syslog	internal syslogd messages	local4	reserved for local use
lpr	line printer subsytem	local5	reserved for local use
news	netnews subsytem	local6	reserved for local use
uucp	uucp subsystem	local7	reserved for local use

Table 32-4 lists the supported PFC QoS data export severity parameter values.

Table 32-4 Supported PFC QoS Data Export Severity Parameter Values

Severity Parameter		
Name	**Number**	**Definition**
emerg	0	system is unusable
alert	1	action must be taken immediately
crit	2	critical conditions
err	3	error conditions
warning	4	warning conditions
notice	5	normal but significant condition
info	6	informational
debug	7	debug-level messages

This example shows how to configure 172.20.52.3 as the destination host and syslog as the UDP port number and verify the configuration:

```
Router# configure terminal
Router(config)# mls qos statistics-export destination 172.20.52.3 syslog
Router(config)# end
Router# show mls qos statistics-export info
QoS Statistics Data Export Status and Configuration information
---------------------------------------------------------------
Export Status : enabled
Export Interval : 250 seconds
Export Delimiter : |
Export Destination : 172.20.52.3, UDP port 514 Facility local6, Severity debug

QoS Statistics Data Export is enabled on following ports:
---------------------------------------------------------
FastEthernet5/24

QoS Statistics Data export is enabled on following shared aggregate policers:
-----------------------------------------------------------------------------
aggr1M

QoS Statistics Data Export is enabled on following class-maps:
---------------------------------------------------------------
class3
```

Setting the PFC QoS Statistics Data Export Field Delimiter

To set the PFC QoS statistics data export field delimiter, perform this task:

	Command	Purpose
Step 1	`Router(config)# mls qos statistics-export delimiter delimiter_character`	Sets the PFC QoS statistics data export field delimiter.
	`Router(config)# no mls qos statistics-export delimiter`	Reverts to the default PFC QoS statistics data export field delimiter
Step 2	`Router(config)# end`	Exits configuration mode.
Step 3	`Router# show mls qos statistics-export info`	Verifies the configuration.

This example shows how to set the PFC QoS statistics data export field delimiter and verify the configuration:

```
Router# configure terminal
Router(config)# mls qos statistics-export delimiter ,
Router(config)# end
Router# show mls qos statistics-export info
QoS Statistics Data Export Status and Configuration information
---------------------------------------------------------------
Export Status : enabled
Export Interval : 250 seconds
Export Delimiter : ,
Export Destination : 172.20.52.3, UDP port 514 Facility local6, Severity debug

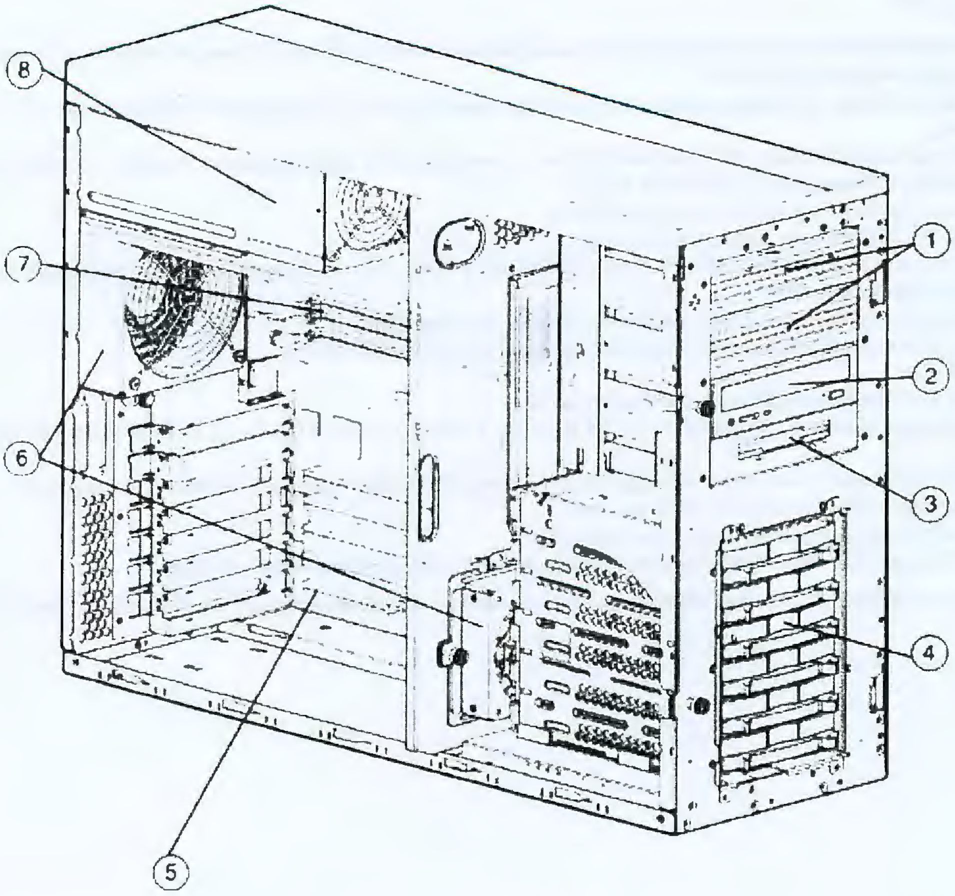
QoS Statistics Data Export is enabled on following ports:
---------------------------------------------------------
FastEthernet5/24

QoS Statistics Data export is enabled on following shared aggregate policers:
-----------------------------------------------------------------------------
aggr1M

QoS Statistics Data Export is enabled on following class-maps:
---------------------------------------------------------------
class3
```

Apêndice FC

Overview



1. Two Removable Media Bays
2. 48X Max IDE (ATAPI) CD-ROM Drive
3. 1.44 Floppy Drive
4. Six 1" Hot Plug Drive Bays
5. Five expansion slots(four 64-bit/100-MHz PCI-X, one 32-bit/33-MHz PCI)
6. System fan
7. DIMM sockets for up to 8GB of memory, optionally interleaved
8. Optional 2nd Power Supply for hot-pluggable 1+1 redundancy

What's New

- Now available with Intel®Xeon 2.8 GHz Processors with 533MHz system bus.

Overview

At A Glance

- The ProLiant ML350 G3 is an expandable rack or tower platform delivering affordable 2-way performance and essential availability to corporate workgroups and growing businesses
- Intel Xeon 2.4 GHz or 2.8 GHz processors (dual processor capability) with 512-KB level 2 cache standard (full speed) and Hyper-Threading Technology
- ServerWorks Grand Champion LE Chipset with 533-MHz Front Side Bus for 2.8GHz processor models or 400-MHz FSB for models < 2.8 GHz
- Integrated Dual Channel Wide Ultra3 SCSI Adapter
- Smart Array Controller (standard in Array Models only)
- NC7760 PCI Gigabit Server Adapter (embedded)
- 512MB of 2-way interleaving capable PC2100 DDR SDRAM, with Advanced ECC capabilities (Array models only; 256MB standard on other models): Expandable to 8GB
- Flexible memory configurations allow interleaving (2x1) or non-interleaving
- Five available expansion slots: four 64-bit/100-MHz PCI-X, one 32-bit/33-MHz PCI
- Two USB ports
- Standard 6 x 1" Wide Ultra320 ready Hot Plug Drive Cage
- Internal storage capacity of up to 880GB (6 x 146.8 GB 1"), 1.174-TB (2 x 146.8 GB 1" + 6 x 146.8 GB 1") with optional 2-bay hot plug drive cage option
- 500W Hot-Pluggable Power Supply (standard) and an optional 500W Hot-Pluggable Redundant Power Supply (1+ 1) available
- Tool-free entry to chassis and access to components
- RBSU (ROM based setup utility) support, redundant ROM
- Insight Manager, SmartStart, ROM-based BIOS Setup Utility, and Automatic Server Recovery (ASR-2)
- Protected by HP Services, including a three-year, next business day, on-site, limited global warranty and extended Pre-Failure Warranty.

Standard Features

Processor *One of the following depending on Model:*	Intel Xeon Processor 2.8 GHz/533-512KB Intel Xeon Processor 2.4 GHz/400-512KB
Cache Memory	Integrated 512-KB Level 2 cache (full speed)
Upgradability	Upgradable to dual processing
Chipset	ServerWorks Grand Champion LE Chipset with 400-MHz or 533-MHz Front Side Bus (model dependent) NOTE: For more information regarding ServerWorks, please see the following URL. http://www.serverworks.com/products/overview.html NOTE: This Web site is available in English only.

Memory
(One of the following depending on model)

2-way interleaving capable PC2100 DDR SDRAM running at 200MHz on 400MHz models or 266MHz on 533MHz models with Advanced ECC capabilities

Standard (Non-Array Models)	256MB
Standard (Array Models)	512MB
Maximum	8 GB

Network Controller

NC7760 Gigabit Server Adapter (embedded)

Expansion Slots

I/O (5 Total, 5 Available)		PCI Voltage:
64-bit/100MHz, PCI	4 (4 available) (Array model has 3 available)	3.3 Volt or universal cards
32-bit/33MHz, PCI	1 (1 available)	5 Volt or universal cards

Storage Controller

Integrated Dual Channel Wide Ultra3 SCSI Adapter
Smart Array 641 Controller (2.8 GHz Array Models Only)

Storage

Diskette Drives	1.44 MB
CD-ROM	48x IDE (ATAPI) CD-ROM Drive
Hard Drives	None
Maximum Internal Storage	1.174 TB GB (6 x 146.8 GB 1" with standard internal hot plug drive cage + (2 x 146.8 GB 1") with optional ML3xx Two Bay Hot Plug SCSI Drive Cage)
External Storage	Two external SCSI knockouts available, optional ProLiant ML350 Internal to External SCSI Cable Option Kit required ● HD68 Internal to External SCSI Cable Option Kit PN 159547-B22 ● VHDCI Internal to External SCSI Cable Option Kit PN 333370-B21

Standard Features

Interfaces	Parallel	1
	Serial	1
	Pointing Device (Mouse)	1
	Graphics	1
	Keyboard	1
	Network RJ-45	1
	USB	2 NOTE: Please see the following URL for additional information regarding USB support: http://www.compaq.com/products/servers/platforms/usb-support.html NOTE: This Web site is available in English only.
	External SCSI knockouts	2
Graphics	Integrated ATI RAGE XL Video Controller with 8-MB SDRAM Video Memory	
Form Factor	Tower or rack (5U) NOTE: Rack models (and rack conversion kit) support: ● Square hole racks from 27" - 32" deep (including Compaq/HP 7000, 9000, 10000 and H9 series) ● Square or round hole racks, from 24" - 35" deep (including HP Rack System /E and HP Systems, with an adjustment) ● Telco racks with 3rd part option kit from Rack Solutions http://www.racksolutions.com/compaq/products.htm NOTE: This Web site is available in English only.	

ProLiant Essentials Foundation Pack Software

Insight Manager 7

Insight Manager 7 helps maximize system uptime and performance and reduces the cost of maintaining the IT infrastructure by providing proactive notification of problems before those problems result in costly downtime and reduced productivity. Insight Manager 7 is easy to set up and provides rapid access to detailed fault and performance information gathered by the Management Agents. One-click-access to the Remote Insight Lights Out Edition II board allows systems administrators to take full graphical control of ProLiant servers in remote locations or lights-out data centers. Finally, Insight Manager 7 in concert with the Version Control Agents and Version Control Repository Manager enables systems administrators to version manage and update system software across groups of ProLiant servers.

Management Agents

The Management Agents form the foundation for HP's Intelligent Manageability strategy. They provide direct, browser-based access to in-depth instrumentation built into HP servers, workstations, desktops, and portables, and send alerts to Insight Manager 7 and other enterprise management applications in case of subsystem or environmental failures. For additional information about the Management Agents and other management products from HP, please visit the management Web site at http://www.hp.com/servers/manage

SmartStart

SmartStart is a tool that simplifies server setup, providing a rapid way to deploy reliable and consistent server configurations. For more information, please visit the SmartStart website at http://www.hp.com/servers/manage.
SmartStart version supported (minimum): SmartStart 5.50

ActiveUpdate

ActiveUpdate is a web-based application that keeps IT managers directly connected to HP for proactive notification and delivery of the latest software updates.

ROMPaq, support software, and configurotion utilities

The latest software, drivers, and firmware fully optimized and tested for your ProLiant server and options.

Survey Utility and diagnostics utilities

The most advanced configuration analysis, reporting and troubleshooting utilities used by HP and at your fingertips.

Optional Proliant Essentials Value Packs

Optional software offerings that selectively extend the functionality of an Adaptive Infrastructure to address specific business problems and needs:

- Rapid Deployment Pack – an automated solution for multi-server deployment and provisioning, enabling companies to quickly and easily adapt to changing business demands.
- Workload Management Pack – provides easier management of complex environments, improving overall server utilization and enabling Windows 2000 customers for the first time to confidently deploy multiple applications on a single multiprocessor ProLiant Server.
- Performance Management Pack – a performance management solution that identifies and explains hardware performance bottlenecks on ProLiant servers and attached options enabling users to better utilize their valuable resources.

NOTE: Flexible and volume quantity license kits are available for ProLiant Essentials Value Packs. Refer to http://www.hp.com/servers/proliantessentials or the various ProLiant Essentials Value Pack product QuickSpecs for more information.
NOTE: For more information regarding ProLiant Essentials Software, please see the following URL: http://www.hp.com/servers/proliantessentials
NOTE: These Web sites are available in English only

Industry Standard Compliance

ACPI V1.0B Compliant
PCI 2.2 Compliant
PXE Support
WOL Support
PCI-X 1.0 Compliant
Novell Certified
Microsoft Logo certifications

Standard Features

Manageability	Insight Monoger 7 Redundont ROM System Firmware Update ROMPoq Remote Insight Lights-Out Edition II (optional) ProLiant RBSU (ROM-Bosed Setup Utility) Automatic Server Recovery-2 (ASR-2) Drive Parameter Tracking (with Smart Array Controller) Dynamic Sector Repairing (with Smart Arroy Controller) Pre-Failure Warranty (covers processors, memory and hard drives)
Security	Power-on password Setup password Diskette boot control Porallel and serial interface control Disk configuration lock Power switch security
Server Power Cords	One Lowline NEMA power cord and one Highline IEC Power cord ship standard Tower models ship with standard country specific power cords. Rack models ship with IEC cables. Depending on the country, some also ship with country specific power cords Redundant power supply options ship with country specific power cords with the exception of the -B21 Rack SKU which ships with an IEC cable only.
Power Supply	500 Watts, Power Factor Correction (PFC), Hot Plug 100 to 240 VAC Rated Input Voltage (Auto-sensing), CE Mark Compliant Optional 2nd Power Supply for hot-pluggable 1 + 1 redundancy.
System Fans	2 fans ship standard, 2 fans total supported (does not include power supply fans)
Required Cabling	For required cabling information, refer to the HP Web site at http://www.hp.com/servers/proliantML350 NOTE: This Web site is available in English only.
OS Support	Microsoft Windows NT® Server 4.0 and Terminal Server 4.0 Microsoft BackOffice Small Business Server 2000 Microsoft Windows 2000 Server and Advanced Server Windows Server 2003 Novell NetWare 5.1, 6.0 Novell NetWore Small Business Suite 6.0 SCO OpenServer 5.0.6a SCO OpenUnix 8 SCO UnixWare 7.1.1 IBM OS/2 Warp Server for e-business LINUX (Red Hat, 2.1 Advanced Server, Red Hat 8.0 and Red Hat 7.3, SuSE, SLES7, UnitedLinux 1.0) NOTE: For a more complete and up-to date listing of supported OSs and versions, please visit our OS Support Matrix at: ftp://ftp.compaq.com/pub/products/servers/os-support-matrix-310.pdf NOTE: Optional hardware may be required to support some operating systems. NOTE: For an up-to-date listing of the latest drivers available for the ProLiant ML350, please see. http://www.compaq.com/support/files/server/us/index.html NOTE: These Web sites are available in English only.

Rack Airflow Requirements

- Rack 9000 and 10000 series Cabinets
  The increasing power of new high-performance processor technology requires increased cooling efficiency for rack-mounted servers. The 9000 and 10000 Series Racks provide enhanced airflow for maximum cooling, allowing these racks to be fully loaded with servers using the latest processors.

- Rack 7000 series Cabinets
  When installing a server with processors running at speeds of 550 MHz or greater in Rack 7000 series racks with glass doors (165753-001 (42U), and 163747-001 (22U)), the new processor technology requires the installation of HP's new High Airflow Rack Door Inserts (327281-B21 (42U), 327281-B22 (42U 6 pack), or 157847-B21 (22U)) to promote enhanced airflow for maximum cooling.

CAUTION: If a third-party rack is used, observe the following additional requirements to ensure adequate airflow and to prevent damage to the equipment:

- Front and rear doors: If your 42U server rack includes closing front and rear doors, you must allow 830 square inches (5,350 sq cm) of hole evenly distributed from top to bottom to permit adequate airflow (equivalent to the required 64 percent open area for ventilation).
- Side. The clearance between the installed rack component and the side panels of the rack must be a minimum of 2.75 inches (7 cm).

CAUTION: Always use blanking panels to fill all remaining empty front panel U-spaces in the rack. This arrangement ensures proper airflow. Using a rack without blanking panels results in improper cooling that can lead to thermal damage.

NOTE: For additional information, refer to the Setup and Installation Guide or the Documentation CD provided with the server, or to the server documentation located in the Support section of the following URL:
http://www5.hp.com/servers/proliantml350
NOTE: This Web site is available in English only.

Installation of Server into Telco Racks

ML350 G3 rack model support: Support for all 2-post Telco racks requires the use of the rack kit and an additional option kit from Rack Solutions. http://www.racksolutions.com/compaq
NOTE: This Web site is available in English only.

HP Factory Express Capabilities

HP Factory Express gives you the flexibility to choose from a full menu of factory capabilities all in one manufacturing facility, in one process, with one touch giving you full control and access to HP's World class manufacturing facility anytime. This approach provides you the speed to deploy your IT needs, with total quality assurance, reliability, and predictability to lower your total cost of ownership by letting HP install, rack, and customize your software and hardware options for you.

Standard Features

Service and Support

HP Services provides a three-year, limited warranty, including Pre-Failure Warranty (coverage of hard drives, memory and processors) fully supported by a worldwide network of resellers and service providers and lifetime toll-free 7 x 24 hardware technical phone support. In addition, available service offerings include:
NOTE: Limited Warranty includes 3 year Parts, 3 year Labor, 3-year on-site support.

A full range of HP Care Pack packaged hardware and software services:

- Installation and start up
- Extended coverage hours and enhanced response times
- System management and performance services
- Availability and recovery services

NOTE: For more infomation, visit http://www.hp.com/services/carepack.

Please see the following URL regarding Warranty Information For Your HP Products

NOTE: These Web sites are available in English only

NOTE: Certain restrictions and exclusions apply. Consult the Customer Support Center at 1-800-345-1518 for detai

Models

ML350T03 X2.8-512KB/533, 256MB *311523-001*	Processor(s)	(1) Intel Xeon Processor 2.8 GHz Processor standard (up to 2 supported)
	Cache Memory	Integrated 512-KB Level 2 cache per processor
	Memory	256 MB Advanced ECC PC2100 DDR SDRAM DIMM (Standard) to 8 GB (Maximum)
	Network Controller	NC7760 PCI Gigabit Server Adapter (Integrated/Embedded)
	Storage Controller	Integrated Dual Channel Wide Ultra3 SCSI Adapter
	Hard Drive	None ship standard
	Internal Storage	1.174 TB maximum hot plug (with optional drive cage & hard drives)
	Optical Drive	48x IDE (ATAPI) CD-ROM Drive
	Form Factor	Tower (5U)
ML350R03 X2.8-512KB/533, 256MB *311524-001*	Processor(s)	(1) Xeon 2.8 GHz Processor standard (up to 2 supported)
	Cache Memory	Integrated 512-KB Level 2 cache per processor
	Memory	256 MB Advanced ECC PC2100 DDR SDRAM DIMM (Standard) to 8 GB (Maximum)
	Network Controller	NC7760 PCI Gigabit Server Adapter (Integrated/Embedded)
	Storage Controller	Integrated Dual Channel Wide Ultra3 SCSI Adapter
	Hard Drive	None ship standard
	Internal Storage	1.174 TB maximum hot plug (with optional drive cage & hard drives)
	Optical Drive	48x IDE (ATAPI) CD-ROM Drive
	Form Factor	Rack (5U)
ML350T03 X2.8-512KB/533, 512MB Array *311525-001*	Processor(s)	(1) Intel Xeon Processor 2.8 GHz Processor standard (up to 2 supported)
	Cache Memory	Integrated 512-KB Level 2 cache per processor
	Memory	512 MB Advanced ECC PC2100 DDR SDRAM DIMM (Standard) to 8 GB (Maximum)
	Network Controller	NC7760 PCI Gigabit Server Adapter (Integrated/Embedded)
	Storage Controller	Integrated Dual Channel Wide Ultra3 SCSI Adapter
	RAID Controller	Smart Array 641
	Hard Drive	None ship standard
	Internal Storage	1.174 TB maximum hot plug (with optional drive cage & hard drives)
	Optical Drive	48x IDE (ATAPI) CD-ROM Drive
	Form Factor	Tower (5U)
ML350R03 X2.8-512KB/533, 512MB Array *311526-001*	Processor(s)	(1) Xeon 2.8 GHz Processor standard (up to 2 supported)
	Cache Memory	Integrated 512-KB Level 2 cache per processor
	Memory	512 MB of Advanced ECC PC2100 DDR SDRAM DIMM (Standard) to 8 GB (Maximum)
	Network Controller	NC7760 PCI Gigabit Server Adapter (Integrated/Embedded)
	Storage Controller	Integrated Dual Channel Wide Ultra3 SCSI Adapter
	RAID Controller	Smart Array 641
	Hard Drive	None ship standard
	Internal Storage	1.174 TB maximum hot plug (with optional hard drive cage)
	Optical Drive	48x IDE (ATAPI) CD-ROM Drive
	Form Factor	Rack (5U)

Models

ML350T03 X2.4-512KB/400, 256MB *269786-001*	Processor(s)	(1) Intel Xeon Processor 2.4 GHz Processor standard (up to 2 supported)
	Cache Memory	Integrated 512-KB Level 2 cache per processor
	Memory	256 MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (Standard) to 8 GB (Maximum)
	Network Controller	NC7760 PCI Gigabit Server Adapter (Integrated/Embedded)
	Storage Controller	Integrated Dual Channel Wide Ultra3 SCSI Adapter
	Hard Drive	None ship standard
	Internal Storage	1.174 TB maximum hot plug (with optional hard drive cage)
	Optical Drive	48x IDE (ATAPI) CD-ROM Drive
	Form Factor	Tower (5U)

ML350R03 X2.4-512KB/400, 256MB *269787-001*	Processor(s)	(1) Xeon 2.4 GHz Processor standard (up to 2 supported)
	Cache Memory	Integrated 512-KB Level 2 cache per processor
	Memory	256 MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (Standard) to 8 GB (Maximum)
	Network Controller	NC7760 PCI Gigabit Server Adapter (Integrated/Embedded)
	Storage Controller	Integrated Dual Channel Wide Ultra3 SCSI Adapter
	Hard Drive	None ship standard
	Internal Storage	1.174 TB maximum hot plug (with optional hard drives & drive cage)
	Optical Drive	48x IDE (ATAPI) CD-ROM Drive
	Form Factor	Rack (5U)

Options

ProLiant ML350 G3 Unique Options	Hot Plug Redundant Power Supply Option Kit	283655-001
	Hot Plug Redundant Power Supply Option Kit (cable) NOTE: PN 283655-B21 SKU contains the 2nd power supply with an IEC power cable. Only purchase if connecting to PDU/UPS that supports IEC cables. All other SKUs contain country specific power cables.	283655-B21
	Intel Xeon 2.80 GHz-512KB Processor Option Kit NOTE: The 2.8 GHz processor option kit (PN 314763-B21) supports ProLiant ML350 G3 systems with 533 MHz front side bus only. This kit cannot be used in 400 MHz front side bus systems such as those with 2.4 GHz, 2.2GHz or 2.0 GHz processors.	314763-B21
	Intel Xeon 2.40 GHz-512KB Processor Option Kit NOTE: This processor option kit (PN 257913-B21) supports the ProLiant ML350 G3 servers.	257913-B21
	Intel Xeon 2.20 GHz-512KB Processor Option Kit NOTE: This processor option kit (PN 283702-B21) supports the ProLiant ML350 G3 servers.	283702-B21
	Intel Xeon 2.0 GHz-512KB Processor Option Kit NOTE: This processor option kit (PN 283701-B21) supports the ProLiant ML350 G3 servers.	283701-B21
	ProLiant ML350 G3 Tower to Rack Conversion Kit (CPQ brand)	290683-B21
ProLiant Essentials Value Pack Software	Rapid Deployment Pack, 1 User, V1.x NOTE: This license allows 1 server to be managed and deployed via the Deployment Server.	267196-B21
	Rapid Deployment Pack, 10 Users, V1.x NOTE: This license allows 10 servers to be managed and deployed via the Deployment Server.	269817-B21
	Flexible Quantity License Kit	302127-B21
	License-Only - for use with a Master License Agreement	302128-B21
	ProLiant Essentials Workload Management Pack 2.0 (Featuring Compaq Resource Partitioning Manager version 2.0)	303284-B21
	ProLiant Essentials Performance Management Pack Flexible License	306697-B21
	NOTE: Flexible and volume quantity license kits are available for ProLiant Essentials Value Packs. Refer to http://www.hp.com/servers/proliantessentials or the various ProLiant Essentials Value Pack product QuickSpecs for more information. NOTE: For more information regarding ProLiant Essentials Software, please see the following URL: http://www.hp.com/servers/proliantessentials NOTE: These Web sites are available in English only.	
HP NetServer Transition Services	HP NetServer to ProLiant integration and assessment service NOTE: HP identifies current levels of NetServer support, services, and management. This service helps maximize customer's ability to add ProLiant platforms into their current environment.	304164-002
	HP TopTools to Insight Manager 7 installation and startup service NOTE: Provides on-site review, installation and configuration services for Insight Manager 7. HP will also re-create, as closely as possible, the views and reports from the customer's current TopTools configuration. This service assures a smooth transition to the ProLiant Essentials software.	304163-002
	HP NetServer to ProLiant Essentials Rapid Deployment Pack installation and startup service NOTE: Install and configure Rapid Deployment Pack in a test environment, then deploy a server image to a maximum of 250 systems in the production environment. This service helps to assure successful system deployment.	304162-002

Options

Processors	**Intel Xeon 2.80 GHz-512KB Processor Option Kit**	314763-B21
	NOTE: The 2.8 GHz processor option kit (PN 314763-B21) supports ProLiant ML350 G3 systems with 533 MHz front side bus only. This kit cannot be used in 400 MHz front side bus systems such as thhose with 2.4 GHz, 2.2GHz or 2.0 GHz processors.	
	Intel Xeon 2.40 GHz-512KB Processor Option Kit	257913-B21
	NOTE: This processor option kit supports ProLiant ML350 G3 servers with 400 MHz front side bus only. This kit (PN 257913-B21) cannot be used in 533 MHz front side bus systems such as the 2.8 GHz systems.	
	Intel Xeon 2.20 GHz-512KB Processor Option Kit	283702-B21
	NOTE: This processor option kit supports ProLiant ML350 G3 servers with 400 MHz front side bus only. This kit (PN 283702-B21) cannot be used in 533 MHz front side bus systems such as the 2.8 GHz systems.	
	Intel Xeon 2.0 GHz-512KB Processor Option Kit	283701-B21
	NOTE: This processor option kit supports ProLiant ML350 G3 servers with 400 MHz front side bus only. This kit (PN 283701-B21) cannot be used in 533 MHz front side bus systems such as the 2.8 GHz systems.	
Memory (DIMMs)	NOTE: The ML350 G3 supports both interleaved and non-interleaved memory configurations. Base models ship standard with one 256MB DIMM or one 512MB DIMM (Array models). For best performance automatically invoke interleaving by populating memory in identical pairs. If 1GB of total memory is desired add three 256MB DIMMs to the base configuration. If 1.5GB of memory is desired add one 256MB DIMM (to pair with the standard DIMM) and two 512MB DIMMs. Interleaving and installation of memory in pairs is not required. Add any combination of memory DIMMs below to operate in non-interleaved mode. NOTE: Each SDRAM Memory kit contains one (1) DIMM.	
	128MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 128 MB)	287494-B21
	256MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 256 MB)	287495-B21
	512MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 512 MB)	287496-B21
	1024MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 1024 MB)	287497-B21
	2048MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 2048 MB)	301044-B21
Internal Storage	**ML3xx Two Bay Hot Plug SCSI Drive Cage**	244059-B21
	NOTE: The drive cage option kit (PN 244059-B21) has one 1" drive bay and one 1 6' drive bay. It installs in two available removable media bays.	
Optical Drives	**16X DVD-ROM Drive Option Kit (Carbon)**	217053-B21
	CD-RW/DVD-ROM 48X Combo Drive Option Kit	3313[illegible]1
Hard Drives	*Ultra320 – Universal Hot Plug*	
	146.8-GB 10,000 rpm U320 Universal Hard Drive (1")	286716-B22
	72.8-GB 10,000 rpm U320 Universal Hard Drive (1")	286714-B22
	36.4-GB 10,000 rpm U320 Universal Hard Drive (1")	286713-B22
	72.8-GB 15,000 rpm U320 Universal Hard Drive (1")	286778-B22
	36.4-GB 15,000 rpm U320 Universal Hard Drive (1")	286776-B22
	18.2-GB 15,000 rpm U320 Universal Hard Drive (1")	286775-B22
	NOTE: All U320 Universal Hard Drives are backward compatible to U2 or U3 speeds. U320 drives require an optional U320 Smart Array Controller or U320 SCSI HBA to support U320 transfer rates	
	NOTE. Please see the Wide Ultra320 Universal Hot Plug QuickSpecs for additional technical information on the hard drives Support details please see the following http www5 compaq com prod ts/quicksp [illegible]

HP Factory Express

Factory Installation, Racking, and Customization Services

Factory Express Server Configuration Level 1	293355-888

NOTE: Free Installation of HP Options - Installation of HP Options memory, NICs, hard drives, controllers, processors, I/O cards, pre-install standard OEM OS image, and tape drives. Installation fees will apply to all non-HP certified hardware and asset tags.
NOTE: Available on ProLiant ML370 G3 Rack Models Only.

Factory Express Server Configuration Level 2	266326-888

NOTE Includes Level 1 Customer Intent of a ProLiant server and options configuration, OS installation, custom image download, IP addressing, network setting, and custom packaging. Customer unique requirements (quick restore creation, cd duplication, test reports, real-time reporting of server MAC address, password, and RILOE). Customer access, validation and control through VPN (price/server).
NOTE: Available on ProLiant ML370 G3 Rack Models Only.

Factory Express Rack Integration Level 3 with 1 - 3 servers or storage enclosures	325736-888
Factory Express Rack Integration Level 3 with 4 - 9 servers or storage enclosures	232539-888
Factory Express Rack Integration Level 3 with 10 or more servers or storage enclosures	325735-888

NOTE: Includes Level 1 Customer Intent for standard mounted servers and storage units plus standard cable mgmt, RAID configuration, servers & storage, power distribution, networking gear and accessories (price/ra520ck).
NOTE: Available on ProLiant ML370 G3 Rack Models Only.

Factory Express Rack Integration Level 4 with 1 - 3 servers or storage enclosures	325734-888
Factory Express Rack Integration Level 4 with 4 - 9 servers or storage enclosures	232540-888
Factory Express Rack Integration Level 4 with 10 or more servers or storage enclosures	325733-888

NOTE: Includes Level 2 Customer Intent plus customer defined cable management and naming convention, customer furnished image download, IP addressing, cluster configurations (SQL, External storage RAID). Quick restore creation, cd duplication, test reports, real-time reporting of server MAC address, password, RILOE). Customer access and validation through VPN (price/rack).
NOTE: Available on ProLiant ML370 G3 Rack Models Only.

Factory Express Rack Integration Level 5 with 1 - 3 servers or storage enclosures	325732-888
Factory Express Rack Integration Level 5 with 4 - 9 servers or storage enclosures	232541-888
Factory Express Rack Integration Level 5 with 10 or more servers or storage enclosures	325731-888

NOTE Includes Level 4 Customer Intent plus Custom SW layering and extended test, Customer access, validation and control through VPN, Clustered racks with networking gear and/or external storage array, Start-up installation services custom quote. (price/rack)
NOTE: Factory Express Engineered Solution Level 6 is a custom solutions available through Factory Express Please contact a your local reseller or Account Manager
NOTE: Available on ProLiant ML370 G3 Rack Models Only.

Service and Support Offerings (HP Care Pack Services)

Hardware Services On-site Service

4-Hour On-site Service, 5-Day x 13-Hour Coverage, 3 Years (Canadian Part Number)	FP-EL3EC-36
4-Hour On-site Service, 5-Day x 13-Hour, 3 Years (U.S. Part Number)	331045-002
4-Hour On-site Service, 7-Day x 24-Hour Coverage, 3 Years (Canadian Part Number)	FP-EL7EC-36
4-Hour On-site Service, 7-Day x 24-Hour Coverage, 3 Years (U.S. Part Number)	162675-002
6-Hour Call to Repair, On-site Service, 7-Day x 24-Hour Coverage, 3 Years (Canadian Part Number)	FP-ELCEC-36
6-Hour Call to Repair, On-site Service 7-Day x 24-Hour Coverage, 3 Years (U.S. Part Number)	331046-002

Options

Installation & Start-up Services

Hardware Installation (Canadian Part Number)	FP-ELINS-EC
Hardware Installation (U.S. Part Number)	401791-002
Installation & Start-Up of a ProLiant server and Microsoft O/S per the Customer Description and/or Data Sheet. To be delivered on a scheduled basis 8am-5pm, M-F, excl. HP holidays. (U.S. Part Number)	240013-002
Installation & Start-Up of a ProLiant server and Microsoft O/S per the Customer Description and/or Data Sheet. To be delivered on a scheduled basis 8am-5pm, M-F, excl. HP holidays. (Canadian Part Number)	FM-MSTEC-01
Installation & Start-Up of a ProLiant server and Linux O/S per the Customer Description and/or Data Sheet. To be delivered on a scheduled basis 8am-5pm, M-F, excl. HP holidays. (U.S. Part Number)	331051-002
Installation & Start-Up of a ProLiant server and Linux O/S per the Customer Description and/or Data Sheet. To be delivered on a scheduled basis 8am-5pm, M-F, excl. HP holidays. (Canadian Part Number)	FM-LSTEC-01

Support Plus

Onsite HW support, 8am-9pm, M-F, 4hr response and Microsoft O/S SW Tech support offsite, onsite at HP's discretion, 8am-9pm, M-F 2hr response time excl. HP holidays. (U.S. Part Number)	239929-002
Onsite HW support, 8am-9pm, M-F, 4hr response and Microsoft O/S SW Tech support offsite, onsite at HP's discretion, 8am-9pm, M-F 2hr response time excl. HP holidays. (Canadian Part Number)	FM-M01E1-36
Onsite HW support, 8am-9pm, M-F, 4hr response and Linux O/S SW Tech support offsite, onsite at HP's discretion, 8am-9pm, M-F 2hr response time excl. HP holidays. (U.S. Part Number)	331049-002
Onsite HW support, 8am-9pm, M-F, 4hr response and Linux O/S SW Tech support offsite, onsite at HP's discretion, 8am-9pm, M-F 2hr response time excl. HP holidays. (Canadian Part Number)	FM-L01E1-36

Support Plus 24

Onsite HW support 24x7, 4hr response and Microsoft O/S SW Tech support offsite, onsite at HP's discretion, 24x7 2hr response time incl. HP holidays. (U.S. Part Number)	239930-002
Onsite HW support 24x7, 4hr response and Microsoft O/S SW Tech support offsite, onsite at HP's discretion, 24x7 2hr response time incl. HP holidays. (Canadian Part Number	FM-M02E1-36
Onsite HW support 24x7, 4hr response and Linux O/S SW Tech support offsite, onsite at HP's discretion, 24x7 2hr response time incl. HP holidays. (U.S. Part Number	331050-002
Onsite HW support 24x7, 4hr response and Linux O/S SW Tech support offsite, onsite at HP's discretion, 24x7 2hr response time incl. HP holidays. (Canadian Part Number	FM-L02E1-36

CarePaq Priority Services for ProLiant Servers – Priority Silver

24 x 7 HW, 4-hr response, Named HW engineer; 24 x 7 Silver Software Support, 1-hr response, Monday – Friday, 8AM – 5PM local time, 2-hr response after hours for Windows NT, Windows 2000, Professional, Server or Advanced Server Operating System, Technical Account Manager, Technical Newsletter, SW activity review, proactive patch notification, 1 System Healthcheck per year (2-5-2 Part Number for Canada)	FM-M04E1-36
24 x 7 HW, 4-hr response, Named HW engineer; 24 x 7 Silver Subsequent System Support for Windows NT, Windows 2000, Professional, Server or Advanced Server Operating System (2-5-2 Part Number for Canada)	FM-M24E1-36
24 x 7 HW, 4-hr response, Named HW engineer; 24 x 7 Silver Software Support, 1-hr response, Monday – Friday, 8AM – 5PM local time, 2-hr response after hours for Novell NetWare Operating System, Technical Account Manager, Technical Newsletter, SW activity review (2-5-2 Part Number for Canada)	FM-N04E1-36
24 x 7 HW, 4-hr response, Named HW engineer; 24 x 7 Silver Subsequent System Support for Novell NetWare Operating System (2-5-2 Part Number for Canada)	FM-N24E1-36
24 x 7 HW, 4-hr response, Named HW engineer; 24 x 7 Silver Software Support, 1-hr response, Monday – Friday, 8AM – 5PM local time, 2-hr response after hours for Windows NT, Windows 2000, Professional, Server or Advanced Server Operating System, Technical Account Manager, Technical Newsletter, SW activity review, proactive patch notification, 1 System Healthcheck per year (6-3 Part Number for U.S.)	239932-002
24 x 7 HW, 4-hr response, Named HW engineer; 24 x 7 Silver Subsequent System Support for Windows NT, Windows 2000, Professional, Server or Advanced Server Operating System (6-3 Part Number for U.S.)	239934-002
24 x 7 HW, 4-hr response, Named HW engineer; 24 x 7 Silver Software Support, 1-hr response, Monday – Friday, 8AM – 5PM local time, 2-hr response after hours for Novell NetWare Operating System, Technical Account Manager, Technical Newsletter, SW activity review (6-3 Part Number for U.S.)	239972-002
24 x 7 HW, 4-hr response, Named HW engineer; 24 x 7 Silver Subsequent System Support for Novell NetWare Operating System (6-3 Part Number for U.S.)	239974-002

NOTE: For more information, customer/resellers can contact http://www.hp.com/services/carepack

Memory

HP ProLiant ML350 G3 Array Models

The ML350 G3 supports both interleaved and non-interleaved memory configurations. Array models ship standard with one 512MB DIMM, non-interleaved. For best performance automatically invoke interleaving by populating memory in identical pairs. Interleaving memory and installing in pairs is not required. Add any combination of memory DIMMs to operate in non-interleaved mode.

Standard Memory

512MB (expandable to 8GB) of 2-way interleoving capoble PC2100 DDR SDRAM running at 200MHz on 400MHz models or 266MHz on 533MHz models, with Advanced ECC capabilities (1x 512MB)

NOTE: Advanced ECC Memory - ECC protection provides the ability to detect and correct single bit memory errors while Advanced ECC extends this coverage to include protection against multiple simultaneous errors on a DIMM. Advanced ECC detects and corrects 4bit memory errors that occur within a single DRAM chip on a DIMM. Advanced ECC algorithms work in combination with industry standard ECC DIMMS.

Standard Memory Plus Optional Memory

Up to 6.7 GB of total memory can be implemented with the installation of three optional PC2100-MHz Registered ECC DDR SDRAM DIMMs.

Standard Memory Replaced with Optional Memory

Up to 8.2 GB of total memory can be implemented with the removal of the standard 512-MB DIMM and the optional installation of PC2100-MHz Registered ECC DDR SDRAM DIMMs.

NOTE: Charts do not represent all possible memory configurations

		Slot 1	Slot 2	Slot 3	Slot 4
Standard	512 MB	512 MB	Empty	Empty	Empty
Optional	6656 MB	512 MB	2048 MB	2048 MB	2048 MB
Maximum	8192 MB	2048 MB	2048 MB	2048 MB	2048 MB
2x1 Interleaved Memory (Recommended)		Pair 1		Pair 2	
	Total Memory	Slot 1	Slot 2	Slot 3	Slot 4
Recommended Configurations for Array Models	1 GB	512 MB	512 MB	Empty	Empty
	1.5 GB	512 MB	512 MB	256 MB	256 MB
	2 GB	512 MB	512 MB	512 MB	512 MB

Following are memory options available from HP:

● 128MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 128 MB)	287494-B21
● 256MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 256 MB)	287495-B21
● 512MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 512 MB)	287496-B21

NOTE: To invoke interleaving in your array model, order this kit for a total of 1-GB of interleaved memory.

● 1024MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 1024 MB)	287497-B21
● 2048MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 2048 MB)	301044-B21

HP ProLiant ML350 G3 Non-Array Models

The ML350 G3 supports both interleaved and non-interleaved memory configurations. Base models ship standard with one 256MB DIMM, non-interleaved. For best performance automatically invoke interleaving by populating memory in identical pairs. Interleaving memory and installing in pairs is not required. Add any combination of memory DIMMs to operate in non-interleaved mode.

Standard Memory

256MB (expandable to 8GB) of 2-way interleaving capable PC2100 DDR SDRAM running at 200MHz on 400MHz models or 266MHz on 533MHz models with Advanced ECC capabilities (1x 256MB)

NOTE: Advanced ECC Memory - ECC protection provides the ability to detect and correct single bit memory errors while Advanced ECC extends this coverage to include protection against multiple simultaneous errors on a DIMM. Advanced ECC detects and corrects 4bit memory errors that occur within a single DRAM chip on a DIMM. Advanced ECC algorithms work in combination with industry standard ECC DIMMS.

Standord Memory Plus Optional Memory

Up to 6.4 GB optional memory is available with the installation of PC2100-MHz Registered ECC DDR SDRAM DIMMs.

Standard Memory Replaced with Optional Memory

'Jp to 8.2 GB of memory is available with the removal of the standard 256-MB of memory and the optional installation of PC2100-MHz Registered ECC DDR SDRAM DIMM installed.

NOTE: Charts do not represent all possible memory configurations

Memory

	Operating Conditions	Temperature	41° to 113° F (5° to 45° C)
		Humidity	10% to 80%
	Dimensions	(HxWxD, maximum)	1.7 x 5.85 x 8.11 in (4.29 x 14.86 x 20.60 cm)
		Weight	2.09 lb (0.95 kg)

NC7760 PCI Gigabit Server Adapter (embedded)	Network Interface	10Base-T/100Base-TX/1000Base-TX	
	Compatibility	IEEE 802.3 10Base-T	
		IEEE 802.3ab 1000Base-T	
		IEEE 80.3u 100Base-TX	
	Data Transfer Method	32-bit bus-master PCI	
	Network Transfer Rate	10Base-T(Half-Duplex)	10 Mb/s
		10Base-T(Full-Duplex)	20 Mb/s
		100Base-TX(Half-Duplex)	100 Mb/s
		100Base-TX(Full-Duplex)	200 Mb/s
		1000Base-TX	1000Mb/s
	Connector	RJ-45	
	Cable Support	10Base-T	Categories 3, 4 or 5 UTP; up to 328 ft (100 m)
		10/100/1000Base-TX	Category 5 UTP; up to 328 ft (100 m)

TechSpecs

Integrated Dual Channel Wide Ultra3 SCSI Adapter	Drives Supported	Up to 28 SCSI devices (14 per channel)
	Data Transfer Method	64-bit PCI bus-master
	SCSI Channel Transfer Rate	80 MB/s per channel
	Maximum Transfer Rate per PCI Bus (peak)	133 MB/s per channel
	SCSI Protocols	Wide Ultra2 SCSI Wide-Ultra SCSI-3 Fast SCSI-2
	Electrical Protocol	Low Voltage Differential (LVD)
	SCSI Termination	Active Termination
	External SCSI Connectors	Two 80-Pin VHDCI connectors
	Internal SCSI Connectors	Two 68-Pin Wide-Ultra SCSI-3 connectors

Smart Array 641 Controller (NOTE: The Smart Array 641 Controller ships standard with the 2.8 GHz Array Models only)	Protocol	Ultra320 SCSI
	SCSI Electrical Interface	Low Voltage Differential (LVD)
	Drives Supported	Up to 6 Ultra 320, Ultra3 and Ultra2 SCSI hard drives
	SCSI Port Connectors SA-641	one internal SCSI port
	Data Transfer Method	64-Bit PCI bus-master
	PCI Bus Speed	64-bit, 133-MHz PCI-X (1 GB/s maximum bandwidth)
	PCI	3.3 volt PCI slot compatibility only
	Simultaneous Drive Transfer Channels	Two
	Channel Transfer Rate	320-MB/s total; 320-MB/s per channel
	Software upgradeable Firmware	Yes
	Cache Memory	64-MB DRAM used for code, transfer buffers, and non-battery backed read cache
	Logical Drives Supported	32
	Maximum Capacity	880.8 GB (6 X 146.8 GB)
	Memory Addressing	64-bit, supporting servers memory greater than 4 GB
	RAID Support	RAID 5 (Distributed Data Guarding) RAID 1+ 0 (Striping & Mirroring) RAID 1 (Mirroring) RAID 0 (Striping)
	Upgradeable Firmware	2-MB Flashable ROM
	Disk Drive and Enclosure Protocol Support	Ultra 320, Ultra2 and Ultra3
	Warranty	Maximum: The remaining warranty of the HP server product in which it is installed (to a maximum three-year limited warranty) Minimum: One-year, on-site limited warranty Pre-Failure Warranty: Drives attached to the Smart Array Controller and monitored under Insight Manager are supported by a Pre-Failure (replacement) Warranty. For complete details, consult the HP Support Center or refer to your HP Server Documentation.

Video Controller	Controller Chip	ATI RAGE XL
	Video DRAM	8 MB Video SDRAM
	Data Transfer Method	32-bit PCI
	Support Resolution	Supported Color Depths:
	640 x 480	16.7M, 64K, 256, 16
	800 x 600	16.7M, 64K, 256, 16
	1024 x 768	16.7M, 64K, 256, 16
	1152 x 864	16.7M, 64K, 256, 16
	1280 x 1024	16.7M, 64K, 256, 16
	1600 x 1200	64K, 256, 16
	Connector	VGA

CHAPTER 34

Configuring Local SPAN and RSPAN

This chapter describes how to configure local Switched Port Analyzer (SPAN) and remote SPAN (RSPAN) on the Catalyst 6500 series switches. The Catalyst 6500 series switches support RSPAN with Release 12.1(13)E and later releases.

This chapter consists of these sections:

Note For complete syntax and usage information for the commands used in this chapter, refer to the *Catalyst 6500 Series Switch Cisco IOS Command Reference* publication.

Understanding How Local SPAN and RSPAN Work

These sections describe how local SPAN and RSPAN work:

Local SPAN and RSPAN Overview

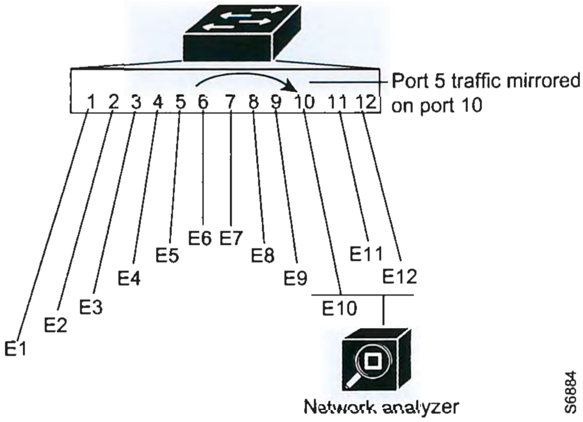
Local SPAN and RSPAN both select network traffic to send to a network analyzer such as a SwitchProbe device or other Remote Monitoring (RMON) probe. SPAN does not affect the switching of network traffic on source ports or VLANs. SPAN sends a copy of the packets received or transmitted by the source ports and VLANs to the destination port. You must dedicate the destination port for SPAN use.

These sections provide an overview of local SPAN and RSPAN:

Local SPAN Overview

Local SPAN supports source ports, source VLANs, and destination ports on the same Catalyst 6500 series switch. Local SPAN copies traffic from one or more source ports in any VLAN or from one or more VLANs to a destination port for analysis (see Figure 34-1). For example, as shown in Figure 34-1, all traffic on Ethernet port 5 (the source port) is copied to Ethernet port 10. A network analyzer on Ethernet port 10 receives all network traffic from Ethernet port 5 without being physically attached to Ethernet port 5.

Figure 34-1 Example SPAN Configuration



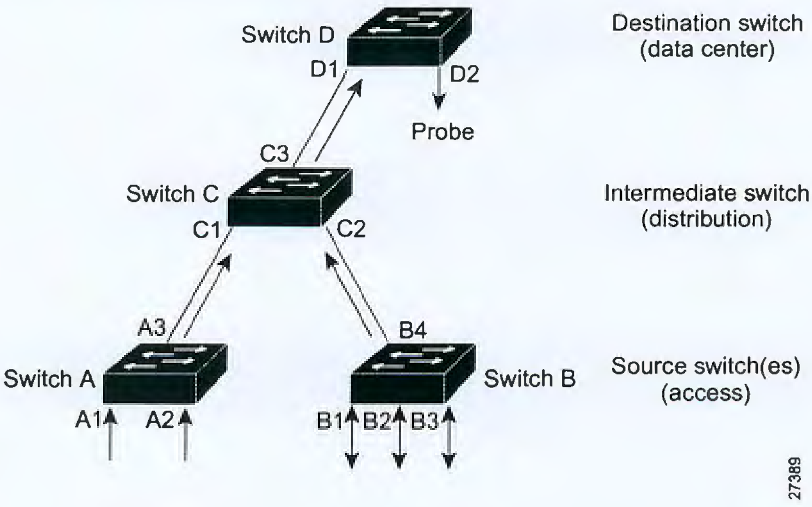
RSPAN Overview

RSPAN supports source ports, source VLANs, and destination ports on different switches, which provides remote monitoring of multiple switches across your network (see Figure 34-2). The traffic for each RSPAN session is carried over a user-specified RSPAN VLAN that is dedicated for that RSPAN session in all participating switches.

The RSPAN source ports can be trunks carrying the RSPAN VLAN. Local SPAN and RSPAN do not monitor the RSPAN traffic in the RSPAN VLAN seen on a source trunk.

The RSPAN traffic from the source ports or source VLANs is switched to the RSPAN VLAN and then forwarded to destination ports, which are in the RSPAN VLAN. The sources (ports or VLANs) in an RSPAN session can be different on different source switches but must be the same for all sources on each RSPAN source switch. Each RSPAN source switch must have either ports or VLANs as RSPAN sources.

Figure 34-2 RSPAN Configuration



Local SPAN and RSPAN Sessions

SPAN sessions (local or remote) allow you to monitor traffic on one or more ports, or one or more VLANs, and send the monitored traffic to one or more destination ports.

A local SPAN session is an association of a set of source ports and source VLANs with one or more destination ports. You configure a local SPAN session on a single network device. Local SPAN does not have separate source and destination sessions.

RSPAN consists of an RSPAN source session, an RSPAN VLAN, and an RSPAN destination session. You separately configure RSPAN source sessions and destination sessions on different network devices. To configure an RSPAN source session on one network device, you associate a set of source ports and VLANs with an RSPAN VLAN. To configure an RSPAN destination session on another device, you associate the destination port with the RSPAN VLAN.

Monitored Traffic

These sections describe the traffic that SPAN (local or remote) can monitor:

- Monitored Traffic Direction, page 34-4
- Monitored Traffic Type, page 34-4
- Duplicate Traffic, page 34-4

Monitored Traffic Direction

You can configure SPAN sessions to monitor ingress network traffic (called ingress SPAN), or to monitor egress network traffic (called egress SPAN), or to monitor traffic flowing in both directions.

Ingress SPAN copies network traffic received by the source ports and VLANs for analysis at the destination port. Egress SPAN copies network traffic transmitted from the source ports and VLANs. When you enter the **both** keyword, SPAN copies the network traffic received and transmitted by the source ports and VLANs to the destination port.

Monitored Traffic Type

By default, local SPAN monitors all network traffic, including multicast and bridge protocol data unit (BPDU) frames. RSPAN does not support BPDU monitoring.

Duplicate Traffic

In some configurations, SPAN sends multiple copies of the same source traffic to the destination port. For example, in a configuration with a bidirectional SPAN session (both ingress and egress) for two SPAN sources, called s1 and s2, to a SPAN destination port, called d1, if a packet enters the switch through s1 and is sent for egress from the switch to s2, ingress SPAN at s1 sends a copy of the packet to SPAN destination d1 and egress SPAN at s2 sends a copy of the packet to SPAN destination d1. If the packet was Layer 2 switched from s1 to s2, both SPAN packets would be the same. If the packet was Layer 3 switched from s1 to s2, the Layer-3 rewrite would alter the source and destination Layer 2 addresses, in which case the SPAN packets would be different.

SPAN Sources

These sections describe local SPAN and RSPAN sources:

- Source Ports, page 34-4
- Source VLANs, pagc 34-5

Source Ports

A source port is a port monitored for network traffic analysis. You can configure both switched and routed ports as SPAN source ports. SPAN can monitor one or more source ports in a single SPAN session. You can configure source ports in any VLAN. Trunk ports can be configured as source ports and mixed with nontrunk source ports, but SPAN does not copy the encapsulation from a source trunk port.

Source VLANs

A source VLAN is a VLAN monitored for network traffic analysis. VLAN-based SPAN (VSPAN) uses a VLAN as the SPAN source. All the ports in the source VLANs become source ports.

Destination Ports

A destination port is a Layer 2 or Layer 3 LAN port to which SPAN sends traffic for analysis.

When you configure a port as a SPAN destination port, it can no longer receive any traffic. When you configure a port as a SPAN destination port, the port is dedicated for use only by the SPAN feature. A SPAN destination port does not forward any traffic except that required for the SPAN session.

With Release 12.1(13)E and later releases, you can configure trunk ports as destination ports, which allows destination trunk ports to transmit encapsulated traffic. With earlier releases, trunk ports stop trunking when you configure them as a destination port.

Local SPAN and RSPAN Configuration Guidelines and Restrictions

These sections describe local SPAN and RSPAN configuration guidelines and restrictions:

- Local SPAN and RSPAN Session Limits, page 34-5
- Local SPAN and RSPAN Source and Destination Limits, page 34-6
- Local SPAN and RSPAN Guidelines and Restrictions, page 34-6
- VSPAN Guidelines and Restrictions, page 34-7
- RSPAN Guidelines and Restrictions, page 34-7

Note

- Release 12.1(13)E and later releases support RSPAN.
- Ports on the WS-X6548-GE-TX and WS-X6548V-GE-TX switching modules cannot be ingress SPAN sources when the switch is operating in truncated mode.

Local SPAN and RSPAN Session Limits

These are the local SPAN and RSPAN session limits:

Total Sessions per Switch	Local SPAN Sessions	RSPAN Source Sessions	RSPAN Destination Sessions
66	2 (ingress or egress or both)	0	64
	1 ingress	1 (ingress or egress or both)	
	1 or 2 egress	0	

Local SPAN and RSPAN Source and Destination Limits

These are the local SPAN and RSPAN source and destination limits:

Sources and Destinations	Local SPAN Sessions	RSPAN Source Sessions	RSPAN Destination Sessions
Egress sources	1 (0 with a remote SPAN source session configured)	1 (0 with a local SPAN egress source session configured)	1 RSPAN VLAN
Ingress sources	64	64	
Destinations per session	64	1 RSPAN VLAN	64

Local SPAN and RSPAN Guidelines and Restrictions

These guidelines and restrictions apply to both local SPAN and RSPAN:

- You need a network analyzer to monitor destination ports.
- You can configure both Layer 2 LAN ports (LAN ports configured with the **switchport** command) and Layer 3 LAN ports (LAN ports not configured with the **switchport** command) as sources or destinations.
- With Release 12.1(13)E and later releases, you can configure destination ports as trunks to capture tagged traffic. With earlier releases, if you configure a trunk port as a destination port, SPAN suspends trunking on the port.
- A port specified as a destination port in one SPAN session cannot be a destination port for another SPAN session.
- A port configured as a destination port cannot be configured as a source port.
- A port channel interface (an EtherChannel) can be a source.
  - With Release 12.1(13)E and later releases, you cannot configure active member ports of an EtherChannel as source ports. Inactive member ports of an EtherChannel can be configured as sources but they are put into the suspended state and carry no traffic.
  - With releases earlier than 12.1(13)E, if you configure a member port of an EtherChannel as a SPAN source port, it is put into the suspended state and carries no traffic.
- A port channel interface (an EtherChannel) cannot be a destination.
  - With Release 12.1(13)E and later releases, you cannot configure active member ports of an EtherChannel as destination ports. Inactive member ports of an EtherChannel can be configured as destinations but they are put into the suspended state and carry no traffic.
  - With releases earlier than 12.1(13)E, if you configure a member port of an EtherChannel as a SPAN destination port, it is put into the suspended state and carries no traffic.
- You cannot mix individual source ports and source VLANs within a single session.
- If you specify multiple ingress source ports, the ports can belong to different VLANs.
- You cannot mix source VLANs and filter VLANs within a session. You can have source VLANs or filter VLANs, but not both at the same time.
- When enabled, local SPAN or RSPAN uses any previously entered configuration.
- When you specify sources and do not specify a traffic direction (ingress, egress, or both), "both" is used by default.

- You cannot configure destination ports to receive ingress traffic.
- Destination ports never participate in any spanning tree instance. Local SPAN includes BPDUs in the monitored traffic, so any BPDUs seen on the destination port are from the source port. RSPAN does not support BPDU monitoring.
- All packets sent through the switch for transmission from a port configured as an egress source are copied to the destination port, including packets that do not exit the switch through the port because STP has put the port into the blocking state, or on a trunk port because STP has put the VLAN into the blocking state on the trunk port.

VSPAN Guidelines and Restrictions

These are VSPAN guidelines and restrictions:

- For VSPAN sessions with both ingress and egress configured, two packets are forwarded from the destination port if the packets get switched on the same VLAN (one as ingress traffic from the ingress port and one as egress traffic from the egress port).
- VSPAN only monitors traffic that leaves or enters Layer 2 ports in the VLAN.
  - If you configure a VLAN as an ingress source and traffic gets routed into the monitored VLAN, the routed traffic is not monitored because it never appears as ingress traffic entering a Layer 2 port in the VLAN.
  - If you configure a VLAN as an egress source and traffic gets routed out of the monitored VLAN, the routed traffic is not monitored because it never appears as egress traffic leaving a Layer 2 port in the VLAN.

RSPAN Guidelines and Restrictions

These are RSPAN guidelines and restrictions:

- Any network device that supports RSPAN VLANs can be an RSPAN intermediate device.
- Networks impose no limit on the number of RSPAN VLANs that the networks carry.
- Intermediate switches might impose limits on the number of RSPAN VLANs that they can support.
- You must configure the RSPAN VLANs in all source, intermediate, and destination network devices. If enabled, the VLAN Trunking Protocol (VTP) can propagate configuration of VLANs numbered 1 through 1024 as RSPAN VLANs. You must manually configure VLANs numbered higher than 1024 as RSPAN VLANs on all source, intermediate, and destination network devices.
- If you enable VTP and VTP pruning, RSPAN traffic is pruned in the trunks to prevent the unwanted flooding of RSPAN traffic across the network.
- RSPAN VLANs can be used only for RSPAN traffic.
- Do not configure a VLAN used to carry management traffic as an RSPAN VLAN.
- Do not assign access ports to RSPAN VLANs. RSPAN puts access ports in an RSPAN VLAN into the suspended state.
- Do not configure any ports in an RSPAN VLAN except those selected to carry RSPAN traffic.
- MAC address learning is disabled on the RSPAN VLAN.
- You can use an output access control list (ACL) on the RSPAN VLAN in the RSPAN source switch to filter the traffic sent to an RSPAN destination.

- RSPAN does not support BPDU monitoring.
- Do not configure RSPAN VLANs as sources in VSPAN sessions.
- You can configure any VLAN as an RSPAN VLAN as long as all participating network devices support configuration of RSPAN VLANs and you use the same RSPAN VLAN for each RSPAN session in all participating network devices.
- Entering SPAN configuration commands does not clear previously configured SPAN parameters. You must enter the **no monitor session** command to clear configured SPAN parameters.

Configuring Local SPAN and RSPAN

These sections describe how to configure local SPAN and RSPAN:

- Local SPAN and RSPAN Configuration Overview, page 34-8
- Configuring RSPAN VLANs, page 34-8
- Configuring Local or RSPAN Sources, page 34-9
- Monitoring Specific Source VLANs on a Source Trunk Port, page 34-10
- Configuring Local SPAN and RSPAN Destinations, page 34-10
- Verifying the Configuration, page 34-12
- Configuration Examples, page 34-12

Note With Release 12.1(11b)E and later releases, when you are in configuration mode you can enter EXEC mode-level commands by entering the **do** keyword before the EXEC mode-level command.

Local SPAN and RSPAN Configuration Overview

To configure a local SPAN session, use the same session number for the sources and the destination ports.

To configure an RSPAN source session, use the same session number for a source and a destination RSPAN VLAN.

To configure an RSPAN destination session, use the same session number for a source RSPAN VLAN and a destination port.

Configuring RSPAN VLANs

To configure a VLAN as an RSPAN VLAN, perform this task:

	Command	Purpose
Step 1	`Router(config)# **vlan** *vlan_ID*{[-*vlan_ID*]|[,*vlan_ID*])`	Creates or modifies an Ethernet VLAN, a range of Ethernet VLANs, or several Ethernet VLANs specified in a comma-separated list (do not enter space characters).

	Command	Purpose
Step 2	Router(config-vlan)# **remote-span**	Configures the VLAN as an RSPAN VLAN.
	Router(config-vlan)# **no remote-span**	Clears the RSPAN VLAN configuration.
Step 3	Router(config-vlan)# **end**	Updates the VLAN database and returns to privileged EXEC mode.

Configuring Local or RSPAN Sources

Note To configure an RSPAN source session, configure a source with an RSPAN VLAN as the destination. To configure an RSPAN destination session, configure an RSPAN VLAN as the source and a port as the destination.

To configure a local SPAN or RSPAN source, perform this task:

Command	Purpose
Router(config)# **monitor session** *session_number* **source** {{*single_interface* | *interface_list* | *interface_range* | *mixed_interface_list* | *single_vlan* | *vlan_list* | *vlan_range* | *mixed_vlan_list*} [**rx** | **tx** | **both**]} | {**remote vlan** *rspan_vlan_ID*}}	Configures the session number, the source ports, VLANs, or RSPAN VLAN, and the traffic direction to be monitored.
Router(config)# **no monitor session** {*session_number* | **all** | **local** | **range** *session_range*[,*session_range*],...] | **remote**}	Clears the monitor configuration.

When configuring monitor sessions, note the following syntax information:

- *single_interface* is **interface** *type slot/port*; *type* is **ethernet**, **fastethernet**, **gigabitethernet**, or **tengigabitethernet**.
- *interface_list* is *single_interface* , *single_interface* , *single_interface* ...

Note In lists, you must enter a space before and after the comma. In ranges, you must enter a space before and after the dash.

- *interface_range* is **interface** *type slot/first_port - last_port*
- *mixed_interface_list* is, in any order, *single_interface* , *interface_range* , ...
- *single_vlan* is a the ID number of a single VLAN.
- *vlan_list* is *single_vlan* , *single_vlan* , *single_vlan* ...
- *vlan_range* is *first_vlan_ID - last_vlan_ID*
- *mixed_vlan_list* is, in any order, *single_vlan* , *vlan_range* , ...

When clearing monitor sessions, note the following syntax information:

- The **no monitor session** *number* command entered with no other parameters clears session *session_number*.
- *session_range* is *first_session_number-last_session_number*

Note In the **no monitor session range** command, do not enter spaces before or after the dash. If you enter multiple ranges, do not enter spaces before or after the commas.

This example shows how to configure session 1 to monitor bidirectional traffic from Fast Ethernet port 5/1:

```
Router(config)# monitor session 1 source interface fastethernet 5/1
```

Monitoring Specific Source VLANs on a Source Trunk Port

To monitor specific VLANs when the local or RSPAN source is a trunk port, perform this task:

Command	Purpose
`Router(config)# monitor session session_number filter {vlan_ID} [, | -]`	Monitors specific VLANs when the source is a trunk port.
`Router(config)# no monitor session session_number filter {vlan_ID}`	Clears trunk source configuration.

This example shows how to monitor VLANs 1 through 5 and VLAN 9 when the source is a trunk port:

```
Router(config)# monitor session 2 filter vlan 1 - 5 , 9
```

Configuring Local SPAN and RSPAN Destinations

These sections describe how to configure local SPAN and RSPAN destinations:

- Configuring a Destination Port as an Unconditional Trunk, page 34-10
- Configuring a Local or RSPAN Destination, page 34-11

Configuring a Destination Port as an Unconditional Trunk

To tag the monitored traffic with Release 12.1(13)E and later releases, configure the destination port as a trunk.

To configure the destination port as a trunk, perform this task:

	Command	Purpose
Step 1	`Router(config)# interface type[1] slot/port`	Selects the LAN port to configure.
Step 2	`Router(config-if)# switchport`	Configures the LAN port for Layer 2 switching (required only if the LAN port is not already configured for Layer 2 switching).
Step 3	`Router(config-if)# switchport trunk encapsulation {isl | dot1q}`	Configures the encapsulation, which configures the Layer 2 switching port as either an ISL or 802.1Q trunk.
Step 4	`Router(config-if)# switchport mode trunk`	Configures the port to trunk unconditionally.
Step 5	`Router(config-if)# switchport nonegotiate`	Configures the trunk not to use DTP.

[1] *type* = **ethernet, fastethernet, gigabitethernet,** or **tengigabitethernet**

This example shows how to configure a port as an unconditional IEEE 802.1q trunk:

```
Router(config)# interface fastethernet 5/12
Router(config-if)# switchport
Router(config-if)# switchport trunk encapsulation dot1q
Router(config-if)# switchport mode trunk
Router(config-if)# switchport nonegotiate
```

Configuring a Local or RSPAN Destination

Note To configure an RSPAN source session, configure a source with an RSPAN VLAN as the destination. To configure an RSPAN destination session, configure an RSPAN VLAN as the source and a port as the destination.

To configure a local or RSPAN destination, perform this task:

Command	Purpose
`Router(config)# monitor session session_number destination {single_interface | interface_list | interface_range | mixed_interface_list} | {remote vlan rspan_vlan_ID}}`	Configures the session number and the destination ports or RSPAN VLAN.
`Router(config)# no monitor session {session_number | all | local | range session_range[[,session_range],...] | remote}`	Clears the monitor configuration.

Note To tag the monitored traffic, you must configure the port to trunk unconditionally before you configure it as a destination (see the "Configuring a Destination Port as an Unconditional Trunk" section on page 34-10).

When configuring monitor sessions, note the following syntax information:

- *single_interface* is **interface** *type slot/port*; *type* is **ethernet**, **fastethernet**, **gigabitethernet**, or **tengigabitethernet**.
- *interface_list* is *single_interface* , *single_interface* , *single_interface* ...

Note In lists, you must enter a space before and after the comma. In ranges, you must enter a space before and after the dash.

- *interface_range* is **interface** *type slot/first_port - last_port*
- *mixed_interface_list* is, in any order, *single_interface* , *interface_range* , ...

When clearing monitor sessions, note the following syntax information:

- Enter the **no monitor session** *number* command with no other parameters to clear session *session_number*.
- *session_range* is *first_session_number-last_session_number*

Note In the **no monitor session range** command, do not enter spaces before or after the dash. If you enter multiple ranges, do not enter spaces before or after the commas.

This example shows how to configure Fast Ethernet port 5/48 as the destination for SPAN session 1:

```
Router(config)# monitor session 1 destination interface fastethernet 5/48
```

Verifying the Configuration

This example shows how to verify the configuration of session 2:

```
Router# show monitor session 2
Session 2
------------
Type : Remote Source Session

Source Ports:
    RX Only:       Fa3/1
Dest RSPAN VLAN:   901
Router#
```

This example shows how to display the full details of session 2:

```
Router# show monitor session 2 detail
Session 2
------------
Type : Remote Source Session

Source Ports:
    RX Only:       Fa1/1-3
    TX Only:       None
    Both:          None
Source VLANs:
    RX Only:       None
    TX Only:       None
    Both:          None
Source RSPAN VLAN: None
Destination Ports: None
Filter VLANs:      None
Dest RSPAN VLAN:   901
```

Configuration Examples

This example shows how to configure RSPAN source session 2:

```
Router(config)# monitor session 2 source interface fastethernet1/1 - 3 rx
Router(config)# monitor session 2 destination remote vlan 901
```

This example shows how to clear the configuration for sessions 1 and 2:

```
Router(config)# no monitor session range 1-2
```

This example shows how to configure an RSPAN source session with multiple sources:

```
Router(config)# monitor session 2 source interface fastethernet 5/15 , 7/3 rx
Router(config)# monitor session 2 source interface gigabitethernet 1/2 tx
Router(config)# monitor session 2 source interface port-channel 102
Router(config)# monitor session 2 source filter vlan 2 - 3
Router(config)# monitor session 2 destination remote vlan 901
```

This example shows how to remove sources for a session:

```
Router(config)# no monitor session 2 source interface fastethernet 5/15 , 7/3
```

This example shows how to remove options for sources for a session:

```
Router(config)# no monitor session 2 source interface gigabitethernet 1/2
Router(config)# no monitor session 2 source interface port-channel 102 tx
```

This example shows how to remove VLAN filtering for a session:

```
Router(config)# no monitor session 2 filter vlan 3
```

This example shows how to configure an RSPAN destination session:

```
Router(config)# monitor session 8 source remote vlan 901
Router(config)# monitor session 8 destination interface fastethernet 1/2 , 2/3
```

CHAPTER 15

Configuring STP and IEEE 802.1s MST

This chapter describes how to configure the Spanning Tree Protocol (STP) and the IEEE 802.1s Multiple Spanning Tree (MST) protocol on Catalyst 6500 series switches.

Note For complete syntax and usage information for the commands used in this chapter, refer to the *Catalyst 6500 Series Switch Cisco IOS Command Reference* publication.

This chapter consists of these sections:

Note

- For information on configuring the PortFast, UplinkFast, and BackboneFast STP enhancements, see Chapter 16, “Configuring Optional STP Features.”
- Release 12.1(13)E and later releases support IEEE 802.1s MST and IEEE 802.1w, rapid reconfiguration of spanning tree.

Understanding How STP Works

These sections describe how STP works:

- STP Overview, page 15-2
- Understanding the Bridge ID, page 15-3
- Understanding Bridge Protocol Data Units, page 15-4
- Election of the Root Bridge, page 15-4
- STP Protocol Timers, page 15-5
- Creating the Spanning Tree Topology, page 15-5
- STP Port States, page 15-6
- STP and IEEE 802.1Q Trunks, page 15-12

STP Overview

STP is a Layer 2 link management protocol that provides path redundancy while preventing undesirable loops in the network. For a Layer 2 Ethernet network to function properly, only one active path can exist between any two stations. STP operation is transparent to end stations, which cannot detect whether they are connected to a single LAN segment or a switched LAN of multiple segments.

Catalyst 6500 series switches use STP (the IEEE 802.1D bridge protocol) on all VLANs. By default, a single instance of STP runs on each configured VLAN (provided you do not manually disable STP). You can enable and disable STP on a per-VLAN basis.

When you create fault-tolerant internetworks, you must have a loop-free path between all nodes in a network. The STP algorithm calculates the best loop-free path throughout a switched Layer 2 network. Layer 2 LAN ports send and receive STP frames at regular intervals. Network devices do not forward these frames, but use the frames to construct a loop-free path.

Multiple active paths between end stations cause loops in the network. If a loop exists in the network, end stations might receive duplicate messages and network devices might learn end station MAC addresses on multiple Layer 2 LAN ports. These conditions result in an unstable network.

STP defines a tree with a root bridge and a loop-free path from the root to all network devices in the Layer 2 network. STP forces redundant data paths into a standby (blocked) state. If a network segment in the spanning tree fails and a redundant path exists, the STP algorithm recalculates the spanning tree topology and activates the standby path.

When two Layer 2 LAN ports on a network device are part of a loop, the STP port priority and port path cost setting determine which port is put in the forwarding state and which port is put in the blocking state. The STP port priority value represents the location of a port in the network topology and how well located it is to pass traffic. The STP port path cost value represents media speed.

Understanding the Bridge ID

Each VLAN on each network device has a unique 64-bit bridge ID consisting of a bridge priority value, an extended system ID, and an STP MAC address allocation.

This section contains these topics:

- Bridge Priority Value, page 15-3
- Extended System ID, page 15-3
- STP MAC Address Allocation, page 15-3

Bridge Priority Value

With Release 12.1(8a)E and later releases, the bridge priority is a 4-bit value when the extended system ID is enabled (see Table 15-2 on page 15-3). With earlier releases, the bridge priority is a 16-bit value (see Table 15-1 on page 15-3). See the "Configuring the Bridge Priority of a VLAN" section on page 15-30.

Extended System ID

Release 12.1(8a)E and later releases support a 12-bit extended system ID field as part of the bridge ID (see Table 15-2 on page 15-3). Chassis that support only 64 MAC addresses always use the 12-bit extended system ID. On chassis that support 1024 MAC addresses, you can enable use of the extended system ID. STP uses the VLAN ID as the extended system ID. See the "Enabling the Extended System ID" section on page 15-24.

Table 15-1 Bridge Priority Value with the Extended System ID Disabled

Bridge Priority Value															
Bit 16	**Bit 15**	**Bit 14**	**Bit 13**	**Bit 12**	**Bit 11**	**Bit 10**	**Bit 9**	**Bit 8**	**Bit 7**	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**
32768	16384	8192	4096	2048	1024	512	256	128	64	32	16	8	4	2	1

Table 15-2 Bridge Priority Value and Extended System ID with the Extended System ID Enabled

Bit 16	**Bit 15**	**Bit 14**	**Bit 13**	**Bit 12**	**Bit 11**	**Bit 10**	**Bit 9**	**Bit 8**	**Bit 7**	**Bit 6**	**Bit 5**	**Bit 4**	**Bit 3**	**Bit 2**	**Bit 1**
32768	16384	8192	4096	2048	1024	512	256	128	64	32	16	8	4	2	1

STP MAC Address Allocation

Catalyst 6500 series switch chassis have either 64 or 1024 MAC addresses available to support software features such as STP. To view the MAC address range on your chassis, enter the **show catalyst6000 chassis-mac-address** command.

Release 12.1(8a)E and later releases support chassis with 64 or 1024 MAC addresses. For chassis with 64 MAC addresses, STP uses the extended system ID plus a MAC address to make the bridge ID unique for each VLAN.

Earlier releases support chassis with 1024 MAC addresses. With earlier releases, STP uses one MAC address per VLAN to make the bridge ID unique for each VLAN.

If you have a network device in your network with MAC address reduction enabled, you should also enable MAC address reduction on all other Layer-2 connected network devices to avoid undesirable root bridge election and spanning tree topology issues.

When MAC address reduction is enabled, the root bridge priority becomes a multiple of 4096 plus the VLAN ID. With MAC address reduction enabled, a switch bridge ID (used by the spanning-tree algorithm to determine the identity of the root bridge, the lowest being preferred) can only be specified as a multiple of 4096. Only the following values are possible: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440.

If another bridge in the same spanning-tree domain does not run the MAC address reduction feature, it could win root bridge ownership because of the finer granularity in the selection of its bridge ID.

Understanding Bridge Protocol Data Units

Bridge protocol data units (BPDUs) are transmitted in one direction from the root bridge. Each network device sends configuration BPDUs to communicate and compute the spanning tree topology. Each configuration BPDU contains the following minimal information:

- The unique bridge ID of the network device that the transmitting network device believes to be tł root bridge
- The STP path cost to the root
- The bridge ID of the transmitting bridge
- Message age
- The identifier of the transmitting port
- Values for the hello, forward delay, and max-age protocol timers

When a network device transmits a BPDU frame, all network devices connected to the LAN on which the frame is transmitted receive the BPDU. When a network device receives a BPDU, it does not forward the frame but instead uses the information in the frame to calculate a BPDU, and, if the topology changes, initiate a BPDU transmission.

A BPDU exchange results in the following:

- One network device is elected as the root bridge.
- The shortest distance to the root bridge is calculated for each network device based on the path cost.
- A designated bridge for each LAN segment is selected. This is the network device closest to the root bridge through which frames are forwarded to the root.
- A root port is selected. This is the port providing the best path from the bridge to the root bridge.
- Ports included in the spanning tree are selected.

Election of the Root Bridge

For each VLAN, the network device with the highest bridge ID (the lowest numerical ID value) is elected as the root bridge. If all network devices are configured with the default priority (32768), the network device with the lowest MAC address in the VLAN becomes the root bridge. The bridge priority value occupies the most significant bits of the bridge ID.

When you change the bridge priority value, you change the probability that the switch will be elected as the root bridge. Configuring a higher value increases the probability; a lower value decreases the probability.

The STP root bridge is the logical center of the spanning tree topology in a Layer 2 network. All paths that are not needed to reach the root bridge from anywhere in the Layer 2 network are placed in STP blocking mode.

BPDUs contain information about the transmitting bridge and its ports, including bridge and MAC addresses, bridge priority, port priority, and path cost. STP uses this information to elect the root bridge for the Layer 2 network, to elect the root port leading to the root bridge, and to determine the designated port for each Layer 2 segment.

STP Protocol Timers

Table 15-3 describes the STP protocol timers that affect STP performance.

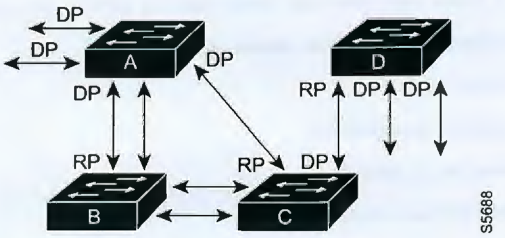
Table 15-3 STP Protocol Timers

Variable	Description
Hello timer	Determines how often the network device broadcasts hello messages to other network devices.
Forward delay timer	Determines how long each of the listening and learning states last before the port begins forwarding.
Maximum age timer	Determines the amount of time protocol information received on an port is stored by the network device.

Creating the Spanning Tree Topology

In Figure 15-1, Switch A is elected as the root bridge because the bridge priority of all the network devices is set to the default (32768) and Switch A has the lowest MAC address. However, due to traffic patterns, number of forwarding ports, or link types, Switch A might not be the ideal root bridge. By increasing the priority (lowering the numerical value) of the ideal network device so that it becomes the root bridge, you force an STP recalculation to form a new spanning tree topology with the ideal network device as the root.

Figure 15-1 Spanning Tree Topology



RP = Root Port
DP = Designated Port

When the spanning tree topology is calculated based on default parameters, the path between source and destination end stations in a switched network might not be ideal. For instance, connecting higher-speed links to a port that has a higher number than the current root port can cause a root-port change. The goal is to make the fastest link the root port.

For example, assume that one port on Switch B is a fiber-optic link, and another port on Switch B (an unshielded twisted-pair [UTP] link) is the root port. Network traffic might be more efficient over the high-speed fiber-optic link. By changing the STP port priority on the fiber-optic port to a higher priority (lower numerical value) than the root port, the fiber-optic port becomes the new root port.

STP Port States

These sections describe the STP port states:

- STP Port State Overview, page 15-6
- Blocking State, page 15-8
- Listening State, page 15-9
- Learning State, page 15-10
- Forwarding State, page 15-11
- Disabled State, page 15-12

STP Port State Overview

Propagation delays can occur when protocol information passes through a switched LAN. As a result, topology changes can take place at different times and at different places in a switched network. When a Layer 2 LAN port transitions directly from nonparticipation in the spanning tree topology to the forwarding state, it can create temporary data loops. Ports must wait for new topology information to propagate through the switched LAN before starting to forward frames. They must allow the frame lifetime to expire for frames that have been forwarded using the old topology.

Each Layer 2 LAN port on a Catalyst 6500 series switch using STP exists in one of the following five states:

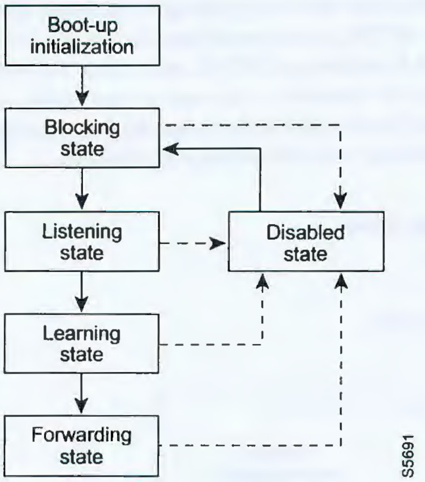
- Blocking—The Layer 2 LAN port does not participate in frame forwarding.
- Listening—First transitional state after the blocking state when STP determines that the Layer 2 LAN port should participate in frame forwarding.
- Learning—The Layer 2 LAN port prepares to participate in frame forwarding.
- Forwarding—The Layer 2 LAN port forwards frames.
- Disabled—The Layer 2 LAN port does not participate in STP and is not forwarding frames.

A Layer 2 LAN port moves through these five states as follows:

- From initialization to blocking
- From blocking to listening or to disabled
- From listening to learning or to disabled
- From learning to forwarding or to disabled
- From forwarding to disabled

Figure 15-2 illustrates how a Layer 2 LAN port moves through the five states.

Figure 15-2 STP Layer 2 LAN Interface States



When you enable STP, every port in the Catalyst 6500 series switch, VLAN, and network goes through the blocking state and the transitory states of listening and learning at power up. If properly configured, each Layer 2 LAN port stabilizes to the forwarding or blocking state.

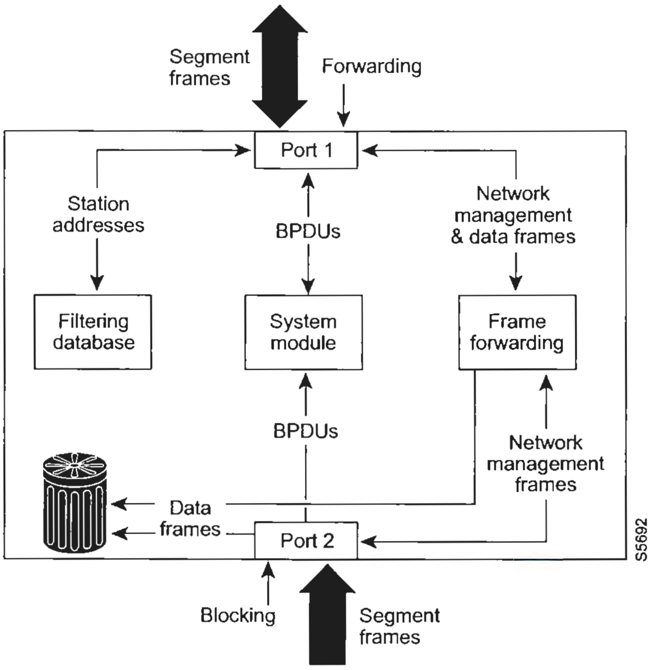
When the STP algorithm places a Layer 2 LAN port in the forwarding state, the following process occurs:

1. The Layer 2 LAN port is put into the listening state while it waits for protocol information that suggests it should go to the blocking state.
2. The Layer 2 LAN port waits for the forward delay timer to expire, moves the Layer 2 LAN port to the learning state, and resets the forward delay timer.
3. In the learning state, the Layer 2 LAN port continues to block frame forwarding as it learns end station location information for the forwarding database.
4. The Layer 2 LAN port waits for the forward delay timer to expire and then moves the Layer 2 LAN port to the forwarding state, where both learning and frame forwarding are enabled.

Blocking State

A Layer 2 LAN port in the blocking state does not participate in frame forwarding, as shown in Figure 15-3. After initialization, a BPDU is sent out to each Layer 2 LAN port. A network device initially assumes it is the root until it exchanges BPDUs with other network devices. This exchange establishes which network device in the network is the root or root bridge. If only one network device is in the network, no exchange occurs, the forward delay timer expires, and the ports move to the listening state. A port always enters the blocking state following initialization.

Figure 15-3 Interface 2 in Blocking State



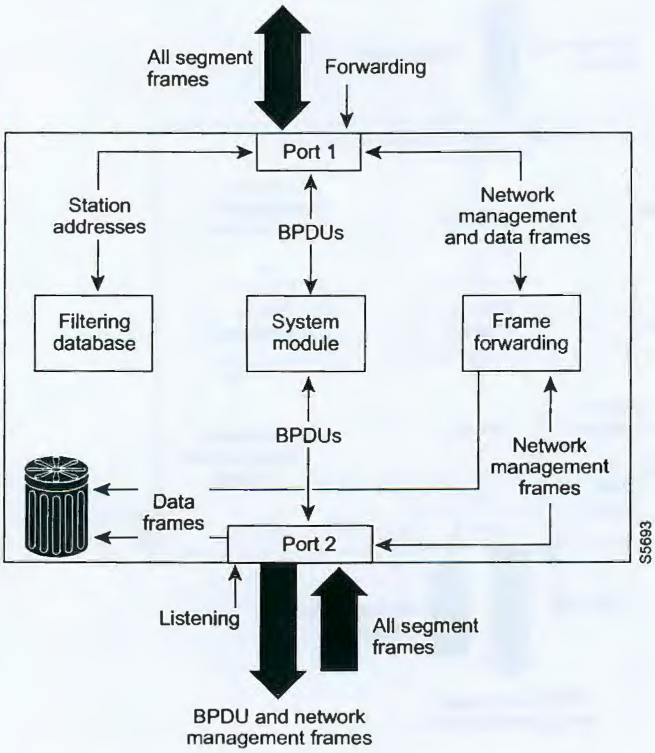
A Layer 2 LAN port in the blocking state performs as follows:

- Discards frames received from the attached segment.
- Discards frames switched from another port for forwarding.
- Does not incorporate end station location into its address database. (There is no learning on a blocking Layer 2 LAN port, so there is no address database update.)
- Receives BPDUs and directs them to the system module.
- Does not transmit BPDUs received from the system module.
- Receives and responds to network management messages.

Listening State

The listening state is the first transitional state a Layer 2 LAN port enters after the blocking state. The Layer 2 LAN port enters this state when STP determines that the Layer 2 LAN port should participate in frame forwarding. Figure 15-4 shows a Layer 2 LAN port in the listening state.

Figure 15-4 Interface 2 in Listening State



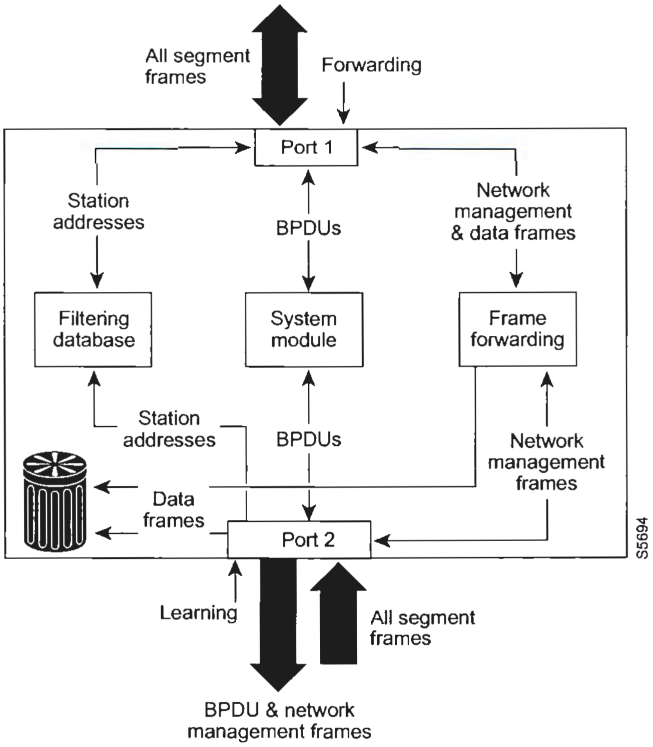
A Layer 2 LAN port in the listening state performs as follows:

- Discards frames received from the attached segment.
- Discards frames switched from another LAN port for forwarding.
- Does not incorporate end station location into its address database. (There is no learning at this point, so there is no address database update.)
- Receives BPDUs and directs them to the system module.
- Receives, processes, and transmits BPDUs received from the system module.
- Receives and responds to network management messages.

Learning State

A Layer 2 LAN port in the learning state prepares to participate in frame forwarding. The Layer 2 LAN port enters the learning state from the listening state. Figure 15-5 shows a Layer 2 LAN port in the learning state.

Figure 15-5 Interface 2 in Learning State



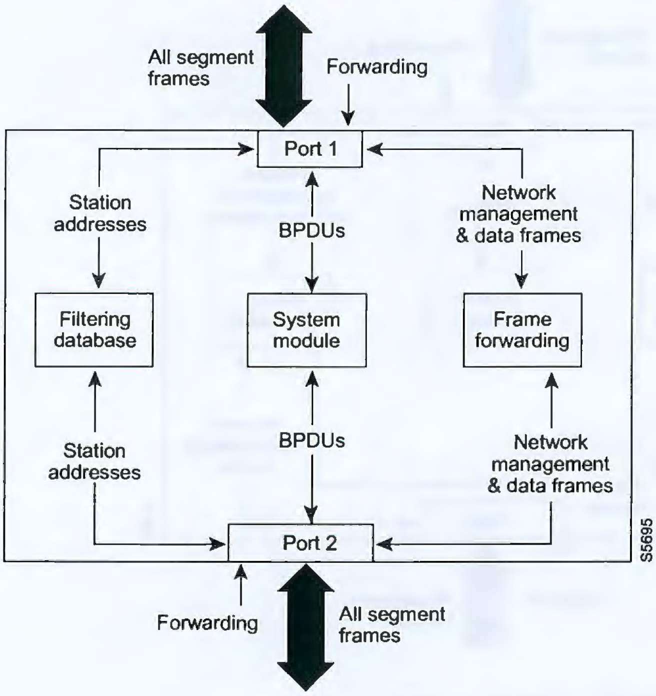
A Layer 2 LAN port in the learning state performs as follows:

- Discards frames received from the attached segment.
- Discards frames switched from another port for forwarding.
- Incorporates end station location into its address database.
- Receives BPDUs and directs them to the system module.
- Receives, processes, and transmits BPDUs received from the system module.
- Receives and responds to network management messages.

Forwarding State

A Layer 2 LAN port in the forwarding state forwards frames, as shown in Figure 15-6. The Layer 2 LAN port enters the forwarding state from the learning state.

Figure 15-6 Interface 2 in Forwarding State



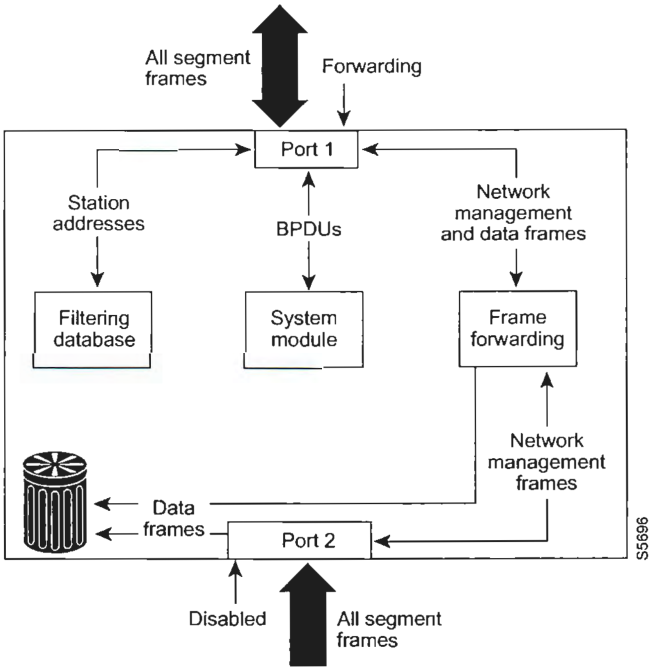
A Layer 2 LAN port in the forwarding state performs as follows:

- Forwards frames received from the attached segment.
- Forwards frames switched from another port for forwarding.
- Incorporates end station location information into its address database.
- Receives BPDUs and directs them to the system module.
- Processes BPDUs received from the system module.
- Receives and responds to network management messages.

Disabled State

A Layer 2 LAN port in the disabled state does not participate in frame forwarding or STP, as shown in Figure 15-7. A Layer 2 LAN port in the disabled state is virtually nonoperational.

Figure 15-7 Interface 2 in Disabled State



A disabled Layer 2 LAN port performs as follows:

- Discards frames received from the attached segment.
- Discards frames switched from another port for forwarding.
- Does not incorporate end station location into its address database. (There is no learning, so there is no address database update.)
- Does not receive BPDUs.
- Does not receive BPDUs for transmission from the system module.

STP and IEEE 802.1Q Trunks

802.1Q trunks impose some limitations on the STP strategy for a network. In a network of Cisco network devices connected through 802.1Q trunks, the network devices maintain one instance of STP for each VLAN allowed on the trunks. However, non-Cisco 802.1Q network devices maintain only one instance of STP for all VLANs allowed on the trunks.

When you connect a Cisco network device to a non-Cisco device through an 802.1Q trunk, the Cisco network device combines the STP instance of the 802.1Q VLAN of the trunk with the STP instance of the non-Cisco 802.1Q network device. However, all per-VLAN STP information is maintained by Cisco network devices separated by a cloud of non-Cisco 802.1Q network devices. The non-Cisco 802.1Q cloud separating the Cisco network devices is treated as a single trunk link between the network devices.

For more information on 802.1Q trunks, see Chapter 7, "Configuring LAN Ports for Layer 2 Switching."

Understanding How IEEE 802.1w RSTP Works

Note In Cisco IOS release 12.1(11)EX and later releases, RSTP is implemented as part of Multiple Spanning Tree Protocol (MSTP). In Cisco IOS release 12.1(13)E and later releases, RSTP is also available as a standalone protocol in Rapid-Per-VLAN-Spanning Tree (Rapid-PVST) mode. In this mode, the switch runs an RSTP instance on each VLAN, which follows the usual PVST+ approach.

These sections describe Rapid Spanning Tree Protocol (RSTP):

- IEEE 802.1w RSTP Overview, page 15-13
- RSTP Port Roles, page 15-13
- RSTP Port States, page 15-14
- Rapid-PVST, page 15-14

IEEE 802.1w RSTP Overview

RSTP significantly reduces the time to reconfigure the active topology of the network when changes occur to the physical topology or its configuration parameters. RSTP selects one switch as the root of a spanning tree-connected active topology and assigns port roles to individual ports of the switch, depending on whether that port is part of the active topology.

RSTP provides rapid connectivity following the failure of a switch, switch port, or a LAN. A new root port and the designated port on the other side of the bridge transition to forwarding using an explicit handshake between them. RSTP allows switch port configuration so that the ports can transition to forwarding directly when the switch reinitializes.

RSTP as specified in 802.1w supersedes STP specified in 802.1D, but remains compatible with STP.

RSTP provides backward compatibility with 802.1D bridges as follows:

- RSTP selectively sends 802.1D-configured BPDUs and topology change notification (TCN) BPDUs on a per-port basis.
- When a port initializes, the migration-delay timer starts and RSTP BPDUs are transmitted. While the migration-delay timer is active, the bridge processes all BPDUs received on that port.
- If the bridge receives an 802.1D BPDU after a port's migration-delay timer expires, the bridge assumes it is connected to an 802.1D bridge and starts using only 802.1D BPDUs.
- When RSTP uses 802.1D BPDUs on a port and receives an RSTP BPDU after the migration-delay expires, RSTP restarts the migration-delay timer and begins using RSTP BPDUs on that port.

RSTP Port Roles

RSTP uses the following definitions for port roles:

- Root—A forwarding port elected for the spanning tree topology.
- Designated—A forwarding port elected for every switched LAN segment.
- Alternate—An alternate path to the root bridge to that provided by the current root port.

- Backup—A backup for the path provided by a designated port toward the leaves of the spanning tree. Backup ports can exist only where two ports are connected together in a loopback by a point-to-point link or bridge with two or more connections to a shared LAN segment.
- Disabled—A port that has no role within the operation of spanning tree.

Port roles are assigned as follows:

- A root port or designated port role includes the port in the active topology.
- An alternate port or backup port role excludes the port from the active topology.

RSTP Port States

The port state controls the forwarding and learning processes and provides the values of discarding, learning, and forwarding. Table 15-4 provides a comparison between STP port states and RSTP port states.

Table 15-4 Comparison Between STP and RSTP Port States

Operational Status	STP Port State	RSTP Port State	Port Included in Active Topology
Enabled	Blocking[1]	Discarding[2]	No
Enabled	Listening	Discarding	No
Enabled	Learning	Learning	Yes
Enabled	Forwarding	Forwarding	Yes
Disabled	Disabled	Discarding	No

[1] IEEE 802.1D port state designation.

[2] IEEE 802.1w port state designation. Discarding is the same as blocking in RSTP and MST.

In a stable topology, RSTP ensures that every root port and designated port transition to forwarding, and ensures that all alternate ports and backup ports are always in the discarding state.

Rapid-PVST

Rapid-PVST uses the existing configuration for PVST+; however, Rapid-PVST uses RSTP to provide faster convergence. Independent VLANs run their own RSTP instance.

Dynamic entries are flushed immediately on a per-port basis upon receiving a topology change.

UplinkFast and BackboneFast configurations are ignored in Rapid-PVST mode; both features are included in RSTP.

Understanding How IEEE 802.1s MST Works

Note In Cisco IOS release 12.1(11)EX and later releases, RSTP is implemented as part of Multiple Spanning Tree Protocol (MSTP). In Cisco IOS release 12.1(13)E and later releases, RSTP is also available as a standalone protocol in Rapid-Per-VLAN-Spanning Tree (Rapid-PVST) mode. In this mode, the switch runs an RSTP instance on each VLAN, which follows the usual PVST+ approach.

These sections describe Multiple Spanning Tree (MST):

- IEEE 802.1s MST Overview, page 15-15
- MST-to-PVST Interoperability, page 15-16
- Common Spanning Tree, page 15-18
- MST Instances, page 15-18
- MST Configuration Parameters, page 15-18
- MST Regions, page 15-19
- Message Age and Hop Count, page 15-20
- Default STP Configuration, page 15-21

IEEE 802.1s MST Overview

Releases 12.1(11b)EX and later releases support MST. MST in this release is based on the draft version of the IEEE standard. 802.1s for MST is an amendment to 802.1Q. MST extends the IEEE 802.1w rapid spanning tree (RST) algorithm to multiple spanning trees. This extension provides both rapid convergence and load balancing in a VLAN environment. MST converges faster than PVST+. MST is backward compatible with 802.1D STP, 802.1w (rapid spanning tree protocol [RSTP]), and the Cisco PVST+ architecture.

MST allows you to build multiple spanning trees over trunks. You can group and associate VLANs to spanning tree instances. Each instance can have a topology independent of other spanning tree instances. This new architecture provides multiple forwarding paths for data traffic and enables load balancing. Network fault tolerance is improved because a failure in one instance (forwarding path) does not affect other instances (forwarding paths).

In large networks, you can more easily administer the network and use redundant paths by locating different VLAN and spanning tree instance assignments in different parts of the network. A spanning tree instance can exist only on bridges that have compatible VLAN instance assignments. You must configure a set of bridges with the same MST configuration information, which allows them to participate in a specific set of spanning tree instances. Interconnected bridges that have the same MST configuration are referred to as an *MST region*.

MST uses the modified RSTP version called the Multiple Spanning Tree Protocol (MSTP). The MST feature has these characteristics:

- MST runs a variant of spanning tree called internal spanning tree (IST). IST augments the common spanning tree (CST) information with internal information about the MST region. The MST region appears as a single bridge to adjacent single spanning tree (SST) and MST regions.
- A bridge running MST provides interoperability with single spanning tree bridges as follows:
  - MST bridges run IST, which augments the common spanning tree (CST) information with internal information about the MST region.
  - IST connects all the MST bridges in the region and appears as a subtree in the CST that includes the whole bridged domain. The MST region appears as a virtual bridge to adjacent SST bridges and MST regions.
  - The common and internal spanning tree (CIST) is the collection of ISTs in each MST region, the CST that interconnects the MST regions, and the SST bridges. CIST is the same as an IST inside an MST region and the same as CST outside an MST region. The STP, RSTP, and MSTP together elect a single bridge as the root of the CIST.

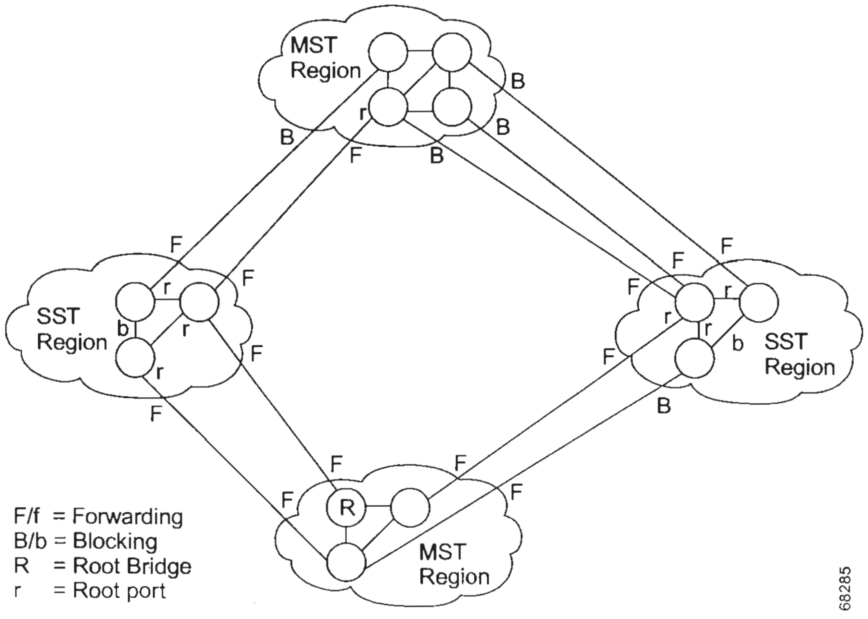
- MST establishes and maintains additional spanning trees within each MST region. These spanning trees are referred to as MST instances (MSTIs). The IST is numbered 0, and the MSTIs are numbered 1,2,3, and so on. Any MSTI is local to the MST region that is independent of MSTIs in another region, even if the MST regions are interconnected. MST instances combine with the IST at the boundary of MST regions to become the CST as follows:
  - Spanning tree information for an MSTI is contained in an MSTP record (M-record).

    M-records are always encapsulated within MST BPDUs (MST BPDUs). The original spanning trees computed by MSTP are called M-trees. M-trees are active only within the MST region. M-trees merge with the IST at the boundary of the MST region and form the CST.
- MST provides interoperability with PVST+ by generating PVST+ BPDUs for the non-CST VLANs.
- MST supports some of the PVST+ extensions in MSTP as follows:
  - UplinkFast and BackboneFast are not available in MST mode; they are included in RSTP.
  - PortFast is supported.
  - BPDU filter and BPDU guard are supported in MST mode.
  - Loop guard and root guard are supported in MST. MST preserves the VLAN 1 disabled functionality except that BPDUs are still transmitted in VLAN 1.
  - MST switches operate as if MAC reduction is enabled.
  - For private VLANs (PVLANs), secondary VLANs must be mapped to the same instance as the primary.

MST-to-PVST Interoperability

A virtual bridged LAN may contain interconnected regions of single spanning tree (SST) and MST bridges. Figure 15-8 shows this relationship.

Figure 15-8 Network with Interconnected SST and MST Regions



An MST region appears as an SST or pseudobridge to STP running in the SST region. Pseudobridges operate as follows:

- The same values for root identifiers and root path costs are sent in all BPDUs of all the pseudobridge ports. Pseudobridges differ from a single SST bridge as follows:
  - The pseudobridge BPDUs have different bridge identifiers. This difference does not affect STP operation in the neighboring SST regions because the root identifier and root cost are the same.
  - BPDUs sent from the pseudobridge ports may have significantly different message ages. Because the message age increases by 1 second for each hop, the difference in the message age is in the order of seconds.
- Data traffic from one port of a pseudobridge (a port at the edge of a region) to another port follows a path entirely contained within the pseudobridge or MST region.
- Data traffic belonging to different VLANs may follow different paths within the MST regions established by MST.
- Loop prevention is achieved by either of the following:
  - Blocking the appropriate pseudobridge ports by allowing one forwarding port on the boundary and blocking all other ports.
  - Setting the CST partitions to block the ports of the SST regions.
- A pseudobridge differs from a single SST bridge because the BPDUs sent from the pseudobridge's ports have different bridge identifiers. The root identifier and root cost are the same for both bridges.

These guidelines apply in a topology where you configure MST switches (all in the same region) to interact with PVST+ switches:

- Configure the root for all VLANs inside the MST region as shown in this example:

```
Router# show spanning-tree mst interface gigabitethernet 1/1

GigabitEthernet1/1 of MST00 is root forwarding
Edge port: no              (trunk)          port guard : none        (default)
Link type: point-to-point  (auto)           bpdu filter: disable     (default)
Boundary : boundary        (PVST)           bpdu guard : disable     (default)
Bpdus sent 10, received 310

Instance Role Sts Cost      Prio.Nbr Vlans mapped
-------- ---- --- --------- -------- -------------------------------
0        Root FWD 20000     128.1    1-2,4-2999,4000-4094
3        Boun FWD 20000     128.1    3,3000-3999
```

  The ports that belong to the MST switch at the boundary simulate PVST+ and send PVST+ BPDUs for all the VLANs.

  If you enable loop guard on the PVST+ switches, the ports might change to a loop-inconsistent state when the MST switches change their configuration. To correct the loop-inconsistent state, you must disable and reenable loop guard on that PVST+ switch.

- Do not locate the root for some or all of the VLANs inside the PVST+ side of the MST switch because when the MST switch at the boundary receives PVST+ BPDUs for all or some of the VLANs on its designated ports, root guard sets the port to the blocking state. Do not designate switches with a slower CPU running PVST+ as a switch running MST.

When you connect a PVST+ switch to two different MST regions, the topology change from the PVST+ switch does not pass beyond the first MST region. In this case, the topology changes are only propagated in the instance to which the VLAN is mapped. The topology change stays local to the first MST region and the CAM entries in the other region are not flushed. To make the topology change visible throughout other MST regions, you can map that VLAN to IST or connect the PVST+ switch to the two regions through access links.

Common Spanning Tree

CST (802.1Q) is a single spanning tree for all the VLANs. In a Catalyst 6000 family switch running PVST+, the VLAN 1 spanning tree corresponds to CST. In a Catalyst 6000 family switch running MST, IST (instance 0) corresponds to CST.

MST Instances

This release supports up to 16 instances; each spanning tree instance is identified by an instance ID that ranges from 0 to 15. Instance 0 is mandatory and is always present. Instances 1 through 15 are option

MST Configuration Parameters

MST configuration includes these three parts:

- Name—A 32-character string (null padded) identifying the MST region.
- Revision number—An unsigned 16-bit number that identifies the revision of the current MST configuration.

Note You must set the revision number when required as part of the MST configuration. The revision number is not incremented automatically each time you commit the MST configuration.

- MST configuration table—An array of 4096 bytes. Each byte, interpreted as an unsigned integer, corresponds to a VLAN. The value is the instance number to which the VLAN is mapped. The first byte that corresponds to VLAN 0 and the 4096th byte that corresponds to VLAN 4095 are unused and always set to zero.

You must configure each byte manually. You can use SNMP or the CLI to perform the configuration.

MST BPDUs contain the MST configuration ID and the checksum. An MST bridge accepts an MST BPDU only if the MST BPDU configuration ID and the checksum match its own MST region configuration ID and checksum. If one value is different, the MST BPDU is considered to be an SST BPDU.

MST Regions

These sections describe MST regions:

- MST Region Overview, page 15-19
- Boundary Ports, page 15-19
- IST Master, page 15-19
- Edge Ports, page 15-20
- Link Type, page 15-20

MST Region Overview

Interconnected bridges that have the same MST configuration are referred to as an MST region. There is no limit on the number of MST regions in the network.

To form an MST region, bridges can be either of the following:

- An MST bridge that is the only member of the MST region.
- An MST bridge interconnected by a LAN. A LAN's designated bridge has the same MST configuration as an MST bridge. All the bridges on the LAN can process MST BPDUs.

If you connect two MST regions with different MST configurations, the MST regions do the following:

- Load balance across redundant paths in the network. If two MST regions are redundantly connected, all traffic flows on a single connection with the MST regions in a network.
- Provide an RSTP handshake to enable rapid connectivity between regions. However, the handshaking is not as fast as between two bridges. To prevent loops, all the bridges inside the region must agree upon the connections to other regions. This situation introduces a delay. We do not recommend partitioning the network into a large number of regions.

Boundary Ports

A boundary port is a port that connects to a LAN, the designated bridge, of which is either an SST bridge, or a bridge with a different MST configuration. A designated port knows that it is on the boundary if it detects an STP bridge or receives an agreement message from an RST or MST bridge with a different configuration.

At the boundary, the role of MST ports do not matter; their state is forced to be the same as the IST port state. If the boundary flag is set for the port, the MSTP port-role selection process assigns a port role to the boundary and assigns the same state as the state of the IST port. The IST port at the boundary can take up any port role except a backup port role.

IST Master

The IST master of an MST region is the bridge with the lowest bridge identifier and the least path cost to the CST root. If an MST bridge is the root bridge for CST, then it is the IST master of that MST region. If the CST root is outside the MST region, then one of the MST bridges at the boundary is selected as the IST master. Other bridges on the boundary that belong to the same region eventually block the boundary ports that lead to the root.

If two or more bridges at the boundary of a region have an identical path to the root, you can set a slightly lower bridge priority to make a specific bridge the IST master.

The root path cost and message age inside a region stay constant, but the IST path cost is incremented and the IST remaining hops are decremented at each hop. To display the information about the IST master, path cost, and remaining hops for the bridge, enter the **show spanning-tree mst** command.

Edge Ports

An edge port is a port that is a port that is connected to a nonbridging device (for example, a host or a router). A port that connects to a hub is also an edge port if the hub or any LAN that is connected by it does not have a bridge. An edge port can start forwarding as soon as the link is up.

MST requires that you configure all ports for each host or router. To establish rapid connectivity after a failure, you need to block the nonedge designated ports of an intermediate bridge. If the port connects to another bridge that can send back an agreement, then the port starts forwarding immediately. Otherwise, the port needs twice the forward delay time to start forwarding again. You must explicitly configure the ports that are connected to the hosts and routers as edge ports while using MST.

To prevent a misconfiguration, the PortFast operation is turned off if the port receives a BPDU. To display the configured and operational status of PortFast, enter the **show spanning-tree mst** *interfac* command.

Link Type

Rapid connectivity is established only on point-to-point links. You must configure ports explicitly to a host or router. However, cabling in most networks meets this requirement, and you can avoid explicit configuration by treating all full-duplex links as point-to-point links by entering the **spanning-tree linktype** command.

Message Age and Hop Count

IST and MST instances do not use the message age and maximum age timer settings in the BPDU. IST and MST use a separate hop-count process that is very similar to the IP TTL process. You can configure each MST bridge with a maximum hop count. The root bridge of the instance sends a BPDU (or M-record) with the remaining hop count that is equal to the maximum hop count. When a bridge receives a BPDU (or M-record), it decrements the received remaining hop count by one. The bridge discards the BPDU (M-record) and ages out the information held for the port if the count reaches zero after decrementing. The nonroot bridges propagate the decremented count as the remaining hop count in th BPDUs (M-records) they generate.

The message age and maximum age timer settings in the RST portion of the BPDU remain the same throughout the region, and the same values are propagated by the region's designated ports at the boundary.

Default STP Configuration

Table 15-5 shows the default STP configuration.

Table 15-5 STP Default Configuration

Feature	Default Value
Enable state	STP enabled for all VLANs
Bridge priority	32768
STP port priority (configurable on a per-port basis—used on LAN ports configured as Layer 2 access ports)	128
STP port cost (configurable on a per-port basis—used on LAN ports configured as Layer 2 access ports)	• 10-Gigabit Ethernet: 2 • Gigabit Ethernet: 4 • Fast Ethernet: 19 • Ethernet: 100
STP VLAN port priority (configurable on a per-VLAN basis—used on LAN ports configured as Layer 2 trunk ports)	128
STP VLAN port cost (configurable on a per-VLAN basis—used on LAN ports configured as Layer 2 trunk ports)	• 10-Gigabit Ethernet: 2 • Gigabit Ethernet: 4 • Fast Ethernet: 19 • Ethernet: 100
Hello time	2 seconds
Forward delay time	15 seconds
Maximum aging time	20 seconds
Mode	PVST

STP and MST Configuration Guidelines and Restrictions

Follow these guidelines and restrictions when configuring MST:

- Do not disable spanning tree on any VLAN in any of the PVST bridges.
- Do not use PVST bridges as the root of CST.
- Ensure that all PVST spanning tree root bridges have lower (numerically higher) priority than the CST root bridge.

- Ensure that trunks carry all of the VLANs mapped to an instance or do not carry any VLANs at all for this instance.
- Do not connect switches with access links because access links may partition a VLAN.
- Any MST configuration involving a large number of either existing or new logical VLAN ports should be completed during a maintenance window because the complete MST database gets reinitialized for any incremental change (such as adding new VLANs to instances or moving VLANs across instances).

Configuring STP

These sections describe how to configure STP on VLANs:

- Enabling STP, page 15-23
- Enabling the Extended System ID, page 15-24
- Configuring the Root Bridge, page 15-25
- Configuring a Secondary Root Bridge, page 15-26
- Configuring STP Port Priority, page 15-27
- Configuring STP Port Cost, page 15-29
- Configuring the Bridge Priority of a VLAN, page 15-30
- Configuring the Hello Time, page 15-32
- Configuring the Forward-Delay Time for a VLAN, page 15-32
- Configuring the Maximum Aging Time for a VLAN, page 15-33
- Enabling Rapid-PVST, page 15-33

Note

- The STP commands described in this chapter can be configured on any LAN port, but they are in effect only on LAN ports configured with the **switchport** keyword.
- With Release 12.1(11b)E and later releases, when you are in configuration mode you can enter EXEC mode-level commands by entering the **do** keyword before the EXEC mode-level command.

Caution

We do not recommend disabling spanning tree, even in a topology that is free of physical loops. Spanning tree serves as a safeguard against misconfigurations and cabling errors. Do not disable spanning tree in a VLAN without ensuring that there are no physical loops present in the VLAN.

Enabling STP

Note STP is enabled by default on VLAN 1 and on all newly created VLANs.

You can enable STP on a per-VLAN basis. The Catalyst 6500 series switch maintains a separate instance of STP for each VLAN (except on VLANs on which you disable STP).

To enable STP on a per-VLAN basis, perform this task:

	Command	Purpose
Step 1	`Router(config)# spanning-tree vlan vlan_ID`	Enables STP on a per-VLAN basis. The *vlan_ID* value can be 1 through 4094, except reserved VLANs (see Table 15-5 on page 15-21).
	`Router(config)# default spanning-tree vlan vlan_ID`	Reverts all STP parameters to default values for the specified VLAN.
	`Router(config)# no spanning-tree vlan vlan_ID`	Disables STP on the specified VLAN; see the following Cautions for information regarding this command.
Step 2	`Router(config)# end`	Exits configuration mode.
Step 3	`Router# show spanning-tree vlan vlan_ID`	Verifies that STP is enabled.

Caution Do not disable spanning tree on a VLAN unless all switches and bridges in the VLAN have spanning tree disabled. You cannot disable spanning tree on some switches and bridges in a VLAN and leave it enabled on other switches and bridges in the VLAN. This action can have unexpected results because switches and bridges with spanning tree enabled will have incomplete information regarding the physical topology of the network.

Caution We do not recommend disabling spanning tree, even in a topology that is free of physical loops. Spanning tree serves as a safeguard against misconfigurations and cabling errors. Do not disable spanning tree in a VLAN without ensuring that there are no physical loops present in the VLAN.

This example shows how to enable STP on VLAN 200:

```
Router# configure terminal
Router(config)# spanning-tree vlan 200
Router(config)# end
Router#
```

Note Because STP is enabled by default, entering a **show running** command to view the resulting configuration does not display the command you entered to enable STP.

This example shows how to verify the configuration:

```
Router# show spanning-tree vlan 200

VLAN0200
  Spanning tree enabled protocol ieee
  Root ID     Priority     32768
              Address      00d0.00b8.14c8
              This bridge is the root
              Hello Time    2 sec   Max Age 20 sec   Forward Delay 15 sec

  Bridge ID   Priority     32768
              Address      00d0.00b8.14c8
              Hello Time    2 sec   Max Age 20 sec   Forward Delay 15 sec
              Aging Time 300

Interface        Role Sts Cost      Prio.Nbr Status
---------------- ---- --- --------- -------- --------------------------------
Fa4/4            Desg FWD 200000    128.196  P2p
Fa4/5            Back BLK 200000    128.197  P2p

Router#
```

Note You must have at least one interface that is active in VLAN 200 to create a VLAN 200 spanning tree. In this example, two interfaces are active in VLAN 200.

Enabling the Extended System ID

Note The extended system ID is enabled permanently on chassis that support 64 MAC addresses.

You can enable the extended system ID on chassis that support 1024 MAC addresses (see the "Understanding the Bridge ID" section on page 15-3).

To enable the extended system ID, perform this task:

	Command	Purpose
Step 1	`Router(config)# spanning-tree extend system-id`	Enables the extended system ID.
	`Router(config)# no spanning-tree extend system-id`	Disables the extended system ID. **Note** You cannot disable the extended system ID on chassis that support 64 MAC addresses or when you have configured extended range VLANs (see "STP Default Configuration" section on page 15-21).
Step 2	`Router(config)# end`	Exits configuration mode.
Step 3	`Router# show spanning-tree vlan vlan_ID`	Verifies the configuration.

Note When you enable or disable the extended system ID, the bridge IDs of all active STP instances are updated, which might change the spanning tree topology.

This example shows how to enable the extended system ID:

```
Router# configure terminal
Router(config)# spanning-tree extend system-id
Router(config)# end
Router#
```

This example shows how to verify the configuration:

```
Router# show spanning-tree summary | include Extended
Extended system ID is enabled.
```

Configuring the Root Bridge

Catalyst 6500 series switches maintain a separate instance of STP for each active VLAN. A bridge ID, consisting of the bridge priority and the bridge MAC address, is associated with each instance. For each VLAN, the network device with the lowest bridge ID becomes the root bridge for that VLAN.

To configure a VLAN instance to become the root bridge, enter the **spanning-tree vlan** *vlan_ID* **root** command to modify the bridge priority from the default value (32768) to a significantly lower value.

When you enter the **spanning-tree vlan** *vlan_ID* **root** command, the switch checks the bridge priority of the current root bridges for each VLAN. When the extended system ID is disabled, the switch sets the bridge priority for the specified VLANs to 8192 if this value will cause the switch to become the root for the specified VLANs. When the extended system ID is enabled, the switch sets the bridge priority for the specified VLANs to 24576 if this value will cause the switch to become the root for the specified VLANs.

If the extended system ID is disabled and if any root bridge for the specified VLANs has a bridge priority lower than 8192, the switch sets the bridge priority for the specified VLANs to 1 less than the lowest bridge priority.

If the extended system ID is enabled and if any root bridge for the specified VLANs has a bridge priority lower than 24576, the switch sets the bridge priority for the specified VLANs to 4096 less than the lowest bridge priority. (4096 is the value of the least significant bit of a 4-bit bridge priority value; see Table 15-2 on page 15-3.)

Note The **spanning-tree vlan** *vlan_ID* **root** command fails if the value required to be the root bridge is less than 1.

The **spanning-tree vlan** *vlan_ID* **root** command can cause the following effects:

- If the extended system ID is disabled, and if all network devices in VLAN 100 have the default priority of 32768, entering the **spanning-tree vlan 100 root primary** command on the switch sets the bridge priority for VLAN 100 to 8192, which causes the switch to become the root bridge for VLAN 100.
- If the extended system ID is enabled, and if all network devices in VLAN 20 have the default priority of 32768, entering the **spanning-tree vlan 20 root primary** command on the switch sets the bridge priority to 24576, which causes the switch to become the root bridge for VLAN 20.

Caution The root bridge for each instance of STP should be a backbone or distribution switch. Do not configure an access switch as the STP primary root.

Use the **diameter** keyword to specify the Layer 2 network diameter (that is, the maximum number of bridge hops between any two end stations in the Layer 2 network). When you specify the network diameter, the Catalyst 6500 series switch automatically selects an optimal hello time, forward delay time, and maximum age time for a network of that diameter, which can significantly reduce the STP convergence time. You can use the **hello** keyword to override the automatically calculated hello time.

Note To preserve a stable STP topology, we recommend that you avoid configuring the hello time, forward delay time, and maximum age time manually after configuring the Catalyst 6500 series switch as the root bridge.

To configure a Catalyst 6500 series switch as the root bridge, perform this task:

	Command	Purpose
Step 1	Router(config)# **spanning-tree vlan** *vlan_ID* **root primary** [**diameter** *hops* [**hello-time** *seconds*]]	Configures a Catalyst 6500 series switch as the root bridge. The *vlan_ID* value can be 1 through 4094, except reserved VLANs (see Table 15-5 on page 15-21).
	Router(config)# **no spanning-tree vlan** *vlan_ID* **root**	Clears the root bridge configuration.
Step 2	Router(config)# **end**	Exits configuration mode.

This example shows how to configure the Catalyst 6500 series switch as the root bridge for VLAN 10, with a network diameter of 4:

```
Router# configure terminal
Router(config)# spanning-tree vlan 10 root primary diameter 4
Router(config)# end
Router#
```

Configuring a Secondary Root Bridge

When you configure a Catalyst 6500 series switch as the secondary root, the STP bridge priority is modified from the default value (32768) so that the switch is likely to become the root bridge for the specified VLANs if the primary root bridge fails (assuming the other network devices in the network use the default bridge priority of 32768).

If the extended system ID is enabled, STP sets the bridge priority to 28672. If the extended system ID is disabled, STP sets the bridge priority to 16384.

You can run this command on more than one Catalyst 6500 series switch to configure multiple backup root bridges. Use the same network diameter and hello time values as you used when configuring the primary root bridge.

To configure a Catalyst 6500 series switch as the secondary root bridge, perform this task:

	Command	Purpose
Step 1	Router(config)# [no] **spanning-tree vlan** *vlan_ID* **root secondary** [**diameter** *hops* [**hello-time** *seconds*]]	Configures a Catalyst 6500 series switch as the secondary root bridge. The *vlan_ID* value can be 1 through 4094, except reserved VLANs (see Table 9-1 on page 9-2).
	Router(config)# **no spanning-tree vlan** *vlan_ID* **root**	Clears the root bridge configuring.
Step 2	Router(config)# **end**	Exits configuration mode.

This example shows how to configure the Catalyst 6500 series switch as the secondary root bridge for VLAN 10, with a network diameter of 4:

```
Router# configure terminal
Router(config)# spanning-tree vlan 10 root secondary diameter 4
Router(config)# end
Router#
```

Configuring STP Port Priority

If a loop occurs, STP considers port priority when selecting a LAN port to put into the forwarding state. You can assign higher priority values to LAN ports that you want STP to select first and lower priority values to LAN ports that you want STP to select last. If all LAN ports have the same priority value, STP puts the LAN port with the lowest LAN port number in the forwarding state and blocks other LAN ports. The possible priority range is 0 through 240 (default 128), configurable in increments of 16.

Cisco IOS uses the port priority value when the LAN port is configured as an access port and uses VLAN port priority values when the LAN port is configured as a trunk port.

To configure the STP port priority of a Layer 2 LAN interface, perform this task:

	Command	Purpose
Step 1	Router(config)# **interface** {{*type*[1] *slot/port*} | {**port-channel** *port_channel_number*}}	Selects an interface to configure.
Step 2	Router(config-if)# **spanning-tree port-priority** *port_priority*	Configures the port priority for the LAN interface. The *port_priority* value can be from 1 to 252 in increments of 4.
	Router(config-if)# **no spanning-tree port-priority**	Reverts to the default port priority value.
Step 3	Router(config-if)# **spanning-tree vlan** *vlan_ID* **port-priority** *port_priority*	Configures the VLAN port priority for the LAN interface. The *port_priority* value can be from 1 to 252 in increments of 4. The *vlan_ID* value can be 1 through 4094, except reserved VLANs (see Table 9-1 on page 9-2).
	Router(config-if)# [no] **spanning-tree vlan** *vlan_ID* **port-priority**	Reverts to the default VLAN port priority value.
Step 4	Router(config-if)# **end**	Exits configuration mode.

	Command	Purpose

Step 5	`Router# show spanning-tree interface {type[1] slot/port} | {port-channel port_channel_number}`
	`Router# show spanning-tree vlan vlan_ID`
		Verifies the configuration.

[1] *type* = **ethernet**, **fastethernet**, **gigabitethernet**, or **tengigabitethernet**

This example shows how to configure the STP port priority of Fast Ethernet port 4/4:

```
Router# configure terminal
Router(config)# interface fastethernet 4/4
Router(config-if)# spanning-tree port-priority 160
Router(config-if)# end
Router#
```

This example shows how to verify the configuration of Fast Ethernet port 4/4:

```
Router# show spanning-tree interface fastethernet 4/4
Vlan             Role Sts Cost      Prio.Nbr Status
---------------- ---- --- --------- -------- --------------------------------
VLAN0001         Back BLK 200000    160.196  P2p
VLAN0006         Back BLK 200000    160.196  P2p
...
VLAN0198         Back BLK 200000    160.196  P2p
VLAN0199         Back BLK 200000    160.196  P2p
VLAN0200         Back BLK 200000    160.196  P2p
Router#
```

Fastethernet 4/4 is a trunk. Several VLANs are configured and active as shown in the example. The port priority configuration applies to all VLANs on this interface.

Note The **show spanning-tree interface** command only displays information if the port is connected and operating. If this condition is not met, enter a **show running-config interface** command to verify the configuration.

This example shows how to configure the VLAN port priority of Fast Ethernet port 4/4:

```
Router# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Router(config)# interface fastEthernet 4/4
Router(config-if)# spanning-tree vlan 200 port-priority 64
Router(config-if)# ^Z
Router#
```

The configuration entered in the example only applies to VLAN 200. All VLANs other than 200 still have a port priority of 160.

This example shows how to verify the configuration:

```
Router# show spanning-tree interface fastethernet 4/4
Vlan             Role Sts Cost      Prio.Nbr Status
---------------- ---- --- --------- -------- --------------------------------
VLAN0001         Back BLK 200000    160.196  P2p
VLAN0006         Back BLK 200000    160.196  P2p
...
VLAN0199         Back BLK 200000    160.196  P2p
VLAN0200         Desg FWD 200000     64.196  P2p

Router#
```

You also can display spanning tree information for VLAN 200 using the following command:

```
Router# show spanning-tree vlan 200 interface fastEthernet 4/4
Interface        Role Sts Cost      Prio.Nbr Status
---------------- ---- --- --------- -------- --------------------------------
Fa4/4            Desg LRN 200000     64.196  P2p
```

Configuring STP Port Cost

The STP port path cost default value is determined from the media speed of a LAN interface. If a loop occurs, STP considers port cost when selecting a LAN interface to put into the forwarding state. You can assign lower cost values to LAN interfaces that you want STP to select first and higher cost values to LAN interfaces that you want STP to select last. If all LAN interfaces have the same cost value, STP puts the LAN interface with the lowest LAN interface number in the forwarding state and blocks other LAN interfaces. The possible cost range is 0 through 200000000 (the default is media specific).

STP uses the port cost value when the LAN interface is configured as an access port and uses VLAN port cost values when the LAN interface is configured as a trunk port.

To configure the STP port cost of a Layer 2 LAN interface, perform this task:

	Command	Purpose
Step 1	`Router(config)# interface {{type[1] slot/port} | {port-channel port_channel_number}}`	Selects an interface to configure.
Step 2	`Router(config-if)# spanning-tree cost port_cost`	Configures the port cost for the LAN interface. The *port_cost* value can be from 1 to 200000000 (1 to 65535 in Release 12.1(2)E and earlier releases).
	`Router(config-if)# no spanning-tree cost`	Reverts to the default port cost.
Step 3	`Router(config-if)# [no] spanning-tree vlan vlan_ID cost port_cost`	Configures the VLAN port cost for the LAN interface. The *port_cost* value can be from 1 to 200000000. The *vlan_ID* value can be 1 through 4094, except reserved VLANs (see Table 9-1 on page 9-2).
Step 4	`Router(config-if)# no spanning-tree vlan vlan_ID cost`	Reverts to the default VLAN port cost.
Step 5	`Router(config-if)# end`	Exits configuration mode.

Step 6	`Router# show spanning-tree interface {type[1] slot/port} | {port-channel port_channel_number}`
	`show spanning-tree vlan vlan_ID`
		Verifies the configuration.

[1] *type* = **ethernet, fastethernet, gigabitethernet,** or **tengigabitethernet**

This example shows how to change the STP port cost of Fast Ethernet port 4/4:

```
Router# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Router(config)# interface fastEthernet 4/4
Router(config-if)# spanning-tree cost 1000
Router(config-if)# ^Z
Router#
```

This example shows how to verify the configuration:

```
Router# show spanning-tree interface fastEthernet 4/4
Vlan             Role Sts Cost      Prio.Nbr Status
---------------- ---- --- --------- -------- --------------------------------
VLAN0001         Back BLK 1000      160.196  P2p
```

```
VLAN0006         Back BLK 1000      160.196  P2p
VLAN0007         Back BLK 1000      160.196  P2p
VLAN0008         Back BLK 1000      160.196  P2p
VLAN0009         Back BLK 1000      160.196  P2p
VLAN0010         Back BLK 1000      160.196  P2p
Router#
```

This example shows how to configure the port priority at an individual port VLAN cost for VLAN 200:

```
Router# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Router(config)# interface fastEthernet 4/4
Router(config-if)# spanning-tree vlan 200 cost 2000
Router(config-if)# ^Z
Router#
```

This example shows how to verify the configuration:

```
Router# show spanning-tree vlan 200 interface fastEthernet 4/4
Interface        Role Sts Cost      Prio.Nbr Status
---------------- ---- --- --------- -------- --------------------------------
Fa4/4            Desg FWD 2000       64.196  P2p
```

Note In the following output other VLANs (VLAN 1 for example) have not been affected by this configuration.

```
Router# show spanning-tree vlan 1 interface fastEthernet 4/4
Interface        Role Sts Cost      Prio.Nbr Status
---------------- ---- --- --------- -------- --------------------------------
Fa4/4            Back BLK 1000      160.196  P2p
Router#
```

Note The **show spanning-tree** command only displays information for ports that are in link-up operative state and are appropriately configured for DTP. If these conditions are not met, you can enter a **show running-config** command to confirm the configuration.

Configuring the Bridge Priority of a VLAN

Note Be careful when using this command. For most situations, we recommend that you enter the **spanning-tree vlan** *vlan_ID* **root primary** and the **spanning-tree vlan** *vlan_ID* **root secondary** commands to modify the bridge priority.

To configure the STP bridge priority of a VLAN when the extended system ID is disabled, perform this task:

	Command	Purpose
Step 1	Router(config)# **spanning-tree vlan** *vlan_ID* **priority** *bridge_priority*	Configures the bridge priority of a VLAN when the extended system ID is disabled. The *bridge_priority* value can be from 1 to 65535. The *vlan_ID* value can be 1 through 4094, except reserved VLANs (see Table 9-1 on page 9-2).
	Router(config)# **no spanning-tree vlan** *vlan_ID* **priority**	Reverts to the default bridge priority value.
Step 2	Router(config)# **end**	Exits configuration mode.
Step 3	Router# **show spanning-tree vlan** *vlan_ID* **bridge** [**detail**]	Verifies the configuration.

To configure the STP bridge priority of a VLAN when the extended system ID is enabled, perform this task:

	Command	Purpose
Step 1	Router(config)# [**no**] **spanning-tree vlan** *vlan_ID* **priority** {**0** | **4096** | **8192** | **12288** | **16384** | **20480** | **24576** | **28672** | **32768** | **36864** | **40960** | **45056** | **49152** | **53248** | **57344** | **61440**}	Configures the bridge priority of a VLAN when the extended system ID is enabled. The *vlan_ID* value can be 1 through 4094, except reserved VLANs (see Table 9-1 on page 9-2).
	Router(config)# **no spanning-tree vlan** *vlan_ID* **priority**	Reverts to the default bridge priority value.
Step 2	Router(config)# **end**	Exits configuration mode.
Step 3	Router# **show spanning-tree vlan** *vlan_ID* **bridge** [**detail**]	Verifies the configuration.

This example shows how to configure the bridge priority of VLAN 200 to 33792 when the extended system ID is disabled:

```
Router# configure terminal
Router(config)# spanning-tree vlan 200 priority 33792
Router(config)# end
Router#
```

This example shows how to verify the configuration:

```
Router# show spanning-tree vlan 200 bridge
                                      Hello Max  Fwd
Vlan                    Bridge ID     Time  Age  Delay  Protocol
---------------- -------------------- ---- ---- -----  --------
VLAN200           33792 0050.3e8d.64c8    2   20    15  ieee
Router#
```

Configuring the Hello Time

Note Be careful when using this command. For most situations, we recommend that you use the **spanning-tree vlan** *vlan_ID* **root primary** and **spanning-tree vlan** *vlan_ID* **root secondary** commands to modify the hello time.

To configure the STP hello time of a VLAN, perform this task:

	Command	Purpose
Step 1	Router(config)# **spanning-tree vlan** *vlan_ID* **hello-time** *hello_time*	Configures the hello time of a VLAN. The *hello_time* value can be from 1 to 10 seconds. The *vlan_ID* value can be 1 through 4094, except reserved VLANs (see Table 9-1 on page 9-2).
	Router(config)# **no spanning-tree vlan** *vlan_ID* **hello-time**	Reverts to the default hello time.
Step 2	Router(config)# **end**	Exits configuration mode.
Step 3	Router# **show spanning-tree vlan** *vlan_ID* **bridge** [**detail**]	Verifies the configuration.

This example shows how to configure the hello time for VLAN 200 to 7 seconds:

```
Router# configure terminal
Router(config)# spanning-tree vlan 200 hello-time 7
Router(config)# end
Router#
```

This example shows how to verify the configuration:

```
Router# show spanning-tree vlan 200 bridge
                                       Hello  Max  Fwd
Vlan                       Bridge ID   Time   Age  Delay  Protocol
---------------- --------------------  ----  ----  -----  --------
VLAN200          49152 0050.3e8d.64c8     7    20     15  ieee
Router#
```

Configuring the Forward-Delay Time for a VLAN

To configure the STP forward delay time for a VLAN, perform this task:

	Command	Purpose
Step 1	Router(config)# **spanning-tree vlan** *vlan_ID* **forward-time** *forward_time*	Configures the forward time of a VLAN. The *forward_time* value can be from 4 to 30 seconds. The *vlan_ID* value can be 1 through 4094, except reserved VLANs (see Table 9-1 on page 9-2).
	Router(config)# **no spanning-tree vlan** *vlan_ID* **forward-time**	Reverts to the default forward time.
Step 2	Router(config)# **end**	Exits configuration mode.
Step 3	Router# **show spanning-tree vlan** *vlan_ID* **bridge** [**detail**]	Verifies the configuration.

This example shows how to configure the forward delay time for VLAN 200 to 21 seconds:

```
Router# configure terminal
Router(config)# spanning-tree vlan 200 forward-time 21
Router(config)# end
Router#
```

This example shows how to verify the configuration:

```
Router# show spanning-tree vlan 200 bridge
                                      Hello Max  Fwd
Vlan                       Bridge ID  Time  Age Delay  Protocol
---------------- -------------------- ---- ---- -----  --------
VLAN200          49152 0050.3e8d.64c8    2   20    21  ieee
Router#
```

Configuring the Maximum Aging Time for a VLAN

To configure the STP maximum aging time for a VLAN, perform this task:

	Command	Purpose
Step 1	`Router(config)# spanning-tree vlan vlan_ID max-age max_age`	Configures the maximum aging time of a VLAN. The *max_age* value can be from 6 to 40 seconds. The *vlan_ID* value can be 1 through 4094, except reserved VLANs (see Table 9-1 on page 9-2).
	`Router(config)# no spanning-tree vlan vlan_ID max-age`	Reverts to the default maximum aging time.
Step 2	`Router(config)# end`	Exits configuration mode.
Step 3	`Router# show spanning-tree vlan vlan_ID bridge [detail]`	Verifies the configuration.

This example shows how to configure the maximum aging time for VLAN 200 to 36 seconds:

```
Router# configure terminal
Router(config)# spanning-tree vlan 200 max-age 36
Router(config)# end
Router#
```

This example shows how to verify the configuration:

```
Router# show spanning-tree vlan 200 bridge
                                      Hello Max  Fwd
Vlan                       Bridge ID  Time  Age Delay  Protocol
---------------- -------------------- ---- ---- -----  --------
VLAN200          49152 0050.3e8d.64c8    2   36    15  ieee
Router#
```

Enabling Rapid-PVST

Rapid-PVST uses the existing PVST+ framework for configuration and interaction with other features. It also supports some of the PVST+ extensions.

To enable Rapid-PVST mode on the switch, enter the **spanning-tree mode rapid-pvst** command in privileged mode. To configure the switch in Rapid-PVST mode, see the "Configuring STP" section on page 15-22.

Specifying the Link Type

Rapid connectivity is established only on point-to-point links. Spanning tree views a point-to-point link as a segment connecting only two switches running the spanning tree algorithm. Because the switch assumes that all full-duplex links are point-to-point links and that half-duplex links are shared links, you can avoid explicitly configuring the link type. To configure a specific link type, enter the **spanning-tree linktype** command.

Restarting Protocol Migration

A switch running both MSTP and RSTP supports a built-in protocol migration process that enables the switch to interoperate with legacy 802.1D switches. If this switch receives a legacy 802.1D configuration BPDU (a BPDU with the protocol version set to 0), it sends only 802.1D BPDUs on that port. An MSTP switch can also detect that a port is at the boundary of a region when it receives a legacy BPDU, or an MST BPDU (version 3) associated with a different region, or an RST BPDU (version 2).

However, the switch does not automatically revert to the MSTP mode if it no longer receives 802.1D BPDUs because it cannot determine whether the legacy switch has been removed from the link unless the legacy switch is the designated switch. A switch also might continue to assign a boundary role to port when the switch to which it is connected has joined the region.

To restart the protocol migration process (force the renegotiation with neighboring switches) on the entire switch, you can use the **clear spanning-tree detected-protocols** privileged EXEC command. To restart the protocol migration process on a specific interface, enter the **clear spanning-tree detected-protocols interface** *interface-id* privileged EXEC command.

Configuring IEEE 802.1s MST

Release 12.1(13)E and later releases support MST. These sections describe how to configure MST:

- Enabling MST, page 15-34
- Displaying MST Configurations, page 15-36
- Configuring MST Instance Parameters, page 15-39
- Configuring MST Instance Port Parameters, page 15-40
- Restarting Protocol Migration, page 15-40

Enabling MST

To enable and configure MST on the switch, perform these tasks in privileged mode:

	Command	Purpose
Step 1	Router# **show spanning-tree mst configuration**	Displays the current MST configuration.
Step 2	Router(config)# **spanning-tree mode mst**	Configures MST mode.
Step 3	Router(config)# **spanning-tree mst configuration**	Configures the MST region by entering the MST configuration submode.
	Router(config)# **no spanning-tree mst configuration**	Clears the MST configuration.

	Command	Purpose
Step 4	`Router(config-mst)# show current`	Displays the current MST configuration from within the MST configuration submode
Step 5	`Router(config-mst)# name name revision revision_number instance instance_number vlan vlan_range`	Enters the MST configuration.
Step 6	`Router(config-mst)# no instance instance_number`	(Optional) Unmaps all VLANs that were mapped to an instance.
Step 7	`Router(config-mst)# no instance instance_number vlan vlan_number`	(Optional) Unmaps a VLAN from an instance.
Step 8	`Router(config-mst)# end`	Applies the configuration and exit configuration mode.
Step 9	`Router# show spanning-tree mst config`	Shows the MST configuration from the global configuration mode.

These examples show how to enable MST:

```
Router# show spanning-tree mst configuration
% Switch is not in mst mode
Name      []
Revision  0
Instance  Vlans mapped
--------  ---------------------------------------------------------------------
0         1-4094
-------------------------------------------------------------------------------

Router# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
Router(config)# spanning-tree mode mst

Router(config)# spanning-tree mst configuration

Router(config-mst)# show current
Current MST configuration
Name      []
Revision  0
Instance  Vlans mapped
--------  ---------------------------------------------------------------------
0         1-4094
-------------------------------------------------------------------------------

Router(config-mst)# name cisco

0         1-4094
-------------------------------------------------------------------------------
```

Displaying MST Configurations

To display MST configurations, perform these tasks in MST mode:

	Command	Purpose
Step 1	Router# **show spanning-tree mst configuration**	Displays the active configuration
Step 2	Router# **show spanning-tree mst** [**detail**]	Displays information about the MST instances currently running.
Step 3	Router# **show spanning-tree mst** *instance-id* [*detail*]	Displays information about a specific MST instance
Step 4	Router# **show spanning-tree mst interface** *interface name* [**detail**]	Displays information for a given port.
Step 5	Router# **show spanning-tree mst** *number* **interface** *interface name* [**detail**]	Displays MST information for a given port and a given instance
Step 6	Router# **show spanning-tree mst** [*x*] [*interface Y*] *detail*	Displays detailed MST information.
Step 7	Router# **show spanning-tree vlan** *vlan_ID*	Displays VLAN information in MST mode.

These examples show how to display spanning tree VLAN configurations in MST mode:

```
Router(config)# spanning-tree mst configuration
Router(config-mst)# instance 1 vlan 1-10
Router(config-mst)# name cisco
Router(config-mst)# revision 1
Router(config-mst)# ^Z

Router# show spanning-tree mst configuration
Name      [cisco]
Revision  1
Instance  Vlans mapped
--------  ---------------------------------------------------------------------
0         11-4094
1         1-10
-------------------------------------------------------------------------------
```

```
Router# show spanning-tree mst

Configuring MST Instance Parameters

To configure MST instance parameters, perform these tasks:

	Command	Purpose
Step 1	Router(config)# **spanning-tree mst** *X* **priority** *Y*	Configures the priority for an MST instance
Step 2	Router(config)# **spanning-tree mst** *X* **root** [**primary** | **secondary**]	Configures the bridge as root for an MST instance.
Step 3	Router# **show spanning-tree mst**	Verifies the configuration.

This example shows how to configure MST instance parameters:

```
Router(config)# spanning-tree mst 1 priority ?
  <0-61440>  bridge priority in increments of 4096

Router(config)# spanning-tree mst 1 priority 1
% Bridge Priority must be in increments of 4096.
% Allowed values are:
  0     4096  8192  12288 16384 20480 24576 28672
  32768 36864 40960 45056 49152 53248 57344 61440

Router(config)# spanning-tree mst 1 priority 49152
Router(config)#

Router(config)# spanning-tree mst 0 root primary
 mst 0 bridge priority set to 24576
 mst bridge max aging time unchanged at 20
 mst bridge hello time unchanged at 2
 mst bridge forward delay unchanged at 15
Router(config)# ^Z
Router#

Router# show spanning-tree mst

Configuring MST Instance Port Parameters

To configure MST instance port parameters, perform these tasks:

	Command	Purpose
Step 1	`Router(config-if)# spanning-tree mst x cost y`	Configures the MST instance port cost.
Step 2	`Router(config-if)# spanning-tree mst x port-priority y`	Configures the MST instance port priority.
Step 3	`Router# show spanning-tree mst x interface y`	Verifies the configuration.

This example shows how to configure MST instance port parameters:

```
Router(config)# interface fastEthernet 4/4
Router(config-if)# spanning-tree mst 1 ?
  cost           Change the interface spanning tree path cost for an instance
  port-priority  Change the spanning tree port priority for an instance

Router(config-if)# spanning-tree mst 1 cost 1234567
Router(config-if)# spanning-tree mst 1 port-priority 240
Router(config-if)# ^Z

Router# show spanning-tree mst 1 interface fastEthernet 4/4

FastEthernet4/4 of MST01 is backup blocking
Edge port:no            (default)        port guard :none        (default)
Link type:point-to-point (auto)          bpdu filter:disable     (default)

-------- ---- --- --------- -------- -------------------------------
1        Back BLK 1234567   240.196  1-10

Router#
```

Restarting Protocol Migration

A switch running both MSTP and RSTP supports a built-in protocol migration mechanism that enables the switch to interoperate with legacy 802.1D switches. If this switch receives a legacy 802.1D configuration BPDU (a BPDU with the protocol version set to 0), it sends only 802.1D BPDUs on that port. An MSTP switch can also detect that a port is at the boundary of a region when it receives a legacy BPDU, an MST BPDU (version 3) associated with a different region, or an RST BPDU (version 2).

However, the switch does not automatically revert to the MSTP mode if it no longer receives 802.1D BPDUs because it cannot determine whether the legacy switch has been removed from the link unless the legacy switch is the designated switch. A switch also might continue to assign a boundary role to a port when the switch to which it is connected has joined the region.

To restart the protocol migration process (force the renegotiation with neighboring switches) on the entire switch, you can use the **clear spanning-tree detected-protocols** privileged EXEC command. Use the **clear spanning-tree detected-protocols interface** *interface-id* privileged EXEC command to restart the protocol migration process on a specific interface.

This example shows how to restart protocol migration:

```
Router# clear spanning-tree detected-protocols interface fastEthernet 4/4
Router#
```

CISCO SYSTEMS

Data Sheet

Cisco Catalyst 6500 **Supervisor** Engines 1A and 2

As Cisco's premier modular multilayer switch, the Catalyst® 6500 Series delivers secure, converged services from the wiring closet to the core, to the data center to the WAN edge.

The supervisor engines for the Catalyst 6500 Series deliver the latest advanced switching technology with proven Cisco software to power a new generation of scalable and intelligent multilayer switching solutions for both enterprise and service provider environments. Designed to integrate data, voice, and video into a single platform for fully integrated IP communications, the Catalyst 6500 Series supervisor engines enable intelligent, resilient, scalable, and secure high performance multilayer switching solutions.

The widely deployed Supervisor Engine 1A and Supervisor Engine 2 are used in wiring closets, distribution/core, data center and WAN edge configurations enabling the seamless integration of advanced services such as security, voice and content into a converged network that reduces the total cost of ownership. And the new Supervisor Engine 720 is ideally suited for high performance core, data center and metro Ethernet deployments with its scalable performance of up to 400 million packets per second using a 720Gbps switch fabric.

By sharing a common set of interfaces, operating system and management tools, the Catalyst 6500 Series supervisors provide operational consistency—enabling common sparing and minimizing training requirements; all modules feature predictable performance and a broad range of capabilities. Supervisor Engine 1A and Supervisor Engine 2 highlights include:

- *Feature-rich and wire-rate intelligent network services*—Support and complement comprehensive security and granular Quality of Service mechanisms, including identity-based networking capabilities based on IEEE 802.1x extensions and simplified configuration using two AutoQoS commands
- *End-to-end flexible deployments*—Position anywhere in the network from the wiring closet to the distribution/core, and from the data center to the WAN edge and the MAN
- *Scaleable and predictable performance*—Feature a flexible switch fabric and forwarding architecture delivering throughput from 15Mpps/32Gbps (Classic interface modules), to 30Mpps/256Gbps (CEF256 interface modules), to 210Mpps/256Gbps (dCEF256 interface modules) for network cores supporting multi-gigabit trunks
- *Flexible multilayer switching support and forwarding architectures*—Select basic Layer 2 forwarding or feature-rich Cisco Express Forwarding (CEF) using the same supervisor

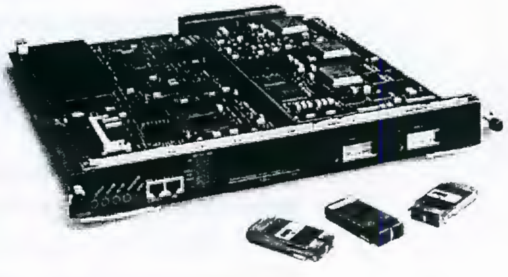
Cisco Systems, Inc.

- *Choice of operating system support*—Support both Cisco IOS® Software, Catalyst OS software, and Hybrid (Catalyst OS software and Cisco IOS Software for the MSFC)
- *Operational consistency*— Support all 3 generations of Catalyst 6500 Series interface and services modules in all Catalyst 6500 3-, 6-, 9- and 13-slot chassis running Cisco IOS® Software and Cisco Catalyst Operating System Software and a common set of Cisco network management tools that support the Catalyst 6500 Supervisor Engine 1A and 2 as well as many other Cisco Systems product lines
- *Maximum network uptime and user productivity*—Provide fault-tolerant network resilience and high availability features including fast 1- to 3-second stateful fail-over between redundant Catalyst 6500 supervisor engines enabling near-hitless software upgrades for business critical network environments, including IP-telephony enabled wiring closets
- *Extensive management tools*—Support CiscoWorks network management platform, Simple Network Management Protocol (SNMP) versions 1, 2, and 3 and four RMON groups (statistics, history, alarms, and events)

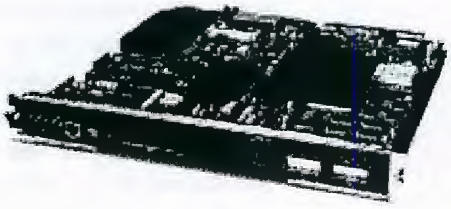
As part of the Catalyst 6500 Series of modular products, Supervisor Engines 1A and 2 share a common operating system and CLI—encouraging an end-to-end Catalyst 6500 Series solution for maximum operational consistency, common sparing, and minimized training requirements (Figure 1).

Figure 1 Supervisor Engines 1A and Supervisor Engine 2

Supervisor Engine 1-PFC



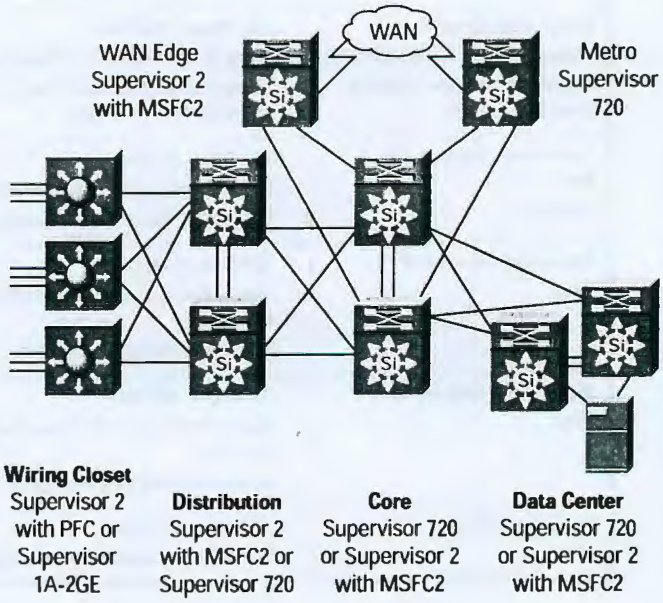
Supervisor Engine 2-MSFC2



Supervisor Engine 1A and Supervisor Engine 2 Deployment Scenarios

With a broad range of interfaces, and services modules, chassis / slot configurations as well as a scalable set of Supervisor Engines, the Catalyst 6500 can be deployed anywhere in the network. The figure below depicts the Catalyst 6500 deployed in the wiring closet, distribution, core, data center, WAN edge and Metro and provides recommended supervisor engines for each part of the network.

Figure 2
Cisco Supervisor Engine 1A and Supervisor Engine 2 Deployment Scenarios



The following table outlines the primary deployment scenarios for Cisco Catalyst 6500 Series supervisor engines.

Table 1 Deployment Scenarios for Cisco Catalyst 6500 Series Supervisor Engines

Supervisor Engine	Performance/Features	Recommended Deployments
Supervisor Engine 720	400 Mpps, 720 Gbps Layer 2–4 distributed Cisco Express Forwarding Supports new accelerated Cisco Express Forwarding 720 and distributed Cisco Express Forwarding 720 interface modules	Enterprise core, distribution, and data centers
Supervisor Engine 2 Policy Feature Card 2 (PFC2) Multilayer Switch Feature Card 2 (MSFC2)	210 Mpps, 256 Gbps Layer 2–4 distributed Cisco Express Forwarding Supports distributed Cisco Express Forwarding 256 interface modules	Enterprise distribution, data centers, and WAN edge
Supervisor Engine 1A PFC MSFC2	15 Mpps, 32 Gbps Centralized Layer 2–4 forwarding Enhanced security and quality of service (QoS)	Distribution and core
Supervisor Engine 2 PFC2	30 Mpps, 256 Gbps Centralized Layer 2 forwarding and Layer 3–4 services Enhanced security and QoS	Premium wiring closet and data center access
Supervisor Engine 1A PFC	15 Mpps, 32Gbps Centralized Layer 2 forwarding and Layer 3–4 services Enhanced security and QoS	Enterprise wiring closets
Supervisor Engine 1A 2GE	15 Mpps, 32 Gbps Centralized Layer 2 forwarding	Value wiring closet

Supervisor Engine 1A and 2 Features

The Supervisor Engine 1A and 2 provide the following features:

- High availability
- Scalable performance
- Wire-rate traffic management
- End-to-end management tools
- Comprehensive security
- Advanced Layer 2, Layer 3, and Layer 4 forwarding

High Availability

Supervisor Engines 1A and 2 can be deployed in dual-supervisor engine configurations in all Cisco Catalyst 6500 Series chassis (6503, 6506, 6509, and 6513). The dual-supervisor engine configuration synchronizes protocol states between the primary and the redundant supervisor engine, provides industry-leading network availability with sub-3-second failover, and maximizes network uptime by allowing hot swapping of standby supervisor engines. Important high-availability features include:

- *Supervisor engine redundancy*—With synchronization of protocol states and support for HSRP and Uplink Fast
- *Rapid failover rates*—Sub-3-second stateful failover and Layer 3 IP Unicast and Multicast failover
- *Hot swapping*—Hot swapping of standby supervisors

Scalable Performance

Supervisor Engines 1A and 2 provide scalable performance, from 15 Mpps to 210 Mpps with bandwidth scaling from 32 Gbps to 256 Gbps, that densely populated wiring closets and high-throughput network cores with multigigabit trunks require.

Supervisor Engine 2 uses the Cisco Express Forwarding routing architecture that performs high-speed lookups even with advanced Layer 3 services enabled, and independent of the number of flows through the switch, while maintaining 30 Mpps of centralized performance and 210 Mpps of distributed performance.

- *Supervisor Engine 1A*—Provides 15-Mpps performance with 32-Gbps bandwidth
- *Supervisor Engine 2*—Provides 30 Mpps of centralized performance and 210 Mpps of distributed performance with 256-Gbps bandwidth

For details see Table 2—Cisco Catalyst 6500 Supervisor Engine Feature Comparison.

Wire-Rate Traffic Management

Supervisor Engines 1A and 2 provide wire-rate traffic management using Layer 2, 3, and 4 QoS and security checks, including ACL policy enforcement, as part of their forwarding process to protect and secure content. These traffic management features enable efficient handling of converged networks that carry a mix of mission-critical, time-sensitive, and bandwidth-intensive multimedia applications.

- Advanced QoS tools such as packet classification and marking and congestion avoidance based on Layer 2, Layer 3, and Layer 4 header information.
- QoS scheduling rules with thresholds can be configured in the switch for multiple receive and transmit queues.
- Rate limiting can be used to police traffic on a per-flow or aggregate basis with a very fine granularity.

For details see Table 3—QoS Features Comparison.

End-to-End Management Tools

Managed with CiscoWorks2000, Cisco Catalyst 6500 Series switches can be configured and managed to deliver end-to-end device, VLAN, traffic, and policy management. Cisco Resource Manager, a Web-based management tool that works with CiscoWorks2000, provides: automated inventory collection, software deployment, easy tracking of network changes, views into device availability, and quick isolation of error conditions.

Supervisor Engines 1A and 2 provide a comprehensive set of management tools to provide the required visibility and control in the network.

- *Console management*—Provide shared interface to the Supervisor Engine 2 and the Multilayer Switch Feature Card 2 (MSFC2) available out-of-band from a local terminal or remote terminal connected through a modem to the console or auxiliary interface
- *In-band management*—Provide shared interface to the Supervisor Engine 2 and the MSFC2 available in-band through SNMP, Telnet client, Bootstrap Protocol (BOOTP), and Trivial File Transfer Protocol (TFTP)
- *SPAN*—Allow management and monitoring of switch traffic
- *RSPAN*—Allow centralized management and monitoring by aggregating and directing traffic from multiple distributed hosts and switches to a remotely located switch through a trunk link
- *VACL Capture*—Direct traffic to a network analysis port using an ACL

For details see Table 4—Management Tools Comparison.

Comprehensive Security

The advanced security capabilities of Supervisor Engines 1A and 2 can reduce the threats of malicious attacks while enabling authentication, authorization, and accounting. With support for up to 32K ACL entries, IP/IPX security ACLs in hardware, and advanced features such as port security, Supervisor Engines 1A and 2 offer a superior set of Layer 2–4 network traffic security capabilities:

- *Layer 2 security features*—Include private VLANs and port security, to help the network architect properly partition and control the utilization of the switch resources.
- *Layer 2, 3, and 4 hardware filters*—Can work on the forwarding engine and in conjunction with optional integrated services modules to inspect each forwarded packet and permit or deny all the streams of traffic according to the network administrator's rules.

For details see Table 5—PFC and PFC2 Security Features Comparison.

Supervisor Engine 1A and 2 Architecture

Catalyst 6500 Series Supervisor Engines 1A and 2 manage the system by storing and running the system software, controlling the various modules in the chassis, performing basic forwarding, and providing the Gigabit uplinks that allow redundant supervisor engine connections.

Supervisor Engine 2 offers an improved forwarding design. The Supervisor Engine 1A CPU performs Layer 2 forwarding, but Supervisor Engine 2 performs Cisco Express Forwarding (CEF) and distributed CEF, doubling the forwarding performance. As shown in Table 2, Supervisor Engines 1A and 2 offer choices in operating characteristics, including forwarding architecture, performance, bandwidth, DRAM and boot Flash sizes, and support for chassis, Policy Feature Card/Policy Feature Card 2 (PFC/PFC2), MSFC2, and Switch Fabric Module (SFM).

Table 2 Cisco Catalyst 6500 Supervisor Engine Feature Comparison

Feature	**Supervisor Engine 2** ***Supervisor Engine-PFC2*** ***Supervisor Engine-MSFC2***	**Supervisor Engine 1A** ***Supervisor Engine 1A-2GE*** ***Supervisor Engine 1A-PFC*** ***Supervisor Engine 1A-/MSF***
Cisco Express Forwarding (CEF)	Yes	No
Performance	30 Mpps—*Supervisor Engine 2- PFC2 and Supervisor Engine 2-MSFC2* up to 210 Mpps—*Supervisor Engine 2- MSFC2 with SFM and DFCs*	15 Mpps
Maximum bandwidth	256 Gbps (with distributed forwarding)	32 Gbps
DRAM	128 MB, 256 MB, 512 MB	128 MB
Onboard Flash (BootFlash)	32 MB	16 MB
Chassis supported	6006, 6009, 6503, 6506, 6509, 6509-NEB, 6509-NEB-A, 6513; 7603, 7606, 7609, OSR-7609, 7613	6006, 6009, 6503, 6506, 6509, 6509-NEB, 6509-NEB-A; 7603, 7606, 7609, OSR-7609
PFC daughter card available	Yes (PFC2); Standard with Supervisor Engine 2	Yes (PFC); Not field upgradable
MSFC2 daughter card available	Yes, and field upgradable	Yes, not field upgradable
SFM supported	Yes	No

The PFC/PFC2 and MSFC2 daughter cards and the SFM increase Supervisor Engines 1A and 2 functions:

- *PFC and PFC2*—Perform hardware-based Layer 2, Layer 3, and Layer 4 packet forwarding as well as packet classification, traffic management, and policy enforcement
- *MSFC2*—Performs Layer 3 control plane functions including address resolution and routing protocols
- *SFM 2*—Provides 256 Gbps dedicated bandwidth to all slots in the chassis and requires Supervisor Engine 2-MSFC2. The SFM 2 will not operate in the same chassis with Supervisor Engine 720.

Policy Feature Card (PFC and PFC2)

The Policy Feature Card provides quality of service (QoS) and policy based intelligent networking capabilities to the Catalyst 6500 Series. Recommended for premier wiring closets, backbone, data center and WAN edge deployments, the PFC identifies and classifies traffic applying the appropriate QoS priority level and Security Policies as defined by the network administrator configured ACLs. The PFC also helps to prevent unauthorized applications from being allowed on the network.

The Supervisor Engine PFC daughter card makes the packet forwarding decision in its application-specific integrated circuit (ASIC) complex. In distributed forwarding implementations, an identical ASIC complex located on an interface module's DFC daughter card allows the interface module to make packet-forwarding decisions locally. After the PFC or DFC makes the forwarding decision for the interface module, it sends the forwarding result to the interface module that does all packet buffering, queuing, and delivery.

In addition to packet forwarding, the PFC performs the following major functions at wire-rate:

- *Layer 3 packet classification*—Using QoS access-control entries
- *Traffic management (rate limiting)*—Using ingress and egress policing
- *Security policy enforcement*—Within subnets or VLANs
- *Intelligent multicast forwarding*—Efficient replication of multicast streams, supplied to appropriate end-user stations
- *NetFlow data export*—Collecting IP flow statistics for inter-subnet flows

QoS

The following table shows the PFC and PFC2 QoS features.

Table 3 QoS Features Comparison

Feature	PFC2 *Supervisor Engine 2 PFC2* *Supervisor Engine 2 MSFC2*	PFC *Supervisor Engine 1A PFC* *Supervisor Engine 1A PFC/MSFC2*	No PFC *Supervisor Engine 1A-2GE*
Layer 2 classification and marking	Yes	Yes	Yes
Layer 3 classification and marking/ Access Control Entries (ACEs)	Yes 32K	Yes 16K	None
Rate limiting location (port)	Ingress port, VLAN	Ingress port, VLAN	None
Rate Limiting Level Types *CIR = Committed Information Rate* *PIR = Peak Information Rate*	CIR, PIR	CIR	None
Aggregate traffic rate limiting/ number of policers	Yes 1023 policers	Yes 1023 policers	None
Flow-based rate limiting method/ number of rates	Full flow; 64 rates	Full flow; 64 rates	None

Management Tools

The following table compares the management tools that are available with Supervisor Engines 1A and 2.

Table 4 Management Tools Comparison

Feature	PFC *Supervisor Engine 1A PFC* *Supervisor Engine 1A PFC/MSFC2* *Supervisor Engine 2 PFC2* *Supervisor Engine 2 MSFC2*	No PFC *Supervisor Engine 1A-2GE*
SPAN	Yes	Yes
RSPAN	Yes	No
ERSPAN	No	No
VACL Capture	Yes	No

Security

Table 5 shows the PFC and PFC2 security features.

Table 5 PFC and PFC2 Security Features Comparison

Feature	With PFC2 *Supervisor Engine 2 PFC2* *Supervisor Engine 2 MSFC2*	With PFC *Supervisor Engine 1A PFC* *Supervisor Engine 1A PFC/MSFC2*	Without PFC *Supervisor Engine 1A-2GE*
Port security	Yes	Yes	Yes
TCP intercept hardware acceleration	Yes	Yes	No
IEEE 802.1X and 802.1X extensions	Yes	Yes	No
IP security ACLs in hardware	Yes	Yes	No
IPX security ACLs in hardware	Yes	Yes	No
Security ACL entries	32K	16K	No
Reflexive ACLs	128K	512K	No
Unicast Reverse Path Forwarding (uRPF) check-in hardware	Yes	No	No
CPU rate limiters	1	None	None

Multi-layer Switch Fabric Card2 (MSFC2)

Supported on both Supervisor 1A and Supervisor 2 as an option the MSFC2 acts as the Layer 3 forwarding routing engine. On its Layer 3 forwarding routing engine, the MSFC2 builds the CEF Forwarding Information Base (FIB) table in software and then downloads this table to the ASICs on the PFC or DFC that make the forwarding decisions for IP Unicast and Multicast traffic. For more information see How Cisco Express Forwarding Works.

Layer 3 Switching

Table 6 shows the MSFC2 Layer 3 switching features.

Table 6 Layer 3 Switching Feature Comparisons

Feature	**MSFC2** ***Supervisor Engine 1A-PFC/MSFC2*** ***Supervisor Engine 2-MSFC2***	**No MSFC2** ***Supervisor Engine 2-PFC2***	**No MSFC2** ***Supervisor Engine 1A-2GE*** ***Supervisor Engine 1A-PFC***
IPv4 routing	Yes	Yes, with MSFC2 upgrade	No, not upgradable
MPLS	Yes, through OSM	Yes, through OSM	No
IPv6	Yes, in software (only on Supervisor Engine 2-MSFC2	No, requires MSFC2 upgrade	No

Note: Refer to the release notes for up-to-date software version information.

Switch Fabric Modules (SFM and SFM2)

Designed to support distributed forwarding, the Cisco Catalyst 6500 Series SFM (WS-X6500-SFM) and SFM2 (WS-X6500-SFM2) provide dedicated bandwidth to each slot up to 256 Gbps per system.

For distributed forwarding to work, an interface module must have a Distributed Forwarding Card (DFC) and must be installed in the chassis with either a Supervisor Engine 2-MSFC2 and an SFM or SFM2, or a Supervisor Engine 720. The SFM works with Cisco Catalyst 6506, 6509, 6509-NEB, and 6509-NEB-A chassis and can occupy any slot. The SFM2 works with 6506, 6509, 6509-NEB, 6509-NEB-A, 6513, 7603, 7606, 7609, OSR-7609, and 7613 chassis; and it can occupy any slot, except in the 6513 and 7613 where it must occupy slot 7 or 8.

The Catalyst 6503 does not currently support the SFM modules as this would leave one slot open after configuring the supervisor and SFM in two of the three available slots. However, the Supervisor 720 provides full CEF256, dCEF256, aCEF720 and dCEF720 capabilities to the Catalyst 6503 chassis with its slot-efficient integration of the supervisor engine and switch fabric in a single module.

Switch Fabric Module Architecture

Providing access to the switch fabric through dual 8-Gbps serial channels, the SFM or SFM2 performs all switching on the module independent of the passive backplane. For more information see How Distributed Cisco Express Forwarding (dCEF) Works.

High Availability

Two SFM and SFM2 modules can be configured in a system for high availability with 1-to-1 redundancy, where one SFM or SFM2 is operational and one serves as a backup.

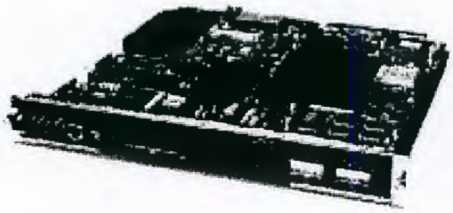
Note: The SFM and SFM2 cannot operate in the same chassis with a Supervisor Engine 720.

Supervisor Engine 2-MSFC2

Suited for deployment in the distribution/core with Classic interface modules, CEF256 interface modules and dCEF256 interface modules, Supervisor 1A-2GE provides Layer 2/3/4 forwarding with the following operational advantages:

- *Layer 2–4 forwarding*—Performs Layer 2 – 4 forwarding with Layer2, 3, 4 features; supports dCEF256 interface modules
- *Media Access Control (MAC) addresses*—128K
- *Forwarding rate*—Up to 30 Mpps per system
- *Bandwidth*—32 Gbps per system; 256 Gbps with SFM in chassis
- *Layer 2, 3 traffic classification and marking*—Layer 2 and Layer 3 (See Table 3—QoS Features Comparison for details)
- *Multilayer (Layer 3) switching*—IPv4 supported (See Table 6 for details)
- Distributed forwarding—Requires Switch Fabric Module and interface modules with Distributed Forwarding Cards (DFCs); for details, see section titled How Distributed Cisco Express Forwarding (dCEF) Works
- *Operating system*—Cisco Catalyst OS with Cisco IOS on the MSFC and Cisco IOS Software
- *Management tools*—SPAN, RSPAN, VACL capture
- *DRAM*—128, 256, 512 MB
- *Onboard flash (BootFlash)*—32 MB
- *Chassis supported*—Cisco Catalyst 6006, 6009, 6503, 6506, 6509, 6509-NEB, 6509-NEB-A, and 6513; 7603, 7606, 7609, OSR-7609, and 7613
- *Slot requirements*—Slots 1 or 2 of any chassis
- *Upgrade support*—None required

Figure 3
Cisco Catalyst 6500 Series Supervisor Engine 2-MSFC2



Supervisor Engine 2-PFC2

Suited for deployment in wiring closets with Classic and CEF256 interface modules, Supervisor Engine 1A-2GE provides basic Layer 2 forwarding with the following operational advantages:

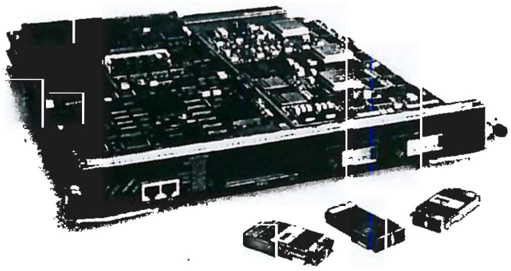
- *Layer 2 forwarding*—Performs Layer 2 forwarding with Layer2, 3, 4 features; requires MSFC2 upgrade to support Layer 3, 4 forwarding
- *MAC addresses*—128K
- *Forwarding rate*—Up to 30 Mpps per system
- *Bandwidth*—32 Gbps per system; 256 Gbps with SFM in chassis
- *Layer 2, 3 traffic classification and marking*—Layer 2 and Layer 3 (See Table 3—QoS Features Comparison for details)
- *Multilayer (Layer 3) switching*—Requires MSFC2 upgrade (See Table 6 for details)
- *Distributed forwarding*—Requires MSFC2 upgrade, SFM, and interface modules with DFCs (for details, see section titled How Distributed Cisco Express Forwarding (dCEF) Works).
- *Operating system*—Cisco Catalyst OS only (Cisco IOS Software supported with MSFC2 upgrade)
- *Management tools*—SPAN, RSPAN, VACL capture
- *DRAM*—128, 256, 512 MB
- *Onboard flash (BootFlash)*—32 MB
- *Chassis supported*—Cisco Catalyst 6006, 6009, 6503, 6506, 6509, 6509-NEB, 6509-NEB-A, and 6513; 7603, 7606, 7609, OSR-7609, and 7613
- *Slot requirements*—Slots 1 or 2 of any chassis
- *Upgrade support*—MSFC2 upgrade

Supervisor Engine 1A-PFC/MSFC2

Suited for deployment in the distribution/core with Classic interface modules, Supervisor Engine 1A-2GE provides Layer 2–4 forwarding with the following operational advantages:

- *Layer 2–4 forwarding*—Performs Layer 2–4 forwarding with Layer 2–4 features
- *MAC addresses*—128K
- *Forwarding rate*—Up to 15 Mpps per system
- *Bandwidth*—32 Gbps per system
- *Layer 2, 3 traffic classification and marking*—Layer 2 and Layer 3 (see Table 3—QoS Features Comparison for details)
- *Multilayer (Layer 3) switching*—IPv4 supported (See Table 6 for details)
- *Distributed forwarding*—Unsupported
- *Operating system*—Cisco Catalyst OS with Cisco IOS on the MSFC and Cisco IOS Software
- *Management tools*—SPAN, RSPAN, VACL capture
- *DRAM*—128 MB
- *Onboard flash (BootFlash)*—16 MB
- *Chassis supported*—Cisco Catalyst 6006, 6009, 6503, 6506, 6509, and 6509-NEB, 6509-NEB-A (6513 not supported); 7603, 7606, 7609, and OSR-7609 (7613 not supported)
- *Slot requirements*—Slots 1 or 2 of any chassis
- *Upgrade support*—None

Figure 4
Cisco Catalyst 6500 Supervisor Engine 1A-PFC/MSFC2



Cisco Systems, Inc.

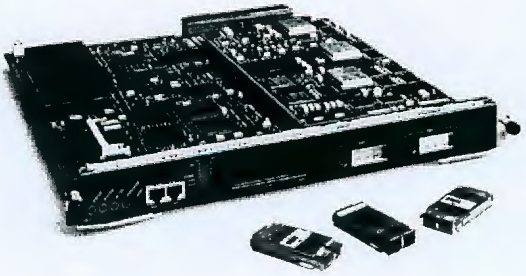
Supervisor Engine 1A-PFC

Suited for deployment in wiring closets with Classic interface modules, Supervisor Engine 1A-2GE provides basic Layer 2 forwarding with the following operational advantages:

- *Layer 2 forwarding*—Performs basic Layer 2 forwarding with no Layer 2–4 features
- *MAC addresses*—128K
- *Forwarding rate*—Up to 15 Mpps per system
- *Bandwidth*—32 Gbps per system
- *Layer 2, 3 traffic classification and marking*—Layer 2 and Layer 3 (See Table 3—QoS Features Comparison for details)
- *Multilayer (Layer 3) switching*—Unsupported
- *Distributed forwarding*—Unsupported
- *Operating system*—Cisco Catalyst OS only
- *Management tools*—SPAN, RSPAN, VACL capture
- *DRAM*—128 MB
- *Onboard flash (BootFlash)*—16 MB
- *Chassis supported*—Cisco Catalyst 6006, 6009, 6503, 6506, 6509, and 6509-NEB, 6509-NEB-A (6513 not supported); 7603, 7606, 7609, and OSR-7609 (7613 not supported)
- *Slot requirements*—Slots 1 or 2 of any chassis
- *Upgrades*—None

Figure 5

Cisco Catalyst 6500 Supervisor Engine 1A-PFC



Supervisor Engine 1A-2GE

Suited for deployment in wiring closets with Classic interface modules, Supervisor Engine 1A-2GE provides basic Layer 2 forwarding with the following operational advantages:

- *Layer 2 forwarding*—Performs Layer 2 forwarding with Layer 4 features
- *MAC addresses*—128K
- *Forwarding rate*—Up to 15 Mpps per system
- *Bandwidth*—32 Gbps per system
- *Layer 2, 3 traffic classification and marking*—Layer 2 only, not upgradable to support Layer 3 (for details, see Table 3—QoS Features Comparison)
- *Multilayer (Layer 3) switching*—Unsupported
- *Distributed forwarding*—Unsupported
- *Operating system*—Cisco Catalyst OS only
- *Management tools*—SPAN only
- *DRAM*—64 MB
- *Onboard flash (BootFlash)*—16 MB
- *Chassis supported*—Cisco Catalyst 6006, 6009, 6503, 6506, 6509, and 6509-NEB, 6509-NEB-A (6513 not supported); 7603, 7606, 7609, and OSR-7609 (7613 not supported)
- *Slot requirements*—Slots 1 or 2 of any chassis
- *Upgrade support*—None

How Cisco Express Forwarding Works

Cisco Express Forwarding (CEF) is a Layer 3 technology that provides increased forwarding scalability and performance to handle many short-duration traffic flows common in today's enterprise and service provider networks. To meet the needs of environments handling large amounts of short-flow, Web-based, or highly interactive types of traffic, CEF forwards all packets in hardware, and maintains its forwarding rate completely independent of the number of flows going though the switch.

On the Cisco Catalyst 6500 Series, the CEF Layer 3 forwarding engine is located centrally on the supervisor engine's PFC2 or PFC3—the same device that performs hardware-based Layer 2 and 3 forwarding, ACL checking, QoS policing and marking, and NetFlow statistics gathering.

Using the routing table that Cisco IOS Software builds to define configured interfaces and routing protocols, the CEF architecture creates CEF tables and downloads them into the hardware-forwarding engine before any user traffic is sent through the switch. The CEF architecture places only the routing prefixes in its CEF tables—the only information it requires to make the Layer 3 forwarding decisions—relying on the routing protocols to do route selection. By performing a simple CEF table lookup, the switch forwards packets at wire-rate, independent of the number of flows transiting the switch.

CEF-based forwarding requirements: Requires a Cisco Catalyst Supervisor Engine 2 or Catalyst Supervisor Engine 720.

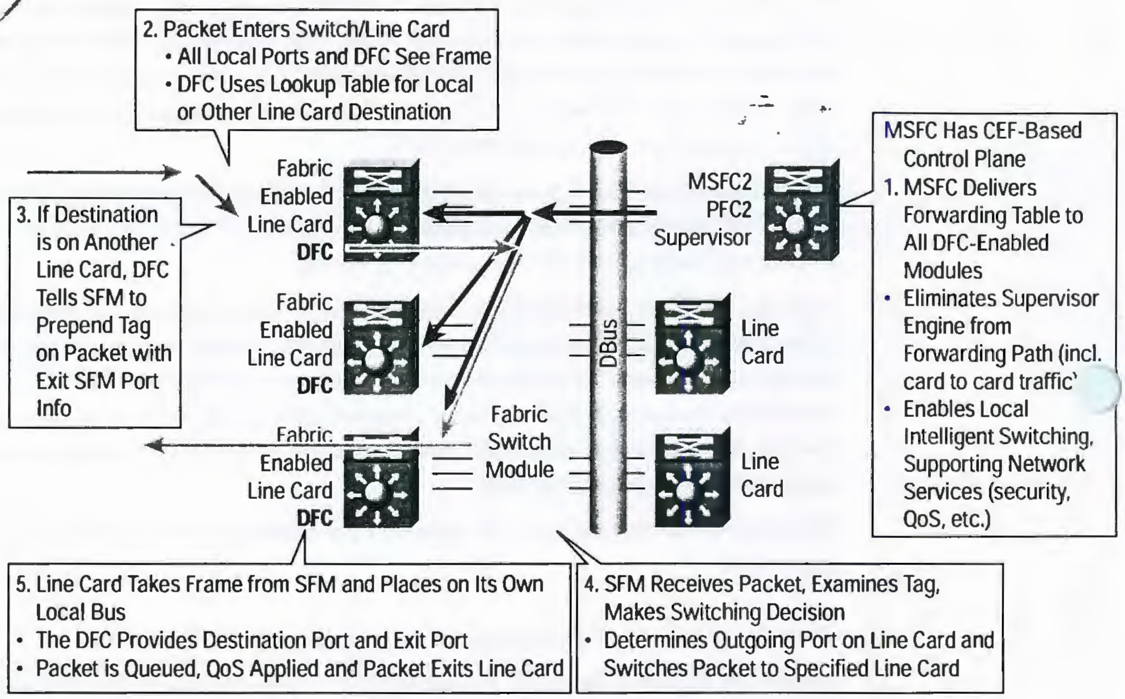
How Distributed Cisco Express Forwarding (dCEF) Works

With Distributed Cisco Express Forwarding (dCEF), forwarding engines located on the interface modules make forwarding decisions locally and in parallel, allowing the Cisco Catalyst 6500 Series to achieve the highest forwarding rates in the industry. With dCEF, forwarding occurs on the interface modules in parallel and system performance scales up to 400 Mpps—the aggregate of all forwarding engines working together.

Using the same ASIC engine design as the central PFCx, DFCs located on the interface modules forward packets between two ports, directly or across the switch fabric, without involving the supervisor engine. With the DFC, each interface module has a dedicated forwarding engine complete with the full forwarding tables. dCEF forwarding works like this:

- As in standard CEF forwarding, the central PFC3 located on the supervisor engine and the DFC engines located on the interface modules are loaded with the same CEF information derived from the forwarding table before any user traffic arrives at the switch.
- As a packet arrives at an interface module, its DFC engine inspects the packet and uses the information in the CEF table (including Layer 2, Layer 3, ACLs, and QoS) to make a completely hardware-based forwarding decision for that packet.
- The dCEF engine handles all hardware-based forwarding for traffic on that module, including Layer 2 and Layer 3 forwarding, ACLs, QoS policing and marking, and NetFlow.
- Because the DFCs make all the switching decisions locally, the supervisor engine is freed from all forwarding responsibilities and can perform other software-based functions, including routing, management, and network services.

Figure 5
Distributed Cisco Express Forwarding Packet Flow



Fabric Enabled Line Card DFC
Fabric Enabled Line Card DFC
Fabric Enabled Line Card DFC
Fabric Switch Module
DBus
MSFC2 PFC2 Supervisor
Line Card
Line Card

2. Packet Enters Switch/Line Card
- All Local Ports and DFC See Frame
- DFC Uses Lookup Table for Local or Other Line Card Destination

3. If Destination is on Another Line Card, DFC Tells SFM to Prepend Tag on Packet with Exit SFM Port Info

MSFC Has CEF-Based Control Plane
1. MSFC Delivers Forwarding Table to All DFC-Enabled Modules
- Eliminates Supervisor Engine from Forwarding Path (incl. card to card traffic'
- Enables Local Intelligent Switching, Supporting Network Services (security, QoS, etc.)

5. Line Card Takes Frame from SFM and Places on Its Own Local Bus
- The DFC Provides Destination Port and Exit Port
- Packet is Queued, QoS Applied and Packet Exits Line Card

4. SFM Receives Packet, Examines Tag, Makes Switching Decision
- Determines Outgoing Port on Line Card and Switches Packet to Specified Line Card

dCEF-based forwarding requirements: Requires a Cisco Catalyst Supervisor Engine 720 for dCEF720 interface modules; requires either a Catalyst Supervisor Engine 720 or a Catalyst Supervisor Engine 2-MSFC2 and a SFM for dCEF256 interface modules.

Software Requirements

Depending on its configuration, a supervisor engine will operate with one or more of the following operating systems:

- Cisco IOS Software for the supervisor engine (native Cisco IOS Software)
- Cisco Catalyst OS software
- Hybrid, Catalyst OS software and Cisco IOS Software for the MSFC

Notes: Refer to the release notes for up-to-date software version information.

Ordering Information

Table 7 lists the ordering information for the Supervisor Engines 1A and 2.

Table 7 Product Numbers for Ordering

Product Number	Description
WS-X6K-SUP1A-2GE	Catalyst 6500 Supervisor Engine1A, 2GE
WS-X6K-SUP1A-PFC	Catalyst 6500 Supervisor Engine1A, 2GE, plus PFC
WS-X6K-S1A-MSFC2	Catalyst 6500 Supervisor Engine1A, 2GE, plus MSFC-2 and PFC
WS-X6K-S2-PFC2	Catalyst 6500 Supervisor Engine 2, 2GE, plus PFC-2
WS-X6K-S2-MSFC2	Catalyst 6500 Supervisor Engine 2, 2GE, plus MSFC-2/PFC-2
WS-X6K-S1A-MSFC2	Supervisor Engine 1A with PFC+MSFC2
WS-X6K-S1A-MSFC2=	Supervisor Engine 1A with PFC+MSFC2=

Technical Support Services

Whether your company is a large organization, a commercial business, or a service provider, Cisco Systems is committed to maximizing the return on your network investment. Cisco offers a portfolio of Technical Support Services to ensure that your Cisco products operate efficiently, remain highly available, and benefit from the most up-to-date system software.

Cisco Technical Support Services offers the following features, which help enable network investment protection and minimal downtime for systems running mission-critical applications:

- Provides Cisco networking expertise online and on the telephone
- Creates a proactive support environment with software updates and upgrades as an ongoing integral part of your network operations, not merely a remedy when a failure or problem occurs
- Makes Cisco technical knowledge and resources available to you on demand
- Augments the resources of your operations technical staff to increase productivity
- Complements remote technical support with onsite hardware replacement
- The Cisco portfolio of Technical Support Services includes:
- Cisco SMARTnet™ support
- Cisco SMARTnet Onsite support
- Cisco Software Application Services, including Software Application Support and Software Application Support plus Upgrades

CHAPTER 3

Installing the Switch

Note In this publication, the term Catalyst 6500 series refers only to the switch chassis listed in Table 1-1. The Catalyst 6000 series switches are described in a separate publication, the *Catalyst 6000 Series Switch Installation Guide.*

This chapter describes how to install a Catalyst 6500 series switch in a rack. For first-time installations, perform the procedures in the following sections in the order listed:

- Unpacking the Switch, page 3-3
- Installing the Rack-Mount Kit, page 3-3
- Installing the Switch Chassis in the Rack, page 3-15
- Installing the Stabilizer Kit (Catalyst 6509-NEB and Catalyst 6513 Switches Only), page 3-19
- Establishing the System Ground, page 3-22
- Installing the Power Supplies in the Switch Chassis, page 3-26
- Attaching the Interface Cables, page 3-26
- Verifying Switch Chassis Installation, page 3-36

Warning **This unit is intended for installation in restricted access areas. A restricted access area can be accessed only through the use of a special tool, lock and key, or other means of security.**

Warning **Only trained and qualified personnel should be allowed to install, replace, or service this equipment.**

Warning **Ultimate disposal of this product should be handled according to all national laws and regulations.**

Warning **This equipment must be installed and maintained by service personnel as defined by AS/NZS 3260. Incorrectly connecting this equipment to a general-purpose outlet could be hazardous. The telecommunications lines must be disconnected 1) before unplugging the main power connector or 2) while th housing is open, or both.**

Warning **This product requires short-circuit (overcurrent) protection, to be provided as part of the building installation. Install only in accordance with national and local wiring regulations.**

Caution During this procedure, wear a grounding wrist strap to avoid ESD damage to the card. Do not directly touch the backplane with your hand or any metal tool, or you could shock yourself.

Note If you are installing a free-standing (not rack-mounted) Catalyst 6509-NEB or Catalyst 6513 switch, you must install the stabilizer kit, which is part of the accessory kit for these two switches.

Before starting the installation procedures in this chapter, see the "Site Preparation Checklist" section on page 2-20 to verify that all site planning activities were completed.

For information on installing modules, refer to the *Catalyst 6500 Series Switch Module Installation Guide*.

Unpacking the Switch

Tip Do not discard the shipping container when you unpack the switch. Flatten the shipping cartons and store them with the pallet. You will need these containers if you need to move or ship the switch in the future. Repacking instructions are provided in Appendix C, "Repacking the Switch."

Perform the following to check the contents of the shipping container:

- Check the contents of the accessory kit against the Accessory Kit Components Checklist and the packing slip. Verify that you received all listed equipment, which should include the following:
  - Switch hardware and software documentation, if ordered
  - Optional equipment that you ordered, such as network interface cables, transceivers, or special connectors
- Check the switching modules in each slot. Ensure that the configuration matches the packing list and that all the specified interfaces are included.

Installing the Rack-Mount Kit

This section describes how to install the rack-mount kit. The kit contains a shelf bracket and crossbar assembly that attaches directly to the rack.

The Catalyst 6500 series chassis also have L brackets that are used to secure the chassis to the rack. Normally, the Catalyst 6500 series chassis are shipped with the L brackets installed. This section also contains procedures for installing the L brackets, for instances in which the chassis are not shipped with the L brackets installed.

Open the rack-mount kit, and use the checklist in Table 3-1 to verify that all parts are included.

Table 3-1 Rack-Mount Kit Contents Checklist

Part Description	Received
2 L brackets[1]	
M3 Phillips countersunk-head screws	
M4 Phillips countersunk-head screws[2]	
12-24 x 3/4-inch Phillips binder-head screws	
10-32 x 3/4-inch Phillips binder-head screws	
2 Shelf brackets	
1 Crossbar bracket	
M3 Phillips pan-head screws	

[1] The Catalyst 6500 series chassis are normally shipped with the L brackets installed.

[2] The M4 Phillips countersunk-head screws are included only in the accessories kits for the Catalyst 6509-NEB and Catalyst 6513 switch chassis. The M4 screws are for use with those two chassis only.

Rack-Mounting Guidelines

Before rack-mounting the switch, ensure that the equipment rack complies with the following guidelines:

- The width of the rack, measured between the two front mounting strips or rails, must be 17.75 inches (45.09 cm).
- The depth of the rack, measured between the front and rear mounting strips, must be at least 19.25 inches (48.9 cm) but not more than 32 inches (81.3 cm).
- The rack must have sufficient vertical clearance to insert the chassis. The chassis heights are as follows:
  - Catalyst 6503 switch—7 inches (17.8 cm) (4 RU)
  - Catalyst 6506 switch—20.1 inches (50.1 cm) (12 RU)
  - Catalyst 6509 switch—25.5 inches (64.8 cm) (15 RU)

- Catalyst 6509-NEB switch—33.5 inches (85.1 cm) (20 RU)
- Catalyst 6513 switch—33.0 inches (83.8 cm) (19 RU)

Note Chassis height is sometimes measured in rack units (RU).

Caution If the rack is on wheels, ensure that the brakes are engaged or that the rack is otherwise stabilized.

Warning **To prevent bodily injury when mounting or servicing this unit in a rack, you must take special precautions to ensure that the system remains stable. The following guidelines are provided to ensure your safety:**

- **This unit should be mounted at the bottom of the rack if it is the only unit in the rack.**
- **When mounting this unit in a partially filled rack, load the rack from the bottom to the top with the heaviest component at the bottom of the rack.**
- **If the rack is provided with stabilizing devices, install the stabilizers before mounting or servicing the unit in the rack.**

Note We recommend that you maintain a minimum air space of 6 inches (15 cm) between walls and the chassis air vents and a minimum horizontal separation of 12 inches (30.5 cm) between two chassis to prevent overheating.

This rack-mounting kit is not suitable for use with racks that have obstructions (such as power strips) because the obstructions could impair access to switch field-replaceable units (FRUs).

Required Tools

These tools and equipment are required to install the rack-mount kit:

- Number 1 and number 2 Phillips screwdrivers
- 3/16-inch flat-blade screwdriver
- Tape measure and level

Installing the Shelf Brackets and Crossbar Bracket

To install the shelf bracket and crossbar bracket, follow these steps:

Step 1 Position one of the two shelf brackets in the rack as shown in Figure 3-1.

Step 2 Secure the shelf bracket to the rack by using three 12-24 x 3/4-inch or 10-32 x 3/4-inch screws.

Step 3 Repeat Steps 1 and 2 for the second shelf bracket. Make sure that the second shelf bracket is level with the first bracket.

Step 4 Attach the crossbar bracket to the back of the shelf brackets using two M3 screws as shown in Figure 3-2.

Figure 3-1 Installing the Shelf Brackets

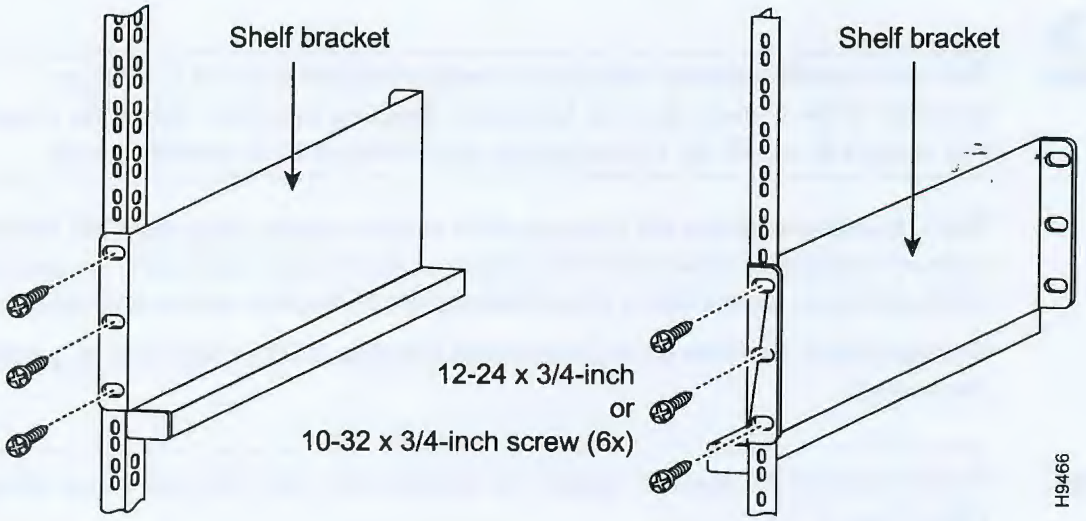

Figure 3-2 Attaching the Crossbar Bracket to the Shelf Brackets

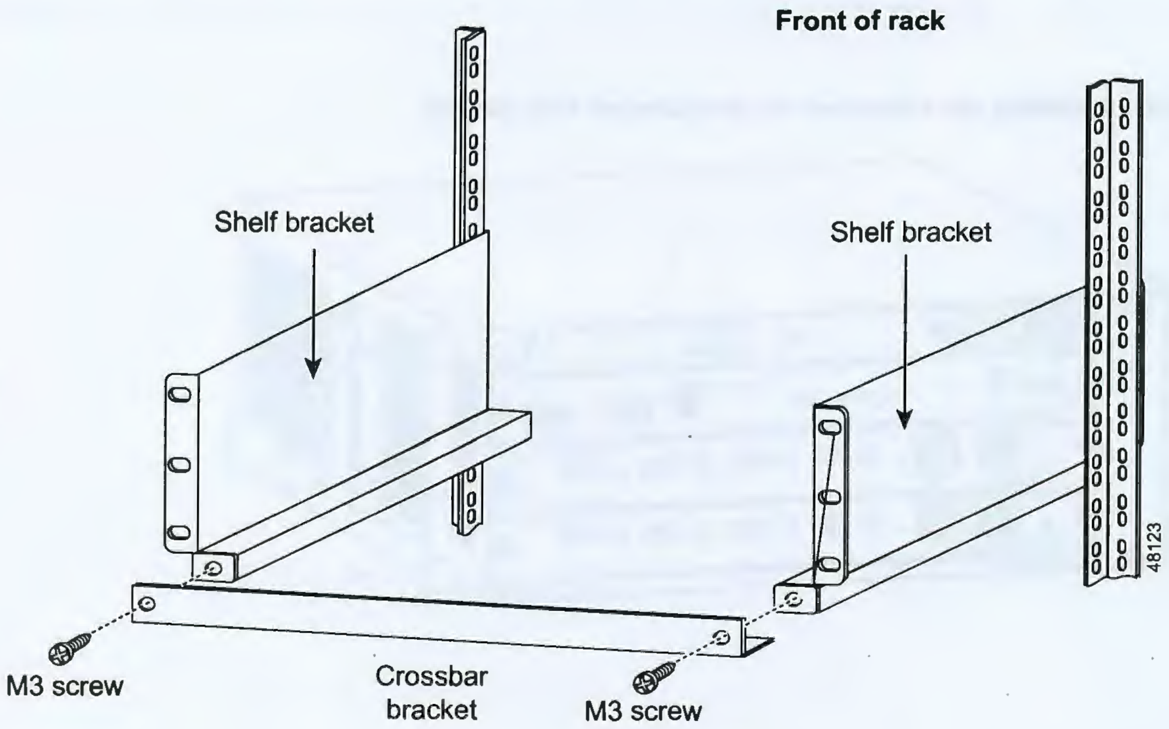


Installing the L Brackets on the Catalyst 6503 Switch

Note The Catalyst 6503 switch chassis is normally shipped with the L brackets installed. If the chassis does not have the L brackets installed, follow the steps in this section to install the L brackets on your Catalyst 6503 switch chassis.

The L brackets attach to the Catalyst 6503 switch chassis using eight M3 Phillips countersunk-head screws (four M3 screws on each side). You attach the optional cable guides by sandwiching them between the L brackets and switch chassis.

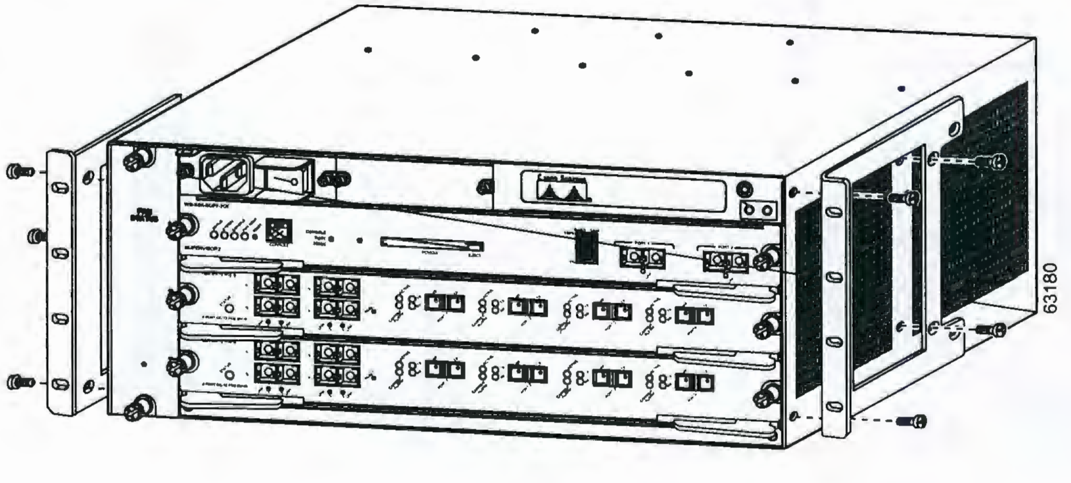
To install the L brackets on the front of the Catalyst 6503 switch chassis, perform these steps:

Step 1 Position one of the brackets against the chassis side, and align the screw holes. (See Figure 3-3.)

Step 2 Secure the bracket to the chassis with four screws.

Step 3 Repeat Steps 1 and 2 for the other bracket.

Figure 3-3 Installing the L-Brackets on the Catalyst 6503 Switch



Installing the L Brackets and Cable Guides on the Catalyst 6506 Switch

Note The Catalyst 6506 switch chassis is normally shipped with the L brackets installed. If the chassis does not have the L brackets installed, follow the steps in this section to install the L brackets on your Catalyst 6506 switch chassis.

The L brackets attach to the Catalyst 6506 switch chassis using eight M3 Phillips countersunk-head screws (four M3 screws on each side). You attach the optional cable guides by sandwiching them between the L brackets and the switch chassis.

Note The L brackets for the Catalyst 6506 switches are stamped with an L and an R to identify them as left and right.

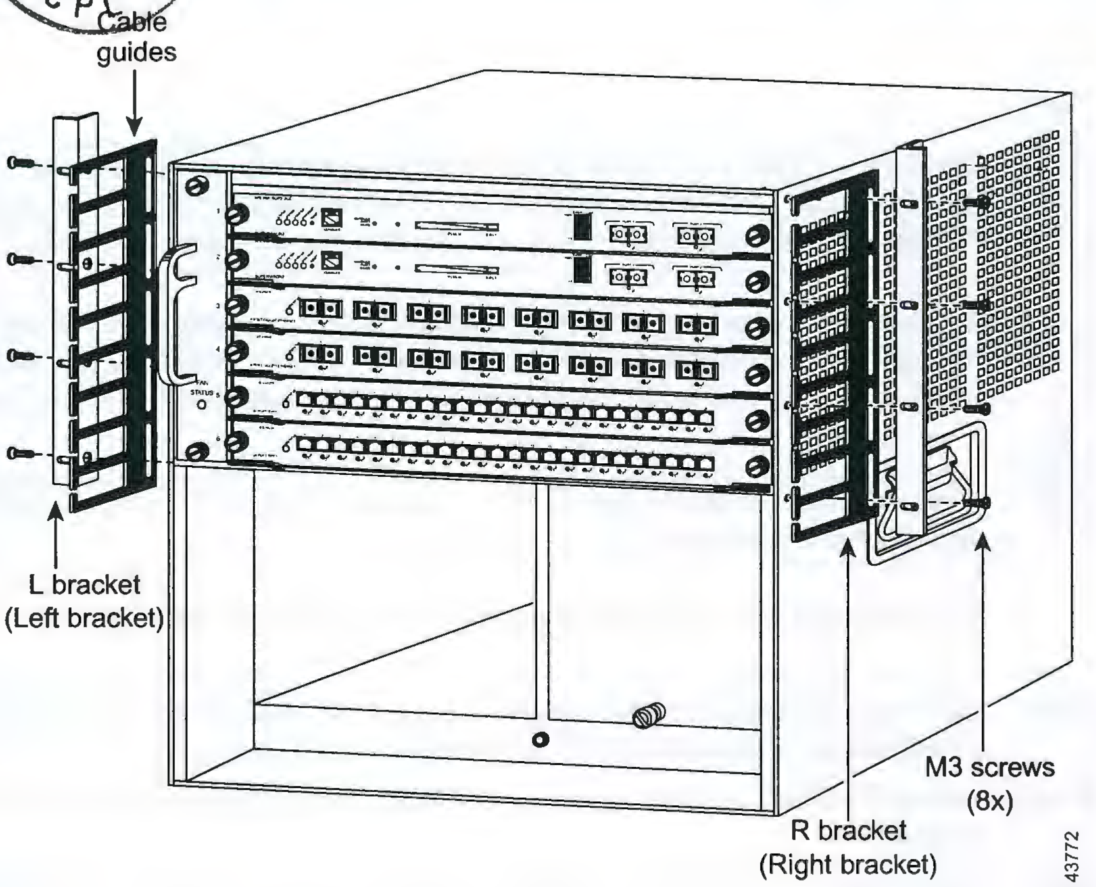
To install the L brackets and optional cable guides, follow these steps:

Step 1 Position the left (L) L bracket and the optional cable guide (if desired) against the switch chassis side, and align the screw holes. (See Figure 3-4.)

Step 2 Secure the L bracket (and optional cable guide) to the switch chassis with four M3 screws.

Step 3 Repeat steps 1 and 2 for the right (R) L bracket (and, if necessary, the optional cable guide).

Figure 3-4 Attaching L Brackets and Cable Guides: Catalyst 6506 Switch



Installing the L Brackets and Cable Guides on the Catalyst 6509 Switch

Note The Catalyst 6509 switch chassis is normally shipped with the L brackets installed. If the chassis does not have the L brackets installed, follow the steps in this section to install the L brackets on your Catalyst 6509 switch chassis.

The L brackets attach to the Catalyst 6509 switch chassis using ten M3 Phillips countersunk-head screws (five screws on each side). You attach the optional cable guides by sandwiching them between the L brackets and switch chassis.

Note The L brackets for the Catalyst 6509 switches are stamped with an L and an R to identify them as left and right.

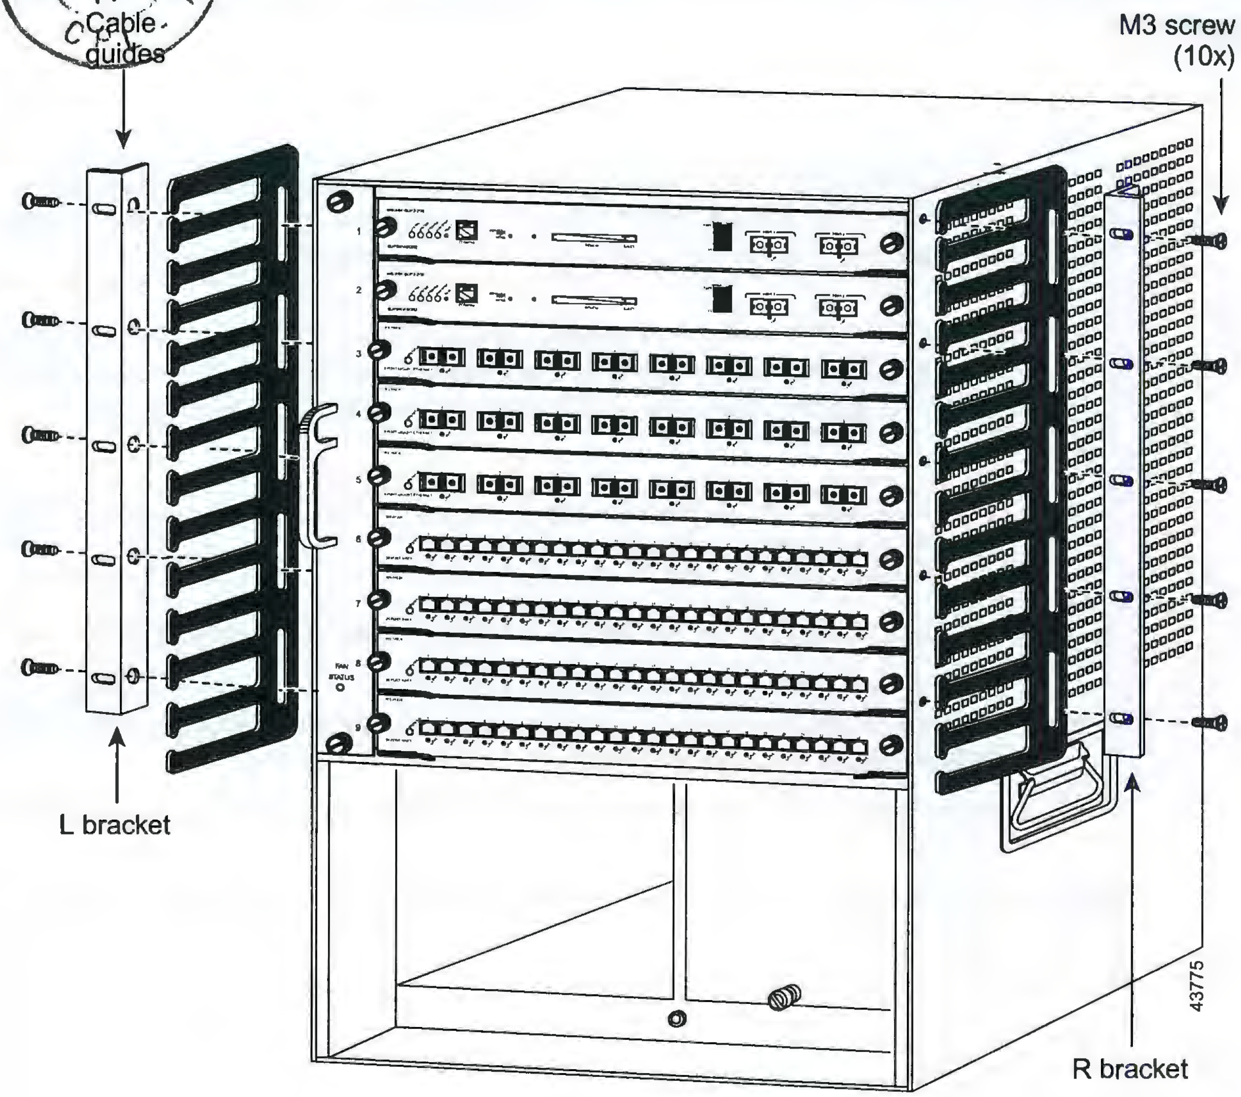
To install the L brackets and optional cable guides, follow these steps:

Step 1 Position the left (L) L bracket and the optional cable guide (if desired) against the switch chassis side, and align the screw holes. (See Figure 3-5.)

Step 2 Secure the L bracket (and optional cable guide) to the switch chassis with five M3 screws.

Step 3 Repeat steps 1 and 2 for the right (R) L bracket (and, if necessary, the optional cable guide).

Figure 3-5 Attaching L Brackets and Cable Guides: Catalyst 6509 Switch



Installing the L Brackets and Cable Guides on the Catalyst 6509-NEB Switch

Note The Catalyst 6509-NEB switch chassis is normally shipped with the L brackets installed. If the chassis does not have the L brackets installed, follow the steps in this section to install the L brackets on your Catalyst 6509-NEB switch chassis.

The Catalyst 6509-NEB L bracket screw holes are stamped + and –. You can install the brackets either on the left or right side of the chassis; use the + holes on one side and the – holes on the other side. The L brackets are installed with ten M4 Phillips countersunk-head screws (five screws on each side).

The optional cable guide installs on the front of the chassis and is secured with four M4 screws. To install the L brackets, follow these steps:

Step 1 Position one of the L brackets against the switch chassis side, and align the screw holes (use either the + or the – holes).

Step 2 Secure the L bracket to the switch chassis with five M4 screws.

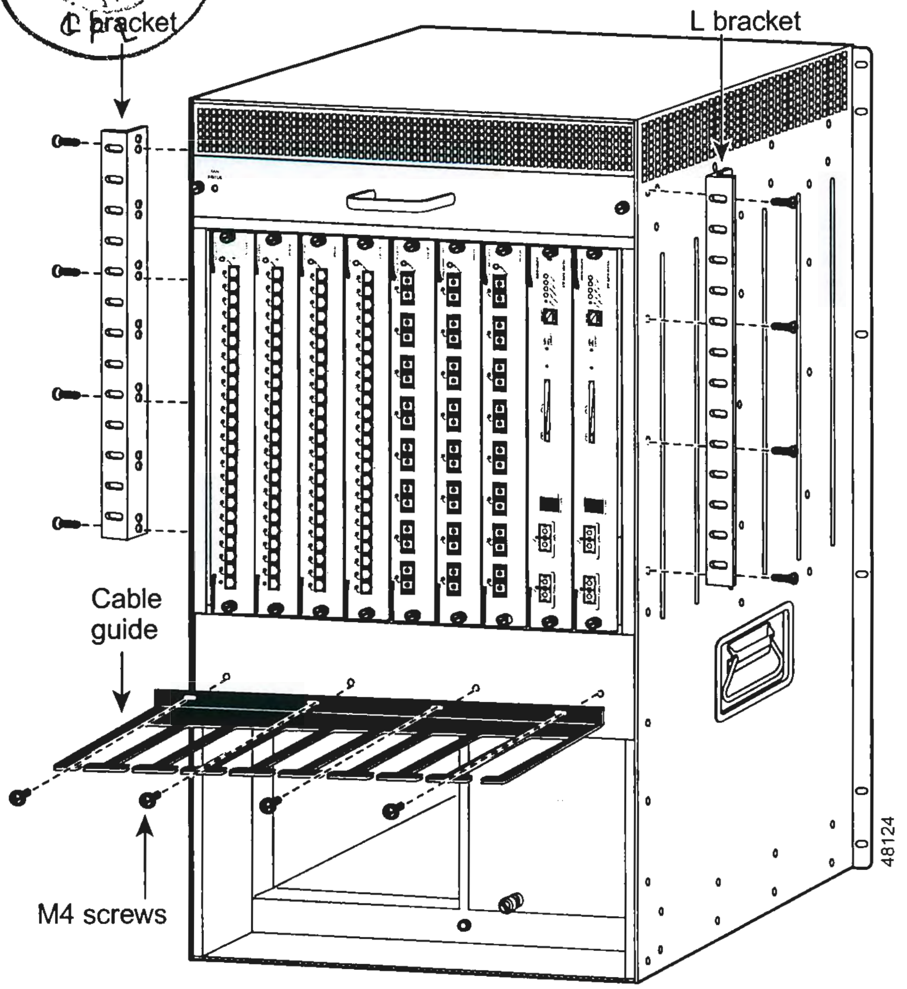
Step 3 Repeat steps 1 and 2 for the other L bracket. If you used the + set of holes for the first L bracket, use the – set of holes for the second L bracket.

To install the optional cable guide, follow these steps:

Step 1 Position the cable guide against the front of the chassis, and align the four screw holes as shown in Figure 3-6.

Step 2 Secure the cable guide with four M4 screws.

Figure 3-6 Attaching L Brackets and Cable Guides: Catalyst 6509-NEB Switch



Installing the Switch Chassis in the Rack

Note If you are not installing the Catalyst 6509-NEB switch or Catalyst 6513 switch in the rack, see "Installing the Stabilizer Kit (Catalyst 6509-NEB and Catalyst 6513 Switches Only)" section on page 3-19.

You are now ready to install the switch chassis in the rack.

Tip We recommend that you have a third person to assist in this procedure.

Caution Two people are required to lift the chassis. Grasp the chassis underneath the lower edge and lift with both hands. To prevent injury, keep your back straight and lift with your legs, not your back.

To install the switch chassis in the equipment rack, follow these steps:

Step 1 With a person standing at each side of the chassis, grasp the chassis handle with one hand and use the other hand near the back of the chassis for balance. Slowly lift the chassis in unison. Avoid sudden twists or moves to prevent injury.

Step 2 Position the chassis in the rack as follows (as shown in Figure 3-7):

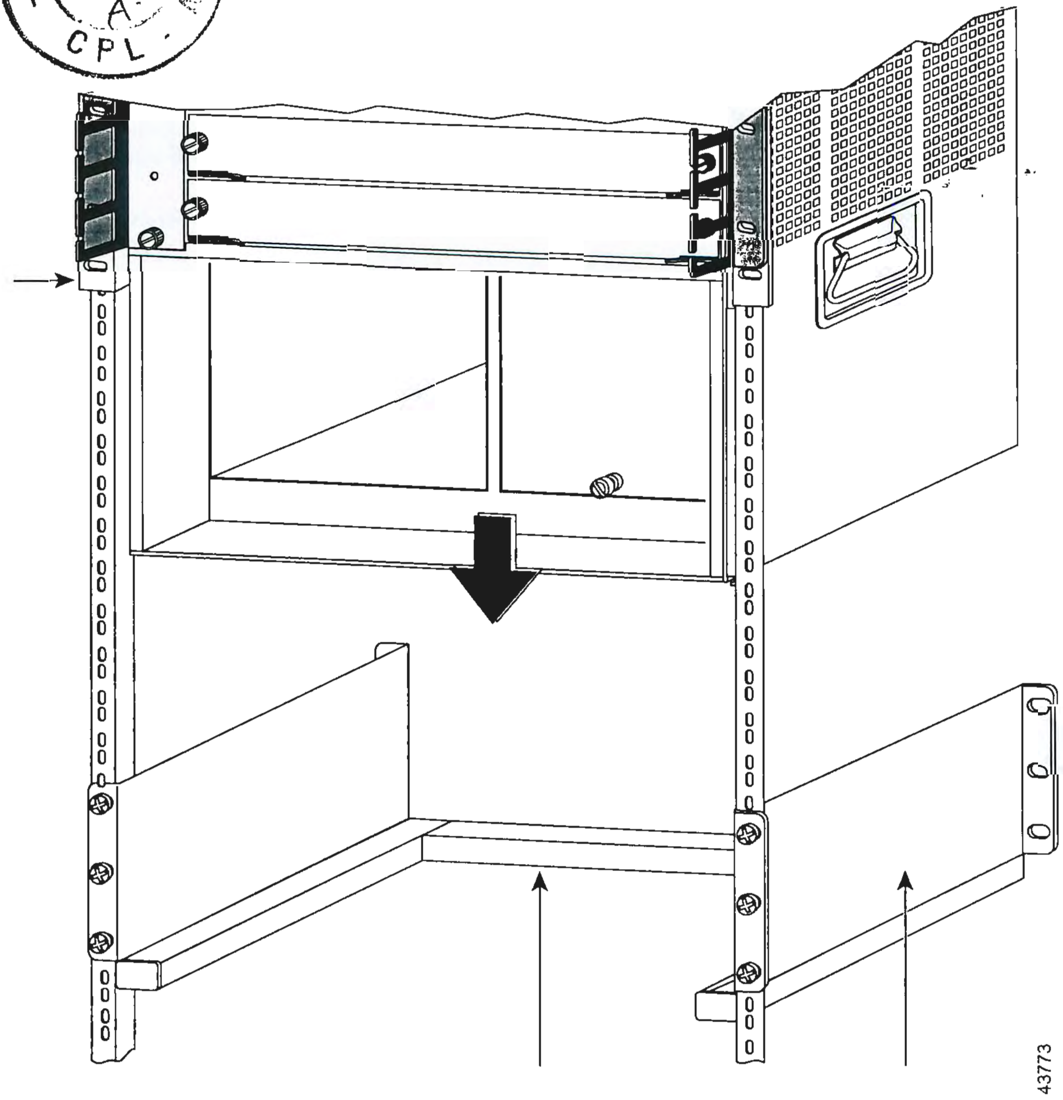
a. If the front of the chassis (front panel) is at the front of the rack, insert the rear of the chassis between the mounting posts.

b. If the rear of the chassis is at the front of the rack, insert the front of the chassis between the mounting posts.

Step 3 Rest the switch chassis on the shelf brackets and crossbar bracket.

Step 4 Align the mounting holes in the L bracket with the mounting holes in the equipment rack.

Figure 3-7 Installing the Switch in the Rack



Note If you are rack-mounting the Catalyst 6513 switch and you want to install the optional cable guides, perform Step 5; if not, go to Step 6.

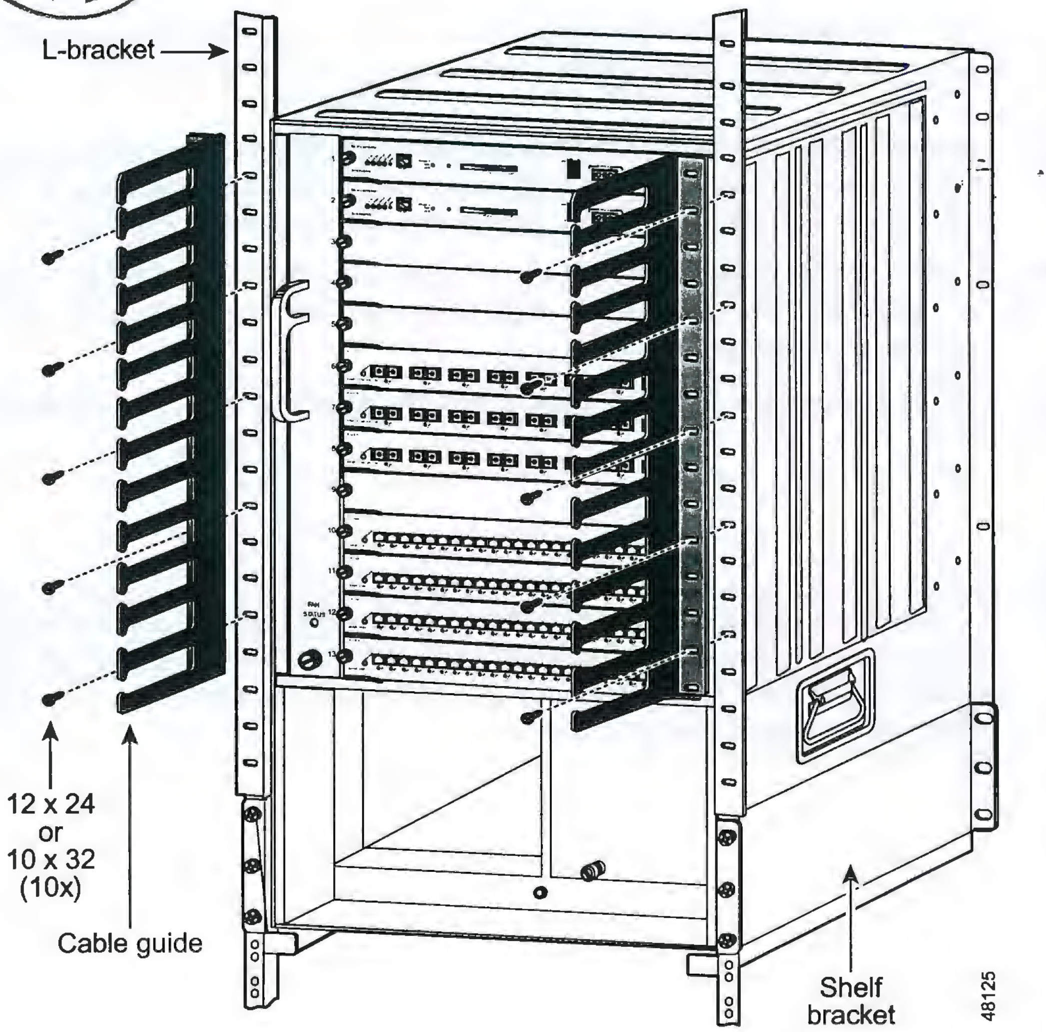
Step 5 Align the cable guide bracket mounting holes with the mounting holes in the L bracket and the mounting holes in the equipment rack and install ten (five per side) 12-24 x 3/4-inch or 10-32 x 3/4-inch screws as shown in Figure 3-8.

Step 6 Install the eight or ten (four or five per side) 12-24 x 3/4-inch or 10-32 x 3/4-inch screws through the holes in the L bracket and into the threaded holes in the equipment rack posts.

Step 7 Use a tape measure and level to verify that the chassis is installed straight and level.

Note If you are not rack-mounting the Catalyst 6513 switch and you are installing the optional cable guide assemblies, you must obtain ten 12x24 or 10x32 nuts. Use the screws supplied in the accessory kit and the nuts you obtained to attach the cable guide assembly to the L bracket.

Figure 3-8 Installing the Catalyst 6513 Switch in the Rack with the Optional Cable Guides



Installing the Stabilizer Kit (Catalyst 6509-NEB and Catalyst 6513 Switches Only)

Note The stabilizer kit is included only in the accessory kits for the Catalyst 6509-NEB and the Catalyst 6513 switches.

If you are not installing the Catalyst 6509-NEB or Catalyst 6513 switch in a rack, you must install stabilizer brackets to the bottom of the chassis. The stabilizer brackets reduce the possibility of the freestanding switch chassis tipping over.

Open the stabilizer kit package and use the kit contents list in Table 3-2 to verify that all parts are included.

Table 3-2 Stabilizer Kit Contents

Quantity	Part Description	Received
16	M4 Phillips countersunk-head screws	
2	Stabilizer brackets	

Note Have a second person available to perform the installation.

To install the stabilizer brackets, follow these steps:

Step 1 Have one person tilt and hold the chassis to one side.

Step 2 With the chassis tilted, attach the stabilizer bracket to the side of the chassis with the eight M4 screws as shown in Figure 3-9.

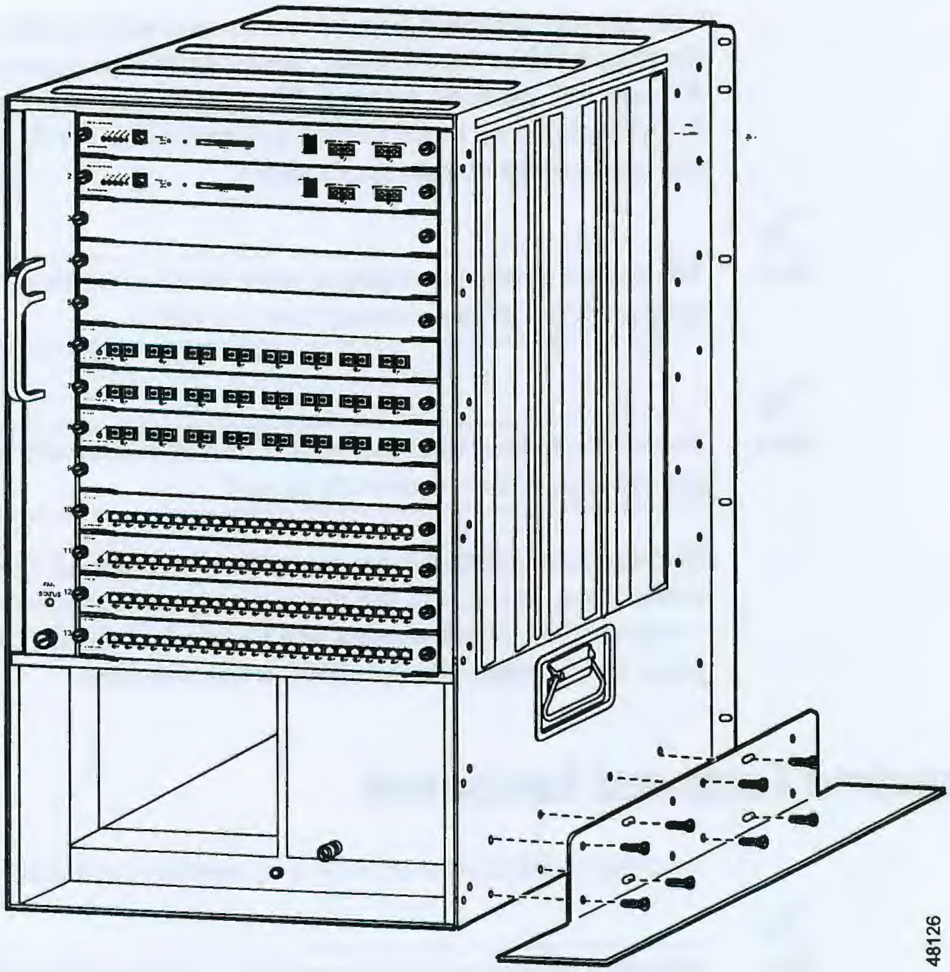
Step 3 Tilt the chassis to the other side.

Step 4 Attach the second stabilizer bracket to the other side of the chassis with eight M4 screws.

Step 5 Lower the chassis so that it rests on both stabilizer brackets.

Note If you are not rack-mounting the Catalyst 6513 switch and you want to install the cable guide assemblies, you must obtain ten 12x24 or 10x32 nuts. Use the screws supplied in the accessory kit and the nuts you obtained to attach the cable guide assembly to the L bracket.

Figure 3-9 Installing the Stabilizer Brackets



Establishing the System Ground

This section describes how to connect a system (earth) ground to the Catalyst 6500 series switches. You must use the system (earth) ground on both AC- and DC-powered systems. The system ground provides additional grounding for EMI shielding requirements and grounding for the low voltage supplies (DC-DC converters) on the modules.

Note The system ground connection must be installed along with any other rack or system power ground connections you make.

Note You must connect both the system ground connection and the power supply ground connection to an earth ground.

Two threaded M4 holes are provided on the chassis frame to attach the ground cable. (See Figure 3-10 for the system ground attachment point for the Catalyst 6503 switch chassis and Figure 3-11 for the system ground attachment point for the other Catalyst 6500 series switches.)

Required Tools and Equipment

To connect the system ground, you need the following tools and materials:

Note Materials are not provided; contact any commercial cable vendor for the required parts.

- Grounding lug—The grounding lug must have two M4 screw holes and accept 6 AWG wire.
- Two M4 (metric) hex-head screws with locking washers.

- One grounding wire—The grounding wire should be sized according to local and national installation requirements. The length of the grounding wires depends on the proximity of the switch to proper grounding facilities.
- Number 2 Phillips screwdriver.
- Crimping tool.
- Wire-stripping tool.

Connecting the System Ground

You must complete this procedure before connecting system power or turning on the Catalyst 6500 series switch.

To attach the grounding lug and cable to the grounding pad, follow these steps:

Step 1 Use a wire-stripping tool to remove approximately 0.75 inch (19 mm) of the covering from the end of the grounding wire.

Step 2 Insert the stripped end of the grounding wire into the open end of the grounding lug.

Step 3 Use a crimping tool to secure the grounding wire in place in the grounding lug.

Step 4 Locate and remove the adhesive label from the system grounding pad on the switch.

Step 5 Place the grounding wire lug against the grounding pad, making sure there is solid metal-to-metal contact.

Step 6 Secure the grounding lug to the chassis with two M4 screws. (See Figure 3-10 for the Catalyst 6503 switch or Figure 3-11 for the other Catalyst 6500 series switches.) Ensure that the grounding lug will not interfere with other switch hardware or rack equipment.

Step 7 Prepare the other end of the grounding wire and connect it to an appropriate grounding point in your site to ensure adequate earth ground for the switch.

Figure 3-10 Catalyst 6503 System Ground Connection

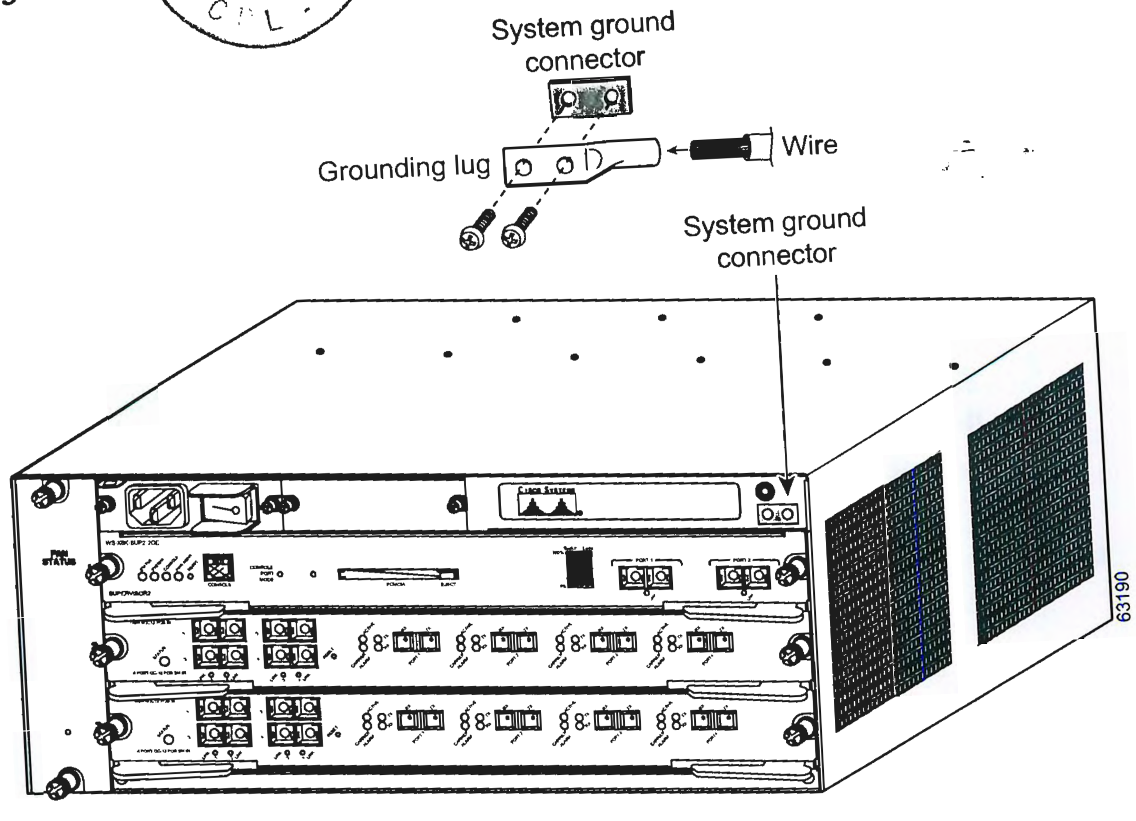


Figure 3-11 System Ground Location

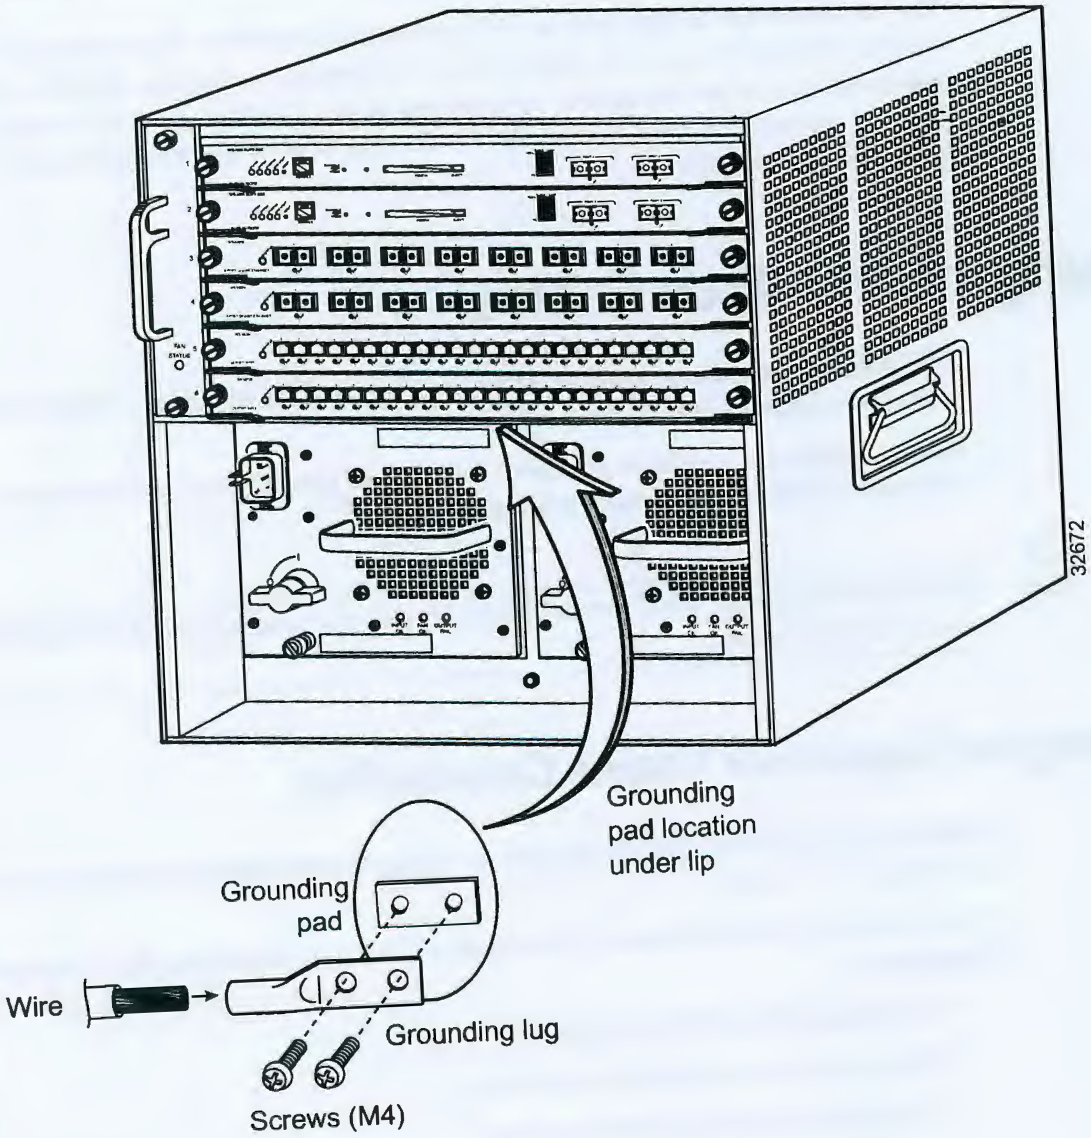


Installing the Power Supplies in the Switch Chassis

The switch power supply (AC or DC) is shipped separately from the switch chassis. Remove the power supply from its shipping packaging, and then install and connect it to the site power by referring to the "Installing an AC-Input Power Supply" section on page 5-23 or the "Installing a DC-Input Power Supply" section on page 5-31.

Attaching the Interface Cables

This section provides general information on attaching interface cables to the supervisor engines and to the modules.

Depending on the modules you have installed in your chassis, you will have different styles of connectors to attach.

Note Refer to the *Catalyst 6500 Series Switch Module Installation Guide* for additional module information.

Connecting the Supervisor Engine Console Port

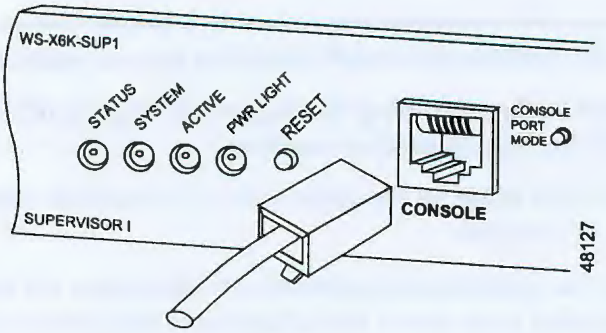
This section describes how to connect to the supervisor engine console port from a terminal or modem.

The console port on the supervisor engine allows you to perform the following functions:

- Configure the switch from the CLI
- Monitor network statistics and errors
- Configure SNMP agent parameters
- Download software updates to the switch or distribute software images residing in Flash memory to attached devices

The console port, located on the front panel of the supervisor engine, is shown in Figure 3-12.

Figure 3-12 Supervisor Engine Console Port Connector



Note The accessory kit that shipped with your Catalyst 6500 series switch contains the necessary cable and adapters to connect a terminal or modem to the console port.

To connect a terminal to the console port using the cable and adapters provided, follow these steps:

Step 1 Place the console port mode switch in the *in* position (factory default).

Step 2 Connect to the port using the RJ-45-to-RJ-45 cable and RJ-45-to-DB-25 DTE adapter or RJ-45-to-DB-9 DTE adapter (labeled "Terminal").

Step 3 Position the cable in the cable guide (if installed). Make sure there are no sharp bends in the cable.

Step 4 Check the terminal documentation to determine the baud rate. The baud rate of the terminal must match the default baud rate (9600 baud) of the console port. Set up the terminal as follows:

- 9600 baud
- 8 data bits
- No parity
- 2 stop bits

To connect a terminal using a Catalyst 5000 family Supervisor Engine III console cable, follow these steps:

Step 1 Place the console port mode switch in the *out* position.

Step 2 Connect to the port using the Supervisor Engine III cable and the appropriate adapter for the terminal connection.

Step 3 Position the cable in the cable guide (if installed). Make sure there are no sharp bends in the cable.

Step 4 Check the terminal documentation to determine the baud rate. The baud rate of the terminal must match the default baud rate (9600 baud) of the console port. Set up the terminal as follows:

- 9600 baud
- 8 data bits
- No parity
- 2 stop bits

To connect a modem to the console port, follow these steps:

Step 1 Place the console port mode switch in the *in* position.

Step 2 Connect to the port using the RJ-45-to-RJ-45 rollover cable and the RJ-45-to-DB-25 DCE adapter (labeled "Modem").

Step 3 Position the cable in the cable guide (if installed). Make sure there are no sharp bends in the cable.

Connecting the Supervisor Engine Uplink Ports

This section describes how to connect to the supervisor engine uplink ports.

Warning **Invisible laser radiation may be emitted from disconnected fibers or connectors. Do not stare into beams or view directly with optical instruments.**

Note In a redundant configuration with two supervisor engines, the uplink ports on the redundant (standby) supervisor engine are active and can be used for normal traffic, like any other ports in the chassis.

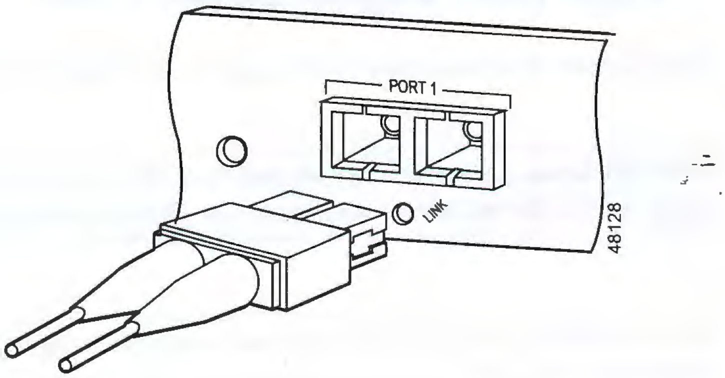
To connect to the supervisor engine uplink ports that use GBICs, follow these steps:

Step 1 Install the GBIC following the installation procedure contained in the *Gigabit Interface Converter Installation Note*.

Step 2 Remove the plugs from the Gigabit Interface Converter (GBIC) optical bores; store them for future use.

Step 3 Remove the plugs from the SC connector on the fiber-optic cable. Insert the connector into the GBIC. (See Figure 3-13.)

Figure 3-13 Connecting the Supervisor Engine Uplink Ports



Note When you plug the SC connector into the GBIC, make sure that both the transmit (Tx) and receive (Rx) fiber-optic cables are fully inserted into the SC connector.

Note If you are using the LX/LH GBIC with MMF, you need to install a patch cord between the GBIC and the MMF cable.

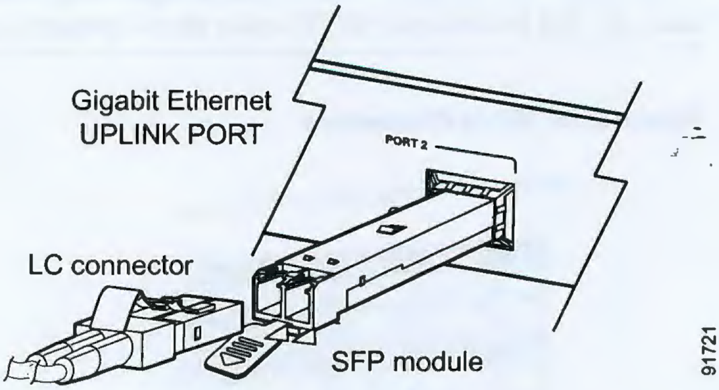
To connect to the supervisor engine uplink ports that use SFPs (Supervisor Engine 720), follow these steps (see Figure 3-14):

Step 1 Install the SFP module following the installation procedure contained in the *Cisco Small Form-Factor Pluggable Modules Installation Notes*.

Step 2 Remove the plug from the SFP optical bore; store it for future use.

Step 3 Remove the plug from the MT-RJ or LC connector on the fiber-optic cable. Insert the connector into the SFP.

Figure 3-14 Supervisor Engine 720 SFP Uplink Port



Connecting a Module

The Catalyst 6500 series modules use the following types of connectors:

- RJ-45
- RJ-21
- SC
- MT-RJ

RJ-45

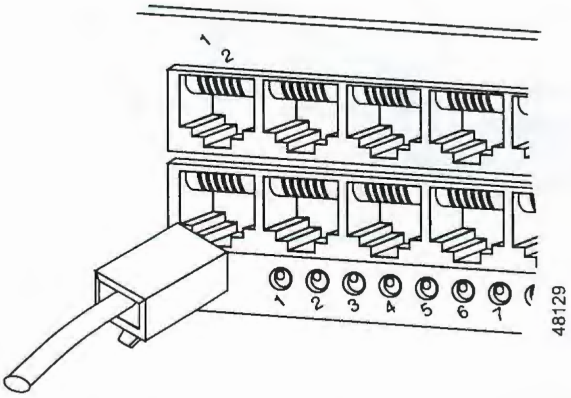
To connect to 10/100BASE-T or 1000BASE-T RJ-45 interfaces, use Category 3, Category 5, Category 5e, or Category 6 UTP or FTP cables with RJ-45 connectors, as shown in Figure 3-15. Connector pinouts are located in Appendix B.

⚠ **Caution** Category 5e and Category 6 cables can store large levels of static electricity because of the dielectric properties of the materials used in their construction. Always ground the cables (especially in new cable runs) to a suitable and safe earth ground before connecting them to the module.

T
7. 062
A.

Caution To comply with GR-1089 intrabuilding, lightening immunity requirements, you must use foil twisted-pair (FTP) cable that is properly grounded at both ends.

Figure 3-15 RJ-45 Connectors

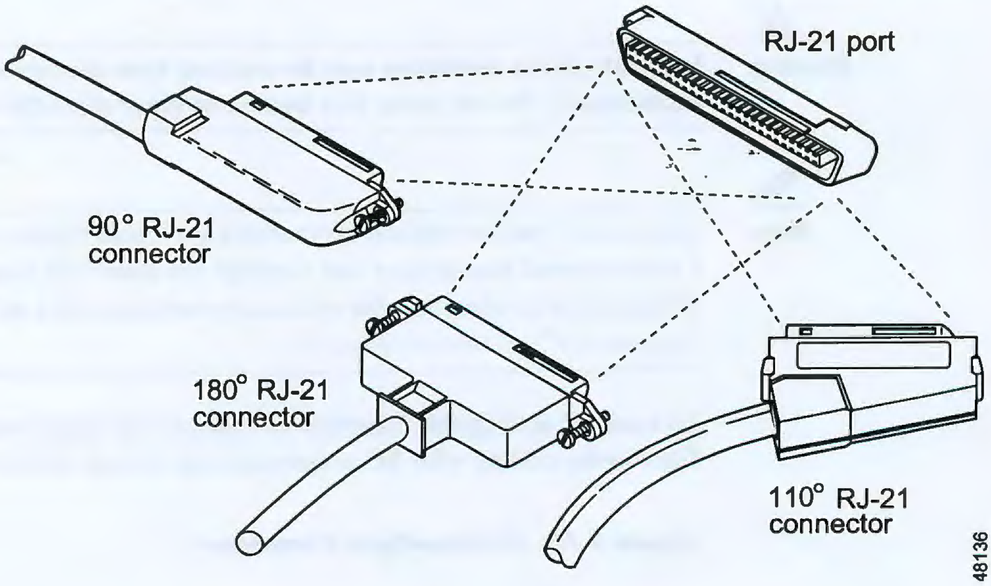


RJ-21

Warning **If the symbol of suitability with an overlaid cross appears above a port, you must not connect the port to a public network that follows the European Union standards. Connecting the port to this type of public network can cause severe personal injury or can damage the unit.**

To connect to 10/100BASE-TX RJ-21 telco interfaces, use Category 5 UTP cables with male RJ-21 connectors, as shown in Figure 3-16. The WS-X6224-FXS analog interface module also uses an RJ-21 connector, but the pinout arrangement is different than the 10/100BASE-TX.

Figure 3-16 RJ-21 Connectors



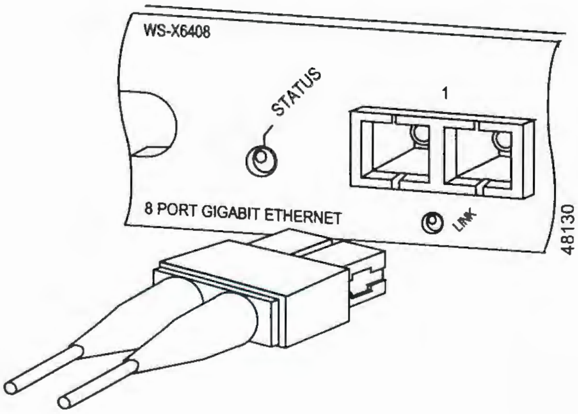
SC

Warning **Invisible laser radiation may be emitted from disconnected fibers or connectors. Do not stare into beams or view directly with optical instruments.**

Note Make sure that the optical connectors are clean before making the connections. Contaminated connectors can damage the fiber and cause data errors. For information on cleaning the optical connectors, refer to "Cleaning the Fiber Optic Connectors" section on page B-11.

To connect to Gigabit Ethernet interfaces, use single-mode or multimode fiber-optic cables with SC connectors, as shown in Figure 3-17.

Figure 3-17 SC Fiber-Optic Connector



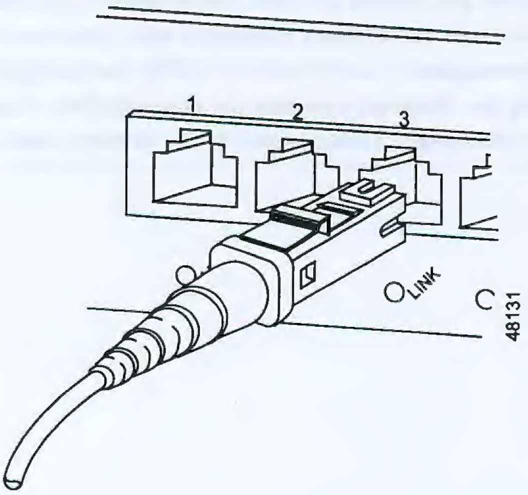
MT-RJ

Warning **Invisible laser radiation may be emitted from disconnected fibers or connectors. Do not stare into beams or view directly with optical instruments.**

Note Make sure that the optical connectors are clean before making the connections. Contaminated connectors can damage the fiber and cause data errors. For information on cleaning the optical connectors, refer to "Cleaning the Fiber Optic Connectors" section on page B-11.

To connect to 100BASE-FX MT-RJ interfaces, use multimode fiber-optic cables with MT-RJ connectors, as shown in Figure 3-18.

Figure 3-18 MT-RJ Connector



Verifying Switch Chassis Installation

To verify the switch chassis installation, follow these steps:

Step 1 Verify that the ejector levers of each module are fully closed (parallel to the faceplate) to ensure that the supervisor engine and all switching modules are fully seated in the backplane connectors.

Step 2 Check the captive installation screws of each module, the power supply, and the fan assembly. Tighten any loose captive installation screws.

Step 3 Verify that all empty module slots have blank faceplates (WS-X6K-SLOT-CVR) installed and that the screws holding the plates in place are tight.

Step 4 Turn on the power supply switches to power up the system.

⚠ **Warning** **Blank faceplates and cover panels serve three important functions: they prevent exposure to hazardous voltages and currents inside the chassis; they contain electromagnetic interference (EMI) that might disrupt other equipment; and they direct the flow of cooling air through the chassis. Do not operate the system unless all cards, faceplates, front covers, and rear covers are in place.**

Apêndice FH

Product Overview

This chapter describes the Catalyst 6500 series switches and contains these sections:

- Catalyst 6503 Switch, page 1-2
- Catalyst 6506 Switch, page 1-4
- Catalyst 6509 Switch, page 1-7
- Catalyst 6509-NEB Switch, page 1-11
- Catalyst 6513 Switch, page 1-14
- System Features, page 1-17
- Fan Assembly, page 1-19
- Power Supplies, page 1-24

The Catalyst 6500 series switch chassis are listed in Table 1-1.

Table 1-1 Catalyst 6500 Series Switches

Catalyst 6500 Series Switch	Orientation/Number of Slots
Catalyst 6503	Horizontal 3-slot
Catalyst 6506	Horizontal 6-slot
Catalyst 6509	Horizontal 9-slot
Catalyst 6509-NEB	Vertical 9-slot
Catalyst 6513	Horizontal 13-slot

Note In this publication, the term Catalyst 6500 series refers only to the switch chassis listed in Table 1-2. The Catalyst 6000 series switches (Catalyst 6006 switch and Catalyst 6009 switch) are described in a separate publication, the *Catalyst 6000 Series Switches Installation Guide.*

Note Throughout this publication, except where noted, the term *supervisor engine* is used to refer to Supervisor Engine 1, Supervisor Engine 2, and Supervisor Engine 720.

Catalyst 6503 Switch

The Catalyst 6503 switch is a 3-slot horizontally-aligned switch. The Catalyst 6503 switch supports the following:

- A supervisor engine with two gigabit interface uplinks and an optional redundant supervisor engine in one of the following configurations:
  - Two supervisor engines, each with no Multilayer Switch Feature Card (MSFC) and no Policy Feature Card (PFC)
  - Two supervisor engines, each configured with a PFC daughter card
  - Two supervisor engines, each configured with both an MSFC and a PFC daughter card

  Note The uplink ports are fully functional on the redundant supervisor engine in standby mode.

  Note Both supervisor engines in a single chassis must be completely identical.

- Up to two hot-swappable Catalyst 6500 series modules:
  - The Switch Fabric Modules (WS-C6500-SFM and WS-X6500-SFM2) are not supported on the Catalyst 6503 switch.
  - The WS-X6816-GBIC 16-port Gigabit Ethernet fabric-enabled module is not supported on the Catalyst 6503 switch.
- Backplane bandwidth of 32 Gbps
- Hot-swappable fan assembly
- Two power entry modules (PEMs)
- Redundant AC-input or DC-input power supplies (950W power supply only)

Figure 1-1 Catalyst 6503 Switch—Front View

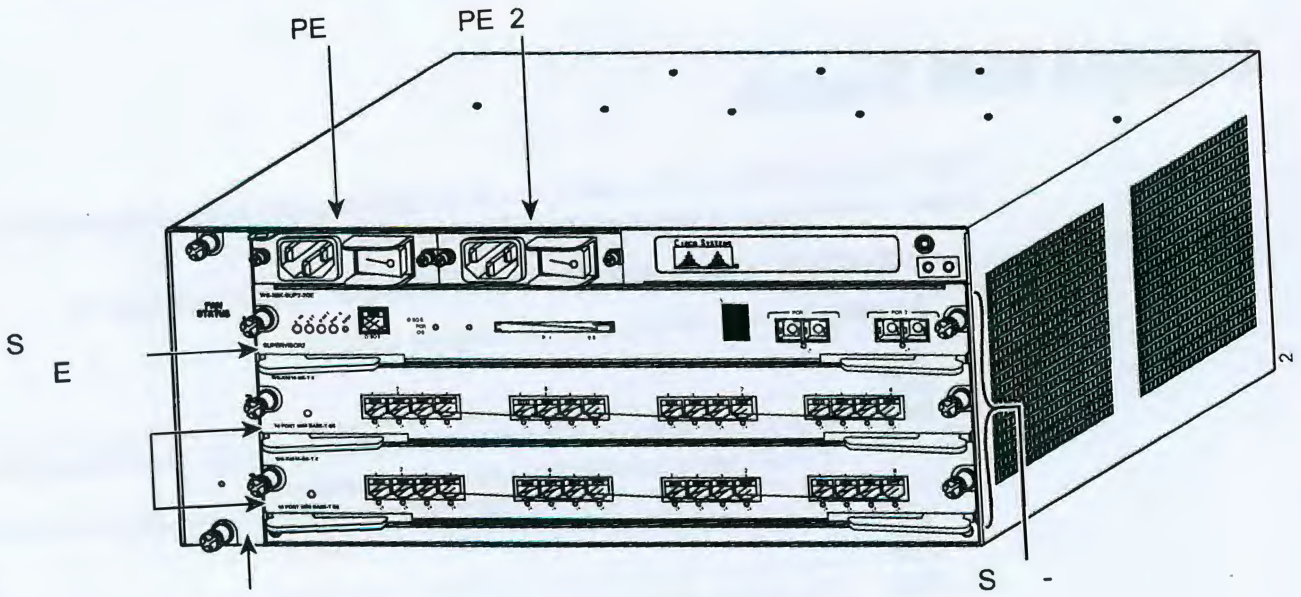


Figure 1-2 Catalyst 6503 Switch—Rear View

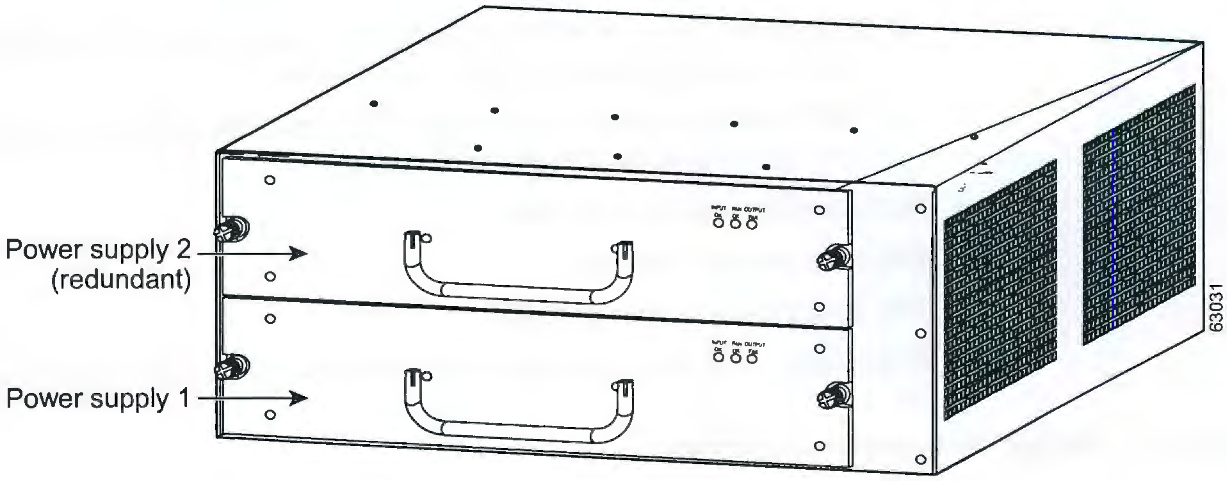

Catalyst 6506 Switch

The Catalyst 6506 switch chassis is a 6-slot horizontally-aligned chassis. The Catalyst 6506 switch supports the following:

- A supervisor engine with two Gigabit Ethernet uplink ports (slot 1)
- An optional redundant supervisor engine (slot 2)

Note Supervisor Engine 720 must be installed in chassis slots 5 or 6. Slots 1 and 2 are available for switching modules.

Note The uplink ports are fully functional on the redundant supervisor engine in standby mode.

Both supervisor engines in a single chassis must be completely identical. You can configure the redundant supervisor engines in a Catalyst 6506 switch in one of three configurations:

  - Two supervisor engines, each with no Multilayer Switch Feature Card (MSFC) and no Policy Feature Card (PFC)
  - Two supervisor engines, each configured with a PFC daughter card
  - Two supervisor engines, each configured with both an MSFC and a PFC daughter card

- Up to five additional hot-swappable Catalyst 6500 series switching modules
  - Fabric-enabled module support provided in slots 2–6 (requires Switch Fabric Module)

    Note Supervisor Engine 720 has built-in switching fabric and does not require that Switch Fabric Modules be installed in the chassis.

- Hot-swappable fan tray

  Note The high capacity fan tray (WS-C6K-6SLOT-FAN2) must be installed when a Supervisor Engine 720 is installed in the chassis.

- Redundant AC-input or DC-input power supplies

  Note When a Supervisor Engine 720 and the high capacity fan tray are installed, you must install 2500 W or higher capacity power supplies in the chassis.

- Backplane bandwidth of 32 Gbps scalable up to 256 Gbps

  Note Backplane bandwidth greater than 32 Gbps requires that you install either a Switch Fabric Module or a Supervisor Engine 720 in the switch chassis.

A

- A Switch Fabric Module (WS-C6500-SFM or WS-X6500-SFM2)
  - The Switch Fabric Module requires Supervisor Engine 2.

    Note Switch Fabric Modules are not supported by Supervisor Engine 720.

  - You must install a Switch Fabric Module in either slot 5 or slot 6 of the Catalyst 6506 switch. For redundancy, you can install a standby Switch Fabric Module. The module first installed functions as the primary module. When you install two Switch Fabric Modules at the same time, the module in slot 5 acts as the primary module, and the module in slot 6 acts as the backup. If you reset the module in slot 5, the module in slot 6 becomes the primary module.
  - Mixing an SFM (WS-C6500-SFM) with an SFM2 (WS-X6500-SFM2) in the same Catalyst 6506, Catalyst 6509, or Catalyst 6509-NEB chassis is supported.
  - Fabric-enabled module support is provided in all slots. (A Switch Fabric Module is required.)

Catalyst 6509 Switch

The Catalyst 6509 switch chassis has nine horizontal slots that are numbered from top to bottom. (See Figure 1-4.) Slot 1 is reserved for the supervisor engine, which provides switching, local and remote management, and multiple gigabit uplink interfaces.

Slot 2 can contain an additional supervisor engine, which can act as a backup if the first supervisor engine fails. If a redundant supervisor engine is not required, slot 2 is available for a switching module.

For a detailed description of supervisor engine operation in a redundant configuration, refer to your software configuration guide.

The Catalyst 6509 switch supports the following:

- A supervisor engine with two Gigabit Ethernet uplink ports and an optional redundant supervisor engine

  Note Supervisor Engine 720 must be installed in chassis slots 5 or 6. Slots 1 and 2 are available for switching modules.

  Note The uplink ports are fully functional on a redundant supervisor engine in standby mode.

  Both supervisor engines in a single chassis must be completely identical. You can configure the redundant supervisor engines in a Catalyst 6500 series switch in one of three configurations:

  - Two supervisor engines, each with no MSFC and no PFC
  - Two supervisor engines, each configured with a PFC daughter card
  - Two supervisor engines, each configured with both an MSFC and a PFC daughter card

- Backplane bandwidth scalable up to 256 Gbps

  Note Backplane bandwidth greater than 32 Gbps requires that you install a Switch Fabric Module or a Supervisor Engine 720 in the Catalyst 6509-NEB switch chassis.

- A Switch Fabric Module (WS-C6500-SFM or WS-X6500-SFM2)
  - The Switch Fabric Modules require Supervisor Engine 2.
  - You must install the Switch Fabric Module in either slot 5 or slot 6 of the Catalyst 6509-NEB switch. For redundancy, you can install a standby Switch Fabric Module. The module first installed functions as the primary module. When you install two Switch Fabric Modules at the same time, the module in slot 5 acts as the primary module, and the module in slot 6 acts as the backup. If you reset the module in slot 5, the module in slot 6 becomes the primary module.

  - Mixing an SFM (WS-C6500-SFM) with an SFM2 (WS-X6500-SFM2) in the same Catalyst 6506, Catalyst 6509, or Catalyst 6509-NEB chassis is supported.

    Note Supervisor Engine 720 has built-in switching fabric and does not require that Switch Fabric Modules be installed in the chassis.

- Up to eight additional Catalyst 6500 series modules
  - Fabric-enabled module support provided in all slots (requires Switch Fabric Module)
- Hot-swappable fan assembly

  Note The high capacity fan tray (WS-C6K-9SLOT-FAN2) must be installed when a Supervisor Engine 720 is installed in the chassis.

- Redundant AC-input or DC-input power supplies

  Note When a Supervisor Engine 720 and the high capacity fan tray are installed, you must install 2500 W or higher capacity power supplies in the chassis.

Catalyst 6509-NEB Switch

The Catalyst 6509-NEB switch chassis has nine vertical slots that are numbered from right to left. (See Figure 1-5.) Slot 1 is reserved for the supervisor engine, which provides switching, local and remote management, and multiple gigabit uplink interfaces.

Slot 2 can contain an additional supervisor engine, which can act as a backup if the first supervisor engine fails. If a redundant supervisor engine is not required, slot 2 is available for a switching module.

For a detailed description of supervisor engine operation in a redundant configuration, refer to your software configuration guide.

The Catalyst 6509-NEB switch supports the following:

- A supervisor engine with two Gigabit Ethernet uplink ports and an optional redundant supervisor engine

Note Supervisor Engine 720 must be installed in slots 5 or 6. Slots 1 and 2 are available for switching modules.

Note The uplink ports are fully functional on the redundant supervisor engine in standby mode.

Both supervisor engines in a single chassis must be completely identical. You can configure the redundant supervisor engines in a Catalyst 6500 series switch in one of three configurations:

  - Two supervisor engines, each with no MSFC and no PFC
  - Two supervisor engines, each configured with a PFC daughter card
  - Two supervisor engines, each configured with both an MSFC and a PFC daughter card

- Backplane bandwidth scalable up to 256 Gbps

Note Backplane bandwidth greater than 32 Gbps requires that you install either a Switch Fabric Module or a Supervisor Engine 720 in the Catalyst 6509-NEB switch chassis.

- A Switch Fabric Module (WS-C6500-SFM or WS-X6500-SFM2)
  - The Switch Fabric Modules require Supervisor Engine 2.
  - You must install the Switch Fabric Module in either slot 5 or slot 6 of the Catalyst 6509-NEB switch. For redundancy, you can install a standby Switch Fabric Module. The module first installed functions as the primary module. When you install two Switch Fabric Modules at the same time, the module in slot 5 acts as the primary module, and the module in slot 6 acts as the backup. If you reset the module in slot 5, the module in slot 6 becomes the primary module.
  - Mixing an SFM (WS-C6500-SFM) with an SFM2 (WS-X6500-SFM2) in the same Catalyst 6506, Catalyst 6509, or Catalyst 6509-NEB chassis is supported.

    Note The Supervisor Engine has built-in switching fabric and does not require that Switch Fabric Modules be installed in the chassis.

- Up to eight additional Catalyst 6500 series hot-swappable modules
  - Fabric-enabled module support provided in all slots (requires Switch Fabric Module or Supervisor Engine 720)
- Hot-swappable fan assembly

Note The high capacity fan tray (WS-C6509-NEB-FAN2) must be installed when a Supervisor Engine 720 is installed in the chassis.

- Redundant AC-input or DC-input power supplies

Note When a Supervisor Engine 720 and the high capacity fan tray are installed, you must install 2500 W or larger capacity power supplies in the chassis.

Power supply 1
ESD ground strap connection
Power supply 2 (redundant)

Catalyst 6513 Switch

The Catalyst 6513 switch chassis has 13 slots. (See Figure 1-6.) Slot 1 is reserved for a Supervisor Engine 2, which provides switching, local and remote management, and multiple gigabit uplink interfaces.

Note The Catalyst 6513 switch requires a Supervisor Engine 2 or Supervisor Engine 720.

Slot 2 can contain an additional Supervisor Engine 2, which can act as a backup if the first supervisor engine fails. If a redundant supervisor engine is not required, slot 2 is available for a switching module.

Note Supervisor Engine 720 must be installed in slots 7 or 8.

For a detailed description of supervisor engine operation in a redundant configuration, refer to your software configuration guide

The Catalyst 6513 switch supports the following:

- A Supervisor Engine 2 with two Gigabit Ethernet uplink ports and an optional redundant Supervisor Engine 2

  Note The uplink ports are fully functional on the redundant Supervisor Engine 2 in standby mode.

  Both supervisor engines in a single chassis must be completely identical. You can configure the redundant supervisor engines in a Catalyst 6500 series switch in one of three configurations:

  - Two supervisor engines, each with no MSFC and no PFC
  - Two supervisor engines, each configured with a PFC daughter card
  - Two supervisor engines, each configured with both an MSFC and a PFC daughter card

- Backplane bandwidth scalable up to 256 Gbps

Note Backplane bandwidth greater than 32 Gbps requires that you install either a Switch Fabric Module or Supervisor Engine 720 in the Catalyst 6513 switch chassis.

- A Switch Fabric Module (supports WS-X6500-SFM2 only)
  - The Switch Fabric Module requires Supervisor Engine 2. Supervisor Engine 1A does not support the Switch Fabric Module.
  - You must install the Switch Fabric Module in slot 7 or slot 8 of the Catalyst 6513 switch. For redundancy, you can install a standby Switch Fabric Module. The module first installed functions as the primary module. When you install two Switch Fabric Modules at the same time, the module in slot 7 acts as the primary module, and the module in slot 8 acts as the backup. If you reset the module in slot 7, the module in slot 8 becomes the primary module.

    Note Supervisor Engine 720 has built-in switching fabric and does not require that Switching Fabric Modules be installed in the chassis.

- Up to 12 additional hot-swappable switching modules
  - Fabric-enabled module support provided in all slots (requires a Switch Fabric Module (WS-X6500-SFM2) or Supervisor Engine 720 be installed)
  - Dual Fabric connectivity supported in slots 9–13 (requires a Switch Fabric Module (WS-X6500-SFM2) or Supervisor Engine 720 be installed)
- Hot-swappable fan assembly

  Note The high capacity fan tray (WS-C6K-13SLT-FAN2) must be installed when a Supervisor Engine 720 is installed in the chassis.

- Redundant AC-input or DC-input power supplies

Note When a Supervisor Engine 720 and the higher capacity fan tray are installed, you must install 2500 W or higher capacity power supplies in the chassis.

System Features

This section describes the hardware features for the Catalyst 6500 series switches. For software descriptions, refer to your software configuration guide. For module descriptions and installation procedures, refer to the *Catalyst 6500 Series Switches Module Installation Guide*.

Port Density

Table 1-2 lists the port densities of the Catalyst 6500 series switches.

Table 1-2 Catalyst 6500 Series Port Density

Architecture	Catalyst 6500 Series Switches
Number of 10 Gigabit Ethernet Ports	2 (3 slots) Catalyst 6503 switch 5 (6 slots) Catalyst 6506 switch 8 (9 slots) Catalyst 6509 switch 12 (13 slots) Catalyst 6513 switch
Number of Gigabit Ethernet Ports	34 (3 slots) Catalyst 6503 switch 82 (6 slots) Catalyst 6506 switch 130 (9 slots) Catalyst 6509 switch 194 (13 slots) Catalyst 6513 switch
Number of 100BASE-FX Ethernet Ports	96 (3 slots) Catalyst 6503 switch 120 (6 slots) Catalyst 6506 switch 192 (9 slots) Catalyst 6509 switch 288 (13 slots) Catalyst 6513 switch
Number of 10/100 Ethernet Ports	96 (3 slots) Catalyst 6503 switch 240 (6 slots) Catalyst 6506 switch 384 (9 slots) Catalyst 6509 switch 576 (13 slots) Catalyst 6513 switch
Number of 10BASE-FL Ethernet Ports	48 (3 slots) Catalyst 6503 switch 120 (6 slots) Catalyst 6506 switch 192 (9 slots) Catalyst 6509 switch 288 (13 slots) Catalyst 6513 switch

Table 1-2 Catalyst 6500 Series Port Density (continued)

Architecture	Catalyst 6500 Series Switches
Number of ATM OC-12 Ports	2 (3 slots) Catalyst 6503 switch 5 (6 slots) Catalyst 6506 switch 8 (9 slots) Catalyst 6509 switch 12 (13 slots) Catalyst 6513 switch
Number of FlexWAN Modules	2 (3 slots) Catalyst 6503 switch 5 (6 slots) Catalyst 6506 switch 8 (9 slots) Catalyst 6509 switch 12 (13 slots) Catalyst 6513 switch

Redundancy

Catalyst 6500 series switches have these redundancy features:

- Ability to house two hot-swappable supervisor engines
- Ability to house two fully redundant, AC-input or DC-input, load-sharing power supplies

Note In certain configurations, the power supplies are not fully redundant. Refer to the "Power Supply Redundancy" section on page 1-29.

- A hot-swappable fan assembly containing multiple fans
- Redundant backplane-mounted clock modules
- Redundant backplane-mounted voltage termination (VTT) modules

Component Hot Swapping

You can hot swap all modules (including the supervisor engine if you have a redundant supervisor engine) and the fan assembly. You can add, replace, or remove modules without interrupting the system power or causing other software or interfaces to shut down.

Fan Assembly

The system fan assembly is located in the chassis and provides cooling air for the supervisor engine and the switching modules. The following figures show the direction of airflow into and out of the switch: Figure 1-7 (Catalyst 6503 switch), Figure 1-8 (Catalyst 6506 switch), Figure 1-9 (Catalyst 6509 switch), Figure 1-10 (Catalyst 6509-NEB switch), and Figure 1-11 (Catalyst 6513 switch). Sensors on the supervisor engine monitor the internal air temperatures. If the air temperature exceeds a preset threshold, the environmental monitor displays warning messages.

Note We recommend that you maintain a minimum air space of 6 inches (15 cm) between walls and the chassis air vents and a minimum horizontal separation of 12 inches (30.5 cm) between two chassis to prevent overheating.

If an individual fan within the assembly fails, the FAN STATUS LED turns red. Individual fans cannot be replaced. To replace a fan assembly, see the "Removing and Replacing the Fan Assembly" section on page 5-35.

Refer to your software configuration guide for information on environmental monitoring.

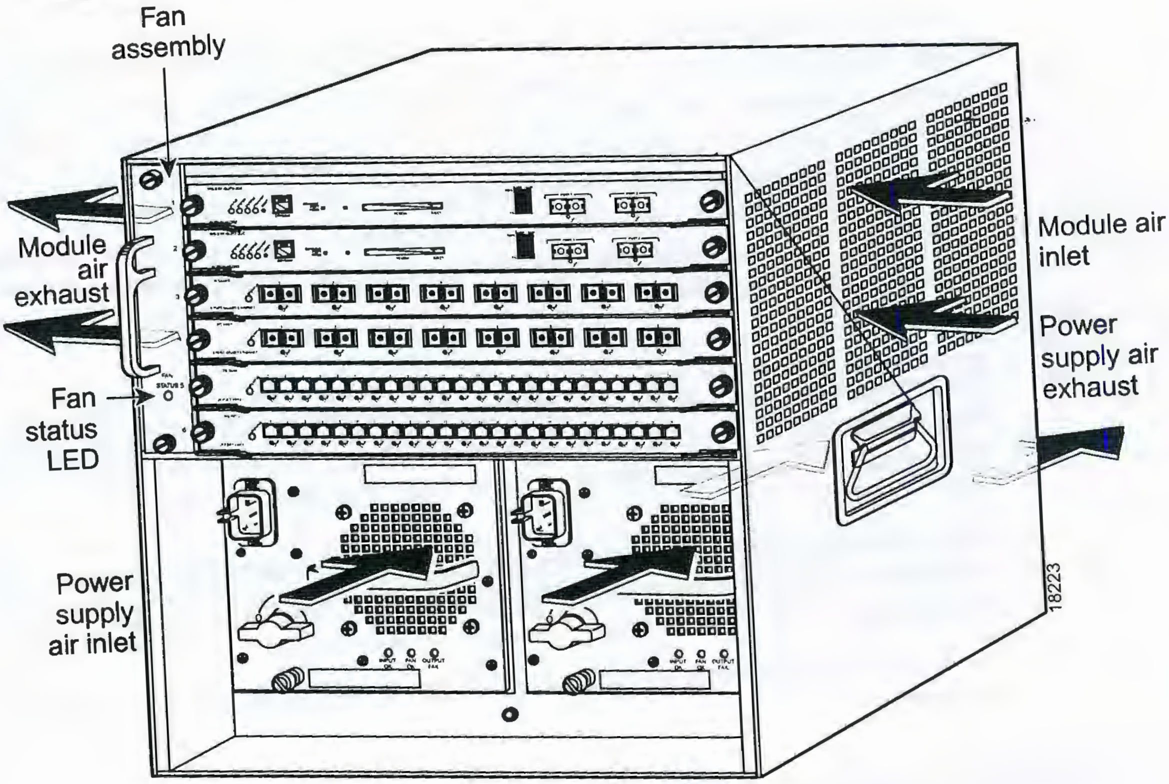

Figure 1-9 Catalyst 6509 Switch Internal Airflow

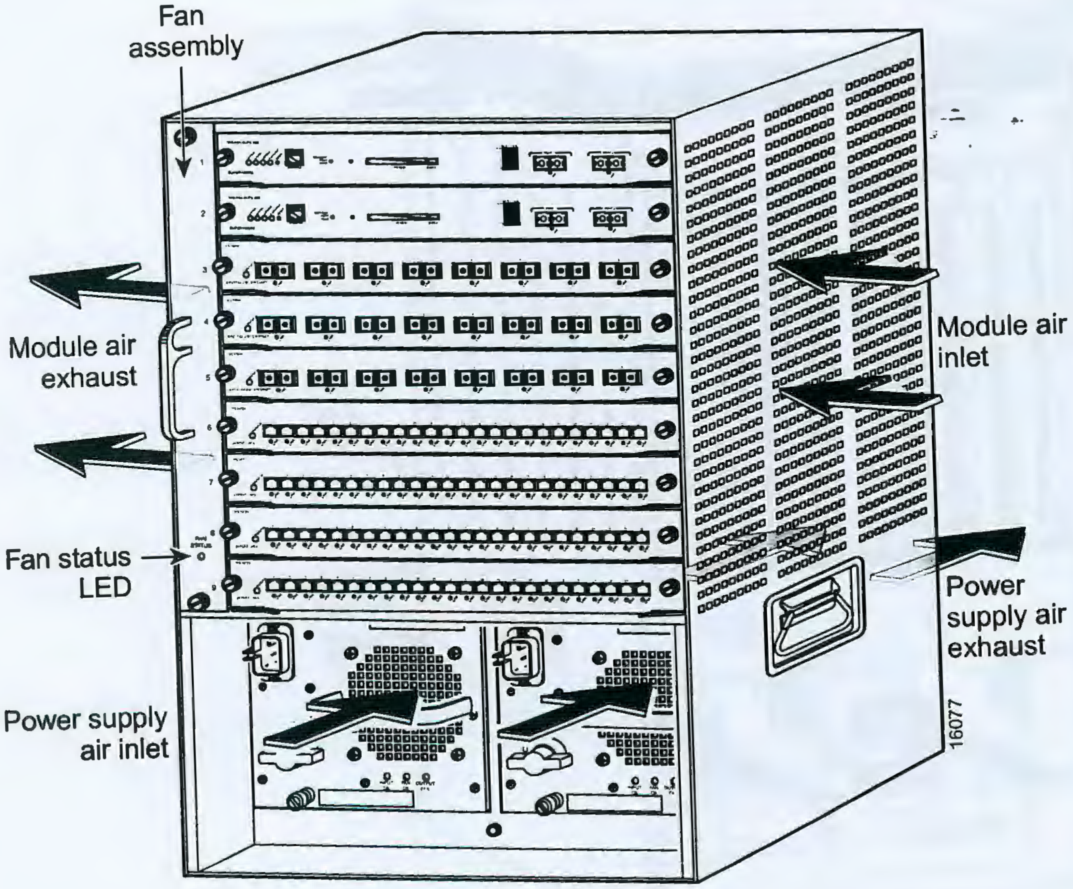

Figure 1-10 Catalyst 6509-NEB Switch Internal Airflow

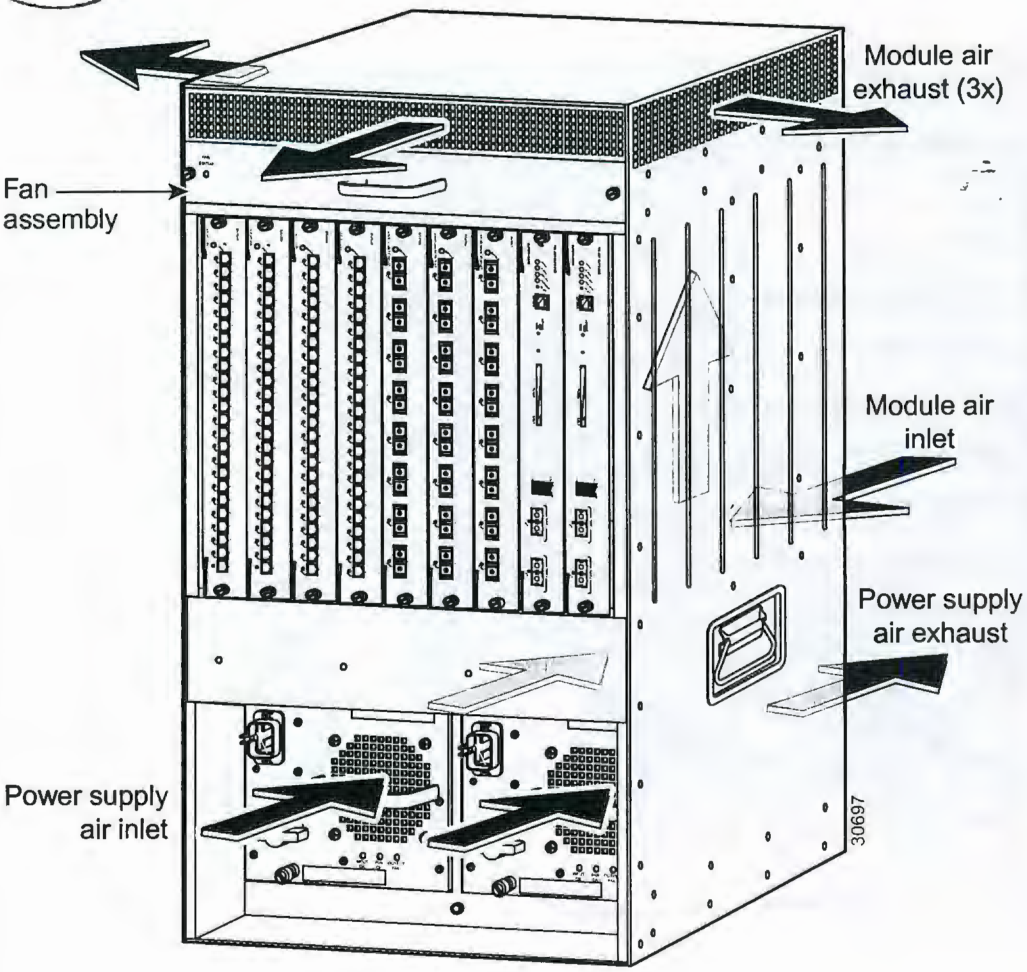

Figure 1-11 Catalyst 6513 Switch Internal Airflow

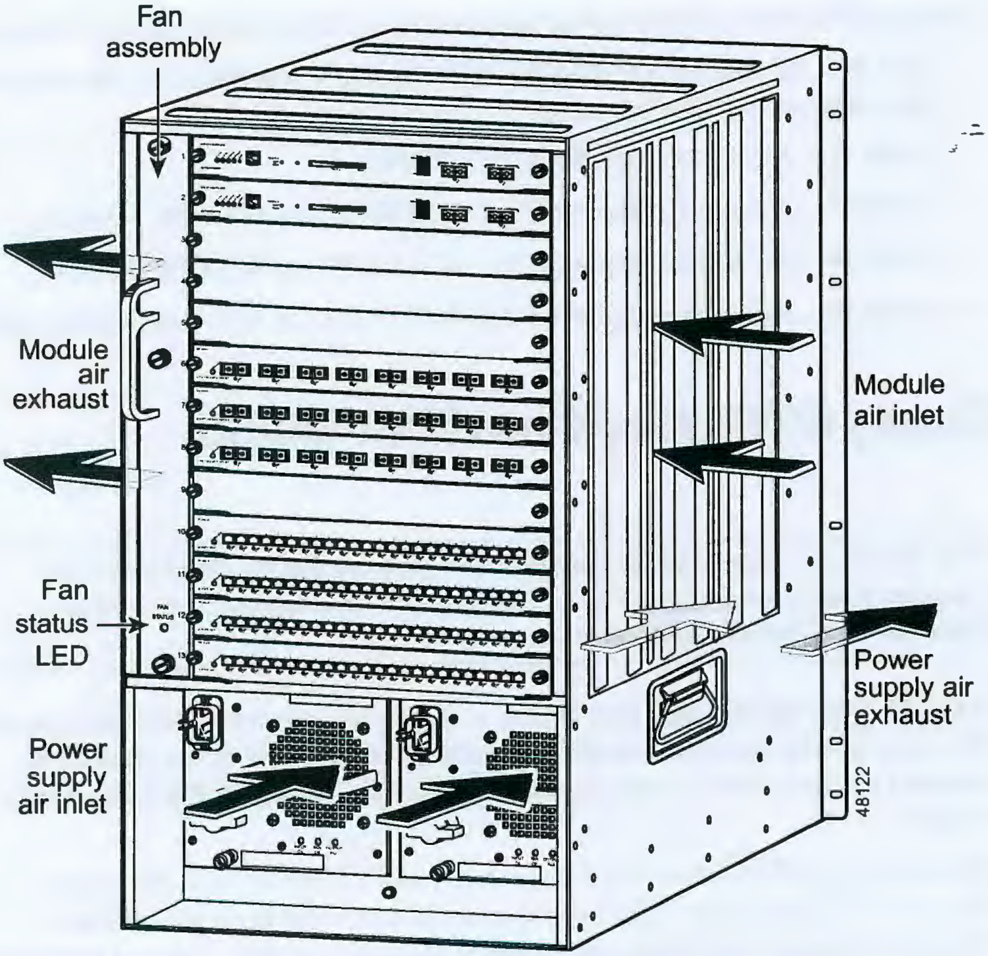

Power Supplies

Catalyst 6500 series switch power supplies are available in five power ratings:

- 950 W—AC and DC input (PWR-950-AC and PWR-950-DC) (for use with the Catalyst 6503 switch only)
- 1000 W—AC input only (WS-CAC-1000W)
- 1300 W—AC and DC input (WS-CAC-1300W and WS-CDC-1300W)
- 2500 W—AC and DC input (WS-CAC-2500W and WS-CDC-2500W)
- 4000 W—AC input only (WS-CAC-4000W-US1 or WS-CAC-4000W-INT)

950 W Power Supply (PWR-950-AC and PWR-950-DC)

Note The 950 W AC-input and DC-input power supplies can be installed in the Catalyst 6503 switch chassis only. They cannot be installed in any other Catalyst 6500 series switch chassis.

The 950 W power supplies (see Figure 1-12) do not connect directly to source AC but use a power entry module (PEM), located on the front of the chassis, to connect the site power source to the power supply located in the back of the chassis.

The AC-input PEM (shown in Figure 1-13) and DC-input PEM (shown in Figure 1-14) provide an input power connection on the front of the router chassis to connect the site power source to the power supply. You can connect the DC-input power supply to the power source with heavy gauge wiring connected to a terminal block. The wire gauge size is determined by local electrical codes and restrictions.

Note The power cord is not shown in Figure 1-13.

The PEMs have an illuminated power switch (AC-input only), current protection, surge and EMI suppression, and filtering functions.

Figure 1-12 Catalyst 6503 950 W AC- and DC-Input Power Supplies

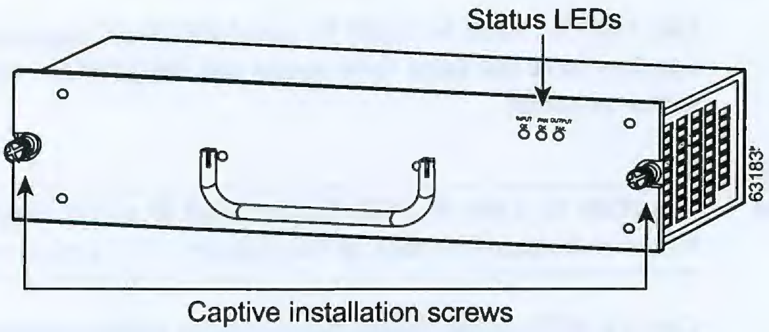

Figure 1-13 Catalyst 6503 AC Power Entry Module (PEM)

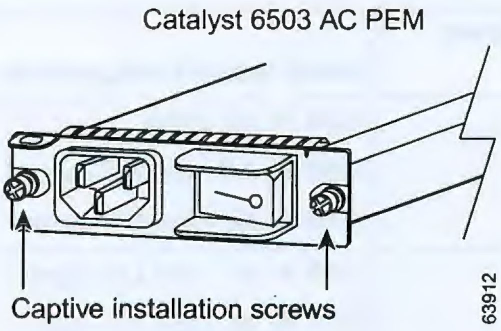

Figure 1-14 Catalyst 6503 DC Power Entry Module (PEM)

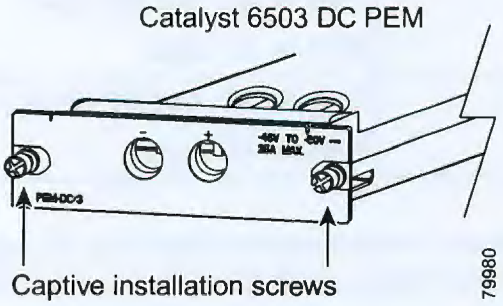

1000 W, 1300 W, 2500 W, and 4000 W Power Supplies

The 1000 W, 1300 W, 2500 W, and 4000 W AC-input and DC-input power supplies have the same form factor and designed for use in the Catalyst 6500 series switches.

Note The 1000 W, 1300 W, 2500 W, and 4000 W power supplies have a different form factor and cannot be used in the Catalyst 6503 series switch.

Catalyst 6500 series chassis power supply configurations for the 1000 W, 1300 W, 2500 W and 4000 W power supplies are shown in Table 1-3.

Table 1-3 Catalyst 6500 Series Power Supply Configurations

Catalyst 6500 Series Switch	Power Supply Configurations
Catalyst 6506	1000 W AC-input 1300 W AC- and DC-input 2500 W AC- and DC-input
Catalyst 6509	1300 W AC- and DC-input 2500 W AC- and DC-input 4000 W AC-input
Catalyst 6509-NEB	1300 W AC- and DC-input 2500 W AC- and DC-input 4000 W AC-input
Catalyst 6513	2500 W AC- and DC-input 4000 W AC-input

Catalyst 6500 series switches support redundant AC-input and DC-input power supplies. Unlike the Catalyst 4000 family and Catalyst 5000 family switches, the Catalyst 6500 series switches allow you to mix AC-input and DC-input power supplies in the same chassis.

Many telco organizations require a –48 VDC power supply to accommodate their power distribution systems. From an operational perspective, the DC-input power supply has the same characteristics as the AC-input version.

The AC-input power supply (see Figure 1-15) has a detachable power cord (except for the WS-CAC-4000W) that allows you to connect each power supply to the site power source. You can connect the DC-input power supply (see Figure 1-16) to the power source with heavy gauge wiring connected to a terminal block. The wire gauge size is determined by local electrical codes and restrictions.

Note The power cord is not shown in Figure 1-15.

Note With a fully populated Catalyst 6513 switch, two 2500 W power supplies are not fully redundant. If you run the 2500 W power supply at the low range input (100 to 120 VAC), it is not redundant in a fully populated Catalyst 6509 or Catalyst 6509-NEB switch.

Note The 2500 W AC-input power supply needs 220 VAC to deliver 2500 W of power. When powered with 110 VAC, it delivers only 1300 W. In addition, the power supply needs 16 A, regardless of whether it is plugged into 110 VAC or 220 VAC.

For complete power specifications, see Appendix A, "Technical Specifications."

Figure 1-15 AC-Input Power Supply

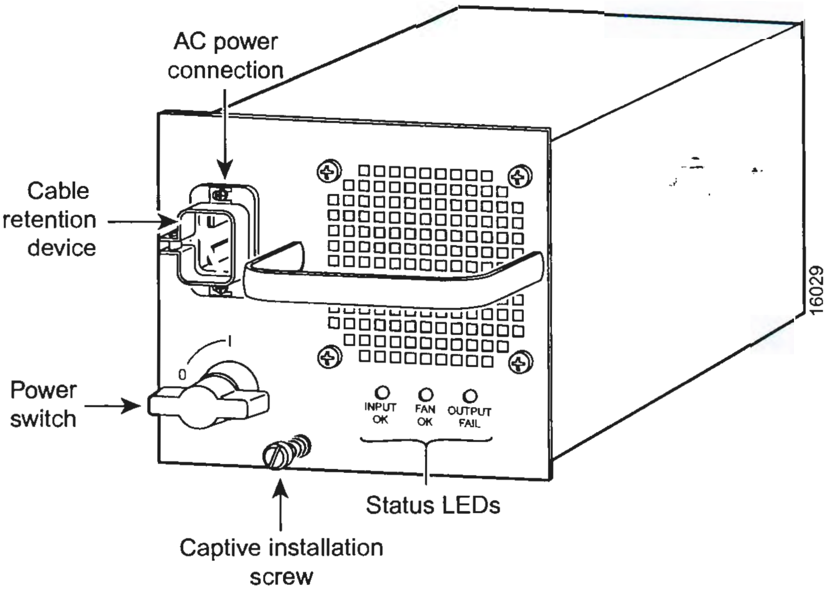

Figure 1-16 DC-Input Power Supply

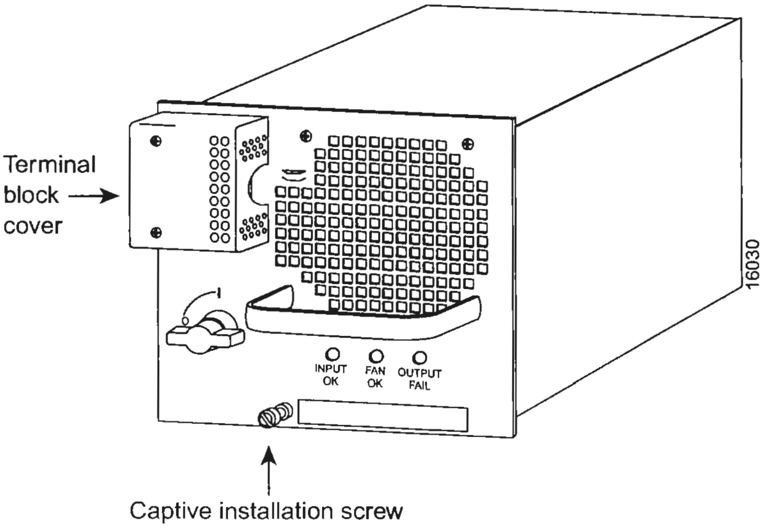

Power Supply Redundancy

Catalyst 6500 series modules have different power requirements. Depending upon the wattage of the power supply, certain switch configurations might require more power than a single power supply can provide. Although the power management feature allows you to power all installed modules with two power supplies, redundancy is not supported in this configuration. Redundant and nonredundant power configurations are summarized in Table 1-4. The effects of changing the power supply configurations are summarized in Table 1-5.

Note For proper load-sharing operation in a redundant power supply configuration, you must install two modules in the chassis. If you fail to install two modules, you might receive spurious OUTPUT FAIL indications on the power supply.

Table 1-4 Power Supply Redundancy

If you have two power supplies of	and redundancy is	Then
Equal wattage	Enabled	The total power drawn from both supplies is never greater than the capability of one supply. If one supply malfunctions, the other supply can take over the entire system load. Each power supply provides approximately half of the required power to the system. Load sharing and redundancy are enabled automatically; no software configuration is required.
Unequal wattage	Enabled	Both power supplies come online, but a syslog message displays that the lower wattage power supply will be disabled. If the active power supply fails, the system shuts down. The lower wattage power supply must then be manually turned on. The lower wattage power supply selectively powers up the modules so that the capacity of the power supply is not exceeded.
Equal or unequal wattage	Disabled	The total power available to the system is approximately 167 percent of the lower wattage power supply. The system powers up as many modules as the combined capacity allows. If the higher wattage power supply fails, the lower wattage supply might also shut down due to overcurrent protection, thus preventing damage to the lower wattage power supply.

Table 1-5 Effects of Power Supply Configuration Changes

Configuration Change	Effect
Redundant to nonredundant	• System log and syslog messages are generated. • System power is increased to approximately 167 percent of the lower wattage power supply. • The modules marked as *power-deny* in the **show module** Status field are brought up if there is sufficient power.
Nonredundant to redundant	• System log and syslog messages are generated. • System power is the power capability of the larger wattage supply. • If there is not enough power for all previously powered-up modules, some modules are powered down and marked as *power-deny* in the **show module** Status field.
Equal wattage power supply is inserted with redundancy enabled	• System log and syslog messages are generated. • System power equals the power capability of one supply (both supplies provide approximately one half of the total current). • No change in the module status because the power capability is unchanged.
Equal wattage power supply is inserted with redundancy disabled	• System log and syslog messages are generated. • System power is the combined power capability of both supplies. • The modules marked as *power-deny* in the **show module** Status field are brought up if there is sufficient power.
Higher wattage power supply is inserted with redundancy enabled	• System log and syslog messages are generated. • The system disables the lower wattage power supply; the higher wattage supply powers the system.
Lower wattage power supply is inserted with redundancy enabled	• System log and syslog messages are generated. • The system disables the lower wattage power supply; the higher wattage supply powers the system.

Table 1-5 Effects of Power Supply Configuration Changes (continued)

Higher or lower wattage power supply is inserted with redundancy disabled	• System log and syslog messages are generated. • System power is increased to the combined power capability of both supplies. • The modules marked as *power-deny* in the **show module** Status field are brought up if there is sufficient power.
Power supply is removed with redundancy enabled	• System log and syslog messages are generated. • If the power supplies are of equal wattage, there is no change in the module status because the power capability is unchanged. If the power supplies are of unequal wattage and the lower wattage supply is removed, there is no change in the module status. If the power supplies are of unequal wattage and the higher wattage supply is removed, the lower wattage power supply must be manually turned on. (The system had previously turned off the lower wattage power supply.)
Power supply is removed with redundancy disabled	• System log and syslog messages are generated. • System power is decreased to the power capability of one supply. • If there is not enough power for all previously powered-up modules, some modules are powered down and marked as *power-deny* in the **show module** Status field.
System is booted with power supplies of different wattage installed and redundancy enabled	• System log and syslog messages are generated. • The lower wattage supply is disabled.
System is booted with power supplies of equal or different wattage installed and redundancy disabled	• System log and syslog messages are generated. • System power equals the combined power capability of both supplies. • The system powers up as many modules as the combined capacity allows.

You can change the configuration of the power supplies to redundant or nonredundant at any time. If you switch from a redundant to a nonredundant configuration, both power supplies are enabled (even a power supply that was disabled because it was of a lower wattage than the other power supply). If you change from a nonredundant to a redundant configuration, both power supplies are initially enabled, and if they are of the same wattage, remain enabled. If they are of different wattage, a syslog message displays and the lower wattage supply is disabled.

For additional information about the power management feature and individual module power consumption, refer to your software configuration guide.

Environmental Monitoring of the Power Supply

The environmental monitoring and reporting functions allow you to maintain normal system operation by resolving adverse environmental conditions prior to loss of operation.

The power supplies monitor their own internal temperature and voltages. In the event of excessive internal temperature, the power supply will shut down to prevent damage. When the power supply returns to a safe operating temperature, it will restart. In the event of an abnormal voltage on one or more outputs of the power supplies, the OUTPUT FAIL LED will light. Substantial overvoltage conditions can lead to a power supply shutdown.

The power supply front panel LEDs are described in Table 1-6.

For more information about the environmental monitoring feature, refer to your software configuration guide.

Table 1-6 Power Supply Front Panel LEDs

LED	Description
INPUT OK	AC-input power supplies: • Green when the input voltage is OK (85 VAC or greater) • Off when the input voltage falls below 70 VAC or if the power supply shuts down DC-input power supplies: • Green when the input voltage is OK (–40.5 VDC or greater) • Off when the input voltage falls below –33 VDC or if the power supply shuts down
FAN OK	Green when the power supply fan is operating properly. Red when a power supply fan failure is detected.
OUTPUT FAIL	Red when there is a problem with one or more of the DC-output voltages of the power supply

Power Supply Fan Assembly

The power supplies have a built-in fan; air enters the front of the fan (power-input end) and exits through the back. An air dam keeps the airflow separate from the rest of the chassis, which is cooled by the system fan assembly.

Power supply fans are not field-replaceable; the power supply must be replaced. To replace a power supply, see the "Removing and Replacing the 1000 W, 1300 W, 2500 W, and 4000 W Power Supplies" section on page 5-20.

CHAPTER 9

Configuring VLANs

This chapter describes how to configure VLANs on the Catalyst 6500 series switches.

Note For complete syntax and usage information for the commands used in this chapter, refer to the *Catalyst 6500 Series Switch Cisco IOS Command Reference* publication.

This chapter consists of these sections:

- Understanding How VLANs Work, pagc 9-1
- VLAN Default Configuration, page 9-6
- VLAN Configuration Guidelines and Restrictions, page 9-8
- Configuring VLANs, page 9-8

Understanding How VLANs Work

The following sections describe how VLANs work:

- VLAN Overview, page 9-1
- VLAN Ranges, page 9-2
- Configurable VLAN Parameters, pagc 9-3
- Understanding Token Ring VLANs, page 9-3

VLAN Overview

A VLAN is a group of end stations with a common set of requirements, independent of physical location. VLANs have the same attributes as a physical LAN but allow you to group end stations even if they are not located physically on the same LAN segment.

VLANs are usually associated with IP subnetworks. For example, all the end stations in a particular IP subnet belong to the same VLAN. Traffic between VLANs must be routed. LAN port VLAN membership is assigned manually on an port-by-port basis.

VLAN Ranges

Note You must enable the extended system ID to use 4096 VLANs (see the "Understanding the Bridge ID" section on page 15-3).

With Release 12.1(13)E and later releases, Catalyst 6500 series switches support 4096 VLANs in accordance with the IEEE 802.1Q standard. These VLANs are organized into several ranges; you use each range slightly differently. Some of these VLANs are propagated to other switches in the network when you use the VLAN Trunking Protocol (VTP). The extended-range VLANs are not propagated, so you must configure extended-range VLANs manually on each network device.

Table 9-1 describes the VLAN ranges.

Table 9-1 VLAN Ranges

VLANs	Range	Usage	Propagated by VTP
0, 4095	Reserved	For system use only. You cannot see or use these VLANs.	—
1	Normal	Cisco default. You can use this VLAN but you cannot delete it.	Yes
2–1001	Normal	For Ethernet VLANs; you can create, use, and delete these VLANs.	Yes
1002–1005	Normal	Cisco defaults for FDDI and Token Ring. You cannot delete VLANs 1002–1005.	Yes
1006–4094	Extended	For Ethernet VLANs only.	No

The following information applies to VLAN ranges:

- Layer 3 LAN ports, WAN interfaces and subinterfaces, and some software features use internal VLANs in the extended range. You cannot use an extended range VLAN that has been allocated for internal use.
- With Release 12.1(13)E and later releases, to display the VLANs used internally, enter the **show vlan internal usage** command. With earlier releases, enter the **show vlan internal usage** and **show cwan vlans** commands.
- With Release 12.1(13)E and later releases, you can configure ascending internal VLAN allocation (from 1006 and up) or descending internal VLAN allocation (from 4094 and down). In previous 12.1EX releases that support 4096 VLANs, internal VLANs are allocated from 1006 and up.
- Switches running the Catalyst operating system do not support configuration of VLANs 1006–1024. If you configure VLANs 1006–1024, ensure that the VLANs do not extend to any switches running Catalyst software.
- You must enable the extended system ID to use extended range VLANs (see the "Understanding the Bridge ID" section on page 15-3).

Configurable VLAN Parameters

Note
- Ethernet VLAN 1 uses only default values.
- Except for the VLAN name, Ethernet VLANs 1006 through 4094 use only default values.
- With Release 12.1(13)E and later releases, you can configure the VLAN name for Ethernet VLANs 1006 through 4094.

You can configure the following parameters for VLANs 2 through 1001:

- VLAN name
- VLAN type (Ethernet, FDDI, FDDI network entity title [NET], TrBRF, or TrCRF)
- VLAN state (active or suspended)
- Security Association Identifier (SAID)
- Bridge identification number for TrBRF VLANs
- Ring number for FDDI and TrCRF VLANs
- Parent VLAN number for TrCRF VLANs
- Spanning Tree Protocol (STP) type for TrCRF VLANs

Understanding Token Ring VLANs

The following section describes the two Token Ring VLAN types supported on network devices running VTP version 2:

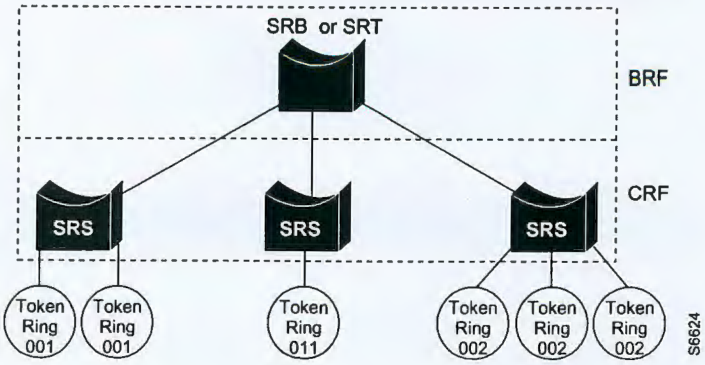
- Token Ring TrBRF VLANs, page 9-3
- Token Ring TrCRF VLANs, page 9-4

Note Catalyst 6500 series switches do not support Inter-Switch Link (ISL)-encapsulated Token Ring frames. When a Catalyst 6500 series switch is configured as a VTP server, you can configure Token Ring VLANs from the switch.

ken Ring TrBRF VLANs

Token Ring Bridge Relay Function (TrBRF) VLANs interconnect multiple Token Ring Concentrator Relay Function (TrCRF) VLANs in a switched Token Ring network (see Figure 9-1). The TrBRF can be extended across network devices interconnected with trunk links. The connection between the TrCRF and the TrBRF is referred to as a *logical port.*

Figure 9-1 Interconnected Token Ring TrBRF and TrCRF VLANs



For source routing, the Catalyst 6500 series switch appears as a single bridge between the logical rings. The TrBRF can function as a source-route bridge (SRB) or a source-route transparent (SRT) bridge running either the IBM or IEEE STP. If an SRB is used, you can define duplicate MAC addresses on different logical rings.

The Token Ring software runs an instance of STP for each TrBRF VLAN and each TrCRF VLAN. For TrCRF VLANs, STP removes loops in the logical ring. For TrBRF VLANs, STP interacts with external bridges to remove loops from the bridge topology, similar to STP operation on Ethernet VLANs.

⚠ **Caution** Certain parent TrBRF STP and TrCRF bridge mode configurations can place the logical ports (the connection between the TrBRF and the TrCRF) of the TrBRF in a blocked state. For more information, see the "VLAN Configuration Guidelines and Restrictions" section on page 9-8.

To accommodate IBM System Network Architecture (SNA) traffic, you can use a combination of SRT and SRB modes. In a mixed mode, the TrBRF determines that some ports (logical ports connected to TrCRFs) operate in SRB mode while other ports operate in SRT mode

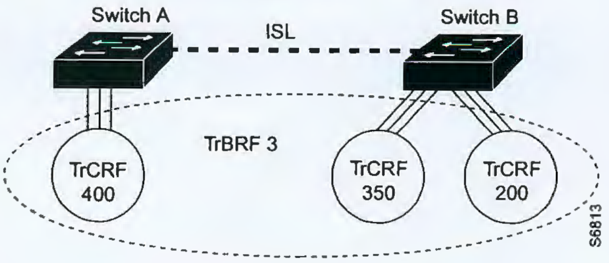
Token Ring TrCRF VLANs

Token Ring Concentrator Relay Function (TrCRF) VLANs define port groups with the same logical ring number. You can configure two types of TrCRFs in your network: undistributed and backup.

TrCRFs typically are undistributed, which means each TrCRF is limited to the ports on a single network device. Multiple undistributed TrCRFs on the same or separate network devices can be associated with a single parent TrBRF (see Figure 9-2). The parent TrBRF acts as a multiport bridge, forwarding traffic between the undistributed TrCRFs.

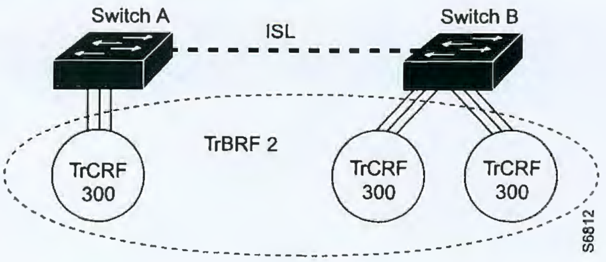
Note To pass data between rings located on separate network devices, you can associate the rings to the same TrBRF and configure the TrBRF for an SRB.

Figure 9-2 Undistributed TrCRFs



By default, Token Ring ports are associated with the default TrCRF (VLAN 1003, trcrf-default), which has the default TrBRF (VLAN 1005, trbrf-default) as its parent. In this configuration, a distributed TrCRF is possible (see Figure 9-3), and traffic is passed between the default TrCRFs located on separate network devices if the network devices are connected through an ISL trunk.

Figure 9-3 Distributed TrCRF



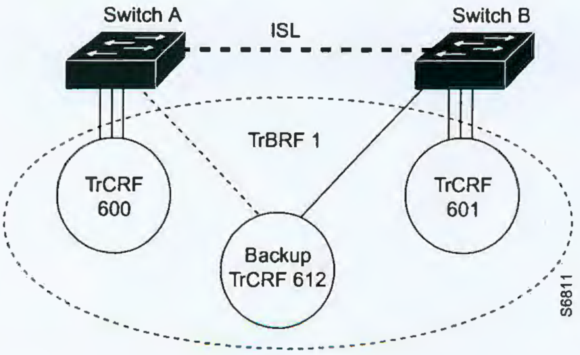
Within a TrCRF, source-route switching forwards frames based on either MAC addresses or route descriptors. The entire VLAN can operate as a single ring, with frames switched between ports within a single TrCRF.

You can specify the maximum hop count for All-Routes and Spanning Tree Explorer frames for each TrCRF. When you specify the maximum hop count, you limit the maximum number of hops an explorer is allowed to traverse. If a port determines that the explorer frame it is receiving has traversed more than the number of hops specified, it does not forward the frame. The TrCRF determines the number of hops an explorer has traversed by the number of bridge hops in the route information field.

If the ISL connection between network devices fails, you can use a backup TrCRF to configure an alternate route for traffic between undistributed TrCRFs. Only one backup TrCRF for a TrBRF is allowed, and only one port per network device can belong to a backup TrCRF.

If the ISL connection between the network devices fails, the port in the backup TrCRF on each affected network device automatically becomes active, rerouting traffic between the undistributed TrCRFs through the backup TrCRF. When the ISL connection is reestablished, all but one port in the backup TrCRF is disabled. Figure 9-4 illustrates the backup TrCRF.

Figure 9-4 Backup TrCRF



VLAN Default Configuration

Tables 9-2 through 9-6 show the default configurations for the different VLAN media types.

Table 9-2 Ethernet VLAN Defaults and Ranges

Parameter	Default	Range
VLAN ID	1	1–4094
VLAN name	"default" for VLAN 1 "VLAN*vlan_ID*" for other Ethernet VLANs	—
802.10 SAID	10*vlan_ID*	100001–104094
MTU size	1500	1500–18190
Translational bridge 1	0	0–1005
Translational bridge 2	0	0–1005
VLAN state	active	active, suspend
Pruning eligibility	VLANs 2–1001 are pruning eligible; VLANs 1006–4094 are not pruning eligible.	—

Table 9-3 FDDI VLAN Defaults and Ranges

Parameter	Default	Range
VLAN ID	1002	1–1005
VLAN name	"fddi-default"	—
802.10 SAID	101002	1–4294967294
MTU size	1500	1500–18190
Ring number	0	1–4095
Parent VLAN	0	0–1005
Translational bridge 1	0	0–1005

Table 9-3 *FDDI VLAN Defaults and Ranges (continued)*

Parameter	Default	Range
Translational bridge 2	0	0–1005
VLAN state	active	active, suspend

Table 9-4 *Token Ring (TrCRF) VLAN Defaults and Ranges*

Parameter	Default	Range
VLAN ID	1003	1–1005
VLAN name	"token-ring-default"	—
802.10 SAID	101003	1–4294967294
Ring Number	0	1–4095
MTU size	VTPv1 default 1500 VTPv2 default 4472	1500–18190
Translational bridge 1	0	0–1005
Translational bridge 2	0	0–1005
VLAN state	active	active, suspend
Bridge mode	srb	srb, srt
ARE max hops	7	0–13
STE max hops	7	0–13
Backup CRF	disabled	disable; enable

Table 9-5 *FDDI-Net VLAN Defaults and Ranges*

Parameter	Default	Range
VLAN ID	1004	1–1005
VLAN name	"fddinet-default"	—
802.10 SAID	101004	1–4294967294
MTU size	1500	1500–18190
Bridge number	1	0–15
STP type	ieee	auto, ibm, ieee
VLAN state	active	active, suspend

Table 9-6 *Token Ring (TrBRF) VLAN Defaults and Ranges*

Parameter	Default	Range
VLAN ID	1005	1–1005
VLAN name	"trnet-default"	—
802.10 SAID	101005	1–4294967294

Table 9-6 Token Ring (TrBRF) VLAN Defaults and Ranges (continued)

Parameter	Default	Range
MTU size	VTPv1 1500; VTPv2 4472	1500–18190
Bridge number	1	0–15
STP type	ibm	auto, ibm, ieee
VLAN state	active	active, suspend

VLAN Configuration Guidelines and Restrictions

Follow these guidelines and restrictions when creating and modifying VLANs in your network:

- RPR+ redundancy (see Chapter 5, "Configuring RPR and RPR+ Supervisor Engine Redundancy") does not support a configuration entered in VLAN database mode. Use global configuration mode with RPR+ redundancy.
- You can configure extended-range VLANs only in global configuration mode. You cannot configure extended-range VLANs in VLAN database mode. See the "VLAN Configuration Options" section on page 9-9.
- Before you can create a VLAN, the Catalyst 6500 series switch must be in VTP server mode or VTP transparent mode. For information on configuring VTP, see Chapter 8, "Configuring VTP."
- The VLAN configuration is stored in the vlan.dat file, which is stored in nonvolatile memory. You can cause inconsistency in the VLAN database if you manually delete the vlan.dat file. If you want to modify the VLAN configuration or VTP, use the commands described in this guide and in the *Catalyst 6500 Series Switch Cisco IOS Command Reference* publication.
- To do a complete backup of your configuration, include the vlan.dat file in the backup.
- The Cisco IOS **end** command is not supported in VLAN database mode.
- You cannot enter **Ctrl-Z** to exit VLAN database mode.
- Catalyst 6500 series switches do not support Token Ring or FDDI media. The switch does not forward FDDI, FDDI-Net, TrCRF, or TrBRF traffic, but it can propagate the VLAN configuration through VTP.
- When a Catalyst 6500 series switch is configured as a VTP server, you can configure FDDI and Token Ring VLANs from the switch.
- You must configure a TrBRF before you configure the TrCRF (the parent TrBRF VLAN you specify must exist).
- In a Token Ring environment, the logical interfaces (the connection between the TrBRF and the TrCRF) of the TrBRF are placed in a blocked state if either of these conditions exists:
  - The TrBRF is running the IBM STP, and the TrCRF is in SRT mode.
  - The TrBRF is running the IEEE STP, and the TrCRF is in SRB mode.

Configuring VLANs

These sections describe how to configure VLANs:

- VLAN Configuration Options, page 9-9
- Creating or Modifying an Ethernet VLAN, page 9-10
- Assigning a Layer 2 LAN Interface to a VLAN, page 9-12
- Configuring the Internal VLAN Allocation Policy, page 9-12
- Mapping 802.1Q VLANs to ISL VLANs, page 9-12

Note

- With releases 12.1(11b)E and later, when you are in configuration mode you can enter EXEC mode commands by entering the **do** keyword before the EXEC mode command.
- VLANs support a number of parameters that are not discussed in detail in this section. For complete information, refer to the *Catalyst 6500 Series Switch Cisco IOS Command Reference* publication.

VLAN Configuration Options

These sections describe the VLAN configuration options:

- VLAN Configuration in Global Configuration Mode, page 9-9
- VLAN Configuration in VLAN Database Mode, page 9-9

VLAN Configuration in Global Configuration Mode

Note Releases 12.1(11b)E and later support VLAN configuration in global configuration mode.

If the switch is in VTP server or transparent mode (see the "Configuring VTP" section on page 8-6), you can configure VLANs in global and config-vlan configuration modes. When you configure VLANs in global and config-vlan configuration modes, the VLAN configuration is saved in the vlan.dat files. To display the VLAN configuration, enter the **show vlan** command.

If the switch is in VLAN transparent mode, use the copy **running-config startup-config** command to save the VLAN configuration to the startup-config file. After you save the running configuration as the startup configuration, use the **show running-config** and **show startup-config** commands to display the VLAN configuration.

Note

- When the switch boots, if the VTP domain name and VTP mode in the startup-config and vlan.dat files do not match, the switch uses the configuration in the vlan.dat file.
- You can configure extended-range VLANs only in global configuration mode. You cannot configure extended-range VLANs in VLAN database mode.

VLAN Configuration in VLAN Database Mode

Note You cannot configure extended-range VLANs in VLAN database mode. You can configure extended-range VLANs only in global configuration mode. RPR+ redundancy does not support configuration entered in VLAN database mode. Use global configuration mode with RPR+ redundancy.

If the switch is in VTP server or transparent mode, you can configure VLANs in the VLAN database mode. When you configure VLANs in VLAN database mode, the VLAN configuration is saved in the vlan.dat files. To display the VLAN configuration, enter the **show vlan** command.

You use the interface configuration command mode to define the port membership mode and add and remove ports from a VLAN. The results of these commands are written to the running-config file, and you can display the file by entering the **show running-config** command.

Creating or Modifying an Ethernet VLAN

User-configured VLANs have unique IDs from 1 to 4094, except for reserved VLANs (see Table 9-1 on page 9-2). Enter the **vlan** command with an unused ID to create a VLAN. Enter the **vlan** command for an existing VLAN to modify the VLAN (you cannot modify an existing VLAN that is being used by a Layer 3 port or a software feature).

See the "VLAN Default Configuration" section on page 9-6 for the list of default parameters that are assigned when you create a VLAN. If you do not specify the VLAN type with the **media** keyword, the VLAN is an Ethernet VLAN.

To create or modify a VLAN, perform this task:

	Command	Purpose

Step 1	`Router# configure terminal`
	or
	`Router# vlan database`
		Enters VLAN configuration mode.

Step 2	`Router(config)# vlan vlan_ID{[-vlan_ID]|[,vlan_ID])`
	`Router(config-vlan)#`
	or
	`Router(vlan)# vlan vlan_ID`
		Creates or modifies an Ethernet VLAN, a range of Ethernet VLANs, or several Ethernet VLANs specified in a comma-separated list (do not enter space characters).

	`Router(config)# no vlan vlan_ID`
	`Router(config-vlan)#`
	or
	`Router(vlan)# no vlan vlan_ID`
		Deletes a VLAN.

Step 3	`Router(config-vlan)# end`
	or
	`Router(vlan)# exit`
		Updates the VLAN database and returns to privileged EXEC mode.

Step 4	`Router# show vlan [id | name] vlan`	Verifies the VLAN configuration.

When you create or modify an Ethernet VLAN, note the following syntax information:

- Releases 12.1(11b)E and later support VLAN configuration in global configuration mode.
- Releases 12.1(13)E and later support extended-range VLANs.
- RPR+ redundancy does not support a configuration entered in VLAN database mode. Use global configuration mode with RPR+ redundancy.

- Because Layer 3 ports and some software features require internal VLANs allocated from 1006 and up, configure extended-range VLANs starting with 4094.
- You can configure extended-range VLANs only in global configuration mode. You cannot configure extended-range VLANs in VLAN database mode.
- Layer 3 ports and some software features use extended-range VLANs. If the VLAN you are trying to create or modify is being used by a Layer 3 port or a software feature, the switch displays a message and does not modify the VLAN configuration.

When deleting VLANs, note the following syntax information:

- You cannot delete the default VLANs for the different media types: Ethernet VLAN 1 and FDDI or Token Ring VLANs 1002 to 1005.
- When you delete a VLAN, any LAN ports configured as access ports assigned to that VLAN become inactive. The ports remain associated with the VLAN (and inactive) until you assign them to a new VLAN.

This example shows how to create an Ethernet VLAN in global configuration mode and verify the configuration:

```
Router# configure terminal
Router(config)# vlan 3
Router(config-vlan)# end
Router# show vlan id 3

VLAN Name                             Status    Ports
---- -------------------------------- --------- -------------------------------
3    VLAN0003                         active

VLAN Type  SAID       MTU   Parent RingNo BridgeNo Stp  BrdgMode Trans1 Trans2
---- ----- ---------- ----- ------ ------ -------- ---- -------- ------ ------
3    enet  100003     1500  -      -      -        -    -        0      0

Primary Secondary Type              Interfaces
------- --------- ----------------- ------------------------------------------
```

This example shows how to create an Ethernet VLAN in VLAN database mode:

```
Router# vlan database
Router(vlan)# vlan 3
VLAN 3 added:
    Name: VLAN0003
Router(vlan)# exit
APPLY completed.
Exiting....
```

This example shows how to verify the configuration:

```
Router# show vlan name VLAN0003
VLAN Name                             Status    Ports
---- -------------------------------- --------- ---------------------
3    VLAN0003                         active

VLAN Type  SAID       MTU   Parent RingNo BridgeNo Stp  Trans1 Trans2
---- ----- ---------- ----- ------ ------ -------- ---- ------ ------
3    enet  100003     1500  -      -      -        -    0      0
Router#
```

Assigning a Layer 2 LAN Interface to a VLAN

A VLAN created in a management domain remains unused until you assign one or more LAN ports to the VLAN.

Note Make sure you assign LAN ports to a VLAN of the appropriate type. Assign Ethernet ports to Ethernet-type VLANs.

To assign one or more LAN ports to a VLAN, complete the procedures in the "Configuring LAN Interfaces for Layer 2 Switching" section on page 7-6.

Configuring the Internal VLAN Allocation Policy

Internal VLAN allocation policy is supported in Release 12.1(13)E and later releases. For more information about VLAN allocation, see the "VLAN Ranges" section on page 9-2.

Note The internal VLAN allocation policy is applied only following a reload.

To configure the internal VLAN allocation policy, perform this task:

	Command	Purpose
Step 1	`Router(config)# vlan internal allocation policy {ascending | descending}`	Configures the internal VLAN allocation policy.
	`Router(config)# no vlan internal allocation policy`	Returns to the default (ascending).
Step 2	`Router(config)# end`	Exits configuration mode.
Step 3	`Router# reload`	Applies the new internal VLAN allocation policy. ⚠ **Caution** You do not need to enter the **reload** command immediately. Enter the **reload** command during a planned maintenance window.

When you configure the internal VLAN allocation policy, note the following syntax information:

- Enter the **ascending** keyword to allocate internal VLANs from 1006 and up.
- Enter the **descending** keyword to allocate internal VLAN from 4094 and down.

This example shows how to configure descending as the internal VLAN allocation policy:

```
Router# configure terminal
Router(config)# vlan internal allocation policy descending
```

Mapping 802.1Q VLANs to ISL VLANs

The valid range of user-configurable ISL VLANs is 1 through 1001 and 1006 through 4094. The valid range of VLANs specified in the IEEE 802.1Q standard is 1 to 4094. You can map 802.1Q VLAN numbers to ISL VLAN numbers.

802.1Q VLANs in the range 1 through 1001 and 1006 through 4094 are automatically mapped to the corresponding ISL VLAN. 802.1Q VLAN numbers corresponding to reserved VLAN numbers must be mapped to an ISL VLAN in order to be recognized and forwarded by Cisco network devices.

These restrictions apply when mapping 802.1Q VLANs to ISL VLANs:

- You can configure up to eight 802.1Q-to-ISL VLAN mappings on the Catalyst 6500 series switch.
- You can only map 802.1Q VLANs to Ethernet-type ISL VLANs.
- Do not enter the native VLAN of any 802.1Q trunk in the mapping table.
- When you map an 802.1Q VLAN to an ISL VLAN, traffic on the 802.1Q VLAN corresponding to the mapped ISL VLAN is blocked. For example, if you map 802.1Q VLAN 1007 to ISL VLAN 200, traffic on 802.1Q VLAN 200 is blocked.
- VLAN mappings are local to each Catalyst 6500 series switch. Make sure you configure the same VLAN mappings on all appropriate network devices.

To map an 802.1Q VLAN to an ISL VLAN, perform this task:

	Command	Purpose
Step 1	`Router(config)# vlan mapping dot1q dot1q_vlan isl isl_vlan`	Maps an 802.1Q VLAN to an ISL Ethernet VLAN. The valid range for *dot1q_vlan* is 1001 to 4094. The valid range for *isl_vlan* is the same.
	`Router(config)# no vlan mapping dot1q {all | dot1q_vlan}`	Deletes the mapping.
Step 2	`Router(config)# end`	Exits configuration mode.
Step 3	`Router# show vlan`	Verifies the VLAN mapping.

This example shows how to map 802.1Q VLAN 1003 to ISL VLAN 200:

```
Router# configure terminal
Router(config)# vlan mapping dot1q 1003 isl 200
Router(config)# end
Router#
```

This example shows how to verify the configuration:

```
Router# show vlan
<...output truncated...>
802.1Q Trunk Remapped VLANs:
802.1Q VLAN    ISL VLAN
-----------   -----------
   1003          200
```

CHAPTER 1

Overview

The GigaStack GBIC (model WS-X3500-XL) adds port density and high-performance connectivity to supporting switches. When installed in a supporting switch, the GigaStack GBIC supports Gigabit connections in a cascaded stack or point-to-point configuration. The GigaStack GBIC autonegotiates the duplex setting of each port to maximize the bandwidth for your configuration.

Features

This section describes the GigaStack GBIC features:

- Half-duplex stacking using only one GBIC slot for each switch

  Stack up to nine switches to form an independent backbone that can be managed with a single IP address. This stack gives the appearance of a single large switch for network management purposes. For this kind of connectivity, see the "Example 1: Cascaded Stack Connection" section on page 1-9.

- Full-duplex connectivity between two switches

  You can also form a point-to-point link between two switches. The GigaStack GBIC supports one full-duplex link (in a point-to-point configuration) or up to eight half-duplex links (in a stack configuration) to other Gigabit Ethernet devices. For this kind of connectivity, see the "Example 2: Point-to-Point Connection" section on page 1-10.

- Support for redundant loop configurations in a GigaStack GBIC stack

  For more information, see the "Minimum IOS Release for Redundant Loop Configurations" section on page 1-7 and the "Cascaded Stack Connections with a Redundant Link" section on page 2-12
- Support for IOS Release 12.0(5)XU or later for Catalyst 2900 XL and 3500 XL switches, support for Release 12.1(6)EA2 or later for Catalyst 2950 switches, and support for Release 12.1(4)EA1 or later for Catalyst 3550 multilayer switches
- Management through the Cisco IOS command-line interface (CLI) or the web-based Cluster Management Suite (CMS)
- Field-replaceable

GigaStack GBIC LEDs

Figure 1-1 shows the LED locations on the GigaStack GBIC, and Table 1-1 describes the LED colors and their meanings.

Figure 1-1 GigaStack GBIC LEDs and Ports

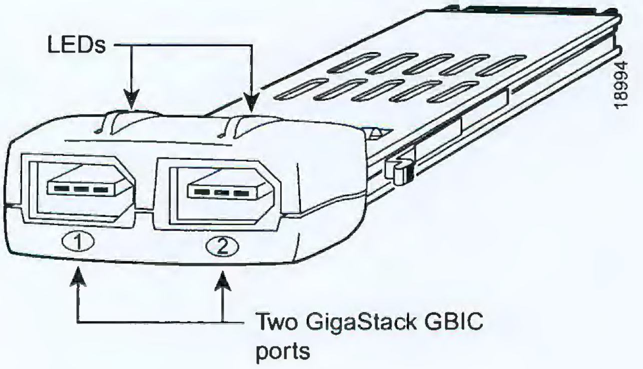


Table 1-1 GigaStack GBIC LEDs

Color	Meaning
Off	No link.
Green	Link present. This link occurs if there is connectivity with another network device and the GigaStack GBIC port.
Amber	Power-on self-test (POST) failure or use of an incorrect cable.
Flashing amber	Loop detection activated.

GBIC Module Slot LEDs

Figure 1-2 shows the GBIC module slot LED on the front of a supporting switch, and Figure 1-3 shows the GBIC LED location when the GigaStack GBIC is installed in the 1000BASE-X module.

Figure 1-2 GBIC Module Slot LED Location on a Switch

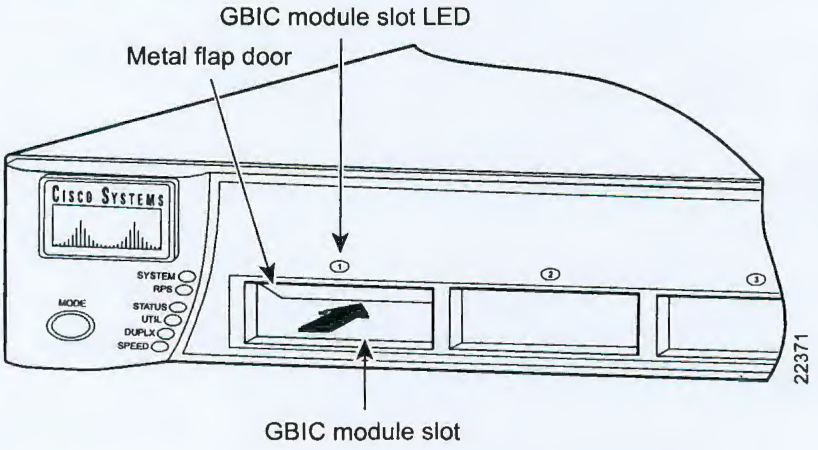

Figure 1-3 GBIC LED Location on a 1000BASE-X Module

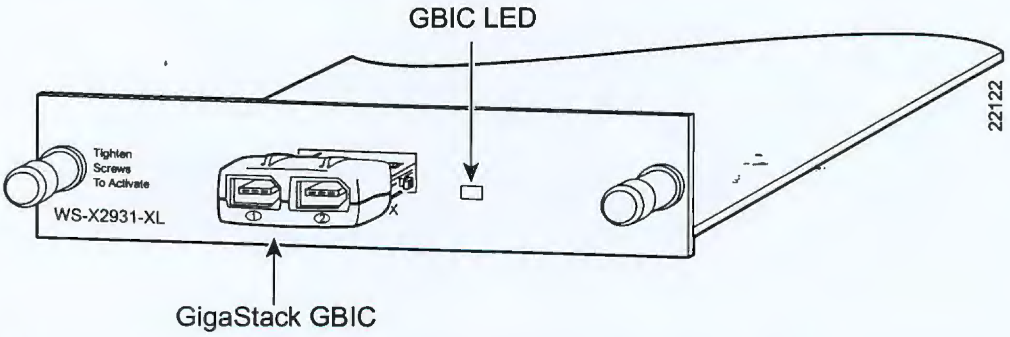

Table 1-2 describes the switch and 1000BASE-X module GBIC slot LED colors and port status.

Table 1-2 Switch and 1000BASE-X Module GBIC Slot LEDs

Color	Meaning
Off	No link, or port was administratively shut down.
Green	Link present.
Flashing green	Activity. Port is transmitting or receiving data.
Alternating green-amber	Link fault. Error frames can affect connectivity, and errors such as excessive collisions, cyclic redundancy check (CRC) errors, and alignment and jabber errors are monitored for a link-fault indication.
Solid amber	Port is blocked by Spanning Tree Protocol (STP) and is not forwarding data. **Note** After a port is reconfigured, the port LED can remain amber for up to 30 seconds as STP checks the switch for possible loops.
Flashing amber	Port is blocked by STP and is sending or receiving packets.

Cabling Guidelines

The GigaStack GBIC uses the following Cisco proprietary cables. See Figure 1-4 and Table 1-3 for more information.

The maximum distance for a GBIC-to-GBIC connection is 1 meter. The GigaStack GBIC requires Cisco proprietary signaling and cabling. For more information about cabling, see Appendix B, “Connectors and Cables.”

Figure 1-4 GigaStack GBIC Cables

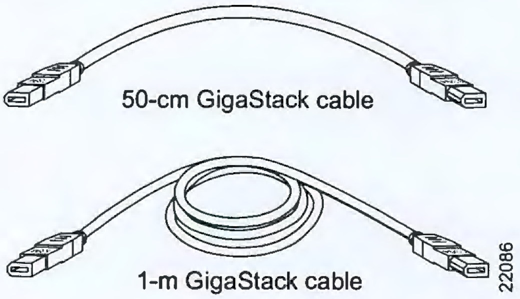

Table 1-3 GigaStack GBIC Cable Part Numbers

Part Number	Cable Length
CAB-GS-50CM	50 cm
CAB-GS-1M	1 m

The 50-cm cable comes with the GigaStack GBIC. You can order additional cables.

⚠ **Caution** Do not use standard IEEE 1394 cables with the GigaStack GBIC. You must use one of the Cisco proprietary cables (CAB-GS-50CM or CAB-GS-1M). If you use any other cable, you will not have connectivity.

⚠ **Caution** Do not use the GigaStack GBIC with standard IEEE 1394 equipment. You might damage the equipment or lose data.

Switches Supporting the GBIC

Refer to the online *GigaStack Gigabit Interface Converter Switch Compatibility Matrix* listed with the GBIC documentation on www.cisco.com for the most current list of products supporting the GBIC.

Caution Installing the GBIC in or connecting it to an unauthorized device might cause damage to the GBIC, the other device, or both.

Table 1-4 lists the switches and the module supporting the GigaStack GBIC.

Table 1-4 Switches and Module Supporting the GigaStack GBIC

Switch Series or Module	Model Number	Description
WS-X2931-XL module for Catalyst 2900 series XL switches	WS-X2931-XL	1 1000BASE-X port[1]
Catalyst 2900 XL switches	Catalyst 2912MF XL	12 100BASE-FX ports and 2 module slots
	Catalyst 2924M XL	24 autosensing 10/100 Ethernet ports and 2 module slots
Catalyst 2950 switches	Catalyst 2950G-12-EI	12 autosensing 10/100 Ethernet ports and 2 GBIC module slots
	Catalyst 2950G-24-EI	24 autosensing 10/100 Ethernet ports and 2 GBIC module slots
	Catalyst 2950G-24-EI-DC	24 autosensing 10/100 Ethernet ports and 2 GBIC module slots with DC-input power
	Catalyst 2950G-48-EI	48 autosensing 10/100 Ethernet ports and 2 GBIC module slots

Switch Series or Module	Model Number	Description
Catalyst 3500 XL switches	Catalyst 3508G XL	8 GBIC module slots
	Catalyst 3512 XL	12 autosensing 10/100 Ethernet ports and 2 GBIC module slots
	Catalyst 3524 XL	24 autosensing 10/100 Ethernet ports and 2 GBIC module slots
	Catalyst 3524 PWR XL	24 autosensing 10/100 inline-power Ethernet ports and 2 GBIC module slots
	Catalyst 3548 XL	48 autosensing 10/100 Ethernet ports and 2 GBIC module slots
Catalyst 3550 switches	Catalyst 3550-12G	2 autosensing 10/100/1000 Ethernet ports and 10 GBIC module slots
	Catalyst 3550-12T	10 autosensing 10/100/1000 Ethernet ports and 2 GBIC module slots
	Catalyst 3550-24-SMI Catalyst 3550-24-EMI	24 autosensing 10/100 Ethernet ports and 2 GBIC module slots
	Catalyst 3550-48-SMI Catalyst 3550-48-EMI	48 autosensing 10/100 Ethernet ports and 2 GBIC module slots

[1] The 1000BASE-X module provides one switched 1000-Mbps port in half-duplex, full-duplex, or autonegotiation mode for a GigaStack GBIC. The port supports the IEEE 802.3Z 1000BASE-X standard.

Minimum IOS Release for Redundant Loop Configurations

To ensure support for redundant loop configurations when using the GigaStack GBIC in a cascaded stack configuration, make sure that every switch in the stack is running at least the minimum IOS Release listed in Table 1-5.

Table 1-5 Minimum IOS Release for Redundant Loop Configurations

Supported Switch	Minimum IOS Release
Modular 2900 XL switches	12.0(5)XU (April 2000)
2950 switches	12.1(6)EA2 (December 2000)
3500 XL switches	12.0(5)XU (April 2000)
3550 multilayer switches	12.1(4)EA1 (May 2001)

Note All switches in a series must run the same software version. For example, if the stack includes only Catalyst 2900 series XL and 3500 series XL switches, they must run Release 12.0(5)XU or later. If the stack includes a mixture of Catalyst 2900 series XL, 3500 series XL, 2950, and 3550 switches, all the 2900 XL and 3500 XL switches must run Release 12.0(5)XW or later, all the Catalyst 2950 switches must run Release 12.1(6)EA2 or later, and all the Catalyst 3550 switches must run Release 12.1(4)EA1 or later.

For more information, see the "Cascaded Stack Connections with a Redundant Link" section on page 2-12. For switch software upgrade information, refer to the release notes for your switch.

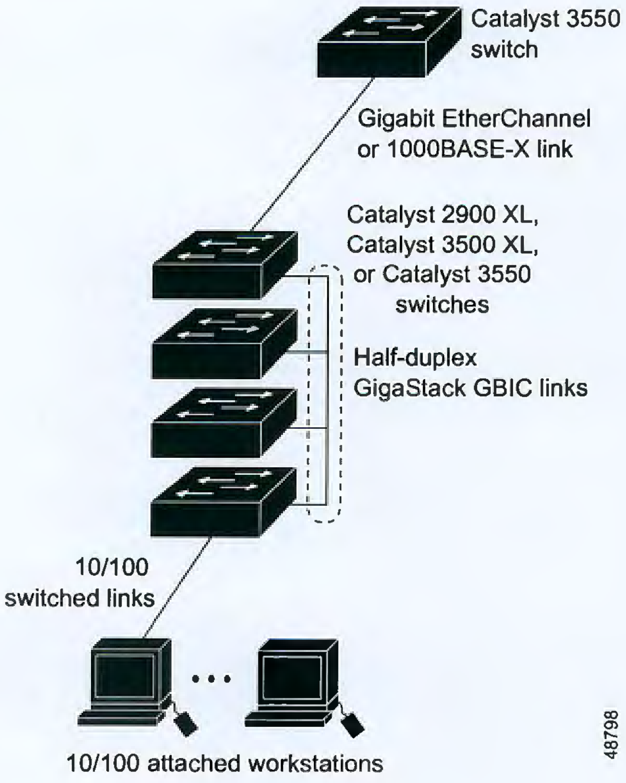
Deployment Examples

This section contains examples that use the GigaStack GBIC as a Gigabit uplink to aggregate traffic in a switched and shared network.

Example 1: Cascaded Stack Connection

Figure 1-5 shows the GigaStack GBIC cascaded in a half-duplex stack configuration.

Figure 1-5 Cascaded Stack Connection

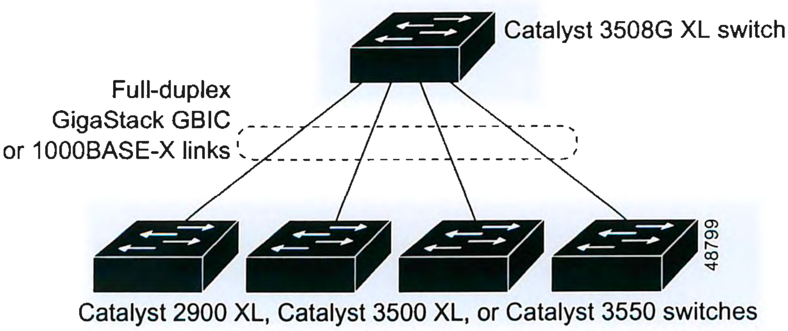


Catalyst 3550 switch
Gigabit EtherChannel or 1000BASE-X link
Catalyst 2900 XL, Catalyst 3500 XL, or Catalyst 3550 switches
Half-duplex GigaStack GBIC links
10/100 switched links
10/100 attached workstations
48798

Example 2: Point-to-Point Connection

Figure 1-6 shows the 3500 XL switch aggregating traffic by using a GigaStack GBIC as a full-duplex, point-to-point uplink connection.

Figure 1-6 Point-to-Point Connection



Apêndice FL

CHAPTER 3

Installation

This chapter describes how to install your switch, interpret the power-on self-test (POST), and connect the switch to other devices. Read these topics, and perform the procedures in this order:

Preparing for Installation

This section provides information about these topics:

- Warnings, page 3-2
- EMC Regulatory Statements, page 3-4
- Installation Guidelines, page 3-7
- Verifying Package Contents, page 3-8

Warnings

These warnings are translated into several languages in Appendix D, “Translat Safety Warnings.”

Warning **This equipment is to be installed and maintained by service personnel only as defined by AS/NZS 3260 Clause 1.2.14.3 Service Personnel.**

Warning **This unit is intended for installation in restricted access areas. A restricted access area can be accessed only through the use of a special tool, lock and key, or other means of security.**

Warning **Only trained and qualified personnel should be allowed to install or replace this equipment.**

Warning **Read the installation instructions before you connect the system to its power source.**

Warning **Unplug the power cord before you work on a system that does not have an on/off switch.**

Warning

Do not stack the chassis on any other equipment. If the chassis falls, it can cause severe bodily injury and equipment damage.

Warning

To comply with safety regulations, mount switches on a wall with the front panel facing up.

Warning

If a redundant power system (RPS) is not connected to the switch, install an RPS connector cover on the back of the switch.

Warning

The plug-socket combination must be accessible at all times because it serves as the main disconnecting device.

Warning

To prevent the switch from overheating, do not operate it in an area that exceeds the maximum recommended ambient temperature of 113°F (45°C). To prevent airflow restriction, allow at least 3 inches (7.6 cm) of clearance around the ventilation openings.

Warning

When installing the unit, always make the ground connection first and disconnect it last.

Warning

This equipment is intended to be grounded. Ensure that the host is connected to earth ground during normal use.

Warning

Before working on equipment that is connected to power lines, remove jewelry (including rings, necklaces, and watches). Metal objects will heat up when connected to power and ground and can cause serious burns or weld the metal object to the terminals.

Warning **Do not work on the system or connect or disconnect cables during periods of lightning activity.**

Warning **Ultimate disposal of this product should be handled according to all national laws and regulations.**

Warning **Attach only the Cisco RPS (model PWR300-AC-RPS-N1) to the RPS receptacle.**

Warning **Invisible laser radiation may be emitted from disconnected fibers or connectors. Do not stare into beams or view directly with optical instruments.**

Warning **Class 1 laser product**

Warning **Avoid direct exposure to the laser beam**

EMC Regulatory Statements

This section includes specific regulatory statements about the Catalyst 2950 switches.

U.S.A.

U.S. regulatory information for this product is in the front matter of this manual.

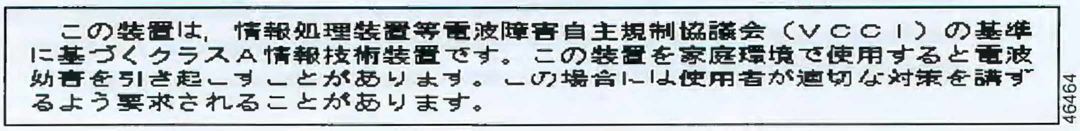
Taiwan

Warning **This is a Class A Information Product, when used in residential environment, it may cause radio frequency interference, under such circumstances, the user may be requested to take appropriate countermeasures.**

警告 這是甲類資訊產品，在居住環境中使用時，可能會造成射頻干擾，在這種情況下，使用者會被要求採取某些適當的對策。

Japan

This is a Class A product based on the standard of the Voluntary Control Council for Interference by Information Technology Equipment (VCCI). If this equipment is used in a domestic environment, radio disturbance may arise. When such trouble occurs, the user may be required to take corrective actions.



この装置は，情報処理装置等電波障害自主規制協議会（ＶＣＣＩ）の基準に基づくクラスＡ情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求されることがあります。

46464

Korea

Warning — This is a Class A Device and is registered for EMC requirements for industrial use. The seller or buyer should be aware of this. If this type was sold or purchased by mistake, it should be replaced with a residential-use type.

주의 — A급 기기 이 기기는 업무용으로 전자파 적합 등록을 한 기기이오니 판매자 또는 사용자는 이 점을 주의하시기 바라며 만약 잘못 판매 또는 구입하였을 때에는 가정용으로 교환하시기 바랍니다.

Hungary

Warning — This equipment is a class A product and should be used and installed properly according to the Hungarian EMC Class A requirements (MSZEN55022). Class A equipment is designed for typical commercial establishments for which special conditions of installation and protection distance are used.

Figyelmeztetés — Figyelmeztetés a felhasználói kézikönyv számára: Ez a berendezés "A" osztályú termék, felhasználására és üzembe helyezésére a magyar EMC "A" osztályú követelményeknek (MSZ EN 55022) megfeleleoen kerülhet sor, illetve ezen "A" osztályú berendezések csak megfelelo kereskedelmi forrásból származhatnak, amelyek biztosítják a megfelelo speciális üzembe helyezési körülményeket és biztonságos üzemelési távolságok alkalmazását.

Installation Guidelines

When determining where to place the switch, observe these guidelines.

- Before installing the switch, first verify that the switch is operational by powering it on and running POST. Follow the procedures in the "Verifying Switch Operation" section on page 3-10.
- For 10/100 ports and 10/100/1000 ports, the cable length from a switch to an attached device cannot exceed 328 feet (100 meters).
- For 100BASE-FX ports, the cable length from a switch to an attached device cannot exceed 6562 feet (2 kilometers).
- For 1000BASE-SX ports and 1000BASE-SX Gigabit Interface Converter (GBIC) module ports, the cable length from a switch to an attached device cannot exceed 1804 feet (550 meters).
- For 1000BASE-LX/LH GBIC module ports, the cable length from a switch to an attached device cannot exceed 32,810 feet (10 kilometers).
- For 1000BASE-ZX GBIC module ports, the cable length from a switch to an attached device cannot exceed 328,100 feet (100 kilometers).
- For 1000BASE-T GBIC module ports, the cable length from a switch to an attached device cannot exceed 328 feet (100 meters).
- For Coarse Wave Division Multiplexing (CWDM) GBIC module ports, the cable length from a switch to an attached device cannot exceed 393,719 feet (120 kilometers). For specific cable lengths, refer to the CWDM GBIC module documentation.
- For GigaStack GBIC module ports, the cable length from a switch to an attached device cannot exceed 3 feet (1 meter).
- For Long-Reach Ethernet (LRE) ports, cable-length specifications vary. See the "LRE Port" section on page 2-12.
- Operating environment is within the ranges listed in Appendix A, "Technical Specifications."
- Clearance to front and rear panels meet these conditions:
  - Front-panel LEDs can be easily read.
  - Access to ports is sufficient for unrestricted cabling.
  - Rear-panel AC power connector on switches other than the LRE switches is within reach of an AC power outlet.

  - Rear-panel direct current (DC) power connector on the Catalyst 2950G-24-EI-DC switch is within reach of a circuit breaker.
  - Front-panel AC power connector on the LRE switches is within reach of an AC power outlet.
  - Front-panel DC power connector on the Catalyst 2950ST-24 LRE 997 switch is within reach of a circuit breaker.
- Airflow around the switch and through the vents is unrestricted.
- Temperature around the unit does not exceed 113°F (45°C).

Note If the switch is installed in a closed or multirack assembly, the temperature around it might be greater than normal room temperature.

- Cabling is away from sources of electrical noise, such as radios, power lines, and fluorescent lighting fixtures.

Verifying Package Contents

Note Carefully remove the contents from the shipping container, and check each item for damage. If any item is missing or damaged, contact your Cisco representative or reseller for support. Return all packing materials to the shipping container and save them.

The switch is shipped with these items:

- This *Catalyst 2950 Desktop Switch Hardware Configuration Guide*
- *About the Catalyst 2950 and Catalyst 2955 Documentation*
- AC power cord (not shipped with the Catalyst 2950G-24-EI-DC switch or the Catalyst 2950ST-24 LRE 997 switch)
- Mounting kit containing these items:
  - Four rubber feet for mounting the switch on a table, shelf, or desk
  - Two 19-inch or 24-inch rack-mounting brackets

  - Six number-8 Phillips flat-head screws for attaching the brackets to the switch
  - Four number-8 Phillips truss-head screws for attaching the brackets to the switch
  - Four number-12 Phillips machine screws for attaching the brackets to a rack
  - One cable guide and one black Phillips machine screw for attaching the cable guide to one of the mounting brackets
  - One RPS connector cover and two number-4 pan-head screws
- DC-switch kit containing these items:
  - One DC terminal block plug (also called a terminal block header)
  - One ground lug
  - Two number-10-32 screws for attaching the ground lug to the switch
  - Two 23-inch rack-mounting brackets (with 1-inch spacing for telco racks)
  - Four number-8 Phillips truss-head screws for attaching the brackets to the switch
  - Two number-12 Phillips machine screws for attaching the brackets to a rack

Note The DC-switch kit ships only with the Catalyst 2950G-24-EI-DC or Catalyst 2950ST-24 LRE 997 switch.

- One RJ-45-to-DB-9 adapter cable
- Product ownership registration card

If you want to connect a terminal to the switch console port, you need to provide an RJ-45-to-DB-25 female DTE adapter. You can order a kit (part number ACS-DSBUASYN=) with that adapter from Cisco.

Verifying Switch Operation

Before installing the switch in a rack, on a wall, or on a table or shelf, you should power on the switch and verify that the switch passes POST. See Chapter 1, "Quick Installation," for the steps required to connect a PC to the switch console port and to power on the switch.

After a successful POST, follow these steps:

Step 1 Turn off power to the switch.

Step 2 Disconnect the cables.

Step 3 Determine where you want to install the switch.

Installing the Switch in a Rack

Warning **To prevent bodily injury when mounting or servicing this unit in a rack, you must take special precautions to ensure that the system remains stable. The following guidelines are provided to ensure your safety:**

- This unit should be mounted at the bottom of the rack if it is the only unit in the rack.
- When mounting this unit in a partially filled rack, load the rack from the bottom to the top with the heaviest component at the bottom of the rack.
- If the rack is provided with stabilizing devices, install the stabilizers before mounting or servicing the unit in the rack.

Note Figure 3-1 to Figure 3-20 show the Catalyst 2950-24, 2950G-24-EI-DC, and 2950G-48-EI switches as examples. You can install other Catalyst 2950 switches in a rack as shown in these illustrations.

To install the switch in a 19-, 23-, or 24-inch rack, follow these steps:

1. Attaching the Brackets to the Switch, page 3-11
2. Mounting the Switch in a Rack, page 3-21
3. Attaching the Optional Cable Guide, page 3-22

Note Installing the Catalyst 2950G-48-EI switch in a 23-inch or 24-inch rack requires an optional bracket kit not included with the switch. You can order a kit containing the 23-inch or 24-inch rack-mounting brackets and hardware from Cisco (part number RCKMNT-1RU=).

Attaching the Brackets to the Switch

The bracket orientation and the screws that you use depend on whether you are attaching the brackets to a 19-, 23-, or 24-inch rack. Follow these guidelines:

- When mounting a switch other than a Catalyst 2950G-48-EI switch in a 19-inch rack, use two Phillips flat-head screws to attach the long side of the 19- or 24-inch bracket to the switch. See Figure 3-1, Figure 3-2, and Figure 3-3.
- When mounting a Catalyst 2950G-48-EI switch in a 19-inch rack, use three Phillips flat-head screws to attach the long side of the 19- or 24-inch bracket to the switch. See Figure 3-4, Figure 3-5, and Figure 3-6.
- When mounting a Catalyst 2950G-24-EI-DC or Catalyst 2950ST-24 LRE 997 switch in a 23-inch rack, use two Phillips truss-head screws to attach the 23-inch bracket to the switch. See Figure 3-7, Figure 3-8, and Figure 3-9.
- When mounting a switch other than a Catalyst 2950G-48-EI switch in a 24-inch rack, use two Phillips truss-head screws to attach the 19- or 24-inch bracket to the switch. See Figure 3-10, Figure 3-11, and Figure 3-12.
- When mounting a Catalyst 2950G-48-EI switch in a 24-inch rack, use three Phillips flat-head screws to attach the 24-inch bracket (part number RCKMNT-1RU=) to the switch. See Figure 3-13, Figure 3-14, and Figure 3-15.

Figure 3-1 to Figure 3-15 show how to attach a bracket to one side of the switch. Follow the same steps to attach the second bracket to the opposite side of the switch.

Figure 3-1 Attaching Brackets on the Switch in a 19-Inch Rack (Front Panel Forward)

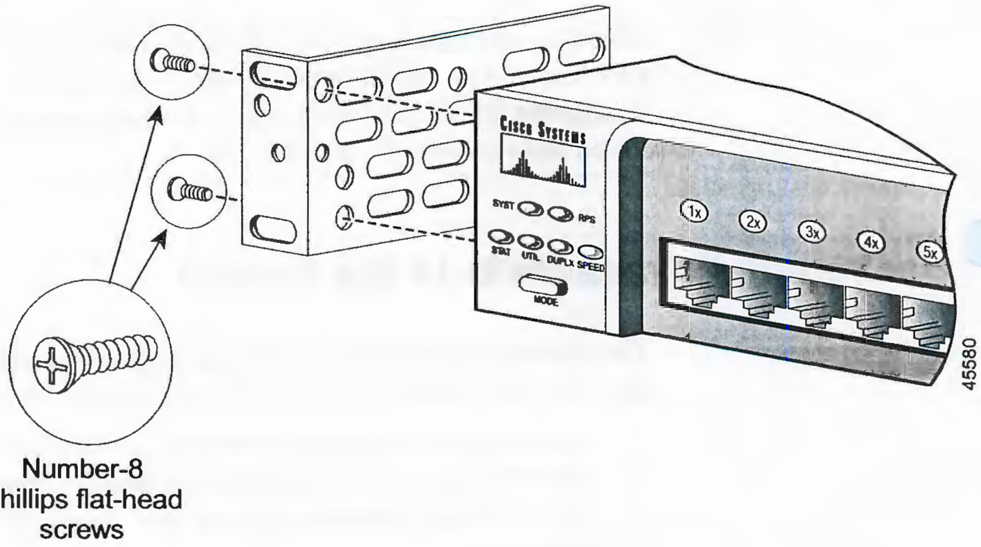


Figure 3-2 *Attaching Brackets on the Switch in a 19-Inch Rack (Rear Panel Forward)*

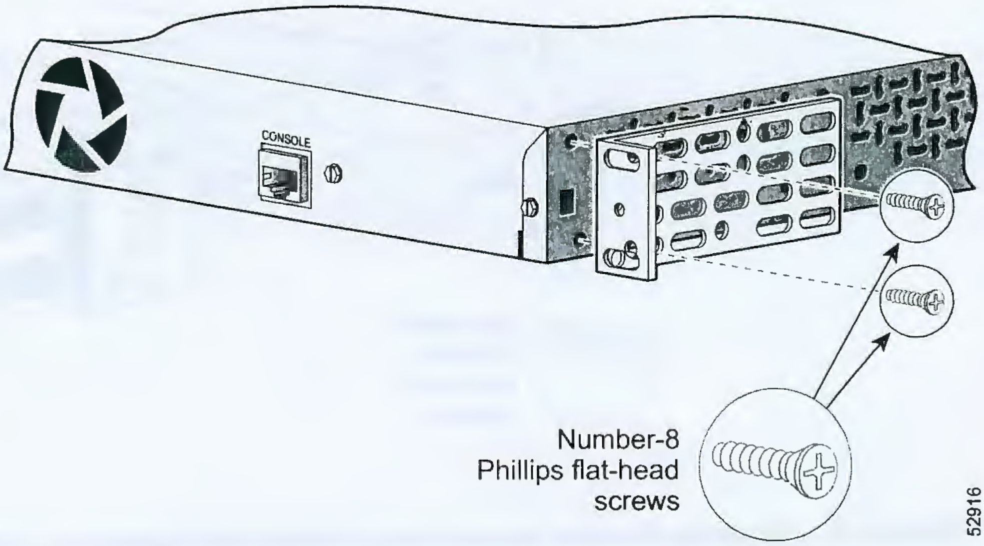

Figure 3-3 *Attaching Brackets on the Switch in a 19-Inch Telco Rack*

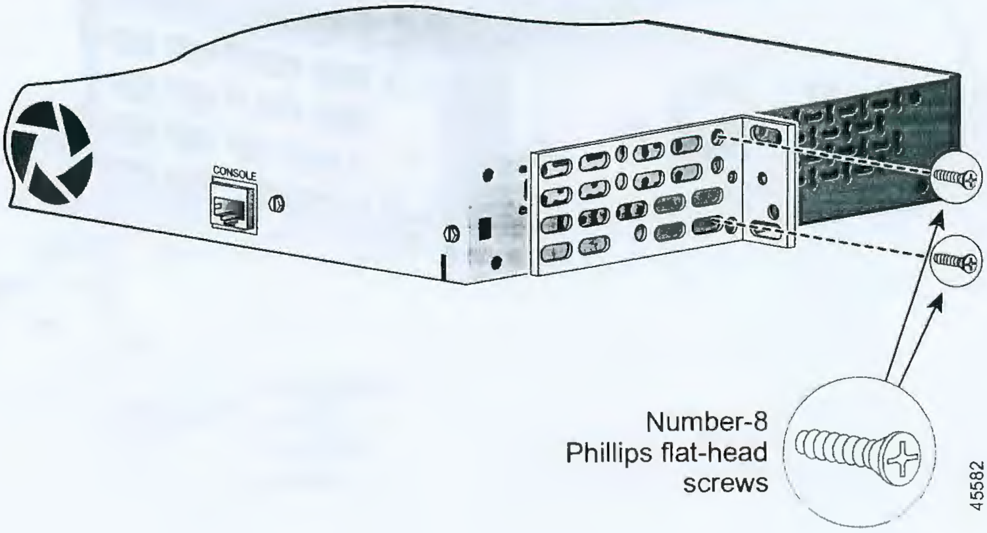

Figure 3-4 Attaching Brackets on the Catalyst 2950G-48-EI Switch in a 19-Inch Rack (Front Panel Forward)

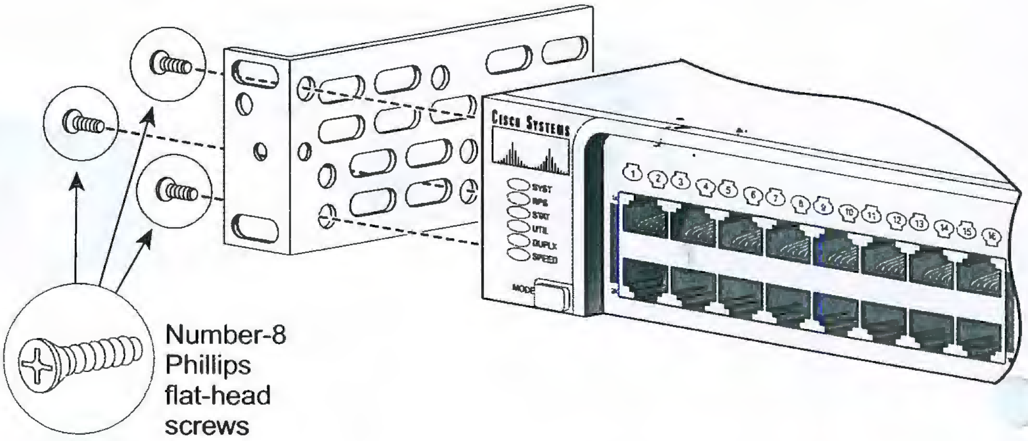

Figure 3-5 Attaching Brackets on the Catalyst 2950G-48-EI Switch in a 19-Inch Rack (Rear Panel Forward)

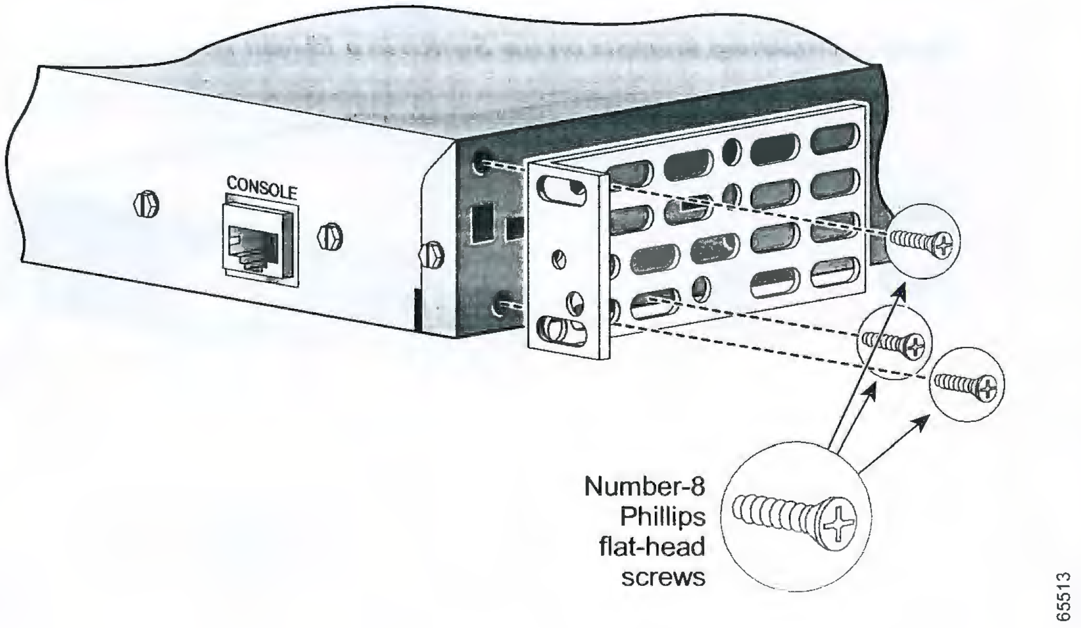

Figure 3-6 Attaching Brackets on the Catalyst 2950G-48-EI Switch in a 19-Inch Telco Rack

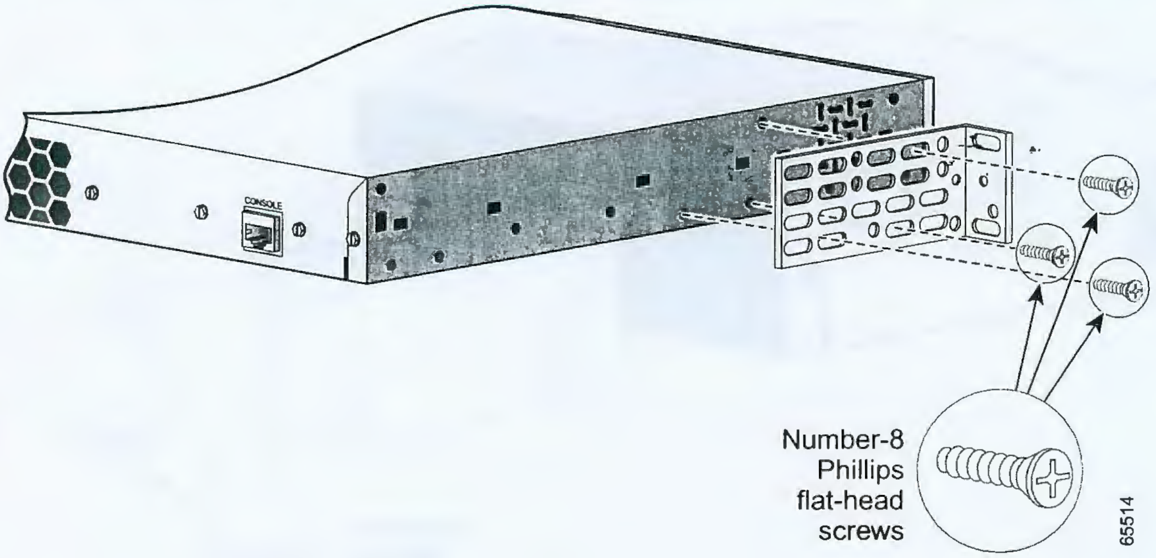

Figure 3-7 Attaching Brackets on the Catalyst 2950G-24-EI-DC or 2950ST-24 LRE 997 Switch in a 23-Inch Telco Rack (Front Panel Forward)

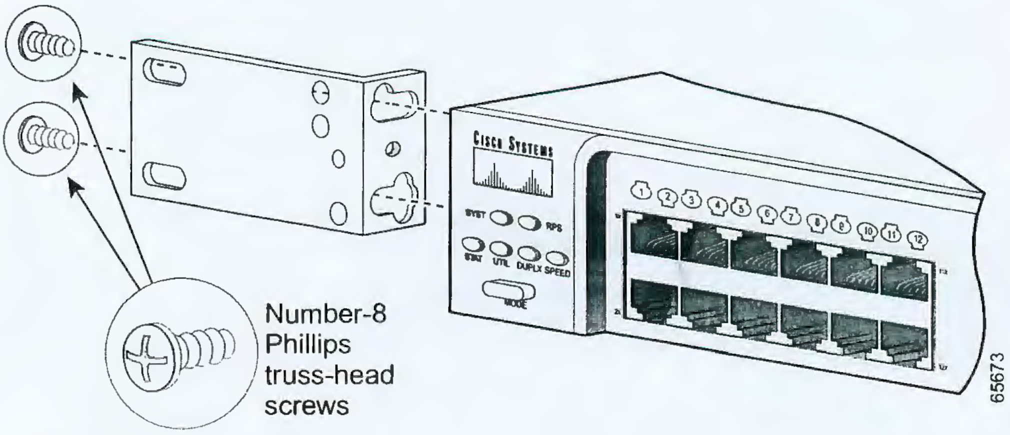

Figure 3-8 Attaching Brackets on the Catalyst 2950G-24-EI-DC or 2950ST-24 LRE 997 Switch in a 23-Inch Telco Rack (Rear Panel Forward)

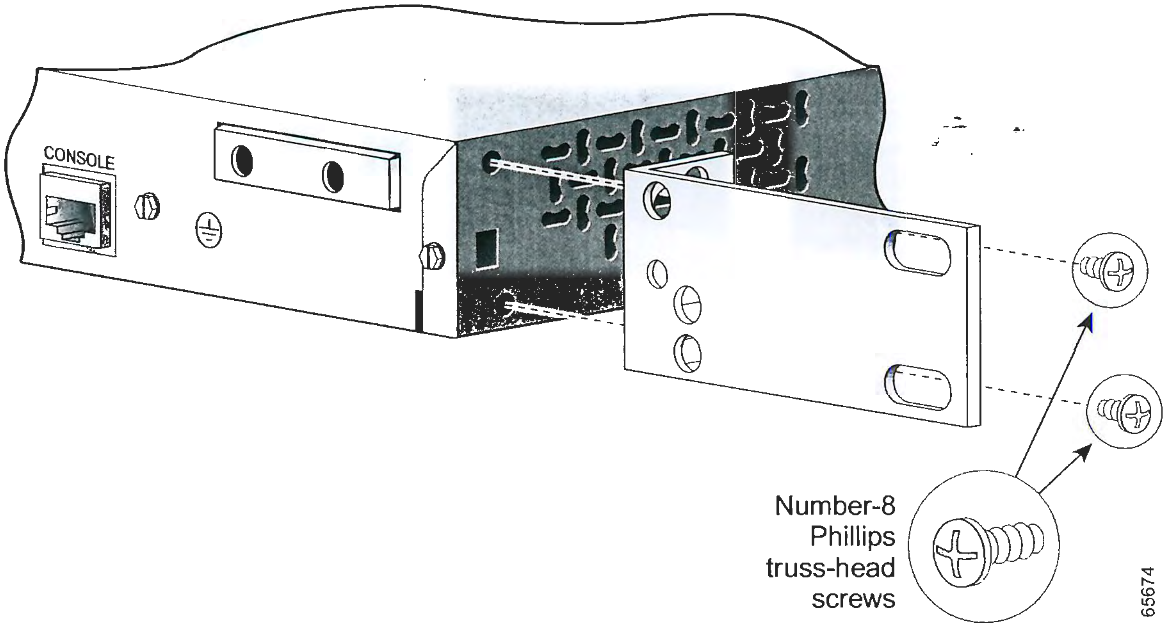

Figure 3-9 Attaching Brackets on the Catalyst 2950G-24-EI-DC or 2950ST-24 LRE 997 Switch in a 23-Inch Telco Rack

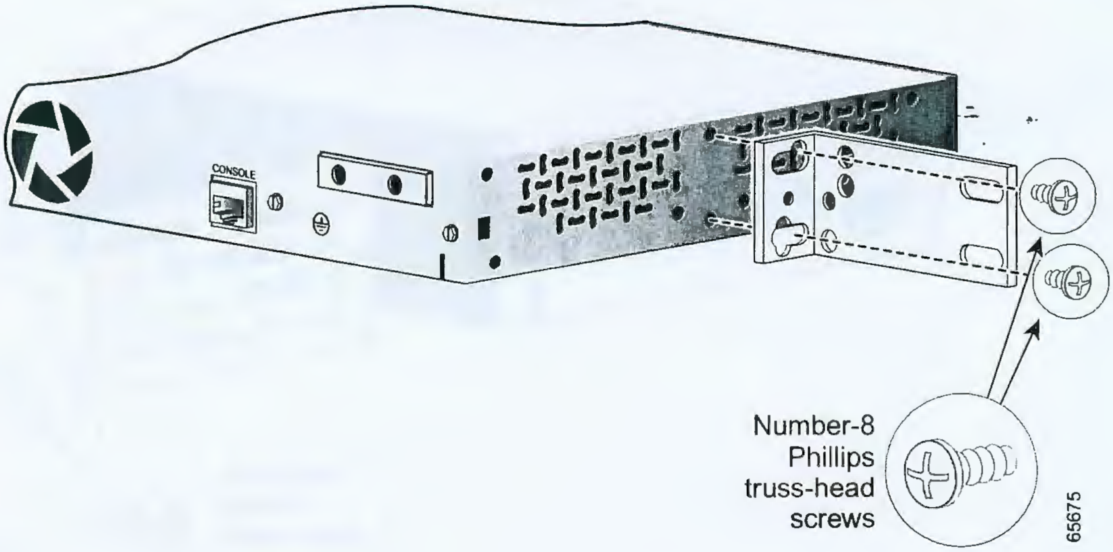

Figure 3-10 Attaching Brackets on the Switch in a 24-Inch Rack (Front Panel Forward)

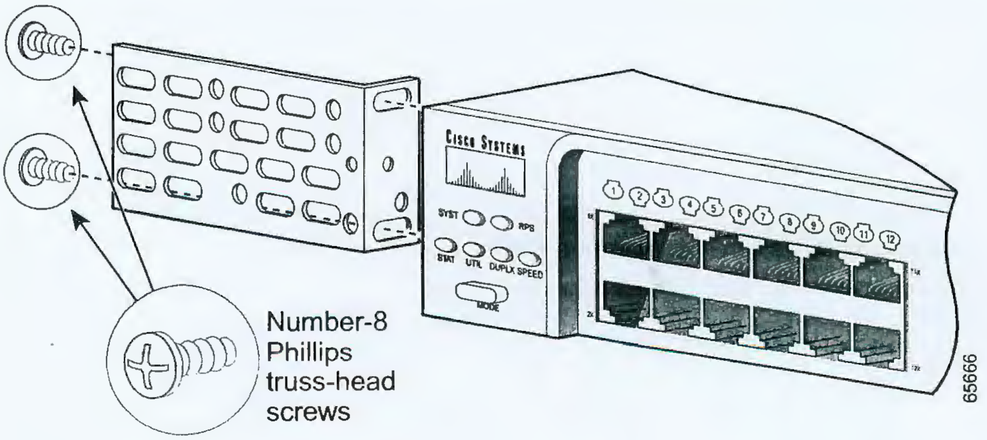

Figure 3-11 Attaching Brackets on the Switch in a 24-Inch Rack (Rear Panel Forward)

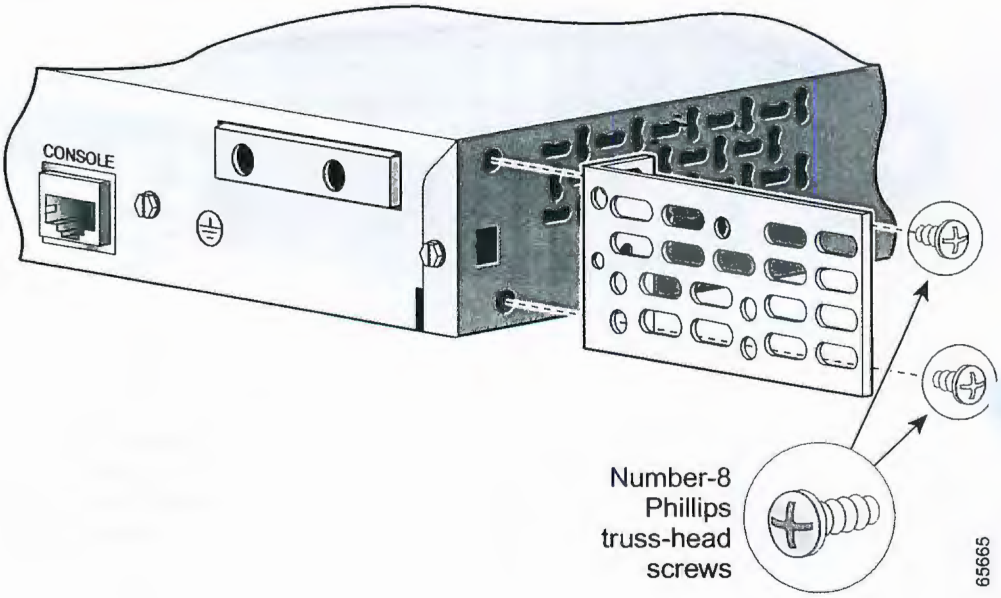

Figure 3-12 Attaching Brackets on the Switch in a 24-Inch Telco Rack

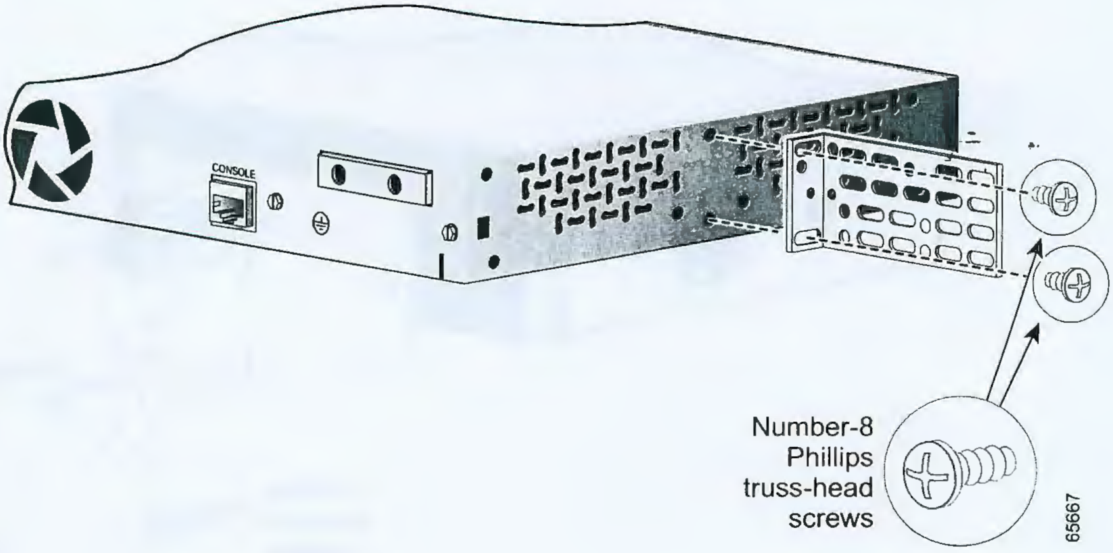

Figure 3-13 Attaching Brackets on the Catalyst 2950G-48-EI Switch in a 24-Inch Rack (Front Panel Forward)

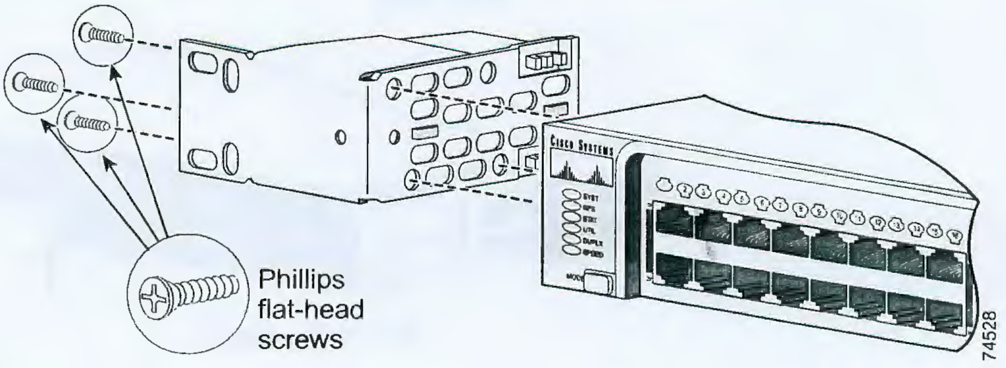

Figure 3-14 Attaching Brackets on the Catalyst 2950G-48-EI Switch in a 24-Inch Rack (Rear Panel Forward)

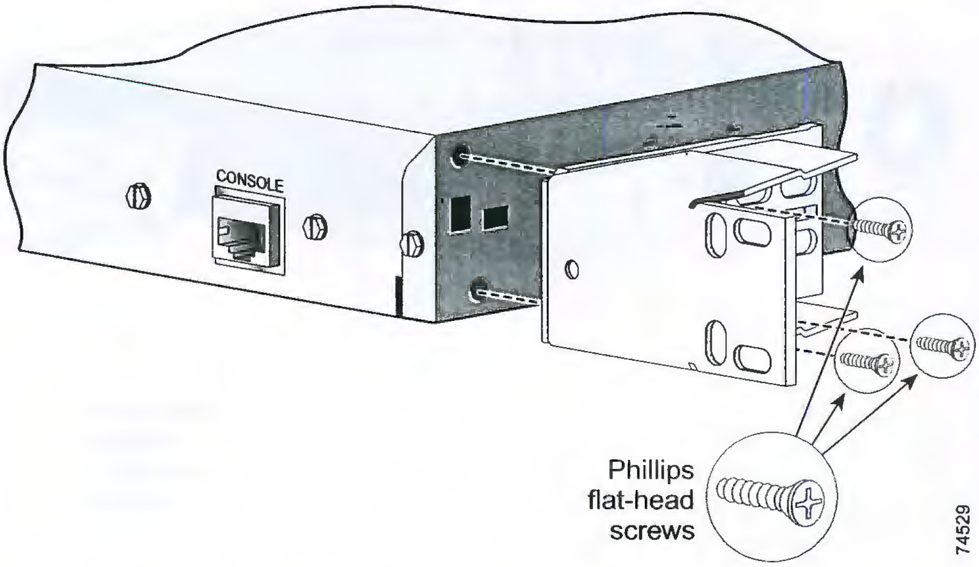

Figure 3-15 Attaching Brackets on the Catalyst 2950G-48-EI Switch in a 24-Inch Telco Rack

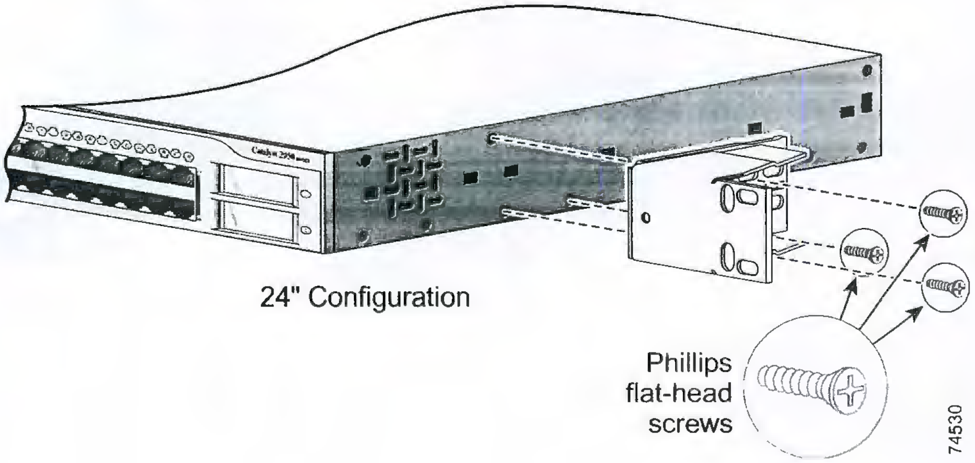
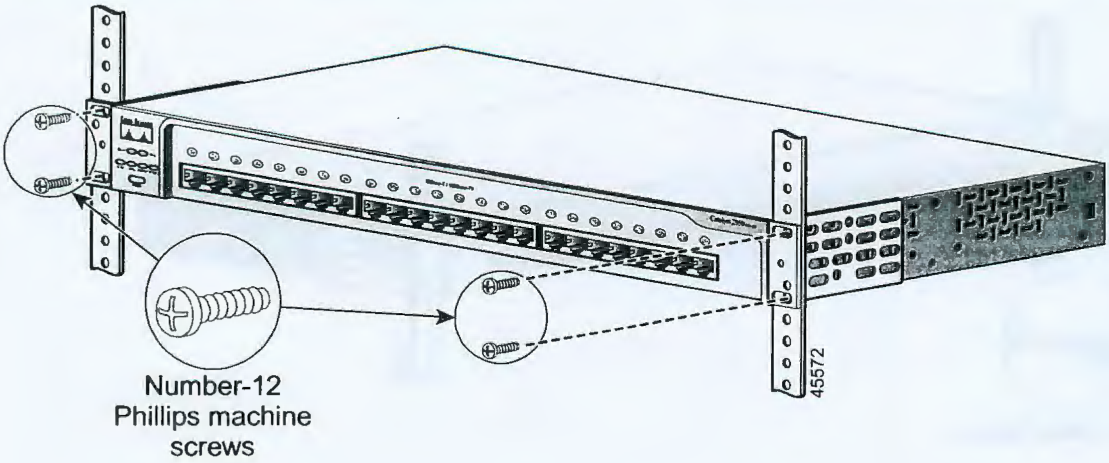


Mounting the Switch in a Rack

After attaching the brackets, use the four Phillips machine screws to securely attach the brackets to the rack, as shown in Figure 3-16.

When installing a switch other than an LRE switch, to prevent the cables from obscuring the switch and other devices in the rack, you can also attach the cable guide to the rack. See the"Attaching the Optional Cable Guide" section for instructions.

Figure 3-16 Mounting the Switch in a Rack



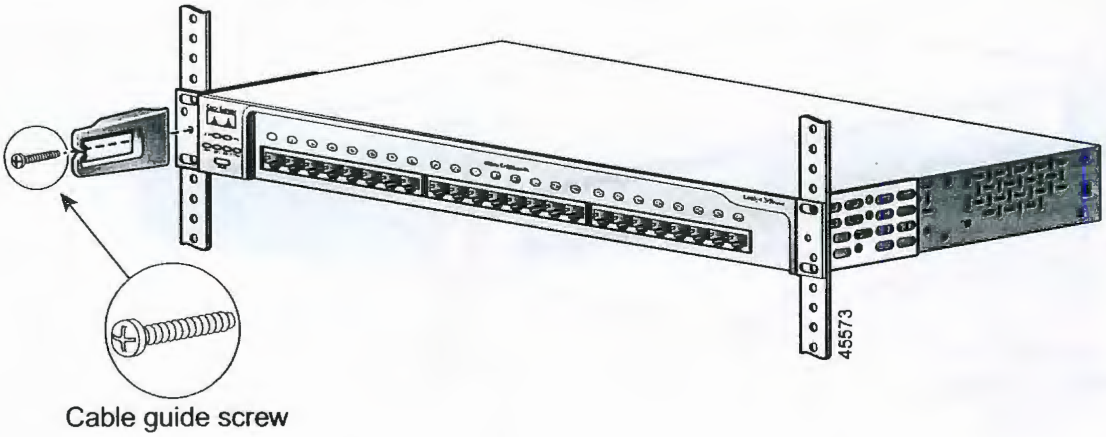
After mounting the switch in the rack, start the terminal-emulation software, and provide power to the switch. See Chapter 1, "Quick Installation" for instructions.

Attaching the Optional Cable Guide

We recommend attaching the cable guide to prevent the cables from obscuring the front panels of the switch and other devices installed in the rack. Use the supplied black Phillips machine screw to attach the cable guide to the left or right bracket, as shown in Figure 3-17.

Note You cannot use the cable guide with Catalyst 2950 LRE switches.

Figure 3-17 Attaching the Cable Guide



Installing the Switch on a Table, Shelf, or Desk

Before placing the switch on a table, shelf, or desk, locate the adhesive strip w rubber feet in the mounting-kit envelope, and attach four rubber feet to the recessed areas on the switch bottom. Place the switch on a table, shelf, or desk near an AC power source or DC-input power source.

Start the terminal-emulation software and provide power to the switch. See Chapter 1, "Quick Installation," for instructions.

Installing the Switch on a Wall

Warning **To comply with safety regulations, mount switches on a wall with the front panel facing up.**

Warning **If a redundant power system (RPS) is not connected to the switch, install an RPS connector cover on the back of the switch.**

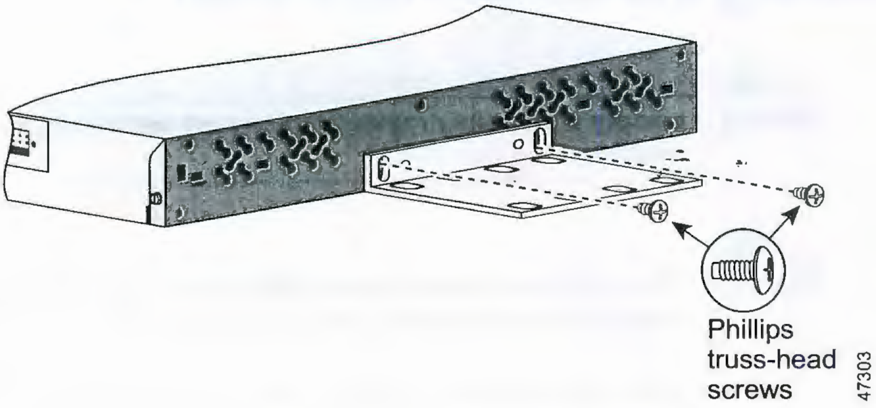
You can mount the Catalyst 2950 switch to a wall in a face-up configuration. To attach the switch to a wall, follow the procedures in this section.

1. Attaching the Brackets to the Switch, page 3-23
2. Attaching the RPS Connector Cover, page 3-24
3. Mounting the Switch to a Wall, page 3-25

Attaching the Brackets to the Switch

Use the supplied Phillips flat-head screws to attach a bracket to the switch. Figure 3-18 shows how to attach the bracket to one side of the switch. Follow the same steps to attach the second bracket to the opposite side of the switch.

Figure 3-18 Attaching Brackets for Wall-Mounting for the Catalyst 2950 Switch

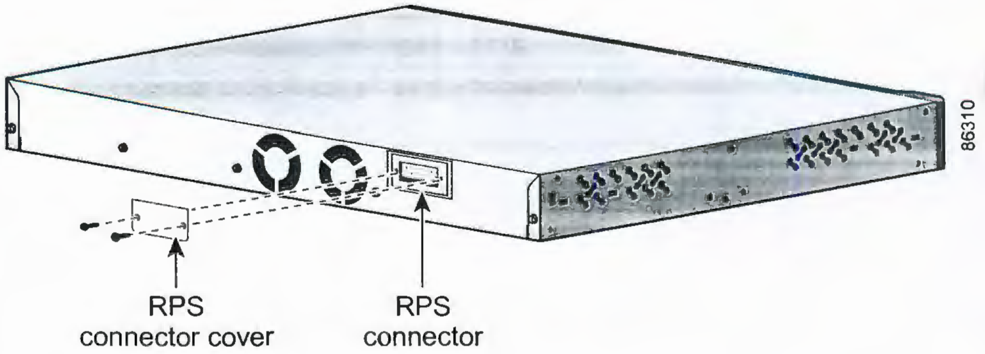


Attaching the RPS Connector Cover

If you are not using a redundant power system (RPS) with your switch, use two number-4 Phillips pan-head screws to install an RPS connector cover to the back of the switch. (See Figure 3-19.) The pan-head screws are included in the accessory kit.

Warning **If an RPS is not connected to the switch, install an RPS connector cover on the back of the switch.**

Figure 3-19 Attaching the RPS Connector Cover

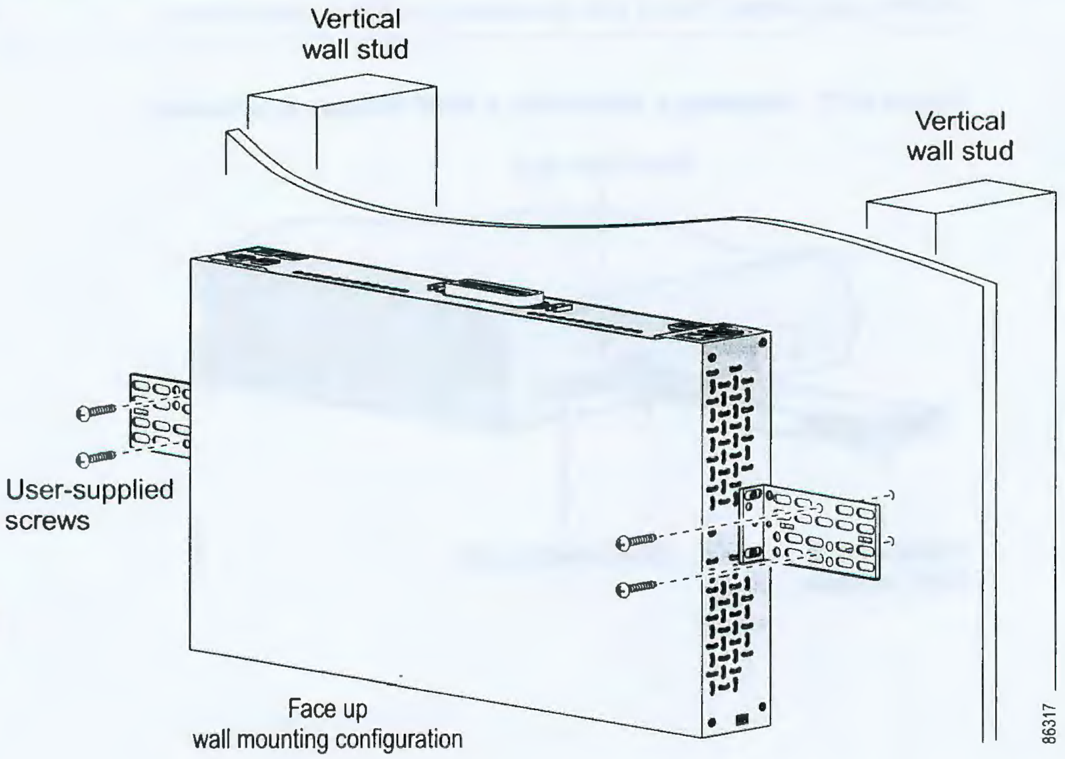


Mounting the Switch to a Wall

Warning **To comply with safety regulations, mount switches on a wall with the front panel facing up.**

For the best support of the switch and cables, make sure the switch is attached securely to a wall stud or to a firmly attached plywood mounting backboard, as shown in Figure 3-20.

Figure 3-20 Mounting a Catalyst 2950 Switch to a Wall



After the switch is mounted on the wall, power the switch as described in Chapter 1, "Quick Installation."

Installing the GBIC Modules

Figure 3-21, Figure 3-22, and Figure 3-23 show how to insert a GBIC module in a GBIC module slot on the switch. For instructions on how to install a CWDM GBIC module in a GBIC module slot, refer to the documentation that came with that GBIC module.

For detailed instructions on installing, removing, and cabling the GBIC module (the 1000BASE-X module, the 1000BASE-T module, the CWDM GBIC module, or the GigaStack module), refer to your GBIC documentation.

⚠ **Caution** To prevent electrostatic-discharge (ESD) damage when installing GBIC modules, follow your normal board and component handling procedures.

Figure 3-21 Installing a 1000BASE-X GBIC Module in a Switch

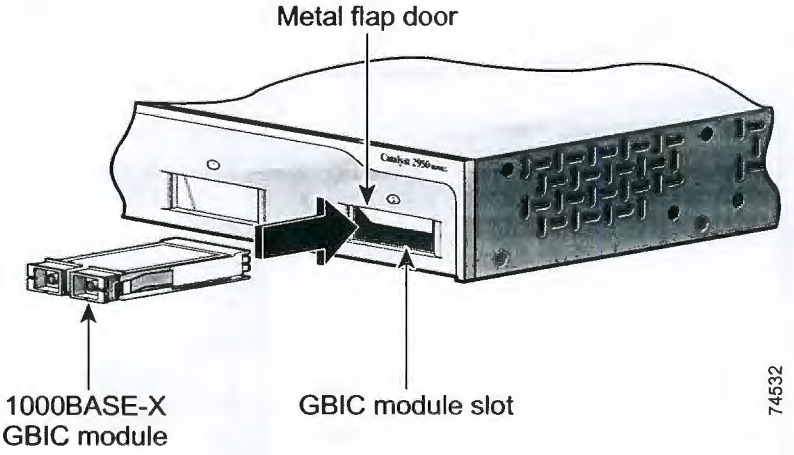


Figure 3-22 Installing a 1000BASE-T GBIC Module in a Switch

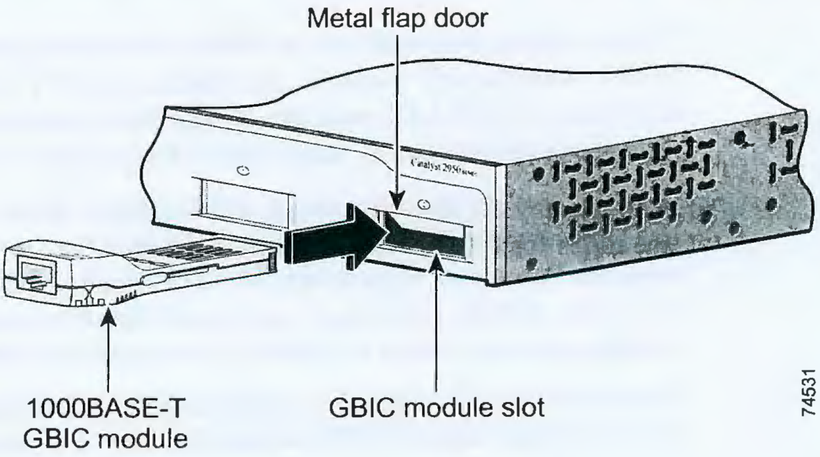

Figure 3-23 Installing a GigaStack GBIC Module in a Switch

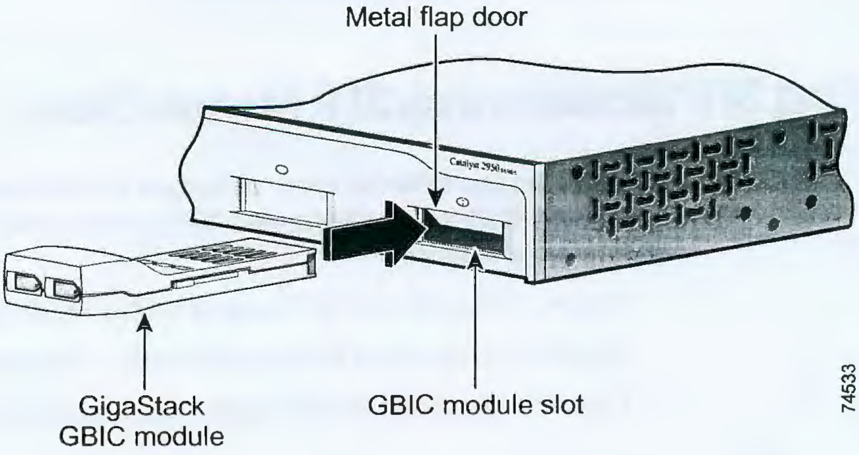

Installing and Removing SFP Modules

These sections describe how to install and remove small-form-factor pluggable (SFP) modules. SFP modules are inserted into SFP module slots on the front of the Catalyst 2950 LRE switches. These field-replaceable modules provide the uplink optical interfaces, laser send (TX) and laser receive (RX).

You can use any combination of SFP modules. Refer to the Catalyst 2950 LRE release notes for the list of SFP modules that the Catalyst 2950 LRE switch supports. Each port must match the wave-length specifications on the other end of the cable, and the cable must not exceed the stipulated cable length for reliable communications. Refer to Table 2-2 for cable stipulations for SFP connections.

Use only Cisco SFP modules on the Catalyst 2950 LRE switch. Each SFP module has an internal serial EEPROM that is encoded with security information. This encoding provides a way for Cisco to identify and validate that the SFP module meets the requirements for the switch.

For detailed instructions on installing, removing, and cabling the SFP module, refer to your SFP module documentation.

Installing SFP Modules into SFP Module Slots

SFP modules use different types of latches for their installation and extraction. Determine which type of latch your SFP module uses before following the installation procedure:

- Figure 3-24 shows an SFP module with a Mylar tab latch.
- Figure 3-25 shows an SFP module with an actuator button latch.
- Figure 3-26 shows an SFP module that has a bale-clasp latch.

⚠ **Caution** We strongly recommend that you do not install or remove the SFP module with fiber-optic cables attached to it because of the potential damage to the cables, the cable connector, or the optical interfaces in the SFP module. Disconnect all cables before removing or installing an SFP module.

Removing and installing an SFP module can shorten its useful life. Do not remove and insert SFP modules more often than is absolutely necessary.

Figure 3-24 SFP Module with a Mylar Tab Latch

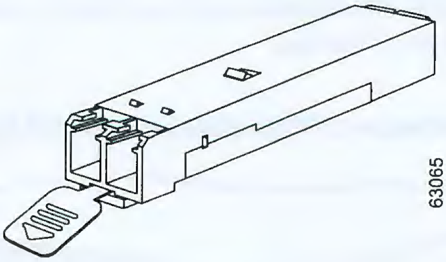

Figure 3-25 SFP Module with an Actuator Button Latch

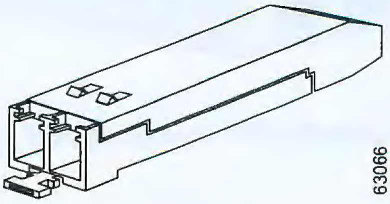

Figure 3-26 SFP Module with a Bale-Clasp Latch

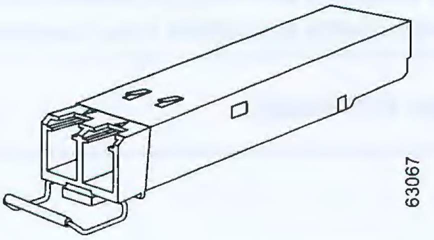


To insert an SFP module into the SFP module slot, follow these steps:

Step 1 Attach an ESD-preventive wrist strap to your wrist and to a bare metal surface on the chassis.

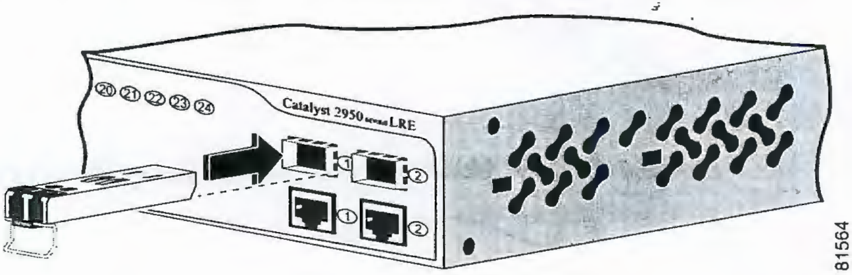
Step 2 Find the send (TX) and receive (RX) markings that identify the top side of the SFP module.

Note On some SFP modules, the send and receive (TX and RX) markings might be replaced by arrows that show the direction of the connection, either send or receive (TX or RX).

Step 3 Align the SFP module in front of the slot opening.

Step 4 Insert the SFP module into the slot until you feel the connector on the module snap into place in the rear of the slot.

Figure 3-27 Installing an SFP Module into an SFP Module Slot



Step 5 Remove the dust plugs from the SFP module optical ports and store them for later use.

Caution Do not remove the dust plugs from the SFP module port or the rubber caps from the fiber-optic cable until you are ready to connect the cable. The plugs and caps protect the SFP module ports and cables from contamination and ambient light.

Step 6 Insert the LC into the SFP module.

Removing SFP Modules from SFP Module Slots

To remove an SFP module from a module receptacle, follow these steps:

Step 1 Attach an ESD-preventive wrist strap to your wrist and to a bare metal surface on the chassis.

Step 2 Disconnect the LC from the SFP module.

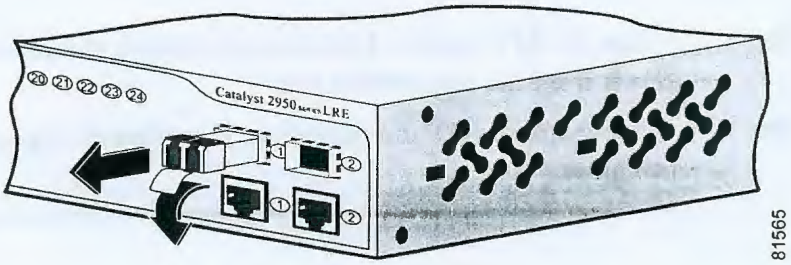
Tip For reattachment, note which cable connector plug is send (TX) and which is receive (RX).

Step 3 Insert a dust plug into the optical ports of the SFP module to keep the optical interfaces clean.

Step 4 Unlock and remove the SFP module, as shown in Figure 3-28, Figure 3-29, and Figure 3-30.

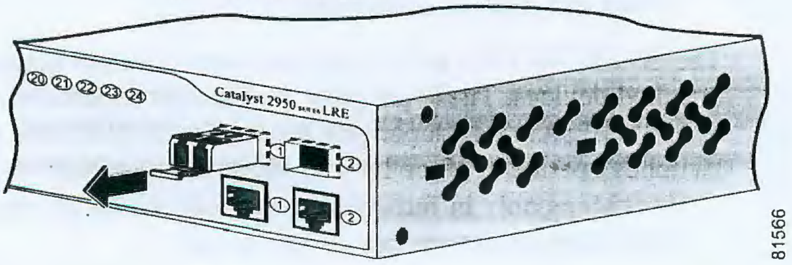
- If the module has a Mylar tab latch, pull the tab straight out so that you remove the SFP module from the port in a parallel direction. Do not twist or pull the tab because you could disconnect it from the SFP module.

Figure 3-28 Using the Mylar Tab Latch to Remove an SFP Module from a Slot



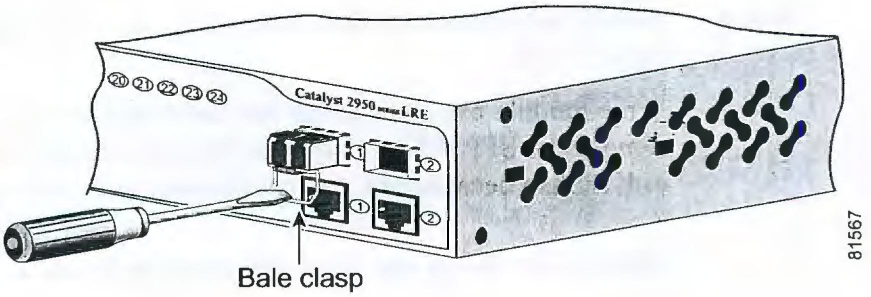
- If the module has an actuator button latch, use your thumb to push inward on the wedge to free the locking pin, and use your index finger to grip the ridge on top of the SFP module. Pull straight out to remove the module.

Figure 3-29 Using the Actuator Button Latch to Remove an SFP Module from an SFP Module Slot



- If the module has a bale-clasp latch, pull the bale out and down to eject the module. If the bale-clasp latch is obstructed and you cannot use your index finger to open it, use a small, flat-blade screwdriver or other long, narrow instrument to open the bale-clasp latch.

Figure 3-30 Removing a Bale-Clasp Latch SFP Module by Using a Flat-Blade Screwdriver



Step 5 Grasp the SFP module between your thumb and index finger, and carefully remove it from the module slot.

Step 6 Place the removed SFP module in an antistatic bag or other protective environment.

Connecting to 10/100 and 10/100/1000 Ports

The 10/100 ports configure themselves to operate at the speed and duplex settings of attached devices.They operate at 10 or 100 Mbps in half- or full-duplex mode. If the attached devices do not support autonegotiation, you can explicitly set the speed and duplex parameters.

The 10/100/1000 ports configure themselves to operate at the speed setting of attached devices. These ports on Catalyst 2950T-24 switches operate at 10, 100, or 1000 Mbps in full-duplex mode. The 10/100/1000 ports on Catalyst 2950 LRE switches operate at 10 or 100 Mbps in either half- or full-duplex mode and at 1000 Mbps only in full-duplex mode. If the attached devices do not support autonegotiation, you can set the speed.

Note On the Catalyst 2950 LRE switches, the four input uplink ports are bundled as two logical ports, each consisting of a copper 10/100/1000 port and a fiber-optic SFP module slot, respectively.

Within each logical port, you can use only the copper or the fiber-optic port at one time. If the Catalyst 2950 LRE switch senses more than two connections for both logical ports, by default, the switch chooses the fiber-optic connections over the copper connections.

See the “SFP Module Slots” section on page 2-14 for more information on LRE uplink logical ports.

Connecting devices that do not autonegotiate or devices with manually set speed and duplex parameters can reduce performance or result in link failures between the devices. To maximize performance, choose one of these methods for configuring the ports:

- Let the 10/100 ports autonegotiate both speed and duplex, let the 10/100/1000 ports on the LRE switches autonegotiate both speed and duplex, and let the 10/100/1000 ports on the Catalyst 2950G-24-EI-DC switch only autonegotiate speed.
- Set the speed and duplex parameters on both ends of the connection.

When connecting the ports on the Catalyst 2950G-24-EI-DC and Catalyst 2950ST-24 LRE 997 switches to other devices, follow these guidelines:

Caution To comply with the intrabuilding lightning surge requirements, intrabuilding wiring must be shielded, and the shield for the wiring must be grounded at both ends.

Caution The Catalyst 2950G-24-EI-DC or Catalyst 2950ST-24 LRE 997 switch is suitable only for intrabuilding or nonexposed wiring connections.

Follow these steps to connect the switch to 10BASE-T, 100BASE-TX, or 1000BASE-T devices:

Caution To prevent electrostatic-discharge (ESD) damage, follow your normal board and component handling procedures.

Step 1 When connecting to servers, workstations, and routers, insert a twisted-pair straight-through cable in a front-panel RJ-45 connector, as shown in Figure 3-31, Figure 3-32, and Figure 3-33. When connecting to switches or repeaters, insert a twisted-pair crossover cable. (See the "Cable and Adapter Specifications" section on page B-8 for cable-pinout descriptions.)

Note When connecting to 1000BASE-T devices, be sure to use a four twisted-pair, Category 5 cable.

Figure 3-31 Connecting to a Port on Catalyst 2950-12, 2950-24, 2950C-24, 2950SX-24, and 2950T-24 Switches

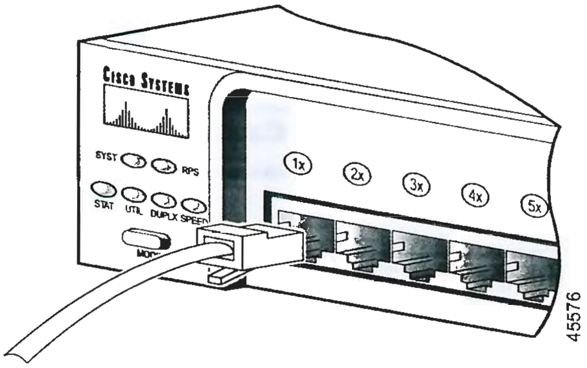


Figure 3-32 Connecting to a Port on Catalyst 2950G-12-EI, 2950G-24-EI, and 2950G-24-EI-DC Switches

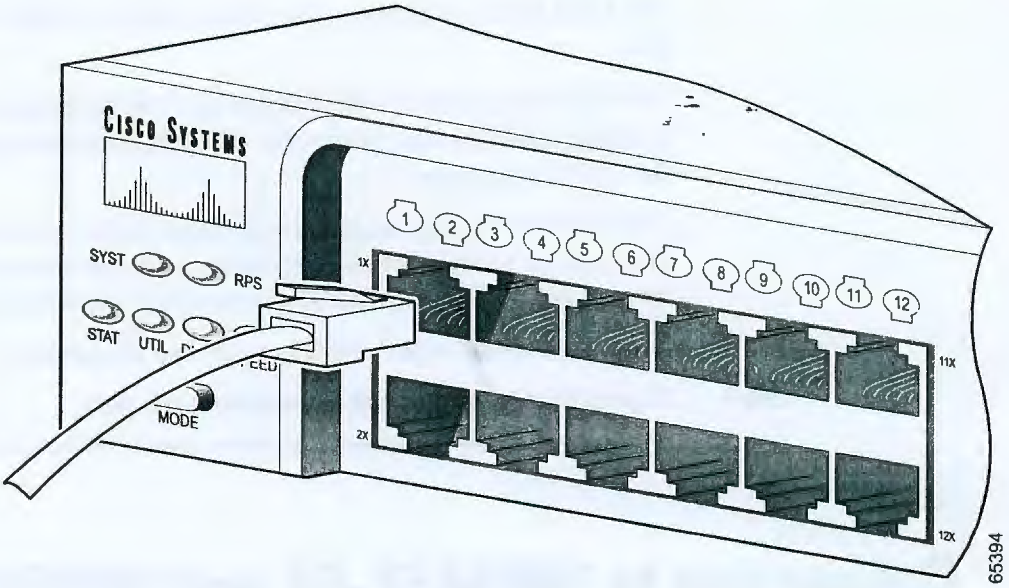

Figure 3-33 Connecting to a Port on Catalyst 2950G-48-EI Switches

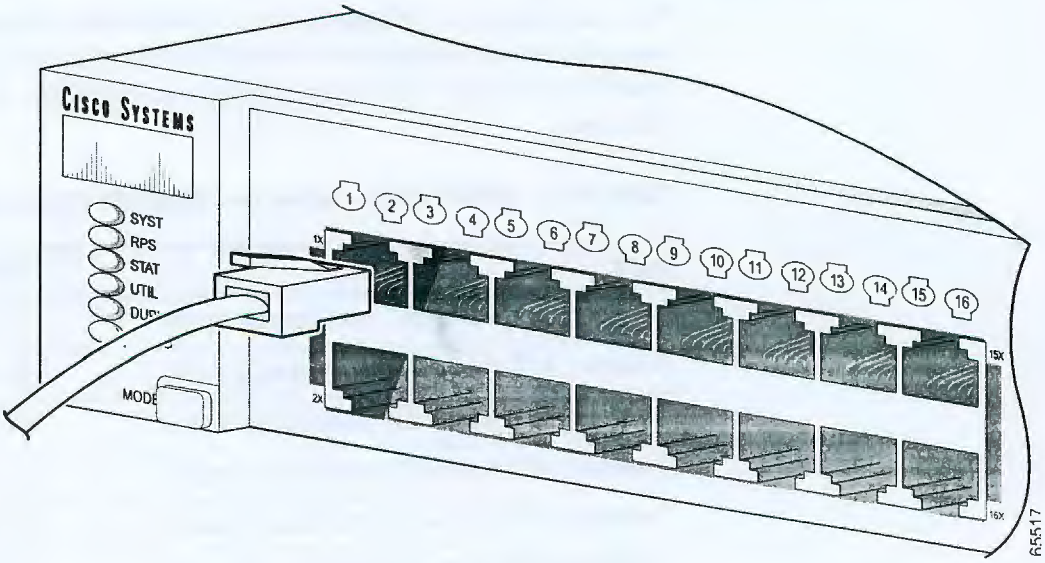


Step 2 Insert the other cable end in an RJ-45 connector on the target device.

Step 3 Observe the port status LED.

The LED turns green when the switch and the target device have an established link.

The LED turns amber while Spanning Tree Protocol (STP) discovers the network topology and searches for loops. This process takes about 30 seconds, and then the LED turns green.

If the LED is off, the target device might not be turned on, there might be a cable problem, or there might be a problem with the adapter installed in the target device. See Chapter 4, "Troubleshooting," for solutions to cabling problems.

Step 4 Reconfigure and restart the target device if necessary.

Step 5 Repeat Steps 1 through 4 to connect each port.

Connecting to 100BASE-FX and 1000BASE-SX Ports

The 100BASE-FX and 1000BASE-SX ports operate only in full-duplex mode.

You can connect a 100BASE-FX or 1000BASE-SX port to an SC or ST port on a target device by using one of the MT-RJ fiber-optic patch cables listed in Table 3-1. Use the Cisco part numbers in Table 3-1 to order the patch cables that you need.

Table 3-1 MT-RJ Patch Cables for 100BASE-FX and 1000BASE-SX Connections

Type	Cisco Part Number
1-meter, MT-RJ-to-SC multimode cable	CAB-MTRJ-SC-MM-1M
3-meter, MT-RJ-to-SC multimode cable	CAB-MTRJ-SC-MM-3M
5-meter, MT-RJ-to-SC multimode cable	CAB-MTRJ-SC-MM-5M
1-meter, MT-RJ-to-ST multimode cable	CAB-MTRJ-ST-MM-1M
3-meter, MT-RJ-to-ST multimode cable	CAB-MTRJ-ST-MM-3M
5-meter, MT-RJ-to-ST multimode cable	CAB-MTRJ-ST-MM-5M

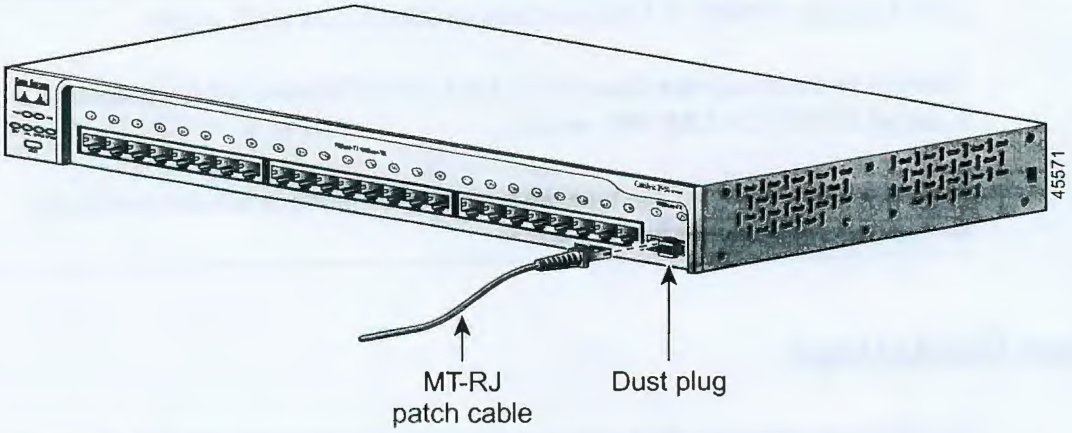
Caution Do not remove the dust plugs from the fiber-optic ports or the rubber caps from the fiber-optic cable until you are ready to connect the cable. The plugs and caps protect the fiber-optic ports and cables from contamination and ambient light.

Follow these steps to connect the switch to a 100BASE-FX or 1000BASE-SX device:

Step 1 Remove the dust plugs from the 100BASE-FX or 1000BASE-SX port and the rubber caps from the MT-RJ patch cable. Store them for future use.

Step 2 Insert the cable in a 100BASE-FX or 1000BASE-SX port. (See Figure 3-34.)

Figure 3-34 Connecting to a 100BASE-FX or 1000BASE-SX Port



Step 3 Insert the other cable end in an SC or ST port on the target device.

Step 4 Observe the port status LED.

The LED turns green when the switch and the target device have an established link.

The LED turns amber while STP discovers the network topology and searches for loops. This process takes about 30 seconds, and then the port LED turns green.

If the LED is off, the target device might not be turned on, there might be a cable problem, or there might be a problem with the adapter installed in the target device. See Chapter 4, “Troubleshooting,” for solutions to cabling problems.

Step 5 Reconfigure and restart the target device if necessary.

Step 6 Repeat Steps 1 through 5 to connect each port.

Connecting to an LRE Port

Depending on the switch model, you can connect the LRE port to up to 8 or up to 24 LRE customer premises equipment (CPE) devices through a patch panel. For information about which LRE CPE devices are supported by the LRE switches, see Table 2-1 on page 2-4.

Note You can connect both Cisco 575 LRE CPE and Cisco 585 LRE CPE devices to your Catalyst 2950ST-8 LRE or Catalyst 2950ST-24 LRE switch.

You can connect only the Cisco 576 LRE CPE 997 device to LRE ports on a Catalyst 2950ST-24 LRE 997 switch.

You can hot swap the CPE devices without powering down the switch or disrupting the other switch ports.

Connection Guidelines

If telephone services, such as voice or Integrated Services Digital Network (ISDN), use the same cabling as the LRE traffic, you must connect the LRE to a plain old telephone service (POTS) splitter. The splitter routes LRE data (high-frequency) and voice (low-frequency) traffic from the telephone line to the switch and private branch exchange (PBX) switch or public switched telephone network (PSTN).

If the other telephone services are connected through a PBX switch, you can use a Cisco LRE 48 POTS Splitter. The PBX routes voice traffic to private telephone networks and the PSTN. For more information about the Cisco LRE 48 POTS Splitter (PS-1M-LRE-48), refer to the *Installation and Warranty Notes for the Cisco LRE 48 POTS Splitter.*

If the installation does not have a PBX, you need to use a homologated POTS splitter to connect to the PSTN. For more information about homologated POTS splitters, contact your Cisco sales representative.

If a connection to a telephone network is not required, you do not need a splitter, and you can connect the switch to the patch panel.

Limitations and Restrictions with POTS Splitters

These limitations and restrictions apply when you use a POTS splitter with Catalyst 2950 LRE switches and Cisco LRE CPE devices:

- The Catalyst 2950ST-8 LRE switch, Catalyst 2950ST-24 LRE switch, Cisco 575 LRE CPE, and Cisco 585 LRE CPE are designed to share lines with analog, ISDN, and digital PBX switch telephones that use the 0 to 700 kHz frequency range.

  Digital telephones connected to digital PBX switches that use frequencies above 700 kHz do not work when sharing a line with LRE signals. Due to the proprietary nature of digital PBX switches, some digital PBX switch services use frequencies above 700 kHz.

- You can use a Cisco LRE 48 POTS Splitter with a Catalyst 2950ST-8 LRE switch, Catalyst 2950ST-24 LRE switch, Cisco 575 LRE CPE, and Cisco 585 LRE CPE. For installation instructions, refer to the *Installation and Warranty Notes for the Cisco LRE 48 POTS Splitter*.

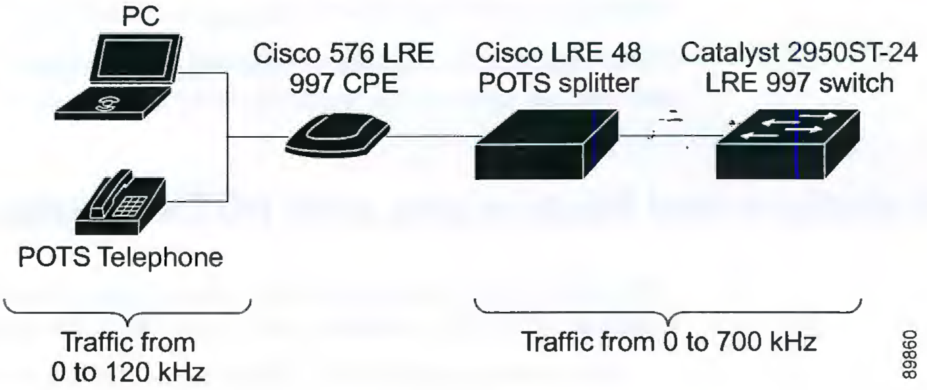
- The Catalyst 2950ST-24 LRE 997 switch and Cisco 576 LRE 997 CPE are designed to share lines with analog and ISDN telephones that use the 0 to 120 kHz frequency range.

- We recommend that *you do not use* a Cisco LRE 48 POTS Splitter with a Catalyst 2950ST-24 LRE 997 switch and a Cisco 576 LRE 997 CPE as shown in Figure 3-35. Only traffic in a specific frequency range can be sent to and from the devices attached to the CPE.

  In Figure 3-35, only traffic from 0 to 120 kHz can pass from a device attached to the CPE, such as a computer or telephone, to the CPE, a splitter, and a switch. In the reverse direction, traffic from 0 to 700 kHz can pass through the switch and splitter to the CPE, but only traffic from 0 to 120 kHz can pass through the CPE to a computer or a telephone.

  For more information, refer to the *Installation and Warranty Notes for the Cisco LRE 48 POTS Splitter*.

Figure 3-35 Limitations Using a Cisco LRE 48 POTS Splitter with a Catalyst 2950ST-24 LRE 997 Switch and a Cisco 576 LRE 997 CPE



PC
Cisco 576 LRE 997 CPE
Cisco LRE 48 POTS splitter
Catalyst 2950ST-24 LRE 997 switch
POTS Telephone
Traffic from 0 to 120 kHz
Traffic from 0 to 700 kHz
89860

Required Cables

Connecting the LRE port to a patch panel or a POTS splitter requires a male-to-male RJ-21 cable, Category 3 or above. You can order RJ-21 cables from your cable vendor, or you can order these cables from your Cisco sales representative:

- CAB-5-M120M120-5= (Category 5 cable with 90-degree, male-to-male RJ-21 connectors)
- CAB-5-M180M120-5= (Category 5 cable with 120-degree, male-to-male RJ-21 connectors)

The screws that you need to secure the cable to the switch are shipped with the cable. Contact your Cisco sales representative for more information.

Connecting to a Patch Panel or POTS Splitter

To connect the LRE port to a patch panel or POTS splitter, follow these steps:

Step 1 Connect one end of a cable connected to the wiring trunk to the RJ-21 connector (the LRE port) on the switch. (See Figure 3-36 and Figure 3-37.)

Step 2 Referring to Figure 3-36 and Figure 3-37, secure the cable to the switch:

- For a 90-degree connector, see the top of Figure 3-36 and Figure 3-37.
- For a 12-degree connector, see the bottom of Figure 3-36 and Figure 3-37.

Note The cable tie is not included with the connector and cable assembly.

Step 3 Connect the other end of the cable to the patch panel or POTS splitter.

Figure 3-36 Connecting to an LRE Port on a Catalyst 2950ST-8 LRE or 2950ST-24 LRE Switch

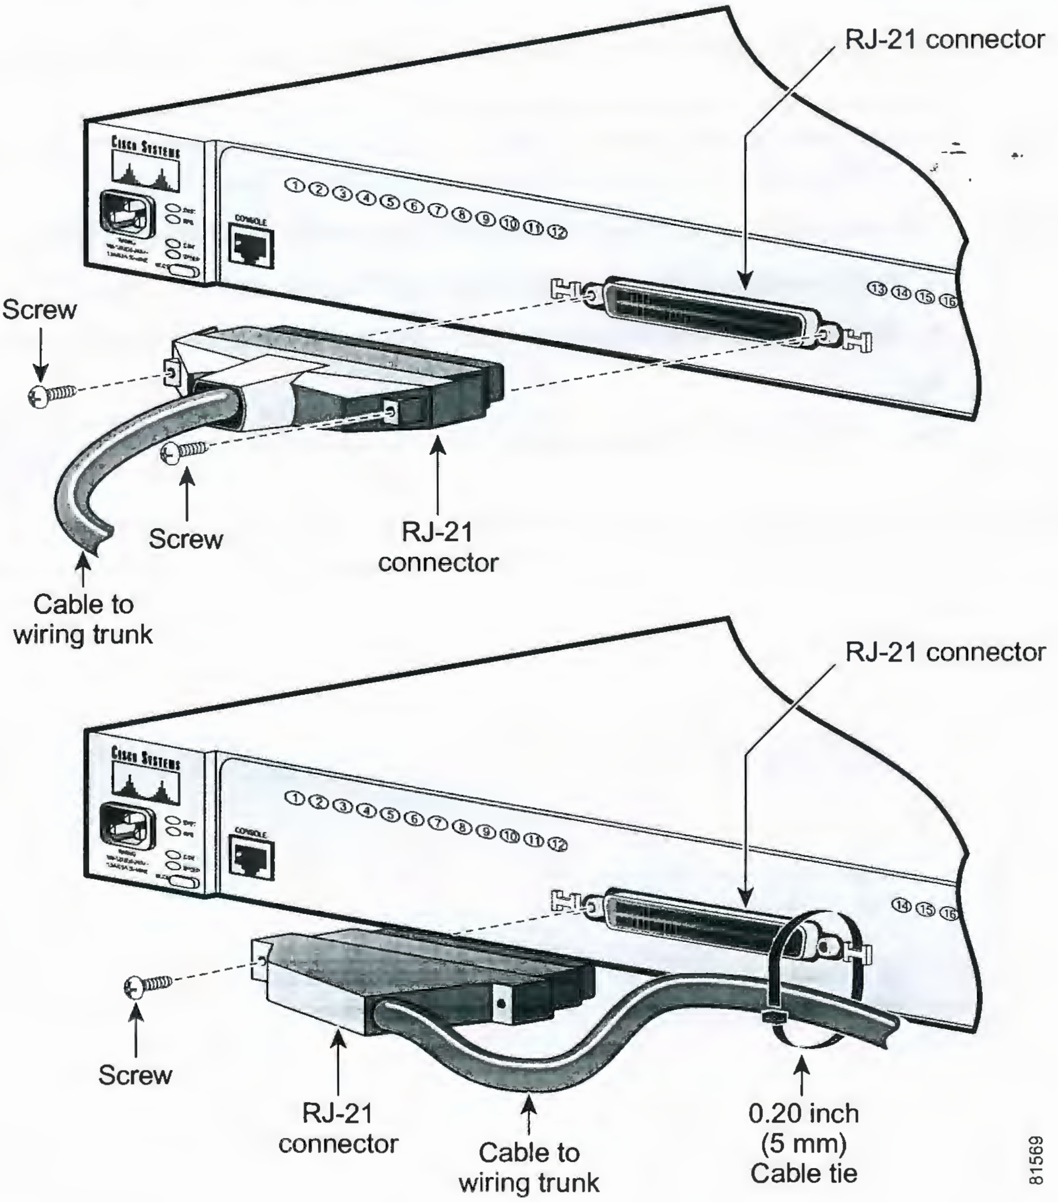


Figure 3-37 Connecting to an LRE Port on a Catalyst 2950ST-24 LRE 997 Switch

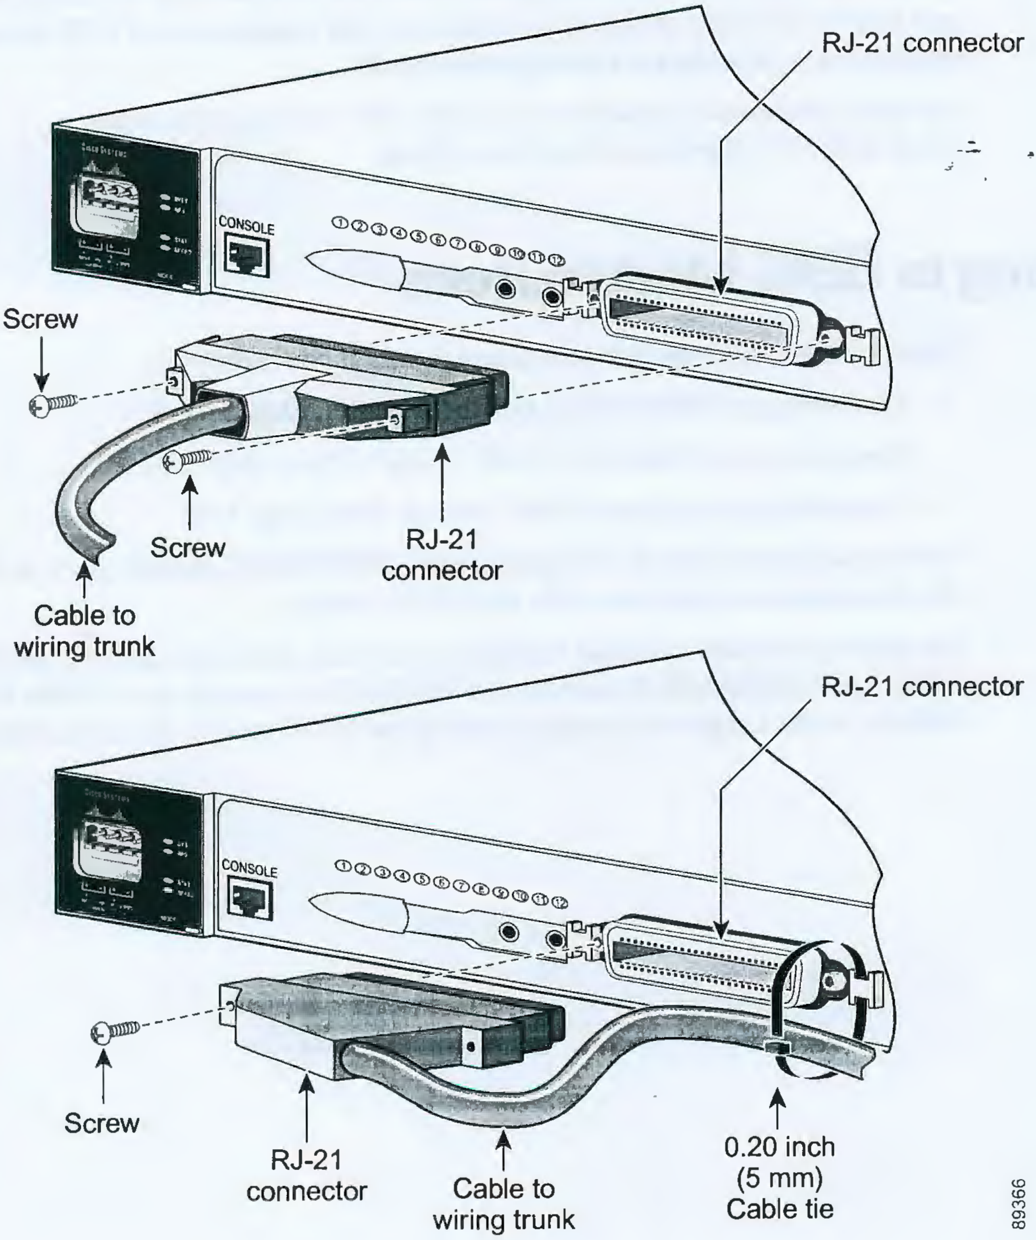


Each LRE port status LED turns on when it establishes a link with a Cisco LRE CPE device. For more information about the LRE link between the switch LRE port and the CPE and about the configuration and management of CPE devices, refer to the switch software configuration guide.

For more information about the Cisco LRE CPE devices, refer to the *Cisco LRE CPE Hardware Installation Guide.*

Connecting to GBIC Module Ports

These sections describe how to connect to a GBIC module port.

- Connecting to 1000BASE-X GBIC Module Ports, page 3-45
- Connecting to 1000BASE-T GBIC Module Ports, page 3-47
- Connecting to GigaStack GBIC Module Ports, page 3-48

For instructions about how to connect to the CWDM GBIC module ports, refer to the documentation that came with that GBIC module.

For detailed instructions about installing, removing, and connecting to the GBIC module (the 1000BASE-X module, the 1000BASE-T module, the CWDM GBIC module, or the GigaStack module), refer to the GBIC module documentation.

When connecting the ports on the Catalyst 2950G-24-EI-DC and Catalyst 2950ST-24 LRE 997 switches to other devices, follow these guidelines:

⚠ **Caution** To comply with the intrabuilding lightning surge requirements, intrabuilding wiring must be shielded, and the shield for the wiring must be grounded at both ends.

⚠ **Caution** The Catalyst 2950G-24-EI-DC or Catalyst 2950ST-24 LRE 997 switch is suitable only for intrabuilding or nonexposed wiring connections.

Connecting to 1000BASE-X GBIC Module Ports

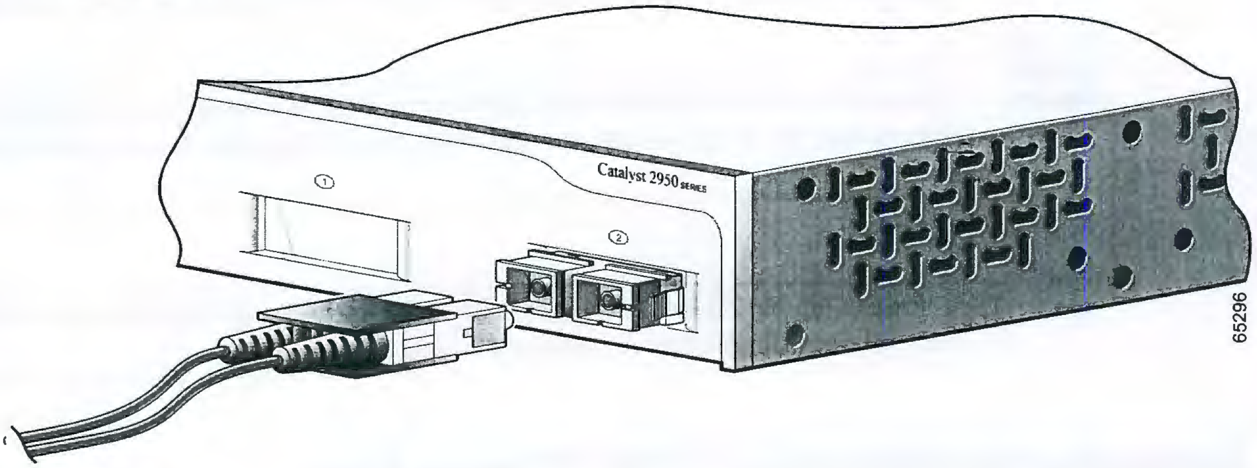
⚠ **Caution** Do not remove the rubber plugs from the GBIC module port or the rubber caps from the fiber-optic cable until you are ready to connect the cable. The plugs and caps protect the GBIC module ports and cables from contamination and ambient light.

After installing the 1000BASE-X GBIC in the GBIC module slot, follow these steps:

Step 1 Remove the rubber plugs from the GBIC module port, and store them for future use.

Step 2 Insert the SC connector in the fiber-optic receptacle (see Figure 3-38).

Figure 3-38 Connecting to a 1000 BASE-X GBIC Port



Step 3 Insert the other cable end in a fiber-optic receptacle on a target device.

Step 4 Observe the port status LED.

The LED turns green when the switch and the target device have an established link.

The LED turns amber while STP discovers the network topology and searches for loops. This process takes about 30 seconds, and then the port LED turns green.

If the LED is off, the target device might not be turned on, there might be a cable problem, or there might be problem with the adapter installed in the target device. See Chapter 3, "Troubleshooting," for solutions to cabling problems.

Step 5 Reconfigure and restart the switch or target device if necessary.

Connecting to 1000BASE-T GBIC Module Ports

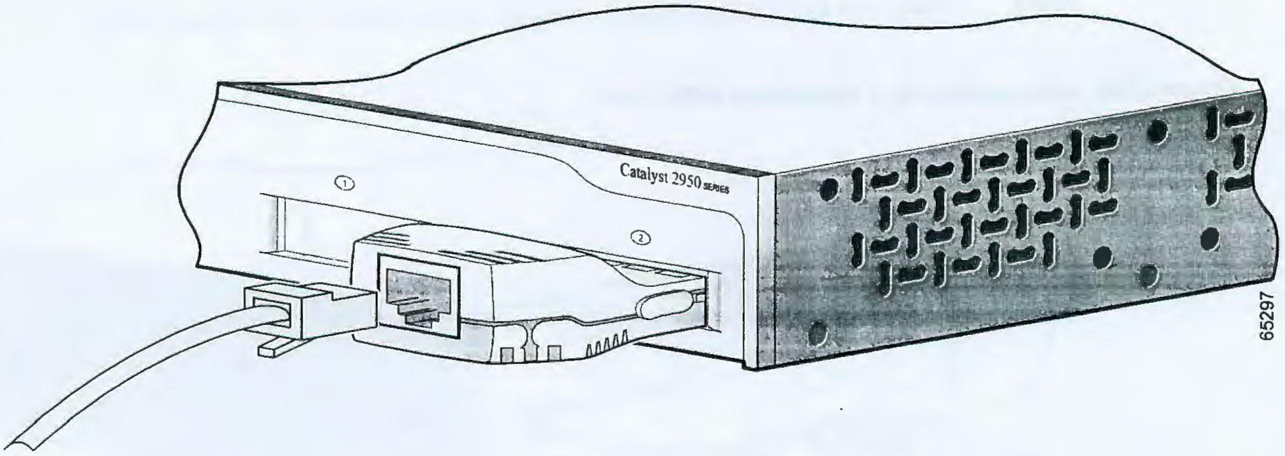
After installing the 1000BASE-T GBIC in the GBIC module slot, follow these steps:

Caution To prevent ESD damage, follow your normal board and component handling procedures.

Step 1 When connecting to servers, workstations, and routers, insert a four twisted-pair, straight-through cable in the RJ-45 connector. When connecting to switches or repeaters, insert a four twisted-pair, crossover cable (see Figure 3-39).

Note When connecting to a 1000BASE-T device, be sure to use a four twisted-pair, Category 5 cable.

Figure 3-39 Connecting to a 1000BASE-T GBIC Port



Step 2 Insert the other cable end in an RJ-45 connector on a target device.

Step 3 Observe the port status LED.

The LED turns green when the switch and the target device have an established link.

The LED turns amber while STP discovers the network topology and searches for loops. This process takes about 30 seconds, and then the LED turns green.

If the LED is off, the target device might not be turned on, there might be a cable problem, or there might be a problem with the adapter installed in the target device. See Chapter 3, "Troubleshooting," for solutions to cabling problems.

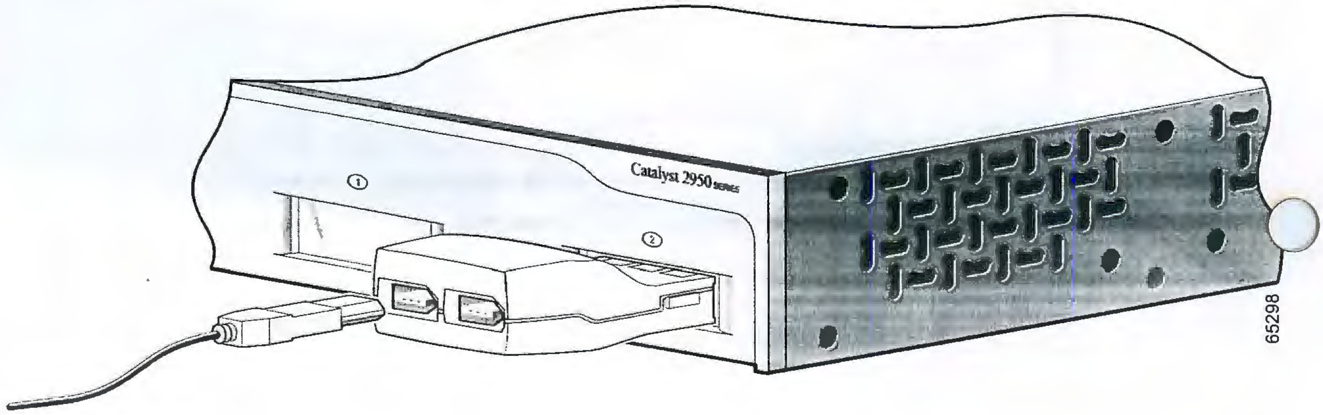
Step 4 Reconfigure and restart the switch or target device, if necessary.

Connecting to GigaStack GBIC Module Ports

After installing the GigaStack GBIC in the GBIC module slot, follow these steps:

Step 1 Insert the GigaStack cable connector in the GBIC (see Figure 3-40).

Figure 3-40 Connecting to a GigaStack GBIC Port



Step 2 Insert the other cable end in a port on a target device.

Step 3 Observe the port status LED.

The LED turns green when the switch and the target device have an established link.

The LED turns amber while STP discovers the network topology and searches for loops. This process takes about 30 seconds, and then the port LED turns green.

If the LED is off, the target device might not be turned on, there might be a cable problem, or there might be a problem with the adapter installed in the target device. See Chapter 4, “Troubleshooting,” for solutions to cabling problems.

Step 4 Reconfigure and restart the switch or target device, if necessary.

Connecting to an SFP Module

This section describes how to connect to an SFP module. For instructions about how to install or remove an SFP module, see the “Installing and Removing SFP Modules” section on page 3-28.

Caution Do not remove the rubber plugs from the SFP module port or the rubber caps from the fiber-optic cable until you are ready to connect the cable. The plugs and caps protect the SFP module ports and cables from contamination and ambient light.

Before connecting to an SFP module, be sure that you understand the port and cabling stipulations in Table 2-2 on page 2-16 and in the “SFP Module Slots” section on page 2-14. See Appendix B, “Connectors and Cables,” for information about the LC on the SFP module.

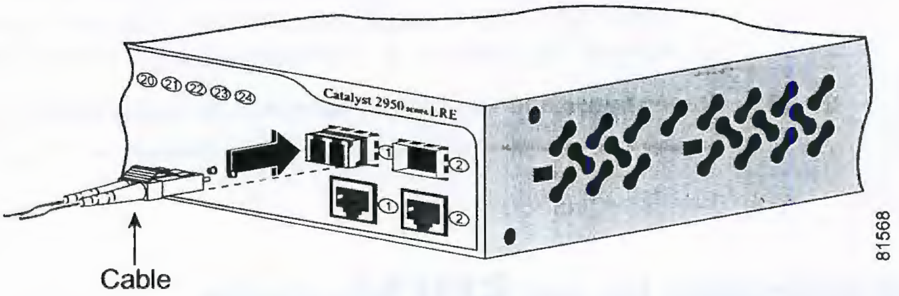
Note Refer to the Catalyst 2950 LRE release notes for the list of supported SFP modules.

Follow these steps to connect a fiber-optic cable to an SFP module:

Step 1 Remove the rubber plugs from the module port and fiber-optic cable, and store them for future use.

Step 2 Insert one end of the fiber-optic cable into the SFP module port (see Figure 3-41).

Figure 3-41 Connecting to an SFP Module Port



Step 3 Insert the other cable end in a fiber-optic receptacle on a target device.

Step 4 Observe the port status LED.

The LED turns green when the switch and the target device have an established link.

The LED turns amber while the STP discovers the network topology and searches for loops. This process takes about 30 seconds, and then the port LED turns green.

If the LED is off, the target device might not be turned on, there might be a cable problem, or there might be problem with the adapter installed in the target device. See Chapter 3, “Troubleshooting,” for solutions to cabling problems.

Step 5 If necessary, reconfigure and restart the switch or target device.

Where to Go Next

For information about starting up the switch, see Chapter 1, “Quick Installation.”

For information about configuring the switch, refer to the switch software configuration guide.

Apêndice FM

CISCO SYSTEMS

Data Sheet

Cisco Catalyst 2950 Series Switches with Cisco **Enhanced** Image Software

Product Overview

Cisco® Catalyst® 2950 Series switches are fixed-configuration, stackable models that provide wire-speed Fast Ethernet and Gigabit Ethernet connectivity for small and medium-sized networks. The Cisco Catalyst 2950 Series is an affordable product line that brings intelligent services, such as enhanced security, high availability and advanced quality of service (QoS), to the network edge—while maintaining the simplicity of traditional LAN switching. When a Cisco Catalyst 2950 Series Switch is combined with a Cisco Catalyst 3550 Series Switch, the solution can enable IP routing from the edge to the core of the network. Embedded in Cisco Catalyst 2950 Series switches is Cisco Cluster Management Suite (CMS) Software, which allows users to simultaneously configure and troubleshoot multiple Cisco Catalyst desktop switches using a standard Web browser. In addition to Cisco CMS Software, Cisco Catalyst 2950 Series switches provide extensive management tools using Simple Network Management Protocol (SNMP) network management platforms such as CiscoWorks.

This product line offers two distinct sets of software features and several configurations to allow small, medium-sized, and enterprise branch offices to select the right combination for the network edge. Cisco Standard Image (SI) Software offers Cisco IOS® Software functioning for basic data, video, and voice services. For networks with requirements for additional security, advanced QoS, and high availability, the Cisco Enhanced Image (EI) Software delivers intelligent services such as rate limiting and security filtering for deployment at the network edge.

The Cisco Catalyst 2950 Series switches consists of the following devices—which are only available with Cisco EI Software for the Cisco Catalyst 2950 Series.

- Catalyst 2950G-48—48 10/100 ports and 2 Gigabit Interface Converter (GBIC)-based Gigabit Ethernet ports
- Catalyst 2950G-24—24 10/100 ports and 2 GBIC ports
- Catalyst 2950G-24-DC—24 10/100 ports, 2 GBIC ports, and DC power
- Catalyst 2950G-12—12 10/100 ports and 2 GBIC ports
- Catalyst 2950T-24—24 10/100 ports and 2 fixed 10/100/1000BASE-T uplink ports
- Catalyst 2950C-24—24 10/100 ports and 2 fixed 100BASE-FX uplink ports

This complete set of switches offers network managers flexibility when selecting a migration path to Gigabit Ethernet. The two built-in Gigabit Ethernet ports on the Cisco Catalyst 2950G-12, 2950G-24, and 2950G-48 accommodate a range of GBIC transceivers, including the Cisco GigaStack® GBIC, as well as 1000BASE-SX, 1000BASE-LX/LH, 1000BASE-ZX, 1000BASE-T, and coarse-wave division multiplexing (CWDM) GBICs. The dual GBIC-based Gigabit Ethernet implementation provides customers with tremendous deployment flexibility—allowing customers increased availability with the redundant uplinks. In sum, the configuration permits customers to implement one type of stacking and uplink configuration today, while preserving the option to migrate to another configuration in the future. High levels of stack resiliency can also be implemented by deploying dual-redundant Gigabit Ethernet uplinks, a redundant GigaStack GBIC loopback cable, Cisco UplinkFast and CrossStack UplinkFast technologies for high-speed uplink and stack interconnection failover, and Per-VLAN Spanning Tree Plus (PVST+) for uplink load balancing.

The Cisco Catalyst 2950T-24 Switch offers small and medium-sized enterprises server connectivity and an easy migration path to Gigabit by using the existing copper cabling infrastructure. Implementing Gigabit Ethernet over copper allows network managers to boost network performance and maximize infrastructure investments in Category 5 copper cabling.

Maximum power availability for a converged voice and data network is attainable when a Cisco Catalyst 2950 Se Switch is combined with the Cisco Redundant Power System (RPS) 300 or RPS 675 for protection against interna power supply failures and an uninterruptable power supply (UPS) system to safeguard against power outages.

Other Cisco Catalyst 2950 Series Switches

Cisco Catalyst 2950 Series with Cisco SI Software

The Cisco Catalyst 2950SX-24, 2950-24, and 2950-12 switches are also members of the Cisco Catalyst 2950 Series. They are standalone, fixed-configuration, and managed 10/100 switches providing basic workgroup connectivity for small to medium-sized companies. These wire-speed desktop switches come with Cisco SI Software features and offer Cisco IOS Software functioning for basic data, video, and voice services at the edge of the network.

Cisco Catalyst 2950 Series Long-Reach Ethernet Switches

- *Cisco Catalyst 2950ST-24-LRE*—24 long-reach Ethernet (LRE) ports, 2 fixed 10/100/1000BASE-T ports, and two small form factor pluggable (SFP) ports (2 of the 4 uplinks active at one time)
- *Cisco Catalyst 2950ST-8-LRE*—Eight LRE ports, 2 fixed 10/100/1000BASE-T ports, and two SFP ports (two of the four uplinks active at one time)

The Cisco Catalyst 2950 Series LRE switch solution delivers cost-effective, high-performance broadband access over existing phone wiring in enterprise campus environments and multitenant buildings (hotels, apartment buildings, office buildings, for example). Cisco Catalyst 2950 Series LRE switches come with Cisco EI Software features, enabling enterprise and service provider customers to extend intelligent services over legacy wiring (Category 1, 2, and 3) to distances up to 5000 feet. Cisco is the only company with technologies that allow customers to deliver intelligent network services across any combination of wired and wireless infrastructures. Refer to the Cisco Catalyst 2950 Series LRE Data Sheet for more information.

Intelligence in the Network

Networks are evolving to address four new developments at the network edge:

- Increase in desktop computing power
- Introduction of bandwidth-intensive applications
- Expansion of highly sensitive data on the network
- Presence of multiple device types, such as IP phones and wireless LAN (WLAN) access points

These new demands are contending for resources with many existing mission-critical applications. As a result, IT professionals must view the edge of the network as critical to the effective management of the delivery of information and applications.

As companies increasingly rely on networks as the strategic business infrastructure, it is more important than ever to ensure high availability, security, scalability, and control. By adding Cisco intelligent functioning to the wiring closet, customers can now deploy network-wide intelligent services that address these requirements in a consistent way, from the desktop to the core and through the WAN.

With Cisco Catalyst switches, Cisco enables companies to fully realize the benefits of adding intelligent services into their networks. Making the network infrastructure highly available to accommodate time-critical needs, scalable to accommodate growth, secure enough to protect confidential information, and capable of differentiating and controlling traffic flows is critical to further optimizing network operations.

Network Security Through Advanced Security Features

Cisco Catalyst 2950 Series switches offer enhanced data security through numerous security features. These features allow customers to enhance LAN security with capabilities to secure network management traffic through the protection of passwords and configuration information; to provide options for network security based on users, ports, and Media Access Control (MAC) addresses; and to enable more immediate reactions to intruder and hacker detection. These security enhancements are available free of charge by downloading the latest software release for the Cisco Catalyst 3550 and 2950 series switches.

Secure Shell (SSH) and SNMPv3 protect information from tampering or eavesdropping by encrypting information being passed along the network, guarding administrative information. Private VLAN Edge isolates ports on a switch, ensuring that traffic travels directly from the entry point to the aggregation device through a virtual path and that it cannot be directed to another port. Local Proxy Address Resolution Protocol (ARP) works in conjunction with Private VLAN Edge to minimize broadcasts and maximize available bandwidth.

Port-based access control parameters (ACPs) restrict sensitive portions of the network by denying packets based on source and destination MAC addresses, IP addresses, or Transmission Control Protocol/User Datagram Protocol (TCP/UDP) ports. ACP lookups are performed in hardware; therefore, forwarding performance is not compromised when implementing this type of security in the network. In addition, time-based access control lists (ACLs) allow configuration of differentiated services based on time periods. ACLs can also be applied to filter traffic based on Differentiated Services Code Point (DSCP) values. Port security provides another means to ensure the appropriate user is on the network by limiting access based on MAC addresses.

For authentication of users with a Terminal Access Controller Access Control System (TACACS+) or Remote Authentication Dial-In User Service (RADIUS) server, 802.1x provides port-level security. In conjunction with a RADIUS server, 802.1x allows for dynamic port-based user authentication, which can be extended to dynamically assign a virtual LAN (VLAN) based on a specific user, regardless of where they connect on the network. This intelligent adaptability allows IT departments to offer greater flexibility and mobility to their stratified user populations. By combining access control and user profiles with secure network connectivity, services, and applications, enterprises can more effectively manage user mobility and drastically reduce the overhead associated with granting and managing access to network resources.

With multilayer Cisco Catalyst 2950 Series switches, network managers can implement high levels of console security. Multilevel access security on the switch console and the Web-based management interface prevent unauthorized users from accessing or altering switch configuration. TACACS+ or RADIUS authentication enables centralized access control of the switch and restricts unauthorized users from altering the configuration. Deploying security can be done through Cisco CMS Software security wizards, which ease the deployment of security features that restrict user access to a server, a portion of the network, or the entire network.

Network Control Through Advanced QoS and Rate Limiting

Cisco Catalyst 2950 Series switches offer superior and highly granular QoS based on Layer 2–4 information to ensure that network traffic is classified and prioritized, and that congestion is avoided in the best possible manner. Configuration of QoS is greatly simplified through automatic QoS (auto-QoS), a feature that detects Cisco IP phones and automatically configures switches for the appropriate classification and egress queuing. This optimizes traffic prioritization and network availability without the challenge of a complex configuration.

Cisco Catalyst 2950 Series switches can classify, reclassify, police (determine if the packet is in or out of predetermined profiles and affect actions on the packet), and mark or drop the incoming packets before the packet is placed in the shared buffer. Packet classification allows the network elements to discriminate between various traffic flows and enforce policies based on Layer 2 and Layer 3 QoS fields.

To implement QoS, these switches first identify traffic flows (or packet groups) and classify or reclassify these groups using the DSCP field in the IP packet or the 802.1p class of service (CoS) field in the Ethernet packet. Classification and reclassification can also be based on criteria as specific as the source/destination IP address, source/destination MAC address, or the Layer 4 TCP/UDP ports. At the ingress (incoming port) level, the Cisco Catalyst switches will also perform policing and marking of the packet.

After the packet goes through classification, policing, and marking, it is assigned to the appropriate queue before exiting the switch. Cisco Catalyst 2950 Series switches support four egress (outgoing port) queues per port, which allows the network administrator to be more discriminating and specific in assigning priorities for the various applications on the LAN. At the egress level, the switch performs scheduling, which is a process that determines the order in which the queues are processed. The switches support Weighted Round Robin (WRR) scheduling or strict priority scheduling. The WRR scheduling algorithm ensures that lower priority packets are not entirely starved for bandwidth and are serviced without compromising the priority settings administered by the network manager. Strict priority scheduling ensures that the highest priority packets will always get serviced first, ahead of all other traffic, and that the other three queues will be serviced using WRR best effort.

These features allow network administrators to prioritize mission-critical or bandwidth-intensive traffic, such as enterprise resource planning (ERP) (Oracle, SAP, and so on), voice (IP telephony traffic), and CAD/CAM over less time-sensitive applications such as File Transfer Protocol (FTP) or e-mail (SMTP). For example, it would be highly undesirable to have a large file download destined to one port on a wiring closet switch and have quality implications, such as increased latency in voice traffic, destined to another port on this switch. This condition is avoided by ensuring that voice traffic is properly classified and prioritized throughout the network. Other applications, such as Web browsing, can be treated as low priority and handled on a best-effort basis.

Cisco Catalyst 2950 Series switches are capable of allocating bandwidth based on several criteria, including MAC source address, MAC destination address, IP source address, IP destination address, and TCP/UDP port number. Bandwidth allocation is essential in network environments that require service-level agreements, or when it is necessary for the network manager to control the bandwidth given to certain users. Cisco Catalyst 2950 Series switches support up to 6 policers per Fast Ethernet port and up to 60 policers on a Gigabit Ethernet port, giving the network administrator granular control of LAN bandwidth.

Network Availability

To provide efficient use of resources for bandwidth-hungry applications like multicasts, Cisco Catalyst 2950 Series switches support Internet Group Management Protocol (IGMP) snooping in hardware. Through the support and configuration of IGMP snooping via Cisco CMS Software, Cisco Catalyst 2950 Series switches deliver outstanding performance and ease of use in administering and managing multicast applications on the LAN.

The IGMP snooping feature allows the switch to "listen in on" the IGMP conversation between hosts and routers. When a switch hears an "IGMP join" request from a host for a given multicast group, the switch adds the host's port number to the group destination address (GDA) list for that group. When the switch hears an "IGMP leave" request, it removes the host's port from the content-addressable memory (CAM) [CAM ACRONYM IS USED TWICE IN DIFFERENT CONTEXTS] table entry.

PVST+ allows users to implement redundant uplinks while distributing traffic loads across multiple links. This is not possible with standard Spanning-Tree Protocol implementations. Cisco UplinkFast technology helps ensure immediate transfer to the secondary uplink, an improvement over the traditional 30-to-60 second convergence time. An additional feature that enhances performance is Voice VLAN, which allows network administrators to assign voice traffic to a VLAN dedicated to IP telephony—simplifying phone installations and providing easier network traffic administration and troubleshooting.

Multicast VLAN Registration (MVR) is designed for applications that use wide-scale deployment of multicast traffic across an Ethernet-ring-based service provider network (for example, the broadcast of multiple television channels over a service-provider network). MVR allows a subscriber on a port to subscribe and unsubscribe to a multicast stream on the network-wide multicast VLAN.

Network Management

Cisco CMS Software is Web-based and embedded in Cisco Catalyst 3550, 2950, 3500 XL, 2900 XL, and 2900 LRE XL series switches. Through Cisco switch clustering technology, users can access Cisco CMS Software with any standard Web browser to manage up to 16 of these switches at once, regardless of their geographic proximity—with the option of using a single IP address for the entire cluster if desired. With the addition of the Cisco Catalyst 3550 Series switches, Cisco CMS Software can now extend beyond routed boundaries for even more flexibility in managing a Cisco cluster.

Cisco CMS Software provides an integrated management interface for delivering intelligent services, such as multilayer switching, QoS, multicast, and security ACLs. Cisco CMS Software allows administrators to take advantage of benefits formerly reserved for only the most advanced networks without having to learn the command-line interface (CLI) or even the details of the technology.

The new Guide Mode in Cisco CMS Software leads the user step-by-step through the configuration of advanced features and provides enhanced online help for context-sensitive assistance. In addition, Cisco AVVID (Architecture for Voice, Video and Integrated Data) wizards provide automated configuration of the switch to optimally support video streaming or videoconferencing, voice over IP (VoIP), and mission-critical applications. These wizards can save hours of time for network administrators, eliminate human errors, and help ensure that the configuration of the switch is optimized for these applications.

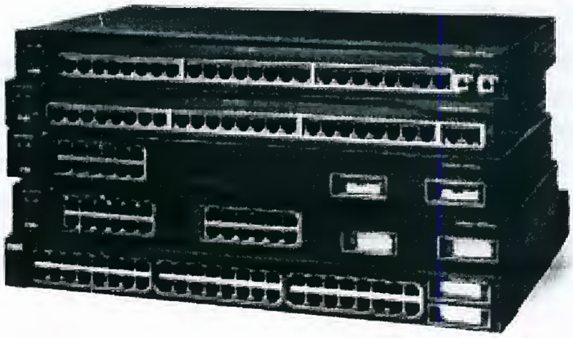
Cisco CMS Software supports standards-based connectivity options such as Ethernet, Fast Ethernet, Fast EtherChannel, Gigabit Ethernet, and Gigabit EtherChannel connectivity. Because Cisco switch clustering technology is not limited to a single stack of switches, Cisco CMS Software expands the traditional cluster domain beyond single wiring closet and saves time and effort for network administrators.

Cisco Catalyst 2950 Series switches can be configured either as command or member switches in a Cisco switch cluster. Cisco CMS Software also allows the network administrator to designate a standby or redundant command switch, which takes the commander duties should the primary command switch fail. Other features include the ability to configure multiple ports and switches simultaneously, to perform software updates across the entire cluster at once, and to clone configurations to other clustered switches for rapid network deployment. Bandwidth graphs and link reports provide useful diagnostic information, and the topology map gives network administrators a quick view of the network status.

In addition to Cisco CMS Software, Cisco Catalyst 2950 Series switches provide extensive management tools using SNMP network management platforms such as CiscoWorks for switched internetworks.

Cisco Catalyst 2950 Series switches deliver a comprehensive set of management tools to provide the required visibility and control in the network (Figure 1). Managed with CiscoWorks, Cisco Catalyst switches can be configured and managed to deliver end-to-end device, VLAN, traffic, and policy management. Coupled with CiscoWorks, Cisco Resource Manager Essentials, a Web-based management tool, offers automated inventory collection, software deployment, easy tracking of network changes, views into device availability, and quick isolation of error conditions.

Figure 1
Cisco Catalyst 2950 Series Switches



Product Features and Benefits

Table 1 lists the features and benefits of the Cisco Catalyst 2950 Series switches.

Table 1 Features and Benefits

Feature	Benefit
Availability	
Superior redundancy for fault backup	• IEEE 802.1D Spanning-Tree Protocol support for redundant backbone connections and loop-free networks simplifies network configuration and improves fault tolerance. • Support for Cisco Spanning-Tree Protocol enhancements such as UplinkFast, BackboneFast, and PortFast technologies ensure quick failover recovery, enhancing overall network stability and availability. • IEEE 802.1w Rapid Spanning-Tree Protocol (RSTP) provides rapid convergence of the spanning tree independent of spanning-tree timers. • Cisco CrossStack UplinkFast technology extends UplinkFast to a stack to ensure quick failover recovery, enhancing network stability and availability. • Support for the optional 300-watt or 675-watt redundant Cisco AC power system provides a backup power source for up to 4 or 6 units, respectively, for improved fault tolerance and network uptime. • Redundant stacking connections provide support for a redundant loopback connection for top and bottom switches in an independent stack backplane cascaded configuration. • Command switch redundancy enabled in Cisco CMS Software allows customers to designate a backup command switch that takes over cluster management functions if the primary command switch fails. • Unidirectional link detection (UDLD) and aggressive UDLD features detect and disable unidirectional links on fiber-optic interfaces caused by incorrect fiber-optic wiring or port faults.
Integrated Cisco IOS Software features for bandwidth optimization	• Bandwidth aggregation of up to 4 Gbps (2 ports full duplex) through Cisco Gigabit EtherChannel® technology and up to 16 Gbps (8 ports full duplex) through Fast EtherChannel technology enhances fault tolerance and offers higher-speed aggregated bandwidth between switches, to routers and individual servers. Port Aggregation Protocol (PAgP) is available to simplify configuration. • Per-port broadcast, multicast, and unicast storm control prevents faulty end stations from degrading overall systems performance. • PVST+ allows for Layer 2 load sharing on redundant links to efficiently use the extra capacity inherent in a redundant design. • IEEE 802.1s Multiple Spanning-Tree Protocol (MSTP) allows a spanning tree instance per VLAN, enabling Layer 2 load sharing on redundant links. • VLAN Trunking Protocol (VTP) pruning limits bandwidth consumption on VTP trunks by flooding broadcast traffic only on trunk links required to reach the destination devices. Dynamic Trunking Protocol (DTP) enables dynamic trunk configuration across all ports in the switch. • IGMP snooping provides for fast client joins and leaves of multicast streams and limits bandwidth-intensive video traffic to only the requestors. MVR, IGMP filtering, fast-join, and immediate leave are available as enhancements. • MVR continuously sends multicast streams in a multicast VLAN while isolating the streams from subscriber VLANs for bandwidth and security reasons. • Supports additional frame formats: Ethernet II (tagged and untagged), 802.3 (sequence number protection [SNAP] encapsulated tagged and untagged frames)

Feature	Benefit
Security	
Network-wide security features	• Filtering of incoming traffic flows based on Layer 2–4 ACPs prevents unauthorized data flows. – The following Layer 2 ACPs (or a combination) can be used for security classification of incoming packets: source MAC address, destination MAC address, and 16-bit Ethertype. – The following Layer 3 and Layer 4 fields (or a combination) can be used for security classification of incoming packets: source IP address, destination IP address, TCP source or destination port number, UDP source, or destination port number. ACLs can also be applied to filter based on DSCP values. – Time-based ACLs allow configuration of differentiated services based on time periods. • A private VLAN edge provides security and isolation between ports on a switch, helping to ensure that voice traffic travels directly from its entry point to the aggregation device through a virtual path and that it cannot be directed to a different port. • Support for the 802.1x standard allows users to be authenticated, regardless of which LAN port they are accessing, and provides unique benefits to customers who have a large base of mobile (wireless) users accessing the network. . 802.1x with VLAN assignment allows a dynamic VLAN assignment for a specific user, regardless of where the user is connected. . 802.1x with an ACL assignment allows for specific security policies based on a user, regardless of where the user is connected. . 802.1x with Voice VLAN gives an IP phone access to the Voice VLAN regardless of the authorized or unauthorized state of the port. • 802.1x with port security enables authenticating the port and managing network access for all MAC addresses, including that of the client. • SSH and SNMPv3 provides network security by encrypting administrator traffic during Telnet and SNMP sessions. SSH and the crypto version of SNMPv3 require a special crypto software image due to U.S. export restrictions. • Port Security secures the access to a port based on the MAC address of a user's device. The aging feature removes the MAC address from the switch after a specific timeframe to allow another device to connect to the same port. • MAC Address Notification allows administrators to be notified of new users added or removed from the network. • Spanning-tree root guard (STRG) prevents edge devices not in the network administrator's control from becoming Spanning-Tree Protocol root nodes. • The Spanning-Tree Protocol PortFast/bridge protocol data unit (BPDU) guard feature disables access ports with Spanning-Tree Protocol PortFast-enabled upon reception of a BPDU, and increases network reliability, manageability, and security. • Multilevel security on console access prevents unauthorized users from altering the switch configuration. • TACACS+ and RADIUS authentication enables centralized control of the switch and restricts unauthorized users from altering the configuration. • The user-selectable address-learning mode simplifies configuration and enhances security. • Trusted Boundary provides the ability to trust the QoS priority settings if an IP phone is present and to disable the trust setting in the event that the IP phone is removed, preventing a rogue user from overriding prioritization policies in the network. • IGMP Filtering provides multicast authentication by filtering out nonsubscribers and limiting the number of concurrent multicast streams available per port. • Support for dynamic VLAN assignment through implementation of the VLAN Membership Policy Server (VMPS) client function provides flexibility in assigning ports to VLANs. Dynamic VLAN enables fast assignment of IP addresses. • Cisco CMS Software security wizards ease the deployment of security features for restricting user access to a server, a portion of the network, or the entire network.

Feature	Benefit
QoS	
Overview	• The switches support the aggregate QoS model by enabling classification, policing/ metering, and marking functions on a per-port basis at ingress and the queuing/ scheduling function at egress. • The switches support configuring QoS ACPs on all ports to ensure proper policing and marking on a per-packet basis using ACPs. Up to 4 ACPs per switch are supported in configuring either QoS ACPs or security filters. • Auto-QoS greatly simplifies the configuration of QoS in VoIP networks by issuing interface and global switch commands that allow the detection of Cisco IP phones, the classification of traffic, and egress queue configuration.
Qos classification support at ingress	• The switches support QoS classification of incoming packets for QoS flows based on Layer 2–4 fields. • The following Layer 2 fields (or a combination) can be used for classifying incoming packets to define QoS flows: source MAC address, destination MAC address, and 16-bit Ethertype. • The switches support identification of traffic based on Layer 3 type of service (ToS) field and DSCP values. • The following Layer 3 and 4 fields (or a combination) can be used to classify incoming packets to define QoS flows: source IP address, destination IP address, TCP source or destination port number, and UDP source or destination port number.
Qos metering/ policing at ingress	• Support for metering/policing of incoming packets restricts incoming traffic flows to a certain rate. • The switches support up to 6 policers per Fast Ethernet port, and 60 policers on a Gigabit Ethernet port. • The switches offer granularity of traffic flows at 1 Mbps on Fast Ethernet ports, and 8 Mbps on Gigabit Ethernet ports.
Qos marking at ingress	• The switches support marking/remarking packets based on state of policers/meters. • The switches support marking/remarking based on the following mappings: from DSCP to 802.1p, and from 802.1p to DSCP. • The switches support 14 widely used DSCP values. • The switches support classifying or reclassifying packets based on default DSCP per port. They also support classification based on DSCP values in the ACL. • The switches support classifying or reclassifying frames based on the default 802.1p value per port. • The switches support 802.1p override at ingress.
QoS scheduling support at egress	• 4 queues per egress port are supported in hardware. • The WRR queuing algorithm ensures that low-priority queues are not starved. • Strict-priority queue configuration via Strict Priority Scheduling ensures that time-sensitive applications such as voice always follow an expedited path through the switch fabric.
Sophisticated traffic management	• The switch supports up to 6 policers per Fast Ethernet port and up to 60 policers on a Gigabit Ethernet port. • The switch offers granularity of traffic flows at 1 Mbps on Fast Ethernet ports and 8 Mbps on Gigabit Ethernet ports. • The switch offers the ability to limit data flows based on MAC source/destination address, IP source/destination address, TCP/UDP port numbers, or any combination of these fields. • The switch offers the ability to manage data flows asynchronously upstream and downstream from the end station or on the uplink.

Feature	Benefit
Management	
Superior manageability	• An embedded Remote Monitoring (RMON) software agent supports 4 RMON groups (history, statistics, alarms, and events) for enhanced traffic management, monitoring, and analysis. • The switch supports all 9 RMON groups through the use of a Cisco SwitchProbe® Analyzer (Switched Port Analyzer [SPAN]) port, permitting traffic monitoring of a single port, a group of ports, or the entire switch from a single network analyzer or RMON probe. • A SPAN port monitors traffic of a single port from a single network analyzer or RMON probe. • Remote Switch Port Analyzer (RSPAN) allows network administrators to locally monitor ports in a Layer 2 switch network from any other switch in the same network. • The Domain Name System (DNS) provides IP address resolution with user-defined device names. • Trivial File Transfer Protocol (TFTP) reduces the cost of administering software upgrades by downloading from a centralized location. • Network Timing Protocol (NTP) provides an accurate and consistent timestamp to all switches within the intranet. • Layer 2 Traceroute eases troubleshooting by identifying the physical path that a packet takes from the source device to a destination device. • Crash Information Support enables a switch to generate a crash file for improved troubleshooting. • Show-interface-capabilities provides information on configuration capabilities of any interface. • The RTTMON [EXPAND?] Management Information Base (MIB) allows users to monitor network performance between a Cisco Catalyst switch and a remote device. • Multifunction LEDs per port for port status, half-duplex/full-duplex, 10BASE-T/100BASE-TX/1000BASE-T indication, as well as switch-level status LEDs for system, redundant power supply, and bandwidth utilization, provide a comprehensive and convenient visual management system.
Management	

Feature	Benefit
Cisco CMS Software	• Cisco CMS Software allows the user to manage up to 16 interconnected Cisco Catalyst 3550, 2950, 3500 XL, 2900 XL, and 2900 LRE XL series switches without the limitation of being physically located in the same wiring closet, and with the option of using a single IP address for the entire cluster if desired. Full backward compatibility helps ensure that any combination of the above switches can be managed with a Cisco Catalyst 2950 Series switch. • Cisco AVVID wizards use just a few user inputs to automatically configure the switch to optimally handle different types of traffic—voice, video, multicast, or high-priority data. • A security wizard is provided to restrict unauthorized access to servers and networks, and to restrict certain applications on the network. • One-click software upgrades can be performed across the entire cluster simultaneously, and configuration cloning enables rapid deployment of networks. • Cisco CMS Software has been extended to include multilayer feature configurations such as ACPs and QoS parameters. • Cisco CMS Software Guide Mode assists users in the configuration of powerful advanced features by providing step-by-step instructions. • Cisco CMS Software provides enhanced online help for context-sensitive assistance. • An easy-to-use graphical interface provides both a topology map and a front-panel view of the cluster. • Multidevice and multiport configuration capabilities allow network administrators to save time by configuring features across multiple switches and ports simultaneously. • Ability to launch the Web-based management for a Cisco Aironet® Wireless Access Point by simply clicking on its icon in the topology map. • A user-personalized interface allows users to modify polling intervals, table views, and other settings within Cisco CMS Software and to retain these settings the next time they use the software. • Alarm notification provides automated e-mail notification of network errors and alarm thresholds.
Support for CiscoWorks	• Manageable through CiscoWorks network management software on a per-port and per-switch basis provides a common management interface for Cisco routers, switches, and hubs. • SNMP v1, v2, and v3 (non-crypto) and Telnet interface support delivers comprehensive in-band management, and a CLI-based management console provides detailed out-of-band management. • Cisco Discovery Protocol Versions 1 and 2 enable a CiscoWorks network management station to automatically discover the switch in a network topology. • Supported by the CiscoWorks LAN Management Solution.
Management	

Feature	Benefit
Ease of use and ease of deployment	• The Cisco GigaStack® GBIC delivers a hardware-based, independent stacking bus with up to a 2-Gbps forwarding rate in a point-to-point configuration, or 1 Gbps of forwarding bandwidth when daisy-chained [OKAY TERM?] with up to 9 switches. • Autoconfiguration eases the deployment of switches in the network by automatically configuring multiple switches across a network via a boot [P?] server. • Auto-QoS greatly simplifies the configuration of QoS in VoIP networks by issuing interface and global switch commands that allow the detection of Cisco IP phones, the classification of traffic, and egress queue configuration. • Autosensing on each non-GBIC port detects the speed of the attached device and automatically configures the port for 10-, 100-, or 1000-Mbps operation, easing the deployment of the switch in mixed 10, 100, and 1000BASE-T environments. • Autonegotiating on all ports automatically selects half- or full-duplex transmission mode to optimize bandwidth. • Cisco VTP supports dynamic VLANs and dynamic trunk configuration across all switches. • Voice VLAN simplifies telephony installations by keeping voice traffic on a separate VLAN for easier network administration and troubleshooting. • DTP enables dynamic trunk configuration across all ports in a switch. • PAgP automates the creation of Cisco Fast EtherChannel or Gigabit EtherChannel groups, enabling linking to another switch, router, or server. • Link Aggregation Control Protocol (LACP) allows the creation of Ethernet channeling with devices that conform to IEEE 802.3ad. This is similar to Cisco EtherChannel and PAgP. • IEEE 802.3z-compliant 1000BASE-SX, 1000BASE-LX/LH, 1000BASE-ZX, and 1000BASE-T physical interface support through a field-replaceable GBIC module provides customers unprecedented flexibility in switch deployment. • The default configuration stored in Flash memory ensures that the switch can be quickly connected to the network and can pass traffic with minimal user intervention. • The switches support nonstandard Ethernet frame sizes (mini-giants) up to 1542 bytes (configurations with GBIC ports only).

Product Specifications

Feature	Description
Performance	• 13.6-Gbps switching fabric • Cisco Catalyst 2950G-48: 13.6 Gbps maximum forwarding bandwidth • Cisco Catalyst 2950G-24: 8.8 Gbps maximum forwarding bandwidth • Cisco Catalyst 2950G-24-DC: 8.8 Gbps maximum forwarding bandwidth • Cisco Catalyst 2950G-12: 6.4 Gbps maximum forwarding bandwidth • Cisco Catalyst 2950T-24: 8.8 Gbps maximum forwarding bandwidth • Cisco Catalyst 2950C-24: 5.2 Gbps maximum forwarding bandwidth (Forwarding rates based on 64-byte packets) • Cisco Catalyst 2950G-48: 10.1-Mpps wire-speed forwarding rate • Cisco Catalyst 2950G-24: 6.6-Mpps wire-speed forwarding rate • Cisco Catalyst 2950G-24-DC: 6.6-Mpps wire-speed forwarding rate • Cisco Catalyst 2950G-12: 4.8-Mpps wire-speed forwarding rate • Cisco Catalyst 2950T-24: 6.6-Mpps wire-speed forwarding rate • Cisco Catalyst 2950C-24: 3.9-Mpps wire-speed forwarding rate • 8 MB memory architecture shared by all ports • Up to 16 MB SDRAM and 8 MB Flash memory • Configurable up to 8000 MAC addresses • Configurable maximum transmission unit (MTU) of up to 1530 bytes (Cisco Catalyst 2950G switches only)
Management	• [CISCO?] BRIDGE-MIB • CISCO-BULK-FILE-MIB • CISCO-2900-MIB • CISCO-CDP-MIB • CISCO-CLASS-BASED-QOS-MIB • CISCO-CLUSTER-MIB • CISCO-CONFIG-COPY-MIB • CISCO-CONFIG-MAN-MIB • CISCO-ENVMON-MIB • CISCO-FLASH-MIB • CISCO-FTP-CLIENT-MIB • CISCO-IMAGE-MIB • CISCO-IPMROUTE-MIB • CISCO-MAC-NOTIFICATION-MIB • CISCO-MEMORY-POOL-MIB • CISCO-PAGP-MIB • CISCO-PING-MIB • CISCO-PROCESS-MIB • CISCO-PRODUCTS-MIB • CISCO-RTTMON-MIB • CISCO-SMI • CISCO-STACKMAKER-MIB • CISCO-STP-EXTENSIONS-MIB • CISCO-SYSLOG-MIB • CISCO-TC • CISCO-TCP-MIB

Feature	Description
Management	• CISCO-VLAN-MEMBERSHIP-MIB • CISCO-VTP-MIB • ENTITY-MIB • IANAifType-MIB • IF-MIB (RFC 1573) • OLD-CISCO-CHASSIS-MIB • OLD-CISCO-CPU-MIB • OLD-CISCO-INTERFACES-MIB • OLD-CISCO-IP-MIB • OLD-CISCO-MEMORY-MIB • OLD-CISCO-SYSTEM-MIB • OLD-CISCO-TCP-MIB • OLD-CISCO-TS-MIB • RFC1213-MIB (MIB-II) • RFC1398-MIB (ETHERNET-MIB) • RMON-MIB (RFC 1757) • RS-232-MIB • SNMPv2-MIB • SNMPv2-SMI • SNMPv2-TC • TCP-MIB • UDP-MIB
Standards	• IEEE 802.1x support • IEEE 802.1w • IEEE 802.1s • IEEE 802.3x full duplex on 10BASE-T, 100BASE-TX, and 1000BASE-T ports • IEEE 802.1D Spanning-Tree Protocol • IEEE 802.1p CoS prioritization • IEEE 802.1Q VLAN • IEEE 802.3 10BASE-T specification • IEEE 802.3u 100BASE-TX specification • IEEE 802.3ab 1000BASE-T specification • IEEE 802.3ad • IEEE 802.3z 1000BASE-X specification • 1000BASE-X (GBIC) • 1000BASE-T (GBIC) • 1000BASE-SX • 1000BASE-LX/LH • 1000BASE-ZX • 1000BASE-CWDM GBIC 1470 nm • 1000BASE-CWDM GBIC 1490 nm • 1000BASE-CWDM GBIC 1510 nm • 1000BASE-CWDM GBIC 1530 nm • 1000BASE-CWDM GBIC 1550 nm • 1000BASE-CWDM GBIC 1570 nm • 1000BASE-CWDM GBIC 1590 nm • 1000BASE-CWDM GBIC 1610 nm

Feature	Description
Standards	• RMON I and II standards • SNMPv1, v2c, and v3 (planned future support for v3)
Y2K	• Y2K compliant
Connectors and cabling	• 10BASE-T ports: RJ-45 connectors; two-pair Category 3, 4, or 5 unshielded twisted-pair (UTP) cabling • 100BASE-TX ports: RJ-45 connectors; two-pair Category 5 UTP cabling • 1000BASE-T ports: RJ-45 connectors; two-pair Category 5 UTP cabling • 100BASE-FX ports: MT-RJ connectors, 50/125 or 62.5/125 micron multimode fiber-optic cabling • 1000BASE-T, 1000BASE-SX, -LX/LH, -ZX GBIC-based ports: SC fiber connectors, single-mode or multimode fiber • Cisco GigaStack GBIC ports: copper-based Cisco GigaStack cabling • Management console port: 8-pin RJ-45 connector, RJ-45-to-RJ-45 rollover cable with RJ-45-to-DB9 adapter for PC connections; for terminal connections, use RJ-45-to-DB25 female data-terminal-equipment (DTE) adapter (can be ordered separately from Cisco, part number ACS-DSBUASYN=)
MT-RJ patch cables for Cisco Catalyst 2950C-24 Switch	*Type of cable, Cisco part number* • 1-meter, MT-RJ-to-SC multimode cable, CAB-MTRJ-SC-MM-1M • 3-meter, MT-RJ-to-SC multimode cable, CAB-MTRJ-SC-MM-3M • 5-meter, MT-RJ-to-SC multimode cable, CAB-MTRJ-SC-MM-5M • 1-meter, MT-RJ-to-ST multimode cable, CAB-MTRJ-ST-MM-1M • 3-meter, MT-RJ-to-ST multimode cable, CAB-MTRJ-ST-MM-3M • 5-meter, MT-RJ-to-ST multimode cable, CAB-MTRJ-ST-MM-5M
Power connectors	Customers can provide power to a switch by using either the internal power supply or the Cisco RPS 300. The connectors are located at the back of the switch. Internal power supply connector • The internal power supply is an autoranging unit. • The internal power supply supports input voltages between 100 and 240 VAC. • The supplied AC power cord should be used to connect the AC power connector to an AC power outlet. Cisco RPS 675 Connector • The connector offers connection for an optional Cisco RPS 675 that uses AC input and supplies DC output to the switch. • The connector offers a 675-watt redundant power system that can support six external network devices and provides power to one failed device at a time. • The connector automatically senses when the internal power supply of a connected device fails and provides power to the failed device, preventing loss of network traffic. • Attach only the Cisco RPS 675 (model PWR675-AC-RPS-NI=) to the RPS receptacle with this connector. Cisco RPS 300 Connector • The connector offers connection for an optional Cisco RPS 300 that uses AC input and supplies DC output to the switch. • The connector offers a 300-watt redundant power system that can support six external network devices and provides power to one failed device at a time. • The connector automatically senses when the internal power supply of a connected device fails and provides power to the failed device, preventing loss of network traffic. • Attach only the Cisco RPS 300 (model PWR300-AC-RPS-N1) to the RPS receptacle with this connector.

Feature	Description
Indicators	• Per-port status LEDs: link integrity, disabled, activity, speed, and full-duplex indications. • System status LEDs: system, RPS, and bandwidth utilization indications.
Dimensions (H x W x D) and weight	• 1.72 x 17.5 x 9.52 in. (4.36 x 44.5 x 24.18 cm) (Cisco Catalyst 2950T-24, 2950C-24, 2950G-12, and 2950G-24) • 1.72 x 17.5 x 13 in. (4.36 x 44.5 x 33.02 cm) (Cisco Catalyst 2950G-48) • 1.0 rack-unit (RU) high • 6.5 lb (3.0 kg) (Cisco Catalyst 2950T-24, 2950C-24, 2950G-12, and 2950G-24) • 10 lb (4.5 kg) (Cisco Catalyst 2950G-48)
Environmental ranges	• Operating temperature: 32 to 113 F (0 to 45 C) • Storage temperature: –13 to 158 F (–25 to 70 C) • Operating relative humidity: 10 to 85 percent (noncondensing) • Operating altitude: Up to 10,000 ft (3000 m) • Storage altitude: Up to 15,000 ft (4500 m) • Not intended for use on top of desktops or in open office environments
Power requirements	• Power consumption: 30W maximum, 102 BTUs per hour (Cisco Catalyst 2950T-24, 2950C-24, 2950G-12, and 2950G-24) • Power consumption: 45W maximum, 154 BTUs per hour (Cisco Catalyst 2950G-48) • AC input voltage/frequency: 100 to 127/200 to 240 VAC (autoranging); 50 to 60 Hz • DC input voltages for Cisco RPS 300: +12V @ 4.5A
Acoustic noise	• ISO 7770, bystander position—operating to an ambient temperature of 30 C: – WS-C2950-24, WS-C2950-12, WS-C2950C-24, WS-C2950T-24: 46 dBa – WS-C2950G-12, WS-C2950G-24: 46 dBa – WS-C2950G-48: 48 dBa
Predicted mean time between failure (MTBF)	• 482,776 hours (Cisco Catalyst 2950G-12) • 468,884 hours (Cisco Catalyst 2950G-24) • 479,086 hours (Cisco Catalyst 2950G-24-DC) • 159,026 hours (Cisco Catalyst 2950G-48) • 297,144 hours (Cisco Catalyst 2950T-24) • 268,292 hours (Cisco Catalyst 2950C-24)
Fiber-port specifications for Cisco Catalyst 2950C-24 Switch	Fiber-port power levels: • Optical transmitter wavelength: 1300 nm • Optical receiver sensibility: –14 dBm2 • Optical transmitter power: –19 to –14 dBm • Transmit: –19 to –14 dBm

Feature	Description
Regulatory Agency Approvals	
Safety certifications	• UL 1950/CSA 22.2 No. 950 • IEC 950-EN 60950 • AS/NZS 3260, TS001 • CE Marking
Electromagnetic emissions certifications	• FCC Part 15 Class A • EN 55022: 1998 Class A (CISPR22 Class A) • EN 55024: 1998 (CISPR24) • VCCI Class A • AS/NZS 3548 Class A • CE Marking • CNS 13438 • BSMI Class A • MIC
Network Equipment Building Standards (NEBS) (For WS-C2950G-24-EI-DC only)	• Bellcore • GR-1089-CORE • GR-63-CORE • SR-3580 Level 3
Warranty	• Limited lifetime warranty

Service and Support

The services and support programs described in Table 2 are available as part of the Cisco Desktop Switching Service and Support solution, and are available directly from Cisco and through resellers.

Table 2 Service and Support Programs

Service and Support	Features	Benefits
Advanced Services		
Total Implementation Solutions (TIS)—available direct from Cisco ***Packaged TIS***—available through resellers	• Project management • Site survey and configuration deployment • Installation, text, and cutover • Training • Major moves, adds, and changes • Design review and product staging	• Supplements existing staff • Ensures that functions meet customer needs • Mitigates risk
Technical Support Services		
Cisco SMARTnet® and Cisco SMARTnet Onsite services—available direct from Cisco ***Packaged Cisco SMARTnet service***—available through resellers	• 24x7 access to software updates • Web access to technical repositories • Telephone support through the Cisco Technical Assistance Center (TAC) • Advance replacement of hardware parts	• Enables proactive or expedited issue resolution • Lowers cost of ownership by using Cisco expertise and knowledge • Minimizes network downtime

Ordering Information

Model Numbers	Configuration
WS-C2950G-48-EI	• 48 10/100 ports and 2 1000BASE-X ports • Cisco EI Software image installed
WS-C2950G-24-EI	• 24 10/100 ports and 2 1000BASE-X ports • Cisco EI Software image installed
WS-C2950G-24-EI-DC	• 24 10/100 ports and 2 1000BASE-X ports; DC power • Cisco EI Software image installed
WS-C2950G-12-EI	• 12 10/100 ports and 2 1000BASE-X ports • Cisco EI Software image installed
WS-C2950T-24	• 24 10/100 ports and 2 1000BASE-T ports • Cisco EI Software image installed
WS-C2950C-24	• 24 10/100 ports and 2 100BASE-FX ports • Cisco EI Software image installed
WS-C2950ST-24-LRE	• 24 LRE ports, 2 fixed 10/100/1000BASE-T ports, and 2 SFP ports • Cisco EI Software image installed
WS-C2950ST-8-LRE	• 8 LRE ports, 2 fixed 10/100/1000BASE-T ports, and 2 SFP ports • Cisco EI Software image installed

CiscoWorks LAN Management Solution 2.2 Introduction

CiscoWorks LAN Management Solution (LMS) provides a robust set of applications for maintaining, monitoring, and troubleshooting a broad range of devices in an end-to-end Cisco AVVID (Architecture for Voice, Video and Integrated Data) network. Built upon popular Internet-based standards, CiscoWorks LMS enables network operators to more efficiently and effectively manage the network through a simplified browser-based interface that can be accessed anytime from anywhere within the network. Taking advantage of a Web-based client/server architecture, CiscoWorks LMS can be easily integrated with other popular network management systems or other third-party management solutions running in the network.

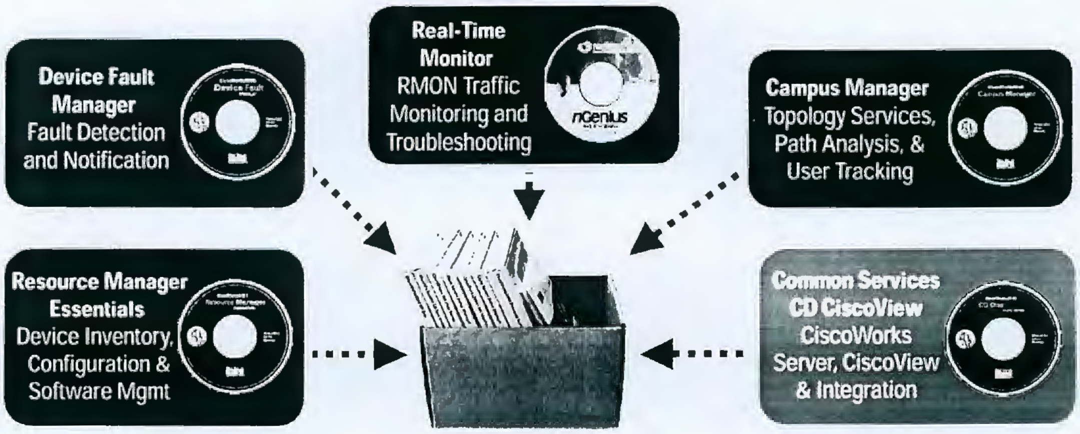
CiscoWorks LMS provides a solid foundation of basic and advanced management applications that complement CiscoWorks products. Other CiscoWorks products include the CiscoWorks Routed WAN Management (RWAN) Solution, which addresses the needs of the WAN with response time and access list management. The IP Telephony Environment Monitor (ITEM) ensures the readiness and manageability of converged networks that support voice over IP (VoIP) and IP telephony traffic and applications. The Cisco VPN/Security Management Solution (VMS) provides an integrated set of Web applications with features that assist in the deployment and monitoring of virtual private network (VPN) and security devices. Together, CiscoWorks products offer leading-edge solutions for improving the accuracy and efficiency of your operations staff, increasing overall availability of your network through proactive planning and maximizing network security.

The Changing Campus LAN

A key part of the business infrastructure, today's LANs are critical systems. The management of local-area networks has evolved from being device centric, to now focusing on managing the convergence of both data and voice traffic over a common infrastructure. As a result, it has become increasingly important to isolate, troubleshoot, and monitor network devices so that connections and services are always available. CiscoWorks LMS delivers advanced discovery technologies, port assignment tools, sophisticated connectivity analysis, configuration management tools, and device and network diagnostic capabilities (including fault management and Remote Monitoring [RMON] traffic monitoring) to help manage the complexities of a converged network.

A Comprehensive Solution

CiscoWorks LMS combines applications and tools for configuring, monitoring, and troubleshooting the campus network. Designed to address the networks powered by Cisco today, it also provides a flexible framework to address the device management needs of networks converging voice, video, and data; networks being protected with Cisco SAFE Blueprint for network security technologies; and networks designed for content migration.



Device Fault Manager
Fault Detection and Notification
Real-Time Monitor
RMON Traffic Monitoring and Troubleshooting
nGenius
Campus Manager
Topology Services, Path Analysis, & User Tracking
Resource Manager Essentials
Device Inventory, Configuration & Software Mgmt
Common Services CD CiscoView
CiscoWorks Server, CiscoView & Integration

The CiscoWorks LMS consists of operationally focused tools. These tools include fault management, scalable topology views, sophisticated configuration, Layer 2/3 path analysis, voice-supported path trace, traffic monitoring, end-station tracking workflow application servers management, and device troubleshooting capabilities.

CiscoWorks LMS is built on the CiscoWorks common services foundation. This design facilitates operations workflow between applications by linking data collection, monitoring, and analysis tools—all from a single desktop application. For example, a user complaint of slow response time or a poor IP phone connection can be quickly diagnosed using CiscoWorks LMS Layer 2 path tools that automatically acquire user path information stored in one database, and highlight devices on a topology map. Additionally, switch or router configurations can then be quickly examined, or RMON traffic data can be reviewed to detect anomalies or the need for changes. Those actions may draw information from one or more applications.

CiscoWorks LMS uses Internet standards to tie together best-of-breed tools and to take advantage of their capabilities through data and task integration standards. Using the common information model (CIM) and Extensible Markup Language (XML), the industry standards for data-sharing CiscoWorks LMS offers a means of extracting data and using it with popular network management platform products. With the CiscoWorks LMS, Cisco offers a complete family of dedicated hardware Cisco Catalyst® network analysis modules (NAMs). Cisco Catalyst NAMs provide increased visibility into switched LAN environments comprising 10/100 and Gigabit Ethernet links for comprehensive, end-to-end, seven-layer monitoring of network infrastructures.

Solution Components

The following applications are included in CiscoWorks LMS:

- CiscoWorks Campus Manager—CiscoWorks Campus Manager is a suite of Web-based applications designed for managing networks powered by Cisco switches. These include Layer 2 device and connectivity discovery, workflow application server discovery and management, detailed topology views, virtual LAN/LAN Emulation (VLAN/LANE) and ATM configuration, end-station tracking, Layer2/3 path analysis tools, and IP phone user and path information.
- CiscoWorks Device Fault Manager—CiscoWorks Device Fault Manager provides real-time fault analysis for Cisco devices. It generates "intelligent Cisco traps" through a variety of data collection and analysis techniques. These can be locally displayed, e-mailed, or forwarded to other popular event management systems.
- nGenius Real-Time Monitor—The nGenius Real-Time Monitor is a Web-enabled multiuser traffic management tool set that provides access to network-wide, real-time RMON information for monitoring, troubleshooting, and maintaining network availability. Its applications graphically report and analyze device, link, and port level RMON collected traffic data from RMON-enabled Cisco Catalyst switches and internal network analysis module.
- CiscoWorks Resource Manager Essentials (RME)—CiscoWorks RME provides the tools needed to manage Cisco devices. It includes inventory and device change management, network configuration and software image management, network availability, and syslog analysis.
- CiscoView—CiscoView is a Web-based tool that graphically provides real-time status of Cisco devices. The tool can drill down to display monitoring information on interfaces and access configuration functions.
- CiscoWorks Management Server—The CiscoWorks Management Server provides the common management desktop services and security across the CiscoWorks Family of solutions. It also provides the foundation for integrating with other Cisco and third-party applications.

Key Functions and Applications

Table 1 gives key functions and applications of the CiscoWorks LMS.

Table 1 CiscoWorks LAN Management Solution Key Application/Function

	Product	Management Benefit
Offers intelligent, automatic discovery of Cisco devices to create topology views of the network	CiscoWorks Campus Manager	The Cisco Campus Manager Topology Services functionality discovers Cisco devices and calculates Layer 2 relationships to provide views of the Cisco network by ATM domain, VTP[1] domain, LAN edge view, and a general Layer 2 view.
Gives topology status indications	CiscoWorks Campus Manager	The topology maps indicate the discovery and SNMP[2] status of Cisco devices; these maps also are launching points for other CiscoWorks applications.
Configures, manages, and monitors VLAN[3] and ATM services/networks	CiscoWorks Campus Manager	CiscoWorks Campus Manager provides tools for creating, deleting, and editing VLANs; it provides ATM tools for displaying virtual circuits and for configuring SPVCs/SPVPs.[4]

Table 1 CiscoWorks LAN Management Solution Key Application/Function

	Product	Management Benefit
Discovers end stations and IP phones connected to switch ports and identifies user locations based on user ID	CiscoWorks Campus Manager	The CiscoWorks Campus Manager User Tracking functionality correlates MAC[5] address and IP address to switch port; integration with Microsoft's PDC and Novell's NDS tree provides the user ID for even more efficient user location and tracking.
Traces Layer 2 and Layer 3 connectivity between two points (devices, servers, phones) in the network	CiscoWorks Campus Manager	The CiscoWorks Campus Manager Path Analysis tool performs path analysis for Layer 2 and Layer 3 devices using the device host name or IP address, and shows results on a map display, in a table display, or in a trace display.
Intelligently analyzes fault conditions designed to detect problems before they become network disruptions	CiscoWorks Device Fault Manager	CiscoWorks Device Fault Manager automated fault detection recognizes common problems in networks without forcing users to define their own rules sets, SNMP trap filters, or device polling intervals.
Interprets fault conditions at both the device and VLAN levels	CiscoWorks Device Fault Manager	With the characteristics of over a 100 Cisco routers and switches predefined, new device support is easily added via Cisco.com. Cisco Device Fault Manager simplifies managing both Layer 2 and Layer 3 environments.
Collects RMON/RMON2 statistics from LAN switches, NAMs, and legacy Cisco SwitchProbe® devices	nGenius Real-Time Monitor	nGenius Real-Time Monitor monitors LAN traffic for protocols, applications, and interfaces to apply appropriate filters, reducing costs and increasing performance.
Provides for LAN troubleshooting at network and application packet levels	nGenius Real-Time Monitor	nGenius Real-Time Monitor helps resolve network and application issues by providing total network visibility from the application layer down to the data link layer for virtually any topology that exists today.
Offers detailed software and hardware inventory reporting	Cisco RME	Cisco RME provides accurate Cisco inventory baseline information, including memory, slots, software versions, and boot ROMs needed to make decisions about the network.
Offers automated update engines for device software and configuration changes	Cisco RME	Cisco RME allows software and configuration updates to be sent to selected devices on a scheduled basis; it reduces time and errors involved in network updates.
Offers a consolidated troubleshooting tools device center	Cisco RME	A wide collection of switch and router analysis tools is accessible from a single location; third-party applications can link to the device center.
Offers centralized change audit logging	Cisco RME	A comprehensive change-monitoring log records users and applications that are active on the network.
Offers graphical device management	CiscoView	CiscoView displays a browser representation of Cisco router and switch devices, color-coded to indicate operational states, with access to configuration and monitoring tools.

Table 1 CiscoWorks LAN Management Solution Key Application/Function

	Product	Management Benefit
Provides application access security	CiscoWorks Server	The CiscoWorks desktop controls user access to applications, ensuring that only appropriate classes of users can access tools that change network parameters versus read-only tools.
Offers third-party integration tools (Integration utility)	CiscoWorks Management Server	The CiscoWorks Management Server simplifies the Web integration of third-party and other Cisco management tools.

1. Virtual Trunking Protocol
2. Simple Network Management Protocol
3. Virtual LAN
4. Soft permanent virtual circuits/soft permanent virtual paths
5. Media Access Control

Key Functions and Applications

Deployment Options

Consider the following when installing the CiscoWorks LAN Management Solution:

- All applications do not have to be installed initially; applications not installed initially may be installed later.
- Most applications require the CiscoWorks Management Server from the Common Services CD (formerly CD One), which must be installed first.
- The CiscoWorks Campus Manager application depends on CiscoWorks RME, which is included as part of the CiscoWorks LAN Management Solution.

All solutions can coexist on the same server if they support and operate with the services of Common Services 2.2. However, network managers may want to consider such factors as the number of applications hosted, system resources, and number of devices to be managed in determining if all or a subset of the solutions are installed on the same server.

CiscoWorks solutions offer deployment flexibility. System administrators should use the guidelines given previously when planning the deployment of the various solution bundles. Some components within a solution require the CiscoWorks Management Server and must be installed on that machine. CiscoView and nGenius Real Time Monitor software can be set up on an independent server. The placement of components is a function of performance requirements and the size of the network.

Server System Requirements

Hardware/Operating System

UNIX

- System: Sun UltraSPARCIII (Sun Blade 1000 Workstation or Sun Fire 280R Workgroup Server) running Solaris 2.8 (dual processor system required for hosting multiple management solutions)
- Memory: 1-GB RAM for workstations, 2-GB RAM for servers, 8-MB e-cache

- Available disk: 40-GB internal FC-AL disk drive for workstation and dual drives of this type for server configurations

Windows

- System: IBM PC compatible with 550-MHz or higher Pentium III processor running Microsoft Windows 2000 Advanced Server (with Terminal Services turned off), Server or Professional Edition with Service Pack 2 (dual processor system required for hosting multiple management solutions)
- Memory: 1-GB RAM
- Available disk: 40 GB with 2-GB swap recommended

Note: These system requirements are based on managing 500 devices with CiscoWorks RWAN and LAN Management solutions loaded on a single server. Refer to the Installation documentation for more information on required operating system patches.

Client Browser System Requirements

Hardware/Operating System

UNIX

- System: Sun Ultra 10 running Solaris Version 2.7 or 2.8
- System: HP9000 Series running HP-UX 11.0
- System: IBM RS/6000 workstation running AIX 4.3.3
- Memory: 256 MB

Windows

- System: IBM PC-compatible computer with 300-MHz or higher Pentium processor running Windows XP Professional, Windows 2000 (Advanced Server, Server or Professional) with Service Pack 3
- Memory: 256 MB

Note: Refer to the installation documentation for more information on required operating system patches.

Web Browser

UNIX

- Solaris: Netscape v4.76
- HP-UX: Netscape v4.78, 4.79
- AIX: Netscape v4.78, 4.79

Windows

- Windows 2000/XP: Netscape v4.78, 4.79
- Windows 2000/XP: Internet Explorer v6.0.26

Note: Refer to the Installation documentation for more information on required operating systems patches, browser plug-ins, or Java Virtual Machine (JVM) versions.

Service and Support

CiscoWorks products are covered by the Cisco Software Application Service (SAS) program. This service program offers customers contract-based 7 x 24 access to the Cisco Technical Assistance Center (TAC), full Cisco.com privileges, and software maintenance updates. A Cisco SAS contract ensures that customers have easy access to the information and services needed to stay up-to-date with newly supported device packages, patches, and minor updates. For further information on service and support offerings, contact your local sales office.

Ordering Information

The CiscoWorks LAN Management Solution includes all the necessary components needed for an independent installation on a Microsoft Windows or Sun Solaris Workstation/Server. The products within this solution can be combined with other CiscoWorks products if they support the same CiscoWorks Management Server version, operating environment, and system requirements. Contact your local Cisco representative for available white papers and documentation outlining best practices for implementing a CiscoWorks management solution architecture.

To place an order, contact your Cisco sales representative.

Refer to the CiscoWorks LAN Management Solution individual product data sheets for more information on operating environment and system requirements.

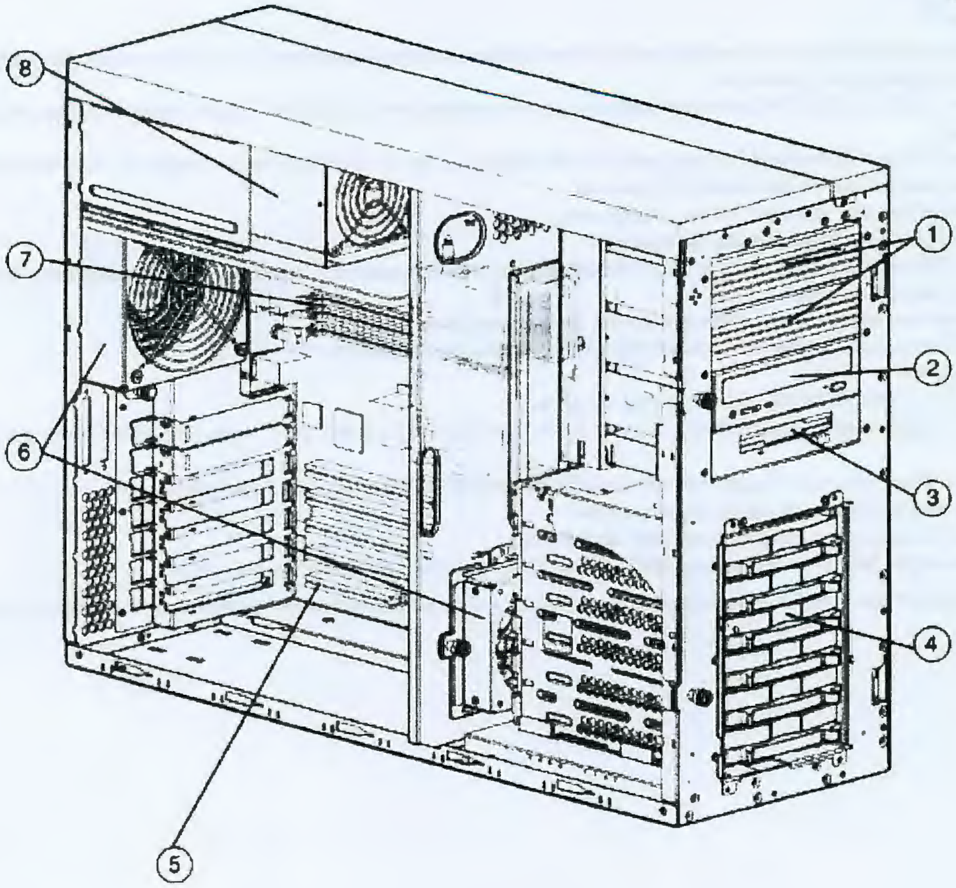
Apêndice FO

Overview



1. Two Removable Media Bays
2. 48X Max IDE (ATAPI) CD-ROM Drive
3. 1.44 Floppy Drive
4. Six 1" Hot Plug Drive Bays
5. Five expansion slots(four 64-bit/100-MHz PCI-X, one 32-bit/33-MHz PCI)
6. System fan
7. DIMM sockets for up to 8GB of memory, optionally interleaved
8. Optional 2nd Power Supply for hot-pluggable 1+1 redundancy

What's New

- Now available with Intel®Xeon 2.8 GHz Processors with 533MHz system bus.

Overview

At A Glance

- The ProLiant ML350 G3 is an expandable rack or tower platform delivering affordable 2-way performance and essential availability to corporate workgroups and growing businesses
- Intel Xeon 2.4 GHz or 2.8 GHz processors (dual processor capability) with 512-KB level 2 cache standard (full speed) and Hyper-Threading Technology
- ServerWorks Grand Champion LE Chipset with 533-MHz Front Side Bus for 2.8GHz processor models or 400-MHz FSB for models < 2.8 GHz
- Integrated Dual Channel Wide Ultra3 SCSI Adapter
- Smart Array Controller (standard in Array Models only)
- NC7760 PCI Gigabit Server Adapter (embedded)
- 512MB of 2-way interleaving capable PC2100 DDR SDRAM, with Advanced ECC capabilities (Array models only; 256MB standard on other models): Expandable to 8GB
- Flexible memory configurations allow interleaving (2x1) or non-interleaving
- Five available expansion slots: four 64-bit/100-MHz PCI-X, one 32-bit/33-MHz PCI
- Two USB ports
- Standard 6 x 1" Wide Ultra320 ready Hot Plug Drive Cage
- Internal storage capacity of up to 880GB (6 x 146.8 GB 1"), 1.174-TB (2 x 146.8 GB 1" + 6 x 146.8 GB 1") with optional 2-bay hot plug drive cage option
- 500W Hot-Pluggable Power Supply (standard) and an optional 500W Hot-Pluggable Redundant Power Supply (1+ 1) available
- Tool-free entry to chassis and access to components
- RBSU (ROM based setup utility) support, redundant ROM
- Insight Manager, SmartStart, ROM-based BIOS Setup Utility, and Automatic Server Recovery (ASR-2)
- Protected by HP Services, including a three-year, next business day, on-site, limited global warranty and extended Pre-Failure Warranty.

Standard Features

Processor *One of the following depending on Model:*	Intel Xeon Processor 2.8 GHz/533-512KB Intel Xeon Processor 2.4 GHz/400-512KB
Cache Memory	Integrated 512-KB Level 2 cache (full speed)
Upgradability	Upgradable to dual processing
Chipset	ServerWorks Grand Champion LE Chipset with 400-MHz or 533-MHz Front Side Bus (model dependent) NOTE: For more information regarding ServerWorks, please see the following URL: http://www.serverworks.com/products/overview.html NOTE: This Web site is available in English only.
Memory (One of the following depending on model)	2-way interleaving capable PC2100 DDR SDRAM running at 200MHz on 400MHz models or 266MHz on 533MHz models with Advonced ECC capabilities Standard (Non-Array Models) 256MB Standard (Array Models) 512MB Moximum 8 GB
Network Controller	NC7760 Gigabit Server Adapter (embedded)

Expansion Slots

I/O (5 Total, 5 Available)		PCI Voltage:
64-bit/100MHz, PCI	4 (4 available) (Array model has 3 available)	3.3 Volt or universal cards
32-bit/33MHz, PCI	1 (1 available)	5 Volt or universal cards

Storage Controller	Integrated Dual Channel Wide Ultra3 SCSI Adapter Smart Array 641 Controller (2.8 GHz Array Models Only)

Storage

Diskette Drives	1.44 MB
CD-ROM	48x IDE (ATAPI) CD-ROM Drive
Hard Drives	None
Maximum Internal Storage	1.174 TB GB (6 x 146.8 GB 1" with standard internal hot plug drive cage + (2 x 146.8 GB 1") with optional ML3xx Two Bay Hot Plug SCSI Drive Cage)
External Storage	Two external SCSI knockouts available, optional ProLiant ML350 Internal to External SCSI Cable Option Kit required ● HD68 Internal to External SCSI Cable Option Kit PN 159547-B22 ● VHDCI Internal to External SCSI Cable Option Kit PN 333370-B21

Standard Features

Interfaces	Parallel	1
	Serial	1
	Pointing Device (Mouse)	1
	Graphics	1
	Keyboard	1
	Network RJ-45	1
	USB	2 NOTE: Please see the following URL for additional information regarding USB support: http://www.compaq.com/products/servers/platforms/usb-support.html. NOTE: This Web site is available in English only.
	External SCSI knockouts	2

Graphics — Integrated ATI RAGE XL Video Controller with 8-MB SDRAM Video Memory

Form Factor — Tower or rack (5U)

NOTE: Rack models (and rack conversion kit) support:

- Square hole racks from 27"- 32" deep (including Compaq/HP 7000, 9000, 10000 and H9 series)
- Square or round hole racks, from 24" - 35" deep (including HP Rack System /E and HP Systems, with an adjustment)
- Telco racks with 3rd part option kit from Rack Solutions

ProLiant Essentials Foundation Pack Software

Insight Manager 7

Insight Manager 7 helps maximize system uptime and performance and reduces the cost of maintaining the IT infrastructure by providing proactive notification of problems before those problems result in costly downtime and reduced productivity. Insight Manager 7 is easy to set up and provides rapid access to detailed fault and performance information gathered by the Management Agents. One-click-access to the Remote Insight Lights Out Edition II board allows systems administrators to take full graphical control of ProLiant servers in remote locations or lights-out data centers. Finally, Insight Manager 7 in concert with the Version Control Agents and Version Control Repository Manager enables systems administrators to version manage and update system software across groups of ProLiant servers.

Management Agents

The Management Agents form the foundation for HP's Intelligent Manageability strategy. They provide direct, browser-based access to in-depth instrumentation built into HP servers, workstations, desktops, and portables, and send alerts to Insight Manager 7 and other enterprise management applications in case of subsystem or environmental failures. For additional information about the Management Agents and other management products from HP, please visit the management Web site at http://www.hp.com/servers/manage.

SmartStart

SmartStart is a tool that simplifies server setup, providing a rapid way to deploy reliable and consistent server configurations. For more information, please visit the SmartStart website at http://www.hp.com/servers/manage.
SmartStart version supported (minimum): SmartStart 5.50

ActiveUpdate

ActiveUpdate is a web-based application that keeps IT managers directly connected to HP for proactive notification and delivery of the latest software updates.

ROMPaq, support software, and configuration utilities

The latest software, drivers, and firmware fully optimized and tested for your ProLiant server and options.

Survey Utility and diagnostics utilities

The most advanced configuration analysis, reporting and troubleshooting utilities used by HP and at your fingertips.

Optional Proliant Essentials Value Packs

Optional software offerings that selectively extend the functionality of an Adaptive Infrastructure to address specific business problems and needs:

- Rapid Deployment Pack – an automated solution for multi-server deployment and provisioning, enabling companies to quickly and easily adapt to changing business demands.
- Workload Management Pack – provides easier management of complex environments, improving overall server utilization and enabling Windows 2000 customers for the first time to confidently deploy multiple applications on a single multiprocessor ProLiant Server.
- Performance Management Pack – a performance management solution that identifies and explains hardware performance bottlenecks on ProLiant servers and attached options enabling users to better utilize their valuable resources.

NOTE: Flexible and volume quantity license kits are available for ProLiant Essentials Value Packs. Refer to http://www.hp.com/servers/proliantessentials or the various ProLiant Essentials Value Pack product QuickSpecs for more information.
NOTE: For more information regarding ProLiant Essentials Software, please see the following URL: http://www.hp.com/servers/proliantessentials
NOTE: These Web sites are available in English only.

Industry Standard Compliance

ACPI V1.0B Compliant
PCI 2.2 Compliant
PXE Support
WOL Support
PCI-X 1.0 Compliant
Novell Certified
Microsoft Logo certifications

Standard Features

Manageability

Insight Manager 7
Redundant ROM
System Firmware Update
ROMPaq
Remote Insight Lights-Out Edition II (optional)
ProLiant RBSU (ROM-Based Setup Utility)
Automatic Server Recovery-2 (ASR-2)
Drive Parameter Tracking (with Smart Array Controller)
Dynamic Sector Repairing (with Smart Array Controller)
Pre-Failure Warranty (covers processors, memory and hard drives)

Security

Power-on password
Setup password
Diskette boot control
Parallel and serial interface control
Disk configuration lock
Power switch security

Server Power Cords

One Lowline NEMA power cord and one Highline IEC Power cord ship standard
Tower models ship with standard country specific power cords.
Rack models ship with IEC cables. Depending on the country, some also ship with country specific power cords
Redundant power supply options ship with country specific power cords with the exception of the -B21 Rack SKU which ships with an IEC cable only.

Power Supply

500 Watts, Power Factor Correction (PFC), Hot Plug 100 to 240 VAC Rated Input Voltage (Auto-sensing), CE Mark Compliant
Optional 2nd Power Supply for hot-pluggable 1 + 1 redundancy.

System Fans

2 fans ship standard, 2 fans total supported (does not include power supply fans)

Required Cabling

For required cabling information, refer to the HP Web site at http://www.hp.com/servers/proliantML350.
NOTE: This Web site is available in English only

OS Support

Microsoft Windows NT® Server 4.0 and Terminal Server 4.0
Microsoft BackOffice Small Business Server 2000
Microsoft Windows 2000 Server and Advanced Server
Windows Server 2003
Novell NetWare 5.1, 6.0
Novell NetWare Small Business Suite 6.0
SCO OpenServer 5.0.6a
SCO OpenUnix 8 SCO UnixWare 7.1.1
IBM OS/2 Warp Server for e-business
LINUX (Red Hat, 2.1 Advanced Server, Red Hat 8.0 and Red Hat 7.3, SuSE, SLES7, UnitedLinux 1.0)
NOTE: For a more complete and up-to-date listing of supported OSs and versions, please visit our OS Support Matrix at: ftp://ftp.compaq.com/pub/products/servers/os-support-matrix-310.pdf
NOTE: Optional hardware may be required to support some operating systems.
NOTE: For an up-to-date listing of the latest drivers available for the ProLiant ML350, please see: http://www.compaq.com/support/files/server/us/index.html.
NOTE: These Web sites are available in English only.

Standard Features

Rack Airflow Requirements

- Rack 9000 and 10000 series Cabinets
  The increasing power of new high-performance processor technology requires increased cooling efficiency for rack-mounted servers. The 9000 and 10000 Series Racks provide enhanced airflow for maximum cooling, allowing these racks to be fully loaded with servers using the latest processors.

- Rack 7000 series Cabinets
  When installing a server with processors running at speeds of 550 MHz or greater in Rack 7000 series racks with glass doors (165753-001 (42U), and 163747-001 (22U)), the new processor technology requires the installation of HP's new High Airflow Rack Door Inserts (327281-B21 (42U), 327281-B22 (42U 6 pack), or 157847-B21 (22U)) to promote enhanced airflow for maximum cooling.

CAUTION: If a third-party rack is used, observe the following additional requirements to ensure adequate airflow and to prevent damage to the equipment:

- Front and rear doors: If your 42U server rack includes closing front and rear doors, you must allow 830 square inches (5,350 sq cm) of hole evenly distributed from top to bottom to permit adequate airflow (equivalent to the required 64 percent open area for ventilation).
- Side: The clearance between the installed rack component and the side panels of the rack must be a minimum of 2.75 inches (7 cm).

CAUTION: Always use blanking panels to fill all remaining empty front panel U-spaces in the rack. This arrangement ensures proper airflow. Using a rack without blanking panels results in improper cooling that can lead to thermal damage.

NOTE: For additional information, refer to the Setup and Installation Guide or the Documentation CD provided with the server, or to the server documentation located in the Support section at the following URL:
http://www5.hp.com/servers/proliantml350
NOTE: This Web site is available in English only.

Installation of Server into Telco Racks

ML350 G3 rack model support: Support for all 2-post Telco racks requires the use of the rack kit and an additional option kit from Rack Solutions. http://www.racksolutions.com/compaq
NOTE: This Web site is available in English only.

HP Factory Express Capabilities

HP Factory Express gives you the flexibility to choose from a full menu of factory capabilities all in one manufacturing facility, in one process, with one touch giving you full control and access to HP's World class manufacturing facility anytime. This approach provides you the speed to deploy your IT needs, with total quality assurance, reliability, and predictability to lower your total cost of ownership by letting HP install, rack, and customize your software and hardware options for you.

Standard Features

Service and Support

HP Services provides a three-year, limited warranty, including Pre-Failure Warranty (coverage of hard drives, memory and processors) fully supported by a worldwide network of resellers and service providers and lifetime toll-free 7 x 24 hardware technical phone support. In addition, available service offerings include:
NOTE: Limited Warranty includes 3 year Parts, 3 year Labor, 3-year on-site support.

A full range of HP Care Pack packaged hardware and software services:

- Installation and start up
- Extended coverage hours and enhanced response times
- System management and performance services
- Availability and recovery services

NOTE: For more infomation, visit http://www.hp.com/services/carepack.

Please see the following URL regarding Warranty Information For Your HP Products:
http://www.compaq.com/support/warranty_upgrades/web_statements/176738.html.

For additional information regarding Worldwide Limited Warranty and Technical Support, please see the following URL:

NOTE: These Web sites are available in English only.

NOTE: Certain restrictions and exclusions apply. Consult the Customer Support Center at 1-800-345-1518 for details

Models

ML350T03 X2.8-512KB/533, 256MB *311523-001*	Processor(s)	(1) Intel Xeon Processor 2.8 GHz Processor standard (up to 2 supported)
	Cache Memory	Integrated 512-KB Level 2 cache per processor
	Memory	256 MB Advanced ECC PC2100 DDR SDRAM DIMM (Standard) to 8 GB (Maximum)
	Network Controller	NC7760 PCI Gigabit Server Adapter (Integrated/Embedded)
	Storage Controller	Integrated Dual Channel Wide Ultra3 SCSI Adapter
	Hard Drive	None ship standard
	Internal Storage	1.174 TB maximum hot plug (with optional drive cage & hard drives)
	Optical Drive	48x IDE (ATAPI) CD-ROM Drive
	Form Factor	Tower (5U)
ML350R03 X2.8-512KB/533, 256MB *311524-001*	Processor(s)	(1) Xeon 2.8 GHz Processor standard (up to 2 supported)
	Cache Memory	Integrated 512-KB Level 2 cache per processor
	Memory	256 MB Advanced ECC PC2100 DDR SDRAM DIMM (Standard) to 8 GB (Maximum)
	Network Controller	NC7760 PCI Gigabit Server Adapter (Integrated/Embedded)
	Storage Controller	Integrated Dual Channel Wide Ultra3 SCSI Adapter
	Hard Drive	None ship standard
	Internal Storage	1.174 TB maximum hot plug (with optional drive cage & hard drives)
	Optical Drive	48x IDE (ATAPI) CD-ROM Drive
	Form Factor	Rack (5U)
ML350T03 X2.8-512KB/533, 512MB Array *311525-001*	Processor(s)	(1) Intel Xeon Processor 2.8 GHz Processor standard (up to 2 supported)
	Cache Memory	Integrated 512-KB Level 2 cache per processor
	Memory	512 MB Advanced ECC PC2100 DDR SDRAM DIMM (Standard) to 8 GB (Maximum)
	Network Controller	NC7760 PCI Gigabit Server Adapter (Integrated/Embedded)
	Storage Controller	Integrated Dual Channel Wide Ultra3 SCSI Adapter
	RAID Controller	Smart Array 641
	Hard Drive	None ship standard
	Internal Storage	1.174 TB maximum hot plug (with optional drive cage & hard drives)
	Optical Drive	48x IDE (ATAPI) CD-ROM Drive
	Form Factor	Tower (5U)
ML350R03 X2.8-512KB/533, 512MB Array *311526-001*	Processor(s)	(1) Xeon 2.8 GHz Processor standard (up to 2 supported)
	Cache Memory	Integrated 512-KB Level 2 cache per processor
	Memory	512 MB of Advanced ECC PC2100 DDR SDRAM DIMM (Standard) to 8 GB (Maximum)
	Network Controller	NC7760 PCI Gigabit Server Adapter (Integrated/Embedded)
	Storage Controller	Integrated Dual Channel Wide Ultra3 SCSI Adapter
	RAID Controller	Smart Array 641
	Hard Drive	None ship standard
	Internal Storage	1.174 TB maximum hot plug (with optional hard drive cage)
	Optical Drive	48x IDE (ATAPI) CD-ROM Drive
	Form Factor	Rack (5U)

Models

ML350T03 X2.4-512KB/400, 256MB 269786-001	Processor(s)	(1) Intel Xeon Processor 2.4 GHz Processor standard (up to 2 supported)
	Cache Memory	Integrated 512-KB Level 2 cache per processor
	Memory	256 MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (Standard) to 8 GB (Maximum)
	Network Controller	NC7760 PCI Gigabit Server Adapter (Integrated/Embedded)
	Storage Controller	Integrated Dual Channel Wide Ultra3 SCSI Adapter
	Hard Drive	None ship standard
	Internal Storage	1.174 TB maximum hot plug (with optional hard drive cage)
	Optical Drive	48x IDE (ATAPI) CD-ROM Drive
	Form Factor	Tower (5U)
ML350R03 X2.4-512KB/400, 256MB 269787-001	Processor(s)	(1) Xeon 2.4 GHz Processor standard (up to 2 supported)
	Cache Memory	Integrated 512-KB Level 2 cache per processor
	Memory	256 MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (Standard) to 8 GB (Maximum)
	Network Controller	NC7760 PCI Gigabit Server Adapter (Integrated/Embedded)
	Storage Controller	Integrated Dual Channel Wide Ultra3 SCSI Adapter
	Hard Drive	None ship standard
	Internal Storage	1.174 TB maximum hot plug (with optional hord drives & drive cage)
	Optical Drive	48x IDE (ATAPI) CD-ROM Drive
	Form Factor	Rack (5U)

ProLiant ML350 G3 Unique Options	Hot Plug Redundant Power Supply Option Kit	283655-001
	Hot Plug Redundant Power Supply Option Kit (cable) NOTE: PN 283655-B21 SKU contains the 2nd power supply with an IEC power cable. Only purchase if connecting to PDU/UPS that supports IEC cables. All other SKUs contain country specific power cables.	283655-B21
	Intel Xeon 2.80 GHz-512KB Processor Option Kit NOTE: The 2.8 GHz processor option kit (PN 314763-B21) supports ProLiant ML350 G3 systems with 533 MHz front side bus only. This kit cannot be used in 400 MHz front side bus systems such as those with 2.4 GHz, 2.2GHz or 2.0 GHz processors.	314763-B21
	Intel Xeon 2.40 GHz-512KB Processor Option Kit NOTE: This processor option kit (PN 257913-B21) supports the ProLiant ML350 G3 servers.	257913-B21
	Intel Xeon 2.20 GHz-512KB Processor Option Kit NOTE: This processor option kit (PN 283702-B21) supports the ProLiant ML350 G3 servers.	283702-B21
	Intel Xeon 2.0 GHz-512KB Processor Option Kit NOTE: This processor option kit (PN 283701-B21) supports the ProLiant ML350 G3 servers.	283701-B21
	ProLiant ML350 G3 Tower to Rack Conversion Kit (CPQ brand)	290683-B21
ProLiant Essentials Value Pack Software	Rapid Deployment Pack, 1 User, V1.x NOTE: This license allows 1 server to be managed and deployed via the Deployment Server.	267196-B21
	Rapid Deployment Pack, 10 Users, V1.x NOTE: This license allows 10 servers to be managed and deployed via the Deployment Server.	269817-B21
	Flexible Quantity License Kit	302127-B21
	License-Only - for use with a Master License Agreement	302128-B21
	ProLiant Essentials Workload Management Pack 2.0 (Featuring Compaq Resource Partitioning Manager version 2.0)	303284-B21
	ProLiant Essentials Performance Management Pack Flexible License	306697-B21
	NOTE: Flexible and volume quantity license kits are available for ProLiant Essentials Value Packs. Refer to http://www.hp.com/servers/proliantessentials or the various ProLiant Essentials Value Pack product QuickSpecs for more information. NOTE: For more information regarding ProLiant Essentials Software, please see the following URL: http://www.hp.com/servers/proliantessentials. NOTE: These Web sites are available in English only.	
HP NetServer Transition Services	HP NetServer to ProLiant integration and assessment service NOTE: HP identifies current levels of NetServer support, services, and management. This service helps maximize customer's ability to add ProLiant platforms into their current environment.	304164-002
	HP TopTools to Insight Manager 7 installation and startup service NOTE: Provides on-site review, installation and configuration services for Insight Manager 7. HP will also re-create, as closely as possible, the views and reports from the customer's current TopTools configuration. This service assures a smooth transition to the ProLiant Essentials software.	304163-002
	HP NetServer to ProLiant Essentials Rapid Deployment Pack installation and startup service NOTE: Install and configure Rapid Deployment Pack in a test environment, then deploy a server image to a maximum of 250 systems in the production environment. This service helps to assure successful system deployment.	304162-002

Options

Processors

Intel Xeon 2.80 GHz-512KB Processor Option Kit NOTE: The 2.8 GHz processor option kit (PN 314763-B21) supports ProLiant ML350 G3 systems with 533 MHz front side bus only. This kit cannot be used in 400 MHz front side bus systems such os thhose with 2.4 GHz, 2.2GHz or 2.0 GHz processors.	314763-B21
Intel Xeon 2.40 GHz-512KB Processor Option Kit NOTE: This processor option kit supports ProLiant ML350 G3 servers with 400 MHz front side bus only. This kit (PN 257913-B21) cannot be used in 533 MHz front side bus systems such as the 2.8 GHz systems.	257913-B21
Intel Xeon 2.20 GHz-512KB Processor Option Kit NOTE: This processor option kit supports ProLiant ML350 G3 servers with 400 MHz front side bus only. This kit (PN 283702-B21) cannot be used in 533 MHz front side bus systems such as the 2.8 GHz systems.	283702-B21
Intel Xeon 2.0 GHz-512KB Processor Option Kit NOTE: This processor option kit supports ProLiant ML350 G3 servers with 400 MHz front side bus only. This kit (PN 283701-B21) cannot be used in 533 MHz front side bus systems such os the 2.8 GHz systems.	283701-B21

Memory (DIMMs)

NOTE: The ML350 G3 supports both interleaved and non-interleaved memory configurotions. Bose models ship standord with one 256MB DIMM or one 512MB DIMM (Array models). For best performance automatically invoke interleaving by populating memory in identical pairs. If 1GB of total memory is desired odd three 256MB DIMMs to the base configuration. If 1.5GB of memory is desired add one 256MB DIMM (to pair with the standard DIMM) and two 512MB DIMMs. Interleaving and installation of memory in pairs is not required. Add any combination of memory DIMMs below to operate in non-interleaved mode.
NOTE: Each SDRAM Memory kit contains one (1) DIMM.

128MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 128 MB)	287494-B21
256MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 256 MB)	287495-B21
512MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 512 MB)	287496-B21
1024MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 1024 MB)	287497-B21
2048MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 2048 MB)	301044-B21

Internal Storage

ML3xx Two Bay Hot Plug SCSI Drive Cage NOTE: The drive cage option kit (PN 244059-B21) has one 1' drive bay and one 1.6" drive bay. It installs in two available removoble media boys	244059-B21

Optical Drives

16X DVD-ROM Drive Option Kit (Carbon)	217053-B21
CD-RW/DVD-ROM 48X Combo Drive Option Kit	33134

Hard Drives

Ultra320 – Universal Hot Plug

146.8-GB 10,000 rpm U320 Universal Hard Drive (1")	286716-B22
72.8-GB 10,000 rpm U320 Universal Hard Drive (1")	286714-B22
36.4-GB 10,000 rpm U320 Universal Hard Drive (1")	286713-B22
72.8-GB 15,000 rpm U320 Universal Hard Drive (1")	286778-B22
36.4-GB 15,000 rpm U320 Universal Hard Drive (1")	286776-B22
18.2-GB 15,000 rpm U320 Universal Hard Drive (1")	286775-B22

NOTE: All U320 Universal Hard Drives are backward compotible to U2 or U3 speeds. U320 drives require an optional U320 Smart Array Controller or U320 SCSI HBA to support U320 transfer rates.

NOTE: Please see the Wide Ultra320 Universal Hot Plug QuickSpecs for additional technical information on the hard drives Support details, please see the following:

UPS and PDU Power Cord Matrix	**Please see the UPS and PDU cable matrix that lists cable descriptions, requirements, and specifications for UPS and PDU units:** ftp://ftp.compaq.com/pub/products/servers/ProLiantstorage/power-protection/powercordmatrix.pdf. NOTE: This Web site is available in English only.	
Uninterruptible Power Systems – Tower UPSs	HP UPS Model T700 (700VA, 500 Watt), Low Voltage	204015-001
	HP UPS T1000 XR (1000 VA, 700 Watts), Low Voltage	204155-001
	HP UPS T1500 XR (1440 VA, 1050 Watts)	204155-002
	HP UPS T2200 XR (1920 VA, 1600 Watts) Low Voltage	204451-001
	HP UPS T2200 XR (2200 VA, 1600 Watts) High Voltage	204451-002
Uninterruptible Power Systems – HP Rack UPSs	HP UPS R1500 XR (100 to 127)	204404-001
	HP UPS R3000 XR (120V)	192186-001
	HP UPS R3000 XR (208V)	192186-002
	Rack-Mountable UPS R6000 (208V) NOTE: UPS R6000 has a hardwired input; and the UPS R12000 XR has a hardwired input and output connection.	347207-001
	HP UPS R12000 XR N+ x (200-240V) NOTE: The UPS R12000 XR has a hardwired input and output. NOTE: HP UPS R6000 has a hardwired input; the UPS R12000 XR has a hardwired input and output connection.	207552-B22
UPS Options	SNMP Serial Port Card NOTE: Supports tower and rack UPS XR models ranging from 1000 – 3000VA	192189-B21
	Six Port Card NOTE: Supports tower and rack UPS XR models ranging from 1000 – 3000VA.	192185-B21
	High to Low Voltage Transformer (250VA) NOTE: Supports R6000 UPS series only. 2.5A @ 125 Volts max output across two NEMA 5-15.	388643-B21
	Extended Runtime Module, T1000 XR	218967-B21
	Extended Runtime Module, T1500 XR/T2200 XR	218969-B21
	Extended Runtime Module, R1500 XR NOTE: 2U each, two ERM maximum.	218971-B21
	Extended Runtime Module, R3000 XR NOTE: 2U each, one ERM maximum.	192188-B21
	Extended Runtime Module, R6000 NOTE: 3U each, two ERM maximum.	347224-B21
	Extended Runtime Module, R12000 XR, 4U each, two ERMs maximum	217800-B21
	R12000 XR BackPlate Receptacle Kit, (2) L6-30R NOTE: The R12000 XR BackPlate Kit has a hardwired input.	325361-001
	R12000 XR BackPlate Receptacle Kit, (2) IEC-309R NOTE: The R12000 XR BackPlate Kit has a hardwired input.	325361-B21
	SNMP-EN Adapter NOTE: Supports R6000 UPS series only.	347225-B21
	Multi-Server UPS Card NOTE: Supports R6000 UPS series only.	123508-B21
	Scalable UPS Card NOTE: Supports R6000 UPS series only.	123509-B21

Options

Modular PDUs 1U/0U (Up to 32 outlets) NOTE: 1U/0U mounting brackets shipped with the unit (optimized for 10000 and 9000 series racks).	HP Modular Power Distribution Units (mPDU), Low Volt Model, 24A (100-127 VAC)	252663-D71
	NOTE: This mPDU (252663-D71) may also be used to connect the low volt model of the UPS R3000 XR.	
	HP Modular Power Distribution Units (mPDU), High Volt Model, 24A (200-240 VAC)	252663-D72
	HP Modular Power Distribution Units (mPDU), High Volt Model, 40A (200-240 VAC)	252663-B21
	NOTE: This mPDU (252663-B21), 40A model has a hardwired input.	
	HP Modular Power Distribution Units (mPDU), High Volt Model, 16A (200-240 VAC)	252663-B24
	NOTE: This PDU has a detachable input power cord and allows for adaptability to country specific power requirements. This model may also be used with the high volt UPSs R3000 XR and R6000. Order cable PN 340653-001.	
	NOTE: Please see the following Modular Power Distribution Unit (Zero-U/1U Modular PDUs) QuickSpecs for additional options including shorter jumper cables and country specific power cords: http://www5.compaq.com/products/quickspecs/11041_na/11041_na.HTML	
PDU Options	Third Party Modular PDU Modular Kit NOTE: This kit allows you to mount the Modular PDUs in (1U configuration only) in racks other than the 9000/10000 Series racks (any racks using the standard 19" rail, including the 7000 Series racks). For more details please refer the Modular PDU QuickSpecs.	310777-B21
	4.5' IEC C 13 to IEC C14 PDU Jumper Cable (1 per pack)	142257-006
	4.5' IEC C 13 to IEC C14 PDU Jumper Cable (15 per pack)	142257-007
USB Options	USB Easy Access Keyboard (carbon)	267146-008
	USB Easy Access Keyboard (carbonite)	DC168B#ABA
	USB 2-Button Scroll Mouse (carbon)	195255-B25
	USB 2-Button Scroll Mouse (carbonite)	DC172B
	USB Floppy	304707-B21
Other	Enhanced Keyboard (Carbon)	296435-005
	ProLiant ML330/ML350 Internal to External SCSI Cable Option Kit (HD68)	159547-B22
	ProLiant ML330/ML350 Internal to External SCSI Cable Option Kit (VHDCI) NOTE: The ProLiant ML330/ML350 Internal to External SCSI Cable Option Kits (PN 159547-B21 and 333370-B21) are supported by the ML330/ML350 Family.	333370-B21
Rack Builder	Please see the Rack Builder for configuration assistance at http://www.compaq.com/rackbuilder/	
Rack Conversion Kit	ProLiant ML350 Generation 3 Tower to Rack Conversion Kit (CPQ branded)	290683-B21

HP Rack 10000 Series (Graphite Metallic)	HP S10614 (14U) Rack Cabinet - Shock Pallet	292302-B22
	HP 10842 (42U) Rack Cabinet - Pallet	257415-B21
	HP 10842 (42U) Rack Cabinet - Shock Pallet	257415-B22
	HP 10647 (47U) – Pallet	245160-B21
	HP 10647 (47U) – Crated	245160-B23

Options

Rack Options for HP Rack 10000 Series	Rack Blanking Panels – Graphite (Multi)	253214-B26
	NOTE: Contains one each of 1U, 2U, 4U and 8U.	
	Rack Blanking Panels – Graphite (1U)	253214-B21
	NOTE: The Rack Blanking Panels (PN 253214-B21) contains 10 each of (1U).	
	Rack Blanking Panels – Graphite (2U)	253214-B22
	NOTE: The Rack Blanking Panels (PN 253214-B22) contains 10 each of (2U).	
	Rack Blanking Panels – Graphite (3U)	253214-B23
	NOTE: The Rack Blanking Panels (PN 253214-B23) contains 10 each of (3U).	
	Rack Blanking Panels – Graphite (4U)	253214-B24
	NOTE: The Rack Blanking Panels (PN 253214-B24) contains 10 each of (4U).	
	Rack Blanking Panels – Graphite (5U)	253214-B25
	NOTE: The Rack Blanking Panels (PN 253214-B25) contains 10 each of (5U).	
	600mm Stabilizer Kit – Graphite	246107-B21
	800mm Wide Stabilizer Kit (Graphite)	255488-B21
	NOTE: Supported by the Rack 10842 cabinet only.	
	Baying Kit for Rack 10000 series (Carbon)	24892
	42U Side Panel – Graphite Metallic	246099-B21
	110V Fan Kit (Graphite)	257413-B21
	NOTE: Roof Mount Includes power cord with IEC320-C13 to Nema 5-15P.	
	220V Fan Kit (Graphite)	257414-B21
	NOTE: Roof Mount Includes power cord with IEC320-C13 to Nema 6-15P.	
	36U Side Panel – Graphite Metallic	246102-B21
	47U Side Panel – Graphite Metallic	255486-B21
	9000/10000 Series Offset Baying Kit (42U)	248931-B21
	NOTE: This kit can be used to connect 9000 and 10000 series racks of the same U height together. Kit contents include hardware for connecting racks and a panel to cover the 100mm gap at the rear of the two racks.	
	NOTE: For additional information regarding Rack Options, please see the following URL: http://h18000.www1.hp.com/products/servers/proliantstorage/rack-ptions/index.html	
	NOTE: This Web site is available in English only.	

Rack Options for Compaq Rack 9000 Series	Baying/Coupling Kit	120669-B21
	42U Side Panel	120670-B21
	NOTE: The 42U Side Panel (PN 120670-B21) supports the Compaq Rack 9142 and Compaq Rack 9842.	
	36U Side Panel	120671-B21
	NOTE: The 36U Side Panel (PN 120671-B21) supports the Compaq Rack 9136.	
	600mm Stabilizer Option Kit	120673-B21
	800mm Stabilizer Option Kit (Opal)	234493-B21
	NOTE: The 800mm Stabilizer Kit (PN 234493-B21) supports the Rack 9842 only.	
	9142 Extension Kit	120679-B21
	NOTE: The 9142 Extension Kit (PN 120679-B21) supports the Compaq Rack 9142 only.	
	Stabilizer Option Kit	120673-B21
	Rack Blanking Panel Kit for Rack 9000 series (Opal) (U.S.) NOTE: The Rack Blanking Panel Kit (PN 169940-B21) contains 4 panels – one each of 1U, 2U, 4U and 8U.	169940-B21
	Rack Blanking Panels (1U) NOTE: The Rack Blanking Panels (PN 189453-B21) contains 10 each of (1U).	189453-B21
	Rack Blanking Panels (2U) NOTE: The Rack Blanking Panels (PN 189453-B22) contains 10 each of (2U).	189453-B22
	Rack Blanking Panels (3U) NOTE: The Rack Blanking Panels (PN 189453-B23) contains 10 each of (3U).	189453-B23
	Rack Blanking Panels (4U) NOTE: The Rack Blanking Panels (PN 189453-B24) contains 10 each of (4U).	189453-B24
	Rack Blanking Panels (5U) NOTE: The Rack Blanking Panels (PN 189453-B25) contains 10 each of (5U)	189453-B25
	9136 Extension Kit	218216-B21
	9142 Short Rear Door NOTE: The 9142 Short Rear Door (PN 218217-B21) supports the Compaq Rack 9142 only.	218217-B21
	Split Rear Door (Opal) NOTE: The Split Rear Door (PN 254045-B21) supports the 600 mm wide, 42U 9000 series rack.	254045-B21
	9136 Short Rear Door	218218-B21
	9142 Split Rear Door	254045-B21
	9000/10000 Offset Baying Kit (42U) NOTE: This kit can be used to connect 9000 and 10000 series racks of same U height together. Kit contents include hardware for connecting racks and a panel to cover the 100mm gap at the rear of the two racks.	248931-B21
	NOTE: For additional information regarding Rack Cabinets, please see the following URL: http://h18000.www1.hp.com/products/servers/proliantstorage/rack-options/index.html NOTE: This Web site is available in English only.	

Rack Options for Compaq Rack 7000 Series	High Air Flow Rack Door Insert for the 7122 Rack	157847-B21
	High Air Flow Rack Door Insert for the 7142 Rack (single)	327281-B21
	High Air Flow Rack Door Insert for the 7142 Rack (6-pack)	327281-B22
	Compaq Networking Cable Management Kit	292407-B21
	Compaq Rack Extension Kit for 7142	154392-B21

Options

Rack Options for Rack 7000, 9000 and 10000 Series

Monitor Utility Shelf	303606-B21
Ballast Option Kit	120672-B21
100kg Sliding Shelf	234672-B21
Rack Rail Adapter Kit (25-inch depth)	120675-B21
Cable Management D-Rings Kit	168233-B21
Console Management Controller (CMC) Option Kit	203039-B21
Console Management Controller (CMC) Sensors Option Kit	203039-B22
Console Management Controller (CMC) Locking Option Kit	203039-B23
Console Management Controller (CMC) Smoke Sensors Option Kit	203039-B24
Server Console Switch 1 x 2 port (100 to 230 VAC)	120206-001
Server Console Switch 1 x 4 port (100 to 230 VAC)	400336-001
Server Console Switch 1 x 8 port (100 to 230 VAC)	400337-001
Server Console Switch 2 x 8 port (100 to 230 VAC)	400338-001
Server Console Switch 2 x 8 port (48 VDC)	400542-B21
IP Console Switch Box, 1x1x16	262585-B21
IP Console Switch Box, 3x1x16	26258
IP Console Interface Adapter, 8 pack	262587-B21
IP Console Interface Adapter, 1 pack	262588-B21
IP Console Expansion Module	262589-B21
KVM 9 PIN Adapter (4 Pack)	149361-B21
CPU to Server Console Cable, 12'	110936-B21
CPU to Server Console Cable, 20'	110936-B22
CPU to Server Console Cable, 40'	110936-B23
CPU to Server Console Cable, 3'	110936-B24
CPU to Server Console Cable, 7'	110936-B25
CPU to Server Console Cable (Plenum Rated) 20'	149363-B21
CPU to Server Console Cable (Plenum Rated) 40'	149364-B21
IP CAT5 Cable 3', 4 pack	263474-B21
IP CAT5 Cable 6', 8 pack	263474-B22
IP CAT5 Cable 12', 8 pack	263474-B23
IP CAT5 Cable 20', 4 pack	263474-B24
IP CAT5 Cable 40', 1 pack	263474-B25
Switch Box Connector Kit (115 V)	144007-001
Switch Box Connector Kit (230 V)	14400
1U Rack Keyboard & Drawer (Carbon)	257054-001
NOTE: The 1U Rack Keyboard & Drawer (PN 257054-001) is to be used with the Keyboards for Racks with Trackball (PN 158649-001).	
TFT5600 Rack Keyboard Monitor	221546-001
Input Device Adjustable Rails	287139-B21
NOTE: Input Device Adjustable Rails (287139-B21) are for use ONLY with the TFT5110R, TFT5600RKM and integrated keyboard/drawer which is used in mounting into third party racks.	
Input Device Telco Rail	287138-B21
NOTE: Input Device Telco Rails (287138-B21) are for use ONLY with the TFT5110R, TFT5600RKM and integrated keyboard/drawer which is used in mounting into third party racks.	
Keyboard/Monitor/Mouse extension cables	169989-001

NOTE: For additional information regarding Rack Options, please see the following URL: http://h18000.www1.hp.com/products/servers/proliantstorage/rack-options/index.html

NOTE: This Web site is available in English only

When routes are created, they are injected into any dynamic routing protocol and distributed to surrounding devices. This traffic flows, requiring IPSec to be directed to the appropriate RRI router for transport across the correct SAs to avoid IPSec policy mismatches and possible packet loss.

Hot Standby Router Protocol and IPSec

Hot Standby Router Protocol (HSRP) is designed to provide high network availability by routing IP traffic from hosts on Ethernet networks without relying on the availability of any single router. HSRP is particularly useful for hosts that do not support a router discovery protocol, such as ICMP Router Discovery Protocol (IRDP), and do not have the functionality to switch to a new router when their selected router reloads or loses power. Without this functionality, a router that loses its default gateway because of a router failure is unable to communicate with the network.

HSRP is configurable on LAN interfaces using standby command line interface (CLI) commands. It is now possible to use the standby IP address from an interface as the local IPSec identity, or local tunnel endpoint.

By using the standby IP address as the tunnel endpoint, failover can be applied to VPN routers by using HSRP. Remote VPN gateways connect to the local VPN router via the standby address that belongs to the active device in the HSRP group. In the event of failover, the standby device takes over ownership of the standby IP address and begins to service remote VPN gateways.

Further Documentation

Refer to the following document for further information about the IPSec VPN High Availability Enhancements feature:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121limit/121e/121e9/ipsecha.htm.

Large-Scale Dial-Out (LSDO) VRF Aware

The Large-Scale Dial-Out (LSDO) VRF Aware feature allows LSDO to support the Layer 2 Tunnel Protocol (L2TP) in an Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN). The basic operation of LSDO relies on per-user static routes stored in an authentication, authorization, and accounting (AAA) server and redistributed static routes and redistributed connected routes to put better routes that point to the same remote network or host on the alternate network access server (NAS). When using LSDO, overlapping IP addresses are often present in virtual routing and forwarding instances (VRFs), so that a unique key is needed to retrieve the correct route from the AAA server. With virtual private dial network (VPDN) as a dial-out resource, a virtual access interface is created for maintaining each PPP session. Software before Cisco IOS Release 12.2(8)T did not update the VRF information on the virtual access interface; rather, this information was cloned from the dialer interface. Now, the VRF table identifier is retrieved from the incoming packet and is mapped to the VRF name. This VRF name and the destination IP address are combined to make the unique key needed to retrieve the dial string and other user profile information from the AAA server.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftlsdvpn.htm.

Media Gateway Control Protocol Based Fax (T.38) and Dual Tone Multifrequency (IETF RFC 2833) Relay

The MGCP-Based Fax (T.38) and DTMF (IETF RFC 2833) Relay feature adds support for fax relay and DTMF relay with MGCP. This feature provides two modes of implementation for each component: gateway (GW) controlled mode and call agent (CA) controlled mode. In GW controlled mode, GWs negotiate DTMF and fax relay transmission by exchanging capability information in Session Definition Protocol (SDP) messages. That transmission is transparent to the CA. GW-controlled mode allows use of the MGCP-Based Fax (T.38) and DTMF (IETF RFC 2833) Relay feature without upgrading the CA software to support the feature. In CA-controlled mode, CAs use MGCP messaging to instruct GWs to process fax and DTMF traffic. For MGCP T.38 Fax Relay, the CAs can also instruct GWs to revert to GW-controlled mode if the CA is unable to handle the fax control messaging traffic; for example, in overloaded or congested networks.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftmgcpfx.htm.

MGCP VoIP Call Admission Control

MGCP CAC determines if calls can be accepted on the IP network on the basis of available network resources. Before this release, MGCP Voice over IP (VoIP) calls were established regardless of the available resources on the gateway or network. The gateway had no mechanism for gracefully refusing calls if resources were not available to process the call. New calls would fail with unexpected behavior and in-progress calls would experience quality-related problems.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_04mac.htm.

MPLS Label Distribution Protocol (LDP)

Cisco MPLS label distribution protocol (LDP) allows the construction of highly scalable and flexible IP Virtual Private Networks (VPNs) that support multiple levels of services.

LDP provides a standard methodology for hop-by-hop distribution of labels in an Multiprotocol Label Switching (MPLS) network by assigning labels to routes that have been chosen by the underlying Interior Gateway Protocol (IGP) routing protocols. The resulting label switch paths (LSPs) forward label traffic across an MPLS backbone to particular destinations. These capabilities enable service providers to implement Cisco MPLS-based IP VPNs and IP+ATM services across multivendor MPLS networks.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_ldp7t.htm.

MPLS Over ATM: Virtual Circuit (VC) Merge

VC merge maps several incoming labels to one single outgoing label. Cells from different virtual channel identifiers (VCIs) that travel to the same destination are transmitted to the same outgoing VC using multipoint-to-point connections.

VC merge allows the switch to transmit cells that come from different VCIs over the same outgoing VCI to the same destination. In other words, VC merge queues ATM Adaptation Layer 5 (AAL5) frames in input buffers until the switch receives the last frame. Then the switch transmits the cells from that AAL5 frame before it sends any cells from other frames. VC merge requires the switch to provide buffering, but no more buffering than is required in IP networks. VC merge slightly delays the transfer of frames; however, VC merge is for IP traffic and not for traffic that requires speed. IP traffic tolerates delays better than other traffic on the ATM network.

MPLS Traffic Engineering (TE) MIB

Simple Network Management Protocol (SNMP) agent code operating in conjunction with the MPLS Traffic Engineering MIB (MPLS TE MIB) enables a standardized, SNMP-based approach to be used in managing the Multiprotocol Label Switching (MPLS) Traffic Engineering (TE) features in Cisco IOS software.

The MPLS TE MIB is based on the Internet Engineering Task Force (IETF) draft MIB entitled draft-ietf-mpls-te-mib-05.txt, which includes objects describing features that support MPLS traffic engineering. This IETF draft MIB, which undergoes revisions from time to time, is being evolved toward becoming a standard. Accordingly, Cisco's implementation of the MPLS TE MIB is expected to track the evolution of the IETF draft MIB.

The SNMP objects defined in the MPLS TE MIB can be viewed by any standard SNMP utility. All MPLS TE MIB objects are based on the IETF draft MIB; thus, no specific Cisco SNMP application is required to support the functions and operations pertaining to the MPLS TE MIB.

The MPLS TE MIB provides the following benefits:

- Provides a standards-based SNMP interface for retrieving information about MPLS traffic engineering.
- Provides information about the traffic flows on MPLS traffic engineering tunnels.
- Presents MPLS traffic engineering tunnel routes, including the configured route, the IGP calculated route, and the actual route traversed.
- Provides information, in conjunction with the Interfaces MIB, about how a tunnel was rerouted in the event of a link failure.
- Provides information about the configured resources used for an MPLS traffic engineering tunnel.
- Supports the generation and queueing of notifications that call attention to major changes in the operational status of MPLS traffic engineering tunnels; forwards notification messages to a designated network management station (NMS) for evaluation/action by network administrators.

Refer to the following document for additional information.

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/temib28t.htm.

MPLS VPN Carrier Supporting Carrier

The carrier supporting carrier feature enables one MPLS VPN-based service provider to allow other service providers to use a segment of its backbone network. The service provider that provides the segment of the backbone network to the other provider is called the backbone carrier. The service provider that uses the segment of the backbone network is called the customer carrier.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftcsc8.htm.

Note This document focuses on a backbone carrier that offers Border Gateway Protocol and Multiprotocol Label Switching (BGP/MPLS) VPN services.

MPLS VPN ID

Using Multiprotocol Label Switching (MPLS) VPN ID you can identify virtual private networks (VPNs) by a VPN identification number, as described in RFC 2685. This implementation of the MPLS VPN ID feature is used for identifying a VPN. The MPLS VPN ID feature is not used to control the distribution of routing information or to associate IP addresses with MPLS VPN ID numbers in routing updates.

Multiple VPNs can be configured in a router. You can use a VPN name (a unique ASCII string) to reference a specific VPN configured in the router. Alternately, you can use a VPN ID to identify a particular VPN in the router. The VPN ID follows a standard specification (RFC 2685). To ensure that the VPN has a consistent VPN ID, assign the same VPN ID to all the routers in the service provider network that services that VPN.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftvpnid.htm.

Multilink Frame Relay

The Multilink Frame Relay feature introduces functionality based on the Frame Relay Forum Multilink Frame Relay UNI/NNI Implementation Agreement (FRF.16). This feature provides a cost-effective way to increase bandwidth for particular applications by enabling multiple serial links to be aggregated into a single bundle of bandwidth. Multilink Frame Relay is supported on User-to-Network Interfaces (UNIs) and Network-to-Network Interfaces (NNIs) in Frame Relay networks.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_mfr.htm.

Multiple RSA Key Pair Support

The Multiple RSA Key Pair Support feature allows the Cisco IOS software to maintain a distinct key pair for each certification authority (CA) with which it is dealing. Thus, the Cisco IOS software can match policy requirements for each CA without compromising the requirements specified by the other CAs, such as key length, key lifetime, and general-purpose versus special-usage keys.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftmltkey.htm.

Multiprotocol BGP (MP-BGP) Support for CLNS

The Multiprotocol BGP Support for CLNS feature allows Border Gateway Protocol (BGP) to be used as an interdomain routing protocol in networks that use Connectionless Network Service (CLNS) as the network-layer protocol. This feature was developed to solve a scaling issue with a data communications network (DCN) where large numbers of routers are managed remotely. The benefits of using Multiprotocol BGP (MP-BGP) to support CLNS are not confined to DCN networks and can be implemented to help scale any network using Open System Interconnection (OSI) routing protocols with CLNS.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/fm_bgpmc.htm.

NAT Support for SIP

The Session Initiation Protocol (SIP) is an application layer signaling protocol used for creating and controlling multimedia sessions with two or more participants. SIP is transported over TCP or UDP. The messages used in the protocol may have IP addresses embedded in the packet payload. If a message passes through a router configured with Network Address Translation (NAT), the embedded information must be translated and encoded back to the packet. An Application Layer Gateway (ALG) is used with NAT to enable SIP.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftnatsip.htm.

Network-Based Application Recognition RTP Payload Type Classification

The RTP Payload Type Classification enhancement has been added to the Network-Based Application Recognition (NBAR) feature. With the addition of NBAR RTP Payload Type Classification, RTP traffic can now be classified as a protocol within the Modular QoS CLI framework.

For additional information on the NBAR feature, including NBAR RTP Payload Type Classification, refer to the following document:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/dtnbarad.htm.

Nonstop Forwarding Enhanced FIB Refresh

Operational networks must minimize traffic disruption and offer the most uptime possible. The Nonstop Forwarding Enhanced FIB Refresh feature provides users the capability to continue forwarding IP traffic while Cisco Express Forwarding (CEF) database tables are being rebuilt. IP forwarding on the router is therefore uninterrupted.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftfibeps.htm.

OSPF Sham-Link Support for MPLS VPN

A sham link is a logical path within an Open Shortest Path First (OSPF) area; it represents an unnumbered point-to-point connection between two provider edge (PE) devices. All routers within the area see the link and use it during the shortest path first (SPF) computation.

On PE routers the VPN Route Forwarding (VRF) routing table is populated by OSPF routes over the sham link. The sham link gives users the capability of specifying which path will be used for traffic.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ospfshmk.htm

PIM Multicast Scalability

This feature enhances the Protocol Independent Multicast (PIM) protocol in Cisco IOS software by adding a new level of scalability. With this feature, edge devices can have a large number of multicast groups and users without increasing the CPU utilization of the router.

Plain NFAS Support on NM-HDV

The current Non-Facility Associated Signaling (NFAS) support on the High-Density Voice network modules (NM-HDV) is joined with the Redundant Link Manager/Signaling System 7 (RLM/SS7). When a user configures an ISDN PRI NFAS group via the Cisco command line interface (CLI), all channels within the PRI are treated as B channels. A D channel is not created and, thus no signaling will be passed to the ISDN stack.

This feature modifies the existing implementation of NFAS/RLM on NM-HDV to activate the generic NFAS feature on Cisco 2600 and 3600 routers and to allow the coexistence of plain NFAS and NFAS/RLM/SS7 on the Cisco 3660 router.

Policer Enhancement—Multiple Actions

This feature further extends the functionality of the Cisco IOS Traffic Policing feature (a single-rate policer) and the Two-Rate Policer feature. The Traffic Policing and Two-Rate Policer features are traffic policing mechanisms that allow you to control the maximum rate of traffic sent or received on an interface. Both of these traffic policing mechanisms mark packets as conforming to, exceeding, or violating a specified rate. After a packet is marked, you can specify an action to be taken on the pack on the basis of that marking.

With both the Traffic Policing feature and the Two-Rate Policer feature, you can specify only one conform action, one exceed action, and one violate action. Now with the new Policer Enhancement—Multiple Actions feature, you can specify multiple conform, exceed, and violate actions for the marked packets. You specify the multiple actions by using the action argument of the police command.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftpolenh.htm.

PPPoE MTU Adjustment

The syntax of the **ip adjust-mss** command has changed to the following:

ip tcp adjust-mss *mss*

where the value of the *mss* argument must be 1452 or less to fix the Point-to-Point Protocol over Ethernet (PPPoE) maximum transmission unit (MTU) problem.

PPPoE Session-Count MIB

The PPPoE Session-Count MIB provides the ability to use Simple Network Management Protocol (SNMP) to monitor in real time the number of PPP over Ethernet sessions configured on permanent virtual circuits (PVCs) and on a router.

This new MIB also introduces two SNMP traps that generate notification messages when a PPPoE session-count threshold is reached on any PVC or on the router.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftpscmib.htm.

Radius Packet of Disconnect

This feature consists of a method for terminating a call that has already been connected. The "Packet of Disconnect" (POD) is a RADIUS access_request packet and is intended to be used in situations in which the authenticating agent server wants to disconnect the user after the session has been accepted by the RADIUS access_accept packet. This may be needed in at least two situations:

- Detection of fraudulent use, which cannot be performed before accepting the call, or a price structure so complex that the maximum session duration cannot be estimated before accepting the call. This may be the case when certain types of discounts are applied or when multiple users use the same subscription simultaneously.
- To prevent unauthorized servers from disconnecting users, the authorizing agent that issues the POD packet must include three parameters in its packet of disconnect request. For a call to be disconnected, all parameters must match their expected values at the gateway. If the parameters do not match, the gateway discards the packet of disconnect packet and sends a NACK (negative acknowledgement message) to the agent.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_pod1.htm.

RADIUS Route Download

The RADIUS Route Download feature allows users to configure their network access server (NAS) to send static route download requests to authentication, authorization, and accounting (AAA) servers specified by a named method list. Before this feature, all RADIUS authorization requests for static route download could be sent only to AAA servers specified by the default method list.

This feature extends the functionality of the **aaa route download** command to allow users to specify the name of the method list that will be used to direct static route download requests to the AAA servers. The **aaa route download** command must be used to add separate method lists; however, users will continue to enable the **aaa authorization configuration default** command to download static route configuration information from the AAA server specified by the default method list.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftradrou.htm.

Rotating Through Dial Strings

The Rotating Through Dial Strings feature allows you to specify the dialing order when multiple dial strings are configured. Options for dialing order include:

- Sequential—Dial using the first dial string configured in a list of multiple strings.
- Round-robin—Dial using the dial string following the most recently successful dial string.
- Last successful call—Dial using the most recently successful dial string.

This feature takes advantage of information available from a previous call attempt, such as whether the call was unsuccessful or the line was busy, and thereby increases the rate of successful calls.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftrotdls.htm.

Secure Shell (SSH) Support over IPv6

Secure Shell (SSH) in IPv6 functions the same and offers the same benefits as SSH in IPv4—the SSH Server feature enables an SSH client to make a secure, encrypted connection to a Cisco router, and the SSH Client feature enables a Cisco router to make a secure, encrypted connection to another Cisco router or to any other device that is running an SSH server. IPv6 enhancements to SSH consist of support for IPv6 addresses that enable a Cisco router to accept and establish secure, encrypted connections with remote IPv6 nodes over an IPv6 transport.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ipv6/index.htm.

Secure Shell (SSH) Version 1 Server Support

Secure Shell (SSH) is an application and a protocol that provide a secure replacement to the Berkeley r-tools. The protocol secures the sessions using standard cryptographic mechanisms, and the application can be used much like the Berkeley rexec and rsh tools are used. There are currently two versions of SSH available: SSH Version 1 and SSH Version 2. Only SSH Version 1 is implemented in Cisco IOS software. For more information on this feature, refer to the "Configuring Secure Shell" chapter of the *Cisco IOS Security Configuration Guide*, Release 12.2.

This feature was originally introduced in Cisco IOS Release 12.1(1)T. This release adds support for the Cisco 826, Cisco 827, and Cisco 827-4V platforms.

Service Selection Gateway

Service Selection Gateway (SSG) is a switching solution for service providers who offer intranet, extranet, and Internet connections to subscribers using broadband access technology such as digital subscriber lines, cable modems, or wireless to allow simultaneous access to network services.

SSG works in conjunction with the Cisco Service Selection Dashboard (SSD) or its successor product, the Cisco Subscriber Edge Services Manager (SESM).

Together with the SSD or SESM, SSG provides subscriber authentication, service selection, and service connection capabilities to subscribers of Internet services.

Subscribers interact with an SSD or SESM web application using a standard Internet browser.

SSG communicates with the authentication, authorization, and accounting (AAA) management network where RADIUS, Dynamic Host Configuration Protocol (DHCP), and Simple Network Management Protocol (SNMP) servers reside and with the Internet service provider (ISP) network, which may connect to the Internet, corporate networks, and value-added services.

A licensed version of SSG works with SESM to present to subscribers a menu of network services that can be selected from a single graphical user interface (GUI). This functionality improves flexibility and convenience for subscribers and enables service providers to bill subscribers for connect time and services used, rather than charging a flat rate.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122b/122b_4/122b4_sg/ft_ssg.htm.

Session Initiation Protocol (SIP) for VoIP

Voice over IP (VoIP) currently implements the ITU H.323 specification within Internet Telephony Gateways (ITGs) to signal voice call setup. Session Initiation Protocol (SIP) is a protocol developed by the Internet Engineering Task Force (IETF) Multiparty Multimedia Session Control (MMUSIC) Working Group as an alternative to H.323. The Cisco SIP functionality equips Cisco routers to signal the setup of voice and multimedia calls over IP networks. SIP provides an alternative to H.323 within the VoIP internetworking software.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_sip72.htm.

Simple Network-Enabled Auto-Provisioning for Cisco IAD2420 Series IADs

The Simple Network-Enabled Auto-Provisioning (SNAP) feature on the Cisco IAD2420 series IAD allows service providers to rapidly deploy and configure services to the Cisco IAD platforms at customer premises without requiring configuration of the IADs at the customer site and with little or no onsite technician intervention. SNAP is part of the Cisco Networking Services (CNS) technology, which allows network products to be installed and automates many of the configuration tasks. SNAP consists of two basic functions: learning and setting the IP address and downloading the configuration for the IAD.

Each Cisco IAD2420 series IAD using SNAP includes a CNS Configuration Agent and CNS Event Agent that communicates with the CNS Configuration Registrar to enable the configuration of the IAD.

Using SNAP in conjunction with a Cisco aggregation router, a CNS Configuration Registrar, and an optional Domain Name System (DNS) server, SNAP performs the IAD configuration on the CNS Configuration Registrar and downloads the configuration to the IAD at the customer premises.

SIP Gateway Support for the Bind Command

In previous releases of Cisco IOS software, the source address of a packet going out of the gateway was never deterministic. That is, the session protocols and Voice over IP (VoIP) layers always depended on the IP layer to give the *best local address*. The best local address was then used as the source address (the address showing where the SIP request came from) for signaling and media packets. Using this nondeterministic address occasionally caused confusion for firewall applications, because a firewall could not be configured with an exact address and would take action on several different source address packets.

However, the bind interface command allows you to configure the source IP address of signaling and media packets to a specific interface's IP address. Thus, the address that goes out on the packet is bound to the IP address of the interface specified with the bind command. Packets that are not destined to the bound address are discarded.

When you do not want to specify a bind address, or if the interface is down, the IP layer still provides the best local address.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftbind.htm.

SIP Gateway Support of RSVP and TEL URL

The SIP Gateway Support of RSVP and TEL URL feature also supports Telephone Uniform Resource Locators or TEL URL. Currently SIP gateways support URLs in the SIP format. SIP URLs are used in SIP messages to indicate the originator, recipient, and destination of the SIP request. However, SIP gateways may also encounter URLs in other formats, such as TEL URLs. TEL URLs describe voice call connections. They also enable the gateway to accept TEL calls sent through the Internet and to generate TEL URLs in the request line of outgoing INVITE requests.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/vvfresrv.htm.

SIP Intra-gateway Hairpinning

SIP hairpinning is a call routing capability in which an incoming call on a specific gateway is signaled through the IP network and back out the same gateway. This call can be a public switched telephone network (PSTN) call routed into the IP network and back out to the PSTN over the same gateway.

Similarly, SIP hairpinning can be a call signaled from a line (for example, a telephone line) to the IP network and back out to a line on the same access gateway. With SIP hairpinning, unique gateways for ingress and egress are no longer necessary.

SIP INVITE Request with Malformed Via Header

A SIP INVITE requests that a user or service participate in a session. Each INVITE contains a Via header that indicates the transport path taken by the request so far and where to send a response.

In the past, when an INVITE contained a malformed Via header, the gateway would print a debug message and discard the INVITE without incrementing a counter. However, the printed debug message was often inadequate, and it was difficult to detect that messages were being discarded.

The SIP INVITE Request with Malformed Via Header feature provides a response to the malformed request. A counter, *Client Error: Bad Request,* increments when a response is sent for a malformed Via field. *Bad Request* is a class 400 response and includes the explanation *Malformed Via Field.* The response is sent to the source IP address (the IP address where the SIP request originated) at User Datagram Protocol (UDP) port 5060.

This feature applies to messages arriving on UDP, because the Via header is not used to respond to messages arriving on TCP.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftmalvia.htm.

SIP T.37 Store and Forward Fax

SIP T.37 is an ITU specification that enables store-and-forward fax applications, as well as toggling from voice to fax, for example, providing an Interactive Voice Response (IVR) front end to a store-and-forward fax application.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/faxapp/index.htm

SIP T.38 Fax Relay

The SIP T.38 Fax Relay feature adds standards-based fax support to Session Initiation Protocol (SIP) and conforms to ITU-T T.38, *Procedures for Real-Time Group 3 Facsimile Communication over IP Networks*. The ITU-T standard specifies real-time transmission of faxes between two regular fax terminals over an IP network.

The SIP T.38 Fax Relay feature also includes the following functionality:

- Support for Facsimile User Datagram Protocol Transport Layer (UDPTL)

  UDPTL, as defined in ITU-T T.38, is a transport layer that is used on top of UDP. UDPTL makes the delivery of packets more reliable by providing data redundancy.

- Support for quality of service (QoS)

  SIP T.38 Fax Relay supports QoS when establishing T.38 sessions. If the dial peer is already configured for QoS, the T.38 stream maintains the QoS support. QoS ensures certain bandwidth reservations for calls.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftsipfax.htm.

SIP—Call Transfer Using Refer Method

Note The SIP—Call Transfer Using Refer Method feature is also known under the feature title Call Transfer Capabilities Using the Refer Method.

The Refer method provides call transfer capabilities to supplement the Bye and Also methods already implemented on Cisco IOS Session Initiation Protocol (SIP) gateways.

Call transfer allows a wide variety of decentralized multiparty call operations. These decentralized call operations form the basis for third-party call control and thus are important features for Voice over IP (VoIP) and SIP. Call transfer is also critical for conference calling, where calls can transition smoothly between multiple point-to-point links and IP level multicasting.

The following are components of call transfer:

- Refer Method
- Refer-To Header
- Referred-By Header
- Notify Method
- Using the Refer Method to Achieve Call TransferBlind Transfer
- Attended Transfer

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftrefer.htm.

SIP—DNS SRV RFC2782 Compliance

Session Initiation Protocol (SIP) on Cisco Voice over IP (VoIP) gateways uses Domain Name System Server (DNS SRV) query to determine the IP address of the user endpoint. The query string has a prefix in the form of "protocol.transport." and is attached to the fully qualified domain name (FQDN) of the next hop SIP server. This prefix style, from RFC 2052, has always been available; however, with this release, a second style is also available. The second style complies with RFC 2782 and prepends the protocol label with an underscore "_"; as in "_protocol._transport." The addition of the underscore reduces the risk of the same name being used for unrelated purposes. The form compliant with RFC 2782 is the default style. Use the **srv version** command to configure the DNS SRV feature.

SNMP IF-MIB Support for VLAN (ISL, 802.1Q) Subinterfaces

This feature updates the Cisco implementation of the Interfaces Group MIB (abbreviated "IF-MIB" and defined in RFC 2233) to completely support ifTable and ifXTable entries for Inter-Switch Link (ISL) or 802.1Q encapsulated subinterfaces.

The Interface Table (the ifTable object) contains information on an Simple Network Management Protocol (SNMP) management entity's interfaces. Each sublayer of a network interface is considered t be an interface. An ifTable is a list of interface entries in which each entry contains management information applicable to that interface. The ifXTable is an extension to the ifTable. It contains replacements for objects of the ifTable that were deprecated. The ifXTable also contains 64-bit versions of the counters defined in the ifTable. Cisco IOS software can support both interfaces and subinterfaces in the ifTable.

ISL is a Cisco protocol for interconnecting switches and maintaining VLAN information as traffic is exchanged between switches. It can also be used to configure routing between any number of VLANs in a network by creating subinterfaces for each VLAN.

802.1Q (also referred to as "DOT1Q") is an IEEE standard protocol for interconnecting bridges/switches and maintaining VLAN information as traffic is exchanged between the devices. 802.1Q can also be used to configure routing between any number of VLANs in a network by creating subinterfaces for each VLAN.

The following objects of the ifTable have been updated: ifIndex, ifDescr, ifType, ifMtu, ifSpeed, ifPhysAddress, ifInOctets, ifInUcastPkts, ifInNUcastPkts, ifOutOctets, ifOutUcastPkts, ifOutNUcastPkts.

The following objects of the ifXTable have been updated: ifName, ifInMulticastPkts, ifInBroadcastPkts, ifOutMulticastPkts, ifOutBroadcastPkts, ifHCInOctets, ifHCInUcastPkts, ifHCInMulticastPkts, ifHCInBroadcastPkts, ifHCOutOctets, ifHCOutUcastPkts, ifHCOutMulticastPkts, ifHCOutBroadcastPkts.

Static Cache Entry for IPv6 Neighbor Discovery

The Static Cache Entry for IPv6 Neighbor Discovery feature enables the configuring of static entries in the IPv6 neighbor discovery cache, which provides functionality in IPv6 that is equivalent to static Address Resolution Protocol (ARP) entries in IPv4. Static entries in the IPv6 neighbor discovery cache are not modified by the neighbor discovery process. Cisco IOS software uses static ARP entries in IPv4 to translate 32-bit IP addresses into 48-bit hardware addresses. In IPv6, Cisco IOS software uses static entries in the IPv6 neighbor discovery cache to translate 128-bit IPv6 addresses into 48-bit hardware addresses.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ipv6/ftipv6s.htm.

Stream Control Transmission Protocol (SCTP) Release 2

Stream Control Transmission Protocol (SCTP) is a reliable datagram-oriented IP transport protocol specified by RFC 2960. It provides the layer between an SCTP user application and an unreliable end-to-end datagram service such as IP. The basic service offered by SCTP is the reliable transfer of user datagrams between peer SCTP users. It performs this service within the context of an association between two SCTP hosts. SCTP is connection-oriented, but SCTP association is a broader concept than the TCP connection, for example.

SCTP is not explicitly configured on routers, but it underlies several Cisco applications. The commands described in the document referenced below are useful for troubleshooting when SCTP issues are suspected as the cause of problems.

The SCTP feature was originally introduced in Cisco IOS Release 12.2(4)T as Release 1. SCTP Release 2 includes updated output for the **show ip sctp association parameters** and **show ip sctp association statistics** commands.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_sctp2.htm.

Survivable Remote Site Telephony Version 1.0

The Survivable Remote Site (SRS) Telephony feature, under the IP Telephony services umbrella, provides the Cisco CallManager with fallback support for the Cisco IP phones attached to the Cisco router on your local Ethernet. The SRS Telephony feature enables the routers to provide call handling support for the Cisco IP phones when the Cisco IP phones lose connection to the remote primary, secondary, or tertiary Cisco CallManager or when the WAN connection is down.

Survivable Remote Site Telephony Version 2.0

The Survivable Remote Site (SRS) Telephony feature, under the IP Telephony services umbrella, provides the Cisco CallManager with fallback support for the Cisco IP phones attached to the Cisco router on your local Ethernet. The SRS Telephony feature enables the routers to provide call handling support for the Cisco IP phones when the Cisco IP phones lose connection to the remote primary, secondary, or tertiary Cisco CallManager or when the WAN connection is down.

Cisco CallManager 3.0 supports Cisco IP phones at remote sites attached to Cisco branch office multiservice routers across the WAN. Prior to the SRS Telephony feature, when the WAN connection between the remote branch office router and the Cisco CallManager failed or connectivity with the Cisco CallManager was lost for some reason, the Cisco IP phones at the branch office became unusable for the duration of the failure. The SRS Telephony feature overcomes this problem and enables the basic features of the Cisco IP phones by providing call-handling support on the branch office router for its attached Cisco IP phones. The system automatically detects the failure and uses the Simple Network Auto Provisioning (SNAP) technology to autoconfigure the branch office router to provide call processing for the local Cisco IP phones. When the WAN link or connection to the primary Cisco CallManager is restored, call-handling capabilities for the Cisco IP phones switch back to the primary Cisco CallManager. During a failure when SRS Telephony feature is enabled, the Cisco IP phone displays a message to inform you that the Cisco IP phones are in the Cisco CallManager fallback mode and are able to perform limited functions.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/access/ip_ph/srs/fallbak2.htm.

T.37 Store-and-Forward Fax for Cisco 1751 Modular Access Routers

Fax applications enable Cisco 1751 modular access routers to send and receive faxes across packet-based networks by using voice interface cards (VICs) that support Foreign Exchange Station (FXS), Foreign Exchange Office (FXO), Ear and Mouth (E&M), and BRI NT/TE signaling protocols.

The Cisco 1751 modular access routers support carrier-class Voice over IP (VoIP) and fax over IP services. Because the Cisco 1751 modular access routers are H.323 compliant, they support a family of industry-standard voice codecs and provide echo cancellation and voice activity detection (VAD) and silence suppression. There is an interactive voice response (IVR) application that provides voice prompts and digit collection in order to authenticate the user and identify the call destination.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/plfxrl17.htm.

T.37 Store-and-Forward Fax for the Cisco 2600 Series and Cisco 3600 Series Routers

This feature adds fax detection and store and forward fax to the Cisco 2600 series and Cisco 3600 series routers. When equipped with digital and analog voice network modules, these routers support configuration of the T.37/T38 fax gateway. Supported network modules are NM-HDV with voice interface cards (VICs) for digital T1 connections and Voice 2V with VICs FXS for analog connections. VWIC and VIC FXS are the voice interface cards within the network modules.

Voice network modules installed in Cisco 2600 series or Cisco 3600 series routers convert telephone voice signals into data packets that can be transmitted over an IP network. VWICs/VICs work with existing telephone and fax equipment and are compatible with H.323 standards for audio and video conferencing.

Cisco 2600 series and Cisco 3600 series routers that support carrier-class Voice over IP (VoIP) and fax over IP services provide echo cancellation and voice activity detection (VAD)/silence suppression. An interactive voice response (IVR) application provides voice prompts and digit collection to authenticate the user and identify the call destination.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/plfxrl17.htm.

TCP Window Scaling

TCP Window Scaling adds support for the Window Scaling extension option in RFC 1323. To improve TCP performance in network paths with a large bandwidth-delay product, Long Fat Networks (LFNs), a larger window size is recommended. This TCP Window Scaling enhancement provides that support.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/tcpwslfn.htm.

Trustpoint CLI

The Trustpoint CLI feature introduces the **crypto ca trustpoint** command, which combines and replaces the functionality of the existing **crypto ca identity** and **crypto ca trusted-root** commands.

Although both of the existing commands allow you to declare the certification authority (CA) that your router should use, only the **crypto ca identity** command supports enrollment (the requesting of a router certificate from a CA). With the **crypto ca trustpoint** command, you can declare the CA and specify any characteristics for the CA that the existing commands supported.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/fttrust.htm.

Tunnel Type of Service (ToS)

The Tunnel Type of Service (ToS) feature allows you to configure the ToS and Time-to-Live (TTL) byte values in the encapsulating IP header of tunnel packets for an IP tunnel interface on a router. The Tunnel ToS feature is supported on Cisco Express Forwarding (CEF), fast switching, and process switching forwarding modes.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios120/120newft/120limit/120s/120s17/12s_tos.htm.

Unspecified Bit Rate Plus (uBR+) and ATM Enhancements for Service Provider Integrated Access

The uBR+ and ATM Enhancements for Service Provider Integrated Access feature includes:

- uBR+ functionality
- Proportional allocation of excess bandwidth
- Oversubscription of the Cisco MC3810-MFT T1/E1 trunk and similar ATM-capable VWIC-1MFT-E1 and VWIC-1MFT-T1 interface offered on the Cisco 2600 series

When uBR CPE to ATM switch is configured, a file transfer from one virtual circuit (VC) utilizes the entire trunk bandwidth when no other VCs (data or voice) are active. When other VCs become active with fixed committed information rates (CIRs), because uBR+ is not configured, the new VCs are not guaranteed their intended CIR. UBR+ resolves this by reallocating the configured CIRs to guarantee that all VCs achieve the appropriate throughput. If there is any remaining bandwidth, bursting up to that availability is still permitted. Because uBR allows for a continuous burst, bandwidth could be conserved by assigning a uBR class of service (CoS) to the VC. However, uBR has a variable bit rate (VBR) that constrains the burst period to a maximum burst size (MBS), rather than allowing a continuous burst. The uBR+ and ATM Enhancements for Service Provider Integrated Access feature does not have an MBS constraint.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ft_ubr.htm.

Update to the MGCP 1.0 Including NCS 1.0 and TGCP 1.0 Profiles

The **voice-port (MGCP profile)** command has been replaced by the **port (MGCP profile)** command. This command associates a voice port with the MGCP profile that is being configured.

The **port (MGCP profile)** command is used with the MGCP 1.0 Including NCS 1.0 and TGCP 1.0 Profiles feature that was released in Cisco IOS Release 12.2(4)T. Only the name of the command has been updated. The syntax and functionality have not changed.

Platforms supported are:

- Cisco CVA122 and Cisco CVA122E
- Cisco uBR925
- Cisco 2600 series
- Cisco 3660
- Cisco MC3810

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_mgupd.htm

VLAN Range

Using the VLAN Range feature, you can group VLAN subinterfaces together so that any command entered in a group applies to every subinterface within the group. This feature simplifies configurations and reduces command parsing.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122b/122b_4/12b_rang.htm.

VoAAL2 Profile 9 Support for BLES Interoperability

This feature allows Cisco routers to provide VoAAL2 (Voice over ATM Adaption Layer 2) Profile 9 (G.711ulaw and G.711alaw with 44-byte voice payload) for interoperability with V5.2 and GR.303 Voice GW to Class 5 switches. This feature allows service providers to deliver voice services over xDSL and T1 ATM networks from Class 5 switches.

Voice Support for Japan on Cisco 800 Series Routers, Phase 2

The Enhanced Voice Services for Japan for Cisco 800 Series Routers, Phase 2 features consist of the following voice capabilities for the Cisco 800 series routers:

Intercom

This feature establishes a voice connection between the two plain old telephone service (POTS) ports within the router. No B channels are used for calling between ports, so the B channels are available for data calls. During an intercom call, call waiting is disabled. If an external call comes to either POTS port, no call waiting tone is generated. The calling party will hear a busy signal. The flash hook and dual tone multifrequency (DTMF) keys are also disabled.

An intercom call is established by pressing **0# on the handset of either POTS port. If either port is busy with an external voice call, the intercom call will not be established.

Redial

This feature allows the user on each POTS port to redial the last number dialed on that port. Redial is activated when the user presses **4# on the handset. The router will store a number of up to 65 digits for each port. Feature access codes starting with an asterisk (*), interactive voice response (IVR) digits, or the pound (#) key are not stored.

The redial feature is supported separately on each POTS port.

Local Call Transfer

An external call received on either POTS port can be transferred to the other port. The transfer is initiated by pressing the flash hook followed by **0# on the handset.

This feature does not support conference calls.

Volume Adjustments

This feature allows the adjustment of the receiver volume on each POTS port. Volume adjustment is configured using command-line interface (CLI) commands, separately for each port.

To configure the telephone receiver volume on each port, use the CLI (the **volume** command).

Distinctive Ringing Based on Caller ID

This feature allows the user to register with the router up to 20 different numbers for each POTS port and to assign distinctive ring cadences to each of these numbers. Three different cadences are available. One of the cadences is the normal ring cadence as defined by Nippon Telegraph and Telephone (NTT) and is the default cadence for unregistered numbers. Numbers are registered, and ring cadences are assigned using CLI commands.

This feature is similar to the Nariwake feature available by subscription from NTT. However, this feature does not require the user to subscribe to any special service from the service provider. If the user already subscribes to Nariwake, Nariwake takes precedence over this feature.

The ring cadences used for this feature are the same as those used by the Nariwake feature.

Distinctive ringing based on caller ID is configured using the CLI (the **caller-number** command).

Subaddresses for POTS Ports

This feature allows the router to assign ISDN subaddresses to the POTS ports. With the subaddressing properly configured on the router, an external call is able to reach the dialed destination directly.

The subaddress for each POTS port is configured separately using the CLI (the **subaddress** command).

Silent Fax Calls

This feature allows either POTS port to be configured as a Type 2 Smart Fax port. When configured in this way, the router will not generate a ring alert when a call comes into the port. Instead, a silent fax tone will be generated, to which the Type 2 Smart Fax machine will respond. The fax machine does not ring, but the fax call gets connected. If a telephone is connected instead of a fax machine, the telephone does not ring.

This feature is configured using the CLI (the **silent-fax** command).

PIAFS Support

This feature provides support for the Personal Handyphone System (PHS) Internet Access Forum Standard (PIAFS). PIAFS is a standard error correction protocol for cellular data communication that has been developed in Japan. It is designed to pass data over the PHS cellular system. It also provides transmission control procedures (comparable to OSI reference model Layer 2) for high-quality data transmission. Both PIAFS version 2.0 and version 2.1 are supported on Cisco 803, 804, and 813 routers.

The common applications that are supported using PIAFS in PHS data communications are as follows:

- E-mail—E-mail is a basic service of the PHS multimedia communications menu. This service enables the user to send and receive e-mail.
- Fax service—The data stored in a personal digital assistant (PDA) can be faxed.
- Internet access—Internet access has influenced PHS in that many users want to be able to obtain necessary information in a timely manner when they are outdoors. It is also projected that PHS will be used extensively to form intranets for in-house communications by facilitating the expansion of office LAN access points.
- Photograph transmission service—The signals of a digital still camera can be transmitted directly or through the medium of a personal computer.
- Mobile office service—The spread of groupware recently has led to frequent instances in which groups share common databases in carrying out or supporting the execution of collaborative work. Demands are being made to extend this collaborative environment even to outside locations by using mobile communications.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_ktna2.htn

VPN Routing Forwarding (VRF) Framed Route (Pool) Assignment via PPP

The VPN Routing Forwarding (VRF) Framed Route (Pool) Assignment via PPP feature introduces support to make the following RADIUS attributes VRF aware: attribute 22 (Framed-Route), a combination of attribute 8 (Framed-IP-Address) and attribute 9 (Framed-IP-Netmask), and the Cisco VSA route command. Thus, static IP routes can be applied to a particular VRF routing table rather than the global routing table.

WRED Enhancement—Explicit Congestion Notification (ECN)

Currently, the congestion control and avoidance algorithms for TCP are based on the idea that packet loss is an appropriate indication of congestion on networks that transmit data using the best-effort service model. When a network uses the best-effort service model, the network delivers data if it can, without any assurance of reliability, delay bounds, or throughput. However, these algorithms and the best-effort service model are not suited to applications that are sensitive to delay or packet loss (for instance, interactive traffic including Telnet, web browsing, and transfer of audio and video data). Weighted random early detection (WRED), and by extension, Explicit Congestion Notification (ECN), helps to solve this problem.

To indicate congestion, WRED drops packets on the basis of the average queue length exceeding a specific threshold value. ECN is an extension to WRED in that ECN marks packets instead of dropping them when the average queue length exceeds a specific threshold value. When configured with the WRED Enhancement—Support for Explicit Congestion Notification feature, routers and end hosts would use this marking as a signal that the network is congested and slow down sending packets.

This feature provides an improved method for congestion avoidance by allowing the network to mark packets for transmission later, rather than dropping them from the queue. Marking the packets for transmission later accommodates applications that are sensitive to delay or packet loss and provides improved throughput and application performance.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftwrdecn.htm.

X.25 Over TCP Profiles

The Cisco X.25 over TCP (XOT) service was originally developed as an X.25 class of service that was only designed to switch X.25 traffic across an IP network. This service allowed network administrators to connect X.25 devices across the rich connectivity and media features available to IP traffic. XOT uses a set of default parameters to make this type of network easy to design.

When the XOT' capabilities were enhanced to support packet assembler/disassembler (PAD) traffic on an XOT session, network designers saw a need to be able to configure parameters for increased flexibility. For instance, because XOT does not have any physical interfaces that an administrator can configure, PAD over XOT sessions cannot be configured with interface map or facility commands to establish a PAD connection using nondefault values.

The introduction of X.25 profiles for XOT allows the network designer added flexibility to control the X.25 class services of XOT for PAD and XOT switching usage.

Another important aspect of this feature is that it allows you to associate access lists with XOT connections, enabling you to apply security on the basis of IP addresses and to have a unique X.25 configuration for specified IP addresses.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_xotp.htm.

X.25 Record Boundary Preservation for Data Communications Networks

The X.25 Record Boundary Preservation for Data Communications Networks feature enables hosts using TCP/IP-based protocols to exchange data with devices that use the X.25 protocol, retaining the logical record boundaries indicated by use of the X.25 "more data" bit (M-bit).

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftdcnrbp.htm.

Hardware Platforms and Modules Newly Supported in Cisco IOS Release 12.2(4)T

The following hardware platforms and modules are now supported in Cisco IOS Release 12.2(4)T. These platforms and modules were first introduced in earlier Cisco IOS software releases.

1-Port ADSL WAN Interface Card

The 1-Port ADSL WAN Interface Card (WIC) provides ADSL high-speed digital data transfer between a single customer premises equipment (CPE) subscriber and the central office.

The ADSL WIC is compatible with the Alcatel Digital Subscriber Loop Access Multiplexer (DSLAM) and the Cisco 6130, Cisco 6160, and Cisco 6260 DSLAMs with Flexi-line cards. It supports ATM Adaptation Layer 2 (AAL2) and AAL5 for the Cisco 2600 series and Cisco 3600 series routers and AAL5 only for the Cisco 1700 series routers, for both voice and data service.

Refer to the following documents for additional information:

- Cisco 1700 series, Cisco 2600 series, and Cisco 3600 series routers:

  http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_adsl4.htm.

- Cisco IAD2420 series platforms:

  http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121limit/121x/121xr/121xr_5/ftiaddsl.htm.

Note This feature was originally introduced in Cisco IOS Release 12.1(2)T on the Cisco 1700 series routers. This release is porting the feature into the Cisco 2600 series and Cisco 3600 series routers and the Cisco IAD2420 series platforms.

1-Port T1/E1 Digital Voice Port Adapters for Cisco 7200 and Cisco 7500

The PA-VXB and the PA-VXC are multichannel packet voice port adapters that allow Cisco 7200 series routers, Cisco 7200 VXR routers, Cisco 7401ASR routers, and Cisco 7500 series routers to become dedicated packet voice hubs or packet voice gateways that connect to both private branch exchanges (PBXs) and the Public Switched Telephone Network (PSTN). With this technology, packet voice and packet fax calls can be placed over the WAN and sent through the gateway into the traditional circuit-switched voice infrastructure. The PA-VXB and PA-VXC are single-width port adapters with t universal ports that are configurable for either T1 or E1 connections. The PA-VXB contains 12 high-performance digital signal processors (DSPs) that support up to 48 medium-complexity or 24 high-complexity channels of compressed voice. The PA-VXC contains 30 high-performance DSPs that support up to 120 medium-complexity or 60 high-complexity channels of compressed voice.

In Voice over IP (VoIP), the DSP segments the voice signal into frames, which are then coupled in groups of two and stored in voice packets. These voice packets are transported using IP in compliance with ITU-T specification H.323. Because VoIP is a delay-sensitive application, you must have a well-engineered end-to-end network to use it successfully. Fine-tuning your network to adequately support VoIP involves a series of protocols and features geared toward quality of service (QoS). Traffic shaping considerations must be taken into account to ensure the reliability of the voice connection.

8-Port Mix-Enabled T1/E1/PRI PA

The PA-MC-8TE1+ port adapter is a single-wide port adapter that provides eight T1 or E1 interfaces for Cisco 7200 series routers. The PA-MC-8TE1+ interfaces can be channelized, fractional, or unframed (E1 only).

The PA-MC-8TE1+ provides the following features:

- Universal ports—Eight interface ports per port adapter are configurable as either T1 (with integrated channel service unit [CSU] and data service unit [DSU]) or E1 (with integrated G.703/G.704 balanced 120-ohm interface).
- Full DS0 channelization capability for all T1/E1 ports, for a maximum of 248 full-duplex HDLC channels.
- Data rates in multiples of 56 kbps or 64 kbps per channel.
- Maximum data rates per port:1.536 Mbps (T1), 1.984 Mbps (E1 G.704), 2.048 Mbps (E1 unframed).
- Integrated T1/E1 supporting linecode AMI, B8SZ (T1), framing AMI or HDB3 (E1), framing SF or ESF (T1), CRC4, no-CRC4 or unframed (E1).
- Full Facility Data Link (FDL) support and FDL performance monitoring per-ANSI T1.403 or AT&T TR 54016.
- Full ISDN support for either 23B+D (T1) or 30B+D via network processing engine (NPE).
- Performance monitoring.

- Alarm integration, detection, and insertion.
- Line and payload loopback on a per-DS0 level.
- BERT functionality to transmit and receive test patterns over any Nx64 channel group.
- Clock jitter attenuators.
- Line or internal clocking.

Refer to the *PA-MC-8TE1+ Port Adapter Installation and Configuration Note* for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/core/7200vx/portadpt/multicha/8port_t1/index.htm.

Cisco 1751 Router

The voice-and-data capable Cisco 1751 router provides global Internet and company intranet access and includes the following:

- Voice-over-IP (VoIP) voice-and-data functionality; the router can provide support for digital and analog voice traffic (for example, telephone calls and faxes) over an IP network.
- Support for virtual private networking
- Modular architecture
- Network device integration

Cisco uBR925 Cable Access Router

The Cisco uBR925 cable access router acts as a cable modem to connect computers and other customer premises equipment (CPE) devices at a subscriber site to the service provider cable, hybrid fiber-coaxial (HFC), and IP backbone network. The Cisco uBR925 router is based on the Data-over-Cable Service Interface Specifications (DOCSIS) and interoperates with any bidirectional, DOCSIS-qualified cable modem termination system (CMTS).

The Cisco uBR925 cable access router supports both data and Voice over IP (VoIP) traffic via a shared two-way cable system and IP backbone network. PCs and other CPE devices can connect to the Cisco uBR925 router either through a four-port Ethernet hub or through the Universal Serial Bus (USB) port of the router. Single-line telephones, fax, or modems can be connected to two RJ-11 analog voice ports of the router. The Cisco uBR925 router supports DOCSIS-compliant bridging data operations, and it can also function as an advanced router, providing WAN data and VoIP connectivity in a variety of configurations.

Cisco CVA122 Cable Voice Adapter

The Cisco CVA122 Cable Voice Adapter acts as a cable modem to connect computers and other customer premises equipment (CPE) devices at a subscriber site to the service provider cable, hybrid fiber-coaxial (HFC), and IP backbone network. The Cisco CVA122 Cable Voice Adapter is based on the Data-over-Cable Service Interface Specifications (DOCSIS) and interoperates with any bidirectional, DOCSIS-qualified cable modem termination system (CMTS).

The Cisco CVA122 Cable Voice Adapter supports both data and Voice over IP (VoIP) traffic via a shared two-way cable system and IP backbone network. PCs and other CPE devices can connect to the cable voice adapter either through an Ethernet port or through a Universal Serial Bus (USB) port. Single-line telephones, fax, or modems can be connected to two RJ-11 analog voice ports of the cable voice adapter. The cable voice adapter supports DOCSIS-compliant bridging data operations, and it can also function as an advanced router, providing WAN data and VoIP connectivity in a variety of configurations.

Cisco CVA122E Cable Voice Adapter

The Cisco CVA122E Cable Voice Adapter acts as a cable modem to connect computers and other customer premises equipment (CPE) devices at a subscriber site to the service provider cable, hybrid fiber-coaxial (HFC), and IP backbone network. The Cisco CVA122E Cable Voice Adapter is based on the European Data-over-Cable Service Interface Specifications (EuroDOCSIS) and interoperates with any bidirectional, EuroDOCSIS-qualified cable modem termination system (CMTS).

The Cisco CVA122 Cable Voice Adapter supports both data and Voice over IP (VoIP) traffic via a shared two-way cable system and IP backbone network. PCs and other CPE devices can connect to the cable voice adapter either through an Ethernet port or through a Universal Serial Bus (USB) port. Single-line telephones, fax, or modems can be connected t o two RJ-11 analog voice ports of the cable voice adapter. The cable voice adapter supports EuroDOCSIS-compliant bridging data operations, and it can also function as an advanced router, providing WAN data and VoIP connectivity in a variety of configurations.

New Software Features in Cisco IOS Release 12.2(4)T

The following new features are supported in Cisco IOS Release 12.2(4)T. Some of these features may have been introduced on other hardware platforms in earlier Cisco IOS software releases.

AAA-PPP-VPDN Non-Blocking

Previously, Cisco IOS created a statically configurable number of processes to authenticate calls. Each of these processes would handle a single call, but in some situations the limited number of processes could not keep up with the incoming call rate. This resulted in some calls timing out. The AAA-PPP-VPDN Non-Blocking feature changes the software architecture such that the number of processes will not limit the rate of call handling.

Ability to Disable Xauth for Static IPSec Peers

The Ability to Disable Xauth for Static IPSec Peers feature allows users to disable extended authentication (Xauth), which prevents the routers from being prompted for Xauth information—username and password.

Without the ability to disable Xauth, a user cannot select which peer on the same crypto map should use Xauth. That is, if a user has router-to-router IP Security (IPSec) on the same crypto map as a Virtual Private Network (VPN)-client-to-Cisco-IOS IPSec, both peers will be prompted for a username and password. Removing Xauth while configuring the preshared key for router-to-router IPSec, prevents duplicate Xauth information from being exchanged, thereby, reducing traffic on your network. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftnxauth.htm.

ACL Default Direction

The ACL Default Direction feature allows you to change the filter direction (where filter direction is not specified) to inbound packets only; that is, you can configure your server to filter packets that are coming toward the network.

This feature introduces the **radius-server attribute 11 direction default** command, which allows you to change the default direction of filters for your access control lists (ACL) via RADIUS. (RADIUS attribute 11 (Filter-Id) indicates the name of the filter list for the user.) Enabling this command allows you to change the filter direction to inbound—which stops traffic from entering a router, thereby reducing resource consumption—rather than the outbound default direction, which waits until the traffic is about to leave the network before filtering.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftacldir.htm.

Accounting of VPDN Disconnect Cause

In the past, whenever a Layer 2 Tunneling Protocol (L2TP) or Layer 2 Forwarding (L2F) session fails or disconnects, the network access server (NAS) and Home GateWay (HGW) report a very generic disconnect-cause code, such as "LOST CARRIER". These generic codes do not provide enough detailed information for accounting and debugging purposes, creating a need for disconnect-cause codes that provide more detailed information. The Accounting of VPDN Disconnect Cause feature adds eight new disconnect-cause codes. These eight disconnect-cause codes describe the status of Virtual Private Dialup Network (VPDN) failures and disconnects more specifically than existing generic disconnect-cause codes. These new disconnect-cause codes can be found in the *Cisco IOS Security Configuration Guide*, Release 12.2 located at the following URL:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122cgcr/fsecur_c/fappendx/fradattr/scfrdat3.htm.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftacldir.htm.

Adaptive Frame Relay Traffic Shaping for Interface Congestion

The Adaptive Frame Relay Traffic Shaping for Interface Congestion feature enhances Frame Relay traffic shaping functionality by adjusting permanent virtual circuit (PVC) sending rates based on interface congestion. When this new feature is enabled, the traffic-shaping mechanism monitors interface congestion. When the congestion level exceeds a configured value called queue depth, the sending rate of all PVCs is reduced to the minimum committed information rate (minCIR). As soon as interface congestion drops below the queue depth, the traffic-shaping mechanism changes the sending rate of the PVCs back to the committed information rate (CIR). This process guarantees the minCIR for PVCs when there is interface congestion.

This new feature works in conjunction with backward explicit congestion notification (BECN) and Foresight functionality.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_afrts.htm.

Advanced Voice Busyout

The local voice busyout feature provides a way to busy out a voice port or DS-0 group (time slot) if a state change is detected in a monitored network interface (or interfaces). When a monitored interface changes to a specified state—to out-of-service or in-service—the voice port presents a seized/busyout condition to the attached PBX or other customer premises equipment (CPE). The PBX or other CPE can then attempt to select an alternate route.

Advanced Voice Busyout adds the following functionality to the local voice busyout feature:

- For Voice over IP (VoIP), monitoring of links to remote, IP-addressable interfaces by use of service assurance agent (SAA)
- Configuration by voice class to simplify and speed up the configuration of voice busyout on multiple voice ports

Using the Advanced Voice Busyout feature you can perform the following tasks:

- Configure individual voice ports to enter the busyout state if an SAA probe signal returned from a remote, IP-addressable interface detects loss of IP connectivity by crossing a specified delay or loss threshold.
- Define voice classes with specified busyout conditions, and assign a particular voice class to any number of voice ports.
- SAA probe monitoring of remote interfaces is intended for use with VoIP networks, although it can also be used with Voice over Frame Relay (VoFR) and Voice over ATM (VoATM) networks.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xa/122xa_2/ft_cacbo.htm.

Note This feature was originally introduced in Cisco IOS Release 12.1(3)T. This release is porting the feature into the Cisco 7200 series routers, and adds support for new and modified commands.

Asynchronous Line Monitoring

Before Cisco IOS Release 12.2(4)T, the Cisco IOS software did not provide a method for displaying asynchronous character mode traffic flowing out of an asynchronous line. Therefore, when a user tried to troubleshoot difficult asynchronous problems, the user had to use RS-232 datascopes in order to examine the data stream. This method is very detailed and cumbersome. The Asynchronous Line Monitoring feature available in Cisco IOS Release 12.2(4)T allows the monitoring of inbound and outbound character mode asynchronous traffic on another terminal line. To monitor inbound or outbound asynchronous character mode traffic on the port to be monitored, enter the **monitor traffic line** command in privileged EXEC mode.

This feature increases the efficiency of the user who performs troubleshooting on asynchronous character mode traffic problems. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftasync.htm.

ATM SNMP Trap and OAM Enhancements

The ATM SNMP Trap and OAM Enhancements feature introduces the following enhancements to the Simple Network Management Protocol (SNMP) notifications for ATM permanent virtual circuits (PVCs) and to operation, administration, and maintenance (OAM) functionality:

- ATM PVC traps will now be generated when the operational state of a PVC changes from the DOWN to UP state.
- ATM PVC traps will now be generated when OAM loopback fails. Additionally, when OAM loopback fails, the PVC will now remain in the UP state, rather than going DOWN.
- The ATM PVC traps are now extended to include virtual path interface/virtual circuit interface (VPI/VCI) information, the number of state transitions a PVC goes through in an interval, and the timestamp of the first and the last PVC state transition.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftpvctrp.htm.

AutoInstall over Frame Relay-ATM Interworking Connections

The AutoInstall over Frame Relay-ATM Interworking Connections feature extends the functionality of the existing Cisco IOS AutoInstall feature. After you connect a new router to the network and turn on the new router, Cisco IOS AutoInstall automatically configures the router from a preexisting configuration file that is downloaded from the network. This process was designed to facilitate the centralized management of router installation.

The AutoInstall over Frame Relay-ATM Interworking Connections feature allows you to configure an ATM permanent virtual circuit (PVC) to accept the BOOTP and TFTP requests from a new router performing AutoInstall. This feature also allows the use of a central router with ATM or Frame Relay IETF encapsulation to run a BOOTP server and provide an initial IP address to the new router.

For details, refer to the "AutoInstall over Frame Relay-ATM Interworking Connections" feature module document. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftautatm.htm.

Automatic Bandwidth Adjustment for MPLS Traffic Engineering Tunnels

Traffic engineering automatic bandwidth adjustment provides the means to automatically adjust the bandwidth allocation for traffic engineering tunnels based on their measured traffic load.

Traffic engineering autobandwidth samples the average output rate for each tunnel marked for automatic bandwidth adjustment. For each marked tunnel, it periodically (for example, once per day) adjusts the tunnel's allocated bandwidth to be the largest sample for the tunnel since the last adjustment.

The frequency with which tunnel bandwidth is adjusted and the allowable range of adjustments is configurable on a per-tunnel basis. In addition, the sampling interval and the interval over which to average tunnel traffic to obtain the average output rate is user-configurable on a per-tunnel basis.

There are three new commands:

- **clear mpls traffic-eng auto-bw timers**: Reinitializes the automatic bandwidth feature.
- **mpls traffic-eng auto-bw timers**: Enables automatic bandwidth adjustment for a platform and starts output rate sampling for tunnels configured for automatic bandwidth adjustment.
- **tunnel mpls traffic-eng auto-bw**: Configures a tunnel for automatic bandwidth adjustment and controls the manner in which the bandwidth for a tunnel is adjusted.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftbwadjm.htm.

BGP Conditional Route Injection

Cisco IOS software provides several methods in which you can originate a prefix into the Border Gateway Protocol (BGP). The existing methods include using the network or **aggregate-address** commands and redistribution. These methods assume the existence of more specific routing information (matching the route to be originated) in either the routing table or the BGP table.

The BGP Conditional Route Injection feature enables you to originate a prefix into BGP without the corresponding match. The routes are injected into the BGP table only if certain conditions are met. The most common condition is the existence of a less-specific prefix.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftbgpri.htm.

BGP Link Bandwidth

The Border Gateway Protocol (BGP) Link Bandwidth feature is used to advertise the bandwidth of an autonomous system exit link as an extended community. The BGP Link Bandwidth feature is supported by the internal BGP (iBGP) and external BGP (eBGP) multipath features. The link bandwidth extended community indicates the preference of an autonomous system exit link in terms of bandwidth. The link bandwidth extended community attribute may be propagated to all iBGP peers and used with the BGP multipath features to configure unequal cost load balancing. When a router receives a route from a directly connected external neighbor and advertises this route to iBGP neighbors, the router may advertise the bandwidth of that link.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftbgplb.htm.

BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS-VPN

The BGP Multipath Load Sharing for eBGP and iBGP feature allows you to configure multipath load balancing with both external BGP (eBGP) and internal BGP (iBGP) paths in Border Gateway Protocol (BGP) networks that are configured to use Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs). This feature provides improved load balancing deployment and service offering capabilities and is useful for multi-homed autonomous systems and Provider Edge (PE) routers that import both eBGP and iBGP paths from multihomed and stub networks.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/fteibmpl.htm.

BGP Prefix-Based Outbound Route Filtering

The BGP Prefix-Based Outbound Route Filtering feature uses Border Gateway Protocol (BGP) outbound route filter (ORF) send and receive capabilities to minimize the number of BGP updates that are sent between peer routers. The configuration of this feature can help reduce the amount of resources required for generating and processing routing updates by filtering out unwanted routing updates at the source.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftbgporf.htm.

Call Admission Control for H.323 VoIP Gateways

Call Admission Control, Call Treatment, and Busyout Components

Before the call admission control feature, gateways did not have a mechanism to gracefully prevent calls from entering when certain resources were not available to process the call. This causes the new call to fail with unreported behavior, and could potentially cause the calls that are in progress to have quality related problems.

This feature set provides the ability to support resource-based call admission control processes. These resources include system resources such as CPU, memory, and call volume, and interface resources such as call volume.

If system resources are not available to admit the call, two kinds of actions are provided: system denial (which busyouts all of T1 or E1) or per call denial (which disconnects, hairpins, or plays a message or tone). If the interface-based resource is not available to admit the call, the call is dropped from the session protocol (such as H.323).

For further information on busyout, please refer to *Advanced Voicebusyout*, Cisco IOS Release 12.2(2)XA. For further information on the call denial aspects of this feature, please refer to *Call Admission Control Based on CPU Utilization*.

User Selected Threshold

This feature allows a user to configure call admission thresholds for local resources as well as memory and CPU resources. The list of local resources that are configured for call admission are described in the command description of "call threshold poll-interval."

With the **call threshold** command, a user is allowed to configure two thresholds, high and low, for each resource. Call treatment is triggered when the current value of a resource goes beyond the configured high. The call treatment remains in effect until current resource value falls below the configured low. Having high and low thresholds prevents call admission flapping and provides hysteresis in call admission decision making.

With the **call spike** command, a user is allowed to configure the limit for incoming calls during a specified time period. A call spike is the term for when a large number of incoming calls arrive from the PSTN in a very short period of time (for example: 100 incoming calls in 10 milliseconds).

Configurable Call Treatment

With the **call treatment** command, users are allowed to select how the call should be treated when local resources are not available to handle the call. For example, when the current resource value for any one of the configured triggers for call threshold has reached beyond the configured threshold, the call treatment choices are as follows:

- Time- division multiplexing (TDM) hairpinning — Hairpins the calls through the plain old telephone service (POTS) dial peer.
- Reject — Disconnects the call.
- Play message or tone — Plays a configured message or tone to the user.

Resource Unavailable Signaling

This feature set supports the autobusyout feature where channels are busied out when local resources are not available to handle the call. Autobusyout is supported on both channel-associated signaling (CAS) and PRI channels.

- CAS — Uses busyout to signal "local resources are unavailable."
- PRI — Uses either service messages or disconnect with correct cause-code to signal "resources are unavailable."

PSTN Fallback

The goal of PSTN fallback is to monitor congestion in the IP network and either redirect calls to the PSTN or reject calls based on the network congestion. Calls can be rerouted to an alternate IP destination or to the PSTN if the IP network is found unsuitable for voice traffic at that time. The user defines the congestion thresholds based on the configured network. This functionality enables the service provider to give a reasonable guarantee about the quality of the conversation to their VoIP users at the time of call admission.

Note PSTN fallback does not provide assurances that a VoIP call that proceeds over the IP network is protected from the effects of congestion. This is the function of the other Quality of Service (QoS) mechanisms such as IP Real-Time Transport Protocol (RTP) priority or low latency queuing (LLQ).

PSTN fallback includes the following features:

- Offers flexibility to define the congestion thresholds based on the network.
  - Defines a threshold based on Calculated Planning Impairment Factor (ICPIF), which is derived as part of International Telecommunication Union (ITU) G.113.
  - Defines a threshold based solely on packet delay and loss measurements.
- Uses Service Assurance Agent (SAA) probes to provide packet delay, jitter, and loss information for the relevant IP addresses. Based on the packet loss, delay, and jitter encountered by these probes, an ICPIF or delay and loss values are calculated.
- Is supported by calls of any codec. Only G.729 and G.711 have accurately simulated probes. Calls of all other codecs are emulated by a G.711 probe.

For more information, including configuration tasks and examples, and command references for PSTN fallback, please refer to PSTN Fallback. Refer to the following document for additional information about the Call Admission Control for H.323 VoIP Gateways feature:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xa/122xa_2/ft_pfavb.htm.

Circuit Interface Identification Persistence for SNMP

The Circuit Interface MIB (CISCO-CIRCUIT-INTERFACE-MIB) provides a MIB object (cciDescr) which can be used to identify individual circuit-based interfaces for SNMP monitoring. The Circuit Interface Identification Persistence for SNMP feature maintains this user-defined name of the circuit across reboots, allowing the consistent identification of circuit interfaces. Circuit Interface Identification Persistence is enabled using the **snmp mib persist circuit** global configuration command.

Cisco H.323 Scalability and Interoperability Enhancements

The Cisco H.323 Scalability and Interoperability Enhancements feature upgrades the Cisco H.323 Gatekeeper and Cisco H.323 Gateway to comply with H.323 Version 3. The enhancements in this release include support for mandatory H.323 Version 3 elements in the gateway, support for H.225 call signalling over User Datagram Protocol (UDP), and address resolution using border elements.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/fth323v3.htm.

Cisco Mobile Networks

The Cisco Mobile Networks feature enables a Mobile Router and its subnets to be mobile and maintain all IP connectivity, transparent to the IP hosts connecting through this Mobile Router.

Mobile IP, as defined in standard RFC 2002, provides the architecture that enables the Mobile Router to connect back to its home network. Mobile IP allows devices to roam while appearing to be at their home network. Such a device is called a mobile node. A mobile node is a node, for example, a personal digital assistant, a laptop computer, or a data-ready cellular phone, that can change its point of attachment from one network or subnet to another. This mobile node can travel from link to link and maintain ongoing communications while using the same IP address.

The Mobile Router functions similarly to the mobile node with one key difference—the Mobile Router allows entire networks to roam. For example, a plane with a Mobile Router can fly around the world while passengers stay connected to the Internet. This communication is accomplished by Mobile IP aware routers tunneling packets, which are destined to hosts on the mobile networks, to the location where the Mobile Router is visiting. The Mobile Router then forwards the packets to the destination device.

These devices can be mobile nodes running mobile IP client software or nodes without the software. The Mobile Router eliminates the need for a mobile IP client. In fact, the nodes on the mobile network are not aware of any IP mobility at all. The Mobile Router "hides" the IP roaming from the local IP nodes so that the local nodes appear to be directly attached to the home network.

The Cisco Mobile Networks feature is a static network implementation that supports stub routers only. The Mobile Router avoids convergence problems by statically defining which networks it can address. The Mobile Router can do the following:

- Perform agent solicitation
- Perform registration and reregistration
- Decapsulate information for its attached devices

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftmbrout.htm.

Cisco Modem User Interface

The Cisco Modem User Interface feature enables Cisco routers to behave like a modem and be configured using standard Hayes modem commands. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftcmodui.htm.

Configuring AAL2 and AAL5 for the High Performance ATM Advanced Integration Module on the Cisco 2600 Series

The High Performance ATM Advanced Integration Module (AIM) is an internally mounted card that offers a cost-effective solution for supporting low-speed ATM WAN connections on the Cisco 2600 family of products. When using the voice DSP capability of a digital T1/E1 packet voice trunk network module (NM-HDV) and a T1/E1 multiflex VWIC, it supports as many as 60 channels of compressed voice over a T1/E1 trunk using AAL2 or AAL5, without using a dedicated ATM network module. AAL2 and AAL5 are the most bandwidth-efficient standards-based trunking methods for transporting compressed voice, voice-band data, circuit-mode data, and frame-mode data over ATM infrastructures. This feature provides a cost-effective, low-density ATM T1 or E1 solution for the Cisco 2600 series.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_24aim.htm.

CNS Configuration Agent

CNS is a foundation technology for linking users to network services. CNS SDK accomplishes this by making applications network-aware and increasing the intelligence of the network elements. CNS SDK provides building blocks to a range of customers in market segments such as Enterprise, service provider, independent software vendors, and system integrators.

The CNS Configuration Agent supports routing devices by providing:

- Initial configurations
- Incremental (partial) configurations
- Synchronized configuration updates

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftcns_ca.htm.

CNS Event Agent

CNS is a foundation technology for linking users to network services. CNS SDK accomplishes this by making applications network-aware and increasing the intelligence of the network elements. CNS SDK provides building blocks to a range of customers in market segments such as Enterprise, service provider, independent software vendors, and system integrators.

The CNS Event Agent is part of the Cisco IOS infrastructure that allows Cisco IOS applications, for example CNS Configuration Agent, to publish and subscribe to events on a CNS Event Bus. CNS Event Agent works in conjunction with CNS Configuration Agent.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftcns_ea.htm.

Crashinfo Support for Cisco 3600 Series

Crashinfo is a mechanism to reliably and quickly store useful information related to unexpected system shutdowns directly to a local flash card. This information can be retrieved after a system reload to aid in the analysis and resolution of a system error.

Cisco IOS Release 12.2(4)T introduces crashinfo support for the Cisco 3600 series. To enable this feature, use the **exception crashinfo file** *device:filename* in global configuration mode. Use the device and filename arguments to specify the flashcard and file to be used for storing the diagnostic information. To change the size of the crashinfo buffer, use the **exception crashinfo buffersize** command. The default buffer size is 32 Kilobytes.

DFP Support in DistributedDirector

DistributedDirector can obtain load information from Cisco LocalDirector, Catalyst 4840g, and other clients using Dynamic Feedback Protocol (DFP). This protocol allows the user to configure the DistributedDirector to communicate with various DFP agents. The DistributedDirector tells the DFP agents how often they should report load information; then the DFP agent can tell the DistributedDirector which LocalDirector cluster to remove from providing service.

Dialer CEF

The Dialer CEF feature introduces Cisco Express Forwarding (CEF) support for dialer interfaces. The Dialer CEF feature allows packets to be CEF switched across dialer interfaces rather than being low-end switched (LES) or fast switched. Compared to fast switching, CEF switching support improves switching performance by decreasing CPU utilization and lowering the packet loss rate. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftdlrcef.htm.

Dialer Persistent

The Dialer Persistent feature allows the connection settings in a dial-on-demand routing (DDR) dialer profile to be configured as *persistent*, that is, the connection is not torn down until the **shutdown** EXEC command is entered on the dialer interface. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftdperst.htm.

Diff-Serv-aware Traffic Engineering

MPLS traffic engineering allows constraint-based routing of constant bit rate (CBR) IP traffic. One of the constraints satisfied by CBR is the availability of required bandwidth over a selected path. Diff-Serv-aware Traffic Engineering extends MPLS traffic engineering to enable you to perform constraint-based routing of "guaranteed" traffic, which satisfies a more restrictive bandwidth constraint than that satisfied by CBR for regular traffic. This ability to satisfy a more restrictive bandwidth constraint translates into an ability to achieve higher Quality of Service performance (in terms of delay, jitter, or loss) for the guaranteed traffic.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_ds_te.htm.

Distinguished Name Based Crypto Maps

The Distinguished Name Based Crypto Maps feature allows you to restrict access to selected encrypted interfaces to peers with specific certificates, especially certificates with particular Distinguished Names (DNs).

Initially, if the router accepted a certificate or a shared secret from the encrypting peer, Cisco IOS did not have a method of preventing the peer from communicating with any encrypted interface other than the restrictions on the IP address of the encrypting peer. This feature allows you to configure which crypto maps are usable to a peer based on the DN that a peer used to authenticate itself. Thus, enabling you to control which encrypted interfaces a peer with a specified DN can access.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftdnacl.htm.

Distributed Link Fragmentation and Interleaving

The Distributed Link Fragmentation and Interleaving feature extends Link Fragmentation and Interleaving functionality to VIP-enabled Cisco 7500 series routers.

The Distributed Link Fragmentation and Interleaving feature supports the transport of real-time traffic, such as voice, and non real-time traffic, such as data, on lower-speed Frame Relay and ATM virtual circuits (VCs) without causing excessive delay to the real-time traffic.

This feature implements link fragmentation and interleaving (LFI) using multilink PPP (MLP) over Frame Relay and ATM. The feature enables delay-sensitive real-time packets and packets that are not real-time data to share the same link by fragmenting the large data packets into a sequence of smaller data packets (fragments). The fragments are then interleaved with the real-time packets. On the receiving side of the link, the fragments are reassembled and the packet is reconstructed.

Distributed LFI is often useful in networks that send real-time traffic, such as voice, but have bandwidth problems that delay this real-time traffic due to the transport of large, less time-sensitive data packets. Distributed LFI can be used in these networks to disassemble the large data packet into multiple segments. The real-time traffic packets can then be sent between these segments of the data packet. In this scenario, the real-time traffic does not experience a lengthy delay waiting for the low-priority data packet to traverse the network. The data packet is reassembled at the receiving side of the link, so the data is delivered intact.

DistributedDirector Enhancements

This release of Cisco DistributedDirector contains two new commands. The new **ip director default priorities** command specifies the default priorities for each type of metric. If a metric does not have a default priority specified, DistributedDirector does not use that metric. The default priorities take effect if no priorities are specified in the DNS TXT record for that host.

The new **ip director drp rttprobe tcp | icmp** command enables DistributedDirector to instruct a DRP agent to send ICMP-echo packets to measure the RTT.

The new **show ip director default priority** command verifies the default priority configurations.

The **ip director default-weights** command has been modified. It is now **ip director default weights**.

The **show ip director default-weights** command has been modified. It is now **show ip director default weights**.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftdd1224.htm.

Distributed Management Event and Expression MIB Persistence

The MIB Persistence feature allows the SNMP data of an MIB to be persistent across reloads; that is, MIB information retains the same set object values each time the user reboots. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftmibpr1.htm.

DNS Server Support for NS Records

DistributedDirector has improved server load-balancing capacity with the DNS Server Support for NS Records feature. This feature adds support for name server (NS) records to the Cisco IOS Domain Name System (DNS) server. With this feature, the DistributedDirector can distribute the server-selection process to multiple DistributedDirectors, improving overall server capacity.

Enhanced Test Command

The Enhanced Test Command feature introduces two new commands—**aaa user profile** and **aaa attribute**—that allow you to create a named user profile with calling line identification (CLID) or dialed number identification service (DNIS) attribute values, which can be associated with a **test aaa group** command.

Use the **aaa attribute** command to add CLID or DNIS attribute values to a user profile, which is created by using the aaa user profile command. The CLID or DNIS attribute values can be associated with the record that is going out with the user profile (via the test aaa group command), thereby providing the RADIUS server with access to CLID or DNIS attribute information for all incoming calls.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftaaacmd.htm.

Enhancements to H.323 Call Statistics

Beginning with Cisco IOS Release 12.2(4)T, enhancements to H.323 call statistics allow you to clear the gateway counters, display H.323 messages that have been sent and received, obtain statistics on the reasons calls are disconnected, and display debug output for various components within the H.323 subsystem. To enable these enhancements, the following commands have been added or modified: **clear h323 gateway**, **show h323 gateway**, and **debug cch323**.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftcallst.htm.

Firewall Authentication Proxy

The Cisco IOS Firewall authentication proxy feature allows network administrators to apply specific security policies on a per-user basis. Previously, user identity and related authorized access was associated with the IP address of a user, or a single security policy had to be applied to an entire user group or sub network. Now, users can be identified and authorized on the basis of their per-user policy, and access privileges tailored on an individual basis are possible, as opposed to general policy applied across multiple users.

With the authentication proxy feature, users can log in to the network or access the Internet via HTTP, and their specific access profiles are automatically retrieved and applied from a CiscoSecure ACS, or other RADIUS, or TACACS+ authentication server. The user profiles are active only when there is active traffic from the authenticated users.

The authentication proxy is compatible with other Cisco IOS security features such as Network Address Translation (NAT), Context-based Access Control (CBAC), IP Security (IPSec) encryption, and Cisco Secure VPN Client (VPN client) software.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121cgcr/secur_c/scprt3/scdauthp.htm.

Four SS7 Link Support on the Cisco Signaling Link Terminal

The Four SS7 Link Support on the Cisco Signaling Link Terminal feature introduces support for up to four Cisco SS7 links on a new platform for the Cisco SLT, the Cisco 2651 Multiservice Access Router. All existing Cisco 2611-based Cisco SLT functionality is supported on the new platform, and both Cisco SLT platforms use the same Cisco IOS software image.

The Cisco 2651-based Cisco SLT supports up to four SS7 A-links and F-links, and each SS7 link can support up to 0.4 erlangs of signaling traffic during normal operation. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_4lnk.htm.

Frame Relay 64-Bit Counters

The Frame Relay 64-Bit Counters feature provides 64-bit counter support on Frame Relay interfaces and subinterfaces. This feature enables the gathering of statistics through Simple Network Management Protocol (SNMP) for faster interfaces operating at OC-3, OC-12, and OC-48 speeds.

The following counters are supported by this feature: Bytes In, Bytes Out, Packets In, and Packets Out.

The **show frame-relay pvc** command has been modified to display the 64-bit counters. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft64bits.htm.

Frame Relay MIB Enhancements

The Cisco Frame Relay MIB describes managed objects that enable users to remotely monitor Frame Relay operations using Simple Network Management Protocol (SNMP). The Frame Relay MIB Enhancements feature extends the Cisco Frame Relay MIB by adding MIB objects to monitor the following Frame Relay functionality:

- Frame Relay fragmentation
- Frame Relay–ATM Network Interworking (FRF.5)
- Frame Relay–ATM Service Interworking (FRF.8)
- Frame Relay switching
- Input and output rates of individual virtual circuits (VCs)

The Frame Relay MIB enhancements also modify the **load-interval** command to enable you to configure the load interval per permanent virtual circuit (PVC). Before the introduction of this feature, the load interval could be configured only for the interface. Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftfrmibe.htm.

High-Performance Gatekeeper

The Cisco High-Performance Gatekeeper feature introduces new gatekeeper functionality and modifications for facilitating carrier class reliability, security, and performance into the Cisco Voice Network solution portfolio. These H.323 standard-based features have carrier grade reliability and performance characteristics with a robust open application protocol interface to enable development of enhanced applications like voice Virtual Private Networks (VPNs) and wholesale voice solutions.

This feature addresses the scalability, redundancy, and performance aspects of the gatekeeper as part of the Cisco Multimedia Conference Manager (MCM) to present a complete Cisco solution. The Cisco H.323 MCM provides the network administrator with the ability to identify H.323 traffic and to apply appropriate policies.

iBGP Multipath Load Sharing

When a Border Gateway Protocol (BGP) speaker router with no local policy configured receives multiple network layer reachability information (NLRI) from the internal BGP for the same destination, the router will choose one internal BGP path as the best path. The best path is then installed in the IP routing table of the router.

The Internal BGP Multipath Load Sharing feature enables the BGP speaker router to select multiple internal BGP paths as the best paths to a destination. The best paths or multipaths are then installed in the IP routing table of the router.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft11bmls.htm

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T. This release is porting the feature into the Cisco 1710, Cisco 1721, Cisco 1751, Cisco 3631, Cisco 3725, and Cisco 3745 routers, and the IGX 8400 series URM.

ICMP ECHO-Based RTT Probing by DRP Agents

DistributedDirector users can now control Director Response Protocol (DRP) agents to send both TCP and ICMP packets for round-trip time (RTT) measurement.The RTT measurement is used to dynamically direct Internet customers to the closest regional web proxy based on response time.

In the original implementation, some Internet DNS servers did not respond when the DRP agents sent them a query to measure the RTT.

This feature introduces the new **ip director drp rttprobe tcp** | **icmp** command that enables DistributedDirector to instruct a DRP agent to send ICMP-echo packets to measure the RTT.

When both ICMP and TCP are enabled, DistributedDirector will instruct DRP agents to send both TCP and ICMP packets for RTT probing. The returned RTT from a DRP agent will be the RTT collected from either the TCP or ICMP mechanism, which ever becomes available first.

IGMP MIB Support Enhancements for SNMP

The Internet Group Management Protocol (IGMP) is used by IP hosts to report their multicast group memberships to neighboring multicast routers. The IGMP MIB describes objects that enable users to remotely monitor and configure IGMP using Simple Network Management Protocol (SNMP). It also allows users to remotely subscribe and unsubscribe from multicast groups. The IGMP MIB Support Enhancements for SNMP feature adds full support of RFC 2933 (Internet Group Management Protocol MIB) in Cisco IOS software. There are no new or modified Cisco IOS commands associated with this feature.

For complete details on the IGMP MIB, see the IGMP-STD-MIB.my file available from the Cisco MIB website on Cisco.com at http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml.

Inter-Domain Gatekeeper Security Enhancement

The Inter-Domain Gatekeeper Security Enhancement provides a means of authenticating and authorizing H.323 calls between the administrative domains of Internet Telephone Service Providers (ITSPs).

An interzone ClearToken (IZCT) is generated in the originating gatekeeper when a location request (LRQ) is initiated or an admission confirmation (ACF) is about to be sent for an intrazone call within an ITSP administrative domain. As the IZCT traverses through the routing path, each gatekeeper stamps the IZCT destination gatekeeper ID with its own ID. This identifies when the IZCT is being passed over to another ITSP domain. The IZCT is then sent back to the originating gateway in the location confirmation (LCF) message. The originating gateway passes the IZCT to the terminating gateway in the SETUP message. The terminating gatekeeper forwards the IZCT in the admission request (ARQ) answerCall field to the terminating gatekeeper, which then validates it.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xa/122xa_2/ft_ctoke.htm.

Interesting Traffic PPP and Customer Profile Idle Timer

The Interesting Traffic PPP and Customer Profile Idle Timer feature supports a PPP idle timer based on interesting traffic for dialer interfaces.

Interface Index Display

The Interface Index (IfIndex) is a user-specified identification number for an interface used in SNMP network management. The IfIndex is an object in the Interfaces Group MIB (IF-MIB), which can be set by a network manager to consistently identify an interface. A new Cisco IOS software command, **show snmp mib ifmib ifindex**, allows the user to display the IfIndex identification numbers assigned to interfaces and subinterfaces using the CLI. The IFIndex provides a way to display these values without the need for a Network Management Station.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftshowif.htm.

IP to ATM Class of Service Mapping for SVC Bundles

The IP to ATM Class of Service Mapping for SVC Bundles feature supports multiple switched virtual circuits (SVCs) to the same NSAP destination for different types of service (ToS). This feature is an extension to the feature described in the chapter "Configuring IP to ATM Class of Service" in the *Cisco IOS Quality of Service Solutions Configuration Guide*. The original feature was limited to permanent virtual circuits (PVCs) only. This feature is an extension because it applies to SVCs.

The PVC bundle feature requires that the user configure PVCs for different IP ToS. The PVCs have to be set up throughout the ATM network between endpoints. The IP to ATM Class of Service Mapping for SVC Bundles feature needs configuration only at the endpoints. The user does not configure SVCs; the software sets up SVCs in a bundle between endpoints. When the router receives the first IP packet for the destination that is configured in the SVC bundle, that event triggers the creation of the SVC.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftsvbund.htm.

IPSec MIB Support for VPN Management

The IPSec MIB Support for VPN Management feature allows the monitoring of IP Security (IPSec) and Internet Key Exchange (IKE) protocols using SNMP. IPSec and IKE monitoring is especially useful in Virtual Private Networks (VPNs) supporting gateway devices and customer premises equipment (CPE).

For IPSec MIB implementation details, see the CISCO-IPSEC-MIB.my, CISCO-IPSEC-POLICY-MAP-MIB.my, and CISCO-IPSEC-FLOW-MONITOR-MIB.my files, available through the Cisco.com MIB site.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121limit/121e/121e4/dtipmib.htm.

IPv6 for Cisco IOS Software

IPv6, formerly called IPng (next generation), is a replacement for the current version of IP (version 4). Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ipv6/index.htm.

IRR Triggers for GKTMP

The IRR Triggers for GKTMP feature allows a Cisco Gateway to send an information request response (IRR) to the Gatekeeper (GK) containing the details of a particular call after a successful connect. The feature also allows a back end application to set triggers for this message and the GK to deliver the IRR information to the application.

ISIS: Allows BGP to Control the Configuration of the Overload Bit

The Intermediate-System to Intermediate-System (IS-IS) protocol defines a special bit in each link-state packet (LSP) called the overload-bit. IS-IS uses the overload bit to "tell" other routers to ignore this router in their shortest path first (SPF) calculations. This function prevents transit traffic from passing through the router before the routing table has converged, and transit traffic is not lost.

L2TP IPSec

The L2TP IPSec feature provides enhanced security for tunneled PPP frames between the L2TP Access Concentrator (LAC) and the L2TP Network Server (LNS). Previous releases of the Cisco IOS provided only a one time, optional mutual authentication during tunnel setup with no authentication of subsequent data packets or control messages. In situations where L2TP is used to tunnel PPP sessions over an untrusted infrastructure such as the internet, the security attributes of L2TP and PPP are inadequate. PPP provides no protection of the L2TP tunnel, and current PPP encryption protocols provide inadequate key management and no authentication or integrity mechanisms. The L2TP IPSec feature allows the robust security features of IPSec to protect the L2TP tunnel and the PPP sessions within the tunnel. In addition, the L2TP IPSec feature provides built in keepalives and standardized interfaces for user authentication and accounting to AAA servers.

The deployment of Windows 2000 demands the integration of IPSec with L2TP as this is the default Virtual Private Dialup Network (VPDN) networking scenario. This integration of protocols is also used for LAN-to-LAN VPDN connections in Windows 2000. The L2TP IPSec feature provides integration of IPSec with L2TP in a solution that is scalable to large networks with minimal configuration.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftl2tsec.htm.

L2TP Large-Scale Dial-Out

The L2TP Large-Scale Dial-Out feature enables the router to dial multiple Layer 2 Tunnel Protocol (L2TP) access concentrators (LACs) from a single L2TP network server (LNS). The LACs are signaled through the LNS and use L2TP to establish the dial sessions. User-defined profiles can be configured on an authentication, authorization, and accounting (AAA) server and retrieved by the LNS when dial-out occurs.The L2TP Large-Scale Dial-Out feature also supports multiple LACs bound into one stack group, call traffic load balancing, and outbound call congestion management.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftl2lsdo.htm.

Leased and Switched BRI Interfaces for ETSI NET3

The Leased and Switched BRI Interfaces for ETSI NET3 feature allows one BRI B channel on an ETSI NET3 switch to be configured as a leased line, and the second B channel to be configured as a standard ISDN or dial interface and used as a switched channel to the Public Switched Telephone Network (PSTN). When the Leased and Switched BRI Interfaces for ETSI NET3 feature is configured, one B channel functions as a point-to-point 64 kbps leased line and the other B channel functions as a circuit-switched channel using the D channel to provide the signaling features available for the ETSI NET3 signaling protocol.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftlswbri.htm.

Location Confirmation Enhancements for Alternate Endpoints

The Location Confirmation (LCF) Enhancements for Alternate Endpoints feature allows a Cisco IOS Gatekeeper (GK) to collect additional routes to endpoints that are indicated by multiple LCF responses from remote GKs, and convey a collection of those routes to the requesting (calling) endpoint. Currently, the originating GK sends Location Request (LRQ) messages to multiple remote zones. Remote GKs in the zones return LCF responses to the originating GK. The LCF responses indicate alternate routes to the remote GK endpoints.

The LCF Enhancements for Alternate Endpoints feature allows the originating GK to discover and relay more possible terminating endpoints to the requesting endpoint, therefore providing alternate routes to endpoints that can be used if the best route is busy or does not provide any alternate routes. The endpoint receiving the list of alternate endpoints tries to reach them in the order in which the alternate endpoints were received. The LCF Enhancements for Alternate Endpoints feature can be used on GKs that originate LRQs and directory GKs that forward LRQ messages.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_lcfep.htm.

Low Latency Queueing

Low Latency Queueing is now supported on Cisco 820 routers. The Low Latency Queueing feature brings strict priority queueing to Class-Based Weighted Fair Queueing (CBWFQ). Strict priority queueing allows delay-sensitive data such as voice to be dequeued and sent first (before packets in other queues are dequeued), giving delay-sensitive data preferential treatment over other traffic. Information about LLQ is provided in the *Quality of Service Solutions Configuration Guide*. For overview information, refer to the following chapter:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122cgcr/fqos_c/fqcprt2/qcfconmg.htm#xtocid1239530.

For configuration instructions, refer to the following chapter:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122cgcr/fqos_c/fqcprt2/qcfwfq.htm#xtocid2836441.

MD5 File Validation

The MD5 File Validation feature allows you to check the integrity of a Cisco IOS software image by comparing its MD5 checksum value against a known MD5 checksum value for the image. MD5 values are now made available on Cisco.com for all Cisco IOS software images for comparison against local system image values.

To perform the MD5 integrity check, execute the verify command using the new "/md5" keyword. For example, executing the **verify flash:c7200-is-mz.122-2.T.bin /md5** command will calculate and display the MD5 value for the software image. Compare this value with the value available on Cisco.com for this image.

Alternatively, you can get the MD5 value from Cisco.com first, then specify this value in the command syntax. For example, executing the **verify flash:c7200-is-mz.122-2.T.bin /MD5 8b5f3062c4caeccae72571440e962233** command will display a message verifying that the MD5 values match or that there is a mismatch.

A mismatch in MD5 values means that either the image is corrupt or the wrong MD5 value was entered.

MGCP 1.0 Including NCS 1.0 and TGCP 1.0 Profiles

This feature implements the following MGCP protocols on Cisco media gateways:

- MGCP 1.0 (IETF RFC2705), which applies to both trunking gateways and residential gateways.
- Network-based Call Signaling (NCS) 1.0, the PacketCable profile of MGCP 1.0 for residential gateways (RGWs)
- Trunking Gateway Control Protocol (TGCP) 1.0, the PacketCable profile of MGCP 1.0 for trunking gateways (TGWs)

The MGCP 1.0 specification and the NCS and TGCP profiles support new packages, endpoints, and event definitions. In addition, the specifications provide more detail regarding error recovery. In general, the latest edition of the MGCP specification provides guidelines for more reliable implementations of the protocol.

Media Gateway Control Protocol (MGCP) 1.0 is a protocol for the control of Voice over IP (VoIP) calls by external call-control elements known as media gateway controllers (MGCs) or call agents (CAs). It is described in the informational RFC2705, published by the Internet Engineering Task Force (IETF). MGCP 1.0 provides interoperability with a wide variety of call agents, thus enabling an extensive range of solutions.

The NCS and TGCP protocol specifications were developed through PacketCable, an industry-wide initiative to develop interoperability standards for multimedia services over cable facilities using packet technology that is led by CableLabs, an industry consortium. In Europe, the EuroPacketCable working group is ensuring that packet cable standards are available to meet European requirements and equipment characteristics.

NCS and TGCP protocol specifications contain extensions and modifications to MGCP while preserving basic MGCP architecture and constructs. NCS 1.0 is designed for use with analog, single-line user equipment on residential gateways, while TGCP 1.0 is intended for use in VoIP-to-PSTN trunking gateways in a cable environment. TGCP and NCS allow participation in packet cable solutions, but the specifications do not preclude their use in non-cable environments.

Media gateway platforms supported for this feature include:

- MGCP 1.0
  - Cisco 2600 series
  - Cisco 2650
  - Cisco MC3810
- MGCP 1.0 and NCS 1.0
  - Cisco CVA122
  - Cisco CVA122E
  - Cisco uBR925
- MGCP 1.0 and TGCP 1.0
  - Cisco 3660

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_lcfep.htm.

MGCP Voice Gateway Interoperability with Cisco CallManager

MGCP voice gateway interoperability with Cisco CallManager allows modular access routers to act as redundant failover MGCP gateways. You can enable IP telephony and Cisco CallManager solutions using Cisco 2600 and Cisco 3600 series routers as voice gateways. This allows you to use the Cisco 2600 and 3600 platforms already in your networks as MGCP gateways within an IP telephony architecture.

An MGCP gateway handles the translation between audio signals and the packet network. The gateways interact with a call agent (also called a Media Gateway Controller or MGC) that performs signal and call processing on gateway calls.

In the MGCP configurations that Cisco IOS supports, the gateway can be any of the following:

- Cisco router
- Access server
- Cable modem

The call agent is either of the following:

- A server from a third-party vendor
- Cisco CallManager

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xa/122xa_2/ft_mgccm.htm.

Mobile IP MIB Support for SNMP

The Mobile IP MIB Support for SNMP feature adds a MIB module which expands network monitoring capabilities of Foreign Agent (FA) and Home Agent (HA) Mobile IP Entities. Mobile IP management using SNMP is defined in two MIBs: the RFC2006-MIB and the CISCO-MOBILE-IP-MIB. The Cisco Mobile IP MIB is a Cisco enterprise-specific extension to IETF RFC 2006 MIB module which allows you to monitor the total number of HA Mobile bindings and the total number of FA visitor bindings. This release also adds support for RFC 2006 Set operations and a SNMP notification. Set operations (performed from a Network Management System) are supported for starting and stopping the mobile IP service, configuring security associations, modifying advertisement parameters, and configuring "care-of addresses" for foreign agents. An SNMP notification (trap or inform) for security violations can be enabled on supported routing devices using the **snmp-server enable traps ipmobile** and **snmp-server host** global configuration CLI commands. As this feature affects security, use of SNMPv3 is strongly recommended.

For further details, refer to the *Mobile IP MIB Support for SNMP* Feature Guide at the following location:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t1/ft1mip.htm.

Mobile Networks

The Cisco Mobile Networks feature enables a Mobile Router and its subnets to be mobile and maintain all IP connectivity, transparent to the IP hosts connecting through this Mobile Router.

Mobile IP, as defined in standard RFC 2002, provides the architecture that enables the Mobile Router to connect back to its home network. Mobile IP allows a device to roam while appearing to be at its home network. Such a device is called a mobile node. A mobile node is a node, for example, a personal digital assistant, a laptop computer, or a data-ready cellular phone, that can change its point of attachment from one network or subnet to another. This mobile node can travel from link to link and maintain ongoing communications while using the same IP address.

The Mobile Router functions similarly to the mobile node with one key difference—the Mobile Router allows entire networks to roam. For example, a plane with a Mobile Router can fly around the world while passengers stay connected to the Internet. This communication is accomplished by Mobile IP aware routers tunneling packets, which are destined to hosts on the mobile networks, to the location where the Mobile Router is visiting. The Mobile Router then forwards the packets to the destination device.

These devices can be mobile nodes running Mobile IP client software or nodes without the software. The Mobile Router eliminates the need for a Mobile IP client. In fact, the nodes on the mobile network are not aware of any IP mobility at all. The Mobile Router "hides" the IP roaming from the local IP nodes so that the local nodes appear to be directly attached to the home network.

The Cisco Mobile Networks feature is a static network implementation that supports stub routers only. The Mobile Router avoids convergence problems by statically defining which networks it can address. The Mobile Router can do the following:

- Perform agent solicitation
- Perform registration and reregistration
- Decapsulate information for its attached devices

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftmbrout.htm.

Mobile Networks MIB Support

The Cisco Mobile Networks MIB Support feature implements mobile node MIB groups for the monitoring and management of Cisco Mobile Network activity. Data from managed objects is returned through the use of the "show" commands described in the documentation for the "Cisco Mobile Networks" 12.2(4)T feature, or can be retrieved from a Network Management System using SNMP.

The Cisco Mobile Networks MIB Support feature implements the following mobile node (mn) groups in the Mobile IP MIB (RFC2006-MIB): the mnSystem group, the mnDiscovery group, and the mnRegistrationGroup.

For further details, refer to the RFC2006-MIB.my file, available through Cisco.com at ftp://ftp.cisco.com/pub/mibs/v2/, and RFC 2206, "The Definitions of Managed Objects for IP Mobility Support using SMIv2."

MPLS Label Switch Controller and Enhancements

The Multiprotocol Label Switching (MPLS) Label Switch Controller (LSC), combined with a slave ATM switch, supports scalable integration of IP services over an ATM network. The MPLS LSC enables the slave ATM switch to:

- Participate in an MPLS network
- Directly peer with IP routers
- Support the IP features in Cisco Internetwork Operating System (IOS) software

This feature was originally introduced in Cisco IOS Release 11.1CT as the Tag Switch Controller. Cisco IOS Release 12.2(4)T adds support for the following changes and additions:

- Changed tag-switching commands and terminology to MPLS format.
- Added support for Cisco MGX 8850 and 8950 switch with the Cisco MGX RPM-PR card as an MPLS LSC.
- Added DiffServ with MPLS QoS multi-VC feature support.
- Added the **vci-range** keyword to the **mpls atm vpi** and **mpls atm vp-tunnel** commands.
- Extended the VPI range from 256 to 4095.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftmpls.htm.

MPLS Traffic Engineering (TE)—Automatic Bandwidth Adjustment for TE Tunnels

Traffic engineering automatic bandwidth adjustment provides the means to automatically adjust the bandwidth allocation for traffic engineering tunnels based on their measured traffic load.

Traffic engineering autobandwidth samples the average output rate for each tunnel marked for automatic bandwidth adjustment. For each marked tunnel, it periodically (for example, once per day) adjusts the tunnel's allocated bandwidth to be the largest sample for the tunnel since the last adjustment.

The frequency with which tunnel bandwidth is adjusted and the allowable range of adjustments is configurable on a per-tunnel basis. In addition, the sampling interval and the interval over which to average tunnel traffic to obtain the average output rate is user-configurable on a per-tunnel basis.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftbwadjm.htm.

MPLS Traffic Engineering (TE)—IP Explicit Address Exclusion

The MPLS traffic engineering Internet Protocol (IP) explicit address exclusion feature provides a means to exclude a link or node from the path for an MPLS traffic engineering label-switched path (LSP).

The feature is accessible by the **ip explicit-path** command that allows you to create an IP explicit path and enter a configuration submode for specifying the path. The feature adds to the submode commands the **exclude-address** command for specifying addresses to exclude from the path.

If the exclude-address for an MPLS traffic engineering LSP identifies a flooded link, the constraint-based shortest path firs (CSPF) routing algorithm does not consider that link when computing paths for the LSP. If the exclude-address specifies a flooded MPLS traffic engineering router ID, the CSPF routing algorithm does not allow paths for the LSP to traverse the node identified by the router ID.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftaddexc.htm.

Multiservice Interchange (MIX) Support

On the Cisco 2600 series router, the Cisco 3620 router, and the Cisco 3640 router, MIX features are software only. On the Cisco 3660 router, MIX requires the installation of a multiservice interchange card, also called a MIX module (MIX-3660-64), which provides additional functionality.

MIX features support applications that are sensitive to time delay, such as voice and video. MIX enables the combination of different types of calls on a single T1 or E1 connection, giving customers the flexibility to manage traffic through their routers efficiently, as either traditional TDM connections or in packet-based format.

On Cisco 2600 series router, MIX allows connection of TDM streams between two voice/WAN interface cards (VWICs) on the same zero-LAN 2-slot network module (NM-2W).

On all Cisco 3600 series routers, MIX allows connection of TDM streams between two voice/WAN interface cards (VWICs) on the same Fast Ethernet network module (NM-xFE2W).

On the Cisco 3660 router, the MIX module also enables the following features:

- Connection of TDM streams between separate MIX-enabled network modules. The following network modules are currently MIX-enabled:
  - High-Density Voice (NM-HDV)
  - Fast Ethernet Mixed Media (NM-xFE2W)
  - ATM OC-3 CES (NM-1AOC3-XX-1V)
- DSP resource sharing across network modules, so that unused DSP resources on one network module (NM-HDV) can be configured to support voice traffic on other network modules (NM-xFE2W or NM-HDV).
- Circuit emulation of T1/E1s on Fast Ethernet Mixed Media cards (NM-xFE2W) and High-Density Voice network modules (NM-HDV) can now be supported by transporting them across MIX to ATM OC-3 network modules (NM-1AOC3-XX-1V).

The MIX feature also enhances extended availability drop and insert (EADI) functionality to ensure that TDM connections across slots survive a software reload if they have been saved in NVRAM. This means that the data or voice connections carried over TDM will survive even if the router goes down and comes back up again. No separate configuration is necessary for EADI, but to ensure that the TDM connections are not interrupted, their connect commands must be saved to NVRAM by writing the configuration. Other types of MIX connections, such as circuit emulation service (CES) connections and voice connections that terminate on the router, will not survive a software reboot or reload.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_24mix.htm.

NAT Support of H.323 RAS

The Cisco IOS NAT feature supports all H.225 and H.245 message types, including Registration, Admission, and Status (RAS). RAS provides a number of messages that are used by software clients and VoIP devices to register their location, request assistance in call setup, and control bandwidth. The RAS messages are directed toward an H.323 gatekeeper.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftnatras.htm.

NAT—Ability to Use Route Maps with Static Translations

The NAT—Ability to Use Route Maps with Static Translations feature provides support for NAT multihoming capability with static address translations. Support has been added for 1-to-1 static address translation only. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftnatrt.htm.

NAT—Static Mapping Support with HSRP for High Availability

The NAT—HSRP VMAC with NAT ARP Response feature allows NAT to use the HSRP Virtual MAC for ARPs. Failover is ensured without having to time out and repopulate upstream ARP caches. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftnthsrp.htm.

NAT—Translation of External IP Addresses Only

The NAT—Translation of External IP Addresses Only feature allows the configuration of Cisco IOS NAT to ignore all embedded IP addresses for any application and traffic type. It cannot be configured on a per application/traffic type basis. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftnatxip.htm.

NetFlow Multiple Export Destinations

The NetFlow Multiple Export Destinations feature enables configuration of multiple destinations of the NetFlow data. With this feature enabled, two identical streams of NetFlow data are sent to the destination host. Currently, the maximum number of export destinations allowed is two.

The NetFlow Multiple Export Destinations feature improves the chances of receiving complete NetFlow data by providing redundant streams of data. Because the same export data is sent to more than one NetFlow collector, fewer packets will be lost.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/dtnfdest.htm.

NetFlow ToS-Based Router Aggregation

The NetFlow ToS-Based Router Aggregation feature provides the ability to enable limited router-based type of service (ToS) aggregation of NetFlow Export data, which results in summarized NetFlow Export data to be exported to a collection device. The result is lower bandwidth requirements for NetFlow Export data and reduced platform requirements for NetFlow data collection devices.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios120/120newft/120limit/120s/120s15/dtnfltos.htm.

Offload Server Accounting Enhancement

The Offload Server Accounting Enhancement feature allows users to configure their access servers (NAS) to synchronize authentication and accounting information— NAS-IP-Address (attribute 4) and Class (attribute 25)—with the offload server.

An offload server interacts with an access server via Virtual Private Network (VPN) to perform required Point-to-Point Protocol (PPP) negotiation for calls. The NAS performs call preauthentication, while the offload server performs user authentication. Thus, this feature allows the authentication and accounting data of the NAS to synchronize with the offload server as follows:

- During preauthentication, the NAS generates a unique session-id, which adds the Acct-Session-Id (attribute 44) before the existing session-id (NAS-IP-Address), and retrieves a Class attribute. The new session-id is sent in preauthentication requests and resource accounting requests; the Class attribute is sent in resource accounting requests.

Note Note Unique session-ids are needed when multiple NASs are being processed by one offload server.

- The NAS-IP-Address, the Acct-Session-Id, and the Class attribute are transmitted to the offload server via Layer 2 Forwarding (L2F) options.

The offload server will include the new, unique session-id in user access requests and user session accounting requests. The Class attribute that was passed from the NAS will be included in the user access request, but a new Class attribute will be received in the user access reply; this new Class attribute should be included in user session accounting requests.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftoffact.htm.

Optimized PPP Negotiation

The Optimized PPP Negotiation feature optimizes the time needed for PPP negotiation when a connection is made. PPP negotiation can include several cycles before the negotiation options are acknowledged. These negotiation cycles can cause a significant user-perceived delay, especially in networks with slow links such as a wireless data connection. Additionally, the PPP negotiation time can add significantly to the total time the user stays connected in these types of connections. Changes to the PPP link control protocol (LCP) and PPP Internet Protocol Control Protocol (IPCP) negotiation strategies as part of Cisco IOS Release 12.2(4)T make a reduction in the negotiation time possible.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftcphneg.htm.

OSPF ABR Type 3 LSA Filtering

The OSPF ABR Type 3 link-state advertisement (LSA) Filtering feature extends the ability of an ABR that is running the OSPF protocol to filter type 3 LSAs between different OSPF areas. This feature allows only specified prefixes to be sent from one area to another area and restricts all other prefixes.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftabrt3f.htm.

OSPF Stub Router Advertisement

The OSPF Stub Router Advertisement feature allows you to bring a new router into a network without immediately routing traffic through the new router and allows you to gracefully shut down or reload a router without dropping packets that are destined for other networks. This feature introduces three configuration options that allow you to configure a router that is running the Open Shortest Path First (OSPF) protocol to advertise a maximum or infinite metric to all neighbors.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftospfau.htm.

OSPF Update Packet-Pacing Configurable Timers

The OSPF Update Packet-Pacing Configurable Timers feature allows you to configure the rate at which Open Shortest Path First (OSPF) link-state advertisement (LSA) flood pacing, group pacing, and retransmission pacing updates occur. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftospfct.htm.

PIM MIB Extension for IP Multicast

Protocol Independent Multicast (PIM) is an IP Multicast routing protocol used for routing multicast data packets to multicast groups. RFC 2934 defines the *Protocol Independent Multicast for IPv4* MIB, which describes managed objects that enable users to remotely monitor and configure PIM using Simple Network Management Protocol (SNMP).

The PIM MIB Extension for IP Multicast feature introduces support in Cisco IOS software for the CISCO-PIM-MIB, which is an extension of RFC 2934 and an enhancement to the existing Cisco implementation of the PIM MIB. This feature introduces the following new classes of PIM notifications:

- neighbor-change—This notification results from the following conditions:
  - When the PIM interface of a router is disabled or enabled (using the **ip pim** command in interface configuration mode)
  - When the PIM neighbor adjacency of a router expires or is established (defined in RFC 2934)
- rp-mapping-change—This notification results from a change in the rendezvous point (RP) mapping information due to either Auto-RP or bootstrap router (BSR) messages.
- invalid-pim-message—This notification results from the following conditions:
  - When an invalid (*, G) join or prune message is received by the device (for example, when a router receives a join or prune message for which the RP specified in the packet is not the RP for the multicast group)
  - When an invalid PIM register message is received by the device (for example, when a router receives a register message from a multicast group for which it is not the RP)

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftpimmib.htm.

PPPoA/PPPoE Autosense for ATM PVCs

The PPPoA/PPPoE Autosense for ATM PVCs feature enables the router to distinguish between incoming PPP over ATM (PPPoA) and PPP over Ethernet (PPPoE) over ATM sessions and to create virtual access based on demand for both PPP types.

The PPPoA/PPPoE Autosense for ATM PVCs feature is supported on LLC-encapsulated ATM PVCs only.

This new feature also adds support for precloning of virtual access interfaces for PPPoA and PPPoE over ATM. Precloning is the allocation of a specified number of virtual access interfaces at system start. Precloning significantly reduces the load on the system during call setup. When precloning is used, the virtual-access interface is attached to the permanent virtual circuit (PVC) upon receipt of the first PPP packet from the client on the PVC. The virtual-access interface is detached from the PVC on termination of the PPP session.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftp_auto.htm.

PPPoE over Gigabit Ethernet

The PPPoE over Gigabit Ethernet feature enhances PPP over Ethernet (PPPoE) functionality by adding support for PPPoE and PPPoE over IEEE 802.1Q VLANs on Gigabit Ethernet interfaces. The PPPoE over Gigabit Ethernet feature is supported on Cisco 7200 series routers with Gigabit Ethernet line cards.

PPPoE Session Limit

The PPPoE Session Limit feature enables you to limit the number of PPP over Ethernet (PPPoE) sessions that can be created on a router or on an ATM permanent virtual circuit (PVC), PVC range, or virtual circuit (VC) class.

This new feature introduces a new command and a modification to an existing command that enable you to specify the maximum number of PPPoE sessions that can be created. The new **pppoe limit max-sessions** command limits the number of PPPoE sessions that can be created on the router. The modified **pppoe max-sessions** command limits the number of PPPoE sessions that can be created on an ATM PVC, PVC range, VC class, or Ethernet subinterface.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftppoesl.htm.

PRI Backhaul Using the Stream Control Transmission Protocol and the ISDN Q.921 User Adaptation Layer

The PRI Backhaul Using the Stream Control Transmission Protocol and the ISDN Q.921 User Adaptation Layer feature fulfills the need for a standards based PRI Signaling backhaul that works with third party Call Agents to enable solutions like Integrated Access, IP PBX, and Telecommuter.

This feature provides the following:

- PRI Backhaul—Specific implementation for backhauling PRI.
- SCTP—New general transport protocol that can be used for backhauling signaling messages.
- IUA—Mechanism for backhauling any Layer 3 protocol that normally uses Q.921.

These features do the following:

- Provide a configuration interface for Cisco IOS software implementation.
- Implement the protocol message flows for SCTP and IUA.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_0546.htm.

PRI/Q.931 Signaling Backhaul for Call Agent Applications

This feature implements PRI/Q.931 signaling backhaul support for call agent applications on the Cisco 2600 and Cisco 3600 series routers and Cisco MC3810 series access concentrators. PRI/Q.931 signaling backhaul is the transport of PRI signaling (Q.931 and above layers) between a media gateway (such as a Cisco access server, router, or concentrator) and a media gateway controller (Cisco VSC3000).

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_bhaul.htm.

PSTN Fallback for Cisco 7200 and 7500 Series Routers

The PSTN Fallback feature monitors congestion in the IP network and redirects calls to the PSTN or rejects calls on the basis of network congestion. The fallback subsystem has a network traffic cache that maintains the Calculated Planning Impairment Factor (ICPIF) or delay/loss values for various destinations. Performance is improved because each new call to a well-known destination does not have to wait on a probe to be admitted and the value is usually cached from a previous call.

This feature was originally introduced in Cisco IOS Release 12.1(3)T. With this release, support is added for the Cisco 7200 and 7500 series routers; the **call fallback** command is added, and the **call fallback reject cause code** command is added.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftpstn4t.htm.

RADIUS Attribute Screening

The RADIUS Attribute Screening feature allows users to configure a list of "accept" or "reject" RADIUS attributes on the network access server (NAS) for purposes such as authorization or accounting.

If a NAS accepts and processes all RADIUS attributes received in an Access-Accept packet, unwanted attributes may be processed, creating a problem for wholesale providers who do not control their customers' authentication, authorization, and accounting (AAA) servers. For example, there may be attributes that specify services to which the customer has not subscribed, or there may be attributes that may degrade service for other wholesale dial users. The ability to configure the NAS to restrict the use of specific attributes has therefore become a requirement for many users.

The RADIUS Attribute Screening feature should be implemented in one of the following ways:

- To allow the NAS to accept and process all standard RADIUS attributes for a particular purpose, except for those on a configured reject list
- To allow the NAS to reject (filter out) all standard RADIUS attributes for a particular purpose, except for those on a configured accept list

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftras.htm.

RADIUS Attribute 82: Tunnel Assignment ID

The RADIUS Attribute 82: Tunnel Assignment ID feature allows the Layer 2 Transport Protocol access concentrator (LAC) to group users from different per-user or domain RADIUS profiles into the same active tunnel. Previously, Cisco IOS software assigned a separate virtual private dialup network (VPDN) tunnel for each per-user or domain RADIUS profile, even if tunnels with identical endpoints already existed. The RADIUS Attribute 82: Tunnel Assignment ID feature defines a new AV pair, Tunnel-Assignment-ID, which allows the LAC to group users from different RADIUS profiles into the same tunnel if the chosen endpoint, tunnel type, and Tunnel-Assignment-ID are identical. This feature introduces new software functionality. No new commands are introduced with this feature.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftrada82.htm.

RADIUS Tunnel Preference for Load Balancing and Fail-Over

Tunnel servers may be load balanced or failed-over from a single tunnel initiator, as selected by the RADIUS Tunnel Preference for Load Balancing and Fail-Over attribute. There is no configuration associated with this feature. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftradtun.htm.

Redial Enhancements

The Redial Enhancements feature improves the performance of redial and provides greater control over redial behavior. The dialer will now cycle through all matching dialer strings or dialer maps before applying the redial interval, and may select a different physical dialer on each redial attempt. New dial-out attempts will not be initiated if a redial to the same destination is pending. The dialer can now be configured to apply a disable timer without performing any redial attempts, and a disable time can be applied to a dialer profile interface and to a serial dialer.

By default, the Cisco IOS software considers a call successful if it connects at the physical layer (Layer 1 of the Open System Interconnection [OSI] reference model). However, problems such as poor quality telco circuits or peer misconfiguration can cause dial-out failure even though a connection is made at tl physical layer. The Redial Enhancements feature introduces a new command that allows the router to be configured to wait a specific amount of time for a line protocol to come up before considering a dial-out attempt successful. If the timer runs out or the call is dropped before the line protocol comes up, the call is considered unsuccessful. Unsuccessful dial-out attempts will trigger redial if the redial options have been configured.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/dialenhc.htm.

RSVP Support for Low Latency Queueing

Resource Reservation Protocol (RSVP) is a network-control protocol that provides a means for reserving network resources—primarily bandwidth—to guarantee that applications transmitting end-to-end across networks achieve the desired quality of service (QoS).

RSVP enables real-time traffic (which includes voice flows) to reserve resources necessary for low latency and bandwidth guarantees.

Voice traffic has stringent delay and jitter requirements. It must have very low delay and minimal jitter per hop to avoid degradation of end-to-end QoS. This calls for an efficient queueing implementation, such as Low Latency Queueing (LLQ), that can service voice traffic at almost strict priority in order t minimize delay and jitter.

RSVP uses weighted fair queueing (WFQ) to provide fairness among flows and to assign a low weight to a packet to attain priority. However, the preferential treatment provided by RSVP is insufficient to minimize the jitter because of the nature of the queueing algorithm itself. As a result, the low latency and jitter requirements of voice flows might not be met in the prior implementation of RSVP and WFQ.

RSVP provides admission control. However, to provide the bandwidth and delay guarantees for voice traffic and get admission control, RSVP must work with LLQ. The RSVP support for LLQ feature allows RSVP to classify voice flows and queue them into the priority queue (PQ) within the LLQ system while simultaneously providing reservations for nonvoice flows by getting a reserved queue.

Sequential LRQ Enhancement

The Sequential LRQ Enhancement feature enhances the existing sequential location request (LRQ) feature in the Cisco IOS Gatekeeper (GK) to provide a potentially faster LRQ response to the originator of the request when a location reject (LRJ) response is received while the GK is sending sequential LRQs. In the current sequential LRQ implementation on the gateway, the GK sends an LRQ to the next zone only after the sequential delay timer expires. The Sequential LRQ Enhancement feature introduces a fixed delay for the GK to send sequential LRQs to successive zones even when a negative response or an LRJ is received from the current zone. If an LRJ is received from the current zone, the GK assumes that the current zone cannot satisfy the request and immediately sends an LRQ to the next zone. This feature works for both typical and directory GKs.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftseqlrq.htm.

SNMPv3 Community MIB Support

The SNMPv3 Community MIB Support feature implements support for the SNMP Community MIB (SNMP-COMMUNITY-MIB) module, defined in RFC 2576, in Cisco IOS software.

The SNMPv1/v2c Message Processing Model and Security Model require mappings between parameters used in SNMPv1 and SNMPv2c messages and the version independent parameters used in the Simple Network Management Protocol (SNMP) architecture. The SNMP Community MIB contains objects for mapping between these community strings and version-independent SNMP message parameters.

The mapped parameters consist of the SNMPv1/v2c community name and the SNMP securityName and contextEngineID/contextName pair. This MIB provides mappings in both directions, that is, a community name may be mapped to a securityName, contextEngineID, and contextName, or the combination of securityName, contextEngineID, and contextName may be mapped to a community name. This MIB also augments the snmpTargetAddrTable with a transport address mask value and a maximum message size value.

For implementation details, refer to the SNMP-COMMUNITY-MIB.my file, available through Cisco.com at ftp://ftp.cisco.com/pub/mibs/v2/.

SS7 Four-Link Support for Cisco Signaling Link Terminal

The SS7 Four-Link Support for Cisco Signaling Link Terminal feature introduces support for up to four Cisco SS7 links on a new platform for the Cisco SLT, the Cisco 2651 Multiservice Access Router. All existing Cisco 2611-based Cisco SLT functionality is supported on the new platform, and both Cisco SLT platforms use the same Cisco IOS software image.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_4lnk.htm.

Stream Control Transmission Protocol (SCTP), Release 1

Stream Control Transmission Protocol (SCTP) is a reliable datagram-oriented IP transport protocol, specified by RFC 2960. It provides the layer between an SCTP user application and an unreliable end-to-end datagram service such as IP. The basic service offered by SCTP is the reliable transfer of user datagrams between peer SCTP users. It performs this service within the context of an association between two SCTP hosts. SCTP is connection-oriented, but SCTP association is a broader concept than the Transmission Control Protocol (TCP) connection, for example.

SCTP provides the means for each SCTP endpoint to provide its peer with a list of transport addresses, such as address and UDP port combinations, for example. This list is provided during association startup and shows the transport addresses through which the endpoint can be reached and from which messages originate. The SCTP association includes transfer over all of the possible source and destination combinations that might be generated from the two endpoint lists (also known as multihoming).

SCTP is not explicitly configured on routers, but it underlies several Cisco applications. The commands described in this document are useful for troubleshooting when SCTP issues are suspected as the cause of problems.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_sctp.htm.

T.38 Fax Services for Cisco 1750 Access Routers

When the Cisco 1750 access router is equipped with a VFC that has one or more slots for voice interface cards (VICs), the Cisco 1750 access router supports carrier-class Voice over IP (VoIP) and fax over IP services. The VIC has Foreign Exchange Station (FXS), Foreign Exchange Office (FXO), and BRI interfaces.

Since the Cisco 1750 access router is H.323 compliant, it supports a family of industry-standard voice codecs and provides echo cancellation and voice activity detection (VAD) and silence suppression. There is an interactive voice response (IVR) application that provides voice prompts and digit collection in order to authenticate the user and identify the call destination.

The VIC is a coprocessor card with a powerful Reduced Instruction Set Computer (RISC) engine and dedicated, high-performance digital signal processors (DSPs) modules to ensure predictable, real-time voice processing. The design enables streamlined packet forwarding. The Cisco 1750 access router supports one VIC with two voice ports.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftfaxrly.htm.

Timer and Retry Enhancements for L2TP and L2F

The L2TP & L2F Timer/Retry Enhancement feature allows the user to configure certain adjustable timers for the Layer 2 Tunnel Protocol (L2TP) and Layer 2 Forwarding (L2F) protocols. For L2F, the settings for control packet retries and control packet timeouts are now both configurable. Initial tunnel packet retries and initial tunnel packet timeouts are now configurable for both the L2F and L2TP protocols.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftretreh.htm.

Two-Rate Policer

Networks police traffic by limiting the input or output transmission rate of a class of traffic based on user-defined criteria. Policing traffic allows you to control the maximum rate of traffic sent or received on an interface, and to partition a network into multiple priority levels or class of service (CoS).

The Two-Rate Policer performs the following functions:

- Limits the input or output transmission rate of a class of traffic based on user-defined criteria.
- Marks packets by setting the ATM Cell Loss Priority (CLP) bit, Frame Relay Discard Eligibility (DE) bit, IP precedence value, IP differentiated services code point (DSCP) value, Multiprotocol Label Switching (MPLS) experimental value, and Quality of Service (QoS) group.

With the Two-Rate Policer, you can enforce traffic policing according to two separate rates—committed information rate (CIR) and peak information rate (PIR). You can specify the use of these two rates, along with their corresponding values, by using two keywords, **cir** and **pir**, of the **police** command. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft2rtplc.htm.

TX Ring Adjustment

Each permanent virtual circuit (PVC) has a hardware transmit queue, or TX ring. It is a simple FIFO queue, and on the c820 it has a default size of 16 packets. This feature allows adjustment of the size of the TX ring. If both voice and data packets are transmitted on the same PVC, the length of the TX ring must be reduced to a value of about 3 packets. This reduces delay and jitter for voice packets by decreasing the maximum number of data packets or fragments that can be in front of a voice packet inside the TX ring.

Using 31-Bit Prefixes on IPv4 Point-to-Point Links

The Using 31-Bit Prefixes on IPv4 Point-to-Point Links feature allows 31-bit prefixes to be used on IP version 4 point-to-point links. The number of IP addresses is reduced by 50 percent and the number of denial of service (DoS) attacks is also reduced. Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ft31addr.htm.

VPDN Group Session Limiting

Before the introduction of the VPDN Group Session Limiting feature, you could only globally limit the number of Virtual Private Dialup Network (VPDN) sessions on a router with limits applied equally to all VPDN groups. Using the VPDN-Group Session Limiting feature, you can limit the number of VPDN sessions allowed per VPDN group. This feature is implemented with the introduction of the **session-limit** *number* command in VPDN group configuration mode. VPDN group session limiting is applied after the global VPDN session limiting (which is configured via the **vpdn session-limit** *session* command in configuration mode) is enforced.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftvpdngs.htm.

Hardware Platforms and Modules Newly Supported in Cisco IOS Release 12.2(2)T

The following hardware platforms and modules are now supported in Cisco IOS Release 12.2(2)T. These platforms and modules were first introduced in earlier Cisco IOS software releases.

1-Port ADSL WAN Interface Card

The ADSL WAN interface card is a 1-port WAN interface card (WIC) for the Cisco 1700 series of modular access routers. The card provides asymmetric digital subscriber line (ADSL) high-speed digital data transfer between a single customer premises equipment (CPE) subscriber and the central office.

The ADSL WIC is compatible with the Alcatel Digital Subscriber Loop Access Multiplexer (DSLAM), the Cisco 6260 DSLAM with Flexi-line cards, and the Cisco 6130 DSLAM with Flexi-line cards. It supports ATM adaptation layer (AAL5) and various classes of quality of service (QoS) for both voice and data service.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_mod/cis3600/wan_mod/index.htm.

ADSL over ISDN

Cisco 826 routers connect corporate telecommuters and small offices via Internet Service Providers (ISPs) over asymmetric digital subscriber lines (ADSLs) to corporate LANs and the Internet. The router can provide bridging and multiprotocol routing between LAN and WAN ports. Cisco 826 routers provid connectivity to an ISDN network through an ADSL port.

Cisco uBR905 Cable Access Router

The Cisco uBR905 Cable Access Router features a single F-connector interface to the cable system, four RJ-45 (10BASE-T Ethernet) hub ports, and one RJ-45 console port to connect to a laptop computer/console terminal for local Cisco IOS configuration. The Cisco uBR905 Cable Access Router also provides an onboard IPSec hardware accelerator, which provides high-performance encryption that is substantially faster than software-based encryption.

Small Office, Home Office ADSL Router

Cisco IOS Release 12.2 T supports the following Cisco SOHO series routers:

- SOHO 76
- SOHO 77

The SOHO 76 and SOHO 77 are small office, home office (SOHO) asymmetric digital subscriber line (ADSL) routers, each with one Ethernet interface for connection to service provider networks.

The SOHO routers also provide the following key hardware features:

- Connection to an ADSL network through an ADSL port.
- A central processing unit: 50 MHz MPC 855T RISC processor.
- Ability to be stacked or mounted on a wall.
- Locking power connectors and a Kensington-compatible locking slot.

WT-2750 Multipoint Broadband Wireless System

The Cisco broadband fixed wireless point-to-multipoint system is an integrated solution consisting of one headend (WT-2751 Multipoint Headend Line Card) and multiple subscriber units (WT-2755 Multipoint Subscriber Network Module). The fixed wireless point-to-multipoint subscriber unit is designed to receive radio frequency (RF) signals from the headend. It also transmits a return signal to the headend. This return signal is a point-to-point signal, so a properly installed subscriber antenna must be correctly oriented with the headend antenna to which it is transmitting.

For more information about the fixed wireless point-to-multipoint headend feature, see *Point-to-Multipoint Support for the Cisco uBR7200 Series Universal Broadband Router* at the following location:

http://www.cisco.com/univercd/cc/td/doc/product/wireless/bbfw/p2mp/index.htm.

The fixed wireless multipoint system incorporates Vector Orthogonal Frequency Division Multiplexing (VOFDM), so it does not always depend on line-of-sight (LOS) deployment. With VOFDM, the system allows wireless operation in obstructed, non-line-of-sight (non-LOS) environments by taking advantage of multipath signals. This can be particularly useful in urban and suburban environments.

Wireless Network Module

The NM-WMDA wireless network module installs in the network module slot of a Cisco 2600 series router. Installing a wireless network module enables the Cisco 2600 series router to act as a subscriber unit (SU) in a point-to-multipoint wireless network. It is configured through the router's system console or via the CiscoView network management system. The network module provides the control and data interface between the Cisco 2600 series digital motherboard and the radio frequency (RF) subsystem in the wireless transverter. It also provides the up/down conversion from baseband to intermediate frequency (IF). One network module supports one or two wireless transverters (main and diversity).

Microcode software images ship in Flash memory along with the system software image. When the router starts, the system software unpacks the microcode software bundle and loads the proper software on all the interface line cards.

It is possible to use a later version of microcode software than the one shipped with the Cisco IOS software from the factory. The microcode software in Flash memory is mapped to the line cards. Unless you fully understand how Cisco IOS software uses microcode software, it is important to keep the factory configuration.

The multipoint wireless modem card requires external microcode software. Information about this microcode software is available (with a Cisco.com login) at the following location:

http://www.cisco.com/cgi-bin/tablebuild.pl/rsu.

For further information regarding the network module, refer to the *Cisco Network Modules Hardware Installation Guide* (for Cisco 2600 series routers) for detailed installation instructions, and the *Software Configuration Guide* (for Cisco 2600 series routers) for an overview of network module configuration procedures and information on configuring specific network modules.

New Software Features in Cisco IOS Release 12.2(2)T

The following new features are supported in Cisco IOS Release 12.2(2)T. Some of these features may have been introduced on other hardware platforms in earlier Cisco IOS software releases.

56K CSU Support for the Cisco Signaling Link Terminal

This feature module verifies support for the WIC-1DSU-56K4 WAN interface card for support of DS0 interconnect by the Cisco Signaling Link Terminal (SLT).

The addition of the WIC-1DSU-56K4 support to the Cisco SLT provides support for DS0 interconnect to the SS7 network without the need for an external CSU/ DSU. The WIC-1DSU-56K4 interface card is a single-port serial interface card providing a 4-wire, 56/64-kbps Kb/s interface with an integrated onboard CSU/DSU. This card is a standard option for the Cisco 2600 series routers.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftsltwic.htm.

Analog DID for Cisco 2600 and Cisco 3600 Series Routers

Direct Inward Dialing (DID) is a service offered by telephone companies that enables callers to dial directly to an extension on a PBX without the assistance of an operator or automated call attendant. This service makes use of DID trunks, which forward only the last three to five digits of a phone number to the PBX. If, for example, a company has a PBX with extensions 555-1000 to 555-1999, and a caller dials 555-1234, the local CO would forward 234 to the PBX. The PBX would then ring extension 234. This entire process is transparent to the caller.

When this feature is configured, a voice-enabled Cisco 2600 and Cisco 3600 series router can receive calls from a DID trunk and connect them to the appropriate extensions. The DID state machine is identical to the E&M state machine and uses one of the following signaling types:

- Immediate start—The originating end seizes the line by going off-hook and, without waiting for a response, it begins to outpulse digits. The address signaling used with immediate-start signaling consists only of dial-pulsing.
- Wink-start—The originating end seizes the line by going off-hook. It waits for acknowledgement from the other end before outpulsing digits. The acknowledgement serves as an integrity check that will identify a malfunctioning trunk and allow the network to send a reorder tone to the calling party.
- Delay dial—The originating end seizes the line and waits 200 ms to see if the far end is on-hook. If so, the originating end then outpulses digits. If the far end is off-hook, the originating end waits until the far end is on-hook before outpulsing digits.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/dt_did.htm.

ATM PVC Range and Routed Bridge Encapsulation Subinterface Grouping

In a digital subscriber line (DSL) environment, many applications require the configuration of a large number of ATM permanent virtual circuits (PVCs). The ATM PVC Range and Routed Bridge Encapsulation Subinterface Grouping feature enables you to group a number of PVCs into a PVC *range* in order to configure them all at once.

For applications that use multipoint subinterfaces, such as PPP over Ethernet and PPP over ATM, the PVC range is on a single multipoint subinterface. For applications that use point-to-point subinterfaces, such as routed bridge encapsulation (RBE), a point-to-point subinterface is created for each PVC in the range.

A PVC range is defined by two VPI-VCI pairs. The two virtual path identifiers (VPIs) define a VPI range, and the two virtual channel identifiers (VCIs) define a VCI range. The number of PVCs in the PVC range equals the number of VPIs in the VPI range multiplied by the number of VCIs in the VCI range.

Once the PVC range is defined, you can configure the range by using the existing interface-ATM-VC configuration commands that are also supported in ATM PVC range configuration mode. The **shutdown** ATM PVC range configuration mode command can be used to deactivate the range without deleting the configuration.

The ATM PVC Range and Routed Bridge Encapsulation Subinterface Grouping feature also introduces the **pvc-in-range** command, which allows you to explicitly configure an individual PVC within the defined range of PVCs on a multipoint subinterface. The **shutdown** ATM PVC-in-range configuration mode command allows you to deactivate an individual PVC within a range.

Note You cannot explicitly configure the individual point-to-point subinterfaces created by the PVC range on a point-to-point subinterface. All of the point-to-point subinterfaces in the range share the same configuration as the subinterface on which the PVC range is configured.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t5/dtatmpvr.htm.

BGP Link Bandwidth

The Border Gateway Protocol (BGP) Link Bandwidth feature is used to advertise the bandwidth of an autonomous system exit link as an extended community. The BGP Link Bandwidth feature is supported by the internal BGP (iBGP) and external BGP (eBGP) multipath features. The link bandwidth extended community indicates the preference of an autonomous system exit link in terms of bandwidth. The link bandwidth extended community attribute may be propagated to all iBGP peers and used with the BGP multipath features to configure unequal cost load balancing. When a router receives a route from a directly connected external neighbor and advertises this route to iBGP neighbors, the router may advertise the bandwidth of that link.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftbgplb.htm.

Circuit Interface Identification Persistence for SNMP

The Circuit Interface MIB (CISCO-CIRCUIT-INTERFACE-MIB) provides a MIB object (cciDescr) that can be used to identify individual circuit-based interfaces for SNMP monitoring. The Circuit Interface Identification Persistence for SNMP feature maintains this user-defined name of the circuit across reboots, allowing the consistent identification of circuit interfaces. Circuit Interface Identification Persistence is enabled using the **snmp mib persist circuit** global configuration command.

Cisco High-Performance Gatekeeper

The Cisco High-Performance Gatekeeper feature introduces new gatekeeper functionality and modifications for facilitating carrier class reliability, security, and performance into Cisco's Voice Network solution portfolio. These H.323 standard-based features have carrier grade reliability and performance characteristics with a robust open application protocol interface to enable development of enhanced applications like voice Virtual Private Networks (VPNs) and wholesale voice solutions.

The new gatekeeper is characterized by the following:

- Increased support for back end applications.
- Increased performance on a single gatekeeper.

- Alternate gatekeeper support to the gatekeeper. Each alternate gatekeeper, or GK node, shares its local zone information so that the cluster can effectively manage all local zones within the cluster. Each alternate gatekeeper has a unique local zone. Clusters provide a mechanism for distributing call processing seamlessly across a converged IP network infrastructure to support IP telephony, facilitate redundancy, and provide feature transparency and scalability.

This feature addresses the scalability, redundancy, and performance aspects of the gatekeeper as part of the Cisco Multimedia Conference Manager (MCM) to present a complete Cisco solution. The Cisco H.323 MCM provides the network administrator with the ability to identify H.323 traffic and to apply appropriate policies. The Cisco H.323 Multimedia Conference Manager is implemented on Cisco IOS software and enables a network manager to do the following:

Limit the H.323 traffic on the LAN and WAN.

Provide user accounting for records based on the service utilization.

Inject quality of service (QoS) parameters for the H.323 traffic generated by applications such as VoIP, and data and video conferencing.

Provide the mechanism to implement security for H.323 communications.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121limit/121x/121xm/121xm_5/ft_0394.htm.

Cisco IOS Server Load Balancing

The IOS SLB feature is a Cisco IOS-based solution that provides IP server load balancing. Using the IOS SLB feature, the network administrator defines a virtual server that represents a group of real servers in a cluster of network servers known as a server farm. In this environment the clients are configured to connect to the IP address of the virtual server. The virtual server IP address is configured as a loopback address, or secondary IP address, on each of the real servers. When a client initiates a connection to the virtual server, the IOS SLB function chooses a real server for the connection based on a configured load-balancing algorithm.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t5/iosslb5t.htm.

Cisco Signaling Link Terminal G.732 Support

The addition of ITU-T G.732 support to the Cisco Signaling Link Terminal (SLT) is a fundamental requirement for passing homologation in many European countries. As an integral part of the Cisco Signaling Controller 2200 (SC2200) and the Cisco VSC3000 Virtual Switch Controller (VSC3000) architecture, the Cisco SLT provides the Cisco Signaling System 7 (SS7) connectivity into the SC or VSC node.

The Cisco SLT enables service providers to reliably transport Signaling System 7 (SS7) protocols across an IP network. The Cisco SLT uses the Cisco IOS SS7 SLT feature set, providing reliable interoperability with the Cisco SC2200 or the Cisco VSC3000. The Cisco SLT is responsible for terminating the Message Transfer Part (MTP) 1 and MTP 2 layers of the SS7 protocol stack. Using the Cisco Reliable User Datagram Protocol (RUDP), the Cisco SLT backhauls, or transports, upper-layer SS7 protocols across an IP network to the Cisco SC2200 or the Cisco VSC3000. The Cisco SLT is supported only on the Cisco 2611 router.

ITU-T G.732 is an extract from the ITU-T blue book describing characteristics of primary Pulse Code Modulation (PCM) multiplex equipment operating at 2048 kbit/s (E1). The requirements describing excessive bit error ratios detected by monitoring the frame alignment signal (loss of frame alignment fault conditions) and subsequent alarming actions relate to the Cisco SLT.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ft_g732.htm.

Cisco Quality of Service Device Manager 2.0 Support for Cisco 1700 Series Routers

QDM is now supported on Cisco 1700 series routers.

Cisco Quality of Service Device Manager (QDM) is a web-based Java application with which users can configure and monitor advanced IP-based Quality of Service (QoS) functionality within Cisco routers using a graphical user interface (GUI).

QDM 2.0 is available as a separate product download and is free of charge. If you would like to install or reinstall QDM, refer to the Release and Installation Notes for Cisco Quality of Service Device Manager 2.0 on Cisco.com and the Documentation CD-ROM for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/rtrmgmt/qdm/qdmrn20.htm.

Class-Based Marking

The Class-Based Packet Marking feature provides users with a user-friendly command-line interface (CLI) for efficient packet marking by which users can differentiate packets based on the designated markings. The Class-Based Packet Marking feature allows users to perform the following tasks:

- Mark packets by setting the IP precedence bits or the IP differentiated services code point (DSCP) in the IP type of service (ToS) byte.
- Mark packets by setting the Layer 2 Class of Service (CoS) value.
- Associate a local quality of service (QoS) group value with a packet.
- Set the Cell Loss Priority (CLP) bit setting in the ATM header of a packet from 0 to 1.
- Set the Frame Relay Discard Eligibility (DE) bit in the address field of the frame relay frame from 0 to 1.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t5/cbpmark2.htm

Note This feature was originally introduced in Cisco IOS Release 12.1(2)T as QoS Packet Marking. Cisco IOS Release 12.2(2)T introduces the **set fr-de** command.

Classifying VoIP Signaling and Media with DSCP for QoS

The Classifying VoIP Signaling and Media with DSCP for QoS feature introduces the **ip qos dscp** command. The **ip precedence** command in dial-peer configuration mode, was originally designed to allow the prioritizing of H.323 traffic and the priority used, typically higher than that of IP data traffic. There was no means, however, for the end user to configure prioritization of H.245, H.225, and SIP signaling packets, which resulted in a delay when a call was set up over a congested network.

In order to provide finer tuning of priorities, the **ip precedence** command has been replaced by the **ip qos dscp** command. If a non zero value is specified for a particular type of traffic stream, this value is stored in the DSCP (Differentiated Services Code Point) before the gateway sends the packet out its WAN interface.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ft_dscp.htm.

CNS Configuration Agent

CNS is a foundation technology for linking users to network services. CNS SDK accomplishes this by making applications network-aware and increasing the intelligence of the network elements. CNS SDK provides building blocks to a range of customers in market segments such as Enterprise, service provider, independent software vendors, and system integrators.

The CNS Configuration Agent supports routing devices by providing:

- Initial configurations
- Incremental (partial) configurations
- Synchronized configuration updates

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftcns_ca.htm.

CNS Event Agent

CNS is a foundation technology for linking users to network services. CNS SDK accomplishes this by making applications network-aware and increasing the intelligence of the network elements. CNS SDK provides building blocks to a range of customers in market segments such as Enterprise, service provider, independent software vendors, and system integrators.

The CNS Event Agent is part of the Cisco IOS infrastructure that allows Cisco IOS applications, for example CNS Configuration Agent, to publish and subscribe to events on a CNS Event Bus. CNS Event Agent works in conjunction with CNS Configuration Agent.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftcns_ea.htm.

Control Plane DSCP for RSVP

The Control Plane DSCP Support for RSVP feature allows you to set the priority value in the type of service (ToS) byte/differentiated services (DiffServ) field in the IP header for RSVP signaling messages. The IP header functions with resource providers such as weighted fair queueing (WFQ), so that voice frames have priority over data fragments and data frames. When packets arrive in a router output queue, the voice packets are placed ahead of the data frames.

There is one new command:

ip rsvp signalling dscp [value]–Specifies the DSCP to be used on all RSVP messages sent on an interface.

There is one modified command:

show ip rsvp interface detail—The detail keyword, was added to display information about RSVP interface parameters.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/dscprsvp.htm.

DF Bit Override Functionality with IPSec Tunnels

The DF Bit Override Functionality with IPSec Tunnels feature allows customers to configure the setting of the DF bit when encapsulating tunnel mode IPSec traffic on a global or per-interface level. Thus, if the DF bit is set to clear, routers can fragment packets regardless of the original DF bit setting. Refer to the following document for additional information:

http:/www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftdfipsc.htm.

DFP Support in DistributedDirector

DistributedDirector can obtain load information from Cisco LocalDirector, Catalyst 4840g, and other clients using Dynamic Feedback Protocol (DFP). This protocol allows the user to configure the DistributedDirector to communicate with various DFP agents. The DistributedDirector tells the DFP agents how often they should report load information; then the DFP agent can tell the DistributedDirector which LocalDirector cluster to remove from providing service.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/iaabu/distrdir/dtdddfp.htm.

DHCP Option 82 Support for Routed Bridge Encapsulation

The DHCP Option 82 Support for Routed Bridge Encapsulation feature provides support for the DHCP relay agent information option when ATM routed bridge encapsulation (RBE) is used.

This feature enables the DHCP relay agent to communicate information to the DHCP server using a suboption of the DHCP relay agent information option called agent remote ID. The information sent in agent remote ID includes an IP address identifying the relay agent and information about the ATM interface and the PVC over which the DHCP request came in. The DHCP server can use this information to make IP address assignments and security policy decisions.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftrbeo82.htm.

Distributed Time-Based Access Lists

Cisco IOS software allows implementation of access lists based on the time of day. To do the implementation, you create a time range that defines specific times of the day and week. The time range is identified by a name and then referenced by a function, so that those time restrictions are imposed on the function itself.

Before the introduction of the Distributed Time-Based Access Lists feature, time-based access lists were not supported on line cards for the Cisco 7500 series routers. If time-based access lists were configured, they behaved as normal access lists. If an interface on a line card was configured with access lists, the packets switched into the interface were not distributed switched through the line card but forwarded to the Route Processor for processing.

The Distributed Time-Based Access Lists feature allows packets destined for an interface configured with time-based access lists to be distributed switched through the line card.

The Distributed Time-Based Access Lists feature gives network administrators more control over permitting or denying a user access to resources. Customers can now take advantage of the performance benefits of distributed switching and the flexibility given by time-based access lists.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftdistac.htm.

DNS Server Support for NS Records

DistributedDirector has improved server load-balancing capacity with the Domain Name System (DNS) Server Support for Name Server (NS) Records feature. This feature adds support for NS records to the Cisco IOS DNS server. With this feature, the DistributedDirector can distribute the server-selection process to multiple DistributedDirectors, improving overall server capacity.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftddns.htm.

Enhanced Multilingual Support for Cisco IOS Integrated Voice Response

This feature releases the infrastructure to support Tool Command Language (TCL)-based script interpreters, which allow you to easily add new languages to your router or access server. You can add a new language by creating a TCL script that interprets prompts into a sequence of audio files or silences. The underlying Cisco IOS dynamic prompting code interfaces with the TCL script to translate the message into a sequence of URLs that point to audio files. Then, the Cisco IOS software plays the sequence of audio files as a dynamic prompt. New TCL-script language interpreters operate simultaneously with the current built-in languages: Spanish, Chinese/Mandarin, and English. Adversely, new TCL-script language interpreters can replace one or more of the built-in languages by overwriting the built-in language functionality.

Note This feature does not release any specific TCL scripts.

Note Although the language intelligence comes from a TCL-based language script, once you configure a language any system (TCL IVR 1.0, 2.0, VxML, MGCP, and so on) on your router can use the configured language with little to no change to Cisco IOS Software.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftmultil.htm.

Firewall Feature Set for Cisco 820 Series Routers

The Cisco IOS Firewall feature set is available on the Cisco 820 series routers. This feature set provides the following capabilities:

- Context-Based Access Control (CBAC)
- Java blocking
- Denial-of-service detection and prevention
- Real-time alerts and audit trails

The Cisco IOS Firewall Feature Set feature module provides several sample firewall configurations, including the following examples for small-office environments:

- IP network to Internet
- Remote office network to corporate office network

Frame Relay Discard Eligibility Bit Setting

The Modular QoS CLI in Cisco IOS Release 12.2(2)T has been enhanced to include matching and marking based on the Frame Relay Discard Eligibility (DE) bit. Frame Relay DE bit Matching and Marking is documented as part of the Class-Based Marking feature module.

The DE bit in the address field of a Frame Relay frame is used as a method for prioritizing the discarding of frames in congested frame relay networks. The Frame Relay DE bit has only one bit and can therefore only have two settings, 0 or 1. If congestion occurs in a Frame Relay network, frames with the DE bit set at 1 are discarded before frames with the DE bit set at 0. Therefore, important traffic should have the DE bit set at 0 and less important traffic should be forwarded with the DE bit set at 1.

The default DE bit setting is 0. The Class-Based Packet Marking feature allows users to change the DE bit setting to 1 for various traffic, giving users the option of keeping the default value of 0 or changing the value to 1. Users can therefore use the Frame Relay DE bit marking to prioritize frames in a Frame Relay network.

Frame Relay Point-Multipoint Wireless

This feature provides an end-to-end frame relay network for customers using wireless interfaces in their frame relay network. Several new commands are used to establish a virtual frame relay interface, then link it to a specific multipoint destination mac address. The configuration information is associated with a new interface type, virtual frame relay and new interface commands, **interface virtual-framerelay** and **frame relay over radio**.

Using the new interface enables Cisco uBR7200 series, Cisco 3600 and Cisco 2600 routers to provide a seamless transition from a serial interface to a multipoint frame relay interface. By implementing RFC 1315, Frame Relay DTE MIB, a virtual frame relay interface can be linked to a specific multipoint radio interface and destination MAC address. The headend (HE) router acts as a frame relay switch, receiving radio frequency signals from subscriber units. Once received, the multipoint link is switched to a serial link and then to an upstream router.

Functionality Changed for the tunnel mpls traffic-eng autoroute metric Command

The default behavior of the **tunnel mpls traffic-eng autoroute metric** interface configuration command has been changed in Cisco IOS Release 12.2(2)T. This command now combines the costs of all Intermediate-System to Intermediate-System (IS-IS) routes that are downstream from a Traffic Engineering (TE) tunnel into an additive path metric. IS-IS uses the additive path metric to set the metric of the TE tunnel.

FXO Answer and Disconnect Supervision

The FXO Answer and Disconnect Supervision feature enables analog FXO ports to monitor call-progress tones, and to monitor voice and fax transmissions returned from a PBX or from the PSTN.

You can configure voice ports to detect either the standard call-progress tones that are preconfigured for certain countries, or you can configure custom call-progress tone detection. Tone detection is performed by the digital signal processor (DSP) and causes a DSP event to be reported to the host software.

Answer supervision can be accomplished in two ways: by detecting battery reversal, or by detecting voice, fax, or modem tones. If an FXO voice port is connected to the PSTN, and battery reversal is supported, use the battery reversal method. Voice ports that do not support battery reversal must use the answer supervision method, in which answer supervision is triggered when the DSP detects voice, modem, or fax transmissions. Configuring answer supervision automatically enables disconnect supervision; however, you can configure disconnect supervision separately if answer supervision is not configured.

Disconnect supervision can be configured to detect call-progress tones sent by the PBX or PSTN (for example, busy, reorder, out-of-service, number-unavailable), or to detect any tone received (for example, busy tone or dial tone). When an incoming call ends, the DSP detects the associated call-progress tone, causing the analog FXO voice port to go on-hook.

You can configure disconnect tones to be detected either continuously during calls or only during call setup (before calls are answered). Detection of any tone operates only during call setup. If you configure detection of any tone, you must also enable echo cancellation to prevent disconnection due to detection of the ringback tone of the router.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ft_ansds.htm.

H.323 Call Redirection Enhancements

The user-to-user information element (UUIE) of the Facility message is used primarily for call redirection. The UUIE contains a field, facilityReason, that indicates the nature of the redirection. The H.323 Call Redirection Enhancements feature adds support for two of the reasons: routeCallToGatekeeper and callForwarded. It also provides a nonstandard method for using the Facility message to effect call transfer.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftcallrd.htm.

H.323 Version 2 Phase 2

Cisco H.323 Version 2 Phase 2 upgrades Cisco IOS software by adding the following optional features, and facilitates customized extensions to the Cisco gatekeeper:

- H.323v2 Fast Connect
- H.245 Tunneling of DTMF Relay in conjunction with Fast Connect
- H.450.2 Call Transfer
- H.450.3 Call Deflection
- Translation of FXS Hookflash Relay
- H.235 Security
- Gatekeeper Transaction Message Protocol (GKTMP) and RAS Messages
- Gatekeeper and Alternate Endpoints
- Gatekeeper C Code Generic API for GKTMP in a UNIX Environment
- Gateway Support for Network-Based Billing Number

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t1/h323v2p2.htm

High-Performance Gatekeeper

The Cisco High-Performance Gatekeeper feature introduces new gatekeeper functionality and modifications for facilitating carrier class reliability, security, and performance into the Cisco voice network solution portfolio. These H.323 standard-based features have carrier grade reliability and performance characteristics with a robust open application protocol interface to enable development of enhanced applications like voice VPNs and wholesale voice solutions.

This feature addresses the scalability, redundancy, and performance aspects of the gatekeeper as part of the Cisco Multimedia Conference Manager (MCM) to present a complete Cisco solution. The Cisco H.323 MCM provides the network administrator with the ability to identify H.323 traffic and to apply appropriate policies.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121limit/121x/121xm/121xm_5/ft_0394.htm.

iBGP Multipath Load Sharing

When a Border Gateway Protocol (BGP) speaker router with no local policy configured receives multiple network layer reachability information (NLRI) from the internal BGP for the same destination, the router will choose one internal BGP path as the best path. The best path is then installed in the IP routing table of the router.

The Internal BGP Multipath Load Sharing feature enables the BGP speaker router to select multiple internal BGP paths as the best paths to a destination. The best paths or multipaths are then installed in the IP routing table of the router.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftbgpls.htm.

Interactive Voice Response Version 2.0 on Cisco VoIP Gateways

IVR Version 2.0 is the fourth release of IVR and TCL scripting on Cisco IOS VoIP gateways. The Cisco IVR feature (first made available in Cisco IOS Release 12.0(3)T and 12.0(7)T) provides IVR capabilities using TCL scripts.

IVR is a term that is used to describe systems that provide information in the form of recorded messages over telephone lines in response to user input in the form of spoken words, or more commonly dual tone multifrequency (DTMF) signaling. For example, when a user makes a call with a debit card, an IVR application is used to prompt the caller to enter a specific type of information, such as a PIN. After playing the voice prompt, the IVR application collects the predetermined number of touch tones (digit collection), forwards the collected digits to a server for storage and retrieval, and then places the call to the destination phone or system. Call records can be kept and a variety of accounting functions performed.

The IVR application (or script) is a voice application designed to handle calls on a voice gateway, which is a router that is equipped with Voice over IP (VoIP) features and capabilities.

The IVR feature allows an IVR script to be used during call processing. The scripts interact with the IVR software to perform the various functions. Typically, IVR scripts contain both executable files and audio files that interact with the system software.

IVR Version 2.0 is made up of several separate components in the section that follows. These new features include:

- Media Gateway Control Protocol (MGCP) scripting package implementation
- Real Time Streaming Protocol (RTSP) client implementation
- New Tool Command Language (TCL) verbs to utilize RTSP and MGCP scripting features
- IVR prompt playout and digit collection on IP call legs
- Performance improvements and TCL infrastructure changes
- IVR application MIB for network management

These features add scalability and enable the IVR scripting functionality on VoIP call legs. In addition, support for RTSP enables VoIP gateways to play messages from RTSP-compliant announcement servers.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_serv/as5800/12_2t/pulskynx.htm.

Interface Alias Long Name Support

The Interface Alias (ifAlias) is a user-specified description of an interface used for SNMP network management. The ifAlias is an object in the Interfaces Group MIB (IF-MIB), which can be set by a network manager to "name" an interface. The ifAlias value for an interface or subinterface can be set using the **description** command in interface configuration mode, or by using a Set operation from a Network Management System.

Prior to the Cisco IOS Release 12.2(2)T, ifAlias descriptions for subinterfaces were limited to 64 characters. A new Cisco IOS software command, **snmp ifmib ifalias long**, configures the system to handle ifAlias descriptions of up to 256 characters. IfAlias descriptions appear in the output of the **show interfaces** CLI command.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftshowif.htm.

Interface Index Display

The Interface Index (IfIndex) is a user-specified identification number for an interface used in SNMP network management. The IfIndex is an object in the Interfaces Group MIB (IF-MIB), which can be set by a network manager to consistently identify an interface. A new Cisco IOS software command, **show snmp mib ifmib ifindex**, allows the user to display the IfIndex identification numbers assigned to interfaces and subinterfaces using the CLI. The IFIndex provides a way to display these values without the need for a Network Management Station.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftshowif.htm.

IP Header Compression Enhancement—PPPoATM and PPPoFR Support

In Cisco IOS Release 12.2(2)T, IP header compression (TCP and IP/UDP/RTP) is now supported on PPP-over-ATM interfaces and PPP-over-Frame Relay interfaces. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122cgcr/fqos_c/fqcprt6/qcflem.htm.

IPSec and 3DES Feature Set for Cisco 820 Series Routers

The Internet Protocol Security (IPSec) feature is available on the Cisco 820 series routers. IPSec is a framework of open standards developed by the Internet Engineering Task Force (IETF) that provides security for transmission of sensitive information over unprotected networks such as the Internet. It acts at the network level and implements the following standards:

- IPSec
- Internet Key Exchange (IKE)
- Data Encryption Standard (DES)
- Message Digest 5 (MD5)
- Secure Hash Algorithm (SHA)
- Authentication Header (AH)
- Encapsulating Security Payload (ESP)

IPSec services are similar to those provided by Cisco Encryption Technology (CET), a proprietary security solution introduced in Cisco IOS Release 11.2. (The IPSec standard was not yet available at Release 11.2.) It provides network data encryption at the IP packet level and implements the following standards:

- Digital Signature Standard (DSS)
- Diffie-Hellman (DH) public key algorithm
- Data Encryption Standard (DES)

IPSec provides a more robust security solution and is standards-based. IPSec also provides data authentication and antireplay services in addition to data confidentiality services, and CET provides only data-confidentiality services.

The following component technologies are implemented for IPSec:

- DES is used to encrypt packet data.
- Cipher Block Chaining (CBC) requires an initialization vector (IV) to start encryption. The IV is explicitly given in the IPSec packet.
- MD5 and SHA are hash algorithms.

Triple Data Encryption Standard Feature Set for Cisco 820 Series Routers

The Triple Data Encryption Standard (3DES) Cisco IOS feature is available on Cisco 820 series routers. This feature encrypts packet data. Cisco IOS software implements the mandatory 56-bit DES-Cipher Block Chaining (CBC) with an Explicit initialization vector (IV).

IPv6 for Cisco IOS Software

IPv6, formerly called IPng (next generation), is the latest version of IP that offers many benefits, such as a larger address space, over the previous version of IP (version 4). Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ipv6/index.htm.

Low Latency Queueing with Priority Percentage Support

This feature allows you to configure bandwidth as a percentage within low latency queueing (LLQ). Specifically, you can designate a percentage of the bandwidth to be allocated to an entity (such as a physical interface, a shaped ATM permanent virtual circuit (PVC), or a shaped Frame Relay PVC) to which a policy map is attached. Traffic associated with the policy map will then be given priority treatment. This feature also allows you to specify the percentage of bandwidth to be allocated to nonpriority traffic classes.

This feature modifies two existing commands—**bandwidth** and **priority**. This feature adds a new keyword to the **bandwidth** command—**remaining percent**. The feature also changes the functionality of the existing **percent** keyword. These changes result in the following commands for bandwidth: **bandwidth percent** and **bandwidth remaining percent**. The **bandwidth percent** command configures bandwidth as an absolute percentage of the total bandwidth on the interface. The **bandwidth remaining percent** command allows you to allocate bandwidth as a relative percentage of the total bandwidth available on the interface. This command allows you to specify the relative percentage of the bandwidth to be allocated to the classes of traffic.

This feature also adds the **percent** keyword to the **priority** command. The **priority percent** command indicates that the bandwidth will be allocated as a percentage of the total bandwidth of the interface. You can then specify the percentage (that is, a number from 1 to 100) to be allocated by using the *percentage* argument with the **priority percent** command.

Unlike the **bandwidth** command, the **priority** command provides a strict priority to the traffic class, which ensures low latency to high priority traffic classes. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftllqpct.htm.

Note This feature was originally introduced in Cisco IOS Release 12.0(5)T. This release adds the **remaining percent** keyword.

MGCP CAS PBX and PRI Backhaul on Cisco 7200 Series Routers

The MGCP CAS PBX and PRI Backhaul on Cisco 7200 Series Routers features extend the earlier Simple Gateway Control Protocol (SGCP) channel-associated signaling (CAS) and AAL2 support onto the merged SGCP/MGCP software base to enable various service provider solutions.

PRI/Q.931 Signaling Backhaul is the ability to reliably transport the signaling (Q.931 and above layers) from a PRI trunk that is physically connected to a media gateway (for example, a Cisco 7200 series router) to a media gateway controller (Cisco VSC3000) for processing.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ft_mg7xx.htm

MGCP CAS PBX and AAL2 PVC with Basic CLASS and Operator Services

The MGCP CAS PBX and AAL2 PVC software package is a solutions-oriented program that focuses on several customer gateway scenarios. These scenarios require features that address residential, business, and trunking gateway needs on a variety of hardware platforms:

- Residential cable connectivity
- CAS and analog PBX connectivity
- Incoming CAS support for trunking gateways that support operator services such as busy-line verify and barge-in xGCP support of Voice over ATM Adaption Layer type 2 (VoAAL2)

To answer these needs, the MGCP CAS PBX and AAL2 PVC feature combines and expands existing feature sets on the merged Simple Gateway Control Protocol (SGCP)/MGCP software platform as follows:

- Voice over IP (VoIP) support of selected channel-associated signaling (CAS) features
- SGCP AAL2 features

Refer to the following documents for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftmgcptk.htm.

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftmgcpgr.htm.

MGCP VoIP Signaling for 1750 Series

The MGCP CAS PBX and AAL2 PVC features extend the earlier Simple Gateway Control Protocol (SGCP) Channel Associated Signaling (CAS) and AAL2 support onto the merged SGCP/MGCP software base to enable various service provider solutions. Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121limit/121x/121xm/121xm_5/ftmgcpba.htm.

Mobile IP MIB Support for SNMP

The Mobile IP MIB Support for SNMP feature adds a MIB module that expands network monitoring capabilities of foreign agent (FA) and home agent (HA) mobile IP entities. Mobile IP management using SNMP is defined in two MIBs: the RFC2006-MIB and the CISCO-MOBILE-IP-MIB. The Cisco Mobile IP MIB is a Cisco enterprise-specific extension to IETF RFC 2006 MIB module that allows you to monitor the total number of HA Mobile bindings and the total number of FA visitor bindings. Cisco IOS Release 12.2(2)T also adds support for RFC 2006 Set operations and a SNMP notification. Set operations (performed from a Network Management System) are supported for starting and stopping the mobile IP service, configuring security associations, modifying advertisement parameters, and configuring "care-of addresses" for foreign agents. An SNMP notification (trap or inform) for security violations can be enabled on supported routing devices using the **snmp-server enable traps ipmobile** and **snmp-server host** global configuration CLI commands. Because this feature affects security, use of SNMPv3 is strongly recommended.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ft1mip.htm.

Modem Script and System Script Support in Large-Scale Dial-Out

Modem connection and system login chat scripts are often used when asynchronous dial-on-demand routing (DDR) is configured. Currently, however, the large-scale dial-out network architecture does not allow chat scripts for a particular session to be passed through the network. Cisco IOS Release 12.2(2)T allows modem and system chat scripts to pass through large-scale dial-out networks by allocating two new authentication, authorization, and accounting (AAA) attributes for outbound service.

The AAA attributes define specific AAA elements in a user profile. Large-scale dial-out supports Cisco attribute-value (AV) pairs and TACACS+ attributes. The Modem Script and System Script Support in Large-Scale Dial-Out feature provides two new outbound service attributes for passing chat scripts: modem-script and system-script.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftlschat.htm.

MPLS Label Distribution Protocol

The Cisco MPLS label distribution protocol (LDP) allows the construction of highly scalable and flexible IP Virtual Private Networks (VPNs) that support multiple levels of services.

LDP provides a standard methodology for hop-by-hop distribution of labels in an MPLS network by assigning labels to routes that have been chosen by the underlying Interior Gateway Protocol (IGP) routing protocols. The resulting label switch paths (LSPs) forward label traffic across an MPLS backbone to particular destinations. These capabilities enable service providers to implement the Cisco MPLS-based IP VPNs and IP+ATM services across multivendor MPLS networks.

LDP enables label switching routers (LSRs) to request, distribute, and release label prefix binding information to peer routers in a network. Thus, LSRs can discover potential peers and establish LDP sessions with those peers to exchange label binding information.

LDP is a superset of the Cisco prestandard Tag Distribution Protocol (TDP), which also supports MPLS forwarding along normally routed paths. For the features that LDP and TDP share in common, the pattern of protocol exchange between network routing platforms is identical. The differences between LDP and TDP for those features supported by both protocols are largely embedded in their respective implementation details, such as the encoding of protocol messages.

This release of LDP supports both the LDP and TDP protocols and provides the means for changing an existing network from a TDP environment to an LDP environment. Thus, you can run LDP and TDP simultaneously on any router platform. The routing protocol that you select can be configured on a per-interface basis for directly connected neighbors and on a per-session basis for nondirectly connected (targeted) neighbors. In addition, an LSP across an MPLS network can be supported by LDP on some hops and by TDP on other hops.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ldp_221t.htm.

MPLS Label Distribution Protocol MIB

The MPLS label distribution protocol (LDP) MIB is an idealized label switching database that provides an effective management infrastructure for using LDP in an MPLS network.

The notation used in the MPLS LDP MIB adheres to the conventions defined in the Abstract System Notation One (ASN.1) standard, which defines an Open System Interconnection (OSI) language used in describing data types independently from particular computer structures and presentation techniques.

Each object in the MPLS LDP MIB incorporates a DESCRIPTION field that describes the meaning and usage of the object, which, together with other object characteristics, provides information that enables network administrators to monitor and control network devices, measure network performance, and collect network statistics.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ldpmib2t.htm.

MPLS Label Switching Router MIB

The MPLS Label Switching Router MIB allows you to use the Simple Network Management Protocol (SNMP) to remotely monitor a label switching router (LSR) that is using the Multiprotocol Label Switching (MPLS) technology. The MPLS-LSR-MIB mirrors the Cisco Label Switching subsystem, specifically the LSR management information that is provided by the label forwarding information base (LFIB).

The MPLS-LSR-MIB contains managed objects that support the retrieval of label switching information from a router and is based on Revision 05 of the IEFT MPLS-LSR-MIB. This implementation enables a network administrator to get information on the status, character, and performance of the following:

- MPLS capable interfaces on the LSR
- Incoming MPLS segments (labels) to an LSR and their associated parameters
- Outgoing segments (labels) from an LSR and their associated parameters

In addition, the network manager can retrieve the status of cross-connect entries that associate MPLS segments together. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/lsrmibt.htm.

MPLS QoS Multi-VC Mode for PA-A3

MPLS QoS Multi-VC Mode functionality substantially enhances MPLS quality of service (QoS) capabilities. This new MPLS QoS feature enables users to map the experimental (EXP) field value of an MPLS label to an ATM virtual circuit (VC) to create "bundles" of labeled virtual circuits (LVCs). Each bundle consists of multiple LVCs, and each LVC is treated as a member of the bundle.

Each member of a bundle can be associated with any pair of ATM-connected routers in the networking environment of the user, and each member of a bundle can have a QoS different from other members of the bundle.

By means of virtual circuit bundles, differentiated services can be provided to users of MPLS-enabled service provider networks. This service differentiation is accomplished by setting an appropriate value in the EXP field in the header of each incoming packet as it is received by the provider edge (PE) router in the service provider network.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/cos1221t.htm.

MPLS Traffic Engineering MIB

SNMP agent code operating in conjunction with the MPLS TE MIB enables a standardized, SNMP-based approach to be used in managing the MPLS traffic engineering features in Cisco IOS software.

The MPLS TE MIB is based on the IETF draft MIB entitled draft-ietf-mpls-te-mib-05.txt, which includes objects describing features that support MPLS traffic engineering. This IETF draft MIB, which undergoes revisions from time to time, is being evolved toward becoming a standard. Accordingly, the Cisco implementation of the MPLS TE MIB is expected to track the evolution of the IETF draft MIB.

Slight differences between the IETF draft MIB and the implementation of the traffic engineering capabilities within Cisco IOS software require some minor translations between the MPLS TE MIB and the internal data structures of Cisco IOS software. These translations are accomplished by means of the SNMP agent code that is installed and operating on various hosts within the network. This SNMP agent code, running in the background as a low priority process, provides a management interface to Cisco IOS software.

The SNMP objects defined in the MPLS TE MIB can be displayed using any standard SNMP utility. All MPLS TE MIB objects are based on the IETF draft MI, which means that no specific Cisco SNMP application is required to support the functions and operations pertaining to the MPLS TE MIB.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/te_mib12.htm.

NAT Support of H.323 RAS

The Cisco IOS NAT feature supports all H.225 and H.245 message types, including Registration, Admission, and Status (RAS). RAS provides a number of messages that are used by software clients and VoIP devices to register their location, request assistance in call setup, and control bandwidth. The RAS messages are directed toward an H.323 gatekeeper.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftnatras.htm.

NetFlow Multiple Export Destinations

The NetFlow Multiple Export Destinations feature enables configuration of multiple destinations of the NetFlow data. With this feature enabled, two identical streams of NetFlow data are sent to the destination host. Currently, the maximum number of export destinations allowed is two.

The NetFlow Multiple Export Destinations feature improves the chances of receiving complete NetFlow data by providing redundant streams of data. Because the same export data is sent to more than one NetFlow collector, fewer packets will be lost.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/dtnfdest.htm.

Network-Based Application Recognition

Network-Based Application Recognition is now supported on Cisco 1700 series routers.

As IP quality of service (QoS) technology matures and customers begin QoS deployment in production networks, new requirements for packet classification have emerged. The applications require high performance to ensure competitiveness in an increasingly fast-paced business environment. Networks provide a variety of services to ensure that mission-critical applications receive the required bandwidth for high performance. Internet-based and client/server applications make it difficult for networks to identify packets and provide the proper level of control.

Network-Based Application Recognition (NBAR) solves this level of control by adding intelligent network classification to network infrastructures. NBAR is a new classification engine that recognizes a wide variety of applications, including web-based and other difficult-to-classify protocols that utilize dynamic TCP/UDP port assignments. When an application is recognized and classified by NBAR, a network can invoke services for that specific application. NBAR ensures that network bandwidth is used efficiently by working with QoS features to provide the following features:

- Guaranteed bandwidth
- Bandwidth limits
- Traffic shaping
- Packet coloring

NBAR introduces several new classification features as follows:

- Classification of applications that dynamically assign TCP/UDP port numbers
- Classification of HTTP traffic by URL, host, or MIME type
- Classification of Citrix ICA traffic by application name
- Classification of application traffic using subport information

NBAR can also classify static port protocols. Although access control lists (ACLs) can also be used for this purpose, NBAR is easier to configure and can provide classification statistics that are not available when using ACLs.

NBAR provides a special Protocol Discovery feature that determines which application protocols are traversing a network at any given time. The Protocol Discovery feature captures key statistics associated with each protocol in a network. These statistics can be used to define traffic classes and QoS policies for each traffic class.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t5/dtnbar.htm.

PPP over Ethernet Client

The PPP over Ethernet Client feature provides PPP over Ethernet (PPPoE) client support on routers or digital subscriber line (DSL) modems on customer premises.

PPPoE client is supported on ATM permanent virtual circuits (PVCs) using a dialer interface for cloning virtual access. One PVC will support one PPPoE client. Multiple PPPoE clients can run concurrently on different PVCs, but each PPPoE client must use a separate dialer interface and a separate dialer pool.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftpppoec.htm.

Preauthentication with ISDN PRI and Channel-Associated Signaling Enhancements

Preauthentication allows a Cisco network access server (NAS) to decide—on the basis of the Dialed Number Identification Service (DNIS) number—whether to answer an incoming call. When an incoming call arrives from the public network switch but before it is answered, the NAS sends the DNIS number to a RADIUS server for authorization.

The Preauthentication with ISDN PRI and Channel-Associated Signaling Enhancements feature provides additional support for preauthentication, which was introduced in a previous Cisco IOS release. For more information about preauthentication, refer to the Cisco IOS Release 12.1(3)T feature module titled *Preauthentication with ISDN PRI and Channel-Associated Signaling*.

This feature supports the use of attribute 44 by the RADIUS server application, which allows user authentication on the basis of the Calling Line Identification (CLID) number in the same transaction. For more information about attribute 44 and how it works with preauthentication, refer to the Cisco IOS Release 12.0(7)T feature module titled *RADIUS Attribute 44 (Accounting Session ID) in Access Requests*.

This feature also supports the use of new RADIUS attributes. These RADIUS attributes are configured in the RADIUS preauthentication profiles to specify preauthentication behavior. They may also be used, for instance, to specify whether subsequent authentication should occur and, if so, what authentication method should be used.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t5/dtdtl.htm.

Prefix Dial for 800 Series Routers

Cisco 803 and Cisco 804 routers now support prefix dialing. You can add a telephone prefix and create a prefix filter to the dialed number for analog telephone calls. When a telephone number is dialed through the telephone port, the router checks for prefix filters. If the router finds a match, no prefix is added to the dialed number. If no filter match is found, the router adds the user-defined prefix to the called number.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ft_vs800.htm.

Quality of Service for Virtual Private Networks

When packets are encapsulated by tunnel or encryption headers, Quality of Service (QoS) features are unable to examine the original packet headers and correctly classify the packets. Packets traveling across the same tunnel have the same tunnel headers, so the packets are treated identically if the physical interface is congested.

With the growing popularity of Virtual Private Networks (VPNs), the need to classify traffic within a traffic tunnel is gaining importance. QoS features have historically been unable to classify traffic within a tunnel. With the introduction of the Quality of Service for Virtual Private Networks (QoS for VPNs) feature, packets can now be classified before tunneling and encryption occur. The process of classifying features before tunneling and encryption is called preclassification.

The QoS for VPNs feature is designed for tunnel interfaces. When the new feature is enabled, the QoS features on the output interface classify packets before encryption, allowing traffic flows to be adjusted in congested environments. The end result is more effective packet tunneling.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t5/dtqosvpn.htm.

RADIUS Attribute 66 (Tunnel-Client-Endpoint) Enhancements

Virtual private networks (VPNs) use Layer 2 Forwarding (L2F) or Layer 2 Tunnel Protocol (L2TP) tunnels to tunnel the link layer of high-level protocols (for example, PPP) or asynchronous High-Level Data Link Control (HDLC)). Internet service providers (ISPs) configure their network access servers (NASs) to receive calls from users and forward the calls to the customer tunnel server. Usually, the ISP maintains only information about the tunnel server—the tunnel endpoint. The customer maintains the IP addresses, routing, and other user database functions of the tunnel server users.

The RADIUS Attribute 66 (Tunnel-Client-Endpoint) Enhancements feature adds the ability to specify the host name of the NAS—rather than the IP address of the NAS—in RADIUS attribute 66 (Tunnel-Client-Endpoint).

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t5/dtdt4.htm.

RSVP Scalability Enhancements

RSVP typically performs admission control, classification, policing, and scheduling of data packets on a per-flow basis and keeps a database of information for each flow. RSVP scalability enhancements let you select a resource provider (formerly called a quality of service (QoS) provider) and disable data-packet classification so that RSVP performs admission control only. These enhancements facilitate integration with service provider (differentiated services) networks and enables scalability across enterprise networks.

Class-based weighted fair queueing (CBWFQ) provides the classification, policing, and scheduling functions. CBWFQ puts packets into classes based on the differentiated services code point (DSCP) value in the IP header of the packet, thereby eliminating the need for per-flow state and per-flow processing.

There are two new commands:

ip rsvp data-packed classifications none—Disables data packet classification.

ip rsvp resource-provider {*none* | *wfq interface* | *wfq pvc*}—Configures a resource provider for an aggregate flow.

There is one modified command:

show ip rsvp interface detail—The detail keyword was added to display information about RSVP interface parameters.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/rsvpscal.htm

RSVP Support for ATM/PVCs

The RSVP Support for ATM/PVCs feature allows RSVP to function with per-PVC queueing for voice-like flows. Specifically, RSVP can install reservations on PVCs defined at the interface and subinterface levels. There is no limit to the number of PVCs that can be configured per interface or subinterface.

There are two new commands:

ip rsvp layer2 overhead [*h c n*]—Controls the overhead accounting performed by RSVP/WFQ when a flow is admitted onto an ATM PVC.

ip rsvp resource-provider {*none* | *wfq interface* | *wfq pvc*}—Configures a resource provider for an aggregate flow.

There is one modified command:

show ip rsvp interface detail—The detail keyword was added to display information about RSVP interface parameters.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/rsvp_atm.htm.

SA Agent Support for Application Monitoring, Frame Relay, VoIP, and MPLS VPN

The Cisco Service Assurance Agent (SA Agent) is a Cisco IOS software network monitoring solution. This enhancement to the Cisco SA Agent provides the following features: Application Performance Monitoring, Frame Relay Monitoring, Path Jitter, and MPLS VPN awareness.

SA Agent Application Performance Monitor (APM) operations allow the user to monitor performance of applications over a network. Monitoring the performance of network-hosted applications gives service providers and IT departments the ability to verify that applications are performing as needed and to implement improvements as necessary.

SA Agent Frame Relay Monitor (FRM) operations allow the user to monitor key performance metrics (round trip latency, packet loss, and data integrity) over Frame Relay PVCs. Proactively monitoring the performance of Frame Relay networks is essential for service providers that offer Frame Relay services.

SA Agent path echo operations have been enhanced to provide hop-by-hop jitter measurement using ICMP packets for VoIP monitoring. The Cisco SA Agent has also been enhanced to allow monitoring within MPLS Virtual Private Networks (VPNs).

Refer to the following document for additional information about the SA Agent Application Performance Monitor:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ft2_apm.htm.

Refer to the following document for additional information about the SA Agent Support for Frame Relay, VoIP, and MPLS VPN Monitoring:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ft1csaa.htm.

Secure Copy

The Secure Copy (SCP) feature provides a secure and authenticated method for copying router configuration or router image files. SCP relies on Secure Shell (SSH), an application and a protocol that provides a secure replacement for the Berkeley r-tools.

The behavior of SCP is similar to that of remote copy (rcp), which comes from the Berkeley r-tools suite, except that it is reliant upon SSH for security. In addition, SCP requires that AAA authorization be configured so the router can determine whether the user has the correct privilege level.

SCP allows a user logged in to Cisco IOS software to copy anything that exists in the Cisco IOS File System (IFS) to and from a router by using the **copy** command. A user using a remote workstation cannot perform this task.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftscp.htm.

Secure Shell Terminal-Line Access

Although Cisco IOS supports reverse Telnet, which allows users to Telnet to a certain port range that connects them to tty (asynchronous) lines, Telnet provides no security because all Telnet traffic goes over the network in the clear. The SSH Terminal-Line Access feature replaces reverse Telnet with secure shell (SSH), thereby, allowing users to configure their Cisco IOS routers securely.

The SSH Terminal-Line Access feature enables users to configure their router with secure access and perform the following tasks:

- Connect to a router that has multiple terminal lines connected to consoles of other routers.
- Simplify connectivity to a router from anywhere by securely connecting to the terminal server on a specific line.
- Allow modems attached to routers to be used for dial-out securely.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftrevssh.htm.

Shell-Based Authentication of VPDN Users

The Shell-Based Authentication of VPDN Users feature provides terminal services for VPDN users to support rollout of wholesale dial networks. Terminal services (shell login or exec login) on the network access server (NAS) provide the following capabilities:

- Enabling a dial-in user session to be terminated at the access server.
- Authenticating the user with a character-mode login dialog such as username/password or username/challenge/password, Secure ID, Safeword, and so on.
- Initiating PPP and tunneling it to a home gateway (HGW).

With the terminal services, user authentication methods other than PAP and CHAP can be applied to PPP users. With the Shell-Based Authentication of VPDN Users feature, PPP authentication data is preconfigured or entered before PPP starts. Authentication is completed without any further input from the user.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftexvpnt.htm.

SIP Diversion Header Implementation for Redirecting Number

SIP is a new protocol developed by the Internet Engineering Task Force (IETF) Multiparty Multimedia Session Control (MMUSIC) Working Group as an alternative to the ITU-T H.323 specification. SIP is defined by RFC 2543 and is used for multimedia call session setup and control over IP networks. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t3/sipcf2.htm.

SIP Gateway Support for Third-Party Call Control

SIP is a new protocol developed by the Internet Engineering Task Force (IETF) Multiparty Multimedia Session Control (MMUSIC) Working Group as an alternative to the ITU-T H.323 specification. SIP is defined by RFC 2543 and is used for multimedia call session setup and control over IP networks. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t3/sipcf2.htm.

SLT Dual Ethernet

The Cisco SLT Dual Ethernet feature adds Cisco SLT dual Ethernet support to the virtual switch controller (VSC). This enhanced Cisco SLT support provides two IP networks and two additional Session Manager sessions (for a total of four Session Manager sessions) for improved backhaul communication. These additions increase the resilience of Cisco SLT/VSC communications by supporting two RUDP sessions from each Ethernet interface to each VSC. These VSC enhancements contribute to determining when to switch Ethernets and when to switch VSC activity.

The Cisco SLT, which is based on the Cisco 2611 Multi-Service Access Router, is shipped with two Ethernet interfaces. Until this feature was released, the Cisco SLT/VSC solution supported only one of the two Ethernet interfaces. Both Session Manager sessions needed to travel over this single Ethernet interface: This Ethernet was a single-point failure. The Cisco SLT Dual Ethernet feature supports the second Ethernet, which improves the resilience of the backhaul IP communications.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftsltdes.htm.

SLT G.732 Support

The Cisco SLT enables service providers to reliably transport Signaling System 7 (SS7) protocols across an IP network. The Cisco SLT uses the Cisco IOS SS7 SLT feature set, providing reliable interoperability with the Cisco SC2200 or the Cisco VSC3000 device. The Cisco SLT is responsible for terminating the Message Transfer Part (MTP) 1 and MTP 2 layers of the SS7 protocol stack. Using the Cisco Reliable User Datagram Protocol (RUDP), the Cisco SLT backhauls, or transports, upper-layer SS7 protocols across an IP network to the Cisco SC2200 or VSC3000 device. The Cisco SLT is supported only on the Cisco 2611 router.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ft_g732.htm.

SNMP Support over VPN

The SNMP Support over VPN feature allows the sending and receiving of SNMP notifications using VPN Routing Forwarding table (VRF).

SNMP is an application-layer protocol that provides a message format for communication between SNMP managers and agents.

A VPN is a network that provides high connectivity transfers on a shared system with the same usage guidelines as a private network. A VPN can be built on the Internet or on the service provider IP, Frame Relay, or ATM system.

A VRF stores per-VPN routing data. It defines the VPN membership of a customer site attached to the network access server (NAS). A VRF consists of an IP routing table, a derived Cisco Express Forwarding (CEF) table, guidelines, and routing protocol parameters that control the information that is included in the routing table.

The SNMP Support over VPN feature provides configuration commands that allow users to associate SNMP agents and managers with specific VRFs. The specified VRF is used for the sending of SNMP notifications (traps and informs) and responses between agents and managers. If a VRF is not specified, the default routing table for the VPN is used.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftnm_vpn.htm

SNMP Trap Support for the Virtual Switch Interface Master MIB

The VSI Master MIB allows you to manage and monitor the activities of the VSI components, including controllers, sessions, logical interfaces, and cross-connects. The MIB provides notifications in the form of traps when any of the VSI components change operational state, violate configured thresholds, or are added or removed.

The MIB allows you to specify which VSI components can send traps. To enable the traps for certain VSI components, you can use the MIB objects or Cisco IOS commands.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/mstrmib.htm.

Supplementary Telephone Services for the Euro-ISDN Switch

The Cisco 800 series routers now support the following plain old telephone service (POTS) features for the European Telecommunications Standards Institute (ETSI) Euro-ISDN switch type:

- Caller ID presentation and restriction are available for Denmark, Finland, and Sweden.
- Calling line identification restriction (CLIR) temporarily prevents your calling ID from being presented to the destination number for an outgoing call. You must configure CLIR prior to each call in which you want to restrict the calling party number from being presented at the destination.
- Call forwarding is enabled using Cisco IOS and dual tone multifrequency (DTMF) keypad commands.
- Call transfer enables you to connect two call destinations. The request for this service must originate from an active, outgoing call.

Note The Euro-ISDN switch was previously called the NET3 switch.

- The following types of voice call forwarding services are supported on the Euro-ISDN switch:
  - Call forward unconditional (CFU) redirects your calls without restrictions and takes precedence over other call forwarding types.
  - Call forward busy (CFB) redirects your call to another number if your number is busy.
  - Call forward no reply (CFNR) forwards your call to another number if your number does not answer within a specified period of time.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ft_vs800.htm.

TCL IVR disconnect cause-code Manipulation

The **leg disconnect** command disconnects one or more call legs that are not part of any connection. The *cause_code* argument, which has been added in Cisco IOS Release 12.2(1)T, is an integer ISDN cause code for the disconnect. It is of the form di-*xxx* or just *xxx*, where *xxx* is the ISDN cause code. Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_serv/vapp_dev/tclivrv2.htm.

Traffic Policing

The Traffic Policing feature performs the following functions:

- Limits the input or output transmission rate of a class of traffic based on user-defined criteria.
- Marks packets by setting the ATM Cell Loss Priority (CLP) bit, Frame Relay Discard Eligibility (DE) bit, IP precedence value, IP differentiated services code point (DSCP) value, MPLS experimental value, and Quality of Service (QoS) group.

Traffic policing allows you to control the maximum rate of traffic transmitted or received on an interface. The Traffic Policing feature is applied when you attach a traffic policy contain the Traffic Policing configuration to an interface. A traffic policy is configured using the Modular Quality of Service Command-Line Interface (Modular QoS CLI).

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftpoli.htm.

Note This feature was originally introduced in Cisco IOS Release 12.1(5)T. This release adds the set-clp-transmit, set-frde-transmit, and set-mpls-exp-transmit options for the *action* argument to the **police** command.

Trimble Palisade NTP Synchronization Driver for the Cisco 7200 Series Routers

The Trimble Palisade Smart Antenna can provide a signal that can by used for NTP time-synchronization of a network. The Trimble Palisade NTP Synchronization Kit can be connected to the auxiliary port of a Cisco 7200 router. The refclock (reference clock) driver provided by this feature provides the ability to receive an RTS time-stamp signal on the auxiliary port of the router.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t1/dtrimble.htm.

Using 31-bit Prefixes on IPv4 Point-to-Point Links

The Using 31-bit Prefixes on IPv4 Point-to-Point Links feature allows 31-bit prefixes to be used on IP version 4 point-to-point links. The number of IP addresses is reduced by 50 percent and the number of denial of service (DoS) attacks is also reduced. Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ft31addr.htm.

Voice over ATM with AAL2 Trunking on Cisco 7200 Series Routers

Voice over ATM (VoATM)

This feature enables Cisco 7200 series routers to carry voice traffic (for example, telephone calls and faxes) over ATM networks using AAL2. AAL2 is the most bandwidth-efficient standards-based trunking method for transporting compressed voice, voice-band data, circuit-mode data, and frame-mode data over ATM infrastructures.

Transparent Common Channel Signaling (T-CCS)

The Transparent Common Channel Signaling (T-CCS) feature provides a way to interconnect PBX, key systems (KTs), and central office (CO) switches when the private integrated services network exchange (PINX) does not support Q (point of the ISDN model) Signaling (QSIG), or when the PINX uses a proprietary solution. T-CCS allows the connection of two PBXs with PRI interfaces that use one CCS protocol without the need for interpretation of CCS signaling for call processing. A PBX PRI group is transported transparently through the data network, and the feature preserves proprietary signaling. From the PBX standpoint, this signaling is accomplished through a point-to-point connection. Calls from the PINXs are not routed, but follow a preconfigured route to the destination. Frame forwarding, used with T-CCS, forwards High-Level Data Link Control (HDLC) frames over a preconfigured interface running HDLC, Frame Relay, or ATM encapsulation.

Additional Information

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ft_aal72.htm.

X.25 Annex G Session Status Change Reporting

The X.25 Annex G Session Status Change Reporting feature introduces the **logging event frame-relay x25** interface configuration command, which provides console or system log notification of X.25 Annex G session status changes when an X.25 Annex G session carried over Frame Relay changes state. Before this feature was introduced, there was no notification.

This feature detects changes in session status using an X.25 Link Access Procedure, Balanced (LAPB) N2 counter. The LAPB N2 counter is the number of unsuccessful transmit attempts that are made before the link is declared down. After the N2 consecutive polled commands have not been answered, a notification is generated, indicating that the X.25 profile or context associated with the data-link connection identifier (DLCI) that is running across the failed radio link has gone down. A message is generated to the console or system log when the link goes down. A message is also generated to the console or system log when the link comes back up. The notification response time is contingent on the values assigned to the LAPB N1 counter and the LAPB T1 timer.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftanxg.htm.

MIBs

To obtain lists of supported MIBs by platform and Cisco IOS release, and to download MIB modules, go to the Cisco MIB website on Cisco.com at the following URL:

http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml.

Deprecated and Replacement MIBs

Old Cisco MIBs will be replaced in a future release. Currently, OLD-CISCO-* MIBs are being converted into more scalable MIBs without affecting existing Cisco IOS products or network management system (NMS) applications. You can update from deprecated MIBs to the replacement MIBs as shown in Table 62.

Table 62 Deprecated and Replacement MIBs

Deprecated MIB	Replacement
OLD-CISCO-APPLETALK-MIB	RFC1243-MIB
OLD-CISCO-CHASSIS-MIB	ENTITY-MIB
OLD-CISCO-CPUK-MIB	To be determined
OLD-CISCO-DECNET-MIB	To be determined
OLD-CISCO-ENV-MIB	CISCO-ENVMON-MIB
OLD-CISCO-FLASH-MIB	CISCO-FLASH-MIB
OLD-CISCO-INTERFACES-MIB	IF-MIB CISCO-QUEUE-MIB
OLD-CISCO-IP-MIB	To be determined
OLD-CISCO-MEMORY-MIB	CISCO-MEMORY-POOL-MIB
OLD-CISCO-NOVELL-MIB	NOVELL-IPX-MIB
OLD-CISCO-SYS-MIB	(Compilation of other OLD* MIBs)
OLD-CISCO-SYSTEM-MIB	CISCO-CONFIG-COPY-MIB
OLD-CISCO-TCP-MIB	CISCO-TCP-MIB
OLD-CISCO-TS-MIB	To be determined
OLD-CISCO-VINES-MIB	CISCO-VINES-MIB
OLD-CISCO-XNS-MIB	To be determined

Important Notes

The following sections contain important notes about Cisco IOS Release 12.2 T.

Field Notices and Bulletins

- Field Notices—Cisco recommends that you view the field notices for this release to see if your software or hardware platforms are affected. If you have an account on Cisco.com, you can find field notices at http://www.cisco.com/warp/customer/770/index.shtml. If you do not have a Cisco.com login account, you can find field notices at http://www.cisco.com/warp/public/770/index.shtml.
- Product Bulletins—If you have an account on Cisco.com, you can find Product Bulletins at http://www.cisco.com/warp/customer/cc/general/bulletin/index.shtml. If you do not have a Cisco.com login account, you can find Product Bulletins at http://www.cisco.com/warp/public/cc/general/bulletin/iosw/index.shtml.
- Deferral Advisories and Software Advisories for Cisco IOS Software—*Deferral Advisories and Software Advisories for Cisco IOS Software* provides information about caveats that are related to deferred software images for Cisco IOS releases. If you have an account on Cisco.com, you can access *Deferral Advisories and Software Advisories for Cisco IOS Software* at http://www.cisco.com/kobayashi/sw-center/sw-ios-advisories.shtml.

- What's New for IOS—*What's New for IOS* lists recently posted Cisco IOS software releases and software releases that have been removed from Cisco.com. If you have an account on Cisco.com, you can access *What's New for IOS* at http://www.cisco.com/kobayashi/sw-center/sw-ios.shtml.
- Cisco IOS Software Roadmap—The *Cisco IOS Software Roadmap* illustrates the relationship of the various Cisco IOS releases. If you have an account on Cisco.com, you can access the *Cisco IOS Software Roadmap* at http://www.cisco.com/warp/customer/620/roadmap_b.shtml.

Important Notes for Cisco IOS Release 12.2(15)T4

The following information applies to Cisco IOS Release 12.2(15)T4.

Images Deferred Because of Caveats CSCea21186, CSCeb07534, CSCeb07595, and CSCeb10053

In Cisco IOS Release 12.2(15)T4, five images have been deferred because of severe defects. These defects have been assigned Cisco caveat ID CSCea21186, CSCeb07534, CSCeb07595, and CSCeb10053. The affected images are as follows:

- rpm-boot-mz
- rpm-jk9o3s-mz
- rpm-js-mz
- rpmxf-boot-mz
- rpmxf-p12-mz

With caveat CSCea21186, TACACS server host command causes reload. With caveat CSCeb07534, reset of dual LSC in node-a results in tailend LVCs created on PE in node-b. With caveat CSCeb07595, provider edge (PE) box may reload after modifying MPLS partition VCIi range on an ATM interface. With caveat CSCeb10053, RPM runs out of buffers causing SAR no_buffer errors. The software solution for these deferred images is Cisco IOS Release 12.2(15)T5.

To increase network availability, Cisco recommends that you upgrade affected Cisco IOS images with the suggested replacement software images. Cisco will discontinue manufacturing shipment of affected Cisco IOS images. Any pending order will be substituted by the replacement software images.

Note Failure to upgrade the affected Cisco IOS images may result in network downtime.

The terms and conditions that governed your rights and obligations and those of Cisco with respect to the deferred images will apply to the replacement images.

Important Notes for Cisco IOS Release 12.2(15)T3

The following information applies to Cisco IOS Release 12.2(15)T3.

Images Deferred Because of Caveats CSCdx08292, CSCea57593, CSCea63209, CSCea67430, CSCea72272, CSCea73441, CSCea74222, CSCea75235, CSCea78687, CSCea84387, CSCea91135, CSCeb02097, and CSCeb02520

In Cisco IOS Release 12.2(15)T3, four images have been deferred because of severe defects. These defects have been assigned Cisco caveat ID CSCdx08292, CSCea57593, CSCea63209, CSCea67430, CSCea72272, CSCea73441, CSCea74222, CSCea75235, CSCea78687, CSCea84387, CSCea91135, CSCeb02097, and CSCeb02520. The affected images are as follows:

- rpm-boot-mz
- rpm-js-mz
- rpmxf-boot-mz
- rpmxf-p12-mz

With caveat CSCdx08292, auto-summary and sync not turned on by default under addr-fam VRF. With caveat CSCea57593, a Cisco RPM-PR router may reload with a bus error at 0x600ED128. With caveat CSCea63209, with dual LSCs and 1:N redundancy configured, one might experience a 10+ sec data disruption when a resetcd is issued for the active/primary LSC. With caveat CSCea67430, SNMP MIB variables are accessible to VRF interfaces on the RPM. With caveat CSCea72272, configuration file goes corrupt with multiple simultaneous VTY write memory. With caveat CSCea73441, RPM Path-Check causes router reset. With caveat CSCea74222, IGP label rewrite information for remote PE is lost from CEF table on a local PE. With caveat CSCea75235, during LSC switchover, a second outage found. With caveat CSCea78687, LSNT: LDP goes up/down under congestion situation. With caveat CSVea84387, two simultaneous policy map displays cause problems. With caveat CSCea91135, RPM may stay in error state (auto recovery disabled/heartbeat going). With caveat CSCeb 02097, LSNT: saving configuration took long time. With caveat CSCeb02520, RPM-PR router configured as eLSR might reset upon execution of the **show queue** command where interface is of MPLS type. The software solution for these deferred images is Cisco IOS Release 12.2(15)T5.

To increase network availability, Cisco recommends that you upgrade affected Cisco IOS images with the suggested replacement software images. Cisco will discontinue manufacturing shipment of affected Cisco IOS images. Any pending order will be substituted by the replacement software images.

Note Failure to upgrade the affected Cisco IOS images may result in network downtime.

The terms and conditions that governed your rights and obligations and those of Cisco with respect to the deferred images will apply to the replacement images.

Important Notes for Cisco IOS Release 12.2(15)T1

The following information applies to Cisco IOS Release 12.2(15)T1.

Images Deferred Because of Caveat CSCin40652

In Cisco IOS Release 12.2(15)T1, 352 images have been deferred because of a severe defect. This defect has been assigned Cisco caveat ID CSCin40652. The affected images are as follows:

• c820-k9osv6y6-mz	• c2691-io3-mz	• c3725-ix-mz	• c7200-jk9o3s-mz
• c820-k9osy6-mz	• c2691-is-mz	• c3725-jk9o3s-mz	• c7200-jk9s-mz
• c820-ov6y6-mz	• c2691-ix-mz	• c3725-jk9s-mz	• c7200-jo3s-mz
• c820-oy6-mz	• c2691-jk8o3s-mz	• c3725-jk9s2-mz	• c7200-js-mz
• c820-sv6y6-mz	• c2691-jk8s-mz	• c3725-js-mz	• c7200-jx2-mz
• c820-sy6-mz	• c2691-jk9o3s-mz	• c3725-js2-mz	• c7200-kboot-mz
• c820-v6y6-mz	• c2691-jk9s-mz	• c3725-jsx-mz	• c7200-p-mz
• c820-y6-mz	• c2691-js-mz	• c3725-p-mz	• c7400-a3jk8s-mz
• c1700-bk8no3r2sv3y7-mz	• c2691-jsx-mz	• c3745-a3jk9s-mz	• c7400-a3jk9s-mz
• c1700-bk8no3r2sv8y7-mz	• c2691-p-mz	• c3745-s3js-mz	• c7400-a3js-mz
• c1700-bk8no3r2sy7-mz	• c3620-i-mz	• c3745-bin-mz	• c7400-dk8o3s-mz
• c1700-bk9no3r2sv3y7-mz	• c3620-ik9o3s6-mz	• c3745-bino3s-mz	• c77400-dk8s-mz
• c1700-k9no3r2sv8y7-mz	• c3620-ik9o3s7-mz	• c3745-bins-mz	• c7400-dk9o3s-mz
• c1700-bk9no3r2sy7-mz	• c3620-in-mz	• c3745-i-mz	• c7400-do3s-mz

With caveat CSCin40652, Media Gateway Control Protocol (MGCP) channel-associated signaling (CAS) does not recieve path confirmation from terminating gateway. The software solution for these deferred images is Cisco IOS Release 12.2(15)T2.

To increase network availability, Cisco recommends that you upgrade affected Cisco IOS images with the suggested replacement software images. Cisco will discontinue manufacturing shipment of affected Cisco IOS images. Any pending order will be substituted by the replacement software images.

Note Failure to upgrade the affected Cisco IOS images may result in network downtime.

The terms and conditions that governed your rights and obligations and those of Cisco with respect to the deferred images will apply to the replacement images.

Important Notes for Cisco IOS Release 12.2(15)T

The following information applies to Cisco IOS Release 12.2(15)T.

Cisco Images Deferred Because of Caveats CSCdv82735, CSCea08727, CSCea11340, CSCea17465, CSCea35454, and CSCin38050

Six images in Cisco IOS Release 12.2(15)T were deferred because of severe defects. These defects have been assigned Cisco caveat ID CSCdv82735, CSCea08727, CSCea11340, CSCea17465, CSCea35454, and CSCin38050. These caveats affect the following images:

- c4224-a3ik9no3rsx3-mz
- c4224-io3sx3-mz
- c2500-is-l
- c2600-g4js-mz
- ubr925-k9o3sv9y5-mz
- ubr925-k9o3sy5mz

With caveat CSCdv82735, speed/duplex cannot be hard set on FE ports connected to IP phone. With caveat CSCea08727, local-address broken in Cisco Easy VPN configuration. With caveat CSCea11340, Cisco Easy VPN web interface is broken on Cisco uBR925. With caveat CSCea17465, input queue size may go negative leading to the Cisco Easy VPN connections getting stuck on the Cisco uBR925. With caveat CSCea35454, the c2500-is-l image size is too large for maximum memory. With CSCin38050, there is wrong accounting for PPPoX SSG users. The software solution for these deferred images is Cisco IOS Release 12.2(15)T1.

To increase network availability, Cisco recommends that you upgrade affected Cisco IOS images with the suggested replacement software images. Cisco will discontinue manufacturing shipment of affected Cisco IOS images. Any pending order will be substituted by the replacement software images.

Note Failure to upgrade the affected Cisco IOS images may result in network downtime.

The terms and conditions that governed your rights and obligations and those of Cisco with respect to the deferred images will apply to the replacement images.

Important Notes for Cisco IOS Release 12.2(13)T1

The following information applies to Cisco IOS Release 12.2(13)T1.

Cisco 1600 Series Router Images Deferred Because of Caveat CSCdz38371

Two images in Cisco IOS Release 12.2(13)T1 were deferred because of severe defects. These defects have been assigned Cisco caveat ID CSCdz38371. This caveat affects the following images:

- c1600-bk8nor2sy-1
- c1600-bk8nor2sy-mz

With caveat CSCdz38371, the c1600-bk8nor2sy-1 and c1600-bk8nor2sy-mz images are too large for maximum router flash. The software solution for these deferred images is Cisco IOS Release 12.2(11)T3.

To increase network availability, Cisco recommends that you upgrade affected Cisco IOS images with the suggested replacement software images. Cisco will discontinue manufacturing shipment of affected Cisco IOS images. Any pending order will be substituted by the replacement software images.

Note Failure to upgrade the affected Cisco IOS images may result in network downtime.

The terms and conditions that governed your rights and obligations and those of Cisco with respect to the deferred images will apply to the replacement images.

Important Notes for Cisco IOS Release 12.2(13)T

The following information applies to Cisco IOS Release 12.2(13)T.

Cisco 1600 Series Router Images Deferred Because of Caveat CSCdz38371

Two images in Cisco IOS Release 12.2(13)T were deferred because of severe defects. These defects have been assigned Cisco caveat ID CSCdz38371. This caveat affects the following images:

- c1600-bk8nor2sy-1
- c1600-bk8nor2sy-mz

With caveat CSCdz38371, the c1600-bk8nor2sy-1 and c1600-bk8nor2sy-mz images are too large for maximum router flash. The software solution for these deferred images is Cisco IOS Release 12.2(11)T3.

To increase network availability, Cisco recommends that you upgrade affected Cisco IOS images with the suggested replacement software images. Cisco will discontinue manufacturing shipment of affected Cisco IOS images. Any pending order will be substituted by the replacement software images.

Note Failure to upgrade the affected Cisco IOS images may result in network downtime.

The terms and conditions that governed your rights and obligations and those of Cisco with respect to the deferred images will apply to the replacement images.

Cisco 3620 Series Router Images Deferred Because of Caveat CSCdz45923

Two images in Cisco IOS Release 12.2(13)T were deferred because of severe defects. These defects have been assigned Cisco caveat ID CSCdz45923. This caveat affects the following images:

- c3620-bin-mz
- c3620-bino3s3-mz

With caveat CSCdz45923, Appletalk is missing from Cisco 3620 images. The software solution for this deferred image is Cisco IOS Release 12.2(15)T.

To increase network availability, Cisco recommends that you upgrade affected Cisco IOS images with the suggested replacement software images. Cisco will discontinue manufacturing shipment of affected Cisco IOS images. Any pending order will be substituted by the replacement software images.

Note Failure to upgrade the affected Cisco IOS images may result in network downtime.

The terms and conditions that governed your rights and obligations and those of Cisco with respect to the deferred images will apply to the replacement images.

Cisco AS5800 Images Deferred Because of Caveats CSCdz04856, CSCdz09639, CSCdz26779, and CSCdy87529

Three images in Cisco IOS Release 12.2(13)T were deferred because of severe defects. These defects have been assigned Cisco caveat ID CSCdz04856, CSCdz09639, CSCdz26779, and CSCdy87529. These caveats affect the following images:

- c5800-k8p4-mz
- dsc-c5800-mz
- c5800-p4-mz

With caveat CSCdz04856, a Cisco UPC324 dial feature card may stop accepting analog calls after running for about two hours. With caveat CSCdz09639, RS reloads at rs_set_debounce_timer after sh run.With caveat CSCdz26779, CRM shows resource active even after calls are disconnected. With caveat CSCdy87529, the Simple Network Management Protocol (SNMP) counters of a Cisco AS5800 may begin to deviate and may no longer reflect the actual number of calls when random analog and digital calls are received. The software solution for these deferred images is Cisco IOS Release 12.2(13)T1.

To increase network availability, Cisco recommends that you upgrade affected Cisco IOS images with the suggested replacement software images. Cisco will discontinue manufacturing shipment of affected Cisco IOS images. Any pending order will be substituted by the replacement software images.

Note Failure to upgrade the affected Cisco IOS images may result in network downtime.

The terms and conditions that governed your rights and obligations and those of Cisco with respect to the deferred images will apply to the replacement images.

Cisco Catalyst 4000 Access Gateway Module Images Deferred Because of Caveat CSCdz27525

Cisco Catalyst 4000 Access Gateway Module images were deferred in Cisco IOS Release 12.2(13)T because of a severe defect. This defect has been assigned Cisco caveat ID CSCdz27525. This caveat affects the following images:

- c4gwy-a3ik9no3rsx3-mz
- c4gwy-a3ino3rsx3-mz
- c4gwy-io3sx3-mz

With caveat CSCdz27525, a Cisco Catalyst 4000 Gateway Module may experience a reload from overtemperature. The software solution for these deferred images is Cisco IOS Release 12.2(13)T2.

To increase network availability, Cisco recommends that you upgrade affected Cisco IOS images with the suggested replacement software images. Cisco will discontinue manufacturing shipment of affected Cisco IOS images. Any pending order will be substituted by the replacement software images.

Note Failure to upgrade the affected Cisco IOS images may result in network downtime.

The terms and conditions that governed your rights and obligations and those of Cisco with respect to the deferred images will apply to the replacement images.

Important Notes for Cisco IOS Release 12.2(11)T3

The following information applies to Cisco IOS Release 12.2(11)T3.

Cisco IAD2420 Images Deferred Because of Caveat CSCdz62759

Two images in Cisco IOS Release 12.2(11)T3 were deferred because of severe defects. These defects have been assigned Cisco caveat ID CSCdz62759. This caveat affects the following images:

- c2420-a2i8sv5-mz
- c2420-a2i8k8sv5-mz

With caveat CSCdz62759, no ring-back tone when making hairpin calls between ports. The software solution for these deferred images is Cisco IOS Release 12.2(11)T4.

To increase network availability, Cisco recommends that you upgrade affected Cisco IOS images with the suggested replacement software images. Cisco will discontinue manufacturing shipment of affected Cisco IOS images. Any pending order will be substituted by the replacement software images.

Note Failure to upgrade the affected Cisco IOS images may result in network downtime.

The terms and conditions that governed your rights and obligations and those of Cisco with respect to the deferred images will apply to the replacement images.

Important Notes for Cisco IOS Release 12.2(11)T2

The following information applies to Cisco IOS Release 12.2(11)T2.

Update to the mgcp fax t38 Command

Some Media Gateway Control Protocol (MGCP) call agents do not properly pass those portions of Session Description Protocol (SDP) messages that advertise T.38 and named service event (NSE) capabilities. As a result, gateways that are controlled by these call agents are unable to use NSEs to signal T.38 fax relay to other gateways that use NSEs. The new syntax for the **mgcp fax t38** command provides a way to enable gateway-controlled T.38 fax relay between an MGCP gateway and another gateway even if the capability to use T.38 and NSEs cannot be negotiated by the MGCP call agent at call setup time. The other gateway can be H.323, Session Initiation Protocol (SIP), or MGCP.

Important Notes for Cisco IOS Release 12.2(11)T

The following information applies to Cisco IOS Release 12.2(11)T.

Cisco Catalyst 4000 Access Gateway Module Images Deferred Because of Caveat CSCdy17203

Cisco Catalyst 4000 Access Gateway Module images were deferred in Cisco IOS Release 12.2(11)T because of a severe defect. This defect has been assigned Cisco caveat ID CSCdy17203. This caveat affects the following images:

- c4gwy-io3s-mz
- c4gwy-ik8o3s-mz
- c4gwy-ik9o3s-mz
- c4gwy-io3sx3-mz
- c4gwy-ik8o3sx3-mz
- c4gwy-ik9o3sx3-mz

With caveat CSCdy17203, a Cisco Catalyst 4000 Gateway Module may experience failure to reboot. The software solution for these deferred images is Cisco IOS Release 12.2(11)T1.

To increase network availability, Cisco recommends that you upgrade affected Cisco IOS images with the suggested replacement software images. Cisco will discontinue manufacturing shipment of affected Cisco IOS images. Any pending order will be substituted by the replacement software images.

Note Failure to upgrade the affected Cisco IOS images may result in network downtime.

The terms and conditions that governed your rights and obligations and those of Cisco with respect to the deferred images will apply to the replacement images.

Cisco H.235 Accounting and Security Enhancements for Cisco Gateways

With the Cisco H.235 Accounting and Security Enhancements for Cisco Gateways feature, Cisco H.323 gateways support three levels of authentication:

- Endpoint—The Registration, Admission, and Status (RAS) channel used for gateway-to-gatekeeper signaling is not a secure channel. To ensure secure communication, H.235 allows gateways to include an authentication key in their RAS messages. This key is used by the gatekeeper to authenticate the source of the messages. At the endpoint level, validation is performed on all messages from the gateway. The cryptoTokens are validated using the password configured for the gateway.
- Per-Call—When the gateway receives a call over the telephony leg, it prompts the user for an account number and personal identification number (PIN). A separate authentication, authorization, and accounting (AAA) RADIUS server is needed for the accounting and authentication process. See *Prepaid Distributed Calling Card Via Packet Telephony* for more information. These two numbers are included in certain RAS messages sent from the endpoint and are used to authenticate the originator of the call.
- All—This option is a combination of the other two. With this option, the validation of cryptoTokens in automatic repeat request (ARQ) messages is based on an the account number and PIN of the user making a call and the validation of cryptoTokens sent in all the other RAS messages is based on the password configured for the gateway.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_serv/as5800/sw_conf/ios_122/pul0242x.htm.

Note This feature was originally introduced in Cisco IOS Release 12.0(7)T on the Cisco 2600 series, the Cisco 3600 series, and the Cisco 7200 series routers, and the Cisco MC3810, Cisco AS5300, and Cisco AS5800 platforms. This release is porting the feature into the Cisco AS5350 and Cisco AS5400 platforms.

Detecting Carrier Sense Errors on the Cisco uBR905 and Cisco uBR925 Cable Access Routers

The Cisco uBR905 and Cisco uBR925 cable access routers cannot detect carrier sense errors on the four Ethernet ports that connect the router to the subscriber's local area network. This is because the four Ethernet ports are provided by an internal hub that always provides a carrier sense signal to the Cisco IOS software, even if no Ethernet devices are connected to the external ports.

In particular, this means that the dot3StatsCarrierSenseErrors attribute in ETHERLIKE-MIB (RFC 2665) will never indicate any drops in carrier of the Ethernet interface.

Dialing Number Enhancement

The Dialing Number Enhancement feature removes previous restrictions on the number of dialed digits accepted as a valid telephone number in the Called Party number information element (IE) by an interface configured for the National or International numbering types.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftdilnme.htm

Displaying Alarm Settings on the Cisco AS5800

The **show vrm vdevices** command displays detailed information for digital signal processors (DSPs) or a brief summary for all voice feature cards (VFCs). The display provides information such as the following: the number of channels, channels per DSP, bitmap of digital signal processor modules (DSPMs), DSP alarm statistics, and version numbers. This information is useful in monitoring the current state of the VFCs on a Cisco AS5800 Universal Access Server. In Cisco IOS Release 12.2(11)T, the **alarms** keyword and *vfc-slot-number-for-alarms* argument have been added for the **show vrm vdevices** command.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft_svv.htm.

Fine-Grain Address Segmentation in Dial Peers

The Fine-Grain Address Segmentation in Dial Peers feature applies to dial plans in universal gateways that use universal ports to handle simultaneous voice and modem calls. It enables you to indicate any numbers within the range that the peer normally handles that should be rejected because they go to modems.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/fx_dpsgw.htm.

Gatekeeper Alias Registration and Address Resolution Enhancements

The Gatekeeper Alias Registration and Address Resolution Enhancements feature allows you to configure multiple prefixes for a local zone and register an endpoint belonging to multiple zone prefixes. With this feature, gatekeepers can accept a registration request (RRQ) message that has multiple E.164 aliases that use different prefixes.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftgkar.htm.

MICA and NextPort Modem Tech-Support Commands for the AS5xxx Platforms

New **show tech-support** modem and **show tech-support spe** commands are useful to the Cisco customer and Cisco customer support personnel alike. For example, when quality assurance technicians gather troubleshooting information, rather than typing in a series of commands, the technicians can simply add the output of the **show tech-support** modem and **show tech-support spe** commands to their report. Development engineers can then have a consistent output to look at when troubleshooting problems.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftmodsho.htm.

OSP Client Performance Improvement

The **url** command change for the OSP Client Performance Improvement feature is a minor modification in the way that the settlement providers are configured. As a result of minimum command-line interface (CLI) change in the architecture, the Open Settlement Protocol (OSP) process must be shut down before any URL change is performed.

RADIUS Debug Enhancements

The RADIUS Debug Enhancements feature provides enhanced RADIUS output. RADIUS is a distributed client/server system that secures networks against unauthorized access. In the Cisco implementation, RADIUS clients run on Cisco routers and send authentication requests to a central RADIUS server that contains all user authentication and network service access information.

The new feature provides enhanced RADIUS output display including the following:

- Packet dump in a more readable, user-friendly ASCII format than before
- Nontruncated display of attribute values
- Ability to select an abbreviated RADIUS **debug** output display

There is one modified command: **debug radius**—displays information associated with RADIUS in enhanced formats.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftdebug.htm.

SIP Media Inactivity Timer

The SIP Media Inactivity Timer feature enables Cisco gateways to monitor and disconnect Voice over IP (VoIP) calls if no Real-Time Control Protocol (RTCP) packets are received within a configurable time period.

When RTCP reports are not received by a Cisco gateway, the SIP Media Inactivity Timer feature releases the hung session and its network resources in an orderly manner. These network resources include the gateway digital signal processor (DSP) and time-division multiplexing (TDM) channel resources that are utilized by the hung sessions. Because call signaling is sent to tear down the call, any stateful Session Initiation Protocol (SIP) proxies involved in the call are also notified to clear the state that they have associated with the hung session. The call is also cleared back through the TDM port so that any attached TDM switching equipment also clears its resources.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftsiprtp.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release ports the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, and Cisco AS5850 platforms.

SS7 Interconnect to Lucent 1AESS Switches

The Lucent 1AESS local exchange telephone switching system was widely deployed in the 1970s across what was then the Bell System. During the past two decades, most 1AESS switches have been replaced by the next-generation digital switches, such as the Lucent 5ESS and Nortel DMS-100. While few 1AESSs remain, those still in service are generally heavily built out—about 2 to 5 percent of lines are on 1AESS switches.

Service providers that offer wholesale dial, Internet/intranet, and access Virtual Private Networks (VPNs) require remote access and expect to provide widely available service at the lowest cost. To do so, they must have Signaling System 7 (SS7) trunks to each local exchange in a service area. And for the Internet service provider (ISP) or competitive local exchange carrier (CLEC) that wants 100 percent dial coverage, interfacing to the remaining 1AESSs is mandatory.

Using SS7 signaling avoids investment in central office circuit switches, which must be used as concentration points for dial-in traffic to the access servers when ISDN PRI or in-band trunk signaling is used.

This feature provides 1AESS support for the Cisco AS5400. The configuration is on a T1 basis: one or several T1 lines are designated to support 1AESS, but no fractional T1s (FT1s) can be configured.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xa/122xa_2/ft1aessv.htm.

T1 CAS for VoIP

The T1 CAS for VoIP feature adds support for T1 channel-associated signaling (CAS) and limited support for E1 R2 signaling to the Cisco AS5800 and Cisco AS5850 with the Voice Feature Card (VFC).

CAS is the transmission of signaling information within the voice channel. Various types of CAS signaling are available in the T1 world. The most common forms of CAS signaling are loop-start, ground-start, and recEive and transMit (E&M). The biggest disadvantage of CAS signaling is its use of user bandwidth to perform signaling functions. CAS signaling is often referred to as robbed-bit-signaling because user bandwidth is being "robbed" by the network for other purposes. In addition to receiving and placing calls, CAS signaling also processes the receipt of Dialed Number Identification System (DNIS) and automatic number identification (ANI) information, which is used to support authentication and other functions.

T1 CAS capabilities have been implemented on the Cisco AS5800 and Cisco AS5850 VFC to enhance and integrate T1 CAS capabilities on common central office (CO) and PBX configurations for voice calls. The service provider application for T1 CAS includes connectivity to the public network using T1 CAS from the Cisco AS5800 or Cisco AS5850 to the end office switch. In this configuration, the Cisco AS5800 or Cisco AS5850 captures the dialed-number or called-party-number information and passes it along to the upper-level applications for interactive voice response (IVR) script selection, modem pooling, and other applications. Service providers also require access to calling party number, ANI, for user identification, for the billing account number, and in the future, for more complicated call routing.

Service providers who implement Voice over IP (VoIP) include traditional voice carriers, new voice and data carriers, and existing Internet service providers. Some of these service providers might use subscriber side lines for their VoIP connectivity to the Public Switched Telephone Network (PSTN); others will use tandem-type service provider connections.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_serv/as5800/sw_conf/ios_122/ft_t1eas.htm.

Important Notes for Cisco IOS Release 12.2(8)T2

The following information applies to Cisco IOS Release 12.2(8)T2.

Use 12.2(8)T1 Version of c7200-kboot-mz Image

For Cisco IOS Release 12.2(8)T2, please use the c7200-kboot-mz image from Cisco IOS Release 12.2(8)T1. This image is available on Cisco.com.

Important Notes for Cisco IOS Release 12.2(8)T1

The following information applies to Cisco IOS Release 12.2(8)T1.

ATM OC-3 Network Modules

The ATM OC-3 Network Modules are not currently supported on the Cisco 2691, Cisco 3725, and Cisco 3745 platforms.

Cisco IGX 8400 Series URM Images Deferred Because of Caveat CSCdx41149

Three images in Cisco IOS Release 12.2(8)T1 were deferred because of a severe defect. This defect has been assigned Cisco caveat ID CSCdx41149. This caveat affects the following images:

- urm-is-mz
- urm-jk9s-mz
- urm-js-mz

With caveat CSCdx41149, a CiscoIGX84 series URM may experience an IPC failure. The software solution for these deferred images is Cisco IOS Release 12.2(8)T4.

To increase network availability, Cisco recommends that you upgrade affected Cisco IOS images with the suggested replacement software images. Cisco will discontinue manufacturing shipment of affected Cisco IOS images. Any pending order will be substituted by the replacement software images.

Note Failure to upgrade the affected Cisco IOS images may result in network downtime.

The terms and conditions that governed your rights and obligations and those of Cisco with respect to the deferred images will apply to the replacement images.

Cisco 7200 Series Router Limitation

The maximum number of Modular QoS CLI (MQC) Quality of Service (QoS) policy maps on a Cisco 7200 series router is limited to 256.

Important Notes for Cisco IOS Release 12.2(8)T

The following information applies to Cisco IOS Release 12.2(8)T.

Changes to Feature Support with Cisco IOS Release 12.2(8)T

Starting with Cisco IOS Release 12.2(8)T, the following features are removed from all features and feature sets for the Cisco 2600 series, Cisco 3640, and Cisco 3660 platforms:

- LAN Extension
- Combinet Packet Protocol (CPP)
- HP Probe Protocol
- Exterior Gateway Protocol (EGP)
- IPX Netware Link State Protocol (NLSP)
- IPX Next Hop Routing Protocol (NHRP)
- XREMOTE
- Decnet Phase IV
- Banyan Virtual Integrated Network Service (VINES)
- Apollo Domain
- Xerox Network System (XNS)
- Wireless Point-to-Multipoint

Starting with Cisco IOS Release 12.2(8)T, the following features are removed or support is not included on all feature sets for the Cisco 3620:

- LAN Extension
- Combinet Packet Protocol (CPP)
- HP Probe Protocol
- Exterior Gateway Protocol (EGP)
- IPX Netware Link State Protocol (NLSP)
- IPX Next Hop Routing Protocol (NHRP)
- XREMOTE
- ATM LAN Emulation (LANE)
- Multiprotocol over ATM (MPOA)
- Decnet Phase IV
- Banyan Virtual Integrated Network Service (VINES)
- Apollo Domain
- Xerox Network System (XNS)
- Wireless Point-to-Multipoint
- Support for High Density Analog and Fax Network Modules (NM-HDA)

Starting with Cisco IOS Release 12.2(8)T, the following features were removed from all "IP Plus" images and incorporated into the "Enterprise Plus" images on the Cisco 2600 only:

- ATM LAN Emulation (LANE)
- Multiprotocol over ATM (MPOA)

Cisco IGX 8400 Series URM Images Deferred Because of Caveat CSCdx41149

Three images in Cisco IOS Release 12.2(8)T were deferred because of a severe defect. This defect has been assigned Cisco caveat ID CSCdx41149. This caveat affects the following images:

- urm-is-mz
- urm-jk9s-mz
- urm-js-mz

With caveat CSCdx41149, a CiscoIGX84 series URM may experience an IPC failure. The software solution for these deferred images is Cisco IOS Release 12.2(8)T4.

To increase network availability, Cisco recommends that you upgrade affected Cisco IOS images with the suggested replacement software images. Cisco will discontinue manufacturing shipment of affected Cisco IOS images. Any pending order will be substituted by the replacement software images.

Note Failure to upgrade the affected Cisco IOS images may result in network downtime.

The terms and conditions that governed your rights and obligations and those of Cisco with respect to the deferred images will apply to the replacement images.

Enhanced Gigabit Ethernet Interface Processor Support on Cisco 7500/RSP Series

The Enhanced Gigabit Ethernet Interface Processor (GEIP+) is a single-port interface processor that, when combined with the appropriate optical fiber cable and a Gigabit Interface Converter (GBIC), provides one Gigabit Ethernet (GE) interface that is compliant with the IEEE 802.3z specification. The GE interface on aGEIP+ operates in full-duplex mode.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/core/cis7505/vip1/vip4/10699dwg/index.htm.

HSRP Restructure

The output of the **show standby** command has been revised, making the output clearer and easier to use.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/fthsrp.htm.

MPLS Defects in Cisco IOS Release 12.2(8)T

Because of the following caveats, it is recommended that you do not enable MPLS and/or Tag Switching on Cisco IOS Release 12.2(8)T. There are no workarounds. You can use the current version of the software release or wait until the next renumber build.

- CSCdw47263 (MPLS)
- CSCdw54940 (MPLS)
- CSCdw59938 (MPLS)
- CSCdw64740 (MPLS)
- CSCdw67208 (MPLS)
- CSCdw67882 (MPLS)
- CSCdw66983 (RPM)
- CSCdw69707 (RPM)

Feature module documentation for new MPLS features that appear in Cisco IOS Release 12.2(8)T are not supported due to the above-listed caveats.

Refer to the Field Notice at the following location for additional information:

http://www.cisco.com/warp/customer/770/fn18286.shtml.

SIP Media Inactivity Timer

The SIP Media Inactivity Timer feature enables Cisco gateways to monitor and disconnect Voice over IP (VoIP) calls if no Real-Time Control Protocol (RTCP) packets are received within a configurable time period.

When RTCP reports are not received by a Cisco gateway, the SIP Media Inactivity Timer feature releases the hung session and its network resources in an orderly manner. These network resources include the gateway digital signal processor (DSP) and time-division multiplexing (TDM) channel resources that are utilized by the hung sessions. Because call signaling is sent to tear down the call, any stateful Session Initiation Protocol (SIP) proxies involved in the call are also notified to clear the state that they have associated with the hung session. The call is also cleared back through the TDM port so that any attached TDM switching equipment also clears its resources.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftsiprtp.htm.

Important Notes for Cisco IOS Release 12.2(4)T

The following information applies to Cisco IOS Release 12.2(4)T.

Cisco 7500 Series Images Deferred Because of Caveat CSCdu01272

Twenty images in Cisco IOS Release 12.2(4)T were deferred because of a severe defect. This defect has been assigned Cisco caveat ID CSCdu01272. This caveat affects the following images:

- rsp-a3jk8sv-mz
- rsp-a3jk9sv-mz

- rsp-a3jsv-mz
- rsp-dk8o3sv-mz
- rsp-dk8sv-mz
- rsp-dk9o3sv-mz
- rsp-do3sv-mz
- rsp-dsv-mz
- rsp-ik8o3sv-mz
- rsp-ik8sv-mz
- rsp-ik9o3sv-mz
- rsp-ik9sv-mz
- rsp-io3sv-mz
- rsp-isv-mz
- rsp-jk8o3sv-mz
- rsp-jk8sv-mz
- rsp-jk9o3sv-mz
- rsp-jk9sv-mz
- rsp-jo3sv-mz
- rsp-jsv-mz

With caveat CSCdu01272, a Cisco 7500 series with a PA-MC-T3 port adapter may experience a Versatile Interface Processor (VIP) reload. The software solution for these deferred images is Cisco IOS Release 12.2(2)T1, which is available on Cisco.com.

To increase network availability, Cisco recommends that you upgrade affected Cisco IOS images with the suggested replacement software images. Cisco will discontinue manufacturing shipment of affected Cisco IOS images. Any pending order will be substituted by the replacement software images.

Note Failure to upgrade the affected Cisco IOS images may result in network downtime.

The terms and conditions that governed your rights and obligations and those of Cisco with respect to the deferred images will apply to the replacement images.

Cisco 15104 Optical Networking System Image Deferred

The regen-i6-mz image for the Cisco 15104 Optical Networking System has been deferred in Cisco IOS Release 12.2(4)T.

MPLS VPN with TE and MPLS InterAS Advisory on Cisco IOS Software

Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) functionality is compromised for the following platforms in Cisco IOS Release 12.2(4)T:

- Cisco 3660 series and 3640 series
- Cisco 7200 series and 7500 series

- Cisco UBR7000 series
- Cisco RPM series

Refer to the advisory notice at the following location:

http://www-tac.cisco.com/Support_Library/field_alerts/fn15911.html.

Important Notes for Cisco IOS Release 12.2(2)T

The following information applies to Cisco IOS Release 12.2(2)T.

Addition of the squeeze Command for Cisco 2600 and Cisco 3600 Series Routers

The **squeeze** command, which is used to erase all files marked for deletion on a Flash file system, is now available on Cisco 2600 and Cisco 3600 series routers.

Changes to the output attenuation Command

In Cisco IOS Release 12.2(2), the range of the **output attenuation** command for voice ports has changed from *0–14* to *–6–14*.

Cisco 820 and SOHO 70 Router Images Deferred Because of Caveat CSCds69577

Six images in Cisco IOS Release 12.2(2)T and 12.2(2)T1 were deferred because of a severe defect. This defect has been assigned Cisco caveat ID CSCds69577. This caveat affects the following images:

- c820-k8osv6y6-mz
- c820-k8osy6-mz
- c820-nsv6y6-mz
- c820-v6y6-mz
- c820-y6-mz
- soho70-y1-mz

With caveat CSCds69577, connectivity to some web sites is lost when the router terminates PPP over Ethernet. The software solution for these deferred images is Cisco IOS Release 12.2(1)XD1, which is available on Cisco.com.

To increase network availability, Cisco recommends that you upgrade affected Cisco IOS images with the suggested replacement software images. Cisco will discontinue manufacturing shipment of affected Cisco IOS images. Any pending order will be substituted by the replacement software images.

Note Failure to upgrade the affected Cisco IOS images may result in network downtime.

The terms and conditions that governed your rights and obligations and those of Cisco with respect to the deferred images will apply to the replacement images.

Cisco Catalyst 4000 Gateway Images Deferred Because of Caveats CSCdu59093 and CSCdu63022

Three images in Cisco IOS Release 12.2(2)T and 12.2(2)T1 were deferred because of severe defects. These defects have been assigned Cisco caveat ID CSCdu59093 and CSCdu63022. These caveats affect the following images:

- c4gwy-cboot-mz
- c4gwy-io3s-mz
- c4gwy-io3sx3-mz

With caveat CSCdu59093, a Catalyst 4000 Gateway may reload when a conference call is made. With caveat CSCdu63022, a Cisco Catalyst 4000 Gateway may not be able to be used as a conference bridge. The software solution for these deferred images is Cisco IOS Release 12.1(5)T9, which is available on Cisco.com.

To increase network availability, Cisco recommends that you upgrade affected Cisco IOS images with the suggested replacement software images. Cisco will discontinue manufacturing shipment of affected Cisco IOS images. Any pending order will be substituted by the replacement software images.

Note Failure to upgrade the affected Cisco IOS images may result in network downtime.

The terms and conditions that governed your rights and obligations and those of Cisco with respect to the deferred images will apply to the replacement images.

Caveats for Cisco IOS Release 12.2 T

Caveats describe unexpected behavior in Cisco IOS software releases. Severity 1 caveats are the most serious caveats; severity 2 caveats are less serious. Severity 3 caveats are moderate caveats, and only select severity 3 caveats are included in the caveats document.

For information on caveats in Cisco IOS Release 12.2 T, refer to the *Caveats for Cisco IOS Release 12.2 T* document, which lists severity 1 and 2 caveats and select severity 3 caveats for Cisco IOS Release 12.2 T and is located on Cisco.com and the Documentation CD-ROM.

Note If you have an account with Cisco.com, you can use the Bug Toolkit to find caveats of any severity for any release. To reach the Bug Toolkit, log in to Cisco.com and click **Service & Support**: **Software Center**: **Cisco IOS Software**: **BUG TOOLKIT**. Another option is to go to http://www.cisco.com/cgi-bin/Support/Bugtool/launch_bugtool.pl.

individual host that is joined to a particular group or channel. The main benefits are that this feature provides minimal leave latencies, faster channel changing, and improved diagnostics capabilities for IGMP.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_xtrk.htm.

IKE—Initiate Aggressive Mode

The IKE—Initiate Aggressive Mode feature allows you to specify RADIUS Tunnel attributes (Tunnel-Client-Endpoint [66] and Tunnel-Password [69]) for an IPSec peer and to initiate an IKE aggressive mode negotiation with the tunnel attributes. This feature is best implemented in a crypto hub-and-spoke scenario, in which the spokes initiate IKE aggressive mode negotiation with the hub by using the preshared keys that are specified as tunnel attributes and stored on the AAA server. This scenario is scalable because the preshared keys are kept at a central repository (the AAA server) and more than one hub router and one application can use the information.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_ikeag.htm.

Integrated IS-IS Point-to-Point Adjacency Over Broadcast Media

When a network consists of only two networking devices that are connected to broadcast media and using the integrated IS-IS protocol, it is better for the system not to have to handle the link as a broadcast link but rather as a point-to-point link. The Integrated IS-IS Point-to-Point Adjacency Over Broadcast Media feature introduces a new command to make IS-IS behave as a point-to-point link between the networking devices.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftissp2p.htm.

Integrated IS-IS Support for IPv6

IPv6 supports Interior Gateway Protocols (IGPs) and Exterior Gateway Protocols (EGPs). Routing Information Protocol (RIP) and Integrated Intermediate System-to-Intermediate System (IS-IS) protocols are the supported IGPs for IPv6. Multiprotocol Border Gateway Protocol (BGP) is the supported EGP for IPv6.

IS-IS in IPv6 functions the same as and offers many of the same benefits as IS-IS in IPv4. IPv6 enhancements to IS-IS allow IS-IS to advertise IPv6 prefixes in addition to IPv4 and Open System Interconnection (OSI) routes. Extensions to the IS-IS CLI allow configuration of IPv6-specific parameters. IS-IS in IPv6 extends the address families supported by IS-IS to include IPv6, in addition to OSI and IPv4.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ipv6/ftipv6s.htm.

Interactive Voice Response Version 2.0 on VoIP Gateways

Interactive Voice Response (IVR) consists of simple voice prompting and digit collection to gather caller information for authenticating the user and identifying the destination. IVR applications can be assigned to specific ports or invoked on the basis of dialed number identification service (DNIS). An IP Public Switched Telephone Network (PSTN) gateway can have several IVR applications to accommodate many different gateway services, and you can customize the IVR applications to present different interfaces to the various callers.

IVR systems provide information in the form of recorded messages over telephone lines in response to user input in the form of spoken words, or more commonly, dual tone multifrequency (DTMF) signaling. IVR uses Tool Command Language (TCL) scripts to gather information and to process accounting and billing.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_ivr72.htm.

IP-FORWARDING-TABLE-MIB

This release introduces support for the new IP-FORWARD-MIB (IP Forwarding Table MIB). The current version of the IP Forwarding Table MIB is defined in RFC 2096. (RFC 2096 replaces RFC 1354.) The Cisco implementation of this MIB does not support the ipCiderRouteNextHopAS object. Additionally, all entries for the ipCidrRouteTos object (the IP Type-of-Service field) remain set to zero, which indicates a default TOS policy.

For details, refer to the IP-FORWARD-MIB.my file, available through the Cisco MIB FTP site at the following URL:

ftp://ftp.cisco.com/pub/mibs/v2/.

IP Multicast MIB Enhancements

The IP Multicast MIB Enhancements feature enhances the IP multicast routing protocol in Cisco IOS software by adding MIB variables to query the number of (S, G) and (*, G) entries. It also adds support for high-speed interface counters.

IPSec VPN High Availability Enhancements

The IPSec VPN High Availability feature consists of two new features—Reverse Route Injection and Hot Standby Router Protocol and IPSec—that work together to provide users with a simplified network design for VPNs and reduced configuration complexity on remote peers with respect to defining gateway lists.

Reverse Route Injection

Reverse Route Injection (RRI) is a feature designed to simplify network design for Virtual Private Network (VPNs) in which there is a requirement for redundancy or load balancing. RRI works with both dynamic and static crypto maps.

In the dynamic case, as remote peers establish IPSec security associations (SAs) with an RRI-enabled router, a static route is created for each subnet or host protected by that remote peer. For static crypto maps, a static route is created for each destination of an extended access-list rule.

HP Factory Express	*Factory Installation, Racking, and Customization Services*	
	Factory Express Server Configuration Level 1	293355-888
	NOTE: Free Installation of HP Options - Installation of HP Options memory, NICs, hard drives, controllers, processors, I/O cords, pre-install standard OEM OS image, and tape drives. Installation fees will apply to all non-HP certified hardware and asset tags. NOTE: Available on ProLiant ML370 G3 Rack Models Only.	
	Factory Express Server Configuration Level 2	266326-888
	NOTE: Includes Level 1 Customer Intent of a ProLiant server and options configuration, OS installation, custom image download, IP addressing, network setting, and custom packaging. Customer unique requirements (quick restore creation, cd duplication, test reports, real-time reporting of server MAC address, password, and RILOE). Customer access, validation and control through VPN (price/server). NOTE: Available on ProLiant ML370 G3 Rack Models Only.	
	Factory Express Rack Integration Level 3 with 1 - 3 servers or storage enclosures	325736-888
	Factory Express Rack Integration Level 3 with 4 - 9 servers or storage enclosures	232539-888
	Factory Express Rack Integration Level 3 with 10 or more servers or storage enclosures	325735-888
	NOTE: Includes Level 1 Customer Intent for standard mounted servers and storage units plus standard cable mgmt, RAID configuration, servers & storage, power distribution, networking gear and accessories (price/ra520ck). NOTE: Available on ProLiant ML370 G3 Rack Models Only.	
	Factory Express Rack Integration Level 4 with 1 - 3 servers or storage enclosures	325734-888
	Factory Express Rack Integration Level 4 with 4 - 9 servers or storage enclosures	232540-888
	Factory Express Rack Integration Level 4 with 10 or more servers or storage enclosures	325733-888
	NOTE: Includes Level 2 Customer Intent plus customer defined cable management and naming convention, customer furnished image download, IP addressing, cluster configurations (SQL, External storage RAID). Quick restore creation, cd duplication, test reports, real-time reporting of server MAC address, password, RILOE). Customer access and validation through VPN (price/rack). NOTE: Available on ProLiant ML370 G3 Rack Models Only.	
	Factory Express Rack Integration Level 5 with 1 - 3 servers or storage enclosures	325732-888
	Factory Express Rack Integration Level 5 with 4 - 9 servers or storage enclosures	232541-888
	Factory Express Rack Integration Level 5 with 10 or more servers or storage enclosures	325731-888
	NOTE: Includes Level 4 Customer Intent plus Custom SW layering and extended test, Customer access, validation and control through VPN, Clustered racks with networking gear and/or external storage array, Start-up installation services custom quote. (price/rack). NOTE: Factory Express Engineered Solution Level 6 is a custom solutions available through Factory Express. Please contact a your local reseller or Account Manager. NOTE: Available on ProLiant ML370 G3 Rack Models Only.	
Service and Support Offerings (HP Care Pack Services)	*Hardware Services On-site Service*

Memory

HP ProLiant ML350 G3 Array Models

The ML350 G3 supports both interleaved and non-interleaved memory configurations. Array models ship standard with one 512MB DIMM, non-interleaved. Far best performance automatically invoke interleaving by populating memory in identical pairs. Interleaving memory and installing in pairs is not required. Add any combination of memory DIMMs to operate in non-interleaved mode.

Standard Memory

512MB (expandable to 8GB) of 2-way interleaving capable PC2100 DDR SDRAM running at 200MHz on 400MHz models or 266MHz on 533MHz models, with Advanced ECC capabilities (1x 512MB)

NOTE: Advanced ECC Memory - ECC protection provides the ability to detect and correct single bit memory errors while Advanced ECC extends this coverage to include protection against multiple simultaneous errors on a DIMM. Advanced ECC detects and corrects 4bit memory errors that occur within a single DRAM chip on a DIMM. Advanced ECC algorithms work in combination with industry standard ECC DIMMS.

Standard Memory Plus Optional Memory

Up to 6.7 GB of total memory can be implemented with the installation of three optional PC2100-MHz Registered ECC DDR SDRAM DIMMs.

Standard Memory Replaced with Optional Memory

Up to 8.2 GB of total memory can be implemented with the removal of the standard 512-MB DIMM and the optional installation of PC2100-MHz Registered ECC DDR SDRAM DIMMs.

NOTE: Charts do not represent all possible memory configurations.

		Slot 1	Slot 2	Slot 3	Slot 4
Standard	512 MB	512 MB	Empty	Empty	Empty
Optional	6656 MB	512 MB	2048 MB	2048 MB	2048 MB
Maximum	8192 MB	2048 MB	2048 MB	2048 MB	2048 MB
2x1 Interleaved Memory (Recommended)		Pair 1		Pair 2	
	Total Memory	Slot 1	Slot 2	Slot 3	Slot 4
Recommended Configurations for Array Models	1 GB	512 MB	512 MB	Empty	Empty
	1.5 GB	512 MB	512 MB	256 MB	256 MB
	2 GB	512 MB	512 MB	512 MB	512 MB

Following are memory options available from HP:

● 128MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 128 MB)	287494-B21
● 256MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 256 MB)	287495-B21
● 512MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 512 MB)	287496-B21
NOTE: To invoke interleaving in your array model, order this kit for a total of 1-GB of interleaved memory.	
● 1024MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 1024 MB)	287497-B21
● 2048MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 2048 MB)	301044-B21

Memory

HP ProLiant ML350 G3 Non-Array Models
The ML350 G3 supports both interleoved and non-interleaved memory configurations. Base models ship standard with one 256MB DIMM, non-interleaved. For best performance automatically invoke interleaving by populating memory in identical pairs. Interleaving memory ond installing in pairs is not required. Add ony combination of memory DIMMs to operate in non-interleaved mode.

Standard Memory
256MB (expandable to 8GB) of 2-way interleaving capable PC2100 DDR SDRAM running at 200MHz on 400MHz models or 266MHz on 533MHz models with Advanced ECC capabilities (1x 256MB)

NOTE: Advanced ECC Memory - ECC protection provides the ability to detect and correct single bit memory errors while Advanced ECC extends this coverage to include protection against multiple simultoneous errors on a DIMM. Advanced ECC detects and corrects 4bit memory errors that occur within a single DRAM chip on a DIMM. Advanced ECC algorithms work in combination with industry standard ECC DIMMS.

Standard Memory Plus Optional Memory
Up to 6.4 GB optional memory is available with the installation of PC2100-MHz Registered ECC DDR SDRAM DIMMs.

Standard Memory Replaced with Optional Memory
Up to 8.2 GB of memory is available with the removal of the standard 256-MB of memory and the optional installation of PC2100-MHz Registered ECC DDR SDRAM DIMM installed.

NOTE: Charts do not represent all possible memory configurations

Memory					
		Slot 1	Slot 2	Slot 3	Slot 4
Standard	256 MB	256 MB	Empty	Empty	Empty
Optional	6400 MB	256 MB	2048 MB	2048 MB	2048 MB

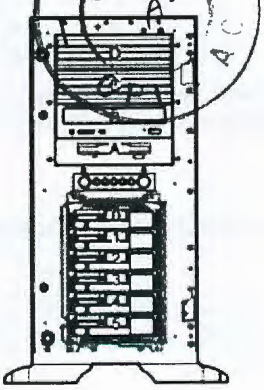
Following are memory options available from HP:

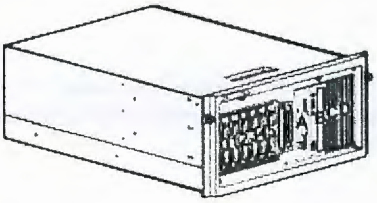
● 128MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 128 MB)	287494-B21
● 256MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 256 MB)	287495-B21

NOTE: To invoke interleaving in your base model, order this kit for a total of 512MB of interleaved memory.

● 512MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 512 MB)	287496-B21
● 1024MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 1024 MB)	287497-B21
● 2048MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (1 x 2048 MB)	301044-B21

Storage





0 - 5	6 x 1 in SCSI Hard Drive Bays
A	3.5 in Diskette Drive
B	48x CD-ROM
C, D	Available half height bay

1.44-MB Diskette Drive	LED Indicators (front panel)	Green	
	Read/Write Capacity per Diskette (high/low density)	1.44 MB/720 KB	
	Drive Supported	One	
	Drive Height	One-third	
	Drive Rotation	300 rpm	
	Transfer Rate (high/low)	500 K/250 K bits/s	
	Bytes/Sector	512	
	Sectors/Track (high/low)	18/9	
	Tracks/Side (high/low)	80/80	
	Access Times	Track-to-Track (high/low)	3/6 ms
		Average (high/low)	169/94 ms
		Settling Time	15 ms
		Latency Average	100 ms
	Cylinders (high/low)	80/80	
	Read/Write Heads	Two	

48X Max IDE (ATAPI) CD-ROM Drive	Disk	Applicable Disk	CD-ROM, CD-XA, CD-DA (Mode 1, Mode 2, Form 1 and 2) Photo CD (Single and Multi-session) Mixed Mode (Audio and Data combined) CD-R
		Capacity	540 MB (Mode 1, 12 cm) 650 MB (Mode 2, 12 cm)
	Block Size	Mode 1	2,048 bytes
		Mode 2	2,340 bytes, 2,336 bytes
		CD-DA	2,352 bytes
		CD-XA	2,328 bytes
	Interface	IDE (ATAPI)	
	Access Times (typical)	Random	<100 ms
		Full-Stroke	<150 ms
	Data Transfer Rate	Sustained	3000 to 7200 KB/s (20X to 48X)
		Burst	150 KBps to 7,200 KBps
		Bus Rate	16.7 MBps
	Cache Buffer	128 KB	
	Start-up Time (typical)	< 7seconds	
	Stop Time	< 4seconds	
	Laser Parameters	Type	Semiconductor Laser GaA1As
		Wave Length	780 ± 25 nm
	Operating Conditions	Temperature	41° to 113° F (5° to 45° C)
		Humidity	10% to 80%
	Dimensions	(HxWxD, maximum)	1.7 x 5.85 x 8.11 in (4.29 x 14.86 x 20.60 cm)
		Weight	2.09 lb (0.95 kg)

NC7760 PCI Gigabit Server Adapter (embedded)	Network Interface	10Base-T/100Base-TX/1000Base-TX	
	Compatibility	IEEE 802.3 10Base-T IEEE 802.3ab 1000Base-T IEEE 80.3u 100Base-TX	
	Data Transfer Method	32-bit bus-master PCI	
	Network Transfer Rate	10Base-T(Half-Duplex)	10 Mb/s
		10Base-T(Full-Duplex)	20 Mb/s
		100Base-TX(Half-Duplex)	100 Mb/s
		100Base-TX(Full-Duplex)	200 Mb/s
		1000Base-TX	1000Mb/s
	Connector	RJ-45	
	Cable Support	10Base-T	Categories 3, 4 or 5 UTP; up to 328 ft (100 m)
		10/100/1000Base-TX	Category 5 UTP; up to 328 ft (100 m)

TechSpecs

Integrated Dual Channel Wide Ultra3 SCSI Adapter	Drives Supported	Up to 28 SCSI devices (14 per channel)
	Data Transfer Method	64-bit PCI bus-master
	SCSI Channel Transfer Rate	80 MB/s per channel
	Maximum Transfer Rate per PCI Bus (peak)	133 MB/s per channel
	SCSI Protocols	Wide Ultra2 SCSI Wide-Ultra SCSI-3 Fast SCSI-2
	Electrical Protocol	Low Voltage Differential (LVD)
	SCSI Termination	Active Termination
	External SCSI Connectors	Two 80-Pin VHDCI connectors
	Internal SCSI Connectors	Two 68-Pin Wide-Ultra SCSI-3 connectors

Smart Array 641 Controller (NOTE: The Smart Array 641 Controller ships standard with the 2.8 GHz Array Models only)	Protocol	Ultra320 SCSI
	SCSI Electrical Interface	Low Voltage Differential (LVD)
	Drives Supported	Up to 6 Ultra 320, Ultra3 and Ultra2 SCSI hard drives
	SCSI Port Connectors SA-641	one internal SCSI port
	Data Transfer Method	64-Bit PCI bus-master
	PCI Bus Speed	64-bit, 133-MHz PCI-X (1 GB/s maximum bandwidth)
	PCI	3.3 volt PCI slot compatibility only
	Simultaneous Drive Transfer Channels	Two
	Channel Transfer Rate	320-MB/s total; 320-MB/s per channel
	Software upgradeable Firmware	Yes
	Cache Memory	64-MB DRAM used for code, transfer buffers, and non-battery backed read cache
	Logical Drives Supported	32
	Maximum Capacity	880.8 GB (6 X 146.8 GB)
	Memory Addressing	64-bit, supporting servers memory greater than 4 GB
	RAID Support	RAID 5 (Distributed Data Guarding) RAID 1+ 0 (Striping & Mirroring) RAID 1 (Mirroring) RAID 0 (Striping)
	Upgradeable Firmware	2-MB Flashable ROM
	Disk Drive and Enclosure Protocol Support	Ultra 320, Ultra2 and Ultra3
	Warranty	Maximum: The remaining warranty of the HP server product in which it is installed (to a maximum three-year limited warranty) Minimum: One-year, on-site limited warranty Pre-Failure Warranty: Drives attached to the Smart Array Controller and monitored under Insight Manager are supported by a Pre-Failure (replacement) Warranty. For complete details, consult the HP Support Center or refer to your HP Server Documentation.

TechSpecs

Video Controller	Controller Chip	ATI RAGE XL
	Video DRAM	8 MB Video SDRAM
	Data Transfer Method	32-bit PCI
	Support Resolution	Supported Color Depths:
	640 x 480	16.7M, 64K, 256, 16
	800 x 600	16.7M, 64K, 256, 16
	1024 x 768	16.7M, 64K, 256, 16
	1152 x 864	16.7M, 64K, 256, 16
	1280 x 1024	16.7M, 64K, 256, 16
	1600 x 1200	64K, 256, 16
	Connector	VGA

CISCO SYSTEMS

Data Sheet

Cisco PIX **535** Security Appliance

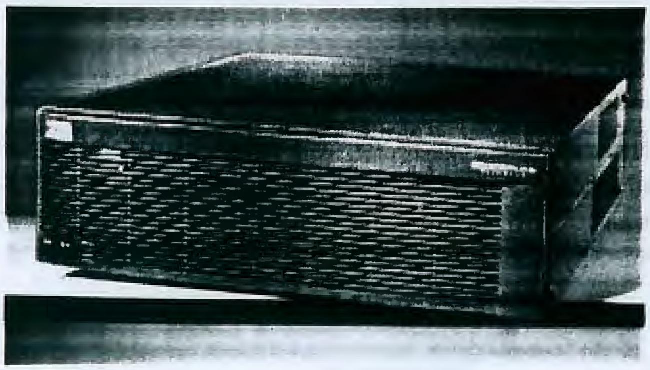
The Cisco PIX® 535 Security Appliance delivers enterprise-class security for enterprise and service provider networks in a high performance, purpose-built appliance. Its highly modular three-rack unit (3RU) design supports up to ten 10/100 Fast Ethernet interfaces or nine Gigabit Ethernet interfaces as well as redundant power supplies, making it an ideal choice for businesses requiring the highest levels of performance, port density, reliability, and investment protection. Part of the world-leading Cisco PIX Security Appliance Series, the Cisco PIX 535 Security Appliance provides a wide range of rich integrated security services, hardware VPN acceleration capabilities, and powerful remote management capabilities in a highly scalable, high-performance solution.

Enterprise-Class Security for Large Enterprise and Service Provider Networks

The Cisco PIX 535 Security Appliance delivers a multilayered defense for enterprise and service provider networks through rich, integrated security services including stateful inspection firewalling, protocol and application inspection, virtual private networking (VPN) in-line intrusion protection, and rich multimedia and voice security in a single device. The state-of-the-art Cisco Adaptive Security Algorithm (ASA) provides rich stateful inspection firewall services, tracking the state of all authorized network communications and preventing unauthorized network access.

Enterprise networks benefit from an additional layer of security via intelligent, "application-aware" security services that examine packet streams at Layers 4–7, using inspection engines specialized for many of today's popular applications. Administrators can also easily create custom security policies for firewall traffic by using the flexible access control methods and the more than 100 predefined applications, services, and protocols that Cisco PIX Security Appliances provide.

Figure 1
Cisco PIX 535 Security Appliance



Market-Leading Voice-over-IP Security Services Protect Next-Generation Converged Networks

Cisco PIX Security Appliances provide market-leading protection for a wide range of voice-over-IP (VoIP) and multimedia standards, allowing businesses to securely take advantage of the many benefits that converged data, voice, and video networks deliver. By combining VPN with the rich stateful inspection firewall services that Cisco PIX Security Appliances provide for these converged networking standards, businesses can securely extend voice and multimedia services to home office and remote office environments for additional cost savings, improved productivity, and competitive advantage.

Flexible VPN Services Extend Networks Economically to Remote Networks and Mobile Users

Businesses can securely extend their networks across low-cost Internet connections to mobile users, business partners, and remote offices worldwide using the full-featured VPN capabilities provided by the Cisco PIX 535 Security Appliance. Solutions range from standards-based site-to-site VPN leveraging the Internet Key Exchange (IKE) and IP security (IPsec) VPN standards, to the innovative Cisco Easy VPN capabilities found in Cisco PIX Security Appliances and other Cisco security solutions—such as Cisco IOS® routers and Cisco VPN 3000 Series Concentrators. Easy VPN delivers a uniquely scalable, cost-effective, and easy-to-manage remote-access VPN architecture that eliminates the operational costs associated with maintaining remote-device configurations typically required by traditional VPN solutions. Cisco PIX Security Appliances encrypt data using 56-bit Data Encryption Standard (DES), 168-bit Triple DES (3DES), or up to 256-bit Advanced Encryption Standard (AES) encryption. Certain Cisco PIX 535 Security Appliance models have integrated hardware VPN acceleration capabilities, delivering highly scalable, high performance VPN services.

Integrated Intrusion Protection Guards Against Popular Internet Threats

The integrated in-line intrusion-protection capabilities of the Cisco PIX 535 Security Appliance can protect enterprise networks from many popular forms of attacks, including Denial-of-Service (DoS) attacks and malformed packet attacks. Using a wealth of advanced intrusion-protection features, including DNSGuard, FloodGuard, FragGuard, MailGuard, IPVerify and TCP intercept, in addition to looking for more than 55 different attack "signatures," Cisco PIX Security Appliances keep a vigilant watch for attacks, can optionally block them, and can notify administrators about them in real time.

Award-Winning Resiliency Provides Maximum Business Uptime

Select models of Cisco PIX 535 Security Appliances provide stateful failover capabilities that ensure resilient network protection for enterprise network environments. Employing a cost-effective, active-standby, high-availability architecture, Cisco PIX Security Appliances that are configured as a failover pair continuously synchronize their connection state and device configuration data. Synchronization can take place over a high-speed LAN connection, providing another layer of protection through the ability to geographically separate the failover pair. In the event of a system or network failure, network sessions are automatically transitioned between appliances, with complete transparency to users.

Robust Remote-Management Solutions Lower Total Cost of Ownership

The Cisco PIX 535 Security Appliance is a reliable, easy-to-maintain platform that provides a wide variety of methods for configuring, monitoring, and troubleshooting. Management solutions range from centralized, policy-based management tools to integrated, Web-based management to support for remote monitoring protocols such as Simple Network Management Protocol (SNMP) and syslog.

Administrators can easily manage large numbers of remote Cisco PIX Security Appliances using CiscoWorks VPN/ Security Management Solution (VMS). This suite consists of numerous modules including Management Center for Firewalls, Auto Update Server Software and Security Monitor. This powerful combination provides a highly scalable, next-generation, three-tier management solution that includes the following features:

- Comprehensive configuration and software image management
- Device hierarchy with "Smart Rules"-based configuration inheritance
- Customizable administrative roles and access privileges
- Comprehensive enterprise change management and auditing
- "Touchless" software image management for remote Cisco PIX Security Appliances
- Support for dynamically addressed appliances

Additional integrated event management and inventory solutions are also available as part of the CiscoWorks VMS network management suite.

The integrated Cisco PIX Device Manager provides an intuitive, Web-based management interface for remotely configuring, monitoring, and troubleshooting a Cisco PIX 535 Security Appliance—without requiring any software (other than a standard Web browser) to be installed on an administrator's computer. A setup wizard is provided for easy installation into any network environment.

Alternatively, through methods including Telnet and Secure Shell (SSH), or out of band through a console port, administrators can remotely configure, monitor, and troubleshoot Cisco PIX Security Appliances using a command-line interface (CLI).

Table 1 Key Product Features and Benefits

Key Features	Benefit
Enterprise-Class Security	
True security appliance	• Uses a proprietary, hardened operating system that eliminates security risks associated with general purpose operating systems • Cisco quality and no moving parts provide a highly reliable security platform
Stateful inspection firewall	• Provides perimeter network security to prevent unauthorized network access • Uses state-of-the-art Cisco ASA for robust stateful inspection firewall services • Provides flexible access-control capabilities for over 100 predefined applications, services and protocols, with the ability to define custom applications and services • Includes numerous application-aware inspection engines that secure advanced networking protocols such as H.323 Version 4, Session Initiation Protocol (SIP), Cisco Skinny Client Control Protocol (SCCP), Real-Time Streaming Protocol (RTSP), Internet Locator Service (ILS), and more • Includes content filtering for Java and ActiveX applets
Easy VPN Server	• Provides remote access VPN concentrator services for a wide variety of Cisco software or hardware-based VPN clients • Pushes VPN policy dynamically to Cisco Easy VPN Remote-enabled solutions upon connection, ensuring the latest corporate security policies are enforced • Extends VPN reach into environments using Network Address Translation (NAT) or Port Address Translation (PAT), via support of Internet Engineering Task Force (IETF) UDP-based draft standard for NAT traversal

Table 1 Key Product Features and Benefits

Key Features	Benefit
Site-to-site VPN	• Supports IKE and IPsec VPN standards • Ensures data privacy/integrity and strong authentication to remote networks and remote users over the Internet • Supports 56-bit DES, 168-bit 3DES and up to 256-bit AES data encryption to ensure data privacy
Intrusion protection	• Provides protection from over 55 different types of popular network-based attacks ranging from malformed packet attacks to DoS attacks • Integrates with Cisco Network Intrusion Detection System (IDS) sensors for the ability to dynamically block/shun hostile network nodes via the firewall
AAA support	• Integrates with popular authentication, authorization, and accounting services via TACACS+ and RADIUS support • Provides tight integration with Cisco Secure Access Control Server (ACS)
X.509 certificate and CRL support	• Supports SCEP-based enrollment with leading X.509 solutions from Baltimore, Entrust, Microsoft, and VeriSign
Integration with leading third-party solutions	• Supports the broad range of Cisco AVVID (Architecture for Voice, Video and Integrated Data) partner solutions that provide URL filtering, content filtering, virus protection, scalable remote management, and more
Robust Network Services/Integration	
Virtual LAN (VLAN)-based virtual interfaces	• Provides increased flexibility when defining security policies and eases overall integration into switched network environments by supporting the creation of logical interfaces based on IEEE 802.1q VLAN tags, and the creation of security policies based on these virtual interfaces • Supports multiple virtual interfaces on a single physical interface through VLAN trunking • Supports multiple VLAN trunks per Cisco PIX Security Appliances • Supports up to 24 VLANs on Cisco PIX 535 Security Appliances
Open Shortest Path First (OSPF) dynamic routing	• Provides comprehensive OSPF dynamic routing services using technology based on world-renowned Cisco IOS Software • Offers improved network reliability through fast route convergence and secure, efficient route distribution • Delivers a secure routing solution in environments using NAT through tight integration with Cisco PIX Security Appliance NAT services • Supports MD5-based OSPF authentication, in addition to plaintext OSPF authentication, to prevent route spoofing and various routing-based DoS attacks • Provides route redistribution between OSPF processes, including OSPF, static, and connected routes • Supports load balancing across equal-cost multipath routes
DHCP server	• Provides DHCP Server services one or more interfaces for devices to obtain IP addresses dynamically • Includes extensions for support of Cisco IP Phones and Cisco SoftPhone IP telephony solutions
DHCP relay	• Forwards DHCP requests from internal devices to an administrator-specified DHCP server, enabling centralized distribution, tracking, and maintenance of IP addresses
NAT/PAT support	• Provides rich dynamic/static NAT and PAT capabilities

Table 1 Key Product Features and Benefits

Key Features	Benefit
Rich Management Capabilities	
CiscoWorks VPN/ Security Management Solution (CiscoWorks VMS)	• Comprehensive management suite for large scale deployments • Integrates policy management, software maintenance, and security monitoring
PIX Device Manager (PDM)	• Intuitive, Web-based GUI enables simple, secure remote management of Cisco PIX Security Appliances • Provides wide range of informative, real-time, and historical reports which give critical insight into usage trends, performance baselines, and security events
Auto Update	• Provides "touchless" secure remote management of Cisco PIX Security Appliance configuration and software images via a unique push/pull management model • Next-generation secure XML/HTTPS management interface can be leveraged by Cisco and third-party management applications for remote Cisco PIX Security Appliance configuration management, inventory, software image management/deployment and monitoring • Integrates seamlessly with Management Center for Firewalls and Auto Update Server for robust, scalable remote management of up to 1000 Cisco PIX Security Appliances (per management server)
Cisco PIX CLI	• Allows customers to use existing PIX CLI knowledge for easy installation and management without additional training • Accessible through variety of methods including console port, Telnet and SSH
Command-level authorization	• Enables businesses to create up to 16 customizable administrative roles/profiles for accessing Cisco PIX Security Appliances (for example, monitoring only, read-only access to configuration, VPN administrator, firewall/NAT administrator, and so on) • Leverages either the internal administrator database or outside sources via TACACS+, such as Cisco Secure ACS
SNMP and syslog support	• Provide remote monitoring and logging capabilities, with integration into Cisco and third-party management applications
Highly Flexible Expansion Capabilities	
Fast Ethernet and Gigabit Ethernet expansion options	• Supports easy installation of additional network interfaces via four 66-Mhz/64-bit and 5 33-MHz/32-bit PCI expansion slots • Supports expansion cards including single-port Fast Ethernet card, 4-port Fast Ethernet card, and single-port Gigabit Ethernet card
Hardware VPN acceleration options	• Delivers high speed VPN services via support of VPN Accelerator Card (VAC) and VPN Accelerator Card+ (VAC+)

License Options

The Cisco PIX 535 Security Appliance is available in three primary models that provide different levels of interface density, failover capabilities, and VPN throughput.

Restricted Software License

The Cisco PIX 535 "Restricted" (PIX 535-R) model provides an excellent value for organizations looking for robust Cisco PIX Security Appliance services with gigabit firewall throughput, high interface density, maximum investment protection, and moderate VPN throughput requirements. It includes 512 MB of RAM and support for up to eight 10/100 Fast Ethernet or eight Gigabit Ethernet interfaces.

Unrestricted Software License

The PIX 535 "Unrestricted" (PIX 535-UR) model extends the capabilities of the family with support for stateful failover, additional LAN interfaces, and increased VPN throughput via integrated hardware-based VPN acceleratio It includes an integrated VAC or VAC+ hardware VPN accelerator, 1 GB of RAM, and support for up to ten 10/1 Fast Ethernet or nine Gigabit Ethernet interfaces. The Cisco PIX 535-UR also adds the ability to share state information with a hot-standby Cisco PIX Security Appliance for resilient network protection.

Failover Software License

The Cisco PIX 535 "Failover" (PIX 535-FO) model is designed for use in conjunction with a PIX 535-UR, providing a cost-effective, high-availability solution. It operates in hot-standby mode acting as a complete redundant system that maintains current session state information. With the same hardware configuration as the Cisco PIX 535-UR, it delivers the ultimate in high availability for a fraction of the price.

Performance Summary

Cleartext throughput: 1.7 Gbps

Concurrent connections: 500,000

168-bit 3DES IPsec VPN throughput: Up to 440 Mbps with VAC+ or 100 Mbps with VAC

128-bit AES IPsec VPN throughput: Up to 535 Mbps with VAC+

256-bit AES IPsec VPN throughput: Up to 440 Mbps with VAC+

Simultaneous VPN tunnels: 2000

Technical Specifications

Processor: 1-GHz Intel Pentium III Processor

Random access memory: 512 MB or 1 GB of SDRAM

Flash memory: 16 MB

Cache: 256 KB level 2 at 1-GHz

System buses: Two 64-bit, 66 MHz PCI, one 32-bit, 33-MHz PCI

Environmental Operating Ranges

Operating

Temperature: –25° to 131°F (-5° to 55°C)

Relative Humidity: 5% to 95%, noncondensing

Altitude: 0 to 9843 ft (3000 m)

Shock: 1.14 m/sec (45 in./sec) 1/2 sine input

Vibration: 0.41 Grms2 (3–500 Hz) random input

Acoustic Noise: 65 dBa maximum

Nonoperating

Temperature: –13° to 158°F (–25° to 70°C)

Relative Humidity: 5% to 95%, noncondensing

Altitude: 0 to 15,000 ft (4570 m)

Shock: 30 G

Vibration: 0.41 Grms2 (3–500 Hz) random input

Power

Input (per power supply)

Range Line Voltage: 100V to 240V AC or 48V DC

Nominal Line Voltage: 100V to 240V AC or 48V DC

Current: 4–2 Amps

Frequency: 50 to 60 Hz, single phase

Power: 220W (dual hot swap power supply capable)

Output

Steady State: 135W

Maximum Peak: 220W

Maximum Heat Dissipation: 750 BTU/hr, full power usage (220W)

Physical Specifications

Dimensions and Weight Specifications

Form factor: 3 RU, standard 19-in. rack mountable

Dimensions (H x W x D): 5.25 x 17.5 x 18.25 in. (13.33 x 44.45 x 46.36 cm)

Weight (one power supply): 32 lb (14.5 kg)

Expansion

Four 64-bit/66-MHz PCI slots

Five 32-bit/33-MHz PCI slots

Six 168-pin DIMM RAM slots, supporting up to 1 GB PC133 DRAM

Interfaces

Console Port: RS-232 (RJ-45) 9600 baud

Failover Port: RS-232 (DB-15) 115 Kbps (Cisco specified cable required)

Two integrated 10/100 Fast Ethernet ports, auto-negotiate (half/full duplex), RJ-45

Regulatory and Standards Compliance

Safety

UL 1950, CSA C22.2 No. 950, EN 60950, IEC 60950, AS/NZS3260, TS001, IEC60825, EN 60825, 21CFR1040

Electro Magnetic Compatibility (EMC)

FCC Part 15 (CFR 47) Class A, ICES 003 Class A with UTP, EN55022 Class A with UTP, CISPR 22 Class A with UTP, AS/NZ 3548 Class A with UTP, VCCI Class A with UTP, EN55024, EN50082-1 (1997), CE marking, EN55022 Class B with FTP, Cispr 22 Class B with FTP, AS/NZ 3548 Class B with FTP, VCCI Class B with FTP

Product Ordering Information

PIX-535	PIX 535 chassis only
PIX-535-R-BUN	PIX 535 restricted bundle (chassis, restricted software, 2 10/100 ports, 512 MB RAM)
PIX-535-UR-BUN	PIX 535 unrestricted bundle (chassis, unrestricted software, 2 10/100 ports, 1 GB RAM, VAC or VAC+)
PIX-535-FO-BUN	PIX 535 failover bundle (chassis, failover software, 2 10/100 ports, 1 GB RAM, VAC or VAC+)
PIX-535-HW=	PIX 535 rack mount kit, console cable, failover serial cable
PIX-FO=	PIX failover serial cable
PIX-4FE	4-port 10/100 Fast Ethernet PCI expansion card
PIX-1FE	Single-port 10/100 Fast Ethernet PCI expansion card
PIX-1GE-66	Single-port Gigabit Ethernet 64-bit/66-MHz PCI expansion card, Multimode (SX) SC connector
PIX-VPN-ACCEL	3DES IPsec hardware VAC
PIX-VAC-PLUS	3DES/AES IPsec hardware VAC+
PIX-VPN-3DES	168-bit 3DES and up to 256-bit AES encryption software license

PIX-VPN-3DES=	168-bit 3DES and up to 256-bit AES encryption software license
PIX-VPN-DES	56-bit DES encryption software license
PIX-VPN-DES=	56-bit DES encryption software license

Support Services

Support services are available from Cisco and Cisco partners. Cisco SMARTnet service augments customer support resources, and provides anywhere, anytime access to technical resources (both online and by telephone), the ability to download updated system software, and hardware advance replacement.

Support Ordering Information

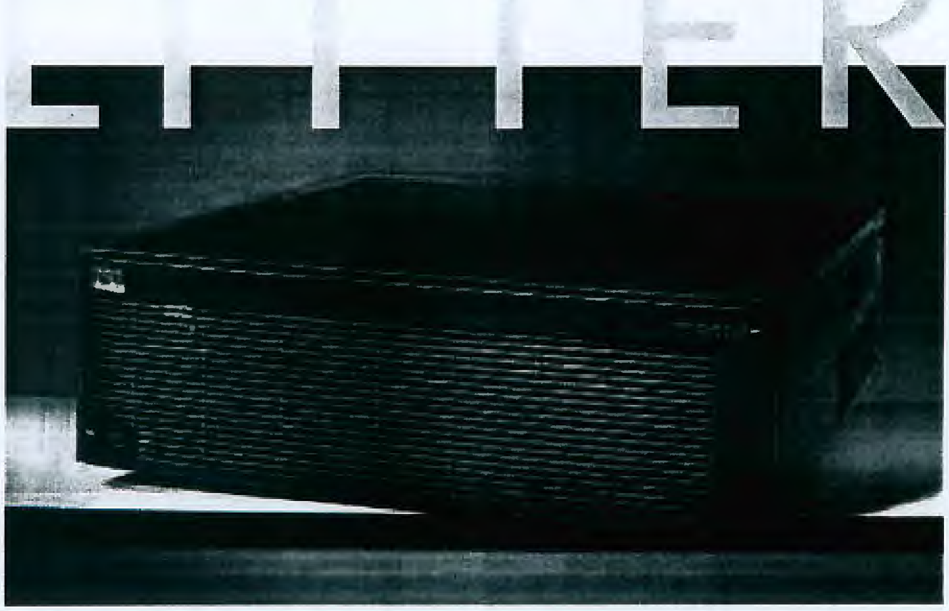
PIX LITTER

New Cisco Secure PIX 535 and VPN accelerator card add higher capacity and performance to Cisco Secure PIX Firewall family



FOR PEOPLE WHO LIKE THEIR FIREWALLS BIG AND POWERFUL, WE'D like to introduce you to the Cisco Secure PIX™ 535 Firewall. Delivering carrier-class performance that meets the needs of large enterprise networks as well as service providers, the PIX 535 is definitely the pick of the litter.

The newest member of the market-leading Cisco Secure PIX Firewall family has the ability to support more than 500,000 concurrent connections and 1 Gigabit per second of throughput. With this level of performance in a single system, the PIX 535 eliminates the need to load balance multiple standalone firewalls. This capability significantly reduces network complexity without compromising security.

"The Cisco Secure PIX 535 Firewall enables an enterprise to connect to a single, fat pipe in the network that previously was a choke point for security processing," says Dennis Vogel, product manager for the Cisco Secure PIX Firewall family. "The processing power offered in a single PIX ¯35 will help enterprises keep pace with ever-growing traffic volumes while assuring reliable, consistent security protection across the network."

Playing It SAFE

The PIX 535 provides important safeguards for large corporate networks against vulnerabilities associated with doing business over the Internet. More importantly, it can be implemented as part of the recently announced Cisco SAFE blueprint for secure e-business.

Developed for real-world network deployment, Cisco SAFE helps companies compete in the Internet economy by integrating scalable, high performance security services throughout the e-business infrastructure. It takes a modular approach to security in which design, solution implementation and management processes are all provided in detail. Companies can choose from several individual modules, or "building blocks," each designed, tested and proven to address specific e-business applications, such as electronic commerce or supply chain management. (See "Play It SAFE, Sam," page 67.)

Firewall Tip: Add an IDS

Deploying an intrusion detection system (IDS) to complement your firewall can significantly enhance your security posture. A firewall's primary function is to control access to services and hosts based on your site security policy. If a connection to a specific host is permitted, the firewall may not be configured to inspect the content of the permitted traffic. For example, all connection requests to a Web server in a demilitarized zone (DMZ) may be permitted by a misconfigured firewall, including malicious traffic designed to exploit a buffer overflow vulnerability in an HTTP server. While some firewalls may not protect against data- or content-driven attacks, an IDS will. An IDS analyzes packet datastreams within a network, searching for unauthorized activity. Furthermore, firewalls typically will not protect you against attacks originating from inside your network or entering your environment from a nonfirewalled ingress point, such as a remote access server. IDS appliances can be strategically deployed to monitor activity from internal sources and other network ingress points without impacting your network performance. Today, network administrators have the choice of deploying dedicated IDS appliances such as the Cisco Secure 4210 IDS appliance and the Catalyst® 6000 IDS module, or turning on IDS capabilities inherent in Cisco IOS® routers and PIX firewalls (see "Security Blanket: Weaving Security into the Network Fabric," page 61).

Which PIX Is Right for You?

From the home office to the central office, there's a Cisco Secure PIX Firewall to meet any environment's security and virtual private network (VPN) requirements.

Cisco Secure PIX 506
Remote office or branch office
Throughput: 9 Mbps
Sessions: 1000
CPU: 200MHz
Interfaces: 2

Cisco Secure PIX 515
Small and midsized business
Throughput: 170 Mbps
Sessions: 128,000
CPU: 200MHz
Interfaces: up to 6

Well-Bred Family

The new PIX 535 extends the line of the market-leading Cisco Secure PIX Firewall family. All PIX firewalls offer built-in IP security (IPsec) encryption, allowing secure site-to-site connectivity or deployment of secure, remote-access VPNs. Like other PIX models, the PIX 535 also supports redundant units with stateful failover capabilities to ensure continued secure processing should the primary unit experience a problem.

Booster Shot—the VPN Accelerator Card

The new VPN accelerator card for the Cisco Secure PIX Firewall family improves the performance of VPNs by offloading IPsec encryption functions from the central Firewall processor to dedicated hardware. Installed in a PCI slot inside the PIX chassis, the card works transparently and does not require activation commands nor configuration changes. It is quite literally a "plug and play" process.

The VPN accelerator card encrypts data using the Data Encryption Standard (DES) and Triple DES algorithms at speeds up to 100 Mbps. By handling IPsec-related tasks such as hashing, key exchange, and storing security associations, the card frees the PIX main processor and memory for other perimeter security functions.▲▲

Fools for Security

The Motley Fool recently selected Cisco Secure PIX firewalls to secure its popular financial Web site, Fool.com. The Fool's IT department evaluated several software-based solutions, but decided against them because they were based on general-purpose operating systems. The evaluation team's preference was to go with a robust, hardened, VPN-enabled firewall appliance that wasn't as susceptible to the types of bugs, glitches and vulnerabilities often associated with other firewalls.

"Cisco's PIX is exactly what we wanted," explained Joel Salamone, MIS Director for The Motley Fool. "There is no extraneous software cluttering the operating system that can be exploited." The PIX family's similar management interface and configuration also shortened training time, and guaranteed easier administration. In addition, the number of maximum possible connections running through PIX was more than enough to accommodate the Fool's global network needs. "One of the things we really like about the PIX," said Dwight Gibbs, Chief Technology Officer for The Motley Fool, "is that it enabled us to quickly and inexpensively roll out a VPN linking our offices in the US, UK, and Germany. We can now collaborate securely thanks to the PIX."

Cisco Secure PIX 520
Enterprise
Throughput: 370 Mbps
Sessions: 250,000
CPU: 350 MHz
Interfaces: up to 6

Cisco Secure PIX 525
Large enterprise
Throughput: 370 Mbps
Sessions: 280,000
CPU: 600 MHz
Interfaces: up to 8

Cisco Secure PIX 535
Large enterprise and service provider
Throughput: 1.0 Gbps
Sessions: 500,000
CPU: 1 GHz
Interfaces: up to 8

Apêndice FR

Cisco PIX **525** Security Appliance

The Cisco PIX® 525 Security Appliance delivers enterprise-class security for medium-to-large enterprise networks in a reliable, purpose-built appliance. Its modular two-rack unit (2RU) design supports up to eight 10/100 Fast Ethernet interfaces or three Gigabit Ethernet interfaces, making it an ideal choice for businesses requiring a resilient, high performance, Gigabit Ethernet-ready solution that provides solid investment protection. Part of the world-leading Cisco PIX Security Appliance Series, the Cisco PIX 525 Security Appliance provides a wide range of rich integrated security services, hardware VPN acceleration capabilities, and powerful remote management capabilities in a cost-effective, highly-resilient solution.

Enterprise-Class Security for Medium-to-Large Enterprise Networks

The Cisco PIX 525 Security Appliance delivers a multilayered defense for large enterprise networks through rich, integrated security services including stateful inspection firewalling, protocol and application inspection, virtual private networking (VPN) in-line intrusion protection and rich multimedia and voice security in a single device. The state-of-the-art Cisco Adaptive Security Algorithm (ASA) provides rich stateful inspection firewall services, tracking the state of all authorized network communications and preventing unauthorized network access.

Figure 1
Cisco PIX 525 Security Appliance

Enterprise networks benefit from an additional layer of security via intelligent, "application-aware" security services that examine packet streams at Layers 4–7, using inspection engines specialized for many of today's popular applications. Administrators can also easily create custom security policies for firewall traffic by using the flexible access control methods and the more than 100 predefined applications, services, and protocols that Cisco PIX Security Appliances provide.

Market-Leading Voice-over-IP Security Services Protect Next-Generation Converged Networks

Cisco PIX Security Appliances provide market-leading protection for a wide range of voice-over-IP (VoIP) and multimedia standards, allowing businesses to securely take advantage of the many benefits that converged data, voice, and video networks deliver. By combining VPN with the rich stateful inspection firewall services that Cisco PIX Security Appliances provide for these converged networking standards, businesses can securely extend voice and multimedia services to home office and remote office environments for additional cost savings, improved productivity, and competitive advantage.

Flexible VPN Services Extend Networks Economically to Remote Networks and Mobile Users

Businesses can securely extend their networks across low-cost Internet connections to mobile users, business partners, and remote offices worldwide using the full-featured VPN capabilities provided by the Cisco PIX 525 Security Appliance. Solutions range from standards-based site-to-site VPN leveraging the Internet Key Exchange (IKE) and IP security (IPsec) VPN standards, to the innovative Cisco Easy VPN capabilities found in Cisco PIX Security Appliances and other Cisco security solutions—such as Cisco IOS® routers and Cisco VPN 3000 Series Concentrators. Easy VPN delivers a uniquely scalable, cost-effective, and easy-to-manage remote-access VPN architecture that eliminates the operational costs associated with maintaining remote-device configurations typically required by traditional VPN solutions. Cisco PIX Security Appliances encrypt data using 56-bit Data Encryption Standard (DES), 168-bit Triple DES (3DES), or up to 256-bit Advanced Encryption Standard (AES) encryption. Certain Cisco PIX 525 Security Appliance models have integrated hardware VPN acceleration capabilities, delivering highly scalable, high performance VPN services.

Integrated Intrusion Protection Guards Against Popular Internet Threats

The integrated in-line intrusion-protection capabilities of the Cisco PIX 525 Security Appliance can protect enterprise networks from many popular forms of attacks, including Denial-of-Service (DoS) attacks and malformed packet attacks. Using a wealth of advanced intrusion-protection features, including DNSGuard, FloodGuard, FragGuard, MailGuard, IPVerify and TCP intercept, in addition to looking for more than 55 different attack "signatures," Cisco PIX Security Appliances keep a vigilant watch for attacks, can optionally block them, and can notify administrators about them in real time.

Award-Winning Resiliency Provides Maximum Business Uptime

Select models of Cisco PIX 525 Security Appliances provide stateful failover capabilities that ensure resilient network protection for enterprise network environments. Employing a cost-effective, active-standby, high-availability architecture, Cisco PIX Security Appliances that are configured as a failover pair continuously synchronize their connection state and device configuration data. Synchronization can take place over a high-speed LAN connection, providing another layer of protection through the ability to geographically separate the failover pair. In the event of a system or network failure, network sessions are automatically transitioned between appliances, with complete transparency to users.

Robust Remote-Management Solutions Lower Total Cost of Ownership

The Cisco PIX 525 Security Appliance is a reliable, easy-to-maintain platform that provides a wide variety of methods for configuring, monitoring, and troubleshooting. Management solutions range from centralized, policy-based management tools to integrated, Web-based management to support for remote monitoring protocols such as Simple Network Management Protocol (SNMP) and syslog.

Administrators can easily manage large numbers of remote Cisco PIX Security Appliances using CiscoWorks VPN/ Security Management Solution (VMS). This suite consists of numerous modules including Management Center for Firewalls, Auto Update Server Software and Security Monitor. This powerful combination provides a highly scalable, next-generation, three-tier management solution that includes the following features:

- Comprehensive configuration and software image management
- Device hierarchy with "Smart Rules"-based configuration inheritance
- Customizable administrative roles and access privileges
- Comprehensive enterprise change management and auditing
- "Touchless" software image management for remote Cisco PIX Security Appliances
- Support for dynamically addressed appliances

Additional integrated event management and inventory solutions are also available as part of the CiscoWorks VMS network management suite.

The integrated Cisco PIX Device Manager provides an intuitive, Web-based management interface for remotely configuring, monitoring, and troubleshooting a Cisco PIX 525 Security Appliance—without requiring any software (other than a standard Web browser) to be installed on an administrator's computer. A setup wizard is provided for easy installation into any network environment.

Alternatively, through methods including Telnet and Secure Shell (SSH), or out of band through a console port, administrators can remotely configure, monitor, and troubleshoot Cisco PIX Security Appliances using a command-line interface (CLI).

Table 1 Key Product Features and Benefits

Key Features	Benefit
Enterprise-Class Security	
True security appliance	• Uses a proprietary, hardened operating system that eliminates security risks associated with general purpose operating systems • Cisco quality and no moving parts provide a highly reliable security platform
Stateful inspection firewall	• Provides perimeter network security to prevent unauthorized network access • Uses state-of-the-art Cisco ASA for robust stateful inspection firewall services • Provides flexible access-control capabilities for over 100 predefined applications, services and protocols, with the ability to define custom applications and services • Includes numerous application-aware inspection engines that secure advanced networking protocols such as H.323 Version 4, Session Initiation Protocol (SIP), Cisco Skinny Client Control Protocol (SCCP), Real-Time Streaming Protocol (RTSP), Internet Locator Service (ILS), and more • Includes content filtering for Java and ActiveX applets
Easy VPN Server	• Provides remote access VPN concentrator services for a wide variety of Cisco software or hardware-based VPN clients • Pushes VPN policy dynamically to Cisco Easy VPN Remote-enabled solutions upon connection, ensuring the latest corporate security policies are enforced • Extends VPN reach into environments using Network Address Translation (NAT) or Port Address Translation (PAT), via support of Internet Engineering Task Force (IETF) UDP-based draft standard for NAT traversal

Table 1 Key Product Features and Benefits

Key Features	Benefit
Site-to-site VPN	• Supports IKE and IPsec VPN standards • Ensures data privacy/integrity and strong authentication to remote networks and remote users over the Internet • Supports 56-bit DES, 168-bit 3DES and up to 256-bit AES data encryption to ensure data privacy
Intrusion protection	• Provides protection from over 55 different types of popular network-based attacks ranging from malformed packet attacks to DoS attacks • Integrates with Cisco Network Intrusion Detection System (IDS) sensors for the ability to dynamically block/shun hostile network nodes via the firewall
AAA support	• Integrates with popular authentication, authorization, and accounting services via TACACS+ and RADIUS support • Provides tight integration with Cisco Secure Access Control Server (ACS)
X.509 certificate and CRL support	• Supports SCEP-based enrollment with leading X.509 solutions from Baltimore, Entrust, Microsoft, and VeriSign
Integration with leading third-party solutions	• Supports the broad range of Cisco AVVID (Architecture for Voice, Video and Integrated Data) partner solutions that provide URL filtering, content filtering, virus protection, scalable remote management, and more
Robust Network Services/Integration	
Virtual LAN (VLAN)-based virtual interfaces	• Provides increased flexibility when defining security policies and eases overall integration into switched network environments by supporting the creation of logical interfaces based on IEEE 802.1q VLAN tags, and the creation of security policies based on these virtual interfaces • Supports multiple virtual interfaces on a single physical interface through VLAN trunking • Supports multiple VLAN trunks per Cisco PIX Security Appliance • Supports up to 10 VLANs on Cisco PIX 525 Security Appliances
Open Shortest Path First (OSPF) dynamic routing	• Provides comprehensive OSPF dynamic routing services using technology based on world-renowned Cisco IOS Software • Offers improved network reliability through fast route convergence and secure, efficient route distribution • Delivers a secure routing solution in environments using NAT through tight integration with Cisco PIX Security Appliance NAT services • Supports MD5-based OSPF authentication, in addition to plaintext OSPF authentication, to prevent route spoofing and various routing-based DoS attacks • Provides route redistribution between OSPF processes, including OSPF, static, and connected routes • Supports load balancing across equal-cost multipath routes
DHCP server	• Provides DHCP Server services one or more interfaces for devices to obtain IP addresses dynamically • Includes extensions for support of Cisco IP Phones and Cisco SoftPhone IP telephony solutions
DHCP relay	• Forwards DHCP requests from internal devices to an administrator-specified DHCP server, enabling centralized distribution, tracking, and maintenance of IP addresses
NAT/PAT support	• Provides rich dynamic/static NAT and PAT capabilities

Table 1 Key Product Features and Benefits

Key Features	Benefit
Rich Remote Management Options	
CiscoWorks VPN/ Security Management Solution (CiscoWorks VMS)	• Comprehensive management suite for large scale deployments • Integrates policy management, software maintenance, and security monitoring
PIX Device Manager (PDM)	• Intuitive, Web-based GUI enables simple, secure remote management of Cisco PIX Security Appliances • Provides wide range of informative, real-time, and historical reports which give critical insight into usage trends, performance baselines, and security events
Auto Update	• Provides "touchless" secure remote management of Cisco PIX Security Appliance configuration and software images via a unique push/pull management model • Next-generation secure XML/HTTPS management interface can be leveraged by Cisco and third-party management applications for remote Cisco PIX Security Appliance configuration management, inventory, software image management/deployment and monitoring • Integrates seamlessly with CiscoWorks Management Center for Firewalls and Auto Update Server for robust, scalable remote management of up to 1000 Cisco PIX Security Appliances (per management server)
Cisco PIX CLI	• Allows customers to use existing PIX CLI knowledge for easy installation and management without additional training • Accessible through variety of methods including console port, Telnet, and SSH
Command-level authorization	• Enables businesses to create up to 16 customizable administrative roles/profiles for accessing Cisco PIX Security Appliances (for example, monitoring only, read-only access to configuration, VPN administrator, firewall/NAT administrator, and so on) • Leverages either the internal administrator database or outside sources via TACACS+, such as Cisco Secure ACS
SNMP and syslog support	• Provide remote monitoring and logging capabilities, with integration into Cisco and third-party management applications
Flexible Expansion Capabilities	
Fast Ethernet and Gigabit Ethernet expansion options	• Supports easy installation of additional network interfaces via 3 PCI expansion slots • Supports expansion cards including single-port Fast Ethernet card, 4-port Fast Ethernet card, and single-port Gigabit Ethernet card
Hardware VPN acceleration options	• Delivers high speed VPN services via support of VPN Accelerator Card (VAC) and VPN Accelerator Card+ (VAC+)

License Options

The Cisco PIX 525 Security Appliance is available in three primary models that provide different levels of interface density, failover capabilities, and VPN throughput.

Restricted Software License

The Cisco PIX 525 "Restricted" (PIX 525-R) model provides an excellent value for organizations looking for robust Cisco PIX Security Appliance services with Gigabit Ethernet support, medium interface density, and moderate VPN throughput requirements. It includes 128 MB of RAM and support for up to six 10/100 Fast Ethernet or three Gigabit Ethernet interfaces.

Unrestricted Software License

The PIX 525 "Unrestricted" (PIX 525-UR) model extends the capabilities of the family with support for stateful failover, additional LAN interfaces, and increased VPN throughput via integrated hardware-based VPN acceleration. It includes an integrated VAC or VAC+ hardware VPN accelerator, 256 MB of RAM, and support for up to eight 10/100 Fast Ethernet or three Gigabit Ethernet interfaces. The Cisco PIX 525-UR also adds the ability to share state information with a hot-standby Cisco PIX Security Appliance for resilient network protection.

Failover Software License

The Cisco PIX 525 "Failover" (PIX 525-FO) model is designed for use in conjunction with a PIX 525-UR, providing a cost-effective, high-availability solution. It operates in hot-standby mode acting as a complete redundant system that maintains current session state information. With the same hardware configuration as the Cisco PIX 525-UR, it delivers the ultimate in high availability for a fraction of the price.

Performance Summary

Cleartext throughput: 330 Mbps

Concurrent connections: 280,000

168-bit 3DES IPsec VPN throughput: Up to 155 Mbps with VAC+ or 72 Mbps with VAC

128-bit AES IPsec VPN throughput: Up to 165 Mbps with VAC+

256-bit AES IPsec VPN throughput: Up to 170 Mbps with VAC+

Simultaneous VPN tunnels: 2000

Technical Specifications

Processor: 600-MHz Intel Pentium III Processor

Random access memory: 128 MB or 256 MB of SDRAM

Flash memory: 16 MB

Cache: 256 KB level 2 at 600 MHz

System bus: Single 32-bit, 33-MHz PCI

Environmental Operating Ranges

Operating

Temperature: –25° to 104°F (–5° to 40°C)

Relative Humidity: 5% to 95%, noncondensing

Altitude: 0 to 6500 ft (2000 m)

Shock: 1.14 m/sec (45 in./sec) 1/2 sine input

Vibration: 0.41 Grms2 (3–500 Hz) random input

Acoustic Noise: 45 dBa maximum

Nonoperating

Temperature: –13° to 158°F (–25° to 70°C)

Relative Humidity: 5% to 95%, noncondensing

Altitude: 0 to 15,000 ft (4570 m)

Shock: 30G

Vibration: 0.41 Grms2 (3–500 Hz) random input

Power

Input (per power supply)

Range Line Voltage: 100V to 240V AC or 48V DC to 60V DC

Nominal Line Voltage: 100V to 240V AC or 48V DC to 60V DC

Current: 5–2.5 Amps AC or 12 Amps DC

Frequency: 50 to 60 Hz, single phase

Output

Steady State: 50W

Maximum Peak: 65W

Maximum Heat Dissipation: 410 BTU/hr, full power usage (65W)

Physical Specifications

Dimensions and Weight Specifications

Form factor: 2 RU, standard 19-in. rack mountable

Dimensions (H x W x D): 3.5 x 17.5 x 18.25 in. (8.89 x 44.45 x 46.36 cm)

Weight (one power supply): 32 lb (14.5 kg)

Expansion

Three 32-bit/33-MHz PCI slots

Two 168-pin DIMM RAM slots, supporting up to 256 MB memory maximum

Interfaces

Console Port: RS-232 (RJ-45) 9600 baud

Failover Port: RS-232 (DB-15) 115 Kbps (Cisco specified cable required)

Two integrated 10/100 Fast Ethernet ports, auto-negotiate (half/full duplex), RJ-45

Regulatory and Standards Compliance

Safety

UL 1950, CSA C22.2 No. 950, EN 60950 IEC 60950, AS/NZS3260, TS001

Electro Magnetic Compatibility (EMC)

CE marking, FCC Part 15 Class A, AS/NZS 3548 Class A, VCCI Class A, EN55022 Class A, CISPR22 Class A, EN61000-3-2, EN61000-3-3

Product Ordering Information

PIX-525	PIX 525 chassis only
PIX-525-DC	PIX 525 DC chassis only
PIX-525-R-BUN	PIX 525 restricted bundle (chassis, restricted software, 2 10/100 ports, 128 MB RAM)
PIX-525-UR-BUN	PIX 525 unrestricted bundle (chassis, unrestricted software, 2 10/100 ports, 256 MB RAM, VAC or VAC+)
PIX-525-UR-GE-BUN	PIX 525 unrestricted 2 GE + 2 FE bundle (chassis, unrestricted software, 2 Gigabit Ethernet + 2 10/100 ports, 256 MB RAM, VAC or VAC+)
PIX-525-FO-BUN	PIX 525 failover bundle (chassis, failover software, 2 10/100 ports, 256 MB RAM, VAC or VAC+)
PIX-525-FO-GE-BUN	PIX 525 failover 2 GE + 2 FE bundle (chassis, failover software, 2 Gigabit Ethernet + 2 10/100 ports, VAC or VAC+)
PIX-525-HW=	PIX 525 rack-mount kit, console cable and failover serial cable
PIX-FO=	PIX failover serial cable
PIX-4FE	4-port 10/100 Fast Ethernet PCI expansion card
PIX-1FE	Single-port 10/100 Fast Ethernet PCI expansion card
PIX-1GE-66	Single-port Gigabit Ethernet 64-bit/66-MHz PCI expansion card, Multimode (SX) SC connector
PIX-VPN-ACCEL	3DES IPsec hardware VAC
PIX-VAC-PLUS	3DES/AES IPsec hardware VAC+

PIX-VPN-3DES	168-bit 3DES and up to 256-bit AES encryption software license
PIX-VPN-3DES=	168-bit 3DES and up to 256-bit AES encryption software license
PIX-VPN-DES	56-bit DES encryption software license
PIX-VPN-DES=	56-bit DES encryption software license

Support Services

Support services are available from Cisco and Cisco partners. Cisco SMARTnet service augments customer support resources, and provides anywhere, anytime access to technical resources (both online and by telephone), the ability to download updated system software, and hardware advance replacement.

Support Ordering Information

CON-SNT-PIX525	SMARTnet 8x5xNBD service for PIX 525 chassis only
CON-SNT-PIX525R	SMARTnet 8x5xNBD service for PIX 525-R bundle
CON-SNT-PIX525UR	SMARTnet 8x5xNBD service for PIX 525-UR bundle
CON-SNT-PIX525FO	SMARTnet 8x5xNBD service for PIX 525-FO bundle
CON-SNTE-PIX525	SMARTnet 8x5x4 service for PIX 525 chassis only
CON-SNTE-PIX525R	SMARTnet 8x5x4 service for PIX 525-R bundle
CON-SNTE-PIX525UR	SMARTnet 8x5x4 service for PIX 525-UR bundle
CON-SNTE-PIX525FO	SMARTnet 8x5x4 service for PIX 525-FO bundle
CON-SNTP-PIX525	SMARTnet 24x7x4 service for PIX 525 chassis only
CON-SNTP-PIX525R	SMARTnet 24x7x4 service for PIX 525-R bundle
CON-SNTP-PIX525UR	SMARTnet 24x7x4 service for PIX 525-UR bundle
CON-SNTP-PIX525FO	SMARTnet 24x7x4 service for PIX 525-FO bundle
CON-S2P-PIX525R	SMARTnet 24x7x2 service for PIX 525-R bundle
CON-S2P-PIX525UR	SMARTnet 24x7x2 service for PIX 525-UR bundle
CON-S2P-PIX525FO	SMARTnet 24x7x2 service for PIX 525-FO bundle
CON-OS-PIX525	SMARTnet On-Site 8x5xNBD service for PIX 525 chassis only
CON-OS-PIX525R	SMARTnet On-Site 8x5xNBD service for PIX 525-R bundle
CON-OS-PIX525UR	SMARTnet On-Site 8x5xNBD service for PIX 525-UR bundle
CON-OS-PIX525FO	SMARTnet On-Site 8x5xNBD service for PIX 525-FO bundle
CON-OSE-PIX525	SMARTnet On-Site 8x5x4 service for PIX 525 chassis only
CON-OSE-PIX525R	SMARTnet On-Site 8x5x4 service for PIX 525-R bundle
CON-OSE-PIX525UR	SMARTnet On-Site 8x5x4 service for PIX 525-UR bundle

CON-OSE-PIX525FO	SMARTnet On-Site 8x5x4 service for PIX 525-FO bundle
CON-OSP-PIX525	SMARTnet On-Site 24x7x4 service for PIX 525 chassis only
CON-OSP-PIX525R	SMARTnet On-Site 24x7x4 service for PIX 525-R bundle
CON-OSP-PIX525UR	SMARTnet On-Site 24x7x4 service for PIX 525-UR bundle
CON-OSP-PIX525FO	SMARTnet On-Site 24x7x4 service for PIX 525-FO bundle

Data Sheet

Cisco **PIX** Firewall Version 6.2

The world-leading Cisco PIX® Firewall Series of purpose-built security appliances provides robust, enterprise-class security services, including stateful inspection firewalling, virtual private networking (VPN), intrusion protection, and much more—in cost-effective, easy-to-deploy solutions. Ranging from compact, plug-and-play desktop firewalls for small/home offices to carrier-class gigabit firewalls for the most demanding enterprise and service-provider environments, Cisco PIX Firewalls provide robust security, performance, and reliability for network environments of all sizes.

Advanced Firewall Technologies Provide Enterprise-Class Network Security

Cisco PIX Firewalls deliver a broad range of advanced firewall services that protect enterprise networks from the threats lurking on the Internet and in today's network environments. The state-of-the-art Cisco Adaptive Security Algorithm (ASA) provides rich stateful inspection firewall services, tracking the state of all authorized network communications and preventing unauthorized network access. Cisco PIX Firewalls deliver an additional layer of security through intelligent, "application-aware" security services that examine packet streams at Layers 4 through 7, using inspection engines specialized for many of today's popular applications. Administrators can easily create custom security policies that will be enforced on network traffic traversing the firewall by leveraging more than 100 pre-defined applications, services, and protocols within Cisco PIX Firewalls, and the flexible access control capabilities that Cisco PIX Firewalls provide. Access to network resources can also be strongly authenticated via the Cisco PIX Firewall's seamless integration with enterprise databases, either directly using TACACS+/RADIUS or indirectly via Cisco Secure Access Control Server (ACS). In addition to these services, Cisco PIX Firewalls provide extensive logging, URL filtering, content filtering, and more in concert with Cisco AVVID (Architecture for Voice, Video and Integrated Data) partner solutions.

Market-Leading Voice-over-IP Security Services Protect Next-Generation Converged Networks

Cisco PIX Firewalls continue to provide market-leading protection for numerous voice-over-IP (VoIP) standards and other multimedia standards, including H.323, Session Initiation Protocol (SIP), Skinny, Real-Time Transport Protocol (RTP), Real-Time Streaming Protocol (RTSP), and Real-Time Transport Control Protocol (RTCP). This allows businesses to securely take advantage of the many benefits that converged data and voice networks provide, such as significant total cost of ownership (TCO) savings and the competitive advantages and improved productivity gained through the power of fully integrated voice, video, and data networks. By combining VPN with the rich stateful inspection firewall services that Cisco PIX Firewalls provide for these converged networking standards, businesses can easily extend voice and multimedia services to remote/satellite offices for additional bandwidth and cost savings.

Site-to-Site VPNs Extend Networks Economically to Remote Sites and Business Partners

Using the standards-based site-to-site VPN capabilities within Cisco PIX Firewalls, businesses can securely extend their network across low-cost Internet connections to business partners and remote/satellite offices worldwide. Built upon the Internet Key Exchange (IKE) and IP Security (IPSec) VPN standards, Cisco PIX Firewalls encrypt data using 56-bit Data Encryption Standard (DES) or advanced 168-bit Triple DES (3DES) encryption, ensuring that malicious individuals cannot see sensitive business data as it safely travels across the Internet. Cisco PIX Firewalls can also participate in X.509-based Public Key Infrastructures (PKI) and provide easy, automated certificate enrollment by taking advantage of the Simplified Certificate Enrollment Protocol (SCEP)—another Internet standard Cisco helped to pioneer. Certain Cisco PIX Firewall models also provide integrated hardware VPN acceleration, providing up to 100 Mbps of 3DES throughput and support for up to 2000 IKE security associations.

Easy VPN Enables Highly Scalable, Easy-to-Manage VPN Deployments

The innovative Easy VPN capabilities found in Cisco PIX Firewalls and other Cisco solutions—such as Cisco IOS® Software-based routers and Cisco VPN 3000 Series Concentrators—deliver a uniquely scalable, cost-effective, and easy-to-manage remote-access VPN architecture. Built upon the foundation of dynamic policy distribution and effortless provisioning, Easy VPN eliminates the operational costs associated with maintaining remote-device configurations typically required by traditional VPN solutions. Easy VPN enables Cisco customers to enjoy the numerous benefits that VPNs provide—increased employee productivity by taking advantage of high-speed broadband connectivity, and significantly reduced operational costs by eliminating expenses associated with legacy dialup architectures—without the problems commonly found with other remote-access VPN solutions.

Cisco PIX Firewalls provide robust, remote-access VPN concentrator services that enable enterprises to securely extend their network to traveling employees, teleworkers, and remote offices for "anytime, anywhere access" to vital corporate network resources. Acting as an Easy VPN Server, Cisco PIX Firewalls support the wide range of Cisco software- and hardware-based Easy VPN Remote products. By dynamically pushing VPN security policies to Easy VPN-enabled users as they connect, Cisco PIX Firewalls ensure that the latest VPN security policy is consistently enforced for all remote-access users.

Certain models of Cisco PIX Firewalls can also act as "hardware VPN clients" using the new Easy VPN Remote features in Cisco PIX Firewall OS, transparently providing secure access to a corporate network for all devices protected by a Cisco PIX Firewall in a remote network. This dramatically simplifies the initial deployment and ongoing management of VPNs deployed to remote offices and teleworker environments by eliminating the need to install and maintain VPN client software on the individual devices protected by a remote Cisco PIX Firewall. Advanced client-side resiliency features ensure maximum VPN uptime by providing automatic failover to backup Easy VPN Servers in the event of a network or service failure.

Integrated Intrusion Protection Guards from Popular Internet Threats

The integrated intrusion-protection capabilities in Cisco PIX Firewalls protect today's networks from many popular forms of attacks, including Denial-of-Service (DoS) attacks and malformed packet attacks. Using a wealth of advanced intrusion-protection features, including DNSGuard, FloodGuard, FragGuard, MailGuard, and TCP intercept, in addition to looking for more than 55 different attack "signatures," Cisco PIX Firewalls keep a vigilant watch for attacks, can optionally block them, and can notify administrators about them in real time. Additionally, Cisco PIX Firewalls support virtual packet reassembly, searching for attacks that are hidden over a series of fragmented packets. Strong integration with Cisco Intrusion Detection Systems (IDS) sensors enables Cisco PIX Firewalls to automatically shun (block) network nodes identified as being hostile by Cisco IDS sensors.

Enterprise-Class Resiliency Provides Maximum Business Uptime

Cisco PIX Firewalls provide award-winning stateful failover capabilities (on select models) that ensure resilient network protection for enterprise network environments. Employing a cost-effective, active-standby high-availability architecture, Cisco PIX Firewalls configured as a failover pair continuously synchronize connection state information and device configuration data between one another. Performing this synchronization over a high-speed LAN connection provides the added benefit of being able to geographically separate failover pair members, thus providing a further layer of protection. In the rare event of a system or network failure, network sessions are automatically transitioned between firewalls seamlessly, and with complete transparency to network users.

Robust Remote-Management Solutions Lower Total Cost of Ownership

Cisco PIX Firewalls deliver a wealth of remote-management methods for configuration, monitoring, and troubleshooting. Management solutions range from an integrated, Web-based management application to highly scalable multi-firewall management tools to support for remote-monitoring protocols such as Simple Network Management Protocol (SNMP) and syslog. Cisco PIX Firewalls additionally provide up to 16 levels of customizable administrative roles, so that enterprises can grant administrators and operations personnel the appropriate level of permissions they need for each firewall they manage (for example, monitoring only, read-only access to the configuration, VPN configuration only, firewall configuration only, etc.). Cisco PIX Firewalls now also support Auto Update, a revolutionary secure remote-management capability that ensures firewalls configurations and software images are kept up-to-date.

Cisco PIX Device Manager (PDM), integrated with Cisco PIX Firewalls, provides administrators an intuitive, Web-based management interface for remotely configuring and monitoring a single Cisco PIX Firewall, without requiring any software (other than a standard Web browser) to be installed on an administrator's computer. Administrators can also remotely configure, monitor, and troubleshoot Cisco PIX Firewalls using a command-line interface (CLI) through various methods, including Telnet and Secure Shell (SSH) Protocol, or out-of-band via a console port.

Administrators can easily manage a large number of remote Cisco PIX Firewalls using either the new combination of the CiscoWorks Management Center for Cisco PIX Firewalls and Auto Update Server, or Cisco Secure Policy Manager (CSPM)—all available within the Cisco VPN Security Management Solution (VMS) network management suite. The CiscoWorks Management Center for Cisco PIX Firewalls is a highly scalable, next-generation, three-tier management solution for Cisco PIX Firewalls that includes features such as hierarchical grouping of managed firewalls, "Smart Rules" configuration inheritance, customizable administrative roles and access privileges, workflow-based enterprise change management, comprehensive support for Cisco PIX Firewall's new Auto Update capabilities, and support for dynamically addressed firewalls. Cisco Secure Policy Manager Release 3.0 is a policy-based centralized management solution for Cisco PIX Firewalls that includes a task-based interface, an interactive network topology map, policy wizards, and policy import capabilities. Additional integrated event management and inventory solutions are also available as part of the Cisco VMS network management suite.

New Features Found in Cisco PIX Firewall Release 6.2

Cisco PIX Firewall Release 6.2 provides a wealth of new innovative features, which are detailed below:

Table 1 New Features and Benefits

New Features	Benefits
Enterprise-Class Security	
LAN-based failover	• Extends failover functionality and enables geographic separation of Cisco PIX Firewalls in a failover pair by allowing failover information to be shared over a dedicated LAN connection (instead of a serial cable) between failover pairs
Bidirectional Network Address Translation (NAT)	• Enhances rich NAT functionality in Cisco PIX Firewalls to support environments with overlapping private address ranges
Turbo access control lists (ACLs)	• Provides significantly enhanced performance and deterministic search times for ACL processing; especially useful in environments where extensive ACLs are deployed
N2H2 URL filtering	• Integrates with N2H2 Sentian™ products—leading Internet filtering solutions—to provide robust employee Web access control and monitoring
Enhanced small-packet performance	• Delivers up to 48 percent more firewall performance for 64- to 512-byte packets than previous Cisco PIX Firewall OS releases, due to further optimization of small-packet processing
Management	
Auto Update	• Provides highly scalable, secure remote management of PIX Firewalls with a unique push/pull management model • Next-generation secure XML/HTTPS interface can be leveraged by Cisco and third-party management applications for remote firewall configuratio management, inventory, software image management/deployment and monitoring • Supports dynamically addressed firewalls in addition to firewalls with static IP addresses • Integrates seamlessly with CiscoWorks Management Center for Cisco PIX Firewalls and Auto Update Server for robust, scalable remote management of up to 1000 PIX Firewalls
Object grouping	• Enables administrators to group network objects (such as devices, networks, and services) into logical groups to greatly simplify access control rule definition and maintenance

Table 1 New Features and Benefits

New Features	Benefits
Command-level authorization	• Enables businesses to create up to 16 customizable administrative roles and profiles for accessing Cisco PIX Firewalls (for example, monitoring only, read-only access to configuration, VPN administrator, firewall administrator, etc.) • Uses either the internal Cisco PIX Firewall administrator database or outside sources via TACACS+, such as Cisco Secure ACS
Dynamic ACLs via Cisco Secure ACS	• Supports dynamic downloading and enforcement of ACLs on a per-user basis, upon user authentication with the firewall
Network Time Protocol (NTP) v3 client	• Provides convenient method for synchronizing the clock on Cisco PIX Firewalls with other devices on a network
CPU monitoring via SNMP v2	• Extends SNMP-based remote firewall health monitoring to include the ability to monitor CPU utilization
Software and configuration updates via HTTP and HTTPS	• Adds support for downloading Cisco PIX Firewall OS and Cisco PIX Device Manager software, as well as configuration updates via HTTP or HTTPS • Provides ability to deliver configuration and software updates over authenticated, encrypted network connection
HTTPS-based CLI access	• Delivers flexible, secure interface for interactive and easily scriptable access to Cisco PIX Firewall CLI via standard HTTPS requests
Packet capture	• Gives administrators new, powerful troubleshooting capabilities by providing robust packet-capturing facilities on each interface of the firewall • Supports several methods of accessing captured packets, including via the console, secure Web access or a file exported to a Trivial File Transfer Protocol (TFTP) server
Small Office/Home Office	
Easy VPN Remote (hardware VPN client)	• Enables dramatically simplified VPN rollouts to small office, teleworker, and remote/branch-office environments, allowing Cisco PIX 501, 506, and 506E Firewalls to act as hardware VPN clients, and eliminating the provisioning complexities of traditional site-to-site VPN deployments • Downloads VPN policy dynamically from an Easy VPN Server upon connection, ensuring the latest corporate security policies are enforced • Provides robust client-side VPN resiliency with support for up to ten Easy VPN servers with automatic failover, in addition to Dead Peer Detection (DPD) support • Enables the network behind a Cisco PIX Firewall to appear as a single user to the VPN headend when using Easy VPN Remote Client Mode • Provides site-to-site VPN-like functionality without requiring any additional provisioning when using Easy VPN Remote Network Extension Mode • Supports both split and non-split tunneling environments • Provides intelligent, transparent Domain Name System (DNS) proxy capabilities for access to both corporate and public DNS servers
PPP over Ethernet (PPPoE) support	• Ensures compatibility with networks that require PPPoE support, such as xDSL and cable modem broadband environments

Table 1 New Features and Benefits

New Features	Benefits
Voice-over-IP (VoIP)/Multimedia	
Multicast support	• Supports wide range of multicast applications by introducing support for Internet Group Management Protocol (IGMP) v2 and stub multicast routing, including NAT and Port Address Translation (PAT) and the ability to build access control lists for multicast traffic
PAT for H.323 and SIP	• Extends market-leading VoIP support and enables SIP and H.323 to work in PAT environments, typically found in home offices and remote offices
DHCP server support for Cisco IP phones	• Simplifies remote Cisco IP Phone deployments by providing Cisco CallManager contact information via DHCP options 66 and 150 to Cisco IP phones for automated bootstrapping
Internet Locator Service (ILS) Fixup	• Adds support for ILS, a popular directory service used by applications suc as Microsoft NetMeeting, SiteServer and Active Directory, for registration and location of network entities/endpoints

Technical Specifications

VPN Client Compatibility

Cisco PIX Firewalls support a wide variety of software- and hardware-based VPN clients, including:

Software IPSec VPN clients	Cisco Secure VPN Client Release 1.1 Cisco VPN 3000 Concentrator Client, Release 2.5 and higher Cisco VPN Client for Microsoft Windows, Release 3.0 and higher Cisco VPN Client for Linux, Release 3.5 and higher Cisco VPN Client for Solaris, Release 3.5 and higher Cisco VPN Client for Mac OS X, Release 3.5 and higher
Hardware IPSec VPN clients	Cisco VPN 3002 Hardware Client, Release 3.0 and higher Cisco IOS Software Easy VPN Remote, Release 12.2(8)YJ Cisco PIX Firewall Easy VPN Remote, Release 6.2 and higher
Layer 2 Tunneling Protocol (L2TP)/IPSec VPN clients	Microsoft Windows 2000
Point-to-Point Tunneling Protocol (PPTP) VPN clients	Microsoft Windows 95 Microsoft Windows 98 Microsoft Windows NT 4.0 Microsoft Windows 2000

Easy VPN Server Compatibility

Cisco PIX Firewalls can now act as hardware-based VPN clients, taking advantage of the new Easy VPN Remote capabilities in Cisco PIX Firewall OS. The following Easy VPN Server platforms are supported for this deployment scenario:

Cisco IOS Routers	Release 12.2(8)T and higher
Cisco PIX Firewalls	Release 6.0(1) and higher
Cisco VPN 3000 Concentrators	Release 3.1 and higher

Cisco Site-to-Site VPN Compatibility

In addition to supporting interoperability with many third-party VPN products, Cisco PIX Firewalls interoperate with the following Cisco VPN products for site-to-site VPN connectivity:

Cisco IOS Routers	Release 12.1(6)T and higher
Cisco PIX Firewalls	Release 5.1(1) and higher
Cisco VPN 3000 Concentrators	Release 2.5.2 and higher

Cryptographic Standards Supported

Cisco PIX Firewalls support numerous cryptographic standards and related third-party products and services, including the following:

Asymmetric (public key) encryption algorithms	RSA (Rivest, Shamir, Adelman) public/private key pairs, 512 bits to 2048 bits
Symmetric encryption algorithms	DES: 56 bits 3DES: 168 bits RC4: 40, 56, 64, and 128 bits
Perfect Forward Secrecy (Diffie-Hellman key negotiation)	Group 1: 768-bits Group 2: 1024-bits
Hash algorithms	MD5: 128-bits SHA-1: 160-bits
X.509 certificate authorities	Baltimore UniCERT Entrust Authority Microsoft Windows 2000 Certificate Services VeriSign OnSite
X.509 certificate enrollment protocols	SCEP

System Requirements

Platforms supported	Cisco PIX 501 Firewall Cisco PIX 506 Firewall Cisco PIX 506E Firewall Cisco PIX 515 Firewall Cisco PIX 515E Firewall Cisco PIX 520 Firewall Cisco PIX 525 Firewall Cisco PIX 535 Firewall
RAM, minimum	32 MB, except Cisco PIX 501 which requires 16 MB
Flash memory, minimum	16 MB, except Cisco PIX 501/506/506E which require 8 MB
Expansion cards supported	Single-port 10/100 Fast Ethernet card Four-port 10/100 Fast Ethernet card Single-port Gigabit Ethernet, multimode (SX) SC, card VPN Acceleration Card (VAC)

Product Ordering Information

PIX-SW-UPGRADE=	Cisco PIX software one-time upgrade for customers without a current SMARTnet™ support contract

Support Services

Support services are available from Cisco partners as well as from Cisco. The Cisco SMARTnet service augments customer support resources. It provides 24x7x 365 access to technical resources (both online and via telephone), the ability to download updated system software, and hardware advance replacement.

CISCO SYSTEMS

Overview

CiscoWorks Routed WAN Management Solution 1.3

The CiscoWorks Routed WAN (RWAN) Management Solution extends the CiscoWorks product family by providing a collection of powerful management applications to configure, administer, and maintain a Cisco routed wide-area network (WAN).

The RWAN solution addresses the needs of managing WANs by improving the accuracy, efficiency, and effectiveness of your network administrators and operations staff while increasing the overall availability of your network through proactive planning, deployment, and troubleshooting tools.

CiscoWorks solutions comply with Internet standards and have no network management system (NMS) prerequisites. These solutions take advantage of Web browser technologies for accessibility and integration with other third-party Web-based management tools and platforms.

Complementary CiscoWorks solutions such as the LAN Management Solution (LMS) provide a solid foundation of campus management tools. The IP Telephony Environment Monitor (ITEM) ensures the readiness and manageability of converged networks that are supporting voice over IP (VoIP) and IP telephony traffic and applications. The Cisco VPN/Security Management Solution (VMS) provides an integrated set of Web-based applications with features that assist in the deployment and monitoring of virtual private network (VPN) and security devices. Additional solutions for managing quality of service (QoS), network and user authentication, identity and access control, content networking, and Remote Monitoring (RMON) are also available.

CiscoWorks management solutions play an integral part in deploying and maintaining a Cisco AVVID (Architecture for Voice, Video and Integrated Data) network infrastructure comprising converged data, voice, and content networking.

WAN Management Challenge

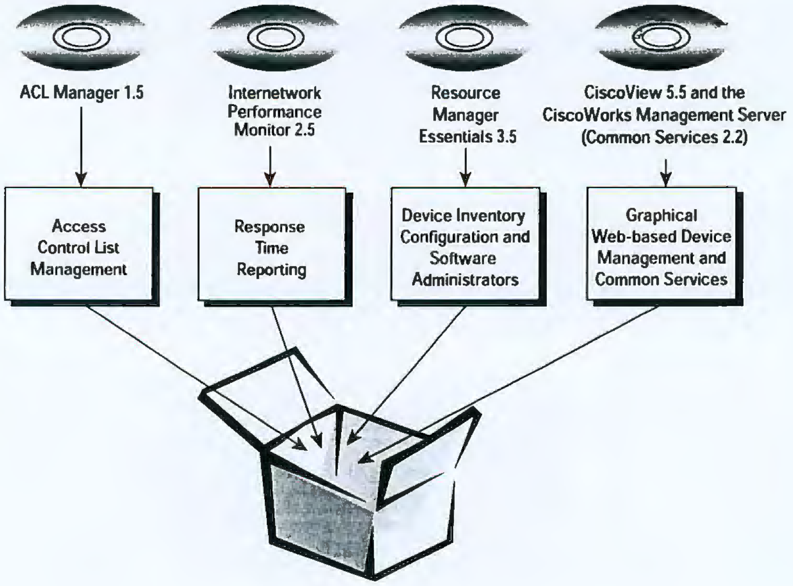
Today's enterprise WANs continue to grow as more mission-critical applications and services depend on reliable, high-performance intranet and Internet connections to remote offices, suppliers, customers, and partners worldwide. WAN links are typically the most expensive part of the network, and monitoring their performance and uptime is critical to maintaining a reliable and cost-effective network.

The ability to effectively measure response time between devices, users, and services is key to maintaining the highest levels of service quality. Proper management of WAN edge devices, links, and services becomes critical, and for this reason, Cisco has assembled a comprehensive set of WAN management tools designed to make the WAN manager's life much easier.

A Comprehensive Solution

The CiscoWorks Routed WAN Management Solution provides increased visibility into network behavior, assists in quickly troubleshooting performance bottlenecks, and provides comprehensive tools to easily administer new software and configuration changes for optimizing bandwidth and utilization across expensive and critical links in the network (Figure 1).

Figure 1
RWAN Management Solution 1.3 Components



ACL Manager 1.5
Internetwork Performance Monitor 2.5
Resource Manager Essentials 3.5
CiscoView 5.5 and the CiscoWorks Management Server (Common Services 2.2)
Access Control List Management
Response Time Reporting
Device Inventory Configuration and Software Administrators
Graphical Web-based Device Management and Common Services

Solution Components

The following applications are included in the CiscoWorks RWAN Management Solution (refer also to Table 1):

- *CiscoWorks Access Control List (ACL) Manager*—CiscoWorks ACL Manager significantly reduces the time typically required to manage and administer access control lists using the command-line interface (CLI) of Cisco IOS® Software. It provides a wizard and policy template-based approach to simplifying the setup, management, and optimization of Cisco IOS Software-based IP and Internetwork Packet Exchange (IPX) traffic filtering and device access control. This tool includes an access list editor, policy template manager, network and service class managers for scalability, access list navigation tools for troubleshooting, and automated distribution of access list updates.
- *CiscoWorks Internetwork Performance Monitor (IPM)*—CiscoWorks IPM is a network response time and availability troubleshooting application that enables WAN managers to proactively troubleshoot network response times using Cisco IOS Software embedded technology. The path and hop performance analysis provided by CiscoWorks IPM simplifies the identification of devices that are contributing to latency and network delays. CiscoWorks IPM is used to diagnose latency, identify network bottlenecks, and analyze response times. The application is also valuable for managing the effectiveness of QoS features based on IP Precedence and for troubleshooting network jitter-related problems, both of which will be needed to deploy VoIP.
- *CiscoWorks Resource Manager Essentials (RME)*— CiscoWorks RME provides the tools needed to manage Cisco devices. It includes inventory and device change management, network configuration and software image management, network availability, and syslog analysis.

- *CiscoView*—CiscoView provides real-time status of Cisco devices graphically. CiscoView can drill down to display monitoring information on interfaces and access configuration functions.
- *CiscoWorks Management Server*—CiscoWorks Management Server provides the common management desktop services and security across the CiscoWorks Family of solutions. It also provides the foundation for integrating with other Cisco and third-party applications.

Table 1 RWAN Management Solution Key Application/Function

Key Application/Function	Product	Management Benefit
ACL optimization	CiscoWorks ACL Manager	Improves router performance by organizing access filters to sort by most frequent usage patterns
ACL profiles	CiscoWorks ACL Manager	Allows administrators to quickly and uniformly apply and update template-based ACLs; can reduce WAN costs and enhance security management
ACL distribution	CiscoWorks ACL Manager	Allows administrator to automate the process of updating access list information in multiple devices
Monitoring of WAN response time characteristics	CiscoWorks IPM	Measures the responsiveness of WAN connections to determine latency and jitter, and to determine where traffic bottlenecks exist
Path and hop analysis	CiscoWorks IPM	Identifies which devices in the network are causing the greatest latency in network traffic
Detailed software and hardware inventory reporting	CiscoWorks RME	Provides accurate Cisco inventory baseline information, including memory, slots, software versions, and boot ROMs needed to make decisions about the network
Automated update engines for device software and configuration changes	CiscoWorks RME	Allows software and configuration updates to be sent to selected devices on a scheduled basis; reduces time and errors involved in network updates
Consolidated troubleshooting tools device center	CiscoWorks RME	Offers a wide collection of switch and router analysis tools accessible from a single location; device center can be linked to by third-party applications
Centralized change audit logging and application access security	CiscoWorks RME	Comprehensive change monitoring log records user and application active on the network; CiscoWorks desktop controls user access to applications, ensuring that only appropriate classes of users can access tools that change network parameters versus read-only tools
Graphic device management	CiscoView	Displays a browser representation of Cisco router and switch devices, color-coded to indicate operations states, with access to configuration and monitoring tools
Third-party integration tools (Integration utility)	CiscoWorks Management Server	Simplifies the Web integration of third-party and other Cisco management tools

Key Functions and Applications

Deployment Options

Consider the following when installing the CiscoWorks RWAN Management Solution:

- All applications do not have to be installed initially; applications not installed initially may be installed later.
- Most applications require the CiscoWorks Management Server from the Common Services CD (formerly CD One), which must be installed first.
- The CiscoWorks ACL Manager application depends on CiscoWorks RME, which is included as part of the CiscoWorks RWAN Management Solution.

All solutions can coexist on the same server if they support and operate with the services of Common Services 2.2. However, network managers may want to consider such factors as the number of applications hosted, system resources, and number of devices to be managed in determining if all or a subset of the solutions are installed on the same server.

CiscoWorks solutions offer deployment flexibility. System administrators should use the guidelines given previously when planning the deployment of the various solution bundles. Some components within a solution require the CiscoWorks Management Server and must be installed on that machine. CiscoWorks IPM and CiscoView Software can be set up on an independent server. The placement of components is a function of performance requirements and the size of the network.

Server System Requirements

Hardware/Operating System

UNIX

- System: Sun UltraSPARCIII (Sun Blade 1000 Workstation or Sun Fire 280R Workgroup Server) running Solaris 2.8 (dual processor system required for hosting multiple management solutions)
- Memory: 1-GB RAM for workstations, 2-GB RAM for servers, 8-MB e-cache
- Available disk: 40-GB internal FC-AL disk drive for workstation and dual drives of this type for server configurations

Windows

- System: IBM PC compatible with 550-MHz or higher Pentium III processor running Microsoft Windows 2000 Advanced Server (with Terminal Services turned off), Server or Professional Edition with Service Pack 3 (dual processor system required for hosting multiple management solutions)
- Memory: 1-GB RAM
- Available disk: 40 GB with 2-GB swap recommended

Note: These system requirements are based on managing 500 devices with CiscoWorks RWAN and LAN Management solutions loaded on a single server. Refer to the installation documentation for more information on required operating system patches.

Client Browser System Requirements

Hardware/Operating System

UNIX

- System: Sun Ultra 10 running Solaris Versions 2.7 or 2.8
- System: HP9000 Series running HP-UX 11.0
- System: IBM RS/6000 workstation running AIX 4.3.3
- Memory: 256 MB

Windows

- System: IBM PC-compatible computer with 300-MHz or higher Pentium processor running Windows XP Professional with Service Pack 1, Windows 2000 Professional with Service Pack 2 or 3, or Windows Server with Server Pack 2 or 3.
- Memory: 256 MB

Note: Refer to the installation documentation for more information on required operating system patches.

Web Browser

UNIX

- Solaris: Netscape v4.76

Windows

- Windows 2000/XP: Netscape v4.78, 4.79
- Windows 2000/XP: Internet Explorer v6.0 or v6.0 with Service Pack1

Note: Refer to the installation documentation for more information on required operating systems patches, browser plug-ins, or Java Virtual Machine (JVM) versions.

Service and Support

CiscoWorks products are covered by the Cisco Software Application Service (SAS) program. This service program offers customers contract-based 7 x 24 access to the Cisco Technical Assistance Center (TAC), full Cisco.com privileges, and software maintenance updates. A Cisco SAS contract ensures that customers have easy access to the information and services needed to stay up-to-date with newly supported device packages, patches, and minor updates. For further information on service and support offerings, contact your local sales office.

Ordering Information

The CiscoWorks RWAN Management Solution includes all the necessary components needed for an independent installation on a Microsoft Windows or Sun Solaris workstation or server. The products within this solution can be combined with other CiscoWorks products if they support the same CiscoWorks Management Server version, operating environment, and system requirements. Contact your local Cisco representative for available white papers and documentation outlining best practices for implementing a CiscoWorks management solution architecture.

To place an order, contact your Cisco sales representative.

Refer to the CiscoWorks RWAN individual product data sheets for more information on operating environment and system requirements.

Apêndice FU

CiscoWorks **VPN/Security Management** Solution Version 2.2

CiscoWorks VPN/Security Management Solution (VMS) is the flagship integrated security management solution from Cisco, and is an integral part of the SAFE Blueprint from Cisco for network security.

CiscoWorks VMS protects the productivity and reduces operating costs for enterprises, by combining Web-based tools for configuring, monitoring, and troubleshooting enterprise VPNs, firewalls, and network and host-based intrusion detection systems (IDS). CiscoWorks VMS delivers the industry's first robust and scalable foundation and feature set that addresses the needs of small and large-scale VPN and security deployments.

Today's business challenges and resulting security deployments require more scalability than merely supporting a large number of devices. Many customers have limited staffing, yet are asked to manage a myriad of security devices. These customers must manage the security and network infrastructure; frequently update many remote devices; implement change control and auditing when multiple organizations are involved in defining and deploying policies; enhance security without adding more headcount; or roll out remote access VPNs to all employees and monitor the VPN service.

CiscoWorks VMS enables customers to deploy security infrastructures from a small to large environment, using the following multifaceted scalability features:

- Complete SAFE Blueprint Coverage

  To completely manage a SAFE environment, a network management solution must manage SAFE infrastructure components, support features based upon an appliance or Cisco IOS® Software, and support a range of management functions. CiscoWorks VMS is uniquely able to scale across SAFE Blueprint components, including firewalls, VPNs, and network- and host-based IDSs. CiscoWorks VMS also takes advantage of Cisco Secure Access Control Server (ACS) by using a common ACS logon. CiscoWorks VMS can manage a feature set through an appliance, for example, the Cisco PIX® Firewall, or through the Cisco IOS Software. Scalable management also involves more than configuring devices. CiscoWorks VMS provides the complete range of management with features to configure, monitor, and troubleshoot the network.

- Scalable Foundation

  CiscoWorks VMS implements a foundation with a consistent user experience, which makes it easier to scale management to many devices. CiscoWorks VMS provides users with a consistent GUI, workflow, ACS logon, roles definition, platforms, database

engine, installation, and more. An industry-leading feature of this foundation is the Auto Update feature, which allows numerous devices to be updated easily and quickly. Auto Update enables devices, even remote and dynamically addressed devices, to periodically "call home" to an update server and "pull" the most current security configurations or Cisco PIX operating system. Auto Update is required to effectively scale remote office firewall deployments across intermittent links or dynamic addresses. Prior policy updating methods relied on a "push" model. Although this model works for known devices, it does not work for remote devices with unknown addresses or devices that are not always active. Without Auto Update a more manual process is required to update each remote device. The Auto Update feature provides a dramatic scalability improvement for organizations that want to deploy devices with many remote and local locations. In addition to easier and faster policy updates, Auto Update also provides consistent policy deployments.

- Enterprise Operational Integration

  CiscoWorks VMS enables organizations to easily integrate management into their operations. One operational need is to replicate policies to multiple locations. The Smart Rules hierarchy addresses this need, by enabling administrators to define device groups and implement policy inheritance. For example, an administrator can define a device group for the New York sales office and deploy that same policy to all other sales offices quic and consistently. The Command and Control Workflow feature provides change control and auditing, and is particularly important for customers who have separate groups for network and security operations. The solution includes processes for generating, approving, and deploying configurations. This can help security operations to define and approve new policies. Network operations can later deploy the new policies during their regular maintenance window. An audit of the changes can be maintained.

- Centralized Role-Based Access Control (RBAC)

  Role-based access control enables organizations to scale access privileges. CiscoWorks VMS conveniently uses a common ACS logon for users, administrators, devices, and applications. CiscoWorks VMS enables different groups to have different access rights across different devices and applications.

- Integrated Infrastructure Management

  Scalability requires that multiple components be managed, not just firewalls, but also VPNs, network- and host-based IDSs, routers, and switches. CiscoWorks VMS not only manages the security infrastructure, but also manages the network infrastructure. Customers benefit from being able to manage these components from one solution. Integrated monitoring is also required to see the larger picture. CiscoWorks VMS provides integrated monitoring of Cisco PIX and Cisco IOS syslogs, and events from network and host-based IDSs, along with event correlation.

CiscoWorks VMS Functions

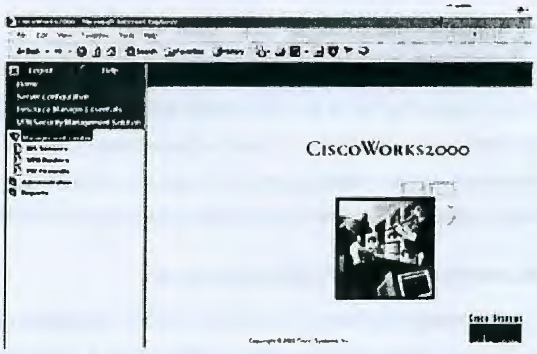
CiscoWorks VMS is launched from the CiscoWorks dashboard and is organized into several functional areas:

- Firewall management
- Auto Update Server
- IDS management, network and host-based
- VPN router management
- Security monitoring
- VPN monitoring
- Operational management

These functional areas supply multifaceted scalability by offering features such as a consistent user experience, auto update, command and control workflow, and role-based access control.

Figure 1 shows CiscoWorks VMS displayed as a "drawer" in the CiscoWorks dashboard.

Figure 1



Firewall Management

CiscoWorks VMS enables the large-scale deployment of Cisco PIX firewalls, by providing the following features:

- Smart Rules hierarchy and inheritance
- User-defined device and customer groups including nesting
- Global role-based access with administrative privileges per device and customer groups with other CiscoWorks products and Cisco Secure ACS
- Mandatory and default device settings inheritance
- Workflow deployment to device, directory, or Auto Update Server
- Look and feel of Cisco PIX Device Manager but with scalability to thousands of PIX firewalls
- Integration with other CiscoWorks network management software
- Complete SAFE Blueprint coverage for centralized management of Cisco PIX firewalls, including access control, VPN, IDS, and authentication, authorization, and accounting (AAA)

Smart Rules is an innovative feature that allows common information including access rules and settings to be inherited for all firewalls in a device or customer group. Smart Rules allows a user to define common rules once, which results in reduced configuration time, fewer administrative errors, and higher device scalability. Using Smart Rules, a user can configure a common rule such as allowing all HTTP traffic once and can apply this rule globally to all firewalls. Smart Rules can also be defined on a device or customer group basis. For specific information on the firewall management functionality of VMS, refer to: http://www.cisco.com/en/US/products/sw/cscowork/ps3992/index.html

Auto Update Server for Firewall Management

CiscoWorks VMS introduces the industry's first firewall Auto Update Server that allows users to implement a "pull" model for security and Cisco PIX operating system management. Auto Update Server permits remote firewall networks with unprecedented scalability. The Auto Update Server allows Cisco PIX firewalls to both periodically and automatically contact the update server for any security configuration, Cisco PIX Operating System, and PIX Device Manager (PDM) updates. The Auto Update Server supports the following features:

- Security management of remote Cisco PIX firewalls that use Dynamic Host Control Protocol (DHCP)
- Automated Cisco PIX OS distribution to groups of Cisco PIX firewalls
- Automated Cisco PDM updates to remote firewalls
- Configuration verification at periodic intervals
- Automated replacement of inaccurate or tampered configurations
- New firewalls configured at "boot time"

The Auto Update Server is an indispensable component of any large-scale remote Cisco PIX firewall deployment. Auto Update Server is an easy-to-use solution to automatically update all remote or local firewalls with new operating system releases. Cisco is the industry's first vendor to provide this pull model of security policy and operating system management. For specific information on the Auto Update Server component of VMS, refer to: http://www.cisco.com/en/US/products/sw/cscowork/ps3993/index.html

Network-Based IDS Management

Administrators can use CiscoWorks VMS to configure network and switch IDS sensors. Many sensors can be quickly configured using group profiles. Additionally, a more powerful signature management feature is included to increase the accuracy and specificity of detection. Some prominent features are:

- Easy-to-use Web-based interface
- Wizards that lead users through common management tasks
- Access to the Network Security Database (NSDB), which provides meaningful information about alarms for users without IDS security expertise
- Ability to define a hierarchy of sensors containing groups and subgroups, and the ability to configure multiple sensors concurrently using group profiles
- Support for several hundred sensor deployments from each console
- Use of a robust relational database to store a high volume of data

For specific information on the network-based IDS management functionality of VMS, refer to:

http://www.cisco.com/en/US/products/sw/cscowork/ps3990/index.html

Host-Based IDS Management

CiscoWorks VMS provides threat protection for server and desktop computing systems, also known as "endpoin VMS goes beyond conventional endpoint security solutions by identifying and preventing malicious behavior before it can occur, thereby removing potential known and unknown security risks that threaten enterprise networks and applications. Because CiscoWorks VMS analyzes behavior rather than relying on signature matching, its solution provides robust protection with reduced operational costs. Features of host-based IDS management include:

- Aggregates and extends multiple endpoint security functions by providing host intrusion prevention, distributed firewall, malicious mobile code protection, operating system integrity assurance, and audit log consolidation all within a single agent.
- Provides preventive protection against entire classes of attacks including port scans, buffer overflows, Trojan horses, malformed packets, and e-mail worms.
- Offers "zero update" prevention for known and unknown attacks

- Provides industry-leading protection for UNIX and Windows servers and Windows desktops allowing customers to patch systems on their own schedules.
- Open and extensible architecture offers the capability to define and enforce security according to corporate policy.
- Scalable to thousands of agents per manager to support large enterprise deployments.

For specific information on the host-based IDS management functionality of VMS, refer to: the Management Center for Cisco Security Agents Datasheet.

VPN Router Management

CiscoWorks VMS includes functions for the setup and maintenance of large deployments of VPN connections and provides users with a point-and-click interface for setting up and deploying connections. This application is intended for scalable configuration of site-to-site VPN connections in a hub-and-spoke topology for centralized, multidevice configuration and deployment of Internet Key Exchange (IKE) and IP Security (IPsec) tunneling policies on VPN routers.

Major features include:

- Wizard-based interface for the creation of IKE and VPN tunneling policies.
- Hierarchical inheritance and Smart Rules hierarchy to reflect the organizational and common setup of devices and simplified device management
- IKE-KA (IKE Keepalive) or generic routing encapsulation (GRE) with Open Shortest Path First (OSPF) and Enhanced Interior Gateway Routing Protocol (EIGRP) for failover routing scenarios.
- Centralized role-based access control model allows for centralized management of users and accounts.

For specific information on the VPN router management functionality of VMS, refer to: http://www.cisco.com/en/US/products/sw/cscowork/ps3994/index.html

Security Monitoring

CiscoWorks VMS provides integrated monitoring to reduce the number of security monitoring consoles, reduce the number of events to monitor, and provide a broader view of security status.

- Integrated monitoring is used to capture, store, view, correlate, and report on events from many of the devices in the SAFE Blueprint such as Cisco network IDSs, switch IDSs, host IDSs, firewalls, and routers.
- Event correlation is used to identify attacks that are not easily recognizable from a single event. A flexible notification scheme and automated responses to critical events also aid in quick action.
- The event viewer can read both real-time and historical events.
- Events are color-coded and administrators can quickly isolate problems. Administrators can also define thresholds and time periods when rules can be triggered to provide notification.
- On-demand and scheduled reports facilitate ongoing monitoring.

For specific information on the security monitoring component of VMS, refer to: http://www.cisco.com/en/US/products/sw/cscowork/ps3991/index.html

VPN Monitoring

CiscoWorks VMS offers a Web-based management tool that allows network administrators to collect, store, and view information on IPsec VPN connections for remote-access or site-to-site VPN terminations. Multiple devices can be viewed from an easy-to-use dashboard that is configured using a Web browser. This dashboard provides the following capabilities:

- Provides data on system resources related to real-time memory usage, percent CPU usage per device, and active tunnel and active sessions. This data simplifies the identification of devices with potential performance problems and devices with the highest usage.
- Enables viewing of current and long-term packet rates and packet dropped percentage which can aid in determining where excess capacity can be tapped or quickly identify bottlenecks and device throughput problems.
- Enables identification of the devices with the most persistent problems through the event log; key device and VPN statistics are evaluated against a set of global and device-specific thresholds, and exceptions are recorded in the event log.
- Provides graphing of important common metrics. Device performance comparisons provide a global view of short-term trends in VPN performance, enabling administrators to identify problem areas before they become critical failures.

For specific information on the VPN monitoring component of VMS, refer to: http://www.cisco.com/en/US/products/sw/cscowork/ps2326/index.html

Operational Management

CiscoWorks VMS provides the operational management for the network, allowing network managers to perform the following:

- Quickly build a complete network inventory
- Manage device credentials information
- Monitor and report on hardware, software, configuration, and inventory changes
- Manage and deploy configuration changes and software image updates to multiple devices
- Monitor and troubleshoot critical LAN and WAN resources
- Quickly identify devices that can be used for VPNs, if upgraded with the appropriate Cisco IOS Software
- Discover which VPN devices have hardware encryption modules
- Graphically compare configurations of VPN devices
- Isolate IPsec-related problems by running customized Syslog reports

For specific information on the operational management functionality of VMS, refer to: http://www.cisco.com/en/US/products/sw/cscowork/ps2073/index.html

Server Specifications (Minimum requirements)

Server Hardware

- PC-compatible computer with 1 GHz or faster Pentium processor
- Sun UltraSPARC 60 MP with 440 MHz or faster processor
- Sun UltraSPARCIII (Sun Blade 2000 Workstation or Sun Fire280R Workgroup Server)

- CD-ROM drive
- 100BASE-T or faster connection
- 1 GB RAM
- 9 GB available disk drive space
- 2 GB virtual memory
- Color monitor with video card capable of 16-bit color

Server Operating System

CiscoWorks VMS requires the following operating systems:

- Windows 2000 Professional, Server, and Advanced Server (Service Pack 3)

Note: Support for Advanced Server requires that Terminal Services be turned off.

Sun Solaris 2.8 with patches:

109742 has been replaced by 108528-13

109322 has been replaced by 108827-15

109279 has been replaced by 108528-13

108991 has been replaced by 108827-15

Java Requirements

Sun Java plug-in 1.3.1-b24

Client Requirements

Hardware

- PC-compatible computer with 300 MHz or faster Pentium processor
- Solaris SPARCstation or Sun Ultra 10

Client Operating System

- Windows 2000 Server or Professional Edition with Service Pack 3, or Windows XP SP1 with Microsoft VM.
- Solaris 2.8

Client Browser

- Internet Explorer 6.0 Service Pack 1, on Windows operating systems
- Netscape Navigator 4.79, on Windows 2000 Server or Professional Edition with Service Pack 3, or Windows XP; Netscape Navigator 4.76 on Solaris 2.8

The CiscoWorks Management Center for Firewalls, and CiscoWorks Management Center for VPN Routers, are supported on Internet Explorer 6.0, but not on Netscape Navigator. In addition to supporting Internet Explorer The Management Center for IDS and the Monitoring Center for Security are also supported on Netscape Navigator.

Service and Support

CiscoWorks products are eligible for coverage under the Cisco Software Application Service (SAS) program. This service program offers customers contract-based 24-hour access to the Cisco Technical Assistance Center (TAC), full Cisco.com privileges, and software maintenance updates. A SAS contract ensures that customers have easy access to the information and services needed to stay current with newly supported device packages, patches, and minor updates. For further information about service and support offerings, contact your local sales office.

Ordering Information

CiscoWorks VMS is available for purchase through regular Cisco sales and distribution channels worldwide. CiscoWorks VMS includes all the necessary components needed for an independent installation on a Microsoft Windows or Sun Solaris workstation.

For More Information

For more information, go to http://www.cisco.com/warp/public/cc/pd/wr2k/vpmnso/prodlit/ or send e-mail to ciscoworks@cisco.com

HOME SOFTWARE SUPPORT FOR FEATURES SOFTWARE SUPPORT FOR HARDWARE

Search By Features | **Search By Release** | Compare Releases

Major Release	12.2T
Product Family	1751
Releases	12.2(15)T
Feature Set	IP/ADSL/VOICE PLUS IPSEC 3DES

Some features are dependent on product model, interface modules (i.e. Line Cards & Port Adapters), and/or require a software feature license.

Your selections are supported by the following

Image Name	DRAM	Flash	Product Number	Options
c1700-k9sv3y7-mz.12.2-15.T	96	16	S17C7VK9-12215T= S17C7VK9-12215T	Search For MIBs Compare Images

AAA Broadcast Accounting
AAA DNIS Map for Authorization
AAA Server Group
AAA Server Group Deadtimer
AAA Server Group Enhancements
AAA Server Groups Based on DNIS
Ability to Disable Xauth for Static IPsec Peers
Accounting of VPDN Disconnect Cause
ACL Authentication of Incoming RSH and RCP
ACL Sequence Numbering
Additional Vendor-Proprietary RADIUS Attributes
Address Resolution Protocol (ARP)
ADSL - Asymmetric Digital Subscriber Line Support
Advanced Encryption Standard (AES)
Always On Dynamic ISDN (AO/DI)
Analog DID (Direct Inward Dial)
Asynchronous Rotary Line Queuing
Asynchronous Serial Traffic Over UDP
ATM-DXI
Autoinstall Using DHCP for LAN Interfaces
Automatic modem configuration
Bandwidth Allocation Control Protocol (BACP)
BGP
BGP 4
BGP 4 Multipath Support
BGP 4 Prefix Filter and In-bound Route Maps
BGP 4 Soft Config
BGP Conditional Route Injection
BGP Hide Local-Autonomous System
BGP Hybrid CLI Support
BGP Link Bandwidth
BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS-VPN
BGP Named Community Lists
BGP Policy Accounting
BGP Prefix-Based Outbound Route Filtering
BGP Soft Reset
BRI QSIG Protocol
Call Admission Control for H.323 VoIP Gateways
Caller ID on Analog Voice Interfaces
CEF on Multipoint GRE Tunnels
CEF/dCEF - Cisco Express Forwarding

CEFv6/dCEFv6 - Cisco Express Forwarding
Certificate Auto-Enrollment
Certificate Enrollment Enhancements
Certificate Security Attribute-Based Access Control
Certification Authority Interoperability (CA)
CGMP - Cisco Group Management Protocol
Challege Handshake Authentication Protocol (CHAP)
Channelized E1 Signaling
Circuit Interface Identification Persistence for SNMP
Cisco Discovery Protocol (CDP)
Cisco Discovery Protocol (CDP) - IPv6 Address Family Support for Neighbor I...
Cisco Discovery Protocol (CDP) over ATM
Class Based Weighted Fair Queuing (CBWFQ)
Class-Based Packet Marking
CLI String Search
CNS Agents SSL Security
CNS Configuration Agent
CNS Event Agent
CNS Flow-Through Provisioning
Commented IP Access List Entries
Committed Access Rate (CAR)
Compression Control Protocol
CT1/RBS (Robbed Bit Signaling)
CUG Selection Facility Suppress Option
Custom Queueing (CQ)
Customer Profile Idle Timer Enhancements for Interesting Traffic
Default Passive Interface
DF Bit Override Functionality with IPSec Tunnels
DHCP Accounting
DHCP Client
DHCP Client - Dynamic Subnet Allocation API
DHCP Client on WAN Interfaces
DHCP ODAP Server Support
DHCP On Demand Address Pool (ODAP) Manager for non-MPLS VPN pools
DHCP Proxy Client
DHCP Relay Agent Support for Unnumbered Interfaces
DHCP Secured IP Address Assignment
DHCP Server - On Demand Address Pool Manager
DHCP Server - Option to Ignore all BOOTP Requests
DHCP Server Options - Import and Autoconfiguration
DHCP Server-Easy IP Phase 2
Dial backup
Dial Peer Enhancements
Dial-on-demand
Dialer Idle Timer Inbound Traffic Configuration
Dialer Persistent
Dialer profiles
Dialer Watch
Dialer Watch Connect Delay
Differentiated Services
Diffserv Compliant WRED
Distinguished Name Based Crypto Maps
D[illegible] Enhancements: PGM RFC-3208 Compliance
DNS-based X.25 routing
DNS Lookups over an IPv6 Transport
Double Authentication
Dynamic Multiple Encapsulation for Dial-in over ISDN
Dynamic Multipoint VPN (DMVPN)
E1 R2 Signaling
Easy IP (Phase 1)
Easy VPN Remote
Easy VPN Remote : Multiple Inside Interface Enhancements
Easy VPN Remote Enhancements
Easy VPN Remote: Local-Address Support
Easy VPN Remote: Manual Tunnel Control Enhancement
Easy VPN Server
Encrypted Vendor Specific Attributes
Enhanced IGRP (EIGRP)
Enhanced IGRP Stub Routing
Enhanced ITU-T G.168 Echo Cancellation
Enhanced Local Management Interface (ELMI)
Enhanced Password Security
Enhanced Tracking Support.
Exporting and Importing RSA Keys
Fast Fragmentation (Fast-Switched Fragmented IP Packets)

Fast-Switched Policy Routing
Flow-Based WRED
Frame Relay
Frame Relay Encapsulation
Frame Relay End-to-End Keepalive
Frame Relay Fragmentation (FRF.12)
Frame Relay FRF.9 Payload Compression
Frame Relay PVC Interface Priority Queueing
Frame Relay Router ForeSight
Frame Relay SVC Support (DTE)
Frame Relay Switching
Frame Relay Switching Diagnostics and Troubleshooting
Frame Relay Switching Enhancements: Shaping and Policing
Frame Relay Traffic Shaping (FRTS)
Frame Relay Voice Adaptive Traffic Shaping
FXO Answer and Disconnect Supervision
G.SHDSL Symmetric DSL Support
Gatekeeper Ecosystem Interoperability
Generic Routing Encapsulation (GRE)
Generic Routing Encapsulation (GRE) Tunnel Keepalive
Generic Traffic Shaping (GTS)
GLBP: Gateway Load Balancing Protocol
H.323 Call Redirection Enhancements
H.323 Scalability and Interoperability Enhancements for Gateways
Half bridge/half router for CPP and PPP
Hoot and Holler over IP
HSRP - Hot Standby Router Protocol
HSRP - Hot Standby Router Protocol and IPSec
HSRP support for ICMP Redirects
HTTP 1.1 Web Server
HTTPS - HTTP with SSL 3.0
iBGP Multipath Load Sharing
IEEE 802.1p Support
IEEE 802.1Q VLAN Support
IGMP Version 3
IGMP Version 3 - Explicit Tracking of Hosts, Groups, and Channels
IKE - Initiate Aggressive Mode
IKE Extended Authentication (Xauth)
IKE Mode Configuration
IKE Security Protocol
IKE Shared Secret Using AAA Server
Integrated routing and bridging (IRB)
Interface Alias Long Name Support
Interface Index Display
Interface Range Specification
IP Enhanced IGRP Route Authentication
IP Header Compression Enhancement - PPPoATM and PPPoFR Support
IP Multicast Load Splitting across Equal-Cost Paths
IP Named Access Control List
IP Precedence for GRE Tunnels
IP Routing
IP RTP Priority
IP Summary Address for RIPv2
IP to ATM CoS, per-VC WFQ and CBWFQ
IP-to-ATM CoS
IPSec MIB Support for Cisco IPSec VPN Management
IPsec NAT Transparency
IPSec Network Security
IPSec Through Network Address Translation Support
IPSec Triple DES Encryption (3DES)
IPSec VPN High Availability Enhancements
IPv6 Extended Access Control List
IPv6 for Cisco IOS Software
ISDN
ISDN Advice of Charge (AOC)
ISDN Caller ID Callback
ISDN Cause Code Override
ISDN Leased Line at 128kbps
L2TP Dial-Out
L2TP Layer 2 Tunneling Protocol
L2TP Security
L2TP Tunnel Preservation of IP TOS
Layer 2 Forwarding-Fast Switching
Lock and Key
Low Latency Queueing (LLQ)

Low Latency Queueing (LLQ) for Frame Relay
Low Latency Queueing (LLQ) with Priority Percentage Support
Manual certificate enrollment (TFTP and cut-and-paste)
MD5 File Validation
Message Banners for AAA Authentication
Microsoft Point-to-Point Compression (MPPC)
MLPPP with Link Fragmentation Interleave (LFI)
Modem User Interface Option
Modular QoS CLI (MQC)
Modular QoS CLI (MQC) - Based Frame Relay Traffic Shaping
Modular QoS CLI (MQC) Three-Level Hierarchical Policer
MPLS VPN support for EIGRP between Provider Edge (PE) and Customer Edge (CE...
MS Callback
MS-CHAP Version 1
Multicast NAT
Multicast Source Discovery Protocol (MSDP)
Multilink PPP
Multiple RSA Keypair Support
Named Method Lists for AAA Authorization and Accounting
NAT Default Inside Server Enhancement
NAT Stateful Fail-over of Network Address Translation
NAT-Network Address Translation
NAT-Support for NetMeeting Directory (Internet Locator Service - ILS)
NAT-Support of H.323v2 RAS
NAT-Support of IP Phone to Cisco Call Manager
NBAR - Network-based Application Recognition
NBAR Real-time Transport Protocol Payload Classification
Netflow
NetFlow Aggregation
NetFlow Multiple Export Destinations
NetFlow Policy Routing (NPR)
NetFlow ToS-Based Router Aggregation
Network Time Protocol (NTP)
Next Hop Resolution Protocol (NHRP)
On Demand Routing (ODR)
OSPF
OSPF ABR type 3 LSA Filtering
OSPF Flooding Reduction
OSPF Not-So-Stubby Areas (NSSA)
OSPF On Demand Circuit (RFC 1793)
OSPF Packet Pacing
OSPF Sham-Link Support for MPLS VPN
OSPF Stub Router Advertisement
OSPF Support for Multi-VRF on CE Routers
PAD Subaddressing
Parse Bookmarks
Parser Cache
Password Authentication Protocol (PAP)
Per-User Configuration
Percentage-Based Policing and Shaping
PGM Router Assist
PIM Dense Mode State Refresh
PIM MIB Extension for IP Multicast
PIM Multicast Scalability
PIM Version 1
PIM Version 2
Policy-Based Routing (PBR)
PPP
PPP over ATM
PPP over ATM (IETF-Compliant)
PPP over Frame Relay
PPPoE Client
PPPoE on Ethernet
Pre-fragmentation For Ipsec VPNs
PRI QSIG protocol
Priority Queueing (PQ)
Privilege Command Enhancement
QoS Device Manager (QDM)
QoS for Virtual Private Networks
QoS Packet Marking
QoS Priority Percentage CLI Support
RADIUS
RADIUS Attribute 44 (Accounting Session ID) in Access Requests
RADIUS Attribute 82: Tunnel Assignment Id
RADIUS Centralized Filter Management

RADIUS for Multiple User Datagram Protocol Ports
RADIUS Route Download
RADIUS Tunnel Preference for Load Balancing and Fail-over
Random Early Detection (RED)
Rate Queues for SVC's per sub-interface
Reflexive Access Lists
Response Time Reporter (RTR)
Response Time Reporter (RTR) enhancements
Reverse Path Forwarding - Source Exists only
Reverse Route Injection (RRI)
RIP
RMON events and alarms
Rotating Through Dial Strings
RSVP - Resource Reservation Protocol
RSVP Local Policy Support
RSVP Support for Frame Relay
RSVP support for LLQ
RTP Header Compression
Secure Copy (SCP)
Secure Shell SSH Support over IPv6
Secure Shell SSH Terminal-line access
Secure Shell SSH Version 1 Integrated Client
Secure Shell SSH Version 1 Server Support
Service Assurance Agent (SAA) APM Application Performance Monitor
Service Assurance Agent (SAA) DHCP Operation
Service Assurance Agent (SAA) Distribution of Data
Service Assurance Agent (SAA) DLSW Operation
Service Assurance Agent (SAA) DNS Operation
Service Assurance Agent (SAA) Frame Relay Operation
Service Assurance Agent (SAA) FTP Operation
Service Assurance Agent (SAA) History Statistics
Service Assurance Agent (SAA) HTTP Operation
Service Assurance Agent (SAA) ICMP Echo Operation
Service Assurance Agent (SAA) ICMP Path Echo Operation
Service Assurance Agent (SAA) Jitter Operation
Service Assurance Agent (SAA) MPLS VPN Operation
Service Assurance Agent (SAA) One Way Jitter
Service Assurance Agent (SAA) Path Jitter
Service Assurance Agent (SAA) Reaction Threshold
Service Assurance Agent (SAA) Scheduling Operation
Service Assurance Agent (SAA) SNA LU2 Echo
Service Assurance Agent (SAA) SNMP Support
Service Assurance Agent (SAA) TCP Connect Operation
Service Assurance Agent (SAA) UDP Echo Operation
Show Command Redirect
Simple Network Time Protocol (SNTP)
Single Rate 3-Color Marker for Traffic Policing
Snapshot routing
SNMP (Simple Network Management Protocol)
SNMP Inform Request
SNMP Manager
SNMP Support for IOS vLAN Subinterfaces
SNMP Support for vLAN (ISL, DOT1Q) Subinterfaces
SNMP Support over VPN
SNMPv2C
Source Interface Selection for Outgoing Traffic with Certificate Authority ...
Spanning Tree Protocol (STP)
Spanning Tree Protocol (STP) Extension
Standard IP Access List Logging
Static Cache Entry for IPv6 Neighbor Discovery
Stub IP Multicast Routing
Subnetwork Bandwidth Manager (SBM)
Switched Multimegabit Data Service (SMDS)
T.38 Fax Relay for VoIP H.323
T1 Channel Associated Signaling (CAS)
T1/E1 Voice PRI Q.931
Tacacs SENDAUTH function
Tacacs Single Connection
TACACS+
TCP Window Scaling
Time-Based Access Lists Using Time Ranges
Timer and Retry Enhancements for L2TP and L2F
Traffic Policing
Transparent Bridging
Triggered RIP

Trusted Root Certification Authority
Trustpoint CLI
Tunnel Endpoint Discovery
Tunnel Type of Service (TOS)
Turbo Flooding of UDP Datagrams
UDLR Tunnel ARP and IGMP Proxy
UDP forwarding support of IP Redundancy Virtual Router Group (VRG)
Uni-Directional Link Routing (UDLR)
Unicast Reverse Path Forwarding (uRPF)
User Maximum Links
Virtual Interface Template Service
Virtual Private Dial-up Network (VPDN)
Virtual Profiles
Virtual Router Redundancy Protocol (VRRP)
Voice Call Tuning
Voice DSP Control Message Logger
Voice over Frame Relay (FRF.11)
Voice Over IP
VoIP Call Admission Control using RSVP
VoIP Outgoing Trunk Group Identification and Carrier ID for Gateways
VPDN Group Session Limiting
VPN Device Manager (VDM)
VPN Tunnel Management
WCCP Redirection on Inbound Interfaces
WCCP Version 1
WCCP Version 2
Weighted Fair Queueing (WFQ)
Weighted RED (WRED)
Wildcard Pre-Shared Key
WRED Enhancement - Explicit Congestion Notification (ECN)
x Digital Subscriber Line (xDSL) Bridge Support
X.25
X.25 Closed User Group
X.25 Failover
X.25 Load Balancing
X.25 on ISDN D-Channel
X.25 over Frame Relay (Annex G)
X.25 over TCP (XOT)
X.25 Over TCP Profiles
X.25 Remote Failure Detection
X.25 Suppression of Security Signaling Facilities
X.25 Switch Local Acknowledgement
X.25 Switching between PVCs and SVCs
X.25 Terminal Line Security for PAD Connections
X.28 Emulation

New and Changed Information

The following is a list of the new features that are supported in Cisco IOS Release 12.2 T. For additional information regarding the features supported in Cisco IOS Release 12.2 T, refer to the new feature documentation at the following location:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/index.htm

Determining Platform Support Through Cisco Feature Navigator

Cisco IOS software is packaged in feature sets that are supported on specific platforms. To get updated information regarding platform support for the new features listed in Cisco IOS Release 12.2 T, access Cisco Feature Navigator. Cisco Feature Navigator is regularly updated as new platform support is added for features.

Cisco Feature Navigator is a web-based tool that enables you to determine which Cisco IOS software images support a specific set of features and which features are supported in a specific Cisco IOS image. You can search by feature or release. Under the release section, you can compare releases side by side to display both the features unique to each software release and the features in common.

To access Cisco Feature Navigator, you must have an account on Cisco.com. If you have forgotten or lost your account information, send a blank e-mail to cco-locksmith@cisco.com. An automatic check will verify that your e-mail address is registered with Cisco.com. If the check is successful, account details with a new random password will be e-mailed to you. Qualified users can establish an account on Cisco.com by following the directions found at this URL:

http://www.cisco.com/register

Cisco Feature Navigator is updated regularly when major Cisco IOS software releases and technology releases occur. For the most current information, go to the Cisco Feature Navigator home page at the following URL:

http://www.cisco.com/go/fn

Note MPLS Class of Service is now referred to as MPLS Quality of Service. This transition reflects the growth of MPLS to encompass a wider meaning and highlight the path toward *Any Transport over MPLS.*

New Hardware Features Supported in Cisco IOS Release 12.2(15)T

The following new hardware features are supported in Cisco IOS Release 12.2(15)T. Some of these features may have been introduced on other hardware platforms in earlier Cisco IOS software releases.

1 Port Enhanced ATM Port Adapter with Support for 8K VCs

The PA-A6 is a series of single-width, single-port, ATM port adapters for Cisco 7200 series and Cisco 7401ASR routers. With advanced ATM features, the PA-A6 supports broadband aggregation, WAN aggregation, and campus/MAN aggregation.

1 and 2-port T1/E1 Multiflex Voice/WAN Interface Card

1- and 2-port T1/E1 Multiflex Voice/WAN interface cards provide basic structured and unstructured service for T1 or E1 networks. The card provides fractional data service and channelized voice services and TDM drop and insert (voice/data integration) services.

1- and 2-Port V.90 Modem WICs for Cisco 1720, 1751 and 1760 Routers

The one- and two-port V.90 Modem WICs expand the extensive range of WICs currently available on these routers. The modem WIC cards provide cost-effective basic telephone service connectivity to allow remote router management, asynchronous Dial-on-Demand routing (DDR) and dial back-up, and low-density remote access server (RAS) services.

Catalyst 4500 Access Gateway Module 16-port RJ21 FXS Module (WS-U4604-16FXS)

The 16-Port RJ21 FXS module for the Catalyst 4500 Access Gateway Module is a high density analog phone and fax interface. By providing service to analog phones and fax machines, the sixteen Foreign Exchange Station (FXS) ports emulate a PSTN central office (CO) or PBX.

Catalyst 4500 AGM Voice/WAN Bundle (WS-X4604-VOICE)

The Cisco Catalyst 4500 AGM Voice/WAN bundle provides integrated telephony and routing services to the Cisco Catalyst 4000 series and Cisco Catalyst 4500 series switches. The Cisco Catalyst 4500 AGM Voice/WAN bundle consists of the following products:

- Cisco Catalyst 4500 Access Gateway Module (WS-X4604-GWY)
- Cisco Catalyst 4500 AGM 96-channel Digital Signal Processor Set (4x6 DSP SIMMS) (WS-X4604-DSP)
- Cisco Catalyst 4500 AGM 128MB RAM DIMM (MEM-C4K-AGM128M)

Gigabit Ethernet Network Module

The Gigabit Ethernet (GE) network module provides gigabit connectivity. The throughput of the interface depends on the platform. The network module has one GBIC slot to carry any standard copper or optical Cisco GBIC, including CWDM. The GE network module optimizes the performance for branch office customers by offering a high-speed uplink to both existing and new LAN or WAN environments. The extended reach of the provided fiber connectivity allows customers the option of interconnecting branch offices with Gigabit Ethernet and avoids expensive leased serial lines. Metro area service providers now have additional options when connecting their customers in branch offices to MANs.

The Gigabit Ethernet network module is supported on the following platforms: Cisco 2691, Cisco 3660, Cisco 3725, and Cisco 3745.

MRP300

The Multiservice Route Processor 300 (MRP300) is a voice-and-data-capable router that can carry voice traffic over an IP network and that can link small-to-medium-size remote Ethernet LANs to central offices over WAN links. The MRP300 has a slot for expanding flash memory; two slots that support WICs, VWICs, and VICs; two PVDM slots for adding DSPs; and a DIMM slot for upgrading DRAM.

MRP3-8FXS

The MRP3-8FXS contains an 8-port Foreign Exchange Station (FXS) module and a slot for any VIC, WIC, or VWIC module that supports digital and analog voice trunks and WAN routing interfaces. The MRP3-8FXS is similar to the analog station interface 81 card (ASI81), with the exception that the ASI81 does not have onboard Flash memory.

MRP3-16FXS

The MRP3-16FXS contains a 16-port Foreign Exchange Station (FXS) module. The MRP3-16FXS is similar to the analog station interface 161 card (ASI160), except that the ASI160 does not have onboard Flash memory.

NPE-G1

The NPE-G1 is the first network processing engine for the Cisco 7200 VXR routers to provide the functionality of both a network processing engine and an I/O controller. If used without an I/O controller, an I/O blank panel must be in place.

Although its design provides I/O controller functionality, it can also work with any I/O controller supported in the Cisco 7200 VXR routers. The NPE-G1, when installed with an I/O controller, provides the primary input/out functionality; that is, the NPE-G1 input/out functionality enhances that of the existing I/O controller. However, when both the I/O controller and NPE-G1 are present, the functionality of the auxiliary port and console port are on the I/O controller.

The NPE-G1 maintains and executes the system management functions for the Cisco 7200 VXR routers and also holds the system memory and environmental monitoring functions.

The NPE-G1 consists of one board with multiple interfaces. It is keyed so that it can be used only in the Cisco 7200 VXR routers.

RPM-XF Card for the MGX 8850

The RPM-XF card is a next-generation, high-performance model of the RPM for the MGX 8850 platform, using PXM45 processor modules. It is a router module based on an RM7000A MIPS processing engine.

The RPM-XF hardware provides forwarding technology for packet switching capabilities in excess of 2-million pps. The forwarding engine is packet based and is interfaced to the midplane of the system through a combination of switch interface technologies.

SDH/STM-1 Trunk Card for Cisco AS5850 Universal Gateway

Channelized STM-1 provides a high speed remote access aggregation solution with 63 E1s and 1890 DSO channels. The SDH/STM-1 trunk card is a high density mux/demux card that takes in an STM-1 (SDH) pipe, used to transport up to 1890 DS0 channels. The SDH/STM-1 trunk card provides an ingress connection between the Cisco AS5850 universal gateway and external networks. The SDH/STM-1 trunk card has a 155-mbps channelized SDH physical interface in a standard dial feature card (DFC) format. The SDH interface supports channelization to 64 kbps and connects to single mode fiber optic supporting intermediate reach PPP applications.

New Software Features in Cisco IOS Release 12.2(15)T

The following new features are supported in Cisco IOS Release 12.2(15)T. Some of these features may have been introduced on other hardware platforms in earlier Cisco IOS software releases.

ADSL over ISDN

Cisco 826 routers connect corporate telecommuters and small offices via Internet service providers (ISPs) over asymmetric digital subscriber lines (ADSLs) to corporate LANs and the Internet. The router can provide bridging and multiprotocol routing between LAN and WAN ports. Cisco 826 routers provide connectivity to an ISDN network through an ADSL port.

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T. This release is porting the feature into the Cisco 820, Cisco SOHO 70, Cisco SOHO 76, Cisco SOHO 77, and Cisco SOHO 77H platforms.

Any Transport over MPLS (AToM)

Any Transport over MPLS (AToM) transports Layer 2 packets over a Multiprotocol Label Switching (MPLS) backbone. AToM enables service providers to connect customer sites with existing data link layer (Layer 2) networks, by using a single, integrated, packet-based network infrastructure—a Cisco MPLS network. Instead of separate networks with network management environments, service providers can deliver Layer 2 connections over an MPLS backbone. AToM provides a common framework to encapsulate and transport supported Layer 2 traffic types over an MPLS network core. AToM supports the following transport types:

- ATM AAL5 over MPLS
- ATM Cell Relay over MPLS
- Ethernet over MPLS
- Frame Relay over MPLS
- PPP over MPLS
- HDLC over MPLS

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/atomt/index.htm

ARP Optimization

The Address Resolution Protocol (ARP) is used to map a Layer 3 IP address to a Layer 2 MAC address. A Cisco router stores this mapped information in an ARP table. The ARP table provides MAC rewrite information when the router is forwarding a packet using Cisco Express Forwarding (CEF) or other IP switching technologies.

In previous versions of Cisco IOS software, the ARP table was organized for easy searching on an entry based on the IP address. However, there are cases such as interface flapping on the router and a topology change in the network in which all related ARP entries need to be refreshed for correct forwarding. This situation could consume a significant amount of CPU time in the ARP process to search and clean up all the entries. The ARP Optimization feature improves ARP performance by reducing the ARP searching time by using an improved data structure.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios120/120newft/120limit/120s/120s22/arpoptim.htm

Asynchronous Call Queueing by Role

The Asynchronous Call Queueing by Role feature allows priority users who are making Telnet connection requests to busy asynchronous rotary groups to be placed at the head of the queue when asynchronous rotary line queueing is enabled. If a second priority user makes a Telnet connection request, this user will be placed behind the first priority user at the head of the queue. This feature allows a priority user to access the first available line. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftasyncq.htm

AutoQoS - VoIP

The AutoQoS - VoIP feature allows you to automate the delivery of quality of service (QoS) on your network, and provides a means for simplifying the implementation and provisioning of QoS for voice over IP (VoIP) traffic. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftautoq1.htm

BGP Hybrid CLI Support

The BGP Hybrid CLI Support feature allows the network operator to configure the Border Gateway Protocol (BGP) using the Network Layer Reachability Information (NLRI) format for IPv4 unicast commands and the address-family identifier (AFI) format for address family commands, such as IPv6, VPNv4, and Connectionless Network Service (CLNS) protocol commands. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftbhycli.htm

BGP Increased Support of Numbered AS-Path Access Lists to 500

The BGP Increased Support of Numbered AS-Path Access Lists to 500 feature is an enhancement for Border Gateway Protocol (BGP) autonomous system access lists. This enhancement increases the maximum number autonomous system access lists from 199 to 500. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftiaaspa.htm

BGP Nonstop Forwarding (NSF) Awareness

Nonstop Forwarding (NSF) awareness allows a router to assist NSF-capable neighbors to continue forwarding packets during a switchover operation or during a well-known failure condition. The BGP Nonstop Forwarding Awareness feature allows an NSF-aware router that is running BGP to forward packets along routes that are already known for a router that is performing a switchover operation or is in a well-known failure mode. This capability allows the BGP peers of the failing router to retain the routing information that is advertised by the failing router and continue to use this information until the failed router has returned to normal operating behavior and is able to exchange routing information. The peering session is maintained throughout the entire NSF operation.

Cisco Nonstop Forwarding (NSF) works with the Stateful Switchover (SSO) feature in Cisco IOS software. SSO is a prerequisite of Cisco NSF. NSF works with SSO to minimize the amount of time a network is unavailable to its users following a switchover. The main objective of Cisco NSF is to continue forwarding IP packets following a Route Processor (RP) switchover. NSF/SSO is configured in the core of your network, and NSF awareness is configured on iBGP peers in the core and the edge of the network.

BGP Restart Session After Max-Prefix Limit

The BGP Restart Session After Max-Prefix Limit feature enhances the capabilities of the **neighbor maximum-prefix** command with the introduction of the **restart** keyword. This enhancement allows the network operator to configure the time interval at which a peering session is reestablished by a router when the number of prefixes that have been received from a peer has exceeded the maximum prefix limit. The **restart** keyword has a configurable timer argument that is specified in minutes. The time range of the timer argument is from 1 to 65535. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftbrsamp.htm

BGP Route-Map Policy List Support

The BGP Route-Map Policy List Support feature introduces new functionality to Border Gateway Protocol (BGP) route maps. This feature adds the capability for a network operator to group route-map match clauses into a named list called a policy list. A policy list functions like a macro within a route map. When the policy list is referenced within a route map with the **match policy-list** command, all match statements in the policy list are executed. Policy lists can be used for all applications of a route map and for redistribution between routing protocols. Policy lists can coexist with configured match and set clauses within the same subblock. Policy lists, however, do not support set statements, and policy lists are not supported by IP routing policy. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftbgprpl.htm

BRI QSIG Protocol

BRI QSIG is the QSIG support over BRI interface. QSIG protocol support allows Cisco voice gateways to connect PBXs, key telephone systems (KTS), and central office switches that communicate by using the QSIG protocol.

Certificate Security Attribute-Based Access Control

Under the IP Security (IPSec) protocol, certification authority (CA) interoperability permits Cisco IOS devices and a CA to communicate so that the Cisco IOS device can obtain and use digital certificates from the CA. Certificates contain several fields that are used to determine whether a device or user is authorized to perform a specified action. The Certificate Security Attribute-Based Access Control feature adds fields to the certificate that allow specifying an access control list (ACL) to create a certificate-based ACL. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftcrtacl.htm

Cisco Easy VPN Remote Enhancements

The Cisco Easy VPN Remote Enhancements feature improve the capabilities of the Cisco Easy VPN Client feature first delivered in Cisco IOS Release 12.2(4)YA. Additional capabilities include the following:

- Establishes and terminates the IP Security (IPSec) Virtual Private Network (VPN) tunnel on demand.
- Configures up to three inside interfaces and four outside tunnels for outside interfaces on the VPN client.
- Restores the Network Address Translation (NAT) configuration automatically when the IPSec VPN tunnel is disconnected.
- Supports a **local-address** attribute that specifies which interface is used to source the Easy VPN tunnel traffic.
- Supports the **loopback** interface for Cisco uBR905 and Cisco uBR925 cable access routers with the **cable-modem dhcp-proxy interface** command.
- Enhances Peer Hostname.
- Supports Proxy DNS Server.
- Supports Cisco PIX Firewall Version 6.2 and Cisco IOS Firewall configurations on all platforms.
- Supports Simultaneous Easy VPN Client and Cisco Easy VPN Server on the same Cisco 1700 series routers.
- Uses a built-in web interface to manage the Cisco Easy VPN Remote feature on the Cisco uBR905 and Cisco uBR925 cable access routers.

These enhancement were introduced in Cisco IOS Release 12.2(8)YJ to support Cisco 806, Cisco 826, Cisco 827, and Cisco 828 routers; Cisco 1700 series routers; and Cisco uBR905 and Cisco uBR925 cable access routers. This release is adding support for Cisco 2600, Cisco 3600, and Cisco 3700 series routers. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftezvpnr.htm

Cisco IOS Firewall Stateful Inspection of ICMP

The Cisco IOS Firewall Stateful Inspection of ICMP feature addresses the limitation of qualifying Internet Control Management Protocol (ICMP) messages into either a malicious or benign category by allowing the Cisco IOS firewall to use stateful inspection to "trust" ICMP messages that are generated within a private network and to permit the associated ICMP replies. Thus, network administrators can debug network issues without needing to block ICMP messages from entering the network because of possible intruders.

Cisco IOS Firewall Support for SIP

The Cisco IOS Firewall Support for SIP feature integrates Cisco IOS firewalls, the Voice over IP (VoIP) protocol, and Session Initiation Protocol (SIP) within a Cisco IOS based platform, enabling better network convergence.

Cisco IOS Firewall Websense URL Filtering

The Cisco IOS Firewall Websense URL Filtering feature enables your Cisco IOS firewall (also known as Cisco Secure Integrated Software [CSIS]) to interact with the Websense URL filtering software, thereby allowing you to prevent users from accessing specified websites on the basis of some policy. The Cisco IOS Firewall feature works with the Websense server to know whether a particular URL should be allowed or denied (blocked). Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122y/122yu11/ftwebsen.htm

Cisco IOS Software Feature Removal—Phase II

The Cisco IOS Software Feature Removal feature is an engineering project to permanently remove selected legacy features (or components) from the Cisco IOS code. These features will not be available in future releases of Cisco IOS software. The legacy features that have been removed as of Cisco IOS Release 12.2(15)T are as follows:

- LAN Extension
- Netware Asynchronous Services Interface (NASI)
- XRemote

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftjencrg.htm

Cisco IOS Telephony Service Version 2.1

Cisco IOS Telephony Service (ITS) offers an entry-level IP telephony solution integrated directly into Cisco IOS software. Customers can now deploy voice, data, and IP telephony on a single platform for their small offices. ITS offers a core set of phone features that customers commonly require for their everyday business needs, and leverages the wide array of voice capabilities that are available in Cisco IOS software to provide a very robust IP telephony offering for the small office environment.

Cisco ITS version 2.1 provides support for the following new features:

- additional languages
- phone loads for Cisco CallManager 3.1 and above
- GUI customization capability
- Live Feed Music on Hold (MOH)
- H450.2 and H450.3 support in Cisco IOS software
- Consultative Transfer
- Hookflash Transfer

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/itsv21/index.htm

Cisco Mobile Networks—Priority Home Agent Assignment

The mobile router currently preconfigures home agents with different priorities, registering with only the highest priority home agent. However, there are situations in which the mobile router roams to an area where a closer home agent is more desirable to register with. The Cisco Mobile Networks—Priority Home Agent Assignment feature allows a mobile router to register with the closer home agent using the existing home agent priority configurations on the mobile router and care-of address access lists configured on the home agent. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftdynaha.htm

Cisco Mobile Networks—Static Collocated Care-of Address

The Cisco Mobile Networks—Static Collocated Care-of Address feature allows a mobile router to roam to foreign networks where foreign agents are not deployed. Before the introduction of this feature, the mobile router was required to use a foreign agent care-of address when roaming. Now a roaming interface with a static IP address configured on the mobile router itself works as the collocated care-of address (CCoA).

Cisco Mobile Networks—Tunnel Templates for Multicast

The Cisco Mobile Networks—Tunnel Templates for Multicast feature allows the configuration of multicast on statically created tunnels to be applied to dynamic tunnels brought up on the home agent and mobile router. A tunnel template is defined and applied to the tunnels between the home agent and the mobile router. The mobile router can now roam carrying multicast sessions to its mobile networks. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftmultic.htm

Cisco Survivable Remote Site Telephony Version 2.1

The Cisco Survivable Remote Site Telephony (SRST) feature offers enterprises a reliable mechanism for providing continuous IP telephony services to small branch offices in the event of an outage. SRST enables enterprises to build large IP telephony networks using centralized call processing resources.

SRST Version 2.1 provides support for the Cisco IP Phone Extension Module 7914, Unity Voice Mail integration, additional languages for Cisco IP Phone 7940 and Cisco IP Phone 7960 display, higher directory number (DN) maximums, and a new command for creating global prefixes. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/srst21/index.htm

Note This feature was originally introduced in Cisco IOS Release 12.2(11)YT. This release is porting the feature into the Cisco 1750, Cisco 1751, Cisco 2420, Cisco 2610–2613, Cisco 2610XM–2611XM, Cisco 2620–2621, Cisco 2620XM–2621XM, Cisco 2650–2651, Cisco 2650XM–2651XM, Cisco 2691, Cisco 3640, Cisco 3640A, Cisco 3660, Cisco 3725, Cisco 3745, and Cisco 7200 series platforms.

Class-Based Policer for the DiffServ AF PHB

The Class-Based Policer for the DiffServ AF PHB feature is based on RFC 2697 *A Single Rate Three Color Marker*. The packet stream is metered and packets are marked "conform," "exceed," or "violate." Marking is based on a Committed Information Rate (CIR) and two associated burst sizes, a Committed Burst Size (CBS) and an Excess Burst Size (EBS). A packet is marked "conform" if it does not exceed the CBS, "exceed" if it exceeds the CBS but not the EBS, and "violate" otherwise.

Note This feature was originally introduced in Cisco IOS Release 12.1(5)T. This release is porting the feature into the Cisco 820 platform.

Clear Channel T3/E3 with Integrated CSU/DSU

Nonchannelized (Clear Channel) T3/E3 service is delivered as a T3/E3 pipe with the bandwidth being 28x24x64k for T3 or 16x32x64k for E3. Clear Channel T3/E3 service is generally used in point-to-point applications (one customer sending data to one remote site). Any subdivision of bandwidth is performed at each customer site rather than at the central office. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122y/122yt/122yt11/ft_te3nm.htm

Clear IPC Statistics

This existing feature provides a way to clear and reset the interprocess communications (IPC) statistics. When debugging IPC problems, the ipc stat counters are clearable, making it easier to diagnose the problem.

DHCP Accounting

The DHCP Accounting feature introduces authentication, authorization, and accounting (AAA) and Remote Authentication Dial-In User Service (RADIUS) support for Dynamic Host Configuration Protocol (DHCP) configuration. The introduction of AAA and RADIUS support improves public wireless LAN (PWLAN) security by sending secure START and STOP accounting messages. The configuration of this feature adds a layer of security that allows DHCP lease assignment and termination to be triggered for the appropriate RADIUS START and STOP accounting records so that the session state is properly maintained by upstream devices, such as a Service Selection Gateway (SSG). The additional security provided by this feature can help to prevent unauthorized clients or hackers from gaining illegal entry to the network by spoofing authorized DHCP leases. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftdhcpac.htm

DHCP ODAP Server Support

The DHCP ODAP Server Support feature introduces the capability to configure an IOS Dynamic Host Configuration Protocol (DHCP) server (or router) as a subnet allocation server. This capability allows the IOS DHCP server to be configured with a pool of subnets for lease to On-Demand Address Pool (ODAP) clients. Subnet pools can be configured for global ODAP clients or Multiprotocol Label Switched (MPLS) Virtual Private Network (VPN) ODAP clients on a per-client basis. The DHCP subnet allocation server creates bindings for the subnet leases and stores these leases in the DHCP database. This feature also supports database agents for subnet lease recovery. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftodapss.htm

DHCP Secured IP Address Assignment

The DHCP Secure IP Address Assignment feature introduces the capability to secure ARP table entries to Dynamic Host Configuration Protocol (DHCP) leases in the DHCP database. This feature secures and synchronizes the MAC address of the client to the DHCP binding, preventing unauthorized clients or hackers from spoofing the DHCP server and taking over a DHCP lease of an authorized client. When this feature is enabled and the DHCP server assigns an IP address to the DHCP client, the DHCP server adds a secure ARP entry to the ARP table with the assigned IP address and the MAC address of the client. This ARP entry cannot be updated by any other dynamic ARP packets, and this ARP entry will exist in the ARP table for the configured lease time or as long as the lease is active. The secured ARP entry can be deleted only by an explicit termination message from the DHCP client or by the DHCP server when the DHCP binding expires. This feature can be configured for a new DHCP network or used to upgrade the security of an existing network. The configuration of this feature does not interrupt service and is not visible to the DHCP client. The configuration of this feature does not interrupt service and is not visible to the DHCP client. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftdsiaa.htm

DHCP Server Import All Enhancement

When the import all DHCP pool configuration command is used, the DHCP Server Import All Enhancement feature allows options imported by one subsystem to coexist with options imported from another subsystem. When the session is terminated or the lease is released, the imported options are cleared from the DHCP server database.

DHCP Server—ODAP Support for Non-MPLS VPN Pools

The DHCP Server—On-Demand Address Pool Manager is a feature in which pools of IP addresses can be dynamically increased or reduced in size depending on the address utilization level. On-demand address pools (ODAPs) support address assignment using the Dynamic Host Configuration Protocol (DHCP) for customers using private addresses. Each ODAP is configured and associated with a particular Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN).

The DHCP Server—ODAP Support for Non-MPLS VPN Pools feature enhances the existing feature to provide support for non-MPLS VPN pools. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftondhcp.htm

E1 R2 Signaling

R2 signaling is an international signaling standard that is common to channelized E1 networks. The E1 R2 Signaling feature was introduced in Cisco IOS Release 11.3(2)T and is now supported on Cisco 1751 and Cisco 1760 platforms in Cisco IOS Release 12.2(15)T

EIGRP Nonstop Forwarding (NSF) Awareness

Nonstop Forwarding (NSF) awareness allows a router to assist NSF-capable neighbors to continue forwarding packets during a switchover operation or during a well-known failure condition. The EIGRP Nonstop Forwarding Awareness feature allows an NSF-aware router that is running EIGRP to forward packets along routes that are already known for a router that is performing a switchover operation or is in a well-known failure mode. This capability allows the EIGRP peers of the failing router to retain the routing information that is advertised by the failing router and continue to use this information until the failed router has returned to normal operating behavior and is able to exchange routing information. The peering session is maintained throughout the entire NSF operation.

Enhanced Debug Capabilities for Cisco Voice Gateways

The enhanced debugging capability for Cisco voice gateways provides improvements to the debugging output in order to identify and track a specific call in a multiple-call environment. Before the implementation of this feature, it was difficult to correlate call information between gateways or to identify specific debug messages associated with a single call, when multiple voice calls were simultaneously active. The output was unstructured and presented in a free form.

This feature adds a standardized header to the debug outputs of multiple voice modules, such as voice telephony service provider (VTSP), call control application program interface (CCAPI), session application (SSAPP), and interactive voice response (IVR). Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ft_dbgs2.htm

Enhanced Object Tracking

Prior to the introduction of the Enhanced Object Tracking feature, the Hot Standby Router Protocol (HSRP) had a simple tracking mechanism that allowed you to track the interface line protocol state only. If the line protocol state of the interface went down, the HSRP priority of the router was reduced, allowing another HSRP router with a higher priority to become active. The Enhanced Object Tracking feature separates the tracking mechanism from HSRP and creates a separate standalone tracking process that can be used by any other process as well as by HSRP. This feature allows tracking of other objects in addition to the interface line protocol state.

A client process, such as HSRP, Virtual Router Redundancy Protocol (VRRP), or Gateway Load Balancing Protocol (GLBP), can now register with the tracking service, its interest in tracking a particular object, such as an interface or a route, and then be notified when the tracked object changes state. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/fthsrptk.htm

Expanded Scope for Cause-Code-Initiated Call Establishment Retries

The Expanded Scope for Cause-Code-Initiated Call Establishment Retries feature enables the gateway to reattempt calls when a disconnect message is received from the public switched telephone network (PSTN) without maintaining extra dial peers. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ft_ccu.htm

Exporting and Importing RSA Keys

The Exporting and Importing RSA Keys feature allows you to transfer security credentials between devices by exporting and importing RSA keys.

The Exporting and Importing RSA Keys feature allows you to share the private RSA key pair of a router with standby routers, therefore transferring the security credentials between networking devices. The key pair that is shared between two routers will allow one router to immediately and transparently take over the functionality of the other router. If the main router were to fail, the standby router could be dropped into the network to replace the failed router without the need to regenerate keys, reenroll in certification authority (CA), or manually redistribute keys.

You can also use the Exporting and Importing RSA Keys feature to place the same RSA key pair on multiple routers, so that all management stations that use SSH can be configured with a single public RSA key. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ft_key.htm

Fax and Modem Pass-Through over VoIP

Fax and modem pass-through are now supported on the Cisco 1750 and Cisco 1761 platforms beginning in Cisco IOS Release 12.2(15)T.

Note The Fax and Modem Pass-Through over VoIP feature is also known under the feature title Modem Passthrough over Voice over IP.

On detection of the fax or modem tone on an established VoIP call, the gateways switch into modem fax or pass-through mode: the voice codec and configuration is suspended and the pass-through parameters are loaded for the duration of the fax or modem session. This changes the bandwidth needed for the call to the equivalent of G.711.

With pass-through, the fax or modem traffic is carried between the two gateways in RTP packets, using an uncompressed format resembling the G.711 codec. Packet redundancy may be used to mitigate the effects of packet loss in the IP network. Even so, fax and modem pass-through remain susceptible to packet loss, jitter and latency in the IP network. The two endpoints must be clocked synchronously for this type of transport to work predictably.

The Fax and Modem Pass-Through feature is also known as Voice Band Data (VBD) by the International Telecommunication Union (ITU). VBD refers to the transport of fax or modem signals over a voice channel through a packet network with an encoding appropriate for fax or modem signals. The minimum set of coders for VBD mode is G.711 ulaw and alaw with VAD disabled. For modem transport, Echo cancellation is also be disabled.

Firewall Intrusion Detection System Signature Enhancements

Before the Firewall Intrusion Detection System Signature Enhancements, the Cisco Intrusion Detection System (IDS) contained 59 signatures, which was only a small subset of the signatures supported by Cisco Secure IDS. Firewall Intrusion Detection System (IDS) Signature Enhancements introduces 42 additional IDS signatures to Cisco IOS IDS that are supported by other Cisco products, such as PIX; these newly added signatures are categorized as follows:

- 21 of the 28 most commonly seen signatures in the Security Posture Assessment (SPA) findings
- 6 of the 7 PIX signatures that were unavailable in Cisco IOS IDS

- All 19 of the most dangerous HTTP signatures in the Cisco Secure IDS Network Security Database (NSDB)

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122y/122yu11/ft_fwids.htm

Firewall N2H2 Support

The Cisco IOS Firewall N2H2 Support feature provides users with an additional option when choosing the URL filter vendor. Just like the Websense URL filtering server, N2H2 interacts with your Cisco IOS firewall (also known as Cisco Secure Integrated Software [CSIS]) to allow you to prevent users from accessing specified websites on the basis of some policy. The Cisco IOS firewall works with the N2H2 Internet Filtering Protocol (IFP) server to know whether a particular URL should be allowed or denied (blocked). Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122y/122yu11/ft_n2h2.htm

Firewall Support of HTTPS Authentication Proxy

The Firewall Support of HTTPS Authentication Proxy feature allows a user to encrypt the change of the username and password between the HTTP client and the Cisco IOS router via Secure Socket Layer (SSL) when authentication proxy is enabled on the Cisco IOS firewall, thereby ensuring confidentiality of the data that is passing between the HTTP client and the Cisco IOS router. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122y/122yu11/ftfwhttp.htm

Frame Relay Voice-Adaptive Traffic Shaping

The Frame Relay Voice-Adaptive Traffic Shaping feature enables a permanent virtual circuit (PVC) to adjust the rate of traffic on the basis of the presence of packets in the priority queue or H.323 call setup signaling packets. This feature also introduces voice-adaptive fragmentation. Frame Relay voice-adaptive fragmentation allows fragmentation to be turned on when packets are detected in the priority queue or H.323 signaling packets are present and to be turned off when priority queue traffic and signaling packets are not present. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ft_vats.htm

G.732 Support for the Integrated Signaling Link Terminal

The G.732 Support for the Integrated Signaling Link Terminal feature ports the existing International Telecommunication Union Telecommunication Standardization Sector (ITU-T) G.732 bit error rate (BER) detection and alarm processing functionality from the Cisco Signaling Link Terminal (SLT) onto the Cisco AS5350 and Cisco AS5400 network access server (NAS) platforms. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftg7325x.htm

Gatekeeper Management Statistics

The Gatekeeper Management Statistics feature adds support for gatekeeper performance management parameters that provide statistics that may be used to monitor and troubleshoot a network. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ft_gms.htm

GLBP: Gateway Load Balancing Protocol

The Gateway Load Balancing Protocol feature provides automatic router backup for IP hosts configured with a single default gateway on an IEEE 802.3 LAN. Multiple first-hop routers on the LAN combine to offer a single virtual first-hop IP router while sharing the IP packet forwarding load between them. Other routers on the LAN may act as redundant GLBP routers that will become active if any of the existing forwarding routers fail.

This feature was originally introduced in Cisco IOS Release 12.2(14)S. This release is porting the feature into the Cisco 1700 series, Cisco 2600 series, Cisco 3640, and Cisco 3660 platforms. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ft_glbp.htm

H.323v4 Gateway Zone Prefix Registration Enhancements

The H.323v4 Gateway Zone Prefix Registration Enhancements feature provides support for two capabilities included in H.323 version 4: additive registration and dynamic zone prefix registration. Additive registration allows a gateway to add to or modify a list of aliases contained in a previous registration without first unregistering from the gatekeeper. Dynamic zone prefix registration allows a gateway to register actual public switched telephone network (PSTN) destinations served by the gateway with its gatekeeper. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftgwzpre.htm

HTTP 1.1 Client

This feature implements support for HTTP clients within Cisco IOS software compliant with the HTTP 1.1 standard (RFC 2616). The HTTP 1.1 Client allows the network device to contact a remote web server and obtain content or interact with remote applications. The HTTP 1.1 Client is enabled by default on supported platforms.

HTTP 1.1 Web Server

The HTTP 1.1 Web Server feature provides a consistent interface for users and applications by implementing the HTTP 1.1 standard (RFC 2616). Prior to this release, Cisco software supported only a partial implementation of HTTP 1.0. The integrated HTTP Server API supports server application interfaces. When combined with the HTTPS and HTTP 1.1 Client features, the HTTP 1.1 Web Server feature provides a complete, secure solution for HTTP services to and from Cisco devices. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/fthttp1s.htm

HTTPS–HTTP with SSL 3.0

The HTTPS–HTTP with SSL 3.0 feature provides integrated Secure Socket Layer (SSL) 3.0 support for the HTTP 1.1 Server and Client in Cisco IOS software. SSL provides encryption to allow secure HTTP communications. HTTP with SSL (HTTPS) allows for encrypted HTTP communications with Cisco devices.

IGMP State Limit

The IGMP State Limit feature provides protection against denial of service (DoS) attacks caused by Internet Group Management Protocol (IGMP) packets. The new command-line interface (CLI) introduced by this feature allows you to configure a limit on the number of IGMP states that results from IGMP, IGMP Version 3 lite (IGMP v3lite), and URL Rendezvous Directory (URD) membership reports on a per-interface or global basis. Membership reports in excess of the configured limits will not be entered in the IGMP cache, and traffic for those excess membership reports will not be forwarded. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ft_igmps.htm

Implementing OSPF for IPv6

The Open Shortest Path First (OSPF) Version 3 for IPv6 (RFC 2740) feature expands on OSPF to provide support for IPv6 routing prefixes. In OSPF for IPv6, the commands used to customize OSPF are in interface configuration mode rather than router configuration mode. When using a nonbroadcast multiaccess (NBMA) interface in OSPF for IPv6, users must manually configure the router in order to detect neighbors.

Integrated IS-IS Multi-Topology Support for IPv6

The Integrated IS-IS Multi-Topology Support for IPv6 feature provides support for routing IPv6 prefixes in Intermediate System-to-Intermediate System (IS-IS) using a multi-topology solution.

Integrated IS-IS Nonstop Forwarding (NSF) Awareness

The Integrated IS-IS Nonstop Forwarding (NSF) Awareness feature allows customer premises equipment (CPE) routers that are NSF-aware to help NSF-capable routers perform nonstop forwarding of packets. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/isnsfawa.ht

Integrated Voice and Data WAN on T1/E1 Interfaces Using the AIM-ATM-VOICE-30 Module

The Integrated Voice and Data WAN on T1/E1 Interfaces Using the AIM-ATM-VOICE-30 Module feature provides configuration enhancements for the AIM-ATM-VOICE-30 digital signaling processor (DSP) card on the Cisco 2600 series, Cisco 2600XM, Cisco 3660, Cisco 3725, and Cisco 3745. This feature provides a migration path to higher bandwidth without the need to change transport facilities and provides a voice processing (termination) solution with AIM-ATM-VOICE-30 without consuming a network module slot. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftbckaim.htm

IP Access List Entry Sequence Numbering

Users can apply sequence numbers to permit or deny statements and also reorder, add, or remove such statements from a named IP access list. This feature makes revising IP access lists much easier. Prior to this feature, users could add access list entries to the end of an access list only; therefore needing to add statements anywhere except the end required reconfiguring the entire access list.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122s/122snwft/release/122s14/fsaclseq.htm

IPMROUTE-STD-MIB

This feature introduces support for the IPMROUTE-STD-MIB in Cisco IOS software. IPMROUTE-STD-MIB, as defined in RFC 2932, is a module for management of IP multicast routing in a manner independent of the specific multicast routing protocol in use. Support for this MIB replaces the draft form of the IPMROUTE-MIB.

The IPMROUTE-STD-MIB supports all the MIB objects of the IPMROUTE-MIB and in addition supports the following four new MIB objects:

1. ipMRouteEntryCount
2. ipMRouteHCOctets
3. ipMRouteInterfaceHCInMcastOctets
4. ipMRouteInterfaceHCOutMcastOctets

Note The ipMRouteScopeNameTable MIB object is not supported because it is not relevant to multicast routers.

IPSec VPN Accounting

The IPSec VPN Accounting feature allows for a session to be accounted for by indicating when the session starts and when it stops. Additionally, session identifying information and session usage information will be passed to the RADIUS server via RADIUS attributes and vendor-specific attributes (VSAs). Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ft_evpna.htm

IPv6 ISATAP Tunnel Support

The Intra-Site Automatic Tunnel Addressing Protocol (ISATAP) is an automatic overlay tunneling mechanism that uses the underlying IPv4 network as a nonbroadcast multiaccess (NBMA) link layer for IPv6. The IPv4 address is encoded in the last 32 bits of the IPv6 address, enabling automatic IPv6-in-IPv4 tunneling within an IPv4 network. ISATAP tunnels allow individual IPv4/IPv6 dual-stack hosts within a site to connect to an IPv6 network using the IPv4 infrastructure. ISATAP uses a normal global IPv6 prefix (/64), that can be used with both local and global unicast IPv6 prefixes, enabling IPv6 routing on the Internet. For additional information, refer to the following document:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ipv6/ipv6imp/sa_tunv6.htm

IPv6 MIB Support

IPv6 MIBs are now available for managing IPv6 traffic. Supported MIBs include the CISCO-IETF-IP-MIB and CISCO-IETF-IP-FORWARDING-MIB.

IPv6 Provider Edge Router over MPLS

The IPv6 Provider Edge Router over MPLS (Cisco 6PE) feature allows service providers that are running an MPLS/IPv4 infrastructure to offer IPv6 services on an Multiprotocol Label Switching (MPLS) network. A Cisco 6PE-enabled backbone allows IPv6 domains to communicate with each other over an MPLS IPv4 core network. A Cisco 6PE implementation requires no backbone infrastructure upgrades and no reconfiguration of core routers, because forwarding is based on labels rather than on the IP header itself.

Additionally, the inherent Virtual Private Network (VPN) and Traffic Engineering (TE) services available within an MPLS environment allow IPv6 networks to be combined into VPNs or extranets over an infrastructure that supports IPv4 VPNs and MPLS-TE.

The provider edge (PE) routers at each end of the MPLS network must be IPv6-enabled. The PE routers apply an appropriate label for the address in the packet to reach the other side of the MPLS backbone. This is similar to tunneling because it allows IPv6 traffic to be transported over MPLS without the routers in the backbone being aware of the IPv6 traffic. An MPLS packet enters and exits the MPLS network on different routers, and each router must be IPv6- and 6PE-enabled.

For more information about the IPv6 Provider Edge Router over MPLS (Cisco 6PE) feature, refer to the following document:

http://www.cisco.com/warp/public/cc/pd/iosw/prodlit/iosip_an.htm

ISDN Generic Transparency Descriptor (GTD) for Setup Message

The ISDN Generic Transparency Descriptor for Setup Message feature provides support for mapping ISDN information elements (IEs) to corresponding GTD parameters. Supported IEs and GTD parameters include the following:

- Originating Line Information (OLI)
- Bearer Capability (USI and TMR)
- Called Party Number (CPN)
- Calling Party Number (CGN)
- Redirecting Number (RGN, OCN, and RNI)

This feature allows networks to do the following:

- Extract Originating Line Information (OLI) to identify pay telephone calls and pass on applicable charges.
- Generate billing records that can be used to validate pay telephone operator settlement requests.

Cisco implements this feature on Cisco IOS gateways by providing a mechanism to allow creating and passing the Q931 Setup message and its parameters in a GTD format. The Setup message, sent by the gateway to initiate call establishment, is mapped to the GTD Initial Address Message (IAM). Generic transparency descriptors represent parameters within signaling messages and enable transport of signaling data in a standard format across network components and applications. The GTD mechanism allows them to share signaling data and achieve interworking between different signaling types.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftgtdisd.htm

ISDN PRI-SLT

The ISDN PRI-SLT feature allows you to release the ISDN PRI signaling time slot for Redundant Link Manager (RLM) configurations and for Signaling System 7 (SS7) applications in integrated Signaling Link Terminal (SLT) configurations. This feature supports the use of DS0 time slots for SS7 links and allows the coexistence of SS7 links and PRI voice and data bearer channels on the same T1 or E1 controller span. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122b/122b_8/ftprislt.htm

ISDN Progress Indicator Support for SIP Using 183 Session Progress

The ISDN Progress Indicator Support for SIP Using 183 Session Progress feature adds the SIP 183 Session Progress and Ringing messages to better map to the ISDN/CAS messages.

The ISDN Progress Indicator Support for SIP Using 183 Session Progress feature was previously released in Cisco IOS Release 12.1(5)T. This feature has been added on the Cisco 1751 and the Cisco 1760 in Cisco IOS Release 12.2(15)T.

L2TP Dial-Out Load Balancing and Redundancy

The L2TP Dial-Out Load Balancing and Redundancy feature enables an L2TP network server (LNS) to dial out to multiple L2TP access concentrators (LACs). When the LAC with the highest priority goes down, it is possible for the LNS to failover to another lower priority LAC. The LNS can also load-balance the sessions between multiple LACs that have the same priority settings. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftl2tlbr.htm

L2TP Large-Scale Dial-Out per-User Attribute via AAA

The L2TP Large-Scale Dial-Out per-User Attribute via AAA feature enhances Layer 2 Tunneling Protocol (L2TP) to support per-user attributes using authentication, authorization, and accounting (AAA) for large-scale dial-out. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftl2taaa.htm

Malicious Caller Identification (MCID) Invocation Support for Enterprise Networks

The Malicious Caller Identification (MCID) Invocation Support for Enterprise Networks feature enables a called party inside an enterprise network to use a configurable sequence of digits to notify the local law enforcement agency of a malicious call. MCID uses Tool Command Language (TCL) and interactive voice response (IVR) to trigger the gateway to send calling number information to the authorities.

The feature is platform independent; uses dual tone multifrequency (DTMF) tones to generate the trigger; and operates in both H.323 and Session Initiation Protocol (SIP) voice gateways and on all phones. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftmcid.htm

Measurement-Based Call Admission Control for SIP

The Measurement-Based Call Admission Control for SIP feature implements support within Session Initiation Protocol (SIP) to monitor IP network capacity and check the availability of router and interface resources, and to decide if adequate resources are available to carry a successful Voice over IP (VoIP) session. This feature also implements a mechanism to prevent calls that arrive from the IP network from entering the gateway when required resources are not available to process the call. This feature also provides the ability to support measurement-based call admission control processes as well as check for resource availability. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftcacsip.htm

MGCP 1.0 Including NCS 1.0 and TGCP 1.0 Profiles

The MGCP 1.0 Including NCS 1.0 and TGCP 1.0 Profiles feature implements the following Media Gateway Control Protocol (MGCP) protocols on the supported Cisco media gateways:

- MGCP 1.0 (RFC 2705)
- Network-based Call Signaling (NCS) 1.0, the PacketCable profile of MGCP 1.0 for residential gateways (RGWs)
- Trunking Gateway Control Protocol (TGCP) 1.0, the PacketCable profile of MGCP 1.0 for trunking gateways (TGWs)

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_24mgl.htm

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco 1751 and Cisco 1760 platforms.

MGCP Based Fax (T.38) and DTMF Relay

This feature adds support for T.38 fax relay and dual tone multifrequency (DTMF) relay with Media Gateway Control Protocols (MGCP). This feature provides two modes of implementation for each component: gateway (GW)-controlled mode and call agent (CA)-controlled mode. In GW-controlled mode, GWs negotiate DTMF and fax relay transmission by exchanging capability information in Session Description Protocol (SDP) messages. That transmission is transparent to the CA. GW-controlled mode allows use of the MGCP-Based Fax (T.38) and DTMF (IETF RFC 2833) Relay feature without upgrading the CA software to support the feature. In CA-controlled mode, CAs use MGCP messagir to instruct GWs to process fax and DTMF traffic. For MGCP T.38 Fax Relay, the CAs can also instruct GWs to revert to GW-controlled mode if the CA is unable to handle the fax control messaging traffic; for example, in overloaded or congested networks.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftmgcpfx.htm

The MGC Protocol Based Fax (T.38) and DTMF (IETF RFC 2833) Relay feature was previously released in Cisco IOS Release 12.2(8)T on the Cisco 3600 series and Cisco MC3810, and in Cisco IOS Release 12.2(11)T on the Cisco AS5300, Cisco AS5400, and Cisco AS5850. This feature has been added on the Cisco 1751 and the Cisco 1760 in Cisco IOS Release 12.2(15)T.

MGCP Basic CLASS and Operator Services

The Media Gateway Control Protocol (MGCP) Basic CLASS and Operator Services feature provides CLASS and 3-way calling functionality using the Simple Gateway Control Protocol (SGCP) and MGCP protocols.

MGCP VoIP Call Admission Control

The MGCP VoIP Call Admission Control (CAC) feature determines if calls can be accepted on the IP network on the basis of available network resources. Before this release, Media Gateway Control Protocol (MGCP) Voice over IP (VoIP) calls were established regardless of the available resources on the gateway or network. The gateway had no mechanism for gracefully refusing calls if resources were not available to process the call. New calls would fail with unexpected behavior and in-progress calls would experience quality-related problems.

The MGCP VoIP Call Admission Control feature provides three CAC mechanisms to address the need for improved quality and predictable gateway behavior. The first mechanism is local/system CAC, which provides the ability to gracefully refuse calls on the basis of the availability of local gateway call processing resources such as CPU utilization and memory. The second CAC mechanism provides synchronization with Resource Reservation Protocol (RSVP) and reports the reservation request to the call agent. The third mechanism provides network congestion detection to gracefully refuse calls on the basis of a measured level of congestion.

The MGCP VoIP Call Admission Control feature was previously released in Cisco IOS Release 12.2(8)T and is now supported on the Cisco 1751 and Cisco 1760 platforms.

Mobile IP—Home Agent Accounting

In Cisco IOS Mobile IP, the home agent keeps track of the location of the mobile node as it roams away from its home network and forwards all traffic destined to the mobile node to its new location on the Internet. The Mobile IP—Home Agent Accounting feature allows the home agent to generate the following three new accounting messages that are forwarded to the Service Selection Gateway (SSG):

- Accounting Start
- Accounting Update
- Accounting Stop

The SSG acts as the proxy server for the authentication, authorization, and accounting (AAA) server and acknowledges the accounting messages sent by the home agent. The accounting records generated by the home agent can be stored on the AAA server and used by Internet service providers (ISPs) for billing, capacity planning, and operations. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/fthaacct.htm

MPLS VPN—MIB Support

The MPLS VPN—MIB Support feature provides Simple Network Management Protocol (SNMP) agent support in Cisco IOS software for Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) management, as implemented in the draft *MPLS/BGP Virtual Private Network Management Information Base Using SMIv2* (*draft-ietf-ppvpn-mpls-vpn-mib-03.txt*). The Provider-Provisioned VPN (PPVPN)-MPLS-VPN MIB provides access to VPN routing/forwarding instance (VRF) information, interfaces included in the VRF, and other configuration and monitoring information.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftvnmb15.htm

The MPLS VPN—MIB Support feature was introduced in Cisco IOS Release 12.0(21)ST. The PPVPN-MPLS-VPN MIB notifications were supported in Cisco IOS Release 12.2(13)T. The PPVPN-MPLS-VPN MIB tables were integrated into Cisco IOS Release 12.2(15)T.

MPLS VPN Support for EIGRP Between Provider Edge (PE) and Customer Edge (CE)

The MPLS VPN Support for EIGRP Between Provider Edge (PE) and Customer Edge (CE) feature provides the Enhanced Interior Gateway Routing Protocol (EIGRP) with the capability to redistribute routes through a Border Gateway Protocol (BGP) Virtual Private Network (VPN) cloud. This feature is configured only on PE routers, requiring no upgrade or configuration changes to customer equipment. This feature also introduces EIGRP support for Multiprotocol Label Switching (MPLS) and BGP extended community attributes. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/fteipece.htm

Multicast Subsecond Convergence

The Multicast Subsecond Convergence feature comprises a comprehensive set of features and protocol enhancements that provide for improved scalability and convergence in multicast-based services. This feature set provides for the ability to scale to larger service levels and to recover multicast forwarding after service failure in subsecond time frames.

Multicast subsecond convergence allows you to send Protocol Independent Multicast (PIM) router-query messages (PIM hellos) every few milliseconds. In earlier releases, you could send the PIM hellos every few seconds. By enabling a router to send PIM hello messages more often, this feature allows the router to discover unresponsive neighbors more quickly. As a result, the router can implement failover or recovery procedures more efficiently.

The scalability enhancements improve on the efficiency of handling increases (or decreases) in service users (receivers) and service load (sources or content). Scalability enhancements in this release include the following:

- Improved Internet Group Management Protocol (IGMP) and PIM state maintenance through new timer management techniques
- Improved scaling of the Multicast Source Discovery Protocol (MSDP) Source-Active (SA) cache

The scalability enhancements provide the following benefits:

- Increased potential PIM multicast route (mroute), IGMP, and MSDP SA cache state capacity
- Decreased CPU usage

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122s/122snwft/release/122s14/fs_subcv.htm

Multiple OPC Support for the Cisco Signaling Link Terminal

Multiple OPC Support for the Cisco Signaling Link Terminal (SLT) feature allows Cisco SLTs to access multiple Signaling System 7 (SS7) point codes (PCs) on a media gateway controller (MGC).

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftsltopc.htm

NAT Support for IPSec ESP—Phase II

The NAT Support for IPSec ESP—Phase II feature allows multiple concurrent IP Security (IPSec) Encapsulating Security Payload (ESP) tunnels or connections through a Cisco IOS Network Address Translation (NAT) device configured in overload or Port Address Translation (PAT) mode. The IPSec ESP deployment does not need to use wrapper techniques that typically use the User Datagram Protocol (UDP) to pass through the NAT router. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftsecnat.htm

Network-Based Application Recognition Protocol Discovery Management Information Base

The existing Network-Based Application Recognition (NBAR) feature is used to identify protocols so that traffic can be classified appropriately for quality of service purposes. NBAR also contains a protocol discovery feature that displays for the user any NBAR-supported protocol traffic that is traversing an interface.

The NBAR Protocol Discovery MIB expands the capabilities of NBAR protocol discovery by providing the following new protocol discovery functionality through simple network management protocol (SNMP):

- Enables or disables protocol discovery per interface.
- Displays protocol discovery statistics.
- Configures and displays multiple top-n tables that list protocols by bandwidth usage.

Configure thresholds based on traffic of particular NBAR-supported protocols or applications that report breaches and send notifications when these thresholds are crossed. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftpdmib.htm

No Service Password-Recovery

The No Service Password-Recovery feature disables password-recovery capability for better console security.

OSPF Forwarding Address Suppression in Translated Type-5 LSAs

The OSPF Forwarding Address Suppression in Translated Type-5 LSAs feature causes a not-so-stubby area (NSSA) area border router (ABR) to translate Type-7 link state advertisements (LSAs) to Type-5 LSAs, but use the address 0.0.0.0 for the forwarding address instead of that specified in the Type-7 LSA. This feature causes routers that are configured not to advertise forwarding addresses into the backbone to direct forwarded traffic to the translating NSSA ABRs. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftoadsup.htm

OSPF Inbound Filtering Using Route Maps with a Distribute List

Users can define a route map to prevent Open Shortest Path First (OSPF) routes from being added to the routing table. In the route map, the user can match on any attribute of the OSPF route.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios120/120newft/120limit/120s/120s24/routmap.htm

OSPF Nonstop Forwarding (NSF) Awareness

The OSPF Nonstop Forwarding (NSF) Awareness feature allows customer premises equipment (CPE) routers that are NSF-aware to help NSF-capable routers perform nonstop forwarding of packets. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftosnsfa.htm

OSPF Shortest Path First Throttling

The OSPF Shortest Path First Throttling feature makes it possible to configure Shortest Path First (SPF) scheduling in millisecond intervals and to potentially delay SPF calculations during network instability. SPF is scheduled to calculate the Shortest Path Tree (SPT) when there is a change in topology. One SPF run may include multiple topology change events.

The interval at which the SPF calculations occur is chosen dynamically and is based on the frequency of topology changes in the network. The chosen interval is within the boundary of the user-specified value ranges. If network topology is unstable, SPF throttling calculates SPF scheduling intervals to be longer until the topology becomes stable. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122s/122snwft/release/122s14/fsspftrl.htm

OSPF Support for Fast Hello Packets

The OSPF Support for Fast Hello Packets feature provides a way to configure the sending of hello packets in intervals less than 1 second. Such a configuration would result in faster convergence in an Open Shortest Path First (OSPF) network. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios120/120newft/120limit/120s/120s23/fasthelo.htm

Per-User QoS via AAA Policy Name

The Per-User QoS via AAA Policy Name feature provides the ability to download a policy name that describes quality of service (QoS) parameters for a user session from a RADIUS server and apply them for the particular session. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ft_puq.htm

Per VRF AAA

The Per VRF AAA feature allows authentication, authorization, and accounting (AAA) on the basis of Virtual Private Network (VPN) routing and forwarding (VRF) instances. For Cisco IOS Release 12.2(15)T or later releases, you can use a customer template which may be stored either locally or remotely, and AAA services can be performed on the information that is stored in the customer template. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftvrfaaa.htm

PPPoE Connection Throttling

This feature will throttle the PPP over Ethernet (PPPoE) connection requests to prevent any denial of service attacks. It will implement per-mac/per-vc initiated session rate throttling in the PPPoE server to limit the session initiate count during a specific period of time.

PPPoE Profiles

The PPPoE Profiles feature introduces PPP over Ethernet (PPPoE) profiles, which contain configuration information for a group of PPPoE sessions. Multiple PPPoE profiles can be defined on a device, allowing different virtual templates and other PPPoE configuration parameters to be assigned to different Ethernet interfaces, VLANs, and ATM permanent virtual circuits (PVCs). Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftpprfls.htm

PRI QSIG Protocol

QSIG is a standardized PBX signaling protocol used primarily in Europe over E1 and BRI trunks and occasionally in North America over T1 trunks. The PRI QSIG Protocol feature provides QSIG signalling over PRI trunks

RADIUS Support of 56-Bit Acct Session-Id

The Radius Support of 56-Bit Acct Session-Id feature introduces a new 32-bit authentication, authorization, and accounting (AAA) variable, acct-session-id-count. The first 8 bits of the acct-session-id-count variable are reserved for the unique-ident, a unique number assigned to the accounting session that is preserved between reloads. The acct-session-id-count variable is used in addition to the existing 32-bit acct-session-id variable, RADIUS Attribute 44. This provides 56 bits to represent the actual accounting session ID. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftradaid.htm

RADIUS Timeout Set During Pre-Authentication

The RADIUS Timeout Set During Pre-Authentication feature provides RADIUS timeout values during the pre-authentication phase of a session, and the values are not overwritten in later phases of the same session. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftattr27.htm

RSVP Message Authentication

The Resource Reservation Protocol (RSVP) Message Authentication feature permits neighbors in an RSVP network to use a secure hash to sign all RSVP signaling messages digitally, thus allowing the receiver of an RSVP message to verify the sender of the message without relying solely on the sender's IP address, as is done by issuing the **ip rsvp neighbor** command with an access control list (ACL). Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftrsvpma.htm

RSVP Support for RTP Header Compression, Phase 1

The Resource Reservation Protocol (RSVP) Support for Real-Time Transport Protocol (RTP) Header Compression, Phase 1 feature provides a method for decreasing a flow's reserved bandwidth requirements so that a physical link can accommodate more voice calls. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftrsvpcf.htm

SIP Call Transfer and Call Forwarding Supplementary Services

The SIP Call Transfer and Call Forwarding Supplementary Services feature introduces the ability of Session Initiation Protocol (SIP) gateways to initiate blind or attended call transfers. Release Link Trunking (RLT) functionality was also added with this feature. With RLT, SIP blind call transfers can now be triggered by channel-associated signaling (CAS) trunk signaling. Finally, the SIP Call Transfer and Call Forwarding Supplementary Services feature implements SIP support of call forwarding requests from a Cisco IOS gateway.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftsipcal.htm

SIP—Configurable PSTN Cause Code Mapping

For calls to be established between a session initiation protocol (SIP) network and a PSTN network, the two networks must be able to interoperate. One aspect of their interoperation is the mapping of PSTN cause codes, which indicate reasons for Public Switched Telephone Network (PSTN) call failure or completion, for SIP status codes or events. The opposite is also true: SIP status codes or events are mapped to PSTN cause codes. Event mapping tables found in this document show the standard or default mappings between SIP and PSTN.

However, you may want to customize the SIP user agent software to override the default mappings between the SIP and PSTN networks. The Configurable PSTN Cause Code to SIP Response Mapping feature allows you to configure specific map settings between the PSTN and SIP networks. Thus, any SIP status code can be mapped to any PSTN cause code, or vice versa. When set, these settings can be stored in the NVRAM and are restored automatically on bootup.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftmap.htm

Note This feature was previously released in Cisco IOS Release 12.2(8)T for the Cisco 2600 series, Cisco 3600 series, and Cisco 7200 series routers as Configurable PSTN Cause Code to SIP Response Mapping. This release is porting the feature into the Cisco 1751 and Cisco 1760 platforms.

SIP Diversion Header Implementation for Redirecting Number

SIP is a new protocol developed by the Internet Engineering Task Force (IETF) Multiparty Multimedia Session Control (MMUSIC) Working Group as an alternative to the ITU-T H.323 specification. SIP is defined by RFC 2543 and is used for multimedia call session setup and control over IP networks. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t3/sipcf2.htm

Note This feature was originally introduced in Cisco IOS Release 12.1(3)T. This release ports the feature into the Cisco 1751 and Cisco 1760 platforms.

SIP—DNS SRV RFC2782 Compliance

Session Initiation Protocol (SIP) on Cisco Voice over IP (VoIP) gateways uses Domain Name System Server (DNS SRV) query to determine the IP address of the user endpoint. The query string has a prefix in the form of "protocol.transport." and is attached to the fully qualified domain name (FQDN) of the next hop SIP server. This prefix style, from RFC 2052, has always been available; however, with this release, a second style is also available. The second style complies with RFC 2782 and prepends the protocol label with an underscore "_"; as in "_protocol._transport." The addition of the underscore reduces the risk of the same name being used for unrelated purposes. The form compliant with RFC 2782 is the default style. Use the **srv version** command to configure the DNS SRV feature.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/vvfresrv.htm

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release ports the feature into the Cisco 1751 and Cisco 1760 platforms.

SIP Gateway Support for Third Party Call Control

SIP is a new protocol developed by the Internet Engineering Task Force (IETF) Multiparty Multimedia Session Control (MMUSIC) Working Group as an alternative to the ITU-T H.323 specification. SIP is defined by RFC 2543 and is used for multimedia call session setup and control over IP networks. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t3/sipcf2.htm

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T. This release ports the feature into the Cisco 1751 and Cisco 1760 platforms.

SIP Gateway Support of RSVP and TEL URL

The SIP Gateway Support of RSVP and TEL URL feature also supports Telephone Uniform Resource Locators or TEL URLs. Currently Session Initiation Protocol (SIP) gateways support URLs in the SIP format. SIP URLs are used in SIP messages to indicate the originator, recipient, and destination of the SIP request. However, SIP gateways may also encounter URLs in other formats, such as TEL URLs. TEL URLs describe voice call connections. They also enable the gateway to accept TEL calls sent through the Internet and to generate TEL URLs in the request line of outgoing INVITE requests.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/vvfresrv.htm

Note This feature was previously released in Cisco IOS Release 12.2(8)T. This release ports the feature into the Cisco 1751 and Cisco 1760 platforms.

SIP Intra-gateway Hairpinning

SIP hairpinning is a call routing capability in which an incoming call on a specific gateway is signaled through the IP network and back out the same gateway. This call can be a public switched telephone network (PSTN) call routed into the IP network and back out to the PSTN over the same gateway.

Similarly, SIP hairpinning can be a call signaled from a line (for example, a telephone line) to the IP network and back out to a line on the same access gateway. With SIP hairpinning, unique gateways for ingress and egress are no longer necessary.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release ports the feature into the Cisco 1751 and Cisco 1760 platforms.

SIP INVITE Request with Malformed Via Header

SIP INVITE requests that a user or service participate in a session. Each INVITE contains a Via header that indicates the transport path taken by the request so far and where to send a response. In the past, when an INVITE contained a malformed Via header, the gateway would print a debug message and discard the INVITE without incrementing a counter. However, the printed debug message was often inadequate, and it was difficult to detect that messages were being discarded.

The SIP INVITE Request with Malformed Via Header feature provides a response to the malformed request. A counter, Client Error: Bad Request, increments when a response is sent for a malformed Via field. Bad Request is a class 400 response and includes the explanation Malformed Via Field. The response is sent to the source IP address (the IP address where the SIP request originated) at User Datagram Protocol (UDP) port 5060.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftmalvia.htm

Note This feature was previously released in Cisco IOS Release 12.2(8)T on the Cisco 2600 series, Cisco 3600 series, and Cisco 7200 series routers. This release ports the feature into the Cisco 1751 and Cisco 1760 platforms.

SIP: ISDN Suspend/Resume Support

The SIP: ISDN Suspend/Resume Support feature adds Session Initiation Protocol (SIP) call-hold support to SIP gateways when an ISDN Suspend event is triggered. Because Suspend and Resume support already exists for H.323, the SIP implementation of Suspend and Resume provides feature parity. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftsusres.htm

SIP—Session Initiation Protocol for VoIP Enhancements

Voice over IP (VoIP) currently implements the International Telecommunication Union (ITU)'s H.323 specification within Internet Telephony Gateways (ITGs) to signal voice call setup. The Session Initiation Protocol (SIP) is a new protocol developed by the Internet Engineering Task Force (IETF) for multimedia conferencing over IP. SIP features are compliant with IETF RFC 2543, *SIP: Session Initiation Protocol*, published in March 1999.

The Cisco SIP functionality, introduced in Cisco IOS Release 12.1(1)T and enhanced in Cisco IOS Release 12.1(3)T, enables Cisco access platforms to signal the setup of voice and multimedia calls over IP networks. This release ports the feature into the Cisco 1751 and Cisco 1760 platforms. The SIP feature also provides nonproprietary advantages in the areas of

- Protocol extensibility
- System scalability
- Personal mobility services
- Interoperability with different vendors

SIP Support for Media Forking

The SIP Support for Media Forking feature provides the ability for Session Initiation Protocol (SIP) networks to create midcall multiple streams (or branches) of audio. The multiple streams of audio are associated with a single call, but can be sent to several different destinations. The SIP Support for Media Forking feature allows service providers to use technologies such as speech recognition, voice authentication, and text-to-speech conversion to provide sophisticated services to their end-user customers. An example is a web-browsing application that uses voice recognition and text-to-speech (TTS) technology to make reservations, verify shipments, or order products. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftspfork.htm

SIP T.38 Fax Relay

The SIP T.38 Fax Relay feature adds standards-based fax support to session initiation protocol (SIP) and conforms to ITU-T T.38 Procedures for real-time Group 3 facsimile communication over IP networks. The ITU-T standard specifies real-time transmission of faxes between two regular fax terminals over an IP network. Much like a voice call, SIP T.38 Fax Relay requires call establishment, data transmission, and release signaling.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftsipfax.htm

Note This feature was previously released in Cisco IOS Release 12.2(8)T for the Cisco 2600 series and Cisco 3600 series routers. This release ports the feature into the Cisco 1751 and Cisco 1760 platforms.

SIP User Agent MIB

The Session Initiation Protocol (SIP) User Agent Client (UAC) and User Agent Server (UAS) are manageable by an SNMP-based network management platform, such as the Cisco Voice Manager. This release ports the feature to the Cisco 1750 and Cisco 1761 platforms. The SIP MIB has been defined, will be submitted to the IETF, and will be implemented on those platforms.

To obtain lists of supported MIBs by platform and Cisco IOS release, and to download MIB modules, go to the Cisco MIB web site on Cisco.com at http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml

Source Interface Selection for Outgoing Traffic with Certificate Authority

The Source Interface Selection for Outgoing Traffic with Certificate Authority feature allows you to specify the address of an interface to be used as the source address for all outgoing TCP connections when a designated trustpoint has been configured. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ft_asish.htm

Support for Bridged RFC 1483 Encapsulated Traffic over ATM SVCs

The Support for Bridged RFC 1483 Encapsulated Traffic over ATM SVCs feature allows you to send bridged RFC 1483 encapsulated packets over ATM switched virtual circuits (SVCs). Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftbridge.htm

Support for IUA with SCTP for Cisco Access Servers

The Support for IUA with SCTP for Cisco Access Servers feature supports the IDSN User Adaptation (IUA) Layer with Stream Control Transmission Protocol (SCTP) for the Cisco AS5x00 network access servers (NASs) and the Cisco 2420, Cisco 2600 series, Cisco 3600 series, and Cisco 3700 series. This feature is to be used as an alternative to the existing IP-based User Datagram Protocol-to-Reliable Link Manager (UDP-to-RLM) transport between the Cisco PGW2200 and Cisco gateways. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftgkrup.htm

T1 Channel Associated Signaling (CAS)

Channel Associated Signaling (CAS) is the transmission of signaling information within the voice channel. Support for CAS is now available on T1 interfaces.

T.37 for Cisco 7200

This feature adds T.37 standards-based store-and-forward fax protocol support for H.323 gateways and gatekeepers to the Cisco 7200 series. T.37 is an ITU-T recommended standard for store-and-forward fax that enables Cisco gateways and gatekeepers to interwork with other Cisco gateways and third-party H.323 devices that support the T.37 protocol.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/faxapp/index.htm

T.37 store-and-forward fax was originally supported in Cisco IOS Rélease 12.1(5)T on the Cisco AS5300 platform. In Cisco IOS Release 12.2(8)T, support was added on the Cisco 1751, Cisco 2600 series, Cisco 3600 series, Cisco 3725, and Cisco 3745. In Cisco IOS Release 12.2(13)T, support was added on the Cisco AS5350 and the Cisco AS5400. Cisco IOS Release 12.2(15)T adds support on the Cisco 7200 series.

Tokenless Call Authorization

The Tokenless Call Authorization feature provides a statically configured access list of authorized H.323 endpoints for the Cisco IOS gatekeeper. The gatekeeper accepts calls from endpoints on the list. This security feature is an alternative to Interzone ClearTokens (IZCTs) and Cisco Access Tokens (CATs), and can be used with Cisco CallManager. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ft_tklss.htm

Tunneled GR-303 for the Cisco Cable Modem

The Tunneled GR-303 Support feature enables the Cisco uBR925 cable access router to send and receive call control messages using GR-303 signaling, in addition to the Media Gateway Control Protocol (MGCP) signaling that was previously supported. This allows the Cisco uBR925 router to support advanced call features such as caller ID and call waiting, using both GR-303 and MGCP signaling. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/dtgrmgcp.htm

UDP Forwarding Support of IP Redundancy Virtual Router Group (VRG)

User Datagram Protocol (UDP) forwarding is used in Cisco IOS software to forward broadcast and multicast packets received for a specific IP address. Virtual Router Group (VRG) support is currently implemented with the Hot Standby Routing Protocol (HSRP), and it allows a set of routers to be grouped as a logical router that answers to a well known IP address. The UDP Forwarding Support of IP Redundancy Virtual Router Group (VRG) feature enables UDP forwarding to be VRG aware, resulting in forwarding only to the active router in the VRG. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftudpvrg.htm

V.92 and V.44 Support for Digital Modems

The V.92 and V.44 Support for Digital Modems feature supports the V.92 Modem on Hold and V.92 Quick Connect portions of the new V.92 modem standard, and the new V.44 LZJH compression standard based on Lempel-Ziv, on the Cisco 3600 and Cisco 3700 series router platforms. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122y/122yt/122yt11/ftv92_44.htm

VRF-Aware IPSec

The VRF-Aware IPSec feature introduces IP Security (IPSec) tunnel mapping to Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs). Using the VRF-Aware IPSec feature, you can map IPSec tunnels to virtual routing and forwarding (VRF) instances using single public-facing addresses.

A VRF instance is a per-VPN routing information repository that defines the VPN membership of a customer site attached to the provider edge (PE) router. A VRF comprises an IP routing table, a derived Cisco Express Forwarding (CEF) table, a set of interfaces that use the forwarding table, and a set of rules and routing protocol parameters that control the information that is included in the routing table. A separate set of routing and CEF tables is maintained for each VPN customer.

The MPLS distribution protocol is a high-performance packet-forwarding technology that integrates the performance and traffic management capabilities of data link layer switching with the scalability, flexibility, and performance of network-layer routing. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ft_vrfip.htm

XML Interface to Syslog Messages

The Cisco IOS system logging (Syslog) process allows the system to report and save important error messages, either locally or to a remote logging server. These Syslog messages include system error messages and debugging output sent during network operation to assist users and Cisco TAC engineers with identifying the type and severity of a problem. Syslog messages can be sent to the console, a monitor (TTY), a buffer, or a remote host.

The XML Interface to Syslog Messages features provides Command Line Interface (CLI) commands for enabling syslog messages to be sent in an XML format. XML (Extensible Markup Language), a derivative of SGML, provides a representation scheme to structuralize consistently formatted data such as that found in Syslog messages. This feature defines a closed set of meaningful XML tags for Syslog messages. Logs in a standardized XML format can be more readily used in external customized monitoring tools. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t15/ftxmlsys.htm

New Hardware Features Supported in Cisco IOS Release 12.2(13)T

The following new hardware features are supported in Cisco IOS Release 12.2(13)T. Some of these features may have been introduced on other hardware platforms in earlier Cisco IOS software releases.

Catalyst 4224 Access Gateway Switch

The Cisco Catalyst 4224 Access Gateway Switch (Catalyst 4224) is an integrated switch/router that provides Voice over IP (VoIP) gateway and IP telephony services to a small branch office. The Cisco Catalyst 4224 provides an integrated switch and WAN/voice gateway for enterprise satellite offices with up to 24 users. It is intended to work in conjunction with a Cisco Call Manager cluster from the central site with fail over capabilities to allow local calls and basic PBX features.

For information about Cisco Catalyst 4224 configuration, see the following:

http://www.cisco.com/univercd/cc/td/doc/product/lan/cat4224/index.htm

Cisco 3631 Router Enhanced Functionality

In Cisco IOS Release 12.2(13)T, the Cisco 3631 will support additional functionality. Beginning in this release, this router will support the following interfaces:

- NM-T3
- NM-E3
- NM-1FE2W
- NM-2FE2W
- NM-2W
- NM-8B-S/T
- NM-8B-U
- NM-1CEB
- NM-1CEU
- NM-2CEB
- NM-2CEU
- ETM

For more information about network module configuration, see the following:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_mod/cis2600/hw_inst/nm_inst/nm-doc/index.htm

For more information about WAN interface card (WIC) configuration, see the following:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_mod/cis2600/hw_inst/wic_inst/wic_doc/index.htm

Cisco 3725 Router, Cisco 3745 Router, Cisco 2691 Router Enhanced Functionality

In Cisco IOS Release 12.2(13)T, the Cisco 3725, Cisco 3745, and Cisco 2691 routers will support additional functionality. Beginning in this release, these routers will support the following interfaces:

- AIM-ATM
- AIM-VOICE-30
- AIM-ATM-VOICE-30
- AIM-VPNII
- OC-3 NMs (multimode, single-mode intermediate reach and single-mode long reach)

- WIC-1SHDSL
- VIC-2BRI-NT/TE

For more information about network module configuration, see the following:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_mod/cis2600/hw_inst/nm_inst/nm-doc/index.htm

For more information about WAN interface card (WIC) configuration, see the following:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_mod/cis2600/hw_inst/wic_inst/wic_doc/index.htm

Cisco 7401 ASR-BB and Cisco 7401 ASR-CP

The Cisco 7401 ASR-BB and Cisco 7401 ASR-CP are now supported on Cisco IOS Release 12.2 T.

Content Engine Network Module for Caching and Content Delivery

The Content Engine (CE) Network Module for Caching and Content Delivery offers the ability to integrate the features of Cisco Application and Content Networking System (ACNS) software into branch office platforms. The CE network module combines the Content Caching, Content Filtering and Content Delivery features of ACNS with robust branch office routing and is supported on Cisco 2600 series, Cisco 3600 series, and Cisco 3700 series routers.

The CE network module can operate as a stand-alone cache or in an integrated enterprise content delivery network (E-CDN) environment. As one element of an E-CDN, the CE network module can be deployed with a combination of other content engines, content routers, content services switches, and content distribution managers to create a complete content delivery network system.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ft_1cenm.htm

PA-MC-8TE1+

The Cisco PA-MC-8TE1+ is a single-wide port adapter designed to provide a full eight-port PRI multichannel solution for the Cisco 7200 and Cisco 7400. The interfaces can be channelized, fractional or ISDN-PRI, or unframed (E1) with up to 256 independent HDLC channels definable for T1 and E1 applications.

SRP MIB for DPT-OC12 WAN Card

This feature provides the SRP MIB for PA-SRP-OC12xx and SRPIP-OC12xx cards for the Cisco 7200 and Cisco 7500 series routers.

Unchannelized support for PA-MC-2T3+ port adapter

The PA-MC-2T3+ is a single-width port adapter that provides two T3 interface connections. Each T3 interface can now be independently configured to be either channelized or unchannelized. A channelized T3 provides 28 T1 lines multiplexed into the T3. Each T1 line can be configured into one or more serial interface data channels.

Using the **no channelized** command, you can configure the T3 as a single, unchannelized serial interface data channel. You can configure this data channel to use all of the T3 bandwidth or a portion of it.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121limit/121e/121e5/5e_ct3.htm

Update to the Enhancements for the Cisco Voice Gateway 200

The Enhancements for the Cisco Voice Gateway 200 (Cisco VG200) feature provides the Cisco VG200 platform (also called CAG-VG200) with increased voice gateway feature parity to the Cisco 2600, Cisco 3600, and Cisco 3700 platforms. This update provides additional feature functionality on the Cisco VG200 platform.

The Cisco VG200 platforms provide the following default memory options: CAG-VG200—16 MB of Flash, 64 MB of DRAM

VPN Accelerator Module (VAM)

The VPN Acceleration Module (VAM) is a single-width acceleration module. It provides high-performance, hardware-assisted tunneling and encryption services suitable for virtual private network (VPN) remote access, site-to-site intranet, and extranet applications. It also provides platform scalability and security while working with all services necessary for successful VPN deployments — security, quality of service (QoS), firewall and intrusion detection, service-level validation, and management. The VAM off-loads IPSec processing from the main processor, thus freeing resources on the processor engines for other tasks.

The VAM provides hardware-accelerated support for multiple encryption functions:

- 56-bit Data Encryption Standard (DES) standard mode: Cipher Block Chaining (CBC)
- 3-Key Triple DES (168-bit)
- Secure Hash Algorithm (SHA)-1 and Message Digest 5 (MD5)
- Rivest, Shamir, Adelman (RSA) public-key algorithm
- Diffie-Hellman key exchange RC4-40

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122y/122ye/1229ye/12ye_vam.htm

VPN Encryption and Compression Module (AIM-VPN/EPII & AIM-VPN/HPII)

The VPN Encryption AIM provides hardware-based DES/3DES/AES and Compression services for Cisco 2691, Cisco 3660, Cisco 3725 and Cisco 3745 series routers. The Data Compression supports IPSec IPPCP and supports the industry standard LZS. For more information about configuring the virtual private network (VPN) encryption hardware advanced integration modules (AIM-VPN/EPII & AIM-VPN/HPII) and network modules, refer to the following document:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftaimvpn.htm

WIC-1-B-U-V2

Beginning in this release, the model number for the existing WIC-1-B-U interface card for the Cisco 1700 series, Cisco 2600 series, and Cisco 3600 series is changing to WIC-1-B-U-V2.

In addition, this interface card will now be supported on the Cisco 1760, Cisco 2691, Cisco 3725 and Cisco 3745 beginning with this release.

New Software Features in Cisco IOS Release 12.2(13)T

The following new features are supported in Cisco IOS Release 12.2(13)T. Some of these features may have been introduced on other hardware platforms in earlier Cisco IOS software releases.

Advanced Encryption Standard (AES)

The Advanced Encryption Standard (AES) feature adds support for the new encryption standard AES, with CBC (Cipher Block Chaining) Mode, to IP Security (IPSec).

The National Institute of Standards and Technology (NIST) has created AES, which is a new Federal Information Processing Standard (FIPS) publication that describes an encryption method. AES is a privacy transforms for IPSec and Internet Key Exchange (IKE) and has been developed to replace the Data Encryption Standard (DES). AES is designed to be more secure than DES: AES offers a larger key size, while ensuring that the only known approach for an intruder to decrypt a message is to try every possible key. AES has a variable key length—the algorithm can specify a 128-bit key (the default), a 192-bit key, or a 256-bit.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ft_aes.htm

Analog DID (Direct Inward Dial)

Analog Direct Inward Dial (DID) is now supported on Cisco 1700 series routers.

Apollo Domain

The Apollo Domain networking protocol will no longer be offered after Cisco IOS Release 12.2. Apollo Domain commands will not appear in future releases of the Cisco IOS software documentation set.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftjencrg.htm

AppleTalk EIGRP

The AppleTalk Enhanced Interior Gateway Routing Protocol (Enhanced IGRP) will no longer be offered after Cisco IOS Release 12.2(13)T. AppleTalk EIGRP commands will not appear in future releases of the Cisco IOS software documentation set.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftjencrg.htm

ATM Multilink PPP Support on Multiple VCs

The ATM Multilink PPP Support on Multiple VCs feature supports the transport of real-time (voice) and other (data) traffic on Frame Relay and ATM virtual circuits (VCs).

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftatmmlt.htm

ATM Policing by Service Category for SVC/SoftPVC

When configured, an ATM switch at the network side of a user-to-network (UNI) interface polices the flow of cells in the forward (into the network) direction of a virtual connection. These traffic policing mechanisms are known as usage parameter control (UPC). With UPC, the switch determines whether received cells comply with the negotiated traffic management values and takes one of the following actions on violating cells:

- Pass the cell without changing the cell loss priority (CLP) bit in the cell header.
- Tag the cell with a CLP bit value of 1.
- Drop (discard) the cell.

The ATM Policing by Service Category for SVC/SoftPVC feature enables you to specify which traffic to police, based on service category, on switched virtual circuits (SVCs) or terminating VCs on the destination end of a soft VC.

For more information on UPC, refer to the "Traffic and Resource Management" chapter in the *Guide to ATM Technology*.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122b/122b_4/svc_upc.htm

ATM Subinterface MIB/Traps

This feature adds support for the monitoring of ATM and Frame Relay (FR) subinterface status using SNMP. New CLI commands allow the enabling or disabling of ATM and Frame Relay notifications (traps and informs), and provide an option for limiting the rate of notifications sent ("trap throttling").

Automatic Protection Switching (APS)

This feature allows switchover of packet-over-SONET (POS) circuits in the event of circuit failure and is often required when connecting SONET equipment to telco equipment.

Banyan VINES

The Banyan Virtual Network System (VINES) protocol will no longer be offered after Cisco IOS Release 12.2(13)T. Banyan VINES commands will not appear in future releases of the Cisco IOS software documentation set.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftjencrg.htm

BGP 4 MIB Support for per-Peer Received Routes

BGP 4 MIB Support for per-Peer Received Routes introduces a new table in the CISCO-BGP4-MIB that provides the capability to query (by using Simple Network Management Protocol [SNMP] commands) for routes that are learned from individual Border Gateway Protocol (BGP) peers.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftbgpmib.htm

BGP Policy Accounting

Border Gateway Protocol (BGP) policy accounting measures and classifies IP traffic that is sent to, or received from, different peers. Policy accounting is enabled on an input interface, and counters based on parameters such as community list, autonomous system number, or autonomous system path are assigned to identify the IP traffic.

Using the BGP **table-map** command, prefixes added to the routing table are classified by BGP attribute, autonomous system number, or autonomous system path. Packet and byte counters are incremented per input interface. A Cisco IOS policy-based classifier maps the traffic into one of eight possible buckets representing different traffic classes.

Using BGP policy accounting, you can account for traffic according to the route it traverses. Service providers (SPs) can identify and account for all traffic by customer and bill accordingly. Customers are billed appropriately for traffic that is routed from a domestic, international, or satellite source.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ft_bgppa.htm

Bisync-to-IP Conversion for Automated Teller Machines

The Bisync-to-IP Conversion for Automated Teller Machines feature enables customers to attach a binary synchronous communication (bisync) automated teller machine to a serial interface on a Cisco router running bisync-to-IP (BIP) protocol translation, and then to route the data over a TCP/IP network directly to an IP-based application host.

As of Cisco IOS Release 12.2(13)T you can use the **bstun peer-map-poll** command in global configuration mode to map the ATM state to polling. The default is to not map the peer state to polling. If you configure this command, BIP activates polling when the BIP tunnel becomes active and stops polling when the tunnel connection is terminated. When the peer state-to-polling is not mapped, BIP waits for the host to issue an "active" status message across the BIP tunnel before polling the ATM device and polling is stopped when an "inactive" status message is received across the tunnel or the tunnel connection is terminated.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftbipatm.htm

Call Admission Control for H.323 VoIP Gateways

Before the call admission control feature, gateways did not have a mechanism to gracefully prevent calls from entering when certain resources were not available to process the call. This causes the new call to fail with unreported behavior, and could potentially cause the calls that are in progress to have quality related problems.

This feature set provides the ability to support resource-based call admission control processes. These resources include system resources such as CPU, memory, and call volume, and interface resources such as call volume.

If system resources are not available to admit the call, two kinds of actions are provided: system denial (which busyouts all of T1 or E1) or per call denial (which disconnects, hairpins, or plays a message or tone). If the interface-based resource is not available to admit the call, the call is dropped from the session protocol (such as H.323).

This feature was previously released in Cisco IOS Release 12.2(4)T on the Cisco 2600 and Cisco 3600 routers, and Cisco MC3810 multiservice concentrators. This release is porting the feature into the IAD2420 platform.

Call Release Source Reporting in Gateway-Generated Call Accounting Records

The Call Release Source Reporting in Gateway-Generated Call Accounting Records feature enables you to track the source of call release in a Voice over IP (VoIP) network. This call release information defines whether a call was released by the calling or called party or by an internal or external source.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ft_crsr.htm

CEF and Distributed CEF Switching for IPv6

Cisco Express Forwarding for IPv6 (CEFv6) is advanced, Layer 3 IP switching technology for the forwarding of IPv6 packets. Distributed CEF for IPv6 (dCEFv6) performs the same functions as CEFv6 but for distributed architecture platforms such as the Cisco 12000 series Internet routers and the Cisco 7500 series routers. dCEFv6 and CEFv6 function the same and offer the same benefits as dCEFv4 and CEFv4—network entries that are added, removed, or modified in the IPv6 Routing Information Base (RIB), as dictated by the routing protocols in use, are reflected in the Forwarding Information Bases (FIBs), and the IPv6 adjacency tables maintain Layer 2 next-hop addresses for all entries in each FIB.

CEFv6 was introduced in Cisco IOS Release 12.2(13)T for nondistributed architecture platforms, such as the Cisco 7200 series routers. dCEFv6 was introduced in Cisco IOS Release 12.0(21)ST for the Cisco 12000 series Internet routers, and was then integrated into Cisco IOS Release 12.2(13)T and later releases for other distributed architecture platforms, such as the Cisco 7500 series routers.

In Cisco IOS Release 12.0(21)ST, dCEFv6 included support for IPv6 addresses and prefixes. In Cisco IOS Release 12.2(13)T or later releases, dCEFv6 and CEFv6 were enhanced to include support for separate FIBs for IPv6 global, site-local, and link-local addresses.

Cisco Conferencing and Transcoding for Voice Gateway Routers

The feature enables voice conferencing to take place among conferees at small, remote branch offices or distributed sites using local resources, without calls having to traverse the company WAN to the central site that supports such services.

The feature also provides transcoding at the remote site. Different IP telephony devices support different codecs and, for communications to be enabled between them, transcoding is required. The feature provides transcoding at the remote site, without having to access transcoding services at the central site.

To provide these services, the feature takes advantage of unused DSP resources on a network module in an already existing small or midsize Cisco router at the remote site. The collection of DSP resources so made available is called a DSP farm. The DSP farm is managed by Cisco CallManager, the software-based call-processing component of the Cisco IP telephony solution, at a central office or branch office.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftdsp.htm

Cisco IOS Software Feature Removal

This feature permanently removes selected legacy features (or components) from the Cisco IOS code. These features will not be available in future releases of Cisco IOS software.

The features that have been removed in the 12.2(13)T release are as follows:

- AppleTalk EIGRP
- Apollo Domain
- Banyan VINES
- Exterior Gateway Protocol (EGP)
- HP Probe
- Interior Gateway Routing Protocol (IGRP)
- Next Hop Resolution Protocol (NHRP) for IPX
- NetWare Link Services Protocol (NLSP)
- Simple Multicast Routing Protocol (SMRP) for AppleTalk
- Xerox Network Systems (XNS)

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftjencrg.htm

Cisco IOS Telephony Service (ITS) Version 2.02

The new feature for Cisco IOS Telephony Service (ITS) Version 2.02 is an increase in directory numbers from 192 to 288 for the following platforms:

- Cisco 2691 router
- Cisco 3640 routers
- Cisco 3660 routers
- Cisco 3725 routers
- Cisco 3745 routers

The *Cisco IOS Telephony Service V2.02 Feature Guide* is located at the following location:

http://www.cisco.com/en/US/products/sw/voicesw/ps4625/products_feature_guides_list.html

Cisco Mobile Networks—Asymmetric Link

An asymmetric link environment such as satellite communications, with a separate uplink and downlink, provides challenges for the mobile router and foreign agent.Because each unidirectional link provides only one way traffic, the inherent mapping in the foreign agent of the return path to the mobile router for incoming messages does not apply. The Cisco Mobile Networks—Asymmetric Link feature solves this problem by extending the use of mobile networks to networks where the mobile router has unidirectional links to the foreign agent. The foreign agent is able to transmit packets back to the mobile router over a different link than the one on which it receives packets from the mobile router.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/asymmetr.htm

Cisco Mobile Networks—Dynamic Network Support

The Cisco Mobile Networks feature enables a mobile router and its subnets to be mobile and maintain all IP connectivity, transparent to the IP hosts connecting through this mobile router. Previously, this feature was a static network implementation that supported stub routers only.

Cisco IOS Release 12.2(13)T introduces dynamic network support, which means that the mobile router dynamically registers its mobile networks to the home agent, which reduces the amount of configuration required at the home agent. For example, if a home agent supports 2000 mobile routers, the home agent does not need 2000 configurations but only a range of home IP addresses to use for the mobile routers.This registration results in minimal configuration on the home agent making administration and set up easier.

Cisco Survivable Remote Site Telephony Service V2.02

The new feature for Cisco Survivable Remote (SRS) Telephony V2.02 is Unity Voice Mail integration, which introduces six new commands:

- **pattern direct**
- **pattern ext-to-ext busy**
- pattern ext-to-ext no-answer
- **pattern trunk-to-ext busy**
- **pattern trunk-to-ext no-answer**
- **vm-integration**

For further information, see *Cisco IOS Telephony Service V2.02* at the following location:

http://www.cisco.com/univercd/cc/td/doc/product/access/ip_ph/srs/index.htm

Class-Based RTP and TCP Header Compression

Real-time Transport Protocol (RTP) or Transmission Control Protocol (TCP) IP header compression is typically configured at the interface level. However, this feature now allows you to configure RTP or TCP IP header compression on a per-class basis, when a class in configured within a policy map. Policy maps are created using the Modular Quality of Service Command-Line Interface (MQC).

Thus, this feature extends the functionality of the MQC and allows you to configure and fine-tune IP header compression at a more granular level.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/fthdrcmp.htm

Clearable SIP-UA Statistics

This feature provides the ability to clear all Session Initiation Protocol (SIP) statistics counters that are displayed by the **show sip-ua statistics** command, which includes response, traffic and retry statistics. Prior to the implementation of the new feature, SIP counters could be cleared only by reloading or resetting the router. The new feature enhances both trouble-shooting and statistical analysis efforts by clearing SIP counters without reloading or resetting the router.

The new feature includes the following functionality:

- Provides an alternate, convenient way to clear statistics counters through the CLI
- Provides separate views of CLI and SNMP statistics counters
- Provides a timestamp indicating **clear sip-ua statistics** command activity to assist in reconciling CLI and SNMP counter polls

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftshadow.htm

Committed Access Rate (CAR)

Committed Access Rate (CAR) can rate limit traffic based on certain matching criteria, such as incoming interface, IP Precedence, or IP access list.

Connection-Oriented Media (Comedia) Enhancements for SIP

This feature provides the following functionality to symmetric Network Address Translation (NAT) traversal:

- Allows the Cisco gateway to check the media source of incoming Real-time Transport Protocol (RTP) packets.
- Allows the endpoint to advertise its presence inside or outside of NAT.

The new feature implements one of many possible SIP solutions to address problems with different NAT types and traversals.With the Connection-Oriented Media (Comedia) Enhancements for SIP feature, the gateway can open an RTP session with the remote end and then update or modify the existing RTP session's remote address and port **(raddr:rport)** with the source address and port of the actual media packet received after passing through NAT.

Dial-Peer Support for Data Calls

The Dial-Peer Support for Data Calls feature enables the configuration and order assignment of dial peers so that a gateway can identify incoming calls as voice or data. The feature provides a unified call processing model that is scalable for voice and data calls through dial-peer provisioning. The feature also enables the capability of assigning separate number ranges for voice or data calls so that the calls will have the same preference level of matching.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftconcrt.htm

Distributed IPv6 for Cisco IOS software

This feature provides distributed CEF switching support for IPv6 on the Cisco 7500 platforms.

DLR Enhancements: PGM RFC-3208 Compliance

In compliance with RFC 3208, the DLR Enhancements feature adds off-tree designated local repairer (DLR) support and redirecting poll response (POLR) capability for upstream DLRs to the Cisco implementation of Pragmatic General Multicast (PGM).

Dual Serial Line Management to Interface Lucent 5ESS

This feature is a part of the Cisco IOS Telco Feature Set, a bundle of applications specific to the data communications network (DCN) environment. Specifically, this feature supports X.25-to-TCP protocol translation, and provides dual serial interfaces to preserve the redundancy and monitoring capability available from SCC0 and SCC1 links on a Lucent 5ESS switch in the DCN network.

Dynamic Multipoint VPN (DMVPN)

The Dynamic Multipoint VPN (DMVPN) feature combines GRE tunnels, IPSec encryption, and NHRP routing to provide users an ease of configuration via crypto profiles, which override the requirement for defining static crypto maps, and dynamic discovery of tunnel endpoints.

This feature relies on the following two Cisco technologies—NHRP and mGRE Tunnel Interface.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftgreips.htm

Dynamic Subscriber Bandwidth Selection

The Dynamic Subscriber Bandwidth Selection (DBS) feature enables wholesale service providers to sell different classes of service to retail service providers by controlling bandwidth at the ATM Virtual Circuit (VC) level. ATM Quality of Service (QoS) parameters from the subscriber domain are applied to the ATM PVC on which a PPPoE or PPPoA session is established.

Using DBS you can set the ATM permanent virtual circuit (PVC) traffic shaping parameters to be dynamically changed based on the RADIUS profile of a PPP over Ethernet (PPPoE) or PPP over ATM (PPPoA) user logging in on the PVC. If the user is the first user on that PVC, then the RADIUS profile values override the default values of the PVC. If users already exist on the PVC, then the new value overrides the existing configuration only if it is higher than the existing value. If multiple PPPoE sessions are allowed on a subscriber VC, then the highest peak cell rate (PCR) and sustainable cell rate (SCR) of all the sessions is selected as the PCR and SCR of the VC.

You can apply DBS QoS parameters per user as well as per domain. If you apply DBS QoS parameters under a domain profile, all users in that profile are assigned the same DBS QoS parameters. These parameters are assigned to the RADIUS profile for that domain. You can also apply distinctive DBS QoS parameters via the RADIUS user profile.

Traffic shaping parameters can be locally configured by IOS CLI in VC-mode, VC-class, range mode, or PVC-in-range mode. These parameters have a lower priority and are overridden by the shaping parameters specified in the domain service profile. Traffic shaping parameters that are CLI configured at the VC class interface or subinterface level are treated as the default QoS parameters for the PVCs to which they apply. These parameters are overridden by the domain service profile QoS parameters of the domain the user is logged in to. If no VC class is configured, the default is the unspecified bit rate (UBR).

When a network access server (NAS) sends a domain authorization request and receives an affirmative response from the RADIUS server, this response may include a "QoS-management" string via vendor-specific attribute (VSA) 26 for QoS management in the NAS. The QoS management values are configured as part of the domain service profile attributes on the RADIUS server. These values contain PCR and SCR values for a particular user or domain. If the QoS specified for a domain or user cannot be applied on the PVC that the session belongs to, the session is not established.

Changing PVC traffic parameters because of new simultaneous PPPoE sessions on the PVC does not cause existing PPPoE sessions that are already established to disconnect. Changing domain service profile QoS parameters on the RADIUS server does not cause traffic parameters to automatically change for PVCs that have existing sessions.

When you enter the **dbs enable** or **no dbs enable** commands to configure or unconfigure DBS, existing sessions are not disconnected. If you have a session that has been configured for DBS and you configure the **no dbs enable** command on a VC, additional sessions that are configured will display DBS configured QoS values until the first new session is up. After the first session is brought up, the VC has default and locally configured values. If you configure the **dbs enable** command after multiple sessior are already up on the VC, all sessions on that VC have DBS QoS parameters.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftdbs.htm

Enhanced Features for Local and Advanced Voice Busyout

This feature introduces 2 new commands, **busyout monitor gatekeeper** and **busyout action graceful**. The **busyout monitor gatekeeper** command busies out the gatekeeper if the gateway loses connection to the primary gatekeeper and removes the busyout state when the gateway restores connection to the primary or backup gatekeeper. The **busyout action graceful** command controls the busyout behavior that is triggered by the **busyout monitor** command. This command busies out the voice port immediately if the busyout behavior is triggered but if there is an active call on this voice port it will wait until the call is over.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ft_lavbo.htm

Enhanced ITU-T G.168 Echo Cancellation

This feature provides an alternative to the default, Cisco proprietary 32-millisecond G.165 echo canceller (EC). The new extended echo canceller provides improved performance for trunking gateway applications and provides a configurable tail length that supports up to 64 milliseconds (ms) of echo cancellation. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftecho.htm

Enhanced Packet Marking

The Enhanced Packet Marking feature allows you to map and convert the marking of a packet from one value to another (for example, the Precedence value can be mapped to the equivalent Class of Service (CoS) value) by using a kind of conversion chart called a table map.

The table map establishes an equivalency from one value to another. For example, the table map can map the CoS value of a packet to the Precedence or differentiated services code point (DSCP) value of the packet. For networks using MPLS, the MPLS EXP value can be mapped to the QoS group value, which can then be mapped to the Precedence or DSCP value of the packet. This value mapping can be propagated for use on the network, as needed. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftenpkmk.htm

Enhancements for the Cisco Voice Gateway 200

The Enhancements for the Cisco Voice Gateway 200 (VG200) feature provides the Cisco VG200 platform with increased voice gateway feature parity to the Cisco 2600, Cisco 3600, and Cisco 3700 platforms. This update provides additional feature functionality on the Cisco VG200 platform. Refer to the following document for additional information:

Exterior Gateway Protocol (EGP)

The Exterior Gateway Protocol (EGP) will no longer be offered after Cisco IOS Release 12.2(13)T. EGP commands will not appear in future releases of the Cisco IOS software documentation set.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftjencrg.htm

File System Check and Repair for PCMCIA ATA Disks

This feature introduces a File-System-Check (fsck) utility in Cisco IOS software for FAT file systems on PCMCIA disks. The utility performs functions such as checking the boot sector and partition table, checking file and directory structure, reclaiming unused disk space, and updating the FAT file structure. Prior to the introduction of this utility, corrupt files could not be removed from ATA disks using the Cisco IOS CLI. This utility is run using the **fsck** privileged EXEC mode command.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ft_fsck.htm

Frame Relay PVC Bundles with IP and MPLS QoS Support

Frame Relay PVC bundles allow you to associate a group of Frame Relay permanent virtual circuits (PVCs) with a single next-hop address. When Frame Relay PVC bundles are used with IP, packets are mapped to specific PVCs in the bundle on the basis of the precedence value or differentiated services code point (DSCP) settings in the type of service (ToS) field of the IP header. Each packet is treated differently according to the QoS configured for each PVC.

Frame Relay PVC bundles with MPLS QoS support extends Frame Relay PVC bundle functionality to support the mapping of Multiprotocol Label Switching (MPLS) packets to specific PVCs in the bundle. MPLS packets are mapped to PVCs according to the settings of the experimental (EXP) bits in the MPLS packet header.Waiting for information.

Frame Relay Queueing and Fragmentation at the Interface

The Frame Relay Queueing and Fragmentation at the Interface feature introduces support for low-latency queueing (LLQ) and FRF.12 end-to-end fragmentation on a Frame Relay interface. This new feature simplifies the configuration of low-latency, low-jitter quality of service (QoS) by enabling the queueing policy and fragmentation configured on the main interface to apply to all permanent virtual circuits (PVCs) and subinterfaces under that interface. Before the introduction of this feature, queueing and fragmentation had to be configured on each individual PVC. Subrate shaping can also be configured on the interface.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/frfrintq.htm

H.323 Call Redirection Enhancements

The user-to-user information element (UUIE) of the Facility message is used primarily for call redirection. The UUIE contains a field, facilityReason, that indicates the nature of the redirection. The H.323 Call Redirection Enhancements feature adds support for two of the reasons: routeCallToGatekeeper and callForwarded. It also provides a non-standard method for using the Facili message to effect call transfer.

This feature was previously released in Cisco IOS Release 12.2(2)T on Cisco 1700, Cisco 2600 series, Cisco 3600 series, Cisco MC3810, Cisco AS5300, Cisco uBR924 platforms. This release is porting the feature into the IAD2420 platform.

H.323 Dual Tone Multifrequency Relay Using Named Telephone Events

The NTE method of DTMF relay was originally available on Cisco gateways only for Session Initiation Protocol (SIP) and Media Gateway Control Protocol (MGCP) gateways. The H.323 DTMF Relay Using Named Telephone Events (NTE) feature adds support for this method for H.323 gateways.

Cisco H.323 gateways advertise capabilities using the H.245 capabilities messages. By default, they advertise that they can receive all DTMF relay modes. If the capabilities of the remote gateway do not match, the Cisco H.323 gateway transmits DTMF tones as in-band voice. Configuring DTMF relay on the Cisco H.323 gateway sets preferences for how the gateway handles DTMF transmission. If multiple methods are configured, the priority is as follows:

- Cisco RTP
- RTP NTE
- H.245 signal
- H.245 alphanumeric

In addition to support for NTE, the H.323 DTMF Relay Using NTE feature provides support for asymmetrical payload types. Payload types can differ between local and remote endpoints. Therefore, the Cisco gateway can transmit one payload type value and receive a different payload type value.

This feature was previously released in Cisco IOS Release 12.2(11)T on Cisco 2600 series, Cisco 3600 series, Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms. This release is porting the feature into the IAD2420 platform.

H.323 (Gateway) Support

Support for H.323 Version 2 Gateway functionality is added to the Cisco IAD2420 series of integrated access devices (IADs). This support provides the Cisco IAD2420 IAD with more market opportunities than when the IAD only supported MGCP and SGCP call control protocols.

The Cisco IAD2420 IAD with 16 FXS analog ports delivers local voice and data service using VoIP in an Ethernet To The Building (ETTx) application. It aggregates the voice traffic from multiple tenants and transports it to an Ethernet switch, such as the Cisco 2950, over the Ethernet link. The built-in WAN interface (either a T1, ADSL or SHDSL module) is not used when using the IAD2420-16FXS.

H.323 Redundant Zone Support

The Redundant H.323 Zone Support feature allows users to configure multiple gatekeepers to service the same zone or technology prefix. This feature can be used with the Gateway Support for Alternate Gatekeepers feature, which allows a user to configure a gateway to point to two gatekeepers (one as the primary and the other as the alternate). Together, these features allow a user to configure a Cisco gateway to send location requests (LRQs) to two or more Cisco gatekeepers---one as a primary and the others as back up gatekeepers.

This feature was previously released in Cisco IOS Release 12.1(1)T on Cisco 2600 series, Cisco 3600 series, Cisco MC3810, Cisco AS5200, Cisco AS5300, and Cisco AS5800 platforms. This release is porting the feature into the Cisco IAD2420 platform.

H.323 Scalability and Interoperability Enhancements

The Cisco H.323 Scalability and Interoperability Enhancements feature upgrades the Cisco H.323 Gatekeeper and Cisco H.323 Gateway to comply with H.323 Version 3. The enhancements in this release include support for mandatory H.323 Version 3 elements in the gateway, support for H.225 call signalling over UDP, and address resolution using border elements.

For gatekeeper support, this feature was previously released in Cisco IOS Release 12.2(4)T on Cisco 2500 series, Cisco 2600 series, Cisco 3600 series, Cisco MC3810, Cisco AS5850, and Cisco 7200 series platforms. For gateway support, this feature was previously released in Cisco IOS Release 12.2(4)T on Cisco 1700, Cisco 2600 series, Cisco 3600 series, Cisco 7200 series, Cisco AS5850, Cisco uBR900 series, and Cisco uBR924 platforms. This release is porting the feature into the IAD2420 platform.

H.323 Support for Virtual Interfaces

The H.323 Support for Virtual Interfaces feature allows users to configure the IP address of the gateway, so that the IP address include in the H.323 packet is deterministic and consistently indicates the same address for the source.

In previous releases of the Cisco IOS software, the source address included in the H.323 packet could vary depending on the protocol (RAS, H.225, H.245, or RTP). This makes it difficult to configure firewall applications to work with H.323 messages.

The H.323 Support for Virtual Interfaces feature addresses that difficulty by allowing the user to explicitly configure an IP address to be used for all protocols

This feature was previously released in Cisco IOS Release 12.1(2)T on Cisco 2500 series, Cisco 2600 series, Cisco 3600 series, Cisco AS5300, Cisco 7200 series, and Cisco uBR924 platforms. This release is porting the feature into the IAD2420 platform.

HP Probe

The HP Probe feature will no longer be offered after Cisco IOS Release 12.2(13)T. HP Probe commands will not appear in future releases of the Cisco IOS software documentation set.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftjencrg.htm

Interim Local Management Interface (ILMI)

The Interim Local Management Interface (ILMI) is a protocol defined by the ATM Forum for setting and capturing physical layer, ATM layer, virtual path, and virtual circuit parameters on ATM interfaces. ILMI uses simple network management protocol (SNMP) messages without User Datagram Protocol (UDP) and IP, and organizes managed objects into the following four management information bases (MIBs).

Interim-Interswitch Signaling Protocol (IISP)

The Interim-Interswitch Signalling Protocol (IISP) defines a static routing protocol (using manually configured prefix tables) for communication between ATM switches. IISP provides support for switched virtual circuits (SVCs) on ATM switches that do not support the Private Network-to-Network Interface (PNNI) protocol.

Interim Update at Call Connect

With this feature, Cisco IOS software generates and sends an additional updated interim accounting record to the accounting server when a call leg is connected. All attributes (for example, h323-connect-time and backward-call-indicators) available at the time of call connection are sent through this interim updated accounting record. Refer to the following document for additional information:

Interior Gateway Routing Protocol (IGRP)

The Interior Gateway Routing Protocol (IGRP) will no longer be offered after Cisco IOS Release 12.2(13)T. IGRP commands will not appear in future releases of the Cisco IOS software documentation set.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftjencrg.htm

IP Event Dampening

Interface state changes occur when interfaces are administratively brought up or down or if an interface changes state. When an interface changes state or flaps, routing protocols are notified of the status of the routes that are affected by the change in state. Every interface state change requires all affected devices in the network to recalculate best paths, install or remove routes from the routing tables, and then advertise valid routes to peer routers. An unstable interface that flaps excessively can cause other devices in the network to consume substantial amounts of system processing resources and cause routing protocols to lose synchronization with the state of the flapping interface.

The IP Event Dampening feature introduces a configurable exponential decay mechanism to suppress the effects of excessive interface flapping events on routing protocols and routing tables in the network. This feature allows the network operator to configure a router to automatically identify and selectively dampen a local interface that is flapping. Dampening an interface removes the interface from the network until the interface stops flapping and becomes stable. Configuring the IP Event Dampening feature improves convergence times and stability throughout the network by isolating failures so that disturbances are not propagated, which reduces the utilization of system processing resources by other devices in the network and improves overall network stability.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftipevdp.htm

IPSec NAT Transparency

Before the introduction of the IPSec NAT Transparency feature, a standard IPSec VPN tunnel would not work if there were one or more NAT or PAT points in the delivery path of the IPSec packet. This feature introduces support for IPSec traffic to travel through NAT or PAT points in the network by encapsulating IPSec packets in a User Datagram Protocol (UDP) wrapper, thereby, allowing remote access users to build IPSec tunnels to home gateways.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftipsnat.htm

IPSec Passive Mode

The IPSec Passive mode feature allows users to configure an intermediate mode—IPSec passive mode—that enables routers within an existing network to accept encrypted and unencrypted data. The routers will also attempt to negotiate an encrypted session when sending data, but they will send the data in unencrypted form as necessary.

IPSec passive mode is valuable for users who wish to migrate existing networks to IPSec because they no longer have wait for all routers to deploy IPSec; that is, all routers will continue to interact with routers that will encrypt data (that have been upgraded with IPSec) and routers that have yet to be upgraded.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftpasips.htm

Note Because a router in IPSec passive mode is insecure, make sure that no routers are accidentally left in this mode after upgrading a network.

IPv6 ADSL and Dial Deployment Support

The IPv6 ADSL and Dial Deployment Support feature adds support for IPv6 prefix pools, and per-user IPv6 Radius attributes. It further enables deployment of IPv6 in DSL and dial access environments. This feature provides the extensions that make large scale IPv6 access possible for IPv6 environments, including IPv6 Radius attributes, stateless address configuration on PPP links, per-user static routes, and access lists (ACLs). Refer to the following document for more information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ipv6/index.htm

IPv6 Extended Access Control Lists

In Cisco IOS Release 12.2(2)T or later releases, 12.0(21)ST, and 12.0(22)S, standard IPv6 access control list (ACL) functionality is used for basic traffic filtering functions—traffic filtering is based on source and destination addresses, inbound and outbound to a specific interface, and with an implicit deny statement at the end of each access list (functionality similar to standard ACLs in IPv4). IPv6 ACLs are defined and their deny and permit conditions are set by using the **ipv6 access-list** command with the **deny** and **permit** keywords in global configuration mode.

In Cisco IOS Release 12.2(13)T or later releases, and 12.0(23)S, the standard IPv6 ACL functionality is extended to support—in addition to traffic filtering based on source and destination addresses—filtering of traffic based on IPv6 option headers and optional, upper-layer protocol type information for finer granularity of control (functionality similar to extended ACLs in IPv4). IPv6 ACLs are defined by using the **ipv6 access-list** command in global configuration mode and their permit and deny conditions are set by using the **deny** and **permit** commands in IPv6 access list configuration mode. (Configuring the **ipv6 access-list** command places the router in IPv6 access list configuration mode, from which permit and deny conditions can be set for the defined IPv6 ACL.)

IPv6 Quality of Service

This feature provides for the application of all the Differentiated Services (DiffServ) QoS features to IPv6 packets. Specific QoS features include packet classification, traffic shaping, traffic policing, packet marking, and Drop based on Weighted Random Early Detect (WRED) on all applicable interfaces.

IPv6 RIP Enhancements

The IPv6 RIP Enhancements feature adds support for a separate IPv6 RIP routing table, the ability to delete routes from the IPv6 RIP routing table, and the ability to set route tags. The holddown timer default is now set to zero, and a maximum number of parallel routes can be configured.

IS-IS HMAC-MD5 Authentication

The IS-IS HMAC-MD5 Authentication feature adds an HMAC-MD5 digest to each Intermediate System-to-Intermediate System (IS-IS) protocol data unit (PDU). HMAC is a mechanism for message authentication codes (MAC) using cryptographic hash functions. The digest allows authentication at the IS-IS routing protocol level, which prevents unauthorized routing messages from being injected into the network routing domain.

IS-IS has five packet types: link-state packet (LSP), LAN Hello, Serial Hello, complete sequence numbe PDU (CSNP), and partial sequence number PDU (PSNP). The IS-IS HMAC-MD5 authentication or th cleartext password authentication can be applied to all five types of PDU. The authentication can be enabled on different IS-IS levels independently. The interface-related PDUs (LAN Hello, Serial Hello, CSNP and PSNP) can be enabled with authentication on different interfaces, with different levels and different passwords.

The HMAC-MD5 mode cannot be mixed with the clear text mode on the same authentication scope (LSP or interface). However, administrators can use one mode for LSP and another mode for some interfaces, for example. If mixed modes are intended, different keys should be used for different modes in order not to compromise the encrypted password in the PDUs.

Refer to the following document for more information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftismd5.htm

L2TP Extended Failover

The L2TP Extended Failover feature extends Layer 2 Tunneling Protocol (L2TP) failover to occur if during tunnel establishment, a router receives a Stop-Control-Connection-Notification (StopCCN) message from its peer or during session establishment, a router receives a Call-Disconnect-Notify (CDN) message from its peer. In either case, the router selects an alternate peer to contact. This is in addition to the existing failover caused by excessive retransmission of Start-Control-Connection-Reply (SCCRQ) messages that indicate there is no response from the peer.

L2TP Extended Failover results in better load distribution and prevents congestion at a tunnel terminator by allowing the busy tunnel terminator to inform the tunnel initiator that it should try another tunnel terminator.

Refer to the following document for more information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftl2tpef.htm

L2TP Redirect

The L2TP Redirect feature allows an L2TP network server (LNS) participating in Stack Group Bidding Protocol (SGBP) to send a redirect message to the L2TP access concentrator (LAC) if another LNS wins the bid. The LAC will then reinitiate the call to the newly redirected LNS. The feature provides two purposes:

- Allows the user to have more evenly load-balanced sessions among a stack of LNSs
- For multilink calls over Layer 2 Tunneling Protocol (L2TP), eliminates the need for multiple hops

Refer to the following document for more information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftl2tpmr.htm

Low Latency Queueing (LLQ) for IPSec

Low Latency Queueing (LLQ) for IPSec encryption engines helps reduce packet latency by introducing the concept of queueing before crypto engines. Prior to this, the crypto processing engine gave data traffic and voice traffic equal status. Administrators now designate voice traffic as priority. Data packets arriving at a router interface are directed into a data packet inbound queue for crypto engine processing. This queue is called the best effort queue. Voice packets arriving on a router interface are directed into a priority packet inbound queue for crypto engine processing. This queue is called the priority queue. The crypto engine undertakes packet processing in a ratio favorable for voice packets. Voice packets are guaranteed a minimum processing bandwidth on the crypto engine.

Refer to the following document for more information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/llqfm.htm

LZ Software with Hardware Encryption

Before the LZ Software with Hardware Encryption feature was introduced, compression was not supported with the VPN encryption hardware advanced integration module (AIM) and network module (NM); that is, a user had to remove the VPN module from the router and run software encryption with software compression. This feature enables all VPN modules to support LZ compression in software when the VPN module is in Cisco 2600 and Cisco 3600 series routers, thereby, allowing users to configure and compress 2 128Kb/sec streams.

Manual Certificate Enrollment (TFTP and Cut-and-Paste)

The Manual Certificate Enrollment (TFTP and Cut-and-Paste) feature allows users to generate a certificate request and accept Certificate Authority (CA) certificates as well as the router's certificates; these tasks are accomplished via a TFTP server or manual cut-and-paste operations. Users may wish to utilize TFTP or manual cut-and-paste enrollment in the following situations:

- Their CA does not support Simple Certificate Enrollment Protocol (SCEP) (which is the most commonly used method for sending and receiving requests and certificates)
- A network connection between the router and CA is not possible (which is how a router running Cisco IOS software obtains it certificate)

Refer to the following document for more information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftmancrt.htm

Media Forking

Media Forking allows the gateway to create multiple streams (or forks) of media associated with a single call and send those streams to multiple destinations, which may include voice portals with speech recognition. Only the original media stream is bidirectional. Additional branches are unidirectional (transmit only), so additional participants are able to hear only the originating caller and not each other. Each media stream is independently configured and can be a variation of voice only, named telephone event (NTE) only, or voice plus NTE media stream.The content of the media stream is specified in the signaling when the media stream is established.

Although there can be more than one media destination, there is only one signaling destination, which might be the voice portal. The call leg that was originally signaled (for instance, from the originating gateway to the voice portal) is maintained for the life of the session. The media destinations are independent of the signaling destination, so media forks can be added and removed dynamically. The local telephony call leg must be maintained, and up to four media forks, including the destination of the original call, are supported. Fax calls are not supported on any media streams (including the original) when multiple forks are requested. No media forks can be created for a fax call session.

MGCP 1.0 and TGCP 1.0 Profiles

This feature implements the following MGCP protocols on the supported Cisco media gateways:

- MGCP 1.0 (RFC 2705)
- Network-based Call Signaling (NCS) 1.0, the MGCP 1.0 profile for residential gateways (RGWs)
- Trunking Gateway Control Protocol (TGCP) 1.0, the MGCP 1.0 profile for trunking gateways (TGWs)

MGCP1.0 is a protocol for the control of Voice over IP (VoIP) calls by external call-control elements known as media gateway controllers (MGCs) or call agents (CAs). It is described in the informational RFC 2705, published by the Internet Society.

PacketCable is an industry-wide initiative for developing interoperability standards for multimedia services over cable facilities using packet technology. PacketCable developed the NCS and TGCP protocols, which contain extensions and modifications to MGCP while preserving basic MGCP architecture and constructs. NCS is designed for use with analog, single-line user equipment on residential gateways, while TGCP is intended for use in VoIP-to-PSTN trunking gateways in a cable environment. To meet European cable requirements and equipment characteristics, the EuroPacketCable working group has adapted PacketCable standards under the name *IP Cablecom*.

The 'cmiHaRegMobilityBindingTable' is augmented from 'haMobilityBindingTable' of the RFC2006-MIB (MIP MIB) to provide the NAI information.

2. HA redundancy feature.

Scalar objects have been added to MIB to monitor the message exchanges between peer home agents. These objects are under the 'cmiHaRedun' subtree of the MIB.

3. Performance monitoring.

There are scalar objects under 'cmiHaReg' subtree which gives statistics about the registration processing rate at home agent. Distinction is made between registration requests authenticated locally and those authenticated at the AAA server. There are scalar objects under the 'cmiMaReg' subtree which give statistics about the rate at which registration requests are received at the mobility agent (HA or FA).

Mobile IP—NAT Detect

The basic purpose of Network Address Translation (NAT) is to take traffic from the internal network and present it to the Internet as if it were coming from a single device having only one IP address. Traditional Mobile IP tunneling is incompatible with NAT. The Mobile IP—NAT Detect feature allows the home agent to tunnel traffic to Mobile IP clients with private IP addresses behind a NAT-enabled device. The home agent is capable of detecting a registration request traversing a NAT-enabled device and applying the appropriate tunnel to reach the Mobile IP client.

Refer to the following document for more information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftnatrav.htm

Mobile IP—Private Addressing Support

The Mobile IP—Private Addressing Support feature allows the use of private IP addresses for mobile nodes. Enhancements have been made to the foreign agent to allow it to distinguish between mobile nodes using the same private home address, but with different home agents.

When a mobile node successfully registers with a foreign agent, a tunnel is set up between the foreign agent and the home agent. When a packet is received by the foreign agent for the mobile node, the foreign agent will identify which mobile node to route the packet to based on the address of the mobile node, as well as the home agent from which the packet came.

Mobile IP—Support for FA Reverse Tunneling

The Mobile IP—Support for Foreign Agent Reverse Tunneling feature prevents packets sent by a mobile node from being discarded by routers configured with ingress filtering by creating a reverse tunnel between the foreign agent and the home agent.

Refer to the following document for more information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ft_farev.htm

Modular QoS CLI (MQC)-Based Frame-Relay Traffic Shaping

The Modular Quality of Service (QoS) Command Line Interface (CLI)-Based Frame-Relay Traffic Shaping feature provides users the ability to configure Frame Relay traffic shaping (FRTS) using Modular Quality of Service (QoS) Command Line Interface (CLI) commands. Modular QoS CLI is known as MQC.

Modular QoS CLI (MQC) Three-Level Hierarchical Policer

Earlier Cisco IOS traffic policing features allowed you to configure traffic policing at two levels of policy map hierarchies; the top level and a secondary level.

The Modular QoS CLI (MQC) Three-Level Hierarchical Policer extends the traffic policing functionality by allowing you to configure traffic policing at *three* levels of policy map hierarchies; a top level, a secondary level, and a third level. Traffic policing may be configured at any or all of these levels, depending on the needs of your network. The feature is configured using the Modular Quality of Service (QoS) Command-Line Interface (CLI) (MQC).

Configuring traffic policing in a three-level hierarchical structure provides a greater degree of granularity for traffic policing.

Refer to the following document for more information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ft3level.htm

Modular QoS CLI (MQC) Unconditional Packet Discard

This feature allows customers to classify traffic matching certain criteria and then configure the system to unconditionally discard any packets matching that criteria. This feature is configured using the Modular Quality of Service Command-Line Interface (MQC) feature.

Refer to the following document for more information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftcbdrp.htm

MPLS DiffServ Tunneling Modes

MPLS DiffServ Tunneling Modes allows service providers to manage the QoS that a router will provide to an MPLS packet in an MPLS network. MPLS DiffServ Tunneling Modes conforms to the IETF draft standard for Uniform, Short Pipe, and Pipe modes, and to Cisco-defined extensions for scalable CLI management of those modes at customer edge, provider edge, and core routers.

Refer to the following document for more information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftdtmode.htm

MPLS Label Distribution Protocol (LDP) MIB

Multiprotocol label switching (MPLS) is a packet forwarding technology that uses a short, fixed-length value called a label in packets to determine the next hop for packet transport through an MPLS network by means of label switching routers (LSRs).

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ldpmib13.htm

MPLS Virtual Private Networks

The Virtual Private Network (VPN) feature for Multiprotocol Label Switching (MPLS) allows a Cisco IOS network to deploy scalable IPv4 Layer 3 VPN backbone services.

This feature was originally introduced in 12.0(5)T. This release introduces the command.

MGCP Model

MGCP bases its call control and intelligence in centralized *call agents*, also called media gateway controllers. The call agents issue commands to simple, low-cost endpoints, which are housed in media gateways (MGs), and the call agents also receive event reports from the gateways. MGCP messages between call agents and media gateways are sent with Internet Protocol over User Datagram Protocol (IP/UDP).

The MGCP 1.0 Including NCS 1.0 and TGCP 1.0 Profiles feature provides protocols for RGWs and TGWs, which sit at the border of the packet network to provide an interface between traditional, circuit-based voice services and the packet network. Residential gateways offer a small number of analog line interfaces, while trunking gateways generally manage a large number of digital trunk circuits.

Refer to the following document for more information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_24mg1.htm

MGCP Gateway Support for the Bind Command

Previous Media Gateway Control Protocols (MGCP) implementation did not allow the assignment of particular IP addresses for sourcing MGCP commands and media packets, which could cause firewall and security problems. With this feature, you can configure interfaces on which control and media packets can be exchanged. This new functionality allows you to separate signaling from voice by binding control (MGCP signaling) and media (Real-Time Transport Protocol, or RTP voice, fax, and modem) to specific gateway interfaces. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftxbind.htm

Mobile IP—Challenge/Response Extensions

The Mobile IP—Challenge/Response Extensions feature enables a foreign agent to authenticate a mobile node by sending mobile foreign challenge extensions (MFCE) and mobile node-AAA authentication extensions (MNAE) to the home agent in registration requests. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ft_chext.htm

Mobile IP—Fastswitching Support on Foreign Agent

The Mobile IP—Fastswitching Support on Foreign Agent feature enables packets to be fast switched from the foreign agent both in the direction of the mobile node and through the reverse tunnel. In the direction of the mobile node, packets will be properly fast-switched for global IP addresses. However, this feature does not support fast-switching to mobile nodes using private home addresses.

Fast-switching packets through the reverse tunnel is achieved by intercepting packets before cache lookup and dynamically switching them through the correct tunnel interface.

Mobile IP—Generic NAI Support and Home Address Allocation

The Mobile IP—Generic NAI Support and Home Address Allocation feature allows a mobile node to be identified by using a network access identifier (NAI) instead of an IP address (home address). The NAI is a character string similar to an email address in that it is formatted as either *user* or *user@realm* but it need not be a valid e-mail address.

The original purpose of the NAI was to support roaming between dialup ISPs. With the NAI, each ISP need not have all the accounts for all of its roaming partners in a single RADIUS database. RADIUS servers can proxy requests to remote servers for each realm.

These services are also valuable for mobile nodes using Mobile IP when the nodes are attempting to connect to foreign domains with AAA servers. The mobile node can identify itself by including the NAI along with the Mobile IP registration request.

Additionally, this feature allows you to configure the home agent to allocate addresses to mobile nodes either statically (including multiple static addresses per NAI flow) or dynamically. Home address allocation can be from address pools configured locally, through either DHCP server access, or from the AAA server.

Refer to the following document for more information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftnaiadd.htm

Mobile IP Home Agent Policy Routing

The Mobile IP Home Agent Policy Routing feature supports route maps on Mobile IP tunnels created at the home agent. This feature allows an ISP to provide service to multiple customers. While reverse tunneling packets, the home agent looks up where the packet should go. For example, if an address corresponds to a configured network access identifier (NAI) realm name (such as cisco.com), the packet goes out interface 1, which has a connection to the Cisco network. If an address corresponds to another NAI realm name (such as nortel.com), the packet goes out interface 2, which has a connection to the Nortel network. This feature was designed to route traffics through VPNs back to an enterprise network.

Refer to the following document for more information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/fthapoli.htm

Mobile IP —IPsec for Home Agent to Foreign Agent Tunnel

The Mobile IP—IPsec for Home Agent to Foreign Agent Tunnel enables the use of IPSec on the home agent to foreign agent tunnel.

Crypto map configuration must be applied to both the tunnel and physical interfaces. For details refer to the “Configuring Cisco Encryption Technology” chapter in the Release 12.2 *Cisco IOS Security Configuration Guide*.

Mobile IP—MIB Support for NAI and HA Redundancy

The CISCO-MOBILE-IP-MIB is enhanced to add support for following features:

1. Compliance with RFC 2794 for mobile nodes identified by Network Access Identifiers (NAI).

The following tables are defined in the MIB to support NAI based mobile nodes (MN):

- cmiFaRegVisitorTable
- cmiHaRegCounterTable
- cmiSecAssocTable
- cmiSecViolationTable

These tables are the same as the corresponding tables in the RFC2006-MIB (MIP MIB) in terms of the information they provide, but indices are changed so that entries for mobile nodes which are not identified by the IP address will also be included in the table.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftvpn13.htm

MPLS VPN—Carrier Supporting Carrier—IPv4 BGP Label Distribution

This feature enables you to configure your carrier supporting carrier network to enable Border Gateway Protocol (BGP) to transport routes and Multiprotocol Label Switching (MPLS) labels between the backbone carrier provider edge (PE) routers and the customer carrier customer edge (CE) routers. Previously you had to use Label Distribution Protocol (LDP) to carry the labels and an internal gateway protocol (IGP) to carry the routes between PE and CE routers to achieve the same goal.

This feature was originally introduced in Cisco IOS Release 12.0(21)ST. This release integrates the feature into Cisco IOS Release 12.2(13)T.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftcscl13.htm

MPLS VPN—Inter-AS—IPv4 BGP Label Distribution

This feature enables you to set up a VPN service provider network so that the autonomous system boundary routers (ASBRs) exchange IPv4 routes with MPLS labels of the provider edge (PE) routers. Route reflectors (RRs) exchange VPNv4 routes, using multihop, multiprotocol, External Border Gateway Protocol (EBGP). This configuration saves the ASBRs from having to store all the VPNv4 routes. Using the route reflectors to store the VPNv4 routes and forward them to the PE routers results in improved scalability.

This feature was originally introduced in Cisco IOS Release 12.0(21)ST. This release integrates the feature into Cisco IOS Release 12.2(13)T.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftiasl13.htm

MPLS VPN-MIB Notifications

The MPLS VPN technology allows service providers to offer intranet and extranet VPN services that directly connect their customers' remote offices to a public network with the same security and service levels that a private network offers. The Provider-Provisioned VPN (PPVPN)-MPLS-VPN MIB notifications provide SNMP notification for critical MPLS VPN events.

The MPLS VPN-MIB Notifications feature provides the following benefits:

- A standards-based SNMP interface for retrieving information about critical MPLS VPN events.
- The generation and queuing of notifications that call attention to major changes in the operational status of MPLS VPN enabled interfaces; the forwarding of notification messages to a designated NMS for evaluation and action by network administrators.
- Advanced warning when VPN routing tables are approaching or exceed their capacity.
- Warnings about the reception of illegal labels on a VRF enabled interface. Such receptions may indicate misconfiguration or an attempt to violate security.

This feature was originally introduced in Cisco IOS Release 12.0(21)ST. This release integrates the feature into Cisco IOS Release 12.2(13)T.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftvpnm13.htm

MS CHAP Version 2

The MS CHAP Version 2 feature in Cisco IOS Release 12.2(13)T introduces the ability of Cisco routers to utilize Microsoft Challenge Handshake Authentication Protocol Version 2 (MS CHAP V2) authentication for PPP connections between a computer using a Microsoft Windows operating system and a network access server (NAS). MS CHAP V2 authentication is an updated version of MS CHAP that is similar to, but incompatible with MS CHAP Version 1 (V1). MS CHAP V2 introduces mutual authentication between peers and a change password feature.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftmschap.htm

Multicast-VPN—IP Multicast Support for MPLS VPNs

The Multicast-VPN—IP Multicast Support for MPLS VPNs feature allows a service provider to configure and support multicast traffic in a Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN) environment. Because MPLS VPNs support only unicast traffic connectivity, deploying the Multicast-VPN feature in conjunction with MPLS VPN allows service providers to offer both unicast and multicast connectivity to MPLS VPN customers.

This feature supports routing and forwarding of multicast packets for each individual VPN routing and forwarding (VRF) instance, and it also provides a mechanism to transport VPN multicast packets across the service provider backbone.

The Multicast-VPN feature in Cisco IOS software provides the ability to support the multicast feature over a Layer 3 VPN. As enterprises extend the reach of their multicast applications, service providers can accommodate these enterprises over their MPLS core network. IP multicast is used to stream video, voice, and data to an MPLS VPN network core.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftmltvpn.htm

Multiclass Multilink PPP

Previous implementations of Cisco IOS Multilink PPP (MLP) include support for Link Fragmentatio Interleaving (LFI). This feature allows the delivery of delay-sensitive packets, such as the packets of a Voice call, to be expedited by omitting the PPP Multilink Protocol header and sending them as raw PPP packets in between the fragments of larger data packets. This feature works well on bundles consisting of a single link. However, when the bundle contains multiple links there is no way to keep the interleaved packets in sequence with respect to each other.

The Multiclass Multilink PPP (MCMP) feature in Cisco IOS Release 12.2(13)T addresses the limitations of MLP LFI on bundles containing multiple links by introducing multiple data classes. Normal data traffic and delay-sensitive data traffic are divided into Class 0 and Class 1, respectively. Class 0 data traffic is subject to fragmentation just as regular Multilink packets are. Class 1 data traffic can be interleaved but never fragmented. The next transmit sequence number, expected sequence number, unassigned fragment list, working packet, lost fragment timer, fastswitching mode, and all statistics are managed per-class, rather than for the bundle as a whole.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftmmlppp.htm

NAT Default Inside Server

The NAT Default Inside Server feature provides for the need to forward packets from the outside to a specified inside local address. Traffic is redirected that does not match any Network Address Translation (NAT) entries and the packets are not dropped.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftnatis.htm

NAT Integration with MPLS VPNs

Network Address Translation (NAT) and MPLS VPNs can now be configured on a single device to work together. NAT can differentiate which MPLS VPN it receives IP traffic from even if the MPLS VPNs are all using the same IP addressing scheme. This enhancement enables MPLS VPN customers the ability to provide common shared services across multiple MPLS VPN customers while ensuring that each MPLS VPN is completely separate from the other.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftnatvpn.htm

NAT MIB (Read-Only)

This feature introduces support for the Network Address Translation (NAT) MIB. NAT provides tables for translating internal network addresses external network addresses. The NAT MIB provides objects for the monitoring and management of NAT bindings and session using SNMP. In this release, access to the MIB is limited to the read-only level. No new or modified Cisco IOS commands are associated with this MIB.

For details on the management options provided by the MIB, see the CISCO-IETF-NAT-MIB.my file available in the "SNMP v2 MIBs" section of the Cisco.com MIB page at http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml. Additional information on the MIB is available in the form of an internet draft (draft-ietf-nat-natmib), available through www.ietf.org.

NAT Protocol Translation

Network Address Translation - Protocol Translation (NAT PT) is an IPv6 translation mechanism allowing IPv6-only devices to communicate with IPv4-only devices, and vice versa. NAT PT was designed using RFC 2766 as a migration tool to help customers transition their IPv4 networks to IPv6 networks. Using existing IPv4 NAT capability and adding a protocol translator allows NAT PT to provide direct communication between hosts speaking a different network protocol.

NAT Stateful Failover of Network Address Translation

There is an increasing need to provide highly resilient IP networks where application connectivity continues unaffected by potential failure to links and routers at the Network Address Translation (NAT) border. The Stateful NAT feature allows two or more network address translators to function as a translation group. A backup router running NAT provides translation services in the event of failure of the active translator.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftsnat.htm

NAT Support of H.323 RAS

Cisco IOS NAT supports all H.225 and H.245 message types, including those sent in the RAS protocol. RAS provides a number of messages that are used by software clients and Voice over IP (VoIP) devices to register their location, request assistance in call setup, and control bandwidth. The RAS messages are directed toward an H.323 gatekeeper.

Some RAS messages include IP addressing information in the payload, typically meant to register a user with the gatekeeper or learn about another user already registered. If these messages are not known to NAT, they cannot be translated to an IP address that will be visible to the public.

Previously, NAT did not support H.323 v2 RAS messages. With this enhancement, embedded IP addresses can be inspected for potential address translation.

This feature was previously released in Cisco IOS Release 12.2(4)T on the Catalyst 2900, Catalyst 2900XL, Catalyst 4000 series, Catalyst 5000 family switches with an installed Route Switch Module Catalyst 6000, Catalyst 8500 series, Cisco 800 series, Cisco 1000 series, Cisco1400 series, Cisco 16 series, Cisco 1700, Cisco 2600 series, Cisco 3600 series, Cisco 4000 series, Cisco 6400 series, Cisco 7000 series, Cisco 8500 series, Cisco 12000 series, Cisco MC3810, Cisco uBR900 series, Cisco uBR7200, and LightStream 1010 series platforms. This release is porting the feature into the IAD2420 platform.

NAT-Support of H.323 v2 Call Signaling

Cisco IOS NAT supports all H.225 and H.245 message types, including FastConnect and Alerting, as part of the H.323 v2 specification.

Previously, NAT only supported H.323 version 1 and that was specific only to the Microsoft NetMeeting application. With this enhancement, any product that makes use of these message types will be able to pass through a Cisco IOS NAT configuration without any static configuration.

This feature was previously released in Cisco IOS Release 12.1(5)T on the Cisco Catalyst 2900, Cisco Catalyst 2900XL, Cisco Catalyst 4000 series, Cisco Catalyst 5000 family switches with an installed Route Switch Module, Cisco Catalyst 6000 series, Cisco Catalyst 8500 series, Cisco LightStream 1010 series, Cisco 800 series, Cisco 1000 series, Cisco 1400 series, Cisco 1600 series, Cisco 1700 series, Cisco 2500 series, Cisco 2600 series, Cisco 3600 series, Cisco 4000 series, Cisco AS5300, Cisco AS5400, Cisco AS5800, Cisco 6400 series, Cisco 7000 series, Cisco 8500 series Cisco 12000 series, Cisco MC3810, Cisco uBR900, and Cisco uBR7200 platforms. This release is porting the feature into the Cisco IAD2420 platform.

NetWare Link Services Protocol (NLSP)

The NetWare Link Services Protocol (NLSP) will no longer be offered after Cisco IOS Release 12.2(13)T. NLSP commands will not appear in future releases of the Cisco IOS software documentation set.

Next Hop Resolution Protocol (NHRP) for IPX

The Next Hop Resolution Protocol (NHRP) for IPX will no longer be offered after Cisco IOS Release 12.2(13)T. NHRP for IPX commands will not appear in future releases of the Cisco IOS software documentation set.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftjencrg.htm

OSPF Support for Multi-VRF on CE Routers

The OSPF Support for Multi-VRF on CE Routers feature provides the capability of suppressing provider edge (PE) checks which are needed to prevent loops when the PE is performing a mutual redistribution of packets between the OSPF and BGP protocols. When VRF is used on a router that is not a PE (that is, one that is not running BGP), the checks can be turned off to allow for correct population of the VRF routing table with routes to IP prefixes.

OSPF multi-VRF allows you to split the router into multiple virtual routers, where each router contains its own set of interfaces, routing table, and forwarding table.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios120/120newft/120limit/120st/120st21/ospfvrfl.htm

Packet Classification Based on Layer 3 Packet Length

This feature allows customers to match and classify traffic on the basis of the layer 3 length in the IP header of a packet. The layer 3 length is the IP datagram plus the IP header.

Traffic that matches a particular layer 3 length can be organized into specific classes that can, in turn, receive specific user-defined quality of service (QoS) treatment (for example, a certain amount of bandwidth or an IP Precedence value) when that class is included in a policy map.

This feature provides the added capability of matching and classifying traffic on the basis of the layer 3 length in the IP packet header. This new match criterion is in addition to the other match criteria, such as the IP precedence, differentiated services code point (DSCP) value, class of service (CoS), currently available.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftmchpkt.htm

Packet Classification Using the Frame Relay DLCI Number

The Packet Classification Using the Frame Relay DLCI Number feature allows customers to match and classify traffic based on the Frame Relay data-link connection identifier (DLCI) number associated with a packet. This new match criterion is in addition to the other match criteria, such as the IP Precedence, Differentiated Service Code Point (DSCP) value, Class of Service (CoS), currently available.

The Packet Classification Using the Frame Relay DLCI Number feature extends the functionality of the Modular Quality of Service (QoS) Command-Line Interface (CLI) (MQC).

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftpcdlci.htm

Per VRF AAA

Using the Per VRF AAA feature, Internet Service Providers (ISPs) can partition authentication, authorization, and accounting (AAA) services based on Virtual Route Forwarding (VRF). This feature permits the Virtual Home Gateway (VHG) to communicate directly with the customer's RADIUS server, which is associated with the customer's Virtual Private Network (VPN), without having to go through a RADIUS proxy. Thus, ISPs can scale their VPN offerings more efficiently because they no longer need to proxy AAA to provide their customers with the flexibility they demand.

This feature was originally introduced in Cisco IOS Release 12.2(1)DX. This release is porting the feature into the Cisco 7100 series, Cisco 7500 series, and Cisco 7700 series platforms.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftvrfaaa.htm

Percentage-Based Policing and Shaping

This feature provides the ability to configure traffic policing and traffic shaping based on a *percentage* of bandwidth available on the interface. Configuring traffic policing and traffic shaping in this manner enables customers to use the same policy map for multiple interfaces with differing amounts of bandwidth.

PPPoE Client DDR Idle-Timer

This feature supports the dial-on-demand routing (DDR) interesting traffic control list functionality of the dialer interface with a PPP over Ethernet (PPPoE) client, but also keeps original functionality (PPPoE connection up and always on after configuration) for those PPPoE clients that require it.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftppecls.htm

Privilege Command Enhancement

This feature simplifies the configuration of privilege levels for specific commands through the enhancement of the **privilege level** global configuration command. A privilege level can now be specified for all keyword options of a command with a single command-line interface (CLI) command. Previously, separate "privilege level" commands were required for each keyword combination of a command. This enhancement can significantly reduce the number of commands needed to configure user privilege levels and correspondingly reduce the size of configuration files.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftprienh.htm

RADIUS Attribute 52 and Attribute 53 Gigaword Support

The RADIUS Attribute 52 and Attribute 53 Gigaword Support feature introduces support for Attribute 52 (Acct-Input-Gigawords) and Attribute 53 (Acct-Output-Gigawords) in accordance with RFC 2869. Attribute 52 keeps track of the number of times the Acct-Input-Octets counter has rolled over the 32-bit integer throughout the course of the provided service; attribute 53 keeps track of the number of times the Acct-Output-Octets counter has rolled over the 32-bit integer throughout the delivery of service. Both attributes can be present only in Accounting-Request records where the Acct-Status-Type is set to "Stop" or "Interim-Update." These attributes can be used to keep accurate track of and bill for usage.

This feature was originally introduced in Cisco IOS Release 12.2(4)B. No additional platform support has been added.

RADIUS Attribute 77 for DSL

The RADIUS Attribute 77 for DSL feature introduces support for Attribute 77 (Connect-Info) to carry the textual name of the virtual circuit class associated with the given permanent virtual circuit (PVC). (Although attribute 77 does not carry the unspecified bit rate (UBR), the UBR can be inferred from the classname used if one UBR is set up on each class.) Attribute 77 is sent from the network access server (NAS) to the RADIUS server via Accounting-Request and Accounting-Response packets.

This feature was originally introduced in Cisco IOS Release 12.2(4)B. No additional platform support has been added.

RADIUS Centralized Filter Management

Before the RADIUS Centralized Filter Management feature, wholesale providers (who provide premium charges for customer services such as access control lists [ACLs]) were unable to prevent customers from applying exhaustive ACLs, which could impact router performance and other customers. This feature introduces a centralized administration point—a filter server—for ACL management. The filter server acts as a centralized RADIUS repository for ACL configuration.

Whether or not the RADIUS server that is used as the filter server is the same server that is used for access authentication, the network access server (NAS) will initiate a second access-request to the filter server. If configured, the NAS will use the filter-id name as the authentication username and the filter server password for the second access-request. The RADIUS server will attempt to authenticate the filter-id name, returning any required filtering configuration in the access-accept.

Because downloading ACLs is time consuming, a local cache is maintained on the NAS. If an ACL name exists on the local cache, that configuration will be used without consulting the filter server.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ft_ftrmn.htm

RADIUS EAP Support

The EAP RADIUS Support feature allows users to apply to the client authentication methods that may not be supported by the network access server; this is done via the Extensible Authentication Protocol (EAP). Before this feature was introduced, support for various authentication methods for PPP connections required custom vendor-specific work and changes to the client and NAS.

EAP is an authentication protocol for PPP that supports multiple authentication mechanisms that are negotiated during the authentication phase (instead of the link control protocol [LCP] phase). EAP allows a third-party authentication server to interact with a PPP implementation through a generic interface.

This feature was originally introduced in Cisco IOS Release 12.2(2)XB5. This release is porting the feature into the Catalyst 4000, Cisco AS5350, Cisco AS5800, Cisco AS5850, Cisco 05, Cisco 806, Cisco 820, Cisco 1400 series, Cisco 1600 series, Cisco 1600R, Cisco 2500 series, Cisco 2600 series, Cisco 3620, Cisco 7100 series, Cisco 7200 series, Cisco 7500 series, Cisco MC3810, Cisco SOHO 70 series, Cisco SOHO78, Cisco uBR7200, Cisco uBR920

RADIUS Logical Line ID

The RADIUS Logical Line ID feature enables users to track their customers on the basis of the physical lines in which the customers' calls originate. Thus, users can better maintain the profile database of their customers as the customers move from one physical line to another.

Logical Line Identification (LLID) is an alphanumeric string (which must be a minimum of one character and a maximum of 253 characters) that is a logical identification of a subscriber line. LLID is maintained in a RADIUS server customer profile database. This customer profile database is connected to a L2TP access concentrator (LAC) and is separate from the RADIUS server that the LAC and L2TP Network Server (LNS) use for the authentication and authorization of incoming users. When the customer profile database receives a preauthorization request from the LAC, the server sends the LLID to the LAC as the Calling-Station-ID attribute (attribute 31).

The LAC sends a preauthorization request to the customer profile database when the LAC is configured for preauthorization. Configure the LAC for preauthorization using the subscriber access pppoe pre-authorize command.

This feature was originally introduced in Cisco IOS Release 12.2(8)B. No additional platform support has been added.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftlineid.htm

RSVP Local Policy Support

The RSVP Local Policy Support feature allows network administrators to create default and access control list (ACL)-based policies. These policies, in turn, control how RSVP filters its signalling messages to allow or deny quality of service (QoS) to networking applications based on the IP addresses of the requesting hosts.

This feature is being introduced in Cisco IOS Release 12.2(13)T.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftrsvplp.htm

RSVP Refresh Reduction and Reliable Messaging

The RSVP Refresh Reduction and Reliable Messaging feature includes refresh reduction, which improves the scalability, latency, and reliability of RSVP signalling by introducing the following extensions:

- Reliable messages (MESSAGE_ID, MESSAGE_ID_ACK objects, and ACK messages)
- Bundle messages (reception and processing only)
- Summary refresh messages (MESSAGE_ID_LIST and MESSAGE_ID_NACK objects)

This feature was originally introduced in Cisco IOS Release 12.2(11)S. This release integrates the feature into Cisco IOS Release 12.2(13)T.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftrsvpre.htm

Session Limit Per VRF

The Session Limit Per VPN Routing and Forwarding Instance (VRF) feature enables session limits to be applied on all VPDN groups associated with a common VPDN virtual template. Before the implementation of Session Limit Per VRF, a single default template carrying the configuration values of a subset of VPDN group commands were associated with all VPDN groups configured on the router. Session Limit Per VRF enables you to create, define and name multiple VPDN templates. You can then associate a specific template with a VPDN group. A session limit can be configured at the VPDN template level to specify a combined session limit for all VPDN groups associated with the configured VPDN template.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122b/122b_4/12b_vrf.htm

Show Command Output Redirection

This feature adds the capability to redirect output from Cisco IOS CLI **show** commands to a file. For each show command issued, a new file can be created, or the output can be appended to an existing file. Command output can optionally be displayed on-screen while being redirected to a file by using the **tee** keyword. Redirection is available using a pipe (|) character after any **show** command, combined with the **redirect**, **append**, or **tee** keywords.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftshowre.htm

Simple Multicast Routing Protocol (SMRP) for AppleTalk

The Simple Multicast Routing Protocol (SMRP) for AppleTalk will no longer be offered after Cisco IOS Release 12.2(13)T. NLSP commands will not appear in future releases of the Cisco IOS software documentation set.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftjencrg.htm

SIP and H.323 Fax Enhancements

The SIP and H.323 Fax Enhancements feature adds an assortment of fax transfer enhancements to the Cisco IOS gateway implementations of H.323 and Session Initiation Protocol (SIP) call control protocols. The enhanced areas include the use of:

- H.323 and SIP fax pass-through
- H.323 and SIP T.38 fax relay fallback protocols
- H.323 and SIP NSE s for T.38 fax relay
- H.323 and SIP resource reservation (RSVP) protocol
- H.323 and SIP call admission control (CAC)

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftsihfax.htm

SIP—Call Transfer Enhancements Using the Refer Method

The SIP—Call Transfer Enhancements Using the Refer Method feature provides blind and attended call transfer capabilities to supplement the Bye and Also methods already implemented on Cisco IOS Session Initiation Protocol (SIP) gateways. The SIP—Call Transfer Enhancements Using the Refer Method feature is compatible with the original forms of call transfer and with third-party call-control protocols. The SIP—Call Transfer Enhancements Using the Refer Method feature enables application service providers (ASPs) to provide attended transfer and blind transfer in accordance with emerging SIP standards.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftsipref.htm

SIP Enhanced 180 Provisional Response Handling

This feature provides the ability to enable or disable early media cut-through on Cisco IOS gateways for SIP 180 response messages. The new feature allows you to specify whether 180 messages with Session Description Protocol (SDP) are handled in the same way as 183 responses with SDP. The 180 Ringing message is a provisional or informational response used to indicate that the INVITE message has been received by the user agent and that alerting is taking place. Both 180 and 183 messages may contain SDP which allow an early media session to be established prior to the call being answered.

Prior to the implementation of the new feature, Cisco gateways handled a 180 Ringing response with SDP in the same manner as a 183 Session Progress response; that is, the SDP was assumed to be an indication that the far end was going to send early media. Cisco gateways handled a 180 response without SDP by providing local ringback, rather than early media cut-through. The new feature provides the capability to ignore the presence or absence of SDP in 180 messages, and as a result, treat all 180 messages in a uniform manner.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ft180sdp.htm

SIP Extensions for Caller Identity and Privacy

This feature provides support for privacy indication, as well as network verification and screening of a call participant's name and number. Cisco implements the new feature on Cisco SIP IOS trunking gateways by supporting a new header, Remote-Party-ID. In previous SIP implementations, the From header was used to indicate calling party identity, and once defined in the initial INVITE request, could not be modified for the duration of that session. Implementing the Remote-Party-ID header, which can be modified, added or removed as a call session is being established, overcomes previous limitations and enables call participant verification and screening

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftsipext.htm

SIP Gateway Compliance to RFC2543-bis-04

RFC2543-bis-04 contains several changes to Session Initiation Protocol (SIP) gateway code. The SIP Gateway Compliance to RFC2543-bis-04 feature updates Cisco SIP Voice over IP (VoIP) gateways with the latest RFC changes. All changes are compatible with older RFC versions. Some of the changes include:

- Comparison of SIP URLs for equality.

- 487 messages are now sent for BYE requests before disconnecting a call.
- Updated processing of 3xx redirection responses.
- Updated DNS SRV query procedures.
- Interpretation of user parameters before dial-peer matching.
- CANCEL requests can no longer have a route header.
- *user=phone* parameter no longer required in SIP URLs.
- Obsoletion of the 303 and 411 SIP cause codes.
- The Content-Type header can now have an empty Session Description Protocol (SDP) body.
- Optional "s=" line in Session Description Protocol (SDP).
- Inclusion of Allow headers to INVITEs and 2xx responses.
- Use of simultaneous Cancel and 2xx Class Responses.

SIP Redirect Processing Enhancements

The SIP Redirect Processing Enhancements feature allows flexibility in the handling of incoming redirect or 3*xx* class of responses so they can be enabled or disabled through the command-line interface (CLI). The default mode is enabled, in which Session Initiation Protocols (SIP) gateways handle incoming 3*xx* messages as per RFC 2543. RFC 2543 states that redirect response messages are used by SIP user agents (UA) to initiate a new Invite when a UA learns that a user has moved from a previously known location. If redirect handling is disabled through the CLI, the UA treats incoming 3*xx* responses as 4*xx* error class responses. The call is not redirected, and is instead released with the appropriate PSTN cause code.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftsipmaz.htm

SNMP Notification Logging

Systems that support Simple Network Management Protocol (SNMP) often need a mechanism for recording notification information as a hedge against lost notifications, whether those are traps or informs that exceed retransmission limits. The Notification Log MIB provides a common infrastructure for other MIBs in the form of a local logging function. The SNMP Notification Logging feature adds Cisco IOS command-line interface (CLI) commands to change the size of the notification log, to set the global ageout value for the log, and to display logging summaries at the command line.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios120/120newft/120limit/120s/120s22/ftmiblog.htm

SSG Autologoff

The SSG Autologoff feature enables the Cisco Service Selection Gateway (SSG) to verify connectivity with each host at configured intervals. If SSG detects that the host is not reachable from SSG, then it automatically initiates the logoff for that host.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ssg/index.htm

SSG Port-Bundle Host Key

The SSG Port-Bundle Host Key feature enhances communication and functionality between the Service Selection Gateway (SSG) and the Cisco Subscriber Edge Services Manager (SESM) by introducing a mechanism that uses the host source IP address and source port to identify and monitor subscribers.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ssg/index.htm

SSG TCP Redirect for Services

The SSG TCP Redirect for Services feature redirects certain packets, which would otherwise be dropped, to captive portals that can handle the packets in a suitable manner. For example, packets sent upstream by unauthorized users are forwarded to a captive portal that can redirect the users to a logon page. Similarly, if users try to access a service to which they have not logged on, the packets are redirected to a captive portal that can provide a service logon screen.

The captive portal can be any server that is programmed to respond to the redirected packets. If the Cisco Subscriber Edge Services Manager (SESM) is used as a captive portal, unauthenticated subscribers can be sent automatically to the SESM logon page when they start a browser session. In SESM Release 3.1(3), captive portal applications can also redirect to service logon pages, advertising pages, and message pages. The SESM captive portal application can also capture a URL in a subscriber's request and redirect the browser to the originally requested URL after successful authentication. Redirected packets are always sent to a captive portal group that consists of one or more servers. SSG selects one server from the group in a round-robin fashion to receive the redirected packets.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ssg/index.htm

Subscriber Service Switch (SSS)

The Subscriber Service Switch (SSS) was developed in response to a need by Internet service providers for increased scalability and extensibility for remote access service selection and Layer 2 subscriber policy management. This Layer 2 subscriber policy is needed to manage tunneling of PPP, Ethernet, Frame Relay, and other link-level protocols in a policy-based bridging fashion

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ft_sss.htm

Support for IPsec ESP Through NAT

The ability to support multiple concurrent IPsec ESP tunnels or connections through a router configured with Network Address Translation (NAT) can now be utilized when the NAT router is configured in overload or Port Address Translation (PAT) mode.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftnatesp.htm

T.38 Fax Relay for VoIP H.323

T.38 Fax Relay for VoIP H.323 provides standards-based fax relay protocol support for H.323 gateways and gatekeepers. T.38 is an ITU-T recommended standard for fax relay. Since T.38 is a standards-based implementation for fax relay, Cisco gateways and gatekeepers are able to interwork with third-party H.323 devices that support T.38 protocol.

This feature was previously released in Cisco IOS Release 12.1(3)T on Cisco 2600 series, Cisco 3640, and Cisco MC3810 platforms. This release is porting the feature into the IAD2420 platform.

Terminal Line Security for PAD Connections

X.25 closed user group (CUG) service is a network service that allows subscribers to be segregated into private subnetworks with limited outgoing and incoming access. A data terminal equipment (DTE) device becomes a member of a CUG by subscription; the DTE must obtain membership from its network service for the set of CUGs to which it needs access.

The Terminal Line Security for PAD Connections feature allows CUG services to be configured on terminal lines, enabling terminal lines to participate in X.25 CUG security for packet assembler/disassembler (PAD) connections. CUG services can be applied to console lines, auxiliary lines, and tty and vty devices. Configuring CUG services on terminal lines allows you to specify CUG protection for lines that are part of the point of presence (POP). Before the introduction of this feature, CUG services could be configured only on X.25 synchronous data communications equipment (DCE) interfaces.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftcugpad.htm

Update to the Interworking of Cisco MGCP Voice Gateways and Cisco CallManager Version 3.2 Feature

This document describes updates to the *Interworking of Cisco MGCP Voice Gateways and Cisco Call Manager Version 3.2* feature. This update introduces the **mgcp validate domain-name** command, which enables you to check if the domain name or host name and the IP address received as part of the endpoint names sent from the Call Agent (CA) or Cisco CallManager (CCM) match with the ones that have been configured on the gateway (GW). This check is valid for the MGCP messages received from the CA or CCM only.

Use the new **mgcp validate domain-name** command first before configuring MGCP in a Voice over IP (VoIP) network.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftvalid.fm

Update to the playout-delay Command

In environments with long network delays, T.38 fax relay can be unsuccessful. The **fax** keyword was added to the **playout-delay** command to allow users to decrease the playout delay value to compensate for long network delays when necessary.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ft_pdfax.htm

Virtual Router Redundancy Protocol (VRRP)

There are several ways a LAN client can determine which router should be the first hop to a particular remote destination. The client can use a dynamic process or static configuration. Examples of dynamic router discovery are as follows:

- Proxy ARP—The client uses Address Resolution Protocol (ARP) to get the destination it wants to reach, and a router will respond to the ARP request with its own MAC address.
- Routing protocol—The client listens to dynamic routing protocol updates (for example, from Routing Information Protocol [RIP]) and forms its own routing table.
- IRDP (ICMP Router Discovery Protocol) client—The client runs an Internet Control Message Protocol (ICMP) router discovery client.

The drawback to dynamic discovery protocols is that they incur some configuration and processing overhead on the LAN client. Also, in the event of a router failure, the process of switching to another router can be slow.

An alternative to dynamic discovery protocols is to statically configure a default router on the client. This approach simplifies client configuration and processing, but creates a single point of failure. If the default gateway fails, the LAN client is limited to communicating only on the local IP network segme and is cut off from the rest of the network.

The Virtual Router Redundancy Protocol (VRRP) feature can solve the static configuration problem. VRRP enables a group of routers to form a single *virtual router*. The LAN clients can then be configured with the virtual router as their default gateway. The virtual router, representing a group of routers, is also known as a VRRP group.

VRRP is supported on Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces, and on MPLS VPNs and VLANs.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios120/120newft/120limit/120st/120st18/st _vrrpx.htm

VLAN Range

Using the VLAN Range feature, you can group VLAN subinterfaces together so that any command entered in a group applies to every subinterface within the group. This capability simplifies configurations and reduces command parsing.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122b/122b_4/1. b_rang.htm

Voice and Quality of Service Features for ADSL and G.SHDSL on Cisco 1700, Cisco 2600, and Cisco 3600 Series Routers

Cisco 1700 series, Cisco 2600 series, and Cisco 3600 series routers with ADSL or G.SHDSL WAN interface cards support the integration of voice and data over the same ADSL or G.SHDSL circuit using Voice over IP (VoIP). Cisco 2600 series and Cisco 3600 series routers with ADSL or G.SHDSL WAN interface cards also support the integration of voice and data over the same ADSL or G.SHDSL circuit using Voice over ATM (VoATM).

This feature was originally introduced in Cisco IOS Release 12.2(4)XL. This release is porting the feature into the Cisco 1700 series platforms.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xl/122x14/ft_qgdsl.htm

Voice Call Tuning

This feature provides tools for quickly taking spot performance measurements of voice call performance while the call is up. You also have the ability to change the echo canceller and jitter buffer parameters of a call while the call is in progress. Audible effects can be immediately noticed, aiding in problem determination and resolution. The feature provides real-time call monitor and manipulation on the interface between Cisco IOS software and the digital signalling processors (DSPs) by addressing the following two items:

- Development of real-time status of a call, including packet flow indication, DSP state, echo canceller state, and jitter state.
- Real-time manipulation of echo canceller and jitter buffer parameters.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftvdsptn.htm

VPDN Multihop by DNIS

The Cisco VPDN Multihop by DNIS feature allows dialed number identification service (DNIS)-based multihop capability in a virtual private dial-up network (VPDN), which enables customers that dial in to a network using a standard telephone line to take advantage of the aggregation capability offered by multihop switching.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122b/122b_8/ftvmhopd.htm

VRRP Support

There are several ways a LAN client can determine which router should be the first hop to a particular remote destination. The client can use a dynamic process or static configuration. Examples of dynamic router discovery are as follows:

- Proxy ARP
- Routing protocol
- IRDP (ICMP Router Discovery Protocol) client

The drawback to dynamic discovery protocols is that they incur some configuration and processing overhead on the LAN client. Also, in the event of a router failure, the process of switching to another router can be slow.

An alternative to dynamic discovery protocols is to statically configure a default router on the client. This approach simplifies client configuration and processing, but creates a single point of failure. If the default gateway fails, the LAN client is limited to communicating only on the local IP network segment and is cut off from the rest of the network.

The Virtual Router Redundancy Protocol (VRRP) feature can solve the static configuration problem. VRRP enables a group of routers to form a single *virtual router*. The LAN clients can then be configured with the virtual router as their default gateway. The virtual router, representing a group of routers, is also known as a VRRP group.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios120/120newft/120limit/120st/120st18/st_vrrpx.htm

X.25 Suppression of Security Signaling Facilities

This feature allows the X.25 Call Redirection/Call Deflection Notification (CRCDN) and Called Line Address Modified Notification (CLAMN) security signaling facilities to be disabled (suppressed) in packets that transit data communication equipment that uses a mix of International Telecommunication Union Telecommunication Standardization Sector T (ITU-T) 1980 and 1984 X.25 protocols.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftsupsgx.htm

Xerox Network Systems (XNS)

The Xerox Network Systems (XNS) feature will no longer be offered after Cisco IOS Release 12.2(13)T. XNS commands will not appear in future releases of the Cisco IOS software documentation set.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t13/ftjencrg.htm

New Hardware Features Supported in Cisco IOS Release 12.2(11)T1

The following new hardware features are supported in Cisco IOS Release 12.2(11)T1. Some of these features may have been introduced on other hardware platforms in earlier Cisco IOS software releases.

Cisco 3640A Router

The Cisco 3640A is identical to the Cisco 3640 router in terms of physical characteristics, interface support, performance and memory. The Cisco 3640A router will support the same Cisco IOS feature sets as the Cisco 3640 router, but requires a different minimum version of Cisco IOS software.

Hardware Platforms and Modules Newly Supported in Cisco IOS Release 12.2(11)T

The following hardware platforms and modules are now supported in Cisco IOS Release 12.2(11)T. These platforms and modules were first introduced in earlier Cisco IOS software releases.

16-Port Ethernet Switch Module for Cisco 2600 Series and Cisco 3600 Series

The 16-port Ethernet switch network module was originally introduced in Cisco IOS Release 12.2(8)T. Cisco IOS Release 12.2(11)T adds stacking and flow control features to the previously released feature.

See the “16-Port Ethernet Switch Module for Cisco 2600 Series and Cisco 3600 Series” section on page 224 or refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft1636nm.htm.

Cisco 1760 Router

The Cisco 1760 router is a voice-and-data-capable router that provides Voice-over-IP (VoIP) functionality and can carry voice traffic (for example, telephone calls and faxes) over an IP network. Using one or two WAN connections, the router links small-to-medium-size remote Ethernet and Fast Ethernet LANs to central offices.

The Cisco 1760 router is available in two models. The Cisco 1760 runs data and data-plus-voice images, providing digital and analog voice support. The Cisco 1760-V includes all the features needed for immediate integration of data and voice services with support for multiple voice channels.

Refer to the documents at the following location for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_serv/5300/index.htm.

Cisco AS5350 Universal Gateway

The Cisco AS5350 Universal Gateway is the only one-rack-unit, two, four, or eight PRI gateway that provides universal services—data, voice, and fax services on any service, any port. The Cisco AS5350 offers high performance and high reliability in a compact, modular design. This cost-effective platform is ideally suited for Internet service providers (ISPs) and enterprises that require innovative universal services.

Refer to the documents at the following location for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_serv/as5350/index.htm.

Cisco AS5850 Universal Gateway

The Cisco AS5850 Universal Gateway provides the highest concentration of port and Integrated Services Digital Network (ISDN) terminations available in a single remote access server product. The Cisco AS5850 is specifically designed to meet the demands of large service providers such as Post, Telephone, and Telegraphs (PTTs), regional bell operating companies (RBOCs), inter-exchange carriers (IXCs), and large Internet service providers (ISPs).

Refer to the documents at the following location for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_serv/as5850/index.htm.

Cisco Signaling Link Terminal (SLT) Dual Ethernet

The Cisco Signaling Link Terminal (SLT) Dual Ethernet feature adds Cisco Cisco Signaling Link Terminal dual Ethernet support to the virtual switch controller (VSC). This enhanced Cisco SLT support provides two IP networks and two additional Session Manager sessions (for a total of four Session Manager sessions) for improved backhaul communication. These additions increase the resilience of Cisco SLT and VSC communications by supporting two Reliable User Datagram Protocol (RUDP) sessions from each Ethernet interface to each VSC. These VSC enhancements help to determine when to switch Ethernets and when to switch VSC activity.

The Cisco SLT, which is based on the Cisco 2611 router, is shipped with two Ethernet interfaces. Until this feature was released, the Cisco SLT and VSC solution supported only one of the two Ethernet interfaces. Both Session Manager sessions had to travel over this single Ethernet interface. The Cisco Signaling Link Terminal Dual Ethernet feature supports the second Ethernet, which improves the resilience of the backhaul IP communications.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftsltdua.htm.

New Software Features in Cisco IOS Release 12.2(11)T

The following new features are supported in Cisco IOS Release 12.2(11)T. Some of these features may have been introduced on other hardware platforms in earlier Cisco IOS software releases.

AAA-PPP-VPDN Non-Blocking

Previously, Cisco IOS created a statically configurable number of processes to authenticate calls. Each of these processes would handle a single call, but in some situations the limited number of processes could not keep up with the incoming call rate. This resulted in some calls timing out. The AAA-PPP-VPDN Non-Blocking feature changes the software architecture such that the number of processes will not limit the rate of call handling.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

Accounting of VPDN Disconnect Cause

In the past, whenever a Layer 2 Tunneling Protocol (L2TP) or Layer 2 Forwarding (L2F) session fails or disconnects, the network access server (NAS) and Home GateWay (HGW) report a very generic disconnect-cause code, such as "LOST CARRIER". These generic codes do not provide enough detailed information for accounting and debugging purposes, creating a need for disconnect-cause codes that provide more detailed information. The Accounting of VPDN Disconnect Cause feature adds eight new disconnect-cause codes. These eight disconnect-cause codes describe the status of Virtual Private Dialup Network (VPDN) failures and disconnects more specifically than existing generic disconnect-cause codes. These new disconnect-cause codes can be found in the *Cisco IOS Security Configuration Guide*, Release 12.2 located at the following URL:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122cgcr/fsecur_c/fappendx/fradattr/scfrdat3.htm.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftacldir.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

ACL Authentication of Incoming rsh and rcp Requests

To enable the Cisco IOS software to receive incoming remote shell (rsh) protocol and remote copy (rcp) protocol requests, customers must configure an authentication database to control access to the router. This configuration is accomplished by using the **ip rcmd remote-host** command.

Currently, when using this command, customers must specify the local user, the remote host, and the remote user in the database authentication configuration. For users who can execute commands to the router from multiple hosts, multiple database authentication configuration entries must be used, one for each host.

This feature allows customers to specify an access list for a given user. The access list identifies the hosts to which the user has access. A new argument, *access-list*, has been added that can be used with this command to specify the access list.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftauth.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, and Cisco AS5400 platforms.

ACL Default Direction

The ACL Default Direction feature allows you to change the filter direction (where filter direction is not specified) to inbound packets only; that is, you can configure your server to filter packets that are coming toward the network.

This feature introduces the **radius-server attribute 11 direction default** command, which allows you to change the default direction of filters for your access control lists (ACL) via RADIUS. (RADIUS attribute 11 (Filter-Id) indicates the name of the filter list for the user.) Enabling this command allows you to change the filter direction to inbound—which stops traffic from entering a router, thereby reducing resource consumption—rather than the outbound default direction, which waits until the traffic is about to leave the network before filtering. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftacldir.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

Advanced Voice Busyout

The local voice busyout feature provides a way to busy out a voice port or DS-0 group (time slot) if a state change is detected in a monitored network interface (or interfaces). When a monitored interface changes to a specified state—to out-of-service or in-service—the voice port presents a seized/busyout condition to the attached PBX or other customer premises equipment (CPE). The PBX or other CPE can then attempt to select an alternate route.

Advanced Voice Busyout adds the following functionality to the local voice busyout feature:

- For Voice over IP (VoIP), monitoring of links to remote, IP-addressable interfaces by use of service assurance agent (SAA)
- Configuration by voice class to simplify and speed up the configuration of voice busyout on multiple voice ports

Using the Advanced Voice Busyout feature you can perform the following tasks:

- Configure individual voice ports to enter the busyout state if an SAA probe signal returned from a remote, IP-addressable interface detects loss of IP connectivity by crossing a specified delay or loss threshold.
- Define voice classes with specified busyout conditions, and assign a particular voice class to any number of voice ports.
- SAA probe monitoring of remote interfaces is intended for use with VoIP networks, although it can also be used with Voice over Frame Relay (VoFR) and Voice over ATM (VoATM) networks.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xa/122xa_2/ft_cacbo.htm.

Note This feature was originally introduced in Cisco IOS Release 12.1(3)T. Cisco IOS Release 12.2(4)T ported the feature into the Cisco 7200 series routers and added support for new and modified commands. This release is porting the feature into the 1760 routers and the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

Analog Centralized Automatic Message Accounting E911 Trunk

Cisco IOS Release 12.2(11)T is the first Cisco IOS release that introduces the Analog Centralized Automatic Message Accounting (CAMA) E911 feature that adds E911 connectivity features to the Cisco 2600 series and Cisco 3600 series routers.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/acam_911.htm.

Asynchronous Line Monitoring

Before Cisco IOS Release 12.2(4)T, the Cisco IOS software did not provide a method for displaying asynchronous character mode traffic flowing out of an asynchronous line. Therefore, when a user tried to troubleshoot difficult asynchronous problems, the user had to use RS-232 datascopes to examine the data stream. This method is detailed and cumbersome. The Asynchronous Line Monitoring feature that is available in Cisco IOS Release 12.2(4)T allows the monitoring of inbound and outbound character mode asynchronous traffic on another terminal line. To monitor inbound or outbound asynchronous character mode traffic on the port to be monitored, enter the **monitor traffic line** command in privileged EXEC mode.

This feature increases the efficiency of the user who performs troubleshooting on asynchronous character mode traffic problems.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftasync.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

ATM Service Level Monitoring (SLM)

The Cisco Service Assurance Agent (SA Agent) is an embedded performance monitoring utility in Cisco IOS software. The ATM Service Level Monitoring (SLM) feature expands the capabilities of the SA Agent to provide detailed monitoring statistics for your ATM network. Monitoring service levels for ATM connections allows service providers to ensure that their networks are meeting or exceeding the performance outlined in service level agreements (SLAs).

The ATM Service Level Monitoring feature can also be used with Cisco Networking Services (CNS). A device running CNS, such as the IE2100, can be used to retrieve the ATM performance statistics generated by the SA Agent. Additionally, these results can be passed to other devices running third-party monitoring software.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftatmslm.htm

Barge-In and Busy Line Verify Operator Services

The Barge-In and Busy Line Verify Operator Services feature enhances Simple Gateway Control Protocol (SGCP)/Media Gateway Control Protocol (MGCP) gateway conferencing capabilities to support the Busy Line Verification/Operator Interrupt (BLV/OI) feature. The Busy Line Verification feature permits an operator to establish a connection to a customer's line to verify a busy condition for a calling party. The Operator Interrupt feature allows the operator to speak to the customer and to connect the calling party and customer, if appropriate. These enhancements support other call flows such as call pickup with barge-in that require the ability to conference a second call into an existing two-party call without intervention by parties in the existing call. No explicit configuration is required to enable this feature.

The MGCP Basic CLASS and Operator Services feature introduced conferencing to support three-way calling on SGCP and MGCP gateways. It is described in MGCP Basic CLASS and Operator Services at

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftmgcpgr.htm.

Basic Service Relationships (H.225 Annex G)

Cisco's H.225 Annex G implements the minimal set of Annex G features needed to allow Cisco border elements to interoperate with any ClearingHouse border element. This feature enhances Cisco's H.225.0 Annex G support to include basic Service Relationships and Usage Reporting. The feature provides enhanced interoperability with a ClearingHouse border element and third party border element as well as address resolution for interdomain call routing.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft_srang.htm.

BGP Conditional Route Injection

Cisco IOS software provides several methods in which you can originate a prefix into the Border Gateway Protocol (BGP). The existing methods include using the network or **aggregate-address** commands and redistribution. These methods assume the existence of more specific routing information (matching the route to be originated) in either the routing table or the BGP table.

The BGP Conditional Route Injection feature enables you to originate a prefix into BGP without the corresponding match. The routes are injected into the BGP table only if certain conditions are met. The most common condition is the existence of a less-specific prefix.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft11bpri.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

BGP Hide Local-Autonomous System

The BGP Hide Local-Autonomous System feature introduces the **no-prepend** keyword to the **neighbor local-as** command. The use of the **no-prepend** keyword allows a network operator to configure a Border Gateway Protocol (BGP) speaker to not prepend the local autonomous system number to any routes that are received from external peers. This feature can be used to help transparently change the autonomous system number of a BGP network and ensure that routes can be propagated throughout the autonomous system, while the autonomous system number transition is incomplete. Because the local autonomous is not prepended to these routes, external routes will not be rejected by internal peers during the transition from one autonomous system number to another.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft11bhla.htm
.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, and Cisco AS5400 platforms.

BGP Link Bandwidth

The Border Gateway Protocol (BGP) Link Bandwidth feature is used to advertise the bandwidth of an autonomous system exit link as an extended community. The BGP Link Bandwidth feature is supported by the internal BGP (iBGP) and external BGP (eBGP) multipath features. The link bandwidth extended community indicates the preference of an autonomous system exit link in terms of bandwidth. The link bandwidth extended community attribute may be propagated to all iBGP peers and used with the BGP multipath features to configure unequal cost load balancing. When a router receives a route from a directly connected external neighbor and advertises this route to iBGP neighbors, the router may advertise the bandwidth of that link. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft11b_lb.htm
.

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco 5800 platforms.

BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS-VPN

The BGP Multipath Load Sharing for eBGP and iBGP feature allows you to configure multipath load balancing with both external BGP (eBGP) and internal BGP (iBGP) paths in Border Gateway Protocol (BGP) networks that are configured to use Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs). This feature provides improved load balancing deployment and service offering capabilities and is useful for multi-homed autonomous systems and Provider Edge (PE) routers that import both eBGP and iBGP paths from multihomed and stub networks. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft11bmpl.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

BGP Prefix-Based Outbound Route Filtering

The BGP Prefix-Based Outbound Route Filtering feature uses Border Gateway Protocol (BGP) outbound route filter (ORF) send and receive capabilities to minimize the number of BGP updates that are sent between peer routers. The configuration of this feature can help reduce the amount of resources required for generating and processing routing updates by filtering out unwanted routing updates at the source. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft11borf.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

Call Admission Control Based on CPU Utilization

The Preauthentication with ISDN PRI feature permits the Cisco AS5300 and AS5800 universal access servers to deny incoming calls exceeding a preconfigured threshold, permitting the selection of a system CPU load level value. This feature helps ensure the quality of service (QoS) of existing calls and reliability of system processes by preventing system overload that is caused by excessive incoming calls. The feature rejects new digital calls (PRI, channel-associated signaling [CAS], and ISDN), with minor disruption to system users.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_serv/as5800/sw_conf/ios_122/dt61294.htm.

Call Admission Control for H.323 VoIP Gateways

Before the call admission control feature was available, gateways did not have a mechanism to prevent calls from entering when certain resources were not available to process the call. This situation caused new calls to fail with unreported behavior and potentially caused the calls in progress to have quality-related problems.

This feature set provides the ability to support resource-based call admission control processes. These resources include system resources such as CPU, memory, and call volume and interface resources such as call volume.

If system resources are not available to admit the call, the following two kinds of actions are provided: system denial (which busy outs all of T1 or E1) or per-call denial (which disconnects, hairpins, or plays a message or tone). If the interface-based resource is not available to admit the call, the call is dropped from the session protocol (such as H.323).

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftcac58.htm.

Note The Call Admission Control for H.323 VoIP Gateways feature was previously released in Cisco IOS Release 12.2(4)T on the Cisco 2600 and Cisco 3600 routers and Cisco MC3810 multiservice concentrators. This feature has been added to the Cisco AS5300, Cisco AS5800, and Cisco AS5850 in Cisco IOS Release 12.2(11)T.

Call Status Tracking Optimization

In an H.323 Voice-over-IP (VoIP) network, gatekeepers use information request (IRQ) messages to obtain information about a certain call or all calls from an endpoint (for example, an originating gateway). The gatekeeper can send an IRQ to request information from the endpoint, which responds with an information request response (IRR). The gatekeeper can also use the IRR Frequency field in the initial admission confirm (ACF) message to instruct the endpoint to periodically report with IRR messages during call admission.

Currently, the Cisco gatekeeper maintains the call states of all calls it has admitted to track bandwidth usage. In addition, the gatekeeper must be able to reconstruct call structures for a newly transferred gateway from an alternate gatekeeper, if a gatekeeper switchover has occurred. In a gatekeeper switchover, the new gatekeeper sends an IRQ message with the call reference value (CRV) set to zero to the newly registered gateway to obtain information about existing calls before the switchover.

If a gateway supports a large volume of calls, the number of IRR messages as responses to an IRQ with the CRV set to zero could be CPU intensive and cause congestion. Additionally, if a gatekeeper serves many endpoints or high-capacity gateways, the IRQ requests and the resulting IRR messages received can flood the network, causing high CPU utilization and network congestion.

The Call Status Tracking Optimization feature provides the following methods to address this potential problem:

- A command-line interface (CLI) command to configure IRR frequency that is included in the ACF message. Currently, the IRR frequency is set to 240 seconds (4 minutes), based on an average 4-minute call hold time. The IRR allows the gatekeepers to terminate calls for which a disengage request (DRQ) has not been received. If missing DRQs are not a problem, the IRR frequency can be set to a larger value than 4 minutes, minimizing the number of unnecessary IRRs sent by a gateway.

- A CLI command to disable the gatekeeper from sending an IRQ with the CRV set to zero when the gatekeeper is requesting the status of all calls after its initialization. Disabling the IRQ can eliminate unnecessary IRR messages in cases where the reconstruction of call structures can be postponed until the next IRR, or in cases where the call information is no longer required because calls are terminated before the periodic IRR is sent. Disabling the IRQ is advantageous if direct bandwidth control is not used in the gatekeeper.
- The number of retries for sending the DRQ is increased from two to nine. If the reliability of DRQ messages is increased, a longer period can be used before the next IRR is sent. Increasing the number of DRQ retries from two to nine increases DRQ reliability. This value is not configurable.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft_csto2.htm.

Call Tracker show Commands Extensions

Before Cisco IOS Release 12.2(11)T, the **show calltracker active** EXEC command and the **show calltracker history** EXEC command provided a simple way to examine the Call Tracker active table and Call Tracker history table in chronological order. The extensions to these commands available in Cisco IOS Release 12.2(11)T allow the command output to be reverse collated (output from most recent to least recent) or to be filtered by call category or service type. Historical data for disconnected call sessions can be filtered by subsystem type.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftcall.htm.

CEF on Multipoint GRE Tunnels

The CEF on Multipoint GRE Tunnels feature enables Cisco Express Forwarding (CEF) switching of IP traffic to and from multipoint generic routing encapsulation (GRE) tunnels. Tunnel traffic can be forwarded to a prefix through a tunnel destination when both the prefix and the tunnel destination are specified by the application.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T as CEF-Switched Multipoint GRE Tunnel. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

Certificate Autoenrollment

The Certificate Autoenrollment feature allows you to configure your router to automatically request a certificate from the certification authority (CA) that is using the parameters in the configuration. Thus, operator convention is no longer required at the time the enrollment request is sent to the CA server.

Automatic enrollment will be performed on startup for any trustpoint CA that is configured and does not have a valid certificate. When the certificate—which is issued by a trustpoint CA that has been configured for autoenrollment—expires, a new certificate is requested. Although this feature does not provide seamless certificate renewal, it does provide unattended recovery from expiration.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftautoen.htm.

Note This feature was originally introduced in Cisco IOS Release 12.1(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, and Cisco AS5800 platforms.

Certificate Enrollment Enhancements

The Certificate Enrollment Enhancements feature introduces five new subcommands to the **crypto ca trustpoint** command—**ip-address** (ca-trustpoint), **password** (ca-trustpoint), **serial-number**, **subject-name**, and **usage**. These commands provide new options for certificate requests and allow users to specify fields in the configuration instead of having to go through prompts. (However, the prompting behavior remains the default if this feature is not enabled.) Thus, users can preload all necessary information into the configuration, allowing each router to obtain its certificate automatically when it is booted.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftenrol2.htm.

Note This feature was originally introduced in Cisco IOS Release 12.1(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, and Cisco AS5800 platforms.

Circuit Interface Identification Persistence for SNMP

The Circuit Interface MIB (CISCO-CIRCUIT-INTERFACE-MIB) provides a MIB object (cciDescr) which can be used to identify individual circuit-based interfaces for SNMP monitoring. The Circuit Interface Identification Persistence for SNMP feature maintains this user-defined name of the circuit across reboots, allowing the consistent identification of circuit interfaces. Circuit Interface Identification Persistence is enabled using the **snmp mib persist circuit** global configuration command.

Note This feature was originally introduced in Cisco IOS Release 12.1(4)T. This release is porting the feature into the Cisco AS5300 platform.

Cisco Gateway Management Agent

The Cisco Gateway Management Agent (CGMA) feature provides an eXtensible Markup Language (XML) interface to support real-time management of a Cisco IOS gateway (GW). Currently, GWs provide statistics using Simple Network Management Protocol (SNMP) and do not support real-time polling. The CGMA feature allows GWs to communicate with third-party management applications using XML over TCP/IP.

Note The Cisco Gateway Management Agent feature was previously released in Cisco IOS Release 12.2(8)T on the Cisco 2600 series, the Cisco 3600 series, and the Cisco 7200 series routers. In Cisco IOS Release 12.2(11)T, this feature is now supported on the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

Cisco Gateway Management Agent (CGMA) Phase 2

The Cisco Gateway Management Agent (CGMA) Phase 2 feature provides additional enhancements for the Cisco Gateway Management Agent (CGMA) feature. The CGMA provides an eXtensible Markup Language (XML) interface to support real-time management of a Cisco IOS gateway. Currently, gateways provide statistics using Simple Network Management Protocol (SNMP) and do not support real-time polling. The CGMA feature allows gateways to communicate with third-party management applications using XML over TCP/IP.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftcgma2.htm.

Note The Cisco Gateway Management Agent (CGMA) Phase 2 feature was previously released in Cisco IOS Release 12.2(8)T on the Cisco 2600 series, the Cisco 3600 series, and the Cisco 7200 series routers. In Cisco IOS Release 12.2(11)T, this feature is now supported on the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

Cisco H.323 Multizone Enhancements

The Cisco H.323 Multizone Enhancements feature enables the Cisco gateway to provide information to the gatekeeper with the use of additional fields in the RAS (registration, admission, and status) messages.

Previously, the source gateway attempted to set up a call to a destination IP address as provided by the gatekeeper in an Admission Confirm (ACF) message. If the gatekeeper was unable to resolve the destination E.164 phone number to an IP address, the incoming call was terminated.

This version of the H.323 software adds support to allow a gatekeeper to provide additional destination information and modify the destinationInfo field in the ACF. The gateway will include the canMapAlias associated destination information in setting up the call to the destination gateway.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_serv/as5800/sw_conf/ios_122/pul0244x.htm.

Note This feature was originally introduced in Cisco IOS Release 12.0(7)T on the Cisco 2600 series, the Cisco 3600 series, and the Cisco 7200 series routers, and the Cisco MC3810 and Cisco AS5300 platforms. This release is porting the feature into the Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

Cisco IOS Telephony Service Version 2.0

The Cisco IOS Telephony Service Version 2.0 feature was previously released in Cisco IOS Release 12.2(8)T. In Cisco IOS Release 12.2(11)T, there are minor enhancements to this feature, which is now referred to as Cisco IOS Telephony Service Version 2.01. Refer to the following document for information about the enhancements added to this release:

http://www.cisco.com/univercd/cc/td/doc/product/access/ip_ph/ip_ks/ipkey2.htm.

Cisco VCWare Version Checker

The Cisco VCWare Version Checker feature adds Cisco VCWare version checker warning output at bootup and when you use the **show vfc version vcware** and **show vfc version dspware** commands.

This new version checker feature detects possible mismatches between Cisco IOS software and Cisco VCWare and DSPWare. If a software mismatch is found, a compatibility mismatch warning is output at bootup and when the **show vfc version** commands are used. If no mismatch is found, there is no advisory output. Because the new information is advisory only, there is no action taken whether the software is compatible or incompatible.

This feature applies only to the Cisco AS5300. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftvdspck.htm

CISCO-BULK-FILE-MIB Enhancements

The Cisco Bulk File Creation MIB (CISCO-BULK-FILE-MIB.my) is a MIB module for creating and deleting bulk files of SNMP data for file transfer. The CISCO-BULK-FILE-MIB Enhancements featu enhances the Cisco Bulk File Creation MIB to support selective-row-transfer and notification-on-file-creation. Prior to this enhancement, when the MIB was used to dump large tables (for example, the ccHistoryTable), much of the data transfer consisted of duplicated data. This feature allows the SNMP manager to specify a starting row in the SNMP Get request.

This feature also introduces a notification that can be sent when file creation is complete or when there is an error during file creation. Specifically, this feature modifies the CISCO-BULK-FILE-MIB by introducing four new MIB objects (cbfDefineFileNotifyOnCompletion, cbfDefineObjectTableInstance, cbfDefineObjectNumEntries, cbfDefineObjectLastPolledInst) and a new notification object (cbfDefineFileCompletion). For details, refer to the CISCO-BULK-FILE-MIB.my file, available through Cisco.com MIB FTP site at the following URL:

ftp://ftp.cisco.com/pub/mibs/v2/CISCO-BULK-FILE-MIB.my.

Note This feature was originally introduced in Cisco IOS Release 12.1(8)T. This release is porting the feature into the Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

CISCO-SIP-UA-MIB Enhancements Providing Functional Parity to SIP related CLI

The CISCO-SIP-UA-MIB Enhancements Providing Functional Parity to session initiation protocol (SII related CLI feature has Simple Network Management Protocol (SNMP)/command-line interface (CLI) MIB enhancements to maintain parity with SIP features released to date.

No documentation work is required. The MIB is “self-documenting.”

CNS Agents SSL Security

CNS Agents SSL Security is a Cisco IOS software feature that allows for the configuration of a secure connection between the CNS Agent, running on the Cisco IOS software-based device, and a CNS Server. Secure Socket Layer (SSL) encryption for CNS connections is enabled on the Cisco IOS device (CNS Agent) side using the **encrypt** keyword with the **cns config initial** or **cns config partial** global configuration mode commands.

Note This feature was originally introduced in Cisco IOS Release 12.1(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

CNS Configuration Agent

CNS is a foundation technology for linking users to network services. CNS SDK accomplishes this by making applications network-aware and increasing the intelligence of the network elements. CNS SDK provides building blocks to a range of customers in market segments such as Enterprise, service provider, independent software vendors, and system integrators.

The CNS Configuration Agent supports routing devices by providing:

- Initial configurations
- Incremental (partial) configurations
- Synchronized configuration updates

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftcns_ca.htm.

Note This feature was originally introduced in Cisco IOS Release 12.1(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

CNS Event Agent

CNS is a foundation technology for linking users to network services. CNS SDK accomplishes this by making applications network-aware and increasing the intelligence of the network elements. CNS SDK provides building blocks to a range of customers in market segments such as Enterprise, service provider, independent software vendors, and system integrators.

The CNS Event Agent is part of the Cisco IOS infrastructure that allows Cisco IOS applications, for example CNS Configuration Agent, to publish and subscribe to events on a CNS Event Bus. CNS Event Agent works in conjunction with CNS Configuration Agent.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftcns_ea.htm.

Note This feature was originally introduced in Cisco IOS Release 12.1(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

Configuring a Gatekeeper to Provide Nonavailability Information for Terminating Endpoints

An H.323 Location Request (LRQ) message is sent by a gatekeeper to another gatekeeper to request a terminating endpoint. The second gatekeeper determines the appropriate endpoint on the basis of the information contained in the LRQ message. However, sometimes all the terminating endpoints are busy servicing other calls and none are available. If you configure the **lrq reject-resource-low** command, the second gatekeeper will reject the LRQ request if no terminating endpoints are available. If the command is not configured, the second gatekeeper will allocate and return a terminating endpoint address to the sending gatekeeper even if all the terminating endpoints are busy.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft_lrqrj.htm.

Connect-Info RADIUS Attribute 77

The Connect-Info RADIUS Attribute 77 feature enables the network access server (NAS) to report Connect-Info (attribute 77) in accounting "start" and "stop" records that are sent to the RADIUS client. The "start" and "stop" records allow you to compare transmit and receive speeds and have a realistic view of a user session. Comparing transmit and receive speeds is important because many modem speeds are often different at the end of the modem connection (after negotiation).

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftattr77.htm.

Customer Profile Idle Timer Enhancements for Interesting Traffic

The Customer Profile Idle Timer Enhancements for Interesting Traffic feature supports a PPP idle timer based on interesting traffic for dialer interfaces.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftprfidl.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T as Interesting Traffic PPP and Customer Profile Idle Timer. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

Default VPDN Group Template

The Default VPDN Group Template feature introduces the ability to configure global default values for virtual private dialup network (VPDN) parameters in a VPDN template. These global default values are applied to all VPDN groups, unless specific values are configured for individual VPDN groups. Previously, the Cisco IOS software required that VPDN parameters be configured for each individual VPDN group if the system default values were not desired.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftdevpdn.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

DF Bit Override Functionality with IPSec Tunnels

The DF Bit Override Functionality with IPSec Tunnels feature allows customers to configure the setting of the DF bit when encapsulating tunnel mode IPSec traffic on a global or per-interface level. Thus, if the DF bit is set to clear, routers can fragment packets regardless of the original DF bit setting. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftdfipsc.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T. This release is porting the feature into the Cisco AS5300 and Cisco AS5400 platforms.

DHCP Client—Dynamic Subnet Allocation API

The DHCP Client–Dynamic Subnet Allocation API feature is an application program interface (API) that is called by the DHCP Server–On-Demand Address Pool Manager feature for obtaining a subnet or releasing a subnet to the source server via DHCP. This feature allows automated configuration of layer 3 devices for simplified deployment.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

DHCP Client on WAN Interfaces

The DHCP Client on WAN Interfaces feature extends the Dynamic Host Configuration Protocol (DHCP) to allow PPP over ATM (PPPoA) and certain ATM interfaces to acquire an IP address through DHCP. By using DHCP rather than the IP Control Protocol (IPCP), a DHCP client can acquire other useful information such as DNS server addresses, the DNS default domain name, and default route.

Previously, the **ip address dhcp** interface configuration command could only be used on Ethernet interfaces. This feature allows the **ip address dhcp** command to be used on WAN interfaces.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftwandhp.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, and Cisco AS5800 platforms.

DHCP Relay—MPLS VPN Support

The DHCP relay agent information option (option 82) enables a Dynamic Host Configuration Protocol (DHCP) relay agent to include information about itself when forwarding client-originated DHCP packets to a DHCP server. The DHCP server can use this information to implement IP address or other parameter-assignment policies. The DHCP relay agent information option is organized as a single DHCP option that contains one or more suboptions that convey information known by the relay agent.

In some environments, a relay agent resides in a network element that also has access to one or more Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs). A DHCP server that wants to offer service to DHCP clients on those different VPNs needs to know the VPN in which each client resides. The network element that contains the relay agent typically knows about the VPN association of the DHCP client and includes this information in the relay agent information option.

The DHCP Relay–MPLS VPN Support feature allows the relay agent to forward this necessary VPN-related information to the DHCP server using the following three suboptions of the DHCP relay agent information option:

- VPN identifier
- Subnet selection

- Server identifier override

The DHCP Relay–MPLS VPN Support feature enables a network administrator to conserve address space by allowing overlapping addresses. The relay agent can now support multiple clients on different VPNs, and many of these clients from different VPNs can share the same IP address.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftdhmpls.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, and Cisco AS5400 platforms.

DHCP Relay Agent Support for Unnumbered Interfaces

Relay agents are used to forward requests and replies between clients and servers when they are not on the same physical subnet. Relay agent forwarding is distinct from the normal forwarding of an IP router, where IP datagrams are switched between networks somewhat transparently. Relay Agents receive Dynamic Host Configuration Protocol (DHCP) messages and then generate a new DHCP message to send out on another interface.

The Cisco IOS DHCP relay agent supports IP unnumbered interfaces. The DHCP relay agent automatically adds a static host route specifying the unnumbered interface as the outbound interface.

DHCP Server—On-Demand Address Pool Manager

The DHCP Server–On-Demand Address Pool Manager is a feature in which pools of IP addresses can be dynamically increased or reduced in size depending on the address utilization level. This feature supports address assignment using the Dynamic Host Configuration Protocol (DHCP) for customers using private addresses. Each on-demand address pool (ODAP) is configured and associated with a particular Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN).

When configured, the ODAP is populated with one or more subnets leased from a source server and is ready to serve address requests from DHCP clients or from PPP sessions. The source server can be a remote DHCP server or a RADIUS server (via AAA). Currently, only the Cisco Access Registrar RADIUS server supports ODAPs. Subnets can be added to the pool when a certain utilization level (high utilization mark) is achieved. When the utilization level falls below a certain level (low utilization mark), a subnet can be returned to the server from which it was originally leased.

This feature allows customers to optimize their use of IP addresses, thus conserving address space.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftondhcp.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

DHCP Server—Option to Ignore All BOOTP Requests

The DHCP Server—Option to Ignore All BOOTP Requests feature introduces the following new global configuration command: **ip dhcp bootp ignore**. This command allows the Cisco IOS DHCP server to ignore received BOOTP requests.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftdbootp.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5400 platform.

Dialer CEF

The Dialer CEF feature introduces Cisco Express Forwarding (CEF) support for dialer interfaces. The Dialer CEF feature allows packets to be CEF switched across dialer interfaces rather than being low-end switched (LES) or fast switched. Compared to fast switching, CEF switching support improves switching performance by decreasing CPU utilization and lowering the packet loss rate. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftdlrcef.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300 and Cisco AS5400 platforms.

Dialer Persistent

The Dialer Persistent feature allows the connection settings in a dial-on-demand routing (DDR) dialer profile to be configured as *persistent*, that is, the connection is not torn down until the **shutdown** EXEC command is entered on the dialer interface. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftdperst.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, and Cisco AS5800 platforms.

Dialer Watch Connect Delay

The Dialer Watch Connect Delay feature introduces the ability to configure a delay in bringing up a secondary link when a primary link that is monitored by Dialer Watch goes down and is removed from the routing table. Previously, the router would instantly dial a secondary route without allowing time for the primary route to come back up. When the Dialer Watch Connect Delay feature is configured, the router will check for availability of the primary link at the end of the specified delay time before dialing the secondary link.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftdialwl.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, and Cisco AS5850 platforms.

Distributed Management Event and Expression MIB Persistence

The MIB Persistence feature allows the SNMP data of an MIB to be persistent across reloads; that is, MIB information retains the same set object values each time the user reboots. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftmibpr1.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the Distributed Management Event MIB Persistence feature into the Cisco AS5300, Cisco AS5400, Cisco AS5800 platforms, and the Distributed Management Expression MIB Persistence feature into the Cisco AS5300 and Cisco AS5800 platforms.

Distributed Management Event MIB Conformance to RFC 2981

Prior to Cisco IOS Release 12.2(4)T3, Event MIB support in Cisco IOS software was based on the IETF internet draft version. In Cisco IOS Release 12.2(4)T3, the Cisco implementation of the EVENT-MIB was updated to comply with the finalized version of the Event MIB, as defined in RFC 2981. For detai see RFC 2981, available through the IETF web site at http://www.ietf.org.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T3. This release is porting the feature into the Cisco AS5300 and Cisco AS5400 platforms.

DLSw+ Enhanced Load Balancing

In a network with multiple capable paths, the Data Link Switch Plus (DLSw+) Load Balancing Enhancements feature improves traffic load balancing between peers by distributing new circuits based on existing loads and the desired ratio.

For each capable peer (peers that have the lowest or equal cost specified), the DLSw+ Load Balancing feature calculates the difference between the desired and the actual ratio of circuits being used on a peer. It detects the path that is underloaded in comparison to the other capable peers and assigns new circuits to that path until the desired ratio is achieved.

Note This feature was originally introduced in Cisco IOS Release 12.0(3)T. This release is porting the feature into the Cisco AS5350 platform.

DLSw+ Peer Group Clusters

The DLSw+ Peer Group Clusters feature reduces the explorer packet replication that typically occurs in a large Data Link Switch Plus (DLSw+) peer group design, where there are multiple routers connected to the same LAN.

The DLSw+ Peer Group Clusters feature associates DLSw+ peers (that are connected to the same LAN) into logical groups. Once the multiple peers are defined in the same peer group cluster, the DLSw+ Border Peer recognizes that it does not have to forward explorers to more than one member within the same peer group cluster.

Note This feature was originally introduced in Cisco IOS Release 12.0(3)T as DLSw+ Peer Clusters. This release is porting the feature into the Cisco AS5350 platform.

DTMF Events Through SIP Signaling

The DTMF Events Through SIP Signaling feature adds support for sending dual tone multifrequency (DTMF) notifications using NOTIFY messages from a session initiation protocol (SIP) gateway. The use of DTMF signaling for this feature enables support for advanced telephony services. Currently there are a number of application servers and service creation platforms that do not support media connections. To provide value added services to the network, these servers and platforms need to be aware of signaling events from a specific participant in the call. After the server or platform is aware of the DTMF events that are being signaled, it can use third-party call control, or other signaling mechanisms, to provide enhanced services. Examples of the types of services and platforms that are supported by this feature are various voice web browser services, Centrex switches/business service platforms, calling card services, and unified message servers. All of these applications require a method for the user to communicate with the application outside of the media connection. The Preauthentication with ISDN PRI feature provides this signaling capability.

The output generated by the **show sip-ua statistics** command displays the enhanced SIP Response and Total Traffic Statistics available with the new feature.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftnotify.htm.

DTMF Relay for SIP calls Using Named Telephone Events

The DTMF Relay using Named Telephone Events feature adds support for relaying dual tone multifrequency (DTMF) tones and hookflash events in session initiation protocol (SIP) on Cisco Voice over IP (VoIP) gateways (note that this feature is implemented for SIP only). Using Named Telephone Events (NTE) to relay DTMF tones provides a standardized means of transporting DTMF tones in RTP packets according to section 3 of RFC 2833, *RTP Payload for DTMF Digits, Telephony Tones and Telephony Signals*, developed by the Internet Engineering Task Force (IETF) Audio/Video Transport (AVT) working group. RFC 2833 defines formats of NTE RTP packets used to transport DTMF digits, hookflash, and other telephony events between two peer endpoints.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ft_dtmf.htm.

Easy VPN Server

The Easy VPN Server feature introduces server support for the Cisco VPN Client Release 3.x software clients and Cisco VPN hardware clients. It allows a remote end user to communicate using IP Security (IPSec) with any Cisco IOS Virtual Private Network (VPN) gateway. Centrally managed IPSec policies are "pushed" to the client by the server, minimizing configuration by the end user.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftunity.htm.

6746

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

Enable Multilink PPP via RADIUS for Preauthentication User

The Enable Multilink PPP via RADIUS for Preauthentication User feature allows you to selectively enable and disable Multilink PPP (MLP) negotiation for different users via RADIUS vendor-specific attribute (VSA) preauth:ppp-multilink=1.

You can enable MLP by configuring the **ppp multilink** command on an interface, but then this command enables MLP negotiation for all connections and users on that interface; that is, you cannot selectively enable or disable MLP negotiation for specific connections and users on an interface.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftppprad.htm

Encrypted Vendor-Specific Attributes

The Encrypted Vendor-Specific Attributes feature introduces support for the following three types of string vendor-specific attributes (VSAs):

- Tagged string VSA—To retrieve the right value for this VSA, the Tag field must be parsed correctly. The value for this field can range only from 0x01 through 0x1F. If the value is not within the specified range, the RADIUS server will ignore the value and consider the Tag field to be a part of the attribute string field.
- Encrypted string VSA—This VSA has a Salt field that ensures the uniqueness of the encryption key that is used to encrypt each instance of the VSA. The first and most significant bit of the Salt field must be set to 1.
- Tagged and Encrypted string VSA—This VSA is similar to encrypted string VSAs *except* this VSA has an additional Tag field. If the Tag field is not within the valid range (0x01 0x01 through 0x1F), it is considered to be part of the Salt field.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftencvsa.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the featu into the Cisco AS5300, Cisco AS5350, Cisco AS5400, and Cisco AS5850 platforms.

Enhanced Codec Support for SIP Using Dynamic Payloads

The Enhanced Codec Support for SIP Using Dynamic Payloads feature enhances codec selection and payload negotiation between originating and terminating session initiation protocol (SIP) gateways. The Enhanced Codec Support for SIP Using Dynamic Payloads feature provides the following SIP enhancements:

- Additional codec support
- Dynamic payload configuration
- Enhanced SDP messages

The feature adds support, which varies on different platforms, for eight additional codecs:

- Clear-channel
- G723ar53
- G723ar63
- G723r53
- G726r16
- G726r24
- G729br8
- GSM-EFR

The feature adds support for dynamic payloads by expanding SIP ability to advertise and negotiate available codecs. The feature also expands the Session Description Protocol (SDP) message body of SIP INVITE requests, which describe codec capabilities of the SIP gateway.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftcodec.htm.

Enhanced Debug Capabilities for Cisco Voice Gateways

The Enhanced Debug Capabilities for Cisco Voice Gateways feature provides a uniform call identifier to track calls end-to-end, filter calls based on certain criteria, and provide more concise debug commands. Previously if all debugs were turned on, the debug output would wrap around, so viewing a smaller amount of debug output to effectively identify the problem areas was critical.

Another requirement was single-call tracing that enables a single call, based on certain criteria, to be traced end-to-end in the gateway. A generic format to identify the trace call was required also and was needed across Media Gateway Control Protocol (MGCP), Session Initiation Protocol (SIP), H.323, voice telephony service providers (VTSPs), session applications, interactive voice response (IVR), Call Control Applications Programming Interface (CCAPI) and digital signal processors (DSPs).

The voice call debug command was implemented to give the user the choice of displaying the full GUID or reduces the length of GUID by displaying the headers only. The **full-guid** keyword displays a full call trace and the default is displaying the header only.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft_dbgsy.htm

Enhanced Password Security

The Enhanced Password Security feature allows you to configure Message Digest 5 (MD5) encryption for username passwords. Before the introduction of this feature, there were two types of passwords associated with usernames: Type 0, which is a clear text password visible to any user who has access to privileged mode on the router, and type 7, which is a password with a weak, exclusive, or type encryption. Type 7 passwords can be retrieved from the encrypted text by using publicly available tools.

Use the **username secret** command to configure a username and an associated MD5-encrypted secret.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_md5.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, and Cisco AS5850 platforms.

Enhanced Test Command

The Enhanced Test Command feature introduces two new commands—**aaa user profile** and **aaa attribute**—that allow you to create a named user profile with calling line identification (CLID) or dialed number identification service (DNIS) attribute values, which can be associated with a **test aaa group** command.

Use the **aaa attribute** command to add CLID or DNIS attribute values to a user profile, which is created by using the aaa user profile command. The CLID or DNIS attribute values can be associated with the record that is going out with the user profile (via the test aaa group command), thereby providing the RADIUS server with access to CLID or DNIS attribute information for all incoming calls. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftaaacmd.ht

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

Enhanced VoiceXML Diagnostics

With the Enhanced VoiceXML Diagnostics feature, debugging output can be filtered for all VoiceXML applications except the application named in the **debug condition application voice** command. When this command is configured, the gateway displays debugging messages only for the specified VoiceXML application when using the **debug vxml** and **debug http client** commands.

Refer to the following documents for additional information:

- Cisco IOS TCL and VoiceXML Application Guide:

  http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ivrapp/index.htm.

- Cisco VoiceXML Programmer's Guide:

  http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/rel_docs/vxmlprg/index.htm.

Enhancements for the Cisco VG200 Voice Gateway

The Enhancements for the Cisco VG200 Voice Gateway feature provides the Cisco VG200 platform with increased voice gateway feature parity to the Cisco 2600 series, Cisco 3600 series, and Cisco 3700 series. This feature is also supported on the Cisco VG200XM platform upgrade. The Cisco VG200XM is new for Cisco IOS Release 12.2(11)T and is a more powerful version of the Cisco VG200, offering higher processing power and improved performance.

The Cisco VG200 platforms provide the following default memory options:

- CiscoVG200—8 MB of Flash, 64 MB of DRAM
- Cisco CG200XM—16 MB of Flash, 64 MB of DRAM

The Enhancements for the Cisco VG200 Voice Gateway feature includes the following features:

- FXO Answer and Disconnect supervision—Enables analog Foreign Exchange Office (FXO) ports to monitor call-progress tones and to monitor voice and fax transmissions returned from a PBX or from the Public Switched Telephone Network (PSTN).
- NM-HDV-1T1/E1-12 —This digital voice card provides telephony interface signaling support, providing a lower density digital solution.
- Private-line automatic ringdown (PLAR)—Provides an off-premises extension (OPX) from a private PBX. Also provides dial tone from a remote PBX.
- Proprietary Transfer Code—Enables the Cisco VG200 (acting as a PSTN gateway with an Survivable Remote Site Telephony (SRST) or ITS device) to support Cisco proprietary call transfer from the SRST or ITS device back to the PSTN.

Enhancing Raw Buffer Management: Audit and Prepopulation for Channel-Associated Signaling

This feature implements an audit process to reclaim leaking raw buffers on a channel-associated signaling (CAS) interface.

Buffers pass voice data between subsystems in a voice-call-control infrastructure. However, pool management and the improper usage of buffers result in either process memory exhaustion or system crashes. Both are relatively difficult to troubleshoot. Auditing raw buffers allows you to detect and reclaim leaking buffers on the CAS interface and thus to improve buffer availability and be memory efficient.

Auditing raw buffers provides the following monitor scheme: When a raw message is allocated, the start time stamp is recorded. An audit process periodically (every 2 minutes) reclaims active raw messages that are more than 10 minutes old and returns the buffers to the appropriate pool. The 10-minute window allows enough time for all the call-related events to pass through.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftrawr11.htm

Event Tracer

The Event Tracer feature provides a binary trace facility for troubleshooting Cisco IOS software. This feature gives Cisco service representatives additional insight into the operation of the Cisco IOS software and can be useful in helping to diagnose problems in the unlikely event of an operating system malfunction or, in the case of redundant systems, route processor switchover.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios120/120newft/120limit/120s/120s18/evnttrcr.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

Fax and Modem Pass-Through over VoIP

Fax and modem pass-through are supported on the Cisco 2600 series, Cisco 3600 series, and the Cisco 3700 series modular access routers beginning in Cisco IOS Release 12.2(11)T.

Note The Fax and Modem Pass-Through over VoIP feature is also known under the feature title Modem Passthrough over Voice over IP.

On detection of the fax or modem tone on an established VoIP call, the gateways switch into modem fax or pass-through mode: the voice codec and configuration is suspended and the pass-through parameters are loaded for the duration of the fax or modem session. This changes the bandwidth needed for the call to the equivalent of G.711.

With pass-through, the fax or modem traffic is carried between the two gateways in RTP packets, using an uncompressed format resembling the G.711 codec. Packet redundancy may be used to mitigate the effects of packet loss in the IP network. Even so, fax and modem pass-through remain susceptible to packet loss, jitter and latency in the IP network. The two endpoints must be clocked synchronously for this type of transport to work predictably.

The Fax and Modem Pass-Through feature is also known as Voice Band Data (VBD) by the International Telecommunication Union (ITU). VBD refers to the transport of fax or modem signals over a voice channel through a packet network with an encoding appropriate for fax or modem signals. The minimum set of coders for VBD mode is G.711 ulaw and alaw with VAD disabled. For modem transport, Ech cancellation is also be disabled.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/faxapp/index.htm.

Fax Detection (Single-number Voice and Fax)

Note The Fax Detection (Single-number Voice and Fax) feature is also known under the feature title Fax Detection for Cisco AS5300, Cisco AS5350 and Cisco AS5400.

On Cisco AS5300, Cisco AS5350, and Cisco AS5400 gateways that are equipped with voice feature cards (VFCs), the fax detection feature lets service providers deploy unified communication applications in which each subscriber has a single E.164 number for both voice mail and fax mail. When configured for fax detection, the gateway automatically listens to incoming calls to discriminate between voice and fax. The gateway then routes the calls to the appropriate application or server.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/faxapp/ind.htm.

Fax Detection for VoiceXML

With the Fax Detection for VoiceXML feature, when a VoiceXML fax detection application is configured on the gateway, callers can dial a single number for both voice and fax calls. The gateway automatically detects that a call is a fax transmission by listening for comfort noise generation (CNG), the distinctive fax "calling" tone. When configured for fax detection, the Cisco VoiceXML gateway continuously listens to incoming calls to determine which calls are voice or fax. The gateway then routes the calls to the appropriate application or media server.

Refer to the following documents for additional information:

- Cisco IOS TCL and VoiceXML Application Guide:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ivrapp/index.htm.

- Cisco VoiceXML Programmer's Guide:

  http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/rel_docs/vxmlprg/index.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(2)XB on the Cisco AS5300 platform. This release is porting the feature into the Cisco 3640 series, Cisco 3660 series, Cisco AS5350, and Cisco AS5400 platforms.

Fax Relay Packet Loss Concealment

The Fax Relay Packet Loss Concealment feature improves the current real-time fax over IP (commonly known as fax relay) implementation in Cisco gateways, allowing fax transmissions to work reliably over higher packet loss conditions.

In addition, this feature includes enhanced real-time fax debug capabilities and statistics. These debugs and statistics will give better visibility into the real-time fax operation in the gateway, allowing for improved field diagnostics and troubleshooting.

These improvements include configuration of fax relay Error Correction Mode (ECM) on the Voice over IP (VoIP) dial peer. ECM provides for error-free page transmission. This mode is available on fax machines that include memory for storage of the page data (usually high-end fax machines).

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ft_0393.htm.

Note This feature was previously released in Cisco IOS Release 12.1(3)T on the Cisco AS5300 and Cisco AS5850 platforms. This release is porting the feature into the Cisco AS5400 platform.

G.Clear, GSMFR, and G.726 Codecs and Modem and Fax Pass-Through for Cisco Universal Gateways

The following features are now available on Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5400HPX, and Cisco AS5850 universal gateways.

The G.Clear, GSMFR, and G.726 Codecs and Modem and Fax Pass-Through for Cisco Universal Gateways feature provides support for G.Clear, GSMFR, and G.726 codecs, as well as support for modem and fax Pass-through for Cisco universal gateways.

G.Clear guarantees bit integrity when transferring a DS-0 through a gateway server, supports the transporting of nonvoice circuit data sessions through a Voice over IP (VoIP) network, and enables the VoIP networks to transport ISDN and switched 56 circuit-switched data calls. With the availability of G.Clear, ISDN data calls that do not require bonding can be supported.

The GSMFR codec was introduced in 1987. The GSMFR speech coder has a frame size of 20 ms and operates at a bit rate of 13 kbps. GSMFR is an Regular Pulse Excited - Linear Predictive (RPE-LTP) coder.

The G.726 Adaptive Differential PCM (ADPCM) voice codec operates at bit rates of 16, 24, and 32 kbps. ADPCM provides the following:

- Voice mail recording and playback that is a requirement for Internet voice mail.

- Voice transport for cellular, wireless, and cable markets.
- High voice quality voice transport at 32 kbps.

In addition, modem and fax pass-through services are supported. When service providers and aggregators are implementing VoIP, they sometimes cannot separate fax or data traffic from voice traffic. These carriers that aggregate voice traffic over VoIP infrastructures require service offerings to carry fax and data as easily as voice.

On detection of the modem answer tone, the gateways switch into modem pass-through mode. With modem pass-through, the modem traffic is carried between the two gateways in RTP packets, using an uncompressed or lightly compressed voice codec—G.711 ulaw, G.711 alaw, or Voice Band Data (VBD). Packet redundancy may be used to mitigate the effects of packet loss in the IP network. Even so, modem pass-through remains susceptible to packet loss and jitter and latency in the IP network.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft_ghost.htm.

Gatekeeper Endpoint Control Enhancements

The Gatekeeper Endpoint Control Enhancements feature provides enhancements to the Cisco IOS gatekeeper, including commands to allow both forced unregistration of an endpoint and rejection of new registrations or calls when a Gatekeeper Transaction Message Protocol (GKTMP) server is down or unreachable. This feature also provides both forced unregistration of an endpoint using a GKTMP command from an application server and a command to enable faster reconnection to a GKTMP server when its TCP connection fails.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftgkece2.htm

Gatekeeper-to-Gatekeeper Authentication

The Gatekeeper-to-Gatekeeper Authentication feature provides additional security for H.323 networks by introducing the ability to validate intra-domain and interdomain gatekeeper-to-gatekeeper Location Request (LRQ) messages on a per-hop basis. When used in conjunction with per-call security using the interzone ClearToken (IZCT), network resources and security holes are protected from hackers. The IZCT was introduced in the Inter-Domain Gatekeeper Security Enhancement feature released in Cisco IOS Release 12.2(2)XA and Cisco IOS Release 12.2(4)T.

The Gatekeeper-to-Gatekeeper Authentication feature provides a Cisco Access Token (CAT) to carry authentication within zones. The CAT is used by adjacent gatekeepers to authenticate each other and configured on a per-zone basis. In addition, service providers can specify inbound passwords to authenticate LRQ messages coming from foreign domains and outbound passwords to be included in LRQ messages to foreign domains.

This release documents two new commands: **security password-group** and **security zone**.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft_idlrq.htm.

Generic Routing Encapsulation (GRE) Tunnel Keepalive

The GRE Tunnel Keepalive feature provides the capability of configuring keepalive packets to be sent over IP-encapsulated generic routing encapsulation (GRE) tunnels. You can specify the rate at which keepalives will be sent and the number of times that a device will continue to send keepalive packets without a response before the interface becomes inactive.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/grekpliv.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, and Cisco AS5400 platforms.

Global Modem Counters

The Global Modem Counters feature adds two new global call counters for ISDN calls to the Cisco IOS software. In Cisco IOS Release 12.2(11)T, this feature is supported only on the Cisco AS5800 universal access server. The CISCO-POP-MGMT-MIB has been updated with two new objects, cpmCallVolSuccISDNDigital and cpmCallVolAnalogCallClearedNormally. The cpmCallVolSuccISDNDigital object allows the Cisco IOS software to track the number of successful incoming and outgoing ISDN digital data calls that have occurred since the system was started. The cpmCallVolAnalogCallClearedNormally object allows the Cisco IOS to track the number of successful incoming and outgoing analog data calls.

No new commands have been introduced with this feature. To use this feature, enable System Network Management Protocol (SNMP) and the corresponding OIDs for these new objects. To obtain lists of supported MIBs by platform and Cisco IOS release, and to download MIB modules, go to the Cisco MIB website on Cisco.com at the following URL:

http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml.

Globalized Cadence and Tone for Cisco IOS Gateways

Because previously Cisco CallManager and Cisco IOS gateways were configured independently and may lead to configuration mismatches, Cisco CallManager is now preconfigured to provide cadences and tones for the user's locale. It is no longer necessary for you to configure the **cptone** command on the gateway. This feature shows the user how to verify which locale is preconfigured on Cisco CallManager.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft_glbl.htm.

GTD for GKTMP using SS7 Interconnect version 2.0

The GTD for GKTMP using SS7 Interconnect version 2.0 feature consists of the following two features:

- GTD for GKTMP using SS7 Interconnect for Voice Gatekeeper version 2.0
- GTD for GKTMP using SS7 Interconnect for Voice Gateway version 2.0

The GTD for GKTMP Using SS7 Interconnect version 2.0 feature provides additional functionality to Cisco gateways and gatekeepers in a Cisco SS7 Interconnect for Voice Gateways Solution. The generic transparency descriptor or generic telephony descriptor (GTD) format is defined in the a Cisco proprietary draft. GTD format defines parameters and messages of existing SS7 ISUP protocols in text format and allows SS7 messages to be carried as a payload in the H.225 registration, admission, and status (RAS) messages between the GW and GK. GTD messages can also be transported between GWs and GKs in H.323 messages. With the GTD feature, the GK extracts the GTD message and the external route server derives routing and accounting information based upon the GTD information provided from the Cisco Gatekeeper Transaction Message Protocol (GKTMP).

Currently routing on Cisco GWs is based on generic parameters such as originating number, destination number, and port source. Adding support for SS7 ISUP messages allows the VoIP network to use additional routing enhancements found in traditional TDM switches.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftgtdpy2.htm

H.323 Call Redirection Enhancements

The user-to-user information element (UUIE) of the Facility message is used primarily for call redirection. The UUIE contains a field, facilityReason, that indicates the nature of the redirection. The H.323 Call Redirection Enhancements feature adds support for two of the reasons: routeCallToGatekeeper and callForwarded. It also provides a nonstandard method for using the Facil message to effect call transfer.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftcallrd.htm.

Note This feature was previously released in Cisco IOS Release 12.2(2)T on Cisco 1700, Cisco 2600 series, Cisco 3600 series, Cisco MC3810, Cisco AS5300, and Cisco uBR924 platforms. This release is porting the feature into the Cisco AS5850 platform.

H.323 Dual Tone Multifrequency (DTMF) Relay Using Named Telephone Events

Until now, the Named Telephone Event (NTE) method of dual tone multifrequency (DTMF) relay was available on Cisco gateways only for Session Initiation Protocol (SIP) and Media Gateway Control Protocol (MGCP) gateways. The H.323 Dual Tone Multifrequency Relay Using Named Telephone Events feature adds support for this method for H.323 gateways.

Cisco H.323 gateways advertise capabilities using the H.245 capabilities messages. By default, they advertise that they can receive all DTMF relay modes. If the capabilities of the remote gateway do not match, the Cisco H.323 gateway transmits DTMF tones as in-band voice. Configuring DTMF relay o the Cisco H.323 gateway sets preferences for how the gateway handles DTMF transmission. If multiple methods are configured, the priority is as follows:

- Cisco RTP
- RTP NTE
- H.245 signal
- H.245 alphanumeric

In addition to support for NTE, the H.323 Dual Tone Multifrequency Relay Using Named Telephone Events feature provides support for asymmetrical payload types. Payload types can differ between local and remote endpoints. Therefore, the Cisco gateway can transmit one payload type value and receive a different payload type value.

There are no new or modified commands.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/fth3dtmf.htm

H.323 Redundant Zone Support

The Redundant H.323 Zone Support feature allows users to configure multiple gatekeepers to service the same zone or technology prefix. This feature can be used with the Gateway Support for Alternate Gatekeepers feature, which allows a user to configure a gateway to point to two gatekeepers (one as the primary and the other as the alternate). Together, these features allow a user to configure a Cisco gateway to send location requests (LRQs) to two or more Cisco gatekeepers—one as a primary and the others as back up gatekeepers. All gatekeepers are active. The gateway can choose to register with any one (but not all) at a given time.

Note This feature was previously released in Cisco IOS Release 12.1(1)T. This release is porting the feature into the Cisco AS5350, Cisco AS5400, and Cisco AS5850 platforms.

iBGP Multipath Load Sharing

When a Border Gateway Protocol (BGP) speaker router with no local policy configured receives multiple network layer reachability information (NLRI) from the internal BGP for the same destination, the router will choose one internal BGP path as the best path. The best path is then installed in the IP routing table of the router.

The Internal BGP Multipath Load Sharing feature enables the BGP speaker router to select multiple internal BGP paths as the best paths to a destination. The best paths or multipaths are then installed in the IP routing table of the router.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft11bmls.htm

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

IGMP MIB Support Enhancements for SNMP

The Internet Group Management Protocol (IGMP) is used by IP hosts to report their multicast group memberships to neighboring multicast routers. The IGMP MIB describes objects that enable users to remotely monitor and configure IGMP using Simple Network Management Protocol (SNMP). It also allows users to remotely subscribe and unsubscribe from multicast groups. The IGMP MIB Support Enhancements for SNMP feature adds full support of RFC 2933 (Internet Group Management Protocol MIB) in Cisco IOS software. There are no new or modified Cisco IOS commands associated with this feature.

For complete details on the IGMP MIB, see the IGMP-STD-MIB.my file available from the Cisco MIB website on Cisco.com at http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

IKE—Initiate Aggressive Mode

The IKE—Initiate Aggressive Mode feature allows you to specify RADIUS Tunnel attributes (Tunnel-Client-Endpoint [66] and Tunnel-Password [69]) for an IPSec peer and to initiate an IKE aggressive mode negotiation with the tunnel attributes. This feature is best implemented in a crypto hub-and-spoke scenario, in which the spokes initiate IKE aggressive mode negotiation with the hub by using the preshared keys that are specified as tunnel attributes and stored on the AAA server. This scenario is scalable because the preshared keys are kept at a central repository (the AAA server) and more than one hub router and one application can use the information.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_ikeag.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

Integrated Signaling Link Terminal

The Integrated Signaling Link Terminal feature pulls existing Cisco distributed Message Transfer Part (MTP) SS7 signaling architecture functionality—previously available only on Cisco 26*xx*-based signaling link terminals (SLTs)—directly onto a single Cisco AS5350 or Cisco AS5400. Like the Cisco 26*xx*-based SLT, the Integrated SLT on a Cisco AS5350 or Cisco AS5400 backhauls upper-layer Signaling System 7 (SS7) protocols across an IP network using Cisco Reliable User Datagram Protocol (RUDP), terminating the MTP1 and MTP2 layers of the SS7 protocol stack at the Media Gateway Controller (MGC).

Using the 2-, 4-, or 8-PRI dial feature card (DFC) or the CT3 (28-PRI) DFC card, this feature is designed for small points of presence (POPs) that require only one or two network access servers (NASs) or Voice-over-IP (VoIP) gateways as part of a dial or VoIP solution. This feature eliminates the use of the Cisco 26*xx*-based SLT in the product configuration.

When the Integrated Signaling Link Feature feature is implemented, a Cisco AS5350 or Cisco AS5400 functions as an SS7 signaling data link terminal and as a NAS, voice gateway, or both when universal ports are used.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftintslt.htm.

Integrated IS-IS Point-to-Point Adjacency Over Broadcast Media

When a network consists of only two networking devices that are connected to broadcast media and using the integrated IS-IS protocol, it is better for the system not to have to handle the link as a broadcast link but rather as a point-to-point link. The Integrated IS-IS Point-to-Point Adjacency Over Broadcast Media feature introduces a new command to make IS-IS behave as a point-to-point link between the networking devices. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftissp2p.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

Interactive Voice Response Version 2.0 on VoIP Gateways

Interactive Voice Response (IVR) consists of simple voice prompting and digit collection to gather caller information for authenticating the user and identifying the destination. IVR applications can be assigned to specific ports or invoked on the basis of dialed number identification service (DNIS). An IP Public Switched Telephone Network (PSTN) gateway can have several IVR applications to accommodate many different gateway services, and you can customize the IVR applications to present different interfaces to the various callers.

IVR systems provide information in the form of recorded messages over telephone lines in response to user input in the form of spoken words, or more commonly, dual tone multifrequency (DTMF) signaling. IVR uses Tool Command Language (TCL) scripts to gather information and to process accounting and billing.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_ivr72.htm.

Note This feature was originally introduced in Cisco IOS Release 12.1(3)T. This release is porting the feature into the Cisco AS5350, Cisco AS5400, and Cisco AS5850 platforms.

Inter-Domain Gatekeeper Security Enhancement

The Inter-Domain Gatekeeper Security Enhancement feature provides a means of authenticating and authorizing H.323 calls between the administrative domains of Internet Telephone Service Providers (ITSPs).

An interzone ClearToken (IZCT) is generated in the originating gatekeeper (OGK) when a location request (LRQ) is initiated or an admission confirmation (ACF) is about to be sent for an intrazone call within an ITSP's administrative domain. As the IZCT traverses the routing path, each gatekeeper (GK) stamps the IZCT's destination GK ID with its own ID. This identifies when the IZCT is being passed over to another ITSP's domain. The IZCT is then sent back to the OGW in the location confirmation (LCF) message. The OGW passes the IZCT to the terminating gateway (TGW) in the SETUP message. The TGW forwards the IZCT in the admission request (ARQ) answerCall field to the terminating gatekeeper (TGK), which then validates it.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xa/122xa_2/ft_ctoke.htm.

Interface Alias Long Name Support

The Interface Alias (ifAlias) is a user-specified description of an interface used for SNMP network management. The ifAlias is an object in the Interfaces Group MIB (IF-MIB), which can be set by a network manager to "name" an interface. The ifAlias value for an interface or subinterface can be set using the **description** command in interface configuration mode, or by using a Set operation from a Network Management System.

Before Cisco IOS Release 12.2(2)T, ifAlias descriptions for subinterfaces were limited to 64 characters. A new Cisco IOS software command, **snmp ifmib ifalias long**, configures the system to handle ifAlias descriptions of up to 256 characters. IfAlias descriptions appear in the output of the **show interfaces** CLI command. Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftshowif.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

Interface Index Display

The Interface Index (IfIndex) is a user-specified identification number for an interface used in SNMP network management. The IfIndex is an object in the Interfaces Group MIB (IF-MIB), which can be set by a network manager to consistently identify an interface. A new Cisco IOS software command, **show snmp mib ifmib ifindex**, allows the user to display the IfIndex identification numbers assigned to interfaces and subinterfaces using the CLI. The IFIndex provides a way to display these values without the need for a Network Management Station. Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftshowif.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

Internal Cause Code Consistency Between SIP and H.323

The Internal Cause Code Consistency Between SIP and H.323 feature establishes a standard set of categories for internal causes of voice call failures. Before this feature, the cause code passed when an internal failure occurred was not standardized or based on any defined rules. The nonstandardization led to confusing or incorrect cause code information, and possibly contributed to billing errors.

The H.323 and SIP standard cause codes that are now generated accurately reflect the nature of each internal failure. This makes H.323 and SIP consistent with cause codes generated for common problems. Also, for each internal failure, an ITU-T Q.850 release cause code is also assigned.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftbibble.htm.

Interworking of Cisco MGCP Voice Gateways and Cisco CallManager Version 3.2

The Interworking of Cisco MGCP Voice Gateways and Cisco CallManager Version 3.2 feature allows Cisco voice gateways to act as redundant fail-over MGCP gateways. The new functionality includes the following configurable options:

- Cisco CallManager Redundancy—A fallback Cisco CallManager instance can assume control of the backup voice gateways in the event of a failure; another pair of resources can be specified for use in case the primary fallback Cisco CallManager also fails.
- Supplementary Services—During a fail-over event, call hold, call transfer when the line is busy or there is no answer, call forwarding, and three-party call conferencing to and from the Public Switched Telephone Network (PSTN) or a private branch exchange (PBX) are supported.
- Cisco CallManager Switchback—This feature allows reestablishment of communication with the primary Cisco CallManager when it becomes available after fallback resources have assumed control.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft_ccm1.htm.

Interworking Signaling Enhancements for H.323 and SIP VoIP

The Interworking Signaling Enhancements for H.323 and SIP VoIP feature enables VoIP networks to properly signal the setup and tear-down of calls when interworking with PSTN networks. These enhancements ensure that in-band tones and announcements are generated when needed so that the voice path is cut-through at the appropriate point of call setup and that early alerting (ringing) does not occur. In addition, support for network-side ISDN and the reducing of speech clipping is addressed.

Note This feature was originally introduced in Cisco IOS Release 12.1(5)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

IP Multicast MIB Enhancements

This feature enhances the IP multicast routing protocol in Cisco IOS software by adding MIB variables to query the number of (S, G) and (*, G) entries. It also adds support for high-speed interface counters.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, and Cisco AS5850 platforms.

IPSec VPN High Availability Enhancements

The IPSec VPN High Availability feature consists of two new features—Reverse Route Injection and Hot Standby Router Protocol and IPSec—that work together to provide users with a simplified network design for VPNs and reduced configuration complexity on remote peers with respect to defining gateway lists.

Reverse Route Injection

Reverse Route Injection (RRI) is a feature designed to simplify network design for Virtual Private Network (VPNs) in which there is a requirement for redundancy or load balancing. RRI works with both dynamic and static crypto maps.

In the dynamic case, as remote peers establish IPSec security associations (SAs) with an RRI-enabled router, a static route is created for each subnet or host protected by that remote peer. For static crypto maps, a static route is created for each destination of an extended access-list rule.

When routes are created, they are injected into any dynamic routing protocol and distributed to surrounding devices. This traffic flows, requiring IPSec to be directed to the appropriate RRI router for transport across the correct SAs to avoid IPSec policy mismatches and possible packet loss.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco 1760 series router and the Cisco AS5300 and Cisco AS5050 platforms.

Hot Standby Router Protocol and IPSec

Hot Standby Router Protocol (HSRP) is designed to provide high network availability by routing IP traffic from hosts on Ethernet networks without relying on the availability of any single router. HSRP is particularly useful for hosts that do not support a router discovery protocol, such as ICMP Router Discovery Protocol (IRDP), and do not have the functionality to switch to a new router when their selected router reloads or loses power. Without this functionality, a router that loses its default gateway because of a router failure is unable to communicate with the network.

HSRP is configurable on LAN interfaces using standby command line interface (CLI) commands. It is now possible to use the standby IP address from an interface as the local IPSec identity, or local tunnel endpoint.

By using the standby IP address as the tunnel endpoint, failover can be applied to VPN routers by using HSRP. Remote VPN gateways connect to the local VPN router via the standby address that belongs to the active device in the HSRP group. In the event of failover, the standby device takes over ownership of the standby IP address and begins to service remote VPN gateways.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco 1760 series router and the Cisco AS5300 and Cisco AS5050 platforms.

Further Documentation

Refer to the following document for further information about the IPSec VPN High Availability Enhancements feature:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121limit/121e/121e9/ipsecha.htm.

IPv6 for Cisco IOS Software

IPv6, formerly called IPng (next generation), is a replacement for the current version of IP (version 4). Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ipv6/index.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300 and Cisco AS5400 platforms.

ISDN and V.120 Support for NextPort DSPs

The ISDN and V.120 Support For NextPort DSPs feature provides full coverage for digital calls and performance enhancement for V.120 calls. The feature permits terminating synchronous ISDN and V.120 sessions without customer intervention. This feature allows the Cisco AS5350 and Cisco AS5400 to terminate more than 256 ISDN sessions per channelized T3 (CT3) controller by adding ISDN capacity. This feature is mandatory for wholesale dial installations in which ISDN is being used. Th. feature permits V.120 calls to operate on the NextPort digital signal processor (DSP) instead of on the CT3 controller to reduce activity on the CPU and to increase the V.120 call capability. Support for these enhancements is automatic, and no configuration steps are required.

ISDN-NFAS with D Channel Backup

ISDN Non-Facility Associated Signaling (NFAS) allows a single D channel to control multiple PRI interfaces. A backup D channel can be configured for use when the primary NFAS D channel fails. Any hard failure causes a switchover to the backup D channel and currently connected calls remain connected. The ISDN-NFAS with D Channel Backup feature also supports the DMS100 and NI2 switch types.

Once the channelized T1controllers are configured for ISDN PRI, only the NFAS primary D channel must be configured; its configuration is distributed to all the members of the associated NFAS group.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_serv/as5800/sw_conf/ios_122/ft_nfas.htm.

Note This feature was originally introduced in Cisco IOS Release 11.3(3)T. This release is porting the feature into the Cisco AS5850 platform. Note that the feature is also known as NFAS with D Channel Backup.

IVR: Configuring Dynamic Prompts

The functionality of dynamic prompts, an existing Cisco IOS feature, has been expanded in Cisco IOS Release 12.2(11)T to play out International Organization for Standardization (ISO) formatted time and date, and visible noncontrol ASCII characters. Dynamic prompts allow a TCL application to play the date and time information on a Cisco voice gateway. The information is first retrieved by using the **clock** command in the Toolkit Command Language (TCL) library and then played through dynamic prompts using the multilanguage script.

The **media play** command in the TCL library plays the specified dynamic prompt on the specified call leg. The English version of the multilanguage TCL script must be enabled before you use the **media play** command; it allows a dynamic prompt to play string and visible noncontrol ASCII characters.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/actap/index.htm.

IVR: Customizing Accounting Templates

You can create an accounting template to customize your accounting records based on your billing needs. An accounting template is a text-based interface that allows you to customize and define the content of that template and helps reduce billing traffic from the gateway to the accounting servers.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/actap/index.htm.

IVR: Directing AAA Requests

Cisco IOS Release 12.2(11)T introduces the capability of splitting authentication, authorization, and accounting (AAA) requests to RADIUS servers based on account number, called party number, and incoming trunk groups.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/actap/index.htm.

IVR: Enhanced Multilanguage Support

This feature releases the infrastructure to support Tool Command Language (TCL)-based script interpreters, which allow you to easily add new languages to your router or access server. You can add a new language by creating a TCL script that interprets prompts into a sequence of audio files or silences. The underlying Cisco IOS dynamic prompting code interfaces with the TCL script to translate the message into a sequence of URLs that point to audio files. Then, the Cisco IOS software plays the sequence of audio files as a dynamic prompt. New TCL-script language interpreters operate simultaneously with the current built-in languages: Spanish, Chinese/Mandarin, and English. Adversely, new TCL-script language interpreters can replace one or more of the built-in languages by overwriting the built-in language functionality.

Note This feature does not release any specific TCL scripts.

Note Although the language intelligence comes from a TCL-based language script, once you configure a language any system (TCL IVR 1.0, 2.0, VxML, MGCP, and so on) on your router can use the configured language with little to no change to Cisco IOS Software.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftmultil.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T as Enhanced Multilingual Support for Cisco IOS Integrated Voice Response. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

L2TP Large-Scale Dial-Out

The L2TP Large-Scale Dial-Out feature enables the router to dial multiple Layer 2 Tunnel Protocol (L2TP) access concentrators (LACs) from a single L2TP network server (LNS). The LACs are signaled through the LNS and use L2TP to establish the dial sessions. User-defined profiles can be configured on an authentication, authorization, and accounting (AAA) server and retrieved by the LNS when dial-out occurs.The L2TP Large-Scale Dial-Out feature also supports multiple LACs bound into one stack group, call traffic load balancing, and outbound call congestion management.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftl2lsdo.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

L2TP Security

The L2TP Security feature provides enhanced security for tunneled PPP frames between the Layer 2 Transport Protocol (L2TP) access concentrator (LAC) and the L2TP network server (LNS). Previous releases of the Cisco IOS software provided only a one-time, optional mutual authentication during tunnel setup with no authentication of subsequent data packets or control messages. In situations in which the L2TP is used to tunnel PPP sessions over an untrusted infrastructure such as the Internet, the security attributes of L2TP and PPP are inadequate. PPP provides no protection of the L2TP tunnel, and current PPP encryption protocols provide inadequate key management and no authentication or integrity mechanisms. The L2TP Security feature allows the robust security features of IP Security (IPSec) to protect the L2TP tunnel and the PPP sessions within the tunnel. In addition, the L2TP Security feature provides built-in keepalives and standardized interfaces for user authentication and accounting to authentication, authorization, and accounting (AAA) servers.

The deployment of Microsoft Windows 2000 demands the integration of IPSec with L2TP because this is the default virtual private dialup network (VPDN) networking scenario. This integration of protocols is also used for LAN-to-LAN VPDN connections in Microsoft Windows 2000. The L2TP Security feature provides integration of IPSec with L2TP in a solution that is scalable to large networks with minimal configuration.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftl2tsec.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400 and Cisco AS5800 platforms.

Location Confirmation (LCF) Enhancements for Alternate Endpoints

This feature was originally introduced in Cisco IOS Release 12.2(4)T; see the "Location Confirmation Enhancements for Alternate Endpoints" section on page 370. Cisco IOS Release 12.2(11)T documents the new **endpoint alt-ep collect** command. In addition, effective with Cisco IOS Release 12.2(11)T, duplicate alternate endpoints that are received in a Location Confirmation (LCF) message are removed from the consolidated list of endpoints.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_lcfep.htm.

Low Latency Queueing with Priority Percentage Support

This feature allows you to configure bandwidth as a percentage within low latency queueing (LLQ). Specifically, you can designate a percentage of the bandwidth to be allocated to an entity (such as a physical interface, a shaped ATM permanent virtual circuit (PVC), or a shaped Frame Relay PVC) to which a policy map is attached. Traffic associated with the policy map will then be given priority treatment. This feature also allows you to specify the percentage of bandwidth to be allocated to nonpriority traffic classes.

This feature modifies two existing commands—**bandwidth** and **priority**. This feature adds a new keyword to the **bandwidth** command—**remaining percent**. The feature also changes the functionality of the existing **percent** keyword. These changes result in the following commands for bandwidth: **bandwidth percent** and **bandwidth remaining percent.** The **bandwidth percent** command configures bandwidth as an absolute percentage of the total bandwidth on the interface. The **bandwidth remaining percent** command allows you to allocate bandwidth as a relative percentage of the total bandwidth available on the interface. This command allows you to specify the relative percentage of the bandwidth to be allocated to the classes of traffic.

This feature also adds the **percent** keyword to the **priority** command. The **priority percent** command indicates that the bandwidth will be allocated as a percentage of the total bandwidth of the interface. You can then specify the percentage (that is, a number from 1 to 100) to be allocated by using the *percentage* argument with the **priority percent** command.

Unlike the **bandwidth** command, the **priority** command provides a strict priority to the traffic class, which ensures low latency to high priority traffic classes. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftllqpct.htm.

Note This feature was originally introduced in Cisco IOS Release 12.0(5)T. This release is porting the feature into the Cisco AS5300 platform.

MD5 File Validation

The MD5 File Validation feature allows you to check the integrity of a Cisco IOS software image by comparing its MD5 checksum value against a known MD5 checksum value for the image. MD5 values are now made available on Cisco.com for all Cisco IOS software images for comparison against local system image values.

To perform the MD5 integrity check, execute the verify command using the new "/md5" keyword. For example, executing the **verify flash:c7200-is-mz.122-2.T.bin /md5** command will calculate and disp the MD5 value for the software image. Compare this value with the value available on Cisco.com for this image.

Alternatively, you can get the MD5 value from Cisco.com first, then specify this value in the command syntax. For example, executing the **verify flash:c7200-is-mz.122-2.T.bin /MD5 8b5f3062c4caeccae72571440e962233** command will display a message verifying that the MD5 values match or that there is a mismatch.

A mismatch in MD5 values means that either the image is corrupt or the wrong MD5 value was entered.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

Media Gateway Control Protocol-Based Fax (T.38) and Dual Tone Multifrequency (IETF RFC 2833) Relay

The MGCP-Based Fax (T.38) and DTMF (IETF RFC 2833) Relay feature adds support for fax relay and DTMF relay with MGCP. This feature provides two modes of implementation for each component: gateway (GW)-controlled mode and call agent (CA)-controlled mode. In GW-controlled mode, GWs negotiate DTMF and fax relay transmission by exchanging capability information in Session Descripti Protocol (SDP) messages. That transmission is transparent to the CA. GW-controlled mode allows use of the MGCP-Based Fax (T.38) and DTMF (IETF RFC 2833) Relay feature without upgrading the CA software to support the feature. In CA-controlled mode, CAs use MGCP messaging to instruct GWs to process fax and DTMF traffic. For MGCP T.38 Fax Relay, the CAs can also instruct GWs to revert to GW-controlled mode if the CA is unable to handle the fax control messaging traffic; for example, in overloaded or congested networks.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftmgcpfx.htm.

Note Fax CODEC up-speeding is not supported.

Note **debug voip rtp [all |** ***named-event*****]** - Enables the new debug flag and displays reception or transmission of RTP named events is not supported on the Cisco AS5850, since the voice packets are CEF and would not be visible on the RSC card.

Note The Media Gateway Control Protocol-Based Fax (T.38) and Dual Tone Multifrequency (IETF RFC 2833) Relay feature was previously released in Cisco IOS Release 12.2(8)T on the Cisco 3600 series and Cisco MC3810. This feature has been added to the Cisco AS5300, Cisco AS5400, and Cisco AS5850 platforms in Cisco IOS Release 12.2(11)T.

MGCP 1.0 Including NCS 1.0 and TGCP 1.0 Profiles

The MGCP 1.0 Including NCS 1.0 and TGCP 1.0 Profiles feature implements the following Media Gateway Control Protocol (MGCP) protocols on the supported Cisco media gateways:

- MGCP 1.0 (RFC 2705)
- Network-based Call Signaling (NCS) 1.0, the PacketCable profile of MGCP 1.0 for residential gateways (RGWs)
- Trunking Gateway Control Protocol (TGCP) 1.0, the PacketCable profile of MGCP 1.0 for trunking gateways (TGWs)

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_24mg1.htm

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5850 platforms.

MGCP Basic CLASS and Operator Services

The MGCP BCOS are a set of calling features, sometimes called "custom calling" features, that use MGCP to transmit voice, video, and data over the IP network. These features are usually found in circuit-based networks. MGCP BCOS brings them to the Cisco IOS gateways on packet-based networks.

The MGCP BCOS software is built on the MGCP CAS PBX and AAL2 software package, and supports MGCP 0.1 and the earlier protocol versions Simple Gateway Control Protocol (SGCP) 1.1 and 1.5.

The following MGCP BCOS features are available on Residential Gateways (RGWs) and Business Gateways (BGWs):

- Distinctive power ring
- Visual Message Waiting Indicator
- Caller ID
- Caller ID with Call Waiting
- Call Forwarding
- Ring Splash
- Distinctive Call Waiting Tone
- Message Waiting Tone

- Stutter Dial Tone
- Off-Hook Warning Tone

The following two features can be run as RGW or trunking gateway (TGW) features:

- 911 calls

  This feature is supported in SGCP mode on Cisco 3660 and Cisco AS5300 platforms and in MGCP mode on all five supported platforms.

- Three-Way Calling

  This feature is supported on the Cisco 3660 and Cisco AS5300 TGW platforms and on the Cisco MC3810 series, and Cisco 2600 RGW platforms. This feature cannot be supported on the G.728 and G.723 codecs.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftmgcpgr.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T. This release is porting the feat into the Cisco AS5300 platform.

MGCP CAS PBX and AAL2 PVC

The MGCP CAS PBX and AAL2 PVC software package is a solutions-oriented program that focuses on several customer gateway scenarios. These scenarios require features that address residential, business, and trunking gateway needs on a variety of hardware platforms:

- Residential cable connectivity
- CAS and analog PBX connectivity
- Incoming CAS support for trunking gateways that support operator services such as busy-line verify and barge-in xGCP support of Voice over ATM Adaption Layer type 2 (VoAAL2)

To answer these needs, the MGCP CAS PBX and AAL2 PVC feature combines and expands existing feature sets on the merged Simple Gateway Control Protocol (SGCP)/MGCP software platform as follows:

- Voice over IP (VoIP) support of selected channel-associated signaling (CAS) features
- SGCP AAL2 features

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftmgcptk.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T. This release is porting the feature into the Cisco AS5300 and Cisco 5850 platforms.

MGCP Generic Configuration Support for Call Manager (IP-PBX)

The MGCP Generic Configuration Support for Call Manager (IP-PBX) feature provides generic configuration support for Cisco IOS Media Gateway Control Protocol (MGCP) gateways with Call Manager. The gateways receive voice configuration from Call Manager by way of an eXtensible Markup Language (XML) file that is downloaded from a TFTP server.

MGCP Line Package Enhancements for Loop Current Feed Open (LCFO)

The MGCP Line Package Enhancements for Loop Current Feed Open (LFCO) feature enhances Media Gateway Control Protocol (MGCP) residential gateway capabilities to support the generation of the LFCO signal at the request of the call agent. LFCO is a new signal in the line package. This enhancement supports call flows that involve answering machines or other automated devices that act as the terminating party and will facilitate the notification of the originating party's on-hook to such devices. There is no explicit configuration required to enable this feature.

MGCP PRI Backhaul and T1-CAS Support for Call Manager (IP-PBX)

ISDN PRI backhaul provides a method for transporting complete IP telephony signaling information from an ISDN PRI interface of an MGCP voice gateway to Cisco CallManager through a highly reliable TCP connection.

This feature works by terminating all the ISDN PRI Layer 2 (Q.921) signaling functions in the Cisco IOS software on the MGCP voice gateway while, at the same time, packaging all the ISDN PRI Layer 3 (Q.931) signaling information into packets for transmission to the Cisco CallManager through an IP tunnel over a highly reliable TCP connection. This methodology ensures the integrity of the Q.931 signaling information being passed through the network for managing IP telephony devices.

A rich set of user-side and network-side ISDN PRI calling functions is supported by the ISDN PRI backhaul feature. A single TCP connection is used by the gateway to backhaul all the ISDN D channels to Cisco CallManager. The "SAP/Channel ID" parameter in the header of each message identifies individual D channels. In addition to carrying the backhaul traffic, the inherent TCP keepalive mechanism is also used to determine MGCP voice gateway connectivity to an available call agent.

The MGCP voice gateway also establishes a TCP link to the backup (secondary) Cisco CallManager server. In the event of Cisco CallManager switchover, the ISDN PRI backhaul functions are assumed by the secondary Cisco CallManager server. During this switchover, all active ISDN PRI calls are preserved, and the affected MGCP gateway is registered with the new Cisco CallManager server through a Restart-in-Progress (RSIP) message to ensure continued gateway operation.

T1 CAS is supported in non-backhaul fashion and supported CAS signaling types on the Cisco CallManager are E&M, wink-start, and E&M delay-dial. E1 CAS is not supported.

MGCP Voice on Cisco AS5850 Universal Gateway

Although the documents listed below were not written specifically for the Cisco AS5850, they still apply to the Cisco AS5850. MGCP Voice on Cisco AS5850 Universal Gateway include the following features:

FGD-OS 911 Calls

The 911 feature can be run as residential gateway (RGW) or trunking gateway (TGW) feature

Interactive Voice Response Version 2.0 on Cisco VoIP Gateway

Refer to the following document for information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t3/dt_skyn.htm.

Note The Configuring IVR on the Inbound VoIP Dial Peer feature and the IVR Prompts Played on IP Call Legs feature is not supported.

Media Gateway Control Protocol Residential Gateway Support

Refer to the following document for information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t3/mgcp1213.htm

MGCP based Fax (T.38) and DTMF (IETF Ver.) Relay

Refer to the following document for information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftmgcpfx.htm

Note Fax CODEC up-speeding is not supported.

Note **debug voip rtp** [**all** | *named-event*] - Enables the new debug flag and displays reception.or transmission of RTP named events is not supported on the Cisco AS5850, since the voice packets are CEF and would not be visible on the RSC card.

MGCP VoIP Call Admission Control

Refer to the following document for information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_04mac.htm

Network Access Server Package for Media Gateway Control Protocol

Refer to the following document for information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ft_mgnas.htm

PRI/Q.931 Signaling Backhaul for Call Agent Applications

Refer to the following document for information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_serv/5300/sw_conf/ios_121/0144cors.htm

Route-Switch-Controller Handover Redundancy on the Cisco AS5850

See the "Route Switch Controller (RSC) Handover Redundancy" section on page 282 or refer to the following document for information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/handred.htm

Note Route-Switch-Controller Handover Redundancy on the Cisco AS5850 features are not supported on the Cisco BTS 10200.

MGCP 1.0 Including NCS 1.0 and TGCP 1.0 Profiles

Refer to the following document for information:

http://lbj.cisco.com/push_targets1/ucdit/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_24mgl.htm

MGCP CAS PBX and AAL2 PVC

Refer to the following document for information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121limit/121x/121xm/121xm_5/ftmgcpba.htm.

Further Documentation

Refer to the following document for further information about the MGCP Voice on Cisco AS5850 Universal Gateway feature:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/pull_daz.htm

MGCP VoIP Call Admission Control

MGCP VoIP Call Admission Control (CAC) determines if calls can be accepted on the IP network on the basis of available network resources. Before this release, Media Gateway Control Protocol (MGCP) Voice over IP (VoIP) calls were established regardless of the available resources on the gateway or network. The gateway had no mechanism for gracefully refusing calls if resources were not available to process the call. New calls would fail with unexpected behavior and in-progress calls would experience quality-related problems.

The MGCP VoIP Call Admission Control feature provides three CAC mechanisms to address the need for improved quality and predictable gateway behavior. The first mechanism is local/system CAC, which provides the ability to gracefully refuse calls on the basis of the availability of local gateway call processing resources such as CPU utilization and memory. The second CAC mechanism provides synchronization with Resource Reservation Protocol (RSVP) and reports the reservation request to the call agent. The third mechanism provides network congestion detection to gracefully refuse calls on the basis of a measured level of congestion.

Modem Relay Support on VoIP Platforms

When service providers and aggregators are implementing Voice over IP (VoIP), they sometimes cannot separate fax or data traffic from voice traffic. These carriers that aggregate voice traffic over VoIP infrastructures require service offerings to carry fax and data as easily as voice.

Modem relay demodulates a modem signal at one voice gateway by decomposing the modem signal to digital form and then passing this signal as packet data to another voice gateway, where the signal is remodulated and sent to a receiving modem. The relay process distinguishes that the call is in fact a modem call. On detection of the modem answer tone, the gateways switch into modem pass-through mode. If the CM (call menu) signal is detected, the two gateways switch into modem relay mode.

There are two ways to transport modem traffic over VoIP networks:

- With modem pass-through, the modem traffic is carried between the two gateways in Real-Time Transport Protocol (RTP) packets, using an uncompressed voice codec—G.711 u-law or a-law. Packet redundancy may be used to mitigate the effects of packet loss in the IP network. Even so, modem pass-through remains susceptible to packet loss, jitter, and latency in the IP network.
- With modem relay, the modem signals are demodulated at one gateway, converted to digital form, and carried in Simple Packet Relay Transport (SPRT) protocol (which is a protocol running over User Datagram Protocol [UDP]) packets to the other gateway, where the modem signal is recreated and remodulated, and passed to the receiving modem.

  In this implementation, the call starts out as a voice call and then switches into modem pass-through mode and then into modem relay mode.

This feature significantly reduces the effects that dropped packets, latency, and jitter have on the modem session. Compared to modem pass-through, it also reduces the amount of bandwidth used. Primary applications for this feature are transport of modem dial-up traffic over IP networks.

Note This version of modem relay is being made available before the ITU agrees on a standard implementation for this feature. This version of the modem relay feature will not interoperate with future versions based on the ITU implementation. When the standard ITU-based modem relay feature becomes available, the modem pass-through feature can be used for interoperability between pre-standard and standards-based modem relay platforms.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftmodrly.htm

Modem Script and System Script Support in Large-Scale Dial-Out

Modem connection and system login chat scripts are often used when asynchronous dial-on-demand routing (DDR) is configured. Currently, however, the large-scale dial-out network architecture does not allow chat scripts for a particular session to be passed through the network. Cisco IOS Release 12.2(2)T allows modem and system chat scripts to pass through large-scale dial-out networks by allocating two new authentication, authorization, and accounting (AAA) attributes for outbound service.

The AAA attributes define specific AAA elements in a user profile. Large-scale dial-out supports Cisco attribute-value (AV) pairs and TACACS+ attributes. The Modem Script and System Script Support in Large-Scale Dial-Out feature provides two new outbound service attributes for passing chat scripts: modem-script and system-script. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftlschat.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T. This release is porting the feature into the Cisco AS5300 and Cisco AS5800 platforms.

Monitoring Voice and Fax Services on the Cisco AS5350 and Cisco AS5400 Universal Gateways

The Universal Port Dial Feature Card (DFC) is a hardware card that processes voice and data services port technology for the Cisco AS5350 and Cisco AS5400.

The ports on the Universal Port DFC support multiple types of service including modem, digital, voice and fax. Ports can be aggregated at the slot level of the Universal Port module, the Service Processing Element (SPE) level within the Universal Port module, and the individual port level.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121limit/121x/121xm/121xm_5/ftupspe.htm.

MPLS Label Distribution Protocol (LDP)

Cisco MPLS label distribution protocol (LDP) allows the construction of highly scalable and flexible IP Virtual Private Networks (VPNs) that support multiple levels of services.

LDP provides a standard methodology for hop-by-hop distribution of labels in an Multiprotocol Label Switching (MPLS) network by assigning labels to routes that have been chosen by the underlying Interior Gateway Protocol (IGP) routing protocols. The resulting label switch paths (LSPs) forward label traffic across an MPLS backbone to particular destinations. These capabilities enable service providers to implement Cisco MPLS-based IP VPNs and IP+ATM services across multivendor MPLS networks.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_ldp7t.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5350 platform.

MPLS VPN ID

Using Multiprotocol Label Switching (MPLS) VPN ID you can identify virtual private networks (VPNs) by a VPN identification number, as described in RFC 2685. This implementation of the MPLS VPN ID feature is used for identifying a VPN. The MPLS VPN ID feature is not used to control the distribution of routing information or to associate IP addresses with MPLS VPN ID numbers in routing updates.

Multiple VPNs can be configured in a router. You can use a VPN name (a unique ASCII string) to reference a specific VPN configured in the router. Alternately, you can use a VPN ID to identify a particular VPN in the router. The VPN ID follows a standard specification (RFC 2685). To ensure that the VPN has a consistent VPN ID, assign the same VPN ID to all the routers in the service provider network that services that VPN.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftvpnid.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5400 platform.

Multicast Music on Hold Support for Call Manager (IP-PBX)

The Multicast Music on Hold Support for Call Manager (IP-PBX) feature provides the functionality to stream music from a Multicast Music on Hold (MOH) server to the voice interfaces of on-net and off-net callers that have been placed on hold.

This integrated multicast capability of Cisco CallManager 3.1 is implemented through the H.323 signaling plane in Cisco CallManager.

In an MOH environment, whenever caller A places caller B on hold, Cisco CallManager requests the MOH server to stream RTP packets to the "on-hold" interface through the preconfigured multicast address. In this way, RTP packets can be relayed to appropriately configured voice interfaces in a VoIP network that have been placed on hold.

Multiple MOH servers can be present in the same network, but each server must have a different Class D IP address, and the address must be preconfigured in Cisco CallManager and the Cisco IOS MGCP voice gateways.

The MOH feature enables you to subscribe to a music streaming service when using a Cisco IOS MGCP voice gateway. By means of a preconfigured multicast address on a gateway, the gateway can "listen for" Real-Time Transport Protocol (RTP) packets that are broadcast from a default router in the network and can relay the packets to designated voice interfaces in the network.

RTP is the Internet-standard protocol for transporting real-time data across a network, including audio and video information. Thus, RTP is well suited for media on demand and interactive services, such as IP telephony.

The default router in the network for handling multicast traffic must have the following enabled:

- Multicast routing
- A multicast routing protocol, for example Protocol Independent Multicast (PIM) or Distance Vector Multicast Routing Protocol (DVMRP)
- An IP routing protocol, for example Routing Information Protocol (RIP) or Open Shortest Path First (OSPF)

When you configure a multicast address on a gateway, the gateway sends an Internet Gateway Management Protocol (IGMP) "join" message to the default router, indicating to the default router that the gateway is to receive RTP multicast packets.

Multiple RSA Keypair Support

The Multiple RSA Keypair Support feature allows the Cisco IOS software to maintain a distinct key for each certification authority (CA) with which it is dealing. Thus, the Cisco IOS software can match policy requirements for each CA without compromising the requirements specified by the other CAs, such as key length, key lifetime, and general-purpose versus special-usage keys.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftmltkey.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

NAT Support for SIP

The Session Initiation Protocol (SIP) is an application layer signaling protocol used for creating and controlling multimedia sessions with two or more participants. SIP is transported over TCP or UDP. The messages used in the protocol may have IP addresses embedded in the packet payload. If a message passes through a router configured with Network Address Translation (NAT), the embedded information must be translated and encoded back to the packet. An Application Layer Gateway (ALG) is used with NAT to enable SIP.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftnatsip.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

NetFlow Multiple Export Destinations

The NetFlow Multiple Export Destinations feature enables configuration of multiple destinations of the NetFlow data. With this feature enabled, two identical streams of NetFlow data are sent to the destination host. Currently, the maximum number of export destinations allowed is two.

The NetFlow Multiple Export Destinations feature improves the chances of receiving complete NetFlow data by providing redundant streams of data. Because the same export data is sent to more than one NetFlow collector, fewer packets will be lost. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/dtnfdest.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300 and Cisco AS5800 platforms.

NetFlow ToS-Based Router Aggregation

The NetFlow ToS-Based Router Aggregation feature provides the ability to enable limited router-based type of service (ToS) aggregation of NetFlow Export data, which results in summarized NetFlow Export data to be exported to a collection device. The result is lower bandwidth requirements for NetFlow Export data and reduced platform requirements for NetFlow data collection devices. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios120/120newft/120limit/120s/120s15/dtnfltos.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300 and Cisco AS5800 platforms.

Network Access Server (NAS) Package for MGCP

The Network Access Server (NAS) Package for MGCP feature adds support for the Media Gateway Control Protocol (MGCP) NAS package on the Cisco AS5350, Cisco AS5400, and Cisco AS5850. With this implementation, data calls can be terminated on a trunking media gateway that is serving as a NAS. Trunks on the NAS are controlled and managed by a call agent that supports MGCP for both voice and data calls. The call agent must support the MGCP NAS package.

These capabilities are enabled by the universal port functionality of the Cisco AS5350, Cisco AS5400, and Cisco AS5850, which allows these platforms to operate simultaneously as network access servers and voice gateways to deliver universal services on any port at any time. These universal services include dial access, real-time voice and fax, wireless data access, and unified communications.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ft_mgnas.htm.

Network Side ISDN PRI Signaling, Trunking, and Switching

The Network Side ISDN PRI Signaling, Trunking, and Switching feature enables Cisco IOS software to replicate the public switched network interface to a PBX that is compatible with the National ISDN (NI) switch types and European Telecommunications Standards Institute (ETSI) Net5 switch types.

Routers and PBXs are both traditionally CPE devices with respect to the public switched network interfaces. However, for Voice over IP (VoIP) applications, it is desirable to interface access servers to PBXs with the access server representing the public switched network.

Enterprise organizations use the current VoIP features with Cisco products as a method to reduce costs for long distance phone calls within and outside their organizations. However, there are times that a call cannot go over VoIP and the call needs to be placed using the Public Switched Telephone Network (PSTN). The customer then must have two devices connected to a PBX to allow some calls to be placed using VoIP and some calls to be placed over the PSTN. In contrast, this feature allows Cisco access servers to connect directly to user-side CPE devices such as PBXs and allows voice calls and data calls to be placed without requiring two different devices to be connected to the PBXs.

The ISDN Network Side ISDN PRI Signaling, Trunking, and Switching feature allows Cisco ISDN-enabled access servers to switch calls across interfaces as legacy phone switches do today and to mimic the behavior of the legacy phone switches.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t3/dtpri_ni.htm.

Nonblocking Gatekeeper AAA Interface

The Nonblocking Gatekeeper AAA Interface feature enables Cisco gatekeepers to perform authentication, authorization, and accounting (AAA) through the gatekeeper interface at much high call rates.

There are no new or modified commands.

Optimized PPP Negotiation

The Optimized PPP Negotiation feature optimizes the time needed for PPP negotiation when a connection is made. PPP negotiation can include several cycles before the negotiation options are acknowledged. These negotiation cycles can cause a significant user-perceived delay, especially in networks with slow links such as a wireless data connection. Additionally, the PPP negotiation time can add significantly to the total time the user stays connected in these types of connections. Changes to the PPP link control protocol (LCP) and PPP Internet Protocol Control Protocol (IPCP) negotiation strategies as part of Cisco IOS Release 12.2(4)T and later releases make a reduction in the negotiation time possible.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftcphneg.htm

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300 and Cisco AS5800 platforms.

OSP Debug Enhancement

The OSP Debug Enhancement feature documents the new **debug voip settlement ssl** command. Use this command if you find a connection or I/O error with the Secure Socket Layer (SSL) connection after using the **debug voip settlement error** command. Turning on the **debug voip settlement ssl** command allows the Open Settlement Protocol (OSP) to display detailed information for the SSL connection.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftdbgosp.htm

OSPF ABR Type 3 LSA Filtering

The OSPF ABR Type 3 link-state advertisement (LSA) Filtering feature extends the ability of an ABR that is running the OSPF protocol to filter type 3 LSAs between different OSPF areas. This feature allows only specified prefixes to be sent from one area to another area and restricts all other prefixes. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft11at3f.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

OSPF Sham-Link Support for MPLS VPN

A sham link is a logical path within an Open Shortest Path First (OSPF) area; it represents an unnumbered point-to-point connection between two provider edge (PE) devices. All routers within the area see the link and use it during the shortest path first (SPF) computation.

On PE routers the VPN Route Forwarding (VRF) routing table is populated by OSPF routes over the sham link. The sham link gives users the capability of specifying which path will be used for traffic.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ospfshmk.htm

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, and Cisco AS5400 platforms.

OSPF Stub Router Advertisement

The OSPF Stub Router Advertisement feature allows you to bring a new router into a network without immediately routing traffic through the new router and allows you to gracefully shut down or reload a router without dropping packets that are destined for other networks. This feature introduces three configuration options that allow you to configure a router that is running the Open Shortest Path First (OSPF) protocol to advertise a maximum or infinite metric to all neighbors. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft11osra.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

OSPF Update Packet-Pacing Configurable Timers

The OSPF Update Packet-Pacing Configurable Timers feature allows you to configure the rate at which Open Shortest Path First (OSPF) link-state advertisement (LSA) flood pacing, group pacing, and retransmission pacing updates occur. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft11opct.htm

.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300 platform.

Particle Drivers

The Particle Drivers feature is a collection of performance and reliability improvements for the Cisco AS5350, Cisco AS5400, and Cisco AS5400HPX universal gateways. It includes particles-based packet drivers for improved performance. These particle drivers optimize Cisco IOS fast switching code and significantly improve the way Cisco IOS uses processor cache memory. Data packets for some protocols, such as MLPPP, IP Multicast, and cRTP, are fast switched with particle drivers. Cisco IOS CEF switching paths are highly optimized with particle drivers.

PIAFS Wireless Data Protocol Version 2.1 for Cisco MICA Modems

The PIAFS Wireless Data Protocol Version 2.1 for Cisco MICA Modems feature adds support for the Personal Handyphone Internet Access Forum Standard (PIAFS) using Cisco MICA technologies modems for the Cisco AS5300 and Cisco AS5800. PIAFS provides data connectivity between a client computer and a remote access server (RAS) using the Personal-Handyphone-System (PHS) digital cellular telephone system. PIAFS 2.1 allows the modem to shift speed during a connection between 32,000 and 64,000 bps when initiated by a remote terminal adapter (TA).

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftblknt.htm.

PIM Multicast Scalability

The PIM Multicast Scalability feature enhances the Protocol Independent Multicast (PIM) protocol in Cisco IOS software by adding a new level of scalability. With this feature, edge devices can have a large number of multicast groups and users without increasing the CPU utilization of the router.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, and Cisco AS5400 platforms.

PIM MIB Extension for IP Multicast

Protocol Independent Multicast (PIM) is an IP Multicast routing protocol used for routing multicast data packets to multicast groups. RFC 2934 defines the *Protocol Independent Multicast for IPv4* MIB, which describes managed objects that enable users to remotely monitor and configure PIM using Simple Network Management Protocol (SNMP).

The PIM MIB Extension for IP Multicast feature introduces support in Cisco IOS software for the CISCO-PIM-MIB, which is an extension of RFC 2934 and an enhancement to the existing Cisco implementation of the PIM MIB.

This feature introduces the following new classes of PIM notifications:

- neighbor-change—This notification results from the following conditions:
  - When the PIM interface of a router is disabled or enabled (using the **ip pim** command in interface configuration mode)
  - When the PIM neighbor adjacency of a router expires or is established (defined in RFC 2934)
- rp-mapping-change—This notification results from a change in the rendezvous point (RP) mapping information due to either Auto-RP or bootstrap router (BSR) messages.
- invalid-pim-message—This notification results from the following conditions:
  - When an invalid (*, G) join or prune message is received by the device (for example, when a router receives a join or prune message for which the RP specified in the packet is not the RP for the multicast group)
  - When an invalid PIM register message is received by the device (for example, when a router receives a register message from a multicast group for which it is not the RP)

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ftpimmib.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

Preauthentication with ISDN PRI and Channel-Associated Signalling Enhancements

Preauthentication allows a Cisco network access server (NAS) to decide—on the basis of the Dialed Number Identification Service (DNIS) number—whether to answer an incoming call. When an incoming call arrives from the public network switch but before it is answered, the NAS sends the DNIS number to a RADIUS server for authorization.

The Preauthentication with ISDN PRI and Channel-Associated Signaling Enhancements feature provides additional support for preauthentication, which was introduced in a previous Cisco IOS release. For more information about preauthentication, refer to the Cisco IOS Release 12.1(3)T feature module titled *Preauthentication with ISDN PRI and Channel-Associated Signaling*.

This feature supports the use of attribute 44 by the RADIUS server application, which allows user authentication on the basis of the Calling Line Identification (CLID) number in the same transaction. For more information about attribute 44 and how it works with preauthentication, refer to the Cisco IOS Release 12.0(7)T feature module titled *RADIUS Attribute 44 (Accounting Session ID) in Access Requests*.

This feature also supports the use of new RADIUS attributes. These RADIUS attributes are configured in the RADIUS preauthentication profiles to specify preauthentication behavior. They may also be used, for instance, to specify whether subsequent authentication should occur and, if so, what authentication method should be used. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t5/dtdt1.htm.

Note This feature was originally introduced in Cisco IOS Release 12.1(5)T. This release is porting the feature into the Cisco AS5350 and Cisco AS5850 platforms.

PRI Backhaul Using the Stream Control Transmission Protocol and the ISDN Q.921 User Adaptation Layer

The PRI Backhaul Using the Stream Control Transmission Protocol and the ISDN Q.921 User Adaptation Layer feature fulfills the need for a standards-based PRI signaling backhaul that works with third-party call agents to enable solutions like Integrated Access, IP PBX, and Telecommuter.

This feature provides the following:

- PRI backhaul—Specific implementation for backhauling PRI.
- Stream control transmission protocol (SCTP)—New general transport protocol that can be used for backhauling signaling messages.
- ISDN Q.921 User Adaptation Layer (IUA)—Mechanism for backhauling any Layer 3 protocol that normally uses Q.921.

This feature provides a configuration interface for Cisco IOS software implementation and implements the protocol message flows for SCTP and IUA.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t4/ft_0546.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5850 platform.

PRI/Q.931 Signaling Backhaul for Call Agent Applications

The PRI/Q.931 Signaling Backhaul for Call Agent Applications feature implements PRI/Q.931 signaling backhaul support for call agent applications on the Cisco 2600 and Cisco 3600 series routers and Cisco MC3810 series access concentrators. PRI/Q.931 signaling backhaul is the transport of PRI signaling (Q.931 and above layers) between a media gateway (such as a Cisco access server, router, or concentrator) and a media gateway controller (Cisco VSC3000).

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_serv/as5400/sw_conf/ios_122/122_2x/122xb/pul0144.htm.

Note This feature was originally introduced in Cisco IOS Release 12.1(1)T on the Cisco AS5300 platform This release is porting the feature into the Cisco AS5350, CIsco AS5400, and Cisco AS5850 platform.

PSTN Fallback

The goal of PSTN fallback is to monitor congestion in the IP network and either redirect calls to the PSTN or reject calls based on the network congestion. Calls can be rerouted to an alternate IP destination or to the PSTN if the IP network is found unsuitable for voice traffic at that time. The user defines the congestion thresholds based on the configured network. This functionality enables the service provider to give a reasonable guarantee about the quality of the conversation to their VoIP users at the time of call admission.

Note PSTN fallback does not provide assurances that a VoIP call that proceeds over the IP network is protected from the effects of congestion. This is the function of the other Quality of Service (QoS) mechanisms such as IP Real-Time Transport Protocol (RTP) priority or low latency queuing (LLQ).

PSTN fallback includes the following features:

- Offers flexibility to define the congestion thresholds based on the network.
  - Defines a threshold based on Calculated Planning Impairment Factor (ICPIF), which is derived as part of International Telecommunication Union (ITU) G.113.
  - Defines a threshold based solely on packet delay and loss measurements.
- Uses Service Assurance Agent (SAA) probes to provide packet delay, jitter, and loss information for the relevant IP addresses. Based on the packet loss, delay, and jitter encountered by these probes, an ICPIF or delay and loss values are calculated.
- Is supported by calls of any codec. Only G.729 and G.711 have accurately simulated probes. Calls of all other codecs are emulated by a G.711 probe.

For more information, including configuration tasks and examples, and command references for PSTN fallback, please refer to PSTN Fallback. Refer to the following document for additional information about the Call Admission Control for H.323 VoIP Gateways feature:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xa/122xa_2/ft_pfavb.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5350, Cisco AS5400, and Cisco AS5850 platforms.

QSIG for TCL IVR 2.0

Q.SIG support is required for European countries to interconnect enterprise customers to a wholesale voice solution. The Q.SIG for TCL IVR 2.0 feature provides transparent Q.SIG interworking when using a TCL IVR version 2.0 voice application on a Cisco IOS voice gateway. This functionality can be enabled using a new CLI on the POTS or VoIP dial peer. Before this feature, Q.SIG messages were interpreted by the TCL IVR 2.0 application, rather than passed transparently to the remote endpoint.

R2 and ISUP Transparency and R2-to-ISUP Interworking Enhancements

The R2 and ISUP Transparency and R2-to-ISUP Interworking Enhancements feature provides enhancements to ISDN User Part (ISUP) transparency, R2-to-ISUP interworking, and R2 transparency using Generic Transparency Descriptor (GTD) objects in Cisco IOS Release 12.2(11)T. This release also provides support for Calling Line ID Presentation (CLIP) and Calling Line ID Restriction (CLIR) and is part of the Cisco SS7 Interconnect for Voice Gateways Solution.

This feature adds the following functionality:

- Additional platform support for Cisco AS5800, Cisco AS5850, Cisco 3660, and Cisco 7200 series routers.
- CLIP and CLIR interworking between ISUP and H.225.
- Global Call Correlation ID GTD parameter generation.

- Global Call Correlation ID GTD parameter relay through the originating and terminating gateways between the Cisco SC2200 NI2+ and H.323 interfaces.
- Nonstandard CPC values support using FDC.
- R2-to-ISUP delayed release interworking using GTD.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft_isup1.htm.

RADIUS Attribute 66 (Tunnel-Client-Endpoint) Enhancements

Virtual private networks (VPNs) use Layer 2 Forwarding (L2F) or Layer 2 Tunnel Protocol (L2TP) tunnels to tunnel the link layer of high-level protocols (for example, PPP) or asynchronous High-Level Data Link Control (HDLC)). Internet service providers (ISPs) configure their network access servers (NASs) to receive calls from users and forward the calls to the customer tunnel server. Usually, the ISP maintains only information about the tunnel server—the tunnel endpoint. The customer maintains the IP addresses, routing, and other user database functions of the tunnel server users.

The RADIUS Attribute 66 (Tunnel-Client-Endpoint) Enhancements feature adds the ability to specify the host name of the NAS—rather than the IP address of the NAS—in RADIUS attribute 66 (Tunnel-Client-Endpoint). Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t5/dtdt4.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

RADIUS Attribute 82: Tunnel Assignment ID

The RADIUS Attribute 82: Tunnel Assignment ID feature allows the Layer 2 Transport Protocol access concentrator (LAC) to group users from different per-user or domain RADIUS profiles into the same active tunnel. Previously, Cisco IOS software assigned a separate virtual private dialup network (VPDN) tunnel for each per-user or domain RADIUS profile, even if tunnels with identical endpoints already existed. The RADIUS Attribute 82: Tunnel Assignment ID feature defines a new AV pair, Tunnel-Assignment-ID, which allows the LAC to group users from different RADIUS profiles into the same tunnel if the chosen endpoint, tunnel type, and Tunnel-Assignment-ID are identical. This feature introduces new software functionality. No new commands are introduced with this feature.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftrada82.htm
.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release ports the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

RADIUS Attribute Value Screening

The RADIUS Attribute Value Screening feature allows users to configure a list of "accept" or "reject" RADIUS attributes on the network access server (NAS) for purposes such as authorization or accounting.

If a NAS accepts and processes all RADIUS attributes received in an Access-Accept packet, unwanted attributes may be processed, creating a problem for wholesale providers who do not control their customers' authentication, authorization, and accounting (AAA) servers. For example, there may be attributes that specify services to which the customer has not subscribed, or there may be attributes that may degrade service for other wholesale dial users. The ability to configure the NAS to restrict the use of specific attributes has therefore become a requirement for many users.

The RADIUS Attribute Value Screening feature should be implemented in one of the following ways:

- To allow the NAS to accept and process all standard RADIUS attributes for a particular purpose, except for those on a configured reject list.
- To allow the NAS to reject (filter out) all standard RADIUS attributes for a particular purpose, except for those on a configured accept list.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T as the RADIUS Attribute Screening feature for the Cisco 7200 series router. This release ports the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

RADIUS Number Translation VSAs for VoIP

The RADIUS Number Translation VSAs for VoIP feature enables a Cisco AS5x00 voice gateway to export pre- and post-translated called and calling numbers to a RADIUS server in the form of generic vendor-specific attributes (VSA). Cisco gateways can be configured to present gateway received, gatekeeper translated, and final translated numbers to the RADIUS server.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_serv/vapp_dev/vsaig3.htm.

RADIUS Packet of Disconnect

The RADIUS Packet of Disconnect feature consists of a method for terminating a call that has already been connected. This "Packet of Disconnect" (POD) is a RADIUS access_request packet and is intended to be used when the authenticating agent server wants to disconnect the user after the session has been accepted by the RADIUS access_accept packet. This may be needed in at least two situations:

- Detection of fraudulent use, which cannot be performed before accepting the call. A price structure so complex that the maximum session duration cannot be estimated before accepting the call. This may be the case when certain types of discounts are applied or when multiple users use the same subscription simultaneously.
- To prevent unauthorized servers from disconnecting users, the authorizing agent that issues the POD packet must include three parameters in its packet of disconnect request. For a call to be disconnected, all parameters must match their expected values at the gateway. If the parameters do not match, the gateway discards the packet of disconnect packet and sends a NACK (negative acknowledgement message) to the agent.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_pod1.htm.

RADIUS Packet Suppression for VoIP GW Rotary Dial-Peer Attempts

The RADIUS Packet Suppression for VoIP GW Rotary Dial-Peer Attempts feature enables the suppression of excess RADIUS start and stop requests that are sent when the originating or terminating gateway does rotary dial-peer retries for outbound call legs. When the rotary retry suppression feature is enabled, only one set of start and stop accounting packets is generated once a connection is successful or once the connection fails in the last rotary dial-peer attempt.

The rotary retry suppression feature gives you more control over authentication, authorization, and accounting (AAA) functions by enabling or disabling accounting on outgoing call legs. Standard RADIUS accounting enabled on the voice gateway sends a start and stop accounting request to RADIUS on every attempt using a rotary dial peer for making a connection. Every attempt can generate a pair of accounting requests even when the connection is not successful. The rotary retry suppression feature eliminates unnecessary traffic flow to the RADIUS server or other Voice over IP (VoIP) billing servers. When the rotary retry feature is activated, no matter how many dial peers are used for the outgoing call leg, only one pair of accounting start and stop records is sent to the billing server.

There is one modified command: **suppress rotary**—the keyword, **rotary**, was added to enable rotary retry suppression.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftsuppre.htm.

RADIUS Preauthentication for H.323 and SIP Voice Calls

The RADIUS Preauthentication for H.323 and SIP Voice Calls feature provides the means for service providers to accept or reject H.323 or SIP voice calls that come in to their networks before the calls are answered. This feature allows a wholesale service provider to screen an originating (PSTN-to-IP network) or terminating (IP-to-PSTN) voice call by using information about the call to determine which customer the call belongs to and whether the call should be admitted to the network. The type of information that can be used for screening includes the called number, the called number prefix, the originating H.323 zone and the originating voice gateway address. The service provider can use this feature in conjunction with a RADIUS-based port-policy management (PPM) server such as Cisco Resource Policy Management Server (RPMS) to make admission control decisions on the basis of information such as the total number of calls in the network, the total number of calls allowed for this customer and the current number of calls from this customer.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft_trg.htm.

RADIUS Progress Codes

The RADIUS Progress Codes feature adds additional progress codes—10, 31, 32, 60, 65, 67—to RADIUS attribute 196 (Ascend-Connect-Progress), which indicates the connection state before the call is disconnected via progress codes.

Attribute 196 is sent in network, exec, and resource accounting start and stop records. This attribute can facilitate call failure debugging because each progress code identifies accounting information relevant start or stop record is requested, authentication, authorization, and accounting (AAA) will add attribute 196 into the record as part of the standard attribute list.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftatr196.htm.

RADIUS Route Download

The RADIUS Route Download feature allows users to configure their network access server (NAS) to send static route download requests to authentication, authorization, and accounting (AAA) servers specified by a named method list. Before this feature, all RADIUS authorization requests for static route download could be sent only to AAA servers specified by the default method list.

This feature extends the functionality of the **aaa route download** command to allow users to specify the name of the method list that will be used to direct static route download requests to the AAA servers. The **aaa route download** command must be used to add separate method lists; however, users will continue to enable the **aaa authorization configuration default** command to download static route configuration information from the AAA server specified by the default method list.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftradrou.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release ports the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

RADIUS Tunnel Preference for Load Balancing and Fail-over

Tunnel servers may be load balanced or failed-over from a single tunnel initiator, as selected by the RADIUS Tunnel Preference for Load Balancing and Fail-Over attribute. There is no configuration associated with this feature. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftradtun.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release ports the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

Reverse Path Forwarding - Source Exists Only

The Reverse Path Forwarding - Source Exists Only feature allows you to verify if the source IP address is valid in the Forwarding Information Base (FIB) for unicast Reverse Path Forwarding (uRPF) traffic. Packets that have not be allocated on the Internet, being used for spoofed source addresses, will be dropped. Packets with an entry in the FIB will be passed. This uRPF option can be used on internet service provider (ISP) peering routing devices with other ISPs.

Rotating Through Dial Strings

The Rotating Through Dial Strings feature allows you to specify the dialing order when multiple dial strings are configured. Options for dialing order include:

- Sequential—Dial using the first dial string configured in a list of multiple strings.
- Round-robin—Dial using the dial string following the most recently successful dial string.
- Last successful call—Dial using the most recently successful dial string.

This feature takes advantage of information available from a previous call attempt, such as whether the call was unsuccessful or the line was busy, and thereby increases the rate of successful calls.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftrotdls.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release ports the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

Route Switch Controller (RSC) Handover Redundancy

Route-Switch-Controller Handover Redundancy on the Cisco AS5850, with its provision of handover-split mode, provides the first phase of high availability to the Cisco AS5850 platform.

If your gateway contains two route-switch-controller (RSC) cards, you can configure your Cisco AS5850 into either of two split modes: classic split or handover split.

Note Route-Switch-Controller Handover Redundancy on the Cisco AS5850 features are not supported on the Cisco BTS 10200.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/handred.htm.

Router-Shelf Redundancy for the AS5800 Series

This feature provides AS5800 router-shelf redundancy by using a second router shelf that automatically takes over the other shelf's resources (dial-shelf cards) if it appears that the other router has died. The failover is disruptive in that there is no attempt to maintain calls that were established on the failing router; the dial-shelf cards controlled by the failing router are restarted under the control of the backup router and hence become available again.

Two router shelves are connected to the same dial shelf (as in split mode) but with only one router active at a time. Both router shelves are configured for normal mode as opposed to split mode. Each router shelf contains the same configuration, being whatever configuration is appropriate for the full set of cards in the dial shelf. The active router controls all the cards in the dial shelf, while the other router functions purely as a backup. If the active router fails, all dial-shelf cards restart under the control of the backup router, which then functions as the active router.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121limit/121x/121xv/121xv_5/ftred3.htm.

SGCP RSIP and AUEP Enhancement

The SGCP RSIP and AUEP Enhancement feature provides additional messaging capabilities that allow an endpoint on an SGCP 1.5 gateway to synchronize with a call agent after the endpoint returns to service from the disconnected procedure. The additional messaging capabilities provide the following:

- A special disconnected-RSIP message that the gateway sends to the call agent as a result of the disconnected procedure.
- Additional fields in the AUEP command that the call agent uses to query the endpoint's status when contact is reestablished.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft_rsip.htm.

Shell-Based Authentication of VPDN Users

The Shell-Based Authentication of VPDN Users feature provides terminal services for VPDN users to support rollout of wholesale dial networks. Terminal services (shell login or exec login) on the network access server (NAS) provide the following capabilities:

- Enabling a dial-in user session to be terminated at the access server.
- Authenticating the user with a character-mode login dialog such as username/password or username/challenge/password, Secure ID, Safeword, and so on.
- Initiating PPP and tunneling it to a home gateway (HGW).

With the terminal services, user authentication methods other than PAP and CHAP can be applied to PPP users. With the Shell-Based Authentication of VPDN Users feature, PPP authentication data is preconfigured or entered before PPP starts. Authentication is completed without any further input from the user. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122defer/ftexvpnt.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T. This release ports the feature into the Cisco AS5300 and Cisco AS5800 platforms.

SIP—Call Transfer Using Refer Method

Note The SIP—Call Transfer Using Refer Method feature is also known under the feature title Call Transfer Capabilities Using the Refer Method.

The Refer method provides call transfer capabilities to supplement the Bye and Also methods already implemented on Cisco IOS Session Initiation Protocol (SIP) gateways.

Call transfer allows a wide variety of decentralized multiparty call operations. These decentralized call operations form the basis for third-party call control and thus are important features for Voice over IP (VoIP) and SIP. Call transfer is also critical for conference calling, where calls can transition smoothly between multiple point-to-point links and IP level multicasting.

The following are components of call transfer:

- Refer Method
- Refer-To Header
- Referred-By Header
- Notify Method
- Using the Refer Method to Achieve Call TransferBlind Transfer
- Attended Transfer

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftrefer.htm.

Note This feature was previously released in Cisco IOS Release 12.2(8)T for the Cisco 2600 series, Cisco 3600 series, and Cisco 7200 series routers. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, and Cisco AS5850 platforms.

SIP Carrier Identification Code

The SIP Carrier Identification Code feature enables the transmission of the Carrier Identification Code (CIC) parameter from the Session Initiation Protocol (SIP) network to the ISDN. The CIC parameter is a three- or four- digit code that is used in routing tables to identify the network serving the remote user when a call is routed over many different networks. The CIC parameter is carried in SIP INVITE requests and 302 REDIRECTs and maps to the ISDN Transit Network Selection Information Element (TNS IE) in the outgoing ISDN SETUP message. The TNS IE identifies the requested transportation networks and allows different providers equal access support based on customer choice.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftsipcic.htm.

SIP—Configurable PSTN Cause Code Mapping

For calls to be established between a session initiation protocol (SIP) network and a PSTN network, the two networks must be able to interoperate. One aspect of their interoperation is the mapping of PSTN cause codes, which indicate reasons for Public Switched Telephone Network (PSTN) call failure or completion, for SIP status codes or events. The opposite is also true: SIP status codes or events are mapped to PSTN cause codes. Event mapping tables found in this document show the standard or default mappings between SIP and PSTN.

However, you may want to customize the SIP user agent software to override the default mappings between the SIP and PSTN networks. The Configurable PSTN Cause Code to SIP Response Mapping feature allows you to configure specific map settings between the PSTN and SIP networks. Thus, any SIP status code can be mapped to any PSTN cause code, or vice versa. When set, these settings can be stored in the NVRAM and are restored automatically on bootup.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftmap.htm.

Note This feature was previously released in Cisco IOS Release 12.2(8)T for the Cisco 2600 series, Cisco 3600 series, and Cisco 7200 series routers as Configurable PSTN Cause Code to SIP Response Mapping. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5850, and Cisco AS5400 platforms.

SIP—DNS SRV RFC2782 Compliance

Session Initiation Protocol (SIP) on Cisco Voice over IP (VoIP) gateways uses Domain Name System Server (DNS SRV) query to determine the IP address of the user endpoint. The query string has a prefix in the form of "protocol.transport." and is attached to the fully qualified domain name (FQDN) of the next hop SIP server. This prefix style, from RFC 2052, has always been available; however, with this release, a second style is also available. The second style complies with RFC 2782 and prepends the protocol label with an underscore "_"; as in "_protocol._transport." The addition of the underscore reduces the risk of the same name being used for unrelated purposes. The form compliant with RFC 2782 is the default style. Use the **srv version** command to configure the DNS SRV feature.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/vvfresrv.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release ports the feature into the Cisco AS5300, Cisco AS5350, and Cisco AS5400 platforms.

SIP Diversion Header Implementation for Redirecting Number

SIP is a new protocol developed by the Internet Engineering Task Force (IETF) Multiparty Multimedia Session Control (MMUSIC) Working Group as an alternative to the ITU-T H.323 specification. SIP is defined by RFC 2543 and is used for multimedia call session setup and control over IP networks. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t3/sipcf2.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T. This release ports the feature into the Cisco AS5300 and Cisco AS5400 platforms.

SIP—Enhanced Billing Support for Gateways

The Enhanced Billing Support for SIP Gateways feature provides changes to authentication, authorization, and accounting (AAA) records and the RADIUS implementations on Cisco session initiation protocol (SIP) gateways. These changes were introduced to provide customers and partners the ability to effectively bill for traffic transported over SIP networks.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftmsnbil.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T as Enhanced Billing Support for SIP Gateways. This release is porting the feature into the Cisco AS5300, Cisco AS5350, and Cisco AS5400 platforms.

SIP Gateway Support for the Bind Command

In previous releases of Cisco IOS software, the source address of a packet going out of the gateway was never deterministic. That is, the session protocols and Voice over IP (VoIP) layers always depended on the IP layer to give the *best local address*. The best local address was then used as the source address (the address showing where the SIP request came from) for signaling and media packets. Using this nondeterministic address occasionally caused confusion for firewall applications, because a firewall could not be configured with an exact address and would take action on several different source address packets.

However, the bind interface command allows you to configure the source IP address of signaling and media packets to a specific interface's IP address. Thus, the address that goes out on the packet is bound to the IP address of the interface specified with the bind command. Packets that are not destined to the bound address are discarded.

When you do not want to specify a bind address, or if the interface is down, the IP layer still provides the best local address.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftbind.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release ports the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, and Cisco AS5850 platforms.

SIP Gateway Support for Third Party Call Control

SIP is a new protocol developed by the Internet Engineering Task Force (IETF) Multiparty Multim Session Control (MMUSIC) Working Group as an alternative to the ITU-T H.323 specification. SII defined by RFC 2543 and is used for multimedia call session setup and control over IP networks. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t3/sipcf2.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T. This release ports the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5850 platforms.

SIP Gateway Support of RSVP and TEL URL

The SIP Gateway Support of RSVP and TEL URL feature also supports Telephone Uniform Resource Locators or TEL URL. Currently session initiation protocol (SIP) gateways support URLs in the SIP format. SIP URLs are used in SIP messages to indicate the originator, recipient, and destination of the SIP request. However, SIP gateways may also encounter URLs in other formats, such as TEL URLs. TEL URLs describe voice call connections. They also enable the gateway to accept TEL calls sent through the Internet and to generate TEL URLs in the request line of outgoing INVITE requests.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/ xb_2/vvfresrv.htm.

Note This feature was previously released in Cisco IOS Release 12.2(8)T for the Cisco 2600 series, Cisco 3600 series, and Cisco 7200 series routers. This release ports the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, and Cisco AS5850 platforms.

SIP INFO Method for DTMF Tone Generation

The SIP INFO Method for DTMF Tone Generation feature adds support for dual tone multifrequency (DTMF) tone generation to allow out-of-band signaling. The SIP INFO method is used to generate DTMF tones on the telephony call leg. The SIP INFO method or request message is used by a user agent

(UA) to send call signaling information to another UA with which it has an established media session. The SIP INFO message is sent along the signaling path of the call. Upon receipt of a SIP INFO message with DTMF relay content, the gateway generates the specified DTMF tone on the telephony end of the call.

The SIP INFO Method for DTMF Tone Generation feature is always enabled and is invoked when a SIP INFO message is received with DTMF relay content. This feature is related to the DTMF Events Through SIP Signaling feature, which provides the ability for an application to be notified about DTMF events using SIP NOTIFY messages. Together, the two features provide a mechanism to both send and receive DTMF digits along the signaling path.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftinfo.htm.

SIP Intra-gateway Hairpinning

SIP hairpinning is a call routing capability in which an incoming call on a specific gateway is signaled through the IP network and back out the same gateway. This call can be a public switched telephone network (PSTN) call routed into the IP network and back out to the PSTN over the same gateway.

Similarly, SIP hairpinning can be a call signaled from a line (for example, a telephone line) to the IP network and back out to a line on the same access gateway. With SIP hairpinning, unique gateways for ingress and egress are no longer necessary.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release ports the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, and Cisco AS5850 platforms.

SIP INVITE Request with Malformed Via Header

SIP INVITE requests that a user or service participate in a session. Each INVITE contains a Via header that indicates the transport path taken by the request so far and where to send a response. In the past, when an INVITE contained a malformed Via header, the gateway would print a debug message and discard the INVITE without incrementing a counter. However, the printed debug message was often inadequate, and it was difficult to detect that messages were being discarded.

The SIP INVITE Request with Malformed Via Header feature provides a response to the malformed request. A counter, Client Error: Bad Request, increments when a response is sent for a malformed Via field. Bad Request is a class 400 response and includes the explanation Malformed Via Field. The response is sent to the source IP address (the IP address where the SIP request originated) at User Datagram Protocol (UDP) port 5060.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftmalvia.htm.

Note This feature was previously released in Cisco IOS Release 12.2(8)T on the Cisco 2600 series, Cisco 3600 series, and Cisco 7200 series routers. This release ports the feature into the Cisco AS5300, Cisco AS5350, and Cisco AS5400 platforms.

SIP Multiple 18x Responses

The SIP Multiple 18x Responses feature enhances forking support on the user agent client (UAC) by supporting sequential forking. With sequential forking the UAC receives multiple provisional responses (18x) but treats each response as a separate call leg. This allows the proxy to initiate a new INVITE if the called party does not pick up.

SIP—Session Initiation Protocol for VoIP

Voice over IP (VoIP) currently implements the ITU H.323 specification within Internet Telephony Gateways (ITGs) to signal voice call setup. Session Initiation Protocol (SIP) is a protocol developed by the Internet Engineering Task Force (IETF) Multiparty Multimedia Session Control (MMUSIC) Working Group as an alternative to H.323. The Cisco SIP functionality equips Cisco routers to signal the setup of voice and multimedia calls over IP networks. SIP provides an alternative to H.323 within the VoIP internetworking software.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_sip72.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T as Session Initiation Protocol (SIP) for VoIP. This release ports the feature into the Cisco AS5850 platform.

SIP—Session Iniation Protocol for VoIP Enhancements

Voice over IP (VoIP) currently implements the International Telecommunication Union (ITU)'s H.323 specification within Internet Telephony Gateways (ITGs) to signal voice call setup. The Session Initiation Protocol (SIP) is a new protocol developed by the Internet Engineering Task Force (IETF) for multimedia conferencing over IP. SIP features are compliant with IETF RFC 2543, *SIP: Session Initiation Protocol*, published in March 1999.

The Cisco SIP functionality, introduced in Cisco IOS Release 12.1(1)T and enhanced in Cisco IOS Release 12.1(3)T, enables Cisco access platforms to signal the setup of voice and multimedia calls over IP networks. The SIP feature also provides nonproprietary advantages in the areas of

- Protocol extensibility
- System scalability
- Personal mobility services
- Interoperability with different vendors

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftsipgv.htm.

SIP Session Timr Support

The SIP Session Timer Support feature adds the capability of a periodic refresh of session initiation protocol (SIP) sessions by sending repeated INVITE requests. The repeated INVITE requests, or re-INVITEs, are sent during an active call leg to allow user agents (UAs) or proxies to determine the status of a SIP session. Without this keepalive mechanism, proxies that remember incoming and outgoing requests (stateful proxies) may continue to retain call state needlessly. If a UA fails to send a

BYE message at the end of a session or if the BYE message gets lost because of network problems, a stateful proxy does not know that the session has ended. The re-INVITES ensure that active sessions stay active and that completed sessions are terminated.

The SIP Session Timer Support feature also adds two new general headers that are used to negotiate the value of the refresh interval.

- The Session-Expires header is used in an INVITE if the user agent client (UAC) wants to use the session timer.
- The Min-SE header conveys the minimum allowed value for the session expiration.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftsiptim.htm.

SIP T.37 Store and Forward Fax

SIP T.37 is an ITU specification that enables store-and-forward fax applications, as well as toggling from voice to fax, for example, providing an Interactive Voice Response (IVR) front end to a store-and-forward fax application.

Refer to the following document for further information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/faxapp/index.htm

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release ports the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, and Cisco AS5850 platforms.

SIP T.38 Fax Relay

The SIP T.38 Fax Relay feature adds standards-based fax support to session initiation protocol (SIP) and conforms to ITU-T T.38 Procedures for real-time Group 3 facsimile communication over IP networks. The ITU-T standard specifies real-time transmission of faxes between two regular fax terminals over an IP network. Much like a voice call, SIP T.38 Fax Relay requires call establishment, data transmission, and release signaling.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftsipfax.htm.

Note This feature was previously released in Cisco IOS Release 12.2(8)T for the Cisco 2600 series and Cisco 3600 series routers. This release ports the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, and Cisco AS5850 platforms.

SIP User Agent MIB

The Session Initiation Protocol (SIP) User Agent Client (UAC) and User Agent Server (UAS) are manageable by an SNMP-based network management platform, such as the Cisco Voice Manager. The SIP UAC/UAS exists on the AS5300 and AS5400 platforms. The SIP MIB has been defined, will be submitted to the IETF, and will be implemented on those platforms.

To obtain lists of supported MIBs by platform and Cisco IOS release, and to download MIB modules, go to the Cisco MIB web site on Cisco.com at the following location:

http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml.

SNMP Support over VPN

The SNMP Support over VPN feature allows the sending and receiving of SNMP notifications using VPN Routing Forwarding table (VRF).

SNMP is an application-layer protocol that provides a message format for communication between SNMP managers and agents.

A VPN is a network that provides high connectivity transfers on a shared system with the same usage guidelines as a private network. A VPN can be built on the Internet or on the service provider IP, Frame Relay, or ATM system.

A VRF stores per-VPN routing data. It defines the VPN membership of a customer site attached to the network access server (NAS). A VRF consists of an IP routing table, a derived Cisco Express Forwarding (CEF) table, guidelines, and routing protocol parameters that control the information that is included in the routing table.

The SNMP Support over VPN feature provides configuration commands that allow users to associate SNMP agents and managers with specific VRFs. The specified VRF is used for the sending of SNMP notifications (traps and informs) and responses between agents and managers. If a VRF is not specified, the default routing table for the VPN is used. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ftnm_vpn.htm

Note This feature was originally introduced in Cisco IOS Release 12.2(2)T. This release ports the feature into the Cisco AS5300 and Cisco AS5800 platforms.

SNMPv3 Community MIB Support

The SNMPv3 Community MIB Support feature implements support for the SNMP Community MIB (SNMP-COMMUNITY-MIB) module, defined in RFC 2576, in Cisco IOS software.

The SNMPv1/v2c Message Processing Model and Security Model require mappings between parameters used in SNMPv1 and SNMPv2c messages and the version independent parameters used in the Simple Network Management Protocol (SNMP) architecture. The SNMP Community MIB contains objects for mapping between these community strings and version-independent SNMP message parameters.

The mapped parameters consist of the SNMPv1/v2c community name and the SNMP securityName and contextEngineID/contextName pair. This MIB provides mappings in both directions, that is, a community name may be mapped to a securityName, contextEngineID, and contextName, or the combination of securityName, contextEngineID, and contextName may be mapped to a community name. This MIB also augments the snmpTargetAddrTable with a transport address mask value and a maximum message size value.

For implementation details, refer to the SNMP-COMMUNITY-MIB.my file, available through Cisco.com at ftp://ftp.cisco.com/pub/mibs/v2/.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release ports the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

Speech Recognition and Synthesis for Voice Applications

The Speech Recognition and Synthesis for Voice Applications feature adds support for automatic speech recognition (ASR) and text-to-speech (TTS) capabilities for VoiceXML and TCL applications. This feature provides interfaces to ASR and TTS media servers using Media Resource Control Protocol (MRCP), an application-level protocol developed by Cisco and its ASR and TTS media server partners. Client devices that process audio or video streams use MRCP to control media resources on the external ASR and TTS servers.

Refer to the following documents for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ivrapp/index.htm.

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/rel_docs/vxmlprg/index.htm.

Static Cache Entry for IPv6 Neighbor Discovery

The Static Cache Entry for IPv6 Neighbor Discovery feature enables the configuring of static entries in the IPv6 neighbor discovery cache, which provides functionality in IPv6 that is equivalent to static Address Resolution Protocol (ARP) entries in IPv4. Static entries in the IPv6 neighbor discovery cache are not modified by the neighbor discovery process. Cisco IOS software uses static ARP entries in IPv4 to translate 32-bit IP addresses into 48-bit hardware addresses. In IPv6, Cisco IOS software uses static entries in the IPv6 neighbor discovery cache to translate 128-bit IPv6 addresses into 48-bit hardware addresses.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ipv6/ftipv6s.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release ports the feature into the Cisco AS5300, Cisco AS5350, and Cisco AS5400 platforms.

Survivable Remote Site Telephony Version 2.0

The Survivable Remote Site Telephony Version 2.0 feature was previously released in Cisco IOS Release 12.2(8)T. In Cisco IOS Release 12.2(11)T, there are minor enhancements to this feature, which is now referred to as Survivable Remote Site Telephony Version 2.01. Refer to the following document for information about the enhancements added to this release:

http://www.cisco.com/univercd/cc/td/doc/product/access/ip_ph/srs/fallbak2.htm.

T.37/T.38 Fax Gateway

This feature adds Store-and-Forward Fax to the Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850. Store-and-Forward Fax, previously documented in the *Cisco IOS Voice, Video, and Fax Configuration Guide*, Release 12.2, enables routers to send and receive faxes across packet-based networks.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/faxapp/index.htm.

Note

The T.37/T.38 Fax Gateway feature was originally supported in Cisco IOS Release 12.1(5)T on the Cisco AS5300 platform. In Cisco IOS Release 12.2(8)T, support was added on the Cisco 1751 router under the feature title T.37 Store-and-Forward Fax for Cisco 1751 Modular Access Routers and for the Cisco 2600 series and Cisco 3600 series routers under the feature title T.37 Store-and-Forward Fax for the Cisco 2600 Series and Cisco 3600 Series Routers. In this release, support for the T.37/T.38 Fax Gateway feature has been added to the Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

T.38 Fax Relay for VoIP H.323

The T.38 Fax Relay for VoIP H.323 feature provides standards-based Fax Relay protocol support on Cisco 2600 series, Cisco 3600 series, Cisco 7200 series and Cisco MC3810 series multiservice gateways. The Cisco proprietary Fax Relay solution is sometimes not an ideal solution for Enterprise and Service Provider customers who have implemented a mixed vendor network. Because the T.38 Fax Relay protocol is standards based, Cisco gateways and gatekeepers will now be able to interoperate with third-party T.38-enabled gateways and gatekeepers in a mixed vendor network where real time Fax Rel capabilities are required.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/faxapp/index.htm.

Note

This feature was originally introduced in Cisco IOS Release 12.1(3)T. This release ports the feature into the Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

TCL IVR 2.0 Call Initiation and Callback

The TCL IVR 2.0 Call Initiation and Callback feature allows Tool Command Language (TCL) Interactive Voice Response (IVR) applications to make outbound calls without specifying an incoming call leg in the setup command.

The TCL IVR 2.0 Call Initiation and Callback feature modifies the following TCL IVR Version 2.0 verbs:

- The **leg setup** command.
- The **aaa authorize** command.

In addition, the following new information tags were added to support the above changes:

- infotag get leg_guid
- infotag get leg_incoming_guid
- infotag get aaa_new_guid

Finally, the following additions were made to the callInfo array:

- CallInfo(guid)
- CallInfo(incomingGuid)

Refer to the following *TCL IVR API Command Reference* for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_serv/vapp_dev/tclivrv2/chapter3.htm.

TCL IVR Disconnect Cause-Code Manipulation

The leg disconnect command disconnects one or more call legs that are not part of any connection. The cause_code argument, which has been added in Cisco IOS Release 12.2(1)T, is an integer ISDN cause code for the disconnect. It is of the form di-xxx or just xxx, where xxx is the ISDN cause code. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_serv/vapp_dev/tclivrv2.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(1)T..This release ports the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

TCL-Enabled Signaling Parameter Mapping

The TCL-Enabled Signaling Parameter Mapping feature provides control over call signaling information elements from a Tool Command Language (TCL) Interactive Voice Response (IVR) script to make the Cisco Media-Gateway (that is, the Cisco AS5300 and Cisco AS5800 platforms) interoperable with British Telecom and France Telecom networks. New parameters were introduced under the **set callinfo** command. Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/access/acs_serv/vapp_dev/tclivrv2/chapter3.htm.

TCP Window Scaling

TCP Window Scaling adds support for the Window Scaling extension option in RFC 1323. To improve TCP performance in network paths with a large bandwidth-delay product, Long Fat Networks (LFNs), a larger window size is recommended. This TCP Window Scaling enhancement provides that support.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/tcpwslfn.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release ports the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

Timer and Retry Enhancements for L2TP and L2F

The Timer and Retry Enhancements for L2TP and L2F feature allows the user to configure certain adjustable timers for the L2TP and L2F protocols. For L2F, the settings for control packet retries and control packet timeouts are now both configurable. Initial tunnel packet retries and initial tunnel packet timeouts are now configurable for both the L2F and L2TP protocols.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftretreh.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T as L2TP and L2F Timer and Retry Enhancement. This release is porting the feature into the Cisco AS5300, Cisco AS5400, and Cisco AS5800 platforms.

Trustpoint CLI

The Trustpoint CLI feature introduces the **crypto ca trustpoint** command, which combines and replaces the functionality of the existing **crypto ca identity** and **crypto ca trusted-root** commands.

Although both of the existing commands allow you to declare the certification authority (CA) that your router should use, only the **crypto ca identity** command supports enrollment (the requesting of a router certificate from a CA). With the **crypto ca trustpoint** command, you can declare the CA and specify any characteristics for the CA that the existing commands supported.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/fttrust.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release ports the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, and Cisco AS5800 platforms.

Tunnel Type of Service (ToS)

The Tunnel Type of Service (ToS) feature allows you to configure the ToS and Time-to-Live (TTL) byte values in the encapsulating IP header of tunnel packets for an IP tunnel interface on a router. The Tunnel ToS feature is supported on Cisco Express Forwarding (CEF), fast switching, and process switching forwarding modes.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios120/120newft/120limit/120s/120s17/12s_tos.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release ports the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

Universal Port Resource Pooling for Voice and Data Services

With Cisco Resource Pool Manager (RPM), telephone companies and Internet service providers (ISPs) can share dial resources for wholesale and retail dial network services in a single network access server (NAS) or across multiple NAS stacks. Call management and call discrimination can be configured to occur before the call is answered, and customers are differentiated by using configurable customer profiles that are based on the dial number identification service (DNIS) and call type determined at tl time of an incoming call. As a result, Cisco RPM enables service providers to count, control, and manage resources and provide accounting for shared resources when implementing different service-level agreements.

The Universal Port Resource Pooling for Voice and Data Services feature enables service providers to mix voice and data services using resource pool management. With the implementation of the new **voice** command in resource-pool profile service configuration mode, a resource group with voice service is designated under a particular customer profile, and voice resource pool service is enabled after resource pool management is configured.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xa/122xa_2/ftuprp.htm.

V.44 LZJH Compression for Cisco AS5300 and Cisco AS5800 Universal Access Servers

Note This feature is for use with Cisco MICA portware.

The V.44 LZJH Compression for Cisco AS5300 and Cisco AS5800 Universal Access Servers feature introduces the V.44 Lempel-Ziv-Jeff-Heath (LZJH) compression algorithm International Telecommunication Union Telecommunication Standardization Sector (ITU-T) standard on Cisco MICA portware platforms.

V.44 LZJH is a new compression standard based on Lempel-Ziv that uses a new string-matching algorithm that increases upload and download speeds to make Internet access and web browsing faster. The V.44 call success rate (CSR) is similar to V.42bis with significant compression improvement for most file types, including HTML files. V.44 applies more millions of instructions per second (MIPS) than V.42bis toward the same application data stream and yields better compression rates in almost any data stream in which V.42bis shows positive results.

V.44 supports automatic switching between compressed and transparent modes on Cisco MICA portware platforms. Automatic switching allows overall performance gains without loss in throughput for file streams that are not compressible.

V.44 is globally controlled through dialed number identification service (DNIS), calling line ID (CLID), and resource pool manager server (RPMS) virtual groups, and performance improvement is determined by the LZJH algorithms. The Cisco MICA portware is responsible for the ITU implementation of V.44 and the collection of statistics related to the new feature.

To support V.44 LZJH compression, the control switch module (CSM) has been modified. MIBs that show the status of V.42bis have been extended to show V.44 configuration status. New disconnect reasons help manage V.44 session status and debugging.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/122xb2_2/ftv44mca.htm.

V.44 LZJH Compression for Cisco AS5350, Cisco AS5400, and Cisco AS5850 Universal Gateways and Cisco AS5800 Universal Access Servers

Note This feature is for use with Cisco NextPort firmware.

The V.44 LZJH Compression for Cisco AS5350, Cisco AS5400, and Cisco.AS5850 Universal Gateways and Cisco AS5800 Universal Access Servers feature introduces the V.44 Lempel-Ziv-Jeff-Heath (LZJH) compression algorithm International Telecommunication Union Telecommunication Standardization Sector (ITU-T) standard on Cisco MICA portware platforms.

V.44 LZJH is a new compression standard based on Lempel-Ziv that uses a new string-matching algorithm that increases upload and download speeds to make Internet access and web browsing faster. The V.44 call success rate (CSR) is similar to V.42bis with significant compression improvement for most file types, including HTML files. V.44 applies more millions of instructions per second (MIPS) than V.42bis toward the same application data stream and yields better compression rates in almost any data stream in which V.42bis shows positive results.

V.44 supports automatic switching between compressed and transparent modes on Cisco MICA portware platforms. Automatic switching allows overall performance gains without loss in throughput for file streams that are not compressible.

V.44 is globally controlled through dialed number identification service (DNIS), calling line ID (CLID), and resource pool manager server (RPMS) virtual groups, and performance improvement is determined by the LZJH algorithms. The Cisco MICA portware is responsible for the ITU implementation of V.44 and the collection of statistics related to the new feature.

To support V.44 LZJH compression, the control switch module (CSM) has been modified. MIBs that show the status of V.42bis have been extended to show V.44 configuration status. New disconnect reasons help manage V.44 session status and debugging.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/122xb2_2/ft_v44.htm.

V.92 Modem on Hold for Cisco AS5300 and Cisco AS5800 Universal Access Servers

Note This feature is for use with Cisco MICA portware.

The V.92 Modem on Hold for Cisco AS5300 and Cisco AS5800 Universal Access Servers introduces the V.92 International Telecommunication Union Telecommunication Standardization Sector (ITU-T) standard Modem on Hold (MOH) feature with Cisco MICA portware.

To remain current with industry needs, the ITU-T V.90 modem standard recommendations have been enhanced. The new standard, V.92, meets the need for a digital modem and analog modem pair on the Public Switched Telephone Network (PSTN). V.92 improves the upstream data signaling rate and adds new features that enhance modem usability.

V.92 is implemented at the modem level as new modem protocols and standards. The new V.92 features co-reside with existing portware features and have no impact on the hardware configuration of either the HMM or DMM (including memory requirements). Cisco IOS software is responsible for controlling the features and displaying the new statistics. V.92 and V.44 support is bound with the rest of the Cisco IOS device driver components.

V.92 Modem on Hold allows a dial-in customer to suspend a modem session to answer an incoming voice call or to place an outgoing call while engaged in a modem session. When the dial-in customer uses Modem on Hold to suspend an active modem session to engage in an incoming voice call, the Internet service provider (ISP) modem listens to the original modem connection and waits for the dial-in customer's modem to resume the connection. When the voice call ends, the modem signals the telephone system to end the second call and return to the original modem connection, then the modem signals the ISP modem that it is ready to resume the modem call. Both modems renegotiate the connection, and the original exchange of data continues.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/122xb2_2/ft92mmoh.htm.

V.92 Modem on Hold for Cisco AS5350, Cisco AS5400, and Cisco AS5850 Universal Gateways and Cisco AS5800 Universal Access Servers

Note This feature is for use with Cisco NextPort firmware.

The V.92 Modem on Hold for Cisco AS5350, Cisco AS5400, and Cisco AS5850 Universal Gateways and Cisco AS5800 Universal Access Servers feature introduces the V.92 International Telecommunication Union Telecommunication Standardization Sector (ITU-T) standard Modem on Hold (MOH) feature with Cisco MICA portware.

To remain current with industry needs, the ITU-T V.90 modem standard recommendations have been enhanced. The new standard, V.92, meets the need for a digital modem and analog modem pair on the Public Switched Telephone Network (PSTN). V.92 improves the upstream data signaling rate and adds new features that enhance modem usability.

V.92 is implemented at the modem level as new modem protocols and standards. The new V.92 features co-reside with existing portware features and have no impact on the hardware configuration of either the HMM or DMM (including memory requirements). Both modems renegotiate the connection, and the original exchange of data continues.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/122xb2_2/ftv92moh.htm.

V.92 Quick Connect for Cisco AS5300 and Cisco AS5800 Universal Access Servers

Note This feature is for use with Cisco MICA portware.

The V.92 Quick Connect for Cisco AS5300 and Cisco AS5800 Universal Access Servers feature introduces the V.92 International Telecommunication Union Telecommunication Standardization Sector (ITU-T) standard Quick Connect (QC) feature with Cisco MICA portware platforms.

V.92 Quick Connect speeds up the client-to-server startup negotiation, reducing the overall connect time up to 30 percent. The client modem retains line condition information and characteristics of the connection of the Internet service provider (ISP), which reduces connect time by avoiding some of the initial signal handshaking.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/122xb2_2/ft92mqc.htm.

V.92 Quick Connect for Cisco AS5350, Cisco AS5400, and Cisco AS5850 Universal Gateways and Cisco AS5800 Universal Access Servers

Note This feature is for use with Cisco NextPort firmware.

The V.92 Quick Connect for Cisco AS5350, Cisco AS5400, and Cisco AS5850 Universal Gateways and Cisco AS5800 Universal Access Servers feature introduces the V.92 International Telecommunication Union Telecommunication Standardization Sector (ITU-T) standard Quick Connect (QC) feature with Cisco MICA portware platforms.

V.92 Quick Connect speeds up the client-to-server startup negotiation, reducing the overall connect time up to 30 percent. The client modem retains line condition information and characteristics of the connection to the Internet service provider (ISP), which reduces connect time by avoiding some of the initial signal handshaking.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/122xb2_2/ftv92qc.htm.

VoAAL2 Profile 9 Support for Broadband Loop Emulation Services Specification Interoperability

The VoAAL2 Profile 9 Support for Broadband Loop Emulation Services Specification Interoperability feature allows the Cisco IAD2420 series integrated access device (IAD) to provide Voice over ATM Adaptation Layer 2 (VoAAL2) Profile 9 using G.711 u-law or G.711 a-law with a 44-byte voice payload. Profile 9 is part of the Broadband Loop Emulation Services (BLES) specification put forth by the ATM Forum. This feature enables Cisco IAD2420 series IADs to offer standards-based interoperability with V5.2 and GR.303 VoAAL2 gateways from various third party vendors that are BLES compliant. The Profile 9 feature allows the Cisco IAD2420 series IADs to deliver business-class voice services from Class 5 switches over T1 ATM and xDSL WAN links. Profile 9 establishes the foundation for accepting packet voice architectures for the carriers and allows the transition to the call agent architectures.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft_iadp9.htm
.

Voice Application Access To SS7 Signaling

The Voice Application Access To SS7 Signaling feature provides a means of transporting ISUP signaling messages from SS7 networks to VoIP networks. ISUP messages and parameters are converted to Generic Transparency Descriptor (GTD) format and transported by the underlying call signalling messages to each node transited by the call.

Refer to the following document for information about the information tags that are associated with this feature:

http://lbj.cisco.com/push_targets1/ucdit/cc/td/doc/product/access/acs_serv/vapp_dev/tclivrv2/chapter4.htm.

Voice DSP Control Message Logger

The Voice DSP Control Message Logger feature provides improved debugging capabilities through Cisco IOS software by allowing you to log control messages that pass through the Cisco IOS software and TI-based voice DSP firmware on the Host Port Interface (HPI). The logged messages can later be examined when voice problems are diagnosed.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftvdsplg.htm.

Voice over IP Q.SIG Network Transparency

Integration of Q.SIG with the Cisco AS5400 universal access server enables Cisco voice switching services to connect private branch exchanges (PBXs), key systems (KTs), and central office switches (COs) that communicate by using the Q.SIG protocol.

The Q.SIG protocol is a variant of ISDN D-channel voice signaling. It is based on the ISDN Q.921 and Q.931 standards and is becoming a worldwide standard for PBX interconnection. By using Q.SIG signaling, the Cisco AS5300 can route incoming voice calls from a private integrated services network exchange (PINX) across a wide-area network (WAN) to a peer Cisco AS5400, which can then transport the signaling and voice packets to a second PINX.

Q.SIG on the AS5400 allows the user to place Q.SIG calls into and receive Q.SIG calls from Cisco Voice-over-IP (VoIP) networks. The Cisco packet network appears to PBXs as a large, distributed transit PBX that can establish calls to any destination served by a Cisco voice node. The switched voice connections are established and torn down in response to Q.SIG control messages that come over an ISDN PRI D channel. The Q.SIG message is passed transparently across the IP network and the message appears to the attached PINXs as a transit network. The PINXs are responsible for processing and provisioning the attached services.

Note This feature was originally introduced in Cisco IOS Release 12.0(7)T on the Cisco AS5300 platform. This release ports the feature into the Cisco AS5400 platform.

VoiceXML For Cisco IOS

Applications written in Voice eXtensible Markup Language (VoiceXML) provide access through a voice browser to content and services over the telephone, just as Hypertext Markup Language (HTML) provides access through a web browser running on a PC. The universal accessibility of the telephone and its ease of use makes VoiceXML applications a powerful alternative to HTML for accessing the information and services of the World Wide Web.

The Cisco IOS VoiceXML feature provides a platform for interpreting VoiceXML documents. When a telephone call is made to the Cisco VoiceXML-enabled gateway, VoiceXML documents are downloaded from web servers, providing content and services to the caller, typically in the form of pre-recorded audio in an IVR application. Customers can access online business applications over the telephone, providing for example, stock quotes, sports scores, or bank balances.

VoiceXML brings the advantages of web-based development and content delivery to voice applications. It is similar to HTML in its simplicity and in its presentation of information. The Cisco IOS VoiceXML feature is based on the *W3C VoiceXML 2.0 Working Draft* and is designed to provide web developers great flexibility and ease in implementing VoiceXML applications.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ivrapp/index.htm.

VoiceXML SS7 ISUP Session Variables

The ISUP signaling message set used in SS7 networks contains information that is used for call establishment, routing, and billing functions. To help transport these messages from SS7 networks (using ISUP based messages) to VoIP networks (using H.323 and SIP based messages), ISUP messages and parameters are represented in generic transparency descriptor (GTD) format and transported by the underlying call signaling messages to each node transited by the call. These GTD parameters and fields are extracted and mapped to TCL and VoiceXML variables for access by Tool Command Language (TCL) and VoiceXML scripts.

VoiceXML Media Volume and Rate Controls

With the VoiceXML Media Volume and Rate Controls feature, the volume of audio prompts played out by VoiceXML applications can now be adjusted during playback. Audio prompts that are played out from memory or chunked transfer mode using G.711 or GSM-FR codecs can also be speeded up or slowed down. A VoiceXML variable contains the rate and duration of the last prompt that was played. The rate and volume of prompts is controlled by using Cisco-specific attributes in the VoiceXML document.

VoiceXML Transfer Enhancements

THe VoiceXML Transfer Enhancements feature enhances the transfer functionality in the Cisco VoiceXML implementation by introducing specific Cisco parameters as attributes for the transfer element.

VoiceXML Voice Store and Forward

The VoiceXML Voice Store and Forward feature expands Cisco IOS VoiceXML to include streaming-based recording and playout. It enables the input and processing of form field entries using recorded audio clips, rather than numeric input only. Audio clips can be captured and then submitted to an external web server using HTTP or Real Time Streaming Protocol (RTSP), or to a messaging server using Simple Mail Transfer Protocol (SMTP) for additional processing.

VoIP Call Admission Control using RSVP

The VoIP Call Admission Control Using RSVP feature synchronizes Resource Reservation Protocol (RSVP) procedures with H.323 Version 2 (Fast Connect) setup procedures to guarantee that the required Quality of Service (QoS) for VoIP calls is maintained across the IP network. In older Cisco IOS releases, VoIP gateways used H.323 Version 1 (Slow Connect) procedures when initiating calls requiring bandwidth reservation. This feature, which is enabled by default, allows gateways to use H.323 Version 2 (Fast Connect) for all calls, including those requiring RSVP.

Note This feature was originally introduced in Cisco IOS Release 12.1(5)T. This release ports the feature into the Cisco AS5350, Cisco AS5400, and Cisco AS5850 platforms.

VoIP Interoperability with Cisco Express Forwarding and Policy Based Routing

The VoIP Interoperability with Cisco Express Forwarding and Policy Based Routing feature consists of the following two features:

- VoIP and Cisco Express Forwarding (CEF) Interoperability
- VoIP and Policy Based Routing (PBR) Interoperability

The VoIP Interoperability with Cisco Express Forwarding and Policy Based Routing feature enables CEF for switching voice signaling and voice payloads from voice interfaces to other LAN/WAN interfaces for applications, such as Tollbypass. This feature also enables Policy Based Routing of VoIP traffic that originates or terminates on the specified voice gateways and introduces voice packet Differentiated Services Code Point (DSCP) marking for Media Gateway Control Protocol (MGCP) voice gateways.

This feature modifies the Voice over IP (VoIP) and interactive voice response (IVR) programming so that they can interoperate with features that are supported only in the CEF path (not in the fast switching path that VoX uses). Voice and IVR currently only work in the fast path on the routers where they are originated and terminated (Voice and IVR on "transit" routers are just data packets and of course can be CEF switched). Cisco Express Forwarding

Cisco Express Forwarding (CEF) is advanced Layer 3 IP switching technology. CEF optimizes network performance and scalability for networks with large and dynamic traffic patterns, such as the Internet, on networks characterized by intensive Web-based applications, or interactive sessions.

Although you can use CEF in any part of a network, it is designed for high-performance, highly resilient Layer 3 IP backbone switching.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ft_cef26.htm .

VoIP Gatekeeper Trunk and Carrier Based Routing Enhancements

The VoIP Gatekeeper Trunk and Carrier Based Routing Enhancements feature implements the capability to report the Public Switched Telephone Network (PSTN)-side interfaces for incoming and outgoing calls to the H.323 gatekeeper and to the peer H.323 gateway and endpoint. The feature permits identification, by means of labeling individual PSTN trunks or trunk groups, the circuit that is sending a call. The software routes the call to a specific outbound circuit using some criteria, such as inbound circuit, time period, or cost, and then forwards the call to a circuit that is connected to the specified outbound carrier.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftgkrenb.htm .

VoIP Gateway Trunk and Carrier Based Routing Enhancements

Voice wholesalers use multiple ingress and egress carriers to route traffic. A call that comes in to a gateway on a particular ingress carrier must be routed to an appropriate egress carrier. As networks grow and become more complicated, the dial plans needed to route the carrier traffic efficiently become more complex and the need for carrier sensitive routing (CSR) increases.

The VoIP Gateway Trunk and Carrier Based Routing Enhancements feature implements Carrier Sensitive Routing (CSR) for Cisco voice gateways. The VoIP Gateway Trunk and Carrier Based Routing Enhancements feature adds the following routing features:

- Implementation of trunk groups and enhanced key matches on several platforms and interfaces
- Reduction of the number of dial peers in a dial plan by using profile aggregation and multiple trunk group supports
- Enhanced hunting schemes
- Carrier ID support
- Trunk group label support
- Number translation profiles per trunk group, source IP group, voice port, and dial peer
- Dial peer support of multiple trunk groups with translations per trunk group
- ENUM support
- Source IP groups
- Voice over IP (VoIP) access list control
- Enhanced translation rules in SED (stream editor) regular expressions
- Incoming call blocking
- Cisco IVR 2.0 support for carrier ID based dial peer matching, incoming call blocking, and dial peer number translation
- Call detail record (CDR) support
- Virtual Private Network (VPN) source routing (also referred to as static or basic carrier routing).

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftgwrepg.htm

VoIP Outgoing Trunk Group Identification and Carrier ID for Gateways

The VoIP Outgoing Trunk Group Identification and Carrier ID for Gateways feature provides an enhancement to Registration, Admission, and Status (RAS) Admission Confirmation and Location Confirm messages. RAS messages include a circuitInfo field that provides trunk group label or carrier ID information for remote endpoints (gateways) in H.323 networks. The Voice over IP (VoIP) Outgoing Trunk Group Identification and Carrier ID for Gateways feature also adds trunk group label and carrier ID support for the alternate endpoint field in the Gatekeeper Transaction Message Protocol (GKTMP Response Admission Request (ARQ), Admission Confirmation (ACF), Location Request (LRQ), and Location Confirm (LCF) messages.

The **carrier-id** keyword and *carrier-name* arguments were introduced for the **endpoint alt-ep h323id** command in Cisco IOS Release 12.2(11)T.

VPDN Group Session Limiting

Before the introduction of the VPDN Group Session Limiting feature, you could only globally limit the number of virtual private dialup network (VPDN) sessions on a router with limits applied equally to all VPDN groups. Using the VPDN Group Session Limiting feature, you can limit the number of VPDN sessions allowed per VPDN group. This feature is implemented with the introduction of the

session-limit *number* command in VPDN group configuration mode. VPDN group session limiting is applied after the global VPDN session limiting (which is configured via the **vpdn session-limit** *session* command in configuration mode) is enforced.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t11/ftvpdngs.htm

Note This feature was originally introduced in Cisco IOS Release 12.2(4)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

VPN Routing Forwarding (VRF) Framed Route (Pool) Assignment via PPP

The VPN Routing Forwarding (VRF) Framed Route (Pool) Assignment via PPP feature introduces support to make the following RADIUS attributes VRF aware: attribute 22 (Framed-Route), a combination of attribute 8 (Framed-IP-Address) and attribute 9 (Framed-IP-Netmask), and the Cisco VSA route command. Thus, static IP routes can be applied to a particular VRF routing table rather than the global routing table.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

WRED Enhancement—Explicit Congestion Notification (ECN)

Currently, the congestion control and avoidance algorithms for TCP are based on the idea that packet loss is an appropriate indication of congestion on networks that transmit data using the best-effort service model. When a network uses the best-effort service model, the network delivers data if it can, without any assurance of reliability, delay bounds, or throughput. However, these algorithms and the best-effort service model are not suited to applications that are sensitive to delay or packet loss (for instance, interactive traffic including Telnet, web browsing, and transfer of audio and video data). Weighted random early detection (WRED), and by extension, Explicit Congestion Notification (ECN), helps to solve this problem.

To indicate congestion, WRED drops packets on the basis of the average queue length exceeding a specific threshold value. ECN is an extension to WRED in that ECN marks packets instead of dropping them when the average queue length exceeds a specific threshold value. When configured with the WRED Enhancement—Support for Explicit Congestion Notification feature, routers and end hosts would use this marking as a signal that the network is congested and slow down sending packets.

This feature provides an improved method for congestion avoidance by allowing the network to mark packets for transmission later, rather than dropping them from the queue. Marking the packets for transmission later accommodates applications that are sensitive to delay or packet loss and provides improved throughput and application performance.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftwrdecn.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

X.25 Over TCP Profiles

The Cisco X.25 over TCP (XOT) service was originally developed as an X.25 class of service that was only designed to switch X.25 traffic across an IP network. This service allowed network administrators to connect X.25 devices across the rich connectivity and media features available to IP traffic. XOT uses a set of default parameters to make this type of network easy to design.

When the XOT' capabilities were enhanced to support packet assembler/disassembler (PAD) traffic on an XOT session, network designers saw a need to be able to configure parameters for increased flexibility. For instance, because XOT does not have any physical interfaces that an administrator can configure, PAD over XOT sessions cannot be configured with interface map or facility commands to establish a PAD connection using nondefault values.

The introduction of X.25 profiles for XOT allows the network designer added flexibility to control the X.25 class services of XOT for PAD and XOT switching usage.

Another important aspect of this feature is that it allows you to associate access lists with XOT connections, enabling you to apply security on the basis of IP addresses and to have a unique X.25 configuration for specified IP addresses.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_xotp.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, Cisco AS5400, Cisco AS5800, and Cisco AS5850 platforms.

X.25 Record Boundary Preservation for Data Communications Networks

The X.25 Record Boundary Preservation for Data Communications Networks feature enables hosts using TCP/IP-based protocols to exchange data with devices that use the X.25 protocol, retaining the logical record boundaries indicated by use of the X.25 “more data” bit (M-bit).

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftdcnrbp.htm.

Note This feature was originally introduced in Cisco IOS Release 12.2(8)T. This release is porting the feature into the Cisco AS5300, Cisco AS5350, and Cisco AS5400 platforms.

Hardware Platforms and Modules Newly Supported in Cisco IOS Release 12.2(8)T1

The following hardware platforms and modules are now supported in Cisco IOS Release 12.2(8)T1. These platforms and modules were first introduced in earlier Cisco IOS software releases.

36-Port Ethernet Switch Module for Cisco 2600 Series and Cisco 3600 Series

The 36-Port Ethernet switch network module is a modular, high-density voice network module that provides Layer 2 switching across Ethernet ports. The 36-port Ethernet switch network module has thirty-six 10/100BASE-TX ports, and an optional power module can also be added to provide inline power for Cisco IP telephones.

The 36-port Ethernet switch network module supports the same features as the 16-port Ethernet switch network module introduced in Cisco IOS Release 12.2(8)T.

Cisco 1721 Router

The Cisco 1721 data-only modular access router is an enhanced Cisco = 1720 router that provides higher performance, additional functionality, and increased memory capacity. The router supports WAN access, Virtual Private Network (VPN), and firewall technology for secure Internet, intranet, and extranet access. Cisco 1721 routers also support standards-based Institute of IEEE 802.1Q VLAN routing, which enables enterprises to set up and route between multiple VLANs for additional security in an internal corporate network.

Cisco 2600XM Series Routers

The Cisco 2600XM series provides new product enhancements to the current Cisco 2600 series. The Cisco 2600XM series is available in three performance levels and six base configurations:

- Cisco 2650XM and Cisco 2651MX—up to 40K packets per second (pps), one and two autosensing 10/100 Mbps Ethernet ports
- Cisco 2620XM and Cisco 2621XM—up to 30K pps, one and two autosensing 10/100 Mbps Ethernet ports
- Cisco 2610XM and Cisco 2611XM—up to 20K pps, one and two autosensing 10/100 Mbps Ethernet ports

Each model also has two WAN interface card (WIC) slots, one Network Module slot, and an Advanced Integration Module.

Cisco 2691 Series Router

Cisco IOS Release 12.2(8)T1 supports a new platform, the Cisco 2691 series router.

The Cisco 2691 router is part of the next generation Modular Multiservice platform for deployment of advanced IP Telephony Solutions and Integrated Services. This platform is the fourth in a series of Cisco 2600 products that offer additional performance levels.

The Cisco 2691 provides two 10/100BASE-T Fast Ethernet (FE) ports with one Network Module (NM) slot, three WAN Interface Cards (WICs) slots, and two Advanced Interface Module (AIM) slots. Many of the current NMs, WICs and AIMs used today on the Cisco 2600 and Cisco 3600 series routers are supported on the Cisco 2691 series router.

New Software Features in Cisco IOS Release 12.2(8)T1

The following new features are supported in Cisco IOS Release 12.2(8)T1. Some of these features may have been introduced on other hardware platforms in earlier Cisco IOS software releases.

MPLS Label Switch Controller and Enhancements

The Multiprotocol Label Switching (MPLS) Label Switch Controller (LSC), combined with a slave ATM switch, supports scalable integration of IP services over an ATM network. The MPLS LSC enables the slave ATM switch to:

- Participate in an MPLS network
- Directly peer with IP routers
- Support the IP features in Cisco Internetwork Operating System (IOS) software

This feature was originally introduced in Cisco IOS Release 11.1CT as the Tag Switch Controller. Cisco IOS Release 12.2(8)T1 adds support for the Cisco 8400 IGX Switch with a Universal Router Module as an MPLS ATM-LSR. In addition, support is added for the Virtual Circuit (VC) Merge and MPLS Diff-Serv-aware features.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftlsc.htm.

Virtual Circuit (VC) Merge

The Virtual Circuit (VC) Merge feature allows multiple incoming VCs to be merged into a single outgoing VC. The feature is only available on frame-based connections carrying ATM Adaptation Layer 5 (AAL5) frames consisting of multiple cells. VC Merge helps scale Multiprotocol Label Switching (MPLS) networks, because it allocates only one VC to each destination on a link.

VC merge maps several incoming labels to one single outgoing label. Cells from different virtual channel identifiers (VCIs) traveling to the same destination are transmitted to the same outgoing VC using multipoint-to-point connections.

VC merge allows the switch to transmit cells coming from different VCIs over the same outgoing VCI to the same destination. In other words, VC merge queues AAL5 frames in input buffers until the switch receives the last frame. Then the switch transmits the cells from that AAL5 frame before it sends any cells from other frames. VC merge requires the switch to provide buffering, but no more buffering than is required in IP networks. VC merge slightly delays the transfer of frames; however, VC merge is for IP traffic and not for traffic that requires speed. IP traffic tolerates delays better than other traffic on the ATM network.

Hardware Platforms and Modules Newly Supported in Cisco IOS Release 12.2(8)T

The following hardware platforms and modules are now supported in Cisco IOS Release 12.2(8)T. These platforms and modules were first introduced in earlier Cisco IOS software releases.

1- and 2-Port V.90 Modem WICs for Cisco 2600 and 3600 Series

Three applications are available for the V.90 modem WAN interface card (WIC) on the Cisco 2600 and Cisco 3600 series multiservice platforms.

Remote Router Management and Out-of-Band Access

In this mode, the modem WIC is used as a dial-in modem for remote terminal access to the router's command-line interface (CLI) for configuration, troubleshooting, and monitoring. The modem WIC acts similar to a modem that is connected to the auxiliary (AUX) port of a router, but the integrated nature of the modem WIC greatly decreases customer configuration time and deployment and sustaining costs. Typically, the 1-port modem WIC is used for this application. Connection speeds of up to 33.6 kbps are possible.

Asynchronous Dial-on-Demand Routing and Dial Backup

In this mode, the V.90 modem WIC transports network traffic. When ISDN service is not available and the traffic load does not justify a leased line or Frame Relay connection, asynchronous dial-on-demand routing (DDR) is often the only choice for making a WAN connection. Even at sites that do have a leased line or Frame Relay connection, asynchronous DDR can increase bandwidth during sustained traffic load. In addition, when the primary leased line or Frame Relay link is down during an outage, asynchronous dial backup provides a secondary way to make the WAN connection. Both the 1-port and 2-port versions of the V.90 modem WIC can be used for this application.

Two ports on one modem WIC (or even three or more ports spanning multiple modem WIC cards) can be combined using Multilink PPP (MLP) to increase connection speeds in a scalar manner. Each connection is capable of V.90 speeds (up to 56 kbps) when connecting to a digital V.90 server modem.

Low-Density Analog RAS Access

In this application, the V.90 modem WIC enables the platform to provide the services of a typical small remote access server (RAS). One service allows remote users to dial in and gain access to resources on the LAN (or even across the WAN). The analog modems in the modem WIC allow dial-in connection speeds of up to 33.6 kbps, but MLP can bind multiple links together and increase the throughput.

Another service allows PCs (running Cisco DialOut Utility) on the LAN to use the modems for dial-out. Users can connect to other modems (bulletin boards, AOL, ISPs, and so on) or fax machines. The modem WIC allows dial-out connection speeds of up to 56 kbps when dialing a digital V.90 server modem or up to 33.6 kbps when dialing another analog modem. Fax calls connect at up to 14.4 kbps.

Typical RAS deployments with the V.90 modem WIC use the 2-port modem version. With enough slots, the V.90 modem WIC can be used to scale to up to 24 modems in a Cisco 3660 multiservice platform.

There is no limit for lines in the MLP bundle with WICs and population of WICs on any Cisco 2600 series or Cisco 3600 series multiservices platforms.

Additional Information

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft12pwi8.htm.

8FXO DID for IAD24xx Platform

Note The 8FXO DID for IAD24xx Platform feature is also known under the feature title Direct Inward Dialing for Cisco IAD2420 Series Integrated Access Devices.

Direct Inward Dialing (DID) is a service offered by telephone companies that enables callers to dial directly to an extension on a private branch exchange (PBX) without the assistance of an operator or automated call attendant. This service makes use of DID trunks, which forward only the last three to five digits of a phone number to the PBX. If, for example, a company has a PBX with extensions 555-1000 to 555-1999, and a caller dials 555-1234, the local central office (CO) would forward 234 to the PBX. The PBX would then ring extension 234. This entire process is transparent to the caller.

The Foreign Exchange Office (FXO) ports on the analog FXO voice module supports the Direct Inward Dialing (DID) for Cisco IAD2420 platform. An eight-port FXO voice interface module for the Cisco IAD2420 platform provides higher FXO port density than was previously available in the Cisco IAD2420 platform. These analog voice ports can be used to support analog voice connections from the Cisco IAD2420 chassis to the PBX on the CO side of the interface.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftdidiad.htm.

16-Port Ethernet Switch Module for Cisco 2600 Series and Cisco 3600 Series

The16-Port Ethernet switch network module is a modular, high-density voice network module that provides Layer 2 switching across Ethernet ports. The 16-port Ethernet switch network module has sixteen 10/100BASE-TX ports, and an optional power module can also be added to provide inline power for Cisco IP telephones.

Features included on this network module include the following:

- Broadcast/Multicast Suppression
- Classless InterDomain Routing (CIDR) IP Default Gateway
- IEEE 802.1Q ISL VLAN Mapping
- IEEE 802.1Q Tunneling
- IEEE 802.1Q VLAN Trunking
- IEEE 802.3x Flow Control
- MAC Address Filtering
- Spanning Tree Protocol-Backbone Fast Convergence
- Spanning Tree Protocol-Portfast Guard
- Spanning Tree Protocol-Uplink Fast Convergence
- Switch Port Analyzer (SPAN)
- Switch Port Analyzer (SPAN)—Disable Receive Traffic Destination Port
- Switch Port Analyzer (SPAN)—Multiple Source Port Selection
- Jumbo Frames

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xt/122xt_2/ft1636nm.htm.

7100 PA Support

The 7100 PA is a port of support for the following features and port adapters on the Cisco 7100: Turbo ACLs, cRTP Acceleration, PA-GE, PA-MC-2T1, PA-MC-2E1/120, PA-POS, PA-MC-4T1, PA-MC-8T1, PA-MC-8E1, PA 2FE, PA-T3+, and PA-2T3+.

AIM-ATM, AIM-VOICE-30, and AIM-ATM-VOICE-30 on the Cisco 2600 Series and Cisco 3660

Three types of Advanced Integration Modules (AIMs) provide components that provide segmentation and reassembly (SAR) of packets for ATM transport over a WAN and voice digital signal processing (DSP) services. The Cisco 2600 series has one internal slot for an AIM, and the Cisco 3660 has two. The three types of AIMs are as follows:

- AIM-ATM—A High-Performance ATM AIM that enables voice and data traffic to be carried over ATM networks using ATM Adaptation Layer 2 (AAL2) and ATM Adaptation Layer 5 (AAL5) encapsulation when installed in Cisco 2600 series or Cisco 3660 routers. If used in conjunction with a T1/E1 multiflex trunk voice/WAN interface card (VWIC-MFT) for circuit-mode data and frame-mode data over ATM infrastructures, it supports up to four T1 or E1 WAN interfaces. These interfaces may be four independent links or four inverse multiplexing over ATM (IMA) groups. When using the voice DSP capability of a digital T1/E1 packet voice trunk network module (NM-HDV) and a T1/E1 multiflex trunk VWIC, it supports as many as 30 channels of compressed voice over a T1/E1 trunk using AAL2 or AAL5. Analog Voice over ATM (VoATM) is enabled with a voice/fax network module (NM-1V or NM-2V) and a voice interface card, which support as many as four analog voice calls using AAL5. The following voice interface cards are supported: FXS, FXO, Analog-DID, E&M, and BRI.
- AIM-VOICE-30—An advanced integration module capable of supporting up to 30 voice or fax channels when used with one of the T1/E1 voice/WAN interface cards (such as VWIC-1T1). This AIM includes powerful digital signal processors (DSPs) that are used for a number of voice processing tasks such as voice compression and decompression, voice activity detection or silence suppression, and private branch exchange (PBX) or public switched telephone network (PSTN) signaling protocols. By using the AIM-VOICE-30 in a Cisco 2600 series router, customers can support Voice over IP (VoIP) or Voice over Frame Relay (VoFR) while the router's network module slot is left open for other functions such as asynchronous or synchronous serial concentration. When used in combination with one of the various ATM network modules, VoATM or VoIP over ATM can be provisioned using AAL5 and Voice over AAL2 (VoAAL2).
- AIM-ATM-VOICE-30—A combined ATM and DSP AIM that supports voice over ATM (VoATM), voice over IP (VoIP), and voice over Frame Relay (VoFR). It supports as many as four T1 or E1 trunks when installed in a Cisco 2600 series or Cisco 3660 router. This AIM is used in combination with one T1/E1 multiflex trunk interface (VWIC-MFT) to provide PBX or PSTN signaling protocols. It uses VoAAL2 (ITU I.366.1/I.363.2) and VoAAL5 and does not require use of a digital T1/E1 packet voice trunk network module. This AIM has an onboard ATM coprocessor for increased AAL2 and AAL5 performance and for as many as four IMA groups, enabling fractional T3 or E3 bandwidth performance.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_04gin.htm.

Analog Station Interface (ASI) Cards

Analog station interface (ASI) cards enable you to connect to analog telephones, fax machines, and teleconferencing stations. The following two ASI cards are available:

- ASI 81—Contains an 8-port Foreign Exchange Station (FXS) module and any one of the VIC/WIC/VWIC modules that support digital and analog voice trunks and WAN routing interfaces, completely integrating voice and data networking.
- ASI 160—Contains a 16-port FXS module.

ATM OC-12 Port Adapter

Platforms: Cisco 7500/RSP series with Versatile Interface Processor (VIP)

The ATM OC-12 Port Adapter is a dual-width ATM port adapter that provides a single-port, 622.08 Mbps connection from Cisco 7500 series routers to any ATM switch. The PA-A3 OC-12 includes two hardware versions (PA-A3-OC12MM and PA-A3-OC12SMI) that support the following standards-based physical interfaces:

- OC-12c/STM-4 multimode
- OC-12c/STM-4 single-mode intermediate reach

http://www.cisco.com/univercd/cc/td/doc/product/cable/cab_rout/cfig_nts/6228oc12/6228ovrn.htm.

Cisco 806 Broadband Gateway Router

The Cisco 806 Broadband Gateway Router adds business-class functionality to affordable broadband access for small offices and corporate telecommuters. Through the power of Cisco IOS technology, the Cisco 806 provides business-class security, remote management, and quality of service capabilities. These value-added features, with the proven reliability of Cisco IOS technology, provide the mission-critical networking required by today's agile businesses.

Cisco 1721 Router

The Cisco 1721 data-only modular access router is an enhanced Cisco 1720 router that provides higher performance, additional functionality, and increased memory capacity. The router supports WAN access, VPN, and firewall technology for secure Internet, intranet, and extranet access. Cisco 1721 routers also support standards-based IEEE 802.1Q VLAN routing, which enables enterprises to set up and route between multiple VLANs for additional security in an internal corporate network.

Cisco 3631 Series Router

Cisco IOS Release 12.2(8)T supports a new platform, the Cisco 3631 series router.

The Cisco 3631 is a new midrange router for Data Communication Network (DCN) applications that provides two network modules and two WICs, one Fast Ethernet port, one console port, and an auxiliary port. The Cisco 3631 is two rack units high in an 11-inch NEBS/ETSI-compliant chassis that functions at 70,000 pps.

Cisco 3725 Application Service Router

Cisco IOS Release 12.2(8)T supports a new platform, the Cisco 3725 router.

The Cisco 3725 Series Application Service Router is part of a new family of modular routers that enable flexible and scalable deployment of new e-business applications in an integrated branch office access platform.

The Cisco 3700 series are new access platforms optimized for the modular integration and consolidation of branch applications and services. The Cisco 3725 is a two-rack unit (RU) router equipped with two on-board Fast Ethernet (FE) interfaces, three WAN Interface Card (WIC) slots and two Advanced

Integration Module (AIM) slots, and two network module (NM) slots. The Cisco 3725 also includes optional -48vDC integrated inline power to support IP Telephony when used with an EtherSwitch network module.

Cisco 3745 Application Service Router

Cisco IOS Release 12.2(8)T supports a new platform, the Cisco 3745 router.

The Cisco 3745 Series Application Service Router is part of a new family of modular routers that enable flexible and scalable deployment of new e-business applications in an integrated branch office access platform.

The Cisco 3745 is a three-rack unit (RU) router equipped with two on-board Fast Ethernet (FE) interfaces, three WAN Interface Card (WIC) slots and two Advanced Integration Module (AIM) slots, and two network module (NM) slots. The Cisco 3745 also includes optional 48vDC integrated inline power, internal redundant AC or DC Power options, and Online Insertion and Removal (OIR) capabilities for like network modules.

The Cisco 3700 series is ideal for sites and solutions requiring the highest levels of integration at the edge, such as:

- Integration of flexible routing and low density switching
- Single platform solution for Branch Office IP Telephony and Voice Gateway allowing flexible, incremental migration and service integration
- Consolidation of service infrastructure and high service density in a compact form factor

Cisco High-Density Analog Voice and Fax Network Module

The Cisco High-Density Analog Voice and Fax Network Module provides dual tone multifrequency (DTMF) detection, voice compression and decompression, call progress tone generation, voice activity detection (VAD), echo cancellation, and adaptive jitter buffering for up to 16 ports.

The base card supports four foreign exchange station (FXS) ports. The addition of an eight-port FXS expansion module can increase the capacity to twelve FXS ports. The addition of two four-port FXO expansion modules can increase the capacity to eight FXO ports and four FXS ports. The addition of one each of the FXS and FXO expansion modules can increase the capacity to twelve FXS ports and four FXO ports. The FXO expansion module supports a power failure port, which connects directly to the central office (CO) in case of failure.

The digital signal processors (DSPs) on the network module support up to eight ports of high-complexity codecs or up to sixteen ports of medium-complexity and low-complexity codecs. The number of DSPs must be increased if more than eight ports of high-complexity codecs are needed. In this case, a DSP expansion module must be installed.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xt/122xt_2/ft_hdanm.htm.

Cisco IOS Voice Features on IGX 8400 Series Universal Router Module

The Universal Router Module (URM) is a Cisco IOS-based IP router blade that enables users to provision Voice over IP (VoIP) and Voice over ATM (VoATM) on a Cisco IGX 8400 series platform. The voice and routing capabilities of the URM have been derived from the Cisco 3660, while the ATM capabilities have been derived from the ATM OC/3 network module for the Cisco 2600 series and

Cisco 3600 series routers. The embedded UXM-E processor supports one OC3 ATM port, and the embedded router supports one OC3 ATM port similar to the 1-port OC-3/STM-1 ATM Circuit Emulation Service network module for the Cisco 3600 series routers. These ATM ports are connected to each other internally.

In addition to VoIP and VoATM, IP routing and Cisco IOS command-line interface (CLI) commands, which enable configuration of the voice ports and dial peers, are now available on the Cisco IGX 8400 series platforms.

The URM interoperates with all Cisco IOS-based voice products and supports 30 voice channels with high-complexity codec types and 60 voice channels with medium-complexity codec types. Note that only digital voice ports are supported on the URM; analog ports are not supported.

The URM also provides support for MPLS, IP Security (IPSec), remote embedded router configuration of the URM (a RAS feature), and support for Enterprise Plus features. Using the BC-URI-2FE back card, you can use the URM for data-only access. Also, support for VPN-AIM/HP enables the URM to provide hardware-accelerated encryption for scalable IPSec-VPN networks.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ft_igxxb.htm.

Digital J1 Voice Interface Card

The J1 interface card provides the proper interface for directly connecting Cisco multiservice access routers to Japanese Private Branch Exchanges (PBXs) that use a J1 interface (2.048 Mbps TDM interface). This interface card supports 30 voice channels per port.

It provides the software and hardware features required to connect to over 80 percent of the Japanese PBXs that use digital interfaces. This new J1 voice interface card (VIC) provides a TTC JJ-20.11 compliant interface between high-density voice network modules (NM-HDV) and a Japanese PBX.

The digital J1 card provides a single-port line interface in a VIC form factor. It is specifically designed to conform to the TTC JJ-20.10-12 standards that define the interface between a PBX and time-division multiplexer (TDM).

For additional information about the Digital J1 Voice Interface Card, refer to the following document:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftj1voip.htm.

G.SHDSL Symmetric DSL Support

Note The G.SHDSL Symmetric DSL Support feature is also known under the feature title 1-Port G.SHDSL WAN Interface Card for Cisco 2600 Series and Cisco 3600 Series Routers.

G.SHDSL is an ATM-based, multirate, high-speed (up to 2.3 MB), symmetrical digital subscriber line technology for data transfer between a single customer premises equipment (CPE) subscriber and a central office.

G.SHDSL is supported on the G.SHDSL WAN interface card (WIC-1SHDSL), a 1-port WAN interface card (WIC) for Cisco 2600 series and Cisco 3600 series routers.

The G.SHDSL WIC is compatible with the Cisco 6015, Cisco 6130, Cisco 6160, and Cisco 6260 Digital Subscriber Line Access Multiplexers (DSLAMs). The DSLAM must be equipped with G.SHDSL line cards that are compatible with the DSL service to be configured.

The G.SHDSL WIC supports ATM Adaptation Layer 2 (AAL2), ATM Adaptation Layer 5 (AAL5), and various classes of service for ATM.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_gdsl8.htm.

Multichannel STM-1 Port Adapter

The Multichannel STM-1 Port Adapter is a high-speed, single-port multichannel STM-1 port adapter. You can configure the PA-MC-STM-1 as a multichannel E1/E0 STM-1 port.

The PA-MC-STM-1 can be configured into 63 individual E1 links. Each E1 link can carry a single channel at full or fractional rates or be broken down into multiple DS0 or nx64 Kbps rates. The PA-MC-STM-1 supports up to three TUG-3/AU-3 transport slots numbered 1 through 3. You can configure each TUG-3/AU-3 to carry 21 SDH TU-12s. Each SDH TU-12 is capable of carrying a channelized E1 frame, which can be unchannelized to nx64-Kbps time slots.

For additional information about the Multichannel STM-1 Port Adapter, refer to the following document:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_stm5.htm.

NM-AIC-64, Contact Closure Network Module

The NM-AIC-64, Contact Closure Network Module (also known as the AIC) is an optional card that expands network management capabilities for customer-defined alarms. The AIC has its own CPU that communicates with the router and external media through serial communication channels. The AIC reduces service provider and enterprise operating costs by providing a flexible, low-cost network solution for migrating existing data communications networks (DCNs) to IP-based DCNs. The AIC provides its users with a single box solution because it can be configured in the same router along with other operations, alarm administration, maintenance management, and provisioning (OAM&P) interfaces.

This feature was first introduced on the Cisco 2600 series and Cisco 3600 series platforms in Cisco IOS Release 12.2(2)XG. For Cisco IOS Release 12.2(8)T, platform support for the Cisco 3631 has been added.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_aicnm.htm.

URM LAN

On the Cisco IGX 8400 series, the Universal Router Module (URM) has been enhanced by new LAN features such as Security and VPN. Installed URMs can be enabled with the new features by upgrading to IGX switch software 9.3.30 and Cisco IOS Release 12.2(2)XX as well as by adding an AIM-VPN daughter module to the URM. Also, a new, price-reduced back card for the URM with 2 FE ports (BC-URI-2FE) for LAN services will be supported. URM together with the voice-enabled back cards (BC-URI-2FE2V-E1/T1) will support the new LAN.

New Software Features in Cisco IOS Release 12.2(8)T

The following new features are supported in Cisco IOS Release 12.2(8)T. Some of these features may have been introduced on other hardware platforms in earlier Cisco IOS software releases.

ACL Authentication of Incoming rsh and rcp Requests

To enable the Cisco IOS software to receive incoming remote shell (rsh) protocol and remote copy (rcp) protocol requests, customers must configure an authentication database to control access to the router. This configuration is accomplished by using the **ip rcmd remote-host** command.

Currently, when using this command, customers must specify the local user, the remote host, and the remote user in the database authentication configuration. For users who can execute commands to the router from multiple hosts, multiple database authentication configuration entries must be used, one for each host.

This feature allows customers to specify an access list for a given user. The access list identifies the hosts to which the user has access. A new argument, *access-list*, has been added that can be used with this command to specify the access list.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftauth.htm.

Asynchronous Serial Traffic Over User Datagram Protocol (UDP)

The Asynchronous Serial Traffic Over User Datagram Protocol (UDP) feature provides the ability to encapsulate asynchronous data into UDP packets, and then unreliably transmit this data without needing to establish a connection with a receiving device.

You load the data you want to transmit through an asynchronous port, and then transmit it, optionally, as a multicast or a broadcast. The receiving device(s) can then receive the data whenever it wants. If the receiver ends reception, the transmission is unaffected.

This process is referred to as UDP Telnet (UDPTN), although it does not---and cannot---use the Telnet protocol. UDPTN is similar to Telnet in that both are used to transmit data, but UDPTN is unique in that it does not require that a connection be established with a receiving device.

ATM PVC Bundle Enhancement—MPLS EXP-Based PVC Selection

The ATM PVC Bundle Enhancement — MPLS EXP-Based PVC Selection feature is an extension to the IP to ATM Class of Service feature suite. The IP to ATM Class of Service feature suite, using virtual circuit (VC) support and bundle management, maps quality of service (QoS) characteristics between IP and ATM. It provides customers who have multiple VCs (with varying qualities of service to the same destination) the ability to build a QoS differentiated network.

The IP to ATM Class of Service feature suite allowed customers to use IP precedence level as the selection criteria for packet forwarding. This new feature now gives customers the option of using th Multiprotocol Label Switching (MPLS) experimental (EXP) level as an additional selection criteria for packet forwarding.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftmpls.htm.

ATM Software Segmentation and Reassembly (SAR)

The ATM Software Segmentation and Reassembly (SAR) feature allows the Cisco 2600 series to carry voice and data traffic over ATM networks using ATM Adaptation Layer 2 (AAL2) and AAL5 and allows the Cisco 3660 router to support AAL2 voice traffic.

For the Cisco 2600 series, this feature works in conjunction with the T1/E1 multiflex voice/WAN interface card (VWIC), which is plugged into a WIC slot to provide one ATM WAN interface at a T1/E1 rate supporting up to 24/30 voice channel.

T1/E1 ATM support is a time-to-market feature that helps service providers take advantage of the inherent quality of service (QoS) features of ATM multiservice applications. FR-ATM (FRF.5 and FRF.8) internetworking is supported on the Cisco 2600 series.

On the Cisco 3660, a T1 IMA network module is used as the Inverse Multiplexing ATM (IMA) interface providing a maximum of one ATM IMA interface that supports up to 48/60 voice channels. Up to eight T1/E1s and multiple IMA groups are permitted, but only the first IMA group supports voice over AAL2 for up to 48/60 voice channels.

NM-IMA already supports AAL5 on both the Cisco 2600 series and Cisco 3600 series (not just the Cisco 3660).

The Cisco 2600 Series T1/E1 ATM portion of this feature provides a shared implementation of the ATM features currently available on the Cisco MC3810 with the Cisco 2600 series.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ft_t1atm.htm.

ATM SVC Troubleshooting Enhancements

The ATM SVC Troubleshooting Enhancements feature introduces the following two new debug commands: **debug atm native** and **debug atm nmba**. These commands can be used to troubleshoot ATM switched virtual circuits (SVCs). The **debug atm nbma** and **debug atm native** commands are used to debug problems with Resource Reservation Protocol (RSVP) SVC creation and teardown. The **debug atm native** command can also be used to debug problems with SVCs created using static maps.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftsvctrb.htm.

BGP Hide Local-Autonomous System

The BGP Hide Local-Autonomous System feature introduces the **no-prepend** keyword to the **neighbor local-as** command. The use of the **no-prepend** keyword allows a network operator to configure a Border Gateway Protocol (BGP) speaker to not prepend the local autonomous system number to any routes that are received from external peers. This feature can be used to help transparently change the autonomous system number of a BGP network and ensure that routes can be propagated throughout the autonomous system, while the autonomous system number transition is incomplete. Because the local autonomous is not prepended to these routes, external routes will not be rejected by internal peers during the transition from one autonomous system number to another.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftbgphla.htm.

BGP Named Community Lists

The BGP Named Community Lists feature introduces a new type of community list called the named community list. The BGP Named Community Lists feature allows the network operator to assign meaningful names to community lists and increases the number of community lists that can be configured. A named community list can be configured with regular expressions and with numbered community lists. All rules of numbered communities apply to named community lists except that there is no limitation on the number of community attributes that can be configured for a named community list.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftbgpncl.htm.

BIP—BSC to IP Conversion for Automated Teller Machines

The Bisync-to-IP (BIP) Conversion for Automated Teller Machines feature enables customers to attach a binary synchronous (bisync) communication automated teller machine to a serial interface on a Cisco router running bisync-to-IP (BIP) protocol translation and then to route the data over a TCP/IP network directly to an IP-based application host.

Call Admission Control for H.323 VoIP Gateways

Call Admission Control for H.323 VoIP Gateways feature set provides the ability to support resource-based call admission control processes. These resources include system resources such as CPU, memory, and call volume and interface resources such as call volume.

If system resources are not available to admit the call, the following two kinds of actions are provided: system denial (which busyouts all of T1 or E1) or per-call denial (which disconnects, hairpins, or plays a message or tone). If the interface-based resource is not available to admit the call, the call is dropped from the session protocol (such as H.323).

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_cac7x.htm.

CDP and ODR Support for ATM PVCs

This feature introduces support for the Cisco Discovery Protocol (CDP) over ATM point-to-point permanent virtual circuits (PVCs). Prior to this release, CDP discovery messages were not supported over ATM interfaces.

CDP is a Cisco proprietary device discovery protocol. Each Cisco device periodically sends messages to a multicast address. These messages advertise information about that device, such as the system ID (name), capabilities, Cisco IOS software version, and the network address of the connected interface. This information will be picked up by any neighboring Cisco devices on the same medium, which are listening for CDP advertisements. The information learned about neighboring devices is available through the Cisco IOS CLI **show cdp** commands and through SNMP monitoring using the CDP MIB.

This feature also adds support for On-Demand Routing (ODR) over ATM PVCs. ODR uses CDP to propagate IP address information in hub-and-spoke topologies. When ODR is enabled, spoke routers automatically advertise their subnets using CDP.

CDP is disabled by default for ATM PVC interfaces. To enable CDP, use the **cdp run** global configuration mode command and the **cdp enable** interface configuration mode command on both ends of the PVC. To enable ODR, use the **router odr** global configuration mode command on the hub router and turn off any dynamic routing protocols in the spoke routers.

For details on configuring CDP, refer to the following documentation:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122cgcr/ffun_c/fcfprt3/fcf015.htm.

For details on configuring ODR, refer to the following documentation:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122cgcr/fipr_c/ipcprt2/1cfodr.htm.

Cisco Discovery Protocol (CDP)— IPv6 Address Family Support for Neighbor Information

The CDP IPv6 Address Family Support for Neighbor Information feature adds the ability to transfer IPv6 addressing information between two Cisco devices using Cisco Discovery Protocol (CDP). CDP in IPv6 functions the same as and offers the same benefits as CDP in IPv4. IPv6 enhancements to CDP allow CDP to exchange IPv6 and neighbor addressing information. IPv6 CDP provides IPv6 information to network management products and provides troubleshooting tools.

CEF-Switched Multipoint GRE Tunnels

The CEF-Switched Multipoint GRE Tunnels feature enables CEF switching of IP traffic to and from multipoint GRE tunnels. Tunnel traffic can be forwarded to a prefix through a tunnel destination when both the prefix and the tunnel destination are specified by the application.

Certificate Autoenrollment

The Certificate Autoenrollment feature allows you to configure your router to automatically request a certificate from the certification authority (CA) that is using the parameters in the configuration. Thus, operator convention is no longer required at the time the enrollment request is sent to the CA server.

Automatic enrollment will be performed on startup for any trustpoint CA that is configured and does not have a valid certificate. When the certificate—which is issued by a trustpoint CA that has been configured for autoenrollment—expires, a new certificate is requested. Although this feature does not provide seamless certificate renewal, it does provide unattended recovery from expiration.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftautoen.htm.

Certificate Enrollment Enhancements

The Certificate Enrollment Enhancements feature introduces five new subcommands to the **crypto ca trustpoint** command—**ip-address** (ca-trustpoint), **password** (ca-trustpoint), **serial-number**, **subject-name**, and **usage**. These commands provide new options for certificate requests and allow users to specify fields in the configuration instead of having to go through prompts. (However, the prompting behavior remains the default if this feature is not enabled.) Thus, users can preload all necessary information into the configuration, allowing each router to obtain its certificate automatically when it is booted.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftenrol2.htm.

CISCO-BULK-FILE-MIB Enhancements

The Cisco Bulk File Creation MIB (CISCO-BULK-FILE-MIB.my) is a MIB module for creating and deleting bulk files of SNMP data for file transfer. The CISCO-BULK-FILE-MIB Enhancements feature enhances the Cisco Bulk File Creation MIB to support selective-row-transfer and notification-on-file-creation. Prior to this enhancement, when the MIB was used to dump large tables (for example, the ccHistoryTable), much of the data transfer consisted of duplicated data. This feature allows the SNMP manager to specify a starting row in the SNMP Get request.

This feature also introduces a notification that can be sent when file creation is complete or when there is an error during file creation. Specifically, this feature modifies the CISCO-BULK-FILE-MIB by introducing four new MIB objects (cbfDefineFileNotifyOnCompletion, cbfDefineObjectTableInstance, cbfDefineObjectNumEntries, cbfDefineObjectLastPolledInst) and a new notification object (cbfDefineFileCompletion). For details, refer to the CISCO-BULK-FILE-MIB.my file, available through Cisco.com MIB FTP site at the following URL:

ftp://ftp.cisco.com/pub/mibs/v2/CISCO-BULK-FILE-MIB.my.

Cisco Gateway Management Agent (CGMA) Phase 2

The Cisco Gateway Management Agent (CGMA) Phase 2 feature provides additional enhancements for the Cisco Gateway Management Agent (CGMA) feature. The CGMA provides an eXtensible Markup Language (XML) interface to support real-time management of a Cisco IOS gateway. Currently, gateways provide statistics using Simple Network Management Protocol (SNMP) and do not support real-time polling. The CGMA feature allows gateways to communicate with third-party management applications using XML over TCP/IP.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftcgma2.htm.

Cisco Hoot and Holler over IP

The Cisco Hoot and Holler over IP feature can now be ported to the Cisco 1750, 1751, and 1760 routers in Cisco IOS Release 12.2(8)T. The feature is already available on the Cisco 2600 and 3600 series routers.

Cisco VoIP technology, which was initially focused on traditional PBX toll-bypass applications, can be used to combine hoot and holler networks with data networks. While some customers may have integrated hoot and data to some level in the late 1980s with time-division multiplexing (TDM), this form of integration does not allow for dynamic sharing of bandwidth that is characteristic of VoIP. This dynamic sharing of bandwidth is even more compelling with hoot and holler than with a toll-bypass application because some hoot circuits may be active for an hour or two for morning reports but dead for the rest of the day. The idle bandwidth can be used by the data applications during these long periods of inactivity.

Beginning with Cisco IOS Release 12.1(2)XH, Cisco hoot and holler over IP can be implemented usir Cisco VoIP technology. This solution leverages Cisco IOS expertise in VoIP, quality of service (QoS), and IP multiplexing and is available on Cisco 1750, 1751, and 1760 routers and on Cisco 2600 and 3600 series multiservice routers.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_hhip.htm.

Cisco IOS Firewall Performance Improvements

The Cisco IOS Firewall Performance Improvements feature introduces the following three performance metrics for Context-Based Access Control (CBAC):

- Throughput Improvement—Allows users to dynamically change the size of the session hash table without reloading the router by using the **ip inspect hashtable** command. By increasing the size of the hash table, the number of sessions per hash bucket can be reduced, which improves the throughput performance of the base engine.
- Connections per Second Improvement—Allows only the first packet of any connection to be bumped up to the process switching path while the remaining packets are processed by the base engine in the fast path. Thus, the base engine is no longer slowed down by bumping up several packets or by processing packets twice.
- CPU Utilization Improvement—Allows the CPU utilization of the router running CBAC to be measured while a specific throughput or connections per second metric is maintained. This improvement is used in conjunction with the throughput and connections per second metrics.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftfirewl.htm.

Cisco IOS Telephony Service Version 2.0

The Cisco IOS Telephony Service, under the IP Telephony services umbrella, provides basic Cisco IP phone call-handling capabilities in a LAN environment on the Cisco routers. This feature enables the Cisco multiservice routers to act as the Cisco IOS Telephony Service for the Cisco IP Phone 7960, Cisco IP Phone 7940, Cisco IP Phone 7910, and Cisco IP Conference Station 7935. This feature also helps download phone software images and configures and manages the Cisco IP phones in your LAN. The Cisco IOS Telephony Service provides you with a telephony system perfect for a small office with a small number of extensions.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/access/ip_ph/ip_ks/ipkey2.htm.

Cisco Service Assurance Agent Support for the Cisco 820 Series and SOHO 70 Series

Cisco IOS Release 12.2(8)T adds support for the Cisco Service Assurance Agent feature to Cisco 820 series and Cisco SOHO 70 series routers. For information on configuration for the Cisco Service Assurance Agent, refer to the following location:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122cgcr/ffun_c/fcfprt3/fcf017.htm.

The Cisco 820 series and SOHO 70 series do not currently support the Cisco Service Assurance Agent Application Performance Monitor (APM) feature.

Class-Based Weighted Fair Queueing (CBWFQ)

Class-based weighted fair queueing (CBWFQ) extends the standard WFQ functionality to provide support for user-defined traffic classes. For CBWFQ, you define traffic classes based on match criteria including protocols, access control lists (ACLs), and input interfaces. Packets satisfying the match criteria for a class constitute the traffic for that class. A queue is reserved for each class, and traffic belonging to a class is directed to the queue for that class.

CNS Agents SSL Security

CNS Agents SSL Security is a Cisco IOS software feature that allows for the configuration of a secure connection between the CNS Agent, running on the Cisco IOS software-based device, and a CNS Server. Secure Socket Layer (SSL) encryption for CNS connections is enabled on the Cisco IOS device (CNS Agent) side using the **encrypt** keyword with the **cns config initial** or **cns config partial** global configuration mode commands.

CNS Flow-Through Provisioning

The CNS Flow-Through Provisioning feature provides the infrastructure for automated configuration of network devices on a mass scale. Based on the already released 12.2 T CNS event and configuration agents, this extra functionality facilitates the industry's first true "zero-touch" network deployment solution, eliminating the need for the traditional technician truck-roll associated with initial device turn-up. This IOS infrastructure interoperates with CNS IE2100 Intelligent Network Engine, creating the foundation for a closed loop binding of the service provider's operational systems, business systems, and Cisco's order process into a single e-business solution. The result is the first automated work flow ranging from initial subscriber order-entry, through Cisco manufacturing and shipping, to final device provisioning and subscriber billing. This process focuses on a root problem of today's service provider business model—use of human labor in the mass production process of subscriber service activation.

Configurable PSTN Cause Code to SIP Response Mapping

For calls to be established between a Session Initiation Protocol (SIP) network and a Public Switched Telephone Network (PSTN), the two networks must be able to interoperate. One aspect of their interoperation is the mapping of PSTN cause codes, which indicate reasons for PSTN call failure or completion, to SIP status codes or events. The opposite is also true: SIP status codes or events are mapped to PSTN cause codes. Event mapping tables in the document referenced below show the standard or default mappings between SIP and PSTN.

However, you may want to customize the SIP user agent software to override the default mappings between the SIP and PSTN networks. The Configurable PSTN Cause Code to SIP Response Mapping feature allows you to configure specific map settings between the PSTN and SIP networks. Thus, any SIP status code can be mapped to any PSTN cause code, and vice versa. When set, these settings can be stored in NVRAM and are restored automatically on bootup.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftmap.htm

Default VPDN Group Template

The Default VPDN Group Template feature introduces the ability to configure global default values for virtual private dialup network (VPDN) parameters in a VPDN template. These global default values are applied to all VPDN groups, unless specific values are configured for individual VPDN groups. Previously, the Cisco IOS software required that VPDN parameters be configured for each individual VPDN group if the system default values were not desired.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftdevpdn.htm.

DHCP Client—Dynamic Subnet Allocation API

The DHCP Client–Dynamic Subnet Allocation API feature is an application program interface (API) that is called by the DHCP Server–On-Demand Address Pool Manager feature for obtaining a subnet or releasing a subnet to the source server via DHCP. This feature allows automated configuration of layer 3 devices for simplified deployment.

DHCP Client on WAN Interfaces

The DHCP Client on WAN Interfaces feature extends the Dynamic Host Configuration Protocol (DHCP) to allow PPP over ATM (PPPoA) and certain ATM interfaces to acquire an IP address through DHCP. By using DHCP rather than the IP Control Protocol (IPCP), a DHCP client can acquire other useful information such as DNS server addresses, the DNS default domain name, and default route.

Previously, the **ip address dhcp** interface configuration command could only be used on Ethernet interfaces. This feature allows the **ip address dhcp** command to be used on WAN interfaces.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftwandhp.htm.

DHCP Relay—MPLS VPN Support

The DHCP relay agent information option (option 82) enables a Dynamic Host Configuration Protocol (DHCP) relay agent to include information about itself when forwarding client-originated DHCP packets to a DHCP server. The DHCP server can use this information to implement IP address or other parameter-assignment policies. The DHCP relay agent information option is organized as a single DHCP option that contains one or more suboptions that convey information known by the relay agent.

In some environments, a relay agent resides in a network element that also has access to one or more Multiprotocol Label Switching (MPLS) Virtual Private Networks (VPNs). A DHCP server that wants to offer service to DHCP clients on those different VPNs needs to know the VPN in which each client resides. The network element that contains the relay agent typically knows about the VPN association of the DHCP client and includes this information in the relay agent information option.

The DHCP Relay–MPLS VPN Support feature allows the relay agent to forward this necessary VPN-related information to the DHCP server using the following three suboptions of the DHCP relay agent information option:

- VPN identifier
- Subnet selection
- Server identifier override

The DHCP Relay–MPLS VPN Support feature enables a network administrator to conserve address space by allowing overlapping addresses. The relay agent can now support multiple clients on different VPNs, and many of these clients from different VPNs can share the same IP address.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftdhmpls.htm.

DHCP Server—On-Demand Address Pool Manager

The DHCP Server–On-Demand Address Pool Manager is a feature in which pools of IP addresses can be dynamically increased or reduced in size depending on the address utilization level. This feature supports address assignment using the Dynamic Host Configuration Protocol (DHCP) for customers using private addresses. Each on-demand address pool (ODAP) is configured and associated with a particular Multiprotocol Label Switching (MPLS) Virtual Private Network (VPN).

When configured, the ODAP is populated with one or more subnets leased from a source server and is ready to serve address requests from DHCP clients or from PPP sessions. The source server can be a remote DHCP server or a RADIUS server (via AAA). Currently, only the Cisco Access Registrar RADIUS server supports ODAPs. Subnets can be added to the pool when a certain utilization level (high utilization mark) is achieved. When the utilization level falls below a certain level (low utilization mark), a subnet can be returned to the server from which it was originally leased.

This feature allows customers to optimize their use of IP addresses, thus conserving address space.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftondhcp.htm.

DHCP Server—Option to Ignore All BOOTP Requests

The DHCP Server—Option to Ignore All BOOTP Requests feature introduces the following new global configuration command: **ip dhcp bootp ignore**. This command allows the Cisco IOS DHCP server to ignore received BOOTP requests.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftdbootp.htm.

DHCP Server Options Import and Autoconfiguration

The Cisco IOS DHCP server was enhanced to allow configuration information to be updated automatically. Network administrators can configure one or more centralized DHCP servers to update specific DHCP options within the DHCP pools. The remote servers can request or "import" these option parameters from the centralized servers.

This feature was originally introduced in Cisco IOS Release 12.1(2)T. This release is porting the feature into the Cisco 800 series platform.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios121/121newft/121t/121t2/dt_dhcpi.htr

Dialer Map VRF-Aware for an MPLS VPN

The Cisco IOS Release 12.2(8)T dialer software is "VRF-aware for an MPLS VPN," which means that it can distinguish between two destinations with the same IP address using information stored in a virtual routing and forwarding instance (VRF). The VRF is identified based on the incoming interface of the packet and is used with a defined destination IP address to determine the telephone number to be dialed.

The Dialer Map VRF-Aware for an MPLS VPN feature allows the dialer software to dial out in a Multiprotocol Label Switching (MPLS)-based Virtual Private Network (VPN). The MPLS VPN model simplifies network routing by allowing several sites to transparently interconnect through the service provider network. One service provider network can support several different IP VPNs, each of which appears to its users as a separate, private network. Within a VPN, each site can send IP packets to any other site in the same VPN because each VPN is associated with one or more VRFs. The VRF is a key element in the VPN technology because it maintains the routing information that defines a customer VPN site.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftmapvrf.htm.

Dialer Watch Connect Delay

The Dialer Watch Connect Delay feature introduces the ability to configure a delay in bringing up a secondary link when a primary link that is monitored by Dialer Watch goes down and is removed from the routing table. Previously, the router would instantly dial a secondary route without allowing time for the primary route to come back up. When the Dialer Watch Connect Delay feature is configured, the router will check for availability of the primary link at the end of the specified delay time before dialing the secondary link.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftdialwl.htm.

Diff-Serv-aware MPLS Traffic Engineering

MPLS traffic engineering allows constraint-based routing of IP traffic. One of the constraints satisfied by constant bit rate (CBR) is the availability of required bandwidth over a selected path. Diff-Serv-aware Traffic Engineering extends MPLS traffic engineering to enable you to perform constraint-based routing of "guaranteed" traffic, which satisfies a more restrictive bandwidth constraint than that satisfied by CBR for regular traffic. This ability to satisfy a more restrictive bandwidth constraint translates into an ability to achieve higher quality of service performance (in terms of delay, jitter, or loss) for the guaranteed traffic. Results include virtual leased lines and voice-trunking services.

This release adds support for label-controlled ATM (LC-ATM) interfaces. Previous releases supported Packet-over-SONNET (POS) and ATM permanent virtual circuit (PVC) interfaces.

Disabling V.110 Padding

In networks with devices such as terminal adapters (TAs) and global system for mobile communication (GSM) handsets that do not fully conform to the V.110 modem standard, you will need to disable V.110 padding. To disable the padded V.110 modem speed report required by the V.110 modem standard, use the **no isdn v110 padding** command in interface configuration mode.

DistributedDirector Boomerang Support

Boomerang is a Director Response Protocol (DRP) metric for DistributedDirector. The boomerang server provides a way to select a content server with the fastest response time from a group of redundant content servers. Instead of relying on static maps, boomerang dynamically recognizes problems such as congestion and link failures and avoids them. The content server with the fastest response time, as determined by the priority of the configured metrics, is determined to be the best site.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftddboom.htm

DistributedDirector Cache Auto Refresh

The DistributedDirector Cache Auto Refresh feature works in the background to continuously update all entries in the DistributedDirector cache. When this background refresh feature is initiated, DistributedDirector periodically updates all expired cache entries. The DistributedDirector cache saves the latest answers to all past Domain Name System (DNS) queries that were received since cache auto refresh was initiated, and any repeat request is served directly from the cache when caching is enabled.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftrefrsh.htm.

DistributedDirector Configurable Cache

DistributedDirector maintains an internal cache of entries, which is dynamically configurable. This internal configurable cache consists of sorting events that occur on a per-client basis. Users can configure both the variable size of this internal cache and the amount of time the DistributedDirector system will retain per-client sorting information.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftddcach.htm.

DistributedDirector MIB Support

The Cisco DistributedDirector MIB provides MIB support for DistributedDirector. This MIB contains DistributedDirector statistics, configurations, and status.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftddmib.htm.

Distributed LFI/dQoS over Leased Lines

Note The Distributed LFI/dQoS over Leased Lines feature is also known under the feature title Distributed Link Fragmentation and Interleaving over Leased Lines.

The Distributed LFI/dQoS over Leased Lines feature extends distributed link fragmentation (dLFI) and interleaving functionality on the VIP-enabled Cisco 7500 series routers to leased lines. Previously, Distributed Link Fragmentation and Interleaving was only available for Frame Relay and ATM.

Note Distributed Link Fragmentation and Interleaving for Frame Relay, ATM, and Leased Lines is referred to as dLFI in this feature description.

The dLFI feature supports the transport of real-time traffic, such as voice, and non-real-time traffic, such as data, on lower-speed Frame Relay and ATM virtual circuits (VCs) and on leased lines without causing excessive delay to the real-time traffic.

This feature is implemented using multilink PPP (MLP) over Frame Relay, ATM, and leased lines on VIP-enabled Cisco 7500 series routers. The feature enables delay-sensitive real-time packets and non-real-time packets to share the same link by fragmenting the large data packets into a sequence of smaller data packets (fragments). The fragments are then interleaved with the real-time packets. On the receiving side of the link, the fragments are reassembled and the packet reconstructed.

The dLFI feature is often useful in networks that send real-time traffic using Distributed Low Latency Queueing, such as voice, but have bandwidth problems that delay this real-time traffic due to the transport of large, less time-sensitive data packets. The dLFI feature can be used in these networks to disassemble the large data packets into multiple segments. The real-time traffic packets then can be sent between these segments of the data packets. In this scenario, the real-time traffic does not experience a lengthy delay waiting for the low-priority data packets to traverse the network. The data packets are reassembled at the receiving side of the link, so the data is delivered intact.

The ability to configure Quality of Service (QoS) using the Modular QoS CLI while also using distributed MLP (dMLP) is also introduced as part of the dLFI feature. The ability to configure QoS using the Modular QoS CLI while using dMLP was not supported prior to the introduction of the dLFI feature.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftdlfi2.htm.

Distributed Multilink Point-to-Point Protocol

The Distributed Multilink Point-to-Point Protocol (dMLPPP) feature allows you to combine T1/E1 lines in a Versatile Interface Processor (VIP) on a Cisco 7500 series router into a bundle that has the combined bandwidth of multiple T1/E1 lines. This is done by using a VIP MLPPP link. You choose the number of bundles and the number of T1/E1 lines in each bundle. This allows you to increase the bandwidth of your network links beyond that of a single T1/E1 line without having to purchase a T3 line. Non-distributed MLPPP can only perform limited links, with CPU utilization quickly reaching 90% with only a few T1/E1 lines running MLPPP. With distributed MLP, you can increase the router's total capacity. DMLP supports bundling of fractional T1/E1 starting from DS0(64KBps) onwards.

Multiprotocol Label Switching (MPLS) and MPLS-VPN configurations are supported on DMLP bundle interfaces. As of Cisco IOS Release 12.2(8)T, Class-Based Weighted Fair Queueing (CBWFQ) and Low Latency Queueing (LLQ) are supported on DMLP.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios120/120newft/120t/120t3/multippp.htm.

DNS Client AAAA Record Lookups over IPv6

The DNS Lookups over an IPv6 Transport feature adds support for IPv6 AAAA record types over an IPv6 transport in the Domain Name System (DNS) name-to-address and address-to-name lookup processes.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t2/ipv6/index.htm.

DRP Agent—Boomerang Support

Boomerang is a Director Response Protocol (DRP) metric for DistributedDirector. When the boomerang metric is active, DistributedDirector instructs the DRP to send Domain Name Service (DNS) responses directly back to the querying client. The DNS response contains the addresses of the sites associated with the respective DRP agent. All involved DRPs send back their DNS responses at the same time. The packet of the DRP that is at shortest delay to the client will arrive first. The client may take the first answer and ignore subsequent ones, a standard behavior of all local DNS server implementations. The DRP agent allows configuration for full boomerang support. The boomerang client is the DRP agent.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftdrpcli.htm.

Dual Tone Multifrequency (DTMF) Relay for SIP Calls Using Named Telephone Events

The Dual Tone Multifrequency (DTMF) Relay for SIP Calls Using Named Telephone Events (NTE) feature provides reliable digit relay between Cisco VoIP gateways when a low bandwidth codec is used. Using NTE to relay DTMF tones provides a standardized means of transporting DTMF tones in Real-Time Transport Protocol (RTP) packets. This feature also adds SIP phone support.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ft_dtmf.htm.

Easy VPN Server

The Easy VPN Server feature introduces server support for the Cisco VPN Client Release 3.x software clients and Cisco VPN hardware clients. It allows a remote end user to communicate using IP Security (IPSec) with any Cisco IOS Virtual Private Network (VPN) gateway. Centrally managed IPSec policies are "pushed" to the client by the server, minimizing configuration by the end user.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftunity.htm.

Enabling Fax Rate on POTS to POTS Fax Calls

This command line interface (CLI) change was made to enable a fax relay between two plain old telephone service (POTS) dial peers to cover the case in which a fax call fails if it is made without DSP (digital signal processor) involvement.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftfxpots.htm.

Encrypted Vendor-Specific Attributes

The Encrypted Vendor-Specific Attributes feature introduces support for the following three types of string vendor-specific attributes (VSAs):

- Tagged string VSA—To retrieve the right value for this VSA, the Tag field must be parsed correctly. The value for this field can range only from 0x01 through 0x1F. If the value is not within the specified range, the RADIUS server will ignore the value and consider the Tag field to be a part of the attribute string field.
- Encrypted string VSA—This VSA has a Salt field that ensures the uniqueness of the encryption key that is used to encrypt each instance of the VSA. The first and most significant bit of the Salt field must be set to 1.
- Tagged and Encrypted string VSA—This VSA is similar to encrypted string VSAs *except* this VSA has an additional Tag field. If the Tag field is not within the valid range (0x01 0x01 through 0x1F), it is considered to be part of the Salt field.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ftencvsa.htm.

Enhanced Billing Support for SIP Gateways

The Enhanced Billing Support for SIP Gateways feature describes the changes to authentication, authorization, and accounting (AAA) records and the RADIUS implementations on Cisco Session Initiation Protocol (SIP) gateways. These changes were introduced to provide customers and partners with the ability to effectively bill for traffic transported over SIP networks.

Username Attribute

The username attribute is included in all AAA records and is the primary means for the billing system to identify an end user. The password attribute is included in authentication and authorization messages of inbound Voice over IP (VoIP) call legs.

For most implementations, the SIP gateway populates the username attribute in the SIP INVITE request with the calling number from the FROM: header and the password attribute with null or with data from an Interactive Voice Response (IVR) script. If a Proxy-Authorization header exists, it is ignored. A new Cisco IOS command, **aaa username**, determines the information with which to populate the username attribute.

Within the Microsoft Passport authentication service that authenticates and identifies users, the passport user ID (PUID) is used. The PUID and a password are passed from a Microsoft network to the Internet telephony service provider (ITSP) network in the Proxy-Authorization header of a SIP INVITE request as a single, base-64 encoded string. For example,

```
Proxy-Authorization: basic MDAwMzAwMDA4MDM5MzJlNjou
```

The new Cisco IOS **aaa username** command enables parsing of the Proxy-Authorization header; decoding of the PUID and password; and populating the PUID into the username attribute and the decoded password into the password attribute. The decoded password is generally a "." because a Microsoft Network (MSN) authenticates users prior to this point. For example,

```
Username = "123456789012345"
Password = "Z\335\304\326KU\037\301\261\326GS\255\242\002\202"
```

The password in the example above is an encrypted "." and is the same for all users.

SIP Call ID

From the Call ID header of the SIP INVITE request, the SIP Call ID is extracted and populated in a Cisco vendor-specific attribute (VSA) as a new attribute-value pair *call-id=string*. The attribute-value pair can be used to correlate RADIUS records from Cisco Session Initiation Protocol (SIP) gateways with RADIUS records from other SIP network elements, for example, proxies. For complete information on this attribute-value pair, refer to the *RADIUS Vendor-Specific Attributes Voice Implementation Guide*.

Session Protocol

Session Protocol is another new attribute-value pair that indicates if the call is using Session Initiation Protocol (SIP) or H.323 as the signaling protocol. For complete information on this attribute-value pair, refer to the *RADIUS Vendor-Specific Attributes Voice Implementation Guide*.

Silent Authentication Script

As part of the Enhanced Billing Support for SIP Gateways feature, a new Tool Command Language (TCL) Interactive Voice Response (IVR) API 2.0 Silent Authorization script has been developed. The Silent Authorization script allows users to be authorized without having to separately enter a username or password into the system. The script automatically extracts the passport user ID (PUID) and password from the SIP INVITE request and then authenticates that information through RADIUS authentication and authorization records. The script is referred to as silent because neither the caller nor the called party hears any prompts.

Further Documentation

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftmsnbil.htm.

Enhanced Password Security

The Enhanced Password Security feature allows you to configure Message Digest 5 (MD5) encryption for username passwords. Before the introduction of this feature, there were two types of passwords associated with usernames: Type 0, which is a clear text password visible to any user who has access to privileged mode on the router, and type 7, which is a password with a weak, exclusive, or type encryption. Type 7 passwords can be retrieved from the encrypted text by using publicly available tools.

Use the **username secret** command to configure a username and an associated MD5-encrypted secret.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/ft_md5.htm.

Error Log Count Enhancement

The Cisco IOS logging facility allows you to save error messages locally or to a remote host. When these error messages exceed the capacity of the local buffer dedicated to storing them, the oldest messages are removed. To provide you with more information about messages that have occurred and may have been removed from the local buffer, an error log counter tabulates the occurrences of each error message and time-stamps the most recent occurrence.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/fterrlog.htm.

Event Tracer

The Event Tracer feature provides a binary trace facility for troubleshooting Cisco IOS software. This feature gives Cisco service representatives additional insight into the operation of the Cisco IOS software and can be useful in helping to diagnose problems in the unlikely event of an operating system malfunction or, in the case of redundant systems, route processor switchover.

This feature was originally introduced in Cisco IOS Release 12.0(18)S.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios120/120newft/120limit/120s/120s18/evnttrcr.htm.

Fax Detection for Cisco 2600 Series and Cisco 3600 Series Routers

Note The Fax Detection for Cisco 2600 Series and Cisco 3600 Series Routers feature is also known under the feature title Fax Detection (Single-number Voice and Fax).

On Cisco 2600 series and Cisco 3600 series routers equipped with digital and analog voice network modules, the fax detection feature enables service providers to deploy unified communications, in which each subscriber has a single E.164 number for both voice and fax by providing the capability to detect automatically whether an incoming call is voice or fax. Supported network modules are NM-HDV with voice interface cards (VIC)/voice WAN interface cards (VWIC) for digital T1connections and Voice 2V with VIC FXS for analog connections. VWIC and VIC FXS are the voice interface cards within the network modules. When configured for fax detection, the gateway automatically listens to incoming calls to discriminate between voice and fax. The gateway then routes the calls to the appropriate application or server.

Note The fax detection feature requires the Cisco 2600 series and Cisco 3600 series routers to have a minimum of 128MB RAM.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/pull2snf.htm.

Firewall Feature Set

The Cisco IOS Firewall feature set provides firewall-specific security features to the Cisco CVA122 Cable Voice Adapter. When this feature is enabled, the router acts as a buffer between the Internet and other public networks and the private network that is connected to the router. Security is provided by access lists, as well as by examining incoming traffic for suspicious activity.

The firewall-specific security features include the following:

- Authentication proxy services to intelligently apply specific security policies on a per-user basis without impacting performance.
- Checking packet headers and dropping suspicious packets to detect and prevent denial of service attacks, such as ICMP and UDP echo packet flooding, SYN packet flooding, half-open or other unusual TCP connections, and deliberate misfragmentation of IP packets.
- Context-Based Access Control (CBAC) which gives internal-to-the-firewall users secure, per-application-based traffic control across the Internet/Intranet. This includes protection against Simple Mail Transfer Protocol (SMTP) attacks, one of the most common attacks against computers connected to the Internet.
- Dynamic port mapping to allow network applications with well-known port assignments to use customized port numbers. This mapping can be done on a host-by-host basis or for an entire subnet, providing a large degree of control over which users can access different applications.
- Intrusion Detection System (IDS) that recognizes the signatures of the most common attack profiles. When an intrusion is detected, IDS can perform a number of actions: send an alarm to a syslog server or to NetRanger Director, drop the packet, or reset the TCP connection.
- Java blocking to protect against destructive Java applets. Applets can be allowed only from known and trusted sources or blocked completely.
- Real-time and configurable alerts and audit trail capabilities to record and time-stamp source and destination hosts.
- Support for a broad range of commonly used protocols, including H.323 and NetMeeting, FTP, HTTP, MS Netshow, RPC, SMTP, SQL*Net, and TFTP.
- User-configurable audit rules, real-time alerts, and audit-trail logs.

Gatekeeper Transaction Message Protocol Interface Resiliency Enhancement

Gatekeeper Transaction Message Protocol (GKTMP) is used between the Cisco IOS Gatekeeper and a server to provide enhanced call routing and address translation services. The GKTMP Interface Resiliency Enhancement feature adds additional parameters in the disengage request (REQUEST DRQ) message sent from the gatekeeper (GK) to the server. It also provides new request alive (REQUEST ALV) and response alive (RESPONSE ALV) messages between the gatekeeper and server, server failure detection, and a flow control command.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122limit/122x/122xb/122xb_2/ftgkire.htm.

Generic Routing Encapsulation (GRE) Tunnel Keepalive

The GRE Tunnel Keepalive feature provides the capability of configuring keepalive packets to be sent over IP-encapsulated generic routing encapsulation (GRE) tunnels. You can specify the rate at which keepalives will be sent and the number of times that a device will continue to send keepalive packets without a response before the interface becomes inactive.

Refer to the following document for additional information:

http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122newft/122t/122t8/grekpliv.htm.

GKTMP Security Token Enhancement

The GKTMP Security Token Enhancement feature provides support for ClearTokens in messages between a NetSpeak route server and the Cisco IOS gatekeeper. The Request ARQ, Response ARQ, Response ACF, Request LRQ, Response LRQ, Request LCF, and Response LCF messages between the Cisco IOS gatekeeper and the route server now include ClearTokens. In addition, the Response ARQ messages include both gateways in a local domain or zone and remote zone gatekeepers and allow prioritization of the resulting sets of gateways. The Response LRQ messages support a combination of endpoint addresses and a list of remote zone gatekeepers to which to forward the LRQ message.

G.SHDSL Symmetric DSL Support

G.SHDSL is a new multirate symmetric high-speed digital subscriber line (DSL) technology for the local loop that connects customer premises equipment (CPE) to the central office (CO) in the access network. This access technology for business applications is important because of its symmetric and multirate functionality. G.SHDSL refers to the approved standard officially designated in International Telecommunication Union-Telecommunications Standards Section (ITU-T) G.991.2.

IGMP Version 3—Explicit Tracking of Hosts, Groups, and Channels

The Internet Group Management Protocol (IGMP) is used by IP hosts to report their multicast group memberships to neighboring multicast routers. IGMP is available in Versions 1, 2, and 3. IGMP Version 3 (IGMPv3) is supported in Cisco IOS Release 12.0(15)S, 12.1(5)T, 12.1(8)E, and later releases.

The IGMP Version 3—Explicit Tracking of Hosts, Groups, and Channels feature enables a multicast router to explicitly track the membership of all multicast hosts in a particular multiaccess network. This enhancement to the Cisco IOS implementation of IGMPv3 enables the router to keep track of each

Introduction

Cisco Products Quick Reference Guide (CPQRG)

CPQRG Background

The Cisco Products Quick Reference Guide (CPQRG) is a handy, compact reference tool that includes brief product overviews, key features, sample part numbers, and abbreviated technical specifications for many of Cisco's products. The CPQRG is primarily published to support Cisco partners, resellers, sales account teams, and even end-user customers who need a broad, high-level overview of Cisco products, but at that moment do not have access to Cisco's Web site, the Cisco Connection Online (CCO) at **http://www.cisco.com**.

Because this book is only published twice per year, there are likely to be new products, configurations, and part numbers not included in this edition. Note: For the most up-to-date and comprehensive information about Cisco products and solutions, please refer to our on-line information or consult a Cisco representative.

CPQRG Ordering Information

Additional printed copies of this book can be purchased on an as-needed basis or through an annual subscription. To order, see **http://shop.cisco.com/login**.

For questions regarding the CPQRG ordering process, please send an email to **companystore@external.cisco.com**.

For questions, comments or to download an Adobe PDF version of the CPQRG, go to **http://www.cisco.com/go/guide**.

How to Get More Complete Product Information

Cisco Product Catalog	For more comprehensive information on all of Cisco's products, please refer to the Cisco Product Catalog at: http://www.cisco.com/univercd/cc/td/doc/pcat/
Cisco Connection Online (CCO)	For even more complete product and solution information, please go to CCO at http://www.cisco.com. In addition to product, technology, and network solutions support, CCO provides a wealth of information including how to find an authorized representative or partner, how to order products, technical support/customer service, Cisco Corporate news and information, and links to training/events/seminars.

Cisco Systems Overview

Cisco Systems, Inc. is the worldwide leader in networking for the Internet. Cisco's Internet Protocol-based (IP) networking solutions are the foundation of the Internet and most corporate, education, and government networks around the world. Cisco provides the broadest line of solutions for transporting data, voice and video within buildings, across campuses, or around the world.

Today, the Internet and computer networking are an essential part of business, learning and personal communications and entertainment. Virtually all messages or transactions passing over the Internet are carried quickly and securely through Cisco equipment. Cisco solutions ensure that networks both public and private operate with maximum performance, security, and flexibility. In addition, Cisco solutions are the basis for most large, complex networks used by corporations, public institutions, telecommunication companies, and are found in a growing number of medium-sized commercial enterprises.

Cisco was founded in 1984 by a group of computer scientists from Stanford University. Since the company's inception, Cisco engineers have been prominent in advancing the development of IP- the basic language to communicate over the Internet and in private networks. The company's tradition of innovation continues today with Cisco creating leading products and key technologies that will make the Internet more useful and dynamic in the years ahead. These technologies include: advanced routing and switching, voice and video over IP, optical networking, wireless, storage networking, security, broadband, and content networking.

In addition to technology and product leadership, Cisco is recognized as an innovator in how business is conducted. The company has been a pioneer in using the Internet to provide customer support, sell products, offer training, and manage finances. Drawing upon the company's own Internet best practices and core-value of customer focus, Cisco has established the Internet Business Solutions Group (IBSG) dedicated to helping top business leaders transform their own businesses into e-businesses.

As a company, Cisco operates on core values of customer focus and corporate citizenship. The company's philanthropic efforts are committed to helping communities prosper while also encouraging Cisco employees to learn about the needs of the communities where Cisco operates. Also, to help bolster education around the world, the company has founded Cisco Networking Academies in 128 countries dedicated to teaching students to design, build, and maintain computer networks.

Cisco Channel Partner Program

Whether you provide services, solutions or a combination of both, Cisco is committed to your success. The Cisco Channel Partner Program can help partners create a sustainable business model in a fast-changing environment, where customers require value-added services, focused technical expertise, and higher levels of satisfaction. As a Cisco certified partner, you'll have the backing of the Cisco brand, and access to world-class products and service packages, technical support, productivity tools, online training, marketing resources and sales promotions.

The Partner Program integrates the technology focus of each Cisco Partner Specialization, flexible individual career certification requirements, customer satisfaction targets, and pre- and post-sales support capabilities. These elements make up the points-based structure of the overall program requirements. There are three partner certification levels: Gold Certification, Silver Certification, and Premier Certification.

The Partner Program requires every partner to specialize in technology areas as part of the program requirement. You may choose the technology area for Specialization, but must earn a minimum number of Specialization points to become certified. You may decide to be strictly a specialized partner or specialize your organization as a means to achieving certification. Either way, you'll have access to structured training roadmaps, free online technical and sales education and video-on-demand content to build your knowledge and skill level through the Partner E-Learning Connection **http://cisco.partnerelearning.com**

For More Information

See the Channel Partner Program Web Site: **http://www.cisco.com/go/channelprograms**

If you are interested in reselling Cisco product without becoming certified or specialized, see **http://www.cisco.com/go/reseller**

Partner and Reseller Service and Support Offerings

Various partner and reseller service and support programs are available according to certification level and method of purchase from Cisco:

Method of Purchase	Service and Support Offerings
Direct from Cisco (only available to Partners with Direct contracts)	• *System Integrator Support*—System Integrator Support 98 (SIS98) program is designed for Silver and Gold partners who wish to provide their own brand of support to their end customers with back-end support from Cisco – SMARTspares provides partners using SIS98 the opportunty to leverage Cisco's logistics infrastructure to provide their customers with enhanced delivery services. • *Shared Support*—Currently only available in the US, Cisco's Shared Support program is designed for Silver and Gold partners who wish to provide their own brand of support to their end customers while leveraging Cisco's Technical Assistance Center (TAC) and logistics infrastructure • *Cisco Brand Resale*—Program allows partners to provide Cisco's services (SMARTnet, etc.) directly to their end customers
2-Tier (through a Distributor)	• *Packaged Services*—Partners and Resellers may purchase warranty extension, hardware replacement, installation and configuration, technical support, software upgrades, and online services. Several of these services have been bundled together to offer convenient service solutions for Cisco customers.

Packaged Resalable Service Products (only via Distributors/2-Tier):

Product	Description
Maintenance Services	
SMARTnet Maintenance	Provides customers with software maintenance, registered access to CCO, advance replacement of hardware, and technical support required for self-maintenance. SMARTnet maintenance has three delivery options: • SMARTnet 8x5xNBD (Next Business Day)—8 hours/day, 5 days/week, next-business-day hardware replacement • SMARTnet 8x5x4—8 hours/day, 5 days/week, 4-hour hardware replacement • SMARTnet 24x7x4—24 hours/day, 7 days/week, 4-hour hardware replacement Available through resellers and distributors.
SMARTnet Onsite	Provides all the benefits of SMARTnet maintenance, plus one of the following onsite hardware services for repairs: • SMARTnet Onsite 8x5xNBD—8 hours/day, 5 days/week, next-business-day response • SMARTnet Onsite 8x5x4—8 hours/day, 5 days/week, 4-hour response • SMARTnet Onsite 24x7x4—24 hours/day, 7 days/week, 4-hour response Packaged SMARTnet OnSite 24x7x4 provides SMARTnet OnSite 24x7x4 service in a shrink-wrapped package, allowing it to be effectively marketed through resellers.
Cisco Advance Replacement	Advance Replacement offers customers the flexibility to cover their equipment with an advance replacement service only. Cisco Advance Replacement comes with a full year of advance replacement coverage, guest access to the public portion of Cisco Connection Online (CCO), and a single technical support incident. This service is intended to be used by customers who need to supplement service offered by their reseller with a replacement option from Cisco.
Software Application Support plus Upgrades (SASU)	Software Application Support plus Upgrades provides customers with software upgrades and maintenance releases for Cisco Application Software, registered access to Cisco.com plus technical support, for one year. For when a customer needs investment protection on software purchases and/or access to the latest software while eliminating unexpected budget revisions.
Noncontract and Consulting Services	Cisco provides noncontract services at current time-and-materials rates. For more information contact Customer Services at 1-800-553-NETS or 1-415-326-1941.
Startup Services	
Total Implementation Services (TIS)	Cisco Total Implementation Solutions (TIS) is a portfolio of services that deliver the tools, expertise, and resources needed to install, configure, and implement Cisco equipment. TIS is intended to supplement services that resellers provide, either directly or indirectly, to their customers. Product Components: Installation, Configuration, and Implementation. For more information, see http://www.cisco.com/go/tis

For More Information

See the Partner and Reseller Support Services Web page at: **http://www.cisco.com/en/US/products/index.html** (CCO login required)

Product Warranty Information

All Cisco hardware and software products are covered for a minimum of 90 days. Some products have a longer or more appropriate coverage, ranging from One-Year to Limited Lifetime warranties. Note that all Warranties are applicable to original owner only and support is subject to product end-of-life terms.

Warranty[1]	Entitlements Description
Cisco Standard 90-day Hardware Warranty, Software Warranty and License Agreement (78-5235-vvrr)	• Advance Replacement shippingwithin 10 business days from RMA date, within 90 days of original shipment from Cisco or from Cisco Reseller • 90-Day Assurance thatthe Media SW is delivered is defect-freeandthe SW conformsto its published specifications • Guest Access to Cisco Connection Online (CCO)
90-Day Limited Hardware Warranty(78-5236-vvrr)	• Advance Replacement shippingwithin 10 business days from RMA date, within 90 days of original shipment from Cisco or from Cisco Reseller • 90-Day Assurance thatthe Media SW is delivered is defect-freeandthe SW conformsto its published specifications • Guest Access to Cisco Connection Online (CCO)
One-Year Limited Hardware Warranty (78-10747-vvrr)	• Advance Replacement shippingwithin 10 business days from RMA date withinOne Year of original shipment from Cisco or from Cisco Reseller • 90-Day Assurance thatthe Media SW is delivered is defect-freeandthe SW conformsto its published specifications • Guest Access to Cisco Connection Online (CCO)
Limited Lifetime Hardware Warranty (78-6310-vvrr)	• Advance Replacement shippingwithin 10 business days from RMA date during supported life of the product,startingoriginal ship date from Ciscoor Ciscoreseller. (fanand power supplywarranty limited to 5 years from ship-date) • 90-Day Assurance thatthe Media SW is delivered is defect-freeandthe SW conformsto its published specifications • Guest Access to Cisco Connection Online (CCO)
End-User Software License Agreement and Software Warranty (78-3621-vvrr)	• 90-Day Assurance thatthe Media SW is delivered is defect-freeandthe SW conformsto its published specifications • End User License Agreement terms • Guest Access to Cisco Connection Online (CCO)
5-Years Limited Hardware and 1-Year Limited Software Warranty (78-13712-vvrr)	• Replacementshipping within 15 business days from RTF date within 5 years from the original ship date from Cisco or Cisco reseller • One-Year SW support includes availability of bug fixes and maintenance releases • Cisco TAC 24x7 support for P1/P2 cases for Five years • Guest Access to Cisco Connection Online (CCO)

[1] "vv" and "rr" suffixes of the warranty document numbers represent the revision and version numbers respectively.

See the Web site:
http://www.cisco.com/en/US/products/prod_warranties_listing.html

Cisco Capital Financing

Cisco Systems Capital cffers a variety of financing and equipment leasing alternatives, both short term and long term, to customers and partners in the United States, Canada, Europe, Asia, Australia, and Latin America. Cisco Capital's financial solutions offer customers the ability to acquire new technologies or refresh existing equipment through flexible, easy-to-use programs.

For More Information

See the Cisco Systems Capital Web site: **http://www.cisco.com/go/CiscoCapital**
Within the United States, call 800 730-4090.

Cisco Authorized Refurbished Equipment (US and Canada Only)

Customers looking for used Cisco equipment can now be assured of the quality and support they come to expect from new Cisco products, through the Cisco Authorized Refurbished Equipment program. Cisco Authorized Refurbished Equipment gives customers a price competitive alternative to buying uncertified and unlicensed products off the secondary market. All equipment sold through this program is labeled "Refurbished by Cisco Systems," indicating that the product is Cisco tested, refurbished, authorized, and supported. The program is limited to certain countries, so interested customers should check with their local Cisco account manager of Cisco authorized reseller for availability.

Resellers: **http://www.cisco.com/go/refurb** (click on "Refurbished Products")

Cisco Services

Cisco Services offers a wide range of services and support to customers, partners and resellers. Through a suite of support services Cisco enables you to improve the overall efficiency of your network operations and network performance, while benefiting from the broad range of Cisco engineering knowledge and experience base, leading practices and innovative, web-based tools.

Cisco Advanced Services (AS) is a comprehensive suite of professional engineering support offerings of Cisco networking solutions delivering the highest levels of availability, quality of service, and security for your specific network needs to realize business return on investment through high performance networking and communications applications enablement. Cisco Technical Support Services (TSS) offer leading-edge services to improve customer productivity, protect customer investment, and maximize operational efficiency. Cisco TSS solutions provide access to highly skilled engineers with technical expertise on multiple disciplines of technology. In addition, Cisco TSS provides you with the online tools and resources, software support and hardware replacement options to address your challenges and provide rapid problem resolution. Key support tools and knowledge provide your staff with the ability to avoid problems, maximize network utility, and expedite problem resolution.

CHAPTER 1

Routers

Routers at a Glance

Product	Features	Page
Cisco IOS® Software	See the Chapter 9—CiscoIOS Software and Network Management foran overview of Cisco IOS Software	9-4
Cisco SOHO Series Secure Broadband Routers	Ethernet, ADSL, ADSL over ISDN, and G.SHDSL Routers for Small Office andHome Ofices • Integrated securty of Cisco IOS Software with Stateful Inspection Frewall and software-based 3DES encryption • Easy setup and deployment usng Cisco Router Web Set Up Tool (CRWS) • Offers many local and remote debug and troubleshooting features in Cisco IOS Software	1-8
Cisco 800 Series Router	Ethernet, ADSL,ADSL over ISDN, G.SHDSL, ISDN, and serial routers for small remote offices and teleworkers • 1-port Ethernet, 1-port ADSL, ADSL over ISDN or G.SHDSL or 1-port BRI (optional NT1), 1-port serial WAN • 4-port Ethernet hub or 10/100 swithch on most models and 2 analog telephone ports on ISDN models and 4 analog voice ports on 827-4V • Advanced securty features including statefulinspectionfirewall and hardware assisted encryption (830 series) • Toll quality voice with VoIP (Cisco 827-4V) • Dial back up and out-of-band management (Cisco 830 series)	1-9
Cisco 1700 Series Router	Flexible, secure, modular access routers • 1-port autosensing 10/100 Fast Ethernet LAN • Modular slots support a wide variety of WAN and voice interface cards • Supports secure Internet, intranet,and extranet access as well as new WAN applications including VPNs, integrated voice/data (VoIP), and broadband services • VLAN Capability • Supports upto three Ethernet connectionswith 1 FE and 2 ENET WICs	1-11
Cisco 2500 Series Router	Fixed-port configuration accessservers • The Cisco AS2509-RJ/AS2511-RJ access/terminal servers provide Ethernet LAN connectivity and enable 8 or 16 (respectively) users/devices via async connections • Ideal for low-density analog telephone lne dial access applications via external modems	1-14
Cisco 2600 Series Router	Modular multiservice router • Single or dual LAN (Ethernet, 10/100 Mbps Ethernet, Token Ring and mixed Ethernet options) • Wide variety of interface support, including integrated 16-port switching, high-density analog and digital, voice, Cisco IOS Firewall and VPN, async and sync serial, ISDN, Fractional and channelized T1/E1, Ethemet, analog modems, ADSL, G.SHDSL, switching integration, and ATM support • Shares WAN interface cards and network modules with Cisco 1700, 3600 and 3700 series • Cisco 2610XM, 2620XM, and 2650XM models offer the features of Cisco 2600 with more default memory, capacity, performance and FE support on all models.	1-16
Cisco 3600 Series Router	Modular multiservice high-density access router • 2-, 4-, and 6-slot models • Wide variety of media support including: high density analog and digital voice, Cisco IOS Firewall and VPN, integrated 16-port switching, ADSL, and G.SHDSL, async and sync serial, BRI and PRI ISDN, channelized T1/E1, Ethernet, Fast Ethernet, Token Ring, digital and analog modems, and ATM • Digital and analog voice/fax over IP or Frame Relay or ATM • The Cisco 3640 is no longer orderable. Customers are encouraged to migrate to the Cisco 3700 Series Routers. On an interim basis we have made available the Cisco3640A as an alternative for customers with configurations not available on the Cisco3700.	1-22

Product	Features	Page
Cisco 3700 Series Router	Modular multiservice high-density access router • Enable higher levels of application andservice integration inenterprise branch offices in a small form factor – Supportsintegrated firewall, intrusion detection, and VPN capabilities and offloads processing to on-board AdvancedIntegration Module (AIM) – Combinesflexible routing and lowdensity switching in a single platformwith new 16 and 36-port EtherSwitch module – Delivers internalin-line powerfor the EtherSwitch portsfor a single platform Branch Office IP Telephony and Voice Gateway – Conserves WAN bandwidth with Content Enginemodule to combine intellgent caching, content routing and management – Higher performanceenables scalable deployment of multiple, concurrent applications • Wide variety of interface support, including integrated36 and 16-port switching, high-density analog anddigital, voice, Cisco IOS Frewall/IDS and VPN, Fractional and channelizedT1/E1 and DS-3, Ethernet, Gigabit Ethernet and ADSL. • Shares WAN interface cardsand networkmodules with Cisco 1700, 2600/2600XM, and 3600 series	1-26
Cisco 7100 Series VPN Router	Large branch and centralsite VPN router, for a dedicated site-to-site VPN solution See Chapter 5—VPN and Security for information onthe Cisco 7100 Series VPN Routers	5-11
Cisco 7200 Series Router	WAN-edge router providing intelligentservices, modularity, high performance, investment protection, and scalability in a small form factor • Modular 3 RU Chassis • 4- or 6-slot modelsand choice of system processors for up to 1 Mpps performance • Wide variety of LAN and WAN options, including Ethernet,Fast Ethernet, Gigabit Ethernet, Token Ring, FDDI, serial, ISDN, HSSI, ATM, Packet over SONET, DPT/RPR	1-31
Cisco 7300 Series	Network Edge routerwith high perfomance IP services delivered at optical speedsfor service providers and enterprise networks • Compact and modular 4 rack unit chassis—4 slots • High performance connectivity—T3 through OC48/STM16 with 3.5 Mpps performance • Built-in Gigabit Ethernet connectivity • Multiprotocol routing:IP, IPX, AppleTalk, DLSw • Compact size, high availability and optimal cooling	1-35
Cisco 7400 Series Router	Highest performance 1 rack unit router inthe industry, with a stackable architecture that is designed for service provider and enterprise networks • One port adapter slot, two built-in 10/100/GE Ethernet ports, and a broad range of WAN media interfacesfrom DS0 to OC3 (40+ port adapters) common with Cisco 7x00-series port adapters • High-density broadband aggregation • Managed CPE for service provider demarcation point • Gigabit Ethernet to Gigabit Ethemet IP services applicationsplatform	1-38
Cisco 7500 Series	High-end services-enabled coreand WAN aggregation routerfor enterprise and service provider applications • 5-, 7-, and 13-slot models • 1-, 2-, or 4-bus models offering 1, 2, or 4 Gbps backplanes • Wide variety of LAN and WAN optionsincluding Ethernet, Fast Ethernet, Gigabit Ethernet, Token Ring, FDDI, serial, ISDN, HSSI, ATM, and Packet over SONET	1-40
Cisco 7600 Series	Service providerand high-end enterprise-class router delivering opticalWAN and Metropolitan Area Networkservices with high-touch IPservices at the networkedge. • Consolidated LAN/WAN/MAN in a single platform • Scalable backplane bandwidth from 32 Gbps to 256 Gbps and performance from 15 Mpps to 30 Mpps • High-volume aggregation of Ethernet traffic (server farms) • Wide range of WAN/MAN interfacesfrom NxDS0, T1, T3 to OC-48 with line rate services • Ideal for Internet data center, metropolitan aggregation, WAN edge aggregation, and enterprise core applications • Also supports Catalyst 6000 series line cards	1-45
Cisco 10000 Series	Service provider-class edge services router • High-Performance IP, MPLS, and Broadband Services — The Cisco 10000 Series enables service providers to deploy revenue-generating services without worrying about performance degradation • Carrier-Class High Availability — With its carrier-class high availability, the Cisco 10000 Series minimizes costly network outages and maximizing end-customer satisfaction • Application Integration — The Cisco 10000 Series leverages service providers' current investments by enabling leased line and broadband aggregationfeatures on a single platform • Application Flexibility — The Cisco 10000 Series has a broad range of channelized, clear channel, ATM and LAN interfaces. Physical interface speeds from E1/T1 up to OC-48c/STM-16c	1-47

Product	Features	Page
Cisco 10700 Series	Service provider-class metro edge services router • Optimized building blockfor the next generation metro Ethernet/IPaccess networks • Equipped with either (24) 10/100 or 4 GbE and 8 FE ports for customer access and OC-48c/STM-16c dynamic packet transport/resilient packet ring (DPT/RPR) technology or Packet Over SONET (POS) for metro optical connectivity • Powered by Cisco IOS 12.0S software and the parallel express forwarding (PXF) architecture • Cost-effective, reliable, high-performance platform supporting full suite of IP/MPLS features and services found in Cisco Internet Routers • With DPT/RPR architecture, enables optimal fiber connectivity as well as features such as IP class of service, VoIP, L2 VPN (EoMPLS and L2TPv3) and L3 VPN (MPLS) services	1-49
Cisco 12000 Series	Premier high-end routing portfolio for service provider backbone and high-speed edge applications. With its unique, modular distributed system architecture, the Cisco 12000 Series Router, is the industry choice for building Carrier IP/MPLS networks with its portfolio of 10Gbps systems and interfaces: • Seven chassis options that fit your scaling and real estate requirements offering the only complete solution for small to large POPs; backbone or edge. • The only platforms supporting backbone—or edge-optimized line cards in the same chassis, maximize the value of line-rate edge applications with 10G uplinks, and sustained line-rate performance as they scale to maximum capacity. • Proven investment protection with simple, field upgrades to higher switching capacities. • The only complete priority packet delivery solution set—the industry's only IP QoS implementation that uniquely enables premium real time IP services such as VoIP and video. • Extensive portfolio of line cards offering leading edge technologies (POS, ATM, DPT/RPR, GbE/FE), support a wide range of networking speeds (from DS1 to OC-192c/STM-64c). • The industry's only high-end router proven (via independent lab testing) to maintain customer connections and network traffic with zero packet loss despite a route processor failure.	1-51
Cisco SN 5400 Series Storage Router	Enables direct access to storage systems anywhere on an IP network. Enables SCSI over IP (iSCSI); the first storage implementation based on IP standards. • Cisco SN 5428: Migrates DAS (Direct Attached Storage) environments to SAN (Storage Area Networks) for small / medium businesses and enterprise workgroups. This is a full function Fibre Channel switch that adds iSCSI, providing very low price per port networked storage configurations	1-55

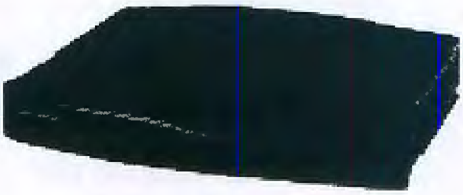
Cisco SOHO Series Ethernet, ADSL over ISDN, ADSL and G.SHDSL Routers



The Cisco SOHOseries provides an affordable, secure, multi-user access solution to small office/home office (SOHO) customers while reducing deployment and operational costs for service providers. Through the power of Cisco IOS software technology, the Cisco SOHO 91 Ethernet to Ethernet Router, the SOHO 96 ADSL over ISDN, the SOHO 97 ADSL and SOHO 78 G.SHDSL routers provide superior manageability and reliability.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco SOHO 91	• Ethernet WAN port for use with an external DSL or cable modem with 4-port 10/100 switch, stateful firewall and software based encryption
Cisco SOHO 96	• ADSL modem for use of ADSL over ISDN with 4-port 10/100 switch, stateful firewall and software based encryption
Cisco SOHO 97	• ADSL modem for ADSL over POTS with 4-port 10/100 switch, stateful firewall and software based encryption
Cisco SOHO 78	• 4-port Ethernet Hub and 1G.SHDSL port with firewall security and Cisco IOS manageabilty and reliability

Key Features

- Integrated security of Cisco IOS Software with Stateful Inspection Firewall and software-based 3DES encryption (no encryption on the SOHO 78)
- Easy setup and deployment using Cisco Router Web Set Up Tool (CRWS)
- Offers many local and remote debug and troubleshooting features in Cisco IOS Software

Cisco 800 Series

The Cisco 800 series router provides enhanced network security and proven reliability through Cisco IOS software, for small offices and telecommuters. It connects users to the Internet or to a corporate LAN via one ADSL, ADSL over ISDN, G.SHDSL, IDSL, ISDN, or serial connection (up to 512 Kbps), or with an Ethernet WAN port connected to an external broadband modem.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 800 Series	• Companies who Cisco IOS-based networks who want to add telecommuters • Service providers who offer value-added services to small offices • VARs who are familiar with Cisco IOS software and want to profitably service small office customers • Ethernet LAN ports and variety of WAN connectivity, including: ISDN BRI, Frame Relay, ADSL, G.SHDSL, async dialup (see Specificationsfor details)

Key Features

- Fixed configuration support for several types of WAN connections
- Standard security with ACLs, PAT/NAT, PAP/CHAP, MS-CHAP, Lock and Key, and Generic Routing Encapsulation (GRE) tunneling
- Enhanced security with stateful inspection firewall, IPSec encryption (hardware based on Cisco 830s and AES encryption on Cisco 830s)
- Toll quality voice with VoIP on Cisco 827-4V
- Integrated 4-port 10/100 Ethernet Switch on Cisco 830 series
- Bandwidth optimization features such as compression, Bandwidth-on-Demand, Dial-on-Demand, Always-On-Dynamic-ISDN (AODI), and X.25 over D channel (Cisco 801- 804)
- Support for CAPI applications in the European market

Competitive Products

- 3Com: Office Connect Remote 511/521
- Alcatel: Speed Touch Pro Routers
- Ascend: Pipeline 75/85

Cisco 1700 Series

The Cisco 1700 series modular access routers are designed to provide a cost-effective integrated access platform for small and medium-sized businesses and enterprise small branch offices. These Cisco IOS-based routers deliver high-speed network access, comprehensive security features, and multiservice data/voice/video/fax integration to meet the most demanding business requirements. Within the Cisco 1700 series, Cisco 1710 security access routers work with existing broadband modems to provide advanced routing and security functionality, Cisco 1721 modular access routers provide flexible, high-performance data access, and Cisco 1751 and Cisco 1760 modular access routers are optimized for both voice and data traffic, providing a simple and cost-effective path to multi-service networking—today or in the future.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 1710	• Advanced routing and security functionalityin one device when connecting to the Internet using a broadband modem • Hardware-assisted 3DES VPN encryption at fullT1/E1 speeds
Cisco 1721	• Secure data-only access solution that adapts to customers' evolving network requirements • Support for data applicationsincluding VPNs and broadband access services • A broad array of WAN services supported, including Frame Relay, leased line, ADSL, G.SHDSL, ISDN BRI, X.25, SMDS and more • IPSec 3DES VPN encryption at full T1/E1 speeds • IEEE 802.1Q VLAN Support
Cisco 1751	All the above, plus: • Analog and digital voice support in a desk-top form factor • 3 modular slots for WAN and Voice interface cards
Cisco 1760	All the above, plus: • 19" rackmount form factor • 4 slots with 2 WIC/VIC and 2 VIC slots • Multiservice analog anddigital voice support • Highest performance multi-service router in the Cisco 1700 family • Higher density analog and digital voice support than Cisco 1751

Key Features

- Support for up to 4 serial interfaces or 2 ISDN BRI; 1 autosensing 10/100 Mbps Fast Ethernet LAN connection; 1 auxiliary (AUX) port for dial-up management or low-speed asynchronous connections (up to 112.5 kbps)
- Flexibility—Cisco 1700 Series supports a diverse set of WAN and Voice Interface Cards that are shared with the 1600 (WAN only), 2600/2600XM, and 3600 series routers enabling field upgradeability to evolve with the needs of growing businesses
- Integrated Device—Cisco 1700 series combines WAN routing, VPN and multiservice access in a single device
- Expansion Slot—Supports optional hardware VPN module for wire-speed IPSec 3DES encryption and can enable future technologies (VPN Module standard on Cisco 1710)
- Integrated Security—The 1700 series supports context-based access control for dynamic firewall filtering, denial-of-service detection and prevention, Java blocking, real-time alerts, Intrusion Detection System (IDS), and encryption.
- IEEE 802.1Q VLAN Support

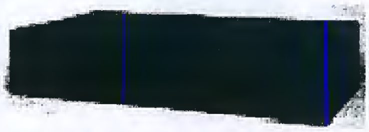
Cisco 2500 Series



The Cisco 2500 series router has served for years as the most deployed and popular branch office router in the world, and provides low cost routing functionality for data-only applications (no voice support). There are currently two access servers to choose from, 8 or 16 asynchronous ports, each with 1 Ethernet port, for aggregating multiple network elements to provide a single Telnet access point (telemetry application)—or for attaching 8 to 16 external analog or digital modems in environments where T1/E1 digital circuits are not available, but multiple dial-up telephone lines can be leveraged for low cost remote access.

For higher performance requirements, where a wider variety of WAN/LAN interfaces are needed, as well as voice support, refer to Cisco 2600/2600XM/3600 or 1700 series routers.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco AS2509-RJ and AS2511-RJ	• Data-only network requirement • An access server combining a terminal server, protocol translator, console port aggregator, and a router in a single device • One Ethernet LAN and dual serial ports • 8 or 16 asynchronous serial ports with RJ-11 jacks, ideal for attaching 8 to 16 external modems

Key Features

- Proven technology with a full suite of Cisco IOS Software
- Setup with Cisco ConfigMaker, a free tool for configuring a network of routers
- With CiscoWorks for Windows, allows remote management and maintenance from a central location

Specifications

Feature	Cisco AS2509-RJ	Cisco AS2511-RJ
Throughput Performance (pps)	3-5 Kpps (dependingon configuration)	3-5 Kpps (depending on configuration)
Memory	8-MB dual Flash bank option (default) 16 MB (max) 16 MB DRAM (default)	Same as Cisco AS2509-RJ
Power Supply	AC, with optional DC or redundant power supply	Same as Cisco AS2509-RJ
Fixed LAN Ports	1-port Ethernet	1-port Ethernet
Fixed WAN Ports	1-port sync serial 8-port async	1-port sync serial 16-port async
Dimensions (H x W x D)	1.75 x 17.5 x 10.56 in.	1.75 x 17.5 x 10.56 in.

Cisco IOS Software and Memory Requirements

To run the Cisco IOS software Feature Packs, you need the amount of memory shown in the following table:

Distribution Part Number	Feature Pack Description	IOS Image Release	Flash Memory Required[2]	DRAM Memory Required
CD25-C-12.0=	IP only	12.0(10) 12.0(7)T	8 MB 8 MB	4 MB 6 MB
CD25-CP-12.0=	IP Plus	12.0(10) 12.0(7)T	8 MB 16 MB	6 MB 8 MB
CD25-CHL-12.0=	IP/FW Plus IPSEC 56	12.0(10) 12.0(7)T	16 MB 16 MB	8 MB 10 MB
CD25-B-12.0=	IP/IPX/AT/DEC	12.0(10) 12.0(7)T	8 MB **16 MB**	6 MB 6 MB
CD25-BP-12.0=	IP/IPX/AT/DEC Plus	12.0(10) 12.0(7)T	16 MB 16 MB	6 MB 8 MB
CD25-AP-12.0=	Enterprise Plus	12.0(10) 12.0(7)T	16 MB 16 MB	6 MB 10 MB

[1] For users with CCO access, search by IOS feature or release via the *Feature Navigator* at http://www.cisco.com/go/fn

[2] Bold numbers indicate that more memory than the default amount is needed to run the Feature Pack.

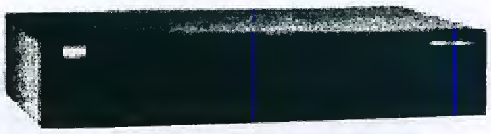
See the Cisco 2500 Series Web site: **http://www.cisco.com/go/2500**

Cisco 2600 Series



The Cisco 2600 series is an award-winning family of modular multiservice access routers, providing flexible LAN and WAN configurations, multiple security options, voice/data integration, and a range of high performance processors. This range of features make the Cisco 2600 series the ideal branch-office router for today's and tomorrow's customer requirements.

The Cisco 2600 series family of modular routers include the Cisco 2600XM models, the Cisco 2691 and the Cisco 2612 token ring router. These new models deliver extended performance, higher density, enhanced security performance and increased concurrent application support to meet the growing demands of branch offices.

The Cisco 2600XM models are based on the classic Cisco 2600 platform architecture, and extend the performance by as much as 33%. They also increase default platform memory and provide increases in memory capacity at the same price as their Cisco 2600 predecessor.

The highest performing router in the Cisco 2600 family that extends the density of emerging branch office applications, is the Cisco 2691 offering almost twice the performance of the Cisco 2650XM platform while leveraging the same modules from other Cisco 2600, Cisco 3600 and Cisco 3700 Series routers. Compared to the Cisco 2600XM models, the new Cisco 2691 is designed to offer a higher degree of versatility, providing greater throughput for higher density WAN applications, support for high speed interfaces and increased performance to handle new services.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 2691	• Enterprises wanting a higherlevel of performance for a broadened range of concurrent remote office applications including unparalleled voice/data integraton, Virtual Private Network (VPN) performance, increased bandwidth to suppot voice and video applications and the delivery of Web-based applications
Cisco 2600XM Series	• Enterprises consideringthe Cisco 2600 for branch office applicationsshould now regard the Cisco 2600XM as the preferential platformfor delivering high performing, flexible solutions to branch and remote offices
	• High Performance 10/100 Dual Ethernet Router with 3 WIC Slots, 1 NM
Cisco 2651XM	• High performance Dual10/100 Modular Router with CiscoIOS IP
Cisco 2650XM	• High performance 10/100 Modular Router with Cisco IOS IP
Cisco 2621XM	• Mid Performance Dual10/100 EthernetRouter with Cisco IOS IP
Cisco 2620XM	• Mid Performance 10/100 Ethemet Router with Cisco IOS IP
Cisco 2611XM	• Dual 10/100 Ethemet Router with Cisco IOS IP
Cisco 2610XM	• 10/100 Ethernet Router with Cisco IOS IP
Cisco 2612	• One Token Ring port and one Ethernet port formixed LANs and migrating from Token Ring to Ethemet

Key Features

- Integration/manageability—Lowers cost of ownership and improves ease of remote management, providing integrated "branch-in-a-box" networking that combines CSU/DSUs, multiplexors, modems, voice/data gateways, ISDN NT1s, firewalls, VPNs, encryption, and compression devices
- Multiservice voice/data networks—Reduces phone/fax costs between offices; using Cisco IOS software QoS features (such as RSVP, WFQ, CAR, and RED), voice/fax traffic is digitized and encapsulated in Frame Relay or IP packets and consolidated with data traffic

- Enterprise/Provider class solution—Meets the requirements of multiservice enterprises and their managed service CPE providers with high reliability features, multiple WAN connections, and the ability to migrate from data- only to TDM voice and data to packetized voice and data infrastructure
- High-density analog/fax network modules provide the ability to directly connect PSTN and legacy telephony equipment to existing Cisco 2600 and 3600 routers
- An EtherSwitch network module for the Cisco 2600/3600 series with 16 ports of 10/100 Ethernet and one optional 1000BaseT (Gigabit Ethernet) connection, providing a fully integrated Layer 2 (L2) switch with the capability to support both Line Power to Cisco IP phones and current Aironet 802.11 wireless base stations (with the addition of an external power supply). This provides a single box solution for branch offices deploying converged IP telephony, extending data, voice and video by delivering IP routing, Ethernet switching, fixed wireless solutions and voice gateway capabilities
- A wide range of Virtual Private Network modules (VPN) optimize the Cisco 2600 Series platforms for virtual private networks (VPNs) and delivers a rich integrated package of routing, firewall, intrusion-detection, and VPN functions
- The introduction of the WIC-ADSL and WIC-1SHDSL, offers business-class broadband service with scalable performance, flexibility, and security for branch and regional offices
- Content Networking Integration and Branch-Office Routing with router-integrated content-delivery system that combines intelligent caching, content routing and management with robust branch-office routing, WAN bandwidth for branch IP services such as voice over IP (VoIP)

NM-CE-BP-40G-K9=	Content Engine NM-Basic Perf-40GB
NM-CE-BP-SCSI-K9=	Content Engine NM-Basic Perf-SCSI Adapter
NM-HDV-1E1-30=	1-port E1 30 channel voice/fax network module
NM-HDV-1E1-30E=	1-port E1 30 enhanced channelvoice/faxnetwork module
NM-HDV-2E1-60=	2-port E1 60 channel voice/fax network module
NM-HDV=	High density voice network module, spare (no T1/E1 or DSPs)
NM-HDA-4FXS=	High density analog voice/fax network module with 4 FXS
EM-HDA-8FXS=	8-port FXS voice/fax expansion module
EM-HDA-4FXO=	4-port FXO voice/fax expansion module
DSP-HDA-16	16-channel DSP module for NM-HDA

Cisco 2600/2600XM and 3600 Series ATM Modules

NM-4T1-IMA=	4-port T1 ATM network module with IMA
NM-4E1-IMA=	4-port E1 ATM network module with IMA
NM-8T1-IMA=	8-port T1 ATM network module with IMA
NM-8E1-IMA=	8-port E1 ATM network module with IMA

Cisco 2600/2600XM and 3600 Series EtherSwitch Modules

NM-16ESW=	Sixteen 10BaseT/100BaseTX autosensing ports EtherSwitch
NM-16ESW-PWR=	Sixteen 10BaseT/100BaseTX autosensing ports EtherSwitch with power daughter card

Cisco 2600/2600XM and 3600 Series High-Density Voice/Fax DSP Upgrade Modules

PVDM-12=	12-channel Packet Voice/Fax DSP Module

Cisco 2600/2600XM and 3600 Series Voice Interface Cards (VICs)

VIC-2E/M=	2-port E&M Voice Interface Card
VIC-2FXO=	2-port FXO Voice Interface Card
VIC-2FXS=	2-port FXS Voice Interface Card
VIC-2DID=	2-port DID Voice/Fax Interface Card
VIC-2FXO-EU=	2-port FXO Voice InterfaceCard (for Europe)
VIC-2FXO-M3=	2-port FXO Voice Interface Card (forAustralia)
VIC-2BRI-S/T-TE=	2-port BRI (S/T user side) Voice Interface Card
VIC-2FXO-M1=	2-port Voice Interface Card—FXO w/ Reversal (for US+)
VIC-2FXO-M2=	2-port Voice Interface Card—FXO w/ Reversal (for EU)

Cisco 2600/2600XM and 3600 Series WAN Network Modules

NM-4B-S/T=	4-port BRI (S/T) networkmodule
NM-8B-S/T=	8-port BRI (S/T) networkmodule
NM-4B-U=	4-port BRI (U) w/ NT1 network module
NM-8B-U=	8-port BRI (U) w/ NT1 network module
NM-4A/S=	4-port Async/Sync Serial network module
NM-8A/S=	8-port Async/Sync Serial network module
NM-16A=	16-port Async Serial network module
NM-32A=	32-port Async Serial network module
NM-1CT1=	1-port Channelized T1/ISDN-PRI network module
NM-2CT1=	2-port Channelized T1/ISDN-PRI network module
NM-1CT1-CSU=	1-port Channelized T1/ISDN-PRI w/ CSU network module

AIM-VOICE-30=	SAR and 30-Channel T1/E1 Digital Voice Module

Cisco 260/2600XM0 Series Factory Memory Options

Product Number	Product Description
MEM2691-32CF-EXT	32MB External Compact Flash Memory for the 2691
MEM2691-64CF-EXT	64MB External Cisco Flash Memory for the 2691
MEM2691-128CF-EXT	128MB External Cisco Flash Memory for 2691

Cisco 2600/2600XM Series Factory DRAM Memory Upgrades

MEM2600-32U40D	32- to 40-MB DRAM Factory Upgrade for the Cisco 2600 Series
MEM2600-32U48D	32- to 48-MB DRAM Factory Upgrade for the Cisco 2600 Series
MEM2600-32U64D	32- to 64-MB DRAM Factory Upgrade for the Cisco 2600 Series
MEM2650-32U40D	32 TO 40MB DRAM Factory Upgrade for the Cisco 265x only
MEM2650-32U48D	32 TO 48MB DRAM Factory Upgrade for the Cisco 265x only
MEM2650-32U64D	32 TO 64MB DRAM Factory Upgrade for the Cisco 265x only
MEM2650-32U96D	32 TO 96MB DRAM Factory Upgrade for the Cisco 265x only
MEM2650-32U128D	32 TO 128MB DRAM Factory Upgrade for the Cisco 265x only
MEM2600XM-32U128D	32 to 128MB DRAM factory upgrade for Cisco 261x/2xXM
MEM2600XM-32U64D	32 to 64MB DRAM factory upgrade for Cisco 261x/2xXM
MEM2600XM-32U96D	32 to 96MB DRAM factory upgrade for Cisco 261x/2xXM
MEM2600XM-64U128D	64 to 128MB DRAM factory upgrade - 265xXM/XM VPN Bundles
MEM2600XM-64U96D	64 to 96MB DRAM factory upgrade - 265xXM/XM VPN Bundles
MEM2691-64U128D	64 to 128MB DIMM DRAM factory upgrade for the Cisco 2691
MEM2691-64U192D	64 to 192MB DIMM DRAM factory upgrade for the Cisco 2691

MEM2691-64U256D	64 to 256MB DIMM DRAM factory upgrade for the Cisco 2691
Cisco 2600/2600XM Series Factory Flash Memory Upgrades	
MEM2600-8U16FS	8 to 16 MB Flash Factory Upgrade for the Cisco 2600 Series
MEM2620-8U32FS	8 TO 32MB Flash SIMM Upgrade for the Cisco262x only
MEM2650-8U32FS	8 TO 32MB Flash SIMM Upgrade for the Cisco265x only
MEM2600XM-16U32FS	16 to 32 MB Flash Factory Upgrade for the Cisco 2600XM
MEM2600XM-16U48FS	16 to 48MB Flash Factory Upgrade for the Cisco 2600XM
MEM2691-32U128CF	32 to 128MB Cisco 2691 Compact Flash factory upgrade
MEM2691-32U64CF	32 to 64MB Cisco 2691 Compact Flash factory
MEM-CE-256U512D	256MB DRAM Factory Upgrade for NM-CE-BP
Cisco 2600/2600XM Series Memory Spares	
MEM2600-8D=	8 MB DRAM DIMM for the Cisco 2600 Series
MEM2600-16D=	16 MB DRAM DIMM for the Cisco 2600 Series
MEM2600-32D=	32 MB DRAM DIMM for the Cisco 2600 Series
MEM2600-4FS=	4 MB Flash SIMM for the Cisco 2600 Series
MEM2600-8FS=	8 MB Flash SIMM for the Cisco 2600 Series
MEM2600-16FS=	16 MB Flash SIMM for the Cisco 2600 Series

MEM2691-64CF=	64MB Cisco 2691 Compact Flash Memory
MEM2691-64D=	64MB DIMM DRAM for the Cisco 2691
MEM-CE-256D=	256MB DRAM Field Upgrade for NM-CE-BP
Cisco 2600/2600XM Series Spares - Power Supplies and Other	
PWR-2600-AC=	Cisco 2600/2600XM AC power supply spare
PWR-2600-DC=	Cisco 2600/2600XM DC power supply spare
PWR-2650-AC=	Cisco265x AC power supply spare
ACS-2600RPS=	RPS Field Upgrade for the Cisco 2600 Series
ACS-2600RM-19=	19 Inch Rack Mount Kit for the Cisco2600 series
ACS-2600RM-24=	24 Inch/23 Inch Rack Mount Kit for the Cisco 2600 Series
ACS-2600ASYN=	Auxiliary and Console Port Cable Kit for Cisco 2600 Series
ACS-2600NEBS/ETSI=	NEBS/ETSI Telco Accessory Kit for Cisco 2600
CAB-RPS-2218	RPS 22/18 Load Cable
CAB-RPS-2218=	RPS 22/18 Load Cable
CAB-RPSY-2218	RPS 22/18 Two-to-one DC Power Cable
CAB-RPSY-2218=	RPS 22/18 Two-to-one DC Power Cable
PWR600-AC-RPS-CAB	600W Redundant AC Power System With DC Power Cables
PWR600-AC-RPS-NCAB	600W Redundant AC Power System W/O DC Power Cables
BOOT-2600=	Boot ROM for Cisco 2600 Series
Cisco 2600/2600XM Series SMARTnet Maintenance	
CON-SNT-PKG5	Cisco 2600 Series Packaged SMARTnet 8x5xNBD Maintenance
Cisco 2691 Series Network Modules	
NM-1GE=	1 Port GE Network Module
NM-1T3/E3=	One port T3/E3 network module

1. This is only a small subset of all parts available via URL listed under "For More Information". Some parts have restricted access or are not available through distribution channels. Resellers: For latest part number and pricing info, see the *Distribution Product Reference Guide* at: http://www.cisco.com/dprg (limited country availability).
2. VoIP and VoFR require use of a Voice/Fax network module
3. Requires Plus feature pack

For More Information

See the Cisco 2600 Series Web site: **http://www.cisco.com/go/2600**

Cisco 3600 Series

The Cisco 3600 Series is a family of modular, high-performance multiservice access routers for medium and large-sized branch offices and Internet service providers. With over 100 modular interface options (shares modular interfaces with the 2600/2600XM series), the Cisco 3600 Series provides solutions for voice/data integration, virtual private networks (VPNs), dial access, and multiprotocol data routing. Using Cisco's digital and analog voice/fax network modules, the Cisco 3600 Series allows customers to consolidate voice, fax, and data traffic on a single network. Its architecture protects customers' investment in network technology and integrates the functions of several devices into a single, manageable solution. Cisco 3600 VPN and Dial Bundles are also available to also address specific VPN/security, and dial-up remote access server requirements. Customers are encouraged to migrate to the Cisco 3700 Series.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 3620	• Medium-density WAN and dialup connectivity • Medium-density LAN connectivity • Low-density Voice over Data • Low-density ATM connections • Mid-density modem-over-PRI bundles
Cisco 3640A	• High-density WAN and dialup connectivity • Medium- to high-density LAN connectivity • Mid-density Voice over Data • Low- to mid-density ATM connections • Low-density modem-over-BRI bundles • Configurationsnot available on the Cisco 3700
Cisco 3660	• Very high-density WAN and dialup connectivty • High-density LAN connectivity • Mid-density Voice over Data • Mid-density ATM connections • Mid- to high-density modem-over-PRI and BRI connectivity

Key Features

- Combines dial access, advanced LAN-to-LAN routing services, ATM connectivity, and multiservice integration of voice, video, and data in a single platform
- Modular, scalable design provides performance, scalability, flexibility, and investment protection
- High-density ISDN PRI capabilities
- Preconfigured BRI and PRI modem bundles available
- Support for modem-over-BRI functionality
- Integrated Cisco IOS software (base price includes IP IOS software)
- Full VPN and Firewall support
- ADSL and G.SHDSL support
- ISDN Modem backup

Specifications

Feature	Cisco 3620	Cisco 3640	Cisco 3660
Fixed Ports	None	None	1 or 2 10/100 Fast Ethernet
Network Module Slots	2	4	6

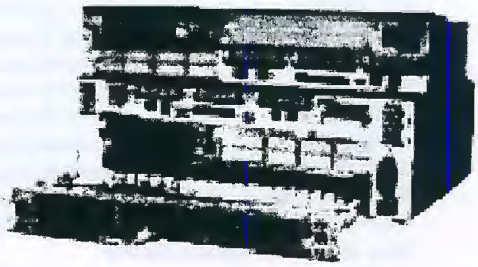
Cisco 3700 Series



The Cisco 3700 Series is a new line of modular routers that enable flexible and scalable deployment of new applications in an integrated branch office access platform. The Cisco 3700 Series is ideal for sites and solutions requiring the highest levels of integration at the branch for branch office IP Telephony, voice gateway, and integrated flexible routing with low-density switching solutions.Integrated security, intrusion detection, and VPN protect the network at the perimeters, while integrated caching conserves WAN bandwidth. The Cisco 3700 Series provides a consolidated service infrastructure and high service density in a compact form factor that enables the incremental incorporation of branch applications.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 3725	• New levels of branch office service density in a compact form factor (2RU) • Integrated Security, intrusion detection, and VPN • Integrated flexble routing andlow-density switching (16-or-36 ports) • Flexible incrementaland scalable migration to a voice/data converged branch office network – Compatibility with more than 90% of the world's legacy analog and digtal TDM PBXs – Survivable Remote Site Telephony (SRST) features that enable centralized call processing with local branch IP Telephony redundancy – Inline power for IP Telephony • Content Networking and Caching integrated for WAN bandwidth conservation
Cisco 3745	Same features as above plus: • New levels of branch office service density in a compact formfactor (3RU) • Availability features such as redundant power, online insertion and removable components and field replaceable components • Increased performance and density

Key Features

- Optimized for multiple high density services
- Versatile High Density Service Module (HDSM) design enhances integrated services options
- Integrated connectivity options free up network module slots
- Optional features enhance availability/resiliency (3745 only): internal redundant power, hot-swappable modules, and field-serviceable components
- Optimized for Integrated IP Telephony: IP phone powered switch, high density voice gateway, flexible WAN routing, and Survivable Remote Site Telephony
- Flexible combination of analog and/or digital voice with scalable port density
- Full support for Cisco IOS voice suite of features
- Platforms performance-tuned for scaling packet voice solutions
- New integrated switching modules (16- and 36-port)
- Common user interface with Catalyst series switches
- Simplified management from a single platform for ease of configuration, deployment, and troubleshooting
- Integrated inline power for wireless access points and IP phones
- GigE connectivity

Digital Packet Voice and Fax Trunk Network Modules

NM-HDV-1T1-12	High Density Voice Network Module, with 1 VWIC-1MFT-T1 and 1 PVDM-12
NM-HDV-1E1-12	High Density Voice Network Module, with 1 VWIC-1MFT-E1 and 1 PVDM-12
NM-HDV-1E1-30	Single-port, 30-channel E1 voice/fax Network Module (supports 30 channels) of medium complexity VoCoders: G.729a/b, G.726, G.711 and fax or 12 channels of G.726, G.729, G.723.1, G.728, G.729a/b, G.711 and fax)
NM-HDV-1E1-30E	Single-port, enhanced 30-channel E1 voice/fax Network Module (supports30 channels of high and medium complexity VoCoders: G.729a/b, G.726, G.729, G.728, G.723.1, G.711 and fax)
NM-HDV-2E1-60	Dual-port, 60-channel E1 voice/fax Network Module (supports 60 channels) of medium complexity VoCoders: G.729a/b, G.726,G.711and fax or 30channels of G726, G729, G723.1, G.728, G729a/b, G711 and fax) Supportsadd/drop multiplexing (drop andinsert)
NM-HDV-1T1-24	Single-port, 24-channel T1 voice/fax Network Module (supports 24 channels of medium complexity VoCoders: G.729a/b, G.726, G.711 and fax or 12 channels of G.726, G.729, G.723.1, G.728, G.729a/b, G.711 and fax)
NM-HDV-1T1-24E	Single-port, enhanced 24-channel T1 voice/fax Network Module (supports24 channels of high and medium complexity VoCoders: G.729a/b, G.726, G.729, G.728, G.723.1, G.711 and fax)
NM-HDV-2T1-48	Dual-port, 48-channel T1 voice/fax Network Module (supports 48 channels) of medium complexity VoCoders:G.729a/b,G.726,G.711 and fax or 24 channels of G726, G729, G723.1, G.728, G729a/b, G711 and fax) Supportsadd/drop multiplexing (drop andinsert)
AIM-ATM-VOICE-30	SAR and 30 Channel T1/E1 Digital Voice module
AIM-VOICE-30	30 Channel T1/E1 Digital Voice module

Analog Packet Voice and Fax Trunk Network Modules

NM-1V	1-slot voice and fax netwok module
NM-2V	2-slot voice and fax netwok module
NM-HDA	High Density Analog Module

Voice Interface Cards

VIC-2FXS	2-port voice interface card—FXS
VIC-2FXO	2-port voice interface card—FXO
VIC-2FXO-EU	2-port voice interface card—FXO (for Europe)
VIC-2FXO-M1	2-port voice interface card—FXO (with batteryreversal, for North America)
VIC-2FXO-M2	2-port voice interface card—FXO (with batteryreversal, for Europe)
VIC-2FXO-M3	2-port voice interface card—FXO (for Austelia)
VIC-2E/M	2-port voice interface card—E&M
VIC-2DID	2-port voice interface card—DID (Direct Inward Dial)
VIC-2BRI-S/T-TE	2-port voice interface card—BRI(Terminal side)
VIC-2BRI-NT/TE	2-port voice interface card—BRI (Network side)

ATM Network Modules

NM-4T1-IMA	4-port T1 ATM network module with Inverse Multiplexing over ATM (IMA)
NM-4E1-IMA	4-port E1 ATM network module with IMA
NM-8T1-IMA	8-port T1 ATM network module with IMA
NM-8E1-IMA	8-port E1 ATM network module with IMA
NM-1A-T3	1-port DS3 ATM network module
NM-1A-E3	1-port E3 ATM network module
AIM-ATM	ATM cell processing module

Serial WAN Interface Cards

WIC-1DSU-T1	One T1 CSU/DSU - Integrated
WIC-2T	2-port High Speed Serial
WIC-2-A/S	2-port Async/Sync Serial
WIC-1DSU-56K4	1-port, four-wire 56/64-Kbps with CSU/DSU

Digital Voice/WAN Interface Cards

VWIC-1MFT-T1	1-port RJ-48 MultiFlex Trunk—T1
VWIC-2MFT-T1	2-port RJ-48 MultiFlex Trunk—T1
VWIC-2MFT-T1-DI	2-port RJ-48 MultiFlex Trunk—T1 with Drop and Insert
VWIC-1MFT-E1	1-port RJ-48 MultiFlex Trunk—E1
VWIC-2MFT-E1	2-port RJ-48 MultiFlex Trunk—E1
VWIC-2MFT-E1-DI	2-port RJ-48 MultiFlex Trunk—E1 with Drop and Insert Add not for VWICs VIC slots & WIC slots
VWIC-1MFT-G703	1-port RJ-48 MultiFlex Trunk—E1 unstructured
VWIC-2MFT-G703	2-port RJ-48 MultiFlex Trunk—E1 unstructured

ISDN WAN Interface Cards

WIC-1B-S/T	1-port ISDN BRI
WIC-1B-U	1-port ISDN BRI with NT1

ISDN and Channelized Serial Network Modules	
NM-1CT1	1-port channelized T1/ISDN PRI network module
NM-1CT1-CSU	1-port channelized T1/ISDN PRI with CSU network module
NM-2CT1	2-port channelized T1/ISDN PRI network module
NM-2CT1-CSU	2-port channelized T1/ISDN PRI with CSU network module
NM-1CE1B	1-port channelized E1/ISDN PRI balanced networkmodule
NM-1CE1U	1-port channelized E1/ISDN PRI unbalancednetwork module
NM-2CE1B	2-port channelized E1/ISDN PRI balanced networkmodule
NM-2CE1U	2-port channelized E1/ISDN PRI unbalancednetwork module
NM-4B-S/T	4-port ISDN BRI network module
NM-4B-U	4-port ISDN BRI with NT1 networkmodule
NM-8B-S/T	8-port ISDN BRI network module (S/T interface)
NM-8B-U	8-port ISDN BRI with NT1 network module (U interface)
Modem Modules	
WIC-1AM	1-port analog modem WAN interface card (WIC)
WIC-2AM	2-port analog modem WAN interface card (WIC)
NM-6DM	6-port digital modem network module
NM-12DM	12-port digital modem networkmodule
NM-18DM	18-port digital modem networkmodule
NM-24DM	24-port digital modem networkmodule
NM-30DM	30-port digital modem networkmodule
NM-8AM	8-port analog modem Network Module
NM-16AM	16-port analog modem Network Module
NM-8AMJ	8-port analog modem Network Module—Japan
NM-16AMJ	16-port analog modem Network Module—Japan
Digital Subscriber Line (DSL)	
WIC-1ADSL	1-port ADSL WAN Interface Card
WIC-G.SHDSL	1-port G.shdsl WAN Interface Card
Encryption Advanced Integration Modules	
AIM-COMPR4	Data Compression AIM for 3660 Series (4 E1 performance)
AIM-VPN/HP	DES/3DES VPN Encryption AIMfor 3660-High Performance
AIM-VPN/EPDES/3DES	VPN Encryption AIM for 2600-Enhanced Performance
Content Engine Network Modules	
NM-CE-BP-20G-K9	Content EngineNetwork Module, Basic Performance, 20GB IDE Hard Disk
NM-CE-BP-40G-K9	Content EngineNetwork Module, Basic Performance, 40GB IDE Hard Disk
NM-CE-BP-SCSI-K9	Content Engine Network Module, Basic Performance, SCSI Controller
Dry Contact Closure Alarm NM	
NM-AIC-64	Alarm Monitoring and Control Network Module
Cisco EtherSwitch Modules	
NM-16ESW	One 16-Port 10/100 EtherSwitch Network Module
NM-16ESW-PWR	One 16 port 10/100 EtherSwitch NM with Inline Power support
NM-16ESW-1GIG	One 16 port 10/100 EtherSwitch NM with 1 GE (1000BaseT) port
NM-16ESW-PWR-1GIG	One 16 port 10/100 EtherSwitch NM withInline Power and GE
PPWR-DCARD-16ESW	One Inline power daughter card for16 port EtherSwitch NM
NMD-36-ESW	One 36 port 10/100 EtherSwitch High Density Service Module
NMD-36-ESW-PWR	One 36 port 10/100 EtherSwitch HDSM withInline Power
NMD-36-ESW-2GIG	One 36 port 10/100 EtherSwitch HDSM withtwo GE (1000BaseT)
NMD-36-ESW-PWR-2G	One 36 port 10/100 EtherSwitch HDSM+ Inline Power and two GE
PPWR-DCARD-36ESW	One Inline Power daughter card for 36 port EtherSwitch HDSM
GE-DCARD-ESW	One GE (1000BaseT) daughter card for EtherSwitch Modules
PPWR-PS-360W	One 48V (360W) power supply for EtherSwitch Modules
PPWR-PS-CHASSIS	One power supply chassis for Cisco 48V (360W) power supply
PWR-CHASSIS-360W	One power supply chassis and 48V power supply for EtherSwitch
CAB-PPWR-PS1-1	Connects one EtherSwitch power supply to one EtherSwitch Module
CAB-PPWR-PS1-2	Connects one EtherSwitch power supply to two EtherSwitch Modules
CAB-PPWR-PS2-1	Connects two EtherSwitch power supplies to one EtherSwitch Module

Cisco 7200 Series

The Cisco 7200 Series routers deliver exceptional price/performance, versatility, and feature-richness in a compact form factor. The Cisco 7200 is ideal as a WAN aggregator for the Service Provider (small POP) or enterprise edge, an enterprise WAN gateway, a high-end managed CPE, or as a small core router. The platform also supports sites that require IBM data center connectivity as well as sites that require multifunction capabilities that combine all the above for multiservice voice, video, and data traffic.

A key strength of the Cisco 7200 is its modularity. With a choice of 4- and 6-slot chassis, a selection of processors providing up to 1 Mpps, an extensive range of LAN and WAN interfaces with up to 48 ports per chassis, and single or dual power supplies, the customer can customize their system to achieve the performance, connectivity, and capacity desired. This modularity combined with a low initial price point guarantees both investment protection and maximum return on investment, allowing the customer to upgrade and/or redeploy their Cisco 7200 as their network needs change.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7204VXR	• 4-slot chassis • Modular processor: 225, 400, 900 Kpps (NPE-225, NPE-400, NPE-G1) or 300 Kpps service accelerator (NSE-1) • 1.2 Gbps backplane • MIX-enabled busfor data/voice/video applications
Cisco 7206VXR	• 6-slot chassis • Modular processor: 225, 400, 900 Kpps (NPE-225, NPE-400, NPE-G1) or 300 Kpps service accelerator (NSE-1) • 1.2 Gbps backplane • MIX-enabled busfor data/voice/video applications

Key Features

- Compact Form Factor—Up to six port adapters in a fully modular 3RU form factor. The optional Rack Density System (RDS) allows for up to nine Cisco 7206 routers per rack with front-to-back airflow
- Exceptional Value—As the most powerful single-processor platform, the Cisco 7200 offers customers a superior price/performance ratio supporting high-speed media and high-density configurations with up to 900 Kpps processing at a competitive price point
- Feature Rich—Full support for Cisco IOS software and enhancements for high-performance network services enables the Cisco 7200 to offer industry-leading network services, including: MPLS, broadband aggregation, quality of service (QoS), security, and voice/video/data support
- Connectivity/Flexibility—Provides high port density and an extensive range of LAN and WAN media, the Cisco 7200 dramatically reduces the cost per port and allows for flexible configurations to meet your specific network needs
- Common port adapters—Port adapters are shared with the Cisco 7300, 7400, 7500, and 7600 (w/FlexWAN Module), which simplifies sparing and protects customer investment in interfaces

Competitive Products

- Redback: SMS-500, SMS-1800
- Juniper: M5, M10
- Unisphere: ERX700, ERX1400

Specifications

Feature	Cisco 7204VXR	Cisco 7206VXR
Fixed Ports	None	Same as 7204VXR
Expansion Slots	4	6
WAN Port Adapters	DS0 to OC-12	Same as 7204VXR
Processor	RM7K RISC Processor with optional PXF Processor	Same as 7204VXR
Forwarding Rate	Up to 1 Mpps	Same as 7204VXR
Backplane Capacity	1.2 Gbps	Same as 7204VXR
Flash PCMCIA Memory	48 MB (expandable to 256 MB)	Same as 7204VXR
System DRAM Memory	128 MB (expandableto 1 GB)	Same as 7204VXR
Minimum Cisco IOS Release	12.0(1)XE	Same as 7204VXR
Internal Power Supply	AC or DC, dual option	Same as 7204VXR
Redundant Power Supply	Yes, for AC or DC	Same as 7204VXR
Chassis Height	3 RU	Same as 7204VXR
Rack Mountable	Yes, up to 16 per rack	Same as 7204VXR
Dimensions (HxWxD)	5.25 x 16.8 x 17 in.	Same as 7204VXR

Cisco IOS Software and Memory Requirements[1]

To run the Cisco IOS Feature Packs, you need, at a minimum, the amount of memory shown in the following table. Some configurations will require more.

Distribution Part Number	Feature Pack Description	IOS Image Release	Flash Memory Required	DRAM Memory Required
CD72-C-12.1T=	IP	12.1T	16MB	64MB

Selected Part Numbers and Ordering Information[1]

Cisco 7204 Chassis	
CISCO7204VXR	Cisco 7204VXR, 4-slot chassis, 1 AC Supply w/IP Software
CISCO7204VXR/225	7204VXR Bundle with NPE-225 and I/O Controller with 2 FE/E
Cisco 7206 Chassis	
CISCO7206VXR	Cisco 7206VXR, 6-slot chassis, 1 AC Supply w/IP Software
C7206VXR/400/2FE	7206VXR with NPE-400 and I/O Controller with 2 FE/E Ports
C7206VXR/400/GE	7206VXR with NPE-400 and GE+E I/O controller
7206VXR/NPE-G1	7206VXR with NPE-G1 processing engine
Cisco 7200 CPE Bundles	
7204VXR/CPE	7204VXR w/ NPE-225, 2 FE I/O, choice of specfied WAN PA
Cisco 7200 Voice Bundles	
C7206VXR/VOICE/400	7206VXR w/ NPE-400, Voice PA PA-VXC-2TE1+, I/O contlr w/ 2FE
Cisco 7200 VPN Bundle	
7204VXR/VPN/400K9	7204VXR VPN Bundle NPE400,128MB, I/O 2FE, ISA,IPSEC 3DES IOS
7204VXR400/VPNK9	7204VXR VPN Bundle NPE400,128MB, I/O 2FE, VAM,IPSEC 3DES IOS
7204VXR225/VPNK9	7204VXR VPN Bundle NPE225,128MB, I/O 2FE, VAM,IPSEC 3DES IOS
7206VXR400/VPNK9	7206VXR VPN Bundle NPE400,256MB, I/O 2FE, VAM,IPSEC 3DES IOS
7206VXRG1/VPNK9	7206VXR VPN Bundle NPE-G1,256MB, 3 FE/GE, VAM,IPSEC 3DES IOS

Cisco 7200 Series Processors

NPE-G1=	Cisco 7200 Network Processing Engine NPE-G1 including 256MB defaultDRAM and 64MB default flash memory.
NPE-225=	Network Processing Engine 225 (128MB default memory)-spare
NPE-400=	7200VXR NPE-400 (128MB default memory),SPARE
NSE-1=	7200VXR Network Services Engine 1 (128MB default mem),SPARE

Cisco 7200 Series Input/Output Controller

C7200-I/O=	Cisco 7200 Input/Output Contoller, Spare
C7200-I/O-2FE/E=	Cisco 7200 Input/Output Controller with Dual 10/100 Ethernet
C7200-I/O-GE+E=	Cisco 7200 Input/Output Controller with GE and Ethernet

Cisco 7200 Rack Mount Systems

CISCO7200RDS	CISCO 7200 Rack Density System

Cisco 7200 Processor Memory: NPE-G1

MEM-NPE-G1-256MB=	Two 128MB memory modules (256MB total) for the Cisco 7200 Network Processing Engine NPE-G1
MEM-NPE-G1-512MB=	Two 256MB memory modules (512MB total) for the Cisco 7200 Network Processing Engine NPE-G1
MEM-NPE-G1-1GB=	Two 512MB memory modules (1GB total) for the Cisco 7200 Network Processing Engine NPE-G1
MEM-NPE-G1-FLD64=	64MB Compact Flash Disk for the Cisco 7200 Network Processing Engine NPE-G1
MEM-NPE-G1-FLD128=	128MB Compact Flash Disk for the Cisco 7200 Network Processing Engine NPE-G1
MEM-NPE-G1-FLD256=	256MB Compact Flash Disk for the Cisco 7200 Network Processing Engine NPE-G1

Cisco 7200 Processor Memory: NPE-100, NPE-150, NPE-200

MEM-NPE-16MB=	16MB Memory Upgrade Kit for NPE-200/NPE-150/NPE-100
MEM-NPE-32MB=	32MB Memory Upgrade Kit for NPE-200/NPE-150/NPE-100
MEM-NPE-64MB=	2 32MB memory modules(64MB total) forNPE-200/NPE-150/NPE-100
MEM-NPE-128MB=	128MB Memory Upgrade Kit for NPE-200/NPE-150/NPE-100

Cisco 7200 Processor Memory: NPE-175 and NPE-300

MEM-SD-NPE-32MB=	32MB Memory Upgrade Kit for NPE-300/NPE-225/NPE-175
MEM-SD-NPE-64MB=	64MB Memory Upgrade Kit for NPE-300/225/175
MEM-SD-NPE-128MB=	128MB Memory Upgrade Kit for NPE-300/NPE-225/NPE-175
MEM-SD-NPE-256MB=	2 128MB memory modules (256MB total) for the NPE-300 in 7200

Cisco 7200 Processor Memory: NPE-225 and NSE-1

MEM-SD-NPE-128MB=	128MB Memory Upgrade Kit for NPE-300/NPE-225/NPE-175
MEM-SD-NSE-256MB=	256MB Memory for NPE-225 or NSE-1 in 7200 Series, SPARE

Cisco 7200 Processor Memory: NPE-400

MEM-NPE-400-128MB=	128MB Memory for NPE-400 in 7200 Series
MEM-NPE-400-256MB=	256MB Memory for NPE-400 in 7200 Series
MEM-NPE-400-512MB=	512MB Memory for NPE-400 in 7200 Series

Cisco 7200 Series Input/Output Controller Memory Options

MEM-CIP-32M=	CIP 32 MB DRAM Upgrade Kit
MEM-CPA-32M=	CPA 32MB DRAM Upgrade Kit
MEM-I/O-FLC20M=	Cisco 7200 I/O PCMCIA Flash Memory, 20MB
MEM-I/O-FLC8M=	Cisco 7200 I/O PCMCIA Flash Memory, 8MB
MEM-I/O-FLD128M=	Cisco 7200 I/O PCMCIA Flash Disk, 128 MB Spare
MEM-I/O-FLD48M=	Cisco 7200 I/O PCMCIA Flash Disk, 48 MB Spare

Cisco 7200 Series Port Adapters

PA-4C-E=	1 Port Enhanced ESCON Channel Port Adapter
PA-A2-4E1XC-E3ATM=	CES Port Adapter E3/E1 120 ohms
PA-A2-4E1XC-OC3SM=	CES OC3 Port Adapter4E1 Ports 120ohms
PA-A2-4T1C-OC3SM=	ATM CES Port Adapter, 4T1 CES Portsand 1 OC3 ATM SM Port
PA-A2-4T1C-T3ATM=	ATM CES Port Adapter, 4T1 CES Ports and 1 T3 ATM Port
PA-GE=	Gigabit Ethernet Port Adapter
PA-MCX-2TE1=	Spare 2 port MIX-enabled multichannel T1/E1 PA with CSU/DSU
PA-MCX-4TE1=	4 port MIX-enabled multichannelT1/E1 PA with CSU/DSU
PA-MCX-8TE1-M=	T1/E1 SS7 link PA for ITP
PA-MCX-8TE1=	8 port MIX-enabled multichannel T1/E1 with CSU/DSU
PA-SRP-OC12MM=	DPT-OC12 Multi-mode port adapter
PA-SRP-OC12SMI=	DPT-OC12 Single-mode intermediate port adapter
PA-SRP-OC12SML=	DPT-OC12 Single-mode long-reachport adapter
PA-SRP-OC12SMX=	DPT-OC12 Singe-mode extended reach PA

Cisco 7200, 7400 and 7500 Series Port Adapters

PA-VXC-2TE1+=	2 port TE1 hi-capacity enhanced voice PA
PA-VXB-2TE1+=	2 port T1/E1 moderate capacity enhanced voice PA
PA-T3=	1 Port T3 Serial Port Adapterwith T3 DSUs
PA-T3+=	1 Port T3 Serial Port Adapter Enhanced
PA-POS-OC3SML=	1-Port Packet/SONET OC3c/STM1 Singlemode (LR) PA
PA-POS-OC3SMI=	1-Port Packet/SONET OC3c/STM1 Singlemode (IR) PA
PA-POS-OC3MM=	1-Port Packet/SONET OC3c/STM1 Multimode PA
PA-POS-2OC3=	2 Port Packet/SONET OC3c/STM1 Port Adapter
PA-MC-T3=	1 port multichannel T3port adapter
PA-MC-E3=	1 port Multi-Channel E3port adapter
PA-MC-4T1=	4 port multichannel T1 port adapter with integrated CSU/DSUs
PA-MC-2T3+=	2 port multichannel T3port adapter
PA-MC-2T1=	2 port multichannel T1 port adapter with integrated CSU/DSUs
PA-MC-2E1/120=	2 port multichannel E1 port adapter with G.703 120ohm interf
PA-H=	Port Adapter: 1-Port HSSI
PA-E3=	1 Port E3 Serial Port Adapterwith E3 DSU
PA-A3-T3=	1-Port ATM Enhanced DS3Port Adapter (Spare)
PA-A3-OC3SML=	1-Port ATM Enhanced OC3c/STM1 Singlemode(LR)Port Adapter
PA-A3-OC3SMI=	1-Port ATM Enhanced OC3c/STM1 Singlemode(IR)Port Adapter
PA-A3-OC3MM=	1-Port ATM Enhanced OC3c/STM1 Multimode Port Adapter
PA-A3-E3=	1-Port ATM Enhanced E3 Port Adapter (Spare)
PA-A3-8E1IMA=	8-port ATM Inverse Mux E1 (120 Ohm) Port Adapter, Spare
PA-8T-X21=	8-Port Serial, X.21 Port Adapter
PA-8T-V35=	8-Port Serial, V.35 Port Adapter
PA-8T-232=	8-Port Serial, 232 Port Adapter
PA-8E=	8-Port Ethernet 10BaseT Port Adapter
PA-4T+=	4-Port Serial Port Adapter, Enhanced
PA-4E1G/75=	4-Port E1 G.703 Serial Port Adapter (75ohm/Unbalanced)
PA-4E1G/120=	4-Port E1 G.703 Serial Port Adapter (120ohm/Balanced)
PA-4E=	4-Port Ethernet 10BaseT Port Adapter
PA-2T3=	2 Port T3 Serial Port Adapterwith T3 DSUs
PA-2T3+=	2 Port T3 Serial Port Adapter Enhanced,Spare
PA-2H=	PORT ADAPTER:2-PORT HSSI
PA-2FE-TX=	2-Port Fast Ethernet 100Base TX Port Adapter
PA-2FE-FX=	2-Port Fast Ethernet 100Base FX Port Adapter
PA-2E3=	2 Port E3 Serial Port Adapterwith E3 DSUs

Cisco 7200 and 7400 Series Port Adapters

PA-8B-S/T=	8-Port BRI Port Adapter, S/T Interface

Cisco 7200 and 7500 Series Port Adapters

PA-VXA-1TE1-30+=	1 Port T1/E1 Digital Voice Port Adapterwith 30 Channels
PA-VXA-1TE1-24+=	1 Port T1/E1 Digital Voice Port Adapterwith 24 Channels
PA-MC-STM-1SMI=	1 port multichannel STM-1 single mode port adapter
PA-MC-STM-1MM=	1 port multichannel STM-1multimode port adapter
PA-MC-8TE1+=	8 port multichannel T1/E1 8PRI port adapter
PA-F/FD-SM=	1-Port FDDI Full Duplex Single-Mode Port Adapter
PA-F/FD-MM=	1-Port FDDI Full Duplex Multi-Mode Port Adapter
PA-A3-8T1IMA=	8-port ATM Inverse Mux T1 Port Adapter, Spare
PA-4R-DTR=	Port Adapter:4-Port Dedicated Token Ring,4/16Mbps, HDX/FDX

Cisco 7200 Series Service Adapters

SA-ISA=	Integrated Services Adapter for IPSec or MPPE encryption
SA-VAM=	VPN Acceleration Module (VAM)IPSec and IPComp Acceleration

Cisco 7200 Series Transceiver Modules

GBIC-LX/LH=	Gigabit Interface Converterfor 1000BASE-LX standard
GBIC-SX=	Gigabit Intf. Converter for 1000BASE-SX (Short Wavelength)
GBIC-ZX=	Gigabit Interface Converterfor 1000 BASE-ZX
POM-OC3-MM	1-port OC3/STM1 Pluggable Optic Module,MM
POM-OC3-SMIR	1-port OC3/STM1 Pluggable Optic Module, SM-IR
POM-OC3-SMLR	1-port OC3/STM1 Pluggable Optic Module, SM-LR

Cisco 7200 Series Power Supplies	
PWR-7200-DC+=	Cisco 7200 DC (24V-60V) Power Supply Option
PWR-7200/2-DC+	Cisco 7200 Dual DC (24V-60V) Power Supply Option
PWR-7200-AC=	Cisco 7200 AC Power Supply With United States Cord
PWR-7200-ACA=	Cisco 7200 AC Power Supply With Australian Cord
PWR-7200-ACE=	Cisco 7200 AC Power Supply With European Cord
PWR-7200-ACI=	Cisco 7200 AC Power Supply With Italian Cord
PWR-7200-ACU=	Cisco 7200 AC Power Supply With United Kingdom Cord
Cisco 7200 Series Spares and Accessories	
ACS-7200-RMK=	Cisco 7200 Rackmount Kit and Cable Management Bracket
CVPN7200FIPS/KIT=	Kit(Instructions,labels)to configure 7206 for FIPS operation

1. This is only a small subset of all parts available via URL listed under "For More Information." Some parts have restricted access or are not available through distribution channels.

For More Information

See the Cisco 7200 Series Web site: **http://www.cisco.com/go/7200**

Cisco 7300 Series

The Cisco 7300 Series Routers are optimized for flexible, high performance IP/MPLS services at the network edge, where service providers and enterprises link together. Coupled with powerful network processing, a broad set of interfaces and a compact, modular form factor the Cisco 7300 Series Routers are ideal for intelligent, multi-gigabit network connectivity.

The Cisco 7304 Series Router is ideally applied as a high-end CPE or as an Internet Gateway router. Architected for network High Availability and multi-protocol support, the 7304 supports the broad set of existing Cisco 7000 Series Port Adapters with the new Cisco 7304 Port Adapter Carrier Card.

The Cisco 7301 Series Router is a compact single rack unit router coupled with a broad set of interfaces and Cisco IOS software features. It packs high performance in a space and power efficient form factor that includes a single 7000 Series port adapter slot, 3 on-board Gigabit Ethernet (copper or optical)/Fast Ethernet ports and a new high-speed bus technologies.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7301	• Compact, powerefficient 1RU form factor • Three times the performance increase over existing single rack unit routers like the Ciso 7401 • Single 7000 Series Port Adapter Slot
Cisco 7304	• Highly modular price and performance optmized platform, rich in IP services • High performance connectivity—DS-1 through OC48/STM16 with 3.5 Mpps performance • Built-in Gigabit Ethernet connectivity • Multiprotocol routing:IP, IPX, AppleTalk, DLSw • Compact size, high availability and optimal cooling

Key Features

- Cisco 7301: With nearly 1 million-packets-per-second (Mpps) processing performance, the fastest Cisco 1RU general-purpose processor, as of January 2003; 3 fixed 10/100/1000-Mbps ports (RJ-45 or SFP optics) directly on the processor; Full Cisco IOS feature support; Pluggable Gigabit Ethernet optics (SFPs); Up to 1GB of available DRAM; Up to 256MB of removable compact flash memory; Front-back airflow and single sided management
- Cisco 7304: Compact modular form factor with four RU with four port adapter slots per chassis; PXF IP processor hardware-accelerated services such as Cisco Express Forwarding (CEF), NetFlow v8, and Turbo ACL; Offers 3.5Mpps performance for PXF-accelerated services with the NSE-100 Network Services Forwarding Engine; Two Gigabit Ethernet ports per NSE-100; System redundancy: optional dual processors and dual AC or DC power supplies increases network availability

Competitive Products

- Redback: SMS-500, SMS-1800
- Juniper: M5, M10
- Unisphere: ERX700, ERX1400

Specifications

Feature	Cisco 7301	Cisco 7304
Fixed Ports	Three Gigabit Ethernet ports	Same as 7301
Expansion Slots	1	4
WAN Interface Range	DS-1 to OC-3	T3 to OC-48
Processor	RM 7000 MIPS Processor + PXF Processor	RM 7000 MIPS Processor + PXF Processor
Forwarding Rate	Up to 1 Mpps	Up to 3.5 Mpps
Backplane Capacity	1.2 Gbps	16 Gbps
Flash PCMCIA Memory	64 MB (expandable to 128 MB)	Same as 7301
System DRAM Memory	128 MB (expandableto 512 MB)	Same as 7301
Minimum Cisco IOS Release	12.2(11)YZ	12.1(9)EX
Internal Power Supply	AC or DC	Same as 7301
Redundant Power Supply Support	Yes, for AC or DC	Same as 7301
Chassis Height	1 RU	4 RU
Rack Mountable	Yes, up to 40 per rack	Yes, up to 11 per rack
Dimensions (HxWxD)	1.73 x 17.3 x 13.87 in.	7 x 17.2 x 20.5 in.

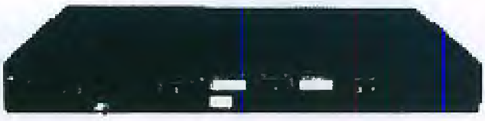
Cisco 7400 Series



With the Cisco 7400, this modular, one-port adapter slot unit leverages over 40 standard 7200/7500 series port adapters. Its compact, stackable architecture is designed for application specific routing deployments, such as broadband services aggregation (PPP/L2TP) and WAN edge connectivity in service provider and enterprise networks. Leveraging Cisco patented technology, the Cisco 7400 series delivers a premium suite of hardware-accelerated network services.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7401ASR-CP	• General WAN edge connectivity in a small form factor, or as managed customer premise equipment (CPE) • Broad range of connectivity options—from DS0 to OC-3 interfaces • Comprehensive management services with remote management, provisioning, trouble shooting and software upgrade • Hardware accelerated services, including: NAT, ACLs, Netflow, CBWFQ, CBWRED, Policing, marking, Hierarchical Traffic Shaping, & VRF lite
Cisco 7401ASR-BB	• Complete broadbandsubscriber services suite with highest subscribers per rack ratio • One fast LAN interface (FE/GE) and one fast WAN interface (DS3/OC3) • High volume/densityof PPP, PPPoE, PPPoA, L2TP tunnel aggregation and termination for broadband services like DSL, Cable, and Wireless

Key Features

- Compact form factor with 1 RU, front-to-back airflow and stackability
- Hardware—accelerated IP network services
- Built-in dual GE connectivity
- Flexible WAN connectivity supporting over 40 interfaces including serial, multichannel, ISDN, Frame Relay, ATM, Packet over SONET (POS), from NxDS0 to OC-3
- Shared port adaptors with the Cisco 7200, 7300, 7500, and 7600 (with FlexWAN Module), which simplifies sparing and protects customer investment in interfaces

Competitive Products

- Redback: SMS500, SMS1800
- Juniper: M5, M10
- Unisphere: ERX700, ERX1400

Specifications

Feature	Cisco 7401ASR-BB	Cisco 7401ASR-CP
Fixed Ports	2 Gigabit Ethernet (RJ or GBIC) ports	Same as 7401ASR-BB
Expansion Slots	1	Same as 7401ASR-BB
WAN Interface Range	DS0 to OC-3	Same as 7401ASR-BB
Processor	RM7K RISC Processor + PXF Processor	Same as 7401ASR-BB
Forwarding Rate	Up to 350 Kpps	Same as 7401ASR-BB
Backplane Capacity	1.2 Gbps	Same as 7401ASR-BB
Flash PCMCIA Memory	64MB (expandable to 128MB)	Same as 7401ASR-BB
System DRAM Memory	256MB (expandable to512MB)	128MB (expandable to 512MB)
Minimum Cisco IOS Release	12.2(1)DX	Same as 7401ASR-BB
Internal Power Supply	AC, DC48V, DC24V, or Dual DC48V	Same as 7401ASR-BB
Redundant Power Supply Support	Yes	Same as 7401ASR-BB
Chassis Height	1 RU	Same as 7401ASR-BB
Rack Mountable	Yes, up to 40 per rack	Same as 7401ASR-BB
Dimensions (HxWxD)	1.72 x 17.3 x 11.80 in	Same as 7401ASR-BB

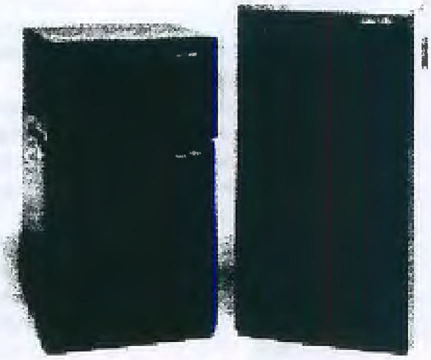
Cisco 7500 Series



An essential part of both Enterprise and Service Provider networks, the Cisco 7500 Series routers are the market leader for edge applications, due to its breadth of services, diverse interfaces, reliability, and performance. Since its inception, the Cisco 7500 has seen huge improvements in performance and its ability to scale, most recently with the Route Switch Processor 16 (RSP16) and Versatile Interface Processor 6-80 (VIP6-80) module. This series combines Cisco's proven software technology with exceptional reliability, availability, serviceability, and performance features to meet the requirements of today's most mission-critical networks.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7505	• 5 expansion slots • One CyBus • DS0 to OC-12 connectivity(all platforms)
Cisco 7507	• 7 expansion slots • Dual CyBuses • Redundant powersupplies • Diverse set of routingprotocols (allplatforms)
Cisco 7513	• 13 expansion slots • Dual CyBuses • Redundant powersupplies • Diverse set of routingprotocols (allplatforms)

Key Features

- High-performance switching—Delivers high performance for mission-critical applications by supporting high-speed media and high-density configurations; using the processing capabilities of the Versatile Interface Processors and Cisco Express Forwarding—the Cisco 7500 series system capacity can exceed two million packets per second
- Full support for Cisco IOS software and enhancements for high-performance network services—Performs network services such as quality of service, security, compression, and encryption at high speed; VIP technology extends the performance of these services through distributed IP services
- High port density—Provides high port density and an extensive range of LAN and WAN media; this feature dramatically reduces the cost per port and allows a flexible configuration
- Unmatched interface flexibility—The Cisco 7500 supports a broad selection of Interface Processors (IPs) and Port Adapters (PAs). Port adapters are shared with the Cisco 7200, 7400, and 7600 (with FlexWAN Module)
- High Availability—Enhanced features and capabilities include redundant route processors, power supplies, fans, and software fault isolation with Stateful Switchover and NonStop Forwarding

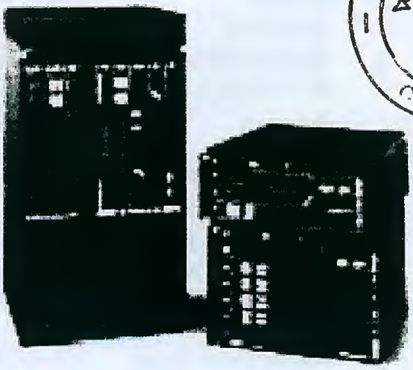
See the Cisco 7500 Series Web site: **http://www.cisco.com/go/7500**

Cisco 7600 Series



The Cisco 7600 Series combines optical WAN/MAN networking and high-volume Ethernet aggregation with a focus on line-rate delivery of high-touch IP services in large data centers and at the edge of service provider networks. It provides customers the flexibility of three different form factors: Cisco 7603, 7606, and 7609. As the most scalable system in the industry, each router offers the ability to deliver DS0 to OC-48 WAN connectivity, and 10-Mbps Ethernet to 10-Gigabit Ethernet LAN connectivity into Internet data center, metropolitan aggregation, WAN edge aggregation, and enterprise networking applications.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7603	• 3 slot (horizontal) chassis • 32 Gbps backplane bandwidth • 15 Mpps forwarding rate • NEBs Compliant
Cisco 7606	• 6 slot (horizontal) chassis • 160 Gbps backplane bandwidth • 30 Mpps forwarding rate • NEBs Compliant
Cisco 7609	• 9 slot (vertical) chassis • 256 Gbps backplane bandwidth • 30 Mpps forwarding rate • NEBs Compliant

Key Features

- Hardware accelerated IP services on each Optical Services Module (OSM), delivering up to 6 Mpps per slot
- 15 to 30 Mpps forwarding processor and up to 512 MB DRAM for Internet routing
- Modular and scalable from 32 Gbps to 256 Gbps switch fabric
- One of the widest, most complete ranges of WAN interfaces in the industry, with DS0 to OC-48 connectivity
- Leveraging the FlexWAN Module, 7x00 port adapters are shared with the Cisco 7200, 7300, 7400, and 7500 which simplifies sparing and protects customer investment in interfaces
- Compatible with Catalyst 6500 LAN interfaces, offering 10 Mbps Ethernet to 1 Gbps

Competitive Products

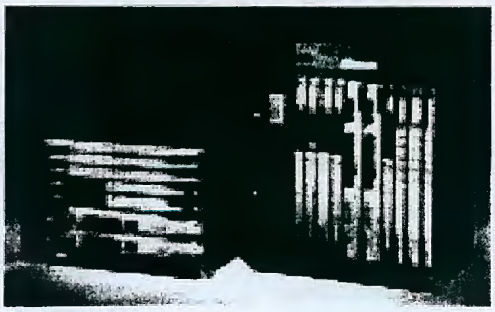
Cisco 10000 Series



The Cisco 10000 Series is the industry's only edge router that delivers consistent, high performance services for carriers deploying IP, MPLS, and broadband services to DSL and private line customers. Coupled with proven high availability and innovative adaptive network processing technology, the Cisco 10000 Series is uniquely designed to meet the service needs of carriers up to DS3/E3 aggregation speeds.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 10008	• Broadband features including PPP over ATM, PPP over Ethernet, routed bridge encapsulation, and Layer 2 Tunneling Protocol • MPLS, MPLS VPN, and MPLS Quality of Service edge features • Leased line features such as seamless integration from a dedicated access environment (TDM or SONET/SDH) to the ATM core.

Key Features

- Industry-leading high availability—nonstop performance, with a complete set of reliability features for high availability (99.999 percent uptime). Full hardware redundancy, hot-swappable elements, and seamless route processor cutover provide continuous traffic forwarding.
- Lowest total cost of ownership—the Cisco 10000 offers the highest leased-line, ATM, frame, and broadband session densities on a single platform, and its high reliability reduces network downtime and operational expenses
- Broad portfolio of line-rate IP sessions—critical service features, such as QoS, MPLS, Multilink PPP, and ACLs are hardware accelerated to deliver exceptional throughput for every connection

- Industry-leading session density—the Cisco 10000 supports thousands of DS0, DS1/E1 connections, or hundreds of clear-channel DS3 connections on a single platform, providing the highest port density of DS3-and-below interfaces

Competitive Products

- Redback: SMS-10000
- Juniper: M5, M10, M20
- Unisphere: ERX700, ERX1400

Specifications

Feature	Cisco 10008
Fixed Ports	None
Expansion Slots	8 (for interfaces)
WAN Interface Range	DS0 to OC-12
Processor	Cisco PXF Processor

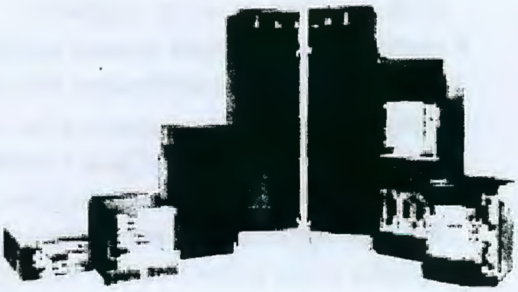
Cisco 12000 Series



The Cisco 12000 Series Internet Router is part of Cisco's family of multimillion packets-per-second (mpps) IP and MPLS routing platforms for building profitable networks in today's communications economy. The Cisco 12000 Series is the premier high-end routing platform for service provider backbone and edge applications, enabling service providers to meet the challenge of building packet networks to satisfy services demand while increasing profitability.

The Cisco 12000 Series offers the only portfolio of 10 Gbps per slot systems and interfaces (including Packet over SONET [POS], Dynamic Packet Transport/Resilient Packet Ring [DPT/RPR], and Gigabit Ethernet [GbE]), delivering 10G economies of scale anywhere in the network. The Cisco 12000 Series provides the highest reliability, the richest set of service enablers, the lowest total cost of ownership, and the only proven investment protection, including systems that can be upgraded in the field to increase switching capacity. This innovative combination of features and capabilities enables service providers to build the most competitive IP and MPLS networks.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 12400 Internet Routers (10G)	• 10 Gbps/slot, from 80 to 320 Gbps of non-blocking switching capacity • Supportfor high-density, high-speedinterfaces: ATM, DPT/RPR, POS, GbE/FE rangingfrom channelized DS3 (to DS1) throughOC-192c/STM-64c • 4 10G platforms to choose from: 12416, 320 Gbps, 16 slots, 40 RU; 12410, 200 Gbps, 10 slots, 20 RU; 12406, 120 Gbps, 6 slots, 10 RU; 12404, 80 Gbps, 4 slots, 5 RU • Support for industry-leading QoS/CoS features ideal for peering, transit, POP consolidation, and IDC bandwidth aggregation as well as latency-sensitive applicationslike voice and video • Support for IP or MPLS forwarding • Support for hundredsof thousandsof routes • Proven carrier- class reliabilityand availability through enhancedfeatures such as Online Insertion and Removal, High Availability (RPR+, NSF and SSO) and APS/MPS
Cisco 12000 Internet Routers (2.5G)	• 2.5 Gbps/slot, from 40 to 80 Gbps switching capacity • Supportfor high-density, high-speedinterfaces: ATM, DPT/RPR, POS, GbE/FE rangingfrom channelized DS3 (to DS1) throughOC-48c/STM-16c • 3 chassis to choose from: 12016, 80 Gbps, 16 slots, 40 RU; 12012, 60 Gbps, 12 slots, 32 RU; 12008, 40 Gbps, 8 slots, 14 RU • The 12016 Internet Router is upgradeableto 320 Gbps via an easy, field-installed switch fabric upgrade kit—no need to pull out existing line cards
Cisco 12000 Manager	• An element management solutionto increase service velocity anddecrease operation costs

Key Features

- Proven investment protection, offering full forward compatibility for all line cards, and the only high-end system with a modular, replaceable switch fabric for field-installed capacity upgrades
- Only fully distributed system architecture scales to the edge, supporting backbone- or edge-optimized line cards in the same chassis
- Only platform that maximizes the value of line-rate edge applications with 10G uplinks. By deploying Cisco 12000 Series IP Services Engine (ISE) line cards in Cisco 12400 Internet Routers, Service Providers benefit from line cards optimized for edge applications, while removing the bandwidth bottleneck with full 10 Gbps uplinks using cost-effective VSR optics or 10 GbE for intra-POP connections.
- The only complete priority packet delivery solution set
- Industry's only complete IP QoS and congestion control implementation that uniquely enables premium real-time services such as VoIP and video. Its distributed architecture and class of service features such as priority based congestion control (WRED) and dedicated low latency queuing (MDRR), along with virtual output queuing (VoQ), eliminate head of line blocking (HOL) and maintain packet sequence integrity under all conditions
- Non-service—impacting online insertion and removal (OIR) of components (including switch fabric cards) and front accessibility reduce downtime and simplify maintenance
- High availability features such as Cisco Non Stop Forwarding (NSF) and Cisco Stateful Switchover (SSO) eliminate single points of failure, help maintain system performance, and prevent service interruption. With these features, packet forwarding remains uninterrupted before, during and after a route processor switchover on the Cisco 12000 Series. Coupled with OIR, the faulty route processor can be replaced without affecting operation
- Designed for NEBS compliance to meet service provider carrier-class requirements

Cisco 10000 Series Memory Options

ESR-PRE-MEM-FD48	C10000 PRE 48M Flash Disk (default)
ESR-PRE-MEM-FD128	C10000 PRE 128M Flash Disk option
ESR10005-PWR-AC	AC Power Entry Module
ESR10005-PWR-DC	DC Power Entry Module
ESR-PWR-DC=	DC POWER ENTRY MODULE FOR ESR10008
ESR-PWR-AC	AC power entry module for ESR10008
ESR-PWR-AC/R	Redundant AC powerentry module for ESR10008,spare
ESR10005-PWR-AC=	AC POWER ENTRY MODULE, SPARE
ESR10005-PWR-AC/R	Redundant AC Power Entry Module
ESR10005-PWR-DC/R	Redundant DC Power Entry Module
CAB-DS-ACE	Power Cables for AC Power Option, European
CAB-DS-ACI	Power Cables for AC Power Option, Italian
CAB-DS-ACJ-TWLK	Power Cables for AC Power Option, Japan
CAB-DS-ACU	Power Cables for AC Power Option, UK
CAB-DS-120VAC	Cisco 120 VAC Power Cable,US
ESR-24CT1/E1	24port Channelized E1/T1 Line Card
ESR-8E3/DS3	8 port clear channelE3/DS3 Line Card
ESR-6CT3	6 port channelized T3line card
ESR-1GE	1 pt Gigabit Ethernet line card (requires a GBIC)
ESR-GBIC-SX	1000base-SX GBIC, multimode,standardized forESR
ESR-GBIC-LHLX	1000base-LH GBIC,singlemode,standardizedfor ESR
ESR-GBIC-ZX	1000base-ZX GBIC,singlemode,standardized for ESR
ESR-4OC3ATM-SM	4 Port OC3/STS3c/STM1c ATM Line Card, single mode
ESR-1COC12-SMI	1 pt ChOC12 (STS12) line card, single mode intermed. reach
ESR-1OC12/P-SMI	1 pt OC12/STS12c/STM4 PDS, single mode, int reach
ESR-1OC12ATM-SM	1 pt OC12/STM4 ATM Line Card, Single-Mode

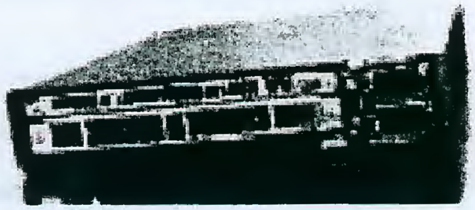
Cisco 10720 Series



The Cisco 10720 Internet Router is a high-performance router and a principle building block in the metro IP network. It enables service providers to offer innovative and differentiated IP services to their customers at optical speeds. Equipped with Ethernet technology for customer access and the innovative Dynamic Packet Transport (DPT)/RPR (Resilient Packet Ring) technology or Packet over SONET (POS) for metro optical connectivity, the Cisco 10720 allows service providers to offer IP services closer to the user, enabling them to better control admission to network resources. This allows service providers to bypass traditional DS1 and DS3 access options. The dual counter rotating ring technology of DPT is also cost effective, since it uses both rings and can be deployed over dark fiber and still maintain the less than 50ms restoration common in SONET/SDH systems. For multiservice applications, DPT can also be deployed over traditional SONET/SDH ADMs and wavelength division multiplexing (WDM) systems.

The Cisco 10720 is a cost-effective, reliable platform that not only supports the full suite of IP routing protocols such as IS-IS, OSPF and BGP, but also allows advanced IP features to be introduced efficiently, without compromising on performance. Although primarily designed for high-speed Internet services for multitenant and business-park applications in the metro, the Cisco 10720 Internet Router is also suitable for a range of other applications such as: Internet data center applications, intra-POP aggregation, cable multisystem operator (MSO) internetworking, and voice-over-IP (VoIP) aggregation.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 10720 Internet Router	• Any service provider planning to offerhigh-performance IP sevices as part of their business strategy by extending IP further out into the network • Any service provider wanting to simplify their current network and implement thesimple, scalable, reliable features of DPT technology while maximizing fiber usage • Any customer already using DPT technology in their network, most likely with DPT cards on the 12000 Internet Router • Metro Ethernet Servicessuch as L2 and L3 VPN with FE/GE handoff to the Customer and 50ms restoration over dark fiber using DPT.

Key Features

- Equipped with Redundant Power Supply by default
- SRP specific features—IPS with <50 ms restoration time and SRP MIB support
- Multicast support including PIM SM, PIM DM, MBGP
- L2 VPN—UTI, L2TPv3 and EoMPLS for Layer 2 to Layer 2 LAN extension; L3 VPN MPLS VPN
- QoS—Modular QoS CLI, CAR, WRED, VTMS traffic shaping, and access lists
- Ethernet features—MDI-MDI-X support, 10/100 speed auto-negotiation, HDX-FDX negotiation and time delay reflectometry (TDR) for 10/100BaseTX
- Hot Standby Routing Protocol (HSRP)/Multiple Hot Standby Routing Protocol (MHSRP)
- 64-MB built-in Flash for software and configuration load
- Optical receive power monitoring support on OC-48/STM-16 Interface and GE
- Supported management information bases (MIBs) include SNMP, SRP, SONET, Etherlike, OSPF

Competitive Products (vs. Cisco's Metro IP RPR Solution using the 10720)

- Extreme Summit: 48/Blackdiamond comb for GigE Hub & Spoke
- Riverstone: RS3000/RS8600 combo for GigE Hub & Spoke

Specifications

Feature	Cisco 10720
Security Features	Including AAA, RADIUS authentication, TACACS+, and encrypted passwords
Management	Cisco IOS CLI TACACS+ and RADIUS Configuration and administration features including Telnet and CiscoDiscovery Protocol (CDP) Serial (aux) and consoleports for local and remote administration Remote software download via TFTP and RCP IP over DCC for remote management of the Cisco ONS 15104 OC-48/STM-16 Optical Regenerator, where applicable
Physical Interfaces	Uplink Modules: 2-port single-mode OC-48c/STM16c DPT (SR 2 km (1.2 miles), IR 15 km (9.3 miles), LR1 40km (24 miles) and LR2 80km (50miles) Interface Modules—The Cisco 10720 Internet Router has two dedicated slots for interface modules—modulesare not interchangeable or hot swappable: • Upper slot is dedicated for DPT or POS Uplink module equipped withtwo physical ports of OC-48c/STM16c that provide an aggregatebandwidth of approximately 5 Gbps. The cards are available in two four versions of optics, short reach (SR) and intermediatereach (IR), Long Reach1 (LR1) and Long Reach2 (LR2) with two small form-factor OC-48 ports with LC connectors • A third option for the upperslot is the CON-AUX module, which is a depopulated uplinkcard equipped with Console and Auxiliary ports only; this allows the configuration of the 10720 as an "EthernetRouter" allowing the use of one or more of the Ethernet ports in the lower slot for network connectivity • Lower slot is dedicated for24-port Fast Ethernet module—available in TX (100 m reach), FX-MM (2 km reach) or FX-SM (15 km reach). The TX module is equippedwith RJ-45 connectorswhile the FX-SM and FX-MM modules are equipped with MT-RJ connectors. • Also available is a combination 4 Gigabit Ethernetwith Small Form Factor Plug-able(SFP) Optics available in SX 550m and LH 10km plus an additional 8 Ports of Fast Ethernet 10/100 TX Copper ports. The TX and the FX-MM versions of the 24-port Fast Ethernet modules accommodate copper or multimode fiber deploymentswithin MTUs and the FX-SM allows for deployment of the Cisco 10720 Internet Router in a central location covering Ethernet connectivity to buildings for a radius of up to 15 km.
Dimensions	3.5 x 17.25 x 18.25 in. (8.9 x 43.81 x 46.35 cm)

8OC03/ATM/TS-IR-B	8-port OC03/STM1 ATM IR LC with SC connector
8OC03/ATM/TS-MM-B	8-port OC03/STM1 ATM MM LC with SC Connector
OC12/SRP-IR-SC-B	OC12 SRP IR line card
OC12/SRP-LR-SC-B	OC12 SRP LR line card
OC12/SRP-MM-SC-B	OC12 SRP MM line card
OC12/SRP-XR-SC	OC12 SRP single ring linecard, single mode 1550, XR
OC48/SRP-LR-SC-B=	DC48 SRP Rev-B Line Card, Single Mode, Long Reach
OC48/SRP-SR-SC-B=	DC48 SRP Rev-B Line Card, Single Mode, Short Reach, GSR
OC48E/POS-LR-SC-B=	1 Port OC-48c/STM-16c SONET/SDH 1550nm LR with SC
DC48E/POS-SR-SC-B=	1 Port OC-48c/STM-16c SONET/SDH 1310nm SR with SC, GSR
OC48X/POS-LR-SC	CONCATENATED OC48 WITH EXTENDED FEATURES LONG REACH
OC48X/POS-SR-SC	1 port OC48 POS Extended features
8OC3/POS-MM=	8 port OC3/STM1 SONET/SDH Multi-Mode LC with MTRJ conn Spare
8OC3/POS-SM=	8 port OC3/STM1 SDNET/SDHSingle-Mode LC with LC conn Spare
1X10GE-LR-SC=	Cisco 12000 1-Port 10GE Card, 1310nm serial, 10km, SC
16OC3/POS-MM=	16 port OC3/STM1 SONET/SDH Multi-Mode LC with MTRJ conn
16OC3/POS-SM=	16 port OC3/STM1 SONET/SDH Single-Mode LC with LC conn Spare
16DC3X/POS-I-LC-B	16 PDRT OC3 WITH EXTENDED FEATURES RELEASE B
EPA-GE/FE-BBRD	Cisco 12000 Modular GE Baseboard w/ 1GE and 3 EPA Slots
EPA-3GE-SX/LH-LC	Cisco 12000 3-Port GE Port Adapter for EPA-GE/FE-BBRD
3GE-GBIC-SC	GSR12000 three-port GE line card
GE-GBIC-SC-B	GSR12000 single port Gigabit Etherret line card
GBIC-SX-MM	1000base-SX GBIC module, multimode,standardized for GSR12000
GBIC-LH-SM	1000base-LH GBIC module,singlemode,standardized for GSR12000
GBIC-ZX-SM	GBIC very long reach GBIC module for the GE line card
6CT3-SMB	Channelized T3for the GSR
GLC-LH-SM	GE SFP, LC connector LHtransceiver
GLC-SX-MM	GE SFP, LC connector SXtransceiver
6DS3-SMB-B	6DS3-SMB-B w/ ECC
6E3-SMB	E3 line card, 6 ports
12DS3-SMB-B	12DS3-SMB-B w/ ECC
12E3-SMB	E3 line card, 12 ports
CHOC12/STS3-IR-SC=	Channelized OC-12/STM-4 with four STS-3c/STM-1 POS paths
LC-OC12-DS3	1 port Channelize OC-12 with 12 DS3s
8FE-FX-SC-B	GSR 8-port 100baseFX, SC connector, version B
8FE-TX-RJ45-B	8-port 100baseTX, RJ45 connectortype, version B
OC192/POS-IR-SC	1 Port OC192c/STM64c POS, 1550nm IR, SC
OC192/POS-SR-SC	1 Port OC192c/STM64c POS, 1310nm SR, SC
OC192/POS-VSR	1 Port OC192c/STM64c POS, VSR Optics
OC192E/POS-VSR	1 Port OC192c/STM64c POS Edge Card, VSR Optics
OC192E/POS-IR-SC	1 Port OC192c/STM64c POS Edge Card, 1550nm IR, SC
OC192E/POS-SR-SC	1 Port OC192c/STM64c POS Edge Card, 1310nm SR, SC
OC192/SRP-VSR	1 Port OC192c/STM64c SRP Linecard, 850nm VSR, MTP
OC192/SRP-IR-SC	1 Port OC192c/STM64c SRP Linecard, 1550nm IR, SC
OC192/SRP-SR-SC	1 Port OC192c/STM64c SRP Linecard, 1310nm SR, SC

4GE-SFP-LC=	4 port-GE line card for Cisco 12000
Cisco 12000 Series Pluggable Optic Modules	
POM-OC48-LR2-LC	1-port OC-48/STM-16 Pluggable Optic Module, 1550nm SM-LR2 LC
POM-OC48-SR-LC	1-port OC-48/STM-16 Pluggable Optic Module, 1310nm SM-SR LC

Cisco SN 5400 Series Storage Router

The Cisco SN 5400 Series implements the iSCSI protocol to extend access of a Fibre Channel fabric and attached storage devices to IP servers. iSCSI (internet SCSI) combines the benefits of the TCP/IP protocol suite with SCSI, the universal standard for storage access. By utilizing iSCSI, the SN 5400 Series extends a Fibre Channel storage network to lower priced/lower performance servers in a data center and departmental servers located throughout the campus and enterprise. With the SN 5428, access to a Fibre Channel Storage Area Network (SAN) from anywhere on an IP network is as easy as accessing direct attached storage.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco SN 5428	• When a customer is moving from a DAS (Direct Attached Storage) environment to a SAN (Storage Area Network) and they do not already have a Fibre Channel switch, the SN 5428 provides a Fibre Channel switch and iSCSI ports to deliver a one system solution. • When the customer wants only a full function Fibre Channel switch, the SN 5428 is a very cost effective, low latency switch that will perfectly fit a Fibre Channel onlyimplementation • When the customer has block level applications and wants to maintain block level access to shared storage combined with IP/Ethernet for a substantial reduction in attachment costs

Key Features

- Provides levels of security and access control beyond what is currently available in traditional storage area networks by including layer 2 and layer 3 protection to resist against unauthorized access to your storage resources
- Uses the TCP/IP protocol suite for storage networking which protects your existing investment in storage and networking infrastructure
- Fully integrates existing management and configuration tools
- Based on industry standards, maximizes your investment and enables you to reduce total cost of ownership for the increasing storage demands on your network
- Uniquely provides standard IP networking capabilities to storage environments
- SN 5428: Designed for high-availability providing continuous access to critical data; Extensive security features to protect valuable storage resources; and, Full breadth of iSCSI drivers

CHAPTER 2

LAN Switching

LAN Switching Products at a Glance

Product	Features	Page
Catalyst 2900 Series	Fixed-configuration Ethernet switches • 10/100 auto sensing and auto negotiating interface • Managed	2-3
Catalyst 2948G-L3	Fixed and Modularports • Gigabit Ethernet over Fiber or Copper • High performance, CiscoExpress Forwarding (CEF) Layer 2/3/4 switching upto 48 Mpps • Advancednetworkcontrolwith predictable performance,granular QoS,advancedsecurity, comprehensive management	2-3
Catalyst 2900 Series XL—Modular Switches	Modular 10/100 Ethemet switches • 12 or 24 10/100 ports • 12 100BASE- FX ports (2912MF XL) • Two high-speed module slots accommodating 10/100, 100BASE-FX, Gigabit Ethernet (including 1000BASE-T), and GigaStack GBIC (2912MF XL and 2924M XL only) • Cisco switch clustering enabled • Managed	2-4
Catalyst 2950 Series	Fixed-configuration basic and Intelligent Ethernet 10/100 switches • 12/24/48 10/100 port managed switches with stackable andstandalone models • Flexible uplink options: fixed 100Base FX, fixed 1000BaseT, fixed 1000BaseSX, and GBIC-based ports • Industrial-grade, rugged models(Catalyst 2955) for harsh environment deployments • Wire-speed, high performance switch • Models with the Standard Image software (SI)provide Layer 2 Cisco IOS functionality for basic data, voice, and videoservices at the edge of the network • Models with the EnhancedImage software (EI) bring Layer 2-4 intelligentservices such as advanced Qualty of Service, rate limiting, security filteringand multicastmanagement capabilities • Stackable up to 9switcheswith GigastackGBIC • Simplified networkmanagement through Cisco ClusterManagement Suite up to 16fixed configuration Catalyst switches	2-6
Catalyst 3500 Series XL	Fixed-configuration 10/100 and Gigabit Ethernetswitches • 24 ports with 2 GBIC-based Gigabit Ethemet ports with in-line power(3524-PWR XL) • 8 GBIC-based ports (3508G XL) • Stackable up to 9switcheswith GigaStack GBIC • Cisco Switch Clusteringcapable • Managed	2-10
Catalyst 3550 Series	Fixed-configuration IntelligentEthemet switchesin stackable 10/100, inline power, or Gigabit Ethernet configurations • Network controland bandwidth optimization via advanced Quality of Service (QoS), granular rate-limiting, Access ControlLists (ACLs), and multicast services • Network security through a wide range of authentication methods,data encryption technologies,and accessrestrictionfeatures based on users, ports, and MAC addresses • Network scalabilitythroughadvancedrouting protocolssuch as EIGRP, OSPF, BGP, and PIM (requires Enhanced Multilayer Software Image (EMI)) • Intelligent adaptabilitythrough Cisco Identity Based Networking Services (IBNS) offering greater flexibility and mobility to stratified users	2-12

Product	Features	Page
Catalyst 4500 Series-Modular Configuration (4503, 4506 and 4507R)	Modular, multilayer switch with integrated intelligent services for converged networks in enterprise campus wiring closets, Layer2/Layer3 distribution, and integrated LAN/WAN branch office. • Resilient architecture for mission critical applications • Up to 240 ports of Ethernet, Fast Ethernet or Gigabit Ethernet over Fiber or Copper • High performance, CiscoExpress Forwarding (CEF) Layer 2/3/4 switching up to 48 Mpps • Up to 64 Gbps of switching capacity • Advanced network control with predictable performance, granular QoS, advanced security, comprehensive management • Managed	2-15
Catalyst 4000 Series—Fixed Configuration (4908G-L3 and 4912G)	High performance fixed Gigabit Ethernet switch with intelligent enterprise Cisco IOS services	2-17
Catalyst 5000 Family	Modular switch that supports a broad range of interfaces for aggregation of legacy technologies with IP technology • End of Sale Effective June 2003/End of Support effective 2008. For further information please contact your local sales representative	2-18
Catalyst 6500 Family	High-performance, multilayer switch with integrated intelligent services for enterprise campus backbones, server aggregation, or internet data centers • 10/100, 100FX Fast Ethernet, 1000BASE-T, 1000BASE-X, and Gigabit Ethernet modules • Layer 4-7 services • Up to 256 Gbps of switching capacity • Packet throughput scalable to 100+ Mpps • Managed	2-20
Catalyst 8500 Series	High-performance, modular, multimedia switch router • Wire speed, nonblocking IP, IPX, IP multicast Layer 3 switching • Multiple interface options • Managed	2-24

Cisco Catalyst 2900 Series

The Catalyst 2948G and 2980G deliver all the Ethernet switching needed for many small to medium-sized wiring closets in a single system without the need for additional modules, cables or other interconnects. Utilizing the same industry-leading software and functionality of the Catalyst 4000, 5000, and 6000 families, the Catalyst 2948G and 2980G have consistent end-to-end services, which ensure complete interoperability with enterprise Catalyst switches.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 2980G Series	• A single box solution without additional cables, modules or configuration • Up to 80 ports of wire-speed, non-blocking performance with large MTBF reliability • End-to-end VLANs, EtherChannel, multicasting, and security • Mature/proven Catalyst software compatibility in the wiring closet and data center
Catalyst 2948G Series	• The same features as 2980G but up to 48 ports of wire-speed, non-blocking performance
Catalyst 2948G-L3	• High performance CPU with Cisco IOS software • Dedicated 48 ports of 10/100 Mbps and two ports of 1000BASEX Gigabit Ethernet with gigabit Ethernet converter (GBIC) support; all ports support Layer 3 capability

Key Features

- Powerful non-blocking performance with proven Cisco IOS services
- Wire speed 18 Million pps switching throughput
- Intelligent multilayer IOS services (security, multicast, quality of service [QoS])
- Advanced multiple queue QoS architecture
- Security (TACACS+, RADIUS, port lockdown)
- Spanning-Tree Protocol (802.1D) with enhancements (UplinkFast, PortFast) for deterministic/fast failover
- Redundant Power Supply (option)

Competitive Products

- HP Procurve: 4108gl, 4000M
- 3Com: SS3300
- Nortel/Bay: BayStack 350T and 450T
- Extreme: Summit 48si

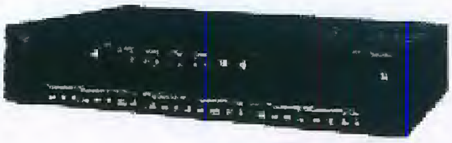
Cisco Catalyst 2900 Series XL—Modular Switches



Cisco's Catalyst 2900 Series XL is a full line of modular, 10/100 autosensing Fast Ethernet switches that combine outstanding performance, ease of use, and integrated Cisco IOS software.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 2912MF XL	• All-fiber switch to aggregate Fast Ethernet workgroups over 100BASE-FX connections in small and mid-size campus environments • High-speed uplnks to backbone or server via Fast Ethernet, Gigabit Ethernet
Catalyst 2924M XL	• Any combination of dedicated 10-Mbps or 100-Mbps connections to individual PCs, servers, and other systems or connectivity between existing Ethernet and Fast Ethernet workgroups • The option to easily increase the switch's port density and provide inexpensive high-speed uplinks through bandwidth aggregation (Fast EtherChannel and Gigabit EtherChannel technologies) • Gigabit Ethernet (including 1000BASE-T) modules for high-speed links • Hot swap insertion and removal of modules • Maximum flexibility

Key Features

- Switch fabric of 3.2 Gbps, a forwarding rate of more than 3.0 million packets per second, and a maximum forwarding bandwidth of 1.6 Gbps, delivering wire-speed performance across all 10/100 ports
- Support for IEEE 802.1p protocol for prioritization of mission-critical and time-sensitive applications such as voice and telephony traffic
- Cisco's switch clustering technology enables up to 16 interconnected Catalyst 1900, 2900 XL, and 3500 XL switches, regardless of geographic location, to form a flexible, single IP managed network
- Up to 250 port-based VLANs or ISL/802.1Q trunks
- Network port allows operation in networks with unlimited MAC addresses
- Autoconfiguration of multiple switches on a network from one boot server
- Up to 4 Gbps bandwidth between routers, switches, and servers with Fast EtherChannel and Gigabit EtherChannel technologies

Competitive Products

- 3Com: SuperStack III 3300
- Nortel: BayStack 350 & 450 switches

Specifications

Feature	Catalyst 2912 MF XL	Catalyst 2924M XL

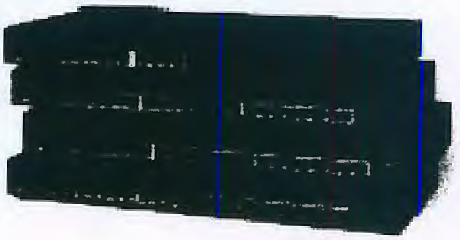
Cisco Catalyst 2950 Series Intelligent Ethernet Switches



The Catalyst 2950 Series with Intelligent Ethernet Switches are fixed-configuration, standalone and stackable models that provide wire-speed Fast Ethernet and Gigabit Ethernet connectivity for small, mid-sized, service provider and industrial networks. The 2950C-24, 2950T-24, 2950G-12-EI, 2950G-24-EI, 2950G-48-EI and 2950G-24-EI-DC are part of an affordable product line that brings intelligent services, such as advanced quality of service, rate-limiting, security filters, and multicast management, to the network edge-while maintaining the simplicity of traditional LAN switching. When a Catalyst 2950 Switch is combined with a Catalyst 3550 Series Switch, the solution is capable of enabling IP routing from the edge to the core of the network. These Intelligent Ethernet Switches come with Enhanced Image (EI) software configuration only.

In addition to the range of Intelligent Ethernet switches, the Catalyst 2950 Series also includes switches with Standard Image (SI) software configuration only. The Cisco Catalyst 2950SX-24, 2950-24 and 2950-12, members of the Cisco Catalyst 2950 Series Switches, are standalone, fixed-configuration, managed 10/100 switches with Gigabit uplinks (2950SX-24 only) providing user connectivity for small to mid-sized networks. These wire-speed desktop switches come with Standard Image (SI) software features and offer Cisco IOS functionality for basic data, video and voice services at the edge of the network.

The Catalyst 2950 Series also includes the Cisco Catalyst 2955T-12, 2955C-12, and 2955S-12. The Cisco Catalyst 2955 are industrial-grade switches that provide Fast Ethernet and Gigabit Ethernet connectivity for deployment in harsh environments. With a range of copper and fiber uplink options, the Catalyst 2955 operates in environments such as industrial networking solutions (industrial Ethernet deployments), intelligent transportation systems (ITSs), and transportation network solutions. It is also suitable for many military and utility market applications where the environmental conditions or suspended solid concentrations exceed the specifications of other commercial switching products.

Embedded in all the products in the Catalyst 2950 Series is the Cisco Cluster Management Suite (CMS) Software, which allows users to simultaneously configure and troubleshoot multiple Catalyst desktop switches using a standard Web browser.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 2950 Series Intelligent Ethernet Switches with Enhanced Image (EI)	• Layer 2/3/4 based services: Advanced QoS, Security, High availability and STP enhancements • Wire-speed performance • Advanced QoS, Security, High availability and STP enhancements • Cisco Cluster Management • Stackable • GBIC based uplink ports for media flexibility
Catalyst 2950G-48-EI	• Ideal for desktop connectivity • High Port Density
Catalyst 2950G-24-EI	• Ideal for desktop connectivity • Medium Port Density
Catalyst 2950G-24-EI-DC	• Ideal for Telco/DCN environments • NEBS compliant • Medium Port Density
Catalyst 2950G-12-EI	• Ideal for desktop connectivity • Low Port density
Catalyst 2950T-24	• High speed uplink flexibility with fixed 10/100/1000BaseT ports • Low price per port
Catalyst 2950C-24	• High speed uplink flexibility over extended distances with fixed 100BASE-FX connections using MT-RJ connectors • Low price per port
Catalyst 2950 Series with Standard Image (SI)	• Wire speed, high performance switches for delivering 10/100 Mbps speed connectivity to desktop PCs, servers and other systems • Layer 2-based QoS and Security features • Cisco Cluster Management • Ideal for desktop connectivity
Catalyst 2950-12	• Low Port density
Catalyst 2950-24	• Medium port density
Catalyst 2950SX-24	• High speed uplinks with 2 fixed 1000BaseSX ports • Medium port density
Catalyst 2955 Series with Enhanced Image (EI)	• Ideal for harsh network environments • Rugged: Implements industrial-grade components, a compact form factor, convection cooling, and relay output signaling. Designed to operate at extreme temperatures and under extreme vibration and shock. • Layer 2/3/4 based services: Advanced QoS, Security, High availability and STP enhancements • Wire-speed performance
Catalyst 2955T-12	• Twelve 10/100 ports and two 10/100/1000BASE-TX (Copper) uplnks
Catalyst 2955C-12	• Twelve 10/100 ports and two 100BASE-FX (Multimode Fiber) uplinks
Catalyst 2955S-12	• Twelve 10/100 ports and two 100BASE-LX (Singlemode Fiber) uplinks

Key Features

- Cisco Cluster Management (CMS) Software offers superior manageability, ease-of-use and ease-of-deployment and enhanced configuration wizards
- Wire-speed performance in connecting end-stations to the LAN
- Catalyst 2950: Ideal for small- and mid-sized networks
- Catalyst 2955: Ideal for harsh network environments
- Sophisticated Multicast Management via IGMP Snooping
- Scalability and high availability features
- Support for Cisco Redundant Power System 300 (RPS 300)
- Switches with Standard Image (SI) include these additional features:
  - Catalyst 2950SX-24 switch provides a cost-effective solution for Gigabit speeds over fiber, offering 2 1000BaseSX uplinks
  - QoS and Security based on Layer 2 information
  - Basic Cisco IOS Services

- Intelligent Ethernet Switches with Enhanced Image (EI) include these additional features:
  - Catalyst 2950T-24 switch is a component of the Cisco Gigabit Ethernet over copper solution, offering 10/100/1000BaseT uplinks
  - Powerful Gigabit-uplink options—GBIC-based or 1000BaseT
  - Superior control through advanced intelligent services—advanced quality of service based on Layer 2 through Layer 4 parameters
  - Superior Security features: based on Layer 2 through Layer 4 Access Control Parameters
  - Enhanced Cisco IOS Services

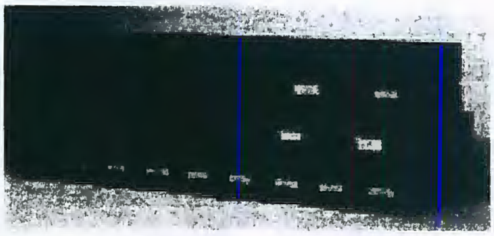
Cisco Catalyst 3500 Series XL



The Cisco Systems Catalyst 3500 series XL is a scalable line of stackable 10/100 and Gigabit Ethernet switches that delivers premium performance, flexibility, and manageability with unparalleled investment protection. This line of low-cost, high-performance switching solutions provides next-generation stackable switching through an independent high-speed stacking bus that preserves valuable desktop ports. Cisco's breakthrough Switch Clustering technology expands the stacking domain beyond a single wiring closet, enabling up to 16 interconnected Catalyst 3550, 2950, 3500 XL, 2950, 2900 XL and 1900 switches—regardless of geographic location—to form a flexible, single IP managed network.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 3524-PWR XL	• A stackable, wire-speed 10/100 and Gigabit Ethernet switch for delivering dedicated 10 or 100 Mbps to individual users and servers • Advanced QoS, high avalability, and integrated in-line power enabling easy deployment of IP phones and wireless access points.
Catalyst 3508G XL	• A stackable Gigabit Ethernet switch with eight GBIC-based portsfor aggregating a groupof Gigabit Ethernet switches and servers through Cisco GigaStack GBICs or standard 1000BASE-X GBICs • Dedicated, high-speed Gigabit Ethernet performance

Key Features

- 10.8 Gbps switch fabric, up to 8 Mpps forwarding rate, and maximum forwarding bandwidth of 5.4 Gbps across all 10/100 ports
- Built-in Gigabit Ethernet ports accommodate a range of GBIC transceivers, including the Cisco GigaStack GBIC, 1000BASE-T, 1000BASE-SX and 1000BASE-LX/LH GBICs, and 1000BASE-ZX extended reach GBIC
- Low-cost, 2-port Cisco GigaStack GBIC offers a range of configurable stacking and performance options by delivering 1-Gbps connectivity in a daisy-chained connection or up to 2-Gbps in a dedicated, switch-to-switch connection
- Support for IEEE 802.1p technology for prioritization of mission-critical and time-sensitive application such as voice and telephony traffic
- 3524-PWR XL provides in-line power to IP phones and other devices

Competitive Products

- 3Com: SuperStack 3Switch 3300 and 3900
- Hewlett Packard: ProCurve 2524, 2424M, 4000, and 8000
- Nortel: BayStack 450T and BPS 2000 switches

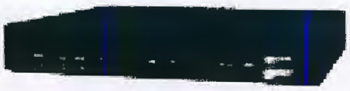
Cisco Catalyst 3550 Series Intelligent Ethernet Switches



The Cisco Catalyst 3550 Series Intelligent Ethernet Switches is a line of enterprise-class, stackable, multilayer switches that provide high availability, scalability, security and control to enhance the operation of the network. With a range of Fast Ethernet and Gigabit Ethernet configurations, the Catalyst 3550 Series can serve as both a powerful access layer switch for medium enterprise wiring closets and as a backbone switch for small networks. Now customers can deploy network-wide intelligent services, such as advanced quality of service, rate-limiting, Cisco security access control lists, multicast management, and high-performance IP routing—while maintaining the traditional LAN switching.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 3550 Series	• Enterprise-class intelligent services such as ACLs, advanced QoS, and rate-limiting • Cisco Cluster Management
Catalyst 3550-48-EMI (Enhanced Multilayer Software Image)	• High performance advancedIP routing • High Port Density • Ideal as a powerful access layer switch for a medium enterprise wiring closet with routed uplinks
Catalyst 3550-48-SMI (Standard Multilayer Software Image)	• High Port Density • Ideal for a powerful access layer switch for a medium enterprise wiring closet • Basic IP routing
Catalyst 3550-24-EMI (Enhanced Multilayer Software Image)	• High performance advancedIP routing • Medium Port Density • Ideal for a powerful access layer switch for a medium enterprise wiring closet with routed uplinks
Catalyst 3550-24-SMI (Standard Multilayer Software Image)	• Medium Port Density • Ideal for a powerful access layer switch for a medium enterprise wiring closet • Basic IP routing
Catalyst 3550-24PWR-EMI (Enhanced Multilayer Software Image)	• High performance advancedIP routing • Medium Port Density • Integrated inlinepower to Cisco IP telephones and Cisco wireless LAN access points • Ideal for a powerful access layer switch for a medium enterprise wiring closet with routed uplinks
Catalyst 3550-24PWR-SMI (Standard Multilayer Software Image)	• Medium Port Density • Integrated inlinepower to Cisco IP telephones and Cisco wireless LAN access points • Ideal for a powerful access layer switch for a medium enterprise wiring closet • Basic IP routing
Catalyst 3550-24-DC-SMI (Standard Multilayer Software Image)	• Medium Port Density • DC powered, NEBS level 3 compliant • Basic IP routing
Catalyst 3550-24-FX-SMI (Standard Multilayer Software Image)	• Medium Port Density • Ideal for 100FX aggregation • Basic IP routing
Catalyst 3550-12G	• High performance IP routing • Gigabit Ethernet aggregation using fiber • Ideal for stack aggregation, server aggregation, or as a backbone switch in a mid-sized network
Catalyst 3550-12T	• High performance advancedIP routing • Gigabit Ethernet aggregation using Category 5 copper cabling • Ideal for stack aggregation, server aggregation, or as a backbone switch in a mid-sized network
CD-3550-EMI	• High performance advancedIP routing • EMI upgrade kit for standardversions of the Catalyst 3550-24, 3550-24 PWR, 3550-24-DC, 3550-24-FX, and 3550-48 switches

Key Features

- Network control and bandwidth optimization via advanced Quality of Service (QoS), granular rate-limiting, Access Control Lists (ACLs), and multicast services
- Network security through a wide range of authentication methods, data encryption technologies, and access restriction features based on users, ports, and MAC addresses
- Network scalability through advanced routing protocols such as EIGRP, OSPF, BGP, and PIM (requires Enhanced Multilayer Software Image (EMI))
- Intelligent adaptability through Cisco Identity Based Networking Services (IBNS) offering greater flexibility and mobility to stratified users
- Lower Total Cost of Ownership (TCO) for IP Telephony and Wireless LAN deployments through integrated inline power (Catalyst 3550-24 PWR only)
- Easy switch configuration and deployment of advanced services through the embedded Cluster Management Suite (CMS) Software
- Stackable up to 9 switches with the Gigastack GBIC

Competitive Products

Cisco Catalyst 4500 Series

The Cisco Catalyst 4500 Series integrates nonblocking Layer 2/3/4 switching with optimal control, enabling business resilience for enterprise and metropolitan Ethernet customers deploying Internet-based business applications. A next generation Catalyst 4000 Series platform, the Cisco Catalyst 4500 Series includes three new chassis: Catalyst 4507R (7-slot: redundant Supervisor IV capable), Catalyst 4506 (6-slot) and Catalyst 4503 (3-slot). A key component of Cisco AVVID (Architecture for Voice, Video and Integrated Data), the Catalyst 4500 extends control to Enterprise wiring closets, branch office and Layer 3 distribution points. A variety of network infrastructure solutions are enabled by the Catalyst 4500 Series of switches including: Cisco IOS Network Services, IP Telephony, 10/100/1000 to the desktop, Wireless LAN, NetFlow Services and Metro Ethernet Switching.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 4507R	• When network resiliency via redundant Supervisor Engines is crucial to customer success • Port density up to 240-10/100, 100-FX, or 10/100/1000BASE-T with modular investment protection • Layer 2 and Layer 3 Cisco Express Forwarding (CEF)-based switching up to 64 Gbps, 48 Mpps
Catalyst 4506	• Port density up to 240-10/100, 100-FX, or 10/100/1000BASE-T with modular investment protection • Layer 2 and Layer 3 Cisco Express Forwarding (CEF)-based switching up to 64 Gbps, 48 Mpps
Catalyst 4503	• Port density up to 96-10/100, 100-FX, or 10/100/1000BASE-T with modular investment protection • Layer 2 and Layer 3 Cisco Express Forwarding (CEF)-based switching up to 28 Gbps, 21 Mpps

Note: Compatible sparing between Catalyst 4507R, 4506, and 4503 chassis provides investment protection with common power supplies and switching line cards. The Catalyst 4500 series also leverages the same feature set with identical software code base along with the same enterprise functionality as the Catalyst 6500 Series in the wiring closet, delivering a consistent end-to-end solution.

Key Features

- Supervisor II
  - Catalyst 4500/6500 Series CatOS Software, single IPQ—Address Management, and security (TACACS+, port lockdown, RADIUS, Kerberos)
  - Enterprise VLANs (4,096) with 802.1Q support on all ports, 16,000 MAC Addresses, and Spanning-Tree Protocol (802.1D) enhancements (UplinkFast, PortFast, and BackboneFast) for deterministic/fast failover
  - Fast and Gigabit EtherChannel aggregation (up to 8 Gbps full duplex), load balancing and failover on every port, and port filtering
- Supervisor IV
  - Capable of 1+1 redundancy in a 4507R (Single Supervisor only in Catalyst 4506 and 4503)
  - Optional NetFlow Services Card Support
  - Integrated Layer 2/3/4 CEF based switching at 64Gbps and 48Mpps
  - Feature rich and proven Cisco IOS Software
  - Port based enhanced QOS with multiple queues (16k input; 16k output), bandwidth management, policing and Access Control Lists (16k input ACL entries; 16k output entries)
  - Enterprise VLANs (4,000) with 802.1Q and ISL support on all ports, 32,000 MAC Addresses, and Spanning-Tree Protocol (802.1D), 802.3w, 802.3s

- Supports RIP I, RIP II, Open Shortest Path First (OSPF), Interior Gateway Routing Protocol (IGRP) Enhanced IGRP (EIGRP), BGP4, IS:IS, Software based IPX and Appletalk, Hot Standby Router Protocol (HSRP), Cisco Group Management Protocol (CGMP), IGMP v1 and II, Internet Control Message Protocol (ICMP), and both Protocol Independent Multicast (PIM) sparse and dense modes, and Distance Vector Multicast Routing Protocol (DVMRP) interoperability
- Optional compact flash memory cards

Cisco Catalyst 4000 Series — Fixed Configuration

Cisco offers two dedicated Gigabit Ethernet fixed configuration switches; the Catalyst 4908G-L3 and the Catalyst 4912G. The Catalyst 4908G-L3 Switch is a fixed configuration Layer 3 Ethernet switch featuring wire-speed switching for IP, IPX and IP Multicast. It provides the high performance required for midsize campus backbones with optimum port density.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 4908G	• Cost effective dedicated Gigabit Ethernet Layer 3 backbone solution ideal for deployment in midsize networks for those customers who need wire speed Layer 3 performance but do not require Gigabit Ethernet density over 8 ports.
Catalyst 4912G	• Advanced wirespeed, non-blocking Layer 2 Gigabit Ethernet performance with intelligent Cisco IOS services and high-speed connections to workstations or servers; flexible Gigabit Interface Converter (GBIC) interfaces on all ports

Key Features

- Catalyst 4908G-L3:
  - 8 ports of 1000BASE x Gigabit Ethernet with GBIC support; Layer 3 switching and routing of IP, IPX and IP Multicast with wire speed Layer 2 switching for non routable protocols; Gigabit Etherchannel capability on every port
- Catalyst 4912G:
  - Wire-speed performance with 24 Gbps of dedicated bandwidth for nonblocking Gigabit Ethernet concentration, broad Gigabit EtherChannel availability, and GBIC flexibility on fiber port interfaces covering a wide range of cabling distances

Competitive Products

- Extreme Networks: Summit 1
- Foundry: Turbo Iron 8
- Nortel: Accellar 1200

Specifications

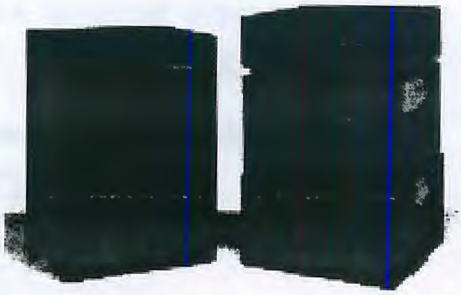
Cisco Catalyst 5000 Family



On October 4, 2002, Cisco Systems announced the end of sale for the Cisco Catalyst 5000 and 5500 series of modular switches, including all related Cisco Catalyst 5000 and 5500 series chassis and modules. The Cisco Catalyst 5000 and 5500 series chassis and modules will be orderable through June 30, 2003.

The Catalyst 5000 family features a Gigabit Ethernet and ATM-ready platform offering users high-speed trunking technologies, including Fast EtherChannel and OC-12 ATM. This series also provides a redundant architecture, dynamic VLANs, complete intranet services support, and media-rate performance with a broad variety of interface modules.

Migration Options

	When a Customer Needs These Features
Catalyst 6500 with Sup2/msfc2	• High Performance L3 wiring closet, data centre,or core feature sets • Integrated L2-7 Serices Modules • Layer 3 Routing Capabilities • Scalability to 256 Gbps • Hardware based QoS and ACLs • IOS software
Catalyst 6500 with Sup2/pfc2	• High Performance L2 wiring closet, data centreor core feature sets • Scalability to 256 Gbps • Hardware based QoS and ACLs
Catalyst 6500 with sup1A-2GE	• Low cost of entry wiring closet solution • Scalability to 32Gbps • Basic security and L2 QoS capabilities • L2 Stateful failover capabilities

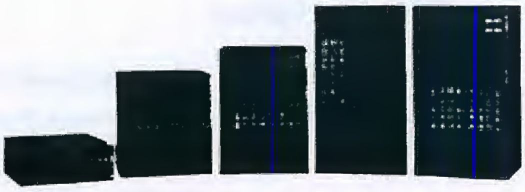
Cisco Catalyst 6500 Family



The Catalyst 6500 Family delivers highly available secure converged network services for the Enterprise and Service Provider networks. Designed to address the increased requirements for gigabit scalability, high-availability, rich services, and multilayer switching in backbone, distribution, and wiring closet topologies as well as datacenter environments, the Catalyst 6500 Family delivers exceptional scalability and price/performance, supporting a wide range of interface densities, performance, and integration of powerful service modules. The Catalyst Family delivers a wide range of intelligent switching solutions, enabling corporate intranets, extranets, and the internet for multimedia, mission-critical data, and voice applications.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 6500 Series	• A highly scalable platformthat meets requirements for a dynamic environment includingvery high multilayer switching performancewith high Fast Ethernet and Gigabit Ethernetport densities
Catalyst 6500 Family Solutions	• Enterprise campus distribution and core—Withindustry-leading port densities, performance, and high availability solutions • Enterprise Server Farm—For Gigabit wire-speed access to mission-critical server farms • High-capacitywiring closets—In very large deployments, the Catalyst 6000 family delivers advanced Layer 2, 3, and 4 switching in wiring closets • Value wiring closets where basic L2 QoS and ACL capabilities are required in addition to 2-3 Sec L2 Stateful failover • WAN/LAN/MAN integration—Single integated platform simplifiés networkdesign, decreases rack space requirements, and decreases overall administration costs • Advanced, integrated hardwae based firewall, contentswitching, intrusion detection, and network analysis capabilies • Service Provider Networks—For all dynamic environments including e-commerce, web hosting, and co-location facilities

Key Features

- Application-aware networking with multilayer switching intelligence and support for CiscoAssure policy networking
- High-availability features deliver maximum uptime for mission-critical application support
- Extensive Quality of Service (QOS) features to support mission-critical applications
- Scalable performance to 210 Mpps
- Maximum 10/100 Ethernet port density: 96 (3-slot chassis), 240 (6-slot chassis), 384 (9-slot chassis), and 576 (13-slot chassis)
- Maximum Gigabit Ethernet port density: 32 (3-slot chassis), 82 (6-slot chassis), 130 (9-slot chassis), and 194 (13-slot chassis)

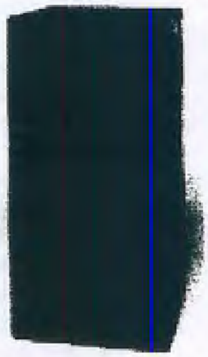
Cisco Catalyst 8500 Multiservice Switch Routers



The Catalyst 8500 family multiservice switch routers integrate multiservice ATM switching with wire-speed multiprotocol routing for Gigabit Ethernet and Fast Ethernet into a single platform that also supports advanced Cisco IOS services for QoS and security. This family delivers enterprise MAN/WAN and Service Provider multiservice edge solutions with scalable performance, lower cost of ownership, and offer multiple interface options in a modular chassis. The Catalyst 8500 series consists of the modular Catalyst 8510 (10-Gbps, 5-slot) switch and the modular Catalyst 8540 (40-Gbps, 13-slot) switch. Both switches implement Cisco IOS Software to provide a variety of network services including reliability, security, management, and QoS with CiscoAssure policy networking.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 8540 and Catalyst 8510	• Integrated 10/100 FE, GE, and ATM • Flexible ATM interfaces (T1/E1, IMA, DS3/E3, OC-3, OC-12, and OC-48) • Frame relay and circuit emulation services • Wire-speed performance • Multiservice MAN/WAN applications • Multiservice Edge solutions • Voice, data, and video solutions • MPLS VPN

Key Features

- Ideal for integrated multiservice ATM switching with wire-speed multiprotocol routing for gigabit Ethernet (L3eATM or Layer 3 enabled ATM)
- Ideal for aggregating multiprotocol traffic from multiple wiring closets or from workgroup switches such as the Catalyst 5000 or distribution/server aggregation switches such as the Catalyst 6000 Family
- Provides nonblocking routing for IP, IPX, and IP multicast while also offering wire-speed Layer 2 switching for nonroutable protocols such as NetBIOS and DECnet local-area transport (LAT)
- Aggregate throughput of up to 24 million packets per second (pps) for non-blocking, wirespeed Layer 3 switching

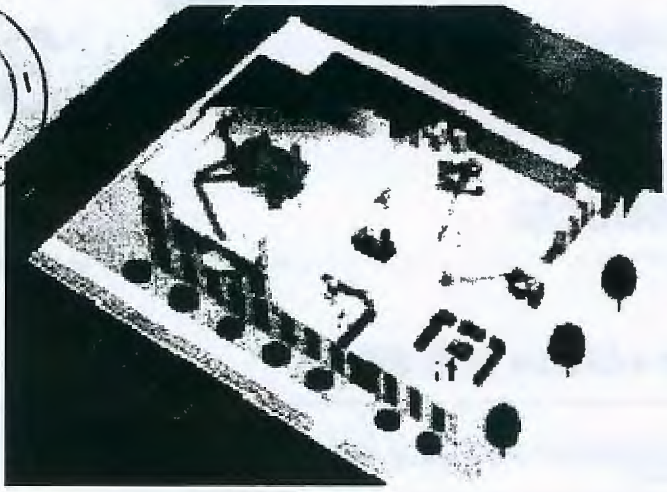
CHAPTER 3

Wireless LAN Products

Wireless LAN Products at a Glance (IEEE 802.11b)

Product	Features	Page
Cisco Aironet 1200 Series Access Points	• Offers investment protection and a smooth migration path to future technologies througha dual band radio design • Delivers an enterprise class security solution with the IEEE 802.11x-based Cisco Wireless Security Suite • Industry-leading security, network management, throughput and software feature set • Support for both line power over Ethernet and localpower	3-2
Cisco Aironet 1100 Series Access Point	• Single 802.11b radio, upgradableto 802.11g • Provides end-to-endsolution support for Intelligent NetworkServices • Delivers an enterprise class security solution with the IEEE 802.11x-based Cisco Wireless Security Suite • Support for both line power over Ethernet and local power • Cost effective, yet feature-rich	3-5
Cisco Aironet 5 GHz 54 Mbps Wireless LAN Client Adapter	• IEEE 802.11a-compliant CardBus adapterthat operatesin the UNII-1 and UNII-2 bands • Complementsthe Cisco Aironet 1200 Series 802.11a Access Point, providing a solution that combinesperformanceand mobilitywith the security and manageability that enterprises require	3-6
Cisco Aironet 350 Series Client Adapters	• Superior range and throughput • Secure networkcommunications • World mode for internationalroaming • PCMCIA card and PCI form factors • IEEE 802.11b	3-8
Cisco Aironet 350 Series Workgroup Bridge	• Driverless installation of up to eight Ethernet-enabled devices • Optimum wireless performance and range • Standards-based centralized security • IEEE 802.11b	3-10
Cisco Aironet 350 Series Wireless Bridge	• High-speed, high-power radios, delivering building-to-building links of up to 25 miles (40.2 km) • A metal casefor durability and plenum rating • Supports both pointto-point and point-to-multipoint configurations • Broad range of support antennas • Simplified installation, improved performance, and upgradeablefirmware, ensuring investment protection • IEEE 802.11b	3-12
Cisco Aironet Antennas and Accessories	• A wide array of options • FCC-approved directionaland omni-directional antennas • Low-loss cable, mounting hardware, and other accessories available	3-14
CiscoWorks Wireless LAN Solution Engine	A hardware-based wireless LAN managementsolution that providestemplate-based configuration with user-defined groupsto effectively manage a large numberof accesspoints and bridges. • Monitors LEAP authentication servers • Enhancessecurity management through misconfiguration detection on acces points and bridges	9-23

Sample Wireless LAN Solution Overview—In-Building or Site-to-Site



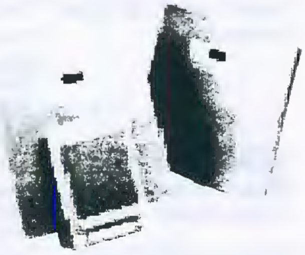
Enterprise, Small/Medium Business Applications

Service common areas for mobile workers
Support employees working in multiple offices
Cost effective, quick network deployment for temporary or leased offices

Sample Vertical Markets

Healthcare, retail, government
Public Access
Multiple Tenant/Dwelling Units
Airports, Hotels, Convention Centers
Education: K-12 and Universities

Cisco Aironet 1200 Series Access Points



The Cisco Aironet 1200 Series Access Point sets the enterprise standard for next-generation high performance secure, manageable, and reliable wireless local-area networks (WLANs) while also providing investment protection because of its upgrade capability and compatibility with current standards. The modular design of the Cisco Aironet 1200 supports IEEE 802.11a and 802.11b technologies in both single-and dual-mode operation. You can configure the Cisco Aironet 1200 to meet customer-specific requirements at the time of purchase and then reconfigure and upgrade the product in the field as these requirements evolve.

The Cisco Aironet 1200 Series protects current and future network infrastructure investments. Compliant with IEEE 802.11a and 802.11b standards, The 802.11a radio supports data rates of up to 54 Mbps and eight non-overlapping channels that offer high performance as well as maximum capacity and scalability. The 802.11b radio provides data rates up to 11 Mbps and three non-overlapping channels to support widely deployed 802.11b clients. The Mini-PCI form factor of the 802.11b radio allows for upgrade to higher-speed 2.4 GHz technologies such as the draft IEEE 802.11g standard.The Cisco Aironet 1200 Series extends end-to-end intelligent networking to the wireless access point with support for enterprise-class virtual LANs (VLANs) and quality of service (QoS). An ideal choice for enterprise installations, the Cisco Aironet 1200 Series can manage up to 16 VLANs, which allows customers to differentiate LAN policies and services, such as security and QoS, for different users. Traffic to and from wireless clients with varying security capabilities can be segregated into VLANs with varying security policies.

Wireless LAN security is a primary concern. The Cisco Aironet 1200 Series secures the enterprise network with a scalable and manageable system featuring the award-winning Cisco Wireless Security Suite. Based on the 802.11x standard for port-based network access, the Cisco Wireless Security Suite takes advantage of the Extensible Authentication Protocol (EAP) framework for user-based authentication.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 1200 Series Access Point	• IT Professionals or business executives want mobility within the enterprise to increase productivity, as an addition or alternative to wired networks. • Business owners or IT directors need flexibility for frequent LAN wiring changes, either throughout the site or in selected areas • Any company whose site is not conducive to LAN wiring because of building or budget limitations, such as older buildings, leased space or temporary sites.

Key Features

- Offers investment protection because of its upgrade capability and compatibility with current standards
- Delivers an enterprise class security solution with the IEEE 802.11x-based Cisco Wireless Security Suite
- Industry-leading security, network management, and software feature set
- Support for both inline power over Ethernet or local power
- Simultaneous support for both IEEE 802.11b and IEEE 802.11a

Specifications

Feature	Cisco Aironet 1200 Series Access Points with 802.11a radio installed	With 802.11b radio installed	With both 802.11a and 802.11b radio installed
Data Rates Supported	6, 9, 12, 18, 24, 36, 48, 54 Mbps	1, 2, 5.5, and 11 Mbps	Same as 802.11a and 802.11b combined
Uplink	Autosensing 802.3 10/100BaseT Ethernet	Autosensing 802.3 10/100BaseT Ethernet	Same as 802.11a and 802.11b combined
Form Factor	CardBus (32-bit)	Mini-PCI	Same as 802.11a and 802.11b combined
Frequency Band	5.15 to 5.35 GHz (FCC UNII 1 and UNII 2), 5.15 to 5.25 GHz (TELEC),5.15 to 5.25 GHz (Singapore),5.25 to 5.35 GHz (Taiwan)	2.412 to 2.462 GHz (FCC),2.412 to 2.472 GHz (ETSI),2.412 to 2.484 GHz (TELEC),2.412 to 2.462 GHz (MII),2.422 to 2.452 GHz (Israel)	Same as 802.11a and 802.11b combined
Wireless Medium	Orthogonal Frequency Division Multiplexing (OFDM)	Direct Sequence Spread Spectrum (DSSS)	Same as 802.11a and 802.11b combined
Modulation	(OFDM subcarrier);BPSK @ 6 and 9 Mbps; QPSK @ 12 and 18 Mbps; 16-QAM @ 24 and 36 Mbps;64-QAM @ 48 and 54 Mbps	DBPSK @1 Mbps; DQPSK @ 2 Mbps; CCK @ 5.5 and 11 Mbps	Same as 802.11a and 802.11b combined
Operating Channels	FCC: 8;TELEC (Japan): 4; Singapore: 4; Taiwan: 4	ETSI: 13; Israel: 7; North America: 11; TELEC (Japan): 14; MII: 11	Same as 802.11a and 802.11b combined
Nonoverlapping Channels	Eight (FCC only); Four (Japan, Singapore, Taiwan)	Three	Eleven
Available Transmit Power Settings[1]	40 mW (16 dBm);20 mW (13 dBm);10 mW (10 dBm);5 mW (7 dBm); Maximum power setting will vary according to individual country regulations.	100 Mw (20 dBm); 5 Mw (17 dBm); 30 mW (15 dBm); 20 mW (13 dBm); 5 mW (7 dBm); 1 mW (0 dBm); Maximum power setting will vary according to individual country regulations	Same as 802.11a and 802.11b combined
Range (typical @ maximum power setting, 2.2 dBi gain diversity dipole antenna)	Omni directional Antenna: Indoor:60 ft (18m)@ 54 Mbps, 130 ft (40m) @ 18 Mbps, 170 ft (52m) @ 6 Mbps; Outdoor: 100 ft (30m) @ 54 Mbps, 600 ft (183m) @ 18 Mbps, 1000 (304m) ft @ 6 Mbps; Patch Antenna: Indoor: 70 ft (21m) @ 54 Mbps, 150 ft (45m) @ 18 Mbps, 200 ft (61m) @ 6 Mbps; Outdoor: 120 ft (36m) @ 54 Mbps, 700 ft (213m) @ 18 Mbps; 1200 ft (355m) @ 6 Mbps	IIndoor:130 ft (40m) @ 11 Mbps; 350 ft (107m) @ 1 Mbps Outdoor: 800 ft (244m) @ 11 Mbps; 2000 ft (610m) @ 1Mbps	Same as 802.11a and 802.11b combined
SMTP Compliance	MIB I and MIB II	MIB I and MIB II	MIB I and MIB II
Antenna	Integrated 6 dBi diversity patch (55 degree horizontal, 55 degree vertical beamwidths, 5 dBi diversity omnidirectional with 360 degree horizontal and 40 degree vertical beamwidths	Two RP-TNC connectors (antennas optional, none supplied with unit)	5 GHz: Integrated6 dBi diversity patch (55 degree horizontal, 55 degree vertical beamwidths, 5 dBi diversity omnidirectional with 360 degree horizontal and 40 vertical beamwidths; 2.4 GHz: Two RP-TNC connectors (antennas optional, none supplied with unit)

Feature	Cisco Aironet 1200 Series Access Points with 802.11a radio installed	With 802.11b radio installed	With both 802.11a and 802.11b radio installed
Security architecture client authentication	Cisco Wireless Security Suite including: Authentication: 802.11x support including LEAP, PEAP, EAP-TLS, EAP-TTLS, and EAP-SIM to yeld mutual authentication and dynamic, per-user, per-session WEP keys; MAC address and by standard 802.11 authentication mechanisms Encryption: Support for static and dynamic IEEE 802.11 WEP keys of 40 bits and 128 bits; Pre-standard TKIP WEP enhancements: key hashing (per-packet keying), message integrity check (MIC) and broadcast key rotation	Cisco Wireless Security Suite including: Authentication: 802.11x support including LEAP, PEAP, EAP-TLS, EAP-TTLS, and EAP-SIM to yeld mutual authentication and dynamic, per-user, per-session WEP keys; MAC address and by standard 802.11 authentication mechanisms Encryption: Support for static and dynamic IEEE 802.11 WEP keys of 40 bits and 128 bits; Pre-standard TKIP WEP enhancements: key hashing (per-packet keying), message integrity check (MIC) and broadcast key rotation	Same as 802.11a and 802.11b combined
Software Image Network and Inventory support	CiscoWorks RME[2], CiscoWorks SWIM[3]	CiscoWorks RME[2], CiscoWorks SWIM[3]	CiscoWorks RME[2], CiscoWorks SWIM[3]
Remote configuration support	BOOTP, DHCP, Telnet, HTTP, FTP, TFTP, and SNMP	Telnet, HTTP, FTP, TFTP, and SNMP	Telnet, HTTP, FTP, TFTP,and SNMP
Local configuration	Direct consoled port (RJ-45 interface)	Direct consoled port (RJ-45 interface)	Direct consoled port (RJ-45 interface)
Environmental	-4° to 122°F (-20° to 50°C), 10 to 90% humidity (noncondensing)	-4° to 131°F (-20° to 55°C), 10 to 90% humidity (noncondensing)	-4° to 122°F (-20° to 50°C), 10 to 90% humidity (noncondensing)
Input Power Requirements	90 to 240 VAC +/- 10% (power supply);48 VDC +/- 10%(device)	90 to 240 VAC +/- 10% (power supply);48 VDC +/- 10%(device)	90 to 240 VAC +/- 10% (power supply);48 VDC +/- 10%(device)
Power Draw	8 watts, RMS	6 watts, RMS	11 watts, RMS
Warranty	One year	One year	One year

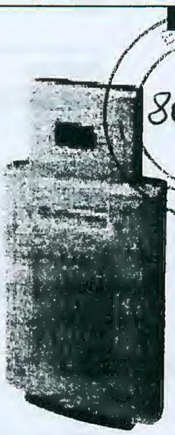
Cisco Aironet 1100 Series Access Points



The Cisco Aironet® 1100 Series Access Point provides a secure, affordable, and easy-to-use wireless LAN solution that combines mobility and flexibility with the enterprise-class features required by networking professionals.

Taking advantage of the Cisco Wireless Security Suite for the strongest enterprise security available and of Cisco IOS® Software for ease-of-use and familiarity, the Cisco Aironet 1100 Series Access Point delivers manageability, performance, investment protection, and scalability in a cost-effective package with a low total cost of ownership. The Cisco Aironet 1100 Series features a single, upgradable 802.11b radio, integrated diversity dipole antennas, and an innovative mounting system for easy installation in a variety of locations and orientations.

The first access point based on Cisco IOS Software, the Cisco Aironet 1100 Series extends end-to-end intelligent networking to the wireless access point. Cisco command-line interface (CLI) allows customers to quickly and consistently implement extended capabilities available in Cisco IOS Software. Customers can manage and standardize their networks using tools they have developed internally for their Cisco routers and switches.

Enterprise-class features including virtual LANs (VLANs), quality of service (QoS), and proxy mobile Internet Protocol (IP) make the Cisco Aironet 1100 Series ideal for enterprise installations. The Cisco Aironet 1100 Series also supports standard Cisco Aironet features such as hot-standby and load balancing, allowing enterprises to implement intelligent, reliable network services.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 1100 Series Access Point	• A cost-effective and upgradable WIAN solution that combines the mobility and flexibility of a WLAN solution with the enterprise-class features required by a business LAN. Want an off the shelf WLAN solution that does not require simultaneous dual band operation, or the additional range offered by high-gain antennas.

Key Features

- Single 802.11b radio, upgradable to 802.11g
- Provides end-to-end solution support for Intelligent Network Services
- Variety of mounting options
- Cost effective, yet feature-rich

Specifications

Feature	Cisco Aironet 1100 Series Access Points
Data Rates Supported	1, 2, 5.5, 11 Mbps
Network standard	IEEE 802.11b
Uplink	Autosensing 802.3 10/100BaseT Ethernet
Frequency Band	2.412 to 2.462 GHz (FCC); 2.412 to 2.472 GHz (ETSI); 2.422 to 2.452 GHz (Israel); 2.412 to 2.484 GHz (TELEC)
Network architecture type	Infrastructure,star topology
Wireless Medium	Direct Sequence Spread Spectum (DSSS)
Modulation	DBPSK @ 1 Mbps; DQPSK @ 2 Mbps; CCK @ 5.5 and 11 Mbps
Operating Channels	ETSI: 13; Israel: 7; Americas: 11; TELEC (Japan): 14
Nonoverlapping Channels	Three
Receive sensitivity	1 Mbps: -94 dBm; 2 Mbps: -91 dBm; 5.5 Mbps: -89 dBm;11 Mbps: -85 dBm

Feature	Cisco Aironet 1100 Series Access Points
Available Transmit Power Settings[1]	100 mW (20 dBm); 50 mW (17 dBm); 30 mW (15 dBm); 20 mW (13 dBm); 5 mW (7 dBm); 1 mW (0 dBm) Maximum power setting will vary according to individual country regulations
Range (typical @ maximum power setting, 2.2 dBi gain diversity dipole antenna)	Indoor: 150 ft (45 m) @ 11 Mbps;; 400 ft (122 m) @ 1 MbpsOutdoor: 800 ft (244 m) @ 11 Mbps; 2000 ft (610 m) @ 1 Mbps
SMTP Compliance	MIB I and MIB II
Antenna	Integrated 2.2dBi diversity dipole antennas
Security architecture client authentication	Cisco Wireless Security Suite includingAuthentication: 802.11x support including LEAP, PEAP, EAP-TLS, EAP-TTLS and EAP-SIM to yield mutual authentication and dynamic, per-user, per-session WEP keys; MAC address and by standard 802.11 authentication mechanisms Encryption: Support forstatic and dynamic IEEE 802.11 WEP keys of 40 bits and 128 bits; Pre-standard TKIP WEP enhancements:key hashing (per-packet keying), message integrity check (MIC) and broadcast key rotation
Software Image Network and Inventory support	CiscoWorks CiscoView, Resource Manager Essentials, and Campus Manager
Remote configuration support	BOOTP, DHCP, Telnet, HTTP, FTP, TFTP, and SNMP
Dimensions	4.1 in. (10.4 cm) wide; 8.1 in. (20.5 cm) high; 1.5 in. (3.8 cm) deep
Weight	10.5 oz. (297 g)
Environmental	;32° to 104° F (0° to 40° C); 10-90% humidity (noncondensing)
System Memory	16 MB RAM; 8 MB Flash
Input Power Requirements	100 to 240 VAC 50 to 60Hz (power supply); 33 to 57 VDC (device)
Power Draw	4.9 watts, RMS
Warranty	One year

Cisco Aironet 5 GHz 54 Mbps Wireless Client Adapter

The Cisco Aironet® 5 GHz 54 Mbps Wireless LAN client adapter is an Institute of Electrical and Electronic Engineers (IEEE) 802.11a-compliant CardBus adapter that operates in the UNII-1 and UNII-2 bands. The client adapter complements the Cisco Aironet 1200 Series 802.11a Access Point, providing a solution that combines performance and mobility with the security and manageability that enterprises require.

Wireless LAN client adapters can increase productivity by enabling mobile users to have network and Internet access anywhere within a building that is equipped with a wireless network infrastructure. Wireless client adapters connect a variety of devices to a wireless network either in ad hoc peer-to-peer mode or in infrastructure mode with access points. With this client adapter, you can quickly add new employees to a network, support temporary workgroups, or enable Internet access in conference rooms or other meeting spaces. And the Cisco Aironet client solution is easy to use, making the benefits of wireless mobility completely transparent.

With Cisco, you can confidently deploy a wireless solution that provides robust enterprise-class security. All Cisco Aironet products feature the award-winning Cisco Wireless Security Suite, which is based on the IEEE 802.11x standard for port-based network access.

The Cisco Wireless Security Suite takes advantage of the Extensible Authentication Protocol (EAP) framework for user-based authentication. It supports a variety of 802.11x authentication types including EAP Cisco Wireless (LEAP) and EAP-Transport Layer Security (EAP-TLS).

The Cisco Aironet Client Utility (ACU), with an intuitive graphical user interface, provides an easy way to configure, monitor, and manage the Cisco Aironet 5 GHz Wireless LAN Client Adapter. The ACU includes site-survey tools that present easy-to-understand detailed graphical information to assist in the placement of access points. Profile Manager allows you to create specific profile settings for various environments, such as the office or home, making it simple for telecommuters and business travelers to move from one environment to another.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 5 GHz 54Mbps Wireless LAN Client Adapters	• Industry leading security: IEEE802.11x support,including LEAP and EAP-TLS,for mutual authentication and dynamic per-user, per session WEP keys • Multiple transmit power settings (20 mW/(13 dBm), 10 mW/(10 dBm), and 5 mW (7 dBm) • End-to-end Cisco branded solution

Key Features

- IEEE 802.11a-compliant CardBus adapter that operates in the UNII-1 and UNII-2 bands
- Complements the Cisco Aironet 1200 Series 802.11a Access Point, providing a solution that combines performance and mobility with the security and manageability that enterprises require

Specifications

Feature	Cisco Aironet 5 GHz 54 Mbps Wireless Client Adapter
Form Factor	CardBus Type II
Interface	32-bit CardBus (PCI)
Operational voltage	3.3 V (+/- 0.33 V)
LED	Status (green) and Activity (amber)
Data Rates Supported	6, 9, 12, 18, 24, 36, 48, 54 Mbps (configurable as fixed or auto selecting to extend range)
Network Standard	IEEE 802.11a
Frequency Band	5.15 to 5.35 GHz (FCC UNII 1 and UNII 2) 5.15 to 5.25 GHz (TELEC); 5.15 to 5.25 GHz (Singapore); 525 to 5.35 GHz (Taiwan)
Network architecture type	Infrastructure,star topology
Media Access Protocol	Carrier sense multiple access with collision avoidance (CSMA/CA)
Wireless Medium	Orthogonal Frequency Division Multiplexing (OFDM)
Modulation	(OFDM sub-carrier); BPSK @ 6 and 9 Mbps; QPSK @ 12 and 18 Mbps; 16-QAM @ 24 and 36 Mbps; 64-QAM @ 48 and 54 Mbps
Operating Channels	FCC: 8 channels (UNII-1 4 channels and UNII-2 4 channels);4 channels for Japan, Singapore, and Taiwan
Available Transmit Power Settings[1]	20 mW (13 dBm);10 mW (10 dBm); 5 mW (7 dBm) Maximum power setting will vary according to individual country regulations.
Current steady state (typical)	¡Transmit: 520 mA; Receive: 580 mA; Sleep: 20 mA
Range	Omni directional Antenna: Indoor:60 ft (18m)@ 54 Mbps, 130 ft (40m) @ 18 Mbps, 170 ft (52m) @ 6 Mbps Outdoor: 100 ft (30m) @ 54 Mbps, 600 ft (183m) @ 18 Mbps, 1000 (304m) @ 6 Mbps Patch Antenna:Indoor: 70 ft (21m) @ 54 Mbps, 150 ft (45m) @ 18 Mbps, 200 ft (61m) @ 6 Mbps Outdoor: 120 ft (36m) @ 54 Mbps, 700 ft (213m) @ 18 Mbps, 1200 ft (355m) @ 6 Mbps
Power Management	3 levels of power consumption available, including: CAM (Constantly Awake Mode), Fast PSP (Power Save Mode), Max PSP (Maximum Power Savings)
Antenna	Integrated 5dBigain patch antenna

Feature	Cisco Aironet 5 GHz 54 Mbps Wireless Client Adapter
Security architecture client authentication	Cisco Wireless Security Suite including: Authentication:802.11x support for LEAP and EAP-TLS to yield mutual authentication and dynamic, per-user, per-session WEP keys; MAC address and by standard 802.11 authentication mechanisms Encryption: Support for static and dynamic IEEE 802.11 WEP keys of 40 bits and 128 bits; Pre-standard TKIP WEP enhancements:key hashing (per-packet keying), message integrity check (MIC) and broadcast key rotation
Drivers	Windows, 98/98SE, Windows ME, Windows 2000 and Windows XP
Environmental	-30° to 70°C; 95% humidity (noncondensing)
Warranty	One year

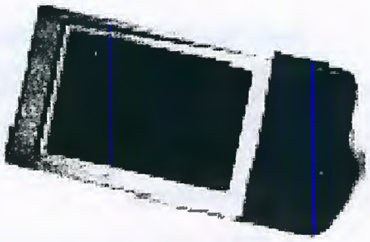
Cisco Aironet 350 Series Client Adapters



Wireless client adapters are the key to adding mobility and flexibility to an enterprise—increasing productivity by enabling users to have network and Internet access anywhere within a building without the limitation of wires. The Cisco Aironet 350 Series 802.11b Client Adapters are a complement to Aironet 350 Series infrastructure devices, providing an enterprise-ready solution that combines mobility with the performance, security, and manageability that people have come to expect from Cisco. Wireless client adapters connect a variety of devices to a wireless network either in ad hoc peer-to-peer mode or in infrastructure mode with Access Points. Available in PC Card (PCMCIA) and Peripheral Component Interconnect (PCI) form factors, Cisco Aironet 350 Series Client Adapters quickly connect desktop and mobile computing devices wirelessly to all network resources. With this product, you can instantly add new employees to the network, support temporary workgroups, or enable Internet access in conference rooms or other meeting spaces.

Cisco Aironet 350 Series Client Adapters deliver superior range, reliability, and performance for business users needing information access anytime, anywhere. Combined with Cisco Aironet unique security services, this product ensures that business-critical information is secure. Most importantly, the Cisco client solution is easy to use, making the benefits of wireless mobility completely transparent.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 350 Series Client Adapters	• IT Professionals or business executives want mobility within the enterprise to increase productivity, as an addition or alternative to wired networks. • Business owners or IT directors need flexibility for frequent LAN wiring changes, either throughout the site or in selected areas • Any company whose site is not conducive to LAN wiring because of building or budget limitations, such as older buildings, leased space or temporary sites.

Key Features

- Superior range and throughput for IEEE 802.11b networks
- Secure network communications
- World mode for international roaming
- Full-featured utilities for easy configuration and management
- Compliance with the IEEE 802.11b high-rate standard
- Support for all popular operating systems

Specifications

Feature	Cisco Aironet 350 Series Client Adapters
Data Rates Supported	1, 2, 5.5, and 11 Mbps
Network Standard	IEEE 802.11b
System Interface	AIR-PCM35x: PC Card (PCMCIA) Type II AIR-PCI 35x: peripheral component interconnect (PCI) Bus
Frequency Band	2.4 to 2.4897 GHz
Network Architecture Types	Infrastructure andad hoc
Wireless Medium	Direct Sequence Spread Spectum (DSSS)
Media Access Protocol	Carrier sense multiple access with collision avoidance (CSMA/CA)
Modulation	DBPSK @1 Mbps; DQPSK @ 2 Mbps; CCK @ 5.5 and 11 Mbps
Operating Channels	North America: 11; ETSI: 13; Japan: 14
Nonoverlapping Channels	Three
Receive Sensitivity	1 Mbps: -94 dBm 2 Mbps: -91 dBm 5.5 Mbps: -89 dBm 11 Mbps: -85 dBm
Delay Spread	1 Mbps: 500 ns; 2 Mbps: 400 ns; 5.5 Mbps: 300 ns; 11 Mbps: 140 ns
Available Transmit Power Settings[1]	100 mW (20 dBm); 50 mW (17 dBm); 30 mW (15 dBm); 20 mW (13 dBm); 5 mW (7 dBm); 1 mW (0 dBm)
Range (typical)	Indoor: 130 ft (40 m) @ 11 Mbps; 350 ft (107 m) @ 1 Mbps Outdoor: 800 ft (244 m) @ 11 Mbps; 2000 ft (610 m) @ 1 Mbps
Compliance	Operates license free under FCC Part 15 and complies as a Class B device; complies with DOC regulations; complies with ETS 300.328, FTZ 2100, and MPT 1349 standards
Operating Systems Supported	Windows 95, 98, NT 4.0, 2000, ME, XP, CE 2.11, CE 3.0, Mac OS 9.x, and Linux
Antenna	AIR-PCM35x: Integrated diversity dipoles AIR-LMC35x: Two MMCX connectors (antennas optional, none supplied with unit) AIR-PCI35x: External, removable 2.2 dBi Dipole with RP-TNC Connector
Encryption Key Length	128-bit
Authentication Type	EAP-Cisco Wireless LEAP
Status Indicators	Link Status and Link Activity
Dimensions (W x D x H)	AIR-PCM35x: 2.13 in. (5.4 cm) x 4.37 in. (11.1 cm) x 0.1 in. (0.3 cm) AIR-LMC35x: 2.13 in. (5.4 cm) x 3.31 in. (8.4 cm) x 0.1 in. (0.3 cm) AIR-PCI35x: 6.6 in. (16.8 cm) x 3.9 in. (9.8 cm) x .5 in. (1.3 cm)
Weight	AIR-PCM35x: 1.6 oz (45g) AIR-LMC35x: 1.4 oz (40g) AIR-PCI35x: 4.4 oz (125g)
Environmental	AIR-PCM35x and AIR-LMC35x: -22° to 158° F (-30° to 70° C) AIR-PCI35x: 32° to 131° F (0° to 55° C) 10 to 90% (noncondensing)
Input Power Requirements	+5 VDC =/- 5%
Typical Power Consumption (at 100 mW transmit power setting)	Transmit: 450 mA; Receive: 270 mA; Sleep mode: 15 mA

1. Maximum power setting will vary according to individual country regulations.

Selected Part Numbers and Ordering Information[1]

Cisco Aironet 350 Series Client Adapters

AIR-PCM352	350 Series PC Card with Diversity Antennas & 128-bit WEP
AIR-PCI352	350 Series PCI Card with 2.2 dBi Dipole Antenna & 128-bit WEP

Cisco Aironet 350 Series Workgroup Bridge

Designed to meet the needs of remote workgroups, satellite offices, and mobile users, the Cisco Aironet 350 Series Workgroup Bridge brings the freedom and flexibility of wireless connectivity to any Ethernet-enabled device. The 802.11b workgroup bridge quickly connects up to eight Ethernet-enabled laptops or other portable computers to a wireless LAN (WLAN), providing a link from these devices to any Cisco Aironet Access Point (AP) or Wireless Bridge (line-of-sight).

Any Ethernet-ready device, including printers, copiers, PCs, point-of-sale devices, or monitoring equipment, can be placed directly at the point of work using the workgroup bridge—without the expense or delay of cabling. For temporary classrooms or temporary office space, the workgroup bridge provides flexible, easy network access for up to eight devices through the use of a standard eight-port Ethernet hub. Equipment can be easily moved as workgroups change in number or location, lowering facilities costs.

The Cisco Aironet 350 Series Workgroup Bridge supports Wired Equivalent Privacy (WEP) security architecture and provides up to 128-bit encryption. The Cisco Aironet security architecture is based upon an IEEE 802.11x standard utilizing the Extensible Authentication Protocol (EAP), an open standard that enables wireless manufacturers and RADIUS server vendors to independently develop interoperable hardware and software. For authentication of devices attached to the workgroup, a username and password may be stored in the workgroup bridge in either static or dynamic memory. When authenticated, the workgroup bridge receives a single-session, single-user encryption key from the Remote Access Dial-In User Service (RADIUS) server via the associated AP. With this centralized and standards-based architecture, wireless security scales to meet the requirements of any enterprise.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 350 Series Workgroup Bridge	• Connectivityto a networkfor remote workgroupslocatedin an area that may be difficult or not practical for wiring. • Supports upto eight Ethernet-baseddevices (with use of Ethernet hub)

Key Features

- Driverless installation of up to eight Ethernet-enabled devices
- Optimum wireless performance and range
- Standards-based centralized security
- Two versions for a range of application requirements
- Full-featured utilities and robust management

Specifications

Feature	Cisco Aironet 350 Series Workgroup Bridge
Data Rates Supported	1, 2, 5.5, and 11 Mbps
Client Interface	10BaseT Ethemet
Clients Supported	Direct: One Via hub: Eight
Network Architecture Types	Infrastructure(via Cisco Aironet Access Point or Bridge)
Frequency Band	2.4 to 2.4897 GHz
Wireless Medium	Direct Sequence Spread Spectum (DSSS)
Media Access Protocol	Carrier sense multiple access with collision avoidance (CSMA/CA)
Modulation	DBPSK @1 Mbps; DQPSK @ 2 Mbps; CCK @ 5.5 and 11 Mbps
Operating Channels	North America: 11; ETSI: 13; Japan: 14
Nonoverlapping Channels	Three
Receive Sensitivity	1 Mbps: -94 dBm; 2 Mbps: -91 dBm; 5.5 Mbps: -89 dBm; 11 Mbps: -85 dBm
Delay Spread	1 Mbps: 500 ns; 2 Mbps: 400 ns; 5.5 Mbps: 300 ns; 11 Mbps: 140 ns
Available Transmit Power Settings[1]	100 mW (20 dBm); 50 mW (17 dBm); 30 mW (15 dBm); 20 mW (13 dBm); 5 mW (7 dBm); 1 mW (0 dBm)
Range (typical)	Indoor: 130 ft (40 m) @ 11 Mbps; 350 ft (107 m) @ 1 Mbps Outdoor: 800 ft (244 m) @ 11 Mbps; 2000 ft (610 m) @ 1 Mbps
Compliance	Operates license free under FCC Part 15 and complies as a Class B device; complies with DOC regulations; complies with EN 300.328 standards
SNMP Compliance	MIB I and MIB II
Antenna	AIR-WGB352C: One nonremovable 2.2-dBi dipole AIR-WGB352R: Two RP-TNC connectors(antennas optional, none supplied with unit)
Encryption Key Length	AIR-WGB352x: 128-bit
Remote Configuration Support	Telnet, HTTP, FTP, TFTP, and SNMP
Dimensions (W x D x H)	6.30 in. (16 cm) x 4.72 in. (12 cm) x 1.45 in. (3.7 cm)
Weight	12.3 oz (350g)
Environmental	Temperature: 32° to 122° F (0° to 50° C); 10 to 90% (Noncondensing)
Input Power Requirements	North American: 120 VAC @ 60 Hz; Universal: 90 to 264 VAC @ 47 to 63 Hz

[1] Maximum power setting will vary according to individual country regulations.

Selected Part Numbers and Ordering Information[1]

Cisco Aironet 350 Series Workgroup Bridge

AIR-WGB352C	350 Series Workgroup Bridge with Captured Antenna & 128-bit WEP
AIR-WGB352R	350 Series Workgroup Bridge with Dual RP-TNC & 128-bit WEP

Cisco Aironet 350 Series Wireless Bridge

The Cisco Aironet 350 Series Wireless Bridge enables high-speed long-range outdoor links between buildings and is ideal for installations subject to plenum rating and harsh environments. It is designed to meet the requirements of even the most challenging applications. The 802.11b wireless bridge delivers high data rates and superior throughput for data-intensive, line-of-sight applications. The bridges connect hard-to-wire sites, noncontiguous floors, satellite offices, school or corporate campus settings, temporary networks, and warehouses. They can be configured for point-to-point or point-to-multipoint applications and allow multiple sites to share a single, high-speed connection to the Internet. For functional flexibility, the wireless bridge may also be configured as an access point.

The Cisco Aironet 350 Series Wireless Bridge features an extended operating temperature range of -20° to 55° C, allowing for placement outdoors in a NEMA enclosure or in harsh indoor environments such as warehouses and factories. With a durable metal case, the Cisco Aironet 350 Series Wireless Bridge is UL 2043 certified, and designed to achieve plenum rating as defined by various municipal fire codes.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 350 Series Ethernet Bridge	• Any company who needs to connect sites into a single LAN, even when separated by obstacles such as freeways, railroads and bodies of water that are normally inaccessible via cabling. • Business owners who want a low-cost, easy-to-deploy solution for connecting line-of-sight networks located in different buildings. • Business owners or IT directors who want multiple buildings on a campus to share a single high-speed line to the Internet.

Key Features

- High-speed (11-Mbps), high-power (100-mW) radios, delivering building-to-building links of up to 25 miles (40.2 km)
- A metal case for durability and plenum rating and an extended operating temperature rating for harsh environments
- Supports both point-to-point and point-to-multipoint configurations
- Broad range of supported antennas
- Simplified installation, improved performance, and upgradeable firmware, ensuring investment protection

Specifications

Feature	Cisco Aironet 350 Series Wireless Bridge
Data Rates Supported	1, 2, 5.5, and 11 Mbps
Frequency Band	2.4 to 2.497 GHz
Wireless Medium	Direct Sequence Spread Spectum (DSSS)
Media Access Protocol	Carrier sense multiple access with collision avoidance (CSMA/CA)
Modulation	DBPSK @1 Mbps DQPSK @ 2 Mbps CCK @ 5.5 and 11 Mbps
Operating Channels	North America: 11; ETSI: 13; Japan: 14
Nonoverlapping Channels	Three
Receive Sensitivity	1 Mbps: -94 dBm; 2 Mbps: -91 dBm; 5.5 Mbps: -89 dBm; 11 Mbps: -85 dBm
Delay Spread	1 Mbps: 500 ns; 2 Mbps: 400 ns; 5.5 Mbps: 300 ns; 11 Mbps: 140 ns
Available Transmit Power Settings[1]	100 mW (20 dBm); 50 mW (17 dBm); 30 mW (15 dBm); 20 mW (13 dBm); 5 mW (7 dBm); 1 mW (0 dBm)
Range (typical, contingent upon antenna selected)	18 miles (28.9 km) @ 11 Mbps Up to 25 miles (40.2 km) @ 2 Mbps
Compliance	Operates license-free under FCC Part 15 and complies as a Class B device; complies with DOC regulations; complies with ETS 300.328, FTZ 2100, and MPT 1349 standards; complies with UL 2043 (The use of this device in a system operating either partially or completely outdoors may require the user to obtain a license for the system according to the Canadian regulations. For further information, contact your local industry Canada office.)
SNMP Compliance	MIB I and MIB II
Antenna	Two RP-TNC connectors (antennas optional, none supplied with unit)
Encryption Key Length	128-bit
Security	128-bit WEP in bridge mode IEEE 802.11x (includes EAP and RADIUS) in AP mode
Status Indicators	Three indicators on the top panel provide information concerning association status, operation, error/warning, firmware upgrade, and configuration, network/modem, and radio status
Automatic Configuration Support	BOOTP and DHCP
Remote Configuration Support	Telnet, HTTP, FTP, TFTP, and SNMP
Local Configuration	Direct console port (with supplied serial cable)
Bridging Protocol	Spanning Tree
Dimensions	6.74 x 6.25 x 1.31 in. (17.1 x 15.9 x 3.3 cm)
Weight	1.43 lbs (.648 kg)
Environmental	Temperature: -4× to 131× F (-20× to 55× C) 10 to 90% (noncondensing)
Enclosure	Metal case (for plenumrating); UL 2043 certified
Input Power Requirements	24VDC 10% to 60 VDC (Ethernet line power)

[1] Maximum power setting will vary according to individual country regulations

Cisco Aironet Antennas and Accessories

Every wireless Local Area Network (LAN) deployment is different. When engineering an in-building solution, varying facility sizes, construction materials, and interior divisions raise a host of transmission and multipath considerations. When implementing a building-to-building solution, distance, physical obstructions between facilities, and number of transmission points involved must be considered.

Cisco is committed to providing not only the best access points, client adapters, and bridges in the industry—it is also committed to providing a complete solution for any wireless LAN deployment. That is why Cisco has the widest range of antennas, cable, and accessories available from any wireless manufacturer.

With the Cisco FCC-approved directional and omnidirectional antennas, low-loss cable, mounting hardware, and other accessories, installers can customize a wireless solution that meets the requirements of even the most challenging applications.

Key Features

- Client Adapter Antennas—Cisco Aironet wireless client adapters come complete with standard antennas that provide sufficient range for most applications at 11 Mbps. To extend the transmission range for more specialized applications, a variety of optional, higher-gain antennas are provided that are compatible with selected client adapters
- Access Point Antennas—Cisco Aironet access point antennas are compatible with all Cisco RP-TNC-equipped access points. The antennas are available with different gain and range capabilities, beam widths, and form factors. Coupling the right antenna with the right access point allows for efficient coverage in any facility, as well as better reliability at higher data rates
- Bridge Antennas—Cisco Aironet bridge antennas allow for extraordinary transmission distances between two or more buildings. Available in directional configurations for point-to-point transmission and omnidirectional configuration for point-to-multipoint implementations, Cisco has a bridge antenna for every application
- Low-loss cable extends the length between any Cisco Aironet bridge and the antenna. With a loss of 6.7 dB per 100 feet (30m), low-loss cable provides installation flexibility without a significant sacrifice in range

Specifications

Client Adapter Antennas

Feature	AIR-ANT3351
Description	POS diversity dipole[1]
Application	Indoor diversity antenna[2] to extend the range of Aironet LMC client adapters
Approximate Indoor Range at 1 Mbps[3]	350 ft (107m)
Approximate Indoor Range at 11 Mbps[3]	100 ft. (51 m)
Cable Length	5 ft. (1.5m)
Dimensions	Base: 7 x 2 in. (18 x 5 cm) Height: 8 in. (20 cm)
Weight	9.2 oz. (261g)

1. A type of low-gain (2.2 dBi) antenna consisting of two (often internal) elements.
2. A ratio of decibels to an isotropic antenna that is commonly used to measure antenna gain. The greater the dBi value, the higher the gain and, as such, the more acute the angle of coverage.
3. All range estimations are based on an integrated client adapter antenna associating with an access point under ideal indoor conditions. The distances referenced here are approximations and should be used for estimation only.

Access Point Antennas

Feature	AIR-ANT5959	AIR-ANT3195	AIR-ANT2012	AIR-ANT3213
Description	Diversity omni-directional ceiling mount	3 dBi Patch Wall Mount Antenna	Diversity patch wall mount	Pillar mount diversity omni
Application	Indoor unobtrusive antenna, best for ceiling mount. Excellent throughput and coverage solution in high multipath cells and dense.	Indoor/Outdoor directional antenna	Indoor/Outdoor, unobtrusive medium range antenna	Indoor, unobtrusive medium-range antenna
Approximate Indoor Range at 1 Mbps[1]	350 ft. (105m)	Access Point: 271 ft. (82m) Bridge: .5 miles (.9 km)	547 ft. (167m)	497 ft. (151m)
Approximate Indoor Range at 11 Mbps[1]	130 ft. (45m)	Access Point: 80 ft. (24m) Bridge: 950 ft. (290m)	167 ft. (51m)	142 ft. (44m)
Cable Length	3 ft. (0.91m)	12 ft.	3 ft. (0.91m)	3 ft. (0.91m)
Dimensions	5.3 x 2.8 x 09. in. (13.5 x 7.1 x 2.3 cm)	4 x 5 in. (9.7 x 13 cm)	4.78 x 6.66 x .82 in. (12.14 x 16.92 x 2.08 cm)	10 x 1 in. (25.4 x 2.5 cm)
Weight	0.3 lbs. (0.14kg)	4.9 oz. (139g)	9.6 oz. (272g)	1 lb. (460g)

1. All range estimations are based on an integrated client adapter antenna associating with an access point under ideal indoor conditions. The distances referenced here are approximations and should be used for estimation only.

Access Point Antennas (cont.)

Feature	AIR-ANT1728	AIR-ANT4941	AIR-ANT3549	AIR-ANT1729
Description	High gain omnidirectional ceiling mount	2.2 dBi dipole antenna	Patch wall mount	Patch wall mount
Application	Indoor medium-range antenna, typically hung from crossbars of drop ceilings	Indoor omni-directional coverage	Indoor, unobtrusive, long-range antenna (may also be used as a medium-range bridge antenna)	Indoor, unobtrusive, medium-range antenna (may also be used as a medium-range bridge antenna)
Approximate Indoor Range at 1 Mbps[1]	497 ft. (151m)	350 ft.	Access Point: 700 ft. (213m) Bridge: 2.0 miles (3.2 km)	Access Point: 542 ft. (165m) Bridge: 1.1 miles (1.8 km)
Approximate Indoor Range at 11 Mbps[1]	142 ft. (44m)	130 ft.	Access Point: 200 ft. (61m) Bridge: 3390 ft. (1032m)	Access Point: 155 ft. (47m) Bridge: 1900 ft. (580m)
Cable Length	3 ft. (0.91m)	N/A	3 ft. (0.91m)	3 ft. (0.91m)
Dimensions	Length: 9 in. (22.86 cm) Diameter: 1 in. (2.5 cm)	5.5 in.	5 x 5 in. (12.4 x 12.4 cm)	4 x 5 in. (9.7 x 13 cm)
Weight	4.6 oz. (131g)	1.1 oz.	5.3 oz. (150g)	4.9 oz. (139g)

1. All range estimations are based on an integrated client adapter antenna associating with an access point under ideal indoor conditions. The distances referenced here are approximations and should be used for estimation only.

Bridge Antennas

Feature	AIR-ANT2506	AIR-ANT4121	AIR-ANT1949	AIR-ANT3338
Description	Omnidirectional Mast mount	High-gain omnidirectional Mast mount	Yagi mast mount	Solid dish
Application	Outdoor short-range point-to-multipoint applications	Outdoor medium-range point-to-multipoint applications	Outdoor medium-range directional connections	Outdoor long-range directional connections
Approximate Indoor Range at 1 Mbps[1]	5000 ft. (1525m)	4.6 miles (7.4 km)	6.5 miles (10.5 km)	25 miles (40 km)
Approximate Indoor Range at 11 Mbps[1]	1580 ft. (480m)	1.4 miles (2.3 km)	2.0 miles (3.3 km)	11.5 miles (18.5 km)
Cable Length	3 ft. (0.91m)	1 ft. (0.30m)	1.5 ft. (0.46m)	2 ft. (0.61m)
Dimensions	Length: 13 in. (33 cm) Diameter: 1 in. (2.5 cm)	Length: 40 in. (101 cm) Diameter: 1.3 in. (3 cm)	Length: 18 in. (46 cm) Diameter: 3 in. (7.6 cm)	Diameter 24 in. (61 cm)
Weight	6 oz. (17g)	1.5 lb. (0.68 kg)	1.5 lb. (0.68 kg)	11 lb. (5 kg)

[1] All range estimations are based on an integrated client adapter antenna associating with an access point under ideal indoor conditions. The distances referenced here are approximations and should be used for estimation only.

Low-Loss/Ultra Low-Loss Antenna Cable

Feature	AIR-CAB020LL-R	AIR-CAB050LL-R	AIR-CAB100ULL-R	AIR-CAB150ULL-R
Cable Length	20 ft. (6m)	50 ft. (15m)	100 ft. (30m)	150 ft. (46m)
Transmission Loss	1.3 dB	3.4 dB	4.4 dB	6.6 dB

Cisco Aironet Accessories

Feature	AIR-ACC2537-060	AIR-ACC3354	AIR-ACC2662
Description	60 in. (152 cm) bulkhead extender	Lightning arrestor	Yagi articulating mount
Application	Flexible antenna cable that extends access point cabling typically within an enclosure	Helps prevent damage due to lightning-induced surges or static electricity	Adds swiveling capability to mast-mounted yagi antennas

Selected Part Numbers and Ordering Information[1]

Cisco Aironet Accessories	
AIR-ACC2662	Yagi Antenna Articulating Mount
AIR-ACC3354	Lightning Arrestor w/ grounding ring
AIR-CAB020LL-R	20 ft. (6m) low-loss antenna cable
AIR-CAB050LL-R	50 ft. (15m) low loss antenna cable
AIR-CAB100ULL-R	100 ft. (30m) low loss antenna cable
AIR-CAB150ULL-R	150 ft. (46m) low loss antenna cable
Cisco Aironet Antennas	
AIR-ANT1728	5.2 dBi Omni Ceiling Mount Antenna
AIR-ANT1729	6 dBi Patch Wall Mount Antenna
AIR-ANT1949	13.5 dBi Yagi Mast Mount Antenna
AIR-ANT2012	6.5 dBi Diversity Patch Wall Mount Antenna
AIR-ANT2506	5.2 dBi Omnidirectional Mast Mount Antenna
AIR-ANT3195	3 dBi Patch Wall Mount Antenna
AIR-ANT3213	5.2 dBi Pillar-Mount Diversity Omni Antenna
AIR-ANT3338	21 dBi Solid Dish Antenna
AIR-ANT3351	2.2 dBi POS Diversity Dipole Antenna
AIR-ANT3549	8.5 dBi Hemispherical Patch Antenna
AIR-ANT4121	12 dBi Omnidirectional Mast Mount Antenna
AIR-ANT4941	2.2 dBi Dipole Antenna (Standard Rubber Duck)
AIR-ANT5959	2.0dBi Diversity Omni Ceiling Mount Antenna

CHAPTER 4

IP Telephony, Video, & Web Collaboration

Campus IP Telephony, Video, & Web Collaboration at a Glance

Product	Features	Page
Cisco IP Phones IP 7900 Series	An exciting, distinctively stylish, and pure Voice over IP phone portfolio to meet the wide range of business communication needs at affordableprices • Display-based technologyprovides ease-of-use • Integratedinline power and 2-port Ethernet Switch provides end-to-end infrastructure integration • Rich application environment enabled byopen APIs based onXML	4-3
Cisco CallManager 3.3	• The software-based call processing and call controlcomponent of Cisco's IP Telephony solution • Resides on Cisco Media Convergence Servers (MCS), Cisco ICS7750, or selected third-party servers (CallManager 3.3)	4-4
CiscoWorks IP Telephony Environment Monitor	A suite of management applicationsthat helps ensure the readiness and manageability of convergednetworks that are supporting VoIP and IP telephonytraffic and applications. The bundle includes: • Voice Health Monitor • Default Fault Manager • CiscoView • CCO Downloadable Modules – IP Phone Information Utility – IP Phone Help Desk Utility. – Fault History Manager	9-18
Cisco IP Contact Center (IPCC) Enterprise Edition	Cisco IP Contact Center (IPCC) Enterprise Edition delivers intelligent callrouting, network-to-desktop CTI, and multi-channelmedia contact management to contact center agents over an IP network. It includes several applications, including thefollowing: • CallManager • Cisco Intelligent Contact Manager (ICM) • Cisco IP IVR/-IP Queue Manager	4-8
Cisco IP IVR	Cisco IP IVR, a new world interactive voice response (IVR) solution, provides a feature-rich foundation for the creation of an IP-based IVR that is open and expandable. Cisco IP IVR has the following key features: • Provides a multimedia (voice/data/Web) IP-empowered application-generation environment • Can be deployed anywhere in the IP network • Offers Web-based activation andadministration	4-10
Cisco IP Contact Center Express Edition (Formerly IP ICD)	• Cisco IPCC Express is a software-based ACD, IVR, and CTI applicationfor mid-sized contact centers with Cisco IP Telephony networks based on Cisco AVVID. • Cisco IPCC Express is an open systems platform allowing ease of configuration. • It has a graphically driven workflow editor providing a common interface for creating interactions, or call flows, and creates business logic between IVR and ACD functions.	4-9
Cisco Unity—Unified Messaging and Voice Mail	Voicemail and unifiedmessaging system delivers all messages into single inbox for access via phone, email or Internet	4-11
Cisco Personal Assistant	Software applicationallows users to browse voicemail, dial by name, and conferencefrom any phone using voice commandsinstead of telephone keypad via speech recognition	4-13
IP Telephony Applications	• Cisco Survivable Remote Site (SRS) Telephony Software—IOS software that runs on local branch office router provides IP Telephony backup redundancy for IP phonesin that office when IP phones detect thatWAN is down or/and CallManageris unreachable • Cisco IP Phone Messenger—sends Instant Messages (IM) between Cisco IP Phones and Lotus Sametime or MS Messenger desktop IM clients • Cisco IP SoftPhone—Windows-based applicationfor PC, allows users to make and receive calls from PC without a dedicated phone • Cisco Conference Connection (CCC)—enables enterprises to bring geographically dispersed employees and customers together to facilitate meetings and collaboration. CCC provides a cost-effective and time-efficientmethod of doing business without the hassle of travel.	4-14

Product	Features	Page
Cisco MCS 7800 Series Media Convergence Servers	High availability server platform for Cisco IP telephony systems • Turnkey solution, includes CallManager or oher software • For large- and medium-sized enterprise IP telephonydeployments	4-17
Cisco ICS 7750 Integrated Communications System	• A branch office/midmarket business with standalone IP telephonyneeds from 35-500 users • An end-user customer or partner who wants a single "box" (or platform) IP telephony solution to ease deployment and/or to standardize on voice configurationsacross multiple sites • An existing multiservice data networkcustomer who wants to add IP telephony functionality to create a converged network solution	4-18
Cisco IAD 2400 Series Integrated Access Device[1]	Business class fixed-configuration Integrated Access Device (IAD) • Delivers packet or TDM voice and data over single WAN uplink • IOS Telephony Service(ITS) provides local IAD-based call processing to offer key switch functionality ideal for small offices (5-24 phones) • IP-based keyswitch functionality ideal for small offices (5-20 phones) who do not need Cisco CallManager capabilities • Supports standard phonesand IP phones on a single platform • 8 FXS/16 FXS/16FXS+8FXO analog voice ports and 1 T1 digital voice port models • WAN Interfaces: T1- PPP, FR, ATM and DSL-ADSL and G.SHDSL	4-18
Cisco Voice Gateways[2]	The Cisco VG248 dedicated voice gatewayprovides connectivity between IP networks and legacy telephony systems/PSTN • Support various types of interfaces, including T1 and E1 • Fully manageable by Cisco CallManager, a CLI interface via Telnet, or via SNMP	4-22
Cisco IP/VC 3500 Series Videoconferencing Products	• Videoconferencing over IP solution • Cost-effective, easy-to-manage • Translates between H.323 and H.320 systems • Management and Qualty of Service	4-22
Cisco IP/TV 3400 Series Video Servers	• High-quality video communicationsover enterprise networks • Support live and scheduled video, video on demand • Enable training, corporate communications, business TV, and distance leaning	4-23
Cisco Web Collaboration Option	• Web-based colaboration, • Share any Windows desktop application • Ideal for both sales- and service-oriented customerservice organizations	4-24
Cisco E-mail Manager	• Automates the process of tracking and responding toinbound email. • Automatically assigns email requests to the most appropiate agent • Graphical rules engine makes it easy to define custom rules for the processing of email	4-25
Cisco Emergency Responder	• Works with Cisco CallManagerto automaticallyprovide E9-1-1 features in North America, and is compatible with any emergencynumber including 112 in Europe, 999 in UK, and 000 in Australia. • Dynamically tracks the location of IP phones, routes emergency calls to the appropriate E9-1-1 network, and provides the current location information to E9-1-1 call center dispatchers. • Provides real-time alert notificationsto on-site or contracted security groups, to facilitate a timely response to emergencysituations.	4-25
Cisco ATA Series of Analog Telephone Adaptors	Tums any analog telephone into an IP telephone. Each of the two voice ports supports independent telephone numbers providing two separate lines. • Interoperable with multiple standardsincluding H.323, SIP, MGCP and SCCP • Enables analog devices, such as phones and fax machines, to support Voice over IP services by converting the analog signalinto an IP signal	4-27
Cisco CTE-1400 Series Content Transformation Engine	Transforms Web content for display and interaction on small screen mobile devices and IP Telephones • Supports a broad range of devices • Transforms existing content • GUI/Console Administrative Tool	6-13

1. IP Keyswitch capabilities also available with 2600/2600XM and 3600 series routers; see IP Keyswitch Web site: http://www.cisco.com/go/keyswitch
2. Cisco's full line of multiservice routers also provide analog and digital voice gateway functionality through use of network modules and voice interface cards. Please see the 1700, 2600XM, 3600, 7200, 5x00 series in Chapter 1—Routers, as well as Chapter 7—Access Products.

Cisco 7900 Series IP Phones

Cisco IP Phones provide unmatched levels of integrated business functionality and converged communications beyond today's conventional voice systems. The Cisco IP Phone7960G "manager set" addresses the communication needs of the professional, with a high or busy amount of phone traffic. The Cisco IP Phone 7940G "business set" addresses the communication needs of a transaction type worker, in a office cubicle environment, who conducts medium to high telephone traffic. The Cisco IP Phone 7912G, 7910G+SW, 7910G, and 7905G "basic sets" address the communication needs of a cubicle worker who conducts low to medium telephone traffic. The Cisco IP Phone 7902G "entry set" addresses voice communication needs of a lobby, lab, manufacturing floor, and other areas where only a minimal amount of features are required. Cisco IP Phone Expansion Module 7914 extends the Cisco IP Phone 7960G with additional buttons and LCD, increasing the total number of buttons to 20 with one module, or 34 with two modules. Cisco IP Conference Station 7935, a high-quality hands-free conference station, is designed for use on desktops and offices and in small to medium-sized conference rooms.

Key Features

- Dynamic soft keys make the telephone simpler to use by presenting calling options based on context
- Open APIs using XML to deliver applications to the display
- Automatic phone discovery, VLAN configuration, and registration
- Quality of Service (QoS) is provided via support of 802.1pq, in addition to configurable DIFFSERV and TOS
- Voice-activity detection, silence suppression, comfort-noise generation, and error concealment
- G.711a, G.711u, G.729ab audio-compression coder-decoders (codecs)
- Software upgrade support via Trivial File Transfer Protocol (TFTP) server
- Microsoft NetMeeting enabled—features such as application sharing and video conferencing are available simply by pressing a button on your Cisco IP telephone
- Integrated Ethernet Switch supporting Ethernet connectivity for a downstream PC
- Integrated Inline power support allows the phone to receive power over the LAN
- A hearing-aid-compatible handset

Cisco CallManager 3.3

Cisco CallManager call-processing software extends enterprise telephony features and capabilities to enterprise LANs and packet telephony network devices such as IP phones, media processing devices, voice-over-IP (VoIP) gateways, and multimedia applications. Additional data, voice, and video services such as unified messaging, multimedia conferencing, collaborative contact centers, and interactive multimedia response systems interact with the IP telephony solution through CallManager's open telephony application programming interfaces (API). Cisco CallManager is installed on the Cisco Media Convergence Server (MCS) and selected third-party servers. It ships with a suite of integrated voice applications and utilities, including the Cisco Attendant Console—a software-only manual attendant console; a conferencing application; and administrative reporting tools. For more VoIP network management features, see the CiscoWorks Manager IP Telephony Environment Monitor, page 9-18.

Cisco CallManager version 3.3 provides a scalable, distributable, and highly available enterprise IP telephony call-processing solution. Multiple servers are clustered and managed as a single entity; yielding scalability of up to 30,000 users per cluster. By interlinking multiple clusters, system capacity can be increased to as many as one million users in a 100-site system. Clustering aggregates the power of multiple, distributed Cisco CallManagers, enhancing the scalability and accessibility of the servers to phones, gateways, and applications. Triple call-processing server redundancy improves overall system availability.

The benefit of this distributed architecture is improved system availability and scalability. Call admission control ensures that voice quality of service (QoS) is maintained across constricted WAN links, and automatically diverts calls to alternative Public Switched Telephone Network (PSTN) routes when WAN bandwidth is not available. A Web-browsable interface to the configuration database enables remote device and system configuration.

Key Features

- Cisco CallManager includes a suite of integrated voice applications that perform voice conferencing and manual attendant console functions, eliminating the need for special-purpose voice processing hardware
- Supplementary and enhanced services such as hold, transfer, forward, conference, multiple line appearances, automatic route selection, speed dial, last-number redial, and other features are extended to IP phones and gateways
- Capabilities enhancements are achieved though software upgradeability, avoiding expensive hardware costs traditional to legacy PBX systems
- Cisco CallManager Attendant Console—This Web-enabled application supports the traditional role of a manual attendant console and allows the attendant to quickly accept and dispatch calls to enterprise users. An integrated directory service provides traditional busy lamp field (BLF) and direct station select (DSS) functions for any line in the system. It monitors the state of every line in the system without requiring hardware-based line monitoring devices, thereby saving costs
- Software-only applications such as the Cisco Interactive Voice Response system, Cisco IP Contact Center, Cisco Automated Attendant, and Cisco SoftPhone are applications that interact with the CallManager through telephony APIs

Specifications

Feature	Cisco CallManager 3.3[1]
Platforms	Media Convergence Server (MCS) Integrated Communications Serer (ICS-7750) Selected third-paty servers
Pre-Installed Software	Cisco CallManager version 3.3 (call processing and call-control application) Cisco CallManager version 3.3 configuration database (contains system and device configuation information, includingdial plan) Cisco CallManager Administration software Cisco Conference Bridge Cisco Attendant Console Bulk Administration Tool (BAT) CDR Analysis and Reporting (CAR) tool Real Time Monitoring Tool RTMT
Sample Subset of System Capabilities	H.323 scalability improvements - 1,000 H.323 calls per CallManager server in cluster Virus checker certification Cisco Intrusion Detection System (IDS) Host-Based Sensor certification

Feature	Cisco CallManager 3.3[1]
Summary of Administrative Features	Application discovery and registration to SNMPmanager
	Automated Alternate Routng Groups
	Bulk Administration
	Call Back
	Call Detail Records (CDR)
	Call forward reason code delivery
	Centralized, replcated configuration database, distributed Web-based management viewers
	Configurable and default ringer WAV files per phone
	Configuration database API
	Database automated change notification
	Date/time display format configurable per phone
	Debug information to common syslog file
	Device addition through wizards
	Device downloadable feature upgades—Phones, hardware transcoder resource, hardware conference bridge resource, VoIP gateway resource
	Device groups and pools for large system management
	Device mapping tool-IP address to MAC address
	Distinctive ring per line
	Dynamic Host Configuration Protocol (DHCP) block IP assignment-phones and gateways
	Dialed number translation table (inbound/outbound translation)
	Dialed Number Identification Service (DNIS)
	Enhanced 911 service
	H.323-compliant interface toH.323 clients, gateways, and gatekeepers
	Individual line Call Waiting Alert Configuration
	JTAPI 1.2 computer telephony interface
	LDAP version 3 directory interface to selected vendor's LDAP directories
	• Active Directory
	• Netscape Directory Server
	Manager Assistant
	Mappable softkeys
	MGCP signaling and control to selected Cisco VoIP gateways
	Multilevel Administration Access (MLA)
	Native supplementary services support to Cisco H.323 gateways
	Network Specific Facilities Paperless phone DNIS-display driven button labels on phones
	Performance monitoring SNMP statistics from applications to SNMP manager or to operating system
	Performance Monitor
	QoS statistics recorded per call
	QSIG Support
	Redirected DNIS (RDNIS), inbound, outbound (to H.323 devices)
	Select specifiedline appearance to ring; Select specified phone to ring
	Single CDR per cluster
	Single point system/device configuration
	Sortable component inventory list by device, user, or line
	System event reporting-to common syslog or operating system event viewer
	TAPI 2.1 computer telephony interface
	Time-zone configurable per phone
	XML API into IP phones (794X/6X)
	Zero cost automated phone moves; Zero cost phoneadds

Feature	Cisco CallManager 3.3[1]
Summary of User Features	Answer/answer release
	Auto-answer/[2]intercom
	Call connection
	Call coverage
	Call forward-all (off-net/on-net); Call forward-busy; Call forward-no answer
	Call hold/retrieve
	Call park/pickup; Call pickup group-universal
	Call status per line (state, duration, number)
	Call waiting/retrieve
	Calling Line Identification (CLID); Calling party name identification (CNID)
	Calling Line Identifiation Restriction (CLIR)
	Direct inward dial (DID; Direct outward dial (DOD)
	Directory dial from phone-corporate, [2]personal
	Directories-missed, placed, received calls list stored on selected IP phones
	Distinctive ring (on-net vs. off-net); Distinctive ring per phone
	Drop last conference party(ad-hoc conferences)
	Extension mobility support
	Hands-free, full-duplex speakerphone
	HTML help access from phone
	Last number redial (off-net/on-net)
	Message waiting indication
	Multiparty conference-Ad-hoc with add-on, Meet-me
	Multiple line appearances per phone
	Music-on-hold
	Mute capability from speakerphone and handset
	On-hook dialing
	Operator attendant-Web-browser interface, loop key notification, logon/logoff, busy/available, left/right hand access, headphone access, busy lamp field, direct station select, drag and drop transfer, call status (state, duration, and number)
	Privacy
	Real-time QoS statistics through http browse to phone
	Recent dial list-calls to phone, calls from phone, auto-dial, and edit dial
	Single button data collaboration on SoftPhone-chat, whiteboard, and app sharing
	Single directory number, multiple phones-bridged line appearances
	Speed dial-multiple speed dials per phone
	Station volume controls (audio, ringer)
	Transfer-with consultation hold
	User-configured speed dial and call forward through Web access
	Web services access from phone
	Wideband audio codec support—proprietary 16-bit resolution, 16 kHz sampling rate codec

1. Additional RAM may be required in Media Convergence Servers to support existing and enhanced services in Cisco CallManager 3.3.
2. Indicates new feature or service for Cisco CallManager version 3.3

Cisco IP Contact Center (IPCC) Enterprise Edition

Cisco IP Contact Center (IPCC) Enterprise Edition delivers intelligent contact routing, call treatment, network-to-desktop computer telephony integration (CTI), and multi-channel contact management over an IP infrastructure. By combining multi-channel automatic call distributor (ACD) functionality with IP telephony in a unified solution, Cisco IPCC Enterprise enables companies to rapidly deploy a distributed contact center infrastructure.

Cisco IPCC Enterprise Edition segments customers, monitors resource availability, and delivers each contact to the most appropriate resource anywhere in the enterprise. The software profiles each customer using contact-related data such as dialed number and calling line ID, caller-entered digits, data submitted on a Web form, and information obtained from a customer profile database lookup. At the same time, the system knows which resources are available to meet the customer's needs based on real-time conditions (agent skills and availability, interactive voice response [IVR] status, queue lengths, and so on) continuously gathered from various contact center components.

Cisco IPCC Enterprise provides a state of the art VoIP contact center solution that allows seamless integration of inbound and outbound voice applications with Internet applications including real-time chat, Web collaboration and e-mail. This integration allows for unified capabilities, enabling a single agent to support multiple interactions simultaneously regardless of the communications channel the customer has chosen. Since each interaction is unique and may require individualized service, Cisco provides contact center solutions to manage each interaction based on virtually any contact attribute.

Furthermore, Cisco can bridge the gap between TDM and IP infrastructures, providing a seamless integration of voice, chat, e-mail, and Web collaboration applications over both of these technology platforms. This allows companies to preserve the value of their existing investments in call center products such as ACDs, IVRs, PBXs, etc. while leveraging Cisco's wide range of solutions to support the same contact center requirements in a converged network environment.

Key Features[1]

- Full Scalability from less than a hundred to thousands of seats
- Multi-channel interaction—Web collaboration with chat and callback, email, voice mail and fax routing
- Multi-site Contact Centers support; CRM Integration
- Cradle-to-grave contact call detail records
- Common agent and supervisor desktops across all Cisco customer interaction management products
- Pre-defined and custom historical reports; Real-time reports integrated in the agent and supervisor desktops
- Support for custom call treatment for calls in queue includes support for music in queue and custom messaging
- Standard screen pop allows any caller-entered information to be popped to the agent
- Full support for agent/supervisor interaction via chat
- Ability to pre-define agent-supervisor messages

Cisco IPCC Express Edition (Formerly IP ICD)

Cisco IPCC Express Edition is an inexpensive, easy-to-install, and easy-to-use automatic call distributor (ACD) for enterprise organizations. It is seamlessly integrated with all other customer response applications, including Cisco IP Interactive Voice Response (IP IVR) and Cisco IP Automated Attendant (IP AA). Key benefits of IPCC Express include: it provides a low-cost, entry-level ACD that is easy to install, administer, and use; it supports multimedia (voice, data, and Web) access when used with Cisco IP IVR; it provides complete customization tools for call flow scripts; and it supports seamless integration with Cisco customer response applications.

Cisco IPCC Express is available as two packages: Cisco IPCC Express Standard and Cisco IPCC Express Enhanced. The Standard version is priced for entry-level users, allowing you to capture opportunities in the small and medium-size business market segment. The Enhanced version offers a full-featured ACD for entry- to mid-size contact centers. The Enhanced version also provides a migration pathway to Cisco IP Contact Center (IPCC), Cisco's premier contact center product.

Key Features[1]

- Browser-based Cisco IPCC Express administration is fully integrated with Cisco CallManager browser-based administration
- Cradle-to-grave contact call detail records
- Standard screen allows any caller-entered information to be popped to the agent
- Pre-defined or custom historical reports
- Real-time reports within the agent and supervisor desktops
- Common agent and supervisor desktops across all Cisco customer interaction management products including Cisco IPCC Express Standard, Enhanced and Cisco IP Contact Center Enterprise (formerly IPCC)
- Localization
- Full support for agent/supervisor interaction via chat; Ability to pre-define agent-supervisor messages
- Full IP call queue points and prompt; Collect voice interaction capabilities
- Optional Automatic Speech Recognition (ASR) and Text to Speech (TTS) capabilities
- Support for custom call treatment such as music for calls in queue

Cisco IP IVR

Cisco IP IVR, an interactive voice response (IVR) solution, provides a feature rich foundation for the creation of an IP-based Cisco IP IVR that is open and expandable. Written in Java to provide customer flexibility, IVR includes the following features:

- Multimedia (voice/data/Web) IP-empowered application-generation environment
- Support for optional Automated Speech Recognition (ASR) and Text-to-Speech (TTS)
- Support for VoiceXML
- Multiple Language support
- Cisco IP IVR can be located in anywhere the IP network
- Offers web-based activation and administration
- Flows (the IP IVR applications) are stored in an industry standard LDAP directory
- Cisco IP IVR is sold with Cisco CallManager and can be co-resident on the same server as CallManager or can function on a separate, dedicated media convergence servers (MCSs) or Cisco-approved customer provided server
- Packages available to scale up to 60 ports
- Cisco IP IVR offers enhanced scalability

Cisco Unity—Unified Messaging and Voice Mail

Cisco Unity is a powerful Unified Communications server that provides advanced, convergence-based communication services and integrates them with the desktop applications business professionals use everyday, improving customer service and productivity. Designed for enterprise-scale organizations, Cisco Unity delivers unified messaging that gives subscribers the ability to access and manage messages and calls from anywhere, at any time, regardless of device or media type. Subscribers can listen to e-mail over the telephone, check voice messages from the Internet, and if a fax server is present, forward faxes to any local fax machine. Cisco Unity voice messaging features robust automated attendant functionality that includes intelligent routing, and easily customizable call screening and message notification options. Cisco Unity supports localized versions in multiple languages and supports multiple languages on a single system.

Cisco Unity's optional digital networking module enables connectivity to other Cisco Unity servers at the same site via the LAN or remotely via WAN. Digital networking gives users the ability to send subscriber-to-subscriber messages anywhere in the world.

Cisco Unity supports both Cisco CallManager and leading legacy telephone systems—even simultaneously—to help smooth the transition to IP telephony and protect existing infrastructure investments. Built on a scalable platform, it uses streaming media and an intuitive HTML browser-style system administration interface. Costs are minimized when Cisco Unity's server architecture is truly unified with an organization's data network.

Key Features

- Architecture allows IT staff to set one back-up procedure, one message storage policy, and one security policy
- Enhanced scalability allows up to 72 ports per server; up to 7,500 subscribers per server; or a total of 250,000 users in an Exchange environment or 100,000 users in a Domino environment
- Support for Exchange 2000/Active Directory as the single message store and directory; AMIS-A and VPIM interoperability for Exchange systems
- Enhanced networking for large deployments—support for complex TDM telephone networks (multiple dialing domains)
- Support for multiple CCM clusters; ability to light Message Waiting Indicators
- With Exchange/Domino off-line, utilizes pre-MTA queue to take messages and give basic message access; Support for Lotus Domino as the single message store
- Fault-tolerant system tools—robust security, file replication, event logging, and optional software RAID levels 0-5
- Support for Windows 2000[1] in a mixed/native mode
- Unity Inbox/VMI (Visual Messaging Interface) is an Internet Explorer-based voice mail inbox providing unified messaging
- Unity Bridge provides advanced message interchange functionality with legacy Avaya/Octel voice mail systems—unlocking proprietary networking to deliver open standards-based IP migration

[1] Unity will not support Windows NT on the Unity server, although it can be installed into an NT environment.

Cisco Personal Assistant

Cisco Personal Assistant streamlines communications with personal call rules, speech recognition, and productivity services for IP phones. As an integral part of Cisco AVVID (Architecture for Voice, Video and Integrated Data), it interoperates with Cisco CallManager and scales to meet the present and future needs of your employees. Users can access voice mail, dial by name, and conference from any telephone using speech recognition instead of the telephone keypad. The Web-based and telephone user administration interfaces allow users to forward and screen calls in advance or in real time. The phone services enable users to check e-mail, voice mail, calendar, and personal contact information using the large, pixel-based LCD and interactive soft keys on the Cisco IP Phone 7940 or 7960.

Key Features

- Ubiquitous Access: Cisco Personal Assistant with Speech Recognition and IP Phone Productivity Services integrate with Cisco CallManager, Cisco Unity, and Microsoft Exchange within Cisco AVVID to streamline communications
- Automatic Speech Recognition (ASR): Speech recognition interface allows users to utilize simple voice commands to perform tasks such as retrieval, replying, recording, and deletion of voice messages; Entries can be dialed from personal address books or the corporate enterprise Lightweight Directory Access Protocol (LDAP) directory; Users can synchronize their Microsoft Exchange contact lists with their personal address books for quick name-dialing and ad-hoc group conferencing; Access to sensitive features such as voice mail is controlled by user authentication
- Manage Inbound and Outbound Calls (Rules-Based Routing): Using a Web interface to create rules, users can forward and screen calls based on caller identification, time of day, and meeting schedules; With "follow me," a special rule that uses speech recognition, users can forward all calls to a phone number immediately; Users can activate sets of pre-created rules from any telephone
- CalendarView: Users can keep track of appointments right on the IP phone, directly from the Microsoft Exchange server with no synchronization necessary. In addition, users can choose to be notified of an upcoming event on the phone display or by pager
- MailView: Cisco Personal Assistant presents users with access to e-mail and Cisco Unity voice-mail messages in the inboxes on the corporate messaging server. Users can access messages from a conference room, lobby phone, or colleague's phone, as well as their own. Any operation performed on the messages using MailView is automatically reflected in Microsoft Exchange and Cisco Unity; Cisco Personal Assistant interfaces with Microsoft Exchange and IMAP 4 message stores for MailView features.

Specifications

Feature	Cisco Personal Assistant
Platform	Cisco Media Convergence Server MCS-7825H-2.2-EVV1 and MCS-7835H-2.4-EVV1
Web Server Requirements for IP Phone Productivity Services Platform	Basic Web Server: Microsoft IIS 4.0 or later Separate server for Cisco Personal Assistant Server and Speech Recognition Server
Software Compatibility	Cisco CallManager 3.1+. 3.2+, and 3.3+ Cisco Unity 2.46+,3.0+, and 4.0+ for voice-mail features Microsoft Exchange 5.5 and Exchange 2000 for calendar, e-mail, contact synchronization features

Additional Cisco IP Telephony Applications

Cisco SRS Telephony

Survivable Remote Site Telephony (SRS Telephony) provides key backup telephony functions at remote branch office routers if connectivity to the centrally-located Cisco CallManager fails (i.e. WAN link is interrupted). In this case the SRS Telephony-enabled router will take over and provide basic telephony service (including off-net calls to 911). Introduced in Cisco IOS Release 12.1.5YD, the application is ideal for enterprise organizations looking to cost-effectively deploy IP telephony in their branch office location. Cisco IOS Release 12.2(13)T added SRS Telephony 2.0 features on Cisco 1751, 1760, 2600, 2600 XM, 2691, 3600, 3725/3745, IAD 2400, Catalyst 4000 AGM, and Cisco 7200 series of routers. SRS Telephony 2.1 features are available in 12.2(11)YT on Cisco 1751, 1760, 2650, 2600XM, 2691, 3640/3640A, 3660, and Cisco 3725/3745 routers.

SRS Telephony 2.0 features: Huntstop support; Music/Tone on Hold; Class of Restriction; Distinctive Ringing; Global forwarding to voicemail across PSTN during Cisco CallManager fallback; TCL based simple AA and IVR on local gateway (SRS Telephony router); Transfer across H323 network of Cisco endpoints; Alias lists for single number to be designated for unregistered phones

SRS Telephony 2.1 features: International language support; Call forward no-answer/busy to Unity server with Personal Greeting; Cisco 7914 and 7935 support; VG248 support

For More Information

See the Cisco SRS Telephony Web site: **http://www.cisco.com/go/srs**

Cisco IP Phone Messenger

The Cisco IP Phone Messenger (IPPM) is a productivity application, providing enhanced, real-time collaboration for Cisco AVVID IP Communications systems. Cisco IPPM extends the benefits of Instant Messaging and Presence to Cisco CallManager networks, allowing users to send and receive instant messages on Cisco 7940 and 7960 IP phones. Cisco IPPM interworks with IBM Lotus Sametime and MSN Messenger clients and supports the IETF SIMPLE (RFC-3428) protocol for instant messaging and presence. IPPM 1.1 requires Cisco CallManager release 3.2 or later and is supported on the Cisco 7825 and 7835 Series Media Convergence Servers.

For More Information

See the Cisco IP Communications Web site:
http://www.cisco.com/go/ipcommunications

Cisco IP SoftPhone

Cisco IP SoftPhone 1.3 is a PC based application that allows you to use your phone extension from wherever you connect to your corporate IP network, even over the Internet when using a VPN client.

It's dual mode operation allows you to either control a physical IP phone, or perform all the functions of a phone in standalone mode using your PC's soundcard or a USB audio handset or headset.

Cisco Survivable Remote Site Telephony (SRS Telephony) Licenses	
FL-SRST-SMALL	SRS Telephony Site License for the Cisco IAD 2400/2600/3620/Catalyst 4224 (up to 24 phones)
FL-SRST-MEDIUM	SRS Telephony Site License for the Cisco 3640 (up to 48 phones) or order multiple licenses for the Cisco 3660 (up to 144 phones, each supports up to 48 phones)
Cisco IP SoftPhone	
SW-IPSOFTPHONE25=	Cisco IP Softphone CD; 25 licenses (licenses also available for 1, 50, and 100 users)

For More Information

See the Cisco IP SoftPhone Web site: **http://www.cisco.com/go/softphone**

Cisco IP Manager Assistant[1]

Cisco IP Manager Assistant is a tool that allows an assistant to provide call coverage for up to five managers simultaneously. When a user is configured as an IPMA manager, they are associated with a primary and secondary assistant. The configured manager is always logged onto the service and selects the preferred assistant from the 7960 services menu. Features available to the manager are initiated from softkeys on the manage's phone. Assistant user features are initiated and managed from a PC-based application named the Assistant Console.

[1] IP Manager Assistant is available as part of Cisco CallManager 3.3 for no additional charge.

Key Features

- Manager tools: 7960 IP phone—selection of assistant from pre-configured list; Divert All, Immediate Divert, Transfer to Voice Mail, Intercept, DND, SetWatch, Assistant Watch, Call Filtering feature invocation; display of toggled feature status for Divert All, Filtering, DND, Assistant Watch and Assistant availability; speed dial and line appearance configuration for intercom functionality; Manager Desktop—secure, browser-based access to configuration for default assistant assignment, Divert All target, Immediate Divert target and filter list (CLID) configuration.
- Admin Assistant Tools: 7960 IP Phone/7914 line extender—speed dial and line appearance configuration for intercom functionality; 7960 IP phone—invocation of new softkey features including Transfer to Voice Mail and Immediate Divert, speed dial to manager's intercom line; Assistant Console application—Windows application installed on assistant PC. GUI consistent with CallManager Attendant Console application. User-sizable application window and panes

Specifications

Feature	Cisco IP Manager Assistant
Platform	Media Convergence Server (MCS)
Software Compatibility	Cisco CallManager version 3.3 Assistant ConsoleApplication—Microsoft Windows98, NT desktop, ME, 2000 Desktop and XP

For More Information

See the Cisco Media Convergence Server Web site: **http://www.cisco.com/go/ipma**

Cisco Conference Connection

Cisco Conference Connection (CCC) is designed for small to medium enterprises and remote offices of larger enterprises. Cisco Conference Connection facilitates relevant participation regardless of location, enables faster decisions, and eliminates travel cost and time and disruptions caused by requirements for a physical conference room presence. Typical applications include service calls, project management, sales reviews, corporate announcements, customer and employee training, and other business meetings. This application is ideal for enterprieses trying to increase productivity while reducing expense. Simple web-based interface enables employees to manage their conference schedules and eliminates the service charges to conference service providers.

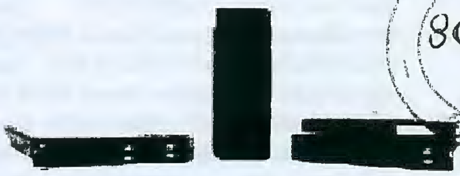
Cisco MCS 7800 Series Media Convergence Servers

Cisco MCS 7815I-2000



The Cisco MCS 7815I-2000 provides an entry level tower server equipped with an Intel Pentium™ 4 2000MHz processor, 40GB ATA hard drive and single non-hot swap power supply. An optional tape backup is available on some models of the MCS 7815I-2000.

Cisco MCS 7825H-2266

The Cisco MCS 7825H-2266 provides an entry level rack mount server that occupies only one rack mounting space. This server is equipped with an Intel Pentium™ 4 2266MHz processor, 40GB ATA hard drive and a single non-hot swap power supply. An optional tape backup is available on some models of the MCS 7825H-2266.

Cisco MCS 7835H-2400 and Cisco MCS 7835I-2400

These Cisco MCS platforms provide a highly available mid-level rack mounted server solution that is equipped with an Intel Prestonia Xeon™ 2400MHz processor, up to six hot-swap Small Computer Systems Interface (SCSI) hard disks, a Redundant Array of Independent Disks (RAID) 1/0 Controller, hot swap fans and redundant hot swap power supplies. An optional tape backup is available for some models of the MCS 7835H-2400 and MCS 7835I-2400.

Cisco MCS 7845H-2400 and Cisco MCS 7845I-2400

These Cisco MCS platforms provide a powerful and highly reliable high level rack mounted server solution that is equipped with two Intel Prestonia Xeon™ 2400MHz processors, up to six hot-swap SCSI hard disks, RAID 1/0 controller, redundant hot swap fans and redundant hot swap power supplies. An optional tape backup is available for some models of the MCS 7845H-2400 and MCS 7845I-2400.

Cisco ICS 7750 Integrated Communications System

The Cisco Integrated Communications System (ICS) 7750 is a versatile IP telephony and services solution that brings the benefits of converged IP services to midmarket businesses and enterprise branch offices. Call processing, voice applications, voice gateways and multiservice IP routing are integrated within the system chassis to deliver true convergence while enhancing system manageability. The modular system architecture enables expansion of call processing redundancy, voice gateway capacity, routing capacity, and IP services to deliver system availability and scalability. The ICS 7750 offers quick and cost-effective deployment of powerful applications including unified messaging, integrated Web call centers, and data/voice collaboration.

The Cisco ICS 7750 includes Cisco CallManager software, and combines an IOS-based multiservice router/voice gateway, application servers running core voice applications, Web-based management, and seamless connectivity to Cisco Catalyst switches.

Cisco Systems also offers four Cisco ICS 7750 voice packages for convenient and cost-effective entry points for customers to deploy IP telephony solutions in their LAN networks. These ICS voice packages are pre-configured to simplify ordering of the necessary voice components including voice mail for a mid-market business or branch site.

When to Sell

Sell This Product	When a Customer Needs These Features
ICS 7750 Integrated Communications System	• A branch office/midmarket business with standalone IP telephony needs from 35-500 users • An end-user customer or partner who wants a single "box" (or platform) IP telephony solution to ease deployment and/or to standardize on voice configurations across multiple sites • An existing multiservice data network customer who wants to add IP telephony functionality to create a converged network solution

Key Features

- Integrated Functionality (includes CallManager for call-processing, multiservice router/voice gateway, Web-based management, and core voice applications)
- Modular chassis architecture features 6 universal slots with hot swapability
- Modular industry-proven Cisco IOS-based Multiservice Route Processor (MRP) delivers data routing and voice trunking; ensures end-to-end QoS
- Industry-leading selection of WAN Interfaces
- World wide selection of voice interfaces
- Optional redundant power supply and uninterruptible power supply
- Optional integrated voice applications including Unity voice/unified messaging, IVR, contact center
- Integrated Web/GUI-based system management tool for simple monitoring and troubleshooting; Console and Telnet access to CLI system management
- Automated inventory, discovery, and configuration of desktop devices and applications
- Automated fault management, auto-notification of problems via e-mail or pager
- Compatible with SNMP-based management tools including CiscoWorks 2000
- N+1 CallManager clustering enables a backup Cisco CallManager to improve system availability

Specifications

Feature	Cisco ICS 7750
System Switch Processor	Fixed slot card; 10/100BaseT autosensing data switch; Two-port RJ-45 connectors; Included with each ICS 7750 system
System Alarm Processor	Fixed slot card; Two serial ports; One console port; Resource Cards; Included with each ICS 7750 system
System Processing Engine	Universal slot card; Intel Pentium III 700 MHz CPU;1 GB SRAM; 40 GB hard disk drive
Multiservice Route Processor	Universal slot card; Standard memory: 64 MB DRAM (max.128 MB); Memory upgrade (option): 16, 32, 64 MB DRAM; Standard flash memory: 16 MB Flash SIMM (max. 80 MB); Flash upgrade (options): 16, 32, 64 MB Flash; modular voice/WAN interface (VWIC) card slots per card; Advanced data networking feature suppot, including: VPN, IPSec 56 and 3DES, Firewall
Dimensions and Weight (HxWxD)	15.75 x 17.25 x 12.5 in. (40.005 x 43.815 x 31.75 cm)Basic configuration-1 MRP, 1 SPE, 1 SSP, 1 SAP (a total of 4 cards = 2 fixed cards + 2 universal cards) and 1 power supply): 42 lb (18.9 kg)
Mounting Options	19 in rack-mount; Standalone

Selected Part Numbers and Ordering Information[1]

Cisco ICS 7750 Voice Packages

ICS-7750-M1V	Cisco ICS 7750 FXO-M1 Analog Voice Package provides eight Foreign Exchange Office (FXO) analog voice interfaces,four analog FXS/DID ports, 25 Cisco Unity Voice Messaging mailboxes and support for upto 50 Cisco CallManager devices.
ICS-7750-TV	Cisco ICS 7750 T1 Digital Voice Package provides 24 digital voice channels (DS0s), 8 analog FXS interfaces, 50 Cisco Unity Voice Messaging mailboxes and support for up to 500 Cisco CallManager devices.
ICS-7750-BV	Cisco ICS 7750 ISDN BRI Voice Package provides four ISDN BRI interfaces(eight B channels), 50 Cisco Unity Voice Messaging mailboxes and support for up to 500 Cisco CallManager devices.
ICS-7750-EV	Cisco ICS 7750 E1 Digital Voice Package provides 30 digital voice channels (DS0s), 50 Cisco Unity Voice Messaging mailboxes and supportfor up to 500 Cisco CallManager devices.

Cisco ICS 77501

ICS-7750	Six-slot ICS chassis, SPE310, SSP, SAP, Power Supply & DOC-CD
SPE310=	System Processing Engine 310 (512MB RAM and Windows 2000)
MRP300=	Multiservice Route Processor 300 with two VIC/WIC slots
MRP3-8FXOM1=	Multiservice Route Processor with 8-ports FXO-M1 and one VIC/WIC slot
MRP3-8FXS=	Multiservice Route Processor with 8-ports FXS and one VIC/WIC slot
MRP3-16FXS=	Multiservice Route Processor with 16-ports FXO-M1
UPS-BASE-UNIT=	UPS with Standard Battery Pack, Ethernet Card (120 V for North America)
UPS-BATT-PACK=	Additional External Battery Pack for UPS Base Unit
PWR-AC-7750=	AC Power Supplyfor ICS 7750 Chassis
FAN-TRAY-7750=	Fan Tray for ICS-7750
ICS-7750-CHASSIS=	ICS-7750 Six-slot chassis & Fan Tray
SAP-7750=	System Alarm Processor for ICS 7750
SSP-7750=	System Switch Processor for ICS 7750

Cisco ICS 7750 WAN Interface Card (WIC) Modules (for MRP cards)

WIC-1DSU-T1=	1-Port T1/Fractional T1 DSU/CSU WAN Interface Card
WIC-1T=	1-Port Serial (T1/E1) Async/Sync WAN Interface Card
WIC-2T=	2-Port Serial (T1/E1)Async/Sync WAN Interface Card
WIC-2A/S=	2-Port low-speed Serial (up to 128kbps) Async/Sync WAN Interface Card spare
WIC-1DSU-56K4=	1-Port 4-Wire 56Kbps DSU/CSU WAN Interface Card
WIC-1B-S/T=	1-Port ISDN BRI S/T WAN Interface Card (dial and leased line)
WIC-1B-U=	1-Port ISDN BRI U with NT-1 WAN Interface Card dial and leased-line

Cisco ICS7750 Voice Interface Card (VIC) Modules (for MRP cards)

VIC-2FXS	Two-port FXS voice/fax interface card
VIC-4FXS/DID	Four-port FXS or DID voice/fax interface card (ports can be configuredfor either FXS or DID)
VIC-2DID	Two-port DID voice/fax interface cad
VIC-2FXO	Two-port FXO voice/fax interface card
VIC-2FXO-M1	Two-port FXO voice/faxinterface cardwith battery reversal and caller ID (for North America)
VIC-2FXO-M2	Two-port FXO voice/faxinterface cardwith battery reversal and caller ID (for Europe)
VIC-2FXO-M3	Two-port FXO voice/faxinterface card with battery reversal and caller ID (for Australia)
VIC-4FXO-M1	Four-port FXO voice/fax interface card withbattery reversal and caller ID (for N. America)
VIC-2E/M	Two-port E&M voice/fax interface cad
VIC-2BRI-NT/TE	Two-port IDSN BRI (NT & TE) voiceinterface card
VWIC-1MFT-T1	One-port T1/fractional T1multiflex trunk with CSU/DSU (for CAS or PRI)
VWIC-2MFT-T1	Dual-port T1/fractional T1multiflex trunk with CSU/DSU (for CAS or PRI)
VWIC-1MFT-E1	One-port E1/fractional E1multiflex trunk with CSU/DSU (for PRI)
VWIC-2MFT-E1	Dual-port E1/fractional E1multiflex trunk with CSU/DSU (for PRI)

Cisco ICS 7750 Packet Voice/Fax DSP Modules (for MRP cards)

PVDM-256K-4=	4-Channel Packet Voice/Fax DSP Module
PVDM-256K-8=	8-Channel Packet Voice/Fax DSP Module
PVDM-256K-12=	12-Channel Packet Voice/Fax DSP Module
PVDM-256K-16=	16-Channel Packet Voice/Fax DSP Module
PVDM-256K-20=	20-Channel Packet Voice/Fax DSP Module

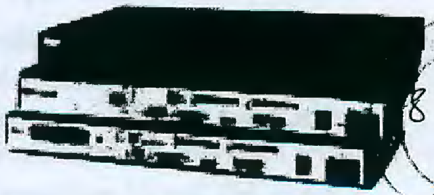
Cisco IAD 2400 Series Integrated Access Device with IOS Telephony Service (ITS)[1]



The Cisco IAD 2400 Series integrated access devices (IADs) combine data, voice, and video services over IP and ATM networks to provide cost-effective and efficient means of delivering high-speed Internet and voice services to small- and medium-sized business customers—all in a small (1 RU) system. When configured with optional ITS software, the IAD 2400 is ideal for delivering converged LAN IP telephony in small office environments (5-20 phones) that do not require CallManager functionality.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco IAD 2400 Series	Business-class, fully integrated accessdevice • IOS Telephony Service (ITS), ideal for small offices (5-20 phones) that donot need Cisco CallManager capabilities • Support for standard phones and IP phones on asingle platform • 8 FXS/16 FXS/16FXS+8FXO analog voice ports and 1 T1 digital voice port models • T1-PPP, FR, HDLC, ATM, ADSL and G.shdsl WAN interfaces

Key Features

- Combines high-speed Internet access and toll-quality voice services on single IOS-based platform (ITS introduced in Cisco IOS Release 12.1(5)YD)
- Offers TDM, VoIP, and VoATM (AAL2) on a single platform
- Seamless migration of customers from TDM-based GR-303 to packet-based GR-303 networks or to call agent-based networks
- Automated remote installation and configuration enabled via Simple Network-enabled Auto Provisioning (SNAP) and the Cisco Configuration Express tool

Competitive Products

- Adtran: TA850, TA750, TA600
- Carrier Access: Adit 600
- Coppercom: MXR 400
- RAD: LA-110, LA-140
- Verilink (formerly Polycom): NetEngine 6200, 7200
- Wave7 Optics: LMG-B

[1] IP Keyswitch capabilities also available with 2600 and 3600 series routers; see IP Keyswitch Web site: http://www.cisco.com/go/keyswitch

Cisco Voice Gateways

Voice Gateways interface directly to PBXs or public telephone networks to carry voice traffic across IP networks—by converting IP calls to standard telephony calls and vice versa. They provide connectivity between packet telephony and legacy telephony such as PSTN, PBX, fax machines, and other devices.

Cisco's full line of multiservice routers can also add analog and digital voice gateway functionality through the use of network modules and voice interface cards[1], such as the Catalyst 6000 Family FXS Analog Interface Module.

Cisco offers the Cisco VG248 dedicated voice gateway.

Cisco VG248 Voice Gateway

The Cisco VG248 Voice Gateway is a 1 unit high rack mountable device allowing 48 analog devices (phones, fax machines & modems) to be used with Cisco Call Manager. It enables organizations with large numbers of analog phones (hotels, universities, hospitals, etc.) to deploy IP Telephony while maintaining the investment in legacy handsets. The analog lines are full featured (caller id, message waiting lights, feature codes) and the price per port is competitive with a legacy PBX.

The VG248 will generate SMDI for the attached analog ports allowing connection to a Cisco Call Manager network through legacy voicemail systems. It shares existing SMDI based voicemail systems between the Cisco Call Manager and the legacy PBX.

Cisco IP/VC 3500 Series Videoconferencing Products

The IP/VC 3500 series is for enterprises and service providers who want a reliable, easy-to-manage, cost-effective network infrastructure for videoconferencing over their IP networks. They consist of the IP/VC 3511 Multipoint Control Unit (MCU, also known as a "video bridge"), the IP/VC 3521 and 3526 H.320 to H.323 Gateways and the IP/VC 3540-Series Videoconferencing System. The Cisco IP/VC product family works with H.323-standards-based videoconference client devices from a variety of vendors and integrates with legacy H.320 networks.

- The Cisco IP/VC 3511 Multipoint Control Unit (MCU) is a 1RU stack/rack-mount system enabling adhoc videoconferences between three or more endpoints. Multiple participants in multiple locations attend the same meeting with real-time interactivity. It is suitable for small to medium enterprises and remote branch offices in larger enterprises
- The IP/VC 3521 and the IP/VC 3526 Videoconferencing Gateways are also 1RU stack/rack-mount systems that translate between H.320 and H.323 protocols. The IP/VC 3521 provides up to four BRI interfaces and the IP/VC 3526 provides one ISDN T1/E1 PRI interface

[1] Please see the 1700, 2600, 3600, 7200, 5x00 series in Chapter 1—Routers, Chapter 7—Access Products.

- The IP/VC 3540 Videoconferencing System integrates multipoint control units, and gateways I onto a single platform for cost-effective deployment of IP-centric videoconferencing networks. In addition, the IP/VC 3540 platform offers T.120 data conferencing through an optional collaboration server. Customers can add the Rate Matching module which enhances the video composition of any multipoint conference. Enhanced features such as Rate Matching, a number of robust Continuous Presence formats and audio transcoding are available
- The Multimedia Conference Manager (MCM) software is part of Cisco IOS Software and available across a wide range of Cisco router platforms, including the Cisco 2600/2600XM, 3600, 3700, and 7200 series. As a gatekeeper/proxy, it enables network managers to control and secure bandwidth and priority settings for H.323 videoconferencing services

Cisco IP/TV 3.4

Cisco IP/TV® 3.4 delivers a complete, highly scalable, bandwidth-efficient solution for high-quality video communications over enterprise networks. Cisco IP/TV supports live video, scheduled video, video on demand (VOD), synchronized presentations and screen captures, and a wide range of video management functions. The solution enables a broad spect.um of applications for enterprise communications including training, corporate communications, business TV, and distance learning.

Cisco IP/TV 3.4 are purchased as Cisco IP/TV 3400 Series Server appliances or software for third party servers. The Cisco IP/TV 3400 Series servers contain pre-configured software, preinstalled capture cards, network interface cards, and device drivers. The Cisco IP/TV 3400 Series includes the IP/TV 3412 Control Server, the IP/TV 3425 and 3425A Broadcast Servers, the IP/TV 3432 Archive Server, and the IP/TV 3417 Video Starter System. This product family offers a range of choices to best suit large-scale enterprise applications, performance requirements, and bandwidth availability.

Selected Part Numbers and Ordering Information[1]

Cisco IP/TV 3400 Series Video Servers	
IPTV-3412-CTRL	Cisco IP/TV 3412 Control Server
IPTV-3425-BCAST-M	Cisco IP/TV 3425 MPEG-1, MPEG-2 Full D1 Broadcast Server
IPTV-3425A-BCAST-M	Cisco IP/TV 3425 MPEG-1 Broadcast Server
IPTV-3432-ARCH	Cisco IP/TV 3432 Archive Server
IPTV-3417-START-M	Starter Kit
Cisco IP/TV Software	
IPTV-CM-3.4	IP/TV Content Manager
IPTV-SERV-3.4	Broadcast/Archive Server
IPTV-SERV-MP4-3.4	Server w/ MPEG-4 card & license
IPTV-START-HD1-3.4	Starter Kit

Web Collaboration—Cisco Web Collaboration Option

The Cisco Web Collaboration Option enables businesses to combine the personal value of human interaction with the information value of the Web-creating a powerful environment for driving increased sales, exceptional service, and customer satisfaction.

The Cisco Web Collaboration Option allows you to add "click-for-help" buttons on your Web site that enable customers to interact with your contact center agents over the Web while conducting a voice conversation (PSTN or Voice over IP [VoIP]) or text chat. Contact center agents and callers can share Web pages-including personalized or dynamically generated pages, complete forms in a collaborative fashion, and share any Windows desktop application using nothing more than a Web browser. By facilitating effective, personalized assistance designed to greatly enhance the customer experience, the Cisco Web Collaboration Option is an ideal solution for both sales- and service-oriented contact centers.

The Cisco Web Collaboration Option can be deployed in a pure IP environment or can be seamlessly integrated with your organization's existing telephony infrastructure to provide automated, blended delivery of phone and Web-based inquiries.

E-Mail Response Management–Cisco E-mail Manager

Cisco E-Mail Manager is a comprehensive, enterprise-class solution for managing high volumes of customer inquiries submitted to your company mailboxes or Web site. Based on customizable business rules, Cisco E-Mail Manager accelerates the response process by automatically directing messages to the right agent or support team, categorizing and prioritizing messages, suggesting relevant response templates, and, if desired, sending automated replies. A full-featured, browser-based interface provides your agents with the productivity tools and knowledge resources they need to provide fast, accurate and personalized responses to your customers. Cisco E-Mail Manager gives managers the queue management, reporting and outbound marketing tools they need to ensure that desired service standards are met, gain valuable insight into customer needs and generate new revenue opportunities.

Whether you are building a customer support system from the ground up or integrating with existing organizational structures and legacy systems, Cisco E-Mail Manager's uniquely flexible, extensible and scalable design delivers a cost-effective, easy-to-implement strategy for building customer relationships over the Internet.

Cisco Emergency Responder

Cisco Emergency Responder revolutionizes enterprise telephony support for E9-1-1 in North America, E1-1-2 in Europe, and other emergency telephone services across the globe. Traditional PBX E9-1-1 implementations in North America support "automatic location identification" of emergency callers through daily manual database update processes, which limit the frequency of location updates and increase the likelihood of update errors. The Cisco Emergency Responder software application works with Cisco CallManager to automatically track the location of Cisco IP phones in enterprise campuses, route emergency calls to an appropriate public safety answering point (PSAP), and provide the location of the caller to the Public Safety Answering Point (PSAP).

Cisco ER performs these functions without requiring tedious manual database updates after phone moves/adds/changes, which significantly reduces the time, headcount, and costs associated with traditional PBX E9-1-1 maintenance. While some vendors may automate location updates, they still require manual PBX configuration changes to trigger the updates. The Cisco ER solution, when coupled with the automated phone moves/adds/changes features in Cisco CallManager, is the first in the industry to completely automates the phone move process while maintaining E9-1-1 and location data integrity.

In addition, Cisco ER can use email/pager messaging, telephone calls, and auto-refreshing webpage updates to notify on-site security operations personnel and third-party agencies of emergency calls in progress.

Key Features

- Meets and exceeds traditional E9-1-1 requirements
- Automates all user and phone moves, adds, and changes; Enables users and phones to move an unlimited number of times per day
- Avoids the expense and burden of daily PS-ALI record uploads
- Avoids daily error-prone documentation and database updates
- Enables quicker and more effective emergency response from onsite personnel and public agencies
- Provides configuration auditing to facilitate responsible change management and investigative or legal processes
- Provides call history logs for capacity planning, management of emergency call abuse, and incident documentation
- Compatible with any emergency number

Specifications

Feature	Cisco Emergency Responder
Supported Platform	Cisco Media Convergence Server, MCS-7835-1266 and MCS-7825-1133
System Capacity	A single Cisco Emergency Responder server supports 10,000 phones and 30,000 Ethernet switch ports. Additional scalability parameters include 500 Emergency Response Locations (ERLs)- locations that can be uniquely identified to a Public Safety Answering Point (PSAP)- as well as 500 manually entered endpoints such as analog or proprietary phones or H.323 clients. Cisco recommends a second Emergency Responder server to form a fully redundant Cisco Emergency Responder Group with the same capacity and increased availability compared with a single Cisco Emergency Responder server. Larger campuses and distributed systems are supported via a network of Cisco Emergency Responder groups called a Cisco Emergency Responder Cluster
Configurable Elements	
Cisco CallManager	Call routing and digit manipulation to forward user-initiated emergency calls and PSAP return calls to and from Cisco Emergency Responder as appropriate
Cisco Emergency Responder	System administration interface-foraccess to all configuration components or oversight of outsourced vendors LAN administration interface-for IT LAN group or an outsourced vendor Emergency Response Location (ERL) administration interface-for IT telecom group or an outsourced vendor
Other Components	Configure e-mail account on a Simple Mail Transfer Protocol (SMTP) Internet mail server for use by Cisco Emergency Responder Configure an email-to-pager gateway, or use an email paging service Configure a PS-ALI transfer application provided by the PS-ALI database service provider (often requires a dialup modem connection) Provision an E9-1-1 capable voice trunk (Centralized Automated Message Accounting [CAMA] or Primary Rate Interface [PRI]) through a localexchange carrier
Supported Switches[1]	Cisco Catalyst 2950, 3500, 3550, 4000, 4500, 6500 Series

[1] Check for updates on CCO, and following is list of tested switch platforms at time of printing

Selected Part Numbers and Ordering Information[1]

Cisco Emergency Responder

SW-ER1.1-SVR	Cisco Emergency Responder software (MCS platforms), including 100 user licenses
SW-ER1.1-SVR-CPQ=	Cisco Emergency Responder software (Compaq platforms) including 100 user licenses
SW-KEY-ER1.1-USER=	Incremental single-user license key for Cisco Emergency Responder

[1] Redundant user licenses are not required when ordering redundant CER servers for a single CER group.

For More Information

See the Cisco Emergency Responder Web site: **http://www.cisco.com/go/cer**

Cisco ATA Series of Analog Telephone Adaptors

The Cisco ATA 186 and 188 Analog Telephone Adaptors bring analog telephones into the networked world. The Cisco ATA series of products address the low-end product portfolio need by targeting the enterprise, business local services, small-office environment and the emerging managed voice services market. These cost effective handset-to-Ethernet adaptors enable analog devices, such as phones and fax machines, to support voice-over-IP (VoIP) services. The Cisco ATA 186 is equipped with, and a single RJ-45 Ethernet port. The Cisco ATA 188 has two RJ-11 voice ports and two RJ-45 ports. The internal Ethernet switch allows for a direct connection to a 10/100BASE-T Ethernet network and connectivity to a co-located PC or other Ethernet-based device via the RJ-45 ports.

Both models ship with a bootload image and must be upgraded to a signaling firmware image available on Cisco.com before deployment. Cisco ATAs can be configured[1] to use the standards-based Voice over IP (VoIP) protocols H.323, Session Initiation Protocol (SIP), Media Gateway Control Protocol (MGCP) and Skinny Client Control Protocol (SCCP).

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco ATA Series of Analog Telephone Adaptors	• Enable analog devices, such as phones and fax machines, to support Voice over IP services by converting the analog signal into an IP signal • Continue use of existing analog phones with IP network

Key Features

- Auto-provisioning with Trivial File Transfer Protocol (TFTP) provisioning servers
- Automatic assignment of IP address, network route IP, and subnet mask via Dynamic Host Configuration Protocol (DHCP)
- Optional web configuration through built-in Web server
- Optional touch-tone telephone keypad configuration with voice prompt
- Administration password to protect configuration and access
- Advanced pre-processing to optimize full-duplex voice compression
- High performance line-echo cancellation eliminates noise and echo
- Voice activity detection (VAD) and comfort noise generation (CNG) save bandwidth by delivering voice, not silence
- Dynamic network monitoring to reduce jitter artifacts such a packet loss

[1] Two softrware image combinations are available on Cisco.com: H.323/SIP and MGCP/SCCP. MGCP/SCCP image includes the letters, ms, in its name.

Specifications

CHAPTER 5

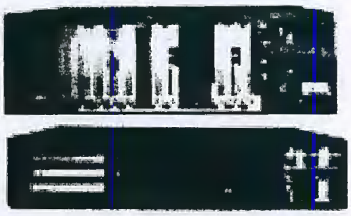
VPN and Security Products

VPN and Security Products at a Glance

Product	Features	Page
Cisco PIX Firewall	Market-leading, purpose-built applianceswhich provide broad range of integrated secuity services • Robust stateful inspection firewalling with applicationawareness • Highly scalable remote access and site-to-site VPN • Intrusion protection with forreal-time responseto network attacks • Award-winning statefulfailover for enterprise-class resiliency	5-2
Cisco IOS Firewall	• Tightly integrated with IOS VPN and advanced routingtechnologies • Stateful packet filteringvia context-based access control(CBAC) • Inline Intrusion detection for realtime response tonetwork attacks • Dynamic, network-to network, per-user authentication and authorization via TACACS+ and RADIUS	5-5
Firewall Blade for Catalyst 6500	Firewall Module is a high performanceintegrated statefulfirewall solutionfor Catalyst 6500 family of switches with performance exceeding 5GB. It is based on proven PIX technology while providing the following benefits to the customers • Investment protection • Low cost of ownership • Ease of use • Operational Consistency • Scalability See the Catalyst 6500 Series Switch in Chapter 2: LAN Switching, page 2-20 , for more information	2-20
Cisco VPN 3000 Family	Remote access Virtual Private Networkplatform • Has models for all size companies, from small to large enterprise organizations • Reduces communications expendtures • Enables users to easily add capacty and throughput	5-6
Cisco IDS Network Sensor	Network-based, real-time intrusion detection system capable of monitoring an entire enterprise network • Distributed intrusion detection system capable of directing andforwarding alams between local, regional, and headquartersbased monitoring consoles • Scalable architecture to allow the depbyment of large numbersof sensors in orderto provide comprehensive security coverage in large networks with performance requirements from T1 to gigabit environments • Cisco IDS Module enablescustomers toperform both securitymonitoring and switching functionswithin the samechassis • CTR (Cisco Threat Response)delivers patented adaptive scan techniques to minimize false alarms	5-8
Cisco Security Agent	The Cisco Security Agent provides threat protection fordesktop andserver computing systems by identifying andpreventing malcious activity. By acting on threats orattacks beforethey can occur, Cisco Security Agent removes known and unknown security risks to enterprise networks and applications: • The Cisco Security Agent aggregates andextends multiple endpoint securityfunctions by providing hostintrusion prevention, distributed firewall, malicious mobile code protection, operating system integrity assurance, and audit log consolidation all within a single agent package • Protects against know andunknown attacks on both servers and desktops	5-10
Cisco 7100 Series	Large branch and centralsite VPN router • Comprehensive suite of VPN services, including encryption, tunneling, firewall, and bandwidth management • Embedded I/O for ease of deployment • Service module slot for IPSec and PPTP encryptioncoprocessing • Dedicated Site-to-Ste VPN router	5-11

Product	Features	Page
Cisco Secure Access Control Server (ACS) for Windows	Controls the authentication, authorization,and accounting (AAA) of users and administrators to network devices and services • Operates as a centralized Remote Access Dial-In User Service (RADIUS) or Terminal Access Controller Access Control System (TACACS+) server • Supports LDAP user authentication • Data replication and backupservices • Flexible user and group policy controls • Support for Cisco802.11x Catalyst Switch and Wireless solutions • Extensible Authentication Protocol (EAP) enhancements to support ProtectedEAP (PEAP) for wireless LANs • All administrative access is encryptedwith SSL	5-14
Cisco Secure User Registration Tool (URT)	Identifiesuserswithinthe network and createsuser registrationpolicybindingsthat help support mobility and tracking: • Ensures that users are associated with their authorized subnet/VLAN • Addresses the challengesassociated with campus user mobility • Supports Web-based authentication for Windows, Macintosh, and Linux client platforms • Secure user accessto the VLAN with MAC address-based security option • Option to allow multiple users connected to a hub to access a VLAN served by a single switch port	5-15
CiscoWorks VPN/Security Management Solution	Combines general device management tools for configuring, monitoring, and troubleshooting enterprise networks with powerful security solutions for managing virtual private networks (VPNs), firewalls, and networkand host-based intrusion detection systems (IDS). This bundle includes: Management and Monitoring Centers, Cisco IDS Host Sensorand Console, Cisco Secure Policy Manager, VPN Monitor, Resource Manager Essentials, and Cisco View See Chapter 9—CiscoIOS Software and Network Management formore informationon CiscoWorks VPN/Security Management Solution	9-16
Cisco 806, 1700, 2600, 3600, 7200, 7400 and SOHO 70 Series	Wide variety of modular router platformswith optionsfor IOS-basedand hardware-enabledVPN and security support. See individual productpagesand Cisco IOS Firewall Feature Set (page 5-5).	1-1

Cisco PIX Firewall Series



The world-leading Cisco PIX® Firewall Series of purpose-built security appliances provides robust, enterprise-class, integrated network security services, including stateful inspection firewalling, virtual private networking (VPN), intrusion protection, and much more-in cost-effective, easy-to-deploy solutions. Ranging from compact, "plug-and-play" desktop firewalls for small and home offices to carrier-class gigabit firewalls for the most demanding enterprise and service-provider environments, Cisco PIX Firewalls provide robust security, performance, and reliability for network environments of all sizes.

When to Sell

Sell This Product	When a Customer Needs These Features
PIX 501	• Small Office / Home Office desktop integrated security appliance • Up to 10 Mbps of firewall throughput and 3Mbps of 3DES VPN throughput[1] • Hardware VPN client (Easy VPN Remote) • VPN concentrator services (EasyVPN Server) for up to 5 remote users • Integrated four pot 10/100 Mbps switch
PIX 506E	• Remote Office / Branch Office desktop integrated security appliance • Up to 20 Mbps of firewall throughput and 16 Mbps of 3DES VPN throughput[1] • Hardware VPN client (Easy VPN Remote) • VPN concentrator services (EasyVPN Server) for up to 25 remote users • Maximum of two 10BASE-T Ethernet interfaces • OSPF dynamic routing support

Sell This Product	When a Customer Needs These Features
PIX 515E	• Small-to-Medium Business (SMB) integrated secuity appliance • Up to 188 Mbps of firewall throughput[1] • Up to 140 Mbps of 3DES/AES-256 VPN throughput[1] using hardware acceleration (integrated inselect models, optional for others) • VPN concentrator services (Easy VPN Server) for up to 2,000 remote users • Up to six 10/100 FE interfaces • VLAN trunking (802.1q tag-based) and OSPF dynamic routing support • Active/standby stateful failover support
PIX 525	• Enterprise-class integrated securty appliance • Up to 330 Mbps of firewall throughput[1] • Up to 155 Mbps of 3DES/AES-256 VPN throughput[1] using hardware acceleration (integrated inselect models, optional for others) • VPN concentrator services (Easy VPN Server) for up to 2,000 remote users • Gigabit Ethernet support; Upto eight 10/100 FE or three Gigabit Ethernet interfaces • VLAN trunking (802.1q tag-based) and OSPF dynamic routing support • Active/standby stateful failover support
PIX 535	• Carrier class large enterprise and service provider firewall appliance • Up to 1.7 Gbps of firewall throughput[1] • Up to 440 Mbps of 3DES/AES-256 VPN throughputusing hardware acceleration (integrated in select models, optional for others) • VPN concentrator services (Easy VPN Server) for up to 2,000 remote users • Gigabit Ethernet throughput; Up to ten 10/100 FE or nine Gigabit Ethernet interfaces • VLAN trunking (802.1q tag-based) and OSPF dynamic routing support • Redundant, hot-swappable power supplies • Active/standby stateful failover support

1. At 1400-byte packets

Key Features

- Security—Purpose-built firewall appliance with a proprietary, hardened operating system
- Performance—Stateful inspection firewall capable of up to 500,000 concurrent connections and 1.7 Gbps of throughput (at 1400-byte packets on Cisco PIX 535 Firewalls)
- High availability—Award-winning, active/standby stateful failover model provides enterprise-class, cost-effective resiliency
- Virtual Private Networking (VPN)—Supports both standards-based IPsec and L2TP/PPTP-based VPN services
- Optional PIX VPN Accelerator Card+—Scales 3DES/AES-256 VPN throughput up to 440 Mbps, using specialized co-processors designed for accelerating encryption operations
- Free software Cisco VPN Client provides secure connectivity across a broad range of platforms including Windows, Mac OS X, Linux and Solaris
- Network Address Translation (NAT) and Port Address Translation (PAT)—Conceals internal IP addresses and expands network address space
- Denial-of-Service (DoS) Attack Protection—Protects the firewall, internal servers and clients from disruptive hacking attempts
- OSPF dynamic routing support for improved network reliability and performance
- VLAN trunking (802.1q tag) support for simplified deployment in switched network environments
- Web-Based PIX Device Manager (PDM)—For simplified configuration and usage reports
- Auto Update, SSH, SNMP, TFTP, HTTPS, and telnet for remote management
- Support from two 10/100 Ethernet interfaces up to nine Gigabit Ethernet interfaces

Competitive Products

- Check Point Software: FireWall-1 / VPN-1
- NetScreen: NetScreen SecurityAppliances
- Nokia: IP-Series SecurityAppliances
- SonicWALL: SonicWALL Security Appliances
- WatchGuard Technologies: Firebox-series and V-series Security Appliances

Cisco IOS Firewall

The Cisco IOS Firewall enriches Cisco IOS Software security capabilities, integrating robust firewall functionality and intrusion detection for every network perimeter. When combined with Cisco IOS IPSec software and other Cisco IOS Software-based technologies such as L2TP tunneling and quality of service (QoS), it provides a complete, integrated virtual private network solution. Because it is available for a wide range of Cisco routers, it gives customers the flexibility to choose a solution that meets their bandwidth, LAN/WAN density, and multiservice requirements, while benefiting from advanced security.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco IOS Firewall	• An integrated firewall solution with powerful security and multiprotocol routing al on the same platform • Scalability options from the Cisco 800 up to the Cisco7500 and the Catalyst 6000 • Low cost solution where high performance is not a requirement • For secure extranet and intranet perimeters and Internet connectivity for branch and remote offices • Secure remote access or data transfer via a Cisco IOS Software-based VPN solution • Real-time (inline) integrated intrusion detection system (IDS) to complement firewall or existing IDS (Cisco Secure IDS) • Security and access to the network on a per-user basis

Key Features

- Context-based access control (CBAC) provides secure, stateful, application-based filtering, supporting the latest protocols and advanced applications
- Intrusion detection for real-time inline monitoring, interception, and response to network misuse
- Dynamic, per-user authentication/authorization for LAN, WAN, and VPN clients
- Graphical configuration and management via the ConfigMaker Security Wizard and Cisco Secure Policy Manager (CSPM)
- Provides strong perimeter security for a complete Cisco IOS Software-based VPN solution, including IPSec, QoS, and tunnelling for a wide range of Cisco routers

Competitive Products

- Lucent (Ascend):SecureAccess Firewall
- Nokia: IP400 Series
- Nortel: BaySecure Firewall-1
- Same competitorsas PIX so theyare also Checkpoint, Linksys, Nokia, Netscreen, etc.

Specifications

Feature	Cisco IOS Firewall
Supported Network Interfaces	All network interfaces on supported platforms
Supported Platforms	Cisco 1720, 2600/2600XM, 3600, 7100, and 7200 series router platforms (supports full feature set) Cisco 800, UBR900, 1600, and 2500 series router platforms include all firewall features with exception ofintrusion detection and authenticatin proxy
Simultaneous Sessions	No maximum; dependenton platform, network connection, and traffic

Part Numbers and Ordering Information

Cisco VPN 3000 Family

The Cisco VPN 3000 Concentrator Series—A family of purpose-built, remote access Virtual Private Network (VPN) platforms that incorporates high availability, high performance and scalability with the most advanced encryption and authentication techniques available today. Customers can greatly reduce costs by leveraging their ISPs' infrastructure and eliminate costly leased lines. This series supports small offices as well as large organizations with up to 10,000 simultaneous remote users per unit. With load balancing configured, multiple units can be clustered to enable unlimited remote access users. It also supports the widest range of VPN clients including Certicom MovianVPN client, Microsoft 2000 L2TP/IPsec Client, and Microsoft PPTP for Windows 95/98/ME/NT/2000/XP.

The Cisco VPN 3002 Hardware Client—Combines the best capabilities of a software client with the reliability and stability of a dedicated hardware platform, and scales to tens of thousands of users. It sets up connections to a variety of Cisco VPN concentrators, including the VPN 3000 series and PIX firewalls.

When to Sell

Sell This Product	When a Customer Needs These Features
VPN 3005 and 3015 Concentrators	• A fixed configuration device designed for small- to medium-sized organizations with bandwidth requirements up to full-duplex T1/E1 (4 Mbps maximum performance) and up to 100 simultaneous remote access sessions • Encryption processing is performed in software • VPN 3015 is field-upgradable to the Cisco VPN 3030 and 3060 models and for redundancy
VPN 3030 and 3060 Concentrators	• VPN 3030 is for medium- to large-sized organizations with bandwidth requirements from full T1/E1 through T3/E3 (50 Mbps max. performance) and up to 1500 simultaneous sessions; field-upgradeable to the Cisco VPN 3060 • VPN 3060 is for large organizations, with high-perfomance, high-bandwidth requirements from fractional T3 through full T3/E3 or greater (100 Mbps max. performance) and up to 5000 simultaneous remote access sessions • Both have specialized SEP modules to perform hardware-based acceleration
VPN 3080 Concentrator	• Optimized to support large enterprise organizations that demand the highest level of performance combined with support for up to 10,000 simultaneous remote access sessions • Specialized SEP modules perform hardware-based acceleration
VPN 3000 Client	• Establishes secure, end-to-end encrypted tunnels to the Cisco VPN 3000 Concentrator and other Cisco Easy VPN compliant devices. • Provided at no charge, installs on PCs and is available for Windows, MAC OS X and Linux/Solaris environments
VPN 3002 Hardware Client	• Emulates the software client in hardware • Ideal for mixed operating system environments and where corporation does not own/control remote PC or for very large applications requiring large number of devices due to ease of deployment, upgradability & scalability

Key Features

- Cisco VPN 3000 Concentrators Series
  - Support for industry standard IPSec DES/3DES/AES and Cisco IPSec/NAT for VPN Access through Port Address Translation firewalls
  - Unlimited-use license for Cisco VPN Client distribution included at no cost with multiple OS support including Windows, MAC OS X, Linux and Solaris; also integrates with Zone Alarms personal firewall
  - Supports standard authentication: RADIUS, SDI Tokens, and Digital Certificates
  - VPN load balancing allows for multiple units to cluster as a single shared pool
- Cisco VPN 3002 Hardware Client supports up to 253 users/stations per VPN 3002
  - Works with most operating systems including Windows, Linux, Solaris, and MAC OS X
  - Auto-upgrade capability automates upgrades with no user intervention required
  - Client technology employs push policy and automatic address assignment from the central site concentrator, enabling virtually unlimited scalability

Competitive Products

- Nortel: Contivity products
- Netscreen: LAN to LAN environments
- Nokia

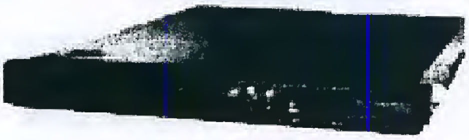
Cisco Intrusion Detection System Network Sensors



Cisco integrated network security solutions enable organizations to protect productivity gains and reduce operating costs. The Cisco Intrusion Protection is designed to efficiently protect your data and information infrastructure. Cisco delivers four four critical elements for efficient intrusion protection system which are:

- Accurate threat detection—Cisco Intrusion Detection System Version 4.0 (Cisco IDS 4.0) delivers the first step in providing a secure environment by comprehensively detecting all potential threats
- Intelligent threat investigation—Cisco Threat Response technology virtually eliminates false alarms, and automatically determines which threats need immediate attention to avoid costly intrusions.
- Ease of management—Browser-based tools simplify the user interaction, while providing powerful analytical tools that allow for a rapid and efficient response to threats.
- Flexible deployment options—A range of high-availability devices provide the flexible backbone for creating the secure and efficient intrusion protection system.

The current Cisco IDS sensing portfolio includes the following sensor appliances: IDS 4210, IDS 4235, IDS 4250, and IDS 4250-XL. Additionally, Cisco IDS delivers network protecting that is integrated into the Catalyst 6500 switch with the Intrusion Detection System Module (IDSM-2).

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco IDS Network Sensors	• Cisco network IDS appliances are network-based, real-time intrusion detection systems capable of monitoring an entire enterpise network • Performance requirements from 45 Mbps to 1 Gbps • The Cisco IDS Module enables customers to perform both security monitoring and switching functions within the same chassis • A robust, 24 hour x 7 day-a-week monitoring and response system with the latest attack detection capabilities • A distributed intrusion detection system capable of directing and forwarding alarms between local, regional, and headquarters-based monitoring consoles • A scalable architecture to allow the deployment of large numbers of sensors in order to provide comprehensive security coverage in large network environments. • An intrusion detection system designed to integrate smoothly with existing network management tools and practices • Automated false alarm reduction capabilities • Integration of fullfeatured IDS protection into the Cisco Catalyst 6500 chassis

Key Features

- High-Speed Performance including support for full line rate gigabit environments
- Easy Installation and Setup; Remote Configuration Capability
- Fault-Tolerant Communications
- Comprehensive Attack Database
- Custom User-Defined Signatures; Automatic Signature Updates
- Notification actions
- Ability to Monitor 802.1q (trunked) traffic
- Secure web-based embedded device management and event monitoring
- Comprehensive IDS Anti-Evasion Techniques
- Cisco IOS-like CLI for full featured IDS management capabilities

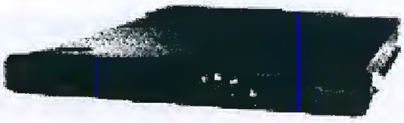
Cisco Security Agent



The next-generation Cisco Security Agent network security software provides threat protection for server and desktop computing systems, also known as "endpoints." The Cisco Security Agent goes beyond conventional host and desktop security solutions by identifying and preventing malicious behavior before it can occur, thereby removing potential known and unknown ("Day Zero") security risks that threaten enterprise networks and applications. The Cisco Security Agent aggregates and extends multiple endpoint security functions by providing host intrusion prevention, distributed firewall, malicious mobile code protection, operating system integrity assurance, and audit log consolidation all within a single agent package.

The Cisco Security Agent analyzes behavior rather than relying on signature matching, its solution provides robust protection with reduced operational costs. Customers require robust endpoint security that prevents security attacks from affecting the network and critical applications.

As a key component of the SAFE blueprint for secure e-business, the Cisco Security Agent provides unprecedented endpoint protection that enables businesses to participate in e-commerce securely and take advantage of the Internet economy.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Security Agent	• Host intrusion protection, distributed firewall, malicious mobile code protection,operating system hardening,file integrity and/or audit logconsolidation. The Cisco Security Agentprovides all of these features in one integrated package • Protection against bothknown and unknown attacks • Protection for servers and/or desktops/laptops • A solution that isscalable to protectthousands of servers and desktopsfor large enterprise deployments

Key Features

- Provides industry-leading protection for Unix and Windows servers
- Open, extensible architecture offers the capability to define and enforce security according to corporate policy

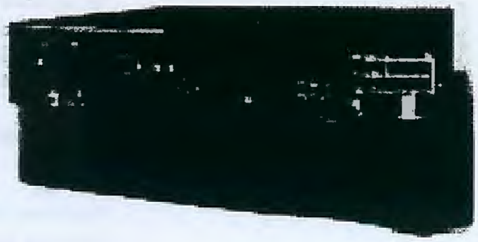
Cisco 7100 Series



The Cisco 7100 series VPN router is a high-end, integrated VPN solution that melds high-speed, industry-leading routing with a comprehensive suite of advanced site-to-site VPN services. The Cisco 7100 series VPN router integrates key features of VPNs—tunneling, data encryption, security, firewall, advanced bandwidth management, and service-level validation—to deliver self-healing, self-defending, VPN platforms that cost-effectively accommodate remote-office and extranet connectivity using public data networks. The Cisco 7100 series VPN router offers specific hardware configurations optimized for VPN applications and network topologies. Optional WAN and embedded Fast Ethernet interfaces combined with high-performance routing and rich VPN services provide turnkey VPN routing solutions.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7120	• Entry-level Cisco 7100 Series Router designed for large branch or centralsite VPN with VPN services throughput of up to 50 Mbps • Designed primarily for site-to-site VPN deployments with incidental remote access requirements
Cisco 7140	• High-end site-to-site VPN platform for central site VPN applications with VPN services throughput up to 140 Mbps • Provides superior routing and VPN services performance for central site environments, as well as dual power supplies for increased solution reliability

Key Features

- Comprehensive suite of VPN services—tunneling, data encryption, security, firewall, quality of service, and service level validation—integrated with industry leading routing
- High performance RISC processor delivering high-speed, scalable VPN services and routing throughput and extensive memory for reliable, high-speed VPN services delivery
- Dual autosensing 10/100BASE-T Fast Ethernet ports for connectivity to the corporate LAN; the Cisco 7120 Series also has an integrated 4-port T1/E1 serial WAN interface
- Integrated Services Module (ISM) is included for support up to 2000 simultaneous tunneling sessions with 90 Mbps encryption performance and Windows 95/98/NT4.0 and Windows 2000 compatibility for remote access; an optional Integrated Services Adapter (ISA) may be installed in the Cisco 7140 to provide dual encryption acceleration performance up to 3000 tunnels and 140 Mbps 3DES encryption throughput

Competitive Products

- Check Point: VPN-1 Appliance
- Nortel: Contivity 4500
- Nokia: IP440

Cisco Secure Access Control Server for Windows

Cisco Secure ACS is a highly scalable, high-performance access control server that operates as a centralized Remote Access Dial-In User Service (RADIUS) or Terminal Access Controller Access Control System (TACACS+) server system. Cisco Secure ACS controls the authentication, authorization, and accounting (AAA) of users and administrators accessing corporate resources through the network. Cisco Secure ACS greatly reduces the administrative and management burden involved in scaling user and network administrative access to your network. Cisco Secure ACS centralizes the administration of user access controls globally to ensure enforcement of assigned policies.

ACS 3.1 provides support for the latest security architecture for Wireless authentication. It also includes SSL server authentication and encryption for administrative login.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Secure Access Control Server (ACS) for Windows	• Centrally manage who can log in to the network from wired or wireless connections • Privileges each user has in the network • Accounting information recorded in terms of security audits or account billing • What access and command controls are enabled for each configuration administrator • Virtual VSA for Aironet rekey • Secure server authentication and encryption • Simplified firewall access and control through Dynamic Port Assignment • Same User AAA services

Key Features

- PEAP support—Provides a new, secure client-server authentication method for wireless networks; Provides new support for one-time token authentication, password change/aging and powerful extensibility of end-user databases such as LDAP, NDS, and ODBC.
- SSL support for administrative access—Administrative access via the Web GUI can be secured with SSL, both certificate-based and encrypted tunnel support
- CHPASS improvements—Allows privileged users control over whether network administrators can change passwords during TACACS+ AAA client-hosted Telnet sessions
- Improved IP pool addressing mechanism—Includes a new, efficient algorithm for allocating IP addresses
- Device search mechanism—Allows users to search for a configured AAA device based on the device name, IP address, type (RADIUS or TACACS+), or device group
- Improved PKI support—Provides a more secure PKI authentication scheme by verifying the user's certificate authority stored in the remote LDAP directory against the one provided by the client

- EAP proxy enhancements—Extends EAP (LEAP, PEAP, or EAP-transport layer security [TLS]) proxy to other RADIUS or external databases using standard RADIUS proxy
- Integration with Cisco's security management software applications—Provides a consolidated administrative TACACS+ control framework for many Cisco security management tools such as CiscoWorks VPN/Security Management Solution (VMS)

Competitive Products

- Funk: Steel Belted RADIUS
- Lucent/Avaya: Security Management Server(LSMS)
- Nortel: Preside RADIUS Server (OEM of Funk product)

Specifications

Feature	Cisco Secure Access Control Server (ACS) for Windows
Platform	Windows 2000 Server must meet the following minimum hardware requirements:Pentium processor, 550 MHz or faster; Minimum resolution of 256 colors at 800 x 600 lines
RAM	256 MB required; more if you are running your database onthe same machine
Disk Drive	250 MB of disk space; more if you are running yoru database onthe same machine
Software Requirements[1]	Cisco Secure ACS Server uses an English-language version of Windows 2000 Server. For specific types of service packs supported, refer to online documentation.The Windows server that runs Cisco Secure ACS must have a compatible browser installed. Cisco Secure ACS was tested with English-language versions of the following browsers on Microsoft Windows operating systems: Microsoft Internet Explorer 5.5 and 6.0, Netscape Communicator6.2
Platform Requirements	Cisco IOS Software 11.2 or higher on Cisco Routing Solutions

[1] Beginning with Cisco Secure ACS Version 3.1, Cisco Secure ACS on a Windows NT 4.0 server is no longer supported. For information about upgrading the operating system of a server running Cisco Secure ACS, see the Installation Guide for Cisco Secure ACS for Windows Server, Version 3.1

Selected Part Numbers and Ordering Information[1]

Cisco Secure Access Control Server (ACS) for Windows

CSACS-3.1-WIN-K9	Cisco Secure ACS 3.1 for Windows
CSACS-3.1-WINUP-K9	Upgrade to CSACS 3.1 for Windows from ACS versions 1.x, 2.x, 3.0 and Cisco Secure ACS for Unix version 2.x

Cisco Secure User Registration Tool

Cisco Secure URT is a virtual LAN (VLAN) assignment service that provides LAN security by actively identifying and authenticating users and then associating them only to the specific network services and resources they need through dynamic VLAN assignments to Cisco Catalyst® Switch networks. URT v2.5 introduces many innovative features, including a Web-based logon from Windows, Macintosh, and Linux clients, RADIUS and Lightweight Directory Access Protocol (LDAP) authentication, and a secure link between the client and the VLAN Policy Server (VPS). It also includes a security feature based on the Media Access Control (MAC) address that prevents users from accessing the network if they are not using authorized machines. Web based LAN authentication allows for user mobility within the LAN environment.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Secure User Registration Tool (URT)	• Web-based LAN authentication for Windows, Macintosh, and Linux client platforms—ideal for mobile users within the LAN environment • Extended security to protect user access to the logon VLAN from unregistered PCs through MAC-based security option • RADIUS authentication and accounting support • Multiple user access per port

Key Features

- Web Client Logon Interface—Supports customizable Web-based authentication for Windows, Macintosh, and Linux client platforms
- MAC-Based Security Option—Provides extended security to protect user access to the logon VLAN from unregistered PCs
- RADIUS Authentication and Accounting Support—RADIUS authentication is offered for Web logon
- Secure Link Between Cisco Secure URT Client and VPS Server—Security authentication and data encryption have been added to URT v2.5 to enable a more secure connection from the user
- LDAP Support (Active Directory and NDS directories)—Cisco Secure URT v2.5 supports Windows' Active Directory and Novell's NDS LDAP servers
- Multiple Users Per Port—Previous versions of Cisco Secure URT support only a single user logon on a single port
- Display of Windows NT Groups—The URT Administrator interface is enhanced to display the users belonging to a Windows NT group
- MAC Address Events History—With URT v2.5 MAC-address-based logon/logoff events are added as an option and reported to the history events tool

Specifications

Feature	Cisco Secure User Registration Tool (URT)
Server Requirements	Windows 2000 (SP2) server, professional, and Windows XP Professional-Min H/W (Pentium III, 512MB DRAM, 65 MB of disk space)
Browser for Web Login	Netscape version 4.79 and 6.2; IE version 5.5 (SP2) or 6.0
Client Software Requirements	Windows 98 (2ndE), Windows NT4 Workstation/Server (SP6A), Windows 2000 (SP2) Professional/server, Windows XP Professional, Windows XP Home (Web Client Only), Mac OS 10.1 (Web client only), Linux Redhat/ SuSE/ Mandrake/ VA (Web Client only)-Min H/W for Web client (Pentium II, 256MB DRAM, 65 MB of disk space), Min H/W for traditional client (Pentium II, 64MB DRAM, 1MB of disk space)
Supported Cisco Products (latest tested version)	1900 series (1912, 1924), v9.00.05; C2800 series (2822, 2828), v9.00.05; C2900XL series (2908XL, 2916XL, 2912XL, 2912LRE-XL, 2924XL, 2924LRE-XL), v12.0(5)WC3b; C2948GL3 series (2948GL3, 4232) v12.0(18)W5(22b); C2950 series, v12.1.6.EA2c; C3500XL series (3508XL, 3512XL, 3524XL, 3548XL, 3550XL), v12.0(5)WC3b; C3550 series, v12.1.8.EA1c; C4000 series (4003, 4006, 4912g), v7.1(2); C5000 series (2900, 2926, 2948, 5000, 5002, 5500, 5505, 5509), v6.3(5); C6000 series (6006, 6009, 6506, 6509, 6513), v7.1(3)

CHAPTER 6

Content Networking Products

Content Networking Products at a Glance

Product	Features	Page
Cisco Content Engine 500 Series	Content services edge delivery platform for Enterprise networks • Functions as edge node device in an Application and Content Networking (ACN) system • Responsible for delivery of cachedor distributed content to the end-user • Enables customers to rapidly deliver strategic applications to branch personnel including web application andcontent acceleration,content filtering and business video • Lays the foundation foradvanced services such as e-learning and point of sale video delivery.	6-2
Cisco Content Engine 7300 Series	Content services platform for Enterprise data centerand Service Provider networks • Offers premium hosting services • Caching capabilities optimize Web site performance and WAN bandwidth utilization • Offers transparent and Internet proxy caching, Content Filtering and ECDN capabilities in a single platform • Accelerates both HTTP and streaming media file formats	6-2
Content Engine Network Modules	Content services edge delivery network module for 2600, 3600, 3700 branch routers • Functions as edge node device in an Application and Content Networking (ACN) system • Enables delivery of new applications and services via a Cisco branch router with no performance degradation of core routing services • Allows rapid delivery of strategic applications to branch personnelincluding web application and content acceleration,contentfiltering and business video	6-2
Cisco 11500 Series Content Services Switches	Next-generation intellgent platform for Web site and e-commerce optimization • Provides an intelligent, distributed architecture to scale for today's e-business infrastructure • Offers Adaptive Session Redundancy (ASR)—a new industry standard in stateful faibver • Delivers the greatest flexiblity of any content switch in its class for customizing combinations of ports, performance, andservices	6-4
Cisco LocalDirector	Integrated hardware and software solution for load balancing across servers • Allows many servers to appear as one server for high availability and easy scalability • Secure real-time embedded operating system	6-6
Cisco Content Distribution Manager 4600 Series	Content networking policy and management device • Central control over acquisition and distribution of content, including live and video on demand video, over IP networks • Intuitive web-based GUI provides integrated, easy-to-use managementover caching and content delivery functions such as multicast replication, intelligent cache bypass and bandwidth management • Roles based access control securely enables multiple administrators and content publishers across the organization	6-7
Cisco Content Router 4430	Integrated global loadbalancing solutionfor content delivery networks • Solves distributed server site selection problems • Uses HTTP (CR-4430) to redirect a client to the best site on the Internet based on network delay • Transparently redirection redirects end user requests to the end user and works with any IP application • Extremely fast site-selection algorithm is optimized for high performance Web-style transactions	6-9
Content Switching Module (CSM) for the Catalyst 6500 Series Switches	Line card for Catalyst 6500 • Balances client traffic across multiple servers within server farms • URL and Cookie-based load balancing • High-performance—200,000 new Layer 4 TCP connection setups per second	6-11
Cisco SSL Module for Catalyst 6500	• Offloads SSL encryption and decryption • Scalable performance • Stickyness	6-11

Product	Features	Page
Cisco 11000 Series Secure Content Accelerator (SCA 11000)	Appliance-based SSL solution • Offloads SSL encryption/decryption from Web servers • Supports 200 new SSL connections and 900 sustained SSL sessions per second • Interoperates withthe CSS 11000 for intelligent load balancingof SSL traffic	6-12
Cisco CTE-1400 Series Content Transformation Engine	Transforms Web and XML-based applicationsfor display and interaction on IPTelephones, PDAs, WAP Phones and other nonPC devices • Supports a broad range of end devices • Transforms existing applications • Design Studio GUI Application	6-13
Cisco DistributedDirector	Global Internet service scaling solution • Solves distributed server site selection problems. Enablesa set of distributed servers to be seen as a single virtual server • Uses DNS to redirect a client to the best site on the Internet basedon a variety of options • Configurable as authoritative Domain Name Services (DNS) cachingname server and/or HTTP Session Redirectoron a per-domain basis	6-14
Cisco GSS 4480 Global Site Selector	Global site selectionfor distributed datacenters • Delivers global load balancing for multipledata centers • Offloads Domain Named System (DNS) servers by doing DNS resolution • Scales to support hundreds ofdata centers orserver load balancers (SLBs)	6-15

Content Networking Overview

Cisco Content Networking solutions are designed to optimize the delivery of content to end users. To accomplish this, Cisco offers solutions for both data center and edge delivery with industry-leading products in both categories.

In the data center, Cisco Content Switching, or L4-7 Switching, solutions optimize any size network to dynamically enable faster responses to Web requests and decrease network bandwidth congestion. Content switching, or intelligent load balancing, insures high levels of content availability and security, and leverages investment in Cisco IP infrastructure.

Cisco's Application and Content Networking (ACN) System allows enterprises to accelerate mission critical web applications such as Siebel and SAP, block viruses and inappropriate web sites and deliver business video, while laying the foundation for advanced services such as e-learning and point of sale video delivery. For Service Providers, the Cisco ACN System represents a highly profitable, new revenue opportunity by enhancing the customer/user Web experience and significantly accelerating the delivery of rich Web applications, content and streaming media.

Cisco Content Engines

Within Cisco's content-networking solutions portfolio, the Cisco Application and Content Networking System (ACNS) Software enables a variety of services that optimize delivery of Web applications and content from the network edge to ensure enhanced speed, availability, and performance for users. ACNS Software combines the technologies of transparent caching and enterprise content-delivery network (ECDN) for accelerated delivery of Web objects, files, and streaming media from a single intelligent edge appliance, the Cisco Content Engine (CE).

The Cisco ECDN solution provides a platform that delivers immediate benefits from entry-level applications such as content and business application acceleration and URL filtering, while laying the foundation for advanced services such as business video and e-learning.

When to Sell

Sell This Product	When a Customer Needs These Features
Content Engine 7325	• Ultra high-end contentdelivery capabilities for advanced applications such as streaming media, e-learning, and corporate communications
Content Engine 7305	• High-end contentdelivery capabilitiesfor advanced applications such as streaming media, e-learning, and corporate communications
Content Engine 565	• Mid-range branch office and datacenter cache ideal for transparent caching, URL fitering, and edge content delivery
Content Engine 510	• Entry-level transparent caching and URL filtering capabilities along with limited contentdelivery
Content Engine Network Modules	• Router-integrated cachingand content delivery network modules for 2600, 3600, 3700 branch access routers

Key Features

- Caching—Provides accelerated content delivery, WAN bandwidth cost savings, and protection vs. uncontrollable bottlenecks
- Content Filtering—Enables administrators to block, monitor, and report on end users' access to non-business and objectionable content (uses N2H2 Internet Filtering Protocol, Secure Computing SmartFilter, or Websense Enterprise Software)
- Content Delivery—Use in conjunction with Cisco Content Distribution Manager to enable rich media e-learning and corporate communications; deliver new premium hosting services such as on-demand content delivery and streaming media; and, to scale Web sites

Competitive Products

- Blue Coat: Blue Coat ServerAccelerator 700 and 7000 Series and Blue Coat Systems Director
- Volera: Excelerator, Media Excelerator, Secure Excelerator
- Network Appliance: NetCache C1200/2100/6100 Series Appliances and Content Director

Specifications

Feature	Cisco Content Engine 7325	Cisco Content Engine 7305	Cisco Content Engine 565	Cisco Content Engine 510	Cisco CE Network Module	Cisco SA-7 and SA-14

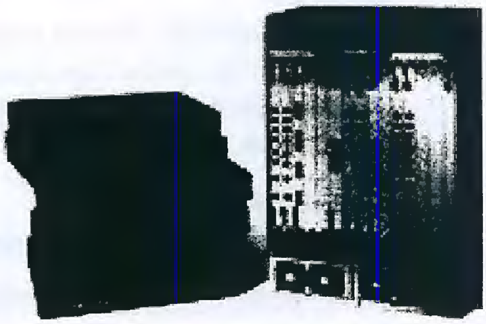
See the Cisco Content Engine Web sites: **http://www.cisco.com/go/ce500** and **http://www.cisco.com/go/ce7300**

Cisco CSS 11500 Series Content Services Switches



The Cisco CSS 11500 Series Content Services Switch is suitable for both enterprises and service providers seeking to reduce data center costs, boost e-business application performance, offer enhanced services, ensure online transaction integrity, and provide the best possible online experience for customers, business partners, and internal workers.

The Cisco CSS 11500 is available in three models—the standalone Cisco CSS 11501, the three-slot Cisco CSS 11503 and the six-slot Cisco CSS 11506. Both the CSS 11503 and CSS 11506 systems take advantage of the same high-performance, modular architecture and use the same set of I/O, Secure Sockets Layer (SSL), and session accelerator modules. Also, all three systems operate with the same WebNS software, enabling the Cisco CSS 11501, 11503 and 11506 to offer industry-leading content switching functionality within three compact, hardware platforms.

When to Sell

Sell This Product	When a Customer Needs These Features
CSS 11501	• Standalone, fixed-configurationswitching platformwith up to 8 Fast Ethernet ports and 1 optional Gigabit Ethernet port • Cost-effective server, cache, and firewall load balancing • Complex Web applications requiring high-level URL and cookie switching
CSS 11503	• Compact, high-performance, modular content switching platform with up to 32 Fast Ethemet ports or up to six Gigabit Ethernet pots • Cost-effective server, cache, and firewall load balancing • Integrated SSL capabilities for secure transactions • Complex Web applications requiring high-level URL and cookie switching
CSS 11506	• Compact, high-performance, modular content switching platform with up to 32 Fast Ethemet ports or up to six Gigabit Ethernet pots • Cost-effective server, cache, and firewall load balancing • Integrated SSL capabilities for secure transactions • Complex Web applications requiring high-level URL and cookie switching

Key Features

- Introduces an intelligent, distributed architecture to meet the real-world scaling requirements of today's e-business infrastructure
- Improves site availability and transaction integrity by introducing Adaptive Session Redundancy (ASR)—a new industry standard in stateful failover
- Delivers the greatest flexibility of any content switch in its class for customizing combinations of ports, performance, and services
- Scales secured transaction performance through support of an integrated, high-capacity Secure Sockets Layer (SSL) module (WebNS 5.20)
- Protects investment by enabling upgrades of performance, ports, and services through modularity

Competitive Products

- Alteon/Nortel: ACEdirector and 700 Series
- F5 Networks: Big/IP and LAN switch Partners
- Foundry Networks: ServerIron
- Radware: Web Server Director (WSD)
- Resonate: Central Dispatch and GlobalDispatch

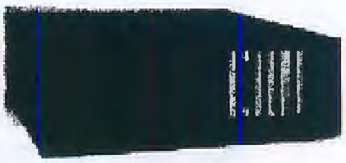
Cisco LocalDirector



The Cisco Local Director Series offers a high-availability, integrated hardware and software solution that intelligently balances the load of user traffic across multiple TCP/IP application servers. Cisco Local Director tracks network sessions and server load conditions in real time, directing each session to the most appropriate server. All physical servers appear as one virtual server, requiring only a single IP address and a single URL for an entire server farm.

A key component of a content delivery network, Cisco Local Director accelerates content delivery by routing client requests to the best Web server at the Web site of origin. Cisco Local Director supports critical content routing protocols such as Dynamic Feedback Protocol (DFP) and the Boomerang Control Protocol (BCP), which ensure seamless content delivery network integration and reduced deployment costs. Layer 4-7 content load balancing guarantees that the correct client is routed to an optimized content location. The accelerated server load balancing (ASLB) feature works with the Cisco Catalyst 6000 and 6500 Series switches to accelerate scaling of TCP sessions and help to protect against Flash crowds—sudden traffic surges that can overwhelm a web site.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco LocalDirector	• Load balancing acros multiple TCP/IP application severs • High availability Internet services such as e-commerce, Web content, ande-mail • High availability Intranet services for employees, customers, and suppliers

Key Features

- HTTP redirect sticky enables client-to-server persistence, regardless of SSL and shopping-cart configurations, to improve site availability
- Hot-standby and stateful failover mechanisms ensures high availability by eliminating all points of failure for the data center
- Transparent support for all common TCP/IP Internet services, including User Datagram Protocol (UDP), accommodates a wide range of applications and communications needs (Web, File Transfer Protocol [FTP], Telnet, Domain Name System [DNS], and Simple Mail Transfer Protocol [SMTP]) without special software configuration
- SSL and cookie sticky ensures completion of complex transactions in proxy server environments
- Client-assigned load balancing provides QoS mechanism by allowing traffic to be directed to servers based on source IP address
- High-performance hardware supports six Fast Ethernet (Cisco Local Director 417) or two Fast Ethernet plus two Gigabit Ethernet (Cisco Local Director 417G) interfaces
- Network Address Translation (NAT) allows unregistered IP addresses on servers without router assistance

- Simple setup in 10 commands offers simple setup for typical configurations, with little disruption to existing network configuration and no changes to network addresses
- Integrated security capability effectively protects server farms from unauthorized access by filtering based on client IP address and service

Competitive Products

- F5 Labs: Big IP
- Foundry Networks: ServerIron Switch
- Nortel Networks/Alteon: Ace Director
- Radware: Web Server Director
- Resonate, Inc.:Central Dispatch

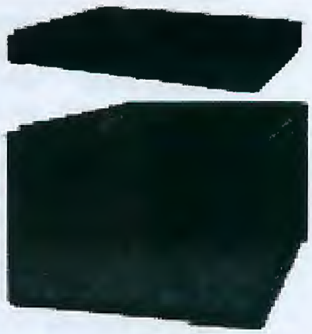
Cisco Content Distribution Manager 4600 Series



The Cisco Content Distribution Manager (CDM) configures network and device policy settings for edge node Content Engines (CE). Used to accelerate web content and save network bandwidth in a content networking architecture, the CDM can be easily integrated into existing network infrastructures. Deployed in an Enterprise or Service Provider Internet or extranet environment, the Cisco CDM and CEs provide transparent on-demand rich media streaming and static file delivery to standard PCs.

Cisco Enterprise Content Delivery Networks (ECDNs) allow service providers and enterprises to distribute rich media content closer to their target customers overcoming issues such as network bandwidth availability, distance or latency obstacles, origin server scalability, and congestion issues during peak usage periods. The ECDN solution enables content delivery services for web hosting, streaming, e-commerce, e-learning, corporate communications, and mission critical e-business applications.

When to Sell

Sell This Product	When a Customer Needs These Features
CDM 4630	• Low-cost early deployment, or small enterprise network trials, proof of concept, and pilot programs
CDM 4650	• Medium and large enterprise networks, supports up to 1000 Cisco Content Engines
CDM 4670	• Service provider deployment, supports thousands of Cisco Content Engines

Key Features

- Complete CDN solution with Cisco Content Router and Cisco Content Engines
- Central control over delivery of high-bandwidth content, live and video-on-demand over any IP network
- Easy-to-use management capabilities through a Web-based GUI; services include previewing and scheduling replication of media to edge devices, bandwidth and content management
- Automatically generates thumbnail reference images and sample Web pages for integration with corporate extranet, intranet, and Internet sites
- One URL per media file provides seamless integration into any Web site
- Integrates with standards for Web multimedia presentation, including HTML/DHTML, eXtensible Markup Language (XML) and SMIL
- Secure and fault-tolerant file transfer using Secure Socket Layer (SSL) encryption for secure media transfers
- Channel configuration for media distribution to any number of discrete audiences using "distribution lists"
- Host content for a variety of customers within a single CDN
- Ability to create multiple virtual CDNs addressing targeted media distribution
- Content registration in cache logs for billing capabilities

Cisco Content Router 4430

The Cisco Content Router 4430 (CR 4430) is a compact, high-performance solution for enabling premium Web services over public or private networks. Featuring either Cisco Enterprise Content-Delivery Network (ECDN) or Content Router 1.1 Software, customers can transparently route user Web browsers to the optimal content engine for file delivery.

With its patented routing technology, the Cisco CR 4430 provides redundancy, scalability, and performance enhancements for network Web sites in either an enterprise or public service provider network. Using Hypertext Transfer Protocol (HTTP)-based re-direction, the Cisco CR 4430 can redirect users over the public network or behind the security of a corporate firewall, making it a vital component of the Cisco end-to-end Content Networking Solution.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Content Router 4430	• When a customer needs to support a Cisco Enterprise Content Delivery Network with HTTP redirection • Supports resiliency for ECDNs when used with a Cisco CSS 11500 content services switch • Up to five Cisco CR 4430s can be deployed in an ECDN network to provide greater network availability and performance

Key Features

- Uses HTTP to redirect a client to the best site on the Internet based on network delay
- Transparent redirection to the end user and works with any IP application
- Easy configuration through a Cisco IOS-style command-line interface
- Redundant configurations, multiple CRs can be deployed at the origin site to provide fail-over and load scaling

Specifications

Feature	Cisco Content Router CR4430
Network Interface Card	10/100BASE-TX
Processor	600- MHz PIII
RAM	1 GB
Internal Storage	18 GB
Rack Units	1
Dimensions (HxWXD)	1.72 x 17.50 x 14.13 in.
Weight	12.5 lbs.

Cisco Content Switching Module

The Cisco Content Switching Module (CSM) is a Catalyst 6500 line card that balances client traffic to farms of servers, firewalls, SSL devices, or VPN termination devices. The CSM provides a high-performance, cost-effective load balancing solution for enterprise and Internet Service Provider (ISP) networks. The CSM meets the demands of high-speed Content Delivery Networks, tracking network sessions and server load conditions in real time and directing each session to the most appropriate server. Fault tolerant CSM configurations maintain full state information and provide true hitless failover required for mission-critical functions.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Content Switching Module	• An integrated bad balancing solution featuring Cisco's Catalyst 6500 • Load balancing for the highes traffic sights • Support for up to 1,000,000 concurrent TCP connections

Key Features

- Market-leading performance—Establishes up to 200,000 Layer 4 connections per second and provides high-speed content switching, while maintaining 1 million concurrent connections
- Outstanding price/performance value for large data centers and ISPs—Features a low connection cost and occupies a small footprint. The CSM slides into a slot in a new or existing Catalyst 6500 and enables all ports in the Catalyst 6500 for layer 4 through layer 7 content switching. Multiple CSMs can be installed in the same Catalyst 6500
- Uses the same Cisco IOS Command Line Interface (CLI) that is used to configure the Catalyst 6500 Switch

Competitive Products

- Alteon/Nortel: ACEdirector and 700 Series
- Radware: Web Server Director (WSD)
- F5 Networks: Big/IP and LAN switch Partners
- Foundry Networks: ServerIron
- Resonate: Central Dispatch and GlobalDispatch

Specifications

Feature	Cisco Content Switching Module (CSM)
Configuration Limits	256 total VLANs (client and server); 4000 virtual servers; 4000 server farms; 16,000 real servers; 4000 probes; 16,000 access control list (ACL0 items
Connections	1,000,000 concurrent TCP connections 200,000 connection setups per second-Layer 4
Throughput	4 Gigabits-per-second total combined (client-to-server and server-to-client) throughput
Catalyst Switch Platform Requirements	Cisco IOS Software only—Catalyst Operating System is not supported Functions as a bus enabled line card—not fabic enabled Multilayer switch feature card-MSFC or MSFC2

Cisco SSL Module for Catalyst 6500

The SSL Services Module is an integrated service module for the Cisco Catalyst® 6500 Series that offloads the processor-intensive tasks related to securing traffic with Secure Sockets Layer (SSL) and increases the number of secure connections supported by a Web site.

When to Sell

Sell This Product	When a Customer Needs These Features
SSL Module for Catalyst 6500	• An integrated SSL encryption/decryption solutionfeaturing Cisco's Catalyst 6500 • Scalable SSL processing: 2,500 connectionsetups/second permodule-10,000 per Chassis fully-populated with SSL modules

Key Features

- Server SSL offload—performs all SSL-related tasks, allowing servers to handle high-speed clear text traffic
- Scalable performance—provides a simple means of addressing increased performance requirements by installing additional SSL modules in a Catalyst 6500 switch
- Stickyness—maintains persistence even when clients request new session IDs, in Integrated Mode with Content Switching Module (CSM)
- Certificate optimization—provides cost savings by requiring only a single certificate copy vs. a copy for each server subject to customer and certificate authority agreement

Competitive Products

• F5 Networks eCommerce 540	• Nortel/Alteon iSD 410 SSL Accelerator

Specifications

Feature	Cisco SSL Module for Catalyst 6500
System Capacity and Performance	2500 connection setups/sec per module-10K per chassis; 60K concurrent client connections-240K per chassis; 300 Mbps bulk rate encryption-1.2 Gbps per chassis; 256 key pairs; 256 key certificates; Up to 2K key sizes,256 proxy servers
Scalability	Up to four SSL modules in the same Catalyst 6500
Integration with Server Load Balancing	Tightly integrated in the Cisco Catalyst 6500 Switch with the CSM

Cisco 11000 Series Secure Content Accelerator (SCA 11000)

The Cisco 11000 Series Secure Content Accelerator (SCA 11000) is an appliance-based solution that increases the number of secure connections supported by a Web site by offloading the processor-intensive tasks related to securing traffic with SSL. Available in two versions, the SCA 11000 simplifies security management and allows Web servers to process more requests for content and handle more e-transactions.

Key Features

- Offloads all encryption, decryption, and secure process for a Web site, freeing Web servers to perform essential Web tasks and eliminating the need for SSL server software
- Boosts e-commerce site performance up to 50 times through dedicated SSL processing hardware—supports 200 or 800 new SSL connections per second
- Centralizes and manages the widest range of digital certificates to ensure complete independence from the Web server
- Provides linear scalability and fault tolerance—interoperates with the Cisco 11500 series Content Services Switches (CSS 11500) for intelligent load balancing of SSL traffic
- Works with any Web server platform to provide SSL support for any Web site
- Installs quickly and easily with very low maintenance—no special software required on Web servers or Cisco 11500 series switches

Specifications

Cisco CTE-1400 Series Content Transformation Engine

The Cisco CTE 1400 Series Content Transformation Engine provides customers with a high-performance, appliance-based solution that delivers real business applications and Internet content to a variety of devices including Wireless Application Protocol (WAP) phones, personal digital assistants (PDAs), Blackberry pagers, Cisco IP Phones and other non PC devices. Examples of applications that can be transformed include e-mail, CRM/SFA applications, intranets, maps, directions, and corporate directories as well as many vertical applications in healthcare, retail, finance, hospitality and education. The Content Transformation Engine (CTE) is a 1 Rack Unit appliance optimized to perform the task of converting HTML and XML applications to a format appropriate for devices with unique display requirements. In addition, the solution recognizes specific Web-enabled devices such as IP Phones, PDAs and mobile phones, and customizes the delivery of information to give users the right form of data, to suit their devices characteristics, capability as well as the usage model.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco CTE-1400 Series Content Transformation Engine	• Quickly and easily transform applicationsto extend them to a variety of new devices. • Low total cost of ownership (TCO) • Immediate results for a rapid return on investment • Self-contained applianceoptimized for transformation

Key Features

- Self-contained appliance for content transformation; includes DesignStudio for defining transformation rules
- Seamlessly transforms content as it moves from server to the target device, leaving the server and underlying data unchanged; Reformats data into all major Markup Languages
- Supports Cisco's AVVID architecture, including transformation for Cisco IP telephony
- Low total cost of ownership

Specifications

Feature	Cisco CTE-1400 Series Content Transformation Engine
Rack Units	1
Dimensions (HxWxD)	1.70 x 16.7 x 22in.
Weight	23 lbs

Cisco DistributedDirector[1]

DistributedDirector provides dynamic, transparent, and scalable Internet traffic load distribution between multiple geographically-dispersed servers. DistributedDirector is a global Internet service-scaling solution that utilizes Cisco IOS software and leverages routing table information, delay characteristics, and other information to make "network intelligent" load distribution and site selection decisions.

DistributedDirector transparently redirects end-user service requests to the closest responsive server, which increases access performance and reduces transmission costs. Users need only a single subdomain name or URL-embedded hostname for accessing a distributed set of servers, thus providing the appearance of a single virtual server.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Distributed Director	• Load distribution across geographically/topologically dispersed TCP/IP servers • High availability for dispersed mission-critical applications • Data center redundancy and failover

Key Features

- Transparent distribution of all IP Services (TCP and UDP), including HTTP, FTP, Telnet, and Gopher; provides global scalability for all IP-based network services
- Improves access performance by redirecting to the topologically closest server
- Calculates client-to-server round-trip times in real time; redirects clients to server with lowest client-to-server link latency, maximizing end-to-end performance
- Redirects clients only to responsive servers, resulting in maximized availability
- Cisco IOS Software & standard command line interface for device configuration
- Transparently add and remove distributed servers, simplifying maintenance
- Supports multiple domains; cost-effective IP service scalability solution

Competitive Products

- Alteon Networks: ACEdirector and Web Switches with WebOS GLSB
- F5 Labs: 3DNS
- Foundry Networks: ServerIron Switch with Internet IronWare
- Resonate, Inc.:Global Dispatch
- RND Networks, Inc.: Web Server Director - Network Proximity (WSD-NP)

For More Information

See the DistributedDirector Web site at **http://www.cisco.com/go/dd**

[1] **DistributedDirector is available in Cisco IOS software for 2600/2600XM, 3600, and 7200 series routers, starting on release 12.2(4)T Enterprise Plus feature sets; Dedicated routers may be recommended for DistributedDirector to meet performance targets of both routing and load balancing; If no dedicated hardware platform is available for running DistributedDirector, it is recommended customers use the Configurable DD Cache feature (available in 12.2(8)T) to limit the memory DistributedDirector may consume for DNS caching; To take advantage of enhanced caching capabilities, routers should be configured with additional DRAM (128MB or more)**

Cisco GSS 4480 Global Site Selector

The Cisco GSS 4480 is a networking product that globally load balances distributed data centers. The Cisco GSS 4480 acts as the cornerstone of multisite disaster recovery plans in deployments of Cisco's market-leading content switches. Customers deploying new Cisco content switches such as the Cisco CSS 11500 Content Services Switch and the Content Switching Module (CSM) for the Cisco Catalyst ® 6500 Series switches or have already deployed legacy switches such as the Cisco CSS 11000 and Cisco Local Directors can benefit from the new levels of traffic management and centralized command and control provided by the Cisco GSS 4480.

Key Features
