- Provides resilient architecture critical for disaster recovery and multisite Web applications deployments
- Offers flexible heterogeneous support for all Cisco SLBs and DNS-capable networking products
- Provides centralized command and control of DNS resolution process for direct and precise control of global load-balancing process
- Offers site persistence for e-commerce applications
- Offers a unique DNS race feature-The Cisco GSS 4480 can in real time direct content consumers to the closest data center
- Supports a Web-based graphical user interface (GUI) and DNS wizard to simplify the DNS command and control

Specifications

Feature	Cisco GSS 4480
Number of Ports	Two 10/100Base TX Ports
Port Description	Network Ports: Two 10/100Base TX; Console Port
DNS requests per second	4000, dependingon configuration(~ 345 million DNS requests per day per Cisco GSS 4480; an entire system is capable of 2.7 billion DNSrequests per day)
Configuration Software OS Support	Windows NT 4.0; Red Hat Linux 5.0, 6.0, 6.1, 6.2
Network management	Console port-CLI Access to system via Telnet; Secure copy(SCP) or FTP; GUI-Secure HTTP (HTTPS) for Internet Exploer and Netscape Navigator
Storage	One 36-GB hard drive
Physical	One-rack unit size chassis; Network management serial port1 GB of RAM600-MHz PIII CPU
Dimensions	1.72 x 17.5 x 14.13 in. (43.7 x 444.5 x 358.9 cm)

CHAPTER 7

Broadband and Dial Access Products

Broadband and Dial Access Products at a Glance

Remote Dial Access—Data and Voice (VoIP)

Product[1]	Features	Page
Cisco AS5350 Series Universal Gateways	• High performance,1RU, universal gateway • Universal Port technology formultiple data, voice, and faxservices on anyport at any time • 2,4, & 8 CT1/7 CE1/PRI configurationsfor 48 to 240 channels • Supports broad range of async/ISDN/VoIP/wireless protocols • Two 10/100 Ethernet ports,two 8 Mbps serial backhaul ports • Two 8 Mbps serial backhaul ports • Cisco SS7 signaling gatewayinteroperability • Flexible, redundant backhaulmethods	7-3
Cisco AS5400 Series Universal Gateways	• High performance,2RU, universal gateway • Universal Port technology formultiple data, voice, and faxservices on anyport at any time • Two models: Cisco AS5400HPX and Cisco AS5400 • 8 to 16 CT1/CE1/PRI or 1 T3 configuration for 192 to 648 channels • Low power and high availability design • Supports a broad range of async/ISDN/VoIP/fax/wireless protocols • Cisco SS7 signaling gatewayinteroperability • Flexible, redundant backhaulmethods	7-6
Cisco AS5850 Universal Gateway	The highest density universal gatewayin the marketplace • Supportingup to 5 x CT3s, 96 T1s or 86 E1s of multiple data, voice, and fax services on any port at any time • Constant density regardless of codectype, ECAN or VAD settings • Extensive high availability features • TDM grooming capability	7-9
Remote Dial Access Network Management	Suite of network management products for configuration, troubleshooting,and maintenance of Cisco dial access and VoIP solutions	7-11
SS7 Signaling & Softswitch Products	• Cisco PGW 2200 Softswitch—Call Agent providing signaling and call controlfunctionality for PSTN Gateway and transit applicationsin international markets • Cisco BTS 10200 Softswitch—MGCP-basedsoftswitch for large-scale Voice over IP and ATM applications	7-12

[1] For Cisco 2509 and 2511 Access Servers, see page 1-14.

Broadband Cable

Product	Features	Page
Headend and Distribution Hub Equipment		
Cisco uBR7100 Series Universal Broadband Router	Entry-level, fixed-configuration CMTS and integrated outer for lower-density residential and MxU customers serviced by Tier 2/Tier 3 cable operators or ISPs. • Choice of four DOCSIS- and EuroDOCSIS-qualified, fixed-configuration modelsthat include: Cisco uBR7111, Cisco uBR7111E, Cisco uBR7114, and Cisco uBR7114E • Integrated upconverter/modulatoron the cable interface • Embedded dual 10/100 BaseT Ethernet network interface • Additional network interface with a variety of LAN and WAN options • Supports up to 1,000[1] data customers	7-13
Cisco uBR7246VXR Universal Broadband Router	• Modular, standards-based communications-grade CMTS and integrated router for high-growth broadband cable deploymentsSupports up to 8,000 subscribers and offers a large variety of LAN and WAN interface options and processors	7-15

Product	Features	Page
Cisco uBR10012 Universal Broadband Router	Highest-capacity communications-grade CMTS and integrated router on the market today that delivers the services, perfomance, scale, and carrier-class reliability large cable operators and ISPs demand • High-performance aggregationplatform that uses Parallel Express Forwarding technology • Eight cable line cards that include support for Cisco Universal Broadband Router (uBR) line cards and the Cisco 5X20 Broadband Processing Engine (BPE) • Four network interfaces that include support for 1 Gbps over Gigabit Ethernet, 622 Mbps over OC-12 Packet over SONET, and OC-48-Dynamic Packet Transport (DPT) Interface Module Set • Cisco uBR10012 supports up to 80,000[1] subscribers	7-16
Cisco RF Switch	• Exceeds PacketCable Availability Requirements • Enables a fully redundant CMTS withno single point of failure;works with the Cisco uBR7246VXR and uBR10012 • Maximizes density with more than 250 MCX-type connector	7-17
Customer Premise Equipment (CPE)		
Cisco uBR900 Series Cable Access Router	Integrated DOCSIS-based cable modem and router with hardware accelerated IPSec VPN tunneling support that includes: • Cisco uBR925 with 4 Ethernet, 1 CATV, 1 USB and 2 FXS ports that support telecommuter and small office DOCSIS-based data, VoIP, and VPN services • Cisco uBR905 with 4 Ethernet and 1 CATV port that supports DOCSIS-based data and VPN services	7-19

1. Numbers are for reference only. Actual numbers for specific systems will vary depending on network/service loading, traffic, and other parameters.

DSL (Digital Subscriber Line) Access

Product	Features	Page
DSL Access CPE[1]	Wide variety of Cisco router-based DSL CPE solutions for business-class to small office applications	7-21
Broadband Services Aggregation	• Cisco 6400 Series Router—ATM switching core, with up to 48,000 subscriber sessions per chassis • Cisco 7200 Series Router—Up to 16000 broadband sessions on a 3 RU platform, including aggregation of PPP, PPPoE, and PPPoA • Cisco 7301 Series Router—1 RU Broadband Aggregation Router that is capable of delivering up to 16000 sessions per chassis • Cisco 7400 Series Router—1 RU broadband optimized applance that delivers up to 8,000 sessions per chassis • Cisco 10000 Series Router—A carrier-class router that supportsup to 32,000 broadband sessions with 99.999 percent system uptime	7-21

1. For ADSL, ISDN, and IDSL small office/home office (SOHO) customer premise equipment (CPE), see Chapter 1: Routers

ATM Multiservice WAN Switching

Product	Features	Page
Cisco BPX 8600 Series Switches	• Large-scale AdvancedATM switch for service provider and large enterprise applications • Narrowband and broadband services in a single, highly reliable platform using a multishelf architecture with intelligent call processing for Frame Relay and ATM switched virtual circuits (SVCs) • 20 Gbps of high-throughput switching for multiple traffic types data, voice, and video	7-23
Cisco MGX 8850 Series Advanced ATM Multiservice Switches	• Multiservice switch, scales from DS0 to OC-48c/STM-16 speeds • Serves as a stand-alone device for narrowband services, an integrated edge concentrator or a broadband edge switch when equipped with 45 Gbps switch card and broadband ATM modules	7-24
Cisco MGX 8830 Series Multiservice Switches	• Multiservice switch scales from from DS0 to OC-3c/STM-1 speeds • A standalone switch with narrowband interfaces and broadband trunking to remote sites with low density and high service mix requirements with 1.2 Gbps switch fabric	7-25
Cisco IGX 8400 Series Multiservice WAN Switches	• ATM-based WAN switching, connects to public services for reduced leased-line costs • Available with 8, 16, or 32 slots	7-25
Cisco MGX 8200 Series Multiservice Gateways	• Edge concentratorsfamily provide a cost-effective narrowband multiservice solution for low to mid-band ATM and Frame Relay aggregation with QoS management features	7-25

Long Reach Ethernet

Product	Features	Page
Cisco Catalyst 2950 LRE XL Switches	Fixed configurationEthernetswitchesfor delivering converged voice, video, and data services over existing category 1/2/3 wiring for the MxU and enterpise markets. • 12- or 24-port 1RU switchesystems with four 10/100 ports, deliver Ethernet traffic (up to15 Mbps) over standard copper cabling (up to 5000 feet); idealfor MxU broadband Internet access • Co-exists with POTS and ISDN traffic on the same line and compatible with ADSL • Advanced qualityof service for supporting converged voice, video, and data services	7-26
Cisco LRE CPE Devices	• Cisco 575 LRE CPE—Compact, includes one RJ-45 Ethernet connection and two RJ-11 connectors(for telephone) • Cisco 585 LRE CPE—Compact, includesfour RJ-45 switched Ethernet connectios and two RJ-11 connectors (for telephone).Supports 802.1p QoS	7-27
Cisco LRE POTS Splitter	• Cisco LRE 48 POTS Splitter—48 ports in 1RU. Ensures that POTS service is separate, and never compromised by LRE switch reconfiguration or downtime	7-27
Cisco Broadband Building Service Maneger	• Server system enables automated onlne activation, integratedbilling, tiered service levels • Ideal for any form of broadband accesstechnology, including Ethernet, LRE, Cable access, DSL, Wireless, or Fiber	7-28

Cisco AS5350 Universal Gateway

The Cisco AS5350 Universal Gateway is the only one-rack-unit gateway supporting two-, four-, or eight-port T1/seven-port E1 configurations that provides universal port data, voice, and fax services on any port at any time. The Cisco AS5350 Universal Gateway offers high performance and high reliability in a compact, modular design. This cost-effective platform is ideally suited for Internet service providers (ISPs) and enterprise companies that require innovative universal services.

The Cisco AS5350 Universal Gateway eliminates the need for switches and routers to create a point-of-presence (POP) or "POP-in-a-box" solution. The Cisco AS5350 Universal Gateway has three primary universal gateway configurations: two Channelized T1(CT1)/Channelized E1(CE1)s, four CT1/CE1s, and eight CT1/seven CE1s . It also includes integrated signaling link termination (SLT) functionality for direct connection to a SS7/C7 signaling gateway.

The Cisco AS5350 Universal Gateway comes two high-speed serial ports are provided to support Frame Relay, Point-to-Point Protocol (PPP), and High-Level Data Link Control (HDLC) backhaul. All backhaul interfaces support Hot Standby Router Protocol (HSRP), and all cards and the fan tray are hot-swappable for carrier-class resiliency. The Cisco AS5350 Universal Gateway is the only access server in this form factor that offers universal port capability with these high-availability features.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco AS5350	• 2 to 8 channelized CT1/7 CE1/PRI compact and modular universal • High-performance modem, ISDN, and voice call termination • Universal port services (data, voice, fax)

Key Features

- 1 RU modular high-performance 2 to 8 channelized CT1/7 CE1/PRI system
- Universal Gateway—which supports multiple data, voice, and fax services on any port at any time
- Ideal for Tier 2/3 ISPs and enterprises requiring innovative universal services
- Feature cards: 2, 4, or 8 CT1/7 E1/PRI feature cards (ISDN calls terminated on the card); 60 or 108 channel Universal Port feature card
- Two 10/100BaseT autosensing Ethernet LAN ports
- Two 8 MB serial WAN ports for Frame Relay, HDLC, or PPP WAN backhaul
- Carrier Class Resiliency: All feature cards and fan tray are hot swappable, modem and voice DSP are pooled and can be configured as spares, AC internal power supply with dual fans, Redundant LAN/WAN backhaul ports, Thermal management and environmental monitoring, ETSI/NEBS Level 3 compliant
- Cisco SS7 signaling gateway interoperability

Specifications

Feature	Cisco AS5350
Processor	250 MHz RISC processor
Memory	SDRAM: 128 MB (default), 512 MB (maximum) Shared Input/output (I/O): 64 MB (default), 128 MB (maximum) Boot Flash: 8 MB (default), 16 MB (maximum) System Flash: 32 MB (default), 64 MB (maximum) Layer 3 Cache: 2 MB
Feature Card Slots	Three slots
Egress Ports	Two 10/100-MB Ethernet ports Two 8-Mbps serial ports T1/E1 DS1 trunk feature cards
LAN Protocols	IP, IPX, AppleTalk, DECNet, ARA, NetBEUI, bridging, HSRP, 802.1Q
WAN Protocols	Frame Relay, PPP, HDLC (leased line)
Routing Protocols	RIP, RIPv2, OSPF, IGRP, EIGRP, BGPv4, IS-IS, AT-EIGRP, IPX-EIGRP, Next Hop Resolution Protocol (NHRP), AppleTalk Update-Based Routing Protocol (AURP)
QoS Protocols	IP Precedence, Resource Reservation Protocol (RSVP), Weighted Fair Queuing (WFQ), Weighted Random Early Detection (WRED), Multichassis Multilink PPP (MMP) fragmentation and interleaving, 802.1P
Access Protocols	PPP, Serial Line Internet Protocol (SLIP), TCP Clear, IPXCP, ATCP, ARA, NBFCP, NetBIOS over TCP/IP, NetBEUI over PPP, protocol translation (PPP, SLIP, ARA, X.25, TCP, local-area transport [LAT], Telnet), and Xremote
Bandwidth Optimization	Multilink PPP (MP), MLP, TCP/IP header compression, Bandwidth Allocation Control Protocol (BACP), bandwidth on demand, nonfacility-associated signaling (NFAS), traffic shaping
Voice Compression	G.711, G.723.1, (5.3K and 6.3K), G.726, G.729ab, G.Clear, GSM-FR
DSP Voice Features	Echo cancellation, programmable up to 128 ms Transparent transcoding between A-law and mu-law encoding Voice activity detection, silence suppression, comfort noise generation Fixed and adaptive jitter buffering Call progress tone detection and generation - Dial tone, busy, ring-back, congestion, and re-order tones with local country variants DTMF, Multifrequency (MF) Continuity Testing (COT)

Feature	Cisco AS5350
Voice and Fax Signaling Protocols	H.323v2, H.323/v3, H.323v4, SIP, MGCP 1.0, TGCP 1.0, Voice Extensible Markup Language (VoiceXML) Real-Time Streaming Protocol (RTSP), Extended Simple Mail Transfer Protocol (ESMTP) T.38 real-time fax relay T.37 fax store and forward Fax detection Fax and modem passthrough Open Settlements Protocol (OSP) Media Recording Control Protocol (MRCP) Text to Speech (TTS) Servers Automatic Speech Recognition (ASR) Servers
SS7	Integrated SLT functionality
Network Security	RADIUS or TACACS+ PAP or CHAP authentication Local user/password database DNIS, CLID, call-type preauthentication Inbound/outbound traffic filtering(including IP, IPX, AppleTalk, bridged traffic) Network Address Translation (NAT) Dynamic access lists SNMPv2, SNMPv3
Virtual Private Networking	IP Security (IPSec) Policy enforcement (RADIUS or TACACS+) L2TP, Layer 2 Forwarding (L2F), and generic routing encapsulation (GRE) tunnels Firewall security and intrusion detection QoS features (committed access rate [CAR], Random Early Detection [RED], IP Precedence, policy-based routing)
Channelized T1	Robbed-bit signaling; Loop Start, Immediate Start, and Wink Start Protocols
Channelized E1	CAS, PRI, E1 R1, E1 R2, leased line, Frame Relay, G.703, G.704
ISDN Protocols Supported	Sync mode PPP, V.120, V.110 at rates up to 38400 bps Network- and User-side ISDN NFAS with backup D-channel QSIG, Feature Group B, Feature Group D DoVBS
Modem Protocols Supported	V.90 or V.92 standard supporting rates of 56000 to 28000 in 1333 bps increments V.92 Modem on Hold V.44 Compression Fax out (transmission) Group 3, standards EIA 2388 Class 2 and EIA 592 Class 2.0, at modulations V.33, V.17, V.29, V.27ter, and V.21 K56Flex at 56000 to 32000 in 2000 -bps increments ITU-T V.34 Annex 12 at 33600 and 31200 bps and many others
Wireless Protocols Supported	V.110, V.120
Full Cisco IOS Support	IP Plus and Enterprise Plus feature sets
Console and Auxiliary Ports	Asynchronous serial (RJ-45)
Chassis	Dimensions (H x W x D): 1.75 x 17.5 x 20.5 in. Weight (fully loaded): 22 lbs. (10 kg)

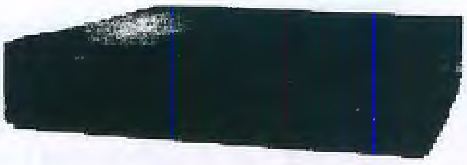
Cisco AS5400 Series Universal Gateways



Cisco AS5400 Series Universal Gateways offer unparalleled capacity in only two rack units (2RUs) and provides universal port data, voice and fax services on any port at any time. High-density (up to 1 CT3), low power consumption (7.2A at 48 VDC per CT3), and universal port digital signal processors (DSPs) make Cisco AS5400 Series Universal Gateways ideal for many network deployment architectures, especially colocation environments and mega points of presence (POPs).

The Cisco AS5400 Series consists of two models, the Cisco AS5400 and the Cisco AS5400HPX. The gateways share the same architecture; the primary difference is the processing capability of the two platforms. The Cisco AS5400 offers unparalled dial capacity and scalability for MLPPP, L2TP, and V.120 sessions, whereas the Cisco AS5400HPX provides enhanced performance for processor intensive voice and fax applications.

Cisco AS5400 Series support a wide range of IP-based value-added services such as high-volume Internet access, regional/branch-office connectivity, corporate virtual private networks (VPNs), mobile wireless solutions, long distance for Internet service providers (ISPs), international wholesale long distance, distributed prepaid calling, Signaling System 7 (SS7) interconnect, and enhanced voice services.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco AS5400HPX	• High densityin a small footprint (16 CT1/CE1 or 1 CT3) • Universal port services (data, voice, fax) • Enhanced performance for processor intensive voice and fax applications • Compact form factor—easy to add capacity as the network grows • Low power per port • High performance async/ISDN/VoIP/wireless • T.38 real-time fax relay, T.37 fax store and forward, fax detection,unified communications • Flexible redundant backhaulmethods
Cisco AS5400	• Async/ISDN/Wireless data to 1 CT3 • Universal port services (data, voice, fax) or voice only services to 16 CT1/CE1

Key Features

- The Industry's only 2RU, CT3-capable universal gateway on the market with hot-swappable cards, internal redundant power supply
- Universal Gateway which provides universal port data, voice, and fax services on any port at any time
- Feature cards: 8 or 16 CT1/CE1 feature cards; 60 or 108 channel Universal Port feature card; All feature cards and fan trays are hot-swappable
- Redundant 10/100 Ethernet ports and redundant 8 Mbps serial backhaul ports for Frame Relay, HDLC or PPP WAN Backhaul
- One fast console port for local administrative access; one auxiliary port for remote administrative access
- Redundant LAN/WAN backhaul ports
- ETSI/NEBS Level 3 compliant
- AC or DC power supply with dual fans
- Cisco SS7 signaling gateway interoperability

Channelized T1	Robbed-bit signaling; loop start, immediate start, and wink start protocols
Channelized E1	CAS, E1 R1, E1 R2, leased line, Frame Relay, G.703, G. 704
ISDN Protocols Supported	Sync mode PPP, V.120, V.110 at rates up to 38400 bps Network- and User-side ISDN DoVBS QSIG NFAS with backup D-channel
Modem Protocols Supported	V.90 or V.92 standard supporting rates of 56000 to 28000 in 1333 bps increments V.92 Modem on Hold, Quick Connect V.44 Compression Fax out (transmission) Group 3, standards EIA 2388 Class 2 and EIA 592 Class 2.0, at modulations V.33, V.17, V.29, V.27ter, and V.21 K56Flex at 56000 to 32000 in 2000 bps increments ITU-T V.34 Annex 12 at 33600 and 31200 bps and many others
Wireless Protocol	V.110, V.120
Full Cisco IOS Support	IP Plus and Enterprise Plus feature sets
Console and Auxiliary Ports	Asynchronous serial (RJ-45)
Chassis Dimensions (H x W x D)	3.5 x 17.5 x 18.25 in.
Chassis Weight (fully loaded)	35 lb maximum (15.8 kg)

Cisco AS5850 Universal Gateway

The Cisco AS5850 Universal Gateway is a high-density, carrier-class gateway, offering unparalleled capacity and high availability. The Cisco AS5850 is specifically designed to meet the demands of large, innovative service providers, supporting up to five channelized T3s (CT3s), 96 T1s or 86 E1s of data, voice, and fax services on any port at any time. It offers high availability features such as hot-swap on all cards, load-sharing and redundant hot-swappable power supplies, redundant route processing cards and call admission control to ensure 99.999-percent availability.

The Cisco AS5850 supports a wide range of IP-based value-added services such as high-volume Internet access, corporate virtual private networks (VPNs), long distance for Internet service providers (ISPs), international wholesale long distance, distributed prepaid calling, Signaling System 7 (SS7) interconnect, and managed voice services such as hosted IP telephony, managed IP-PBX, multiservice VPNs, and IP contact centers.

Using the rich set of Cisco IOS Software features and Signaling System 7 (SS7) interconnection, service providers can quickly provision their network for new services to meet the rapidly changing demands of the communications provider marketplace.

As a highly flexible voice gateway, the Cisco AS5850 supports any coder-decoder (CODEC) at 100-percent capacity simplifying network engineering. An open programmable architecture streamlines rapid voice service creation with H.323, Session Initiation Protocol (SIP) or Media Gateway Control Protocol (MGCP).

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco AS5850	• Supportingup to 5 x CT3s, 96 T1s or 86 E1s of multiple data, voice, and fax services on any port at any time • Service provider or IP-focused installations • Highly available single system with multiple redundancy • Wholesale dial/voice, retail dial/voice, TDM grooming or wireless applications

Key Features

- High scalability—up to 3360 ports in a 14 RU chassis and provides for 6 times growth in same chassis
- Hot-swap redundant power supplies and power feeds
- Redundant DSPs and RSC
- Thermal/Power management and redundant fans
- DSP Resource Recovery Feature
- Supports H.323v2, H.323v3, H.323v4, SIP and MGCP 1.0
- Application-specific support including AOL and Prodigy traffic
- WAN optimization including routing filters, snapshot routine, dial-on-demand routing ASAP
- ETSI/NEBS Level 3 compliant
- Cisco SS7 signaling gateway interoperability

Competitive Products

- 3Com: TC 2000
- Lucent: APX 8000
- Siemens: HiPath Series
- Alcatel: 7505 Series

Specifications

Feature	Cisco AS5850
Slots	12 feature boardslots 2 RSC slots
Processor Type	266 MHz RISC processor plus 2MB of L3 cache SDRAM
RSC Switch Fabric	5 GBps, Layer 3 / 4 switching
Memory	512 MB SDRAM with ECC per RSC 128 MB SDRAM (with parity) perfeature card
Trunk Cards	Single CT3 plus216 DSP Channelfeature card 24 CE1/CT1 feature card G.703, G.704
Universal Port Card	324 Channel DSP-feature card
Egress Ports	Dual Gigabit load-balanced redundant Ethernetports with GBIC interfaces for user traffic One 10/100-Mbps Ethernet port with RJ45 connector for managementtraffic
LAN Protocols	IP
Service Support	Port Policy Management andSS7/C7
Routing Protocols	RIP, RIPv2, OSPF, IGRP, EIGRP, BGPv4, IS-IS, Next Hop Resolution Protocol(NHRP)
Access Protocols	PPP, Serial Line Iternet Protocol (SLIP), TCP Clear
Bandwidth Optimization	Multilink PPP (MLPPP), TCP/IP header compression, Bandwidth Allocation Control Protocol (BACP), Bandwidth on demand, Nonfacility-associated signaling (NFAS),traffic shaping
Network Security	RADIUS or TACACS+, PAP or CHAP authentication, local user/password database,DNIS, CLID, call-type pre-authentication, Inbound/outbound traffic filtering (including IP), SNMPv2, SNMPv3
Virtual Private Networking	IP Security (IPSec) and Policy enforcement (RADIUS or TACACS+), L2TP, Layer 2 Forwarding (L2F), and generic routing encapsulation(GRE) tunnels, Firewall security andintrusion detection, IP Precedence, policy-based routing
Channelized T1	PRI, robbed-bit signaling; loop start, immediate start, and wink start protocols
Channelized E1	CAS, E1 R2, PRI
ISDN Protocols	Sync mode PPP, V. 120, V. 110 at rates up to 38400
Voice Protocols	G.711, G.723.1, , G.726, G.729ab, G.Clear, GSM-FR H.323v2, H.323v3, H.323v4, SIP, MGCP 1.0 ECAN up to 128ms T.38 real-time fax relay Fax detection Fax and modem passthrough
Modem Protocols	V.90 or V.92 standard supporting rates of 56000 to 28000 in 1333-bps increments V.44 supporting increased throughput bymore than 100 percent for Internet browsing Fax out (transmission) Group 3, standardsEIA 2388 Class 2 and EIA 592 Class 2.0, at modulationsV.33, V.17, V.29, V.27ter, and V.21 K56Flex at 56000 to 32000 in 2000-bps increments ITU-T V.34 Annex 12 at 33600 and 31200 bps and more
ISDN Protocols	Sync mode PPP, V.120, V.110 at rates up to 38400 bps
Wireless Protocol	V.110
Console and Auxiliary Ports	Asynchronous serial (RJ-45)
Chassis Dimensions (HxWxD)	24.5 x 17.5 x 24 in.
Chassis Weight	220 lb (100 kg)

Remote Dial Access Network Management Products

Universal Gateway Manager (UGM)

Network management applications and tools are critical for the successful deployment and operations of voice or data services. The Cisco Universal Gateway Manager (UGM) is an element management system for Cisco AS5000 Universal Gateways. The Cisco UGM enables network operators and administrators to efficiently deploy, manage and maintain Cisco AS5000 Universal Gateways supporting Voice over IP, managed voice, PSTN gateway, and dial access services.

Key Features

- Enables the efficient deployment and configuration of Cisco AS5000 Universal Gateways
- Monitors the operational status of Cisco AS5000 Universal Gateways and their subcomponents so that corrective action can be taken quickly
- Supports the rapid reconfiguration of Cisco AS5000 Universal Gateways for network or service changes
- Collects and presents a wide range of performance-related statistics for monitoring gateway and network efficiency
- Co-resides with Cisco MGC Node Manager (MNM) for Cisco PGW 2200 PSTN Gateway node management
- Provides interfaces to support its integration with existing network management applications

For More Information

See the Cisco Universal Gateway Manager Web site: **http://www.cisco.com/go/ugm**

Cisco Universal Gateway Call Analyzer

The Cisco Universal Gateway Call Analyzer (UGCA) tool monitors and troubleshoots Cisco AS5000 universal gateways that support dialup services. The Cisco Universal Gateway Call Analyzer complements other network management system (NMS) applications, adding call-level analysis capabilities that are not available with standard NMS applications.

Maintaining high call-success rates and quality connections are key challenges for any dial service provider. These metrics directly affect customer satisfaction and are fundamental indicators of network performance and efficiency. Numerous issues may cause service degradation, which may be rapid or may occur slowly. While public switched telephone network (PSTN) issues are frequently the source of problems, they are especially difficult to identify.

Cisco AS5000 universal gateways collect the detailed call-characteristic data needed to detect and diagnose issues that affect service. The Cisco Universal Gateway Call Analyzer is the window into this data, providing analysis and reporting features through an intuitive Web interface.

For More Information

See the Cisco Universal Gateway Call Analyzer Web site:
http://www.cisco.com/go/ugca

Cisco Resource Policy Management System

Wholesalers face a challenge when delivering service level agreements (SLAs) on a common network, especially when providing a range of services for different customers. The Cisco Resource Policy Management System (RPMS) is a software tool that provides policy management of platform resources. With Cisco RPMS, wholesalers are able to offer a variety of services to a variety of customers on a single set of gateways. Cisco RPMS offers not only effective resource management but the capability to build and deliver flexible service models that fit customers' unique requirements. Cisco RPMS can grow to support a wholesaler's changing needs, scaling as the network expands and delivering the services that customers demand, including wholesale dial, access to virtual private network (VPN) services.

SS7 Signaling & Softswitch Products

Cisco AS5x00 series products interoperate with various SS7 and Softswitch products, including the Cisco SC2200 Signaling Controller, the Cisco PGW 2200 Softswitch and the Cisco BTS 10200 Softswitch.

Cisco SC2200 Signaling Controller

Please see PGW 2200 Softswitch.

Cisco PGW 2200 Softswitch

The Cisco PGW 2200 provides the signaling and call control functionality that enables service providers (SPs) to bridge the boundary between the legacy PSTN and today's new world packet networks. Combined with Cisco's award winning media gateways, the PGW 2200 is the catalyst for PSTN Gateway solutions enabling dial offload, transit, business voice, H.323 and SIP based applications. The PGW 2200 leverages its protocol library of 90+ SS7/C7 variants to enable interconnect worldwide. In signaling mode the PGW adds SS7/C7 to the AS5X00 gateways, giving service providers around the world a proven cost-saving and reliable solution for connecting VoIP and Internet Dial Access solutions to the PSTN. SS7 signaling allows service providers to enter into new markets, optimize their networks for both voice and data traffic, and save drastically on monthly interconnect fees.

Cisco BTS 10200 Softswitch

The Cisco BTS 10200 Softswitch provides call-control intelligence for establishing, maintaining, routing, and terminating voice calls. The Cisco BTS 10200 Softswitch also serves as an interface to enhanced service and application platforms. Leveraging the power of packet networks while seamlessly operating with legacy circuit switched infrastructures, the Cisco BTS 10200 Softswitch empowers service providers and carriers to gracefully transition to packet-based technology. Implementing the Cisco BTS 10200 Softswitch ensures rapid service deployment, carrier-grade reliability, service flexibility, scalability to millions of subscribers, and cost savings through investment optimization and operational efficiencies.

See SS7 Signaling & Softswitch Products Web site:
http://www.cisco.com/en/US/products/hw/vcallcon/index.html

Additional Remote Dial Access Products

- In addition to the AS5350/AS5400/AS5850 series access gateways, the Cisco 2600/3600 series routers (see pages 1-16 and 1-22) also support dial-up, data, and voice access via network and modem modules, and voice interface cards
- For sites that require access via multiple external analog modems, the AS2509/AS2511-RJ access servers (see page 1-14) and 2600 series routers (see page 1-16) are ideal for low-density, dial applications
- For small office ISDN connectivity, see Cisco 800 series routers (see page 1-9)

Cisco uBR7100 Series Universal Broadband Router

The Cisco uBR7100 Series is a complete, compact, easy-to-use product that enables cost-effective, high-speed Internet access in the hospitality multidwelling (MDU) and multitenant (MTU) market space using the coaxial cable already in a building. The product requires exceptionally low capital investment and minimal setup time to provide online Internet access and support residential voice services. For Tier 2 or Tier 3 cable operators, it is the industry's most cost-effective, feature-rich CMTS and integrated router. The Cisco uBR7111 and Cisco uBR7114 models are CableLabs qualified to DOCSIS 1.0 specifications. The Cisco uBR7111E and Cisco uBR7114E models are tComLabs qualified to EuroDOCSIS 1.0 specifications. The Cisco uBR7111 and Cisco uBR7111E contain one downstream port and one upstream port. The Cisco uBR7114 and Cisco uBR7114E contain one downstream port and four upstream ports. All models support bidirectional or telco-return traffic.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco uBR7100 Series	• For MxU customers: the Cisco uBR7100 Series enables high-value Internet and residential voice services over a DOCSIS or EuroDOCSIS cable infrastructure • For cable operators: the Multi-tenant/dwelling Unit (MxU) market represents an untapped opportunity to expand broadbandcable service. Given the small subscriber base of a typical MxU setting, the challenge has been to deliver robust services quickly and cost-effectively for an accelerated break-even point and a quicker return on investment—enabled by the Cisco uBR7100 Series

Key Features

- Complete package that includes a combined router and CMTS with an integrated upconverter, and embedded Network Interface
- Standards-based: DOCSIS 1.0 and DOCSIS 1.1-based; EuroDOCSIS models available
- Reliable operation to ensure the system remains online
- Uses Cisco IOS Software

Specifications

Feature	Cisco uBR7111 and uBR7114	Cisco uBR7111E and uBR7114E
Memory	Flash: 48 MB; System: 128 MB	Flash: 48 MB; System: 128 MB

Cisco uBR7246VXR Universal Broadband Router

The Cisco uBR7246VXR-a member of the Cisco uBR7200 Series-combines the functionality of a CMTS with an advanced router. The Cisco uBR7246VXR provides a single, multiservice, scalable platform that gives cable companies and ISPs the ability to deliver IP data and VoIP services to DOCSIS or EuroDOCSIS-compliant cable modems and set-top boxes. The Cisco uBR7246VXR is CableLabs qualified to DOCSIS 1.1, as well as PacketCable 1.0 specifications. The product is also tComLabs qualified to EuroDOCSIS 1.1 specifications.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco uBR7246VXR	• Positioned for high-growth cable deployments • Flexible port expansion for multiservice deployment options • Supports up to 8,000 subscribers per chassis with 3.2 Gbps back plane • 4 line card slots, 2 port adapter slots, 1 I/O controller slot, 1 NPE slot, and 1 clock card slot for VoIP

Key Features

- Standards-based—Supports DOCSIS/EuroDOCSIS 1.0 and DOCSIS 1.1
- Modularity allows for customized configuration per plant characteristics for optimization of topology and network bandwidth
- Cisco IOS Software—Delivers proven stability and offers advanced features such as multiprotocol routing, tunneling, bandwidth management, QoS, guaranteed service levels, service-level monitoring and many CPE management options
- Ease of management and upgrades—Supports online insertion and removal of components to allow seamless upgrades of port adapters, line cards, and power supplies without service interruption. Provides single, centralized point of administration for remote devices

Specifications

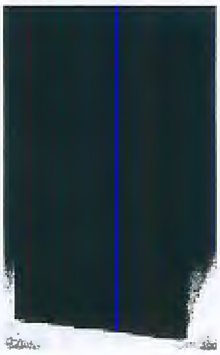
Feature	Cisco uBR7246VXR
Cable Line Cards and Number of Slots	4
Supported cable line cards (Cable Plant Interfaces)	uBR-MC14C; uBR-MC16C; uBR-MC16E; uBR-MC16S; uBR-MC28C
Port Adapter Slots (LAN/WAN interfaces)	2
Supported PA categories	Ethernet: Fast Ethemet; Gigabit Ethernet Serial (V.35, E1-G.703/G.704, T3/E3) Serial Multi-channel T1 HSSI ATM T3/E3 ((PCI-based) ATM OC-3c (PCI-based) POS OC-3c DPT OC-12c/STM4c
Power Supply Shots	2
Power Supply Option	AC; Dual AC; DC; Dual DC

Feature	Cisco uBR7246VXR
Input/Output (I/O) controller	uBR7200-I/O uBR7200-I/O-FE uBR7200-I/O-2FE/E
I/O flash options for PCMCIA slots	Flash disk (48 MB) Flash disk (128 MB)
Network processing engines (NPE)	uBR7200-NPE-G1,NPE-400, and NPE-225
Add-on processor memory options	SDRAM (128 MB, 256 MB) for NPE-225 only SDRAM (128 MB, 256 MB = 512 MB) for NPE-400 only 1 GB, 512 MB, 128 MB for uBR7200-NPE-G1
Router Bandwidth	3.2 Gbps

For More Information

See the uBR7200 Web site: **http://www.cisco.com/go/ubr7200**

Cisco uBR10012 Universal Broadband Router



The Cisco uBR10012 Universal Broadband Router is a new class of CMTS, that handles the volume, capacity, and complexity of large cable headends or distribution hubs. It combines the revenue-generating features and stability of the market-leading Cisco uBR7200 Series with an architecture that is optimized for aggregation and virtually limitless future growth. The Cisco uBR10012 goes beyond the traditional "carrier class" definition, to deliver the highest level of service availability and capacity of any production CMTS available today. It employs a mix of distributed, centralized, and parallel processing to enable consistently high, real-world performance. The Cisco uBR10012 is CableLabs qualified to DOCSIS 1.0 and DOCSIS 1.1 specifications. The product is also tComLabs qualified to EuroDOCSIS 1.0 specifications.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco uBR10012	• High-end throughput, capacity, and service handling for a mix of IP data, voice, and video services over cable—supporting a wide variety of applications, media, session types, subscriber profiles, and access devices • Support for advanced feature sets, varying QoS requirements, service-level differentiations, and transport strategies (MPEG, IP, multicast, unicast, broadcast) that include implementing flow control to various cable CPE devices

Key Features

- Highest-capacity CMTS that leverages the proven stability of the industry-standard Cisco uBR7200 Series, the highly scalable architecture of the Cisco 10000 Internet Router, and feature-rich Cisco IOS Software
- Multiservice support, optimized to provide high throughput and accelerated processing using PXF technology; exceptional throughput on each connection in the chassis is achieved
- Standards-based design, support includes DOCSIS 1.0 and DOCSIS 1.1
- Reliability—Designed to eliminate single points of failure and allow technicians to swap out cards online; architected to provide redundancy throughout the system that includes redundant processing engines, bus interconnects, and power supplies

- Secure, scalable choices protect your investment and ensure current and future business growth can be accommodated; the architecture supports planned system and network expansion, including scaling IP services forwarding capacity, increasing connection speeds and densities, and extensive route scaling techniques

Specifications

Feature	Cisco uBR10012
Modular Slots	8 slots for cable line cards 4 slots for LAN/WAN interfaces 2 slots for Performance Routing Engines(PREs) 2 slots for Timing Communication and Control Plus (TCC+) modules
Supported Cards	Cable line cards that include: CiscouBR line cards with a Cisco Line Card Processor (LCP2) and Cisco 5X20 BPE Timing, Communications, and Control Plus(TCC+) card Gigabit Ethernet (GE) netwok uplink card OC-12 Packet Over SONET (POS) networkuplink card OC-48 DPT Interface
Processor Type	Parallel Express Forwarding (PXF)
Flash Memory	48 MB (default); 128 MB (maximum)
DRAM Memory	512 DRAM (default)
Software Supported	Minimum software requirement: Cisco IOS Software Release 12.2(11)BC1 minimum for the Cisco 5X20 BPE, Cisco IOS Software Release 12.2(13)BC minimum for the Cisco OC-48 DPT Interface
Power Supply	DC, AC
Hot-Swappable	Yes
Backplane Capacity	51.2 Gbps
Physical Dimensions (H x W x D)	Height: 31.25 in. (79.4 cm)—18 rack units (RU) Width: 17.2 in. (43.7 cm) Depth: 22.75 in. (57.8) Mounting: 19 in. rack mountable (front or rear), 2 units per 7 ft. rack Note: Mounting in 23 in. racks is possible with optional third-party hardware
Weight	Weight: 235 lb (106.6 kg) fully configured chassis

For More Information

See the Cisco uBR10012 Web site: **http://www.cisco.com/go/ubr10012**

Cisco RF Switch

The Cisco RF Switch works with the Cisco uBR10002 and uBR7246VXR Universal Broadband Router to provide a fully redundant DOCSIS system that enables cable service providers to achieve PacketCable system availability, minimize service disruptions, and simplify operations. The Cisco RF Switch is part of Cisco's newest high-availability N+1 solution set. In combination with the Cisco uBR10012 and uBR7246VXR, the Cisco RF Switch enables a fully redundant CMTS with no single point of failure. The product maximizes density with more than 250 MCX-type connectors that interface the Cisco uBR10012 and the cable plant. The Cisco RF Switch contains RF combiners/splitters, RF switch logic, and RF switch drivers. The product offers ten upstream switch modules, three downstream switch modules, an Ethernet controller module, an AC or DC power supply, and color coding, preterminated cabling.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco RF Switch	As cable service providers enter the VoIP market, high availability (24x7 service) for broadband cable IP services is becoming a requirement. The Cisco RF Switch enables cable service providers to achieve PacketCable system availability, minimize service disruptions, and simplify operations.

Key Features

- Front-panel serviceability with module Hot Swap capability that eliminates downtime for RF paths
- Modular upstream and downstream capacity with ten upstream, three downstream, and one blank slot that optimizes the serviceability of the CMTS; each of the 14 modules represent a port on a cable line card. Each switch module contains seven working or "active" inputs, plus one protect or "standby" input and seven protected outputs. Inputs are connections from the Cisco uBR10012 and uBR7246VXR to the Cisco RF Switch. Outputs are connections from the Cisco RF Switch to the HFC plant
- Fully passive working path; hardware components do not affect data and VoIP services
- Active components only in protect path; servicing of protect cards offer no disruption to data and VoIP services
- Position-sensing latching relays; robust design maintains operation during power disruptions
- Flexible, external design with more than 250 connectors—unmatched port density
- N+1 redundancy

7962
A.

Specifications

Feature	Cisco RF Switch
Input Power Requirements	• AC: 100 to 240 VAC, 50 or 60 Hz, operating range: 90 to 254 VAC • DC: -48 to -60 VDC, operating range: -40.5 to –72 VDC, 200 mVpp ripple/noise
Environmental	• Operational temperature range: 0 to +40°C • Operating temperature range: -5 to +55°C
Unit Control	• 10BaseT Ethernet—SNMP • Switching time from active (working) to standby (protect): 150 mS maximum after SNMP command • Cisco uBR10012 and uBR7246VXR
Connectors	• RF connectors: MCX • AC power: IEC320 type • DC power: Three terminal block • Ethernet: RJ-45 • RS-232 Bus: 9-pin male D
Reliability	• 41,000 MTBF @ +50°C as calculated by Bellcore 5, 80 percent confidence factor
Physical	• Dimensions (H x W x D): 19 x 15.5 x 5.25 in. (842 x 384 x 132 mm) • Weight: 36 lbs
Input Power Requirements	• AC: 100 to 240 VAC, 50 or 60 Hz, operating range: 90 to 254 VAC • DC: -48 to -60 VDC, operating range: -40.5 to –72 VDC, 200 mVpp ripple/noise

Feature	Cisco RF Switch
Environmental	• Operational temperature range: 0 to +40°C • Operating temperature range: -5 to +55°C
RF requirements	• Input/output impedance: 75 ohms • Maximum RF input power: +15 dBm (63.75 dBmV) • Switch type: Electro-mechanical, absorptive for working path, non-absorptive on the protect path • Switch setting time per switch module: 20 ms maximum • Downstream frequency range: 54 to 860 MHz • Typical downstream insertion loss: +/-1.1 dB from CMTS to cable plant; +/- 2.1 dB from protect to cable plant; 5.5 dB from working to output; 8.0 dB from protect to output • Downstream insertion loss flatness: +/- 1.1 dB from CMTS to cable plant; +/- 2.1 dB from protect to cable plant • Downstream output return loss: >15.0dB at <450 MHz, > 12.0 dB at >= 450 MHz • Downstream input return loss: >15.0 dB • Downstream isolation: > 60 dB from channel to channel in working mode; > 52 dB from CMTS to protect when in protect mode • Upstream frequency range: 5 to 70 MHz • Typical upstream insertion loss: 4.1 dB from cable plant to CMTS; 5.2 dB from cable plant to protect • Upstream insertion loss flatness: +/- 0.4 dB from cable plant to CMTS, +/- 0.6 dB from cable plant to protect • Upstream input return loss:> 16 dB • Upstream isolation: > 60 dB from channel to channel in working mode; > 60 dB from CMTS to protect when in protect mode • Protect mode: CMTS return loss >10 dB, cable plant return loss: >10dB

Broadband Cable—Customer Premise Equipment (CPE)[1]

Cisco uBR900 Series Cable Access Routers

The Cisco uBR900 Series Cable Access Routers provide commercial services for cable operators, allowing them to expand their broadband service offerings. Both the Cisco uBR905 and Cisco uBR925 support IP data transmission over a cable plant and offer hardware-accelerated IPSec VPN support.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco uBR905 Cable Access Router	• Data-only broadband services (or voice separately via Ethernet) • High-speed, secure remote tunneling via hardware accelerated IPSec VPN
Cisco uBR925 Cable Access Router	• Two voice (VoIP) connections via RJ-11 ports • Data broadband services, router functionality, and VPN support • Easy-to-manage solution for telecommuters and small offices

[1] Cisco VoIP Residential CPE Partner Program—To help drive deployment of residential VoIP services to market, Cisco offers a program that identifies low-cost residential VoIP modems that have passed interoperability testing with Cisco. Cable service providers should contact their sales representatives for vendors, models, pricing and volume discount opportunities.

Key Features

- Integrated high-speed cable modem and router that operates with any DOCSIS 1.1 or DOCSIS 1.0-compliant CMTS; both Cisco uBR900 Series models are DOCSIS 1.1-ready
- Integrated Cisco IOS Software router, cable modem, and four-port Ethernet hub that offers advanced networking capabilities and investment protection

Specifications

Feature	Cisco uBR905	Cisco uBR925
Ports	4-port 10Base-T Ethernethub 1-port console 1-port CATV (Female F Connector)	4-port 10Base-T Ethernet hub 1-port USB 2 ports RJ-11 1-port console 1-port CATV
Routing Features	NAT/PAT, DHCP Server	Same as Cisco uBR905
Security Features	56-bit IPSec 3DES IPSec optional IPSec hardware acceleration Firewall optional	Same as uBR905
Voice Support	No	Yes

For More Information

See the uBR900 series Web site: **http://www.cisco.com/go/ubr900**

Remote Cable Access—Network Management Products

Cisco Cable Manager

Cisco Cable Manager is a client/server application that helps cable service providers deploy, maintain, monitor and troubleshoot cable equipment on an HFC network. The product manages DOCSIS and EuroDOCSIS-compliant CMTS and CPE, providing both operations center visibility, as well as technician access.

Cisco Cable Diagnostic Manager

Cisco Cable Diagnostic Manager is a web-based tool to help Customer Service Representatives at cable companies better handle subscriber calls and determine where problems reside in the network. Cisco Cable Diagnostic Manager provides status summary for the network neighborhood and fiber node, status on the DOCSIS or EuroDOCSIS-certified cable modem, as well as status on the Cisco CMTS products: Cisco uBR10012, uBR7200 Series, and uBR7100 Series.

Cisco Broadband Troubleshooter

Cisco Broadband Troubleshooter provides an efficient tool to help network operations center (NOC) personnel and field technicians detect, diagnose, and isolate problems between the cable plant and connected DOCSIS CPE devices. The product allows a technician to characterize upstream and downstream trouble patterns and quickly identify "flapping" CPE devices that are experiencing persistent connectivity problems. Operators can quickly discern CPE connectivity impairments by identifying noise, attenuation, provisioning, and packet-corruption issues.

Cisco Broadband Configurator

Cisco Broadband Configurator is a GUI-based tool designed to collect information needed to generate and download configuration files for DOCSIS or EuroDOCSIS cable modems and set-top boxes. There are two versions of the tool: a free, web-based version accessible via Cisco.com, and a stand-alone Java-based desktop version. Cisco Broadband Configurator enables point and click configuration of CPE values for RF, class of service, vendor information, SNMP parameters, BPI, TFTP, telco-return attributes, and CPE data.

For More Information

See the Cable Manager Web site: **http://www.cisco.com/go/cablemgr**
See the Cisco Cable Troubleshooter Web site:
http://www.cisco.com/go/troubleshooter

DSL Remote Access—Customer Premise Equipment (CPE)

Cisco offers the industry's broadest array of business-class DSL (G.SHDSL and ADSL) CPE solutions, from Enterprise to branch office, to Small Office/Home Office (SOHO) applications. Cisco's CPE solutions offer the choice of key features including Firewall, VPN, and Voice-over DSL support. And, Cisco's industry leading IOS-based capabilities enable QoS, policy management, and standardized set-up and configuration. Cisco CPE Products include:

- Cisco SOHO Series Ethernet, ADSL over ISDN, ADSL and G.SHDSL RoutersRouters (page 1-8)
- Cisco 800 Series Routers (page 1-9)
- G.SHDSL WAN Interface Cards (WICs) for 1700, 2600/2600XM, 3600 Series (see Chapter 1: Routers)
- Cisco IAD 2400 Series (w/G.SHDSL) (page 4-21)

Broadband Services Aggregation

The Cisco broadband aggregation portfolio includes the Cisco 6400 Broadband Aggregator, Cisco 7200 Series Router, the Cisco 7400 Series Internet Router, and the Cisco 10000 Series Internet Router. This portfolio covers all possible broadband aggregation markets. The Cisco 6400 and Cisco 10000 Series routers are carrier class broadband aggregation routers designed to provide high-density, high-performance services while maintaining the high-availability standards of large-scale carrier deployments. The Cisco 7200,Cisco 7301and Cisco 7400 Series routers cover the ISP and retail space by providing a dense, feature-rich platform but only taking a small footprint in the network.

- Cisco 7400: Highest density PPP aggregation per rack-unit
- Cisco 7301: Highest Density PPP aggregation per rack-unit
- Cisco 7200: Most versatile platform
- Cisco 6400: Only platform offering ATM switching and broadband aggregation
- Cisco 10000: Highest availability on a carrier-class integrated edge router

With this portfolio, Cisco can address the broadest set of requirements in terms of form factor, density, performance and scale, and offer customers a unique level of choice, with products optimized for any customer deployment.

Cisco 7200 Series

When ordered with the Cisco IOS 7200 Series Broadband User Services License (part number FR-BUS72), the 7200 delivers scaled PPP, RBE, and L2TP sessions and tunnels in addition to rich IP services. It enables service providers to provision broadband Internet access and supports all of the popular access technologies deployed today, including DSL, Cable, Wireless, and Dial Access. It is ideal for medium-density applications and is capable of handling up to 16000 subscribers in a single chassis. The 7200 is a modular platform with a choice of processing engines and a wide variety of WAN and LAN port adapters, including T1/E1, DS3, OC-3, Fast Ethernet, and Gigabit Ethernet. See page 1-31 for more information on the 7200 series.

Cisco 7301 Series

When ordered as 7301-BB-8K and 7301-BB-16K the Cisco 7301 Series Router provides a compact, high-performance single-rack-unit (1RU) router coupled with a broad set of interfaces and Cisco IOS® Software features, which makes it ideal for Broadband applications. The Cisco is capable of handling up to 16,000 simultaneous sessions and allowing for a pay-as-you-grow "rack and stack" architecture.

Cisco 7400 Series

When ordered as a part number 7401ASR-BB, the 7400 series provides high-performance broadband services aggregation like the 7200, but in a low-power one rack unit (1 RU) form factor. It offers one port adapter (PA) slot supporting over 40 standard 7200 series PAs, including T1/E1, DS3, OC-3, Fast Ethernet, and Gigabit Ethernet; making it ideal for small- and medium-density applications. See page 1-38 for more information on the 7400 series.

Cisco 10000 Series

With recent enhancements, the Cisco 10000 is the industry's only integrated edge router that delivers highly available, line-rate performance without compromises for service providers deploying IP services to broadband, leased line, ATM, and frame relay customers. With 99.999 percent uptime, the platform delivers high-performance broadband features including support for 32,000 (61,500 in the future) broadband subscribers, hardware-accelerated PPP over Ethernet and PPP over ATM, routed bridge encapsulation and 1483 routing. See page 1-47 for more information on the 10000 series.

Cisco 6400 Series

The Cisco 6400 is designed for use in high-availability environments such as service provider central offices, and corporate premises; and aggregates access media (DSL, cable, wireless, and dial) to serve as the intelligent equal access point, allowing multiple operating companies and service providers access to end users. It includes switch, router, and line card redundancy.

The Cisco 6400 is a high-performance service gateway that enables the delivery of network services, VPNs, and voice- and entertainment-driven traffic over any access media. ATM interfaces connect the Cisco 6400 to dial access servers, DSLAMs, and Cisco IP DSL Switches; ATM and packet interfaces connect to the network core.

Key Features

- Session scalability and modular design—The Cisco 6400 represents a quantum leap in session scalability, capable of scaling from 2000 subscribers in its entry level configuration to 96,000 subscribers in a full configuration.
- Routing and VPN scalability—Using the Cisco 6400, service providers can simultaneously route end-user traffic over secure, independent pathways exceeding 1000 different domains or end destinations, with an aggregate throughput of over 2.4 Gbps forwarding capacity for handling even the most bandwidth-intensive broadband traffic.

For More Information

See the 6400 series Web site: **http://www.cisco.com/go/6400**

ATM Multiservice WAN Switching

Cisco BPX 8600 Series—Advanced ATM Multiservice Switches

The Cisco BPX 8600 series is standards-based ATM switch with advanced IP and ATM capabilities. Designed to meet the demanding, high-traffic needs of a public service provider or large private enterprise, the BPX switch delivers high-performance ATM switching, multiservice adaptation and aggregation for all types of user traffic. Proven in the world's largest ATM and Frame Relay networks, the BPX 8600 enables service providers and large enterprises to meet skyrocketing network demands.

The Cisco BPX 8600 series switch offers up to 20 Gbps of high-throughput switching for multiple traffic types data, voice, and video and supports a wide range of interfaces, from Frame Relay to full broadband subscriber interfaces, up to 622 Mbps. You can offer multiple services for LAN, X.25, SNA, IP, Frame Relay, and ATM traffic from a single BPX platform. The Cisco BPX 8600 series supports multiprotocol label switching (MPLS) today, and this functionality can be easily added to any BPX switch already installed in the field.

For More Information

See the Cisco BPX Web site: **http://www.cisco.com/go/bpx**

Cisco MGX 8850 ATM Multiservice Switch

The Cisco MGX 8850 ATM Multiservice Switch enables delivery of a complete portfolio of service offerings while scaling from DS0 to OC-48c/STM-16 speeds. It enables service providers to be first to market with the new high-margin voice and data services while maintaining existing services.

The MGX 8850 universal chassis provides a unified ATM architecture that delivers a complete portfolio of differentiated services —from circuit emulation to IP VPNs—all with a single chassis, to enable service providers to easily add new services.

The Cisco MGX 8850 can function in three different modes of operation:

- PXM-1 configuration—Operates as a stand-alone device for narrowband services, or as an integrated edge concentrator for the Cisco BPX 8600 series or the Cisco MGX 8850 PXM-45
- PXM-1E configuration-Operates as a stand alone switch for low density narrowband services and included 1.2 Gbps switch card and PNNI routing
- PXM-45 configuration—Serves as a broadband edge switch and includes the 45 Gbps switch card and broadband ATM modules

Key Features

- Flexible ATM multiservice platform
- Highly scalable—from 1.2 to 45 Gbps of non-blocking throughput in single chassis
- Highest reliability, availability, and serviceability in the industry
- IP VPNs using Cisco IOS software-based Multiprotocol Label Switching (MPLS)
- Market-leading Frame Relay capabilities, with price-per-port leadership and advanced QoS
- High-density Point-to-Point protocol (PPP) for Internet access and aggregation
- Full-featured narrowband ATM for managed data, voice, and video services; high-density broadband ATM for wholesale ATM services
- Circuit Emulation for Private Line replacement
- Highly scalable packet voice gateway providing VoIP, VoATM(AAL1 & AAL2), ATM SVCs, Onboard MPLS

For More Information

See the Cisco MGX 8850 Web site: **http://www.cisco.com/go/mgx8850**

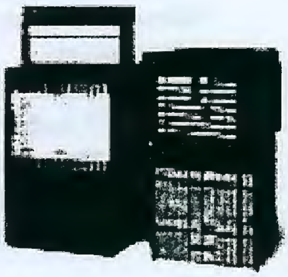
Cisco MGX 8830 ATM Multiservice Switch

The Cisco MGX 8830 Advanced ATM Multiservice Switch extends a full suite of narrowband interfaces and broadband trunking to remote sites with low density and high service mix requirements, using PNNI and MPLS for flexible network and services evolution. The Cisco MGX 8830, with a switching capacity of up to 1.2 Gbps, acts as a standalone switch, and offers a full range of service interfaces.

For More Information

See the Cisco MGX 8830 Series Web site: **http://www.cisco.com/go/mgx8830**

Cisco MGX 8200 Series



Cisco MGX 8230 Edge Concentrator

The Cisco MGX 8230 Edge Concentrator provides the most cost-effective gateway for narrowband services in space and power limited situations. It can acts as a stand-alone gateway or as an edge concentrator for the Cisco BPX 8600, Cisco MGX 8850 with PXM-45, and IGX 8400 series multiservice switches. The MGX 8230 offers a full range of narrowband service interfaces and a switching capacity up to 1.2 Gbps.

Cisco MGX 8250 Edge Concentrator

The Cisco MGX 8250 is a high-density edge concentrator designed for service providers needing flexibility for aggregation of IP, voice, Frame Relay, circuit emulation, and ATM services. An ATM narrowband edge concentrator, the MGX 8250 can serve as a stand-alone edge concentrator or as a feeder node for the Cisco BPX 8600 series and MGX 8850 switches. The MGX 8250 Edge Concentrator offers up to 1.2 Gbps of IP + ATM switching capacity.

For More Information

See the Cisco MGX 8200 Series Web site: **http://www.cisco.com/go/mgx8200**

Cisco IGX 8400 Series Multiservice WAN Switch

Efficient bandwidth utilization, intelligent QoS management features, and carrier-class reliability make the IGX 8400 series switch the ideal choice for meeting unique Wide-Area Networking (WAN) needs. This series provides the ATM backbone required to deliver data, voice, fax, and video services with guaranteed quality of service (QoS). The IGX 8400 series switch connects to public services for reduced leased-line costs by maximizing the use of these WAN links. Available with 8, 16, or 32 slots, the IGX 8400 series switches offers high flexibility to meet a wide range of Enterprise and Service Provider needs. Tight integration with the broad range of Cisco access products enables you to efficiently and cost-effectively run backbone-to-branch data, voice, fax, and video services between premises. By integrating IOS technology, the Cisco IGX 8400 series switch helps deliver a seamless migration path to technologies such as VoIP and MPLS.

For More Information

See the Cisco IGX 8400 Web site: **http://www.cisco.com/go/igx**

Cisco Long Reach Ethernet Solution

The Cisco Long-Reach Ethernet solution meets the demands of high bandwidth applications while leveraging existing copper wiring infrastructures. Catalyst® 2950 Long-Reach Ethernet (LRE) Series switches enable enterprise and service provider customers to extend intelligent Ethernet services over existing phone and legacy wiring, at distances of up to 5000 feet. Cisco is the only company with the breadth of technologies that allow customers to deliver intelligent network services across any combination of wired and wireless infrastructures.

The Cisco 2950 LRE solution includes the Cisco Catalyst® 2950 LRE switches, the Cisco 575 and 585 LRE Customer Premise Equipment (CPE) devices, and the Cisco LRE POTS Splitter. Each LRE link is terminated with either the Cisco 575 or 585 LRE CPEs, and a POTS splitter is required when POTS traffic coexists with the LRE link over the same line.

Catalyst 2950 LRE Series Intelligent Ethernet Switches

The Cisco Catalyst® 2950 LRE switches are fixed-configuration, stackable models that provide wire-speed LRE and Gigabit Ethernet connectivity for small and midsized networks. The Catalyst 2950 Series is an affordable product line that brings intelligent services, such as enhanced security, high availability and advanced quality of service (QoS), to the network edge-while maintaining the simplicity of traditional LAN switching. When a Catalyst 2950 LRE switch is combined with a Catalyst 3550 Series switch, the solution can enable IP routing from the edge to the core of the network. Embedded in Catalyst 2950 Series switches is the Cisco Cluster Management Suite (CMS) Software, which allows users to simultaneously configure and troubleshoot multiple Catalyst desktop switches using a standard Web browser. In addition to CMS, Cisco Catalyst 2950 LRE switches provide extensive management tools using Simple Network Management Protocol (SNMP) network management platforms such as CiscoWorks for Switched Internetworks.

The Cisco Catalyst 2950 LRE switches consist of the following devices-which are based upon the Enhanced Image (EI) Software for the Catalyst 2950 Series.

- Catalyst 2950ST-24-LRE-24 LRE ports + 2 10/100/1000BASE-T ports + 2 Small Form-Factor Pluggable (SFP) ports (two of the four uplinks active at one time)
- Catalyst 2950ST-8-LRE-8 LRE ports + 2 10/100/1000BASE-T ports + 2 SFP ports (two of the four uplinks active at one time)

The two built-in Gigabit Ethernet SFP ports support 1000BASE-SX and 1000BASE-LX modules. The dual SFP-based and copper Gigabit Ethernet implementation provides customers with tremendous deployment flexibility-allowing customers increased availability with the redundant uplinks. High levels of stack resiliency can also be implemented by deploying dual redundant Gigabit Ethernet uplinks and UplinkFast technologies for high-speed uplink and stack interconnection failover, and Per VLAN Spanning Tree Plus (PVST+) for uplink load balancing.

Cisco 575 and 585 LRE CPE Devices

Each LRE port is terminated in the room with either the Cisco 575 or 585 LRE Customer Premise Equipment (CPE) devices. These compact devices bridge LRE and Ethernet. The 575 CPE has one RJ-45 Ethernet connection and two RJ-11 connectors—one for the wall and one for a telephone. The 585 CPE has four RJ-45 switched Ethernet connections and two RJ-11 connectors and supports 802.1p QoS so that voice and video traffic are prioritized over normal data traffic. Both the Cisco 575 and 585 LRE CPE device can be mounted on or under a desk, or on a wall. They ship with a mount lock-in mechanism and clip-on Ethernet cable guard to discourage theft. It supports voice (Plain Old Telephone Service—POTS) traffic-including ISDN or digital phones-that coexists over the same LRE line by splitting LRE and POTS traffic at the CPE device.

Cisco LRE 48 POTS Splitter

The Cisco LRE 48 POTS Splitter is a high-density, low-cost device that is ideal for building deployments where the PBX system is on-site and POTS traffic must coexist over the same copper wiring as LRE traffic. Unlike "splitterless" building broadband network solutions, the Cisco LRE 48 POTS Splitter ships as a separate, compact form factor to ensure that POTS service is separate, and never compromised by LRE switch reconfigurations or downtime.

The Cisco LRE 48 POTS Splitter supports 48 ports in a 1RU form factor. Each splitter has six RJ-21 connectors-two each for connectivity to the patch panel, the LRE switch(es), and the on-site PBX system.

Key Features

- Performance—Delivers 2-15 Mbps symmetric over existing category 1/2/3 wiring at distances up to 5000 feet. Rate Selection feature automates the process of selecting a data rate for a line for ease of installation and increased robustness.
- Powerful Gigabit Ethernet uplink options—1000BaseT and SFP ports
- Superior control through intelligent services—advanced quality of service and security based on Layer 2 through Layer 4 parameters.
- Multicast support—Multicast VLAN Registration (MVR) and IGMP Snooping.
- Enhanced Cisco IOS Services
- Network Management—Cisco Switch Clustering technology and the advanced, Web-based Cisco Cluster Management Suite (CMS) software deliver easy-to-use configuration and ongoing monitoring and management of up to 16 switches. This software is embedded in the switches and delivers remote management of clustered switches and connected CPE devices through a single IP address

Competitive Products

- Paradyne Networks: BitStorm solution (Etherloop) and ReachDSL products
- Tut Systems: IntelliPOP VDSL
- Extreme Networks: Alpine chassis with FM-8Vi blade (Ethernet over VDSL)
- Huawei: Quidway s3026v

Cisco Building Broadband Service Manager (BBSM) Version 5.2

Cisco Building Broadband Service Manager (BBSM) is an access gateway for public access networks that enables simple, plug-and-play access, end user self-provisioning of services, customizable portal and advertising platforms and Web-based management, reporting and configuration. In addition, multiple automated authentication and billing options are supported, including credit card, RADIUS, property management system and access code.

The Cisco BBSM platform manages Internet access services with no routine IT support, enabling property owners and service providers to offer services in remote and unattended locations. BBSM supports tiered service levels in order to deliver targeted customer offerings. For instance, a hotel can set-up daily network access for a series of meetings providing a variety of bandwidth/pricing options to capture lucrative meeting room revenue opportunities.

The Cisco BBSM has been designed for compatibility with Cisco access-layer LAN products to provide a complete solution that enables service providers or property owners to create, market and operate broadband access services in new vertical markets such as: Hospitality, Higher-Education, and Public Access

Cisco BBSM Hotspot Server Version 1.0

The Cisco Building Broadband Service Manager (BBSM) Hotspot server connects mobile users to broadband services anywhere, anytime. Cisco BBSM Hotspot is a cost effective access management gateway suited for small- to medium-sized public access locations, as well as for visitor access in larger enterprise locations. BBSM Hotspot enables simple plug-and-play connectivity, end user self-provisioning of services, and multiple authentication options.

BBSM Hotspot works with Cisco Local Area Network (LAN) products to provide a complete solution for secure wired and wireless Internet Access for visitors, guests and other temporary users. Use Cisco BBSM Hotspot to manage and operate broadband access services in public hotspots, small hotels, and public overlays on business networks.

For More Information

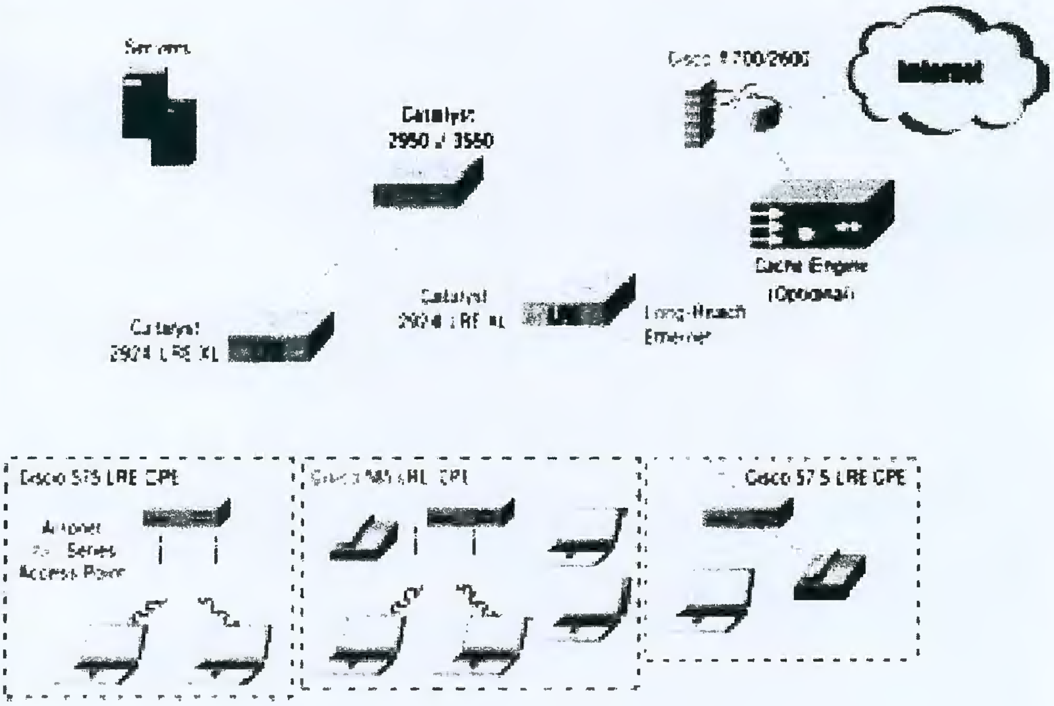
Sample LRE Solution Overview—Broadband Internet Access for MxU



CHAPTER 8

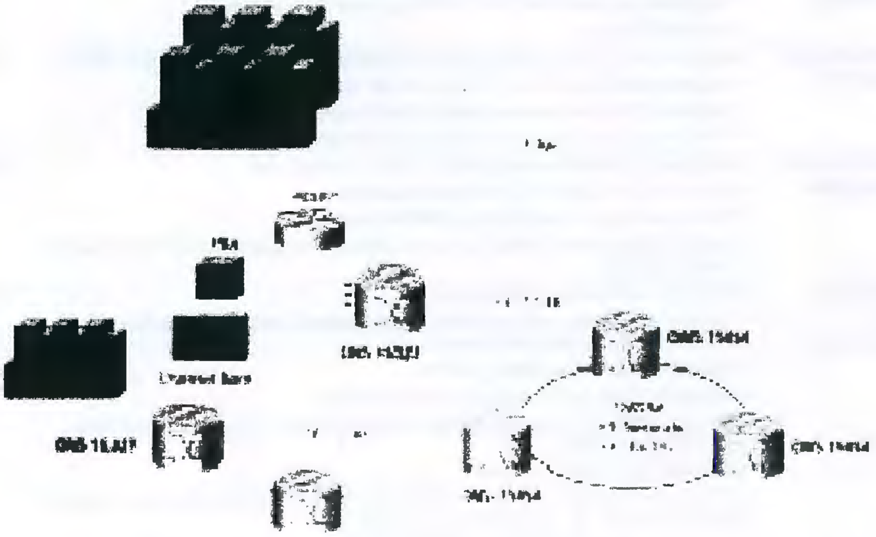
Optical Transport

Optical Transport Products at a Glance

Product	Features	Page
Cisco ONS 15200 Metro DWDM Series	Cisco ONS 15252 and ONS 15201 DWDM solutions • Supports a mixture of point-to-point,hubbed, and meshed traffic patterns (SDH/SONET, Gigabit Ethernet overa range of line rates up to 2.5 Gbit/s) • Modulararchitecture,capacitymay be addedchannel-by-channelin a highly cost-effective manner • High transmission efficiencyfor more channels, nodes and greater distances • Compact design	8-3
Cisco ONS 15302/15305 SDH Multiservice CPE & Aggregation Platforms	The Cisco ONS 15302/ONS 15305 Multiservice CPE and aggregation solutions are ultra-compact integrated systems that extend next-generation optical networks (access nodes or CPE): • Low Cost Access or CPE Platform • E1, E3, DS3, 10/100 BaseT Ethernet and GigE • STM-1 (15302) or STM-1/4/16 (15305)	8-3
Cisco ONS 15327 SONET Multiservice CPE & Aggregation Platform	Metro Edge Multiservice Provisioning Platform (MSPP) • Highly cost-efficient for delivering multiservices to the metro edge • Aggregates and switches TDM, 10/100/GigE, data and video services • Very small footprint	8-4
Cisco ONS 15454 SONET and ONS 15454 SDH Platforms	Industry-leading SONET Multi-service Provisioning Platform (MSPP) and SDH MSPP: • Aggregates DS1, DS3, STS-1, OC-3, OC-12, OC-48 • Supports OC-192 and mulitwavelength DWDM optics • Wide range of data interfaces, including 10/100/GigE, data and video	8-4
Cisco ONS 15501 Erbium Doped Fiber Amplifier	• Designed for Enterprise and Service Provider environments • Low-noise, gain flattened C-band optical amplifier • Complements the CiscoONS 155xx DWDM solution • Capable of extending 100GHz, 32-channel, 2.5Gbps / 10Gbps optical infrastructure over longer distances	8-5
Cisco ONS 15216 and 15501 Optical Transmission Families	Cisco ONS 15216 Metro DWDM Series • Supports 32 ITU-grid wavelengths at 100 GHz spacing and provides unprecedented transport flexibility with optical filtering • Optical Add/Drop Multiplexing (OADM) • Optical PerformanceMonitoring and Amplification • The ONS 15216 allows carriers to deliver more services per wavelength and more wavelengths per fiber Cisco ONS 15501 Optical Amplifier • Constant flat gain of 17 dB over the 1530nm to 1563nm band simplifies network design. • Metro optimized auto gaincontrol and variable gain • Low noise figure of <6.0 dB allows the use multiple amplifiers in cascade • Input power range of -29to 0 dBm	8-5
Cisco ONS 15530 Metro DWDM Aggregation Platform	Metro Optical DWDM Multiservice Aggregation Platform • Enables storage and data networking, transparent wavelength services, and legacy applications • ESCON Aggregation up to 40 channels on 1 wavelength • Scales from 2.5Gbps to 10Gbps • Supports wide range of protocolsover optical infrastructure • Highly resilient network with flexible topology design options	8-5

Product	Features	Page
Cisco ONS 15540 Extended Services Platform	Highly modular and scalable next-generation Dense Wave Division Multiplexing (DWDM) platform • Ideal for enterprises and service providers • Delivers the integration of data, storage and metro networking • Ultra-high bandwidth intelligent optical infrastructure • Supports any packet on any wavelength from any platform	8-6
Cisco ONS 15600 Multiservice Switching Platform (SONET/SDH)	The Cisco ONS 15600 MSSP is a true multiservice switch, providing carrier class reliability, availability, serviceability, operations, and management. • Combines the functionality of multiple metro systems including SONET/SDH multiplexers and digital cross-connect network elements • Scalable, easy-to-use platform supports all metro topologies	8-7
Cisco Transport Manager (CTM 4.x) (Network Management)	Carrier-class element management system • Ideal for service provider and enterprise networks • Supports Cisco ONS 15454/15327/15600 (SONET/SDH), 15540, 15530, 15501, 152xx, 1580X systems • Manages fault/performance/configuration/alarm/security/inventory/administrative tasks • Native Circuit/Equipment Provisioning for 15454/15327/15600 SONET/SDH product family • Northbound interfaces include SNMP, TL1 and CORBA • Integrates into OSS/BSS systems • Requires SUN/Solaris/UNIX server and Oracle database	8-8
Cisco 10720 Internet Router	Service provider-class metro access services router • Optimized building block for the next generation metro IP network • Equipped with 24 ports of Ethernet technology for customer access and dynamic packet transport (DPT) technology for metro optical connectivity • Powered by Cisco IOS software and the parallel express forwarding (PXF) architecture • Cost-effective, reliable platform supporting full suite of IP routing protocols • With DPT architecture, enables optimal fiber connectivity as well as features such as IP class of service, TLS, VoIP and VPN services See Chapter 1—Routers for more information on the Cisco 10720 Internet Router	1-49

Sample Metro Optical Transport Solution Overview—Delivering Multiservices to the Edge



Cisco ONS 15200 Optical Metro DWDM Series

The Cisco ONS 15252, 15201, and 15216 are part of the Cisco ONS 15200 Metro DWDM family, the first solution to deliver instant wavelengths to buildings, premises, or PoPs.

The ONS 15252 and 15201 may be used to realize many sub-network topologies and can handle a mixture of point-to-point, hubbed, and meshed traffic patterns. Capacity may be added channel-by-channel in a highly cost-effective manner. Since they feature broadband transponders, a wide range of traffic types may be handled (SONET/SDH, Gigabit Ethernet) over a range of line rates up to 2.5 Gbs. Channel protection options include unprotected, client-protected, and (optical channel) fiber protection. The ONS 15252 is a multi-channel unit and the ONS 15201 is a single channel unit node. Both have exceptionally small footprints and low power consumption.

The Cisco ONS 15216 supercharges wavelength services by supporting up to 32 ITU-grid wavelengths, and provides unprecedented transport flexibility with optical filtering, Optical Add/Drop Multiplexing (OADM), Optical Performance Monitoring and Amplification. It allows service providers to deliver more services per wavelength and more wavelengths per fiber.

The Cisco ONS 15216 optical filter solution enables service providers to deploy point-to-point, bus, and ring networks using the terminal filter multiplexing and demultiplexing and OADM. The Cisco ONS 15216 platform provides an open and flexible solution to combine wavelengths launched by the Cisco ONS 15454, ONS 15252, ONS 15201, and ONS 15540. The Cisco ONS 15216 supercharges wavelength services and extends Cisco's optical leadership to metro regional DWDM.

For More Information

See the ONS 15200 Series Web site: **http://www.cisco.com/go/ons15200**

Cisco ONS 15302/15305 SDH Multiservice CPE & Aggregation Platforms

The Cisco ONS 15302/ONS 15305 Multiservice CPE and Aggregation solutions are ultra-compact integrated systems that offer cost effective solutions with short ROI. These platforms provide native multiservice capabilities (i.e., TDM interfaces, multiplexing and Ethernet data interfaces). These products can be managed under Cisco Transport Manager (CTM), Cisco's unified optical network management system.

The ONS 15302 CPE platform provides the following TDM interfaces—STM-1 uplink (protected or unprotected STM-1 optical uplink, 1+1 MSP, future SNCP) and E1 customer interfaces (12 E1 ports). This product also provides native Ethernet customer access via 4-port 10/100BaseT module that supports full layer 2 capacity, bridging, VLANs, spanning tree, and priority management. An optional WAN module is available for point to multi-point applications.

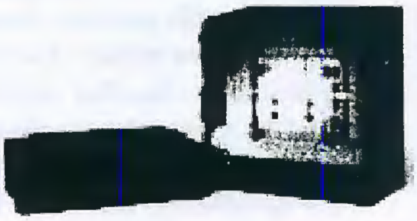
The ONS 15305 Aggregation platform provides the following TDM interfaces—protected or unprotected optical interfaces (8 port S-1.1 optical module, 2 port S-4.1 optical module, 1 port S-16.1 optical module, 1+1 MSP, SNCP, 2F MS-SPRing for STM-16) and electrical customer interfaces (8 and 63 port E1 modules and a 6-port

E3/DS3 module). This product also provides native Ethernet customer access via an 8-port 10/100BaseT module and a 2-port GigE module (supports full layer 2 capacity, bridging, VLANs, spanning tree, and priority management). An optional WAN module is available for point to multi-point applications.

For More Information

See the ONS 15302/ONS 15305 web site: **http://www.cisco.com/go/ons15300**

Cisco ONS 15454 and 15327 Multiservice Provisioning Platforms



The Cisco ONS 15454 and ONS 15327 Multi-service Provisioning Platforms (MSPP) are key building blocks in today's optical networks due to their unprecedented transport performance and economics. They offer supercharged transport capability by combining the best of traditional SONET TDM (time division multiplexing) and statistical multiplexing in single units.

The Cisco ONS 15454 aggregates traditional facilities such as DS1, DS3, STS-1, OC-3, OC-12, and OC-48 including multi-wavelength DWDM optics, but it also supports data interfaces for 10/100/GigE, data and video. This enables drastically improved efficiencies in the transport layer and breakthrough cost savings for initial and life cycle deployment. A single ONS 15454 shelf can support combinations of OC-3/c, OC-12/c, OC-48/c, and OC-192.

The new Cisco ONS 15454 SDH MSPP offers an international optical transport solution that combines the best of traditional SDH TDM and statistical multiplexing in a single platform. The Cisco ONS 15454 SDH MSP can aggregate traditional services such as E1, E3, DS3, STM-1, STM-4, STM-16 and STM-64 including multi-wavelength DWDM optics, but is also designed to support data interfaces such as Ethernet/IP.

The Cisco ONS 15327 combines industry-leading bandwidth capacity and service diversity in a very compact footprint, enabling service providers to achieve radical economics at the metro edge. Based on the same technology as the industry leading Cisco ONS 15454, the ONS 15327 supports high optical bandwidth and has the ability to drop a DS1 from an OC-48 stream. With comprehensive STS- and VT-level bandwidth management and integrated data switching, the Cisco ONS 15327 also serves as a digital cross-connect without the need for additional equipment. It aggregates and switches TDM, Ethernet, and ATM services, and can be managed using the Cisco Transport Manager element management system.

See the ONS 15454 SDH Web site: **http://www.cisco.com/go/15454sdh**

See the ONS 15327 Web site: **http://www.cisco.com/go/ons15327**

Cisco ONS 15501 Erbium Doped Fiber Amplifier

The Cisco ONS 15501 is a low-noise, gain-flattened C-band optical erbium doped fiber amplifier designed to extend the distance of today's metro high-bandwidth optical network beyond existing optical budget constraints. The Cisco ONS 15501 complements the Cisco ONS 155xx DWDM and Catalyst 6500 solutions, providing customers with the capability to extend their 2.5-Gbps or 10-Gbps optical infrastructures over greater distances. Packaged in a one-rack-unit (1RU) chassis, the Cisco ONS 15501 incorporates features such as 17-dB constant flat gain, automatic gain control, and low noise figure for excellent Optical Signal to Noise Ratio (OSNR) characteristics.

For More Information

See the Cisco ONS 15501 Web site: **http://www.cisco.com/go/ons15501**

Cisco ONS 15530

The Cisco ONS 15530 is a DWDM (dense wavelength division multiplexing) multiservice aggregation platform. The ONS 15530 can be used in applications such as storage networking, data networking, transparent wavelength services, and legacy SONET / SDH / ATM. These features make the ONS 15530 an excellent choice for building a scalable, ultra-high-bandwidth-ready, intelligent optical aggregation and transport infrastructure.

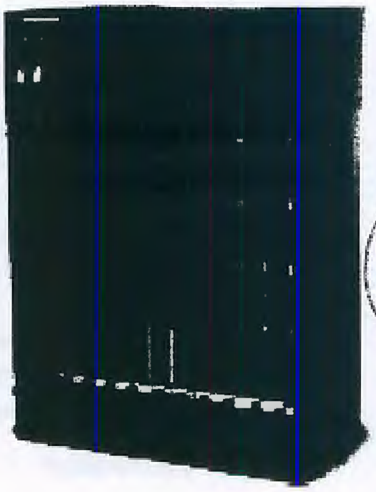
Key Features

- Aggregation—up to 40 ports of ESCON or 8 ports of Fibre Channel, FICON, or Gigabit Ethernet per wavelength, lowering total cost of ownership through bandwidth efficiency
- Scalability—up to 32 wavelengths ranging from 2.5Gbps to 10Gbps for network growth and design flexibility
- Multiservice Interfaces—protocol-independent transponders supporting data rates between 16Mbps to 2.5Gbps for protocols such as ESCON, FICON, Fibre Channel, 2G Fibre Channel, Gigabit Ethernet, SONET/SDH, Digital Video, and other protocols
- Cost-efficient point-to-point fiber trunk protection capability using the Protection Switch Module
- Complete Amplification Solution—Together with ONS 15501 EDFA optical amplifier, the VOA modules enables enterprises and service providers to further expand their optical DWDM networks over greater distances.
- Design Flexibility—can be used to deploy Point-to-point, Hub Ring, or Mesh Ring networks
- Network assurance—through high availability and resilient optical design
- IOS-based—easily integrates into existing Cisco networks

For More Information

See the Cisco ONS 15530 Web site: **http://www.cisco.com/go/ons15530**

Cisco ONS 15540 Extended Services Platform (ESPx)



The ONS 15540 Extended Services Platform with external cross connect capability (ESPx) is a highly modular, flexible, and scalable next generation dense wave division multiplexer (DWDM) platform that integrates data networking, storage area networking (SAN), time division multiplexing, (TDM) Synchronous Optical Network (SONET) and Synchronous Digital Hierarchy (SDH) technologies over an ultra high bandwidth, intelligent optical infrastructure that can support any packet, over any wavelength on any platform.

- Flexible Multi-Protocol Support—The Cisco ONS 15540 offers both variable rate transparent and fixed rate multi-protocol transponders that feature user selectable small form factor pluggables (SFPs) and support a variety of industry standard data rates between 16Mbps to 2.5Gbps as well as 10Gb Ethernet
- Scalable, flexible, and modular architecture in a high-density compact footprint—Provides superior operational support and network expansion on an as needed basis through its hot swappable modular lines cards, transponders, and optical multiplexers
- Simple Network Consolidation and Comprehensive Multi Service Support provided by the available ONS 15540 2.5GB and 10GbE transponders
- Optical, Service, and Application Level Performance Monitoring—provides industry-leading supports for service level agreements (SLAs)
- High Availability for mission critical networks—Provides 99.999% availability for demanding Managed Network Service Providers and enterprise business continuance applications, with hardware redundancy and automatic protection switching to protect against fiber cuts and equipment failures
- Multi-Service Integration—Transports ESCON, FICON, 1Gb/2GB Fibre Channel for Storage Area Networking (SAN), Fast and Gigabit Ethernet, and 10 Gb Ethernet for data networking, and SONET/SDH at OC-3/STM1, OC-12/STM4, and OC-48/STM12

Key Features:

- Compact modular design with external connectorization: External Direct Connect system from Line card to OADMs; Optional cross connect and fiber management system
- Transparent Tuneable Variable data rate Type 1 Transponders: 16Mbps to 622Mbps MM fiber support; 16Mbps to 2.5Gbp SM fiber support; 16 Tuneable transponders support 32 channels for reduced sparing costs; Multi-protocol support for Enterprise
- Tuneable Type 2 Transponders with Multi Protocol Small form Factor Pluggables (SFPs): Variable data rate support between 16Mbps to 2.5Gbps; 16 Tuneable transponders support 32 channels for reduced sparing costs; Multi-protocol SFP Support
- Standards based Management support for SNMP, Ciscoview and Cisco Transport Manager (CTM)
- Protection Switch Module provides highly cost effective solution for fiber trunk protection
- Standards based Optical architecture conforming to ITU G.692 100GHz channel spacing
- This system has been qualified by IBM for Geographically Dispersed Parallel Sysplex (GDPS), and by EMC for Symmetrix Synchronous support as tested in their E-LAB environment

For More Information

See the Cisco ONS 15500 Series Web site: **http://www.cisco.com/go/ons15500**

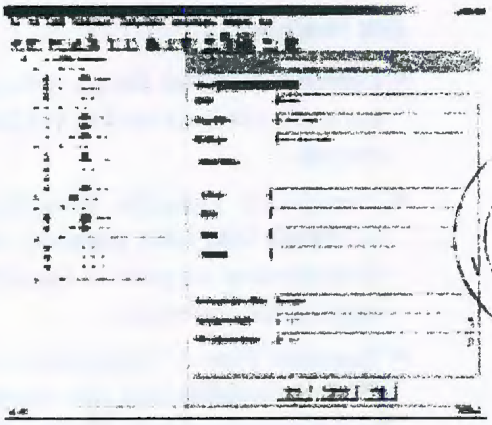
Cisco ONS 15600 Multiservice Switching Platform

The Cisco ONS 15600 provides unparalleled flexibility in designing next generation metro networks. Fully engineered and optimized for metro networks, the Cisco ONS 15600 MSSP simplifies and revolutionizes bandwidth management in the metro core by allowing service providers to seamlessly integrate their metro core and metro edge networks, while dramatically reducing initial turn up costs. Delivering scalability to 960 Gbps of traffic in a single rack, it complements the market-leading Cisco ONS 15454 Multiservice Provisioning Platform (MSPP) by leveraging its proven architecture and operating software. This allows service providers to dramatically simplify their metro networks and realize immediate cost, space and operational benefits. The Cisco ONS 15600 MSSP provides complete integration of metro core and edgenetworks for service provisioning and network management.

For More Information

See the ONS 15600 Series web site: **http://www.cisco.com/go/ons15600**

Cisco Transport Manager (CTM 4.x) (Element/Network Management)



7942
A.

Cisco Transport Manager is an integrated optical element management system for Cisco ONS 15000 series optical networking platforms. CTM manages configuration, fault isolation, performance, and security for Cisco optical network elements. With integrated support for SONET, SDH, DWDM and Ethernet, along with open interfaces to operations support systems (OSS), CTM delivers the full power of Cisco's wide range of advanced optical systems to today's network operators and enterprises.

CHAPTER 9

IOS Software & Network Management

Cisco IOS® Software & Network Management Products at a Glance

Product	Features	Page
CiscoWorks for Windows	An entry level suite of integrated network management tools for smaller networks: • Event management and topologymapping application • Includes Cisco's popular CiscoView Element Management Tool	9-2
Cisco IOS Software	Feature-rich network operating system supported on wide range of Cisco products • Provides a common IP fabric, functionality, and command-line interface (CLI) across network infrastructures • Enables a vast array of key routing, multiservice, traffic shaping, security/firewall, and traffic monitoring applications, and a broad variety of network connections	9-4
CiscoWorks Small Network Management Solution	Web-based network management solution designed for small to medium businesses (SMB) • Device auto-discovery using SNMP simplifies setup and reduces startup time • Standards-based, multi-vendor management • Event management and topologymapping application • Includes Cisco's popular CiscoView Element Management Tool	9-11
CiscoWorks Routed WAN Management Solution	A comprehensive set of applications formanaging the router elements of a multiservice Enterprise wide-area network. This bundle includesAccess Control List Manager, Internetwork Performance Monitor, Resource Manager Essentials, and CiscoView	9-13
CiscoWorks LAN Management Solution	Provides key applications neededto manage Cisco switch-based Enterpise campus networks. This bundle includes Campus Manager, Device Fault Manager, nGenius Real Time Monitor, Resource Manager Essentials, and CiscoView	9-14
CiscoWorks VPN/Security Management Solution	Combines general device management tools forconfiguring, monitoring, and troubleshooting enterprise networks with powerful security solutions for managing virtual private networks (VPNs), firewalls, and network and host-based intrusion detection systems (IDS). This bundle includes Management and Montoring Centers, Cisco IDS Host Sensor and Console, Cisco Secure Policy Manager, VPN Monitor, Resource Manager Essentials, and Cisco View	9-16
CiscoWorks Manager IP Telephony Environment Monitor	A suite of telephony management applicationsthat ensuresthe readiness and manageablity of convergednetworks supporting VoIP and IP telephonytraffic and applications. The bundle includes Voice Health Monitor, Default FaultManager, CiscoView, and DownloadableModules: IP Phone Information Utility, IP Phone Help Desk Utility, Fault History Manager	9-18
CiscoWorks Voice Manager for Voice Gateways	Enables the management and monitoring of devices used as gateways between analog voice equipment and the data network. • Enhanced capabilitiesto configure and provision voice ports • Create and modify dial plans on voice-enabled Cisco routers for voice over IP (VoIP), voice over Frame Relay (VoFR), and voice over ATM (VoATM) network deployments	9-19
CiscoWorks QoS Policy Manager (QPM)	Enables centralzed administrationand automated deployment of bandwidth reservation and prioritization policiesfor critical network applications • Differentiates services of Web applications, voice traffic, and business-critical applications	9-21
Cisco Ethernet Subscriber Solution Engine	A hardware-based managementsystem for metro access networks that use the Cisco ONT 1000 Gigabit Ethernet SeriesOptical Network Terminator. • Enables complete remote managementand troubleshooting of the customer demarcation point for Ethernet over fiber	9-22
CiscoWorks Hosting Solution Engine	A hardware-based contentmanagement solution for e-business operations in Cisco-powered data Centers. This product provides network infrastructure monitoring and Layer 4-7 hosted services configuration and activation.	9-24
CiscoWorks Wireless LAN Solution Engine	A hardware paced wireless LAN management solution that provides template-based configuation with user-defined groups to effectivelymanage a large number of access points and bridges • Monitors LEAP authenticationservers • Enhancessecurity management through mis-configuration detection on access points and bridges	9-23
Cisco Catalyst 6500 Series Network Analysis Modules 1 and 2	NAM is an integrated, netwok monitoring instrumentation and Web-browser based traffic analysis solution for the Catalyst 6500 based environments. It enable greater visibility into traffic at all layers of the networkby providing real time traffic analysis and troubleshooting capabilities.	9-25

Product	Features	Page
Cisco Secure User Registration Tool (URT)	Provides organizations with increased LAN security by actively identifies users within the network and createsuser registration policy bindingsthat help supportmobility and tracking: • Ensures that usersare associated with their authorized subnet/VLAN; Addresses the challenges associated with campususer mobility; Supports Web-based authentication for Windows, Macintosh, and Linux client platforms; Secure user accessto the VLAN with MAC address-based security option Option to allow multiple users connected toa hub accessto a VLAN served by single switch port See Chapter 5—VPN and Security for more information on Cisco Secure User Registration Tool	5-15
Cisco Secure Access Control Server (ACS) for Windows	Controls the authentication, authorizationand accounting (AAA) of users and administrators to network devices and services; Operates as a centralized Remote AccessDial-In User Service (RADIUS) or Terminal Access Controller Access Control System (TACACS+) server; Supports Lightweight Directory Access Protocol (LDAP) user authentication; Data replication and backup services; Flexible user and group policy controls; Support for Cisco 802.11x Catalyst Switch and Wireless solutions; Extensible Authenticaton Protocol (EAP)enhancementsto support Protected EAP (PEAP) for wireless LANs All administrative accessis encrypted with SSL See Chapter5—VPN and Securityfor more information on CiscoSecureAccessControl Server (ACS) for Windows	5-14

CiscoWorks for Windows

CiscoWorks for Windows is a powerful set of network management tools to easily manage your small to medium network or workgroup. It provides information such as dynamic status, statistics, and comprehensive configuration information for Cisco routers, switches, hubs, and access servers. Using the included WhatsUp Gold from Ipswitch, you can also monitor printer, workstations, servers and important non Cisco network services.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks for Windows	• A single solution for managing all resources attachedto a small multivendor network • A smaller solution, where centralizemanagementof configurationsof a software distribution is not needed • Low-cost network management • Needsto quickly understand basic network connectivity, accessindividual device configurations and statistics, and troubleshoot problems

Also available for small and medium size customers is the CiscoWorks Small Network Management Solution (Small NMS). Small SNMS includes all the features above and includes CiscoWorks Resource Manager Essentials (Essentials) which provides additional functionality that allows the customer to of build and maintain an up-to-date hardware and software inventory for up to 20 devices in a network.

Key Features

CiscoWorks for Windows provides the following features when used in conjunction with WhatsUp Gold from Ipswitch (included in the CiscoWorks for Windows package):

- Automatic discovery process for networked devices
- Management of network hardware, printers, servers, and workstations
- Customizable monitoring of services such as FTP and HTTP
- Access to extensive data on port status, bandwidth utilization, traffic statistics, protocol information, and other network performance statistics
- Flexible graphing capabilities for quickly recording and analyzing historical data that can be exported to files
- Management Information Base (MIB) compiler and browser for managing third-party SNMP devices
- Tools to simplify device configuration and management for Cisco routers, switches, and access servers
- Threshold management features that can be set for many performance variables to generate an alarm or event notification
- Flexible event notification, including voice, paging, and e-mail notification of user-defined events

CiscoWorks for Windows Components

CiscoWorks for Windows includes the following tools:

- WhatsUp Gold from Ipswitch, Inc.—Provides network discovery, mapping, monitoring, and alarm tracking
- CiscoView—Provides back- and front-panel displays; dynamic, color-coded graphical displays simplify device-status monitoring, device-specific component diagnostics, and application launching
- Threshold Manager—Enhances the ability to set thresholds on Cisco RMON-enabled devices, reducing management overhead and improving troubleshooting capabilities
- StackMaker—Allows users to combine multiple Cisco devices of specific types into a single stack and visually manage them in a single window
- Show Commands—Displays detailed router system and protocol information without requiring the user to remember complex Cisco IOS Software command-line languages or syntax

Specifications

Feature	CiscoWorks for Windows
Hardware Requirements	266 MHz Pentium-based IBM PC or compatible computer 128-MB RAM total 1 GB free hard drive space
Software Requirements	Windows 98, Windows NT 4.0, or Windows 2000 Netscape 461, 4.7, 4.76 or Internet Explorer 5.0, 5.1, 5.5

Selected Part Numbers and Ordering Information

CiscoWorks for Windows	
CWW-6.1-WIN	CiscoWorks for Windows 6.1
CWW-6.1-WIN-UP	Upgrade to CWW 6.1 for Windows from CWW 5.0
CWW-6.1-WIN-MR	Maintenance Release: Requires existing CWW 6.0 - June 02

For More Information

See the CiscoWorks for Windows Web site: **http://www.cisco.com/go/cwwin**

3

Cisco IOS® Software

Cisco's IOS Software is a feature-rich network operating system that provides network intelligence for the majority of today's Internet and for most of the world's business-critical networking applications.

Supporting Cisco's extensive range of platforms, Cisco IOS Software provides a common IP fabric, functionality and command-line interface (CLI) across network infrastructures. Cisco IOS Software enables a vast array of key routing functions, multi-service capabilities, traffic shaping, connections, security/firewall protection, traffic monitoring, and highly flexible network and product configuration.

Below is an abbreviated list of key capabilities, intelligent network technologies, and architectures enabled by Cisco IOS Software:

- Quality of Service (QoS)
- Converged data, voice, and video over IP
- IP/ATM/Frame Relay network connectivity and scalability features
- Security/firewall/IPSec/access lists
- Traffic monitoring and NetFlow based monitoring, accounting, and billing
- Wide range of routing protocols (including MPLS)
- IPv6
- Multicast

Quality of Service (QoS)

The promise of networking is sharing networked resources among many users and applications for greater productivity and competitive advantage. Cisco IOS quality of services (QoS) capabilities enable complex networks to control and predictably service a variety of applications. Every network needs QoS for optimum efficiency, whether it is for a small business, large enterprise, or a service provider.

QoS expedites the handling of mission-critical applications, while sharing network resources with non-critical applications. QoS also ensures available bandwidth and minimum delays required by time-sensitive multimedia and voice applications. It also gives network managers control over network applications, improves cost-efficiency of WAN connections, and enables advanced differentiated services. QoS technologies are elemental building blocks for other Cisco IOS enabling services—particularly for converged data and voice networks (LAN/WAN + telephony), video conferencing over IP, and IBM networking, and for future business applications in campus, WAN, and service provider networks.

Key QoS Capabilities:

Committed Access Rate (CAR)	Performs two QoS functions • Bandwidth management throughrate limiting, which allows you to control the maximum rate fortraffic sent or received onan interface • Packet classificationthrough IP precedence and QoS group setting, which allows you to partitionyour network into multiple priority levels or classes of service (CoS)
Differentiated Services (DiffServ)	QoS architecture that divides traffic into a small number of classes and provides QoS to large aggregates of traffic bytreating sometraffic better than the est (faster handling, more bandwidth on average, lower loss rate on average). This is a statistical preference, not a hardand fast guarantee.
Expedited Forwarding (EF)	Per-Hop Behavior (PHB) in the DiffServ standard, used to create avirtual leased line service.

Integrated Services (IntServ)	A QoS architecture in which each network element is required to identify the coordinated set of QoS control capabilities it provides in terms of the function it performs, the information it requires, and the information it expots.
Random Early Detection (RED)	Monitors traffic levels on very large networks to prevent congestion and guarantee priority traffic delivery.
Resource Reservation Protocol (RSVP)	A protocol that supports the reservation of resources across an IP network.
Weighted Fair Queueing (WFQ)	Adds new levels of control to previous queuing methods
Weighted Random Early Detection (WRED)	Combines the capablities of the random early detection (RED) algorithm with IP precedence or the differentiated services code point (DSCP). This combination provides for preferential traffic handling for higher-priority packets.

Key QoS Categories

Classification	• Committed Access Rate (CAR) • Policy Based Routing (PBR) • QoS Policy Propagation Though BGP
Congestion Management	• First in First Out (FIFO) • Priority Queueing (PQ) • Custom Queueing (CQ) • Weighted Fair Queueing (WFQ) • Weighted Random Early Detection (WRED)
Policy and Shaping	• Committed Access Rate (CAR) • Generic Traffic Shaping (GTS) • Frame Relay Traffic Shaping (FRTS)
Link Efficiency Mechanisms	• Compressed Real Time Protocol (CRTP) • Link Fragmentation and Interleaving (LFI) • Data Compression

Converged LAN/WAN and Telephony Networks

A broad range of Cisco products support standards-based voice over packet implementations, including H.323-based Voice over IP (VoIP). These products enable highly efficient, converged IP-based telephony in today's enterprise and service provider networks, thereby eliminating the need for legacy telephone equipment and overlay networks (including PBXs and central office circuit switched network equipment). Furthermore, a single IT organization can now support campus and enterprise requirements—regardless if for data, voice, or video requirements.

In addition, Cisco voice over packet technologies enable businesses and service providers to avoid long distance telephone charges by leveraging their existing data networks, instead of paying for dedicated voice connections and circuits.

Cisco Connectivity and Scalability Solutions

A wide range of access solutions are enabled via Cisco IOS Software including:

- Virtual Private Networking; DSL; Dial Access (including ISDN, modem, fax, voice)
- Frame Relay, X.25
- ATM; VoIP, VoFR, VoATM
- SONET, OC-x/STM-x, Packet-over-SONET
- Broadband Services Aggregation (includes large-scale PPPoE, PPPoA, L2TP tunneling)
- Cable Access Solutions

Security

Cisco's powerful suite of Cisco IOS Software-embedded security and firewall technologies includes:

Digital Signature Standard (DSS) and digital certification	Positively authenticates users or devices
Network Address Translation (NAT) and Port Address Translation (PAT)	Hides private topology and IP addresses from an external network
IPSec	Enables secure communications of data over public networks

Time-based Access Control Lists (ACLs)	Implements access lists based on time of day
Password Authentication Protocol (PAP)	Allows a remote node to establish its identity using a two-way handshake
Terminal Access Controller Access Control System Plus (TACACS+) and Remote Access Dial-in User Service (RADIUS)	Gives complete network access security for dial-in connections, for enterprise and service provider applications
Challenge Handshake Authentication Protocol (CHAP)	Allows a remote node to establish its identity using a three-way handshake
Calling Line Identification (CLID)	Uses calling line identification to compare the telephone number of a calling device against a list of known callers
Access Lists	Checks the source address of packets (standard access lists) and checks the source and destination addresses and other parameters (extended access lists)
Context-Based Access Control (CBAC)	Provides secure, application-based stateful filtering for the most popular protocols and a wide variety of advanced applications; available in the Cisco IOS Firewall feature set

Cisco IOS NetFlow

NetFlow technology provides the metering base for a key set of applications including network traffic accounting, usage-based network billing, network planning, network monitoring, outbound marketing, and data mining capabilities for both service provider and enterprise customers. Cisco provides a set of NetFlow applications to collect exported NetFlow data, to perform data volume reduction, and to post-process and display data. Cisco is currently working with a number of partners to provide customers with comprehensive solutions for NetFlow-based billing, planning, and monitoring. NetFlow also provides the measurement base for Cisco's new Internet Quality of Service (QoS) initiatives. NetFlow captures the traffic classification or precedence associated with each flow, enabling differentiated charging based on Quality of Service.

Furthermore, the combination of NetFlow data along with Cisco IOS Software-based routing information can prove key to developing effective security policies and preventive measures for Denial of Service (DoS).

Cisco IOS Routing Services

Cisco IOS Software has long been recognized for its rich support of multiple protocols including IP, Novell IPX, SNA, AppleTalk, DECnet, OSI, and Banyan VINES

IP Routing Protocols

Cisco IOS Software offers the industry's widest variety of enterprise and service provider-class routing protocols, including On Demand Routing (ODR), Routing Information Protocol (RIP), Interior Gateway Routing Protocol (IGRP), Open Shortest Path First (OSPF), IP Multicast, Integrated IS-IS, Enhanced Interior Gateway Routing Protocol (EIGRP), Border Gateway Protocol (BGP), and MPLS

Multi Protocol Label Switching (MPLS)

Cisco IOS MPLS fuses intelligent routing capabilities with the performance of switching. It provides significant benefits to networks with pure IP architectures and those with IP and ATM or a mix of other Layer 2 technologies. MPLS technology is key to implementing scalable Virtual Private Networks (VPNs) and end-to-end QoS, enabling efficient utilization of existing networks to meet growth needs and to rapidly correct link fault and node failure. This technology also helps deliver highly scalable, differentiated IP services with simpler configuration, management, and provisioning for both Internet service providers and end-user customers.

Common MPLS Applications Available with Cisco IOS Software

- Traffic engineering is enabled through MPLS mechanisms that allow traffic to be directed through a specific path, which may not necessarily be the least-expensive path. Network managers can implement policies to ensure optimal traffic distribution and improve overall network utilization
- Guaranteed bandwidth is a value-added enhancement to traditional traffic-engineering mechanisms. MPLS lets service providers deliver guaranteed pipes and bandwidth allocations. Guaranteed bandwidth also allows bookkeeping of quality-of-service (QoS) resources to traffic engineer both premium and best-effort traffic such as voice and data
- Fast reroute (FRR) allows extremely quick recovery if a node or link fails. Such fast recovery prevents end-user applications from timing out and also prevents loss of data
- MPLS VPNs greatly simplify service deployment compared to traditional IP VPNs. As the number of routes and customers increases, MPLS VPNs easily scale, while providing the same level of privacy as Layer 2 technologies. In addition, they can transport non-unique IP addresses across a public domain
- MPLS class-of-service (CoS) capability ensures that important traffic is given the appropriate priority over the network and that latency requirements are met. IP QoS mechanisms can be seamlessly implemented in an MPLS environment

MPLS Mechanisms

Cisco IOS MPLS delivers both traffic engineering (TE) and VPN solutions built on the following mechanisms:

- Cisco AutoBandwidth Allocator: Automatically increases or decreases MPLS TE tunnel bandwidth based on measured traffic load
- Constraint-based Routing Label Distribution Protocol (CR-LDP): A signaling mechanism used to support TE across a MPLS backbone
- Fast Reroute (FRR): Enables quick recovery in case of link failures, which prevents end-user applications from timing out and also prevents loss of data
- Label Distribution Protocol (LDP): Provides communication between edge and core devices. It assigns labels in edge and core devices to establish Label Switched Paths (LSPs) in conjunction with routing protocols such as OSPF, IS-IS, EIGRP, or BGP
- Transmission Control Protocol (TCP): Connection-oriented transport-layer protocol that provides reliable full-duplex data transmission. Part of the TCP/IP protocol stack

For More Information

See the Cisco IOS MPLS Web site: **http://www.cisco.com/go/mpls**

IP Multicast and Multicast Solutions

IP Multicast is a bandwidth-conserving technology that reduces traffic by simultaneously delivering a single stream of information to thousands of corporate recipients and homes. Applications that take advantage of multicast technologies include video conferencing, corporate communications, distance learning, and distribution of software, stock quotes, and news.

Multicast technology is key to preventing severe network slowdown and Cisco IOS Multicast is the gateway to Internet broadcasting applications. Internet service providers (ISPs) and content providers use Cisco IOS multicast solutions successfully to host events such as live concerts, radio shows, and football games.

Another application of multicast technologies relates to replacing dedicated point-to-point telephone/voice circuits and specialized bridging and mixing multi-user audio conferencing telephone equipment for “always-on” service (referred to in some industries as “Hoot & Holler” systems). This ability eliminates the need for dedicated, costly, overlay voice networks and point-to-point telephone company circuits, and allows the same capabilities to be implemented over a converged IP network without requiring users to dial in.

Multicast Solutions

Cisco IOS Multicast solutions are classified as Multicast-Lite, Core Multicast, and Enhanced Multicast, and are the building blocks for Internet broadcast. Customers can start with Multicast-Lite, then add more sophisticated interactive communication capabilities, as needed.

- Multicast-Lite provides for one-to-many broadcast capability with no back channel. This solution is eminently suitable for content distribution and broadcasting over the Internet. It does not require setting up of source discovery across domains and autonomous systems. Multicast Lite includes Protocol Independent Multicast version 2 (PIMv2), Internet Group Management Protocol (IGMPv1/v2/v3) or Universal Resource Locator Rendezvous Directory (URD).
- Core Multicast provides interactive, reliable campus multicast for interactive distance learning, corporate videoconferencing, inventory updates, software distribution, and content distribution. Core Multicast includes PIM, IGMP, Cisco Group Management Protocol (CGMP), and now Pragmatic General Multicast (PGM).
- Enhanced Multicast provides interactive Internet Multicast across domains for network gaming, inter-company conferencing, Internet software distribution, and extranet content distribution. Enhanced Multicast includes Multicast Border Gateway Protocol (MBGP) and Multicast Source Discovery Protocol (MSDP) in addition to all the protocols supported in Core Multicast.

Multicast is available across all Cisco IOS Software-based platforms, including Cisco routers and Catalyst family switches. Multicast-supported routing platforms include the following: Cisco 1600, 2500, 2600/2600XM, 3600, 3700, 3800, 7200, 7500, and 12000 series; it also is available on Catalyst 6000 and 8500 platforms.

Multicast Features

Cisco has the greatest depth of experience with IP Multicast in the industry, and offers multicast features such as:

Bi-dir PIM	An extension to the PIM suite of pdocols that implements shared sparse trees with bi-directional flowof data.
Cisco Group Management Protocol (CGMP)	Cisco-develbped protocol that allows Layer 2 switches to leverage IGMP information on Cisco routers tomake Layer 2 forwarding decisions.
Internet Group Management Protocol v2 (IGMP)	Used by IP routers and their immediately connectedhosts to communicate multicast group membership states: • Query: IGMP messages originating from the router(s) to elict multicast group membership information from its connected hosts • Report: IGMP messages originatingfrom the hosts that are joining, maintaining or leaving their membership in a multicast group
Internet Group Management Protocol v3 (IGMP)	Version 3 of IGMP adds support for "source filtering," that is, the ability for a system to report interest in receiving packetsonly from specific source addresses, or from all but specific source addresses, sent to a particular multicast address.
IGMP Snooping	Requires the LAN switch to examine, or "snoop," some Layer 3 information in the IGMP packet sent from the host to the router. When the switch hears an IGMP Report from a host for a particular multicast group,the switch adds the host's port number to theassociated multicast table entry. When it hears an IGMP Leave Group message from a host, it removes the host's port from the table entry
Inter domain Multicast	Supportsinter-domain routing and source discovery across the Internet or across multiple domains comprising an enteprise
Intra domain Multicast	Supports mukicast applicationswithin an enterpise campus
Multicast Source Discovery Protocol (MSDP)	A mechanism to connect multiple PIM sparse-mode (SM) domains. MSDP allows multicast sources for a group to be known to all rendezvous point(s) (RPs) in different domains.
Multicast Routing Monitor (MRM)	A managementdiagnostictool that provides network fault detection and isolation in a large multicast routing infrastructure
Multi-protocol Extensions for Border Gateway Protocol (MBGP)	Also known as BGP+, MBGP adds capabilties to BGP to enable mukicast routing policy throughoutthe Internet and to connect multicast topologieswithin and between BGP autonomous systems.
Pragmatic General Multicast (PGM)	A reliable multicast transport protocol for applications that require ordered, duplicate-free, multicast data delivery from multiple sources to multiple receivers. PGM guaranteesthat a receiver in a multicast group either receives all data packets from transmissions and retransmissions, or can detect unrecoverable data packetloss.
Protocol Independent Multicast (PIM)	A multicast routing architecture that enables IP multicast routing on existing IP networks: • SM = Spare Mode (RFC 2362): Relies upon an explicitly joining method beforeattempting to send multicast data to receivers of a multicast group. • DM = Dense Mode (Internet Draft Spec): Actively attempts to send multicast data to all potential receivers (flooding) and relies upon their self-pruning (removal from group) to achieve desired distribution.
Unidirectional Link Routing (UDLR) Protocol	A routing protocol that provides a way to forward multicast packets over a physical unidirectional interface (such asa satellite link of high bandwidth) to stub networks that have a back channel
URL Rendezvous Directory (URD)	Directly provides the network with information about the specificsource of a content stream. It enablesthe network to quickly establish the most direct distribution path from the source to the receiver, thus significantly reducing the time and effort required in receiving the streaming media. URD allows an applicationto identify the source of the contentstream through a web page link or web directly.

For More Information

See the Multicast Web site: **http://www.cisco.com/go/multicast**

IPv6

Internet Protocol version 6 (IPv6), most notably offers expanded IP addresses to accommodate the proliferation of Internet devices such as personal computers, personal digital assistants, wireless devices, and new Internet appliances—and the expansion of Internet access, particularly "always-on" connections throughout the world. IPv6 also provides integrated auto-configuration for "plug-and-play" capabilities, enhanced mobility and end-to-end security.

Incorporating IPv6 into Cisco IOS Software further enables growth of the Internet and expansion into new applications and capabilities, while maintaining compatibility with existing Internet services. Cisco's IPv6 solution was first made available in Cisco IOS Software Release 12.2(1)T. Platforms supported include: Cisco 800, 1700, 2500, 2600/2600XM, 3600, 7100, 7200, and 7500 Series Routers, and Cisco AS5300 and AS5400 Universal Access Servers.

For more information

See the Cisco IOS IPv6 Web site: **http://www.cisco.com/go/ipv6**

Cisco IOS Software Release Process

There are three categories of Cisco IOS Software releases: Early Deployment, Major, and General Deployment (GD) releases.

- Early Deployment releases (i.e. T, S, X, E release families)—Provide advanced networking technologies to customers for delivery of leading-edge Internet applications. These offer new software capabilities, new platforms, and interface extensions. Customers for whom receiving a new feature is critical to their competitive advantage will benefit from these releases
- Major releases (i.e. Release 12.2)—Consolidate features, platform support, and functionality from early deployment releases, and emphasize stability. Regular maintenance releases do not introduce new functionality or platform support, but provide continuous improvement and greater quality, leading to general deployment
- General Deployment certification (i.e. Release 12.0) Releases—Have had extensive market exposure in a wide range of network environments and are qualified through extensive metrics that analyze stability, software defect trends, and customer satisfaction surveys. Used for major, business-critical applications

At some point, GD releases are replaced by newer releases with the latest networking technologies. A release retirement process has been established with three principal milestones: End of Sales (EOS), End of Engineering (EOE), and End of Life (EOL).

For More Information on Cisco IOS Software

See the Cisco IOS Software Web site: **http://www.cisco.com/go/ios**

Cisco Network Management Overview

Cisco is transforming traditional network management by focusing on the strengths of Internet-based architectures for greater accessibility and simplification of network management tools, tasks, and processes. Cisco's network management strategy calls for a Web-based model with the following characteristics:

- Simplification of tools, tasks, and processes
- Web-level integration with NMS platforms and general management products
- Capable of providing end-to-end solutions for managing routers, switches, and access servers
- Creation of a management intranet by integrating discovered device knowledge with CCO and third-party application knowledge

Cisco Network Management Products

The CiscoWorks product line offers a set of solutions designed to manage the enterprise network. These solutions focus on key areas in the network such as; optimization of the wide area network (WAN), administering switch-based local area networks (LAN), securing remote and local virtual private networks, and measuring service level agreements within all types of networks. The expanding CiscoWorks product line offers the flexibility to deploy end-to-end network management when and where it is needed.

CiscoWorks Small Network Management Solution

CiscoWorks SNMS is a new network management solution aimed at small to medium businesses (SMB), with 20 or fewer switches, routers, hubs and access servers. CiscoWorks SNMS can also monitor non-Cisco IT assets such as servers, applications, services and printers. CiscoWorks SNMS is an ideal solution for companies that need centralized network management to help optimize performance and maximize network productivity.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks Small Network Management Solution	• Simple integrated installation,autodiscovery and automated import of devices using SNMP • Standards-based multi vendor management • Reduce the time and complexity of keeping the networks' configuration, software version and connectivity optimized

Also available for small and medium size customers is the CiscoWorks for Windows (CWW). CWW includes all the features above except for CiscoWorks Resource Manager Essentials (Essentials) which provides additional functionality that allows the customer to of build and maintain an up-to-date hardware and software inventory for up to 20 devices in a network.

Key Features

- Monitors and reports on hardware, configuration, and inventory changes
- Provides a wizard-based approach for managing and deploys configuration changes and software image updates to multiple Cisco devices
- Allows configuration changes to be performed against multiple switches or routers in the network
- Provides software update analysis reports showing prerequisites and impacts of proposed updates
- Provides a comprehensive audit of network changes, showing who changed what, when, and how
- Summarizes syslog events by severity or user criteria for switches, routers, and Cisco IOS and PIX firewalls
- Discovery and mapping wizard displays customizable vector-based graphics and hierarchical maps of networked devices

CiscoWorks Small Network Management Solution Components

CiscoWorks Small Network Management Solution includes the following tools:

- CiscoView 5.3—Provides graphical back and front panel views of Cisco devices; dynamic, color-coded graphical displays to simplify device-status monitoring, device-specific component diagnostics, device configuration, and application launching
- WhatsUp Gold 7.0 from Ipswitch, Inc.—Provides network discovery, mapping, monitoring, and alarm tracking
- Resource Manager Essentials 3.3.2—Resource Manager Essentials (RME) provides tools for building and managing network inventory, deploying configuration and software image changes, archiving configurations, and providing an audit trail of network changes

Important: RME has a device limit of 20 or fewer Cisco devices.

Specifications

Feature	CiscoWorks Small Network Management Solution
Hardware Requirements	2 Pentium III or better-based IBM PC or compatible computer, 256 MB RAM total, 4 GB free hard drive space
Software Requirements	Windows 2000 with SP1 or 2 (Professional or Sever), Netscape 4.77, 4.78 or Internet Explorer 5.5 with Service Pack 1

Selected Part Numbers and Ordering Information

CiscoWorks Small Network Management Solution	
CWSNM-1.0-WIN	Small Network Management Solution 1.0 for Windows; includes WhatsUp Gold 7.0, Resource Manager Essentials 3.3.2 (20 Cisco Device restriction), CiscoView 5.3

For More Information

See the CiscoWorks Small Network Management Solution Web Site:
http://www.cisco.com/go/wrsnms

CiscoWorks Routed WAN Management Solution

The RWAN solution addresses the needs of managing WANs by improving the accuracy, efficiency, and effectiveness of your network administrators and operations staff while increasing the overall availability of your network through proactive planning, deployment, and troubleshooting tools. The CiscoWorks Routed WAN Management Solution provides increased visibility into network behavior, assists in quickly troubleshooting performance bottlenecks, and provides comprehensive tools to easily administer new software and configuration changes for optimizing bandwidth and utilization across expensive and critical links in the network.

When to Sell

Sell This Product	When a Customer Needs These Features
Routed WAN Management Solution	• Optimize router performance by automatically streamlining access control lists, and applying policy-based changes via templates • Understand the responsiveness of WAN connections to determine where bottlenecks are; provides real-time analysis of end-to-end hop delays • Increase network performance by monitoring traffic of protocols, applications, and interface characteristics • A watchdog system to monitor WAN characteristics • An accurate inventory baseline; including memory, slots, software versions, and boot ROMs needed to make decisions • Automate the process of updating device software and configuration • Graphically displays a devices operational status with tools to monitor its activity or change its configurations • Support for secure browser communications and downloads from CiscoView, RME and ACLM via Secure Socket Layer(SSL) or Secure Shell (SSH) protocol

Key Features

- Access Control List Manager—Provides a wizard and policy template-based approach to simplifying the setup, management, and optimization of Cisco IOS Software-based IP and Internetwork Packet Exchange (IPX) traffic filtering and device access control
- Internetwork Performance Monitor—Used to diagnose latency, identify network bottlenecks, and analyze response times
- Resource Manager Essentials—Provides the tools needed to manage Cisco devices. It includes inventory and device change management, network configuration and software image management, network availability, and syslog analysis
- CiscoView—Provides back- and front-panel displays; dynamic, color-coded graphical displays simplify device-status monitoring, device-specific component diagnostics, and application launching
- CiscoWorks Server—Provides the common management desktop services and security across the CiscoWorks family of solutions. It also provides the foundation for integrating with other Cisco and third-party applications
- Support for secure browser communications with CiscoView and RME sessions via Secure Socket Layer (SSL) and Secure Shell (SSH) protocol

Specifications

Feature	Routed WAN Management Solution Requirements
Server	Sun UltraSPARCIII (Sun Blade1000 Workstation or Sun Fire 280R Workgroup Server) IBM PC compatible with 550-MHz or higher Pentium III processor running (Dual processor system required for hosting multiple management solutions) Microsoft Windows2000 Server or Professional Edition with Service Pack 2, Solaris 2.8
Client	IBM PC-compatible computer with 300-MHz or higher Pentium processor, Sun Ultra 10, HP9000 Series, IBM RS/6000 Windows NT 4 (Workstation and Server) with Service Pack 6a, Windows 98, 2000 Professional and Server with Service Pack 2; Solaris 2.7, 2.8; HP-UX 11.0; AIX 4.3.3 IBM PC-compatible computer with 300-MHz or higher Pentium processor, Sun Ultra 10, HP9000 Series, IBM RS/6000
Supported Devices	Most Cisco IOS Software routers, access servers, hubs, and switches
Supported Cisco IOS Software Versions	Generally supports Cisco IOS Software Versions 10.3 and above; Catalyst Supervisor code 2.1 and above Note: Some CiscoWorks applications require specific versions of IOS and CAT these releases in order to operate; please see the specific application documentation and releas notes for more information.

Selected Part Numbers and Ordering Information[1]

Cisco Routed WAN Management Solution

CWRW-1.2-K9	Routed WAN Management Solution 12 for Windows and Solaris platforms; includes Access Control List Manager 1.4, Internetwork Performance Monitor 2.4, Resource Manager Essentials 3.4, CD One 5th Edition (IncludesCiscoView 5.4)
CWRW-1.2-P1-K9	Cross Bundle Discount RWAN 1.2 for Windows and Solaris platforms; available to customers who have previously purchased LMS 1.X or LMS 2.X and want to add RWAN
CWRW-1.2-MR-K9	Maintenance kit for customers that purchased RWAN 1.X and now want new device support and code upgrades; kit includes support for Windows and Solaris platforms; includes updates to all components

[1] This is only a small subset of all parts available via URL listed under "For More Information." Some parts have restricted access or are not available through distribution channels.

For More Information

See the Routed WAN Management Solution Web site: **http://www.cisco.com/go/rwan**

CiscoWorks LAN Management Solution

The CiscoWorks LAN Management Solution consists of operationally focused tools. These tools include fault management, scalable topology views, sophisticated configuration, Layer 2/3 path analysis, voice-supported path trace, traffic monitoring, end-station tracking workflow application servers management, and device troubleshooting capabilities. CiscoWorks LMS combines applications and tools for configuring, monitoring, and troubleshooting the campus network.

When to Sell

Sell This Product	When a Customer Needs These Features
LAN Management Solution	• A set of tools for managing Cisco's award winning Catalyst switches • Time saving user tracking and path trace analysis tools with support of IP phones • Automated process of inventorying network devices, updating device software, and managing configuration to reduce the time and errors involved in network updates • Browser-accessible, graphical tool for configuring and monitoring Cisco device components and operational status • VLAN, ATM, or LANE service management tools • RMON traffic monitoring and analysis capability • Active fault monitoring of Cisco devices

Key Features

- Campus Manager—Web-based applications designed for managing Layer 2 device and connectivity discovery, workflow application server discovery and management, detailed topology views, virtual LAN/LAN Emulation (VLAN/LANE) and ATM configuration, end-station tracking, Layer2/3 path analysis tools, and IP phone user and path information
- Device Fault Manager—Provides real-time fault analysis for Cisco devices, automatically includes Cisco devices into its monitoring environment and applies a Cisco "Best Practices" fault rule to each device
- nGenius Real Time Monitor—Web-enabled multiuser traffic management tool set that provides access to network-wide, real-time RMON information for monitoring, troubleshooting, and maintaining network availability
- Resource Manager Essentials—Provides the tools needed to manage Cisco devices. It includes inventory and device change management, network configuration and software image management, network availability, and syslog analysis
- CiscoView—Provides back- and front-panel displays; dynamic, color-coded graphical displays simplify device-status monitoring, device-specific component diagnostics, and application launching
- CiscoWorks Server—Provides the common management desktop services and security across the CiscoWorks Family of solutions. It also provides the foundation for integrating with other Cisco and third-party applications
- Support for secure browser communications with CiscoView and RME sessions via Secure Socket Layer (SSL) and Secure Shell (SSH) protocol

Specifications

Feature	Description
Server	Sun UltraSPARCIII (Sun Blade 1000 Workstation or Sun Fire 280R Workgroup Server) IBM PC compatible with 550-MHz or higher Pentium III processor running (Dual processor system required for hosting multiple management solutions) Microsoft Windows 2000 Server or Professional Edition with Service Pack 2, Solaris 2.8
Client	IBM PC-compatible computer with 300-MHz or higher Pentium processor, Sun Ultra 10, HP9000 Series, IBM RS/6000 Windows NT 4 (Workstation and Server) with Service Pack 6a, Windows 98, 2000 Professional and Server with Service Pack 2; Solaris 2.7, 2.8; HP-UX 11.0; AIX 4.3.3 Internet Explorer v5.5 with Service Pack 2, 6.0; Netscape 4.76, 4.77, 4.78, 4.79
Supported Cisco Devices	Most Cisco IOS Software routers, access servers, hubs, and switches
Supported Cisco IOS Software Versions	Generally Cisco IOS Software Versions 10.3 and higher Catalyst Supervisor code 2.1 through 4.1 Note: Some CiscoWorks applications require certain versions of IOS and CAT these releases in order to operate, please see the specific application documentation and release notes for more information.

CiscoWorks VPN/Security Management Solution

CiscoWorks VPN/Security Management Solution (VMS), an integral part of the SAFE Blueprint for network security, combines Web-based tools for configuring, monitoring, and troubleshooting enterprise virtual private networks (VPNs), firewalls, and network and host-based intrusion detection systems (IDS). It offers the ability to monitor remote access links, and IPSec based site to site VPN's links. VMS is a Web-based solution that provides a "dashboard" view of critical VPN resources and their performance, VPN hardware and configuration and troubleshooting reports.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks VPN/Security Management Solution	• Complete management of a SAFEinfrastructure environment • Configuring andmonitoring VPN, PIX, IOS routers, and IDS devices. • Monitoring large remote access, and site-to-site hub and spoke VPNs from a single management console and focus on problem areas and performance.

Key Features

- Management and Monitoring Centers—Supplies the latest in management functionality and multifaceted scalability by offering features such as a consistent user experience, auto update, command and control workflow, and role-based access control. The management and monitoring centers include Management Center for PIX Firewalls, Management Center for IDS Sensors, Management Center for VPN Routers, and Monitoring Center for Security and Management center for PIX Firewalls (downloadable from CCO Software Center Fall 2002)
- VPN Monitor—Allows network administrators to collect, store, and view information on IPSec VPN connections for remote-access or site-to-site VPN terminations. Multiple devices can be viewed from an easy-to-use dashboard that is configured using a Web browser
- Cisco IDS Host Sensor Console—Provides real-time analysis and reaction to network hacking attempts by identifying an attack and preventing access to critical server resources before any unauthorized transactions occur

- Cisco Secure Policy Manager (CSPM)—Provides scalable, powerful policy-based security management system for Cisco firewalls and IPSec VPN routers which allows a customer to define, distribute, enforce, and audit network-wide security policies from a central location
- Resource Manager Essentials (RME)—Provides the tools needed to manage Cisco devices. It includes inventory and device change management, network configuration and software image management, network availability, and syslog analysis
- CiscoView—Provides back- and front-panel displays; dynamic, color-coded graphical displays simplify device-status monitoring, device-specific component diagnostics, and application launching
- CiscoWorks Server—Provides the common management desktop services and security across the CiscoWorks family of solutions. It also provides the foundation for integrating with other Cisco and third-party applications
- Support for secure browser communications with CiscoView and RME sessions via Secure Socket Layer (SSL) and Secure Shell (SSH) protocol

Specifications

Feature	CiscoWorks VPN/Security Management Solution
Server Hardware Requirements	IBM PC-compatible computerwith 1-GHz or faster Pentium processor Sun UltraSPARC 60 MP with 440-MHz or faster processor Sun UltraSPARCIII (Sun Blade 1000 Workstation or Sun Fire 280R Workgroup Server)
Server Software Requirements	Windows 2000 Professional, Windows 2000 Server (Service Pack 2) Sun Solaris 2.7, 2.8
Client Hardware Requirements	IBM PC-compatible computer with 300-MHz or faster Pentium Solaris SPARCstation or Sun Ultra 10
Client Software Requirements	Windows 98, Windows NT 4.0, or Windows 2000 Server or Professional Edition with Service Pack 2 Solaris 2.7, 2.8
Browser Requirements	Internet Explorer 6.0 or 5.5 with Service Pack 2, on Windows 2000 Server or Professional Edition, Windows 98, and Windows NT 4.0. Netscape Navigator 4.79, on Windows 2000 Server or Professional Edition and Windows98. Netscape Navigator 4.76 on Solaris 2.7, 2.8.

CiscoWorks IP Telephony Environment Monitor

CiscoWorks IP Telephony Environment Monitor (ITEM) is a bundled suite of management applications that helps ensure the manageability of converged networks that support Cisco IP telephony and IP telephony data applications. ITEM tracks the health of Cisco IP telephony environments by proactively monitoring the Cisco elements that support voice in the network to alert operations personnel of potential problems in order to minimize IP telephony service interruption.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks IP Telephony Environment Monitor	• Network managers who need to effectively manage their converged networks while maintaining high confidence that their IP telephony environments are performing as expected • Network Managers who need to use synthetic traffic (replicating key forms of network activity associated with VoIP and IP telephony) to enable around-the-clock monitoring of key voice elements in the network

Key Features

- Cisco Voice Health Monitor (VHM)—tracks the health of Cisco IP telephony environments by proactively monitoring Cisco voice elements in the network to alert operations personnel to potential problems and helps to minimize IP telephony service in network downtime. VHM leverages and requires the services of DFM while providing sophisticated capabilities of its own to ensure timely information on the health of IP telephony environments
- Cisco Device Fault Manager (DFM)—DFM provides real-time fault detection and determination about the underlying Cisco IP fabric on which the IP telephony implementation executes. DFM reports faults that occur on Cisco network devices, often identifying problems before users of network services realize that a problem exists
- CiscoView—CiscoView is a web-based graphical device-management technology and is the standard for managing Cisco devices, and providing back and front panel displays. Features include: Real-time monitoring of key information relating to device performance, traffic, and usage, with metrics such as utilization percentage, frames transmitted and received, errors, and a variety of other device-specific indicators

Optional Drop-In Modules

Fault History Manager

Fault History is an optional drop-in module (downloadable from CCO) that provides a web-based tool to access historical fault and alert data from a database. The user has several filtering options that can facilitate the search for specific information.

IP Phone Information Utility

The IP Phone Information Utility is an optional drop-in module (downloadable from CCO) that provides a web-based tool to show detailed information about individual IP telephone. The operator can access the IP phone information by using its extension number, IP address, and/or MAC address. This utility bases its information on the devices created in VHM.

IP Phone Help Desk Utility

The IP Phone Help Desk Utility is an optional applet (downloadable from CCO) that provides a MS Windows 2000 desktop tool to show summary information about individual IP telephone. The help desk operator can access the IP phone information by using its extension number (or can configure the application to search by IP or MAC addresses). This utility requires a connection to an ITEM server running VHM with the IP Phone Information Utility installed.

Gateway Statistics Utility

When available, the Gateway Statistics Utility is an optional drop-in module (downloadable from CCO) that provides a web-based tool to collect performance and behavior statistics about CCM-controlled IP telephony gateways. This statistical information can be subsequently exported for processing by reporting packages for capacity planning and trending information.

Specifications

Feature	CiscoWorks IP Telephony Environment Manager
Server Hardware	IBM PC-compatible wth 1 GHz or higher Pentium IV processor UNIX (If DFM is on Unix platform; Sun UltraSPARCIII (Sun Blade 1000 Workstation or Sun Fire 280R Workgroup Server) (Dual processor system required for hosting multiple management solutions)
Server Software	Windows 2000 Server or Professional Edition with Service Pack 2 Solaris 2.8
Client	IBM PC-compatible computer with 300 MHz or higher Pentium processor Windows NT 4 (Workstation & Server) with Service Pack 6a, Win 98 or Windows 2000 Professional & Server with Service Pack 2 Windows 98/NT/2000: Netscape v4.77, 4.78, 4.79 Windows 98/NT/2000: Internet Explorer v5.5 with Service Pack 2, 6.0

Selected Part Numbers and Ordering Information

CiscoWorks IP Telephony Environment Monitor

CWITEM-1.3-WIN-K9	CiscoWorks IP Telephony Environment Manager 1.3 for Windows Add-On for existing LMS 2.X and DFM 1.1 customers; includes VHM only
CWITEM-1.3-WIN-UP	CiscoWorks VoIP Health Monitor 1.0 Add-On for existing LMS 2.0 and DFM 1.1 customers; includes VHM only
CWITEM-1.3-MR-K9	Maintenance kit for customers that purchased CiscoWorks VoIP Health Monitor 1.0 and now want the new ITEM 1.3 device support and minor updates; kit includes support for Windows platforms only; includes updates to all components

For More Information

See the CiscoWorks IP Telephony Environment Monitor Web site at:
http://www.cisco.com/go/cwvoip

CiscoWorks Voice Manager for Voice Gateways

CiscoWorks Voice Manager for Voice Gateways (CVM) is a client-server, web-based voice management and reporting solution. The application provides enhanced capabilities to configure and provision voice ports, and create and modify dial plans on voice-enabled Cisco routers for voice over IP (VoIP), voice over Frame Relay (VoFR), and voice over ATM (VoATM) network deployments.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks IP Telephony Environment Monitor	• Network managers who need to maintaina distributed network architecture for increased scalability • Network Managers who need to manage multiple customernetworks from one common server

7922
3

Key Features

- Web interface management of voice ports and dial plan generation and management—Create and manage local dial plans and VoIP, VoFR, and VoATM network dial plans
- Report generation—Enhance graphical reporting capabilities with the software provided by an alliance with Telemate.Net (WIndows NT), a leading developer of enterprise information management tools; optional capabilities for enhanced reports, custom report creation, and multiple data source record collection exists.
- Optional capabilities to provide reporting on other data sources such as private branch exchanges (PBXs) and selected firewalls
- CiscoView—CiscoView is a web-based graphical device-management technology and is the standard for managing Cisco devices, and providing back and front panel displays. Features include: Real-time monitoring of key information relating to device performance, traffic, and usage, with metrics such as utilization percentage, frames transmitted and received, errors, and a variety of other device-specific indicators

Specifications

Feature	CiscoWorks Voice Manager for Voice Gateways
Server Hardware Requirements	256 MB of memory; 8-GB available hard disk space CPU running at 450 MHz (for WindowsNT) Sun Sparc/Ultra @333 MHz (for Solaris)
Server Software Requirements	Windows NT 4.0 with Service Pack 5 CiscoWorks CD One 4th Edition for WindowsNT
Client Hardware Requirements	64 MB of memory CPU running at 300 MHz
Client Software Requirements	Windows 95 running Netscape4.04 or Internet Explorer 4.01 and 64 MB of virtual memory Windows NT running Netscape 404 or Internet Explorer 4.01 and 64 MB of virtual memory Solaris running Netscape 404 with Telnet and Java enabled and 64 MB of virtual memory

Selected Part Numbers and Ordering Information[1]

CiscoWorks Voice Manager for Voice Gateways 2.1 9

CWVM-2.1	Voice Manager 2.1 for Windows & Solaris; includes Voice Manager 21 and CD One 4th Edition (CiscoView 5.3 and the October2001 Java patch update)
CWVM-2.1-UPG	Upgrade kit for CWVM 1.X customers wanting to upgrade to CVM 2.1; kit includes support for both Windows and Solaris platforms
CWVM-2.1-UPT	Minor updates to CWVM 2.1 for Windows and Solaris from CWVM 2.X; update includes support for both Windows and Solaris platforms

CiscoWorks QoS Policy Manager

QoS Policy Manager allows you to centrally define and administer IOS and CAT parameters needed for differentiating network traffic. This ensures high availability and predictable performance for business-critical which rely on advanced voice and video services. Cisco QoS Policy Manager (QPM) 3.0 is a key enabler of end-to-end QoS for converged networks. It delivers differentiated services across network infrastructures with converged voice, video, and data applications, simply by taking advantage of Cisco IOS and Catalyst OS Software with built-in QoS mechanisms in LAN and WAN switching and routing equipment.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco QoS Policy Manager	• End-to-end QoS configurationand automated, reliable policy deployment while eliminating device-by-device command streams • Rules-based policiesthat combine static and dynamic port applications and host system traffic filters • QoS Policy Manager's services, including congestion management & avoidance, and traffic-shaping • Efficientlytranslate polcies to specific QoS config commands,ensuring consistency across domains • Validate polcies prior to deploying them quickly and reliably to LAN and WAN policy domains • Generate Web-based reportson QoS policiesdeployed in the network

Key Features

- Provides baseline monitoring which profiles traffic by top applications and a small number of classes before QoS deployment
- Validates QoS deployments by obtaining detailed feedback on traffic patterns after QoS at different points in the network
- Provides statistics related to QoS policies which include traffic matching NBAR filters and action statistics
- Supports CBQoSMIB and CAR MIB
- IP Telephony templates provide pre-defined QoS policies that ensure strict priority for voice traffic in Enterprise networks
- Delivers the appropriate service-level to business-critical applications by supporting the extension of IP packet classification to include application signature, Web URLs, and negotiated ports
- Extend security by defining access control policies to permit or deny transport of packets into or out of device interfaces
- Allows QoS policy validation checking, uploading of existing device configuration, previewing configuration changes, incremental ACL updates, and managing policy distribution

Specifications

Feature	Cisco QoS Policy Manager
Server Hardware Requirements	IBM PC-compatible computerwith 1-GHz or faster Pentium processor Sun UltraSPARC 60 MP with 440-MHz or faster processor Sun UltraSPARCIII (Sun Blade 1000 Workstation or Sun Fire 280R Workgroup Server)
Server Software Requirements	Windows 2000 Professional, Windows 2000 Server (Service Pack 2) Sun Solaris 2.7, 2.8
Client Hardware Requirements	IBM PC-compatible computer with 300-MHz or faster Pentium Solaris SPARCstation or Sun Ultra 10Complete
Client Software Requirements	Windows 98, Windows NT 4.0, or Windows 2000 Server or Professional Edition with Service Pack 2 Solaris 2.7, 2.8
Browser Requirements	Internet Explorer 6.0 or 5.5 with Service Pack 2, on Windows 2000 Server or Professional Edition, Windows 98, and Windows NT 4.0. Netscape Navigator 4.79, on Windows 2000 Server or Professional Edition and Windows 98. Netscape Navigator 4.76 on Solaris 2.7, 2.8.

Cisco Ethernet Subscriber Solution Engine

The Cisco Ethernet Subscriber Solution Engine (ESSE) is a hardware-based management system for metro access networks that use the Cisco ONT 1000 Gigabit Ethernet Series Optical Network Terminator. The Cisco ESSE enables complete remote management and troubleshooting of the customer demarcation point for Ethernet over fiber. Remote management and diagnostics reduce operating expenses and increase profitability by eliminating the need for unnecessary visits to the customer premises. The Cisco ESSE runs on the Cisco 1105, which is one rack unit (1RU) high, enabling you to conveniently deploy the Cisco ESSE on the same rack with the rest of your Cisco metro Ethernet network aggregation equipment.

The Cisco ESSE automatically discovers all Cisco ONT 1000 Gigabit Ethernet Series devices in the metro access network, applies the designated configuration, and instantly begins collecting statistics and management information.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Ethernet Subscriber Solution Engine	The Cisco Ethernet Subscriber Solution Engine is ideal for service providers seeking to: • Reduce operating expenses byimplementingmetro accessnetworkswith Ethernet over fiber • Reduce customeronsite visits, which are time-consuming and expensive • Perform complete remote configuration and troubleshooting of the Cisco ONT 1000 Gigabit Ethernet Series

Key Features

- Enables service providers to perform remote control of inventory, configuration, statistics, fault management, and troubleshooting on the Cisco ONT 1000 Gigabit Ethernet Series
- Full Layer 1 and Layer 2 remote configuration and monitoring of Optical Network Terminators
- Access to all Ethernet port registers and statistics on the Cisco ONT 1000 Gigabit Ethernet Series
- Easy identification of ONTs with searchable, user-defined properties such as customer name, VLAN ID, and street address

CiscoWorks Wireless LAN Solution Engine

The CiscoWorks WLSE is a specialized, daily operational solution that allows customers to manage the entire Cisco Aironet WLAN infrastructure. It offers powerful, centralized template-based configuration with user-defined device groups to efficiently configure large numbers of access points and bridges. The CiscoWorks WLSE provides centralized firmware updates to facilitate firmware changes throughout the WLAN. It monitors Access Control Server (ACS) authentication servers, supports both Cisco Extensible Authentication Protocol (LEAP) and generic RADIUS servers, and further enhances security management by detecting misconfigurations on access points and bridges. The CiscoWorks WLSE proactively monitors WLAN infrastructures and generates notifications for unavailability and performance degradation. The CiscoWorks WLSE aids in capacity planning by identifying the most used access points, and accelerates troubleshooting by generating client association reports.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks Wireless LAN Solution Engine	The CiscoWorks WLSE is ideal for enterprise customers: • Implementing large-scale Cisco Aironet WLAN infrastructures • Template-based configuration tool which can include a large number of uniform policies for Cisco access points and bridges • Access point and bridge mis-configuration alerts to minimize security vulnerabilities • Proactive fault and performance monitoring of Cisco access points, bridges, LEAP authentication server, and switches connected to theaccess points

Key Features

- Centralized template-based configuration with hierarchical, user-defined groups
- Plug and play configuration of newly deployed access points and bridges
- Centralized firmware update to facilitate firmware changes
- Access point and bridge misconfiguration alerts to minimize security vulnerabilities
- Proactive monitoring of access points, bridges, ACS authentication servers (both LEAP and generic RADIUS), and the switches connected to the access points
- Configuration and monitoring of virtual LAN (VLAN) and quality of service (QoS) on access points to maximize security and performance
- Access point usage, summary, and client association reports with XML, CSV, and PDF data export
- Secure HTML-based user interface for easy access anywhere
- Upper-layer network management system and operations support system (NMS/OSS) integration with syslog message, SNMP trap, and e-mail notifications

CiscoWorks Hosting Solution Engine

CiscoWOrks Hosting Solution Engine is a network management appliance that monitors, activates, and configures a variety of e-business services in Cisco powered data centers. It provides up-to-date fault and performance information about the network infrastructure and Layer 4-7 network services.

HSE automatically discovers the entire data center infrastructure and instantly begins collecting statistics and management information, providing a current snapshot of the managed environment. HSE provides up-to-date information for operational staff to easily pinpoint the source of a problem. HSE itself is a manageable Cisco device with a full Cisco Discovery Protocol implementation and supports Cisco MIB II.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks Hosting Solution Engine	• Ideal for enterprise and service providers with e-business data center facilties • Granular user access model to partition network resources for Layer 4-7 services and switch ports, and authorize user group access to individual application services • Robust Layer 4-7 service configuration and service activation of server load balancing devices, including virtual servers, real servers, and content ownersand rules

Key Features

- Granular user access to partition network resources for Layer 4-7 services as well as switch ports; authorize user group access to individual application services
- Robust Layer 4-7 service configuration and service activation of content switches
- Monitoring and reporting of SSL Proxy services on Cisco Catalyst 6000 Series with SSL Service Modules and Cisco Content Services Switch
- Flexible fault and performance monitoring of Cisco routers, switches, Cisco PIX® Firewalls, Cisco Content Engines, Cisco Content Switches and L4-7 services
- HTML-based, secure graphic user interface with easy customer view/report personalization and historical data reporting
- Upper layer NMS/OSS integration with SYSLOG, trap, email notifications and historical data XML export

Cisco Catalyst 6500 Series Network Analysis Module 1 and 2(with NAM software version 2.2)

The Cisco Network Analysis Module (NAM) 1 and 2, second generation high performance network analysis modules for the Cisco Catalyst 6500 Series provides network monitoring instrumentation and web-browser based traffic analysis for Catalyst based AVVID environments. The NAM enables network managers to gain application-level visibility into network traffic with the ultimate goal of improving performance, reducing failures, and maximizing returns on network investment. The new NAMs are available in two hardware versions, NAM-1 and NAM-2, to meet diverse network analysis needs in a scalable switching environment running up to gigabit speeds. The NAMs come with an embedded, Web-based traffic analyzer, which provides full scale remote monitoring and troubleshooting capabilities that are accessible through a Web browser.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 6500 Series Network Analysis Module 1 and 2 (with NAM software version 2.2)	• Needs Application-Level visibility built into the network • Provides network managers visibility into all layers of network traffic • Monitoring in a scalable switching environment that supports traffic monitoring in a scalable switching environment • Offers investment protection by interfacing with both the bus and the crossbar switching fabric-based architectures in the Cisco Catalyst 6500 Series

Key Features

- Provides application-level Remote Monitoring (RMON) functions based on RMON2 and other advanced Management Information Bases (MIBs)
- Collects statistics on both data and VoIP streams flowing through the host switch using the Switch Port Analyzer (SPAN) and NetFlow Data Export features of the Cisco Catalyst 6500 Series
- Collects data from remote switches using the remote SPAN (RSPAN) feature of the Cisco Catalyst 6500 and 4000 Series switches
- Easy to deploy and use at LAN aggregation where they can see most of the traffic, at service points where performance is critical and at important access points where quick troubleshooting is required
- Application monitoring can be done using RMON, RMON2, and several extended RMON MIBs, which can detect the applications on the network and provide detailed information about how these applications utilize the bandwidth, which hosts access those applications, and which client/server pairs generate the most traffic
- Performance management provides valuable information about the delays in server responses to client requests

Cisco Systems

Data Sheet

Cisco **1751** Modular Access Router

Cisco 1751 Modular Access Router is ideally suited to help you evolve your organization into an e-Business. It supports e-Business features such as VPNs; secure Internet, intranet, and extranet access with optional firewall technology; broadband DSL and cable connectivity; and multiservice voice/video/data/fax integration. The Cisco 1751 Modular Access Router offers:

- Flexibility to adapt to changing requirements
- Modularity that allows you to individually configure the system to meet specific business needs
- Investment protection with features and performance to support new WAN services such as broadband DSL and cable access, multiservice voice/data integration, and VPNs
- Integration of multiple network functions, including an optional firewall VPN, and data service unit/channel service unit (DSU/CSU) to simplify deployment and management

The Cisco 1751 Router delivers these capabilities with the power of Cisco IOS Software in a modular integrated access solution. The Cisco 1751 Router provides a cost-effective solution to support e-Business applications through a comprehensive feature set including support for:

- Multiservice voice/fax/data integration
- Secure Internet, intranet, and extranet access with VPN and firewall
- Integrated broadband DSL connectivity
- VLAN support (IEEE 802.1Q)

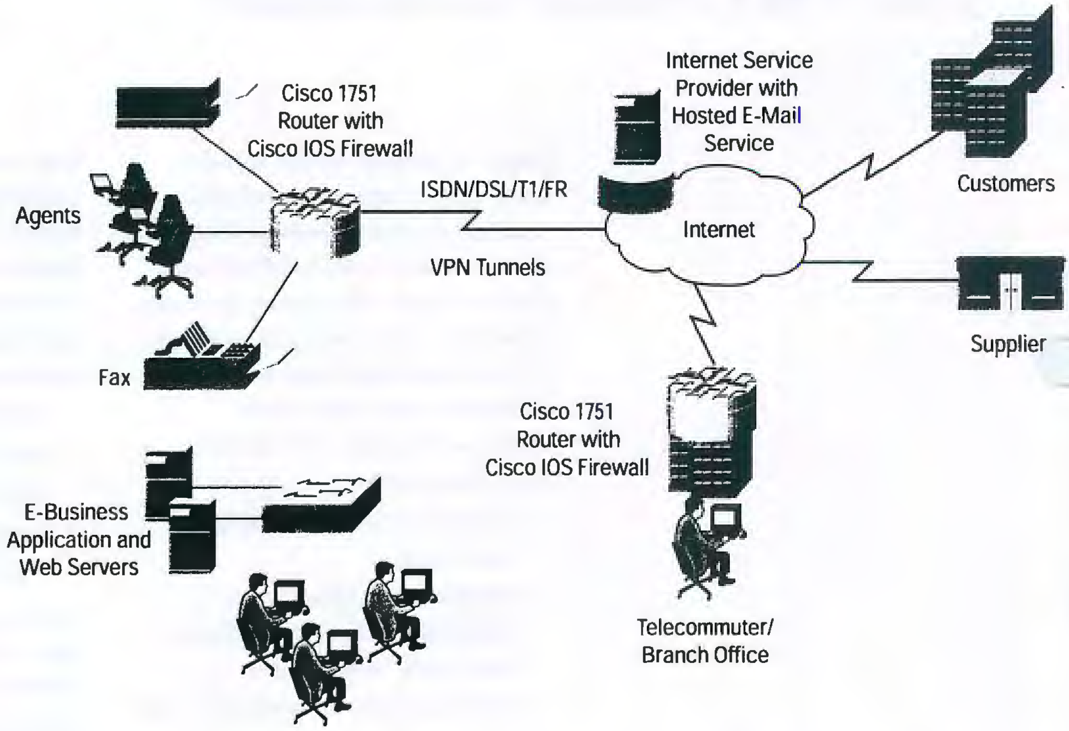
The Cisco 1751 Router, a member of the Cisco 1700 Family, features a modular architecture that enables cost-effective upgrades and additions of WAN and voice interfaces. Integrated network services and functions, such as optional firewall, DSU/CSU, and VPN features, reduce the complexity of deploying and managing e-Business solutions. The Cisco 1751 Router offers investment protection when your business needs it, with a RISC architecture and features to support new technologies and applications such as voice/video/data/fax integration and VPNs. See Figure 2.

Figure 1

The Cisco 1751 Router delivers a versatile e-Business WAN access solution.

Figure 2

Cisco 1751 Routers provide all necessary capabilities to connect to the Internet and communicate with vendors, customers, and other employees and offices.



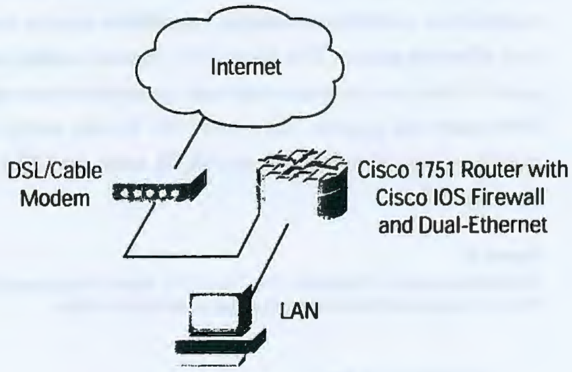
The Cisco 1751 Router is available in two models that enable you to easily tailor an access solution to suit your e-Business requirements today and in the future. See Table 1.

Table 1 The Cisco 1751 Modular Access Router

Cisco 1751 **Base Model**	Includes everything an office needs for data networking now (16 MB Flash, 32 MB DRAM, and Cisco IOS IP software feature set), with a simple upgrade path to full voice functionality. WAN interface cards are available separately.
Cisco 1751-V **Multiservice Model**	Includes all the features needed for immediate integration of data and voice services with support for up to two voice channels (32 MB Flash and 64 MB DRAM, one DSP (PVDM-256K-4), and Cisco IOS IP Plus Voice feature set). Voice and WAN interface cards are available separately.

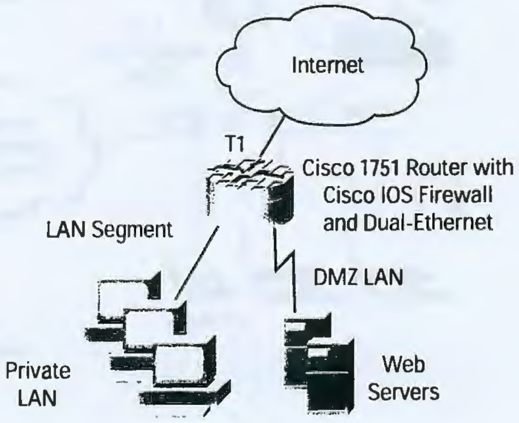
All Cisco 1751 models offer three modular slots for voice and data interface cards, an autosensing 10/100BaseT Fast Ethernet LAN port supporting standards-based IEEE 802.1Q VLAN, a console port, and an auxiliary port. The Cisco 1751 Router supports the same WAN interface cards as the Cisco 1600, 1700, 2600, and 3600 Series routers, and the same voice interface cards and voice-over-IP (VoIP) technology as the Cisco 1700, 2600, and 3600 Series routers. This simplifies support requirements. The WAN interface cards support a wide range of services, including synchronous and asynchronous serial, Integrated Services Digital Network Basic Rate Interface (ISDN BRI), ADSL, and serial with DSU/CSU options for primary and backup WAN connectivity. The voice interface cards support Foreign Exchange Office (FXO), Foreign Exchange Station (FXS), Network and User Side Voice BRI (ISDN BRI NT/TE), Ear & Mouth (E&M), direct inward dial (DID), and T1/E1 Multiflex VWICs. Additionally, an Ethernet interface card provides the Cisco 1751 Router with dual-Ethernet capability to support the external broadband modem devices. See Figure 3.

Figure 3
Cisco 1751 Router Incorporating Ethernet WAN Interface Card (WIC) Deployed with Broadband Modem



In addition, dual-Ethernet capability on the Cisco 1751 Router enables the creation of perimeter/DMZ (demilitarized zone) LANs to enhance security by physically separating private and public data. See Figure 4.

Figure 4
Cisco 1751 Router Incorporating Ethernet WIC to Deploy Perimeter/DMZ LAN



Combined, these interfaces support a comprehensive set of applications, including multiservice voice/video/data/fax integration, Frame Relay, ISDN BRI, SMDS, X.25, broadband DSL and cable services, and VPNs.

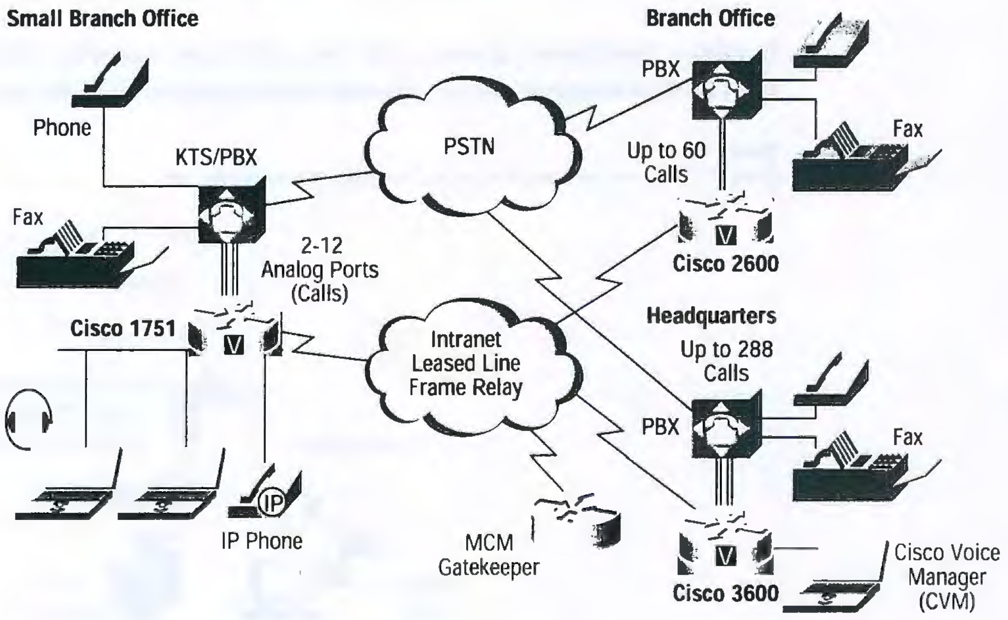
Key Benefits

The Cisco 1700 Series routers support the value of end-to-end Cisco network solutions with the following benefits:

Flexibility—The modular Cisco 1751 Router adapts easily to fit the needs of growing businesses. Interchangeable WAN interface cards enable easy additions or changes in WAN technologies without requiring a forklift upgrade of the entire platform. Modular data and voice slots enable users to tailor data and voice services as needed. With the ability to use the same field-upgradable WAN and voice interface cards across multiple Cisco access router platforms, the Cisco 1751 Router reduces requirements for spare parts inventory and support training.

Multiservice Access—For businesses that want to become e-Businesses and incorporate applications that integrate multiservice voice/video/data/fax capabilities now or in the future, the Cisco 1751 Router offers a flexible, cost-effective answer. The Cisco 1751 Router enables network managers to save on long-distance interoffice billing costs. It also interoperates with next-generation voice-enabled applications such as integrated messaging and Web-based call centers. The Cisco 1751 Router works with the existing telephone infrastructure—phones, fax machines, key telephone systems (KTS) units, and PBX (including digital PBXs)—minimizing capital costs. See Figure 5.

Figure 5
Voice/video/data/fax integration. The Cisco 1751 Router integrates data and voice capabilities, significantly lowering toll charges for small- and medium-sized businesses and enterprise small branch offices.



Lower Cost of Ownership—The Cisco 1751 Router provides a complete solution for integrated voice and data access in a single product, eliminating the need to install and maintain a large number of separate devices. You can combine optional functions—including a voice gateway, dynamic firewall, VPN tunnel server, DSU/CSU, ISDN network termination-1 (NT1) device, and more—to reduce deployment and management costs. This solution can be managed remotely using network management applications such as CiscoWorks2000 and CiscoView or any SNMP-based management tool.

Investment Protection—The Cisco 1751 Router RISC architecture, Cisco IOS Software, and modular slots provide solid investment protection. The Cisco 1751 incorporates services such as multiservice voice/video/data/fax integration, VPNs, and broadband DSL and cable communications to enable today's successful e-Business. An internal expansion slot on the mother- board offers the ability to support hardware-assisted IPSec data encryption at T1/E1 speeds.

For a complete list of Cisco 1751 Router features and benefits, see Table 2.

Table 2 Key Features and Benefits

Features	Benefits
Flexibility	
Full Cisco IOS Software support, including multiprotocol routing (IP, IPX, Apple Talk, IBM/ SNA) and bridging	• Provides the industry's most robust, scalable, and feature-rich internetworking software support using the de facto standard networking software for the Internet and private WANs • Part of the Cisco end-to-end network solution
Integrated Voice and Data Networking	
Cisco 1751 router chassis accepts both WAN and voice interface cards	• Reduces long-distance toll charges by allowing the data network to carry interoffice voice and fax traffic • Works with existing handsets, key units, and PBXs, eliminating the need for a costly phone-equipment upgrade
Modular Architecture	
Accepts an array of WAN and voice interface cards	• Adds flexibility and investment protection
WAN interface cards and voice interface cards are shared with Cisco 1600, 1700, 2600, and 3600 routers	• Reduce cost of maintaining inventory • Lower training costs for support personnel • Protect investments through re-use on various platforms
Autosensing 10/100 Fast Ethernet	• Simplifies migration to Fast Ethernet performance in the office
Expansion Slot on Motherboard	• Allows expandability to support hardware-assisted encryption at T1/E1 speeds • Allows support for future technologies
Dual DSP Slots	• Allow expandability to support additional voice channels
Security	
The Cisco IOS Firewall Feature Set includes context-based access control for dynamic firewall filtering, denial-of-service detection and prevention, Java blocking, real-time alerts, Intrusion Detection System (IDS), and encryption	• Allows internal users to access the Internet with secure, per-application-based, dynamic access control, while preventing unauthorized Internet users from accessing the internal LAN

Table 2 Key Features and Benefits (Continued)

Features	Benefits
IPSec DES and 3DES	• Enable creation of VPNs by providing industry-standard data privacy, integrity, and authenticity as data traverses the Internet or a shared public network • Supports up to 168-bit encryption
Hardware-Based Encryption Using Optional VPN Module	• Supports wire-speed encryption up to T1/E1 speeds
Device Authentication and Key Management	
IKE, X.509v3 digital certification, and support for certificate enrollment protocol (CEP) with certification authorities (CAs) such as Verisign and Entrust	• Ensure proper identity and authenticity of devices and data • Enable scalability to very large IPSec networks through automated key management
User Authentication	
PAP/CHAP, RADIUS, TACACS+	• Support all leading user identity verification schemes
VPN Tunneling	
IPSec, GRE, L2TP, L2F	• Offer choice of standards-based tunneling methods to create VPNs for IP and non-IP traffic • Allow standards-based IPSec or L2TP client to interoperate with Cisco IOS tunneling technologies • Fully interoperable with public certificate authorities and IPSec standards-based products • Part of the scalable Cisco end-to-end VPN solution portfolio
Cisco Easy VPN client	• Allows the router to act as remote VPN client and have VPN policies pushed down from the VPN concentrator
Cisco Unified VPN Access Server	• Allows the router to terminate remote access VPNs initiated by mobile and remote workers running Cisco VPN client software on PCs; and allows the router to terminate site-site VPNs initiated by IOS routers using the Cisco Easy CPN client feature
Management	
IEEE 802.1Q VLAN Support	• VLANs enable efficient traffic separation, provide better bandwidth utilization, and alleviate scaling issues by logically segmenting the physical LAN infrastructure into different subnets
Manageable via SNMP (CiscoView, CiscoWorks2000), Telnet, and console port	• Allow central monitoring, configuration, and diagnostics for all functions integrated in the Cisco 1751 router, reducing management time and costs
Cisco SDM	• Simplifies router and security configuration through smart wizards to enable customers to quickly and easily deploy, configure and monitor a Cisco access router without requiring knowledge of Cisco IOS Command Line Interface (CLI)

Table 2 Key Features and Benefits (Continued)

Features	Benefits
Ease of Use and Installation	
Cisco ConfigMaker, SETUP configuration utility, AutoInstall, color-coded ports/cables, and LED status indicators	• Simplifies and reduces deployment time and costs with graphical LAN/VPN policy configurator; command-line, context-sensitive configuration questions; and straightforward cabling • LEDs allows quick diagnostics and troubleshooting
Network Address Translation (NAT) and Easy IP	• Simplifies deployment and reduces Internet access costs
QoS	
CAR, Policy Routing, WFQ, PQ/CBWFQ, GTS, RSVP, DSCP, cRTP, MLPPP and LFI	• Allocates WAN bandwidth to priority applications for improved performance
Reliability and Scalability	
Cisco IOS Software, dial-on-demand routing, dual-bank Flash memory, scalable routing protocols such as OSPF, EIGRP, and HSRP	• Improves network reliability and enables scalability to large networks
Broadband Connectivity Options	
ADSL and cable connectivity deliver business-class broadband access	• Leverage broadband access technologies like cable and DSL to increase WAN connectivity speeds and reduce WAN access costs • The Cisco 1751 supports ADSL connectivity with ADSL WIC • Cable connectivity with the Cisco 1751 and optional integrated Cisco uBR910 Series Cable DSU deliver business-class broadband access
Device Integration	
Integrated router, voice gateway, firewall, encryption, VPN tunnel server, DSU/CSU, and NT1 in a single device	• Reduce costs and simplifies management

Cisco IOS Technology

Internet and Intranet Access

Cisco IOS Software provides an extensive set of features that make the Cisco 1751 Router ideal for flexible, high-performance communications across both intranets and the Internet:

- Multiprotocol routing (IP, IPX, and AppleTalk), IBM/SNA, and transparent bridging over ISDN, asynchronous serial, and synchronous serial such as leased lines, Frame Relay, SMDS, Switched 56, X.25, and X.25 over ISDN D
- WAN optimization—including dial-on-demand routing (DDR), bandwidth-on-demand (BOD) and OSPF-on-demand circuit, Snapshot routing, compression, filtering, and spoofing to reduce WAN costs

Security

Cisco IOS Software supports an extensive set of basic and advanced network security features, including access control lists (ACLs); user authentication, authorization, and accounting (such as PAP/CHAP, TACACS+, and RADIUS); and data encryption. To increase security, the integrated Cisco IOS Firewall Feature Set protects internal LANs from attacks with context-based access control (CBAC) and Intrusion Detection (IDS), while IPSec tunneling with data encryption standard DES and 3DES encryption provide standards-based data privacy, integrity, and authenticity as data travels through a public network. Additionally, remote management applications, such as Cisco Security Device Manager (SDM), make it easier than ever to deploy and monitor security applications on your Cisco router.

The Cisco 1700 Series routers support the Cisco Easy VPN client feature that allows the routers to act as remote VPN clients. As such, these devices can receive predefined security policies from the headquarters' VPN head-end, thus minimizing configuration of VPN parameters at the remote locations. This solution makes deploying VPN simpler for remote offices with little IT support or for large deployments where it is impractical to individual configure multiple remote devices. While customers wishing to deploy and manage site-to-site VPN would benefit from Cisco Easy VPN client because of its simplification of VPN deployment and management, managed VPN service providers and enterprises who must deploy and manage numerous remote sites and branch offices with IOS routers for VPN will realize the greatest benefit.

The Cisco 1700 Series routers also support the Cisco Unified VPN Access Server feature that allows a Cisco 1700 router to act as a VPN head-end device. In site-to-site VPN environments, the Cisco 1700 router can terminate VPN tunnels initiated by the remote office routers using the Cisco Easy VPN client. Security policies can be pushed down to the remote office routers from the Cisco 1700 Series routers. In addition to terminating site-to-site VPNs, a Cisco 1700 Series router running the Unified VPN Access Server can terminate remote access VPNs initiated by mobile and remote workers running Cisco VPN client software on PCs. This flexibility makes it possible for mobile and remote workers, such as sales people on the road, to access company intranet where critical data and applications exist.

For remote access, VPNs, Layer 2 Forwarding (L2F), and Layer 2 Tunneling Protocol (L2TP) combine with IPSec encryption to provide a secure multiprotocol solution for IP, IPX, and AppleTalk traffic, and more. Mobile users can dial in to a service provider's local point of presence (POP) and data is "tunneled" (or encapsulated inside a second protocol such as IPSec or L2TP) back to the Cisco 1751 router to securely access the corporate network via the Internet.

Cisco IOS Software QoS Features

Through Cisco IOS Software, the Cisco 1751 Router delivers quality of service (QoS) capabilities, including Resource ReSerVation Protocol (RSVP), Weighted Fair Queuing (WFQ), Committed Access Rate (CAR), and IP Precedence. These features enable businesses to prioritize traffic on their networks by user, application, traffic type, and other parameters, to ensure that business-critical data and delay-sensitive voice are appropriately prioritized.

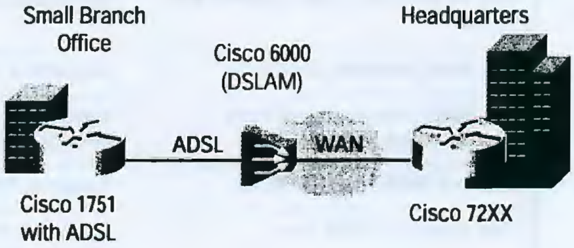
Because the Cisco 1751 Router provides robust voice compression, up to 8 voice calls can occupy a single 64K data channel simultaneously, without compromising data performance. Cisco IOS voice compression technology integrates data and voice traffic to enable efficient use of existing data networks.

High-Performance Architecture for VPNs and Broadband Service

A robust RISC architecture and Cisco IOS features enable the Cisco 1751 Router to support VPN applications with tunneling and security, as well as DSL, cable, and other broadband access technologies. An internal slot on the Cisco 1751 motherboard supports an optional VPN module that provides hardware-assisted IPSec DES and 3DES encryption at T1/E1 speeds. The Cisco 1751 Router equipped with the WIC-1ADSL supports VPN over ADSL service. See Figure 6. The Cisco 1751 Router with the uBR910 series cable DSU supports business-class broadband cable access. The Ethernet WIC (WIC-1ENET) provides an alternate method of deploying DSL/cable Internet access with the use of an external modem. In some cases, the ISP provides the broadband modem.

Figure 6

The Cisco 1751Router, deployed in conjunction with the ADSL WIC, enables SMB and small branch customers to reap the benefits of ADSL.



Network Management and Ease of Installation

The Cisco 1751 Router supports a range of network-management and ease-of-installation tools:

- The Cisco Security Device Manager (SDM) is an intuitive, web-based device management tool embedded within the Cisco IOS access routers. SDM simplifies router and security configuration through smart wizards to enable customers to quickly and easily deploy, configure and monitor a Cisco access router without requiring knowledge of Cisco IOS Command Line Interface (CLI). For more information visit www.Cisco.com/go/sdm.
- Cisco ConfigMaker is a Windows wizard-based tool designed to configure a small network of Cisco routers, switches, hubs, and other network devices from a single PC. This tool makes it easy to configure value-add security features such as the Cisco IOS Firewall Feature Set, IPSec encryption, and network address translation (NAT); establish VPN policies (including QoS and security); and configure the Dynamic Host Configuration Protocol (DHCP) server.
- CiscoWorks for Windows, a comprehensive network management solution for small to medium sized networks that provides Web-based network monitoring and device configuration management.
- CiscoWorks2000, the industry-leading Web-based network management suite from Cisco, simplifies tasks such as network inventory management and device change, rapid software image deployment, and troubleshooting.
- For service providers, Cisco Service Management (CSM) provides an extensive suite of service management solutions to enable planning, provisioning, monitoring, and billing.

Extending Cisco End-to-End Solutions

As part of the comprehensive Cisco end-to-end networking solution, the Cisco 1700 Series routers enable businesses to extend a cost-effective, seamless network infrastructure to the small branch office. The Cisco 1700 Family of access routers includes the Cisco 1751 Router and Cisco 1721 Router—a modular device optimized for data-only connections. WAN cards work with both devices, as well as with Cisco 1600, 2600, and 3600 Series routers. They are powered by Cisco IOS Software for robust WAN service between branches and central offices in organizations with multiple sites. Both feature RISC-based processors to provide performance for encryption and support for emerging broadband technologies.

The Cisco 1751 Router also shares VoIP technology and analog voice interface cards with Cisco 2600 and 3600 Series routers. This feature provides an end-to-end solution for multiservices communications between offices, simplifying inventory needs and leveraging IT expertise across more devices in an organization.

For a complete list of physical interfaces, see Tables 3, 4, 5, and 6.

Table 3 Physical Interfaces/Architecture

One 10/100 BaseT Fast Ethernet Port (RJ45)	Automatic speed detection; automatic duplex negotiation; VLAN support
One Voice Interface Card Slot	Supports a single voice interface card with two ports per card
Two WAN Interface Card/Voice Interface Card Slots	Supports any combination of up to two WAN interface cards or voice interface cards
Ethernet WAN Interface Cards	Supports PPP and PPPoE; operates in full and half-duplex modes
One Auxiliary (AUX) Port	RJ-45 jack with RS232 interface (plug compatible with Cisco 2500 Series AUX port); asynchronous serial DTE with full modem controls (CD, DSR, RTS, CTS); asynchronous serial data rates up to 115.2 kbps
One Console Port	RJ-45 jack with RS232 interface (plug compatible with Cisco 1000/1600/2500 series console ports); asynchronous serial DTE; transmit/receive rates up to 115.2 kbps (default 9600 bps, not a network data port); no hardware handshaking such as RTS/CTS
One Internal Expansion Slot	Supports hardware-assisted services such as encryption (up to T1/E1)
RISC Processor	Motorola MPC860P PowerQUICC at 48MHz

Table 4 WAN Support

Asynchronous Serial Interfaces on Serial WAN Interface Cards	Interface speed: up to 115.2 Kbps; asynchronous serial protocols: Point-to-Point Protocol (PPP), Serial Line Internet Protocol (SLIP); asynchronous interface; EIA/TIA-232
ISDN WAN Interface Cards	ISDN dialup and ISDN leased line (IDSL) at 64 and 128 Kbps; encapsulation over ISDN leased line; Frame Relay and PPP
ADSL WAN Interface Cards	Supports ATP adaption Layer 5 (AAL5) services and applications; interoperates with Alcatel DSLAM with Alcatel chipset and Cisco 6130/6260 DSLAM with Globespan chipset; ANSI T1.413 issue 2 and ITU 992.1 (G.DMT) compliant

Table 5 WAN Interface Cards for the Cisco 1751 Router

Module	Description
WIC-1T	One serial, async, and sync (T1/E1)
WIC-2T	Two serial, async, and sync (T1/E1)
WIC-2A/S	Two low-speed serial (up to 128 kbps), async, and sync
WIC-1B-S/T	One ISDN BRI S/T
WIC-1B-U	One ISDN BUI U with integrated NT1
WIC-1DSU-56K4	One integrated 56/64-kbps, four-wire DSU/CSU
WIC-1DSU-T1	One integrated T1/fractional T1 DSU/CSU
WIC-1ADSL	One-port ADSL interface
WIC-1ENET	One-port 10BaseT Ethernet Interface
WIC-1SHDSL	One-port G.SHDSL interface
WIC-1AM	One-port V.90 analog modem WIC
WIC-2AM	Two-portV.90 analog modem WIC

Table 6 Voice Interface Cards for the Cisco 1751

VIC-2FXS	Two-port FXS voice/fax interface card for voice/fax network module
VIC-2DID	Two-port DID (direct inward dial) voice/fax interface card
VIC-2FXO	Two-port FXO voice/fax interface card for voice/fax network module
VIC-2FXO-EU	Two-port FXO voice/fax interface card for Europe
VIC-2FXO-MI	Two-port FXO voice/fax interface card with battery reversal detection and Caller ID support (for US, Canada, and others) [enhanced version of the VIC-2FXO]
VIC-2FXO-M2	Two-port FXO voice/fax interface card with battery reversal detection and Caller ID support (for Europe) [enhanced version of the VIC-2FXO-EU]
VIC-2FXO-M3	Two-port FXO voice/fax interface card for Australia
VIC-2E/M	Two-port E&M voice/fax interface card for voice/fax network module
VIC-2BRI-NT/TE	Two-port network Side ISDN BRI interface
VIC-4FXS/DID[1]	Four-port FXS and DID voice/fax interface card
VWIC-1MFT-T1	One-port RJ-48 multiflex trunk - T1
VWIC-2MFT-T1	Two-port RJ-48 multiflex trunk - T1
VWIC-2MFT-T1-DI	Two-port RJ-48 multiflex trunk - T1 with drop and insert
VWIC-1MFT-E1	One-port RJ-48 multiflex trunk - E1
VWIC-2MFT-E1	Two-port RJ-48 multiflex trunk - E1

Table 6 Voice Interface Cards for the Cisco 1751

VWIC-2MFT-E1-DI	Two-port RJ-48 multiflex trunk - E1 with drop and insert
VWIC-1MFT-G703	One-port RJ-48 multiflex trunk - E1 G.703
VWIC-2MFT-G703	Two-port RJ-48 multiflex trunk - E1 G.703

[1] The Cisco 1751 can support three VIC-4FXS/DID cards with a maximum of four ports in DID mode

Voice Implementation Requirements

The Cisco 1751 Modular Access Router supports FXO, FXS, E&M, ISDN BRI VICs, and T1/E1 multiflex V/WICs.

The FXO interface allows an analog connection to the central office of the Public Switched Telephone Network

(PSTN). The FXS interface connects basic telephone service phones (home phones), fax machines, key sets, and PBXs through ring voltage and dial tone. The E&M interface allows connection for PBX trunk lines (tie lines). The ISDN-BRI NT/TE VIC is used to connect to the PSTN or a PBX/KTS, whereas the T1/E1 multiflex V/WIC (multiflex V/WIC) supports both data and voice services. The multiservice-ready Cisco 1751-V router version includes all the features needed for immediate integration of data and voice services:

- One DSP—(PVDM-256K-4)
- 32-MB Flash memory
- 64-MB DRAM
- Cisco IOS IP/VOX Plus feature set

VICs and WICs are available separately.

The Cisco 1751 and Cisco 1751-V routers have two DSP module slots on the motherboard and a maximum of eight DSPs are supported per router.

DSP Requirements

Cisco 1751 routers support 3 types of DSP images: high complexity (HC), medium complexity (MC) and Flexi-6. HC and MC are used for analog[1] and BRI (VIC-2BRI-NT/TE) VICs; Flexi-6 is used for T1/E1 VWICs[2] and BRI VIC. MC is introduced in Cisco 1751 starting from Cisco IOS 12.2(8)YN release, which will merge into 12.3(1)T. Therefore, please make sure to use Cisco 12.2(8) YN or later releases when using MC. In addition, starting from 12.2(8)YN release, the default DSP image for BRI VIC is changed from HC to Flexi-6. Table 7 lists the default images for each type of VICs; Table 8 lists IOS support for each DSP image. Table 9 lists the number of channels supported by one DSP (PVDM-256K-4) for each codec type.

Please use the following rules for calculating DSP requirements on the Cisco 1751:

1. For the Early Deployment (ED) releases: Cisco IOS 12.2(2)XK, 12.2(4)XW, 12.2(4)XL, 12.2(4)XM, 12.2(4)YA, 12.2(4)YB, 12.2(8)YL, 12.2(8)YM and 12.2(11)YT, or T train releases prior to 12.3(1)T:

[1] Analog VICs include VIC-2FXS, VIC-2FXO, VIC-2FXO-M1, VIC-2FXO-M2, VIC-2FXO-M3, VIC-2FXO-EU, VIC-2E/M, VIC-2DID,VIC-4FXS/DID

[2] T1/E1 VWICs include VWIC-1MFT-T1, VWIC-2MFT-T1, VWIC-2MFT-T1-DI, VWIC-1MFT-E1, VWIC-2MFT-E1, VWIC-2MFT-E1-DI, VWIC-1MFT-G703, VWIC-2MFT-G703

- a. Each 2-port analog VIC requires 1 DSP (PVDM-256K-4)
- b. Each VIC-2BRI-NT/TE requires 2 DSPs (PVDM-256K-8)
- c. For VWICs, refer to Table 9. For example, 12 G.711 digital T1/E1 voice calls require two DSPs; 12 G.729 calls require four DSPs
- d. Total DSP requirement is the sum of a, b and c. The DSP resources can not be shared between analog VICs, BRI VIC and VWICs.

2. For the Early Deployment (ED) releases: Cisco IOS 12.2(8)YN or later (Note: not including 12.2(11)YT) or T train releases 12.3(1)T or later, please always refer to the DSP Calculator in the following link:

   http://www.cisco.com/cgi-bin/Support/DSP/cisco_prodsel.pl

The DSP calculator optimizes the DSP resources for your configuration and suggests CLI configurations.

Table 7 DSP Firmware for each type of VICs

VIC Type	Firmware Support
2-port Analog VICs	HC (default), MC (starting from 12.2(8)YN)
4-port Analog VIC	HC, MC (default, starting from 12.2(8)YN)
VIC-2BRI-NT/TE	HC (default for ED releases prior to 12.2(8)YN or T train releases prior to 12.3(1)T); MC; Flexi-6 (default for ED releases 12.2(8)YN or later or T train releases 12.3(1)T or later);
T1/E1 VWICs	Flexi-6 (default)

Table 8 Cisco IOS support for DSP firmware

Firmware Support	IOS Release Support
HC	In all orderable IOS Releases
MC	ED Releases: Cisco IOS 12.2(8)YN or later [1] T Train Releases: Cisco IOS 12.3(1)T or later
Flexi-6	For T1/E1 VWICs: • ED Releases: Cisco IOS 12.2(4)YB or later [2] • T Train Releases: 6th releases of 12.2T or later For VIC-2BRI-NT/TE: • ED Releases: Cisco IOS 12.2(8)YN or later [3] • T Train Releases: Cisco IOS 12.3(1)T or later

[1] It doesn't include Cisco 12.2(11)YT. 12.2(11)YT doesn't support MC.
[2] It doesn't include Cisco 12.2(11)YT. 12.2(11)YT doesn't support Flexi-6.
[3] It doesn't include Cisco 12.2(11)YT. 12.2(11)YT doesn't support Flexi-6.

Table 9 The number of channels supported by one DSP (PVDM-256K-4) per codec type

	Firmware		
Codec	HC (for analog & BRI VICs)	MC (for analog & BRI VICs)	Flexi 6 (for VWICs & BRI VIC[1])

Table 9 The number of channels supported by one DSP (PVDM-256K-4) per codec type

		Firmware	
G.711	2	4	6
G.729ab[2] /G.729a	2	4	3
G.726	2	4	3
G.723	2	-	2
G.728	2	-	2
Fax Relay	2	4	3

[1] BRI VIC support in Flexi-6 starts from 12.2(8)YN or 12.3(1)T.

[2] G.729 and G.729b is not supported in MC or Flexi-6 images.

Table 10 DSP Modules Available on Cisco 1751

Modules	DSPs
PVDM-256K-4	1 DSP Module
PVDM-256K-8	2 DSP Modules
PVDM-256K-12	3 DSP Modules
PVDM-256K-16HD	4 DSP Modules
PVDM-256K-20HD	5 DSP Modules

Cisco IOS Software Feature Sets

The Cisco 1751 Router supports a choice of Cisco IOS Software feature sets. Each feature set requires specific amounts of Flash and DRAM memory in the product. For default memory configurations, please see Table 11.

Table 11 Cisco 1751 Router Memory Defaults and Maximums

Model Number	Default FLASH/Maximum FLASH	Default DRAM/Maximum DRAM
Cisco 1751	16 MB/16 MB	32 MB/96 MB
Cisco 1751-V Multiservice Model	32 MB/32 MB	64 MB/128 MB

The Cisco 1751 Router supports a choice of Cisco IOS Software feature sets with rich data features as well as data/ voice features (Table 12). Each feature set requires specific amounts of RAM and Flash memory in the product.

- Cisco IOS IP base feature sets include: NAT, OSPF, RADIUS, and NHRP.
- Plus feature sets contain L2TP, L2F, the Border Gateway Protocol (BGP), IP Muliticast, Frame Relay SVC, RSVP, the NetWare Link Services Protocol (NLSP), AppleTalk SMRP, the Web Cache Control Protocol (WCCP), and the Network Timing Protocol (NTP).

- Encryption is offered in special encryption feature sets (Plus IPSec 56, and Plus IPSec 3DES). The VPN encryption module requires an IOS IP Plus IPSec image.
- DSL support is only in the Plus feature sets.

Table 12 Cisco IOS Features

Cisco 1751 Router Data Software Feature Sets for Cisco IOS Release 12.1.(5)YB		
Feature Name	**Product Code**	**CD Number**

Other IOS Features Include:

QoS Features

- Frame Relay Fragmentation (FRF.12)
- IP Precedence
- Generic Traffic Shaping (GTS)
- Frame Relay Traffic Shaping (FRTS)
- Weighted Random Early Detection (WRED)
- DSCP Marking
- Compressed RTP
- Multiple Link PPP & Link Fragmentation and Interleaving
- Resourse Reservation Protocol (RSVP)
- Queuing Techniques: Weighted Fair Queuing (WFQ), Priority Queuing (PQ), Low Laterey Queuing (LLQ) and Custom Queuing (CQ)
- Preclassification for IPSec Tunneling

Voice Support

- VoIP
- VoFR
- VoATM
- Fax Pass Through
- Fax Relay
- Modem Pass Through

VoIP Protocol Support

- H.323 V2
- Media Gateway Control Protocol 1.0
- Session Initiation Protocol 2.0

Codec Support

- G.711
- G.729
- G.729a
- G.723.1
- G.726
- G.728

Technical Specifications

Dimensions

- Width: 11.2 in. (28.4 cm)
- Height: 4.0 in. (10.0 cm)
- Depth: 8.7 in. (22.1 cm)
- Weight (minimum): 3.0 lb (1.36 kg)
- Weight (maximum): 3.5 lb (1.59 kg)

Power

- Locking connector on power socket
- External Power Brick
- AC Input Voltage: 100 to 240 VAC
- Frequency: 50 - 60 Hz
- AC Input Current: rated 1 A, measured 0.5 A
- Power Dissipation: 20W (maximum)

Environmental

- Operating Temperature: 32 to 104 F (0 to 40 C)
- Nonoperating Temperature: –4 to 149 F (–20 to 65 C)
- Relative Humidity: 10 to 85% noncondensing operating; 5 to 95% noncondensing, nonoperating

Safety

- Regulatory Approvals
  - UL 1950, 3rd Edition
  - CSA 22.2 No 950-95, 3rd Edition
  - EN60950 with A1 through A4 and A11
  - EN41003
  - TCA TS001–1997
  - AS/NZS 3260 with A1 through A4
- IEC 60950 with A1 through A4 and all country deviations
- NOM-019-SCFI
- GB4943
  - ETSI 300-047
  - BS 6301 (power supply) EMI
  - AS/NRZ 3548 Class B
- CNS-13438
  - FCC Part 15 Class B
  - EN60555-2 Class B

- EN55022 Class B
- VCCI Class II
- CISPR-22 Class B

- EN55024 comprised of:
  - IEC 1000-4-2 (EN61000-4-2)
  - IEC 1000-4-3 (ENV50140)
  - IEC 1000-4-4 (EN61000-4-4)
  - IEC 1000-4-5 (EN61000-4-5)
  - IEC 1000-4-6 (ENV50141)
  - IEC 1000-4-11
  - IEC 1000-3-2 Network Homologation
  -
- Europe: CTR2, CTR3, TBR21
- Canada: CS-03
- United States: FCC Part 68
- Japan: Jate NTT
- Australia/New Zealand: TS013/TS-031, TS002, TS003
- Hong Kong: CR22

Service and Support

Leading-edge technology deserves leading-edge support. Service and support for the Cisco 1751 is available on a one-time or an annual contract basis. Support options range from help desk assistance to proactive, onsite consultation. All support contracts include:

- Major Cisco IOS Software updates in protocol, security, bandwidth, and feature improvements
- Full access to Cisco.com for technical assistance, electronic commerce, and product information
- 24-hour-a-day access to the industry's largest dedicated technical support staff

A support contract maximizes the value of your technology investment throughout its lifecycle, ensuring optimum performance and availability. Augment your internal staff's capabilities by taking full advantage of Cisco expertise.

Contact your local sales office for further information.

Q & A

Cisco 1751 Modular Access Router

Product Features and Positioning

What is the ideal environment for the Cisco 1751 router?

A. The Cisco 1751 modular access router is an ideal access solution for small- and medium-sized businesses and small branch offices. The Cisco 1751 is a modular access platform that offers customers secure Internet and intranet access, as well as the capability to implement a variety of applications in the same platform, including voice over IP, virtual-private- network (VPN) access, and business-class Digital Subscriber Line (DSL) access when needed.

In addition to the various functions available on the 1720, the Cisco 1751 provides multiservice integrated voice/data support. By implementing the Cisco 1751 into existing data networks, customers can save on long-distance interoffice phone/fax toll charges while enabling next-generation voice-enabled applications such as integrated messaging and Web based call centers.

The Cisco 1751 router is particularly suitable for environments that require:

- Modularity, flexibility, and investment protection to upgrade to new services and technologies such as multiservice, VPN, and broadband access now or later
- VPN deployment either now or in the future, with requirements for encryption speeds up to T1/E1 (the Cisco 1751

can encrypt at 512 Kbps using software-based encryption, and at T1/E1 using the VPN hardware-based encryption card inserted on the motherboard)

- Multiservice data/voice/fax integration
- Digital voice support (ISDN NT/TE VIC support, VIC-BRI-NT/TE)
- 10/100 Ethernet LAN
- Dual Ethernet capability (with 10BaseT Ethernet WIC)
- VLAN support (802.1Q))
- The flexibility of one voice and two WAN/voice interface card slots
- Higher number of serial interfaces (up to five, including AUX port)
- Dual ISDN Basic Rate Interface (BRI) connections
- Compression at speeds greater than 128 Kbps
- Support for ADSL and G.SHDSL interface card

Q. What are the key differences between the Cisco 1751 and the Cisco 1751-V?

A. The Cisco 1751 and 1751-V support the same data and voice functionality. The main difference between these two models is that the Cisco 1751-V is voice ready, i.e. it comes with higher default memory, 1 DSP module and the IOS IP/Voice PLUS image. Table 1 compares the Cisco 1751 and Cisco 1751-V.

Table 1: Feature Comparison of the Cisco 1751 and the Cisco 1751-V

Cisco 1751	**Cisco 1751-V**
Base version	**Multiservice-ready version**
Includes everything for data networking	Includes all the features needed for *immediate* integration of voice and data
16-MB Flash memory (Non-upgradeable)	32-MB Flash memory (Non-Upgradeable)
32-MB DRAM (on board)	64-MB DRAM (32 MB on board, 32 MB in DRAM DIMM[1] socket)
Cisco IOS IP Software Feature Set	Cisco IOS IP/Voice Plus feature set
Two DSP[2] module slots available DSPs available separately	Two DSP module slots available Comes with one DSP (PVDM-256K-4) inserted in one DSP module slot DSPs available separately for further upgrades
VICs available separately	VICs available separately

Flash memory and DRAM upgrades available separately	Flash memory and DRAM upgrades available separately
WICs available separately	WICs available separately

[1] Double in-line memory module

[2] Digital signal processor

Table 2: Feature Comparison of the Cisco 1751 and Cisco 1750

Feature	Cisco 1751	Cisco 1750
Digital voice support (ISDN BRI VIC and T1/E1 VWICs)	Yes	No
VLAN (IEEE 802.1Q)	Yes	No
Routing performance (64-byte packets)—fast-switching	12,000 pps	8,500 pps
Base models: flash/ DRAM (default)	Cisco 1751: 16/32 Cisco 1751-V: 32/64	Cisco 1750: 4/16 Cisco 1750-2V: 8/32 Cisco 1750-4V: 8/32
No. of PVDM slots	2	1

Q. Is the Cisco 1751 a replacement for the Cisco 1750?

A. The Cisco 1751 is a superior solution when compared to the Cisco 1750 in terms of performance, value and functionality (see Table 2).

Q. Will the Cisco 1750 be discontinued (i.e. EOS)?

A. Yes. Cisco 1750 Router will be end of sale on May 31st 2002. Please refer to the following product bulletin for details: http://www.cisco.com/warp/public/cc/pd/rt/1700/prodlit/1660_pp.htm

We urge the customers to migrate to the Cisco 1751 due to the clear advantages that it offers at the same price point. The Cisco 1751 Router provides all of the features of the 1750 plus support for; digital voice, VLAN, and greater performance. In addition, the Cisco 1751 Router comes with more memory than the 1750 (both flash and DRAM), which reduces the overall solution cost when deploying voice and/or security features.

Q. What are the differences between the Cisco 1600-R series and the Cisco 1700 series router?

A. Compared with the Cisco 1600-R series, the Cisco 1700 series offers increased performance, added flexibility with fully modular chasses, and investment protection with support for new services such as DSL, Voice over IP (VoIP), and VPNs at similar price points to the Cisco 1600-R. Wherever possible, Cisco encourages customers to move to the new Cisco 1700 platform to be best positioned for future growth and services. Some services (DSL, VoIP) are and will not be supported on the Cisco 1600-R series because of performance and architecture limitations. Table 3 clarifies the features of the Cisco 1600-R and 1700 series families. The Cisco 1600-R series will continue to be available, but Cisco is actively marketing the 1700 series as the next-generation access platform ideal for small- and medium-sized businesses and small branch offices. Most Cisco 1600-R models have a list price of $1495 (US), and an equivalent configuration of the Cisco

1720 is $1595 (US list). For $100, customers get the added benefits of increased performance and the ability to benefit from a broad array of services including VPNs, VoIP, and DSL when needed.

- Secure Internet/intranet access with firewall- and software-based DES and 3DES encryption
- VPN (with optional hardware-based encryption card)
- Multiservice voice with VoIP and Voice over Frame Relay (VoFR)
- ADSL and G.SHDSL
- High-speed LAN (10/100 Ethernet)
- More modularity

Table 3: Key Enhanced Capabilities of Cisco 1751 Series Compared to Cisco 1600-R Series

Feature	Cisco 1600-R Series Modular Access Routers	Cisco 1751 Series Modular Access Routers
WAN slots	1601-R-1604-R: One fixed WAN port plus one modular WAN interface card (WIC) slot 1605-R: One modular WAN interface card (WIC) slot and two 10 Mbps Ethernet ports	Two WAN interface card slots
WAN Interface Cards Supported	Single serial (sync, async): WIC-1T Single ISDN BRI S/T: WIC-1B-S/T Single ISDN BRI U: WIC-1B-U Single serial with integrated 56/64 K DSU: WIC-1DSU-56K4 Single serial with integrated T1/FT1 DSU: WIC-1DSU-T1	All Cisco 1600-R series WAN interface cards plus: Dual serial (sync): WIC-2T Dual serial (async/sync): WIC-2A/S Ethernet WIC: WIC-1ENET ADSL WIC: WIC-1ADSL G.SHDSL WIC: WIC-1SHDSL Modem WIC: WIC-1AM and WIC-2AM
Maximum WAN Interfaces Supported	Two serial (synchronous/asynchronous)	Five serial (sync/async, including the auxiliary port)
	One ISDN BRI (maximum)	Two ISDN BRI
LAN	1601-R-1604-R: One 10BaseT Ethernet port 1605-R: Two 10BaseT Ethernet ports	One autosensing 10/100 Fast Ethernet
Dual Ethernet support	1605-R: Two 10BaseT Ethernet ports	One autosensing 10/100 Fast

		Ethernet on-board interface + 10BaseT Ethernet WIC
VLAN support (802.1Q)	No	Yes
Support for Voice Interface Cards (VICs)	No	Yes: 2-port ear and mouth (E&M) voice interface card (VIC) 2-port Direct Inward Dial (DID) 2-port Foreign Exchange Office (FXO) VIC, and 2-port Foreign Exchange Station (FXS) VIC 2-port Network/Userside BRI (VIC-2BRI-NT/TE) 1 or 2-port T1/E1 Multiflex VWICs
Maximum Voice Channels Supported	None	Analog: 6 total (2 slots support voice or WAN interface cards; all voice cards provide 2 voice ports) Digital: 24 total (T1/E1 Multiflex VWICs)
AUX Port (async up to 115.2 kbps)	No	Yes
Support for Dual ISDN BRI	No	Yes
Encryption Support	DES	DES, triple DES
IPSec DES Encryption Speed	Software performance (DES, 256-byte packets) 128 Kbps (ISDN)	Software performance (3DES, 256-byte packets) 256 Kbps (2xISDN) Performance with VPN module (3DES, 256-byte packets) 1700 Kbps (T1/E1)
Expansion Slot for High-Speed Hardware-Based Encryption	No	Yes

Card		
Maximum Flash Memory	16 MB	Cisco1751: 16MB Cisco1751-V: 32MB
Maximum DRAM Memory	24 MB	Cisco1751: 96 MB Cisco1751-V: 128MB

Q. Will the Cisco 1600-R support DSL or VPN or multiservice voice or 10/100 Ethernet or 3DES encryption in the future?

A. No. The Cisco 1600-R series was not designed to support the above technologies.

Q. Should we position Cisco 1700 series to the customer instead of 1600-R?

A. Yes. Always. Please educate the value proposition of the Cisco 1700 series and the applications and services that it can support either now or later. We strongly suggest the sales team to help educate the customer to invest in Cisco 1700 series and avoid the cost of upgrading later.

Q. What is the proper positioning of the Cisco 1700 series, and 2600 series routers?

A. The Cisco 1700 series routers are positioned for small- and medium-sized businesses and small branch offices. Because of its modularity, increased performance, and investment protection capabilities, the Cisco 1700 is a strategic platform for small- and medium-sized businesses and small branch offices. The Cisco 2600 series routers are positioned as enterprise-class solutions for enterprise large branch offices, offering rack-mount for wiring-closet environments, internal power supply, and optional redundant power supply. The Cisco 2600 series offers a flexible, modular solution with higher performance; more WAN density such as dual ISDN Primary Rate Interface (PRI), 10 ISDN BRIs, four T1/E1s, 36 async serial interfaces; and support for dial and digital voice with densities ranging from two to 60 calls.

These four router families are positioned as two winning pairs:

- Cisco 1700 series for small and medium-sized businesses and enterprise small branch offices
- Cisco 2600 series for enterprise branch offices

Q. When would a customer want a Cisco 2600 series router rather than a Cisco 1751 router?

A. The Cisco 2600 series is better suited for larger enterprise branch offices that require multiple WAN ports and, typically, a 19-inch rack-mount enclosure. It provides two WAN interface card slots, plus an additional network module slot, which provides higher port densities as well as support for voice services. The key differences are highlighted in Table 4.

Table 4: Key Differences between Cisco 1751 Router and Cisco 2600 Series Routers

Feature	**Cisco 1751**	**Cisco 2600 Series**
Performance (fast-switch 64-byte packets)	12,000 pps	12,000 to 37,000 pps

Performance (IPSec DES-encrypted 256-byte Packets)	512 Kbps	512 Kbps
"Class of Product"	Small/medium business and small enterprise branch office	"Enterprise class"
	Desktop	19-in. rack-mount, ideal for wiring closets
	External power supply	Internal power supply
	No redundant power supply option	Redundant power supply option
	Optional Plus feature sets for enterprise-class software features (IP multicast, RSVP, BGP, and so on)	Enterprise-class software features standard in Base IP, for example, IP multicast, RSVP, BGP
	No enterprise or APPN feature sets	Enterprise and APPN feature sets
	Not NEBS compliant	NEBS compliant
	No Token Ring LAN	Token Ring LAN option
Support for Voice Interface Cards	Yes: supports dual port E&M, FXO, FXS, DID and ISDN BRI NT/TE, T1/E1 Multiflex VWICs	Yes: supports dual-port E&M, FXO, FXS, ISDN BRI-N/T-TE and BRI-ST/TE, digital T1/E-1 packet voice trunk network module, T1/E-1 multiflex WAN/voice interface card (multiflex WAN/voice interface card)
Maximum Voice Interfaces Supported	Analog: 4 ports with 1 WAN slot (up to dual T1/E1 WIC) or 6 ports without WAN access Digital: 24 calls with one channelized T1 or E1 or 12 ports without WAN access	2 to 60 voice calls
Maximum WAN Densities	4 serial, 2 BRI, 4 A/S	10 BRI, 12 A/S, 36 A, 2 PRI, 1 ATM
Maximum LAN Density	2 (one on-board 10/100 and an optional Ethernet WIC)	6 Ethernet
Slots	2 WAN/voice interface cards + 1 voice interface card	2 WAN interface cards + 1 network module
	1 internal expansion slot for VPN hardware encryption card	1 AIM slot for encryption, compression, voice processing, ATM SAR

Voice	Voice-over-IP (VoIP), VoFR	Voice/fax-over-IP capable, VoFR capable
Integrated Dial Capability	Not supported	16 modem or 32 async serial

Q. Which Cisco IOS® release is available with the Cisco 1751 at first customer ship (FCS)?

A. At FCS, the Cisco 1751 router shipped with Cisco IOS Release 12.1(5)YB, which is a special release. The Cisco 1751 router will be available on the 12.2T Release train in 12.2(4)T.

Software Feature Sets

Q. What software feature sets are available for the Cisco 1751 router?

A. Twenty-four feature sets are available (see Table 5). This includes 14 data images and 10 data and voice images.

Table 5: Minimum Memory Requirements and Software Feature Sets for Cisco IOS Releases 12.1(5)YB

Cisco IOS Feature Set	**Memory Requirement**	
	FLASH	**DRAM**
IP	4MB	24MB
IP/ADSL	8MB	24MB
IP/ADSL Plus	8MB	32MB
IP/ADSL Plus IPSec 56	8MB	32MB
IP/FW/IDS	4MB	24MB
IP/ADSL/FW/IDS Plus IPSec 56	8MB	32MB
IP/IPX	4MB	24MB
IP/ADSL/IPX/FW/IDS Plus	8MB	32MB
IP/ADSL Plus IPSec 3DES	8MB	32MB
IP/ADSL/FW/IDS Plus IPSec 3DES	8MB	32MB
IP/IPX/AT/IBM	8MB	24MB
IP/ADSL/IPX/AT/IBM Plus	16MB	48MB
IP/ADSL/IPX/AT/IBM/FW/IDS Plus IPSec 56	16MB	48MB

IP/ADSL/IPX/AT/IBM/FW/IDS Plus IPSec 3DES	16MB	48MB
IP/ADSL/VoicePlus	8MB	32MB
IP/Voice Plus	8MB	32MB
IP/ADSL/Voice Plus IPSec 56	16MB	48MB
IP/ADSL/FW/IDS/VoicePlus	16MB	48MB
IP/ADSL/FW/IDS/Voice Plus IPSec 56	16MB	48MB
IP/IPX/FW/IDS/Voice Plus	16MB	48MB
IP/ADSL Voice Plus IPSec 3DES	16MB	48MB
IP/ADSL/FW/IDS/Voice Plus IPSec 3DES	8MB	32MB
IP/ADSL/IPX/AT/IBM/FW/IDS/VoicePlus IPSec 56	16MB	48MB
IP/ADSL/IPX/AT/IBM/FW/IDS/Voice Plus IPSec 3DES	16MB	48MB

Check on Cisco Release Notes for the recent software feature sets and minimum memory requirements. http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122relnt/index.htm

Starting with Cisco IOS Release 12.0, the base feature sets on the 1600/1700 series include some features formerly in the PLUS feature sets: Network Address Translation (NAT), Open Shortest Path First (OSPF), Remote Access Dial-In User Service (RADIUS), and Next Hop Resolution Protocol (NHRP). Plus feature sets contain all the features in their corresponding Base feature sets, plus additional value-added features such as Layer 2 Tunneling Protocol (L2TP), Layer 2 Forwarding (L2F), Border Gateway Protocol (BGP), IP multicast, Frame Relay, Switched Virtual Circuit (SVC), Resource Reservation Protocol (RSVP), PPPoE, NetWare Link Services Protocol (NLSP), AppleTalk Simple Multicast Routing Protocol (SMRP), and Network Timing Protocol (NTP).

Tables 6 through 8 show the features available in the Cisco IOS 1751 feature sets.

Table 6: Features in Cisco IOS Base Feature Sets

Category	Basic Protocols/Features	IP	IP/ADSL	IP/IPX	IP Firewall	IP/IPX/AT/IBM
LAN	Transparent bridging	X	X	X	X	X
	IP	X	X	X	X	X
	IPX, NetBIOS access lists, name caching			X		X
	AppleTalk phases 1 and 2					X

WAN	Leased lines, Frame Relay, Switched 56, SMDS, HDLC	X	X	X	X	X
	ISDN leased line (IDSL) at 64 and 128 Kbps	X	X	X	X	X
	ISDN Caller ID callback	X	X	X	X	X
	PPP, PPP compression	X	X	X	X	X
	Async, SLIP	X	X	X	X	X
	X.25, X.25 PAD, X.25 over ISDN D channel	X	X	X	X	X
	LLC2, LAPB	X	X	X	X	X
IP Routing	RIP, RIP2, IGRP, Enhanced IGRP, OSPF, NHRP	X	X	X	X	X
	IP policy routing	X	X	X	X	X
	GRE tunneling	X	X	X	X	X
Other Routing	IPX-RIP			X		X
	(AppleTalk) RTMP					X
Security	PAP/CHAP, local password	X	X	X	X	X
	Extended access lists; Lock and Key	X	X	X	X	X
	RADIUS, TACACS+, Token Ring	X	X	X	X	X
Quality of Service (QoS)	Weighted Fair Queueing (WFQ)	X	X	X	X	X
WAN Optimization	Bandwidth on demand, dial on demand	X	X	X	X	X
	IPX and SPX spoofing			X		X
	Snapshot routing	X	X	X	X	X
	Frame Relay FRF.9	X	X	X	X	X
Ease of Use and						

Deployment	ConfigMaker	X	X	X	X	X
	Easy IP (PAT, IPCP, and DHCP server)	X	X	X	X	X
	Network Address Translation (NAT)	X	X	X	X	X
	AutoInstall for leased line and Frame Relay	X	X	X	X	X
Management	SNMP, Telnet, console port	X	X	X	X	X
	CiscoView, CiscoWorks2000	X	X	X	X	X
	Simple Network Timing Protocol (SNTP)	X	X	X	X	X

Note: AppleTalk routing and bridging are not supported for asynchronous interfaces.

Table 7: Data Only Plus Feature Sets—Additional Features

Category	Plus Protocols/ Features	IP/ADSL Plus	IP/ADSL Plus IPSec 56	IP/ADSL Plus IPSec 3DES	IP/ADSL FW/IDS Plus IPSec 56	IP/ADSL FW/IDS Plus IPSec 3DES	IP/ADSL/IPX FW/IDS Plus
WAN	Frame Relay SVC	X	X	X	X	X	X
IP Routing	BGP	X	X	X	X	X	X
Other Routing	NetWare Link Services Protocol						X
	AppleTalk AURP, ATIP						
VPN/Security	IPSec DES		X	X	X	X	
	IPSec Triple DES			X		X	
VPN/Tunnels	L2TP, L2F	X	X	X	X	X	X

QoS	Resource Reservation Protocol (RSVP)	X	X	X	X	X	X
	Random Early Detection (RED)	X	X	X	X	X	X
	Cisco Express Forwarding (CEF)	X	X	X	X	X	X
	Committed access rate (CAR)	X	X	X	X	X	X
	NetFlow	X	X	X	X	X	X
	RTP Header Compression (RTP-HC)	X	X	X	X	X	X
Multi media	IP Multicast (Protocol Independent Multicast, or PIM)	X	X	X	X	X	X
	AppleTalk SMRP (multicast)						
Management	Network Timing Protocol (NTP)	X	X	X	X	X	X

Note: FW denotes Cisco IOS Firewall Feature Set. Encryption is offered in special encryption feature sets (Plus IPSec 56 and Plus IPSec 3DES). To build an IP VPN, the recommended images are IP Firewall Plus IPSec 56 or IP Firewall Plus IPSec 3DES.

Table 8: Data and Voice Plus Feature Sets—Additional Features

Category	**Plus Protocol/Features**	**IP/ADSL/Voice Plus**	**IP/ADSL/FW/IDS/ Voice Plus**	**IP/ADSL/Voice Plus IPSec 56**	**IP/ADSL/V Plus IPSec 3DES**
WAN	Frame Relay SVC	X	X	X	X

IP Routing	BGP	X	X	X	
Other Routing	NetWare Link Services Protocol				
	AppleTalk AURP, ATIP				
VPN/Security	IPSec DES			X	X
	IPSec Triple DES				X
VPN/Tunnels	L2TP, L2F	X	X	X	X
QoS	Resource Reservation Protocol (RSVP)	X	X	X	X
	Random Early Detection (RED)	X	X	X	X
	Cisco Express Forwarding (CEF)	X	X	X	X
	Committed Access Rate (CAR)	X	X	X	X
	NetFlow	X	X	X	X
	RTP Header Compression (RTP-HC)	X	X	X	X
Multi media	IP Multicast (Protocol Independent Multicast, or PIM)	X	X	X	X
	AppleTalk SMRP (multicast)				
Codes	G.711	X	X	X	X
	G.729a	X	X	X	X
	G.723.1	X	X	X	X
	G.726	X	X	X	X

Voice Features	Voice over IP	X	X	X	X
	Fax support (group III fax)	X	X	X	X
	Private Line Automatic Ringdown (PLAR)	X	X	X	X
	Support for Off-premise Extension (OPX)	X	X	X	X
	Support for FXS	X	X	X	X
	Support for FXO	X	X	X	X
	Support for E&M	X	X	X	X
	Support for ISDN NT/TE VIC	X	X	X	X
	Voice Activity Detection (VAD)	X	X	X	X
	Busy out	X	X	X	X
	Comfort noise generation	X	X	X	X
	H.323 Version 1 and 2	X	X	X	X
	DTMF relay	X	X	X	X
	FRF.12	X	X	X	X
QoS	MLPPP w/ LFI (process-switched)	X	X	X	X
	FRF traffic shaping with per VC queuing	X	X	X	X
	IP RTP priority	X	X	X	X
	cRTP (Fast-switched)	X	X	X	X

MLPPP w/ LFI (fast-switched)	X	X	X	X
LLQ (PQ/CBWFQ)	X	X	X	X
FRF.11 (VoFR)	X	X	X	X
DiffServ	X	X	X	X

LAN Functionality

Q. What types of LANs does the Cisco 1751 router support?

A. The Cisco 1751 router supports one autosensing 10/100 Fast Ethernet connection, with one 10/100BaseTX ransceiver (RJ-45 connector). The 10/100BaseTX port can connect to an external 10/100BaseTX hub or switch or ectly to a PC Ethernet port (using a crossover cable) using inexpensive, unshielded twisted-pair (UTP) wiring.

Q. Is the 10BaseT Ethernet WIC supported on the 1751?

A. Yes, the 10Base T Ethernet WIC is supported on the 1751 to provide dual Ethernet functionality.

Q. What LAN and routing protocols are supported by the Cisco 1751 router?

A. The Cisco 1751 router supports IP, Internetwork Packet Exchange (IPX), AppleTalk routing, IBM Systems Network Architecture (SNA), and transparent bridging. Routing protocols supported include IP Routing Information Protocol (RIP), RIP V.2, Interior Gateway Routing Protocol (IGRP), Enhanced Interior Gateway Routing Protocol (EIGRP), IPX-RIP, OSPF, on-demand OSPF, NHRP, and AppleTalk Routing Table Maintenance Protocol (RTMP). Additionally, Plus feature sets including: BGP, NLSP and AppleTalk Update-Based Routing Protocol (AURP) are supported in Plus feature sets that support IPX and AppleTalk, respectively.

Q. Is it possible to manually set the Fast Ethernet (FE) speed on the Cisco 1751?

A. Yes, this feature was implemented in releases 12.1 and 12.1T. With prior releases, the FE port speed is tonegotiated.

Q. Is ISL or IEEE802.1Q supported on the Cisco 1751?

A. IEEE802.1Q is supported on the Cisco 1751. ISL is not supported. The Cisco 1720 and 1750 do not support VLAN (IEEE 802.1Q or ISL).

WAN Functionality

Q. What WAN interface cards are available?

A. Available WAN interface cards are shown in Table 9.

Table 9: Available WAN Interface Cards

WAN Interface Card	Interfaces

WIC-1T	1 serial, async and sync (T1/E1)
WIC-2T	2 serial, async and sync (T1/E1)
WIC-2A/S	2 low-speed (up to 128 kbps) serial, async, and sync
WIC-1B-S/T	1 ISDN BRI S/T
WIC-1B-U	1 ISDN BRI U with integrated NT1
WIC-1DSU-56K4	1 integrated 56/64 Kbps 4-wire DSU/CSU
WIC-1DSU-T1	1 integrated T1/fractional T1 DSU/CSU
WIC-1ENET	1 10BaseT Ethernet (only supported in Slot 0)
WIC-1ADSL	1 ADSL
WIC-1SHDSL	1 G.SHDSL
WIC-1AM	1 V.90 modem card
WIC-2AM	2 V.90 modem card

Q. Are there any WIC slot dependencies with respect to order or maximum number of a certain type?

A. All WICs are supported in any slot and in any combination.

Q. Does the Cisco 1751 router support two ISDN BRI interfaces?

A. Yes. The Cisco 1751 router supports two BRI interfaces (dial and ISDN leased line) with two ISDN BRI WAN interface cards installed in the two WAN interface card slots. Multilink PPP (MP) can combine the four B channels to achieve data rates up to 256 Kbps.

Q. Do the WIC-1T, WIC-2T, and WIC-2A/S WAN interface cards support asynchronous serial when installed in the Cisco 1751 router?

A. Yes. The Cisco 1751 router supports asynchronous serial (up to 115.2 Kbps) as well as synchronous serial on the serial WAN interface cards. The onboard aux port also supports asynchronous serial at speeds up to 115.2 Kbps.

Q. What WAN protocols does the Cisco 1751 router support?

A. Point-to-Point Protocol (PPP), High-Level Data Link Control (HDLC), X.25 Link Access Procedure, Balanced (LAPB), Switched Multimegabit Data Service (SMDS), Frame Relay, and IBM/SNA are supported over permanent or switched digital lines. PPP and Serial Line Internet Protocol (SLIP) are supported over asynchronous analog lines.

Q. Do the serial ports on the Cisco 1751 router support data-communications-equipment (DCE) functionality?

A. Yes, the Cisco 1751 router supports DCE (that is, supplies clocking), allowing the Cisco 1751 router to interconnect without requiring a null modem. Also, X.25 packet assembler/disassembler (PAD) functionality is supported. IBM Synchronous Data Link Control (SDLC), bisync, and other serial protocols are supported.

Q. Is IDSL supported on the Cisco 1751?

A. No.

Q. Will the Cisco 1751 support three WICs?

A. The Cisco 1751 can only support two WAN interfaces. The AUX port can be used as another WAN port. If your customer needs greater density, the Cisco 2600 would be the solution.

Q. Does the Cisco 1751 Router support Modem WIC card?

A. Yes. The Cisco 1751 Router supports one and two-port V.90 modem WIC card. Product number is WIC-1AM and WIC-2AM. For more details about the Modem WIC, please refer to the following data sheet:

http://www.cisco.com/warp/public/cc/pd/rt/1700/prodlit/17srt_ds.htm

Voice Functionality

Q. Does Cisco 1751 support Survivable Remote Site Telephony (SRST)?

Yes. For the detailed information, please refer to the below documents

Announcement: http://www.cisco.com/cpropart/salestools/cc/pd/rt/1700/prodlit/1601_po.htm

Datasheet: http://www.cisco.com/warp/partner/synchronicd/cc/pd/unco/srstl/prodlit/srstd_ds.htm

Q. What voice interface cards (VICs) are supported on the Cisco 1751?

A. The voice interface cards currently supported are given in Table 10.

Table 10: Voice Interface Cards Currently Supported

Voice Interface Card	**Interfaces**
VIC-2DID	2-port direct inward dial (DID) voice/fax interface card
VIC-2E/M	2-port voice interface card E&M
VIC-2FXO	2-port voice interface card FXO
VIC-2FXS	2-port voice interface card FXS
VIC-2FXO-M1	2-port FXO voice/fax interface card with battery reversal detection and Caller ID support (for U.S. and Canada) [enhanced version of the VIC-2FXO]
VIC-2FXO-M2	2-port FXO voice/fax interface card with battery reversal detection and Caller ID support (for Europe) [enhanced version of the VIC-2FXO-EU]
VIC-2FXO-M3	2-port voice interface card FXO (for Australia)
VIC-2FXO-EU	2-port voice interface card FXO (for Europe)

VIC-2BRI-NT/TE	2-port network side/terminal side ISDN BRI interface
VWIC-1MFT-T1	1-port RJ-48 multiflex trunk - T1
VWIC-2MFT-T1	2-port RJ-48 multiflex trunk - T1
VWIC-2MFT-T1-DI	2-port RJ-48 multiflex trunk - T1 with drop and insert
VWIC-1MFT-E1	1-port RJ-48 multiflex trunk - E1
VWIC-2MFT-E1	2-port RJ-48 multiflex trunk - E1
VWIC-2MFT-E1-DI	2-port RJ-48 multiflex trunk - E1 with drop and insert
VWIC-1MFT-G703	1-port RJ-48 multiflex trunk - E1 G.703
VWIC-2MFT-G703	2-port RJ-48 multiflex trunk - E1 G.703

Q. How many DSPs are supported in the 1751?

A. The 1751 has 2 DSP module slots on the motherboard, each of which supports the 5 DSP module. This provides a DSP density of 10 DPS's.

Q. What are the PVDM/VIC combinations that are supported?

A. The supported combinations are shown in Table 11.

Table 11: Supported PVDM/VIC Combinations

PVDM	**Number of DSPs Supported**	**VIC Combinations**
PVDM- 256K-4	1	1 analog VIC
PVDM-256K-8	2	Up to 2 analog VICs or 1 voice-BRI VIC
PVDM-256K-12	3	Up to 3 analog VICs or 1 analog VIC + 1 voice-BRI VIC

PVDM-256K-16	4	Up to 3 analog VICs or Up to 2 voice-BRI VICs or Up to 2 analog VICs+1 voice-BRIVIC
PVDM-256K-20	5	Up to 3 analog VICs or Up to 2 voice-BRI VICs or Upto 2 analog VICs+1 voice- BRIVIC or 1 analog VIC+up to 2 voice-BRI VICs

Q. Are the PVDM-4 (supported in Cisco 1750) supported in Cisco 1751?

A. PVDM-4, 8,12 are not officially supported in the Cisco1751.

Q. Are the PVDM-256K-4 (supported in Cisco 1751) supported in Cisco 1750?

A. PVDM-256K-4, 8,12 are not officially supported in the Cisco1751.

Q. Does the 1751 support digital VICs?

A. Yes, the 1751 supports digital VICs. At FCS, the ISDN BRI NT/TE VIC is supported, and 1 or 2 port T1/E1 VWICs are supported in Cisco IOS 12.2(4)YB or later releases.

Q. Does the Cisco 1751 support the T1/E1 VWICs (i.e. the multi-flex cards)?

A. Yes. From Cisco IOS 12.2(4) YB or later releases. It will roll into 5th 12.2 T train release.

Q. How many DSPs are required to support the various VICs?

Q. The analog VICs require 1 DSP/VIC, the ISDN BRI VIC requires 2 DSPs/VIC. For T1/E1 VWICs, it depends on the codec and how many voice channels are used. The number of maximum channels support per DSP is listed in Table 12.

Table 12: Maximum Channels Support per DSP for T1/E1 Multiflex VWICs

Codec	**Kbps**	**Max Channels/DSP** **(Digital Calls)**
G.711	64 (PCM)	6
G.729a	8 (CS-ACELP)	3
G.726	16 (ADPCM)	3
G.723.1	5.3/6.3 (ACELP)	2
G.728	32 (ADPCM/LDCLP)	2

For example, if you are running 12 G.711 digital T1/E1 voice calls, then you will need two DSPs. If these are G.729 calls, then you will need four DSPs.

DSP used for the digital calls and for the analog calls have to be calculated separately and one DSP can support multiple Codecs concurrently for T1/E1 VWICs.

487e

Q. Does Cisco 1751 support Caller ID?

A. Yes, Cisco 1751 supports Caller ID transmission on FXS, FXO-M1 and FXO-M2 interfaces. It provides Caller ID blocking configurable at the source location on FXS, and ability to unblock Caller ID on FXO-M1, M2 interfaces.

Q. Does Cisco 1751 support analog DID trunk card?

A. Yes.

Q. What does toll reduction or toll bypass mean?

A. In most of today's corporate networks, voice networks are separate from data networks. Typically, data networks are priced by a monthly fixed cost basis and are usually much cheaper than the voice networks. An example of this is a leased-line environment. In this case, the customer pays for that network, whether data is flowing or not. In a typical phone network, charges are incurred on a usage basis. Therefore, phone expenses on interoffice dialing can be quite expensive, especially since most interoffice calling occurs during "peak" business hours.

When you have the ability to put your interoffice voice calls across a lower-price or fixed-price network with a product such as the Cisco 1751 platform, you can avoid the "toll" that is charged by the long-distance carrier, local exchange carrier (LEC), or Port, Telephone, and Telegraph (PTT). The voice call then travels over the same network that your dat travels over and avoids going into the Public Switched Telephone Network (PSTN) and, therefore, does not incur charges.

It is easy for companies to figure out the savings that they will get, because they receive accurate monthly reports that describe their costs from their LECs. Any company that does a great deal of interoffice calling will save more money than one that does more "off-net" PSTN-type calling.

Q. What do the terms FXO, FXS, and E&M mean?

A. The Cisco 1751 router supports FXO, FXS, and E&M voice interface cards. Each type provides a slightly different interface for connecting to different types of equipment.

Foreign Exchange Office

The FXO interface allows an analog connection to be directed at the central office (CO) of the PSTN. This interface is of value for off-premise extension applications. This is the only voice interface card that will be approved to connect to of premise lines. This interface may be used to provide backup over the PSTN or for Centrex-type operations. This voice interface card needs to be approved by PTTs; it is not available in every country. Check the homologation status page at http://wwwin-eng.cisco.com/Eng/MSABU/Eng_Ops/WWW/index.htmfor up-to-date availability information.

Foreign Exchange Station

The FXS interface allows connection for basic telephone service phones (home phones), fax machines, keysets, and private branch exchange (PBXs) by providing ring voltage, dial tone, and so on. This interface will be used where phones are connecting directly to the router. FXS will be very popular for trials because it allows the phones to be plugged directly into the router.

Ear and Mouth

The E&M interface allows connection for PBX trunk lines (tie lines). It is a signaling technique for two- and four-wire telephone and trunk interfaces.

Q. What's the difference between FXO and FXO-M1, FXO-M2?

A. VIC-2FXO-M1 and VIC-2FXO-M2 support battery reversal detection and Caller ID. While the regular VIC-2FXO doesn't. VIC-2FXO-M1 is for U.S. and Canada, VIC-2FXO-M2 is for Europe.

Q. Does the Cisco 1751 support three analog VICs, or six analog voice ports?

A. Yes. Customers requiring this capability need to order the PVDM-256k-12 module (part number: PVDM-256k-12=), which provides three DSPs.

Q. Is RAS for H.323 gatekeeper registration supported on the Cisco 1751 platform?

A. Yes.

Q. In a VoFR and VoIP environment, there are cases where people using OPX extensions would like to use their message waiting lights at the remote sites. To provide functionality, the 150 V signal must be sensed on the originating end and reproduced on the terminating side. Is the message waiting function supported on the Cisco 1751?

The FXS port does not have the ability to provide the voltage levels necessary to perform this function.

Q. What are the key features when implementing voice on the Cisco 1751?

A. Please refer to Cisco 1700 Modular Access Voice Feature Overview

http://wwwin.cisco.com/cmc/cc/pd/rt/1700/sales/orwir_st.htm

Cisco IOS Security

Q. What security functions are available for the Cisco 1751 router?

A. Cisco IOS software supports a wide range of security features. Standard features in base feature sets include access control lists (ACLs); authentication, authorization, and accounting (AAA) features such as Password Authentication Protocol/Challenge Handshake Authentication Protocol (PAP/CHAP), TACACS+, RADIUS, and Token Ring; and Lock and Key. Optional features include the Cisco IOS Firewall Feature Set, IP Security (IPSec) encryption, and tunneling protocols such as IPSec, generic routing encapsulation (GRE), L2F, and L2TP.

Q. Can I use the Cisco 1751 router as a firewall?

A. Yes. The Cisco IOS Firewall Feature Set is supported in the Cisco 1751 router. This feature set offers enhanced firewall functionality, including context-based access control (CBAC), which enables securing a network on a per-application basis. Additional firewall security features include Java applet blocking, denial-of-service detection and prevention, and more advanced logging capabilities. For more information, see: http://www.cisco.com/warp/partner/synchronicd/cc/cisco/mkt/security/iosfw/index.htmpartner/synchronicd/cc/cisco/mkt

Q. Can I encrypt data on the Cisco 1751 router?

A. Yes. Two types of encryption technologies are supported: IPSec Data Encryption Standard (DES) 56 and IPSec Triple DES.

Processor

Q. What is the processor on the Cisco 1751 router?

A. The Cisco 1751 router uses a Motorola MPC860P PowerQUICC at 48 MHz. The Cisco 2600 series uses an MPC860 The 860P processor of the Cisco 1751 router has an integrated Fast Ethernet controller. This has implications on performance, as discussed in the Performance section.

Performance

Q. How does the performance of the Cisco 1700 series compare to that of the Cisco 1600-R series?

A. As Table 13 shows, the Cisco 1751 router performance is greater than that of the Cisco 1600-R series.

Table 13: Performance Comparison of the Cisco 1600-R Series and the Cisco 1751

Feature	**Cisco 1600-R Series**	**Cisco 1751**
Encryption IPSec DES 56 (256-byte packets)	128 Kbps	512 Kbps
Encryption IPSec 3DES (256-byte packets)	Not supported	256 Kbps
Fast Switching (64-byte packets)	2 Mbps (4000 pps)	4.3 Mbps (8400 pps)
Processor Switching (64-byte packets)	300 Kbps (600 pps)	768 Kbps (1500 pps)

Q. How does the performance of the Cisco 1751 router compare with that of the Cisco 2600 series routers?

A. The Cisco 2600 series router has higher fast-switching performance (12,000 to 37,000 pps for 64-byte packets) compared to the Cisco 1751 router (8400 pps). However, the encryption and process switching performance for both platforms are similar (512 Kbps for IPSec DES 56 encryption with 256 byte packets; 768 Kbps or 1500 pps for process switching of 64-byte packets).

Q. Why is the fast-switching performance of the Cisco 1751 router not equal to that of the Cisco 2600 series when they appear to use the same processor?

A. The Cisco 1751 router uses a Motorola MPC860P processor, which is different from the MPC860 processor on the Cisco 2600 series. The Motorola 860P has an integrated Fast Ethernet controller. This processor uses an arbitration scheme that continuously polls for contenders for the Fast Ethernet bus in a round-robin fashion. Contenders are the serial communications controllers (SCCs), Ethernet controller, and cache. This process of round-robin polling uses up clock cycles, resulting in lower fast-switching performance.

Internal Expansion Slot and Encryption Card

Q. Can the internal expansion slot of the Cisco 1751 router support the advanced integration module (AIM) expansion cards (for example, encryption) that is supported on the Cisco 2600 series?

A. No. The Cisco 2600 series has an AIM slot that is based on a protocol control information (PCI)-bus architecture; th Cisco 1751 router, on the other hand, uses a Q-bus to lower cost. Although the expansion cards on these platforms are not the same, the encryption technology is interoperable and, therefore, creates a complete Cisco end-to-end solution.

Q. Does the Cisco 1751 support the 1700 VPN module that accelerates DES and 3DES for IPSec?

A. Yes. See VPN Module Q&A at:
http://wwwin.cisco.com/Mkt/cmc/cc/cisco/mkt/access/1700/internal/vpn17_qa.htmvpn17_qa.htm.

Compression

Q. Does the Cisco 1751 router support compression?

A. Yes. Up to 4:1 compression is supported. The Cisco 1751 router supports both Stac and predictor compression algorithms. Compression performance for the Cisco 1751 router has not been measured yet.

Q. What compression algorithms are supported on the Cisco 1751 router?

A. The WAN interfaces of the Cisco 1751 router support the types of compression algorithms for each of the WAN encapsulations given in Table 14.

Table 14: Compression Algorithms Supported on the Cisco 1751 Router

Encapsulation	Compression Algorithm
PPP	Predictor stacker
Frame Relay	Payload
HDLC	Stac
X.25	Payload
LAPB	Predictor Stac

IBM/SNA Features

Q. What IBM/SNA features are available for Cisco 1751 router?

A. The supported IBM/SNA features on the Cisco 1751 router are equivalent to those supported on the Cisco 1600-R, 2500, and 2600 series routers (see Table 15):

Table 15: IBM/SNA Features Supported on the Cisco 1751 Router

STUN	**NetBIOS**
SDLC	SNA priority queue
SDLLC	NetView NSP
Bisync	BSTUN native client interface architecture (NCIA) server
DLSW+ (data-link switching plus)	Local acknowledgment
QLLC	RSRB (required for DLSw)
FRAS (BNN, BAN, RFC 1490)	Response time reporter (internetwork performance monitor)
IBM Network Manager/LAN Manager	All CiscoWorks Blue (maps and so on)

DSPU	All Cisco IBM MIBs

Note: Token Ring and Advanced Peer-to-Peer Networking (APPN), supported on the Cisco 2500 and 2600 series, are not supported on Cisco 1600-R series and 1751 routers.

Q. Will the Cisco 1751 router support Token Ring interfaces?

A. No, there are no plans to support Token Ring on the Cisco 1751 router.

Q. When do I sell a Cisco 1751 router IBM solution?

A. The Cisco 1751 router is best sold for IBM/SNA opportunities that require:

- One Ethernet/1-5 WAN configuration (including the AUX)
- Modularity/flexibility—The Cisco 1751 series provides two WAN interface card slots, allowing customers to add or change WAN services as needed
- Multiservice voice/data integration now or in the future

Q. What IBM/SNA software feature sets are available for Cisco 1751 router?

A. IBM/SNA feature sets available for Cisco 1751 router include:

- IP/IPX/AppleTalk/IBM
- IP/ADSL/IPX/AppleTalk/IBM Plus
- IP/ADSL/IPX/AT/IBM/FW/IDS Plus IPSec 56
- IP/ADSL/IPX/AT/IBM/FW/IDS Plus IPSec 3DES
- IP/ADSL/IPX/AT/IBM/FW/IDS/Voice Plus IPSec 56
- IP/ADSL/IPX/AT/IBM/FW/IDS/Voice Plus IPSec 3DES

Note Use Plus for L2F, L2TP, BGP, NTP, NLSP, RSVP, IP multicast, Frame Relay SVC, and encryption support.

Memory Architecture

Q. What memory architecture does the Cisco 1751 router use?

Q. The Cisco 1751 router uses the run-from-RAM memory architecture.

Q. What type of DRAM memory does the Cisco 1751 router use?

A. The Cisco 1751 router uses synchronous DRAM (SDRAM). The default DRAM is 32 MB fixed onboard for the 1751 model, and 64 MB for the 1751-V model. There is one DIMM slot for adding additional memory in increments of 16, 32, and 64 MB. The maximum DRAM for the 1751 model is 96MB (32 MB onboard plus 64 MB DIMM). The maximum DRAM for the 1751-V model is 128MB (64 MB onboard plus 64 MB DIMM).

	Cisco 1751	Cisco 1751-V
Default DRAM (MB)	32	64
Max. DRAM (MB)	96	128

Q. What type of Flash memory does the Cisco 1751 router use?

A. The Cisco 1751 router uses onboard (soldered on the motherboard) flash. The Cisco1751 has 16 MB of flash. The Cisco 1751-V have 32 MB of flash. This is a fixed configuration—it is not upgradeable and there is not a flash card slot on the motherboard to add more flash.

	Cisco 1751	Cisco 1751-V
Default Flash (MB)	16	32
Max. Flash (MB)	16	32

Q. What is the flash memory used for?

A. Cisco IOS software and configuration files are stored flash. Also, flash memory allows software upgrades to be downloaded over the WAN or LAN link to be stored in the Mini-Flash card.

Q. How are software images and configuration files stored in flash?

A. Flash come preprogrammed with Cisco IOS software. Software upgrades and configuration files must be copied using Trivial File Transfer Protocol (TFTP) onto a Mini-Flash card in a Cisco 1751 router.

Q. Is dual Flash bank supported on Cisco 1751 routers?

A. Yes. Dual Flash bank is supported. Although both the Cisco 1751 and Cisco 1751-V support dual flash bank, we recommend that customers requiring dual flash bank purchase the Cisco 1751-V model since it comes with 32 MB flash.

Q. Does the Cisco 1751 use the same DRAM as the Cisco 1720/1750?

A. Yes. However, the Cisco 1751 does not support the 4 and 8 MB DIMM (MEM1700-4D= and MEM1700-8D=). In addition there is a new 64MB DIMM available for the Cisco 1751

Q. Does the Cisco 1751 use the same flash as the Cisco 1720/1750?

A. No. The flash in the Cisco 1751 is soldered on the motherboard, and is therefore not upgradeable.

Q. Can the amount of shared (input/output [I/O]) memory on a Cisco 1751 router be configured?

A. Yes. It can be modified using Cisco IOS command-line interface (CLI) and saved as part of the router configuration.

Power Supply

Q. What type of power supplies does the Cisco 1751 router use?

A. The Cisco 1751 router uses one universal power supply that is applicable for all countries. There are no country-specific power supplies. The AC input voltage of this universal power supply spans from 100 to 240 V; the frequency from 47 to 64 Hz. (Although this power supply works in all countries, the user still has to specify the power cord appropriate for a particular country.) The router also has a locking connector on the power socket to ensure that the power cord remains securely fastened.

MTBF

Q. What is the mean time between failures (MTBF) for the Cisco 1751 router?

A. The predicted MTBF is 514,526 hours. This predicted MTBF includes the chassis and external power supply but not the WAN interface cards or voice interface cards.

Network Management

Q. How is the Cisco 1751 router managed?

A. Like all Cisco routers, the Cisco 1751 router can be managed via Simple Network Management Protocol (SNMP), via a Telnet session, and through a directly connected terminal or PC running terminal emulator software.

Q. Do CiscoView, CiscoWorks2000, and Cisco Voice Manager support Cisco 1751 routers?

A. Yes, CiscoView, CiscoWorks2000 and Cisco Voice Manager supported.

Q. Does Cisco ConfigMaker support Cisco 1751 routers?

A. Yes, Cisco ConfigMaker supports Cisco 1751 routers, starting with Release 2.5b.

Q. Does the Cisco 1751 router support Remote Monitoring (RMON)?

A. The Cisco 1751 router supports only RMON lite. RMON lite covers two out of the nine RMON groups, alarms, and events. Full RMON (statistics, history, hosts, hostTopN, matrix, filter, capture) features are available for the Cisco 2500 and 2600 series routers.

Cisco IOS File System Commands

This chapter describes the basic set of commands used to manipulate files on your routing device using the Cisco IOS File System (IFS) in Cisco IOS Release 12.2.

Commands in this chapter use URLs as part of the command syntax. URLs used in the Cisco IFS contain two parts: a file system or network prefix, and a file identification suffix. The following tables list URL keywords that can be used in the *source-url* and *destination-url* arguments for all commands in this chapter. The prefixes listed below can also be used in the *filesystem* arguments in this chapter.

Table 18 lists common URL network prefixes used to indicate a device on the network.

Table 18 Network Prefixes for Cisco IFS URLs

Prefix	Description
ftp:	Specifies a File Transfer Protocol (FTP) network server.
rcp:	Specifies an remote copy protocol (rcp) network server.
tftp:	Specifies a TFTP server.

Table 19 lists the available suffix options (file indentification suffixes) for the URL prefixes used in Table 18.

Table 19 File ID Suffixes for Cisco IFS URLs

Prefix	Suffix Options
ftp:	[[//[username[:password]@]location]/directory]/filename For example: **ftp://network-config** (*prefix://filename*) **ftp://jeanluc:secret@enterprise.cisco.com/ship-config**
rcp:	rcp:[[//[username@]location]/directory]/filename
tftp:	tftp:[[//location]/directory]/filename

Table 20 lists common URL prefixes used to indicate memory locations on the system.

Table 20 File System Prefixes for Cisco IFS URLs

Prefix	Description
bootflash:	Bootflash memory.
disk0:	Rotating disk media.
flash: [*partition-number*]	Flash memory. This prefix is available on most platforms. For platforms that do not have a device named **flash:**, the prefix **flash:** is aliased to **slot0:**. Therefore, you can use the prefix **flash:** to refer to the main Flash memory storage area on all platforms
flh:	Flash load helper log files.
null:	Null destination for copies. You can copy a remote file to null to determine its size.
nvram:	NVRAM. This is the default location for the running-configuration file.
slavebootflash:	Internal Flash memory on a slave RSP card of a router configured with Dual RSPs.
slavenvram:	NVRAM on a slave RSP card.
slaveslot0:	First PCMCIA card on a slave RSP card.
slaveslot1:	Second PCMCIA card on a slave RSP card.
slot0:	First PCMCIA Flash memory card.
slot1:	Second PCMCIA Flash memory card.
xmodem:	Obtain the file from a network machine using the Xmodem protocol.
ymodem:	Obtain the file from a network machine using the Ymodem protocol.

For details about the Cisco IFS, and for IFS configuration tasks, refer to the "Configuring the Cisco IOS File System" chapter in the Release 12.2 *Cisco IOS Configuration Fundamentals Configuration Guide*.

cd

To change the default directory or file system, use the **cd** EXEC command.

cd [*filesystem*:]

Syntax Description

filesystem:	(Optional) The URL or alias of the directory or file systems followed by a colon.

Defaults

The initial default file system is **flash:**. For platforms that do not have a physical device named **flash:**, the keyword **flash:** is aliased to the default Flash device.

If you do not specify a directory on a file system, the default is the root directory on that file system.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

For all EXEC commands that have an optional *filesystem* argument, the system uses the file system specified by the **cd** command when you omit the optional *filesystem* argument. For example, the **dir** EXEC command, which displays a list of files on a file system, contain an optional *filesystem* argument. When you omit this argument, the system lists the files on the file system specified by the **cd** command.

Examples

In the following example, the cd command is used to set the default file system to the Flash memory card inserted in slot 0:

```
Router# pwd
bootflash:/
Router# cd slot0:
Router# pwd
slot0:/
```

Related Commands

Command	Description
copy	Copies any file from a source to a destination.
delete	Deletes a file on a Flash memory device.
dir	Displays a list of files on a file system.
pwd	Displays the current setting of the **cd** command.
show file systems	Lists available file systems and their alias prefix names.
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.

configure network

The **configure network** command was replaced by the **copy** {**rcp** | **tftp**} **running-config** command in Cisco IOS Release 11.0. To maintain backward compatibility, the **configure network** command continues to function in Cisco IOS Release 12.2 for most systems, but support for this command may be removed in a future release.

The **copy** {**rcp** | **tftp**} **running-config** command was replaced by the **copy** {**ftp:** | **rcp:** | **tftp:**}[*filename*] **system:running-config** command in Cisco IOS Release 12.1.

The **copy** {**ftp:** | **rcp:** | **tftp:**}[*filename*] **system:running-config** command specifies that a configuration file should be copied from a FTP, rcp, or TFTP source to the running configuration. See the description of the **copy** in this chapter command for more information.

copy

To copy any file from a source to a destination, use the **copy** EXEC command.

copy [**/erase**] *source-url destination-url*

Syntax Description

/erase	(Optional) Erases the destination file system before copying.
source-url	The location URL or alias of the source file or directory to be copied.
destination-url	The destination URL or alias of the copied file or directory.

The exact format of the source and destination URLs varies according to the file or directory location. You may enter either an alias keyword for a particular file or an alias keyword for a file system type (not a file within a type).

Timesaver Aliases are used to cut down on the amount of typing you need to perform. For example, it is easier to type **copy run start** (the abbreviated form of the **copy running-config startup-config** command) than it is to type **copy system:r nvram:s** (the abbreviated form of the **copy system:running-config nvram:startup-config** command). These aliases also allow you to continue using some of the common commands used in previous versions of Cisco IOS software.

Table 21 shows two keyword shortcuts to URLs.

Table 21 Common Keyword Aliases to URLs

Keyword	Source or Destination
running-config	(Optional) Keyword alias for the **system:running-config** URL. The **system:running-config** keyword represents the current running configuration file. This keyword does not work in **more** and **show file** EXEC command syntaxes.
startup-config	(Optional) Keyword alias for the **nvram:startup-config** URL. The **nvram:startup-config** keyword represents the configuration file used during initialization (startup). This file is contained in NVRAM for all platforms except the Cisco 7000 family, which uses the CONFIG_FILE environment variable to specify the startup configuration. The Cisco 4500 series cannot use the **copy running-config startup-config** command. This keyword does not work in **more** and **show file** EXEC command syntaxes.

The following tables list aliases by file system type. If you do not specify an alias, the router looks for a file in the current directory.

Table 22 lists URL aliases for Special (opaque) file systems. Table 23 lists them for network file systems, and Table 24 lists them for local writable storage.

Table 22 URL Prefix Aliases for Special File Systems

Alias	Source or Destination
flh:	Source URL for flash load helper log files.
modem:	Destination URL for loading modem firmware on Cisco 5200 and 5300 Series routers.
nvram:	Router NVRAM. You can copy the startup configuration into or from NVRAM. You can also display the size of a private configuration file.
null:	Null destination for copies or files. You can copy a remote file to null to determine its size.
system:	Source or destination URL for system memory, which includes the running configuration.
xmodem:	Source destination for the file from a network machine that uses the Xmodem protocol.
ymodem:	Source destination for the file from a network machine that uses th Xmodem protocol.

Table 23 URL Prefix Aliases for Network File Systems

Alias	Source or Destination
ftp:	Source or destination URL for an File Transfer Protocol (FTP) network server. The syntax for this alias is as follows: **ftp:**[[[//*username* [:*password*]@]*location*]/*directory*]/*filename*.
rcp:	Source or destination URL for a Remote Copy Protocol (rcp) network server. The syntax for this alias is as follows: **rcp:**[[[//*username*@]*location*]/*directory*]/*filename*.
tftp:	Source or destination URL for a TFTP network server. The syntax for this alias is **tftp:**[[//*location*]/*directory*]/*filename*.

Table 24 URL Prefix Aliases for Local Writable Storage File Systems

Alias	Source or Destination
bootflash:	Source or destination URL for boot flash memory.
disk0: and disk1:	Source or destination URL of rotating media.
flash:	Source or destination URL for Flash memory. This alias is available on all platforms. For platforms that lack a flash: device, note that **flash:** is aliased to **slot0:**, allowing you to refer to the main Flash memory storage area on all platforms.
slavebootflash:	Source or destination URL for internal Flash memory on the slave RSP card of a router configured for HSA.
slaveram:	NVRAM on a slave RSP card of a router configured for HSA.
slaveslot0:	Source or destination URL of the first PCMCIA card on a slave RSP card of a router configured for HSA.

Table 24 URL Prefix Aliases for Local Writable Storage File Systems (continued)

Alias	Source or Destination
slaveslot1:	Source or destination URL of the second PCMCIA slot on a slave RSP card of a router configured for HSA.
slot0:	Source or destination URL of the first PCMCIA Flash memory card.
slot1:	Source or destination URL of the second PCMCIA Flash memory card.

Command Modes

EXEC

Command History

Release	Modification
11.3 T	This command was introduced.

Usage Guidelines

You can enter on the command line all necessary source- and destination-URL information and the username and password to use, or you can enter the **copy** command and have the router prompt you for any missing information.

If you enter information, choose one of the following three options: **running-config**, **startup-config**, or a file system alias (see previous tables.) The location of a file system dictates the format of the source or destination URL.

The colon is required after the alias. However, earlier commands not requiring a colon remain supported, but are unavailable in context-sensitive help.

The entire copying process may take several minutes and differs from protocol to protocol and from network to network.

In the alias syntax for **ftp:**, **rcp:**, and **tftp:**, the location is either an IP address or a host name. The filename is specified relative to the directory used for file transfers.

This section contains usage guidelines for the following topics:

- Understanding Invalid Combinations of Source and Destination
- Understanding Character Descriptions
- Understanding Partitions
- Using rcp
- Using FTP
- Storing Images on Servers
- Copying from a Server to Flash Memory
- Verifying Images
- Copying a Configuration File from a Server to the Running Configuration
- Copying a Configuration File from a Server to the Startup Configuration
- Storing the Running or Startup Configuration on a Server
- Saving the Running Configuration to the Startup Configuration

- Using CONFIG_FILE, BOOT, and BOOTLDR Environment Variables
- Using the Copy Command with the Dual RSP Feature

Understanding Invalid Combinations of Source and Destination

Some invalid combinations of source and destination exist. Specifically, you cannot copy the following:

- From a running configuration to a running configuration
- From a startup configuration to a startup configuration
- From a device to the same device (for example, the **copy flash: flash:** command is invalid)

Understanding Character Descriptions

Table 25 describes the characters that you may see during processing of the **copy** command.

Table 25 copy Character Descriptions

Character	Description
!	For network transfers, an exclamation point indicates that the copy process is taking place. Each exclamation point indicates the successful transfer of ten packets (512 bytes each).
.	For network transfers, a period indicates that the copy process timed out. Many periods in a row typically mean that the copy process may fail.
O	For network transfers, an uppercase O indicates that a packet was received out of order and the copy process may fail.
e	For Flash erasures, a lowercase e indicates that a device is being erased.
E	An uppercase E indicates an error. The copy process may fail.
V	A series of uppercase Vs indicates the progress during the verification of the image checksum.

Understanding Partitions

You cannot copy an image or configuration file to a Flash partition from which you are currently running. For example, if partition 1 is running the current system image, copy the configuration file or image to partition 2. Otherwise, the copy operation will fail.

You can identify the available Flash partitions by entering the **show file system** EXEC command.

Using rcp

The rcp protocol requires a client to send a remote username upon each rcp request to a server. When you copy a configuration file or image between the router and a server using rcp, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The remote username specified in the **copy** command, if a username is specified.
2. The username set by the **ip rcmd remote-username** global configuration command, if the command is configured.
3. The remote username associated with the current tty (terminal) process. For example, if the user is connected to the router through Telnet and was authenticated through the **username** command, the router software sends the Telnet username as the remote username.
4. The router host name.

For the rcp copy request to process, an account must be defined on the network server for the remote username. If the network administrator of the destination server did not establish an account for the remote username, this command will not run. If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the remote username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

If you are writing to the server, the rcp server must be properly configured to accept the rcp write request from the user on the router. For UNIX systems, add an entry to the .rhosts file for the remote user on the rcp server. Suppose the router contains the following configuration lines:

```
hostname Rtr1
ip rcmd remote-username User0
```

If the router IP address translates to Router1.company.com, then the .rhosts file for User0 on the rcp server should contain the following line:

```
Router1.company.com Rtr1
```

Refer to the documentation for your rcp server for more details.

If you are using a personal computer as a file server, the computer must support the remote shell protocol (rsh).

Using FTP

The FTP protocol requires a client to send a remote username and password upon each FTP request to a server. When you copy a configuration file from the router to a server using FTP, the Cisco IOS software sends the first valid username that it encounters in the following sequence:

1. The username specified in the **copy** command, if a username is specified.
2. The username set by the **ip ftp username** command, if the command is configured.
3. Anonymous.

The router sends the first valid password in the following list:

1. The password specified in the **copy** command, if a password is specified.
2. The password set by the **ip ftp password** command, if the command is configured.
3. The router forms a password username@routername.domain. The variable username is the username associated with the current session, routername is the configured host name, and domain is the domain of the router.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept the FTP write request from the user on the router.

If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

Refer to the documentation for your FTP server for more details.

Use the **ip ftp username** and **ip ftp password** global configuration commands to specify a username and password for all copies. Include the username in the **copy** command if you want to specify a username for that copy operation only.

Storing Images on Servers

Use the **copy** *flash: destination-url* command (for example, **copy flash: tftp:**) to copy a system image or boot image from Flash memory to a network server. Use the copy of the image as a backup copy. Also, use it to verify that the copy in Flash memory is the same as that in the original file.

Copying from a Server to Flash Memory

Use the **copy** *destination-url flash:* command (for example, **copy tftp: flash:**) to copy an image from a server to Flash memory.

On Class B file system platforms, the system provides an option to erase existing Flash memory before writing onto it.

Note Verify the image in Flash memory before booting the image.

Verifying Images

When copying a new image to your router, you should confirm that the image was not corrupted during the copy process. Depending on the destination filesystem type, a checksum for the image file may be displayed when the **copy** command completes. You can verify this checksum by comparing it to the checksum value provided for your image file on Cisco.com.

Caution If the checksum values do not match, do not reboot the router. Instead, reissue the **copy** command and compare the checksums again. If the checksum is repeatedly wrong, copy the original image back into Flash memory *before* you reboot the router from Flash memory. If you have a corrupted image in Flash memory and try to boot from Flash memory, the router will start the system image contained in ROM (assuming booting from a network server is not configured). If ROM does not contain a fully functional system image, the router might not function and will need to be reconfigured through a direct console port connection.

An alternate method for file verification is to use the UNIX 'diff' command. This method can also be applied to file types other than Cisco IOS images. If you suspect that a file is corrupted, copy the suspect file and the original file to a Unix server. (The file names may need to be modified if you try to save the files in the same directory.) Then run the Unix 'diff' command on the two files. If there is no difference, then the file has not been corrupted.

Copying a Configuration File from a Server to the Running Configuration

Use the **copy** {**ftp:** | **rcp:** | **tftp:**} **running-config** command to load a configuration file from a network server to the running configuration of the router (note that **running-config** is the alias for the **system:running-config** keyword). The configuration will be added to the running configuration as if the commands were typed in the command-line interface (CLI). Thus, the resulting configuration file will be a combination of the previous running configuration and the loaded configuration file, with the loaded configuration file having precedence.

You can copy either a host configuration file or a network configuration file. Accept the default value of *host* to copy and load a host configuration file containing commands that apply to one network server in particular. Enter *network* to copy and load a network configuration file containing commands that apply to all network servers on a network.

Copying a Configuration File from a Server to the Startup Configuration

Use the **copy** {**ftp:** | **rcp:** | **tftp:**} **nvram:startup-config** command to copy a configuration file from a network server to the router startup configuration. These commands replace the startup configuration file with the copied configuration file.

Storing the Running or Startup Configuration on a Server

Use the **copy system:running-config** {**ftp:** | **rcp:** | **tftp:**} command to copy the current configuration file to a network server using FTP, rcp, or TFTP. Use the **copy nvram:startup-config** {**ftp:** | **rcp:** | **tftp:**} command to copy the startup configuration file to a network server.

The configuration file copy can serve as a backup copy.

Saving the Running Configuration to the Startup Configuration

Use the **copy system:running-config nvram:startup-config** command to copy the running configuration to the startup configuration.

Note Some specific commands might not get saved to NVRAM. You will need to enter these commands again if you reboot the machine. These commands are noted in the documentation. We recommend that you keep a listing of these settings so you can quickly reconfigure your router after rebooting.

If you issue the **copy system:running-config nvram:startup-config** command from a bootstrap system image, a warning will instruct you to indicate whether you want your previous NVRAM configuration to be overwritten and configuration commands to be lost. This warning does not appear if NVRAM contains an invalid configuration or if the previous configuration in NVRAM was generated by a bootstrap system image.

On all platforms except Class A file system platforms, the **copy system:running-config nvram:startup-config** command copies the currently running configuration to NVRAM.

On the Class A Flash file system platforms, the **copy system:running-config nvram:startup-config** command copies the currently running configuration to the location specified by the CONFIG_FILE environment variable. This variable specifies the device and configuration file used for initialization. When the CONFIG_FILE environment variable points to NVRAM or when this variable does not exist (such as at first-time startup), the software writes the current configuration to NVRAM. If the current configuration is too large for NVRAM, the software displays a message and stops executing the command.

When the CONFIG_FILE environment variable specifies a valid device other than **nvram:** (that is, **flash:**, **bootflash:**, **slot0:**, or **slot1:**), the software writes the current configuration to the specified device and filename, and stores a distilled version of the configuration in NVRAM. A distilled version is one that does not contain access list information. If NVRAM already contains a copy of a complete configuration, the router prompts you to confirm the copy.

Using CONFIG_FILE, BOOT, and BOOTLDR Environment Variables

For the Class A Flash file system platforms, specifications are as follows:

- The CONFIG_FILE environment variable specifies the configuration file used during router initialization.
- The BOOT environment variable specifies a list of bootable images on various devices.
- The BOOT environment variable specifies a list of bootable images on various devices.
- The BOOTLDR environment variable specifies the Flash device and filename containing the rxboot image that ROM uses for booting.

- Cisco 3600 routers do not use a dedicated boot helper image (rxboot), which many other routers use to help with the boot process. Instead, the BOOTLDR ROM monitor environment variable identifies the Flash memory device and filename that are used as the boot helper; the default is the first system image in Flash memory.

To view the contents of environment variables, use the **show bootvar** EXEC command. To modify the CONFIG_FILE environment variable, use the **boot config** global configuration command. To modify the BOOTLDR environment variable, use the **boot bootldr** global configuration command. To modify the BOOT environment variable, use the **boot system** global configuration command. To save your modifications, use the **copy system:running-config nvram:startup-config** command.

When the destination of a **copy** command is specified by the CONFIG_FILE or BOOTLDR environment variable, the router prompts you for confirmation before proceeding with the copy. When the destination is the only valid image in the BOOT environment variable, the router also prompts you for confirmation before proceeding with the copy.

Using the Copy Command with the Dual RSP Feature

The Dual RSP feature allows you to install two Route/Switch Processor (RSP) cards in a single router on the Cisco 7507 and Cisco 7513 platforms.

On a Cisco 7507 or Cisco 7513 router configured for Dual RSPs, if you copy a file to **nvram:startup-configuration** with automatic synchronization disabled, the system asks if you also want to copy the file to the slave startup configuration. The default answer is **yes**. If automatic synchronization is enabled, the system automatically copies the file to the slave startup configuration each time you use a **copy** command with **nvram:startup-configuration** as the destination.

Examples

The following examples illustrate uses of the **copy** command.

- Copying an Image from a Server to Flash Memory Examples
- Saving a Copy of an Image on a Server Examples
- Copying a Configuration File from a Server to the Running Configuration Example
- Copying a Configuration File from a Server to the Startup Configuration Example
- Copying the Running Configuration to a Server Example
- Copying the Startup Configuration to a Server Example
- Saving the Current Running Configuration Example
- Moving Configuration Files to Other Locations Examples
- Copying an Image from the Master RSP Card to the Slave RSP Card Example

Copying an Image from a Server to Flash Memory Examples

The following three examples use a **copy rcp:**, **copy tftp:**, or **copy ftp:** command to copy an image file from a server to Flash memory:

- Copying an Image from a Server to Flash Memory Example
- Copying an Image from a Server to a Flash Memory Using Flash Load Helper Example
- Copying an Image from a Server to a Flash Memory Card Partition Example

Copying an Image from a Server to Flash Memory Example

This example copies a system image named file1 from the remote rcp server with an IP address of 172.16.101.101 to Flash memory. On Class B file system platforms, the Cisco IOS software allows you to first erase the contents of Flash memory to ensure that enough Flash memory is available to accommodate the system image.

```
Router# copy rcp://netadmin@172.16.101.101/file1 flash:file1

Destination file name [file1]?
Accessing file 'file1' on 172.16.101.101...
Loading file1 from 172.16.101.101 (via Ethernet0): ! [OK]

Erase flash device before writing? [confirm]
Flash contains files. Are you sure you want to erase? [confirm]

Copy 'file1' from server
  as 'file1' into Flash WITH erase? [yes/no] yes
Erasing device... eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee...erased
Loading file1 from 172.16.101.101 (via Ethernet0): !
[OK - 984/8388608 bytes]

Verifying checksum... OK (0x14B3)
Flash copy took 0:00:01 [hh:mm:ss]
```

Copying an Image from a Server to a Flash Memory Using Flash Load Helper Example

The following example copies a system image into a partition of Flash memory. The system will prompt for a partition number only if there are two or more read/write partitions or one read-only and one read/write partition and dual Flash bank support in boot ROMs. If the partition entered is not valid, the process terminates. You can enter a partition number, a question mark (**?**) for a directory display of all partitions, or a question mark and a number (**?***number*) for directory display of a particular partition. The default is the first read/write partition. In this case, the partition is read-only and has dual Flash bank support in boot ROM, so the system uses Flash Load Helper.

```
Router# copy tftp: flash:

System flash partition information:
Partition   Size     Used     Free     Bank-Size   State        Copy-Mode
    1       4096K    2048K    2048K    2048K       Read Only    RXBOOT-FLH
    2       4096K    2048K    2048K    2048K       Read/Write   Direct

[Type ?<no> for partition directory; ? for full directory; q to abort]
Which partition? [default = 2]

                             **** NOTICE ****
Flash load helper v1.0
This process will accept the copy options and then terminate
the current system image to use the ROM based image for the copy.
Routing functionality will not be available during that time.
If you are logged in via telnet, this connection will terminate.
Users with console access can see the results of the copy operation.
                             ---- ******** ----
Proceed? [confirm]
System flash directory, partition 1:
File  Length   Name/status
  1   3459720  master/igs-bfpx.100-4.3

Address or name of remote host [255.255.255.255]? 172.16.1.1
Source file name? master/igs-bfpx-100.4.3
Destination file name [default = source name]?

Loading master/igs-bfpx.100-4.3 from 172.16.1.111: !
```

```
Erase flash device before writing? [confirm]
Flash contains files. Are you sure? [confirm]
Copy 'master/igs-bfpx.100-4.3' from TFTP server
as 'master/igs-bfpx.100-4.3' into Flash WITH erase? [yes/no] yes
```

Copying an Image from a Server to a Flash Memory Card Partition Example

The following example copies the file c3600-i-mz from the rcp server at IP address 172.23.1.129 to the Flash memory card in slot 0 of a Cisco 3600 series router, which has only one partition. As the operation progresses, the Cisco IOS software asks you to erase the files on the Flash memory PC card to accommodate the incoming file. This entire operation takes 18 seconds to perform, as indicated at the end of the example.

```
Router# copy rcp: slot0:

PCMCIA Slot0 flash

Partition   Size    Used      Free      Bank-Size  State          Copy Mode

Saving a Copy of an Image on a Server Examples

The following four examples use **copy** commands to copy image files to a server for storage:

- Copy an Image from Flash Memory to an rcp Server Example
- Copy an Image from a Partition of Flash Memory to a Server Example
- Copying an Image from a Flash Memory File System to an FTP Server Example
- Copying an Image from Boot Flash Memory to a TFTP Server Example

Copy an Image from Flash Memory to an rcp Server Example

The following example copies a system image from Flash Memory to an rcp server using the default remote username. Because the rcp server address and filename are not included in the command, the router prompts for it.

```
Router# copy flash: rcp:

IP address of remote host [255.255.255.255]? 172.16.13.110
Name of file to copy? gsxx
writing gsxx - copy complete
```

Copy an Image from a Partition of Flash Memory to a Server Example

The following example copies an image from a particular partition of Flash memory to an rcp server using a remote username of netadmin1.

The system will prompt if there are two or more partitions. If the partition entered is not valid, the process terminates. You have the option to enter a partition number, a question mark (**?**) for a directory display of all partitions, or a question mark and a number (**?***number*) for a directory display of a particular partition. The default is the first partition.

```
Router# configure terminal
Router# ip rcmd remote-username netadmin1
Router# end
Router# copy flash: rcp:
System flash partition information:
Partition   Size    Used    Free    Bank-Size   State       Copy-Mode
    1       4096K   2048K   2048K   2048K       Read Only   RXBOOT-FLH
    2       4096K   2048K   2048K   2048K       Read/Write  Direct
[Type ?<number> for partition directory; ? for full directory; q to abort]
Which partition? [1] 2

System flash directory, partition 2:
File  Length   Name/status
  1   3459720  master/igs-bfpx.100-4.3
[3459784 bytes used, 734520 available, 4194304 total]
Address or name of remote host [ABC.CISCO.COM]?
Source file name? master/igs-bfpx.100-4.3
Destination file name [master/igs-bfpx.100-4.3]?
Verifying checksum for 'master/igs-bfpx.100-4.3' (file # 1)... OK
Copy 'master/igs-bfpx.100-4.3' from Flash to server
as 'master/igs-bfpx.100-4.3'? [yes/no] yes
!!!!...
Upload to server done
Flash copy took 0:00:00 [hh:mm:ss]
```

Copying an Image from a Flash Memory File System to an FTP Server Example

The following example copies the file c3600-i-mz from partition 1 of the Flash memory card in slot 0 to an FTP server at IP address 172.23.1.129.

```
Router# show slot0: partition 1

PCMCIA Slot0 flash directory, partition 1:
File  Length   Name/status
  1   1711088 c3600-i-mz
[1711152 bytes used, 2483152 available, 4194304 total]

Router# copy slot0:1:c3600-i-mz ftp://myuser:mypass@172.23.1.129/c3600-i-mz
Verifying checksum for '/tftpboot/cisco_rules/c3600-i-mz' (file # 1)...  OK
Copy '/tftpboot/cisco_rules/c3600-i-mz' from Flash to server
  as 'c3700-i-mz'? [yes/no] yes
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
Upload to server done
Flash device copy took 00:00:23 [hh:mm:ss]
```

Copying an Image from Boot Flash Memory to a TFTP Server Example

The following example copies an image from boot Flash memory to a TFTP server:

```
Router# copy bootflash:file1 tftp://192.168.117.23/file1

Verifying checksum for 'file1' (file # 1)... OK
Copy 'file1' from Flash to server
  as 'file1'? [yes/no]y
!!!!...
Upload to server done
Flash copy took 0:00:00 [hh:mm:ss]
```

Copying a Configuration File from a Server to the Running Configuration Example

The following example copies and runs a configuration filename host1-confg from the netadmin1 directory on the remote server with an IP address of 172.16.101.101:

```
Router# copy rcp://netadmin1@172.16.101.101/host1-confg system:running-config

Configure using host1-confg from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-confg:![OK]
Router#
%SYS-5-CONFIG: Configured from host1-config by rcp from 172.16.101.101
```

Copying a Configuration File from a Server to the Startup Configuration Example

The following example copies a configuration file host2-confg from a remote FTP server to the startup configuration. The IP address is172.16.101.101, the remote username is netadmin1, and the remote password is ftppass.

```
Router# copy ftp://netadmin1:ftppass@172.16.101.101/host2-confg nvram:startup-config
Configure using rtr2-confg from 172.16.101.101?[confirm]
Connected to 172.16.101.101
Loading 1112 byte file rtr2-confg:![OK]
[OK]
Router#
%SYS-5-CONFIG_NV:Non-volatile store configured from rtr2-config by
FTP from 172.16.101.101
```

Copying the Running Configuration to a Server Example

The following example specifies a remote username of netadmin1. Then it copies the running configuration file named rtr2-confg to the netadmin1 directory on the remote host with an IP address of 172.16.101.101.

```
Router# configure terminal
Router(config)# ip rcmd remote-username netadmin1
Router(config)# end
Router# copy system:running-config rcp:
Remote host[]? 172.16.101.101

Name of configuration file to write [Rtr2-confg]?
Write file rtr2-confg on host 172.16.101.101?[confirm]
Building configuration...[OK]
Connected to 172.16.101.101
```

Copying the Startup Configuration to a Server Example

The following example copies the startup configuration to a TFTP server:

```
Router# copy nvram:startup-config tftp:

Remote host[]? 172.16.101.101

Name of configuration file to write [rtr2-confg]? <cr>
Write file rtr2-confg on host 172.16.101.101?[confirm] <cr>
![OK]
```

Saving the Current Running Configuration Example

The following example copies the running configuration to the startup configuration. On a Class A Flash file system platform, this command copies the running configuration to the startup configuration specified by the CONFIG_FILE variable.

```
copy system:running-config nvram:startup-config
```

The following example shows the warning that the system provides if you try to save configuration information from bootstrap into the system:

```
Router(boot)# copy system:running-config nvram:startup-config

Warning: Attempting to overwrite an NVRAM configuration written
by a full system image. This bootstrap software does not support
the full configuration command set. If you perform this command now,
some configuration commands may be lost.
Overwrite the previous NVRAM configuration?[confirm]
```

Enter **no** to escape writing the configuration information to memory.

Moving Configuration Files to Other Locations Examples

On some routers, you can store copies of configuration files on a Flash memory device. Five examples follow.

Copying the Startup Configuration to a Flash Memory Device Example

The following example copies the startup configuration file (specified by the CONFIG_FILE environment variable) to a Flash memory card inserted in slot 0:

```
copy nvram:startup-config slot0:router-confg
```

Copying the Running Configuration to a Flash Memory Device Example

The following example copies the running configuration from the router to the Flash memory PC card in slot 0:

```
Router# copy system:running-config slot0:berlin-cfg

Building configuration...
```

```
5267 bytes copied in 0.720 secs
```

Copying to the Running Configuration from a Flash Memory Device Example

The following example copies the file named ios-upgrade-1 from the Flash memory card in slot 0 to the running configuration:

```
Router# copy slot0:4:ios-upgrade-1 system:running-config

Copy 'ios-upgrade-1' from flash device
  as 'running-config' ? [yes/no] yes
```

Copying to the Startup Configuration from a Flash Memory Device Example

The following example copies the router-image file from the Flash memory to the startup configuration:

```
copy flash:router-image nvram:startup-config
```

Copying a Configuration File from one Flash Device to Another Example

The following example copies the file running-config from the first partition in internal Flash memory to the Flash memory PC card in slot 1. The checksum of the file is verified, and its copying time of 30 seconds is displayed.

```
Router# copy flash: slot1:

System flash

Partition    Size     Used      Free      Bank-Size  State          Copy Mode
  1          4096K    3070K     1025K     4096K      Read/Write     Direct
  2         16384K    1671K    14712K     8192K      Read/Write     Direct

[Type ?<no> for partition directory; ? for full directory; q to abort]
Which partition? [default = 1]

System flash directory, partition 1:
File  Length   Name/status
  1   3142748  dirt/images/mars-test/c3600-j-mz.latest
  2   850      running-config
[3143728 bytes used, 1050576 available, 4194304 total]

PCMCIA Slot1 flash directory:
File  Length   Name/status
  1   1711088  dirt/images/c3600-i-mz
  2   850      running-config
[1712068 bytes used, 2482236 available, 4194304 total]
Source file name? running-config
Destination file name [running-config]?
Verifying checksum for 'running-config' (file # 2)...  OK
Erase flash device before writing? [confirm]
Flash contains files. Are you sure you want to erase? [confirm]

Copy 'running-config' from flash: device
  as 'running-config' into slot1: device WITH erase? [yes/no] yes
Erasing device... eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee ...erased
!

Verifying checksum...  OK (0x16)
```

Copying an Image from the Master RSP Card to the Slave RSP Card Example

The following example copies the router-image file from the Flash memory card inserted in slot 1 of the master RSP card to slot 0 of the slave RSP card in the same router:

```
copy slot1:router-image slaveslot0:
```

Related Commands

Command	Description
boot config	Specifies the device and filename of the configuration file from which the router configures itself during initialization (startup).
boot system	Specifies the system image that the router loads at startup.
cd	Changes the default directory or file system.
copy xmodem: flash:	Copies any file from a source to a destination.
copy ymodem: flash:	Copies any file from a source to a destination.
delete	Deletes a file on a Flash memory device.
dir	Displays a list of files on a file system.
erase	Erases a file system.
ip rcmd remote-username	Configures the remote username to be used when requesting a remote copy using rcp.
reload	Reloads the operating system.
show bootvar	Displays the contents of the BOOT environment variable, the name of the configuration file pointed to by the CONFIG_FILE environment variable, the contents of the BOOTLDR environment variable, and the configuration register setting.
show (Flash file system)	Displays the layout and contents of a Flash memory file system.
slave auto-sync config	Turns on automatic synchronization of configuration files for a Cisco 7507 or Cisco 7513 router that is configured for Dual RSP Backup.
verify bootflash:	Either of the identical **verify bootflash:** or **verify bootflash** commands replaces the **copy verify bootflash** command. Refer to the **verify** command for more information.

delete

To delete a file from a Flash memory device or NVRAM, use the **delete** EXEC command.

delete *URL* [**/force** | **/recursive**]

Syntax Description

URL	IFS URL of the file to be deleted. Include the filesystem prefix, followed by a colon, and, optionally, the name of a file or directory.
/force	(Optional) Deletes the specified file or directory with prompting you for verification. **Note** Use this keyword with caution: the system will not ask you to confirm the file deletion.
/recursive	(Optional) Deletes all files in the specified directory, as well as the directory itself.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

If you attempt to delete the configuration file or image specified by the CONFIG_FILE or BOOTLDR environment variable, the system prompts you to confirm the deletion. Also, if you attempt to delete the last valid system image specified in the BOOT environment variable, the system prompts you to confirm the deletion.

When you delete a file in Flash memory, the software simply marks the file as deleted, but it does not erase the file. To later recover a "deleted" file in Flash memory, use the **undelete** EXEC command. You can delete and undelete a file up to 15 times.

To permanently delete all files marked "deleted" on a linear Flash memory device, use the **squeeze** EXEC command.

Examples

The following example deletes the file named "test" from the Flash filesystem:

```
Router# delete flash:test
Delete flash:test? [confirm]
```

Related Commands

Command	Description
cd	Changes the default directory or file system.
dir	Displays a list of files on a file system.

Command	Description
show bootvar	Displays the contents of the BOOT environment variable, the name of the configuration file pointed to by the CONFIG_FILE environment variable, the contents of the BOOTLDR environment variable, and the configuration register setting.
squeeze	Permanently deletes Flash files by squeezing a Class A Flash file system.
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.

dir

To display a list of files on a file system, use the **dir** EXEC command.

dir [**/all**] [*filesystem*:][*file-url*]

Syntax Description

/all	(Optional) Lists deleted files, undeleted files, and files with errors.
filesystem:	(Optional) File system or directory containing the files to list, followed by a colon.
file-url	(Optional) The name of the files to display on a specified device. The files can be of any type. You can use wildcards in the filename. A wildcard character (*) matches all patterns. Strings after a wildcard are ignored.

Defaults

The default file system is specified by the **cd** command. When you omit the **/all** keyword, the Cisco I software displays only undeleted files.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

Use the **show** (Flash file system) command to display more detail about the files in a particular file system.

Examples

The following is sample output from the **dir** command:

```
Router# dir slot0:

Directory of slot0:/

  1  -rw-     4720148   Aug 29 1997 17:49:36  hampton/nitro/c7200-j-mz
  2  -rw-     4767328   Oct 01 1997 18:42:53  c7200-js-mz
  5  -rw-         639   Oct 02 1997 12:09:32 rally
  7  -rw-         639   Oct 02 1997 12:37:13  the_time

20578304 bytes total (3104544 bytes free)

Router# dir /all slot0:

Directory of slot0:/

  1  -rw-     4720148   Aug 29 1997 17:49:36  hampton/nitro/c7200-j-mz
  2  -rw-     4767328   Oct 01 1997 18:42:53  c7200-js-mz
  3  -rw-     7982828   Oct 01 1997 18:48:14  [rsp-jsv-mz]
  4  -rw-         639   Oct 02 1997 12:09:17  [the_time]
```

```
5   -rw-          639    Oct 02 1997 12:09:32  rally
6   -rw-          639    Oct 02 1997 12:37:01  [the_time]
7   -rw-          639    Oct 02 1997 12:37:13  the_time
```

Table 26 describes the significant fields shown in the displays.

Table 26 dir Field Descriptions

Field	Description
1	Index number of the file.
-rw-	Permissions. The file can be any or all of the following: • d—directory • r—readable • w—writable • x—executable
4720148	Size of the file.
Aug 29 1997 17:49:36	Last modification date.
hampton/nitro/c7200-j-mz	Filename. Deleted files are indicated by square brackets around the filename.

Related Commands

Command	Description
cd	Changes the default directory or file system.
delete	Deletes a file on a Flash memory device.
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.

erase

To erase a file system, use the **erase** EXEC command. The **erase nvram:** command replaces the **write erase** command and the **erase startup-config** command.

erase *filesystem***:**

Syntax Description

filesystem:	File system name, followed by a colon. For example, **flash:** or **nvram:**

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

When a file system is erased, none of the files in the file system can be recovered.

The **erase** command can be used on both Class B and Class C Flash file systems only. To reclaim space on Flash file systems after deleting files using the **delete** command, you must use the **erase** command. This command erases all of the files in the Flash file system.

Class A Flash file systems cannot be erased. You can delete individual files using the **delete** EXEC command and then reclaim the space using the **squeeze** EXEC command. You can use the **format** EXEC command to format the Flash file system.

On Class C Flash file systems, space is dynamically reclaimed when you use the **delete** command. You can also use either the **format or erase** command to reinitialize a Class C Flash file system.

The **erase nvram:** command erases NVRAM. On Class A file system platforms, if the CONFIG_FILE variable specifies a file in Flash memory, the specified file will be marked "deleted."

Examples

The following example erases the NVRAM, including the startup configuration located there:

```
erase nvram:
```

The following example erases all of partition 2 in internal Flash memory:

```
Router# erase flash:2

System flash directory, partition 2:
File  Length   Name/status
  1   1711088  dirt/images/c3600-i-mz
[1711152 bytes used, 15066064 available, 16777216 total]

Erase flash device, partition 2? [confirm]
Are you sure? [yes/no]: yes
Erasing device... eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee ...erased
```

The following example erases Flash memory when Flash is partitioned, but no partition is specified in the command:

```
Router# erase flash:

System flash partition information:
Partition    Size     Used     Free     Bank-Size     State        Copy-Mode
    1        4096K    2048K    2048K    2048K         Read Only    RXBOOT-FLH
    2        4096K    2048K    2048K    2048K         Read/Write   Direct

[Type ?<no> for partition directory; ? for full directory; q to abort]
Which partition? [default = 2]
```

The system will prompt only if there are two or more read/write partitions. If the partition entered is not valid or is the read-only partition, the process terminates. You can enter a partition number, a question mark (**?**) for a directory display of all partitions, or a question mark and a number (**?***number*) for directory display of a particular partition. The default is the first read/write partition.

```
System flash directory, partition 2:
File  Length   Name/status
  1   3459720  master/igs-bfpx.100-4.3
[3459784 bytes used, 734520 available, 4194304 total]

Erase flash device, partition 2? [confirm] <Return>
```

Related Commands

Command	Description
boot config	Specifies the device and filename of the configuration file from which the router configures itself during initialization (startup).
delete	Deletes a file on a Flash memory device.
more nvram:startup-config	Displays the startup configuration file contained in NVRAM or specified by the CONFIG_FILE environment variable.
show bootvar	Displays the contents of the BOOT environment variable, the name of the configuration file pointed to by the CONFIG_FILE environment variable, the contents of the BOOTLDR environment variable, and the configuration register setting
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.

erase bootflash

The **erase bootflash:** and **erase bootflash** commands have identical functions. See the description of the **erase** command in this chapter for more information.

file prompt

To specify the level of prompting, use the **file prompt** global configuration command.

file prompt [**alert** | **noisy** | **quiet**]

Syntax Description

alert	(Optional) Prompts only for destructive file operations. This is the default.
noisy	(Optional) Confirms all file operation parameters.
quiet	(Optional) Seldom prompts for file operations.

Defaults

alert

Command Modes

Global configuration

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

Use this command to change the amount of confirmation needed for different file operations.

This command affects only prompts for confirmation of operations. The router will always prompt for missing information.

Examples

The following example configures confirmation prompting for all file operations:

```
file prompt noisy
```

format

To format a Class A or Class C Flash file system, use the **format** EXEC command.

Class C Flash File System

format *filesystem1*:

Class A Flash File System

format [**spare** *spare-number*] *filesystem1*: [[*filesystem2*:][*monlib-filename*]]

Caution Reserve a certain number of memory sectors as spares, so that if some sectors fail, most of the Flash memory card can still be used. Otherwise, you must reformat the Flash card when some of the sectors fail.

Syntax Description

spare	(Optional) Reserves spare sectors as specified by the *spare-number* argument when formatting Flash memory.
spare-number	(Optional) Number of the spare sectors to reserve on formatted Flash memory. Valid values are from 0 to 16. The default value is zero.
filesystem1:	Flash memory to format, followed by a colon.
filesystem2:	(Optional) File system containing the monlib file to use for formatting filesystem1 followed by a colon.
monlib-filename	(Optional) Name of the ROM monitor library file (monlib file) to use for formatting the *filesystem1* argument. The default monlib file is the one bundled with the system software. When used with HSA and you do not specify the *monlib-filename* argument, the system takes ROM monitor library file from the slave image bundle. If you specify the *monlib-filename* argument, the system assumes that the files reside on the slave devices.

Defaults

The default monlib file is the one bundled with the system software.

The default number of spare sectors is zero (0).

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

Use this command to format Class A or C Flash memory file systems.

In some cases, you might need to insert a new PCMCIA Flash memory card and load images or backup configuration files onto it. Before you can use a new Flash memory card, you must format it.

Sectors in Flash memory cards can fail. Reserve certain Flash memory sectors as "spares" by using the optional *spare* argument on the **format** command to specify 0 to 16 sectors as spares. If you reserve a small number of spare sectors for emergencies, you can still use most of the Flash memory card. If you specify 0 spare sectors and some sectors fail, you must reformat the Flash memory card, thereby erasing all existing data.

The monlib file is the ROM monitor library. The ROM monitor uses this file to access files in the Flash file system. The Cisco IOS system software contains a monlib file.

In the command syntax, *filesystem1:* specifies the device to format and *filesystem2:* specifies the optional device containing the monlib file used to format *filesystem1:*. If you omit the optional *filesystem2:* and *monlib-filename* arguments, the system formats *filesystem1:* using the monlib file already bundled with the system software. If you omit only *the optional filesystem2:* argument, the system formats *filesystem1:* using the monlib file from the device you specified with the **cd** command. If you omit only the optional *monlib-filename* argument, the system formats *filesystem1:* using the *filesystem2:* monlib file. When you specify both arguments—*filesystem2:* and *monlib-filename*—the system formats *filesystem1:* using the monlib file from the specified device. You can specify *filesystem1:*'s own monlib file in this argument. If the system cannot find a monlib file, it terminates its formatting.

⚠ **Caution** You can read from or write to Flash memory cards formatted for Cisco 7000 series Route Processor (RP) cards in your Cisco 7200 and 7500 series routers, but you cannot boot the Cisco 7200 and 7500 series routers from a Flash memory card formatted for the Cisco 7000 series routers. Similarly, you can read from or write to Flash memory cards formatted for the Cisco 7200 and 7500 series routers in your Cisco 7000 series routers, but you cannot boot the Cisco 7000 series routers from a Flash memory card formatted for the Cisco 7200 and 7500 series routers.

Examples

The following example formats a Flash memory card inserted in slot 0:

```
Router# format slot0:

Running config file on this device, proceed? [confirm]y
All sectors will be erased, proceed? [confirm]y
Enter volume id (up to 31 characters): <Return>
Formatting sector 1 (erasing)
Format device slot0 completed
```

When the console returns to the EXEC prompt, the new Flash memory card is formatted and ready for use.

Related Commands

Command	Description
cd	Changes the default directory or file system.
copy	Copies any file from a source to a destination.
delete	Deletes a file on a Flash memory device.
show file systems (Flash file system)	Lists available file systems.

Command	Description
squeeze	Permanently deletes Flash files by squeezing a Class A Flash file system.
undelete	Recovers a file marked “deleted” on a Class A or Class B Flash file system.

fsck

To check a Class C Flash file system for damage and repair any problems, use the **fsck** EXEC command.

fsck [/nocrc] *filesystem*:

Syntax Description

/nocrc	(Optional) Omits cyclic redundancy checks (CRCs).
filesystem:	The file system to check.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

This command is only valid on Class C Flash file systems.

Examples

The following example checks the Flash file system:

```
Router# fsck flash:

Fsck operation may take a while. Continue? [confirm]
flashfs[4]: 0 files, 2 directories
flashfs[4]: 0 orphaned files, 0 orphaned directories
flashfs[4]: Total bytes: 8128000
flashfs[4]: Bytes used: 1024
flashfs[4]: Bytes available: 8126976
flashfs[4]: flashfs fsck took 23 seconds.
Fsck of flash: complete
```

mkdir

To create a new directory in a Class C Flash file system, use the **mkdir** EXEC command.

mkdir *directory*

Syntax Description

directory	The name of the directory to create.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

This command is only valid on Class C Flash file systems.

If you do not specify the directory name in the command line, the router prompts you for it.

Examples

The following example creates a directory named newdir:

```
Router# mkdir newdir

Mkdir file name [newdir]?
Created dir flash:newdir
Router# dir
Directory of flash:

  2  drwx          0   Mar 13 1993 13:16:21  newdir

8128000 bytes total (8126976 bytes free)
```

Related Commands

Command	Description
dir	Displays a list of files on a file system.
rmdir	Removes an existing directory in a Class C Flash file system.

more

To display a file, use the **more** EXEC command.

more [**/ascii** | **/binary** | **/ebcdic**] *file-url*

Syntax Description

/ascii	(Optional) Displays a binary file in ASCII format.
/binary	(Optional) Displays a file in hex/text format.
/ebcdic	(Optional) Displays a binary file in EBCDIC format.
file-url	The URL of the file to display.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

The **more system:running-config** command displays the same output as the **show running-config** command. The **more nvram:startup-config** command replaces the **show startup-config** command and the **show configuration** command.

You can use this command to display configuration files, as follows:

- The **more nvram:startup-config** command displays the startup configuration file contained in NVRAM or specified by the CONFIG_FILE environment variable. The Cisco IOS software informs you whether the displayed configuration is a complete configuration or a distilled version. A distilled configuration is one that does not contain access lists.
- The **more system:running-config** command displays the running configuration.

These commands show the version number of the software used when you last changed the configuration file.

You can display files on remote systems using the **more** command.

Examples

The following partial sample output displays the configuration file named startup-config in NVRAM:

```
Router# more nvram:startup-config

!
! No configuration change since last restart
! NVRAM config last updated at 02:03:26 PDT Thu Oct 2 1997
!
version 12.1
service timestamps debug uptime
service timestamps log uptime
service password-encryption
service udp-small-servers
service tcp-small-servers
.
```

```
.
.
end
```

The following is partial sample output from the **more nvram:startup-config** command when the configuration file has been compressed:

```
Router# more nvram:startup-config

Using 21542 out of 65536 bytes, uncompressed size = 142085 bytes
!
version 12.1
service compress-config
!
hostname rose
!
.
.
.
```

The following partial sample output displays the running configuration:

```
Router2# more system:running-config

Building configuration...

Current configuration:
!
version 12.1
no service udp-small-servers
no service tcp-small-servers
!
hostname Router2
!
.
.
.
!
end
```

Related Commands

Command	Description
boot config	Specifies the device and filename of the configuration file from which the router configures itself during initialization (startup).
service compress-config	Compresses startup configuration files.
show bootvar	Displays the contents of the BOOT environment variable, the name of the configuration file pointed to by the CONFIG_FILE environment variable, the contents of the BOOTLDR environment variable, and the configuration register setting.

pwd

To show the current setting of the **cd** command, use the **pwd** EXEC command.

pwd

Syntax Description

This command has no arguments or keywords.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

Use the **pwd** command to show which directory or file system is specified as the default by the **cd** command. For all EXEC commands that have an optional *filesystem* argument, the system uses the file system specified by the **cd** command when you omit the optional *filesystem* argument.

For example, the **dir** command contains an optional *filesystem* argument and displays a list of files on a particular file system. When you omit this *filesystem* argument, the system shows a list of the files on the file system specified by the **cd** command.

Examples

The following example shows that the present working file system specified by the **cd** command is slot 0:

```
Router> pwd
slot0:/
```

The following example uses the **cd** command to change the present file system to slot 1 and then uses the **pwd** command to display that present working file system:

```
Router> cd slot1:
Router> pwd
slot1:/
```

Related Commands

Command	Description
cd	Changes the default directory or file system.
dir	Displays a list of files on a file system.

rename

To rename a file in a Class C Flash file system, use the **rename** EXEC command.

rename *url1 url2*

Syntax Description

url1	The original path and filename.
url2	The new path and filename.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

This command is valid only on Class C Flash file systems.

Examples

In the following example, the file named Karen.1 is renamed test:

```
Router# dir

Directory of disk0:/Karen.dir/

  0  -rw-          0   Jan 21 1998 09:51:29  Karen.1
  0  -rw-          0   Jan 21 1998 09:51:29  Karen.2
  0  -rw-          0   Jan 21 1998 09:51:29  Karen.3
  0  -rw-          0   Jan 21 1998 09:51:31  Karen.4
243  -rw-        165   Jan 21 1998 09:53:17  Karen.cur

340492288 bytes total (328400896 bytes free)

Router# rename disk0:Karen.dir/Karen.1 disk0:Karen.dir/test
Router# dir

Directory of disk0:/Karen.dir/

  0  -rw-          0   Jan 21 1998 09:51:29  Karen.2
  0  -rw-          0   Jan 21 1998 09:51:29  Karen.3
  0  -rw-          0   Jan 21 1998 09:51:31  Karen.4
243  -rw-        165   Jan 21 1998 09:53:17  Karen.cur
  0  -rw-          0   Apr 24 1998 09:49:19  test

340492288 bytes total (328384512 bytes free)
```

rmdir

To remove an existing directory in a Class C Flash file system, use the **rmdir** EXEC command.

rmdir *directory*

Syntax Description

directory	Directory to delete.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

This command is valid only on Class C Flash file systems.

Examples

The following example deletes the directory named newdir:

```
Router# dir

Directory of flash:

  2  drwx           0    Mar 13 1993 13:16:21   newdir

8128000 bytes total (8126976 bytes free)
Router# rmdir newdir
Rmdir file name [newdir]?
Delete flash:newdir? [confirm]
Removed dir flash:newdir
Router# dir
Directory of flash:

No files in directory

8128000 bytes total (8126976 bytes free)
```

Related Commands

Command	Description
dir	Displays a list of files on a file system.
mkdir	Creates a new directory in a Class C Flash file system.

show configuration

The **show configuration** command is replaced by the **show startup-config** and **more nvram:startup-config** commands. See the description of the **show startup-config** and **more** commands for more information.

show file descriptors

To display a list of open file descriptors, use the **show file descriptors** EXEC command.

show file descriptors

Syntax Description

This command has no arguments or keywords.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

File descriptors are the internal representations of open files. You can use this command to learn if another user has a file open.

Examples

The following is sample output from the **show file descriptors** command:

```
Router# show file descriptors

File Descriptors:

   FD  Position  Open  PID  Path
    0    187392  0001    2  tftp://dirt/hampton/c4000-i-m.a
    1    184320  030A    2  flash:c4000-i-m.a
```

Table 27 describes the significant fields shown in the display.

Table 27 show file descriptors Field Descriptions

Field	Description
FD	File descriptor. The file descriptor is a small integer used to specify the file once it has been opened.
Position	Byte offset from the start of the file.
Open	Flags supplied when opening the file.
PID	Process ID of the process that opened the file.
Path	Location of the file.

show file information

To display information about a file, use the **show file information** EXEC command.

show file information *file-url*

Syntax Description

file-url	The URL of the file to display.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Examples

The following is sample output from the **show file information** command:

```
Router# show file information tftp://dirt/hampton/c2500-j-l.a

tftp://dirt/hampton/c2500-j-l.a:
  type is image (a.out) [relocatable, run from flash]
  file size is 8624596 bytes, run size is 9044940 bytes [8512316+112248+420344]
  Foreign image

Router# show file information slot0:c7200-js-mz

slot0:c7200-js-mz:
  type is image (elf) []
  file size is 4770316 bytes, run size is 4935324 bytes
  Runnable image, entry point 0x80008000, run from ram

Router1# show file information nvram:startup-config

nvram:startup-config:
  type is ascii text
```

Table 28 describes the possible file types.

Table 28 Possible File Types

Types	Description
image (a.out)	Runnable image in a.out format.
image (elf)	Runnable image in elf format.
ascii text	Configuration file or other text file.
coff	Runnable image in coff format.
ebcdic	Text generated on an IBM mainframe.
lzw compression	Lzw compressed file.
tar	Text archive file used by the Channel Interface Processor (CIP).

show file systems

To list available file systems, use the **show file systems** command in EXEC mode.

show file systems

Syntax Description

This command has no arguments or keywords.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

Use this command to learn the alias names (Prefixes) of the file systems your router supports.

Examples

The following is sample output from the **show file systems** command:

```
Router# show file systems

File Systems:

     Size(b)       Free(b)   Type     Flags  Prefixes
          -             -   opaque    rw     null:
          -             -   opaque    rw     system:
          -             -   opaque    ro     xmodem:
          -             -   opaque    ro     ymodem:
          -             -  network    rw     tftp:
          -             -  network    rw     rcp:
          -             -  network    rw     ftp:
*    4194304       4190616    flash    rw     flash:
      131066        129185    nvram    rw     nvram:
          -             -   opaque    wo     lex:
```

Table 29 describes the significant fields shown in the display.

Table 29 show file systems Field Descriptions

Type	Description
Size(b)	Amount of memory in the file system (in bytes).
Free(b)	Amount of free memory in the file system (in bytes).
Type	Type of file system.
Flags	Permissions for file system.
Prefixes	Alias for file system.
disk	The file system is for a rotating medium.
flash	The file system is for a Flash memory device.

Table 29 show file systems Field Descriptions (continued)

Type	Description
network	The file system is a network file system (TFTP, rcp, FTP, and so on).
nvram	The file system is for an NVRAM device.
opaque	The file system is a locally generated “pseudo” file system (for example, the “system”) or a download interface, such as brimux.
rom	The file system is for a ROM or EPROM device.
tty	The file system is for a collection of terminal devices.
unknown	The file system is of unknown type.

Table 30 describes file system flags.

Table 30 Possible File System Flags

Flag	Description
ro	The file system is Read Only.
rw	The file system is Write Only.
wo	The file system is Read/Write.

squeeze

To permanently erase files tagged as “deleted” or “error” on Class A Flash file systems, use the **squeeze** command in EXEC mode.

squeeze [/nolog] [/quiet] *filesystem*:

Syntax Description

/nolog	(Optional) Disables the squeeze log (recovery data) and accelerates the squeeze process.
/quiet	(Optional) Disables status messages during the squeeze process.
filesystem:	The Flash file system, followed by a colon. Typically **flash:** or **slot0:**.

Command Modes

EXEC

Command History

Release	Modification
11.1	This command was introduced.
12.2(1)	This command was implemented in images for the Cisco 2600 and Cisco 3600 series.
12.2(4)XL	This command was implemented in images for the Cisco 1700 series.
12.1(9), 12.0(17)S 12.0(17)ST, 12.2(2), 12.2(2)T, 12.2(2)B, 12.1(9)E	The **/nolog** and **/quiet** keywords were added.

Usage Guidelines

When Flash memory is full, you might need to rearrange the files so that the space used by the files marked “deleted” can be reclaimed. (This “squeeze” process is required for linear Flash memory cards to make sectors contiguous; the free memory must be in a “block” to be usable.)

When you enter the **squeeze** command, the router copies all valid files to the beginning of Flash memory and erases all files marked “deleted.” After the squeeze process is completed, you can write to the reclaimed Flash memory space.

⚠ **Caution** After performing the squeeze process you cannot recover deleted files using the **undelete** EXEC mode command.

In addition to removing deleted files, the **squeeze** command removes any files that the system has marked as “error”. An error file is created when a file write fails (for example, the device is full). To remove error files, you must use the **squeeze** command.

Rewriting Flash memory space during the squeeze operation may take several minutes.

Using the **/nolog** keyword disables the log for the squeeze process. In most cases this will speed up the squeeze process. However, if power is lost or the Flash card is removed during the squeeze process, all the data on the Flash card will be lost, and the device will have to be reformatted.

7827
a

Note Using the **/nolog** keyword makes the squeeze process uninterruptible.

Using the **/quiet** keyword disables the output of status messages to the console during the squeeze process.

If the optional keywords are not used, the progress of squeeze process will be displayed to the console, a log for the process will be maintained, and the squeeze process is interruptible.

On Cisco 2600 or Cisco 3600 series routers, the entire file system needs to be erased once before the **squeeze** command can be used. After being erased once, the **squeeze** command should operate properly on the Flash file system for the rest of the Flash file system's history.

To erase an entire flash file system on a Cisco 2600 or 3600 series router, perform the following steps:

Step 1 If the Flash file system has multiple partitions, enter the **no partition** command to remove the partitions. The reason for removing partitions is to ensure that the entire Flash file system is erased. The **squeeze** command can be used in a Flash file system with partitions after the Flash file system is erased once.

Step 2 Enter the **erase** command to erase the Flash file system.

Examples

In the following example, the file named "config1" is deleted, and then the **squeeze** command is used to reclaim the space used by that file. The **/nolog** option is used to speed up the squeeze process.

```
Router# delete config1
Delete filename [config1]?
Delete slot0:conf? [confirm]
Router# dir slot0:
! Note that the deleted file name appears in square brackets
Directory of slot0:/

    1  -rw-     4300244   Apr 02 2001 03:18:07  c7200-boot-mz.122-0.14
    2  -rw-        2199   Apr 02 2001 04:45:15  [config1]
    3  -rw-     4300244   Apr 02 2001 04:45:23  image
20578304 bytes total (11975232 bytes free)
!20,578,304 - 4,300,244 - 4,300,244 - 2,199 - 385 = 11975232

Router# squeeze /nolog slot0:
%Warning: Using /nolog option would render squeeze operation uninterruptible.
All deleted files will be removed. Continue? [confirm]
Squeeze operation may take a while. Continue? [confirm]

Squeeze of slot0 completed in 291.832 secs .
Router# dir slot0:
Directory of slot0:/

    1  -rw-     4300244   Apr 02 2001 03:18:07  c7200-boot-mz.122-0.14
    2  -rw-     4300244   Apr 02 2001 04:45:23  image

20578304 bytes total (11977560 bytes free)
!20,578,304 - 4,300,244 - 4,300,244 - 256 = 11977560
```

Related Commands

Command	Description
delete	Deletes a file on a Flash memory device.
dir	Displays a list of files on a file system.
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.

undelete

To recover a file marked “deleted” on a Class A or Class B Flash file system, use the **undelete** EXEC command.

undelete *index* [*filesystem*:]

Syntax Description

index	A number that indexes the file in the **dir** command output.
filesystem:	(Optional) A file system containing the file to undelete, followed by a colon.

Defaults

The default file system is the one specified by the **cd** command.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

For Class A and B Flash file systems, when you delete a file, the Cisco IOS software simply marks the file as deleted, but it does not erase the file. This command allows you to recover a “deleted” file on a specified Flash memory device. You must undelete a file by its index because you could have multiple deleted files with the same name. For example, the “deleted” list could contain multiple configuration files with the name router-config. You undelete by index to indicate which of the many router-config files from the list to undelete. Use the **dir** command to learn the index number of the file you want to undelete.

You cannot undelete a file if a valid (undeleted) file with the same name exists. Instead, you first delete the existing file and then undelete the file you want. For example, if you had an undeleted version of the router-config file and you wanted to use a previous, deleted version instead, you could not simply undelete the previous version by index. You would first delete the existing router-config file and then undelete the previous router-config file by index. You can delete and undelete a file up to 15 times.

On Class A Flash file systems, if you try to recover the configuration file pointed to by the CONFIG_FILE environment variable, the system prompts you to confirm recovery of the file. This prompt reminds you that the CONFIG_FILE environment variable points to an undeleted file. To permanently delete all files marked “deleted” on a Flash memory device, use the **squeeze** EXEC command.

On Class B Flash file systems, you must use the **erase** EXEC command to recover any space taken up by deleted files.

Examples

The following example recovers the deleted file whose index number is 1 to the Flash memory card inserted in slot 0:

```
undelete 1 slot0:
```

Related Commands

Command	Description
delete	Deletes a file on a Flash memory device.
dir	Displays a list of files on a file system.
squeeze	Permanently deletes Flash files by squeezing a Class A Flash file system.

verify

To verify the checksum of a file on a Flash memory file system, use the **verify** EXEC command.

verify *filesystem*:[*file-url*]

Syntax Description

filesystem:	Flash memory file system containing the files to list, followed by a colon. Standard file system keywords for this command include **flash:**, **bootflash:**, and **slot0:**.
file-url	(Optional) URL of the file to verify. Generally this consists only of the filename(s), but you may also specify directories (file paths), separated by forward-slashes (/). The files can be of any type. You can use wildcards in the filename. A wildcard character (*) matches all patterns. Strings after a wildcard are ignored.

Defaults

The current working device is the default device.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

This command replaces the **copy verify** and **copy verify flash** commands.

Use the **verify** command to verify the checksum of a file before using it.

Each software image that is distributed on disk uses a single checksum for the entire image. This checksum is displayed only when the image is copied into Flash memory; it is not displayed when the image file is copied from one disk to another.

To display the contents of Flash memory, use the **show flash** command. The Flash contents listing do not include the checksum of individual files. To recompute and verify the image checksum after the image has been copied into Flash memory, use the **verify** command.

Note The verify command only performs a check on the integrity of the file after it has been saved in the file system. It is possible for a corrupt image to be transferred to the router and saved in the file system without detection.
To verify that a Cisco IOS software image was not corrupted while it was transfered to the router, copy the image from where it is stored on your router to a Unix server. Also copy the same image from CCO (Cisco.com) to the same Unix server. (The name may need to be modified if you try to save the image in the same directory as the image that you copied from the router.) Then run a Unix **diff** command on the two Cisco IOS software images. If there is no difference then the image stored on the router has not been corrupted.

Examples

The following example verifies that the file named c7200-js-mz is on the Flash memory card inserted in slot 0:

```
Router# dir slot0:
Directory of slot0:/

  1  -rw-     4720148   Aug 29 1997 17:49:36  hampton/nitro/c7200-j-mz
  2  -rw-     4767328   Oct 01 1997 18:42:53  c7200-js-mz
  5  -rw-         639   Oct 02 1997 12:09:32  rally
  7  -rw-         639   Oct 02 1997 12:37:13  the_time

20578304 bytes total (3104544 bytes free)
tw3-7200-1# verify slot0:
Verify filename []? c7200-js-mz
Verified slot0:
```

The following example also verifies that the file named c7200-js-mz is on the Flash memory card inserted in slot 0:

```
Router# verify slot0:?
slot0:c7200-js-mz  slot0:rally slot0:hampton/nitro/c7200-j-mz  slot0:the_time

Router# verify slot0:c7200-js-mz
Verified slot0:c7200-js-mz
```

Related Commands

Command	Description
cd	Changes the default directory or file system.
copy	Copies any file from a source to a destination, use the copy EXEC command.
dir	Displays a list of files on a file system.
pwd	Displays the current setting of the **cd** command.
show file systems	Lists available file systems.

write erase

The **write erase** command is replaced by the **erase nvram:** command. See the description of the **erase** command in this chapter for more information.

write terminal

The **more system:running-config** command replaces the **write terminal** command. See the description of the **more** command in this chapter for more information.

AP 65

Smart Serial Connector Cables

The following cables are specific to the new dual-serial port WAN interface cards and feature Cisco's new, compact, high-density Smart Serial connector to support a wide variety of electrical interfaces when used with the appropriate transition cable. Two cables are required to support the two ports on the WIC. Each port on a WIC can support a different physical interface (protocol and DTE/DCE).

Table 9-9: Smart Serial Connector Cables

WAN Interface Card	Cable Type	Product Number	Length	Gender
WIC-2A/S (up to 128 kbps Sync or 115.2 kbps Async)	V.35 DTE	CAB-SS-V35MT(=)	10 ft (3.048 m)	Male
WIC-2T (high speed serial)	V.35 DCE	CAB-SS-V35FC(=)	10 ft (3.048 m)	Female
	RS-232 DTE	CAB-SS-232MT(=)	10 ft (3.048 m)	Male
	RS-232 DCE	CAB-SS-232FC(=)	10 ft (3.048 m)	Female
	RS-449 DTE	CAB-SS-449MT(=)	10 ft (3.048 m)	Male
	RS-449 DCE	CAB SS-449FC(=)	10 ft (3.048 m)	Female

CHAPTER 1

Overview of Cisco 3700 Series Routers

Cisco 3700 series routers are modular access routers with LAN and WAN connections that can be configured by means of interchangeable network modules and interface cards.

This chapter describes the features and specifications of the routers and includes the following sections:

Hardware Features

Cisco 3700 series includes the Cisco 3725 and the Cisco 3745 routers, which provide the following features:

- Cisco 3700 compact Flash cards
- Advanced integration module (AIM) slots
- Support for double-width network modules
- Two sockets for synchronized DRAM (SDRAM)
- User-configurable memory (shared memory or processor memory)
- Two FastEthernet ports
- High-speed console and auxiliary ports (up to 115.2 kbps)

Cisco 3725

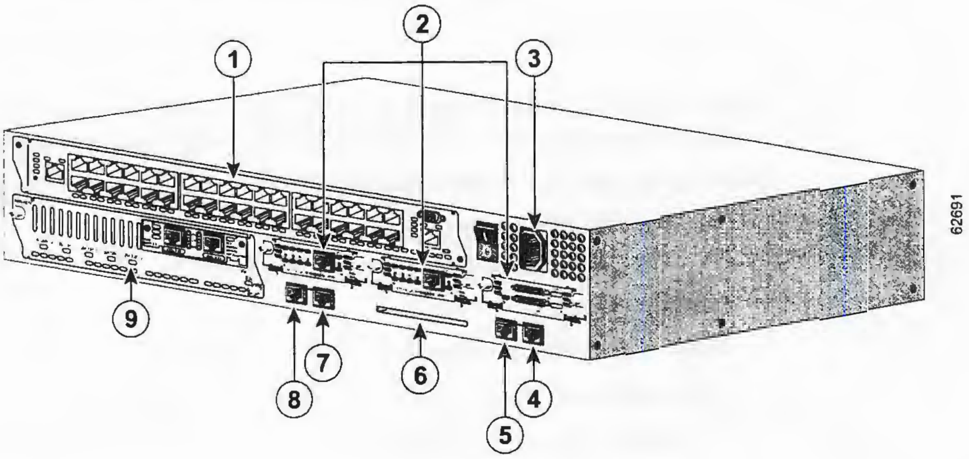
Cisco 3725 routers include the following additional features:

- High-performance 240-MHz Reduced Instruction Set Computer (RISC) processor
- Up to 256 MB SDRAM
- Up to 128 MB Flash memory
- Two slots for network modules, one of which can accommodate a double-width network module
- Three interface card slots

- Two Cisco 3700 compact Flash slots (one external and one internal)
- Two AIM slots
- Can be installed in a 19- or 23-inch rack or on a desk
- Supports the Cisco Redundant Power System
- 2 rack units (RU) chassis height

Figure 1-1 shows the rear panel of the Cisco 3725.

Figure 1-1 Rear Panel of the Cisco 3725 Router



1	Double-width network module slot	6	Compact Flash slot
2	Interface card slots	7	FastEthernet 0/0 port
3	Power supply	8	FastEthernet 0/1 port
4	Auxiliary port	9	Single-width network module slot
5	Console port		

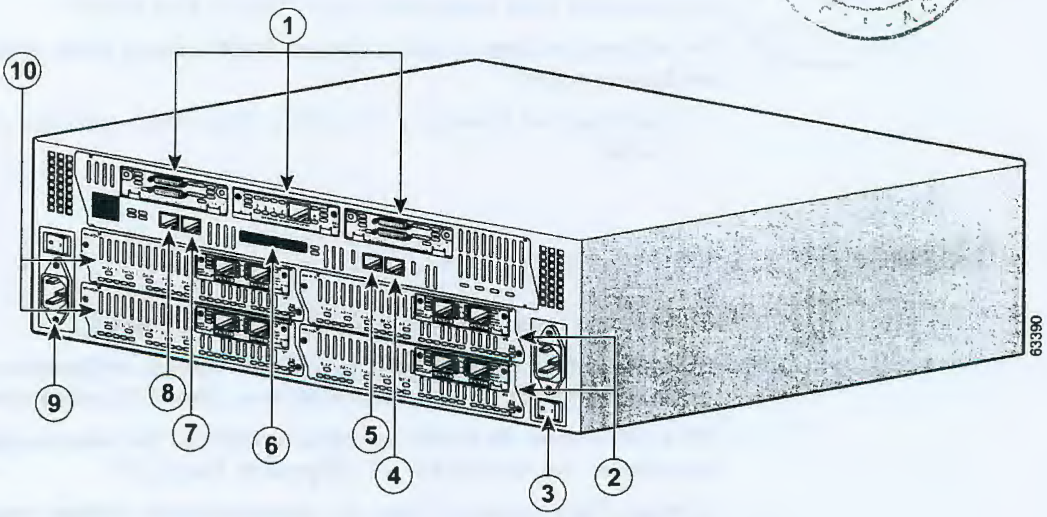
Cisco 3745

Cisco 3745 routers include the following additional features:

- High-performance 350-MHz RISC processor
- Up to 256 MB SDRAM
- Up to 128 MB Flash memory
- Four slots for network modules that can accommodate up to two double-width network modules
- Three interface card slots
- Two Cisco 3700 compact Flash slots (one external and one internal)
- Two AIM slots
- Can be installed in a 19- or 23-inch rack or on a desk
- Supports the Cisco Redundant Power System
- 3 rack units (RU) chassis height

Figure 1-2 shows the rear panel of the Cisco 3745.

Figure 1-2 Rear Panel of the Cisco 3745 Router



1	Interface card slots	**6**	Cisco 3700 compact Flash slot
2	Network modules	**7**	Auxiliary port
3	Power supply	**8**	Console port
4	FastEthernet 0/0 port	**9**	Power supply
5	FastEthernet 0/1 port	**10**	Network modules

Modules, Interface Cards, and Memory

The latest information on network modules, WAN interface cards (WICs), voice interface cards (VICs), advanced integration modules (AIMs), and memory is available online and on the documentation CD-ROM.

- For information on installing network modules, refer to the following documents:
  - *Quick Start Guide: Network Modules for Cisco 2600 Series, Cisco 3600 Series, and Cisco 3700 Series Routers*
  - *Cisco Network Modules Hardware Installation Guide*
- For information on installing WICs and VICs, refer to the following documents:
  - *Quick Start Guide: Interface Cards for Cisco 1600, 1700, 2600, 3600, and 3700 Series*
  - *Cisco Interface Cards Hardware Installation Guide*
- For information on installing AIMs, refer to the following documents:
  - *AIM Installation Quick Start Guide: Cisco 2600, 3600, and 3700 Series*
  - *Installing Advanced Integration Modules in Cisco 2600 Series, Cisco 3600 Series, and Cisco 3700 Series Routers*

- For information about installing DRAM, SDRAM, NVRAM, and Flash memory SIMMs, refer to the following hardware configuration notes:
  - *Upgrading System Memory in Cisco 3700 Series Routers*
  - *Installing Field Replaceable Units in Cisco 3745 Routers*
- For information about installing compact Flash memory cards, refer to the following hardware configuration note:
  - *Installing and Formatting Cisco 2691, Cisco 3631, and Cisco 3700 Compact Flash Memory Cards*

Memory

Cisco 3700 series routers support the following types of memory:

- SDRAM—Serves two functions: It stores the running configuration and routing tables and is used for packet buffering by the network interfaces. Cisco IOS software executes from SDRAM memory.
- NVRAM—Stores the system configuration file and the virtual configuration register. (For more information, see Appendix C, "Configuration Register.")
- Compact Flash memory—Stores the operating system software image. You can increase compact Flash memory by adding Cisco 3700 compact Flash cards. Refer to the *Installing and Formatting Cisco 3631, and Cisco 3700 Compact Flash Memory Cards* document.
- EPROM-based memory—Stores the ROM monitor, which allows you to boot an operating system software image from Flash memory or Cisco Flash.

Table 1-1 and Table 1-2 list processor and memory specifications for Cisco 3700 series routers.

Table 1-1 Cisco 3725 Router Processor and Memory Specifications

Description	Specification
Processor	240-MHz PMC-Sierra RM7061A RISC processor
SDRAM	128 to 256 MB
NVRAM	56 KB
Compact Flash	32, 64, or 128 MB
Boot ROM	512 KB

Table 1-2 Cisco 3745 Router Processor and Memory Specifications

Description	Specification
Processor	350-MHz PMC-Sierra RM7000A RISC processor
SDRAM	128 to 256 MB
NVRAM	152 KB
Compact Flash	32, 64, or 128 MB
Boot ROM	704 KB

Power Supply Options

Table 1-3 lists the power supply options supported by Cisco 3700 series routers. Depending on the configuration specified when you placed your order, your router may not support all of these options.

Table 1-3 Power Supply Options for Cisco 3700 Series Routers

Power Supply Option	Cisco 3725	Cisco 3745
AC input power	Yes	Yes
DC input power	No	Yes
–48V telephony power module provides inline power to IP phones	Yes	Yes
Dual hot-swappable power supplies	No	Yes[1]
Compatible with Cisco Redundant Power System	Yes	Yes

[1] Due to increased power consumption in high-temperature environments, a fully loaded Cisco 3745 requires both power supplies when ambient temperature exceeds 40°C. Cisco 3745 routers operating under these conditions do not support the online replacement of power supplies.

Internal –48V Telephony Power Modules

Cisco 3700 series routers provide inline power to IP phones connected to the router through Ethernet Switch Network Modules. This power is supplied by special –48V modules that connect directly to the chassis power supplies in Cisco 3725 and Cisco 3745 routers. A single –48V power module meets the power needs of up to 36 IP phones. A Cisco 3745 router with two –48V power modules installed provides redundant power for up to 36 IP phones. Figure 1-3 and Figure 1-4 show the –48V power modules as they appear when installed in Cisco 3700 series routers.

Figure 1-3 Cisco 3725 Router with Optional –48V Power Module Installed

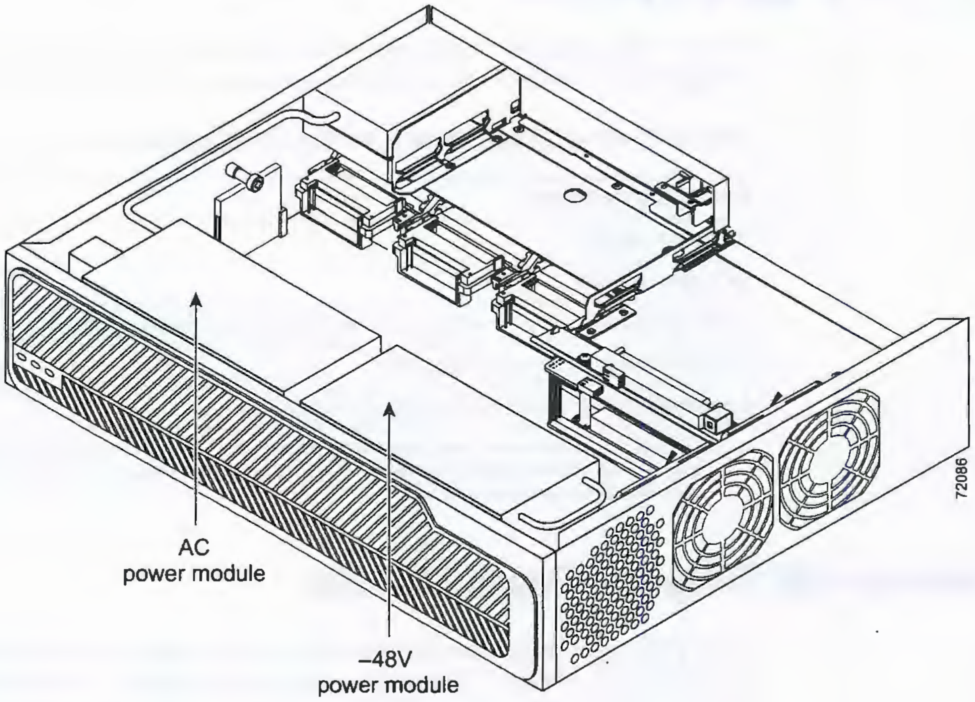


Figure 1-4 Cisco 3745 Router with Optional –48V Power Modules Installed

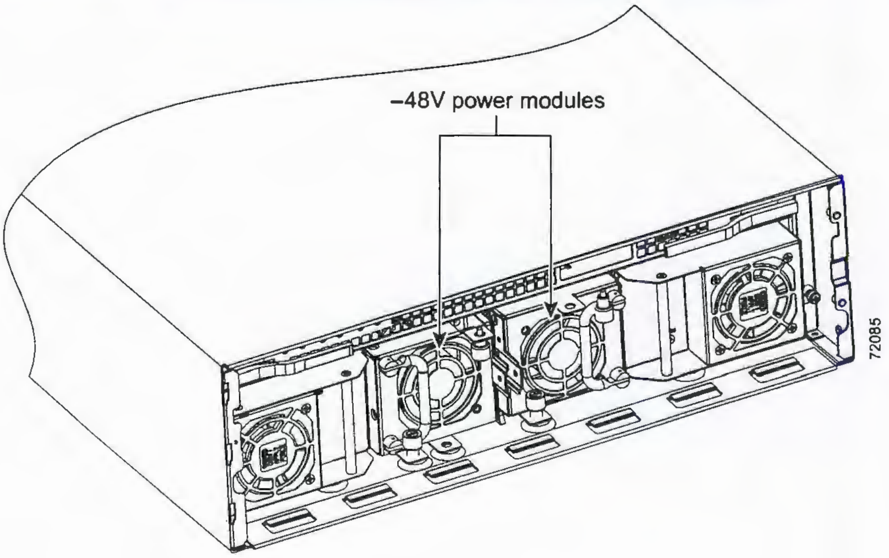

System Specifications

Table 1-4 and Table 1-5 list Cisco 3700 series system specifications.

Table 1-4 Cisco 3725 Router System Specifications

Description	Specification
Dimensions (H x W x D)	3.5 x 17.1 x 15.0 in. (8.9 x 43.4 x 38.1 cm), 2 RU chassis height
Weight	14 lb (6.4 kg)
Input voltage, AC power supply Frequency Input surge current (AC)	100 to 240 VAC, autoranging 47 to 63 Hz 50 A maximum, one cycle (–48 V power module included)
Power dissipation	135 W (maximum)
Console and auxiliary ports	RJ-45 connector
Operating humidity	5 to 95%, noncondensing
Operating temperature	32 to 104°F (0 to 40°C)
Nonoperating temperature	–40 to 162°F (–40 to 72°C)
Noise level	52 dBA (maximum)
Regulatory compliance	FCC Part 15 Class A. For additional compliance information, refer to the *Cisco 2600 Series, Cisco 3600 Series, and Cisco 3700 Series Regulatory Compliance and Safety Information* document that accompanied the router.
Safety compliance	UL 60950; CAN/CSA C22.2 No. 60950-00; IEC 60950, EN 60950; AS/NZS 3260; TS001

Introduction

Cisco Products Quick Reference Guide (CPQRG)

CPQRG Background

The Cisco Products Quick Reference Guide (CPQRG) is a handy, compact reference tool that includes brief product overviews, key features, sample part numbers, and abbreviated technical specifications for many of Cisco's products. The CPQRG is primarily published to support Cisco partners, resellers, sales account teams, and even end-user customers who need a broad, high-level overview of Cisco products, but at that moment do not have access to Cisco's Web site, the Cisco Connection Online (CCO) at **http://www.cisco.com**.

Because this book is only published twice per year, there are likely to be new products, configurations, and part numbers not included in this edition. Note: For the most up-to-date and comprehensive information about Cisco products and solutions, please refer to our on-line information or consult a Cisco representative.

CPQRG Ordering Information

Additional printed copies of this book can be purchased on an as-needed basis or through an annual subscription. To order, see **http://shop.cisco.com/login**.

For questions regarding the CPQRG ordering process, please send an email to **companystore@external.cisco.com**.

For questions, comments or to download an Adobe PDF version of the CPQRG, go to **http://www.cisco.com/go/guide**.

How to Get More Complete Product Information

Cisco Product Catalog	For more comprehensive information on all of Cisco's products, please refer to the Cisco Product Catalog at: http://www.cisco.com/univercd/cc/td/doc/pcat/
Cisco Connection Online (CCO)	For even more complete product and solution information, please go to CCO at http://www.cisco.com. In addition to product, technology, and network solutions support, CCO provides a wealth of information including how to find an authorized repesentative or partner, how to order products, technical support/customerservice, Cisco Corporate news and information, and links to training/events/seminars.

Cisco Systems Overview

Cisco Systems, Inc. is the worldwide leader in networking for the Internet. Cisco's Internet Protocol-based (IP) networking solutions are the foundation of the Internet and most corporate, education, and government networks around the world. Cisco provides the broadest line of solutions for transporting data, voice and video within buildings, across campuses, or around the world.

Today, the Internet and computer networking are an essential part of business, learning and personal communications and entertainment. Virtually all messages or transactions passing over the Internet are carried quickly and securely through Cisco equipment. Cisco solutions ensure that networks both public and private operate with maximum performance, security, and flexibility. In addition, Cisco solutions are the basis for most large, complex networks used by corporations, public institutions, telecommunication companies, and are found in a growing number of medium-sized commercial enterprises.

Cisco was founded in 1984 by a group of computer scientists from Stanford University. Since the company's inception, Cisco engineers have been prominent in advancing the development of IP- the basic language to communicate over the Internet and in private networks. The company's tradition of innovation continues today with Cisco creating leading products and key technologies that will make the Internet more useful and dynamic in the years ahead. These technologies include: advanced routing and switching, voice and video over IP, optical networking, wireless, storage networking, security, broadband, and content networking.

In addition to technology and product leadership, Cisco is recognized as an innovator in how business is conducted. The company has been a pioneer in using the Internet to provide customer support, sell products, offer training, and manage finances. Drawing upon the company's own Internet best practices and core-value of customer focus, Cisco has established the Internet Business Solutions Group (IBSG) dedicated to helping top business leaders transform their own businesses into e-businesses.

As a company, Cisco operates on core values of customer focus and corporate citizenship. The company's philanthropic efforts are committed to helping communities prosper while also encouraging Cisco employees to learn about the needs of the communities where Cisco operates. Also, to help bolster education around the world, the company has founded Cisco Networking Academies in 128 countries dedicated to teaching students to design, build, and maintain computer networks.

Cisco Channel Partner Program

Whether you provide services, solutions or a combination of both, Cisco is committed to your success. The Cisco Channel Partner Program can help partners create a sustainable business model in a fast-changing environment, where customers require value-added services, focused technical expertise, and higher levels of satisfaction. As a Cisco certified partner, you'll have the backing of the Cisco brand, and access to world-class products and service packages, technical support, productivity tools, online training, marketing resources and sales promotions.

The Partner Program integrates the technology focus of each Cisco Partner Specialization, flexible individual career certification requirements, customer satisfaction targets, and pre- and post-sales support capabilities. These elements make up the points-based structure of the overall program requirements. There are three partner certification levels: Gold Certification, Silver Certification, and Premier Certification.

The Partner Program requires every partner to specialize in technology areas as part of the program requirement. You may choose the technology area for Specialization, but must earn a minimum number of Specialization points to become certified. You may decide to be strictly a specialized partner or specialize your organization as a means to achieving certification. Either way, you'll have access to structured training roadmaps, free online technical and sales education and video-on-demand content to build your knowledge and skill level through the Partner E-Learning Connection **http://cisco.partnerelearning.com**

For More Information

See the Channel Partner Program Web Site:
http://www.cisco.com/go/channelprograms
If you are interested in reselling Cisco product without becoming certified or specialized, see **http://www.cisco.com/go/reseller**

Partner and Reseller Service and Support Offerings

Various partner and reseller service and support programs are available according to certification level and method of purchase from Cisco:

Method of Purchase	Service and Support Offerings
Direct from Cisco (only available to Partners with Direct contracts)	• *System Integrator Support*—System Integrator Support 98 (SIS98) program is designed for Silver and Gold partners who wish to provide their own brand of support to their end customers with back-end support from Cisco – SMARTspares provides partners using SIS98 the opportunity to leverage Cisco's logistics infrastructure to provide their customers with enhanced delivery services. • *Shared Support*—Currently only available in the US, Cisco's Shared Support program is designed for Silver and Gold partners who wish to provide their own brand of support to their end customers while leveraging Cisco's Technical Assistance Center (TAC) and logistics infrastructure • *Cisco Brand Resale*—Program allows partners to provide Cisco's services (SMARTnet, etc.) directly to their end customers
2-Tier (through a Distributor)	• *Packaged Services*—Partners and Resellers may purchase warranty extension, hardware replacement, installation and configuration, technical support, software upgrades, and online services. Several of these services have been bundled together to offer convenient service solutions for Cisco customers.

Packaged Resalable Service Products (only via Distributors/2-Tier):

Product	Description
Maintenance Services	
SMARTnet Maintenance	Provides customers with software maintenance, registered access to CCO, advance replacement of hardware, and technical support required for self-maintenance. SMARTnet maintenance has three delivery options: • SMARTnet 8x5xNBD (Next Business Day)—8 hours/day, 5 days/week, next-business-day hardware replacement • SMARTnet 8x5x4—8 hours/day, 5 days/week, 4-hour hardware replacement • SMARTnet 24x7x4—24 hours/day, 7 days/week, 4-hour hardware replacement Available through resellers and distributors.
SMARTnet Onsite	Provides all the benefits of SMARTnet maintenance, plus one of the following onsite hardware services for repairs: • SMARTnet Onsite 8x5xNBD—8 hours/day, 5 days/week, next-business-day response • SMARTnet Onsite 8x5x4—8 hours/day, 5 days/week, 4-hour response • SMARTnet Onsite 24x7x4—24 hours/day, 7 days/week, 4-hour response Packaged SMARTnet OnSite 24x7x4 provides SMARTnet OnSite 24x7x4 service in a shrink-wrapped package, allowing it to be effectively marketed through resellers.
Cisco Advance Replacement	Advance Replacement offers customers the flexibility to cover their equipment with an advance replacement service only. Cisco Advance Replacement comes with a full year of advance replacement coverage, guest access to the public portion of Cisco Connection Online (CCO), and a single technical support incident. This service is intended to be used by customers who need to supplement service offered by their reseller with a replacement option from Cisco.
Software Application Support plus Upgrades (SASU)	Software Application Support plus Upgrades provides customers with software upgrades and maintenance releases for Cisco Application Software, registered access to Cisco.com plus technical support, for one year. For when a customer needs investment protection on software purchases and/or access to the latest software while eliminating unexpected budget revisions.
Noncontract and Consulting Services	Cisco provides noncontract services at current time-and-materials rates. For more information contact Customer Services at 1-800-553-NETS or 1-415-326-1941.
Startup Services	
Total Implementation Services (TIS)	Cisco Total Implementation Solutions (TIS) is a portfolio of services that deliver the tools, expertise, and resources needed to install, configure, and implement Cisco equipment. TIS is intended to supplement services that resellers provide, either directly or indirectly, to their customers. Product Components: Installation, Configuration, and Implementation. For more information, see http://www.cisco.com/go/tis

For More Information

See the Partner and Reseller Support Services Web page at:
http://www.cisco.com/en/US/products/index.html (CCO login required)

Product Warranty Information

All Cisco hardware and software products are covered for a minimum of 90 days. Some products have a longer or more appropriate coverage, ranging from One-Year to Limited Lifetime warranties. Note that all Warranties are applicable to original owner only and support is subject to product end-of-life terms.

Warranty[1]	Entitlements Description
Cisco Standard 90-day Hardware Warranty, Software Warranty and License Agreement (78-5235-vvrr)	• Advance Replacement shippingwithin 10 business days from RMA date, within 90 days of original shipment from Cisco or from Cisco Reseller • 90-Day Assurance that the Media SW is delivered is defect-freeand the SW conformsto its published specifications • Guest Access to Cisco Connection Online (CCO)
90-Day Limited Hardware Warranty(78-5236-vvrr)	• Advance Replacement shippingwithin 10 business days from RMA date, within 90 days of original shipment from Cisco or from Cisco Reseller • 90-Day Assurance that the Media SW is delivered is defect-freeand the SW conformsto its published specifications • Guest Access to Cisco Connection Online (CCO)
One-Year Limited Hardware Warranty (78-10747-vvrr)	• Advance Replacement shippingwithin 10 business days from RMA date withinOne Year of original shipment from Cisco or from Cisco Reseller • 90-Day Assurance that the Media SW is delivered is defect-freeand the SW conformsto its published specifications • Guest Access to Cisco Connection Online (CCO)
Limited Lifetime Hardware Warranty (78-6310-vvrr)	• Advance Replacement shippingwithin 10 business days from RMA date during supported life of the product, starting original ship date from Cisco or Cisco reseller. (fan and power supply warranty limited to 5 years from ship-date) • 90-Day Assurance that the Media SW is delivered is defect-freeand the SW conformsto its published specifications • Guest Access to Cisco Connection Online (CCO)
End-User Software License Agreement and Software Warranty (78-3621-vvrr)	• 90-Day Assurance that the Media SW is delivered is defect-freeand the SW conformsto its published specifications • End User License Agreement terms • Guest Access to Cisco Connection Online (CCO)
5-Years Limited Hardware and 1-Year Limited Software Warranty (78-13712-vvrr)	• Replacementshipping within 15 business days from RTF date within 5 years from the original ship date from Cisco or Cisco reseller • One-Year SW support includes availability of bug fixes and maintenance releases • Cisco TAC 24x7 support for P1/P2 cases for Five years • Guest Access to Cisco Connection Online (CCO)

[1] "vv" and "rr" suffixes of the warranty document numbers represent the revision and version numbers respectively.

For More Information

See the Web site:
http://www.cisco.com/en/US/products/prod_warranties_listing.html

Cisco Capital Financing

Cisco Systems Capital offers a variety of financing and equipment leasing alternatives, both short term and long term, to customers and partners in the United States, Canada, Europe, Asia, Australia, and Latin America. Cisco Capital's financial solutions offer customers the ability to acquire new technologies or refresh existing equipment through flexible, easy-to-use programs.

For More Information

See the Cisco Systems Capital Web site: **http://www.cisco.com/go/CiscoCapital**
Within the United States, call 800 730-4090.

Cisco Authorized Refurbished Equipment (US and Canada Only)

Customers looking for used Cisco equipment can now be assured of the quality and support they come to expect from new Cisco products, through the Cisco Authorized Refurbished Equipment program. Cisco Authorized Refurbished Equipment gives customers a price competitive alternative to buying uncertified and unlicensed products off the secondary market. All equipment sold through this program is labeled "Refurbished by Cisco Systems," indicating that the product is Cisco tested, refurbished, authorized, and supported. The program is limited to certain countries, so interested customers should check with their local Cisco account manager of Cisco authorized reseller for availability.

Resellers: **http://www.cisco.com/go/refurb** (click on "Refurbished Products")

Cisco Services

Cisco Services offers a wide range of services and support to customers, partners and resellers. Through a suite of support services Cisco enables you to improve the overall efficiency of your network operations and network performance, while benefiting from the broad range of Cisco engineering knowledge and experience base, leading practices and innovative, web-based tools.

Cisco Advanced Services (AS) is a comprehensive suite of professional engineering support offerings of Cisco networking solutions delivering the highest levels of availability, quality of service, and security for your specific network needs to realize business return on investment through high performance networking and communications applications enablement. Cisco Technical Support Services (TSS) offer leading-edge services to improve customer productivity, protect customer investment, and maximize operational efficiency. Cisco TSS solutions provide access to highly skilled engineers with technical expertise on multiple disciplines of technology. In addition, Cisco TSS provides you with the online tools and resources, software support and hardware replacement options to address your challenges and provide rapid problem resolution. Key support tools and knowledge provide your staff with the ability to avoid problems, maximize network utility, and expedite problem resolution.

CHAPTER 1

Routers

Routers at a Glance

Product	Features	Page
Cisco IOS® Software	See the Chapter 9—CiscoIOS Software and Network Management foran overview of Cisco IOS Software	9-4
Cisco SOHO Series Secure Broadband Routers	Ethernet, ADSL, ADSL over ISDN, and G.SHDSL Routers for Small Office and Home Ofices • Integrated securty of Cisco IOS Software with Stateful Inspection Firewall and software-based 3DES encryption • Easy setup and deployment using Cisco Router Web Set Up Tool (CRWS) • Offers many local and remote debug and troubleshooting features in Cisco IOS Software	1-8
Cisco 800 Series Router	Ethernet, ADSL, ADSL over ISDN, G.SHDSL, ISDN, and serial routers for small remote offices and teleworkers • 1-port Ethernet, 1-port ADSL, ADSL over ISDN or G.SHDSL or 1-port BRI (optional NT1), 1-port serial WAN • 4-port Ethernet hub or 10/100 swithch on most models and 2 analog telephone ports on ISDN models and 4 analog voice ports on 827-4V • Advanced securty features including statefulinspection firewall and hardware assisted encryption (830 series) • Toll quality voice with VoIP (Cisco 827-4V) • Dial back up and out-of-band management (Cisco 830 series)	1-9
Cisco 1700 Series Router	Flexible, secure, modular access routers • 1-port autosensing 10/100 Fast Ethernet LAN • Modular slots support a wide variety of WAN and voice interface cards • Supports secure Internet, intranet,and extranet access as well as new WAN applications including VPNs, integrated voice/data (VoIP), and broadband services • VLAN Capabilty • Supports up to three Ethernet connectionswith 1FE and 2 ENET WICs	1-11
Cisco 2500 Series Router	Fixed-port configuration access servers • The Cisco AS2509-RJ/AS2511-RJ access/terminal servers provide Ethernet LAN connectivity and enable 8 or 16 (respectively) users/devices via async connections • Ideal for low-density analog telephone lne dial access applications via external modems	1-14
Cisco 2600 Series Router	Modular multiservice router • Single or dual LAN (Ethernet, 10/100 Mbps Ethernet, Token Ring and mixed Ethernet options) • Wide variety of interface support, including integrated 16-port switching, high-density analog and digital, voice, Cisco IOS Firewall and VPN, async and sync serial, ISDN, Fractional and channelized T1/E1, Ethemet, analog modems, ADSL, G.SHDSL, switching integration, and ATM support • Shares WAN interface cards and network modules with Cisco 1700, 3600 and 3700 series • Cisco 2610XM, 2620XM, and 2650XM models offer the features of Cisco 2600 with more default memory, capacity, performance and FE support on all models.	1-16
Cisco 3600 Series Router	Modular multiservice high-densty access router • 2-, 4-, and 6-slot models • Wide variety of media support including: high density analog and digital voice, Cisco IOS Firewall and VPN, integrated 16-port switching, ADSL, and G.SHDSL, async and sync serial, BRI and PRI ISDN, channelized T1/E1, Ethernet, Fast Ethernet, Token Ring, digital and analog modems, and ATM • Digital and analog voice/fax over IP or Frame Relay or ATM • The Cisco 3640 is no longer orderable. Customers are encouraged to migrate to the Cisco 3700 Series Routers. On an interim basis we have made available the Cisco3640A as an alternative for customers with configurations not available on the Cisco3700.	1-22

Product	Features	Page
Cisco 3700 Series Router	Modular multiservice high-density access router • Enable higher levels of application and service integration in enterprise branch offices in a small form factor – Supports integrated firewall, intrusion detection, and VPN capabilities and offloads processing to on-board Advanced Integration Module (AIM) – Combines flexible routing and low density switching in a single platform with new 16 and 36-port EtherSwitch module – Delivers internal in-line power for the EtherSwitch ports for a single platform Branch Office IP Telephony and Voice Gateway – Conserves WAN bandwidth with Content Engine module to combine intellgent caching, content routing and management – Higher performance enables scalable deployment of multiple, concurrent applications • Wide variety of interface support, including integrated 36 and 16-port switching, high-density analog and digital, voice, Cisco IOS Firewall/IDS and VPN, Fractional and channelized T1/E1 and DS-3, Ethernet, Gigabit Ethernet and ADSL. • Shares WAN interface cards and network modules with Cisco 1700, 2600/2600XM, and 3600 series	1-26
Cisco 7100 Series VPN Router	Large branch and central site VPN router, for a dedicated site-to-site VPN solution See Chapter 5—VPN and Security for information on the Cisco 7100 Series VPN Routers	5-11
Cisco 7200 Series Router	WAN-edge router providing intelligent services, modularity, high performance, investment protection, and scalability in a small form factor • Modular 3 RU Chassis • 4- or 6-slot models and choice of system processors for up to 1 Mpps performance • Wide variety of LAN and WAN options, including Ethernet, Fast Ethernet, Gigabit Ethernet, Token Ring, FDDI, serial, ISDN, HSSI, ATM, Packet over SONET, DPT/RPR	1-31
Cisco 7300 Series	Network Edge router with high perfomance IP services delivered at optical speeds for service providers and enterprise networks • Compact and modular 4 rack unit chassis—4 slots • High performance connectivity—T3 through OC48/STM16 with 3.5 Mpps performance • Built-in Gigabit Ethernet connectivity • Multiprotocol routing: IP, IPX, AppleTalk, DLSw • Compact size, high availability and optimal cooling	1-35
Cisco 7400 Series Router	Highest performance 1 rack unit router in the industry, with a stackable architecture that is designed for service provider and enterprise networks • One port adapter slot, two built-in 10/100/GE Ethernet ports, and a broad range of WAN media interfaces from DS0 to OC3 (40+ port adapters) common with Cisco 7x00-series port adapters • High-density broadband aggregation • Managed CPE for service provider demarcation point • Gigabit Ethernet to Gigabit Ethernet IP services applications platform	1-38
Cisco 7500 Series	High-end services-enabled core and WAN aggregation router for enterprise and service provider applications • 5-, 7-, and 13-slot models • 1-, 2-, or 4-bus models offering 1, 2, or 4 Gbps backplanes • Wide variety of LAN and WAN options including Ethernet, Fast Ethernet, Gigabit Ethernet, Token Ring, FDDI, serial, ISDN, HSSI, ATM, and Packet over SONET	1-40
Cisco 7600 Series	Service provider and high-end enterprise-class router delivering optical WAN and Metropolitan Area Network services with high-touch IP services at the network edge. • Consolidated LAN/WAN/MAN in a single platform • Scalable backplane bandwidth from 32 Gbps to 256 Gbps and performance from 15 Mpps to 30 Mpps • High-volume aggregation of Ethernet traffic (server farms) • Wide range of WAN/MAN interfaces from NxDS0, T1, T3 to OC-48 with line rate services • Ideal for Internet data center, metropolitan aggregation, WAN edge aggregation, and enterprise core applications • Also supports Catalyst 6000 series line cards	1-45
Cisco 10000 Series	Service provider-class edge services router • High-Performance IP, MPLS, and Broadband Services — The Cisco 10000 Series enables service providers to deploy revenue-generating services without worrying about performance degradation • Carrier-Class High Availability — With its carrier-class high availability, the Cisco 10000 Series minimizes costly network outages and maximizing end-customer satisfaction • Application Integration — The Cisco 10000 Series leverages service providers' current investments by enabling leased line and broadband aggregation features on a single platform • Application Flexibility — The Cisco 10000 Series has a broad range of channelized, clear channel, ATM and LAN interfaces. Physical interface speeds from E1/T1 up to OC-48c/STM-16c	1-47

Product	Features	Page
Cisco 10700 Series	Service provider-class metro edge services router • Optimized building block for the next generation metro Ethernet/IP access networks • Equipped with either (24) 10/100 or 4 GbE and 8 FE ports for customer access and OC-48c/STM-16c dynamic packet transport/resilient packet ring (DPT/RPR) technology or Packet Over SONET (POS) for metro optical connectivity • Powered by Cisco IOS 12.0S software and the parallel express forwarding (PXF) architecture • Cost-effective, reliable, high-performance platform supporting full suite of IP/MPLS features and services found in Cisco Internet Routers • With DPT/RPR architecture, enables optimal fiber connectivity as well as features such as IP class of service, VoIP, L2 VPN (EoMPLS and L2TPv3) and L3 VPN (MPLS) services	1-49
Cisco 12000 Series	Premier high-end routing portfolio for service provider backbone and high-speed edge applications. With its unique, modular distributed system architecture, the Cisco 12000 Series Router, is the industry choice for building Carrier IP/MPLS networks with its portfolio of 10Gbps systems and interfaces: • Seven chassis options that fit your scaling and real estate requirements offering the only complete solution for small to large POPs; backbone or edge. • The only platforms supporting backbone—or edge-optimized line cards in the same chassis, maximize the value of line-rate edge applicatons with 10G uplinks, and sustained line-rate performance as they scale to maximum capacity. • Proven investment protection with simple, field upgrades to higher switching capacities. • The only complete priority packet delivery solution set—the industry's only IP QoS implementation that uniquely enables premium real time IP services such as VoIP and video. • Extensive portfolio of line cards offering leading edge technologies (POS, ATM, DPT/RPR, GbE/FE), support a wide range of networking speeds (from DS1 to OC-192c/STM-64c). • The industry's only high-end router proven (via independent lab testing) to maintain customer connections and network traffic with zero packet loss despite a route processor failure.	1-51
Cisco SN 5400 Series Storage Router	Enables direct access to storage systems anywhere on an IP network. Enables SCSI over IP (iSCSI); the first storage implementation based on IP standards. • Cisco SN 5428: Migrates DAS (Direct Attached Storage) environments to SAN (Storage Area Networks) for small / medium businesses and enterprise workgroups. This is a full function Fibre Channel switch that adds iSCSI, providing very low price per port networked storage configurations	1-55

Cisco SOHO Series Ethernet, ADSL over ISDN, ADSL and G.SHDSL Routers

The Cisco SOHOseries provides an affordable, secure, multi-user access solution to small office/home office (SOHO) customers while reducing deployment and operational costs for service providers. Through the power of Cisco IOS software technology, the Cisco SOHO 91 Ethernet to Ethernet Router, the SOHO 96 ADSL over ISDN, the SOHO 97 ADSL and SOHO 78 G.SHDSL routers provide superior manageability and reliability.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco SOHO 91	• Ethernet WAN port for use with an external DSL or cable modem with 4-port 10/100 switch, stateful firewall and software based encryption
Cisco SOHO 96	• ADSL modem for use of ADSL over ISDN with 4-port 10/100 switch, stateful firewall and software based encryption
Cisco SOHO 97	• ADSL modem for ADSL over POTS with 4-port 10/100 switch, stateful fiewall and software based encryption
Cisco SOHO 78	• 4-port Ethernet Hub and 1G.SHDSL port with firewall security and Cisco IOS manageabilty and reliability

Key Features

- Integrated security of Cisco IOS Software with Stateful Inspection Firewall and software-based 3DES encryption (no encryption on the SOHO 78)
- Easy setup and deployment using Cisco Router Web Set Up Tool (CRWS)
- Offers many local and remote debug and troubleshooting features in Cisco IOS Software

Cisco 800 Series

The Cisco 800 series router provides enhanced network security and proven reliability through Cisco IOS software, for small offices and telecommuters. It connects users to the Internet or to a corporate LAN via one ADSL, ADSL over ISDN, G.SHDSL, IDSL, ISDN, or serial connection (up to 512 Kbps), or with an Ethernet WAN port connected to an external broadband modem.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 800 Series	• Companies who Cisco IOS-based networks who want to add telecommuters • Service providers who offer value-added services to small offices • VARs who are familiar with Cisco IOS software and want to profitably service small office customers • Ethernet LAN ports and variety of WAN connectivity, including: ISDN BRI, Frame Relay, ADSL, G.SHDSL, async dialup (see Specificationsfor details)

Key Features

- Fixed configuration support for several types of WAN connections
- Standard security with ACLs, PAT/NAT, PAP/CHAP, MS-CHAP, Lock and Key, and Generic Routing Encapsulation (GRE) tunneling
- Enhanced security with stateful inspection firewall, IPSec encryption (hardware based on Cisco 830s and AES encryption on Cisco 830s)
- Toll quality voice with VoIP on Cisco 827-4V
- Integrated 4-port 10/100 Ethernet Switch on Cisco 830 series
- Bandwidth optimization features such as compression, Bandwidth-on-Demand, Dial-on-Demand, Always-On-Dynamic-ISDN (AODI), and X.25 over D channel (Cisco 801- 804)
- Support for CAPI applications in the European market

Competitive Products

Cisco 1700 Series

The Cisco 1700 series modular access routers are designed to provide a cost-effective integrated access platform for small and medium-sized businesses and enterprise small branch offices. These Cisco IOS-based routers deliver high-speed network access, comprehensive security features, and multiservice data/voice/video/fax integration to meet the most demanding business requirements. Within the Cisco 1700 series, Cisco 1710 security access routers work with existing broadband modems to provide advanced routing and security functionality, Cisco 1721 modular access routers provide flexible, high-performance data access, and Cisco 1751 and Cisco 1760 modular access routers are optimized for both voice and data traffic, providing a simple and cost-effective path to multi-service networking—today or in the future.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 1710	• Advanced routing and security functionalityin one device when connecting to the Internet using a broadband modem • Hardware-assisted 3DES VPN encryption at fullT1/E1 speeds
Cisco 1721	• Secure data-only access solution that adapts to customers' evolving network requirements • Support for data applicationsincluding VPNs and broadband access services • A broad array of WAN services supported, including Frame Relay, leased line, ADSL, G.SHDSL, ISDN BRI, X.25, SMDS and more • IPSec 3DES VPN encryption at full T1/E1 speeds • IEEE 802.1Q VLAN Support
Cisco 1751	All the above, plus: • Analog and digital voice support in a desk-top form factor • 3 modular slots for WAN and Voice interface cards
Cisco 1760	All the above, plus: • 19" rackmount form factor • 4 slots with 2 WIC/VIC and 2 VIC slots • Multiservice analog anddigital voice support • Highest performance multi-service router in the Cisco 1700 family • Higher density analog and digital voice support than Cisco 1751

Key Features

- Support for up to 4 serial interfaces or 2 ISDN BRI; 1 autosensing 10/100 Mbps Fast Ethernet LAN connection; 1 auxiliary (AUX) port for dial-up management or low-speed asynchronous connections (up to 112.5 kbps)
- Flexibility—Cisco 1700 Series supports a diverse set of WAN and Voice Interface Cards that are shared with the 1600 (WAN only), 2600/2600XM, and 3600 series routers enabling field upgradeability to evolve with the needs of growing businesses
- Integrated Device—Cisco 1700 series combines WAN routing, VPN and multiservice access in a single device
- Expansion Slot—Supports optional hardware VPN module for wire-speed IPSec 3DES encryption and can enable future technologies (VPN Module standard on Cisco 1710)
- Integrated Security—The 1700 series supports context-based access control for dynamic firewall filtering, denial-of-service detection and prevention, Java blocking, real-time alerts, Intrusion Detection System (IDS), and encryption.
- IEEE 802.1Q VLAN Support

Cisco 1700 Series Modular Access Routers

CISCO1760	10/100 Modular Router w/ 2WIC/VIC,2VIC slots,19 inch Chassis
CISCO1760-ADSL	10/100 BaseT Modular Router w/ADSL WIC, IP/ADSL
CISCO1760-SHDSL	10/100 BaseT Modular G.SHDSL Router, 19 inch Chassis
CISCO1760-VPN/K9	1760 VPN Bundle with VPN Module, 48MB DRAM, IP Plus/FW/3DES
CISCO1760-VPN/K9-A	1760 VPN Bun. w/ADSL WIC, VPN Module, 48MB DRAM, IP+/FW/3DES
CISCO1760-V	10/100 Modular Router w/Voice IP/VOICE Plus, 19 inch Chassis
CISCO1751	10/100 Modular Router w/ 3 slots, IOS IP, 16F/32D
CISCO1751-V	10/100 Modular Router w/Voice, IOS IP/VOICE Plus, 32F/64D
CISCO1751-VPN/K9	1751 VPN Bundle with VPN Module, 48MB DRAM, IP Plus/FW/3DES
CISCO1751-VPN/K9-A	1751 VPN Bun. w/ADSL WIC, VPN Module, 48MB DRAM, IP+/FW/3DES
CISCO1721-ADSL	10/100 BaseT Modular ADSL Router, IP/DSL

CISCO1721	10/100BaseT Modular Router w/2 WAN slots, 16M Flash/32M DRAM
CISCO1721-VPN/K9	1721 VPN Bundle with VPN Module, 48MB DRAM, IP Plus/FW/3DES
CISCO1721-VPN/K9-A	1721 VPN Bun. w/ADSL WIC, VPN Module, 48MB DRAM, IP+/FW/3DES
CISCO1721-SHDSL	10/100 BaseT Modular G.SHDSL Router, IP/DSL
CISCO1710-VPN-M/K9	Dual-Ethernet SecurityAccess Router, VPN Module, IP/3DES/FW

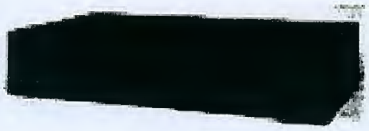
Cisco 2500 Series



The Cisco 2500 series router has served for years as the most deployed and popular branch office router in the world, and provides low cost routing functionality for data-only applications (no voice support). There are currently two access servers to choose from, 8 or 16 asynchronous ports, each with 1 Ethernet port, for aggregating multiple network elements to provide a single Telnet access point (telemetry application)—or for attaching 8 to 16 external analog or digital modems in environments where T1/E1 digital circuits are not available, but multiple dial-up telephone lines can be leveraged for low cost remote access.

For higher performance requirements, where a wider variety of WAN/LAN interfaces are needed, as well as voice support, refer to Cisco 2600/2600XM/3600 or 1700 series routers.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco AS2509-RJ and AS2511-RJ	• Data-only network requirement • An access server combining a terminal server, protocol translator, console port aggregator, and a router in a single device • One Ethernet LAN and dual serial ports • 8 or 16 asynchronous serial ports with RJ-11 jacks, ideal for attaching 8 to 16 external modems

Key Features

- Proven technology with a full suite of Cisco IOS Software
- Setup with Cisco ConfigMaker, a free tool for configuring a network of routers
- With CiscoWorks for Windows, allows remote management and maintenance from a central location

Specifications

Feature	Cisco AS2509-RJ	Cisco AS2511-RJ
Throughput Performance (pps)	3-5 Kpps (dependingon configuration)	3-5 Kpps (depending on configuration)
Memory	8-MB dual Flash bank option (default) 16 MB (max) 16 MB DRAM (default)	Same as Cisco AS2509-RJ
Power Supply	AC, with optional DC or redundant power supply	Same as Cisco AS2509-RJ
Fixed LAN Ports	1-port Ethernet	1-port Ethernet
Fixed WAN Ports	1-port sync serial 8-port async	1-port sync serial 16-port async
Dimensions (H x W x D)	1.75 x 17.5 x 10.56 in.	1.75 x 17.5 x 10.56 in.

Cisco IOS Software and Memory Requirements

To run the Cisco IOS software Feature Packs, you need the amount of memory shown in the following table:

Distribution Part Number	Feature Pack Description	IOS Image Release	Flash Memory Required[2]	DRAM Memory Required
CD25-C-12.0=	IP only	12.0(10)	8 MB	4 MB
		12.0(7)T	8 MB	6 MB
CD25-CP-12.0=	IP Plus	12.0(10)	8 MB	6 MB
		12.0(7)T	16 MB	8 MB
CD25-CHL-12.0=	IP/FW Plus IPSEC 56	12.0(10)	16 MB	8 MB
		12.0(7)T	16 MB	10 MB
CD25-B-12.0=	IP/IPX/AT/DEC	12.0(10)	8 MB	6 MB
		12.0(7)T	**16 MB**	6 MB
CD25-BP-12.0=	IP/IPX/AT/DEC Plus	12.0(10)	16 MB	6 MB
		12.0(7)T	16 MB	8 MB
CD25-AP-12.0=	Enterprise Plus	12.0(10)	16 MB	6 MB
		12.0(7)T	16 MB	10 MB

[1] For users with CCO access, search by IOS feature or release via the *Feature Navigator* at http://www.cisco.com/go/fn

[2] Bold numbers indicate that more memory than the default amount is needed to run the Feature Pack.

See the Cisco 2500 Series Web site: **http://www.cisco.com/go/2500**

Cisco 2600 Series

The Cisco 2600 series is an award-winning family of modular multiservice access routers, providing flexible LAN and WAN configurations, multiple security options, voice/data integration, and a range of high performance processors. This range of features make the Cisco 2600 series the ideal branch-office router for today's and tomorrow's customer requirements.

The Cisco 2600 series family of modular routers include the Cisco 2600XM models, the Cisco 2691 and the Cisco 2612 token ring router. These new models deliver extended performance, higher density, enhanced security performance and increased concurrent application support to meet the growing demands of branch offices.

The Cisco 2600XM models are based on the classic Cisco 2600 platform architecture, and extend the performance by as much as 33%. They also increase default platform memory and provide increases in memory capacity at the same price as their Cisco 2600 predecessor.

The highest performing router in the Cisco 2600 family that extends the density of emerging branch office applications, is the Cisco 2691 offering almost twice the performance of the Cisco 2650XM platform while leveraging the same modules from other Cisco 2600, Cisco 3600 and Cisco 3700 Series routers. Compared to the Cisco 2600XM models, the new Cisco 2691 is designed to offer a higher degree of versatility, providing greater throughput for higher density WAN applications, support for high speed interfaces and increased performance to handle new services.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 2691	• Enterprises wanting a higherlevel of performance for a broadened range of concurrent remote office applications including unparalleled voice/data integraton, Virtual Private Network (VPN) performance, increased bandwidth to suppot voice and video applications and the delivery of Web-based applications
Cisco 2600XM Series	• Enterprises consideringthe Cisco 2600 for branch office applicationsshould now regard the Cisco 2600XM as the preferential platform for delivering high performing, flexible solutions to branch and remote offices. • High Performance 10/100 Dual Ethernet Router with 3 WIC Slots, 1 NM
Cisco 2651XM	• High performance Dual10/100 Modular Router with CiscoIOS IP
Cisco 2650XM	• High performance 10/100 Modular Router with Cisco IOS IP
Cisco 2621XM	• Mid Performance Dual10/100 Ethernet Router with Cisco IOS IP
Cisco 2620XM	• Mid Performance 10/100 Ethemet Router with Cisco IOS IP
Cisco 2611XM	• Dual 10/100 Ethemet Router with Cisco IOS IP
Cisco 2610XM	• 10/100 Ethernet Router with Cisco IOS IP
Cisco 2612	• One Token Ring port and one Ethernet port formixed LANs and migrating from Token Ring to Ethemet

Key Features

- Integration/manageability—Lowers cost of ownership and improves ease of remote management, providing integrated "branch-in-a-box" networking that combines CSU/DSUs, multiplexors, modems, voice/data gateways, ISDN NT1s, firewalls, VPNs, encryption, and compression devices
- Multiservice voice/data networks—Reduces phone/fax costs between offices; using Cisco IOS software QoS features (such as RSVP, WFQ, CAR, and RED), voice/fax traffic is digitized and encapsulated in Frame Relay or IP packets and consolidated with data traffic

- Enterprise/Provider class solution—Meets the requirements of multiservice enterprises and their managed service CPE providers with high reliability features, multiple WAN connections, and the ability to migrate from data- only to TDM voice and data to packetized voice and data infrastructure
- High-density analog/fax network modules provide the ability to directly connect PSTN and legacy telephony equipment to existing Cisco 2600 and 3600 routers
- An EtherSwitch network module for the Cisco 2600/3600 series with 16 ports of 10/100 Ethernet and one optional 1000BaseT (Gigabit Ethernet) connection, providing a fully integrated Layer 2 (L2) switch with the capability to support both Line Power to Cisco IP phones and current Aironet 802.11 wireless base stations (with the addition of an external power supply). This provides a single box solution for branch offices deploying converged IP telephony, extending data, voice and video by delivering IP routing, Ethernet switching, fixed wireless solutions and voice gateway capabilities
- A wide range of Virtual Private Network modules (VPN) optimize the Cisco 2600 Series platforms for virtual private networks (VPNs) and delivers a rich integrated package of routing, firewall, intrusion-detection, and VPN functions
- The introduction of the WIC-ADSL and WIC-1SHDSL, offers business-class broadband service with scalable performance, flexibility, and security for branch and regional offices
- Content Networking Integration and Branch-Office Routing with router-integrated content-delivery system that combines intelligent caching, content routing and management with robust branch-office routing, WAN bandwidth for branch IP services such as voice over IP (VoIP)

NM-HDV-1E1-30=	1-port E1 30 channel voice/fax network module
NM-HDV-1E1-30E=	1-port E1 30 enhanced channelvoice/fax network module
NM-HDV-2E1-60=	2-port E1 60 channel voice/fax network module
NM-HDV=	High density voice networkmodule, spare (no T1/E1 or DSPs)
NM-HDA-4FXS=	High density analog voice/fax networkmodule with 4 FXS
EM-HDA-8FXS=	8-port FXS voice/fax expansion module
EM-HDA-4FXO=	4-port FXO voice/fax expansion module
DSP-HDA-16	16-channel DSP module for NM-HDA

Cisco 2600/2600XM and 3600 Series ATM Modules

NM-4T1-IMA=	4-port T1 ATM network module with IMA
NM-4E1-IMA=	4-port E1 ATM network module with IMA
NM-8T1-IMA=	8-port T1 ATM network module with IMA
NM-8E1-IMA=	8-port E1 ATM network module with IMA

Cisco 2600/2600XM and 3600 Series EtherSwitch Modules

NM-16ESW=	Sixteen 10BaseT/100BaseTX autosensing ports EtherSwitch
NM-16ESW-PWR=	Sixteen 10BaseT/100BaseTX autosensing ports EtherSwitch with power daughter card

Cisco 2600/2600XM and 3600 Series High-Density Voice/Fax DSP Upgrade Modules

PVDM-12=	12-channel Packet Voice/Fax DSP Module

Cisco 2600/2600XM and 3600 Series Voice Interface Cards (VICs)

VIC-2E/M=	2-port E&M Voice Interface Card
VIC-2FXO=	2-port FXO Voice Interface Card
VIC-2FXS=	2-port FXS Voice Interface Card
VIC-2DID=	2-port DID Voice/Fax Interface Card
VIC-2FXO-EU=	2-port FXO Voice InterfaceCard (for Europe)
VIC-2FXO-M3=	2-port FXO Voice Interface Card (forAustralia)
VIC-2BRI-S/T-TE=	2-port BRI (S/T user side) Voice Interface Card
VIC-2FXO-M1=	2-port Voice Interface Card—FXO w/ Reversal (for US+)
VIC-2FXO-M2=	2-port Voice Interface Card—FXO w/ Reversal (for EU)

Cisco 2600/2600XM and 3600 Series WAN Network Modules

NM-4B-S/T=	4-port BRI (S/T) networkmodule
NM-8B-S/T=	8-port BRI (S/T) networkmodule
NM-4B-U=	4-port BRI (U) w/ NT1 network module
NM-8B-U=	8-port BRI (U) w/ NT1 network module
NM-4A/S=	4-port Async/Sync Serial network module
NM-8A/S=	8-port Async/Sync Serial network module
NM-16A=	16-port Async Serial network module
NM-32A=	32-port Async Serial network module
NM-1CT1=	1-port Channelized T1/ISDN-PRI network module
NM-2CT1=	2-port Channelized T1/ISDN-PRI network module

AIM-VOICE-30=	SAR and 30-Channel T1/E1 Digital Voice Module

Cisco 260/2600XM0 Series Factory Memory Options

Product Number	Product Description
MEM2691-32CF-EXT	32MB External Compact Flash Memory for the 2691
MEM2691-64CF-EXT	64MB External Cisco Flash Memory for the 2691
MEM2691-128CF-EXT	128MB External Cisco Flash Memory for 2691

Cisco 2600/2600XM Series Factory DRAM Memory Upgrades

MEM2600-32U40D	32- to 40-MB DRAM Factory Upgrade forthe Cisco 2600 Series
MEM2600-32U48D	32- to 48-MB DRAM Factory Upgrade forthe Cisco 2600 Series
MEM2600-32U64D	32- to 64-MB DRAM Factory Upgrade forthe Cisco 2600 Series
MEM2650-32U40D	32 TO 40MB DRAM Factory Upgrade for the Cisco 265x only
MEM2650-32U48D	32 TO 48MB DRAM Factory Upgrade for the Cisco 265x only
MEM2650-32U64D	32 TO 64MB DRAM Factory Upgrade for the Cisco 265x only
MEM2650-32U96D	32 TO 96MB DRAM Factory Upgrade for the Cisco 265x only
MEM2650-32U128D	32 TO 128MB DRAM Factory Upgrade forthe Cisco 265x only
MEM2600XM-32U128D	32 to 128MB DRAM factory upgrade for Cisco 261x/2xXM
MEM2600XM-32U64D	32 to 64MB DRAM factory upgrade for Cisco 261x/2xXM
MEM2600XM-32U96D	32 to 96MB DRAM factory upgrade for Cisco 261x/2xXM
MEM2600XM-64U128D	64 to 128MB DRAM factory upgrade - 265xXM/XM VPN Bundles
MEM2600XM-64U96D	64 to 96MB DRAM factory upgrade - 265xXM/XM VPN Bundles
MEM2691-64U128D	64 to 128MB DIMM DRAM factory upgrade for the Cisco 2691
MEM2691-64U192D	64 to 192MB DIMM DRAM factory upgrade for the Cisco 2691

MEM2691-64U256D	64 to 256MB DIMM DRAM factory upgrade for the Cisco 2691
Cisco 2600/2600XM Series Factory Flash Memory Upgrades	
MEM2600-8U16FS	8 to 16 MB Flash Factory Upgrade for the Cisco 2600 Series
MEM2620-8U32FS	8 TO 32MB Flash SIMM Upgrade for the Cisco262x only
MEM2650-8U32FS	8 TO 32MB Flash SIMM Upgrade for the Cisco265x only
MEM2600XM-16U32FS	16 to 32 MB Flash Factory Upgrade for the Cisco 2600XM
MEM2600XM-16U48FS	16 to 48MB Flash Factory Upgrade for the Cisco 2600XM
MEM2691-32U128CF	32 to 128MB Cisco 2691 Compact Flash factory upgrade
MEM2691-32U64CF	32 to 64MB Cisco 2691 Compact Flash factory
MEM-CE-256U512D	256MB DRAM Factory Upgrade for NM-CE-BP
Cisco 2600/2600XM Series Memory Spares	
MEM2600-8D=	8 MB DRAM DIMM for the Cisco 2600 Series
MEM2600-16D=	16 MB DRAM DIMM for the Cisco 2600 Series
MEM2600-32D=	32 MB DRAM DIMM for the Cisco 2600 Series
MEM2600-4FS=	4 MB Flash SIMM for the Cisco 2600 Series
MEM2600-8FS=	8 MB Flash SIMM for the Cisco 2600 Series
MEM2600-16FS=	16 MB Flash SIMM for the Cisco 2600 Series
MEM2620-32FSBOOT=	32MB FLASH SIMM and BOOTROM for 262x Dnly
MEM2650-32FS=	32MB Flash SIMM for the Cisco 265x only
MEM2650-8D=	8MB DRAM DIMM for the Cisco 265x only
MEM2650-16D=	16MB DRAM DIMM for the Cisco 265x only
MEM2650-32D=	32MB DRAM DIMM for the Cisco 265x only
MEM2650-64D=	64MB DRAM DIMM for the Cisco 265x only
MEM2600XM-16FS=	16MB Flash SIMM for the Cisco 2600XM
MEM2600XM-32D=	32MB DIMM DRAM for the Cisco 2600XM
MEM2600XM-32FS=	32MB Flash SIMM for the Cisco 2600XM
MEM2600XM-64D=	64MB DIMM DRAM for the Cisco 2600XM

MEM2691-64CF=	64MB Cisco 2691 Compact Flash Memory
MEM2691-64D=	64MB DIMM DRAM for the Cisco 2691
MEM-CE-256D=	256MB DRAM Field Upgrade for NM-CE-BP
Cisco 2600/2600XM Series Spares - Power Supplies and Other	
PWR-2600-AC=	Cisco 2600/2600XM AC power supply spare
PWR-2600-DC=	Cisco 2600/2600XM DC power supply spare
PWR-2650-AC=	Cisco265x AC power supply spare
ACS-2600RPS=	RPS Field Upgrade for the Cisco 2600 Series
ACS-2600RM-19=	19 Inch Rack Mount Kit for the Cisco2600 series
ACS-2600RM-24=	24 Inch/23 Inch Rack Mount Kit for the Cisco 2600 Series
ACS-2600ASYN=	Auxiliary and Console Port Cable Kit for Cisco 2600 Series
ACS-2600NEBS/ETSI=	NEBS/ETSI Telco Accessory Kit for Cisco 2600
CAB-RPS-2218	RPS 22/18 Load Cable
CAB-RPS-2218=	RPS 22/18 Load Cable
CAB-RPSY-2218	RPS 22/18 Two-to-one DC Power Cable
CAB-RPSY-2218=	RPS 22/18 Two-to-one DC Power Cable
PWR600-AC-RPS-CAB	600W Redundant AC Power System With DC Power Cables
PWR600-AC-RPS-NCAB	600W Redundant AC Power System W/O DC Power Cables
BOOT-2600=	Boot ROM for Cisco 2600 Series
Cisco 2600/2600XM Series SMARTnet Maintenance	
CON-SNT-PKG5	Cisco 2600 Series Packaged SMARTnet 8x5xNBD Maintenance
Cisco 2691 Series Network Modules	
NM-1GE=	1 Port GE Network Module
NM-1T3/E3=	One port T3/E3 network module

1. This is only a small subset of all parts available via URL listed under "For More Information". Some parts have restricted access or are not available through distribution channels. Resellers: For latest part number and pricing info, see the *Distribution Product Reference Guide* at: http://www.cisco.com/dprg (limited country availability).
2. VoIP and VoFR require use of a Voice/Fax network module
3. Requires Plus feature pack

For More Information

See the Cisco 2600 Series Web site: **http://www.cisco.com/go/2600**

Cisco 3600 Series

The Cisco 3600 Series is a family of modular, high-performance multiservice access routers for medium and large-sized branch offices and Internet service providers. With over 100 modular interface options (shares modular interfaces with the 2600/2600XM series), the Cisco 3600 Series provides solutions for voice/data integration, virtual private networks (VPNs), dial access, and multiprotocol data routing. Using Cisco's digital and analog voice/fax network modules, the Cisco 3600 Series allows customers to consolidate voice, fax, and data traffic on a single network. Its architecture protects customers' investment in network technology and integrates the functions of several devices into a single, manageable solution. Cisco 3600 VPN and Dial Bundles are also available to also address specific VPN/security, and dial-up remote access server requirements. Customers are encouraged to migrate to the Cisco 3700 Series.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 3620	• Medium-density WAN and dialup connectivity • Medium-density LAN connectivity • Low-density Voice over Data • Low-density ATM connections • Mid-density modem-over-PRI bundles
Cisco 3640A	• High-density WAN and dialup connectivity • Medium- to high-density LAN connectivity • Mid-density Voice over Data • Low- to mid-density ATM connections • Low-density modem-over-BRI bundles • Configurations not available on the Cisco 3700
Cisco 3660	• Very high-density WAN and dialup connectivty • High-density LAN connectivity • Mid-density Voice over Data • Mid-density ATM connections • Mid- to high-density modem-over-PRI and BRI connectivity

Key Features

- Combines dial access, advanced LAN-to-LAN routing services, ATM connectivity, and multiservice integration of voice, video, and data in a single platform
- Modular, scalable design provides performance, scalability, flexibility, and investment protection
- High-density ISDN PRI capabilities
- Preconfigured BRI and PRI modem bundles available
- Support for modem-over-BRI functionality
- Integrated Cisco IOS software (base price includes IP IOS software)
- Full VPN and Firewall support
- ADSL and G.SHDSL support
- ISDN Modem backup

Specifications

Feature	Cisco 3620	Cisco 3640	Cisco 3660
Fixed Ports	None	None	1 or 2 10/100 Fast Ethernet
Network Module Slots	2	4	6
Advanced Integration Module (AIM) Slots	None	None	2
LAN/Combo Modules	See Part Numbersand Ordering Information	Same as Cisco 3620	Same as Cisco 3620

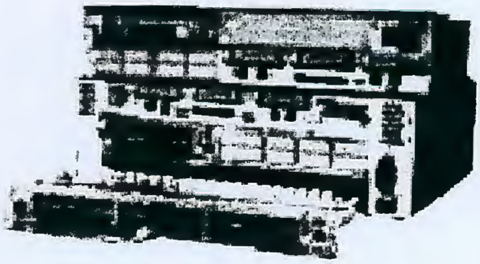
Cisco 3700 Series



The Cisco 3700 Series is a new line of modular routers that enable flexible and scalable deployment of new applications in an integrated branch office access platform. The Cisco 3700 Series is ideal for sites and solutions requiring the highest levels of integration at the branch for branch office IP Telephony, voice gateway, and integrated flexible routing with low-density switching solutions.Integrated security, intrusion detection, and VPN protect the network at the perimeters, while integrated caching conserves WAN bandwidth. The Cisco 3700 Series provides a consolidated service infrastructure and high service density in a compact form factor that enables the incremental incorporation of branch applications.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 3725	• New levels of branch office sewice density in a compact form factor (2RU) • Integrated Security, intrusion detection, and VPN • Integrated flexble routing and low-density switching (16-or-36 ports) • Flexible incremental and scalable migration to a voice/data converged branch office network – Compatibility with more than 90% of the world's legacy analog and digtal TDM PBXs – Survivable Remote Site Telephony (SRST) features that enable centralized call processing with local branch IP Telephony redundancy – Inline power for IP Telephony • Content Networking and Caching integrated for WAN bandwidth conservation
Cisco 3745	Same features as above plus: • New levels of branch office service density in a compact form factor (3RU) • Availability features such as redundant power, online insertion and removable components and field replaceable components • Increased performance and density

Key Features

- Optimized for multiple high density services
- Versatile High Density Service Module (HDSM) design enhances integrated services options
- Integrated connectivity options free up network module slots
- Optional features enhance availability/resiliency (3745 only): internal redundant power, hot-swappable modules, and field-serviceable components
- Optimized for Integrated IP Telephony: IP phone powered switch, high density voice gateway, flexible WAN routing, and Survivable Remote Site Telephony
- Flexible combination of analog and/or digital voice with scalable port density
- Full support for Cisco IOS voice suite of features
- Platforms performance-tuned for scaling packet voice solutions
- New integrated switching modules (16- and 36-port)
- Common user interface with Catalyst series switches
- Simplified management from a single platform for ease of configuration, deployment, and troubleshooting
- Integrated inline power for wireless access points and IP phones
- GigE connectivity

Digital Packet Voice and Fax Trunk Network Modules	
NM-HDV-1T1-12	High Density Voice Network Module, with 1 VWIC-1MFT-T1 and 1 PVDM-12
NM-HDV-1E1-12	High Density Voice Network Module, with 1 VWIC-1MFT-E1 and 1 PVDM-12
NM-HDV-1E1-30	Single-port, 30-channel E1 voice/fax Network Module (supports 30 channels) of medium complexity VoCoders: G.729a/b, G.726, G.711 and fax or 12 channels of G.726, G.729, G.723.1, G.728, G.729a/b, G.711 and fax)
NM-HDV-1E1-30E	Single-port, enhanced 30-channel E1 voice/fax Network Module (supports30 channels of high and medium complexity VoCoders G.729a/b, G.726, G.729, G.728, G.723.1, G.711 and fax)
NM-HDV-2E1-60	Dual-port, 60-channel E1 voice/fax Network Module (supports 60 channels) of medium complexity VoCoders: G.729a/b, G.726,G.711 and fax or 30channels of G726, G729, G723.1, G.728, G729a/b, G711 and fax) Supportsadd/drop multiplexing (drop andinsert)
NM-HDV-1T1-24	Single-port, 24-channel T1 voice/fax Network Module (supports 24 channels of medium complexity VoCoders: G.729a/b, G.726, G.711 and fax or 12 channels of G.726, G.729, G.723.1, G.728, G.729a/b, G.711 and fax)
NM-HDV-1T1-24E	Single-port, enhanced 24-channel T1 voice/fax Network Module (supports24 channels of high and medium complexity VoCoders G.729a/b, G.726, G.729, G.728, G.723.1, G.711 and fax)
NM-HDV-2T1-48	Dual-port, 48-channel T1 voice/fax Network Module (supports 48 channels) of medium complexity VoCoders:G.729a/b,G.726,G.711 and fax or 24 channels of G726, G729, G723.1, G.728, G729a/b, G711 and fax) Supportsadd/drop multiplexing (drop andinsert)
AIM-ATM-VOICE-30	SAR and 30 Channel T1/E1 Digital Voice module
AIM-VOICE-30	30 Channel T1/E1 Digital Voice module
Analog Packet Voice and Fax Trunk Network Modules	
NM-1V	1-slot voice and fax netwok module
NM-2V	2-slot voice and fax netwok module
NM-HDA	High Density Analog Module
Voice Interface Cards	
VIC-2FXS	2-port voice interface card—FXS
VIC-2FXO	2-port voice interface card—FXO
VIC-2FXO-EU	2-port voice interface card—FXO (for Europe)
VIC-2FXO-M1	2-port voice interface card—FXO (with batteryreversal, for North America)
VIC-2FXD-M2	2-port voice interface card—FXO (with batteryreversal, for Europe)
VIC-2FXO-M3	2-port voice interface card—FXO (for Austalia)
VIC-2E/M	2-port voice interface card—E&M
VIC-2DID	2-port voice interface card—DID (Direct Inward Dial)
VIC-2BRI-S/T-TE	2-port voice interface card—BRI(Terminal side)
VIC-2BRI-NT/TE	2-port voice interface card—BRI (Network side)
ATM Network Modules	
NM-4T1-IMA	4-port T1 ATM network module with Inverse Multiplexing over ATM (IMA)
NM-4E1-IMA	4-port E1 ATM network module with IMA
NM-8T1-IMA	8-port T1 ATM network module with IMA
NM-8E1-IMA	8-port E1 ATM network module with IMA
NM-1A-T3	1-port DS3 ATM network module
NM-1A-E3	1-port E3 ATM network module
AIM-ATM	ATM cell processing module
Serial WAN Interface Cards	
WIC-1DSU-T1	One T1 CSU/DSU - Integrated
WIC-2T	2-port High Speed Serial
WIC-2-A/S	2-port Async/Sync Serial
WIC-1DSU-56K4	1-port, four-wire 56/64-Kbps with CSU/DSU
Digital Voice/WAN Interface Cards	
VWIC-1MFT-T1	1-port RJ-48 MultiFlex Trunk—T1
VWIC-2MFT-T1	2-port RJ-48 MultiFlex Trunk—T1
VWIC-2MFT-T1-DI	2-port RJ-48 MultiFlex Trunk—T1 with Drop and Insert
VWIC-1MFT-E1	1-port RJ-48 MultiFlex Trunk—E1
VWIC-2MFT-E1	2-port RJ-48 MultiFlex Trunk—E1
VWIC-2MFT-E1-DI	2-port RJ-48 MultiFlex Trunk—E1 with Drop and Insert Add not for VWICs VIC slots & WIC slots
VWIC-1MFT-G703	1-port RJ-48 MultiFlex Trunk—E1 unstructured
VWIC-2MFT-G703	2-port RJ-48 MultiFlex Trunk—E1 unstructured
ISDN WAN Interface Cards	
WIC-1B-S/T	1-port ISDN BRI
WIC-1B-U	1-port ISDN BRI with NT1

ISDN and Channelized Serial Network Modules	
NM-1CT1	1-port channelized T1/ISDN PRI network module
NM-1CT1-CSU	1-port channelized T1/ISDN PRI with CSU network module
NM-2CT1	2-port channelized T1/ISDN PRI network module
NM-2CT1-CSU	2-port channelized T1/ISDN PRI with CSU network module
NM-1CE1B	1-port channelized E1/ISDN PRI balanced networkmodule
NM-1CE1U	1-port channelized E1/ISDN PRI unbalancednetwork module
NM-2CE1B	2-port channelized E1/ISDN PRI balanced networkmodule
NM-2CE1U	2-port channelized E1/ISDN PRI unbalancednetwork module
NM-4B-S/T	4-port ISDN BRI network module
NM-4B-U	4-port ISDN BRI with NT1 networkmodule
NM-8B-S/T	8-port ISDN BRI network module (S/T interface)
NM-8B-U	8-port ISDN BRI with NT1 network module (U interface)
Modem Modules	
WIC-1AM	1-port analog modem WAN interface card (WIC)
WIC-2AM	2-port analog modem WAN interface card (WIC)
NM-6DM	6-port digital modem network module
NM-12DM	12-port digital modem networkmodule
NM-18DM	18-port digital modem networkmodule
NM-24DM	24-port digital modem networkmodule
NM-30DM	30-port digital modem networkmodule
NM-8AM	8-port analog modemNetwork Module
NM-16AM	16-port analog modemNetwork Module
NM-8AMJ	8-port analog modem NetworkModule—Japan
NM-16AMJ	16-port analog modemNetwork Module—Japan
Digital Subscriber Line (DSL)	
WIC-1ADSL	1-port ADSL WAN Interface Card
WIC-G.SHDSL	1-port G.shdsl WAN Interface Card
Encryption Advanced Integration Modules	
AIM-COMPR4	Data Compression AIM for3660 Series (4 E1 performance)
AIM-VPN/HP	DES/3DES VPN Encryption AIMfor 3660-High Performance
AIM-VPN/EPDES/3DES	VPN Encryption AIM for2600-Enhanced Performance
Content Engine Network Modules	
NM-CE-BP-20G-K9	Content EngineNetwork Module, Basic Performance, 20GB IDE Hard Disk
NM-CE-BP-40G-K9	Content EngineNetwork Module, Basic Performance, 40GB IDE Hard Disk
NM-CE-BP-SCSI-K9	Content EngineNetwork Module, Basic Performance, SCSI Controller
Dry Contact Closure Alarm NM	
NM-AIC-64	Alarm Monitoringand Control NetworkModule
Cisco EtherSwitch Modules	
NM-16ESW	One 16-Port 10/100 EtherSwitch Network Module
NM-16ESW-PWR	One 16 port 10/100 EtherSwitch NM with Inline Power support
NM-16ESW-1GIG	One 16 port 10/100 EtherSwitch NM with 1 GE (1000BaseT) port
NM-16ESW-PWR-1GIG	One 16 port 10/100 EtherSwitch NM withInline Powerand GE
PPWR-DCARD-16ESW	One Inlinepower daughter card for16 port EtherSwitch NM
NMD-36-ESW	One 36 port 10/100 EtherSwitch HighDensity Service Module
NMD-36-ESW-PWR	One 36 port 10/100 EtherSwitch HDSM withInline Power
NMD-36-ESW-2GIG	One 36 port 10/100 EtherSwitch HDSM withtwo GE (1000BaseT)
NMD-36-ESW-PWR-2G	One 36 port 10/100 EtherSwitch HDSM+ Inline Power and two GE
PPWR-DCARD-36ESW	One Inline Power daughter card for36 port EtherSwitch HDSM
GE-DCARD-ESW	One GE (1000BaseT) daughter cardfor EtherSwitch Modules
PPWR-PS-360W	One 48V (360W) power supply for EtherSwitch Modules
PPWR-PS-CHASSIS	One power supply chassis for Cisco 48V (360W) power supply
PWR-CHASSIS-360W	One power supply chassis and 48V power supply for EtherSwitch
CAB-PPWR-PS1-1	Connectsone EtherSwitch power supply to one EtherSwitch Module
CAB-PPWR-PS1-2	Connectsone EtherSwitch power supply to two EtherSwitch Modules
CAB-PPWR-PS2-1	Connectstwo EtherSwitch power supplies to one EtherSwitch Module

Cisco 7200 Series

The Cisco 7200 Series routers deliver exceptional price/performance, versatility, and feature-richness in a compact form factor. The Cisco 7200 is ideal as a WAN aggregator for the Service Provider (small POP) or enterprise edge, an enterprise WAN gateway, a high-end managed CPE, or as a small core router. The platform also supports sites that require IBM data center connectivity as well as sites that require multifunction capabilities that combine all the above for multiservice voice, video, and data traffic.

A key strength of the Cisco 7200 is its modularity. With a choice of 4- and 6-slot chassis, a selection of processors providing up to 1 Mpps, an extensive range of LAN and WAN interfaces with up to 48 ports per chassis, and single or dual power supplies, the customer can customize their system to achieve the performance, connectivity, and capacity desired. This modularity combined with a low initial price point guarantees both investment protection and maximum return on investment, allowing the customer to upgrade and/or redeploy their Cisco 7200 as their network needs change.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7204VXR	• 4-slot chassis • Modular processor: 225, 400, 900 Kpps (NPE-225, NPE-400, NPE-G1) or 300 Kpps service accelerator (NSE-1) • 1.2 Gbps backplane • MIX-enabled busfor data/voice/video applications
Cisco 7206VXR	• 6-slot chassis • Modular processor: 225, 400, 900 Kpps (NPE-225, NPE-400, NPE-G1) or 300 Kpps service accelerator (NSE-1) • 1.2 Gbps backplane • MIX-enabled busfor data/voice/video applications

Key Features

- Compact Form Factor—Up to six port adapters in a fully modular 3RU form factor. The optional Rack Density System (RDS) allows for up to nine Cisco 7206 routers per rack with front-to-back airflow
- Exceptional Value—As the most powerful single-processor platform, the Cisco 7200 offers customers a superior price/performance ratio supporting high-speed media and high-density configurations with up to 900 Kpps processing at a competitive price point
- Feature Rich—Full support for Cisco IOS software and enhancements for high-performance network services enables the Cisco 7200 to offer industry-leading network services, including: MPLS, broadband aggregation, quality of service (QoS), security, and voice/video/data support
- Connectivity/Flexibility—Provides high port density and an extensive range of LAN and WAN media, the Cisco 7200 dramatically reduces the cost per port and allows for flexible configurations to meet your specific network needs
- Common port adapters—Port adapters are shared with the Cisco 7300, 7400, 7500, and 7600 (w/FlexWAN Module), which simplifies sparing and protects customer investment in interfaces

7206VXR400/VPNK9	7206VXR VPN Bundle NPE400,256MB, I/O 2FE, VAM,IPSEC 3DES IOS
7206VXRG1/VPNK9	7206VXR VPN Bundle NPE-G1,256MB, 3 FE/GE, VAM,IPSEC 3DES IOS

Cisco 7200 Series Processors

NPE-G1=	Cisco 7200 Network Processing Engine NPE-G1 including 256MB default DRAM and 64MB default flash memory.
NPE-225=	Network Processing Engine 225 (128MB default memory)-spare
NPE-400=	7200VXR NPE-400 (128MB default memory),SPARE
NSE-1=	7200VXR Network Services Engine 1 (128MB default mem),SPARE

Cisco 7200 Series Input/Output Controller

C7200-I/O=	Cisco 7200 Input/Output Controller, Spare
C7200-I/O-2FE/E=	Cisco 7200 Input/Output Controlle with Dual 10/100 Ethernet
C7200-I/O-GE+E=	Cisco 7200 Input/Output Controller with GE and Ethernet

Cisco 7200 Rack Mount Systems

CISCO7200RDS	CISCO 7200 Rack Density System

Cisco 7200 Processor Memory: NPE-G1

MEM-NPE-G1-256MB=	Two 128MB memory modules (256MB total) for the Cisco 7200 Network Processing Engine NPE-G1
MEM-NPE-G1-512MB=	Two 256MB memory modules (512MB total) for the Cisco 7200 Network Processing Engine NPE-G1
MEM-NPE-G1-1GB=	Two 512MB memory modules (1GB total) for the Cisco 7200 Network Processing Engine NPE-G1
MEM-NPE-G1-FLD64=	64MB Compact Flash Disk for the Cisco 7200 Network Processing Engine NPE-G1
MEM-NPE-G1-FLD128=	128MB Compact Flash Disk for the Cisco 7200 Network Processing Engine NPE-G1
MEM-NPE-G1-FLD256=	256MB Compact Flash Disk for the Cisco 7200 Network Processing Engine NPE-G1

Cisco 7200 Processor Memory: NPE-100, NPE-150, NPE-200

MEM-NPE-16MB=	16MB Memory Upgrade Kit for NPE-200/NPE-150/NPE-100
MEM-NPE-32MB=	32MB Memory Upgrade Kit for NPE-200/NPE-150/NPE-100
MEM-NPE-64MB=	2 32MB memory modules(64MB total) for NPE-200/NPE-150/NPE-100
MEM-NPE-128MB=	128MB Memory Upgrade Kit for NPE-200/NPE-150/NPE-100

Cisco 7200 Processor Memory: NPE-175 and NPE-300

MEM-SD-NPE-32MB=	32MB Memory Upgrade Kit for NPE-300/NPE-225/NPE-175
MEM-SD-NPE-64MB=	64MB Memory Upgrade Kit for NPE-300/225/175
MEM-SD-NPE-128MB=	128MB Memory Upgrade Kit for NPE-300/NPE-225/NPE-175
MEM-SD-NPE-256MB=	2 128MB memory modules (256MB total) for the NPE-300 in 7200

Cisco 7200 Processor Memory: NPE-225 and NSE-1

MEM-SD-NPE-128MB=	128MB Memory Upgrade Kit for NPE-300/NPE-225/NPE-175
MEM-SD-NSE-256MB=	256MB Memory for NPE-225 or NSE-1 in 7200 Series, SPARE

Cisco 7200 Processor Memory: NPE-400

MEM-NPE-400-128MB=	128MB Memory for NPE-400 in 7200 Series
MEM-NPE-400-256MB=	256MB Memory for NPE-400 in 7200 Series
MEM-NPE-400-512MB=	512MB Memory for NPE-400 in 7200 Series

Cisco 7200 Series Input/Output Controller Memory Options

MEM-CIP-32M=	CIP 32 MB DRAM Upgrade Kit
MEM-CPA-32M=	CPA 32MB DRAM Upgrade Kit
MEM-I/O-FLC20M=	Cisco 7200 I/O PCMCIA Flash Memory, 20MB
MEM-I/O-FLC8M=	Cisco 7200 I/O PCMCIA Flash Memory, 8MB
MEM-I/O-FLD128M=	Cisco 7200 I/O PCMCIA Flash Disk, 128 MB Spare
MEM-I/O-FLD48M=	Cisco 7200 I/O PCMCIA Flash Disk, 48 MB Spare

Cisco 7200 Series Port Adapters

PA-4C-E=	1 Port Enhanced ESCON Channel Port Adapter
PA-A2-4E1XC-E3ATM=	CES Port Adapter E3/E1 120 ohms
PA-A2-4E1XC-OC3SM=	CES OC3 Port Adapter4E1 Ports 120ohms
PA-A2-4T1C-OC3SM=	ATM CES Port Adapter, 4T1 CES Ports and 1 OC3 ATM SM Port
PA-A2-4T1C-T3ATM=	ATM CES Port Adapter, 4T1 CES Ports and 1 T3 ATM Port
PA-GE=	Gigabit Ethernet Port Adapter
PA-MCX-2TE1=	Spare 2 port MIX-enabled multichannel T1/E1 PA with CSU/DSU
PA-MCX-4TE1=	4 port MIX-enabled multichannelT1/E1 PA with CSU/DSU
PA-MCX-8TE1-M=	T1/E1 SS7 link PA for ITP
PA-MCX-8TE1=	8 port MIX-enabled multichannel T1/E1 with CSU/DSU
PA-SRP-OC12MM=	DPT-OC12 Multi-mode port adapter
PA-SRP-OC12SMI=	DPT-OC12 Single-mode intermediate port adapter
PA-SRP-OC12SML=	DPT-OC12 Single-mode long-reachport adapter
PA-SRP-OC12SMX=	DPT-OC12 Singe-mode extended reach PA

Cisco 7200, 7400 and 7500 Series Port Adapters

PA-VXC-2TE1+=	2 port TE1 hi-capacity enhanced voice PA
PA-VXB-2TE1+=	2 port T1/E1 moderate capacity enhanced voice PA
PA-T3=	1 Port T3 Serial Port Adapterwith T3 DSUs
PA-T3+=	1 Port T3 Serial Port Adapter Enhanced
PA-POS-OC3SML=	1-Port Packet/SONET OC3c/STM1 Singlemode (LR) PA
PA-POS-OC3SMI=	1-Port Packet/SONET OC3c/STM1 Singlemode (IR)PA
PA-POS-OC3MM=	1-Port Packet/SONET OC3c/STM1 Multimode PA
PA-POS-2OC3=	2 Port Packet/SONET OC3c/STM1 Port Adapter
PA-MC-T3=	1 port multichannel T3port adapter
PA-MC-E3=	1 port Multi-Channel E3port adapter
PA-MC-4T1=	4 port multichannel T1 port adapter with integrated CSU/DSUs
PA-MC-2T3+=	2 port multichannel T3port adapter
PA-MC-2T1=	2 port multichannel T1 port adapter with integrated CSU/DSUs
PA-MC-2E1/120=	2 port multichannel E1 port adapter with G.703 120ohm interf
PA-H=	Port Adapter: 1-Port HSSI
PA-E3=	1 Port E3 Serial Port Adapterwith E3 DSU
PA-A3-T3=	1-Port ATM Enhanced DS3Port Adapter (Spare)
PA-A3-OC3SML=	1-Port ATM Enhanced OC3c/STM1 Singlemode(LR)Port Adapter
PA-A3-OC3SMI=	1-Port ATM Enhanced OC3c/STM1 Singlemode(IR)Port Adapter
PA-A3-OC3MM=	1-Port ATM Enhanced OC3c/STM1 Multimode Port Adapter
PA-A3-E3=	1-Port ATM Enhanced E3 Port Adapter (Spare)
PA-A3-8E1IMA=	8-port ATM Inverse Mux E1 (120 Ohm) Port Adapter, Spare
PA-8T-X21=	8-Port Serial, X.21 Port Adapter
PA-8T-V35=	8-Port Serial, V.35 Port Adapter
PA-8T-232=	8-Port Serial, 232 Port Adapter
PA-8E=	8-Port Ethernet 10BaseT Port Adapter
PA-4T+=	4-Port Serial Port Adapter, Enhanced
PA-4E1G/75=	4-Port E1 G.703 Serial Port Adapter (75ohm/Unbalanced)
PA-4E1G/120=	4-Port E1 G.703 Serial Port Adapter (120ohm/Balanced)
PA-4E=	4-Port Ethernet 10BaseT Port Adapter
PA-2T3=	2 Port T3 Serial Port Adapterwith T3 DSUs
PA-2T3+=	2 Port T3 Serial Port Adapter Enhanced,Spare
PA-2H=	PORT ADAPTER:2-PORT HSSI
PA-2FE-TX=	2-Port Fast Ethernet 100Base TX Port Adapter
PA-2FE-FX=	2-Port Fast Ethernet 100Base FX Port Adapter
PA-2E3=	2 Port E3 Serial Port Adapterwith E3 DSUs

Cisco 7200 and 7400 Series Port Adapters

PA-8B-S/T=	8-Port BRI Port Adapter, S/T Interface

Cisco 7200 and 7500 Series Port Adapters

PA-VXA-1TE1-30+=	1 Port T1/E1 Digital Voice Port Adapterwith 30 Channels
PA-VXA-1TE1-24+=	1 Port T1/E1 Digital Voice Port Adapterwith 24 Channels
PA-MC-STM-1SMI=	1 port multichannel STM-1 single mode port adapter
PA-MC-STM-1MM=	1 port multichannel STM-1multimode port adapter
PA-MC-8TE1+=	8 port multichannel T1/E1 8PRI port adapter
PA-F/FD-SM=	1-Port FDDI Full Duplex Single-Mode Port Adapter
PA-F/FD-MM=	1-Port FDDI Full Duplex Multi-Mode Port Adapter
PA-A3-8T1IMA=	8-port ATM Inverse Mux T1 Port Adapter, Spare
PA-4R-DTR=	Port Adapter:4-Port Dedicated Token Ring,4/16Mbps, HDX/FDX

Cisco 7200 Series Service Adapters

SA-ISA=	Integrated Services Adapter for IPSec or MPPE encryption
SA-VAM=	VPN Acceleration Module (VAM)IPSec and IPComp Acceleration

Cisco 7200 Series Transceiver Modules

GBIC-LX/LH=	Gigabit Interface Converterfor 1000BASE-LX standard
GBIC-SX=	Gigabit Intf. Converter For 1000BASE-SX (Short Wavelength)
GBIC-ZX=	Gigabit Interface Converterfor 1000 BASE-ZX
POM-OC3-MM	1-port OC3/STM1 Pluggable Optic Module,MM
POM-OC3-SMIR	1-port OC3/STM1 Pluggable Optic Module, SM-IR
POM-OC3-SMLR	1-port OC3/STM1 Pluggable Optic Module, SM-LR

Cisco 7200 Series Power Supplies	
PWR-7200-DC+=	Cisco 7200 DC (24V-60V) Power Supply Option
PWR-7200/2-DC+	Cisco 7200 Dual DC (24V-60V) Power Supply Option
PWR-7200-AC=	Cisco 7200 AC Power Supply With United States Cord
PWR-7200-ACA=	Cisco 7200 AC Power Supply With Australian Cord
PWR-7200-ACE=	Cisco 7200 AC Power Supply With European Cord
PWR-7200-ACI=	Cisco 7200 AC Power Supply With Italian Cord
PWR-7200-ACU=	Cisco 7200 AC Power Supply With United Kingdom Cord
Cisco 7200 Series Spares and Accessories	
ACS-7200-RMK=	Cisco 7200 Rackmount Kit and Cable Management Bracket
CVPN7200FIPS/KIT=	Kit(Instructions,labels)to configure 7206 for FIPS operation

Cisco 7300 Series

The Cisco 7300 Series Routers are optimized for flexible, high performance IP/MPLS services at the network edge, where service providers and enterprises link together. Coupled with powerful network processing, a broad set of interfaces and a compact, modular form factor the Cisco 7300 Series Routers are ideal for intelligent, multi-gigabit network connectivity.

The Cisco 7304 Series Router is ideally applied as a high-end CPE or as an Internet Gateway router. Architected for network High Availability and multi-protocol support, the 7304 supports the broad set of existing Cisco 7000 Series Port Adapters with the new Cisco 7304 Port Adapter Carrier Card.

The Cisco 7301 Series Router is a compact single rack unit router coupled with a broad set of interfaces and Cisco IOS software features. It packs high performance in a space and power efficient form factor that includes a single 7000 Series port adapter slot, 3 on-board Gigabit Ethernet (copper or optical)/Fast Ethernet ports and a new high-speed bus technologies.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7301	• Compact, power efficient 1RU form factor • Three times the performance increase over existing single rack unit routers like the Ciso 7401 • Single 7000 Series Port Adapter Slot
Cisco 7304	• Highly modular price and performance optmized platform, rich in IP services • High performance connectivity—DS-1 through OC48/STM16 with 3.5 Mpps performance • Built-in Gigabit Ethernet connectivity • Multiprotocol routing:IP, IPX, AppleTalk, DLSw • Compact size, high availability and optimal cooling

Key Features

- Cisco 7301: With nearly 1 million-packets-per-second (Mpps) processing performance, the fastest Cisco 1RU general-purpose processor, as of January 2003; 3 fixed 10/100/1000-Mbps ports (RJ-45 or SFP optics) directly on the processor; Full Cisco IOS feature support; Pluggable Gigabit Ethernet optics (SFPs); Up to 1GB of available DRAM; Up to 256MB of removable compact flash memory; Front-back airflow and single sided management
- Cisco 7304: Compact modular form factor with four RU with four port adapter slots per chassis; PXF IP processor hardware-accelerated services such as Cisco Express Forwarding (CEF), NetFlow v8, and Turbo ACL; Offers 3.5Mpps performance for PXF-accelerated services with the NSE-100 Network Services Forwarding Engine; Two Gigabit Ethernet ports per NSE-100; System redundancy: optional dual processors and dual AC or DC power supplies increases network availability

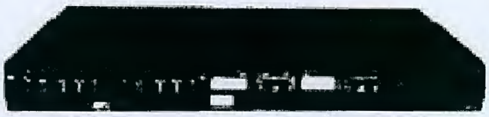
Cisco 7400 Series



With the Cisco 7400, this modular, one-port adapter slot unit leverages over 40 standard 7200/7500 series port adapters. Its compact, stackable architecture is designed for application specific routing deployments, such as broadband services aggregation (PPP/L2TP) and WAN edge connectivity in service provider and enterprise networks. Leveraging Cisco patented technology, the Cisco 7400 series delivers a premium suite of hardware-accelerated network services.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7401ASR-CP	• General WAN edge connectivity in a small form factor, or as managed customer premise equipment (CPE) • Broad range of connectivity options—from DS0 to OC-3 interfaces • Comprehensive management services with remote management, provisioning, trouble shooting and software upgrade • Hardware accelerated services, including: NAT, ACLs, Netflow, CBWFQ, CBWRED, Policing, marking, Hierarchical Traffic Shaping, & VRF lite
Cisco 7401ASR-BB	• Complete broadbandsubscriber services suite with highest subscribers per rack ratio • One fast LAN interface (FE/GE) and one fast WAN interface (DS3/OC3) • High volume/densityof PPP, PPPoE, PPPoA, L2TP tunnel aggregation and termination for broadband services like DSL, Cable, and Wireless

Key Features

- Compact form factor with 1 RU, front-to-back airflow and stackability
- Hardware—accelerated IP network services
- Built-in dual GE connectivity
- Flexible WAN connectivity supporting over 40 interfaces including serial, multichannel, ISDN, Frame Relay, ATM, Packet over SONET (POS), from NxDS0 to OC-3
- Shared port adaptors with the Cisco 7200, 7300, 7500, and 7600 (with FlexWAN Module), which simplifies sparing and protects customer investment in interfaces

Cisco 7500 Series

An essential part of both Enterprise and Service Provider networks, the Cisco 7500 Series routers are the market leader for edge applications, due to its breadth of services, diverse interfaces, reliability, and performance. Since its inception, the Cisco 7500 has seen huge improvements in performance and its ability to scale, most recently with the Route Switch Processor 16 (RSP16) and Versatile Interface Processor 6-80 (VIP6-80) module. This series combines Cisco's proven software technology with exceptional reliability, availability, serviceability, and performance features to meet the requirements of today's most mission-critical networks.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7505	• 5 expansion slots • One CyBus • DS0 to OC-12 connectivity (all platforms)
Cisco 7507	• 7 expansion slots • Dual CyBuses • Redundant powersupplies • Diverse set of routingprotocols (allplatforms)
Cisco 7513	• 13 expansion slots • Dual CyBuses • Redundant powersupplies • Diverse set of routingprotocols (allplatforms)

Key Features

- High-performance switching—Delivers high performance for mission-critical applications by supporting high-speed media and high-density configurations; using the processing capabilities of the Versatile Interface Processors and Cisco Express Forwarding—the Cisco 7500 series system capacity can exceed two million packets per second
- Full support for Cisco IOS software and enhancements for high-performance network services—Performs network services such as quality of service, security, compression, and encryption at high speed; VIP technology extends the performance of these services through distributed IP services
- High port density—Provides high port density and an extensive range of LAN and WAN media; this feature dramatically reduces the cost per port and allows a flexible configuration
- Unmatched interface flexibility—The Cisco 7500 supports a broad selection of Interface Processors (IPs) and Port Adapters (PAs). Port adapters are shared with the Cisco 7200, 7400, and 7600 (with FlexWAN Module)
- High Availability—Enhanced features and capabilities include redundant route processors, power supplies, fans, and software fault isolation with Stateful Switchover and NonStop Forwarding

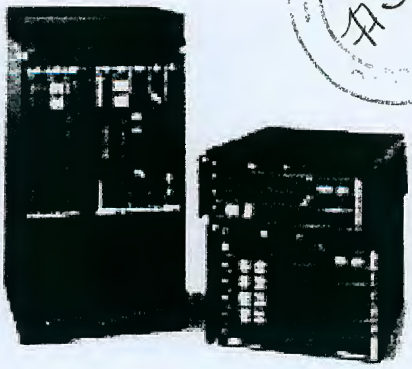
See the Cisco 7500 Series Web site: **http://www.cisco.com/go/7500**

Cisco 7600 Series



The Cisco 7600 Series combines optical WAN/MAN networking and high-volume Ethernet aggregation with a focus on line-rate delivery of high-touch IP services in large data centers and at the edge of service provider networks. It provides customers the flexibility of three different form factors: Cisco 7603, 7606, and 7609. As the most scalable system in the industry, each router offers the ability to deliver DS0 to OC-48 WAN connectivity, and 10-Mbps Ethernet to 10-Gigabit Ethernet LAN connectivity into Internet data center, metropolitan aggregation, WAN edge aggregation, and enterprise networking applications.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7603	• 3 slot (horizontal) chassis • 32 Gbps backplane bandwidth • 15 Mpps forwarding rate • NEBs Compliant
Cisco 7606	• 6 slot (horizontal) chassis • 160 Gbps backplane bandwidth • 30 Mpps forwarding rate • NEBs Compliant
Cisco 7609	• 9 slot (vertical) chassis • 256 Gbps backplane bandwidth • 30 Mpps forwarding rate • NEBs Compliant

Key Features

- Hardware accelerated IP services on each Optical Services Module (OSM), delivering up to 6 Mpps per slot
- 15 to 30 Mpps forwarding processor and up to 512 MB DRAM for Internet routing
- Modular and scalable from 32 Gbps to 256 Gbps switch fabric
- One of the widest, most complete ranges of WAN interfaces in the industry, with DS0 to OC-48 connectivity
- Leveraging the FlexWAN Module, 7x00 port adapters are shared with the Cisco 7200, 7300, 7400, and 7500 which simplifies sparing and protects customer investment in interfaces
- Compatible with Catalyst 6500 LAN interfaces, offering 10 Mbps Ethernet to 1 Gbps

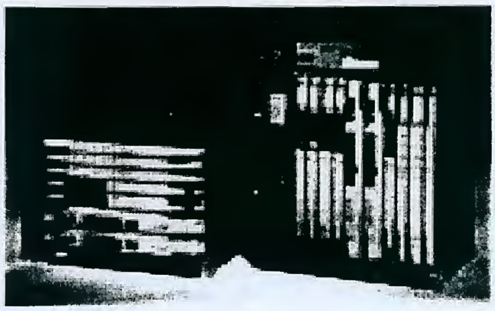
Cisco 10000 Series



The Cisco 10000 Series is the industry's only edge router that delivers consistent, high performance services for carriers deploying IP, MPLS, and broadband services to DSL and private line customers. Coupled with proven high availability and innovative adaptive network processing technology, the Cisco 10000 Series is uniquely designed to meet the service needs of carriers up to DS3/E3 aggregation speeds.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 10008	• Broadband features including PPP over ATM, PPP over Ethernet, routed bridge encapsulation, and Layer 2 Tunneling Protocol • MPLS, MPLS VPN, and MPLS Quality of Service edge features • Leased line features such as seamless integration from a dedicated access environment (TDM or SONET/SDH) to the ATM core.

Key Features

- Industry-leading high availability—nonstop performance, with a complete set of reliability features for high availability (99.999 percent uptime). Full hardware redundancy, hot-swappable elements, and seamless route processor cutover provide continuous traffic forwarding.
- Lowest total cost of ownership—the Cisco 10000 offers the highest leased-line, ATM, frame, and broadband session densities on a single platform, and its high reliability reduces network downtime and operational expenses
- Broad portfolio of line-rate IP sessions—critical service features, such as QoS, MPLS, Multilink PPP, and ACLs are hardware accelerated to deliver exceptional throughput for every connection

- Industry-leading session density—the Cisco 10000 supports thousands of DS0, DS1/E1 connections, or hundreds of clear-channel DS3 connections on a single platform, providing the highest port density of DS3-and-below interfaces

Competitive Products

- Redback: SMS-10000
- Juniper: M5, M10, M20
- Unisphere: ERX700, ERX1400

Specifications

Feature	Cisco 10008
Fixed Ports	None
Expansion Slots	8 (for interfaces)
WAN Interface Range	DS0 to OC-12
Processor	Cisco PXF Processor
Forwarding Rate	10005Up to approximately 6 Mpps
Backplane Capacity	51.2 Gbps
Flash PCMCIA Memory	48 MB (expandable to 128 MB)
System DRAM Memory	512 MB
Minimum Cisco IOS Release	12.0(9)SL
Internal Power Supply	AC or DC, dual option
Redundant Power Supply	Yes, for both AC and DC
Chassis Height	13 RU
Rack Mountable	Yes, up to 3 per rack
Dimensions (HxWxD)	21.75 x 17.5 x 12 in.

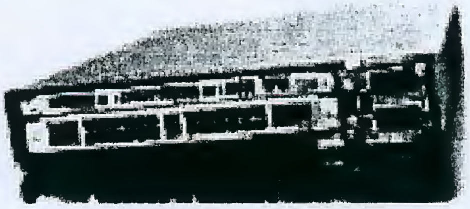
Cisco 10720 Series



The Cisco 10720 Internet Router is a high-performance router and a principle building block in the metro IP network. It enables service providers to offer innovative and differentiated IP services to their customers at optical speeds. Equipped with Ethernet technology for customer access and the innovative Dynamic Packet Transport (DPT)/RPR (Resilient Packet Ring) technology or Packet over SONET (POS) for metro optical connectivity, the Cisco 10720 allows service providers to offer IP services closer to the user, enabling them to better control admission to network resources. This allows service providers to bypass traditional DS1 and DS3 access options. The dual counter rotating ring technology of DPT is also cost effective, since it uses both rings and can be deployed over dark fiber and still maintain the less than 50ms restoration common in SONET/SDH systems. For multiservice applications, DPT can also be deployed over traditional SONET/SDH ADMs and wavelength division multiplexing (WDM) systems.

The Cisco 10720 is a cost-effective, reliable platform that not only supports the full suite of IP routing protocols such as IS-IS, OSPF and BGP, but also allows advanced IP features to be introduced efficiently, without compromising on performance. Although primarily designed for high-speed Internet services for multitenant and business-park applications in the metro, the Cisco 10720 Internet Router is also suitable for a range of other applications such as: Internet data center applications, intra-POP aggregation, cable multisystem operator (MSO) internetworking, and voice-over-IP (VoIP) aggregation.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 10720 Internet Router	• Any service provider planning to offerhigh-performance IP services as part of their business strategy by extending IP further out into the network • Any service provider wanting to simplify their current network and implement thesimple, scalable, reliable features of DPT technology while maximizing fiber usage • Any customer already using DPT technology in their network, most likely with DPT cards on the 12000 Internet Router • Metro Ethernet Servicessuch as L2 and L3 VPN with FE/GE handoff to the Customer and 50ms restoration overdark fiber using DPT.

Key Features

- Equipped with Redundant Power Supply by default
- SRP specific features—IPS with <50 ms restoration time and SRP MIB support
- Multicast support including PIM SM, PIM DM, MBGP
- L2 VPN—UTI, L2TPv3 and EoMPLS for Layer 2 to Layer 2 LAN extension; L3 VPN MPLS VPN
- QoS—Modular QoS CLI, CAR, WRED, VTMS traffic shaping, and access lists
- Ethernet features—MDI-MDI-X support, 10/100 speed auto-negotiation, HDX-FDX negotiation and time delay reflectometry (TDR) for 10/100BaseTX
- Hot Standby Routing Protocol (HSRP)/Multiple Hot Standby Routing Protocol (MHSRP)
- 64-MB built-in Flash for software and configuration load
- Optical receive power monitoring support on OC-48/STM-16 Interface and GE
- Supported management information bases (MIBs) include SNMP, SRP, SONET, Etherlike, OSPF

Competitive Products (vs. Cisco's Metro IP RPR Solution using the 10720)

- Extreme Summit: 48/Blackdiamond comb for GigE Hub & Spoke
- Riverstone: RS3000/RS8600 combo for GigE Hub & Spoke

Specifications

Feature	Cisco 10720
Security Features	Including AAA, RADIUS authentication, TACACS+, and encrypted passwords
Management	Cisco IOS CLI TACACS+ and RADIUS Configuration and administration features including Telnet and CiscoDiscovery Protocol (CDP) Serial (aux) and consoleports for local and remote administration Remote software download via TFTP and RCP IP over DCC for remote management of the Cisco ONS 15104 OC-48/STM-16 Optical Regenerator, where applicable
Physical Interfaces	Uplink Modules: 2-port single-mode OC-48c/STM16c DPT (SR 2 km (1.2 miles), IR 15 km (9.3 miles), LR1 40km (24 miles) and LR2 80km (50miles) Interface Modules—The Cisco 10720 Internet Router has two dedicated slots for interface modules—modulesare not interchangeable or hot swappable: • Upper slot is dedicated for DPT or POS Uplink module equipped withtwo physical ports of OC-48c/STM16c that provide an aggregate bandwidth of approximately 5 Gbps. The cards are available in two four versions of optics, short reach (SR) and intermediate reach (IR), Long Reach1 (LR1) and Long Reach2 (LR2) with two small form-factor OC-48 ports with LC connectors • A third option for the upperslot is the CON-AUX module, which is a depopulated uplinkcard equipped with Console and Auxiliary ports only; this allows the configuration of the 10720 as an "Ethernet Router" allowing the use of one or more of the Ethernet ports in the lower slot for network connectivity • Lower slot is dedicated for24-port Fast Ethernet module—available in TX (100 m reach), FX-MM (2 km reach) or FX-SM (15 km reach). The TX module is equipped with RJ-45 connectorswhile the FX-SM and FX-MM modules are equipped with MT-RJ connectors. • Also available is a combination 4 Gigabit Ethernetwith Small Form Factor Plug-able (SFP) Optics available in SX 550m and LH 10km plus an additional 8 Ports of Fast Ethernet 10/100 TX Copper ports. The TX and the FX-MM versions of the 24-port Fast Ethernet modules accommodate copper or multimode fiber deploymentswithin MTUs and the FX-SM allows for deployment of the Cisco 10720 Internet Router in a central location covering Ethernet connectivity to buildings for a radius of up to 15 km.
Dimensions	3.5 x 17.25 x 18.25 in. (8.9 x 43.81 x 46.35 cm)

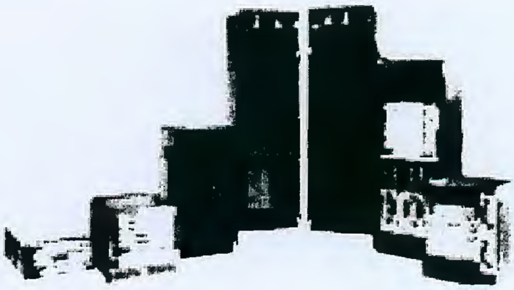
Cisco 12000 Series



The Cisco 12000 Series Internet Router is part of Cisco's family of multimillion packets-per-second (mpps) IP and MPLS routing platforms for building profitable networks in today's communications economy. The Cisco 12000 Series is the premier high-end routing platform for service provider backbone and edge applications, enabling service providers to meet the challenge of building packet networks to satisfy services demand while increasing profitability. The Cisco 12000 Series offers the only portfolio of 10 Gbps per slot systems and interfaces (including Packet over SONET [POS], Dynamic Packet Transport/Resilient Packet Ring [DPT/RPR], and Gigabit Ethernet [GbE]), delivering 10G economies of scale anywhere in the network. The Cisco 12000 Series provides the highest reliability, the richest set of service enablers, the lowest total cost of ownership, and the only proven investment protection, including systems that can be upgraded in the field to increase switching capacity. This innovative combination of features and capabilities enables service providers to build the most competitive IP and MPLS networks.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 12400 Internet Routers (10G)	• 10 Gbps/slot, from 80 to 320 Gbps of non-blocking switching capacity • Supportfor high-density, high-speedinterfaces: ATM, DPT/RPR, POS, GbE/FE ranging from channelized DS3 (to DS1) throughOC-192c/STM-64c • 4 10G platforms to choose from: 12416, 320 Gbps, 16 slots, 40 RU; 12410, 200 Gbps, 10 slots, 20 RU; 12406, 120 Gbps, 6 slots, 10 RU; 12404, 80 Gbps, 4 slots, 5 RU • Support for industry-leading QoS/CoS featuresideal for peering, transit, POP consolidation, and IDC bandwidth aggregation as well as latency-sensitive applicationslike voice and video • Support for IP or MPLS forwarding • Support for hundredsof thousandsof routes • Proven carrier- class reliabilityand availability throughenhancedfeatures such as Online Insertion and Removal, High Availability (RPR+, NSF and SSO) and APS/MPS
Cisco 12000 Internet Routers (2.5G)	• 2.5 Gbps/slot, from 40 to 80 Gbps switching capacity • Supportfor high-density, high-speedinterfaces: ATM, DPT/RPR, POS, GbE/FE ranging from channelized DS3 (to DS1) throughOC-48c/STM-16c • 3 chassis to choose from: 12016, 80 Gbps, 16 slots, 40 RU; 12012, 60 Gbps, 12 slots, 32 RU; 12008, 40 Gbps, 8 slots, 14 RU • The 12016 InternetRouter is upgradeableto 320 Gbps via an easy, field-installed switch fabric upgrade kit—no need to pull out existing line cards
Cisco 12000 Manager	• An element management solutionto increase service velocity and decrease operation costs

Key Features

- Proven investment protection, offering full forward compatibility for all line cards, and the only high-end system with a modular, replaceable switch fabric for field-installed capacity upgrades
- Only fully distributed system architecture scales to the edge, supporting backbone- or edge-optimized line cards in the same chassis
- Only platform that maximizes the value of line-rate edge applications with 10G uplinks. By deploying Cisco 12000 Series IP Services Engine (ISE) line cards in Cisco 12400 Internet Routers, Service Providers benefit from line cards optimized for edge applications, while removing the bandwidth bottleneck with full 10 Gbps uplinks using cost-effective VSR optics or 10 GbE for intra-POP connections.
- The only complete priority packet delivery solution set
- Industry's only complete IP QoS and congestion control implementation that uniquely enables premium real-time services such as VoIP and video. Its distributed architecture and class of service features such as priority based congestion control (WRED) and dedicated low latency queuing (MDRR), along with virtual output queuing (VoQ), eliminate head of line blocking (HOL) and maintain packet sequence integrity under all conditions
- Non-service—impacting online insertion and removal (OIR) of components (including switch fabric cards) and front accessibility reduce downtime and simplify maintenance
- High availability features such as Cisco Non Stop Forwarding (NSF) and Cisco Stateful Switchover (SSO) eliminate single points of failure, help maintain system performance, and prevent service interruption. With these features, packet forwarding remains uninterrupted before, during and after a route processor switchover on the Cisco 12000 Series. Coupled with OIR, the faulty route processor can be replaced without affecting operation
- Designed for NEBS compliance to meet service provider carrier-class requirements

Competitive Products

- Juniper: T640, M160, M40E, M40, and M20
- Avici: Stackable Switch Router (SSR)

8OC03/ATM/TS-IR-B	8-port OC03/STM1 ATM IR LC with SC connector
8OC03/ATM/TS-MM-B	8-port OC03/STM1 ATM MM LC with SC Connector
OC12/SRP-IR-SC-B	OC12 SRP IR line card
OC12/SRP-LR-SC-B	OC12 SRP LR line card
OC12/SRP-MM-SC-B	OC12 SRP MM line card
OC12/SRP-XR-SC	OC12 SRP single ring linecard, single mode 1550, XR
OC48/SRP-LR-SC-B=	OC48 SRP Rev-B Line Card, Single Mode, Long Reach
OC48/SRP-SR-SC-B=	OC48 SRP Rev-B Line Card, Single Mode, Short Reach, GSR
OC48E/POS-LR-SC-B=	1 Port OC-48c/STM-16c SONET/SDH 1550nm LR with SC
OC48E/POS-SR-SC-B=	1 Port OC-48c/STM-16c SONET/SDH 1310nm SR with SC, GSR
OC48X/POS-LR-SC	CONCATENATED OC48 WITH EXTENDED FEATURES LONG REACH
OC48X/POS-SR-SC	1 port OC48 POS Extended features
8OC3/POS-MM=	8 port OC3/STM1 SONET/SDH Multi-Mode LC with MTRJ conn Spare
8OC3/POS-SM=	8 port OC3/STM1 SONET/SDHSingle-Mode LC with LC conn Spare
1X10GE-LR-SC=	Cisco 12000 1-Port 10GE Card, 1310nm serial, 10km, SC
16OC3/POS-MM=	16 port OC3/STM1 SONET/SDH Multi-Mode LC with MTRJ conn
16OC3/POS-SM=	16 port OC3/STM1 SONET/SDH Single-Mode LC with LC conn Spare
16OC3X/POS-I-LC-B	16 PORT OC3 WITH EXTENDED FEATURES RELEASE B
EPA-GE/FE-BBRD	Cisco 12000 Modular GE Baseboard w/ 1GE and 3 EPA Slots
EPA-3GE-SX/LH-LC	Cisco 12000 3-Port GE Port Adapter for EPA-GE/FE-BBRD
3GE-GBIC-SC	GSR12000 three-port GE line card
GE-GBIC-SC-B	GSR12000 single port Gigabit Ethernet line card
GBIC-SX-MM	1000base-SX GBIC module, multimode,standardized for GSR12000
GBIC-LH-SM	1000base-LH GBIC module,singlemode,standardized for GSR12000
GBIC-ZX-SM	GBIC very long reach GBIC module for the GE line card
6CT3-SMB	Channelized T3for the GSR
GLC-LH-SM	GE SFP, LC connector LHtransceiver
GLC-SX-MM	GE SFP, LC connector SXtransceiver
6DS3-SMB-B	6DS3-SMB-B w/ ECC
6E3-SMB	E3 line card, 6 ports
12DS3-SMB-B	12DS3-SMB-B w/ ECC
12E3-SMB	E3 line card, 12 ports
CHOC12/STS3-IR-SC=	Channelized OC-12/STM-4 with four STS-3c/STM-1 POS paths
LC-OC12-DS3	1 port Channelize OC-12 with 12 DS3s
8FE-FX-SC-B	GSR 8-port 100baseFX, SC connector, version B
8FE-TX-RJ45-B	8-port 100baseTX, RJ45 connectortype, version B
OC192/POS-IR-SC	1 Port OC192c/STM64c POS, 1550nm IR, SC
OC192/POS-SR-SC	1 Port OC192c/STM64c POS, 1310nm SR, SC
OC192/POS-VSR	1 Port OC192c/STM64c POS, VSR Optics
OC192E/POS-VSR	1 Port OC192c/STM64c POS Edge Card, VSR Optics
OC192E/POS-IR-SC	1 Port OC192c/STM64c POS Edge Card, 1550nm IR, SC
OC192E/POS-SR-SC	1 Port OC192c/STM64c POS Edge Card, 1310nm SR, SC
OC192/SRP-VSR	1 Port OC192c/STM64c SRP Linecard, 850nm VSR, MTP
OC192/SRP-IR-SC	1 Port OC192c/STM64c SRP Linecard, 1550nm IR, SC
OC192/SRP-SR-SC	1 Port OC192c/STM64c SRP Linecard, 1310nm SR, SC

4GE-SFP-LC=	4 port-GE line card for Cisco 12000
Cisco 12000 Series Pluggable Optic Modules	
POM-OC48-LR2-LC	1-port OC-48/STM-16 Pluggable Optic Module, 1550nm SM-LR2 LC
POM-OC48-SR-LC	1-port OC-48/STM-16 Pluggable Optic Module, 1310nm SM-SR LC

Cisco SN 5400 Series Storage Router

The Cisco SN 5400 Series implements the iSCSI protocol to extend access of a Fibre Channel fabric and attached storage devices to IP servers. iSCSI (internet SCSI) combines the benefits of the TCP/IP protocol suite with SCSI, the universal standard for storage access. By utilizing iSCSI, the SN 5400 Series extends a Fibre Channel storage network to lower priced/lower performance servers in a data center and departmental servers located throughout the campus and enterprise. With the SN 5428, access to a Fibre Channel Storage Area Network (SAN) from anywhere on an IP network is as easy as accessing direct attached storage.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco SN 5428	• When a customer is moving from a DAS (Direct Attached Storage) environment to a SAN (Storage Area Network) and they do not already have a Fibre Channel switch, the SN 5428 provides a Fibre Channel switch and iSCSI ports to deliver a one system solution. • When the customer wants only a full function Fibre Channel switch, the SN 5428 is a very cost effective, low latency switch that will perfectly fit a Fibre Channel only implementation • When the customer has block level applications and wants to maintain block level access to shared storage combined with IP/Ethernet for a substantial reduction in attachment costs

Key Features

- Provides levels of security and access control beyond what is currently available in traditional storage area networks by including layer 2 and layer 3 protection to resist against unauthorized access to your storage resources
- Uses the TCP/IP protocol suite for storage networking which protects your existing investment in storage and networking infrastructure
- Fully integrates existing management and configuration tools
- Based on industry standards, maximizes your investment and enables you to reduce total cost of ownership for the increasing storage demands on your network
- Uniquely provides standard IP networking capabilities to storage environments
- SN 5428: Designed for high-availability providing continuous access to critical data; Extensive security features to protect valuable storage resources; and, Full breadth of iSCSI drivers

CHAPTER 2

LAN Switching

LAN Switching Products at a Glance

Product	Features	Page
Catalyst 2900 Series	Fixed-configuration Ethernet switches • 10/100 auto sensing and auto negotiating interface • Managed	2-3
Catalyst 2948G-L3	Fixed and Modular ports • Gigabit Ethernet over Fiber or Copper • High performance, Cisco Express Forwarding (CEF) Layer 2/3/4 switching up to 48 Mpps • Advanced network control with predictable performance, granular QoS, advanced security, comprehensive management	2-3
Catalyst 2900 Series XL—Modular Switches	Modular 10/100 Ethernet switches • 12 or 24 10/100 ports • 12 100BASE- FX ports (2912MF XL) • Two high-speed module slots accommodating 10/100, 100BASE-FX, Gigabit Ethernet (including 1000BASE-T), and GigaStack GBIC (2912MF XL and 2924M XL only) • Cisco switch clustering enabled • Managed	2-4
Catalyst 2950 Series	Fixed-configuration basic and Intelligent Ethernet 10/100 switches • 12/24/48 10/100 port managed switches with stackable and standalone models • Flexible uplink options: fixed 100Base FX, fixed 1000BaseT, fixed 1000BaseSX, and GBIC-based ports • Industrial-grade, rugged models (Catalyst 2955) for harsh environment deployments • Wire-speed, high performance switch • Models with the Standard Image software (SI) provide Layer 2 Cisco IOS functionality for basic data, voice, and video services at the edge of the network. • Models with the Enhanced Image software (EI) bring Layer 2-4 intelligent services such as advanced Quality of Service, rate limiting, security filtering and multicast management capabilities • Stackable up to 9 switches with Gigastack GBIC • Simplified network management through Cisco Cluster Management Suite up to 16 fixed configuration Catalyst switches	2-6
Catalyst 3500 Series XL	Fixed-configuration 10/100 and Gigabit Ethernet switches • 24 ports with 2 GBIC-based Gigabit Ethernet ports with in-line power(3524-PWR XL) • 8 GBIC-based ports (3508G XL) • Stackable up to 9 switches with GigaStack GBIC • Cisco Switch Clustering capable • Managed	2-10
Catalyst 3550 Series	Fixed-configuration Intelligent Ethernet switches in stackable 10/100, inline power, or Gigabit Ethernet configurations • Network control and bandwidth optimization via advanced Quality of Service (QoS), granular rate-limiting, Access Control Lists (ACLs), and multicast services • Network security through a wide range of authentication methods, data encryption technologies, and access restriction features based on users, ports, and MAC addresses • Network scalability through advanced routing protocols such as EIGRP, OSPF, BGP, and PIM (requires Enhanced Multilayer Software Image (EMI)) • Intelligent adaptability through Cisco Identity Based Networking Services (IBNS) offering greater flexibility and mobility to stratified users	2-12

Product	Features	Page
Catalyst 4500 Series-Modular Configuration (4503, 4506 and 4507R)	Modular, multilayer switch with integrated intelligent services for converged networks in enterprise campus wiring closets, Layer2/Layer3 distribution, and integrated LAN/WAN branch office. • Resilient architecture for mission critical applications • Up to 240 ports of Ethernet, Fast Ethernet or Gigabit Ethernet over Fiber or Copper • High performance, Cisco Express Forwarding (CEF) Layer 2/3/4 switching up to 48 Mpps • Up to 64 Gbps of switching capacity • Advanced network control with predictable performance, granular QoS, advanced security, comprehensive management • Managed	2-15
Catalyst 4000 Series—Fixed Configuration (4908G-L3 and 4912G)	High performance fixed Gigabit Ethernet switch with intelligent enterprise Cisco IOS services	2-17
Catalyst 5000 Family	Modular switch that supports a broad range of interfaces for aggregation of legacy technologies with IP technology • End of Sale Effective June 2003/End of Support effective 2008. For further information please contact your local sales representative	2-18
Catalyst 6500 Family	High-performance, multilayer switch with integrated intelligent services for enterprise campus backbones, server aggregation, or internet data centers • 10/100, 100FX Fast Ethernet, 1000BASE-T, 1000BASE-X, and Gigabit Ethernet modules • Layer 4-7 services • Up to 256 Gbps of switching capacity • Packet throughput scalable to 100+ Mpps • Managed	2-20
Catalyst 8500 Series	High-performance, modular, multimedia switch router • Wire speed, nonblocking IP, IPX, IP multicast Layer 3 switching • Multiple interface options • Managed	2-24

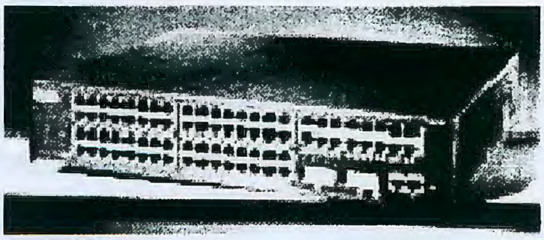
Cisco Catalyst 2900 Series



The Catalyst 2948G and 2980G deliver all the Ethernet switching needed for many small to medium-sized wiring closets in a single system without the need for additional modules, cables or other interconnects. Utilizing the same industry-leading software and functionality of the Catalyst 4000, 5000, and 6000 families, the Catalyst 2948G and 2980G have consistent end-to-end services, which ensure complete interoperability with enterprise Catalyst switches.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 2980G Series	• A single box solution without additional cables, modules or configuration • Up to 80 ports of wire-speed, non-blocking performance with large MTBF reliability • End-to-end VLANs, EtherChannel, multicasting, and security • Mature/proven Catalyst software compatibility in the wiring closet and data center
Catalyst 2948G Series	• The same features as 2980G but up to 48 ports of wire-speed, non-blocking performance
Catalyst 2948G-L3	• High performance CPU with Cisco IOS software • Dedicated 48 ports of 10/100 Mbps and two ports of 1000BASEX Gigabit Ethernet with gigabit Ethernet converter (GBIC) support; all ports support Layer 3 capability

Key Features

- Powerful non-blocking performance with proven Cisco IOS services
- Wire speed 18 Million pps switching throughput
- Intelligent multilayer IOS services (security, multicast, quality of service [QoS])
- Advanced multiple queue QoS architecture
- Security (TACACS+, RADIUS, port lockdown)
- Spanning-Tree Protocol (802.1D) with enhancements (UplinkFast, PortFast) for deterministic/fast failover
- Redundant Power Supply (option)

Competitive Products

- HP Procurve: 4108gl, 4000M
- 3Com: SS3300
- Nortel/Bay: BayStack 350T and 450T
- Extreme: Summit 48si

Cisco Catalyst 2900 Series XL—Modular Switches

Cisco's Catalyst 2900 Series XL is a full line of modular, 10/100 autosensing Fast Ethernet switches that combine outstanding performance, ease of use, and integrated Cisco IOS software.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 2912MF XL	• All-fiber switch to aggregate Fast Ethernet workgroups over 100BASE-FX connections in small and mid-size campus environments • High-speed uplinks to backbone or server via Fast Ethernet, Gigabit Ethernet
Catalyst 2924M XL	• Any combination of dedicated 10-Mbps or 100-Mbps connections to individual PCs, servers, and other systems or connectivity between existing Ethernet and Fast Ethernet workgroups • The option to easily increase the switch's port density and provide inexpensive high-speed uplinks through bandwidth aggregation (Fast EtherChannel and Gigabit EtherChannel technologies) • Gigabit Ethernet (including 1000BASE-T) modules for high-speed links • Hot swap insertion and removal of modules • Maximum flexibility

Key Features

- Switch fabric of 3.2 Gbps, a forwarding rate of more than 3.0 million packets per second, and a maximum forwarding bandwidth of 1.6 Gbps, delivering wire-speed performance across all 10/100 ports
- Support for IEEE 802.1p protocol for prioritization of mission-critical and time-sensitive applications such as voice and telephony traffic
- Cisco's switch clustering technology enables up to 16 interconnected Catalyst 1900, 2900 XL, and 3500 XL switches, regardless of geographic location, to form a flexible, single IP managed network
- Up to 250 port-based VLANs or ISL/802.1Q trunks
- Network port allows operation in networks with unlimited MAC addresses
- Autoconfiguration of multiple switches on a network from one boot server
- Up to 4 Gbps bandwidth between routers, switches, and servers with Fast EtherChannel and Gigabit EtherChannel technologies

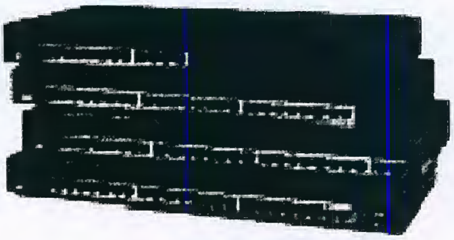
Cisco Catalyst 2950 Series Intelligent Ethernet Switches



The Catalyst 2950 Series with Intelligent Ethernet Switches are fixed-configuration, standalone and stackable models that provide wire-speed Fast Ethernet and Gigabit Ethernet connectivity for small, mid-sized, service provider and industrial networks. The 2950C-24, 2950T-24, 2950G-12-EI, 2950G-24-EI, 2950G-48-EI and 2950G-24-EI-DC are part of an affordable product line that brings intelligent services, such as advanced quality of service, rate-limiting, security filters, and multicast management, to the network edge-while maintaining the simplicity of traditional LAN switching. When a Catalyst 2950 Switch is combined with a Catalyst 3550 Series Switch, the solution is capable of enabling IP routing from the edge to the core of the network. These Intelligent Ethernet Switches come with Enhanced Image (EI) software configuration only.

In addition to the range of Intelligent Ethernet switches, the Catalyst 2950 Series also includes switches with Standard Image (SI) software configuration only. The Cisco Catalyst 2950SX-24, 2950-24 and 2950-12, members of the Cisco Catalyst 2950 Series Switches, are standalone, fixed-configuration, managed 10/100 switches with Gigabit uplinks (2950SX-24 only) providing user connectivity for small to mid-sized networks. These wire-speed desktop switches come with Standard Image (SI) software features and offer Cisco IOS functionality for basic data, video and voice services at the edge of the network.

The Catalyst 2950 Series also includes the Cisco Catalyst 2955T-12, 2955C-12, and 2955S-12. The Cisco Catalyst 2955 are industrial-grade switches that provide Fast Ethernet and Gigabit Ethernet connectivity for deployment in harsh environments. With a range of copper and fiber uplink options, the Catalyst 2955 operates in environments such as industrial networking solutions (industrial Ethernet deployments), intelligent transportation systems (ITSs), and transportation network solutions. It is also suitable for many military and utility market applications where the environmental conditions or suspended solid concentrations exceed the specifications of other commercial switching products.

Embedded in all the products in the Catalyst 2950 Series is the Cisco Cluster Management Suite (CMS) Software, which allows users to simultaneously configure and troubleshoot multiple Catalyst desktop switches using a standard Web browser.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 2950 Series Intelligent Ethernet Switches with Enhanced Image (EI)	• Layer 2/3/4 based services: Advanced QoS, Security, High availability and STP enhancements • Wire-speed performance • Advanced QoS, Security, High availability and STP enhancements • Cisco Cluster Management • Stackable • GBIC based uplink ports for media flexibility
Catalyst 2950G-48-EI	• Ideal for desktop connectivity • High Port Density
Catalyst 2950G-24-EI	• Ideal for desktop connectivity • Medium Port Density
Catalyst 2950G-24-EI-DC	• Ideal for Telco/DCN environments • NEBS compliant • Medium Port Density
Catalyst 2950G-12-EI	• Ideal for desktop connectivity • Low Port density
Catalyst 2950T-24	• High speed uplink flexibility with fixed 10/100/1000BaseT ports • Low price per port
Catalyst 2950C-24	• High speed uplink flexibility over extended distances with fixed 100BASE-FX connections using MT-RJ connectors • Low price per port
Catalyst 2950 Series with Standard Image (SI)	• Wire speed, high performance switches for delivering 10/100 Mbps speed connectivity to desktop PCs, servers and other systems • Layer 2-based QoS and Security features • Cisco Cluster Management • Ideal for desktop connectivity,
Catalyst 2950-12	• Low Port density
Catalyst 2950-24	• Medium port density
Catalyst 2950SX-24	• High speed uplinks with 2 fixed 1000BaseSX ports • Medium port density
Catalyst 2955 Series with Enhanced Image (EI)	• Ideal for harsh network environments • Rugged: Implements industrial-grade components, a compact form factor, convection cooling, and relay output signaling. Designed to operate at extreme temperatures and under extreme vibration and shock. • Layer 2/3/4 based services: Advanced QoS, Security, High availability and STP enhancements • Wire-speed performance
Catalyst 2955T-12	• Twelve 10/100 ports and two 10/100/1000BASE-TX (Copper) uplinks
Catalyst 2955C-12	• Twelve 10/100 ports and two 100BASE-FX (Multimode Fiber) uplinks
Catalyst 2955S-12	• Twelve 10/100 ports and two 100BASE-LX (Singlemode Fiber) uplinks

Key Features

- Cisco Cluster Management (CMS) Software offers superior manageability, ease-of-use and ease-of-deployment and enhanced configuration wizards
- Wire-speed performance in connecting end-stations to the LAN
- Catalyst 2950: Ideal for small- and mid-sized networks
- Catalyst 2955: Ideal for harsh network environments
- Sophisticated Multicast Management via IGMP Snooping
- Scalability and high availability features
- Support for Cisco Redundant Power System 300 (RPS 300)
- Switches with Standard Image (SI) include these additional features:
  - Catalyst 2950SX-24 switch provides a cost-effective solution for Gigabit speeds over fiber, offering 2 1000BaseSX uplinks
  - QoS and Security based on Layer 2 information
  - Basic Cisco IOS Services

- Intelligent Ethernet Switches with Enhanced Image (EI) include these additional features:
  - Catalyst 2950T-24 switch is a component of the Cisco Gigabit Ethernet over copper solution, offering 10/100/1000BaseT uplinks
  - Powerful Gigabit-uplink options—GBIC-based or 1000BaseT
  - Superior control through advanced intelligent services—advanced quality of service based on Layer 2 through Layer 4 parameters
  - Superior Security features: based on Layer 2 through Layer 4 Access Control Parameters
  - Enhanced Cisco IOS Services

Cisco Catalyst 3500 Series XL

The Cisco Systems Catalyst 3500 series XL is a scalable line of stackable 10/100 and Gigabit Ethernet switches that delivers premium performance, flexibility, and manageability with unparalleled investment protection. This line of low-cost, high-performance switching solutions provides next-generation stackable switching through an independent high-speed stacking bus that preserves valuable desktop ports. Cisco's breakthrough Switch Clustering technology expands the stacking domain beyond a single wiring closet, enabling up to 16 interconnected Catalyst 3550, 2950, 3500 XL, 2950, 2900 XL and 1900 switches—regardless of geographic location—to form a flexible, single IP managed network.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 3524-PWR XL	• A stackable, wire-speed 10/100 and Gigabit Ethernet switch for delivering dedicated 10 or 100 Mbps to individual users and servers • Advanced QoS, high availability, and integrated in-line power enabling easy deployment of IP phones and wireless access points.
Catalyst 3508G XL	• A stackable Gigabit Ethernet switch with eight GBIC-based ports for aggregating a group of Gigabit Ethernet switches and servers through Cisco GigaStack GBICs or standard 1000BASE-X GBICs • Dedicated, high-speed Gigabit Ethernet performance

Key Features

- 10.8 Gbps switch fabric, up to 8 Mpps forwarding rate, and maximum forwarding bandwidth of 5.4 Gbps across all 10/100 ports
- Built-in Gigabit Ethernet ports accommodate a range of GBIC transceivers, including the Cisco GigaStack GBIC, 1000BASE-T, 1000BASE-SX and 1000BASE-LX/LH GBICs, and 1000BASE-ZX extended reach GBIC
- Low-cost, 2-port Cisco GigaStack GBIC offers a range of configurable stacking and performance options by delivering 1-Gbps connectivity in a daisy-chained connection or up to 2-Gbps in a dedicated, switch-to-switch connection
- Support for IEEE 802.1p technology for prioritization of mission-critical and time-sensitive application such as voice and telephony traffic
- 3524-PWR XL provides in-line power to IP phones and other devices

Competitive Products

- 3Com: SuperStack 3 Switch 3300 and 3900
- Hewlett Packard: ProCurve 2524, 2424M, 4000, and 8000
- Nortel: BayStack 450T and BPS 2000 switches

Cisco Catalyst 3550 Series Intelligent Ethernet Switches

The Cisco Catalyst 3550 Series Intelligent Ethernet Switches is a line of enterprise-class, stackable, multilayer switches that provide high availability, scalability, security and control to enhance the operation of the network. With a range of Fast Ethernet and Gigabit Ethernet configurations, the Catalyst 3550 Series can serve as both a powerful access layer switch for medium enterprise wiring closets and as a backbone switch for small networks. Now customers can deploy network-wide intelligent services, such as advanced quality of service, rate-limiting, Cisco security access control lists, multicast management, and high-performance IP routing—while maintaining the traditional LAN switching.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 3550 Series	• Enterprise-class intelligent services such as ACLs, advanced QoS, and rate-limiting • Cisco Cluster Management
Catalyst 3550-48-EMI (Enhanced Multilayer Software Image)	• High performance advancedIP routing • High Port Density • Ideal as a powerful access layer switch for a medium enterprise wiring closet with routed uplinks
Catalyst 3550-48-SMI (Standard Multilayer Software Image)	• High Port Density • Ideal for a powerful access layer switch for a medium enterprise wiring closet • Basic IP routing
Catalyst 3550-24-EMI (Enhanced Multilayer Software Image)	• High performance advancedIP routing • Medium Port Density • Ideal for a powerful access layer switch for a medium enterprise wiring closet with routed uplinks
Catalyst 3550-24-SMI (Standard Multilayer Software Image)	• Medium Port Density • Ideal for a powerful access layer switch for a medium enterprise wiring closet • Basic IP routing
Catalyst 3550-24PWR-EMI (Enhanced Multilayer Software Image)	• High performance advancedIP routing • Medium Port Density • Integrated inlinepower to Cisco IP telephones and Cisco wireless LAN access points • Ideal for a powerful access layer switch for a medium enterprise wiring closet with routed uplinks
Catalyst 3550-24PWR-SMI (Standard Multilayer Software Image)	• Medium Port Density • Integrated inlinepower to Cisco IP telephones and Cisco wireless LAN access points • Ideal for a powerful access layer switch for a medium enterprise wiring closet • Basic IP routing
Catalyst 3550-24-DC-SMI (Standard Multilayer Software Image)	• Medium Port Density • DC powered, NEBS level 3 compliant • Basic IP routing
Catalyst 3550-24-FX-SMI (Standard Multilayer Software Image)	• Medium Port Density • Ideal for 100FX aggregation • Basic IP routing
Catalyst 3550-12G	• High performance IP routing • Gigabit Ethernet aggregation using fiber • Ideal for stack aggregation, server aggregation, or as a backbone switch in a mid-sized network
Catalyst 3550-12T	• High performance advancedIP routing • Gigabit Ethernet aggregation using Category 5 copper cabling • Ideal for stack aggregation, server aggregation, or as a backbone switch in a mid-sized network
CD-3550-EMI	• High performance advancedIP routing • EMI upgrade kit for standard versions of the Catalyst 3550-24, 3550-24 PWR, 3550-24-DC, 3550-24-FX, and 3550-48 switches

Key Features

- Network control and bandwidth optimization via advanced Quality of Service (QoS), granular rate-limiting, Access Control Lists (ACLs), and multicast services
- Network security through a wide range of authentication methods, data encryption technologies, and access restriction features based on users, ports, and MAC addresses
- Network scalability through advanced routing protocols such as EIGRP, OSPF, BGP, and PIM (requires Enhanced Multilayer Software Image (EMI))
- Intelligent adaptability through Cisco Identity Based Networking Services (IBNS) offering greater flexibility and mobility to stratified users
- Lower Total Cost of Ownership (TCO) for IP Telephony and Wireless LAN deployments through integrated inline power (Catalyst 3550-24 PWR only)
- Easy switch configuration and deployment of advanced services through the embedded Cluster Management Suite (CMS) Software
- Stackable up to 9 switches with the Gigastack GBIC

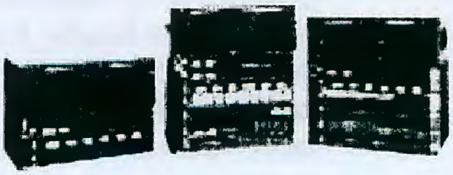
Cisco Catalyst 4500 Series



The Cisco Catalyst 4500 Series integrates nonblocking Layer 2/3/4 switching with optimal control, enabling business resilience for enterprise and metropolitan Ethernet customers deploying Internet-based business applications. A next generation Catalyst 4000 Series platform, the Cisco Catalyst 4500 Series includes three new chassis: Catalyst 4507R (7-slot: redundant Supervisor IV capable), Catalyst 4506 (6-slot) and Catalyst 4503 (3-slot). A key component of Cisco AVVID (Architecture for Voice, Video and Integrated Data), the Catalyst 4500 extends control to Enterprise wiring closets, branch office and Layer 3 distribution points. A variety of network infrastructure solutions are enabled by the Catalyst 4500 Series of switches including: Cisco IOS Network Services, IP Telephony, 10/100/1000 to the desktop, Wireless LAN, NetFlow Services and Metro Ethernet Switching.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 4507R	• When network resiliency via redundant Supervisor Engines is crucial to customer success • Port density up to 240-10/100, 100-FX, or 10/100/1000BASE-T with modular investment protection • Layer 2 and Layer 3 Cisco Express Forwarding (CEF)-based switching up to 64 Gbps, 48 Mpps
Catalyst 4506	• Port density up to 240-10/100, 100-FX, or 10/100/1000BASE-T with modular investment protection • Layer 2 and Layer 3 Cisco Express Forwarding (CEF)-based switching up to 64 Gbps, 48 Mpps
Catalyst 4503	• Port density up to 96-10/100, 100-FX, or 10/100/1000BASE-T with modular investment protection • Layer 2 and Layer 3 Cisco Express Forwarding (CEF)-based switching up to 28 Gbps, 21 Mpps

Note: Compatible sparing between Catalyst 4507R, 4506, and 4503 chassis provides investment protection with common power supplies and switching line cards. The Catalyst 4500 series also leverages the same feature set with identical software code base along with the same enterprise functionality as the Catalyst 6500 Series in the wiring closet, delivering a consistent end-to-end solution.

Key Features

- Supervisor II
  - Catalyst 4500/6500 Series CatOS Software, single IPQ—Address Management, and security (TACACS+, port lockdown, RADIUS, Kerberos)
  - Enterprise VLANs (4,096) with 802.1Q support on all ports, 16,000 MAC Addresses, and Spanning-Tree Protocol (802.1D) enhancements (UplinkFast, PortFast, and BackboneFast) for deterministic/fast failover
  - Fast and Gigabit EtherChannel aggregation (up to 8 Gbps full duplex), load balancing and failover on every port, and port filtering
- Supervisor IV
  - Capable of 1+1 redundancy in a 4507R (Single Supervisor only in Catalyst 4506 and 4503)
  - Optional NetFlow Services Card Support
  - Integrated Layer 2/3/4 CEF based switching at 64Gbps and 48Mpps
  - Feature rich and proven Cisco IOS Software
  - Port based enhanced QOS with multiple queues (16k input; 16k output), bandwidth management, policing and Access Control Lists (16k input ACL entries; 16k output entries)
  - Enterprise VLANs (4,000) with 802.1Q and ISL support on all ports, 32,000 MAC Addresses, and Spanning-Tree Protocol (802.1D), 802.3w, 802.3s

- Supports RIP I, RIP II, Open Shortest Path First (OSPF), Interior Gateway Routing Protocol (IGRP) Enhanced IGRP (EIGRP), BGP4, IS:IS, Software based IPX and Appletalk, Hot Standby Router Protocol (HSRP), Cisco Group Management Protocol (CGMP), IGMP v1 and II, Internet Control Message Protocol (ICMP), and both Protocol Independent Multicast (PIM) sparse and dense modes, and Distance Vector Multicast Routing Protocol (DVMRP) interoperability
- Optional compact flash memory cards

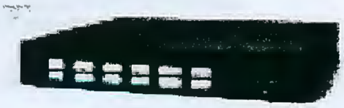
Cisco Catalyst 4000 Series — Fixed Configuration



Cisco offers two dedicated Gigabit Ethernet fixed configuration switches; the Catalyst 4908G-L3 and the Catalyst 4912G. The Catalyst 4908G-L3 Switch is a fixed configuration Layer 3 Ethernet switch featuring wire-speed switching for IP, IPX and IP Multicast. It provides the high performance required for midsize campus backbones with optimum port density.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 4908G	• Cost effective dedicated Gigabit Ethernet Layer 3 backbone solution ideal for deployment in midsize networks for those customers who need wire speed Layer 3 performance but do not require Gigabit Ethernet density over 8 ports.
Catalyst 4912G	• Advanced wirespeed, non-blocking Layer 2 Gigabit Ethernet performance wth intelligent Cisco IOS services and high-speed connections to workstations or servers; flexible Gigabit Interface Converter (GBIC) interfaces on all ports

Key Features

- Catalyst 4908G-L3:
  - 8 ports of 1000BASE x Gigabit Ethernet with GBIC support; Layer 3 switching and routing of IP, IPX and IP Multicast with wire speed Layer 2 switching for non routable protocols; Gigabit Etherchannel capability on every port
- Catalyst 4912G:
  - Wire-speed performance with 24 Gbps of dedicated bandwidth for nonblocking Gigabit Ethernet concentration, broad Gigabit EtherChannel availability, and GBIC flexibility on fiber port interfaces covering a wide range of cabling distances

Competitive Products

- Extreme Networks: Summit 1
- Foundry: Turbo Iron 8
- Nortel: Accellar 1200

Specifications

Cisco Catalyst 5000 Family

On October 4, 2002, Cisco Systems announced the end of sale for the Cisco Catalyst 5000 and 5500 series of modular switches, including all related Cisco Catalyst 5000 and 5500 series chassis and modules. The Cisco Catalyst 5000 and 5500 series chassis and modules will be orderable through June 30, 2003.

The Catalyst 5000 family features a Gigabit Ethernet and ATM-ready platform offering users high-speed trunking technologies, including Fast EtherChannel and OC-12 ATM. This series also provides a redundant architecture, dynamic VLANs, complete intranet services support, and media-rate performance with a broad variety of interface modules.

Migration Options

	When a Customer Needs These Features
Catalyst 6500 with Sup2/msfc2	• High Performance L3 wiring closet, data centre,or core feature sets • Integrated L2-7 Serices Modules • Layer 3 Routing Capabilities • Scalability to 256 Gbps • Hardware based QoS and ACLs • IOS software
Catalyst 6500 with Sup2/pfc2	• High Performance L2 wiring closet, data centreor core feature sets • Scalability to 256 Gbps • Hardware based QoS and ACLs
Catalyst 6500 with sup1A-2GE	• Low cost of entry wiring closet solution • Scalability to 32Gbps • Basic security and L2 QoS capabilities • L2 Stateful failover capabilities

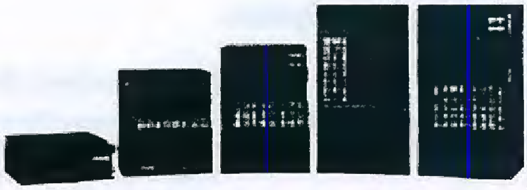
Cisco Catalyst 6500 Family



The Catalyst 6500 Family delivers highly available secure converged network services for the Enterprise and Service Provider networks. Designed to address the increased requirements for gigabit scalability, high-availability, rich services, and multilayer switching in backbone, distribution, and wiring closet topologies as well as datacenter environments, the Catalyst 6500 Family delivers exceptional scalability and price/performance, supporting a wide range of interface densities, performance, and integration of powerful service modules. The Catalyst Family delivers a wide range of intelligent switching solutions, enabling corporate intranets, extranets, and the internet for multimedia, mission-critical data, and voice applications.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 6500 Series	• A highly scalable platformthat meets requirements for a dynamic environment includingvery high multilayer switching performancewith high Fast Ethernet and Gigabit Ethernetport densities
Catalyst 6500 Family Solutions	• Enterprise campus distribution and core—Withindustry-leading port densities, performance, and high availability solutions • Enterprise Server Farm—For Gigabit wire-speed access to mission-critical server farms • High-capacitywiring closets—In very large deployments, the Catalyst 6000 family delivers advanced Layer 2, 3, and 4 switching in wiring closets • Value wiring closets where basic L2 QoS and ACL capabilities are required in addition to 2-3 Sec L2 Stateful failover • WAN/LAN/MAN integration—Single integated platform simplifies network design, decreases rack space requirements, and decreases overall administration costs • Advanced, integrated hardwae based firewall, contentswitching, intrusion detection, and network analysis capabilies • Service Provider Networks—For all dynamic environments including e-commerce, web hosting, and co-location facilities

Key Features

- Application-aware networking with multilayer switching intelligence and support for CiscoAssure policy networking
- High-availability features deliver maximum uptime for mission-critical application support
- Extensive Quality of Service (QOS) features to support mission-critical applications
- Scalable performance to 210 Mpps
- Maximum 10/100 Ethernet port density: 96 (3-slot chassis), 240 (6-slot chassis), 384 (9-slot chassis), and 576 (13-slot chassis)
- Maximum Gigabit Ethernet port density: 32 (3-slot chassis), 82 (6-slot chassis), 130 (9-slot chassis), and 194 (13-slot chassis)

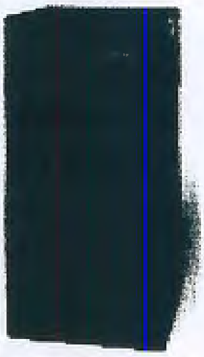
Cisco Catalyst 8500 Multiservice Switch Routers



The Catalyst 8500 family multiservice switch routers integrate multiservice ATM switching with wire-speed multiprotocol routing for Gigabit Ethernet and Fast Ethernet into a single platform that also supports advanced Cisco IOS services for QoS and security. This family delivers enterprise MAN/WAN and Service Provider multiservice edge solutions with scalable performance, lower cost of ownership, and offer multiple interface options in a modular chassis. The Catalyst 8500 series consists of the modular Catalyst 8510 (10-Gbps, 5-slot) switch and the modular Catalyst 8540 (40-Gbps, 13-slot) switch. Both switches implement Cisco IOS Software to provide a variety of network services including reliability, security, management, and QoS with CiscoAssure policy networking.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 8540 and Catalyst 8510	• Integrated 10/100 FE, GE, and ATM • Flexible ATM interfaces (T1/E1, IMA, DS3/E3, OC-3, OC-12, and OC-48) • Frame relay and circuit emulation services • Wire-speed performance • Multiservice MAN/WAN applications • Multiservice Edge solutions • Voice, data, and video solutions • MPLS VPN

Key Features

- Ideal for integrated multiservice ATM switching with wire-speed multiprotocol routing for gigabit Ethernet (L3eATM or Layer 3 enabled ATM)
- Ideal for aggregating multiprotocol traffic from multiple wiring closets or from workgroup switches such as the Catalyst 5000 or distribution/server aggregation switches such as the Catalyst 6000 Family
- Provides nonblocking routing for IP, IPX, and IP multicast while also offering wire-speed Layer 2 switching for nonroutable protocols such as NetBIOS and DECnet local-area transport (LAT)
- Aggregate throughput of up to 24 million packets per second (pps) for non-blocking, wirespeed Layer 3 switching

Competitive Products

- Foundry: Big Iron
- Lucent: PSAX 1250 and 2300
- Marconi: ASX 1000, 1200, and 4000

Wireless LAN Products

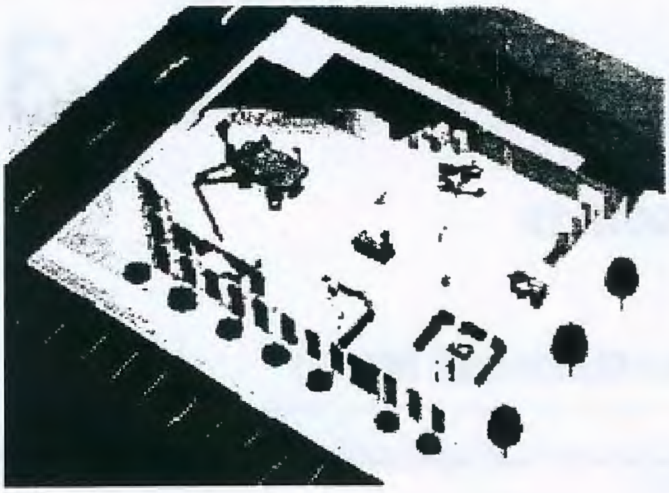
Wireless LAN Products at a Glance (IEEE 802.11b)

Product	Features	Page
Cisco Aironet 1200 Series Access Points	• Offers investment protection and a smooth migration path to future technologies through a dual band radio design • Delivers an enterprise class security solution with the IEEE 802.11x-based Cisco Wireless Security Suite • Industry-leading security, network management, throughput and software feature set • Support for both line power over Ethernet and localpower	3-2
Cisco Aironet 1100 Series Access Point	• Single 802.11b radio, upgradable to 802.11g • Provides end-to-endsolution support for Intelligent NetworkServices • Delivers an enterprise class security solution with the IEEE 802.11x-based Cisco Wireless Security Suite • Support for both line power over Ethernet and local power • Cost effective, yet feature-rich	3-5
Cisco Aironet 5 GHz 54 Mbps Wireless LAN Client Adapter	• IEEE 802.11a-compliant CardBus adapterthat operatesin the UNII-1 and UNII-2 bands • Complementsthe Cisco Aironet 1200 Series 802.11a Access Point, providing a solution that combines performance and mobility with the security and manageability that enterprises require	3-6
Cisco Aironet 350 Series Client Adapters	• Superior range and throughput • Secure networkcommunications • World mode for internationalroaming • PCMCIA card and PCI form factors • IEEE 802.11b	3-8
Cisco Aironet 350 Series Workgroup Bridge	• Driverless installation of up to eight Ethernet-enabled devices • Optimum wireless performance and range • Standards-based centralized security • IEEE 802.11b	3-10
Cisco Aironet 350 Series Wireless Bridge	• High-speed, high-power radios, delivering building-to-building links of up to 25 miles (40.2 km) • A metal case for durability and plenum rating • Supports both pointto-point and point-to-multipoint configurations • Broad range of support antennas • Simplified installation, improved performance, and upgradeablefirmware, ensuring investment protection • IEEE 802.11b	3-12
Cisco Aironet Antennas and Accessories	• A wide array of options • FCC-approved directional and omni-directional antennas • Low-loss cable, mounting hardware, and other accessories available	3-14
CiscoWorks Wireless LAN Solution Engine	A hardware-based wireless LAN managementsolution that provides template-based configuration with user-defined groupsto effectively manage a large numberof accesspoints and bridges. • Monitors LEAP authentication servers • Enhancessecurity management through misconfiguration detection on acces points and bridges	9-23

CHAPTER 3 WIRELESS LAN PRODUCTS

Af

Sample Wireless LAN Solution Overview—In-Building or Site-to-Site



Enterprise, Small/Medium Business Applications

Service common areas for mobile workers
Support employees working in multiple offices
Cost effective, quick network deployment for temporary or leased offices

Sample Vertical Markets

Healthcare, retail, government
Public Access
Multiple Tenant/Dwelling Units
Airports, Hotels, Convention Centers
Education:K-12 and Universities

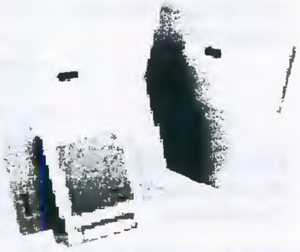
Cisco Aironet 1200 Series Access Points



The Cisco Aironet 1200 Series Access Point sets the enterprise standard for next-generation high performance secure, manageable, and reliable wireless local-area networks (WLANs) while also providing investment protection because of its upgrade capability and compatibility with current standards. The modular design of the Cisco Aironet 1200 supports IEEE 802.11a and 802.11b technologies in both single-and dual-mode operation. You can configure the Cisco Aironet 1200 to meet customer-specific requirements at the time of purchase and then reconfigure and upgrade the product in the field as these requirements evolve.

The Cisco Aironet 1200 Series protects current and future network infrastructure investments. Compliant with IEEE 802.11a and 802.11b standards, The 802.11a radio supports data rates of up to 54 Mbps and eight non-overlapping channels that offer high performance as well as maximum capacity and scalability. The 802.11b radio provides data rates up to 11 Mbps and three non-overlapping channels to support widely deployed 802.11b clients. The Mini-PCI form factor of the 802.11b radio allows for upgrade to higher-speed 2.4 GHz technologies such as the draft IEEE 802.11g standard.The Cisco Aironet 1200 Series extends end-to-end intelligent networking to the wireless access point with support for enterprise-class virtual LANs (VLANs) and quality of service (QoS). An ideal choice for enterprise installations, the Cisco Aironet 1200 Series can manage up to 16 VLANs, which allows customers to differentiate LAN policies and services, such as security and QoS, for different users. Traffic to and from wireless clients with varying security capabilities can be segregated into VLANs with varying security policies.

Wireless LAN security is a primary concern. The Cisco Aironet 1200 Series secures the enterprise network with a scalable and manageable system featuring the award-winning Cisco Wireless Security Suite. Based on the 802.11x standard for port-based network access, the Cisco Wireless Security Suite takes advantage of the Extensible Authentication Protocol (EAP) framework for user-based authentication.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 1200 Series Access Point	• IT Professionals or business executives want mobility within the enterprise to increase productivity, as an addition or alternative to wired networks. • Business owners or IT directors need flexibility for frequent LAN wiring changes, either throughout the site or in selected areas. • Any company whose site is not conducive to LAN wiring because of building or budget limitations, such as older buildings, leased space or temporary sites.

Key Features

- Offers investment protection because of its upgrade capability and compatibility with current standards
- Delivers an enterprise class security solution with the IEEE 802.11x-based Cisco Wireless Security Suite
- Industry-leading security, network management, and software feature set
- Support for both inline power over Ethernet or local power
- Simultaneous support for both IEEE 802.11b and IEEE 802.11a

Specifications

Feature	Cisco Aironet 1200 Series Access Points with 802.11a radio installed	With 802.11b radio installed	With both 802.11a and 802.11b radio installed
Data Rates Supported	6, 9, 12, 18, 24, 36, 48, 54 Mbps	1, 2, 5.5, and 11 Mbps	Same as 802.11a and 802.11b combined
Uplink	Autosensing 802.3 10/100BaseT Ethernet	Autosensing 802.3 10/100BaseT Ethernet	Same as 802.11a and 802.11b combined
Form Factor	CardBus (32-bit)	Mini-PCI	Same as 802.11a and 802.11b combined
Frequency Band	5.15 to 5.35 GHz (FCC UNII 1 and UNII 2), 5.15 to 5.25 GHz (TELEC),5.15 to 5.25 GHz (Singapore),5.25 to 5.35 GHz (Taiwan)	2.412 to 2.462 GHz (FCC),2.412 to 2.472 GHz (ETSI),2.412 to 2.484 GHz (TELEC),2.412 to 2.462 GHz (MII),2.422 to 2.452 GHz (Israel)	Same as 802.11a and 802.11b combined
Wireless Medium	Orthogonal Frequency Division Multiplexing (OFDM)	Direct Sequence Spread Spectrum (DSSS)	Same as 802.11a and 802.11b combined
Modulation	(OFDM subcarrier);BPSK @ 6 and 9 Mbps; QPSK @ 12 and 18 Mbps; 16-QAM @ 24 and 36 Mbps;64-QAM @ 48 and 54 Mbps	DBPSK @1 Mbps; DQPSK @ 2 Mbps; CCK @ 5.5 and 11 Mbps	Same as 802.11a and 802.11b combined
Operating Channels	FCC: 8;TELEC (Japan): 4; Singapore: 4; Taiwan: 4	ETSI: 13; Israel: 7; North America: 11; TELEC (Japan): 14; MII: 11	Same as 802.11a and 802.11b combined
Nonoverlapping Channels	Eight (FCC only); Four (Japan, Singapore, Taiwan)	Three	Eleven
Available Transmit Power Settings[1]	40 mW (16 dBm);20 mW (13 dBm);10 mW (10 dBm);5 mW (7 dBm); Maximum power setting will vary according to individual country regulations.	100 Mw (20 dBm); 5 Mw (17 dBm); 30 mW (15 dBm); 20 mW (13 dBm); 5 mW (7 dBm); 1 mW (0 dBm); Maximum power setting will vary according to individual country regulations	Same as 802.11a and 802.11b combined
Range (typical @ maximum power setting, 2.2 dBi gain diversity dipole antenna)	Omni directional Antenna: Indoor: 60 ft (18m)@ 54 Mbps, 130 ft (40m) @ 18 Mbps, 170 ft (52m) @ 6 Mbps; Outdoor: 100 ft (30m) @ 54 Mbps, 600 ft (183m) @ 18 Mbps, 1000 (304m) ft @ 6 Mbps; Patch Antenna: Indoor: 70 ft (21m) @ 54 Mbps, 150 ft (45m) @ 18 Mbps, 200 ft (61m) @ 6 Mbps; Outdoor: 120 ft (36m) @ 54 Mbps, 700 ft (213m) @ 18 Mbps; 1200 ft (355m) @ 6 Mbps	IIndoor:130 ft (40m) @ 11 Mbps; 350 ft (107m) @ 1 Mbps Outdoor: 800 ft (244m) @ 11 Mbps; 2000 ft (610m) @ 1Mbps	Same as 802.11a and 802.11b combined
SMTP Compliance	MIB I and MIB II	MIB I and MIB II	MIB I and MIB II
Antenna	Integrated 6 dBi diversity patch (55 degree horizontal, 55 degree vertical beamwidths, 5 dBi diversity omnidirectional with 360 degree horizontal and 40 degree vertical beamwidths	Two RP-TNC connectors (antennas optional, none supplied with unit)	5 GHz: Integrated 6 dBi diversity patch (55 degree horizontal, 55 degree vertical beamwidths, 5 dBi diversity omnidirectional with 360 degree horizontal and 40 vertical beamwidths; 2.4 GHz: Two RP-TNC connectors (antennas optional, none supplied with unit)

Cisco Aironet 1100 Series Access Points

The Cisco Aironet® 1100 Series Access Point provides a secure, affordable, and easy-to-use wireless LAN solution that combines mobility and flexibility with the enterprise-class features required by networking professionals.

Taking advantage of the Cisco Wireless Security Suite for the strongest enterprise security available and of Cisco IOS® Software for ease-of-use and familiarity, the Cisco Aironet 1100 Series Access Point delivers manageability, performance, investment protection, and scalability in a cost-effective package with a low total cost of ownership. The Cisco Aironet 1100 Series features a single, upgradable 802.11b radio, integrated diversity dipole antennas, and an innovative mounting system for easy installation in a variety of locations and orientations.

The first access point based on Cisco IOS Software, the Cisco Aironet 1100 Series extends end-to-end intelligent networking to the wireless access point. Cisco command-line interface (CLI) allows customers to quickly and consistently implement extended capabilities available in Cisco IOS Software. Customers can manage and standardize their networks using tools they have developed internally for their Cisco routers and switches.

Enterprise-class features including virtual LANs (VLANs), quality of service (QoS), and proxy mobile Internet Protocol (IP) make the Cisco Aironet 1100 Series ideal for enterprise installations. The Cisco Aironet 1100 Series also supports standard Cisco Aironet features such as hot-standby and load balancing, allowing enterprises to implement intelligent, reliable network services.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 1100 Series Access Point	• A cost-effective and upgradable WLAN solution that combines the mobility and flexibility of a WLAN solution with the enterprise-class features required by a business LAN. Want an off the shelf WLAN solution that does not require simultaneous dual band operation, or the additional range offered by high-gain antennas.

Key Features

- Single 802.11b radio, upgradable to 802.11g
- Provides end-to-end solution support for Intelligent Network Services
- Variety of mounting options
- Cost effective, yet feature-rich

Specifications

Feature	Cisco Aironet 1100 Series Access Points
Data Rates Supported	1, 2, 5.5, 11 Mbps
Network standard	IEEE 802.11b
Uplink	Autosensing 802.3 10/100BaseT Ethernet
Frequency Band	2.412 to 2.462 GHz (FCC); 2.412 to 2.472 GHz (ETSI); 2.422 to 2.452 GHz (Israel); 2.412 to 2.484 GHz (TELEC)
Network architecture type	Infrastructure, star topology
Wireless Medium	Direct Sequence Spread Spectrum (DSSS)
Modulation	DBPSK @ 1 Mbps; DQPSK @ 2 Mbps; CCK @ 5.5 and 11 Mbps
Operating Channels	ETSI: 13; Israel: 7; Americas: 11; TELEC (Japan): 14
Nonoverlapping Channels	Three
Receive sensitivity	1 Mbps: -94 dBm; 2 Mbps: -91 dBm; 5.5 Mbps: -89 dBm;11 Mbps: -85 dBm

Feature	Cisco Aironet 1100 Series Access Points
Available Transmit Power Settings[1]	100 mW (20 dBm); 50 mW (17 dBm); 30 mW (15 dBm); 20 mW (13 dBm); 5 mW (7 dBm); 1 mW (0 dBm) Maximum power setting will vary according to individual country regulations
Range (typical @ maximum power setting, 2.2 dBi gain diversity dipole antenna)	Indoor: 150 ft (45 m) @ 11 Mbps; 400 ft (122 m) @ 1 MbpsOutdoor: 800 ft (244 m) @ 11 Mbps; 2000 ft (610 m) @ 1 Mbps
SMTP Compliance	MIB I and MIB II
Antenna	Integrated 2.2 dBi diversity dipole antennas
Security architecture client authentication	Cisco Wireless Security Suite including:Authentication: 802.11x support including LEAP, PEAP, EAP-TLS, EAP-TTLS and EAP-SIM to yield mutual authentication and dynamic, per-user, per-session WEP keys; MAC address and by standard 802.11 authentication mechanisms Encryption: Support for static and dynamic IEEE 802.11 WEP keys of 40 bits and 128 bits; Pre-standard TKIP WEP enhancements: key hashing (per-packet keying), message integrity check (MIC) and broadcast key rotation
Software Image Network and Inventory support	CiscoWorks CiscoView, Resource Manager Essentials, and Campus Manager
Remote configuration support	BOOTP, DHCP, Telnet, HTTP, FTP, TFTP, and SNMP
Dimensions	4.1 in. (10.4 cm) wide; 8.1 in. (20.5 cm) high; 1.5 in. (3.8 cm) deep
Weight	10.5 oz. (297 g)
Environmental	32° to 104° F (0° to 40° C); 10-90% humidity (noncondensing)
System Memory	16 MB RAM; 8 MB Flash
Input Power Requirements	100 to 240 VAC 50 to 60Hz (power supply); 33 to 57 VDC (device)
Power Draw	4.9 watts, RMS
Warranty	One year

Cisco Aironet 5 GHz 54 Mbps Wireless Client Adapter

The Cisco Aironet® 5 GHz 54 Mbps Wireless LAN client adapter is an Institute of Electrical and Electronic Engineers (IEEE) 802.11a-compliant CardBus adapter that operates in the UNII-1 and UNII-2 bands. The client adapter complements the Cisco Aironet 1200 Series 802.11a Access Point, providing a solution that combines performance and mobility with the security and manageability that enterprises require.

Wireless LAN client adapters can increase productivity by enabling mobile users to have network and Internet access anywhere within a building that is equipped with a wireless network infrastructure. Wireless client adapters connect a variety of devices to a wireless network either in ad hoc peer-to-peer mode or in infrastructure mode with access points. With this client adapter, you can quickly add new employees to a network, support temporary workgroups, or enable Internet access in conference rooms or other meeting spaces. And the Cisco Aironet client solution is easy to use, making the benefits of wireless mobility completely transparent.

With Cisco, you can confidently deploy a wireless solution that provides robust enterprise-class security. All Cisco Aironet products feature the award-winning Cisco Wireless Security Suite, which is based on the IEEE 802.11x standard for port-based network access.

The Cisco Wireless Security Suite takes advantage of the Extensible Authentication Protocol (EAP) framework for user-based authentication. It supports a variety of 802.11x authentication types including EAP Cisco Wireless (LEAP) and EAP-Transport Layer Security (EAP-TLS).

The Cisco Aironet Client Utility (ACU), with an intuitive graphical user interface, provides an easy way to configure, monitor, and manage the Cisco Aironet 5 GHz Wireless LAN Client Adapter. The ACU includes site-survey tools that present easy-to-understand detailed graphical information to assist in the placement of access points. Profile Manager allows you to create specific profile settings for various environments, such as the office or home, making it simple for telecommuters and business travelers to move from one environment to another.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 5 GHz 54Mbps Wireless LAN Client Adapters	• Industry leading security: IEEE 802.11x support, including LEAP and EAP-TLS, for mutual authentication and dynamic per-user, per session WEP keys • Multiple transmit power settings (20 mW/(13 dBm), 10 mW/(10 dBm), and 5 mW (7 dBm) • End-to-end Cisco branded solution

Key Features

- IEEE 802.11a-compliant CardBus adapter that operates in the UNII-1 and UNII-2 bands
- Complements the Cisco Aironet 1200 Series 802.11a Access Point, providing a solution that combines performance and mobility with the security and manageability that enterprises require

Specifications

Feature	Cisco Aironet 5 GHz 54 Mbps Wireless Client Adapter
Form Factor	CardBus Type II
Interface	32-bit CardBus (PCI)
Operational voltage	3.3 V (+/- 0.33 V)
LED	Status (green) and Activity (amber)
Data Rates Supported	6, 9, 12, 18, 24, 36, 48, 54 Mbps (configurable as fixed or auto selecting to extend range)
Network Standard	IEEE 802.11a
Frequency Band	5.15 to 5.35 GHz (FCC UNII 1 and UNII 2); 5.15 to 5.25 GHz (TELEC); 5.15 to 5.25 GHz (Singapore); 5.25 to 5.35 GHz (Taiwan)
Network architecture type	Infrastructure, star topology
Media Access Protocol	Carrier sense multiple access with collision avoidance (CSMA/CA)
Wireless Medium	Orthogonal Frequency Division Multiplexing (OFDM)
Modulation	(OFDM sub-carrier); BPSK @ 6 and 9 Mbps; QPSK @ 12 and 18 Mbps; 16-QAM @ 24 and 36 Mbps; 64-QAM @ 48 and 54 Mbps
Operating Channels	FCC: 8 channels (UNII-1 4 channels and UNII-2 4 channels); 4 channels for Japan, Singapore, and Taiwan
Available Transmit Power Settings[1]	20 mW (13 dBm);10 mW (10 dBm); 5 mW (7 dBm) Maximum power setting will vary according to individual country regulations.
Current steady state (typical)	Transmit: 520 mA; Receive: 580 mA; Sleep: 20 mA
Range	Omni directional Antenna: Indoor: 60 ft (18m)@ 54 Mbps, 130 ft (40m) @ 18 Mbps, 170 ft (52m) @ 6 Mbps Outdoor: 100 ft (30m) @ 54 Mbps, 600 ft (183m) @ 18 Mbps, 1000 (304m) @ 6 Mbps Patch Antenna: Indoor: 70 ft (21m) @ 54 Mbps, 150 ft (45m) @ 18 Mbps, 200 ft (61m) @ 6 Mbps Outdoor: 120 ft (36m) @ 54 Mbps, 700 ft (213m) @ 18 Mbps, 1200 ft (355m) @ 6 Mbps
Power Management	3 levels of power consumption available, including: CAM (Constantly Awake Mode), Fast PSP (Power Save Mode), Max PSP (Maximum Power Savings)
Antenna	Integrated 5dBi gain patch antenna

Feature	Cisco Aironet 5 GHz 54 Mbps Wireless Client Adapter
Security architecture client authentication	Cisco Wireless Security Suite including: Authentication: 802.11x support for LEAP and EAP-TLS to yield mutual authentication and dynamic, per-user, per-session WEP keys; MAC address and by standard 802.11 authentication mechanisms Encryption: Support for static and dynamic IEEE 802.11 WEP keys of 40 bits and 128 bits; Pre-standard TKIP WEP enhancements: key hashing (per-packet keying), message integrity check (MIC) and broadcast key rotation
Drivers	Windows, 98/98SE, Windows ME, Windows 2000 and Windows XP
Environmental	-30° to 70°C; 95% humidity (noncondensing)
Warranty	One year

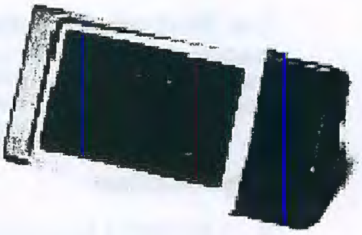
Cisco Aironet 350 Series Client Adapters



Wireless client adapters are the key to adding mobility and flexibility to an enterprise—increasing productivity by enabling users to have network and Internet access anywhere within a building without the limitation of wires. The Cisco Aironet 350 Series 802.11b Client Adapters are a complement to Aironet 350 Series infrastructure devices, providing an enterprise-ready solution that combines mobility with the performance, security, and manageability that people have come to expect from Cisco. Wireless client adapters connect a variety of devices to a wireless network either in ad hoc peer-to-peer mode or in infrastructure mode with Access Points. Available in PC Card (PCMCIA) and Peripheral Component Interconnect (PCI) form factors, Cisco Aironet 350 Series Client Adapters quickly connect desktop and mobile computing devices wirelessly to all network resources. With this product, you can instantly add new employees to the network, support temporary workgroups, or enable Internet access in conference rooms or other meeting spaces.

Cisco Aironet 350 Series Client Adapters deliver superior range, reliability, and performance for business users needing information access anytime, anywhere. Combined with Cisco Aironet unique security services, this product ensures that business-critical information is secure. Most importantly, the Cisco client solution is easy to use, making the benefits of wireless mobility completely transparent.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 350 Series Client Adapters	• IT Professionals or business executives want mobility within the enterprise to increase productivity, as an addition or alternative to wired networks. • Business owners or IT directors need flexibility for frequent LAN wiring changes, either throughout the site or in selected areas. • Any company whose site is not conducive to LAN wiring because of building or budget limitations, such as older buildings, leased space or temporary sites.

Key Features

- Superior range and throughput for IEEE 802.11b networks
- Secure network communications
- World mode for international roaming
- Full-featured utilities for easy configuration and management
- Compliance with the IEEE 802.11b high-rate standard
- Support for all popular operating systems

Specifications

Feature	Cisco Aironet 350 Series Client Adapters
Data Rates Supported	1, 2, 5.5, and 11 Mbps
Network Standard	IEEE 802.11b
System Interface	AIR-PCM35x: PC Card (PCMCIA) Type II AIR-PCI 35x: peripheral component interconnect (PCI) Bus
Frequency Band	2.4 to 2.4897 GHz
Network Architecture Types	Infrastructure and ad hoc
Wireless Medium	Direct Sequence Spread Spectrum (DSSS)
Media Access Protocol	Carrier sense multiple access with collision avoidance (CSMA/CA)
Modulation	DBPSK @1 Mbps; DQPSK @ 2 Mbps; CCK @ 5.5 and 11 Mbps
Operating Channels	North America: 11; ETSI: 13; Japan: 14
Nonoverlapping Channels	Three
Receive Sensitivity	1 Mbps: -94 dBm 2 Mbps: -91 dBm 5.5 Mbps: -89 dBm 11 Mbps: -85 dBm
Delay Spread	1 Mbps: 500 ns; 2 Mbps: 400 ns; 5.5 Mbps: 300 ns; 11 Mbps: 140 ns
Available Transmit Power Settings[1]	100 mW (20 dBm); 50 mW (17 dBm); 30 mW (15 dBm); 20 mW (13 dBm); 5 mW (7 dBm); 1 mW (0 dBm)
Range (typical)	Indoor: 130 ft (40 m) @ 11 Mbps; 350 ft (107 m) @ 1 Mbps Outdoor: 800 ft (244 m) @ 11 Mbps; 2000 ft (610 m) @ 1 Mbps
Compliance	Operates license free under FCC Part 15 and complies as a Class B device; complies with DOC regulations; complies with ETS 300.328, FTZ 2100, and MPT 1349 standards
Operating Systems Supported	Windows 95, 98, NT 4.0, 2000, ME, XP, CE 2.11, CE 3.0, Mac OS 9.x, and Linux
Antenna	AIR-PCM35x: Integrated diversity dipoles AIR-LMC35x: Two MMCX connectors (antennas optional, none supplied with unit) AIR-PCI35x: External, removable 2.2 dBi Dipole with RP-TNC Connector
Encryption Key Length	128-bit
Authentication Type	EAP-Cisco Wireless LEAP
Status Indicators	Link Status and Link Activity
Dimensions (W x D x H)	AIR-PCM35x: 2.13 in. (5.4 cm) x 4.37 in. (11.1 cm) x 0.1 in. (0.3 cm) AIR-LMC35x: 2.13 in. (5.4 cm) x 3.31 in. (8.4 cm) x 0.1 in. (0.3 cm) AIR-PCI35x: 6.6 in. (16.8 cm) x 3.9 in. (9.8 cm) x .5 in. (1.3 cm)
Weight	AIR-PCM35x: 1.6 oz (45g) AIR-LMC35x: 1.4 oz (40g) AIR-PCI35x: 4.4 oz (125g)
Environmental	AIR-PCM35x and AIR-LMC35x: -22° to 158° F (-30° to 70° C) AIR-PCI35x: 32° to 131° F (0° to 55° C) 10 to 90% (noncondensing)
Input Power Requirements	+5 VDC =/- 5%
Typical Power Consumption (at 100 mW transmit power setting)	Transmit: 450 mA; Receive: 270 mA; Sleep mode: 15 mA

[1] Maximum power setting will vary according to individual country regulations.

Selected Part Numbers and Ordering Information[1]

Cisco Aironet 350 Series Client Adapters

AIR-PCM352	350 Series PC Card with Diversity Antennas & 128-bit WEP
AIR-PCI352	350 Series PCI Card with 2.2 dBi Dipole Antenna & 128-bit WEP

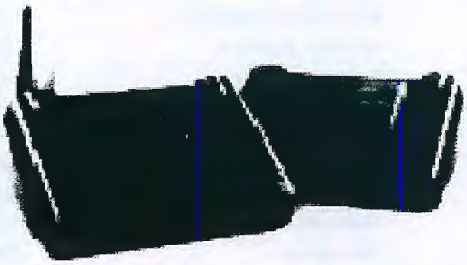
Cisco Aironet 350 Series Workgroup Bridge



Designed to meet the needs of remote workgroups, satellite offices, and mobile users, the Cisco Aironet 350 Series Workgroup Bridge brings the freedom and flexibility of wireless connectivity to any Ethernet-enabled device. The 802.11b workgroup bridge quickly connects up to eight Ethernet-enabled laptops or other portable computers to a wireless LAN (WLAN), providing a link from these devices to any Cisco Aironet Access Point (AP) or Wireless Bridge (line-of-sight).

Any Ethernet-ready device, including printers, copiers, PCs, point-of-sale devices, or monitoring equipment, can be placed directly at the point of work using the workgroup bridge—without the expense or delay of cabling. For temporary classrooms or temporary office space, the workgroup bridge provides flexible, easy network access for up to eight devices through the use of a standard eight-port Ethernet hub. Equipment can be easily moved as workgroups change in number or location, lowering facilities costs.

The Cisco Aironet 350 Series Workgroup Bridge supports Wired Equivalent Privacy (WEP) security architecture and provides up to 128-bit encryption. The Cisco Aironet security architecture is based upon an IEEE 802.11x standard utilizing the Extensible Authentication Protocol (EAP), an open standard that enables wireless manufacturers and RADIUS server vendors to independently develop interoperable hardware and software. For authentication of devices attached to the workgroup, a username and password may be stored in the workgroup bridge in either static or dynamic memory. When authenticated, the workgroup bridge receives a single-session, single-user encryption key from the Remote Access Dial-In User Service (RADIUS) server via the associated AP. With this centralized and standards-based architecture, wireless security scales to meet the requirements of any enterprise.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 350 Series Workgroup Bridge	• Connectivity to a network for remote workgroups located in an area that may be difficult or not practical for wiring. • Supports up to eight Ethernet-based devices (with use of Ethernet hub)

Key Features

- Driverless installation of up to eight Ethernet-enabled devices
- Optimum wireless performance and range
- Standards-based centralized security
- Two versions for a range of application requirements
- Full-featured utilities and robust management

Specifications

Feature	Cisco Aironet 350 Series Workgroup Bridge
Data Rates Supported	1, 2, 5.5, and 11 Mbps
Client Interface	10BaseT Ethernet
Clients Supported	Direct: One Via hub: Eight
Network Architecture Types	Infrastructure (via Cisco Aironet Access Point or Bridge)
Frequency Band	2.4 to 2.4897 GHz
Wireless Medium	Direct Sequence Spread Spectrum (DSSS)
Media Access Protocol	Carrier sense multiple access with collision avoidance (CSMA/CA)
Modulation	DBPSK @1 Mbps; DQPSK @ 2 Mbps; CCK @ 5.5 and 11 Mbps
Operating Channels	North America: 11; ETSI: 13; Japan: 14
Nonoverlapping Channels	Three
Receive Sensitivity	1 Mbps: -94 dBm; 2 Mbps: -91 dBm; 5.5 Mbps: -89 dBm; 11 Mbps: -85 dBm
Delay Spread	1 Mbps: 500 ns; 2 Mbps: 400 ns; 5.5 Mbps: 300 ns; 11 Mbps: 140 ns
Available Transmit Power Settings[1]	100 mW (20 dBm); 50 mW (17 dBm); 30 mW (15 dBm); 20 mW (13 dBm); 5 mW (7 dBm); 1 mW (0 dBm)
Range (typical)	Indoor: 130 ft (40 m) @ 11 Mbps; 350 ft (107 m) @ 1 Mbps Outdoor: 800 ft (244 m) @ 11 Mbps; 2000 ft (610 m) @ 1 Mbps
Compliance	Operates license free under FCC Part 15 and complies as a Class B device; complies with DOC regulations; complies with EN 300.328 standards
SNMP Compliance	MIB I and MIB II
Antenna	AIR-WGB352C: One nonremovable 2.2-dBi dipole AIR-WGB352R: Two RP-TNC connectors (antennas optional, none supplied with unit)
Encryption Key Length	AIR-WGB352x: 128-bit
Remote Configuration Support	Telnet, HTTP, FTP, TFTP, and SNMP
Dimensions (W x D x H)	6.30 in. (16 cm) x 4.72 in. (12 cm) x 1.45 in. (3.7 cm)
Weight	12.3 oz (350g)
Environmental	Temperature: 32° to 122° F (0° to 50° C); 10 to 90% (Noncondensing)
Input Power Requirements	North American: 120 VAC @ 60 Hz; Universal: 90 to 264 VAC @ 47 to 63 Hz

[1] Maximum power setting will vary according to individual country regulations.

Selected Part Numbers and Ordering Information[1]

Cisco Aironet 350 Series Workgroup Bridge

AIR-WGB352C	350 Series Workgroup Bridge with Captured Antenna & 128-bit WEP
AIR-WGB352R	350 Series Workgroup Bridge with Dual RP-TNC & 128-bit WEP

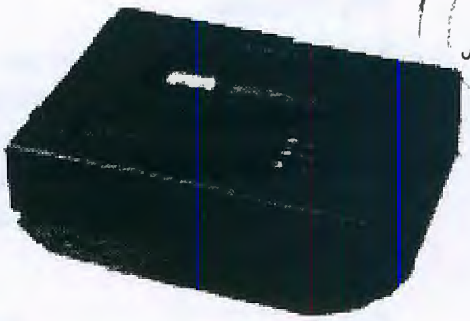
Cisco Aironet 350 Series Wireless Bridge



The Cisco Aironet 350 Series Wireless Bridge enables high-speed long-range outdoor links between buildings and is ideal for installations subject to plenum rating and harsh environments. It is designed to meet the requirements of even the most challenging applications. The 802.11b wireless bridge delivers high data rates and superior throughput for data-intensive, line-of-sight applications. The bridges connect hard-to-wire sites, noncontiguous floors, satellite offices, school or corporate campus settings, temporary networks, and warehouses. They can be configured for point-to-point or point-to-multipoint applications and allow multiple sites to share a single, high-speed connection to the Internet. For functional flexibility, the wireless bridge may also be configured as an access point.

The Cisco Aironet 350 Series Wireless Bridge features an extended operating temperature range of -20° to 55° C, allowing for placement outdoors in a NEMA enclosure or in harsh indoor environments such as warehouses and factories. With a durable metal case, the Cisco Aironet 350 Series Wireless Bridge is UL 2043 certified, and designed to achieve plenum rating as defined by various municipal fire codes.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 350 Series Ethernet Bridge	• Any company who needs to connect sites into a single LAN, even when separated by obstacles such as freeways, railroads and bodies of water that are normally inaccessible via cabling. • Business owners who want a low-cost, easy-to-deploy solution for connecting line-of-sight networks located in different buildings. • Business owners or IT directors who want multiple buildings on a campus to share a single high-speed line to the Internet.

Key Features

- High-speed (11-Mbps), high-power (100-mW) radios, delivering building-to-building links of up to 25 miles (40.2 km)
- A metal case for durability and plenum rating and an extended operating temperature rating for harsh environments
- Supports both point-to-point and point-to-multipoint configurations
- Broad range of supported antennas
- Simplified installation, improved performance, and upgradeable firmware, ensuring investment protection

Specifications

Feature	Cisco Aironet 350 Series Wireless Bridge
Data Rates Supported	1, 2, 5.5, and 11 Mbps
Frequency Band	2.4 to 2.497 GHz
Wireless Medium	Direct Sequence Spread Spectrum (DSSS)
Media Access Protocol	Carrier sense multiple access with collision avoidance (CSMA/CA)
Modulation	DBPSK @1 Mbps DQPSK @ 2 Mbps CCK @ 5.5 and 11 Mbps
Operating Channels	North America: 11; ETSI: 13; Japan: 14
Nonoverlapping Channels	Three
Receive Sensitivity	1 Mbps: -94 dBm; 2 Mbps: -91 dBm; 5.5 Mbps: -89 dBm; 11 Mbps: -85 dBm
Delay Spread	1 Mbps: 500 ns; 2 Mbps: 400 ns; 5.5 Mbps: 300 ns; 11 Mbps: 140 ns
Available Transmit Power Settings[1]	100 mW (20 dBm); 50 mW (17 dBm); 30 mW (15 dBm); 20 mW (13 dBm); 5 mW (7 dBm); 1 mW (0 dBm)
Range (typical, contingent upon antenna selected)	18 miles (28.9 km) @ 11 Mbps Up to 25 miles (40.2 km) @ 2 Mbps
Compliance	Operates license-free under FCC Part 15 and complies as a Class B device; complies with DOC regulations; complies with ETS 300.328, FTZ 2100, and MPT 1349 standards; complies with UL 2043 (The use of this device in a system operating either partially or completely outdoors may require the user to obtain a license for the system according to the Canadian regulations. For further information, contact your local industry Canada office.)
SNMP Compliance	MIB I and MIB II
Antenna	Two RP-TNC connectors (antennas optional, none supplied with unit)
Encryption Key Length	128-bit
Security	128-bit WEP in bridge mode IEEE 802.11x (includes EAP and RADIUS) in AP mode
Status Indicators	Three indicators on the top panel provide information concerning association status, operation, error/warning, firmware upgrade, and configuration, network/modem, and radio status
Automatic Configuration Support	BOOTP and DHCP
Remote Configuration Support	Telnet, HTTP, FTP, TFTP, and SNMP
Local Configuration	Direct console port (with supplied serial cable)
Bridging Protocol	Spanning Tree
Dimensions	6.74 x 6.25 x 1.31 in. (17.1 x 15.9 x 3.3 cm)
Weight	1.43 lbs (.648 kg)
Environmental	Temperature: -4× to 131× F (-20× to 55× C) 10 to 90% (noncondensing)
Enclosure	Metal case (for plenum rating); UL 2043 certified
Input Power Requirements	24VDC 10% to 60 VDC (Ethernet line power)

[1] Maximum power setting will vary according to individual country regulations

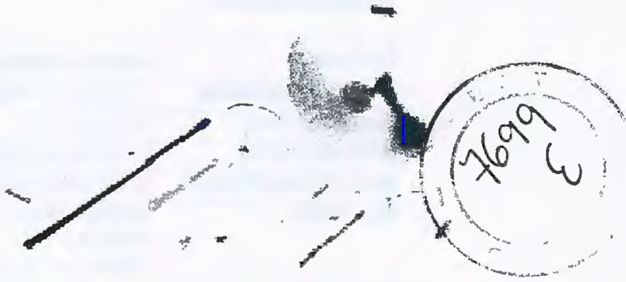
Cisco Aironet Antennas and Accessories



7699 3

Every wireless Local Area Network (LAN) deployment is different. When engineering an in-building solution, varying facility sizes, construction materials, and interior divisions raise a host of transmission and multipath considerations. When implementing a building-to-building solution, distance, physical obstructions between facilities, and number of transmission points involved must be considered.

Cisco is committed to providing not only the best access points, client adapters, and bridges in the industry—it is also committed to providing a complete solution for any wireless LAN deployment. That is why Cisco has the widest range of antennas, cable, and accessories available from any wireless manufacturer.

With the Cisco FCC-approved directional and omnidirectional antennas, low-loss cable, mounting hardware, and other accessories, installers can customize a wireless solution that meets the requirements of even the most challenging applications.

Key Features

- Client Adapter Antennas—Cisco Aironet wireless client adapters come complete with standard antennas that provide sufficient range for most applications at 11 Mbps. To extend the transmission range for more specialized applications, a variety of optional, higher-gain antennas are provided that are compatible with selected client adapters
- Access Point Antennas—Cisco Aironet access point antennas are compatible with all Cisco RP-TNC-equipped access points. The antennas are available with different gain and range capabilities, beam widths, and form factors. Coupling the right antenna with the right access point allows for efficient coverage in any facility, as well as better reliability at higher data rates
- Bridge Antennas—Cisco Aironet bridge antennas allow for extraordinary transmission distances between two or more buildings. Available in directional configurations for point-to-point transmission and omnidirectional configuration for point-to-multipoint implementations, Cisco has a bridge antenna for every application
- Low-loss cable extends the length between any Cisco Aironet bridge and the antenna. With a loss of 6.7 dB per 100 feet (30m), low-loss cable provides installation flexibility without a significant sacrifice in range

Specifications

Client Adapter Antennas

Feature	AIR-ANT3351
Description	POS diversity dipole[1]
Application	Indoor diversity antenna[2] to extend the range of Aironet LMC client adapters
Approximate Indoor Range at 1 Mbps[3]	350 ft (107m)
Approximate Indoor Range at 11 Mbps[3]	100 ft. (51 m)
Cable Length	5 ft. (1.5m)
Dimensions	Base: 7 x 2 in. (18 x 5 cm) Height: 8 in. (20 cm)
Weight	9.2 oz. (261g)

[1] A type of low-gain (2.2 dBi) antenna consisting of two (often internal) elements.

[2] A ratio of decibels to an isotropic antenna that is commonly used to measure antenna gain. The greater the dBi value, the higher the gain and, as such, the more acute the angle of coverage.

[3] All range estimations are based on an integrated client adapter antenna associating with an access point under ideal indoor conditions. The distances referenced here are approximations and should be used for estimation only.

Access Point Antennas

Feature	AIR-ANT5959	AIR-ANT3195	AIR-ANT2012	AIR-ANT3213
Description	Diversity omni-directional ceiling mount	3 dBi Patch Wall Mount Antenna	Diversity patch wall mount	Pillar mount diversity omni
Application	Indoor unobtrusive antenna, best for ceiling mount. Excellent throughput and coverage solution in high multipath cells and dense.	Indoor/Outdoor directional antenna	Indoor/Outdoor, unobtrusive medium range antenna	Indoor, unobtrusive medium-range antenna
Approximate Indoor Range at 1 Mbps[1]	350 ft. (105m)	Access Point: 271 ft. (82m) Bridge: .5 miles (.9 km)	547 ft. (167m)	497 ft. (151m)
Approximate Indoor Range at 11 Mbps[1]	130 ft. (45m)	Access Point: 80 ft. (24m) Bridge: 950 ft. (290m)	167 ft. (51m)	142 ft. (44m)
Cable Length	3 ft. (0.91m)	12 ft.	3 ft. (0.91m)	3 ft. (0.91m)
Dimensions	5.3 x 2.8 x 09. in. (13.5 x 7.1 x 2.3 cm)	4 x 5 in. (9.7 x 13 cm)	4.78 x 6.66 x .82 in. (12.14 x 16.92 x 2.08 cm)	10 x 1 in. (25.4 x 2.5 cm)
Weight	0.3 lbs. (0.14kg)	4.9 oz. (139g)	9.6 oz. (272g)	1 lb. (460g)

[1] All range estimations are based on an integrated client adapter antenna associating with an access point under ideal indoor conditions. The distances referenced here are approximations and should be used for estimation only.

Access Point Antennas (cont.)

Feature	AIR-ANT1728	AIR-ANT4941	AIR-ANT3549	AIR-ANT1729
Description	High gain omnidirectional ceiling mount	2.2 dBi dipole antenna	Patch wall mount	Patch wall mount
Application	Indoor medium-range antenna, typically hung from crossbars of drop ceilings	Indoor omni-directional coverage	Indoor, unobtrusive, long-range antenna (may also be used as a medium-range bridge antenna)	Indoor, unobtrusive, medium-range antenna (may also be used as a medium-range bridge antenna)
Approximate Indoor Range at 1 Mbps[1]	497 ft. (151m)	350 ft.	Access Point: 700 ft. (213m) Bridge: 2.0 miles (3.2 km)	Access Point: 542 ft. (165m) Bridge: 1.1 miles (1.8 km)
Approximate Indoor Range at 11 Mbps[1]	142 ft. (44m)	130 ft.	Access Point: 200 ft. (61m) Bridge: 3390 ft. (1032m)	Access Point: 155 ft. (47m) Bridge: 1900 ft. (580m)
Cable Length	3 ft. (0.91m)	N/A	3 ft. (0.91m)	3 ft. (0.91m)
Dimensions	Length: 9 in. (22.86 cm) Diameter: 1 in. (2.5 cm)	5.5 in.	5 x 5 in. (12.4 x 12.4 cm)	4 x 5 in. (9.7 x 13 cm)
Weight	4.6 oz. (131g)	1.1 oz.	5.3 oz. (150g)	4.9 oz. (139g)

[1] All range estimations are based on an integrated client adapter antenna associating with an access point under ideal indoor conditions. The distances referenced here are approximations and should be used for estimation only.

Bridge Antennas

Feature	AIR-ANT2506	AIR-ANT4121	AIR-ANT1949	AIR-ANT3338
Description	Omnidirectional Mast mount	High-gain omnidirectional Mast mount	Yagi mast mount	Solid dish
Application	Outdoor short-range point-to-multipoint applications	Outdoor medium-range point-to-multipoint applications	Outdoor medium-range directional connections	Outdoor long-range directional connections
Approximate Indoor Range at 1 Mbps[1]	5000 ft. (1525m)	4.6 miles (7.4 km)	6.5 miles (10.5 km)	25 miles (40 km)
Approximate Indoor Range at 11 Mbps[1]	1580 ft. (480m)	1.4 miles (2.3 km)	2.0 miles (3.3 km)	11.5 miles (18.5 km)
Cable Length	3 ft. (0.91m)	1 ft. (0.30m)	1.5 ft. (0.46m)	2 ft. (0.61m)
Dimensions	Length: 13 in. (33 cm) Diameter: 1 in. (2.5 cm)	Length: 40 in. (101 cm) Diameter: 1.3 in. (3 cm)	Length: 18 in. (46 cm) Diameter: 3 in. (7.6 cm)	Diameter 24 in. (61 cm)
Weight	6 oz. (17g)	1.5 lb. (0.68 kg)	1.5 lb. (0.68 kg)	11 lb. (5 kg)

[1] All range estimations are based on an integrated client adapter antenna associating with an access point under ideal indoor conditions. The distances referenced here are approximations and should be used for estimation only.

Low-Loss/Ultra Low-Loss Antenna Cable

Feature	AIR-CAB020LL-R	AIR-CAB050LL-R	AIR-CAB100ULL-R	AIR-CAB150ULL-R
Cable Length	20 ft. (6m)	50 ft. (15m)	100 ft. (30m)	150 ft. (46m)
Transmission Loss	1.3 dB	3.4 dB	4.4 dB	6.6 dB

Cisco Aironet Accessories

Feature	AIR-ACC2537-060	AIR-ACC3354	AIR-ACC2662
Description	60 in. (152 cm) bulkhead extender	Lightning arrestor	Yagi articulating mount
Application	Flexible antenna cable that extends access point cabling typically within an enclosure	Helps prevent damage due to lightning-induced surges or static electricity	Adds swiveling capability to mast-mounted yagi antennas

Selected Part Numbers and Ordering Information[1]

Cisco Aironet Accessories	
AIR-ACC2662	Yagi Antenna Articulating Mount
AIR-ACC3354	Lightning Arrestor w/ grounding ring
AIR-CAB020LL-R	20 ft. (6m) low-loss antenna cable
AIR-CAB050LL-R	50 ft. (15m) low loss antenna cable
AIR-CAB100ULL-R	100 ft. (30m) low loss antenna cable
AIR-CAB150ULL-R	150 ft. (46m) low loss antenna cable
Cisco Aironet Antennas	
AIR-ANT1728	5.2 dBi Omni Ceiling Mount Antenna
AIR-ANT1729	6 dBi Patch Wall Mount Antenna
AIR-ANT1949	13.5 dBi Yagi Mast Mount Antenna
AIR-ANT2012	6.5 dBi Diversity Patch Wall Mount Antenna
AIR-ANT2506	5.2 dBi Omnidirectional Mast Mount Antenna
AIR-ANT3195	3 dBi Patch Wall Mount Antenna
AIR-ANT3213	5.2 dBi Pillar-Mount Diversity Omni Antenna
AIR-ANT3338	21 dBi Solid Dish Antenna
AIR-ANT3351	2.2 dBi POS Diversity Dipole Antenna
AIR-ANT3549	8.5 dBi Hemispherical Patch Antenna
AIR-ANT4121	12 dBi Omnidirectional Mast Mount Antenna
AIR-ANT4941	2.2 dBi Dipole Antenna (Standard Rubber Duck)
AIR-ANT5959	2.0dBi Diversity Omni Ceiling Mount Antenna

CHAPTER 4

IP Telephony, Video, & Web Collaboration

Campus IP Telephony, Video, & Web Collaboration at a Glance

Product	Features	Page
Cisco IP Phones IP 7900 Series	An exciting, distinctively stylish, and pure Voice over IP phone portfolio to meet the wide range of business communication needs at affordable prices • Display-based technology provides ease-of-use • Integrated inline power and 2-port Ethernet Switch provides end-to-end infrastructure integration • Rich application environment enabled by open APIs based on XML	4-3
Cisco CallManager 3.3	• The software-based call processing and call control component of Cisco's IP Telephony solution • Resides on Cisco Media Convergence Servers (MCS), Cisco ICS7750, or selected third-party servers (CallManager 3.3)	4-4
CiscoWorks IP Telephony Environment Monitor	A suite of management applications that helps ensure the readiness and manageability of converged networks that are supporting VoIP and IP telephony traffic and applications. The bundle includes: • Voice Health Monitor • Default Fault Manager • CiscoView • CCO Downloadable Modules: – IP Phone Information Utility – IP Phone Help Desk Utility. – Fault History Manager	9-18
Cisco IP Contact Center (IPCC) Enterprise Edition	Cisco IP Contact Center (IPCC) Enterprise Edition delivers intelligent call routing, network-to-desktop CTI, and multi-channelmedia contact management to contact center agents over an IP network. It includes several applications, including the following: • CallManager • Cisco Intelligent Contact Manager (ICM) • Cisco IP IVR/-IP Queue Manager	4-8
Cisco IP IVR	Cisco IP IVR, a new world interactive voice response (IVR) solution, provides a feature-rich foundation for the creation of an IP-based IVR that is open and expandable. Cisco IP IVR has the following key features: • Provides a multimedia (voice/data/Web) IP-empowered application-generation environment • Can be deployed anywhere in the IP network • Offers Web-based activation and administration	4-10
Cisco IP Contact Center Express Edition (Formerly IP ICD)	• Cisco IPCC Express is a software-based ACD, IVR, and CTI application for mid-sized contact centers with Cisco IP Telephony networks based on Cisco AVVID. • Cisco IPCC Express is an open systems platform allowing ease of configuration. • It has a graphically driven workflow editor providing a common interface for creating interactions, or call flows, and creates business logic between IVR and ACD functions.	4-9
Cisco Unity—Unified Messaging and Voice Mail	Voicemail and unified messaging system delivers all messages into single inbox for access via phone, email or Internet	4-11
Cisco Personal Assistant	Software application allows users to browse voicemail, dial by name, and conference from any phone using voice commands instead of telephone keypad via speech recognition	4-13
IP Telephony Applications	• Cisco Survivable Remote Site (SRS) Telephony Software—IOS software that runs on local branch office router provides IP Telephony backup redundancy for IP phones in that office when IP phones detect that WAN is down or/and CallManager is unreachable • Cisco IP Phone Messenger—sends Instant Messages (IM) between Cisco IP Phones and Lotus Sametime or MS Messenger desktop IM clients • Cisco IP SoftPhone—Windows-based application for PC, allows users to make and receive calls from PC without a dedicated phone • Cisco Conference Connection (CCC)—enables enterprises to bring geographically dispersed employees and customers together to facilitate meetings and collaboration. CCC provides a cost-effective and time-efficient method of doing business without the hassle of travel.	4-14

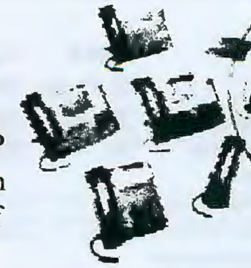
7695 3

Product	Features	Page
Cisco MCS 7800 Series Media Convergence Servers	High availability server platform for Cisco IP telephony systems • Turnkey solution, includes CallManager or other software • For large- and medium-sized enterprise IP telephony deployments	4-17
Cisco ICS 7750 Integrated Communications System	• A branch office/midmarket business with standalone IP telephony needs from 35-500 users • An end-user customer or partner who wants a single "box" (or platform) IP telephony solution to ease deployment and/or to standardize on voice configurations across multiple sites • An existing multiservice data network customer who wants to add IP telephony functionality to create a converged network solution	4-18
Cisco IAD 2400 Series Integrated Access Device[1]	Business class fixed-configuration Integrated Access Device (IAD) • Delivers packet or TDM voice and data over single WAN uplink • IOS Telephony Service (ITS) provides local IAD-based call processing to offer key switch functionality, ideal for small offices (5-24 phones) • IP-based keyswitch functionality, ideal for small offices (5-20 phones) who do not need Cisco CallManager capabilities • Supports standard phones and IP phones on a single platform • 8 FXS/16 FXS/16FXS+8FXO analog voice ports and 1 T1 digital voice port models • WAN Interfaces: T1- PPP, FR, ATM and DSL-ADSL and G.SHDSL	4-18
Cisco Voice Gateways[2]	The Cisco VG248 dedicated voice gateway provides connectivity between IP networks and legacy telephony systems/PSTN • Support various types of interfaces, including T1 and E1 • Fully manageable by Cisco CallManager, a CLI interface via Telnet, or via SNMP	4-22
Cisco IP/VC 3500 Series Videoconferencing Products	• Videoconferencing over IP solution • Cost-effective, easy-to-manage • Translates between H.323 and H.320 systems • Management and Quality of Service	4-22
Cisco IP/TV 3400 Series Video Servers	• High-quality video communications over enterprise networks • Support live and scheduled video, video on demand • Enable training, corporate communications, business TV, and distance learning	4-23
Cisco Web Collaboration Option	• Web-based collaboration, • Share any Windows desktop application • Ideal for both sales- and service-oriented customer service organizations	4-24
Cisco E-mail Manager	• Automates the process of tracking and responding to inbound email. • Automatically assigns email requests to the most appropriate agent • Graphical rules engine makes it easy to define custom rules for the processing of email	4-25
Cisco Emergency Responder	• Works with Cisco CallManager to automatically provide E9-1-1 features in North America, and is compatible with any emergency number including 112 in Europe, 999 in UK, and 000 in Australia. • Dynamically tracks the location of IP phones, routes emergency calls to the appropriate E9-1-1 network, and provides the current location information to E9-1-1 call center dispatchers. • Provides real-time alert notifications to on-site or contracted security groups, to facilitate a timely response to emergency situations.	4-25
Cisco ATA Series of Analog Telephone Adaptors	Turns any analog telephone into an IP telephone. Each of the two voice ports supports independent telephone numbers, providing two separate lines. • Interoperable with multiple standards including H.323, SIP, MGCP and SCCP • Enables analog devices, such as phones and fax machines, to support Voice over IP services by converting the analog signal into an IP signal	4-27
Cisco CTE-1400 Series Content Transformation Engine	Transforms Web content for display and interaction on small screen mobile devices and IP Telephones • Supports a broad range of devices • Transforms existing content • GUI/Console Administrative Tool	6-13

[1] IP Keyswitch capabilities also available with 2600/2600XM and 3600 series routers; see IP Keyswitch Web site: http://www.cisco.com/go/keyswitch

[2] Cisco's full line of multiservice routers also provide analog and digital voice gateway functionality through use of network modules and voice interface cards. Please see the 1700, 2600XM, 3600, 7200, 5x00 series in Chapter 1—Routers, as well as Chapter 7—Access Products.

Cisco 7900 Series IP Phones



Cisco IP Phones provide unmatched levels of integrated business functionality and converged communications beyond today's conventional voice systems. The Cisco IP Phone7960G "manager set" addresses the communication needs of the professional, with a high or busy amount of phone traffic. The Cisco IP Phone 7940G "business set" addresses the communication needs of a transaction type worker, in a office cubicle environment, who conducts medium to high telephone traffic. The Cisco IP Phone 7912G, 7910G+SW, 7910G, and 7905G "basic sets" address the communication needs of a cubicle worker who conducts low to medium telephone traffic. The Cisco IP Phone 7902G "entry set" addresses voice communication needs of a lobby, lab, manufacturing floor, and other areas where only a minimal amount of features are required. Cisco IP Phone Expansion Module 7914 extends the Cisco IP Phone 7960G with additional buttons and LCD, increasing the total number of buttons to 20 with one module, or 34 with two modules. Cisco IP Conference Station 7935, a high-quality hands-free conference station, is designed for use on desktops and offices and in small to medium-sized conference rooms.

Key Features

- Dynamic soft keys make the telephone simpler to use by presenting calling options based on context
- Open APIs using XML to deliver applications to the display
- Automatic phone discovery, VLAN configuration, and registration
- Quality of Service (QoS) is provided via support of 802.1pq, in addition to configurable DIFFSERV and TOS
- Voice-activity detection, silence suppression, comfort-noise generation, and error concealment
- G.711a, G.711u, G.729ab audio-compression coder-decoders (codecs)
- Software upgrade support via Trivial File Transfer Protocol (TFTP) server
- Microsoft NetMeeting enabled—features such as application sharing and video conferencing are available simply by pressing a button on your Cisco IP telephone
- Integrated Ethernet Switch supporting Ethernet connectivity for a downstream PC
- Integrated Inline power support allows the phone to receive power over the LAN
- A hearing-aid-compatible handset

Cisco CallManager 3.3

Cisco CallManager call-processing software extends enterprise telephony features and capabilities to enterprise LANs and packet telephony network devices such as IP phones, media processing devices, voice-over-IP (VoIP) gateways, and multimedia applications. Additional data, voice, and video services such as unified messaging, multimedia conferencing, collaborative contact centers, and interactive multimedia response systems interact with the IP telephony solution through CallManager's open telephony application programming interfaces (API). Cisco CallManager is installed on the Cisco Media Convergence Server (MCS) and selected third-party servers. It ships with a suite of integrated voice applications and utilities, including the Cisco Attendant Console—a software-only manual attendant console; a conferencing application; and administrative reporting tools. For more VoIP network management features, see the CiscoWorks Manager IP Telephony Environment Monitor, page 9-18.

Cisco CallManager version 3.3 provides a scalable, distributable, and highly available enterprise IP telephony call-processing solution. Multiple servers are clustered and managed as a single entity; yielding scalability of up to 30,000 users per cluster. By interlinking multiple clusters, system capacity can be increased to as many as one million users in a 100-site system. Clustering aggregates the power of multiple, distributed Cisco CallManagers, enhancing the scalability and accessibility of the servers to phones, gateways, and applications. Triple call-processing server redundancy improves overall system availability.

The benefit of this distributed architecture is improved system availability and scalability. Call admission control ensures that voice quality of service (QoS) is maintained across constricted WAN links, and automatically diverts calls to alternative Public Switched Telephone Network (PSTN) routes when WAN bandwidth is not available. A Web-browsable interface to the configuration database enables remote device and system configuration.

Key Features

- Cisco CallManager includes a suite of integrated voice applications that perform voice conferencing and manual attendant console functions, eliminating the need for special-purpose voice processing hardware
- Supplementary and enhanced services such as hold, transfer, forward, conference, multiple line appearances, automatic route selection, speed dial, last-number redial, and other features are extended to IP phones and gateways
- Capabilities enhancements are achieved though software upgradeability, avoiding expensive hardware costs traditional to legacy PBX systems
- Cisco CallManager Attendant Console—This Web-enabled application supports the traditional role of a manual attendant console and allows the attendant to quickly accept and dispatch calls to enterprise users. An integrated directory service provides traditional busy lamp field (BLF) and direct station select (DSS) functions for any line in the system. It monitors the state of every line in the system without requiring hardware-based line monitoring devices, thereby saving costs
- Software-only applications such as the Cisco Interactive Voice Response system, Cisco IP Contact Center, Cisco Automated Attendant, and Cisco SoftPhone are applications that interact with the CallManager through telephony APIs

Specifications

Feature	Cisco CallManager 3.3[1]
Platforms	Media Convergence Server (MCS) Integrated Communications Server (ICS-7750) Selected third-party servers
Pre-Installed Software	Cisco CallManager version 3.3 (call processing and call-control application) Cisco CallManager version 3.3 configuration database (contains system and device configuration information, including dial plan) Cisco CallManager Administration software Cisco Conference Bridge Cisco Attendant Console Bulk Administration Tool (BAT) CDR Analysis and Reporting (CAR) tool Real Time Monitoring Tool RTMT
Sample Subset of System Capabilities	H.323 scalability improvements - 1,000 H.323 calls per CallManager server in cluster Virus checker certification Cisco Intrusion Detection System (IDS) Host-Based Sensor certification

Feature	Cisco CallManager 3.3[1]
Summary of Administrative Features	Application discovery and registration to SNMP manager
	Automated Alternate Routing Groups
	Bulk Administration
	Call Back
	Call Detail Records (CDR)
	Call forward reason code delivery
	Centralized, replicated configuration database, distributed Web-based management viewers
	Configurable and default ringer WAV files per phone
	Configuration database API
	Database automated change notification
	Date/time display format configurable per phone
	Debug information to common syslog file
	Device addition through wizards
	Device downloadable feature upgrades—Phones, hardware transcoder resource, hardware conference bridge resource, VoIP gateway resource
	Device groups and pools for large system management
	Device mapping tool-IP address to MAC address
	Distinctive ring per line
	Dynamic Host Configuration Protocol (DHCP) block IP assignment-phones and gateways
	Dialed number translation table (inbound/outbound translation)
	Dialed Number Identification Service (DNIS)
	Enhanced 911 service
	H.323-compliant interface to H.323 clients, gateways, and gatekeepers
	Individual line Call Waiting Alert Configuration
	JTAPI 1.2 computer telephony interface
	LDAP version 3 directory interface to selected vendor's LDAP directories • Active Directory • Netscape Directory Server
	Manager Assistant
	Mappable softkeys
	MGCP signaling and control to selected Cisco VoIP gateways
	Multilevel Administration Access (MLA)
	Native supplementary services support to Cisco H.323 gateways
	Network Specific Facilities Paperless phone DNIS-display driven button labels on phones
	Performance monitoring SNMP statistics from applications to SNMP manager or to operating system
	Performance Monitor
	QoS statistics recorded per call
	Q.SIG Support
	Redirected DNIS (RDNIS), inbound, outbound (to H.323 devices)
	Select specified line appearance to ring; Select specified phone to ring
	Single CDR per cluster
	Single point system/device configuration
	Sortable component inventory list by device, user, or line
	System event reporting-to common syslog or operating system event viewer
	TAPI 2.1 computer telephony interface
	Time-zone configurable per phone
	XML API into IP phones (794X/6X)
	Zero cost automated phone moves; Zero cost phone adds

Feature	Cisco CallManager 3.3[1]
Summary of User Features	Answer/answer release
	Auto-answer/[2]intercom
	Call connection
	Call coverage
	Call forward-all (off-net/on-net); Call forward-busy; Call forward-no answer
	Call hold/retrieve
	Call park/pickup; Call pickup group-universal
	Call status per line (state, duration, number)
	Call waiting/retrieve
	Calling Line Identification (CLID); Calling party name identification (CNID)
	Calling Line Identifiation Restriction (CLIR)
	Direct inward dial (DID; Direct outward dial (DOD)
	Directory dial from phone-corporate, [2]personal
	Directories-missed, placed, received calls list stored on selected IP phones
	Distinctive ring (on-net vs. off-net); Distinctive ring per phone
	Drop last conference party (ad-hoc conferences)
	Extension mobility support
	Hands-free, full-duplex speakerphone
	HTML help access from phone
	Last number redial (off-net/on-net)
	Message waiting indication
	Multiparty conference-Ad-hoc with add-on, Meet-me
	Multiple line appearances per phone
	Music-on-hold
	Mute capability from speakerphone and handset
	On-hook dialing
	Operator attendant-Web-browser interface, loop key notification, logon/logoff, busy/available, left/right hand access, headphone access, busy lamp field, direct station select, drag and drop transfer, call status (state, duration, and number)
	Privacy
	Real-time QoS statistics through http browse to phone
	Recent dial list-calls to phone, calls from phone, auto-dial, and edit dial
	Single button data collaboration on SoftPhone-chat, whiteboard, and app sharing
	Single directory number, multiple phones-bridged line appearances
	Speed dial-multiple speed dials per phone
	Station volume controls (audio, ringer)
	Transfer-with consultation hold
	User-configured speed dial and call forward through Web access
	Web services access from phone
	Wideband audio codec support—proprietary 16-bit resolution, 16 kHz sampling rate codec

1. Additional RAM may be required in Media Convergence Servers to support existing and enhanced services in Cisco CallManager 3.3.
2. Indicates new feature or service for Cisco CallManager version 3.3

Cisco IP IVR

Cisco IP IVR, an interactive voice response (IVR) solution, provides a feature rich foundation for the creation of an IP-based Cisco IP IVR that is open and expandable. Written in Java to provide customer flexibility, IVR includes the following features:

- Multimedia (voice/data/Web) IP-empowered application-generation environment
- Support for optional Automated Speech Recognition (ASR) and Text-to-Speech (TTS)
- Support for VoiceXML
- Multiple Language support
- Cisco IP IVR can be located in anywhere the IP network
- Offers web-based activation and administration
- Flows (the IP IVR applications) are stored in an industry standard LDAP directory
- Cisco IP IVR is sold with Cisco CallManager and can be co-resident on the same server as CallManager or can function on a separate, dedicated media convergence servers (MCSs) or Cisco-approved customer provided server
- Packages available to scale up to 60 ports
- Cisco IP IVR offers enhanced scalability

Cisco Unity—Unified Messaging and Voice Mail

Cisco Unity is a powerful Unified Communications server that provides advanced, convergence-based communication services and integrates them with the desktop applications business professionals use everyday, improving customer service and productivity. Designed for enterprise-scale organizations, Cisco Unity delivers unified messaging that gives subscribers the ability to access and manage messages and calls from anywhere, at any time, regardless of device or media type. Subscribers can listen to e-mail over the telephone, check voice messages from the Internet, and if a fax server is present, forward faxes to any local fax machine. Cisco Unity voice messaging features robust automated attendant functionality that includes intelligent routing, and easily customizable call screening and message notification options. Cisco Unity supports localized versions in multiple languages and supports multiple languages on a single system.

Cisco Unity's optional digital networking module enables connectivity to other Cisco Unity servers at the same site via the LAN or remotely via WAN. Digital networking gives users the ability to send subscriber-to-subscriber messages anywhere in the world.

Cisco Unity supports both Cisco CallManager and leading legacy telephone systems—even simultaneously—to help smooth the transition to IP telephony and protect existing infrastructure investments. Built on a scalable platform, it uses streaming media and an intuitive HTML browser-style system administration interface. Costs are minimized when Cisco Unity's server architecture is truly unified with an organization's data network.

Key Features

- Architecture allows IT staff to set one back-up procedure, one message storage policy, and one security policy
- Enhanced scalability allows up to 72 ports per server; up to 7,500 subscribers per server; or a total of 250,000 users in an Exchange environment or 100,000 users in a Domino environment
- Support for Exchange 2000/Active Directory as the single message store and directory; AMIS-A and VPIM interoperability for Exchange systems
- Enhanced networking for large deployments—support for complex TDM telephone networks (multiple dialing domains)
- Support for multiple CCM clusters; ability to light Message Waiting Indicators
- With Exchange/Domino off-line, utilizes pre-MTA queue to take messages and give basic message access; Support for Lotus Domino as the single message store
- Fault-tolerant system tools—robust security, file replication, event logging, and optional software RAID levels 0-5
- Support for Windows 2000[1] in a mixed/native mode
- Unity Inbox/VMI (Visual Messaging Interface) is an Internet Explorer-based voice mail inbox providing unified messaging
- Unity Bridge provides advanced message interchange functionality with legacy Avaya/Octel voice mail systems—unlocking proprietary networking to deliver open standards-based IP migration

[1] Unity will not support Windows NT on the Unity server, although it can be installed into an NT environment.

Cisco Personal Assistant

Cisco Personal Assistant streamlines communications with personal call rules, speech recognition, and productivity services for IP phones. As an integral part of Cisco AVVID (Architecture for Voice, Video and Integrated Data), it interoperates with Cisco CallManager and scales to meet the present and future needs of your employees. Users can access voice mail, dial by name, and conference from any telephone using speech recognition instead of the telephone keypad. The Web-based and telephone user administration interfaces allow users to forward and screen calls in advance or in real time. The phone services enable users to check e-mail, voice mail, calendar, and personal contact information using the large, pixel-based LCD and interactive soft keys on the Cisco IP Phone 7940 or 7960.

Key Features

- Ubiquitous Access: Cisco Personal Assistant with Speech Recognition and IP Phone Productivity Services integrate with Cisco CallManager, Cisco Unity, and Microsoft Exchange within Cisco AVVID to streamline communications
- Automatic Speech Recognition (ASR): Speech recognition interface allows users to utilize simple voice commands to perform tasks such as retrieval, replying, recording, and deletion of voice messages; Entries can be dialed from personal address books or the corporate enterprise Lightweight Directory Access Protocol (LDAP) directory; Users can synchronize their Microsoft Exchange contact lists with their personal address books for quick name-dialing and ad-hoc group conferencing; Access to sensitive features such as voice mail is controlled by user authentication
- Manage Inbound and Outbound Calls (Rules-Based Routing): Using a Web interface to create rules, users can forward and screen calls based on caller identification, time of day, and meeting schedules; With "follow me," a special rule that uses speech recognition, users can forward all calls to a phone number immediately; Users can activate sets of pre-created rules from any telephone
- CalendarView: Users can keep track of appointments right on the IP phone, directly from the Microsoft Exchange server with no synchronization necessary. In addition, users can choose to be notified of an upcoming event on the phone display or by pager
- MailView: Cisco Personal Assistant presents users with access to e-mail and Cisco Unity voice-mail messages in the inboxes on the corporate messaging server. Users can access messages from a conference room, lobby phone, or colleague's phone, as well as their own. Any operation performed on the messages using MailView is automatically reflected in Microsoft Exchange and Cisco Unity; Cisco Personal Assistant interfaces with Microsoft Exchange and IMAP 4 message stores for MailView features.

Specifications

Feature	Cisco Personal Assistant
Platform	Cisco Media Convergence Server MCS-7825H-2.2-EVV1 and MCS-7835H-2.4-EVV1

Additional Cisco IP Telephony Applications

Cisco SRS Telephony

Survivable Remote Site Telephony (SRS Telephony) provides key backup telephony functions at remote branch office routers if connectivity to the centrally-located Cisco CallManager fails (i.e. WAN link is interrupted). In this case the SRS Telephony-enabled router will take over and provide basic telephony service (including off-net calls to 911). Introduced in Cisco IOS Release 12.1.5YD, the application is ideal for enterprise organizations looking to cost-effectively deploy IP telephony in their branch office location. Cisco IOS Release 12.2(13)T added SRS Telephony 2.0 features on Cisco 1751, 1760, 2600, 2600 XM, 2691, 3600, 3725/3745, IAD 2400, Catalyst 4000 AGM, and Cisco 7200 series of routers. SRS Telephony 2.1 features are available in 12.2(11)YT on Cisco 1751, 1760, 2650, 2600XM, 2691, 3640/3640A, 3660, and Cisco 3725/3745 routers.

SRS Telephony 2.0 features: Huntstop support; Music/Tone on Hold; Class of Restriction; Distinctive Ringing; Global forwarding to voicemail across PSTN during Cisco CallManager fallback; TCL based simple AA and IVR on local gateway (SRS Telephony router); Transfer across H323 network of Cisco endpoints; Alias lists for single number to be designated for unregistered phones

SRS Telephony 2.1 features: International language support; Call forward no-answer/busy to Unity server with Personal Greeting; Cisco 7914 and 7935 support; VG248 support

For More Information

See the Cisco SRS Telephony Web site: **http://www.cisco.com/go/srs**

Cisco IP Phone Messenger

The Cisco IP Phone Messenger (IPPM) is a productivity application, providing enhanced, real-time collaboration for Cisco AVVID IP Communications systems. Cisco IPPM extends the benefits of Instant Messaging and Presence to Cisco CallManager networks, allowing users to send and receive instant messages on Cisco 7940 and 7960 IP phones. Cisco IPPM interworks with IBM Lotus Sametime and MSN Messenger clients and supports the IETF SIMPLE (RFC-3428) protocol for instant messaging and presence. IPPM 1.1 requires Cisco CallManager release 3.2 or later and is supported on the Cisco 7825 and 7835 Series Media Convergence Servers.

For More Information

See the Cisco IP Communications Web site:
http://www.cisco.com/go/ipcommunications

Cisco IP SoftPhone

Cisco IP SoftPhone 1.3 is a PC based application that allows you to use your phone extension from wherever you connect to your corporate IP network, even over the Internet when using a VPN client.

It's dual mode operation allows you to either control a physical IP phone, or perform all the functions of a phone in standalone mode using your PC's soundcard or a USB audio handset or headset.

Cisco IP Manager Assistant[1]

Cisco IP Manager Assistant is a tool that allows an assistant to provide call coverage for up to five managers simultaneously. When a user is configured as an IPMA manager, they are associated with a primary and secondary assistant. The configured manager is always logged onto the service and selects the preferred assistant from the 7960 services menu. Features available to the manager are initiated from softkeys on the manage's phone. Assistant user features are initiated and managed from a PC-based application named the Assistant Console.

[1] IP Manager Assistant is available as part of Cisco CallManager 3.3 for no additional charge.

Key Features

- Manager tools: 7960 IP phone—selection of assistant from pre-configured list; Divert All, Immediate Divert, Transfer to Voice Mail, Intercept, DND, SetWatch, Assistant Watch, Call Filtering feature invocation; display of toggled feature status for Divert All, Filtering, DND, Assistant Watch and Assistant availability; speed dial and line appearance configuration for intercom functionality; Manager Desktop—secure, browser-based access to configuration for default assistant assignment, Divert All target, Immediate Divert target and filter list (CLID) configuration.
- Admin Assistant Tools: 7960 IP Phone/7914 line extender—speed dial and line appearance configuration for intercom functionality; 7960 IP phone—invocation of new softkey features including Transfer to Voice Mail and Immediate Divert, speed dial to manager's intercom line; Assistant Console application—Windows application installed on assistant PC. GUI consistent with CallManager Attendant Console application. User-sizable application window and panes

Specifications

Feature	Cisco IP Manager Assistant
Platform	Media Convergence Server (MCS)
Software Compatibility	Cisco CallManager version 3.3 Assistant Console Application—Microsoft Windows 98, NT desktop, ME, 2000 Desktop and XP

Cisco Conference Connection

Cisco Conference Connection (CCC) is designed for small to medium enterprises and remote offices of larger enterprises. Cisco Conference Connection facilitates relevant participation regardless of location, enables faster decisions, and eliminates travel cost and time and disruptions caused by requirements for a physical conference room presence. Typical applications include service calls, project management, sales reviews, corporate announcements, customer and employee training, and other business meetings. This application is ideal for enterprieses trying to increase productivity while reducing expense. Simple web-based interface enables employees to manage their conference schedules and eliminates the service charges to conference service providers.

Cisco MCS 7800 Series Media Convergence Servers

Cisco MCS 7815I-2000

The Cisco MCS 7815I-2000 provides an entry level tower server equipped with an Intel Pentium™ 4 2000MHz processor, 40GB ATA hard drive and single non-hot swap power supply. An optional tape backup is available on some models of the MCS 7815I-2000.

Cisco MCS 7825H-2266

The Cisco MCS 7825H-2266 provides an entry level rack mount server that occupies only one rack mounting space. This server is equipped with an Intel Pentium™ 4 2266MHz processor, 40GB ATA hard drive and a single non-hot swap power supply. An optional tape backup is available on some models of the MCS 7825H-2266.

Cisco MCS 7835H-2400 and Cisco MCS 7835I-2400

These Cisco MCS platforms provide a highly available mid-level rack mounted server solution that is equipped with an Intel Prestonia Xeon™ 2400MHz processor, up to six hot-swap Small Computer Systems Interface (SCSI) hard disks, a Redundant Array of Independent Disks (RAID) 1/0 Controller, hot swap fans and redundant hot swap power supplies. An optional tape backup is available for some models of the MCS 7835H-2400 and MCS 7835I-2400.

Cisco MCS 7845H-2400 and Cisco MCS 7845I-2400

These Cisco MCS platforms provide a powerful and highly reliable high level rack mounted server solution that is equipped with two Intel Prestonia Xeon™ 2400MHz processors, up to six hot-swap SCSI hard disks, RAID 1/0 controller, redundant hot swap fans and redundant hot swap power supplies. An optional tape backup is available for some models of the MCS 7845H-2400 and MCS 7845I-2400.

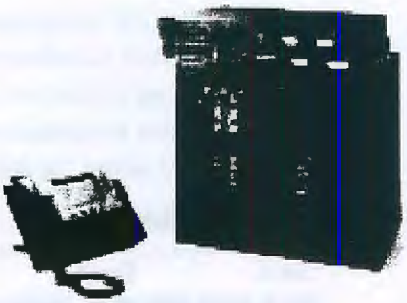
Cisco ICS 7750 Integrated Communications System



The Cisco Integrated Communications System (ICS) 7750 is a versatile IP telephony and services solution that brings the benefits of converged IP services to midmarket businesses and enterprise branch offices. Call processing, voice applications, voice gateways and multiservice IP routing are integrated within the system chassis to deliver true convergence while enhancing system manageability. The modular system architecture enables expansion of call processing redundancy, voice gateway capacity, routing capacity, and IP services to deliver system availability and scalability. The ICS 7750 offers quick and cost-effective deployment of powerful applications including unified messaging, integrated Web call centers, and data/voice collaboration.

The Cisco ICS 7750 includes Cisco CallManager software, and combines an IOS-based multiservice router/voice gateway, application servers running core voice applications, Web-based management, and seamless connectivity to Cisco Catalyst switches.

Cisco Systems also offers four Cisco ICS 7750 voice packages for convenient and cost-effective entry points for customers to deploy IP telephony solutions in their LAN networks. These ICS voice packages are pre-configured to simplify ordering of the necessary voice components including voice mail for a mid-market business or branch site.

When to Sell

Sell This Product	When a Customer Needs These Features
ICS 7750 Integrated Communications System	• A branch office/midmarket business with standalone IP telephony needs from 35-500 users • An end-user customer or partner who wants a single "box" (or platform) IP telephony solution to ease deployment and/or to standardize on voice configurations across multiple sites • An existing multiservice data network customer who wants to add IP telephony functionality to create a converged network solution

Key Features

- Integrated Functionality (includes CallManager for call-processing, multiservice router/voice gateway, Web-based management, and core voice applications)
- Modular chassis architecture features 6 universal slots with hot swapability
- Modular industry-proven Cisco IOS-based Multiservice Route Processor (MRP) delivers data routing and voice trunking; ensures end-to-end QoS
- Industry-leading selection of WAN Interfaces
- World wide selection of voice interfaces
- Optional redundant power supply and uninterruptible power supply
- Optional integrated voice applications including Unity voice/unified messaging, IVR, contact center
- Integrated Web/GUI-based system management tool for simple monitoring and troubleshooting; Console and Telnet access to CLI system management
- Automated inventory, discovery, and configuration of desktop devices and applications
- Automated fault management, auto-notification of problems via e-mail or pager
- Compatible with SNMP-based management tools including CiscoWorks 2000
- N+1 CallManager clustering enables a backup Cisco CallManager to improve system availability

Specifications

Feature	Cisco ICS 7750
System Switch Processor	Fixed slot card; 10/100BaseT autosensing data switch; Two-port RJ-45 connectors; Included with each ICS 7750 system
System Alarm Processor	Fixed slot card; Two serial ports; One console port; Resource Cards; Included with each ICS 7750 system
System Processing Engine	Universal slot card; Intel Pentium III 700 MHz CPU;1 GB SRAM; 40 GB hard disk drive
Multiservice Route Processor	Universal slot card; Standard memory: 64 MB DRAM (max.128 MB); Memory upgrade (option): 16, 32, 64 MB DRAM; Standard flash memory: 16 MB Flash SIMM (max. 80 MB); Flash upgrade (options): 16, 32, 64 MB Flash; modular voice/WAN interface (VWIC) card slots per card; Advanced data networking feature support, including: VPN, IPSec 56 and 3DES, Firewall
Dimensions and Weight (HxWxD)	15.75 x 17.25 x 12.5 in. (40.005 x 43.815 x 31.75 cm)Basic configuration-1 MRP, 1 SPE, 1 SSP, 1 SAP (a total of 4 cards = 2 fixed cards + 2 universal cards) and 1 power supply): 42 lb (18.9 kg)
Mounting Options	19 in rack-mount; Standalone

Selected Part Numbers and Ordering Information[1]

Cisco ICS 7750 Voice Packages

ICS-7750-M1V	Cisco ICS 7750 FXO-M1 Analog Voice Package provides eight Foreign Exchange Office (FXO) analog voice interfaces, four analog FXS/DID ports, 25 Cisco Unity Voice Messaging mailboxes and support for up to 50 Cisco CallManager devices.
ICS-7750-TV	Cisco ICS 7750 T1 Digital Voice Package provides 24 digital voice channels (DS0s), 8 analog FXS interfaces, 50 Cisco Unity Voice Messaging mailboxes and support for up to 500 Cisco CallManager devices.
ICS-7750-BV	Cisco ICS 7750 ISDN BRI Voice Package provides four ISDN BRI interfaces (eight B channels), 50 Cisco Unity Voice Messaging mailboxes and support for up to 500 Cisco CallManager devices.
ICS-7750-EV	Cisco ICS 7750 E1 Digital Voice Package provides 30 digital voice channels (DS0s), 50 Cisco Unity Voice Messaging mailboxes and support for up to 500 Cisco CallManager devices.

Cisco ICS 77501

ICS-7750	Six-slot ICS chassis, SPE310, SSP, SAP, Power Supply & DOC-CD
SPE310=	System Processing Engine 310 (512MB RAM and Windows 2000)
MRP300=	Multiservice Route Processor 300 with two VIC/WIC slots
MRP3-8FXOM1=	Multiservice Route Processor with 8-ports FXO-M1 and one VIC/WIC slot
MRP3-8FXS=	Multiservice Route Processor with 8-ports FXS and one VIC/WIC slot
MRP3-16FXS=	Multiservice Route Processor with 16-ports FXO-M1
UPS-BASE-UNIT=	UPS with Standard Battery Pack, Ethernet Card (120 V for North America)
UPS-BATT-PACK=	Additional External Battery Pack for UPS Base Unit
PWR-AC-7750=	AC Power Supply for ICS 7750 Chassis
FAN-TRAY-7750=	Fan Tray for ICS-7750
ICS-7750-CHASSIS=	ICS-7750 Six-slot chassis & Fan Tray
SAP-7750=	System Alarm Processor for ICS 7750
SSP-7750=	System Switch Processor for ICS 7750

Cisco ICS 7750 WAN Interface Card (WIC) Modules (for MRP cards)

WIC-1DSU-T1=	1-Port T1/Fractional T1 DSU/CSU WAN Interface Card
WIC-1T=	1-Port Serial (T1/E1) Async/Sync WAN Interface Card
WIC-2T=	2-Port Serial (T1/E1) Async/Sync WAN Interface Card
WIC-2A/S=	2-Port low-speed Serial (up to 128kbps) Async/Sync WAN Interface Card spare
WIC-1DSU-56K4=	1-Port 4-Wire 56Kbps DSU/CSU WAN Interface Card
WIC-1B-S/T=	1-Port ISDN BRI S/T WAN Interface Card (dial and leased line)
WIC-1B-U=	1-Port ISDN BRI U with NT-1 WAN Interface Card dial and leased-line

Cisco ICS7750 Voice Interface Card (VIC) Modules (for MRP cards)

VIC-2FXS	Two-port FXS voice/fax interface card
VIC-4FXS/DID	Four-port FXS or DID voice/fax interface card (ports can be configured for either FXS or DID)
VIC-2DID	Two-port DID voice/fax interface card
VIC-2FXO	Two-port FXO voice/fax interface card
VIC-2FXO-M1	Two-port FXO voice/fax interface card with battery reversal and caller ID (for North America)
VIC-2FXO-M2	Two-port FXO voice/fax interface card with battery reversal and caller ID (for Europe)
VIC-2FXO-M3	Two-port FXO voice/fax interface card with battery reversal and caller ID (for Australia)
VIC-4FXO-M1	Four-port FXO voice/fax interface card with battery reversal and caller ID (for N. America)
VIC-2E/M	Two-port E&M voice/fax interface card
VIC-2BRI-NT/TE	Two-port IDSN BRI (NT & TE) voice interface card
VWIC-1MFT-T1	One-port T1/fractional T1 multiflex trunk with CSU/DSU (for CAS or PRI)
VWIC-2MFT-T1	Dual-port T1/fractional T1 multiflex trunk with CSU/DSU (for CAS or PRI)
VWIC-1MFT-E1	One-port E1/fractional E1 multiflex trunk with CSU/DSU (for PRI)
VWIC-2MFT-E1	Dual-port E1/fractional E1 multiflex trunk with CSU/DSU (for PRI)

Cisco ICS 7750 Packet Voice/Fax DSP Modules (for MRP cards)

PVDM-256K-4=	4-Channel Packet Voice/Fax DSP Module
PVDM-256K-8=	8-Channel Packet Voice/Fax DSP Module
PVDM-256K-12=	12-Channel Packet Voice/Fax DSP Module
PVDM-256K-16=	16-Channel Packet Voice/Fax DSP Module
PVDM-256K-20=	20-Channel Packet Voice/Fax DSP Module

Cisco IAD 2400 Series Integrated Access Device with IOS Telephony Service (ITS)[1]

The Cisco IAD 2400 Series integrated access devices (IADs) combine data, voice, and video services over IP and ATM networks to provide cost-effective and efficient means of delivering high-speed Internet and voice services to small- and medium-sized business customers--all in a small (1 RU) system. When configured with optional ITS software, the IAD 2400 is ideal for delivering converged LAN IP telephony in small office environments (5-20 phones) that do not require CallManager functionality.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco IAD 2400 Series	Business-class, fully integrated access device • IOS Telephony Service (ITS), ideal for small offices (5-20 phones) that do not need Cisco CallManager capabilities • Support for standard phones and IP phones on a single platform • 8 FXS/16 FXS/16FXS+8FXO analog voice ports and 1 T1 digital voice port models • T1-PPP, FR, HDLC, ATM, ADSL and G.shdsl WAN interfaces

Key Features

- Combines high-speed Internet access and toll-quality voice services on single IOS-based platform (ITS introduced in Cisco IOS Release 12.1(5)YD)
- Offers TDM, VoIP, and VoATM (AAL2) on a single platform
- Seamless migration of customers from TDM-based GR-303 to packet-based GR-303 networks or to call agent-based networks
- Automated remote installation and configuration enabled via Simple Network-enabled Auto Provisioning (SNAP) and the Cisco Configuration Express tool

Competitive Products

- Adtran: TA850, TA750, TA600
- Carrier Access: Adit 600
- Coppercom: MXR 400
- RAD: LA-110, LA-140
- Verilink (formerly Polycom): NetEngine 6200, 7200
- Wave7 Optics: LMG-B

Specifications

[1] IP Keyswitch capabilities also available with 2600 and 3600 series routers; see IP Keyswitch Web site: http://www.cisco.com/go/keyswitch

Cisco Voice Gateways

Voice Gateways interface directly to PBXs or public telephone networks to carry voice traffic across IP networks—by converting IP calls to standard telephony calls and vice versa. They provide connectivity between packet telephony and legacy telephony such as PSTN, PBX, fax machines, and other devices.

Cisco's full line of multiservice routers can also add analog and digital voice gateway functionality through the use of network modules and voice interface cards[1], such as the Catalyst 6000 Family FXS Analog Interface Module.

Cisco offers the Cisco VG248 dedicated voice gateway.

Cisco VG248 Voice Gateway

The Cisco VG248 Voice Gateway is a 1 unit high rack mountable device allowing 48 analog devices (phones, fax machines & modems) to be used with Cisco Call Manager. It enables organizations with large numbers of analog phones (hotels, universities, hospitals, etc.) to deploy IP Telephony while maintaining the investment in legacy handsets. The analog lines are full featured (caller id, message waiting lights, feature codes) and the price per port is competitive with a legacy PBX.

The VG248 will generate SMDI for the attached analog ports allowing connection to a Cisco Call Manager network through legacy voicemail systems. It shares existing SMDI based voicemail systems between the Cisco Call Manager and the legacy PBX.

Cisco IP/VC 3500 Series Videoconferencing Products

The IP/VC 3500 series is for enterprises and service providers who want a reliable, easy-to-manage, cost-effective network infrastructure for videoconferencing over their IP networks. They consist of the IP/VC 3511 Multipoint Control Unit (MCU, also known as a "video bridge"), the IP/VC 3521 and 3526 H.320 to H.323 Gateways and the IP/VC 3540-Series Videoconferencing System. The Cisco IP/VC product family works with H.323-standards-based videoconference client devices from a variety of vendors and integrates with legacy H.320 networks.

- The Cisco IP/VC 3511 Multipoint Control Unit (MCU) is a 1RU stack/rack-mount system enabling adhoc videoconferences between three or more endpoints. Multiple participants in multiple locations attend the same meeting with real-time interactivity. It is suitable for small to medium enterprises and remote branch offices in larger enterprises
- The IP/VC 3521 and the IP/VC 3526 Videoconferencing Gateways are also 1RU stack/rack-mount systems that translate between H.320 and H.323 protocols. The IP/VC 3521 provides up to four BRI interfaces and the IP/VC 3526 provides one ISDN T1/E1 PRI interface

[1] Please see the 1700, 2600, 3600, 7200, 5x00 series in Chapter 1—Routers, Chapter 7—Access Products.

- The IP/VC 3540 Videoconferencing System integrates multipoint control units, and gateways I onto a single platform for cost-effective deployment of IP-centric videoconferencing networks. In addition, the IP/VC 3540 platform offers T.120 data conferencing through an optional collaboration server. Customers can add the Rate Matching module which enhances the video composition of any multipoint conference. Enhanced features such as Rate Matching, a number of robust Continuous Presence formats and audio transcoding are available
- The Multimedia Conference Manager (MCM) software is part of Cisco IOS Software and available across a wide range of Cisco router platforms, including the Cisco 2600/2600XM, 3600, 3700, and 7200 series. As a gatekeeper/proxy, it enables network managers to control and secure bandwidth and priority settings for H.323 videoconferencing services

Cisco IP/TV 3.4

Cisco IP/TV® 3.4 delivers a complete, highly scalable, bandwidth-efficient solution for high-quality video communications over enterprise networks. Cisco IP/TV supports live video, scheduled video, video on demand (VOD), synchronized presentations and screen captures, and a wide range of video management functions. The solution enables a broad spectrum of applications for enterprise communications including training, corporate communications, business TV, and distance learning.

Cisco IP/TV 3.4 are purchased as Cisco IP/TV 3400 Series Server appliances or software for third party servers. The Cisco IP/TV 3400 Series servers contain pre-configured software, preinstalled capture cards, network interface cards, and device drivers. The Cisco IP/TV 3400 Series includes the IP/TV 3412 Control Server, the IP/TV 3425 and 3425A Broadcast Servers, the IP/TV 3432 Archive Server, and the IP/TV 3417 Video Starter System. This product family offers a range of choices to best suit large-scale enterprise applications, performance requirements, and bandwidth availability.

Web Collaboration—Cisco Web Collaboration Option

The Cisco Web Collaboration Option enables businesses to combine the personal value of human interaction with the information value of the Web-creating a powerful environment for driving increased sales, exceptional service, and customer satisfaction.

The Cisco Web Collaboration Option allows you to add "click-for-help" buttons on your Web site that enable customers to interact with your contact center agents over the Web while conducting a voice conversation (PSTN or Voice over IP [VoIP]) or text chat. Contact center agents and callers can share Web pages-including personalized or dynamically generated pages, complete forms in a collaborative fashion, and share any Windows desktop application using nothing more than a Web browser. By facilitating effective, personalized assistance designed to greatly enhance the customer experience, the Cisco Web Collaboration Option is an ideal solution for both sales- and service-oriented contact centers.

The Cisco Web Collaboration Option can be deployed in a pure IP environment or can be seamlessly integrated with your organization's existing telephony infrastructure to provide automated, blended delivery of phone and Web-based inquiries.

E-Mail Response Management–Cisco E-mail Manager

Cisco E-Mail Manager is a comprehensive, enterprise-class solution for managing high volumes of customer inquiries submitted to your company mailboxes or Web site. Based on customizable business rules, Cisco E-Mail Manager accelerates the response process by automatically directing messages to the right agent or support team, categorizing and prioritizing messages, suggesting relevant response templates, and, if desired, sending automated replies. A full-featured, browser-based interface provides your agents with the productivity tools and knowledge resources they need to provide fast, accurate and personalized responses to your customers. Cisco E-Mail Manager gives managers the queue management, reporting and outbound marketing tools they need to ensure that desired service standards are met, gain valuable insight into customer needs and generate new revenue opportunities.

Whether you are building a customer support system from the ground up or integrating with existing organizational structures and legacy systems, Cisco E-Mail Manager's uniquely flexible, extensible and scalable design delivers a cost-effective, easy-to-implement strategy for building customer relationships over the Internet.

Selected Part Numbers and Ordering Information[1]

Cisco Email Manager	
CEM-SVR-W	Cisco Email Manager Server (Win 2K)
CEM-AGT	Cisco Email Manager Agent License

Cisco Emergency Responder

Cisco Emergency Responder revolutionizes enterprise telephony support for E9-1-1 in North America, E1-1-2 in Europe, and other emergency telephone services across the globe. Traditional PBX E9-1-1 implementations in North America support "automatic location identification" of emergency callers through daily manual database update processes, which limit the frequency of location updates and increase the likelihood of update errors. The Cisco Emergency Responder software application works with Cisco CallManager to automatically track the location of Cisco IP phones in enterprise campuses, route emergency calls to an appropriate public safety answering point (PSAP), and provide the location of the caller to the Public Safety Answering Point (PSAP).

Cisco ER performs these functions without requiring tedious manual database updates after phone moves/adds/changes, which significantly reduces the time, headcount, and costs associated with traditional PBX E9-1-1 maintenance. While some vendors may automate location updates, they still require manual PBX configuration changes to trigger the updates. The Cisco ER solution, when coupled with the automated phone moves/adds/changes features in Cisco CallManager, is the first in the industry to completely automates the phone move process while maintaining E9-1-1 and location data integrity.

In addition, Cisco ER can use email/pager messaging, telephone calls, and auto-refreshing webpage updates to notify on-site security operations personnel and third-party agencies of emergency calls in progress.

Key Features

- Meets and exceeds traditional E9-1-1 requirements
- Automates all user and phone moves, adds, and changes; Enables users and phones to move an unlimited number of times per day
- Avoids the expense and burden of daily PS-ALI record uploads
- Avoids daily error-prone documentation and database updates
- Enables quicker and more effective emergency response from onsite personnel and public agencies
- Provides configuration auditing to facilitate responsible change management and investigative or legal processes
- Provides call history logs for capacity planning, management of emergency call abuse, and incident documentation
- Compatible with any emergency number

Specifications

Feature	Cisco Emergency Responder
Supported Platform	Cisco Media Convergence Server, MCS-7835-1266 and MCS-7825-1133
System Capacity	A single Cisco Emergency Responder server supports 10,000 phones and 30,000 Ethernet switch ports. Additional scalability parameters include 500 Emergency Response Locations (ERLs)- locations that can be uniquely identified to a Public Safety Answering Point (PSAP)- as well as 500 manually entered endpoints such as analog or proprietary phones or H.323 clients. Cisco recommends a second Emergency Responder server to form a fully redundant Cisco Emergency Responder Group with the same capacity and increased availability compared with a single Cisco Emergency Responder server. Larger campuses and distributed systems are supported via a network of Cisco Emergency Responder groups called a Cisco Emergency Responder Cluster.
Configurable Elements	
Cisco CallManager	Call routing and digit manipulation to forward user-initiated emergency calls and PSAP return calls to and from Cisco Emergency Responder as appropriate
Cisco Emergency Responder	System administration interface-for access to all configuration components or oversight of outsourced vendors LAN administration interface-for IT LAN group or an outsourced vendor Emergency Response Location (ERL) administration interface-for IT telecom group or an outsourced vendor
Other Components	Configure e-mail account on a Simple Mail Transfer Protocol (SMTP) Internet mail server for use by Cisco Emergency Responder Configure an email-to-pager gateway, or use an email paging service Configure a PS-ALI transfer application provided by the PS-ALI database service provider (often requires a dialup modem connection) Provision an E9-1-1 capable voice trunk (Centralized Automated Message Accounting [CAMA] or Primary Rate Interface [PRI]) through a local exchange carrier
Supported Switches[1]	Cisco Catalyst 2950, 3500, 3550, 4000, 4500, 6500 Series

[1] Check for updates on CCO, and following is list of tested switch platforms at time of printing

Selected Part Numbers and Ordering Information[1]

Cisco Emergency Responder

SW-ER1.1-SVR	Cisco Emergency Responder software (MCS platforms), including 100 user licenses
SW-ER1.1-SVR-CPQ=	Cisco Emergency Responder software (Compaq platforms), including 100 user licenses
SW-KEY-ER1.1-USER=	Incremental single-user license key for Cisco Emergency Responder

[1] Redundant user licenses are not required when ordering redundant CER servers for a single CER group.

See the Cisco Emergency Responder Web site: **http://www.cisco.com/go/cer**

Cisco ATA Series of Analog Telephone Adaptors

The Cisco ATA 186 and 188 Analog Telephone Adaptors bring analog telephones into the networked world. The Cisco ATA series of products address the low-end product portfolio need by targeting the enterprise, business local services, small-office environment and the emerging managed voice services market. These cost effective handset-to-Ethernet adaptors enable analog devices, such as phones and fax machines, to support voice-over-IP (VoIP) services. The Cisco ATA 186 is equipped with, and a single RJ-45 Ethernet port. The Cisco ATA 188 has two RJ-11 voice ports and two RJ-45 ports. The internal Ethernet switch allows for a direct connection to a 10/100BASE-T Ethernet network and connectivity to a co-located PC or other Ethernet-based device via the RJ-45 ports.

Both models ship with a bootload image and must be upgraded to a signaling firmware image available on Cisco.com before deployment. Cisco ATAs can be configured[1] to use the standards-based Voice over IP (VoIP) protocols H.323, Session Initiation Protocol (SIP), Media Gateway Control Protocol (MGCP) and Skinny Client Control Protocol (SCCP).

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco ATA Series of Analog Telephone Adaptors	• Enable analog devices, such as phones and fax machines, to support Voice over IP services by converting the analog signal into an IP signal • Continue use of existing analog phones with IP network

Key Features

- Auto-provisioning with Trivial File Transfer Protocol (TFTP) provisioning servers
- Automatic assignment of IP address, network route IP, and subnet mask via Dynamic Host Configuration Protocol (DHCP)
- Optional web configuration through built-in Web server
- Optional touch-tone telephone keypad configuration with voice prompt
- Administration password to protect configuration and access
- Advanced pre-processing to optimize full-duplex voice compression
- High performance line-echo cancellation eliminates noise and echo
- Voice activity detection (VAD) and comfort noise generation (CNG) save bandwidth by delivering voice, not silence
- Dynamic network monitoring to reduce jitter artifacts such a packet loss

[1] Two softrware image combinations are available on Cisco.com: H.323/SIP and MGCP/SCCP. MGCP/SCCP image includes the letters, ms, in its name.

Specifications

CHAPTER 5

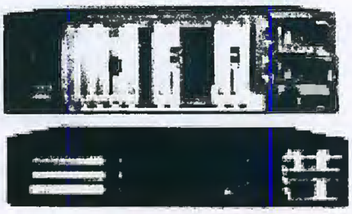
VPN and Security Products

VPN and Security Products at a Glance

Product	Features	Page
Cisco PIX Firewall	Market-leading, purpose-built appliances which provide broad range of integrated security services • Robust stateful inspection firewalling with application awareness • Highly scalable remote access and site-to-site VPN • Intrusion protection with for real-time response to network attacks • Award-winning stateful failover for enterprise-class resiliency	5-2
Cisco IOS Firewall	• Tightly integrated with IOS VPN and advanced routing technologies • Stateful packet filtering via context-based access control (CBAC) • Inline Intrusion detection for real-time response to network attacks • Dynamic, network-to network, per-user authentication and authorization via TACACS+ and RADIUS	5-5
Firewall Blade for Catalyst 6500	Firewall Module is a high performance integrated stateful firewall solution for Catalyst 6500 family of switches with performance exceeding 5GB. It is based on proven PIX technology while providing the following benefits to the customers • Investment protection • Low cost of ownership • Ease of use • Operational Consistency • Scalability See the Catalyst 6500 Series Switch in Chapter 2: LAN Switching, page 2-20 , for more information	2-20
Cisco VPN 3000 Family	Remote access Virtual Private Network platform • Has models for all size companies, from small to large enterprise organizations • Reduces communications expenditures • Enables users to easily add capacity and throughput	5-6
Cisco IDS Network Sensor	Network-based, real-time intrusion detection system capable of monitoring an entire enterprise network: • Distributed intrusion detection system capable of directing and forwarding alarms between local, regional, and headquarters-based monitoring consoles • Scalable architecture to allow the deployment of large numbers of sensors in order to provide comprehensive security coverage in large networks with performance requirements from T1 to gigabit environments • Cisco IDS Module enables customers to perform both security monitoring and switching functions within the same chassis • CTR (Cisco Threat Response) delivers patented adaptive scan techniques to minimize false alarms	5-8
Cisco Security Agent	The Cisco Security Agent provides threat protection for desktop and server computing systems by identifying and preventing malicious activity. By acting on threats or attacks before they can occur, Cisco Security Agent removes known and unknown security risks to enterprise networks and applications: • The Cisco Security Agent aggregates and extends multiple endpoint security functions by providing host intrusion prevention, distributed firewall, malicious mobile code protection, operating system integrity assurance, and audit log consolidation all within a single agent package • Protects against know and unknown attacks on both servers and desktops	5-10
Cisco 7100 Series	Large branch and central site VPN router • Comprehensive suite of VPN services, including encryption, tunneling, firewall, and bandwidth management • Embedded I/O for ease of deployment • Service module slot for IPSec and PPTP encryption coprocessing • Dedicated Site-to-Site VPN router	5-11

Product	Features	Page
Cisco Secure Access Control Server (ACS) for Windows	Controls the authentication, authorization, and accounting (AAA) of users and administrators to network devices and services • Operates as a centralized Remote Access Dial-In User Service (RADIUS) or Terminal Access Controller Access Control System (TACACS+) server • Supports LDAP user authentication • Data replication and backup services • Flexible user and group policy controls • Support for Cisco 802.11x Catalyst Switch and Wireless solutions • Extensible Authentication Protocol (EAP) enhancements to support Protected EAP (PEAP) for wireless LANs • All administrative access is encrypted with SSL	5-14
Cisco Secure User Registration Tool (URT)	Identifies users within the network and creates user registration policy bindings that help support mobility and tracking: • Ensures that users are associated with their authorized subnet/VLAN • Addresses the challenges associated with campus user mobility • Supports Web-based authentication for Windows, Macintosh, and Linux client platforms • Secure user access to the VLAN with MAC address-based security option • Option to allow multiple users connected to a hub to access a VLAN served by a single switch port	5-15
CiscoWorks VPN/Security Management Solution	Combines general device management tools for configuring, monitoring, and troubleshooting enterprise networks with powerful security solutions for managing virtual private networks (VPNs), firewalls, and network and host-based intrusion detection systems (IDS). This bundle includes: Management and Monitoring Centers, Cisco IDS Host Sensor and Console, Cisco Secure Policy Manager, VPN Monitor, Resource Manager Essentials, and Cisco View See Chapter 9—Cisco IOS Software and Network Management for more information on CiscoWorks VPN/Security Management Solution	9-16
Cisco 806, 1700, 2600, 3600, 7200, 7400 and SOHO 70 Series	Wide variety of modular router platforms with options for IOS-based and hardware-enabled VPN and security support. See individual product pages and Cisco IOS Firewall Feature Set (page 5-5).	1-1

Cisco PIX Firewall Series



The world-leading Cisco PIX® Firewall Series of purpose-built security appliances provides robust, enterprise-class, integrated network security services, including stateful inspection firewalling, virtual private networking (VPN), intrusion protection, and much more-in cost-effective, easy-to-deploy solutions. Ranging from compact, "plug-and-play" desktop firewalls for small and home offices to carrier-class gigabit firewalls for the most demanding enterprise and service-provider environments, Cisco PIX Firewalls provide robust security, performance, and reliability for network environments of all sizes.

When to Sell

Sell This Product	When a Customer Needs These Features
PIX 501	• Small Office / Home Office desktop integrated security appliance • Up to 10 Mbps of firewall throughput and 3 Mbps of 3DES VPN throughput[1] • Hardware VPN client (Easy VPN Remote) • VPN concentrator services (Easy VPN Server) for up to 5 remote users • Integrated four port 10/100 Mbps switch
PIX 506E	• Remote Office / Branch Office desktop integrated security appliance • Up to 20 Mbps of firewall throughput and 16 Mbps of 3DES VPN throughput[1] • Hardware VPN client (Easy VPN Remote) • VPN concentrator services (Easy VPN Server) for up to 25 remote users • Maximum of two 10BASE-T Ethernet interfaces • OSPF dynamic routing support

Sell This Product	When a Customer Needs These Features
PIX 515E	• Small-to-Medium Business (SMB) integrated security appliance • Up to 188 Mbps of firewall throughput[1] • Up to 140 Mbps of 3DES/AES-256 VPN throughput[1] using hardware acceleration (integrated in select models, optional for others) • VPN concentrator services (Easy VPN Server) for up to 2,000 remote users • Up to six 10/100 FE interfaces • VLAN trunking (802.1q tag-based) and OSPF dynamic routing support • Active/standby stateful failover support
PIX 525	• Enterprise-class integrated security appliance • Up to 330 Mbps of firewall throughput[1] • Up to 155 Mbps of 3DES/AES-256 VPN throughput[1] using hardware acceleration (integrated in select models, optional for others) • VPN concentrator services (Easy VPN Server) for up to 2,000 remote users • Gigabit Ethernet support; Up to eight 10/100 FE or three Gigabit Ethernet interfaces • VLAN trunking (802.1q tag-based) and OSPF dynamic routing support • Active/standby stateful failover support
PIX 535	• Carrier class large enterprise and service provider firewall appliance • Up to 1.7 Gbps of firewall throughput[1] • Up to 440 Mbps of 3DES/AES-256 VPN throughput using hardware acceleration (integrated in select models, optional for others) • VPN concentrator services (Easy VPN Server) for up to 2,000 remote users • Gigabit Ethernet throughput; Up to ten 10/100 FE or nine Gigabit Ethernet interfaces • VLAN trunking (802.1q tag-based) and OSPF dynamic routing support • Redundant, hot-swappable power supplies • Active/standby stateful failover support

[1] At 1400-byte packets

Key Features

- Security—Purpose-built firewall appliance with a proprietary, hardened operating system
- Performance—Stateful inspection firewall capable of up to 500,000 concurrent connections and 1.7 Gbps of throughput (at 1400-byte packets on Cisco PIX 535 Firewalls)
- High availability—Award-winning, active/standby stateful failover model provides enterprise-class, cost-effective resiliency
- Virtual Private Networking (VPN)—Supports both standards-based IPsec and L2TP/PPTP-based VPN services
- Optional PIX VPN Accelerator Card+—Scales 3DES/AES-256 VPN throughput up to 440 Mbps, using specialized co-processors designed for accelerating encryption operations
- Free software Cisco VPN Client provides secure connectivity across a broad range of platforms including Windows, Mac OS X, Linux and Solaris
- Network Address Translation (NAT) and Port Address Translation (PAT)—Conceals internal IP addresses and expands network address space
- Denial-of-Service (DoS) Attack Protection—Protects the firewall, internal servers and clients from disruptive hacking attempts
- OSPF dynamic routing support for improved network reliability and performance
- VLAN trunking (802.1q tag) support for simplified deployment in switched network environments
- Web-Based PIX Device Manager (PDM)—For simplified configuration and usage reports
- Auto Update, SSH, SNMP, TFTP, HTTPS, and telnet for remote management
- Support from two 10/100 Ethernet interfaces up to nine Gigabit Ethernet interfaces

Competitive Products

- Check Point Software: FireWall-1 / VPN-1
- NetScreen: NetScreen Security Appliances
- Nokia: IP-Series Security Appliances
- SonicWALL: SonicWALL Security Appliances
- WatchGuard Technologies: Firebox-series and V-series Security Appliances

Cisco IOS Firewall

The Cisco IOS Firewall enriches Cisco IOS Software security capabilities, integrating robust firewall functionality and intrusion detection for every network perimeter. When combined with Cisco IOS IPSec software and other Cisco IOS Software-based technologies such as L2TP tunneling and quality of service (QoS), it provides a complete, integrated virtual private network solution. Because it is available for a wide range of Cisco routers, it gives customers the flexibility to choose a solution that meets their bandwidth, LAN/WAN density, and multiservice requirements, while benefiting from advanced security.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco IOS Firewall	• An integrated firewall solution with powerful security and multiprotocol routing all on the same platform • Scalability options from the Cisco 800 up to the Cisco 7500 and the Catalyst 6000 • Low cost solution where high performance is not a requirement • For secure extranet and intranet perimeters and Internet connectivity for branch and remote offices • Secure remote access or data transfer via a Cisco IOS Software-based VPN solution • Real-time (inline) integrated intrusion detection system (IDS) to complement firewall or existing IOS (Cisco Secure IDS) • Security and access to the network on a per-user basis

Key Features

- Context-based access control (CBAC) provides secure, stateful, application-based filtering, supporting the latest protocols and advanced applications
- Intrusion detection for real-time inline monitoring, interception, and response to network misuse
- Dynamic, per-user authentication/authorization for LAN, WAN, and VPN clients
- Graphical configuration and management via the ConfigMaker Security Wizard and Cisco Secure Policy Manager (CSPM)
- Provides strong perimeter security for a complete Cisco IOS Software-based VPN solution, including IPSec, QoS, and tunnelling for a wide range of Cisco routers

Competitive Products

- Lucent (Ascend): SecureAccess Firewall
- Nokia: IP400 Series
- Nortel: BaySecure Firewall-1
- Same competitors as PIX so they are also Checkpoint, Linksys, Nokia, Netscreen, etc.

Specifications

Feature	Cisco IOS Firewall
Supported Network Interfaces	All network interfaces on supported platforms
Supported Platforms	Cisco 1720, 2600/2600XM, 3600, 7100, and 7200 series router platforms (supports full feature set) Cisco 800, UBR900, 1600, and 2500 series router platforms include all firewall features with exception of intrusion detection and authentication proxy
Simultaneous Sessions	No maximum; dependent on platform, network connection, and traffic

Part Numbers and Ordering Information

For Cisco IOS Images containing firewall (FW) and intrusion detection (IDS) capabilities, see individual product pages of supported platforms and the Cisco IOS Feature Navigator at http://www.cisco.com/go/fn (CCO login required) for part numbers and more info.

For More Information

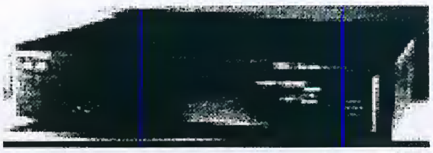
Cisco VPN 3000 Family



The Cisco VPN 3000 Concentrator Series—A family of purpose-built, remote access Virtual Private Network (VPN) platforms that incorporates high availability, high performance and scalability with the most advanced encryption and authentication techniques available today. Customers can greatly reduce costs by leveraging their ISPs' infrastructure and eliminate costly leased lines. This series supports small offices as well as large organizations with up to 10,000 simultaneous remote users per unit. With load balancing configured, multiple units can be clustered to enable unlimited remote access users. It also supports the widest range of VPN clients including Certicom MovianVPN client, Microsoft 2000 L2TP/IPsec Client, and Microsoft PPTP for Windows 95/98/ME/NT/2000/XP.

7663 5

The Cisco VPN 3002 Hardware Client—Combines the best capabilities of a software client with the reliability and stability of a dedicated hardware platform, and scales to tens of thousands of users. It sets up connections to a variety of Cisco VPN concentrators, including the VPN 3000 series and PIX firewalls.

When to Sell

Sell This Product	When a Customer Needs These Features
VPN 3005 and 3015 Concentrators	• A fixed configuration device designed for small- to medium-sized organizations with bandwidth requirements up to full-duplex T1/E1 (4 Mbps maximum performance) and up to 100 simultaneous remote access sessions • Encryption processing is performed in software • VPN 3015 is field-upgradable to the Cisco VPN 3030 and 3060 models and for redundancy
VPN 3030 and 3060 Concentrators	• VPN 3030 is for medium- to large-sized organizations with bandwidth requirements from full T1/E1 through T3/E3 (50 Mbps max. performance) and up to 1500 simultaneous sessions; field-upgradeable to the Cisco VPN 3060 • VPN 3060 is for large organizations, with high-performance, high-bandwidth requirements from fractional T3 through full T3/E3 or greater (100 Mbps max. performance) and up to 5000 simultaneous remote access sessions • Both have specialized SEP modules to perform hardware-based acceleration
VPN 3080 Concentrator	• Optimized to support large enterprise organizations that demand the highest level of performance combined with support for up to 10,000 simultaneous remote access sessions • Specialized SEP modules perform hardware-based acceleration
VPN 3000 Client	• Establishes secure, end-to-end encrypted tunnels to the Cisco VPN 3000 Concentrator and other Cisco Easy VPN compliant devices. • Provided at no charge, installs on PCs and is available for Windows, MAC OS X and Linux/Solaris environments
VPN 3002 Hardware Client	• Emulates the software client in hardware • Ideal for mixed operating system environments and where corporation does not own/control remote PC or for very large applications requiring large number of devices due to ease of deployment, upgradability & scalability

Key Features

- Cisco VPN 3000 Concentrators Series
  - Support for industry standard IPSec DES/3DES/AES and Cisco IPSec/NAT for VPN Access through Port Address Translation firewalls
  - Unlimited-use license for Cisco VPN Client distribution included at no cost with multiple OS support including Windows, MAC OS X, Linux and Solaris; also integrates with Zone Alarms personal firewall
  - Supports standard authentication: RADIUS, SDI Tokens, and Digital Certificates
  - VPN load balancing allows for multiple units to cluster as a single shared pool
- Cisco VPN 3002 Hardware Client supports up to 253 users/stations per VPN 3002
  - Works with most operating systems including Windows, Linux, Solaris, and MAC OS X
  - Auto-upgrade capability automates upgrades with no user intervention required
  - Client technology employs push policy and automatic address assignment from the central site concentrator, enabling virtually unlimited scalability

Competitive Products

- Nortel: Contivity products
- Netscreen: LAN to LAN environments
- Nokia

Cisco VPN 3002 Hardware Client

Feature	VPN 3002 Hardware Client
Hardware Processor	Motorola PowerPC processor; Dual flash image architecture
Network Interfaces	CPVN3002-K9: One Public 10/100Mbps RJ-45 Ethernet Interface and One Private Port 10/100Mbps RJ-45 Ethernet Interface CVPN3002-8E-K9: One Public 10/100Mbps RJ-45 Ethernet Interface and Eight Private Port 10/100Mbps RJ-45 Ethernet Interfaces via AUTO-MDIX switch
Physical Dimensions	1.967 x 8.6 x 6.5 in. (5 x 8.6 x 16.51 cm)
Power Supply	External AC Operation: 100-240V at 50/60 Hz with universal power factor correction; 4 foot cord included and international "pigtail" power cord selection
Tunneling Protocol Support	IPsec with IKE key management
Monitoring & Configuration	Event logging; SNMP MIB-II support Embedded management interface is accessible via console port or local web browser; SSH/SSL
Encryption Algorithms, Key Management & Authentication Algorithms	56-bit DES (IPsec); 168-bit Triple DES (IPsec); AES 128 & 256-bit (IPsec)
Authentication and Accounting Servers	Support for redundant external authentication servers including RADIUS Microsoft NT Domain authentication, X.509v3 Digital Certs (PKC7-PKCS10)
Configuration Modes	Client Mode—acts as client, receives random IP address from Concentrator Pool; Uses NAPT to hide stations 3002; Network behind 3002 is unroutable; few configuration parameters Network Extension Mode—acts as site-to-site device; Uses NAPT to hide stations only to Internet (stations visible to central site); Network behind 3002 is routable; additional configuration parameters

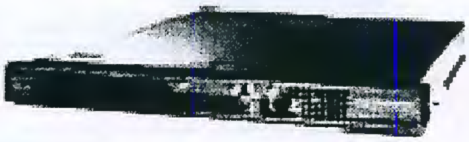
Cisco Intrusion Detection System Network Sensors



Cisco integrated network security solutions enable organizations to protect productivity gains and reduce operating costs. The Cisco Intrusion Protection is designed to efficiently protect your data and information infrastructure. Cisco delivers four four critical elements for efficient intrusion protection system which are:

- Accurate threat detection—Cisco Intrusion Detection System Version 4.0 (Cisco IDS 4.0) delivers the first step in providing a secure environment by comprehensively detecting all potential threats
- Intelligent threat investigation—Cisco Threat Response technology virtually eliminates false alarms, and automatically determines which threats need immediate attention to avoid costly intrusions.
- Ease of management—Browser-based tools simplify the user interaction, while providing powerful analytical tools that allow for a rapid and efficient response to threats.
- Flexible deployment options—A range of high-availability devices provide the flexible backbone for creating the secure and efficient intrusion protection system.

The current Cisco IDS sensing portfolio includes the following sensor appliances: IDS 4210, IDS 4235, IDS 4250, and IDS 4250-XL. Additionally, Cisco IDS delivers network protecting that is integrated into the Catalyst 6500 switch with the Intrusion Detection System Module (IDSM-2).

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco IDS Network Sensors	• Cisco network IDS appliances are network-based, real-time intrusion detection systems capable of monitoring an entire enterprise network • Performance requirements from 45 Mbps to 1 Gbps • The Cisco IDS Module enables customers to perform both security monitoring and switching functions within the same chassis • A robust, 24 hour x 7 day-a-week monitoring and response system with the latest attack detection capabilities • A distributed intrusion detection system capable of directing and forwarding alarms between local, regional, and headquarters-based monitoring consoles • A scalable architecture to allow the deployment of large numbers of sensors in order to provide comprehensive security coverage in large network environments. • An intrusion detection system designed to integrate smoothly with existing network management tools and practices • Automated false alarm reduction capabilities • Integration of full featured IDS protection into the Cisco Catalyst 6500 chassis

Key Features

- High-Speed Performance including support for full line rate gigabit environments
- Easy Installation and Setup; Remote Configuration Capability
- Fault-Tolerant Communications
- Comprehensive Attack Database
- Custom User-Defined Signatures; Automatic Signature Updates
- Notification actions
- Ability to Monitor 802.1q (trunked) traffic
- Secure web-based embedded device management and event monitoring
- Comprehensive IDS Anti-Evasion Techniques
- Cisco IOS-like CLI for full featured IDS management capabilities

Cisco Security Agent

The next-generation Cisco Security Agent network security software provides threat protection for server and desktop computing systems, also known as "endpoints." The Cisco Security Agent goes beyond conventional host and desktop security solutions by identifying and preventing malicious behavior before it can occur, thereby removing potential known and unknown ("Day Zero") security risks that threaten enterprise networks and applications. The Cisco Security Agent aggregates and extends multiple endpoint security functions by providing host intrusion prevention, distributed firewall, malicious mobile code protection, operating system integrity assurance, and audit log consolidation all within a single agent package.

The Cisco Security Agent analyzes behavior rather than relying on signature matching, its solution provides robust protection with reduced operational costs. Customers require robust endpoint security that prevents security attacks from affecting the network and critical applications.

As a key component of the SAFE blueprint for secure e-business, the Cisco Security Agent provides unprecedented endpoint protection that enables businesses to participate in e-commerce securely and take advantage of the Internet economy.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Security Agent	• Host intrusion protection, distributed firewall, malicious mobile code protection, operating system hardening, file integrity and/or audit log consolidation. The Cisco Security Agent provides all of these features in one integrated package • Protection against both known and unknown attacks • Protection for servers and/or desktops/laptops • A solution that is scalable to protect thousands of servers and desktops for large enterprise deployments

Key Features

- Provides industry-leading protection for Unix and Windows servers
- Open, extensible architecture offers the capability to define and enforce security according to corporate policy

Cisco 7100 Series

The Cisco 7100 series VPN router is a high-end, integrated VPN solution that melds high-speed, industry-leading routing with a comprehensive suite of advanced site-to-site VPN services. The Cisco 7100 series VPN router integrates key features of VPNs—tunneling, data encryption, security, firewall, advanced bandwidth management, and service-level validation—to deliver self-healing, self-defending, VPN platforms that cost-effectively accommodatc remote-office and extranet connectivity using public data networks. The Cisco 7100 series VPN router offers specific hardware configurations optimized for VPN applications and network topologies. Optional WAN and embedded Fast Ethernet interfaces combined with high-performance routing and rich VPN services provide turnkey VPN routing solutions.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7120	• Entry-level Cisco 7100 Series Router designed for large branch or central site VPN with VPN services throughput of up to 50 Mbps • Designed primarily for site-to-site VPN deployments with incidental remote access requirements
Cisco 7140	• High-end site-to-site VPN platform for central site VPN applications with VPN services throughput up to 140 Mbps • Provides superior routing and VPN services performance for central site environments, as well as dual power supplies for increased solution reliability

7657 3

Key Features

- Comprehensive suite of VPN services—tunneling, data encryption, security, firewall, quality of service, and service level validation—integrated with industry leading routing
- High performance RISC processor delivering high-speed, scalable VPN services and routing throughput and extensive memory for reliable, high-speed VPN services delivery
- Dual autosensing 10/100BASE-T Fast Ethernet ports for connectivity to the corporate LAN; the Cisco 7120 Series also has an integrated 4-port T1/E1 serial WAN interface
- Integrated Services Module (ISM) is included for support up to 2000 simultaneous tunneling sessions with 90 Mbps encryption performance and Windows 95/98/NT4.0 and Windows 2000 compatibility for remote access; an optional Integrated Services Adapter (ISA) may be installed in the Cisco 7140 to provide dual encryption acceleration performance up to 3000 tunnels and 140 Mbps 3DES encryption throughput

Cisco Secure Access Control Server for Windows

Cisco Secure ACS is a highly scalable, high-performance access control server that operates as a centralized Remote Access Dial-In User Service (RADIUS) or Terminal Access Controller Access Control System (TACACS+) server system. Cisco Secure ACS controls the authentication, authorization, and accounting (AAA) of users and administrators accessing corporate resources through the network. Cisco Secure ACS greatly reduces the administrative and management burden involved in scaling user and network administrative access to your network. Cisco Secure ACS centralizes the administration of user access controls globally to ensure enforcement of assigned policies.

ACS 3.1 provides support for the latest security architecture for Wireless authentication. It also includes SSL server authentication and encryption for administrative login.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Secure Access Control Server (ACS) for Windows	• Centrally manage who can log in to the network from wired or wireless connections • Privileges each user has in the network • Accounting information recorded in terms of security audits or account billing • What access and command controls are enabled for each configuration administrator • Virtual VSA for Aironet rekey • Secure server authentication and encryption • Simplified firewall access and control through Dynamic Port Assignment • Same User AAA services

Key Features

- PEAP support—Provides a new, secure client-server authentication method for wireless networks; Provides new support for one-time token authentication, password change/aging and powerful extensibility of end-user databases such as LDAP, NDS, and ODBC.
- SSL support for administrative access—Administrative access via the Web GUI can be secured with SSL, both certificate-based and encrypted tunnel support
- CHPASS improvements—Allows privileged users control over whether network administrators can change passwords during TACACS+ AAA client-hosted Telnet sessions
- Improved IP pool addressing mechanism—Includes a new, efficient algorithm for allocating IP addresses
- Device search mechanism—Allows users to search for a configured AAA device based on the device name, IP address, type (RADIUS or TACACS+), or device group
- Improved PKI support—Provides a more secure PKI authentication scheme by verifying the user's certificate authority stored in the remote LDAP directory against the one provided by the client

- EAP proxy enhancements—Extends EAP (LEAP, PEAP, or EAP-transport layer security [TLS]) proxy to other RADIUS or external databases using standard RADIUS proxy
- Integration with Cisco's security management software applications—Provides a consolidated administrative TACACS+ control framework for many Cisco security management tools such as CiscoWorks VPN/Security Management Solution (VMS)

Competitive Products

- Funk: Steel Belted RADIUS
- Lucent/Avaya: Security Management Server (LSMS)
- Nortel: Preside RADIUS Server (OEM of Funk product)

Specifications

Feature	Cisco Secure Access Control Server (ACS) for Windows
Platform	Windows 2000 Server must meet the following minimum hardware requirements:Pentium processor, 550 MHz or faster; Minimum resolution of 256 colors at 800 x 600 lines
RAM	256 MB required; more if you are running your database on the same machine
Disk Drive	250 MB of disk space; more if you are running yoru database on the same machine
Software Requirements[1]	Cisco Secure ACS Server uses an English-language version of Windows 2000 Server. For specific types of service packs supported, refer to online documentation.The Windows server that runs Cisco Secure ACS must have a compatible browser installed. Cisco Secure ACS was tested with English-language versions of the following browsers on Microsoft Windows operating systems: Microsoft Internet Explorer 5.5 and 6.0, Netscape Communicator 6.2
Platform Requirements	Cisco IOS Software 11.2 or higher on Cisco Routing Solutions

[1] Beginning with Cisco Secure ACS Version 3.1, Cisco Secure ACS on a Windows NT 4.0 server is no longer supported. For information about upgrading the operating system of a server running Cisco Secure ACS, see the Installation Guide for Cisco Secure ACS for Windows Server, Version 3.1

Selected Part Numbers and Ordering Information[1]

Cisco Secure Access Control Server (ACS) for Windows

CSACS-3.1-WIN-K9	Cisco Secure ACS 3.1 for Windows
CSACS-3.1-WINUP-K9	Upgrade to CSACS 3.1 for Windows from ACS versions 1.x, 2.x, 3.0 and Cisco Secure ACS for Unix version 2.x

Cisco Secure User Registration Tool

Cisco Secure URT is a virtual LAN (VLAN) assignment service that provides LAN security by actively identifying and authenticating users and then associating them only to the specific network services and resources they need through dynamic VLAN assignments to Cisco Catalyst® Switch networks. URT v2.5 introduces many innovative features, including a Web-based logon from Windows, Macintosh, and Linux clients, RADIUS and Lightweight Directory Access Protocol (LDAP) authentication, and a secure link between the client and the VLAN Policy Server (VPS). It also includes a security feature based on the Media Access Control (MAC) address that prevents users from accessing the network if they are not using authorized machines. Web based LAN authentication allows for user mobility within the LAN environment.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Secure User Registration Tool (URT)	• Web-based LAN authentication for Windows, Macintosh, and Linux client platforms—ideal for mobile users within the LAN environment • Extended security to protect user access to the logon VLAN from unregistered PCs through MAC-based security option • RADIUS authentication and accounting support • Multiple user access per port

Key Features

- Web Client Logon Interface—Supports customizable Web-based authentication for Windows, Macintosh, and Linux client platforms
- MAC-Based Security Option—Provides extended security to protect user access to the logon VLAN from unregistered PCs
- RADIUS Authentication and Accounting Support—RADIUS authentication is offered for Web logon
- Secure Link Between Cisco Secure URT Client and VPS Server—Security authentication and data encryption have been added to URT v2.5 to enable a more secure connection from the user
- LDAP Support (Active Directory and NDS directories)—Cisco Secure URT v2.5 supports Windows' Active Directory and Novell's NDS LDAP servers
- Multiple Users Per Port—Previous versions of Cisco Secure URT support only a single user logon on a single port
- Display of Windows NT Groups—The URT Administrator interface is enhanced to display the users belonging to a Windows NT group
- MAC Address Events History—With URT v2.5 MAC-address-based logon/logoff events are added as an option and reported to the history events tool

Specifications

Feature	Cisco Secure User Registration Tool (URT)
Server Requirements	Windows 2000 (SP2) server, professional, and Windows XP Professional-Min H/W (Pentium III, 512MB DRAM, 65 MB of disk space)
Browser for Web Login	Netscape version 4.79 and 6.2; IE version 5.5 (SP2) or 6.0
Client Software Requirements	Windows 98 (2ndE), Windows NT4 Workstation/Server (SP6A), Windows 2000 (SP2) Professional/server, Windows XP Professional, Windows XP Home (Web Client Only), Mac OS 10.1 (Web client only), Linux Redhat/ SuSE/ Mandrake/ VA (Web Client only)-Min H/W for Web client (Pentium II, 256MB DRAM, 65 MB of disk space), Min H/W for traditional client (Pentium II, 64MB DRAM, 1MB of disk space)
Supported Cisco Products (latest tested version)	1900 series (1912, 1924), v9.00.05; C2800 series (2822, 2828), v9.00.05; C2900XL series (2908XL, 2916XL, 2912XL, 2912LRE-XL, 2924XL, 2924LRE-XL), v12.0(5)WC3b; C2948GL3 series (2948GL3, 4232) v12.0(18)W5(22b); C2950 series, v12.1.6.EA2c; C3500XL series (3508XL, 3512XL, 3524XL, 3548XL, 3550XL), v12.0(5)WC3b; C3550 series, v12.1.8.EA1c; C4000 series (4003, 4006, 4912g), v7.1(2); C5000 series (2900, 2926, 2948, 5000, 5002, 5500, 5505, 5509), v6.3(5); C6000 series (6006, 6009, 6506, 6509, 6513), v7.1(3)

Selected Part Numbers and Ordering Information[1]

Cisco Secure User Registration Tool (URT)

URT-2.5-K9	Starter Kit: includes one (1) User Registration Tool 2.5 Software license, and one (1) Cisco 1101 VLAN Policy Server (VPS) appliance
URT-2.5-UP	Software only; upgrades customers from URT 2.X to 2.5; includes upgrade for both URT Admin Server and Cisco 1100 VPS appliance
URT-1101-HW-K9	Hardware Only; Cisco 1101 VPS appliance; additional appliance needed for backup, use in distributed deployments, or deployments requiring Web logon capabilities

CHAPTER 6

Content Networking Products

Content Networking Products at a Glance

Product	Features	Page
Cisco Content Engine 500 Series	Content services edge delivery platform for Enterprise networks • Functions as edge node device in an Application and Content Networking (ACN) system • Responsible for delivery of cached or distributed content to the end-user • Enables customers to rapidly deliver strategic applications to branch personnel including web application and content acceleration, content filtering and business video • Lays the foundation for advanced services such as e-learning and point of sale video delivery.	6-2
Cisco Content Engine 7300 Series	Content services platform for Enterprise data center and Service Provider networks • Offers premium hosting services • Caching capabilities optimize Web site performance and WAN bandwidth utilization • Offers transparent and Internet proxy caching, Content Filtering and ECDN capabilities in a single platform • Accelerates both HTTP and streaming media file formats	6-2
Content Engine Network Modules	Content services edge delivery network module for 2600, 3600, 3700 branch routers • Functions as edge node device in an Application and Content Networking (ACN) system • Enables delivery of new applications and services via a Cisco branch router with no performance degradation of core routing services • Allows rapid delivery of strategic applications to branch personnel including web application and content acceleration, content filtering and business video	6-2
Cisco 11500 Series Content Services Switches	Next-generation intelligent platform for Web site and e-commerce optimization • Provides an intelligent, distributed architecture to scale for today's e-business infrastructure • Offers Adaptive Session Redundancy (ASR)—a new industry standard in stateful failover • Delivers the greatest flexibility of any content switch in its class for customizing combinations of ports, performance, and services	6-4
Cisco LocalDirector	Integrated hardware and software solution for load balancing across servers • Allows many servers to appear as one server for high availability and easy scalability • Secure real-time embedded operating system	6-6
Cisco Content Distribution Manager 4600 Series	Content networking policy and management device • Central control over acquisition and distribution of content, including live and video on demand video, over IP networks • Intuitive web-based GUI provides integrated, easy-to-use management over caching and content delivery functions such as multicast replication, intelligent cache bypass and bandwidth management • Roles based access control securely enables multiple administrators and content publishers across the organization	6-7
Cisco Content Router 4430	Integrated global load balancing solution for content delivery networks • Solves distributed server site selection problems • Uses HTTP (CR-4430) to redirect a client to the best site on the Internet based on network delay • Transparently redirection redirects end user requests to the end user and works with any IP application • Extremely fast site-selection algorithm is optimized for high performance Web-style transactions	6-9
Content Switching Module (CSM) for the Catalyst 6500 Series Switches	Line card for Catalyst 6500 • Balances client traffic across multiple servers within server farms • URL and Cookie-based load balancing • High-performance—200,000 new Layer 4 TCP connection setups per second	6-11
Cisco SSL Module for Catalyst 6500	• Offloads SSL encryption and decryption • Scalable performance • Stickyness	6-11

Product	Features	Page
Cisco 11000 Series Secure Content Accelerator (SCA 11000)	Appliance-based SSL solution • Offloads SSL encryption/decryption from Web servers • Supports 200 new SSL connections and 900 sustained SSL sessions per second • Interoperates with the CSS 11000 for intelligent load balancing of SSL traffic	6-12
Cisco CTE-1400 Series Content Transformation Engine	Transforms Web and XML-based applications for display and interaction on IP Telephones, PDAs, WAP Phones and other non PC devices • Supports a broad range of end devices • Transforms existing applications • Design Studio GUI Application	6-13
Cisco DistributedDirector	Global Internet service scaling solution • Solves distributed server site selection problems. Enables a set of distributed servers to be seen as a single virtual server • Uses DNS to redirect a client to the best site on the Internet based on a variety of options • Configurable as authoritative Domain Name Services (DNS) caching name server and/or HTTP Session Redirector on a per-domain basis	6-14
Cisco GSS 4480 Global Site Selector	Global site selection for distributed data centers • Delivers global load balancing for multiple data centers • Offloads Domain Named System (DNS) servers by doing DNS resolution • Scales to support hundreds of data centers or server load balancers (SLBs)	6-15

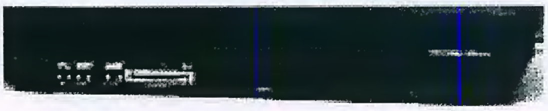
Content Networking Overview

Cisco Content Networking solutions are designed to optimize the delivery of content to end users. To accomplish this, Cisco offers solutions for both data center and edge delivery with industry-leading products in both categories.

In the data center, Cisco Content Switching, or L4-7 Switching, solutions optimize any size network to dynamically enable faster responses to Web requests and decrease network bandwidth congestion. Content switching, or intelligent load balancing, insures high levels of content availability and security, and leverages investment in Cisco IP infrastructure.

Cisco's Application and Content Networking (ACN) System allows enterprises to accelerate mission critical web applications such as Siebel and SAP, block viruses and inappropriate web sites and deliver business video, while laying the foundation for advanced services such as e-learning and point of sale video delivery. For Service Providers, the Cisco ACN System represents a highly profitable, new revenue opportunity by enhancing the customer/user Web experience and significantly accelerating the delivery of rich Web applications, content and streaming media.

Cisco Content Engines



Within Cisco's content-networking solutions portfolio, the Cisco Application and Content Networking System (ACNS) Software enables a variety of services that optimize delivery of Web applications and content from the network edge to ensure enhanced speed, availability, and performance for users. ACNS Software combines the technologies of transparent caching and enterprise content-delivery network (ECDN) for accelerated delivery of Web objects, files, and streaming media from a single intelligent edge appliance, the Cisco Content Engine (CE).

The Cisco ECDN solution provides a platform that delivers immediate benefits from entry-level applications such as content and business application acceleration and URL filtering, while laying the foundation for advanced services such as business video and e-learning.

When to Sell

Sell This Product	When a Customer Needs These Features
Content Engine 7325	• Ultra high-end content delivery capabilities for advanced applications such as streaming media, e-learning, and corporate communications
Content Engine 7305	• High-end content delivery capabilities for advanced applications such as streaming media, e-learning, and corporate communications
Content Engine 565	• Mid-range branch office and datacenter cache ideal for transparent caching, URL filtering, and edge content delivery
Content Engine 510	• Entry-level transparent caching and URL filtering capabilities along with limited content delivery
Content Engine Network Modules	• Router-integrated caching and content delivery network modules for 2600, 3600, 3700 branch access routers

Key Features

- Caching—Provides accelerated content delivery, WAN bandwidth cost savings, and protection vs. uncontrollable bottlenecks
- Content Filtering—Enables administrators to block, monitor, and report on end users' access to non-business and objectionable content (uses N2H2 Internet Filtering Protocol, Secure Computing SmartFilter, or Websense Enterprise Software)
- Content Delivery—Use in conjunction with Cisco Content Distribution Manager to enable rich media e-learning and corporate communications; deliver new premium hosting services such as on-demand content delivery and streaming media; and, to scale Web sites

Competitive Products

- Blue Coat: Blue Coat Server Accelerator 700 and 7000 Series and Blue Coat Systems Director
- Volera: Excelerator, Media Excelerator, Secure Excelerator
- Network Appliance: NetCache C1200/2100/6100 Series Appliances and Content Director

Specifications

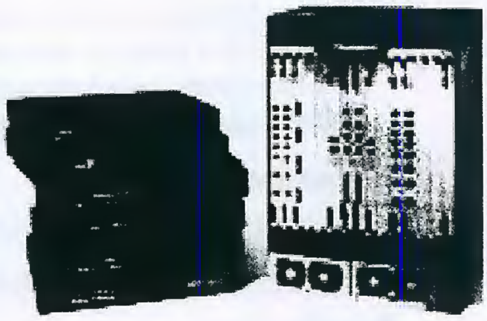
Cisco CSS 11500 Series Content Services Switches



The Cisco CSS 11500 Series Content Services Switch is suitable for both enterprises and service providers seeking to reduce data center costs, boost e-business application performance, offer enhanced services, ensure online transaction integrity, and provide the best possible online experience for customers, business partners, and internal workers.

The Cisco CSS 11500 is available in three models—the standalone Cisco CSS 11501, the three-slot Cisco CSS 11503 and the six-slot Cisco CSS 11506. Both the CSS 11503 and CSS 11506 systems take advantage of the same high-performance, modular architecture and use the same set of I/O, Secure Sockets Layer (SSL), and session accelerator modules. Also, all three systems operate with the same WebNS software, enabling the Cisco CSS 11501, 11503 and 11506 to offer industry-leading content switching functionality within three compact, hardware platforms.

When to Sell

Sell This Product	When a Customer Needs These Features
CSS 11501	• Standalone, fixed-configuration switching platform with up to 8 Fast Ethernet ports and 1 optional Gigabit Ethernet port • Cost-effective server, cache, and firewall load balancing • Complex Web applications requiring high-level URL and cookie switching
CSS 11503	• Compact, high-performance, modular content switching platform with up to 32 Fast Ethernet ports or up to six Gigabit Ethernet ports • Cost-effective server, cache, and firewall load balancing • Integrated SSL capabilities for secure transactions • Complex Web applications requiring high-level URL and cookie switching
CSS 11506	• Compact, high-performance, modular content switching platform with up to 32 Fast Ethernet ports or up to six Gigabit Ethernet ports • Cost-effective server, cache, and firewall load balancing • Integrated SSL capabilities for secure transactions • Complex Web applications requiring high-level URL and cookie switching

Key Features

- Introduces an intelligent, distributed architecture to meet the real-world scaling requirements of today's e-business infrastructure
- Improves site availability and transaction integrity by introducing Adaptive Session Redundancy (ASR)—a new industry standard in stateful failover
- Delivers the greatest flexibility of any content switch in its class for customizing combinations of ports, performance, and services
- Scales secured transaction performance through support of an integrated, high-capacity Secure Sockets Layer (SSL) module (WebNS 5.20)
- Protects investment by enabling upgrades of performance, ports, and services through modularity

Competitive Products

- Alteon/Nortel: ACEdirector and 700 Series
- F5 Networks: Big/IP and LAN switch Partners
- Foundry Networks: ServerIron
- Radware: Web Server Director (WSD)
- Resonate: Central Dispatch and Global Dispatch

Cisco LocalDirector

7647
3

The Cisco Local Director Series offers a high-availability, integrated hardware and software solution that intelligently balances the load of user traffic across multiple TCP/IP application servers. Cisco Local Director tracks network sessions and server load conditions in real time, directing each session to the most appropriate server. All physical servers appear as one virtual server, requiring only a single IP address and a single URL for an entire server farm.

A key component of a content delivery network, Cisco Local Director accelerates content delivery by routing client requests to the best Web server at the Web site of origin. Cisco Local Director supports critical content routing protocols such as Dynamic Feedback Protocol (DFP) and the Boomerang Control Protocol (BCP), which ensure seamless content delivery network integration and reduced deployment costs. Layer 4-7 content load balancing guarantees that the correct client is routed to an optimized content location. The accelerated server load balancing (ASLB) feature works with the Cisco Catalyst 6000 and 6500 Series switches to accelerate scaling of TCP sessions and help to protect against Flash crowds—sudden traffic surges that can overwhelm a web site.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco LocalDirector	• Load balancing across multiple TCP/IP application servers • High availability Internet services such as e-commerce, Web content, and e-mail • High availability Intranet services for employees, customers, and suppliers

Key Features

- HTTP redirect sticky enables client-to-server persistence, regardless of SSL and shopping-cart configurations, to improve site availability
- Hot-standby and stateful failover mechanisms ensures high availability by eliminating all points of failure for the data center
- Transparent support for all common TCP/IP Internet services, including User Datagram Protocol (UDP), accommodates a wide range of applications and communications needs (Web, File Transfer Protocol [FTP], Telnet, Domain Name System [DNS], and Simple Mail Transfer Protocol [SMTP]) without special software configuration
- SSL and cookie sticky ensures completion of complex transactions in proxy server environments
- Client-assigned load balancing provides QoS mechanism by allowing traffic to be directed to servers based on source IP address
- High-performance hardware supports six Fast Ethernet (Cisco Local Director 417) or two Fast Ethernet plus two Gigabit Ethernet (Cisco Local Director 417G) interfaces
- Network Address Translation (NAT) allows unregistered IP addresses on servers without router assistance

- Simple setup in 10 commands offers simple setup for typical configurations, with little disruption to existing network configuration and no changes to network addresses
- Integrated security capability effectively protects server farms from unauthorized access by filtering based on client IP address and service

Competitive Products

- F5 Labs: Big IP
- Foundry Networks: ServerIron Switch
- Nortel Networks/Alteon: Ace Director
- Radware: Web Server Director
- Resonate, Inc.: Central Dispatch

Specifications

Feature	LocalDirector 417	LocalDirector 417G

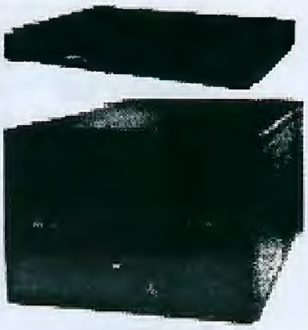
Cisco Content Distribution Manager 4600 Series



The Cisco Content Distribution Manager (CDM) configures network and device policy settings for edge node Content Engines (CE). Used to accelerate web content and save network bandwidth in a content networking architecture, the CDM can be easily integrated into existing network infrastructures. Deployed in an Enterprise or Service Provider Internet or extranet environment, the Cisco CDM and CEs provide transparent on-demand rich media streaming and static file delivery to standard PCs.

Cisco Enterprise Content Delivery Networks (ECDNs) allow service providers and enterprises to distribute rich media content closer to their target customers overcoming issues such as network bandwidth availability, distance or latency obstacles, origin server scalability, and congestion issues during peak usage periods. The ECDN solution enables content delivery services for web hosting, streaming, e-commerce, e-learning, corporate communications, and mission critical e-business applications.

When to Sell

Sell This Product	When a Customer Needs These Features
CDM 4630	• Low-cost early deployment, or small enterprise network trials, proof of concept, and pilot programs
CDM 4650	• Medium and large enterprise networks, supports up to 1000 Cisco Content Engines
CDM 4670	• Service provider deployment, supports thousands of Cisco Content Engines

Key Features

- Complete CDN solution with Cisco Content Router and Cisco Content Engines
- Central control over delivery of high-bandwidth content, live and video-on-demand over any IP network
- Easy-to-use management capabilities through a Web-based GUI; services include previewing and scheduling replication of media to edge devices, bandwidth and content management
- Automatically generates thumbnail reference images and sample Web pages for integration with corporate extranet, intranet, and Internet sites
- One URL per media file provides seamless integration into any Web site
- Integrates with standards for Web multimedia presentation, including HTML/DHTML, eXtensible Markup Language (XML) and SMIL
- Secure and fault-tolerant file transfer using Secure Socket Layer (SSL) encryption for secure media transfers
- Channel configuration for media distribution to any number of discrete audiences using "distribution lists"
- Host content for a variety of customers within a single CDN
- Ability to create multiple virtual CDNs addressing targeted media distribution
- Content registration in cache logs for billing capabilities

Competitive Products

- Cacheflow: Client and Server Accelerators
- Inktomi: Traffic Server
- Network Appliance: ContentDirector

Cisco Content Router 4430

The Cisco Content Router 4430 (CR 4430) is a compact, high-performance solution for enabling premium Web services over public or private networks. Featuring either Cisco Enterprise Content-Delivery Network (ECDN) or Content Router 1.1 Software, customers can transparently route user Web browsers to the optimal content engine for file delivery.

With its patented routing technology, the Cisco CR 4430 provides redundancy, scalability, and performance enhancements for network Web sites in either an enterprise or public service provider network. Using Hypertext Transfer Protocol (HTTP)-based re-direction, the Cisco CR 4430 can redirect users over the public network or behind the security of a corporate firewall, making it a vital component of the Cisco end-to-end Content Networking Solution.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Content Router 4430	• When a customer needs to support a Cisco Enterprise Content Delivery Network with HTTP redirection • Supports resiliency for ECDNs when used with a Cisco CSS 11500 content services switch • Up to five Cisco CR 4430s can be deployed in an ECDN network to provide greater network availability and performance

Key Features

- Uses HTTP to redirect a client to the best site on the Internet based on network delay
- Transparent redirection to the end user and works with any IP application
- Easy configuration through a Cisco IOS-style command-line interface
- Redundant configurations, multiple CRs can be deployed at the origin site to provide fail-over and load scaling

Specifications

Feature	Cisco Content Router CR4430
Network Interface Card	10/100BASE-TX
Processor	600- MHz PIII
RAM	1 GB
Internal Storage	18 GB
Rack Units	1
Dimensions (HxWXD)	1.72 x 17.50 x 14.13 in.
Weight	12.5 lbs.

Cisco Content Switching Module

The Cisco Content Switching Module (CSM) is a Catalyst 6500 line card that balances client traffic to farms of servers, firewalls, SSL devices, or VPN termination devices. The CSM provides a high-performance, cost-effective load balancing solution for enterprise and Internet Service Provider (ISP) networks. The CSM meets the demands of high-speed Content Delivery Networks, tracking network sessions and server load conditions in real time and directing each session to the most appropriate server. Fault tolerant CSM configurations maintain full state information and provide true hitless failover required for mission-critical functions.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Content Switching Module	• An integrated load balancing solution featuring Cisco's Catalyst 6500 • Load balancing for the highest traffic sights • Support for up to 1,000,000 concurrent TCP connections

Key Features

- Market-leading performance—Establishes up to 200,000 Layer 4 connections per second and provides high-speed content switching, while maintaining 1 million concurrent connections
- Outstanding price/performance value for large data centers and ISPs—Features a low connection cost and occupies a small footprint. The CSM slides into a slot in a new or existing Catalyst 6500 and enables all ports in the Catalyst 6500 for layer 4 through layer 7 content switching. Multiple CSMs can be installed in the same Catalyst 6500
- Uses the same Cisco IOS Command Line Interface (CLI) that is used to configure the Catalyst 6500 Switch

Competitive Products

- Alteon/Nortel: ACEdirector and 700 Series
- Radware: Web Server Director (WSD)

Cisco SSL Module for Catalyst 6500

The SSL Services Module is an integrated service module for the Cisco Catalyst® 6500 Series that offloads the processor-intensive tasks related to securing traffic with Secure Sockets Layer (SSL) and increases the number of secure connections supported by a Web site.

When to Sell

Sell This Product	When a Customer Needs These Features
SSL Module for Catalyst 6500	• An integrated SSL encryption/decryption solution featuring Cisco's Catalyst 6500 • Scalable SSL processing: 2,500 connection setups/second per module-10,000 per Chassis fully-populated with SSL modules

Key Features

- Server SSL offload—performs all SSL-related tasks, allowing servers to handle high-speed clear text traffic
- Scalable performance—provides a simple means of addressing increased performance requirements by installing additional SSL modules in a Catalyst 6500 switch
- Stickyness—maintains persistence even when clients request new session IDs, in Integrated Mode with Content Switching Module (CSM)
- Certificate optimization—provides cost savings by requiring only a single certificate copy vs. a copy for each server subject to customer and certificate authority agreement

Competitive Products

• F5 Networks eCommerce 540	• Nortel/Alteon iSD 410 SSL Accelerator

Specifications

Feature	Cisco SSL Module for Catalyst 6500
System Capacity and Performance	2500 connection setups/sec per module-10K per chassis; 60K concurrent client connections-240K per chassis; 300 Mbps bulk rate encryption-1.2 Gbps per chassis; 256 key pairs; 256 key certificates; Up to 2K key sizes;256 proxy servers
Scalability	Up to four SSL modules in the same Catalyst 6500
Integration with Server Load Balancing	Tightly integrated in the Cisco Catalyst 6500 Switch with the CSM

Cisco 11000 Series Secure Content Accelerator (SCA 11000)

The Cisco 11000 Series Secure Content Accelerator (SCA 11000) is an appliance-based solution that increases the number of secure connections supported by a Web site by offloading the processor-intensive tasks related to securing traffic with SSL. Available in two versions, the SCA 11000 simplifies security management and allows Web servers to process more requests for content and handle more e-transactions.

7641
3

Key Features

- Offloads all encryption, decryption, and secure process for a Web site, freeing Web servers to perform essential Web tasks and eliminating the need for SSL server software
- Boosts e-commerce site performance up to 50 times through dedicated SSL processing hardware—supports 200 or 800 new SSL connections per second
- Centralizes and manages the widest range of digital certificates to ensure complete independence from the Web server
- Provides linear scalability and fault tolerance—interoperates with the Cisco 11500 series Content Services Switches (CSS 11500) for intelligent load balancing of SSL traffic
- Works with any Web server platform to provide SSL support for any Web site
- Installs quickly and easily with very low maintenance—no special software required on Web servers or Cisco 11500 series switches

Cisco CTE-1400 Series Content Transformation Engine

The Cisco CTE 1400 Series Content Transformation Engine provides customers with a high-performance, appliance-based solution that delivers real business applications and Internet content to a variety of devices including Wireless Application Protocol (WAP) phones, personal digital assistants (PDAs), Blackberry pagers, Cisco IP Phones and other non PC devices. Examples of applications that can be transformed include e-mail, CRM/SFA applications, intranets, maps, directions, and corporate directories as well as many vertical applications in healthcare, retail, finance, hospitality and education. The Content Transformation Engine (CTE) is a 1 Rack Unit appliance optimized to perform the task of converting HTML and XML applications to a format appropriate for devices with unique display requirements. In addition, the solution recognizes specific Web-enabled devices such as IP Phones, PDAs and mobile phones, and customizes the delivery of information to give users the right form of data, to suit their devices characteristics, capability as well as the usage model.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco CTE-1400 Series Content Transformation Engine	• Quickly and easily transform applications to extend them to a variety of new devices. • Low total cost of ownership (TCO) • Immediate results for a rapid return on investment • Self-contained appliance optimized for transformation

Key Features

- Self-contained appliance for content transformation; includes DesignStudio for defining transformation rules
- Seamlessly transforms content as it moves from server to the target device, leaving the server and underlying data unchanged; Reformats data into all major Markup Languages
- Supports Cisco's AVVID architecture, including transformation for Cisco IP telephony
- Low total cost of ownership

Cisco DistributedDirector[1]

DistributedDirector provides dynamic, transparent, and scalable Internet traffic load distribution between multiple geographically-dispersed servers. DistributedDirector is a global Internet service-scaling solution that utilizes Cisco IOS software and leverages routing table information, delay characteristics, and other information to make “network intelligent” load distribution and site selection decisions.

DistributedDirector transparently redirects end-user service requests to the closest responsive server, which increases access performance and reduces transmission costs. Users need only a single subdomain name or URL-embedded hostname for accessing a distributed set of servers, thus providing the appearance of a single virtual server.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Distributed Director	• Load distribution across geographically/topologically dispersed TCP/IP servers • High availability for dispersed mission-critical applications • Data center redundancy and failover

Key Features

- Transparent distribution of all IP Services (TCP and UDP), including HTTP, FTP, Telnet, and Gopher; provides global scalability for all IP-based network services
- Improves access performance by redirecting to the topologically closest server
- Calculates client-to-server round-trip times in real time; redirects clients to server with lowest client-to-server link latency, maximizing end-to-end performance
- Redirects clients only to responsive servers, resulting in maximized availability
- Cisco IOS Software & standard command line interface for device configuration
- Transparently add and remove distributed servers, simplifying maintenance
- Supports multiple domains; cost-effective IP service scalability solution

Competitive Products

- Alteon Networks: ACEdirector and Web Switches with WebOS GLSB
- F5 Labs: 3DNS
- Foundry Networks: ServerIron Switch with Internet IronWare
- Resonate, Inc.: Global Dispatch
- RND Networks, Inc.: Web Server Director - Network Proximity (WSD-NP)

For More Information

See the DistributedDirector Web site at **http://www.cisco.com/go/dd**

[1] DistributedDirector is available in Cisco IOS software for 2600/2600XM, 3600, and 7200 series routers, starting on release 12.2(4)T Enterprise Plus feature sets; Dedicated routers may be recommended for DistributedDirector to meet performance targets of both routing and load balancing; If no dedicated hardware platform is available for running DistributedDirector, it is recommended customers use the Configurable DD Cache feature (available in 12.2(8)T) to limit the memory DistributedDirector may consume for DNS caching; To take advantage of enhanced caching capabilities, routers should be configured with additional DRAM (128MB or more)

Cisco GSS 4480 Global Site Selector

The Cisco GSS 4480 is a networking product that globally load balances distributed data centers. The Cisco GSS 4480 acts as the cornerstone of multisite disaster recovery plans in deployments of Cisco's market-leading content switches. Customers deploying new Cisco content switches such as the Cisco CSS 11500 Content Services Switch and the Content Switching Module (CSM) for the Cisco Catalyst ® 6500 Series switches or have already deployed legacy switches such as the Cisco CSS 11000 and Cisco Local Directors can benefit from the new levels of traffic management and centralized command and control provided by the Cisco GSS 4480.

Key Features

- Provides resilient architecture critical for disaster recovery and multisite Web applications deployments
- Offers flexible heterogeneous support for all Cisco SLBs and DNS-capable networking products
- Provides centralized command and control of DNS resolution process for direct and precise control of global load-balancing process
- Offers site persistence for e-commerce applications
- Offers a unique DNS race feature-The Cisco GSS 4480 can in real time direct content consumers to the closest data center
- Supports a Web-based graphical user interface (GUI) and DNS wizard to simplify the DNS command and control

CHAPTER 7

Broadband and Dial Access Products

Broadband and Dial Access Products at a Glance

Remote Dial Access—Data and Voice (VoIP)

Product[1]	Features	Page
Cisco AS5350 Series Universal Gateways	• High performance, 1RU, universal gateway • Universal Port technology for multiple data, voice, and fax services on any port at any time • 2,4, & 8 CT1/7 CE1/PRI configurations for 48 to 240 channels • Supports broad range of async/ISDN/VoIP/wireless protocols • Two 10/100 Ethernet ports, two 8 Mbps serial backhaul ports • Two 8 Mbps serial backhaul ports • Cisco SS7 signaling gateway interoperability • Flexible, redundant backhaul methods	7-3
Cisco AS5400 Series Universal Gateways	• High performance, 2RU, universal gateway • Universal Port technology for multiple data, voice, and fax services on any port at any time • Two models: Cisco AS5400HPX and Cisco AS5400 • 8 to 16 CT1/CE1/PRI or 1 T3 configuration for 192 to 648 channels • Low power and high availability design • Supports a broad range of async/ISDN/VoIP/fax/wireless protocols • Cisco SS7 signaling gateway interoperability • Flexible, redundant backhaul methods	7-6
Cisco AS5850 Universal Gateway	The highest density universal gateway in the marketplace • Supporting up to 5 x CT3s, 96 T1s or 86 E1s of multiple data, voice, and fax services on any port at any time • Constant density regardless of codec type, ECAN or VAD settings • Extensive high availability features • TDM grooming capability	7-9
Remote Dial Access Network Management	Suite of network management products for configuration, troubleshooting, and maintenance of Cisco dial access and VoIP solutions	7-11
SS7 Signaling & Softswitch Products	• Cisco PGW 2200 Softswitch—Call Agent providing signaling and call control functionality for PSTN Gateway and transit applications in international markets • Cisco BTS 10200 Softswitch—MGCP-based softswitch for large-scale Voice over IP and ATM applications	7-12

1. For Cisco 2509 and 2511 Access Servers, see page 1-14.

Broadband Cable

Product	Features	Page
Headend and Distribution Hub Equipment		
Cisco uBR7100 Series Universal Broadband Router	Entry-level, fixed-configuration CMTS and integrated router for lower-density residential and MxU customers serviced by Tier 2/Tier 3 cable operators or ISPs. • Choice of four DOCSIS- and EuroDOCSIS-qualified, fixed-configuration models that include: Cisco uBR7111, Cisco uBR7111E, Cisco uBR7114, and Cisco uBR7114E • Integrated upconverter/modulator on the cable interface • Embedded dual 10/100 BaseT Ethernet network interface • Additional network interface with a variety of LAN and WAN options • Supports up to 1,000[1] data customers	7-13
Cisco uBR7246VXR Universal Broadband Router	• Modular, standards-based communications-grade CMTS and integrated router for high-growth broadband cable deploymentsSupports up to 8,000 subscribers and offers a large variety of LAN and WAN interface options and processors	7-15

7635
E

Product	Features	Page
Cisco uBR10012 Universal Broadband Router	Highest-capacity communications-grade CMTS and integrated router on the market today that delivers the services, performance, scale, and carrier-class reliability large cable operators and ISPs demand • High-performance aggregation platform that uses Parallel Express Forwarding technology • Eight cable line cards that include support for Cisco Universal Broadband Router (uBR) line cards and the Cisco 5X20 Broadband Processing Engine (BPE) • Four network interfaces that include support for 1 Gbps over Gigabit Ethernet, 622 Mbps over OC-12 Packet over SONET, and OC-48-Dynamic Packet Transport (DPT) Interface Module Set • Cisco uBR10012 supports up to 80,0001 subscribers	7-16
Cisco RF Switch	• Exceeds PacketCable Availability Requirements • Enables a fully redundant CMTS with no single point of failure; works with the Cisco uBR7246VXR and uBR10012 • Maximizes density with more than 250 MCX-type connector	7-17
Customer Premise Equipment (CPE)		
Cisco uBR900 Series Cable Access Router	Integrated DOCSIS-based cable modem and router with hardware accelerated IPSec VPN tunneling support that includes: • Cisco uBR925 with 4 Ethernet, 1 CATV, 1 USB and 2 FXS ports that support telecommuter and small office DOCSIS-based data, VoIP, and VPN services • Cisco uBR905 with 4 Ethernet and 1 CATV port that supports DOCSIS-based data and VPN services	7-19

1. Numbers are for reference only. Actual numbers for specific systems will vary depending on network/service loading, traffic, and other parameters.

DSL (Digital Subscriber Line) Access

Product	Features	Page
DSL Access CPE[1]	Wide variety of Cisco router-based DSL CPE solutions for business-class to small office applications	7-21
Broadband Services Aggregation	• Cisco 6400 Series Router—ATM switching core, with up to 48,000 subscriber sessions per chassis • Cisco 7200 Series Router—Up to 16000 broadband sessions on a 3 RU platform, including aggregation of PPP, PPPoE, and PPPoA • Cisco 7301 Series Router—1 RU Broadband Aggregation Router that is capable of delivering up to 16000 sessions per chassis • Cisco 7400 Series Router—1 RU broadband optimized appliance that delivers up to 8,000 sessions per chassis • Cisco 10000 Series Router—A carrier-class router that supports up to 32,000 broadband sessions with 99.999 percent system uptime	7-21

1. For ADSL, ISDN, and IDSL small office/home office (SOHO) customer premise equipment (CPE), see Chapter 1: Routers

ATM Multiservice WAN Switching

Product	Features	Page
Cisco BPX 8600 Series Switches	• Large-scale Advanced ATM switch for service provider and large enterprise applications • Narrowband and broadband services in a single, highly reliable platform using a multishelf architecture with intelligent call processing for Frame Relay and ATM switched virtual circuits (SVCs) • 20 Gbps of high-throughput switching for multiple traffic types data, voice, and video	7-23
Cisco MGX 8850 Series Advanced ATM Multiservice Switches	• Multiservice switch, scales from DS0 to OC-48c/STM-16 speeds • Serves as a stand-alone device for narrowband services, an integrated edge concentrator or a broadband edge switch when equipped with 45 Gbps switch card and broadband ATM modules	7-24
Cisco MGX 8830 Series Multiservice Switches	• Multiservice switch scales from from DS0 to OC-3c/STM-1 speeds • A standalone switch with narrowband interfaces and broadband trunking to remote sites with low density and high service mix requirements with 1.2 Gbps switch fabric	7-25
Cisco IGX 8400 Series Multiservice WAN Switches	• ATM-based WAN switching, connects to public services for reduced leased-line costs • Available with 8, 16, or 32 slots	7-25
Cisco MGX 8200 Series Multiservice Gateways	• Edge concentrators family provide a cost-effective narrowband multiservice solution for low to mid-band ATM and Frame Relay aggregation with QoS management features	7-25

Long Reach Ethernet

Product	Features	Page
Cisco Catalyst 2950 LRE XL Switches	Fixed configuration Ethernet switches for delivering converged voice, video, and data services over existing category 1/2/3 wiring for the MxU and enterprise markets. • 12- or 24-port 1RU switchesystems with four 10/100 ports, deliver Ethernet traffic (up to 15 Mbps) over standard copper cabling (up to 5000 feet); ideal for MxU broadband Internet access • Co-exists with POTS and ISDN traffic on the same line and compatible with ADSL • Advanced quality of service for supporting converged voice, video, and data services	7-26
Cisco LRE CPE Devices	• Cisco 575 LRE CPE—Compact, includes one RJ-45 Ethernet connection and two RJ-11 connectors (for telephone) • Cisco 585 LRE CPE—Compact, includes four RJ-45 switched Ethernet connections and two RJ-11 connectors (for telephone). Supports 802.1p QoS	7-27
Cisco LRE POTS Splitter	• Cisco LRE 48 POTS Splitter—48 ports in 1RU. Ensures that POTS service is separate, and never compromised by LRE switch reconfiguration or downtime	7-27
Cisco Broadband Building Service Manager	• Server system enables automated online activation, integrated billing, tiered service levels • Ideal for any form of broadband access technology, including Ethernet, LRE, Cable access, DSL, Wireless, or Fiber	7-28

Cisco AS5350 Universal Gateway

The Cisco AS5350 Universal Gateway is the only one-rack-unit gateway supporting two-, four-, or eight-port T1/seven-port E1 configurations that provides universal port data, voice, and fax services on any port at any time. The Cisco AS5350 Universal Gateway offers high performance and high reliability in a compact, modular design. This cost-effective platform is ideally suited for Internet service providers (ISPs) and enterprise companies that require innovative universal services.

The Cisco AS5350 Universal Gateway eliminates the need for switches and routers to create a point-of-presence (POP) or "POP-in-a-box" solution. The Cisco AS5350 Universal Gateway has three primary universal gateway configurations: two Channelized T1(CT1)/Channelized E1(CE1)s, four CT1/CE1s, and eight CT1/seven CE1s . It also includes integrated signaling link termination (SLT) functionality for direct connection to a SS7/C7 signaling gateway.

The Cisco AS5350 Universal Gateway comes two high-speed serial ports are provided to support Frame Relay, Point-to-Point Protocol (PPP), and High-Level Data Link Control (HDLC) backhaul. All backhaul interfaces support Hot Standby Router Protocol (HSRP), and all cards and the fan tray are hot-swappable for carrier-class resiliency. The Cisco AS5350 Universal Gateway is the only access server in this form factor that offers universal port capability with these high-availability features.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco AS5350	• 2 to 8 channelized CT1/7 CE1/PRI compact and modular universal • High-performance modem, ISDN, and voice call termination • Universal port services (data, voice, fax)

Key Features

- 1 RU modular high-performance 2 to 8 channelized CT1/7 CE1/PRI system
- Universal Gateway—which supports multiple data, voice, and fax services on any port at any time
- Ideal for Tier 2/3 ISPs and enterprises requiring innovative universal services
- Feature cards: 2, 4, or 8 CT1/7 E1/PRI feature cards (ISDN calls terminated on the card); 60 or 108 channel Universal Port feature card
- Two 10/100BaseT autosensing Ethernet LAN ports
- Two 8 MB serial WAN ports for Frame Relay, HDLC, or PPP WAN backhaul
- Carrier Class Resiliency: All feature cards and fan tray are hot swappable, modem and voice DSP are pooled and can be configured as spares, AC internal power supply with dual fans, Redundant LAN/WAN backhaul ports, Thermal management and environmental monitoring, ETSI/NEBS Level 3 compliant
- Cisco SS7 signaling gateway interoperability

Cisco AS5400 Series Universal Gateways

Cisco AS5400 Series Universal Gateways offer unparalleled capacity in only two rack units (2RUs) and provides universal port data, voice and fax services on any port at any time. High-density (up to 1 CT3), low power consumption (7.2A at 48 VDC per CT3), and universal port digital signal processors (DSPs) make Cisco AS5400 Series Universal Gateways ideal for many network deployment architectures, especially colocation environments and mega points of presence (POPs).

The Cisco AS5400 Series consists of two models, the Cisco AS5400 and the Cisco AS5400HPX. The gateways share the same architecture; the primary difference is the processing capability of the two platforms. The Cisco AS5400 offers unparalled dial capacity and scalability for MLPPP, L2TP, and V.120 sessions, whereas the Cisco AS5400HPX provides enhanced performance for processor intensive voice and fax applications.

Cisco AS5400 Series support a wide range of IP-based value-added services such as high-volume Internet access, regional/branch-office connectivity, corporate virtual private networks (VPNs), mobile wireless solutions, long distance for Internet service providers (ISPs), international wholesale long distance, distributed prepaid calling, Signaling System 7 (SS7) interconnect, and enhanced voice services.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco AS5400HPX	• High density in a small footprint (16 CT1/CE1 or 1 CT3) • Universal port services (data, voice, fax) • Enhanced performance for processor intensive voice and fax applications • Compact form factor—easy to add capacity as the network grows • Low power per port • High performance async/ISDN/VoIP/wireless • T.38 real-time fax relay, T.37 fax store and forward, fax detection, unified communications • Flexible redundant backhaul methods
Cisco AS5400	• Async/ISDN/Wireless data to 1 CT3 • Universal port services (data, voice, fax) or voice only services to 16 CT1/CE1

Key Features

- The Industry's only 2RU, CT3-capable universal gateway on the market with hot-swappable cards, internal redundant power supply
- Universal Gateway which provides universal port data, voice, and fax services on any port at any time
- Feature cards: 8 or 16 CT1/CE1 feature cards; 60 or 108 channel Universal Port feature card; All feature cards and fan trays are hot-swappable
- Redundant 10/100 Ethernet ports and redundant 8 Mbps serial backhaul ports for Frame Relay, HDLC or PPP WAN Backhaul
- One fast console port for local administrative access; one auxiliary port for remote administrative access
- Redundant LAN/WAN backhaul ports
- ETSI/NEBS Level 3 compliant
- AC or DC power supply with dual fans
- Cisco SS7 signaling gateway interoperability

Cisco AS5850 Universal Gateway

The Cisco AS5850 Universal Gateway is a high-density, carrier-class gateway, offering unparalleled capacity and high availability. The Cisco AS5850 is specifically designed to meet the demands of large, innovative service providers, supporting up to five channelized T3s (CT3s), 96 T1s or 86 E1s of data, voice, and fax services on any port at any time. It offers high availability features such as hot-swap on all cards, load-sharing and redundant hot-swappable power supplies, redundant route processing cards and call admission control to ensure 99.999-percent availability.

The Cisco AS5850 supports a wide range of IP-based value-added services such as high-volume Internet access, corporate virtual private networks (VPNs), long distance for Internet service providers (ISPs), international wholesale long distance, distributed prepaid calling, Signaling System 7 (SS7) interconnect, and managed voice services such as hosted IP telephony, managed IP-PBX, multiservice VPNs, and IP contact centers.

Using the rich set of Cisco IOS Software features and Signaling System 7 (SS7) interconnection, service providers can quickly provision their network for new services to meet the rapidly changing demands of the communications provider marketplace.

As a highly flexible voice gateway, the Cisco AS5850 supports any coder-decoder (CODEC) at 100-percent capacity simplifying network engineering. An open programmable architecture streamlines rapid voice service creation with H.323, Session Initiation Protocol (SIP) or Media Gateway Control Protocol (MGCP).

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco AS5850	• Supporting up to 5 x CT3s, 96 T1s or 86 E1s of multiple data, voice, and fax services on any port at any time • Service provider or IP-focused installations • Highly available single system with multiple redundancy • Wholesale dial/voice, retail dial/voice, TDM grooming or wireless applications

Key Features

- High scalability—up to 3360 ports in a 14 RU chassis and provides for 6 times growth in same chassis
- Hot-swap redundant power supplies and power feeds
- Redundant DSPs and RSC
- Thermal/Power management and redundant fans
- DSP Resource Recovery Feature
- Supports H.323v2, H.323v3, H.323v4, SIP and MGCP 1.0
- Application-specific support including AOL and Prodigy traffic
- WAN optimization including routing filters, snapshot routine, dial-on-demand routing ASAP
- ETSI/NEBS Level 3 compliant
- Cisco SS7 signaling gateway interoperability

Remote Dial Access Network Management Products

Universal Gateway Manager (UGM)

Network management applications and tools are critical for the successful deployment and operations of voice or data services. The Cisco Universal Gateway Manager (UGM) is an element management system for Cisco AS5000 Universal Gateways. The Cisco UGM enables network operators and administrators to efficiently deploy, manage and maintain Cisco AS5000 Universal Gateways supporting Voice over IP, managed voice, PSTN gateway, and dial access services.

Key Features

- Enables the efficient deployment and configuration of Cisco AS5000 Universal Gateways
- Monitors the operational status of Cisco AS5000 Universal Gateways and their subcomponents so that corrective action can be taken quickly
- Supports the rapid reconfiguration of Cisco AS5000 Universal Gateways for network or service changes
- Collects and presents a wide range of performance-related statistics for monitoring gateway and network efficiency
- Co-resides with Cisco MGC Node Manager (MNM) for Cisco PGW 2200 PSTN Gateway node management
- Provides interfaces to support its integration with existing network management applications

For More Information

See the Cisco Universal Gateway Manager Web site: **http://www.cisco.com/go/ugm**

Cisco Universal Gateway Call Analyzer

The Cisco Universal Gateway Call Analyzer (UGCA) tool monitors and troubleshoots Cisco AS5000 universal gateways that support dialup services. The Cisco Universal Gateway Call Analyzer complements other network management system (NMS) applications, adding call-level analysis capabilities that are not available with standard NMS applications.

Maintaining high call-success rates and quality connections are key challenges for any dial service provider. These metrics directly affect customer satisfaction and are fundamental indicators of network performance and efficiency. Numerous issues may cause service degradation, which may be rapid or may occur slowly. While public switched telephone network (PSTN) issues are frequently the source of problems, they are especially difficult to identify.

Cisco AS5000 universal gateways collect the detailed call-characteristic data needed to detect and diagnose issues that affect service. The Cisco Universal Gateway Call Analyzer is the window into this data, providing analysis and reporting features through an intuitive Web interface.

For More Information

See the Cisco Universal Gateway Call Analyzer Web site:
http://www.cisco.com/go/ugca

Cisco Resource Policy Management System

Wholesalers face a challenge when delivering service level agreements (SLAs) on a common network, especially when providing a range of services for different customers. The Cisco Resource Policy Management System (RPMS) is a software tool that provides policy management of platform resources. With Cisco RPMS, wholesalers are able to offer a variety of services to a variety of customers on a single set of gateways. Cisco RPMS offers not only effective resource management but the capability to build and deliver flexible service models that fit customers' unique requirements. Cisco RPMS can grow to support a wholesaler's changing needs, scaling as the network expands and delivering the services that customers demand, including wholesale dial, access to virtual private network (VPN) services.

SS7 Signaling & Softswitch Products

Cisco AS5x00 series products interoperate with various SS7 and Softswitch products, including the Cisco SC2200 Signaling Controller, the Cisco PGW 2200 Softswitch and the Cisco BTS 10200 Softswitch.

Cisco SC2200 Signaling Controller

Please see PGW 2200 Softswitch.

Cisco PGW 2200 Softswitch

The Cisco PGW 2200 provides the signaling and call control functionality that enables service providers (SPs) to bridge the boundary between the legacy PSTN and today's new world packet networks. Combined with Cisco's award winning media gateways, the PGW 2200 is the catalyst for PSTN Gateway solutions enabling dial offload, transit, business voice, H.323 and SIP based applications. The PGW 2200 leverages its protocol library of 90+ SS7/C7 variants to enable interconnect worldwide. In signaling mode the PGW adds SS7/C7 to the AS5X00 gateways, giving service providers around the world a proven cost-saving and reliable solution for connecting VoIP and Internet Dial Access solutions to the PSTN. SS7 signaling allows service providers to enter into new markets, optimize their networks for both voice and data traffic, and save drastically on monthly interconnect fees.

Cisco BTS 10200 Softswitch

The Cisco BTS 10200 Softswitch provides call-control intelligence for establishing, maintaining, routing, and terminating voice calls. The Cisco BTS 10200 Softswitch also serves as an interface to enhanced service and application platforms. Leveraging the power of packet networks while seamlessly operating with legacy circuit switched infrastructures, the Cisco BTS 10200 Softswitch empowers service providers and carriers to gracefully transition to packet-based technology. Implementing the Cisco BTS 10200 Softswitch ensures rapid service deployment, carrier-grade reliability, service flexibility, scalability to millions of subscribers, and cost savings through investment optimization and operational efficiencies.

For More Information

See SS7 Signaling & Softswitch Products Web site:
http://www.cisco.com/en/US/products/hw/vcallcon/index.html

Additional Remote Dial Access Products

- In addition to the AS5350/AS5400/AS5850 series access gateways, the Cisco 2600/3600 series routers (see pages 1-16 and 1-22) also support dial-up, data, and voice access via network and modem modules, and voice interface cards
- For sites that require access via multiple external analog modems, the AS2509/AS2511-RJ access servers (see page 1-14) and 2600 series routers (see page 1-16) are ideal for low-density, dial applications
- For small office ISDN connectivity, see Cisco 800 series routers (see page 1-9)

Cisco uBR7100 Series Universal Broadband Router

The Cisco uBR7100 Series is a complete, compact, easy-to-use product that enables cost-effective, high-speed Internet access in the hospitality multidwelling (MDU) and multitenant (MTU) market space using the coaxial cable already in a building. The product requires exceptionally low capital investment and minimal setup time to provide online Internet access and support residential voice services. For Tier 2 or Tier 3 cable operators, it is the industry's most cost-effective, feature-rich CMTS and integrated router. The Cisco uBR7111 and Cisco uBR7114 models are CableLabs qualified to DOCSIS 1.0 specifications. The Cisco uBR7111E and Cisco uBR7114E models are tComLabs qualified to EuroDOCSIS 1.0 specifications. The Cisco uBR7111 and Cisco uBR7111E contain one downstream port and one upstream port. The Cisco uBR7114 and Cisco uBR7114E contain one downstream port and four upstream ports. All models support bidirectional or telco-return traffic.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco uBR7100 Series	• For MxU customers: the Cisco uBR7100 Series enables high-value Internet and residential voice services over a DOCSIS or EuroDOCSIS cable infrastructure • For cable operators: the Multi-tenant/dwelling Unit (MxU) market represents an untapped opportunity to expand broadband cable service. Given the small subscriber base of a typical MxU setting, the challenge has been to deliver robust services quickly and cost-effectively for an accelerated break-even point and a quicker return on investment—enabled by the Cisco uBR7100 Series

7623 3

Key Features

- Complete package that includes a combined router and CMTS with an integrated upconverter, and embedded Network Interface
- Standards-based: DOCSIS 1.0 and DOCSIS 1.1-based; EuroDOCSIS models available
- Reliable operation to ensure the system remains online
- Uses Cisco IOS Software

Cisco uBR7246VXR Universal Broadband Router

The Cisco uBR7246VXR-a member of the Cisco uBR7200 Series-combines the functionality of a CMTS with an advanced router. The Cisco uBR7246VXR provides a single, multiservice, scalable platform that gives cable companies and ISPs the ability to deliver IP data and VoIP services to DOCSIS or EuroDOCSIS-compliant cable modems and set-top boxes. The Cisco uBR7246VXR is CableLabs qualified to DOCSIS 1.1, as well as PacketCable 1.0 specifications. The product is also tComLabs qualified to EuroDOCSIS 1.1 specifications.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco uBR7246VXR	• Positioned for high-growth cable deployments • Flexible port expansion for multiservice deployment options • Supports up to 8,000 subscribers per chassis with 3.2 Gbps back plane • 4 line card slots, 2 port adapter slots, 1 I/O controller slot, 1 NPE slot, and 1 clock card slot for VoIP

Key Features

- Standards-based—Supports DOCSIS/EuroDOCSIS 1.0 and DOCSIS 1.1
- Modularity allows for customized configuration per plant characteristics for optimization of topology and network bandwidth
- Cisco IOS Software—Delivers proven stability and offers advanced features such as multiprotocol routing, tunneling, bandwidth management, QoS, guaranteed service levels, service-level monitoring and many CPE management options
- Ease of management and upgrades—Supports online insertion and removal of components to allow seamless upgrades of port adapters, line cards, and power supplies without service interruption. Provides single, centralized point of administration for remote devices

Specifications

Feature	Cisco uBR7246VXR
Cable Line Cards and Number of Slots	4
Supported cable line cards (Cable Plant Interfaces)	uBR-MC14C; uBR-MC16C; uBR-MC16E; uBR-MC16S; uBR-MC28C
Port Adapter Slots (LAN/WAN interfaces)	2
Supported PA categories	Ethernet: Fast Ethernet; Gigabit Ethernet Serial (V.35, E1-G.703/G.704, T3/E3) Serial Multi-channel T1 HSSI ATM T3/E3 ((PCI-based) ATM OC-3c (PCI-based) POS OC-3c DPT OC-12c/STM4c
Power Supply Shots	2
Power Supply Option	AC; Dual AC; DC; Dual DC

Feature	Cisco uBR7246VXR
Input/Output (I/O) controller	uBR7200-I/O uBR7200-I/O-FE uBR7200-I/O-2FE/E
I/O flash options for PCMCIA slots	Flash disk (48 MB) Flash disk (128 MB)
Network processing engines (NPE)	uBR7200-NPE-G1,NPE-400, and NPE-225
Add-on processor memory options	SDRAM (128 MB, 256 MB) for NPE-225 only SDRAM (128 MB, 256 MB = 512 MB) for NPE-400 only 1 GB, 512 MB, 128 MB for uBR7200-NPE-G1
Router Bandwidth	3.2 Gbps

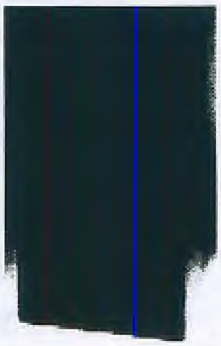
Cisco uBR10012 Universal Broadband Router



The Cisco uBR10012 Universal Broadband Router is a new class of CMTS, that handles the volume, capacity, and complexity of large cable headends or distribution hubs. It combines the revenue-generating features and stability of the market-leading Cisco uBR7200 Series with an architecture that is optimized for aggregation and virtually limitless future growth. The Cisco uBR10012 goes beyond the traditional "carrier class" definition, to deliver the highest level of service availability and capacity of any production CMTS available today. It employs a mix of distributed, centralized, and parallel processing to enable consistently high, real-world performance. The Cisco uBR10012 is CableLabs qualified to DOCSIS 1.0 and DOCSIS 1.1 specifications. The product is also tComLabs qualified to EuroDOCSIS 1.0 specifications.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco uBR10012	• High-end throughput, capacity, and service handling for a mix of IP data, voice, and video services over cable—supporting a wide variety of applications, media, session types, subscriber profiles, and access devices • Support for advanced feature sets, varying QoS requirements, service-level differentiations, and transport strategies (MPEG, IP, multicast, unicast, broadcast) that include implementing flow control to various cable CPE devices

Key Features

- Highest-capacity CMTS that leverages the proven stability of the industry-standard Cisco uBR7200 Series, the highly scalable architecture of the Cisco 10000 Internet Router, and feature-rich Cisco IOS Software
- Multiservice support, optimized to provide high throughput and accelerated processing using PXF technology; exceptional throughput on each connection in the chassis is achieved
- Standards-based design, support includes DOCSIS 1.0 and DOCSIS 1.1
- Reliability—Designed to eliminate single points of failure and allow technicians to swap out cards online; architected to provide redundancy throughout the system that includes redundant processing engines, bus interconnects, and power supplies

- Secure, scalable choices protect your investment and ensure current and future business growth can be accommodated; the architecture supports planned system and network expansion, including scaling IP services forwarding capacity, increasing connection speeds and densities, and extensive route scaling techniques

Specifications

Feature	Cisco uBR10012
Modular Slots	8 slots for cable line cards 4 slots for LAN/WAN interfaces 2 slots for Performance Routing Engines (PREs) 2 slots for Timing Communication and Control Plus (TCC+) modules
Supported Cards	Cable line cards that include: Cisco uBR line cards with a Cisco Line Card Processor (LCP2) and Cisco 5X20 BPE Timing, Communications, and Control Plus (TCC+) card Gigabit Ethernet (GE) network uplink card OC-12 Packet Over SONET (POS) network uplink card OC-48 DPT Interface
Processor Type	Parallel Express Forwarding (PXF)
Flash Memory	48 MB (default); 128 MB (maximum)
DRAM Memory	512 DRAM (default)
Software Supported	Minimum software requirement: Cisco IOS Software Release 12.2(11)BC1 minimum for the Cisco 5X20 BPE, Cisco IOS Software Release 12.2(13)BC minimum for the Cisco OC-48 DPT Interface
Power Supply	DC, AC
Hot-Swappable	Yes
Backplane Capacity	51.2 Gbps
Physical Dimensions (H x W x D)	Height: 31.25 in. (79.4 cm)—18 rack units (RU) Width: 17.2 in. (43.7 cm) Depth: 22.75 in. (57.8) Mounting: 19 in. rack mountable (front or rear), 2 units per 7 ft. rack Note: Mounting in 23 in. racks is possible with optional third-party hardware
Weight	Weight: 235 lb (106.6 kg) fully configured chassis

For More Information

See the Cisco uBR10012 Web site: **http://www.cisco.com/go/ubr10012**

Cisco RF Switch

The Cisco RF Switch works with the Cisco uBR10002 and uBR7246VXR Universal Broadband Router to provide a fully redundant DOCSIS system that enables cable service providers to achieve PacketCable system availability, minimize service disruptions, and simplify operations. The Cisco RF Switch is part of Cisco's newest high-availability N+1 solution set. In combination with the Cisco uBR10012 and uBR7246VXR, the Cisco RF Switch enables a fully redundant CMTS with no single point of failure. The product maximizes density with more than 250 MCX-type connectors that interface the Cisco uBR10012 and the cable plant. The Cisco RF Switch contains RF combiners/splitters, RF switch logic, and RF switch drivers. The product offers ten upstream switch modules, three downstream switch modules, an Ethernet controller module, an AC or DC power supply, and color coding, preterminated cabling.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco RF Switch	As cable service providers enter the VoIP market, high availability (24x7 service) for broadband cable IP services is becoming a requirement. The Cisco RF Switch enables cable service providers to achieve PacketCable system availability, minimize service disruptions, and simplify operations.

Key Features

- Front-panel serviceability with module Hot Swap capability that eliminates downtime for RF paths
- Modular upstream and downstream capacity with ten upstream, three downstream, and one blank slot that optimizes the serviceability of the CMTS; each of the 14 modules represent a port on a cable line card. Each switch module contains seven working or "active" inputs, plus one protect or "standby" input and seven protected outputs. Inputs are connections from the Cisco uBR10012 and uBR7246VXR to the Cisco RF Switch. Outputs are connections from the Cisco RF Switch to the HFC plant
- Fully passive working path; hardware components do not affect data and VoIP services
- Active components only in protect path; servicing of protect cards offer no disruption to data and VoIP services
- Position-sensing latching relays; robust design maintains operation during power disruptions
- Flexible, external design with more than 250 connectors—unmatched port density
- N+1 redundancy

Specifications

Feature	Cisco RF Switch
Input Power Requirements	• AC: 100 to 240 VAC, 50 or 60 Hz, operating range: 90 to 254 VAC • DC: -48 to -60 VDC, operating range: -40.5 to –72 VDC, 200 mVpp ripple/noise
Environmental	• Operational temperature range: 0 to +40°C • Operating temperature range: -5 to +55°C
Unit Control	• 10BaseT Ethernet—SNMP • Switching time from active (working) to standby (protect): 150 mS maximum after SNMP command • Cisco uBR10012 and uBR7246VXR
Connectors	• RF connectors: MCX • AC power: IEC320 type • DC power: Three terminal block • Ethernet: RJ-45 • RS-232 Bus: 9-pin male D
Reliability	• 41,000 MTBF @ +50°C as calculated by Bellcore 5, 80 percent confidence factor
Physical	• Dimensions (H x W x D): 19 x 15.5 x 5.25 in. (842 x 384 x 132 mm) • Weight: 36 lbs
Input Power Requirements	• AC: 100 to 240 VAC, 50 or 60 Hz, operating range: 90 to 254 VAC • DC: -48 to -60 VDC, operating range: -40.5 to –72 VDC, 200 mVpp ripple/noise

Feature	Cisco RF Switch
Environmental	• Operational temperature range: 0 to +40°C • Operating temperature range: -5 to +55°C
RF requirements	• Input/output impedance: 75 ohms • Maximum RF input power: +15 dBm (63.75 dBmV) • Switch type: Electro-mechanical, absorptive for working path, non-absorptive on the protect path • Switch setting time per switch module: 20 ms maximum • Downstream frequency range: 54 to 860 MHz • Typical downstream insertion loss: +/-1.1 dB from CMTS to cable plant; +/- 2.1 dB from protect to cable plant; 5.5 dB from working to output; 8.0 dB from protect to output • Downstream insertion loss flatness: +/- 1.1 dB from CMTS to cable plant; +/- 2.1 dB from protect to cable plant • Downstream output return loss: >15.0dB at <450 MHz, > 12.0 dB at >= 450 MHz • Downstream input return loss: >15.0 dB • Downstream isolation: > 60 dB from channel to channel in working mode; > 52 dB from CMTS to protect when in protect mode • Upstream frequency range: 5 to 70 MHz • Typical upstream insertion loss: 4.1 dB from cable plant to CMTS; 5.2 dB from cable plant to protect • Upstream insertion loss flatness: +/- 0.4 dB from cable plant to CMTS, +/- 0.6 dB from cable plant to protect • Upstream input return loss:> 16 dB • Upstream isolation: > 60 dB from channel to channel in working mode; > 60 dB from CMTS to protect when in protect mode • Protect mode: CMTS return loss >10 dB, cable plant return loss: >10dB

Broadband Cable—Customer Premise Equipment (CPE)[1]

Cisco uBR900 Series Cable Access Routers

The Cisco uBR900 Series Cable Access Routers provide commercial services for cable operators, allowing them to expand their broadband service offerings. Both the Cisco uBR905 and Cisco uBR925 support IP data transmission over a cable plant and offer hardware-accelerated IPSec VPN support.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco uBR905 Cable Access Router	• Data-only broadband services (or voice separately via Ethernet) • High-speed, secure remote tunneling via hardware accelerated IPSec VPN
Cisco uBR925 Cable Access Router	• Two voice (VoIP) connections via RJ-11 ports • Data broadband services, router functionality, and VPN support • Easy-to-manage solution for telecommuters and small offices

[1] Cisco VoIP Residential CPE Partner Program—To help drive deployment of residential VoIP services to market, Cisco offers a program that identifies low-cost residential VoIP modems that have passed interoperability testing with Cisco. Cable service providers should contact their sales representatives for vendors, models, pricing and volume discount opportunities.

Key Features

- Integrated high-speed cable modem and router that operates with any DOCSIS 1.1 or DOCSIS 1.0-compliant CMTS; both Cisco uBR900 Series models are DOCSIS 1.1-ready
- Integrated Cisco IOS Software router, cable modem, and four-port Ethernet hub that offers advanced networking capabilities and investment protection

Specifications

Feature	Cisco uBR905	Cisco uBR925
Ports	4-port 10Base-T Ethernet hub 1-port console 1-port CATV (Female F Connector)	4-port 10Base-T Ethernet hub 1-port USB 2 ports RJ-11 1-port console 1-port CATV
Routing Features	NAT/PAT, DHCP Server	Same as Cisco uBR905
Security Features	56-bit IPSec 3DES IPSec optional IPSec hardware acceleration Firewall optional	Same as uBR905
Voice Support	No	Yes

For More Information

See the uBR900 series Web site: **http://www.cisco.com/go/ubr900**

Remote Cable Access—Network Management Products

Cisco Cable Manager

Cisco Cable Manager is a client/server application that helps cable service providers deploy, maintain, monitor and troubleshoot cable equipment on an HFC network. The product manages DOCSIS and EuroDOCSIS-compliant CMTS and CPE, providing both operations center visibility, as well as technician access.

Cisco Cable Diagnostic Manager

Cisco Cable Diagnostic Manager is a web-based tool to help Customer Service Representatives at cable companies better handle subscriber calls and determine where problems reside in the network. Cisco Cable Diagnostic Manager provides status summary for the network neighborhood and fiber node, status on the DOCSIS or EuroDOCSIS-certified cable modem, as well as status on the Cisco CMTS products: Cisco uBR10012, uBR7200 Series, and uBR7100 Series.

Cisco Broadband Troubleshooter

Cisco Broadband Troubleshooter provides an efficient tool to help network operations center (NOC) personnel and field technicians detect, diagnose, and isolate problems between the cable plant and connected DOCSIS CPE devices. The product allows a technician to characterize upstream and downstream trouble patterns and quickly identify "flapping" CPE devices that are experiencing persistent connectivity problems. Operators can quickly discern CPE connectivity impairments by identifying noise, attenuation, provisioning, and packet-corruption issues.

Cisco Broadband Configurator

Cisco Broadband Configurator is a GUI-based tool designed to collect information needed to generate and download configuration files for DOCSIS or EuroDOCSIS cable modems and set-top boxes. There are two versions of the tool: a free, web-based version accessible via Cisco.com, and a stand-alone Java-based desktop version. Cisco Broadband Configurator enables point and click configuration of CPE values for RF, class of service, vendor information, SNMP parameters, BPI, TFTP, telco-return attributes, and CPE data.

For More Information

See the Cable Manager Web site: **http://www.cisco.com/go/cablemgr**
See the Cisco Cable Troubleshooter Web site:

DSL Remote Access—Customer Premise Equipment (CPE)

Cisco offers the industry's broadest array of business-class DSL (G.SHDSL and ADSL) CPE solutions, from Enterprise to branch office, to Small Office/Home Office (SOHO) applications. Cisco's CPE solutions offer the choice of key features including Firewall, VPN, and Voice-over DSL support. And, Cisco's industry leading IOS-based capabilities enable QoS, policy management, and standardized set-up and configuration. Cisco CPE Products include:

- Cisco SOHO Series Ethernet, ADSL over ISDN, ADSL and G.SHDSL RoutersRouters (page 1-8)
- Cisco 800 Series Routers (page 1-9)
- G.SHDSL WAN Interface Cards (WICs) for 1700, 2600/2600XM, 3600 Series (see
  Chapter 1: Routers)
- Cisco IAD 2400 Series (w/G.SHDSL) (page 4-21)

Broadband Services Aggregation

The Cisco broadband aggregation portfolio includes the Cisco 6400 Broadband Aggregator, Cisco 7200 Series Router, the Cisco 7400 Series Internet Router, and the Cisco 10000 Series Internet Router. This portfolio covers all possible broadband aggregation markets. The Cisco 6400 and Cisco 10000 Series routers are carrier class broadband aggregation routers designed to provide high-density, high-performance services while maintaining the high-availability standards of large-scale carrier deployments. The Cisco 7200,Cisco 7301and Cisco 7400 Series routers cover the ISP and retail space by providing a dense, feature-rich platform but only taking a small footprint in the network.

- Cisco 7400: Highest density PPP aggregation per rack-unit
- Cisco 7301: Highest Density PPP aggregation per rack-unit
- Cisco 7200: Most versatile platform
- Cisco 6400: Only platform offering ATM switching and broadband aggregation
- Cisco 10000: Highest availability on a carrier-class integrated edge router

With this portfolio, Cisco can address the broadest set of requirements in terms of form factor, density, performance and scale, and offer customers a unique level of choice, with products optimized for any customer deployment.

Cisco 7200 Series

When ordered with the Cisco IOS 7200 Series Broadband User Services License (part number FR-BUS72), the 7200 delivers scaled PPP, RBE, and L2TP sessions and tunnels in addition to rich IP services. It enables service providers to provision broadband Internet access and supports all of the popular access technologies deployed today, including DSL, Cable, Wireless, and Dial Access. It is ideal for medium-density applications and is capable of handling up to 16000 subscribers in a single chassis. The 7200 is a modular platform with a choice of processing engines and a wide variety of WAN and LAN port adapters, including T1/E1, DS3, OC-3, Fast Ethernet, and Gigabit Ethernet. See page 1-31 for more information on the 7200 series.

Cisco 7301 Series

When ordered as 7301-BB-8K and 7301-BB-16K the Cisco 7301 Series Router provides a compact, high-performance single-rack-unit (1RU) router coupled with a broad set of interfaces and Cisco IOS® Software features, which makes it ideal for Broadband applications. The Cisco is capable of handling up to 16,000 simultaneous sessions and allowing for a pay-as-you-grow "rack and stack" architecture.

Cisco 7400 Series

When ordered as a part number 7401ASR-BB, the 7400 series provides high-performance broadband services aggregation like the 7200, but in a low-power one rack unit (1 RU) form factor. It offers one port adapter (PA) slot supporting over 40 standard 7200 series PAs, including T1/E1, DS3, OC-3, Fast Ethernet, and Gigabit Ethernet; making it ideal for small- and medium-density applications. See page 1-38 for more information on the 7400 series.

Cisco 10000 Series

With recent enhancements, the Cisco 10000 is the industry's only integrated edge router that delivers highly available, line-rate performance without compromises for service providers deploying IP services to broadband, leased line, ATM, and frame relay customers. With 99.999 percent uptime, the platform delivers high-performance broadband features including support for 32,000 (61,500 in the future) broadband subscribers, hardware-accelerated PPP over Ethernet and PPP over ATM, routed bridge encapsulation and 1483 routing. See page 1-47 for more information on the 10000 series.

Cisco 6400 Series

The Cisco 6400 is designed for use in high-availability environments such as service provider central offices, and corporate premises; and aggregates access media (DSL, cable, wireless, and dial) to serve as the intelligent equal access point, allowing multiple operating companies and service providers access to end users. It includes switch, router, and line card redundancy.

The Cisco 6400 is a high-performance service gateway that enables the delivery of network services, VPNs, and voice- and entertainment-driven traffic over any access media. ATM interfaces connect the Cisco 6400 to dial access servers, DSLAMs, and Cisco IP DSL Switches; ATM and packet interfaces connect to the network core.

Key Features

- Session scalability and modular design—The Cisco 6400 represents a quantum leap in session scalability, capable of scaling from 2000 subscribers in its entry level configuration to 96,000 subscribers in a full configuration.
- Routing and VPN scalability—Using the Cisco 6400, service providers can simultaneously route end-user traffic over secure, independent pathways exceeding 1000 different domains or end destinations, with an aggregate throughput of over 2.4 Gbps forwarding capacity for handling even the most bandwidth-intensive broadband traffic.

For More Information

See the 6400 series Web site: **http://www.cisco.com/go/6400**

ATM Multiservice WAN Switching

Cisco BPX 8600 Series—Advanced ATM Multiservice Switches

The Cisco BPX 8600 series is standards-based ATM switch with advanced IP and ATM capabilities. Designed to meet the demanding, high-traffic needs of a public service provider or large private enterprise, the BPX switch delivers high-performance ATM switching, multiservice adaptation and aggregation for all types of user traffic. Proven in the world's largest ATM and Frame Relay networks, the BPX 8600 enables service providers and large enterprises to meet skyrocketing network demands.

The Cisco BPX 8600 series switch offers up to 20 Gbps of high-throughput switching for multiple traffic types data, voice, and video and supports a wide range of interfaces, from Frame Relay to full broadband subscriber interfaces, up to 622 Mbps. You can offer multiple services for LAN, X.25, SNA, IP, Frame Relay, and ATM traffic from a single BPX platform. The Cisco BPX 8600 series supports multiprotocol label switching (MPLS) today, and this functionality can be easily added to any BPX switch already installed in the field.

For More Information

See the Cisco BPX Web site: **http://www.cisco.com/go/bpx**

Cisco MGX 8850 ATM Multiservice Switch

The Cisco MGX 8850 ATM Multiservice Switch enables delivery of a complete portfolio of service offerings while scaling from DS0 to OC-48c/STM-16 speeds. It enables service providers to be first to market with the new high-margin voice and data services while maintaining existing services.

The MGX 8850 universal chassis provides a unified ATM architecture that delivers a complete portfolio of differentiated services —from circuit emulation to IP VPNs—all with a single chassis, to enable service providers to easily add new services.

7613
ε

The Cisco MGX 8850 can function in three different modes of operation:

- PXM-1 configuration—Operates as a stand-alone device for narrowband services, or as an integrated edge concentrator for the Cisco BPX 8600 series or the Cisco MGX 8850 PXM-45
- PXM-1E configuration-Operates as a stand alone switch for low density narrowband services and included 1.2 Gbps switch card and PNNI routing
- PXM-45 configuration—Serves as a broadband edge switch and includes the 45 Gbps switch card and broadband ATM modules

Key Features

- Flexible ATM multiservice platform
- Highly scalable—from 1.2 to 45 Gbps of non-blocking throughput in single chassis
- Highest reliability, availability, and serviceability in the industry
- IP VPNs using Cisco IOS software-based Multiprotocol Label Switching (MPLS)
- Market-leading Frame Relay capabilities, with price-per-port leadership and advanced QoS
- High-density Point-to-Point protocol (PPP) for Internet access and aggregation
- Full-featured narrowband ATM for managed data, voice, and video services; high-density broadband ATM for wholesale ATM services
- Circuit Emulation for Private Line replacement
- Highly scalable packet voice gateway providing VoIP, VoATM(AAL1 & AAL2), ATM SVCs, Onboard MPLS

For More Information

See the Cisco MGX 8850 Web site: **http://www.cisco.com/go/mgx8850**

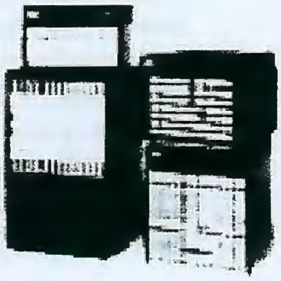
Cisco MGX 8830 ATM Multiservice Switch

The Cisco MGX 8830 Advanced ATM Multiservice Switch extends a full suite of narrowband interfaces and broadband trunking to remote sites with low density and high service mix requirements, using PNNI and MPLS for flexible network and services evolution. The Cisco MGX 8830, with a switching capacity of up to 1.2 Gbps, acts as a standalone switch, and offers a full range of service interfaces.

For More Information

See the Cisco MGX 8830 Series Web site: **http://www.cisco.com/go/mgx8830**

Cisco MGX 8200 Series



Cisco MGX 8230 Edge Concentrator

The Cisco MGX 8230 Edge Concentrator provides the most cost-effective gateway for narrowband services in space and power limited situations. It can acts as a stand-alone gateway or as an edge concentrator for the Cisco BPX 8600, Cisco MGX 8850 with PXM-45, and IGX 8400 series multiservice switches. The MGX 8230 offers a full range of narrowband service interfaces and a switching capacity up to 1.2 Gbps.

Cisco MGX 8250 Edge Concentrator

The Cisco MGX 8250 is a high-density edge concentrator designed for service providers needing flexibility for aggregation of IP, voice, Frame Relay, circuit emulation, and ATM services. An ATM narrowband edge concentrator, the MGX 8250 can serve as a stand-alone edge concentrator or as a feeder node for the Cisco BPX 8600 series and MGX 8850 switches. The MGX 8250 Edge Concentrator offers up to 1.2 Gbps of IP + ATM switching capacity.

For More Information

See the Cisco MGX 8200 Series Web site: **http://www.cisco.com/go/mgx8200**

Cisco IGX 8400 Series Multiservice WAN Switch

Efficient bandwidth utilization, intelligent QoS management features, and carrier-class reliability make the IGX 8400 series switch the ideal choice for meeting unique Wide-Area Networking (WAN) needs. This series provides the ATM backbone required to deliver data, voice, fax, and video services with guaranteed quality of service (QoS). The IGX 8400 series switch connects to public services for reduced leased-line costs by maximizing the use of these WAN links. Available with 8, 16, or 32 slots, the IGX 8400 series switches offers high flexibility to meet a wide range of Enterprise and Service Provider needs. Tight integration with the broad range of Cisco access products enables you to efficiently and cost-effectively run backbone-to-branch data, voice, fax, and video services between premises. By integrating IOS technology, the Cisco IGX 8400 series switch helps deliver a seamless migration path to technologies such as VoIP and MPLS.

For More Information

See the Cisco IGX 8400 Web site: **http://www.cisco.com/go/igx**

Cisco Long Reach Ethernet Solution

The Cisco Long-Reach Ethernet solution meets the demands of high bandwidth applications while leveraging existing copper wiring infrastructures. Catalyst® 2950 Long-Reach Ethernet (LRE) Series switches enable enterprise and service provider customers to extend intelligent Ethernet services over existing phone and legacy wiring, at distances of up to 5000 feet. Cisco is the only company with the breadth of technologies that allow customers to deliver intelligent network services across any combination of wired and wireless infrastructures.

The Cisco 2950 LRE solution includes the Cisco Catalyst® 2950 LRE switches, the Cisco 575 and 585 LRE Customer Premise Equipment (CPE) devices, and the Cisco LRE POTS Splitter. Each LRE link is terminated with either the Cisco 575 or 585 LRE CPEs, and a POTS splitter is required when POTS traffic coexists with the LRE link over the same line.

Catalyst 2950 LRE Series Intelligent Ethernet Switches

The Cisco Catalyst® 2950 LRE switches are fixed-configuration, stackable models that provide wire-speed LRE and Gigabit Ethernet connectivity for small and midsized networks. The Catalyst 2950 Series is an affordable product line that brings intelligent services, such as enhanced security, high availability and advanced quality of service (QoS), to the network edge-while maintaining the simplicity of traditional LAN switching. When a Catalyst 2950 LRE switch is combined with a Catalyst 3550 Series switch, the solution can enable IP routing from the edge to the core of the network. Embedded in Catalyst 2950 Series switches is the Cisco Cluster Management Suite (CMS) Software, which allows users to simultaneously configure and troubleshoot multiple Catalyst desktop switches using a standard Web browser. In addition to CMS, Cisco Catalyst 2950 LRE switches provide extensive management tools using Simple Network Management Protocol (SNMP) network management platforms such as CiscoWorks for Switched Internetworks.

The Cisco Catalyst 2950 LRE switches consist of the following devices-which are based upon the Enhanced Image (EI) Software for the Catalyst 2950 Series.

- Catalyst 2950ST-24-LRE-24 LRE ports + 2 10/100/1000BASE-T ports + 2 Small Form-Factor Pluggable (SFP) ports (two of the four uplinks active at one time)
- Catalyst 2950ST-8-LRE-8 LRE ports + 2 10/100/1000BASE-T ports + 2 SFP ports (two of the four uplinks active at one time)

The two built-in Gigabit Ethernet SFP ports support 1000BASE-SX and 1000BASE-LX modules. The dual SFP-based and copper Gigabit Ethernet implementation provides customers with tremendous deployment flexibility-allowing customers increased availability with the redundant uplinks. High levels of stack resiliency can also be implemented by deploying dual redundant Gigabit Ethernet uplinks and UplinkFast technologies for high-speed uplink and stack interconnection failover, and Per VLAN Spanning Tree Plus (PVST+) for uplink load balancing.

Cisco 575 and 585 LRE CPE Devices

Each LRE port is terminated in the room with either the Cisco 575 or 585 LRE Customer Premise Equipment (CPE) devices. These compact devices bridge LRE and Ethernet. The 575 CPE has one RJ-45 Ethernet connection and two RJ-11 connectors—one for the wall and one for a telephone. The 585 CPE has four RJ-45 switched Ethernet connections and two RJ-11 connectors and supports 802.1p QoS so that voice and video traffic are prioritized over normal data traffic. Both the Cisco 575 and 585 LRE CPE device can be mounted on or under a desk, or on a wall. They ship with a mount lock-in mechanism and clip-on Ethernet cable guard to discourage theft. It supports voice (Plain Old Telephone Service—POTS) traffic-including ISDN or digital phones-that coexists over the same LRE line by splitting LRE and POTS traffic at the CPE device.

Cisco LRE 48 POTS Splitter

The Cisco LRE 48 POTS Splitter is a high-density, low-cost device that is ideal for building deployments where the PBX system is on-site and POTS traffic must coexist over the same copper wiring as LRE traffic. Unlike "splitterless" building broadband network solutions, the Cisco LRE 48 POTS Splitter ships as a separate, compact form factor to ensure that POTS service is separate, and never compromised by LRE switch reconfigurations or downtime.

The Cisco LRE 48 POTS Splitter supports 48 ports in a 1RU form factor. Each splitter has six RJ-21 connectors-two each for connectivity to the patch panel, the LRE switch(es), and the on-site PBX system.

Key Features

- Performance—Delivers 2-15 Mbps symmetric over existing category 1/2/3 wiring at distances up to 5000 feet. Rate Selection feature automates the process of selecting a data rate for a line for ease of installation and increased robustness.
- Powerful Gigabit Ethernet uplink options—1000BaseT and SFP ports
- Superior control through intelligent services—advanced quality of service and security based on Layer 2 through Layer 4 parameters.
- Multicast support—Multicast VLAN Registration (MVR) and IGMP Snooping.
- Enhanced Cisco IOS Services
- Network Management—Cisco Switch Clustering technology and the advanced, Web-based Cisco Cluster Management Suite (CMS) software deliver easy-to-use configuration and ongoing monitoring and management of up to 16 switches. This software is embedded in the switches and delivers remote management of clustered switches and connected CPE devices through a single IP address

Cisco Building Broadband Service Manager (BBSM) Version 5.2

Cisco Building Broadband Service Manager (BBSM) is an access gateway for public access networks that enables simple, plug-and-play access, end user self-provisioning of services, customizable portal and advertising platforms and Web-based management, reporting and configuration. In addition, multiple automated authentication and billing options are supported, including credit card, RADIUS, property management system and access code.

The Cisco BBSM platform manages Internet access services with no routine IT support, enabling property owners and service providers to offer services in remote and unattended locations. BBSM supports tiered service levels in order to deliver targeted customer offerings. For instance, a hotel can set-up daily network access for a series of meetings providing a variety of bandwidth/pricing options to capture lucrative meeting room revenue opportunities.

The Cisco BBSM has been designed for compatibility with Cisco access-layer LAN products to provide a complete solution that enables service providers or property owners to create, market and operate broadband access services in new vertical markets such as: Hospitality, Higher-Education, and Public Access

Cisco BBSM Hotspot Server Version 1.0

The Cisco Building Broadband Service Manager (BBSM) Hotspot server connects mobile users to broadband services anywhere, anytime. Cisco BBSM Hotspot is a cost effective access management gateway suited for small- to medium-sized public access locations, as well as for visitor access in larger enterprise locations. BBSM Hotspot enables simple plug-and-play connectivity, end user self-provisioning of services, and multiple authentication options.

BBSM Hotspot works with Cisco Local Area Network (LAN) products to provide a complete solution for secure wired and wireless Internet Access for visitors, guests and other temporary users. Use Cisco BBSM Hotspot to manage and operate broadband access services in public hotspots, small hotels, and public overlays on business networks.

For More Information

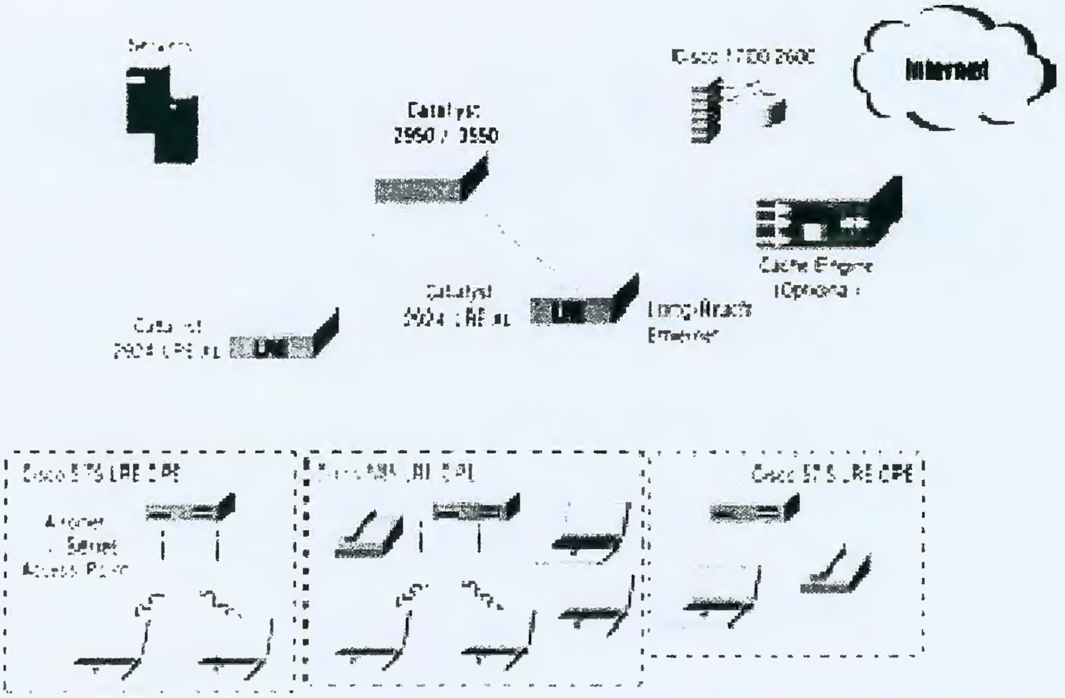
Sample LRE Solution Overview—Broadband Internet Access for MxU



CHAPTER 8

Optical Transport

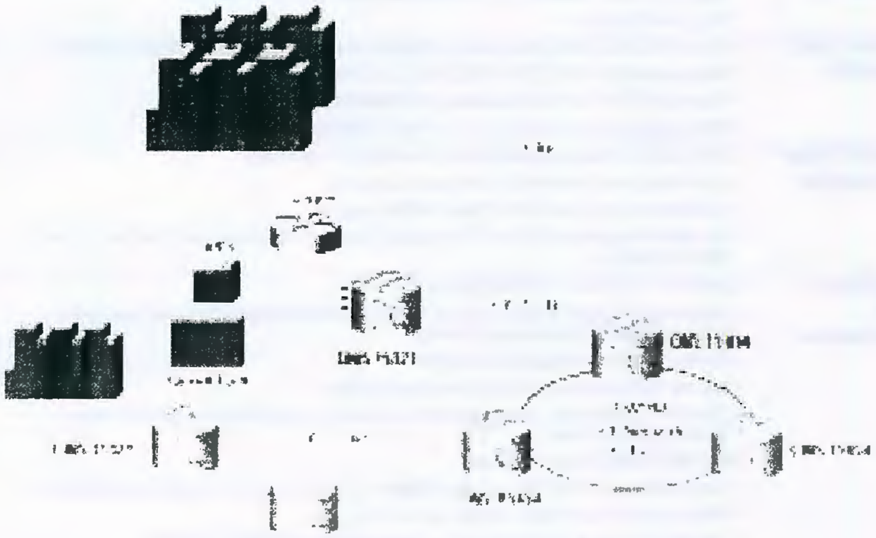
Optical Transport Products at a Glance

Product	Features	Page
Cisco ONS 15200 Metro DWDM Series	Cisco ONS 15252 and ONS 15201 DWDM solutions • Supports a mixture of point-to-point, hubbed, and meshed traffic patterns (SDH/SONET, Gigabit Ethernet over a range of line rates up to 2.5 Gbit/s) • Modular architecture, capacity may be added channel-by-channel in a highly cost-effective manner • High transmission efficiency for more channels, nodes and greater distances • Compact design	8-3
Cisco ONS 15302/15305 SDH Multiservice CPE & Aggregation Platforms	The Cisco ONS 15302/ONS 15305 Multiservice CPE and aggregation solutions are ultra-compact integrated systems that extend next-generation optical networks (access nodes or CPE): • Low Cost Access or CPE Platform • E1, E3, DS3, 10/100 BaseT Ethernet and GigE • STM-1 (15302) or STM-1/4/16 (15305)	8-3
Cisco ONS 15327 SONET Multiservice CPE & Aggregation Platform	Metro Edge Multiservice Provisioning Platform (MSPP) • Highly cost-efficient for delivering multiservices to the metro edge • Aggregates and switches TDM, 10/100/GigE, data and video services • Very small footprint	8-4
Cisco ONS 15454 SONET and ONS 15454 SDH Platforms	Industry-leading SONET Multi-service Provisioning Platform (MSPP) and SDH MSPP: • Aggregates DS1, DS3, STS-1, OC-3, OC-12, OC-48 • Supports OC-192 and mulitwavelength DWDM optics • Wide range of data interfaces, including 10/100/GigE, data and video	8-4
Cisco ONS 15501 Erbium Doped Fiber Amplifier	• Designed for Enterprise and Service Provider environments • Low-noise, gain flattened C-band optical amplifier • Complements the Cisco ONS 155xx DWDM solution • Capable of extending 100GHz, 32-channel, 2.5Gbps / 10Gbps optical infrastructure over longer distances	8-5
Cisco ONS 15216 and 15501 Optical Transmission Families	Cisco ONS 15216 Metro DWDM Series • Supports 32 ITU-grid wavelengths at 100 GHz spacing and provides unprecedented transport flexibility with optical filtering • Optical Add/Drop Multiplexing (OADM) • Optical Performance Monitoring and Amplification • The ONS 15216 allows carriers to deliver more services per wavelength and more wavelengths per fiber Cisco ONS 15501 Optical Amplifier • Constant flat gain of 17 dB over the 1530nm to 1563nm band simplifies network design. • Metro optimized auto gain control and variable gain • Low noise figure of <6.0 dB allows the use multiple amplifiers in cascade • Input power range of -29 to 0 dBm	8-5
Cisco ONS 15530 Metro DWDM Aggregation Platform	Metro Optical DWDM Multiservice Aggregation Platform • Enables storage and data networking, transparent wavelength services, and legacy applications • ESCON Aggregation up to 40 channels on 1 wavelength • Scales from 2.5Gbps to 10Gbps • Supports wide range of protocols over optical infrastructure • Highly resilient network with flexible topology design options	8-5

7605 G

Product	Features	Page
Cisco ONS 15540 Extended Services Platform	Highly modular and scalable next-generation Dense Wave Division Multiplexing (DWDM) platform • Ideal for enterprises and service providers • Delivers the integration of data, storage and metro networking • Ultra-high bandwidth intelligent optical infrastructure • Supports any packet on any wavelength from any platform	8-6
Cisco ONS 15600 Multiservice Switching Platform (SONET/SDH)	The Cisco ONS 15600 MSSP is a true multiservice switch, providing carrier class reliability, availability, serviceability, operations, and management. • Combines the functionality of multiple metro systems including SONET/SDH multiplexers and digital cross-connect network elements • Scalable, easy-to-use platform supports all metrotopologies	8-7
Cisco Transport Manager (CTM 4.x) (Network Management)	Carrier-class element management system • Ideal for service provider and enterprise networks • Supports Cisco ONS 15454/15327/15600 (SONET/SDH), 15540, 15530, 15501, 152xx, 1580Xsystems • Manages fault /performance/configuration/alarm/security/inventory/administrative tasks • Native Circuit/Equipment Provisioning for 15454/15327/15600 SONET/SDH product family • Northbound interfaces include SNMP, TL1 and CORBA • Integrates into OSS/BSS systems • Requires SUN/Solaris/UNIX server and Oracle database	8-8
Cisco 10720 Internet Router	Service provider-class metro access services router • Optimized building block for the next generation metro IP network • Equipped with 24 ports of Ethernet technology for customer access and dynamic packet transport (DPT) technology for metro optical connectivity • Powered by Cisco IOS software and the parallel express forwarding (PXF) architecture • Cost-effective, reliable platform supporting full suite of IP routing protocols • With DPT architecture, enables optimal fiber connectivity as well as features such as IP class of service, TLS, VoIP and VPN services See Chapter 1—Routers for more information on the Cisco 10720 Internet Router	1-49

Sample Metro Optical Transport Solution Overview—Delivering Multiservices to the Edge



Cisco ONS 15200 Optical Metro DWDM Series

The Cisco ONS 15252, 15201, and 15216 are part of the Cisco ONS 15200 Metro DWDM family, the first solution to deliver instant wavelengths to buildings, premises, or PoPs.

The ONS 15252 and 15201 may be used to realize many sub-network topologies and can handle a mixture of point-to-point, hubbed, and meshed traffic patterns. Capacity may be added channel-by-channel in a highly cost-effective manner. Since they feature broadband transponders, a wide range of traffic types may be handled (SONET/SDH, Gigabit Ethernet) over a range of line rates up to 2.5 Gbs. Channel protection options include unprotected, client-protected, and (optical channel) fiber protection. The ONS 15252 is a multi-channel unit and the ONS 15201 is a single channel unit node. Both have exceptionally small footprints and low power consumption.

The Cisco ONS 15216 supercharges wavelength services by supporting up to 32 ITU-grid wavelengths, and provides unprecedented transport flexibility with optical filtering, Optical Add/Drop Multiplexing (OADM), Optical Performance Monitoring and Amplification. It allows service providers to deliver more services per wavelength and more wavelengths per fiber.

The Cisco ONS 15216 optical filter solution enables service providers to deploy point-to-point, bus, and ring networks using the terminal filter multiplexing and demultiplexing and OADM. The Cisco ONS 15216 platform provides an open and flexible solution to combine wavelengths launched by the Cisco ONS 15454, ONS 15252, ONS 15201, and ONS 15540. The Cisco ONS 15216 supercharges wavelength services and extends Cisco's optical leadership to metro regional DWDM.

For More Information

See the ONS 15200 Series Web site: **http://www.cisco.com/go/ons15200**

Cisco ONS 15302/15305 SDH Multiservice CPE & Aggregation Platforms

The Cisco ONS 15302/ONS 15305 Multiservice CPE and Aggregation solutions are ultra-compact integrated systems that offer cost effective solutions with short ROI. These platforms provide native multiservice capabilities (i.e., TDM interfaces, multiplexing and Ethernet data interfaces). These products can be managed under Cisco Transport Manager (CTM), Cisco's unified optical network management system.

The ONS 15302 CPE platform provides the following TDM interfaces—STM-1 uplink (protected or unprotected STM-1 optical uplink, 1+1 MSP, future SNCP) and E1 customer interfaces (12 E1 ports). This product also provides native Ethernet customer access via 4-port 10/100BaseT module that supports full layer 2 capacity, bridging, VLANs, spanning tree, and priority management. An optional WAN module is available for point to multi-point applications.

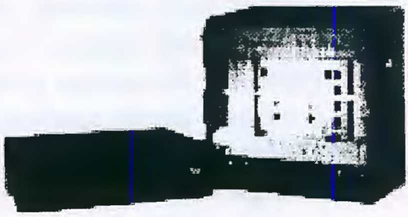
The ONS 15305 Aggregation platform provides the following TDM interfaces—protected or unprotected optical interfaces (8 port S-1.1 optical module, 2 port S-4.1 optical module, 1 port S-16.1 optical module, 1+1 MSP, SNCP, 2F MS-SPRing for STM-16) and electrical customer interfaces (8 and 63 port E1 modules and a 6 port

E3/DS3 module). This product also provides native Ethernet customer access via an 8-port 10/100BaseT module and a 2-port GigE module (supports full layer 2 capacity, bridging, VLANs, spanning tree, and priority management). An optional WAN module is available for point to multi-point applications.

For More Information

See the ONS 15302/ONS 15305 web site: **http://www.cisco.com/go/ons15300**

Cisco ONS 15454 and 15327 Multiservice Provisioning Platforms



The Cisco ONS 15454 and ONS 15327 Multi-service Provisioning Platforms (MSPP) are key building blocks in today's optical networks due to their unprecedented transport performance and economics. They offer supercharged transport capability by combining the best of traditional SONET TDM (time division multiplexing) and statistical multiplexing in single units.

The Cisco ONS 15454 aggregates traditional facilities such as DS1, DS3, STS-1, OC-3, OC-12, and OC-48 including multi-wavelength DWDM optics, but it also supports data interfaces for 10/100/GigE, data and video. This enables drastically improved efficiencies in the transport layer and breakthrough cost savings for initial and life cycle deployment. A single ONS 15454 shelf can support combinations of OC-3/c, OC-12/c, OC-48/c, and OC-192.

The new Cisco ONS 15454 SDH MSPP offers an international optical transport solution that combines the best of traditional SDH TDM and statistical multiplexing in a single platform. The Cisco ONS 15454 SDH MSP can aggregate traditional services such as E1, E3, DS3, STM-1, STM-4, STM-16 and STM-64 including multi-wavelength DWDM optics, but is also designed to support data interfaces such as Ethernet/IP.

The Cisco ONS 15327 combines industry-leading bandwidth capacity and service diversity in a very compact footprint, enabling service providers to achieve radical economics at the metro edge. Based on the same technology as the industry leading Cisco ONS 15454, the ONS 15327 supports high optical bandwidth and has the ability to drop a DS1 from an OC-48 stream. With comprehensive STS- and VT-level bandwidth management and integrated data switching, the Cisco ONS 15327 also serves as a digital cross-connect without the need for additional equipment. It aggregates and switches TDM, Ethernet, and ATM services, and can be managed using the Cisco Transport Manager element management system.

For More Information

See the ONS 15454 SONET Web site: **http://www.cisco.com/go/ons15454**

See the ONS 15454 SDH Web site: **http://www.cisco.com/go/15454sdh**

See the ONS 15327 Web site: **http://www.cisco.com/go/ons15327**

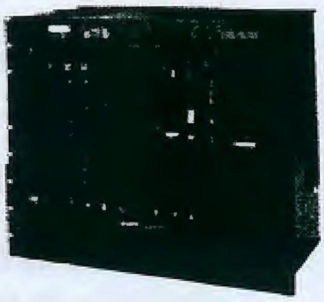
Cisco ONS 15501 Erbium Doped Fiber Amplifier

The Cisco ONS 15501 is a low-noise, gain-flattened C-band optical erbium doped fiber amplifier designed to extend the distance of today's metro high-bandwidth optical network beyond existing optical budget constraints. The Cisco ONS 15501 complements the Cisco ONS 155xx DWDM and Catalyst 6500 solutions, providing customers with the capability to extend their 2.5-Gbps or 10-Gbps optical infrastructures over greater distances. Packaged in a one-rack-unit (1RU) chassis, the Cisco ONS 15501 incorporates features such as 17-dB constant flat gain, automatic gain control, and low noise figure for excellent Optical Signal to Noise Ratio (OSNR) characteristics.

For More Information

See the Cisco ONS 15501 Web site: **http://www.cisco.com/go/ons15501**

Cisco ONS 15530



The Cisco ONS 15530 is a DWDM (dense wavelength division multiplexing) multiservice aggregation platform. The ONS 15530 can be used in applications such as storage networking, data networking, transparent wavelength services, and legacy SONET / SDH / ATM. These features make the ONS 15530 an excellent choice for building a scalable, ultra-high-bandwidth-ready, intelligent optical aggregation and transport infrastructure.

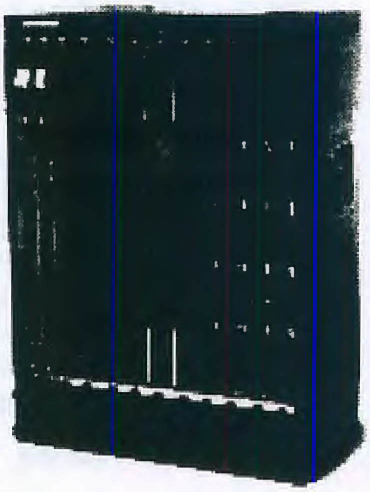
Key Features

- Aggregation—up to 40 ports of ESCON or 8 ports of Fibre Channel, FICON, or Gigabit Ethernet per wavelength, lowering total cost of ownership through bandwidth efficiency
- Scalability—up to 32 wavelengths ranging from 2.5Gbps to 10Gbps for network growth and design flexibility
- Multiservice Interfaces—protocol-independent transponders supporting data rates between 16Mbps to 2.5Gbps for protocols such as ESCON, FICON, Fibre Channel, 2G Fibre Channel, Gigabit Ethernet, SONET/SDH, Digital Video, and other protocols
- Cost-efficient point-to-point fiber trunk protection capability using the Protection Switch Module
- Complete Amplification Solution—Together with ONS 15501 EDFA optical amplifier, the VOA modules enables enterprises and service providers to further expand their optical DWDM networks over greater distances.
- Design Flexibility—can be used to deploy Point-to-point, Hub Ring, or Mesh Ring networks
- Network assurance—through high availability and resilient optical design
- IOS-based—easily integrates into existing Cisco networks

For More Information

See the Cisco ONS 15530 Web site: **http://www.cisco.com/go/ons15530**

Cisco ONS 15540 Extended Services Platform (ESPx)



The ONS 15540 Extended Services Platform with external cross connect capability (ESPx) is a highly modular, flexible, and scalable next generation dense wave division multiplexer (DWDM) platform that integrates data networking, storage area networking (SAN), time division multiplexing, (TDM) Synchronous Optical Network (SONET) and Synchronous Digital Hierarchy (SDH) technologies over an ultra high bandwidth, intelligent optical infrastructure that can support any packet, over any wavelength on any platform.

- Flexible Multi-Protocol Support—The Cisco ONS 15540 offers both variable rate transparent and fixed rate multi-protocol transponders that feature user selectable small form factor pluggables (SFPs) and support a variety of industry standard data rates between 16Mbps to 2.5Gbps as well as 10Gb Ethernet
- Scalable, flexible, and modular architecture in a high-density compact footprint—Provides superior operational support and network expansion on an as needed basis through its hot swappable modular lines cards, transponders, and optical multiplexers
- Simple Network Consolidation and Comprehensive Multi Service Support provided by the available ONS 15540 2.5GB and 10GbE transponders
- Optical, Service, and Application Level Performance Monitoring—provides industry-leading supports for service level agreements (SLAs)
- High Availability for mission critical networks—Provides 99.999% availability for demanding Managed Network Service Providers and enterprise business continuance applications, with hardware redundancy and automatic protection switching to protect against fiber cuts and equipment failures
- Multi-Service Integration—Transports ESCON, FICON, 1Gb/2GB Fibre Channel for Storage Area Networking (SAN), Fast and Gigabit Ethernet, and 10 Gb Ethernet for data networking, and SONET/SDH at OC-3/STM1, OC-12/STM4, and OC-48/STM12

Key Features:

- Compact modular design with external connectorization: External Direct Connect system from Line card to OADMs; Optional cross connect and fiber management system
- Transparent Tuneable Variable data rate Type 1 Transponders: 16Mbps to 622Mbps MM fiber support; 16Mbps to 2.5Gbp SM fiber support; 16 Tuneable transponders support 32 channels for reduced sparing costs; Multi-protocol support for Enterprise
- Tuneable Type 2 Transponders with Multi Protocol Small form Factor Pluggables (SFPs): Variable data rate support between 16Mbps to 2.5Gbps; 16 Tuneable transponders support 32 channels for reduced sparing costs; Multi-protocol SFP Support
- Standards based Management support for SNMP, Ciscoview and Cisco Transport Manager (CTM)
- Protection Switch Module provides highly cost effective solution for fiber trunk protection
- Standards based Optical architecture conforming to ITU G.692 100GHz channel spacing
- This system has been qualified by IBM for Geographically Dispersed Parallel Sysplex (GDPS), and by EMC for Symmetrix Synchronous support as tested in their E-LAB environment

For More Information

See the Cisco ONS 15500 Series Web site: **http://www.cisco.com/go/ons15500**

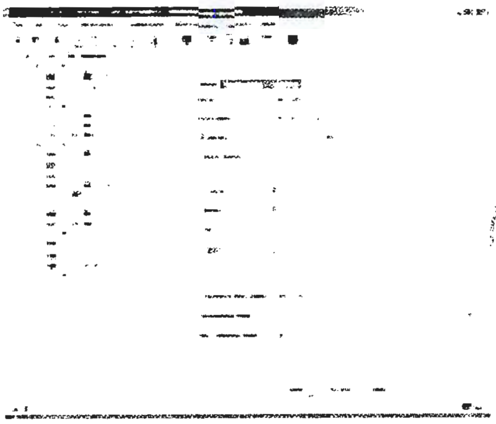
Cisco ONS 15600 Multiservice Switching Platform

The Cisco ONS 15600 provides unparalleled flexibility in designing next generation metro networks. Fully engineered and optimized for metro networks, the Cisco ONS 15600 MSSP simplifies and revolutionizes bandwidth management in the metro core by allowing service providers to seamlessly integrate their metro core and metro edge networks, while dramatically reducing initial turn up costs. Delivering scalability to 960 Gbps of traffic in a single rack, it complements the market-leading Cisco ONS 15454 Multiservice Provisioning Platform (MSPP) by leveraging its proven architecture and operating software. This allows service providers to dramatically simplify their metro networks and realize immediate cost, space and operational benefits. The Cisco ONS 15600 MSSP provides complete integration of metro core and edgenetworks for service provisioning and network management.

For More Information

See the ONS 15600 Series web site: **http://www.cisco.com/go/ons15600**

Cisco Transport Manager (CTM 4.x) (Element/Network Management)



Cisco Transport Manager is an integrated optical element management system for Cisco ONS 15000 series optical networking platforms. CTM manages configuration, fault isolation, performance, and security for Cisco optical network elements. With integrated support for SONET, SDH, DWDM and Ethernet, along with open interfaces to operations support systems (OSS), CTM delivers the full power of Cisco's wide range of advanced optical systems to today's network operators and enterprises.

CHAPTER 9

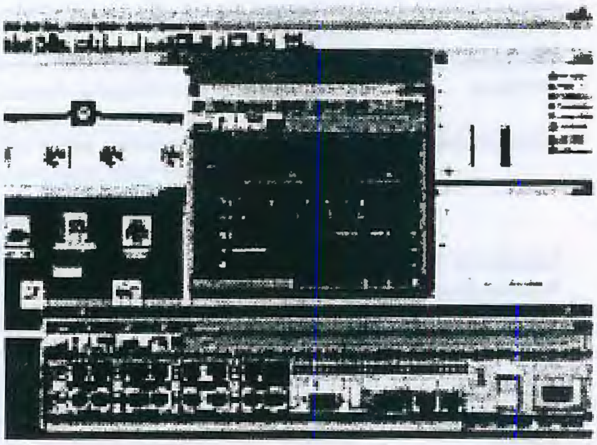
IOS Software & Network Management

Cisco IOS® Software & Network Management Products at a Glance

Product	Features	Page
CiscoWorks for Windows	An entry level suite of integrated network management tools for smaller networks: • Event management and topology mapping application • Includes Cisco's popular CiscoView Element Management Tool	9-2
Cisco IOS Software	Feature-rich network operating system supported on wide range of Cisco products • Provides a common IP fabric, functionality, and command-line interface (CLI) across network infrastructures • Enables a vast array of key routing, multiservice, traffic shaping, security/firewall, and traffic monitoring applications, and a broad variety of network connections	9-4
CiscoWorks Small Network Management Solution	Web-based network management solution designed for small to medium businesses (SMB) • Device auto-discovery using SNMP simplifies setup and reduces startup time • Standards-based, multi-vendor management • Event management and topology mapping application • Includes Cisco's popular CiscoView Element Management Tool	9-11
CiscoWorks Routed WAN Management Solution	A comprehensive set of applications for managing the router elements of a multiservice Enterprise wide-area network. This bundle includes Access Control List Manager, Internetwork Performance Monitor, Resource Manager Essentials, and CiscoView	9-13
CiscoWorks LAN Management Solution	Provides key applications needed to manage Cisco switch-based Enterprise campus networks. This bundle includes Campus Manager, Device Fault Manager, nGenius Real Time Monitor, Resource Manager Essentials, and CiscoView	9-14
CiscoWorks VPN/Security Management Solution	Combines general device management tools for configuring, monitoring, and troubleshooting enterprise networks with powerful security solutions for managing virtual private networks (VPNs), firewalls, and network and host-based intrusion detection systems (IDS). This bundle includes Management and Monitoring Centers, Cisco IDS Host Sensor and Console, Cisco Secure Policy Manager, VPN Monitor, Resource Manager Essentials, and Cisco View	9-16
CiscoWorks Manager IP Telephony Environment Monitor	A suite of telephony management applications that ensures the readiness and manageability of converged networks supporting VoIP and IP telephony traffic and applications. The bundle includes Voice Health Monitor, Default Fault Manager, CiscoView, and Downloadable Modules: IP Phone Information Utility, IP Phone Help Desk Utility, Fault History Manager	9-18
CiscoWorks Voice Manager for Voice Gateways	Enables the management and monitoring of devices used as gateways between analog voice equipment and the data network. • Enhanced capabilities to configure and provision voice ports • Create and modify dial plans on voice-enabled Cisco routers for voice over IP (VoIP), voice over Frame Relay (VoFR), and voice over ATM (VoATM) network deployments	9-19
CiscoWorks QoS Policy Manager (QPM)	Enables centralized administration and automated deployment of bandwidth reservation and prioritization policies for critical network applications • Differentiates services of Web applications, voice traffic, and business-critical applications	9-21
Cisco Ethernet Subscriber Solution Engine	A hardware-based management system for metro access networks that use the Cisco ONT 1000 Gigabit Ethernet Series Optical Network Terminator. • Enables complete remote management and troubleshooting of the customer demarcation point for Ethernet over fiber	9-22
CiscoWorks Hosting Solution Engine	A hardware-based content management solution for e-business operations in Cisco-powered data Centers. This product provides network infrastructure monitoring and Layer 4-7 hosted services configuration and activation.	9-24
CiscoWorks Wireless LAN Solution Engine	A hardware paced wireless LAN management solution that provides template-based configuration with user-defined groups to effectively manage a large number of access points and bridges • Monitors LEAP authentication servers • Enhances security management through mis-configuration detection on access points and bridges	9-23
Cisco Catalyst 6500 Series Network Analysis Modules 1 and 2	NAM is an integrated, network monitoring instrumentation and Web-browser based traffic analysis solution for the Catalyst 6500 based environments. It enable greater visibility into traffic at all layers of the network by providing real time traffic analysis and troubleshooting capabilities.	9-25

Product	Features	Page
Cisco Secure User Registration Tool (URT)	Provides organizations with increased LAN security by actively identifies users within the network and creates user registration policy bindings that help support mobility and tracking: • Ensures that users are associated with their authorized subnet/VLAN; Addresses the challenges associated with campus user mobility; Supports Web-based authentication for Windows, Macintosh, and Linux client platforms; Secure user access to the VLAN with MAC address-based security option Option to allow multiple users connected to a hub access to a VLAN served by single switch port See Chapter 5—VPN and Security for more information on Cisco Secure User Registration Tool	5-15
Cisco Secure Access Control Server (ACS) for Windows	Controls the authentication, authorization, and accounting (AAA) of users and administrators to network devices and services; Operates as a centralized Remote Access Dial-In User Service (RADIUS) or Terminal Access Controller Access Control System (TACACS+) server; Supports Lightweight Directory Access Protocol (LDAP) user authentication; Data replication and backup services; Flexible user and group policy controls; Support for Cisco 802.11x Catalyst Switch and Wireless solutions; Extensible Authentication Protocol (EAP) enhancements to support Protected EAP (PEAP) for wireless LANs All administrative access is encrypted with SSL See Chapter 5—VPN and Security for more information on CiscoSecure Access Control Server (ACS) for Windows	5-14

CiscoWorks for Windows



CiscoWorks for Windows is a powerful set of network management tools to easily manage your small to medium network or workgroup. It provides information such as dynamic status, statistics, and comprehensive configuration information for Cisco routers, switches, hubs, and access servers. Using the included WhatsUp Gold from Ipswitch, you can also monitor printer, workstations, servers and important non Cisco network services.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks for Windows	• A single solution for managing all resources attached to a small multivendor network • A smaller solution, where centralize management of configurations of a software distribution is not needed • Low-cost network management • Needs to quickly understand basic network connectivity, access individual device configurations and statistics, and troubleshoot problems

Also available for small and medium size customers is the CiscoWorks Small Network Management Solution (Small NMS). Small SNMS includes all the features above and includes CiscoWorks Resource Manager Essentials (Essentials) which provides additional functionality that allows the customer to of build and maintain an up-to-date hardware and software inventory for up to 20 devices in a network.

Key Features

CiscoWorks for Windows provides the following features when used in conjunction with WhatsUp Gold from Ipswitch (included in the CiscoWorks for Windows package):

- Automatic discovery process for networked devices
- Management of network hardware, printers, servers, and workstations
- Customizable monitoring of services such as FTP and HTTP
- Access to extensive data on port status, bandwidth utilization, traffic statistics, protocol information, and other network performance statistics
- Flexible graphing capabilities for quickly recording and analyzing historical data that can be exported to files
- Management Information Base (MIB) compiler and browser for managing third-party SNMP devices
- Tools to simplify device configuration and management for Cisco routers, switches, and access servers
- Threshold management features that can be set for many performance variables to generate an alarm or event notification
- Flexible event notification, including voice, paging, and e-mail notification of user-defined events

CiscoWorks for Windows Components

CiscoWorks for Windows includes the following tools:

- WhatsUp Gold from Ipswitch, Inc.—Provides network discovery, mapping, monitoring, and alarm tracking
- CiscoView—Provides back- and front-panel displays; dynamic, color-coded graphical displays simplify device-status monitoring, device-specific component diagnostics, and application launching
- Threshold Manager—Enhances the ability to set thresholds on Cisco RMON-enabled devices, reducing management overhead and improving troubleshooting capabilities
- StackMaker—Allows users to combine multiple Cisco devices of specific types into a single stack and visually manage them in a single window
- Show Commands—Displays detailed router system and protocol information without requiring the user to remember complex Cisco IOS Software command-line languages or syntax

Specifications

Feature	CiscoWorks for Windows
Hardware Requirements	266 MHz Pentium-based IBM PC or compatible computer 128-MB RAM total 1 GB free hard drive space
Software Requirements	Windows 98, Windows NT 4.0, or Windows 2000 Netscape 4.61, 4.7, 4.76 or Internet Explorer 5.0, 5.1, 5.5

CiscoWorks for Windows	
CWW-6.1-WIN	CiscoWorks for Windows 6.1
CWW-6.1-WIN-UP	Upgrade to CWW 6.1 for Windows from CWW 5.0
CWW-6.1-WIN-MR	Maintenance Release: Requires existing CWW 6.0 -June 02

For More Information

See the CiscoWorks for Windows Web site: **http://www.cisco.com/go/cwwin**

Cisco IOS® Software

Cisco's IOS Software is a feature-rich network operating system that provides network intelligence for the majority of today's Internet and for most of the world's business-critical networking applications.

Supporting Cisco's extensive range of platforms, Cisco IOS Software provides a common IP fabric, functionality and command-line interface (CLI) across network infrastructures. Cisco IOS Software enables a vast array of key routing functions, multi-service capabilities, traffic shaping, connections, security/firewall protection, traffic monitoring, and highly flexible network and product configuration.

Below is an abbreviated list of key capabilities, intelligent network technologies, and architectures enabled by Cisco IOS Software:

- Quality of Service (QoS)
- Converged data, voice, and video over IP
- IP/ATM/Frame Relay network connectivity and scalability features
- Security/firewall/IPSec/access lists
- Traffic monitoring and NetFlow based monitoring, accounting, and billing
- Wide range of routing protocols (including MPLS)
- IPv6
- Multicast

Quality of Service (QoS)

The promise of networking is sharing networked resources among many users and applications for greater productivity and competitive advantage. Cisco IOS quality of services (QoS) capabilities enable complex networks to control and predictably service a variety of applications. Every network needs QoS for optimum efficiency, whether it is for a small business, large enterprise, or a service provider.

QoS expedites the handling of mission-critical applications, while sharing network resources with non-critical applications. QoS also ensures available bandwidth and minimum delays required by time-sensitive multimedia and voice applications. It also gives network managers control over network applications, improves cost-efficiency of WAN connections, and enables advanced differentiated services. QoS technologies are elemental building blocks for other Cisco IOS enabling services—particularly for converged data and voice networks (LAN/WAN + telephony), video conferencing over IP, and IBM networking, and for future business applications in campus, WAN, and service provider networks.

Key QoS Capabilities:

Committed Access Rate (CAR)	Performs two QoS functions: • Bandwidth management through rate limiting, which allows you to control the maximum rate for traffic sent or received on an interface • Packet classification through IP precedence and QoS group setting, which allows you to partition your network into multiple priority levels or classes of service (CoS)
Differentiated Services (DiffServ)	QoS architecture that divides traffic into a small number of classes and provides QoS to large aggregates of traffic by treating some traffic better than the rest (faster handling, more bandwidth on average, lower loss rate on average). This is a statistical preference, not a hard and fast guarantee.
Expedited Forwarding (EF)	Per-Hop Behavior (PHB) in the DiffServ standard, used to create a virtual leased line service.

Integrated Services (IntServ)	A QoS architecture in which each network element is required to identify the coordinated set of QoS control capabilities it provides in terms of the functions it performs, the information it requires, and the information it exports.
Random Early Detection (RED)	Monitors traffic levels on very large networks to prevent congestion and guarantee priority traffic delivery.
Resource Reservation Protocol (RSVP)	A protocol that supports the reservation of resources across an IP network.
Weighted Fair Queueing (WFQ)	Adds new levels of control to previous queuing methods
Weighted Random Early Detection (WRED)	Combines the capabilities of the random early detection (RED) algorithm with IP precedence or the differentiated services code point (DSCP). This combination provides for preferential traffic handling for higher-priority packets.

Key QoS Categories

Classification	• Committed Access Rate (CAR) • Policy Based Routing (PBR) • QoS Policy Propagation Through BGP
Congestion Management	• First in First Out (FIFO) • Priority Queueing (PQ) • Custom Queueing (CQ) • Weighted Fair Queueing (WFQ) • Weighted Random Early Detection (WRED)
Policy and Shaping	• Committed Access Rate (CAR) • Generic Traffic Shaping (GTS) • Frame Relay Traffic Shaping (FRTS)
Link Efficiency Mechanisms	• Compressed Real Time Protocol (CRTP) • Link Fragmentation and Interleaving (LFI) • Data Compression

Converged LAN/WAN and Telephony Networks

A broad range of Cisco products support standards-based voice over packet implementations, including H.323-based Voice over IP (VoIP). These products enable highly efficient, converged IP-based telephony in today's enterprise and service provider networks, thereby eliminating the need for legacy telephone equipment and overlay networks (including PBXs and central office circuit switched network equipment). Furthermore, a single IT organization can now support campus and enterprise requirements—regardless if for data, voice, or video requirements.

In addition, Cisco voice over packet technologies enable businesses and service providers to avoid long distance telephone charges by leveraging their existing data networks, instead of paying for dedicated voice connections and circuits.

Cisco Connectivity and Scalability Solutions

A wide range of access solutions are enabled via Cisco IOS Software including:

- Virtual Private Networking; DSL; Dial Access (including ISDN, modem, fax, voice)
- Frame Relay, X.25
- ATM; VoIP, VoFR, VoATM
- SONET, OC-x/STM-x, Packet-over-SONET
- Broadband Services Aggregation (includes large-scale PPPoE, PPPoA, L2TP tunneling)
- Cable Access Solutions

Security

Cisco's powerful suite of Cisco IOS Software-embedded security and firewall technologies includes:

Digital Signature Standard (DSS) and digital certification	Positively authenticates users or devices
Network Address Translation (NAT) and Port Address Translation (PAT)	Hides private topology and IP addresses from an external network
IPSec	Enables secure communications of data over public networks

Time-based Access Control Lists (ACLs)	Implements access lists based on time of day
Password Authentication Protocol (PAP)	Allows a remote node to establish its identity using a two-way handshake
Terminal Access Controller Access Control System Plus (TACACS+) and Remote Access Dial-in User Service (RADIUS)	Gives complete network access security for dial-in connections, for enterprise and service provider applications
Challenge Handshake Authentication Protocol (CHAP)	Allows a remote node to establish its identity using a three-way handshake
Calling Line Identification (CLID)	Uses calling line identification to compare the telephone number of a calling device against a list of known callers
Access Lists	Checks the source address of packets (standard access lists) and checks the source and destination addresses and other parameters (extended access lists)
Context-Based Access Control (CBAC)	Provides secure, application-based stateful filtering for the most popular protocols and a wide variety of advanced applications; available in the Cisco IOS Firewall feature set

Cisco IOS NetFlow

NetFlow technology provides the metering base for a key set of applications including network traffic accounting, usage-based network billing, network planning, network monitoring, outbound marketing, and data mining capabilities for both service provider and enterprise customers. Cisco provides a set of NetFlow applications to collect exported NetFlow data, to perform data volume reduction, and to post-process and display data. Cisco is currently working with a number of partners to provide customers with comprehensive solutions for NetFlow-based billing, planning, and monitoring. NetFlow also provides the measurement base for Cisco's new Internet Quality of Service (QoS) initiatives. NetFlow captures the traffic classification or precedence associated with each flow, enabling differentiated charging based on Quality of Service.

Furthermore, the combination of NetFlow data along with Cisco IOS Software-based routing information can prove key to developing effective security policies and preventive measures for Denial of Service (DoS).

Cisco IOS Routing Services

Cisco IOS Software has long been recognized for its rich support of multiple protocols including IP, Novell IPX, SNA, AppleTalk, DECnet, OSI, and Banyan VINES

IP Routing Protocols

Cisco IOS Software offers the industry's widest variety of enterprise and service provider-class routing protocols, including On Demand Routing (ODR), Routing Information Protocol (RIP), Interior Gateway Routing Protocol (IGRP), Open Shortest Path First (OSPF), IP Multicast, Integrated IS-IS, Enhanced Interior Gateway Routing Protocol (EIGRP), Border Gateway Protocol (BGP), and MPLS

Multi Protocol Label Switching (MPLS)

Cisco IOS MPLS fuses intelligent routing capabilities with the performance of switching. It provides significant benefits to networks with pure IP architectures and those with IP and ATM or a mix of other Layer 2 technologies. MPLS technology is key to implementing scalable Virtual Private Networks (VPNs) and end-to-end QoS, enabling efficient utilization of existing networks to meet growth needs and to rapidly correct link fault and node failure. This technology also helps deliver highly scalable, differentiated IP services with simpler configuration, management, and provisioning for both Internet service providers and end-user customers.

Common MPLS Applications Available with Cisco IOS Software

- Traffic engineering is enabled through MPLS mechanisms that allow traffic to be directed through a specific path, which may not necessarily be the least-expensive path. Network managers can implement policies to ensure optimal traffic distribution and improve overall network utilization
- Guaranteed bandwidth is a value-added enhancement to traditional traffic-engineering mechanisms. MPLS lets service providers deliver guaranteed pipes and bandwidth allocations. Guaranteed bandwidth also allows bookkeeping of quality-of-service (QoS) resources to traffic engineer both premium and best-effort traffic such as voice and data
- Fast reroute (FRR) allows extremely quick recovery if a node or link fails. Such fast recovery prevents end-user applications from timing out and also prevents loss of data
- MPLS VPNs greatly simplify service deployment compared to traditional IP VPNs. As the number of routes and customers increases, MPLS VPNs easily scale, while providing the same level of privacy as Layer 2 technologies. In addition, they can transport non-unique IP addresses across a public domain
- MPLS class-of-service (CoS) capability ensures that important traffic is given the appropriate priority over the network and that latency requirements are met. IP QoS mechanisms can be seamlessly implemented in an MPLS environment

MPLS Mechanisms

Cisco IOS MPLS delivers both traffic engineering (TE) and VPN solutions built on the following mechanisms:

- Cisco AutoBandwidth Allocator: Automatically increases or decreases MPLS TE tunnel bandwidth based on measured traffic load
- Constraint-based Routing Label Distribution Protocol (CR-LDP): A signaling mechanism used to support TE across a MPLS backbone
- Fast Reroute (FRR): Enables quick recovery in case of link failures, which prevents end-user applications from timing out and also prevents loss of data
- Label Distribution Protocol (LDP): Provides communication between edge and core devices. It assigns labels in edge and core devices to establish Label Switched Paths (LSPs) in conjunction with routing protocols such as OSPF, IS-IS, EIGRP, or BGP
- Transmission Control Protocol (TCP): Connection-oriented transport-layer protocol that provides reliable full-duplex data transmission. Part of the TCP/IP protocol stack

For More Information

See the Cisco IOS MPLS Web site: **http://www.cisco.com/go/mpls**

IP Multicast and Multicast Solutions

IP Multicast is a bandwidth-conserving technology that reduces traffic by simultaneously delivering a single stream of information to thousands of corporate recipients and homes. Applications that take advantage of multicast technologies include video conferencing, corporate communications, distance learning, and distribution of software, stock quotes, and news.

Multicast technology is key to preventing severe network slowdown and Cisco IOS Multicast is the gateway to Internet broadcasting applications. Internet service providers (ISPs) and content providers use Cisco IOS multicast solutions successfully to host events such as live concerts, radio shows, and football games.

Another application of multicast technologies relates to replacing dedicated point-to-point telephone/voice circuits and specialized bridging and mixing multi-user audio conferencing telephone equipment for "always-on" service (referred to in some industries as "Hoot & Holler" systems). This ability eliminates the need for dedicated, costly, overlay voice networks and point-to-point telephone company circuits, and allows the same capabilities to be implemented over a converged IP network without requiring users to dial in.

Multicast Solutions

Cisco IOS Multicast solutions are classified as Multicast-Lite, Core Multicast, and Enhanced Multicast, and are the building blocks for Internet broadcast. Customers can start with Multicast-Lite, then add more sophisticated interactive communication capabilities, as needed.

- Multicast-Lite provides for one-to-many broadcast capability with no back channel. This solution is eminently suitable for content distribution and broadcasting over the Internet. It does not require setting up of source discovery across domains and autonomous systems. Multicast Lite includes Protocol Independent Multicast version 2 (PIMv2), Internet Group Management Protocol (IGMPv1/v2/v3) or Universal Resource Locator Rendezvous Directory (URD).
- Core Multicast provides interactive, reliable campus multicast for interactive distance learning, corporate videoconferencing, inventory updates, software distribution, and content distribution. Core Multicast includes PIM, IGMP, Cisco Group Management Protocol (CGMP), and now Pragmatic General Multicast (PGM).
- Enhanced Multicast provides interactive Internet Multicast across domains for network gaming, inter-company conferencing, Internet software distribution, and extranet content distribution. Enhanced Multicast includes Multicast Border Gateway Protocol (MBGP) and Multicast Source Discovery Protocol (MSDP) in addition to all the protocols supported in Core Multicast.

Multicast is available across all Cisco IOS Software-based platforms, including Cisco routers and Catalyst family switches. Multicast-supported routing platforms include the following: Cisco 1600, 2500, 2600/2600XM, 3600, 3700, 3800, 7200, 7500, and 12000 series; it also is available on Catalyst 6000 and 8500 platforms.

Multicast Features

Cisco has the greatest depth of experience with IP Multicast in the industry, and offers multicast features such as:

Bi-dir PIM	An extension to the PIM suite of protocols that implements shared sparse trees with bi-directional flow of data.
Cisco Group Management Protocol (CGMP)	Cisco-developed protocol that allows Layer 2 switches to leverage IGMP information on Cisco routers to make Layer 2 forwarding decisions.
Internet Group Management Protocol v2 (IGMP)	Used by IP routers and their immediately connected hosts to communicate multicast group membership states: • Query: IGMP messages originating from the router(s) to elicit multicast group membership information from its connected hosts • Report: IGMP messages originating from the hosts that are joining, maintaining or leaving their membership in a multicast group
Internet Group Management Protocol v3 (IGMP)	Version 3 of IGMP adds support for "source filtering," that is, the ability for a system to report interest in receiving packets only from specific source addresses, or from all but specific source addresses, sent to a particular multicast address.
IGMP Snooping	Requires the LAN switch to examine, or "snoop," some Layer 3 information in the IGMP packet sent from the host to the router. When the switch hears an IGMP Report from a host for a particular multicast group, the switch adds the host's port number to the associated multicast table entry. When it hears an IGMP Leave Group message from a host, it removes the host's port from the table entry.
Inter domain Multicast	Supports inter-domain routing and source discovery across the Internet or across multiple domains comprising an enterprise
Intra domain Multicast	Supports multicast applications within an enterprise campus
Multicast Source Discovery Protocol (MSDP)	A mechanism to connect multiple PIM sparse-mode (SM) domains. MSDP allows multicast sources for a group to be known to all rendezvous point(s) (RPs) in different domains.
Multicast Routing Monitor (MRM)	A management diagnostic tool that provides network fault detection and isolation in a large multicast routing infrastructure
Multi-protocol Extensions for Border Gateway Protocol (MBGP)	Also known as BGP+, MBGP adds capabilities to BGP to enable multicast routing policy throughout the Internet and to connect multicast topologies within and between BGP autonomous systems.
Pragmatic General Multicast (PGM)	A reliable multicast transport protocol for applications that require ordered, duplicate-free, multicast data delivery from multiple sources to multiple receivers. PGM guarantees that a receiver in a multicast group either receives all data packets from transmissions and retransmissions, or can detect unrecoverable data packet loss.
Protocol Independent Multicast (PIM)	A multicast routing architecture that enables IP multicast routing on existing IP networks: • SM = Spare Mode (RFC 2362): Relies upon an explicitly joining method before attempting to send multicast data to receivers of a multicast group. • DM = Dense Mode (Internet Draft Spec): Actively attempts to send multicast data to all potential receivers (flooding) and relies upon their self-pruning (removal from group) to achieve desired distribution.
Unidirectional Link Routing (UDLR) Protocol	A routing protocol that provides a way to forward multicast packets over a physical unidirectional interface (such as a satellite link of high bandwidth) to stub networks that have a back channel
URL Rendezvous Directory (URD)	Directly provides the network with information about the specific source of a content stream. It enables the network to quickly establish the most direct distribution path from the source to the receiver, thus significantly reducing the time and effort required in receiving the streaming media. URD allows an application to identify the source of the content stream through a web page link or web directly.

For More Information

See the Multicast Web site: **http://www.cisco.com/go/multicast**

IPv6

Internet Protocol version 6 (IPv6), most notably offers expanded IP addresses to accommodate the proliferation of Internet devices such as personal computers, personal digital assistants, wireless devices, and new Internet appliances—and the expansion of Internet access, particularly “always-on” connections throughout the world. IPv6 also provides integrated auto-configuration for “plug-and-play” capabilities, enhanced mobility and end-to-end security.

Incorporating IPv6 into Cisco IOS Software further enables growth of the Internet and expansion into new applications and capabilities, while maintaining compatibility with existing Internet services. Cisco’s IPv6 solution was first made available in Cisco IOS Software Release 12.2(1)T. Platforms supported include: Cisco 800, 1700, 2500, 2600/2600XM, 3600, 7100, 7200, and 7500 Series Routers, and Cisco AS5300 and AS5400 Universal Access Servers.

For more information

See the Cisco IOS IPv6 Web site: **http://www.cisco.com/go/ipv6**

Cisco IOS Software Release Process

There are three categories of Cisco IOS Software releases: Early Deployment, Major, and General Deployment (GD) releases.

- Early Deployment releases (i.e. T, S, X, E release families)—Provide advanced networking technologies to customers for delivery of leading-edge Internet applications. These offer new software capabilities, new platforms, and interface extensions. Customers for whom receiving a new feature is critical to their competitive advantage will benefit from these releases
- Major releases (i.e. Release 12.2)—Consolidate features, platform support, and functionality from early deployment releases, and emphasize stability. Regular maintenance releases do not introduce new functionality or platform support, but provide continuous improvement and greater quality, leading to general deployment
- General Deployment certification (i.e. Release 12.0) Releases—Have had extensive market exposure in a wide range of network environments and are qualified through extensive metrics that analyze stability, software defect trends, and customer satisfaction surveys. Used for major, business-critical applications

At some point, GD releases are replaced by newer releases with the latest networking technologies. A release retirement process has been established with three principal milestones: End of Sales (EOS), End of Engineering (EOE), and End of Life (EOL).

For More Information on Cisco IOS Software

See the Cisco IOS Software Web site: **http://www.cisco.com/go/ios**

Cisco Network Management Overview

Cisco is transforming traditional network management by focusing on the strengths of Internet-based architectures for greater accessibility and simplification of network management tools, tasks, and processes. Cisco's network management strategy calls for a Web-based model with the following characteristics:

- Simplification of tools, tasks, and processes
- Web-level integration with NMS platforms and general management products
- Capable of providing end-to-end solutions for managing routers, switches, and access servers
- Creation of a management intranet by integrating discovered device knowledge with CCO and third-party application knowledge

Cisco Network Management Products

The CiscoWorks product line offers a set of solutions designed to manage the enterprise network. These solutions focus on key areas in the network such as; optimization of the wide area network (WAN), administering switch-based local area networks (LAN), securing remote and local virtual private networks, and measuring service level agreements within all types of networks. The expanding CiscoWorks product line offers the flexibility to deploy end-to-end network management when and where it is needed.

CiscoWorks Small Network Management Solution

CiscoWorks SNMS is a new network management solution aimed at small to medium businesses (SMB), with 20 or fewer switches, routers, hubs and access servers. CiscoWorks SNMS can also monitor non-Cisco IT assets such as servers, applications, services and printers. CiscoWorks SNMS is an ideal solution for companies that need centralized network management to help optimize performance and maximize network productivity.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks Small Network Management Solution	• Simple integrated installation, autodiscovery and automated import of devices using SNMP • Standards-based multi vendor management • Reduce the time and complexity of keeping the networks' configuration, software version and connectivity optimized

Also available for small and medium size customers is the CiscoWorks for Windows (CWW). CWW includes all the features above except for CiscoWorks Resource Manager Essentials (Essentials) which provides additional functionality that allows the customer to of build and maintain an up-to-date hardware and software inventory for up to 20 devices in a network.

Key Features

- Monitors and reports on hardware, configuration, and inventory changes
- Provides a wizard-based approach for managing and deploys configuration changes and software image updates to multiple Cisco devices
- Allows configuration changes to be performed against multiple switches or routers in the network
- Provides software update analysis reports showing prerequisites and impacts of proposed updates
- Provides a comprehensive audit of network changes, showing who changed what, when, and how
- Summarizes syslog events by severity or user criteria for switches, routers, and Cisco IOS and PIX firewalls
- Discovery and mapping wizard displays customizable vector-based graphics and hierarchical maps of networked devices

CiscoWorks Small Network Management Solution Components

CiscoWorks Small Network Management Solution includes the following tools:

- CiscoView 5.3—Provides graphical back and front panel views of Cisco devices; dynamic, color-coded graphical displays to simplify device-status monitoring, device-specific component diagnostics, device configuration, and application launching
- WhatsUp Gold 7.0 from Ipswitch, Inc.—Provides network discovery, mapping, monitoring, and alarm tracking
- Resource Manager Essentials 3.3.2—Resource Manager Essentials (RME) provides tools for building and managing network inventory, deploying configuration and software image changes, archiving configurations, and providing an audit trail of network changes

Important: RME has a device limit of 20 or fewer Cisco devices.

Specifications

Feature	CiscoWorks Small Network Management Solution
Hardware Requirements	2 Pentium III or better-based IBM PC or compatible computer, 256 MB RAM total, 4 GB free hard drive space
Software Requirements	Windows 2000 with SP1 or 2 (Professional or Sever), Netscape 4.77, 4.78 or Internet Explorer 5.5 with Service Pack 1

Selected Part Numbers and Ordering Information

CiscoWorks Small Network Management Solution

CWSNM-1.0-WIN	Small Network Management Solution 1.0 for Windows; includes WhatsUp Gold 7.0, Resource Manager Essentials 3.3.2 (20 Cisco Device restriction), CiscoView 5.3

For More Information

See the CiscoWorks Small Network Management Solution Web Site:
http://www.cisco.com/go/wrsnms

CiscoWorks Routed WAN Management Solution

The RWAN solution addresses the needs of managing WANs by improving the accuracy, efficiency, and effectiveness of your network administrators and operations staff while increasing the overall availability of your network through proactive planning, deployment, and troubleshooting tools. The CiscoWorks Routed WAN Management Solution provides increased visibility into network behavior, assists in quickly troubleshooting performance bottlenecks, and provides comprehensive tools to easily administer new software and configuration changes for optimizing bandwidth and utilization across expensive and critical links in the network.

When to Sell

Sell This Product	When a Customer Needs These Features
Routed WAN Management Solution	• Optimize router performance by automatically streamlining access control lists, and applying policy-based changes via templates • Understand the responsiveness of WAN connections to determine where bottlenecks are; provides real-time analysis of end-to-end hop delays • Increase network performance by monitoring traffic of protocols, applications, and interface characteristics • A watchdog system to monitor WAN characteristics • An accurate inventory baseline; including memory, slots, software versions, and boot ROMs needed to make decisions • Automate the process of updating device software and configuration • Graphically displays a devices operational status with tools to monitor its activity or change its configurations • Support for secure browser communications and downloads from CiscoView, RME and ACLM via Secure Socket Layer (SSL) or Secure Shell (SSH) protocol

Key Features

- Access Control List Manager—Provides a wizard and policy template-based approach to simplifying the setup, management, and optimization of Cisco IOS Software-based IP and Internetwork Packet Exchange (IPX) traffic filtering and device access control
- Internetwork Performance Monitor—Used to diagnose latency, identify network bottlenecks, and analyze response times
- Resource Manager Essentials—Provides the tools needed to manage Cisco devices. It includes inventory and device change management, network configuration and software image management, network availability, and syslog analysis
- CiscoView—Provides back- and front-panel displays; dynamic, color-coded graphical displays simplify device-status monitoring, device-specific component diagnostics, and application launching
- CiscoWorks Server—Provides the common management desktop services and security across the CiscoWorks family of solutions. It also provides the foundation for integrating with other Cisco and third-party applications
- Support for secure browser communications with CiscoView and RME sessions via Secure Socket Layer (SSL) and Secure Shell (SSH) protocol

Specifications

Feature	Routed WAN Management Solution Requirements
Server	Sun UltraSPARCIII (Sun Blade 1000 Workstation or Sun Fire 280R Workgroup Server) IBM PC compatible with 550-MHz or higher Pentium III processor running (Dual processor system required for hosting multiple management solutions) Microsoft Windows 2000 Server or Professional Edition with Service Pack 2, Solaris 2.8
Client	IBM PC-compatible computer with 300-MHz or higher Pentium processor, Sun Ultra 10, HP9000 Series, IBM RS/6000 Windows NT 4 (Workstation and Server) with Service Pack 6a, Windows 98, 2000 Professional and Server with Service Pack 2; Solaris 2.7, 2.8; HP-UX 11.0; AIX 4.3.3 IBM PC-compatible computer with 300-MHz or higher Pentium processor, Sun Ultra 10, HP9000 Series, IBM RS/6000
Supported Devices	Most Cisco IOS Software routers, access servers, hubs, and switches
Supported Cisco IOS Software Versions	Generally supports Cisco IOS Software Versions 10.3 and above; Catalyst Supervisor code 2.1 and above Note: Some CiscoWorks applications require specific versions of IOS and CAT these releases in order to operate; please see the specific application documentation and release notes for more information.

Selected Part Numbers and Ordering Information[1]

Cisco Routed WAN Management Solution

CWRW-1.2-K9	Routed WAN Management Solution 1.2 for Windows and Solaris platforms; includes Access Control List Manager 1.4, Internetwork Performance Monitor 2.4, Resource Manager Essentials 3.4, CD One 5th Edition (Includes CiscoView 5.4)
CWRW-1.2-P1-K9	Cross Bundle Discount RWAN 1.2 for Windows and Solaris platforms; available to customers who have previously purchased LMS 1.X or LMS 2.X and want to add RWAN
CWRW-1.2-MR-K9	Maintenance kit for customers that purchased RWAN 1.X and now want new device support and code upgrades; kit includes support for Windows and Solaris platforms; includes updates to all components

[1] This is only a small subset of all parts available via URL listed under "For More Information." Some parts have restricted access or are not available through distribution channels.

For More Information

See the Routed WAN Management Solution Web site: **http://www.cisco.com/go/rwan**

CiscoWorks LAN Management Solution

The CiscoWorks LAN Management Solution consists of operationally focused tools. These tools include fault management, scalable topology views, sophisticated configuration, Layer 2/3 path analysis, voice-supported path trace, traffic monitoring, end-station tracking workflow application servers management, and device troubleshooting capabilities. CiscoWorks LMS combines applications and tools for configuring, monitoring, and troubleshooting the campus network.

When to Sell

Sell This Product	When a Customer Needs These Features
LAN Management Solution	• A set of tools for managing Cisco's award winning Catalyst switches • Time saving user tracking and path trace analysis tools with support of IP phones • Automated process of inventorying network devices, updating device software, and managing configuration to reduce the time and errors involved in network updates • Browser-accessible, graphical tool for configuring and monitoring Cisco device components and operational status • VLAN, ATM, or LANE service management tools • RMON traffic monitoring and analysis capability • Active fault monitoring of Cisco devices

Key Features

- Campus Manager—Web-based applications designed for managing Layer 2 device and connectivity discovery, workflow application server discovery and management, detailed topology views, virtual LAN/LAN Emulation (VLAN/LANE) and ATM configuration, end-station tracking, Layer2/3 path analysis tools, and IP phone user and path information
- Device Fault Manager—Provides real-time fault analysis for Cisco devices, automatically includes Cisco devices into its monitoring environment and applies a Cisco "Best Practices" fault rule to each device
- nGenius Real Time Monitor—Web-enabled multiuser traffic management tool set that provides access to network-wide, real-time RMON information for monitoring, troubleshooting, and maintaining network availability
- Resource Manager Essentials—Provides the tools needed to manage Cisco devices. It includes inventory and device change management, network configuration and software image management, network availability, and syslog analysis
- CiscoView—Provides back- and front-panel displays; dynamic, color-coded graphical displays simplify device-status monitoring, device-specific component diagnostics, and application launching
- CiscoWorks Server—Provides the common management desktop services and security across the CiscoWorks Family of solutions. It also provides the foundation for integrating with other Cisco and third-party applications
- Support for secure browser communications with CiscoView and RME sessions via Secure Socket Layer (SSL) and Secure Shell (SSH) protocol

Specifications

Feature	Description
Server	Sun UltraSPARCIII (Sun Blade 1000 Workstation or Sun Fire 280R Workgroup Server) IBM PC compatible with 550-MHz or higher Pentium III processor running (Dual processor system required for hosting multiple management solutions) Microsoft Windows 2000 Server or Professional Edition with Service Pack 2, Solaris 2.8
Client	IBM PC-compatible computer with 300-MHz or higher Pentium processor, Sun Ultra 10, HP9000 Series, IBM RS/6000 Windows NT 4 (Workstation and Server) with Service Pack 6a, Windows 98, 2000 Professional and Server with Service Pack 2; Solaris 2.7, 2.8; HP-UX 11.0; AIX 4.3.3 Internet Explorer v5.5 with Service Pack 2, 6.0; Netscape 4.76, 4.77, 4.78, 4.79
Supported Cisco Devices	Most Cisco IOS Software routers, access servers, hubs, and switches
Supported Cisco IOS Software Versions	Generally Cisco IOS Software Versions 10.3 and higher Catalyst Supervisor code 2.1 through 4.1 Note: Some CiscoWorks applications require certain versions of IOS and CAT these releases in order to operate, please see the specific application documentation and release notes for more information.

7583 W

Selected Part Numbers and Ordering Information[1]

LAN Management Solution	
CWLMS-2.1-K9	LAN Management Solution 2.1 for Windows and Solaris; includes Campus Manager 3.2, Device Fault Manager 1.2, Resource Manager Essentials 3.4, nGenius Real Time Monitor 1.4, CD One 5th Edition (Includes CiscoView 5.4)
CWLMS-2.1-P1-K9	Cross Bundle Discount LMS 2.1 for Windows and Solaris platforms; available to customers who have previously purchased RWAN 1.X and want to add LMS
LAN Management Solution Upgrades	
CWLMS-2.1-UP-K9	Upgrade kit for LMS 1.X customers wanting to upgrade to LMS 2.1; kit includes support for both Windows and Solaris platforms; primary value of this kit is to provide DFM to LMS 1.X customers
CWLMS-2.1-MR-K9	Maintenance kit for customers that purchased LMS 2.0 and want new device support and code updates; kit includes support for both Windows and Solaris platforms; includes updates to all LMS 2.X components (Should not be purchased by LMS 1.X customers)
CWLMS-1.2-MR-K9	Maintenance kit for customers that purchased LMS 1.X and want new device support and code updates to components in the 1.X release train; DFM is not included

See the LAN Management Solution Web site: **http://www.cisco.com/go/lms**

CiscoWorks VPN/Security Management Solution

CiscoWorks VPN/Security Management Solution (VMS), an integral part of the SAFE Blueprint for network security, combines Web-based tools for configuring, monitoring, and troubleshooting enterprise virtual private networks (VPNs), firewalls, and network and host-based intrusion detection systems (IDS). It offers the ability to monitor remote access links, and IPSec based site to site VPN's links. VMS is a Web-based solution that provides a "dashboard" view of critical VPN resources and their performance, VPN hardware and configuration and troubleshooting reports.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks VPN/Security Management Solution	• Complete management of a SAFE infrastructure environment • Configuring and monitoring VPN, PIX, IOS routers, and IDS devices. • Monitoring large remote access, and site-to-site hub and spoke VPNs from a single management console and focus on problem areas and performance.

Key Features

- Management and Monitoring Centers—Supplies the latest in management functionality and multifaceted scalability by offering features such as a consistent user experience, auto update, command and control workflow, and role-based access control. The management and monitoring centers include Management Center for PIX Firewalls, Management Center for IDS Sensors, Management Center for VPN Routers, and Monitoring Center for Security and Management center for PIX Firewalls (downloadable from CCO Software Center Fall 2002)
- VPN Monitor—Allows network administrators to collect, store, and view information on IPSec VPN connections for remote-access or site-to-site VPN terminations. Multiple devices can be viewed from an easy-to-use dashboard that is configured using a Web browser
- Cisco IDS Host Sensor Console—Provides real-time analysis and reaction to network hacking attempts by identifying an attack and preventing access to critical server resources before any unauthorized transactions occur

- Cisco Secure Policy Manager (CSPM)—Provides scalable, powerful policy-based security management system for Cisco firewalls and IPSec VPN routers which allows a customer to define, distribute, enforce, and audit network-wide security policies from a central location
- Resource Manager Essentials (RME)—Provides the tools needed to manage Cisco devices. It includes inventory and device change management, network configuration and software image management, network availability, and syslog analysis
- CiscoView—Provides back- and front-panel displays; dynamic, color-coded graphical displays simplify device-status monitoring, device-specific component diagnostics, and application launching
- CiscoWorks Server—Provides the common management desktop services and security across the CiscoWorks family of solutions. It also provides the foundation for integrating with other Cisco and third-party applications
- Support for secure browser communications with CiscoView and RME sessions via Secure Socket Layer (SSL) and Secure Shell (SSH) protocol

Specifications

Feature	CiscoWorks VPN/Security Management Solution
Server Hardware Requirements	IBM PC-compatible computer with 1-GHz or faster Pentium processor Sun UltraSPARC 60 MP with 440-MHz or faster processor Sun UltraSPARCIII (Sun Blade 1000 Workstation or Sun Fire 280R Workgroup Server)
Server Software Requirements	Windows 2000 Professional, Windows 2000 Server (Service Pack 2) Sun Solaris 2.7, 2.8
Client Hardware Requirements	IBM PC-compatible computer with 300-MHz or faster Pentium Solaris SPARCstation or Sun Ultra 10
Client Software Requirements	Windows 98, Windows NT 4.0, or Windows 2000 Server or Professional Edition with Service Pack 2 Solaris 2.7, 2.8
Browser Requirements	Internet Explorer 6.0 or 5.5 with Service Pack 2, on Windows 2000 Server or Professional Edition, Windows 98, and Windows NT 4.0. Netscape Navigator 4.79, on Windows 2000 Server or Professional Edition and Windows 98. Netscape Navigator 4.76 on Solaris 2.7, 2.8.

Selected Part Numbers and Ordering Information

CiscoWorks VPN/Security Management Solution

CWVMS-2.1-UR-K9	CiscoWorks VMS 2.1 Windows and Solaris; Includes: Management Center for IDS Sensors, Management Center for VPN Routers, and Monitoring Center for Security, VPN Monitor 1.2, RME 3.4, CSPM 3.1, IDS Host Sensor 2.1, CD One 5th Edition[1]
CWVMS-2.1-WINR-K9	CiscoWorks VMS 2.1 Windows (20-Device Restricted License); Includes: Management Center for IDS Sensors, Management Center for VPN Routers, and Monitoring Center for Security, VPN Monitor 1.2, RME 3.4, CSPM 3.1, IDS Host Sensor 2.1, CD One 5th Edition
CWVMS-2.1-URC-K9	Conversion from CiscoWorks VMS 2.1 for Windows (20-device Restricted License) to Unrestricted License (add Solaris Versions of CV, RME, VPN, and adds an unrestricted license to CSPM for Windows)[1]
CWVMS-2.1-UPGUR-K9	Upgrade from CSPM 2.x (Unrestricted License) to CiscoWorks VMS 2.1 for Windows and Solaris (Unrestricted License)[1]
CWVMS-2.1-WUPGR-K9	Upgrade from CSPM 2.X (Unrestricted License) to CiscoWorks VMS 2.1 for (20-device Restricted License)
CWVMS-2.1-UR-MR-K9	Maintenance release update for VMS 2.0 Windows and Solaris (Unrestricted License)[1]
CWVMS-2.1-R-MR-K9	Maintenance release update for VMS 2.0 Windows Only (20-device Restricted License)

[1] Contains Windows-only versions of CSPM and IDS Host Sensor

CiscoWorks IP Telephony Environment Monitor

CiscoWorks IP Telephony Environment Monitor (ITEM) is a bundled suite of management applications that helps ensure the manageability of converged networks that support Cisco IP telephony and IP telephony data applications. ITEM tracks the health of Cisco IP telephony environments by proactively monitoring the Cisco elements that support voice in the network to alert operations personnel of potential problems in order to minimize IP telephony service interruption.

7581
3

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks IP Telephony Environment Monitor	• Network managers who need to effectively manage their converged networks while maintaining high confidence that their IP telephony environments are performing as expected • Network Managers who need to use synthetic traffic (replicating key forms of network activity associated with VoIP and IP telephony) to enable around-the-clock monitoring of key voice elements in the network

Key Features

- Cisco Voice Health Monitor (VHM)—tracks the health of Cisco IP telephony environments by proactively monitoring Cisco voice elements in the network to alert operations personnel to potential problems and helps to minimize IP telephony service in network downtime. VHM leverages and requires the services of DFM while providing sophisticated capabilities of its own to ensure timely information on the health of IP telephony environments
- Cisco Device Fault Manager (DFM)—DFM provides real-time fault detection and determination about the underlying Cisco IP fabric on which the IP telephony implementation executes. DFM reports faults that occur on Cisco network devices, often identifying problems before users of network services realize that a problem exists
- CiscoView—CiscoView is a web-based graphical device-management technology and is the standard for managing Cisco devices, and providing back and front panel displays. Features include: Real-time monitoring of key information relating to device performance, traffic, and usage, with metrics such as utilization percentage, frames transmitted and received, errors, and a variety of other device-specific indicators

Optional Drop-In Modules

Fault History Manager

Fault History is an optional drop-in module (downloadable from CCO) that provides a web-based tool to access historical fault and alert data from a database. The user has several filtering options that can facilitate the search for specific information.

IP Phone Information Utility

The IP Phone Information Utility is an optional drop-in module (downloadable from CCO) that provides a web-based tool to show detailed information about individual IP telephone. The operator can access the IP phone information by using its extension number, IP address, and/or MAC address. This utility bases its information on the devices created in VHM.

IP Phone Help Desk Utility

The IP Phone Help Desk Utility is an optional applet (downloadable from CCO) that provides a MS Windows 2000 desktop tool to show summary information about individual IP telephone. The help desk operator can access the IP phone information by using its extension number (or can configure the application to search by IP or MAC addresses). This utility requires a connection to an ITEM server running VHM with the IP Phone Information Utility installed.

Gateway Statistics Utility

When available, the Gateway Statistics Utility is an optional drop-in module (downloadable from CCO) that provides a web-based tool to collect performance and behavior statistics about CCM-controlled IP telephony gateways. This statistical information can be subsequently exported for processing by reporting packages for capacity planning and trending information.

Specifications

Feature	CiscoWorks IP Telephony Environment Manager
Server Hardware	IBM PC-compatible with 1 GHz or higher Pentium IV processor UNIX (If DFM is on Unix platform; Sun UltraSPARCIII (Sun Blade 1000 Workstation or Sun Fire 280R Workgroup Server) (Dual processor system required for hosting multiple management solutions)
Server Software	Windows 2000 Server or Professional Edition with Service Pack 2 Solaris 2.8
Client	IBM PC-compatible computer with 300 MHz or higher Pentium processor Windows NT 4 (Workstation & Server) with Service Pack 6a, Win 98 or Windows 2000 Professional & Server with Service Pack 2 Windows 98/NT/2000: Netscape v4.77, 4.78, 4.79 Windows 98/NT/2000: Internet Explorer v5.5 with Service Pack 2, 6.0

CiscoWorks Voice Manager for Voice Gateways

CiscoWorks Voice Manager for Voice Gateways (CVM) is a client-server, web-based voice management and reporting solution. The application provides enhanced capabilities to configure and provision voice ports, and create and modify dial plans on voice-enabled Cisco routers for voice over IP (VoIP), voice over Frame Relay (VoFR), and voice over ATM (VoATM) network deployments.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks IP Telephony Environment Monitor	• Network managers who need to maintain a distributed network architecture for increased scalability • Network Managers who need to manage multiple customer networks from one common server

Key Features

- Web interface management of voice ports and dial plan generation and management—Create and manage local dial plans and VoIP, VoFR, and VoATM network dial plans
- Report generation—Enhance graphical reporting capabilities with the software provided by an alliance with Telemate.Net (WIndows NT), a leading developer of enterprise information management tools; optional capabilities for enhanced reports, custom report creation, and multiple data source record collection exists.
- Optional capabilities to provide reporting on other data sources such as private branch exchanges (PBXs) and selected firewalls
- CiscoView—CiscoView is a web-based graphical device-management technology and is the standard for managing Cisco devices, and providing back and front panel displays. Features include: Real-time monitoring of key information relating to device performance, traffic, and usage, with metrics such as utilization percentage, frames transmitted and received, errors, and a variety of other device-specific indicators

CiscoWorks QoS Policy Manager

QoS Policy Manager allows you to centrally define and administer IOS and CAT parameters needed for differentiating network traffic. This ensures high availability and predictable performance for business-critical which rely on advanced voice and video services. Cisco QoS Policy Manager (QPM) 3.0 is a key enabler of end-to-end QoS for converged networks. It delivers differentiated services across network infrastructures with converged voice, video, and data applications, simply by taking advantage of Cisco IOS and Catalyst OS Software with built-in QoS mechanisms in LAN and WAN switching and routing equipment.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco QoS Policy Manager	• End-to-end QoS configuration and automated, reliable policy deployment, while eliminating device-by-device command streams • Rules-based policies that combine static and dynamic port applications and host system traffic filters • QoS Policy Manager's services, including congestion management & avoidance, and traffic-shaping • Efficiently translate policies to specific QoS config commands, ensuring consistency across domains • Validate policies prior to deploying them quickly and reliably to LAN and WAN policy domains • Generate Web-based reports on QoS policies deployed in the network

Key Features

- Provides baseline monitoring which profiles traffic by top applications and a small number of classes before QoS deployment
- Validates QoS deployments by obtaining detailed feedback on traffic patterns after QoS at different points in the network
- Provides statistics related to QoS policies which include traffic matching NBAR filters and action statistics
- Supports CBQoSMIB and CAR MIB
- IP Telephony templates provide pre-defined QoS policies that ensure strict priority for voice traffic in Enterprise networks
- Delivers the appropriate service-level to business-critical applications by supporting the extension of IP packet classification to include application signature, Web URLs, and negotiated ports
- Extend security by defining access control policies to permit or deny transport of packets into or out of device interfaces
- Allows QoS policy validation checking, uploading of existing device configuration, previewing configuration changes, incremental ACL updates, and managing policy distribution

Specifications

Feature	Cisco QoS Policy Manager
Server Hardware Requirements	IBM PC-compatible computer with 1-GHz or faster Pentium processor Sun UltraSPARC 60 MP with 440-MHz or faster processor Sun UltraSPARCIII (Sun Blade 1000 Workstation or Sun Fire 280R Workgroup Server)
Server Software Requirements	Windows 2000 Professional, Windows 2000 Server (Service Pack 2) Sun Solaris 2.7, 2.8
Client Hardware Requirements	IBM PC-compatible computer with 300-MHz or faster Pentium Solaris SPARCstation or Sun Ultra 10Complete
Client Software Requirements	Windows 98, Windows NT 4.0, or Windows 2000 Server or Professional Edition with Service Pack 2 Solaris 2.7, 2.8
Browser Requirements	Internet Explorer 6.0 or 5.5 with Service Pack 2, on Windows 2000 Server or Professional Edition, Windows 98, and Windows NT 4.0. Netscape Navigator 4.79, on Windows 2000 Server or Professional Edition and Windows 98, Netscape Navigator 4.76 on Solaris 2.7, 2.8.

Cisco Ethernet Subscriber Solution Engine

The Cisco Ethernet Subscriber Solution Engine (ESSE) is a hardware-based management system for metro access networks that use the Cisco ONT 1000 Gigabit Ethernet Series Optical Network Terminator. The Cisco ESSE enables complete remote management and troubleshooting of the customer demarcation point for Ethernet over fiber. Remote management and diagnostics reduce operating expenses and increase profitability by eliminating the need for unnecessary visits to the customer premises. The Cisco ESSE runs on the Cisco 1105, which is one rack unit (1RU) high, enabling you to conveniently deploy the Cisco ESSE on the same rack with the rest of your Cisco metro Ethernet network aggregation equipment.

The Cisco ESSE automatically discovers all Cisco ONT 1000 Gigabit Ethernet Series devices in the metro access network, applies the designated configuration, and instantly begins collecting statistics and management information.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Ethernet Subscriber Solution Engine	The Cisco Ethernet Subscriber Solution Engine is ideal for service providers seeking to: • Reduce operating expenses by implementing metro access networks with Ethernet over fiber • Reduce customer onsite visits, which are time-consuming and expensive • Perform complete remote configuration and troubleshooting of the Cisco ONT 1000 Gigabit Ethernet Series

Key Features

- Enables service providers to perform remote control of inventory, configuration, statistics, fault management, and troubleshooting on the Cisco ONT 1000 Gigabit Ethernet Series
- Full Layer 1 and Layer 2 remote configuration and monitoring of Optical Network Terminators
- Access to all Ethernet port registers and statistics on the Cisco ONT 1000 Gigabit Ethernet Series
- Easy identification of ONTs with searchable, user-defined properties such as customer name, VLAN ID, and street address

CiscoWorks Wireless LAN Solution Engine

The CiscoWorks WLSE is a specialized, daily operational solution that allows customers to manage the entire Cisco Aironet WLAN infrastructure. It offers powerful, centralized template-based configuration with user-defined device groups to efficiently configure large numbers of access points and bridges. The CiscoWorks WLSE provides centralized firmware updates to facilitate firmware changes throughout the WLAN. It monitors Access Control Server (ACS) authentication servers, supports both Cisco Extensible Authentication Protocol (LEAP) and generic RADIUS servers, and further enhances security management by detecting misconfigurations on access points and bridges. The CiscoWorks WLSE proactively monitors WLAN infrastructures and generates notifications for unavailability and performance degradation. The CiscoWorks WLSE aids in capacity planning by identifying the most used access points, and accelerates troubleshooting by generating client association reports.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks Wireless LAN Solution Engine	The CiscoWorks WLSE is ideal for enterprise customers: • Implementing large-scale Cisco Aironet WLAN infrastructures • Template-based configuration tool which can include a large number of uniform policies for Cisco access points and bridges • Access point and bridge mis-configuration alerts to minimize security vulnerabilities • Proactive fault and performance monitoring of Cisco access points, bridges, LEAP authentication server, and switches connected to the access points

Key Features

- Centralized template-based configuration with hierarchical, user-defined groups
- Plug and play configuration of newly deployed access points and bridges
- Centralized firmware update to facilitate firmware changes
- Access point and bridge misconfiguration alerts to minimize security vulnerabilities
- Proactive monitoring of access points, bridges, ACS authentication servers (both LEAP and generic RADIUS), and the switches connected to the access points
- Configuration and monitoring of virtual LAN (VLAN) and quality of service (QoS) on access points to maximize security and performance
- Access point usage, summary, and client association reports with XML, CSV, and PDF data export
- Secure HTML-based user interface for easy access anywhere
- Upper-layer network management system and operations support system (NMS/OSS) integration with syslog message, SNMP trap, and e-mail notifications

Selected Part Numbers and Ordering Information[1]

CiscoWorks Wireless LAN Solution Engine	
CWWLSE-1105-K9	Wireless LAN Solution Engine1.0; includes the Cisco 1105 hardware platform and wireless LAN management software version 1.0

CiscoWorks Hosting Solution Engine

CiscoWOrks Hosting Solution Engine is a network management appliance that monitors, activates, and configures a variety of e-business services in Cisco powered data centers. It provides up-to-date fault and performance information about the network infrastructure and Layer 4-7 network services.

HSE automatically discovers the entire data center infrastructure and instantly begins collecting statistics and management information, providing a current snapshot of the managed environment. HSE provides up-to-date information for operational staff to easily pinpoint the source of a problem. HSE itself is a manageable Cisco device with a full Cisco Discovery Protocol implementation and supports Cisco MIB II.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks Hosting Solution Engine	• Ideal for enterprise and service providers with e-business data center facilities • Granular user access model to partition network resources for Layer 4-7 services and switch ports, and authorize user group access to individual application services • Robust Layer 4-7 service configuration and service activation of server load balancing devices, including virtual servers, real servers, and content owners and rules

Key Features

- Granular user access to partition network resources for Layer 4-7 services as well as switch ports; authorize user group access to individual application services
- Robust Layer 4-7 service configuration and service activation of content switches
- Monitoring and reporting of SSL Proxy services on Cisco Catalyst 6000 Series with SSL Service Modules and Cisco Content Services Switch
- Flexible fault and performance monitoring of Cisco routers, switches, Cisco PIX® Firewalls, Cisco Content Engines, Cisco Content Switches and L4-7 services
- HTML-based, secure graphic user interface with easy customer view/report personalization and historical data reporting
- Upper layer NMS/OSS integration with SYSLOG, trap, email notifications and historical data XML export

Selected Part Numbers and Ordering Information[1]

Cisco 1105 Hosting Solution Engine	
CWHSE1105-1.5-K9	CiscoWorks Hosting Solution Engine; includes 1105 hardware platform with software version 1.5; can be configured for international power cords

Cisco Catalyst 6500 Series Network Analysis Module 1 and 2(with NAM software version 2.2)

The Cisco Network Analysis Module (NAM) 1 and 2, second generation high performance network analysis modules for the Cisco Catalyst 6500 Series provides network monitoring instrumentation and web-browser based traffic analysis for Catalyst based AVVID environments. The NAM enables network managers to gain application-level visibility into network traffic with the ultimate goal of improving performance, reducing failures, and maximizing returns on network investment. The new NAMs are available in two hardware versions, NAM-1 and NAM-2, to meet diverse network analysis needs in a scalable switching environment running up to gigabit speeds. The NAMs come with an embedded, Web-based traffic analyzer, which provides full scale remote monitoring and troubleshooting capabilities that are accessible through a Web browser.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 6500 Series Network Analysis Module 1 and 2 (with NAM software version 2.2)	• Needs Application-Level visibility built into the network • Provides network managers visibility into all layers of network traffic • Monitoring in a scalable switching environment that supports traffic monitoring in a scalable switching environment • Offers investment protection by interfacing with both the bus and the crossbar switching fabric-based architectures in the Cisco Catalyst 6500 Series

Key Features

- Provides application-level Remote Monitoring (RMON) functions based on RMON2 and other advanced Management Information Bases (MIBs)
- Collects statistics on both data and VoIP streams flowing through the host switch using the Switch Port Analyzer (SPAN) and NetFlow Data Export features of the Cisco Catalyst 6500 Series
- Collects data from remote switches using the remote SPAN (RSPAN) feature of the Cisco Catalyst 6500 and 4000 Series switches
- Easy to deploy and use at LAN aggregation where they can see most of the traffic, at service points where performance is critical and at important access points where quick troubleshooting is required
- Application monitoring can be done using RMON, RMON2, and several extended RMON MIBs, which can detect the applications on the network and provide detailed information about how these applications utilize the bandwidth, which hosts access those applications, and which client/server pairs generate the most traffic
- Performance management provides valuable information about the delays in server responses to client requests

Cisco IOS File System Commands

This chapter describes the basic set of commands used to manipulate files on your routing device using the Cisco IOS File System (IFS) in Cisco IOS Release 12.2.

Commands in this chapter use URLs as part of the command syntax. URLs used in the Cisco IFS contain two parts: a file system or network prefix, and a file identification suffix. The following tables list URL keywords that can be used in the *source-url* and *destination-url* arguments for all commands in this chapter. The prefixes listed below can also be used in the *filesystem* arguments in this chapter.

Table 18 lists common URL network prefixes used to indicate a device on the network.

Table 18 Network Prefixes for Cisco IFS URLs

Prefix	Description
ftp:	Specifies a File Transfer Protocol (FTP) network server.
rcp:	Specifies an remote copy protocol (rcp) network server.
tftp:	Specifies a TFTP server.

Table 19 lists the available suffix options (file indentification suffixes) for the URL prefixes used in Table 18.

Table 19 File ID Suffixes for Cisco IFS URLs

Prefix	Suffix Options
ftp:	[[//[username[:password]@]location]/directory]/filename For example: **ftp://network-config** (*prefix://filename*) **ftp://jeanluc:secret@enterprise.cisco.com/ship-config**
rcp:	rcp:[[//[username@]location]/directory]/filename
tftp:	tftp:[[//location]/directory]/filename

Table 20 lists common URL prefixes used to indicate memory locations on the system.

First Published: April 30, 2001; Last Updated: July 31, 2002

Table 20 File System Prefixes for Cisco IFS URLs

Prefix	Description
bootflash:	Bootflash memory.
disk0:	Rotating disk media.
flash: [*partition-number*]	Flash memory. This prefix is available on most platforms. For platforms that do not have a device named **flash:**, the prefix **flash:** is aliased to **slot0:**. Therefore, you can use the prefix **flash:** to refer to the main Flash memory storage area on all platforms
flh:	Flash load helper log files.
null:	Null destination for copies. You can copy a remote file to null to determine its size.
nvram:	NVRAM. This is the default location for the running-configuration file.
slavebootflash:	Internal Flash memory on a slave RSP card of a router configured with Dual RSPs.
slavenvram:	NVRAM on a slave RSP card.
slaveslot0:	First PCMCIA card on a slave RSP card.
slaveslot1:	Second PCMCIA card on a slave RSP card.
slot0:	First PCMCIA Flash memory card.
slot1:	Second PCMCIA Flash memory card.
xmodem:	Obtain the file from a network machine using the Xmodem protocol.
ymodem:	Obtain the file from a network machine using the Ymodem protocol.

For details about the Cisco IFS, and for IFS configuration tasks, refer to the "Configuring the Cisco IOS File System" chapter in the Release 12.2 *Cisco IOS Configuration Fundamentals Configuration Guide*.

cd

To change the default directory or file system, use the **cd** EXEC command.

cd [*filesystem*:]

Syntax Description

filesystem:	(Optional) The URL or alias of the directory or file systems followed by a colon.

Defaults

The initial default file system is **flash:**. For platforms that do not have a physical device named **flash:**, the keyword **flash:** is aliased to the default Flash device.

If you do not specify a directory on a file system, the default is the root directory on that file system.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

For all EXEC commands that have an optional *filesystem* argument, the system uses the file system specified by the **cd** command when you omit the optional *filesystem* argument. For example, the **dir** EXEC command, which displays a list of files on a file system, contain an optional *filesystem* argument. When you omit this argument, the system lists the files on the file system specified by the **cd** command.

Examples

In the following example, the cd command is used to set the default file system to the Flash memory card inserted in slot 0:

```
Router# pwd
bootflash:/
Router# cd slot0:
Router# pwd
slot0:/
```

Related Commands

Command	Description
copy	Copies any file from a source to a destination.
delete	Deletes a file on a Flash memory device.
dir	Displays a list of files on a file system.
pwd	Displays the current setting of the **cd** command.
show file systems	Lists available file systems and their alias prefix names.
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.

7559 w

configure network

The **configure network** command was replaced by the **copy** {**rcp** | **tftp**} **running-config** command in Cisco IOS Release 11.0. To maintain backward compatibility, the **configure network** command continues to function in Cisco IOS Release 12.2 for most systems, but support for this command may be removed in a future release.

The **copy** {**rcp** | **tftp**} **running-config** command was replaced by the **copy** {**ftp:** | **rcp:** | **tftp:**}[*filename*] **system:running-config** command in Cisco IOS Release 12.1.

The **copy** {**ftp:** | **rcp:** | **tftp:**}[*filename*] **system:running-config** command specifies that a configuration file should be copied from a FTP, rcp, or TFTP source to the running configuration. See the description of the **copy** in this chapter command for more information.

copy

To copy any file from a source to a destination, use the **copy** EXEC command.

copy [**/erase**] *source-url destination-url*

Syntax Description

/erase	(Optional) Erases the destination file system before copying.
source-url	The location URL or alias of the source file or directory to be copied.
destination-url	The destination URL or alias of the copied file or directory.

The exact format of the source and destination URLs varies according to the file or directory location. You may enter either an alias keyword for a particular file or an alias keyword for a file system type (not a file within a type).

Timesaver Aliases are used to cut down on the amount of typing you need to perform. For example, it is easier to type **copy run start** (the abbreviated form of the **copy running-config startup-config** command) than it is to type **copy system:r nvram:s** (the abbreviated form of the **copy system:running-config nvram:startup-config** command). These aliases also allow you to continue using some of the common commands used in previous versions of Cisco IOS software.

Table 21 shows two keyword shortcuts to URLs.

Table 21 Common Keyword Aliases to URLs

Keyword	Source or Destination
running-config	(Optional) Keyword alias for the **system:running-config** URL. The **system:running-config** keyword represents the current running configuration file. This keyword does not work in **more** and **show file** EXEC command syntaxes.
startup-config	(Optional) Keyword alias for the **nvram:startup-config** URL. The **nvram:startup-config** keyword represents the configuration file used during initialization (startup). This file is contained in NVRAM for all platforms except the Cisco 7000 family, which uses the CONFIG_FILE environment variable to specify the startup configuration. The Cisco 4500 series cannot use the **copy running-config startup-config** command. This keyword does not work in **more** and **show file** EXEC command syntaxes.

The following tables list aliases by file system type. If you do not specify an alias, the router looks for a file in the current directory.

Table 22 lists URL aliases for Special (opaque) file systems. Table 23 lists them for network file systems, and Table 24 lists them for local writable storage.

Table 22 URL Prefix Aliases for Special File Systems

Alias	Source or Destination
flh:	Source URL for flash load helper log files.
modem:	Destination URL for loading modem firmware on Cisco 5200 and 5300 Series routers.
nvram:	Router NVRAM. You can copy the startup configuration into or from NVRAM. You can also display the size of a private configuration file.
null:	Null destination for copies or files. You can copy a remote file to null to determine its size.
system:	Source or destination URL for system memory, which includes the running configuration.
xmodem:	Source destination for the file from a network machine that uses the Xmodem protocol.
ymodem:	Source destination for the file from a network machine that uses th Xmodem protocol.

Table 23 URL Prefix Aliases for Network File Systems

Alias	Source or Destination
ftp:	Source or destination URL for an File Transfer Protocol (FTP) network server. The syntax for this alias is as follows: **ftp:**[[[//*username* [:*password*]@]*location*]/*directory*]/*filename*.
rcp:	Source or destination URL for a Remote Copy Protocol (rcp) network server. The syntax for this alias is as follows: **rcp:**[[[//*username*@]*location*]/*directory*]/*filename*.
tftp:	Source or destination URL for a TFTP network server. The syntax for this alias is **tftp:**[[//*location*]/*directory*]/*filename*.

Table 24 URL Prefix Aliases for Local Writable Storage File Systems

Alias	Source or Destination
bootflash:	Source or destination URL for boot flash memory.
disk0: and disk1:	Source or destination URL of rotating media.
flash:	Source or destination URL for Flash memory. This alias is available on all platforms. For platforms that lack a flash: device, note that **flash:** is aliased to **slot0:**, allowing you to refer to the main Flash memory storage area on all platforms.
slavebootflash:	Source or destination URL for internal Flash memory on the slave RSP card of a router configured for HSA.
slaveram:	NVRAM on a slave RSP card of a router configured for HSA.
slaveslot0:	Source or destination URL of the first PCMCIA card on a slave RSP card of a router configured for HSA.

Table 24 URL Prefix Aliases for Local Writable Storage File Systems (continued)

Alias	Source or Destination
slaveslot1:	Source or destination URL of the second PCMCIA slot on a slave RSP card of a router configured for HSA.
slot0:	Source or destination URL of the first PCMCIA Flash memory card.
slot1:	Source or destination URL of the second PCMCIA Flash memory card.

Command Modes

EXEC

Command History

Release	Modification
11.3 T	This command was introduced.

Usage Guidelines

You can enter on the command line all necessary source- and destination-URL information and the username and password to use, or you can enter the **copy** command and have the router prompt you for any missing information.

If you enter information, choose one of the following three options: **running-config**, **startup-config**, or a file system alias (see previous tables.) The location of a file system dictates the format of the source or destination URL.

The colon is required after the alias. However, earlier commands not requiring a colon remain supported, but are unavailable in context-sensitive help.

The entire copying process may take several minutes and differs from protocol to protocol and from network to network.

In the alias syntax for **ftp:**, **rcp:**, and **tftp:**, the location is either an IP address or a host name. The filename is specified relative to the directory used for file transfers.

This section contains usage guidelines for the following topics:

- Understanding Invalid Combinations of Source and Destination
- Understanding Character Descriptions
- Understanding Partitions
- Using rcp
- Using FTP
- Storing Images on Servers
- Copying from a Server to Flash Memory
- Verifying Images
- Copying a Configuration File from a Server to the Running Configuration
- Copying a Configuration File from a Server to the Startup Configuration
- Storing the Running or Startup Configuration on a Server
- Saving the Running Configuration to the Startup Configuration

- Using CONFIG_FILE, BOOT, and BOOTLDR Environment Variables
- Using the Copy Command with the Dual RSP Feature

Understanding Invalid Combinations of Source and Destination

Some invalid combinations of source and destination exist. Specifically, you cannot copy the following:

- From a running configuration to a running configuration
- From a startup configuration to a startup configuration
- From a device to the same device (for example, the **copy flash: flash:** command is invalid)

Understanding Character Descriptions

Table 25 describes the characters that you may see during processing of the **copy** command.

Table 25 copy Character Descriptions

Character	Description
!	For network transfers, an exclamation point indicates that the copy process is taking place. Each exclamation point indicates the successful transfer of ten packets (512 bytes each).
.	For network transfers, a period indicates that the copy process timed out. Many periods in a row typically mean that the copy process may fail.
O	For network transfers, an uppercase O indicates that a packet was received out of order and the copy process may fail.
e	For Flash erasures, a lowercase e indicates that a device is being erased.
E	An uppercase E indicates an error. The copy process may fail.
V	A series of uppercase Vs indicates the progress during the verification of the image checksum.

Understanding Partitions

You cannot copy an image or configuration file to a Flash partition from which you are currently running. For example, if partition 1 is running the current system image, copy the configuration file or image to partition 2. Otherwise, the copy operation will fail.

You can identify the available Flash partitions by entering the **show file system** EXEC command.

Using rcp

The rcp protocol requires a client to send a remote username upon each rcp request to a server. When you copy a configuration file or image between the router and a server using rcp, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The remote username specified in the **copy** command, if a username is specified.
2. The username set by the **ip rcmd remote-username** global configuration command, if the command is configured.
3. The remote username associated with the current tty (terminal) process. For example, if the user is connected to the router through Telnet and was authenticated through the **username** command, the router software sends the Telnet username as the remote username.
4. The router host name.

For the rcp copy request to process, an account must be defined on the network server for the remote username. If the network administrator of the destination server did not establish an account for the remote username, this command will not run. If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the remote username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

If you are writing to the server, the rcp server must be properly configured to accept the rcp write request from the user on the router. For UNIX systems, add an entry to the .rhosts file for the remote user on the rcp server. Suppose the router contains the following configuration lines:

```
hostname Rtr1
ip rcmd remote-username User0
```

If the router IP address translates to Router1.company.com, then the .rhosts file for User0 on the rcp server should contain the following line:

```
Router1.company.com Rtr1
```

Refer to the documentation for your rcp server for more details.

If you are using a personal computer as a file server, the computer must support the remote shell protocol (rsh).

Using FTP

The FTP protocol requires a client to send a remote username and password upon each FTP request to a server. When you copy a configuration file from the router to a server using FTP, the Cisco IOS software sends the first valid username that it encounters in the following sequence:

1. The username specified in the **copy** command, if a username is specified.
2. The username set by the **ip ftp username** command, if the command is configured.
3. Anonymous.

The router sends the first valid password in the following list:

1. The password specified in the **copy** command, if a password is specified.
2. The password set by the **ip ftp password** command, if the command is configured.
3. The router forms a password username@routername.domain. The variable username is the username associated with the current session, routername is the configured host name, and domain is the domain of the router.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept the FTP write request from the user on the router.

If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

Refer to the documentation for your FTP server for more details.

Use the **ip ftp username** and **ip ftp password** global configuration commands to specify a username and password for all copies. Include the username in the **copy** command if you want to specify a username for that copy operation only.

Storing Images on Servers

Use the **copy** *flash: destination-url* command (for example, **copy flash: tftp:**) to copy a system image or boot image from Flash memory to a network server. Use the copy of the image as a backup copy. Also, use it to verify that the copy in Flash memory is the same as that in the original file.

Copying from a Server to Flash Memory

Use the **copy** *destination-url flash:* command (for example, **copy tftp: flash:**) to copy an image from a server to Flash memory.

On Class B file system platforms, the system provides an option to erase existing Flash memory before writing onto it.

Note Verify the image in Flash memory before booting the image.

Verifying Images

When copying a new image to your router, you should confirm that the image was not corrupted during the copy process. Depending on the destination filesystem type, a checksum for the image file may be displayed when the **copy** command completes. You can verify this checksum by comparing it to the checksum value provided for your image file on Cisco.com.

Caution If the checksum values do not match, do not reboot the router. Instead, reissue the **copy** command and compare the checksums again. If the checksum is repeatedly wrong, copy the original image back into Flash memory *before* you reboot the router from Flash memory. If you have a corrupted image in Flash memory and try to boot from Flash memory, the router will start the system image contained in ROM (assuming booting from a network server is not configured). If ROM does not contain a fully functional system image, the router might not function and will need to be reconfigured through a direct console port connection.

An alternate method for file verification is to use the UNIX 'diff' command. This method can also be applied to file types other than Cisco IOS images. If you suspect that a file is corrupted, copy the suspect file and the original file to a Unix server. (The file names may need to be modified if you try to save the files in the same directory.) Then run the Unix 'diff' command on the two files. If there is no difference, then the file has not been corrupted.

Copying a Configuration File from a Server to the Running Configuration

Use the **copy** {**ftp:** | **rcp:** | **tftp:**} **running-config** command to load a configuration file from a network server to the running configuration of the router (note that **running-config** is the alias for the **system:running-config** keyword). The configuration will be added to the running configuration as if the commands were typed in the command-line interface (CLI). Thus, the resulting configuration file will be a combination of the previous running configuration and the loaded configuration file, with the loaded configuration file having precedence.

You can copy either a host configuration file or a network configuration file. Accept the default value of *host* to copy and load a host configuration file containing commands that apply to one network server in particular. Enter *network* to copy and load a network configuration file containing commands that apply to all network servers on a network.

Copying a Configuration File from a Server to the Startup Configuration

Use the **copy** {**ftp:** | **rcp:** | **tftp:**} **nvram:startup-config** command to copy a configuration file from a network server to the router startup configuration. These commands replace the startup configuration file with the copied configuration file.

Storing the Running or Startup Configuration on a Server

Use the **copy system:running-config** {**ftp:** | **rcp:** | **tftp:**} command to copy the current configuration file to a network server using FTP, rcp, or TFTP. Use the **copy nvram:startup-config** {**ftp:** | **rcp:** | **tftp:**} command to copy the startup configuration file to a network server.

The configuration file copy can serve as a backup copy.

Saving the Running Configuration to the Startup Configuration

Use the **copy system:running-config nvram:startup-config** command to copy the running configuration to the startup configuration.

Note Some specific commands might not get saved to NVRAM. You will need to enter these commands again if you reboot the machine. These commands are noted in the documentation. We recommend that you keep a listing of these settings so you can quickly reconfigure your router after rebooting.

If you issue the **copy system:running-config nvram:startup-config** command from a bootstrap system image, a warning will instruct you to indicate whether you want your previous NVRAM configuration to be overwritten and configuration commands to be lost. This warning does not appear if NVRAM contains an invalid configuration or if the previous configuration in NVRAM was generated by a bootstrap system image.

On all platforms except Class A file system platforms, the **copy system:running-config nvram:startup-config** command copies the currently running configuration to NVRAM.

On the Class A Flash file system platforms, the **copy system:running-config nvram:startup-config** command copies the currently running configuration to the location specified by the CONFIG_FILE environment variable. This variable specifies the device and configuration file used for initialization. When the CONFIG_FILE environment variable points to NVRAM or when this variable does not exist (such as at first-time startup), the software writes the current configuration to NVRAM. If the current configuration is too large for NVRAM, the software displays a message and stops executing the command.

When the CONFIG_FILE environment variable specifies a valid device other than **nvram:** (that is, **flash:**, **bootflash:**, **slot0:**, or **slot1:**), the software writes the current configuration to the specified device and filename, and stores a distilled version of the configuration in NVRAM. A distilled version is one that does not contain access list information. If NVRAM already contains a copy of a complete configuration, the router prompts you to confirm the copy.

Using CONFIG_FILE, BOOT, and BOOTLDR Environment Variables

For the Class A Flash file system platforms, specifications are as follows:

- The CONFIG_FILE environment variable specifies the configuration file used during router initialization.
- The BOOT environment variable specifies a list of bootable images on various devices.
- The BOOT environment variable specifies a list of bootable images on various devices.
- The BOOTLDR environment variable specifies the Flash device and filename containing the rxboot image that ROM uses for booting.

4556

- Cisco 3600 routers do not use a dedicated boot helper image (rxboot), which many other routers use to help with the boot process. Instead, the BOOTLDR ROM monitor environment variable identifies the Flash memory device and filename that are used as the boot helper; the default is the first system image in Flash memory.

To view the contents of environment variables, use the **show bootvar** EXEC command. To modify the CONFIG_FILE environment variable, use the **boot config** global configuration command. To modify the BOOTLDR environment variable, use the **boot bootldr** global configuration command. To modify the BOOT environment variable, use the **boot system** global configuration command. To save your modifications, use the **copy system:running-config nvram:startup-config** command.

When the destination of a **copy** command is specified by the CONFIG_FILE or BOOTLDR environment variable, the router prompts you for confirmation before proceeding with the copy. When the destination is the only valid image in the BOOT environment variable, the router also prompts you for confirmation before proceeding with the copy.

Using the Copy Command with the Dual RSP Feature

The Dual RSP feature allows you to install two Route/Switch Processor (RSP) cards in a single router on the Cisco 7507 and Cisco 7513 platforms.

On a Cisco 7507 or Cisco 7513 router configured for Dual RSPs, if you copy a file to **nvram:startup-configuration** with automatic synchronization disabled, the system asks if you also want to copy the file to the slave startup configuration. The default answer is **yes**. If automatic synchronization is enabled, the system automatically copies the file to the slave startup configuration each time you use a **copy** command with **nvram:startup-configuration** as the destination.

Examples

The following examples illustrate uses of the **copy** command.

- Copying an Image from a Server to Flash Memory Examples
- Saving a Copy of an Image on a Server Examples
- Copying a Configuration File from a Server to the Running Configuration Example
- Copying a Configuration File from a Server to the Startup Configuration Example
- Copying the Running Configuration to a Server Example
- Copying the Startup Configuration to a Server Example
- Saving the Current Running Configuration Example
- Moving Configuration Files to Other Locations Examples
- Copying an Image from the Master RSP Card to the Slave RSP Card Example

Copying an Image from a Server to Flash Memory Examples

The following three examples use a **copy rcp:**, **copy tftp:**, or **copy ftp:** command to copy an image file from a server to Flash memory:

- Copying an Image from a Server to Flash Memory Example
- Copying an Image from a Server to a Flash Memory Using Flash Load Helper Example
- Copying an Image from a Server to a Flash Memory Card Partition Example

Copying an Image from a Server to Flash Memory Example

This example copies a system image named file1 from the remote rcp server with an IP address of 172.16.101.101 to Flash memory. On Class B file system platforms, the Cisco IOS software allows you to first erase the contents of Flash memory to ensure that enough Flash memory is available to accommodate the system image.

```
Router# copy rcp://netadmin@172.16.101.101/file1 flash:file1

Destination file name [file1]?
Accessing file 'file1' on 172.16.101.101...
Loading file1 from 172.16.101.101 (via Ethernet0): ! [OK]

Erase flash device before writing? [confirm]
Flash contains files. Are you sure you want to erase? [confirm]

Copy 'file1' from server
  as 'file1' into Flash WITH erase? [yes/no] yes
Erasing device... eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee...erased
Loading file1 from 172.16.101.101 (via Ethernet0): !
[OK - 984/8388608 bytes]

Verifying checksum... OK (0x14B3)
Flash copy took 0:00:01 [hh:mm:ss]
```

Copying an Image from a Server to a Flash Memory Using Flash Load Helper Example

The following example copies a system image into a partition of Flash memory. The system will prompt for a partition number only if there are two or more read/write partitions or one read-only and one read/write partition and dual Flash bank support in boot ROMs. If the partition entered is not valid, the process terminates. You can enter a partition number, a question mark (?) for a directory display of all partitions, or a question mark and a number (?*number*) for directory display of a particular partition. The default is the first read/write partition. In this case, the partition is read-only and has dual Flash bank support in boot ROM, so the system uses Flash Load Helper.

```
Router# copy tftp: flash:

System flash partition information:
Partition   Size    Used    Free    Bank-Size   State        Copy-Mode
    1       4096K   2048K   2048K   2048K       Read Only    RXBOOT-FLH
    2       4096K   2048K   2048K   2048K       Read/Write   Direct

[Type ?<no> for partition directory; ? for full directory; q to abort]
Which partition? [default = 2]

                              **** NOTICE ****
Flash load helper v1.0
This process will accept the copy options and then terminate
the current system image to use the ROM based image for the copy.
Routing functionality will not be available during that time.
If you are logged in via telnet, this connection will terminate.
Users with console access can see the results of the copy operation.
                              ---- ******** ----
Proceed? [confirm]
System flash directory, partition 1:
File  Length   Name/status
  1   3459720  master/igs-bfpx.100-4.3
[3459784 bytes used, 734520 available, 4194304 total]
Address or name of remote host [255.255.255.255]? 172.16.1.1
Source file name? master/igs-bfpx-100.4.3
Destination file name [default = source name]?

Loading master/igs-bfpx.100-4.3 from 172.16.1.111: !
```

```
Erase flash device before writing? [confirm]
Flash contains files. Are you sure? [confirm]
Copy 'master/igs-bfpx.100-4.3' from TFTP server
as 'master/igs-bfpx.100-4.3' into Flash WITH erase? [yes/no] yes
```

Copying an Image from a Server to a Flash Memory Card Partition Example

The following example copies the file c3600-i-mz from the rcp server at IP address 172.23.1.129 to the Flash memory card in slot 0 of a Cisco 3600 series router, which has only one partition. As the operation progresses, the Cisco IOS software asks you to erase the files on the Flash memory PC card to accommodate the incoming file. This entire operation takes 18 seconds to perform, as indicated at the end of the example.

```
Router# copy rcp: slot0:

PCMCIA Slot0 flash

Partition    Size     Used      Free      Bank-Size  State          Copy Mode

Saving a Copy of an Image on a Server Examples

The following four examples use **copy** commands to copy image files to a server for storage:

- Copy an Image from Flash Memory to an rcp Server Example
- Copy an Image from a Partition of Flash Memory to a Server Example
- Copying an Image from a Flash Memory File System to an FTP Server Example
- Copying an Image from Boot Flash Memory to a TFTP Server Example

Copy an Image from Flash Memory to an rcp Server Example

The following example copies a system image from Flash Memory to an rcp server using the default remote username. Because the rcp server address and filename are not included in the command, the router prompts for it.

```
Router# copy flash: rcp:

IP address of remote host [255.255.255.255]? 172.16.13.110
Name of file to copy? gsxx
writing gsxx - copy complete
```

Copy an Image from a Partition of Flash Memory to a Server Example

The following example copies an image from a particular partition of Flash memory to an rcp server using a remote username of netadmin1.

The system will prompt if there are two or more partitions. If the partition entered is not valid, the process terminates. You have the option to enter a partition number, a question mark (?) for a directory display of all partitions, or a question mark and a number (?*number*) for a directory display of a particular partition. The default is the first partition.

```
Router# configure terminal
Router# ip rcmd remote-username netadmin1
Router# end
Router# copy flash: rcp:
System flash partition information:
Partition    Size     Used     Free     Bank-Size     State          Copy-Mode
    1        4096K    2048K    2048K    2048K         Read Only      RXBOOT-FLH
    2        4096K    2048K    2048K    2048K         Read/Write     Direct
[Type ?<number> for partition directory; ? for full directory; q to abort]
Which partition? [1] 2

System flash directory, partition 2:
File  Length   Name/status
  1   3459720  master/igs-bfpx.100-4.3
[3459784 bytes used, 734520 available, 4194304 total]
Address or name of remote host [ABC.CISCO.COM]?
Source file name? master/igs-bfpx.100-4.3
Destination file name [master/igs-bfpx.100-4.3]?
Verifying checksum for 'master/igs-bfpx.100-4.3' (file # 1)... OK
Copy 'master/igs-bfpx.100-4.3' from Flash to server
as 'master/igs-bfpx.100-4.3'? [yes/no] yes
!!!!...
Upload to server done
Flash copy took 0:00:00 [hh:mm:ss]
```

Copying an Image from a Flash Memory File System to an FTP Server Example

The following example copies the file c3600-i-mz from partition 1 of the Flash memory card in slot 0 to an FTP server at IP address 172.23.1.129.

```
Router# show slot0: partition 1

PCMCIA Slot0 flash directory, partition 1:
File  Length   Name/status
  1   1711088 c3600-i-mz
[1711152 bytes used, 2483152 available, 4194304 total]

Router# copy slot0:1:c3600-i-mz ftp://myuser:mypass@172.23.1.129/c3600-i-mz
Verifying checksum for '/tftpboot/cisco_rules/c3600-i-mz' (file # 1)...  OK
Copy '/tftpboot/cisco_rules/c3600-i-mz' from Flash to server
  as 'c3700-i-mz'? [yes/no] yes

!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!!
Upload to server done
Flash device copy took 00:00:23 [hh:mm:ss]
```

4547 3

Copying an Image from Boot Flash Memory to a TFTP Server Example

The following example copies an image from boot Flash memory to a TFTP server:

```
Router# copy bootflash:file1 tftp://192.168.117.23/file1

Verifying checksum for 'file1' (file # 1)... OK
Copy 'file1' from Flash to server
  as 'file1'? [yes/no]y
!!!!...
Upload to server done
Flash copy took 0:00:00 [hh:mm:ss]
```

Copying a Configuration File from a Server to the Running Configuration Example

The following example copies and runs a configuration filename host1-confg from the netadmin1 directory on the remote server with an IP address of 172.16.101.101:

```
Router# copy rcp://netadmin1@172.16.101.101/host1-confg system:running-config

Configure using host1-confg from 172.16.101.101? [confirm]
Connected to 172.16.101.101
Loading 1112 byte file host1-confg:![OK]
Router#
%SYS-5-CONFIG: Configured from host1-config by rcp from 172.16.101.101
```

Copying a Configuration File from a Server to the Startup Configuration Example

The following example copies a configuration file host2-confg from a remote FTP server to the startup configuration. The IP address is172.16.101.101, the remote username is netadmin1, and the remote password is ftppass.

```
Router# copy ftp://netadmin1:ftppass@172.16.101.101/host2-confg nvram:startup-config
Configure using rtr2-confg from 172.16.101.101?[confirm]
Connected to 172.16.101.101
Loading 1112 byte file rtr2-confg:![OK]
[OK]
Router#
%SYS-5-CONFIG_NV:Non-volatile store configured from rtr2-config by
FTP from 172.16.101.101
```

Copying the Running Configuration to a Server Example

The following example specifies a remote username of netadmin1. Then it copies the running configuration file named rtr2-confg to the netadmin1 directory on the remote host with an IP address of 172.16.101.101.

```
Router# configure terminal
Router(config)# ip rcmd remote-username netadmin1
Router(config)# end
Router# copy system:running-config rcp:
Remote host[]? 172.16.101.101

Name of configuration file to write [Rtr2-confg]?
Write file rtr2-confg on host 172.16.101.101?[confirm]
Building configuration...[OK]
Connected to 172.16.101.101
```

Copying the Startup Configuration to a Server Example

The following example copies the startup configuration to a TFTP server:

```
Router# copy nvram:startup-config tftp:

Remote host[]? 172.16.101.101

Name of configuration file to write [rtr2-confg]? <cr>
Write file rtr2-confg on host 172.16.101.101?[confirm] <cr>
![OK]
```

Saving the Current Running Configuration Example

The following example copies the running configuration to the startup configuration. On a Class A Flash file system platform, this command copies the running configuration to the startup configuration specified by the CONFIG_FILE variable.

```
copy system:running-config nvram:startup-config
```

The following example shows the warning that the system provides if you try to save configuration information from bootstrap into the system:

```
Router(boot)# copy system:running-config nvram:startup-config

Warning: Attempting to overwrite an NVRAM configuration written
by a full system image. This bootstrap software does not support
the full configuration command set. If you perform this command now,
some configuration commands may be lost.
Overwrite the previous NVRAM configuration?[confirm]
```

Enter **no** to escape writing the configuration information to memory.

Moving Configuration Files to Other Locations Examples

On some routers, you can store copies of configuration files on a Flash memory device. Five examples follow.

Copying the Startup Configuration to a Flash Memory Device Example

The following example copies the startup configuration file (specified by the CONFIG_FILE environment variable) to a Flash memory card inserted in slot 0:

```
copy nvram:startup-config slot0:router-confg
```

Copying the Running Configuration to a Flash Memory Device Example

The following example copies the running configuration from the router to the Flash memory PC card in slot 0:

```
Router# copy system:running-config slot0:berlin-cfg

Building configuration...
```

```
5267 bytes copied in 0.720 secs
```

4545
W

Copying to the Running Configuration from a Flash Memory Device Example

The following example copies the file named ios-upgrade-1 from the Flash memory card in slot 0 to the running configuration:

```
Router# copy slot0:4:ios-upgrade-1 system:running-config

Copy 'ios-upgrade-1' from flash device
  as 'running-config' ? [yes/no] yes
```

Copying to the Startup Configuration from a Flash Memory Device Example

The following example copies the router-image file from the Flash memory to the startup configuration:

```
copy flash:router-image nvram:startup-config
```

Copying a Configuration File from one Flash Device to Another Example

The following example copies the file running-config from the first partition in internal Flash memory to the Flash memory PC card in slot 1. The checksum of the file is verified, and its copying time of 30 seconds is displayed.

```
Router# copy flash: slot1:

System flash

Partition    Size     Used      Free      Bank-Size  State          Copy Mode
  1          4096K    3070K     1025K     4096K      Read/Write     Direct
  2         16384K    1671K    14712K     8192K      Read/Write     Direct

[Type ?<no> for partition directory; ? for full directory; q to abort]
Which partition? [default = 1]

System flash directory, partition 1:
File  Length   Name/status
  1   3142748  dirt/images/mars-test/c3600-j-mz.latest
  2   850      running-config
[3143728 bytes used, 1050576 available, 4194304 total]

PCMCIA Slot1 flash directory:
File  Length   Name/status
  1   1711088  dirt/images/c3600-i-mz
  2   850      running-config
[1712068 bytes used, 2482236 available, 4194304 total]
Source file name? running-config
Destination file name [running-config]?
Verifying checksum for 'running-config' (file # 2)...  OK
Erase flash device before writing? [confirm]
Flash contains files. Are you sure you want to erase? [confirm]

Copy 'running-config' from flash: device
  as 'running-config' into slot1: device WITH erase? [yes/no] yes
Erasing device... eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee ...erased
!
 [OK - 850/4194304 bytes]

Flash device copy took 00:00:30 [hh:mm:ss]
Verifying checksum...  OK (0x16)
```

Copying an Image from the Master RSP Card to the Slave RSP Card Example

The following example copies the router-image file from the Flash memory card inserted in slot 1 of the master RSP card to slot 0 of the slave RSP card in the same router:

```
copy slot1:router-image slaveslot0:
```

Related Commands

Command	Description
boot config	Specifies the device and filename of the configuration file from which the router configures itself during initialization (startup).
boot system	Specifies the system image that the router loads at startup.
cd	Changes the default directory or file system.
copy xmodem: flash:	Copies any file from a source to a destination.
copy ymodem: flash:	Copies any file from a source to a destination.
delete	Deletes a file on a Flash memory device.
dir	Displays a list of files on a file system.
erase	Erases a file system.
ip rcmd remote-username	Configures the remote username to be used when requesting a remote copy using rcp.
reload	Reloads the operating system.
show bootvar	Displays the contents of the BOOT environment variable, the name of the configuration file pointed to by the CONFIG_FILE environment variable, the contents of the BOOTLDR environment variable, and the configuration register setting.
show (Flash file system)	Displays the layout and contents of a Flash memory file system.
slave auto-sync config	Turns on automatic synchronization of configuration files for a Cisco 7507 or Cisco 7513 router that is configured for Dual RSP Backup.
verify bootflash:	Either of the identical **verify bootflash:** or **verify bootflash** commands replaces the **copy verify bootflash** command. Refer to the **verify** command for more information.

delete

To delete a file from a Flash memory device or NVRAM, use the **delete** EXEC command.

delete *URL* [**/force** | **/recursive**]

Syntax Description

URL	IFS URL of the file to be deleted. Include the filesystem prefix, followed by a colon, and, optionally, the name of a file or directory.
/force	(Optional) Deletes the specified file or directory with prompting you for verification. **Note** Use this keyword with caution: the system will not ask you to confirm the file deletion.
/recursive	(Optional) Deletes all files in the specified directory, as well as the directory itself.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

If you attempt to delete the configuration file or image specified by the CONFIG_FILE or BOOTLDR environment variable, the system prompts you to confirm the deletion. Also, if you attempt to delete the last valid system image specified in the BOOT environment variable, the system prompts you to confirm the deletion.

When you delete a file in Flash memory, the software simply marks the file as deleted, but it does not erase the file. To later recover a "deleted" file in Flash memory, use the **undelete** EXEC command. You can delete and undelete a file up to 15 times.

To permanently delete all files marked "deleted" on a linear Flash memory device, use the **squeeze** EXEC command.

Examples

The following example deletes the file named "test" from the Flash filesystem:

```
Router# delete flash:test
Delete flash:test? [confirm]
```

Related Commands

Command	Description
cd	Changes the default directory or file system.
dir	Displays a list of files on a file system.

Command	Description
show bootvar	Displays the contents of the BOOT environment variable, the name of the configuration file pointed to by the CONFIG_FILE environment variable, the contents of the BOOTLDR environment variable, and the configuration register setting.
squeeze	Permanently deletes Flash files by squeezing a Class A Flash file system.
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.

7541
3

dir

To display a list of files on a file system, use the **dir** EXEC command.

dir [**/all**] [*filesystem*:][*file-url*]

Syntax Description

/all	(Optional) Lists deleted files, undeleted files, and files with errors.
filesystem:	(Optional) File system or directory containing the files to list, followed by a colon.
file-url	(Optional) The name of the files to display on a specified device. The files can be of any type. You can use wildcards in the filename. A wildcard character (*) matches all patterns. Strings after a wildcard are ignored.

Defaults

The default file system is specified by the **cd** command. When you omit the **/all** keyword, the Cisco I software displays only undeleted files.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

Use the **show** (Flash file system) command to display more detail about the files in a particular file system.

Examples

The following is sample output from the **dir** command:

```
Router# dir slot0:

Directory of slot0:/

  1  -rw-     4720148   Aug 29 1997 17:49:36  hampton/nitro/c7200-j-mz
  2  -rw-     4767328   Oct 01 1997 18:42:53  c7200-js-mz
  5  -rw-         639   Oct 02 1997 12:09:32 rally
  7  -rw-         639   Oct 02 1997 12:37:13  the_time

20578304 bytes total (3104544 bytes free)

Router# dir /all slot0:

Directory of slot0:/

  1  -rw-     4720148   Aug 29 1997 17:49:36  hampton/nitro/c7200-j-mz
  2  -rw-     4767328   Oct 01 1997 18:42:53  c7200-js-mz
  3  -rw-     7982828   Oct 01 1997 18:48:14  [rsp-jsv-mz]
  4  -rw-         639   Oct 02 1997 12:09:17  [the_time]
```

```
 5  -rw-         639   Oct 02 1997 12:09:32  rally
 6  -rw-         639   Oct 02 1997 12:37:01  [the_time]
 7  -rw-         639   Oct 02 1997 12:37:13  the_time
```

Table 26 describes the significant fields shown in the displays.

Table 26 dir Field Descriptions

Field	Description
1	Index number of the file.
-rw-	Permissions. The file can be any or all of the following: • d—directory • r—readable • w—writable • x—executable
4720148	Size of the file.
Aug 29 1997 17:49:36	Last modification date.
hampton/nitro/c7200-j-mz	Filename. Deleted files are indicated by square brackets around the filename.

Related Commands

Command	Description
cd	Changes the default directory or file system.
delete	Deletes a file on a Flash memory device.
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.

erase

To erase a file system, use the **erase** EXEC command. The **erase nvram:** command replaces the **write erase** command and the **erase startup-config** command.

erase *filesystem*:

Syntax Description

filesystem:	File system name, followed by a colon. For example, **flash:** or **nvram:**

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

When a file system is erased, none of the files in the file system can be recovered.

The **erase** command can be used on both Class B and Class C Flash file systems only. To reclaim space on Flash file systems after deleting files using the **delete** command, you must use the **erase** command. This command erases all of the files in the Flash file system.

Class A Flash file systems cannot be erased. You can delete individual files using the **delete** EXEC command and then reclaim the space using the **squeeze** EXEC command. You can use the **format** EXEC command to format the Flash file system.

On Class C Flash file systems, space is dynamically reclaimed when you use the **delete** command. You can also use either the **format** or **erase** command to reinitialize a Class C Flash file system.

The **erase nvram:** command erases NVRAM. On Class A file system platforms, if the CONFIG_FILE variable specifies a file in Flash memory, the specified file will be marked "deleted."

Examples

The following example erases the NVRAM, including the startup configuration located there:

```
erase nvram:
```

The following example erases all of partition 2 in internal Flash memory:

```
Router# erase flash:2

System flash directory, partition 2:
File  Length   Name/status
  1   1711088  dirt/images/c3600-i-mz
[1711152 bytes used, 15066064 available, 16777216 total]

Erase flash device, partition 2? [confirm]
Are you sure? [yes/no]: yes
Erasing device... eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee ...erased
```

The following example erases Flash memory when Flash is partitioned, but no partition is specified in the command:

```
Router# erase flash:

System flash partition information:
Partition    Size     Used     Free     Bank-Size    State          Copy-Mode
     1       4096K    2048K    2048K    2048K        Read Only      RXBOOT-FLH
     2       4096K    2048K    2048K    2048K        Read/Write     Direct

[Type ?<no> for partition directory; ? for full directory; q to abort]
Which partition? [default = 2]
```

The system will prompt only if there are two or more read/write partitions. If the partition entered is not valid or is the read-only partition, the process terminates. You can enter a partition number, a question mark (**?**) for a directory display of all partitions, or a question mark and a number (**?***number*) for directory display of a particular partition. The default is the first read/write partition.

```
System flash directory, partition 2:
File  Length   Name/status
  1   3459720  master/igs-bfpx.100-4.3
[3459784 bytes used, 734520 available, 4194304 total]

Erase flash device, partition 2? [confirm] <Return>
```

Related Commands

Command	Description
boot config	Specifies the device and filename of the configuration file from which the router configures itself during initialization (startup).
delete	Deletes a file on a Flash memory device.
more nvram:startup-config	Displays the startup configuration file contained in NVRAM or specified by the CONFIG_FILE environment variable.
show bootvar	Displays the contents of the BOOT environment variable, the name of the configuration file pointed to by the CONFIG_FILE environment variable, the contents of the BOOTLDR environment variable, and the configuration register setting
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.

erase bootflash

The **erase bootflash:** and **erase bootflash** commands have identical functions. See the description of the **erase** command in this chapter for more information.

file prompt

To specify the level of prompting, use the **file prompt** global configuration command.

file prompt [alert | noisy | quiet]

Syntax Description

alert	(Optional) Prompts only for destructive file operations. This is the default.
noisy	(Optional) Confirms all file operation parameters.
quiet	(Optional) Seldom prompts for file operations.

Defaults

alert

Command Modes

Global configuration

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

Use this command to change the amount of confirmation needed for different file operations.

This command affects only prompts for confirmation of operations. The router will always prompt for missing information.

Examples

The following example configures confirmation prompting for all file operations:

```
file prompt noisy
```

7535 3

format

To format a Class A or Class C Flash file system, use the **format** EXEC command.

Class C Flash File System

format *filesystem1*:

Class A Flash File System

format [**spare** *spare-number*] *filesystem1*: [[*filesystem2*:][*monlib-filename*]]

Caution Reserve a certain number of memory sectors as spares, so that if some sectors fail, most of the Flash memory card can still be used. Otherwise, you must reformat the Flash card when some of the sectors fail.

Syntax Description

spare	(Optional) Reserves spare sectors as specified by the *spare-number* argument when formatting Flash memory.
spare-number	(Optional) Number of the spare sectors to reserve on formatted Flash memory. Valid values are from 0 to 16. The default value is zero.
filesystem1:	Flash memory to format, followed by a colon.
filesystem2:	(Optional) File system containing the monlib file to use for formatting filesystem1 followed by a colon.
monlib-filename	(Optional) Name of the ROM monitor library file (monlib file) to use for formatting the *filesystem1* argument. The default monlib file is the one bundled with the system software. When used with HSA and you do not specify the *monlib-filename* argument, the system takes ROM monitor library file from the slave image bundle. If you specify the *monlib-filename* argument, the system assumes that the files reside on the slave devices.

Defaults

The default monlib file is the one bundled with the system software.

The default number of spare sectors is zero (0).

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

Use this command to format Class A or C Flash memory file systems.

In some cases, you might need to insert a new PCMCIA Flash memory card and load images or backup configuration files onto it. Before you can use a new Flash memory card, you must format it.

Sectors in Flash memory cards can fail. Reserve certain Flash memory sectors as "spares" by using the optional *spare* argument on the **format** command to specify 0 to 16 sectors as spares. If you reserve a small number of spare sectors for emergencies, you can still use most of the Flash memory card. If you specify 0 spare sectors and some sectors fail, you must reformat the Flash memory card, thereby erasing all existing data.

The monlib file is the ROM monitor library. The ROM monitor uses this file to access files in the Flash file system. The Cisco IOS system software contains a monlib file.

In the command syntax, *filesystem1:* specifies the device to format and *filesystem2:* specifies the optional device containing the monlib file used to format *filesystem1:*. If you omit the optional *filesystem2:* and *monlib-filename* arguments, the system formats *filesystem1:* using the monlib file already bundled with the system software. If you omit only *the optional filesystem2:* argument, the system formats *filesystem1:* using the monlib file from the device you specified with the **cd** command. If you omit only the optional *monlib-filename* argument, the system formats *filesystem1:* using the *filesystem2:* monlib file. When you specify both arguments—*filesystem2:* and *monlib-filename*—the system formats *filesystem1:* using the monlib file from the specified device. You can specify *filesystem1:*'s own monlib file in this argument. If the system cannot find a monlib file, it terminates its formatting.

⚠ **Caution** You can read from or write to Flash memory cards formatted for Cisco 7000 series Route Processor (RP) cards in your Cisco 7200 and 7500 series routers, but you cannot boot the Cisco 7200 and 7500 series routers from a Flash memory card formatted for the Cisco 7000 series routers. Similarly, you can read from or write to Flash memory cards formatted for the Cisco 7200 and 7500 series routers in your Cisco 7000 series routers, but you cannot boot the Cisco 7000 series routers from a Flash memory card formatted for the Cisco 7200 and 7500 series routers.

Examples

The following example formats a Flash memory card inserted in slot 0:

```
Router# format slot0:

Running config file on this device, proceed? [confirm]y
All sectors will be erased, proceed? [confirm]y
Enter volume id (up to 31 characters): <Return>
Formatting sector 1 (erasing)
Format device slot0 completed
```

When the console returns to the EXEC prompt, the new Flash memory card is formatted and ready for use.

Related Commands

Command	Description
cd	Changes the default directory or file system.
copy	Copies any file from a source to a destination.
delete	Deletes a file on a Flash memory device.
show file systems (Flash file system)	Lists available file systems.

Command	Description
squeeze	Permanently deletes Flash files by squeezing a Class A Flash file system.
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.

fsck

To check a Class C Flash file system for damage and repair any problems, use the **fsck** EXEC command.

fsck [**/nocrc**] *filesystem*:

Syntax Description

/nocrc	(Optional) Omits cyclic redundancy checks (CRCs).
filesystem:	The file system to check.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

This command is only valid on Class C Flash file systems.

Examples

The following example checks the Flash file system:

```
Router# fsck flash:

Fsck operation may take a while. Continue? [confirm]
flashfs[4]: 0 files, 2 directories
flashfs[4]: 0 orphaned files, 0 orphaned directories
flashfs[4]: Total bytes: 8128000
flashfs[4]: Bytes used: 1024
flashfs[4]: Bytes available: 8126976
flashfs[4]: flashfs fsck took 23 seconds.
Fsck of flash: complete
```

mkdir

To create a new directory in a Class C Flash file system, use the **mkdir** EXEC command.

mkdir *directory*

Syntax Description

directory	The name of the directory to create.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

This command is only valid on Class C Flash file systems.

If you do not specify the directory name in the command line, the router prompts you for it.

Examples

The following example creates a directory named newdir:

```
Router# mkdir newdir

Mkdir file name [newdir]?
Created dir flash:newdir
Router# dir
Directory of flash:

  2  drwx           0   Mar 13 1993 13:16:21  newdir

8128000 bytes total (8126976 bytes free)
```

Related Commands

Command	Description
dir	Displays a list of files on a file system.
rmdir	Removes an existing directory in a Class C Flash file system.

more

To display a file, use the **more** EXEC command.

more [**/ascii** | **/binary** | **/ebcdic**] *file-url*

Syntax Description

/ascii	(Optional) Displays a binary file in ASCII format.
/binary	(Optional) Displays a file in hex/text format.
/ebcdic	(Optional) Displays a binary file in EBCDIC format.
file-url	The URL of the file to display.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

The **more system:running-config** command displays the same output as the **show running-config** command. The **more nvram:startup-config** command replaces the **show startup-config** command and the **show configuration** command.

You can use this command to display configuration files, as follows:

- The **more nvram:startup-config** command displays the startup configuration file contained in NVRAM or specified by the CONFIG_FILE environment variable. The Cisco IOS software informs you whether the displayed configuration is a complete configuration or a distilled version. A distilled configuration is one that does not contain access lists.
- The **more system:running-config** command displays the running configuration.

These commands show the version number of the software used when you last changed the configuration file.

You can display files on remote systems using the **more** command.

Examples

The following partial sample output displays the configuration file named startup-config in NVRAM:

```
Router# more nvram:startup-config

!
! No configuration change since last restart
! NVRAM config last updated at 02:03:26 PDT Thu Oct 2 1997
!
version 12.1
service timestamps debug uptime
service timestamps log uptime
service password-encryption
service udp-small-servers
service tcp-small-servers
.
```

7529
3

```
.
.
end
```

The following is partial sample output from the **more nvram:startup-config** command when the configuration file has been compressed:

```
Router# more nvram:startup-config

Using 21542 out of 65536 bytes, uncompressed size = 142085 bytes
!
version 12.1
service compress-config
!
hostname rose
!
.
.
.
```

The following partial sample output displays the running configuration:

```
Router2# more system:running-config

Building configuration...

Current configuration:
!
version 12.1
no service udp-small-servers
no service tcp-small-servers
!
hostname Router2
!
.
.
.
!
end
```

Related Commands

Command	Description
boot config	Specifies the device and filename of the configuration file from which the router configures itself during initialization (startup).
service compress-config	Compresses startup configuration files.
show bootvar	Displays the contents of the BOOT environment variable, the name of the configuration file pointed to by the CONFIG_FILE environment variable, the contents of the BOOTLDR environment variable, and the configuration register setting.

pwd

To show the current setting of the **cd** command, use the **pwd** EXEC command.

pwd

Syntax Description

This command has no arguments or keywords.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

Use the **pwd** command to show which directory or file system is specified as the default by the **cd** command. For all EXEC commands that have an optional *filesystem* argument, the system uses the file system specified by the **cd** command when you omit the optional *filesystem* argument.

For example, the **dir** command contains an optional *filesystem* argument and displays a list of files on a particular file system. When you omit this *filesystem* argument, the system shows a list of the files on the file system specified by the **cd** command.

Examples

The following example shows that the present working file system specified by the **cd** command is slot 0:

```
Router> pwd
slot0:/
```

The following example uses the **cd** command to change the present file system to slot 1 and then uses the **pwd** command to display that present working file system:

```
Router> cd slot1:
Router> pwd
slot1:/
```

Related Commands

Command	Description
cd	Changes the default directory or file system.
dir	Displays a list of files on a file system.

rename

To rename a file in a Class C Flash file system, use the **rename** EXEC command.

rename *url1 url2*

Syntax Description

url1	The original path and filename.
url2	The new path and filename.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

This command is valid only on Class C Flash file systems.

Examples

In the following example, the file named Karen.1 is renamed test:

```
Router# dir

Directory of disk0:/Karen.dir/

  0  -rw-          0   Jan 21 1998 09:51:29  Karen.1
  0  -rw-          0   Jan 21 1998 09:51:29  Karen.2
  0  -rw-          0   Jan 21 1998 09:51:29  Karen.3
  0  -rw-          0   Jan 21 1998 09:51:31  Karen.4
243  -rw-        165   Jan 21 1998 09:53:17  Karen.cur

340492288 bytes total (328400896 bytes free)

Router# rename disk0:Karen.dir/Karen.1 disk0:Karen.dir/test
Router# dir

Directory of disk0:/Karen.dir/

  0  -rw-          0   Jan 21 1998 09:51:29  Karen.2
  0  -rw-          0   Jan 21 1998 09:51:29  Karen.3
  0  -rw-          0   Jan 21 1998 09:51:31  Karen.4
243  -rw-        165   Jan 21 1998 09:53:17  Karen.cur
  0  -rw-          0   Apr 24 1998 09:49:19  test

340492288 bytes total (328384512 bytes free)
```

rmdir

To remove an existing directory in a Class C Flash file system, use the **rmdir** EXEC command.

rmdir *directory*

Syntax Description

directory	Directory to delete.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

This command is valid only on Class C Flash file systems.

Examples

The following example deletes the directory named newdir:

```
Router# dir

Directory of flash:

  2  drwx           0   Mar 13 1993 13:16:21  newdir

8128000 bytes total (8126976 bytes free)
Router# rmdir newdir
Rmdir file name [newdir]?
Delete flash:newdir? [confirm]
Removed dir flash:newdir
Router# dir
Directory of flash:

No files in directory

8128000 bytes total (8126976 bytes free)
```

Related Commands

Command	Description
dir	Displays a list of files on a file system.
mkdir	Creates a new directory in a Class C Flash file system.

show configuration

The **show configuration** command is replaced by the **show startup-config** and **more nvram:startup-config** commands. See the description of the **show startup-config** and **more** commands for more information.

show file descriptors

To display a list of open file descriptors, use the **show file descriptors** EXEC command.

show file descriptors

Syntax Description

This command has no arguments or keywords.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

File descriptors are the internal representations of open files. You can use this command to learn if another user has a file open.

Examples

The following is sample output from the **show file descriptors** command:

```
Router# show file descriptors

File Descriptors:

   FD  Position  Open   PID  Path
    0    187392  0001     2  tftp://dirt/hampton/c4000-i-m.a
    1    184320  030A     2  flash:c4000-i-m.a
```

Table 27 describes the significant fields shown in the display.

Table 27 show file descriptors Field Descriptions

Field	Description
FD	File descriptor. The file descriptor is a small integer used to specify the file once it has been opened.
Position	Byte offset from the start of the file.
Open	Flags supplied when opening the file.
PID	Process ID of the process that opened the file.
Path	Location of the file.

45233

show file information

To display information about a file, use the **show file information** EXEC command.

show file information *file-url*

Syntax Description

file-url	The URL of the file to display.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Examples

The following is sample output from the **show file information** command:

```
Router# show file information tftp://dirt/hampton/c2500-j-l.a

tftp://dirt/hampton/c2500-j-l.a:
  type is image (a.out) [relocatable, run from flash]
  file size is 8624596 bytes, run size is 9044940 bytes [8512316+112248+420344]
  Foreign image

Router# show file information slot0:c7200-js-mz

slot0:c7200-js-mz:
  type is image (elf) []
  file size is 4770316 bytes, run size is 4935324 bytes
  Runnable image, entry point 0x80008000, run from ram

Router1# show file information nvram:startup-config

nvram:startup-config:
  type is ascii text
```

Table 28 describes the possible file types.

Table 28 Possible File Types

Types	Description
image (a.out)	Runnable image in a.out format.
image (elf)	Runnable image in elf format.
ascii text	Configuration file or other text file.
coff	Runnable image in coff format.
ebcdic	Text generated on an IBM mainframe.
lzw compression	Lzw compressed file.
tar	Text archive file used by the Channel Interface Processor (CIP).

show file systems

To list available file systems, use the **show file systems** command in EXEC mode.

show file systems

Syntax Description

This command has no arguments or keywords.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

Use this command to learn the alias names (Prefixes) of the file systems your router supports.

Examples

The following is sample output from the **show file systems** command:

```
Router# show file systems

File Systems:

     Size(b)       Free(b)     Type     Flags   Prefixes
           -             -   opaque     rw      null:
           -             -   opaque     rw      system:
           -             -   opaque     ro      xmodem:
           -             -   opaque     ro      ymodem:
           -             -  network     rw      tftp:
           -             -  network     rw      rcp:
           -             -  network     rw      ftp:
*    4194304       4190616    flash     rw      flash:
      131066        129185    nvram     rw      nvram:
           -             -   opaque     wo      lex:
```

Table 29 describes the significant fields shown in the display.

Table 29 show file systems Field Descriptions

Type	Description
Size(b)	Amount of memory in the file system (in bytes).
Free(b)	Amount of free memory in the file system (in bytes).
Type	Type of file system.
Flags	Permissions for file system.
Prefixes	Alias for file system.
disk	The file system is for a rotating medium.
flash	The file system is for a Flash memory device.

7521 3

Table 29 show file systems Field Descriptions (continued)

Type	Description
network	The file system is a network file system (TFTP, rcp, FTP, and so on).
nvram	The file system is for an NVRAM device.
opaque	The file system is a locally generated "pseudo" file system (for example, the "system") or a download interface, such as brimux.
rom	The file system is for a ROM or EPROM device.
tty	The file system is for a collection of terminal devices.
unknown	The file system is of unknown type.

Table 30 describes file system flags.

Table 30 Possible File System Flags

Flag	Description
ro	The file system is Read Only.
rw	The file system is Write Only.
wo	The file system is Read/Write.

squeeze

To permanently erase files tagged as "deleted" or "error" on Class A Flash file systems, use the **squeeze** command in EXEC mode.

squeeze [**/nolog**] [**/quiet**] *filesystem*:

Syntax Description

/nolog	(Optional) Disables the squeeze log (recovery data) and accelerates the squeeze process.
/quiet	(Optional) Disables status messages during the squeeze process.
filesystem:	The Flash file system, followed by a colon. Typically **flash:** or **slot0:**.

Command Modes

EXEC

Command History

Release	Modification
11.1	This command was introduced.
12.2(1)	This command was implemented in images for the Cisco 2600 and Cisco 3600 series.
12.2(4)XL	This command was implemented in images for the Cisco 1700 series.
12.1(9), 12.0(17)S 12.0(17)ST, 12.2(2), 12.2(2)T, 12.2(2)B, 12.1(9)E	The **/nolog** and **/quiet** keywords were added.

Usage Guidelines

When Flash memory is full, you might need to rearrange the files so that the space used by the files marked "deleted" can be reclaimed. (This "squeeze" process is required for linear Flash memory cards to make sectors contiguous; the free memory must be in a "block" to be usable.)

When you enter the **squeeze** command, the router copies all valid files to the beginning of Flash memory and erases all files marked "deleted." After the squeeze process is completed, you can write to the reclaimed Flash memory space.

Caution After performing the squeeze process you cannot recover deleted files using the **undelete** EXEC mode command.

In addition to removing deleted files, the **squeeze** command removes any files that the system has marked as "error". An error file is created when a file write fails (for example, the device is full). To remove error files, you must use the **squeeze** command.

Rewriting Flash memory space during the squeeze operation may take several minutes.

Using the **/nolog** keyword disables the log for the squeeze process. In most cases this will speed up the squeeze process. However, if power is lost or the Flash card is removed during the squeeze process, all the data on the Flash card will be lost, and the device will have to be reformatted.

Note Using the **/nolog** keyword makes the squeeze process uninterruptible.

Using the **/quiet** keyword disables the output of status messages to the console during the squeeze process.

If the optional keywords are not used, the progress of squeeze process will be displayed to the console, a log for the process will be maintained, and the squeeze process is interruptible.

On Cisco 2600 or Cisco 3600 series routers, the entire file system needs to be erased once before the **squeeze** command can be used. After being erased once, the **squeeze** command should operate properly on the Flash file system for the rest of the Flash file system's history.

To erase an entire flash file system on a Cisco 2600 or 3600 series router, perform the following steps:

Step 1 If the Flash file system has multiple partitions, enter the **no partition** command to remove the partitions. The reason for removing partitions is to ensure that the entire Flash file system is erased. The **squeeze** command can be used in a Flash file system with partitions after the Flash file system is erased once.

Step 2 Enter the **erase** command to erase the Flash file system.

Examples

In the following example, the file named "config1" is deleted, and then the **squeeze** command is used to reclaim the space used by that file. The **/nolog** option is used to speed up the squeeze process.

```
Router# delete config1
Delete filename [config1]?
Delete slot0:conf? [confirm]
Router# dir slot0:
! Note that the deleted file name appears in square brackets
Directory of slot0:/

    1  -rw-     4300244   Apr 02 2001 03:18:07  c7200-boot-mz.122-0.14
    2  -rw-        2199   Apr 02 2001 04:45:15  [config1]
    3  -rw-     4300244   Apr 02 2001 04:45:23  image
20578304 bytes total (11975232 bytes free)
!20,578,304 - 4,300,244 - 4,300,244 - 2,199 - 385 = 11975232

Router# squeeze /nolog slot0:
%Warning: Using /nolog option would render squeeze operation uninterruptible.
All deleted files will be removed. Continue? [confirm]
Squeeze operation may take a while. Continue? [confirm]

Squeeze of slot0 completed in 291.832 secs .
Router# dir slot0:
Directory of slot0:/

    1  -rw-     4300244   Apr 02 2001 03:18:07  c7200-boot-mz.122-0.14
    2  -rw-     4300244   Apr 02 2001 04:45:23  image

20578304 bytes total (11977560 bytes free)
!20,578,304 - 4,300,244 - 4,300,244 - 256 = 11977560
```

Related Commands

Command	Description
delete	Deletes a file on a Flash memory device.
dir	Displays a list of files on a file system.
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.

undelete

To recover a file marked "deleted" on a Class A or Class B Flash file system, use the **undelete** EXEC command.

undelete *index* [*filesystem*:]

Syntax Description

index	A number that indexes the file in the **dir** command output.
filesystem:	(Optional) A file system containing the file to undelete, followed by a colon.

Defaults

The default file system is the one specified by the **cd** command.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

For Class A and B Flash file systems, when you delete a file, the Cisco IOS software simply marks the file as deleted, but it does not erase the file. This command allows you to recover a "deleted" file on a specified Flash memory device. You must undelete a file by its index because you could have multiple deleted files with the same name. For example, the "deleted" list could contain multiple configuration files with the name router-config. You undelete by index to indicate which of the many router-config files from the list to undelete. Use the **dir** command to learn the index number of the file you want to undelete.

You cannot undelete a file if a valid (undeleted) file with the same name exists. Instead, you first delete the existing file and then undelete the file you want. For example, if you had an undeleted version of the router-config file and you wanted to use a previous, deleted version instead, you could not simply undelete the previous version by index. You would first delete the existing router-config file and then undelete the previous router-config file by index. You can delete and undelete a file up to 15 times.

On Class A Flash file systems, if you try to recover the configuration file pointed to by the CONFIG_FILE environment variable, the system prompts you to confirm recovery of the file. This prompt reminds you that the CONFIG_FILE environment variable points to an undeleted file. To permanently delete all files marked "deleted" on a Flash memory device, use the **squeeze** EXEC command.

On Class B Flash file systems, you must use the **erase** EXEC command to recover any space taken up by deleted files.

Examples

The following example recovers the deleted file whose index number is 1 to the Flash memory card inserted in slot 0:

```
undelete 1 slot0:
```

Related Commands

Command	Description
delete	Deletes a file on a Flash memory device.

verify

To verify the checksum of a file on a Flash memory file system, use the **verify** EXEC command.

verify *filesystem*:[*file-url*]

Syntax Description

filesystem:	Flash memory file system containing the files to list, followed by a colon. Standard file system keywords for this command include **flash:**, **bootflash:**, and **slot0:**.
file-url	(Optional) URL of the file to verify. Generally this consists only of the filename(s), but you may also specify directories (file paths), separated by forward-slashes (/). The files can be of any type. You can use wildcards in the filename. A wildcard character (*) matches all patterns. Strings after a wildcard are ignored.

Defaults

The current working device is the default device.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

This command replaces the **copy verify** and **copy verify flash** commands.

Use the **verify** command to verify the checksum of a file before using it.

Each software image that is distributed on disk uses a single checksum for the entire image. This checksum is displayed only when the image is copied into Flash memory; it is not displayed when the image file is copied from one disk to another.

To display the contents of Flash memory, use the **show flash** command. The Flash contents listing dc not include the checksum of individual files. To recompute and verify the image checksum after the image has been copied into Flash memory, use the **verify** command.

Note The verify command only performs a check on the integrity of the file after it has been saved in the file system. It is possible for a corrupt image to be transferred to the router and saved in the file system without detection.
To verify that a Cisco IOS software image was not corrupted while it was transfered to the router, copy the image from where it is stored on your router to a Unix server. Also copy the same image from CCO (Cisco.com) to the same Unix server. (The name may need to be modified if you try to save the image in the same directory as the image that you copied from the router.) Then run a Unix **diff** command on the two Cisco IOS software images. If there is no difference then the image stored on the router has not been corrupted.

Examples

The following example verifies that the file named c7200-js-mz is on the Flash memory card inserted in slot 0:

```
Router# dir slot0:
Directory of slot0:/

  1  -rw-     4720148   Aug 29 1997 17:49:36  hampton/nitro/c7200-j-mz
  2  -rw-     4767328   Oct 01 1997 18:42:53  c7200-js-mz
  5  -rw-         639   Oct 02 1997 12:09:32  rally
  7  -rw-         639   Oct 02 1997 12:37:13  the_time

20578304 bytes total (3104544 bytes free)
tw3-7200-1# verify slot0:
Verify filename []? c7200-js-mz
Verified slot0:
```

The following example also verifies that the file named c7200-js-mz is on the Flash memory card inserted in slot 0:

```
Router# verify slot0:?
slot0:c7200-js-mz  slot0:rally slot0:hampton/nitro/c7200-j-mz  slot0:the_time

Router# verify slot0:c7200-js-mz
Verified slot0:c7200-js-mz
```

Related Commands

Command	Description
cd	Changes the default directory or file system.
copy	Copies any file from a source to a destination, use the copy EXEC command.
dir	Displays a list of files on a file system.
pwd	Displays the current setting of the **cd** command.
show file systems	Lists available file systems.

Configuring BGP

This chapter describes how to configure Border Gateway Protocol (BGP). For a complete description of the BGP commands in this chapter, refer to the "BGP Commands" chapter of the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols*. To locate documentation of other commands that appear in this chapter, use the command reference master index, or search online. For multiprotocol BGP configuration information and examples, refer to the "Configuring Multiprotocol BGP Extensions for IP Multicast" chapter of the *Cisco IOS IP Configuration Guide*. For multiprotocol BGP command descriptions, refer to the "Multiprotocol BGP Extensions for IP Multicast Commands" chapter of the *Cisco IOS IP Command Reference*.

BGP, as defined in RFCs 1163 and 1267, is an Exterior Gateway Protocol (EGP). It allows you to set up an interdomain routing system that automatically guarantees the loop-free exchange of routing information between autonomous systems.

For protocol-independent features, see the chapter "Configuring IP Routing Protocol-Independent Features" in this book.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the "Identifying Supported Platforms" section in the "Using Cisco IOS Software" chapter in this book.

The Cisco BGP Implementation

In BGP, each route consists of a network number, a list of autonomous systems that information has passed through (called the *autonomous system path*), and a list of other *path attributes*. We support BGP Versions 2, 3, and 4, as defined in RFCs 1163, 1267, and 1771, respectively.

The primary function of a BGP system is to exchange network reachability information with other BGP systems, including information about the list of autonomous system paths. This information can be used to construct a graph of autonomous system connectivity from which routing loops can be pruned and with which autonomous system-level policy decisions can be enforced.

You can configure the value for the Multi Exit Discriminator (MED) metric attribute using route maps. (The name of this metric for BGP Versions 2 and 3 is INTER_AS_METRIC.) When an update is sent to an internal BGP (iBGP) peer, the MED is passed along without any change. This action enables all the peers in the same autonomous system to make a consistent path selection.

A next hop router address is used in the NEXT_HOP attribute, regardless of the autonomous system of that router. The Cisco IOS software automatically calculates the value for this attribute.

Transitive, optional path attributes are passed along to other BGP-speaking routers.

BGP Version 4 supports classless interdomain routing (CIDR), which lets you reduce the size of your routing tables by creating aggregate routes, resulting in *supernets*. CIDR eliminates the concept of network classes within BGP and supports the advertising of IP prefixes. CIDR routes can be carried by Open Shortest Path First (OSPF), Enhanced IGRP (EIGRP), and Intermediate System-to-Intermediate System (ISIS)-IP, and Routing Information Protocol (RIP).

See the "BGP Route Map Examples" section at the end of this chapter for examples of how to use route maps to redistribute BGP Version 4 routes.

How BGP Selects Paths

A router running Cisco IOS Release 12.0 or later does not select or use an iBGP route unless both of the following conditions are true:

- The router has a route available to the next hop router:
- The router has received synchronization via an IGP (unless IGP synchronization has been disabled).

BGP bases its decision process on the attribute values. When faced with multiple routes to the same destination, BGP chooses the best route for routing traffic toward the destination. The following process summarizes how BGP chooses the best route.

1. If the next hop is inaccessible, do not consider it.

   This decision is why it is important to have an IGP route to the next hop.

2. If the path is internal, synchronization is enabled, and the route is not in the IGP, do not consider the route.
3. Prefer the path with the largest weight (weight is a Cisco proprietary parameter).
4. If the routes have the same weight, prefer the route with the largest local preference.
5. If the routes have the same local preference, prefer the route that was originated by the local router.

   For example, a route might be originated by the local router using the **network bgp** router configuration command, or through redistribution from an IGP.

6. If the local preference is the same, or if no route was originated by the local router, prefer the route with the shortest autonomous system path.
7. If the autonomous system path length is the same, prefer the route with the lowest origin code (IGP < EGP < INCOMPLETE).
8. If the origin codes are the same, prefer the route with the lowest MED metric attribute.

   This comparison is only made if the neighboring autonomous system is the same for all routes considered, unless the **bgp always-compare-med** router configuration command is enabled.

   Note The most recent Internet Engineering Task Force (IETF) decision regarding BGP MED assigns a value of infinity to the missing MED, making the route lacking the MED variable the least preferred. The default behavior of BGP routers running Cisco IOS software is to treat routes without the MED attribute as having a MED of 0, making the route lacking the MED variable the most preferred. To configure the router to conform to the IETF standard, use the **bgp bestpath med missing-as-worst** router configuration command.

9. Prefer the external BGP (eBGP) path over the iBGP path.

   All confederation paths are considered internal paths.

10. Prefer the route that can be reached through the closest IGP neighbor (the lowest IGP metric).

    The router will prefer the shortest internal path within the autonomous system to reach the destination (the shortest path to the BGP next hop).

11. If the following conditions are all true, insert the route for this path into the IP routing table:
    - Both the best route and this route are external.
    - Both the best route and this route are from the same neighboring autonomous system.
    - The **maximum-paths** router configuration command is enabled.

    Note eBGP load sharing can occur at this point, which means that multiple paths can be installed in the forwarding table.

12. If multipath is not enabled, prefer the route with the lowest IP address value for the BGP router ID.

    The router ID is usually the highest IP address on the router or the loopback (virtual) address, but might be implementation-specific.

BGP Multipath Support

When a BGP speaker learns two identical eBGP paths for a prefix from a neighboring autonomous system, it will choose the path with the lowest route ID as the best path. This best path is installed in the IP routing table. If BGP multipath support is enabled and the eBGP paths are learned from the same neighboring autonomous system, instead of one best path being picked, multiple paths are installed in the IP routing table.

During packet switching, depending on the switching mode, either per-packet or per-destination load balancing is performed among the multiple paths. A maximum of six paths is supported. The **maximum-paths** router configuration command controls the number of paths allowed. By default, BGP will install only one path to the IP routing table.

Basic BGP Configuration Task List

The BGP configuration tasks are divided into basic and advanced tasks, which are described in the following sections. The basic tasks described in the first two sections are required to configure BGP; the basic and advanced tasks in the remaining sections are optional:

- Enabling BGP Routing (Required)
- Configuring BGP Neighbors (Required)
- Managing Routing Policy Changes (Optional)
- Verifying BGP Soft Reset (Optional)
- Configuring BGP Interactions with IGPs (Optional)
- Configuring BGP Weights (Optional)
- Disabling Autonomous System Path Comparison (Optional)
- Configuring BGP Route Filtering by Neighbor (Optional)
- Configuring BGP Filtering Using Prefix Lists (Optional)
- Configuring BGP Path Filtering by Neighbor (Optional)

- Disabling Next Hop Processing on BGP Updates (Optional)
- Configuring the BGP Version (Optional)
- Configuring the MED Metric (Optional)

Advanced BGP Configuration Task List

Advanced, optional BGP configuration tasks are described in the following sections:

- Using Route Maps to Modify Updates (Optional)
- Resetting eBGP Connections Immediately upon Link Failure (Optional)
- Configuring Aggregate Addresses (Optional)
- Disabling Automatic Summarization of Network Numbers (Optional)
- Configuring BGP Community Filtering (Optional)
- Configuring BGP Conditional Advertisement (Optional)
- Configuring a Routing Domain Confederation (Optional)
- Configuring a Route Reflector (Optional)
- Configuring BGP Peer Groups (Optional)
- Disabling a Peer or Peer Group (Optional)
- Indicating Backdoor Routes (Optional)
- Modifying Parameters While Updating the IP Routing Table (Optional)
- Setting Administrative Distance (Optional)
- Adjusting BGP Timers (Optional)
- Changing the Default Local Preference Value (Optional)
- Redistributing Network 0.0.0.0 (Optional)
- Configuring the Router to Consider a Missing MED as Worst Path (Optional)
- Selecting Path Based on MEDs from Other Autonomous Systems (Optional)
- Configuring the Router to Use the MED to Choose a Path from Subautonomous System Paths (Optional)
- Configuring the Router to Use the MED to Choose a Path in a Confederation (Optional)
- Configuring Route Dampening (Optional)

For information on configuring features that apply to multiple IP routing protocols (such as redistributing routing information), see the chapter "Configuring IP Routing Protocol-Independent Features."

Configuring Basic BGP Features

The tasks described in this section are for configuring basic BGP features.

Enabling BGP Routing

To enable BGP routing and establish a BGP routing process, use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# **router bgp** *as-number*	Enables a BGP routing process, which places the router in router configuration mode.
Step 2	Router(config-router)# **network** *network-number* [**mask** *network-mask*] [**route-map** *route-map-name*]	Flags a network as local to this autonomous system and enters it to the BGP table.

Note For exterior protocols, a reference to an IP network from the **network** router configuration command controls only which networks are advertised. This behavior is in contrast to IGP, such as IGRP, which also use the **network** command to determine where to send updates.

Note The **network** command is used to inject IGP routes into the BGP table. The *network-mask* portion of the command allows supernetting and subnetting. The resources of the router, such as configured NVRAM or RAM, determine the upper limit of the number of **network** commands you can use. Alternatively, you could use the **redistribute** router configuration command to achieve the same result.

Configuring BGP Neighbors

Like other EGPs, BGP must completely understand the relationships it has with its neighbors. Therefore, this task is required.

BGP supports two kinds of neighbors: internal and external. *Internal neighbors* are in the same autonomous system; *external neighbors* are in different autonomous systems. Normally, external neighbors are adjacent to each other and share a subnet, while internal neighbors may be anywhere in the same autonomous system.

To configure BGP neighbors, use the following command in router configuration mode:

Command	Purpose
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*	Specifies a BGP neighbor.

See the "BGP Neighbor Configuration Examples" section at the end of this chapter for an example of configuring BGP neighbors.

Managing Routing Policy Changes

Routing policies for a peer include all the configurations such as route-map, distribute-list, prefix-list, and filter-list that may impact inbound or outbound routing table updates. Whenever there is a change in the routing policy, the BGP session must be soft cleared, or soft reset, for the new policy to take effect. Performing inbound reset enables the new inbound policy to take effect. Performing outbound reset causes the new local outbound policy take effect without resetting the BGP session. As a new set of updates is sent during outbound policy reset, a new inbound policy of the neighbor can also take effect.

There are two types of reset, hard reset and soft reset. Table 8 lists their advantages and disadvantages.

Table 8 Advantages and Disadvantages of Hard and Soft Resets

Type of Reset	Advantages	Disadvantages
Hard reset	No memory overhead.	The prefixes in the BGP, IP, and Forwarding Information Base (FIB) tables provided by the neighbor are lost. Not recommended.
Outbound soft reset	No configuration, no storing of routing table updates. The procedure for an outbound reset is described in the section "Configuring BGP Soft Reset Using Stored Routing Policy Information."	Does not reset inbound routing table updates.
Dynamic inbound soft reset	Does not clear the BGP session and cache. Does not require storing of routing table updates, and has no memory overhead.	Both BGP routers must support the route refresh capability (in Cisco IOS Release 12.1 and later releases).
Configured inbound soft reset (uses the **neighbor soft-reconfiguration** router configuration command)	Can be used when both BGP routers do not support the automatic route refresh capability.	Requires preconfiguration. Stores all received (inbound) routing policy updates without modification; is memory-intensive. Recommended only when absolutely necessary, such as when both BGP routers do not support the automatic route refresh capability.

Once you have defined two routers to be BGP neighbors, they will form a BGP connection and exchange routing information. If you subsequently change a BGP filter, weight, distance, version, or timer, or make a similar configuration change, you must reset BGP connections for the configuration change to take effect.

A soft reset updates the routing table for inbound and outbound routing updates. Cisco IOS software Release 12.1 and later releases support soft reset without any prior configuration. This soft reset allows the dynamic exchange of route refresh requests and routing information between BGP routers, and the subsequent re-advertisement of the respective outbound routing table. There are two types of soft reset:

- When soft reset is used to generate inbound updates from a neighbor, it is called dynamic inbound soft reset.
- When soft reset is used to send a new set of updates to a neighbor, it is called outbound soft reset.

To use soft reset without preconfiguration, both BGP peers must support the soft route refresh capability, which is advertised in the OPEN message sent when the peers establish a TCP session. Routers running Cisco IOS software releases prior to Release 12.1 do not support the route refresh capability and must clear the BGP session using the **neighbor soft-reconfiguration** router configuration command, described in "Configuring BGP Soft Reset Using Stored Routing Policy Information." Clearing the BGP session in this way will have a negative impact upon network operations and should only be used as a last resort.

Resetting a Router Using BGP Dynamic Inbound Soft Reset

If both the local BGP router and the neighbor router support the route refresh capability, you can perform a dynamic soft inbound reset. This type of reset has the following advantages over a soft inbound reset using stored routing update information:

- Does not require preconfiguration
- Does not require additional memory for storing routing update information

To determine whether a router supports the route refresh capability, use the **show ip bgp neighbors** command in EXEC mode:

Command	Purpose
Router# **show ip bgp neighbors** *ip-address*	Displays whether a neighbor supports the route refresh capability. If the specified router supports the route refresh capability, the following message is displayed: Received route refresh capability from peer.

If all the BGP routers support the route refresh capability, you can use the dynamic soft reset method for resetting the inbound routing table. To perform a dynamic soft reset of the inbound routing table, use the following command in EXEC mode:

Command	Purpose
Router# **clear ip bgp** {***** | *neighbor-address* | *peer-group-name*} **soft in**	Performs a dynamic soft reset on the connection specified in the command. The *neighbor-address* argument specifies the connection to be reset. Use the ***** keyword to specify that all connections be reset.

See the "BGP Soft Reset Examples" section at the end of this chapter for examples of both types of BGP soft resets.

Resetting a Router Using BGP Outbound Soft Reset

Outbound soft resets do not require any preconfiguration. Using the **soft** keyword specifies that a soft reset be performed. To perform an outbound soft reset, use the following command in EXEC mode:

Command	Purpose
`Router# clear ip bgp {*	neighbor-address	peer-group-name} soft out`	Performs a soft reset on the connection specified in the command. The *neighbor-address* argument specifies the connection to be reset. Use the * keyword to specify that all connections be reset.

Configuring BGP Soft Reset Using Stored Routing Policy Information

If all of the BGP routers in the connection do not support the route refresh capability, use the soft reset method that generates a new set of inbound routing table updates from information previously stored. To initiate storage of inbound routing table updates, you must first preconfigure the router using the **neighbor soft-reconfiguration** router configuration command. The **clear ip bgp EXEC** command initiates the soft reset, which generates a new set of inbound routing table updates using the stored information.

Remember that the memory requirements for storing the inbound update information can become quite large.To configure BGP soft reset using stored routing policy information, use the following commands beginning in router configuration mode:

	Command	Purpose
Step 1	`Router(config-router)# neighbor {ip-address	peer-group-name} soft-reconfiguration inbound`	Resets the BGP session and initiates storage of inbound routing table updates from the specified neighbor or peer group. From that point forward, a copy of the BGP routing table for the specified neighbor or peer group is maintained on the router. The Cisco implementation of BGP supports BGP Versions 2, 3, and 4. If the neighbor does not accept default Version 4, dynamic version negotiation is implemented to negotiate down to Version 2. If you specify a BGP peer group by using the *peer-group-name* argument, all members of the peer group will inherit the characteristic configured with this command.
Step 2	`Router# clear ip bgp {*	neighbor-address	peer-group-name} soft in`	Performs a soft reset on the connection specified in the command, using the stored routing table information for that connection.

See the "BGP Path Filtering by Neighbor Examples" section at the end of this chapter for an example of BGP path filtering by neighbor.

Verifying BGP Soft Reset

To verify whether a soft reset is successful and check information about the routing table and about BGP neighbors, perform the following steps:

Step 1 Enter the **show ip bgp** EXEC command to display entries in the BGP routing table. The following output shows that the peer supports the route refresh capability:

```
Router# show ip bgp

BGP table version is 5, local router ID is 10.0.33.34
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal
Origin codes: i - IGP, e - EGP, ? - incomplete

*> 1.0.0.0          0.0.0.0                  0         32768 ?
*  2.0.0.0          10.0.33.35              10             0 35 ?
*>                  0.0.0.0                  0         32768 ?
*  10.0.0.0         10.0.33.35              10             0 35 ?
*>                  0.0.0.0                  0         32768 ?
*> 192.168.0.0/16   10.0.33.35              10             0 35 ?
```

Step 2 Enter the **show ip bgp neighbors** EXEC command to display information about the BGP and TCP connections to neighbors:

```
Router# show ip bgp neighbors 171.69.232.178

BGP neighbor is 172.16.232.178,  remote AS 35, external link
  BGP version 4, remote router ID 192.168.3.3
  BGP state = Established, up for 1w1d
  Last read 00:00:53, hold time is 180, keepalive interval is 60 seconds
  Neighbor capabilities:
    Route refresh: advertised and received
    Address family IPv4 Unicast: advertised and received
    Address family IPv4 Multicast: advertised and received
  Received 12519 messages, 0 notifications, 0 in queue
  Sent 12523 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 30 seconds

 For address family: IPv4 Unicast
  BGP table version 5, neighbor version 5
  Index 1, Offset 0, Mask 0x2
  Community attribute sent to this neighbor
  Inbound path policy configured
  Outbound path policy configured
  Route map for incoming advertisements is uni-in
  Route map for outgoing advertisements is uni-out
  3 accepted prefixes consume 108 bytes
  Prefix advertised 6, suppressed 0, withdrawn 0

 For address family: IPv4 Multicast
  BGP table version 5, neighbor version 5
  Index 1, Offset 0, Mask 0x2
  Inbound path policy configured
  Outbound path policy configured
  Route map for incoming advertisements is mul-in
  Route map for outgoing advertisements is mul-out
  3 accepted prefixes consume 108 bytes
  Prefix advertised 6, suppressed 0, withdrawn 0

  Connections established 2; dropped 1
  Last reset 1w1d, due to Peer closed the session
```

```
Connection state is ESTAB, I/O status: 1, unread input bytes: 0
Local host: 172.16.232.178, Local port: 179
Foreign host: 172.16.232.179, Foreign port: 11002

Enqueued packets for retransmit: 0, input: 0  mis-ordered: 0 (0 bytes)

Event Timers (current time is 0x2CF49CF8):

```

Configuring BGP Interactions with IGPs

If your autonomous system will be passing traffic through it from another autonomous system to a third autonomous system, make sure that your autonomous system is consistent about the routes that it advertises. For example, if your BGP were to advertise a route before all routers in your network had learned about the route through your IGP, your autonomous system could receive traffic that some routers cannot yet route. To prevent this condition from occurring, BGP must wait until the IGP has propagated routing information across your autonomous system, thus causing BGP to be synchronized with the IGP. Synchronization is enabled by default.

In some cases, you need not synchronize. If you will not be passing traffic from a different autonomous system through your autonomous system, or if all routers in your autonomous system will be running BGP, you can disable synchronization. Disabling this feature can allow you to carry fewer routes in your IGP and allow BGP to converge more quickly. To disable synchronization, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# no synchronization`	Disables synchronization between BGP and an IGP.

See the "BGP Path Filtering by Neighbor Examples" section at the end of this chapter for an example of BGP synchronization.

In general, you will not want to redistribute most BGP routes into your IGP. A common design is to redistribute one or two routes and to make them exterior routes in IGRP, or have your BGP speaker generate a default route for your autonomous system. When redistributing from BGP into IGP, only the routes learned using eBGP get redistributed.

In most circumstances, you also will not want to redistribute your IGP into BGP. List the networks in your autonomous system with **network** router configuration commands and your networks will be advertised. Networks that are listed this way are referred to as *local networks* and have a BGP origin attribute of "IGP." They must appear in the main IP routing table and can have any source; for example, they can be directly connected or learned via an IGP. The BGP routing process periodically scans the main IP routing table to detect the presence or absence of local networks, updating the BGP routing table as appropriate.

If you do perform redistribution into BGP, you must be very careful about the routes that can be in your IGP, especially if the routes were redistributed from BGP into the IGP elsewhere. Redistributing routes from BGP into the IGP elsewhere creates a situation where BGP is potentially injecting information into the IGP and then sending such information back into BGP, and vice versa. Incorrectly redistributing routes into BGP can result in the loss of critical information, such as the autonomous system path, that is required for BGP to function properly.

Networks that are redistributed into BGP from the EGP protocol will be given the BGP origin attribute "EGP." Other networks that are redistributed into BGP will have the BGP origin attribute of "incomplete." The origin attribute in the Cisco implementation is only used in the path selection process.

Configuring BGP Weights

A weight is a number that you can assign to a path so that you can control the path selection process. The administrative weight is local to the router. A weight can be a number from 0 to 65535. Any path that a Cisco router originates will have a default weight of 32768; other paths have weight 0. If you have particular neighbors that you want to prefer for most of your traffic, you can assign a higher weight to all routes learned from that neighbor.

Weights can be assigned based on autonomous system path access lists. A given weight becomes the weight of the route if the autonomous system path is accepted by the access list. Any number of weight filters are allowed. Weights can only be assigned via route maps.

Disabling Autonomous System Path Comparison

RFC 1771, the IETF document defining BGP, does not include autonomous system path as part of the "tie-breaker" decision algorithm. By default, Cisco IOS software considers the autonomous system path as a part of the decision algorithm. This enhancement makes it possible to modify the decision algorithm, bringing the behavior of the router in selecting a path more in line with the IETF specification.

To prevent the router from considering the autonomous system path length when selecting a route, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# bgp bestpath as-path ignore`	Configures the router to ignore autonomous system path length in selecting a route.

Configuring BGP Route Filtering by Neighbor

You can filter BGP advertisements in two ways:

- Use autonomous system path filters, as with the **ip as-path access-list** global configuration command and the **neighbor filter-list** router configuration command
- Use access or prefix lists, as with the **neighbor distribute-list** router configuration command.

Filtering using prefix lists is described in the "Configuring BGP Filtering Using Prefix Lists" section.

If you want to restrict the routing information that the Cisco IOS software learns or advertises, you can filter BGP routing updates to and from particular neighbors. You can either define an access list or a prefix list and apply it to the updates.

Note Distribute-list filters are applied to network numbers and not autonomous system paths.

To filter BGP routing updates, use the following command in router configuration mode:

Command	Purpose
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **distribute-list** {*access-list-number* | *access-list-name*} {**in** | **out**}	Filters BGP routing updates to and from neighbors as specified in an access list. **Note** The **neighbor prefix-list** router configuration command can be used as an alternative to the **neighbor distribute-list** router configuration command, but you cannot use both commands to configure the same BGP peer in any specific direction. These two commands are mutually exclusive, and only one command (**neighbor prefix-list** or **neighbor distribute-list**) an be applied for each inbound or outbound direction.

Note Although the **neighbor prefix-list** router configuration command can be used as an alternative to the **neighbor distribute-list** command, do not use attempt to apply both the **neighbor prefix-list** and **neighbor distribute-list** command filtering to the same neighbor in any given direction. These two commands are mutually exclusive, and only one command (**neighbor prefix-list** or **neighbor distribute-list**) can be applied for each inbound or outbound direction.

Configuring BGP Filtering Using Prefix Lists

Prefix lists can be used as an alternative to access lists in many BGP route filtering commands. The section "How the System Filters Traffic by Prefix List" describes the way prefix list filtering works. The advantages of using prefix lists are as follows:

- Significant performance improvement in loading and route lookup of large lists.
- Support for incremental updates. Filtering using extended access lists does not support incremental updates.

- More user-friendly command-line interface (CLI). The command-line interface for using access lists to filter BGP updates is difficult to understand and use because it uses the packet filtering format.
- Greater flexibility

Before using a prefix list in a command, you must set up a prefix list, and you may want to assign sequence numbers to the entries in the prefix list.

How the System Filters Traffic by Prefix List

Filtering by prefix list involves matching the prefixes of routes with those listed in the prefix list. When there is a match, the route is used. More specifically, whether a prefix is permitted or denied is based upon the following rules:

- An empty prefix list permits all prefixes.
- An implicit deny is assumed if a given prefix does not match any entries of a prefix list.
- When multiple entries of a prefix list match a given prefix, the longest, most specific match is chosen.

  The router begins the search at the top of the prefix list, with the sequence number 1. Once a match or deny occurs, the router need not go through the rest of the prefix list. For efficiency, you may want to put the most common matches or denies near the top of the list, using the **seq** argument in the **ip prefix-list** global configuration command. The **show** commands always include the sequence numbers in their output.

Sequence numbers are generated automatically unless you disable this automatic generation. If you disable the automatic generation of sequence numbers, you must specify the sequence number for each entry using the *sequence-value* argument of the **ip prefix-list** global configuration command.

Regardless of whether the default sequence numbers are used in configuring a prefix list, a sequence number need not be specified when removing a configuration entry.

show commands include the sequence numbers in their output.

Creating a Prefix List

To create a prefix list, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# ip prefix-list list-name [seq sequence-value] {deny	permit network/length} [ge ge-value] [le le-value]`	Creates a prefix list with the name specified for the *list-name* argument.

Note To create a prefix list you must enter at least one **permit** or **deny** clause.

To remove a prefix list and all of its entries, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# no ip prefix-list list-name [seq sequence-value] {deny	permit network/length} [ge ge-value] [le le-value]`	Removes a prefix list with the name specified for *list-name*.

7497
3

Configuring a Prefix List Entry

You can add entries to a prefix list individually. To configure an entry in a prefix list, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)#` **`ip prefix-list`** *`list-name`* `[`**`seq`** *`sequence-value`*`] {`**`deny`** `|` **`permit`** *`network/length`*`} [`**`ge`** *`ge-value`*`] [`**`le`** *`le-value`*`]`	Creates an entry in a prefix list and assigns a sequence number to the entry.

The optional **ge** and **le** keywords can be used to specify the range of the prefix length to be matched for prefixes that are more specific than the *network/length* argument. An exact match is assumed when neither **ge** nor **le** is specified. The range is assumed to be from *ge-value* to 32 if only the **ge** attribute is specified, and from **len** to *le-value* if only the **le** attribute is specified.

A specified *ge-value* or *le-value* must satisfy the following condition:

```
len < ge-value <= le-value <= 32
```

For example, to deny all prefixes matching /24 in 128.0.0.0/8, use the following command:

```
ip prefix-list abc deny  128.0.0.0/8 ge 24 le 24
```

Note You can specify sequence values for prefix list entries in any increments you want (the automatically generated numbers are incremented in units of 5). If you specify the sequence values in increments of 1, you cannot insert additional entries into the prefix list. If you choose very large increments, you could run out of sequence values.

Configuring How Sequence Numbers of Prefix List Entries Are Specified

By default, the sequence numbers are automatically generated when you create a prefix list entry. Sequence numbers can be suppressed with the **no ip prefix-list sequence-number** global configuration command. Sequence values are generated in increments of 5. The first sequence value generated in a prefix list would be 5, then 10, then 15, and so on. If you specify a value for an entry and then do not specify values for subsequent entries, the assigned (generated) sequence values are incremented in units of five. For example, if you specify that the first entry in the prefix list has a sequence value of 3, and then do not specify sequence values for the other entries, the automatically generated numbers will be 8, 13, 18, and so on.

To disable the automatic generation of sequence numbers, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)#` **`no ip prefix-list sequence-number`**	Disables the automatic generation of the sequence numbers for prefix list entries.

To re-enable automatic generation of the sequence numbers of prefix list entries, use the **ip prefix-list sequence number** command in router configuration mode:

Command	Purpose
Router(config-router)# **ip prefix-list sequence-number**	Enables the automatic generation of the sequence numbers of prefix list entries. The default is enable.

If you disable automatic generation of sequence numbers in a prefix list, you must specify the sequence number for each entry using the *sequence-value* argument of the **ip prefix-list** global configuration command.

Regardless of whether the default sequence numbers are used in configuring a prefix list, a sequence number need not be specified when deconfiguring an entry. **show** commands include the sequence numbers in their output.

Deleting a Prefix List or Prefix List Entries

To delete a prefix list, use the following command in router configuration mode:

Command	Purpose
Router(config-router)# **no ip prefix-list** *list-name*	Deletes a prefix list.

You can delete entries from a prefix list individually. To delete an entry in a prefix list, use the following command in router configuration mode:

Command	Purpose
Router(config-router)# **no ip prefix-list seq** *sequence-value*	Deletes an entry in a prefix list.

Note The sequence number of an entry need not be specified when you delete the entry.

Displaying Prefix Entries

To display information about prefix tables, prefix table entries, the policy associated with a node, or specific information about an entry, use the following commands in EXEC mode as needed:

Command	Purpose
Router# **show ip prefix-list** [**detail** | **summary**]	Displays information about all prefix lists.
Router# **show ip prefix-list** [**detail** | **summary**] *prefix-list-name*	Displays a table showing the entries in a prefix list.
Router# **show ip prefix-list** *prefix-list-name* [*network*/*length*]	Displays the policy associated with the node.
Router# **show ip prefix-list** *prefix-list-name* [**seq** *sequence-number*]	Displays the prefix list entry with a given sequence number.

7495.6

Router# **show ip prefix-list** *prefix-list-name* [*network/length*] **longer**	Displays all entries of a prefix list that are more specific than the given network and length.
Router# **show ip prefix-list** *prefix-list-name* [*network/length*] **first-match**	Displays the entry of a prefix list that matches the given prefix (network and length of prefix).

Clearing the Hit Count Table of Prefix List Entries

To clear the hit count table of prefix list entries, use the following command in EXEC mode:

Command	Purpose
Router# **clear ip prefix-list** *prefix-list-name* [*network/length*]	Clears the hit count table of the prefix list entries.

Configuring BGP Path Filtering by Neighbor

In addition to filtering routing updates based on network numbers, you can specify an access list filte: on both incoming and outbound updates based on the BGP autonomous system paths. Each filter is an access list based on regular expressions. To specify the access list filter, define an autonomous system path access list and apply it to updates to and from particular neighbors. See the "Regular Expressions" appendix in the *Cisco IOS Terminal Services Configuration Guide* for more information on forming regular expressions.

To configure BGP path filtering, use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	Router# **ip as-path access-list** *access-list-number* {**permit** | **deny**} *as-regexp*	Defines a BGP-related access list.
Step 2	Router# **router bgp** *as-number*	Enters router configuration mode.
Step 3	Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **filter-list** *access-list-number* {**in** | **out**}	Establishes a BGP filter.

See the "BGP Path Filtering by Neighbor Examples" section at the end of this chapter for an example of BGP path filtering by neighbor.

Disabling Next Hop Processing on BGP Updates

You can configure the Cisco IOS software to disable next hop processing for BGP updates to a neighbor. Disabling next hop processing might be useful in nonmeshed networks such as Frame Relay or X.25, where BGP neighbors might not have direct access to all other neighbors on the same IP subnet. There are two ways to disable next hop processing:

- Provide a specific address to be used instead of the next hop address (manually configuring each address).
- Use a route map to specify that the address of the remote peer for matching inbound routes, or the local router for matching outbound routes (automatic method).

Disabling Next Hop Processing Using a Specific Address

To disable next hop processing and provide a specific address to be used instead of the next hop address, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# neighbor {ip-address | peer-group-name} next-hop-self`	Disables next hop processing on BGP updates to a neighbor.

Configuring this command causes the current router to advertise its peering address as the next hop for the specified neighbor. Therefore, other BGP neighbors will forward to it packets for that address. This configuration is useful in a nonmeshed environment because you know that a path exists from the present router to that address. In a fully meshed environment, this configuration is not useful because it will result in unnecessary extra hops and because there might be a direct access through the fully meshed cloud with fewer hops.

Disabling Next Hop Processing Using a Route Map

To override the inbound next hop setting for BGP routes and specify that the next hop of the matching routes is to be the IP address of the remote peer, or to set the peering address of the local router to be the next hop of the matching routes, use the **neighbor next-hop-self** router configuration command.

To configure the neighbor peering address to be used for the next hop address, use the following command in route map configuration mode:

Command	Purpose
`Router(config-route-map)# set ip next-hop ip-address [...ip-address] [peer-address]`	In an inbound route map of a BGP peer, sets the next hop of the matching routes to be the neighbor peering address, overriding any third-party next hops and allowing the same route map to be applied to multiple BGP peers to override third-party next hops. With an outbound route map of a BGP peer, sets the next hop of the received address to the peering address of the local router, disabling the next hop calculation. The next hop must be an adjacent router.

Configuring the BGP Version

By default, BGP sessions begin using BGP Version 4 and negotiating downward to earlier versions if necessary. To prevent negotiation and force the BGP version used to communicate with a neighbor, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# neighbor {ip-address | peer-group-name} version number`	Specifies the BGP version to use when communicating with a neighbor.

Configuring the MED Metric

BGP uses the MED metric as a hint to external neighbors about preferred paths. (The name of this metric for BGP Versions 2 and 3 is INTER_AS_METRIC.) To set the MED of the redistributed routes, Use the following command in router configuration mode. All the routes without a MED will also be set to this value.

Command	Purpose
`Router(config-router)# default-metric number`	Sets an MED.

Alternatively, you can set the MED using the **route-map** router configuration command. See the "BGP Route Map Examples" section at the end of this chapter for examples of using BGP route maps.

Configuring Advanced BGP Features

The tasks in this section are for configuring advanced BGP features.

Using Route Maps to Modify Updates

You can use a route map on a per-neighbor basis to filter updates and modify various attributes. A route map can be applied to either inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates.

On both the inbound and the outbound updates, we support matching based on autonomous system path, community, and network numbers. Autonomous system path matching requires the **as-path access-list** global configuration command, community based matching requires the **ip community-list** global configuration command and network-based matching requires the **ip access-list** global configuration command. To apply a route map to incoming and outgoing routes, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# neighbor {ip-address	peer-group-name} route-map map-name {in	out}`	Applies a route map to incoming or outgoing routes.

See the "BGP Route Map Examples" section at the end of this chapter for BGP route map examples.

Resetting eBGP Connections Immediately upon Link Failure

Normally, when a link between external neighbors goes down, the BGP session will not be reset immediately.To reset the eBGP session as soon as an interface goes down, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# bgp fast-external-fallover`	Resets eBGP sessions automatically.

Configuring Aggregate Addresses

CIDR enables you to create aggregate routes (or *supernets*) to minimize the size of routing tables. You can configure aggregate routes in BGP either by redistributing an aggregate route into BGP or by using the BGP Conditional Aggregation feature. An aggregate address will be added to the BGP table if at least one more specific entry is in the BGP table.

To create an aggregate address in the routing table, use the following commands in router configuration mode:

Command	Purpose
`Router(config-router)# aggregate-address address mask`	Creates an aggregate entry in the BGP routing table.
`Router(config-router)# aggregate-address address mask as-set`	Generates autonomous system set path information.
`Router(config-router)# aggregate-address address-mask summary-only`	Advertises summary addresses only.
`Router(config-router)# aggregate-address address mask suppress-map map-name`	Suppresses selected, more specific routes.
`Router(config-router)# aggregate-address address mask advertise-map map-name`	Generates an aggregate based on conditions specified by the route map.
`Router(config-router)# aggregate-address address mask attribute-map map-name`	Generates an aggregate with attributes specified in the route map.

See the "BGP Aggregate Route Examples" section at the end of this chapter for examples of using BGP aggregate routes.

Disabling Automatic Summarization of Network Numbers

In BGP Version 3, when a subnet is redistributed from an IGP into BGP, only the network route is injected into the BGP table. By default, this automatic summarization is enabled. To disable automatic network number summarization, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# no auto-summary`	Disables automatic network summarization.

Configuring BGP Community Filtering

BGP supports transit policies via controlled distribution of routing information. The distribution of routing information is based on one of the following three values:

- IP address (see the "Configuring BGP Route Filtering by Neighbor" section earlier in this chapter).
- The value of the autonomous system path attribute (see the "Configuring BGP Path Filtering by Neighbor" section earlier in this chapter).
- The value of the communities attribute (as described in this section).

The *communities* attribute is a way to group destinations into communities and apply routing decisions based on the communities. This method simplifies the configuration of a BGP speaker that controls distribution of routing information.

A *community* is a group of destinations that share some common attribute. Each destination can belong to multiple communities. Autonomous system administrators can define to which communities a destination belongs. By default, all destinations belong to the general Internet community. The community is carried as the communities attribute.

The communities attribute is an optional, transitive, global attribute in the numerical range from 1 to 4,294,967,200. Along with Internet community, there are a few predefined, well-known communities, as follows:

- internet—Advertise this route to the Internet community. All routers belong to it.
- no-export—Do not advertise this route to eBGP peers.
- no-advertise—Do not advertise this route to any peer (internal or external).
- local-as—Do not advertise this route to peers outside the local autonomous system. This route will not be advertised to other autonomous systems or sub-autonomous systems when confederations are configured.

Based on the community, you can control which routing information to accept, prefer, or distribute to other neighbors. A BGP speaker can set, append, or modify the community of a route when you learn, advertise, or redistribute routes. When routes are aggregated, the resulting aggregate has a communities attribute that contains all communities from all the initial routes.

You can use community lists to create groups of communities to use in a match clause of a route map. Just like an access list, a series of community lists can be created. Statements are checked until a match is found. As soon as one statement is satisfied, the test is concluded.

To create a community list, use the following command in global configuration mode:

Command	Purpose
Router(config)# **ip community-list** *community-list-number* {**permit** | **deny**} *community-number*	Creates a community list.

To set the communities attribute and match clauses based on communities, see the **match community-list** and **set community** route map configuration commands in the "Redistribute Routing Information" section in the "Configuring IP Routing Protocol-Independent Features" chapter.

By default, no communities attribute is sent to a neighbor. To specify that the communities attribute to be sent to the neighbor at an IP address, use the following command in router configuration mode:

Command	Purpose
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **send-community** [**both** | **standard** | **extended**]	Specifies that the communities attribute be sent to the neighbor at this IP address. Both standard and extended communities can be specified with the **both** keyword. Only standard or only extended can be specified with the **standard** and **extended** keywords.

To remove communities from the community attribute of an inbound or outbound update using a route map to filter and determine the communities to be deleted, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# **set comm-list** *community-list-number* **delete**`	Removes communities in a community attribute that match a standard or extended community list.

Specifying the Format for the Community

A BGP community is displayed in a two-part format 2 bytes long in the **show ip bgp community** EXEC command output, and wherever communities are displayed in the router configuration, such as router maps and community lists. In the most recent version of the RFC for BGP, a community is of the form AA:NN, where the first part is the autonomous system number and the second part is a 2-byte number. The Cisco default community format is in the format NNAA.

To display BGP communities in the new format, use the following command in global configuration mode:

Command	Purpose
`Router(config)# **ip bgp-community new-format**`	Displays and parses BGP communities in the format AA:NN.

Configuring BGP Conditional Advertisement

BGP advertises routes from its routing table to external peers (peers in different autonomous systems) by default. The BGP Conditional Advertisement feature provides additional control of route advertisement depending on the existence of other prefixes in the BGP table. Normally, routes are propagated regardless of the existence of a different path. The BGP Conditional Advertisement feature uses the non-exist-map and the advertise-map to track routes by the route prefix. If a route prefix is not present in the non-exist-map, the route specified by the advertise-map is announced. The announced route is installed to the BGP routing table as a locally originated route and will behave as a locally originated route. The announced route will be originated by BGP only if the corresponding IGP route exists. After the prefix is locally originated by BGP, BGP will advertise the prefix to internal and external peers. If the route prefix is present, the route in the advertise-map is not announced.

Conditional advertisement can be useful in a multihomed network, in which some prefixes are to be advertised to one of the providers, only if information from the other provider is missing. This condition would indicate a failure in the peering session, or partial reachability.

If the same information is advertised to all providers in a multihomed environment, the information is duplicated in the global BGP table. When the BGP Conditional Advertisement feature is used, only partial routes are advertised to each provider, and the size of the global BGP table is not increased with redundant information. The administrator can also guarantee the path that inbound traffic will follow because only specific paths are advertised to providers.

Note The conditional BGP announcements are sent in addition to the normal announcements that a BGP router sends to its peers.

Note Autonomous system path list information cannot be used for conditional advertisement because the IP routing table does not contain autonomous system path information.

BGP Conditional Advertisement Configuration Task List

See the following section for configuration tasks for the BGP Conditional Advertisement feature. Each task in the list indicates if the task is optional or required.

- Configure the route-maps that will be used in conjunction with the advertise-map and the non-exist-map. This step may include the configuration of access-lists and prefix-lists. (Required)
- Configure the router to run BGP. (Required)
- Configure the advertise-map and the non-exist-map with the **neighbor advertise-map non-exist-map** router configuration command. (Required)
- Verify that the BGP Condition Advertisement feature has been configured with the **show ip bgp neighbor** command. (Optional)

Conditional Advertisement of a Set of Routes

To conditionally advertise a set of routes, use the following commands beginning in router configuration mode:

	Command	Purpose
Step 1	`Router(config)#` **`router bgp`** *`as-number`*	Configures the router to run a BGP process.
Step 2	`Router(config-router)#` **`neighbor`** *`ip-address`* **`remote-as`** *`as-number`*	Specifies the peer that should receive conditional advertisement for a given set routes.
Step 3	`Router(config-router)#` **`neighbor`** *`ip-address`* **`advertise-map`** *`map1`* **`non-exist-map`** *`map2`*	Configures the advertise-map and non-exist map for the BGP Conditional Advertisement feature.

See the "BGP Conditional Advertisement Configuration Examples" section at the end of this chapter for an example configuration of BGP conditional advertisement.

Verifying BGP Conditional Advertisement

To verify that the BGP Condition Advertisement feature has been configured, use the **show ip bgp neighbor** command. The **show ip bgp neighbor EXEC** command will show the status of the BGP Conditional Advertisement feature as initialized or uninitialized. The following example shows output from the **show ip bgp neighbor EXEC** command:

```
router# show ip bgp neigbor 172.16.1.1
BGP neighbor is 172.16.1.1,  remote AS 65200, internal link
 Description:link to boston as 65200
  BGP version 4, remote router ID 10.1.1.1
  BGP state = Established, up for 01:04:30
  Last read 00:00:30, hold time is 180, keepalive interval is 60 seconds
  Neighbor capabilities:
    Route refresh:advertised and received
    Address family IPv4 Unicast:advertised and received
  Received 83 messages, 0 notifications, 0 in queue
  Sent 78 messages, 0 notifications, 0 in queue
 Route refresh request:received 0, sent 0
 Minimum time between advertisement runs is 5 seconds

For address family:IPv4 Unicast
 BGP table version 18, neighbor version 18
 Index 2, Offset 0, Mask 0x4
 Inbound soft reconfiguration allowed
 NEXT_HOP is always this router
 Community attribute sent to this neighbor
 Condition-map old-route, Advertise-map new-route, status:Uninitialized
 2 accepted prefixes consume 72 bytes
 Prefix advertised 7, suppressed 0, withdrawn 4

 Connections established 1; dropped 0
 Last reset 01:05:29, due to Soft reconfig change
```

BGP Conditional Advertisement Troubleshooting Tips

This section provides troubleshooting information for the BGP conditional advertisement feature.

The BGP Conditional Advertisement feature is based on the nonexistence of a prefix and the advertisement of another. Normally, only two problems can occur:

- The tracked prefix exists, but the conditional advertisement occurs.
- The tracked prefix does not exist, and the conditional advertisement does not occur.

The same method of troubleshooting is used for both problems:

- Verify the existence (or not) of the tracked prefix in the BGP table with the **show ip bgp EXEC** command.
- Verify the advertisement (or not) of the other prefix using the **show ip bgp neighbor advertised-routes EXEC** command.

The user needs to ensure that all of the characteristics specified in the route maps match the routes in the BGP table.

Configuring a Routing Domain Confederation

One way to reduce the iBGP mesh is to divide an autonomous system into multiple subautonomous systems and group them into a single confederation. To the outside world, the confederation looks like a single autonomous system. Each autonomous system is fully meshed within itself, and has a few connections to other autonomous systems in the same confederation. Even though the peers in different autonomous systems have eBGP sessions, they exchange routing information as if they were iBGP peers. Specifically, the next hop, MED, and local preference information is preserved. This feature allows the you to retain a single IGP for all of the autonomous systems.

To configure a BGP confederation, you must specify a confederation identifier. To the outside world, the group of autonomous systems will look like a single autonomous system with the confederation identifier as the autonomous system number. To configure a BGP confederation identifier, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# `**`bgp confederation identifier`**` `*`as-number`*	Configures a BGP confederation.

7487 3

In order to treat the neighbors from other autonomous systems within the confederation as special eBGP peers, use the following command in router configuration mode:

Command	Purpose
Router(config-router)# **bgp confederation peers** *as-number* [as-number]	Specifies the autonomous systems that belong to the confederation.

See the "BGP Community with Route Maps Examples" section at the end of this chapter for an example configuration of several peers in a confederation.

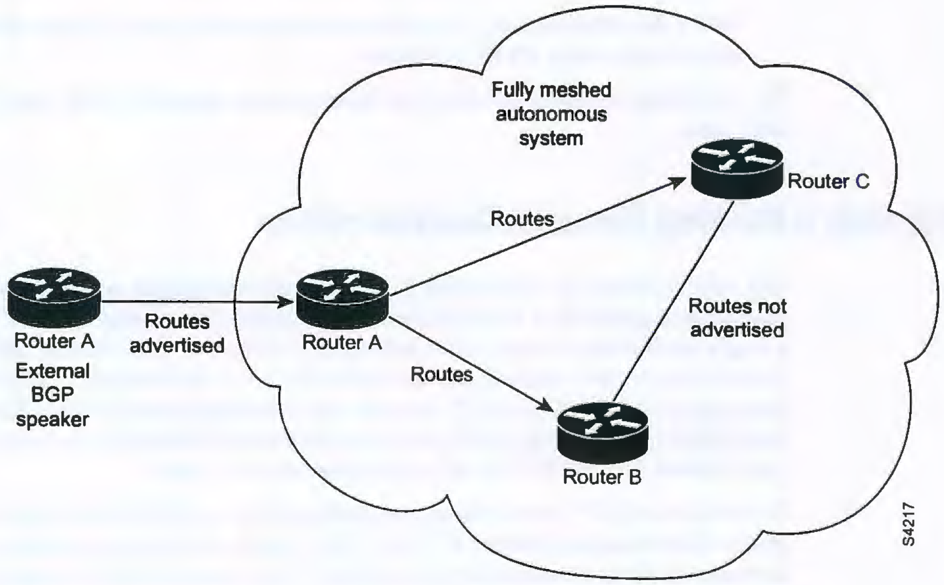
For an alternative way to reduce the iBGP mesh, see the next section, "Configuring a Route Reflector."

Configuring a Route Reflector

BGP requires that all iBGP speakers be fully meshed. However, this requirement does not scale well when there are many iBGP speakers. Instead of configuring a confederation, another way to reduce the iBGP mesh is to configure a *route reflector.*

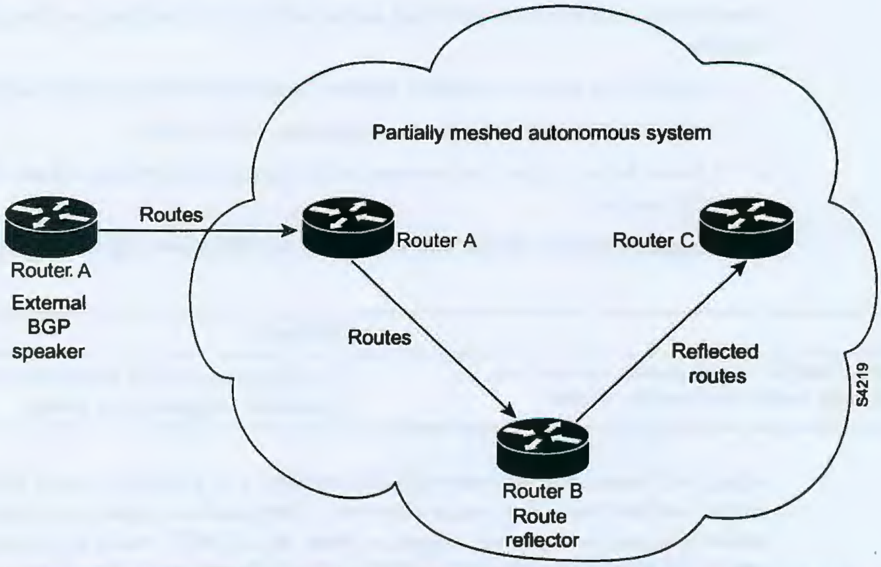
Figure 53 illustrates a simple iBGP configuration with three iBGP speakers (Routers A, B, and C). Without route reflectors, when Router A receives a route from an external neighbor, it must advertise it to both routers B and C. Routers B and C do not readvertise the iBGP learned route to other iBGP speakers because the routers do not pass on routes learned from internal neighbors to other internal neighbors, thus preventing a routing information loop.

Figure 53 Three Fully Meshed iBGP Speakers



With route reflectors, all iBGP speakers need not be fully meshed because there is a method to pass learned routes to neighbors. In this model, an iBGP peer is configured to be a route reflector responsible for passing iBGP learned routes to a set of iBGP neighbors. In Figure 54, Router B is configured as a route reflector. When the route reflector receives routes advertised from Router A, it advertises them to Router C, and vice versa. This scheme eliminates the need for the iBGP session between Routers A and C.

Figure 54 Simple BGP Model with a Route Reflector



The internal peers of the route reflector are divided into two groups: client peers and all the other routers in the autonomous system (nonclient peers). A route reflector reflects routes between these two groups. The route reflector and its client peers form a *cluster*. The nonclient peers must be fully meshed with each other, but the client peers need not be fully meshed. The clients in the cluster do not communicate with iBGP speakers outside their cluster.

Figure 55 More Complex BGP Route Reflector Model

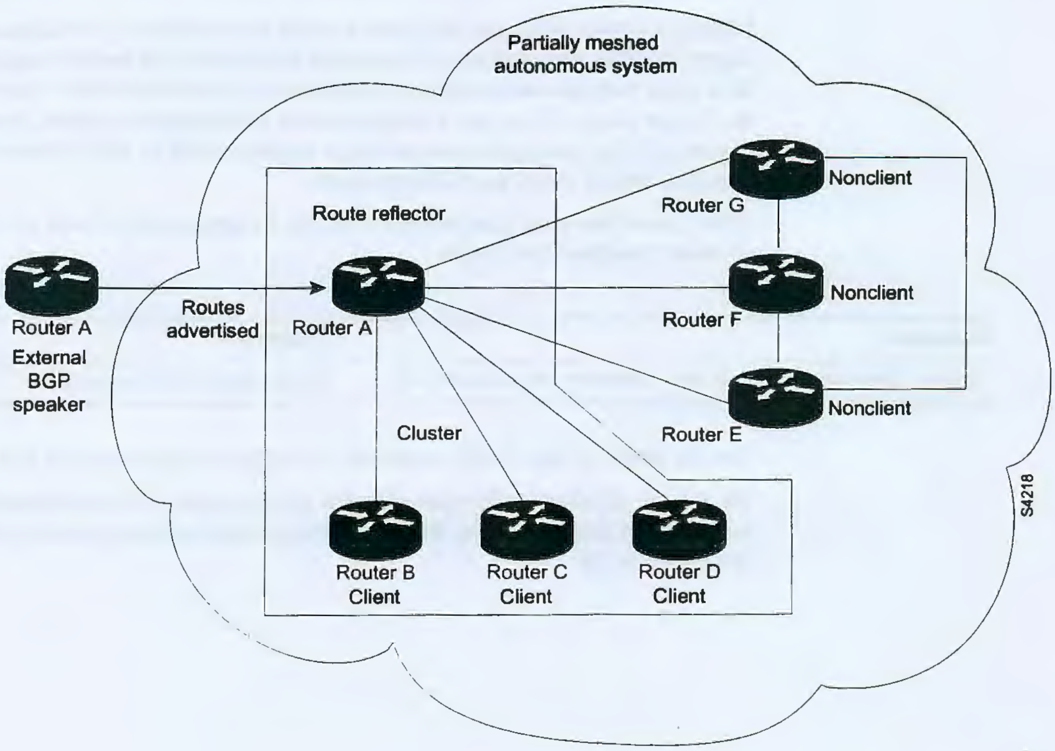


Figure 55 illustrates a more complex route reflector scheme. Router A is the route reflector in a cluster with routers B, C, and D. Routers E, F, and G are fully meshed, nonclient routers.

When the route reflector receives an advertised route, depending on the neighbor, it takes the following actions:

- A route from an external BGP speaker is advertised to all clients and nonclient peers.
- A route from a nonclient peer is advertised to all clients.
- A route from a client is advertised to all clients and nonclient peers. Hence, the clients need not be fully meshed.

To configure a route reflector and its clients, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# neighbor ip-address | peer-group-name route-reflector-client`	Configures the local router as a BGP route reflector and the specified neighbor as a client.

Along with route reflector-aware BGP speakers, it is possible to have BGP speakers that do not understand the concept of route reflectors. They can be members of either client or nonclient groups allowing a easy and gradual migration from the old BGP model to the route reflector model. Initially, you could create a single cluster with a route reflector and a few clients. All the other iBGP speakers could be nonclient peers to the route reflector and then more clusters could be created gradually.

An autonomous system can have multiple route reflectors. A route reflector treats other route reflectors just like other iBGP speakers. A route reflector can be configured to have other route reflectors in a client group or nonclient group. In a simple configuration, the backbone could be divided into many clusters. Each route reflector would be configured with other route reflectors as nonclient peers (thus, all the route reflectors will be fully meshed). The clients are configured to maintain iBGP sessions with only the route reflector in their cluster.

Usually a cluster of clients will have a single route reflector. In that case, the cluster is identified by the router ID of the route reflector. To increase redundancy and avoid a single point of failure, a cluster might have more than one route reflector. In this case, all route reflectors in the cluster must be configured with the 4-byte cluster ID so that a route reflector can recognize updates from route reflectors in the same cluster. All the route reflectors serving a cluster should be fully meshed and all of them should have identical sets of client and nonclient peers.

If the cluster has more than one route reflector, configure the cluster ID by using the following command in router configuration mode:

Command	Purpose
`Router(config-router)# bgp cluster-id cluster-id`	Configures the cluster ID.

Use the **show ip bgp** EXEC command to display the originator ID and the cluster-list attributes.

By default, the clients of a route reflector are not required to be fully meshed and the routes from a client are reflected to other clients. However, if the clients are fully meshed, the route reflector need not reflect routes to clients.

To disable client-to-client route reflection, use the **no bgp client-to-client reflection** command in router configuration mode:

Command	Purpose
`Router(config-router)# no bgp client-to-client reflection`	Disables client-to-client route reflection.

As the iBGP learned routes are reflected, routing information may loop. The route reflector model has the following mechanisms to avoid routing loops:

- Originator ID is an optional, nontransitive BGP attribute. It is a 4-byte attributed created by a route reflector. The attribute carries the router ID of the originator of the route in the local autonomous system. Therefore, if a misconfiguration causes routing information to come back to the originator, the information is ignored.
- Cluster-list is an optional, nontransitive BGP attribute. It is a sequence of cluster IDs that the route has passed. When a route reflector reflects a route from its clients to nonclient peers, and vice versa, it appends the local cluster ID to the cluster-list. If the cluster-list is empty, a new cluster-list is created. Using this attribute, a route reflector can identify if routing information is looped back to the same cluster due to misconfiguration. If the local cluster ID is found in the cluster-list, the advertisement is ignored.
- Use **set** clauses in outbound route maps to modify attributes, possibly creating routing loops. To avoid this behavior, **set** clauses of outbound route maps are ignored for routes reflected to iBGP peers.

Configuring BGP Peer Groups

Often, in a BGP speaker, many neighbors are configured with the same update policies (that is, the same outbound route maps, distribute lists, filter lists, update source, and so on). Neighbors with the same update policies can be grouped into peer groups to simplify configuration and, more importantly, to make updating more efficient. When you have many peers, this approach is highly recommended.

The three steps to configure a BGP peer group, described in the following sections, are as follows:

1. Creating the Peer Group
2. Assigning Options to the Peer Group
3. Making Neighbors Members of the Peer Group

You can disable a BGP peer or peer group without removing all the configuration information using the **neighbor shutdown** router configuration command.

Creating the Peer Group

To create a BGP peer group, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# neighbor peer-group-name peer-group`	Creates a BGP peer group.

Assigning Options to the Peer Group

After you create a peer group, you configure the peer group with **neighbor** commands. By default, members of the peer group inherit all the configuration options of the peer group. Members can also be configured to override the options that do not affect outbound updates.

Peer group members will always inherit the following attributes: minimum-advertisement-interval, next-hop-self, out-route-map, out-filter-list, out-dist-list, remote-as (if configured), version, and update-source. All the peer group members will inherit changes made to the peer group.

To assign configuration options to an individual neighbor, specify any of the following commands using the IP address. To assign the options to a peer group, specify any of the commands using the peer group name. Use the following commands in router configuration mode as needed.

Command	Purpose
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **remote-as** *as-number*	Specifies a BGP neighbor.
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **description** *text*	Associates a description with a neighbor.
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **default-originate** [**route-map** *map-name*]	Allows a BGP speaker (the local router) to send the default route 0.0.0.0 to a neighbor for use as a default route.
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **send-community**	Specifies that the communities attribute be sent to the neighbor at this IP address.
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **update-source** *interface-type*	Allows iBGP sessions to use any operational interface for TCP connections.
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **ebgp-multihop**	Allows BGP sessions, even when the neighbor is not on a directly connected segment. The multihop session is not established if the only route to the address of the multihop peer is the default route (0.0.0.0).
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **advertisement-interval** *seconds*	Sets the minimum interval between sending BGP routing updates.
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **maximum-prefix** *maximum* [*threshold*] [**warning-only**]	Limits the number of prefixes allowed from a neighbor.
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **password** *string*	Invokes MD5 authentication on a TCP connection to a BGP peer.
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **distribute-list** {*access-list-number* | access-list-*name*} {**in** | **out**}	Filters BGP routing updates to and from neighbors, as specified in an access list.
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **filter-list** *access-list-number* {**in** | **out**}	Establishes a BGP filter.
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **next-hop-self**	Disables next hop processing on the BGP updates to a neighbor.
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **version** *value*	Specifies the BGP version to use when communicating with a neighbor.

Command	Purpose
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **route-map** *map-name* {**in** | **out**}	Applies a route map to incoming or outgoing routes.
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **soft-reconfiguration inbound**	Configures the software to start storing received updates. This command requires at least one keyword. Currently the only keyword available is **inbound**, so the use of inbound is not optional.

If a peer group is not configured with a remote-as attribute, the members can be configured with the **neighbor remote-as** router configuration command. This command allows you to create peer groups containing eBGP neighbors.

You can customize inbound policies for peer group members (using, for example, a distribute list, route map, or filter list) because one identical copy of an update is sent to every member of a group. Therefore, neighbor options related to outgoing updates cannot be customized for peer group members.

External BGP peers normally must reside on a directly connected network. Sometimes it is useful to relax this restriction in order to test BGP; do so by specifying the **neighbor ebgp-multihop** router configuration command.

Note To avoid the accidental creation of loops through oscillating routes, the multihop session will not be established if the only route to the address of the multihop peer is the default route (0.0.0.0).

Members of a peer group can pass routes from one member of the peer group to another. For example, if router B is peering with routers A and C, router B can pass routes from router A to router C.

For iBGP, you might want to allow your BGP connections to stay up regardless of which interface is used to reach a neighbor. To enable this configuration, you first configure a *loopback* interface and assign it an IP address. Next, configure the BGP update source to be the loopback interface. Finally, configure your neighbor to use the address on the loopback interface. Now the iBGP session will be up as long as there is a route, regardless of any interface.

You can set the minimum interval of time between BGP routing updates.

You can invoke MD5 authentication between two BGP peers, meaning that each segment sent on the TCP connection between them is verified. This feature must be configured with the same password on both BGP peers; otherwise, the connection between them will not be made. The authentication feature uses the MD5 algorithm. Invoking authentication causes the Cisco IOS software to generate and check the MD5 digest of every segment sent on the TCP connection. If authentication is invoked and a segment fails authentication, then a message appears on the console.

See the "BGP Peer Group Examples" at the end of this chapter for an example of enabling MD5 authentication.

Making Neighbors Members of the Peer Group

To configure a BGP neighbor to be a member of a BGP peer group, use the following command in router configuration mode, using the same peer group name:

Command	Purpose
Router(config-router)# **neighbor** *ip-address* **peer-group** *peer-group-name*	Makes a BGP neighbor a member of the peer group.

See the “BGP Peer Group Examples” section at the end of this chapter for examples of iBGP and eBGP peer groups.

Disabling a Peer or Peer Group

To disable an existing BGP neighbor or neighbor peer group, use the following command in router configuration mode:

Command	Purpose
Router(config-router)# **neighbor** {*ip-address* | *peer-group-name*} **shutdown**	Shuts down or disables a BGP neighbor or peer group.

To enable a previously existing neighbor or neighbor peer group that had been disabled using the **neighbor shutdown** router configuration command, use the following command in router configuration mode:

Command	Purpose
Router(config-router)# **no neighbor** {*ip-address* | *peer-group-name*} **shutdown**	Enables a BGP neighbor or peer group.

Indicating Backdoor Routes

You can indicate which networks are reachable by using a *backdoor* route that the border router should use. A backdoor network is treated as a local network, except that it is not advertised. To configure backdoor routes, use the **network backdoor** command, beginning in router configuration mode:

Command	Purpose
Router(config-router)# **network** *ip-address* **backdoor**	Indicates reachable networks through backdoor routes.

Modifying Parameters While Updating the IP Routing Table

By default, when a BGP route is put into the IP routing table, the MED is converted to an IP route metric, the BGP next hop is used as the next hop for the IP route, and the tag is not set. However, you can use a route map to perform mapping. To modify metric and tag information when the IP routing table is updated with BGP learned routes, use the following command in router configuration mode:

Command	Purpose
Router(config-router)# **table-map** *map-name*	Applies a route map to routes when updating the IP routing table.

Setting Administrative Distance

Administrative distance is a measure of the preference of different routing protocols. BGP uses three different administrative distances: external, internal, and local. Routes learned through external BGP are given the external distance, routes learned with iBGP are given the internal distance, and routes that are part of this autonomous system are given the local distance. To assign a BGP administrative distance, use the following command in router configuration mode:

Command	Purpose

`Router(config-router)# `**`distance bgp`**
`external-distance internal-distance local-distance`
	Assigns a BGP administrative distance.

Changing the administrative distance of BGP routes is considered dangerous and generally is not recommended. The external distance should be lower than any other dynamic routing protocol, and the internal and local distances should be higher than any other dynamic routing protocol.

Adjusting BGP Timers

BGP uses certain timers to control periodic activities such as the sending of keepalive messages and the interval after not receiving a keepalive message after which the Cisco IOS software declares a peer dead. By default, the keepalive timer is 60 seconds, and the hold-time timer is 180 seconds.You can adjust these timers. When a connection is started, BGP will negotiate the hold time with the neighbor. The smaller of the two hold times will be chosen. The keepalive timer is then set based on the negotiated hold time and the configured keepalive time.

To adjust BGP timers for all neighbors, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# `**`timers bgp`**` `*`keepalive holdtime`*	Adjusts BGP timers for all neighbors.

To adjust BTP keepalive and hold-time timers for a specific neighbor, use the following command in router configuration mode:

Command	Purpose

`Router(config-router)# `**`neighbor`**` [`*`ip-address`*` |`
`peer-group-name``] `**`timers`**` `*`keepalive holdtime`*
	Sets the keepalive and hold-time timers (in seconds) for the specified peer or peer group.

Note The timers configured for a specific neighbor or peer group override the timers configured for all BGP neighbors using the **timers bgp** router configuration command.

To clear the timers for a BGP neighbor or peer group, use the **no** form of the **neighbor timers** command.

7479
3

Changing the Default Local Preference Value

You can define a particular path as more preferable or less preferable than other paths by changing the default local preference value of 100. To assign a different default local preference value, use the following command in router configuration mode:

Command	Purpose
Router(config-router)# **bgp default local-preference** *value*	Changes the default local preference value.

You can use route maps to change the default local preference of specific paths. See the "BGP Route Map Examples" section at the end of this chapter for examples when used with BGP route maps.

Redistributing Network 0.0.0.0

By default, you are not allowed to redistribute network 0.0.0.0. To permit the redistribution of networ' 0.0.0.0, use the following command in router configuration mode:

Command	Purpose
Router(config-router)# **default-information originate**	Allows the redistribution of network 0.0.0.0 into BGP.

Configuring the Router to Consider a Missing MED as Worst Path

To configure the router to consider a path with a missing MED attribute as the worst path, use the following command in router configuration mode:

Command	Purpose
Router(config-router)# **bgp bestpath med missing-as-worst**	Configures the router to consider a missing MED as having a value of infinity, making the path without a MED value the least desirable path.

Selecting Path Based on MEDs from Other Autonomous Systems

The MED is one of the parameters that is considered when selecting the best path among many alternative paths. The path with a lower MED is preferred over a path with a higher MED.

By default, during the best path selection process, MED comparison is done only among paths from the same autonomous system. You can allow comparison of MEDs among paths regardless of the autonomous system from which the paths are received. To do so, use the following command in router configuration mode:

Command	Purpose
Router(config-router)# **bgp always-compare-med**	Allows the comparison of MEDs for paths from neighbors in different autonomous systems.

Configuring the Router to Use the MED to Choose a Path from Subautonomous System Paths

To configure the router to consider the MED value in choosing a path, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# bgp bestpath med confed`	Configures the router to consider the MED in choosing a path from among those advertised by different subautonomous systems within a confederation.

The comparison between MEDs is only made if there are no external autonomous systems in the path (an external autonomous system is an autonomous system that is not within the confederation). If there is an external autonomous system in the path, then the external MED is passed transparently through the confederation, and the comparison is not made.

The following example compares route A with these paths:

```
path= 65000 65004, med=2
path= 65001 65004, med=3
path= 65002 65004, med=4
path= 65003 1, med=1
```

In this case, path 1 would be chosen if the **bgp bestpath med confed** router configuration command is enabled. The fourth path has a lower MED, but it is not involved in the MED comparison because there is an external autonomous system is in this path.

Configuring the Router to Use the MED to Choose a Path in a Confederation

To configure the router to use the MED to select the best path from among paths advertised by a single subautonomous system within a confederation, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# bgp deterministic med`	Configures the router to compare the MED variable when choosing among routes advertised by different peers in the same autonomous system.

Note If the **bgp always-compare-med** router configuration command is enabled, all paths are fully comparable, including those from other autonomous systems in the confederation, even if the **bgp deterministic med** command is also enabled.

4477

Configuring Route Dampening

Route dampening is a BGP feature designed to minimize the propagation of flapping routes across an internetwork. A route is considered to be flapping when it is repeatedly available, then unavailable, then available, then unavailable, and so on.

For example, consider a network with three BGP autonomous systems: autonomous system 1, autonomous system 2, and autonomous system 3. Suppose the route to network A in autonomous system 1 flaps (it becomes unavailable). Under circumstances without route dampening, the eBGP neighbor of autonomous system 1 to autonomous system 2 sends a withdraw message to autonomous system 2. The border router in autonomous system 2, in turn, propagates the withdraw message to autonomous system 3. When the route to network A reappears, autonomous system 1 sends an advertisement message to autonomous system 2, which sends it to autonomous system 3. If the route to network A repeatedly becomes unavailable, then available, many withdrawal and advertisement messages are sent. This is a problem in an internetwork connected to the Internet because a route flap in the Internet backbone usually involves many routes.

Note No penalty is applied to a BGP peer reset when route dampening is enabled. Although the reset withdraws the route, no penalty is applied in this instance, even if route flap dampening is enabled.

Minimizing Flapping

The route dampening feature minimizes the flapping problem as follows. Suppose again that the route to network A flaps. The router in autonomous system 2 (where route dampening is enabled) assigns network A a penalty of 1000 and moves it to history state. The router in autonomous system 2 continues to advertise the status of the route to neighbors. The penalties are cumulative. When the route flaps so often that the penalty exceeds a configurable suppress limit, the router stops advertising the route to network A, regardless of how many times it flaps. Thus, the route is dampened.

The penalty placed on network A is decayed until the reuse limit is reached, upon which the route is once again advertised. At half of the reuse limit, the dampening information for the route to network A is removed.

Understanding Route Dampening Terms

The following terms are used when describing route dampening:

- Flap—A route is available, then unavailable, or vice versa.
- History state—After a route flaps once, it is assigned a penalty and put into history state, meaning the router does not have the best path, based on historical information.
- Penalty—Each time a route flaps, the router configured for route dampening in another autonomous system assigns the route a penalty of 1000. Penalties are cumulative. The penalty for the route is stored in the BGP routing table until the penalty exceeds the suppress limit. At that point, the route state changes from history to damp.
- Damp state—In this state, the route has flapped so often that the router will not advertise this route to BGP neighbors.
- Suppress limit—A route is suppressed when its penalty exceeds this limit. The default value is 2000.
- Half-life—Once the route has been assigned a penalty, the penalty is decreased by half after the half-life period (which is 15 minutes by default). The process of reducing the penalty happens every 5 seconds.

- Reuse limit—As the penalty for a flapping route decreases and falls below this reuse limit, the route is unsuppressed. That is, the route is added back to the BGP table and once again used for forwarding. The default reuse limit is 750. The process of unsuppressing routes occurs at 10-second increments. Every 10 seconds, the router finds out which routes are now unsuppressed and advertises them to the world.
- Maximum suppress limit—This value is the maximum amount of time a route can be suppressed. The default value is four times the half-life.

The routes external to an autonomous system learned via iBGP are not dampened. This policy prevent the iBGP peers from having a higher penalty for routes external to the autonomous system.

Enabling Route Dampening

To enable BGP route dampening, use the following command in address family or router configuration mode:

Command	Purpose
`Router(config)# bgp dampening`	Enables BGP route dampening.

To change the default values of various dampening factors, use the following command in address family or router configuration mode:

Command	Purpose
`Router(config)# bgp dampening half-life reuse suppress max-suppress [route-map map-name]`	Changes the default values of route dampening factors.

Monitoring and Maintaining BGP Route Dampening

You can monitor the flaps of all the paths that are flapping. The statistics will be deleted once the route is not suppressed and is stable for at least one half-life. To display flap statistics, use the following commands in EXEC mode as needed:

Command	Purpose
`Router# show ip bgp flap-statistics`	Displays BGP flap statistics for all paths.
`Router# show ip bgp flap-statistics regexp regexp`	Displays BGP flap statistics for all paths that match the regular expression.
`Router# show ip bgp flap-statistics filter-list access-list`	Displays BGP flap statistics for all paths that pass the filter.
`Router# show ip bgp flap-statistics ip-address mask`	Displays BGP flap statistics for a single entry.
`Router# show ip bgp flap-statistics ip-address mask longer-prefix`	Displays BGP flap statistics for more specific entries.

To clear BGP flap statistics (thus making it less likely that the route will be dampened), use the following commands in EXEC mode as needed:

Command	Purpose
Router# **clear ip bgp flap-statistics**	Clears BGP flap statistics for all routes.
Router# **clear ip bgp flap-statistics regexp** *regexp*	Clears BGP flap statistics for all paths that match the regular expression.
Router# **clear ip bgp flap-statistics filter-list** *list*	Clears BGP flap statistics for all paths that pass the filter.
Router# **clear ip bgp flap-statistics** *ip-address mask*	Clears BGP flap statistics for a single entry.
Router# **clear ip bgp** *ip-address* **flap-statistics**	Clears BGP flap statistics for all paths from a neighbor.

Note The flap statistics for a route are also cleared when a BGP peer is reset. Although the reset withdraws the route, there is no penalty applied in this instance, even if route flap dampening is enabled.

Once a route is dampened, you can display BGP route dampening information, including the time remaining before the dampened routes will be unsuppressed. To display the information, use the following command in EXEC mode:

Command	Purpose
Router# **show ip bgp dampened-paths**	Displays the dampened routes, including the time remaining before they will be unsuppressed.

You can clear BGP route dampening information and unsuppress any suppressed routes by using the following command in EXEC mode:

Command	Purpose
Router# **clear ip bgp dampening** [*ip-address network-mask*]	Clears route dampening information and unsuppresses the suppressed routes.

Monitoring and Maintaining BGP

You can remove all contents of a particular cache, table, or database. You also can display specific statistics. The following sections describe each of these tasks.

Clearing Caches, Tables, and Databases

You can remove all contents of a particular cache, table, or database. Clearing a cache, table, or database can become necessary when the contents of the particular structure have become, or are suspected to be, invalid.

To clear caches, tables, and databases for BGP, use the following commands in EXEC mode, as needed:

Command	Purpose
Router# **clear ip bgp** *neighbor-address*	Resets a particular BGP connection.
Router# **clear ip bgp** *	Resets all BGP connections.
Router# **clear ip bgp peer-group** *tag*	Removes all members of a BGP peer group.

Displaying System and Network Statistics

You can display specific statistics such as the contents of BGP routing tables, caches, and databases. Information provided can be used to determine resource utilization and solve network problems. You can also display information about node reachability and discover the routing path that the packets of your device are taking through the network.

To display various routing statistics, use the following commands in EXEC mode, as needed:

Command	Purpose
Router# **show ip bgp** *prefix*	Displays peer groups and peers not in peer groups to which the prefix has been advertised. Also displays prefix attributes such as the next hop and the local prefix.
Router# **show ip bgp cidr-only**	Displays all BGP routes that contain subnet and supernet network masks.
Router# **show ip bgp community** *community-number* [**exact**]	Displays routes that belong to the specified communities.
Router# **show ip bgp community-list** *community-list-number* [**exact**]	Displays routes that are permitted by the community list.
Router# **show ip bgp filter-list** *access-list-number*	Displays routes that are matched by the specified autonomous system path access list.
Router# **show ip bgp inconsistent-as**	Displays the routes with inconsistent originating autonomous systems.
Router# **show ip bgp regexp** *regexp*	Displays the routes that have an autonomous system path that matches the specified regular expression entered on the command line.
Router# **show ip bgp**	Displays the contents of the BGP routing table.
Router# **show ip bgp neighbors** [*neighbor-address*]	Displays detailed information on the BGP and TCP connections to individual neighbors.
Router# **show ip bgp neighbors** [*address*] [**received-routes** | **routes** | **advertised-routes** | **paths** *regexp* | **dampened-routes**]	Displays routes learned from a particular BGP neighbor.
Router# **show ip bgp paths**	Displays all BGP paths in the database.
Router# **show ip bgp peer-group** [*tag*] [**summary**]	Displays information about BGP peer groups.
Router# **show ip bgp summary**	Displays the status of all BGP connections.

Logging Changes in Neighbor Status

To enable the logging of messages generated when a BGP neighbor resets, comes up, or goes down, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# bgp log-neighbor-changes`	Logs messages generated when a BGP neighbor goes up or down, or resets

BGP Route Map Examples

The following example shows how you can use route maps to modify incoming data from a neighbor. Any route received from 140.222.1.1 that matches the filter parameters set in autonomous system access list 200 will have its weight set to 200 and its local preference set to 250, and it will be accepted.

```
router bgp 100
!
 neighbor 140.222.1.1 route-map FIX-WEIGHT in
 neighbor 140.222.1.1 remote-as 1
!
ip as-path access-list 200 permit ^690$
ip as-path access-list 200 permit ^1800
!
route-map FIX-WEIGHT permit 10
 match as-path 200
 set local-preference 250
 set weight200
```

In the following example, the route map named freddy marks all paths originating from autonomous system 690 with an MED metric attribute of 127. The second permit clause is required so that routes not matching autonomous system path list 1 will still be sent to neighbor 1.1.1.1.

```
router bgp 100
 neighbor 1.1.1.1 route-map freddy out
!
ip as-path access-list 1 permit ^690_
ip as-path access-list 2 permit .*
!
route-map freddy permit 10
 match as-path 1
 set metric 127
!
route-map freddy permit 20
 match as-path 2
```

The following example shows how you can use route maps to modify redistributed information from the IP forwarding table:

```
router bgp 100
 redistribute igrp 109 route-map igrp2bgp
!
route-map igrp2bgp
 match ip address 1
 set local-preference 25
 set metric 127
 set weight 30000
 set next-hop 192.92.68.24
 set origin igp
!
access-list 1 permit 131.108.0.0 0.0.255.255
access-list 1 permit 160.89.0.0 0.0.255.255
access-list 1 permit 198.112.0.0 0.0.127.255
```

It is proper behavior to not accept any autonomous system path not matching the **match** clause of the route map. This behavior means that you will not set the metric and the Cisco IOS software will not accept the route. However, you can configure the software to accept autonomous system paths not matched in the **match** clause of the **route-map** router configuration command by using multiple maps of the same name, some without accompanying **set** commands.

```
route-map fnord permit 10
 match as-path 1
 set local-preference 5
!
route-map fnord permit 20
 match as-path 2
```

The following example shows how you can use route maps in a reverse operation to set the route tag (as defined by the BGP/OSPF interaction document, RFC 1403) when exporting routes from BGP into the main IP routing table:

```
router bgp 100
 table-map set_ospf_tag
!
route-map set_ospf_tag
 match as-path 1
 set automatic-tag
!
ip as-path access-list 1 permit .*
```

The following example shows how the route map named set-as-path is applied to outbound updates to the neighbor 200.69.232.70. The route map will prepend the autonomous system path "100 100" to routes that pass access list 1. The second part of the route map is to permit the advertisement of other routes.

```
router bgp 100
 network 171.60.0.0
 network 172.60.0.0
 neighbor 200.69.232.70 remote-as 200
 neighbor 200.69.232.70 route-map set-as-path out
!
route-map set-as-path 10 permit
 match address 1
 set as-path prepend 100 100
!
route-map set-as-path 20 permit
 match address 2
!
access-list 1 permit 171.60.0.0 0.0.255.255
access-list 1 permit 172.60.0.0 0.0.255.255
!
access-list 2 permit 0.0.0.0 255.255.255.255
```

Inbound route maps could perform prefix-based matching and set various parameters of the update. Inbound prefix matching is available in addition to autonomous system path and community list matching. The following example shows how the **set local-preference** route-map configuration command sets the local preference of the inbound prefix 140.10.0.0/16 to 120:

```
!
router bgp 100
 network 131.108.0.0
 neighbor 131.108.1.1 remote-as 200
 neighbor 131.108.1.1 route-map set-local-pref in
!
route-map set-local-pref permit 10
 match ip address 2
 set local preference 120
!
route-map set-local-pref permit 20
!
access-list 2 permit 140.10.0.0 0.0.255.255
access-list 2 deny any
```

The following examples show how to ensure that traffic from one router on a shared LAN will always be passed through a second router, rather than being sent directly to a third router on the same LAN.

Routers A, B, and C connect to the same LAN. Router A peers with router B, and router B peers with router C. Router B sends traffic over the routes of router A to router C, but wants to make sure that all traffic from router C to router A goes through router B, rather than directly from router C to router A over the shared LAN. This configuration can be useful for traffic accounting purposes or to satisfy the peering agreement between router C and router B. You can achieve this configuration by using the **set ip next-hop** route-map configuration command as shown in the following two examples.

Example one applies an inbound route map on the BGP session of router C with router B.

Router A Configuration

```
router bgp 100
 neighbor 1.1.1.2 remote-as 200
```

Router B Configuration

```
router bgp 200
```

```
 neighbor 1.1.1.1 remote-as 100
 neighbor 1.1.1.3 remote-as 300
```

Router C Configuration

```
router bgp 300
 neighbor 1.1.1.2 remote-as 200
 neighbor 1.1.1.2 route-map set-peer-address in

route-map set-peer-address permit 10
 set ip next-hop peer-address
```

The following example applies an outbound route map on the BGP session of router B with router C:

Router A Configuration

```
router bgp 100
 neighbor 1.1.1.2 remote-as 200
```

Router B Configuration

```
router bgp 200
 neighbor 1.1.1.1 remote-as 100
 neighbor 1.1.1.3 remote-as 300
 neighbor 1.1.1.3 route-map set-peer-address out

route-map set-peer-address permit 10
 set ip next-hop peer-address
```

Router C Configuration

```
router bgp 300
 neighbor 1.1.1.2 remote-as 200
```

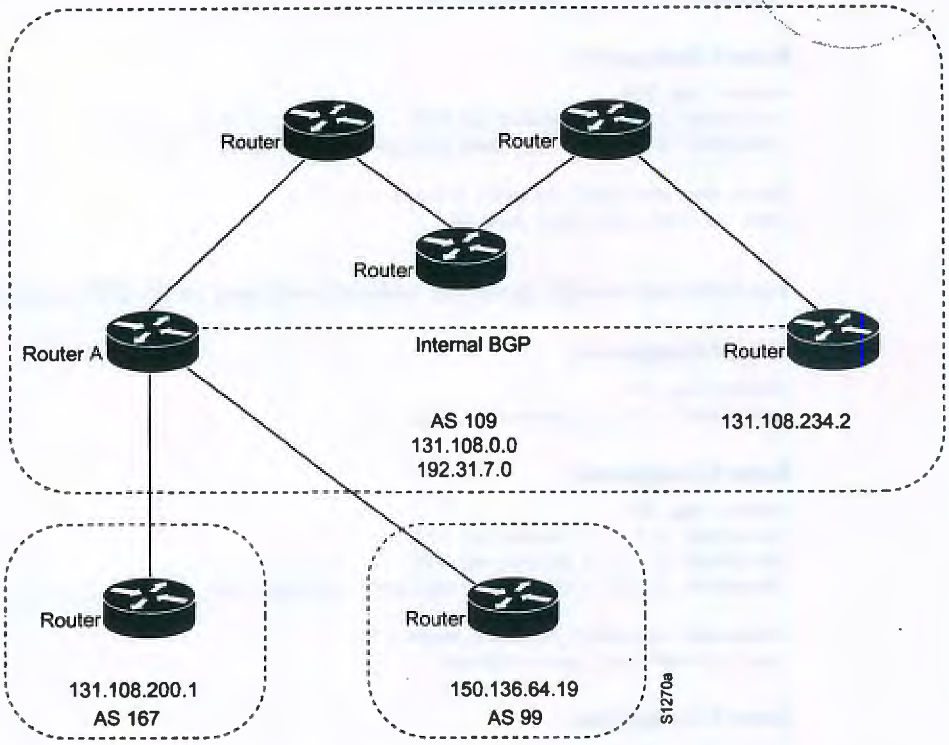
BGP Neighbor Configuration Examples

The following example shows how BGP neighbors on an autonomous system are configured to share information. In the example, a BGP router is assigned to autonomous system 109, and two networks are listed as originating in the autonomous system. Then the addresses of three remote routers (and their autonomous systems) are listed. The router being configured will share information about networks 131.108.0.0 and 192.31.7.0 with the neighbor routers. The first router listed is in a different autonomous system; the second **neighbor remote-as** router configuration command specifies an internal neighbor (with the same autonomous system number) at address 131.108.234.2; and the third **neighbor remote-as** router configuration command specifies a neighbor on a different autonomous system.

```
router bgp 109
 network 131.108.0.0
 network 192.31.7.0
 neighbor 131.108.200.1 remote-as 167
 neighbor 131.108.234.2 remote-as 109
 neighbor 150.136.64.19 remote-as 99
```

In Figure 56, Router A is being configured. The iBGP neighbor is not directly linked to Router A. External neighbors (in autonomous system 167 and autonomous system 99) must be linked directly to Router A.

Figure 56 Assigning Internal and External BGP Neighbors



BGP Prefix List Filtering Examples

The following examples show route filtering using a single prefix list and a group of prefixes, and how to add or delete an individual entry from a prefix list.

Route Filtering Configuration Example Using a Single Prefix List

The following example shows how a prefix list denies the default route 0.0.0.0/0:

```
ip prefix-list abc deny 0.0.0.0/0
```

The following example shows how a prefix list permits a route that matches the prefix 35.0.0.0/8:

```
ip prefix-list abc permit 35.0.0.0/8
```

The following example shows how to configure the BGP process so that it only accept prefixes with a prefix length of /8 to /24:

```
router bgp
version 2
network 101.20.20.0
distribute-list prefix max24 in
!
ip prefix-list max24 seq 5 permit 0.0.0.0/0 ge 8 le 24
```

The following example configuration shows how to conditionally originate a default route (0.0.0.0/0) in RIP when a prefix 10.1.1.0/24 exists in the routing table:

```
ip prefix-list cond permit 10.1.1.0/24
!
route-map default-condition permit 10
match ip address prefix-list cond
!
router rip
default-information originate route-map default-condition
```

The following example shows how to configure BGP to accept routing updates from 192.1.1.1 only, besides filtering on the prefix length:

```
router bgp
distribute-list prefix max24 gateway allowlist in
!
ip prefix-list allowlist seq 5 permit 192.1.1.1/32
!
```

The following example shows how to direct the BGP process to filter incoming updates to the prefix using name1, and match the gateway (next hop) of the prefix being updated to the prefix list name2, on the Ethernet interface 0:

```
router bgp 103
distribute-list prefix name1 gateway name2 in ethernet 0.
```

Route Filtering Configuration Example Specifying a Group of Prefixes

The following example shows how to configure BGP to permit routes with a prefix length up to 24 in network 192/8:

```
ip prefix-list abc permit 192.0.0.0/8 le 24
```

The following example shows how to configure BGP to deny routes with a prefix length greater than in 25 in 192/8:

```
ip prefix-list abc deny 192.0.0.0/8 ge 25
```

The following example shows how to configure BGP to permit routes with a prefix length greater than 8 and less than 24 in all address space:

```
ip prefix-list abc permit 0.0.0.0/0 ge 8 le 24
```

The following example shows how to configure BGP to deny routes with a prefix length greater than 25 in all address space:

```
ip prefix-list abc deny 0.0.0.0/0 ge 25
```

The following example shows how to configure BGP to deny all routes in 10/8, because any route in the Class A network 10.0.0.0/8 is denied if its mask is less than or equal to 32 bits:

```
ip prefix-list abc deny 10.0.0.0/8 le 32
```

The following example shows how to configure BGP to deny routes with a mask greater than 25 in 204.70.1/24:

```
ip prefix-list abc deny 204.70.1.0/24 ge 25
```

The following example shows how to configure BGP to permit all routes:

```
ip prefix-list abc permit 0.0.0.0/0 le 32
```

Added or Deleted Prefix List Entries Examples

You can add or delete individual entries in a prefix list if a prefix list has the following initial configuration:

```
ip prefix-list abc deny 0.0.0.0/0 le 7
ip prefix-list abc deny 0.0.0.0/0 ge 25
ip prefix-list abc permit 35.0.0.0/8
ip prefix-list abc permit 204.70.0.0/15
```

The following example shows how to delete an entry from the prefix list so that 204.70.0.0 is not permitted, and add a new entry that permits 198.0.0.0/8:

```
no ip prefix-list abc permit 204.70.0.0/15
ip prefix-list abc permit 198.0.0.0/8
```

The new configuration is as follows:

```
ip prefix-list abc deny 0.0.0.0/0 le 7
ip prefix-list abc deny 0.0.0.0/0 ge 25
ip prefix-list abc permit 35.0.0.0/8
ip prefix-list abc permit 198.0.0.0/8
```

BGP Soft Reset Examples

The following examples show two ways to reset the connection for BGP peer 131.108.1.1.

Dynamic Inbound Soft Reset Example

The following examples shows the **clear ip bgp 131.108.1.1 soft in** EXEC command used to initiate a dynamic soft reconfiguration in the BGP peer 131.108.1.1. This command requires that the peer support the route refresh capability.

```
clear ip bgp 131.108.1.1 soft in
```

Inbound Soft Reset Using Stored Information Example

The following example shows how to enable inbound soft reconfiguration for the neighbor 131.108.1.1. All the updates received from this neighbor will be stored unmodified, regardless of the inbound policy. When inbound soft reconfiguration is performed later, the stored information will be used to generate a new set of inbound updates.

```
router bgp 100
 neighbor 131.108.1.1 remote-as 200
 neighbor 131.108.1.1 soft-reconfiguration inbound
```

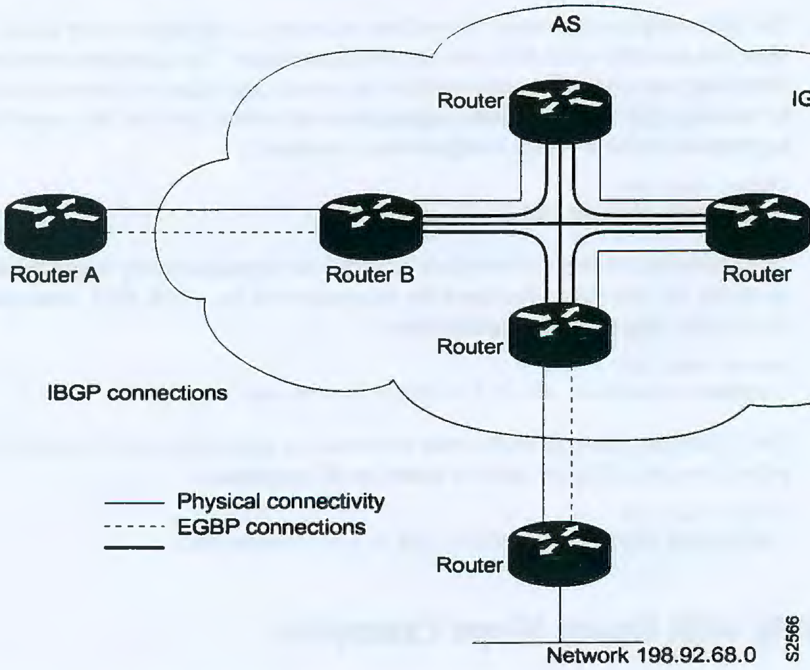
The following example clears the session with the neighbor 131.108.1.1.

```
clear ip bgp 131.108.1.1 soft in
```

BGP Synchronization Examples

The example shown in Figure 57 shows how to use the **no synchronization** router configuration command. In the figure, synchronization is on, and Router B does not advertise network 198.92.68.0 to Router A until an IGRP route for network 198.92.68.0 exists. If you specify the **no synchronization** router configuration command, Router B advertises network 198.92.68.0 as soon as possible. However, because routing information still must be sent to interior peers, you must configure a full iBGP mesh.

Figure 57 BGP Synchronization Configuration



BGP Path Filtering by Neighbor Examples

The following example shows BGP path filtering by neighbor. Only the routes that pass autonomous system path access list 2 will be sent to 193.1.12.10. Similarly, only routes passing access list 3 will be accepted from 193.1.12.10.

```
router bgp 200
 neighbor 193.1.12.10 remote-as 100
 neighbor 193.1.12.10 filter-list 1 out
 neighbor 193.1.12.10 filter-list 2 in
ip as-path access-list 1 permit _109_
ip as-path access-list 2 permit _200$
ip as-path access-list 2 permit ^100$
ip as-path access-list 3 deny _690$
ip as-path access-list 3 permit .*
```

BGP Aggregate Route Examples

The following examples show how you can use aggregate routes in BGP either by redistributing an aggregate route into BGP or by using the BGP Conditional Aggregate routing feature.

In the following example, the **redistribute static** router configuration command is used to redistribute aggregate route 193.0.0.0:

```
ip route 193.0.0.0 255.0.0.0 null 0
!
router bgp 100
 redistribute static
```

The following configuration shows how to create an aggregate entry in the BGP routing table when at least one specific route falls into the specified range. The aggregate route will be advertised as coming from your autonomous system and has the atomic aggregate attribute set to show that information might be missing. (By default, atomic aggregate is set unless you use the **as-set** keyword in the **aggregate-address** router configuration command.)

```
router bgp 100
 aggregate-address 193.0.0.0 255.0.0.0
```

The following example shows how to create an aggregate entry using the same rules as in the previous example, but the path advertised for this route will be an AS_SET consisting of all elements contained in all paths that are being summarized:

```
router bgp 100
 aggregate-address 193.0.0.0 255.0.0.0 as-set
```

The following example shows how to create the aggregate route for 193.0.0.0 and also suppress advertisements of more specific routes to all neighbors:

```
router bgp 100
 aggregate-address 193.0.0.0 255.0.0.0 summary-only
```

BGP Community with Route Maps Examples

This section contains three examples of the use of BGP communities with route maps, and two examples that also contain confederation configurations. For an example of how to configure a BGP confederation, see the section "BGP Confederation Examples" in this chapter.

The first example shows how the route map named set-community is applied to the outbound updates to the neighbor 171.69.232.50. The routes that pass access list 1 have the special community attribute value no-export. The remaining routes are advertised normally. This special community value automatically prevents the advertisement of those routes by the BGP speakers in autonomous system 200.

```
router bgp 100
 neighbor 171.69.232.50 remote-as 200
 neighbor 171.69.232.50 send-community
 neighbor 171.69.232.50 route-map set-community out
!
route-map set-community 10 permit
 match address 1
 set community no-export
!
route-map set-community 20 permit
 match address 2
```

The second example shows how the route map named set-community is applied to the outbound updates to neighbor 171.69.232.90. All the routes that originate from autonomous system 70 have the community values 200 200 added to their already existing values. All other routes are advertised as normal.

```
route-map bgp 200
 neighbor 171.69.232.90 remote-as 100
 neighbor 171.69.232.90 send-community
 neighbor 171.69.232.90 route-map set-community out
!
route-map set-community 10 permit
 match as-path 1
 set community 200 200 additive
!
route-map set-community 20 permit
!
ip as-path access-list 1 permit 70$
ip as-path access-list 2 permit .*
```

The third example shows how community-based matching is used to selectively set MED and local preference for routes from neighbor 171.69.232.55. All the routes that match community list 1 get the MED set to 8000, including any routes that have the communities 100 200 300 or 900 901. These routes could have other community values also.

All the routes that pass community list 2 get the local preference set to 500. This includes the routes that have community values 88 or 90. If they belong to any other community, they will not be matched by community list 2.

All the routes that match community list 3 get the local preference set to 50. Community list 3 will match all the routes because all the routes are members of the Internet community. Thus, all the remaining routes from neighbor 171.69.232.55 get a local preference 50.

```
router bgp 200
 neighbor 171.69.232.55 remote-as 100
 neighbor 171.69.232.55 route-map filter-on-community in
!
route-map filter-on-community 10 permit
 match community 1
 set metric 8000
!
route-map filter-on-community 20 permit
 match community 2 exact-match
 set local-preference 500
!
route-map filter-on-community 30 permit
 match community 3
 set local-preference 50
!
ip community-list 1 permit 100 200 300
ip community-list 1 permit 900 901
!
ip community-list 2 permit 88
ip community-list 2 permit 90
!
ip community-list 3 permit internet
```

The next two examples show how BGP community attributes are used with BGP confederation configurations to filter routes.

The next example shows how the route map named set-community is applied to the outbound updates to neighbor 171.69.232.50 and the local-as community attribute is used to filter the routes. The routes that pass access list 1 have the special community attribute value local-as. The remaining routes are advertised normally. This special community value automatically prevents the advertisement of those routes by the BGP speakers outside autonomous system 200.

```
router bgp 65000
 network 1.0.0.0 route-map set-community
 bgp confederation identifier 200
 bgp confederation peers 65001
 neighbor 171.69.232.50 remote-as 100
 neighbor 171.69.233.2 remote-as 65001
!
route-map set-community permit 10
 match ip address 1
 set community local-as
!
```

The following example shows how to use the local-as community attribute to filter the routes. Confederation 100 contains three autonomous systems: 100, 200, and 300. For network 1.0.0.0, the route map named set-local-as specifies that the advertised routes have the community attribute local-as. These routes are not advertised to any eBGP peer outside the local autonomous system. For network 2.0.0.0 the route map named set-no-export specifies that the routes advertised have the community attribute no-export.

A route between router 6500 and router 65001 does not cross the boundary between autonomous systems within the confederation. A route between subautonomous systems for which router 65000 is the controlling router does not cross the boundary between the confederation and an external autonomous system, and also does not cross the boundary between subautonomous systems within the local autonomous system. A route to from router 65000 to router 65001 would not be acceptable for network 1.0.0.0 because it crosses the boundary between subautonomous systems within the confederation.

```
router bgp 65001
 bgp confederation identifier 200
 bgp confederation peer 65000
 network 2.0.0.0 route-map  set-community
 neighbor 171.69.233.1 remote-as 65000
route-map set-community permit 10
 set community no-export
```

BGP Conditional Advertisement Configuration Examples

This section provides a configuration example of the BGP Conditional Advertisement feature. In the following example, the *ip-address* argument refers to the IP address of the neighbor, and the *map1-name* and *map2-name* arguments, refer to the names of the route maps:

neighbor{*ip-address*} **advertise-map** {*map1-name*} **non-exist-map** {*map2-name*}

no neighbor{*ip-address*} **advertise-map** {*map1-name*} **non-exist-map** {*map2-name*}

The route map associated with the non-exist-map specifies the prefix that the BGP speaker tracks. The route map associated with the advertise map specifies the prefix that is advertised when the prefix in the non-exist-map no longer exists. The prefix tracked by the BGP speaker must be present in the IP routing table for the conditional advertisement not to take place. In the following example, the router advertises 172.16.0.0/16 to its neighbor only if 192.168.7.0/24 is not present in the IP routing table.

To conditionally advertise a set of routes, use the following commands in router configuration mode:

```
router bgp 109
```

```
neighbor 10.89.2.33 remote-as 2051
neighbor 10.89.2.33 advertise-map map1-name non-exist-map map2-name
route-map map1-name permit 10
match ip address 1
route-map map2-name permit 10
match ip address 2
access-list 1 permit 172.16.0.0
access-list 2 permit 192.168.7.0
```

BGP Confederation Examples

The following is a sample configuration that shows several peers in a confederation. The confederation consists of three internal autonomous systems with autonomous system numbers 6001, 6002, and 6003. To the BGP speakers outside the confederation, the confederation looks like a normal autonomous system with autonomous system number 666 (specified via the **bgp confederation identifier** router configuration command).

In a BGP speaker in autonomous system 6001, the **bgp confederation peers** router configuration command marks the peers from autonomous systems 6002 and 6003 as special eBGP peers. Hence peers 171.69.232.55 and 171.69.232.56 will get the local preference, next hop, and MED unmodified in the updates. The router at 160.69.69.1 is a normal eBGP speaker and the updates received by it from this peer will be just like a normal eBGP update from a peer in autonomous system 666.

```
router bgp 6001
 bgp confederation identifier 666
 bgp confederation peers 6002 6003
 neighbor 171.69.232.55 remote-as 6002
 neighbor 171.69.232.56 remote-as 6003
 neighbor 160.69.69.1 remote-as 777
```

In a BGP speaker in autonomous system 6002, the peers from autonomous systems 6001 and 6003 are configured as special eBGP peers. 170.70.70.1 is a normal iBGP peer and 199.99.99.2 is a normal eBGP peer from autonomous system 700.

```
router bgp 6002
 bgp confederation identifier 666
 bgp confederation peers 6001 6003
 neighbor 170.70.70.1 remote-as 6002
 neighbor 171.69.232.57 remote-as 6001
 neighbor 171.69.232.56 remote-as 6003
 neighbor 199.99.99.2 remote-as 700
```

In a BGP speaker in autonomous system 6003, the peers from autonomous systems 6001 and 6002 are configured as special eBGP peers. 200.200.200.200 is a normal eBGP peer from autonomous system 701.

```
router bgp 6003
 bgp confederation identifier 666
 bgp confederation peers 6001 6002
 neighbor 171.69.232.57 remote-as 6001
 neighbor 171.69.232.55 remote-as 6002
 neighbor 200.200.200.200 remote-as 701
```

The following is a part of the configuration from the BGP speaker 200.200.200.205 from autonomous system 701 in the same example. Neighbor 171.69.232.56 is configured as a normal eBGP speaker from autonomous system 666. The internal division of the autonomous system into multiple autonomous systems is not known to the peers external to the confederation.

```
router bgp 701
 neighbor 171.69.232.56 remote-as 666
 neighbor 200.200.200.205 remote-as 701
```

For examples of how the BGP **set-community** route-map configuration command can be used with a confederation configuration, see the last two examples in the section"BGP Community with Route Maps Examples" in this chapter.

BGP Peer Group Examples

This section contains an iBGP peer group example and an eBGP peer group example.

iBGP Peer Group Example

The following example shows how the peer group named internal configures the members of the peer group to be iBGP neighbors. By definition, this is an iBGP peer group because the **router bgp** global configuration command and the **neighbor remote-as** router configuration command indicate the same autonomous system (in this case, autonomous system 100). All the peer group members use loopback 0 as the update source and use set-med as the outbound route map. The example also shows that, except for the neighbor at address 171.69.232.55, all the neighbors have filter list 2 as the inbound filter list.

```
router bgp 100
 neighbor internal peer-group
 neighbor internal remote-as 100
 neighbor internal update-source loopback 0
 neighbor internal route-map set-med out
 neighbor internal filter-list 1 out
 neighbor internal filter-list 2 in
 neighbor 171.69.232.53 peer-group internal
 neighbor 171.69.232.54 peer-group internal
 neighbor 171.69.232.55 peer-group internal
 neighbor 171.69.232.55 filter-list 3 in
```

eBGP Peer Group Example

The following example shows how the peer group named external-peers is defined without the **neighbor remote-as** router configuration command, making it an eBGP peer group. Each member of the peer group is configured with its respective autonomous system number separately. Thus, the peer group consists of members from autonomous systems 200, 300, and 400. All the peer group members have set-metric route map as an outbound route map and filter list 99 as an outbound filter list. Except for neighbor 171.69.232.110, all have 101 as the inbound filter list.

```
router bgp 100
 neighbor external-peers peer-group
 neighbor external-peers route-map set-metric out
 neighbor external-peers filter-list 99 out
 neighbor external-peers filter-list 101 in
 neighbor 171.69.232.90 remote-as 200
 neighbor 171.69.232.90 peer-group external-peers
 neighbor 171.69.232.100 remote-as 300
 neighbor 171.69.232.100 peer-group external-peers
 neighbor 171.69.232.110 remote-as 400
 neighbor 171.69.232.110 peer-group external-peers
 neighbor 171.69.232.110 filter-list 400 in
```

TCP MD5 Authentication for BGP Examples

The following example specifies that the router and its BGP peer at 145.2.2.2 invoke MD5 authentication on the TCP connection between them:

```
router bgp 109
 neighbor 145.2.2.2 password v61ne0qkel33&
```

AP · GL

Configuring DVMRP Interoperability

This chapter describes the Distance Vector Multicast Routing Protocol (DVMRP) Interoperability feature. For a complete description of the DVMRP commands in this chapter, refer to the "IP Multicast Routing Commands" chapter of the *Cisco IOS IP Command Reference, Volume 3 of 3: Multicast* publication. To locate documentation of other commands that appear in this chapter, use the command reference master index, or search online.

Cisco routers run Protocol Independent Multicast (PIM), and know enough about DVMRP to successfully forward multicast packets to and receive packets from a DVMRP neighbor. It is also possible to propagate DVMRP routes into and through a PIM cloud. The Cisco IOS software propagates DVMRP routes and builds a separate database for these routes on each router, but PIM uses this routing information to make the packet-forwarding decision. Cisco IOS software does not implement the complete DVMRP.

DVMRP builds a parent-child database using a constrained multicast model to build a forwarding tree rooted at the source of the multicast packets. Multicast packets are initially flooded down this source tree. If redundant paths are on the source tree, packets are not forwarded along those paths. Forwarding occurs until prune messages are received on those parent-child links, which further constrains the broadcast of multicast packets.

DVMRP is implemented in the equipment of many vendors and is based on the public-domain mrouted program. The Cisco IOS software supports dynamic discovery of DVMRP routers and can interoperate with them over traditional media such as Ethernet and FDDI, or over DVMRP-specific tunnels.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the "Identifying Supported Platforms" section in the "Using Cisco IOS Software" chapter.

Basic DVMRP Interoperability Configuration Task List

To configure basic interoperability with DVMRP machines, perform the tasks described in the following sections. The tasks in the first section are required; the tasks in the remaining sections are optional.

- Configuring DVMRP Interoperability (Required)
- Configuring a DVMRP Tunnel (Optional)
- Advertising Network 0.0.0.0 to DVMRP Neighbors (Optional)

For more advanced DVMRP interoperability features, see the section "Advanced DVMRP Interoperability Configuration Task List" later in this chapter.

Configuring DVMRP Interoperability

Cisco multicast routers using PIM can interoperate with non-Cisco multicast routers that use the DVMRP.

PIM routers dynamically discover DVMRP multicast routers on attached networks. Once a DVMRP neighbor has been discovered, the router periodically sends DVMRP report messages advertising the unicast sources reachable in the PIM domain. By default, directly connected subnets and networks are advertised. The router forwards multicast packets that have been forwarded by DVMRP routers and, in turn, forwards multicast packets to DVMRP routers.

You can configure which sources are advertised and which metrics are used by configuring the **ip dvmrp metric** interface configuration command. You can also direct all sources learned via a particular unicast routing process to be advertised into DVMRP.

The mrouted protocol is a public-domain implementation of DVMRP. It is necessary to use mrouted Version 3.8 (which implements a nonpruning version of DVMRP) when Cisco routers are directly connected to DVMRP routers or interoperate with DVMRP routers over an multicast backbone (MBONE) tunnel. DVMRP advertisements produced by the Cisco IOS software can cause older versions of mrouted to corrupt their routing tables and those of their neighbors. Any router connected to the MBONE should have an access list to limit the number of unicast routes that are advertised via DVM.

To configure the sources that are advertised and the metrics that are used when DVMRP report messages are sent, use the following command in interface configuration mode:

Command	Purpose
`Router(config-if)#` **`ip dvmrp metric`** *`metric`* `[`**`list`** *`access-list`*`] [`*`protocol process-id`*`]`	Configures the metric associated with a set of destinations for DVMRP reports.

A more sophisticated way to achieve the same results as the preceding command is to use a route map instead of an access list. Thus, you have a finer granularity of control. To subject unicast routes to route map conditions before they are injected into DVMRP, use the following command in interface configuration mode:

Command	Purpose
`Router(config-if)#` **`ip dvmrp metric`** *`metric`* `[`**`route-map`** *`map-name`*`]`	Subjects unicast routes to route map conditions before they are injected into DVMRP.

Responding to mrinfo Requests

The Cisco IOS software answers mrinfo requests sent by mrouted systems and Cisco routers. The software returns information about neighbors on DVMRP tunnels and all of the interfaces of the router. This information includes the metric (which is always set to 1), the configured TTL threshold, the status of the interface, and various flags. The **mrinfo** EXEC command can also be used to query the router itself, as in the following example:

```
mm1-7kd# mrinfo

  171.69.214.27 (mm1-7kd.cisco.com) [version cisco 11.1] [flags: PMS]:
  171.69.214.27 -> 171.69.214.26 (mm1-r7kb.cisco.com) [1/0/pim/querier]
  171.69.214.27 -> 171.69.214.25 (mm1-45a.cisco.com) [1/0/pim/querier]
  171.69.214.33 -> 171.69.214.34 (mm1-45c.cisco.com) [1/0/pim]
  171.69.214.137 -> 0.0.0.0 [1/0/pim/querier/down/leaf]
```

```
171.69.214.203 -> 0.0.0.0 [1/0/pim/querier/down/leaf]
171.69.214.18 -> 171.69.214.20 (mm1-45e.cisco.com) [1/0/pim]
171.69.214.18 -> 171.69.214.19 (mm1-45c.cisco.com) [1/0/pim]
171.69.214.18 -> 171.69.214.17 (mm1-45a.cisco.com) [1/0/pim]
```

See the “DVMRP Interoperability Example” section later in this chapter for an example of how to configure a PIM router to interoperate with a DVMRP router.

Configuring a DVMRP Tunnel

The Cisco IOS software supports DVMRP tunnels to the MBONE. You can configure a DVMRP tunnel on a router if the other end is running DVMRP. The software then sends and receives multicast packets over the tunnel. This strategy allows a PIM domain to connect to the DVMRP router in the case where all routers on the path do not support multicast routing. You cannot configure a DVMRP tunnel between two routers.

When a Cisco router runs DVMRP over a tunnel, it advertises sources in DVMRP report messages much as it does on real networks. In addition, the software caches DVMRP report messages it receives and uses them in its Reverse Path Forwarding (RPF) calculation. This behavior allows the software to forward multicast packets received over the tunnel.

When you configure a DVMRP tunnel, you should assign a tunnel an address in the following two cases:

- To enable the sending of IP packets over the tunnel
- To indicate whether the Cisco IOS software should perform DVMRP summarization

You can assign an IP address either by using the **ip address** interface configuration command, or by using the **ip unnumbered** interface configuration command to configure the tunnel to be unnumbered. Either of these two methods allows IP multicast packets to flow over the tunnel. The software will not advertise subnets over the tunnel if the tunnel has a different network number from the subnet. In this case, the software advertises only the network number over the tunnel.

To configure a DVMRP tunnel, use the following commands in interface configuration mode:

	Command	Purpose
Step 1	`Router(config-if)# `**`interface tunnel`**` `*`number`*	Specifies a tunnel interface in global configuration mode and puts the router into interface configuration mode.
Step 2	`Router(config-if)# `**`tunnel source`**` `*`ip-address`*	Sets the source address of the tunnel interface. This address is the IP address of the interface on the router.
Step 3	`Router(config-if)# `**`tunnel destination`**` `*`ip-address`*	Sets the destination adddress of the tunnel interface. This address is the IP address of the mrouted multitask router.
Step 4	`Router(config-if)# `**`tunnel mode dvmrp`**	Configures a DVMRP tunnel.

Step 5	`Router(config-if)# `**`ip address`**` `*`address mask`*
	or
	`Router(config-if)# `**`ip unnumbered`**` `*`type number`*
		Assigns an IP address to the interface.
		or
		Configures the interface as unnumbered.

Step 6	`Router(config-if)# `**`ip pim`**` [`**`dense-mode`**`	`**`sparse-mode`**`]`	Configures PIM on the interface.
Step 7	`Router(config-if)# `**`ip dvmrp accept-filter`**` `*`access-list`*` [`*`distance`*`	`**`ip neighbor-list`**` `*`access-list`*`]`	Configures an acceptance filter for incoming DVMRP reports.

See the "DVMRP Tunnel Example" section later in this chapter for an example of how to configure a DVMRP tunnel.

Advertising Network 0.0.0.0 to DVMRP Neighbors

The mrouted protocol is a public domain implementation of DVMRP. If your router is a neighbor to an mrouted Version 3.6 device, you can configure the Cisco IOS software to advertise network 0.0.0.0 to the DVMRP neighbor. Do not advertise the DVMRP default into the MBONE. You must specify whether only route 0.0.0.0 is advertised or if other routes can also be specified.

To advertise network 0.0.0.0 to DVMRP neighbors on an interface, use the following command in interface configuration mode:

Command	Purpose
`Router(config-if)# ip dvmrp default-information {originate | only}`	Advertises network 0.0.0.0 to DVMRP neighbors.

Advanced DVMRP Interoperability Configuration Task List

Cisco routers run PIM and know enough about DVMRP to successfully forward multicast packets to receivers and receive multicast packets from senders. It is also possible to propagate DVMRP routes into and through a PIM cloud. PIM uses this information; however, Cisco routers do not implement DVMRP to forward multicast packets.

The basic DVMRP interoperability features are described in the section "Basic DVMRP Interoperability Configuration Task List" earlier in this chapter. To configure more advanced DVMRP interoperability features on a Cisco router, perform the optional tasks described in the following sections:

- Enabling DVMRP Unicast Routing (Optional)
- Limiting the Number of DVMRP Routes Advertised (Optional)
- Changing the DVMRP Route Threshold (Optional)
- Configuring a DVMRP Summary Address (Optional)
- Disabling DVMRP Automatic summarization (Optional)
- Adding a Metric Offset to the DVMRP Route (Optional)
- Rejecting a DVMRP Nonpruning Neighbor (Optional)
- Configuring a Delay Between DVRMP Reports (Optional)

Enabling DVMRP Unicast Routing

Because policy for multicast routing and unicast routing requires separate topologies, PIM must follow the multicast topology to build loopless distribution trees. Using DVMRP unicast routing, Cisco routers and mrouted machines exchange DVMRP unicast routes, to which PIM can then reverse path forward.

Cisco routers do not perform DVMRP multicast routing among each other, but they can exchange DVMRP routes. The DVMRP routes provide a multicast topology that may differ from the unicast topology. These routes allow PIM to run over the multicast topology, thereby allowing PIM sparse mode over the MBONE topology.

When DVMRP unicast routing is enabled, the router caches routes learned in DVMRP report messages in a DVMRP routing table. PIM prefers DVMRP routes to unicast routes by default, but that preference can be configured.

DVMRP unicast routing can run on all interfaces, including generic routing encapsulation (GRE) tunnels. On DVMRP tunnels, it runs by virtue of DVMRP multicast routing. This feature does not enable DVMRP multicast routing among Cisco routers. However, if there is a DVMRP-capable multicast router, the Cisco router will do PIM/DVMRP multicast routing interaction.

To enable DVMRP unicast routing, use the following command in interface configuration mode:

Command	Purpose
`Router(config-if)# ip dvmrp unicast-routing`	Enables DVMRP unicast routing.

Limiting the Number of DVMRP Routes Advertised

By default, only 7000 DVMRP routes will be advertised over an interface enabled to run DVMRP (that is, a DVMRP tunnel, an interface where a DVMRP neighbor has been discovered, or an interface configured to run the **ip dvmrp unicast-routing** interface configuration command).

To change this limit, use the following command in global configuration mode:

Command	Purpose
`Router(config)# ip dvmrp route-limit count`	Changes the number of DVMRP routes advertised over an interface enabled to run DVMRP.

Changing the DVMRP Route Threshold

By default, 10,000 DVMRP routes may be received per interface within a 1-minute interval. When that rate is exceeded, a syslog message is issued, warning that a route surge might be occurring. The warning is typically used to quickly detect when routers have been misconfigured to inject a large number of routes into the MBONE.

To change the threshold number of routes that trigger the warning, use the following command in global configuration mode:

Command	Purpose
`Router(config)# ip dvmrp routehog-notification route-count`	Configures the number of routes that trigger a syslog message.

Use the **show ip igmp interface** EXEC command to display a running count of routes. When the count is exceeded, "*** ALERT ***" is appended to the line.

Configuring a DVMRP Summary Address

You can customize the summarization of DVMRP routes if the default classful automatic summarization does not suit your needs. To summarize such routes, specify a summary address by using the following command in interface configuration mode:

Command	Purpose
Router(config-if)# **ip dvmrp summary-address** *summary-address mask* [**metric** *value*]	Specifies a DVMRP summary address.

Note At least one, more-specific route must be present in the unicast routing table before a configured summary address will be advertised.

Disabling DVMRP Automatic summarization

By default, the Cisco IOS software performs some level of DVMRP summarization automatically. Disable this function if you want to advertise all routes, not just a summary. If you configure the **ip dvmrp summary-address** interface configuration command and did not configure the **no ip dvmrp auto-summary** command, you get both custom and automatic summaries.

To disable DVMRP automatic summarization, use the following command in interface configuratioı mode:

Command	Purpose
Router(config-if)# **no ip dvmrp auto-summary**	Disables DVMRP automatic summarization.

Adding a Metric Offset to the DVMRP Route

By default, the router increments by 1 the metric of a DVMRP route advertised in incoming DVMRP reports. You can change the metric if you want to favor or not favor a certain route. The DVMRP metric is a hop count. Therefore, a very slow serial line of one hop is preferred over a route that is two hops over FDDI or another fast medium.

For example, perhaps a route is learned by Router A and the same route is learned by Router B with a higher metric. If you want to use the path through Router B because it is a faster path, you can apply a metric offset to the route learned by Router A to make it larger than the metric learned by Router B, allowing you to choose the path through Router B.

To change the default metric, use the following command in interface configuration mode:

Command	Purpose
Router(config-if)# **ip dvmrp metric-offset** [**in** | **out**] *increment*	Changes the metric added to DVMRP routes advertised in incoming reports.

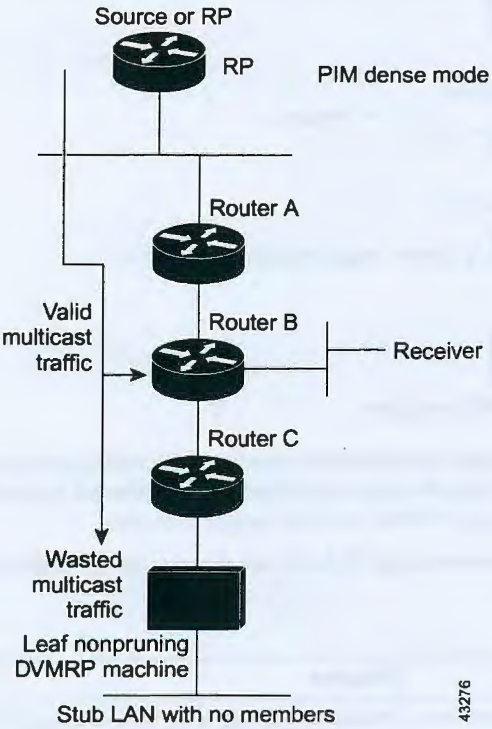
Similar to the **metric** keyword in mrouted configuration files, the following is true when using the **ip dvmrp metric-offset** interface configuration command:

- When you specify the **in** keywordor no keyword, the *increment* value is added to incoming DVMRP reports and is reported in mrinfo replies. The default value for the **in** keyword is 1.
- When you specify the **out** keyword, the *increment* is added to outgoing DVMRP reports for routes from the DVMRP routing table. The default value for the **out** keyword is 0.

Rejecting a DVMRP Nonpruning Neighbor

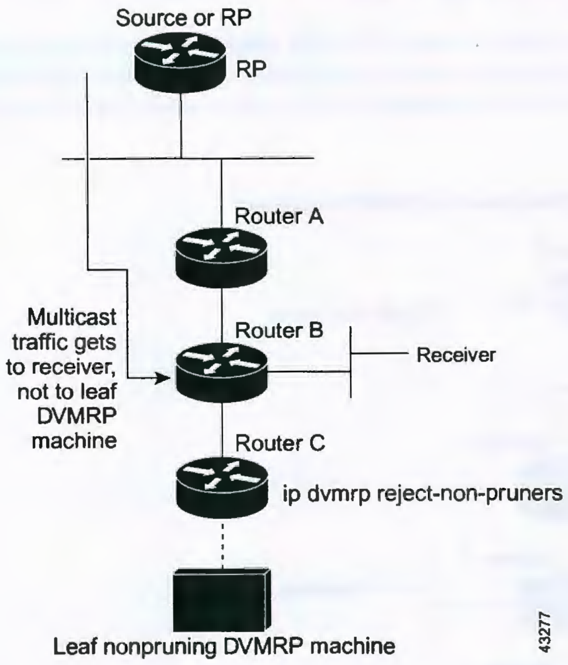
By default, Cisco routers accept all DVMRP neighbors as peers, regardless of their DVMRP capability or lack of. However, some non-Cisco machines run old versions of DVMRP that cannot prune, so they will continuously receive forwarded packets unnecessarily, wasting bandwidth. Figure 91 shows this scenario.

Figure 91 Leaf Nonpruning DVMRP Neighbor



You can prevent a router from peering (communicating) with a DVMRP neighbor if that neighbor does not support DVMRP pruning or grafting. To do so, configure Router C (which is a neighbor to the leaf, nonpruning DVMRP machine) with the **ip dvmrp reject-non-pruners** interface configuration command on the interface to the nonpruning machine. Figure 92 illustrates this scenario. In this case, when the router receives a DVMRP probe or report message without the Prune-Capable flag set, the router logs a syslog message and discards the message.

Figure 92 Router Rejects Nonpruning DVMRP Neighbor



Source or RP
RP
Router A
Multicast traffic gets to receiver, not to leaf DVMRP machine
Router B
Receiver
Router C
ip dvmrp reject-non-pruners
Leaf nonpruning DVMRP machine
43277

Note that the **ip dvmrp reject-non-pruners** command prevents peering with neighbors only. If there are any nonpruning routers multiple hops away (downstream toward potential receivers) that are not rejected, then a nonpruning DVMRP network might still exist.

To prevent peering with nonpruning DVMRP neighbors, use the following command in interface configuration mode:

Command	Purpose
`Router(config-if)# ip dvmrp reject-non-pruners`	Prevents peering with nonpruning DVMRP neighbors.

Configuring a Delay Between DVRMP Reports

You can configure an interpacket delay of a DVMRP report. The delay is the number of milliseconds th elapse between transmissions of sets of packets that constitute a report. The number of packets in the . is determined by the *burst* value, which defaults to 2 packets. The *milliseconds* value defaults to 100 milliseconds.

To change the default values of the delay, use the following command in interface configuration mode:

Command	Purpose

`Router(config-if)# ip dvmrp output-report-delay`
`milliseconds [burst]`
	Configures an interpacket delay between DVMRP reports.

Monitoring and Maintaining DVMRP

To clear routes from the DVMRP routing table, use the following command in EXEC mode:

Command	Purpose
`Router# clear ip dvmrp route { * | route}`	Deletes routes from the DVMRP routing table.

To display entries in the DVMRP routing table, use the following command in EXEC mode:

Command	Purpose
`Router# show ip dvmrp route [name | ip-address | type number]`	Displays the entries in the DVMRP routing table.

DVMRP Configuration Examples

This section provides the following DVMRP configuration examples:

- DVMRP Interoperability Example
- DVMRP Tunnel Example

DVMRP Interoperability Example

The following example configures DVMRP interoperability for configurations when the PIM router and the DVMRP router are on the same network segment. In this example, access list 1 advertises the networks (198.92.35.0, 198.92.36.0, 198.92.37.0, 131.108.0.0, and 150.136.0.0) to the DVMRP router, and access list 2 is used to prevent all other networks from being advertised (the **ip dvmrp metric 0** interface configuration command).

```
interface ethernet 0
 ip address 131.119.244.244 255.255.255.0
 ip pim dense-mode
 ip dvmrp metric 1 list 1
 ip dvmrp metric 0 list 2

access-list 1 permit 198.92.35.0 0.0.0.255
access-list 1 permit 198.92.36.0 0.0.0.255
access-list 1 permit 198.92.37.0 0.0.0.255
access-list 1 permit 131.108.0.0 0.0.255.255
access-list 1 permit 150.136.0.0 0.0.255.255
access-list 1 deny   0.0.0.0 255.255.255.255
access-list 2 permit 0.0.0.0 255.255.255.255
```

DVMRP Tunnel Example

The following example configures a DVMRP tunnel:

```
!
ip multicast-routing
!
interface tunnel 0
```

```
 ip unnumbered ethernet 0
 ip pim dense-mode
 tunnel source ethernet 0
 tunnel destination 192.70.92.133
 tunnel mode dvmrp
!
interface ethernet 0
 description Universitat DMZ-ethernet
 ip address 192.76.243.2 255.255.255.0
 ip pim dense-mode
```

AP 6M

Troubleshooting and Fault Management

This chapter describes basic tasks that you can perform to troubleshoot your system and the network. For detailed troubleshooting procedures and scenarios, refer to the *Internetwork Troubleshooting Guide*. For complete details on all **debug** commands, refer to the *Cisco IOS Debug Command Reference*.

For a complete description of the troubleshooting commands in this chapter, refer to the "Troubleshooting and Fault Management Commands" chapter in "Cisco IOS System Management Commands" part of the Release 12.2 *Cisco IOS Configuration Fundamentals Command Reference*. To locate documentation of other commands that appear in this chapter, use the *Cisco IOS Command Reference Master Index* or search online.

For additional troubleshooting tips, refer to the *Troubleshooting Tools* Tech Tip document on Cisco.com.

To identify hardware or software image support for a specific feature, use Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the "Identifying Platform Support for Cisco IOS Software Features" section in the "About Cisco IOS Software Documentation" chapter.

Troubleshooting and Fault Management Task List

To manage network faults, you need to discover, isolate, and correct problems. You can discover problems with the system monitoring commands, isolate problems with the system test commands, and resolve problems with other commands, including **debug** commands.

To perform general fault management, perform the tasks described in the following sections:

- Displaying System Information Using show Commands
- Testing Network Connectivity
- Testing Memory and Interfaces
- Logging System Error Messages
- Using Field Diagnostics on Line Cards
- Troubleshooting Specific Line Cards
- Storing Line Card Crash Information
- Creating Core Dumps
- Enabling Debug Operations
- Enabling Conditionally Triggered Debugging
- Using the Environmental Monitor

In addition to the material presented in this chapter, many chapters in the Cisco IOS software configuration guides include fault management tasks specific to certain technologies and features. You can find these tasks in the "Monitoring and Maintaining" sections.

Displaying System Information Using show Commands

To provide information about system processes, the Cisco IOS software includes an extensive list of EXEC commands that begin with the word **show**, which, when executed, display detailed tables of system information. Following is a partial list of system management **show** commands. To display the information described, use the following commands in EXEC mode, as needed:

Command	Purpose
Router# **show c2600**	Displays information about the Cisco 2600 platform, including interrupts, IOS Priority Masks, and IDMA status, for troubleshooting.
Router# **show c7200**	Displays information about the CPU and midplane for the Cisco 7200 series routers.
Router# **show context**	Displays information stored in NVRAM when the router crashes. This command is only useful to your technical support representative. This command is supported on the Cisco 2600 and 7000 series routers.
Router# **show controllers**	Displays information specific to the hardware on a line card.
Router# **show controllers logging**	Displays logging information about a line card.
Router# **show controllers tech-support**	Displays general information about a line for use when reporting a problem.
Router# **show controllers vip** *slot-number* **tech-support**	Displays information about the Versatile Interface Processor (VIP) card for use when reporting a problem
Router# **show diag**	Displays hardware information (including DRAM and static RAM details) for line cards.
Router# **show environment** [**all** | **last** | **table**]	Displays a message indicating whether an environmental warning condition currently exists, the temperature and voltage information, the last measured value from each of the six test points stored in nonvolatile memory, or environmental specifications. Examples of systems that support this comman include the Cisco 7000 and the Cisco 12000 series routers.
Router# **show gsr**	Displays hardware information on the Cisco 12000 series Gigabit Switch Router (GSR).
Router# **show gt64010**	Displays all GT64010 internal registers and interrupt status on the Cisco 7200 series routers.
Router# **show memory** [*memory-type*] [**free**] [**summary**]	Displays memory pool statistics including summary information about the activities of the system memory allocator and a block-by-block listing of memory use.
Router# **show pci** {**hardware** | **bridge** [*register*]}	Displays information about the peripheral component interconnect (PCI) hardware registers or bridge registers for the Cisco 2600 and 7000 series routers.

Command	Purpose
Router# **show processes** [**cpu**]	Displays information about all active processes.
Router# **show processes memory**	Displays information about memory usage.
Router# **show protocols**	Displays the configured protocols.
Router# **show stacks**	Displays stack usage of processes and interrupt routines, including the reason for the last system reboot. This command is only useful to your technical support representative.
Router# **show subsys** [**class** *class* | **name** *name*]	Displays subsystem information.
Router# **show tcp** [*line-number*]	Displays the status of TCP connections.
Router# **show tcp brief** [**all**]	Displays a concise description of TCP connection endpoints.
Router# **show tdm connections** [**motherboard** | **slot** *number*]	Displays a snapshot of the time-division multiplexing (TDM) bus connection or data memory in a Cisco AS5200 access server.
Router# **show tech-support** [**page**] [**password**]	Displays information about the system for use when reporting a problem.

Refer to specific **show** commands in the tables of configuration commands found throughout the chapters in Cisco IOS software configuration guides. Refer to the Cisco IOS software command reference publications for detailed descriptions of the commands.

Testing Network Connectivity

To test basic network connectivity, perform the tasks described in the following sections:

- Configuring the TCP Keepalive Packet Service
- Testing Connections with the ping Command
- Tracing Packet Routes

Configuring the TCP Keepalive Packet Service

The TCP keepalive capability allows a router to detect when the host with which it is communicating experiences a system failure, even if data stops being sent (in either direction). This capability is most useful on incoming connections. For example, if a host failure occurs while the router is communicating with a printer, the router might never notice, because the printer does not generate any traffic in the opposite direction. If keepalives are enabled, they are sent once every minute on otherwise idle connections. If 5 minutes pass and no keepalives are detected, the connection is closed. The connection is also closed if the host replies to a keepalive packet with a reset packet. This will happen if the host crashes and comes back up again.

To generate the TCP keepalive packet service, use the following command in global configuration mode:

Command	Purposes
`Router(config)# service {tcp-keepalives-in | tcp-keepalives-out}`	Generates TCP keepalive packets on idle network connections, either incoming connections initiated by a remote host, or outgoing connections initiated by a user.

Testing Connections with the ping Command

As an aid to diagnosing basic network connectivity, many network protocols support an echo protocol. The protocol involves sending a special datagram to the destination host, then waiting for a reply datagram from that host. Results from this echo protocol can help in evaluating the path-to-host reliability, delays over the path, and whether the host can be reached or is functioning.

To invoke the echo protocol, use the following command in either user or privileged EXEC mode:

Command	Purposes
`Router# ping [protocol] {host | address}`	Invokes a diagnostic tool for testing connectivity.

Refer to specific **ping** commands in the tables of configuration commands found throughout the chapters in Cisco IOS software configuration guides. Refer to the Cisco IOS software command reference publications for detailed descriptions of the command.

Tracing Packet Routes

To trace the routes that packets will actually take when traveling to their destinations, use the following command in either user or privileged EXEC mode:

Command	Purposes
`Router# trace [protocol] [destination]`	Traces packet routes through the network (privileged level).

Testing Memory and Interfaces

To test the status memory and interfaces, perform the tasks described in the following sections:

- Testing Flash Memory Status
- Testing System Memory
- Testing Interfaces Statuss

⚠ **Caution** We do not recommend using these **test** commands; they are intended to aid manufacturing personnel in checking system functionality.

Testing Flash Memory Status

To test the status of Flash memory, use the following command in privileged EXEC mode:

Command	Purposes
`Router# test flash`	Tests Flash memory on MCI and envm Flash EPROM interfaces.

Testing System Memory

To diagnose the status of system memory, use the following command in privileged EXEC mode:

Command	Purposes
`Router# test memory`	Diagnoses Multibus memory, including NVRAM.

Testing Interfaces Status

Caution Do not use this test to diagnose problems with an operational server.

To test the status of the interfaces, use the following command on a nonoperational server in privileged EXEC mode:

Command	Purposes
`Router# test interfaces`	Tests network interfaces.

Logging System Error Messages

By default, routers send **debug** EXEC command output and system error messages to a logging process. The logging process controls the distribution of logging messages to the various destinations, such as the logging buffer, terminal lines, or a UNIX syslog server, depending on your configuration. The process also sends messages to the console. When the logging process is on, the messages are displayed on the console after the process that generated them has finished.

Note The syslog format is compatible with 4.3 Berkeley Standard Distribution (BSD) UNIX.

When the logging process is disabled, messages are sent only to the console. The messages are sent as they are generated, so error and debug output will be interspersed with prompts or output from the command.

You can set the severity level of the messages to control the type of messages displayed for the console and each destination. You can time-stamp log messages or set the syslog source address to enhance real-time debugging and management.

Refer to the *Cisco IOS Software System Error Messages* publication for detailed information on error messages.

Enabling Message Logging

Message logging is enabled by default. It must be enabled in order to send messages to any destination other than the console.

To disable message logging, use the **no logging on** command. Note that disabling the logging process can slow down the router because a process cannot continue until the messages are written to the console.

To reenable message logging after it has been disabled, use the following command in global configuration mode:

Command	Purposes
Router(config)# **logging on**	Enables message logging.

Enabling Message Logging for a Slave Card

To enable slave VIP cards to log status messages to the console (print the messages to the screen), use the following command in global configuration mode:

Command	Purposes
Router(config)# **service slave-log**	Enables slave message logging.

Setting the Error Message Display Device

If message logging is enabled, you can send messages to specified locations, in addition to the console.

To set the locations that receive messages, use the following commands in global configuration mode, as needed:

Command	Purposes
Router(config)# **logging buffered** [*size*]	Logs messages to an internal buffer.
Router(config)# **terminal monitor**	Logs messages to a nonconsole terminal.
Router(config)# **logging** *host*	Logs messages to a UNIX syslog server host.

The **logging buffered** command copies logging messages to an internal buffer. The buffer is circular, so newer messages overwrite older messages after the buffer is full. To display the messages that are logged in the buffer, use the **show logging** EXEC command. The first message displayed is the oldest message in the buffer. To clear the current contents of the buffer, use the **clear logging** privileged EXEC command.

The **terminal monitor** EXEC command locally accomplishes the task of displaying the system error messages to a nonconsole terminal.

The **logging** command identifies a syslog server host to receive logging messages. The *host* argument is the name or Internet address of the host. By issuing this command more than once, you build a list of syslog servers that receive logging messages. The **no logging** command deletes the syslog server with the specified address from the list of syslogs.

Configuring Synchronization of Logging Messages

You can configure the system to synchronize unsolicited messages and **debug** command output with solicited device output and prompts for a specific line. You can identify the types of messages to be output asynchronously based on the level of severity. You can also determine the maximum number of buffers for storing asynchronous messages for the terminal after which messages are dropped.

When synchronous logging of unsolicited messages and **debug** command output is turned on, unsolicited device output is displayed on the console or printed after solicited device output is displayed or printed. Unsolicited messages and **debug** command output is displayed on the console after the prompt for user input is returned. Therefore, unsolicited messages and **debug** command output are not interspersed with solicited device output and prompts. After the unsolicited messages are displayed, the console displays the user prompt again.

To configure for synchronous logging of unsolicited messages and **debug** command output with solicited device output and prompts, use the following commands beginning in global configuration mode:

	Command	Purposes
Step 1	`Router(config)# line [aux	console	vty] beginning-line-number [ending-line-number]`	Specifies the line to be configured for synchronous logging of messages.
Step 2	`Router(config-line)# logging synchronous [level severity-level	all] [limit number-of-buffers]`	Enables synchronous logging of messages.

Enabling Time-Stamps on Log Messages

By default, log messages are not time-stamped. To enable time-stamping of log messages, use either of the following commands in global configuration mode:

Command	Purposes

`Router(config)# service timestamps log uptime`
or
`Router(config)# service timestamps log datetime [msec] [localtime] [show-timezone]`
	Enables log time stamps.

Limiting the Error Message Severity Level and Facilities

You can limit the number of messages displayed to the selected device by specifying the severity level of the error message (see Table 16 for level descriptions). To do so, use the following commands in global configuration mode, as needed:

Command	Purposes
Router(config)# **logging console** *level*	Limits the number of messages logged to the console.
Router(config)# **logging monitor** *level*	Limits the number of messages logged to the terminal lines.
Router(config)# **logging trap** *level*	Limits the number of messages logged to the syslog servers.

If you have enabled syslog messages traps to be sent to a Simple Network Management Protocol (SNMP) network management station with the **snmp-server enable trap** command, you can change the level of messages sent and stored in a history table on the router. You can also change the number of messages that get stored in the history table.

Messages are stored in the history table because SNMP traps are not guaranteed to reach their destination. By default, one message of the level warning and above (see Table 16) is stored in the history table even if syslog traps are not enabled.

To change level and table size defaults, use the following commands in global configuration mode:

	Command	Purposes
Step 1	Router(config)# **logging history** *level*	Changes the default level of syslog messages stored in the history file and sent to the SNMP server.
Step 2	Router(config)# **logging history size** *number*	Changes the number of syslog messages that can be stored in the history table.

Note Table 16 lists the level keywords and severity level. For SNMP usage, the severity level values use +1. For example, **emergency** equals 1 not 0 and **critical** equals 3 not 2.

The **logging console** command limits the logging messages displayed on the console terminal to messages with a level number at or below the specified severity level, which is specified by the *level* argument. Table 16 lists the error message *level* keywords and corresponding UNIX syslog definitions in order from the most severe level to the least severe level.

Table 16 Error Message Logging Keywords

Level Keyword	Level	Description	Syslog Definition
emergencies	0	System unusable	LOG_EMERG
alerts	1	Immediate action needed	LOG_ALERT
critical	2	Critical conditions	LOG_CRIT
errors	3	Error conditions	LOG_ERR
warnings	4	Warning conditions	LOG_WARNING
notifications	5	Normal but significant condition	LOG_NOTICE
informational	6	Informational messages only	LOG_INFO
debugging	7	Debugging messages	LOG_DEBUG

The **no logging console** command disables logging to the console terminal.

The default is to log messages to the console at the **debugging** level and those level numbers that are lower, which means all levels. The **logging monitor** command defaults to **debugging** also. The **logging trap** command defaults to the **informational** level.

To display logging messages on a terminal, use the **terminal monitor** EXEC command.

Current software generates the following four categories of error messages:

- Error messages about software or hardware malfunctions, displayed at levels **warnings** through **emergencies**
- Output from the **debug** commands, displayed at the **debugging** level
- Interface up/down transitions and system restart messages, displayed at the **notifications** level
- Reload requests and low-process stack messages, displayed at the **informational** level

Defining the UNIX System Logging Facility

You can log messages produced by UNIX system utilities. To do this, enable this type logging and define the UNIX system facility from which you want to log messages. Table 17 lists the UNIX system facilities supported by the Cisco IOS software. Consult the operator manual for your UNIX operating system for more information about these UNIX system facilities.

To define UNIX system facility message logging, use the following command in global configuration mode:

Command	Purposes
`Router(config)# logging facility facility-type`	Configures system log facilities.

Table 17 Logging Facility Type Keywords

Facility Type Keyword	Description
auth	Indicates the authorization system.
cron	Indicates the cron facility.
daemon	Indicates the system daemon.
kern	Indicates the Kernel.
local0–7	Reserved for locally defined messages.
lpr	Indicates line printer system.
mail	Indicates mail system.
news	Indicates USENET news.
sys9	Indicates system use.
sys10	Indicates system use.
sys11	Indicates system use.
sys12	Indicates system use.
sys13	Indicates system use.
sys14	Indicates system use.
syslog	Indicates the system log.

Table 17 Logging Facility Type Keywords (continued)

Facility Type Keyword	Description
user	Indicates user process.
uucp	Indicates UNIX-to-UNIX copy system.

Displaying Logging Information

To display logging information, use the following commands in EXEC mode, as needed:

Command	Purposes
`Router# show logging`	Displays the state of syslog error and event logging, including host addresses, whether console logging is enabled, and other logging statistics.
`Router# show controllers vip slot-number logging`	Displays the state of syslog error and event logging of a VIP card, including host addresses, whether console logging i enabled, and other logging statistics
`Router# show logging history`	Displays information in the syslog history table such as the table size, the status of messages, and the text of the messages stored in the table.

Logging Errors to a UNIX Syslog Daemon

To configure the syslog daemon on a 4.3 BSD UNIX system, include a line such as the following in the /etc/syslog.conf file:

```
local7.debugging /usr/adm/logs/cisco.log
```

The **debugging** keyword specifies the syslog level; see Table 16 for a general description of other keywords. The **local7** keyword specifies the logging facility to be used; see Table 17 for a general description of other keywords.

The syslog daemon sends messages at this level or at a more severe level to the file specified in the next field. The file must already exist, and the syslog daemon must have permission to write to it.

Setting the Syslog Source Address

By default, a syslog message contains the IP address of the interface it uses to leave the router. To set all syslog messages to contain the same IP address, regardless of which interface they use, use the following command in global configuration mode:

Command	Purposes
`Router(config)# logging source-interface type number`	Sets the syslog source address.

Using Field Diagnostics on Line Cards

Each line card on the Cisco 12000 series routers can perform field diagnostic testing to isolate faulty hardware without disrupting normal operation of the system. However, performing field diagnostic testing on a line card does halt all activity on the line card for the duration of the testing. After successful completion of the field diagnostic testing, the Cisco IOS software is automatically reloaded on the line card.

Note The field diagnostic **diag** command must be executed from the Gigabit Route Processor (GRP) main console port.

To perform field diagnostic testing on a line card, use the following command in privileged EXEC mode:

Command	Purposes
`Router# diag slot-number [previous | post | verbose | wait]`	Specifies the line card on which you want to perform diagnostic testing. Optionally, specifies that previous test results are displayed, that only extended power-on self-tests (POST) be performed, that the maximum messages are displayed, or that the Cisco IOS software not be reloaded on the line card after successful completion of the tests. The following prompt is displayed: `Running Diags will halt ALL activity on the requested slot. [confirm]` At the prompt, press **Return** to confirm that you want to perform field diagnostic testing on the specified line card, or type **no** to stop the testing.

To stop field diagnostic testing on a line card, use either of the following commands in privileged EXEC mode:

Command	Purpose

`Router# diag slot-number halt`
or
`Router# no diag slot-number`
	Specifies the line card on which you want to stop diagnostic testing.

Note When you stop the field diagnostic test, the line card remains down (that is, in an unbooted state). In most cases, you stopped the testing because you need to remove the line card or replace the line card. If that is not the case and you want to bring the line card back up (that is, online), you must use the **microcode reload** global configuration command or power cycle the line card.

Troubleshooting Specific Line Cards

Cisco IOS provides the **execute-on** command to allow you to issue Cisco IOS commands (such as **show** commands) to a specific line card for monitoring and maintenance. For example, you could show which Cisco IOS image is loaded on the card in slot 3 of a Cisco 12012 Gigabit Switch Router (GSR) by issuing the **execute-on slot 3 show version** command. You can also use this command for troubleshooting cards in the dial shelf of Cisco access servers. For complete documentation of this command, refer to the "Troubleshooting" chapter of the Release 12.2 *Cisco IOS Configuration Fundamentals Command Reference*.

Storing Line Card Crash Information

This section explains how to enable storing of crash information for a line card and optionally specify the type and amount of information stored. Technical support representatives need to be able to look at the crash information from the line card to troubleshoot serious problems on the line card. The crash information contains all the line card memory information, including the main memory and transmit and receive buffer information.

⚠ **Caution** Use the **exception linecard** global configuration command only when directed by a technical support representative, and only enable options that the technical support representative requests you to enable.

To enable and configure the crash information options for a line card, use the following command in global configuration mode:

Command	Purpose
Router(config)# **exception linecard** {**all** | **slot** *slot-number*} [**corefile** *filename* | **main-memory** *size* [**k** | **m**] | **queue-ram** *size* [**k** | **m**] | **rx-buffer** *size* [**k** | **m**] | **sqe-register-rx** | **sqe-register-tx** | **tx-buffer** *size* [**k** | **m**]]	Specifies the line card for which you want crash information when a line card resets. Optionally, specify the type and amount of memory to be stored.

Creating Core Dumps

When your router crashes, it is sometimes useful to obtain a full copy of the memory image (called a core dump) to identify the cause of the crash. Not all crash types will produce a core dump.

Core dumps are generally useful only to your technical support representative. The core dump file, which is a very large binary file, must be transferred to a Trivial File Transfer Protocol (TFTP), File Transfer Protocol (FTP), or remote copy protocol (rcp) server and subsequently interpreted by technical personnel that have access to source code and detailed memory maps.

⚠ **Caution** Use the **exception** commands only under the direction of a technical support representative. Creating a core dump while the router is functioning in a network can disrupt network operation.

To configure your system to generate core dump files, use the following commands in global configuration mode:

Command	Purpose
Router(config)# **ip ftp password** [*encrypt-type*] *password*	(Optional for core dump file transfers using FTP) Specifies the password to be used for FTP connections.
Router(config)# **ip ftp username** *username*	(Optional for core dump file transfers using FTP) Configures the user name for FTP connections.
Router(config)# **exception protocol** {**ftp** | **rcp** | **tftp**}	Configures the protocol used for core dumps.
Router(config)# **exception flash**	Configures the router for a core dump using a Flash disk.
Router(config)# **exception core-file** *name*	Specifies the name of the core dump file when your router has generated a core dump file after crashing.
Router(config)# **exception dump** *ip-address*	Configures the router to dump a core file to a particular server when the router crashes.
Router(config)# **exception memory** {**fragment** *size* | **minimum** *size*}	Causes the router to create a core dump and reboot when certain memory size parameters are violated.
Router(config)# **exception spurious-interrupt** [*number*]	Causes the router to create a core dump and reboot after a specified number of spurious interrupts.

Specifying the Protocol for the Core Dump

To configure the router to generate a core dum, perform the tasks described in the following sections:

- Using TFTP for Core Dumps
- Using FTP for Core Dumps
- Using rcp for Core Dumps
- Using a Flash Disk

Using TFTP for Core Dumps

Due to a limitation of most TFTP applications, the router will dump only the first 16 MB of the core file. Therefore, if your router's main memory is larger than 16 MB, do not use TFTP.

To configure a router for a core dump using TFTP, use the following commands in global configuration mode:

Command	Purpose
Router(config)# **exception protocol tftp**	Specifies that the TFTP protocol should be used for core dumps.
Router(config)# **exception dump** *ip-address*	Configures the router to dump a core file to a particular server when the router crashes.

For example, the following command configures a router for a core dump using TFTP, where 172.17.92.2 is the IP address of the TFTP server:

```
Router(config)# exception protocol tftp
Router(config)# exception dump 172.17.92.2
```

The core dump is written to a file named *hostname*-core on the TFTP server, where *hostname* is the name of the router (in the example, the file would be named Router-core). You can change the name of the core file by adding the **exception core-file** *filename* configuration command.

Depending on the TFTP server application used, it may be necessary to create, on the TFTP server, the empty target file to which the router can write the core. Also, make sure that there is enough memory on your TFTP server to hold the complete core dump.

Using FTP for Core Dumps

To configure the router for a core dump using FTP, use the following commands in global configuration mode:

	Command	Purposes
Step 1	`Router(config)# ip ftp username username`	(Optional) Configures the user name for FTP connections.
Step 2	`Router(config)# ip ftp password [type] password`	(Optional) Specifies the password to be used for FTP connections.
Step 3	`Router(config)# exception protocol ftp`	Specifies that FTP should be used for core dump file transfers.
Step 4	`Router(config)# exception dump ip-address`	Configures the router to dump a core file to a particular server when the router crashes.
Step 5	`Router(config)# exception core-file name`	Specifies the name of the core dump file when your router has generated a core dump file after crashing.

The following example configures a router to use FTP to dump a core file named dumpfile to the FTP server at 172.17.92.2 when it crashes.

```
ip ftp username red
ip ftp password blue
exception protocol ftp
exception dump 172.17.92.2
exception core-file dumpfile
```

Using rcp for Core Dumps

You can use rcp to capture a core dump. Enabling rcp on a router is described in the “Configuring a Router to Use rcp” section of the “Configuring Basic File Transfer Services” chapter.

To enable rcp on the router, use the following commands in global configuration mode to capture the core dump:

	Command	Purposes
Step 1	`Router(config)# exception protocol ftp`	Specifies that rcp should be used for core dump file transfers.
Step 2	`Router(config)# exception dump ip-address`	Configures the router to dump a core file to a particular server when the router crashes.

The following example sets 172.17.92.2 as the IP address of the host on which rcp is enabled:

```
exception protocol rcp
exception dump 172.17.92.2
```

Using a Flash Disk for Core Dumps

Some router platforms support the Flash disk as an alternative to the linear Flash memory or Personal Computer Memory Card Industry Association (PCMCIA) Flash card. The large storage capacity of these Flash disks makes them good candidates for another means of capturing a core dump. To configure a router for a core dump using a Flash disk, use the following command in global configuration mode:

Command	Purpose
`Router(config)#` **`exception flash`** `[`**`procmem`** `|`**`iomem`** `|` **`all`**`]` *`device-name`*`[:`*`partition-number`*`] [`**`erase`** `|` **`no_erase`**`]`	Configures the router for a core dump using a flash disk.

The **show flash all** EXEC command will list the devices you can use for the **exception flash** command.

Specifying the Name of the Core Dump File

To specify a filename of a core dump file when the router crashes, use the following command in global configuration mode:

Command	Purpose
`Router(config)#` **`exception core-file`** *`name`*	Specifies the name of the core dump file when your router has generated a core dump file after crashing.

Creating an Exception Memory Core Dump

To cause the router to create a core dump and reboot when certain memory size parameters are violated during the debugging process, use the following commands in global configuration mode:

Command	Purpose
`Router(config)#` **`exception memory fragment`** *`size`*	The minimum contiguous block of memory in the free pool (in bytes).
`Router(config)#` **`exception memory minimum`** *`size`*	The minimum size of the free memory pool (in bytes).

The size parameter is expressed in bytes and is checked every 60 seconds. If you enter a size that is greater than the free memory and the **exception dump** command has been configured, a core dump and router reload is generated after 60 seconds. If the **exception dump** command is not configured, the router reloads without triggering a core dump. The following example configures the router to monitor the free memory. If the memory falls below 250,000 bytes, the core dump is created and the router reloads.

```
exception dump 172.16.92.2
exception core-file memory.overrun
exception memory minimum 250000
```

Setting a Spurious Interrupt Core Dump

During the debugging process, you can configure the router to create a spurious interrupt core dump and reboot when a specified number of interrupts have occurred.

Caution Use the exception spurious-interrupt global configuration command only when directed by a technical support representative and only enable options requested by the technical support representative.

To enable and configure the crash information for spurious interrupts, use the following command in global configuration mode:

Command	Purpose
`Router(config)# exception spurious-interrupt number`	Sets the maximum number of spurious interrupts to include in the core dump before reloading.

The following example configures a router to create a core dump with a limit of two spurious interrupts:

```
exception spurious-interrupt 2
```

Enabling Debug Operations

Your router includes hardware and software to aid in troubleshooting internal problems and problems with other hosts on the network. The **debug** privileged EXEC mode commands start the console display of several classes of network events. The following commands describe in general the system debug message feature. Refer to the *Cisco IOS Debug Command Reference* for all information regarding **debug** commands. Also refer to the *Internetwork Troubleshooting Guide* publication for additional information.

To enable debugging operations, use the following commands:

Command	Purposes
`Router# show debugging`	Displays the state of each debugging option.
`Router# debug ?`	Displays a list and brief description of all the **debug** command options.
`Router# debug command`	Begins message logging for the specified **debug** command.
`Router# no debug command`	Turns message logging off for the specified **debug** command.

Caution The system gives high priority to debugging output. For this reason, debugging commands should be turned on only for troubleshooting specific problems or during troubleshooting sessions with technical support personnel. Excessive debugging output can render the system inoperable.

You can configure time-stamping of system **debug** messages. Time-stamping enhances real-time debugging by providing the relative timing of logged events. This information is especially useful when customers send debugging output to your technical support personnel for assistance. To enable time-stamping of system **debug** messages, use either of the following commands in global configuration mode:

Command	Purposes

`Router(config)# service timestamps debug uptime`
or
`Router(config)# service timestamps debug datetime [msec] [localtime] [show-timezone]`
	Enables time-stamping of system **debug** messages.

Normally, the messages are displayed only on the console terminal. Refer to the section "Setting the Error Message Display Device" earlier in this chapter to change the output device.

Enabling Conditionally Triggered Debugging

When the Conditionally Triggered Debugging feature is enabled, the router generates debugging messages for packets entering or leaving the router on a specified interface; the router will not generate debugging output for packets entering or leaving through a different interface. You can specify the interfaces explicitly. For example, you may only want to see debugging messages for one interface or subinterface. You can also turn on debugging for all interfaces that meet specified condition. This feature is useful on dial access servers, which have a large number of ports.

Normally, the router will generate debugging messages for every interface, resulting in a large number of messages. The large number of messages consumes system resources, and can affect your ability to find the specific information you need. By limiting the number of debugging messages, you can receive messages related to only the ports you wish to troubleshoot.

Conditionally Triggered Debugging controls the output from the following protocol-specific **debug** commands:

- **debug aaa** {**accounting** | **authorization** | **authentication**}
- **debug dialer** {**events** | **packets**}
- **debug isdn** {**q921** | **q931**}
- **debug modem** {**oob** | **trace**}
- **debug ppp** {**all** | **authentication** | **chap** | **error** | **negotiation** | **multilink events** | **packet**}

Although this feature limits the output of the commands listed, it does not automatically enable the generation of debugging output from these commands. Debugging messages are generated only when the protocol-specific **debug** command is enabled. The **debug** command output is controlled through two processes:

- The protocol-specific **debug** commands specify which protocols are being debugged. For example, the **debug dialer events** command generates debugging output related to dialer events.
- The **debug condition** commands limit these debugging messages to those related to a particular interface. For example, the **debug condition username bob** command generates debugging output only for interfaces with packets that specify a username of bob.

To configure Conditionally Triggered Debugging, perform the tasks described in the following sections:

- Enabling Protocol-Specific debug Commands
- Enabling Conditional Debugging Commands
- Specifying Multiple Debugging Conditions

Enabling Protocol-Specific debug Commands

In order to generate any debugging output, the protocol-specific **debug** command for the desired output must be enabled. Use the **show debugging** command to determine which types of debugging are enabled. To display the current debug conditions, use the **show debug condition** command. To enable the desired protocol-specific **debug** commands, use the following commands in privileged EXEC mode :

Command	Purpose
`Router#` **`show debugging`**	Determines which types of debugging are enabled.
`Router#` **`show debug condition`** `[`*`condition-id`*`]`	Displays the current **debug** conditions.
`Router#` **`debug`** *`protocol`*	Enables the desired debugging commands.
`Router#` **`no debug`** *`protocol`*	Disables the debugging commands that are not desired.

If you do not want output, disable all the protocol-specific **debug** commands.

Enabling Conditional Debugging Commands

If no **debug condition** commands are enabled, all debugging output, regardless of the interface, will be displayed for the enabled protocol-specific **debug** commands.

The first **debug condition** command you enter enables conditional debugging. The router will display only messages for interfaces that meet one of the specified conditions. If multiple conditions are specified, the interface must meet at least one of the conditions in order for messages to be displayed.

To enable messages for interfaces specified explicitly or for interfaces that meet certain conditions, perform the tasks described in the following sections:

- Displaying Messages for One Interface
- Displaying Messages for Multiple Interfaces
- Limiting the Number of Messages Based on Conditions

Displaying Messages for One Interface

To disable debugging messages for all interfaces except one, use the following command in privileged EXEC mode:

Command	Purpose
`Router#` **`debug condition interface`** *`interface`*	Enables debugging output for only the specified interface.

To reenable debugging output for all interfaces, use the **no debug interface** command.

Displaying Messages for Multiple Interfaces

To enable debugging messages for multiple interfaces, use the following commands in privileged EXEC mode:

	Command	Purposes
Step 1	`Router# debug condition interface interface`	Enables debugging output for only the specified interface
Step 2	`Router# debug condition interface interface`	Enable debugging messages for additional interfaces. Repeat this task until debugging messages are enabled for all desired interfaces.

If you specify more than one interface by entering this command multiple times, debugging output will be displayed for all of the specified interfaces. To turn off debugging on a particular interface, use the **no debug interface** command. If you use the **no debug interface all** command or remove the last **debug interface** command, debugging output will be reenabled for all interfaces.

Limiting the Number of Messages Based on Conditions

The router can monitor interfaces to learn if any packets contain the specified value for one of the following conditions:

- username
- calling party number
- called party number

If you enter a condition, such as calling number, debug output will be stopped for all interfaces. The router will then monitor every interface to learn if a packet with the specified calling party number is sent or received on any interfaces. If the condition is met on an interface or subinterface, **debug** command output will be displayed for that interface. The debugging output for an interface is "triggered" when the condition has been met. The debugging output continues to be disabled for the other interfaces. If, at some later time, the condition is met for another interface, the debug output also will become enabled for that interface.

Once debugging output has been triggered on an interface, the output will continue until the interface goes down. However, the session for that interface might change, resulting in a new username, called party number, or calling party number. Use the **no debug interface** command to reset the debug trigger mechanism for a particular interface. The debugging output for that interface will be disabled until the interface meets one of the specified conditions.

To limit the number of debugging messages based on a specified condition, use the following command in privileged EXEC mode:

Command	Purpose
`Router# debug condition {username username	called dial-string	caller dial-string}`	Enables conditional debugging. The router will display only messages for interfaces that meet this condition.

To reenable the debugging output for all interfaces, enter the **no debug condition all** command.

Specifying Multiple Debugging Conditions

To limit the number of debugging messages based on more than one condition, use the following commands in privileged EXEC mode:

	Command	Purposes
Step 1	`Router# debug condition {username username | called dial-string | caller dial-string}`	Enables conditional debugging, and specifies the first condition.
Step 2	`Router# debug condition {username username | called dial-string | caller dial-string}`	Specifies the second condition. Repeat this task until all conditions are specified.

If you enter multiple **debug condition** commands, debugging output will be generated if an interface meets at least one of the conditions. If you remove one of the conditions using the **no debug condition** command, interfaces that meet only that condition no longer will produce debugging output. However, interfaces that meet a condition other than the removed condition will continue to generate output. Only if no active conditions are met for an interface will the output for that interface be disabled.

Conditionally Triggered Debugging Configuration Examples

In this example, four conditions have been set by the following commands:

- **debug condition interface serial 0**
- **debug condition interface serial 1**
- **debug condition interface virtual-template 1**
- **debug condition username fred**

The first three conditions have been met by one interface. The fourth condition has not yet been met:

```
Router# show debug condition

Condition 1: interface Se0 (1 flags triggered)
        Flags: Se0
Condition 2: interface Se1 (1 flags triggered)
        Flags: Se1
Condition 3: interface Vt1 (1 flags triggered)
        Flags: Vt1
Condition 4: username fred (0 flags triggered)
```

When any **debug condition** command is entered, debugging messages for conditional debugging are enabled. The following debugging messages show conditions being met on different interfaces as the serial 0 and serial 1 interfaces come up. For example, the second line of output indicates that serial interface 0 meets the username fred condition.

```
*Mar  1 00:04:41.647: %LINK-3-UPDOWN: Interface Serial0, changed state to up
*Mar  1 00:04:41.715: Se0 Debug: Condition 4, username fred triggered, count 2
*Mar  1 00:04:42.963: %LINEPROTO-5-UPDOWN: Line protocol on Interface Serial0, changed
state to up
*Mar  1 00:04:43.271: Vi1 Debug: Condition 3, interface Vt1 triggered, count 1
*Mar  1 00:04:43.271: %LINK-3-UPDOWN: Interface Virtual-Access1, changed state to up
*Mar  1 00:04:43.279: Vi1 Debug: Condition 4, username fred triggered, count 2
*Mar  1 00:04:43.283: Vi1 Debug: Condition 1, interface Se0 triggered, count 3
*Mar  1 00:04:44.039: %IP-4-DUPADDR: Duplicate address 172.27.32.114 on Ethernet 0,
sourced by 00e0.1e3e.2d41
```

```
*Mar  1 00:04:44.283: %LINEPROTO-5-UPDOWN: Line protocol on Interface Virtual-Access1,
changed state to up
*Mar  1 00:04:54.667: %LINK-3-UPDOWN: Interface Serial1, changed state to up
*Mar  1 00:04:54.731: Se1 Debug: Condition 4, username fred triggered, count 2
*Mar  1 00:04:54.735: Vi1 Debug: Condition 2, interface Se1 triggered, count 4
*Mar  1 00:04:55.735: %LINEPROTO-5-UPDOWN: Line protocol on Interface Serial1, changed
state to up
```

After a period of time, the **show debug condition** command displays the revised list of conditions:

```
Router# show debug condition

Condition 1: interface Se0 (2 flags triggered)
        Flags: Se0 Vi1
Condition 2: interface Se1 (2 flags triggered)
        Flags: Se1 Vi1
Condition 3: interface Vt1 (2 flags triggered)
        Flags: Vt1 Vi1
Condition 4: username fred (3 flags triggered)
        Flags: Se0 Vi1 Se1
```

Next, the serial 1 and serial 0 interfaces go down. When an interface goes down, conditions for that interface are cleared.

```
*Mar  1 00:05:51.443: %LINK-3-UPDOWN: Interface Serial1, changed state to down
*Mar  1 00:05:51.471: Se1 Debug: Condition 4, username fred cleared, count 1
*Mar  1 00:05:51.479: Vi1 Debug: Condition 2, interface Se1 cleared, count 3
*Mar  1 00:05:52.443: %LINEPROTO-5-UPDOWN: Line protocol on Interface Serial1, changed
state to down
*Mar  1 00:05:56.859: %LINK-3-UPDOWN: Interface Serial0, changed state to down
*Mar  1 00:05:56.887: Se0 Debug: Condition 4, username fred cleared, count 1
*Mar  1 00:05:56.895: Vi1 Debug: Condition 1, interface Se0 cleared, count 2
*Mar  1 00:05:56.899: Vi1 Debug: Condition 3, interface Vt1 cleared, count 1
*Mar  1 00:05:56.899: Vi1 Debug: Condition 4, username fred cleared, count 0
*Mar  1 00:05:56.903: %LINK-3-UPDOWN: Interface Virtual-Access1, changed state to down
*Mar  1 00:05:57.907: %LINEPROTO-5-UPDOWN: Line protocol on Interface Serial0, changed
state to down
*Mar  1 00:05:57.907: %LINEPROTO-5-UPDOWN: Line protocol on Interface Virtual-Access1,
changed state to down
```

The final **show debug condition** output is the same as the output before the interfaces came up:

```
Router# show debug condition

Condition 1: interface Se0 (1 flags triggered)
        Flags: Se0
Condition 2: interface Se1 (1 flags triggered)
        Flags: Se1
Condition 3: interface Vt1 (1 flags triggered)
        Flags: Vt1
Condition 4: username fred (0 flags triggered)
```

Using the Environmental Monitor

Some routers and access servers have an environmental monitor that monitors the physical condition of the router. If a measurement exceeds acceptable margins, a warning message is printed to the system console. The system software collects measurements once every 60 seconds, but warnings for a given test point are printed at most once every 4 hours. If the temperature measurements are out of specification more than the shutdown, the software shuts the router down (the fan will remain on). The router must be manually turned off and on after such a shutdown. You can query the environmental monitor using the **show environment** command at any time to determine whether a measurement is out of tolerance. Refer to the *Cisco IOS System Error Messages* publication for a description of environmental monitor warning messages.

On routers with an environmental monitor, if the software detects that any of its temperature test points have exceeded maximum margins, it performs the following steps:

1. Saves the last measured values from each of the six test points to internal nonvolatile memory.
2. Interrupts the system software and causes a shutdown message to be printed on the system console.
3. Shuts off the power supplies after a few milliseconds of delay.

The system displays the following message if temperatures exceed maximum margins, along with a message indicating the reason for the shutdown:

```
Router#
%ENVM-1-SHUTDOWN: Environmental Monitor initiated shutdown
%ENVM-2-TEMP: Inlet temperature has reached SHUTDOWN level at 64(C)
```

Refer to the hardware installation and maintenance publication for your router for more information about environmental specifications.

Configuring IP Routing Protocol-Independent Features

This chapter describes how to configure IP routing protocol-independent features. For a complete description of the IP routing protocol-independent commands in this chapter, refer to the "IP Routing Protocol-Independent Commands" chapter of the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols* publication. To locate documentation of other commands in this chapter, use the command reference master index, or search online.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the "Identifying Supported Platforms" section in the "Using Cisco IOS Software" chapter in this book.

Protocol-Independent Feature Task List

Previous chapters addressed configurations of specific routing protocols. To configure optional protocol-independent features, perform any of the tasks described in the following sections:

- Using Variable-Length Subnet Masks (Optional)
- Configuring Static Routes (Optional)
- Specifying Default Routes (Optional)
- Changing the Maximum Number of Paths (Optional)
- Configuring Multi-Interface Load Splitting (Optional)
- Redistributing Routing Information (Optional)
- Filtering Routing Information (Optional)
- Enabling Policy Routing (Optional)
- Managing Authentication Keys (Optional)
- Monitoring and Maintaining the IP Network (Optional)

See the section "IP Routing Protocol-Independent Configuration Examples" at the end of this chapter for configuration examples.

Using Variable-Length Subnet Masks

Enhanced IGRP (EIGRP), Intermediate System-to-Intermediate System (IS-IS) Interdomain Routing Protocol, Open Shortest Path First (OSPF), Routing Information Protocol (RIP) Version 2, and static routes support variable-length subnet masks (VLSMs). With VLSMs, you can use different masks for the same network number on different interfaces, which allows you to conserve IP addresses and more efficiently use available address space. However, using VLSMs also presents address assignment challenges for the network administrator and ongoing administrative challenges.

Refer to RFC 1219 for detailed information about VLSMs and how to correctly assign addresses.

Note Consider your decision to use VLSMs carefully. You can easily make mistakes in address assignments and you will generally find it more difficult to monitor your network using VLSMs.

Note The best way to implement VLSMs is to keep your existing numbering plan in place and gradually migrate some networks to VLSMs to recover address space. See the "Variable-Length Subnet Mask Example" section at the end of this chapter for an example of using VLSMs.

Configuring Static Routes

Static routes are user-defined routes that cause packets moving between a source and a destination to take a specified path. Static routes can be important if the Cisco IOS software cannot build a route to a particular destination. They are useful for specifying a gateway of last resort to which all unroutable packets will be sent.

To configure a static route, use the following command in global configuration mode:

Command	Purpose
`Router(config)# ip route prefix mask {ip-address | interface-type interface-number} [distance] [tag tag] [permanent]`	Establishes a static route.

See the "Overriding Static Routes with Dynamic Protocols Example" section at the end of this chapter for an example of configuring static routes.

The software remembers static routes until you remove them (using the **no** form of the **ip route** global configuration command). However, you can override static routes with dynamic routing information through prudent assignment of administrative distance values. Each dynamic routing protocol has a default administrative distance, as listed in Table 9. If you would like a static route to be overridden by information from a dynamic routing protocol, simply ensure that the administrative distance of the static route is higher than that of the dynamic protocol.

Table 9 Dynamic Routing Protocol Default Administrative Distances

Route Source	Default Distance
Connected interface	0
Static route	1

Table 9 Dynamic Routing Protocol Default Administrative Distances (continued)

Route Source	Default Distance
Enhanced IGRP (EIGRP) summary route	5
Exterior Border Gateway Protocol (BGP)	20
Internal EIGRP	90
IGRP	100
OSPF	110
IS-IS	115
RIP	120
EIGRP external route	170
Interior BGP	200
Unknown	255

Static routes that point to an interface will be advertised via RIP, IGRP, and other dynamic routing protocols, regardless of whether **redistribute static** router configuration commands were specified for those routing protocols. These static routes are advertised because static routes that point to an interface are considered in the routing table to be connected and hence lose their static nature. However, if you define a static route to an interface that is not one of the networks defined in a **network** command, no dynamic routing protocols will advertise the route unless a **redistribute static** command is specified for these protocols.

When an interface goes down, all static routes through that interface are removed from the IP routing table. Also, when the software can no longer find a valid next hop for the address specified as the address of the forwarding router in a static route, the static route is removed from the IP routing table.

Specifying Default Routes

A router might not be able to determine the routes to all other networks. To provide complete routing capability, the common practice is to use some routers as *smart routers* and give the remaining routers default routes to the smart router. (Smart routers have routing table information for the entire internetwork.) These default routes can be passed along dynamically, or can be configured into the individual routers.

Most dynamic interior routing protocols include a mechanism for causing a smart router to generate dynamic default information that is then passed along to other routers.

Specifying a Default Network

If a router has a directly connected interface onto the specified default network, the dynamic routing protocols running on that device will generate or source a default route. In the case of RIP, the router will advertise the pseudonetwork 0.0.0.0. In the case of IGRP, the network itself is advertised and flagged as an exterior route.

A router that is generating the default for a network also may need a default of its own. One way a router can generate its own default is to specify a static route to the network 0.0.0.0 through the appropriate device.

To define a static route to a network as the static default route, use the following command in global configuration mode:

Command	Purpose
Router(config)# **ip default-network** *network-number*	Specifies a default network.

Understanding Gateway of Last Resort

When default information is being passed along through a dynamic routing protocol, no further configuration is required. The system periodically scans its routing table to choose the optimal default network as its default route. In the case of RIP, there is only one choice, network 0.0.0.0. In the case of IGRP, there might be several networks that can be candidates for the system default. The Cisco IOS software uses both administrative distance and metric information to determine the default route (gateway of last resort). The selected default route appears in the gateway of last resort display of the **show ip route** EXEC command.

If dynamic default information is not being passed to the software, candidates for the default route are specified with the **ip default-network** global configuration command. In this usage, the **ip default-network** command takes an unconnected network as an argument. If this network appears in the routing table from any source (dynamic or static), it is flagged as a candidate default route and is a possible choice as the default route.

If the router has no interface on the default network, but does have a route to it, it considers this network as a candidate default path. The route candidates are examined and the best one is chosen, based on administrative distance and metric. The gateway to the best default path becomes the gateway of last resort.

Changing the Maximum Number of Paths

By default, most IP routing protocols install a maximum of four parallel routes in a routing table. Static routes always install six routes. The exception is BGP, which by default allows only one path to a destination.

The range of maximum paths is one to six paths. To change the maximum number of parallel paths allowed, use the following command in router configuration mode:

Command	Purpose
Router(config-router)# **maximum-paths** *maximum*	Configures the maximum number of parallel paths allowed in a routing table.

Configuring Multi-Interface Load Splitting

Multi-interface load splitting allows you to efficiently control traffic that travels across multiple interfaces to the same destination. The **traffic-share min** router configuration command specifies that if multiple paths are available to the same destination, only paths with the minimum metric will be installed in the routing table. The number of paths allowed is never more than six. For dynamic routing protocols, the number of paths is controlled by the **maximum-paths** router configuration command. The static route source can always install six paths. If more paths are available, the extra paths are discarded. If some installed paths are removed from the routing table, pending routes are added automatically.

When the **traffic-share min** command is used with the **across-interfaces** keyword, an attempt is made to use as many different interfaces as possible to forward traffic to the same destination. When the maximum path limit has been reached and a new path is installed, the router compares the installed paths. For example, if path X references the same interface as path Y and the new path uses a different interface, path X is removed and the new path is installed.

To configure traffic that is distributed among multiple routes of unequal cost for equal cost paths across multiple interfaces, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# traffic-share min {across-interfaces}`	Configures multi-interface load splitting across different interfaces with equal cost paths.

Redistributing Routing Information

In addition to running multiple routing protocols simultaneously, the Cisco IOS software can redistribute information from one routing protocol to another. For example, you can instruct the software to readvertise IGRP-derived routes using RIP, or to readvertise static routes using the IGRP protocol. Redistributing information from one routing protocol to another applies to all of the IP-based routing protocols.

You also can conditionally control the redistribution of routes between routing domains by defining a method known as *route maps* between the two domains.

The following four tables list tasks associated with route redistribution. Although redistribution is a protocol-independent feature, some of the **match** and **set** commands are specific to a particular protocol.

To define a route map for redistribution, use the following command in global configuration mode:

Command	Purpose
`Router(config)# route-map map-tag [permit	deny] [sequence-number]`	Defines any route maps needed to control redistribution.

One or more **match** commands and one or more **set** commands typically follow a **route-map** global configuration command. If there are no **match** commands, then everything matches. If there are no **set** commands, nothing is done (other than the match). Therefore, you need at least one **match** or **set** command.

To define conditions for redistributing routes from one routing protocol into another, use at least one of the following commands in route-map configuration mode, as needed:

Command	Purpose
`Router(config-route-map)# match as-path path-list-number`	Matches a BGP autonomous system path access list.
`Router(config-route-map)# match community-list community-list-number [exact]`	Matches a BGP community list.

Command	Purpose
Router(config-route-map)# **match ip address** {*access-list-number* | *access-list-name*} [*...access-list-number* | *...access-list-name*]	Matches a standard access list.
Router(config-route-map)# **match metric** *metric-value*	Matches the specified metric.
Router(config-route-map)# **match ip next-hop** {*access-list-number* | *access-list-name*} [*access-list-number* | *access-list-name*]	Matches a next-hop router address passed by one of the access lists specified.
Router(config-route-map)# **match tag** *tag-value* [*tag-value*]	Matches the specified tag value.
Router(config-route-map)# **match interface** *interface-type interface-number* [*interface-type interface-number*]	Matches the specified next hop route out one of the interfaces specified.
Router(config-route-map)# **match ip route-source** {*access-list-number* | *access-list-name*} [*access-list-number* | *access-list-name*]	Matches the address specified by the specified advertised access lists.
Router(config-route-map)# **match route-type** {**local** | **internal** | **external** [**type-1** | **type-2**] | **level-1** | **level-2**}	Matches the specified route type.

One or more **match** commands and one or more **set** commands should follow a **route-map** router configuration command. To define conditions for redistributing routes from one routing protocol into another, use at least one of the following commands in route-map configuration mode as needed:

Command	Purpose
Router(config-route-map)# **set community** {*community-number* [**additive**]} | **none**	Sets the communities attribute.
Router(config-route-map)# **set dampening** *halflife reuse suppress max-suppress-time*	Sets BGP route dampening factors.
Router(config-route-map)# **set local-preference** *number-value*	Assigns a value to a local BGP path.
Router(config-route-map)# **set weight** *weight*	Specifies the BGP weight for the routing table.
Router(config-route-map)# **set origin** {**igp** | **egp** *as-number* | **incomplete**}	Sets the BGP origin code.
Router(config-route-map)# **set as-path** {**tag** | **prepend** *as-path-string*}	Modifies the BGP autonomous system path.
Router(config-route-map)# **set next-hop** *next-hop*	Specifies the address of the next hop.
Router(config-route-map)# **set automatic-tag**	Enables automatic computing of the tag table.
Router(config-route-map)# **set level** {**level-1** | **level-2** | **level-1-2** | **stub-area** | **backbone**}	Specifies the areas in which to import routes.
Router(config-route-map)# **set metric** *metric-value*	Sets the metric value to give the redistributed routes (for any protocol except IGRP or Enhanced IGRP [EIGRP]).
Router(config-route-map)# **set metric** *bandwidth delay reliability loading mtu*	Sets the metric value to give the redistributed routes (for IGRP or EIGRP only).
Router(config-route-map)# **set metric-type** {**internal** | **external** | **type-1** | **type-2**}	Sets the metric type to give redistributed routes.

Command	Purpose
Router(config-route-map)# **set metric-type internal**	Sets the Multi Exit Discriminator (MED) value on prefixes advertised to Exterior BGP neighbor to match the Interior Gateway Protocol (IGP) metric of the next hop.
Router(config-route-map)# **set tag** *tag-value*	Sets the tag value to associate with the redistributed routes.

See the "BGP Route Map Examples" section in the "Configuring BGP" chapter for examples of BGP route maps. See the "BGP Community with Route Maps Examples" section in the "Configuring BGP" chapter for examples of BGP communities and route maps.

To distribute routes from one routing domain into another and to control route redistribution, use the following commands in router configuration mode:

	Command	Purpose
Step 1	Router(config-router)# **redistribute** *protocol* [*process-id*] {**level-1** | **level-1-2** | **level-2**} [**metric** *metric-value*] [**metric-type** *type-value*] [**match internal** | **external** *type-value*] [**tag** *tag-value*] [**route-map** *map-tag*] [**subnets**]	Redistributes routes from one routing protocol to another routing protocol.
Step 2	Router(config-router)# **default-metric** *number*	Causes the current routing protocol to use the same metric value for all redistributed routes (BGP, OSPF, RIP).
Step 3	Router(config-router)# **default-metric** *bandwidth delay reliability loading mtu*	Causes the IGRP or Enhanced IGRP (EIGRP) routing protocol to use the same metric value for all non-IGRP redistributed routes.
Step 4	Router(config-router)# **no default-information** {**in** | **out**}	Disables the redistribution of default information between IGRP processes, which is enabled by default.

The metrics of one routing protocol do not necessarily translate into the metrics of another. For example, the RIP metric is a hop count and the IGRP metric is a combination of five quantities. In such situations, an artificial metric is assigned to the redistributed route. Because of this unavoidable tampering with dynamic information, carelessly exchanging routing information between different routing protocols can create routing loops, which can seriously degrade network operation.

Understanding Supported Metric Translations

This section describes supported automatic metric translations between the routing protocols. The following descriptions assume that you have not defined a default redistribution metric that replaces metric conversions:

- RIP can automatically redistribute static routes. It assigns static routes a metric of 1 (directly connected).
- BGP does not normally send metrics in its routing updates.

- IGRP can automatically redistribute static routes and information from other IGRP-routed autonomous systems. IGRP assigns static routes a metric that identifies them as directly connected. IGRP does not change the metrics of routes derived from IGRP updates from other autonomous systems.
- Note that any protocol can redistribute other routing protocols if a default metric is in effect.

Filtering Routing Information

To filter routing protocol information performing the tasks in the following sections. The tasks in the first section are required; the tasks in the remaining sections are optional:

- Preventing Routing Updates Through an Interface (Required)
- Controlling the Advertising of Routes in Routing Updates (Optional)
- Controlling the Processing of Routing Updates (Optional)
- Filtering Sources of Routing Information (Optional)

Note When routes are redistributed between OSPF processes, no OSPF metrics are preserved.

Preventing Routing Updates Through an Interface

To prevent other routers on a local network from learning about routes dynamically, you can keep routing update messages from being sent through a router interface. Keeping routing update messages from being sent through a router interface prevents other systems on the interface from learning about routes dynamically. This feature applies to all IP-based routing protocols except BGP.

OSPF and IS-IS behave somewhat differently. In OSPF, the interface address you specify as passive appears as a stub network in the OSPF domain. OSPF routing information is neither sent nor received through the specified router interface. In IS-IS, the specified IP addresses are advertised without actually running IS-IS on those interfaces.

To prevent routing updates through a specified interface, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# passive-interface interface-type interface-number`	Suppresses the sending of routing updates through the specified interface.

See the "Passive Interface Examples" section at the end of this chapter for examples of configuring passive interfaces.

Configuring Default Passive Interfaces

In Internet service provider (ISP) and large enterprise networks, many of the distribution routers have more than 200 interfaces. Before the introduction of the Default Passive Interface feature, there were two possibilities for obtaining routing information from these interfaces:

- Configure a routing protocol such as OSPF on the backbone interfaces and redistribute connected interfaces.
- Configure the routing protocol on all interfaces and manually set most of them as passive.

Network managers may not always be able to summarize type 5 link-state advertisements (LSAs) at the router level where redistribution occurs, as in the first possibility. Thus, a large number of type 5 LSAs can be flooded over the domain.

In the second possibility, large type 1 LSAs might be flooded into the area. The Area Border Router (ABR) creates type 3 LSAs, one for each type 1 LSA, and floods them to the backbone. It is possible, however, to have unique summarization at the ABR level, which will inject only one summary route into the backbone, thereby reducing processing overhead.

The prior solution to this problem was to configure the routing protocol on all interfaces and manually set the **passive-interface** router configuration command on the interfaces where adjacency was not desired. But in some networks, this solution meant coding 200 or more passive interface statements. With the Default Passive Interface feature, this problem is solved by allowing all interfaces to be set as passive by default using a single **passive-interface default** command, then configuring individual interfaces where adjacencies are desired using the **no passive-interface** command.

Thus, the Default Passive Interface feature simplifies the configuration of distribution routers and allows the network manager to obtain routing information from the interfaces in large ISP and enterprise networks.

To set all interfaces as passive by default and then activate only those interfaces that need to have adjacencies set, use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	`Router(config)#` **`router`** *`protocol`*	Configures the routing protocol on the network.
Step 2	`Router(config-router)#` **`passive-interface default`**	Sets all interfaces as passive by default.
Step 3	`Router(config-router)#` **`no passive-interface`** *`interface-type`*	Activates only those interfaces that need to have adjacencies set.
Step 4	`Router(config-router)#` **`network`** *`network-address`* `[`*`options`*`]`	Specifies the list of networks for the routing process. The *network-address* argument is an IP address written in dotted decimal notation—172.24.101.14, for example.

See the section "Default Passive Interface Example" at the end of this chapter for an example of a default passive interface.

To verify that interfaces on your network have been set to passive, you could enter a network monitoring command such as the **show ip ospf interface** EXEC command, or you could verify the interfaces you enabled as active using a command such as the **show ip interface** EXEC command.

Controlling the Advertising of Routes in Routing Updates

To prevent other routers from learning one or more routes, you can suppress routes from being advertised in routing updates. Suppressing routes in route updates prevents other routers from learning the interpretation of a particular device of one or more routes. You cannot specify an interface name in OSPF. When used for OSPF, this feature applies only to external routes.

To suppress routes from being advertised in routing updates, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)#` **`distribute-list`** {*`access-list-number`* | *`access-list-name`*} **`out`** [*`interface-name`* | *`routing-process`* | *`as-number`*]	Permits or denies routes from being advertised in routing updates depending upon the action listed in the access list.

Controlling the Processing of Routing Updates

You might want to avoid processing certain routes listed in incoming updates. This feature does not apply to OSPF or IS-IS. To suppress routes in incoming updates, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)#` **`distribute-list`** {*`access-list-number`* | *`access-list-name`*} **`in`** [*`interface-type interface-number`*]	Suppresses routes listed in updates from being processed.

Filtering Sources of Routing Information

Filtering sources of routing information prioritizes routing information from different sources, because some pieces of routing information may be more accurate than others. An *administrative distance* is a rating of the trustworthiness of a routing information source, such as an individual router or a group of routers. In a large network, some routing protocols and some routers can be more reliable than others as sources of routing information. Also, when multiple routing processes are running in the same router for IP, it is possible for the same route to be advertised by more than one routing process. By specifying administrative distance values, you enable the router to intelligently discriminate between sources of routing information. The router will always pick the route whose routing protocol has the lowest administrative distance.

To filter sources of routing information, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)#` **`distance`** {*`ip-address`* {*`wildcard-mask`*}} [*`ip-standard-list`*] [*`ip-extended`*]	Filters on routing information sources.

There are no general guidelines for assigning administrative distances because each network has its own requirements. You must determine a reasonable matrix of administrative distances for the network as a whole. Table 9 shows the default administrative distance for various routing information sources.

For example, consider a router using IGRP and RIP. Suppose you trust the IGRP-derived routing information more than the RIP-derived routing information. In this example, because the default IGRP administrative distance is lower than the default RIP administrative distance, the router uses the IGRP-derived information and ignores the RIP-derived information. However, if you lose the source of the IGRP-derived information (because of a power shutdown in another building, for example), the router uses the RIP-derived information until the IGRP-derived information reappears.

For an example of filtering on sources of routing information, see the section "Administrative Distance Examples" later in this chapter.

Note You also can use administrative distance to rate the routing information from routers running the same routing protocol. This application is generally discouraged if you are unfamiliar with this particular use of administrative distance, because it can result in inconsistent routing information, including forwarding loops.

Note The weight of a route can no longer be set with the **distance** command. To set the weight for a route, use a route-map.

Enabling Policy Routing

Policy routing is a more flexible mechanism for routing packets than destination routing. It is a process whereby the router puts packets through a route map before routing them. The route map determines which packets are routed to which router next. You might enable policy routing if you want certain packets to be routed some way other than the obvious shortest path. Possible applications for policy routing are to provide equal access, protocol-sensitive routing, source-sensitive routing, routing based on interactive versus batch traffic, and routing based on dedicated links.

To enable policy routing, you must identify which route map to use for policy routing and create the route map. The route map itself specifies the match criteria and the resulting action if all of the match clauses are met. These steps are described in the following task tables.

To enable policy routing on an interface, indicate which route map the router should use by using the following command in interface configuration mode. All packets arriving on the specified interface will be subject to policy routing. This command disables fast switching of all packets arriving on this interface.

Command	Purpose
`Router(config-if)# ip policy route-map map-tag`	Identifies the route map to use for policy routing.

To define the route map to be used for policy routing, use the following command in global configuration mode:

Command	Purpose
`Router(config)# route-map map-tag [permit	deny] [sequence-number]`	Defines a route map to control where packets are output.

To define the criteria by which packets are examined to learn if they will be policy-routed, use either one or both of the following commands in route-map configuration mode. No match clause in the route map indicates all packets.

Command	Purpose
Router(config-route-map)# **match length** *minimum-length maximum-length*	Matches the Level 3 length of the packet.
Router(config-route-map)# **match ip address** {*access-list-number* | *access-list-name*} [*access-list-number* | *access-list-name*]	Matches the destination IP address that is permitted by one or more standard or extended access lists.

To set the precedence and specify where the packets that pass the match criteria are output, use the following commands in route-map configuration mode:

	Command	Purpose
Step 1	Router(config-route-map)# **set ip precedence** *number* | *name*	Sets the precedence value in the IP header.
Step 2	Router(config-route-map)# **set ip next-hop** *ip-address* [*ip-address*]	Specifies the next hop to which to route the packet. (It must be an adjacent router).
Step 3	Router(config-route-map)# **set interface** *interface-type interface-number* [... *interface-type interface-number*]	Specifies the output interface for the packet.
Step 4	Router(config-route-map)# **set ip default next-hop** *ip-address* [*ip-address*]	Specifies the next hop to which to route the packet, if there is no explicit route for this destination. **Note** Like the **set ip next-hop** command, the **set ip default next-hop** command needs to specify an adjacent router.
Step 5	Router(config-route-map)# **set default interface** *interface-type interface-number* [... *interface-type interface-number*]	Specifies the output interface for the packet, if there is no explicit route for this destination.

Note The **set ip next-hop** and **set ip default next-hop** are similar commands but have a different order of operations. Configuring the **set ip next-hop** command causes the system to use policy routing first and then use the routing table. Configuring the **set ip default next-hop** causes the system to use the routing table first and then policy route the specified next hop.

The precedence setting in the IP header determines whether, during times of high traffic, the packets will be treated with more or less precedence than other packets. By default, the Cisco IOS software leaves this value untouched; the header remains with the precedence value it had.

The precedence bits in the IP header can be set in the router when policy routing is enabled. When the packets containing those headers arrive at another router, the packets are ordered for transmission according to the precedence set, if the queueing feature is enabled. The router does not honor the precedence bits if queueing is not enabled; the packets are sent in FIFO order.

You can change the precedence setting, using either a number or name. The names came from RFC 791, but are evolving. You can enable other features that use the values in the **set ip precedence** route-map configuration command to determine precedence. Table 10 lists the possible numbers and their corresponding name, from least important to most important.

Table 10 IP Precedence Values

Number	Name
0	routine
1	priority
2	immediate
3	flash
4	flash-override
5	critical
6	internet
7	network

The **set** commands can be used with each other. They are evaluated in the order shown in the previous task table. A usable next hop implies an interface. Once the local router finds a next hop and a usable interface, it routes the packet.

To display the cache entries in the policy route cache, use the **show ip cache policy** EXEC command.

If you want policy routing to be fast switched, see the following section "Enabling Fast-Switched Policy Routing."

See the "Policy Routing Example" section at the end of this chapter for an example of policy routing.

Enabling Fast-Switched Policy Routing

IP policy routing can now be fast switched. Prior to fast-switched policy routing, policy routing could only be process switched, which meant that on most platforms, the switching rate was approximately 1000 to 10,000 packets per second. Such rates were not fast enough for many applications. Users that need policy routing to occur at faster speeds can now implement policy routing without slowing down the router.

Fast-switched policy routing supports all of the **match** commands and most of the **set** commands, except for the following restrictions:

- The **set ip default** command is not supported.
- The **set interface** command is supported only over point-to-point links, unless a route cache entry exists using the same interface specified in the **set interface** command in the route map. Also, at the process level, the routing table is consulted to determine if the interface is on a reasonable path to the destination. During fast switching, the software does not make this check. Instead, if the packet matches, the software blindly forwards the packet to the specified interface.

Policy routing must be configured before you configure fast-switched policy routing. Fast switching of policy routing is disabled by default. To have policy routing be fast switched, use the following command in interface configuration mode:

Command	Purpose
`Router(config-if)# ip route-cache policy`	Enables fast switching of policy routing.

Enabling Local Policy Routing

Packets that are generated by the router are not normally policy routed. To enable local policy routing for such packets, indicate which route map the router should use by using the following command in global configuration mode. All packets originating on the router will then be subject to local policy routing.

Command	Purpose
`Router(config)# ip local policy route-map map-tag`	Identifies the route map to use for local policy routing.

Use the **show ip local policy** EXEC command to display the route map used for local policy routing, if one exists.

Enabling NetFlow Policy Routing

NetFlow policy routing (NPR) integrates policy routing, which enables traffic engineering and traffic classification, with NetFlow services, which provide billing, capacity planning, and monitoring information on real-time traffic flows. IP policy routing now works with Cisco Express Forwarding (CEF), distributed CEF (dCEF), NetFlow, and NetFlow flow acceleration.

As quality of service (QoS) and traffic engineering become more popular, so does interest in the ability of policy routing to selectively set IP Precedence and type of service (ToS) bits (based on access lists and packet size), thereby routing packets based on predefined policy. It is important that policy routing work well in large, dynamic routing environments. Hence, distributed support allows customers to leverage their investment in distributed architecture.

NetFlow policy routing leverages the following technologies:

- CEF, which looks at a Forwarding Information Base (FIB) instead of a routing table when switching packets, to address maintenance problems of a demand caching scheme.
- dCEF, which addresses the scalability and maintenance problems of a demand caching scheme.
- NetFlow, which allows accounting, capacity planning, traffic monitoring, and flow-accelerating specific applications.

Following are NPR benefits:

- NPR takes advantage of the new switching services. CEF, dCEF, and NetFlow can now use policy routing.
- Now that policy routing is integrated into CEF, policy routing can be deployed on a wide scale and on high-speed interfaces.

Following are NPR restrictions:

- NPR is only available on Cisco IOS platforms that support CEF.
- Distributed FIB-based policy routing is only available on platforms that support dCEF.
- The Cisco 12000 platform currently is not supported.

- Policy routing will not be flow accelerated if any match packet-size clause of a route map is configured. Because packet size is not part of a flow definition, a policy routing decision cannot be based on a flow entry.
- The **set ip next-hop verify-availability** route-map configuration command of route-map is not supported in dCEF because dCEF does not support the Cisco Discovery Protocol (CDP) database.

In order for NetFlow policy routing to work, the following features must already be configured:

- CEF, dCEF, or NetFlow
- Policy routing

To configure CEF, dCEF, or NetFlow, refer to the appropriate chapter of the *Cisco IOS Switching Services Configuration Guide*.

NPR is the default policy routing mode. No additional configuration tasks are required to enable policy routing in conjunction with CEF, dCEF, or NetFlow. As soon as one of these features is turned on, packets are automatically subject to policy routing in the appropriate switching path.

There is one new, optional configuration command (**set ip next-hop verify-availability**). This command has the following restrictions:

- It can cause some performance degradation due to CDP database lookup overhead per packet.
- CDP must be enabled on the interface.
- The directly connected next hop must be a Cisco device with CDP enabled.
- It is supported in NetFlow accelerated policy routing, but not available in dCEF, due to the dependency of the CDP neighbor database.

It is assumed that policy routing itself is already configured.

If the router is policy routing packets to the next hop and the next hop happens to be down, the router will try unsuccessfully to use Address Resolution Protocol (ARP) for the next hop (which is down). This behavior will continue forever.

To prevent this situation, you can configure the router to first verify that the next hops of the route map are CDP neighbors of the router before routing to that next hop.

This task is optional because some media or encapsulations do not support CDP, or it may not be a Cisco device that is sending the router traffic.

To configure the router to verify that the next hop is a CDP neighbor before the router tries to policy route to it, use the following command in route-map configuration mode:

Command	Purpose
`Router(config-route-map)# set ip next-hop verify-availability`	Causes the router to confirm that the next hops of the route map are CDP neighbors of the router.

If the command shown is set and the next hop is not a CDP neighbor, the router looks to the subsequent next hop, if there is one. If there is none, the packets simply are not policy routed.

If the command shown is not set, the packets are either policy routed or remain forever unrouted.

If you want to selectively verify availability of only some next hops, you can configure different route-map entries (under the same route map name) with different criteria (using access list matching or packet size matching), and use the **set ip next-hop verify-availability** configuration command selectively.

Typically, you would use existing policy routing and NetFlow **show** EXCEC commands to monitor these features. For more information on these **show** commands, refer to the "IP Routing Protocol-Independent Commands" chapter of the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols* publication for policy routing commands and the appropriate chapter of the *Cisco IOS Switching Services Command Reference* publication for NetFlow commands.

To display the route map Inter Processor Communication (IPC) message statistics in the Route Processor (RP) or Versatile Interface Processor (VIP), use the following command in EXEC mode:

Command	Purpose
Router# **show route-map ipc**	Displays the route map IPC message statistics in the RP or VIP.

Managing Authentication Keys

Key management is a method of controlling authentication keys used by routing protocols. Not all protocols can use key management. Authentication keys are available for Director Response Protocol (DRP) Agent, Enhanced IGRP (EIGRP), and RIP Version 2.

Before you manage authentication keys, authentication must be enabled. See the appropriate protocol chapter to learn how to enable authentication for that protocol.

To manage authentication keys, define a key chain, identify the keys that belong to the key chain, and specify how long each key is valid. Each key has its own key identifier (specified with the **key** key chain configuration command), which is stored locally. The combination of the key identifier and the interface associated with the message uniquely identifies the authentication algorithm and Message Digest 5 (MD5) authentication key in use.

You can configure multiple keys with lifetimes. Only one authentication packet is sent, regardless of how many valid keys exist. The software examines the key numbers in order from lowest to highest, and uses the first valid key it encounters. The lifetimes allow for overlap during key changes. Note that the router must know the time. Refer to the Network Time Protocol (NTP) and calendar commands in the "Performing Basic System Management" chapter of the *Cisco IOS Configuration Fundamentals Configuration Guide*.

To manage authentication keys, use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)#**key chain** *name-of-chain*	Identifies a key chain.
Step 2	Router(config-keychain)# **key** *number*	Identifies the key number in key chain configuration mode.
Step 3	Router(config-keychain-key)# **key-string** *text*	Identifies the key string in key chain configuration mode.
Step 4	Router(config-keychain-key)# **accept-lifetime** *start-time* {**infinite** | *end-time* | **duration** *seconds*}]	Specifies the time period during which the key can be received.
Step 5	Router(config-keychain-key)# **send-lifetime** *start-time* {**infinite** | *end-time* | **duration** *seconds*}	Specifies the time period during which the key can be sent.

Use the **show key chain** EXEC command to display key chain information. For examples of key management, see the "Key Management Examples" section at the end of this chapter.

Monitoring and Maintaining the IP Network

You can remove all contents of a particular cache, table, or database. You also can display specific statistics. The following sections describe each of these tasks.

Clearing Routes from the IP Routing Table

You can remove all contents of a particular table. Clearing a table can become necessary when the contents of the particular structure have become, or are suspected to be, invalid.

To clear one or more routes from the IP routing table, use the following command in EXEC mode:

Command	Purpose
`Router# clear ip route {network [mask] | *}`	Clears one or more routes from the IP routing table.

Displaying System and Network Statistics

You can display specific statistics such as the contents of IP routing tables, caches, and databases. Information provided can be used to determine resource utilization and solve network problems. You can also display information about node reachability and discover the routing path packets leaving your device are taking through the network.

To display various routing statistics, use the following commands in EXEC mode, as needed:

Command	Purpose
`Router# show ip cache policy`	Displays the cache entries in the policy route cache.
`Router# show ip local policy`	Displays the local policy route map if one exists.
`Router# show ip policy`	Displays policy route maps.
`Router# show ip protocols`	Displays the parameters and current state of the active routing protocol process.
`Router# show ip route [address [mask] [longer-prefixes]] | [protocol [process-id]]`	Displays the current state of the routing table.
`Router# show ip route summary`	Displays the current state of the routing table in summary form.
`Router# show ip route supernets-only`	Displays supernets.
`Router# show key chain [name-of-chain]`	Displays authentication key information.
`Router# show route-map [map-name]`	Displays all route maps configured or only the one specified.

IP Routing Protocol-Independent Configuration Examples

The following sections provide routing protocol-independent configuration examples:

- Variable-Length Subnet Mask Example
- Overriding Static Routes with Dynamic Protocols Example
- Administrative Distance Examples
- Static Routing Redistribution Example
- IGRP Redistribution Example
- RIP and IGRP Redistribution Example
- EIGRP Redistribution Examples
- RIP and EIGRP Redistribution Examples
- OSPF Routing and Route Redistribution Examples
- Default Metric Values Redistribution Example
- Route Map Examples
- Passive Interface Examples
- Policy Routing Example
- NetFlow Policy Routing Example
- Key Management Examples

Variable-Length Subnet Mask Example

In the following example, a 14-bit subnet mask is used, leaving two bits of address space reserved for serial line host addresses. There is sufficient host address space for two host endpoints on a point-to-point serial link.

```
interface ethernet 0
 ip address 131.107.1.1 255.255.255.0
! 8 bits of host address space reserved for ethernets

interface serial 0
 ip address 131.107.254.1 255.255.255.252
! 2 bits of address space reserved for serial lines

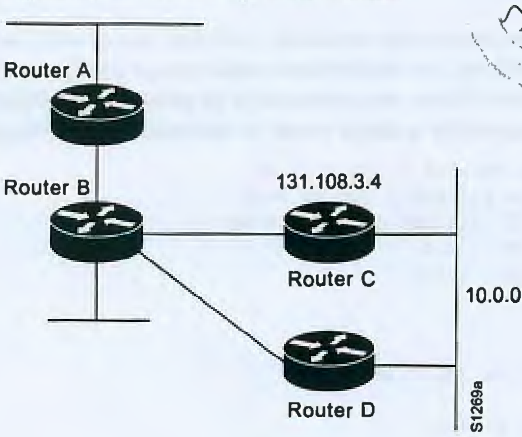
! Router is configured for OSPF and assigned AS 107
router ospf 107
! Specifies network directly connected to the router
 network 131.107.0.0 0.0.255.255 area 0.0.0.0
```

Overriding Static Routes with Dynamic Protocols Example

In the following example, packets for network 10.0.0.0 from Router B (where the static route is installed) will be routed through 131.108.3.4 if a route with an administrative distance less than 110 is not available. Figure 60 illustrates this example. The route learned by a protocol with an administrative distance of less than 110 might cause Router B to send traffic destined for network 10.0.0.0 via the alternate path—through Router D.

```
ip route 10.0.0.0 255.0.0.0 131.108.3.4 110
```

Figure 60 Overriding Static Routes



Administrative Distance Examples

In the following example, the **router igrp** global configuration command sets up IGRP routing in autonomous system 109. The **network** router configuration commands specify IGRP routing on networks 192.31.7.0 and 128.88.0.0. The first **distance** router configuration command sets the default administrative distance to 255, which instructs the router to ignore all routing updates from routers for which an explicit distance has not been set. The second **distance** command sets the administrative distance to 90 for all routers on the Class C network 192.31.7.0. The third **distance** command sets the administrative distance to 120 for the router with the address 128.88.1.3.

```
router igrp 109
 network 192.31.7.0
 network 128.88.0.0
 distance 255
 distance 90 192.31.7.0 0.0.0.255
 distance 120 128.88.1.3 0.0.0.0
```

The following example assigns the router with the address 192.31.7.18 an administrative distance of 100, and all other routers on subnet 192.31.7.0 an administrative distance of 200:

```
distance 100 192.31.7.18 0.0.0.0
distance 200 192.31.7.0 0.0.0.255
```

However, if you reverse the order of these commands, all routers on subnet 192.31.7.0 are assigned an administrative distance of 200, including the router at address 192.31.7.18:

```
distance 200 192.31.7.0 0.0.0.255
distance 100 192.31.7.18 0.0.0.0
```

Assigning administrative distances is a problem unique to each network and is done in response to the greatest perceived threats to the connected network. Even when general guidelines exist, the network manager must ultimately determine a reasonable matrix of administrative distances for the network as a whole.

In the following example, the distance value for IP routes learned is 90. Preference is given to these IP routes rather than routes with the default administrative distance value of 110.

```
router isis
 distance 90 ip
```

Static Routing Redistribution Example

In the example that follows, three static routes are specified, two of which are to be advertised. The static routes are created by specifying the **redistribute static** router configuration command, then specifying an access list that allows only those two networks to be passed to the IGRP process. Any redistributed static routes should be sourced by a single router to minimize the likelihood of creating a routing loop.

```
ip route 192.1.2.0 255.255.255.0 192.31.7.65
ip route 193.62.5.0 255.255.255.0 192.31.7.65
ip route 131.108.0.0 255.255.255.0 192.31.7.65
access-list 3 permit 192.1.2.0
access-list 3 permit 193.62.5.0
!
router igrp 109
 network 192.31.7.0
 default-metric 10000 100 255 1 1500
 redistribute static
 distribute-list 3 out static
```

7407
3

IGRP Redistribution Example

Each IGRP routing process can provide routing information to only one autonomous system; the Cisco IOS software must run a separate IGRP process and maintain a separate routing database for each autonomous system it services. However, you can transfer routing information between these routing databases.

Suppose the router has one IGRP routing process for network 15.0.0.0 in autonomous system 71 and another for network 192.31.7.0 in autonomous system 109, as the following commands specify:

```
router igrp 71
 network 15.0.0.0
router igrp 109
 network 192.31.7.0
```

To transfer a route to 192.31.7.0 into autonomous system 71 (without passing any other information about autonomous system 109), use the command in the following example:

```
router igrp 71
 redistribute igrp 109
 distribute-list 3 out igrp 109
access-list 3 permit 192.31.7.0
```

RIP and IGRP Redistribution Example

Consider a WAN at a university that uses RIP as an interior routing protocol. Assume that the university wants to connect its WAN to a regional network, 128.1.0.0, which uses IGRP as the routing protocol. The goal in this case is to advertise the networks in the university network to the routers on the regional network. The commands for the interconnecting router are listed in the example that follows:

```
router igrp 109
 network 128.1.0.0
 redistribute rip
 default-metric 10000 100 255 1 1500
 distribute-list 10 out rip
```

In this example, the **router** global configuration command starts an IGRP routing process. The **network** router configuration command specifies that network 128.1.0.0 (the regional network) is to receive IGRP routing information. The **redistribute** router configuration command specifies that RIP-derived routing information be advertised in the routing updates. The **default-metric** router configuration command assigns an IGRP metric to all RIP-derived routes.

The **distribute-list** router configuration command instructs the Cisco IOS software to use access list 10 (not defined in this example) to limit the number of entries in each outgoing update. The access list prevents unauthorized advertising of university routes to the regional network.

EIGRP Redistribution Examples

Each Enhanced IGRP (EIGRP) routing process provides routing information to only one autonomous system. The Cisco IOS software must run a separate EIGRP process and maintain a separate routing database for each autonomous system it services. However, you can transfer routing information between these routing databases.

Suppose the software has one EIGRP routing process for network 15.0.0.0 in autonomous system 71 and another for network 192.31.7.0 in autonomous system 109, as the following commands specify:

```
router eigrp 71
 network 15.0.0.0
router eigrp 109
 network 192.31.7.0
```

To transfer a route from 192.31.7.0 into autonomous system 71 (without passing any other information about autonomous system 109), use the command in the following example:

```
router eigrp 71
 redistribute eigrp 109 route-map 109-to-71
 route-map 109-to-71 permit
 match ip address 3
 set metric 10000 100 1 255 1500
access-list 3 permit 192.31.7.0
```

The following example is an alternative way to transfer a route to 192.31.7.0 into autonomous system 71. Unlike the previous configuration, this one does not allow you to arbitrarily set the metric.

```
router eigrp 71
 redistribute eigrp 109
 distribute-list 3 out eigrp 109
access-list 3 permit 192.31.7.0
```

RIP and EIGRP Redistribution Examples

This section provides a simple RIP redistribution example and a complex redistribution example between Enhanced IGRP (EIGRP) and BGP.

Simple Redistribution Example

Consider a WAN at a university that uses RIP as an interior routing protocol. Assume that the university wants to connect its WAN to a regional network, 128.1.0.0, which uses Enhanced IGRP (EIGRP) as the routing protocol. The goal in this case is to advertise the networks in the university network to the routers on the regional network.

The commands for the interconnecting router are listed in the example that follows:

```
router eigrp 109
 network 128.1.0.0
 redistribute rip
 default-metric 10000 100 255 1 1500
 distribute-list 10 out rip
```

In this example, the **router** global configuration command starts an EIGRP routing process. The **network** router configuration command specifies that network 128.1.0.0 (the regional network) is to send and receive EIGRP routing information. The **redistribute** router configuration command specifies that RIP-derived routing information be advertised in the routing updates. The **default-metric** router configuration command assigns an EIGRP metric to all RIP-derived routes.

The **distribute-list** router configuration command instructs the Cisco IOS software to use access list 10 (not defined in this example) to limit the entries in each outgoing update. The access list prevents unauthorized advertising of university routes to the regional network.

Complex Redistribution Example

The most complex redistribution case is one in which *mutual* redistribution is required between an IGP (in this case EIGRP) and BGP.

Suppose that BGP is running on a router somewhere else in autonomous system 1, and that the BGP routes are injected into EIGRP routing process 1. You must use filters to ensure that the proper routes are advertised. The example configuration for router R1 illustrates use of access filters and a distribution list to filter routes advertised to BGP neighbors. This example also illustrates configuration commands for redistribution between BGP and EIGRP.

```
! Configuration for router R1:
router bgp 1
 network 131.108.0.0
 neighbor 192.5.10.1 remote-as 2

```

OSPF Routing and Route Redistribution Examples

OSPF typically requires coordination among many internal routers, ABRs, and Autonomous System Boundary Routers (ASBRs). At a minimum, OSPF-based routers can be configured with all default parameter values, with no authentication, and with interfaces assigned to areas.

Three types of examples follow:

- The first examples are simple configurations illustrating basic OSPF commands.
- The second example illustrates a configuration for an internal router, ABR, and ASBRs within a single, arbitrarily assigned, OSPF autonomous system.
- The third example illustrates a more complex configuration and the application of various tools available for controlling OSPF-based routing environments.

Basic OSPF Configuration Examples

The following example illustrates a simple OSPF configuration that enables OSPF routing process 9000, attaches Ethernet interface 0 to area 0.0.0.0, and redistributes RIP into OSPF, and OSPF into RIP:

```
interface ethernet 0
 ip address 130.93.1.1 255.255.255.0
 ip ospf cost 1
!
interface ethernet 1
 ip address 130.94.1.1 255.255.255.0
!
router ospf 9000
 network 130.93.0.0 0.0.255.255 area 0.0.0.0
 redistribute rip metric 1 subnets
!
router rip
 network 130.94.0.0
 redistribute ospf 9000
 default-metric 1
```

The following example illustrates the assignment of four area IDs to four IP address ranges. In the example, OSPF routing process 109 is initialized, and four OSPF areas are defined: 10.9.50.0, 2, 3, and 0. Areas 10.9.50.0, 2, and 3 mask specific address ranges, while area 0 enables OSPF for *all other* networks.

```
router ospf 109
 network 131.108.20.0 0.0.0.255 area 10.9.50.0
 network 131.108.0.0 0.0.255.255 area 2
 network 131.109.10.0 0.0.0.255 area 3
 network 0.0.0.0 255.255.255.255 area 0
!
! Interface Ethernet0 is in area 10.9.50.0:
interface ethernet 0
 ip address 131.108.20.5 255.255.255.0
!
! Interface Ethernet1 is in area 2:
interface ethernet 1
 ip address 131.108.1.5 255.255.255.0
!
! Interface Ethernet2 is in area 2:
interface ethernet 2
 ip address 131.108.2.5 255.255.255.0
!
! Interface Ethernet3 is in area 3:
interface ethernet 3
 ip address 131.109.10.5 255.255.255.0
!
! Interface Ethernet4 is in area 0:
interface ethernet 4
 ip address 131.109.1.1 255.255.255.0
!
```

7403
6

```
! Interface Ethernet5 is in area 0:
interface ethernet 5
 ip address 10.1.0.1 255.255.0.0
```

Each **network** router configuration command is evaluated sequentially, so the specific order of these commands in the configuration is important. The Cisco IOS software sequentially evaluates the address/wildcard-mask pair for each interface. See the "IP Routing Protocols Commands" chapter of the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols* publication for more information.

Consider the first **network** command. Area ID 10.9.50.0 is configured for the interface on which subnet 131.108.20.0 is located. Assume that a match is determined for interface Ethernet 0. Interface Ethernet 0 is attached to Area 10.9.50.0 only.

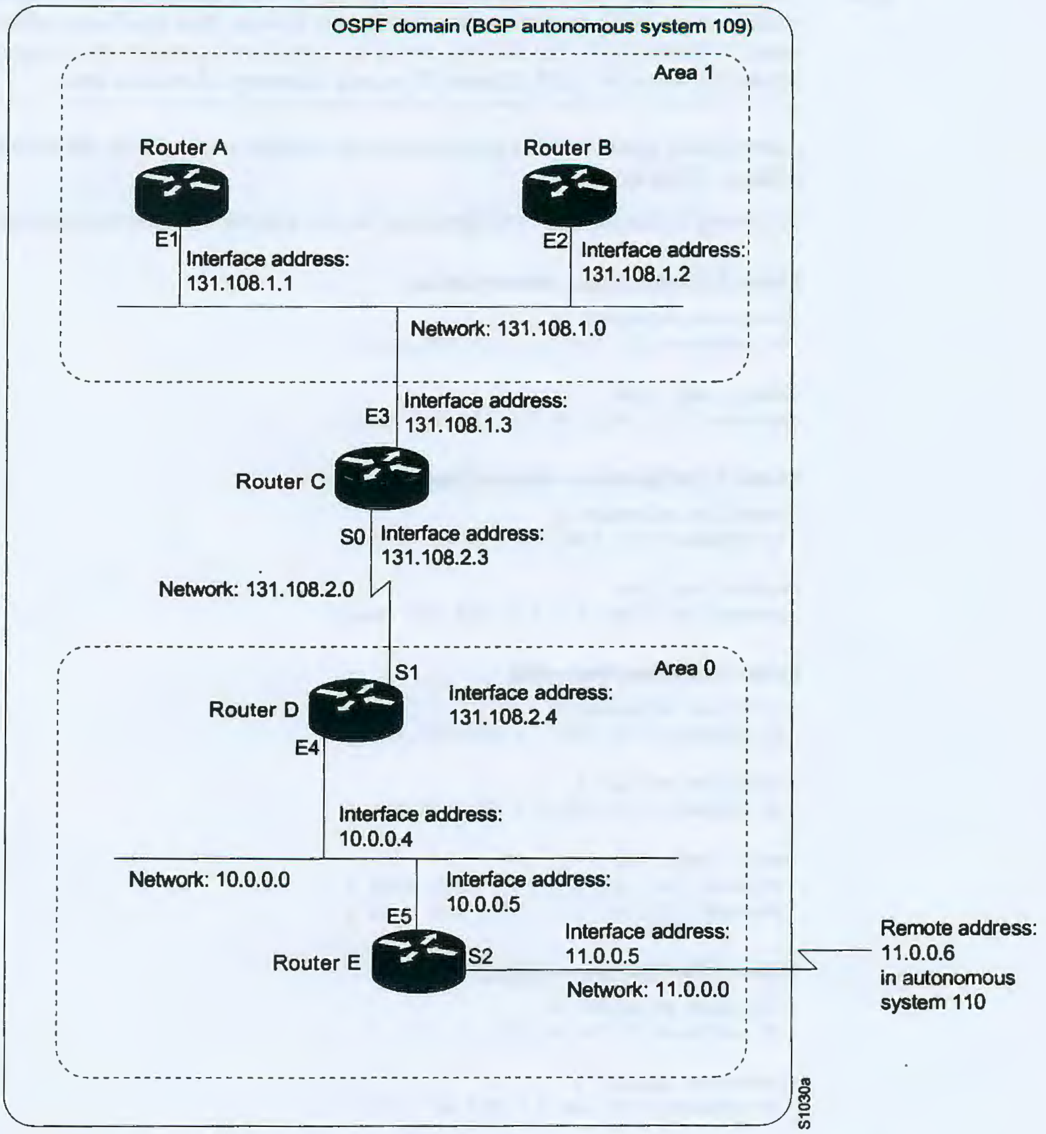
The second **network** command is evaluated next. For Area 2, the same process is then applied to all interfaces (except interface Ethernet 0). Assume that a match is determined for interface Ethernet 1. OSPF is then enabled for that interface and Ethernet 1 is attached to Area 2.

This process of attaching interfaces to OSPF areas continues for all **network** commands. Note that the last **network** command in this example is a special case. With this command, all available interfaces (not explicitly attached to another area) are attached to Area 0.

Internal Router, ABR, and ASBRs Configuration Example

Figure 61 provides a general network map that illustrates a sample configuration for several routers within a single OSPF autonomous system.

Figure 61 Example OSPF Autonomous System Network Map



In this configuration, five routers are configured in OSPF autonomous system 109:

- Router A and Router B are both internal routers within area 1.
- Router C is an OSPF ABR. Note that for Router C, area 1 is assigned to E3 and Area 0 is assigned to S0.
- Router D is an internal router in area 0 (backbone area). In this case, both **network** router configuration commands specify the same area (area 0, or the backbone area).
- Router E is an OSPF ASBR. Note that BGP routes are redistributed into OSPF and that these routes are advertised by OSPF.

7401
3

Note It is not necessary to include definitions of all areas in an OSPF autonomous system in the configuration of all routers in the autonomous system. You must only define the *directly* connected areas. In the example that follows, routes in Area 0 are learned by the routers in area 1 (Router A and Router B) when the ABR (Router C) injects summary LSAs into area 1.

Autonomous system 109 is connected to the outside world via the BGP link to the external peer at IP address 11.0.0.6.

Following is the example configuration for the general network map shown in Figure 61.

Router A Configuration—Internal Router

```
interface ethernet 1
 ip address 131.108.1.1 255.255.255.0

router ospf 109
 network 131.108.0.0 0.0.255.255 area 1
```

Router B Configuration—Internal Router

```
interface ethernet 2
 ip address 131.108.1.2 255.255.255.0

router ospf 109
 network 131.108.0.0 0.0.255.255 area 1
```

Router C Configuration—ABR

```
interface ethernet 3
 ip address 131.108.1.3 255.255.255.0

interface serial 0
 ip address 131.108.2.3 255.255.255.0

router ospf 109
 network 131.108.1.0 0.0.0.255 area 1
 network 131.108.2.0 0.0.0.255 area 0
```

Router D Configuration—Internal Router

```
interface ethernet 4
 ip address 10.0.0.4 255.0.0.0

interface serial 1
 ip address 131.108.2.4 255.255.255.0

router ospf 109
 network 131.108.2.0 0.0.0.255 area 0
 network 10.0.0.0 0.255.255.255 area 0
```

Router E Configuration—ASBR

```
interface ethernet 5
 ip address 10.0.0.5 255.0.0.0

interface serial 2
 ip address 11.0.0.5 255.0.0.0

router ospf 109
 network 10.0.0.0 0.255.255.255 area 0
 redistribute bgp 109 metric 1 metric-type 1
```

```
router bgp 109
 network 131.108.0.0
 network 10.0.0.0
 neighbor 11.0.0.6 remote-as 110
```

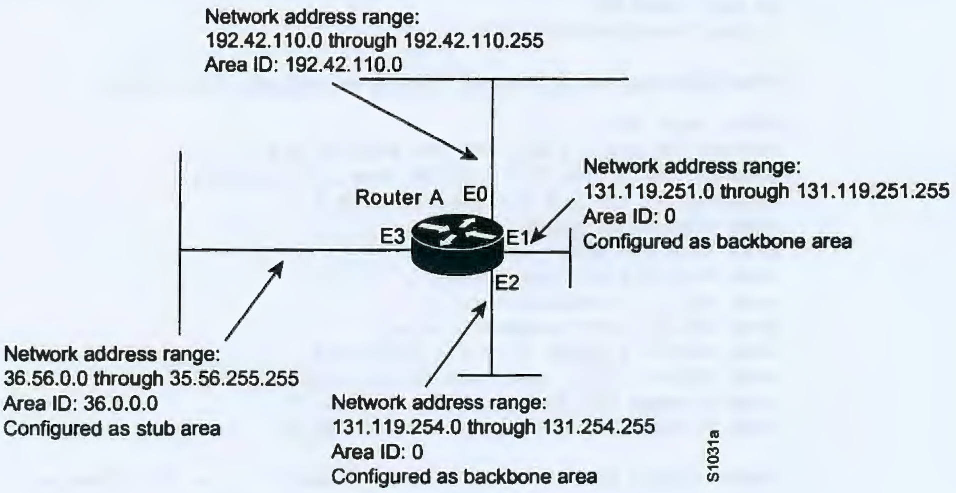
Complex OSPF Configuration Example

The following example configuration accomplishes several tasks in setting up an ABR. These tasks can be split into two general categories:

- Basic OSPF configuration
- Route redistribution

The specific tasks outlined in this configuration are detailed briefly in the following descriptions. Figure 62 illustrates the network address ranges and area assignments for the interfaces.

Figure 62 Interface and Area Specifications for OSPF Configuration Example



The basic configuration tasks in this example are as follows:

- Configure address ranges for Ethernet interface 0 through Ethernet interface 3.
- Enable OSPF on each interface.
- Set up an OSPF authentication password for each area and network.
- Assign link-state metrics and other OSPF interface configuration options.
- Create a *stub area* with area ID 36.0.0.0. (Note that the **authentication** and **stub** options of the **area** router configuration command are specified with separate **area** command entries, but can be merged into a single **area** command.)
- Specify the backbone area (area 0).

Configuration tasks associated with redistribution are as follows:

- Redistribute IGRP and RIP into OSPF with various options set (including **metric-type**, **metric**, **tag**, and **subnet**).
- Redistribute IGRP and OSPF into RIP.

The following is an example OSPF configuration:

```
interface ethernet 0
 ip address 192.42.110.201 255.255.255.0
 ip ospf authentication-key abcdefgh
 ip ospf cost 10
!
interface ethernet 1
 ip address 131.119.251.201 255.255.255.0
 ip ospf authentication-key ijklmnop
 ip ospf cost 20
 ip ospf retransmit-interval 10
 ip ospf transmit-delay 2
 ip ospf priority 4
!
interface ethernet 2
 ip address 131.119.254.201 255.255.255.0
 ip ospf authentication-key abcdefgh
 ip ospf cost 10
!
interface ethernet 3
 ip address 36.56.0.201 255.255.0.0
 ip ospf authentication-key ijklmnop
 ip ospf cost 20
 ip ospf dead-interval 80
```

In the following configuration, OSPF is on network 131.119.0.0:

```
router ospf 201
 network 36.0.0.0 0.255.255.255 area 36.0.0.0
 network 192.42.110.0 0.0.0.255 area 192.42.110.0
 network 131.119.0.0 0.0.255.255 area 0
 area 0 authentication
 area 36.0.0.0 stub
 area 36.0.0.0 authentication
 area 36.0.0.0 default-cost 20
 area 192.42.110.0 authentication
 area 36.0.0.0 range 36.0.0.0 255.0.0.0
 area 192.42.110.0 range 192.42.110.0 255.255.255.0
 area 0 range 131.119.251.0 255.255.255.0
 area 0 range 131.119.254.0 255.255.255.0

 redistribute igrp 200 metric-type 2 metric 1 tag 200 subnets
 redistribute rip metric-type 2 metric 1 tag 200
```

In the following configuration IGRP autonomous system 200 is on 131.119.0.0:

```
router igrp 200
 network 131.119.0.0
!
! RIP for 192.42.110
!
router rip
 network 192.42.110.0
 redistribute igrp 200 metric 1
 redistribute ospf 201 metric 1
```

Default Metric Values Redistribution Example

The following example shows a router in autonomous system 109 using both RIP and IGRP. The example advertises IGRP-derived routes using RIP and assigns the IGRP-derived routes a RIP metric of 10.

```
router rip
 default-metric 10
 redistribute igrp 109
```

Route Map Examples

The examples in this section illustrate the use of redistribution, with and without route maps. Examples from both the IP and Connectionless Network Service (CLNS) routing protocols are given.

The following example redistributes all OSPF routes into IGRP:

```
router igrp 109
 redistribute ospf 110
```

The following example redistributes RIP routes with a hop count equal to 1 into OSPF. These routes will be redistributed into OSPF as external LSAs with a metric of 5, metric a type of type 1, and a tag equal to 1.

```
router ospf 109
 redistribute rip route-map rip-to-ospf
!
route-map rip-to-ospf permit
 match metric 1
 set metric 5
 set metric-type type1
 set tag 1
```

The following example redistributes OSPF learned routes with tag 7 as a RIP metric of 15:

```
router rip
 redistribute ospf 109 route-map 5
!
route-map 5 permit
 match tag 7
 set metric 15
```

The following example redistributes OSPF intra-area and interarea routes with next hop routers on serial interface 0 into BGP with an INTER_AS metric of 5:

```
router bgp 109
 redistribute ospf 109 route-map 10
!
route-map 10 permit
 match route-type internal
 match interface serial 0
 set metric 5
```

The following example redistributes two types of routes into the integrated IS-IS routing table (supporting both IP and CLNS). The first type is OSPF external IP routes with tag 5; these routes are inserted into Level 2 IS-IS link-state packets (LSPs) with a metric of 5. The second type is ISO-IGRP derived CLNS prefix routes that match CLNS access list 2000; these routes will be redistributed into IS-IS as Level 2 LSPs with a metric of 30.

```
router isis
 redistribute ospf 109 route-map 2
 redistribute iso-igrp nsfnet route-map 3
!
route-map 2 permit
 match route-type external
 match tag 5
 set metric 5
 set level level-2
!
route-map 3 permit
 match address 2000
 set metric 30
```

With the following configuration, OSPF external routes with tags 1, 2, 3, and 5 are redistributed into RIP with metrics of 1, 1, 5, and 5, respectively. The OSPF routes with a tag of 4 are not redistributed.

```
router rip
 redistribute ospf 109 route-map 1
!
route-map 1 permit
 match tag 1 2
 set metric 1
!
route-map 1 permit
 match tag 3
 set metric 5
!
route-map 1 deny
 match tag 4
!
route map 1 permit
 match tag 5
 set metric 5
```

Given the following configuration, a RIP learned route for network 160.89.0.0 and an ISO-IGRP learned route with prefix 49.0001.0002 will be redistributed into an IS-IS Level 2 LSP with a metric of 5:

```
router isis
 redistribute rip route-map 1
 redistribute iso-igrp remote route-map 1
!
route-map 1 permit
 match ip address 1
 match clns address 2
 set metric 5
 set level level-2
!
access-list 1 permit 160.89.0.0 0.0.255.255
 clns filter-set 2 permit 49.0001.0002...
```

The following configuration example illustrates how a route map is referenced by the **default-information** router configuration command. This type of reference is called *conditional default origination*. OSPF will originate the default route (network 0.0.0.0) with a type 2 metric of 5 if 140.222.0.0 is in the routing table.

```
route-map ospf-default permit
 match ip address 1
 set metric 5
 set metric-type type-2
!
access-list 1 140.222.0.0 0.0.255.255
!
router ospf 109
 default-information originate route-map ospf-default
```

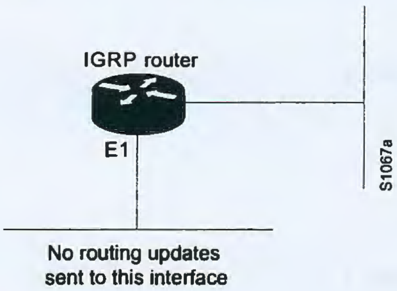
See more route map examples in the sections "BGP Route Map Examples" and "BGP Community with Route Maps Examples" in the "Configuring BGP" chapter.

Passive Interface Examples

The following example sends IGRP updates to all interfaces on network 131.108.0.0 except Ethernet interface 1. Figure 63 shows this configuration.

```
router igrp 109
 network 131.108.0.0
 passive-interface ethernet 1
```

Figure 63 Filtering IGRP Updates



In the following example, as in the first example, IGRP updates are sent to all interfaces on network 131.108.0.0 except Ethernet interface 1. However, in this case a **neighbor** router configuration command is included, which permits the sending of routing updates to specific neighbors. One copy of the routing update is generated per neighbor.

```
router igrp 109
 network 131.108.0.0
 passive-interface ethernet 1
 neighbor 131.108.20.4
```

In OSPF, hello packets are not sent on an interface that is specified as passive. Hence, the router will not be able to discover any neighbors, and none of the OSPF neighbors will be able to see the router on that network. In effect, this interface will appear as a stub network to the OSPF domain. This configuration is useful if you want to import routes associated with a connected network into the OSPF domain without any OSPF activity on that interface.

The **passive-interface** router configuration command typically is used when the wildcard specification on the **network** router configuration command configures more interfaces than is desirable. The following configuration causes OSPF to run on all subnets of 131.108.0.0:

```
interface ethernet 0
 ip address 131.108.1.1 255.255.255.0
interface ethernet 1
 ip address 131.108.2.1 255.255.255.0
interface ethernet 2
 ip address 131.108.3.1 255.255.255.0
!
router ospf 109
 network 131.108.0.0 0.0.255.255 area 0
```

If you do not want OSPF to run on 131.108.3.0, enter the following commands:

```
router ospf 109
```

```
 network 131.108.0.0 0.0.255.255 area 0
 passive-interface ethernet 2
```

Default Passive Interface Example

The following example configures the network interfaces, sets all interfaces running OSPF as passive, then enables serial interface):

```
interface Ethernet0
 ip address 172.19.64.38 255.255.255.0 secondary
 ip address 171.69.232.70 255.255.255.240
 no ip directed-broadcast
!
interface Serial0
 ip address 172.24.101.14 255.255.255.252
 no ip directed-broadcast
 no ip mroute-cache
!
interface TokenRing0
 ip address 140.10.10.4 255.255.255.0
 no ip directed-broadcast
 no ip mroute-cache
 ring-speed 16
!
router ospf 100
 passive-interface default
 no passive-interface Serial0
 network 140.10.10.0 0.0.0.255 area 0
 network 171.69.232.0 0.0.0.255 area 4
 network 172.24.101.0 0.0.0.255 area 4
```

Policy Routing Example

The following example provides two sources with equal access to two different service providers. Packets arriving on asynchronous interface 1 from the source 1.1.1.1 are sent to the router at 6.6.6.6 if the router has no explicit route for the destination of the packet. Packets arriving from the source 2.2.2.2 are sent to the router at 7.7.7.7 if the router has no explicit route for the destination of the packet. All other packets for which the router has no explicit route to the destination are discarded.

```
access-list 1 permit ip 1.1.1.1
access-list 2 permit ip 2.2.2.2
!
interface async 1
 ip policy route-map equal-access
!
route-map equal-access permit 10
 match ip address 1
 set ip default next-hop 6.6.6.6
route-map equal-access permit 20
 match ip address 2
 set ip default next-hop 7.7.7.7
route-map equal-access permit 30
 set default interface null0
```

NetFlow Policy Routing Example

The following example configures CEF, NetFlow, and NetFlow with flow acceleration. It also configures policy routing to verify that next hop 50.0.0.8 of the route map named test is a CDP neighbor before the router tries to policy route to it.

If the first packet is being policy routed via route map test sequence 10, the subsequent packets of the same flow always take the same route map test sequence 10, not route map test sequence 20, because they all match or pass access list 1 check. Therefore, policy routing can be flow accelerated by bypassing the access list check.

```
ip cef
ip flow-cache feature-accelerate
interface ethernet0/0/1
 ip route-cache flow
 ip policy route-map test
route-map test permit 10
 match ip address 1
 set ip precedence priority
 set ip next-hop 50.0.0.8
 set ip next-hop verify-availability
route-map test permit 20
 match ip address 101
 set interface Ethernet0/0/3
 set ip tos max-throughput
```

Key Management Examples

The following example configures a key chain named trees. In this example, the software will always accept and send willow as a valid key. The key chestnut will be accepted from 1:30 p.m. to 3:30 p.m. and be sent from 2:00 p.m. to 3:00 p.m. The overlap allows for migration of keys or discrepancy in the set time of the router. Likewise, the key birch immediately follows chestnut, and there is a 30-minute leeway on each side to handle time-of-day differences.

```
interface ethernet 0
 ip rip authentication key-chain trees
 ip rip authentication mode md5
!
router rip
 network 172.19.0.0
 version 2
!
key chain trees
 key 1
 key-string willow
 key 2
 key-string chestnut
 accept-lifetime 13:30:00 Jan 25 1996 duration 7200
 send-lifetime 14:00:00 Jan 25 1996 duration 3600
 key 3
 key-string birch
 accept-lifetime 14:30:00 Jan 25 1996 duration 7200
 send-lifetime 15:00:00 Jan 25 1996 duration 3600
```

The following example configures a key chain named trees:

```
key chain trees
 key 1
 key-string willow
 key 2
 key-string chesnut
 accept-lifetime 00:00:00 Dec 5 1995 23:59:59 Dec 5 1995
 send-lifetime 06:00:00 Dec 5 1995 18:00:00 Dec 5 1995
!
interface Ethernet0
 ip address 172.19.104.75 255.255.255.0 secondary
 ip address 171.69.232.147 255.255.255.240
 ip rip authentication key-chain trees
 media-type 10BaseT
!
interface Ethernet1
 no ip address
 shutdown
 media-type 10BaseT
interface Fddi0
 ip address 2.1.1.1 255.255.255.0
 no keepalive
!
interface Fddi1
 ip address 3.1.1.1 255.255.255.0
 ip rip send version 1
 ip rip receive version 1
 no keepalive
!
router rip
 version 2
 network 172.19.0.0
 network 2.0.0.0
 network 3.0.0.0
```

Ap 60

Configuring Passwords and Privileges

Using passwords and assigning privilege levels is a simple way of providing terminal access control in your network.

For a complete description of the commands used in this chapter, refer to the "Password and Privileges Commands" chapter in the *Cisco IOS Security Command Reference*. To locate documentation of other commands that appear in this chapter, use the command reference master index or search online.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the "Identifying Supported Platforms" section in the chapter "Using Cisco IOS Software."

In This Chapter

This chapter includes the following sections:

- Protecting Access to Privileged EXEC Commands
- Configuring Multiple Privilege Levels
- Recovering a Lost Enable Password
- Recovering a Lost Line Password
- Configuring Identification Support
- Passwords and Privileges Configuration Examples

Protecting Access to Privileged EXEC Commands

The following tasks provide a way to control access to the system configuration file and privileged EXEC (enable) commands:

- Setting or Changing a Static Enable Password
- Protecting Passwords with Enable Password and Enable Secret
- Setting or Changing a Line Password
- Encrypting Passwords

Setting or Changing a Static Enable Password

To set or change a static password that controls access to privileged EXEC (enable) mode, use the following command in global configuration mode:

Command	Purpose
`Router(config)# enable password password`	Establishes a new password or change an existing password for the privileged command level.

For examples of how to define enable passwords for different privilege levels, see the section "Multiple Levels of Privileges Examples" at the end of this chapter.

Protecting Passwords with Enable Password and Enable Secret

To provide an additional layer of security, particularly for passwords that cross the network or are stored on a TFTP server, you can use either the **enable password** or **enable secret** commands. Both comman accomplish the same thing; that is, they allow you to establish an encrypted password that users must enter to access enable mode (the default), or any privilege level you specify.

We recommend that you use the **enable secret** command because it uses an improved encryption algorithm. Use the **enable password** command only if you boot an older image of the Cisco IOS software, or if you boot older boot ROMs that do not recognize the **enable secret** command.

If you configure the **enable secret** command, it takes precedence over the **enable password** command; the two commands cannot be in effect simultaneously.

To configure the router to require an enable password, use either of the following commands in global configuration mode:

Command	Purpose
`Router(config)# enable password [level level] {password| encryption-type encrypted-password}`	Establishes a password for a privilege command mode.
or	
`Router(config)# enable secret [level level] {password | encryption-type encrypted-password}`	Specifies a secret password, saved using a non-reversible encryption method. (If enable password and enable secret are both set, users must enter the enable secret password.)

Use either of these commands with the **level** option to define a password for a specific privilege level. After you specify the level and set a password, give the password only to users who need to have access at this level. Use the **privilege level** configuration command to specify commands accessible at various levels.

If you have the **service password-encryption** command enabled, the password you enter is encrypted. When you display it with the **more system:running-config** command, it is displayed in encrypted form.

If you specify an encryption type, you must provide an encrypted password—an encrypted password you copy from another router configuration.

Note You cannot recover a lost encrypted password. You must clear NVRAM and set a new password. See the section "Recovering a Lost Enable Password" or "Recovering a Lost Line Password" in this chapter if you have lost or forgotten your password.

Setting or Changing a Line Password

To set or change a password on a line, use the following command in global configuration mode:

Command	Purpose
`Router(config)# password password`	Establishes a new password or change an existing password for the privileged command level.

Encrypting Passwords

Because protocol analyzers can examine packets (and read passwords), you can increase access security by configuring the Cisco IOS software to encrypt passwords. Encryption prevents the password from being readable in the configuration file.

To configure the Cisco IOS software to encrypt passwords, use the following command in global configuration mode:

Command	Purpose
`Router(config)# service password-encryption`	Encrypts a password.

The actual encryption process occurs when the current configuration is written or when a password is configured. Password encryption is applied to all passwords, including authentication key passwords, the privileged command password, console and virtual terminal line access passwords, and BGP neighbor passwords. The **service password-encryption** command is primarily useful for keeping unauthorized individuals from viewing your password in your configuration file.

Caution The **service password-encryption** command does not provide a high level of network security. If you use this command, you should also take additional network security measures.

Although you cannot recover a lost encrypted password (that is, you cannot get the original password back), you can recover from a lost encrypted password. See the section "Recovering a Lost Enable Password" or "Recovering a Lost Line Password" in this chapter if you have lost or forgotten your password.

73896

Configuring Multiple Privilege Levels

By default, the Cisco IOS software command-line interface (CLI) has two levels of access to commands: user EXEC mode (level 1) and privileged EXEC mode (level 15). However, you can configure additional levels of access to commands, called privilege levels, to meet the needs of your users while protecting the system from unauthorized access. Up to 16 privilege levels can be configured, from level 0, which is the most restricted level, to level 15, which is the least restricted level.

Access to each privilege level is enabled through separate passwords, which you specify when configuring the privilege level.

For example, if you want a certain set of users to be able to configure only certain interfaces, but not allow them access to other configuration options, you could create a separate privilege level for only specific interface configuration commands and distribute the password for that level to those users.

The following tasks describe how to configure additional levels of security:

- Setting the Privilege Level for a Command
- Changing the Default Privilege Level for Lines
- Displaying Current Privilege Levels
- Logging In to a Privilege Level

Setting the Privilege Level for a Command

To create a new privilege level and associate commands with that privilege level, use the following commands in beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# **privilege** *mode* **level** *level* *command-string*	Configures the specified privilege level to allow access to the specified command.
Step 2	Router(config)# **enable secret level** *level* {0 |5} *password-string*	Sets the password for the specified privilege level. This is the password users will enter after entering the **enable** *level* command to access the specified level. • **0** indicates an unencrypted password string follows; **5** indicates an encrypted password string follows.
Step 3	Router(config)# **exit**	Exists global configuration mode and returns to EXEC mode.
Step 4	Router# do copy running-config startup-config	(Optional) Saves the configuration to the startup configuration file in NVRAM. **Note** The **do** keyword allows execution of EXEC commands in configuration mode.

Changing the Default Privilege Level for Lines

To change the default privilege level for a given line or a group of lines, use the following command in line configuration mode:

Command	Purpose
`Router(config-line)# privilege level level`	Specifies a default privilege level for a line.

Displaying Current Privilege Levels

To display the current privilege level you can access based on the password you used, use the following command in EXEC mode:

Command	Purpose
`Router# show privilege`	Displays your current privilege level.

Logging In to a Privilege Level

To log into a router at a specified privilege level, use the following command in EXEC mode:

Command	Purpose
`Router# enable level`	Logs in to a specified privilege level.

To exit to a specified privilege level, use the following command in EXEC mode:

Command	Purpose
`Router# disable level`	Exits to a specified privilege level.

Recovering a Lost Enable Password

You can restore access to enable mode on a router when the password is lost using one of the three procedures described in this section. The procedure you use depends on your router platform.

You can perform password recovery on most of the platforms without changing hardware jumpers, but all platforms require the configuration to be reloaded. Password recovery can be done only from the console port on the router. Table 26 shows which password recovery procedure to use with each router platform.

4387
6

Table 26 Platform-Specific Password Recovery Procedures

Password Recovery Procedure	Router Platform
Password Recovery Procedure 1	Cisco 2000 series Cisco 2500 series Cisco 3000 series Cisco 4000 series with 680x0 Motorola CPU Cisco 7000 series running Cisco IOS Release 10.0 or later in ROMs installed on the RP card IGS series running Cisco IOS Release 9.1 or later in ROMs
Password Recovery Procedure 2	Cisco 1003 Cisco 1600 series Cisco 2600 series Cisco 3600 series Cisco 4500 series Cisco 7100 series Cisco 7200 series Cisco 7500 series IDT Orion-based routers Cisco AS5200 and AS5300 platforms

This section includes the following sections:

- Password Recovery Process
- Password Recovery Procedure 1
- Password Recovery Procedure 2

Password Recovery Process

Both password recovery procedures involve the following basic steps:

Step 1 Configure the router to boot up without reading the configuration memory (NVRAM). This is sometimes called the test system mode.

Step 2 Reboot the system.

Step 3 Access enable mode (which can be done without a password if you are in test system mode).

Step 4 View or change the password, or erase the configuration.

Step 5 Reconfigure the router to boot up and read the NVRAM as it normally does.

Step 6 Reboot the system.

Note Some password recovery requires that a terminal issue a Break signal; you must be familiar with how your terminal or PC terminal emulator issues this signal. For example, in ProComm, the keys Alt-B by default generates the Break signal, and in a Windows terminal you press Break or CTRL-Break. A Windows terminal also allows you to define a function key as a BREAK signal. To do so, select function keys from the Terminal window and define one as Break by entering the characters **^$B** (**Shift 6**, **Shift 4**, and uppercase **B**).

Password Recovery Procedure 1

Use this procedure to recover lost passwords on the following Cisco routers:

- Cisco 2000 series
- Cisco 2500 series
- Cisco 3000 series
- Cisco 4000 series with 680x0 Motorola CPU
- Cisco 7000 series running Cisco IOS Release 10.0 or later in ROMs installed on the RP card. The router can be booting Cisco IOS Release 10.0 software in Flash memory, but it needs the actual ROMs on the processor card too.
- IGS series running Cisco IOS Release 9.1 or later in ROMs

To recover a password using Procedure 1, perform the following steps:

Step 1 Attach a terminal or PC with terminal emulation software to the console port of the router.

Step 2 Enter the **show version** command and record the setting of the configuration register. It is usually 0x2102 or 0x102.

The configuration register value is on the last line of the display. Note whether the configuration register is set to enable Break or disable Break.

The factory-default configuration register value is 0x2102. Notice that the third digit from the left in this value is 1, which disables Break. If the third digit is *not* 1, Break is enabled.

Step 3 Turn off the router, then turn it on.

Step 4 Press the **Break** key on the terminal within 60 seconds of turning on the router.

The `rommon>` prompt with no router name appears. If it does not appear, the terminal is not sending the correct Break signal. In that case, check the terminal or terminal emulation setup.

Step 5 Enter **o/r0x42** at the `rommon>` prompt to boot from Flash memory or **o/r0x41** to boot from the boot ROMs.

Note The first character is the letter o, not the numeral zero. If you have Flash memory and it is intact, 0x42 is the best setting. Use 0x41 only if the Flash memory is erased or not installed. If you use 0x41, you can only view or erase the configuration. You cannot change the password.

7385
6

Step 6 At the `rommon>` prompt, enter the initialize command to initialize the router.

This causes the router to reboot but ignore its saved configuration and use the image in Flash memory instead. The system configuration display appears.

Note If you normally use the **boot network** command, or if you have multiple images in Flash memory and you boot a non-default image, the image in Flash might be different.

Step 7 Enter **no** in response to the System Configuration Dialog prompts until the following message appears:

```
Press RETURN to get started!
```

Step 8 Press **Return**.

The `Router>` prompt appears.

Step 9 Enter **enable**.

The `Router#` prompt appears.

Step 10 Choose one of the following options:

- To view the password, if it is not encrypted, enter **more nvram:startup-config**.
- To change the password (if it is encrypted, for example), enter the following commands:

```
Router# configure memory
Router# configure terminal
Router(config)# enable secret 1234abcd
Router(config)# ctrl-z
Router# write memory
```

Note The **enable secret** command provides increased security by storing the enable secret password using a non-reversible cryptographic function; however, you cannot recover a lost password that has been encrypted.

Step 11 Enter **configure terminal** at the EXEC prompt to enter configuration mode.

Step 12 Enter **config-register** and whatever value you recorded in Step 2.

Step 13 Press **Ctrl-Z** to quit from the configuration editor.

Step 14 Enter **reload** at the privileged EXEC prompt and enter **write memory** to save the configuration.

Password Recovery Procedure 2

Use this procedure to recover lost passwords on the following routers:

- Cisco 1003
- Cisco 1600 series
- Cisco 2600 series
- Cisco 3600 series
- Cisco 3810
- Cisco 4500 series

- Cisco 7100 series
- Cisco 7200 series
- Cisco 7500 series
- IDT Orion-Based Routers
- Cisco AS5200 and AS5300 platforms

To recover a password using Procedure 2, perform the following steps:

Step 1 Attach a terminal or PC with terminal emulation software to the console port of the router.

Step 2 Enter **show version** and record the setting of the configuration register. It is usually 0x2102 or 0x102.

The configuration register value is on the last line of the display. Note whether the configuration register is set to enable Break or disable Break.

The factory-default configuration register value is 0x2102. Notice that the third digit from the left in this value is 1, which disables Break. If the third digit is *not* 1, Break is enabled.

Step 3 Turn off the router, then turn it on.

Step 4 Press the **Break** key on the terminal within 60 seconds of turning on the router.

The `rommon>` prompt appears. If it does not appear, the terminal is not sending the correct Break signal. In that case, check the terminal or terminal emulation setup.

Step 5 Enter **confreg** at the `rommon>` prompt.

The following prompt appears:

```
Do you wish to change configuration [y/n]?
```

Step 6 Enter **yes** and press **Return**.

Step 7 Enter **no** to subsequent questions until the following prompt appears:

```
ignore system config info [y/n]?
```

Step 8 Enter **yes**.

Step 9 Enter **no** to subsequent questions until the following prompt appears:

```
change boot characteristics [y/n]?
```

Step 10 Enter **yes**.

The following prompt appears:

```
enter to boot:
```

Step 11 At this prompt, either enter **2** and press **Return** if Flash memory or, if Flash memory is erased, enter **1**. If Flash memory is erased, the Cisco 4500 must be returned to Cisco for service. If you enter **1**, you can only view or erase the configuration. You cannot change the password.

A configuration summary is displayed and the following prompt appears:

```
Do you wish to change configuration [y/n]?
```

Step 12 Enter **no** and press **Return**.

The following prompt appears:

```
rommon>
```

Step 13 Enter **reset** at the rommon prompt or, for Cisco 4500 series and Cisco 7500 series routers, power cycle the router.

Step 14 As the router boots, enter **no** to all the setup questions until the following prompt appears:

```
Router>
```

Step 15 Enter **enable** to enter enable mode.

The `Router#` prompt appears.

Step 16 Choose one of the following options:

- To view the password, if it is not encrypted, enter **more nvram:startup-config**.
- To change the password (if it is encrypted, for example), enter the following commands:

```
Router# configure memory
Router# configure terminal
Router(config)# enable secret 1234abcd
Router(config)# ctrl-z
Router# write memory
```

Note The **enable secret** command provides increased security by storing the enable secret password using a non-reversible cryptographic function; however, you cannot recover a lost password that has been encrypted.

Step 17 Enter **configure terminal** at the prompt.

Step 18 Enter **config-register** and whatever value you recorded in Step 2.

Step 19 Press **Ctrl-Z** to quit from the configuration editor.

Step 20 Enter **reload** at the prompt and enter **write memory** to save the configuration.

Recovering a Lost Line Password

If your router has the nonvolatile memory option, you can accidentally lock yourself out of enable mode if you enable password checking on the console terminal line and then forget the line password. To recover a lost line password, perform the following steps:

Step 1 Force the router into factory diagnostic mode.

See the hardware installation and maintenance publication for your product for specific information about setting the processor configuration register to factory diagnostic mode. Table 27 summarizes the hardware or software settings required by various products to set factory diagnostic mode.

Step 2 Enter **Yes** when asked if you want to set the manufacturers' addresses.

The following prompt appears:

```
TEST-SYSTEM >
```

Step 3 Enter **enable** to enter enable mode:

```
TEST-SYSTEM > enable
```

7382
ω

Step 4 Enter **more nvram:startup-config** to review the system configuration and find the password. Do not change anything in the factory diagnostic mode.

```
TEST-SYSTEM # more nvram:startup-config
```

Step 5 To resume normal operation, restart the router or reset the configuration register.

Step 6 Log in to the router with the password that was shown in the configuration file.

Note All debugging capabilities are turned on during diagnostic mode.

See the hardware installation and maintenance publication for your product for specific information about configuring the processor configuration register for factory diagnostic mode. Table 27 summarizes the hardware or software settings required by the various products to set factory diagnostic mode.

Table 27 Factory Diagnostic Mode Settings for the Configuration Register

Platform	Setting
Modular products	Set jumper in bit 15 of the processor configuration register, then restart; remove the jumper when finished.
Cisco AS5100 Cisco AS5200 Cisco AS5300 Cisco 1600 series Cisco 2500 series Cisco 3000 series Cisco 3600 series Cisco 4000 series Cisco 4500 series Cisco 7000 series Cisco 7100 series Cisco 7200 series Cisco 7500 series	Use the **config-register** command to set the processor configuration register to 0x8000, then initialize and boot the system. Use the **reload** command to restart and set the processor configuration register to 0x2102 when finished.

Configuring Identification Support

Identification support allows you to query a Transmission Control Protocol (TCP) port for identification. This feature enables an unsecure protocol, described in RFC 1413, to report the identity of a client initiating a TCP connection and a host responding to the connection. With identification support, you can connect a TCP port on a host, issue a simple text string to request information, and receive a simple text-string reply.

To configure identification support, use the following command in global configuration mode:

Command	Purpose
`Router(config)# ip identd`	Enables identification support.

Passwords and Privileges Configuration Examples

The following sections provide password and privileges configuration examples:

- Multiple Levels of Privileges Examples
- Username Examples

Multiple Levels of Privileges Examples

This section provides examples of using multiple privilege levels to specify who can access different s of commands. This section includes the following sections:

- Allowing Users to Clear Lines Examples
- Defining an Enable Password for System Operators Examples
- Disabling a Privilege Level Example

Allowing Users to Clear Lines Examples

If you want to allow users to clear lines, you can do either of the following:

- Change the privilege level for the **clear** and **clear line** commands to 1 or "ordinary user level," as follows. This allows any user to clear lines.

  ```
  privilege exec level 1 clear line
  ```

- Change the privilege level for the **clear** and **clear line** commands to level 2. To do so, use the **privilege level** global configuration command to specify privilege level 2. Then define an enable password for privilege level 2 and tell only those users who need to know what the password is.

  ```
  enable password level 2 pswd2
  privilege exec level 2 clear line
  ```

Defining an Enable Password for System Operators Examples

In the following example, you define an enable password for privilege level 10 for system operators and make **clear** and **debug** commands available to anyone with that privilege level enabled.

```
enable password level 10 pswd10
privilege exec level 10 clear line
privilege exec level 10 debug ppp chap
privilege exec level 10 debug ppp error
privilege exec level 10 debug ppp negotiation
```

The following example lowers the privilege level of the **more system:running-config** command and most configuration commands to operator level so that the configuration can be viewed by an operator. It leaves the privilege level of the **configure** command at 15. Individual configuration commands are displayed in the **more system:running-config** output only if the privilege level for a command has been lowered to 10. Users are allowed to see only those commands that have a privilege level less than or equal to their current privilege level.

```
enable password level 15 pswd15
privilege exec level 15 configure
enable password level 10 pswd10
privilege exec level 10 more system:running-config
```

Disabling a Privilege Level Example

In the following example, the **show ip route** command is set to privilege level 15. To keep all **show ip** and **show** commands from also being set to privilege level 15, these commands are specified to be privilege level 1.

```
privilege exec level 15 show ip route
privilege exec level 1 show ip
privilege exec level 1 show
```

Username Examples

The following sample configuration sets up secret passwords on Routers A, B, and C, to enable the three routers to connect to each other.

To authenticate connections between Routers A and B, enter the following commands:

On Router A:

```
username B password a-b_secret
```

On Router B:

```
username A password a-b_secret
```

To authenticate connections between Routers A and C, enter the following commands:

On Router A:

```
username C password a-c_secret
```

On Router C:

```
username A password a-c_secret
```

To authenticate connections between Routers B and C, enter the following commands:

On Router B:

```
username C password b-c_secret
```

On Router C:

```
username B password b-c_secret
```

For example, suppose you enter the following command:

```
username bill password westward
```

The system displays this command as follows:

```
username bill password 7 21398211
```

The encrypted version of the password is 21398211. The password was encrypted by the Cisco-defined encryption algorithm, as indicated by the "7."

However, if you enter the following command, the system determines that the password is already encrypted and performs no encryption. Instead, it displays the command exactly as you entered it.

```
username bill password 7 21398211
username bill password 7 21398211
```

AP GP

Configuring Voice Ports

Voice ports are found at the intersections of packet-based networks and traditional telephony networks, and they facilitate the passing of voice and call signals between the two networks. Physically, voice ports connect a router or access server to a line from a circuit-switched telephony device in a PBX or the public switched telephone network (PSTN).

Basic software configuration for voice ports describes the type of connection being made and the type of signaling to take place over this connection. Additional commands provide fine-tuning for voice quality, enable special features, and specify parameters to match those of proprietary PBXs.

This chapter includes the following sections:

Not all voice-port commands are covered in this chapter. Some are described in the "Configuring Trunk Connections and Conditioning Features" chapter or the "Configuring ISDN Interfaces for Voice" chapter in this configuration guide. The voice-port configuration commands included in this chapter are fully documented in the *Cisco IOS Voice, Video, and Fax Command Reference*.

To identify the hardware platform or software image information associated with a feature in this chapter, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the "Identifying Supported Platforms" section in the "Using Cisco IOS Software" chapter.

2377 W

Voice Port Configuration Overview

Voice ports on routers and access servers emulate physical telephony switch connections so that voice calls and their associated signaling can be transferred intact between a packet network and a circuit-switched network or device.

For a voice call to occur, certain information must be passed between the telephony devices at either end of the call, such as the devices' on-hook status, the line's availability, and whether an incoming call is trying to reach a device. This information is referred to as signaling, and to process it properly, the devices at both ends of the call segment (that is, those directly connected to each other) must use the same type of signaling.

The devices in the packet network must be configured to convey signaling information in a way that the circuit-switched network can understand. They must also be able to understand signaling information received from the circuit-switched network. This is accomplished by installing appropriate voice hardware in the router or access server and by configuring the voice ports that connect to telephony devices or the circuit-switched network.

The illustrations below show examples of voice port usage.

- In Figure 10, one voice port connects a telephone to the wide-area network (WAN) through the router.
- In Figure 11, one voice port connects to the PSTN and another to a telephone; the router acts like a small PBX.
- Figure 12 shows how two PBXs can be connected over a WAN to provide toll bypass.

Figure 10 Telephone to WAN

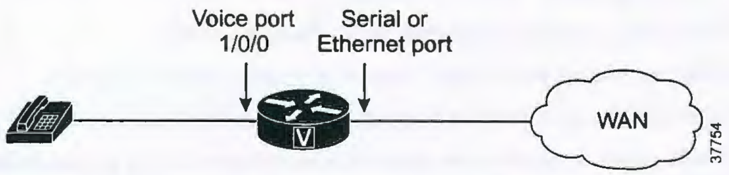


Figure 11 Telephone to PSTN

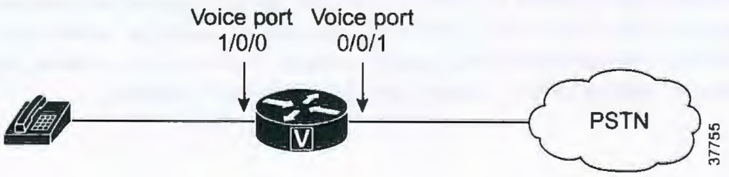

Figure 12 PBX-to-PBX over a WAN

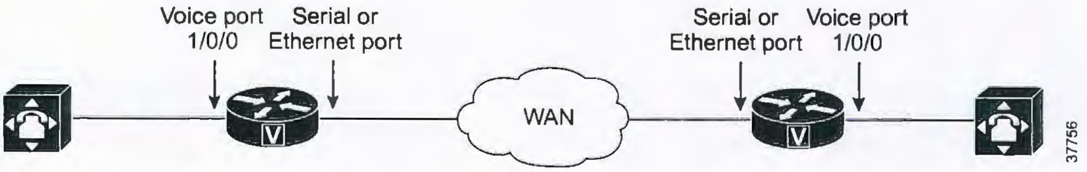

Cisco provides a variety of Cisco IOS commands for flexibility in programming voice ports to match the physical attributes of the voice connections that are being made. Some of these connections are made using analog means of transmission, while others use digital transmission. Table 4 shows the analog and digital voice-port connection support of the router platforms discussed in this chapter.

Table 4 Analog and Digital Voice-port Support on Cisco Routers and Access Servers

Platform	Analog	Digital
Cisco 803 and 804	Yes	No
Cisco 1750	Yes	No
Cisco 2600 series	Yes	Yes
Cisco 3600 series	Yes	Yes
Cisco MC3810	Yes	Yes
Cisco AS5300	No	Yes
Cisco AS5800	No	Yes
Cisco 7200 series	No	Yes
Cisco 7500 series	No	Yes

Telephony Signaling Interfaces

Voice ports on routers and access servers physically connect the router or access server to telephony devices such as telephones, fax machines, PBXs, and PSTN central office (CO) switches. These devices may use any of several types of signaling interfaces to generate information about on-hook status, ringing, and line seizure.

The router's voice-port hardware and software need to be configured to transmit and receive the same type of signaling being used by the device with which they are interfacing so that calls can be exchanged smoothly between the packet network and the circuit-switched network.

The signaling interfaces discussed in this chapter include foreign exchange office (FXO), foreign exchange station (FXS), and receive and transmit (E&M), which are types of analog interfaces. Some digital connections emulate FXO, FXS, and E&M interfaces, and they are discussed in the second half of this chapter. It is important to know which signaling method the telephony side of the connection is using, and to match the router configuration and voice interface hardware to that signaling method.

The next three illustrations show how the different signaling interfaces are associated with different uses of voice ports. In Figure 13, FXS signaling is used for end-user telephony equipment, such as a telephone or fax machine. Figure 14 shows an FXS connection to a telephone and an FXO connection to the PSTN at the far side of a WAN; this might be a telephone at a local office going over a WAN to a router at headquarters that connects to the PSTN. In Figure 15, two PBXs are connected across a WAN by E&M interfaces. This illustrates the path over a WAN between two geographically separated offices in the same company.

7375 3

Figure 13 FXS Signaling Interfaces

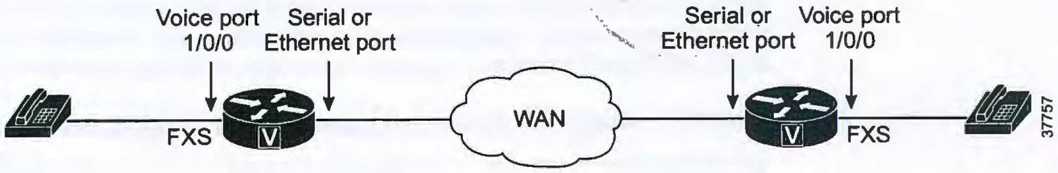

Figure 14 FXS and FXO Signaling Interfaces

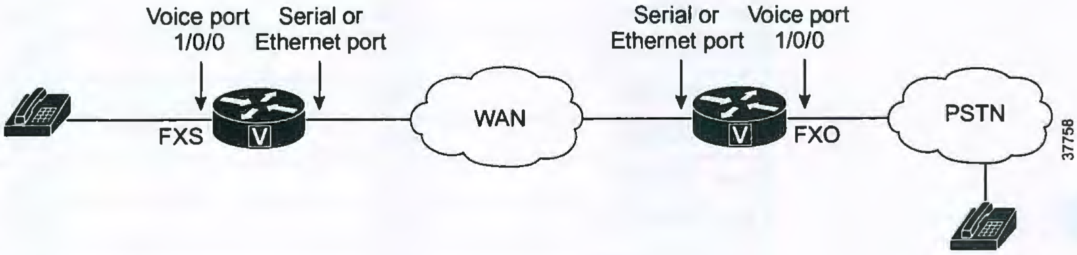

Figure 15 E&M Signaling Interfaces

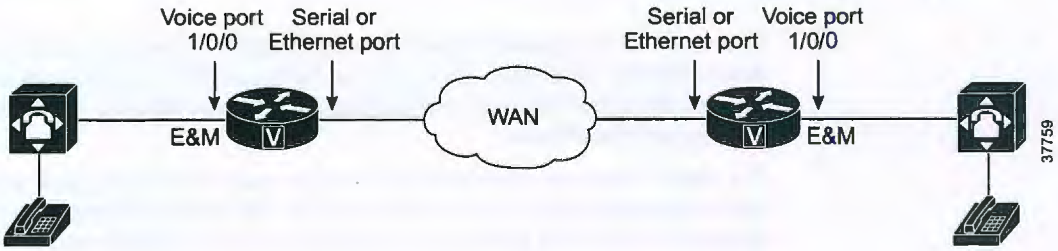

FXS and FXO Interfaces

An FXS interface connects the router or access server to end-user equipment such as telephones, fax machines, or modems. The FXS interface supplies ring, voltage, and dial tone to the station and includes an RJ-11 connector for basic telephone equipment, keysets, and PBXs.

An FXO interface is used for trunk, or tie line, connections to a PSTN CO or to a PBX that does not support E&M signaling (when local telecommunications authority permits). This interface is of value for off-premise station applications. A standard RJ-11 modular telephone cable connects the FXO voice interface card to the PSTN or PBX through a telephone wall outlet.

FXO and FXS interfaces indicate on-hook or off-hook status and the seizure of telephone lines by one of two access signaling methods: loop start or ground start. The type of access signaling is determined by the type of service from the CO; standard home telephone lines use loop start, but business telephones can order ground start lines instead.

Loop-start is the more common of the access signaling techniques. When a handset is picked up (the telephone goes off-hook), this action closes the circuit that draws current from the telephone company CO and indicates a change in status, which signals the CO to provide dial tone. An incoming call is signaled from the CO to the handset by sending a signal in a standard on/off pattern, which causes the telephone to ring.

Loop-start has two disadvantages, however, that usually are not a problem on residential telephones but that become significant with the higher call volume experienced on business telephones. Loop-start signaling has no means of preventing two sides from seizing the same line simultaneously, a condition known as *glare.* Also, loop start signaling does not provide switch-side disconnect supervision for FXO calls. The telephony switch (the connection in the PSTN, another PBX, or key system) expects the router's FXO interface, which looks like a telephone to the switch, to hang up the calls it receives through its FXO port. However, this function is not built into the router for received calls; it only operates for calls originating from the FXO port.

Another access signaling method used by FXO and FXS interfaces to indicate on-hook or off-hook status to the CO is ground start signaling. It works by using ground and current detectors that allow the network to indicate off-hook or seizure of an incoming call independent of the ringing signal and allow for positive recognition of connects and disconnects. For this reason, ground start signaling is typically used on trunk lines between PBXs and in businesses where call volume on loop start lines can result in glare. See the "Disconnect Supervision Commands" section on page 84 and "FXO Supervisory Disconnect Tone Commands" section on page 87 for voice port commands that configure additional recognition of disconnect signaling.

In most cases, the default voice port command values are sufficient to configure FXO and FXS voice ports.

E&M Interfaces

Trunk circuits connect telephone switches to one another; they do not connect end-user equipment to the network. The most common form of analog trunk circuit is the E&M interface, which uses special signaling paths that are separate from the trunk's audio path to convey information about the calls. The signaling paths are known as the *E-lead* and the *M-lead*. The name *E&M* is thought to derive from the phrase *Ear* and *Mouth* or *rEceive* and *transMit* although it could also come from *Earth* and *Magnet*. The history of these names dates back to the days of telegraphy, when the CO side had a key that grounded the E circuit, and the other side had a sounder with an electromagnet attached to a battery. Descriptions such as *Ear* and *Mouth* were adopted to help field personnel determine the direction of a signal in a wire. E&M connections from routers to telephone switches or to PBXs are preferable to FXS/FXO connections because E&M provides better answer and disconnect supervision.

Like a serial port, an E&M interface has a data terminal equipment/data communications equipment (DTE/DCE) type of reference. In the telecommunications world, the *trunking* side is similar to the DCE, and is usually associated with CO functionality. The router acts as this side of the interface. The other side is referred to as the *signaling* side, like a DTE, and is usually a device such as a PBX. Five distinct physical configurations for the signaling part of the interface (Types I-V) use different methods to signal on-hook/off-hook status, as shown in Table 5. Cisco voice implementation supports E&M Types I, II, III, and V.

The physical E&M interface is an RJ-48 connector that connects to PBX trunk lines, which are classified as either two-wire or four-wire. This refers to whether the audio path is full duplex on one pair of wires (two-wire) or on two pair of wires (four-wire). A connection may be called a four-wire E&M circuit although it actually has six to eight physical wires. It is an analog connection although an analog E&M circuit may be emulated on a digital line. For more information on digital voice port configuration of E&M signaling, see the "DS0 Groups on Digital T1/E1 Voice Ports" section on page 72.

7372
E

PB?s built by different manufacturers can indicate on-hook/off-hook status and telephone line seizure on the E&M interface by using any of three types of access signaling that are as follows:

- Immediate-start is the simplest method of E&M access signaling. The calling side seizes the line by going off-hook on its E-lead and sends address information as dual-tone multifrequency (DTMF) digits (or as dialed pulses on Cisco 2600 series routers and Cisco 3600 series routers) following a short, fixed-length pause.
- Wink-start is the most commonly used method for E&M access signaling, and is the default for E&M voice ports. Wink-start was developed to minimize glare, a condition found in immediate-start E&M, in which both ends attempt to seize a trunk at the same time. In wink-start, the calling side seizes the line by going off-hook on its E-lead, then waits for a short temporary off-hook pulse, or "wink," from the other end on its M-lead before sending address information. The switch interprets the pulse as an indication to proceed and then sends the dialed digits as DTMF or dialed pulses.
- In delay-dial signaling, the calling station seizes the line by going off-hook on its E-lead. After a timed interval, the calling side looks at the status of the called side. If the called side is on-hook, the calling side starts sending information as DTMF digits; otherwise, the calling side waits until the called side goes on-hook and then starts sending address information.

Table 5 E&M Wiring and Signaling Methods

E&M Type	E-Lead Configuration	M-Lead Configuration	Signal Battery Lead Configuration	Signal Ground Lead Configuration
I	Output, relay to ground	Input, referenced to ground	—	—
II	Output, relay to SG	Input, referenced to ground	Feed for M, connected to –48V	Return for E, galvanically isolated from ground
III	Output, relay to ground	Input, referenced to ground	Connected to –48V	Connected to ground
V	Output, relay to ground	Input, referenced to –48V	—	—

Analog Voice Ports Configuration Task List

Analog voice port interfaces connect routers in packet-based networks to analog two-wire or four-wire analog circuits in telephony networks. Two-wire circuits connect to analog telephone or fax devices, and four-wire circuits connect to PBXs. Typically, connections to the PSTN CO are made with digital interfaces.

This section describes how to configure analog voice ports and covers the following topics:

- Configuring Codec Complexity for Analog Voice Ports on the Cisco MC3810 with High-Performance Compression Modules, page 47
- Configuring Basic Parameters on Analog FXO, FXS, or E&M Voice Ports, page 48
- Configuring Analog Telephone Connections on Cisco 803 and 804 Routers, page 52

Three other sections later in the chapter provide help with fine-tuning and troubleshooting:

- Fine-Tuning Analog and Digital Voice Ports, page 80
- Verifying Analog and Digital Voice-Port Configurations, page 99
- Troubleshooting Analog and Digital Voice Port Configurations, page 110

Prerequisites for Configuring Analog Voice Ports

- Obtain two- or four-wire line service from your service provider or from a PBX.
- Complete your company's dial plan.
- Establish a working telephony network based on your company's dial plan.
- Install at least one other network module or WAN interface card to provide the connection to the network LAN or WAN.
- Establish a working IP and Frame Relay or ATM network. For more information about configuring IP, refer to the *Cisco IOS IP Configuration Guide*, Release 12.2.
- Install appropriate voice processing and voice interface hardware on the router. See the "Configuring Platform-Specific Analog Voice Hardware" section on page 45.

Preparing to Configure Analog Voice Ports

Before configuring an analog voice port, assemble the following information about the telephony connection that the voice port will be making. If connecting to a PBX, it is important to understand the PBX's wiring scheme and timing parameters. This information should be available from your PBX vendor or the reference manuals that accompany your PBX.

- Telephony signaling interface: FXO, FXS, or E&M
- Locale code (usually the country) for call progress tones
- If FXO, type of dialing: DTMF (touch-tone) or pulse
- If FXO, type of start signal: loop-start or ground-start
- If E&M, type: I, II, III, or V
- If E&M, type of line: two-wire or four-wire
- If E&M, type of start signal: wink, immediate, delay-dial

Table 6 should help you determine which hardware and configuration instructions are appropriate for your situation. Table 7 on page 44 shows slot and port numbering, which differs for each of the voice-enabled routers. More current information may be available in the release notes that accompany the Cisco IOS software you are using.

Table 6 Analog Voice Port Configurations

Telephony Signaling Interface	Router Platform	Voice Hardware Required	Section Containing Voice Port Configuration Instructions
End user: telephone or fax	Cisco 803 Cisco 804	—	"Configuring Analog Telephone Connections on Cisco 803 and 804 Routers"
FXO	Cisco 1750 Cisco 2600 series Cisco 3600 series	VIC-2FXO, VIC-2FXO-EU	"Configuring Basic Parameters on Analog FXO, FXS, or E&M Voice Ports"

Configuring Platform-Specific Analog Voice Hardware

This section describes the general types of analog voice port hardware available for the router platforms included in this chapter:

- Cisco 800 Series Routers, page 45
- Cisco 1750 Modular Router, page 45
- Cisco 2600 Series and Cisco 3600 Series Routers, page 46
- Cisco MC3810 Multiservice Concentrator, page 46

Note For current information about supported hardware, see the release notes for the platform and Cisco IOS release being used.

Cisco 800 Series Routers

Cisco 803 and Cisco 804 routers support data and voice applications. The data applications on these routers are implemented through the ISDN port, and the voice applications are implemented with ISDN Basic Rate Interface (BRI) through the telephone ports. If a Cisco 803 or 804 router is being used, connect two devices, such as an analog touch-tone telephone, fax machine, or modem through two fixed telephone ports, the gray PHONE 1 and PHONE 2 ports that have RJ-11 connectors. Each device is connected to basic telephone services through the ISDN line.

For more information, refer to the *Cisco 800 Series Routers Hardware Installation Guide.*

Cisco 1750 Modular Router

The Cisco 1750 modular router provides Voice over IP (VoIP) functionality and can carry voice traffic (for example, telephone calls and faxes) over an IP network. To make a voice connection, the router must have a supported VIC installed. The Cisco 1750 router supports two slots for either WAN interface cards (WICs) or VICs and supports one VIC-only slot. For analog connections, two-port VICs are available to support FXO, FXS, and E&M signaling. VICs provide direct connections to telephone equipment (analog phones, analog fax machines, key systems, or PBXs) or to a PSTN.

For more information, refer to the *Cisco 1750 Voice-over-IP Quick Start Guide.*

4368
ε

Cisco 2600 Series and Cisco 3600 Series Routers

The Cisco 2600 and 3600 series routers are modular, multifunction platforms that combine dial access, routing, local area network-to-local area network (LAN) services, and multiservice integration of voice, video, and data in the same device.

Voice network modules installed in Cisco 2600 series or Cisco 3600 series routers convert telephone voice signals into data packets that can be transmitted over an IP network. The voice network modules have no connectors; VICs installed in the network modules provide connections to the telephone equipment or network. VICs work with existing telephone and fax equipment and are compatible with H.323 standards for audio and video conferencing.

The Cisco 2600 series router can house one network module. In the Cisco 3600 series, the Cisco 3620 router has slots for up to two network modules; the Cisco 3640 router has slots for up to four network modules; and the Cisco 3660 router has slots for up to six network modules. (Typically, one of the slots is used for LAN connectivity.)

For analog telephone connections, low-density voice/fax network modules that contain either one or two VIC slots are installed in the network module slots. Each VIC is specific to a particular telephone signaling interface (FXS, FXO, or E&M); therefore, the VIC determines the type of signaling on that module.

For more information, refer to the following:

- *Cisco 2600 Series Hardware Installation Guide*
- *Cisco 3600 Series Hardware Installation Guide*
- *Cisco Network Module Hardware Installation Guide*

Cisco MC3810 Multiservice Concentrator

To support analog voice circuits, a Cisco MC3810 multiservice concentrator must be equipped with an AVM, which supports six analog voice ports. By installing specific signaling modules known as analog personality modules (APMs), the analog voice ports may be equipped for the following signaling types in various combinations: FXS, FXO, and E&M. For FXS, the analog voice ports use an RJ-11 connector interface to connect to analog telephones or fax machines (two-wire) or to a key system (four-wire). For FXO, the analog voice ports use an RJ-11 physical interface to connect to a CO trunk. For E&M connections, the analog voice ports use an RJ-1CX physical interface to connect to an analog PBX (two-wire or four-wire).

Optional high-performance voice compression modules (HCMs) can replace standard voice compression modules (VCMs) to operate according to the voice compression coding algorithm (codec) specified when the Cisco MC3810 concentrator is configured. The HCM2 provides four voice channel at high codec complexity and eight channels at medium complexity. The HCM6 provides 12 voice channels at high complexity and 24 channels at medium complexity. One or two HCMs can be installed in a Cisco MC3810 multiservice concentrator, but an HCM may not be combined with a VCM in one chassis.

For more information, refer to the *Cisco MC3810 Multiservice Concentrator Hardware Installation Guide*.

Note For current information about supported hardware, see the release notes for the platform and Cisco IOS release being used.

Configuring Codec Complexity for Analog Voice Ports on the Cisco MC3810 with High-Performance Compression Modules

The term *codec* stands for *coder-decoder.* A codec is a particular method of transforming analog voice into a digital bit stream (and vice versa) and also refers to the type of compression used. Several different codecs have been developed to perform these functions, and each one is known by the number of the International Telecommunication Union-Telecommunication Standardization Sector (ITU-T) standard in which it is defined. For example, two common codecs are the G.711 and the G.729 codecs. The various codecs use different algorithms to encode analog voice into digital bit-streams and have different bit rates, frame sizes, and coding delays associated with them. The codecs also differ in the amount of perceived voice quality they achieve. Specialized hardware and software in the digital signal processors (DSPs) perform codec transformation and compression functions, and different DSPs may offer different selections of codecs.

Select the same type of codec as the one that is used at the other end of the call. For instance, if a call was coded with a G.729 codec, it must be decoded with a G.729 codec. Codec choice is configured on dial peers. For more information, see the "Configuring Dial Plans, Dial Peers, and Digit Manipulation" chapter in this configuration guide.

Codec complexity refers to the amount of processing power that a codec compression technique requires: some require more processing power than others. Codec complexity affects call density, which is the number of calls that can take place on the DSP interfaces, which can be HCMs, port adapter DSP farms, or voice cards, depending on the type of router (in this case, the Cisco MC3810 multiservice concentrator). The greater the codec complexity, the fewer the calls that can be handled.

Codec complexity is either medium or high. The difference between medium- and high-complexity codecs is the amount of CPU power necessary to process the algorithm and, therefore, the number of voice channels that can be supported by a single DSP. All medium-complexity codecs can also be run in high-complexity mode, but fewer (usually half as many) channels will be available per DSP.

For details on the number of calls that can be handled simultaneously using each of the codec standards, refer to the entries for the **codec** and **codec complexity** commands in the *Cisco IOS Voice, Video, and Fax Command Reference*.

On a Cisco MC3810 concentrator, only a single codec complexity setting is used, even when two HCMs are installed. The value that is specified in this task affects the choice of codecs available when the **codec** dial-peer configuration command is configured. See the "Configuring Dial Plans, Dial Peers, and Digit Manipulation" chapter in this configuration guide.

Note On the Cisco MC3810 with high-performance compression modules, check the DSP voice channel activity with the **show voice dsp** command. If any DSP voice channels are in the busy state, the codec complexity cannot be changed. When all the DSP channels are in the idle state, changes can be made to the codec complexity selection.

7366 E

To configure codec complexity on the Cisco MC3810 multiservice concentrator using HCMs, use the following commands beginning in privileged EXEC mode:

	Command	Purpose
Step 1	`Router# show voice dsp`	Checks the DSP voice channel activity. If any DSP voice channels are in the busy state, the codec complexity cannot be changed. When all the DSP channels are in the idle state, continue to Step 2.
Step 2	`Router# configure terminal`	Enters global configuration mode.
Step 3	`Router(config)# voice-card 0`	Enters voice-card configuration mode and specifies voice card 0.
Step 4	`Router(config-voicecard)# codec complexity {high | medium}`	(For analog voice ports) Specifies codec complexity based on the codec standard being used. This setting restricts the codecs available in dial peer configuration. All voice cards in a router must use the same codec complexity setting. The keywords are as follows: • **high**—Specifies two voice channels encoded in any of the following formats: G.711ulaw, G.711alaw, G.723.1(r5.3), G.723.1 Annex A(r5.3), G.723.1(r6.3), G.723.1 Annex A(r6.3), G.726(r16), G.726(r24), G.726(r32), G.728, G.729, G.729 Annex B, and fax relay. • **medium**—(default) Specifies four voice channels encoded in any of the following formats: G.711ulaw, G.711alaw, G.726(r16), G.726(r24), G.726(r32), G.729 Annex A, G.729 Annex B with Annex A, and fax relay. **Note** If two HCMs are installed, this command configures both HCMs at once.

Configuring Basic Parameters on Analog FXO, FXS, or E&M Voice Ports

This section describes commands for basic analog voice port configuration. All the data recommended in the "Preparing to Configure Analog Voice Ports" section on page 43 should be gathered before starting this procedure.

If configuring a Cisco MC3810 multiservice concentrator that has HCMs, codec complexity should also be configured, following the steps in the "Configuring Codec Complexity for Analog Voice Ports on the Cisco MC3810 with High-Performance Compression Modules" section on page 47.

Note If you have a Cisco MC3810 multiservice concentrator or Cisco 3660 router, the **compand-type a-law** command must be configured on the analog ports only. The Cisco 2660, 3620, and 3640 routers do not require the configuration of th **compand-type a-law** command, however, if you request a list of commands, the **compand-type a-law** command will display.

In addition to the basic voice port parameters described in this section, there are commands that allow voice port configurations to be fine tuned. In most cases, the default values for fine-tuning commands are sufficient for establishing FXO and FXS voice port configurations. E&M voice ports are more likely to require some configuration. If it is necessary to change some of the voice port values to improve voice quality or to match parameters on proprietary PBXs to which you are connecting, use the commands in the current section and also in the "Fine-Tuning Analog and Digital Voice Ports" section on page 80.

After the voice-port has been configured, make sure that the ports are operational by following the steps described in the following sections:

- Verifying Analog and Digital Voice-Port Configurations, page 99
- Troubleshooting Analog and Digital Voice Port Configurations, page 110

For more information on these and other voice port commands, see the *Cisco IOS Voice, Video, and Fax Command Reference*.

Note The commands, keywords, and arguments that you are able to use may differ slightly from those presented here, based on your platform, Cisco IOS release, and configuration. When in doubt, use Cisco IOS command help (**command ?**) to determine the syntax choices that are available.

To configure basic analog voice port parameters on Cisco 1750, Cisco 2600 series, Cisco 3600 series, and Cisco MC3810 routers, use the following commands beginning in global configuration mode:

	Command	Purpose

Step 1	**Cisco 1750 and MC3810**
	`Router(config)# voice-port slot/port`
	Cisco 2600 and 3600 series
	`Router(config)# voice-port slot/subunit/port`
		Enters voice-port configuration mode.
		The arguments are as follows:
		• *slot*—Specifies the number of the router slot where the voice network module is installed (Cisco 2600 and Cisco 3600 series routers) or the router slot number where the analog voice module is installed (Cisco MC3810 multiservice concentrator).
		• *port*—Indicates the voice port. Valid entries are 0 or 1.
		• *subunit*—Specifies the location of the VIC.
		Note The slash must be entered between *slot* and *port*.
		Valid entries vary by router platform; see Table 7 on page 44 or enter the **show voice port summary** command for available values.

Step 2	**FXO or FXS** `Router(config-voiceport)# signal {loop-start | ground-start}`	Selects the access signaling type to match that of the telephony connection you are making. The keywords are as follows: • **loop-start**—(default) Uses a closed circuit to indicate off-hook status; used for residential loops. • **ground-start**—Uses ground and current detectors; preferred for PBXs and trunks.

	Command	Purpose
	E&M `Router(config-voiceport)# signal {wink-start | immediate-start | delay-dial}`	The keywords are as follows: • **wink-start**—(default) Indicates that the calling side seizes the line, then waits for a short off-hook *wink* from the called side before proceeding. • **immediate-start**—Indicates that the calling side seizes the line and immediately proceeds; used for E&M tie trunk interfaces. • **delay-dial**—Indicates that the calling side seizes the line and waits, then checks to determine whether the called side is on-hook before proceeding; if not, it waits until the called side is on-hook before sending digits. Used for E&M tie trunk interfaces. **Note** Configuring the **signal** keyword for one voice port on a Cisco 2600 or 3600 series router VIC changes the signal value for both ports on the VIC.
Step 3	`Router(config-voiceport)# cptone locale`	Selects the two-letter locale for the voice call progress tones and other locale-specific parameters to be used on this voice port. Cisco routers comply with the ISO 3166 locale name standards. To see valid choices, enter a question mark (?) following the **cptone** command. The default is **us**.
Step 4	`Router(config-voiceport)# dial-type {dtmf | pulse}`	(FXO only) Specifies the dialing method for outgoing calls.
Step 5	`Router(config-voiceport)# operation {2-wire | 4-wire}`	(E&M only) Specifies the number of wires used for voice transmission at this interface (the audio path only, not the signaling path). The default is 2-wire.
Step 6	`Router(config-voiceport)# type {1 | 2 | 3 | 5}`	(E&M only) Specifies the type of E&M interface to which this voice port is connecting. See Table 5 on page 42 for an explanation of E&M types. The default is 1.

Step 7	**Cisco 1750 Router and 2600 and 3600 Series Routers**
	`Router(config-voiceport)# ring frequency {25 | 50}`
	Cisco MC3810 Multiservice Concentrator
	`Router(config-voiceport)# ring frequency {20 | 30}`
		(FXS only) Selects the ring frequency, in hertz, used on the FXS interface. This number must match the connected telephony equipment and may be country-dependent. If not set properly, the attached telephony device may not ring or it may buzz.
		The keyword default is 25 on the Cisco 1750 router, 2600 and 3600 series routers; and 20 on the Cisco MC3810 multiservice concentrator.

	Command	Purpose
Step 8	`Router(config-voiceport)# ring number number`	(FXO only) Specifies the maximum number of rings to be detected before an incoming call is answered by the router. The default is 1.
Step 9	`Router(config-voiceport)# ring cadence {[pattern01 | pattern02 | pattern03 | pattern04 | pattern05 | pattern06 | pattern07 | pattern08 | pattern09 | pattern10 | pattern11 | pattern12] | [define pulse interval]}`	(FXS only) Specifies an existing pattern for ring, or it defines a new one. Each pattern specifies a ring-pulse time and a ring-interval time. The keywords and arguments are as follows: • **pattern01** through **pattern12** name pre-set ring cadence patterns. Enter **ring cadence ?** to see ring pattern explanations. • **define** *pulse interval* specifies a user-defined pattern: *pulse* is a number (one or two digits, from 1 to 50) specifying ring pulse (on) time in hundreds of milliseconds, and *interval* is a number (one or two digits from 1 to 50) specifying ring interval (off) time in hundreds of milliseconds. The default is the pattern specified by the cptone locale that has been configured.
Step 10	`Router(config-voiceport)# description string`	Attaches a text string to the configuration that describes the connection for this voice port. This description appears in various displays and is useful for tracking the purpose or use of the voice port. The *string* argument is a character string from 1 to 255 characters in length. The default is that there is no text string (describing the voice port) attached to the configuration.
Step 11	`Router(config-voiceport)# no shutdown`	Activates the voice port. If a voice port is not being used, shut the voice port down with the **shutdown** command.

7.362)

Configuring Analog Telephone Connections on Cisco 803 and 804 Routers

Multiple devices (analog telephone, fax machine, or modem) can be connected to a Cisco 803 or 804 telephone port. The number of devices that can be connected depends on the ringer equivalent number (REN) of each device that is to be connected. (The REN can usually be found on the bottom of a device.) The REN of the router telephone port is 5, so if the REN of each device to be connected is 1, a maximum of five devices can be connected to that particular telephone port.

These routers support touch-tone analog telephones only; they do not support rotary telephones.

To configure standard features for analog telephone connections on Cisco 803 and 804 routers, use the following commands in global configuration mode:

	Command	Purpose
Step 1	`Router(config)# pots country country`	Specifies the country to use for country-specific default settings for physical characteristics. Enter **pots country ?** for a list of supported countries and the codes to enter. A default country is not defined.
Step 2	`Router(config)# pots line-type {type1 | type2 | type3}`	(Optional) Specifies the impedance of telephones, fax machines, or modems connected to a Cisco 800 series router. The keywords are as follows: • **type1**—Specifies the resistance used for the POTS connection, typically 600 ohms. • **type2**—Specifies the resistance used for the POTS connection, typically 900 ohms. • **type3**—Specifies the resistance used for the POTS connection, typically 300/400 ohms. The default depends on the country chosen in the **pots country** command.
Step 3	`Router(config)# pots dialing-method {overlap | enblock}`	(Optional) Specifies how the router collects and sends digits dialed on connected telephones, fax machines, or modems. The keywords are as follows: • **overlap**—Tells the router to send each digit dialed in a separate message. • **enblock**—Tells the router to collect all digits dialed and to send the digits in one message. The default depends on the country chosen in the **pots country** command.

4.361

	Command	Purpose
Step 4	`Router(config)# pots disconnect-supervision {osi | reversal}`	(Optional) Specifies how the router notifies the connected telephones, fax machines, or modems when the calling party has disconnect. The keywords are as follows: • **osi**—(open switching interval) Specifies the duration for which DC voltage applied between tip and ring conductors of a telephone port is removed. • **reversal**—Specifies the polarity reversal of the tip and ring conductors of a telephone port. The default depends on the country chosen in the **pots country** command.
Step 5	`Router(config)# pots encoding {alaw | ulaw}`	(Optional) Specifies the pulse code modulation (PCM) encoding scheme for telephones, fax machines, or modems connected to a Cisco 800 series router. The keywords are as follows: • **alaw**—Specifies the ITU-T PCM encoding scheme used to represent analog voice samples as digital values. • **ulaw**—Specifies the North American PCM encoding scheme used to represent analog voice samples as digital values. The default depends on the country chosen in the **pots country** command.
Step 6	`Router(config)# pots tone-source {local | remote}`	(Optional) Specifies the source of dial, ringback, and busy tones for telephones, fax machines, or modems connected to a Cisco 800 series router. The keywords are as follows: • **local**—(default) Specifies that the router supplies the tones. • **remote**—Specifies that the telephone switch supplies the tones.
Step 7	`Router(config)# pots ringing-freq {20Hz | 25Hz | 50Hz}`	(Optional) Specifies the frequency at which telephones, fax machines, or modems connected to a Cisco 800 series router ring. The keywords are as follows: • **20Hz**—Indicates that connected devices ring at 20 Hz. • **25Hz**—Indicates that connected devices ring at 25 Hz. • **50Hz**—Indicates that connected devices ring at 50 Hz. The default depends on the country chosen in the **pots country** command.

7.360

	Command	Purpose
Step 8	`Router(config)# `**`pots disconnect-time`** *`interval`*	(Optional) Specifies the interval at which the disconnect method is applied if connected telephones, fax machines, or modems fail to detect that a calling party has disconnected. The *interval* argument is the number of milliseconds of the interval and ranges from 50 to 2000. The default depends on the country chosen in the **pots country** command.
Step 9	`Router(config)# `**`pots silence-time`** *`seconds`*	(Optional) Specifies the interval of silence after a calling party disconnects. The *seconds* argument is the number of seconds of the interval and ranges from 0 to 10. The default depends on the country chosen in the **pots country** command.
Step 10	`Router(config)# `**`pots distinctive-ring-guard-time`** *`milliseconds`*	(Optional) Specifies the delay after which a telephone port can be rung after a previous call is disconnected. The *milliseconds* argument is the number of milliseconds of the delay and ranges from 0 to 1000. The default depends on the country chosen in the **pots country** command.

Verifying Analog Telephone Connections on Cisco 803 and 804 Routers

After configuring analog telephone connections, perform the following steps to verify proper operation:

Step 1 Pick up the handset of an attached telephony device and check for a dial tone.

Step 2 Review the configuration using the **show pots status** command, which displays settings of physical characteristics and other information on telephone interfaces.

```
Router# show pots status

Troubleshooting Tip for Cisco 803 and 804 Routers

Check to ensure that all cables are securely connected.

Configuring Digital Voice Ports

The digital voice port commands discussed in this section configure channelized T1 or E1 connections; for information on ISDN connections, see "Configuring ISDN Interfaces for Voice" in this configuration guide.

The T1 or E1 lines that connect a telephony network to the digital voice ports on a router or access server contain channels for voice calls; a T1 line contains 24 full-duplex channels or *timeslots*, and an E1 line contains 30. The signal on each channel is transmitted at 64 kbps, a standard known as digital signal 0 (DS0); the channels are known as DS0 channels. The **ds0-group** command creates a logical voice port (a DS0 group) from some or all of the DS0 channels, which allows you to address those channels easily, as a group, in voice-port configuration commands.

Digital voice ports are found at the intersection of a packet voice network and a digital, circuit-switched telephone network. The digital voice port interfaces that connect the router or access server to T1 or E1 line pass voice data and signaling between the packet network and the circuit-switched network.

Signaling is the exchange of information about calls and connections between two ends of a communication path. For instance, signaling communicates to the call's end points whether a line is idle or busy, whether a device is on-hook or off-hook, and whether a connection is being attempted. An end point can be a CO switch, a PBX, a telephony device such as a telephone or fax machine, or a voice-equipped router acting as a gateway. There are two aspects to consider about signaling on digital lines: one aspect is the actual information about line and device states that is transmitted, and the second aspect is the method used to transmit the information on the digital lines.

The actual information about line and device states is communicated over digital lines using signaling methods that emulate the methods used in analog circuit-switched networks: FXS, FXO, and E&M.

The method used to transmit the information describes the way that the emulated analog signaling is transmitted over digital lines, which may be *common-channel signaling* (CCS) or *channel-associated signaling* (CAS). CCS sends signaling information down a dedicated channel and CAS takes place within the voice channel itself. This chapter describes CAS signaling, which is sometimes called *robbed-bit signaling* because user bandwidth is *robbed* by the network for signaling. A bit is taken from every sixth frame of voice data to communicate on- or off-hook status, wink, ground start, dialed digits, and other information about the call.

In addition to setting up and tearing down calls, CAS provides the receipt and capture of dialed number identification (DNIS) and automatic number identification (ANI) information, which are used to suppo authentication and other functions. The main disadvantage of CAS signaling is its use of user bandwidth to perform these signaling functions.

For signaling to pass between the packet network and the circuit-switched network, both networks must use the same type of signaling. The voice ports on Cisco routers and access servers can be configured to match the signaling of most COs and PBXs, as explained in this chapter.

This section discusses the following topics:

- Prerequisites for Configuring Digital Voice Ports, page 57
- Preparing Information to Configure Digital Voice Ports, page 58
- Platform-Specific Digital Voice Hardware, page 60
- Configuring Basic Parameters on Digital T1/E1 Voice Ports, page 63

Prerequisites for Configuring Digital Voice Ports

Digital T1 or E1 packet voice capability requires specific service, software, and hardware:

- Obtain T1 or E1 service from the service provider or from your PBX.
- Create your company's dial plan.
- Establish a working telephony network based on your company's dial plan.
- Establish a connection to the network LAN or WAN.
- Set up a working IP and Frame Relay or ATM network. For more information about configuring IP, refer to the *Cisco IOS IP Configuration Guide*, Release 12.2.
- Install appropriate voice processing and voice interface hardware on the router. See the "Platform-Specific Digital Voice Hardware" section on page 60.
- (Cisco 2600 and 3600 series routers) For digital T1 packet voice trunk network modules, install Cisco IOS Release 12.0(5)XK, 12.0(7)T, 12.2(1), or a later release. The minimum DRAM memory requirements are as follows:
  - 32 MB, with one or two T1 lines
  - 48 MB, with three or four T1 lines
  - 64 MB, with five to ten T1 lines
  - 128 MB, with more than ten T1 lines

  The memory required for high-volume applications may be greater than that listed. Support for digital T1 packet voice trunk network modules is included in Plus feature sets. The IP Plus feature set requires 8 MB of Flash memory; other Plus feature sets require 16 MB.
- (Cisco 2600 and 3600 series routers) For digital E1 packet voice trunk network modules, install Cisco IOS Release 12.1(2)T, 12.2(1), or a later release. The minimum DRAM memory requirements are:
  - 48 MB, with one or two E1s
  - 64 MB, with three to eight E1s
  - 128 MB, with 9 to 12 E1s

  For high-volume applications, the memory required may be greater than these minimum values. Support for digital E1 packet voice trunk network modules is included in Plus feature sets. The IP Plus feature set requires 16 MB of Flash memory.
- (Cisco MC3810 concentrators) HCMs require Cisco IOS Release 12.0(7)XK or 12.1(2)T, 12.2(1), or a later release.
- (Cisco 7200 and 7500 series routers) For digital T1/E1 voice port adapters, install Cisco IOS Release 12.0(5)XE, 12.0(7)T, 12.2(1), or a later release. The minimum DRAM memory requirement to support T1/E1 high-capacity digital voice port adapters is 64 MB.

The memory required for high-volume applications may be greater than that listed. Support for T1/E1 high-capacity digital voice port adapters is included in Plus feature sets. The IP Plus feature set requires 16 MB of Flash memory.

7.356 ✓

Preparing Information to Configure Digital Voice Ports

Gather the following information about the telephony network connection that the voice port will be making:

- Line interface: T1 or E1
- Signaling interface: FXO, FXS, or E&M. If the interfaces are Primary Rate Interface (PRI) or BRI, see the "Configuring ISDN Interfaces for Voice" chapter in this configuration guide and *Cisco IOS Terminal Services Configuration Guide.*
- Line coding: AMI or B8ZS for T1, and AMI or HDB3 for E1
- Framing format: SF (D4) or ESF for T1, and CRC4 or no-CRC4 for E1
- Number of channels

Table 8 describes voice-port hardware configurations for various platforms. After the controllers have been configured, the **show voice port summary** command can also be used to determine available voice port numbers. If the **show voice port** command and a specific port number is entered, the default voice-port configuration for that port displays.

Table 8 Digital Voice Slot/Port Designations

Router Platform	Voice Hardware	Slot Number	Port Number
Cisco 2600 series	Digital T1/E1 Packet Voice Trunk Network Module (NM-HDV with VWIC-1MFT or VWIC-2MFT) One network module can be installed in a Cisco 2600 series router.	*slot* is the router location of the voice module. 1	*port* is the VWIC location in the network module. 0 to 1
Cisco 3600 series	Digital T1/E1 Packet Voice Trunk Network Module (NM-HDV with VWIC-1MFT or VWIC-2MFT) One network module can be installed in a Cisco 3620 router. A Cisco 3640 router can support three modules, and as many as six can be installed in a Cisco 3660 router.	*slot* is the router location of the voice module. 3620: 0 to 1 3640: 0 to 3 3660: 0 to 5	*port* is the VWIC location in the network module. 0 to 1

Table 8 Digital Voice Slot/Port Designations (continued)

Router Platform	Voice Hardware	Slot Number	Port Number
Cisco MC3810	• Digital voice module (DVM) • Voice compression module (VCM3 or VCM6) or • High-compression module (HCM2 or HCM6) VCM3 and VCM6 do not support codec complexity options.	1	—
Cisco AS5300	One Octal T1/E1 feature card (eight ports) or one Quad T1/E1 feature card (four ports) and one or two VFCs for voice and fax features.	—	*controller* is : Octal: 0 to 7 Quad: 0 to 3
Cisco AS5800	Up to four 12-port T1/E1 trunk cards and up to eight VFCs	*shelf* is 1 *slot* is 0 to 5	0 to 11
Cisco 7200 series	• Two-port T1/E1 enhanced digital voice port adapters • PA-VXC (high-capacity) • PA-VXB (moderate capacity) Port adapter slot 0 is reserved for the Fast Ethernet port on the I/O controller (if present).	Port adapter slot: from 1 to 4, or from 1 to 6	Interface port: 0 to 1
Cisco 7500 series	PA-VXB and PA-VXC on a VIP2 or VIP4 in Cisco 7500 series routers If the VIP is inserted in interface processor slot 3 and port adapter slot 0, then the addresses of the PA-VXB or PA-VXC are 3/0/0 or 3/0/1 (interface processor slot 3, port adapter slot 0, and interfaces 0 and 1).	Interface processor slot: 0 to 12 (depends on the number of slots in the router)	Port adapter slot: always 0 or 1 Interface port: 0 or 1

The following is **show voice port summary** sample output for a Cisco MC3810 multiservice concentrator:

7.354

```
Router# show voice port summary

```

Platform-Specific Digital Voice Hardware

This section briefly describes digital voice hardware on the following platforms:

- Cisco 2600 series and Cisco 3600 series routers
- Cisco MC3810 multiservice concentrator
- Cisco AS5300 universal access server
- Cisco AS5800 universal access server
- Cisco 7200 series and Cisco 7500 series routers

Note For current information about supported hardware, see the release notes for the platform and Cisco IOS release you are using.

Cisco 2600 Series and Cisco 3600 Series Routers

Digital voice hardware on Cisco 2600 series and Cisco 3600 series modular access routers includes the high-density voice (HDV) network module and the multiflex trunk (MFT) voice/WAN interface card (VWIC). When an HDV is used in conjunction with an MFT and packet voice DSP modules (PVDMs), the HDV module is also called a *digital packet voice trunk network module*. The digital T1 or E1 packet voice trunk network module supports T1 or E1 applications, including fractional use. The T1 version integrates a fully managed data service unit/channel service unit (DSU/CSU), and the E1 version includes a fully managed DSU. The digital T1 or E1 packet voice trunk network module provides per-channel T1 or E1 data rates of 64 or 56 kbps for WAN services (Frame Relay or leased line).

Digital T1 or E1 packet voice trunk network modules for Cisco 2600 and 3600 series routers allow enterprises or service providers, using the voice-equipped routers as customer premise equipment (CPE), to deploy digital voice and fax relay. These network modules receive constant bit-rate telephony information over T1 or E1 interfaces and convert that information to a compressed format so that it can be sent over a packet network. The digital T1 or E1 packet voice trunk network modules can connect either to a PBX (or similar telephony device) or to a CO to provide PSTN connectivity. One digital T1 or E1 packet voice trunk network module can be installed in a Cisco 2600 series router or in a Cisco 3620 router. A Cisco 3640 router can support three network modules, and a Cisco 3660 router can support up to six network modules.

The MFT VWICs that are used in the packet voice trunk network modules are available in one- and two-port configurations for T1 and for E1, and in two-port configurations with drop-and-insert capability for T1 and E1. MFTs support the following kinds of traffic:

- Data. As WICs for T1 or E1 applications, including fractional data line use, the T1 version includes a fully managed DSU/CSU, and the E1 version includes a fully managed DSU.
- Packet voice. As VWICs included with the digital T1 or E1 packet voice trunk network module to provide connections to PBXs and COs, the MFTs enable packet voice applications.
- Multiplexed voice and data. Some two-port T1 or E1 VWICs can provide drop-and-insert multiplexing services with integrated DSU/CSUs. For example, when used with a digital T1 packet voice trunk network module, drop-and-insert allows 64-kbps DS0 channels to be taken from one T1 and digitally cross-connected to 64-kbps DS0 channels on another T1. Drop and insert, sometimes called TDM cross-connect, uses circuit switching rather than the DSPs that VoIP technology employs. (Drop-and-insert is described in the "Configuring Trunk Connections and Trunk Conditioning Features" chapter in this configuration guide.)

The digital T1 or E1 packet voice trunk network module contains five 72-pin Single In-line Memory Module (SIMM) sockets or banks, numbered 0 through 4, for PVDMs. Each socket can be filled with a single 72-pin PVDM, and there must be at least one packet voice data module (PVDM-12) in the network module to process voice calls. Each PVDM holds three digital signal processors (DSPs), so with five PVDM slots populated, a total of 15 DSPs are provided. High-complexity codecs support two simultaneous calls on each DSP, and medium-complexity codecs support four calls on each DSP. A digital T1 or E1 packet voice trunk network module can support the following numbers of channels:

- When the digital T1 or E1 packet voice trunk network module is configured for high-complexity codec mode, up to six voice or fax calls can be completed per PVDM-12, using the following codecs: G.711, G.726, G.729, G729 Annex A (E1), G.729 Annex B, G.723.1, G723.1 Annex A (T1), G.728, and fax relay.
- When the digital T1 or E1 packet voice trunk network module is configured for medium-complexity codec mode, up to 12 voice or fax calls can be completed per PVDM-12, using the following codecs: G.711, G.726, G.729 Annex A, G.729 Annex B with Annex A, and fax relay.

For more information, refer to the following publications:

- *Cisco 2600 Series Hardware Installation Guide*
- *Cisco 3600 Series Hardware Installation Guide*
- *Cisco Network Module Hardware Installation Guide*
- Cisco IOS Release 12.0(7)T online document *Configuring 1- and 2-Port T1/E1 Multiflex Voice/WAN Interface Cards on Cisco 2600 and 3600 Series Routers*

Cisco MC3810 Multiservice Concentrator

To support a T1 or E1 digital voice interface, the Cisco MC3810 multiservice concentrator must be equipped with a digital voice interface card (DVM). The DVM interfaces with a digital PBX, channel bank, or video codec. It supports up to 24 channels of compressed digital voice at 8 kbps, or it can cross-connect channelized data from user equipment directly onto the router's trunk port for connection to a carrier network.

The DVM is available with a balanced interface using an RJ-48 connector or with an unbalanced interface using Bayonet-Neill-Concelman (BNC) connectors.

Optional HCMs can replace standard VCMs to operate according to the voice compression coding algorithm (codec) specified when the Cisco MC3810 multiservice concentrator is configured. The HCM2 provides 4 voice channels at high codec complexity and 8 channels at medium complexity. The

HCM6 provides 12 voice channels at high complexity and 24 channels at medium complexity. You can install one or two HCMs in a Cisco MC3810, but an HCM can not be combined with a VCM in the same chassis.

For more information, refer to the following publications:

- *Cisco MC3810 Multiservice Concentrator Hardware Installation Guide*
- *Overview of the Cisco MC3810 Series*
- *Configuring Cisco MC3810 Series Concentrators to Use High-Performance Compression Modules*

Cisco AS5300 Universal Access Server

The Cisco AS5300 Universal Access Server includes three expansion slots. One slot is for either an Octal T1/E1/PRI feature card (eight ports) or a Quad T1/E1/PRI feature card (four ports), and the other two can be used for voice/fax or modem feature cards. Because a single voice/fax feature card (VFC) can support up to 48 (T1) or 60 (E1) voice calls, the Cisco AS5300/Voice Gateway system can support a total of 96 or 120 simultaneous voice calls. The use of VFCs requires Cisco IOS release 12.0.2XH or later.

Cisco AS5300 VFCs are coprocessor cards, each with a powerful reduced instruction set computing (RISC) engine and dedicated, high-performance DSPs to ensure predictable, real-time voice processing. The design couples this coprocessor with direct access to the Cisco AS5300 routing engine for streamlined packet forwarding.

For more information, refer to the following publications:

- *Cisco AS5300 Chassis Installation Guide*
- *Cisco AS5300 Module Installation Guide*

Cisco AS5800 Universal Access Server

The Cisco AS5800 Universal Access Server consists of two primary system components: the Cisco 5814 dial shelf (DS), which holds channelized trunk cards and connects to the PSTN, and the Cisco 7206 router shelf (RS), which holds port adapters and connects to the IP backbone.

The dial shelf acts as the access concentrator by accepting and consolidating all types of remote traffic, including voice, dial-in analog and digital ISDN data, and industry-standard WAN and remote connection types. The dial shelf also contains controller cards voice feature cards, modem feature cards, trunk cards, and dial shelf interconnect cards.

One or two dial shelf controllers (DSCs) provide clock and power control to the dial shelf cards. Each DSC contains a block of logic that is referred to as the common logic and system clocks. This block of logic can use a variety of sources to generate the system timing, including an E1 or T1/T3 input signal from the BNC connector on the DSC's front panel. The configuration commands for the master clock specify the various clock sources and a priority for each source (see the "Clock Sources on Digital T1/E1 Voice Ports" section on page 68).

The Cisco AS5800 voice feature card is a multi-DSP coprocessing board and software package that adds VoIP capabilities to the Cisco AS5800 platform. The Cisco AS5800 voice feature card, when used with other cards such as LAN/WAN and modem cards, provides a gateway for up to 192 packetized voice/fax calls and 360 data calls per card. A Cisco AS5800 can support up to 1,344 voice calls in split-dial-shelf configuration with two 7206VXR router shelves.

For more information, refer to the following publications:

- *Cisco AS5800 Universal Access Server Operation, Administration, Maintenance, and Provisioning Guide*
- *Cisco AS5800 Access Server Hardware Installation Guide*

Cisco 7200 and Cisco 7500 Series Routers

Cisco 7200 and Cisco 7500 series routers support multimedia routing and bridging with a wide variety of protocols and media types. The Cisco 7000 family versatile interface processor (VIP) is based on a RISC engine optimized for I/O functions. To this engine are attached one or two port adapters or daughter boards, which provide the media-specific interfaces to the network. The network interfaces provide connections between the routers' peripheral component interconnect (PCI) buses and external networks. Port adapters can be placed in any available port adapter slot, in any desired combination.

T1/E1 high-capacity digital voice port adapters for Cisco 7200 and Cisco 7500 series routers allow enterprises or service providers, using the equipped routers as customer premise equipment, to deploy digital voice and fax relay. These port adapters receive constant bit-rate telephony information over T1/E1 interfaces and can convert that information to a compressed format for transmission as voice over IP (VoIP). Two types of digital voice port adapters are supported on Cisco 7200 and Cisco 7500 series routers: two-port high-capacity (up to 48 or 120 channels of compressed voice, depending on codec choice), and two-port moderate capacity (up to 24 or 48 channels of compressed voice). These single-width port adapters incorporate two universal ports configurable for either T1 or E1 connection, for use with high-performance digital signal processors (DSPs). Integrated CSU/DSUs, echo cancellation, and DS0 drop-and-insert functionality eliminate the need for external line termination devices and multiplexers.

For more information, refer to the following publications:

- *Cisco 7200 VXR Installation and Configuration Guide*
- *Cisco 7500 Series Installation and Configuration Guide*
- *Two-Port T1/E1 Moderate-Capacity and High-Capacity Digital Voice Port Adapter Installation and Configuration*

Note For current information about supported hardware, see the release notes for the platform and Cisco IOS release being used.

Configuring Basic Parameters on Digital T1/E1 Voice Ports

This section describes commands for basic digital voice port configuration. Make sure you have all the data recommended in the "Preparing Information to Configure Digital Voice Ports" section on page 58 before starting this procedure.

4.350

The basic steps for configuring digital voice ports are described in the next three sections. They are grouped by the configuration mode from which they are executed, as follows:

- Configuring Codec Complexity for Digital T1/E1 Voice Ports, page 64

  Codec complexity refers to the amount of processing power assigned to codec processing on a voice port. On most router platforms that support codec complexity, codec complexity is selected in voice card configuration mode, although it is selected in DSP interface mode on the Cisco 7200 and 7500 series. The value configured for codec complexity establishes the choice of codecs that are available on the dial peers. See the *Configuring Dial Plans, Dial Peers, and Digit Manipulation* chapter in this configuration guide for more information about configuring dial peers.
- Configuring Controller Settings for Digital T1/E1 Voice Ports, page 67

  Specific line characteristics must be configured to match those of the PSTN line that is being connected to the voice port. These are typically configured in controller configuration mode.
- Configuring Basic Voice Port Parameters for Digital T1/E1 Voice Ports, page 78

  Voice port configuration mode allows many of the basic voice call attributes to be configured to match those of the PSTN or PBX connection being made on this voice port.

In addition to the basic voice port parameters, there are additional commands that allow for the fine-tuning of the voice port configurations or for configuration of optional features. In most cases, the default values for these commands are sufficient for establishing voice port configurations. If it is necessary to change some of these parameters to improve voice quality or to match parameters in proprietary PBXs to which you are connecting, use the commands in the "Fine-Tuning Analog and Digital Voice Ports" section on page 80.

After voice port configuration, make sure the ports are operational by following the steps described in these sections:

- Verifying Analog and Digital Voice-Port Configurations, page 99
- Troubleshooting Analog and Digital Voice Port Configurations, page 110

For more information on voice port commands, refer to the *Cisco IOS Voice, Video, and Fax Command Reference*.

Configuring Codec Complexity for Digital T1/E1 Voice Ports

On the Cisco 2600, 3600, 7200, and 7500 routers, codec complexity can be configured separately for each T1/E1 digital packet voice trunk network module or port adapter. On a Cisco MC3810 multiservice concentrator, only a single codec complexity setting is used, even when two HCMs are installed. The value specified in this task affects the choice of codecs available when the **codec** dial-peer configuration command is configured.

For details on the number of calls that can be handled simultaneously using each of the codec standards, refer to the entries for **codec** and **codec complexity** in the *Cisco IOS Voice, Video, and Fax Command Reference* and to platform-specific product literature.

For more information on codec complexity, see the "Configuring Codec Complexity for Analog Voice Ports on the Cisco MC3810 with High-Performance Compression Modules" section on page 47.

Two configuration task tables are shown below: one for the Cisco 2600 and 3600 series routers and the Cisco MC3810 concentrator, which use voice card configuration mode, and the second for the Cisco 7200 and 7500 series routers, which use DSP interface configuration mode.

Cisco 2600 and 3600 Series and Cisco MC3810

This procedure applies to voice ports on digital packet voice trunk network modules on Cisco 2600 series and Cisco 3600 series routers, and to voice ports on HCMs on Cisco MC3810 multiservice concentrators.

Note On Cisco 2600 and 3600 series routers with digital T1/E1 packet voice trunk network modules, codec complexity cannot be configured if DS0 groups are configured. Use the **no ds0-group** command to remove DS0 groups before configuring codec complexity.

Note On the Cisco MC3810 multiservice concentrator with high compression modules, check the DSP voice channel activity with the **show voice dsp** command. If any DSP voice channels are in the busy state, you cannot change the codec complexity. When all of the DSP channels are in the idle state, you can make changes to the codec complexity selection.

To configure codec complexity, use the following commands beginning in privileged EXEC mode:

	Command	Purpose
Step 1	`Router# show voice dsp`	Checks the DSP voice channel activity. If any DSP voice channels are in the busy state, codec complexity cannot be changed. When all of the DSP channels are in the idle state, continue to Step 2.
Step 2	`Router# configure terminal`	Enters global configuration mode.
Step 3	`Router(config)# voice-card slot`	Enters voice card configuration mode for the card or cards in the slot specified. For the Cisco 2600 and 3600 series routers, the *slot* argument ranges from 0 to 5. For the Cisco MC3810 multiservice concentrator, *slot* must be 0.
Step 4	`Router(config-voicecard)# codec complexity {high | med}`	Specifies codec complexity based on the codec standard being used. This setting restricts the codecs available in dial peer configuration. All voice cards in a router must use the same codec complexity setting. The keywords are as follows: • **high**—(Optional) Specifies up to six voice or fax calls completed per PVDM-12, using the following codecs: G.711, G.726, G.729, G.729 Annex B, G.723.1, G.723.1 Annex A, G.728, and fax relay. • **med**—(Optional) Supports up to 12 voice or fax calls completed per PVDM-12, using the following codecs: G.711, G.726, G.729 Annex A, G.729 Annex B with Annex A, and fax relay. The default is **med**. **Note** On the Cisco MC3810 multiservice concentrator, this command is valid only with one or more HCMs installed, and voice card 0 must be specified. If two HCMs are installed, this command configures both HCMs at once.

7.348

Cisco AS5300 Universal Access Server

Codec support on the Cisco AS5300 universal access server is determined by the capability list on the voice feature card, which defines the set of codecs that can be negotiated for a voice call. The capability list is created and populated when VCWare is unbundled and DSPWare is added to VFC Flash memory. The capability list does not indicate codec preference; it simply reports the codecs that are available. The session application decides which codec to use. Codec support is configured on dial peers rather than on voice ports; see the "Configuring Dial Plans, Dial Peers, and Digit Manipulation" chapter in this configuration guide.

Cisco AS5800 Universal Access Server

Selection of codec support on Cisco AS5800 access servers is made during dial peer configuration. See the "Configuring Dial Plans, Dial Peers, and Digit Manipulation" chapter in this configuration guide.

Cisco 7200 Series and Cisco 7500 Series Routers

On Cisco 7200 series and Cisco 7500 series routers, codec complexity is configured on the DSP interface.

Note Check the DSP voice channel activity using the **show interfaces dspfarm** command. If any DSP voice channels are in the busy state, codec complexity cannot be changed. When all of the DSP channels are in the idle state, changes can be made to the codec complexity selection.

To configure the DSP interface, use the following commands beginning in privileged EXEC mode:

	Command	Purpose
Step 1	`Router#` **`show interfaces dspfarm`**	Displays the DSP voice channel activity. If any DSP voice channels are in the busy state, codec complexity cannot be changed. When all of the DSP channels are in the idle state, continue to Step 2.
Step 2	`Router#` **`configure terminal`**	Enters global configuration mode.

Step 3	**Cisco 7200 series**
	`Router(config)#` **`dspint dspfarm`** *`slot/port`*
	Cisco 7500 series
	`Router(config)#` **`dspint dspfarm`** *`slot/port-adapter/port`*
		Enters DSP interface configuration mode. The arguments are as follows:
		• *slot/port*—Specifies the slot and port numbers of the interface.
		• *adapter/port*—Specifies the adapter and port numbers of the interface.

	Command	Purpose
Step 4	`Router(config-dspfarm)# codec {high | med}`	Specifies the codec complexity based on the codec standard being used. The keyword specified for **codec** affects the choice of codecs available when the **codec** dial-peer configuration command is used. The keywords are as follows: • **high**—Supports two voice channels encoded in any of the following formats: G.711, G.726, G.729, G.729 Annex B, G.723.1, G.723.1 Annex A, G.728, and fax relay. • **med**—(default) Supports up to four calls using the following codecs: G.711, G.726, G.729 Annex A, G.729 Annex B with Annex A, and fax relay.
Step 5	`Router(config-dspfarm)# description`	Enters a string to include descriptive text about this DSP interface connection. This information is displayed in the output for **show** commands and does not affect the operation of the interface in any way.

Configuring Controller Settings for Digital T1/E1 Voice Ports

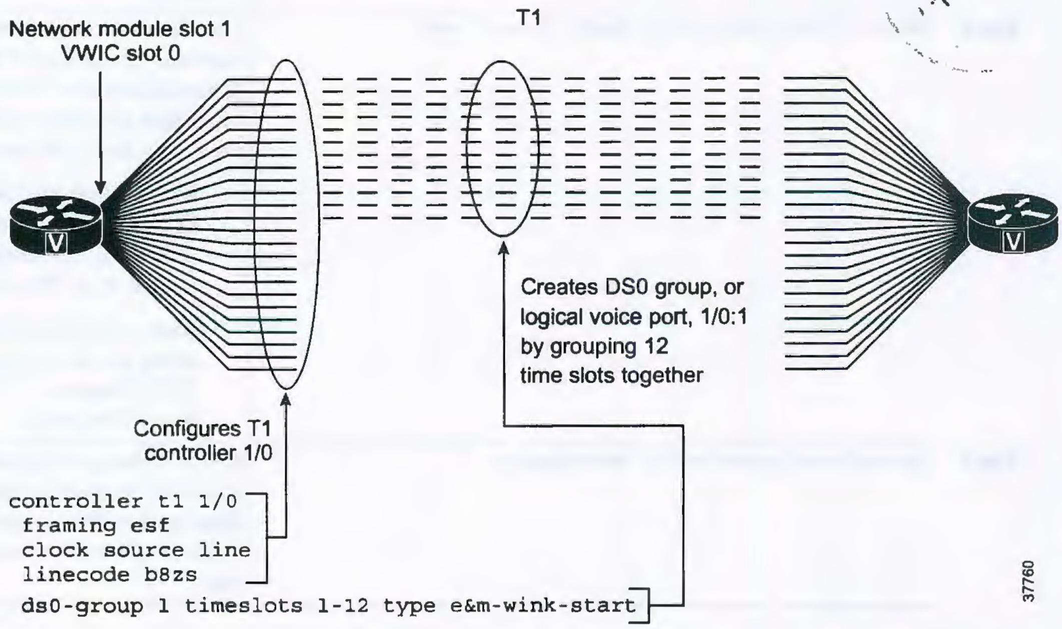
The purpose of configuring controllers for digital T1/E1 voice ports is to match the configuration of the router to the line characteristics of the telephony network connection being made so that voice and signaling can be transferred between them and so that logical voice ports, or DS0 groups, may be established.

Figure 16 shows how a **ds0-group** command gathers some of the DS0 time slots from a T1 line into a group that becomes a single logical voice port, which can later be addressed as a single entity in voice port configurations. Other DS0 groups for voice can be created from the remaining time slots shown in the figure, or the time slots can be used for data or serial pass-through.

Note that all the controller commands in Figure 16 other than **ds0-group** apply to all the time slots in the T1.

7.346

Figure 16 T1 Controller Configuration on Cisco 2600 or 3600 Series Routers



```
controller t1 1/0
 framing esf
 clock source line
 linecode b8zs
 ds0-group 1 timeslots 1-12 type e&m-wink-start
```

Voice port controller configuration includes setting the parameters described in the following sections:

- Framing Formats on Digital T1/E1 Voice Ports
- Clock Sources on Digital T1/E1 Voice Ports
- Line Coding on Digital T1/E1 Voice Ports
- DS0 Groups on Digital T1/E1 Voice Ports

Another controller command that might be needed, **cablelength**, is discussed in the *Cisco IOS Interface Command Reference*, Release 12.2.

Framing Formats on Digital T1/E1 Voice Ports

The framing format parameter describes the way that bits are robbed from specific frames to be used for signaling purposes. The controller must be configured to use the same framing format as the line from the PBX or CO that connects to the voice port you are configuring.

Digital T1 lines use super frame (SF) or extended super frame (ESF) framing formats. SF provides two-state, continuous supervision signaling, in which bit values of 0 are used to represent on-hook and bit values of 1 are used to represent off-hook. ESF robs four bits instead of two, yet has little impact on voice quality. ESF is required for 64-kbps operation on DS0 and is recommended for Primary Rate Interface (PRI) configurations.

E1 lines can be configured for cyclic redundancy check (CRC4) or no cyclic redundancy check, with an optional argument for E1 lines in Australia.

Clock Sources on Digital T1/E1 Voice Ports

Digital T1/E1 interfaces use timers called *clocks* to ensure that voice packets are delivered and assembled properly. All interfaces handling the same packets must be configured to use the same source of timing so that packets are not lost or delivered late. The timing source that is configured can be external (from the line) or internal to the router's digital interface.

7.345

If the timing source is internal, timing derives from the onboard phase-lock loop (PLL) chip in the digital voice interface. If the timing source is line (external), then timing derives from the PBX or PSTN CO to which the voice port is connected. It is generally preferable to derive timing from the PSTN because their clocks are maintained at an extremely accurate level. This is the default setting for the clocks. When two or more controllers are configured, one should be designated as the primary clock source; it will drive the other controllers.

The **line** keyword specifies that the clock source is derived from the active line rather than from the free-running internal clock. The following rules apply to clock sourcing on the controller ports:

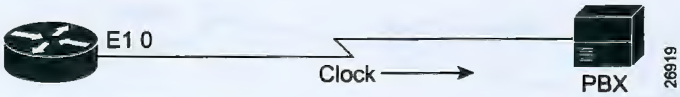
- When both ports are set to line clocking with no primary specification, port 0 is the default primary clock source and port 1 is the default secondary clock source.
- When both ports are set to line and one port is set as the primary clock source, the other port is by default the backup or secondary source and is loop-timed.
- If one port is set to clock source line or clock source line primary and the other is set to clock source internal, the internal port recovers clock from the clock source line port if the clock source line port is up. If it is down, then the internal port generates its own clock.
- If both ports are set to clock source internal, there is only one clock source: internal.

This section describes the five basic timing scenarios that can occur when a digital voice port is connected to a PBX or CO. In all the examples that follow, the PSTN (or CO) and the PBX are interchangeable for purposes of providing or receiving clocking.

- Single Voice Port Providing Clocking—In this scenario, the digital voice hardware is the clock source for the connected device, as shown in Figure 17. The PLL generates the clock internally and drives the clocking on the line. Generally, this method is useful only when connecting to a PBX, key system, or channel bank. A Cisco VoIP gateway rarely provides clocking *to* the CO because CO clocking is much more reliable. The following configuration sets up this clocking method for a digital E1 voice port:

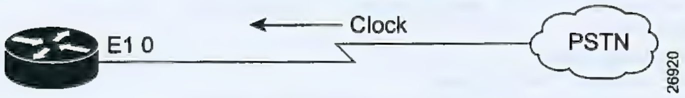
```
controller E1 1/0
 framing crc4
 linecoding hdb3
 clock source internal
 ds0-group timeslots 1-15 type e&m-wink-start
```

Figure 17 Single Voice Port Providing Clocking



- Single Voice Port Receiving Internal Clocking—In this scenario, the digital voice hardware receives clocking from the connected device (CO telephony switch or PBX) (see Figure 18). The PLL clocking is driven by the clock reference on the receive (Rx) side of the digital line connection.

Figure 18 Single E1 Port Receiving Clocking from the Line



7.344

The following configuration sets up this clocking method:

```
controller T1 1/0
 framing esf
 linecoding ami
 clock source line
 ds0-group timeslots 1-12 type e&m-wink-start
```

- Dual Voice Ports Receiving Clocking from the Line—In this scenario, the digital voice port has two reference clocks, one from the PBX and another from the CO, as shown in Figure 19. Because the PLL can derive clocking from only one source, this case is more complex than the two preceding examples.

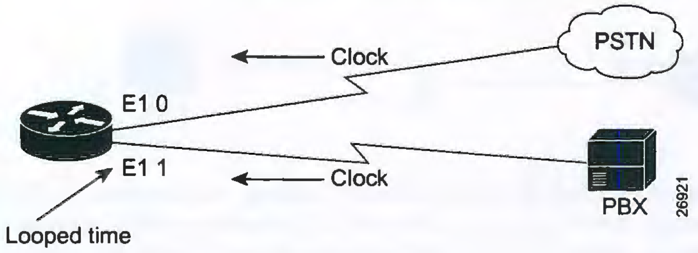
  Before looking at the details, consider the following as they pertain to the clocking method:

  - Looped-time clocking: The voice port takes the clock received on its Rx (receive) pair and regenerates it on its Tx (transmit) pair. While the port receives clocking, the port is not driving the PLL on the card but is "spoofing" (that is, fooling) the port so that the connected device has a viable clock and does not see slips (that is, loss of data bits). PBXs are not designed to accept slips on a T1 or E1 line, and such slips cause a PBX to drop the link into failure mode. While in looped-time mode, the router often sees slips, but because these are controlled slips, they usually do not force failures of the router's voice port.
  - Slips: These messages indicate that the voice port is receiving clock information that is out of phase (out of synchronization). Because the router has only a single PLL, it can experience controlled slips while it receives clocking from two different time sources. The router can usually handle controlled slips because its single-PLL architecture anticipates them.

Note Physical layer issues, such as bad cabling or faulty clocking references, can cause slips. Eliminate these slips by addressing the physical layer or clock reference problems.

In the dual voice ports receiving clocking from the line scenario, the PLL derives clocking from the CO and puts the voice port connected to the PBX into looped-time mode. This is usually the best method because the CO provides an excellent clock source (and the PLL usually requires that the CO provide that source) and a PBX usually must receive clocking from the other voice port.

Figure 19 Dual E1 Ports Receiving Clocking from the Line



The following configuration sets up this clocking method:

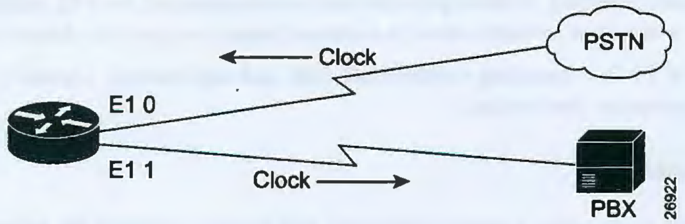
```
controller E1 1/0 << description - connected to the CO
 framing crc4
 linecoding hdb3
 clock source line primary
 ds0-group timeslots 1-15 type e&m-wink-start
!
```

```
controller E1 1/1 << description - connected to the PBX
 framing crc4
 linecoding hdb3
 clock source line
 ds0-group timeslots 1-15 type e&m-wink-start
```

The **clock source line primary** command tells the router to use this voice port to drive the PLL. All other voice ports configured as **clock source line** are then put into an implicit loop-timed mode. If the primary voice port fails or goes down, the other voice port instead receives the clock that drives the PLL. In this configuration, port 1/1 might see controlled slips, but these should not force it down. This method prevents the PBX from seeing slips.

- Dual Voice Ports (One Receives Clocking and One Provides Clocking)—In this scenario, the digital voice hardware receives clocking for the PLL from E1 0 and uses this clock as a reference to clock E1 1 (see Figure 20). If controller E1 0 fails, the PLL internally generates the clock reference to drive E1 1.

Figure 20 Dual E1 ports—One Receiving and One Providing Clocking

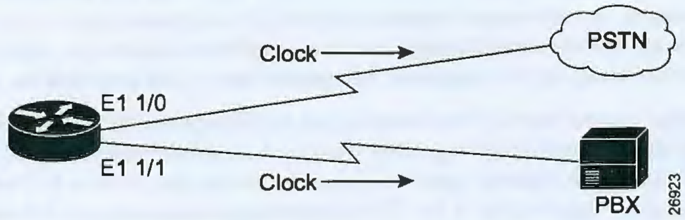


The following configuration sets up this clocking method:

```
controller E1 1/0
 framing crc4
 linecoding hdb3
 clock source line
 ds0-group timeslots 1-15 type e&m-wink-start
!
controller E1 1/1
 framing crc4
 linecoding hdb3
 clock source internal
 ds0-group timeslots 1-15 type e&m-wink-start
```

- Dual Voice Ports (Router Provides Both Clocks)—In this scenario, the router generates the clock for the PLL and, therefore, for both voice ports (see Figure 21).

Figure 21 Dual E1 Ports—both Clocks from the Router



The following configuration sets up this clocking method:

```
controller E1 1/0
 framing crc4
 linecoding hdb3
 clock source internal
 ds0-group timeslots 1-15 type e&m-wink-start
!
controller E1 1/1
 framing esf
 linecoding b8zs
 clock source internal
 ds0-group timeslots 1-15 type e&m-wink-start
```

Line Coding on Digital T1/E1 Voice Ports

Digital T1/E1 interfaces require that line encoding be configured to match that of the PBX or CO that is being connected to the voice port. Line encoding defines the type of framing used on the line.

T1 line encoding methods include alternate mark inversion (AMI) and binary 8 zero substitution (B8ZS). AMI is used on older T1 circuits and references signal transitions with a binary 1, or "mark." B8ZS, a more reliable method, is more popular and is recommended for PRI configurations as well. B8ZS encodes a sequence of eight zeros in a unique binary sequence to detect line-coding violations.

Supported E1 line encoding methods are AMI and high-density bipolar 3 (HDB3), which is a form of zero-suppression line coding.

DS0 Groups on Digital T1/E1 Voice Ports

For digital voice ports, a single command, **ds0-group**, performs the following functions:

- Defines the T1/E1 channels for compressed voice calls.
- Automatically creates a logical voice port.

  The numbering for the logical voice port created as a result of this command is *controller:ds0-group-no*, where *controller* is defined as the platform-specific address for a particular controller. On a Cisco 3640 router, for example, **ds0-group 1 timeslots 1-24 type e&m-wink** automatically creates the voice port 1/0:1 when issued in the configuration mode for controller 1/0. On a Cisco MC3810 universal concentrator, when you are in the configuration mode for controller 0, the command **ds0-group 1 timeslots 1-24 type e&m-wink** creates logical voice port 0:1.

  To map individual DS0s, define additional DS0 groups under the T1/E1 controller, specifying different time slots. Defining additional DS0 groups also creates individual DS0 voice ports.

- Defines the emulated analog signaling method that the router uses to connect to the PBX or PSTN

  Most digital T1/E1 connections used for switch-to-switch (or switch-to-router) trunks are E&M connections, but FXS and FXO connections are also supported. These are normally used to provide emulated-OPX (Off-Premises eXtension) from a PBX to remote stations. FXO ports connect to FXS ports. The FXO or FXS connection between the router and switch (CO or PBX) must use matching signaling, or calls cannot connect properly. Either ground start or loop start signaling is appropriate for these connections. Ground start provides better disconnect supervision to detect when a remote user has hung up the telephone, but ground start is not available on all PBXs.

  Digital ground start differs from digital E&M because the A and B bits do not track each other as they do in digital E&M signaling (that is, A is not necessarily equal to B). When the CO delivers a call, it *seizes* a channel (goes off-hook) by setting the A bit to 0. The CO equipment also simulates ringing by toggling the B bit. The terminating equipment goes off-hook when it is ready to answer the call. Digits are usually not delivered for incoming calls.

E&M connections can use one of three different signaling types to acknowledge on-hook and off-hook states: wink start, immediate start, and delay start. E&M wink start is usually preferred, but not all COs and PBXs can handle wink start signaling. The E&M connection between the router and switch (CO or PBX) must match the CO or PBX E&M signaling type, or calls cannot be connected properly.

E&M signaling is normally used for trunks. It is normally the only way that a CO switch can provide two-way dialing with Direct Inward Dialing (DID). In all the E&M protocols, off-hook is indicated by A=B=1 and on-hook is indicated by A=B=0 (robbed-bit signaling). If dial pulse dialing is used, the A and B bits are pulsed to indicate the addressing digits. The are several further important subclasses of E&M robbed-bit signaling:

- E&M Wink Start—Feature Group B

  In the original wink start handshaking protocol, the terminating side responds to an off-hook from the originating side with a short wink (transition from on-hook to off-hook and back again). This wink tells the originating side that the terminating side is ready to receive addressing digits. After receiving addressing digits, the terminating side then goes off-hook for the duration of the call. The originating endpoint maintains off-hook for the duration of the call.

- E&M Wink Start—Feature Group D

  In Feature Group D wink start with wink acknowledge handshaking protocol, the terminating side responds to an off-hook from the originating side with a short wink (transition from on-hook to off-hook and back again) just as in the original wink start. This wink tells the originating side that the terminating side is ready to receive addressing digits. After receiving addressing digits, the terminating side provides another wink (called an *acknowledgment wink*) that tells the originating side that the terminating side has received the dialed digits. The terminating side then goes off-hook to indicate connection. This last indication can be due to the ultimate called endpoint's having answered. The originating endpoint maintains an off-hook condition for the duration of the call.

- E&M Immediate Start

  In the immediate-start protocol, the originating side does not wait for a wink before sending addressing information. After receiving addressing digits, the terminating side then goes off-hook for the duration of the call. The originating endpoint maintains off-hook for the duration of the call.

Note Feature Group D is supported on Cisco AS5300 platforms, and on Cisco 2600, 3600, and 7200 series with digital T1 packet voice trunk network modules. Feature Group D is not supported on E1 or analog voice ports.

7.340

To configure controller settings for digital T1/E1 voice ports, use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	**Cisco 7200 and 7500 series** `Router(config)# card type {t1 | e1} slot`	Defines the card as T1 or E1 and stipulates the location. The keywords and arguments are as follows: • **t1** | **e1**—Defines the type of card. • *slot*—A value from 0 to 5.

Step 2	**Cisco 2600 and 3600 series, Cisco MC3810, and Cisco 7200 series**
	`Router(config)# controller {t1 | e1} slot/port`
	Cisco AS5300
	`Router(config)# controller {t1 | e1} number`
	Cisco AS5800
	`Router(config)# controller {t1 | e1} shelf/slot/port`
	Cisco 7500 series
	`Router(config)# controller {t1 | e1} slot/port-adapter/slot`
		Enters controller configuration mode.
		The keywords and arguments are as follows:
		• **t1** | **e1**—The type of controller.
		• *slot/port*—The backplane slot number and port number for the interface being configured.
		• *number*—The network processor module number; the range is from 0 to 2.
		• *shelf/slot/port*—Indicates the controller ports; the range for *port* is from 0 to 11.

Step 3	**T1**
	`Router(config-controller)# framing {sf | esf}`
	E1
	`Router(config-controller)# framing {crc4 | no-crc4} [australia]`
		Selects frame type for T1 or E1 line.
		The keywords and arguments are as follows:
		T1 lines
		• **sf**—super frame
		• **esf**—extended super frame
		E1 lines
		• **crc4**—Provides 4 bits of error protection.
		• **no-crc4**—Disables **crc4**.
		• **australia**—(Optional) Specifies the E1 frame type used in Australia.
		The default for T1 is **sf**.
		The default for E1 is **crc4**.

7.339

	Command	Purpose
Step 4	Router(config-controller)# **clock source** {**line** [**primary** | **secondary**] | **internal**}	Configures the clock source. The keywords and arguments are as follows: • **line**—Specifies that the PLL on this port derives clocking from the external source to which the port is connected (generally the CO). • **primary**—(Optional) Specifies that the PLL on this port derives clocking from the external source and puts the other port (generally connected to the PBX) into looped-time mode. Both ports are configured with **line**, but only the port connected to the external source is configured with **primary**. • **secondary**—(Optional) Indicates a backup external source for clocking if the primary clocking shuts down. Configure the **clock source line secondary** command on the controller that has the next-best-known clocking. • **internal**—(Optional) Specifies that the clock is generated from the voice port's internal PLL. For more information about clock sources, see the "Clock Sources on Digital T1/E1 Voice Ports" section on page 68. The default is **line**.

Step 5	**T1 lines**
	Router(config-controller)# **linecode** {**ami** | **b8zs**}
	E1 lines
	Router(config-controller)# **linecode** {**ami** | **hdb3**}
		Specifies the line encoding to use.
		The keywords are as follows:
		• **ami**—Specifies the alternate mark inversion (AMI) line code type. (T1 and E1)
		• **b8zs**—Specifies the binary 8 zero substitution (B8ZS) line code type. (T1 only)
		• **hdb3**—Specifies the high-density bipolar 3 (HDB3) line code type. (E1 only)
		The default for T1 is **ami**.
		The default for E1 is **hdb3**.

7.338 >

	Command	Purpose
Step 6	**Cisco 2600 and 3600 Series Routers and Cisco MC3810 Multiservice Concentrators—T1** Router(config-controller)# **ds0-group** *ds0-group-no* **timeslots** *timeslot-list* **type** {**e&m-delay-dial** | **e&m-fgd** | **e&m-immediate-start** **e&m-wink-start** | **ext-sig** | **fgd-eana** | **fxo-ground-start** | **fxo-loop-start** | **fxs-ground-start** | **fxs-loop-start**} **Cisco 2600 and 3600 Series Routers and Cisco MC3810 Multservice Concentrators—E1** Router(config-controller)# **ds0-group** *ds0-group-no* **timeslots** *timeslot-list* **type** {**e&m-delay-dial** | **e&m-immediate-start** | **e&m-melcas-delay** | **e&m-melcas-immed** | **e&m-melcas-wink** | **e&m-wink-start** | **ext-sig** | **fgd-eana** | **fxo-ground-start** | **fxo-loop-start** | **fxo-melcas** | **fxs-ground-start** | **fxs-loop-start** | **fxs-melcas** | **r2-analog** | **r2-digital** | **r2-pulse**} **Cisco AS5300 Universal Access Servers—T1** Router(config-controller)# **ds0-group** *ds0-group-no* **timeslots** *timeslot-list* [**service** {**data** | **fax** | **voice**}] [**type** {**e&m-fgb** | **e&m-fgd** | **e&m-immediate-start** | **fxs-ground-start** | **fxs-loop-start** | **fgd-eana** | **fgd-os** | **r1-itu** | **sas-ground-start** | **sas-loop-start** | **none**}] **Cisco AS5300 Universal Access Servers—E1** Router(config-controller)# **ds0-group** *ds0-group-no* **timeslots** *timeslot-list* **type** {**none** | **p7** | **r2-analog** | **r2-digital** | **r2-lsv181-digital** | **r2-pulse**} **Cisco AS5800 Universal Access Servers—T1** Router(config-controller)# **ds0-group** *ds0-group-no* **timeslots** *timeslot-list* **type** {**e&m-fgb** | **e&m-fgd** | **e&m-immediate-start** | **fxs-ground-start** | **fxs-loop-start** | **fgd-eana** | **r1-itu** | **r1-modified** | **r1-turkey** | **sas-ground-start** | **sas-loop-start** | **none**} **Cisco AS5800 Universal Access Servers E1 Voice Ports** Router(config-controller)# **ds0-group** *ds0-group-no* **timeslots** *timeslot-list* **type** {**e&m-fgb** | **e&m-fgd** | **e&m-immediate-start** | **fxs-ground-start** | **fxs-loop-start** | **p7** | **r2-analog** | **r2-digital** | **r2-pulse** | **sas-ground-start** | **sas-loop-start** | **none**} **Cisco 7200 and 7500 Series Series Routers T1 and E1 Voice Ports** Router(config-controller)# **ds0-group** *ds0-group-no* **timeslots** *timeslot-list* **type** {**e&m-delay** | **e&m-immediate** | **e&m-wink** | **fxs-ground-start** | **fxs-loop-start** | **fxo-ground-start** | **fxo-loop-start**}	Defines the T1 channels for use by compressed voice calls and the signaling method that the router uses to connect to the PBX or CO. **Note** This step shows the basic syntax and signaling types available with the **ds0-group** command. For the complete syntax, see the *Cisco IOS Voice, Video, and Fax Command Reference*, Release 12.2. The keywords and arguments are as follows: • *ds0-group-no*—Identifies the DS0 group (number from 0 to 23, for T1, or from 0 to 30, for E1). • **timeslots** *timeslot-list*—Specifies the single time slot number, single range of numbers, or multiple ranges of numbers separated by commas. For T1/E1, allowable values are from 1 to 24. Examples are as follows: – 2, 3-5 – 1, 7, 9 – 1-12 • **service**—Indicates the type of calls to be handled by this DS0 group—data, fax, or voice). • **type**—Refers to the signaling type of the telephony connection being made. Types include the following: – **e&m-delay-dial**—Specifies the originating endpoint that sends an off-hook signal and waits for the off-hook signal followed by an on-hook signal from the destination. – **e&m-fgb**—E & M Type II Feature Group B. – **e&m-fgd**—E & M Type II Feature Group D.

7.337
J

	Command	Purpose
		- **e&m-immediate-start**—E & M Immediate Start. - **e&m-melcas-delay**—E&M Mercury Exchange Limited Channel Associated Signaling (MELCAS) delay start signaling support. - **e&m-melcas-immed**—E&M MELCAS immediate start signaling support. - **e&m-melcas-wink**—E&M MELCAS wink start signaling support. - **e&m-wink-start**—The originating endpoint sends an off-hook signal and waits for a - **ext-sig**—For the specified channel, automatically generates the off-hook signal and stays in the off-hook state. - **fgd-eana**—Feature Group D Exchange Access North American. - **fgd-os**—Feature Group D Operator Services. - **fxo-melcas**—MELCAS Foreign Exchange Office signaling support. - **fxs-melcas**—MELCAS Foreign Exchange Station signaling support. - **fxs-ground-start**—FXS Ground Start. - **fxs-loop-start**—FXS Loop Start. - **none**—Null Signaling for External Call Control. - **p7**—Specifies the p7 switch type. - **r1-itu**—R1 ITU - **sas-ground-start**—SAS Ground Start. - **sas-loop-start**—SAS Loop Start. The **r1** and **r2** keywords refer to line signaling, based on international signaling standards. The **r1 itu** keywords are based on signaling standards in countries besides the United States. An "ITU variant" means that there are multiple R1 standards in a particular country but that Cisco supports the ITU variant.
Step 7	`Router(config-controller)# no shutdown`	Activates the controller.

7.336

Configuring Basic Voice Port Parameters for Digital T1/E1 Voice Ports

For FXO and FXS connections the default voice-port parameter values are often adequate. However, for E&M connections, it is important to match the characteristics of your PBX, so voice port parameters may need to be reconfigured from their defaults.

Each voice port that you address in digital voice port configuration is one of the logical voice ports that you created with the **ds0-group** command.

Companding (from *compression* and *expansion*), used in Step 4 of the following table, is the part of the PCM process in which analog signal values are logically rounded to discrete scale-step values on a nonlinear scale. The decimal step number is then coded in its binary equivalent prior to transmission. The process is reversed at the receiving terminal using the same nonlinear scale.

Note The commands, keywords, and arguments that you are able to use may differ slightly from those presented here, based on your platform, Cisco IOS release, and configuration. When in doubt, use Cisco IOS command help (**command ?**) to determine the syntax choices that are available.

To configure basic parameters for digital T1/E1 voice ports, use the following commands beginning in global configuration mode.

	Command	Purpose

Step 1	**Cisco 2600 and 3600 Series Routers**
	`Router(config)# voice-port slot/port:ds0-group-no`
	Cisco MC3810 Multiseries Concentrators
	`Router(config)# voice-port slot:ds0-group-no`
	Cisco AS5300 Universal Access Server
	`Router(config)# voice-port controller:ds0-group-no`
	Cisco AS5800 Universal Access Server
	`Router(config)# voice-port shelf/slot/port:ds0-group-no`
	Cisco 7200 Series Routers
	`Router(config)# voice-port slot/port-adapter:ds0-group-no`
	Cisco 7500 Series Routers
	`Router(config)# voice-port slot/port-adapter/slot:ds0-group-no`
		Enters voice-port configuration mode. The arguments are defined as the following
		• *slot*—Specifies the router location where the network module (Cisco 2600, 3600, and MC3810) or voice port adapter (Cisco AS5300, AS5800, 7200, and 7500) is installed. This is the same number as the controller for the T1/E1 voice port.
		• *port*—Indicates the voice interface card location.
		• *ds0-group-no*—Specifies the logical voice port that was created with the **ds0-group** controller command.
		• *controller*—Indicates the controller for the T1/E1 voice port.
		• *shelf*—Specifies the dial shelf, which is always 0.
		• *port-adapter*—Indicates the port adapter for the voice port.

Step 2	`Router(config-voiceport)# type {1 | 2 | 3 | 5}`	(E&M only) Specifies the type of E&M interface to which this voice port is connected. See Table 5 for an explanation of E&M types. The default is 1.

	Command	Purpose
Step 3	`Router(config-voiceport)# `**`cptone`** *`locale`*	Selects a two-letter **locale** keyword for the voice call progress tones and other locale-specific parameters to be used on this voice port. Voice call progress tones include dial tone, busy tone, and ringback tone, which vary with geographical region. Other parameters include ring cadence and compand type. Cisco routers comply with the ISO3166 locale name standards; to see valid choices, enter a question mark (?) following the **cptone** command. The default is **us**.
Step 4	`Router(config-voiceport)# `**`compand-type`**` {`**`u-law`**` | `**`a-law`**`}`	(Cisco 2600 and 3600 series routers and Cisco MC3810 multiservice concentrators only) Specifies the companding standard used. This command is used in cases when the DSP is not used, such as local cross-connects, and overwrites the **compand-type** value set by the **cptone** command. The keywords are as follows: • **a-law**—Specifies the ITU-T PCM a-law companding standard used primarily in Europe. The default for E1 is **a-law**. • **u-law**—Specifies the ITU-T PCM mu-law companding standard used in North America and Japan. The default for T1 is **u-law**. **Note** If you have a Cisco MC3810 multiservice concentrator or Cisco 3660 router, the **compand-type a-law** command must be configured on the analog ports only. The Cisco 2660, 3620, and 3640 routers do not require the **compand-type a-law** command configured, however, if you request a list of commands, the **compand-type a-law** command will display.

Step 5	**Cisco 2600 series and 3600 series**
	`Router(config-voiceport)# `**`ring frequency`**` {25 | 50}`
	Cisco MC3810
	`Router(config-voiceport)# `**`ring frequency`**` {20 | 30}`
		(FXS only) Selects the ring frequency, in hertz, used on the FXS interface. This number must match the connected telephony equipment, and can be country-dependent. If not set properly, the attached telephony device may not ring or it may buzz.
		The default is 25 on the Cisco 2600 and 3600 series routers and 20 on the Cisco MC3810 multiservice concentrators.

7.334

	Command	Purpose
Step 6	Router(config-voiceport)# **ring number** *number*	(FXO only) Specifies the maximum number of rings to be detected before an incoming call is answered by the router. The default is 1.
Step 7	Router(config-voiceport)# **ring cadence** {[**pattern01** | **pattern02** | **pattern03** | **pattern04** | **pattern05** | **pattern06** | **pattern07** | **pattern08** | **pattern09** | **pattern10** | **pattern11** | **pattern12**] [**define** *pulse interval*]}	(FXS only) Specifies an existing pattern for ring, or defines a new one. Each pattern specifies a ring-pulse time and a ring-interval time. The keywords and arguments are as follows: • **pattern01** through **pattern12**—Specifies preset ring cadence patterns. Enter **ring cadence ?** to see ring pattern explanations. • **define** *pulse interval*—Specifies a user-defined pattern as follows: – *pulse* is a number (1 or 2 digits from 1 to 50) specifying ring pulse (on) time in hundreds of milliseconds. – *interval* is a number (1 or 2 digits from 1 to 50) specifying ring interval (off) time in hundreds of milliseconds. The default is the pattern specified by the configured **cptone locale** command.
Step 8	Router(config-voiceport)# **description** *string*	Attaches a text string to the configuration that describes the connection for this voice port. This description appears in various displays and is useful for tracking the purpose or use of the voice port. The *string* argument is a character string from 1 to 255 characters in length. The default is that no description is attached to the configuration.
Step 9	Router(config-voiceport)# **no shutdown**	Activates the voice port.

Fine-Tuning Analog and Digital Voice Ports

Normally, default parameter values for voice ports are sufficient for most networks. Depending on the specifics of your particular network, however, you may need to adjust certain parameters that are configured on voice ports. Collectively, these commands are referred to as voice port tuning commands.

Note The commands, keywords, and arguments that you are able to use may differ slightly from those presented here, based on your platform, Cisco IOS release, and configuration. When in doubt, use Cisco IOS command help (**command ?**) to determine the syntax choices that are available.

The voice port tuning commands are grouped into these categories and explained in the following sections:

- Auto Cut-Through Command, page 81
- Bit Modification Commands for Digital Voice Ports, page 81
- Calling Number Outbound Commands, page 83
- Disconnect Supervision Commands, page 84
- FXO Supervisory Disconnect Tone Commands, page 87
- Timeouts Commands, page 89
- Timing Commands, page 91
- DTMF Timer Inter-Digit Command for Cisco AS5300 Access Servers, page 92
- Voice Quality Tuning Commands, page 94

Full descriptions of the commands in this section can be found in the *Cisco IOS Voice, Video, and Fax Command Reference*, Release 12.2.

Auto Cut-Through Command

The **auto-cut-through** command allows you to connect to PBXs that do not provide an M-lead response.

To configure auto-cut-through, use the following command in voice-port configuration mode:

Command	Purpose
`Router(config-voiceport)# **auto-cut-through**`	(E&M only) Enables call completion on a router when a PBX does not provide an M-lead response.

Bit Modification Commands for Digital Voice Ports

The bit modification commands for digital voice ports modify sent or received bit patterns. Different versions of E&M use different ABCD signaling bits to represent idle and seize. For example, North American CAS E&M represents idle as 0XXX and seize as 1XXX, where X indicates that the state of the BCD bits is ignored. In MELCAS E&M, idle is 1101 and seize is 0101. The commands in this section are provided to modify bit patterns to match particular E&M schemes.

To manipulate bit patterns for digital voice ports, use the following commands as necessary, in voice-port configuration mode:

7.332

<table>
<tr><th></th><th>Command</th><th>Purpose</th></tr>
<tr><td><b>Step 1</b></td><td><code>Router(config-voiceport)# <b>condition</b> {<b>tx-a-bit</b> | <b>tx-b-bit</b> | <b>tx-c-bit</b> | <b>tx-d-bit</b>} {<b>rx-a-bit</b> | <b>rx-b-bit</b> | <b>rx-c-bit</b> | <b>rx-d-bit</b>} {<b>on</b> | <b>off</b> | <b>invert</b>}</code></td><td>Manipulates sent or received bit patterns to match expected patterns on a connected device. Repeat the command for each transmit and/or receive bit to be modified, but be careful not to destroy the information content of the bit pattern.
The default is that the signaling format is not manipulated (for all transmit or receive A, B, C, and D bits).</td></tr>
<tr><td></td><td></td><td>The keywords are as follows:
• <b>on</b>—Sets the bit to 1 permanently.
• <b>off</b>—Sets the bit to 0 permanently.
• <b>invert</b>—Changes the state to the opposite of the original transmit or receive state.
<b>Note</b> The <b>show voice port</b> command reports at the protocol level, and the <b>show controller</b> command reports at the driver level. The driver is not notified of any bit manipulation using the <b>condition</b> command. As a result, the <b>show controller</b> command output does not account for the bit conditioning.</td></tr>
<tr><td><b>Step 2</b></td><td><code>Router(config-voiceport)# <b>define</b> {<b>tx-bits</b> | <b>rx-bits</b>} {<b>seize</b> | <b>idle</b>} {0000 | 0001 | 0010 | 0011 | 0100 | 0101 | 0110 | 0111 | 1000 | 1001 | 1010 | 1011 | 1100 | 1101 | 1110 | 1111}</code></td><td>(Digital E1 E&M voice ports on Cisco 2600 and 3600 series routers and Cisco MC3810 multiservice concentrators only) Defines specific transmit or receive signaling bits to match the bit patterns required by a connected device for North American E&M and E&M MELCAS voice signaling, if patterns different from the preset defaults are required.
Also specifies which bits a voice port monitors and which bits it ignores, if patterns that are different from the defaults are required.
See the <b>define</b> command for the default signaling patterns as defined in American National Standards Institute (ANSI) and code excited linear prediction compression (CEPT) standards. The keywords are as follows:
• <b>tx-bits</b>—Indicates the pattern applies to transmit signaling bits.</td></tr>
</table>

	Command	Purpose
		• **rx-bits**—Indicates the pattern applies to receive signaling bits • **seize**—Indicates that the pattern represents line seizure. • **idle**—Indicates that the pattern represents an idle condition. • **0000...1111**—Represents the bit pattern to use.
Step 3	`Router(config-voiceport)# ignore {rx-a-bit | rx-b-bit | rx-c-bit | rx-d-bit}`	(Digital E1 E&M voice ports on Cisco 2600 and 3600 series routers and Cisco MC3810 multiservice concentrators only) Configures the voice port to ignore the specified receive bit for North American E&M or E&M MELCAS, if patterns different from the defaults are required. See the command reference for the default signaling patterns as defined in ANSI and CEPT standards.

Calling Number Outbound Commands

On the Cisco AS5300 universal access server platform, if T1 CAS is configured with the Feature Group-D (FGD)—Exchange Access North American (FGD-EANA) signaling, the automatic number identification (ANI) can be sent for outgoing calls by using the **calling-number outbound** command.

FGD-EANA is a FGD signaling protocol of type EANA, which provides certain call services, such as emergency (USA 911) calls. ANI is an SS7 (Signaling System 7) feature in which a series of digits, analog or digital, are included in the call to identify the telephone number of the calling device. In other words, ANI identifies the number of the calling party. ANI digits are used for billing purposes by Internet service providers (ISPs), among other things. The commands in this section can be issued in voice-port or dial-peer mode, because the syntax is the same.

To configure your digital T1/E1 packet voice trunk network module to generate outbound ANI digits on a Cisco AS5300 universal access server, use the following commands in voice-port configuration mode:

7.330

	Command	Purpose
Step 1	`Router(config-voiceport)# calling-number outbound range string1 string2`	(Cisco AS5300 universal access server only) Specifies ANI to be sent out when the T1-CAS **fgd-eana** command is configured as signaling type. The *string1* and *string2* arguments are valid E.164 telephone number strings. Both strings must be of the same length and cannot be more than 32 digits long. Only the last four digits are used for specifying the range (*string1* to *string2*) and for generating the sequence of ANI by rotating through the range until *string2* is reached and then starting from *string1* again. If strings are less than four digits in length, then entire strings are used.
Step 2	`Router(config-voiceport)# calling-number outbound sequence [string1] [string2] [string3] [string4] [string5]`	(Cisco AS5300 universal access server only) Specifies ANI to be sent out when the T1-CAS **fgd-eana** command is configured as signaling type. This option configures a sequence of discrete strings (*string1*...*string5*) to be passed out as ANI for successive calls using the dial peer or voice port. Limit is five (5) strings. All strings must be valid E.164 numbers, up to 32 digits in length.
Step 3	`Router(config-voiceport)# calling-number outbound null`	(Cisco AS5300 universal access server only) Suppresses ANI. No ANI is passed when this voice port is selected.

Disconnect Supervision Commands

PBX and PSTN switches use several different methods to indicate that a call should be disconnected because one or both parties have hung up. The commands in this section are used to configure the router to recognize the type of signaling in use by the PBX or PSTN switch connected to the voice port. These methods include the following:

- Battery reversal disconnect
- Battery denial disconnect
- Supervisory tone disconnect (STD)

Battery reversal occurs when the connected switch changes the polarity of the line in order to indicate changes in call state (such as off-hook or, in this case, call disconnect). This is the signaling looked for when the **battery reversal** command is enabled on the voice port, which is the default configuration.

Battery denial (sometimes called *power denial*) occurs when the connected switch provides a short (approximately 600 ms) interruption of line power to indicate a change in call state. This is the signaling looked for when the **supervisory disconnect** command is enabled on the voice port, which is the default configuration.

Supervisory tone disconnect occurs when the connected switch provides a special tone to indicate a change in call state. Some PBXs and PSTN CO switches provide a 600-millisecond interruption of line power as a supervisory disconnect, and others provide supervisory tone disconnect (STD). This is the signal that the router is looking for when the **no supervisory disconnect** command is configured on the voice port.

Note In some circumstances, you can use the FXO Disconnect Supervision feature to enable analog FXO ports to monitor call progress tones for disconnect supervision that are returned from a PBX or from the PSTN. For more information, see the "FXO Supervisory Disconnect Tone Commands" section on page 87.

7.328

To change parameters related to disconnect supervision, use the following commands as appropriate, in voice-port configuration mode:

	Command	Purpose
Step 1	`Router(config-voiceport)# no battery-reversal`	(Analog only) Enables battery reversal. The default is that battery reversal is enabled. • For FXO ports—Use the **no battery-reversal** command to configure a loop-start voice port not to disconnect when it detects a second battery reversal. The default is to disconnect when a second battery reversal is detected. This functionality is supported on Cisco MC3810 analog voice ports; on Cisco 1750, Cisco 2600 series, and Cisco 3600 series routers, only analog voice ports on VIC-2FXO cards are able to detect battery reversal. – Also use the **no battery-reversal** command when a connected FXO port does not support battery reversal detection. • For FXS ports—Use the **no battery-reversal** command to configure the voice port not to reverse battery when it connects calls. The default is to reverse battery when a call is connected, then return to normal when the call is over, providing positive disconnect. See also the **disconnect-ack** command (Step 7).
Step 2	`Router(config-voiceport)# no supervisory disconnect`	(FXO only) Enables the PBX or PSTN switch to provide STD. By default the **supervisory disconnect** command is enabled.
Step 3	`Router(config-voiceport)# disconnect-ack`	(FXS only) Configures the voice port to return an acknowledgment upon receipt of a disconnect signal. The FXS port removes line power if the equipment on the FXS loop-start trunk disconnects first. This is the default. The **no disconnect-ack** command prevents the FXS port from responding to the on-hook disconnect with a removal of line power.

7.327
J

FXO Supervisory Disconnect Tone Commands

If the FXO supervisory disconnect tone is configured and a detectable tone from the PSTN or PBX is detected by the digital signal processor (DSP), the analog FXO port goes on-hook. This feature prevents an analog FXO port from remaining in an off-hook state after an incoming call is ended. FXO supervisory disconnect tone enables interoperability with PSTN and PBX systems whether or not they transmit supervisory tones.

Note This feature applies only to analog FXO ports with loop-start signaling on the Cisco 2600 and 3600 series routers and on Cisco MC3810 multiservice concentrators with high-performance compression modules (HCMs).

To configure a voice port to detect incoming tones, you need to know the parameters of the tones expected from the PBX or PSTN. Then create a voice class that defines the tone detection parameters, and, finally, apply the voice class to the applicable analog FXO voice ports. This procedure configures the voice port to go on-hook when it detects the specified tones. The parameters of the tones need to be precisely specified to prevent unwanted disconnects due to detection of nonsupervisory tones or noise.

A supervisory disconnect tone is normally a dual tone consisting of two frequencies; however, tones of only one frequency can also be detected. Use caution if you configure voice ports to detect nondual tones, because unwanted disconnects can result from detection of random tone frequencies. You can configure a voice port to detect a tone with one on/off time cycle, or you can configure it to detect tones in a cadence pattern with up to four on/off time cycles.

Note In the following procedure, the following commands were not supported until Cisco IOS Release 12.2(2)T: **freq-max-deviation**, **freq-max-power**, **freq-min-power**, **freq-power-twist**, and **freq-max-delay**.

7.326

To create a voice class that defines the specific tone or tones to be detected and then apply the voice class to the voice port, use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	`Router(config)#` **`voice class dualtone`** *`tag`*	Creates a voice class for defining one tone detection pattern. The range for the tag number is from 1 to 10000. The tag number must be unique on the router. For more information about configuring voice classes, see the "Configuring Dial Plans, Dial Peers, and Digit Manipulation" chapter in this configuration guide.
Step 2	`Router(config-voice-class)#` **`freq-pair`** *`tone-id frequency-1 frequency-2`*	Specifies the two frequencies, in Hz, for a tone to be detected (or one frequency if a nondual tone is to be detected). If the tone to be detected contains only one frequency, enter 0 for *frequency-2*. The arguments are as follows: • *tone-id*—Ranges from 1 to 16. There is no default. • *frequency-1* and *frequency-2*—Ranges from 300 to 3600, or you can enter 0 for *frequency-2*. There is no default. **Note** Repeat this command for each additional tone to be specified.
Step 3	`Router(config-voice-class)#` **`freq-max-deviation`** *`frequency`*	Specifies the maximum frequency deviation that will be detected, in Hz. The *frequency* argument ranges from 10 to 125. The default is 10.
Step 4	`Router(config-voice-class)#` **`freq-max-power`** *`dBm0`*	Specifies the maximum tone power that will be detected, in dBmO. The *dBmO* argument ranges from 0 to 20. The default is 10.
Step 5	`Router(config-voice-class)#` **`freq-min-power`** *`dBm0`*	Specifies the minimum tone power that will be detected, in dBmO. The *dBmO* argument ranges from 10 to 35. The default is 30.
Step 6	`Router(config-voice-class)#` **`freq-power-twist`** *`dBm0`*	Specifies the power difference allowed between the two frequencies, in dBmO. The *dBmO* argument ranges from 0 to 15. The default is 6.
Step 7	`Router(config-voice-class)#` **`freq-max-delay`** *`time`*	Specifies the timing difference allowed between the two frequencies, in 10-millisecond increments. The *time* argument ranges from 10 to 100 (100 ms to 1 s). The default is 20 (200 ms).
Step 8	`Router(config-voice-class)#` **`cadence-min-on-time`** *`time`*	Specifies the minimum tone on time that will be detected, in 10-millisecond increments. The *time* argument ranges from 0 to 100 (0 ms to 1 s).
Step 9	`Router(config-voice-class)#` **`cadence-max-off-time`** *`time`*	Specifies the maximum tone off time that will be detected, in 10-millisecond increments. The *time* argument ranges from 0 to 5000 (0 ms to 50 s).

7.325

	Command	Purpose
Step 10	`Router(config-voice-class)# cadence-list cadence-id cycle-1-on-time cycle-1-off-time cycle-2-on-time cycle-2-off-time cycle-3-on-time cycle-3-off-time cycle-4-on-time cycle-4-off-time`	(Optional) Specifies a tone cadence pattern to be detected. Specify an on time and off time for each cycle of the cadence pattern. The arguments are as follows: • *cadence-id*—Ranges from 1 to 10. There is no default. • *cycle-N-on-time* and *cycle-N-off-time*—Range from 0 to 1000 (0 ms to 10 s). The default is 0.
Step 11	`Router(config-voice-class)# cadence-variation time`	(Optional) Specifies the maximum time that the tone onset can vary from the specified onset time and still be detected, in 10-millisecond increments. The *time* argument ranges from 0 to 200 (0 ms to 2 s). The default is 0.
Step 12	`Router(config-voice-class)# exit`	Exits voice class configuration mode.

Step 13	**Cisco 2600 and 3600 Series Routers**
	`Router(config)# voice-port slot/subunit/port`
	Cisco MC3810 Multiservice Concentrators
	`Router(config)# voice-port slot/port`
		Enters voice-port configuration mode.
		The arguments are as follows:
		• *slot*—Specifies the slot number where the voice network module is installed (Cisco 2600 and Cisco 3600 series routers) or the router slot number where the analog voice module is installed (Cisco MC3810 multiservice concentrators).
		• *subunit*—Specifies the voice interface card (VIC) where the voice port is located.
		• *port*—Identifies the analog voice-port number.

Step 14	`Router(config-voiceport)# supervisory disconnect dualtone {mid-call | pre-connect} voice-class tag`	Assigns an FXO supervisory disconnect tone voice class to the voice port. The keywords are as follows: • **mid-call**—Specifies tone detection during the entire call. • **pre-connect**—Specifies tone detection only during call set-up.
Step 15	`Router(config-voiceport)# supervisory disconnect anytone`	Configures the voice port to disconnect on receipt of any tone.

Timeouts Commands

To change timeouts parameters, use the following commands as appropriate, in voice-port configuration mode:

7.324

	Command	Purpose
Step 1	`Router(config-voiceport)#` **`timeouts call-disconnect`** *`seconds`*	Configures the call disconnect timeout value in seconds. Valid entries range from 0 to 120. The default is 60.
Step 2	`Router(config-voiceport)#` **`timeouts initial`** *`seconds`*	Sets the number of seconds that the system waits between the caller input of the initial digit and the subsequent digit of the dialed string. If the wait time expires before the destination is identified, a tone sounds and the call ends. The *seconds* argument is the initial timeout duration. A valid entry is an integer from 0 to 120. The default is 10.
Step 3	`Router(config-voiceport)#` **`timeouts interdigit`** *`seconds`*	Configures the number of seconds that the system waits after the caller has input the initial digit or a subsequent digit of the dialed string. If the timeout ends before the destination is identified, a tone sounds and the call ends. This value is important when using variable-length dial peer destination patterns (dial plans). The *seconds* argument is the interdigit timeout wait time in seconds. A valid entry is an integer from 0 to 120. The default is 10.
Step 4	`Router(config-voiceport)#` **`timeouts ringing`** `{`*`seconds`* `|` **`infinity`**`}`	Specifies the duration that the voice port allows ringing to continue if a call is not answered. The keyword and argument are as follows: • **infinity**—Indicates ringing should continue until the caller goes on hook. • *seconds*—Specifies the number of seconds to allow ringing without answer. The range is from 5 to 60000. The default is 180.
Step 5	`Router(config-voiceport)#` **`timeouts wait-release`** `{`*`seconds`* `|` **`infinity`**`}`	Specifies the duration that a voice port stays in the call-failure state while the Cisco device sends busy tone, reorder tone, or an out-of-service to the port. The keyword and argument are as follows: • **infinity**—Indicates the voice port should not be released as long as the call-failure state remains. • *seconds*—Specifies the number of seconds to allow before the call is released. The range is from 3 to 3600. The default is 30.

7.323
J

Timing Commands

To change timing parameters, use the following commands as appropriate, in voice-port configuration mode:

	Command	Purpose
Step 1	Router(config-voiceport)# **timing clear-wait** *milliseconds*	(E&M only) Specifies the minimum amount of time between the inactive seizure signal and clearing of the call. Valid entries for the *milliseconds* argument are from 200 to 2000 milliseconds. The default is 400.
Step 2	Router(config-voiceport)# **timing delay-duration** *milliseconds*	(E&M only) Specifies the delay signal duration for delay-dial signaling in milliseconds. Valid entries are from 100 to 5000. The default is 2000.
Step 3	Router(config-voiceport)# **timing delay-start** *milliseconds*	(E&M only) Specifies minimum delay time, in milliseconds, from outgoing seizure to outdial address. Valid entries are from 20 to 2000. The default is 300 for the Cisco 3600 series routers, and 150 for the Cisco MC3810 multiservice concentrators.
Step 4	Router(config-voiceport)# **timing delay-with-integrity** *milliseconds*	(Cisco MC3810 multiservice concentrators E&M ports only) Specifies duration of the wink pulse for the delay dial in milliseconds. Valid entries are from 0 to 5000. The default is 0.
Step 5	Router(config-voiceport)# **timing dial-pulse min-delay** *milliseconds*	Specifies time, in milliseconds, between the generation of wink-like pulses when the type is pulse. Valid entries are from 0 to 5000. The default is 300 for the Cisco 3600 series routers, and 140 for the Cisco MC3810 multiservice concentrators.
Step 6	Router(config-voiceport)# **timing dialout-delay** *milliseconds*	(Cisco MC3810 multiservice concentrators only) Specifies dialout delay, in milliseconds, for the sending digit or cut-through on an FXO trunk or an E&M immediate trunk. Valid entries are from 100 to 5000. The default is 300.
Step 7	Router(config-voiceport)# **timing digit** *milliseconds*	Specifies the DTMF digit signal duration in milliseconds. Valid entries are from 50 to 100. The default is 100.
Step 8	Router(config-voiceport)# **timing guard-out** *milliseconds*	(FXO ports only) Specifies the duration in milliseconds of the guard-out period that prevents this port from seizing a remote FXS port before the remote port detects a disconnect signal. The range is from 300 to 3000. The default is 2000.
Step 9	Router(config-voiceport)# **timing hookflash-out** *milliseconds*	Specifies the duration, in milliseconds, of the hookflash. Valid entries are from 50 to 500. The default is 300.

7.322

	Command	Purpose
Step 10	Router(config-voiceport)# **timing interdigit** *milliseconds*	Specifies the DTMF interdigit duration, in milliseconds. Valid entries are from 50 to 500. The default is 100.
Step 11	Router(config-voiceport)# **timing percentbreak** *percent*	(Cisco MC3810 multiservice concentrators FXO and E&M ports only) Specifies the percentage of the break period for the dialing pulses, if different from the default. The range is from 20 to 80. The default is 50.
Step 12	Router(config-voiceport)# **timing pulse** *pulses-per-second*	(FXO and E&M only) Specifies the pulse dialing rate in pulses per second. Valid entries are from 10 to 20. The default is 20.
Step 13	Router(config-voiceport)# **timing pulse-digit** *milliseconds*	(FXO only) Configures the pulse digit signal duration. The range of the pulse digit signal duration is from 10 to 20. The default is 20.
Step 14	Router(config-voiceport)# **timing pulse-interdigit**	(FXO and E&M only) Specifies pulse dialing interdigit timing in milliseconds. Valid entries are from 100 to 1000. The default is 500.
Step 15	Router(config-voiceport)# **timing wink-duration** *milliseconds*	(E&M only) Specifies maximum wink-signal duration, in milliseconds, for a wink-start signal. Valid entries are from 100 to 400. The default is 200.
Step 16	Router(config-voiceport)# **timing wink-wait** *milliseconds*	(E&M only) Specifies maximum wink-wait duration, in milliseconds, for a wink-start signal. Valid entries are from 100 to 5000. The default is 200.

DTMF Timer Inter-Digit Command for Cisco AS5300 Access Servers

To configure the DTMF timer for Cisco AS5300 access servers, use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	Router(config)# **controller T1** *number*	Configures a T1 controller and enters controller configuration mode.
Step 2	Router(config)# **ds0-group** *channel-number* **timeslots** *range* **type** *signaling-type* **dtmf dnis**	Configures channelized T1 timeslots, which enables a Cisco AS5300 modem to answer and send an analog call.
Step 3	Router(config)# **cas-custom** *channel*	Customizes E1 R2 signaling parameters for a particular E1 channel group on a channelized E1 line.
Step 4	Router(conf-ctrl-cas)# **dtmf-timer-inter-digit** *milliseconds*	Configures the DTMF inter-digit timer for a DS0 group.

7.321

Verifying DTMF Timer Inter-Digit Command

To verify the DTMF timer, use the following command in EXEC mode:

Command	Purpose
`Router# show running-config`	Displays the configuration information currently running on the terminal.

Voice Activity Detection Commands Related to Voice-Port Configuration Mode

In normal voice conversations, only one person speaks at a time. Today's circuit-switched telephone networks dedicate a bidirectional, 64 kbps channel for the duration of each conversation, regardless of whether anyone is speaking at the moment. This means that, in a normal voice conversation, at least 50 percent of the bandwidth is wasted when one or both parties are silent. This figure can actually be much higher when normal pauses and breaks in conversation are taken into account.

Packet-switched voice networks, on the other hand, can use this "wasted" bandwidth for other purposes when voice activity detection (VAD) is configured. VAD works by detecting the magnitude of speech in decibels and deciding when to cut off the voice from being framed. VAD has some technological problems, however, which include the following:

- General difficulties determining when speech ends
- Clipped speech when VAD is slow to detect that speech is beginning again
- Automatic disabling of VAD when conversations take place in noisy surroundings

VAD is configured on dial peers; by default it is enabled. For more information, see the "Configuring Dial Plans, Dial Peers, and Digit Manipulation" chapter in this configuration guide. Two parameters associated with VAD, music threshold and comfort noise, are configured on voice ports.

If VAD is enabled, use the following commands to adjust parameter values associated with VAD, beginning in voice-port configuration mode:

	Command	Purpose
Step 1	`Router(config-voiceport)# music-threshold number`	Specifies the minimal decibel level of music played when calls are put on hold. The decibel level affects how voice activity detection (VAD) treats the music data. Valid entries range from –70 to –30. When used with VAD, if the level is set too high, the remote end hears no music; if it is set too low, there is unnecessary voice traffic. The default is –38.
Step 2	`Router(config-voiceport)# comfort-noise`	This parameter creates subtle background noise to fill silent gaps during calls when VAD is enabled on voice dial peers. If comfort noise is not generated, the resulting silence can fool the caller into thinking the call is disconnected instead of being merely idle. The default is that comfort noise is enabled.

7.320

Voice Quality Tuning Commands

The commands in this section configure parameters to improve voice quality. Common voice quality issues include the following:

- Delay in Voice Networks
- Jitter Adjustment
- Echo Adjustment
- Voice Level Adjustment

Delay in Voice Networks

Delay is the time it takes for voice packets to travel between two endpoints. Excessive delay can cause quality problems with real-time traffic such as voice. However, because of the speed of network links and the processing power of intermediate devices, some delay is expected.

When listening to speech, the human ear normally accepts up to about 150 ms of delay without noticing delays. The ITU G.114 standard recommends no more than 150 ms of one-way delay for a normal voice conversation. Once the delay exceeds 150 ms, a conversation is more like a "walkie-talkie" conversation in which one person must wait for the other to stop speaking before beginning to talk.

You can measure delay fairly easily by using ping tests at various times of the day with different network traffic loads. If network delay is excessive, it must be reduced for adequate voice quality.

Several different types of delay combine to make up the total end-to-end delay associated with voice calls:

- Propagation delay—Amount of time it takes the data to physically travel over the media.
- Handling delay—Amount of time it takes to process data by adding headers, taking samples, forming packets, etc.
- Queuing delay—Amount of time lost due to congestion.
- Variable delay or jitter—Amount of time that causes the conversation to break and become unintelligible. Jitter is described in detail below.

Propagation, handling, and queuing delay are not addressed by voice-port commands and fall outside the scope of this chapter.

Jitter Adjustment

Delay can cause unnatural starting and stopping of conversations, but variable-length delays (also known as jitter) can cause a conversation to break and become unintelligible. Jitter is not usually a problem with PSTN calls because the bandwidth of calls is fixed and each call has a dedicated circuit for the duration of the call. However, in VoIP networks, data traffic might be bursty, and jitter from the packet network can become an issue. Especially during times of network congestion, packets from the same conversation can arrive at different interpacket intervals, disrupting the steady, even delivery needed for voice calls. Cisco voice gateways have built-in jitter buffering to compensate for a certain amount of jitter; the **playout-delay** command can be used to adjust the jitter buffer.

Normally, the defaults in effect are sufficient for most networks. However, a small playout delay from the jitter buffer can cause lost packets and choppy audio, and a large playout delay can cause unacceptably high overall end-to-end delay.

7.319

Note Prior to Cisco IOS Release 12.1(5)T, playout delay was configured in voice-port configuration mode. For Cisco IOS Release 12.1(5)T and later releases, in most cases playout delay should be configured in dial-peer configuration mode on the VoIP dial peer that is on the receiving end of the voice traffic that is to be buffered. This dial peer senses network conditions and relays them to the DSPs, which adjust the jitter buffer as necessary. When multiple applications are configured on the gateway, playout delay should be configured in dial-peer configuration mode. When there are numerous dial peers to configure, it might be simpler to configure playout delay on a voice port. If there are conflicting playout delay configurations on a voice port and also on a dial peer, the dial peer configuration takes precedence.

To configure the playout delay jitter buffer, use the following commands beginning in dial-peer or voice-port configuration mode:

	Command	Purpose
Step 1	`Router(config-voiceport)# playout-delay mode {adaptive | fixed}`	Determines the mode in which the jitter buffer will operate for calls on this voice port. The keywords are as follows: • **adaptive**—Adjusts the jitter buffer size and amount of playout delay during a call based on current network conditions. • **fixed**—Defines the jitter buffer size as fixed so that the playout delay does not adjust during a call. A constant playout delay is added. The default is **adaptive**.

7.3.8

	Command	Purpose
Step 2	`Router(config-voiceport)# playout-delay {nominal value | maximum value | minimum {default | low | high}}`	Tunes the playout buffer to accommodate packet jitter caused by switches in the WAN. The keywords and arguments are as follows: • **nominal**—Defines the amount of playout delay applied at the beginning of a call by the jitter buffer in the gateway. In fixed mode, this is also the maximum size of the jitter buffer throughout the call. • *value*—Specifies the range that depends on type of DSP and configured codec complexity. For medium codec complexity, the range is from 0 to 150 ms. For high codec complexity and DSPs that do not support codec complexity, the range is from 0 to 250 ms. • **maximum** (adaptive mode only)—Specifies the jitter buffer's upper limit (80ms), or the highest value to which the adaptive delay is set. • **minimum** (adaptive mode only)—Specifies the jitter buffer's lower limit (10 ms), or the lowest value to which the adaptive delay is set. • **default**—Specifies 40 ms.

Echo Adjustment

Echo is the sound of your own voice reverberating in the telephone receiver while you are talking. When timed properly, echo is not a problem in the conversation; however, if the echo interval exceeds approximately 25 milliseconds, it is distracting. Echo is controlled by echo cancellers.

In the traditional telephony network, echo is generally caused by an impedance mismatch when the four-wire network is converted to the two-wire local loop. In voice packet-based networks, echo cancellers are built into the low-bit rate codecs and are operated on each DSP.

By design, echo cancellers are limited by the total amount of time they wait for the reflected speech to be received, which is known as an echo trail. The echo trail is normally 32 milliseconds. In Cisco System's voice implementations, echo cancellers are enabled using the **echo-cancel enable** command, and echo trails are configured using the **echo-cancel coverage** command.

To configure parameters related to the echo canceller, use the following commands beginning in voice-port configuration mode:

	Command	Purpose
Step 1	`Router(config-voiceport)# echo-cancel enable`	Enables the cancellation of voice that is sent and received on the same interface. Echo cancellation coverage must also be configured. The default is that echo cancellation is enabled. **Note** Not valid for four-wire E&M interfaces. Use **no echo-cancel enable** to disable the feature.
Step 2	`Router(config-voiceport)# echo-cancel coverage {8 | 16 | 24 | 32}`	Adjusts the echo canceller by the specified number of milliseconds. The default is 16.
Step 3	`Router(config-voiceport)# non-linear`	Enables nonlinear processing (residual echo suppression) in the echo canceler, which shuts off any signal if no near-end speech is detected. Echo cancelling must be enabled for this feature. The default is that nonlinear processing is enabled.

7.316

Voice Level Adjustment

As much as possible, it is desirable to achieve a uniform input decibel level to the packet voice network in order to limit or eliminate any voice distortion due to incorrect input and output decibel levels. Adjustments to levels may be required by the type of equipment connected to the network or by local country-specific conditions.

Incorrect input or output levels can cause echo, as can an impedance mismatch. Too much input gain can cause clipped or fuzzy voice quality. If the output level is too high at the remote router's voice port, the local caller will hear echo. If the local router's voice port input decibel level is too high, the remote side will hear clipping. If the local router's voice port input decibel level is too low, or the remote router's output level is too low, the remote side voice can be distorted at a very low volume and DTMF may be missed.

Use the **input gain** and **output attenuation** commands to adjust voice levels, and the **impedance** command to set the impedance value to match that of the voice circuit to which the voice port connects.

To change parameters related to voice levels, use the following commands as appropriate, in voice-port configuration mode:

	Command	Purpose
Step 1	Router(config-voiceport)# **input gain** *value*	Specifies, in decibels, the amount of gain to be inserted at the receiver side of the interface, increasing or decreasing the signal. After an input gain setting is changed, the voice call must be disconnected and reestablished before the changes take effect. The *value* argument is any integer from –6 to 14. The default is 0.
Step 2	Router(config-voiceport)# **output attenuation** *value*	Specifies the amount of attenuation in decibels at the transmit side of the interface, decreasing the signal. A system-wide loss plan can be implemented using the **input gain** and **output attenuation** commands. The default value for this command assumes that a standard transmission loss plan is in effect, meaning that normally there must be –6 dB attenuation between phones. The *value* argument is any integer from –6 to 14. The default is 0.
Step 3	Router(config-voiceport)# **impedance** {**600c** | **600r** | **900c** | **complex1** | **complex2**}	Specifies the terminating impedance of a voice port interface, which needs to match the specifications from the specific telephony system to which it is connected. • **600c**—Specifies 600 ohms complex. • **600r**—Specifies 600 ohms real. • **900c**—Specifies 900 ohms complex. • **complex1**—Specifies Complex 1. • **complex2**—Specifies Complex 2. The default is 600r.

	Command	Purpose
Step 4	`Router(config-voiceport)# loss-plan {plan1 | plan2 | plan5 | plan6 | plan7 | plan8 | plan9}`	(Cisco MC3810 multiservice concentrators FXO or FXS analog voice ports only) Specifies the analog-to-digital gain offset loss plan. For definitions of each plan, see the *Cisco IOS Voice, Video, and Fax Command Reference*. The default is the **plan1** keyword.
Step 5	`Router(config-voiceport)# idle-voltage {high | low}`	(Cisco MC3810 multiservice concentrators analog FXS ports only) Specifies the talk-battery (tip-to-ring) voltage condition when the port is idle. The keywords are as follows: • **high**—Specifies that the voltage is high (–48V). • **low**—Specifies that the voltage is low (–24V) and is the default.

Verifying Analog and Digital Voice-Port Configurations

After configuring the voice ports on your router, perform the following steps to verify proper operation:

Step 1 Pick up the handset of an attached telephony device and check for a dial tone.

Step 2 If you have dial tone, check for DTMF detection. If the dial tone stops when you dial a digit, then the voice port is most likely configured properly.

Step 3 To identify port numbers of voice interfaces installed in your router, use the **show voice port summary** command. For examples of the output, see the "show voice port summary Command Examples" section on page 100.

Step 4 To verify voice-port parameter settings, use the **show voice port** command with the appropriate syntax from Table 9. For sample output, see the "show voice port Command Examples" section on page 101.

Table 9 Show Voice Port Command Syntax

Platform	Voice Port Type	Command Syntax
Cisco 1750	Analog	**show voice port** [*slot/port* | **summary**]
Cisco 2600 series Cisco 3600 series	Analog	**show voice port** [*slot/port* | **summary**]
	Digital	**show voice port** [*slot/port:ds0-group-no* | **summary**]
Cisco MC3810	Analog	**show voice port** [*slot/port* | **summary**]
	Digital	**show voice port** [*slot:ds0-group-no* | **summary**]
Cisco AS5300	Digital	**show voice-port** *controller:ds0-group-no*
Cisco AS5800	Digital	**show voice-port** {*shelf/slot/port:ds0-group-no*}
Cisco 7200 series	Digital	**show voice port** {*slot/port-adapter:ds0-group-no*}
Cisco 7500 series	Digital	**show voice port** {*slot/port-adapter/slot:ds0-group-no*}

7.34 >

Step 5 For digital T1/E1 connections, to verify the codec complexity configuration, use the **show running-config** command to display the current voice-card setting. If medium complexity is specified, the codec complexity setting is not displayed. If high complexity is specified, the setting codec complexity high is displayed. The following example shows an excerpt from the command output when high complexity has been specified:

```
Router# show running-config
.
.
.
hostname router-alpha

voice-card 0
 codec complexity high
.
.
.
```

Step 6 For digital T1/E1 connections, to verify that the controller is up and that no alarms have been reported, and to display information about clock sources and other controller settings, use the **show controller** command. For output examples, see the "show controller Command Examples" section on page 105.

```
Router# show controller {t1 | e1} controller-number
```

Step 7 To display voice-channel configuration information for all DSP channels, use the **show voice dsp** command. For output examples, see the "show voice dsp Command Examples" section on page 106.

```
Router# show voice dsp
```

Step 8 To verify the call status for all voice ports, use the **show voice call summary** command. For output examples, see the "show voice call summary Command Examples" section on page 107.

```
Router# show voice call summary
```

Step 9 To display the contents of the active call table, which shows all of the calls currently connected through the router or concentrator, use the **show call active voice** command. For output examples, see the "show call active voice Command Example" section on page 107.

```
Router# show call active voice
```

Step 10 To display the contents of the call history table, use the **show call history voice** command. To limit the display to the last calls connected through this router, use the keyword **last** and define the number of calls to be displayed with the argument *number*. To limit the display to a shortened version of the call history table, use the **brief** keyword. For output examples, see the "show call history voice Command Example" section on page 108.

```
Router# show call history voice [last | number | brief]
```

show voice port summary Command Examples

In the following sections, output examples of the following types are shown:

- Cisco 3640 Router Analog Voice Port
- Cisco MC3810 Multiservice Concentrator Digital Voice Port

Cisco 3640 Router Analog Voice Port

The following output is from a Cisco 3640 router:

```
Router# show voice port summary
                                      IN        OUT
PORT    CH SIG-TYPE   ADMIN OPER STATUS    STATUS   EC
====== == ========== ===== ==== ======== ======== ==
2/0/0   -- e&m-wnk    up    dorm idle      idle     y
2/0/1   -- e&m-wnk    up    dorm idle      idle     y
2/1/0   -- fxs-ls     up    dorm on-hook   idle     y
2/1/1   -- fxs-ls     up    dorm on-hook   idle     y
```

Cisco MC3810 Multiservice Concentrator Digital Voice Port

The following output is from a Cisco MC3810 multiservice concentrator:

```
Router# show voice port summary
                                      IN        OUT
PORT    CH SIG-TYPE   ADMIN OPER STATUS    STATUS   EC
====== == ========== ===== ==== ======== ======== ==
0:17    18 fxo-ls     down  down idle      on-hook  y
0:18    19 fxo-ls     up    dorm idle      on-hook  y
0:19    20 fxo-ls     up    dorm idle      on-hook  y
0:20    21 fxo-ls     up    dorm idle      on-hook  y
0:21    22 fxo-ls     up    dorm idle      on-hook  y
0:22    23 fxo-ls     up    dorm idle      on-hook  y
0:23    24 e&m-imd    up    dorm idle      idle     y
1/1     -- fxs-ls     up    dorm on-hook   idle     y
1/2     -- fxs-ls     up    dorm on-hook   idle     y
1/3     -- e&m-imd    up    dorm idle      idle     y
1/4     -- e&m-imd    up    dorm idle      idle     y
1/5     -- fxo-ls     up    dorm idle      on-hook  y
1/6     -- fxo-ls     up    dorm idle      on-hook  y
```

show voice port Command Examples

In the following sections, output examples of the following types are shown:

- Cisco 3600 Series Router Analog E&M Voice Port, page 101
- Cisco 3600 Series Router Analog FXS Voice Port, page 102
- Cisco 3600 Series Router Digital E&M Voice Port, page 103
- Cisco AS5300 Universal Access Server T1 CAS Voice Port, page 103
- Cisco 7200 Series Router Digital E&M Voice Port, page 104

Cisco 3600 Series Router Analog E&M Voice Port

The following output is from a Cisco 3600 series router analog E&M voice port:

```
Router# show voice port 1/0/0

E&M Slot is 1, Sub-unit is 0, Port is 0
 Type of VoicePort is E&M
 Operation State is unknown
 Administrative State is unknown
 The Interface Down Failure Cause is 0
 Alias is NULL
```

7.3.2

```
Noise Regeneration is disabled
Non Linear Processing is disabled
Music On Hold Threshold is Set to 0 dBm
In Gain is Set to 0 dB
Out Attenuation is Set to 0 dB
Echo Cancellation is disabled
Echo Cancel Coverage is set to 16ms
Connection Mode is Normal
Connection Number is
Initial Time Out is set to 0 s
Interdigit Time Out is set to 0 s
Analog Info Follows:
Region Tone is set for northamerica
Currently processing none
Maintenance Mode Set to None (not in mtc mode)
Number of signaling protocol errors are 0

Voice card specific Info Follows:
Signal Type is wink-start
Operation Type is 2-wire
Impedance is set to 600r Ohm
E&M Type is unknown
Dial Type is dtmf
In Seizure is inactive
Out Seizure is inactive
Digit Duration Timing is set to 0 ms
InterDigit Duration Timing is set to 0 ms
Pulse Rate Timing is set to 0 pulses/second
InterDigit Pulse Duration Timing is set to 0 ms
Clear Wait Duration Timing is set to 0 ms
Wink Wait Duration Timing is set to 0 ms
Wink Duration Timing is set to 0 ms
Delay Start Timing is set to 0 ms
Delay Duration Timing is set to 0 ms
```

Cisco 3600 Series Router Analog FXS Voice Port

The following output is from a Cisco 3600 series router analog FXS voice port:

```
Router# show voice port 1/2

Voice port 1/2 Slot is 1, Port is 2
 Type of VoicePort is FXS
 Operation State is UP
 Administrative State is UP
 No Interface Down Failure
 Description is not set
 Noise Regeneration is enabled
 Non Linear Processing is enabled
 In Gain is Set to 0 dB
 Out Attenuation is Set to 0 dB
 Echo Cancellation is enabled
 Echo Cancel Coverage is set to 8 ms
 Connection Mode is normal
 Connection Number is not set
 Initial Time Out is set to 10 s
 Interdigit Time Out is set to 10 s
 Coder Type is g729ar8
 Companding Type is u-law
 Voice Activity Detection is disabled
 Ringing Time Out is 180 s
 Wait Release Time Out is 30 s
 Nominal Playout Delay is 80 milliseconds
```

```
Maximum Playout Delay is 160 milliseconds

Analog Info Follows:
Region Tone is set for northamerica
Currently processing Voice
Maintenance Mode Set to None (not in mtc mode)
Number of signaling protocol errors are 0
Impedance is set to 600r Ohm
Analog interface A-D gain offset = -3 dB
Analog interface D-A gain offset = -3 dB
Voice card specific Info Follows:
Signal Type is loopStart
Ring Frequency is 20 Hz
Hook Status is On Hook
Ring Active Status is inactive
Ring Ground Status is inactive
Tip Ground Status is active
Digit Duration Timing is set to 100 ms
InterDigit Duration Timing is set to 100 ms
Ring Cadence are [20 40] * 100 msec
InterDigit Pulse Duration Timing is set to 500 ms
```

Cisco 3600 Series Router Digital E&M Voice Port

The following output is from a Cisco 3600 series router digital E&M voice port:

```
Router# show voice port 1/0:1

receEive and transMit Slot is 1, Sub-unit is 0, Port is 1
 Type of VoicePort is E&M
 Operation State is DORMANT
 Administrative State is UP
 No Interface Down Failure
 Description is not set
 Noise Regeneration is enabled
 Non Linear Processing is enabled
 Music On Hold Threshold is Set to -38 dBm
 In Gain is Set to 0 dB
 Out Attenuation is Set to 0 dB
 Echo Cancellation is enabled
 Echo Cancel Coverage is set to 8 ms
 Connection Mode is normal
 Connection Number is not set
 Initial Time Out is set to 10 s
 Interdigit Time Out is set to 10 s
 Region Tone is set for US
```

Cisco AS5300 Universal Access Server T1 CAS Voice Port

The following output is from a Cisco AS5300 universal access server T1 CAS voice port:

```
Router# show voice port

DS0 Group 1:0 - 1:0
 Type of VoicePort is CAS
 Operation State is DORMANT
 Administrative State is UP
 No Interface Down Failure
 Description is not set
 Noise Regeneration is enabled
 Non Linear Processing is enabled
 Music On Hold Threshold is Set to -38 dBm
```

```
In Gain is Set to 0 dB
Out Attenuation is Set to 0 dB
Echo Cancellation is enabled
Echo Cancel Coverage is set to 8 ms
Playout-delay Mode is set to default
Playout-delay Nominal is set to 60 ms
Playout-delay Maximum is set to 200 ms
Connection Mode is normal
Connection Number is not set
Initial Time Out is set to 10 s
Interdigit Time Out is set to 10 s
Call-Disconnect Time Out is set to 60 s
Ringing Time Out is set to 180 s
Companding Type is u-law
Region Tone is set for US
Wait Release Time Out is 30 s
Station name None, Station number None

Voice card specific Info Follows:

DS0 channel specific status info:
                              IN      OUT

```

7.310

Cisco 7200 Series Router Digital E&M Voice Port

The following output is from a Cisco 7200 series router digital E&M voice port:

```
Router# show voice port 1/0:1

receEive and transMit Slot is 1, Sub-unit is 0, Port is 1  << voice-port 1/0:1

 Type of VoicePort is E&M

 Operation State is DORMANT

 Administrative State is UP

 No Interface Down Failure
 Description is not set
 Noise Regeneration is enabled
 Non Linear Processing is enabled
 Music On Hold Threshold is Set to -38 dBm
 In Gain is Set to 0 dB

 Out Attenuation is Set to 0 dB

 Echo Cancellation is enabled

 Echo Cancel Coverage is set to 8 ms
 Connection Mode is normal
 Connection Number is not set
 Initial Time Out is set to 10 s

 Interdigit Time Out is set to 10 s

 Region Tone is set for US
```

show controller Command Examples

In the following sections, output examples of the following types are shown:

- Cisco 3600 Series Router T1 Controller, page 105
- Cisco MC3810 Multiservice Concentrator E1 Controller, page 105
- Cisco AS5800 Universal Access Server T1 Controller, page 105

Cisco 3600 Series Router T1 Controller

The following output is from a Cisco 3600 series router with a T1 controller:

```
Router# show controller T1 1/1/0

T1 1/0/0 is up.
  Applique type is Channelized T1
  Cablelength is long gain36 0db
  No alarms detected.
  alarm-trigger is not set
  Framing is ESF, Line Code is B8ZS, Clock Source is Line.
  Data in current interval (180 seconds elapsed):
     0 Line Code Violations, 0 Path Code Violations
     0 Slip Secs, 0 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins
     0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 0 Unavail Secs
```

Cisco MC3810 Multiservice Concentrator E1 Controller

The following output is from a Cisco MC3810 multiservice concentrator with an E1 controller:

```
Router# show controller E1 1/0

E1 1/0 is up.
  Applique type is Channelized E1
  Cablelength is short 133
  Description: E1 WIC card Alpha
  No alarms detected.
  Framing is CRC4, Line Code is HDB3, Clock Source is Line Primary.
  Data in current interval (1 seconds elapsed):
     0 Line Code Violations, 0 Path Code Violations
     0 Slip Secs, 0 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins
     0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 0 Unavail Secs
```

Cisco AS5800 Universal Access Server T1 Controller

The following output is from a Cisco AS5800 universal access server with a T1 controller:

```
Router# show controller t1 2

 T1 2 is up.
   No alarms detected.
   Version info of slot 0:  HW: 2, Firmware: 16, PLD Rev: 0

 Manufacture Cookie Info:
  EEPROM Type 0x0001, EEPROM Version 0x01, Board ID 0x42,
  Board Hardware Version 1.0, Item Number 73-2217-4,
  Board Revision A0, Serial Number 06467665,
  PLD/ISP Version 0.0, Manufacture Date 14-Nov-1997.

   Framing is ESF, Line Code is B8ZS, Clock Source is Internal.
```

```
Data in current interval (269 seconds elapsed):
 0 Line Code Violations, 0 Path Code Violations
   0 Slip Secs, 0 Fr Loss Secs, 0 Line Err Secs, 0 Degraded Mins
   0 Errored Secs, 0 Bursty Err Secs, 0 Severely Err Secs, 0 Unavail Secs
```

7.308

show voice dsp Command Examples

The following output is from a Cisco 3640 router when a digital voice port is configured:

```
Router# show voice dsp

TYPE DSP CH CODEC    VERS STATE STATE   RST AI PORT    TS ABORT   TX/RX-PAK-CNT
==== === == ======== ==== ===== ======= === == ======= == ===== ===============
C549 010 00 g729r8    3.3 busy  idle      0  0 1/015    1     0     67400/85384
         01 g729r8     .8 busy  idle      0  0 1/015    7     0     67566/83623
         02 g729r8        busy  idle      0  0 1/015   13     0     65675/81851
         03 g729r8        busy  idle      0  0 1/015   20     0     65530/83610
C549 011 00 g729r8    3.3 busy  idle      0  0 1/015    2     0     66820/84799
         01 g729r8     .8 busy  idle      0  0 1/015    8     0     59028/66946

show voice call summary Command Examples

In the following sections, output examples of the following types are shown:

- Cisco MC3810 Multiservice Concentrator Analog Voice Port
- Cisco 3600 Series Router Digital Voice Port

Cisco MC3810 Multiservice Concentrator Analog Voice Port

The following output is from a Cisco MC3810 multiservice concentrator:

```
Router# show voice call summary

PORT      CODEC    VAD VTSP STATE            VPM STATE
========= ======== === ==================== =======================
1/1       g729r8    y  S_CONNECT            FXSLS_CONNECT
1/2       -         -  -                    FXSLS_ONHOOK
1/3       -         -  -                    EM_ONHOOK
1/4       -         -  -                    EM_ONHOOK
1/5       -         -  -                    FXOLS_ONHOOK
1/6       -         -  -                    FXOLS_ONHOOK
```

Cisco 3600 Series Router Digital Voice Port

The following output is from a Cisco 3600 series router:

```
Router# show voice call summary

PORT      CODEC    VAD VTSP STATE            VPM STATE
========= ======== === ==================== =======================
1/015.1  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.2  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.3  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.4  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.5  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.6  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.7  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.8  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.9  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.10 g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.11 g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.12 g729r8    y  S_CONNECT            S_TSP_CONNECT
```

Troubleshooting Analog and Digital Voice Port Configurations

7.304

The following sections will assist in analyzing and troubleshooting voice port problems:

- Troubleshooting Chart, page 110
- Voice Port Testing Commands, page 112

Troubleshooting Chart

Table 10 lists some problems you might encounter after configuring voice ports and has some suggested remedies.

Table 10 Troubleshooting Voice Port Configurations

Problem	Suggested Action
No connectivity	Ping the associated IP address to confirm connectivity. If you cannot successfully ping your destination, refer to the *Cisco IOS IP Configuration Guide.*
No connectivity	Enter the **show controller t1** or **show controller e1** command with the controller number for the voice port you are troubleshooting. This will tell you: • If the controller is up. If it is not, use the **no shutdown** command to make it active. • Whether alarms have been reported. • What parameter values have been set for the controller (framing, clock source, line code, cable length). If these values do not match those of the telephony connection you are making, reconfigure the controller. See the "show controller Command Examples" section on page 105 for output.
No connectivity	Enter the **show voice port** command with the voice port number that you are troubleshooting, which will tell you: • If the voice port is up. If it is not, use the **no shutdown** command to make it active. • What parameter values have been set for the voice port, including default values (these do not appear in the output for the **show running-config** command). If these values do not match those of the telephony connection you are making, reconfigure the voice port. See the "show voice port Command Examples" section on page 101 for sample output.
Telephony device buzzes or does not ring	Use the **show voice port** command to confirm that ring frequency is configured correctly. It must match the connected telephony equipment and may be country-dependent.

Table 10 Troubleshooting Voice Port Configurations (continued)

Problem	Suggested Action
Distorted speech	Use the **show voice port** command to confirm the **cptone** keyword setting (also called *region tone*) is US. Setting a wrong cptone could result in faulty voice reproduction during analog-to-digital or digital-to-analog conversions.
Music on hold is not heard	Reduce the music-threshold level.
Background noise is not heard	Enable the **comfort-noise** command.
Long pauses occur in conversation; like speaking on a walkie-talkie	Overall delay is probably excessive; the standard for adequate voice quality is 150 ms one-way transit delay. Measure delay by using ping tests at various times of the day with different network traffic loads. If delay must be reduced, areas to examine include propagation delay of signals between the sending and receiving endpoints, voice encoding delay, and the voice packetization time for various VoIP codecs.
Jerky or choppy speech	Variable delay, or jitter, is being introduced by congestion in the packet network. Two possible remedies are to: • Reduce the amount of congestion in your packet network. Pings between VoIP endpoints will give an idea of the round-trip delay of a link, which should never exceed 300 ms. Network queuing and dropped packets should also be examined. • Increase the size of the jitter buffer with the **playout-delay** command. (See the "Jitter Adjustment" section on page 94.)
Clipped or fuzzy speech	Reduce input gain. (See the "Voice Level Adjustment" section on page 98.)
Clipped speech	Reduce the input level at the listener's router. (See the "Voice Level Adjustment" section on page 98.)
Volume too low or missed DTMF	Increase speaker's output level or listener's input level. (See the "Voice Level Adjustment" section on page 98.)
Echo interval is greater than 25 ms (sounds like a separate voice)	Configure the **echo-cancel enable** command and increase the value for the **echo-cancel coverage** keyword. (See the "Echo Adjustment" section on page 96.)
Too much echo	Reduce the output level at the speaker's voice port. (See the "Voice Level Adjustment" section on page 98.)

Voice Port Testing Commands

These commands allow you to force voice ports into specific states for testing. They require the use of Cisco IOS Release 12.0(7)XK or 12.1(2)T or a later release, and they apply only to Cisco 2600 and 3600 series routers, and to Cisco MC3810 multiservice concentrators. The following types of voice-port tests are covered:

7.302

- Detector-Related Function Tests, page 112
- Loopback Function Tests, page 114
- Tone Injection Tests, page 115
- Relay-Related Function Tests, page 116
- Fax/Voice Mode Tests, page 116

Detector-Related Function Tests

Using the **test voice port detector** command, you are able to force a particular detector into an on or off state, perform tests on the detector, and then return the detector to its original state.

To configure this feature, use the following commands in privileged EXEC mode:

	Command	Purpose

Step 1	**Cisco 2600 and 3600 Series Routers Analog Voice Ports**
	Router# **test voice port** *slot/subunit/port* **detector** {**m-lead** | **battery-reversal** | **loop-current** | **ring** | **tip-ground** | **ring-ground** | **ring-trip**} {**on** | **off**}
	Cisco 2600 and 3600 Series Routers Digital Voice Ports
	Router# **test voice port** *slot/port:ds0-group* **detector** {**m-lead** | **battery-reversal** | **loop-current** | **ring** | **tip-ground** | **ring-ground** | **ring-trip**} {**on** | **off**}
	Cisco MC3810 Multiservice Concentrators Analog Voice Ports
	Router# **test voice port** *slot/port detector* {**m-lead** | **battery-reversal** | **loop-current** | **ring** | **tip-ground** | **ring-ground** | **ring-trip**} {**on** | **off**}
		Identifies the voice port you want to test. Enter a keyword for the detector under test and specify whether to force it to the on or off state.
		Note For each signaling type (E&M, FXO, FXS), only the applicable keywords are displayed. The **disable** keyword is displayed only when a detector is in the forced state.

<table>
<tr><th></th><th>Command</th><th>Purpose</th></tr>
<tr><td></td><td><b>Cisco MC3810 Multiservice Concentrators Digital Voice Ports</b>
<code>Router# test voice port slot:ds0-group detector {m-lead | battery-reversal | loop-current | ring | tip-ground | ring-ground | ring-trip} {on | off}</code></td><td></td></tr>
<tr><td><b>Step 2</b></td><td><b>Cisco 2600 and 3600 Series Routers Analog Voice Ports</b>
<code>Router# test voice port slot/subunit/port detector {m-lead | battery-reversal | loop-current | ring | tip-ground | ring-ground | ring-trip} disable</code>
<b>Cisco 2600 and 3600 Series Routers Digital Voice Ports</b>
<code>Router# test voice port slot/port:ds0-group detector {m-lead | battery-reversal | loop-current | ring | tip-ground | ring-ground | ring-trip} disable</code>
<b>Cisco MC3810 Multiservice Concentrators Analog Voice Ports</b>
<code>Router# test voice port slot/port detector {m-lead | battery-reversal | loop-current | ring | tip-ground | ring-ground | ring-trip} disable</code>
<b>Cisco MC3810 Multiservice Concentrators Digital Voice Ports</b>
<code>Router# test voice port slot:ds0-group detector {m-lead | battery-reversal | loop-current | ring | tip-ground | ring-ground | ring-trip} disable</code></td><td>Identifies the voice port on which you want to end the test. Enter a keyword for the detector under test and the keyword <b>disable</b> to end the forced state.
<b>Note</b> For each signaling type (E&M, FXO, FXS), only the applicable keywords are displayed. The <b>disable</b> keyword is displayed only when a detector is in the forced state.</td></tr>
</table>

7.300

Loopback Function Tests

To establish loopbacks on a voice port, use the following commands in privileged EXEC mode:

<table>
<tr><th></th><th>Command</th><th>Purpose</th></tr>
<tr><td>Step 1</td><td><b>Cisco 2600 and 3600 Series Routers Analog Voice Ports</b>
Router# <b>test voice port</b> <i>slot/subunit/port</i> <b>loopback</b> {<b>local</b> | <b>network</b>}</td><td>Identifies the voice port you want to test and enters a keyword for the loopback direction.
<b>Note</b> A call must be established on the voice port under test.</td></tr>
<tr><td></td><td><b>Cisco 2600 and 3600 Series Routers Digital Voice Ports</b>
Router# <b>test voice port</b> <i>slot/port:ds0-group</i> <b>loopback</b> {<b>local</b> | <b>network</b>}</td><td></td></tr>
<tr><td></td><td><b>Cisco MC3810 Multiservice Concentrators Analog Voice Ports</b>
Router# <b>test voice port</b> <i>slot/port detector</i> <b>loopback</b> {<b>local</b> | <b>network</b>}</td><td></td></tr>
<tr><td></td><td><b>Cisco MC3810 Multiservice Concentrators Digital Voice Ports</b>
Router# <b>test voice port</b> <i>slot:ds0-group</i> <b>loopback</b> {<b>local</b> | <b>network</b>}</td><td></td></tr>
<tr><td>Step 2</td><td><b>Cisco 2600 and 3600 Series Routers Analog Voice Ports</b>
Router# <b>test voice port</b> <i>slot/subunit/port</i> <b>loopback disable</b></td><td>Identifies the voice port on which you want to end the test and enters the keyword disable to end the loopback.</td></tr>
<tr><td></td><td><b>Cisco 2600 and 3600 Series Routers Digital Voice Ports</b>
Router# <b>test voice port</b> <i>slot/port:ds0-group</i> <b>loopback disable</b></td><td></td></tr>
<tr><td></td><td><b>Cisco MC3810 Multiservice Concentrators Analog Voice Ports</b>
Router# <b>test voice port</b> <i>slot/port detector</i> <b>loopback disable</b></td><td></td></tr>
<tr><td></td><td><b>Cisco MC3810 Multiservice Concentrators Digital Voice Ports</b>
Router# <b>test voice port</b> <i>slot:ds0-group</i> <b>loopback disable</b></td><td></td></tr>
</table>

Tone Injection Tests

To inject a test tone into a voice port, use the following commands in privileged EXEC mode:

<table>
<tr><th></th><th>Command</th><th>Purpose</th></tr>
<tr><td><b>Step 1</b></td><td><b>Cisco 2600 and 3600 Series Routers Analog Voice Ports</b>
<code>Router# test voice port <i>slot/subunit/port</i> inject-tone {local | network} {1000hz | 2000hz | 200hz | 3000hz | 300hz | 3200hz | 3400hz | 500hz | quiet}</code>
<b>Cisco 2600 and 3600 Series Routers Digital Voice Ports</b>
<code>Router# test voice port <i>slot/port:ds0-group</i> inject-tone {local | network} {1000hz | 2000hz | 200hz | 3000hz | 300hz | 3200hz | 3400hz | 500hz | quiet}</code>
<b>Cisco MC3810 Multiservice Concentrators Analog Voice Ports</b>
<code>Router# test voice port <i>slot/port detector</i> inject-tone {local | network} {1000hz | 2000hz | 200hz | 3000hz | 300hz | 3200hz | 3400hz | 500hz | quiet}</code>
<b>Cisco MC3810 Multiservice Concentrators Digital Voice Ports</b>
<code>Router# test voice port <i>slot:ds0-group</i> inject-tone {local | network} {1000hz | 2000hz | 200hz | 3000hz | 300hz | 3200hz | 3400hz | 500hz | quiet}</code></td><td>Identifies the voice port you want to test and enter keywords for the direction to send the test tone and for the frequency of the test tone.
<b>Note</b> A call must be established on the voice port under test.</td></tr>
<tr><td><b>Step 2</b></td><td><b>Cisco 2600 and 3600 Series Routers Analog Voice Ports</b>
<code>Router# test voice port <i>slot/subunit/port</i> inject-tone disable</code>
<b>Cisco 2600 and 3600 Series Routers Digital Voice Ports</b>
<code>Router# test voice port <i>slot/port:ds0-group</i> inject-tone disable</code>
<b>Cisco MC3810 Multiservice Concentrators Analog Voice Ports</b>
<code>Router# test voice port <i>slot/port detector</i> inject-tone disable</code>
<b>Cisco MC3810 Multiservice Concentrators Digital Voice Ports</b>
<code>Router# test voice port <i>slot:ds0-group</i> inject-tone disable</code></td><td>Identifies the voice port on which you want to end the test and enter the keyword <b>disable</b> to end the test tone.
<b>Note</b> The <b>disable</b> keyword is available only if a test condition is already activated.</td></tr>
</table>

7.298

Relay-Related Function Tests

To test relay-related functions on a voice port, use the following commands in privileged EXEC mode:

	Command	Purpose

Step 1	**Cisco 2600 and 3600 Series Routers Analog Voice Ports**
	Router# **test voice port** *slot/subunit/port* **relay** {**e-lead** | **loop** | **ring-ground** | **battery-reversal** | **power-denial** | **ring** | **tip-ground**} {**on** | **off**}
	Cisco 2600 and 3600 Series Routers Digital Voice Ports
	Router# **test voice port** *slot/port:ds0-group* **relay** {**e-lead** | **loop** | **ring-ground** | **battery-reversal** | **power-denial** | **ring** | **tip-ground**} {**on** | **off**}
	Cisco MC3810 Multiservice Concentrators Analog Voice Ports
	Router# **test voice port** *slot/port detector* **relay** {**e-lead** | **loop** | **ring-ground** | **battery-reversal** | **power-denial** | **ring** | **tip-ground**} {**on** | **off**}
	Cisco MC3810 Multiservice Concentrators Digital Voice Ports
	Router# **test voice port** *slot:ds0-group* **relay** {**e-lead** | **loop** | **ring-ground** | **battery-reversal** | **power-denial** | **ring** | **tip-ground**} {**on** | **off**}
		Identifies the voice port you want to test. Enter a keyword for the relay under test and specify whether to force it to the on or off state.
		Note For each signaling type (E&M, FXO, FXS), only the applicable keywords are displayed. The **disable** keyword is displayed only when a relay is in the forced state.

Step 2	**Cisco 2600 and 3600 Series Routers Analog Voice Ports** Router# **test voice port** *slot/subunit/port* **relay** {**e-lead** | **loop** | **ring-ground** | **battery-reversal** | **power-denial** | **ring** | **tip-ground**} **disable** **Cisco 2600 and 3600 Series Routers Digital Voice Ports** Router# **test voice port** *slot/port:ds0-group* **relay** {**e-lead** | **loop** | **ring-ground** | **battery-reversal** | **power-denial** | **ring** | **tip-ground**} **disable** **Cisco MC3810 Multiservice Concentrators Analog Voice Ports** Router# **test voice port** *slot/port detector* **relay** {**e-lead** | **loop** | **ring-ground** | **battery-reversal** | **power-denial** | **ring** | **tip-ground**} **disable** **Cisco MC3810 Multiservice Concentrators Digital Voice Ports** Router# **test voice port** *slot:ds0-group* **relay** {**e-lead** | **loop** | **ring-ground** | **battery-reversal** | **power-denial** | **ring** | **tip-ground**} **disable**	Identifies the voice port on which you want to end the test. Enter a keyword for the relay under test, and the keyword **disable** to end the forced state. **Note** For each signaling type (E&M, FXO, FXS), only the applicable keywords are displayed. The **disable** keyword is displayed only when a relay is in the forced state.

Fax/Voice Mode Tests

The **test voice port switch fax** command forces a voice port into fax mode for testing. After you enter this command, you can use the **show voice call** or **show voice call summary** command to check whether the voice port is able to operate in fax mode. If no fax data is detected by the voice port, the voice port remains in fax mode for 30 seconds and then reverts automatically to voice mode.

The **disable** keyword ends the forced mode switch; however, the fax mode ends automatically after 30 seconds. The disable keyword is available only while the voice port is in fax mode.

7.297

To force a voice port into fax mode and return it to voice mode, use the following commands in privileged EXEC mode:

	Command	Purpose

Step 1	**Cisco 2600 and 3600 Series Routers Analog Voice Ports**
	`Router# test voice port slot/subunit/port switch fax`
	Cisco 2600 and 3600 Series Routers Digital Voice Ports
	`Router# test voice port slot/port:ds0-group switch fax`
	Cisco MC3810 Multiservice Concentrators Analog Voice Ports
	`Router# test voice port slot/port detector switch fax`
	Cisco MC3810 Multiservice Concentrators Digital Voice Ports
	`Router# test voice port slot:ds0-group switch fax`
		Identifies the voice port you want to test. Enter the keyword **fax** to force the voice port into fax mode.

Step 2	**Cisco 2600 and 3600 Series Routers Analog Voice Ports**
	`Router# test voice port slot/subunit/port switch disable`
	Cisco 2600 and 3600 Series Routers Digital Voice Ports
	`Router# test voice port slot/port:ds0-group switch disable`
	Cisco MC3810 Multiservice Concentrators Analog Voice Ports
	`Router# test voice port slot/port detector switch disable`
	Cisco MC3810 Multiservice Concentrators Digital Voice Ports
	`Router# test voice port slot:ds0-group switch disable`
		Identifies the voice port on which you want to end the test. Enter the keyword **disable** to return the voice port to voice mode.
