, when a general government unit acquires an asset below or above its current market price, the division of the actual transaction into an exchange and a transfer is an example of partitioning (see paragraph 3.11**).**

Reassignment

3.30 Reassignment records a transaction arranged by a third party on behalf of others as taking place directly by the two principal parties involved. Reassignment is required when one unit arranges for a transaction to be carried out between two other units, generally in return for a fee from one or both parties to the transaction. In this case, one unit acts as an agent for another unit. In such a case, the transaction is recorded exclusively in the accounts of the two parties engaging in the transaction and not in the accounts of the third party facilitating the transaction. The accounts of the agent show only the fee charged for the facilitation services rendered. For example, reassignment may occur when one government unit collects taxes and then transfers some or all of the taxes to another government unit. In some arrangements of this nature, the collecting unit retains a small portion of the tax collected in return for its collection efforts. The amount retained is treated as the sale of a service by the collecting unit, while the total amount of taxes collected is shown as revenue for the beneficiary government unit. For guidelines on the reassignment or attribution of taxes to collecting or beneficiary governments, see paragraphs 5.33–5.38.

Other Economic Flows

3.31 Other economic flows are changes in the volume or value of assets or liabilities that do not result from transactions. These other economic flows are not transactions because they do not meet one or more of the characteristics of transactions. For example, the institutional units involved may not be acting by mutual agreement, as in the case of an uncompensated seizure of assets, or changes due to natural events, such as an earthquake or a flood. Alternatively, the value of an asset expressed in foreign currency may change as a result of exchange rate changes, or the value of an asset may change due to the passing of time.

3.32 There are two major categories of other economic flows, described as *holding gains and losses*, and *other changes in the volume of assets and liabilities*.[8]

Holding gains and losses

3.33 A holding gain or loss[9] is a change in the monetary value of an asset or liability resulting from changes in the level and structure of prices, excluding qualitative or quantitative changes in the asset or liability. Holding gains and losses on assets and

[8] References to changes in the valuation or volume of assets also apply to liabilities.
[9] Holding gains and losses are also referred to as revaluations in the *2008 SNA* and in generally accepted accounting standards.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

liabilities include changes resulting from exchange rate movements. In concept, holding gains and losses are continuously recorded as market prices change.

3.34 A holding gain or loss accrues continuously, purely as a result of holding an asset or liability over time without transforming it in any way. Holding gains/losses can apply to virtually any type of asset or liability, and they may accrue on an asset held for any length of time during the reporting period. (See paragraphs 10.05–10.45 for a complete discussion.)

Other changes in the volume of assets/ liabilities

3.35 Other changes in the volume of assets are any changes in the value of an asset or liability that do not result from a transaction or a holding gain/loss. Other changes in the volume of assets cover a wide variety of specific events. These events are divided into three main categories:[10]

- The first category consists of events that involve the appearance or disappearance of economic assets other than by transactions. In other words, certain assets and liabilities enter and leave the GFS balance sheet through events other than by transactions. (See paragraphs 10.48–10.58 for a complete discussion.)
- The second group consists of the effects of external events—exceptional and unexpected—on the economic benefits derivable from assets and corresponding liabilities. (See paragraphs 10.59–10.75 for a complete discussion.)
- The final group is made up of changes in classifications. (See paragraphs 10.76–10.84 for a complete discussion.)

Stock Positions

3.36 A **stock position** is the total holdings of assets and/or liabilities at a point in time. Stock positions are recorded in the balance sheet of the GFS framework (see Chapter 7). The integrated GFS framework shows stock positions at the beginning and end of a reporting period. Stock positions at these two points in time are connected by flows during that period because changes in positions are caused by transactions and other economic flows. In order to discuss stock positions, it is necessary to determine the asset boundary in macroeconomic statistics from which the definition of assets and liabilities is derived. The coverage of assets in GFS is limited to economic assets from which economic benefits may flow to the owners.

Economic Benefits

3.37 Economic benefits arise from owning and using economic assets. The economic benefits of ownership usually include the right to use, rent out, or otherwise generate income, or to sell the asset. Different kinds of economic benefits that may be derived from an asset include:

- The ability to use assets, such as buildings or machinery, in production
- The generation of services (e.g., renting out produced assets to another entity)
- The generation of property income (e.g., interest and dividends received by the owners of financial assets)
- The potential to sell and thus realize holding gains.

Ownership

3.38 Two types of ownership can be distinguished in macroeconomic statistics: legal ownership and economic ownership. The **legal owner** of resources such as goods and services, natural resources, financial assets, and liabilities is the institutional unit entitled by law and sustainable under the law to claim the benefits associated with the resource. Sometimes government may claim legal ownership of a resource on behalf of the community at large. To be recognized in the GFS framework, a resource must have a legal owner, on either an individual or a collective basis.

3.39 The **economic owner** of resources such as goods and services, natural resources, financial assets, and liabilities is the institutional unit entitled to claim the benefits associated with the use of these resources by virtue of accepting the associated risks. In most cases, the economic owner and the legal owner of a resource are the same. Where they are not, the legal owner has passed responsibility for the risk involved in using the resource in an economic activity to the economic owner as well as associated benefits. In return, the legal owner accepts another package of risks and benefits from the economic owner. In GFS, when the expression "ownership" or "owner" is used and the

[10] The distinctions made are only for purposes of description; the GFS framework and classification system does not allow for this breakdown.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

legal and economic owners are different, the reference should generally be understood to be to the economic owner. Appendix 4 discusses a number of cases where legal and economic ownership are different.

3.40 Sometimes government may claim legal ownership of a resource on behalf of the community at large, such as territorial waters. If so, the benefits also accrue to the government on behalf of the community at large. Thus, government is both the legal and economic owner of these resources. However, governments may share the benefits with other entities but, by virtue of accepting the majority of the risks, become the economic owner of a resource. For example, in the case of public-private partnerships, economic ownership can be vested with government when government accepts the majority of the risks (see paragraphs A4.58–A4.65).

3.41 The benefits inherent in financial assets and liabilities are seldom transferred from a legal owner to an economic owner in exactly the same state. They are usually transformed to new forms of financial assets and liabilities by the intermediation of a financial institution that assumes some of the risk and benefits while passing the financial instrument on to other units.

Definition of Assets and Liabilities

3.42 An **asset** is a store of value representing a benefit or series of benefits accruing to the economic owner by holding or using the resource over a period of time. It is a means of carrying forward value from one reporting period to another.

3.43 Only economic assets are recorded in the macroeconomic statistical systems (i.e., included within the asset boundary) and they appear in the balance sheet of the unit that is the economic owner of the asset. **Economic assets** are resources over which ownership rights are enforced and from which economic benefits may flow to the owners. Personal attributes such as reputation or skill, which are sometimes described as an asset, are not recognized as such in GFS because they are not economic assets as defined earlier. A distinction is made between nonfinancial and financial assets. All financial assets have liabilities as counterparts, except for gold bullion held as a reserve asset, which, by convention, is a financial asset (7.128).

Financial assets and liabilities

3.44 A particularly important mechanism in the economy is the device whereby one economic unit exchanges a particular set of benefits with another economic unit for future payments. From this a financial claim, and hence a liability, can be defined. There are no nonfinancial liabilities recognized in the GFS framework, and thus the term liability necessarily refers to a liability that is financial in nature.[11]

3.45 A **liability** is established when one unit (the debtor) is obliged, under specific circumstances, to provide funds or other resources to another unit (the creditor). Normally, a liability is established through a legally binding contract that specifies the terms and conditions of the payment(s) to be made and payment according to the contract is unconditional. These are typically established through the provision of economic value by one institutional unit, the creditor, to another, the debtor, normally under a contractual arrangement. Liabilities can also be created by the force of law, and by events that require future transfer payments. In many cases, liabilities (and their corresponding financial claims) are explicitly identified by formal documents expressing the debtor-creditor relationship. In other cases, liabilities are imputed to reflect the underlying economic reality of a transaction, such as the creation of a notional loan when an asset is acquired under a financial lease.

3.46 Liabilities created by the force of law include those arising from taxes, penalties (including penalties arising from commercial contracts), and judicial awards at the time they are imposed. Liabilities established by events that require future transfer payments include claims on nonlife insurance companies, claims for damages not involving nonlife insurance companies, and claims arising from winnings from lottery and gambling activities.

3.47 Whenever a liability exists, the creditor has a corresponding financial claim on the debtor. A **financial claim** is an asset that typically entitles the owner of the asset (the creditor) to receive funds or other resources from another unit, under the terms of a liability. Like liabilities, financial claims are unconditional. A financial claim provides benefits to the creditor, such as by acting as a store of value, or by generating

[11] In contrast, accounting standards recognize nonfinancial liabilities under certain conditions.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

interest, other property income, or holding gains. Financial claims consist of equity and investment fund shares, debt instruments, financial derivatives and employee stock options, and monetary gold in the form of unallocated gold accounts (see paragraphs 7.15, 7.127, and 7.139).

3.48 Financial assets consist of financial claims and gold bullion held by monetary authorities as a reserve asset. For a complete discussion of financial assets and liabilities, see paragraphs 7.118–7.227.

3.49 This *Manual* follows the *2008 SNA* by not treating guarantees other than derivatives and the provision for calls under standardized guarantee schemes as financial assets or liabilities. However, it is recommended to report these guarantees as memorandum items to the balance sheet. (See paragraphs 4.48 and 7.251–7.261.)

Nonfinancial assets

3.50 Nonfinancial assets are economic assets other than financial assets. Nonfinancial assets are further subdivided into those that are produced (fixed assets, inventories, and valuables) and those that are nonproduced (land, mineral and energy resources, other naturally occurring assets, and intangible nonproduced assets). For a complete description of the nature of nonfinancial assets, see paragraphs 7.34–7.117.

Accounting Rules

3.51 All entries in GFS have to be measured in monetary terms. In some cases, the amounts entered are the actual payments that form part of flows, and in other cases the amounts entered are estimated by reference to monetary values. Money is thus the unit of account in which all stocks and flows are recorded.

3.52 In principle, a reporting period can cover any period of time. Periods that are too short have the disadvantage that statistical data are influenced by incidental factors, while long periods may not adequately portray changes in the economy in a timely manner. Merely seasonal effects can be avoided by having the reporting period cover a whole cycle of regularly recurrent economic phenomena. In general, calendar years, financial years, and quarters are well suited for drawing up a complete set of GFS for the consolidated general government or public sectors, while monthly data with the broadest institutional coverage possible provide a good high-frequency indicator of fiscal performance. Country-specific circumstances will influence the coverage, frequency, and periodicity of fiscal reporting. However, in deciding these, data reporting guidelines and standards, such as the *General Data Dissemination System* (GDDS), *Special Data Dissemination Standard* (SDDS), *SDDS Plus*, and *Code on Good Practices on Fiscal Transparency*, should also be considered.[12]

3.53 The GFS framework is well suited to cover all economic activities in such a way that it is possible to compile GFS statements for individual units, groups of units, or all units in the general government or public sectors. To permit this, the accounting rules for recording flows and stock positions in the GFS framework are designed to ensure consistency in the data generated, and to conform to accepted standards for compiling other macroeconomic statistics. With the exception of consolidation, as noted later in this chapter, the accounting rules of the GFS framework are the same as those of the *2008 SNA* (see Appendix 7). There are also many similarities between the rules used in the GFS framework and those applied by businesses and governments in their financial statements.[13] The following sections describe the type of accounting system used, the accounting rules governing topics such as the time of recording, and the valuation of flows and stock positions.

Type of Accounting System

3.54 The recording of economic events underlying GFS derives from general bookkeeping principles. Double-entry recording is used for recording all flows. In a **double-entry system**, each transaction gives rise to at least two equal-value entries, traditionally referred to as a credit entry and a debit entry. This principle ensures that the total of all credit entries and that of all debit entries for all transactions are equal, thus permitting a check on consistency of the GFS accounts for a unit, subsector, or sector. Other economic flows also lead to debit and credit entries. These flows have their corresponding entries directly in changes in net worth. As a result, double-entry recording ensures the fundamental identity of a balance sheet—that

[12] http://dsbb.imf.org.

[13] Appendix 6 presents a broad description of linkages with financial accounting standards. It is recommended that the financial statements of government entities compiled in accordance with international accounting standards for governments be harmonized to the extent possible, and where differences remain, be reconciled with the equivalent GFS statements.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

is, the total value of assets equals the total value of liabilities plus net worth.

3.55 A **debit** entry is an increase in an asset, a decrease in a liability, or a decrease in net worth. A **credit** entry is a decrease in an asset, an increase in a liability, or an increase in net worth. Revenue entries result in an increase in assets or decrease in liabilities, which ultimately increase net worth; therefore, revenue entries are recorded as credits. Conversely, expense entries result in a decrease in assets or increase in liabilities, which ultimately decrease net worth; therefore, expense entries are recorded as debits. Other economic flows can increase or decrease assets and liabilities, thereby directly impacting net worth. In the case of the reclassification of assets or liabilities, a change occurs in the stock positions of two categories of assets or liabilities with no impact on net worth (e.g., an increase in one category of asset is paired with a decrease in another category of asset).

3.56 A **balance sheet** is a statement of the values of the stock positions of assets owned and of the liabilities owed by an institutional unit or group of units, drawn up in respect of a particular point in time. The fundamental identity of the balance sheet and of accounting in general is that the total value of the assets always equals the total value of the liabilities plus net worth. Use of the double-entry recording ensures that this identity is maintained. There are several possible combinations of debits and credits affecting assets, liabilities, and net worth. For example, the purchase of a service by a general government unit with payment to be made in 30 days would be recorded on an accrual basis as an *expense* (debit) and an increase in the liability, *other accounts payable* (credit). Thus, net worth, through the expense, decreases by the same amount that liabilities increase, and assets are not affected. The subsequent payment at the end of the 30 days would be recorded on an accrual basis as a decrease in *currency and deposits* (credit) and a decrease in *other accounts payable* (debit). In this case, both assets and liabilities decrease by the same amount and net worth is unaffected.

Time of Recording Flows

3.57 Once a flow has been identified, the time at which it occurred must be determined so that the results of all flows within a given reporting period can be reported. Although this section is concerned with the time assigned to flows, the integrated nature of the GFS framework means that the stock positions recorded on the balance sheet are also influenced by the timing of flows.

3.58 One of the problems in determining the timing of transactions is the frequent existence of a long period between the initiation of an action and its final completion. For instance, many purchases of goods commence with the signing of a contract between a seller and a buyer, followed by the initiation and completion of production of the item ordered, shipment from the seller's location, arrival at the buyer's location, preparation and mailing the invoice, receipt of the invoice, approval of payment, the beginning of interest accruing on a late payment or the expiration of a discount for prompt payment, signing a check for payment, mailing of the check by the buyer, receipt of the check by the seller, deposit of the check in the seller's bank, and finally the check is paid by the buyer's bank. Even then, the transaction may not be complete as there may be rights of return or warranty claims. Each of these distinct moments is to some extent economically relevant and may result in multiple transactions being recorded in GFS, but only one time can be attributed to each transaction.

3.59 Similarly, in analyzing government expense and acquisition of nonfinancial assets, one can distinguish the day that a budget is voted upon by the legislature, the day on which the ministry of finance authorized a department to pay out specified funds, the day a particular commitment is entered into by the departments, the day deliveries take place, and finally, the day payment orders are issued and checks are paid. With regard to taxes, for example, important moments are the day or the period in which the liability arises, the moment the tax liability is definitively assessed, the day that it becomes due for payment without penalty, and the day the tax is paid or refunds are made.

3.60 In summary, when using the accrual basis of recording, transactions are recorded when economic ownership changes hands for goods, nonproduced nonfinancial assets and financial assets and liabilities, when services are provided, and for distributive transactions when the related claims arise. On the other hand, when using the cash basis of recording, flows are recorded when cash is received and disbursed.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

These alternative recording bases are discussed in more detail in paragraphs 3.61–3.68.

Alternative recording bases

3.61 While making entries for all successive stages discernible within the activities of institutional units may be possible, it could severely overburden compilers, so a choice has to be made. Broadly, the time of recording could be determined on four bases: the accrual basis, the commitments basis, the due-for-payment basis, and the cash basis. In practice though, many variations on these bases of recording may exist. Accounting systems may use a mixed basis of recording; for example, tax revenue may be recorded on a cash basis while other transactions are recorded on an accrual basis.

3.62 In the **accrual basis of recording**, flows are recorded at the time economic value is created, transformed, exchanged, transferred, or extinguished. In other words, the effects of economic events are recorded in the period in which they occur, irrespective of whether cash was received or paid, or was due to be received or paid. Nevertheless, the time at which the economic events occur is not always clear. In general, the time attributed to events is the time at which economic ownership of goods changes, services are provided, the obligation to pay taxes is created, the claim to a social benefit payment is established, or other unconditional claims are established.

3.63 If an economic event requires a subsequent cash flow, such as purchases of goods and services on an installment plan, then the length of time between the time attributed to an event with the accrual basis and the time of the cash flow is bridged by recording *other accounts receivable/payable*. For example, when a general government unit purchases goods on credit, it records a debit to an inventory account and a credit to *other accounts payable* when ownership of the goods shifts. When the cash payment is made, the general government unit records a debit to *other accounts payable* and a credit to *currency and deposits*.

3.64 All events that result in the creation, transformation, exchange, transfer, or extinguishment of economic value are recorded on an accrual basis in the GFS *Statement of Operations* or *Statement of Other Economic Flows* (see paragraphs 4.16–4.31 and 4.36–4.38). Thus, all monetary and nonmonetary transactions are included in statistics compiled on the accrual basis.

3.65 In the **commitments basis of recording**, flows are recorded when an institutional unit has committed itself to a transaction. This basis often applies only to purchases of assets, goods, services, and to compensation of employees. The time of recording generally is when approval for the purchase was issued, which results in funds being earmarked for a specific transaction. Flows for which the commitments basis is not applicable, such as revenue, must be recorded using one of the other three bases of recording. In-kind transactions may or may not be recorded.

3.66 In the **due-for-payment basis of recording**, flows that give rise to cash payments are recorded at the latest times they can be paid without incurring additional charges or penalties or, if sooner, when the cash payment is made.[14] The period of time (if any) between the moment a payment becomes due and the moment it is actually made is bridged by recording *other accounts receivable/payable*, just as with the accrual basis. If a payment is made before it is due, then no receivable is necessary. Although due-for-payment recording furnishes a more comprehensive description of monetary flows than cash accounting, recording is limited to monetary flows and therefore does not capture all economic events.

3.67 In the **cash basis of recording**, flows are recorded when cash is received or disbursed. The cash basis of recording provides analytically useful information on the liquidity position of government, which allows for liquidity management. All events resulting in a cash flow are recorded in the GFS *Statement of Sources and Uses of Cash* (see paragraphs 4.32–4.35). Nonmonetary flows are not recorded, since no cash flows are involved in these transactions. Therefore, the cash basis of recording does not fully record all economic activity and resource flows.

3.68 Cash flows determine the government's ability to pay its bills and, by influencing the liquidity of the community, activate or validate the demand for goods and services in the rest of the economy. Traditionally, payments data form the basis for most government accounting systems and often represent the most readily available estimates generated by the

[14] Another basis of recording is when flows are recorded at the time legal controls that are necessary to authorize a payment have been completed. This basis of recording is entitled "due-and-payable."

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

administrative accounting system. For instance, data on payments for the delivery of goods and services may frequently be more readily available than data on the time of delivery. But while statistics based on cash flows are of analytical value in their own right they do not fully meet the government's reporting needs. Therefore, the statistics on the accrual basis should be seen as necessary for the proper recording of all governments' operations.

Using the accrual basis of recording in the Statements of Operations and Other Economic Flows, and Balance Sheet of the GFS framework

3.69 Using the accrual basis of reporting provides the most comprehensive information because all economic events and resource flows are recorded, including internal transactions, in-kind transactions, and other economic flows. Moreover, it is only this comprehensive recording framework that permits the full integration of all flows with stock positions in the balance sheet. In general, accounts using the commitment, due-for-payment, or cash basis are restricted to monetary transactions.

3.70 The integrated framework of GFS uses the accrual basis, primarily because the time of recording matches the time of the actual resource flows and economic events. As a result, the accrual basis provides the best estimate of the macroeconomic impact of government fiscal policy. With the cash basis, the time of recording may diverge significantly from the time of the economic activities and the transactions to which they relate. For example, the interest accrued on a zero-coupon bond would not be recorded until the bond matures, which could be many years after the expense was incurred. The due-for-payment basis will frequently record transactions after the resource flows have taken place, although the very long delays permitted by the cash basis would, in most cases, be reduced. The timing of the commitments basis will precede the actual resource flow.

3.71 The accrual basis of recording also fully captures all amounts receivable or payable in arrears. **Arrears** are defined as amounts that are both unpaid and past the due date for payment. Because the due-for-payment date is always the same or later than the date attributed to a flow under the accrual basis, all arrears will be included in statistics compiled using the accrual basis. Without supplementary information, however, it may be difficult to estimate the share of total accounts payable that is in arrears as opposed to the share that exists because of normal payment delays. By definition, the due-for-payment basis will clearly show the arrears arising from purchases on installment plans, but arrears from the failure to repay debt obligations as scheduled, such as loans and debt securities, will not always be apparent without supplemental information. With the commitments basis, the availability of information on arrears will be the same as with the accrual basis. With the cash basis, there is no impact on the accounts when a unit does not pay for purchases made or comply with the terms for the repayment of debt. Thus, there will be no information on arrears unless special compilation effort is made.

3.72 In accrual accounting systems, provision is usually made for a separate statement of cash flows to be prepared as part of the comprehensive suite of statements—implementing accruals accounting systems therefore usually maintains some information on cash flows. Managing liquidity is crucial for the operation of any unit, and information on cash flows helps meet this need. Moreover, it may be difficult to assess solvency and future cash flows without an accrual-based system because information on arrears and on *other accounts payable/receivable*, such as trade credits and advances, is missing.

3.73 Accounts using the due-for-payment, commitments, or cash basis normally do not differentiate between the time of payment, acquisition, and use of resources. With the accrual basis, acquisitions of nonfinancial assets are recorded separately and the expense of using those assets in operating activities is matched with the period of their use through the consumption of fixed capital.

3.74 Additionally, the other major macroeconomic statistical frameworks (national accounts, balance of payments, and monetary and financial statistics) use the accrual basis. Thus, the consistency of statistics from the different systems is facilitated greatly by sharing the use of the accrual basis for all the macroeconomic frameworks.

3.75 Despite the advantages of the accrual basis of recording, its implementation is likely to be more complex than the other bases of recording and may require additional estimates. For example, it may

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

be difficult for a government unit to know the full amount of tax revenue to which it is entitled because these amounts may depend on transactions and other events to which the government is not a party.

Application of the accrual principles

3.76 As a general rule, a flow is recorded under the accrual basis of recording when economic ownership changes or another economic event has occurred. More specific guidelines for the application of the accrual recording basis are described in the following paragraphs.

Time of recording and measurement of taxes and other compulsory transfers

3.77 The general principle is that taxes and other compulsory transfers should be recorded when the underlying activities, transactions, or other events occur that give rise to the liability to pay (i.e., the moment when it creates the government's unconditional claim to the taxes or other payments) (see paragraphs 5.10–5.20). This time is not necessarily the time at which the event being taxed occurred. For example, the obligation to pay tax on capital gains normally occurs when an asset is sold, not when the asset's value appreciated.

3.78 Estimating the revenue from taxes and compulsory social insurance contributions must take many uncertainties into account. The primary uncertainty is that the government unit receiving the revenue is usually not a party to the transaction or other event that creates the obligation to pay the taxes or social insurance contributions. Consequently, many of these transactions and events permanently escape the attention of the tax authorities. The amount of revenue from taxes and social insurance contributions should exclude the amounts that possibly could have been received from such unreported events, had the government learned about them. In other words, only those taxes and social insurance contributions that are evidenced by tax assessments and declarations, customs declarations, and similar documents are considered to create revenue for government units.

3.79 In addition, it is typical that some of the taxes and social insurance contributions that have been assessed will never be collected. Uncollectable taxes include amounts deemed uncollectable due to noncompliance with tax laws or insolvency of taxpayers. Taxes should also exclude contested tax assessments, which are treated as contingencies. It would be inappropriate to accrue revenue for an amount that the government unit does not realistically expect to collect. Thus, the difference between assessments and expected collections represents a claim that has no real value and should not be recorded as revenue (see paragraph 5.20). The amount of taxes and social insurance contributions that is recorded as revenue should be the amount that is realistically expected to be collected. The actual collection, however, may be in a later period, possibly much later.

3.80 To ensure that the amount of taxes and social contributions recorded on an accrual basis is equivalent to the corresponding amounts actually received over a reasonable amount of time, the following possibilities for the accrual recording of taxes could be considered:

- Amounts to be recorded are assessed amounts adjusted by coefficients reflecting the assessments not likely to be collected. The coefficients are estimated on the basis of past experience and current expectations in respect of assessed amounts never collected.
- Cash amounts are recorded in the accounts, but they are time-adjusted so that they are attributed to the period when the activity took place to generate the liability.

3.81 If taxes are imposed on specific transactions or events, they are recorded at the time the underlying transaction or event occurs, even though these times may not coincide with the actual payment of the tax to the government. This implies that taxes on products and imports are recorded at the time the products in question are produced, imported, or sold, depending on the basis of the taxation. Examples include sales taxes, value-added taxes, import duties, and estate and gift taxes.

3.82 In principle, income taxes and social contributions based on income should be attributed to the period in which the income is earned, even though there may be a significant delay between the end of the reporting period and the time at which it is feasible to determine the actual liability. In practice, however, some flexibility is permitted. In particular, as a practical deviation from the general principle, income taxes deducted at source, such as pay-as-you-earn taxes and regular prepayments of income taxes,

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

may be recorded in the periods in which they are paid, and any final tax liability on income may be recorded in the period in which it is determined.

3.83 Income taxes are normally imposed on the income earned during an entire year. If monthly or quarterly statistics are compiled in the absence of monthly accrual administrative records, indicators of seasonal activity or other appropriate indicators may be utilized to allocate the annual totals.

3.84 Taxes on the ownership of specific types of property may be based on the value of the property at a particular time, but are deemed to accrue continuously over the entire year or the portion of the year that the property was owned, if less than the entire year. Similarly, taxes on the use of goods or the permission to use goods or perform activities usually relate to a specific time period, such as a license to operate a business during a specific period.

3.85 Some compulsory transfers, such as fines, penalties, and property forfeitures, are determined at a specific time. These transfers are recorded when the government has an unconditional legal claim to the funds or property, which usually is when a court renders judgment or an administrative ruling is published. If such judgment or ruling is subject to further appeal, then the time of recording is when the appeal is resolved.

3.86 Determining the time of recording for grants and other voluntary transfers is influenced by a wide variety of eligibility conditions that have varying legal powers. In some cases, a potential grant recipient has a legal claim when it has satisfied certain conditions, such as the prior incurrence of expenses for a specific purpose or the passage of legislation. These transfers are recorded by recipient and donor when all conditions are satisfied. In other cases, the grant recipient never has a claim on the donor, and the transfer should be attributed to the time at which the cash payment is made, or when the goods or services are delivered (see paragraph 5.105).

Time of recording dividends

3.87 Dividends and withdrawals of income from quasi-corporations are distributive transactions for which the time of recording depends on the unit's decision regarding when to distribute income (see paragraphs 5.111–5.119). The level of dividends is not unambiguously attributable to earnings of a particular period, and dividends are to be recorded as of the moment the associated share starts to be quoted "ex-dividend." Withdrawals of income from quasi-corporations are recorded on the date the payment actually occurs.

Time of recording transactions in goods, services, and nonfinancial assets

3.88 The time of recording transactions (including by barter, payment in kind, or transfer in kind)[15] in goods and nonfinancial assets is, in principle, when economic ownership changes, which depends on the provisions in the sales contract (see paragraphs 8.13–8.17). When change of ownership is not obvious, the time of recording by the transaction partners[16] may be a good indication and, failing that, the moment when there is a change in physical possession or control. For example, a change of ownership is imputed to have taken place under a financial lease when the lessee takes control of the asset.

3.89 Transactions in services normally should be recorded when the services are provided. If a service, such as transportation, is provided at a specific time, then the transaction is recorded at that time. Some services are supplied or take place on a continuous basis. For example, insurance, and rental of housing services are continuous flows and should be recorded continuously for as long as they are being provided. More practically, the value of the services attributed to a reporting period is based on the quantity supplied during the period rather than the payments required.

3.90 Several other transactions also relate to flows that take place continuously or over extended periods. For example, operating leases and consumption of fixed capital accrue continuously over the whole period a fixed asset is used and interest[17] accrues continuously over the period that the financial claim exists. These flows are recorded as being provided

[15] These transactions are excluded from a pure cash basis of recording.

[16] To maintain symmetry in the macroeconomic statistical system, the time of recording should be the same for both parties to the transaction.

[17] The counterpart entry to accruing interest expense is a simultaneous increase in the amount of liability outstanding. Periodic payments reduce the liability that has accrued and are not expense transactions.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

continuously over the whole period the contract lasts or the asset is available for use.

3.91 Inventories may be materials and supplies held as input for producing goods and services, work-in-progress, or finished goods held for resale or distribution. Additions to inventories are recorded when products are purchased, produced, or otherwise acquired. Withdrawals from inventories are recorded when products are sold, used up in production, or otherwise relinquished. Additions to work-in-progress inventories are recorded continuously as work proceeds. When production is completed, the goods valued at costs accumulated to that point are transferred to inventories of finished goods.

3.92 *Use of goods and services* is recorded when the good or service enters the process of production, as distinct from the time it was acquired. For goods, this time may be quite different from the time they were acquired. In the meantime, they are classified as inventories.

Time of recording transactions in financial assets and liabilities

3.93 Transactions in many types of financial assets and liabilities, such as debt securities, loans, currency, and deposits, are recorded when economic ownership changes (see paragraphs 9.13–9.16). This date may be specified according to a contract to ensure matching entries in the books of both parties. If no precise date is fixed, the date on which the creditor receives payment, or some other financial claim, is the determining factor. For example, loan drawings are entered in the accounts when actual disbursements are made and financial claims are established, which is not necessarily when an agreement is signed. On practical grounds, public sector liabilities may have to take account of the time of recording from the viewpoint of the public sector unit.

3.94 In some cases, the parties to a transaction may perceive ownership to change on different dates because they acquire the documents evidencing the transaction at different times. This variation usually is caused by the process of clearing, or the time checks are in the mail. The amounts involved in such a "float" may be substantial in the case of transferable deposits and *other accounts receivable* or *payable*. If there is disagreement on a transaction between two units, the date on which the transaction is fully completed, which is the day the creditor regards change of ownership to have taken place, is the date of record; this date could be when the creditor receives payment or some other financial claim.

3.95 Some financial claims or liabilities, in particular the various types of *other accounts payable* and *receivable*, such as trade credit and advances, general accounts payable, and wages payable, are the result of a nonfinancial transaction and are not otherwise evidenced. In these cases, the financial claim is created when the counterpart transaction (such as the purchase of a good on credit or provision of labor) occurs.

3.96 For securities, the transaction date (i.e., the time of the change in ownership of the securities) may precede the settlement date (i.e., the time of the delivery of the securities). Both parties should record the transactions at the time ownership changes, not when the underlying financial asset is delivered. Any significant difference between transaction and settlement dates gives rise to *other accounts payable* or *receivable*. In practice, when the delay between the transaction and settlement is short, the time of settlement may be considered an acceptable proxy.

3.97 According to the accrual basis of recording, repayments of debts are recorded when they are extinguished (such as when they are paid, or rescheduled, or forgiven by the creditor). When arrears occur, no transactions should be imputed, but the arrears should continue to be included in the same instrument until the liability is extinguished. If the contract provided for a change in the characteristics of a financial instrument when it goes into arrears, this change should be recorded as a reclassification in the other changes in volume of the financial assets and liabilities account. The reclassification applies to situations where the original contract remains, but the terms within it change (e.g., interest rates, repayment periods, etc.).[18] If a new contract is negotiated or the nature of the instrument changes from one instrument category to another (e.g., from bonds to equity), transactions should be recorded to reflect the redemption of the old instrument and to create a new instrument.

[18] Charging a penalty interest rate on arrears that was stipulated in the original contract is not in itself a reason to reclassify the debt.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Time of recording other economic flows

3.98 Other changes in the volume of assets are usually discrete events that occur or accrue at particular moments or within fairly short periods of time (see paragraphs 10.46–10.47). For example, the destruction of an asset by fire happens at a specific time, and the impact of a natural disaster can be allocated to a specific period.

3.99 Changes in prices often have a more continuous character, particularly in respect of assets for which active markets exist. In practice, holding gains or losses will be computed between two points in time. The starting point will be the moment at which:

- The reporting period begins
- Ownership is acquired from other units (through purchase or a transaction in kind)
- An asset is produced.

The end point in time will be the moment at which:

- The reporting period ends
- Ownership of an asset is relinquished (through a sale or a transaction in kind)
- An asset is consumed in the production process.

3.100 Holding gains and losses are not calculated over a period beginning the moment two units agree to a mutual exchange of assets. Instead, the calculation of the holding gains and losses starts when economic ownership of the assets is acquired. The signing of the contract fixes the market price for the transaction. A unit can incur holding gains and losses only on the assets or liabilities over which it has economic ownership. This implies that during the period between the signing of a contract and the date on which the first party delivers, the second party cannot incur any price risks on this contract; the second party neither owns the assets to be delivered nor owns a claim on the first party to be recorded in the financial accounts.[19]

3.101 Other changes in volume, including reclassifications, are recorded as these changes occur. An integrated stock-flow framework requires that both the removal of an existing asset or liability from the original category and its inclusion in the new category are recorded at the same time.

3.102 Reclassifications should be recorded when the change in the nature of the asset, liability, or entity occurs. Although one might be tempted to stockpile major reclassifications for a number of years and enter them as one block at the end of this period, this procedure does not conform to the accrual principles of GFS, which aim for correct estimates at all times. Keeping records of reclassifications makes it possible to reconstruct supplementary time series based on the situation before the reclassification, if needed.

Using the cash basis of recording in the Statement of Sources and Uses of Cash

3.103 GFS includes a *Statement of Sources and Uses of Cash*. For this statement, statistics on monetary flows should be based on transactions as close to the payment/receipt stage as possible. These statistics, based on cash payments/receipts, measure in aggregate the government's impact on the liquidity conditions in the economy (see paragraph 3.67). Although these cash-based data lack an integration of flows with stock positions, they are complementary to the accrual data and form an integral part of the complete GFS framework.

3.104 For expense and the acquisition of nonfinancial assets, data at the stage of payment by cash disbursed, or checks or warrants issued, represent the most desirable basis on which to record the cash-based data.[20] For revenue, data representing the tax payments received by government, net of refunds paid out during the period covered should be reported. These data will include taxes paid after the original assessment, taxes paid or refunds deducted from taxes after subsequent assessments, and taxes paid or refunds deducted after any subsequent reopening of the accounts. In the reporting of tax revenue, the use of payment basis data is often the first best estimate for a cash statement.

3.105 In the case of government borrowing, the cash basis of recording will report borrowing when funds are received by government, or when lenders

[19] For example, a sales contract to the value of 100 is agreed on day 1, when the market price of the transaction is 100, for delivery on day 5. On day 5, the price of the item prevailing on the market is 102—the buyer records a transaction of 100 and immediately revalues the item.

[20] Cash accounting that allows back-dated transactions (known as complementary periods), may distort actual cash flows. Recording of cash transactions in such a manner should be disclosed.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

pay government suppliers on behalf of government. Government lending should be recorded when the government makes payment, or when funds are provided to a borrower.

3.106 However, payments data must be adjusted to an accrual basis to permit the measurement of production, income, consumption, capital accumulation, and finance in the national accounts. To reconcile data extracted from cash-based data and data maintained on an accrual basis, the cash flows must be adjusted for accrued revenue not yet received and accrued expense not yet paid, respectively.

Valuation

General rule

3.107 All flows and stock positions should be measured at market prices. **Market prices** refer to current exchange value—that is, the value at which goods, services, labor, or assets are exchanged or else could be exchanged for cash (currency or transferable deposits). Flows recorded in the *Statement of Operations* should be valued at the market prices at which these flows take place, while flows recorded in the *Statement of Sources and Uses of Cash* should be valued at the monetary value of the cash flows. Stock positions should be valued at the market prices prevailing on the balance sheet date. Valuation of specific types of flows and stock positions are discussed in further detail in the remainder of this section.

Valuation of transactions

3.108 Market prices for transactions are defined as amounts of money that willing buyers pay to acquire something from willing sellers; the exchanges are made between independent parties and on the basis of commercial considerations only, sometimes called "at arm's length." Thus, according to this strict definition, a market price refers only to the price for one specific exchange under the stated conditions. A second exchange of an identical unit, even under circumstances that are almost exactly the same, could result in a different market price. A market price defined in this way is to be clearly distinguished from a price quoted in the market, a world market price, a going price, a fair market price, or any price that is intended to express the generality of prices for a class of supposedly identical exchanges rather than the price actually applying to a specific exchange. Furthermore, a market price should not necessarily be construed as equivalent to a free market price; that is, a market transaction should not be interpreted as occurring exclusively in a purely competitive market situation. In fact, a market transaction could take place in a monopolistic, monopsonistic, or any other market structure. Indeed, the market may be so narrow that it consists of a sole transaction of its kind between independent parties.

3.109 When a price is agreed to by both parties in advance of a transaction taking place, this agreed or contractual price is the market price for that transaction regardless of the prices that prevail when the transaction takes place.

3.110 Actual exchange values, expressed in monetary terms, are presumed to be the market prices in most cases. Paragraph 3.122 describes those cases where actual exchange values do not represent market prices. Transactions that involve dumping and discounting represent market prices. Transaction prices for goods and services are inclusive of appropriate taxes and subsidies. A market price is the price payable by the buyer after taking into account any rebates, refunds, adjustments, etc., from the seller.

3.111 Transactions in financial assets and liabilities are recorded at the prices at which they are acquired or disposed of. Transactions in financial assets and liabilities should be recorded exclusive of any service charges, commissions, fees, taxes, and similar payments for services that would be necessary to require the asset or incur the liability. These costs of ownership transfers are excluded regardless of whether these are charged explicitly, included in the purchaser's price, or deducted from the seller's proceeds. This is because both debtors and creditors should record the same amount for the same financial instrument. The commissions, fees, and/or taxes should be recorded separately from the transaction in the financial asset and liability, under appropriate categories of revenue or expense. The valuation of financial instruments, which excludes commission charges, differs from the valuation of nonfinancial assets (excluding land), which includes any costs of ownership transfer. Costs of ownership transfer on land are included in the value of land improvements (see paragraphs 8.6–8.8).

3.112 When market prices for transactions are not observable, such as for some barter or transfers-in-kind transactions, valuation according to market

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

price-equivalents provides an approximation to market prices. In such cases, market prices of the same or similar items, when such prices exist, will provide a good basis for applying the principle of market prices. Generally, market prices should be taken from the markets where the same or similar items are currently traded in sufficient numbers and in similar circumstances. If there is no appropriate market in which a particular good or service is currently traded, the valuation of a transaction involving that good or service may be derived from the market prices of similar goods and services by making adjustments for quality and other differences.

Valuation of stock positions

3.113 Stock positions should be valued at **market value**—that is, as if they were acquired in market transactions on the balance sheet reporting date (reference date). Market prices are readily available for assets and liabilities that are traded in active markets, most commonly certain financial assets and their corresponding liabilities. Market values of other assets and liabilities need to be estimated in a manner similar to nonmonetary flows, as described in paragraphs 3.118–3.125 and 7.20–7.33.

3.114 Valuation according to market-value equivalent is needed for valuing assets and liabilities that are not traded in markets or are traded only infrequently. For these assets and liabilities, it will be necessary to estimate values that, in effect, approximate market prices (see paragraph 3.125).[21]

3.115 It may also be analytically useful and appropriate, in some circumstances, to use alternative valuation methods and to compare these with market values. Market values, fair values, and nominal values should be distinguished from such notions as amortized values, face values, book values, and historic cost.

- **Fair value** is a market-equivalent value defined as the amount for which an asset could be exchanged, or a liability settled, between knowledgeable, willing parties in an arm's-length transaction. It thus represents an estimate of what could be obtained if the owner sold the asset or the debtor settled the liability.
- **Nominal value** at any moment in time is the amount that the debtor owes to the creditor. It reflects the value of the instrument at creation and subsequent economic flows, such as transactions, valuation changes (excluding market price changes), and other changes, such as exchange rate changes. For financial instruments other than debt securities, equity, and financial derivatives, the lack of generally available market values means that these values are estimated by using the nominal value.
- The **amortized value** of a loan reflects the gradual elimination of the liability by regular payments over a specified period of time. On the date of each scheduled payment, the amortized value is the same as the nominal value, but it may differ from the nominal value on other dates because the nominal value includes interest that has accrued.
- The **face value** of a debt instrument is the undiscounted amount of principal to be repaid at (or before) maturity.[22] The use of face value as a proxy for nominal value in measuring the gross debt position can result in an inconsistent approach across all instruments and is not recommended. For example, the face value of deep-discounted bonds and zero-coupon bonds includes interest not yet accrued, which runs counter to accrual principles.
- **Written-down replacement cost** is the current acquisition price of an equivalent new asset minus the accumulated consumption of fixed capital, amortization, or depletion.
- **Book value** generally refers to the value recorded in the entities' records. Book values may have different meanings because their values are influenced by accounting standards, rules, and policies, as well as the timing of acquisition, company

[21] International statistical manuals consider that for nonnegotiable instruments, nominal value is an appropriate proxy for market value (see paragraph 7.30). Nonetheless, the development of markets, such as for credit derivatives linked to the credit risk of individual entities, is increasing the likelihood that market prices can be estimated even for nonnegotiable instruments. As these markets extend, consideration might be given to compiling additional information on market values of nonnegotiable debt.

[22] In some statistical databases, face value is also called nominal value. However, in GFS, nominal value is understood to be different from face value, except on the date of maturity of the instrument.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

takeovers, frequency of revaluations, and tax and other regulations.

- **Historic cost,** in its strict sense, reflects the cost at the time of acquisition, but sometimes it may also reflect occasional revaluations.

3.116 The valuation of assets and liabilities based on accounting standards may not fully reflect the market prices of the assets and liabilities. In such cases, the source data for GFS should be adjusted to reflect, as closely as possible, the market value of the assets and liabilities.[23]

3.117 Some financial assets and liabilities, such as bonds, have a nominal value, face value, and market value, and for some purposes, supplementary data on the nominal and face values of stock positions may be useful.[24] However, transactions in these assets and liabilities should be valued at the prices actually paid. Similarly, to attain integration between stock positions and flows, the stock positions of debt securities should be valued at their market value when recorded on the balance sheet.

Valuation adjustments in special cases

3.118 When a unit sells an item and does not expect to receive payment, or the corresponding payment is not due for an unusually long time,[25] the value of the principal (recorded in other accounts payable/receivable) is reduced by an amount that reflects the time to maturity using an appropriate discount rate, such as the contractual rate for similar debt instruments. If payment is not due for an unusually long period of time, this reduction is by partitioning the market price of the item purchased, which equals the reduced principal amount, and accrued interest, the assumption being that the amount to be paid includes an allowance for interest. If payment is not expected for an unusually long period of time, such as due to the circumstances of the debtor, a reduction in the principal to be paid is recorded through a valuation change in other accounts payable/receivable, with interest accruing on the reduced principal amount, reflecting the time delay in payment. In both the circumstances described in this paragraph, interest should accrue until payment is made, at the rate used to discount the principal.

3.119 Flows and stock positions expressed in a foreign currency are converted to their value in the domestic currency at the rate prevailing at the moment they are entered in the accounts—that is, the moment the transactions or other flow takes place, and stock positions are converted at the rate prevailing on the balance sheet date. The midpoint between the buying and selling spot rates should be used so that any service charge is excluded. When a multiple exchange rate system is in operation, the valuation should be based on the rate applicable to the type of asset in question. The valuation in the domestic currency of a purchase or sale on credit expressed in a foreign currency may differ from the value in domestic currency of the subsequent cash payment because the exchange rate changed in the interim. Both transactions should be valued at their market values as of the dates they actually occurred, and a holding gain or loss resulting from the change in the exchange rate should be recorded for the period or periods in which it occurs.

3.120 For some transactions in goods, contracts establish a quotation period often months after the goods have changed hands. In such cases, market value at the time of the change of ownership of the goods should be initially estimated, and revised with the actual market value, when known. Market value is given by the contract price even if it is unknown at the time of change of ownership.

3.121 Transfers in kind should be valued at the market prices that would have been receivable if the resources had been sold in the market. In the absence of a market price, the donor's view of the imputed value of the transaction will often be quite different from that of the recipient. The suggested rule of thumb is to use the value assigned by the donor as the basis of recording.

3.122 In some cases, actual exchange values may not represent market prices. Examples are transactions involving transfer prices between affiliated units, manipulative agreements with third parties, and certain noncommercial transactions. Prices may be under- or overinvoiced, in which case an assessment

[23] More information on the valuation rules and numerical examples are in the *PSDS Guide*, paragraphs 2.115–2.123, and the *2013 EDS Guide*.

[24] The *PSDS Guide* recommends that debt instruments should be valued at nominal value, while debt securities should be valued at market value as well.

[25] What constitutes an unusually long time in this context will depend on the circumstances. For example, for any given time period, the higher the level of interest rates or the longer the delay in payment, the greater is the opportunity cost of delayed payment.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

of a market-equivalent price needs to be made. Although, conceptually, adjustment should be made when actual exchange values do not represent market prices, this may not be practical in many cases. In some cases, transfer pricing may be motivated by income distribution or equity buildups or withdrawals. Replacing book values with market-value equivalents is desirable in principle, when the distortions are large and when the availability of data (such as adjustments by customs or tax officials or from partner economies) makes it feasible to do so. Selection of the best market-value equivalents to replace book values is an exercise calling for cautious and informed judgment. In many cases, compilers may have no choice other than to accept valuations based on explicit costs incurred in production or any other values assigned by the unit.

3.123 While some nonmarket transactions, such as grants in kind, have no market price, other nonmarket transactions may take place at implied prices that include some element of grant or concession so that those prices also are not market prices (see paragraphs 3.10–3.11). Examples of such transactions could include negotiated exchanges of goods between governments and governments' concessional lending. While there is no precise definition of concessional loans, it is generally accepted that they occur when units lend to other units and the contractual interest rate is intentionally set below the market interest rate that would otherwise apply. The degree of concessionality can be enhanced with grace periods (see paragraph 6.69), frequencies of payments, and a maturity period favorable to the debtor. Since the terms of a concessional loan are more favorable to the debtor than market conditions would otherwise permit, concessional loans effectively include a transfer from the creditor to the debtor. However, except for the case of concessional lending to government employees (see paragraph 6.17 and Chapter 6, footnote 11) and concessional lending by central banks (see Box 6.2), the means of incorporating the impact of concessional lending into GFS have not been fully developed. Accordingly, until the appropriate treatment of concessional debt is resolved, information on concessional debt should be provided as supplementary information (see paragraph 7.246).

3.124 Where a single amount payable/receivable refers to more than one transaction category, the individual flows should be partitioned and recorded separately (see paragraph 3.29). In such a case, the total value of the individual transactions after partitioning must equal the market value of the exchange that actually occurred.

3.125 The value of flows that are not already expressed at their market value, such as barter transactions, must be estimated. In addition, market values for many stock positions will not be readily available and must be estimated. The following list suggests several estimation possibilities. The choice of which method to use in a given circumstance depends on the information available.

- It may be possible to estimate the values of transactions based on values taken from markets in which similar transactions take place under similar conditions. The value of certain stock positions, primarily financial assets, may also be estimated using market transactions involving similar assets that take place at the end of the reporting period.
- Flows and stock positions involving existing fixed assets can be valued using the market price for similar new goods, properly adjusted for consumption of fixed capital and other events that may have occurred since they were produced.
- If there is no appropriate market in which a particular good or service is currently traded, the valuation of a flow involving that good or service may be derivable from the market prices of similar goods and services by making adjustments for quality and other differences.
- The value of flows and stock positions of assets may be estimated on the basis of the historic or acquisition cost of the item, adjusted for all changes that have occurred since it was purchased or produced, such as consumption of fixed capital, holding gains or losses, depletion, exhaustion, degradation, unforeseen obsolescence, and exceptional losses.[26]
- Goods and services can be valued by the amount that it would cost to produce them in the current reporting period. For market producers, the market value of a nonfinancial asset valued in this way should include a mark-up that reflects the net operating surplus attributable to

[26] This estimate is also referred to as the "written-down current acquisition" value.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

the producer. For nonmarket goods and services produced by general government units or nonprofit institutions serving households (NPISHs), however, no allowance should be made for any net operating surplus in the calculation of the market price.

- Assets can be valued at the discounted present value of their expected future returns. This method is particularly prominent for a number of financial assets, natural assets, and intangible assets. For some financial assets, the present market value is established by discounting future payments or receipts to the present, using the market interest rate. In principle, therefore, if a reasonably robust estimate of the stream of future earnings to come from an asset can be made, along with a suitable discount rate, this method allows an estimate of the present value. However, it may be difficult to determine the future earnings with the appropriate degree of certainty, given that assumptions are also needed about the asset's life span and the discount factor to be applied. Because of these uncertainties, the other possible sources of valuation described in the preceding paragraphs should be exhausted before resorting to this method.

Valuation of other economic flows

3.126 Apart from transactions, the change in the value of assets and liabilities between two end-periods also results from holding gains and losses, and other changes in volume of assets and liabilities. The valuation of these other economic flows is discussed in the remainder of this section.

Holding gains and losses

3.127 Holding gains and losses accrue continuously and apply to both nonfinancial and financial assets and liabilities. Since all financial assets, except gold bullion, are matched by liabilities either within the domestic economy or with the rest of the world, it is important that holding gains/losses are recorded symmetrically. A holding gain occurs when an asset increases in value or a liability decreases in value; a holding loss occurs when an asset decreases in value or a liability increases in value. Holding gains and losses during a reporting period are shown separately for assets and liabilities. In practice, the value of holding gains and losses is calculated for each asset and liability between two points in time: the beginning of the period or when the asset or liability is acquired or incurred, and the end of the period or when the asset or liability is sold or extinguished.

Other changes in the volume of assets

3.128 In order to determine the valuation of the other changes in the volume of nonfinancial assets, it is usually necessary to determine the market value of the asset before and after the economic event, such as its appearance, disappearance, catastrophic loss, or reclassification (see paragraphs 10.46–10.84). The value of the other change in volume is calculated as the difference in the market value of the asset immediately before and after the event.

3.129 Other changes in the volume of financial assets and liabilities are recorded at the market or market-equivalent prices of similar instruments. For writing-off of marketable financial instruments that are valued at their market values, the value recorded in the other changes in the volume of asset account should correspond to their market values prior to being written off. For nonmarketable financial instruments that are recorded at nominal values, the value recorded in the other changes in the volume of assets account should correspond to their nominal value prior to being written off. For all reclassifications of assets and liabilities, values of both the new and old instruments should be the same.

Currency

Unit of account

3.130 The compilation of GFS, particularly transactions and stock positions with nonresidents, is complicated by the fact that the values may be expressed initially in a variety of currencies or perhaps in other standards of value, such as Special Drawing Rights (SDRs). The conversion of these transactions and stock positions expressed in another currency, or a commodity into a reference unit of account, is a requisite for the construction of consistent and analytically meaningful statistics. If financial assets or liabilities are in foreign currency units, data in a single currency unit are needed for compiling meaningful statistics.

3.131 From the perspective of the national compiler, the domestic currency unit is the obvious choice for measuring transactions and stock positions. Denominating government finance transactions and

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

stock positions in such a way is compatible with the national accounts and most of the economy's other economic statistics. Where a foreign currency is used to settle domestic transactions, such as with "dollarized" economies, this foreign currency may be the relevant currency unit for the compilation of GFS.

Currency conversion

3.132 The most appropriate exchange rate to be used for conversion of transactions and stock positions is the market (spot) rate prevailing on the transaction or balance sheet date. The midpoint between buying and selling rates should be used.

3.133 For debt transactions, in principle, the actual exchange rate applicable to each transaction should be used for currency conversion. The use of a daily average exchange rate for transactions usually provides a good approximation. If daily rates cannot be applied, average rates for the shortest period should be used. Some transactions occur on a continuous basis, such as the accrual of interest over a period of time. For such flows, therefore, an average exchange rate for the period in which the flows occur should be used for currency conversion. More details on currency conversion are given in the *BPM6*, paragraphs 3.104–3.108.

Domestic and foreign currency

3.134 For an economy, a domestic currency is distinguished from foreign currency. **Domestic currency** is that which is legal tender in the economy and issued by the monetary authority for that economy—that is, either that of an individual economy or, in a currency union, that of the common currency area to which the economy belongs. All other currencies are **foreign currencies**.

3.135 Under this definition, an economy that uses as its legal tender a currency issued by a monetary authority of another economy—such as U.S. dollars—or of a common currency area to which it does not belong should classify the currency as a foreign currency, even if domestic transactions are settled in this currency. Unallocated gold accounts and other unallocated accounts in precious metals giving title to claim the delivery of gold or precious metal are treated as denominated in foreign currency.

3.136 SDRs are considered to be foreign currency in all cases, including for the economies that issue the currencies in the SDR basket. Any other currency units issued by an international organization, except in the context of a currency union, are considered foreign currency.

Currency of denomination and currency of settlement

3.137 For debt statistics, a distinction should be made between the currency of denomination and the currency of settlement. The currency of denomination is determined by the currency in which the value of flows and stock positions is fixed as specified in the contract between the parties. Accordingly, all cash flows are determined using the currency of denomination and, if necessary, converted to the domestic currency or another unit of account for the purpose of settlement or compilation of accounts. The currency of denomination is important for distinguishing transaction values and holding gains and losses.

3.138 The currency of settlement may be different from the currency of denomination. Using a currency in settlement that is different from the currency of denomination simply means that a currency conversion is involved each time a settlement occurs. The currency of settlement is important for international liquidity and measurement of potential foreign exchange drains.

3.139 A financial instrument may be settled in domestic currency with both the amount to be paid at maturity and all periodic payments (such as coupons) linked (or indexed) to a foreign currency. In this instance, the currency of denomination is the foreign currency. Some instruments are denominated in more than one currency. However, if the amounts payable are linked to one specific currency, then the liability should be attributed to that currency.

Derived Measures

3.140 Derived measures consist of aggregates and balancing items. They are important analytic tools that summarize the values of selected flows or stock positions that have been individually recorded in the GFS framework. These derived measures are the sum or the balance of two or more flows or stock positions.

3.141 Aggregates are summations of individual entries and elements in a class of flows or stock positions. They allow for these data to be arranged in a

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

manageable and analytically useful way. For example, tax revenue is the sum of all flows that are classified as taxes, and data for social security funds are the aggregations of the data for all institutional units in the economy that are classified as social security funds. Aggregates and classifications are closely linked in that classifications are designed to produce the aggregates thought to be most useful. Conceptually, the value for each aggregate is the sum of the values for all items in the relevant category. However, estimates of some aggregates may be needed due to deficiencies in source data, such as missing information on individual transactions, other economic flows, and asset and liability positions that may be incomplete or even nonexistent.

3.142 Balancing items are economic constructs obtained by subtracting one aggregate from a second aggregate. For example, the net operating balance is obtained by subtracting the total expense aggregate from the total revenue aggregate. Net worth is the balancing item equal to total assets minus total liabilities (see Chapter 4).

Netting of Flows and Stock Positions

3.143 It is feasible to present many categories of flows and stock positions on a gross or net basis. An item presented on a net basis is calculated as the sum of one set of flows or stock positions minus the sum of a second set of a similar kind. For example, total tax revenue could be presented on a gross basis as the total amount of all taxes accrued, or on a net basis as the gross amount minus tax refunds. Similarly, interest can be presented on a gross basis as interest revenue and interest expense, respectively, while it is feasible to calculate the net interest. The choice depends on the category of flows or stock positions, the nature of the items that might be subtracted to obtain the net value, and the analytic utility of the gross and net values. The choices for gross and net presentations as used in the GFS framework are discussed in paragraphs 3.144–3.151.

3.144 In GFS, revenue categories are presented gross of expense categories for the same or related category and likewise for expense categories. In particular, interest revenue and interest expense are presented gross rather than as net interest expense or net interest revenue. Similarly, social benefits and social contributions, grant revenue and expense, and rent revenue and expense are presented gross. Also, sales of goods and services are presented gross of the expenses incurred in their production.

3.145 In the case of the correction of erroneous or unauthorized transactions, revenue categories are presented net of refunds of the relevant revenue, and expense categories are presented net of inflows from the recovery of the expense. For example, refunds of income taxes may be paid when the amount of taxes withheld or otherwise paid in advance of the final determination exceeds the actual tax due. Such refunds are recorded as a reduction in tax revenue. Similarly, if social benefits that were paid in error are recovered, then such recoveries are recorded as a reduction in expense.

3.146 Acquisitions and disposals of nonfinancial assets other than inventories are presented gross. For example, acquisitions of land are presented separately from disposals of land. For analytic presentations, the net acquisition of each category of nonfinancial asset may be preferable and can be derived easily.

3.147 Netting is implicit in the presentation of some specific transactions categories in GFS—for example, *changes in inventories*. Changes in each type of inventories are presented net rather than tracking daily additions and withdrawals. That is, the change in materials and supplies is presented in the GFS framework as the net value of additions minus withdrawals. Nonetheless, full inventory accounting could allow for the gross recording of all the movements in inventories in the underlying administrative records. Similarly, tax revenue is presented net of nonpayable tax credits (see paragraphs 5.29–5.32).

3.148 Acquisitions and disposals of each category of financial assets/liabilities are also presented net in the GFS framework, to reflect the nature of the financial flows. For example, only the net change in the holding of assets related to *currency and deposits* is presented, not gross receipts and disbursements. Similarly, additions to liabilities in the form of *loans* are presented net of repayments. However, for analytical and administrative reasons, it may be useful to develop source data on the gross acquisitions and the gross disposals of each financial instrument as separate data categories.

3.149 Other economic flows are presented net. That is, the net holding gain for each asset and liability is presented, not gross holding gains and gross

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

holding losses. Similarly, other changes in the volume of assets and liabilities are presented net, rather than recording increases and decreases in volume changes on a gross basis.

3.150 Stock positions held for the same type of financial instrument, both financial assets or liabilities, are presented gross. For example, a unit's holding of *debt securities* as financial assets is presented separately from its liabilities for *debt securities* issued.

3.151 In the GFS framework the terms "gross" and "net" are used in a very specific manner. Apart from the balancing items *net worth*, *net operating balance*, and *net lending/net borrowing*, the GFS classifications employ the word "gross" and "net" to indicate the value of the operating balance and investment in nonfinancial assets before or after deduction of *consumption of fixed capital*. The framework also uses the term "net" to indicate that the *net acquisition of financial assets* represents both acquisition and disposal of assets, while the *net incurrence of liabilities* represents both incurrence and repayment of liabilities.

Consolidation

3.152 A consolidated set of accounts for a group of units, subsectors, or sectors, is produced by, first, an aggregation of all flows and stock positions within the GFS analytical framework, followed by the elimination, in principle, of all flows and stock positions that represent relationships among the units or entities being consolidated. In other words, consolidation eliminates the double-count because a flow or stock position of one unit is paired with the corresponding flow or stock position recorded for the second unit with which it is being consolidated, and both flows and/or stock positions are eliminated. For example, if one general government unit owns a bond issued by a second general government unit, and data for the two units are being consolidated, then the stock positions of bonds held as assets and liabilities of the consolidated unit are reported as zero (i.e., as if the bond position between them did not exist). At the same time, the interest related to this bond is consolidated, so that the interest revenue and expense of the consolidated account exclude the interest paid by the debtor general government unit to the creditor general government unit. Similarly, sales of goods and services between consolidated units are also eliminated.[27]

Definitions

3.153 Consolidation is a method of presenting statistics for a set of units (or entities) as if they constituted a single unit. In the GFS framework, the data presented for a group of units are consolidated. In particular, statistics for the general government sector and each of its subsectors are presented on a consolidated basis. When units of the public sector are included in a presentation, the data for public corporations should be presented in two ways: as separate subsectors for the financial public corporations and for the nonfinancial public corporations; and together with general government units for the consolidated public sector. In both cases, the statistics should be presented on a consolidated basis within each group.

3.154 When compiling general government or public sector statistics, two types of consolidation may be necessary—namely, intrasectoral consolidation and intersectoral consolidation.

3.155 Intrasectoral consolidation is consolidation within a particular subsector to produce consolidated statistics for that particular subsector—for example, within the central government subsector or within the public nonfinancial corporations subsector. This consolidation may be required at two stages. A single institutional unit may require consolidation when the unit has multiple funds and accounts to carry out its operations and there are flows and stock positions among those funds. For example, a country may have a core central government institutional unit that has one or more departmental accounts, as well as special funds and accounts established for specific purposes. There are often flows and stock positions held between these accounts and funds that are recorded on a gross basis in the respective accounts. Failure to eliminate these transfers would yield aggregates that result from the accounting device, and not from interaction with units outside of the central government.

3.156 Intersectoral consolidation is consolidation between subsectors of the public sector to produce consolidated statistics for a particular grouping of public

[27] See *PSDS Guide*, Box 8.1 and Table 8.2, for examples of consolidation.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

sector units—for example, consolidation between central, state, and local governments, and between general government and public nonfinancial corporations.

3.157 Intrasectoral consolidation is always done before intersectoral consolidation—for example, where more than one central government social security fund exists, the data for all social security funds should be consolidated before the consolidated social security data is presented as a subsector of the central government. Subsequently, data for all the subsectors of the central government will be subject to intersectoral consolidation to produce data for the consolidated central government.

Reasons for consolidation

3.158 The main reason for consolidation lies in the analytical usefulness of the consolidated statistics: consolidation eliminates the distorting effects on aggregates of differing administrative arrangements across countries or over time. The main impact of consolidation on the statistics is on the magnitude of aggregates. To relate government aggregates to the economy as a whole (e.g., revenue, expense, or debt to gross domestic product (GDP) ratios), it is better to eliminate the internal movement of economic value and include only those flows and stock positions that actually cross the boundaries with other sectors or nonresidents. The same arguments apply to why public corporations and public sector statistics should be consolidated.

3.159 By eliminating all reciprocal flows and stock positions among the units being consolidated, consolidation has the effect of measuring only flows or stocks of the consolidated units versus units outside the boundary. Consolidation excludes the economic interaction within the grouping of institutional units, and presents only those flows or stocks that involve interactions with all other institutional units in the economy, and the rest of the world.

3.160 Consolidation avoids double-counting of flows or stock positions among a grouping of institutional units, thus producing statistics that exclude these internal flows or stock positions. It is the avoidance of double-counting that produces the increased analytical usefulness of consolidated statistics in cases where it makes sense to view the consolidated group as acting as if it were a single entity.

Conceptual guidelines

3.161 Conceptually, consolidation entails the elimination of all intra- and intergovernmental flows and all debtor-creditor relationships among the units or entities that are combined. Consolidation requires a review of the accounts to be consolidated to identify inter- and intrasectoral flows and stock positions. The goal is to eliminate, in a consistent manner, flows and stock positions that will have a significant effect on the final derived measures. However, two types of transactions that appear to take place between two government units are never consolidated because they are rerouted in GFS (see paragraph 3.28):

- Employer social contributions, whether paid to social security or government pension funds, are treated as being payable to the employee in the household sector as part of compensation and then payable by the employee to the social security scheme.
- Taxes withheld by government units from the compensation of their employees, such as pay-as-you-earn taxes, and paid to other government units should be treated as being paid directly by the employees. The government employer is simply the collecting agent for another government unit, and is acting on behalf of the employees in the household sector.

3.162 Consolidation covers a range of categories of flows that may vary greatly in importance. The major transactions, in likely order of importance, cover:

- Grants (current and capital) among general government units or entities
- Interest income/expense
- Taxes paid by one government unit or entity to another (except those taxes withheld on behalf of the household sector)
- Purchases/sales of goods and services
- Acquisitions/disposals of nonfinancial assets.

3.163 The following major transactions, other economic flows, and stock positions in financial assets and liabilities, in likely order of importance, should be consolidated:

- Loans
- Debt securities
- Other accounts receivable/payable.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

3.164 For the public sector, in addition to the foregoing financial instruments, the following flows and stock positions should also be eliminated—in principle—in both intra- and intersectoral consolidation:

- Equity and investment fund shares
- Currency and deposits
- Insurance, pension, and standardized guarantee schemes.

Implementing consolidation

3.165 This *Manual* recommends that, based on Table 3.1, counterparty flows and stock position information be identified that will be eliminated in consolidation. But practicality should be kept in mind: the resources devoted to consolidation and the level of detail applied in consolidation should be in direct proportion to their fiscal significance. Suggestions for the sequence of analysis are:

- Begin all consolidation exercises with an analysis of the accounts involved to determine whether there are flows or stock positions internal to the unit(s) to be consolidated. This will depend on knowledge of the relationships among the units involved. Do some of the units incur expense or receive revenue from the other units? Do some units extend loans to the other units? Do they buy debt securities issued by the other units? Do they have currency and deposits held by the other units?
- Once these relationships are established, compilers must determine whether the intra- and/or intersectoral flows and stock positions can be measured or estimated, and whether the amounts will be significant in terms of analytical importance.
- If the amounts are likely to be significant, are they large enough to justify the effort to collect the data and other information for consolidation purposes? The effort and cost to identify an amount to be consolidated should be directly proportional to the expected amount and its impact on the aggregates.
- The "one-side" rule of thumb is commonly used. That is, if there is convincing evidence from the one institutional unit that a flow or stock position exists, it should be imputed to the counterparty. The imputation should be recorded even if there is no record of the flow or stock position in the counterparty's accounts. When such an adjustment is made in the data for a unit where the flow or stock position cannot be directly identified, it will be necessary to ensure that the records for that unit are properly modified.
- For flows and stock positions in financial assets and liabilities, normally the creditor can be expected to maintain the most reliable records. For loans, the creditor unit usually maintains the most complete records, but, with the international emphasis on proper debt recording, the debtor unit may be equally reliable. For debt securities, especially bearer instruments, only the creditor may have the information needed for consolidation. For example, when a central government issues bearer securities, some of which are acquired by public corporations, the central government may have no direct information on who is holding the securities, especially if they can be acquired on secondary markets. It is therefore necessary to rely on the creditor's records.
- Sometimes discrepancies exist between data for two units that are being consolidated. There are many reasons for such discrepancies, such as coverage, time of recording, valuation, and classification. Resolving these discrepancies will promote proper consolidation and improve the overall

Table 3.1 Detailed Classification of Counterparty Information

Code	Sector[1]
	General government
	Central government
	State governments
	Local governments
	Social security funds[2]
	Corporations
	Private corporations
	Private nonfinancial corporations
	Private financial corporations
	Public corporations
	Public nonfinancial corporations
	Public financial corporations

[1]Further breakdown/"of which" lines could allow for the identification of subsectors and individual units.

[2]Social security funds are presented as a subsector only if their data are excluded from the data of the government level at which they are organized (see paragraph 2.78).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

quality of GFS compiled. However, where a discrepancy cannot be resolved, decisions need to be made about which unit or group of units has the most reliable source data. Generally, the higher level of government is considered to have more reliable records than the lower levels of government.

- To create consistency with other macroeconomic datasets, components of the data for the public sector should be presented in such a way that they show the data before consolidation and after consolidation. This will allow for the unconsolidated data to be consistent with the data required in the national accounts and other datasets that are presented before consolidation (see paragraph 3.168).

3.166 Consolidation does not affect balancing items. In other words, the balancing items that are produced by simple aggregation are the same as those produced by consolidation. This is a result of the symmetry of the consolidation process, wherein the two sides of the consolidation adjustment fall within the same section of the analytical framework. When consolidated data produce different balancing items from the unconsolidated data, recording errors have been made. Therefore, when intra- or intersectoral flows and stock positions to be consolidated are not measured in the same amount by the units or subsectors involved, a consolidation method must be chosen that does not affect balancing items (see paragraph 3.165).

Consolidation in other datasets

2008 System of National Accounts

3.167 The *2008 SNA* recommends, as a matter of principle, that statistics of institutional units should not be consolidated in the national accounts, but that consolidated accounts may be compiled for complementary presentations and analyses. Even then, transactions appearing in different accounts of the national accounts are never consolidated. The difference between the *2008 SNA* and this *Manual* reflects the different uses of the statistics. The GFS framework is designed to produce statistics suitable for use in the analysis of the net relations between government and the rest of the economy. In particular, assessing the overall impact of government operations on the total economy or the sustainability of government operations is more effective when the measure of government operations is a set of consolidated statistics rather than unconsolidated statistics. The GFS framework also is not intended to produce a measure of production. The *2008 SNA*, on the other hand, serves a range of other uses, including a comprehensive measure of production and relations among all the sectors of the economy.

Financial statements

3.168 In financial statements, compiled in accordance with accounting standards, accounting entries are often presented on a consolidated basis for the reporting entity and all of its controlled entities. This is done without regard to whether the controlled entities are general government units or public corporations, as those terms are used in this *Manual*, or whether the controlled entities are residents or nonresidents. This use of consolidation attempts to portray the operations and financial position of a parent and its subsidiaries as though the group of enterprises were a single unit. For example, a financial report for a state government unit would include all public corporations controlled by that government unit but would not include the statistics of any other state governments. In contrast, the consolidated statistics of the state government subsector in the GFS framework would include all state government units of the country, but would exclude all public corporations owned or controlled by those state governments.

4 The Government Finance Statistics Analytic Framework

This chapter introduces the government finance statistics analytic framework[1] *and describes the relationships among its elements and use of government finance statistics in fiscal analysis.*

Introduction

4.1 Government units and public corporations carry out a multitude of activities. To manage the internal operations of government and assess their impact on the economy, these activities—resulting in transactions and other economic flows—must be organized into a framework within which they can be summarized and analyzed. For accountability purposes, these activities may be organized according to the government unit that carries them out. For managerial or planning purposes, these activities may be organized by the kind of item purchased/sold or service provided/acquired. For billing or control purposes, these activities may be organized by the particular transactors with whom the government deals. The GFS framework, on the other hand, is designed to facilitate fiscal analysis in a broader macroeconomic context. While there is clearly a close link between accounting data and macroeconomic statistics, they do not serve the same objectives and may differ in the treatment of particular items.[2]

4.2 Traditionally, governments have recorded their activities on a cash basis; this is reflected in the analytic framework of the *GFSM 1986*. Including only cash revenue and expenditure has the advantage of focusing the government's attention on its financing/liquidity constraint, which has traditionally been viewed as its most binding priority. However, governments have become less liquidity-constrained in carrying out fiscal policy and have become more adept at separating the time of a fiscal action from the time it is paid for, so that cash transactions do not adequately capture either the timing of activities or their economic impact. In consequence, there has been increasing recognition worldwide of the need to adopt the accrual system of recording, which includes a cash-flow statement for assessing fiscal policy.[3]

4.3 The GFS analytic framework introduced in the *GFSM 2001*, and as updated in this *Manual*, reflects these developments and is presented in the form of a set of interrelated accrual-based statements. These statements are harmonized with the *2008 SNA*, that integrate flows and stock positions, and are supplemented with a cash-flow statement. The GFS analytic framework facilitates a more comprehensive assessment of the economic impact of government activity and the resulting changes on liquidity and the implications for the sustainability of fiscal policy. More specifically, the use of accrual-based statements and the integration of balance sheets with flows are consistent with the need for government behavior to be determined in the context of its intertemporal budget constraint. For example, a government's policies will not be sustainable if they significantly reduce its net worth. The framework also provides an improved basis for monitoring efficiency in the allocation and use of all government resources. The analytic framework set out in this *Manual* encompasses the traditional cash-based fiscal reporting, to support liquidity analysis.

[1] The GFS analytic framework refers to the structure of accounts and their relationships as a body of thought, while the term GFS framework more generally refers to the framework for the compilation and dissemination of GFS data.

[2] See Appendix 6 for a detailed description of the linkages between GFS and international accounting standards, and see Appendix 7 for linkages between GFS and other macroeconomic statistics.

[3] For example, see Study 11, Part III of International Federation of Accountants, *Government Financial Reporting: Accounting Issues and Practices* (New York, 2000), and IFAC Recommendations to G-20 meeting, New York, 2010 and 2012.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Analytic Objectives

4.4 The GFS analytic framework is a quantitative tool that supports fiscal analysis. To permit effective analysis of fiscal policy, the GFS framework must facilitate the identification, measurement, monitoring, and assessment of the impact of a government's economic policies and other activities on the economy.

4.5 To achieve the analytic objectives, the GFS framework should generate data that:

- Are sufficiently detailed and effectively organized to allow an assessment of management and policy decisions
- Are closely linked to other macroeconomic statistical frameworks (national accounts, balance of payments and international investment position, and monetary and financial statistics)
- Enable analysts to assess the financial soundness of the general government and public sectors in ways commonly applied to other organizations in the economy[4]
- Enable assessment of sustainability over the long term
- Enable assessment of liquidity constraints and financing needs.

Construction of the Analytic Framework: Relation to the *GFSM 1986*

4.6 The analytic framework of this *Manual* builds on the *GFSM 1986* framework, and extends it by incorporating additional elements that are useful in assessing fiscal policy. There are three types of modifications:

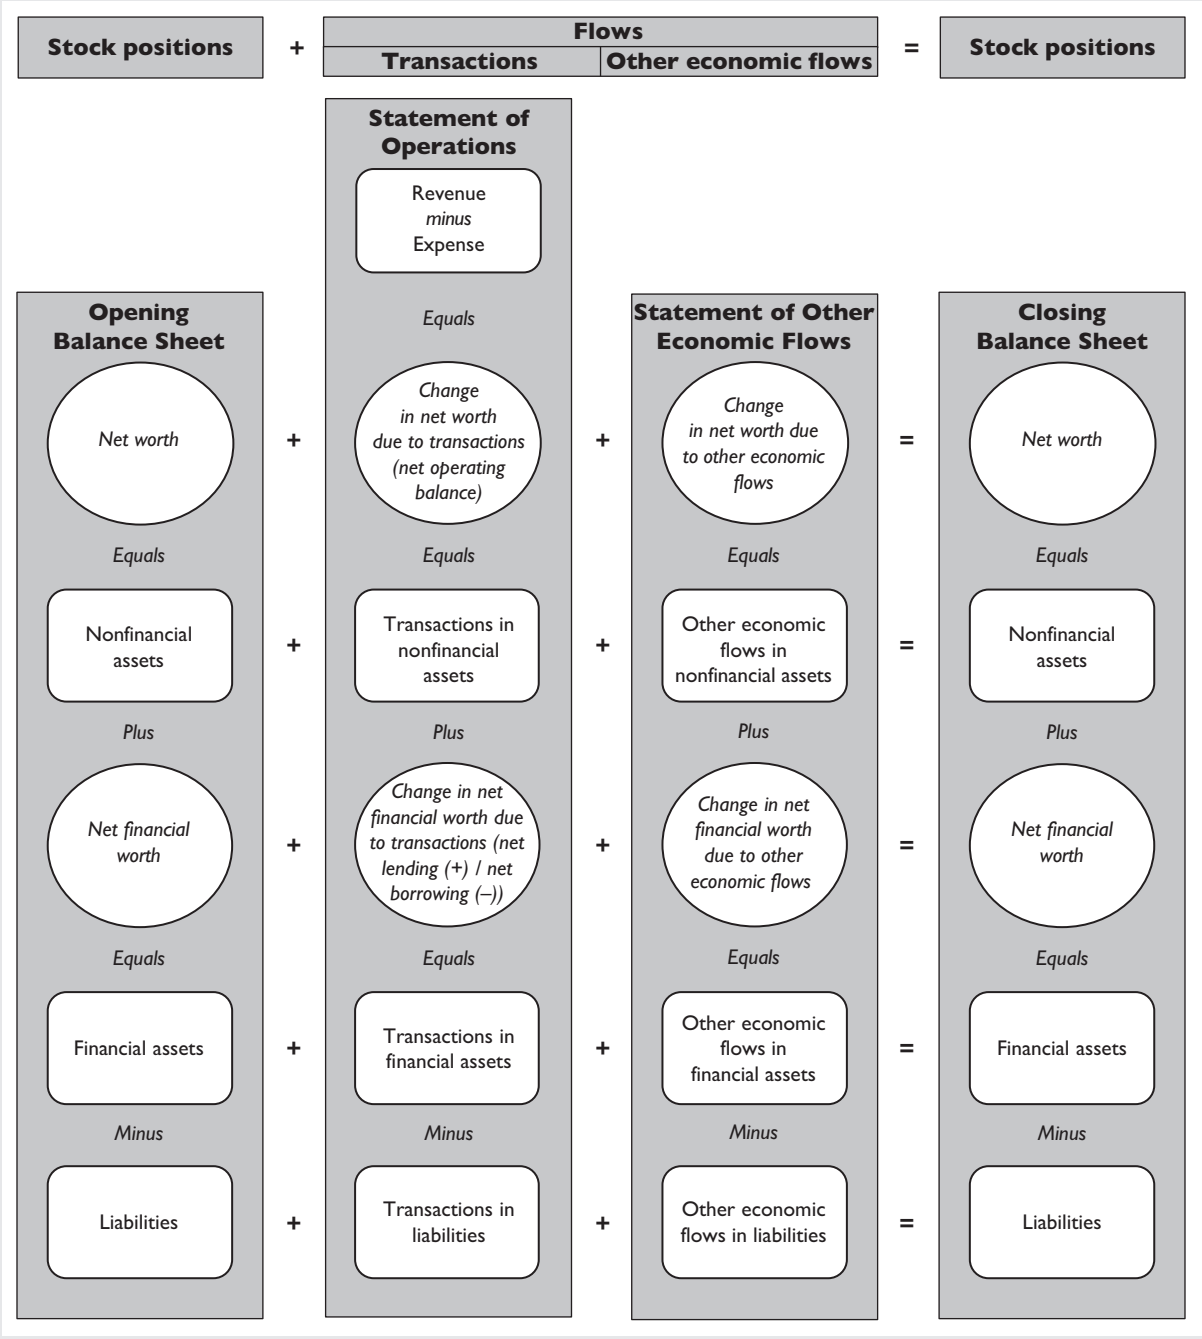
- The definitions of individual statistical variables are closely aligned with economic concepts. An important example is the treatment of nonfinancial assets, where the sale of such assets is no longer included in revenue and their purchase is no longer included in expense.
- Concepts are harmonized with the *2008 SNA*. These include: the shift from a functional-based definition of general government and public sectors to one built on institutional units (see paragraphs 2.22–2.48); a switch from using only the cash basis of recording to a framework of accounts using the accrual basis of recording, while maintaining a cash-flow statement (see paragraphs 3.70–3.72); and the complete integration of flows and stock positions (see paragraphs 3.2–3.3).
- The *GFSM 1986* framework has been extended to include nonmonetary transactions, such as in-kind and imputed transactions (see paragraphs 3.19–3.20), flows other than transactions (see paragraphs 3.31–3.35), and a balance sheet (see paragraphs 3.36–3.50).

4.7 In principle, the coverage of GFS encompasses all institutional units that materially affect fiscal policies. Therefore, two principal constructs are used for which GFS should be compiled. The general government sector captures those institutional units primarily involved in nonmarket activities of government, while the public sector captures all the activities of public corporations, including their market and quasi-fiscal activities (see Chapter 2). Once an institutional unit has been classified to a sector, all its flows and stock positions are recorded in that sector. Thus, statistics for the general government sector as well as for the public sector should be compiled. The analytic framework described in this chapter can be applied to both sectors, and their subsectors.

Components and Concepts of the Analytic Framework

4.8 The core of the analytic framework is a set of four financial statements. Three of the statements can be combined to show that all changes in stock positions result from flows (see Figure 4.1 and paragraph 3.4). These are the:

- *Statement of Operations*
- *Statement of Other Economic Flows*
- *Balance Sheet*.



In addition, the core framework includes a *Statement of Sources and Uses of Cash* to provide key information on liquidity.

4.9 The *Statement of Operations* is a summary of the transactions of a sector or subsector in a given reporting period. In essence, transactions represent changes to stock positions that arise from mutually agreed interactions between institutional units, such

[4] Organizations in other sectors of the economy record their operations in the form of integrated accounting systems that include income statements, balance sheets, and cash-flow statements.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Figure 4.1 Structure of the GFS Analytic Framework

as the sale of a good or service by one unit and its purchase by another (see paragraph 3.5). The framework also recognizes that a unit can act in two capacities of economic interest and includes as transactions some items that do not involve another institutional unit. For example, consumption of fixed capital recognizes that a unit is both the owner of a fixed asset and the consumer of the services provided by the asset. Taken together, transactions constitute the largest share of the flows associated with the implementation of fiscal policy. As described in the following section, transactions are classified to demonstrate how general government and public sector units raise revenue and spend it, and to show the effects of fiscal

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

policy decisions on the net worth of the sector, on its demand for credit, and on its ability to invest in assets.

4.10 The *Statement of Other Economic Flows* tabulates changes to stock positions of assets, liabilities, and net worth that come about for reasons other than transactions. More specifically, *holding gains and losses* represent changes to stock positions that arise from price movements, including exchange rate movements.[5] *Other changes in the volume of assets* represent changes to stock positions arising from events such as the discovery of new assets/liabilities (e.g., mineral deposits), depletion or destruction of assets, or reclassification of assets/liabilities.

4.11 The *Balance Sheet* records the stock positions of assets, liabilities, and net worth of the sector or subsector at the end of each reporting period.

4.12 The *Statement of Sources and Uses of Cash* records cash inflows and outflows using a classification similar to that of the *Statement of Operations*, but with a focus on the net change in cash flows arising from transactions during the reporting period.

4.13 In addition to the core statements of the GFS framework, two supplementary statements are included in the framework due to their analytic usefulness. These statements are the:

- *Statement of Total Changes in Net Worth*
- *Summary Statement of Explicit Contingent Liabilities and Net Implicit Obligations for Future Social Security Benefits*.

4.14 The *Statement of Total Changes in Net Worth* combines the revenue and expense transactions from the *Statement of Operations* with the *Statement of Other Economic Flows* in one statement. In its summary format, this supplementary statement serves to highlight the total changes in net worth of government.

4.15 The *Summary Statement of Explicit Contingent Liabilities and Net Implicit Obligations for Future Social Security Benefits* summarizes the explicit and implicit guarantees outstanding. Contingent liabilities create fiscal risks and may arise from deliberate public policy or from unforeseen events. The stock positions of explicit and some implicit contingent liabilities are recorded as memorandum items to the GFS balance sheet (see paragraphs 7.251–7.261). For details on the recording of contingent liabilities, also see paragraphs 7.251–7.259 and the *PSDS Guide*, paragraphs 4.3–4.26.

[5] "Holding gains" is used as a short form of the more general term "holding gains and losses."

The Statement of Operations

4.16 The *Statement of Operations* (see Table 4.1) presents details of transactions in revenue and expense, as well as the net investment in nonfinancial assets, the net acquisition of financial assets, and the net incurrence of liabilities.[6] Revenue is defined as the increase in net worth resulting from transactions, and expense as the decrease in net worth resulting from transactions. The net investment in nonfinancial assets equals the acquisitions minus disposals of fixed assets, minus consumption of fixed capital, plus changes in inventories, plus the net acquisition (acquisitions minus disposals) of valuables and nonproduced assets.

4.17 Two important analytic balances are derived in the *Statement of Operations*. Revenue minus expense equals the *net operating balance*, reflecting the total change in net worth due to transactions. The subsequent deduction of the net investment in nonfinancial assets results in *net lending (+) / net borrowing (–)*, which is also equal to the net result of transactions in financial assets and liabilities. In addition to these balances, the annex to Chapter 4 describes a number of other important fiscal indicators that could be derived from GFS and that are used in fiscal analysis.

4.18 The *net operating balance* is a summary measure of the sustainability of the reporting sector or subsector's operations. It is comparable to the national accounts concept of saving plus net capital transfers receivable. The net operating balance as defined here excludes gains and losses resulting from changes in price levels and other changes in the volume of assets. The component of the change in net worth that

[6] As explained in paragraph 3.69, the *Statement of Operations* is intended to be compiled using the accrual basis of recording transactions. It is recognized, however, that many governments may be able to compile statistics only on the cash or partial accrual basis for some time. If only cash data are available, the classification of cash flows shown in Table 4.2 should be used. Otherwise, with accrual or partial accrual (noncash) source data, the classification of transactions shown in Table 4.1 should be used. With the exception of consumption of fixed capital, in-kind and imputed transactions, and other accounts receivable/payable, all of the line items in Table 4.1 can be applied to both cash and accrual data. However, the benefits of the fully integrated GFS framework can be derived only when using the accrual basis of recording.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

is due to transactions can largely be attributed directly to government policies since governments have direct control over the decisions that lead to the interaction with other units by mutual agreement. The same cannot always be said for the other components of the total change in net worth. For example, changes in the market prices or events that impact on the volume of assets or liabilities are not in the direct control of government. Still, these risks need to be monitored so that governments can manage them proactively to minimize their potential fiscal impact.

4.19 *Net lending (+) / net borrowing (–)* is a summary measure indicating the extent to which government is either putting financial resources at the disposal of other sectors in the economy or abroad, or utilizing the financial resources generated by other sectors in the economy or from abroad. It may therefore be viewed as an indicator of the financial impact of government activity on the rest of the economy and the rest of the world. While this balancing item is conceptually the same as in the *2008 SNA*, amounts reported as net lending/net borrowing may differ to the extent that a government maintains an unfunded pension scheme for its employees (see paragraphs 5.95, 7.192–7.193 and Appendixes 2 and 7).

4.20 The *gross operating balance* as presented in the *Statement of Operations* differs from the net operating balance in that it does not include consumption of fixed capital as an expense. *Consumption of fixed capital* can be difficult to measure in practice and a satisfactory estimate may not be available. If so, the gross operating balance may be more practical for analysis than the net operating balance.[7] The net operating balance is, however, preferred in principle because it captures all costs of operations during the reporting period.

4.21 Expenditure is the sum of expense and the net investment in nonfinancial assets and is presented as an additional aggregate in the *Statement of Operations*. This aggregate is not influenced by the level of consumption of fixed capital and is therefore suitable for international comparisons between countries even if they cannot reliably measure consumption of fixed capital.

[7] The availability of data on *consumption of fixed capital* has no influence on net lending/net borrowing. The counterpart entry for the expense recorded for consumption of fixed capital reduces the value of investment in fixed assets—thereby neutralizing the impact on *net lending/net borrowing*.

Table 4.1 Statement of Operations

Transactions Affecting Net Worth:	
1	**Revenue**
11	Taxes
12	Social contributions [GFS]
13	Grants
14	Other revenue
2	**Expense**
21	Compensation of employees [GFS]
22	Use of goods and services
23	Consumption of fixed capital [GFS]
24	Interest [GFS]
25	Subsidies
26	Grants
27	Social benefits [GFS]
28	Other expense
NOB/GOB	***Net/gross operating balance*** (1–2)[1]
Transactions in Nonfinancial Assets:	
31	Net/gross investment in nonfinancial assets[2]
311	Fixed assets
312	Inventories
313	Valuables
314	Nonproduced assets
2M	***Expenditure*** (2+31)
NLB	***Net lending (+) / Net borrowing (–) [GFS]*** (1–2–31 = 1–2M = 32–33)
Transactions in Financial Assets and Liabilities (Financing):	
32	Net acquisition of financial assets
321	Domestic[3]
322	External[3]
33	Net incurrence of liabilities
331	Domestic[3]
332	External[3]

[1] The net operating balance equals revenue minus expense. The gross operating balance equals revenue minus expense other than consumption of fixed capital.

[2] The net investment in nonfinancial assets equals acquisitions minus disposals minus consumption of fixed capital. The gross investment in nonfinancial assets equals acquisitions minus disposals.

[3] Classified by instrument and/or sector of the counterparty (see Tables 9.1 and 9.2).

4.22 As illustrated in Table 4.1, the *Statement of Operations* is divided into three sections that present: revenue and expense transactions; transactions in nonfinancial assets; and transactions in financial assets and liabilities. The following paragraphs follow this structure in providing an overview of the various categories of transactions. These definitions and descriptions are not intended to be comprehensive.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

In each section, reference is made to the chapter that contains more detailed information.

Revenue and Expense

4.23 Revenue is an increase in net worth resulting from a transaction.[8] The major types of revenue are *taxes* (11), *social contributions* (12), *grants* (13), and *other revenue* (14).[9] The detailed classification of revenue is described in Chapter 5. The disposal of a nonfinancial asset by sale or barter is not revenue because it has no effect on net worth. Rather, it changes the composition of the balance sheet by exchanging one asset (the nonfinancial asset) for another (the proceeds of the sale). Similarly, amounts receivable from loan repayments and loan disbursements are not revenue. These are transactions in assets or liabilities as described in Chapters 8 and 9.

4.24 Expense is a decrease in net worth resulting from a transaction.[10] The major types of expense are *compensation of employees* (21), *use of goods and services* (22), *consumption of fixed capital* (23), *interest* (24), *subsidies* (25), *grants* (26), *social benefits* (27), and *other expense* (28). In addition, expense can be classified according to the functions of government, such as health or social protection. The economic and functional classifications of expense are described in Chapter 6. The acquisition of a nonfinancial asset by purchase or barter is not an expense because it has no effect on net worth. Rather, it changes the composition of the balance sheet by acquiring one asset (the nonfinancial asset) against the disposal/reduction in another asset or by incurring a liability (the payable for the asset). Similarly, amounts payable on loans extended and repayments on loans incurred are not classified as expense. These are transactions in assets or liabilities as described in Chapter 8 and 9.

Transactions in Nonfinancial Assets[11]

4.25 The second section of the *Statement of Operations* (see Table 4.1) records transactions that change a government's net investment in nonfinancial assets. **Nonfinancial assets** are economic assets other than financial assets. Nonfinancial assets are stores of value and provide benefits either through their use in the production of goods and services or in the form of property income and holding gains. These assets are classified as *fixed assets* (311), *inventories* (312), *valuables* (313), and *nonproduced assets* (314). The classification of nonfinancial assets is described in Chapter 7 and transactions in nonfinancial assets are discussed in Chapter 8.

Transactions in Financial Assets and Liabilities

4.26 The third section of the *Statement of Operations* (see Table 4.1) records financing transactions, which are transactions that change a government's holdings of financial assets and liabilities (financial assets and liabilities are defined in paragraphs 3.48 and 3.45, respectively). The classification of financial assets and liabilities is described in Chapter 7 and transactions in financial assets and liabilities are discussed in Chapter 9.

4.27 Transactions in financial assets can be classified in multiple ways; for ease of presentation, Table 4.1 indicates a classification of financial assets according to whether the counterpart liability was incurred by a resident (indicated by "domestic" in the table) or a nonresident (indicated by "external") and similarly for the classification of liabilities.

4.28 There are additional classifications of transactions in financial assets and liabilities in GFS. The first classification is based on the type of financial instruments involved in the transactions. The instruments are: *monetary gold and SDRs*; *currency and deposits*; *debt securities*; *loans*; *equity and investment fund shares or units*; *insurance, pension, and standardized*

[8] In general, transactions that increase net worth result from current operations. Capital transfers are an exception. Capital transfers are defined in paragraph 3.16. In GFS, capital transfers receivable are classified as revenue because they increase the recipient's net worth and they are often indistinguishable from current transfers in their effect on government operations.

[9] The numbers in parentheses after each classification category are the GFS classification codes. Appendix 8 provides all classification codes used in the GFS system.

[10] As with revenue, transactions that decrease net worth result mainly from current operations. Capital transfers payable or otherwise obligated are an exception. See footnote 8.

[11] This section deals only with the net investment in nonfinancial assets (acquisitions minus disposals of nonfinancial assets, minus consumption of fixed capital) by the reporting unit or sector. Government or public sector institutional units may also facilitate public capital formation by transferring funds to other governments or to public corporations with a requirement that the funds be used to acquire nonfinancial assets. Rather than being considered transactions in nonfinancial assets, these transactions are included in *capital transfers*, either as *capital grants* or *other expense*, as relevant.

Box 4.1 Policy Lending

Whether to consider the acquisition of a financial asset or assumption of a liability as being for public policy purposes, for liquidity management, or for other purposes rests largely on an assessment of the particular purpose for acquiring the instrument.[1]

Some fiscal policies that may lead to the ownership of financial claims include fostering new industries, assisting ailing government corporations, or helping particular businesses that are experiencing economic adversity. For example, a government unit may provide loans at favorable rates to particular economic sectors, acquire shares in a corporation active in a particular geographical region or in a function that the government wishes to promote, or sell shares in a public corporation for less than their market value.

Liquidity management, on the other hand, refers to actions taken to ensure the availability of financial assets to fulfill requirements for short-term funds and to ensure that such funds earn the best available rate of return. Prudent financial management requires that government units acquire and dispose of financial assets in the process of their financing operations. The motive underlying these transactions is the effective management of finances.

Other purposes for acquiring financial assets, and perhaps incurring related liabilities, include the need to make a long-term provision for society, such as acquiring financial assets derived from the sale of natural resource assets to hold in a special-purpose government fund.

Some factors that should be considered when identifying policy-related financial instruments are as follows:

- Nonnegotiable financial assets are usually held for policy-related purposes, as are negotiable financial claims issued by a lower level of government and held by a higher level of government.
- Financial assets issued by a public corporation—for example, shares and other equity, debt securities, or loans—and held by government are typically held for public policy purposes.
- A government statement about the acquisition of a financial asset may indicate that the purpose is policy-related.
- Noncommercial terms favoring the borrower generally indicate a policy-related purpose, such as concessional interest rates on loans or arrangements for repayment that do not meet normal commercial standards.
- Assets acquired as a result of government units acting as guarantors are likely to be policy-related.
- Assets acquired through nationalization are policy-related.
- Holdings of monetary gold, SDRs, currency, and nonlife insurance technical reserves are always liquidity-related.
- Deposits may be acquired for policy or liquidity purposes.

[1]As explained in paragraph 6.91 and Box 6.3, under some circumstances, "capital or equity injections" are considered to be expense (i.e., when they do not result in an effective financial claim on the debtor).

guarantee schemes; *financial derivatives and employee stock options*; and *other accounts receivable/payable* (see Table 9.1). The second classification is based on the sector of the counterparty of the transactions in financial instruments. That is, transactions in liabilities are classified according to the sector of the institutional unit conducting the counterpart transaction in financial assets, such as financial corporations, nonfinancial corporations, households, and nonprofit institutions serving households (see Table 9.2).

4.29 Another possible classification of transactions in financial assets and liabilities is whether they were acquired or disposed of for the purpose of public policy or liquidity management. This distinction is not included in the *Statement of Operations*, but is used to define the *overall fiscal balance*, as described in the annex to Chapter 4, Table 4A.2.

4.30 Public policy-related assets or liabilities (also called policy lending—see Box 4.1) may be acquired for a variety of reasons, such as fostering new industries, assisting ailing government corporations, or helping particular businesses suffering economic adversity. Such transactions can take a variety of forms, including loans, equity securities, and debt securities. Given that there is often a concessional element to such transactions, it is useful to identify them in a

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

separate category so that for some analyses the fiscal impact of these policy-related transactions in assets could be assessed separately.[12]

4.31 All other transactions in financial assets are assumed to be for liquidity management or other purposes. That is, the assets are acquired to earn a market rate of return while keeping sufficient funds on hand to finance day-to-day operations, or to meet the long-term needs of society, such as through a special-purpose government fund.

The Statement of Sources and Uses of Cash

4.32 Information on the sources and uses of cash is important for assessing the liquidity of the general government and public sectors. The *Statement of Sources and Uses of Cash* (see Table 4.2) shows the total amount of cash generated or absorbed by current operating activities, transactions in nonfinancial assets, and transactions involving financial assets and liabilities other than the financial asset *currency and deposit* (cash) itself. The net change in the stock of cash is the sum of the net cash received from these three sources.

4.33 The net change in the stock of cash refers to the financial asset *currency and deposits* (3202). **Currency** consists of notes and coins that are of fixed nominal values and are issued or authorized by the central bank or government. **Deposits** are all claims, represented by evidence of deposit, on the deposit-taking corporations (including the central bank) and, in some cases, general government or other institutional units. The classification of this financial asset is described in Chapter 7 and transactions are discussed in Chapter 9.

4.34 The *Statement of Sources and Uses of Cash* (Table 4.2) reflects transactions when using the cash basis of recording. This, in effect, means that transactions are captured only when cash is received or when cash payments are made (see paragraphs 3.67 and 3.103–3.105).

Table 4.2 Statement of Sources and Uses of Cash

Cash Flows from Operating Activities:	
C1	**Revenue cash flows**
C11	Taxes
C12	Social contributions
C13	Grants
C14	Other receipts
C2	**Expense cash flows**
C21	Compensation of employees
C22	Purchases of goods and services
C24	Interest
C25	Subsidies
C26	Grants
C27	Social benefits
C28	Other payments
CIO	***Net cash inflow from operating activities*** (1–2)
Cash Flows from Transactions in Nonfinancial Assets:	
C31	Net cash outflow from investment in nonfinancial assets[1]
C311	Fixed assets
C312	Inventories[2]
C313	Valuables
C314	Nonproduced assets
C2M	**Expenditure cash flows** (2+31)
CSD	***Cash surplus (+) / Cash deficit (–)*** (1–2–31 = 1–2M = 32–33)
Cash Flows from Transactions in Financial Assets and Liabilities (Financing):	
C32x	Net acquisition of financial assets other than cash
C321x	Domestic[3]
C322x	External[3]
C33	Net incurrence of liabilities
C331	Domestic[3]
C332	External[3]
NFB	***Net cash inflow from financing activities*** (33–32x)
NCB	***Net change in the stock of cash*** (CSD+NFB = 3202 = 3212+3222)

[1]The net cash outflow from investment in nonfinancial assets equals purchases minus sales.

[2]On a cash basis, the category *inventories* (C312) is limited to changes in strategic stocks. Other inventories are, by definition of the cash basis of recording, considered an expense when acquired.

[3]Classified by instrument and/or sector of the counterparty (see Tables 9.1 and 9.2).

4.35 Additional useful information for fiscal analysis is obtained from an analysis of the differences between amounts reported in the *Statement of Operations* and the *Statement of Sources and Uses of Cash*.

[12] The net acquisition of financial assets for policy purposes was called "lending minus repayments" in the *GFSM 1986* and was often referred to as "net lending." These terms should not be confused with the term "net lending/net borrowing" used in this *Manual*.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

There are some broad types of transactions that are recorded in Table 4.1 but not in Table 4.2:

- Expense transactions that will be settled in cash in the future—With accrual recording, a purchase of goods and services is recognized when the ownership of goods changes hands or services are provided. The associated cash payment may not take place until a subsequent reporting period, in which case it would not be included in Table 4.2 in the same period as it appears in Table 4.1. The fiscal implication of such differences in amounts reported may indicate a larger need for liquidity in the future to provide for the payments of accrued expense.
- Revenue transactions that were settled in cash but will be earned in the future—Revenue can be received in cash before it is earned by the delivery of goods or provision of services to the purchaser. In addition, taxes and other compulsory revenue may be earned, but may be unpaid and will be settled in the future. The fiscal implication of such differences may indicate a larger demand for service delivery in the future, or a need to assess the efficiency of tax collection efforts.
- There may also be transactions in assets and liabilities that will be settled in cash in future periods, such as the interest accruing from the amortization of the discount on a zero-coupon or other discounted bond. There may be fiscal implications for liquidity management.
- There are transactions that are not in cash by their nature. Consumption of fixed capital, imputed transactions, barter, other transactions in kind, and debt forgiveness and write-off are noncash transactions and would therefore not be recorded in a *Statement of Sources and Uses of Cash*. The difference between the two statements in this case will be an indication of the size of economic activities not measured in cash.

The Statement of Other Economic Flows

4.36 The *Statement of Other Economic Flows* (see Table 4.3) presents changes in assets, liabilities, and net worth that are not the result of transactions. They are classified as changes either in the value or volume of assets, liabilities, and net worth. The balancing item of this statement, the **change in net worth due to other economic flows**, is defined as the sum of the change in net worth due to holding gains or losses and the change in net worth due to other changes in the volume of assets. In line with the integrated approach, these other economic flows are classified by the type of asset or liability affected. *Other economic flows* are described in Chapter 10.

Table 4.3 Statement of Other Economic Flows

9	**Change in net worth due to other economic flows** (4+5)[1]
4	**Change in net worth due to holding gains and losses**
41	Nonfinancial assets

412	Inventories
413	Valuables
414	Nonproduced assets
42	Financial assets[2]
43	Liabilities[2]
5	**Change in net worth due to other changes in the volume of assets and liabilities**
51	Nonfinancial assets
511	Fixed assets
512	Inventories
513	Valuables
514	Nonproduced assets
52	Financial assets[2]
53	Liabilities[2]

[1]See Table 10.2 for a detailed classification of other economic flows.

[2]Classified by residence, instrument, and/or sector of the counterparty (see Tables 9.1 and 9.2).

4.37 Change in net worth due to holding gains or losses is defined as the sum of the positive or negative holding gains and holding losses on all assets and liabilities. These include all changes in the value of assets, liabilities, and net worth due solely to price effects. They can result from changes in the general price level or in relative prices. Changes in the exchange rate cause holding gains or losses in financial assets and liabilities denominated in a foreign currency (see paragraph 10.44).

4.38 Change in net worth due to other changes in the volume of assets and liabilities is defined as the sum of the positive and negative other changes in the volume of assets and liabilities. These changes in the volume of assets and liabilities, other than from transactions and price effects, may arise for a variety of reasons. They can be described as resulting from

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

the appearance or disappearance of existing resources as economic assets, effects of external events that are exceptional and unexpected, and changes in classification (see paragraphs 10.46–10.84).

The Balance Sheet

4.39 A **balance sheet** is a statement of the values of the stock positions of assets owned and of the liabilities owed by an institutional unit or group of units, drawn up in respect of a particular point in time. The *Balance Sheet*, shown in Table 4.4, presents the stock positions of assets and liabilities at the end of the reporting period in comparison to the stock positions at the beginning of the reporting period.[13] The main balancing item on the balance sheet is *net worth*. The **net worth** of an institutional unit (or grouping of units) is the total value of its assets minus the total value of its liabilities. The change in net worth (comprising the change in net worth due to transactions in revenue and expense and the change in net worth due to other economic flows) is a fiscal indicator for assessing the sustainability of fiscal activities.

4.40 For public corporations, using changes in net worth as a fiscal indicator for assessing sustainability should be approached with caution. Because of the inclusion of shareholders' equity as a liability in the calculation of net worth, the interpretation of net worth may be counterintuitive for public corporations. In cases where the market value of a public corporation's shares and equity is increasing by more than the market value of the recognized assets minus liabilities, the net worth of the public corporations will decrease in GFS (and in other macroeconomic statistics). Thus, for public corporations' own funds (including the value of *shares and other equity* and *net worth*) may provide a more useful fiscal indicator than net worth alone (see paragraphs 7.229–7.232 for more details on own funds).

4.41 Where market values of some nonfinancial assets are not available or are unreliable, net financial worth is another fiscal indicator of sustainability. The **net financial worth** of an institutional unit (or grouping of units) is the total value of its financial assets minus the total value of its liabilities.

4.42 The *Balance Sheet* shows the stock positions in assets and liabilities. (The definitions and classifications of assets and liabilities are described in Chapter 7.)

[13] Table 7.1 presents the balance sheet in another format.

Table 4.4 Balance Sheet

		Opening balance	Closing balance

631	Domestic[1]		
632	External[1]		
Memorandum items[2]			
	...		

[1]Classified by instrument and/or sector of the counterparty (see Tables 7.9 and 7.11).

[2]See Chapter 7 for a list of standard memorandum items that should be included on the balance sheet.

Assets

4.43 The assets included in the *Balance Sheet* are **economic assets**, defined as resources over which ownership rights are enforced and from which economic benefits may flow to the owners. Economic benefits arise from owning and using economic assets over a period of time. Assets not owned and controlled by a reporting unit or sector and assets that have no economic value are excluded.

4.44 As shown in Table 4.4, stock positions in assets are classified in the same way that transactions and other economic flows in assets are classified. Assets are either nonfinancial or financial. Nonfinancial assets are further classified as fixed assets, inventories, valuables, or nonproduced assets. Financial assets are classified by residence of the counterparty and by type of instrument. Financial assets can also be classified by sector of the counterparty and maturity.

Liabilities

4.45 A **liability** is established when one unit (the debtor) is obliged, under specific circumstances, to provide funds or other resources to another unit (the creditor). Most classifications that apply to financial assets also apply to liabilities. Liabilities are classified by the residence of the counterparty and by type of

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

instrument. Liabilities can also be classified by sector of the counterparty and maturity.

The Statement of Total Changes in Net Worth

4.46 The *Statement of Total Changes in Net Worth* (see Table 4.5) combines the results from the *Statement of Operations* for revenue and expense transactions with the *Statement of Other Economic Flows* in one statement. The statement provides a clear statistical explanation of the factors causing the change in the net worth of government. It explains the sources of changes in assets and liabilities from one reporting period to another in terms of transactions in revenue and expense and other economic flows. In its summary format, this supplementary statement serves to highlight the total change in net worth of government.[14]

CNW	**Total change in net worth** (NOB+9)

[1]The net operating balance equals revenue minus expense.
[2]Classified by categories of assets and liabilities as needed.

The Summary Statement of Explicit Contingent Liabilities and Net Implicit Obligations for Future Social Security Benefits

4.47 The *Summary Statement of Explicit Contingent Liabilities and Net Implicit Obligations for Future Social Security Benefits* records the explicit and some implicit contingent liabilities. **Contingent liabilities** are obligations that do not arise unless a particular, discrete event(s) occurs in the future. These contingencies create fiscal risks and may arise from deliberate public policy or from unforeseen events. The stock positions of contingent liabilities are recorded as a memorandum item to the balance sheet (see paragraph 7.255). Some details on the nature and composition of these contingencies are recorded in this statement (see Table 4.6).[15]

4.48 In GFS, the net implicit obligations for future social security benefits (other than employment-related retirement benefits) are not recognized as liabilities (see Appendix 2).[16] Social security contributions are classified as revenue (and therefore as an increase in net worth), and social security benefits payable as expense (a decrease in net worth). This treatment is in line with conventional fiscal analysis. Alternatively, in a full intertemporal framework, social security contributions may be seen more appropriately as akin to a buildup of assets (arising from contributions made) associated with future liabilities of the government. Likewise, many social security benefit payments may be seen as the extinction of previously incurred government liabilities. This approach is not taken in the main tables of GFS because it is considered that social security schemes, other than employment-related pension schemes, do not result in a contractual liability for the government—that is, there is no direct link between the contributions made and the benefits eventually payable.

4.49 Indeed, it is not uncommon for governments to change unilaterally the structure of benefits of social security schemes (e.g., by changing the circumstances under which the benefits become payable or the amount of the benefit). Moreover, in most cases, these benefits become payable only when certain contingent events occur, such as sickness or unemployment. Nonetheless, it is important for a government to be aware of the implicit contingent liability that

[14] This format brings the statistical presentation closer to the presentation used in financial statements compiled in accordance with *International Public Sector Accounting Standards* (see Appendix 6).
[15] For more details, see the *PSDS Guide*, paragraphs 4.3–4.26.
[16] These implicit obligations exclude amounts that become overdue after all criteria for benefits have been met—GFS include these as liabilities in *other accounts payable*.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

arises from its social security programs. Such a contingency recognizes the present value of future benefits that have already been earned according to the existing laws and regulations, net of the present value of future contributions to the scheme according to existing laws and regulations. As a result, a memorandum item is included in the *Balance Sheet*, with more details on these net obligations disclosed in this Statement (see Table 4.6).

4.50 The implicit contingent liabilities related to social security schemes exclude the liabilities associated with employment-related pension schemes, including in cases where the employment-related pensions are provided through the social security scheme. In GFS, imputed obligations incurred for unfunded government employee retirement schemes are considered to involve a contractual liability for a government or public sector unit to its employees. As a result, the actual or imputed contributions receivable to such employment-related schemes are considered to give rise to an incurrence of a liability, and the payment of retirement benefits is considered to be a reduction in the same liability (see paragraph 6.25).

Table 4.6 Summary Statement of Explicit Contingent Liabilities and Net Implicit Obligations for Future Social Security Benefits

6M6	**Total explicit contingent liabilities**
6M61	Publicly guaranteed debt[1]
6M62	Other one-off guarantees[2]
6M63	Explicit contingent liabilities not elsewhere classified
	Legal claims
	Indemnities
	Uncalled share capital
	…
6M7	**Net implicit obligations for future social security benefits**
	Present value of implicit obligations for future social security benefits
	Minus: Present value of future contributions to social security schemes

[1]It is recommended that details of publicly guaranteed debt (i.e., loan and other debt instrument guarantees) are shown by maturity and type of debt instrument, at nominal values.

[2]For example, credit guarantees and other similar contingent liabilities (such as lines of credit and loan commitments), contingent "credit availability" guarantees, and contingent credit facilities.

Annex: Using GFS for Fiscal Analysis

This annex describes the use of GFS in creating fiscal indicators.

Introduction

4.51 This annex offers an overview of the application of the GFS framework in creating commonly used fiscal indicators.[1] Some of these indicators can be observed or derived directly from the GFS framework, while others can be derived using a combination of GFS with other macroeconomic data.

4.52 Fiscal indicators may be produced for the general government and public sectors (see Chapter 2). Fiscal indicators for the subsectors of general government and the public sector can also be produced to take account of the decentralized nature of fiscal responsibilities in an economy. Using data from the GFS framework enhances the comparability of data across countries (see paragraph 1.13), which is important in establishing robust analytical findings.

Fiscal Indicators Available from the GFS Framework

4.53 The GFS framework produces fiscal indicators from the transactions, other economic flows, stock positions, aggregates, or balancing items. For example, in the *Statement of Operations*, *net lending/net borrowing* is the basic indicator of the fiscal balance, measured from "above-the-line" as *revenue* minus *expenditure* (with expenditure comprising *expense* plus the *net investment in nonfinancial assets*). This fiscal balance can alternatively be measured from "below-the-line" as the difference between transactions in *financial assets* and *liabilities*, also referred to as financing transactions. From an above-the-line perspective, GFS provide detailed information on revenue sources, and the composition of expenditure, while the "below-the-line" approach provides detailed information on how governments invest surpluses or finance deficits.

4.54 The *Balance Sheet* offers data on regularly used fiscal stock position indicators, such as the gross and net debt, and the stock position and composition of various categories of assets and liabilities (see paragraphs 7.14–7.19). Additional aggregates, such as the stock position of cash and the maturity breakdown of other financial instruments, are useful for an analysis of liquidity. Balancing items such as *net worth* and *net financial worth* allows for an analysis of the wealth of government.

4.55 An analysis of gross debt sustainability requires calculating a primary balance, which can be calculated by excluding *interest expense* from the calculation of *net lending/net borrowing* or *cash surplus/deficit*. When net debt is considered in the analysis, the primary balance should be calculated excluding the impact of *interest expense* and *interest revenue*. Similarly, the fiscal burden—an indicator of the compulsory contributions to the government—can be derived from transactions related to *taxes* and *social contributions*.

4.56 Table 4A.1 presents a list of some fiscal indicators that are directly available from GFS or that can be derived from GFS.

Fiscal Indicators Requiring Additional Data

4.57 Some fiscal indicators require additional information. The *overall fiscal balance*, for example, reflects the *net lending/net borrowing* after transactions in assets and liabilities are adjusted for transactions that are deemed to be for public policy purposes (also called "policy lending"). Notably, all proceeds under privatization (including proceeds from the sale of fixed assets) are included as financial items, while policy lending is treated as if it is an expense rather than a transaction in financial assets.

[1] The *International Financial Statistics* and the *Government Finance Statistics Yearbook* contain a large and comprehensive database of macroeconomic statistics, including GFS. See also the IMF's Fiscal Transparency Code at www.imf.org/external/np/fad/trans/. First published in 1998 and updated in 2007 and 2014, the IMF's *Code of Good Practices on Fiscal Transparency* and accompanying *Manual* and *Guide* are centerpieces of the global architecture of fiscal transparency norms and standards.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

For example, privatization proceeds or the repayment of policy lending is treated as financing while capital injections or loans to public corporations (policy lending) are added to expense in calculating the overall fiscal balance. Calculating the overall fiscal balance requires therefore a distinction between transactions in financial assets/liabilities undertaken for public policy purposes and those undertaken for liquidity management (see paragraph 4.29 and Box 4.1).

4.58 Cyclically adjusted and structural balances are other examples of fiscal indicators where information from various datasets must be assembled. These more complex fiscal balances attempt to measure fiscal positions net of cyclical and other transitory effects by taking into consideration the effects of exogenous factors on the fiscal balance. Examples of these more complex balances are also provided in Table 4A.2. Cyclically adjusted balances are measures of the government's fiscal position in an economy as if the economy was operating at potential gross domestic product (GDP). These balances can be calculated by adjusting the GFS concept of *net lending/net borrowing* (or other fiscal balances in the GFS framework) for the effect on revenue and expense of the difference between actual and potential GDP. Structural balances are an extension of cyclically adjusted balances, by adjusting for a broader range of factors, such as commodity prices, which may over- or understate fiscal performance.

4.59 In resource-rich countries, analysts often take into account the volatility of commodity prices (which affects fiscal balances but is outside of the direct control of government) when assessing fiscal performance. Calculating nonresource balances requires removing from net lending/net borrowing (or other fiscal balances) net resource-related revenue and expenditure. These resource-related items are not available in the core classifications of GFS, but could be provided in underlying source data.

4.60 Table 4A.2 presents a list of fiscal indicators that are built using GFS with additional data. These fiscal indicators are usefully expressed as a percentage change or as ratios of aggregates, such as GDP.

Table 4A.1 Fiscal Indicators Available from the GFS Framework

Fiscal Indicator	Equivalent Term in Statistical Methodologies	GFS Codes
	Fiscal balances	
Cash balance (also referred to as deficit/ surplus)	Cash surplus (+) / Cash deficit (–) (CSD) equal to the net cash inflow from operating activities minus the net cash outflow from investment in nonfinancial assets. Cash surplus/cash deficit is also equal to total cash flows from financing transactions.	C1–C2–C31, or C1–C2M, or NFB+NCB
Net operating balance (NOB)	Revenue minus expense. Net operating balance is also equal to change in net worth due to transactions.	1–2
Gross operating balance (GOB)	Revenue minus expense, excluding consumption of fixed capital.	1–2+23
Net lending/net borrowing (NLB)	Revenue minus expense minus net investment in nonfinancial assets; or Revenue minus expenditure; or Net operating balance minus net investment in nonfinancial assets; or Gross operating balance minus gross investment in nonfinancial assets. Net lending/net borrowing is also equal to total financing.	1–2–31, or 1–2M, or NOB–31, or GOB–31.1+31.2 32–33
Primary cash balance	Cash surplus/cash deficit excluding interest expense or net interest expense. For gross debt sustainability analysis, use cash surplus/cash deficit excluding interest expense. For net debt sustainability analysis, use cash surplus/cash deficit excluding net interest expense.	 CSD+C24 CSD+C24–C1411

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Table 4A.1 Fiscal Indicators Available from the GFS Framework *(continued)*

Fiscal Indicator	Equivalent Term in Statistical Methodologies	GFS Codes
	Fiscal balances (continued)	
Primary operating balance	Net operating balance excluding interest expense or net interest expense. For gross debt sustainability analysis, use net operating balance excluding interest expense. For net debt sustainability analysis, use net operating balance excluding net interest expense.	 NOB+24 NOB+24–1411
Primary balance	Net lending/net borrowing excluding interest expense or net interest expense. For gross debt sustainability analysis use net lending/net borrowing excluding interest expense. For net debt sustainability analysis use net lending/net borrowing excluding net interest expense.	 NLB+24 NLB+24–1411
	Other Macroeconomic Fiscal Indicators	
Above-the-line transactions	All transactions in revenue, expense, and net investment in nonfinancial assets. (The main balancing items, such as cash surplus/cash deficit or net lending/net borrowing, serve as the "line.")	1, 2, and 31, or C1, C2, and C31
Below-the-line transactions	All transactions in the net acquisition of financial assets, and the net incurrence of liabilities—also referred to as financing transactions. (The main balancing items, such as cash surplus/cash deficit or net lending/net borrowing, serve as the "line.")	32 and 33, or NFB and NCB
Fiscal burden	Revenue in the form of taxes plus social contributions. (In principle, only compulsory social contributions should be included—where voluntary social contributions are significant, these need to be excluded to calculate the fiscal burden, in which case this indicator becomes a fiscal indicator requiring additional data.)	11+12, or 11+121+122
Tax burden	Revenue in the form of taxes.	11
Direct taxes	Taxes that take into account individual circumstances of taxpayers (e.g., taxes on individual and corporate income).	111+1131+1132+1136
Indirect taxes	Taxes that do not take into account individual circumstances of taxpayers (e.g., taxes imposed on goods and services).	112+114+115+116
Capital taxes	Capital taxes are taxes levied at irregular and infrequent intervals on the values of the assets or net worth owned by institutional units or on the values of assets transferred between institutional units as a result of legacies, gifts, or other transfers.	1133+1135
Government final consumption expenditure	Approximated by compensation of employees, plus the use of goods and services, plus consumption of fixed capital, plus purchases of goods and services for direct transfer to households (mainly social benefits in kind), minus the sales of goods and services.	21+22+23+282–142
Gross saving	Gross operating balance excluding net capital transfers receivable (capital transfers including net capital grants and capital taxes); or Net lending/net borrowing excluding gross investment in nonfinancial assets,and excluding net capital transfers receivable (capital transfers including net capital grants and capital taxes).	GOB–(1133+1135+1312+1322+1332+1442+1452–2612–2622–2632–2822–2832), or NLB+31+23–(1133+1135+1312+1322+1332+1442+1452–2612–2622–2632–2822–2832)

Table 4A.1 Fiscal Indicators Available from the GFS Framework *(continued)*

Fiscal Indicator	Equivalent Term in Statistical Methodologies	GFS Codes
Other Macroeconomic Fiscal Indicators (continued)		
Capital spending	Net investment in nonfinancial assets equals acquisition of nonfinancial assets minus disposal of nonfinancial assets minus consumption of fixed capital.	31.1–31.2–31.3
Gross investment in nonfinancial assets	Net acquisition of nonfinancial assets equals acquisition of nonfinancial assets minus disposal of nonfinancial assets. Net investment in nonfinancial assets plus consumption of fixed capital.	31.1–31.2, or 31+23
Gross capital formation	Acquisition minus disposals of produced nonfinancial assets, which comprise fixed assets, inventories, and valuables.	311.1–311.2+312+313
Gross fixed capital formation	Acquisitions minus disposals of fixed assets.	311.1–311.2
Net interest expense	Interest expense minus interest revenue.	24–1411
Social spending	Approximated by functional classification of expenditure on housing, health, education, and social protection.	706+707+709+710
Total expenditure or outlays	Expense plus net investment in nonfinancial assets; or expenditure.	2+31, or 2M
Transfer payments excluding grants	Transfers to corporations, households, and nonprofit institutions serving households, which comprise subsidies, social benefits, transfers not elsewhere classified, and premiums, fees, and claims related to nonlife insurance and standardized guarantee schemes.	25+27+282+283
Financing Indicators		
Total financing	Transactions in financial assets minus transactions in liabilities.	32–33, or 82–83
Domestic financing	Transactions in financial assets minus transactions in liabilities, both with resident institutional units (domestic debtors/creditors).	321–331, or 821–831
Foreign financing	Transactions in financial assets minus transactions in liabilities, both with nonresident institutional units (external debtors/creditors).	322–332, or 822–832
Domestic bank financing	Transactions in financial assets and liabilities with the central bank and resident deposit-taking corporations other than the central bank.	8212+8213–8312–8313
Domestic nonbank financing	Transactions in financial assets and liabilities by resident institutional units other than the central bank and resident deposit-taking corporations other than the central bank; or Transactions in financial assets and liabilities with general government units, and resident other financial corporations, nonfinancial corporations, and households and nonprofit institutions serving households.	(821–8212–8213)–(831–8312–8313), or 8211+8214+8215+8216–8311–8314–8315–8316
Wealth and Debt Indicators		
Accounts payable	Stock position in other accounts payable, which comprise trade credit and advances, and miscellaneous other items due to be paid.	6318
Arrears	Stock position in amounts unpaid and past the due date for payment.	6M5
Contingent liabilities	Obligations that do not arise unless a particular, discrete event(s) occurs in the future.	6M6
Total pension and insurance liabilities	Stock position in insurance, pension, and standardized guarantee scheme liabilities plus net obligations for social security benefits.	6306+6M7
Gross debt	Stock position in financial claims that require payment(s) of interest and/or principal by the debtor to the creditor at a date, or dates, in the future. Includes all liabilities held in debt instruments (i.e., total liabilities excluding equity and investment fund shares and financial derivatives and employee stock options).	63–6305–6307, or 6301+6302+6303+6304+6306+6308

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Table 4A.1 Fiscal Indicators Available from the GFS Framework *(concluded)*

Fiscal Indicator	Equivalent Term in Statistical Methodologies	GFS Codes
Wealth and Debt Indicators (concluded)		
Net debt	Gross debt minus stock position in financial assets corresponding to debt instruments. Includes all financial assets/liabilities held in debt instruments (i.e., financial assets/liabilities excluding equity and investment fund shares and financial derivatives and employee stock options).	(63–6305–6307)–(62–6205–6207), or 6301+6302+6303+6304+6306+6308–6201–6202–6203–6204–6306–6308
Gross debt, net of highly liquid assets	Gross debt minus financial assets held in the most liquid financial instruments. In most countries, liquid assets would primarily comprise currency and deposits. (Where other financial assets are partly considered highly liquid financial assets, this indicator becomes a fiscal indicator requiring additional data.)	63–6305–6307–6201, or 6301+6302+6303+6304+6306+6308–6201
Net financial wealth	Net financial worth equals the stock position in financial assets minus stock position in liabilities.	62–63, or 6M1
Net worth	Stock position in assets minus stock position in liabilities at end of reference period.	61+62–63, or 6
Total change in net worth	Net worth at the end of the current reporting period minus net worth at the end of the previous reporting period. (A split between change in net worth due to transactions [i.e., net operating balance] and change in net worth due to other economic flows is also analytically useful.)	$6_{t1}–6_{t0}$, or $(61+62–63)_{t1}–(61+62–63)_{t0}$, or NOB+9

Table 4A.2 Fiscal Indicators Requiring Additional Data

Fiscal Indicator	Related Term in Statistical Methodologies
Resource revenue	Revenue receivable that is related to natural resources. These receivables may be related to various types of taxes, subsidies, dividends, contracts, leases, and licenses, rent, or other transfers.
Resource expense	Expense payable that is related to natural resources. These payables may be related to various types of expense such as subsidies, property expense, and transfers.
Nonresource operating balance	Total revenue excluding natural resource-related revenue minus total expense excluding natural resource-related expense.
Nonresource primary operating balance	Nonresource operating balance excluding interest expense for gross debt sustainability analysis or excluding net interest expense for net debt sustainability analysis.
Nonresource net lending/net borrowing	Nonresource operating balance minus net investment in nonresource related nonfinancial assets.
Nonresource primary net lending/net borrowing	Nonresource net lending/net borrowing excluding interest expense for gross debt sustainability analysis or excluding net interest expense for net debt sustainability analysis.
Overall fiscal balance	Net lending/net borrowing adjusted through the rearrangement of transactions in assets and liabilities that are deemed to be for public policy purposes (also called policy lending/borrowing). Policy lending is added to expense. Privatization proceeds from the sale of nonfinancial assets and repayments on policy lending (see Box 4.1) are included as transactions in financial items in calculating the overall fiscal balance.
Overall primary balance	Overall fiscal balance excluding interest expense or net interest expense. For gross debt sustainability analysis, use overall fiscal balance excluding interest expense. For net debt sustainability analysis, use overall fiscal balance excluding net interest expense.
Cyclically adjusted balance	Trend balance through an economic cycle, which is the fiscal balance, stripped of the impact of cyclical movements in revenue and expenditure (for government, usually only unemployment benefits payable are eliminated).
Cyclically adjusted primary balance	Trend balance through an economic cycle, which is primary fiscal balance, stripped of the impact of cyclical movements in revenue and expenditure (for government, usually only unemployment benefits payable are eliminated).
Structural balance	Underlying or permanent fiscal balance, which is the fiscal balance, stripped of the impact of cyclical movements in revenue, expenditure, and the effects of unusual or one-off events.
Structural primary balance	Underlying or permanent primary fiscal balance, which is the primary fiscal balance, after removing the impact of cyclical movements in revenue, expenditure, and the effects of unusual or one-off events.
Fiscal impulse	Change in the structural primary balance between two reporting periods. (Often also calculated using the [overall] structural balance, or the cyclically adjusted [primary] balance.)
Gross financing needs	Net lending/net borrowing during a particular reporting period plus debt maturing within that reporting period. (This concept is a forward-looking indicator and should not be confused with total financing.)
Concessional loans	Loans that provide to the borrower some concessional benefits. An estimate of the one-off benefit at the point of loan origination can be calculated as equal to the difference between the nominal value of the debt and its present value using a relevant market discount rate.
Development spending	Represents government's expenditure on national development and encompasses transactions in the acquisition of nonfinancial assets, usually related to infrastructure. Development spending is often financed from specific designated sources (e.g., foreign loans, foreign grants, privatization proceeds, one-off tax levies).
Quasi-fiscal operations	Quasi-fiscal operations are government operations carried out by institutional units other than government units (e.g., central banks and other public corporations). Quasi-fiscal operations encompass a broad array of activities that have the same fiscal policy impact on the economy as government operations.

5 Revenue

This chapter defines the concept of revenue and describes the manner in which revenue is classified.

Defining Revenue

5.1 ***Revenue*** (1) is an increase in net worth resulting from a transaction. Revenue transactions, as defined in GFS, have counterpart entries either in an increase in assets or in a decrease in liabilities—thereby increasing net worth. General government units have four types of revenue: (i) compulsory levies in the form of taxes and certain types of social contributions; (ii) property income derived from the ownership of assets; (iii) sales of goods and services; and (iv) other transfers receivable from other units. Of these, compulsory levies and transfers are the main sources of revenue for most general government units. Public corporations do not levy taxes, but derive their revenue from all the other sources—of these, property income and the sales of goods and services are the main sources of revenue.

5.2 ***Taxes*** (11)[1] are compulsory, unrequited amounts receivable by government units from institutional units. Taxes can be receivable in cash[2] or in kind.[3] By its nature, only a government unit can receive revenue in the form of taxes. When an institutional unit other than a government unit collects taxes, the tax should be attributed in accordance with tax attribution guidelines (see paragraphs 5.33–5.40). Tax revenue is considered to be unrequited because the government provides nothing directly to the individual unit in exchange for the payment. Governments may use the tax revenue to provide goods or services to other units, either individually or collectively, or to the community as a whole. Certain compulsory receivables, such as fines, penalties, and most social security contributions, are not considered taxes (see paragraph 5.23). These types of revenue have, under certain conditions, an element of exchange and are therefore not classified as taxes.

5.3 All other types of revenue are frequently combined into a heterogeneous broad category: revenue other than taxes (also sometimes referred to as nontax revenue). In this manual, however, the various other types of revenue are separately identified and classified as social contributions, grants, and other revenue.

5.4 ***Social contributions*** *[GFS]*[4] (12) are actual or imputed revenue receivable by social insurance schemes to make provision for social insurance benefits payable.[5] Social contributions may be from employers on behalf of their employees, from employees, or from self-employed or unemployed persons on their own behalf. These contributions secure entitlement to social benefits payable to the contributors, their dependents, or their survivors when certain social risks arise. The contributions may be compulsory or voluntary (see paragraph 5.94 and Appendix 2).

5.5 ***Grants*** (13) are transfers receivable by government units from other resident or nonresident government units or international organizations, and that do not meet the definition of a tax, subsidy, or social contribution. When statistics are compiled for the general government sector, grants from other domestic government units would be

[1] The numbers in parentheses after each classification category are the GFS classification codes. Appendix 8 provides all classification codes used in the GFS framework.

[2] The use of the term "cash" here does not refer to the cash basis of recording, but rather refers to the monetary nature of the settlement.

[3] Revenue receivable in kind will not be recorded when using the cash basis of recording—no cash flows are involved (see paragraph 3.67).

[4] [GFS] indicates that an item has the same name but different coverage in the *2008 SNA*.

[5] *Social contributions [GFS]*(12) revenue excludes amounts receivable as employment-related pension and other retirement contributions that create a liability for future benefits payable (see paragraphs 4.50 and 5.95).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

eliminated in consolidation so that only grants from foreign governments and international organizations would remain in the general government accounts. Grants may be classified as capital or current and can be receivable in cash or in kind (see paragraphs 5.103–5.105).

5.6 ***Other revenue*** (14) is all revenue receivable excluding taxes, social contributions, and grants. Other revenue comprises: (i) property income; (ii) sales of goods and services; (iii) fines, penalties, and forfeits; (iv) transfers not elsewhere classified; and (v) premiums, fees, and claims related to nonlife insurance and standardized guarantee schemes (see paragraphs 5.106–5.151).

5.7 Refunds (see paragraph 5.27) and corrections of erroneously collected revenue are transactions that decrease the net worth of the recipient government unit. More accurately, they are adjustments that allow the excessive increase in net worth previously recorded to be corrected. These refund transactions are recorded as a reduction in revenue, with a corresponding reduction in financial assets or an increase in liabilities.[6]

5.8 Some transactions are exchanges in assets and/or liabilities and should not be recorded as revenue. The disposal of a nonfinancial asset, other than inventories,[7] by sale or barter does not affect net worth and these transactions are not revenue. They are transactions in nonfinancial assets as described in paragraphs 8.3–8.4. However, when ownership of an asset is acquired without having to give up anything of commensurate value in return, the net worth of the unit increases. This increase in assets has a counterpart entry in an increase in revenue and should be recorded as a type of capital transfer receivable, such as a capital grant. Repayments on loans previously extended to other institutional units, and loan disbursements, are not revenue. These are transactions in financial assets or liabilities as described in paragraphs 9.3–9.4.

5.9 For the purposes of fiscal analysis, additional aggregations of revenue could be calculated, such as the fiscal burden, direct versus indirect taxes, and revenue related to natural resources. A discussion of these supplementary fiscal indicators and their uses in fiscal analysis is presented in the annex to Chapter 4.

Time of Recording and Measurement of Revenue

5.10 In the *Statement of Operations*, revenue should be recorded according to the accrual basis of recording. In the accrual basis of recording, transactions are recorded when the underlying activities, transactions, or other events occur that create the unconditional claims to receive the taxes or other types of revenue (see paragraphs 3.69–3.102). The application of the general rule to various types of revenue is indicated in each section of the classification as needed.

5.11 In the *Statement of Sources and Uses of Cash*, cash receipts from operating activities are recorded in accordance with the cash basis of recording. In the cash basis of recording, transactions are recorded when cash payments for the respective revenue categories are received (see paragraph 3.103–3.104).

5.12 According to the accrual principles of GFS, income taxes and social contributions based on income should be attributed to the period in which the income is earned, even though there may be a significant delay between the end of the reporting period and the time at which it is feasible to determine the actual liability of the taxpayer.

5.13 Conceptually, when using the accrual basis of recording, the time between the moment a revenue transaction accrues and the payment is received (or made in the case of refunds) is bridged by recording a transaction in financial assets or liabilities (see paragraph 7.224). In cases where a prepayment of revenue covering two or more reporting periods is made to government, government should record an increase in liabilities, usually recorded in *other accounts payable* (3308), for the revenue that falls due in future periods. In effect, this is a financial advance made to government by the payee. It constitutes a liability of the government and an asset of the payee. This liability is extinguished as the revenue falls due in future periods.

5.14 In practice, however, some flexibility is permitted as the accrual recording of revenue can be difficult to implement because government accounting

[6] Similarly, refunds of expense are recorded as a reduction in expense, rather than revenue (see paragraph 6.4).
[7] For a description of the treatment of inventories, see paragraphs 8.44–8.47.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

systems often record revenue only on a cash basis. This is especially the case for taxes. Further, even when accrued taxes are estimated from assessments of taxes due, there may be a risk of over- or understatement of tax revenue. The remainder of this section provides additional practical guidance on the appropriate time of recording for taxes.

5.15 As a practical deviation from the general principle, income taxes deducted at source, such as pay-as-you-earn taxes, and regular prepayments of income taxes may be recorded in the periods in which they are paid and any final tax liability on income may be recorded in the period in which the liability is determined.

5.16 It is also possible that governments receive cash amounts before having an unconditional claim on them.[8] Such circumstances include advances for provision of goods and services to be delivered in the future, and grants for the construction of fixed assets over several periods. When using the accrual basis of recording, these cash receipts cannot be recognized as revenue until such time as the government acquires the unconditional claim on the amount. However, when using the cash basis of recording, the full amount of revenue will be recognized in the period in which the cash amounts were received, irrespective of whether the service, delivery, or compliance with the conditions were met in the past or will be met in the future.

5.17 With the exception of taxes and social contributions, the amount of revenue to be recorded on the accrual basis is the entire amount to which the general government unit has an unconditional claim. In the case of taxes and social insurance contributions, only those amounts that are evidenced by assessments and declarations, customs declarations, and similar documents are considered to constitute revenue for government units.

5.18 As indicated in paragraph 3.78, the amount of taxes and social contributions recorded must take into account that the government unit receiving the revenue is usually not a party to the transaction or other event that creates the obligation to pay the taxes or social insurance contributions. Consequently, many of these transactions and events permanently escape the attention of the tax authorities. The amount of revenue from taxes and social insurance contributions should exclude the amounts that possibly could have been received from such unreported events had the government learned about them, but instead permanently escape the attention of the tax authorities.

5.19 Furthermore, in some countries, and for some taxes, the amounts of taxes eventually paid may diverge substantially and systematically from the amounts due to be paid. It would be inappropriate to accrue revenue for an amount that the government unit does not realistically expect to collect. The amount that is realistically expected to be collected may sometimes be influenced by tax amnesties. Governments use tax amnesties to capture some of the taxes accrued but unpaid, to speed up payment of taxes, and to capture revenue from transactions or events that have previously escaped the attention of the tax authorities. The time of recording and measurement of revenue arising from such tax amnesties depends on the exact nature of the amnesty granted and whether the revenue has been previously accrued. The case of adjusting for underestimation or overestimation of tax revenue is discussed later.

5.20 It is typical that some of the taxes and social insurance contributions that have been assessed and accrued will never be collected. Thus, the difference between estimates based on these assessments and expected collections represents a claim that has no real value and should not be recorded as revenue. If transactions are recorded for such taxes (and other revenue) that overestimate the amount of revenue receivable, a correction should be recorded in the GFS framework. This requires an adjustment that allows the excessive increase in net worth previously recorded to be corrected.[9] In keeping with the accrual basis of recording (see paragraph 3.79), such an adjustment should occur in the period in which the overestimation of receivables occurred. However, in cases where it is not possible to identify the time of the overestimation, the adjustment is recorded when the need for the adjustment is identified. As such, a correction to reduce revenue, with a corresponding correction

[8] These receipts are also referred to as "deferred revenue" or "advances" (see also paragraph 7.225).

[9] These corrections in transactions recorded for revenue receivables should be distinguished from the case where a specific debtor is deemed bankrupt and amounts receivable are deemed to be uncollectable (see paragraph 10.57).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

(reduction) in *other accounts receivable* (3208), should be recorded. The amount of taxes and social insurance contributions that is recorded as revenue should be the amount that is realistically expected to be receivable. The actual collection, however, may be in a later period, possibly much later.

The Classification of Revenue

5.21 Revenue comprises heterogeneous elements, classified according to different characteristics depending on the type of revenue. For taxes, the classification scheme is determined mainly by the base on which the tax is levied. Revenue other than taxes is classified by the nature of the economic flow, and in some cases by the source from which the revenue is derived. The summary classification of revenue in the GFS framework is shown in Table 5.1, and the remainder of this chapter describes each category in detail.

5.22 While the summary GFS revenue classification structure provides guidance on the minimum requirements for internationally comparable classifications of revenue, analytical needs may necessitate further detailed classifications to be added as subitems in national data presentations. Additional subitems, presented either as a comprehensive breakdown of the standard item or as "of which" lines, could be used to identify items required:

- To facilitate consolidation—for example, a breakdown of items according to the subsectors and institutional units of general government (see paragraph 3.152)
- As input into other macroeconomic datasets to enhance consistency with these data—for example, a breakdown of interest to identify recipients according to residence and sectors (see paragraph 7.264)
- To facilitate the calculation of supplementary aggregates or balances used as fiscal indicators in fiscal analysis—for example, identifying all revenue related to a particular resource could allow the calculation of government balances without such resource revenue (see paragraph 4.59), or identifying all environment-related revenue and payments to government could facilitate the compilation of environmental accounts (see paragraph A7.107).

Taxes (11)

5.23 Taxes are compulsory, unrequited amounts receivable by government units from institutional units. In GFS, taxes are classified mainly according to the base on which the tax is levied. Normally, designating a tax for a particular use does not affect its classification. An exception is the distinction between taxes on payroll and workforce and social security contributions. If a tax on payroll or workforce is designated for use in a social security scheme, then it is classified as a social security contribution (see paragraphs 5.45 and 5.96). Otherwise, it is classified under taxes on payroll and workforce. Taxes also exclude compulsory payments receivable by government, as contributions to employment-related pension schemes. Since these compulsory contributions are associated with the expectation of future benefits payable, they are not tax revenue receivable, but rather recorded as the incurrence of a pension entitlement liability (see paragraphs 9.63–9.67).

5.24 In principle, interest charged on overdue taxes or fines and penalties imposed for the attempted evasion of taxes should be recorded as *interest* (1411), or *fines, penalties, and forfeits* (143) and not as taxes. However, it may not be possible to separate receivables of interest, fines, or other penalties from the taxes to which they relate, so in practice they are usually grouped with the relevant tax receivable (see also paragraph 6.82).

GFS tax classifications in comparison with other statistical databases

5.25 The coverage, timing, and valuation of tax revenue in GFS and the *2008 SNA* are identical, but the classification systems differ. The *2008 SNA* classifies taxes according to their role in economic activities—namely: (i) taxes on production and imports (D2); (ii) current taxes on income, wealth, etc. (D5); and (iii) capital taxes (D91). The result is that some categories of taxes in GFS need to be allocated between two of the SNA tax categories according to whether they are payable by producers or final consumers, or whether they are current or capital taxes.[10] In GFS, taxes are classified into six major categories: (i) taxes on income, profits, and capital gains; (ii) taxes on

[10] For a detailed description of the linkages between the GFS and the *2008 SNA* categories of taxes, see Appendix 7.

Table 5.1 Summary Classification of Revenue

1	**Revenue**
11	**Taxes**
111	Taxes on income, profits, and capital gains
1111	Payable by individuals
1112	Payable by corporations and other enterprises
1113	Other taxes on income, profits, and capital gains[1]
112	Taxes on payroll and workforce
113	Taxes on property
1131	Recurrent taxes on immovable property
1132	Recurrent taxes on net wealth
1133	Estate, inheritance, and gift taxes
1135	Capital levies
1136	Other recurrent taxes on property
114	Taxes on goods and services
1141	General taxes on goods and services
11411	Value-added taxes
11412	Sales taxes
11413	Turnover and other general taxes on goods and services
11414	Taxes on financial and capital transactions
1142	Excise
1143	Profits of fiscal monopolies
1144	Taxes on specific services
1145	Taxes on use of goods and on permission to use goods or perform activities
11451	Motor vehicle taxes
11452	Other taxes on use of goods and on permission to use goods or perform activities[1]
1146	Other taxes on goods and services
115	Taxes on international trade and transactions
1151	Customs and other import duties
1152	Taxes on exports
1153	Profits of export or import monopolies
1154	Exchange profits
1155	Exchange taxes
1156	Other taxes on international trade and transactions
116	Other taxes
1161	Payable solely by business
1162	Payable by other than business or unidentifiable
12	**Social contributions [GFS]**
121	Social security contributions [GFS]
1211	Employee contributions [GFS]
1212	Employer contributions [GFS]
1213	Self-employed or unemployed contributions [GFS]
1214	Unallocable contributions [GFS]
122	Other social contributions [GFS]
1221	Employee contributions [GFS]
1222	Employer contributions [GFS]
1223	Imputed contributions [GFS]
13	**Grants**
131	From foreign governments
1311	Current
1312	Capital
132	From international organizations
1321	Current
1322	Capital
133	From other general government units[1]
1331	Current
1332	Capital
14	**Other revenue**
141	Property income [GFS]
1411	Interest [GFS][1]
1412	Dividends[1]
1413	Withdrawals of income from quasi-corporations
1414	Property income from investment income disbursements
1415	Rent
1416	Reinvested earnings on foreign direct investment
142	Sales of goods and services
1421	Sales by market establishments
1422	Administrative fees
1423	Incidental sales by nonmarket establishments
1424	Imputed sales of goods and services
143	Fines, penalties, and forfeits
144	Transfers not elsewhere classified
1441	Current transfers not elsewhere classified
14411	Subsidies[1]
14412	Other current transfers not elsewhere classified[1]
1442	Capital transfers not elsewhere classified
145	Premiums, fees, and claims related to nonlife insurance and standardized guarantee schemes[1]
1451	Premiums, fees, and current claims[1]
1452	Capital claims

[1]Indicates that a further breakdown may be analytically useful and is presented in detailed tables.

payroll and workforce; (iii) taxes on property; (iv) taxes on goods and services; (v) taxes on international trade and transactions; and (vi) other taxes. These categories are described in the various sections on the respective tax categories.

5.26 The classification of taxes in this manual is quite similar to the classification employed in *Revenue Statistics*, which is published annually by the Organisation for Economic Co-operation and Development. The two primary differences in the classification structure are that in *Revenue Statistics*, compulsory social security contributions are treated as taxes and the categories of taxes on goods and services, and taxes on international trade and transactions are combined into a single category. In addition, at a detailed classification level, *Revenue Statistics* differs in the following aspects: (i) payable tax credits are recorded as negative taxes to the extent that the payable tax credit offsets existing income tax receivable; (ii) imputed taxes or subsidies resulting from the central bank imposing a rate of interest other than the market rate are excluded from *Revenue Statistics*; and (iii) imputed taxes or subsidies resulting from the operation of multiple exchange rate systems are excluded from *Revenue Statistics*.

Treatment of tax refunds and tax relief

5.27 Tax refunds are adjustments for overestimation of taxes payable or the return of amounts to taxpayers due to overpayments. Tax refunds generally are recorded as a reduction in the appropriate tax category. When using the accrual basis of recording, refunds are attributed to the period in which the event occurred that generated the overassessments or overpayments. However, in cases where it is not possible to identify the time of the overestimation, the adjustment is recorded at the time when the need for the adjustment is identified. When using the cash basis of recording, such refunds should be recorded at the time the payment occurs. In the case of a value-added tax, taxpayers other than final consumers normally are allowed a refund of taxes paid on purchases. Even if this refund exceeds the taxes payable by an individual taxpayer, the net refund is recorded as a reduction in that category of tax.

5.28 Tax relief measures are incentives that reduce the amount of tax owed by an institutional unit. Tax relief can take the form of a tax allowance, an exemption, a deduction, or a tax credit. Tax allowances, exemptions, and deductions are subtracted from the tax base before the tax liability is computed—it reduces the taxable amount before assessing the tax. These tax relief measures are also known as tax expenditures. **Tax expenditures** are concessions or exemptions from a "normal" tax structure that reduce government revenue collection. No tax expenditures are recorded as flows in the GFS. However, because the government policy objectives could be achieved alternatively through a subsidy or other direct outlays, for fiscal transparency purposes, all tax expenditures should be reported in supplementary reports.

5.29 A **tax credit** is an amount subtracted directly from the tax liability due by the beneficiary household or corporation after the liability has been computed. Tax credits can be payable or nonpayable. Tax credits can be payable, in the sense that any amount of the credit that exceeds the tax liability is paid to the beneficiary. Under a payable tax credit system, the credits payable can be awarded to nontaxpayer beneficiaries, as well as taxpayers. In contrast, tax credits that are nonpayable (sometimes called "wastable") are limited at most to the size of the tax liability of the taxpayer.

5.30 Tax relief that is embedded in the tax system reduces the taxes receivable from the taxpayer and therefore reduces government tax revenue. This is the case for tax allowances, exemptions, and deductions because they enter directly into the calculation of the tax liability. Tax relief granted in this form of nonpayable tax credits should also be recorded as a reduction in the relevant tax category.

5.31 However, when tax relief is granted in the form of payable tax credits, it should be recorded on a gross basis: the total amount of tax receivable should be recorded as tax revenue of government and the total amounts due as payable tax credits should be recorded as expense. Payable tax credits are often not connected with the assessment of the taxable event, and should be shown as a current transfer classified according to the purpose of the credit and the nature of the recipient:

- The transfer is a *subsidy* (25) if receivable by an enterprise on the basis of the level of its production activities or the quantities or values of the goods or services it produces, sells, exports, or imports (see paragraph 6.84).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

- The transfer is an implicit *social assistance benefit* (272) if receivable by households intended to provide for the needs that arise from certain events or circumstances (see paragraph 6.101), or
- The transfer is classified as *transfers not elsewhere classified* (282) if receivable by individuals, private nonprofit institutions, nongovernmental foundations, corporations, or government units, and the nature of the transfer is not such that it could be included in the other categories of transfers (see paragraph 6.122).

5.32 Payable tax credits should be recorded for the full amount when the tax claim is recognized by government regardless of the time when it is paid in cash by government or used to decrease the amount of taxes to be paid to government. Gross recording of the payable tax credit allows GFS to reflect the economic substance of government intervention in the economy.[11] This treatment differs from the treatment of the imputation system of corporate income tax (see paragraph 5.44).

Tax attribution[12]

5.33 In some cases, one government unit collects taxes and then transfers some or all of them to another government unit or international organization. Depending on the arrangement, the taxes passed on to the second government unit may be reassigned as tax revenue of that unit or they can be recorded as tax revenue of the collecting unit and a grant from that unit to the second government unit.

5.34 A tax is attributed to the government unit that: (i) exercises the authority to impose the tax (either as a principal or through the delegated authority of the principal); and (ii) has final discretion to set and vary the rate of the tax.

5.35 Where an amount is collected by one government for and on behalf of another government, and the latter government has the authority to impose the tax, and to set and vary its rate, then the former is acting as an agent for the latter. The full amount of tax raised is assigned as tax revenue to the government on whose behalf the collection was made. Any amounts retained by the collecting government as a collection charge should be recorded as a payment for a service, classified as the relevant category of *sales of goods and services* (142). The same amount is recorded as an expense for *use of goods and services* (22) by the counterparty. Any other amounts retained by the collecting government, such as under a tax-sharing arrangement, should be recorded as *current grants* (1331) receivable while the counterparty will record *current grants* (2631) payable. If the collecting government was delegated the authority to set and vary the rate, then the amount collected should be recorded as tax revenue of the collecting government.

5.36 Where different governments jointly and equally set the rate of a tax, with no individual government having ultimate overriding authority, then the tax revenues are attributed to each government according to its respective share of the proceeds.[13] If an arrangement allows one government unit to exercise ultimate overriding authority, then all of the tax revenue is attributed to that unit.

5.37 There may also be circumstances where a tax is imposed under the constitutional or other authority of a government unit or an international organization,[14] but participating governments individually set the tax rate in their jurisdictions. The proceeds of the tax generated in each respective government's jurisdiction are attributed as tax revenues to the individual government units.

5.38 When taxes are collected by an institutional unit other than a government unit, the tax is always reassigned to the government unit that permitted the nongovernment unit to act as a collecting agent (see paragraph 5.2). For example, a public corporation may act as an agent to collect a specific tax on behalf of government. In this case, the taxes collected by the public corporations should be recorded as transactions in financial assets and liabilities for the collecting agent, and the full amount collected should be

[11] For example, when tax credits on *customs and other import duties* (1151) on raw materials are used to support producers of exports, the full amount of *customs and other import duties* (1151) should be reflected, as well as the *subsidy* (25) to the producers of the exports.

[12] Similar attribution principles could be applied to subsidies or social benefits.

[13] These respective shares of the proceeds should reflect the underlying taxable economic event. If, under the revenue sharing arrangement, these shares amount to more or less than the underlying taxable economic event, a transfer for the difference should be recognized.

[14] For a discussion on the tax attribution in the case of supranational authorities and regional cooperation, see Appendix 5.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

recorded as tax revenue receivable by the government unit. Amounts retained by the collecting unit as a collection charge should be recorded as a payment for a service receivable by the collecting unit and payable by the government unit.

5.39 The attribution of church or "zakat" taxes requires some further consideration. The treatment of these taxes depends on the sector classification of the religious institutional units (see paragraph 2.61). In countries where some of the activities of the religious organizations are funded from earmarked taxes raised by general government, such as church or zakat taxes, these are included in the tax component of government revenue, provided they meet the definition of taxes set out in paragraphs 5.2 and 5.23. The base on which such religious taxes are levied can vary from country to country (the most usual cases are income, property, or net wealth). These taxes should be classified in the tax category that best describes the tax base on which they are levied.

5.40 When the religious organizations are not part of general government,[15] historical and administrative reasons may still determine that contributions to religious organizations are collected through the tax authorities. In this case, the contributions should be recorded as financial transactions classified in *other accounts payable* (3308). Amounts retained by the tax authority as a collection charge should be recorded as *sales of goods and services* (142) receivable from the religious organizations. The collected amounts are not taxes and are therefore not included in tax revenue if any of the following conditions apply:

- Individuals may opt out of the "tax" payment by formally declaring to the tax authorities their wish to leave the religious organizations.
- Government is acting in a collection agency capacity on behalf of the religious organizations.
- Government does not exercise the authority to impose a compulsory contribution, or
- Government has limited or no discretion to set and vary the rate of the contributions.[16]

[15] The authority to raise taxes is an exclusive right of government units. As a result, when religious organizations are not part of general government, religious "taxes" are classified as transfers from households to religious organizations when compiling national accounts.

[16] If the individuals may not opt out of the liability for the payment of the tax, or where the government imposes and sets the rates of such contributions, it may be a sufficient indication that such contributions to the religious organizations are indeed a tax.

Tax categories

Taxes on income, profits, and capital gains (111)

5.41 ***Taxes on income, profits, and capital gains*** (111) consist of taxes assessed on the actual or presumed incomes of institutional units. They include taxes assessed on holdings of property, land, or real estate when these holdings are used as a basis for estimating the income of their owners. These taxes, often referred to as income taxes, include:

- *Taxes on individual or household income*—These consist of personal income taxes, including those deducted by employers (pay-as-you-earn taxes) and surtaxes. Such taxes are usually levied on the total declared or presumed income from all sources of the person concerned: compensation of employees (e.g., wages, salaries, tips, fees, commissions, fringe benefits), property income (e.g., interest, dividends, rent, royalty incomes), and pensions (taxable portions of social security, pension, annuity, life insurance, and other retirement benefit distributions), etc., after deducting certain allowances in accordance with tax laws. Taxes on the income of the owners of unincorporated enterprises[17] are included here. Also included are income taxes on the income of family estates and trusts where the beneficiaries are individuals.
- *Taxes on the income of corporations*—These consist of corporate income taxes, corporate profits taxes, corporate surtaxes, etc. Such taxes are usually assessed on the total incomes of corporations—with corporations understood as in macroeconomic statistics. This item includes taxes on the income of units such as partnerships, sole proprietorships, estates,[18] and some trusts that are recognized as corporations. This covers income from all sources and not simply profits generated by production. Also included are income taxes on trusts where the beneficiaries are corporations.
- *Taxes on capital gains*—These consist of taxes on the capital gains (including capital gains distributions of investment funds) of persons or

[17] For a definition and discussion of unincorporated enterprises, see paragraphs 2.32–2.33.

[18] These types of estates are recognized as quasi-corporations and generally classified as captive financial institutions.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

corporations that become payable during the current reporting period, irrespective of the periods over which the gains have accrued. They are usually payable on nominal, rather than real, capital gains and on realized, rather than unrealized, capital gains.

- *Taxes on winnings from lotteries or gambling*—These are taxes payable on the amounts receivable by winners. They do not include taxes on the turnover of producers that organize gambling or lotteries, which are recorded as taxes on goods and services.

5.42 Taxes on income, profits, and capital gains are attributed as being payable by either *individuals* (1111) or *corporations and other enterprises* (1112). These individuals, corporations, and other enterprises may be resident or nonresident institutional units. Taxes on income, profits, and capital gains are classified as *other taxes on income, profits, and capital gains* (1113) when these taxes are payable by general government units, or when information needed to determine whether taxes should be attributed to individuals, corporations, or general government units is not available. In the event that general government units are subject to this tax category, these taxes should be classified under this category, identifiable according to the subsector of the taxpayer to allow for consolidation (see paragraphs 6.122–6.123). Similarly, taxes payable by public corporations are subject to consolidation and should be identified as a subcategory of taxes payable by corporations (see Table 5.2). Income taxes on trusts, estates, capital gains, or winnings from lotteries and gambling may fall under income taxes *payable by individuals* (1111), *payable by corporations and other enterprises* (1112), or *other taxes on income, profits, and capital gains* (1113), depending on the institutional unit that benefited from the income (see paragraph 5.41). Income taxes payable by nonprofit institutions serving households or corporations are recorded as taxes on corporations. These taxes may be levied on actual or presumed income and profits, and usually only on realized capital gains. The amount of income subject to tax is usually less than gross income because various deductions are permitted. A profits tax is levied on revenue minus allowable deductions.

Table 5.2 Detailed Classification of Taxes on Income, Profits, and Capital Gains (111)

111	Taxes on income, profits, and capital gains
1111	Payable by individuals
1112	Payable by corporations and other enterprises[1,2]
1113	Other taxes on income, profits, and capital gains
11131	Payable by general government[1,2]
11132	Unallocable taxes on income, profits, and capital gains

[1]Further breakdown/"of which" lines could allow for the identification of subsectors and individual units (see Table 3.1).

[2]Further breakdown/"of which" lines could allow for the identification of those taxes related to specific natural resources or environmental taxes.

5.43 When using the accrual basis of recording, income taxes are normally imposed on the income earned during an entire year. In the absence of high-frequency source data, indicators of seasonal activity or other appropriate indicators may be used to allocate the annual totals when monthly or quarterly statistics are compiled. When using the cash basis of recording, income taxes are recorded when the tax payment is received.

5.44 Under imputation systems of corporate income tax, shareholders are wholly or partially relieved of their liability for an income tax on dividends paid by the corporation out of income or profits liable to corporate income tax. The relief is usually called a tax credit, although it actually is a means of allocating a tax among taxpayers. If the relief exceeds a shareholder's total tax liability, the excess may be payable to the shareholder. Because this "tax credit" is an integral part of the imputation system of corporate income tax, any net payment to shareholders is recorded as a negative tax rather than expense. This treatment differs from the general treatment of tax credits described in paragraph 5.29. The total tax paid by the corporation is attributed to *corporations and other enterprises* (1112). The associated tax credit is for the benefit of the shareholders.

Taxes on payroll and workforce (112)

5.45 ***Taxes on payroll or workforce*** (112) are taxes payable by enterprises assessed either as a proportion of the wages and salaries paid or as a fixed amount per person employed. They do not include:

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

- Payments earmarked for social security schemes, which are classified as *social security contributions* (121)
- Taxes paid by the employees themselves out of their wages or salaries, which are classified as *taxes on income, profits, and capital gains,* payable by *individuals* (1111).

Taxes on property (113)

5.46 ***Taxes on property*** (113) are taxes payable on the use, ownership, or transfer of wealth. The taxes may be levied at regular intervals, one time only, or on a change in ownership.

5.47 Taxes on the ownership or use of specific types of property often are based on the value of the property at a particular time but, when using the accrual basis of recording, are deemed to accrue continuously over the entire year, or the portion of the year that the property was owned, if less than the entire year.[19] Taxes on the transfer of wealth are recorded at the time of the transfer, and some taxes on the ownership or use of property are recorded at a specific time, such as a one-time tax on net wealth. When using the cash basis of recording, these property taxes are recorded when the cash is received.

5.48 Taxes on property are divided into five categories: (i) recurrent taxes on immovable property; (ii) recurrent taxes on net wealth; (iii) estate, inheritance, and gift taxes; (iv) capital levies; and (v) other recurrent taxes on property.

5.49 ***Recurrent taxes on immovable property*** (1131) cover taxes levied regularly on the use or ownership of immovable property, which includes land, buildings, and other structures. The taxes can be levied on proprietors, tenants, or both. The amount of the taxes is usually a percentage of an assessed property value that is based on a notional rental income, sales price, capitalized yield, or other characteristics, such as size or location. Unlike *recurrent taxes on net wealth* (1132), liabilities incurred on the property are usually not taken into account in assessment of these taxes.

5.50 ***Recurrent taxes on net wealth*** (1132) cover taxes levied regularly on net wealth. Net wealth is usually defined as the value of a wide range of movable and immovable property minus liabilities incurred on that property.

5.51 ***Estate, inheritance, and gift taxes*** (1133)[20] cover taxes on transfers of property at death and on gifts, including gifts made between living members of the same family to avoid, or minimize, the payment of inheritance taxes. Taxes on the transfer of property at death include estate taxes, which are usually based on the size of the total estate, and inheritance taxes, which may be determined by the amount received by beneficiaries and/or their relationship to the deceased.

5.52 ***Capital levies*** (1135)[21] cover taxes on the values of the assets or net worth owned by institutional units levied at irregular and very infrequent intervals of time. Capital levies are recorded as exceptional both by units concerned and by the government. They may be payable by households or enterprises. They include taxes on net wealth levied to meet emergency expenditures or to effect a redistribution of wealth; taxes on property, such as betterment levies, that are taxes on the increase in the value of agricultural land due to planning permission being given by government units to develop the land for commercial or residential purposes; taxes on the revaluation of capital; and any other exceptional taxes on particular items of property.

5.53 ***Other recurrent taxes on property*** (1136) include all recurrent taxes on property other than immovable property or net wealth. This category includes recurrent gross taxes on personal property, jewelry, cattle, other livestock, other particular items of property, and external signs of wealth. Taxes on the use of particular types of movable property, such as motor vehicles and guns, are classified in *taxes on use of goods and on permission to use goods or perform activities* (1145).

[19] In compiling high-frequency GFS, the application of the accrual basis of recording would require the distribution of the tax receivable throughout the whole period of the taxable ownership (see paragraph 3.84).

[20] *Estate, inheritance, and gift taxes* (1133) are one of the two categories of taxes that are considered to be capital taxes in the *2008 SNA*. The other category is *capital levies* (1135). Capital taxes are taxes levied at irregular and very infrequent intervals on the values of the assets or net worth owned by institutional units or on the values of assets transferred between institutional units as a result of legacies, gifts, or other transfers.

[21] To maintain consistency with codes used in the *GFSM 2001*, this code does not follow directly the code of the previous category of taxes. *Taxes on capital and financial transactions* (1134 in the *GFSM 2001*) were reclassified as 11414, one of the categories of *taxes on goods and services* (114), to improve consistency with the *2008 SNA*.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

5.54 While sharing certain characteristics with taxes on property, the following taxes are classified elsewhere:

- Taxes on immovable property that are levied on the basis of a presumed net income should be recorded as *taxes on income, profits, and capital gains* (111).
- Taxes on the use of property for residence, where the tax is payable by either proprietor or tenant and the amount payable is a function of the user's personal circumstances, such as net income or the number of dependents, are recorded as *taxes on income, profits, and capital gains* (111).
- Taxes on construction, enlargement, or alteration of all buildings, or those whose value or use density exceeds a certain threshold, are included in *taxes on use of goods and on permission to use goods or perform activities* (1145).
- Taxes on use of one's own property for special trading purposes, such as selling alcohol, tobacco, or meat, should be recorded under *taxes on use of goods and on permission to use goods or perform activities* (1145).
- Taxes on exploitation of natural resources, such as land and subsoil assets not owned by government units, including taxes on extraction and exploitation of minerals and other resources, should be recorded in *other taxes on goods and services* (1146). Payments to a government unit as the owner of land and subsoil assets for the exploitation of such natural resources (often referred to as royalties) should be recorded in *rent* (1415). Payments for licenses that allow the beneficiary to carry out the business of exploitation of land and subsoil assets are classified in *taxes on use of goods and on permission to use goods or perform activities* (1145).
- Taxes on capital gains resulting from the sale of property are included in *taxes on income, profits, and capital gains* (111).

Taxes on goods and services (114)

5.55 ***Taxes on goods and services*** (114) are taxes that become payable as a result of the production, sale, transfer, leasing, or delivery of goods and rendering of services, or as a result of their use for own consumption, or own capital formation. *Taxes on goods and services* are divided into six categories, as described in paragraphs 5.57–5.82:

- *General taxes on goods and services* (1141), whether levied at manufacturer/producer, wholesale, or retail level—including single-stage taxes and cumulative multistage taxes, where "stage" refers to stage of production or distribution
- *Excises* (1142)
- *Profits of fiscal monopolies* (1143)
- *Taxes on specific services* (1144)
- *Taxes on the use of goods and on permission to use goods or perform activities* (1145), comprising various types of licenses to use motor vehicles and other goods, or to perform specific activities
- *Other taxes on goods and services* (1146) that include taxes levied on the extraction, processing, or production of minerals and other products.

5.56 This category does not include *taxes levied on international trade and transactions* (115) but does include taxes levied upon importation, or at the border, if the tax liability does not result solely from the fact that the goods have crossed the border and is applicable to domestic goods or transactions as well.

General taxes on goods and services (1141)

5.57 ***General taxes on goods and services*** (1141) are levied on the production, leasing, delivery, sale, purchase, or other change of ownership of a wide range of goods and the rendering of a wide range of services (see Table 5.3). General taxes on goods and services may be levied regardless of whether the goods or services are produced domestically or imported, and they may be imposed at any stage of production or distribution. Adjustments made in connection with these taxes when goods cross a border are included

Table 5.3 Detailed Classification of General Taxes on Goods and Services (1141)

1141	General taxes on goods and services
11411	Value-added taxes[1,2]
11412	Sales taxes[1,2]
11413	Turnover and other general taxes on goods and services[1,2]
11414	Taxes on financial and capital transactions[1,2]

[1]Further breakdown/"of which" lines could allow for the identification of subsectors and individual units (see Table 3.1).

[2]Further breakdown/"of which" lines could allow for the identification of these taxes related to specific natural resources or environmental taxes.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

in this tax category. Conversely, refunds of these taxes when goods are exported are recorded as a reduction of the taxes within this category. This item excludes *customs and other import duties* (1151) and *taxes on exports* (1152). When taxes are levied on a limited range of goods rather than a wide range, they are included in *excises* (1142). Borderline cases are resolved on the basis of the predominant character of the tax.

Value-added taxes (11411)

5.58 ***Value-added taxes*** (VAT) (11411) are taxes on goods or services collected in stages by enterprises but that are ultimately charged in full to the final purchasers. This tax is described as a deductible tax because producers are not usually required to pay the government the full amount of the tax they invoice to their customers, as they are permitted to deduct the amount of tax they have been invoiced on their own purchases of goods or services intended for intermediate consumption or fixed capital formation (i.e., only the net amount of VAT is recorded after deducting refunds—see paragraph 5.27). VAT is usually calculated on the price of the good or service, including any other tax on the product. VAT may also be payable on imports of goods or services in addition to any import duties or other taxes on the imports.

Sales taxes (11412)

5.59 ***Sales taxes*** (11412) are all general taxes levied on sales at one stage only, whether at manufacturing or production stages or on wholesale or retail trade.

Turnover and other general taxes on goods and services (11413)

5.60 ***Turnover and other general taxes on goods and services*** (11413) are multistage cumulative taxes and taxes where elements of consumption taxes are combined with multistage taxes. These taxes are levied each time a transaction takes place without deduction for taxes paid on inputs. Multistage taxes can be combined with elements of value-added or sales taxes.

Taxes on financial and capital transactions (11414)[22]

5.61 ***Taxes on financial and capital transactions*** (11414) are taxes levied on the change in ownership of property, except those classified as gifts, inheritance, or estate transactions. These taxes are recorded as taxes on the services of the unit selling the asset. Included are taxes on the purchase and sale of nonfinancial or financial assets (including foreign exchange or securities), taxes on checks and other forms of payment, and taxes levied on specific legal transactions, such as the validation of contracts and the sale of immovable property. This category does not include *taxes on the use of goods* (part of 1145); *taxes on capital gains* (part of 111); *recurrent taxes on net wealth* (1132); *capital levies* (1135); fees paid to cover court charges or for birth, marriage, or death certificates that are included in *administrative fees* (1422); *sales taxes* (11412); or general stamp taxes (part of 116).

Excises (1142)

5.62 ***Excises*** (1142) are taxes levied as a product-specific unit tax on a predefined limited range of goods. Excises are usually levied at differentiated rates on nonessential or luxury goods, alcoholic beverages, tobacco, and energy. Excises may be imposed at any stage of production or distribution and are usually assessed as a specific charge per unit based on characteristics by reference to the value, weight, strength, or quantity of the product. Included are special taxes on individual products such as sugar, sugar beets, matches, and chocolates; taxes levied at varying rates on a certain range of goods; and taxes levied on tobacco goods, alcoholic drinks, motor fuels, and hydrocarbon oils. If a tax collected principally on imported goods also applies, or would apply, under the same law to comparable domestically produced goods, then the revenue from this tax is classified as arising from excises rather than from import duties. This principle applies even if there is no comparable domestic production or no possibility of such production. Taxes on the use of utilities such as water, electricity, gas, and energy are regarded as excises rather than *taxes on specific services* (1144). Excises exclude those taxes that are levied as *general taxes on goods and services* (1141); *profits of fiscal monopolies* (1143); *customs and other import duties* (1151); or *taxes on exports* (1152).

Profits of fiscal monopolies (1143)

5.63 ***Profits of fiscal monopolies*** (1143) cover that part of the profits of fiscal monopolies that is

[22] This item was classified as 1134 in the *GFSM 2001* (see footnote 21).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

transferred to the government. Fiscal monopolies are public corporations, public quasi-corporations, or government-owned unincorporated enterprises that have been granted a legal monopoly over the production or distribution of a particular kind of good or service in order to raise revenue and not in order to further the interests of public economic or social policy. Such monopolies are typically engaged in the production of goods or services that may be heavily taxed in other countries—for example, alcoholic beverages, tobacco, matches, petroleum products, salt, playing cards, lotteries, gambling, etc. The exercise of monopoly powers is simply an alternative way for the government to raise revenue instead of the more overt procedure of taxing the private production of such products. In such cases the sales prices of the monopolies are deemed to include implicit taxes on the products sold.

5.64 In principle, only the excess of the monopoly profits over some notional "normal" profits should be recorded as taxes, while the "normal" profits are regarded as *dividends* (1412) or *withdrawals of income from quasi-corporations* (1413). However, it is recognized that it may be difficult to estimate this amount, and, in practice, the value of the taxes should be taken as equal to the amount of the profits actually payable from fiscal monopolies to government. Any reserves retained by fiscal monopolies are excluded. This tax is recorded when the payment takes place rather than when the profits were earned.

5.65 When a public enterprise is granted monopoly powers as a matter of deliberate economic or social policy because of the special nature of the good or service or the technology of production (e.g., public utilities, post offices and telecommunications, railways), it should not be treated as a fiscal monopoly. Property income payable to government from such public enterprises is recorded as *dividends* (1412) or *withdrawals of income from quasi-corporations* (1413). Export and import monopoly profits receivable from marketing boards or other enterprises dealing with international trade are similar to fiscal monopoly profits, but are classified as *profits of export or import monopolies* (1153).

5.66 The treatment of lotteries and other gambling activities deserves special mention. The concept of fiscal monopoly applies to state lotteries and other gambling to the extent that they are devices to raise revenue rather than further the interests of public economic or social policy, even though they may compete with other privately organized lotteries and other gambling. As is the case with other fiscal monopolies (see paragraph 5.64), in principle, the "normal" profits should be regarded as *dividends* (1412) or *withdrawals of income from quasi-corporations* (1413), while the excess should be recorded as a tax classified as *profits on fiscal monopolies* (1143). However, in practice it may be difficult to estimate the "normal" profits, and the taxes should be taken as equal to the amount of profits actually payable to government.

5.67 Governments that have monopoly powers over lotteries and other gambling activities often delegate the organization of these activities to nonprofit institutions serving households, with a view to a final distribution of the profits earned, through social transfers. This delegation of functions normally requires the nonprofit institution to organize those activities through a specialized department. When such departments have the attributes of an institutional unit (as described in paragraph 2.22), they may be classified as public corporations (see paragraph 2.104) that constitute a fiscal monopoly.

5.68 Depending on the administrative arrangements, the distribution of the profits earned may be done in two ways: (i) the fiscal monopoly transfers its profits to a government unit (classified as a tax in *profits of fiscal monopolies* (1143)), and the government unit then transfers the profits to the population; or (ii) the fiscal monopoly transfers the profits directly to the population (normally through criteria determined by law). In the latter case, a rerouting treatment is required because the government does not appear as a party to the transaction in the actual accounting records. Rerouting means the transaction is recorded as if the monopoly transferred its profits to government as described in (i) (see paragraph 3.28).

Taxes on specific services (1144)

5.69 ***Taxes on specific services*** (1144) are levied on payments for specific services. These taxes are levied on services such as transportation (including airport and other passenger taxes),[23] insurance, banking, entertainment, restaurants, and advertising. Also

[23] If these taxes are based exclusively on international travel, they are classified as *other taxes on international trade and transactions* (1156) (see paragraph 5.92).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

included in this item are taxes levied on gambling and betting stakes for horse races, football pools, lotteries, and so forth. Taxes on entry to casinos, races, etc. are also classified as taxes on specific services.

5.70 This category also includes the implicit taxes resulting from the central bank imposing a rate of interest other than the market rates. The central bank's main responsibility is to formulate and carry out monetary policy as part of economic policy. It therefore often acts differently than other financial corporations and generally has received the authority from government to impose its policies. In cases where the central bank uses its special powers to set interest rates that are out of line with market rates, the difference gives rise to an implicit tax and subsidy (see paragraph 6.89 and Box 6.2 for an illustration of recording these implicit taxes and subsidies). This procedure is analogous to and consistent with the practice of treating the difference between the market exchange rate and an alternative exchange rate imposed by the central bank as an implicit tax or subsidy (see paragraph 5.89).

5.71 This category does not include:

- Taxes that are included in *general taxes on goods and services* (1141)
- Taxes on individual gains from football pools or other gambling proceeds, classified in *taxes on income, profits, and capital gains* (111)
- Profits transferred to government from state lotteries and other gambling enterprises regarded as *profits of fiscal monopolies* (1143), *dividends* (1412), or *withdrawals of income from quasi-corporations* (1413)
- Taxes on checks and on the issue, transfer, or redemption of securities, classified as *taxes on financial and capital transactions* (11414)
- Stamp tax revenues that cannot be assigned to taxes on services or other transactions, classified as *other taxes* (116)
- Taxes on the use of utilities, such as water, electricity, gas, and energy, which are included under *excises* (1142).

Taxes on use of goods and on permission to use goods or perform activities (1145)

5.72 ***Taxes on use of goods and on permission to use goods or perform activities*** (1145) are fees levied for the issuance of a license or permit that are not commensurate with the cost of the control function of government. There are cases where the government provides something to the individual unit directly in return for a payment in the form of the granting of a permit or authorization. In such instances, the payment is part of a mandatory process that ensures proper recognition of ownership or ensures that activities are performed under the authorization of the law. The boundary between when such payments are to be recorded as a tax and when they are to be recorded as the sale of a service or as the sale of an asset by the government requires additional guidance.

Boundary with administrative fees

5.73 One of the regulatory functions of governments is to prohibit the ownership or use of certain goods or the pursuit of certain activities, unless specific permission is granted by issuing a license or other certificate for which a fee is demanded. To decide whether such a fee constitutes this tax category or *administrative fees* (1422), the following recommendations apply:

- The payment is recorded as a tax when a license or a permit is automatically granted by the government as a mandatory condition to perform an activity or acquire an asset. The government unit performs little or no work other than a minimum control of the legal capacity of the acquirer to receive the permit (e.g., to confirm the applicant has not been convicted of a crime). The payment of the fee in such a case is not commensurate with the control function that the government exercises.
- The payment is recorded as the sale of a service when, for instance, issuing the license or permit involves a proper regulatory function of the government by exercising control on the activity, checking the competence or qualifications of the persons concerned, etc. In such a case, the payment is taken to be proportional to the costs of producing the service for all or any of the entities benefiting from the services and is borne by those benefiting. The payment is recorded as a tax only if it is out of proportion to the costs of producing the services.

5.74 More specifically, the following types of fees are considered taxes:

- Fees where the payer of the levy is not the receiver of the benefit, such as a fee collected from

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

slaughterhouses to finance a service provided to farmers

- Fees where government is not providing a specific service commensurate with the levy even though a license may be issued to the payer, such as a hunting, fishing, or shooting license that is not accompanied by the right to use specific government-owned natural resources
- Fees where benefits are received only by those paying the fee but the benefits received by each individual are not necessarily in proportion to the payments, such as a milk marketing levy paid by dairy farmers and used to promote the consumption of milk
- Fees paid to government for deposit insurance and other guarantee schemes if they are compulsory—that is, if beneficiaries cannot opt out of the scheme, if the payment is clearly out of proportion to the service provided, if the payment is not set aside in a fund, or if it can be used for other purposes.[24]

5.75 Although taxes in this category are levied on the use of goods rather than on the ownership or transactions in goods, registration of the ownership of goods may generate the tax claim. For example, registration of the ownership of animals or motor vehicles may be the event that causes a tax on the use of these items to be assessed. Taxes on the use of goods may apply even to functionally unusable goods, such as antique motor vehicles or guns.

Boundary with taxes on business activities levied on different bases

5.76 Boundary cases arise with taxes on business activities, which are levied on a combined income, payroll, or turnover base. If it is possible to estimate receipts related to each base, then the total should be allocated among the bases. If separate amounts cannot be estimated, but it is known that most of the receipts are derived from one base, then the whole of the receipts are classified according to that base.

Boundaries with other tax categories

5.77 Boundary cases arise with taxes on the ownership or use of property that could be classified as *recurrent taxes on immovable property* (1131), *recurrent taxes on net wealth* (1132), or *other recurrent taxes on property* (1136). Unlike the taxes under this item (category 1145), category 1131 is confined to taxes on the ownership or tenancy of immovable property and such taxes are usually a percentage of the assessed property value. The taxes included in categories 1132 and 1136 are confined to ownership rather than use of assets, apply to groups of assets rather than particular goods, and are based on the value of assets.

Boundary with the acquisition or use of an asset

5.78 Boundary cases arise with the payments for licenses to make use of a natural resource. If the natural resource qualifies as an asset and the government controls it on behalf of the community, payments for the license could be recorded as the disposal of the asset when government surrenders economic control of the asset and the life span of the license and the life span of the asset are the same. If the license agreement is recorded as the sale of an asset in its own right, it should be recorded as the disposal of an asset in the category of *contracts, leases, and licenses* (31441). A license for the use of the natural resource itself for a finite period does not reflect a disposal of an asset and should be classified as *rent* (see paragraph 5.124). Licenses to permit the use of natural resources not under the control of government will be treated as a tax (classified under this item) in all other cases except if the license is legally and practically transferable to a third party, in which case it should be classified as an asset in the category of *contracts, leases, and licenses* (see paragraphs A4.54–A4.55).

5.79 *Taxes on use of goods and on permission to use goods or perform activities* (1145) are subdivided into *motor vehicle taxes* (11451) and *other taxes on the use of goods and on the permission to use goods or perform activities* (11452), while several subcategories of taxes are identifiable in the latter (see Table 5.4).

[24] If the fees are proportional to the cost of the service provided, they constitute a payment for an insurance-type transaction, in which case it will be classified as a premium in the category *premiums, fees, and claims related to nonlife insurance and standardized guarantee schemes* (145). The criterion of proportionality between payments and provision of an insurance-type of service (including payments for the risk element) should be examined on a case-by-case basis. The existence of an institutional unit with a full set of accounts operating a fund that functions on insurance rules may indicate that the payment is for an insurance-type of service.

Table 5.4	Detailed Classification of Taxes on Use of Goods and on Permission to Use Goods or Perform Activities (1145)
1145	Taxes on use of goods and on permission to use goods or perform activities
11451	Motor vehicle taxes[1]
11452	Other taxes on use of goods and on permission to use goods or perform activities[1]
114521	Business and professional licenses[1]
114522	Pollution taxes[1]
114523	Radio and television licenses[1]
114524	Licenses and permits for households[1]
114525	Other taxes on the use of goods and on permission to use goods or perform activities not elsewhere classified[1]

[1]Further breakdown/"of which" lines could allow for the identification of specific goods or activities, and how these taxes relate to specific natural resources or environmental taxes.

5.80 ***Motor vehicle taxes*** (11451) include taxes on the use of motor vehicles or permission to use motor vehicles. It does not include taxes on motor vehicles as property or net wealth or tolls for use of roads, bridges, and tunnels.

5.81 ***Other taxes on use of goods and on permission to use goods or perform activities*** (11452) include business and professional licenses that consist of taxes paid by enterprises in order to obtain a license to carry on a particular kind of business or profession and taxes payable by individuals to perform certain activities. Included in this tax category are the following:

- General business taxes or licenses levied in a fixed amount, on a schedule according to the kind of business, or on the basis of various indicators such as floor space, installed horsepower, capital, or shipping tonnage would be included. It would not cover business taxes levied on gross sales, which would be classified under *general taxes on goods and services* (1141).
- Taxes or licenses for particular kinds of businesses including permission to sell goods or provide services may be levied at regular intervals, on a one-time basis, or each time goods are used. Business licenses payable by enterprises are included, such as for taxi, casino, mining, exploitation of land and subsoil assets, or broadcasting. This category also includes all cases where government issues licenses to limit the number of units operating in a particular field where the limit is fixed arbitrarily and is not dependent on qualifying criteria. When government restricts the number of cars entitled to operate as taxis or limits the number of casinos permitted by issuing licenses, they are in effect creating monopoly profits for the approved operators and recovering some of the profits as the fee. These license fees should also be recorded as taxes in this category. In principle, if the license is valid for several years, the payment should be recorded on an accrual basis with an entry in *other accounts payable* (3308) for the amount of the prepayment of license fees covering future years. However, if government does not recognize a liability to repay the licensee in the case of a cancellation, the whole of the fee payable is recorded as a single tax payment at the time it is paid.
- Taxes on pollution levied on the emission or discharge into the environment of noxious gases, liquids, or other harmful substances are included. On an accrual basis, the revenue receivable for emission permits, issued by governments under cap and trade schemes, should be recorded in this category at the time the emissions occur. No revenue should be recorded for permits that government issues free of charge. The timing difference between the cash received by government for the permits and the time the emission occurs constitutes a prepaid tax and gives rise to a financial liability (*other accounts payable*) for government. The difference between the prepaid tax value of the permit and the market value of the permit represents a marketable contract (nonproduced nonfinancial asset) for the holder (see paragraphs A4.48–A4.49). Amounts payable to government for the collection and disposal of waste or noxious substances are excluded from this tax category as they constitute a sale of services, recorded as *sales of goods and services* (142).
- Taxes in this category other than business and professional licenses include taxes payable by persons or households for licenses for recreational hunting, shooting, or fishing, and taxes on the ownership of pets when the amount payable is not commensurate with the administrative cost. They also include radio and television licenses payable by viewers, unless the public authorities provide general broadcasting services, in which case a service payment, rather than a tax, is recorded.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Other taxes on goods and services (1146)

5.82 ***Other taxes on goods and services*** (1146) include taxes on the extraction of minerals, fossil fuels, and other exhaustible resources from deposits owned privately or by another government and any other taxes on goods or services not included in categories 1141 through 1145. Taxes on the extraction of exhaustible resources usually are a fixed amount per unit of quantity or weight, but can be a percentage of value. The taxes are recorded when the resources are extracted. Payments for timber felling and the extraction of exhaustible natural resources from deposits owned by the government unit receiving the payment are classified as *rent* (1415) (see paragraph 5.129).

Taxes on international trade and transactions (115)

5.83 ***Taxes on international trade and transactions*** (115) are taxes that become payable when goods cross the national or customs frontiers of the economic territory, or when transactions in services exchange between residents and nonresidents. These taxes are classified into various subcategories according to the nature of the exchange and whether the exchange is related to imports or exports (see Table 5.5).

5.84 ***Customs and other import duties*** (1151) cover revenue from all levies and duties payable on goods of a particular kind because they are entering the country or services because they are delivered by nonresidents to residents. The levies may be imposed with the intention to raise revenue or discourage imports in order to protect resident producers of the same goods or services. The duties may be determined on a specific or ad valorem basis, but they must be restricted by law to imported products. Included are duties levied under the customs tariff schedule and its annexes, including surtaxes that are based on the tariff schedule, consular fees, tonnage charges, statistical taxes, fiscal duties, and surtaxes not based on the customs tariff schedule. This category covers taxes that fall on imports only. Imports that fall into a wider category of goods that are subject to the tax should be recorded under *general taxes on goods and services* (1141) or *excises* (1142). If excises are levied on imported goods under the same law to comparable domestically produced goods, then the revenue from the tax should be classified as arising from excises rather than from import duties (see paragraph 5.62).

Table 5.5 Detailed Classification of Taxes on International Trade and Transactions (115)

115	Taxes on international trade and transactions[1]
1151	Customs and other import duties
1152	Taxes on exports
1153	Profits of export or import monopolies
1154	Exchange profits
1155	Exchange taxes
1156	Other taxes on international trade and transactions

[1]Further breakdown/"of which" lines could allow for the identification of specific goods or activities, and how these taxes relate to specific natural resources or environmental taxes.

5.85 *Taxes on exports* (1152) include all levies that become payable on goods that are transported out of the country, or services that are provided to nonresidents by residents. Rebates on exported goods that are repayments of previously paid general consumption taxes, excises, or import duties are deducted from the gross amounts receivable from the respective taxes, not from amounts receivable in this category.

5.86 *Profits of export or import monopolies* (1153) include the profits from government-established enterprises with the domestic monopoly right to export or import particular goods and/or control services provided to or received from nonresidents. The exercise of the monopoly powers is an alternative way of raising revenue through taxes on exports, imports, or dealings in foreign exchange. When such export or import monopolies exist, the profits remitted to government by the monopolistic enterprises or marketing boards are considered to be taxes, classified as *profits of export or import monopolies* (1153). While in principle only the excess of the monopoly profits over some notional "normal" profits should be treated as taxes, it is difficult to estimate this amount, and in practice the value of the taxes should be taken as equal to the amount of the profits actually payable from the export or import monopolies to government. This tax is recorded when the payment to the government takes place rather than when the profits were earned and does not include the retained reserves of the enterprises or marketing boards.[25]

[25] If an enterprise of this type generates profits from its exports or imports of products, and a government unit provides a subsidy on other products, then the taxes and subsidies should be separately recorded to the extent possible rather than recording only the net value of taxes minus subsidies.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

5.87 Property income receivable from export or import enterprises or marketing boards that do not represent monopoly profits should be recorded as *dividends* (1412) or *withdrawals of income from quasi-corporations* (1413). Fiscal monopoly profits receivable from public enterprises or marketing boards dealing in commodities domestically, outside of international trade, should be recorded under *profits of fiscal monopolies* (1143).

5.88 *Exchange profits* (1154) include the profits generated when the monopoly powers of government or monetary authorities are exercised to extract a margin between the purchase and sale prices of foreign exchange, other than to cover administrative costs. The revenue derived constitutes a compulsory levy extracted from both purchaser and seller of foreign exchange. Similarly, an implicit tax results from the operation of a multiple exchange rate regime by the central bank or other official agency. It is the common equivalent of an import duty and export duty levied in a single exchange rate system or of a tax on the sale or purchase of foreign exchange. As in the case of the profits of export or import monopolies, the revenue represents the exercise of monopoly powers for tax purposes and is included in tax revenue when received by government.

5.89 Under a multiple exchange rate regime, two or more exchange rates are applicable to different categories of transactions; the rates favor some categories and discourage others. The net proceeds as a result of these transactions are calculated as implicit taxes or subsidies (see paragraph 6.89). The amount of the implicit tax or subsidy for each transaction can be calculated as the difference between the value of the transaction in domestic currency at the actual exchange rate applicable and the value of the transaction at a unitary rate that is calculated as a weighted average of all official rates used for external transactions.

5.90 Exchange profits are often included in a lump-sum payment from the monetary authorities to government. Such a lump-sum payment should be disaggregated according to the economic nature of the components, and each component classified according to its nature. These lump-sum payments may include components of dividends, exchange profits, interest, and/or equity withdrawals. This category for exchange profits should not include any payments to government of exchange profits realized other than as a result of maintenance of an exchange rate differential. Also excluded from this category are any payments to government of unrealized revaluation profits, which are in the nature of a book entry resulting from revaluation of foreign exchange or gold holdings for the owner. As discussed in paragraph 5.115, such payments to government based on holding gains are classified as a withdrawal of equity rather than a tax. Any operational profits transferred to government should be classified as *dividends* (1412) (see paragraph 5.111).

5.91 *Exchange taxes* (1155) cover taxes that are levied upon the sale or purchase of foreign exchange, whether at a unified exchange rate or at different exchange rates. Included are taxes on remittances abroad if the taxes are levied on the purchase of foreign exchange that is to be remitted. Remittance taxes that are not levied on the purchase of foreign exchange should be recorded under *other taxes on international trade and transactions* (1156).

5.92 *Other taxes on international trade and transactions* (1156) include other taxes levied on various aspects of international trade and transactions, except those payable by producers. This item includes taxes levied exclusively on international travel, taxes on insurance or investment abroad, and taxes on foreign remittances, excluding taxes levied on the purchase of foreign exchange to be remitted abroad, which are included in *exchange taxes* (1155).

Other taxes (116)

5.93 ***Other taxes*** (116) cover revenue from taxes levied predominantly on a base or bases not elsewhere classified, and unidentified taxes. The item is subdivided into *other taxes payable solely by business* (1161) and *other taxes payable by other than business or unidentifiable* (1162). The item includes taxes on persons that are not based on income or presumed income, sometimes referred to as poll taxes, head taxes, or capitation taxes. Personal taxes based on actual or presumed income should be recorded as *taxes on income, profits, and capital gains* (111). Also included are stamp taxes that do not fall exclusively or predominantly on a single class of transactions or activities covered by *taxes on financial and capital transactions* (11414). Examples would be revenues from the sale of stamps required to be affixed to contracts. Revenues from the sale of

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

stamps assignable to a single category, such as liquor and cigarettes, would be shown as taxes on those products, either *excises* (1142) or *taxes on specific services* (1144). Similarly, stamp duties on financial transactions would be shown as *taxes on financial and capital transactions* (11414). Also included in *other taxes* (116) would be an expenditure tax that is levied on purchases but is personalized by the application of personal deductions and exemptions. Revenue from taxes levied on a combination of several tax bases, or on multiple tax bases, where the revenue cannot be readily allocated to each tax base or to one predominant tax base is also reported in this category of taxes.

Social Contributions [GFS] (12)

5.94 ***Social contributions*** *[GFS]* (12) are actual or imputed revenue receivable by social insurance schemes to make provision for social insurance benefits payable. *Social contributions [GFS]* (12) exclude contributions receivable under employment-related pension and other retirement schemes that create a liability for future benefits payable. Social contributions are further classified according to the nature of the payee and the nature of the scheme that received these contributions (see Table 5.6). These receipts are from employers on behalf of their employees, from employees, or from self-employed or unemployed persons on their own behalf to secure entitlement to social benefits, payable in cash and in kind, to the contributors, their dependents, or their survivors.[26] The contributions are usually compulsory, but may also be voluntary. Voluntary contributions are usually made in arrangements where a means test determines whether contributors are exempted from compulsory contributions, but are eligible to participate by choice. If any contributions are voluntary, a memorandum item of their total amount would be useful for computing the fiscal burden and other analytical uses. Social contributions are classified as *social security contributions* (121) or *other social contributions* (122) depending on the type of scheme receiving them.

5.95 The coverage of social contributions in GFS is more restricted than in the *2008 SNA*. In GFS, only amounts that constitute revenue are included in *social contributions [GFS]* (12)—that is, those transactions that create a recognized liability are not part of revenue. In GFS, social contributions exclude contributions to autonomous and nonautonomous pension funds and to unfunded employment-related schemes that provide pension and other retirement benefits. These transactions should be recorded in GFS as incurrence of liabilities for future pension and other retirement benefits payable. The *2008 SNA* records them both as social contributions and incurrence of liabilities, with the double recording being neutralized by recording an adjustment in the use of income account for the change in pension entitlements.[27]

Table 5.6 Detailed Classification of Social Contributions [GFS] (12)

12	Social contributions [GFS][1]
121	Social security contributions [GFS]
1211	Employee contributions [GFS]
1212	Employer contributions [GFS]
1213	Self-employed or unemployed contributions [GFS]
1214	Unallocable contributions [GFS]
122	Other social contributions [GFS]
1221	Employee contributions [GFS]
1222	Employer contributions [GFS]
1223	Imputed contributions [GFS]

[1]Further breakdown/"of which" lines could allow for the identification of the contributions in cash and in kind, and make a distinction between compulsory and voluntary contributions.

The boundary between social contributions and other categories of taxes

5.96 Compulsory transfers can be classified as either a tax or a social contribution. Social contributions include payments made by insured persons, or their employers, to secure entitlement to social benefits. The contributions are levied as a function of earnings, payroll, or the number of employees. When income is used as a proxy for gross wages, as for the self-employed, the receipts are included as social contributions. Compulsory payments levied as a tax

[26] The institutional units involved, classification, and recording of flows and stock positions related to social protection are described in Appendix 2.

[27] The *2008 SNA* allows some flexibility regarding the recording of pension entitlements of unfunded pension schemes sponsored by government for all employees. Given the different institutional arrangements in countries, and using this flexibility, only some of these pension entitlements may be recorded in the main sequence of accounts (core accounts). However, in such instances, a supplementary table is to be presented that discloses the proportion of pension provision covered in the core accounts with some approximate estimates of the liability arising from the remaining schemes (see the *2008 SNA*, paragraph 17.193).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

assessed on a different base and earmarked for funding social protection schemes are classified in the respective tax category and not as social contributions. In particular, receipts based on net income personalized by adjustments for personal deductions and exemptions are classified as *taxes on income, profits, and capital gains* (111), even if earmarked for the payment of social benefits. Compulsory payments levied on enterprises as a function of earnings, payroll, or the number of employees that do not make provision for entitlement to social security benefits are classified as *taxes on payroll or workforce* (112). Similarly, compulsory levies on the use of fuel are classified as *excises* (1142), even though some of it could be earmarked to finance social benefits to victims of motor vehicle accidents. In these cases, if the government unit that levies the tax and the unit providing the social benefits are not the same, a subsequent grant should be recorded to the unit providing the social benefit.

Social security contributions [GFS] (121)

5.97 ***Social security contributions*** *[GFS]* (121) are actual revenue receivable by social security schemes organized and operated by government units, for the benefit of the contributors to the scheme. These contributions are classified by the source of the contribution, which may be the employers or the household sector (separated according to whether they are employees, self-employed, or unemployed). *Employee contributions* (1211) are either payable directly by employees or deducted from employees' wages and salaries and transferred on their behalf by the employer. *Employer contributions* (1212) are payable directly by employers on behalf of their employees. *Self-employed or unemployed contributions* (1213) are paid by contributors who are not employees. *Unallocable contributions* (1214) are those contributions whose source cannot be determined. Amounts payable by general government employers are not eliminated by consolidation when the paying and receiving units are in the same sector or subsector because the contributions are considered to be rerouted as described in paragraph 3.28.

Other social contributions [GFS] (122)

5.98 ***Other social contributions*** *[GFS]* (122) are actual and imputed contributions receivable by social insurance schemes operated by employers on behalf of their employees. Unlike social security schemes, social insurance schemes for employees generally tie the level of benefits directly to the level of contributions. Such schemes usually are operated by general government units for their own employees, but they can be operated by one unit on behalf of the employees of many government units or even public corporations. These contributions can be receivable from employees or from employers.

5.99 *Employee contributions* (1221) include amounts payable directly by employees or deducted from wages and salaries and transferred by employers on behalf of employees. *Employer contributions* (1222) include amounts payable by employers on behalf of their employees. As with employer contributions to social security schemes, these contributions are not eliminated by consolidation when the paying and receiving governments are in the same sector or subsector.

5.100 *Imputed contributions* (1223) are revenue that arises when government employers provide nonpension benefits directly to their employees, former employees, or dependents out of their own resources without involving an insurance enterprise and without creating a special fund or segregated reserve for the purpose.[28] As described in detail in paragraphs A2.64–2.66, in this situation, existing employees may be considered as being protected against various specified needs or circumstances, even though no reserves are built up to provide for future entitlement. *Compensation of employees* (2122) is therefore imputed (see paragraph 6.22) equal to the amount of social contributions that would be needed to secure the de facto entitlements to the social benefits they accumulate. A simultaneous transaction is recorded between the household sector and government, for the household *imputed contributions* (1223) receivable.

Grants (13)

5.101 ***Grants*** (13) are transfers receivable by government units, from other resident or nonresident government units or international organizations, that do not meet the definition of a tax, subsidy, or social contribution. As indicated in paragraph 3.10, a transfer is a transaction in which one institutional unit provides a

[28] Revenue from imputed contributions excludes imputed contributions to employment-related pension and retirement schemes, which are recorded as the incurrence of a liability.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

good, service, or asset to another unit without receiving from the latter any good, service, or asset in return as a direct counterpart. Grants are normally receivable in cash, but may also take the form of the receipt of goods or services (in kind). Grants receivable are classified first by the type of unit providing the grant and then by whether the grant is current or capital.

5.102 Three sources of grants are recognized in GFS: *grants from foreign governments* (131), *grants from international organizations* (132), and *grants from other general government units* (133). For the general government sector, these transactions should be eliminated in consolidation. Therefore, *grants from other general government units* (133) will have a nonzero value only when statistics are compiled for a subsector of the general government sector. To allow for consolidation, it may be useful to identify grants receivable from other general government units also according to the subsector of the counterparty (see Table 5.7).

5.103 ***Current grants*** (1311/1321/1331) are current transfers receivable by government units, from other resident or nonresident government units or international organizations, that do not meet the definition of a tax, subsidy, or a social contribution. Current grants are those transfers (see paragraph 3.17) receivable that are not capital transfers. ***Capital grants*** (1312/1322/1332) are capital transfers receivable by government units, from other resident or nonresident government units or international organizations, that do not meet the definition of a tax, subsidy, or a social contribution (see paragraph 3.16). If doubt exists regarding the character of a grant, it should be classified consistently by both parties (see paragraph 3.18).

Table 5.7 Detailed Classification of Grants (13)

13	Grants
131	From foreign governments
1311	Current
1312	Capital
132	From international organizations
1321	Current
1322	Capital
133	From other general government units[1]
1331	Current
1332	Capital

[1]Further breakdown/"of which" lines could allow for the identification of subsectors and individual units (see Table 3.1).

5.104 A grant in kind concerns a good or service provided free of charge or the change of ownership of an existing nonfinancial asset in the accounts of the donor without receiving anything of commensurate value in return. Goods and services that are consumed, such as food contributions, blankets, and medical and rescue services and supplies, are classified as current grants. Aid of a capital nature receivable from resident and nonresident general governments and international organizations is classified as capital grants. Grants in kind should be valued at current market prices. If market prices are not available, then the value should be the explicit costs incurred in providing the resources or the amounts that would be received if the resources were sold. A capital grant in kind necessarily concerns the change of ownership of a product previously recorded as a nonfinancial asset in the accounts of the donor government. In this case, there is no effect in the net lending/net borrowing, because the counterpart entry for the positive effect in the net worth (the transfer of wealth implied by the grant revenue) is a transaction in nonfinancial assets (the acquisition of the asset being transferred by the donor). In some cases, the donor and the recipient may view the value of the nonfinancial asset quite differently. To maintain consistency in the macroeconomic statistical system, the valuation from the viewpoint of the donor should be used for recording transactions. If the market value of the asset in the balance sheet of the recipient of the asset is different, the recipient would then record a subsequent holding gain or loss on this asset (see paragraph 10.5).

5.105 When using the accrual basis for recording, the time at which a grant is recorded is dependent on whether the recipient has a claim on the donor. In many cases, the grant recipient never has a claim on the donor and the grant should be attributed to the time at which the cash payment is made or the goods or services are delivered by the donor. When a claim is involved, grants are recorded when all requirements and conditions for receiving them are satisfied and the receiving unit has an unconditional claim recorded under *other accounts receivable* (3208). In some cases, a potential grant recipient has

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

a legal claim when it has satisfied certain conditions, such as the prior incurrence of expenses for a specific purpose or when a certain event has occurred, such as the passage of legislation. Determining this time can be complex because there could be a wide variety of eligibility conditions that have varying legal powers, and so grants are most commonly recorded when received. When using the cash basis of recording, grants are recorded when cash is received. Grants in kind will not be recorded in a cash system.

Other Revenue (14)

5.106 ***Other revenue*** (14) is all revenue receivable excluding taxes, social contributions, and grants. This category of revenue includes property income, sales of goods and services, and miscellaneous other types of revenue.

Property income [GFS] (141)

5.107 ***Property income*** *[GFS]* (141) is the revenue receivable in return for putting financial assets and natural resources at the disposal of another unit.[29] Revenue in this category may take the form of interest, distributed income of corporations, investment income, and rent. Distributed income of corporations includes dividends, withdrawals of income from quasi-corporations, and reinvested earnings on foreign direct investment. Investment income includes property income from investment income disbursements, and holders of investment fund shares.

Interest [GFS] (1411)

5.108 ***Interest*** *[GFS]* (1411) is a form of investment income that is receivable by the owners of certain kinds of financial assets (SDRs, deposits, debt securities, loans, and other accounts receivable) for putting these financial assets and other resources at the disposal of another institutional unit.[30] The financial assets giving rise to interest are all claims of creditors over debtors. Under the accrual basis of recording, the amount of outstanding debt increases as interest accrues continuously over the period that the financial asset exists, and the amount due to the creditor declines as the payments are made on the debt by the debtor. The amount that the debtor owes to the creditor is referred to as the principal amount. Interest revenue also includes imputed interest that originates from interest forgone by employers when they provide loans to employees at reduced or even zero rates of interest as part of the remuneration in kind of government and public sector employees (see paragraph 6.17).

5.109 Interest may be a predetermined sum of money or a fixed or variable percentage of the principal outstanding. If some or all of the interest accruing to the creditor is not paid during the period in question, it should be added to the amount of the principal outstanding. However, the interest may not necessarily be due for payment until a later date and sometimes not until the loan or other financial instrument matures. To the extent that interest has accrued without being paid, the debtor's total liability to the creditor has increased. On an accrual basis, any periodic or other payments reduce the total liability but are not revenue transactions.

5.110 Many considerations must be taken into account when determining the amount of interest revenue to record, or to eliminate, in consolidation. To avoid repetition, interest is described in more detail in paragraphs 6.62–6.83. Interest should also be recorded according to the subsector of the counterparty, to allow for consolidation of the general government and public sectors (see Table 5.8).

Table 5.8 Detailed Classification of Interest [GFS] (1411)

1411	Interest [GFS]
	Interest [SNA]
	Minus: FISIM
14111	From nonresidents
14112	From residents other than general government[1]
14113	From other general government units[1]

[1]Further breakdown/"of which" lines could allow for the identification of subsectors and individual units (see Table 3.1).

[29] *Property income [GFS]* (141) differs due to the treatment of financial intermediation services indirectly measured (FISIM) in *interest* [GFS] (1411).

[30] *Interest [GFS]* (1411) differs due to the treatment of FISIM (see paragraph 6.81 and Appendix 7).

Dividends (1412)

5.111 ***Dividends*** (1412) are the distributed earnings allocated to government or public sector units, as the owners of equity, for placing funds at the disposal of corporations.[31] Raising equity through the issue of shares is an alternative way of raising funds compared to borrowing. Equity does not give rise to a liability that is fixed in monetary terms and it does not entitle the holders to a fixed or predetermined income. Instead, the board of directors or other managers of the corporation must declare a dividend payable on their own volition. Dividends exclude issues of bonus shares that simply represent a reclassification between own funds, reserves, and undistributed profits.

5.112 Although dividends represent a part of income that has been generated over a substantial period of time, often 6 or 12 months, dividends are not recorded in GFS at the time the economic value is generated. For public corporations where government or another public corporation is the only shareholder and the shares are not publicly traded, the dividends are recorded at the time they are payable. Quoted shares go "ex-dividend," meaning that the dividend is payable to the owner at that date. In other words, the owner of the equity at the ex-dividend date, and not the owner on the date dividends became payable, has the right to the dividend. A share sold "ex-dividend" is therefore worth less than one sold without this constraint. In this case, the time of recording of dividends is the point at which the share price starts to be quoted on an "ex-dividend" basis rather than at a price that includes the dividend.

5.113 General government units may receive dividends from resident or nonresident private or public corporations (see Table 5.9). In exceptional cases, legally constituted corporations that are classified as a general government unit may also distribute dividends, so that dividends may also be receivable from other general government units (though subject to consolidation). The sector of the counterparty to dividends receivable should be identified separately to allow for consolidation of the general government and public sectors.

5.114 Distributions of profits by public corporations may take place irregularly and may not be explicitly labeled as dividends. Nevertheless, dividends include all distributions of profits by corporations to their shareholders or owners, by whatever name they are called, including profits of central banks transferred to government units, profits transferred or distributed from the operation of monetary authority functions outside the central bank, and profits transferred by state lotteries that compete with other privately organized lotteries. Distributions of *profits of fiscal monopolies* (1143) and *profits of export or import monopolies* (1153), however, are classified as taxes, as described in paragraphs 5.63 and 5.86.

Table 5.9 Detailed Classification of Dividends (1412)

1412	Dividends
14121	From nonresidents
14122	From residents[1]

[1]Further breakdown/"of which" lines could allow for the identification of subsectors and individual units (see Table 3.1).

5.115 Dividends are notionally paid out of the current period's operating surplus. However, corporations often smooth the payments of dividends, sometimes paying out rather less than their operating surplus but sometimes paying out a little more, especially when the operating surplus itself is very volatile. For practical reasons, no attempt is made to align dividend payments with earnings except in one circumstance. The exception occurs when dividends are disproportionately large relative to the recent level of dividends and earnings. Such disproportionally large and irregular payments, often referred to as "super-dividends," are often based on accumulated reserves, privatization receipts, other sales of assets, or holding gains. Any dividends declared greatly in excess of the recent level of dividends and earnings should be recorded as a transaction in financial assets, specifically the withdrawal of owners' equity from the corporation (see paragraph 9.49).

5.116 To determine whether "super-dividends" are disproportionately large, it is helpful to introduce the concept of distributable income. **Distributable income** of a corporation is equal to entrepreneurial income, plus all current transfers receivable, minus all current transfers payable, and minus the adjustment for the change in pension entitlements relating to the pension scheme of that corporation (see also *2008 SNA* 7.131). From this it is possible to look at

[31] Government or public sector units, in their capacity as shareholders, may in some cases also acquire equity by transferring nonfinancial assets to a corporation.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

the ratio of dividends to distributable income over the recent past and assess the plausibility that the current level of dividends declared is in line with past practice. In practice, a proxy for distributable income can be measured by the *net operating balance* (NOB), excluding dividends payable and net capital transfers. Determining whether dividends are in line with past practice is recommended for all corporations, including the central bank.

5.117 Interim dividends are dividend payments during a reporting period, before the final operating result of a corporation is known. If evidence exists that such dividends are not from the current period's operating surplus, interim dividend payments should be recorded as a financial advance to the shareholder in transactions in financial assets and liabilities.

Withdrawals of income from quasi-corporations (1413)

5.118 *Withdrawals of income from quasi-corporations* (1413) consist of that part of distributable income[32] that the owner withdraws from the quasi-corporation. By definition, quasi-corporations[33] cannot distribute income in the form of dividends, but the owner may choose to withdraw some or all of the distributable income. Conceptually, the withdrawal of such income is equivalent to the distribution of corporate income through dividends and is recorded the same way. The amount of income that the owner of a quasi-corporation chooses to withdraw will depend largely on the size of its disposable income before taxes. All such withdrawals are recorded on the date the payment actually occurs.

5.119 As with dividends, withdrawals of income from quasi-corporations do not include withdrawals of funds realized from the sale or other disposal of the quasi-corporation's assets. Withdrawals based on such sales should be recorded as disposals of nonfinancial assets in the accounts of the quasi-corporation and the reduction of the equity of quasi-corporations owned by government sector units. Similarly, funds withdrawn by liquidating large amounts of accumulated retained earnings or other reserves of the quasi-corporation are recorded as withdrawals from equity.

[32] See paragraph 5.116 for a discussion on distributable income.
[33] The criteria to identify quasi-corporations are described in paragraph 2.33.

Property income from investment income disbursements (1414)

5.120 ***Property income from investment income disbursements*** (1414) includes property income attributed to insurance policyholders and holders of investment fund shares.[34] Insurance enterprises hold technical reserves in the form of prepayments of premiums, reserves against outstanding claims, and actuarial reserves against outstanding risks with respect to life insurance policies. These reserves are liabilities toward the beneficiaries, including any government or other public sector units that are policyholders. Any income receivable from the investment of the corresponding assets should also be attributed as the property income of the policyholders or beneficiaries. However, for government sector units as the holder of policies, the revenue related to this item is likely to be unknown and would probably be calculated only in the context of the whole of the economy; therefore this revenue item is excluded from GFS and so is an adjustment item between GFS and national accounts (see Appendix 7). This type of property income is described in greater detail in paragraphs 6.113–6.119 in the context of the corresponding expense.

5.121 Investment income attributed to holders of shares or units in investment funds includes two separate items. The first of these is the dividends distributed to investment fund shareholders. The second is retained earnings attributed to investment fund shareholders. The increase in value of investment fund shares or units other than from holding gains and losses is recorded as distributed to the share- or unit holders and reinvested by them in the financial instrument.

Rent (1415)

5.122 ***Rent*** (1415) is the revenue receivable by the owners of a natural resource (the lessor or landlord) for putting the natural resource at the disposal of another institutional unit (a lessee or tenant) for use of the natural resource in production. Rent receivable is typically related to a resource lease on land, subsoil resources, and other natural resources. In terms of the

[34] Investment income disbursements by definition also include investment income attributed to participants in pension schemes. However, public sector institutional units are not entitled to pension benefits, and therefore this subcategory of investment income disbursement is not applicable as a GFS revenue category.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

agreement, the owner can extend or withhold permission for continued use of the asset from one year to the next. It constitutes an agreement whereby the legal owner of a natural resource that is considered to have an infinite life makes it available to a lessee in return for a regular payment recorded as property income and described as rent.[35]

5.123 On the accrual basis of recording, rent accrues continuously to the asset's owner throughout the period of the contract. The rent recorded for a particular reporting period is, therefore, equal to the value of the accumulated rent that becomes payable over the reporting period and may differ from the amount of rent that becomes due for payment or is actually paid during the period.

5.124 Rent excludes payments receivable by the owners of natural resources if such payments permit the resource to be used to extinction—such activity is regarded as a sale (see paragraphs 8.54 and A4.19) and possibly depletion (see paragraph 10.52) of the nonproduced asset. Also excluded from rent are amounts receivable by owners of natural resources when they allow the resource to be used for an extended period of time in such a way that, in effect, the user controls the use of the resource during this time with little, if any, intervention from the legal owner. This option leads to recording a transaction in an asset, classified as *contracts, leases, and licenses* (31441), for the user, distinct from the resource itself (see paragraphs 8.56 and A4.19).

5.125 Two types of resource rent are described ahead in detail: rent on land and rent on subsoil resources. Resource rent on other natural resources follows the pattern laid out by these two types. The boundary between resource rent and the rental of produced assets is discussed in paragraphs 5.126 and 5.129.

Rent on land

5.126 Rent on land is recorded as accruing continuously to the landowner throughout the period of the contract. Rent may be paid in cash or in kind. Under sharecropping or similar schemes, the value of the rent payable is not fixed in advance in monetary terms and is measured by the value at basic prices[36] of the crops that the tenants are obliged to provide to the landowner government unit under the contract between them.

5.127 Rent on land also includes the rent payable to general government sector units for the use of inland waters and rivers (for the right to exploit such waters for recreational or other purposes, including fishing) or noncultivated land (for the right to cut timber on such land). In the case of permits that allow timber felling in a natural forest, it is common for these fellings to be allowed under strict limits with a fee payable per unit volume of timber felled (stumpage). The limits are usually such that the harvest of timber is sustainable and so these payments should also be recorded as *rent* (1415). However, if a unit is given permission to fell an area of natural forest, or to fell at its discretion without any restriction in perpetuity, the payments made to the owner constitute the sale of an asset. For those forests that are produced assets, the extraction of timber is treated as the sale of a product.

5.128 A landowner may be liable to pay land taxes or incur certain maintenance expenses solely as a consequence of owning the land. By convention, such taxes or expenses are recorded as payable by the tenant who is deemed to deduct them from the rent that he would otherwise be obliged to pay to the landowner. Rent reduced in this way by taxes or other expenses for which the landowner is liable is described as "after-tax rent." The adoption of this convention reflects the true economic nature of the transactions involved in the accounts of both parties.

Rent on subsoil assets

5.129 The ownership of subsoil assets in the form of deposits of minerals or fossil fuels (coal, oil, or natural gas) depends upon the way in which property rights are defined by law and also on international agreements in the case of deposits below international waters. In some cases the assets may belong to the owner of the ground below which the deposits are located, but in other cases they may belong to a local or central government unit.

[35] A more detailed discussion on the boundary between alternative uses of natural resources is presented in the context of the discussion on leases, licenses, permits, and other contracts to use a natural resource in Appendix 4.

[36] Basic prices are prices before taxes on products are added and subsidies on products are subtracted.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

5.130 General government units may grant leases to other institutional units that permit them to extract these deposits over a specified period of time in return for a payment or series of payments. These payments are often described as "royalties," but they are essentially rent that accrues to owners of natural resources in return for putting these assets at the disposal of other units for specified periods of time. The rent may take the form of periodic payments of fixed amounts, irrespective of the rate of extraction, or, more commonly, they may be a function of the quantity, volume, or value of the asset extracted. Enterprises engaged in exploration on government land may make payments to general government units in exchange for the right to undertake test drilling or otherwise investigate the existence and location of subsoil assets. Such payments are also recorded as rents even though no extraction may take place.

Boundary with rental of produced assets

5.131 Rent should not be confused with the rental of produced assets, which is recorded as *sales of goods and services* (142).[37] Rentals are payments made under an operating lease to use a fixed asset belonging to a unit where the owner maintains and replaces as necessary, and makes available the fixed asset on demand to lessees. The difference in treatment arises because lessors of produced assets are engaged in a production process whereby they provide services to the lessees, such as maintaining inventories of fixed assets available for lease at short notice and repairing and maintaining the leased assets. In particular, the rentals payable by government units as tenants are recorded as payments for the provision of building or housing services. Rent is revenue receivable by owners of natural resources for placing these assets at the disposal of other units.

5.132 A single payment may cover both rent and rentals when an institutional unit rents land that consists of land improvements and land and buildings situated on the land in a single contract, or lease, in which the two kinds of payments are not differentiated from each other. If there is no objective basis on which to split the payment between rent on land and rental on the produced assets, it is recommended to treat the whole amount as rent when the value of the land is believed to exceed the value of the buildings and other produced assets, and as a rental otherwise.

Boundary with taxes

5.133 Rent should also not be confused with severance taxes, business licenses, or other taxes. Severance taxes are imposed on the extraction of minerals and fossil fuels from reserves owned privately or by another government. If the payment counts toward the taxes on profits, then it should be classified as *taxes on income, profits, and capital gains* (111). Payments related to the gross value of production should be classified as *other taxes on goods and services* (1146). Payments for a license or permit to conduct extraction operations should be classified as *taxes on use of goods and on permission to use goods or perform activities* (1145).

Reinvested earnings on foreign direct investment (1416)

5.134 Reinvested earnings are the direct investor's share of the retained earnings of the direct investment[38] enterprise. A general government unit or public corporation may have foreign direct investment in nonresident special purpose entities (SPEs), or nonresident branches or subsidiaries of public corporations. Actual distributions receivable from such nonresident units out of their distributable income should be recorded as *dividends* (1412) or *withdrawals of income from quasi-corporations* (1413). In addition, these entities may have retained some of their earnings. Retained earnings of a corporation or quasi-corporation are equal to the distributable income[39] minus the dividends payable or withdrawal of income from the corporation or quasi-corporation, respectively.

5.135 Retained earnings of a foreign direct investment enterprise are to be recorded as if they were distributed to foreign direct investors in proportion to their ownership of the equity of the enterprise and then reinvested by them.[40] The imputed remittance

[37] The rentals paid by tenants of buildings are treated as payments for the provision of real estate activities or housing services.

[38] Direct investment is a category of cross-border investment associated with a resident in one economy having control or a significant degree of influence on the management of an enterprise that is resident in another economy (see the *BPM6*, paragraphs 6.8 and 11.40–11.47).

[39] Distributable income is discussed in paragraph 5.116.

[40] See paragraph 10.33 for the treatment of retained earnings of other corporations.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

of these retained earnings should be recorded as reinvested earnings on foreign direct investment, while the counterpart entry for the imputed reinvestment should be recorded as the acquisitions of *equity and investment fund shares* (3205). The rationale behind this treatment is that, because a direct investment enterprise is, by definition, subject to control or influence by the direct investor or investors, the decision to retain some of its earnings within the enterprise represents an investment decision on the part of the investor(s) (see paragraph 6.120).[41]

Sales of goods and services (142)

5.136 ***Sales of goods and services*** (142) consist of the sales by market establishments, administrative fees charged for services, incidental sales by nonmarket establishments, and imputed sales of goods and services. Sales of goods and services are recorded as revenue without deduction of the expenses incurred in generating that revenue. Sales of goods and services are further classified according to whether they relate to market or nonmarket production (see Table 5.10). It is quite possible for general government sector units to sell their output at prices that are less than the cost of production (which is calculated as the sum of compensation of employees, use of goods and services, consumption of fixed capital, and taxes (minus subsidies) on production). Indeed, as nonmarket producers, most general government units distribute their output without charge, or for prices that are not economically significant. These prices defray some of the costs or may eliminate some of the excess demand that otherwise would exist. In contrast, corporations sell their output at prices that are economically significant.

5.137 ***Sales by market establishments*** (1421) are the sales of an establishment that is a part of an enterprise (see paragraph 2.75) situated in a single location and at which only a single productive activity is carried out or the principal productive activity accounts for most of the value added. A market establishment within a government unit is an establishment that sells or otherwise disposes of all or most of its output at prices that are economically significant. This category consists of the sales of all market establishments that are part of the units for which statistics are being compiled. Because public corporations comprise primarily market establishments, their sales are included in this category when compiling statistics for the public sector, unless the sales are of a specific type that are to be recorded elsewhere, such as under insurance premiums and administrative fees. Rentals of produced assets are recorded as sales of services and are included in this category. Sales of nonfinancial assets other than inventories are disposals of nonfinancial assets (as described in Chapter 8) and are not sales of goods and services.

Table 5.10 Detailed Classification of Sales of Goods and Services (142)

142	Sales of goods and services[1]
1421	Sales by market establishments
1422	Administrative fees
1423	Incidental sales by nonmarket establishments
1424	Imputed sales of goods and services

[1]Detailed data about the sectors of the counterparty may not be available. Where such data are available, further breakdown/"of which" lines could identify the subsectors to allow consolidation. For analytical purposes, it may also be useful to separately identify the nature of the respective goods or services that were sold.

5.138 ***Administrative fees*** (1422) include fees for compulsory licenses and other administrative fees that are sales of services. Examples are drivers' licenses, passports, visas, court fees, and radio and television licenses when public authorities provide general broadcasting services. Also included are fees payable for voluntary participation in deposit insurance or other guarantee schemes that do not qualify to be a standardized guarantee scheme. These fees are considered a sale of a service when, for instance, issuing the license or permit implies a proper regulatory function of the government. In this case, the payment is taken to be proportional to the cost of producing the service. For a detailed description on the boundary between taxes and the purchases of services, see paragraph 5.74. If a payment is clearly out of all proportion to such cost, then the fee is classified as *taxes on use of goods and on permission to use goods or perform activities* (1145).

5.139 ***Incidental sales by nonmarket establishments*** (1423) cover sales of goods and services by nonmarket establishments of general government units other than administrative fees. Included are sales incidental

[41] The *2008 SNA* research agenda includes a proposal to extend the treatment of distributing retained earnings to the owners of other corporations, in particular of public corporations.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

to the usual social or community activities of government departments and agencies, such as sales of products made at vocational schools, seeds from experimental farms, postcards and art reproductions by museums, fees at government hospitals and clinics, tuition fees at government schools, and admission fees to government museums, parks, and cultural and recreational facilities that are not public corporations.

5.140 ***Imputed sales of goods and services*** (1424) are recorded when a unit produces goods and services for the purpose of using them as compensation of employees in kind. The unit is acting in two capacities: as an employer and as a general producer of goods and services. In order to indicate the total amount paid as compensation of employees, it is necessary to treat the amount paid in kind as if it had been paid in cash as wages and salaries and then the employees had used this income to purchase the goods and services. This category includes the total value of these imputed sales. Wages and salaries in kind are explained in greater detail in paragraphs 6.17–6.18. For a defined-contribution pension scheme, this category also includes an imputed sale for the services rendered if the employer operates the scheme itself. In that case, the value of the costs of operating the scheme is recorded as an imputed contribution payable to the employee as part of compensation of employees. The counterpart of this amount should be recorded as an imputed sale of a financial service to the household sector (see paragraph 6.25).

5.141 On the accrual basis of recording, sales of goods are recorded when legal ownership changes. If that time cannot be determined precisely, recording may take place when there is a change in physical ownership or control. Transactions in services normally are recorded when the services are provided. Some services are supplied or take place on a continuous basis. For example, rentals are continuous flows and, in concept, are recorded continuously as long as they are being provided.

Fines, penalties, and forfeits (143)

5.142 **Fines and penalties** are compulsory current transfers imposed on units by courts of law or quasi-judicial bodies for violations of laws or administrative rules. Out-of-court agreements are also included. **Forfeits** are amounts that were deposited with a general government unit pending a legal or administrative proceeding and that have been transferred to the general government unit as part of the resolution of that proceeding.

5.143 In principle, fines and penalties charged on overdue taxes or penalties imposed for the evasion of taxes should be recorded in this category and not as taxes. However, it may not be possible to separate payments of fines or other penalties from the taxes to which they relate. In this case, the fines and penalties relating to a particular tax are recorded together with that tax, and fines and penalties related to unidentifiable taxes are classified as *other taxes* (116).

5.144 Most fines, penalties, and forfeits are determined at a specific time. These transfers are recorded on an accrual basis when the general government unit has an unconditional claim to the funds, which may be when a court renders judgment or an administrative ruling is published, or it may be when a late payment or other infringement automatically causes a fine or penalty. Fines also include bail set by courts, when bail conditions have been violated. When bail is set, repayable amounts received should be recorded as *other accounts payable* (3308), and should be recorded as revenue only once the conditions for the bail were violated. In cases where no actual payment is made when bail is set, government acquires a conditional claim. Such a conditional claim is not recorded in GFS until the conditions are fulfilled.

Transfers not elsewhere classified (144)

5.145 ***Transfers not elsewhere classified*** (144) receivable include subsidies, as well as gifts and transfers from individuals, private nonprofit institutions, nongovernmental foundations, corporations, or sources other than governments and international organizations. These transfers could be classified according to the sector of the counterparty and whether they are current or capital transfers (see Table 5.11). If doubt exists regarding the character of a transfer, it should be classified consistently by both parties (see paragraph 3.18).

5.146 ***Subsidies*** (14411) are current unrequited transfers that government units make to enterprises on the basis of the level of their production activities or the quantities or values of the goods or services they produce, sell, export, or import. As revenue, these are amounts receivable, mainly by public corporations. In rare cases, general government units and

Table 5.11 Detailed Classification of Transfers Not Elsewhere Classified (144)	
144	Transfers not elsewhere classified
1441	Current transfers not elsewhere classified
14411	Subsidies[1,2,3]
14412	Other current transfers not elsewhere classified[1,3]
1442	Capital transfers not elsewhere classified[1,3]

[1]Further breakdown/"of which" lines could allow for the identification of subsectors and individual units (see Table 3.1).

[2]Further breakdown/"of which" lines could also identify whether these subsidies are subsidies on products or production.

[3]Further breakdown/"of which" lines could also identify whether these transfers are related to specific natural resource or environmental revenue.

nonprofit institutions serving households can receive subsidies when the transfer receivable depends on the general regulations of the subsidy scheme, applicable to all producers—that is, market and nonmarket producers. Subsidies are explained in greater detail in paragraphs 6.84–6.91.

5.147 ***Other current transfers not elsewhere classified*** (14412) are gifts and transfers of a current nature (other than grants or subsidies) from individuals, private nonprofit institutions, nongovernmental foundations, or corporations. These transfers could be in cash or in kind—for example, contributions to government of food, blankets, and medical supplies for relief purposes.

5.148 ***Capital transfers not elsewhere classified*** (1442) are gifts and transfers of a capital nature (other than grants) from individuals, private nonprofit institutions, nongovernmental foundations, or corporations. Examples of transfers included in this category are:

- Major nonrecurrent payments receivable in compensation for extensive damages or serious injuries not covered by insurance policies. The payments may be awarded by courts of law or settled out of court. They include payments of compensation for damages caused by major explosions, oil spillages, etc.
- International aid of a capital nature receivable after natural disasters from nonresidents other than international organizations and foreign governments[42]
- Payments receivable for damage to property other than payments from an insurance settlement (insurance settlements are included in *claims receivable* (14513 or 1452))
- Transfers receivable by public corporations from government units, to cover large operating deficits accumulated over two or more years[43]
- Legacies or large gifts receivable by government or public sector units, including gifts of land, buildings, or research and development assets such as patents and copyrights
- Exceptionally large donations receivable from households or enterprises to public sector units to finance gross fixed capital formation: for example, transfers for the construction or purchase of hospitals, schools, museums, theaters, and cultural centers, or gifts to universities to cover the costs of building new residential colleges, libraries, laboratories, etc.
- Capital transfers from corporations, quasi-corporations, nonprofit institutions serving households, households, and nonresidents other than governments and international organizations (see paragraph 5.103) for the cancelation or assumption of a debt by mutual agreement with the government without the government incurring an effective liability toward them[44]
- Amounts receivable in excess of the expected value of liabilities assumed for the provision of pension entitlements[45]
- Community-built assets where responsibility for maintenance is then assumed by a public sector unit.

Premiums, fees, and claims receivable related to nonlife insurance and standardized guarantee schemes (145)

5.149 ***Premiums, fees, and claims receivable related to nonlife insurance and standardized guarantee schemes*** (145) comprise nonlife insurance premiums

[42] International aid receivable from resident and nonresident general government units and international organizations is classified as grants (see paragraph 5.101).

[43] Where a realistic expectation exists that such amounts will be repayable, as indicated by certain criteria (see Box 6.3), the transaction should be classified as the acquisition of a financial asset. A regular transfer covering an operating deficit is recorded as a subsidy.

[44] Details on debt cancellation, debt assumption, and other government debt operations can be found in Appendix 3, and in the *PSDS Guide*, Chapter 4.

[45] Amounts receivable up to the expected value of the liabilities should be recorded as transactions in financial assets and liabilities (i.e., the incurrence of a liability) (see paragraph 9.67).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

receivable[46] by insurance schemes to provide entitlement to insurance against risks; claims receivable from insurance schemes by beneficiaries; and fees receivable for the issuance of standardized guarantees. While premiums and fees are always of a current nature, claims receivable could be of a capital or current nature. The types of insurance and standardized guarantee schemes, terminology used in insurance, and the statistical recording of flows and stock positions related to these are described in Appendix 4. To allow for consolidation of the general government and public sectors, this revenue should be classified according to the sector of the counterparty (see Table 5.12).[47]

5.150 ***Premiums, fees, and current claims receivable*** (1451) comprise nonlife insurance premium revenue and fees receivable for the issuance of standardized guarantees, as well as insurance settlement revenue that is not exceptional. On an accrual basis, premiums and fees receivable should include only those that provide insurance coverage in the reporting period. Receipts of prepayment of premiums and fees should not be recognized as revenue, but should be recorded as the incurrence of a liability in the form of insurance technical reserves (see paragraphs 7.183 and A4.79).

5.151 ***Capital claims receivable*** (1452) comprise exceptionally large insurance settlements receivable in the wake of a catastrophic event or disaster. It may be difficult for the parties to identify these exceptionally large settlements consistently, so as a simplifying convention, all nonlife insurance claims are classified as current transfers, unless it is necessary to record a capital transfer to be consistent with the national accounts.

Table 5.12 Detailed Classification of Premiums, Fees, and Claims Receivable Related to Nonlife Insurance and Standardized Guarantee Schemes (145)

145	Premiums, fees, and claims receivable related to nonlife insurance and standardized guarantee schemes
1451	Premiums, fees, and current claims receivable
14511	Premiums receivable[1]
14512	Fees receivable for standardized guarantee schemes[1]
14513	Current claims receivable[1]
1452	Capital claims receivable[1]

[1]Further breakdown/"of which" lines could allow for the identification of subsectors and individual units (see Table 3.1).

[46] In the *2008 SNA*, nonlife insurance premiums receivable are partitioned into a sale of a service and a transfer. In GFS, the entire premium is considered a transfer.

[47] See Appendix 4 for an illustration of the recording of transactions and stock positions related to insurance, including standardized guarantees.

6 Expense

This chapter defines the concept of expense and describes the manner in which expense is classified.

Defining Expense

6.1 ***Expense*** (1) is a decrease in net worth resulting from a transaction. Expense transactions as defined in GFS have counterpart entries either in a decrease in assets or an increase in liabilities—thereby decreasing net worth. The general government sector has two broad economic responsibilities: (i) to assume responsibility for the provision of selected goods and services to the community, primarily on a nonmarket basis; and (ii) to redistribute income and wealth by means of transfers (see paragraph 2.38). These responsibilities are largely fulfilled through expense transactions, which are classified in two ways in GFS: an economic classification and a functional classification.

6.2 The **economic classification of expense** identifies the types of expense incurred according to the economic process involved. When supplying goods and services to the community, a government unit may produce the goods and services itself and distribute them, purchase them from a third party and distribute them, or transfer cash to households so they can purchase the goods and services directly. For example, compensation of employees, use of goods and services, and consumption of fixed capital all relate to the costs of producing nonmarket (and, in certain instances, market) goods and services by government. Subsidies, grants, social benefits, and transfers other than grants relate to transfers in cash or in kind, and are aimed at redistributing income and wealth.

6.3 The **functional classification of expense** provides information on the purpose for which an expense was incurred. Examples of functions are education, health, and environmental protection. The functional classification is described in the annex to this chapter.[1] In addition, the economic and functional classifications can be cross-classified to show the types of transactions engaged in to carry out a given function (see the annex to Chapter 6, paragraphs 6.126–6.148).

6.4 Refunds, recoveries of overpayments, receivables on erroneous payments, and similar transactions are transactions that increase net worth. More accurately, they are adjustments that correct the excessive decrease in net worth previously recorded. These transactions are treated as a reduction in expense, with a corresponding reduction in liabilities or an increase in financial assets.

6.5 Some transactions are exchanges in assets and/or liabilities and should not be recorded as expense. The acquisition of a nonfinancial asset by purchase or barter does not affect net worth, and such transactions are not an expense. They are transactions in nonfinancial assets, as described in paragraph 8.3. However, when ownership of an asset is given up without receiving anything of commensurate value in return, the net worth of the unit has decreased. This reduction in assets has a counterpart entry in an increase in expense and should be recorded as a type of capital transfer payable, such as a capital grant. Amounts payable on loans extended and repayments on loans incurred are also not an expense. These are transactions in financial assets or liabilities as described in paragraph 9.3.

Time of Recording Expense

6.6 In the *Statement of Operations*, expense should be recorded according to the accrual basis of recording. According to the accrual basis of recording, transactions are recorded when activities, transactions, or other events occur that create the unconditional

[1] In GFS, the functional classification is applied to expenditure—that is, the sum of expense transactions and net investment in nonfinancial assets.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

obligation to make payments or otherwise give up resources (see paragraph 3.62). In the absence of a complete inventory accounting system (see paragraph 8.46), complications arise with the recording of the acquisition and subsequent use of goods. Conceptually, the purchase of goods that are not immediately used in some manner is an addition to inventories rather than an expense. When the goods are consumed in production or otherwise utilized, a decrease in inventories should be recorded, as well as an expense or an increase in some other category of asset, depending on the manner in which these goods are used.[2] However, in practice, as described in paragraphs 8.45–8.47, the change in inventories is often not recorded for each transaction, but rather calculated as a residual from information on stock positions and flows in inventories. Other applications of the accrual basis to specific categories of expense transactions are indicated in each section of the economic classification, as relevant.

6.7 In the *Statement of Sources and Uses of Cash*, expense transactions should be recorded according to the cash basis of recording, as close to the payment stage as possible (see paragraph 3.103).

The Economic Classification of Expense

6.8 Table 6.1 shows the summary economic classification of expense, and the remainder of this chapter describes each category in detail.[3] While the summary GFS expense classification structure provides guidance on the minimum requirements for internationally comparable classifications of expense, analytical needs may necessitate further detailed classifications to be added as subitems in national data presentations. These additional subitems may be presented either as a comprehensive breakdown of the standard item, or presented as "of which" lines. These items usually relate to the need for consolidation of the general government or public sector, input into other macroeconomic datasets, or items that will allow the calculation of supplementary aggregates or balances (see paragraph 5.22).

[2] Where these goods are used in own-account capital formation to create another asset, such as a fixed asset or another category of inventories, they would be recorded as part of the cost of the acquisition of such assets. However, where the goods are consumed during the process of providing a service, an expense is recorded.
[3] See also Appendix 8, Table A8.2, for the detailed classifications.

Compensation of Employees [GFS][4] (21)[5]

6.9 Compensation of employees is the total remuneration, in cash or in kind, payable to an individual in an employer-employee relationship in return for work performed by the latter during the reporting period. These amounts are payable as an exchange for manual and intellectual labor services of individuals used in the production process of the institutional unit. *Compensation of employees [GFS]* (21)[6] excludes amounts connected with own-account capital formation (see Table 6.2). In GFS, compensation of employees payable to employees engaged in own-account capital formation, which is the production of nonfinancial assets for own use, is directly recorded as a component of the cost of the acquisition of nonfinancial assets. *Compensation of employees [GFS]* (21) also excludes amounts payable when an employer-employee relationship does not exist, such as for contractors and self-employed outworkers. Such amounts payable are classified as *use of goods and services* (22). For a description of this boundary between compensation of employees and use of goods and services, see paragraph 6.33.

6.10 When using the accrual basis of recording, compensation of employees is measured by the value of the remuneration in cash and/or in kind that an employee becomes entitled to receive from an employer for work performed during the relevant period, whether paid in advance, simultaneously, or in arrears of the work itself. To the extent that payment has not been made for work performed, the unit should record an entry in *other accounts payable* (3308) (see paragraphs 7.224–7.227 and 9.83).[7] On the other hand, to the extent that payment has been made in advance of the work itself, an entry in *other accounts receivable* (3208) must be recorded until such time as the work is completed. When using the cash basis of recording, compensation of employees is recorded at the time the cash

[4] [GFS] indicates that an item has the same name but different coverage in the *2008 SNA*.
[5] The numbers in parentheses after each classification category are the GFS classification codes. Appendix 8 provides all classification codes used in the GFS framework.
[6] Compensation of employees is described in the *2008 SNA*, paragraphs 7.28–7.70.
[7] To the extent that *compensation of employees* is not paid on the agreed due for payment date, these *other accounts payable* will be in arrears from the date they became due (see paragraphs 9.20 and 7.226).

283	Premiums, fees, and claims related to nonlife insurance and standardized guarantee schemes[1]
2831	Premiums, fees, and current claims
2832	Capital claims

[1]Indicates that further breakdown may be analytically useful and is presented in detailed tables.

flow occurs, irrespective of when the labor exchange takes place. Wages and salaries in kind are not recorded in the cash basis of recording since no cash flows are involved.

6.11 Compensation of employees comprises *wages and salaries* (211) and *employers' social contributions* (212) payable by employers on behalf of employees to social insurance schemes.

Wages and salaries [GFS] (211)

6.12 Wages and salaries are compensation of employees payable in cash and/or in kind, except for social contributions payable by employers. As indicated in Table 6.2, *wages and salaries* [GFS] (211) exclude amounts connected with own-account capital formation. They include amounts withheld from wages and salaries by the employer for administrative convenience or other reasons, such as social contributions, income taxes, and other deductibles, payable by the employee. These deductibles are often paid directly to social insurance schemes, tax authorities, etc., on behalf of the employee. Wages and salaries may be payable in various ways, including goods or services provided to employees as remuneration in kind instead of, or in addition to, remuneration in cash. Including remuneration in kind allows GFS to measure the full cost of labor employed.

	Minus: Related to own-account capital formation

[1]Further breakdown/"of which" lines could allow for the identification of the types of compensation of employees payable.

Wages and salaries in cash [GFS] (2111)

6.13 Wages and salaries in cash[8] are the amounts payable in cash, or any other financial instruments used as means of payments, to employees in return for work performed. As indicated in Table 6.2, *wages and salaries in cash [GFS]* (2111) exclude amounts connected with own-account capital formation. Included are the following kinds of remuneration:

- Basic wages or salaries payable at regular weekly, monthly, or other intervals, including payments by results and piecework payments; enhanced payments or special allowances for working overtime, at nights, on weekends, or other irregular hours; allowances for working away from home or in disagreeable or hazardous circumstances; expatriation allowances for working abroad, etc.
- Supplementary allowances payable regularly, such as housing allowances or allowances to cover the costs of travel to and from work, but excluding social benefits payable by the employers (see paragraph 6.16)
- Wages or salaries payable to employees away from work for short periods—for example, on vacation or as a result of a temporary halt to production, except during absences due to sickness, injury, etc. (see paragraph 6.16)
- Annual supplementary pay, such as bonuses and "13th month" pay
- Ad hoc bonuses or other exceptional payments linked to the overall performance of the enterprise made under incentive schemes
- Commissions, gratuities, and tips received by employees: these should be included in payments for services rendered by the unit employing the worker, even when they are payable directly to the employee by a third party. They are thus regarded as being paid by the employer to the employee.[9]

6.14 In some instances, an employee benefit, such as a car or extra pension contributions, may not be provided to the employee for free (i.e., not provided without an opportunity cost to the employee). The benefit may be "purchased" from the employer by forgoing some salary. The attraction of such schemes often lies in the tax advantages that an employee may enjoy by restructuring salary packages. In these cases, the full salary should include the employee benefits "purchased" and be recorded as payable in cash—the cost of acquiring the benefit is regarded as an expenditure of the employee.

6.15 Wages and salaries in cash do not include the reimbursement by the government of costs incurred

[8]The use of the term "cash" should not be viewed as denoting the cash basis of recording, but rather denotes monetary remuneration.

[9]Amounts directly paid to the employee should be rerouted to be included in revenue of the employer related to the service provided, and then expensed as wages and salaries.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

by its employees in order to enable them to take up their jobs or to carry out their work—for example:

- The reimbursement of travel, relocation, or related expenses made by employees when they take up new jobs or are required by their employers to move their homes to different parts of the country or to another country
- The reimbursement of costs incurred by employees on tools, equipment, special clothing, or other items that are needed exclusively, or primarily, to enable them to carry out their work. In these cases, the amounts reimbursed are recorded as *use of goods and services* (22). To the extent that employees who are required by their contract of employment to purchase tools, equipment, special clothing, etc. are not fully reimbursed, the remaining expense they incur should be deducted from the amounts receivable in wages and salaries and the government's use of goods and services increased accordingly.

6.16 Wages and salaries also exclude social benefits payable by governments to their employees in the form of:

- Children's, spouse's , family, education, or other allowances in respect of dependents
- Payments made at full, or reduced, wage or salary rates to workers absent from work because of illness, accidental injury, maternity leave, etc.[10]
- Severance payments to workers or their survivors who lose their jobs because of redundancy, incapacity, accidental death, etc.

These social benefits are recorded as an *imputed employers' social contributions* (2122) payable to households, and subsequent *imputed social contributions* (1223) payable by these households to the employer, before including it in *employment-related social benefits* (273) (see paragraph 6.104).

Wages and salaries in kind [GFS] (2112)

6.17 Wages and salaries in kind are amounts payable in the form of goods, services, interest forgone, and shares issued to employees in return for work performed. As indicated in Table 6.2, *wages and salaries in kind [GFS]* (2111) exclude amounts connected with own-account capital formation. This category consists of goods and services provided without charge, or at reduced prices. When provided at reduced prices, the value of the wages and salaries in kind is given by the difference between the full value of the goods and services and the amount payable by the employees. These goods and services provided in kind by the government to its employees are not necessary to enable them to perform their work. They could be used by employees in their own time, and at their own discretion, for the satisfaction of their own needs or wants, or those of other members of their households. Almost any kind of good or service may be provided as wages and salaries in kind. The following are the most common types of goods and services provided without charge, or at reduced prices:

- Meals and drinks provided on a regular basis, including any subsidy element of an office canteen (for practical reasons, it is not necessary to make estimates for meals and drinks consumed as part of official entertainment or during business travel)
- Clothing or footwear that employees may choose to wear frequently outside of the workplace and while at work
- Housing services or accommodation of a type that can be used by all members of the household to which the employee belongs
- The services of vehicles or other durables provided for the personal use of employees
- Goods and services produced by the employer, such as free travel on government airplanes or trains
- Sports, recreation, or holiday facilities for employees and their families
- Transportation to and from work, free or subsidized parking, when it would otherwise have to be paid for
- Child care for the children of employees
- The value of the interest forgone[11] by employers when they provide loans to employees at reduced

[10] If it is difficult to separate payments of wages and salaries to employees on short periods of absence due to sickness, accidents, etc., from other payments of wages and salaries, the payments during short periods of absence should remain included in wages and salaries.

[11] This value may be estimated as the amount the employee would have to pay if the market equivalent interest rates were charged minus the amount of interest actually payable. The sums involved could be large when nominal interest rates are very high, but otherwise they may be too small and too uncertain to be worth estimating.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

or even zero rates of interest for purposes of buying houses, vehicles, furniture, or other goods or services (these amounts are also recorded as interest receivable as explained in paragraph 5.108)

- In the case of public corporations, wages and salaries in kind can also include bonus shares or stock options[12] distributed to employees.

6.18 Some of these services, such as transportation to and from work, parking, and child care may have some of the characteristics of use of goods and services by the employee. However, when governments are obliged to provide these benefits to attract and retain labor, they are similar to other forms of compensation of employees and should be recorded as such. If the same types of benefits are provided because of the nature of the production process or the physical conditions under which employees have to work, they should be recorded as *use of goods and services* (22) expense of the employer.

Employers' social contributions [GFS] (212)

6.19 Employers' social contributions are social contributions payable by employers to social security funds, employment-related pension funds, or other employment-related social insurance schemes to obtain entitlement to social benefits for their employees. Employers' social contributions are payable by employers for the benefit of their employees, and are therefore recorded as a component of compensation of employees. *Employers' social contributions [GFS]* (212) exclude amounts connected with own-account capital formation (see Table 6.2). Social protection is described in Appendix 2.

6.20 Some social contributions are payable directly by the government unit that is the employer to a second public sector unit, often a social security fund or a public financial corporation. It is administratively more efficient for the employer to pay the contributions on behalf of their employees, rather than each employee making individual payments. The administrative arrangement should not obscure the underlying economic reality—namely, that the government unit incurs an expense for compensation of employees payable to households, while the employee contributes to the social insurance scheme.[13] These transactions are not eliminated in consolidation because they are rerouted to better show the economic nature of the transaction, as described in paragraph 3.28, first to the employees and then from the employees to the social insurance schemes.

Actual employers' social contributions [GFS] (2121)

6.21 Actual employers' social contributions consist of actual contributions payable to social security funds, employment-related pension funds, and other employment-related social insurance schemes to obtain entitlement to social benefits for their employees. This category consists of actual contributions payable to insurance enterprises, social security funds, or other institutional units responsible for the administration and management of social insurance schemes, or employment-related pension schemes. As indicated in Table 6.2, *actual employer's social contributions [GFS]* (2121) also exclude amounts connected with own-account capital formation.

Imputed employers' social contributions (2122)

6.22 Imputed employers' social contributions are the amounts calculated and added to actual contributions, sufficient to exactly match the increases in employees' social benefit entitlements. These imputed employers' social contributions may relate to pension and to nonpension benefits. *Imputed employers' social contributions [GFS]* (2122) exclude amounts connected with own-account capital formation (see Table 6.2).

Imputed employers' social contributions related to nonpension benefits

6.23 Some government units provide employment-related nonpension social benefits directly to their employees, former employees, or dependents out of their own resources without involving an insurance enterprise (see paragraph 6.16 for examples of the types of benefits payable). In this situation, employees

[12] Under a stock option agreement, the employer gives an employee the option to buy stocks or shares at a specified price at a future date (see paragraphs 9.77–9.81).

[13] The situation is parallel to one in which income taxes payable by employees are deducted by employers from the wages or salaries and paid directly to the tax authorities. The direct payment of social contributions, or income taxes, by government units as employers to other government units, such as social security schemes, other employment-related social insurance schemes, or tax authorities, is merely a shortcut taken on grounds of administrative convenience and efficiency.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

may be considered as being protected against various specified needs or circumstances, even though no reserves are built up to provide for future entitlement to benefits. Compensation of employees in the form of employers' social contributions equal in value to the amount of social contributions that would be needed to secure the de facto entitlements should be imputed. These amounts take into account any actual contributions made by the employer or employee and depend not only on the levels of the benefits currently payable, but also on the ways in which employers' liabilities under such schemes are likely to evolve in the future as a result of factors such as expected changes in the number, age distribution, and life expectancies of their present and previous employees. Thus, the values that should be imputed for the contributions ought, in principle, to be based on the same kind of actuarial considerations that determine the levels of premiums charged by insurance enterprises.

6.24 In practice, however, it may be difficult to decide how large such imputed contributions should be. The government sector unit may make estimates, perhaps on the basis of the contributions payable into similar funded schemes, in order to calculate its likely liabilities in the future, and such estimates may be used when available. Otherwise, the only practical alternative may be to use the unfunded nonpension benefits payable by the unit during the same reporting period as an estimate of the imputed expense that would be needed to cover the imputed contributions (see paragraph 6.104).

Imputed employers' social contributions to employment-related pension benefits

6.25 The imputation of employers' social contributions related to employment-related pension benefits is influenced by the type of pension scheme the government unit operates:

- In general, in the case of social security schemes, there are no imputed contributions recognized for social insurance. However, in cases where employment-related pensions are administered by such a social security scheme, imputed contributions should be recorded for these pension obligations.
- For a defined-contribution pension scheme, there are no imputed contributions recognized unless the employing unit operates the scheme itself. In that case, the value of the costs of operating the scheme is recorded as an imputed contribution payable to the employee as part of compensation of employees.
- For a defined-benefit pension scheme, there is an imputed contribution recognized, equal to the increase in benefits payable due to current period employment, plus the costs of operating the scheme, minus the sum of the government's actual contribution and the sum of any contributions by the employees.[14]

6.26 Some schemes may be generally described as noncontributory because no actual contributions are ever made by the employee. Nevertheless, in the case of employment-related schemes, an imputed contribution by the employer is calculated and should be imputed for GFS as just described. The fact that the value of imputed contributions for a noncontributory scheme may be set equal to the value of benefits payable does not mean that the benefits themselves are recorded as part of compensation of employees. Rather, the employee has a pension asset that is reduced when benefits are payable. When a pension manager is a unit different from the administrator, and the responsibility for any deficits, or claims on any excess rests with the pension manager, the counterpart entry for such claims is included in imputed social security contributions on a net basis (i.e., an expense to increase the liability and a reduction in the expense when the liability reduces or when government acquires an asset. See paragraph 7.199).

Use of Goods and Services (22)

6.27 ***Use of goods and services*** (22) consists of the value of goods and services used for the production of market and nonmarket goods and services.[15] Excluded are:

- *Consumption of fixed capital* (23)
- The use of goods and services in own-account capital formation, which should be recorded as the acquisition of nonfinancial assets (see paragraph 8.3)

[14] Some defined-benefit pension schemes may have financial assets that exceed the liabilities of the scheme to present and past employees. It is possible that in this case, the government may take a "contribution holiday" and not make actual contributions for one or more periods. Nonetheless, an imputed contribution by the government should be calculated and recorded (see paragraph A2.46).

[15] Use of goods and services is closely related to intermediate consumption in the *2008 SNA*. The relationship between the two concepts is explained in Appendix 7. Intermediate consumption is described in the *2008 SNA*, paragraphs 6.213–6.239.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

- Goods purchased by government and distributed without transformation, which should be recorded as some type of transfer in kind; these transfers are classified as *subsidies* (25), *grants* (26), *social benefits* (27), or *current transfers not elsewhere classified* (2821).

6.28 In the *Statement of Operations*, the value of use of goods or services is recorded when the goods or services are actually used rather than when they were acquired or paid for. In practice, these events often coincide for inputs of services but not for goods, which may be acquired some time in advance of their use. The value of goods purchased and held for resale is recorded as use of goods and services when they are sold.

6.29 In practice, government units do not usually record the actual use of goods in production directly. Instead, they keep records of purchases of materials and supplies intended to be used as inputs and also of any changes in the amounts of such goods held in inventories. An estimate of use of goods and services during a given reporting period can be derived through the indirect method by considering the purchases of goods and services and changes in inventories,[16] as illustrated in Table 6.3.

6.30 *Use of goods and services* (22) is recorded on a gross basis. Fees and charges collected for goods and services provided by general government units, such as for certain types of social benefits or administrative services, such as the issuance of licenses and passports, should be shown as revenue rather than deducted from expense.

6.31 In the *Statement of Sources and Uses of Cash*, the purchases of goods and services are recorded as close to the payment stage as possible. The value of these goods and services will include all cash payments made for goods and services during the reporting period, irrespective of whether the good or service was used during the reporting period. This amount will not include the value of goods paid for in prior periods, but used in the current period.

6.32 The boundaries between use of goods and services and other expenditure items, such as compensation of employees, transfers, or acquisition of nonfinancial assets, are explained in more detail in paragraphs 6.33–6.52.

Table 6.3 Relationship between Inventories (612) and Use of Goods and Services (22)

612_{t0}	Opening stock position of inventories
	Plus: Purchases of goods and services
	Minus: Used in own-account capital formation
	Minus: Goods distributed directly as transfers in kind
412	Plus/Minus: Holding gains/losses
512	Plus/Minus: Other volume changes
612_{t1}	Minus: Closing stock position of inventories
22	**Equals: Use of goods and services**

The boundary between use of goods and services and compensation of employees

6.33 Compensation of employees excludes amounts payable to contractors, self-employed outworkers, and other workers who are not employees of general government or public sector units. Any such amounts should be recorded under *use of goods and services* (22). An employer-employee relationship exists when there is a written or oral agreement, which may be formal or informal, between an entity and an individual, normally entered into voluntarily by both parties, whereby the person works for the enterprise in return for remuneration in cash or in kind. The remuneration is normally based on either the time spent at work or another objective indicator of the amount of work performed. If an individual is contracted to produce a single specific task, it suggests that no employer-employee relationship exists, but that a service contract relationship exists between the entity and a self-employed individual.

6.34 An indication of whether an employer-employee relationship exists is that of control. The right to control or to direct work performed and how it shall be performed is a strong indication of an employer-employee relationship. The method of measuring or arranging for the payment is not important as long as the employer has effective control over both the method and the result of the work undertaken by the individual. However, certain control of the work being undertaken may also exist for the purchase of

[16] As described in paragraph 7.75, inventories may include materials and supplies, work in progress, finished goods, goods for resale, and military inventories. See paragraphs 8.44–8.47 for a discussion on transactions in inventories.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

a service—for example, when subcontracts are entered into. Therefore, other criteria should also be used to define more clearly the employer-employee relationship. The fact that the individual is solely responsible for social contributions would suggest that the individual is a self-employed service provider. By contrast, payment of social contributions by the employer is an indication of employer-employee relationship. Entitlement by the individual to the same kinds of benefits (e.g., allowances, holidays, and sick leave) generally provided to an entity's employees would also indicate an employer-employee relationship. Payment of taxes on the provision of services (such as sales tax or value-added tax) by the individual is an indication that the individual is a self-employed service provider.

6.35 Certain goods and services used by governments do not enter directly into the process of production itself but are consumed by employees working on that process. In general, when the goods or services are used by employees on their own time and at their own discretion for the direct satisfaction of their needs or wants, they constitute remuneration in kind (see paragraph 6.17). However, when such use is mandatory in order to enable employees to carry out their work, it should be recorded as use of goods and services. Examples of the latter are:

- Tools or equipment used exclusively, or mainly, at work
- Clothing or footwear of a kind that ordinary consumers do not choose to purchase or wear and that are worn exclusively, or mainly, at work—for example, protective clothing, overalls, or uniforms
- Accommodation services at the place of work of a kind that cannot be used by the households to which the employees belong: barracks, cabins, dormitories, huts, etc.
- Special meals or drinks necessitated by exceptional working conditions, while traveling for business reasons, or meals or drinks provided to employees while on active duty
- Changing facilities, washrooms, showers, baths, etc. necessitated by the nature of the work
- First aid facilities, medical examinations, or other health checks required because of the nature of the work.

6.36 Employees may sometimes be responsible for purchasing the kinds of goods or services just listed and are subsequently reimbursed by the employer. Such reimbursements are recorded as use of goods and services rather than as wages and salaries.

The boundary between use of goods and services and transfers

6.37 All transfers of goods and services to other institutional units other than goods and services produced by the donor government unit are recorded as *grants* (26) or *transfers not elsewhere classified* (282). Such transfers may entail the transfer of government-owned fixed assets, the transfer of goods held in inventories, the construction of fixed assets, or the purchase and subsequent transfer of either fixed assets or goods and services for current consumption. Examples are transfers of food, clothing, blankets, and medicines as emergency aid after natural disasters; transfers of machinery and other equipment; the direct provision of the construction of buildings or other structures; and transfers of military equipment of all types.

6.38 Goods and services used by a donor government unit to produce nonmarket goods and services consumed by other governments and international organizations are included in use of goods and services. An example would be the goods and services acquired so that government employees can conduct relief operations in a foreign country after a natural disaster. The purpose of this treatment is to show in GFS the reduction in cash, or increase in other accounts payable, with an entry in the respective expense items that made up the cost of producing nonmarket goods and services provided by the government sector unit.[17]

6.39 Use of goods and services also includes all goods and services consumed by a general government unit to produce nonmarket goods and services that are distributed either as social benefits in kind or distributed to households in particular circumstances, such as following a natural disaster. Such social benefits can

[17] The treatment in the *2008 SNA* differs because national accounts have the purpose to calculate production, transfers, and consumption. Therefore, the SNA treatment is to record the cost of production and the imputed sale of the goods and services to the final recipient as the user of the goods and services. In addition, the SNA also records a transfer that is deemed to be used by the recipient to pay for the imputed sale (see the *2008 SNA*, paragraphs 8.43–8.51).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

be distributed through social security schemes; social insurance schemes operated for the benefit of government employees, their dependents, or survivors; or social assistance. A common type of social benefit likely to be produced by general government units and distributed in kind is related to health care, such as medical or dental treatments, surgery, hospital accommodation, home care, and similar services. Benefits for government employees and dependents typically include general medical services not related to the employee's work,[18] convalescent and retirement homes, education services, and access to recreation or vacation facilities. Any nominal payments made by the recipients to the government unit distributing these goods and services should not be deducted from use of goods and services expense, but rather be recorded as the appropriate category of *sales of goods and services* (142), as relevant.

6.40 Goods and services that were not produced by the donor government unit, but are distributed as social benefits in kind or distributed to households in particular circumstances, are classified as *social benefits* (27) rather than use of goods and services. Such distributions include transfers of goods held in inventories, the purchase and simultaneous transfer of goods and services from market producers, and the reimbursement by a general government unit for purchases by households of specified goods or services, such as food, education services, medicines, medical or dental treatments, hospital bills, and optometrists' bills.

6.41 On occasion, government units transfer economic value by purchasing goods and services for prices that greatly exceed their market value. As described in paragraph 3.29, when such transactions can be detected, they should be partitioned into a purchase of goods and services at their true market value and a transfer recorded under the relevant category.

6.42 Membership dues and subscription fees should be recorded as an expense in *use of goods and services* (22) if there is an exchange of a payment for some form of a service. These include payments by public corporations of membership dues or subscriptions to market nonprofit institutions (NPIs) serving businesses, such as chambers of commerce or trade associations, since these are payments for services rendered and are not transfers. In rare cases, market establishments included in the general government sector may have similar membership dues or subscriptions payable to market NPIs serving businesses. Some membership dues and subscription fees are different in nature and are not included in use of goods and services:

- In some cases, membership dues and subscription fees payable to international organizations are recorded as the acquisition of *equity* (32051) when there is a possibility—even if unlikely—of repayment of the full amount. In these cases, the payee is also entitled to a share of the assets upon windup of the international organization.
- Membership dues and subscription fees are recorded as transfers if the transaction is unrequited; if the recipient is an international organization, foreign government, or another general government unit, the transfer is classified as a *grant* (26), or otherwise as *current transfers not elsewhere classified* (2821).

The boundary between use of goods and services and the acquisition of nonfinancial assets

6.43 Goods acquired for use as fixed assets or valuables, or for use in own-account capital formation, are classified as acquisitions of fixed assets or valuables. Costs incurred on inexpensive durable goods, such as small/hand tools, are recorded as *use of goods and services* (22) when such expenses are incurred regularly and are small compared with the costs incurred for the acquisition of machinery and equipment (see paragraphs 7.40 and 7.52). This exclusion of small/hand tools is pragmatic rather than conceptual. Some goods may be used repeatedly, or continuously, in production over many years but may nevertheless be small, inexpensive, and used to perform relatively simple operations. Hand tools such as saws, spades, knives, axes, hammers, screwdrivers, and spanners or wrenches are examples. If expense on such tools takes place at a fairly steady rate and if their value is small compared with amounts payable on more complex machinery and equipment, it may be appropriate to treat the tools as materials or supplies under *use of goods and services* (22). Some flexibility is needed, however, depending on the relative importance of

[18] Should these benefits be related to their employment contract, they will be included in *compensation of employees* (21).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

such tools. In countries in which they account for a significant part of the value of the total stock of machinery and equipment, they may be regarded as fixed assets and their acquisition and disposal by public sector units recorded under the net acquisition of nonfinancial assets.

6.44 Goods and services acquired to increase inventories of materials and supplies, work in progress, finished goods, and goods for resale are included in *changes in inventories* (312), a type of nonfinancial asset (see paragraph 7.75).

6.45 Goods and services consumed for the ordinary maintenance and repair of fixed assets constitute use of goods and services. However, major renovations, reconstructions, or enlargements of existing fixed assets are recorded as acquisitions of fixed assets. See paragraphs 8.25–8.27 for more information on distinguishing these activities.

6.46 Goods and services used in research and development are recorded as acquisitions of fixed assets in the category *intellectual property products* (31132), except in cases where it is clear that the activity does not create any future economic benefit for its owner, in which case it is recorded as use of goods and services. For a description of the recognition criteria for intellectual property products, see paragraphs 8.37–8.41.

6.47 Goods and services used in mineral exploration and evaluation are not recorded as use of goods and services. Regardless of whether successful, they are needed to acquire new reserves and so are all classified as acquisitions of fixed assets recorded as *intellectual property products* (31132).

6.48 Materials to produce coins or notes of the national currency or amounts payable to contractors to produce the currency are included in use of goods and services. The issuance of the coins or notes is a financial transaction that does not involve revenue or expense. Commemorative coins that are not actually in circulation as legal tender are classified as nonfinancial assets (see paragraph 7.135).

6.49 Expenditure on military equipment, including large military weapons systems and armored vehicles acquired by the police and internal security services, are recorded as acquisition of the respective categories of fixed assets, namely *weapons systems* (3114) or *machinery and equipment* (3112). Expenditure on military goods, such as single-use weapons (ammunition, missiles, rockets, bombs, torpedoes) and spare parts, should be recorded as inventories until used, when they are recorded as *use of goods and services* and a withdrawal from *inventories* (see paragraphs 7.74 and 7.86).

Other boundaries related to use of goods and services

6.50 There is a significant conceptual difference between rentals of fixed assets under an operating lease and the acquisition of an asset under a financial lease. Under an operating lease, (see paragraph A4.6) the lessor remains the economic owner of the fixed asset and payments by the lessee are recorded as payments for a service, and therefore recorded as use of goods and services. Under a financial lease (see paragraphs 8.17 and A4.10), the lessee becomes the economic owner of the fixed asset and payments are recorded as payments of interest and repayments of principal by the lessee to the lessor, and thus do not affect use of goods and services (also see paragraphs A4.6–A4.15).

6.51 Amounts payable for the use of nonproduced naturally occurring assets, such as land, are classified as *rent* (2814) and not as *use of goods and services* (22). See paragraphs 5.131–5.132 for a description of this boundary.

6.52 Explicit fees for financial services should always be classified as use of goods and services. However, some transactions include an implicit fee for financial services that is not recorded separately in GFS. These implicit fees can be calculated only in the context of an analysis of the whole of the economy or industry. As indicated in paragraph 6.81, financial intermediation services indirectly measured (FISIM) can usually be estimated only indirectly by compilers of the national accounts. Similarly, the service fee implied by nonlife insurance premiums can be estimated only by looking at all the transactions and costs of the insurance industry (see paragraph 6.125).

Consumption of Fixed Capital [GFS] (23)

6.53 Consumption of fixed capital is the decline, during the course of the reporting period, in the current value of the stock of fixed assets owned and used by a government unit as a result of physical

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Table 6.4 Detailed Classification of Consumption of Fixed Capital [GFS] (23)	
23	Consumption of fixed capital [GFS][1]
	Consumption of fixed capital [SNA][1]
	Minus: Related to own-account capital formation

[1]Further breakdown/"of which" lines could allow for the identification of the category of fixed assets that the consumption relates to. Identifying the type of assets is required for the integration of stocks and flows of each type of asset (see Table 7.2).

deterioration, normal obsolescence, or normal accidental damage.[19] The concept of consumption of fixed capital is identical to the concept used in the *2008 SNA*. However, the amount of *consumption of fixed capital [GFS]* (23) expense recorded in GFS may differ from the amount recorded in the production account of the *2008 SNA* because of the GFS treatment of own-account capital formation (see Table 6.4). When nonfinancial assets are produced on own-account, the consumption of fixed capital related to that production process is recorded in GFS as part of the cost of acquisitions of the fixed assets rather than expense (see paragraph A7.25).

6.54 Consumption of fixed capital may deviate considerably from depreciation as recorded in government financial records. Consumption of fixed capital is a forward-looking measure that is determined by future rather than past events—it is determined by the benefits that institutional units expect to derive in the future from using the asset in production over the remainder of its service life. Consumption of fixed capital is therefore based on the current market value or replacement cost of the asset. Depreciation is normally an allocation of the original costs of fixed assets (historic cost) over subsequent reporting periods. Consumption of fixed capital is calculated on the basis of the estimated opportunity costs of using the assets at the time they are used, as distinct from the prices at which the assets were acquired. Even when the fixed assets used are not actually to be replaced, the amount of consumption of fixed capital charged as a cost of production should be sufficient to enable the assets to be replaced, if desired.

6.55 Consumption of fixed capital is estimated with respect to all fixed assets owned by government units, but not for valuables (precious metals, precious stones, etc.) that are acquired precisely because their value, in real terms, is not expected to decline over time. Consumption of fixed capital does not cover the depletion or degradation of natural assets, such as land, mineral or other deposits, coal, oil, or natural gas, or contracts, leases, and licenses, which are recorded as other changes in the volume of assets (see paragraph 10.52).

6.56 The calculation of the consumption of fixed capital reflects assumptions about normal rates of physical deterioration, obsolescence, and accidental damage. Although some fixed assets, such as roads or railway tracks, may appear to have infinite service lives if properly maintained, their value may nevertheless decline because of a decrease in the demand for their services as a result of technical progress and the appearance of substitutes. Many fixed assets are scrapped or demolished only because they have become obsolete. Consequently, consumption of fixed capital must include an allowance for anticipated obsolescence. Any difference between the normal expected rate of obsolescence and the actual rate of obsolescence within a given period should be recorded as other changes in the volume of assets (see paragraph 10.66).

6.57 Losses of fixed assets due to normal or expected levels of accidental damage (i.e., damage caused to assets used in production resulting from their exposure to the risk of fires, storms, accidents due to human error, etc.) are also included under consumption of fixed capital. When these kinds of accidents occur with predictable regularity, they are taken into account in calculating the average service lives of the goods in question. Any difference between the normal expected and the actual accidental damage within a given period should be recorded as other changes in the volume of assets (see paragraph 10.67).

6.58 Consumption of fixed capital excludes the loss of value when fixed assets are destroyed by acts of war, natural disasters, and other exceptional events that occur very infrequently. Similarly, it excludes losses due to unexpected technological developments that may significantly shorten the service life of an existing fixed asset. These events are recorded as other economic flows and recorded as an other change in the volume of assets (see paragraph 10.66). Holding gains and losses

[19] Consumption of fixed capital is described in the *2008 SNA* in paragraphs 6.240–6.257.

Box 6.1 The Calculation of Consumption of Fixed Capital

Consumption of fixed capital should reflect underlying resource costs and relative demands at the time the production takes place. It should therefore be calculated using the actual or estimated prices and equivalent costs of the rentals of fixed assets prevailing at that time and not at the times the goods were originally acquired. It is recommended that independent estimates of consumption of fixed capital should be compiled in conjunction with estimates of the capital stock. These can be built up from data on the acquisition of fixed assets in the past combined with estimates of the rates at which the efficiency of fixed assets declines over their service lives.

Whenever possible, the initial value of a new fixed asset should be the value at which it was acquired. If assets of all ages and specifications were regularly traded on markets, these prices should be used to value every asset as it ages. However, there is scarce information on the prices of secondhand assets, so a more theoretical approach to determining the price of an asset as it ages must be adopted.

Conceptually, market forces should ensure that the purchaser's price of a new fixed asset is equivalent to the present value of the future benefits that can be derived from it. Therefore, given the initial market price and knowledge of the characteristics of the asset in question, it is possible to project the stream of future benefits and continually update the remaining present value of these. This method of building up estimates of the capital stock and changes in the capital stock over time is known as the perpetual inventory method, or PIM. Estimates of consumption of fixed capital are obtained as a by-product of the PIM.

In the absence of an asset register with appropriate valuations of assets, the PIM requires an estimate to be made of the stock of fixed assets in existence and in the hands of general government or public corporations. The first step is to estimate what proportion of the fixed assets acquired in previous years has survived to the current period. Average service lives, or survival functions, based on observations or technical studies may be applied to past investments for this purpose. Fixed assets purchased at different prices in the past have then to be revalued at the prices of the current period by utilizing appropriate price indices for fixed assets. The construction of suitable price indices covering long periods of time raises difficult conceptual and practical problems, but these technical problems of price measurement must be faced in any case in developing balance sheet values of assets. The stock of fixed assets surviving from past investment and revalued at the purchasers' prices of the current period but before deduction of consumption of fixed capital is often also described as the gross capital stock.

The benefits obtained from the use of a given fixed asset tend to diminish over time. The rate at which the efficiency declines may vary from one type of asset to another. The simplest case to consider is one where the efficiency of the asset remains constant until it disintegrates, like a lightbulb. Other simple cases include the case where the efficiency declines linearly or exponentially over its life. Other methods employ a hyperbolic rate of efficiency loss with relatively little decline in the initial years but increasingly steeper decline as time progresses. However, in practice, calculations are usually not undertaken asset by asset, but for cohorts of assets of similar ages and characteristics. Individual assets within the cohort will retire at different moments, but the age-efficiency profile for the cohort as a whole is typically convex to the origin.

The efficiency profiles of fixed assets determine the profiles of the benefits they command over their service lives. Once the profiles of the benefits over the service lives of the fixed asset have been determined, it becomes possible to calculate the consumption of fixed capital, period by period. Consumption of fixed capital is derived as the reduction in the present value of the remaining benefits, as explained earlier. This reduction, and the rate at which it takes place over time, must be clearly distinguished from the decline in the efficiency of the capital assets themselves. Although the efficiency, and hence the benefit, of an asset may remain constant from period to period until it disintegrates, the value of the asset declines over time. It also follows that the consumption of fixed capital is not constant.

Consumption of fixed capital should not be estimated in isolation from the derivation of a set of data on stock positions of fixed assets. Such data are needed for the balance sheet, as shown in Chapter 7.

due to changes in the price of the asset must also be excluded from consumption of fixed capital. These price changes should be recorded as holding gains or losses, as described in paragraphs 10.5 and 10.15.

6.59 To compute consumption of fixed capital, the fixed assets purchased in the past and still in use have to be revalued at the average prices of the reference period and assumptions have to be made regarding the remaining service lives of each asset and the rate at which their efficiency is expected to diminish. Consumption of fixed capital should be calculated on the assumption of appropriately long service lives. Linear or geometric patterns of decline, or some combination of them, are the patterns most commonly

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

assumed.[20] Box 6.1 provides a more comprehensive explanation of the calculation of consumption of fixed capital.

6.60 Conceptually, costs of ownership transfer on the acquisition of nonfinancial assets should be written off as consumption of fixed capital over the period the asset is expected to be held by the purchaser rather than over the whole life of the asset. This approach reflects the assumption that the benefits provided by the asset must be sufficient to cover both the cost of the asset and the costs of ownership transfer. Cost of ownership transfer on the disposal of an asset is recorded similarly because it is assumed that the benefit that the asset produced during the time the asset is used in production should cover such costs. Cost of ownership transfer on the disposal of a nonfinancial asset is estimated at the time of the acquisition of the asset and is written off over the period that the owner expects to hold the asset), except for the terminal costs, which should be written off over the whole life of the asset. If an asset is disposed of before the costs of ownership transfer are completely written off, the remainder of these costs should be recorded as an other change in the volume of assets (see paragraph 10.68).

6.61 In the *Statement of Sources and Uses of Cash*, expense transactions are recorded only when cash flows occurred. Since no cash flows are associated with consumption of fixed capital, no entry for this accrual concept is made in this statement (see paragraph 3.67).

Interest [GFS] (24)

6.62 Interest is a form of investment income that is receivable by the owners of certain kinds of financial assets (SDRs, deposits, debt securities, loans, and other accounts receivable)[21] for putting these financial and other resources at the disposal of another institutional unit. *Interest [GFS]* (24) is not adjusted for the service charge related to FISIM (see paragraph 6.81). The liabilities giving rise to interest expense are all claims of creditors upon debtors. The liabilities generating the interest may have arisen from the supply of financial or nonfinancial resources (as in the case of financial leases). As indicated in Table 6.5, interest should be recorded according to the subsector of the counterparty to allow for consolidation of the general government and public sectors. The amount of the liability due to the creditor declines as payments are made on the debt by the debtor and increases as interest accrues.

Table 6.5 Detailed Classification of Interest (24)

24	Interest [GFS][1]
	Interest [SNA]
	Plus: FISIM
241	To nonresidents
242	To residents other than general government[1]
243	To other general government units[1]

[1]Further breakdown/"of which" lines could allow for the identification of subsectors and individual units (see Table 3.1).

6.63 Interest is payable by units that incur liabilities by borrowing funds from another unit. Interest is the expense that the debtor unit incurs for the use of the principal outstanding, which represents the economic value that has been provided by the creditor. Interest may be payable in various ways and may not always explicitly be described as interest (see paragraph 6.71). On the other hand, net settlement payments under a swap or forward rate agreement contract (possibly described as "interest" in the contract) are not considered as interest and are to be recorded as transactions in financial derivatives (see paragraphs 6.79 and 9.71).

6.64 Interest is recorded as accruing continuously over time to the creditor on the amount outstanding. Depending on the contractual arrangements, the rate at which interest accrues can be a percentage of the amount outstanding, a predetermined sum of money, a variable sum of money dependent on a defined indicator, or some combination of these. Interest normally is not payable until the expense has accrued. That is, if interest on a loan is payable monthly, the amount paid is usually the expense that has accrued during the previous month. Under the accrual basis of recording, as interest accrues, the debtor's total liability to the creditor has increased by the amount of interest expense accrued but not yet paid. That is, as interest accrues on a government bond, the value of the bond increases. What are commonly referred to as interest payments,

[20] Organisation for Economic Co-operation and Development, *Measuring Capital—OECD Manual: Measurement of Capital Stocks, Consumption of Fixed Capital and Capital Services* (Paris, 2009) contains an extensive discussion of the methods for estimating capital stock and consumption of fixed capital.

[21] Financial assets and their classification are described in Chapter 7.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

therefore, from an accrual recording perspective, are reductions of the debtor's existing liability, part of which was created by the accrued interest expense.

6.65 From a cash recording perspective, periodic debt service payments, recorded in the *Statement of Source and Uses of Cash*, can be distinguished as interest payments ("coupons" or "coupon payments") or principal payments. When using the cash basis of recording, interest payments are recorded as an expense transaction when such cash flows occur. In this case, only principal repayments will reduce the debtor's liability. The amount initially advanced or borrowed is also known as initial principal.

6.66 In macroeconomic statistics, interest is calculated according to the debtor approach.[22] According to this approach, interest is equal to the amounts the debtors will have to pay to their creditors over and above the repayments of the amounts advanced by the creditor. For fixed rate instruments, this approach assumes that interest expense is determined for the entire life of a financial instrument by the conditions set at inception of the instrument. Interest accrual is therefore determined by using the original yield-to-maturity. A single effective yield, established at the time of security issuance, is used to calculate the amount of accrued interest in each period to maturity. The accrual of interest should be calculated by the compound interest method.[23]

6.67 In the simplest case, a sum of money is borrowed, periodic payments are made equal to the interest expense incurred during the previous period, and at the end of the contract, a final payment of interest is made together with a repayment of the original amount borrowed. The amount of interest expense incurred each period is equal to the interest rate stated in the contract multiplied by the amount borrowed.

6.68 When the end of the reporting period does not coincide with a periodic payment, the total liability at the end of the period will include some amount of interest incurred but not yet paid. As each period passes, the amount of principal outstanding increases as interest expense is incurred. Any periodic payment of the accrued interest reduces the principal to the amount originally borrowed.

6.69 Some debt instruments may have a grace period[24] during which no interest payments are to be made. For those debt instruments for which the contract requires the accrual of interest during the grace period (i.e., the relevant interest rate that applies during the grace period is greater than zero), the accrual of interest should be recorded as specified in the contract, increasing the value of the principal. On the other hand, if the debtor can repay the same amount of principal at the end of the grace period as at the beginning (i.e., the relevant interest rate applied to the grace period is zero), no interest costs accrue during the grace period.[25] This remains true even if the rate of interest applied in a second and/or subsequent time period is adjusted (e.g., there is a step up), so that the final yield is roughly similar to what it would have been under normal conditions over the total life of the instrument. This treatment applies to loans and deposits but not to debt securities.

6.70 Loans with step-up interest should accrue at the contractual rate of interest for any period and not at the internal rate of return[26] of the loan. On the other hand, interest on debt securities with step-up interest should accrue at the original yield-to-maturity rate over the life of the security.[27]

6.71 Certain financial instruments, such as short-term bills and zero-coupon bonds, do not require the debtor to make payments to the creditor until the liability matures. In effect, the debtor's liability is discharged by a single payment covering both the amount of the funds originally borrowed and the interest accrued and accumulated over the entire life of the liability. Instruments of this type are said to be discounted because the amount initially borrowed is less than the amount to be repaid. The difference

[22] There are three approaches for defining and measuring interest for traded debt instruments: debtor approach, creditor approach, and acquisition approach (see the *BPM6*, paragraphs 11.52–11.53).

[23] Examples of the calculation of interest can be found in the *PSDS Guide*, Box 2.3, and *2013 EDS Guide*, paragraphs 2.65–2.77.

[24] The grace period is the period from the disbursement of the loan until the first payment due by the debtor.

[25] If a prepayment fee or a penalty for prepayment is paid, it should be classified as a service fee under *use of goods and services* (22), and not as interest.

[26] See the *2013 EDS Guide*, paragraph 2.98 and Box 2.4, for a discussion on internal rate of return.

[27] The original yield-to-maturity rate is the rate at which the present value of future interest and principal payments equals the issue price of the bond—that is, the yield of the security at issuance.

between the amount to be repaid at the end of the contract and the amount originally borrowed is interest, which on the accrual basis of recording must be allocated over the reporting periods between the beginning and end of the contract. The interest accruing in each period is recorded as if being paid by the debtor and then borrowed as an additional amount of the same liability. Thus, interest expense and an increase in the liability are recorded in each period. When more than one reporting period is involved, there are a number of ways to allocate the total amount of interest among the periods involved. The most common and simple method is to assume that the interest rate is constant throughout the contract period. On the cash basis of recording, the full amount of the difference between the amount to be repaid at the end of the contract and the amount originally borrowed is recorded as interest when the payment is made—that is, at the end of the contract when the liability matures.

6.72 A slightly more complicated case is a deep-discount bond, which is a discounted instrument that also requires periodic payments. In such cases, the accrued interest expense is the amount of the coupon payable periodically plus the amount of interest accruing each period attributable to the difference between the redemption price and the issue price. Again, the most common assumption is that the interest rate is constant over the entire period of the contract. This interest rate is the one that makes the sum of all future payments equal to the amount initially borrowed when the future payments are discounted by the interest rate.

6.73 In some cases, debt securities are issued at a premium rather than at a discount. The method of determining the accrued interest expense is identical to the case of a discounted instrument except that the premium (the difference between the redemption price and the issue price—see paragraph 9.40) is amortized over the life of the instrument and reduces (rather than increases) the amount of interest accruing in each period. These premiums are therefore recorded as an increase in cash receipts with a corresponding entry in other accounts payable for the unearned portion of the premium. A reduction in interest expense, with a corresponding reduction in the other accounts payable, is subsequently recorded over the period of the contract. On the cash basis of recording, the full amount of premiums will be recognized as a reduction in interest expense at the time the debt instrument is issued.

6.74 Loans are often structured with periodic payments that incorporate both interest and principal payments. The excess of the periodic payment over the interest accrued reduces the original principal. Over time, the share of the payment allocated to the payment of accrued interest decreases and the share allocated to reducing the original principal increases.

6.75 Index-linked securities are instruments for which either the coupon payments (interest) or the principal or both are linked to another item, such as a price index, an interest rate, or the price of a commodity (see paragraph 7.153). The item is one that normally changes over time in response to market pressures. The values of the indicators are not known in advance. For debt securities with indexation of the amount to be paid at maturity, these amounts may be known only at the time of redemption. As a result, total interest flows before redemption cannot be determined with certainty. To estimate interest accrued before the values of the reference indicators are known, it is useful to distinguish various arrangements.

Indexation of the coupon payments only

6.76 When only coupon payments are index-linked, as with floating-rate notes, the full amount resulting from indexation is recorded as interest accruing during the period covered by the coupon. To the extent that data are compiled after the coupon payment date, the value of the index is known and can be used to estimate that payment. If the data are compiled before the date for the coupon payment, the movement in the index during that part of the reporting period covered by the coupon can be used to calculate the interest accrued.

Indexation of the amount to be paid at maturity

6.77 When the amount to be paid at maturity is also index-linked, the amount of interest accrued becomes uncertain because the redemption value is unknown; in some cases, the maturity time may be several years in the future. There are two approaches,

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

depending on whether the index is based on a broad or narrow reference item.[28]

- When the amount to be paid at maturity and coupon payments are indexed to a broad-based index (e.g., the consumer price index), interest accruing in a reporting period may be calculated by summing two elements:
  - The amount resulting from the indexation of the coupon payment (as described in paragraph 6.76) that is attributable to the reporting period
  - The change in the value of the amount outstanding between the end and beginning of the reporting period due to the movement in the relevant index.

  This approach works well when a broad-based index is used, as such indexation is expected to change relatively smoothly over time.
- When the amount to be paid at maturity or the coupon payments and the amount to be paid at maturity are indexed to a narrow index (e.g., a gold index) that includes a holding gain motive, interest accruing may be determined by fixing the yield-to-maturity (rate of accrual) at the time of issue. Accordingly, interest accrues over the life of the instrument at a rate that reconciles the difference between the issue price and the market expectation, at inception, of all payments that the debtor will have to make over the life of the instrument. Any deviation of the underlying index from the originally expected path leads to holding gains or losses that will not necessarily cancel out over the life of the instrument.

  This approach works well when the indexation of the amount to be paid at maturity combines motives for both interest income and holding gains (e.g., a commodity price, stock prices, or gold prices). The treatment of indexation of securities is also discussed in paragraph 9.41.

6.78 Debt instruments with both the amount to be paid at maturity and coupon payments indexed to foreign currency are recorded as though they are denominated in that foreign currency. Interest, other economic flows, and stock positions for these instruments should be calculated using the same principles that apply to foreign-currency-denominated instruments (see paragraph 9.11).

6.79 For debt securities with embedded derivatives, the recording for accrued interest on the financial instrument is the same as for securities that do not have such features. No interest accrues on the derivative itself (see paragraph 9.43).

6.80 For arrears arising from a debt contract, interest should accrue at the same interest rate as on the original debt, unless a different interest rate for arrears was stipulated in the original debt contract, in which case this stipulated interest rate should be used. The stipulated rate may include a penalty rate in addition to the interest rate on the original debt. If an item is purchased on credit and the debtor fails to pay within the period stated at the time the purchase was made, any extra charges incurred should be regarded as interest and accrue until the debt is extinguished.

6.81 The interest expense payable to financial intermediaries recorded in GFS differs from the amount recorded in the *2008 SNA*. *Interest [GFS]* (24) does not partition interest to separately record a service fee. A financial intermediary sets its interest rates for depositors and borrowers at levels that will provide a margin large enough to at least defray the costs of providing its services to its depositors and borrowers without explicit fees. Interest could be partitioned to separately record the component payable in return for the resources that were put at the disposal of the borrower, as well as an implicit service charge. In concept, the value of the services provided by financial intermediaries to a borrowing unit should be recorded as a use of goods and services expense. To accomplish this treatment, the actual interest expense payable to financial intermediaries would need to be reduced by the value of the fee for the services.[29] These fees, known as FISIM, can be estimated only indirectly by compilers of the national accounts because data for all depositors and borrowers of financial intermediaries are required.

6.82 In principle, interest payable on overdue taxes should be recorded as *interest* (24). However, it may not be possible to separate payments of interest, fines, or other penalties from the taxes to which they relate,

[28] These approaches are discussed in more detail in the *2008 SNA*, paragraphs 17.274–17.282, and the *BPM6*, paragraphs 11.59–11.65.

[29] Similarly, any interest receivable from financial intermediaries would need to be increased by the value of the implicit service fee that has reduced the interest receivable.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

so that in practice they are usually grouped with the relevant tax payable (see also paragraph 5.24). If this tax that includes the interest on late payment of taxes is payable by a general government or public sector unit, then it is classified as a tax payable from one government unit to another and classified as a component of *transfers not elsewhere classified* (282) (see paragraph 6.122). For purposes of consolidation, the relevant government units should be identified as counterparty to the transaction.

6.83 Total interest payable is subdivided into interest payable *to nonresidents* (241), interest payable *to residents other than general government* (242), and interest payable *to other general government units* (243). Interest payable to other general government units will have a nonzero value when statistics are compiled for a subsector of the general government sector or public corporations. For the general government sector, all such transactions are eliminated in consolidation. To allow for consolidation of the general government and public sectors, data could further identify a breakdown according to the recipient of the interest.

Subsidies (25)[30]

6.84 ***Subsidies*** (25) are current unrequited transfers that government units make to enterprises on the basis of the level of their production activities or the quantities or values of the goods or services they produce, sell, export, or import. Subsidies are receivable by resident producers or importers, and in exceptional cases, nonresident producers of goods and services. Subsidies may be designed to influence levels of production, the prices at which outputs are sold, or the profits of the enterprises. Subsidies include payable tax credits receivable by enterprises for these purposes (see paragraph 5.31). By the nature of subsidies, only government units incur an expense in this form. When an institutional unit, other than a government unit, incurs subsidy expense on behalf of a government unit, the subsidy should be attributed in accordance with attribution guidelines, similar to those for tax attribution (see paragraphs 5.32–5.39). When an institutional unit acts on behalf of another unit to distribute subsidies, these should be reported as financial transactions by the distributing agency. Subsidies payable should be recorded only in the account of the entity that has the control over the subsidy scheme.

6.85 Subsidies are payable to producers only, not to final consumers, and are current transfers only, not capital transfers. Transfers that government units make directly to households as consumers and most transfers to nonprofit institutions serving households are recorded as either *social benefits* (27) or *transfers not elsewhere classified* (282), depending on the reason for the payment. Most transfers made to other general government units are included in *grants* (26).

6.86 In some cases, general government units, nonprofit institutions serving households, and households can receive subsidies in their capacity as producers. To be classified as subsidies, such payments must depend on general regulations of the subsidy scheme applicable to all producers, market and nonmarket. For example, a general government unit may pay a subsidy to all employers (including general government units and/or nonprofit institutions) that employ members of a specified profession or people with a specified disability. Subsidies payable to households include only amounts payable to households as producers—therefore, they will include only amounts payable to those unincorporated household enterprises that do not qualify as a quasi-corporation. In practice, many schemes called "subsidies" provide social benefits to households.

6.87 As indicated in Table 6.6, subsidies may be classified according to the institutional sector of the recipients. Subsidies *to public corporations* (251) and *to private enterprises* (252) are further subdivided into nonfinancial or financial corporations and enterprises.

Table 6.6 Detailed Classification of Subsidies (25)

25	Subsidies[1]
251	To public corporations
2511	Public nonfinancial corporations
2512	Public financial corporations
252	To private enterprises
2521	Private nonfinancial enterprises
2522	Private financial enterprises
253	To other sectors[2]

[1]Further breakdown/"of which" lines could identify whether these subsidies are subsidies on products or production.

[2]Further breakdown/"of which" lines could allow for the identification of subsectors and individual units (see Table 3.1).

[30] Subsidies are described in the *2008 SNA*, paragraphs 7.98–7.106.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Subsidies to other sectors (253) include subsidies payable to other general government units, to nonprofit institutions serving households, and to households, in their capacity as producers. To allow for consolidation of the general government and public sectors, identifying the subsectors of the counterparties is needed.

6.88 Although not specifically used in the GFS classification structure, the *2008 SNA* further identifies subsidies according to whether they are payable on specific products or on production in general, depending on how the value of the subsidy is calculated. Further breakdown of GFS codes could allow for this distinction.

6.89 A **subsidy on products** is a subsidy payable per unit of a good or service. The subsidy may be a specific amount of money per unit of quantity of a good or service, or it may be calculated ad valorem as a specified percentage of the price per unit. A subsidy may also be calculated as the difference between a specified target price and the market price actually paid by a buyer. A subsidy on a product usually becomes payable when the good or service is produced, sold, exported, or imported, but it may also be payable in other circumstances, such as when a good is transferred, leased, delivered, or used for own consumption or own-account capital formation. These subsidies include:

- Direct foreign trade subsidies, such as subsidies on imported or exported goods and services that become payable when the goods cross the frontier of the economic territory or when the services are delivered to resident institutional units (e.g., import subsidies) or to nonresident units (e.g., export subsidies)[31]
- Implicit subsidies resulting from the operation of an official system of multiple exchange rates or resulting from payable tax credits (see paragraph 5.31)
- Losses of government trading organizations whose function is to buy products and then sell them at lower prices to residents or nonresidents, when they are incurred as a matter of deliberate government economic or social policy[32]
- Subsidies payable to resident producers in respect of their production that is used or consumed within the economic territory
- Regular transfers payable to corporations and quasi-corporations that are intended to compensate for recurrent losses (i.e., negative operating surpluses) incurred on their productive activities as a result of charging prices that are lower than their average costs of production as a matter of deliberate government economic and social policy[33]
- Subsidies resulting from the central bank accepting interest rates lower than the prevailing market rates (see Box 6.2).

6.90 Other subsidies on production are subsidies that enterprises receive as a consequence of engaging in production but that are not related to specific products. Included are:

- Subsidies on payroll or workforce, which are payable on the total wage or salary bill, the size of the total workforce, or the employment of particular types of persons such as physically handicapped persons or persons who have been unemployed for long periods; the subsidies may also be intended to cover some or all of the costs of training schemes organized or financed by enterprises.
- Subsidies to reduce pollution, which are transfers intended to cover some or all of the costs of additional processing undertaken to reduce or eliminate the discharge of pollutants into the environment.

6.91 Subsidies do not include:

- Payment of interest or other debt service cost on behalf of other producer units without acquiring an effective claim on the original debtor—these payments are recorded as capital transfers, and according to the nature of the recipient, are recorded either as *capital grants* (26) or *capital transfers not elsewhere classified* (2822).
- Transfers made by governments to other resident or nonresident units to finance all or part of the

[31] Export subsidies do not include the repayment at the customs frontier of taxes previously paid on goods or services while they were inside the economic territory. They also exclude the waiving of the taxes that would be due if the goods were to be sold or used inside the economic territory instead of being exported. These tax expenditures/credits are not recorded separately in GFS (see paragraph 5.86).

[32] In these cases, the subsidy is calculated as the difference between the purchase and the selling price.

[33] Transfers to corporations and quasi-corporations to cover large operating deficits accumulated over two or more years are recorded as *capital transfers not elsewhere classified* (2822).

Box 6.2 Implicit Subsidies of Central Banks

The central bank's main responsibility is to formulate and carry out monetary aspects of economic policy. It therefore often acts differently from other financial corporations and generally has the authority from government to enforce its mandate. In cases where the central bank makes payments that are clearly for policy rather than commercial purposes—for example, when it pays above-market rates in a situation where the external value of the currency is under pressure or when it acts as a development bank offering loans at below-market rates to priority industries—it may be argued that implicit subsidies are being provided. This procedure is analogous to and consistent with the practice of treating the difference between the market exchange rate and an alternative exchange rate imposed by the central bank as an implicit subsidy (discussed in paragraph 5.89).

If the central bank interest rates are out of line with those of commercial banks, then the difference between flows calculated using the reference rate and the actual rate set by the central bank should be recorded as implicit taxes receivable (see paragraph 5.70) and subsidies payable by government. These transactions are recorded as follows:

- Below market rates on reserve deposits—Suppose the central bank pays only 3 percent to a commercial bank on reserve deposits when the market rate is 5 percent. The following is recorded in GFS:
  - Although the commercial bank actually receives only 3 percent as interest, it is recorded as receiving 5 percent as interest from the central bank and paying 2 percent to government as *taxes on specific services* (1144) (see paragraph 5.69).
  - Government records a *subsidy* (25) to the central bank.
- Above market rates for currency support—Suppose the central bank pays 7 percent to a commercial bank for a limited period when the currency is under pressure at a time when the market rate is 5 percent. The following is recorded:
  - Although the commercial bank actually receives 7 percent as interest, it is recorded as receiving 5 percent as interest and receiving another 2 percent from government as a *subsidy* (25).
  - Government records a tax of 2 percent receivable from the central bank classified as *taxes on specific services* (1144) (see paragraph 5.69).
- Below market rates to priority industries—Suppose the central bank charges only 3 percent to a priority industry when the market rate is 5 percent. The following is recorded:
  - Although the priority industry actually pays only 3 percent as interest, it is recorded as paying 5 percent as interest but receiving 2 percent from government as a *subsidy* (25).
  - Government records a tax of 2 percent receivable from the central bank classified as *taxes on specific services* (1144) (see paragraph 5.69).

costs of their acquiring nonfinancial assets other than inventories—these payments are recorded either as *capital grants* (26) or as *capital transfers not elsewhere classified* (2822).

- Extraordinary payments into social insurance funds, in so far as these payments are designed to increase the actuarial reserves of these funds: These payments are recorded either as *capital grants to other general government units* (2632) or as *capital transfers not elsewhere classified* (2822).
- Transfers made by general government units to corporations and quasi-corporations to cover large operating deficits accumulated over two or more years, or exceptional losses due to factors outside the control of the enterprise: These payments are recorded as *capital transfers not elsewhere classified* (2822) (see Box 6.3).
- The cancellation of debts that institutional units have incurred to government units (resulting, for example, from loans advanced by a government unit to a nonfinancial enterprise that does not have the ability to make repayments due to trading losses accumulated over several financial years): These transactions are recorded as *capital grants to other general government units* (2632) or as *capital transfers not elsewhere classified* (2822) if the beneficiary is a unit other than general government.
- Payments made by general government for damage to, or losses of, capital goods as a result of acts of war, other political events or natural disasters:

Box 6.3 Transactions with Public Corporations

Owners may inject significant financial support to capitalize or recapitalize a corporation. Such financial support may take various legal forms and its economic substance may also vary (see Figure A3.2). These payments from a government unit, often referred to as "capital injections," could be recorded as:

- An expense, either as a subsidy or capital transfer, or
- A transaction in financial assets/liabilities, either as an addition to equity or an issuance of a loan or securities other than shares.

Recorded as an expense

If the enterprise is publicly controlled and runs a recurrent deficit each year as a matter of government economic or social policy objectives, and the deficit is covered by a regular transfer receivable from government to match this deficit, the payment is regarded as a subsidy (see paragraph 6.89). If the payment from government is to cover large operating deficits accumulated over two or more years or exceptional losses due to factors outside the control of the enterprise, it is recorded as a capital transfer (see paragraph 6.124). Similarly, if government makes an investment in a public corporation without a reasonable expectation of a realistic rate of return on the investment, or without receiving anything of equal value in exchange, this is also recorded as a capital transfer. The latter includes investments in quasi-corporations with negative imputed equity (see paragraph A3.53).

Recorded as transactions in financial assets/liabilities

There may be cases where the owners agree to make new financing available to permit expansion, and where such financing establishes an effective claim on the public corporation. Such financing could consist of funds for use by the enterprise according to its need, including purchasing fixed assets, accumulating inventories, acquiring financial assets, or redeeming liabilities. Where evidence of a contractual financing agreement exists, these could constitute the issuance of a specific financial asset, such as loans, for government and the incurrence of a corresponding debt instrument by the public corporations. Without evidence of a specific financing agreement, such payments are to be included as the acquisition of equity in the public corporation even if no new shares are issued in response to the financial contribution. In such a case, government, acting in the same capacity as a private shareholder, provides funds while receiving contractually something of equal value in exchange (i.e., increased value of its equity) and expecting to earn a sufficient rate of return on its investment, in the form of dividends (as a return on equity). Treatment of these payments as the increase in equity depends on evidence of the corporation's profitability and its ability to pay dividends in future.

These payments are recorded as *capital grants to other general government units* (2632) or as *capital transfers not elsewhere classified* (2822).

- Transfers to households (often called "subsidies") but intended to supplement household income or defray household expense: These do not relate to production activities and should therefore be included in the relevant category of *social benefits* (27).
- Increases in equity in corporate enterprises of general government: These are recorded as transactions in the financial instrument *equity and investment fund shares* (3205) if an effective financial claim is acquired (see Box 6.3).
- Transfers made by a general government unit that has assumed responsibility for pension claims on public enterprises: These payments are recorded as *capital transfers not elsewhere classified* (2822).
- Payments made by general government to market producers to pay entirely, or in part, for goods and services that those market producers provide directly and individually to households in the context of social risks or needs and to which the households have a right: These payments are recorded as *social benefits* (27).

Grants (26)

6.92 ***Grants*** (26) are transfers payable by government units to other resident or nonresident government units or international organizations and that do not meet the definition of a tax, subsidy, or social contribution (see paragraph 3.10). Grants are normally payable in cash, but may also take the form of provision of goods or services (in kind). Grants payable are classified first by the type of unit receiving the grant and then by whether the grant is current or capital.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

6.93 Three types of recipients of grants are recognized in GFS: *grants to foreign governments* (261), *grants to international organizations* (262), and *grants to other general government units* (263). The category of grants payable by government units to other general government units has a nonzero value only in the case of statistics compiled for a subsector of the general government sector. For the general government sector, these transactions are eliminated in consolidation. To allow for consolidation, grants payable to other general government units should be identified according to the subsector of the counterparty (see Table 6.7).

6.94 Grants payable distinguish *current grants* (2611/2621/2631) and *capital grants* (2612/2622/2632). The distinction between current and capital grants is described in paragraph 5.103. If doubt exists regarding the character of a grant, it should be classified as current. The nature of grants in kind, the time at which a grant is recorded, and the valuation are discussed in paragraphs 5.104–5.105.

6.95 In the *Statement of Sources and Uses of Cash*, the value of grants will be limited to grants paid in cash. Grants in kind will not be recognized in this statement since no cash flows related to the in-kind transaction are recorded. However, any cash payments incurred in the production of the goods or services provided in kind will be included in the respective expense items (i.e., compensation of employees, goods and services and consumption of fixed capital).

Table 6.7 Detailed Classification of Grants (26)

26	Grants
261	To foreign governments
2611	Current
2612	Capital
262	To international organizations
2621	Current
2622	Capital
263	To other general government units
2631	Current[1]
2632	Capital[1]

[1]Further breakdown/"of which" lines could allow for the identification of subsectors and individual units (see Table 3.1).

Social Benefits [GFS] (27)[34]

6.96 Social benefits are current transfers receivable by households intended to provide for the needs that arise from social risks—for example, sickness, unemployment, retirement, housing, education, or family circumstances. These benefits are payable in cash or in kind to protect the entire population or specific segments of it against certain social risks. **Social risks** are events or circumstances that may adversely affect the welfare of the households concerned either by imposing additional demands on their resources or by reducing their income. Examples of social benefits are the provision of medical services, unemployment compensation, and social security pensions. For a complete discussion on social protection, see Appendix 2.

6.97 Not all social benefits as defined in the *2008 SNA* are classified in this GFS expense item (see Table 6.8). *Social benefits [GFS]* (27) exclude:

- The payment of pensions and other retirement benefits through employment-related social schemes, which are recorded in GFS as reductions in liabilities.[35]
- Goods and services produced by government and transferred to households are expense transactions not classified as social benefits. Instead, the expense transactions are recorded as production expenses as part of compensation of employees, use of goods and services, and consumption of fixed capital, as appropriate.[36]

6.98 Social benefits are classified first according to the type of social protection arrangement governing their payment: social security, social assistance, or employment-related social insurance schemes, and

[34] The institutional units involved, classification, and recording of flows and stock positions related to social protection are described in Appendix 2.

[35] In the *2008 SNA*, all payments of pension and other retirement benefits are recorded as transfer payments: those paid through social security schemes are solely transfer payments, whereas payments through employment-related schemes, other than social security (defined contributions or defined benefits), are first recorded as transfer payments to households in the use of income account, and then as a change in pension entitlements in the financial account. Subsequently, the reductions in liabilities are recorded as an adjustment entry made to remove any inconsistency between the benefits and the change in liabilities.

[36] In the *2008 SNA*, when a general government unit produces goods and services that are distributed as social benefits, the expense items related to the costs of producing them, such as compensation of employees, are the same as in this *Manual*. However, in the *2008 SNA*, unlike this *Manual*, the value of the goods and services produced is also included as social benefits.

273	Employment-related social benefits [GFS]
2731	Employment-related social benefits in cash [GFS]
2732	Employment-related social benefits in kind [GFS]

[1]A similar breakdown could be applied to other subcategories of social benefits, as relevant.

then by whether the payment was made in cash or in kind. These benefits are divided between pensions and nonpension benefits.

6.99 ***Social security benefits*** *[GFS]* (271) are social benefits expense payable in cash or in kind to households by social security schemes (see paragraph A2.33). Typical *social security benefits in cash [GFS]* (2711) include extended sickness and invalidity benefits, maternity allowances, children's or family allowances, unemployment benefits, retirement and survivors' pensions, and death benefits.

6.100 *Social security benefits in kind [GFS]* (2712) typically consist of goods and services purchased from a market producer on behalf of households and benefits related to the reimbursements of costs of goods and services purchased by households in accordance with the rules of the scheme.[37] These benefits are likely to consist of medical or dental treatments, surgery, hospital accommodation, spectacles or contact lenses, pharmaceutical products, home care, and similar goods or services.

[37] Although these reimbursements (partial or in full) are normally paid in cash, they are recorded as social benefits in kind, because they are assumed to be incurred directly by the social security fund at the time the household makes the purchase.

6.101 ***Social assistance benefits*** (272) are transfers payable in cash or in kind to households to meet the same needs as social insurance benefits but that are not made under a social insurance scheme. Eligibility to receive such benefits is not dependent on having elected to participate as demonstrated by the payment of contributions. Social assistance benefits therefore exclude all benefits payable by social security funds.

6.102 Social assistance benefits may include those benefits payable under any one of the following circumstances:

- No social insurance scheme exists to cover the circumstances in question.
- Although a social insurance scheme, or schemes, may exist, the households in question do not participate and are not eligible for social insurance benefits.
- Contributions to social insurance schemes were made on behalf of households who cannot otherwise afford to participate in the scheme, in order to secure entitlement to the benefits of the scheme for them.
- Social insurance benefits are deemed to be inadequate to cover the needs in question, so the social assistance benefits are being paid in addition.
- Implicit social assistance benefits were paid resulting from payable tax credits (see paragraph 5.31).
- As a matter of general social policy.

6.103 Social assistance benefits do not include transfers made in response to events or circumstances, such as natural disasters, which are not normally covered by social insurance schemes. Such transfers are recorded under *transfers not elsewhere classified* (282).

6.104 ***Employment-related social benefits*** (273) are social benefits payable in cash or in kind by government or public sector units to their employees or employees of other government or public sector units participating in the scheme (or to survivors and dependents of the employees who are eligible for such payments). The kinds of benefits provided relate to nonpension benefits, and are similar to those listed for social security schemes, such as the continued payment of wages during periods of absence from work as a result of ill health, accidents, maternity,

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

etc.; family, education, or other allowances; severance allowances in the event of redundancy, incapacity, or accidental death; general medical expenses not related to the employees' work; and charges for convalescent and retirement homes.

6.105 The payment of employer social benefits is often made out of the government's own resources without involving an insurance enterprise or an autonomous or nonautonomous pension fund. To reflect the true economic nature of the operation and to ensure comparability with similar payments made through social security schemes, an imputation of *employers' social contributions [GFS]* (2122) (see paragraph 6.22) is made in expense, recorded as compensation of employees (21), and in revenue, recorded as *imputed social contributions* (1223). These imputed values are equal to the value of the employment-related social benefits payable in this item.

6.106 When using the accrual basis of recording, the payment of pensions and other retirement benefits through these employment-related pension schemes is recorded as reductions in liabilities (see paragraph 7.189). However, when using the cash basis of recording, the liability did not accumulate through imputed contributions recorded in the past, and all payment of these employment-related pensions should be recorded as *employment-related social benefits* (2731).

Other Expense (28)

6.107 Other expense comprises *property expense other than interest* (281), *transfers not elsewhere classified* (282), and amounts payable in respect of *premiums, fees, and claims payable related to nonlife insurance and standardized guarantees* (283).

Property expense other than interest (281)

6.108 ***Property expense*** (281) is the expense payable to the owners of financial assets or natural resources when they put them at the disposal of another unit. Property expense is the sum of investment expense and rent. One type of investment expense is *interest [GFS]* (24), which is classified separately in GFS. Property expense other than interest may take the form of *dividends* (2811); *withdrawals of income from quasi-corporations* (2812); *property expense for investment income disbursements* (2813); *rent* (2814); and *reinvested earnings on direct foreign investments* (2815). Dividends and withdrawals of income from quasi-corporations as an expense will primarily apply to public corporations and foreign direct investment of the public sector.

Table 6.9 Detailed Classification of Dividends (2811)

2811	Dividends
28111	To nonresidents
28112	To residents[1]

[1]Further breakdown/"of which" lines could allow for the identification of subsectors and individual units (see Table 3.1).

Dividends (2811)

6.109 ***Dividends*** (2811) are the distributed earnings allocated to government or public sector units, as the owners of equity, for placing funds at the disposal of corporations. As shown in Table 6.9, identifying the recipient of dividends from public corporations would allow for consolidation of statistics of the public sector. Dividend payments are not required; the board of directors or other managers of the corporation must declare a dividend payable on their own volition. Distributions of profits by public corporations may take place irregularly and may not be explicitly labeled as dividends. Nevertheless, except for distributions by fiscal, export, or import monopolies, dividends include all distributions of profits by public corporations to their shareholders or owners.[38] The time of recording of dividends is the point at which the share price starts to be quoted on an "ex-dividend" basis. Dividends are described in more detail in paragraphs 5.111–5.117.

6.110 Dividends are notionally payable out of the current period's operating surplus, although corporations often smooth the payments of dividends, sometimes paying out less than the operating surplus but sometimes paying out more, especially when the operating surplus itself is very low. Dividends that are disproportionately large relative to the recent level of dividends and earnings, often referred to as "superdividends," require special consideration. See paragraphs 5.115–5.116 for a description of the treatment

[38] Distributions of profits by fiscal, export, and import monopolies are recorded as taxes payable (see paragraphs 5.63–5.68 and 5.86). Therefore, in expense, these amounts payable are classified as *transfers not elsewhere classified* (282).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

of these "super-dividends" in the context of the corresponding revenue item.

Withdrawals of income from quasi-corporations (2812)

6.111 ***Withdrawals of income from quasi-corporations*** (2812) consists of that part of distributable income that the owner withdraws from the quasi-corporation. By definition, quasi-corporations cannot distribute income in the form of dividends, but the owner may choose to withdraw some or all of the income. Conceptually, the withdrawal of such income is equivalent to the distribution of corporate income through dividends and is recorded in the same way. The amount of income that the owner of a quasi-corporation chooses to withdraw will depend largely on the size of its net income. All such withdrawals are recorded on the date the payment actually occurs. See paragraphs 5.118–5.119 for a description of the recording of the corresponding revenue item.

6.112 As with dividends, withdrawals of income from quasi-corporations do not include withdrawals of funds realized by the sale or other disposal of the quasi-corporation's assets. Funds withdrawn by liquidating large amounts of accumulated retained earnings or other reserves of the quasi-corporation are recorded as withdrawals from equity. The sale of inventories, fixed assets, land, or other nonproduced assets to withdraw funds would be recorded in the accounts of the quasi-corporation as disposals in the appropriate category of assets (see paragraphs 7.34–7.117), with government recording a withdrawal from equity.

Property expense for investment income disbursements (2813)

6.113 ***Property expense for investment income disbursements*** (2813) includes property income attributed to insurance policyholders, pension entitlements, and holders of investment fund shares (see paragraphs 7.174 and 7.178). Public corporations can be insurance enterprises or may operate pension schemes, in which case they will hold technical reserves in the form of reserves against outstanding risks in respect of nonlife and life insurance policies, as well as reserves to provide for the entitlement on pension and nonpension benefits and calls under standardized guarantee schemes. The reserves are liabilities toward the policyholders or beneficiaries. Any income receivable from the investment of the corresponding assets should be attributed as the property income of the policyholders or beneficiaries, and therefore a property expense is recorded to reflect the increase in liabilities.

6.114 General government units are less likely to operate an insurance scheme, but if they do and if they maintain separate reserves, the property expense attributed to insurance policyholders would be recorded in the same manner as for a public corporation. If the general government unit does not maintain separate reserves, then no investment income is generated and so no property expense is attributed to the policyholders.[39]

6.115 For government units operating a standardized guarantee scheme against fees, there may also be investment income earned on the reserves of the scheme and this should be shown as a property expense being distributed to the units paying the fees (which may not be the same units that stand to benefit from the guarantees). Appendix 4 describes the recording of transactions related to standardized guarantee schemes.

6.116 As described in Appendix 2, pension entitlements arise from one of two types of pension schemes: defined-contribution schemes and defined-benefit schemes. Under both schemes, the operator of the scheme records a property expense attributed to policyholders to reflect changes in the liability outstanding for the pension entitlements. These changes may arise from investment income and the change in value due to the passage of time.

6.117 With a defined-benefit scheme, the future pension benefits are defined by some formula normally related to participants' length of service and salary. The nominal values of the pension benefits payable in the future are determined actuarially based on estimates of variables, such as expected retirement ages, mortality rates, expected inflation, and expected salary increases. The nominal values can then be converted to present values using an appropriate discount rate. Over time, the total liability of the pension scheme will change because of the receipt

[39] For a description of flows and stock positions related to insurance and standardized guarantee schemes, see paragraphs A4.66–A4.80.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

of additional contributions and property income, the payment of benefits, changes in the actuarial assumptions, and the passage of time. The property expense attributed to a pension fund's policyholders is equal to the increase in the liability resulting from the property income accruing on the pension fund's assets held on behalf of the beneficiaries and the passage of time, which occurs because the future benefits are discounted over fewer reporting periods.

6.118 With defined-contribution schemes, the level of contributions to the fund, rather than the level of benefits, is guaranteed by the employer. All defined-contribution schemes are funded (see paragraph A2.55), and the liability of a defined-contribution scheme is equal to the current market value of the fund's assets. Therefore, the property expense attributed to insurance policyholders is equal to the property income receivable from the investment of the scheme's assets. Any holding gains on the scheme's assets are equally reflected in holding losses on the scheme's unit's liability to the beneficiaries.

6.119 The increase/decrease in the value of investment fund shares (or units), other than from other economic flows, is recorded as property income, either distributed to the share- (or unit) holders or reinvested by the holders in the shares (or units).

Rent (2814)

6.120 ***Rent*** (2814) is the expense payable to the owners of a natural resource (the lessor or landlord) for putting the natural resource at the disposal of another institutional unit (a lessee or tenant) for use of the natural resource in production. Rent payable is typically related to a resource lease on land, subsoil resources, and on other natural resources. Rent accrues continuously to the asset's owner throughout the period of the contract and may be payable in cash or in kind. The types of resource rent and the boundary between resource rent, rental of produced assets, and taxes are described in detail in paragraphs 5.124–5.132 in the context of the corresponding revenue item.

Reinvested earnings on foreign direct investment (2815)

6.121 Reinvested earnings are the direct investor's share of the retained earnings of the direct investment enterprise. Public corporations may have foreign direct investors. Actual distributions to such nonresident foreign direct investors may be made out of their distributable income in the form of dividends or withdrawals of income from quasi-corporations. However, macroeconomic statistics also require the retained earnings of a foreign direct investment enterprise to be recorded as if they were distributed and remitted to foreign direct investors in proportion to their ownership of the equity in the enterprise and then reinvested by them by means of additions to equity. The imputed remittance of these retained earnings is classified as a form of distributed income that is separate from, and additional to, any actual payments of dividends or withdrawals of income from quasi-corporations. This treatment assumes that the decision to retain some earnings within the enterprise must represent a deliberate investment decision on the part of the foreign direct investor. Reinvested earnings are described in detail in paragraphs 5.134–5.135 in the context of the corresponding revenue item.

Transfers not elsewhere classified (282)

6.122 ***Transfers not elsewhere classified*** (282) payable include a number of gifts and transfers to individuals, private nonprofit institutions, nongovernmental foundations, corporations, or government units that are not included in other categories of transfers and serve quite different purposes. *Transfers not elsewhere classified* (282) are subdivided into *current transfers not elsewhere classified* (2821) and *capital transfers not elsewhere classified* (2822). It may be of analytic interest to classify this group of transactions according to the recipients, such as residents and nonresidents. Among residents, it may also be of interest to classify them according to whether these are households, nonprofit institutions serving households, public nonfinancial corporations, public financial corporations, or private corporations (see Table 6.10).

Current transfers not elsewhere classified (2821)

6.123 The most important types of current transfers included here are:

- Current transfers to nonprofit institutions serving households: These transfers usually consist of cash

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Table 6.10 Detailed Classification of Transfers Not Elsewhere Classified (282)	
282	Transfers not elsewhere classified[1]
2821	Current transfers not elsewhere classified
2822	Capital transfers not elsewhere classified

[1]Further breakdown/"of which" lines could allow for the identification of subsectors and individual units (see Table 3.1).

in the form of membership dues, subscriptions, and voluntary donations, whether made on a regular or occasional basis.[40] Such transfers are intended to cover the costs of the production of nonprofit institutions serving households or to provide the funds out of which current transfers may be made to households in the form of social assistance benefits. This category also covers transfers in kind in the form of food, clothing, blankets, and medicines to charities for distribution to households.

- Current taxes, compulsory fees, and fines imposed by one unit of general government or public corporations on another government unit or public corporation: These transfers are subject to elimination by consolidation.
- Net nonpayable tax credits: When, due to timing differences, the amount of a nonpayable tax credit exceeds the amount of tax otherwise receivable from taxpayers in the reporting period, and the excess is paid to the taxpayer, the net payment should be recorded as expense rather than negative tax.
- Gross payable tax credits other than those classified as subsidies or social benefits: These amounts arise from tax credits payable irrespective of whether taxes are payable, and are recorded on a gross basis so that the total amount payable is recorded as expense (see paragraphs 5.29–5.32).
- Fines and penalties imposed by courts of law or quasi-judicial bodies.
- Payments of compensation for injury to persons or damage to property caused by general government or public sector units, excluding payments of nonlife insurance claims: These payments can be either compulsory payments awarded by courts of law or ex gratia payments agreed out of court.
- Scholarships and other educational benefits payable for households that are not related to social risks.
- Purchases of goods and services from market producers that are distributed directly to households for final consumption other than social benefits.

[40] Membership dues and subscription fees are recorded as an expense in *use of goods and services* (22) if there is an exchange of a payment for some form of a service (see paragraph 6.42).

Capital transfers not elsewhere classified (2822)

6.124 The most important types of capital transfers included here are:

- Capital taxes (see paragraph 5.51) imposed by one unit of general government on another government unit or public corporation: These transfers are subject to elimination by consolidation.
- Major, nonrecurrent, exceptional payments in compensation for extensive damages or serious injuries such as those arising from catastrophes not covered by insurance policies are included as a capital transfer.
- Capital transfers to corporations, quasi-corporations, nonprofit institutions serving households, households, and nonresidents in cash or in kind, to finance all or part of the costs of acquiring nonfinancial assets, to cancel or assume a debt by mutual agreement with the debtor without acquiring an effective financial claim on the original debtor (see Box 6.3).[41]
- Transfers payable to corporations and quasi-corporations to cover large operating deficits accumulated over two or more years.[42]
- Payment of interest or other debt service cost on behalf of other producer units without acquiring an effective claim on the original debtor.
- Amounts payable in excess of the value of liabilities for the provision of pension entitlements assumed by other units.[43]

[41] This expense category excludes amounts payable for the acquisition of equity (see paragraph 9.49).

[42] Where a realistic expectation exists that such amounts will be repayable, as indicated by certain criteria (see Box 6.3), the transaction should be classified as the acquisition of a financial asset. A regular transfer covering an operating deficit is recorded as a subsidy.

[43] Amounts payable up to the value of the liability assumed should be recorded as transactions in financial assets and liabilities (i.e., the reduction in liabilities) (see paragraphs 9.66–9.67).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Premiums, fees, and claims payable related to nonlife insurance and standardized guarantee schemes (283)

6.125 ***Premiums, fees, and claims payable related to nonlife insurance and standardized guarantee schemes*** (283) include nonlife insurance premiums payable to insurance schemes/corporations to secure entitlement to insurance against risks, claims payable by insurance schemes to beneficiaries, and fees payable to obtain standardized guarantees. To allow for consolidation of the general government and public sectors, this expense should also be classified according to the subsector of the counterparty (see Table 6.11). A distinction is made between *premiums, fees, and current claims payable* (2831) and *capital claims payable* (2832):

- ***Premiums, fees, and current claims payable*** (2831) comprise nonlife insurance premiums expense and fees payable for the issuance of standardized guarantees, as well as insurance settlement expense that are not exceptional. The premiums and fees are payable to insurance schemes and corporations to obtain coverage against various events or accidents. Such amounts are always recorded as current transfers.[44] Also included are nonlife insurance claims payable by insurance schemes operated by a general government unit or public insurance corporation in settlement of claims that become due during the current reporting period. Claims become payable when the eventuality occurs that gives rise to a valid claim, regardless of whether paid, settled, or reported during the reporting period. Such insurance claims that are not exceptional are recorded as current transfers (see also paragraph A4.79 for the recording of standardized guarantee schemes).
- ***Capital claims payable*** (2832) comprise exceptionally large insurance settlements payable in the wake of a catastrophic event or disaster. For these exceptional large claims payable, such as those following a catastrophe, some part of the claims may be recorded as capital transfers rather than as current transfers. It may be difficult for the parties to identify these events consistently, so as a simplifying convention, all nonlife insurance claims are classified as current transfers, unless it is necessary to record a capital transfer to be consistent with the national accounts.

Table 6.11 Detailed Classification of Premiums, Fees, and Claims Payable Related to Nonlife Insurance and Standardized Guarantee Schemes (283)

283	Premiums, fees, and claims payable related to nonlife insurance and standardized guarantee schemes
2831	Premiums, fees, and current claims payable
28311	Premiums payable[1]
28312	Fees payable for standardized guarantee schemes
28313	Current claims payable[1]
2832	Capital claims payable[1]

[1]Further breakdown/"of which" lines could allow for the identification of subsectors and individual units (see Table 3.1).

[44] In the *2008 SNA*, nonlife insurance premiums payable are partitioned into a purchase of a service and a transfer. In GFS, the entire premium is considered a transfer because the policyholder is not able to partition the service and transfer components.

Annex: Classification of the Functions of Government

This annex describes the classification of expenditure according to the functions of government.

Introduction

6.126 The **Classification of Functions of Government** (COFOG) is a detailed classification of the functions, or socioeconomic objectives, that general government units aim to achieve through various kinds of expenditure. COFOG is integral to the GFS presentation. It is one of a family of four classifications referred to as classifications of expenditure according to purpose.[45] COFOG provides a classification of government outlays by functions that experiences have shown to be of general interest and useful to a wider variety of analytic applications. Statistics on health, education, social protection, and environmental protection, for example, can be used to study the effectiveness of government programs in those areas. In contrast, the Classification of Environmental Activities (CEA) is a functional classification that covers a more limited but specialized activity.[46]

6.127 While the COFOG as used in this *Manual* fully agrees with the OECD/UN classification, the concept is applied slightly differently in GFS. Final outlays are referred to in a general sense by the OECD/UN, and therefore include grants, loans, and/or subsidies. In GFS, COFOG is applied only to expenditure, comprising expense and the net investment in nonfinancial assets. Transactions in financial assets and liabilities, such as loans, are excluded when compiling COFOG data for GFS reporting purposes. For the general government sector, transactions in financial assets and liabilities are usually fungible, to such an extent that a functional classification of these financing activities may be less useful.

Structure of COFOG Classifications

6.128 The classification codes of COFOG are somewhat different from the structure of other GFS classification codes. The functions are classified using a three-level scheme. There are 10 first-level, or two-digit, categories, referred to as divisions. Examples are *health* (Division 07) and *social protection* (Division 10). Within each division, there are several groups, or three-digit categories, such as *hospital services* (Group 073) and *sickness and disability* (Group 101). Within each group, there are one or more classes, or four-digit categories, such as *nursing and convalescent home services* (Class 0734) and *disability* (Class 1012). All three classification levels and detailed descriptions of the contents of each class are reproduced in this annex. Table 6A.1 lists the divisions and groups. In the GFS framework, the prefix "7" has been added to align the COFOG codes with other GFS classification codes.

6.129 All expenditure on a particular function is aggregated in one category of COFOG regardless of the economic nature of the expenditure. That is, transfers payable in cash designed to be used for a particular function, the purchase of goods and services from a market producer that are transferred to households for the same function, the production of goods and services by a general government unit, and/or the net investment in a nonfinancial asset for that same function are all reported under the same function.

Uses of COFOG

6.130 COFOG permits trends in government expenditure on particular functions or policy purposes

[45] COFOG was produced by the Organisation for Economic Cooperation and Development (OECD) and was published together with the other three classifications in United Nations (UN), *Classifications of Expenditure according to Purpose* (New York, 2000). The other classifications are the Classifications of Individual Consumption According to Purpose (COICOP), the Classification of the Purpose of Nonprofit Institutions Serving Households (COPNI), and the Classification of the Outlays of Producers According to Purpose (COPP).

[46] CEA is one of the classifications and lists contained in the *System of Environmental-Economic Accounting Central Framework (SEEA)*. See Appendix 7 for a description of the linkages between GFS and the *SEEA*. For more details on CEA, also see the *Classification of Environmental Protection Activities and Expenditure* (*CEPA*) (UN, 2000c).

Table 6A.1 Classification of Expenditure by Functions of Government According to Divisions and Groups

7	**Total expenditure**
701	**General public services**
7011	Executive and legislative organs, financial and fiscal affairs, external affairs
7012	Foreign economic aid
7013	General services
7014	Basic research
7015	R&D General public services
7016	General public services n.e.c.
7017	Public debt transactions
7018	Transfers of a general character between different levels of government
702	**Defense**
7021	Military defense
7022	Civil defense
7023	Foreign military aid
7024	R&D Defense
7025	Defense n.e.c.
703	**Public order and safety**
7031	Police services
7032	Fire protection services
7033	Law courts
7034	Prisons
7035	R&D Public order and safety
7036	Public order and safety n.e.c.
704	**Economic affairs**
7041	General economic, commercial, and labor affairs
7042	Agriculture, forestry, fishing, and hunting
7043	Fuel and energy
7044	Mining, manufacturing, and construction
7045	Transport
7046	Communication
7047	Other industries
7048	R&D Economic affairs
7049	Economic affairs n.e.c.
705	**Environmental protection**
7051	Waste management
7052	Waste water management
7053	Pollution abatement
7054	Protection of biodiversity and landscape
7055	R&D Environmental protection
7056	Environmental protection n.e.c.
706	**Housing and community amenities**
7061	Housing development
7062	Community development
7063	Water supply
7064	Street lighting
7065	R&D Housing and community amenities
7066	Housing and community amenities n.e.c.
707	**Health**
7071	Medical products, appliances, and equipment
7072	Outpatient services
7073	Hospital services
7074	Public health services
7075	R&D Health
7076	Health n.e.c.
708	**Recreation, culture, and religion**
7081	Recreational and sporting services
7082	Cultural services
7083	Broadcasting and publishing services
7084	Religious and other community services
7085	R&D Recreation, culture, and religion
7086	Recreation, culture, and religion n.e.c.
709	**Education**
7091	Pre-primary and primary education
7092	Secondary education
7093	Postsecondary nontertiary education
7094	Tertiary education
7095	Education not definable by level
7096	Subsidiary services to education
7097	R&D Education
7098	Education n.e.c.
710	**Social protection**
7101	Sickness and disability
7102	Old age
7103	Survivors
7104	Family and children
7105	Unemployment
7106	Housing
7107	Social exclusion n.e.c.
7108	R&D Social protection
7109	Social protection n.e.c.

Note: R&D = research and development; n.e.c. = not elsewhere classified.

to be examined over time. Conventional government accounts are not usually suitable for this purpose because they reflect the organizational structures of governments. Not only might time series be distorted by organizational changes, but at a specific time some organizations may be responsible for more than one function, and responsibility for one function might be divided among several organizations. For example, if a government establishes a new department that brings together some of the functions previously

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

administered by several departments or at several levels of government, it will not usually be possible to use conventional government accounts to compare expenditure on these purposes over time.

6.131 COFOG is also used for making international comparisons of the extent to which governments are involved in particular economic and social functions. Just as COFOG avoids the problems of organizational changes in a single government, so too does it avoid the problems of organizational differences among countries. In one country, for example, all functions connected with water supply may be undertaken by a single government agency, while in another country, they may be distributed among departments dealing with the environment, housing, or industrial development.

6.132 For particular kinds of analyses, COFOG provides key aggregates that could be used as indicators or measures of results. For example, in studies of social assistance, information on past expenditure on the social protection function could give an indication of changes in the support provided by government for the welfare of the population. Similarly, analyzing the impact of economic growth on the environment may require information on the expenditure on environmental protection.

Individual versus Collective Goods and Services

6.133 Government services can benefit the community either individually or collectively. COFOG is used to distinguish between individual and collective goods and services provided by general government units. The COFOG functions are defined so that they represent individual or collective consumption, but not both.

6.134 A **collective service** is a service provided simultaneously to all members of the community or to all members of a particular section of the community, such as all households living in a particular region. Other characteristics of these collective services may be summarized as follows:

- The use of such services is usually passive and does not require the explicit agreement or active participation of all the individuals concerned.
- The provision of a collective service to one individual does not reduce the amount available to others in the same community or section of the community. There is no rivalry in consuming these services.

6.135 An **individual consumption good or service** is one that is acquired by a household and used to satisfy the needs or wants of members of that household. Individual goods and services are essentially "private" as distinct from "public" goods and services. They have the following characteristics:

- It must be possible to observe and record the acquisition of the good or service by an individual household or member thereof as well as the time at which it took place.
- The household must have agreed to accept the provision of the good or service and to take whatever action is necessary to make it possible—for example, by attending a school or clinic.
- The good or service must be such that its acquisition by one household or person, or possibly by a small, restricted group of persons, precludes its acquisition by other households or persons.

6.136 An important characteristic of an individual good or service is that its acquisition by one household, person, or group of persons brings no (or very little) benefit to the rest of the community. The borderline between individual goods and services and collective services is not always clear. While the provision of certain individual health or education services (e.g., vaccination or immunization) may bring some external benefits to the rest of the community, in general, the individuals concerned derive the main benefit. When a government unit incurs expenditure on the provision of individual goods or services, it must decide not only how much to spend in total but how to allocate, or distribute, the goods or services among individual members of the community. In contrast, in the case of collective services, all members of the community benefit from such services.

6.137 Expenditure incurred by governments in connection with individual services such as health and education are to be treated as collective services when they are concerned with the formulation and administration of government policy, the setting and enforcement of public standards, the regulation, licensing, or supervision of producers, etc. For example, the expenditure incurred by ministries of health or education at a national level are to be included in

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

collective consumption expenditure as they are concerned with general matters of policy, standards, and regulation. On the other hand, any overhead expenses connected with the administration or functioning of a group of hospitals, schools, colleges, or similar institutions are to be included in individual expenditure. For example, if a group of private hospitals has a central unit that provides certain common services such as purchasing, laboratories, ambulances, or other facilities, the costs of these common services would be taken into account in the prices charged to patients. The same principle must be followed when the hospitals are nonmarket producers: all the costs that are associated with the provision of services to particular individuals, including those of any central units providing common services, should be included in the value of expenditure on individual services.

6.138 All of classes 701 to 706 are collective services, as are sections 7075 and 7076 of health; sections 7083 to 7086 of recreation, culture, and religion; sections 7097 and 7098 of education; and sections 7108 and 7109 of social protection. These sections cover expenditure on general administration, regulation, research that is not recorded as investment in nonfinancial assets, and so on. The remaining sections of health, recreation, culture and religion, education, and social protection (which dominate each of the classes) are considered to be individual services.

6.139 In this annex, each class is marked "CS" or "IS" to designate it as collective services or individual services, respectively. This distinction is used for the computation of final consumption expenditure and actual final consumption of the general government and household sectors in the national accounts, as described in paragraphs A7.53–A7.62. Purchases of goods and services that are provided to individual households or persons are treated as social transfers in kind in the *2008 SNA* so that the actual final consumption of government and households, in addition to their final consumption expenditure, can be computed. Therefore, statistics compiled for each economic type of expenditure by function are needed for compiling national accounts according to the *2008 SNA*.

Units of Classification

6.140 The units of classification are, in principle, individual transactions. Each purchase of goods and services, wages payable, transfer, or other expenditure should be assigned a COFOG code according to the function that the transaction serves. For most expenditure, however, it will generally not be possible to use transactions as the unit of classification and institutional units may also not necessarily be performing a single function. Instead, COFOG codes may best be done at the smallest level of entities, regardless of their status as institutional units. Functions often have to be assigned to all transactions of agencies, offices, programs, bureaus, and similar smaller entities within government departments or ministries.

6.141 When these smaller government entities rather than transactions are used for classification, it may happen that the smallest entity that can be identified in the government accounts may perform more than one COFOG function. If possible, the expenditure of multifunction entities should be allocated among COFOG functions using a relevant physical indicator, such as hours worked by employees. It may be possible only to assign all expenditure by multifunction entities to whichever purpose appears to account for the largest part of expenditure.

6.142 A single classification cannot serve all analytic purposes. The selection of functions in COFOG is based on judgment. The scope of each function could be broader or narrower, and completely different functions could have been included. For example, expenditure for medical schools is classified in COFOG as education rather than health. Also, research and development could be a function of its own, but in COFOG, research and development expenditure is shown separately, classified according to the function the goal of the research and development most closely serves. Thus, COFOG statistics must be used with care to be sure that the desired coverage is obtained for a specific analytic purpose.

Problems in Identifying Functions of Government

Shared Expenditure

6.143 Government ministries generally are responsible for the formulation, administration, coordination, and monitoring of overall policies, plans, programs, and budgets; for the preparation (in some countries) and enforcement of legislation; and for the production and

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

dissemination of general information, technical documentation, and statistics. Consequently, the expenditure of these ministries has to be shared across the classes for which they are responsible. For example, the expenditure of a ministry of transport should be divided between *road transport* (70451), *water transport* (70452), *railway transport* (70453), *air transport* (70454), and *pipeline and other transport* (70455).

Administrative Expenditure

6.144 Administrative expenditure on general services, such as personnel services, supply and purchasing services, accounting and auditing services, and computer and data processing services, undertaken by ministries or units within ministries should be classified at the most detailed level possible. If administrative expenditure overlaps two or more classes, an attempt should be made to apportion expenditure between the classes concerned. If this approach is not feasible, the total should be allocated to that class that accounts for the largest part of the total expenditure.

Subsidies

6.145 Particular difficulties may arise with regard to subsidies. The main objective behind such government support may be, for example, to assure capacity to build naval vessels considered vital to national defense, to maintain living standards of important groups such as farmers or miners, or to provide employment for workers in underutilized hospitals. These political objectives are not to be confused with functions as the term is used in COFOG. Hence, a government subsidy to shipyards is classified under *manufacturing* (70442), and grants to hospitals are classified under *hospital services* (7073) regardless of the ultimate purposes. Subsidies and grants designed chiefly to increase employment opportunities in general are an exception to this rule. Because such programs do not focus on any single industry, they are classified under *general labor affairs* (70412).

Consumption of Fixed Capital

6.146 It is likely that consumption of fixed capital will be difficult to allocate by function, especially if only aggregated figures for total government capital stock and consumption of fixed capital are compiled. In these circumstances, approximations will have to be used. One possibility may be to distribute consumption of fixed capital according to book value depreciation, if it is available for detailed organizational units within government. Another approach would be to distribute consumption of fixed capital among functions in proportion to the net acquisition of fixed assets over a number of earlier years.

6.147 Another caution regarding the use of COFOG statistics relates to net investment in nonfinancial assets. Because expenditure classified by COFOG includes consumption of fixed capital as an expense, and includes it in the calculation of net investment in nonfinancial assets (deducted from acquisition minus disposals), the consumption of fixed capital will net out in COFOG data. However, if a functional classification is compiled for expense items only, this will include consumption of fixed capital representing part of the resource cost of using previously acquired fixed assets.

Cross-Classification of Expenditure

6.148 The economic and functional classifications of expenditure can be cross-classified as illustrated in Table 6A.2. A cross-classification of COFOG with each of the categories of the economic classification of expense is analytically useful. The cross-classification allows an analysis of:

- The inputs, which show how governments perform their functions, and the outputs, which show what governments are doing
- How governments carry out their public expenditure policy functions to meet social objectives
- The changes in the composition of expenditure over time to serve specific policy objectives
- Comparison of how specific functions are carried out by different governments.

6.149 Table 6A.2 includes a column for each major economic type of expense and for net investment in nonfinancial assets. As indicated earlier, this classification is needed to compile data on the actual final consumption of the general government and households (see paragraph 6.139).

Detailed Classification of the Functions of Government

6.150 As outlined earlier, the complete Classification of the Functions of Government (COFOG) has three levels of detail: Divisions, Groups, and Classes.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

Table 6A.2 Cross-Classification of Expenditure by Functional and Economic Classifications

	Compensation of employees [GFS]	Use of goods and services	Consumption of fixed capital [GFS]	Interest [GFS]	Subsidies	Grants	Social benefits [GFS]	Other expense	Net Investment in nonfinancial assets
General public services									
Defense									
Public order and safety									
Economic affairs									
Environmental protection									
Housing and community amenities									
Health									
Recreation, culture, and religion									
Education									
Social protection									

[1]Consumption of fixed capital is a cost (expense) for a general government unit and reduces the value of nonfinancial assets. The net effect of consumption of fixed capital on total expenditure is thus zero.

The Divisions could be seen as the broad objectives of government, while the Groups and Classes detail the means by which these broad objectives are achieved. The classification numbers have been modified slightly to conform with the coding system of this *Manual*. The numeral "7" is prefixed to all codes and the punctuation separating Divisions, Groups, and Classes are deleted. In addition, where appropriate, reference has been made to expenditure rather than outlays. Otherwise, these descriptions are the same as those of the United Nations Statistical Division.[47]

[47] See http://unstats.un.org/unsd/cr/registry/regcst.asp?Cl=4&Top=1&Lg=1.

701 GENERAL PUBLIC SERVICES

7011 EXECUTIVE AND LEGISLATIVE ORGANS, FINANCIAL AND FISCAL AFFAIRS, EXTERNAL AFFAIRS

70111 Executive and legislative organs (CS)

- Administration, operation, or support of executive and legislative organs:

Includes: office of the chief executive at all levels of government—office of the monarch, governor-general, president, prime minister, governor, mayor, etc.; legislative bodies at all levels of government—parliaments, chambers of deputies, senates, assemblies, town councils, etc.; advisory, administrative, and political staffs attached to chief executive offices and legislatures;

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

libraries and other reference services serving mainly executive and legislative organs; physical amenities provided to the chief executive, the legislature, and their aides; permanent or ad hoc commissions and committees created by or acting on behalf of the chief executive or legislature.

Excludes: ministerial offices, offices of heads of departments of local governments, interdepartmental committees, etc. concerned with a specific function (classified according to function).

70112 Financial and fiscal affairs (CS)

- Administration of financial and fiscal affairs and services; management of public funds and public debt; operation of taxation schemes
- Operation of the treasury or ministry of finance, the budget office, the inland revenue agency, the customs authorities, the accounting and auditing services
- Production and dissemination of general information, technical documentation and statistics on financial and fiscal affairs and services.

Includes: financial and fiscal affairs and services at all levels of government.

Excludes: underwriting or flotation charges and interest payments on government loans (70170); supervision of the banking industry (70411).

70113 External affairs (CS)

- Administration of external affairs and services
- Operation of the ministry of external affairs and diplomatic and consular missions stationed abroad or at offices of international organizations; operation or support of information and cultural services for distribution beyond national boundaries; operation or support of libraries, reading rooms, and reference services located abroad
- Regular subscriptions and special contributions to meet general operating expenses of international organizations.

Excludes: economic aid to developing countries and countries in transition (70121); economic aid missions accredited to foreign governments (70121); contributions to aid programs administered by international or regional organizations (70122); military units stationed abroad (70210); military aid to foreign countries (70230); general foreign economic and commercial affairs (70411); tourism affairs and services (70473).

7012 FOREIGN ECONOMIC AID

70121 Economic aid to developing countries and countries in transition (CS)

- Administration of economic cooperation with developing countries and countries in transition
- Operation of economic aid missions accredited to foreign governments; operation or support of technical assistance programs, training programs, and fellowship and scholarship schemes
- Economic aid in the form of grants (in cash or in kind) or loans (regardless of interest charged).

Excludes: contributions to economic development funds administered by international or regional organizations (70122); military aid to foreign countries (70230).

70122 Economic aid routed through international organizations (CS)

- Administration of economic aid routed through international organizations
- Contributions in cash or in kind to economic development funds administered by international, regional, or other multinational organizations.

Excludes: aid to international peacekeeping operations (70230).

7013 GENERAL SERVICES

This group covers services that are not connected with a specific function and that are usually undertaken by central offices at the various levels of government. It also covers those services connected with a particular function that are undertaken by such central offices. For example, the compilation of industry, environment, health, or education statistics by a central statistical agency is included here.

70131 General personnel services (CS)

- Administration and operation of general personnel services, including development and implementation of general personnel policies and procedures covering selection, promotion, rating

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

methods, the description, evaluation and classification of jobs, the administration of civil service regulations, and similar matters.

Excludes: personnel administration and services connected with a specific function (classified according to function).

70132 Overall planning and statistical services (CS)

- Administration and operation of overall economic and social planning services and of overall statistical services, including formulation, coordination, and monitoring of overall economic and social plans and programs and of overall statistical plans and programs.

Excludes: economic and social planning services and statistical services connected with a specific function (classified according to function).

70133 Other general services (CS)

- Administration and operation of other general services, such as centralized supply and purchasing services, maintenance and storage of government records and archives, operation of government-owned or -occupied buildings, central motor vehicle pools, government-operated printing offices, centralized computer and data processing services, etc.

Excludes: other general services connected with a specific function (classified according to function).

7014 BASIC RESEARCH

Basic research is experimental or theoretical work undertaken primarily to acquire new knowledge of the underlying foundations of phenomena and observable facts, without any particular application or use in view.

70140 Basic research (CS)

- Administration and operation of government agencies engaged in basic research
- Grants, loans, or subsidies to support basic research undertaken by nongovernment bodies such as research institutes and universities.

Excludes: applied research and experimental development (classified by function).

7015 R&D GENERAL PUBLIC SERVICES

Applied research is original investigation undertaken in order to acquire new knowledge, but directed primarily toward a specific practical aim or objective.

Experimental development is systematic work, drawing on existing knowledge gained from research and practical experience that is directed to producing new materials, products, and devices; to installing new processes, systems, and services; or to improving substantially those already produced or installed.

70150 R&D General public services (CS)

- Administration and operation of government agencies engaged in applied research and experimental development related to general public services
- Grants, loans, or subsidies to support applied research and experimental development related to general public services undertaken by nongovernment bodies, such as research institutes and universities.

Excludes: basic research (70140).

7016 GENERAL PUBLIC SERVICES N.E.C.

70160 General public services n.e.c. (CS)

- Administration, operation, or support of general public services, such as registration of voters, holding of elections and referendums, administration of nonself-governing and trust territories, etc.

Includes: general public services that cannot be assigned to (7011), (7012), (7013), (7014), or (7015).

Excludes: public debt transactions (7017); transfers of a general character between different levels of government (7018).

7017 PUBLIC DEBT TRANSACTIONS

70170 Public debt transactions (CS)

- Interest payments and expense for underwriting and floating government loans.

Excludes: administrative costs of public debt management (70112).

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

7018 TRANSFERS OF A GENERAL CHARACTER BETWEEN DIFFERENT LEVELS OF GOVERNMENT

70180 Transfers of a general character between different levels of government (CS)

- Transfers between different levels of government that are of a general character and not allocated to a particular function.

702 DEFENSE

7021 MILITARY DEFENSE

70210 Military defense (CS)

- Administration of military defense affairs and services
- Operation of land, sea, air, and space defense forces; operation of engineering, transport, communication, intelligence, personnel, and other noncombat defense forces; operation or support of reserve and auxiliary forces of the defense establishment.

Includes: offices of military attachés stationed abroad; field hospitals.

Excludes: military aid missions (70230); base hospitals (7073); military schools and colleges where curricula resemble those of civilian institutions even though attendance may be limited to military personnel and their families (7091), (7092), (7093), or (7094); pension schemes for military personnel (7102).

7022 CIVIL DEFENSE

70220 Civil defense (CS)

- Administration of civil defense affairs and services; formulation of contingency plans; organization of exercises involving civilian institutions and populations
- Operation or support of civil defense forces.

Excludes: civil protection services (70320); purchase and storage of food, equipment, and other supplies for emergency use in the case of peacetime disasters (71090).

7023 FOREIGN MILITARY AID

70230 Foreign military aid (CS)

- Administration of military aid and operation of military aid missions accredited to foreign governments or attached to international military organizations or alliances
- Military aid in the form of grants (in cash or in kind), loans (regardless of interest charged), or loans of equipment; contributions to international peacekeeping forces, including the assignment of manpower.

7024 R&D DEFENSE

Definitions of basic research, applied research, and experimental development are given under (7014) and (7015).

70240 R&D Defense (CS)

- Administration and operation of government agencies engaged in applied research and experimental development related to defense
- Grants, loans, or subsidies to support applied research and experimental development related to defense undertaken by nongovernment bodies, such as research institutes and universities.

Excludes: basic research (70140).

7025 DEFENSE N.E.C.

70250 Defense n.e.c. (CS)

- Administration, operation, or support of activities such as formulation, administration, coordination, and monitoring of overall policies, plans, programs, and budgets relating to defense; preparation and enforcement of legislation relating to defense; production and dissemination of general information, technical documentation, and statistics on defense; etc.

Includes: defense affairs and services that cannot be assigned to (7021), (7022), (7023), or (7024).

Excludes: administration of war veterans' affairs (7102).

703 PUBLIC ORDER AND SAFETY

7031 POLICE SERVICES

70310 Police services (CS)

- Administration of police affairs and services, including alien registration, issuing work and travel documents to immigrants, maintenance of arrest records and statistics related to police work, road traffic regulation and control, prevention of smuggling, and control of offshore and ocean fishing
- Operation of regular and auxiliary police forces, of port, border, and coast guards, and of other

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

special police forces maintained by public authorities; operation of police laboratories; operation or support of police training programs.

Includes: traffic wardens.

Excludes: police colleges offering general education in addition to police training (7091), (7092), (7093), or (7094).

7032 FIRE PROTECTION SERVICES

70320 Fire protection services (CS)

- Administration of fire prevention and firefighting affairs and services
- Operation of regular and auxiliary fire brigades and of other fire prevention and firefighting services maintained by public authorities; operation or support of fire prevention and firefighting training programs.

Includes: civil protection services such as mountain rescue, beach surveillance, evacuation of flooded areas, etc.

Excludes: civil defense (70220); forces especially trained and equipped for fighting or preventing forest fires (70422).

7033 LAW COURTS

70330 Law courts (CS)

- Administration, operation, or support of civil and criminal law courts and the judicial system, including enforcement of fines and legal settlements imposed by the courts and operation of parole and probation systems
- Legal representation and advice on behalf of government or on behalf of others provided by government in cash or in services.

Includes: administrative tribunals, ombudsmen, and the like.

Excludes: prison administration (70340).

7034 PRISONS

70340 Prisons (CS)

- Administration, operation, or support of prisons and other places for the detention or rehabilitation of criminals such as prison farms, workhouses, reformatories, borstals, asylums for the criminally insane, etc.

7035 R&D PUBLIC ORDER AND SAFETY

Definitions of basic research, applied research, and experimental development are given under (7014) and (7015).

70350 R&D Public order and safety (CS)

- Administration and operation of government agencies engaged in applied research and experimental development related to public order and safety
- Grants, loans, or subsidies to support applied research and experimental development related to public order and safety undertaken by nongovernment bodies, such as research institutes and universities.

Excludes: basic research (70140).

7036 PUBLIC ORDER AND SAFETY N.E.C.

70360 Public order and safety n.e.c. (CS)

- Administration, operation, or support of activities such as formulation, administration, coordination, and monitoring of overall policies, plans, programs, and budgets relating to public order and safety; preparation and enforcement of legislation and standards for the provision of public order and safety; production and dissemination of general information, technical documentation, and statistics on public order and safety.

Includes: public order and safety affairs and services that cannot be assigned to (7031), (7032), (7033), (7034), or (7035).

704 ECONOMIC AFFAIRS

7041 GENERAL ECONOMIC, COMMERCIAL, AND LABOR AFFAIRS

70411 General economic and commercial affairs (CS)

- Administration of general economic and commercial affairs and services, including general foreign commercial affairs; formulation and implementation of general economic and commercial policies; liaison among different branches of government and between government and business
- Regulation or support of general economic and commercial activities such as export and import trade as a whole, commodity and equity markets, overall income controls, general trade promotion

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

activities, general regulation of monopolies and other restraints on trade and market entry, etc.; supervision of the banking industry

- Operation or support of institutions dealing with patents, trademarks, copyrights, company registration, weather forecasting, standards, hydrologic surveys, geodesic surveys, etc.
- Grants, loans, or subsidies to promote general economic and commercial policies and programs.

Includes: consumer education and protection.

Excludes: economic and commercial affairs of a particular industry (classified to (7042) through (7047) as appropriate).

70412 General labor affairs (CS)

- Administration of general labor affairs and services; formulation and implementation of general labor policies; supervision and regulation of labor conditions (hours of work, wages, safety, etc.); liaison among different branches of government and between government and overall industrial, business, and labor organizations
- Operation or support of general programs or schemes to facilitate labor mobility, to reduce sex, race, age, and other discrimination, to reduce the rate of unemployment in distressed or underdeveloped regions, to promote the employment of disadvantaged or other groups characterized by high unemployment rates, etc.; operation of labor exchanges; operation or support of arbitration and mediation services
- Production and dissemination of general information, technical documentation, and statistics on general labor affairs and services
- Grants, loans, or subsidies to promote general labor policies and programs.

Excludes: labor affairs of a particular industry (classified to (7042) through (7047) as appropriate); provision of social protection in the form of cash benefits and benefits in kind to persons who are unemployed (71050).

7042 AGRICULTURE, FORESTRY, FISHING, AND HUNTING

70421 Agriculture (CS)

- Administration of agricultural affairs and services; conservation, reclamation, or expansion of arable land; agrarian reform and land settlement; supervision and regulation of the agricultural industry
- Construction or operation of flood control, irrigation, and drainage systems, including grants, loans, or subsidies for such works
- Operation or support of programs or schemes to stabilize or improve farm prices and farm incomes; operation or support of extension services or veterinary services to farmers, pest control services, crop inspection services, and crop grading services
- Production and dissemination of general information, technical documentation, and statistics on agricultural affairs and services
- Compensation, grants, loans, or subsidies to farmers in connection with agricultural activities, including payments for restricting or encouraging output of a particular crop or for allowing land to remain noncultivated.

Excludes: multipurpose development projects (70474).

70422 Forestry (CS)

- Administration of forestry affairs and services; conservation, extension, and rationalized exploitation of forest reserves; supervision and regulation of forest operations and issuance of tree-felling licenses
- Operation or support of reforestation work, pest and disease control, forest firefighting and fire prevention services, and extension services to forest operators
- Production and dissemination of general information, technical documentation, and statistics on forestry affairs and services
- Grants, loans, or subsidies to support commercial forest activities.

Includes: forest crops in addition to timber.

70423 Fishing and hunting (CS)

This class covers both commercial fishing and hunting, and fishing and hunting for sport. The fishing and hunting affairs and services listed here refer to activities that take place outside natural parks and reserves.

- Administration of fishing and hunting affairs and services; protection, propagation, and rationalized exploitation of fish and wildlife stocks;

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

supervision and regulation of freshwater fishing, coastal fishing, ocean fishing, fish farming, wildlife hunting, and issuance of fishing and hunting licenses

- Operation or support of fish hatcheries, extension services, stocking or culling activities, etc.
- Production and dissemination of general information, technical documentation, and statistics on fishing and hunting affairs and services
- Grants, loans, or subsidies to support commercial fishing and hunting activities, including the construction or operation of fish hatcheries.

Excludes: control of offshore and ocean fishing (70310); administration, operation, or support of natural parks and reserves (70540).

7043 FUEL AND ENERGY

70431 Coal and other solid mineral fuels (CS)

This class covers coal of all grades, lignite, and peat, irrespective of the method used in their extraction or beneficiation, and the conversion of these fuels to other forms, such as coke or gas.

- Administration of solid mineral fuel affairs and services; conservation, discovery, development, and rationalized exploitation of solid mineral fuel resources; supervision and regulation of the extraction, processing, distribution, and use of solid mineral fuels
- Production and dissemination of general information, technical documentation, and statistics on solid mineral fuel affairs and services
- Grants, loans, or subsidies to support the solid mineral fuel industry and the coke, briquette, or manufactured gas industries.

Excludes: solid mineral fuel transportation affairs (classified to the appropriate class of group 7045).

70432 Petroleum and natural gas (CS)

This class covers natural gas, liquefied petroleum gases and refinery gases, oil from wells or other sources, such as shale or tar sands, and the distribution of town gas regardless of its composition.

- Administration of petroleum and natural gas affairs and services; conservation, discovery, development, and rationalized exploitation of petroleum and natural gas resources; supervision and regulation of the extraction, processing, distribution, and use of petroleum and natural gas
- Production and dissemination of general information, technical documentation, and statistics on petroleum and natural gas affairs and services
- Grants, loans, or subsidies to support the petroleum extraction industry and the industry refining crude petroleum and related liquid and gaseous products.

Excludes: petroleum or gas transportation affairs (classified to the appropriate class of group 7045).

70433 Nuclear fuel (CS)

- Administration of nuclear fuel affairs and services; conservation, discovery, development, and rationalized exploitation of nuclear material resources; supervision and regulation of the extraction and processing of nuclear fuel materials and of the manufacture, distribution, and use of nuclear fuel elements
- Production and dissemination of general information, technical documentation, and statistics on nuclear fuel affairs and services
- Grants, loans, or subsidies to support the nuclear materials mining industry and the industries processing such materials.

Excludes: nuclear fuel transportation affairs (classified to the appropriate class of group 7045); disposal of radioactive wastes (70510).

70434 Other fuels (CS)

- Administration of affairs and services involving fuels, such as alcohol, wood and wood wastes, bagasse, and other noncommercial fuels
- Production and dissemination of general information, technical documentation, and statistics on availability, production, and utilization of such fuels
- Grants, loans, or subsidies to promote the use of such fuels for the production of energy.

Excludes: forest management (70422); wind and solar heat (70435) or (70436); geothermal resources (70436).

70435 Electricity (CS)

This class covers both traditional sources of electricity, such as thermal or hydro supplies, and newer sources, such as wind or solar heat.

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

- Administration of electricity affairs and services; conservation, development, and rationalized exploitation of electricity supplies; supervision and regulation of the generation, transmission, and distribution of electricity
- Construction or operation of nonenterprise-type electricity supply systems
- Production and dissemination of general information, technical documentation, and statistics on electricity affairs and services
- Grants, loans, or subsidies to support the electricity supply industry, including such expenditure for the construction of dams and other works, designed chiefly to provide electricity.

Excludes: nonelectric energy produced by wind or solar heat (70436).

70436 Nonelectric energy (CS)

- Administration of nonelectric energy affairs and services that chiefly concern the production, distribution, and utilization of heat in the form of steam, hot water, or hot air
- Construction or operation of nonenterprise-type systems supplying nonelectric energy
- Production and dissemination of general information, technical documentation, and statistics on availability, production, and utilization of nonelectric energy
- Grants, loans, or subsidies to promote the use of nonelectric energy.

Includes: geothermal resources; nonelectric energy produced by wind or solar heat.

7044 MINING, MANUFACTURING, AND CONSTRUCTION

70441 Mining of mineral resources other than mineral fuels (CS)

This class covers metal-bearing minerals, sand, clay, stone, chemical and fertilizer minerals, salt, gemstones, asbestos, gypsum, etc.

- Administration of mining and mineral resource affairs and services; conservation, discovery, development, and rationalized exploitation of mineral resources; supervision and regulation of prospecting, mining, marketing, and other aspects of mineral production
- Production and dissemination of general information, technical documentation, and statistics on mining and mineral resource affairs and services
- Grants, loans, or subsidies to support commercial mining activities.

Includes: issuance of licenses and leases, regulation of production rates, inspection of mines for conformity to safety regulations, etc.

Excludes: coal and other solid fuels (70431), petroleum and natural gas (70432), and nuclear fuel materials (70433).

70442 Manufacturing (CS)

- Administration of manufacturing affairs and services; development, expansion, or improvement of manufacturing; supervision and regulation of the establishment and operation of manufacturing plants; liaison with manufacturers' associations and other organizations interested in manufacturing affairs and services
- Production and dissemination of general information, technical documentation, and statistics on manufacturing activities and manufactured products
- Grants, loans, or subsidies to support manufacturing enterprises.

Includes: inspection of manufacturing premises for conformity with safety regulations, protection of consumers against dangerous products, etc.

Excludes: affairs and services concerning the coal processing industry (70431), the petroleum refinery industry (70432), or the nuclear fuel industry (70433).

70443 Construction (CS)

- Administration of construction affairs and services; supervision of the construction industry; development and regulation of construction standards
- Production and dissemination of general information, technical documentation, and statistics on construction affairs and services.

Includes: issuance of certificates permitting occupancy, inspection of construction sites for conformity with safety regulations, etc.

Excludes: grants, loans, and subsidies for the construction of housing, industrial buildings, streets, public

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

utilities, cultural facilities, etc. (classified according to function); development and regulation of housing standards (70610).

7045 TRANSPORT

70451 Road transport (CS)

- Administration of affairs and services concerning operation, use, construction, and maintenance of road transport systems and facilities (roads, bridges, tunnels, parking facilities, bus terminals, etc.)
- Supervision and regulation of road users (vehicle and driver licensing, vehicle safety inspection, size and load specifications for passenger and freight road transport, regulation of hours of work of bus, coach and lorry drivers, etc.), road transport system operations (granting of franchises, approval of freight tariffs and passenger fares, and of hours and frequency of service, etc.), and road construction and maintenance
- Construction or operation of nonenterprise-type road transport systems and facilities
- Production and dissemination of general information, technical documentation, and statistics on road transport system operations and on road construction activities
- Grants, loans, or subsidies to support the operation, construction, maintenance, or upgrading of road transport systems and facilities.

Includes: highways, urban roads, streets, bicycle paths, and footpaths.

Excludes: road traffic control (70310); grants, loans, and subsidies to road vehicle manufacturers (70442); street cleaning (70510); construction of noise embankments, hedges, and other anti-noise facilities, including the resurfacing of sections of urban highways with noise reducing surfaces (70530); street lighting (70640).

70452 Water transport (CS)

- Administration of affairs and services concerning operation, use, construction, and maintenance of inland, coastal, and ocean water transport systems and facilities (harbors, docks, navigation aids and equipment, canals, bridges, tunnels, channels, breakwaters, piers, wharves, terminals, etc.)
- Supervision and regulation of water transport users (registration, licensing and inspection of vessels and crews, regulations concerning passenger safety and freight security, etc.), water transport system operations (granting of franchises, approval of freight tariffs and passenger fares, and of hours and frequency of service, etc.), and water transport facility construction and maintenance
- Construction or operation of nonenterprise-type water transport systems and facilities (such as ferries)
- Production and dissemination of general information, technical documentation, and statistics on water transport system operations and water transport facility construction activities
- Grants, loans, or subsidies to support the operation, construction, maintenance, or upgrading of water transport systems and facilities.

Includes: radio and satellite navigation aids; emergency rescue and towing services.

Excludes: grants, loans, and subsidies to shipbuilders (70442).

70453 Railway transport (CS)

- Administration of affairs and services concerning operation, use, construction, or maintenance of railway transport systems and facilities (railway roadbeds, terminals, tunnels, bridges, embankments, cuttings, etc.)
- Supervision and regulation of railway users (rolling stock condition, roadbed stability, passenger safety, security of freight, etc.), railway transport system operations (granting of franchises, approval of freight tariffs and passenger fares, and of hours and frequency of service, etc.), and railway construction and maintenance
- Construction or operation of nonenterprise-type railway transport systems and facilities
- Production and dissemination of general information, technical documentation, and statistics on railway transport system operations and railway construction activities
- Grants, loans, or subsidies to support the operation, construction, maintenance, or upgrading of railway transport systems and facilities.

Includes: long-line and interurban railway transport systems, urban rapid transit railway transport systems,

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

and street railway transport systems; acquisition and maintenance of rolling stock.

Excludes: grants, loans, and subsidies to rolling stock manufacturers (70442); construction of noise embankments, hedges, and other anti-noise facilities, including the resurfacing of sections of railways with noise reducing surfaces (70530).

70454 Air transport (CS)

- Administration of affairs and services concerning operation, use, construction, and maintenance of air transport systems and facilities (airports, runways, terminals, hangars, navigation aids and equipment, air control amenities, etc.)
- Supervision and regulation of air transport users (registration, licensing, and inspection of aircraft, pilots, crews, ground crews, regulations concerning passenger safety, investigation of air transport accidents, etc.), air transport system operations (allocation of routes, approval of freight tariffs and passenger fares, and of frequency and levels of service, etc.), and air transport facility construction and maintenance
- Construction or operation of nonenterprise-type public air transport services and facilities
- Production and dissemination of general information, technical documentation, and statistics on air transport system operations and on air transport facility construction
- Grants, loans, or subsidies to support the operation, construction, maintenance, or upgrading of air transport systems and facilities.

Includes: radio and satellite navigation aids; emergency rescue services; scheduled and nonscheduled freight and passenger services; regulation and control of flying by private individuals.

Excludes: grants, loans, and subsidies to aircraft manufacturers (70442).

70455 Pipeline and other transport (CS)

- Administration of affairs and services concerning operation, use, construction, and maintenance of pipeline and other transport systems (funiculars, cable cars, chairlifts, etc.)
- Supervision and regulation of users of pipeline and other transport systems (registration, licensing, inspection of equipment, operator skills and training, safety standards, etc.); pipeline and other transport systems operations (granting of franchises, setting tariffs, frequency, and levels of service, etc.), and pipeline and other transport systems construction and maintenance
- Construction or operation of nonenterprise-type pipeline and other transport systems
- Production and dissemination of general information, technical documentation, and statistics on the operation and construction of pipeline and other transport systems
- Grants, loans, or subsidies to support the operation, construction, maintenance, or upgrading of pipeline and other transport systems.

7046 COMMUNICATION

70460 Communication (CS)

- Administration of affairs and services concerning construction, extension, improvement, operation, and maintenance of communication systems (postal, telephone, telegraph, wireless, and satellite communication systems)
- Regulation of communication system operations (granting of franchises; assignment of frequencies, specification of markets to be served and tariffs to be charged, etc.)
- Production and dissemination of general information, technical documentation, and statistics on communication affairs and services
- Grants, loans, or subsidies to support the construction, operation, maintenance, or upgrading of communication systems.

Excludes: radio and satellite navigation aids for water transport (70452) and air transport (70454); radio and television broadcasting systems (70830).

7047 OTHER INDUSTRIES

70471 Distributive trades, storage, and warehousing (CS)

- Administration of affairs and services concerning the distributive trade and the storage and warehousing industry
- Supervision and regulation of wholesale and retail trade (licensing, sales practices, labeling of packaged food and other goods intended for household consumption, inspection of scales and other

Para verificar as assinaturas, acesse www.tcu.gov.br/autenticidade, informando o código 57399319.

weighing machines, etc.) and the storage and warehousing industry (including licensing and control of government-bonded warehouses, etc.)

- Administration of price control and rationing schemes operating through retailers or wholesalers regardless of the type of goods involved or intended consumer; administration and provision of food and other such subsidies to the general public
- Production and dissemination of information to the trade and to the public on prices, the availability of goods, and other aspects of the distributive trade and the storage and warehousing industry; compilation and publication of statistics on the distributive trade and the storage and warehousing industry
- Grants, loans, or subsidies to support the distributive trade and to the storage and warehousing industry.

Excludes: administration of price and other controls applied to the producer (classified according to function); food and other such subsidies applicable to particular population groups or individuals (710).

70472 Hotels and restaurants (CS)

- Administration of affairs and services concerning construction, extension, improvement, operation, and maintenance of hotels and restaurants
- Supervision and regulation of hotel and restaurant operations (regulations governing prices, cleanliness, and sales practices, hotel and restaurant licensing, etc.)
- Production and dissemination of general information, technical documentation, and statistics on hotel and restaurant affairs and services
- Grants, loans, or subsidies to support the construction, operation, maintenance, or upgrading of hotels and restaurants.

70473 Tourism (CS)

- Administration of tourism affairs and services; promotion and development of tourism; liaison with the transport, hotel, and restaurant industries and other industries benefiting from the presence of tourists
- Operation of tourist offices at home and abroad, etc.; organization of advertising campaigns, including the production and dissemination of promotional literature and the like
- Compilation and publication of statistics on tourism.

70474 Multipurpose development projects (CS)

Multipurpose development projects typically consist of integrated facilities for generation of power, flood control, irrigation, navigation, and recreation.

- Administration of affairs and services concerning construction, extension, improvement, operation, and maintenance of multipurpose projects
- Production and dissemination of general information, technical documentation, and statistics on multipurpose development project affairs and services
- Grants, loans, or subsidies to support the construction, operation, maintenance, or upgrading of multipurpose development projects.

Excludes: projects with one main function and other functions that are secondary (classified according to main function).

7048 R&D ECONOMIC AFFAIRS

Definitions of basic research, applied research, and experimental development are given under (7014) and (7015).
