10. Manager v6.x is web based GUI that resides on an FC4700, CX600, CX400 or CX200 Array and is downloaded to the browser when the storage processor of the array is accessed.The browser requires a Manager Client that supports Java 1.31_01. Manager includes two Windows components for management of non-FC4700, non-CX600, non-CX400, non-CX200 arrays from a Windows 2000 host.

1. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
2. For FC4700, CX600, and CX400 only. SnapView and Mirrorview require Access Logix.
3. ATF/CDE not supported on CX600 and CX400 arrays. ATF/CDE and PowerPath cannot co-exist on the same server.
4. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
5. SAN Copy Operational restrictions apply when using SAN Copy with Clusters and AIX Systems. Refer to the SAN Copy release notice for more information.
6. SAN Copy installation is supported on CX600, CX400, FC4700, and FC4700-2 arrays. Data movement is supported in and between CX Series arrays, FC4500, FC4700, FC4700-2, FC5300, Symmetrix 8000 series, Symmetrix DMX Series, Symmetrix 3832, Symmetrix 3x30, and Symmetrix 3700 arrays.
7. Data movement between CLARiiON and Symmetrix requires Navisphere host agent attached to Symmetrix. Agents supported are Windows, SUN, HP/UX, AIX, IRIX, and Linux
8. A Snapshot must not be in a clustered Storage Group.
Shipped with Navisphere Manager.Integrator supports HP Open view 6.1,Tivoli NetView 6.0b, and Unicenter TNG 2.2 and 2.4.
Powerpath supported on FC4500, FC5300, FC4700, CX600, CX400, and CX200.
PowerPath Base supported on FC4500, CX200 only.
CLARiiON and Symmetrix can co-exist in the SAN with the same server.
11. Manager v6.x is web based GUI that resides on an FC4700, CX600, CX400 or CX200 Array and is downloaded to the browser when the storage processor of the array is accessed.The browser requires a Manager Client that supports Java 1.31_01. Manager includes two Windows components for management of non-FC4700, non-CX600, non-CX400, non-CX200 arrays from a Windows 2000 host.
12. This HBA is equivalent to the qLogic QLA2340.

Microsoft Windows 2003

Microsoft Windows 2003			
No.	Operating System	Host Bus Adapter	Application Software
1	Microsoft Windows 2003: DataCenter[1, 2, 3, 4], Enterprise Edition (Advanced Server)[1, 2, 3, 4], Standard Edition (Server)[1, 2, 3, 4]	Emulex: LP8000-EMC[7], LP9002-E (LP9002L-E), LP9802-E, LP9802DC-E, LP982-E; HPQ Dual-port mezzanine controller card; QLogic: QLA2310F-E-SP, QLA2340-E-SP, QLA2342-E-SP	MirrorView 1.7[5]; Navisphere: Agent/CLI 6.4, Analyzer 6.4, Integrator 6.2.0[8], Manager, Event Monitor 6.4.1[8, 12]; SAN Copy v1.0[9, 10, 11]; SnapView 2.1[5, 6]; admsnap 2.1[5, 6]

1. Support limited to the following configurations: 1 HBA with 1 path to 1 SP; 2 HBAs, one with a single path to SPA and the other with a single path to SPB. Powerpath not supported. Refer to HBA guides for expected device behavior.
2. PowerPath is not supported.
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. Windows 2003 is only supported on 32-Bit Intel platforms. 64-Bit Itanium systems supported by RPQ only.
5. For FC4700, CX600, and CX400 only. SnapView and Mirrorview require Access Logix.
6. A Snapshot must not be in a clustered Storage Group.
7. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
8. Shipped with Navisphere Manager.Integrator supports HP Open view 6.1,Tivoli NetView 6.0b, and Unicenter TNG 2.2 and 2.4.

1. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
2. This kernel is supported with PowerPath v3.0.2 via RPQ only.
3. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath.
   Booting from EMC storage arrays is NOT supported with PowerPath.
4. A Snapshot must not be in a clustered Storage Group.
5. For FC4700, CX600, and CX400 only. SnapView and Mirrorview require Access Logix.
6. **Data movement between CLARiiON and Symmetrix requires Navisphere host agent attached to Symmetrix. Agents supported are Windows, SUN, HP/UX, AIX, IRIX, and Linux**
7. **SAN Copy installation is supported on CX600, CX400, FC4700, and FC4700-2 arrays. Data movement is supported in and between CX Series arrays, FC4500, FC4700, FC4700-2, FC5300, Symmetrix 8000 series, Symmetrix DMX Series, Symmetrix 3832, Symmetrix 3x30, and Symmetrix 3700 arrays.**
8. **SAN Copy Operational restrictions apply when using SAN Copy with Clusters and AIX Systems. Refer to the SAN Copy release notice for more information.**
9. **Supported with QLogic driver v6.04.02 or v6.05.00.**
10. Shipped with Navisphere Manager.Integrator supports HP Open view 6.1,Tivoli NetView 6.0b, and Unicenter TNG 2.2 and 2.4.
11. Manager v6.x is web based GUI that resides on an FC4700, CX600, CX400 or CX200 Array and is downloaded to the browser when the storage processor of the array is accessed.The browser requires a Manager Client that supports Java 1.31_01. Manager includes two Windows components for management of non-FC4700, non-CX600, non-CX400, non-CX200 arrays from a Windows 2000 host
12. **PowerPath Base is supported on the FC4500 and CX200 only.**

13. **Requires QLogic driver v6.04.02 and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
14. **QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.**
15. **FC-AL and FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.**
16. **FC-SW applies only to CX600, CX400, CX200, FC4500, FC4700 and FC5300. FC5300 with FC-SW available from selected channels.**
17. **This kernel is supported with the Qlogic v6.04.01 driver included in the kernel.**
18. **Requires QLogic driver v6.04.01 (included in 2.4.9-e.24 kernel) and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
19. **Single HBA zoning is required regardless of the switch being utilized.**
20. **Requires QLogic driver v6.04.01 (included in 2.4.9-e.24 kernel) and BIOS v1.83 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
21. **Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.**
22. **Host must be offline for CLARiiON-licensed (Flare) upgrade and Storage Processor replacement.**

2. **SAN Copy Operational restrictions apply when using SAN Copy with Clusters and AIX Systems. Refer to the SAN Copy release notice for more information.**
3. **Data movement between CLARiiON and Symmetrix requires Navisphere host agent attached to Symmetrix. Agents supported are Windows, SUN, HP/UX, AIX, IRIX, and Linux**
4. **SAN Copy installation is supported on CX600, CX400, FC4700, and FC4700-2 arrays. Data movement is supported in and between CX Series arrays, FC4500, FC4700, FC4700-2, FC5300, Symmetrix 8000 series, Symmetrix DMX Series, Symmetrix 3832, Symmetrix 3x30, and Symmetrix 3700 arrays.**
   A Snapshot must not be in a clustered Storage Group.
   Shipped with Navisphere Manager.Integrator supports HP Open view 6.1,Tivoli NetView 6.0b, and Unicenter TNG 2.2 and 2.4.
7. **Manager v6.x is web based GUI that resides on an FC4700, CX600, CX400 or CX200 Array and is downloaded to the browser when the storage processor of the array is accessed.The browser requires a Manager Client that supports Java 1.31_01. Manager includes two Windows components for management of non-FC4700, non-CX600, non-CX400, non-CX200 arrays from a Windows 2000 host.**

1. Requires rev2_sles7upg2418.patch available from ftp://ftp.emc.com/pub/elab/linux
2. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ
3. **A Snapshot must not be in a clustered Storage Group.**
4. For FC4700, CX600, and CX400 only. SnapView and Mirrorview require Access Logix.
5. **Data movement between CLARiiON and Symmetrix requires Navisphere host agent attached to Symmetrix. Agents supported are Windows, SUN, HP/UX, AIX, IRIX, and Linux**
6. **SAN Copy Operational restrictions apply when using SAN Copy with Clusters and AIX Systems. Refer to the SAN Copy release notice for more information.**
7. **SAN Copy installation is supported on CX600, CX400, FC4700, and FC4700-2 arrays. Data movement is supported in and between CX Series arrays, FC4500, FC4700, FC4700-2, FC5300, Symmetrix 8000 series, Symmetrix DMX Series, Symmetrix 3832, Symmetrix 3x30, and Symmetrix 3700 arrays.**
8. Shipped with Navisphere Manager.Integrator supports HP Open view 6.1,Tivoli NetView 6.0b, and Unicenter TNG 2.2 and 2.4.
9. Supported with QLogic driver v6.04.02
10. Requires rev1_sles7.patch available from ftp://ftp.emc.com/pub/elab/linux for CLARiiON attach only.
11. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
12. Requires QLogic driver v6.04.02 and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
13. Requires QLogic v6.04.02 driver.
14. Requires rev3_sles8.patch available from ftp://ftp.emc.com/pub/elab/linux.

15. Requires QLogic driver v6.04.00 or above.
16. Requires QLogic driver v6.04.02 and BIOS v1.83 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
17. Manager v6.x is web based GUI that resides on an FC4700, CX600, CX400 or CX200 Array and is downloaded to the browser when the storage processor of the array is accessed.The browser requires a Manager Client that supports Java 1.31_01. Manager includes two Windows components for management of non-FC4700, non-CX600, non-CX400, non-CX200 arrays from a Windows 2000 host.
18. **EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.**
19. **Requires QLogic v6.04.02 or v6.05.00 driver.**
20. **PowerPath Base is supported on the FC4500 and CX200 only.**
21. **CLARiiON and Symmetrix can co-exist in the SAN with the same server.**
22. **PowerPath supported on FC4500, FC4700, CX600, CX400, and CX200.**
23. **Requires QLogic driver v6.04.02 and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65**
24. **QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.**
25. **Requires rev1 sles8sp2a.patch for CLARiiON-attached hosts available from ftp://ftp.emc.com/pub/elab/linux.**
26. **Requires QLogic driver v6.04.02 and BIOS 1.83 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65**
27. **Requires QLogic driver v6.04.02 or v6.05.00 and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**

Fibre Channel

Fibre Channel Cables

Fibre Channel Connector Types

19.617

Fibre Channel Cables

This table lists Fibre Channel cables. Click here for more information.

LC and SC fiber optic connector types are illustrated in Figure 1.
MM = Multimode, SM = Single-mode,SC = Standard Connector, LC = Lucent Connector. See the table EMC Fibre Channel Connector Types.
As an example for determining cable model:
From the Single Host Tables in the column titled "Cable Models," the entry MM-SC/xx is interpreted as follows:
MM = mode, SC = HBA connector end, xx = the opposite cable end, which could be SC or LC.
For MM -SC/LC, use cable FC*L*M-50MSLC, where *L* = desired length in meters.
For MM -SC/SC, use cable FC*L*M-50M, where *L* = desired length in meters.

	Fibre Channel		Cable Length (Meters)[1]								
Storage System	Mode	Connector Type	1M	3M	5M	10M	30M	50M	100M	250M	500M

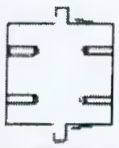
Symmetrix	SM	SC/LC LC/SC	FC1M-9MSLC	FC3M-9MSLC	FC5M-9MSLC	FC10M-9MSLC	FC30M-9MSLC	FC50M-9MSLC	FC100M-9MSLC		
Symmetrix	SM	LC/LC			FC5M-9MLC	FC10M-9MLC	FC30M-9MLC	FC50M-9MLC	FC100M-9MLC		

1. For cable lengths between 100 and 500 meters, contact AMP Incorporated at 717-986-5710 or a local fiber optic cable supplier/installer.
2. Ships with SC male-to-female adapter.

LC Connector

SC Connector



SC Coupler

FIGURE 1. LC and SC Fiber Optic Connectors with SC Coupler.

The Lucent LC™ has a form factor about half the size of the SC connector, and uses an insertion release mechanism similar to those on telephone plugs.

The SC coupler is provided with the 1 meter and 3 meter cables, the coupler allows connection to exiting fibre cable plants using SC connectors. The coupler is included with the following cables listed in the table Fibre Channel Cables:
FC1M-50MSLC
FC3M-50MSLC
FC1M-9MSLC
FC3M-9MSLC

EMC Fibre Channel Connector Types

This table lists Fibre Channel connectors. Click here for more information.

MM = Multimode, SM = Single-mode, SC = Standard Connector, LC = Lucent Connector (LC and SC fiber optic connector types are illustrated in Figure 1 above)

Storage and FC Hub/Switch Models	Fibre Adapter	Connector Type	#of Connections-Mode(s)	Comments
ARiiON CX600		LC	8-MM	2 Gbit, 4 connects per SP
ARiiON 4700-2		LC	4-MM	1 or 2 Gbit, 2 connects per SP

2. Minimum Symmetrix microcode revision 5567.34.19A.

iSCSI to FC Routing

No.	Bridge	Firmware Revision	Network Configuration	Topology	Microcode	Operating System	Network Interface Card	Driver	Storage System
1	Cisco SN 5420[2, 3, 4, 5, 6]	2.1.2.6	LAN Only	FC-AL	EMC 5568.47.17[1]	Microsoft Windows 2000; Advanced Server SP3[7], Server SP3[7]; Sun Solaris 8	Generic NIC 10/100, Generic NIC GE	2.1.4	EMC Symmetrix 8000 Series
2	Cisco SN 5420[2, 3, 4, 5, 6]	2.1.2.6	LAN Only	FC-AL	EMC 5669	Microsoft Windows 2000; Advanced Server SP3[7], Server SP3[7]; Sun Solaris 8	Generic NIC 10/100, Generic NIC GE	2.1.4	EMC Symmetrix DMX Series

1. If 200-561-900 FA boards are used, the FA must be configured through SymmWin with a loop ID 0x20.
2. Refer to document - Symmetrix in an iSCSI Cisco Storage Router Configuration EMC P/N 300-000-688, for configuration guidelines.
3. Booting over iSCSI is not supported.
4. PowerPath is supported and the configuration is specified in the configuration document.
5. SymAPI 5.0.1 is required.
6. Clusters are not supported.
7. EMC strongly recommends that HBAs of different vendors not be used in the same host server.

Switched Fabric Topology Parameters

For fabrics consisting of McData and Brocade directors/switches, see the Interoperability Solution Statement, EMC P/N 300-000-067, at http://avatar.eng.emc.com.
Server / HBA model limitations are subject to switch support as listed in Fibre Connectivity: Switch Interoperability Application. EMC recommends the latest code revisions be used on all fabrics.
Switch Interoperability describes the limitations for a mixed Fibre Channel switched fabric topology. The fabric topology envelope limitations and the switch management applications are defined in the attribute columns.
The following is an example showing how to utilize the table:
1. The objective of this example are to construct a SAN consisting of a Connetrix ED-1032, a Connectrix DS-32M, a Connectrix DS-16B, and to verify firmware and management application compatibility. In this case you need to verify that each of these components interoperates with the other two.
2. As the data shows, devices listed in Fibre Channel Switch column can be the same SAN with devices listed in the Fibre Channel Switch B column. For example: a DS-32M model switch running 1.02.00 firmware can interoeprate with an ED-1032 Director running 3.02.00 firmware, and with a DS-16B running a2.5.0d firmware.
3. In order to verify that the ED-1032 Director running 3.02.00 firmware can also interoperate with the S-16B running a2.5.0d, find the ED-1032 in the Fibre Channel Switch column and the DS-16B in the Fibre Channel Switch B column. These two steps verify that alll three firmware levels are compatible with each other. The management application in these cases is Connectrix Manager orEFCM 4.01.00.
For DWDM support, see the Distance Extension Solution Interoperability Application and the "Distance Extension Considerations" in the EMC Networked Storage Topology Guide at http://avatar.eng.emc.com.
For McData switches / directors, Single Mode optics are supported up to 20 km.
For Brocade switches and directors, Single Mode optics support 10km, 20km, and 35km distance switch to switch.

1. Obsolete (End of Support).
2. The maximum number of ISLs (Inter-Switch Links) a frame needs to traverse between any input port of the fabric to any output port, assuming all ISLs are active (no ISL or switch fault condition is present) This is the maximum number of hops in a fabric.
3. Switch Management versions are backward compatible. You may manage any lower-level switch with a higher level Management Application Revision.
4. The use of mixed code revisions in the same fabric should be limited to code upgrade processes only. You must always use the management code rev. associated with the highest level of switch code.
5. The maximum number of ISLs (Inter-Switch Links) between two switches in a fabric.
6. The maximum number of switches a Fibre Channel fabric may contain under the current topology limitations.
7. ESN Manager 2.1.
8. Hard set ISL E-port speed to 1 Gb or 2 Gb.
9. For fabrics consisting of McData and Brocade directors/switches, see the Interoperability Solution Statement, EMC P/N 300-000-067.
10. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
    Auto-negotiation with 200-563-920 requires Enginuity 5568.47.17.
12. CLARiiON environments only: groups of 4 consecutively numbered ports may be referred to as a "quad". The 4 quads correspond to ports 0 - 3, 4 -7, 8- 11, and 12- 15. Only one port within any quad may be connected to an array SP port. The remaining 3 ports within the quad may be used for connection to HBA ports and as ISLs.
13. EMC DS-16B2 for "Extended Fabric License" , use minimum 3.0.2f firmware, 1 ISL per quad only.
14. Upgrade required to 4.01.00.
15. For fabric and zone size considerations, refer to the latest Connectrix Planning Guide and Release Notes.
16. Mirrored fabrics with redundant switch hardware are strongly recommended.
17. Zoning, discovery, and statistics for ESN Manager 2.0 or earlier are not available.
18. No support currently for QuickLoop.
19. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
20. This is a Brocade Silkworm 2800 (16 ports)
21. Firmware revision levels distributed and supported by Bull Please see appropriate Bull documentation.
22. Brocade 2400 and 2800 require the purchase of the "extended fabric license" from Brocade for long distance applications.
23. For QuickLoop support, see Fibre Connectivity: Switch Interoperability Application.
24. No ISLs supported.
25. Host connectivity only
26. T-port mode only. Limited to a maximum of 16 zones.
27. Port zoning only. Minimum Enginuity code 5567.29.15s.
28. T-port mode only Port zoning only Single switch only.
29. Single Brocade 6400 cabinet only.
30. When creating a fabric with ED-12000B and DS-16B, DS-16B2, and / or DS-32B2, a maximum of 4 ED-12000B domains can be used
31. **20 VSANs maximum, with 8 domains per-VSAN.**

Mixed Storage Environment Matrix

EMC continues to qualify the individual non-EMC storage arrays in environments that share resources (SAN, Server, and HBA) with EMC equipment and in the interest of simplicity, we provide the following statements on the support of those environments. EMC will continue to support EMC manufactured or EMC supplied equipment in environments that meet the following criteria. Any environment that does not adhere to these requirements would require a PRPQ for identification of supportability.

Requirements:

1. Clariion and Symmetrix Storage

EMC storage (Clariion & Symmetrix) interoperability support is listed as part of the Base Connectivity, Clustered Host and Switch Interoperability tables of the EMC Support Matrix. It should be understood that arrays with matching matrix configurations can be used in a shared SAN, Shared Server or Shared HBA,

unless explicitly noted. PowerPath and other load balancing software versions must be reviewed independently for mutual array support or coexistence concerns.

2. Compatibility with Non-EMC Storage

a. Shared SAN, Shared Server, Shared HBA

When working in a heterogeneous storage environment the fabric components (switches, directors, and HBAs) along with the operating system level, HBA models, drivers and firmware must all be at the EMC supported levels. Non-EMC storage connecting to this fabric environment must also be supported through their respective OEM vendors in the stated environment. Deviations in any of the supported levels for any component can either be handle through EMC's or the respective vendor's RPQ process. This will ensure that all storage arrays remain supported through their respective OEM vendors.

b. Individual Storage Vendor Zoning

No matter which sharing model you choose(Shared HBA, Shared Server, or Shared SAN), EMC recommends that you limit the amount of possible interactions between the arrays. This will assist in troubleshooting, maintenance and management of the environment.

To limit the interactions and dependencies we recommend that you do not include storage array ports from different vendors in the same zone. Multiple zones can be created that use the same HBA, as long as the storage arrays are in separate zones with that common HBA. Zoning in this fashion will ensure that there are no direct interactions between the different storage arrays.

c. Third Party Load Balancing and Path Management Software

Load balancing and path management software compatibility cannot be inferred by any table, and unless concurrent support for such software is explicitly listed in the applicable Base Connectivity sections, then support will require an RPQ submission.

d. Metavolume Creation and Striping

To further limit the dependencies and interaction of these arrays, we recommend that you do not use logical partitions from separate array vendors in the same metavolume or stripe set. Doing this will complicate troubleshooting, maintenance activities and follow on management of the arrays.

1. Maximum distance between sites (for Fibre Channel ISLs distance is measured as total distance between E-ports including switch to DWDM interface), or optical power budget limit per system spec (whichever is shorter).
2. 850 nm multi-mode and 1310 nm single-mode Fibre Channel protocol connections for FC-SW attach.
3. FC-SW Inter-Switch Link (ISL) extension
4. IBM OEMs this product and sells as the IBM 2029.
5. All E-ports or ISLs should be hard set to either 1 Gb or 2 Gb in unison with the client-side interfaces to DWDM units.
6. The following manufacturers and systems is the same product: Adva(FSP-II), Alcatel (Optinex 1690), Siemens (Waveline EL2), InRange (Spectrum).
7. Only 1310 nm single-mode Fibre Channel connections supported.
8. Support with ONS 15501 (Erbium Doped Fiber Amplifier) units per one fiber distance strand for Protected and Unprotected environments. Minimum supported firmware 1.2. Hardware Rev 303041.
9. Unprotected or splitter-protected
10. Minimum supported Transponder firmware 1.59. Minimum supported MUX/DeMUX motherboard firmware 2.50. Minimum supported line card motherboard firmware 2.48. Minimum supported CPU firmware 1.24
11. Splitter-protected
12. OEM from Pandatel.
13. Minimum supported firware 1.05V.
14. GRDM 850nm/1310 nm cards must be utilized for Fibre Channel protocols.
15. No mixing of protocols allowed on the same GRDM card -- FC only.

16. UPSR and BLSR protected.
17. No direct host or storage connections into system (except for ESCON links).
18. **2Gb FC link speeds with the WCIRG-2.5Gb Circuit Pack**
19. **Minimum supported firmware 4.1.2.**
20. **The ONLINE Metro can be used with UPSR or BLSR protection options.**
21. N-port extender (HBA to switch) solution
22. Supported for Solaris 2.6 with JNI FC-1063-EMC, JNI FC64-1063-EMC HBAs. Refer to Sun Base Connectivity for currently supported Solaris/JNI driver versions.
23. Support for Windows NT 4.0 with SP6A with Emulex LP7000E-EMC and LP8000-EMC. Refer to Intel based Windows Servers (Fibre Channel) Base Connectivity for currently supported Windows NT/Emulex driver versions.
24. FC-SW ISL Extension: >500 meters &lt: 40 kilometers solution.
25. Distances up to 10 km can be obtained using LW GBICs in qualified switches.
26. FLX-2000-40 requires rev 3.0.
27. Minimum supported firmware: 1 05v Minimum network element processor: rnel. 2.6.3 Minimum service channel processor: 2.6.4. Minimum OC-48-Transceiver (191.90 and 195.50 THz): 2.6.4z. 2.6.4
28. UPSR protected.
29. The following manufacturers and systems are the same product: CNT (Inrange) Spectrum 2000
30. No longer available
31. CLARiiON (Extended Fabric License required for distances &gt:= 10 kilometers) Solution requires 2 extenders.
32. MirrorView 1.2 or higher
33. Maximum distance between sites (measured as total distance between E-ports) without RSM. 40Km with RSM and Protected Mode, or optical power budget limit per system spec (whichever is shorter).
34. ESCON 4:1 TDM
35. UltraNet Wave Optimizer TDM is qualified
36. Extended Distance Solutions Channel Extension
37. Solution requires dedicated FC switch that must be provided by CNT.
38. This configuration requires completion of a Pre-Sales Questionnaire (PSQ).
39. Minimum AccessLogix: CLARiiON FC4700: 8.45.5.x. CLARiiON CX600: v02.01.1.60.5.006, CLARiiON CX400: 02.02.1.40.5.xxx.
40. Minimum microcode for Symmetrix 4.8 and 8000 Series is 5x65.
41. 8 ESCON X 4 Fast Ethernet
42. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only
43. Deployments must be fully redundant.
44. Minimum microcode for Symmetrix 8000 is 5567.36.xx. Minimum microcode for Symmetrix DMX is 5669.
45. ESCON traffic with LSBB Circuit Packs recommended (LSBB OTPM)
46. **1310 nm single-mode Fibre Channel protocol connections for FC-SW attach to both 2DM25 and UBB circuit packs.**
47. **UBB (OTPM UBB) circuit pack for 1Gb and 2Gb FC support. UBB provisioned to ISC3PEER mode.**
48. **Minimum supported firmware Release 8.2.1 NE Software 10-May-02 (rev. 4)**
49. **Fibre Chanel trafic through ELSBB Circuit Packs (ELSBB OTPM)**
50. **2DM25 (MUX OTU) 2:1 multiplexer circuit pack for 1Gb FC support. 2DM25 provisioned to FC-100 mode.**
51. EMC DS-16B2 for "Extended Fabric License" , use minimum 3.0.2f firmware, 1 ISL per quad only.
52. Interfacing through DWDM is supported via SONET client interfaces.
53. Refer to the document "Lucent OptiStar" on Avatar for configuration guidelines.
54. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
55. EMC considers Wave Division Multiplexing technologies (Coarse and Dense WDM) to be mature and industry proven.
    EMC no longer tests standard WDM technology on site therefor devices covered under this support model are not physically tested in the EMC engineering lab.
    Engineering will provide Best Reasonable Effort (BRE) support for this WDM device.
56. Release CLIP firmware version 1.26 (not field soft upgradeable but requires a physical hardware upgrade of a chip on the CLIP board).
57. Release NCB software SNM version 1.1
58. **Nishan switches can only be configured to connect locally to the Symmetrix or CLARiiON systems or as an e-port connection to a FC-Switch. No host attach to the Nishan switches is supported and host IO over the iFCP link is also not supported.**
59. **Each SAN Island should include no more than 2 switches (one Nishan switch and one other vendor switch)**
60. SRDF between Symmetrix DMX and Symmetrix 8000 in this configuration requires an RPQ.
61. Switch must be dedicated for the SRDF application. Firmware a2.5.0d is required.
62. Validated for connectivity and performance only. Virus protection and dual disk support validated by Inrange.
63. INRANGE must order application software part number 98-154.EMC which is installed at the factory.
64. Minimum Access Logix: CLARiiON FC4700: 08.49.xx or higher, CLARiiON CX600/400: 02.04.1.60.x.xxx or higher.
65. 4:1 and 8:1 TDM cards qualified.
66. E-ports conneted to High Frequency DRW cards, residing in a 4-by-any card.
67. Sub-lambda service concentrator "4xAny" supported for 2:1 Fibre Channel and 4:1 ESCON. No protocol mixing supported on a single "4xAny" cencentrator.
68. Minimal IOS version: 12.1(10) EV2
69. 15530-CHAS-NEBS 15530 NEBS compliant chassis: H/W 3.1, Firmware 3.C
70. 15530-MDX-04H0 4 Channel Mux/Demux module: H/W 1.0, Firmware not applicable
71. 15530-OSCM OSC daughter module: H/W 3.0, Firmware 0.52
72. 15530-TSP1-2912 Transponder linecard 29-Ch splitter protected: H/W 5.8. Firmware 3.C
73. The WCIRT-e CWDM Card Circuit Pack will accept 1 E-port and the speed must be "User defined" (1Gb or 2Gb).
74. When SFADM02-e (SONET/SDH-Framed Data ADM) Circuit Pack is operating in "Distance Buffering" mode ON, Connectrix "-B" switchs (Brocade) must operate in Open Fabric Mode (interopmode 1), and any Extended Distance mode must be disabled.
75. SFADM02-e (SONET/SDH-Framed Data ADM) Circuit Pack will accept 2 E-ports at 1Gb (100MB) speed.
76. Minimum microcode for Symmetrix 8000 Series is 5567.36.xx.
    May be attached directly to a Symmetrix RF port without a switch.
    The following manufacturers and systems are the same product: CNT (Inrange) Spectrum 3000, Fujitsu Network Communications "FLASHWAVE"

19.602

Tape Support

Tape to ESN Connectivity

Note: It is important to identify not only the connection technology of the tape drives, but also the connection technology of the tape library controller. The library may use an external FC to SCSI bridge, an embedded bridge or a proprietary FC connection kit. The method of connection is essential to the ESN connectivity reliability and must be noted to identify if the system configuration is truly a qualified solution.
Library partitioning effects the SAN environment at both the OS level as well as the backup software level. Though partioning is not prohibited in an EMC solution, support for the backup software as well as the library's partioning solution must be provided separately via the library vendor and/or the backup software vendor. The customer should make sure that partioning and backup software integration are performed by persons trained/certified to do such work.
SCSI bridges listed provide support for both HVD and LVD SCSI connections, unless explicitly stated otherwise.
a. Check the backup software supplier's device matrix to ensure that these tape drives and Fibre Channel-to-SCSI bridges are supported for your particular operating system.
b. The backup software supplier may require optional software packages for its software to use a tape drive.
c. Unless otherwise stated, the drives listed are SCSI attached and are supported with FC-to_SCSI bridges as listed.
d. When operating in an Open Fabric environment, review the current Switch Interoperability Application and the Interoperability Solution at http://avatar.eng.emc.com, part number 300-000-067, for full list of firmware requirements and supported solutions.
For additional information please refer to the ESN Topology Guide at http://avatar.eng.emc.com (under tools).

1. Reference the Switch Fabric Topology Parameters and Mixed Storage Environment Interoperability Applications for code levels.
2. Recommend firmware levels: 18N2, 25D4
3. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set.
4. Tape drive is configured as public FL port. QuickLoop fabric assist and translative mode is not supported.
5. Reference the Mixed Storage Environment Interoperability Application for HBA sharing support.
6. Bridge not applicable. Directly attached to FL_ports on a Brocade Switch.
7. Refer to Heterogeneous switch table for the current list of supported switch combinations and supported firmware combinations
8. Unless otherwise specified, use the common EMC supported HBA drivers (Symmetrix and CLARiiON) specified in the Base Connectivity tables.
9. Moving the Fibre Channel cables associated with the tape or with the server communication to a different switch port while I/O is running will result in I/O failures and device lockout. If this occurs, you may be required to either power cycle the tape device or return FC cables to their original ports, and manually release the tape device to return the system to working order. It will then be necessary to restart the backup job.
10. Only single-ported applications of the STK 9840 and T9940 is supported. Simultaneous use of both ports may result in contention and is not supported.
11. May also be used in open fabric mode (see Switch Interoperability Matrix for open fabric parameters).
12. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
13. EMC DS-16B2 for "Extended Fabric License" , use minimum 3.0.2f firmware, 1 ISL per quad only.
14. Symmetrix microcode version: 5266.33.23 or higher, 5566.35.23 or higher, 5267.22.15 or higher, 5567.29.15 or higher.
15. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
16. CLARiiON
17. JNI SBus HBAs in Sun Servers (not applicable for EMC common driver support). The CLARiiON SBus driver used in conjunction with the JNI HBA does not support tape devices, therefore a separate JNI HBA with a different driver must be used to access the tape library. This requirement does not apply to SBus systems using the Emulex LP9002S-F2 HBA. This situation requires two different drivers: A special EMC CLARiiON driver for the JNI cards communicating to the CLARiiON storage system. The JNI-supplied driver for the JNI card communicating with the tape library. What to do: Contact CLARiiON Technical Support to obtain the special EMC CLARiiON driver and support notes S000412A and S000710 for detailed instructions (the JNI HBAs need to be renamed). Download the JNI-supplied driver (Revision 2.5.9) for the JNI card communicating with the tape library, which is fcaw.pkg under the jni heading. from http://www.jni.com/Drivers/drivers3.cfm?ID=10&OSID=8. CAUTION: Do not use fcaw.pkg under the emc subheading. Order the standard HBA model (HBAGL-SUNS). This model includes a driver that the customers should ignore or discard since they will be using the drivers referenced in 1 and 2 above.
18. Supported for both 1 Gb and 2 Gb operation. See device vendor capability for link speed autonegotiation details.
19. Moving the tape connection on the back panel of the ADIC (Pathlight) SAN Gateway requires a reboot of the bridge.
20. ADIC Management Console (AMC) 2.6 or above.
21. Shortwave connections only. Must submit an RPQ for longwave environments.
22. ADIC (Pathlight) SAN Gateway Virtual Private SAN (VPS) was used during validation to map SCSI-attached target devices to server HBAs.
23. Corresponds to IBM SDG 2108 model G07.
24. Set switch to 1 GB mode
25. Bridge ports should be configured as FC-SW
26. Recommend two SCSI tape targets per SCSI bus including robotics device.
27. All switches must be set Open Fabric mode when using an MDR bridge with any other combination of ED-1032, ED-xM, ES-xM, or McData switches.
28. "x" corresponds to the number of independent SCSI buses available (x = 1,2, or 4).
29. OEMed as STK 3x00.
30. An HP A4689A corresponds to a Crossroads 4450. An HP A4688A corresponds to a Crossroads 4250.
31. OEMed as STK 3250 and ADIC FC250
32. Must be used in Gb mode. Check with vendor for availability for shipment to Pacific Rim Not supported with the Comm Vault Galaxy.
33. Maximum number of NWFS volumes that can be mounted is 64.
34. Shared HBA environments between disk and tape/tape libraries are not supported for Novell.
35. Recommended Firmware levels: 29V0
36. **Tru64 V5.1 latest qualified Patch Kit-0006 (T64V51B20AS0006-20030210).**
37. Tru64 V5.1A latest qualified Patch Kit-0004 (T64V51AB21AS0004-20030206).
38. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
39. **Tru64 V5.1B latest qualified Patch Kit 2 (T64V51BB22AS0002-20030415).**
40. **V5.x:255 LUNs/Symmetrix Fibre director port (LUNs 001-0FE valid) Symmetrix 8000 Series only, OVMS director flag required (minimum 5265.48.30 or 5566.26.19), LUN 000 must be mapped to gatekeeper device, LUN 000 is not usable by Tru64 host.**
41. May operate in Open Fabric mode, but must be directly connected to a "M" type or McDATA switch.
42. Supported inside the HP A6356A Interface Manager
43. Review the current switch interoperability configurations for supported combinations of heterogeneous switches and firmware levels.
44. When working in a heterogeneous storage (Disk or Tape)environment the fabric components (switches, directors, and HBAs) along with the operating system level, HBA model, drivers and firmware must all be at the EMC supported levels. Non-EMC storage (Disk or Tape) connecting to this fabric environment must also be supported through their respective OEM vendors in the stated environment. Deviations in any of the supported levels for any component can either be handle through EMC's or the respective vendor's RPQ process. It is ensure that all storage remain supported through their respective OEM vendors.

19. 556 1

Tape Library

1. Check the backup software suppliers device matrix to ensure that these tape libraries, tape drives and Fibre Channel–to–SCSI Bridges are supported for your particular operating system.
2. The backup software supplier may require optional software packages for its software to use a tape library.
3. When operating in an "Open Fabric" environment, review the current Switch Interoperability Application and the Interoperability Solution Statement at http://avatar.eng.emc.com, part number 300–000–067, for a full list of firmware requirements and supported solutions.
4. SCSI attached libraries are supported with the FC–to–SCSI bridges defined in the Tape To ESN Connectivity Interoperability Application.
5. Fibre Channel based libraries contain an embedded FC–to–SCSI bridge. See the Tape To ESN Connectivity Interoperability Application for FC–to–SCSI bridge information.
6. Not qualified for direct attachment with DS– xM, ES– xM or McData switches

1. Supported with CLARiiON attach only
2. Specified version or above is recommended.
3. Currently not support with Emulex Sbus adapters
4. Fiber Channel Option revision T520
5. Fibre Channel library is not supported for direct attachment with DS–xM, ES–xM, or McData switches

EMC Data Manager (EDM) 5.0.0 Matrix

June 24, 2003 16:31

Supported Server OS and Platforms

The EDM 5.0.0 software requires Sun Microsystem's Solaris 2.8 operating system and Solaris patches. EMC ships EDM with Solaris 2.8 and the Solaris patches already installed.

The EDM 5.0.0 software runs on the following hardware from Sun Microsystems:

- Enterprise 450
- Ultra Enterprise 3500
- Ultra Enterprise 4500
- Ultra Enterprise 6500
- Ultra Enterprise 10000
- Sun Fire V280 (Customer must supply additional disk space for catalogs)
- Sun Fire V480 (Customer must supply additional disk space for catalogs)
- Sun Fire V880
- Sun Fire 3800/4800/6800

Supported Clients for Network Backups

Supported Network Backup and Recovery Clients.

Vendor & Platform	Operating System		Backup Client Features: Filesystem Clients	Database Clients	Remarks
EMC Celerra File Server	NAS	2.2.35.4 2.2.25.6 2.2.15.4 3.0.15 3.0.21 4.0, 4.1. 4.2.10, 5.0.10			Beginning with 3.0.15, the EMC HighRoad (MPFS – Multiplex Filesystem) option is also available, allowing for support of both NFS– and MPFS–mounted filesystems. For Solaris platforms, all available HighRoad (MPFS) must be installed.
Fujitsu PRIMEPOWER (GPF7000F and GPF7000S)	Solaris	2.6	ACL, FB, LFS, LNK, VxFS	Oracle 8.0.x, 8.1.x, 9.0.1, 9.2.x

1. cc:Mail and Lotus Notes (except the native Domino R5 client) require St. Bernard Software's OFM.

Limitations on File Size for Network Backups

Size Limits for Certain Clients

Platform and OS Release	Large File Support	Raw Partition
DEC UNIX 4.0 or higher	1 TB minus 1 block of 512 bytes	1 TB minus 1 block of 512 bytes
HP-UX 10.20 or higher	1 TB minus 1 block of 1024	1 TB minus 1 block of 1024
IBM AIX 4.3 or higher	64 GB minus 1 block of 512	64 GB minus 1 block of 512
Pyramid Nile DC/OSx 1.1 or higher	see footnote[2]	4 GB minus 1 block of 512
Sequent DYNIX/ptx 4.4.x or higher	1 TB minus 1 block of 512[1]	1 TB minus 2 blocks of 512[1]
SGI 6.2	see footnote[2]	1 TB minus 2 blocks of 512
SGI 6.4 or higher	1 TB minus 1 block of 512	1 TB minus 2 blocks of 512
Sun Solaris 2.6 or higher	1 TB minus 1 block of 512	1 TB minus 2 blocks of 512
Sun Solaris 2.6 Local Client	1 TB minus 1 block of 512	1 TB minus 2 blocks of 512
Other UNIX clients	2 GB minus 1 block of native block size	2 GB minus 1 block of native block size
NetWare	4 GB	N/A
OS/2	4 GB	N/A
OpenVMS	Up to OpenVMS maximum size	N/A
Windows NT 4.0, Windows 2000	8.388 TB	N/A

1.These limits apply only if the special binaries named in the section Large File Support on Sequent DYNIX 4.2.3 Clients are installed.
2.2 GB minus 1 block of the system's native disk block size for all undesignated UNIX clients.

DM Symmetrix Path Support

This table lists platforms and database clients that EDM Symmetrix Path supports.

- ***Supported PowerPath versions 2.1.x, 3.0.x***
- ***Supported SymAPI versions 5.0.x, 5.1.x, 5.2.x***
- ***EDM 5.0 patch 6 and above contains Symm Socket Layer 1.7.x (this drops support for HP-UX 10.20).***
- ***Minimum microcode level 64 (69 microcode supported on EDM 5.0 patch 6 and above)***

Supported EDM Symmetrix Path Backup Clients

Vendor & Platform	Operating System	Database Version	Remarks
Fujitsu PRIMEPOWER (Models GPF7000F and GPF7000S)	Solaris 2.6	Oracle 8.0.x, 8.1.x, 9.0.1, 9.2.x (32-bit)

1. See EDM Acronym Definitions

Network Data Management Protocol Support (NDMP)

EDM 5.0.0 supports NDMP backup and restore of EMC Celerra File Server and of EMC CLARiiON FC4700/IP4700.

File server versions for NDMP support are:

- Celerra File Server version 2.2.x.x, minimum 2.2.46.4, network or the EMC HighRoad (MPFS) option for Celerra 3.x versions.
- FC4700/IP4700 release R2.0 with a minimum of R2.0 p19.1.

Network Data Management Protocol Support (NDMP) Tape Library Unit Support

See Supported Tape Library/Drive Configurations for tape library unit and drive support for EDM NDMP. Contact an EDM Sales Representative for details.

Supported Media for EMC Supplied Tape Library Units

For DLT tape IV half-inch data cartridges the following vendors are supported:

- Fujifilm
- Maxell
- Quantum
- EMC

For LTO tape the following vendors are supported:

- Fujifilm
- Maxell

Supported Tape Library/Drive Configurations

Refer to the EDM Matrix, available at EMC.com, or contact your EDM sales representative for support of any devices not listed.

EDM Acronym Definitions

This table describes acronyms and abbreviations that appear in the EDM matrix.

Acronyms Used for EDM

Acronym	Definition
ACL	Access Control List
ADV	Compaq/DEC Advanced Filesystem
EFS	Enhanced Filesystem
FB	EDM File Browser
FS	Filesystem
JFS	Journal Filesystem
JFS2	Enhanced Journal Filesystem
LFS	Large File Support(See Size Limits for Certain Clients for limits)
LNK	EDM Transfer Protocol, also called EDM-Link, a replacement for remote shell support (rsh)
NDMP	Network Data Management Protocol
RAW	Raw Filesystem
RPQ	Request for Price Quotation
STD	Standard-speed client
VxFS	VERITAS File System
VxVM	VERITAS Volume Manager
XFS	SGI Extended Filesystem

Non-EMC Backup Software Solutions

This section lists all the Open Systems topologies and associated configurations and components that are currently supported.

- EMC only specifies backup related components and revisions for those configurations that have EMC unique content. For configurations where the backup server is not connected to an EMC storage system, the backup software supplier should be consulted for questions about supported backup server hardware and software components (e.g., tape libraries, backup servers, and operating systems supported).
- An RPO is required for CLARiiON configurations with both VERITAS NetBackup and VERITAS Cluster Server. Per VERITAS, these configurations must be installed by VERITAS Professional Services.
- For supported tape libraries and drives, see the table Tape Libraries.

	Backup Topology						
	Local and LAN-Based Topologies	LAN Free, SAN with Dedicated Tape Drives[1,2]			LAN Free, SAN with Shared Tape Drives[1,2]

1.A dedicated tape drive is a tape drive within a library that is statically and permanently associated with one backup client. A shared tape drive is one that is dynamically and temporarily associated to a backup client.
2.Ancor switch is not supported. Hub (loop) configurations may not connect through a FC/SCSI bridge to a tape library.

Understanding Backup Software License Guidelines

With any backup application you must be aware of the licensing guidelines. For example, every vendor has standard support for a typical small tape library that consists of 1 drive and perhaps unlimited slots. If support for more than one tape drive is required, then another option (e.g., Tape Library Option) is required. Also, most client options include support for a set number of clients. Additional licenses must be purchased for additional installations.

The following chart provides a general overview of the options and agents that are available from the major backup application vendors. Please use it as a guideline for understanding customer solutions. Most vendors have all or a subset of these features but may use different names or terminology.

Backup Application License Guidelines

Main Component	Description	Questions to Ask
Basic Server Edition	Single Server Support	How many tape drives are supported?
Advanced Server	Multiple Server Support	Usually includes support for one drive and unlimited slots.
Enhanced Options & Agents		
Tape Library Option	Advanced library features	In most cases provides unlimited tape device support.
Cross-Platform Management	Heterogeneous platform support	What platforms does it support?
Clustering		
Open File Agent	Backup of files in use	
Disaster Recovery		What type of DR?
Client Agents		
_000, NetWare, UNIX, Linux, OS/2, Windows 3.x, 9X, etc.	This option is usually sold on a per client basis or on a given limit such as 5 or 25 clients per package.	How many clients does your customer have?
Storage Area Network		
SAN Option	Support for Fibre Channel configurations. Allows multiple servers to share tape devices.	
Serverless Backup	Backup directly to a library avoiding server resources	
Database Protection		
Exchange, SQL, Oracle, Sybase, Informix, Lotus, etc	Database protection with various levels of support while online	License for how many databases?
High Speed Performance		
Image Option	Block level image of data rather than file by file including file-level restores	
Tape RAID	Provides striping across multiple tape devices	Improves performance and protection.
Archival Support		
Optical Library Option		

Backup Topologies

Local, LAN-Based, and Private LAN Topologies

Backup Vendor/Product	Backup Server or Client with Attached CLARiiON Storage Systems	Backup Server or Client with No Attached CLARiiON Storage Systems	Backup Components
EMC Data Manager (EDM)	Must confirm to restrictions in the other sections of this document.	No restrictions	Consult EDM support matrix.
Other vendors	Must confirm to restrictions in the other sections of this document.	No restrictions	Consult vendor's support matrix.

1.Currently, EDM backup servers are not configured with CLARiiON storage systems.

Configuration Rules

Use the following rules when configuring local, LAN-based and private LAN topologies and SAN-connected servers that are backed up by a local, LAN-based or private LAN topology (that is, topologies where the backup data does not flow over the SAN):

- Any backup server or client server that connects to EMC storage systems must adhere to the requirements in the other sections of this document.
- EMC places no restrictions on any backup server or client server that is not connected to EMC storage systems.
- Consult the backup software supplier's support matrix for component compatibility (server platform, operating systems, HBAs, tape driver, and tape libraries).

SAN with Dedicated Tape Drives

For information about supported tape libraries, tape drives, and Fibre Channel–to–SCSI bridges, see the table Tape to ESN Connectivity Information.

1. See CLARiiON Open Systems Support Matrix tables for supported servers.
2. For CLARiiON environments, see the table Tape to ESN Connectivity Information. This requirement does not apply to SBus systems using the Emulex LP9002S–F2 HBA.
3. Sharing a tape library between Window NT4 and Windows 2000 platforms running Backup Exec 8.6 and NetWare systems running Backup Exec for NetWare 9.0 is not supported.
4. Customers must run the OmniBack II 4.1 Device Test Tool (DTT) as a check to determine whether or not their FC/SAN environment is supported by OmniBack II 4.1. This tool is available on the HP Web site.
5. Server Free backup is not supported.
6. Windows 2000 using Emulex HBAs use driver 2.11a2 instead of 2.13a4.
7. Exceptions include: BakBone NetVault, Syncsort Backup Express, and Trivoli Manager.
8. Supported only as backup client. Only V–Class, N–Class, and L–Class models supported.
9. Supported only as backup client. SP series systems are not supported.
10. A dedicated HBA running the IBM native driver is required for Tivoli to communicate with tape drives and tape library autochangers.
11. Supported only with QLogic HBAs.
12. Supported only with the Dell PV–132T and PV–136T tape libraries and SDLT 320, LTO–1 and LTO–2 SCSI tape drives

SAN and LAN with Dedicated Tape Drives

nformation about supported tape libraries, tape drives, and Fibre Channel–to–SCSI bridges, see the table Tape to ESN Connectivity Information.

2. For CLARiiON environments, see the table Tape to ESN Connectivity Information. This requirement does not apply to SBus systems using the Emulex LP9002S–F2 HBA.
3. Supported in environment with Computer Associates BrightStor ARCserve 2000 sharing a SAN–connected library between the NetWare. Windows NT4 and Windows 2000 servers.
4. Customers must run the OmniBack II 4.1 Device Test Tool (DTT) as a check to determine whether or not their FC/SAN environment is supported by OmniBack II 4.1. This tool is available on the HP Web site.
5. Sharing a tape library between Window NT4 and Windows 2000 platforms running Backup Exec 8.6 and NetWare systems running Backup Exec for NetWare 9.0 is not supported.
6. Server Free backup is not supported.
7. Windows 2000 using Emulex HBAs use driver 2.11a2 instead of 2.13a4.
8. Exceptions include: BakBone NetVault, Syncsort Backup Express, and Trivoli Manager.
9. Supported only as backup client. Only V–Class, N–Class, and L–Class models supported.
10. Supported only as backup client. SP series systems are not supported.
11. A dedicated HBA running the IBM native driver is required for Tivoli to communicate with tape drives and tape library autochangers.
12. Supported only with QLogic HBAs.
13. Supported only with the Dell PV–132T and PV–136T tape libraries and SDLT 320, LTO–1 and LTO–2 SCSI tape drives

SAN and LAN with Shared Drives

For information about supported tape libraries, tape drives, and Fibre Channel–to–SCSI bridges, see the table Tape to ESN Connectivity Information.

EMC Database Edition for Oracle by VERITAS Version 4.0 on Solaris	***VxVM 3.5, VxFS 3.5, VxTF 4.0, VEA 3.5, VxTFag 4.0***	***Solaris 8***	***VCS 3.5***	***GA***	***Y***	***3.02***	***Symmetrix 3000/5000 series, 8000 series, DMX series***	***5x67***	***5x67, 5x68, 5669***	***5568, 5669***	***5.1***	***Supports VxTF in a VCS environment.*** ***Includes 3 VCS Agents: Device Group Agent (VxSymDevGrp), Log Agent (VxSymLog), Recovery Agent (VxSymRecover)*** ***VxTF can't be used with Informix database.***	***N/A***
EMC GeoSpan for VERITAS Cluster Server: Refer to the Symmetrix Geographically Dispersed Cluster Table													

1.VxTF is not supported in clustered environments.
2.Except Symmetrix 3700/5700.
3.Supported only with WideSky 5.1.
4.C-bit must be enabled for VxVM.
5.Requires Sun recommended patch cluster with minimum kernel patch 108528 20.

19.573

6.Refer to EFSIEDE 4.0 Release Notes for complete patch requirements.
7.If running VERITAS version of VxVM/VxFS, VERITAS FS3.5 FP1 is required.

VxVM 3.2[29]		AIX 5.1[25], ***5.2***[24, 25]	Qualified	Y[11]	N/A	Symmetrix 8000 series, DMX series	5x67.46 5x68.52 5669		
VxVM 3.2[29]		AIX 5.1[25], ***5.2***[24, 25]	Supported	Y[11]	N/A	Symmetrix DMX series	5669		

1.Manual manipulation of Veritas disk group IDs is required to mount BCVs.
2.When working with DMP and PowerPath the following should be done:
- When working with Native device names (c#t#d#) DMP should be enabled.
- When working with pseudo (emcpower) device names. DMP can be disabled.
- When working with Sun Cluster / DR DMP must be disabled.

3.DMP may not be disabled with VxVM 3.1.1 and higher. When VxVM 3.1.1 and higher is installed, DMP will be automatically re-enabled.
4.There is a new DMP driver that should be installed after the VxVM install. This driver (needs Microcode patch 9321 available for Microcode 5265-47 and up), solves the problem that DMP hangs if the device is in NR state.
5.If DMP is enabled, minimum microcode is 5568.45.17.
6.FC4700, CX600, CX400 only.
7.When neither ATF or PowerPath are present, VERITAS DMP as part of Volume Manager 3.2 can be used to manage CLARiiON arrays only if the CLR-ASL is installed.
8.vxdiskadm should be used to disable DMP control of clusters (HBAs) with CLARiiON arrays attached.
9.Native names only.
10.VxVM DMP support is not compatible with PowerPath. PowerPath overrides DMP functionality.
11.DMP functionality requires setting the C-bit on the Symmetrix directors.
12.Detailed information:

Application Build	HBA	MSCS Support	Notes
5.25.66	Emulex LP8000	Yes	Requires Driver 2.11a2
5.25.78	Emulex LP8000	Yes	MSCS w/VxVM 2.5 Dynamic Link support, HBA requires Driver 2.11a2, 5567.23.12s microcode
5.25.78	QLogic 2200		

13.Hot relocation must be disabled.
14.VxVM 3.0 with MSCS in a Symmetrix or CLARiiON environment requires VxVM 3.0 SP1 with Hot Fix 03.
VxVM 3.0 with PowerPath requires minimum PowerPath 3.0.
15.Admsnap does not support the option of specifying the VxVM objects for start and stop operations. The Admsnap script must specify the LUNs that make up the volume using individual Admsnap commands.
16.VxVM Service Pack 1 required for use with EMC PowerPath. Contact Customer Service for information on registry changes necessary for PowerPath/VxVM 3.0 compatibility.
17.Dynamic disks are not supported as Quorum disks with GeoSpan clusters (Quorum disk must a basic disk).
DMP not supported.
VM is not supported on CLARiiON with servers booting from the array.
equires Update 2.
21.VxVM is not supported on Symmetrix with servers booting from the array.
22.VxVM DMP and PowerPath may not be used on the same host.
23.The Admsnap utility is not supported in a Linux DMP environment.
24.***AIX 5.2 requires VxVM 3.2.2.0 patch for AIX.***
25.32 bit or 64 bit.
26.The package patch-2.5.4-10.i386.rpm is required and is available on Red Hat 2.1 Advanced Server CD #2.
27.Refer to Veritas technote #255172 for the required CLARiiON ASL installation to enable DMP support on the CLARiiON.
28.Refer to Veritas technote #243712 for instructions on the Foundation Suite installation.
29.Except Symmetrix 3700/5700.

SWITCH TIPO 5 **Concentrador de VPNs**

ATRIBUTO	REQUISITOS DO EDITAL	ATRIBUTOS OFERTADOS	ATRIBUTOS OFERTADOS ADICIONALMENTE	CONFIRMA ATENDIMENTO (SIM / NÃO)	PÁGINA DA DOCUMENTAÇÃO TÉCNICA
1- Descrição	Deverá operar como concentrador de VPN, devendo ser composto por sistema integrado de hardware e software, com o objetivo de concentrar, configurar e monitorar acessos remotos via VPN	A solução está composta por um concentrador de VPNs (Cisco 3060) e um servidor de autenticação com software Cisco Secure ACS 3.2 (Cisco CSACSE-1111-K9)	N/A	SIM	Anexo 15 - pág. 1 Anexo 15B (todas as páginas) Ver propostas Técnica e Comercial
	Capacidade de Firewall	Capacidade de Firewall	N/A	SIM	Anexo 15 - pág. 4
	Suporte aos protocolos de tunelamento PPTP, IPSec, L2TP, L2TP/IPSec for Windows 2000 e NAT transparent IPSec	Todos os exigidos	N/A	SIM	Anexo 15 - pág 5
	O suporte a serviços deve ser estendido a todo e qualquer serviço que funcione sobre o protocolo IP, com a possibilidade de customização	Conforme Edital	N/A	SIM	Anexo 15C (todas as páginas)
	Suporte a certificados digitais padrão X 509v3	Todos os exigidos	N/A	SIM	Anexo 15 - pág. 7
	Capacidade de tolerância a falhas (failover)	Todos os exigidos	N/A	SIM	Anexo 15 - pág. 4
	Suporte ao gerenciamento de chaves tipo IKE	Todos os exigidos	N/A	SIM	Anexo 15 - pág. 6
	Capacidade de registrar eventos e de envio de notificações por e-mail	Todos os exigidos	N/A	SIM	Anexo 15 - pág. 6
	Suporte aos protocolos de roteamento RIP, RIP2, OSPF e estático	Todos os exigidos	N/A	SIM	Anexo 15 - pág. 6

19.569

2- Características e Funcionalidades do Sistema	Permitir aplicação de configurações e políticas de acesso	Todos os exigidos	N/A	SIM	Anexo 15F - pág. 14-1
	Possuir no mínimo 03 interfaces 10baseT	Conforme Edital	Possui 03 interfaces 10/100TX já montadas no equipamento	SIM	Anexo 15 - pág. 5
	O sistema deverá se integrar com um sistema de autenticação externa	Conforme Edital	N/A	SIM	Anexo 15D (todas as páginas) e Anexo 15E (todas as páginas)
	Capacidade para autenticação de no mínimo 5000 usuários	Até 5000 sessões simultâneas	N/A	SIM	Anexo 15 - pág. 2
	Suporte ao padrão LDAP	Todos os exigidos	N/A	SIM	Anexo 15 -pág. 7
	Integração com o domínio Microsoft Windows	Todos os exigidos	N/A	SIM	Anexo 15 - pág. 1
	Permitir configuração de níveis de acesso administrativos	Todos os exigidos	N/A	SIM	Anexo 15 - pág. 4
	Permitir a configuração de poíticas de segurança nas estações clientes	Conforme Edital	N/A	SIM	Anexo 16B
	Capacidade de gerenciamento de política para usuários e grupos	Todos os exigidos	N/A	SIM	Anexo 15 - pág. 7
	Controle de tempo e horário de acesso do usuário	Todos os exigidos	N/A	SIM	Anexo 15- pág. 7
	Suporte ao gerenciamento utilizando SNMP MIB II	Todos os exigidos	N/A	SIM	Anexo 15 - pág. 6
	Oferecer ferramentas de gerenciamento que possibilite a verificação de estatísticas de tráfego criptografado, negociações de handshake e resposta a pacotes	Conforme Edital	N/A	SIM	Anxo 16A pág. 17-2
	Possibilidade de crescimento (escalabilidade) conforme demanda, com configuração e gerência centralizadas	Conforme Edital	N/A	SIM	Anexo 16 (todas as páginas)

19.568

3 - Características e Funcionalidades do Software Cliente VPN	Capacidade de geração de relatórios gerenciais	Conforme Edital	N/A	SIM	Anexo 16C (todas as páginas)
	Sistema de gerenciamento em Hardware do tipo Servidor	Conforme Edital	N/A	SIM	Anexo 16D (todas as páginas)
	Número mínimo de 5.000 licenças	Todos os exigidos	Sem limite de liceças	SIM	Anexo 15 - pág. 3
	Auto-atualização	Conforme Edital	N/A	SIM	Anexo 16E (todas as páginas) - Anexo 16F (todas as páginas) - Anexo 16G (todas as páginas)
	Suporte aos Sistemas Operacionais Windows 95, 98, ME, NT 4.0, 2000 e XP	Todos os exigidos	N/A	SIM	Anexo 15 - pág. 1
	Interface padronizada com o Logotipo da Contratada	Conforme Edital	N/A	SIM	Ver propostas Técnica e Comercial
4 - Características de Desempenho	Capacidade de tratar no mínimo 5000 usuários ao mesmo tempo	Capacidade para 5000 usuários simultâneos	N/A	SIM	Anexo 15 - pág. 2
	Capacidade de processamento de encriptação mínima de 100Mbps	Encryption Troughput	N/A	SIM	Anexo 15 -pág. 3
	Instalada na configuração máxima do equipamento	Conforme Edital	N/A	SIM	Anexo 15 (todas as páginas)
	Hot-Swappable / Hot-Pluggable	Conforme Edital	N/A	SIM	Ver Carta do Fabricante
5 - Fonte de Alimentação	Deverá possuir alimentação elétrica de acordo com a localidade ond serão instalados os equipamentos e operar na frequência de 60Hz	Voltagem de entrada de 100 a 240 VAC - 50/60 Hz	N/A	SIM	Anexo 15 - pág. 8

19.567

	As fontes de alimentação deverão ser redundantes por fontes internas independentes, com alimentação redundante	Conforme Edital	N/A	SIM	Anexo 15 (todas as páginas)

Data Sheet

Cisco **VPN 3000** Series Concentrator

Introduction

The Cisco® VPN Series 3000 Concentrator allow corporations to take full advantage of the unprecedented cost savings, flexibility, performance, and reliability of remote access VPN connections. Corporations use VPNs to establish secure, end-to-end private network connections over a public networking infrastructure. VPNs have become the logical solution for remote-access connectivity for two main reasons:

- Deploying a remote-access VPN enables corporations to reduce communications expenses by using the local dialup infrastructures of Internet service providers.
- Remote Access VPNs allow mobile workers, telecommuters and day extenders to take advantage of broadband connectivity.

To fully realize the benefits of high-performance, remote-access VPNs, a corporation must deploy a robust, highly available VPN solution, and dedicated VPN devices are optimal for this purpose.

The Cisco VPN 3000 Series Concentrator is a best-in-class, remote-access VPN solution for enterprise-class deployment. A standards-based, asy-to-use VPN client and scalable VPN tunnel termination devices are included, as well as a management system that enables corporations to easily install, configure, and monitor their remote access VPNs. Incorporating the most advanced, high-availability capabilities with a unique purpose-built, remote-access architecture, the Cisco VPN 3000 Concentrator allows corporations to build high-performance, scalable, and robust VPN infrastructures to support their mission-critical, remote-access applications.

Unique to the industry, it is the only scalable platform to offer components that are field-swappable and can be upgraded by the customer. These components, called Scalable Encryption Processing (SEP/SEP-E) modules, enable users to easily add capacity and throughput.

The Cisco VPN 3000 Concentrator supports the widest range of VPN client software implementations, including the Cisco VPN Client, the Microsoft Windows 2000/XP L2TP/IPsec Client, the Microsoft L2TP/IPSec VPN Client for Windows 98, Windows Millennium (ME), Windows NT Workstation 4.0, and Microsoft PPTP.

J

Five Models

The Cisco VPN 3000 Concentrator is available in five different models:

Cisco VPN 3005 Concentrator

The Cisco VPN 3005 Concentrator is a VPN platform designed for small- to medium-sized organizations with bandwidth requirements up to full-duplex T1/E1 (4 Mbps maximum performance) and up to 100 simultaneous sessions. Encryption processing is performed in software. The Cisco VPN 3005 does not have built-in upgrade capability.

Cisco VPN 3015 Concentrator

The Cisco VPN 3015 Concentrator is a VPN platform designed for small- to medium-sized organizations with bandwidth requirements up to full-duplex T1/E1 (4 Mbps maximum performance) and up to 100 simultaneous sessions. Like the Cisco VPN 3005, encryption processing is performed in software, but the Cisco VPN 3015 is also field-upgradable to the Cisco VPN 3030 and 3060 models.

Cisco VPN 3030 Concentrator

The Cisco VPN 3030 Concentrator is a VPN platform designed for medium to large organizations with bandwidth requirements from full T1/E1 through T3/E3(50 Mbps maximum performance) and up to 1500 simultaneous sessions. Specialized SEP modules perform hardware-based acceleration. The Cisco VPN 3030 is field-upgradeable to the Cisco VPN 3060. Redundant and nonredundant configurations are available.

Cisco VPN 3060 Concentrator

The Cisco VPN 3060 is a VPN platform designed for large organizations demanding the highest level of performance and reliability, with high-bandwidth requirements from fractional T3 through full T3/E3 or greater (100 Mbps maximum performance) and up to 5000 simultaneous sessions. Specialized SEP modules perform hardware-based acceleration. Redundant and nonredundant configurations are available.

Cisco VPN 3080 Concentrator

The Cisco VPN 3080 Concentrator is optimized to support large enterprise organizations that demand the highest level of performance combined with support for up to 10,000 simultaneous remote access sessions. Specialized SEP modules perform hardware-based acceleration. The VPN 3080 is available in a fully redundant configuration only.

J

Models Comparison

Table 1 The Cisco VPN 3000 Series Supports the Entire Range of Enterprise Applications

	Cisco VPN 3005	Cisco VPN 3015	Cisco VPN 3030	Cisco VPN 3060	Cisco VPN 3080
Simultaneous Users[1]	100	100	1,500	5,000	10,000
Maximum LAN-to-LAN Sessions	100	100	500	1000	1000
Encryption Throughput	4 Mbps	4 Mbps	50 Mbps	100 Mbps	100 Mbps
Encryption Method	Software	Software	Hardware	Hardware	Hardware
Available Expansion Slots	0	4	3	2	2
Encryption (SEP) Module	0	0	1	2	4
Redundant SEP	–	–	Option	Option	Yes
System Memory	32/64 MB (fixed)	128 MB	128/256 MB	256/512 MB	256/512 MB
Hardware Configuration	1U	Fixed 2U	Scalable 2U	Scalable 2U	Fixed 2U
Dual Power Supply	Single	Option	Option	Option	Yes
Client License	Unlimited	Unlimited	Unlimited	Unlimited	Unlimited

1. For planning purposes, a simultaneous user is considered to be a remote access VPN user connected in all tunneling mode—this includes one IKE Security Association and two unidirectional IPsec SAs (Security Associations). For environments with rekeying or split tunneling, we recommend using a VPN remote access load-balancing environment with spare capacity because these particular sessions will use additional system resources that otherwise would be used to support additional users. The Cisco VPN 3000 Series Concentrator supports the entire range of enterprise applications.

Cisco VPN Client

Simple to deploy and operate, the Cisco VPN Client is used to establish secure, end-to-end encrypted tunnels to the Cisco VPN 3000 Concentrator. This thin design, IPsec-compliant implementation is provided with the Cisco VPN 3000 Concentrator and is licensed for an unlimited number of users. The client can be pre-configured for mass deployments and the initial logons require very little user intervention. VPN access policies are created and stored centrally in the Cisco VPN 3000 Concentrator and pushed to the client when a connection is established.

19.562

Features and Benefits

Product Highlights

High-Performance, Distributed-Processing Architecture

- Cisco SEP modules provide hardware-based encryption, ensuring consistent performance throughout the rated capacity (Cisco VPN 3030–3080).
- Large-scale tunneling support provided for IPsec, PPTP and L2TP/IPsec connections.

Scalability (Cisco VPN 3015–3060)

- Modular design (four expansion slots) provides investment protection, redundancy and a simple upgrade path.
- System architecture is designed to supply consistent, high-availability performance.
- All digital design provides the highest reliability and 24-hour continuous operation.
- Robust instrumentation package provides run-time monitoring and alerts.
- Microsoft compatibility offers large-scale client deployment and smooth integration with related systems.

Security

- Full support of current and emerging security standards allows for integration of external authentication systems and interoperability with third-party products.
- Firewall capabilities through stateless packet filtering and address translation to ensure the required security of a corporate LAN.
- User and group level management offers maximum flexibility.

High Availability

- Redundant subsystems and multichassis failover capabilities ensure maximum system uptime.
- Extensive instrumentation and monitoring capabilities provide network managers with real-time system status and early-warning alerts.

Robust Management

- The Cisco VPN 3000 Concentrator can be managed using any standard Web browser (HTTP or HTTPS), as well as by Telnet, SSHv1, and using a console port. Files can be accessed through HTTPS, FTP, and SSH Copy (SCP).
- Configuration and monitoring capability is provided for both the enterprise and the service provider.
- Access levels are configurable by user and groups, allowing easy configuration and maintenance of security policies. For larger scale deployments, the VPN 3000 Concentrators are supported in several Cisco network management applications. Those applications include:
  - *IP Solution Center (ISC)*—Provisions site-to-site and remote access VPN services
  - *VPN Monitor*—Monitors and reports on remote access and site-to-site VPN tunnel connections
  - *Resource Manager Essentials (RME)*—Provides operational management features such as software distribution, syslog reporting, inventory management
  - *CiscoView*—Provides real time system status monitoring

Technical Specifications

Hardware

Processor

- Motorola PowerPC Processor

Memory

- Redundant system images (Flash)
- Variable memory options (see chart)

Encryption

- *Cisco VPN 3005, 3015*—Software encryption
- *Cisco VPN 3030–3080*—Hardware encryption

Embedded LAN Interfaces

- *Cisco VPN 3005*—Two autosensing, full-duplex 10/100BASE-TX Fast Ethernet (public/untrusted, private/trusted)
- *Cisco VPN 3015–3080*—Three autosensing, full-duplex 10/100BASE-TX Fast Ethernet (public/untrusted, private/trusted and DMZ)

Instrumentation

- *Cisco VPN 3005 Front panel*—Unit status indicator
- *Cisco VPN 3005 Rear panel*—Status LEDs for Ethernet ports
- *Cisco VPN 3015-3080 Front panel*—Status LEDs for system, expansion modules, power supplies, Ethernet modules, fan
- *Cisco VPN 3015–3080 Rear panel*—Status LEDs for Ethernet modules, expansion modules, power supplies
- *Cisco VPN 3015–3080*—Activity monitor displays number of sessions, aggregate throughput, or CPU utilization; push-button selectable

Software

Client Software Compatibility

- Cisco VPN Client (IPsec) for Windows 98, ME, NT 4.0, 2000, XP, Linux (Intel), Solaris (UltraSparc 32 and 64-bit), and Mac OS X 10.2 (Jaguar), including centralized split-tunneling control and data compression
- Microsoft PPTP/MPPE/MPPC, MSCHAPv1/v2, EAP/ RADIUS pass-through for EAP/TLS and EAP/GTC support
- Microsoft L2TP/IPsec forWindows 2000/XP (including XP DHCP option for route population)
- Microsoft L2TP/IPsec for Windows 98, Windows Millennium (ME), and Windows NT Workstation 4.0
- MovianVPN (Certicom) Handheld VPN Client with ECC
- Netlock (Mac OS 8 & 9) VPN Client

Tunneling Protocols

- IPsec, PPTP, L2TP, L2TP/IPsec, NAT Transparent IPsec, Ratified IPsec/UDP (with auto-detection and fragmentation avoidance), IPsec/TCP
- Support for Easy VPN (client and network extension mode)

19.560

Encryption/Authentication

- IPsec Encapsulating Security Payload (ESP) using DES/3DES (56/168-bit) or AES (128, 192, 256-bit) with MD5 or SHA, MPPE using 40/128-bit RC4

Key Management

- Internet Key Exchange (IKE)
- Diffie-Hellman (DH) Groups 1, 2, 5, 7 (ECDH)

Routing

- RIP, RIP2, OSPF, RRI (Reverse Route Injection), static, automatic endpoint discovery, Network Address Translation (NAT), Classless Interdomain Routing (CIDR)
- IPsec fragmentation policiy control, including support for Path MTU Discovery (PMTUD)
- Interface MTU control

Third-Party Compatibility

- Certicom, iPass Ready, Funk Steel Belted RADIUS certified, NTS TunnelBuilder VPN Client (Macintosh and Windows), Microsoft Internet Explorer, Netscape Communicator, Entrust, Baltimore, SA Keon

High Availability

- VRRP protocol for multi-chassis redundancy and fail-over
- Remote Access Load Balancing clusters
- Destination pooling for client-based fail-over and connection re-establishment
- Redundant SEP modules (optional), power supplies, and fans (Cisco VPN 3015–3080)

Management

Configuration

- Embedded management interface is accessible through console port, Telnet, SSHv1, and Secure HTTP (HTTPS)
- Administrator access is configurable for five levels of authorization. Authentication can be performed externally through TACACS+
- Role-based management policy separates functions for service provider and end-user management

Monitoring

- Event logging and notification through e-mail (SMTP)
- Automatic FTP backup of event logs
- SNMP MIB-II support
- Configurable SNMP traps
- Syslog output
- System status
- Session data (including client assign IP, encryption type connection duration, client OS, version, etc)
- General statistics

Security

Authentication and Accounting Servers

- Support for redundant external authentication servers:
  - RADIUS
  - Kerberos/Active Directory authentication
  - Microsoft NT Domain authentication
  - Microsoft NT Domain authentication with Password Expiration (MSCHAPv2)

RSA Security Dynamics (SecurID Ready), including native support for RSA 5 (Load Balancing, Resiliency)

- User authorization through LDAP or RADIUS
- Internal Authentication server for up to 100 users
- X.509v3 digital certificates (including CRL/LDAP and CRL/HTTP, CRL Caching and Backup CRL Distribution Point support)
- RADIUS accounting
- TACACS+ Administrative user authentication

Internet-Based Packet Filtering

- Source and destination IP address
- Port and protocol type
- Fragment protection
- FTP session filtering
- Site-to-Site Filters and NAT (for overlapping address space)

Policy Management

- By individual user or group
  - Filter profiles (defined internally or externally)
  - Idle and maximum session timeouts
  - Time and day access control
  - Tunneling protocol and security authorization profiles
  - IP Pool
  - Authentication Servers

Certification

- FIPS 140-2 Level 2 (3.6) in process, FIPS 140-1 Level 2 (3.1), VPNC

Ports

- Console port-Asynchronous serial (DB-9)

Table 2 Physical Characteristics

Concentrator	Cisco VPN 3005	CiscoVPN 3015	Cisco VPN 3030	Cisco VPN 3060	Cisco VPN 3080
Height	1.75" (4.45cm)	3.5" (8.89cm)	3.5" (8.89cm)	3.5" (8.89cm)	3.5" (8.89cm)
Width	17.5" (44.45cm)	17.5" (4.45cm)	17.5" (4.45cm)	17.5" (4.45cm)	17.5" (4.45cm)

Hardware Features

Current VPN Concentrator Models: 3005, 3015, 3030, 3060, and 3080.

Previous VPN Concentrator Models: C10, C20, and C50.

All systems feature:

- 10/100Base-T Ethernet interfaces (autosensing)
  - 3005: Two interfaces
  - 3015–3080: Three interfaces
- Motorola® PowerPC CPU
- SDRAM memory for normal operation
- Nonvolatile memory for critical system parameters
- Flash memory for file management

In addition, individual models have the following hardware features:

VPN Concentrator Model	Hardware Features
Model 3005	• Software-based encryption • Single power supply
Model 3015	• Software-based encryption • Single power supply • Expansion capabilities: – Up to four Cisco Scalable Encryption Processing modules for maximum system throughput and redundancy – Optional redundant power supply
Model 3030	• One Scalable Encryption Processing module for hardware-based encryption • Single power supply • Expansion capabilities: – One additional SEP module for maximum system throughput and redundancy – Optional redundant power supply
Models 3060 and 3080	• Two Scalable Encryption Processing modules for hardware-based encryption at maximum system throughput • Dual redundant power supplies • Expansion capabilities: – Up to two additional SEP modules for maximum system redundancy

Cisco Systems

Product Bulletin No. 1913

Cisco Secure **Access Control Server** 3.2 Adds Security Enhancements and the Availability of Cisco Secure ACS Solution Engine

Cisco Systems announces the availability of the Cisco Secure Access Control Server (ACS) version 3.2 for Windows and Cisco Secure ACS Solution Engine. Cisco Secure ACS, a key component of Cisco's Identity Based Networking Services (IBNS) architecture, extends access security by combining authentication, user/admin access and policy control from a centralized Identity Networking framework allowing for greater flexibility and mobility, increased security, and user productivity gains.

Cisco Secure ACS also provides identity networking support for Cisco Structured Wireless Aware Networks (SWAN), as an extension of the local authentication provided on Cisco Aironet Access Points.

Cisco Secure ACS greatly reduces the administrative and management burden involved in scaling user and network administrative access to your network. In addition, network managers can use the same Cisco Secure ACS solution to manage the administrative roles and groups and control how they change, access, and configure the network internally.

With ACS you can manage and administer user access for Cisco IOS® routers, virtual private networks (VPNs), firewalls, dial and broadband DSL, cable access solutions, storage, content, voice over IP (VoIP), Cisco wireless solutions, and Cisco Catalyst® switches via IEEE 802.1x access control.

Up to version 3.1, Cisco Secure ACS has been available as software for Windows installations. Version 3.2 introduces a new, secure, hardware-based offering for Cisco Secure ACS. The Cisco Secure ACS Solution Engine, a 1-rack-unit (1-RU) security-hardened solution engine with a preinstalled Cisco Secure ACS license, provides essentially the same features and functions as the Cisco Secure ACS for Windows, in a dedicated, application-specific solution engine package.

The Cisco Secure ACS Solution Engine provides a zero-touch installation and highly reliable AAA solution with increased total-cost-of-ownership protection through high availability and simplified day-to-day operation of the Cisco Secure ACS service. The Cisco Secure ACS Solution Engine also includes additional features specific to its operation and management. For more information, refer to the Cisco Secure ACS Solution Engine data sheet.

The following features are new in Cisco Secure Access Control Server 3.2:

- *Protected Extensible Authentication Protocol (PEAP) support for Microsoft® Windows and Cisco clients*—Provides support for Microsoft® PEAP on Windows 98, NT, 2000 and XP by supporting client

authentication with MS-CHAPv2, and support for Cisco PEAP with one-time token authentication and support of non-MSCHAP end-user databases such as LDAP, NDS, and ODBC.

- *EAP mixed configurations*—Allows flexible EAP settings to be set concurrently and processed per the 802.1X protocol presented by the end user. ACS supports PEAP-EAP-GTC (Cisco PEAP), PEAP-EAP-MSCHAPv2 (Microsoft® PEAP), EAP-TLS, EAP-MD5, and Cisco EAP Wireless (LEAP).
- *Accounting Support for Aironet*—Supports user-based accounting from the Aironet Wireless Access Points when they are configured as RADIUS (Cisco Aironet) AAA clients.
- *EAP-TLS enhancements*—Extends ACS PKI capabilities with the addition of EAP-TLS authentication against ODBC user databases, and EAP-TLS silent session resume support which prevents users from re-authenticating during a RADIUS session timeout.
- *Machine authentication support*—Supports machine authentication by maintaining communication to a back end Windows Active Directory during boot time. ACS supports machine authentication using PEAP with MSCHAPv2 or EAP-TLS 802.1X authentication types.
- *LDAP Multithreading*—Increases performance by processing multiple LDAP authentication requests in parallel rather than in sequential order.
- *Downloadable access control lists for Virtual Private Network (VPN) users*—Allows administrators to define access control lists of any length, per user or group of users. It extends per-user access control list support to Cisco VPN solutions and PIX Firewall solutions.

Availability

The Cisco Secure ACS 3.2 for Windows software and associated upgrade kit will begin shipping on June 17, 2003. The Cisco Secure ACS 3.2 Solution Engine and upgrade kit for existing Cisco Secure ACS for Windows customers, will begin shipping June 27, 2003. Customers interested in purchasing these products can place orders through their normal sales channels beginning June 10, 2003 for the Cisco Secure ACS 3.2 for Windows software and June 16, 2003 for the Cisco Secure ACS 3.2 Solution Engine.

Existing Cisco Secure Access Control Server 3.1 for Windows customers with current Software Application Support (SAS) contracts can request the ACS 3.2 for Windows update kit using their service contract number at http://www.cisco.com/upgrade beginning June 10, 2003.

Ordering Information

The following table contains part numbers commonly used to order Cisco Secure ACS Version 3.2 for Windows and Cisco Secure ACS Solution Engine. This product includes strong encryption technology, which is restricted for some types of U.S. export.

Table 1 Ordering Information for Cisco Secure ACS 3.2

Part Number	Description
CSACS-3.2-WIN-K9	Cisco Secure ACS 3.2 for Windows
CSACS-3.2-WINUP-K9	Upgrade to CSACS 3.2 for Windows from ACS versions 1.x, 2.x, 3.x and Cisco Secure ACS for Unix version 2.x

19.552

Table 1 Ordering Information for Cisco Secure ACS 3.2

Part Number	Description
CON-SAS-CSACS-3.2	SAS service contract for ACS 3.2 for Windows; provides TAC support, CCO Software Center access, and minor updates
CSACSE-1111-K9	Cisco Secure ACS Solution Engine version 3.2; includes Cisco 1111 hardware platform and Cisco Secure Access Control Server software, version 3.2
CSACSE-1111-UP-K9	Upgrade for customers using Cisco Secure ACS 3.X for Windows or Cisco Secure ACS for Unix customers to the Cisco Secure ACS Solution Engine version 3.2; includes Cisco 1111 hardware platform and Cisco Secure Access Control Server software, version 3.2
CON-SAS-CSACE32	SAS service contract for the software component of the Cisco Secure ACS Solution Engine version 3.2; provides TAC support, Cisco.com Software Center Access, and minor updates[1]
CON-SNT-CSACS1111	8x5xNBD service contract for the hardware component of the Cisco Secure ACS Solution Engine version 3.2; provides TAC support, CCO Access and hardware parts replacements[2]

1. Customers must purchase separate SAS software and a hardware support contract for full service coverage of a solution engine
2. Additional hardware service programs are available. Please contact your Cisco Sales Representative for information

Existing Products Affected

With the availability of Cisco Secure Access Control Server version 3.2 for Windows, Cisco is announcing the End of Sales (EoS) for the following products. Older versions will continue to have extended support contracts offered for them as indicated below.

Table 2 Product End of Sales Dates

Part Number	Description	End-of-Sales	End-of-Support
CSACS-3.1-WIN-K9*	Access Control Server 3.1 for Windows	June 16, 2003	June 2006*
CSACS-3.1-WINUP-K9[1]	Upgrade to Cisco ACS 3.1 for Windows from ACS 1.x 2.x, 3.x and Cisco Secure ACS for Unix version 2.x	June 16, 2003	June 2006*

1. Support may require customers to move to a higher product version for resolution. Service programs associated with this part number are also affected by this end of sales date.

Product Information

For additional product information refer to:

http://www.cisco.com/go/acs/

Additional Information

For additional information or questions, send an e-mail to the product-marketing group at ciscoworks@cisco.com.

IP Routing

In a typical installation, the VPN Concentrator is connected to the public network through an external router, which routes data traffic between networks, and it might also be connected to the private network through a router.

The VPN Concentrator itself includes an IP routing subsystem with static routing, RIP (Routing Information Protocol), and OSPF (Open Shortest Path First) functions. RIP and OSPF are routing protocols that routers use for messages to other routers within an internal or private network, to determine network connectivity, status, and optimum paths for sending data traffic.

Once the IP routing subsystem establishes the data paths, the routing itself occurs at wire speed. The subsystem looks at the destination IP address in all packets coming through the VPN Concentrator, even tunneled ones, to determine where to send them. If the packets are encrypted, it sends them to the appropriate tunneling protocol subsystem (PPTP, L2TP, IPSec) for processing and subsequent routing. If the packets are not encrypted, it routes them in accordance with the configured IP routing parameters.

To route packets, the subsystem uses learned routes first (learned from RIP and OSPF), then static routes, then uses the default gateway. If you do not configure the default gateway, the subsystem drops packets that it cannot otherwise route. The VPN Concentrator also provides a tunnel default gateway, which is a separate default gateway for tunneled traffic only.

You configure static routes, the default gateways, and system-wide OSPF parameters in this section. This section also includes the system-wide DHCP (Dynamic Host Configuration Protocol) parameters. You configure RIP and interface-specific OSPF parameters on the network interfaces; see Configuration | Interfaces.

This section of the Manager also lets you configure VPN Concentrator redundancy using VRRP (Virtual Router Redundancy Protocol). This feature applies to installations of two or more VPN Concentrators in a parallel, redundant configuration. It provides automatic switchover to a backup system in case the primary system is out of service, thus ensuring user access to the VPN. This feature supports user access via IPSec LAN-to-LAN connections, IPSec client (single-user remote-access) connections, and PPTP client connections.

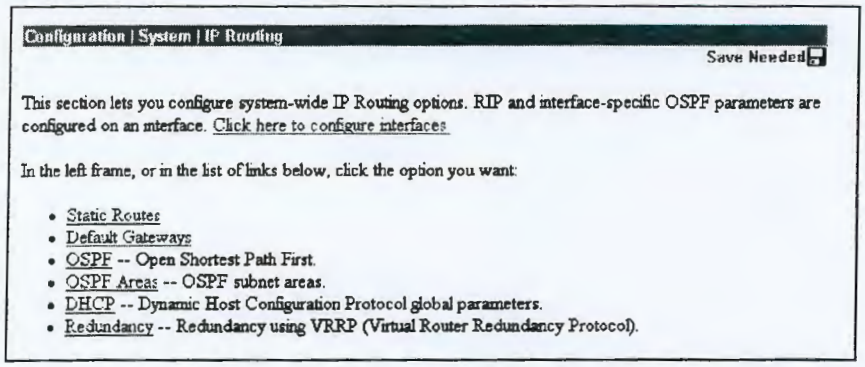
Configuration | System | IP Routing

This section of the Manager lets you configure system-wide IP routing parameters:

- Static Routes: Manually configured routing tables.
- Default Gateways: Routes for otherwise unrouted traffic.
- OSPF: Open Shortest Path First routing protocol.
- OSPF Areas: Subnet areas within the OSPF domain.
- DHCP: Dynamic Host Configuration Protocol global parameters.
- Redundancy: Virtual Router Redundancy Protocol parameters.

You configure RIP and interface-specific OSPF parameters on the network interfaces; click the highlighted link to go to the Configuration | Interfaces screen.

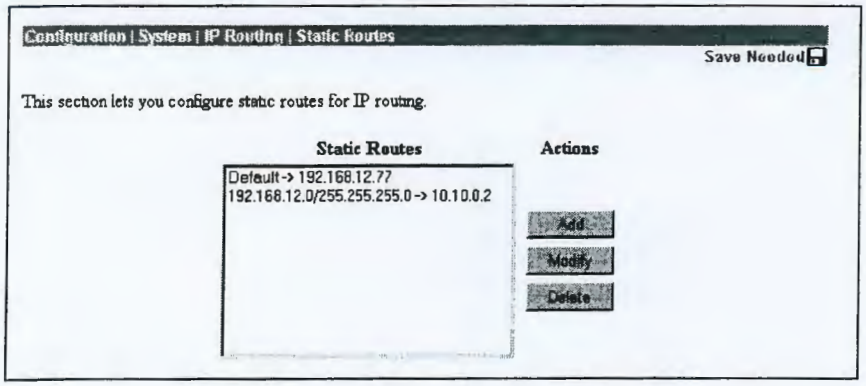
Figure 8-1 Configuration / System / IP Routing Screen



Configuration | System | IP Routing | Static Routes

This section of the Manager lets you configure static routes for IP routing. You usually configure static routes for private networks that cannot be learned via RIP or OSPF.

Figure 8-2 Configuration / System / IP Routing / Static Routes Screen



Static Routes

The Static Routes list shows manual IP routes that have been configured. The format is *[destination network address/subnet mask -> outbound destination]*, for example: 192.168.12.0/255.255.255.0 -> 10.10.0.2. If you have configured the default gateway, it appears first in the list as Default -> default router address. If no static routes have been configured, the list shows --Empty--.

Add / Modify / Delete

To configure and add a new static route, click **Add**. The Manager opens the Configuration | System | IP Routing | Static Routes | Add screen.

To modify a configured static route, select the route from the list and click **Modify**. The Manager opens the Configuration | System | IP Routing | Static Routes | Modify screen. If you select the default gateway, the Manager opens the Configuration | System | IP Routing | Default Gateways screen.

To delete a configured static route, select the route from the list and click **Delete**.

Note There is no confirmation and no undo.

The Manager refreshes the screen and shows the remaining static routes in the list. You cannot delete the default gateways here; to do so, see the Configuration | System | IP Routing | Default Gateways screen.

Reminder:

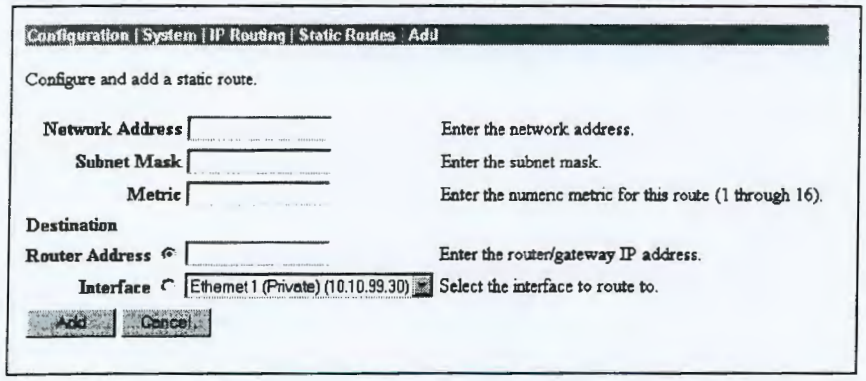
The Manager immediately includes your changes in the active configuration. To save the active configuration and make it the boot configuration, click the **Save Needed** icon at the top of the Manager window.

Configuration | System | IP Routing | Static Routes | Add or Modify

These Manager screens let you:

- Add: Configure and add a new static, or manual, route to the IP routing table.
- Modify: Modify the parameters for a configured static route.

Figure 8-3 Configuration / System / IP Routing / Static Routes / Add or Modify Screen



Network Address

Enter the destination network IP address to which this static route applies. Packets with this destination address will be sent to the destination you enter. Used dotted decimal notation, for example: 192.168.12.0.

Subnet Mask

Enter the subnet mask for the destination network IP address. Use dotted decimal notation, for example: 255.255.255.0. The subnet mask indicates which part of the IP address represents the network and which part represents hosts. The router subsystem looks at only the network part.

The Manager automatically supplies a standard subnet mask appropriate for the IP address you just entered. For example, the IP address 192.168.12.0 is a Class C address, and the standard subnet mask is 255.255.255.0. You can accept this entry or change it. Note that 0.0.0.0 is not allowed here, since that would resolve to the equivalent of a default gateway.

Metric

Enter the metric, or cost, for this route. Use a number from 1 to 16, where 1 is the lowest cost. The routing subsystem always tries to use the least costly route. For example, if a route uses a low-speed line, you might assign a high metric so the system will use it only if all high-speed routes are unavailable.

Destination

Click a radio button to choose the outbound destination for these packets. You can choose only one destination: either a specific router/gateway, or a VPN Concentrator interface.

Router Address

Enter the IP address of the specific router or gateway to which to route these packets; that is, the IP address of the next hop between the VPN Concentrator and the ultimate destination of the packet. Use dotted decimal notation, for example: 10.10.0.2.

Interface

Click the **Interface** drop-down menu button and choose a configured VPN Concentrator interface as the outbound destination. The menu lists all interfaces that have been configured.

For example, in a LAN-to-LAN configuration where remote-access clients are assigned IP addresses that are not on the private network, you could configure a static route with those addresses outbound to the Ethernet 1 (Private) interface. The clients could then access the peer VPN Concentrator and its networks.

Add or Apply / Cancel

To add a new static route to the list of configured routes, click **Add**. Or to apply your changes to a static route, click **Apply**. Both actions include your entries in the active configuration. The Manager returns to the Configuration | System | IP Routing | Static Routes screen. Any new route appears at the bottom of the Static Routes list.

Reminder:

To save the active configuration and make it the boot configuration, click the **Save Needed** icon at the top of the Manager window.

To discard your entries, click **Cancel**. The Manager returns to the Configuration | System | IP Routing | Static Routes screen, and the Static Routes list is unchanged.

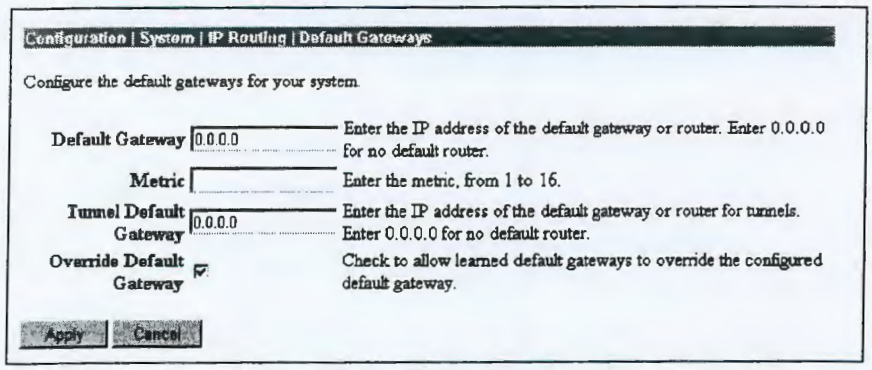
Configuration | System | IP Routing | Default Gateways

This screen lets you configure the default gateway for IP routing, and configure the tunnel default gateway for tunneled traffic. You use this same screen both to initially configure and to change default gateways. You can also configure the default gateway on the Configuration | Quick | System Info screen.

The IP routing subsystem routes data packets first using learned routes, then static routes, then the default gateway. If you do not specify a default gateway, the system drops packets it cannot otherwise route.

For tunneled data, if the system does not know a destination address, it tries to route the packet to the tunnel default gateway first. If that route is not configured, it uses the regular default gateway.

Figure 8-4 Configuration / System / IP Routing / Default Gateways Screen



Default Gateway

Enter the IP address of the default gateway or router. Use dotted decimal notation, for example: 192.168.12.77. This address must *not* be the same as the IP address configured on any VPN Concentrator interface. If you do not use a default gateway, enter 0.0.0.0 (the default entry).

To delete a configured default gateway, enter `0.0.0.0`.

The default gateway must be reachable from a VPN Concentrator interface, and it is usually on the public network. The Manager displays a warning screen if you enter an IP address that is not on one of its interface networks, and it displays a dialog box if you enter an IP address that is not on the public network.

Metric

Enter the metric, or cost, for the route to the default gateway. Use a number from 1 to 16, where 1 is the lowest cost. The routing subsystem always tries to use the least costly route. For example, if this route uses a low-speed line, you might assign a high metric so the system will use it only if all high-speed routes are unavailable.

Tunnel Default Gateway

Enter the IP address of the default gateway for tunneled data. Use dotted decimal notation, for example: 10.10.0.2. If you do not use a tunnel default gateway, enter `0.0.0.0` (the default entry).

To delete a configured tunnel default gateway, enter `0.0.0.0`.

This gateway is often a firewall in parallel with the VPN Concentrator and between the public and private networks. The tunnel default gateway applies to all tunneled traffic, including IPSec LAN-to-LAN traffic.

Note If you use an external device instead of the VPN Concentrator for NAT (Network Address Translation), you must configure the tunnel default gateway.

Override Default Gateway

To allow default gateways learned via RIP or OSPF to override the configured default gateway, check the **Override Default Gateway** check box (the default). To always use the configured default gateway, uncheck the box.

Apply / Cancel

To apply the settings for default gateways, and to include your settings in the active configuration, click **Apply**. The Manager returns to the Configuration | System | IP Routing screen. If you configure a Default Gateway, it also appears in the Static Routes list on the Configuration | System | IP Routing | Static Routes screen.

Reminder:

To save the active configuration and make it the boot configuration, click the **Save Needed** icon at the top of the Manager window.

To discard your entries, click **Cancel**. The Manager returns to the Configuration | System | IP Routing screen.

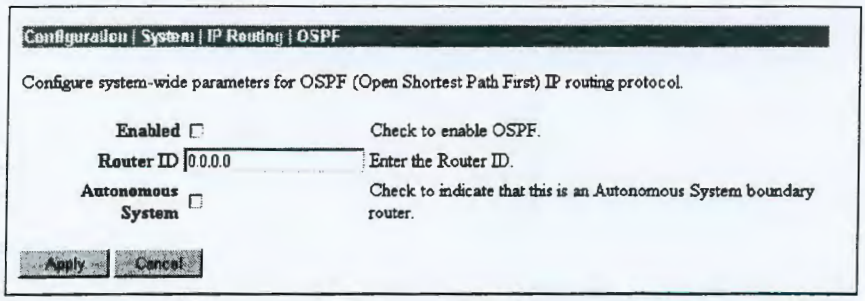
Configuration | System | IP Routing | OSPF

This screen lets you configure system-wide parameters for the OSPF (Open Shortest Path First) routing protocol. You must also configure interface-specific OSPF parameters on the Configuration | Interfaces screens.

OSPF is a protocol that the IP routing subsystem uses for messages to other OSPF routers within an internal or private network, to determine network connectivity, status, and optimum paths for sending data traffic. The VPN Concentrator supports OSPF version 2 (RFC 2328).

The complete private network is called an OSPF Autonomous System (AS), or domain. The subnets within the AS are called areas. You configure OSPF areas on the Configuration | System | IP Routing | OSPF Areas screens.

Figure 8-5 Configuration / System / IP Routing / OSPF Screen



Enabled

To enable the VPN Concentrator OSPF router, check the **Enabled** check box. (By default it is unchecked.) You must also enter a Router ID. You must check this box for OSPF to work on any interface that uses it.

To change a configured Router ID, you must disable OSPF here.

To enable OSPF routing on an interface, you must also configure and enable OSPF on the appropriate Configuration | Interfaces screen.

19.543

Router ID

The router ID uniquely identifies the VPN Concentrator OSPF router to other OSPF routers in its domain. While the format is that of an IP address, it functions only as an identifier and not an address. By convention, however, this identifier is the same as the IP address of the interface that is connected to the OSPF router network.

Enter the router ID in the field. Use dotted decimal IP address format, for example: 10.10.4.6. The default entry is 0.0.0.0 (no router configured). If you enable the OSPF router, you must enter an ID.

Note Once you configure and apply a router ID, you must disable OSPF before you can change it. You cannot change the ID back to 0.0.0.0.

Autonomous System

An OSPF Autonomous System (AS), or domain, is a complete internal network. An AS boundary router exchanges routing information with routers belonging to other Autonomous Systems, and advertises external AS routing information throughout its AS.

Check the **Autonomous System** check box to indicate that the VPN Concentrator OSPF router is the boundary router for an Autonomous System. If you check this box, the VPN Concentrator also redistributes RIP and static routes into the OSPF areas. By default, the box is unchecked.

Apply / Cancel

To apply your OSPF settings, and to include your settings in the active configuration, click **Apply**. The Manager returns to the Configuration | System | IP Routing screen.

Reminder:

To save the active configuration and make it the boot configuration, click the **Save Needed** icon at the top of the Manager window.

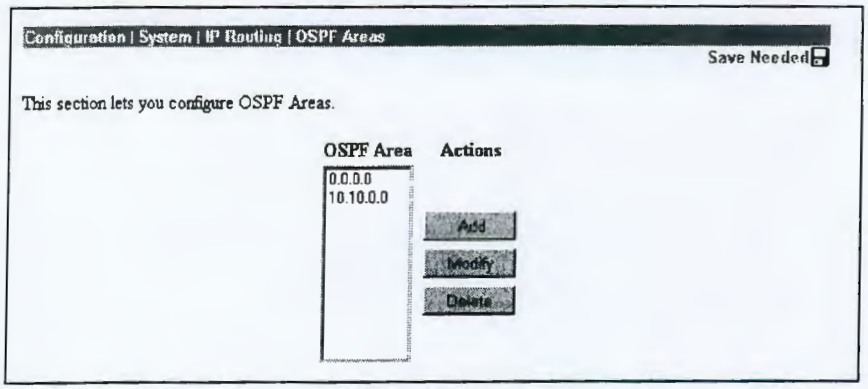
To discard your settings, click **Cancel**. The Manager returns to the Configuration | System | IP Routing screen.

Configuration | System | IP Routing | OSPF Areas

This section of the Manager lets you configure OSPF areas, which are the subnets within an OSPF Autonomous System or domain. You should configure entries for all areas connected to this VPN Concentrator OSPF router.

You can also identify an OSPF area on a VPN Concentrator network interface (see Configuration | Interfaces). Those area identifiers appear in the OSPF Area list on this screen.

Figure 8-6 Configuration / System / IP Routing / OSPF Areas Screen



OSPF Area

The OSPF Area list shows identifiers for all areas that are connected to this VPN Concentrator OSPF router. The format is the same as a dotted decimal IP address, for example: 10.10.0.0. The default entry is 0.0.0.0. This entry identifies a special area known as the backbone that contains all area border routers, which are the routers connected to multiple areas.

Add / Modify / Delete

To configure and add a new OSPF area, click **Add**. The Manager opens the Configuration | System | IP Routing | OSPF Areas | Add screen.

To modify a configured OSPF area, select the area from the list and click **Modify**. The Manager opens the Configuration | System | IP Routing | OSPF Areas | Modify screen.

To delete a configured OSPF area, select the area from the list and click **Delete**.

Note There is no confirmation or undo.

The Manager refreshes the screen and shows the remaining entries in the OSPF Area list.

Reminder:

The Manager immediately includes your changes in the active configuration. To save the active configuration and make it the boot configuration, click the **Save Needed** icon at the top of the Manager window.

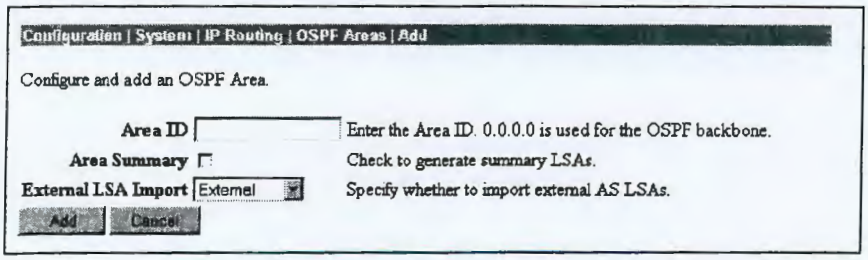
Configuration | System | IP Routing | OSPF Areas | Add or Modify

These Manager screens let you:

- Add: Configure and add an OSPF area.
- Modify: Modify parameters for a configured OSPF area.

Note Once you have configured an OSPF Area, you cannot modify its ID. To change an area ID, delete the existing area and add a new one.

Figure 8-7 Configuration / System / IP Routing / OSPF Areas / Add or Modify Screen



Area ID

- Add: Enter the area ID in the field. Use IP address dotted decimal notation, for example: 10.10.0.0. The default entry is 0.0.0.0, the backbone.
- Modify: Once you have configured an area ID, you cannot change it. See preceding note.

The Area ID identifies the subnet area within the OSPF Autonomous System or domain. While its format is the same as an IP address, it functions only as an identifier and not an address. The 0.0.0.0 area ID identifies a special area—the backbone—that contains all area border routers.

Area Summary

Check the **Area Summary** check box to have the OSPF router generate and propagate summary LSAs (Link-State Advertisements) into OSPF stub areas. LSAs describe the state of the router's interfaces and routing paths. Stub areas contain only final-destination hosts and do not pass traffic through to other areas. Sending LSAs to them is usually not necessary. By default this box is unchecked.

External LSA Import

Click the **External LSA Import** drop-down menu button and choose whether to bring in LSAs from neighboring Autonomous Systems. LSAs describe the state of the AS router's interfaces and routing paths. Importing those LSAs builds a more complete link-state database, but it requires more processing. The choices are:

- External = Yes, import LSAs from neighboring ASs (the default).
- No External = No, do not import external LSAs.

Add or Apply / Cancel

To add this OSPF area to the list of configured areas, click **Add**. Or to apply your changes to this OSPF area, click **Apply**. Both actions include your entry in the active configuration. The Manager returns to the Configuration | System | IP Routing | OSPF Areas screen. Any new entry appears at the bottom of the OSPF Area list.

Reminder:

To save the active configuration and make it the boot configuration, click the **Save Needed** icon at the top of the Manager window.

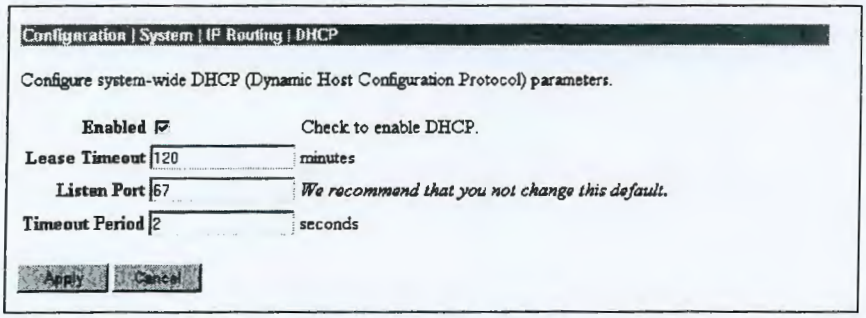
To discard your entries, click **Cancel**. The Manager returns to the Configuration | System | IP Routing | OSPF Areas screen, and the OSPF Area list is unchanged.

Configuration | System | IP Routing | DHCP

This screen lets you configure DHCP (Dynamic Host Configuration Protocol) parameters that apply to DHCP functions within the VPN Concentrator. You can use external DHCP servers to assign IP addresses to clients as a VPN tunnel is established.

If you check the Use DHCP check box on the Configuration | System | Address Management | Assignment screen, you must configure at least one DHCP server on the Configuration | System | Servers | DHCP screens. You configure global DHCP parameters here.

Figure 8-8 Configuration / System / IP Routing / DHCP Screen



Enabled

Check the **Enabled** check box to enable DHCP functions within the VPN Concentrator. The box is checked by default. To use DHCP address assignment, you must enable DHCP functions here.

Lease Timeout

Enter the timeout in minutes for addresses that are obtained from a DHCP server. The minimum timeout is 5 minutes. The default is 120 minutes. The maximum is 500000 minutes. DHCP servers "lease" IP addresses for this period of time. Before the lease expires, the VPN Concentrator asks to renew it on behalf of the client. If for some reason the lease is not renewed, the connection terminates when the lease expires. The DHCP server's lease period takes precedence over this setting.

Listen Port

Enter the UDP port number on which DHCP server response messages are accepted. The default is 67, which is the well-known port. *To ensure proper communication with DHCP servers, we strongly recommend that you not change this default.*

Timeout Period

Enter the initial time in seconds to wait for a response to a DHCP request before sending the request to the next configured DHCP server. The minimum time is 1 second. The default time is 2 seconds. The maximum time is 10 seconds. This time doubles with each cycle through the list of configured DHCP servers.

Apply / Cancel

To apply the settings for DHCP parameters, and to include your settings in the active configuration, click **Apply**. The Manager returns to the Configuration | System | IP Routing screen.

Reminder:

To save the active configuration and make it the boot configuration, click the **Save Needed** icon at the top of the Manager window.

To discard your entries, click **Cancel**. The Manager returns to the Configuration | System | IP Routing screen.

Configuration | System | IP Routing | Redundancy

This screen lets you configure parameters for Virtual Router Redundancy Protocol (VRRP), which manages automatic switchover from one VPN Concentrator to another in a redundant installation. Automatic switchover provides user access to the VPN even if one VPN Concentrator is out of service for some reason, for example a system crash, power failure, hardware failure, physical interface failure, system shutdown or reboot.

These functions apply only to installations where two or more VPN Concentrators are in parallel, with the Public interfaces of all systems on a common LAN and with the Private and/or External interfaces of all systems on different common LANs. One VPN Concentrator is the Master system, and the others are Backup systems. A Backup system acts as a virtual Master system when a switchover occurs.

VRRP works only on LAN (Ethernet) interfaces, not on WAN interfaces.

Note If VRRP is configured on a VPN Concentrator, you cannot also enable load balancing. In a VRRP configuration, the backup device remains idle unless the active VPN Concentrator fails. Load balancing does not permit idle devices.

This feature supports user access via IPSec LAN-to-LAN connections, IPSec client (single-user remote-access) connections, and PPTP client connections.

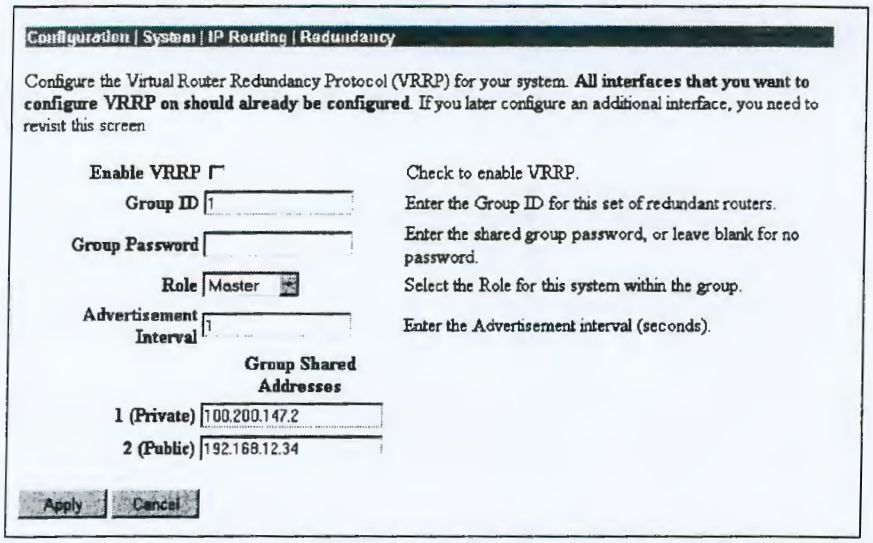
- For IPSec LAN-to-LAN connections, switchover is fully automatic. Users do not need to do anything.
- For single-user IPSec and PPTP connections, users are disconnected from the failing system but they can reconnect without changing any connection parameters.

Switchover typically occurs within 3 to 10 seconds.

Note Before configuring or enabling VRRP on this screen, you must configure all Ethernet interfaces that apply to your installation, on all redundant VPN Concentrators. See the Configuration | Interfaces screens.

Note You must also configure *identical* IPSec LAN-to-LAN parameters on the redundant VPN Concentrators. See the Configuration | System | Tunneling Protocols | IPSec LAN-to-LAN screens.

Figure 8-9 Configuration / System / IP Routing / Redundancy Screen



Enable VRRP

Check the **Enable VRRP** check box to enable VRRP functions. The box is unchecked by default.

Group ID

Enter a number that uniquely identifies this group of redundant VPN Concentrators. This number must be the same on all systems in this group. Use a number from 1 (default) to 255. Since there is rarely more than one virtual group on a LAN, we suggest you accept the default.

Group Password

Enter a password for additional security in identifying this group of redundant VPN Concentrators. The maximum password length is 8 characters. The Manager shows your entry in clear text, and VRRP advertisements contain this password in clear text. This password must be the same on all systems in this group. Leave this field blank to use no password.

Role

Click the **Role** drop-down menu button and choose the role of this VPN Concentrator in this redundant group.

- Master = This is the Master system in this group (the default choice). Be sure to configure only one Master system in a group with a given Group ID.
- Backup 1 through Backup 5 = This is a Backup system in this group.

Advertisement Interval

Enter the time interval in seconds between VRRP advertisements to other systems in this group. Only the Master system sends advertisements; this field is ignored on Backup systems while they remain Backup. The minimum interval is 1 second. The default interval is 1 second. The maximum is 255 seconds. Since a Backup system can become a Master system, we suggest you accept the default for all systems.

Group Shared Addresses

Enter the IP addresses that are treated as configured router addresses by all virtual routers in this group. The Manager displays fields only for the Ethernet interfaces that have been configured.

On the Master system, these entries are the IP addresses configured on its Ethernet interfaces, and the Manager supplies them by default.

On a Backup system, the fields are empty by default, and you must enter the same IP addresses as those on the *Master* system.

1 (Private)

The IP address for the Ethernet 1 (Private) interface shared by the virtual routers in this group.

2 (Public)

The IP address for the Ethernet 2 (Public) interface shared by the virtual routers in this group.

3 (External)

The IP address for the Ethernet 3 (External) interface shared by the virtual routers in this group.

Apply / Cancel

To apply the settings for VRRP, and to include your settings in the active configuration, click **Apply**. The Manager returns to the Configuration | System | IP Routing screen.

Reminder:

To save the active configuration and make it the boot configuration, click the **Save Needed** icon at the top of the Manager window.

To discard your entries, click **Cancel**. The Manager returns to the Configuration | System | IP Routing screen.

Cisco – Using RADIUS Servers with VPN 3000 Products

Table of Contents

Using RADIUS Servers with VPN 3000 Products

Introduction

This document describes the following issues encountered when using various RADIUS servers with the VPN 3000 Concentrator and the VPN 3000 Client:

- Setting the authentication parameter on a Windows 2000 RADIUS server
- Using a RADIUS server that does not support MSCHAP
- Using encryption with PPTP

Some of these notes have appeared in product release notes.

Before You Begin

Conventions

For more information on document conventions, see the Cisco Technical Tips Conventions.

Prerequisites

There are no specific prerequisites for this document.

Components Used

The information in this document is based on the software and hardware versions below.

- Cisco VPN 3000 Concentrator
- Cisco VPN 3000 Client

The information presented in this document was created from devices in a specific lab environment. All of the devices used in this document started with a cleared (default) configuration. If you are working in a live network, ensure that you understand the potential impact of any command before using it.

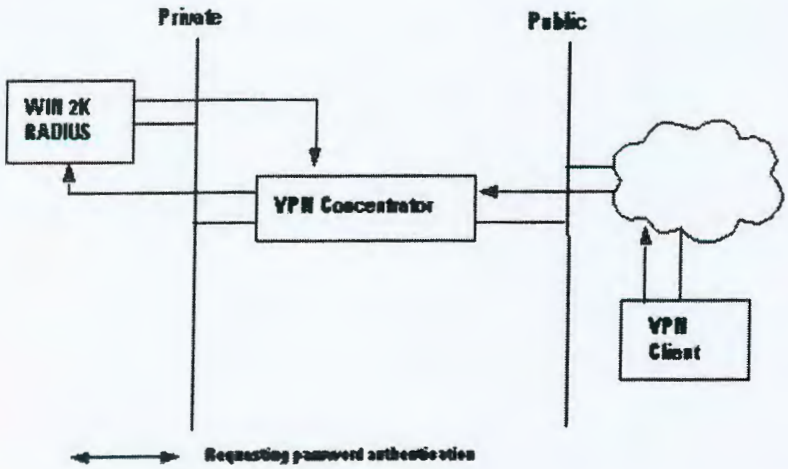
Setting Authentication Parameter on the Windows 2000 RADIUS Server

You can use a Windows 2000 RADIUS server to authenticate a VPN 3000 Client user. In the following

scenario (Client is requesting authentication), the VPN 3000 Concentrator receives a request from the VPN 3000 Client containing the Client user's username and password. Before sending the username/password to a Windows 2000 RADIUS server in the private network for verification, the VPN Concentrator hashes it, using the HMAC/MD5 algorithm.

The Windows 2000 RADIUS server requires PAP for authenticating a VPN 3000 Client session. To enable the RADIUS server to authenticate a VPN 3000 Client, set (check) the **Unencrypted Authentication (PAP, SPAP)** parameter on the **Edit Dial-in Profile** window (by default, this parameter is not checked). To set this parameter, select the **Remote Access Policy** you are using, select **Properties** and go to the **Authentication** tab.

Note that the word *Unencrypted* on this parameter's name is misleading. Using this parameter does *not* cause a breach of security, because when the VPN Concentrator sends the authentication packet to the RADIUS server, it does not send the password in the clear . The VPN Concentrator receives the username/password and encrypted packets from the VPN Client, and performs an HMAC/MD5 hash on the password before sending the authentication packet to the server.



Using a RADIUS Server that Does Not Support MSCHAP

Some RADIUS servers do not support MSCHAPv1 or MSCHAPv2 user authentication. If you are using a RADIUS server that does not support MSCHAP (v1 or v2), you must configure the Base Group's PPTP authentication protocol to use PAP and/or CHAP only. Examples of RADIUS servers that do not support MSCHAP are the Livingston v1.61 RADIUS server or any RADIUS server based on Livingston code.

Using Encryption with PPTP

To use encryption with PPTP, a RADIUS server must support MSCHAP authentication and the return attribute MSCHAP-MPPE-Keys. Examples of RADIUS servers that support this attribute are:

- Cisco Secure ACS for Windows – version 2.6 or later
- Funk Software Steel-Belted RADIUS
- Microsoft Internet Authentication Server on NT 4.0 Server Options Pack
- Microsoft Commercial Internet System (MCIS 2.0)
- Microsoft Windows 2000 Server — Internet Authentication Server

Supported and Interoperable Devices and Software Tables for Cisco Secure ACS Appliance version 3.2

Revised: July 8, 2003

Because the number of devices that Cisco Secure ACS Appliance version 3.2 interoperates with runs into the hundreds, this device list differs significantly from those of other Cisco products with which you may be familiar. This document lists supported devices and software, that is, those that we have tested against. However, this document also lists devices and software programs that are, to the best of our knowledge, interoperable. Of the hundreds of devices and software programs that Cisco Secure ACS Appliance version 3.2 interoperates with, Cisco officially supports only those that have been tested.

For details regarding other limitations and known problems see *Release Notes for CiscoSecure Access Control Server Appliance Version 3.2*. On Cisco.com, you can find the latest version all documentation by selecting **Products & Services > Security and VPN Software > Cisco Secure Access Control Server Appliance > Technical Documentation.**

CISCO SYSTEMS

Corporate Headquarters:
Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

With regard to third-party RADIUS and TACACS+ clients, Cisco Secure ACS Appliance fully interoperates with devices that adhere to the governing protocols. Also, support for RADIUS and TACACS+ functions depends on device-specific implementation. On a given device, TACACS+ may not be available for user authentication and authorization. Likewise, RADIUS may not be available for administrative authentication and authorization.

For RADIUS these include the following RFCs:

- RFC 2138 - Remote Authentication Dial In User Service (RADIUS)
- RFC 2139 - RADIUS Accounting
- RFC 2865 - Remote Authentication Dial In User Service (RADIUS)
- RFC 2866 - RADIUS Accounting
- RFC 2867 - RADIUS Accounting for Tunnel Protocol Support
- RFC 2868 - RADIUS Attributes for Tunnel Protocol Support
- RFC 2869 - RADIUS Extensions

For details regarding the implementation of vendor-specific attributes (VSAs), see *User Guide for Cisco Secure ACS Appliance Version 3.2*.

Cisco Secure ACS Appliance conforms to the TACACS+ protocol as defined by Cisco Systems in draft 1.77.

The following tables show the devices and software that Cisco Secure ACS Appliance supports or with which it interoperates:

- Table 1, Web Browsers
- Table 2, Device Operating Systems
- Table 3, Routers
- Table 4, Access Devices/Universal Gateways
- Table 5, Cable Devices
- Table 6, Content Networking Devices
- Table 7, Security and VPN Devices
- Table 8, Storage Networking Devices
- Table 9, Switches
- Table 10, Cisco Aironet Software (Access Points for Wireless LAN)
- Table 11, CiscoWorks VMS

- Table 12, PKI/Certificate Servers
- Table 13, Token Servers
- Table 14, LDAP Servers
- Table 15, User Databases
- Table 16, Proxy Support

You can find information about new device support at Cisco.com, http://www.cisco.com.

To ensure full capabilities, the clients you deploy to interoperate with Cisco Secure ACS Appliance should use the most recent operating systems available. Nonetheless, Table 2 provides details on the minimum acceptable client operating system versions.

Table 1 Web Browsers[1]

Program	Versions	Notes
Microsoft Internet Explorer	5.5 for Microsoft Windows - English Language version	Tested
	6.0 for Microsoft Windows - English Language version	Tested
Netscape	7.0 for Microsoft Windows - English Language version	Tested
	7.0 on Solaris 2.7- English Language version	Tested

1. To use a web browser to access the Cisco Secure ACS HTML interface, you must enable both Java and JavaScript in the browser. Also, the web browser must not be configured to use a proxy server.

Table 2 Device Operating Systems

Operating System	Minimum Version	Notes
IOS	11.2	For full RADIUS support
CAT OS	7.2	Cisco products—and other third-party products that are RFC compliant—will work with Cisco Secure ACS even when running earlier versions of CAT OS. However, full functionality, including the 802.1x VLAN assignment, is supported only when the listed version is used.

Table 3 Routers

Series	Notes
Cisco 1400	End of life (EOL) status

Funk Steel Belted Radius	Enterprise Edition	—

CHAPTER 14

User Management

Groups and users are core concepts in managing the security of VPNs and in configuring the VPN Concentrator. Groups and users have attributes, configured via parameters, that determine their access to and use of the VPN. *Users* are members of *groups*, and groups are members of the *base group*. If you do not assign a user to a particular group, that user is by default a member of the base group. This section of the Manager lets you configure those parameters.

Groups simplify system management. To streamline the configuration task, the VPN Concentrator provides a base group that you configure first. The base-group parameters are those that are most likely to be common across all groups and users. As you configure a group, you can simply specify that it "inherit" parameters from the base group; and a user can also "inherit" parameters from a group. Thus you can quickly configure authentication for large numbers of users.

Of course, if you decide to grant identical rights to all VPN users, then you do not need to configure specific groups. But VPNs are seldom managed that way. For example, you might allow a Finance group to access one part of a private network, a Customer Support group to access another part, and an MIS group to access other parts. Further, you might allow specific users within MIS to access systems that other MIS users cannot access.

You can configure detailed parameters for groups and users on the VPN Concentrator internal authentication server. External RADIUS authentication servers also can return group and user parameters that match those on the VPN Concentrator; other authentication servers do not; they can, however, authenticate users.

The VPN 3000 software CD-ROM includes a link that customers with CCO logins can use to access an evaluation copy of the CiscoSecure ACS RADIUS authentication server. The VPN 3000 software CD-ROM also has current VPN 3000 VSA registry files that let customers load new supported attributes on their ACS server, and provides instructions for using them.

The VPN Concentrator internal authentication server is adequate for a small user base. The maximum number of groups and users (combined) that you can configure in the internal server depends on your VPN Concentrator model. (See Table 14-1.) For larger numbers of users, we recommend using the internal server to configure groups (and perhaps a few users) and using an external authentication server (RADIUS, NT Domain, SDI) to authenticate the users.

Table 14-1 Maximum Number of Groups and Users for the Internal Authentication Server

VPN Concentrator Model	Maximum Number of Groups and Users (Combined)
3005	100
3015	100
3030	500
3060	1000
3080	1000

The VPN Concentrator checks authentication parameters in this order:

- First: User parameters. If any parameters are missing, the system looks at:
- Second: Group parameters. If any parameters are missing, the system looks at:
- Third, for IPSec users only: IPSec tunnel-group parameters. These are the parameters of the IPSec group used to create the tunnel. The IPSec group is configured on the internal server or on an external RADIUS server. If any parameters are missing, the system looks at base group parameters. For VPN 3002 Hardware Client parameters, which enable or disable interactive hardware client authentication and individual user authentication, the IPSec tunnel group parameters take precedence over parameters set for users and groups.
- Last: Base-group parameters.

If you use a non-RADIUS server, only the IPSec tunnel-group or base-group parameters apply to users.

Some additional points to note:

- Base-group parameters are the default, or system-wide, parameters.
- A user can be a member of only one group.
- A user that is not a member of a group can nevertheless assume attributes from that group if you join the groupname to the username using a delimiter. See Configuration | System | General | Global Authentication Parameters for information on how to select and use a delimiter.
- Users who are not members of a specific group are, by default, members of the base group. Therefore, to ensure maximum security and control, you should assign all users to appropriate groups, and you should configure base-group parameters carefully.
- You can change group parameters, thereby changing parameters for all its members at the same time.
- You can delete a group, but when you do, all its members revert to the base group. Deleting a group, however, does not delete its members' user profiles.
- You can override the base-group parameters when you configure groups and users, and give groups and users more or fewer rights with this exception:

  For PPTP and L2TP authentication protocols, you can allow specific groups and users to use *fewer* protocols than the base group, but not more.

  For all other parameters, groups' and users' rights can be greater than the base group. For example, you can give a specific user 24-hour access to the VPN, but give the base group access during business hours only.

- You apply filters to groups and users, and thus govern *tunneled* data traffic through the VPN Concentrator. You also apply filters to network interfaces, and thus govern *all* data traffic through the VPN Concentrator. See the Configuration | Policy Management | Traffic Management screens.
- We can supply a "dictionary" of Cisco-specific user and group parameters for external RADIUS servers.

We recommend that you *define* groups when planning your VPN, and that you *configure* groups and users on the VPN Concentrator in this order:

1. Base-group parameters.
2. Group parameters.
3. User parameters.

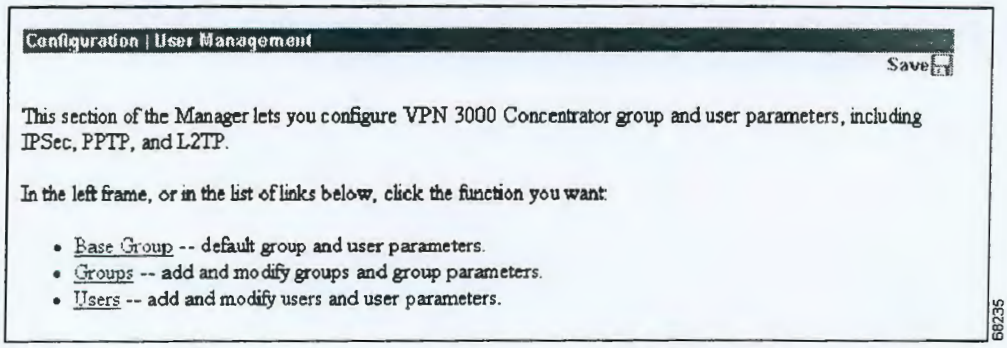
Before configuring groups and users, you should configure system policies, including network lists, access hours, filters, rules, and IPSec security associations (see Configuration | Policy Management).

In addition to configuring groups and users, you also need to configure authentication servers--specifically the internal authentication server (see Configuration | System | Servers). You can specify authentication servers globally or per group.

Configuration | User Management

This section of the Manager lets you configure base-group, group, and individual user parameters. These parameters determine access and use of the VPN Concentrator.

Figure 14-1 Configuration | User Management Screen



Configuration | User Management | Base Group

This Manager screen lets you configure the default, or base-group, parameters. Base-group parameters are those that are most likely to be common across all groups and users, and they streamline the configuration task. Groups can "inherit" parameters from this base group, and users can "inherit" parameters from their group or the base group. You can override these parameters as you configure groups and users. Users who are not members of a group are, by default, members of the base group.

On this screen, you configure the following kinds of parameters:

- General Parameters: Security, access, performance, and protocols.
- IPSec Parameters: IP Security tunneling protocol.
- Mode Config Parameters: Banner, password storage, split-tunneling policy, default domain name, IPSec over UDP, backup servers.
- Client FW Parameters: VPN Client personal firewall requirements.
- HW Client Parameters: Interactive hardware client and individual user authentication; network extension mode.
- PPTP/L2TP Parameters: PPTP and L2TP tunneling protocols.

Before configuring these parameters, you should configure:

- Access Hours (Configuration | Policy Management | Access Hours).
- Rules and filters (Configuration | Policy Management | Traffic Management | Rules and Filters).
- IPSec Security Associations (Configuration | Policy Management | Traffic Management | Security Associations).
- Network Lists for filtering and split tunneling (Configuration | Policy Management | Traffic Management | Network Lists).
- User Authentication servers, and specifically the internal authentication server (Configuration | System | Servers | Authentication).

Using the Tabs

This screen includes three tabbed sections. Click each tab to display its parameters. As you move from tab to tab, the Manager retains your settings. When you have finished setting parameters on all tabbed sections, click **Apply** or **Cancel**.

General Parameters Tab

This tab lets you configure general security, access, performance, and protocol parameters that apply to the base group.

Figure 14-2 Configuration / User Management / Base Group Screen, General Tab

Configuration | User Management | Base Group

General | IPSec | Client Config | Client FW | HW Client | PPTP/L2TP

General Parameters

Attribute	Value	Description
Access Hours	-No Restrictions-	Select the access hours for this group.
Simultaneous Logins	3	Enter the number of simultaneous logins for users in this group.
Minimum Password Length	8	Enter the minimum password length for users in this group.
Allow Alphabetic-Only Passwords	☑	Enter whether to allow users with alphabetic-only passwords to be added to this group.
Idle Timeout	30	(minutes) Enter the idle timeout for this group.
Maximum Connect time	0	(minutes) Enter the maximum connect time for this group.
Filter	-None-	Select the filter assigned to this group.
Primary DNS		Enter the IP address of the primary DNS server for this group.
Secondary DNS		Enter the IP address of the secondary DNS server.
Primary WINS		Enter the IP address of the primary WINS server for this group.
Secondary WINS		Enter the IP address of the secondary WINS server.
Tunneling Protocols	☑ PPTP ☑ L2TP ☑ IPSec ☐ L2TP over IPSec	Select the tunneling protocols this group can connect with.
Strip Realm	☐	Check to remove the realm qualifier of the user name during authentication.
DHCP Network Scope		Enter the IP sub-network to which users within this group will be assigned when using the concentrator as a DHCP Proxy.

Apply Cancel

83896

Access Hours

Click the **Access Hours** drop-down menu button and select the named hours when remote-access users can access the VPN Concentrator. Configure access hours on the Configuration | Policy Management | Access Hours screen. Default entries are:

- -No Restrictions- = No named access hours applied (the default), which means that there are no restrictions on access hours.
- Never = No access at any time.
- Business Hours = Access 9 a.m. to 5 p.m., Monday through Friday.

Additional named access hours that you have configured also appear on the list.

Simultaneous Logins

Enter the number of simultaneous logins permitted for a single internal user. The minimum is 0, which disables login and prevents user access; default is 3. While there is no maximum limit, allowing several could compromise security and affect performance.

ANEXO 16

19.512

Cisco Systems

Product Bulletin No. 1914

Announcing CiscoWorks **VPN/Security Management Solution**, Version 2.1

Cisco Systems announces the availability of the CiscoWorks VPN/Security Management Solution (VMS) 2.1. This suite combines general device management tools for configuring, monitoring, and troubleshooting enterprise networks with powerful security solution for managing virtual private networks (VPNs), firewalls, and network and host-based intrusion detection systems (IDS).

CiscoWorks VPN/Security Management Solution features the following:

- New CiscoWorks Management Centers for:
  - PIX Firewalls and Auto Update Server, version 1.0—Supports large deployments of Cisco PIX Firewalls. Features Smart Rules hierarchy and inheritance and user-defined device and customer groups including nesting.
  - IDS Sensors, version 1.0—Centrally configures multiple network and switch IDS sensors using group security profiles.
  - VPN Routers, version 1.0—Provides centralized multi-device administration for large-scale, site-to-site VPN connections in a hub-and-spoke topology. Allows the configuration and deployment of Internet Key Exchange (IKE) and IP Security (IPSec) tunnel policies.
- Monitoring Center for Security, version 1.0—Captures and stores centralized reports on events and identify attacks that may occur on Cisco Network IDS, Switch IDS, Host IDS, firewalls and routers.
- Cisco IDS Host Sensor and Console, version 2.5— Provides real-time analysis and intervention to network for server-based security intrusion attempts.
- Cisco Secure Policy Manager, version 3.1—Allows security policies to be centrally defined, distributed, and audited for Cisco firewalls and IPSec VPN routers.
- VPN Monitor, version 1.2 —Provides centralized administration of multiple IPSec VPN connections configured for remote-access or site-to-site VPN terminations.
- Resource Manager Essentials, version 3.4—Provides detailed inventory information, device configurations tools, change audit reports and Syslog analysis for notification of VPN and security operational problems.
- CiscoView, version 5.4—Provides browser access to real-time device status, and operational and configuration functions.

Availability

CiscoWorks VPN/Security Management Solution 2.1 and associated minor release update kits will start shipping September 26, 2002. Customers can order these new products through their normal sales channels beginning September 13, 2002.

Existing VPN/Security Management Solution 2.0 customers with current Software Application Support (SAS) contracts can request a VMS 2.1 minor update kit using their contract number at http://www.cisco.com/upgrade beginning September 30, 2002.

Ordering Information

The following table contains part numbers commonly used to order VMS, version 2.1. Some VMS 2.1 components include strong encryption technologies, which are restricted for some types of U.S. export.

Important Notice: Customers interested in deploying VMS 2.1's Management Center for Firewalls, Auto Update Server, or Management Center for IDS Signature files, should downlowd these modules from the following link: http://www.cisco.com/kobayashi/sw-center/cw2000/vms-planner.shtml. These tools were not included in all product shipments, but all VMS 2.1 customers are eligible to access and use them. Cisco's VMS product team is planning several future updates to the security elements in VMS 2.1, so customers are encouraged to check periodically for the latest downloadable updates. Also, some VMS 2.1 components contain strong encryption technology subject to export control by the U.S. Government. Prior to downloading VMS update software, customers are required to provide export related information. Once submitted, the authorizationi process typically takes 30 minutes or next business day approval for requests made outside normal Pacific Standard Time zone business hours.

Table 1 Ordering Information for CiscoWorks VMS 2.1

Part Number	Description
CWVMS-2.1-UR-K9	VMS 2.1 for Win/Sol; Unrestricted Device Usage; 1 server installation license; includes Management Centers for: PIX Firewalls* and Auto Update Server 1.0*, for IDS Sensors 1.0*; for VPN Routers 1.0*; Monitoring Center for Security 1.0*, Cisco IDS Host Sensor and Console 2.5*, CSPM 3.1*, VPN Monitor 1.2, RME 3.4, CiscoView 5.4 (*Indicates Windows-only support)
CWVMS-2.1-WINR-K9	VMS 2.1 for Windows; 20-device Restricted Usage; 1 server installation license; includes Management Centers: for PIX Firewalls and Auto Update Server 1.0: for IDS Sensors 1.0; for VPN Routers 1.0; Monitoring Center for Security 1.0, Cisco IDS Host Sensor and Console 2.5, CSPM 3.1, VPN Monitor 1.2, RME 3.4, CiscoView 5.4
CWVMS-2.1-UPGUR-K9	Upgrade from CSPM 2.x or VMS 1.x to VMS 2.1 for Windows and Solaris; Unrestricted Usage; 1 server installation license
CWVMS-2.1-WUPGR-K9	Upgrade from CSPM 2.x to VMS 2.1 for Windows; 20-device Restricted Usage; 1 server installation license
CWVMS-2.1-URC-K9	Conversion from VMS restricted-license to VMS 2.1 for Windows and Solaris—Unrestricted Device License (adds Solaris versions of CV, RME, VPN Monitor, and an unrestricted license to CSPM for Windows and management and monitoring centers)
CWVMS-2.1-UR-MR-K9	Minor update kit for existing VMS 2.0 Unrestricted Device Usage customers; Includes updates for Windows and Solaris to existing components and includes management and monitoring centers

Table 1 Ordering Information for CiscoWorks VMS 2.1

Part Number	Description
CWVMS-2.1-R-MR-K9	Minor update kit for existing VMS 2.0; 20-device Restricted Usage customers; Includes updates for Windows to existing components and includes management and monitoring centers
CON-SAS-CWVMS-URW	SAS Service for VMS 2.1 for WIN/SOL (Unrestricted Device License); provides TAC support, CCO Software Center access, and minor updates
CON-SAS-CWVMS-R2	SAS Service for VMS 2.1 for Windows (20-device Restricted License); provides TAC support, CCO Software Center access, and minor updates
CON-SAS-CWVMSURC2	SAS Service for VMS 2.1 for customers that convert from a restricted license to an un-restricted license; provides TAC support, CCO Software Center access, and minor updates

Table 2 VMS 2.0 to 2.1 Minor Update Options

Currently Own	Type of previous license	You want	Desired License	Update Kit to Order
VMS 2.0	Restricted	VMS 2.1	Restricted	CWVMS-2.1-R-MR-K9 or SAS customers can request update kits from Cisco's Product Upgrade Tool www.cisco.com/upgrade
VMS 2.0	Unrestricted	VMS 2.1	Unrestricted	CWVMS-2.1-UR-MR-K9 or SAS customers can request update kits from Cisco's Product Upgrade Tool www.cisco.com/upgrade

Table 3 VMS and CSPM Upgrade Options

Currently Own	Type of previous license	You want	Desired License	Upgrade to Order
VMS 1.0	Restricted	VMS 2.1	Restricted	CWVMS-2.1-WUPGR-K9
VMS 1.0	Unrestricted	VMS 2.1	Unrestricted	CWVMS-2.1-UPGUR-K9
CSPM 2.X	Restricted*	VMS 2.1	Restricted*	CWVMS-2.1-WUPGR-K9
CSPM 2.X	Unrestricted	VMS 2.1	Unrestricted	CWVMS-2.1-UPGUR-K9
VMS 2.X	Restricted	VMS 2.1	Unrestricted	CWVMS-2.1-URC-K9
VMS 1.0 or CSPM 2.X	Restricted	VMS 2.1	Unrestricted	CWVMS-2.1-WUPGR-K9 then add CWVMS-2.1-URC-K9

*Also covers upgrades from SEC-POL-MGR-2.3-R.

Existing Products Affected

With the availability of the CiscoWorks VMS, version 2.1, Cisco is announcing the End of Sales (EoS) for the following products. Older versions will continue to have extended support offered for them as indicated below.

Table 4 Product End of Sales Dates

Part Number	Description	End-of-Sales	End-of-Support
CWVMS-2.0-UR-K9	VPN/Security Management Solution 2.0 (Win) (Unrestricted License)	September 30, 2002	September 2005*
CWVMS-2.0-WINR-K9	VMS 2.0 (Win) (10-device Restricted License)	September 30, 2002	September 2005*
CWVMS-2.0-URC-K9	Conversion from VMS 2.0 (10-device Restricted) to Unrestricted	September 30, 2002	September 2005*
CWVMS-2.0-UPGUR-K9	Upgrade from CSPM 2.X (Unrestricted) moving to VMS 2.0 (Unrestricted)	September 30, 2002	September 2005*
CWVMS-2.0-WUPGR-K9	Upgrade from VMS 1.X or CSPM 2.x (Restricted) to VMS 2.0 (10 device)	September 30, 2002	September 2005*

* Note: Support may require customers to move to a higher product version for resolution.

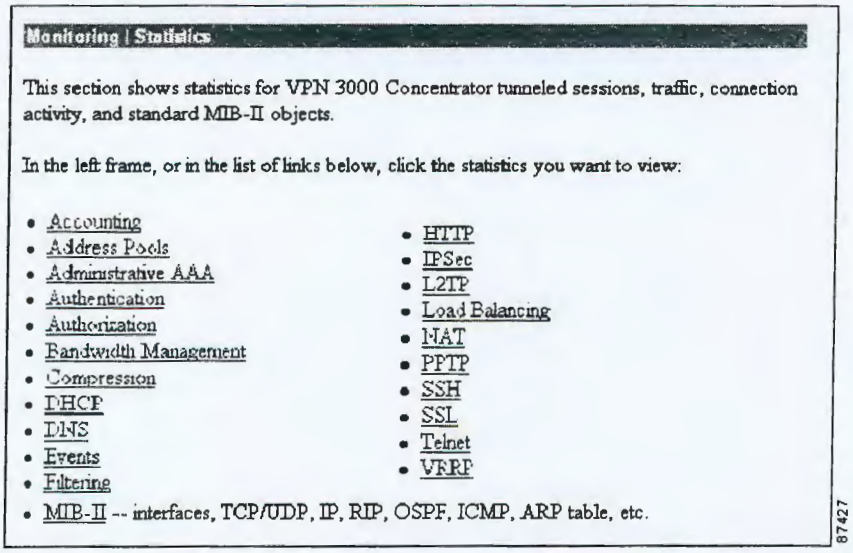
CHAPTER 17

Statistics

Monitoring | Statistics

This section of the Manager shows statistics for traffic and activity on the VPN Concentrator since it was last booted or reset, and for current tunneled sessions, plus statistics in standard MIB-II objects for interfaces, TCP/UDP, IP, ICMP, and the ARP table.

Figure 17-1 Monitoring / Statistics Screen



Statistics include:

- Accounting: total requests, responses, timeouts, etc.
- Address Pools: configured pools, allocated and available addresses.
- Administrative AAA: requests, accepts, rejects, challenges, timeouts, etc.
- Authentication: total requests, accepts, rejects, challenges, timeouts, etc.
- Authorization: total requests, accepts, rejects, challenges, timeouts, etc.
- Bandwidth Management: volume and rate of traffic managed by bandwidth policies.
- Compression: pre and post-compression byte totals for IPComp and MPPC.
- DHCP: leased addresses, duration, server addresses, etc.
- DNS: total requests, responses, timeouts, etc.
- Events: total events sorted by class, number, and count.
- Filtering: total inbound and outbound filtered traffic by interface.
- HTTP: total data traffic and connection statistics.
- IPSec: total Phase 1 and Phase 2 tunnels, received and transmitted packets, failures, drops, etc.
- L2TP: total tunnels, sessions, received and transmitted control and data packets; and detailed current session data.
- Load Balancing: device role; device load; and cluster peers' sessions, IP addresses, priority, etc.
- NAT: Network Address Translation session data.
- PPTP: total tunnels, sessions, received and transmitted control and data packets; and detailed current session data.
- SSH: total and active sessions, bytes and packets sent and received, etc.
- SSL: total sessions, encrypted vs. unencrypted traffic, etc.
- Telnet: total sessions, and current session inbound and outbound traffic.
- VRRP: total advertisements, Master router roles, errors, etc.
- MIB-II Stats: interfaces, TCP/UDP, IP, RIP, OSPF, ICMP, ARP table, Ethernet, and SNMP.

User Management

This chapter provides information about setting up and managing user accounts in Cisco Secure Access Control Server (Cisco Secure ACS) Appliance version 3.2.

Note Settings at the user level override settings configured at the group level.

Before you configure User Setup, you should understand how this section functions. Cisco Secure ACS dynamically builds the User Setup section interface depending on the configuration of your AAA client and the security protocols being used. That is, what you see under User Setup is affected by settings in both the Network Configuration and Interface Configuration sections.

This chapter contains the following sections:

- **User Setup Features and Functions, page 7-2**—An overview of the User Setup section functionality.
- **User Setup Features and Functions, page 7-2**—Information about user databases.
- **Basic User Setup Options, page 7-2**—Information and step-by-step procedures regarding the many basic settings and options that are available when configuring a user account in the Cisco Secure ACS.
- **Advanced User Authentication Settings, page 7-22**—Details on the steps necessary to configure a user account for authentication outside the system using the TACACS+ or RADIUS protocol options.
- **User Management, page 7-55**—Information about viewing, disabling, and resetting user accounts.

User Setup Features and Functions

The User Setup section of the Cisco Secure ACS HTML interface is the centralized location for all operations regarding user account configuration and administration.

From within the User Setup section, you can perform the following tasks:

- View a list of all users in the CiscoSecure user database.
- Find a user.
- Add a user.
- Assign the user to a group, including Voice-over-IP (VoIP) Groups.
- Edit user account information.
- Establish or change user authentication type.
- Configure callback information for the user.
- Set network access restrictions (NARs) for the user.
- Configure Advanced Settings.
- Set the maximum number of concurrent sessions (Max Sessions) for the user.
- Disable or re-enable the user account.
- Delete the user.

Basic User Setup Options

This section presents the basic activities you perform when configuring a new user. At its most basic level, configuring a new user requires only three steps, as follows:

- Specify a name.
- Specify either a method for remote password authentication or, for authentication via the CiscoSecure user database, a password.
- Submit the information.

For detailed procedural information, see Adding a Basic User Account, page 7-4.

What other procedures you perform when setting up new user accounts is a function both of the complexity of your network and of the granularity of control you desire. The other basic procedures detailed in this section include the following:

- Setting Supplementary User Information, page 7-5
- Setting a Separate CHAP/MS-CHAP/ARAP Password, page 7-6
- Assigning a User to a Group, page 7-7
- Setting User Callback Option, page 7-8
- Assigning a User to a Client IP Address, page 7-10
- Setting Network Access Restrictions for a User, page 7-11
- Setting Max Sessions Options for a User, page 7-16
- Setting User Usage Quotas Options, page 7-18
- Setting Options for User Account Disablement, page 7-20
- Assigning a Downloadable IP ACL to a User, page 7-21

Beyond these basic user setup options, there are also procedures for configuring a user account for authentication via TACACS+ and RADIUS; these procedures are located in Advanced User Authentication Settings, page 7-22.

Note The steps for editing user account settings are essentially identical to those used when adding a user account but, to edit, you navigate directly to the field or fields to be changed. You cannot edit the name associated with a user account; to change a username you must delete the user account and establish another.

Bear in mind two things when setting up new user accounts:

- You must have configured a AAA client or external database to assign a user to.
- You must enable most options from within the Interface Configuration section so they appear in User Setup.

CHAPTER 16

Sessions

Monitoring | Sessions

The following screen shows comprehensive data for all active user and administrator sessions on the VPN Concentrator.

Figure 16-1 Monitoring | Sessions Screen

Monitoring | Sessions — Friday, 24 May 2002 16:48:41

Reset | Refresh

This screen shows statistics for sessions. To refresh the statistics, click **Refresh**. Select a **Group** to filter the sessions. For more information on a session, click on that session's name.

Group: -All-

Session Summary

Active LAN-to-LAN Sessions	Active Remote Access Sessions	Active Management Sessions	Total Active Sessions	Peak Concurrent Sessions	Concurrent Sessions Limit	Total Cumulative Sessions
0	0	1	1	1	100	19

LAN-to-LAN Sessions [Remote Access Sessions | Management Sessions]

Connection Name	IP Address	Protocol	Encryption	Login Time	Duration	Bytes Tx	Bytes Rx
No LAN-to-LAN Sessions							

Remote Access Sessions [LAN-to-LAN Sessions | Management Sessions]

Username	Assigned IP Address / Public IP Address	Group	Protocol / Encryption	Login Time / Duration	Client Type / Version	Bytes Tx / Bytes Rx
No Remote Access Sessions						

Management Sessions [LAN-to-LAN Sessions | Remote Access Sessions]

Administrator	IP Address	Protocol	Encryption	Login Time	Duration
admin	10.10.98.11	HTTP	None	May 24 16:48:32	0:00:08

78543

Reset

To reset, or start anew, the screen contents, click **Reset**. The system temporarily resets a counter for the chosen statistics without affecting the operation of the device. You can then view statistical information without affecting the actual current values of the counters or other management sessions. The function is like that of a vehicle's trip odometer, versus the regular odometer.

Restore

To restore the screen contents to their actual statistical values, click **Restore**. This icon displays only if you previously clicked the Reset icon.

Refresh

To update the screen and its data, click **Refresh**. The date and time indicate when the screen was last updated.

Group

Choose a group from the menu to monitor sessions for that group only. The default value is --All--, which displays sessions for all groups.

Session Summary Table

This table shows summary totals for LAN-to-LAN, remote access, and management sessions.

A session is a VPN tunnel established with a specific peer. In most cases, one user connection = one tunnel = one session. However, one IPSec LAN-to-LAN tunnel counts as one session, but it allows many host-to-host connections through the tunnel.

Active LAN-to-LAN Sessions

The number of IPSec LAN-to-LAN sessions that are currently active.

Active Remote Access Sessions

The number of PPTP, L2TP, IPSec remote-access user, L2TP over IPSec, and IPSec through NAT sessions that are currently active.

Active Management Sessions

The number of administrator management sessions that are currently active.

Total Active Sessions

The total number of sessions of all types that are currently active.

Peak Concurrent Sessions

The highest number of sessions of all types that were concurrently active since the VPN Concentrator was last booted or reset.

Concurrent Sessions Limit

The maximum number of concurrently active sessions permitted on this VPN Concentrator. This number is model-dependent, for example, model 3060 = 5000 sessions.

Total Cumulative Sessions

The total cumulative number of sessions of all types since the VPN Concentrator was last booted or reset.

LAN-to-LAN Sessions Table

This table shows parameters and statistics for all active IPSec LAN-to-LAN sessions, initially sorted alphanumerically by connection name. Each session here identifies only the outer LAN-to-LAN connection or tunnel, not individual host-to-host sessions within the tunnel.

[Remote Access Sessions | Management Sessions]

Click these active links to go to the other session tables on this Manager screen.

Connection Name

The name of the IPSec LAN-to-LAN connection.

To display detailed parameters and statistics for this connection, click this name. See the Monitoring | Sessions | Detail screen.

IP Address

The IP address of the remote peer VPN Concentrator or other secure gateway that initiated this LAN-to-LAN connection.

Protocol, Encryption, Login Time, Duration, Bytes Tx, Bytes Rx

See Table 16-1 for definitions of these parameters.

Remote Access Sessions Table

This table shows parameters and statistics for all active remote-access sessions. Each session is a single-user connection from a remote client to the VPN Concentrator. Remote-access sessions include PPTP, L2TP, IPSec remote-access user, L2TP over IPSec, and IPSec through NAT sessions.

Click a column header in this table to sort the table entries in ascending alphanumeric order, using that column as the sort key field.

[LAN-to-LAN Sessions | Management Sessions]

Click these active links to go to the other session tables on this Manager screen.

Username

The username or login name for the session. The field shows `Authenticating...` if the remote-access client is still negotiating authentication. If the client is using a digital certificate for authentication, the field shows the Subject CN or Subject OU from the certificate.

To display detailed parameters and statistics for this session, click this name. See the Monitoring | Sessions | Detail screen.

Public IP Address

The public IP address of the client for this remote-access session. This is also known as the "outer" IP address. It is typically assigned to the client by the ISP, and it lets the client function as a host on the public network.

Assigned IP Address

The private IP address assigned to the remote client for this session. This is also known as the "inner" or "virtual" IP address, and it lets the client appear to be a host on the private network.

Group

The group name of the client for this remote-access session. Clicking the column head for Group sorts the table entries in ascending alphanumeric order and also sorts the usernames within each group in ascending alphanumeric order.

Client Type and Operating System

The client type of connected clients, and, when available, the associated operating system, sorted by username. For example:

Client Type	Operating System
VPN 3000 Hardware Client	VPN3002
Windows NT client	Windows NT 4.0, Windows 2000, and Windows XP
Windows 98 client	Windows 98
Windows 95client	Windows 95

Version

The software version number (for example, rel. 3.6,_int 50) for connected clients, sorted by username.

Protocol, Encryption, Login Time, Duration, Bytes Tx, Bytes Rx

See Table 16-1 for definitions of these parameters.

Management Sessions Table

This table shows parameters and statistics for all active administrator management sessions on the VPN Concentrator.

[LAN-to-LAN Sessions | Remote Access Sessions]

Click these active links to go to the other session tables on this Manager screen.

Administrator

The administrator username or login name for the session.

Address

The IP address of the manager workstation that is accessing the system. Local indicates a direct connection through the Console port on the system.

Protocol, Encryption, Login Time, Duration, Bytes Tx, Bytes Rx

See Table 16-1 for definitions of these parameters.

Table 16-1 Parameter definitions for Monitoring | Sessions Screen

Parameter	Definition
Protocol	The protocol this session is using. `Console` indicates a direct connection through the Console port on the system. See Monitoring | Sessions | Protocols for a graphical representation of sessions by protocol.
Encryption	The data encryption algorithm this session is using, if any. See Monitoring | Sessions | Encryption for a graphical representation of sessions by encryption algorithm used.
Login Time	The date and time (`MMM DD HH:MM:SS`) that the session logged in. Time is displayed in 24-hour notation.
Duration	The elapsed time (`HH:MM:SS`) between the session login time and the last screen refresh.
Bytes Tx	The total number of bytes transmitted to the remote peer or client by the VPN Concentrator.
Bytes Rx	The total number of bytes received from the remote peer or client by the VPN Concentrator.

Monitoring | Sessions | Detail

These Manager screens show detailed parameters and statistics for a specific remote-access or LAN-to-LAN session. The parameters and statistics differ depending on the session protocol. There are unique screens for:

- IPSec LAN-to-LAN (IPSec/LAN-to-LAN)
- IPSec remote access (IPSec User)
- IPSec through UDP (IPSec/UDP)
- IPSec through TCP (IPSec/TCP)
- L2TP
- L2TP over IPSec (L2TP/IPSec)
- PPTP

The Manager displays the appropriate screen when you click a highlighted connection name or username on the Monitoring | Sessions screen. Figure Figure 16-2 shows an example of one kind of detail screen. Depending on the type of connection you select, your detail screen might look somewhat different from the example shown. But, each session detail screen shows three tables: summary data, bandwidth management information, and detail data. The summary data echoes the session data from the Monitoring | Sessions screen. The Bandwidth Statistics table shows information about the effect of policing on that session. The session detail table shows all the relevant parameters for each session and subsession.

See Table 16-2 for definitions of the possible session detail parameters, in alphabetical order.

Monitoring | Sessions | Detail Parameters

Table 16-2 Parameter Definitions for Monitoring / Sessions / Detail Screens

Parameter	Definition
Assigned IP Address	The private IP address assigned to the remote client for this session. This is also known as the "inner" or "virtual" IP address, and it lets the client appear to be a host on the private network.
Authentication Mode	The protocol or mode used to authenticate this session.
Bytes Rx Bytes Received	The total number of bytes received from the remote peer or client by the VPN Concentrator.
Bytes Tx Bytes Transmitted	The total number of bytes transmitted to the remote peer or client by the VPN Concentrator.
Compression	The data compression algorithm this session is using. LZS is the data compression algorithm used by IPComp. MPPC uses LZ.
Connection Name	The name of the IPSec LAN-to-LAN connection.
Diffie-Hellman Group	The algorithm and key size used to generate IPSec SA encryption keys.
Duration	The elapsed time (HH:MM:SS) between the session login time and the last screen refresh.
Dynamic Filter	RADIUS user filter applied to this session.
Dynamic Rules	The rules that make up the dynamic filter. For the syntax of these rules, see Dynamic Filters, page 13-3.
Encapsulation Mode	The mode for applying IPSec ESP (Encapsulation Security Payload protocol) encryption and authentication, in other words, what part of the original IP packet has ESP applied.
Encryption Encryption Algorithm	The data encryption algorithm this session is using, if any.
Hashing Algorithm	The algorithm used to create a hash of the packet, which is used for IPSec data authentication.
Idle Time	The elapsed time (HH:MM:SS) between the last communication activity on this session and the last screen refresh.
IKE Negotiation Mode	The IKE (IPSec Phase 1) mode for exchanging key information and setting up SAs: Aggressive or Main.
IKE Sessions	The total number of IKE (IPSec Phase 1) sessions; usually 1. These sessions establish the tunnel for IPSec traffic.
IP Address	The IP address of the remote peer VPN Concentrator or other secure gateway that initiated the IPSec LAN-to-LAN connection.
IPSec Sessions	The total number of IPSec (Phase 2) sessions, which are data traffic sessions through the tunnel. Each IPSec remote-access session may have two IPSec sessions: one showing the tunnel endpoints, and one showing the private networks reachable through the tunnel.
L2TP Sessions	The total number of user sessions through this L2TP or L2TP / IPSec tunnel; usually 1.

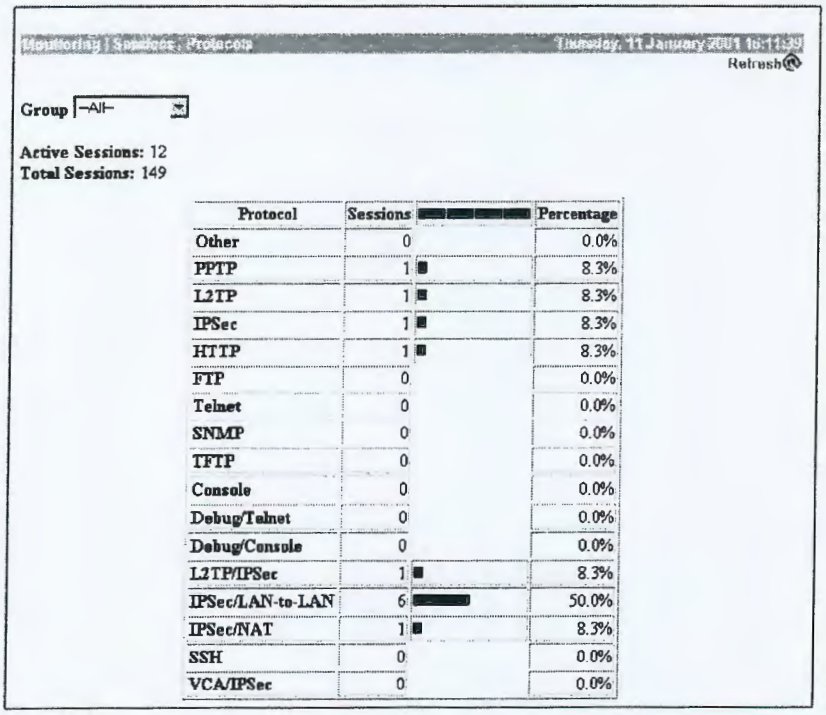
Table 16-2 Parameter Definitions for Monitoring / Sessions / Detail Screens (continued)

Parameter	Definition
Local Address	The IP address (and wildcard mask) of the destination host (or network) for this session.
Login Time	The date and time (MMM DD HH:MM:SS) that the session logged in. Time is displayed in 24-hour notation.
Perfect Forward Secrecy Group	The Diffie-Hellman algorithm and key size used to generate IPSec SA encryption keys using Perfect Forward Secrecy.
PFS Group	The Perfect Forward Secrecy group: 1, 2, 3, 4, or 7.
PPTP Sessions:	The total number of user sessions through this PPTP tunnel; usually 1.
Protocol	The tunneling protocol that this session is using.
Public IP Address	The public IP address of the client for this remote-access session. This is also known as the "outer" IP address. It is typically assigned to the client by the ISP, and it lets the client function as a host on the public network.
Rekey Data Interval	The lifetime in kilobytes of the IPSec (IKE) SA encryption keys.
Rekey Time Interval	The lifetime in seconds of the IPSec (IKE) SA encryption keys.
Remote Address	The IP address (and wildcard mask) of the remote peer (or network) that initiated this session.
SEP	The Scalable Encryption Module that is handling cryptographic processing for this session.
Session ID	An identifier for session components (subsessions) on this screen. With IPSec, there is one identifier for each SA.
UDP Port	The UDP port number used in an IPSec through NAT connection.
Username	The username or login name for the session. If the client is using a digital certificate for authentication, the field shows the Subject CN or Subject OU from the certificate.

Monitoring | Sessions | Protocols

This screen graphically displays the protocols used by currently active user and administrator sessions on the VPN Concentrator.

Figure 16-3 Monitoring | Sessions | Protocols Screen



Refresh

To update the screen and its data, click **Refresh**. The date and time indicate when the screen was last updated.

Group

Choose a group from the menu to show protocols used by currently active users in that group only. The default value is --All--, which displays protocols for users in all groups.

Active Sessions

The number of currently active sessions.

Total Sessions

The total number of sessions since the VPN Concentrator was last booted or reset.

Protocol

The protocol that the session is using:

- Other = Protocol other than those listed here.
- PPTP = Point-to-Point Tunneling Protocol.
- L2TP = Layer 2 Tunneling Protocol.
- IPSec = Internet Protocol Security tunneling protocol (remote-access users).
- HTTP = Hypertext Transfer Protocol (web browser).
- FTP = File Transfer Protocol.
- Telnet = Terminal emulation protocol.
- SNMP = Simple Network Management Protocol.
- TFTP = Trivial File Transfer Protocol.
- Console = Directly connected console; no protocol.
- Debug/Telnet = Debugging via Telnet (for Cisco use only).
- Debug/Console = Debugging via console (for Cisco use only).
- L2TP/IPSec = L2TP over IPSec.
- IPSec/LAN-to-LAN = IPSec LAN-to-LAN connection.
- IPSec/UDP = IPSec through NAT (Network Address Translation) via UDP.
- SSH = Secure SHell protocol.
- VCA/IPSec = Virtual Cluster Agent via IPSec. (For Cisco use only.)
- IPSec/TCP = IPSec through NAT (Network Address Translation) via TCP.
- IPSec/NAT-T = IPSec over NAT Traversal.
- IPSec/LAN-to-LAN/NAT-T = IPSec LAN-to-LAN connection over NAT Traversal.
- L2TP/IPSec/NAT-T = L2TP/IPSec connection over NAT Traversal.

Sessions

The number of active sessions using this protocol. The sum of this column equals the total number of Active Sessions shown above.

Bar Graph

The percentage of sessions using this protocol relative to the total active sessions, as a horizontal bar graph. Each segment of the bar in the column heading represents 25 percent.

Percentage

The percentage of sessions using this protocol relative to the total active sessions, as a number. The sum of this column equals 100 percent (rounded).

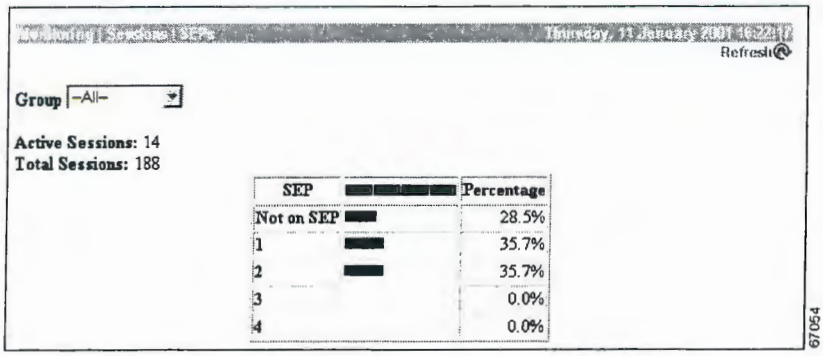
Gr

Monitoring | Sessions | SEPs

Note This screen appears on models 3015–3080 only.

This screen graphically displays the SEP (Scalable Encryption Processing) or SEP-E (Enhanced SEP) modules used by currently active user and administrator sessions on the VPN Concentrator. SEP modules perform data encryption functions in hardware.

Figure 16-4 Monitoring / Sessions / SEPs Screen



Refresh

To update the screen and its data, click **Refresh**. The date and time indicate when the screen was last updated.

Group

Choose a group from the menu to display SEP modules for that group only. The default value is --All--, which displays SEP modules for all groups.

Active Sessions

The number of currently active sessions.

Total Sessions

The total number of sessions since the VPN Concentrator was last booted or reset.

SEP

The SEP module that the sessions are using.

- Not on SEP = using software encryption, or not using encryption.
- 1, 2, 3, 4 = SEP module 1, 2, 3, and 4, respectively.

Sessions

The number of active sessions using this SEP module. The sum of this column equals the total number of Active Sessions shown above.

Bar Graph

The percentage of sessions using this SEP module relative to the total active sessions, as a horizontal bar graph. Each segment of the bar in the column heading represents 25 percent.

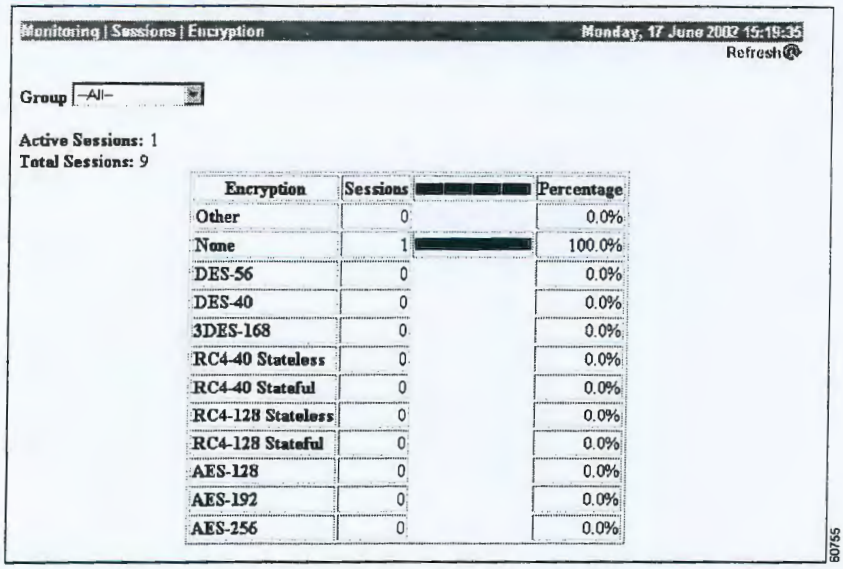
Percentage

The percentage of sessions using this SEP module relative to the total active sessions, as a number. The sum of this column equals 100 percent (rounded).

Monitoring | Sessions | Encryption

This screen graphically displays the data encryption algorithms used by currently active user and administrator sessions on the VPN Concentrator.

Figure 16-5 Monitoring | Sessions | Encryption Screen



Refresh

To update the screen and its data, click **Refresh**. The date and time indicate when the screen was last updated.

Group

Choose a group from the menu to monitor data encryption algorithms used by currently active users in that group only. The default value is --All--, which displays data encryption algorithms for all groups.

Active Sessions

The number of currently active sessions.

Total Sessions

The total number of sessions since the VPN Concentrator was last booted or reset.

Encryption

The data encryption algorithm that the sessions are using:

- Other = other than listed below.
- None = no data encryption.
- DES-56 = Data Encryption Standard algorithm with a 56-bit key.
- DES-40 = DES encryption with a 56-bit key, 40 bits of which are private.
- 3DES-168 = Triple-DES encryption with a 168-bit key.
- RC4-40 Stateless = RSA RC4 encryption with a 40-bit key, and with keys changed on every packet.
- RC4-40 Stateful = RSA RC4 encryption with a 40-bit key, and with keys changed after some number of packets or whenever a packet is lost.
- RC4-128 Stateless = RSA RC4 encryption with a 128-bit key, and with keys changed on every packet.
- RC4-128 Stateful = RSA RC4 encryption with a 128-bit key, and with keys changed after some number of packets or whenever a packet is lost.
- AES-128 = Advanced Encryption Standard (AES) encryption with a 128-bit key.
- AES-192 = AES encryption with a 192-bit key.
- AES-256 = AES encryption with a 256-bit key.

Sessions

The number of active sessions using this encryption algorithm. The sum of this column equals the total number of Active Sessions shown above.

Bar Graph

The percentage of sessions using this encryption algorithm relative to the total active sessions, as a horizontal bar graph. Each segment of the bar in the column heading represents 25 percent.

Percentage

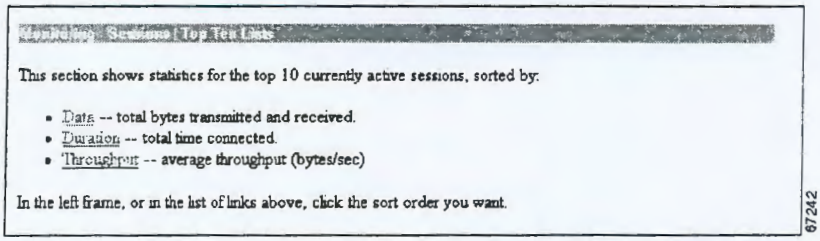
The percentage of sessions using this encryption algorithm relative to the total active sessions, as a number. The sum of this column equals 100 percent (rounded).

Monitoring | Sessions | Top Ten Lists

This section of the Manager shows statistics for the top 10 currently active VPN Concentrator sessions, sorted by:

- Data: total bytes transmitted and received.
- Duration: total time connected.
- Throughput: average throughput (bytes/sec).

Figure 16-6 Monitoring / Sessions / Top Ten Lists Screen



Monitoring | Sessions | Top Ten Lists | Data

Refresh

To update the screen and its data, click **Refresh**. The date and time indicate when the screen was last updated.

Group

Choose a group from the menu to show session statistics for that group only. The default value is --All--, which displays session statistics for all groups.

Username

The login username for the session.

Group

The user's group.

IP Address

The IP address of the session user. This is the address assigned to or supplied by a remote user, or the host address of a networked user. Local identifies the console directly connected to the VPN Concentrator.

Protocol

The protocol that the session is using:

- Console = Directly connected console; no protocol.
- Debug/Console = Debugging via console (for Cisco use only).
- Debug/Telnet = Debugging via Telnet (for Cisco use only).
- FTP = File Transfer Protocol.
- HTTP = Hypertext Transfer Protocol (web browser).
- IPSec = Internet Protocol Security tunneling protocol (remote-access user).
- IPSec/LAN-to-LAN = IPSec LAN-to-LAN connection.
- IPSec/NAT = IPSec through NAT (Network Address Translation).
- L2TP = Layer 2 Tunneling Protocol.
- L2TP/IPSec = L2TP over IPSec.
- Other = Protocol other than those listed here.
- PPTP = Point-to-Point Tunneling Protocol.
- SNMP = Simple Network Management Protocol.
- Telnet = Terminal emulation protocol.
- TFTP = Trivial File Transfer Protocol.

Encryption

The data encryption algorithm that the session is using:

- None = No data encryption.
- DES-40 = Data Encryption Standard algorithm with a 56-bit key, 40 bits of which are private.
- DES-56 = DES encryption with a 56-bit key.
- 3DES-168 = Triple-DES encryption with a 168-bit key.
- RC4-40 Stateless = RSA RC4 encryption with a 40-bit key, and with keys changed on every packet.
- RC4-40 Stateful = RSA RC4 encryption with a 40-bit key, and with keys changed after some number of packets or whenever a packet is lost.
- RC4-128 Stateless = RSA RC4 encryption with a 128-bit key, and with keys changed on every packet.
- RC4-128 Stateful = RSA RC4 encryption with a 128-bit key, and with keys changed after some number of packets or whenever a packet is lost.
- AES-128 = Advanced Encryption Standard (AES) encryption with a 128-bit key.
- AES-192 = AES encryption with a 192-bit key.
- AES-256 = AES encryption with a 256-bit key.

Login Time

The date and time that this session logged in: MM/DD/YYYY HH:MM:SS. Time is in 24-hour notation.

Total Bytes

The total number of bytes transmitted and received by this session. N/A = the session is not passing data, in other words, it is an administrator session.

Monitoring | Sessions | Top Ten Lists | Duration

This screen shows statistics for the top 10 currently active VPN Concentrator sessions, sorted by duration: total time connected.

Figure 16-8 Monitoring / Sessions / Top Ten Lists / Duration Screen

To update the screen and its data, click **Refresh**. The date and time indicate when the screen was last updated.

Group

Choose a group from the menu to show session statistics for that group only. The default value is --All--, which displays session statistics for all groups.

Username

The login username for the session.

Group

The user's group.

IP Address

The IP address of the session user. This is the address assigned to or supplied by a remote user, or the host address of a networked user. Local identifies the console directly connected to the VPN Concentrator.

Protocol

The protocol that the session is using:

- Console = Directly connected console; no protocol.
- Debug/Console = Debugging via console (for Cisco use only).
- Debug/Telnet = Debugging via Telnet (for Cisco use only).
- FTP = File Transfer Protocol.
- HTTP = Hypertext Transfer Protocol (web browser).
- IPSec = Internet Protocol Security tunneling protocol (remote-access user).
- IPSec/LAN-to-LAN = IPSec LAN-to-LAN connection.
- IPSec/NAT = IPSec through NAT (Network Address Translation).
- L2TP = Layer 2 Tunneling Protocol.
- L2TP/IPSec = L2TP over IPSec.
- Other = Protocol other than those listed here.
- PPTP = Point-to-Point Tunneling Protocol.
- SNMP = Simple Network Management Protocol.
- Telnet = Terminal emulation protocol.
- TFTP = Trivial File Transfer Protocol.

Encryption

The data encryption algorithm that the session is using.

- None = no data encryption.
- DES-40 = Data Encryption Standard algorithm with a 56-bit key, 40 bits of which are private.
- DES-56 = DES encryption with a 56-bit key.
- 3DES-168 = Triple-DES encryption with a 168-bit key.
- RC4-40 Stateless = RSA RC4 encryption with a 40-bit key, and with keys changed on every packet.
- RC4-40 Stateful = RSA RC4 encryption with a 40-bit key, and with keys changed after some number of packets or whenever a packet is lost.
- RC4-128 Stateless = RSA RC4 encryption with a 128-bit key, and with keys changed on every packet.
- RC4-128 Stateful = RSA RC4 encryption with a 128-bit key, and with keys changed after some number of packets or whenever a packet is lost.
- AES-128 = Advanced Encryption Standard (AES) encryption with a 128-bit key.
- AES-192 = AES encryption with a 192-bit key.
- AES-256 = AES encryption with a 256-bit key.

Login Time

The date and time that this session logged in: MM/DD/YYYY HH:MM:SS. Time is in 24-hour notation.

Duration

The total amount of time that this session has been connected: HH:MM:SS.

Monitoring | Sessions | Top Ten Lists | Throughput

This screen shows statistics for the top 10 currently active VPN Concentrator sessions, sorted by average throughput (bytes/sec).

- TFTP = Trivial File Transfer Protocol.

Encryption

The data encryption algorithm that the session is using.

- None = No data encryption.
- DES-40 = Data Encryption Standard algorithm with a 56-bit key, 40 bits of which are private.
- DES-56 = DES encryption with a 56-bit key.
- 3DES-168 = Triple-DES encryption with a 168-bit key.
- RC4-40 Stateless = RSA RC4 encryption with a 40-bit key, and with keys changed on every packet.
- RC4-40 Stateful = RSA RC4 encryption with a 40-bit key, and with keys changed after some number of packets or whenever a packet is lost.
- RC4-128 Stateless = RSA RC4 encryption with a 128-bit key, and with keys changed on every packet.
- RC4-128 Stateful = RSA RC4 encryption with a 128-bit key, and with keys changed after some number of packets or whenever a packet is lost.
- AES-128 = Advanced Encryption Standard (AES) encryption with a 128-bit key.
- AES-192 = AES encryption with a 192-bit key.
- AES-256 = AES encryption with a 256-bit key.

Login Time

The date and time that this session logged in: MM/DD/YYYY HH:MM:SS. Time is in 24-hour notation.

Avg. Throughput (bytes/sec)

The average throughput of the session, which is [total bytes transmitted and received] divided by total connect time. N/A = the session is not passing data, in other words, it is an administrator session.

Product Overview

VPN Monitor provides a web-based interface for monitoring and troubleshooting enterprise Virtual Private Networks (VPNs).

This chapter contains:

- System Requirements
- Supported Devices

System Requirements

This section contains:

- Server Requirements
  - Windows
  - Solaris
- Client Requirements

Server Requirements

VPN Monitor is a component of the VPN/Security Management Solution (VMS) bundle. The VMS bundle is the integration of CiscoWorks2000 CD One, CD Two, VPN Monitor, and other individual products. For information about all of the products in the VMS bundle, see *CiscoWorks2000 VPN/Security Management Solution Quick Start Guide*. The server requirements are based on the entire VMS bundle.

The VMS bundle products can be installed on:

- Windows
- Solaris

Windows

Table 1-1 shows server requirements for Windows 2000 and Windows NT systems. The server requirements are based on the entire VMS bundle.

Table 1-1 Server Requirements for Windows 2000 and Windows NT

Hardware	• IBM PC-compatible computer with 550 MHz or faster Pentium processor • Color monitor with video card capable of 256 colors or more • CD-ROM drive • 10BaseT or faster (10 Mbps or faster network connection)
Memory (RAM)	• 1 GB minimum
Available disk drive space	• 9 GB minimum • 2 GB virtual memory • NTFS file system recommended

Table 1-1 Server Requirements for Windows 2000 and Windows NT (cont'd)

Software for Windows 2000	• ODBC Driver Manager 3.510 or later • One of the following: – Windows 2000 Professional – Windows 2000 Server – Windows 2000 Advanced Server • Service Pack 2
Software for Windows NT	• One of the following: – Windows NT Workstation 4.0 – Windows NT Server 4.0 • Service Pack 6a

Note The download and installation programs for these required Windows software packages are sensitive to your system configuration and are subject to change by Microsoft at any time. Therefore, it is not possible to provide step-by-step procedures. Installation information is provided in the Windows installation documentation for the prerequisite products.

Solaris

Table 1-2 shows server requirements for Solaris systems. Server requirements are based on the entire VMS bundle.

Table 1-2 Server Requirements for Solaris

Hardware	• Sun Ultra 60 or later with 440 MHz or faster processor (dual processor required for hosting multiple management solutions) • Color monitor with video card capable of 256 colors or more • CD-ROM drive • 10BaseT or faster (10 Mbps or faster network connection)
Memory	• 1 GB minimum
Available disk drive space	• 9 GB on the partition on which you install the CDs (the default is /opt) • 2 GB swap space
Software	• Solaris 2.6 • Solaris 2.7 See Table 1-3 for a list of required and recommended Solaris patches.

Solaris Patches

Table 1-3 lists the required and recommended patches for Solaris 2.6 and 2.7.

Table 1-3 Solaris Patches

Operating System	Required	Recommended
Solaris 2.6	• 105181-19 Kernel Update Patch • 105210-27 Libaio, Libc, and Watchmalloc Patch • 105490-07 (or 107733-01) Linker Patch • 105568-16 /usr/lib/libthread.so.1.Patch • 105591-06 Shared Library Patch for C++ • 105633-36 Xsun Patch (Asian only) • 106040-13 X Input and Output Method Patch (Japanese only) • 106409-01 Traditional Chinese True Type Fonts Patch • 108091-03 ISO8859-01 Locales Patch	• 105284-31 Runtime Library Patch • 105669-10 LibdtSvc Patch
Solaris 2.7	• 106327-05 Shared Library Patch for C++ • 106980-10 Libthread Patch • 107636-03 X Input and Output Method Patch • 107081-11 Motif 1.2.7 and 2.1.1: Runtime Library Patch • 108376-03 (1) Open Windows 3.6.1 Xsun Patch	

Client Requirements

All product features can be accessed from a client according to the hardware and software requirements in Table 1-4 by using the web browsers noted in Table 1-5.

Table 1-4 Hardware and Software Requirements

Hardware/software	One of the following: • IBM PC-compatible computer with 300 MHz or faster Pentium processor running one of the following: – Windows 98 – Windows NT 4.0 Workstation or Server with Service Pack 6a – Windows 2000 Server or Professional edition with Service Pack 2 • Solaris SPARCstation or Sun Ultra 10 with 333 MHz processor running Solaris 2.6 or Solaris 2.7
Available disk drive space	One of the following: • 400 MB virtual memory (for Windows) • 512 MB swap space (for Solaris)
Available memory	256 MB minimum

Table 1-5 Browser Requirements

Browser	JVM[1]	Version	Platform
Internet Explorer (recommended)	5.0.3186 or later	5.5 with Service Pack 2	Windows 2000, Windows NT 4.0, Windows 98, Solaris 2.6, and Solaris 2.7
Navigator	—	4.75 or later	Windows 2000, Windows NT 4.0, Windows 98, Solaris 2.6, and Solaris 2.7

1. JVM=Java Virtual Machine

Supported Devices

VPN Monitor supports the following devices:

- Cisco VPN 3000 Concentrators running the 2.5.2f image or later
- Cisco 7100 and 7200 series routers running Cisco IOS release 12.1(5a)E or later
- Cisco 1700, 2600, and 3600 series routers running Cisco IOS release 12.2(4)T or later

Customizing the VPN Client Software

This chapter explains how to replace the Cisco Systems brand with your own organization's brand. When you install and launch the VPN Client software, you see your own organization name, program name, and application names on menus, windows, dialogs, and icons.

For the Windows platform, it also explains how to set up the software so that your users can install it automatically without being prompted. This feature is called *silent install*.

To customize the VPN Client software, you create your own distribution image combining the following elements, which this chapter describes.

For all platforms, you can customize the following:

- Cisco Systems image that you receive on the Cisco Systems software distribution CD.
- Your own portable network graphics (PNG) (Table 5-2) and icon files to replace the Cisco Systems brand.
- A vpnclient.ini file for configuring the VPN Client software globally (see Chapter 2, "Preconfiguring the VPN Client for Remote Users").
- Individual profile (.pcf) files for each connection entry (see Chapter 2, "Preconfiguring the VPN Client for Remote Users").

For the Windows platform, you can also customize the following:

- An oem.ini file that you create. Cisco supplies a sample oem.ini file that you can use as a template and customize.
- setup.bmp—a bitmap file that displays on the first InstallShield® window when you install the VPN Client. (InstallShield only)

These elements should all be in the same directory and folder. Because some of the files may be too large to distribute the oem software on diskettes, we recommend that you make a CD ROM distribution image.

Customizing the VPN Client GUI for Windows

This section describes how to customize the VPN Client GUI for the Windows platform. To customize the GUI for the Mac OS X platform, see Customizing the VPN Client GUI for Mac OS X, page 5-18.

Customizing the VPN Client occurs when the VPN Client and installation program see a text file called oem.ini on your distribution image. The oem.ini file is patterned after Microsoft standard initialization files. You create the oem.ini file and supply your own text, PNG files, and icon files. When present, the oem.ini, PNG, and icon files are read when you first start the VPN Client. Since the VPN Client software reads these files when it first starts, the changes to them take effect only *after* you restart the VPN Client application.

This chapter contains the following sections:

- Areas Affected by Customizing the VPN Client
- Creating the oem.ini File
- Installing the VPN Client Without User Interaction
- Customizing the VPN Client Using an MSI Transform

Areas Affected by Customizing the VPN Client

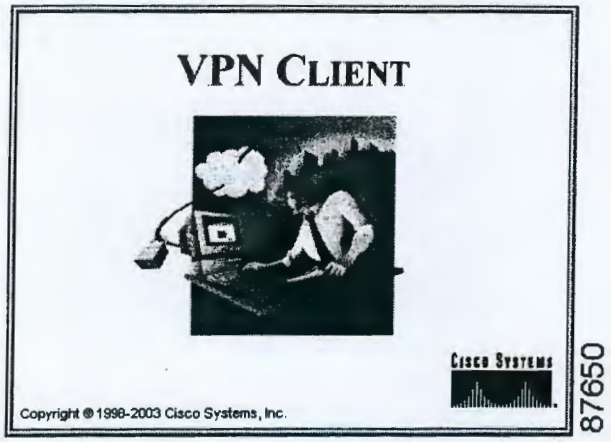
Customizing replaces the following screen text, bitmaps, and icons.

- Brand names on dialog boxes
- Product names on dialog boxes
- Organization logo on all dialog boxes
- Graphic at the left end of the title bar
- Icons on the system tray (at the bottom right of the screen) and the desktop (shortcut)

Installation Bitmap

The InstallShield uses a bitmap when installing the VPN Client software: the setup bitmap (setup.bmp). Figure 5-1 shows the setup bitmap that displays as the first screen during installation via InstallShield.

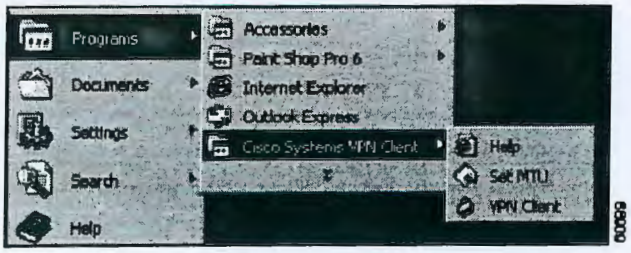
Figure 5-1 Setup Bitmap



Program Menu Titles and Text

After installation, your organization or company, product, and application names appear in the Cisco Systems VPN Client applications menu. (See Figure 5-2.)

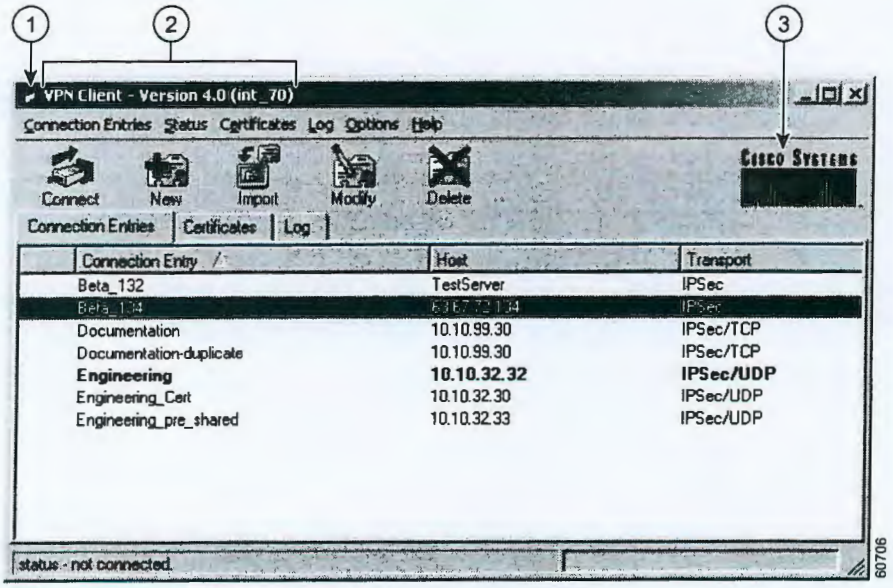
Figure 5-2 Applications menu



VPN Client

Figure 5-3 shows a lock image (title_bar.png), window title (AppNameText in the oem.ini file), and organization logo (logo.png file). The oem.ini file can replace the window title, the image at the left end of the title bar, and the organization or company logo in the VPN Client software. It can replace the open lock and closed lock icons in the system tray (see Figure 5-4 and Figure 5-5).

Figure 5-3 Three Types of Branding Changes



1	Title bar lock image (title_bar.png)	3	Organization logo (logo.png)
2	Window title (oem.ini file)		

Figure 5-4 Closed Lock Icon on System Tray (connected.ico)

Figure 5-5 Open Lock Icon on the System Tray (unconnected.ico)

Setup Bitmap—setup.bmp

The InstallShield version of VPN Client includes a bitmap on the distribution CD that is not in the oem.ini file: `setup.bmp`. You can substitute your own image for this .bmp file, as long as you keep the current filename (setup.bmp) and make sure that the file is in the same directory and folder as the oem.ini file. This file displays a logo on the window when you start the InstallShield installation program. The size of the Cisco Systems setup bitmap is 330x330 pixels and it uses 256 colors.

Creating the oem.ini File

Your distribution CD must contain the oem.ini file for customizing. The oem.ini file contains the locations and names of bitmaps, icons, window titles, and screen text needed for customizing, all of which need to be in the same directory. When you install or start the VPN Client, the software checks to see if there is an oem.ini file. If so, the software scans it for bitmaps, icons, and text. If the oem.ini file lacks an element (for example, text for the product name), then the software uses whatever you have specified in the default section of the file. If no oem.ini file exists, the software defaults to Cisco Systems bitmaps, icons, and text.

Use Notepad or another ASCII text editor to create the oem.ini file and enter brand text and the names of your bitmap and icon files. See Table 5-1.

Note You can edit the oem.ini file that Cisco Systems supplies.

The format of the oem.ini file is the same as a standard Windows `ini` file:

- Use a semicolon (;) to begin a comment.
- Set values by entering `keyword=value`.
- If you don't specify a value for a keyword, the application uses the default.
- Keywords are not case-sensitive, but using upper and lowercase makes them more readable.

Sample oem.ini File

```
; This is a sample oem.ini file that you can use to overwrite Cisco Systems
; brand name on windows, bitmaps, and icons with your organization's brand
; name.
;
; This file has five sections: [Main],[Brand], [Default], [Dialer], and [SetMTU]
; Each section has keywords designating parts of the interface that the file replaces.
;
; The [Main] section determines whether kerberos uses TCP or UDP (the default).

[Main]
DisableKerberosOverTCP = 1

; The [Brand] section controls window titles during installation and in the
; destination folder for the product and applications.
;
[Brand]
CompanyText = Wonderland University
ProductText = Wonderland Client

;
; The [Default] section establishes the default bitmap and icon to use if
```

```
; assignments are left blank. This section also sets up silent installation.
; Silent mode installation proceeds without user intervention.
;
[Default]
SilentMode = 1
InstallPath = C:\Program Files\Wonderland University\Wonderland Client
DefGroup = Wonderland Client
Reboot = 1
;
; The [Dialer] section controls the text and icons for the dialer software.
; AppNameText appears on the application selection menu. DialerBitMap
; appears on connection windows. AllowSBLLaunches controls whether a remote user can
; launch an application before connecting and logging on to a Windows NT platform.
;
[Dialer]
MainIcon=is_install.ico
AppNameText = Wonderland Dialer
AllowSBLLaunches = 0
;
; The [Set MTU] section controls the text and icon for the
; Set MTU applications. AppNameText appears on the application
; selection menu and the title screen. MainIcon appears on the window title.
; bar.
;
[Set MTU]
AppNameText = MTU Setter Application
MainIcon = MtuIcon.ico
AutoSetMtu = 1
SetMtuValue = 1300
MTUAdjustmentOverride = 144
```

oem.ini File Keywords and Values

Table 5-1 describes each part of the oem.ini file.

Table 5-1 oem.ini File Parameters

Keyword	Description	Value
[Main]	Optional field that identifies a section of the OEM.ini file to address special circumstances.	Keep exactly as shown.
DisableKerberosOverTCP=	InstallShield only When installing the VPN Client on Windows, the installation program sets a registry value that forces windows to use Kerberos over TCP instead of UDP, the default. Some NAT devices, such as Linksys, do not support out-of-order IP fragments, which breaks Kerberos. With TCP, fragmentation is not required.	After the keyword and equal sign, enter either 1 or 0. 0 = keep the default, which is to force Kerberos to use TCP. 1 = prevent Kerberos from using TCP.
[Brand]	Required field that identifies the branding text that appears on window titles and descriptions throughout the client application.	Keep exactly as shown, as the branding section of the file.
CompanyText=	Identifies the name of your organization. If not present, the default is "Cisco Systems."	After the keyword and equal sign, enter the organization's name. The name can contain spaces and is not case sensitive.

Table 5-1 oem.ini File Parameters (continued)

Keyword	Description	Value
`ProductText=`	Identifies the name of the application. If not present, the default is "VPN Client."	After the keyword and equal sign, enter the product name. The name can contain spaces and is not case sensitive.
`[Default]`	Required field that identifies the section that contains names of default bitmap and icon to use if values are blank.	Enter exactly as shown, as the default section of the file.
`SilentMode=`	InstallShield only Specifies whether to activate silent installation.	After the keyword and equal sign, enter either 0 or 1. 1 activates silent installation: 0 = prompt the user during installation. 1= do not prompt the user during installation.
`InstallPath=`	InstallShield only Identifies the directory into which to install the client software.	After the keyword and equal sign, enter the name of the directory in the suggested format: *`root:\programs\company\product`*
`DefGroup=`	InstallShield only Identifies the name of the folder to contain the client software.	After the keyword and equal sign, enter the name of the destination folder in the suggested format: *`foldername`*
`Reboot=`	InstallShield only Specifies whether to restart the system after the silent installation. If SilentMode is on (1) and Reboot is 1, the system automatically reboots after installation finishes.	After the keyword and equal sign, enter 0, 1, or 2: 0 = display the reboot dialog. 1 (and SilentMode = 1) = automatically reboot the system when installation finishes. 2 (and SilentMode = 1) = do not reboot after installation finishes.
`[Dialer]`	Required field that identifies the section that contains the name of the Dialer application, the bitmap to use on the connections window, and the connection icons.	Enter exactly as shown, as the Dialer section of the file.
`AppNameText=`	Identifies the name of the dialer application.	After the keyword and equal sign, enter the name of the dialer application. The name can contain spaces and is not case sensitive.
`MainIcon=`	This is used only by InstallShield for shortcuts to the vpngui.exe.	After the keyword and equal sign, enter the name of the icon file.
`AllowSBLLaunches`	InstallShield only Specifies whether a VPN Client user is allowed to launch a third party application before logging on to a Windows NT platform.	After the keyword and equal sign, enter 1 to enable or 0 to disable this feature. The default is 0 (to disable). (See Note after table.)
`[Set Mtu]`	Required field that identifies the section that contains the name of the Set MTU application, the name of the Set MTU icon, and other settings.	Enter exactly as shown; identifies the Set MTU section of the file.

Table 5-1 oem.ini File Parameters (continued)

Keyword	Description	Value
`AppNameText=`	Identifies the name of the Set MTU application.	After the keyword and equal sign, enter the name you want to give to this application. The name can contain spaces and is not case sensitive.
`MainIcon=`	Identifies the icon for the Set MTU title bar, About window, and applications menu. There are two sizes used: dimensions are 32x32 and 16x16 pixels; 256 colors.	After the keyword and equal sign, enter the name of the icon (.ico) file for this icon.
`AutoSetMtu=`	InstallShield only Identifies whether to automatically set the MTU for all adaptors during installation using SetMTUValue.	After the keyword and equal sign, enter a value 0 or 1: 0 = do not set MTU; do not launch. 1 = set MTU and silently launch during installation. This is the default
`SetMTUValue=`	InstallShield only Identifies the value to be used for all adapters bound to TCP/IP	After the keyword and equal sign, enter a value between 64 and 1500, inclusive. The default = 1300.
`MTUAdjustOverride=`	InstallShield only; Windows NT-based only. Identifies the DNE MtuAdjustment parameter. This value identifies the amount the NIC's MTU is reduced.	After the keyword and equal sign, set to a value between 0 and 1300, inclusive. To use the SetMTU application to set the MTU for the TCP/IP protocol, set this parameter to 0.

Note When AllowSBLLaunches is 0, "Allow launching of third party applications before logon" under Windows Logon Properties is unavailable. There might be cases when you need to launch an application before starting your connection, for example, to authenticate your access credentials. In this case you can use the following procedure:
In the VPN Dialer program, choose **Options > Windows Logon Properties**.
Uncheck **Disconnect VPN connection when logging off**.
Log out.
Log in with cached credentials.
Make your VPN Dialer connection.
Log out.
Log in again while already connected.

Table 5-2 lists the GUI image (portable network graphic) files that the VPN Client uses. If you want to replace any of them with your own image files, you must name your image files exactly as shown in the list; otherwise, the VPN Client GUI does not recognize them.

Table 5-2 Portable Network Graphic Files

PNG File	Description
splash_screen.png	Splash screen that appears for 2 to 5 seconds when the GUI starts. This screen contains a logo, product name and version, and copyright information.
title_bar.png	Image at the left end of the title bar
connected.png	Image next to connection entry when connection is active
logo.png	Organization logo for simple and advanced mode main dialogs
password_logo.png	Organization logo for password dialog (XAuth), group name and password)
profile_logo.png	Organization logo for new/modify profile dialog
status_down_arrow.png	Down arrow on the status bar of advanced mode, used to change the status bar display
cancel.png	Cancel button on advanced mode connection entries toolbar
connect_pressed.png	Connect button pressed on advanced mode connection entries toolbar
disconnect.png	Disconnect button on advanced mode connection entries toolbar
disconnect_pressed.png	Disconnect button pressed on advanced mode connection entries toolbar
new_profile.png	New button on advanced mode connection entries toolbar
new_profile_pressed.png	New button pressed on advanced mode connection entries toolbar
import_profile.png	Import button on advanced mode connection entries toolbar
import_profile_pressed.png	Import button pressed on advanced mode connection entries toolbar
modify_profile.png	Modify button on advanced mode connection entries toolbar
modify_profile_pressed.png	Modify button pressed on advanced mode connection entries toolbar
delete_profile.png	Delete button on advanced mode connection entries toolbar
delete_profile_pressed.png	Delete button pressed on advanced mode view certificates toolbar
import_certificate.png	Import button on advanced mode view certificates toolbar
import_certificate_pressed.png	Import button pressed on advanced mode view certificates toolbar
export_certificate.png	Export button on advanced mode view certificates toolbar
export_certificate_pressed.png	Export button pressed on advanced mode view certificates toolbar
delete_certificate.png	Delete button on advanced mode view certificates toolbar
delete_certificate_pressed.png	Delete button pressed on advanced mode view certificates toolbar
enroll_certificate.png	Enroll button on advanced mode view certificates toolbar
enroll_certificate_pressed.png	Enroll button pressed on advanced mode view certificates toolbar
verify_certificate.png	Verify button on advanced mode view certificates toolbar
verify_certificate_pressed.png	Verify button pressed on advanced mode view certificates toolbar
show_certificate.png	Show button on advanced mode view certificates toolbar

Table 5-2 Portable Network Graphic Files (continued)

PNG File	Description
show_certificate_pressed.png	Show button pressed on advanced mode view certificates toolbar
enable_log.png	Enable button on advanced mode connection entries toolbar
enable_log_pressed.png	Enable button pressed on advanced mode view log toolbar
disable_log.png	Disable button on advanced mode view log toolbar
disable_log_pressed.png	Disable button pressed on advanced mode view log toolbar
clear_log.png	Clear button on advanced mode view log toolbar
clear_log_pressed.png	Clear button pressed on advanced mode view log toolbar
options_log.png	Options button on advanced mode view log toolbar
options_log_pressed.png	Options button pressed on advanced mode view log toolbar
show_log.png	Show button on advanced mode view log toolbar
show_log_pressed.png	Show button pressed on advanced mode view log toolbar
arrow_up.png	Up Arrow button in Backup Servers tab of the new/modify profile dialog
arrow_down.png	Down Arrow button in Backup Servers tab of the new/modify profile dialog

You can also replace the following icon files (as long as your icon files have these same names):

- connected.ico—the tray icon when connected (also in resource file for vpngui.exe icon)
- unconnected.ico—the tray icon when not connected
- disconnecting.ico—the tray icon when disconnecting

Customizing the VPN Client Using an MSI Transform

This section describes how to customize VPN Client installation using a transform for the MSI. To customize the applications, you need *both* a transform and an oem.ini file.

Caution Do not modify the MSI file. To customize MSI, use a transform. Failure to follow recommended procedure will limit the level of support you can expect from Cisco.

Creating the Transform

To create the transform, you edit the vpnclient_en.msi file. You can create the transform with any commercially available MSI installation package, such as Wise or InstallShield. The procedure in this section uses the Microsoft ORCA editor available from the Microsoft Windows Installer SDK. The version used here is from Microsoft Platform SDK November 2001. So before you begin, make sure that ORCA is installed on your system. If you need information on transforms and ORCA, refer to the ORCA documentation.

Here is the procedure:

Step 1 Start ORCA.

Step 2 Select **File > Open** and enter **vpnclient_en.msi**.

Step 3 Select **Transform > Apply Transform** and select **oem.mst**, the transform template.

To customize oem.mst, you modify some of the information you see in the tables. The parts to modify have green change bars on the left side of the row. Figure 5-6 shows a partial oem.mst file.

Figure 5-6 Editing the Tables in a Transform File

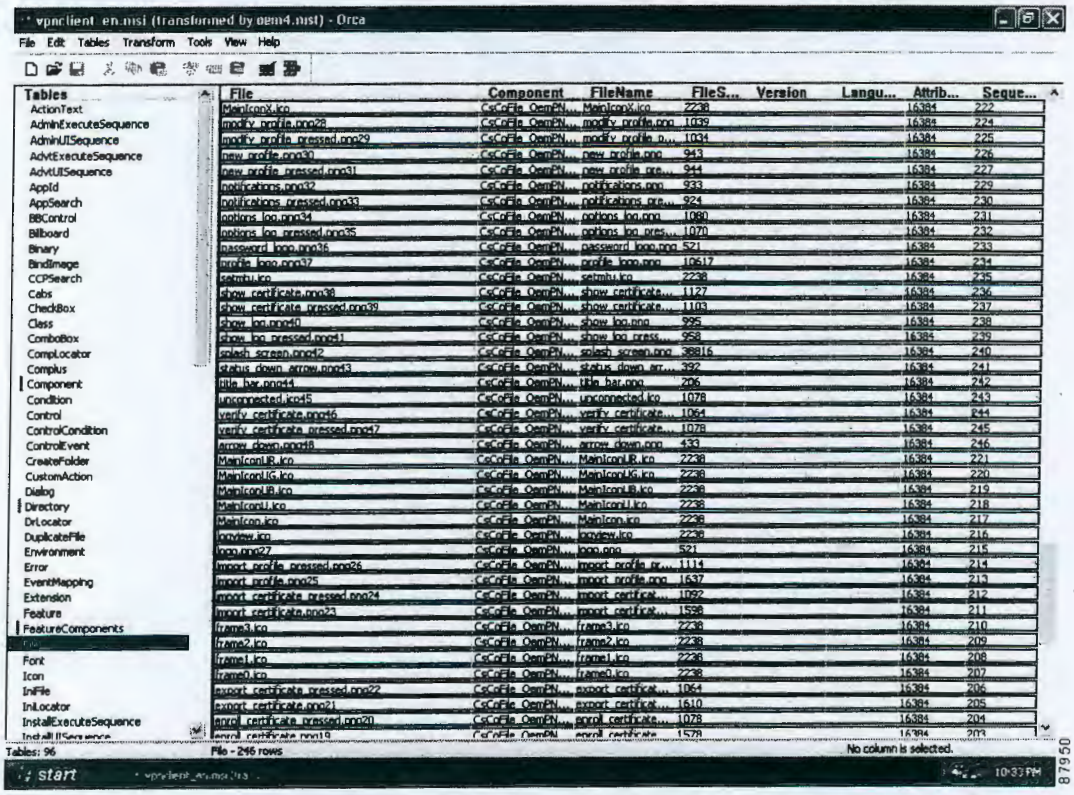


Table 5-3 outlines the changes to make in the tables in the oem.mst file. The columns in the table are defined as follows:

- Table Name—the name of the table to edit
- Changes Needed—a list of the changes to make to the table
- Install Requirement—the entries that modify the installation software
- Client Requirement—the entries that modify the way the VPN Client operates at runtime

Table 5-3 Oem.mst Tables

Table Name	Changes Needed		Modifies Install Parameters	Modifies VPN Client Runtime Parameters
Binary	top16—Add your own 500x63 bitmap for the MSI Install side16—Add you own 501x314 bitmap for the MSI Install		Yes for both	No for both
Component	CsCoFile_OemFiles—needed to install oem.ini file for custom VPN Clients CsCoFile_oempngFiles—needed to install icons, bitmaps, and png files		No	Yes
Directory	INSTALLDIR—Change to your own directory INSTALLDIR2—Change to your own directory Cisco_Systems_VPN_Client—Change to your own folder name		Yes for all	No for all
Feature Components	Complete | CsCoFile_OemFiles—needed to install oem.ini file for custom VPN Clients CsCoFile_oempngFiles—needed to install icons, bitmaps, and png files		No	Yes

Table 5-3 Oem.mst Tables (continued)

Table Name	Changes Needed		Modifies Install Parameters	Modifies VPN Client Runtime Parameters
File	Add the following files for customizing the VPN Client. For examples, see the oem.mst transform and the oem.ini files. arrow_down.png arrow_up.png cancel.png cancel_pressed.png clear_log.png clear_log_pressed.png connect.png connected.ico connected.png connect_pressed.png delete_certificate.png delete_certificate_pressed.png delete_profile.png delete_profile_pressed.png disable_log.png disable_log_pressed.png disconnect.png disconnecting.ico disconnect_pressed.png enable_log.png enable_log_pressed.png enroll_certificate.png enroll_certificate_pressed.png	export_certificate.png export_certificate_pressed.png import_certificate.png import_certificate_pressed.png import_profile.png import_profile_pressed.png logo.png modify_profile.png modify_profile_pressed.png new_profile.png new_profile_pressed.png notifications.png notifications_pressed.png options_log.png options_log_pressed.png password_logo.png profile_logo.png show_certificate.png show_certificate_pressed.png show_log.png show_log_pressed.png splash_screen.png status_down_arrow.png title_bar.png unconnected.ico verify_certificate.png verify_certificate_pressed.png vpn_panel.png	No	Yes
Icon	Add the following icon files for customizing the VPN Client. These icons are for shortcuts on the Program Group. For examples, see the oem.mst transform and the oem.ini files. MainIcon.ico setmtu.ico		No	Yes

Table 5-3 Oem.mst Tables (continued)

Table Name	Changes Needed		Modifies Install Parameters	Modifies VPN Client Runtime Parameters
Media	Add the following files for customizing the VPN Client. For examples, see the oem.mst transform and the oem.ini files. arrow_down.png arrow_up.png cancel.png cancel_pressed.png clear_log.png clear_log_pressed.png connect.png connected.ico connected.png connect_pressed.png delete_certificate.png delete_certificate_pressed.png delete_profile.png delete_profile_pressed.png disable_log.png disable_log_pressed.png disconnect.png disconnecting.ico disconnect_pressed.png enable_log.png enable_log_pressed.png enroll_certificate.png enroll_certificate_pressed.png	export_certificate.png export_certificate_pressed.png import_certificate.png import_certificate_pressed.png import_profile.png import_profile_pressed.png logo.png modify_profile.png modify_profile_pressed.png new_profile.png new_profile_pressed.png notifications.png notifications_pressed.png options_log.png options_log_pressed.png password_logo.png profile_logo.png show_certificate.png show_certificate_pressed.png show_log.png show_log_pressed.png splash_screen.png status_down_arrow.png title_bar.png unconnected.ico verify_certificate.png verify_certificate_pressed.png vpn_panel.png	No	Yes
Property	ProductName—Supply company and product names for installation. Manufacturer—Change *publisher* in the support information screen under Control Panel > Add/Remove Programs. ARPURLINFOABOUT—Change the web page in the support information screen under Control Panel > Add/Remove Programs.		Yes No No	No Yes Yes
Shortcut	Dialer—Change the name and the icon for the VPN Dialer application. SET_MTU—Change the name and the icon for the Set MTU application.		No for all	Yes for all

OEM.INI File and MSI

At run-time, you need an oem.ini file to tell the VPN Client to use OEM company and application names.

Copy your oem.ini file, the custom PNG files, and the custom icons to your distribution media, for example a CD, placing them in the same directory as the vpnclient_en.msi file. Use a transform to install the VPN Client, the oem.ini file, PNG files (Table 5-2), and icons, along with the VPN Client files during installation. For a sample oem.ini file, see "Sample oem.ini File." For more information on the oem.ini file, see Table 5-1.

Table 5-4 lists InstallShield-specific control parameters and how to achieve similar results in MSI. The oem.ini file modifies both InstallShield installation parameters and VPN Client runtime parameters. For MSI all oem.ini parameters are required except the installation-time parameters.

Table 5-4 Oem.ini File Keywords and MSI Equivalents

Keyword	MSI Equivalent
`DisableKerberosOverTCP=`	Transform Table: Property DISABLEKERBEROSOVERTCP
`SilentMode=`	Executing MSI installation using the /q switch For example: **msiexec /I vpnclient_en.msi /q**
`InstallPath=`	Transform Table: Directory INSTALLDIR INSTALLDIR2
`DefGroup=`	Transform Table: Directory Cisco_Systems_VPN_Client
`AllowSBLLaunches`	Transform Table: Registry registry18 Software\Cisco Systems\VPN Client\Secure | AllowsSBLLaunches
`AutoSetMtu=`	Transform Table: Property LAUNCHSETMTU
`SetMTUValue=`	Transform Table: Property SETMTUVALUE
`MTUAdjustOverride=`	Transform Table: Property DNEMTUADJUSTMENT Windows NT-based only.

Installing the VPN Client using the Transform

To install the VPN Client with the transform oem.mst that you have prepared, execute the following command at the command-line prompt.

msiexec /i vpnclient_en_msi TRANSFORMS=oem.mst

If you want to record errors that might occur during the installation, you can create a log file as follows:

msiexec /i vpnclient_en_msi /l*v! c:oeminstall.log TRANSFORMS=oem.mst

Installing the VPN Client Without User Interaction

This section describes how to produce installation without user interaction for both InstallShield installations and MSI installations. Installing the VPN Client without user interaction is called *silent mode*. In silent mode, no messages or prompts appear on the screen.

Note You can launch silent installation from the command line by using the **-sd** parameter with the vpnclient.exe command. For example, **vpnclient -sd toVPN**. For information on the vpnclient command, refer to "Using the VPN Client Command-Line Interface".

Silent Installation Using InstallShield

To implement silent mode with or without customizing the VPN Client applications, you can create an oem.ini file containing only the part that configures silent mode. In this file, you turn silent mode on, identify the pathname and folder to contain the VPN Client software, and reboot the system, all without user interaction.

During silent mode installation, the installation program does not display error messages. The program stores error messages in a log file named VPNLog.txt located in the windows system directory (WINSYSDIR).

Note If the installation program detects a 2.x version of the VPN Client, the program still prompts the user for input when converting the connection entry profiles.

A sample oem.ini file for implementing silent mode follows:

```
[Default]
SilentMode = 1
InstallPath = C:\Program Files\Engineering\IPSec Connections
DefGroup = IPSec remote users
Reboot = 1
```

Table 5-5 oem.ini File Silent Mode Parameters

.ini parameter (keyword)	Parameter Description	Values
`SilentMode=`	Identifies whether to activate noninteractive installation.	After the keyword and equal sign, enter either 0 or 1. 1 activates silent installation: 0 = prompt the user during installation. 1= do not prompt the user during installation.
`InstallPath=`	Identifies the directory for the client software installation.	After the keyword and equal sign, enter the name of the directory in the suggested format: *root:\programs\organization\product*

Table 5-5 oem.ini File Silent Mode Parameters (continued)

.ini parameter (keyword)	Parameter Description	Values
DefGroup=	Identifies the name of the folder to contain the client software.	After the keyword and equal sign, enter the name of the destination folder in the suggested format: *foldername*
Reboot=	Identifies whether to restart the system after the silent installation. If SilentMode is on (1) and Reboot is 1, the system automatically reboots after installation finishes.	After the keyword and equal sign, enter 0, 1, or 2: 0 = display the reboot dialog. 1 (and SilentMode = 1) = automatically reboot the system when installation finishes. 2 (and SilentMode = 1) = do not reboot after installation finishes.

Silent Installation Using MSI

To install the VPN Client without dialogs and messages (user interface) displaying on the screen, you can use either of the two following commands on the command line.

msiexec.exe /q [n|b|r|f] /i vpnclient_en.msi

or

vpnclient_en.exe /q [n|b|r|f]

Option	What it Displays
q or **qn**	No user interface. It is advisable to enable logging to determine whether the installation succeeded, since this option eliminates all information including fatal error messages.
qb	The basic user interface, which is a limited progress dialog that Windows Installer generates. It is advisable to enable logging with this option as well.
qr	Reduced user interface, similar to the full user interface option, but includes only a subset of all dialogs. For example, this option displays the welcome, license agreement, destination folder, and start dialogs, but does not let the user change the destination folder.
qf	Full or complete user interface including all dialogs. This is the default setting.

Launching SetMTU with Silent Installation

The SetMTU utility is automatically launched in silent mode with the value of 1300 for all installed adapters. To disable the SetMTU utility during installation, set the LAUNCHSETMTU property on the command-line to 0. To modify the MTU value, set SETMTUVALUE to *value*. To override the DNE MtuAdjuistment parameter, which is set to 0, set DNEMTUADJUSTMENT to *value*.

For example, to disable SetMTU and set the DNE Mtuadjustment to 144, execute the following command:

vpnclient_en.msi LAUNCHSETMTU=0 DNEMTUADJUSTMENT=144

For information on the SetMTU utility, see "Changing the MTU Size."

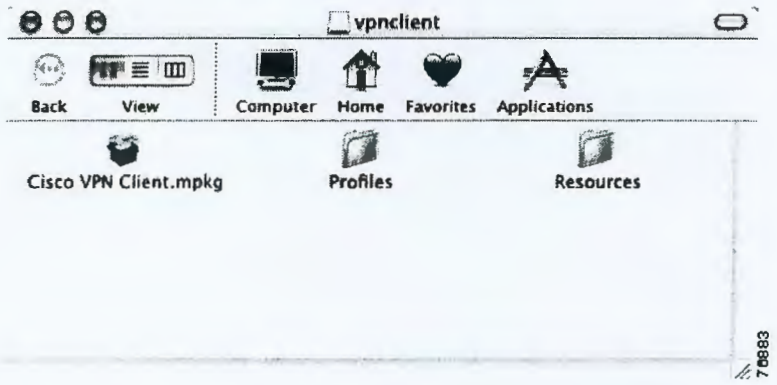
Customizing the VPN Client GUI for Mac OS X

To customize the VPN Client GUI for the Mac OS X platform, place the custom images in the Resources folder of the installer directory.

Figure 5-7 shows the vpnclient installer directory. This directory contains the installer package and any preconfigured files in the Profiles and Resources folders.

The Resources folder contains all images for the VPN Client.

Figure 5-7 VPN Client Installer Directory



To distribute custom images, replace the image files in the Resources folder with your own custom images. For example:

- To customize the logo, replace the file /etc/CiscoSystems/Resources/logo.png with your own custom logo.
- To customize the splash screen, replace the file /etc/CiscoSystems/Resources/splash_screen.png with your own custom splash screen.

When the VPN Client is installed, the images in the Resources file are used for the client GUI.

Client Update

Updating VPN Client software in an environment with a large number of devices in different locations can be a formidable task. For this reason, the VPN 3000 Concentrator includes a client update feature that simplifies the software update process. This feature works differently for VPN software clients and VPN 3002 Hardware Clients.

VPN Software Clients

The client update feature lets administrators at a central location automatically notify VPN Client users when it is time to update the VPN Client software.

When you enable client update, upon connection the central-site VPN Concentrator sends an IKE packet that contains an encrypted message that notifies VPN Client users about acceptable versions of executable system software. The message includes a location that contains the new version of software for the VPN Client to download. The administrator for that VPN Client can then retrieve the new software version, and update the VPN Client software.

You configure parameters that specify the acceptable versions of software and their locations. Updates are supported per group. This means that all members of a group can obtain the same updates from the same server at approximately the same time.

VPN 3002 Hardware Clients

The client update feature lets administrators at a central location automatically update software/firmware for VPN 3002 Hardware Clients deployed in diverse locations.

When you enable client update, upon connection the central-site VPN Concentrator sends an IKE packet that contains an encrypted message that notifies VPN 3002 hardware clients about acceptable versions of executable system software and their locations. If the VPN 3002 is not running an acceptable version, its software is automatically updated via TFTP.

To use client update, you need to have a TFTP server that can handle the volume and frequency of updates that your network requires. We recommend that you locate this server inside your network. The client update facility sends notify messages to VPN 3002s in batches of 10 at 5-minutes intervals.

You configure parameters that specify the acceptable versions of software and their locations. Updates are supported per group. This means that all members of a group can obtain the same updates from the same server at approximately the same time.

The VPN 3002 logs event messages at the start of the update. When the update completes, the Hardware Client reboots automatically.

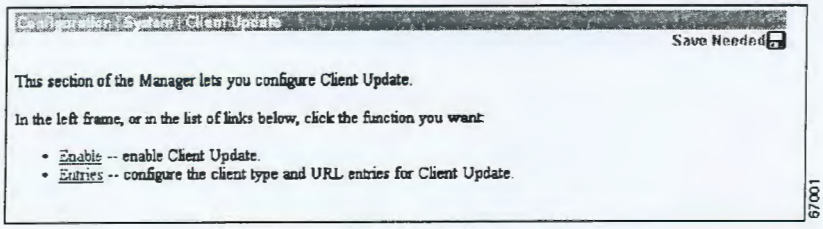
Note The VPN 3002 stores image files in two locations: the active location, which stores the image currently running on the system; and the backup location. Updating the image overwrites the stored image file in the backup location and makes it the active location for the next reboot. The client update process includes a test to validate the updated image. In the unlikely event that a client update is unsuccessful, the client does not reboot, and the invalid image does not become active. The update facility retries up to twenty times at 3-minute intervals. If an update is unsuccessful, the log files contain information indicating TFTP failures.

Configuration | System | Client Update

This section of the VPN 3000 Concentrator Manager lets you configure the client update feature.

- Enable: Enables or disables client update.
- Entries: Configures updates by client type, acceptable firmware and software versions, and their locations.

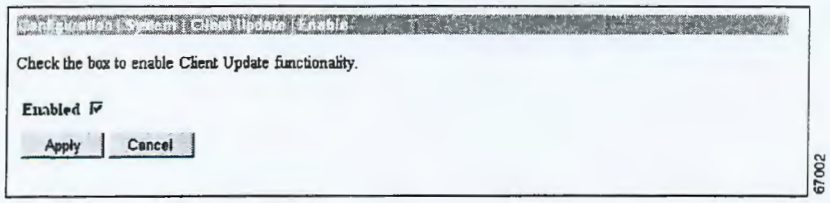
Figure 12-1 Configuration / System / Client Update Screen



Configuration | System | Client Update | Enable

This screen lets you disable or enable client update.

Figure 12-2 Configuration | System | Client Update | Enable Screen



Enable

Uncheck or check the **Enable** check box to disable or enable client update (by default, client update is enabled).

Apply or Cancel

To apply your change to client update, click **Apply**. This action includes your entry in the active configuration. The Manager returns to the Configuration | System | Client Update screen.

Reminder:

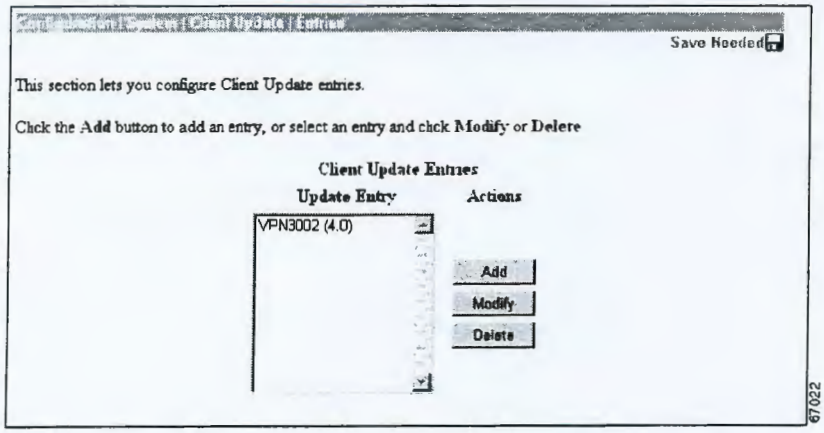
To save the active configuration and make it the boot configuration, click the **Save Needed** icon at the top of the Manager window.

To discard your entries, click **Cancel**. The Manager returns to the Configuration | System |Client Update screen, and the settings are unchanged.

Configuration | System | Client Update | Entries

This screen lets you add, modify, or delete client update entries.

Figure 12-3 Configuration / System / Client Update / Entries Screen



Update Entry

The update entry list shows the configured client update entries. Each entry shows the platform and acceptable software/firmware versions. If no updates have been configured, the list shows --Empty--.

Actions

To configure and add a new client update entry, click **Add**. The Manager opens the Configuration | System | Client Update | Entries | Add screen.

To modify parameters for a client update entry that has been configured, select the entry from the list and click **Modify**. The Manager opens the Configuration | System | Client Update | Modify screen.

To remove a client update entry that has been configured, select the entry from the list and click **Delete**.

Note There is no confirmation or undo.

The Manager refreshes the screen and shows the remaining entries in the list.

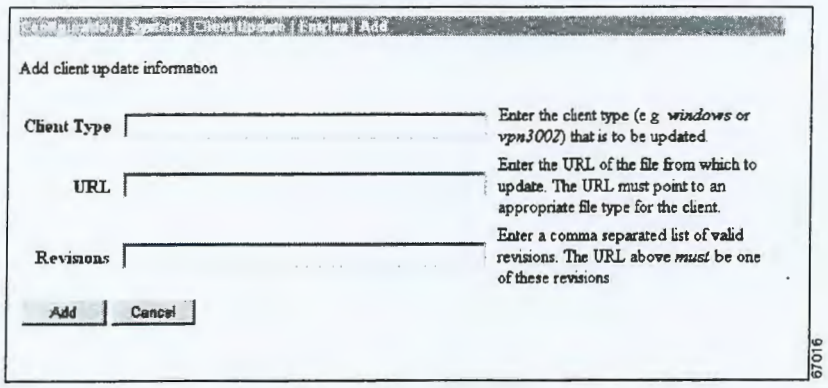
Reminder:

To save the active configuration and make it the boot configuration, click the **Save Needed** icon at the top of the Manager window.

Configuration | System | Client Update | Entries | Add or Modify

These screens let you configure and change client update parameters.

Figure 12-4 Configuration / System / Client Update / Entries / Add or Modify Screens



Client Type

Enter the client type you want to update.

- For the VPN Client: Enter the windows operating systems to notify. The entry must be exact, including case and spacing:
  - **Windows** includes *all* Windows-based platforms.
  - **Win9X** includes Windows 95, Windows 98, and Windows ME platforms.
  - **WinNT** includes Windows NT 4.0, Windows 2000, and Windows XP platforms.

Note The VPN Concentrator sends a separate notification message for each entry in a Client Update list. Therefore your client update entries must not overlap. For example, the value Windows includes all Windows platforms, and the value WinNT includes Windows NT 4.0, Windows 2000 and Windows XP platforms. So you would not include both the values Windows and WinNT.

- For the VPN 3002 Hardware Client: Your entry must be **vpn3002**, including case and spacing.

URL

Enter the URL for the software/firmware image. This URL must point to a file appropriate for this client.

- For the VPN Client: To activate the Launch button on the VPN Client Notification, the URL must include the protocol HTTP or HTTPS and the server address of the site that contains the update. The format of the URL is: http(s)://*server_address:port/directory/filename*. The server address can be either an IP address or a hostname if you have configured a DNS server. For example:

  http://10.10.99.70/vpnclient-win-3.5.Rel-k9.exe

  The directory is optional. You need the port number only if you use ports other than 80 for http or 443 for https.

- For the VPN 3002 Hardware Client: The format of the URL is tftp://*server_address/directory/filename*. The server address can be either an IP address or a hostname if you have configured a DNS server. For example:

  tftp://10.10.99.70/vpn3002-3.5.Rel-k9.bin

  The directory is optional.

Revisions

Enter a comma-separated list of software or firmware images appropriate for this client. The following caveats apply:

- The revision list must include the software version for this update.
- Your entries must match exactly those on the URL for the VPN Client, or the TFTP server for the VPN 3002.
- The URL above must point to one of the images you enter.

If the client is already running a software version on the list, it does not need a software update. If the client is not running a software version on the list, an update is in order.

- A VPN Client user must download an appropriate software version from the listed URL.
- The VPN 3002 Hardware Client software is automatically updated via TFTP.

Add or Apply / Cancel

To add this client update entry to the list of configured update entries, click **Add**. Or, to apply your changes, click **Apply**. Both actions include your entry in the active configuration. The Manager returns to the Configuration | System | Client Update screen. Any new entry appears at the bottom of the Update Entries list.

Reminder:

To save the active configuration and make it the boot configuration, click the **Save Needed** icon at the top of the Manager window.

To discard your entries, click **Cancel**. The Manager returns to the Configuration | System | Client Update screen, and the Update Entries list is unchanged.

Tip For more information about VPN Client updates, specifically the VPN Client Launch button, refer to the *VPN Client Administrator Guide*.

CHAPTER 2

Preconfiguring the VPN Client for Remote Users

This chapter explains how to prepare configurations for remote users and how to distribute them. This chapter includes the following sections:

- Profiles
- Creating a Global Profile
- Creating Connection Profiles

Profiles

Groups of configuration parameters define the connection entries that remote users use to connect to a VPN device. Together these parameters form files called profiles. There are two profiles: a global profile and an individual profile.

- A global profile sets rules for all remote users; it contains parameters for the VPN Client as a whole. The name of the global profile file is vpnclient.ini.
- Individual profiles contain the parameter settings for each connection entry and are unique to that connection entry. Individual profiles have a .pcf extension.

Profiles get created in two ways:

1. When an administrator or a remote user creates connection entries using the VPN Client graphical user interface (Windows and Macintosh only)
2. When you create profiles using a text editor

   In the first case, the remote user is also creating a file that can be edited through a text editor. You can start with a profile file generated through the GUI and edit it. This approach lets you control some parameters that are not available in the VPN Client GUI application. For example, auto-initiation or dial-up wait for third-party dialers.

The default location for individual profiles is:

- For Windows platforms—C:\Program Files\Cisco Systems\VPN Client\Profiles.
- For the Linux, Solaris, and Mac OS X platforms— /etc/CiscoSystemsVPNClient/Profiles/

This chapter explains how to create and edit the vpnclient.ini and individual profiles. Both files use the same conventions.

Note The easiest way to create a profile for the Windows platforms is to run the VPN Client and use the VPN Client GUI to configure the parameters. When you have created a profile in this way, you can copy the .pcf file to a distribution disk for your remote users. This approach eliminates errors you might introduce by typing the parameters and the group password gets automatically converted to an encrypted format.

File Format for All Profile Files

The vpnclient.ini and .pcf files follow normal Windows.ini file format:

- Use a semicolon (;) to begin a comment.
- Place section names within brackets [section name]; they are not case sensitive.
- Use key names to set values for parameters; *keyword = value*. Keywords without values, or unspecified keywords, use VPN Client defaults. Keywords can be in any order and are not case sensitive, although using lower and uppercase makes them more readable.

Making a Parameter Read Only

To make a parameter read-only so that the client user cannot change it within the VPN Client applications, precede the parameter name with an exclamation mark (!). This controls what the user can do within the VPN Client applications only. You cannot prevent someone from editing the global or .pcf file and removing the read-only designator.

Creating a Global Profile

The name of the global profile is vpnclient.ini. This file is located in the following directories:

- For Windows platforms—C:\Program Files\Cisco Systems\VPN Client directory
- For the Linux, Solaris, and Mac OS X platforms— /etc/CiscoSystemsVPNClient/vpnclient.ini

These are the default locations created during installation.

Features Controlled by Global Profile

The vpnclient.ini file controls the following features on all VPN Client platforms:

- Start before logon
- Automatic disconnect upon log off
- Control of logging services by class
- Certificate enrollment
- Identity of a proxy server for routing HTTP traffic
- Identity of an application to launch upon connect
- Missing group warning message
- Logging levels for log classes
- RADIUS SDI extended authentication behavior

- GUI parameters—appearance and behavior of GUI applications

The vpnclient.ini file controls the following additional features in the Windows platform:

- Location of the Entrust.ini file
- List of GINAs that are not compatible with the VPN Client
- Auto initiation
- Setting of the Stateful Firewall option
- The method to use in adding suffixes to domain names on Windows 2000 and Windows XP platforms
- When working with a third-party dialer, time to wait after receiving an IP address before initiating an IKE tunnel
- Network proxy server for routing HTTP traffic
- Application launching
- DNS suffixes
- Force Network Login, which forces a user on Windows NT, Windows 2000, or Windows XP to log out and log back in to the network without using cached credentials

Sample vpnclient.ini file

Note Profiles for the VPN Client are interchangeable between platforms. Keywords that are specific to the Windows platform are ignored by other platforms.

This sample file shows what you might see if you open it with a text editor

```
[main]

The rest of this section explains the parameters that can appear in the vpnclient.ini file, what they mean, and how to use them.

Global Profile Configuration Parameters

Table 2-1 lists all parameters, keywords, and values. It also includes the parameter name as used in the VPN Client GUI application if it exists, and where to configure it in the application.

Each parameter can be configured on all VPN Client platforms unless specified.

Table 2-1 vpnclient.ini file parameters

.ini Parameter (Keyword)	VPN Client Parameter Description	Values	VPN Client GUI Configuration Location(s)
[main]	Required keyword to identify main section.	[main] Enter exactly as shown, as first entry in the file.	Does not appear in GUI
DialupWait	Specifies the number of seconds to wait between receiving an IP address from a third-party dialer such as General Packet Radio Services (GPRS) before initiating an IKE tunnel. This grants enough time for the connection to go through on the first attempt.	After the keyword and equal sign, enter the number of seconds to wait. For example: DialupWait=1 Default number = 0.	Does not appear in GUI
IncompatibleGinas (Windows-only)	Lists Graphical Identification and Authentication dynamic link libraries (GINA.DLLs) that are not compatible with Cisco's GINA. Adding a GINA to the list causes the VPN Client to leave the GINA alone during installation and use fallback mode. The VPN Client goes into fallback mode only if RunAtLogon = 1. Otherwise, the Client GINA is never installed. (See "Installing the VPN Client Without User Interaction".	After the keyword and equal sign, enter the name(s) of the GINAs, separated by commas. For example: IncompatibleGinas= PALgina.dll, Yourgina.dll, Theirgina.dll Do not enclose the name in quotes.	Does not appear in GUI
MissingGroupDialog	Controls the pop up window warning that occurs when a user tries to connect without setting the group name in a preshared connection.	0= (default) Do not show the warning message. 1=Show the warning message.	Does not appear in GUI
RunAtLogon (Windows-only)	Specifies whether to start the VPN Client connection before users log on to their Microsoft network. Available only for the Windows NT platform (Windows NT 4.0, Windows 2000 and Windows XP). This feature is sometimes known as the NT Logon feature.	0 = Disable (default) 1 = Enable	Options > Windows Logon Properties > Enable start before logon
EntrustIni= (Windows-only)	Locates the entrust.ini file if it is in a location that is different from the default.ini file. The default location is the base Windows system directory.	Complete pathname of location	Does not appear in GUI

Table 2-1 vpnclient.ini file parameters (continued)

.ini Parameter (Keyword)	VPN Client Parameter Description	Values	VPN Client GUI Configuration Location(s)
DialerDisconnect= (Windows-only)	Determines whether to automatically disconnect upon logging off a Windows NT platform (Windows NT 4.0, Windows 2000 and Windows XP). Disabling this parameter lets the VPN connection remain when the user logs off, allowing that user to log back in without having to establish another connection.	0 = Disable 1 = Enable (default disconnect on logoff)	Options > Windows Logon Properties > Disconnect VPN connection when logging off
There are limitations to DialerDisconnect. For example, in the case of MS DUN, the RAS (PPP) connection might go down when the user logs off. For more information about this specific case, see the following URL: http://support.microsoft.com/support/kb/articles/Q158/9/09.asp?LN=EN-US&SD=gn&FR=0&qry=RAS%20AND%20LOGOFF&rnk=2&src=DHCS_MSPSS_gn_SRCH&SPR=NTW40			
EnableLog=	Determines whether to override log settings for the classes that use the logging services. By default, logging is turned on. This parameter lets a user disable logging without having to set the log levels to zero for each of the classes. By disabling logging you can improve the performance of the client system.	0 = Disable 1 = Enable (default)	Log > Enable/Disable
StatefulFirewall= (Windows-only)	Determines whether the stateful firewall is always on. When enabled, the stateful firewall always on feature allows no inbound sessions from all networks, whether a VPN connection is in effect or not. Also, the firewall is active for both tunneled and nontunneled traffic.	0 = Disable (default) 1 = Enable	Options > Stateful Firewall (Always On)
StatefulFirewallAllowICMP (Windows only)	Controls whether StatefulFirewall (Always On) allows ICMP traffic. Some DHCP Servers use ICMP pings to detect if the DHCP client PCs are up so that the lease can be revoked or retained.	0 = Disable (default) 1 = Enable	Does not appear in the GUI.
AutoInitiationEnable (Windows-only)	Enables auto initiation, which is an automated method for establishing a wireless VPN connection in a LAN environment. For information on this feature see Configuring Automatic VPN Initiation—Windows Only	0 = Disable (default) 1 = Enable	Options > Automatic VPN Initiation
AutoInitiationRetry-Interval (Windows-only)	Specifies the time to wait, in minutes, before retrying auto initiation after a connection attempt failure.	1 to 10 minutes Default = 1 minute	Options > Automatic VPN Initiation

Table 2-1 vpnclient.ini file parameters (continued)

.ini Parameter (Keyword)	VPN Client Parameter Description	Values	VPN Client GUI Configuration Location(s)
AutoInitiationRetry-IntervalType (Windows-only)	Changes the retry interval from minutes (the default) to seconds. The range in seconds is 5-600.	0 = minutes (default) 1 = seconds	Options > Automatic VPN Initiation
AutoInitiationList (Windows-only)	Identifies auto initiation-related section names within the vpnclient.ini file. The vpnclient.ini file can contain a maximum of 64 auto initiation list entries.	A list of section names separated by commas; for example: SJWLAN, RTPWLAN, CHWLAN	Does not appear in GUI
[*section name*] (of an item in the AutoInitiationList) (Windows-only)	Each section contains a network address, network mask, connection entry name, and a connect flag. The network and mask values identify a subnet. The connection entry identifies a connection profile (.pcf file). The connect flag specifies whether to auto initiate the connection.	*Section name in brackets* Network = *IP address* Mask = *Subnet mask* ConnectionEntry = *name of a connection entry (profile)* Connect = 1 or 0 0 = Do not auto initiate the connection 1 = Auto initiate the connection (the default) Example: [SJWLAN] Network=110.110.110.0 Mask=255.255.0.0 ConnectionEntry=SantaJuan WirelessLAN	Does not appear in GUI
For each class that follows, use the LogLevel= parameter to set the logging level			
[LOG.IKE]	Identifies the Internet Key Exchange class for setting the logging level.	[LOG.IKE] Enter exactly as shown.	Log > Settings
[LOG.CM]	Identifies the Connection Manager class for setting the logging level.	[LOG.CM] Enter exactly as shown.	Log > Settings
[LOG.XAUTH]	Identifies the Extend authorization class for setting the logging level.	[LOG.XAUTH] Enter exactly as shown.	Log > Settings
[LOG.PPP] (Windows-only)	Identifies the PPP class for setting the logging level.	[LOG.PPP] Enter exactly as shown.	Log > Settings
[LOG.CVPND]	Identifies the Cisco VPN Daemon class for setting the logging level.	[LOG.CVPND] Enter exactly as shown.	Log > Settings
[LOG.CERT]	Identifies the Certificate Management class for setting the logging level.	[LOG.CERT] Enter exactly as shown.	Log > Settings
[LOG.IPSEC]	Identifies the IPSec module class for setting the logging level.	[LOG.IPSEC] Enter exactly as shown.	Log > Settings
[LOG.FIREWALL] (Windows-only)	Identifies the FWAPI class for setting the logging level.	[LOG.FIREWALL] Enter exactly as shown	Log > Settings

Table 2-1 vpnclient.ini file parameters (continued)

.ini Parameter (Keyword)	VPN Client Parameter Description	Values	VPN Client GUI Configuration Location(s)
[LOG.CLI]	Identifies the Command-Line Interface class for setting the logging level.	[LOG.CLI] Enter exactly as shown	Log > Settings
[LOG.GUI]	Identifies the Graphical User Interface class for setting the logging level.	[LOG.GUI] Enter exactly as shown	Log > Settings
LogLevel=	Determines the log level for individual classes that use logging services. By default, the log level for all classes is Low. You can use this parameter to override the default setting for the preceding [LOG] parameters.	The VPN Client supports log levels from 1 (lowest) to 15 (highest). Default = 1 To set logging levels, you must first enable logging: **EnableLog=1**.	Log > Settings
[CertEnrollment]	Required keyword to identify the Certificate Enrollment section.	[CertEnrollment] Enter exactly as shown.	Does not appear in GUI
SubjectName=	Identifies the username associated with this certificate.	Maximum of 519 alphanumeric characters.	Certificates > Enroll Certificate Enrollment form
Company=	Identifies the company or organization of the certificate owner.	Maximum of 129 alphanumeric characters.	Certificates > Enroll Certificate Enrollment form
Department=	Identifies the department or organizational unit of the certificate owner. If matching by IPSec group in a VPN 3000 Concentrator, must match the group name in the configuration.	Maximum of 129 alphanumeric characters.	Certificates > Enroll Certificate Enrollment form
ıte=	Identifies the state or province of the certificate owner.	Maximum of 129 alphanumeric characters.	Certificates > Enroll Certificate Enrollment form
Country=	Identifies the two-letter code identifying the country of this certificate owner.	Maximum of 2 alphanumeric characters.	Certificates > Enroll Certificate Enrollment form
Email=	Identifies the certificate owner's email address.	Maximum of 129 alphanumeric characters.	Certificates > Enroll Certificate Enrollment form
IPAddress	Identifies the IP address of the system of the certificate owner.	Internet address in dotted decimal notation.	Certificates > Enroll Certificate Enrollment form
Domain	Identifies the fully qualified domain name of the host that is serving the certificate owner.	Maximum of 129 alphanumeric characters.	Certificates > Enroll Certificate Enrollment form

Table 2-1 vpnclient.ini file parameters (continued)

.ini Parameter (Keyword)	VPN Client Parameter Description	Values	VPN Client GUI Configuration Location(s)
CADomainName=	Identifies the domain name that the certificate authority belongs to; for network enrollment.	Maximum of 129 alphanumeric characters.	Certificates > Enroll Certificate Enrollment form
CAHostAddress=	Identifies the IP address or hostname of the certificate authority.	Internet hostname or IP address in dotted decimal notation. Maximum of 129 alphanumeric characters.	Certificates > Enroll Certificate Enrollment form
CACertificate=	Identifies the name of the self-signed certificate issued by the certificate authority.	Maximum of 519 alphanumeric characters. Note: The VPNClient GUI ignores a read-only setting on this parameter.	Certificates > Enroll Certificate Enrollment form
NetworkProxy= (Windows-only)	Identifies a proxy server you can use to route HTTP traffic. Using a network proxy can help prevent intrusions into your private network.	IP address in dotted decimal notation or domain name. Maximum of 519 alphanumeric characters. The proxy setting sometimes has a port associated with it. Example:10.10.10.10:8080	Does not appear in GUI
[ApplicationLauncher] (Windows-only)	(No VPN Client field) Required keyword to identify Application Launcher section.	[ApplicationLauncher] Enter exactly as shown, as first entry in the section.	Does not appear in GUI
Enable= (Windows-only)	Use this parameter to allow VPN Client users to launch an application when connecting to the private network.	0 = Disabled (default) 1 = Enabled Disabled means no launching.	Options> Application Launcher
Command= (Windows-only)	The name of the application to be launched. This variable includes the pathname to the command, and the name of the command complete with arguments.	*command string* Maximum 512 alphanumeric characters. Example: c:\auth\swtoken.exe.	Options> Application Launcher> Application
[DNS] (Windows-only)	(No VPN Client field) Required keyword to identify DNS section.	[DNS] Enter exactly as shown, as first entry in the section.	Does not appear in GUI
AppendOriginalSuffix= (Windows-only)	Determines the way the VPN Client treats suffixes to domain names. See "DNS Suffixes and the VPN Client—Windows 2000 and Windows XP Only", following this table.	0 = do nothing 1= append the primary DNS suffix to the suffix that the VPN Concentrator supplies. 2= append the primary and connection-specific DNS suffixes to the suffix that the VPN Concentrator supplies.	Does not appear in GUI

Table 2-1 vpnclient.ini file parameters (continued)

.ini Parameter (Keyword)	VPN Client Parameter Description	Values	VPN Client GUI Configuration Location(s)
[RadiusSDI]	Required keyword to identify the RADIUS SDI extended authentication (XAuth) section. Configure this section to enable a VPN Client to handle Radius SDI authentication the same as native SDI authentication, which makes authentication easier for VPN Client users to authenticate using SDI.	Enter exactly as shown.	Does not appear in GUI.
estionSubStr	Uniquely identifies question-type RADIUS SDI Xauth prompts.	Enter text up to 32 bytes in length. The default text is a question mark. Example: "Are you prepared to have the system generate your PIN? (y/n):" Response: _____	The question appears in the GUI during extended authentication. It is followed by a Response field.
NewPinSubStr	Uniquely identifies new PIN RADIUS SDI Xauth prompts.	Enter text up to 32 bytes in length. Default text is "new PIN." Example: "Enter a new PIN of 4 to 8 digits."	Appears in the GUI during extended authentication.
NewPasscodeSubStr	Uniquely identifies new passcode RADIUS Xauth prompts.	Enter text up to 32 bytes in length. Default text is "new passcode." Example: "PIN accepted. Wait for the token code to change, then enter the new passcode"	Appears in the GUI during extended authentication.
[Netlogin] (windows-only	Identifies the Force Network Login section of the vpnclient.ini file. This feature forces a user on Windows NT, Windows 2000, and Windows XP to log out and log back in to the network without using cached credentials.	Enter exactly as shown; this is required as part of the feature.	Does not appear in the GUI.

Note You cannot use this feature with Start Before Logon. If users are connecting via dialup (RAS), you should add the registry key described in the Microsoft article: http://support.microsoft.com/default.aspx?scid=kb;en-us;Q158909. Adding the registry key assures that the RAS connection does not drop when the user gets logged off.

Table 2-1 vpnclient.ini file parameters (continued)

.ini Parameter (Keyword)	VPN Client Parameter Description	Values	VPN Client GUI Configuration Location(s)
`Force (windows-only)`	Specifies what action to take for the Force Network Login feature. This parameter is required for this feature.	0 = (default) Do not force the user to log out and log in. 1 = Force user to log out when the Wait time is reached unless an option is selected. 2 = Disconnect VPN session upon reaching the Wait time unless an option is selected. 3 = Wait for the user to select Connect or Disconnect.	Does not appear in the GUI.
`Wait (windows-only)`	Determines the number of seconds to wait before performing an action specified by the Force parameter. This parameter is optional.	x number of seconds. The default is 5 seconds.	Does not appear in the GUI.
`DefaultMsg (windows-only)`	Specifies a message to display before performing the action specified by the Force parameter. Message can vary according to setting of Force. This parameter is optional.	Ascii text up to 1023 bytes. Default message = You will soon be disconnected.	Does not appear in the GUI.
`Separator (windows-only)`	Specifies the separator text that separates banner text from the message. If no banner exists, the separator is not displayed. This parameter is optional.	Ascii text up to 511 bytes. Default separator = ----------	Does not appear in the GUI.
`[GUI]`	Required keyword to identify the section of the file that lets you control features of the Graphical User Interface application.	`[GUI]` Enter exactly as shown, as first entry in the section.	Does not appear in the GUI.
`DefaultConnectionEntry`	Specifies the name of the connection entry for the VPN Client to use to initiate a connection, unless otherwise indicated.	*`ConnectionEntryName`*	Connection Entries > Add/Modify > Set as default entry.
`WindowWidth`	Controls the width of the window.	Default = 578 pixels	Manual control
`WindowHeight`	Controls the height of the window.	Default = 367 pixels	Manual control
`WindowX`	Controls the X coordinate of the window.	0 to 1024 pixels Default = 324	Where the window appears horizontally relative to your monitor's screen
`WindowY`	Controls the Y coordinate of the window.	0 to 768 pixels Default = 112	Where the window appears vertically relative to your monitor's screen

Table 2-1 vpnclient.ini file parameters (continued)

.ini Parameter (Keyword)	VPN Client Parameter Description	Values	VPN Client GUI Configuration Location(s)
VisibleTab	Tracks which tab is currently visible in the advanced mode main dialog; an index.	Connection Entries Certificates Log	VPN Client main dialog
ConnectionAttibute	Indicates the current setting for the status bar display. The status bar is the line area at the bottom of the dialog that shows the state of the connection (connect/not connected), if connected, the name of the connection entry on the left and what the status is on the right.	If you click on the arrow on the right end of the status bar, the right part of the status bar changes. This value records the current display selection.	VPN Client main dialog > status bar
AdvancedView	Toggles between Advanced and Simple modes of operation.	Simple Mode = 0 Advanced Mode = 1 (default)	Main menu > Options menu > Advanced/ Simple Mode
MinimizeOnConnect	Controls whether to minimize to a system tray icon upon connection to a VPN device.	0 = Do not minimize 1 = Do minimize (default)	Main menu > Options > Preferences > Hide upon connect
UseWindowSettings	Controls whether to save windows settings.	0 = No 1 = Yes (default)	Main menu > Options > Preferences > Save window settings
ShowTooltips	Controls whether to display the tool tips.	0 = No 1 = Yes (default)	Main menu > Options > Preferences > Enable tooltips
ShowConnectHistory	Controls whether to display the connection history dialog during connection negotiation.	0 = No (default) 1 = Yes	Main menu > Options > Preferences > Enable Connection History Display

DNS Suffixes and the VPN Client—Windows 2000 and Windows XP Only

When a command or program such as **ping server123** passes a hostname without a suffix to a Windows 2000 or Windows XP platform, Windows 2000/XP has to convert the name into a fully-qualified domain name (FQDN). The Windows operating system has two methods for adding suffixes to domain names: Method 1 and Method 2. This section describes these two methods.

Method 1—Primary and Connection-Specific DNS Suffixes

A primary DNS suffix is global across all adapters. A connection-specific DNS suffix is only for a specific connection (adapter), so that each connection can have a different DNS suffix.

Identifying a Primary DNS Suffix

A primary suffix comes from the computer name. To find or assign a primary DNS suffix, use the following procedure according to your operating system:

On Windows 2000

Step 1 On a Windows 2000 desktop, right click the **My Computer** icon, and select **Properties** from the menu.

The System Properties dialog displays.

Step 2 Open the **Network Identification** tab.

The entry next to *Full Computer Name* identifies the computer's name and DNS suffix on this screen, for example, `SILVER-W2KP.tango.dance.com`. The part after the first dot is the primary DNS suffix, in this example: `tango.dance.com`.

Step 3 To change the primary DNS suffix, click **Properties** on the Network Identification tab.

The Identification Changes dialog displays.

Step 4 Click **More...**.

This action displays the DNS Suffix and Net BIOS Computer Name dialog. The *Primary DNS suffix of this computer* entry identifies the primary suffix. You can edit this entry.

On Windows XP

Step 1 Right click **My Computer**, and select **Properties** from the menu.

The System Properties dialog displays.

Step 2 Open the **Computer Name** tab.

The entry next to *Full Computer Name* identifies the computer's name and DNS suffix on this screen (for example, `SILVER-W2KP.tango.dance.com`). The part after the first dot is the primary DNS suffix (in this example: `tango.dance.com`).

Step 3 To change the primary DNS suffix, click **Change** on the Computer Name tab.

The Computer Name Changes dialog displays.

Step 4 Click **More...**.

This action displays the DNS Suffix and Net BIOS Computer Name dialog. The Primary DNS suffix of this computer entry identifies the primary suffix. You can edit this entry.

Identifying a Connection-Specific DNS Suffix

You can identify a connection-specific DNS suffix in one of two ways.

1. The connection-specific DNS value is listed as the DNS suffix for the selected connection on the Advanced TCP/IP Settings dialog.

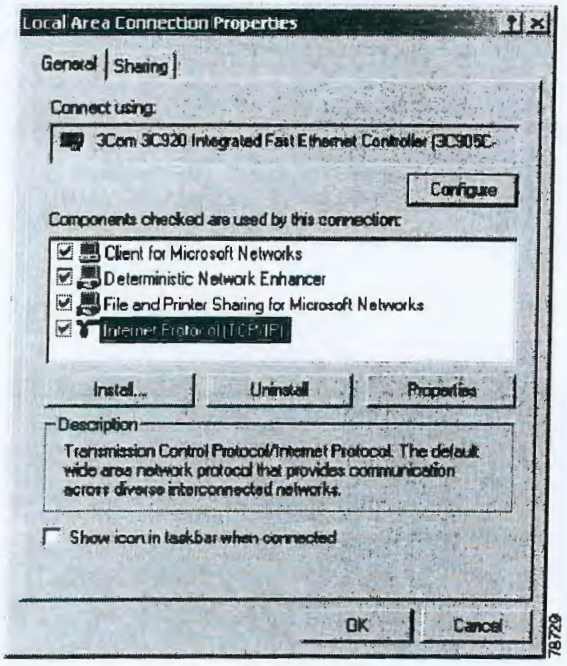
Note The following instructions are for a Windows 2000 platform. There may be slight variations on a Windows XP platform.

To display the Advanced TCP/IP Settings dialog, use the following procedure:

Step 1 Right click the **My Network Places** icon to display the Properties dialog, which lists your connections.

Step 2 Double-click on a connection (for example, **local**) to display its Properties dialog. The connection uses the checked components, such as those shown in Figure 2-1, which shows components of a connection named Local Area Connection.

Figure 2-1 Displaying Properties for a Connection



Step 3 Double-click **Internet Protocol (TCP/IP)** to reveal its properties.

Step 4 Select **Advanced**.

Step 5 Display the **DNS** tab and look at `DNS suffix for this connection` box. If the box is empty, you can have it assigned by the DHCP Server.

a. To identify the connection-specific suffix assigned by the DHCP Server, use the **ipconfig /all** command (Alternative 2, below) and for the DNS Server address.

2. The connection-specific DNS value is listed in the output from the **ipconfig /all** command, executed at the command-line prompt. Look under Windows 2000 IP Configuration for `DNS Suffix Search List`. Under Ethernet Adapter Connection Name, look for `Connection-specific DNS Suffix`.

Method 2—User Supplied DNS Suffix

For this method, you can provide specific suffixes. You can view and change suffixes in the DNS tab of the connection properties page. The Append these DNS suffixes (in order) edit box supplies the name that you can edit. The values you provide here are global to all adapters.

VPN Client Behavior

When the VPN Client establishes a VPN tunnel to the VPN central device (for example, the VPN 3000 Concentrator), the VPN Client uses Method 2 without regard for the method that the Windows platform uses. If the Windows platform is using Method 2, the VPN Client appends the suffix provided by the VPN central device. This is the default behavior and works correctly with no problem.

However if Windows is using Method 1, the VPN Client does not append the primary or connection-specific suffix. To fix this problem, you can set the AppendOriginalSuffix option in the vpnclient.ini file. In Table 2-1, the [DNS] section contains this option:

[DNS]

AppendOriginalSuffix Option=1:

In this case, the VPN Client appends the primary DNS suffix to the suffix provided by the VPN Concentrator. While the tunnel is established, Windows has two suffixes: one provided by the VPN Concentrator and the primary DNS suffix.

AppendOriginalSuffix Option=2:

In this case, the VPN Client appends the primary and connection-specific DNS suffixes to the suffix provided by the VPN Concentrator. While the tunnel is established, Windows has three suffixes: one provided by the VPN Concentrator, the primary DNS suffix, and the connection-specific DNS suffix.

Note If Windows is using Method 2, adding these values to the vpnclient.ini file has no effect.

The VPN Client sets these values every time a tunnel is established and then restores the original configuration when tearing down the tunnel.

Setting Up RADIUS SDI Extended Authentication

You can configure the VPN Client to handle RADIUS SDI authentication the same way it handles "native" SDI authentication, which is more seamless and easier to use. With this configuration, users do not have to deal with the RSA SecurID software interface; the VPN Client software directly interfaces with the RSA SecureID software for the user.

To enable intelligent handling of RADIUS SDI authentication, you must configure one profile (.pcf) parameter and possibly three global (vpnclient.ini) parameters:

- In the vpnclient.ini file, enter the following information. (For complete information on these parameters, see Table 2-1.)
  - RadiusSDI—identifies the configuration section for RADIUS SDI
  - A question sub-string to identify question prompts (e.g. "?")
  - A new PIN sub-string to identify prompts for a new PIN
  - A new passcode sub-string to identify prompts for a new passcode
- In the profile (connection entry) file under the Main section, enter the parameter "RadiusSDI = 1". (See Table 2-2.)

Now when the request comes in to the VPN Client, the software identifies it as a RADIUS SDI extended authentication request and knows how to process the request.

Creating Connection Profiles

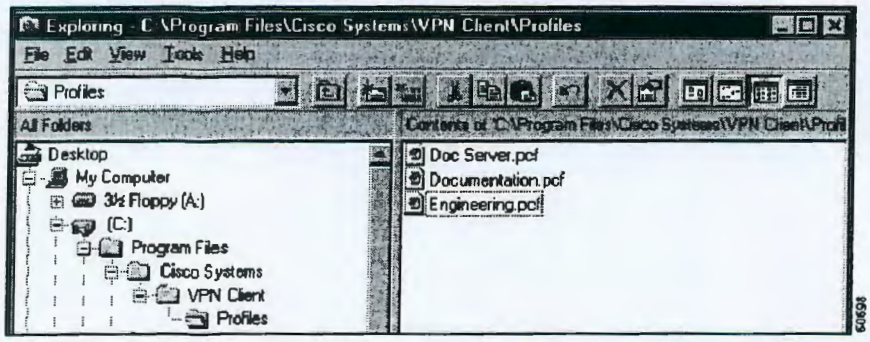
The VPN Client uses parameters that must be uniquely configured for each remote user of the private network. Together these parameters make up a user profile, which is contained in a profile configuration file (.pcf file) in the VPN Client user's local file system in the following directories:

- For Windows platforms—Program Files\Cisco Systems\VPN Client\Profiles (if the software installed in the default location)
- For the Linux, Solaris, and Mac OS X platforms— /etc/CiscoSystemsVPNClient/Profiles/

These parameters include the remote server address, IPSec group name and password, use of a log file, use of backup servers, and automatic Internet connection via Dial-Up Networking. Each connection entry has its own .pcf file. For example, if you have three connection entries, named Doc Server, Documentation, and Engineering, the Profiles directory shows the list of .pcf files.

Figure 2-2 shows the directory structure for the user profile in the Windows platforms.

Figure 2-2 List of .pcf files



Features Controlled by Connection Profiles

A connection profile (.pcf file) controls the following features on all platforms):

- Description of the connection profile
- The remote server address
- Authentication type
- Name of IPSec group containing the remote user
- Group password
- Connecting to the Internet via dial-up networking
- Name of remote user
- Remote user's password
- Backup servers
- Split DNS
- Type of dial-up networking connection
- Transparent tunneling

- TCP tunneling port
- Allowing of local LAN access
- Enabling of IKE and ESP keepalives
- Setting of peer response time-out
- Certificate parameters for a certificate connection
- Setting of certificate chain
- Diffie-Hellman group
- Verification of the DN of a peer certificate
- RADIUS SDI extended authentication setting
- Use of SDI hardware token setting
- Split DNS setting
- Use legacy IKE port setting

A connection profile (.pcf file) controls the following additional features on the Windows platform:

- Dial-Up networking phone book entry for Microsoft
- Command string for connecting through an ISP
- NT domain
- Logging on to Microsoft Network and credentials
- Change the default IKE port from 500/4500 (must be explicitly added)
- Enable Force Network Login, which forces a user on Windows NT, Windows 2000, and Windows XP to log out and then log back in to the network without using cached credentials

Sample .pcf file

Note Connection profiles for the VPN Client are interchangeable between platforms. Keywords that are specific to the Windows platform are ignored by other platforms.

When you open the Doc Server.pcf file, it looks like the example below. This is a connection entry that uses preshared keys. Note that the `enc_` prefix (for example, `enc_GroupPwd`) indicates that the value for that parameter is encrypted.

```
[main]
Description=connection to TechPubs server
Host=10.10.99.30
AuthType=1
GroupName=docusers
GroupPwd=
enc_GroupPwd=158E47893BDCD398BF863675204775622C494B39523E5CB65434D3C851ECF2DCC8BD488857EFA
FDE1397A95E01910CABECCE4E040B7A77BF
EnableISPConnect=0
ISPConnectType=0
ISPConnect=
ISPCommand=
Username=alice
SaveUserPassword=0
UserPassword=
enc_UserPassword=
NTDomain=
```

```
EnableBackup=1
BackupServer=Engineering1, Engineering2, Engineering 3, Engineering4
EnableMSLogon=0
MSLogonType=0
EnableNat=1
EnableLocalLAN=0
TunnelingMode=0
TCPTunnelingPort=10000
CertStore=0
CertName=
CertPath=
CertSubjectName
SendCertChain=0
VerifyCertDN=CN="ID Cert",OU*"Cisco",ISSUER-CN!="Entrust",ISSURE-OU!*"wonderland"
DHGroup=2
PeerTimeOut=90
ForceNetLogin=1
```

You can configure the VPN Client for remote users by creating a profile configuration file for each connection entry and distribute the .pcf files with the VPN Client software. These configuration files can include all, or only some, of the parameter settings. Users must configure those settings not already configured.

You can also distribute the VPN Client to users without a configuration file and let them configure it on their own. In this case, when they complete their configuration using the VPN Client program, they are in effect creating a `.pcf` file for each connection entry, which they can edit and share.

To protect system security you should *not* include key security parameters such as the IPSec group password, authentication username, or authentication password in .pcf files for remote users.

Note Whatever preconfiguring you provide, you must supply users with the information they need to configure the VPN Client. See "Gathering Information You Need" in Chapter 2 of the *VPN Client User Guide* for your platform.

Creating a .pcf file for a Connection Profile

Each user requires a unique configuration file. Use Notepad or another ASCII text editor to create and edit each file. Save as a text-only file with no formatting.

Naming the Connection Profile

For a Windows platform, you can create profile names that contain spaces. However, if you want to distribute profiles to other platforms (Linux, Mac OS X, or Solaris), the name cannot contain spaces.

Connection Profile Configuration Parameters

Table 2-2 lists all parameters, keywords, and values. It also includes the VPN Client parameter name (if it exists) that corresponds to the keyword and where it is configured on the VPN Client GUI.

You can configure each parameter on all VPN Client platforms unless specified.

Table 2-2 .pcf file parameters

.pcf Parameter (Keyword)	VPN Client Parameter Description	Values	VPN Client Configuration Location(s)
[main]	(No VPN Client field) Required keyword to identify main section.	[main] As the first entry in the file, enter exactly as shown.	Does not appear in GUI
Description=	Description A line of text that describes this connection entry. Optional.	Any text. Maximum 246 alphanumeric characters.	Connection Entry> New/Modify
Host=	Remote server address The hostname or IP address of the Cisco remote access server (a VPN device) to which remote users connect.	Internet hostname, or IP address in dotted decimal notation. Maximum 255 alphanumeric characters.	Connection Entry > New/Modify
AuthType=	Authentication type	The authentication type of this user: 1 = Pre-shared keys (default) 3 = Digital Certificate using an RSA signature.	Connection Entry > New/Modify > Authentication
GroupName=	Group Name The name of the IPSec group that contains this user. Used with pre-shared keys.	The exact name of the IPSec group configured on the VPN device. Maximum 32 alphanumeric characters. Case-sensitive.	Connection Entry > New/Modify > Authentication
GroupPwd=	Group Password The password for the IPSec group that contains this user. Used with pre-shared keys. The first time the VPN Client reads this password, it replaces it with an encypted one (enc_GroupPwd).	The exact password for the IPSec group configured on the VPN device. Minimum of 4, maximum 32 alphanumeric characters. Case-sensitive clear text.	Connection Entry > New/Modify > Authentication
encGroupPwd=	The password for the IPSec group that contains the user. Used with preshared keys. This is the scrambled version of the GroupPwd.	Binary data represented as alphanumeric text.	Does not appear in GUI.
EnableISPConnect= (Windows-only)	Connect to the Internet via Dial-Up Networking Specifies whether the VPN Client automatically connects to an ISP before initiating the IPSec connection; determines whether to use PppType parameter.	0 = Disable (default) 1 = Enable The VPN Client GUI ignores a read-only setting on this parameter.	Connection Entry > New/Modify >Dial-Up > Connect to the Internet via dial-up

Table 2-2 .pcf file parameters (continued)

.pcf Parameter (Keyword)	VPN Client Parameter Description	Values	VPN Client Configuration Location(s)
`ISPConnectType= (Windows-only)`	Dial-Up Networking connection entry type Identifies the type to use: ISPConnect or ISPCommand.	0 = ISPConnect (default) 1 = ISPCommand The VPN Client GUI ignores a read-only setting on this parameter.	Connection Entry > New/Modify >Dial-Up > (choosing either DUN or Third Party (command)
`ISPConnect= (Windows-only)`	Dial-Up Networking Phonebook Entry (Microsoft) Use this parameter to dial into the Microsoft network; dials the specified dial-up networking phone book entry for the user's connection. Applies only if EnableISPconnect=1 and ISPConnectType=0.	*phonebook_name* This variable is the name of the phone book entry for DUN – maximum of 256 alphanumeric characters. The VPN Client GUI ignores a read-only setting on this parameter.	Connection Entry > New/Modify >Dial-Up > Microsoft Dial-Up Networking > Phonebook
`ISPCommand= (Windows-only)`	Dial-Up Networking Phonebook Entry (command) Use this parameter to specify a command to dial the user's ISP dialer. Applies only if EnableISPconnect=1 and ISPConnectType=1.	*command string* This variable includes the pathname to the command and the name of the command complete with arguments; for example: `c:\isp\ispdialer.exe dialEngineering` Maximum 512 alphanumeric characters.	Connection Entry > New/Modify >Dial-Up > Third party dialup program > Application
`Username=`	User Authentication: Username The name that authenticates a user as a valid member of the IPSec group specified in `GroupName`.	The exact username. Case-sensitive, clear text, maximum of 32 characters. The VPN Client prompts the user for this value during user authentication.	Connection Entry > New/Modify > Authentication
`UserPassword=`	User Authentication: Password The password used during extended authentication. The first time the VPN Client reads this password, it saves it in the file as the enc_UserPassword and deletes the clear-text version. If SaveUserPassword is disabled, then the VPN Client deletes the UserPassword and does not create an encrypted version. You should only modify this parameter manually if there is no GUI interface to manage profiles.	Maximum of 32 alphanumeric characters, case sensitive.	Connection Entry > New/Modify > Authentication

Table 2-2 .pcf file parameters (continued)

.pcf Parameter (Keyword)	VPN Client Parameter Description	Values	VPN Client Configuration Location(s)
encUserPassword	Scrambled version of the user's password	Binary data represented as alphanumeric text.	Does not appear in GUI.
SaveUserPassword	Determines whether or not the user password or its encrypted version are valid in the profile. This value is pushed down from the VPN device.	0 = (default) do not allow user to save password information locally. 1 = allow user to save password locally.	Does not appear in GUI.
NTDomain= (Windows-only)	User Authentication: Domain The NT Domain name configured for the user's IPSec group. Applies only to user authentication via a Windows NT Domain server.	NT Domain name. Maximum 14 alphanumeric characters. Underbars are not allowed.	Connection Entry > New/Modify
EnableBackup=	Enable backup server(s) Specifies whether to use backup servers if the primary server is not available.	0 = Disable (default) 1 = Enable	Connection Entry > New/Modify > Backup Servers
BackupServer=	(Backup server list) List of hostnames or IP addresses of backup servers. Applies only if EnableBackup=1.	Legitimate Internet hostnames, or IP addresses in dotted decimal notation. Separate multiple entries by commas. Maximum of 255 characters in length.	Connection Entry > New/Modify > Backup Servers
EnableMSLogon= (Windows-only)	Logon to Microsoft Network. Specifies that users log on to a Microsoft network. Applies only to systems running Windows 9x.	0 = Disable 1 = Enable (Default)	Connection Entry > New/Modify > Microsoft Logon This is available only on Windows 98 and Windows ME.
MSLogonType= (Windows-only)	Use default system logon credentials. Prompt for network logon credentials. Specifies whether the Microsoft network accepts the user's Windows username and password for logon, or whether the Microsoft network prompts for a username and password. Applies only if EnableMSLogon=1.	0 = (default) Use default system logon credentials; i.e., use the Windows logon username and password. 1 = Prompt for network logon username and password.	Connection Entry > New/Modify > Microsoft Logon This is available only on Windows 98 and Windows ME.

Table 2-2 .pcf file parameters (continued)

.pcf Parameter (Keyword)	VPN Client Parameter Description	Values	VPN Client Configuration Location(s)
EnableNat=	Enable Transparent Tunneling. Allows secure transmission between the VPN Client and a secure gateway through a router serving as a firewall, which may also be performing NAT or PAT.	0 = Disable 1 = Enable (default)	Connection Entry > New/Modify > Transport
TunnelingMode=	Specifies the mode of transparent tunneling, over UDP or over TCP; must match that used by the secure gateway with which you are connecting.	0 = UDP (default) 1 = TCP	Connection Entry > New/Modify > Transport
TCPTunnelingPort=	Specifies the TCP port number, which must match the port number configured on the secure gateway.	Port number from 1 through 65545 Default = 10000	Connection Entry> New/Modify > Transport
EnableLocalLAN=	Allow Local LAN Access. Specifies whether to enable access to resources on a local LAN at the Client site while connected through a secure gateway to a VPN device at a central site.	0 = Disable (default) 1 = Enable	Connection Entry > New/Modify > Transport
PeerTimeout=	Peer response timeout The number of seconds to wait before terminating a connection because the VPN device on the other end of the tunnel is not responding.	Number of seconds Minimum = 30 seconds Maximum = 480 seconds Default = 90 seconds	Connection Entry > New/Modify > Transport
CertStore=	Certificate Store Identifies the type of store containing the configured certificate.	0 = No certificate (default) 1 = Cisco 2 = Microsoft The VPN Client GUI ignores a read-only (!) setting on this parameter. (See note)	Windows GUI Does not appear in GUI. You can view on Certificates tab. Mac OS X GUI Connection Entry > New/Modify > Transport

Note Normally, if a parameter is marked as read only, the GUI disables the checkbox or edit box so users can not change the value of the parameter. However, this is not true for Certificate parameters. These values cannot be overwritten in the file. Users can change them in the GUI display, but these changes are not saved.

CertName=	Certificate Name Identifies the certificate used to connect to a VPN device.	Maximum 129 alphanumeric characters The VPN Client GUI ignores a read-only setting on this parameter.	Certificates > View

Table 2-2 .pcf file parameters (continued)

.pcf Parameter (Keyword)	VPN Client Parameter Description	Values	VPN Client Configuration Location(s)
CertPath=	The complete pathname of the directory containing the certificate file.	Maximum 259 alphanumeric characters The VPN Client GUI ignores a read-only setting on this parameter.	Certificates > Import
CertSubjectName	The fully qualified distinguished name (DN) of certificate's owner. If present, the VPN Dialer enters the value for this parameter.	Either do not include this parameter or leave it blank. The VPN Client GUI ignores a read-only setting on this parameter.	Certificates > View
CertSerialHash	A hash of the certificate's complete contents, which provides a means of validating the authenticity of the certificate. If present, the VPN Dialer enters the value for this parameter.	Either do not include this parameter or leave it blank. The VPN Client GUI ignores a read-only setting on this parameter.	Certificates > View
SendCertChain	Sends the chain of CA certificates between the root certificate and the identity certificate plus the identity certificate to the peer for validation of the identity certificate.	0 = disable (default) 1 = enable	• Connection Entry > New/Modify • Certificates > Export
VerifyCertDN	Prevents a user from connecting to a valid gateway by using a stolen but valid certificate and a hijacked IP address. If the attempt to verify the domain name of the peer certificate fails, the client connection also fails.	Include any certificate DN values of both subject and issuer: You can use all valid ASCII characters including -_@<>()., as well as wildcards. See example:	Does not appear in GUI

```
Example: VerifyCertDN=CN="ID Cert",OU*"Cisco",ISSUER-CN!="Entrust",ISSUER-OU!*"wonderland"
CN="ID Cert"—Specifies an exact match on the CN.
OU*"Cisco"—Specifies any OU that contains the string "Cisco".
ISSUER-CN!"Entrust"—Specifies that the Issuer CN must not equal "Entrust".
ISSUER-OU!*"wonderland"—Specifies that the Issuer OU must not contain "wonderland".
```

DHGroup	Allows a network administrator to override the default group value on a VPN device used to generate Diffie-Hellman key pairs.	1 = modp group 1 2 = modp group 2 (default) 5 = modp group 5 Note: This value is preset only for pre-shared keys; for a certificate-authenticated connection, the DHGroup number is negotiated.	Does not appear in GUI

Table 2-2 .pcf file parameters (continued)

.pcf Parameter (Keyword)	VPN Client Parameter Description	Values	VPN Client Configuration Location(s)
RadiusSDI	Tells the VPN Client to assume that Radius SDI is being used for extended authentication (XAuth).	0 = No (default) 1 = Yes	If this parameter is enabled, the prompts in the GUI for SDI authentication are from Radius SDI and configured using parameters in the vpnclient.ini file.
SDIUseHardwareToken	Enables a connection entry to avoid using RSA SoftID software.	0 = Yes, use RSA SoftID (default) 1 = No, ignore RSA SoftID software installed on the PC.	Does not appear in GUI
ableSplitDNS	Determines whether the connection entry is using splitDNS, which can direct packets in clear text over the Internet to domains served through an external DNS or through an IPSec tunnel to domains served by a corporate DNS. This feature is configured on the VPN 3000 Concentrator and is used in a split-tunneling connection. **Note** You must also enable this feature on the VPN device you are connecting to.	0 = No 1 = Yes (default)	Does not appear in GUI

Table 2-2 .pcf file parameters (continued)

.pcf Parameter (Keyword)	VPN Client Parameter Description	Values	VPN Client Configuration Location(s)
`UseLegacyIKEPort`	Changes the default IKE port from 500/4500 to dynamic ports to be used during all connections. You must explicitly enter this parameter into the .pcf file.	0 = Turn off the legacy setting; use dynamic ports with cTCP. 1 = (default) Maintain the legacy setting 500/4500. This lets TCP/UDP work easily with VPN devices that support cTCP. This setting enables interoperability with VPN devices that expect the VPN Client to use static port assignments. Enabling this parameter inhibits interoperability with certain versions of Windows.	Does not appear in GUI
`ForceNetlogin (windows-only)`	Enables the Force Net Login feature for this connection profile.	0 = Do not force the user to log out and log in (default). 1 = Force user to log out when the Wait time is reached unless an option is selected. 2 = Disconnect VPN session upon reaching the Wait time unless an option is selected. 3 = Wait for the user to select Connect or Disconnect.	Does not appear in GUI

Distributing Configured VPN Client Software to Remote Users

When you have created the VPN Client profile configuration file, you can distribute it to users separately or as part of the VPN Client software.

Separate Distribution

To distribute the configuration file separately and have users import it to the VPN Client after they have installed it on their PCs, follow these steps:

Note For the Mac OS X platform, the configuration file is placed in the Profiles folder before the VPN Client is installed. See Chapter 2 of the *VPN Client User Guide for Mac OS X* for more information.

Step 1 Distribute the appropriate profile files to users on whatever media you prefer.

Step 2 Supply users with necessary configuration information.

Step 3 Instruct users to:

a. Install the VPN Client according to the instructions in the *VPN Client User Guide* for your platform.

b. Start the VPN Client and follow the instructions in Chapter 5 of the *VPN Client User Guide* for your platform. See the section "Importing a VPN Client Configuration File." (Windows-only)

c. Finish configuring the VPN Client according to the instructions in Chapter 4of the *VPN Client User Guide* for your platform.

d. Connect to the private network, and enter parameters according to the instructions in Chapter 5 of the *VPN Client User Guide* for your platform.

Distribution with the VPN Client Software

If the vpnclient.ini file is bundled with the VPN Client software when it is first installed, it automatically configures the VPN Client during installation. You can also distribute the profile files (one .pcf file for each connection entry) as preconfigured connection profiles for automatic configuration.

To distribute preconfigured copies of the VPN Client software to users for installation, perform the following steps:

Step 1 Copy the VPN Client software files from the distribution CD-ROM into each directory where you created an vpnclient.ini (global) file and separate connection profiles for a set of users.

Note For the Mac OS X platform, preconfigured files are placed in the Profiles and Resources folders before the VPN Client is installed. The vpnclient.ini file is placed in the installer directory. See Chapter 2 of the *VPN Client User Guide for Mac OS X* for more information.

Step 2 Prepare and distribute the bundled software.

CD-ROM or network distribution: Be sure the vpnclient.ini file and profile files are in the same directory with all the CD-ROM image files. You can have users install from this directory through a network connection; or you can copy all files to a new CD-ROM for distribution; or you can create a self-extracting ZIP file that contains all the files from this directory, and have users download it, and then install the software.

Step 3 Supply users with any other necessary configuration information and instructions. See Chapter 2 of the *VPN Client User Guide* for your platform.

Data Sheet

Cisco Secure **Access Control Server**
Version 3.2 for Windows

The Cisco® Secure Access Control Server (ACS) provides a comprehensive identity networking solution and secure user experience for Cisco intelligent information networks. It is the integration and control layer among all enterprise users, administrators, and the resources of the network infrastructure.

Introduction

With the ever-increasing methods of accessing networks today, security breaches and uncontrolled user access are becoming a primary concern. With the increased usage of the Internet, network administrators are challenged to identify devices as well as users, to guarantee secure transactions, and to prevent the spread of viruses and denial-of-service (DoS) attacks. These challenges exist not only at the perimeter but also inside a network. The wide adoption of 802.11 wireless LAN and the high-speed, always-on Internet connections (such as DSL and cable) are only making these challenges more severe from within an organization's network. Investing in identity networking technologies that can mitigate these ubiquitous security vulnerabilities is worth considering from both an operational and a return-on-investment perspective.

These changing network dynamics and increased security threats have driven new opportunities in access control management solutions. According to the latest report by IDC, security authentication, authorization, and accounting (AAA) solutions represent the fastest growing segment in the security software market, with a 22-percent compound annual growth rate (CAGR) throughout 2006. As AAA becomes more available throughout the network and the requirement to control user access expands beyond simple dialup, new trends (including expanded authentication, tracking, and audit management) are emerging that require identity-networking solutions to be pervasive, scalable, and relevant throughout the network. In particular, identity networking solutions must address user access from an expanding set of network access points (that is, voice, video, virtual private network [VPN], firewalls, content, storage, wireless, DSL, and cable).

Stronger forms of authentication, such as public key infrastructure (PKI) and two-factor authentication, are now being used to control users accessing corporate resources from public networks and VPN. Network administrators are looking for solutions that provide flexible authorization policies that are tied not only to who the user is at the end point, but also to the service type that the user has access to. Lastly, the ability to track and monitor the behavior of network users, in a manner independent from the access medium through which users choose to connect, is of primary importance in isolating unwanted and excessive use of valuable network resources.

Identity networking and the ability to provision the network to user- or device-specific services are now possible with the Cisco Secure ACS. The Cisco Secure ACS is a highly scalable, high-performance access control server that operates as a centralized RADIUS server or TACACS+ server. The Cisco Secure ACS extends access security by combining authentication, user or administrator access, and policy control from a centralized identity networking solution, thereby allowing for greater flexibility and mobility, increased security, and user productivity gains. The Cisco Secure ACS greatly reduces the administrative and management burden involved in scaling user and network administrative access to your network. By using a central database for all user accounts, the Cisco Secure ACS centralizes the control of all user privileges and distributes them to hundreds or thousands of access points throughout the network. As an accounting service, the Cisco Secure ACS reduces IT operating costs by providing detailed reporting and monitoring capabilities of network users' behavior and by keeping a record of every access connection and device configuration change across the entire network.

The Cisco Secure ACS provides a centralized identity networking solution and simplified user management experience across all Cisco devices and security-management applications. The Cisco Secure ACS ensures enforcement of assigned policies by allowing network administrators to control:

- Who can log in to the network
- What privileges each user has in the network
- What accounting information is recorded in terms of security audits or account billing
- What access and command controls are enabled for each configuration administrator

The Cisco Secure ACS supports a wide array of access connection types, including wired and wireless LAN, dialup, broadband, content, storage, voice over IP (VoIP), firewalls, and VPNs.

The Cisco Secure ACS is a key component of the Cisco Identity-Based Networking Services (IBNS) architecture. Cisco IBNS is based on port security standards such as 802.1X (IEEE standard for port-based network access control) and Extensible Authentication Protocol (EAP) to extend security AAA inside the LAN when, historically, access control was managed at the perimeter of the network. New policy controls (such as per-user quotas and virtual LANs [VLANs]) are possible with this new architecture, now that the authenticator (switch or wireless access point) becomes a RADIUS client capable of querying an AAA server for these controls. Cisco IBNS offers greater flexibility and mobility to stratified users by combining access control and user profiles. This combination enhances secure network connectivity, services, and applications, allowing enterprises to increase user productivity and reduce operating costs. Cisco IBNS, combined with the Cisco Secure ACS, allows the network administrator to implement true, identity-based network access control and policy enforcement at the user and port levels. It provides user and device identification with policies that are centrally created and administered by the Cisco Secure ACS while using secure and reliable strong authentication technologies (such as one-time-token or smartcard authentication methods).

In addition to offering dynamic, port-based authentication for securing network access based on an identity, the Cisco IBNS architecture, in conjunction with the Cisco Secure ACS, offers the following additional per-user or per-device policy assignments:

- Time-of-day and day-of-week restrictions
- Network access server IP filter that restricts user and switch access based on network-access-server IP address
- Media Access Control (MAC) address filtering that restricts authentication of devices based on their MAC addresses
- Per-user VLANs
- Per-user ACLs

Up to version 3.1, Cisco Secure ACS has been available as software for Windows installations. Version 3.2 introduces a new, secure, appliance-based offering for Cisco Secure ACS. The Cisco Secure ACS Solution Engine, a 1-rack-unit (1-RU) security-hardened appliance with a preinstalled Cisco Secure ACS license, provides essentially the same features and functions as the Cisco Secure ACS for Windows, in a dedicated, application-specific appliance package.

The Cisco Secure ACS Solution Engine provides a zero-touch installation and highly reliable AAA solution with increased total-cost-of-ownership protection through high availability and simplified day-to-day operation of the Cisco Secure ACS service. The Cisco Secure ACS Solution Engine also includes additional features specific to its operation and management. For more information, refer to the Cisco Secure ACS Solution Engine data sheet.

Cisco Secure ACS 3.2 adds new Extensible Authentication Protocol (EAP) enhancements to support Protected EAP (PEAP) for Microsoft Windows clients. PEAP retains the security benefits of Cisco EAP wireless (LEAP) while providing more extensibility and support for one-time-token authentication. PEAP is a draft in the Internet Engineering Task Force (IETF) Internet Standards group. Cisco Secure ACS Version 3.2 adds support for machine authentication (using EAP-Transport Layer Security [TLS] or PEAP) on secure 802.1X ports, further extending the Cisco IBNS scope. This capability is crucial for device control access in an 802.1X secure environment where port access is blocked until a user has successfully been identified behind an 802.1X-provisioned port. Also new to Cisco Secure ACS 3.2 are EAP-TLS enhancements that provide expanded PKI authentication into open-database-connectivity (ODBC) databases and improved EAP-TLS domain search capabilities.

Features and Benefits

New Features for Cisco Secure ACS Version 3.2

- *PEAP support for Microsoft Windows clients*—Cisco Secure ACS 3.2 adds support for Microsoft PEAP supplicants available today for Windows 98, NT, 2000, and XP. The Microsoft PEAP supplicant supports client authentication only by MS-CHAPv2, as compared to Cisco PEAP supplicant (available through Cisco Aironet® wireless adapters), which supports client authentication by logon passwords or one-time passwords. Unlike the Microsoft PEAP supplicant the Cisco PEAP supplicant provides support for one-time-token authentication and powerful extensibility of non-MSCHAP end-user databases such as Lightweight Directory Access Protocol (LDAP), Novell Directory Service (NDS), and ODBC. Cisco Secure ACS 3.2 allows selection of Microsoft PEAP or Cisco PEAP from its EAP configuration page.
- *LDAP multithreading*—Cisco Secure ACS 3.2 is now capable of processing multiple LDAP authentication requests in parallel, as opposed to the sequential processing mechanism employed in pre-3.2 versions. This feature greatly improves Cisco Secure ACS performance in "task-intensive" configurations such as in wireless deployments.
- *EAP-TLS enhancements*—New EAP-TLS enhancements have been added to Cisco Secure ACS 3.2 that further extend Cisco Secure ACS PKI capabilities. EAP-TLS authentication against ODBC user databases and EAP-TLS silent-session-resume support are among the new added capabilities. Similar to the PEAP silent session resume, EAP-TLS silent session resume prevents users from reauthenticating during a RADIUS session timeout. This feature is particularly advantageous in wireless applications where users are constantly mobile. The duration of the EAP-TLS silent session timeout is configurable from the Cisco Secure ACS GUI.

- *Machine authentication support*—Cisco Secure ACS 3.2 adds the 802.1X machine authentication option using either PEAP with MSCHAPv2 implementation (PEAP-EAP-MSCHAPv2) or EAP-TLS. Machine authentication is used at boot time to authenticate and communicate with Windows domain controllers when connecting to 802.1X secure ports. Machine authentication allows pulling down machine group policies from the Windows Active Directory independent of a subsequent interactive user authentication session.
- *EAP mixed configurations*—Cisco Secure ACS 3.2 now supports the following EAP types: PEAP-EAP-GTC (Cisco PEAP), PEAP-EAP-MSCHAPv2 (Microsoft PEAP), EAP-TLS, EAP message digest algorithm 5 (MD5), and Cisco EAP Wireless (LEAP). Cisco Secure ACS 3.2 allows flexible EAP settings (one or several EAP types can be selected concurrently), allowing Cisco Secure ACS to intelligently process EAP authentications, depending on the nature of the 802.1X supplicant presented by the end users.
- *Accounting support for Cisco Aironet wireless access points*—Cisco Secure ACS 3.2 now supports user-based accounting from Cisco Aironet wireless access points when they are configured as RADIUS (Cisco Aironet Access Point) AAA clients.
- *Downloadable access control lists (ACLs) for VPN users*—Cisco Secure ACS 3.2 extends per-user access-control-list support to Cisco VPN solutions (in addition to the current support for Cisco PIX® Firewall solutions). With this option, administrators can define ACLs of any length, for a user or group of users within the Cisco Secure ACS GUI. Cisco VPN 3000 Concentrator v4.0 is required for this feature.

Cisco Secure ACS Benefits

Cisco Secure ACS is a powerful access control server with many high-performance and scalability features for any organization growing its WAN or LAN connectivity:

- *Ease of use*—A Web-based user interface simplifies and distributes configuration for user profiles, group profiles, and Cisco Secure ACS configuration.
- *Scalability*—Cisco Secure ACS is built to support large networked environments with support for redundant servers, remote databases, and user database backup services.
- *Extensibility*—LDAP authentication forwarding supports the authentication of user profiles stored in directories from leading directory vendors, including Sun, Novell, and Microsoft.
- *Management*—Windows Active Directory and Windows NT database support consolidates Windows username and password management, and uses the Windows Performance Monitor for real-time statistics viewing.
- *Administration*—Different access levels for each Cisco Secure ACS administrator—and the ability to group network devices—enable easier control and maximum flexibility to facilitate enforcement and changes of security policy administration over all the devices in a network.
- *Product flexibility*—Because Cisco IOS® Software has embedded support for AAA, Cisco Secure ACS can be used across virtually any network access server that Cisco sells. (The Cisco IOS Software release must support RADIUS or TACACS+.)
- *Protocol flexibility*—Cisco Secure ACS includes simultaneous TACACS+ and RADIUS support for a flexible solution with VPN or dial support at the origin and termination of IP Security (IPSec) and Point-to-Point Tunneling Protocol (PPTP) tunnels.
- *Integration*—Tight coupling with Cisco IOS routers and VPN solutions provides features such as Multichassis Multilink Point-to-Point Protocol and Cisco IOS command authorization.

19.430

- *Third-party support*—Cisco Secure ACS offers token server support for any OTP vendor that provides an RFC-compliant RADIUS interface (such as RSA, PassGo, Secure Computing, ActiveCard, Vasco, and CryptoCard).
- *Control*—Cisco Secure ACS provides dynamic quotas for time-of-day, network usage, number of logged sessions, and day-of-week access restrictions.

System Requirements

Cisco Secure ACS is available in two options: Cisco Secure ACS Windows and Cisco Secure ACS Solution Engine—a 1-RU security-hardened appliance with a preinstalled Cisco Secure ACS license

Hardware Requirements

For implementation of Cisco Secure ACS Windows, your Windows Server must meet the following minimum hardware requirements:

- Pentium processor, 550 MHz or faster
- 256 MB RAM
- 250 MB free disk space, more if you are running your database on the same device
- Minimum resolution of 800 x 600 with 256 colors

The Cisco Secure ACS Solution Engine is available on a Cisco 1111 platform with the following specifications:

- Pentium IV processor, 2.66 GHz
- 1 GB RAM
- 40 GB free disk space
- 2 built-in 10/100 Ethernet controllers
- 1 floppy disk drive
- 1 CD-ROM drive

Device and User Directory Compatibility

A complete list of minimum system and software requirements for devices, browsers, and user directories compatible with Cisco Secure ACS 3.2 is found in the *Supported and Interoperable Devices and Software Tables for Cisco Secure ACS v3.2* document published with Cisco Secure ACS v3.2 user guides.

Ordering Information

Cisco Secure ACS is available for purchase through regular Cisco sales and distribution channels worldwide. Cisco Secure ACS Windows includes all the necessary components needed for an independent installation on a Microsoft Windows workstation. Cisco Secure ACS Solution Engine is shipped with a preinstalled Cisco Secure ACS software license.

Data Sheet

Cisco Secure **Access Control Server** Solution Engine

The Cisco® Secure Access Control Server (ACS) provides a comprehensive identity networking solution and secure user experience for Cisco intelligent information networks. It is the integration and control layer among all enterprise users, administrators, and the resources of the network infrastructure. The Cisco Secure ACS Solution Engine adds new security improvements, simplified management, and reduced total cost of ownership (TCO) for the operation of the underlying ACS service.

Introduction

The Cisco Secure ACS Solution Engine is a high-performance and highly scalable user and administrative access control solution that operates as a centralized RADIUS or TACACS+ server system for the Cisco 1111 platform. Packaged in a dedicated and secure 1-rack-unit (1-RU) hardened appliance, the Cisco Secure ACS Solution Engine provides a reduced-configuration, plug and play solution, and highly reliable platform with the unique ability to protect existing networking infrastructure through fully Web-based remote-access and configuration capabilities.

The need for security appliances is rapidly increasing in today's IT space. Security, convenience, and ease of installation and troubleshooting are the important advantages of security appliances compared to the many software-based security applications that exist in the marketplace today. The innovative, new, 1-RU, security-hardened Cisco Secure ACS Solution Engine was designed to specifically alleviate the security issue with a closed-device design that makes it substantially more difficult for intruders to penetrate than an open-platform system.

Security appliances provide an all-in-one approach that simplifies product selection, product integration, and ongoing support. By combining all necessary operating system installation and patching with the ACS software service, customers can avoid maintaining software versioning and proliferation of servers, patches, and operating system (OS) maintenance issues. This is particularly important in large networking environments where security solutions are required in remote sites with no IT professionals present to regularly manage and upgrade these solutions. In addition, a security appliance greatly simplifies support and troubleshooting in failure modes, hence enabling quick service restoration (through a one-stop support contact)—an important consideration, especially when the security application is mission-critical, a situation that is true with security authentication, authorization, and accounting (AAA) applications.

Changing network dynamics and increased security threats have influenced new opportunities in access control management solutions. As AAA becomes more relevant and the requirement to

control user access expands beyond just dialup, new trends (including expanded authentication, tracking, and audit management) are emerging that require identity-networking solutions to be pervasive, scalable, and available throughout the network.

Cisco Secure ACS extends access security by combining authentication, user or administrator access, and policy control from a centralized location, allowing for greater flexibility and mobility, increased security, and user productivity gains. As an accounting service, the Cisco Secure ACS Solution Engine reduces IT operations costs by providing detailed reporting and monitoring capabilities of network users' behavior and by keeping a record of every access connection and device configuration change across the entire network.

Cisco Secure ACS provides a centralized identity networking solution and simplified user-management experience across all Cisco devices and security-management applications. Cisco Secure ACS ensures enforcement of assigned policies by allowing network administrators to control:

- Who can log in to the network
- What privileges each user has in the network
- What accounting information is recorded in terms of security audits or account billing
- What access and command controls are enabled for each configuration administrator

Like the Cisco Secure ACS for Windows, the Cisco Secure ACS Solution Engine supports a wide array of access connection types, including wired or wireless LAN, dialup, broadband, content, storage, voice over-IP (VoIP), firewall, and virtual private networks (VPNs).

Cisco Secure ACS Solution Engine Highlights

The Cisco Secure ACS Solution Engine is a highly secure, OS-independent, and dedicated platform that offers a highly manageable access control solution with an increasingly reduced setup and troubleshooting time. The Cisco Secure ACS Solution Engine provides Plug and Play deployment, a highly reliable AAA solution, and increased TCO protection through the high availability and simplified day-to-day operation and management of the Cisco Secure ACS service. It provides the same features and functions as the Cisco Secure ACS for Windows, in a dedicated, security-hardened, application-specific appliance package. Customers with existing Windows-based Cisco Secure ACS deployments can add or upgrade to Cisco Secure ACS Solution Engines without any effect on existing AAA configurations, including remote logging and replication configurations. More information about the latest Cisco Secure ACS features is available from the Cisco Secure ACS for Windows data sheet.

To ensure the high-security posture of the Cisco Secure ACS Solution Engine, additional functions specific to operating and managing the Cisco Secure ACS Solution Engine are provided. Additionally, a Cisco Secure ACS remote agent is available with each Cisco Secure ACS Solution Engine to enable remote logging and Windows authentication. Forwarding all accounting data from the solution engine to a remote agent preserves disk space on the solution engine. It also improves AAA performance by eliminating the frequent and time-consuming disk writes required for local logging on the solution engine. Also, because a Cisco Secure ACS Solution Engine is never a member of a Microsoft Windows domain, the Cisco Secure ACS remote agent establishes the necessary Windows domain trust relationships for Windows-based authentication.

Table 1 lists additional functions provided by the Cisco Secure ACS Solution Engine. These functions are not available from the Cisco Secure ACS for Windows software product.

Table 1 Functions Provided by the Cisco Secure ACS Solution Engine

Hardened underlying operating system	• The Cisco Secure ACS Solution Engine is dedicated to run only the Cisco Secure ACS service, thereby preventing any appliance-based OS changes, additions, or configuration modifications.
Serial console interface	• A serial console interface is provided on the Cisco Secure ACS Solution Engine for initial configuration, subsequent management of IP connections, access to the Cisco Secure ACS HTML interface, and application of upgrade and recovery procedures. • The serial console interface supports both serial line and Telnet connections through which the Cisco Secure ACS service can be reimaged, reloaded, and rebooted, both locally and remotely.
Solution Engine-specific management tools	• Integrated into the existing Cisco Secure ACS HTML interface, Solution Engine-specific management tools provide generic appliance-management capabilities, including backup, recovery, software upgrades, monitoring, maintenance, and troubleshooting functions. • The Cisco Secure ACS HTML interface is accessed though a secured Secure Sockets Layer (SSL)-based connection.
Cisco Secure ACS remote agent	• The Cisco Secure ACS remote agent provides two functions: authentication against Windows domains and remote logging capabilities of user accounting records. • Administrators can provision primary and backup Cisco Secure ACS remote agents in distributed Cisco Secure ACS configurations.
Port-based packet filtering	• The Cisco Secure ACS Solution Engine implements a packet-filtering service to block traffic on all but the necessary Cisco Secure ACS-specific TCP and UDP ports.
Network Timing Protocol (NTP) support	• The Cisco Secure ACS Solution Engine has built-in NTP functions to maintain network timing synchronization and consistency with other Cisco Secure ACS appliances or network devices.

Cisco Secure ACS Solution Engine-Specific Benefits

In addition to the many benefits the Cisco Secure ACS solution brings in controlling user and administrative AAA inside your network, the Cisco Secure ACS Solution Engine, with its 1-RU hardened form factor, adds specific security and operational advantages in the following areas:

- *Security*—With a security-hardened service focused on running exclusively the Cisco Secure ACS service, the solution engine significantly increases the security posture of the Cisco Secure ACS system. All solution engine services and ports not used by the Cisco Secure ACS service are disabled to secure access to the Cisco Secure ACS Solution Engine.
- *Plug and Play solution*—The Cisco Secure ACS Solution Engine provides a record service uptime before starting to configure the Cisco Secure ACS service.
- *Manageability*—With a dedicated, exclusive, and complete Cisco Secure ACS solution, the appliance greatly simplifies manageability and support of the Cisco Secure ACS service while removing the necessity to manage any UNIX or Windows network operating systems.
- *Supportability*—With no external services or applications (other than the Cisco Secure ACS service) allowed to be installed on the solution engine, the support and the day-to-day management of the Cisco Secure ACS Solution Engine are greatly simplified.

- *Reliability*—Enabling only the services that are required by Cisco Secure ACS allows an increase in overall reliability and security of the Cisco Secure ACS service.
- *TCO*—With a turnkey security-hardened solution engine that is easily deployed, Cisco is able to guarantee full support, maintenance, and serviceability of the overall Cisco Secure ACS system—not just the Cisco Secure ACS software running on various hardware configurations, supported by third-party vendors.
- *Migration from Cisco Secure ACS UNIX*—The Cisco Secure ACS Solution Engine provides a suitable alternative for Cisco Secure ACS UNIX customers not willing to install or manage Cisco Secure ACS on the Windows OS.

System Requirements

Hardware Requirements

The Cisco Secure ACS Solution Engine is available on Cisco 1111 platforms with the following specifications:

- Pentium IV processor, 2.66 GHz
- 1 GB RAM
- 40 GB free disk space
- Two built-in 10/100 Ethernet controllers
- 1 floppy disk drive
- 1 CD-ROM drive

The Cisco Secure ACS remote agent is available in a Windows version that can be installed on a Windows 2000 Server (Windows Domain Controller or Member Server supported).

The computer running Cisco Secure ACS remote agent for Windows must meet the following minimum hardware requirements:

- Pentium III processor, 550 MHz or faster
- 256 MB RAM
- 250 MB free disk space

Ordering Information

The Cisco Secure ACS Solution Engine is available for purchase through normal Cisco sales and distribution channels worldwide. The Cisco Secure ACS Solution Engine is shipped with a preinstalled Cisco Secure ACS Software license.

<BODY><XMP>--
-- Title: Fibre Channel Switch MIB, Version 4.0
--
-- This is specified based on SMIv1, mainly to ensure that the
   specification
-- can be parsed easily by off-the-shelf network management product in
-- the market.
--
-- Changes since the last release (v3.0):
--
-- swAdmStatus has new enumeration 'switchReboot'.
-- swEndDeviceRlsTable has header description.
-- swNbMyPort, swNbRemPort, swFcPortIndex, swTrunkPortIndex,
   swTrunkMaster,
-- swTrunkGrpMaster enumerations are removed for port numbers.
-- swFwActs has new enumeration for e-mail alerts.
-- swFCPortType has new enumerations.
-- swPortTrunked description is modified to reflect enumeration.
-- swBlmPerfAlpaCRCCnt description had a spelling mistake and is
   corrected.
-- swBlmPerfEEDid description is changed to add more info.
-- swFwDefaultInBetweenActs and swFwDefaultInBetweenActs are included
   in
-- SwFwClassAreaEntry.
-- swEventNumEntries syntax is changed.
-- swEventIndex syntax is changed.
-- swFCPortSpeed description is changed.
-- swFlashDLAdmStatus now has description for swCurrent (1)
   enumeration
-- and a note about initializing to 0 is removed since the
-- default value is 1 (swCurrent).
--
-- Major changes since the last release (V2.2):
--
-- Added the Table Related to Bloom Performance.
-- Added the swTrunkPortTable.
-- Added the swTrunkGrpTable.

Customer Support

This appendix reviews the EMC process for detecting and resolving software problems, and provides essential questions that you should answer before contacting the EMC Customer Support Center.

This appendix covers the following topics:

Overview of Detecting and Resolving Problems

EMC software products are supported directly by the EMC Customer Support Center in the United States.

EMC uses the following process to resolve customer problems with its software products (Figure F-1).

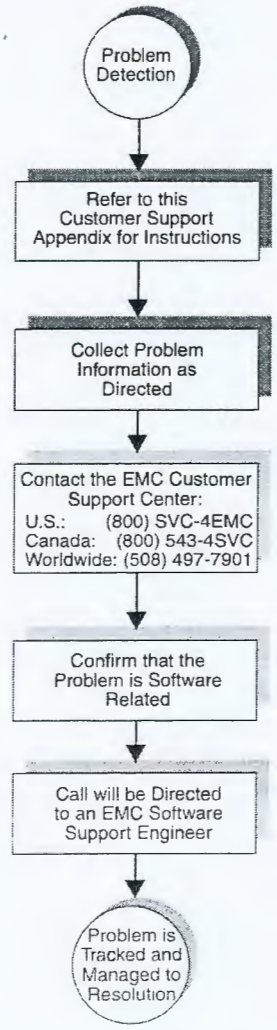

Figure F-1 Problem Detection and Resolution Process

Troubleshooting the Problem

Please perform the relevant diagnostic steps before you contact the EMC Customer Support Center:

1. Read the documentation carefully.
2. Reconstruct the events leading up to the problem and describe them in writing.
3. Run some test cases to reproduce the problem.

If you encounter a problem that requires technical programming or analysis, call the nearest EMC office or contact the EMC Customer Support Center at one of the following numbers:

United States: **(800) 782-4362 (SVC-4EMC)**

Canada: **(800) 543-4782 (543-4SVC)**

Worldwide: **(508) 497-7901**

Please do not request a specific support representative unless one has already been assigned to your particular system problem.

For additional information on EMC products and services available to customers and partners, refer to the EMC Powerlink website at:

```
http://powerlink.EMC.com
```

Before Calling the Customer Support Center

Have the following information available before calling the Customer Support Center or your support representative (if one has been assigned to you):

- ❑ Your company name
- ❑ Your name
- ❑ Your phone number
- ❑ For an existing problem, the problem tracking system ID, if one was previously assigned to the problem by a support representative
- ❑ For an MVS problem, the JESLOG, SYSPRINT, all STDOUT DD members of the server job output and similar output for the client, and the relevant portion of the SYSLOG

Documenting the Problem

If the EMC Customer Support Center requests information regarding the problem, please document it completely, making sure to include the following information:

- ❑ Your company name and address
- ❑ Your name
- ❑ Your telephone number
- ❑ The importance of the problem, so that it can be assigned a priority level

To expedite the processing of your support request, you can photocopy this list and include it with the package.

Reporting a New Problem

For a new problem, please provide the following information:

- ❑ Release level of the software that you are running
- ❑ Software installation parameters
- ❑ Host type on which you are running
- ❑ Operating system you are running and its release number
- ❑ Functions of the software that you are running
- ❑ Whether you can reproduce the problem
- ❑ Previous occurrences of the problem
- ❑ Whether the software has ever worked correctly
- ❑ Time period that the software did work properly
- ❑ Conditions under which the software worked properly
- ❑ Changes to your system between the time the software worked properly and the problem began
- ❑ Exact sequence of events that led to the system error
- ❑ Message numbers and complete text of any messages that the system produced
- ❑ Log file dated near the time the error occurred
- ❑ Results from tests that you have run
- ❑ Other related system output
- ❑ Other information that may help solve the problem

Sending Problem Documentation

Use one of the following methods to send documentation of the problem to the EMC Customer Support Center:

- E-mail
- FTP
- U.S. mail to the following address:

  EMC Customer Support Center
  45 South Street
  Hopkinton, MA 01748-9103

  If the problem was assigned a number or a specific support representative, please include that information in the address as well.

Glossary

The terms in the glossary relate to the switch and Fibre Channel connections. Many of these terms are used in this manual.

Numbers

8b/10b Encoding An encoding scheme that converts each 8-bit byte into 10 bits. Used to balance ones and zeros in high speed transports.

16-Port Card The fibre channel port card provided with the ED-12000B switch. Contains 16 fibre channel ports and the corresponding LEDs indicating port status and speed. See also *Port Card*.

A

Access Control List Enables an organization to bind a specific WWN to a specific switch port or set of ports, preventing a port in another physical location from assuming the identity of a real WWN. May also refer to a list of the read/write access of a particular community string. See also *Device Connection Controls*.

Address Identifier A 24-bit value or 8-bit value used to identify the source or destination of a frame.

Admin Account A login account intended for use by the customer to control switch operation.

Alias An alternate name for an element or group of elements in the fabric. Aliases can be used to simplify the entry of port numbers and WWNs when creating zones.

Alias Address Identifier An address identifier recognized by a port in addition to its standard identifier. An alias address identifier may be shared by multiple ports.

Alias Server A fabric software facility that supports multicast group management.

AL_PA Arbitrated loop physical address. A unique 8-bit value assigned during loop initialization to a port in an arbitrated loop.

ANSI American National Standards Institute. The governing body for Fibre Channel standards in the U.S.A.

API Application programming interface. A defined protocol that allows applications to interface with a set of services.

Arbitrated Loop A shared Fibre Channel transport structured as a loop. Supports up to 126 devices and one fabric attachment. See also *Topology*.

Area Number A number assigned to each potential port location in the ED- 12000B. Used to distinguish ED- 12000B ports that have the same port number but are on different port cards.

ASIC Application-specific integrated circuit.

ATM Asynchronous transfer mode. A transport used for transmitting data over LANs or WANs that transmit fixed-length units of data. Provides any-to-any connectivity, and allows nodes to transmit simultaneously.

Auto-Negotiate Speed Process that allows two devices at either end of a link segment to negotiate common features, speed (e.g., 1 or 2 Gb/s) and functions.

Autosense Process during which a network device automatically senses the speed of another device.

B

Backup FCS Switch Backup fabric configuration server switch. The switch or switches assigned as backup in case the primary FCS switch fails. See also *FCS Switch* and *Primary FCS Switch*.

Bandwidth The total transmission capacity of a cable, link, or system. Usually measured in bps (bits per second). May also refer to the range of transmission frequencies available to a network. See also *Throughput*.

BB_Credit Buffer-to-buffer credit. The number of frames that can be transmitted to a directly connected recipient or within an arbitrated loop. Determined by the number of receive buffers available. See also *Buffer to Buffer Flow Control* and *EE_Credit*.

Beacon When all the port LEDs on a switch are set to flash from one side of the switch to the other, to enable identification of an individual switch in a large fabric. A switch can be set to beacon by tTlnet command or through Web Tools.

Beginning Running Disparity The disparity at the transmitter or receiver when the special character associated with an ordered set is encoded or decoded. See also *Disparity*.

BER Bit error rate. Tthe rate at which bits are expected to be received in error. Expressed as the ratio of error bits to total bits transmitted. See also *Error*.

Blade See *16-Port Card*.

Block As applies to Fibre Channel, upper-level application data that is transferred in a single sequence.

Blower Assembly A fan that prevents a switch (or individual elements within a switch) from over heating.

Boot Flash Flash memory that stores the boot code and boot parameters. The processor executes its first instructions from boot flash. Data is cached in RAM.

Boot Monitor Code used to initialize the CP (control processor) environment after powering on. Identifies the amount of memory available and how to access it, and retrieves information about system buses.

Broadcast The transmission of data from a single source to all devices in the fabric, regardless of zoning. See also *Multicast* and *Unicast*.

Buffer to Buffer Flow Control Management of the frame transmission rate in either a point-to-point topology or in an arbitrated loop. See also *BB_Credit*.

C

Cascade The interconnection means through which data flows from one switch to another in a fabric.

Chassis The metal frame in which the switch and switch components are mounted.

Circuit An established communication path between two ports. Consists of two virtual circuits capable of transmitting in opposite directions. See also *Link*.

Class 1 The class of frame-switching service that provides a dedicated connection between two communicating ports (also called connection- oriented service), with acknowledgment of delivery or nondelivery of frames.

Class 2 A connectionless class of frame switching service that includes acknowledgment of delivery or nondelivery of frames.

Class 3 A connectionless frame switching service that does not include acknowledgment of delivery or nondelivery of frames. Can be used to provide a multicast connection between the originator and recipients, with acknowledgment of delivery or nondelivery of frames.

Class F The class of frame switching service for a direct connection between two switches, allowing communication of control traffic between the E_Ports, with notification of delivery or nondelivery of data.

Class of Service A specified set of delivery characteristics and attributes for frame delivery.

CLI Command line interface. Interface that depends entirely on the use of commands, such as through Telnet or SNMP, and does not involve a graphical user interface.

Comma A unique pattern (either 1100000 or 0011111) used in 8b/10b encoding to specify character alignment within a data stream. See also *K28.5*.

Community (SNMP) A relationship between a group of SNMP managers and an SNMP agent, in which authentication, access control, and proxy characteristics are defined. See also *SNMP*.

Compact Flash Flash memory that stores the run time operating system and is used like hard disk storage. Not visible within the processor's memory space. Data is stored in file system format.

Configuration How a system is set up. May refer to hardware or software.

Hardware: The number, type, and arrangement of components that make up a system or network.

Software: The set of parameters that guide switch operation. May include general system parameters, IP address information, domain ID, and other information. Modifiable by any login with administrative privileges.

Connection Initiator A port that has originated a Class 1 dedicated connection and received a response from the recipient.

Connection Recipient A port that has received a Class 1 dedicated connection request and transmitted a response to the originator.

Control Panel Refers to the left-side panel of Web Tools, which accesses fabric-wide functions such as zoning and events.

Core Switch A switch whose main task is to interconnect other switches. See also *Edge Switch*.

CP Card Control processor card. The central processing unit of the ED-12000B switches contains two CP card slots to provide redundancy. Provides ethernet, serial, and modem ports with the corresponding LEDs.

CRC Cyclic redundancy check. A check for transmission errors included in every data frame.

Credit As applies to Fibre Channel, the number of receive buffers available for transmission of frames between ports. See also *BB_Credit* and *EE_Credit*.

Cut-through A switching technique that allows the route for a frame to be selected as soon as the destination address is received. See also *Route*.

D

Data Word Type of transmission word that occurs within frames. The frame header, data field, and CRC all consist of data words. See also *Frame*, *Ordered Set*, and *Transmission Word*.

DB-9 Connector A 9-pin version of the RS-232C port interface. May be either the male or female interface. See also *RS-232 Port*.

dBm, dBW Logarithmic units of power used in electronics. Indicates signal strength in decibels above the reference level, which is 1 milliwatt for dBm, and 1 watt for dBW. An increase of 10 dBm or 10 dBW represents a 10-fold increase in power.

DCE Port A data communications equipment port capable of interfacing between a DTE (data terminal equipment) port and a transmission circuit. DTE devices with an RS-232 (or EIA-232) port interface transmit on pin 3, and receive on pin 2. See also *DTE Port* and *RS-232 Port*.

Defined Zone Configuration The set of all zone objects defined in the fabric. May include multiple zone configurations. See also *Zone Configuration*.

Device A disk, a RAID, or an HBA.

Device Connection Controls Enables organizations to bind an individual device port to a set of one or more switch ports. Device ports are specified by a WWN and typically represent HBAs (servers). See also *Access Control List*.

Disparity The relationship of ones and zeros in an encoded character. Neutral disparity means an equal number of each, positive disparity means a majority of ones, and negative disparity means a majority of zeros.

DLS Dynamic load sharing. Dynamic distribution of traffic over available paths. Allows for recomputing of routes when an Fx_Port or E_Port changes status.

Domain ID As applies to Departmental Switches, a unique number between 1 and 239 that identifies the switch to the fabric and is used in routing frames. Usually automatically assigned by the switch, but can be manually assigned.

DTE Port A data terminal equipment port capable of interfacing to a transmission circuit through a connection to a DCE (data communications equipment) port. DTE devices with an RS-232 (or (EIA-232) port interface transmit on pin 3, and receive on pin 2 in a 9-pin connection (reversed in 25-pin connectors). See also *DCE Port* and *RS-232 Port*.

DWDM Dense wavelength multiplexing. A means to concurrently transmit more than one stream of data through a single fiber by modulating each stream of data on to a different wavelength of light.

E

Edge Switch A switch whose main task is to connect nodes to the fabric. See also *Core Switch*.

E_D_TOV Error detect time-out value. The minimum amount of time a target waits for a sequence to complete before initiating recovery. Can also be defined as the maximum time allowed for a round-trip transmission before an error condition is declared. See also *R_A_TOV*.

E_Port Expansion port. A type of switch port that can be connected to an E_Port on another switch to create an ISL. See also *ISL*.

EE_Credit End-to-end credit. The number of receive buffers allocated by a recipient port to an originating port. Used by Class 1 and 2 services to manage the exchange of frames across the fabric between source and destination. See also *End-to-End Flow Control* and *BB_Credit*.

Effective Zone Configuration The currently enabled configuration of zones. Only one configuration can be enabled at a time. See also *Defined Zone Configuration* and *Zone Configuration*.

EIA Rack A storage rack that meets the standards set by the Electronics Industry Association.

End-to-End Flow Control Governs flow of Class 1 and 2 frames between N_Ports. See also *EE_Credit*.

Error As applies to Fibre Channel, a missing or corrupted frame, time-out, loss of synchronization, or loss of signal (link errors).

ESN Enterprise Storage Network. A storage network implementation that integrates products, technology, and services offering universal data access for every major computing platform, operating system, and application across any combination of SCSI, Ultra SCSI, Fibre Channel, and ESCON technologies.

Exchange The highest level Fibre Channel mechanism used for communication between N_Ports. Composed of one or more related sequences, and can work in one or both directions.

Extended Fabrics A product that runs on Fabric OS and allows creation of a Fibre Channel fabric interconnected over distances of up to 100 kilometers.

F

F_Port Fabric port. A port that is able to transmit under fabric protocol and interface over links. Can be used to connect an N_Port to a switch. See also *FL_Port* and *Fx_Port*.

Fabric A Fibre Channel network containing two or more switches in addition to hosts and devices. May also be referred to as a switched fabric. See also *Topology*, *ESN*, and *Cascade*.

Fabric Access Allows the application to control the fabric directly for functions such as discovery, access (zoning) management, performance, and switch control. Consists of a host-based library that interfaces the application to switches in the fabric over an out-of-band TCP/IP connection or in-band using an IP-capable host bus adapter (HBA).

Fabric Name The unique identifier assigned to a fabric and communicated during login and port discovery.

Failover The act that causes control to pass from one redundant unit to another.

FC-AL-3 The Fibre Channel Arbitrated Loop standard defined by ANSI. Defined on top of the FC-PH standards.

FCIA Fibre Channel Industry Association. An international organization of Fibre Channel industry professionals. Provides oversight of ANSI and industry-developed standards, among other tasks.

FC-FLA The Fibre Channel Fabric Loop Attach standard defined by ANSI.

FCP Fibre Channel Protocol. Mapping of protocols onto the Fibre Channel standard protocols. For example, SCSI FCP maps SCSI-3 onto Fibre Channel.

FC-PH-1, 2, 3 The Fibre Channel Physical and Signalling Interface standards defined by ANSI.

FC-PI The Fibre Channel Physical Interface standard defined by ANSI.

FC-PLDA The Fibre Channel Private Loop Direct Attach standard defined by ANSI. Applies to the operation of peripheral devices on a private loop.

FCS Switch Fabric configuration server switch. One or more designated switches that store and manage the configuration and security parameters for all switches in the fabric. FCS switches are designated by WWN, and the list of designated switches is communicated fabric-wide. See also *Backup FCS Switch* and *Primary FCS Switch*.

FC-SW-2 The second generation of the Fibre Channel Switch Fabric standard defined by ANSI. Specifies tools and algorithms for the interconnection and initialization of Fibre Channel switches in order to create a multiswitch Fibre Channel fabric.

Fibre Channel Transport A protocol service that supports communication between Fibre Channel service providers. See also *FSP*.

FIFO First in, First out. May also refer to a data buffer that follows the first in, first out rule.

Fill Word An IDLE or ARB ordered set that is transmitted during breaks between data frames to keep the Fibre Channel link active.

Firmware The basic operating system provided with the hardware.

Firmware Download The process of loading firmware down from a server into the switch.

Flash Programmable NVRAM memory that maintains its contents.

Flash Partition Two redundant usable areas, called partitions, into which firmware can be downloaded.

FLOGI Fabric Login. The process by which an N_Port determines whether a fabric is present, and if so, exchanges service parameters with it. See also *PLOGI*.

FL_Port Fabric loop port. A port that is able to transmit under fabric protocol and also has arbitrated loop capabilities. Can be used to connect an NL_Port to a switch. See also *F_Port* and *Fx_Port*.

Frame The Fibre Channel structure used to transmit data between ports. Consists of a start-of-frame delimiter, header, any optional headers, the data payload, a cyclic redundancy check (CRC), and an end-of-frame delimiter. There are two types of frames: link control frames (transmission acknowledgements, etc.) and data frames.

FRU Field replaceable unit. A component that can be replaced on site.

FS Fibre Channel Service. A service that is defined by Fibre Channel standards and exists at a well-known address. For example, the Simple Name Server is a Fibre Channel service. See also *FSP*.

FSP Fibre Channel Service Protocol. The common protocol for all fabric services, transparent to the fabric type or topology. See also *FS*.

FSPF Fabric Shortest Path First. A routing protocol for Fibre Channel switches.

Full Duplex A mode of communication that allows the same port to simultaneously transmit and receive frames. See also *Half Duplex*.

Full Fabric The EMC software license that allows multiple E_Ports on a switch, making it possible to create multiple ISLs.

Fx_Port A fabric port that can operate as either an F_Port or FL_Port. See also *F_Port* and *FL_Port*.

G

G_Port Generic port. A port that can operate as either an E_Port or F_Port. A port is defined as a G_Port when it is not yet connected or has not yet assumed a specific function in the fabric.

Gateway Hardware that connects incompatible networks by providing translation for both hardware and software. For example, an ATM gateway can be used to connect a Fibre Channel link to an ATM connection.

GBIC Gigabit interface converter. A removable serial transceiver module that allows gigabaud physical level transport for Fibre Channel and Gigabit Ethernet. GBIC and SFP terms are used interchangeably throughout the documentation, although they are different types of optics and the hardware is not interchangeable. See also *SFP*.

Gb/s Gigabits per second (1,062,500,000 bits/second).

GB/s GigaBytes per second (1,062,500,000 bytes/second).

H

Half Duplex A mode of communication that allows a port to either transmit or receive frames at any time, but not simultaneously (with the exception of link control frames, which can be transmitted at any time). See also *Full Duplex*.

HBA Host bus adapter. The interface card between a server or workstation bus and the Fibre Channel network.

High Availability An attribute of equipment that identifies it as being capable of conducting customer operations well in excess of 99% of the time. Typically, high availability is identified by the number of nines in that percentage. Five nines means the equipment is rated as being capable of conducting customer operations 99.999% of the time without failure.

Host A computer that accesses storage devices over the fabric. May also be referred to as a server. See also *Workstation*.

Hot Pluggable A FRU capability that indicates it may be extracted or installed while customer data is otherwise flowing in the chassis.

Hub A Fibre Channel wiring concentrator that collapses a loop topology into a physical star topology. Nodes are automatically added to the loop when active and removed when inactive.

I

Idle Continuous transmission of an ordered set over a Fibre Channel link when no data is being transmitted, to keep the link active and maintain bit, byte, and word synchronization.

Initiator A server or workstation on a Fibre Channel network that initiates communications with storage devices. See also *Target*.

Integrated Fabric The fabric created by connecting multiple switches with multiple ISL cables, and configuring the switches to handle traffic as a seamless group.

IOD In-order delivery. A parameter that, when set, guarantees that frames are either delivered in order or dropped.

ISL Interswitch link. A Fibre Channel link from the E_Port of one switch to the E_Port of another. See also *E_Port* and *Cascade.*

Isolated E_Port An E_Port that is online but not operational due to overlapping domain IDs or nonidentical parameters (such as E_D_TOVs). See also *E_Port*.

IU Information unit. A set of information as defined by either upper-level process protocol definition or upper-level protocol mapping.

J

JBOD Just a bunch of disks. A number of disks connected in a single chassis to one or more controllers. See also *RAID*.

K

K28.5 A special 10-bit character used to indicate the beginning of a transmission word that performs Fibre Channel control and signaling functions. The first seven bits of the character are the comma pattern. See also *Comma*.

Kernel Flash Flash memory that stores the bootable kernel code and is visible within the processor's memory space. Data is stored as raw bits.

L

L_Port Loop port. A node port (NL_Port) or fabric port (FL_Port) that has arbitrated loop capabilities. An L_Port can be in one of two modes:

- Fabric mode: Connected to a port that is not loop capable, and using fabric protocol.
- Loop mode: In an arbitrated loop and using loop protocol. An L_Port in loop mode can also be in participating mode or nonparticipating mode .

See also *Nonparticipating Mode* and *Participating Mode.*

Latency The period of time required to transmit a frame, from the time it is sent until it arrives.

LED Light-emitting diode. Used to indicate status of elements on switch.

Link As applies to Fibre Channel, a physical connection between two ports, consisting of both transmit and receive fibres. See also *Circuit*.

Link Services A protocol for link-related actions.

LWL Long wavelength. A type of fiber-optic cabling that is based on 1300mm lasers and supports link speeds of 1.0625 Gb/s and 2.125 Gb/s. May also refer to the type of GBIC or SFP. See also *SWL*.

M

Media See *Transceiver*.

MIB Management Information Base. An SNMP structure to help with device management, providing configuration and device information.

Modem Serial Port The upper serial port on the CP card. Can be used to connect the CP card to a country-specific modem. Has a DB-9 connector wired as a ttyS1 DTE device, and can be connected by serial cable to a DCE device. Can be connected to a modem using a standard 9-pin modem cable. A Hayes-compatible modem or Hayes-emulation is required. See also *DCE Port* and *Terminal Serial Port*.

Multicast The transmission of data from a single source to multiple specified N_Ports (as opposed to all the ports on the network). See also *Broadcast* and *Unicast*.

Multimode A fiber-optic cabling specification that allows up to 500 meters for 1 GB Fibre Channel and 300 meters for 2 GB Fibre Channel between devices.

N

N_Port Node port. A port on a node that can connect to a Fibre Channel port or to another N_Port in a point-to-point connection. See also *NL_Port* and *Nx_Port*.

Name Server The term frequently used to indicate Simple Name Server. See also *SNS*.

Node A Fibre Channel device that contains an N_Port or NL_Port.

Negotiate See *Auto-Negotiate Speed* and *Autosense*.

NL_Port Node loop port. A node port that has arbitrated loop capabilities. Used to connect an equipment port to the fabric in a loop configuration through an FL_Port. See also *N_Port* and *Nx_Port*.

Nonparticipating Mode A mode in which an L_Port in a loop is inactive and cannot arbitrate or send frames, but can retransmit any received transmissions. This mode is entered if there are more than 127 devices in a loop and an AL_PA cannot be acquired. See also *L_Port* and *Participating Mode*.

Nx_Port A node port that can operate as either an N_Port or NL_Port.

O

Ordered Set A transmission word that uses 8b/10b mapping and begins with the K28.5 character. Ordered sets occur outside of frames, and include the following items:

- Frame delimiters mark frame boundaries and describe frame contents.
- Primitive signals indicate events.
- Primitive sequences indicate or initiate port states.

Ordered sets are used to differentiate Fibre Channel control information from data frames and to manage the transport of frames.

P

Packet A set of information transmitted across a network. See also *Frame*.

Participating Mode A mode in which an L_Port in a loop has a valid AL_PA and can arbitrate, send frames, and retransmit received transmissions. See also *L_Port* and *Nonparticipating Mode*.

Path Selection The selection of a transmission path through the fabric. EMC switches use the FSPF protocol.

PLOGI Port Login. The port-to-port login process by which initiators establish sessions with targets. See also *FLOGI*.

Point-to-Point A Fibre Channel topology that employs direct links between each pair of communicating entities. See also *Topology*.

Port_Name The unique identifier assigned to a Fibre Channel port. Communicated during login and port discovery.

Port Cage The metal casing extending out of the optical port on the switch, and in which the GBIC or SFP can be inserted.

Port Card A Fibre Channel card that contains optical port interfaces. See also *16-Port Card*.

Port Module A collection of ports in a switch.

POST Power-on self test. A series of tests run by a switch after it is turned on.

Principal Switch The switch that assumes the responsibility to assign Domain IDs. The role of Principle Switch is negotiated after a Build Fabric event.

Primary FCS Switch Primary fabric configuration server switch. The switch that actively manages the configuration and security parameters for all switches in the fabric. See also *Backup FCS Switch* and *FCS Switch*.

Private Device A device that supports arbitrated loop protocol and can interpret 8-bit addresses, but cannot log in to the fabric.

Private Loop An arbitrated loop that does not include a participating FL_Port.

Private NL_Port An NL_Port that communicates only with other private NL_Ports in the same loop and does not log in to the fabric.

Protocol A defined method and a set of standards for communication.

Public Device A device that supports arbitrated loop protocol, can interpret 8-bit addresses, and can log in to the fabric.

Public Loop An arbitrated loop that includes a participating FL_Port, and may contain both public and private NL_Ports.

Public NL_Port An NL_Port that logs into the fabric, can function within either a public or a private loop, and can communicate with either private or public NL_Ports.

Q

Quad A group of four adjacent ports that share a common pool of frame buffers.

R

R_A_TOV Resource allocation time-out value. The maximum time a frame can be delayed in the fabric and still be delivered. See also *E_D_TOV*.

R_RDY Receiver ready. A primitive signal indicating that the port is ready to receive a frame.

RAID Redundant array of independent disks. A collection of disk drives that appear as a single volume to the server and are fault tolerant through mirroring or parity checking. See also *JBOD*.

Remote Fabric A fabric that spans across WANs by using protocol translation (a process also known as tunneling) such as Fibre Channel over ATM or Fiber Channel over IP.

Request Rate The rate at which requests arrive at a servicing entity. See also *Service Rate*.

Root Account A login used for debugging purposes and is not intended for customer use.

Route As applies to a fabric, the communication path between two switches. May also apply to the specific path taken by an individual frame, from source to destination. See also *SFP*.

Routing The assignment of frames to specific switch ports, according to frame destination.

RS-232 Port A port that conforms to a set of EIA (Electrical Industries Association) standards. Used to connect DTE and DCE devices for communication between computers, terminals, and modems. See also *DCE Port* and *DTE Port*.

RSCN Registered state change notification. A switch function that allows notification of fabric changes to be sent from the switch to specified nodes.

S

SAN Storage area network. A network of systems and storage devices that communicate using Fibre Channel protocols. See also *Fabric*.

SCSI Small computer systems interface. A parallel bus architecture and protocol for transmitting large data blocks to a distance of 15-25 meters.

SDRAM Synchronous dynamic random access memory. The main memory for the switch. Used for volatile storage during switch operation. See also *Flash*.

Sequence A group of related frames transmitted in the same direction between two N_Ports.

Service Rate The rate at which an entity can service requests. See also *Request Rate*.

SES A Brocade product that runs on Fabric OS and allows monitoring, configuring, and maintenance of the Departmental Switch family using SCSI 3 Enclosure Services.

SFP Small form factor pluggable. Optical transceiver used to convert signals between optical fiber cables and switches. GBIC and SFP terms are used interchangeably throughout the documentation, although they are different types of optics and the hardware is not interchangeable. See also *GBIC*.

SI Sequence initiative.

SID/DID Source identifier/destination identifier. S_ID is a 3-byte field in the frame header that is used to indicate the address identifier of the N_Port from which the frame was sent.

Single Mode A Fibre Channel optic cabling standard for use with long-wavelength lasers operating in the infrared portion of the spectrum at 1300 nonmeters (nm).

SNMP Simple Network Management Protocol. An Internet management protocol that uses either IP for network-level functions and UDP for transport-level functions, or TCP/IP for both. Can be made available over other protocols, such as UDP/IP, because it does not rely on the underlying communication protocols. See also *Community (SNMP)*.

SNS Simple Name Server. A switch service that stores names, addresses, and attributes for up to 15 minutes, and provides them as required to other devices in the fabric. SNS is defined by Fibre Channel standards and exists at a well-known address. May also be referred to as directory service. See also *FS*.

Subordinate Switch All switches in the fabric other than the principal switch. See also *Principal Switch*.

Switch Hardware that routes frames according to Fibre Channel protocol and is controlled by software.

Switch Name The arbitrary name assigned to a switch.

Switch Port A port on a switch. Switch ports can be E_Ports, F_Ports, or FL_Ports.

SWL Short wavelength. A type of fiber-optic cabling that is based on 850mm lasers and supports link speeds of 1.0625 Gb/s and 2.125 Gb/s. May also refer to the type of GBIC or SFP. See also *LWL*.

T

Target A storage device on a Fibre Channel network. See also *Initiator*.

Terminal Serial Port The lower serial port on the CP card. Receives error messages. Can be used to connect the CP card to a computer terminal. Has a DB-9 connector wires as a ttyS0 DTE device, and can be connected by serial cable to a DCE device. The connector has pins two and three swapped so that a straight-through cable can be used to connected to a terminal. See also *DB-9 Connector*, *DCE Port*, and *Modem Serial Port*.

Throughput The rate of data flow achieved within a cable, link, or system. Usually measured in bps (bits per second). See also *Bandwidth*.

Topology As applies to Fibre Channel, the configuration of the Fibre Channel network and the resulting communication paths allowed. There are three possible topologies:

- Point-to-point — A direct link between two communication ports.
- Switched fabric — Multiple N_Ports linked to a switch by F_Ports.
- Arbitrated loop — Multiple NL_Ports connected in a loop.

Transceiver Device that converts one form of signaling to another for transmission and reception. In fiber optics, it refers to optical and electrical.

Transmission Character A 10-bit character encoded according to the rules of the 8b/10b algorithm.

Transmission Word A group of four transmission characters.

Trap (SNMP) The message sent by an SNMP agent to inform the SNMP management station of a critical error. See also *SNMP*.

Tunneling A technique for enabling two networks to communicate when the source and destination hosts are both on the same type of network, but are connected by a different type of network.

U

U_Port Universal port. A switch port that can operate as a G_Port, E_Port, F_Port, or FL_Port. A port is defined as a U_Port when it is not connected or has not yet assumed a specific function in the fabric.

UDP User Datagram Protocol. A protocol that runs on top of IP and provides port multiplexing for upper-level protocols.

ULP Upper-level Protocol. The protocol that runs on top of Fibre Channel. Typical upper-level protocols are SCSI, IP, HIPPI, and IPI.

ULP_TOV Upper-level time-out value. The minimum time that a SCSI ULP process waits for SCSI status before initiating ULP recovery.

Unicast The transmission of data from a single source to a single destination. See also *Broadcast* and *Multicast*.

User Account A login intended for use by the customer to monitor, but not control, switch operation.

V

VC Virtual circuit. A one-way path between N_Ports that allows fractional bandwidth.

W

Well-Known Address — As pertaining to Fibre Channel, a logical address defined by the Fibre Channel standards as assigned to a specific function, and stored on the switch.

Workstation — A computer used to access and manage the fabric. May also be referred to as a management station or host.

WWN — World Wide Name. An identifier that is unique worldwide. Each entity in a fabric has a separate WWN.

Z

Zone — A set of devices and hosts attached to the same fabric and configured as being in the same zone. Devices and hosts within the same zone have access permission to others in the zone, but are not visible to any outside the zone.

Zone Alias — A name assigned to a device or group of devices in a zone. Aliases can greatly simplify the zone administrative process.

Zone Configuration — A specified set of zones. Enabling a configuration enables all zones in that configuration. See also *Defined Zone Configuration*.

Zone Member — A port, node, WWN, or alias, which is part of a zone.

Zone Schemes — The level of zoning granularity selected. For example, zoning may be done by switch/port, WWN, or a mixture. See also *Zone Configuration*.

Zone Set — See *Zone Configuration*.

EMC's Policies and Requirements for EMC Support Matrix

EMC's Support Matrix Policies and Requirements

This section describes EMC's policies and requirements for the EMC Support Matrix document.

Purpose and Limitations of this Document

This document is being provided for informational purposes only and may change at any time. This version supercedes and replaces all previous versions. The information is to serve only as a guide for those configurations/products which EMC has qualified. This document identifies and lists various vendor host systems and integral components that have been tested and qualified by EMC for use with EMC products. Vendor components include, but are not limited to, host operating systems, HBAs (host bus adapters) and associated drivers, firmware and BIOS; Fibre Channel switches, hubs and bridges. This document also lists various vendors, cluster software, tape hardware, storage system boot procedures, heterogeneous information storage, and configurations that EMC has tested and/or qualified for use with EMC products.

The information included in this document is intended as a guide in the configuration of systems for EMC's products. It is not intended to be the sole resource for system configuration. For more information or answers to questions not found in this document, please see EMC's website, other EMC documentation, such as EMC's Host Connectivity Guides, EMC Networked Storage Topology Guide, EMC CLARiiON Open Systems Configuration Guide, relevant vendor documentation, or contact your EMC Sales or EMC Customer Service representative. For Symmetrix 4.x support, please look at the Symmetrix 8000 Series section and check the footnotes for model/microcode compatibility. EMC employees can obtain additional Symmetrix 4.x information from the C4 support group.

Policies for Qualifying Systems

Policies and procedures for support of EMC products are set forth in the customer's applicable agreements. EMC's publication of information relating to system configurations covers only those outlined in this document or by approval from EMC Engineering. Other system configurations not found in this document are not qualified without EMC Engineering approval. EMC has qualified hardware and software provided only by the vendors listed in this document, and host systems, hardware and software from other vendors are not qualified, and may never be. Please contact your EMC Sales or EMC Customer Service representative for updates or information not included in this document.

EMC maintains a large collection of the products listed above as well as third-party application software for qualification with EMC's storage systems and to simulate customer environments, but you must consult the vendors for information about their system internals, such as hardware and associated drivers.

Policy for Future Qualification of Operating System Software Releases

The information in this document is maintained by EMC and EMC strives to update this document with new releases of hardware, operating systems, firmware, BIOS, switch software, etc., as they become available from the vendors. EMC works with the vendors during their development and release processes in order to be fully informed at the time the vendors release new versions. EMC does not announce qualification prior to vendors' General Availability. In some cases, EMC may choose to perform regression testing following the vendors' GA; in these cases and in cases where advance preparation is not possible, EMC may test and qualify vendors' products as appropriate after they have been released. For early support of such products, including vendor beta participation, contact your EMC Sales or EMC Customer Service representative.

Policy for End-of-Life Support

EMC strives to continue support for any installed platforms, but may remove support from this host matrix for new installations within three months after the vendor has announced that this platform has reached the end of life. EMC will continue support for existing installations of hardware, operating systems, and components that the vendor has officially declared to have reached end of life as long as support is available from the vendor.

Symmetrix 5000 and 3000 Series

For Symmetrix 4.x support, please look at the Symmetrix 8000 Series section and check the footnotes for model/microcode compatibility. EMC Employees can obtain additional Symmetrix 4.x information from the C4 support group.

Symmetrix 8000 Series

Base Connectivity

Do not use a LUN in the CLARiiON DAE2-ATA as a host OS boot device.EMC has qualified the following hosts. No other hosts are supported at this time. Symmetrix models and minimum Enginuity revisions are listed in the footnotes on most tables.EMC supports Symmetrix configured as a boot device for the servers listed below, provided that these requirements are followed. The purpose of these requirements is primarily to ensure the best possible response times for boot/root/swap volumes. For qualified configurations, Where possible, EMC recommends an alternate mirrored boot volume be configured.1. Spindles can be shared on Symm4 or later units only.Do not use a LUN in the CLARiiON DAE2-ATA as a host OS boot device.2. Spindles can be shared if they are larger than 9GB in size.3. For Symmetrix 3000 and 5000 systems, the maximum number of Symmetrix logical volumes per Symmetrix boot port is 32. For Symmetrix 8000 and DMX systems, the following guidelines and recommendations must be adhered to. When using a SAN for boot/swap/page device the operation and performance of the server might be affected by external events that might cause the storage device not to be immediately accessible for periods of time. These events might result in slow response times as observed by the operating system and longer boot times. In some cases it can cause the server to crash (please see comments below for W2K/NT).
EMC recommends designing the distribution and mapping of the boot devices on the SAN in a way that will:
-- Minimize the number of components between the server and the boot storage device.
-- Will not present a load that will exceed the limits of the SAN. Below are some issues that must be considered when designing your SAN. Please refer to EMC Networked Storage Topology Guide ("Networked Storage Design Considerations/Fabric Design Practices" section) for a complete discussion on the topic.
- Sufficient bandwidth on the link between the switch and the storage port
- Sufficient ISLs in case where boot device and server are more than one hop apart
- ISL utilization
Events that could affect the availability of an external storage device:
Fibre Channel and SCSI environments:
-- Lost connection to external storage (pulled or damaged external Fibre/SCSI cable connection).
-- External storage service/upgrade procedures such as in some cases, online microcode upgrades and/or configuration changes.
-- External storage director failures including failed lasers on Fibre Channel directors.
-- External storage power failure.
-- HBA failures.
Fibre Channel environment only:
-- Storage area network failures such as Fibre Channel switches, switch components, and switch power failures.
-- Storage area network service/upgrade procedures such as firmware upgrades or hardware replacements.4. Boot/root and swap from a single host can be on the same channel.5. The boot disk should be high SCSI priority, e.g. SCSI TID 6 (0-7, 8-15: higher priority TID is 7, lowest is 8).6. A dedicated SA or FA is not required for boot devices.7. The Internal Host Boot Device may be mirrored with the External Symmetrix Boot Device to allow redundant pathing. Does not apply to Microsoft Windows.8. The Boot path must not include a hub in the topology.9. The maximum number of boot devices per port is equal to Fanout values listed in Fibre Channel Connectivity table.Note: All of the requirements below are necessary for Symmetrix 3/5000 Series. It is recommended, however, that they be considered for Symmetrix 8000 Series also.1. The Boot Device may not be a striped Meta Device on a Symmetrix 4.x.2. One spindle cannot house both boot/root and swap for any single host (does not apply to Microsoft Windows).3. One spindle cannot house boot/root for a given host and either boot/root or swap from another host.4. One spindle should not house swap from more than one host, nor should there be excessive swapping.5. The maximum number of hypers per Symmetrix spindle is 8.6. A spindle housing boot/root for a given host should be behind a different Director than the spindle housing swap for that host.7. Remaining hyper volumes on boot/root or swap spindle should be low-utilization and not high write content.Windows NT/Windows 2000/2003 Servers (Fibre Channel/SCSI) Boot CAUTION: Microsoft Windows NT uses virtual memory paging files that reside on the boot disk by default. Please refer to the information contained in Microsoft Knowledge Base article Q305547. The article explains how Microsoft supports booting Windows systems through a SAN (storage area network.) Although this article specifically mentions Windows 2000, the information also pertains to Windows NT 4.0 systems booting through a SAN. EMC recommends shutting down the host server during maintenance procedures that could cause the boot disk to become unavailable to the host. If the paging file is unavailable to the operating system for a minimum of 10 seconds, a crash can occur.

Amdahl UTS

Amdahl

Amdahl – Amdahl UTS						
No.	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot
1	Millennium: GS2000A, GS2000C, GS2000E, GS700	Mainframe Bus	Amdahl UTS: 2.1.5, 2.1.7, 4.3.2, 4.3.3, 4.4.0	IBM BMC-Parallel[1]	BMC-Parallel	N
2	Millennium: GS2000A, GS2000C, GS2000E, GS700	Mainframe Bus	Amdahl UTS: 2.1.5, 2.1.7, 4.3.2, 4.3.3, 4.4.0	IBM ESCON	ESCON	N

1. Parallel channel attachment is only available on the Symmetrix 5000 series.

Bull GCOS

Bull

Bull – Bull GCOS						
No.	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot
1	DPS9000/500; DPS9000/800	Mainframe Bus	Bull GCOS 8 SR4500	Bull BMC-Parallel	BMC-Parallel	N

1 EMC does not support this HBA, supported by Unisys ONLY
2 Not supported on a Symmetrix 8000 Series, no plans for support.
3. Supported by Unisys RPQ only
4. Supported by Unisys only.
5. Symm5 & 66/67 support via RPQ(5x67)(UnixWare)
6 Also ClearPath VX14xx Styles
7 Also ClearPath VX13xx Styles
8 Use with Copper Hub
9 For ES7000-100, ES7000-200 Plateau below 8.1.1 use BIOS 1.63 For ES7000-100, ES7000-200 Plateau 8.1.1 must use BIOS 1.71 Use driver 3.13c
10 For ES7000 and QLA 2200 use driver 3.10 and 3.10a and BIOS 1.63

1. For more information see http://athena.europe.dg.com
2. Symmetrix 8000 Series: 66/67 support at DG/UX 4.11. 5568 support at DG/UX 4.20.
3. The release notice for DG/UX (included with the software release at path. "/usr/release/dgux" rn) lists supported platforms.
4. Only the Brocade FC switch connection is supported. Connectrix FC switch is not supported.
5. DG/UX automatically loads the firmware and BIOS onto the Emulex HBA during boot-up as needed. Current DG/UX R4.20MU06 OS supported firmware is V3.20x1 and BIOS V1.4.
6. FC-AL support requires LP8000 BIOS version DB1.60A7 and firmware version DS3.20x4.
7. Requires Legacy PCI slot (not available on new servers.)
8. The driver is available at http://www.adaptec.com/worldwide/support/suppbyproduct.html?cal=/Technology/SCSI+Host+Adapters&fromPage=driverindex
9. Supported with Magic OS.
10. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.

1 For use in Asia Pacific Japan only Refer to Fujitsu Siemens Base Connectivity information for US/Europe
2 Requires N-bit for PCI SCSI interface to support PowerPath
3 Disconnecting and reconnecting the SCSI cable on an active system will reduce I/O transfer rate due to negotiation issues Host is not capable of WDTR after recovery from SCSI
4. Symm5 & 66/67 support Solaris 2.6,7 or 8
5 EMC required Solaris patches for Fujitsu PCI Bus servers running Solaris 2.6 (must be obtained from Fujitsu): 105181-33 SunOS 5.6 kernel update patch 105357-16 SunOS 5.6 /kernel/drv/ssd and /kernel/drv/sd patch 105590-19 SunOS 5.6 /kernel/drv/glm patch
6 Additional Fujitsu Sate Series software qualified in the single host environment and associated patch requirement (must be obtained from Fujitsu) Fujitsu SafeFile 1.1 910232-18 Fujitsu SafeFile 1.2 910738-05 Fujitsu SafeFile 1.3 910879-04 Fujitsu SafeFile,Global 1.2 910937-06 Fujitsu SafeDisk 1.1 910315-08 910432-01 Fujitsu SafeDisk 1.2.1 910721-06 Fujitsu SafeDisk/Global 2.0 910920-05 Fujitsu SafeDisk 2.0 910926-05 Fujitsu SafeLink 2.0 910743-07 910766-03
7

EMC required Solaris patches for Fujitsu PCI Bus servers running Solaris 7 (must be obtained from Fujitsu): 106541-23 SunOS 5.7: kernel update patch, 106925-09 SunOS 5.7: GLM driver patch, Fujitsu requires all patches for Solaris 7 be obtained through Fujitsu in the form of a Solaris 7 PTF patch CD. The current patch CD is Solaris 7 PTF R03051.

8. Fujitsu GP7B8FC1 HBA requires Fujitsu PCI Fibre Channel driver v2.2 and Fujitsu patch 910936-11.
9. EMC DP3-FCD8 may not be used with Fujitsu GP7B8FC1 FC-AL.
10. **EMC required Solaris patches for Fujitsu PCI Bus servers running Solaris 8: 108528-19: SunOS 5.8: Kernel update patch, 108974-27: data,uata,dad,sd and SCSI patch, 109885-09 SunOS 5.8: GLM driver patch, 108901-06 SunOS 5.8: /Kernel/sys/rpcmod and /kernel/strmod/rpcmod(for PowerPath 2.x), 110918-04 SunOS 5.8: openeepr patch. Fujitsu requires all patches for Solaris 8 be obtained through Fujitsu in the form of a Solaris 8 PTF patch CD. The current patch CD is Solaris 8 PTF R03051.**
11. Same machine as Sun Ultra 10 Model 300, and Fujitsu Ltd. GP400S Model 10
12. Fabric topology(FC-SW) supported with Solaris 7 and 8 only.
13. Requires Fujitsu PFCA 2.2.1 and patch 912069-07
14. EMC requires Solaris patches for Fujitsu servers running Solaris 9

112233-05 SunOS 5.9: kernel update patch,
113277-08 SunOS 5.9: sd,ssd patch
112834-02
Fujitsu requires that all patches for Solaris 9 be obtained through Fujitsu in the form of a Solaris 9 PTF patch CD. The current patch CD is Solaris 9 PTF R03051

Fujitsu UXP/DS
Fujitsu

Fujitsu – Fujitsu UXP/DS							
No.	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot	Comments
1	PRIMEPOWER GP7000D	SBUS	Fujitsu UXP/DS V20L10[2] V20L40[2]	Fujitsu F7958HS1	FWD	N	See[1]

1. Requires Fujitsu patch V20L30 or higher
2. Symm5 & 66/67 support: Solaris 2 6 7 or 8

Fujitsu Siemens BS2000/OSD
Fujitsu Siemens

Fujitsu Siemens – Fujitsu Siemens BS2000/OSD

1. 128 LUNs supported only with Reliant UNIX V5.44C1014 and higher
2. Symmetrix 8000 Series: 66/67 support: Reliant UNIX 5.44,5.45 Solaris 2.6, 7, 8 or 9. Symmetrix 8000 Series:5568 support: Solaris 8.9
3. PowerPath is not supported on any RM400C or RM400E model. DRAID is supported on Reliant UNIX 5.43.C20 and above
4. V5 45A30 OS and higher supports upto 4096 LUNs. FC switch support starts with Reliant UNIX V5 45A20 and higher.
5. Adapter can either be Emulex LP6502 (FW 2 12) or LP8000 (FW 3 82a1) LP6502 not supported with Symmetrix DP3-FCD4, DP3-FCD42G(S) (900-563-xxx) adapter.
6. PowerPath support requires version 1.5.0 with patch 1.5.0 1 Patch.b07 PowerPath is supported only on RM600E platforms.
7. Minimum Symmetrix microcode level 5264.19 17 No DRAID support until Reliant UNIX 5.43C20. V5 45A30 OS supports up to 4096 LUNs. SYMCLI/API v4.1 does not support DRAID on Reliant UNIX 5.44C OS
8. Fast-Wide SCSI is a default setting.Ultra-Wide can be enabled through software Refer to the latest Symmetrix Open Systems Environment Product Guide, P/N 200-999-563 PowerPath support requires version 1 5 0 with patch 1 5 0 1.patch.b.07 Powerpath is supported only on RM600E platforms.
9. **SHC-OSD (Symmetrix Host Component for BS2000/OSD) is the only external software for TimeFinder/SRDF features. Further restrictions apply. Contact C4 Group or reference http://www.fujitsu-siemens.com/rl/products/bs2000/symmetrix_bs2000.html.**
10. DS2000 contains one Open Systems host SR2000 and one mainframe host BS2000
11. Fast-Wide SCSI is a default setting Ultra-Wide can be enabled through software. Refer to the latest Symmetrix Open Systems Environment Product Guide P/N 200-999-563
12. FC switch support starts with Reliant UNIX V5.45A20 and higher
13. PowerPath support requires version 1.5.0 with patch 1.5.0 1 Patch.b07 PowerPath is supported only on RM600E platforms
14. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support
15. EMC strongly recommends that HBAs of different vendors not be used in the same host server
16. Minimum Symmetrix microcode level 5062.61.40 with fba_impl flag set to A004 No DRAID support

Fujitsu Siemens SINIX

1. For use in US/Europe only. Refer to Fujitsu Base Connectivity information for Asia Pacific/Japan.
2. Also supports Fujitsu Technology Solutions Inc.
3. Requires Emulex driver 5.01e and firmware 3.90a7
4. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
5. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
6. Symmetrix 8000 Series: 66/67 support: Reliant UNIX 5.44,5.45 Solaris 2.6, 7, 8 or 9. Symmetrix 8000 Series:5568 support: Solaris 8,9.
7. FSC requires all patches for Solaris 2.6 be obtained through FSC in the form of a Solaris 2.6 PTF patch CD. The current patch CD is Solaris 2.6 PTF R03051.
8. Requires Emulex Open Boot Version 1.33a1.
9. FSC requires all patches for Solaris 7 be obtained through FSC in the form of a Solaris 7 PTF patch CD. The current patch CD is Solaris 7 PTF R03051.
10. No dynamic partition support. Disconnecting and reconnecting SCSI cables on an active system may induce the system to crash.
11. PowerPath support for this controller is only with Solaris 2.6.
12. The LP9002-E now ships with the LP9002L-E low profile adapter.
13. **SHC-OSD (Symmetrix Host Component for BS2000/OSD) is the only external software for TimeFinder/SRDF features. Further restrictions apply. Contact C4 Group or reference http://www.fujitsu-siemens.com/rl/products/bs2000/symmetrix_bs2000.html.**
14. **FSC requires that all patches for Solaris 9 be obtained through FSC in the form of a Solaris 9 PTF patch CD. The current patch CD is Solaris 9 PTF R03051.**
15. Refer to Fujitsu Base Connectivity information for Asia Pacific/Japan.
16. **Requires Emulex driver 5.01e and firmware 1.00a4.**

1 PA8000 RISC architecture supported on K series models today

2 For releases prior to 11.0, boot device maximum capacity is 4 GB

3. These qualified HBAs for EMC Symmetrix storage in the HP9000 server model and the HP-UX revision installed may co-exist in that same server or the same hard partition. Other supported HBAs not used to attach to the Symmetrix may also co-exist on the same server unless specified by EMC and/or HP.

4. Symmetrix 8000 Series & 66/67 support. HP-UX 10.20,11.0,11.10. 11.0 ACE,11i MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01. Symmetrix 8000 Series 5568 support. HP-UX 10.20, 11.0, 11i MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01

5. For HP-UX systems only.LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set.

6 Symmetrix microcode version: 5266 33.23 or higher, 5566 35.23 or higher, 5267.22.15 or higher, 5567.29.15 or higher

7 D, R Class only. Releases before 11.0, boot device max. capacity is 4 GB. Boot from Fibre Channel supported in non-HA configurations on D and K class servers running HP-UX 11.0

8 The cables are the same as the Cxx mini 68S ("VHDCI" 8mm to SCSI3). Cables require termination at host end for N-Class, L-Class, A-Class and Superdome. Can be terminated either on cable or on HBA, but not both.

9 Symmetrix 5567 code is required to support Ultra2 LVD SCSI director (DF3-U2SD4L)

10 A4800A and A5159A HBAs are both capable of Ultra 1 speeds, but ship from HP with a default setting of FWD. Symmetrix is supported at Ultra 1 speeds with autospeed HBA. 2000 can be enabled in the V-Class, N-Class, and L-Class. A-Class and Superdome PDC firmware. V-Class supports the A4800A Only

HP e3000 MPE SYSTEMS – The above note applies but only includes the A-Class and N-Class Servers. The HP e3000 A-Class does not support the dual port HBA A5159A

11. Minimum OS revision is HP-UX 11.0 Rev 9812.
12. Minimum OS revision is HP-UX 11.0 990P.
13. A4800A and A5159A HBAs are both capable of Ultra 1 speeds, but ship from HP with default setting of FWD. Symmetrix is supported at Ultra 1 speeds with both HBAs. Ultra 1 can be enabled in the N-Class PDC firmware.
14. rp5405, rp5430, rp5470, rp7400: (PA-8700 processors): Initial support with HP-UX 11.0 Sept 2001, 11i Sept 2001. Symmetrix microcode supported: 5266.40.28 or higher, 5566.41.28 or higher, 5267.27.19 or higher, 5567.34.19 or higher.
15. VPARS supported in boot environment with HBA supported defined in Base Connectivity table.
16. PA-8700 processors: Initial support with HP-UX 11.0 Sept 2001, HP-UX 11i Sept 2001
17. Requires minimum PDC firmware 39.46 (39.26 acceptable) or higher.
18. PDC firmware. Arbitrated loop and fabric, use 40.32 or higher.
19. Requires minimum microcode release 5265.39.24.
20. Requires minimum PDC firmware 32.2 and PDHC 7.3 or higher
21. Qualified and supported by HP.
22. Requires PDC firmware TSSW5.3.
23. HP-UX 11.0 switched fabric support is enabled with: fabric device driver version B.11.00.03 and higher; minimum operating system level HP/UX 11.0 990P with March 2000 HW-CR bundle and dependency patch PHKL_21381 patches may be superceded or have co-dependencies as defined by HP. Symmetrix microcode versions: 5265.49.31, 5266.20, 5566.22 or latest Symmetrix microcode versions.
24. HP A5158A FC-SW is enabled in the March 2000 HWCR bundle XSWHWCR1100.48. Additional patches may be required for support.
25. PDC firmware: V2200, 2250: Arbitrated loop and fabric, use TSSW 5.3 or higher. V2500, 2600: Arbitrated loop, use TSSW 3.1 or higher. Fabric, use TSSW 3.2 or higher.
26. The Brocade (Brocade, EMC, or HP models) switch port the HBA involved in a FC-SW topology boot process or FC-SW topology dump process is attached to, is required to be locked as G port when the boot or dump volume resides on the Symmetrix. This can be accomplished by executing the "portCfgGport port_number,1" command from a telnet session on the Brocade switch.The boot device can not be located more than two hops from the initiator involved in the boot process.
27. For direct attached FC-AL boot or dump from a Symmetrix FA port configured for 2 Gbit speed, the Symmetrix auto-negotiation director flag must also be enabled on the FA port. FC-SW 2-Gbit boot and/or dump using A6795A requires Auto-Negotiation flag to be enabled on the switch port the HBA is attached to.
28. FC-AL and FC-SW topologies can co-exist on the same server but not on the same HBA, provided that the different topologies are attached to different HBAs
29. HP A5158A FC-SW software requirement: FC-AL and FC-SW requires the HP A5158A Tachlite PCI Fibre Channel Adapter. The A5158A FC-SW software fabric driver version "AP0301", for HP-UX 11i is now available for download from HP's software depot site, http://www.software.hp.com under "drivers" . It is referred to as the "hp pci tachyon tl fibre channel adapter", and requires the installation of dependent patch PHKL_22874 prior to installing the fabric driver, patches may be superceded or have co-dependencies as defined by HP.
30. Minimum driver version for SNIA HBA API support with HP-UX 11.0 is B.11.00.10. Minimum driver version for SNIA HBA API support with HP-UX 11.11 is B.11.11.09.
31. Boot from Fibre Channel is supported in non-HA configurations on N class servers running HP-UX 11.0 with direct attachment.
32. N-Class: Arbitrated loop boot with PDC rev 40.04 or higher.Fabric boot with PDC rev 40.25 or higher.
33. Requires PDC firmware N-Class 40.25, rp7400 (PA-8700) requires PDC firmware 41.36.
34. Fibre boot from N-Class and L-Class in both non-HA and HA configurations is now supported in multi-initiator configurations.
35. Initial support for fabric is enabled with: fabric device driver version B.11.00.03; minimum operating system level HP/UX 11.0 990P with March 2000 HW-CR bundle and dependency patch PHKL_21381; Symmetrix microcode versions 5265.49.31, 5266.20, 5566.22. Please refer to the Base Connectivity section for the latest driver and OS support.
36. Brocade 12000 and EMC ED-12000B do not support boot at this time.
37. Requires PDC firmware N-Class 40.25,L-Class 40.26.
38. PDC firmware: Arbitrated Loop (direct attach): use 40.19 or higher; Fabric: use 40.26 or higher
39. **rp5430/5470 requires minimum PDC firmware 41.36 or higher.**
40. **PA-8700 processors: Supports both 11.00 and HP-UX 11i processor 8700+ only supports HP-UX 11i.**
41. **Virtual Partitions (VPAR) is supported on the L-class/rp5470 server.**
    VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later.
    Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 41.02 or later.
42. **Minimum driver revision for HP-UX 11i v1.0 (HP-UX 11.11) is PCI/HSC Fibre Channel Driver B.11.11.09. In a (Vpar) environment.**
43. **HP-UX 11.00 minimum driver revision B.11.00.06.**
    HP-UX 11i minimum driver revision B.11.11.06.
44. Requires PDC firmware 40.32 or higher.
45. **Only PowerPath 3.0.1 is supported for DMX series systems**
46. **FC-AL supported for direct attach only. No support for hubs or Quickloop at this time**
47. **Requires minimum PDC firmware 35.4 and PDHC 7.3 or higher**
48. **Virtual Partitions (VPAR) is supported on the SuperDome server with 4.x and 5.x Symmetrix models and DMX series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.02.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 36.1 or later.**
49. Initial Symmetrix microcode support: 5x67 minimum of 5567.38 or 5267.31 .
    Initial Symmetrix microcode support: 5568 minimum of 5568.34.14 .
50. Required dependent FCMS patches are required (patches may be superceded or have co-dependencies as defined by HP): HP-UX 11.0, PHKL_21834 HP-UX 11i: PHKL_23626.NOTE: These patches must be installed before installing the driver, available at http://us-support2.external.hp.com, HSC Tachlite driver available at http://www.software.hp.com, under "drivers" and locate Fibre Channel HSC Tachlite adapter (A6684A or A6685A).For HP-UX 11i, the driver is under "hp tachyon tl fibre channel adapter" which enables support for A6684A/A6685A/A5158A.
51. Supports: K260/360/460 and K370/380/570/580 for HP-UX 11.0 and 11i only.Boot support currently not available.
52. HP-UX 10.20 minimum driver revision B.10.20.01. HP-UX 11.0 minimum driver revision B.11.00.06. HP-UX 11i minimum driver revision B.11.11.06.
53. HP-UX 10.20 required patches (patches may be superceded or have co-dependencies as defined by HP): PHKL_16751, PHKL_17590, PHSS_23581. Note: These patches must be installed before installing the driver, available at http://us-support2.external.hp.com. HSC Tachlite driver available at http://www.software.hp.com, under drivers and locate Fibre Channel HSC Tachlite adapter (A6684A or A6685A). Installation instructions available at: http://www.software.hp.com/cgi-bin/swdepot_parser.cgi/cgi/displayProductInfo.pl?productNumber=A6685A&oper=install.
54. Dx90, Rx90 servers support a maximum of 2 A6684A HBAs. The first must be installed in the turbo slot 10/12 and the second in any HSC slot.
55. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC Symmetrix devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set. No additional patches are required for this option in HP-UX 11.0, HP-UX 11.11 and forward, however in HP-UX 10.x the "N" flag option was introduced with the following patches are required to be installed or patches which supercede or replace these in order to configured the logical volumes residing on Symmetrix devices in this manner. For all HP/UX 10.xx versions install the following Bad Block Reallocation Patch Pair: 10.01: PHKL_11294, PHKL_11890, PHCO_11288 (patches may be superseded or have co-dependencies as defined by HP). 10.10: PHKL_11816, PHCO_11817 (patches may be superseded or have co-dependencies as defined by HP). 10.20: PHKL_11086, PHKL_11903, PHCO_10964 (patches may be superseded or have co-dependencies as defined by HP).
56. Dx90, Rx90 require minimum PDC firmware 41.35 or higher.
57. **HP-UX 11.0 minimum driver revision B.11.00.06. HP-UX 11i minimum driver revision B.11.11.06.**
58. **Symm 6 is qualified with: HP-UX 11.00 Support Plus Sept '02 bundle = QPK1100 Sept '02 & HWE1100 Sept '02**
59. **Requires minimum PDC firmware 41.34 or higher**
60. The A6685A is not supported in slots 10/0 and 10/8 of the K570 and K580. In the K570 and K580, there are restrictions for the number of A6685A HBA cards supported when graphics cards are installed.
61. Symmetrix microcode supported:5266.40.28 or higher, 5566.41.28 or higher, 5267.27.19 or higher, 5567.34.19 or higher
62. Virtual Partitions (VPAR) is supported on the N-class/rp7400 server with 4.x and 5.x Symmetrix models. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 42.06 or later
63. rp7400 requires minimum PDC firmware 41.36 or higher
64. rp8400 requires minimum PDC firmware 13.10 or higher.
65. Requires minimum PDC firmware for N-class 40.25 or higher. The rp7400 (PA-8700) requires minimum PDC firmware 41.36 or higher
66. HP-UX required patches. HP-UX 11.0 ACE, PHKL_23939, HP-UX 11i : PHKL_23626
67. rp7400 A5158A requires: HP-UX 11i minimum driver version B11.11.06 or higher. HP-UX 11.0 minimum driver version B11.00.06 or higher. rp8400 A5158A requires: HP-UX 11i minimum driver version B11.11.06 or higher
68. A device may not be shared on both NIO(HP-PB) and HSC buses from the same server(e.g., A2969A with 28696A on K-class.or A3644A with 28696A on T600)
69. Requires minimum firmware revision 104
70. Non-HA, single initiator only. Symmetrix microcode supported: 5266.41.29s or higher, 5566.42.29s or higher, 5267.29.20a or higher, 5567.36.20a or higher
71. rx4610 A5158A requires: HP-UX 11i Version 1.5 (11.20) minimum driver version B11.20.04 or higher
72. A4800A and A5159A HBAs are both capable of Ultra 1 speeds, but ship from HP with a default setting of FWD. Symmetrix is supported at Ultra 1 speeds with both these HBAs. Ultra 1 can be enabled in the V-Class, N-Class, and L-Class. A-Class and Superdome PDC firmware. V-Class supports the A4800A Only
73. **rp5405, rp5430, rp5470, rp7400: (PA-8700 processors): Initial support with HP-UX 11.0 Sept 2001, 11i Sept 2001.**
74. **Symmetrix microcode supported:5566.41.28 or higher, 5567.34.19 or higher.**
75. **The A6795A HBA is capable of supporting both 1 and 2 Gb speeds.**
76. **Minimum driver revision for HP-UX 11i v1.0 (HP-UX 11.11) is PCI/HSC Fibre Channel Driver B.11.11.09.**
77. Auto-sensing capability on the HBA is permanently enabled. There is no option to disable auto-sensing on the HBA
78. PDC firmware 15.05 or higher. Arbitrated Loop (direct attach) or FC-SW
79. HP-UX driver requirements: HP-UX 11.0 A6795A HP PCI Tachyon TL/XL2 Fibre Channel driver B.11.00.10 or later release which supports this HBA. HP-UX 11i A6684A/A6685A/A5158A/A6795A HP Tachyon TL/XL2 Fibre Channel driver B.11.11.09 or later release which supports this HBA
80. The A6795A HBA is capable of supporting both 1 and 2 Gb speeds. QuickLoop is not supported with Brocade 3200/3800/12000 or EMC DS-16B2, ED-12000B
81. L-Class requires minimum PDC firmware 40.26 or higher
82. PDC firmware 42.06 or higher. Arbitrated Loop (direct attach) or FC-SW
83. **rp5430/5470 required minimum PDC firmware 41.46 or higher.**
84. PDC firmware 41.39 or higher. Arbitrated Loop (direct attach) or FC-SW

85. PDC firmware 41.46 or higher; Arbitrated Loop (direct attach) or FC-SW
86. A500/550 requires minimum PDC 40.32 or higher.
87. PDC firmware 42.09 or higher; Arbitrated Loop (direct attach) or FC-SW
88. Requires minimum PDC firmware 15.005
89. **Virtual Partitions (VPAR) is supported on the rp7405/7410 server with 4.x and 5.x Symmetrix models and DMX Series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.02.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 4.0 or later.**
90. **rp7410 requires minimum PDC firmware 16.009 or higher.**
91. **Virtual Partitions (VPAR) is supported on the rp7405/7410 server with 4.x and 5.x Symmetrix models and DMX Series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.02.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 16.009 or later.**
92. **For rp7405 and rp7410 required minimum PDC firmware is 15.005**
93. Requires minimum PDC firmware 42.03 or higher.
94. FC-AL and FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.
95. The driver is available at http://www.adaptec.com/worldwide/support/suppbyproduct.html?cat=/Technology/SCSI+Host+Adapters&fromPage=driverindex
96. Virtual Partitions (VPAR) is supported on the rp7405 server with 4.x and 5.x Symmetrix models. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.02.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 4.0 or later.
97. Symmetrix microcode version:
    5266.33.23 or higher,
    5566.35.23 or higher,
    5267.22.15 or higher,
    5567.29.15 or higher.
98. FC-AL, FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.
99. **Virtual Partitions (VPAR) is supported on the rp8400 server with 4.x and 5.x Symmetrix models and DMX Series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 16.009 or later.**
100. **Virtual Partitions (VPAR) is supported on the rp8400 server with 4.x and 5.x Symmetrix models and DMX Series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 4.0 or later.**
101. **Virtual Partitions (VPAR) is supported on the N-class/rp7400 server with 4.x and 5.x Symmetrix models and DMX series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 42.06 or later.**
102. Requires HP-UX 11.0 General Release patch bundle XSWGR1100 B.11.00.47.05 released November 1999 or equivalent.
103. Virtual Partitions (VPAR) is supported on the N-class/rp7400 server.
    VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later.
    Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 42.06 or later. Powerpath support on Virtual Partitions has to be RPQed at this time.
104. HP-UX required patches: PHKL_23626
105. Initial Symmetrix microcode support. 5x67 minimum of 5567.38 or 5267.31.
106. Initial Symmetrix microcode support: 5568 minimum of 5568.34.14.
107. HP-UX 11i . A6684A/A6685A/A5158A/A6795A HP Tachyon TL/XL2 Fibre Channel driver B.11.11.09 or later release which supports this HBA.
108. Minimum driver version for SNIA HBA API support with HP-UX 11.11 is B.11.11.09.
109. **Requires minimum PDC firmware for N-class 40.25 or higher. The rp7400 (PA-8700) requires minimum PDC firmware 41.46 or higher.**
110. **Virtual Partitions (VPAR) is supported on the rp8400 server with the Clariion CX600 and FC4700.**
    FC-AL only support, Requires PDC 16.009 or later.

    VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later.
    Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later.
111. **Virtual Partitions (VPAR) is supported on the rp8400 server with the Clariion CX600 and FC4700.**
    FC-AL only support, Requires PDC 16.009 or later.

    VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later.
    Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or

1 For HP-UX systems only LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set.

2 Qualified and supported by HP

3 Minimum OS revision is HP-UX 11.0 Rev 9812

4 Adapter is Ultra-capable, but disabled by HP; HP 'Commercial Server' will negotiate bus as FWD; HP 'Technical Server' will negotiate bus as UWD

5. A4800A and A5159A HBAs are both capable of Ultra 1 speeds, but ship from HP with a default setting of FWD. Symmetrix is supported at Ultra 1 speeds with both these HBAs. Ultra 1 can be enabled in the V-Class, N-Class, and L-Class, A-Class and Superdome PDC firmware. V-Class supports the A4800A Only.

HP e3000 MPE SYSTEMS – The above note applies but only includes the A-Class and N-Class Servers. The HP e3000 A-Class does not support the dual port HBA A5159A.

6 rp8400 requires minimum PDC firmware 13.10 or higher

7 Symmetrix microcode supported 5266.40.28 or higher, 5566.41.28 or higher, 5267.27.19 or higher, 5567.34.19 or higher

8. Minimum driver version for SNIA HBA API support with HP-UX 11.0 is B.11.00.10. Minimum driver version for SNIA HBA API support with HP-UX 11.11 is B.11.11.09

9. A4800A and A5159A HBAs are both capable of Ultra 1 speeds, but ship from HP with a default setting of FWD. Symmetrix is supported at Ultra 1 speeds with both these HBAs. Ultra 1 can be enabled in the V-Class, N-Class, and L-Class, A-Class and Superdome PDC firmware. V-Class supports the A4800A Only.

10 Minimum OS revision is HP-UX 11.0 990P

11 Symmetrix microcode version 5266.33.23 or higher, 5566.35.23 or higher, 5267.22.15 or higher, 5567.29.15 or higher

12 Symmetrix 5567 code is required to support Ultra2 LVD SCSI director (DP3-U2SD4L)

13 The cables are the same as the Cxx mini 68S ("VHDCI" 8mm to SCSI3). Cables require termination at host end for N-Class, L-Class, A-Class and Superdome. Can be terminated on cable or on HBA, but not both.

14 rp7400 requires minimum PDC firmware 41.36 or higher

15 rp5405, rp5430, rp5470, rp7400 (PA-8700 processors): Initial support with HP-UX 11.0 Sept 2001, 11i Sept 2001. Symmetrix microcode supported: 5266.40.29 or higher, 5566.41.28 or higher, 5267.27.19 or higher, 5567.34.19 or higher

16 Arbitrated loop boot with PDC rev TSSW.3.1 or higher. Fabric boot with PDC rev TSSW.3.2 or higher

17 HP-UX 11.0 switched fabric support is enabled with: fabric device driver version B.11.00.03 and higher, minimum operating system level HP/UX 11.0 990P with March 2002 HW-CR bundle and dependency patch PHKL_21381 patches may be superceded or have co-dependencies as defined by HP. Symmetrix microcode versions: 5265.49.31, 5565.50.22 or latest Symmetrix microcode versions.

18. FC-AL and FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.
19. HP A5158A FC-SW software requirement: FC-AL and FC-SW requires the HP A5158A Tachlite PCI Fibre Channel Adapter. Type A5158A FC-SW software fabric driver version "AP0301", for HP-UX 11i is now available for download from HP's software depot site, http://www.software.hp.com under "drivers". It is referred to as the "hp pci tachyon tl fibre channel adapter", and requires the installation of dependent patch PHKL_22874 prior to installing the fabric driver, patches may be superceded or have co-dependencies as defined by HP.
20. Requires PDC firmware N-Class 40.25,L-Class 40.26.
21. Requires PDC firmware 40.32 or higher.
22. Requires PDC firmware 7.3, 10.0 or higher.
23. The A6795A HBA is capable of supporting both 1 and 2 Gb speeds. QuickLoop is not supported with Brocade 3200/3800/12000 or EMC DS-16B2. ED-12000B.
24. Initial Symmetrix microcode support: 5x67 minimum of 5567.38 or 5267.31 .
    Initial Symmetrix microcode support: 5568 minimum of 5568.34.14 .
25. HP-UX required patches. HP-UX 11.0 ACE: PHKL_23939, HP-UX 11i : PHKL_23626
26. HP-UX driver requirements: HP-UX 11.0 : A6795A HP PCI Tachyon TL/XL2 Fibre Channel driver B.11.00.10 or later release which supports this HBA. HP-UX 11i : A6684A/A6685A/A5158A/A6795A HP Tachyon TL/XL2 Fibre Channel driver B.11.11.09 or later release which supports this HBA.
27. Requires PDC firmware 40.26 or higher.
28. Requires minimum PDC firmware 42.03 or higher
29. HP-UX 11.0 switched fabric support is enabled with: fabnc device driver version B.11.00.03 and higher; minimum operating system level HP/ UX 11.0 990P with March 2000 HW-CR bundle. Refer to Base Connectivity table for additional information.
30. FC-AL and FC-SW topologies can co-exist on the same server but not on the same HBA, provided that the different topologies are attached to different HBAs
31. Requires minimum PDC firmware 15.005 or higher.
32. Requires minimum PDC firmware 40.26 or higher.
33. Auto-sensing capability on the HBA is permanently enabled. There is no option to disable auto-sensing on the HBA.

HPQ MPE/ix
HPQ

HPQ – HPQ MPE/ix							
No.	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot	Comments
1	e3000 900 Series[5]	HP-PB	HPQ MPE/ix 7.5[11, 12, 13, 14]	HPQ 28696A	FWD	Y[2]	See[1]
2	e3000 900 Series[5]	HP-PB	HPQ MPE/ix: 6.0[4], 6.5[4], 6.5.02[4, 6], 7.0.01[6, 8, 9]	HPQ 28696A[3]	FWD	Y[2]	See[1]
3	e3000 N-Class (N4000)	PCI	HPQ MPE/ix 7.0.01[6, 8, 9]	HPQ: A5149A[10], A5150A[10]	U2 LVD	Y[1, 2]	See[1]
4	e3000 N-Class (N4000)	PCI	HPQ MPE/ix 7.5[11, 12, 13, 14]	HPQ: A5149A[10], A5150A[10]	U2 LVD	Y[1, 2, 15]

7	e3000 N-Class (N4000)	PCI	HPQ MPE/ix 7.5[11, 12, 13, 14]	HPQ: A4800A[7], A5159A[7]	UWD	Y[1, 2, 15]	
8	e3000 A-Class	PCI	HPQ MPE/ix: 7.0.01[6, 8, 9], 7.5[11, 12, 13, 14]	HPQ A4800A[7]	UWD	Y[2]	See[1]

1. HAFO is supported with 6.5.02+ and 7.0.01+, and 7.5 on 9xx Series, A-Class and N-Class.
2. RAID-1 ONLY Requires MPE_XL_SYSTEM_VOLUME_SET on a dedicated channel. Boot device maximum capacity is 4 GB.
3. HP 3000 Series 9x9 Core I/O card (A2372-60004 or A3453-60010 a.k.a Mustang) is supported for Symmetrix only if the 'dedicated SCSI bus' requirement above is met by disconnecting the internal devices attached to the Core I/O card (firmware patch FWSJXB6A required for this support.)
4. Symmetrix 8000 Series & 66/67 support: HP-UX 10.20,11.0,11.10, 11.0 ACE,11.i. MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01: Symmetrix 8000 Series 5568 support: HP-UX 10.20, 11.0, 11i. MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
5. The HP end-of-support for MPE/iX 5.0, 5.5 was 10/31/99 and 12/31/2000 respectively
6. MPE/iX 6.0, 6.5, 6.5.02 or 7.0, 7.0.01 require Symmetrix microcode: 5266.40.28 or higher, 5566.40.27 or higher, 5267.25.17 or higher, 5567.32.16 or higher, 5568.34.14 or higher.
7. A4800A and A5159A HBAs are both capable of Ultra 1 speeds, but ship from HP with a default setting of FWD. Symmetrix is supported at Ultra 1 speeds with both these HBAs. Ultra 1 can be enabled in the V-Class, N-Class, and L-Class, A-Class and Superdome PDC firmware. V-Class supports the A4800A Only.

HP e3000 MPE SYSTEMS – The above note applies but only includes the A-Class and N-Class Servers. The HP e3000 A-Class does not support the dual port HBA A5159A.

8. Symmetrix 8000 Series & 66/67 support: HP-UX 10.20,11.0,11.10, 11.0 ACE,11.i.
   Symmetrix 8000 Series 5568 support: HP-UX 10.20, 11.0, 11i.
   Symmetrix 8000 Series & 66/67 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01:
   Symmetrix 8000 Series 5568 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
9. Symmetrix 8000 Series & 66/67 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01: Symmetrix 8000 Series 5568 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
10. Symmetrix 5567 code is required to support Ultra2 LVD SCSI director (DP3-U2SD4L).
11. Requires Symmetrix microcode:
    5266.40.28 or higher
    5566.40.27 or higher
    5267.25 17 or higher
    5567.32 16 or higher
    5568.34 14 or higher
12. Symmetrix 8000 Series & 66/67 support:
    MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01, 7.5
    Symmetrix 8000 Series 5568 support:
    MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01, 7.5
13. LDEV1, the boot volume, has no size limit in MPEi/X 7.5. The 4GB limit that existed in previous releases has been eliminated.
14. Symmetrix 8000 Series & 66/67 support.HP-UX 10.20, 11.0, 11.0 ACE, 11i.
    Symmetrix 8000 Series 5568 support: HP-UX 10 20, 11.0, 11i
    Symmetrix 8000 Series & 66/67 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
    Symmetrix 8000 Series 5568 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
    LDEV1, the boot volume, has no size limit in MPE i/X. The 4GB limit that existed in previous releases has been eliminated.

1. Apply latest revision of SCSI patches
2. Refer to Base Connectivity, Clustered Host HPQ sections for connectivity details.
3. KZPSA-BB: Latest/Minimum firmware revision is A12
4. KZPSA-BB (FWD) has been discontinued by HPQ (Compaq).
5. Latest SCSI patch qualified: VMS721H1 FIBRE SCSI-V0500
6. Symmetrix 8000 Series: 66/67 support: Tru64 4.0F, 4.0G, 5.0A, 5.1, 5.1A, 5.1B; Open VMS 7.1.7.2-1H1, 7.3, 7.3-1. 5568 support: Tru64 4.0F, 4.0G, 5.1, 5.1A, 5.1B; Open VMS 7.2-2, 7.3, 7.3-1
7. OpenVMS 7.2-1, 7.2-1H1 FC-SW requires console firmware 5.6 or later and patch VMS721_fibre_SCSI-V0400. Available from http://ftp1.support.compaq.com/public/
8. Latest qualified Alpha Systems firmware is V6.4.
9. Open VMS 7.1-2 requires console firmware 5.6 or later and patch VMS712_SCSI-V0300.
10. KZPBA-CB: Latest/Minimum firmware revision is 5.57.
11. Requires Fibre Channel switch. Refer to Fibre Channel Connectivity – HPQ sections for connectivity details.
12. KGPSA-CA, KGPSA-DA. Latest/Minimum firmware revision 3.82a1.
13. Latest SCSI patch qualified. VMS722 FIBRE SCSI-V0400
14. Open VMS 7.2-2 FC-SW requires console firmware 5.6 or later and patch VMS722 fibre SCSI-V0100
15. KGPSA-BC Latest/Minimum firmware revision is 3.20x7
16. Latest SCSI patch qualified VMS73 FIBRE SCSI-V0500
17. Open VMS 7.3 FC-SW requires console firmware 5.6 or later and patch VMS73 update-V0100 or patch VMS73 fibre SCSI-V0200.
18. Latest SCSI patch qualified: VMS731 FIBRE SCSI-V0300
19. KGPSA-CA/KGPSA-DA(FCA2354): Minimum firmware revision 3.81A4
20. KGPSA-CA/KGPSA-DA(FCA2354): Latest firmware revision 3.82A1
21. KGPSA-BC. Latest firmware revision 3.20X7
22. The KGPSA-BC login to switch may fail if the Brocade switch port speed is set to auto-negotiate. Set the port speed to 1 Gb
23. KGPSA-BC Minimum firmware revision 3.03A1
24. **KGPSA-EA(FCA2384): Latest qualified firmware revision 1-00X6.**
25. **KGPEA-EA(FCA2384): Latest qualified firmware revision 1-00X6.**

1. Apply latest revision of SCSI patches.
2. Minimum AlphaServer SRM console firmware V6.0 required for boot device support.
3. Symmetrix 8000 Series: 66/67 support: Tru64 4.0F, 4.0G, 5.0A, 5.1, 5.1A, 5.1B; Open VMS 7.1,7.2-1H1, 7.3, 7.3-1. 5568 support: Tru64 4.0F, 4.0G, 5.1, 5.1A, 5.1B; Open VMS 7.2-2, 7.3, 7.3-1.
4. Tru64 V4.0F BL13 Patch Kit 2 may introduce problems with KZPBA adapters. Tru64 V4.0F latest qualified Patch Kit-0007 (DUV40FB18AS0007-20020102).
5. V4.0F, V4.0G: 8 LUNs/Symmetrix Fibre director port (LUNs 000-007 valid).
6. KZPBA-CB: Latest/Minimum firmware revision is 5.57.
7. Latest qualified Alpha Systems firmware is V6.4.
8. Tru64 V4.0G latest qualified patch kit-0003 (T64V40GAS0003-20010613).
9. KZPSA-BB [FWD] has been discontinued by HPQ (Compaq).
10. KZPSA-BB: Latest/Minimum firmware revision is A12.
11. Requires Fibre Channel switch. Refer to Fibre Channel Connectivity - HPQ sections for connectivity details.
12. KGPSA-CA, KGPSA-DA: Latest/Minimum firmware revision 3.82a1.
13. KGPSA-BC: Latest/Minimum firmware revision is 3.20x7.
14. Tru64 V5.1A latest qualified Patch Kit-0004 (T64V51AB21AS0004-20030206).
15. **Tru64 V5.1 latest qualified Patch Kit-0006 (T64V51B20AS0006-20030210).**
16. V5.x: 255 LUNs/Symmetrix Fibre director port (LUNs 000-0FE valid) on Symmetrix 8000 Series, requires OVMS director bit setting (minimum 5265.48.30 or 5566.26.19). LUN 000 must be mapped to gatekeeper device, the LUN 000 array controller device will not be usable by the Tru64 host.
17. The KGPSA-BC login to switch may fail if the Brocade switch port speed is set to auto-negotiate. Set the port speed to 1 Gb.
18. AlphaServer SC systems have special Tru64 UNIX operating system and AlphaServer SC System Software requirements.
19. Requires RPQ
20. **Tru64 V5.1B latest qualified Patch Kit 2 (T64V51BB22AS0002-20030415).**
21. **AlphaServer GS1280,ES80,ES47: Minimum Tru64 V5.1B with Patch Kit 1 (T64V51BB1AS0001-20021229)**
22. **FCA2384(KGPSA-EA): Latest firmware revision 1.00X6**
23. **FCA2384(KGPSA-EA): Minimum firmware revision 1.00X2**

1. Mixed FC-AL and FC-SW are supported on the same server
2. Fibre Channel HBAs: DCCG141-0000: LP7000e copper DCCG147-0000: LP8000 copper DCCG148-0000: LP8000 fibre
3. Fibre Channel device driver distributed and supported by Bull
4. Symmetrix 8000 Series 66/67 support at AIX 4.3.x, 5568 support at AIX 4.3.3, 5.1, 5.2
5. Bull supplies the appropriate cables
6. The latest qualified operating system is AIX 4.3.3 except for RL Series
7. Mixed FC-AL and FC-SW supported on the same server, MSKG006-0000 = Brocade Silkworm 2800

8. 32-bit kernel support only with AIX 5.1.
9. AIX 5.1 32/64-bit kernel support.
10. MSKG0008-0000 = Brocade® Silkworm® 2800.
11. LPAR and SMP modes supported.
12. SMDF007-B000-Brocade SilkWorm 3800
    SMDF008-B000-Brocade SilkWorm 3800

1 For all PCI-based hosts only: See http://www-1.ibm.com/servers/eserver/pseries/library/hardware_docs/sa38/380538.pdf for appropriate HBA placement guidelines.

2 Symmetrix 8000 Series:66/67 support AIX 4.3.x, 5.1. 5568 support at AIX 4.3.3, 5.1

3. The following link provides detailed data for all 9076-SP2 models and feature codes:
http://www1.ibmlink.ibm.com/cgi-bin/master?request=salesmanual&parms=SMS&xh=NTZH*daEMSRi4n1USenGnN9332&xhi=usa.main%7Csalesmanual%5E&type=D&search=9076&title=T&product

4. AIX 5.1 32/64 bit Kernel supported. Minimum PowerPath Version 2.1.2 supported . Requires minimum EMC ODM fileset support 5.0.0.0
5. Symmetrix 5567 code is required to support Ultra2 LVD SCSI director (DP3-U2SD4L).
6. AIX 5.1 only supported with 32-bit kernel. Minimum PowerPath Version 2.1.2 supported. Requires minimum EMC ODM fileset support 5.0.0.0.
7. PowerPC 32-bit only.
8. HBA and driver available exclusively as EMC Fibre Channel Interface V2.0 for AIX Platforms. Latest PTF package (V2.0.0.3 PTF.tar.Z) can be downloaded from the EMC FTP server at ftp://ftp.emc.com/pub/elab/aix/EMC-FC-Kit
9. No longer available
10. Mixed FC-AL and FC-SW are supported on the same server.
11. Requires minimum Symmetrix microcode level 5265.39.25. Requires minimum AIX APAR IY05369. Requires minimum EMC ODM fileset support (4.3.3.0 IBM Fibre Channel interface support for Symmetrix). Supported adapter firmware, 3.22A1.
12. **System/Service processor combined microcode Version SPH02254/sh020307 dated 11/20/2002 or later.**
13. **AIX 4.3.3 ML9, APAR IY22024**
14. **Requires minimum HBA firmware 3.22A1. For all PCI-based hosts only: see HBA placement guidelines in the IBM document PCI Adapter Placement Reference SA38-0538-6, available at http://www-1.ibm.com/servers/eserver/pseries/library/hardware_docs/sa38/380538.pdf**
15. **Booting from a PowerPath device is supported with FC-SW topology only. Any other topologies must be approved via the RPQ process.**
16. **Minimum Powerpath version 3.0.2. For Powerpath patches 3.0.x, the bootfix.sh script is required for boot support. See the EMC Primus case ID emc58038 for more details and the PowerPath Release Notes for installation**
17. **Obtain the EMC Symmetrix and AIX Fibre boot document from avatar.eng.emc.com for installation and configuration instructions.**
18. **Fibre boot when used under AIX 4.3 requires APAR IY42989 which can be obtained from IBM at https://techsupport.services.ibm.com/server/fixes?view=pSeries.**
19. IBM Native Fibre Channel drivers with feature code 6227 and with feature code 6228 are supported on the same server. Feature 6228 and 6239 are supported on the same server. Mixed FC-AL and FC-SW are supported on the same server. 6227 filesets: devices.pci.df1000f7.com, devices.pci.df1000f7.diag, devices.pci.df1000f7.rte; 6228 filesets: devices.pci.df1000f7.com, devices.pci.df1000f7.diag, devices.pci.df1000f9.diag, devices.pci.df1000f9.rte; 6239 filesets: devices.pci.df1000f7.com, devices.pci.df1000f7.diag, devices.pci.df1080f9.diag, devices.pci.df1080f9.rte
20. Requires minimum Symmetrix microcode level 5265.48.30. Requires minimum AIX APAR IY08960, IY03872. Requires minimum EMC ODM fileset support (4.3.3.1 IBM Fibre Channel interface support for Symmetrix). Supported adapter firmware, 3.22A1.
21. **System microcode CL020407 or later.**
22. **System/Service processor combined microcode Version SST01256/SS010614 dated 10/23/2001 or later.**
23. **System/Service processor combined microcode Version L02113/ag010611 or later.**
24. **System microcode CM020407 or later.**
25. **System microcode MM020407 or later.**
26. **System/Service processor combined microcode Version NAN02066/SC020308 dated 03/29/2002 or later.**
27. **System/Service processor combined microcode Version 20020920 dated 11/19/2002 or later.**
28. Requires minimum EMC ODM fileset support (4.3.3.1 IBM Fibre Channel interface support for Symmetrix). Device driver df1000f9 is distributed by IBM.
29. Requires minimum AIX 4.3.3 with maintenance level 08 and adapter firmware 3.82A1.
30. **Requires minimum HBA firmware 3.82A1. For all PCI-based hosts only: see HBA placement guidelines in the IBM document PCI Adapter Placement Reference SA38-0538-6, available at http://www-1.ibm.com/servers/eserver/pseries/library/hardware_docs/sa38/380538.pdf**
31. The Following feature codes are supported: 2054: Power 3 High Node 2055: SP expansion I/O 2056: 375 MHz Power 3 thin node 2058: 375 MHz Power 3 high node.
32. **AIX 5.1 ML1, APAR IY21957**
33. **Fibre boot when used under AIX 5.1 requires APAR IY40885 which can be obtained from IBM at https://techsupport.services.ibm.com/server/fixes?view=pSeries.**
34. Requires minimum ODM fileset support (5.0.0.0 EMC Symmetrix Fibre Channel support software).
35. See http://www.rs6000.ibm.com/resource/hardware_docs/sa38-0538/380538.pdf for appropriate HBA placement guidelines
36. Requires minimum HBA firmware 3.22A1.
37. **AIX 5.1 32/64 bit Kernel supported. Requires minimum EMC ODM fileset support 5.0.0.0.**
38. **AIX 5.1 supported with 32/64-bit kernel. Requires minimum EMC ODM fileset support 5.0.0.0.**
39. Requires minimum HBA firmware 3.82A1.
40. **System/Service processor combined microcode Version CLT02066/ct020307 dated 04/04/2002 or later.**
41. **Minimum microcode levels RH0 20413 dated 05/22/2002 or later.**
42. **System/Service processor combined microcode Version RH020413 dated 05/22/2002 or later.**
43. **AIX 5.1 ML1, APAR IY21957 or higher.**
44. **System/Service processor combined microcode Version RR020822 dated 09/19/2002 or later.**
45. Support only SMP mode. No LPAR support.
46. Latest APAR for PSSP 3.1.1 is IY17870.
47. Requires minimum AIX5.1 with maintenance level 03 APAR IY32749.
48. **System/Service processor combined microcode Version RK021120 dated 12/11/2002 or later.**
49. **Minimum Powerpath version 3.0.3 is supported.**
50. **Fibre boot when used under AIX 5.2 requires APAR IY41028 which can be obtained from IBM at https://techsupport.services.ibm.com/server/fixes?view=pSeries.**
51. AIX 5.2 32/64 bit kernel supported. Requires Minimum EMC ODM fileset support 5.0.0.0.
52. **System/Service processor combined microcode Version RK030206 dated 03/31/2003 or later.**
53. Requires AIX 5.1 with minimum maintenance level 04 APAR IY44478.
54. Requires minimum HBA firmware 1.00X5.
55. Requires AIX 5.2 with minimum maintenance level 01 APAR IY44479.

IBM DYNIX/ptx
IBM

11	xSeries NUMA-Q 2000	PCI	IBM DYNIX/ptx 4.4 6[12], 4.4 7[12]	IBM IOC-210-52 (LP6500)[9]	FC-SW	N	
12	Symmetry 5000	PCI	IBM DYNIX/ptx 4.2.4[1] 4.4.6[12], 4.4 7[12] 4.4.8[1]	IBM: QCIC-E QCIC-W-CTLR-01	FWD		
13	Symmetry 2000[2]	PCI	IBM DYNIX/ptx 4.2.4[1] 4.4.8[1]	IBM: QCIC-E QCIC-W-CTLR-01	FWD		
14	Symmetry 2000	PCI	IBM DYNIX/ptx 4.4.6[12], 4.4 7[12]	IBM: QCIC-E, QCIC-W-CTLR-01	FWD		

1. Symmetrix 8000 Series 66/67 support DYNIX/ptx 4.2.4(66 only) 4.4.x, 4.5.1, 4.6.0(Symmetry @ 4.2)
2. Dynix 4.5.1 is not supported on Symmetry 2000
3. Attachment is through an integrated Fibre Channel to SCSI Bridge C10V cable requires switched termination ptx 4.4.2 requires a minimum Symmetrix microcode level of 5264.25.2
4. FC to SCSI Bridge and firmware v1.5.5

5. FC-AL support only available in DYNIX/ptx 4.5.0 and above.
6. Boot device cannot be mapped to FC-to-SCSI bridges.
7. Not supported on the EMC DP3-FCD4 or on the DP3-FCD42G(S).
8. EMC DP3-FCD4 supported on DYNIX/ptx 4.4.8, 4.4.9, 4.4.10, 4.5.2, 4.5.3, and 4.6.1 only. Requires minimum 5x67 microcode 5567.34.19A, or 5568.27.12A.
9. EMC DP3-FCD42G and EMC DP3-FCD42GS supported on DYNIX/ptx 4.4.8, 4.4.9 and 4.4.10 only.
10. DYNIX/ptx 4.4.10 and 4.5.3 are not supported in FC-AL Configurations
11. Attachment is through and integrated Fibre Channel to SCSI bridge C10V cable requires switched termination.
12. Only supported in cluster configurations

IBM MVS/ESA

IBM

IBM – IBM MVS/ESA							
No.	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot	Comments
1	ES/9000: 9020, 9121, 9221	Mainframe Bus	IBM MVS/ESA 5.1	IBM BMC-Parallel	BMC-Parallel	N	See[1]
2	S/390 parallel Enterprise Servers (G5 series) 9672-Rxx	Mainframe Bus	IBM MVS/ESA 5.1	IBM BMC-Parallel	BMC-Parallel	N	
3	ES/9000: 9020, 9121, 9221	Mainframe Bus	IBM MVS/ESA 5.1	IBM ESCON	ESCON	N	See[1]
4	S/390 parallel Enterprise Servers (G5 series) 9672-Rxx	Mainframe Bus	IBM MVS/ESA 5.1	IBM ESCON	ESCON	N	

1. SuSE Linux AG kernel 2.2 / 2.4, TurboLinux kernel 2.2 / 2.4, and Red Hat kernel 2.2 / 2.4: support for Linux on Symmetrix is limited to basic I/O operations only. Control of Symmetrix features (i.e., SRDF, TF. Config Mgr) is not supported at this time. Linux is supported both in an LPAR and as a guest under VM/ESA.

IBM – IBM OS/400							
No.	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot	Comments
14	AS/400 9406: 500[6], 50S[6], 510[6], 530[6], 53S[6], 620[6], 640[6], 650[6], 720[6], 730[6], 740[6], 820[9], 830[9], 840[9], S20[6], S30[6], S40[6]	SPD	IBM OS/400 V5R2	IBM 6501	FWD	N	See[13]

1. Minimum Symmetrix microcode for V4R5: 5065.26.12, 5265.50.32, 5266.22.18, 5566.23.18, 5568.36.14A.
2. Primary Load Source: uHDA. Primary Load Source used for stand-alone system or primary partition.
3. Secondary Load Source: N/A. Secondary Load Source used for secondary partition in an expansion bus.
4. Symm5 & 66/67 support: OS/400 V4R5, V5R1, V5R2
5. Subject to IBMs limitations per host model.
6. These systems can come with an SPD-bus in the base-system cabinet, but can also be equipped with a "PCI-Only" Card-Cage. In a "PCI-Only" case, an additional SPD attachment and Expansion Cabinet is neccesary to attach the #6501-Cards to the AS/400
7. Secondary Load Source: uHDA. Secondary Load Source used for secondary partition in an expansion bus.
8. Primary Load Source. eHDA. Primary Load Source used for stand-alone system or primary partition.
9. Requires IBM SPD migration tower 5057 or 5077 for external storage connection to 6501.
10. Primary Load Source: 8HDA. Primary Load Source used for stand-alone system or primary partition
11. Requires IBM SPD migration tower 5057 or 5077 for external storage connection to 6501 and for expansion buses.
12. Secondary Load Source. uHDA, 8HDA. Secondary Load Source used for secondary partition in an expansion bus.
13. Minimum Symmetrix microcode for V5R1: 5266.39.27S, 5566.40.27S, 5267.24.16S, 5567.31.16S, 5568.36.14A. V5R2 min ucode 5267.40.27, 5567.49.27
14. Minimum Symmetrix microcode 5568.36.14A or later using DP3-FCD4, DP3-FCD42G in 1Gb mode.
15. Direct connect only. Hub connection not supported for boot device.
16. Direct Connect only
17. Minimum Symmetrix microcode 5568.36.14A or later using DP3-FCD4, DP3-FCD42G in 1Gb mode. V5R2 minimum Symmetrix microcode 5568.54.20. Can support 1Gb or 2Gb mode.
18. 8HDA is the only load source compatible with model 890
19. 8HDA is the only load source compatible with model 270

Microsoft Windows 2000

EMC recommends shutting down the host server during maintenance procedures that could cause the boot disk to become unavailable to the host. If the paging file is unavailable to the operating system for a minimum of 10 seconds, a crash can occur.Events that could cause a system to crash when booting from external storage are:
1)Lost connection to external storage (pulled or damaged cable connection).
2)External storage service/upgrade procedures such as online microcode upgrades and/or configuration changes.
3)External storage director failures including failed lasers on Fibre Channel directors.
4)External storage power failure.
5)Storage area network failures such as Fibre Channel switches, switch components, and switch power failures.
6)Storage area network service/upgrade procedures such as firmware upgrades or hardware replacements.CAUTION: Microsoft Windows NT uses virtual memory paging files that reside on the boot disk by default. Please refer to the information contained in Microsoft Knowledge Base article Q305547. The article explains how Microsoft supports booting Windows systems through a SAN (storage area network.) Although this article specifically mentions Windows 2000, the information also pertains to Windows NT 4.0 systems booting through a SAN.

1. Requires Legacy PCI slot (not available on new servers.)
2. Requires BIOS version 2.20 and driver version 2.20b (native on Windows 2000 Advanced Server CD-ROM).
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.
5. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
6. Booting Windows 2000 systems through ISLs (inter-switch links) in heterogenous fabrics is not currently supported.
7. Booting Windows 2000 systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
8. MSCS cluster configurations are supported. PowerPath 3.0 or greater required.
9. **Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**
10. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
11. **Qlogic SANSurfer/SANBlade Manager is not supported.**
12. **Requires driver 8.2.1.20, and bios 1.33 for Stratus ftServers. Supports SNIA HBA API. Available at http://www.qlogic.com.**
13. **Bus Enumeration Issue Causes Problems using SYMCLI SCSI bus enumeration of disks will change depending on cold boot or warm boot. This causes symcli commands to fail because the path is changed and SYMCLI can no longer communicate with the Symmetrix.**

    By "shutdown" and booting system, internal disks are assigned first, followed by Symmetrix disks.
    By "restart" the system, Symmetrix disks are assigned first, followed by internal disks. Drive letter are not changed in both cases.
    The workaround is to perform "symcfg discover" after rebooting.
14. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
15. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
16. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
17. Host must be offline for interfamily Symmetrix microcode upgrade
18. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.62a1. Emulex drivers are available at http://www.emulex.com. For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com. Supports SNIA HBA API.
    NOTE: LP8000/850 HBAs without -EMC label must have minimum rev. dragonfly 2.0 of the Emulex ASIC.
    CLARiiON CX200 NOTE: Requires 1.00x3 for direct-connect configurations only
19. The LP9002-E now ships with the LP9002L-E low profile adapter
20. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com Supports SNIA HBA API.
21. Requires HBA driver revision 2.13a4 and firmware 3.30a7. Supports SNIA HBA API. Emulex drivers are available at http://www.emulex.com
22. Adaptec AHA2944UW is OEMed by HP as A5252A and A5252B.
23. Requires BIOS version 3.10.0 and driver 4.10.4002 set V 1.02
24. Symmetrix 5567 code is required to support Ultra2 LVD SCSI director (DP3-U2SD4L)
25. Adaptec AHA-2944UW has been OEM'ed by HP as A5252A and A5252B
26. Windows 2000 Professional is supported as the management workstation.

1. Data General servers that are rack-mountable (designated by Data General with an "R") are supported.
2. Booting Windows 2000 systems through ISLs (inter-switch links) in heterogeneous fabrics is not currently supported.
3. Booting Windows 2000 systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
4. MSCS cluster configurations are supported. PowerPath 3.0 or greater required.
5. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
6. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.
7. Requires HBA driver revision 2.13a4 and firmware 3.30a7. Supports SNIA HBA API. Emulex drivers are available at http://www.emulex.com
8. Data General servers that are rack-mountable (designated with an "R") are supported.
9. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
10. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
11. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
12. **Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**
13. Requires Legacy PCI slot (not available on new servers.)
14. Requires BIOS version 2.20 and driver version 2.20b (native on Windows 2000 Advanced Server CD-ROM).
15. AHA-2944W is no longer available in distribution channels.
16. Adaptec AHA2944UW is OEMed by HP as A5252A and A5252B.
17. **Qlogic SANSurfer/SANBlade Manager is not supported.**
18. **Qlogic SanBlade Manager is not supported.**
19. Adaptec AHA-2944UW has been OEM'ed by HP as A5252A and A5252B.
20. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
21. Requires BIOS version 3.10.0 and driver 4.10.4002 set V.1.02
22. Symmetrix 5567 code is required to support Ultra2 LVD SCSI director (DP3-U2SD4L).
23. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
24. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.

1 Booting Windows 2000 systems through ISLs (inter-switch links) in heterogeneous fabrics is not currently supported
2 Booting Windows 2000 systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops
3. MSCS cluster configurations are supported. PowerPath 3.0 or greater required

4. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
5. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.
6. If using Dell PERC Controller, requires PERC 3 with OpenManager 3.0 and Array Manager 3.1. The afamgl.sys must be version 2.6.0.3486 (or above)..
7. Requires driver 8 1 5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
8. Not supported with the HP NetServer LC-2000
9. Requires HBA driver revision 2.13a4 and firmware 3 30a7 Supports SNIA HBA API. Emulex drivers are available at http://www.emulex.com
10. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
11. PowerEdge 2550 supports a maximum of 2 Emulex HBAs at one time and the total PCI power cannot exceed 20 Watts.
12. Requires Legacy PCI slot (not available on new servers.)
13. Requires BIOS version 2.20 and driver version 2.20b (native on Windows 2000 Advanced Server CD-ROM).
14. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
15. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
16. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
17. Host must be offline for interfamily Symmetrix microcode upgrade.
18. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.62a1. Emulex drivers are available at http://www.emulex.com. For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com. Supports SNIA HBA API
NOTE: LP8000/850 HBAs without -EMC label must have minimum rev. dragonfly 2.0 of the Emulex ASIC.
19. When used with the HP NetServer LC2000: 32 device maximum.
20. **Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**
21. CLARiiON CX200 NOTE: Requires 1.00x3 for direct-connect configurations only.
22. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API Drivers available at http://www.emulex.com.
23. The LP9002-E now ships with the LP9002L-E low profile adapter.
24. Adaptec AHA2944UW is OEMed by HP as A5252A and A5252B.
25. Linux v2.4.x Kernels support a maximum of 128 devices per system
26. Symmetrix 8000 Series. 66/67 support at Red Hat Kernel v2.4.x or later, 5568 support at Red Hat kernel v2.4.x or later.
27. Requires BIOS version 3.10.0 and driver 4.10.4002 set V.1 02
28. Symmetrix 5567 code is required to support Ultra2 LVD SCSI director (DP3-U2SD4L).
29. Adaptec AHA-2944UW has been OEM'ed by HP as A5252A and A5252B.
30. **Dell PowerEdge supports a maximum of 2 Emulex HBAs at one time and the total power cannot exceed 20 Watts.**

1. Requires Legacy PCI slot (not available on new servers.)
2. Requires BIOS version 2.20 and driver version 2.20b (native on Windows 2000 Advanced Server CD-ROM).
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.
5. Requires Fujitsu Services (ICL) BN550/260 to connect the Fujitsu Services (ICL) Management Control Station to the Symmetrix for ECC use
6. EMC requires and supports only one port of the dual-channel adapter.
7. BIOS 2.20.0, driver 5.00.2144.1 aic78xx.sys. Drivers for Adaptec are available at http://www.adaptec.com/worldwide/support/suppbyproduct.html?cat=/Technology/SCSI+Host+Adapters&fromPage=driverindex
8. Cables to be ordered from Fujitsu Services (ICL)
9. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support
10. Requires driver 8 1 5 20, and bios 1.79 Available at http://www.qlogic.com. Supports SNIA HBA API

1 Requires Legacy PCI slot (not available on new servers.)
2. Requires BIOS version 2.11.0 and driver 2.20b (native on Windows 2000 Advanced Server CD-ROM).
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.
5. Booting Windows 2000 systems through ISLs (inter-switch links) in heterogenous fabrics is not currently supported.
6. Booting Windows 2000 systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
7 MSCS cluster configurations are supported. PowerPath 3.0 or greater required.
8. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
Requires BIOS version 2.20 and driver version 2.20b (native on Windows 2000 Advanced Server CD-ROM).
Must use standard PCI 32bit/33MHz slot for SCSI
11. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
12. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.62a1. Emulex drivers are available at http://www.emulex.com. For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com. Supports SNIA HBA API
NOTE: LP8000/850 HBAs without -EMC label must have minimum rev. dragonfly 2.0 of the Emulex ASIC.
13. Host must be offline for interfamily Symmetrix microcode upgrade
14 Requires driver version 2 20a12, firmware version 3.90a7, and BIOS 1 62a1. Supports SNIA HBA API Available at http://www emulex com
15 The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3 3 VDC bus power The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces
16 CLARiiON CX200 NOTE: Requires 1.00x3 for direct-connect configurations only.
17. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
18. Requires HBA driver revision 2.13a4 and firmware 3.30a7. Supports SNIA HBA API. Emulex drivers are available at http://www.emulex.com
19. Requires driver 8 1 5 20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API
20 **Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**

1. Adaptec AHA2944UW is OEMed by HP as A5252A and A5252B.
2. Requires Legacy PCI slot (not available on new servers.)
3. Requires BIOS version 2.20 and driver version 2.20b (native on Windows 2000 Advanced Server CD-ROM).
4. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
5. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.
6. (Adaptec AHA-2944UW)
7. MSCS cluster configurations are supported. PowerPath 3.0 or greater required.
   This server is equipped with plastic shielding around the PCI slots. Since the PCI slots are 32-bit, this shielding prohibits 64-bit HBAs from properly seating in the PCI slots. To accomodate 64-bit HBAs, this shielding must be removed, or modified to allow the 64-bit HBA to fully seat in the 32-bit slots.
9. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
10. Requires BIOS version 3.10.0 and driver 4.10.4002 set V.1.02
11. Symmetrix 5567 code is required to support Ultra2 LVD SCSI director (DP3-U2SD4L).
12. Includes both Pentium PRO and XEON models
13. Booting Windows 2000 systems through ISLs (inter-switch links) in heterogenous fabrics is not currently supported.
14. Booting Windows 2000 systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
15. **Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**
16. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
17. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
18. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
19. Requires HBA driver revision 2.13a4 and firmware 3.30a7. Supports SNIA HBA API. Emulex drivers are available at http://www.emulex.com
20. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
21. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
22. Host must be offline for interfamily Symmetrix microcode upgrade.
23. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.62a1. Emulex drivers are available at http://www.emulex.com. For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com. Supports SNIA HBA API.
    NOTE: LP8000/850 HBAs without -EMC label must have minimum rev. dragonfly 2.0 of the Emulex ASIC.
24. HPQ Proliant ML350 (1GHz) : D04,F04 (11/13/2000) , HPQ Proliant ML350(600,733,800,866,933 MHz) : D02, F04 (11/13/2000).
25. The LP9002-E now ships with the LP9002L-E low profile adapter.
26. HPQ Proliant servers that are rack-mountable (designated with an "R") are supported.
27. Adaptec AHA-2944UW has been OEM'ed by HP as A5252A and A5252B.
28. Not supported with the HP NetServer LC-2000.
29. Not supported with the HP LC2000.
30. When used with the HP NetServer LC2000: 32 device maximum.
31. The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC, HP part number D6975A, must be ordered separately from HP.
32. Requires driver version 2.0.25.44 available at http://h20004.www2.hp.com/keeper motes/bsdmatrix/matrix213991.html
33. Does not support Connectrix DS-16M, DS-32M, or McData ED-5000
34. Requires manual intervention on bootup to clear "new hardware found" message box at boot time.
35. (HHBA-5101BK-01)
36. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
37. CLARiiON CX200 NOTE: Requires 1.00x3 for direct-connect configurations only.
38. Requires driver 8.00.08.01 and BIOS 1.76.
39. PCI-X servers must use single 5 volt PCI slot for Adaptec 2944 family.
40. AHA-2944UW has been OEM'ed as HP A5252A and A5252B
41. Dual port fibre Channel controller.
42. Dual port PCI-X fibre channel mezzanine card option is embedded. No PCI/PCI-X slots available.
43. BIOS must be obtained from HP at http://h18000.www1.hp.com/products/servers/proliant-bl/p-class/20p/index.html instead of BIOS on Qlogic web site. EMC NVRAM settings must be configured manually. Refer to EMC Fibre Channel documentation for QLogic HBAs for the settings.
44. Booting off of an EMC storage array is not currently supported with the HPQ BL20P
45. Requires driver 8.2.1.20, and bios 1.34. Supports SNIA HBA API. Driver and BIOS available at http://www.qlogic.com.
46. Requires STORPort driver version 8.2.2.20, and BIOS 1.34. Available at http://www.qlogic.com This driver requires Microsoft STORPort hotfix Q817789 available from Microsoft. Refer to http://support.microsoft.com/default.aspx?scid=kb;[LN];817789
47. BIOS for the BL20p mezzanine card must be obtained from HP. Cannot use BIOS from Qlogic web site. EMC NVRAM settings must be configured manually. Refer to page 2-6 of the Readme document "EMC Fibre Channel with QLogic Host Bus Adapters in the Windows NT/Windows 2000 Environment" found at http://www.qlogic.com for the settings.

1. Booting Windows 2000 systems through ISLs (inter-switch links) in heterogenous fabrics is not currently supported.
2. Booting Windows 2000 systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
3. MSCS cluster configurations are supported. PowerPath 3.0 or greater required.
4. **Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**
5. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
6. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
7. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.
8. This server only supports 5 Volt HBAs. qLogic 22XX family (if applicable), qLogic 23XX family. Emulex LP8000, and Emulex LP850 (if applicable).
9. For IBM xSeries Servers running Windows NT and Windows 2000 with IBM ServerRaid controller 4M, the ServerRaid Driver must be 6.00 or above for use with EMC PowerPath 3.0 and above. IBM driver can be downloaded at: http://www-3.ibm.com/pc/support/site.wss/document.do?lndocid=MIGR-39723
10. Requires BIOS version 3.10.0 and driver 4.10.4002 set V.1.02
11. Symmetrix 5567 code is required to support Ultra2 LVD SCSI director (DP3-U2SD4L).
12. Adaptec AHA-2944UW has been OEM'ed by HP as A5252A and A5252B
13. Cables to be ordered from Fujitsu Services (ICL).
14. Requires BIOS version 2.20 and driver version 2.20b (native on Windows 2000 Advanced Server CD-ROM).
15. Requires Legacy PCI slot (not available on new servers.)
16. Adaptec AHA2944UW is OEMed by HP as A5252A and A5252B.
17. Requires BIOS version 2.11.0 and driver 2.20b (native on Windows 2000 Advanced Server CD-ROM).
18. Not supported with the HP NetServer LC-2000
19. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
20. Requires HBA driver revision 2.13a4 and firmware 3.30a7. Supports SNIA HBA API. Emulex drivers are available at http://www.emulex.com
21. (QLA2200) For IBM xSeries and Netfinity servers only.
22. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
23. For IBM Netfinity and xSeries Intel servers only.
24. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
25. **Qlogic SANSurfer/SANBlade Manager is not supported.**
26. **Qlogic SanBlade Manager is not supported.**
27. The LP9002-E now ships with the LP9002L-E low profile adapter
28. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces
29. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.62a1. Emulex drivers are available at http://www.emulex.com. For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com. Supports SNIA HBA API.
    NOTE: LP8000/850 HBAs without -EMC label must have minimum rev. dragonfly 2.0 of the Emulex ASIC
30. Host must be offline for interfamily Symmetrix microcode upgrade
31. This HBA is equivalent to the qLogic QLA2310
32. EMC requires and supports only one port of the dual-channel adapter
33. Adaptec AHA-2944UW is not supported
34. This HBA is equivalent to the qLogic QLA2340
35. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com
36. CLARiiON CX200 NOTE: Requires 1.00x3 for direct-connect configurations only
37. Supported by direct attach only
38. (Adaptec AHA-2944UW)
39. The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC, HP part number D6975A, must be ordered separately from HP.
40. Requires manual intervention on bootup to clear "new hardware found" message box at boot time
41. Does not support Connectrix DS-16M, DS-32M, or McData ED-5000
42. Requires driver version 2.0.25.44 available at http://h20004.www2.hp.com/keeper_rnotes/bsdmatrix/matrix213991.html
43. (HHBA-5101BK-01)

44. HP OEMs Adaptec AHA-2944UW AS A52524 AND A5252B.
45. Supported via RPQ and only one of the two ports can be used.
46. Requires BIOS version 1.31 and HBA driver 2.20b (native on Windows 2000 Advanced Server CD-ROM).
47. BIOS 2.20.0, driver 5.00.2144.1 aic78xx.sys Drivers for Adaptec are available at http://www.adaptec.com/worldwide/support/suppbyproduct.html?cat=/Technology/SCSI+Host+Adapters&fromPage=drivenndex
48. It is recommended that the QLogic QLA2340 is not installed in Slot 1.
49. **When flashing HBA bios on the HS20 FC Expansion card, you may receive the error message: "Error erasing flash at I/O address 2600 (this is the second port on the HBA)"**

    This is a known issue as the expansion card only has one flashable port. IBM is working to resolve this and this message can be ignored.
50. **Due to the HS20's embedded FC-SW design, EMC Volume Logix is required to assign LUNS to each individual blade server.**
51. **This server has a built-in FC-SW and must be direct-attached to the external storage.**
52. **IBM BIOS 1.34, EMC Approved Qlogic Driver Version 8.2.2.25. Available at http://www.qlogic.com.**
53. **EMC VolumeLogix Software required for multiple BladeServers when direct-attached to EMC Symmetrix storage.**
54. **IBM HS20 Fibre Channel Expansion Card (48P7061)**

1. Requires Legacy PCI slot (not available on new servers.)
2. Requires BIOS version 2.20 and driver version 2.20b (native on Windows 2000 Advanced Server CD-ROM).
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.
5. Requires driver 8 1 5 20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
6. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
7. **Requires driver 8.2.2.25. and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**
8. MSCS cluster configurations are supported. PowerPath 3.0 or greater required.
9. Booting Windows 2000 systems through ISLs (inter-switch links) in heterogenous fabrics is not currently supported.
10. Booting Windows 2000 systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
11. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.62a1. Emulex drivers are available at http://www.emulex.com. For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com. Supports SNIA HBA API
    NOTE: LP8000/850 HBAs without -EMC label must have minimum rev. dragonfly 2.0 of the Emulex ASIC.
12. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
13. Requires HBA driver revision 2.13a4 and firmware 3.30a7. Supports SNIA HBA API. Emulex drivers are available at http://www.emulex.com
    Bus Enumeration Issue Causes Problems using SYMCLI SCSI bus enumeration of disks will change depending on cold boot or warm boot. This causes symcli commands to fail because the path is changed and SYMCLI can no longer communicate with the Symmetrix.

    By "shutdown" and booting system, internal disks are assigned first, followed by Symmetrix disks.
    By "restart" the system, Symmetrix disks are assigned first, followed by internal disks. Drive letter are not changed in both cases.
    The workaround is to perform "symcfg discover" after rebooting.
15. Supported by direct attach only
16. **Requires driver 8.2.1.20. and bios 1.33 for Stratus ftServers. Supports SNIA HBA API. Available at http://www.qlogic.com.**
17. **Qlogic SANSurfer/SANBlade Manager is not supported.**
18. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1 Supports SNIA HBA API Drivers available at http://www.emulex.com.
19. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
20. CLARiiON CX200 NOTE: Requires 1.00x3 for direct-connect configurations only.
21. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
22. Adaptec AHA2944UW is OEMed by HP as A5252A and A5252B
23. Symmetrix 5567 code is required to support Ultra2 LVD SCSI director (DP3-U2SD4L)
24. Requires BIOS version 3.10 0 and driver 4.10 4002 set V.1.02
25. Adaptec AHA-2944UW has been OEM'ed by HP as A5252A and A5252B
26. Host must be offline for interfamily Symmetrix microcode upgrade.
27. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.63a1. Emulex drivers are available at http://www.emulex.com. Supports SNIA HBA API.
28. **Qlogic SanBlade Manager is not supported.**
29. Windows 2000 Professional is supported as the management workstation
30. CX200 available through selected channels

1. Booting Windows 2000 systems through ISLs (inter-switch links) in heterogenous fabrics is not currently supported.
2. Booting Windows 2000 systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
3. MSCS cluster configurations are supported. PowerPath 3.0 or greater required.
4. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
5. **Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**
6. 64-bit slots for 3.3v HBAs only.
7. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.
8. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
9. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
10. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
11. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.62a1. Emulex drivers are available at http://www.emulex.com. For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com. Supports SNIA HBA API.
    NOTE: LP8000/850 HBAs without -EMC label must have minimum rev. dragonfly 2.0 of the Emulex ASIC.
12. Host must be offline for interfamily Symmetrix microcode upgrade
13. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
14. Requires HBA driver revision 2.13a4 and firmware 3.30a7. Supports SNIA HBA API. Emulex drivers are available at http://www.emulex.com
15. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
16. AHA-2944W is no longer available in distribution channels
17. Adaptec AHA2944UW is OEMed by HP as A5252A and A5252B
18. Symmetrix 5567 code is required to support Ultra2 LVD SCSI director (DP3-U2SD4L)
19. Requires BIOS version 3.10.0 and driver 4.10.4002 set V.1.02
20. Adaptec AHA-2944UW has been OEM'ed by HP as A5252A and A5252B.
21. CLARiiON CX200 NOTE. Requires 1.00x3 for direct-connect configurations only
22. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.

Stratus

Stratus – Microsoft Windows 2000							
No	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot	Comments
1	**ftServer: 3210[6], 3220[6], 3300[6], 5200[6]**	PCI	**Microsoft Windows 2000 Advanced Server SP2[4, 5]**	**QLogic QLA2310F-E-SP[1, 2, 3]**	**FC-AL, FC-SW**	**N**	
2	**ftServer 3210[6], 3220[6], 3300[6] 5200[6], 5240[6], 6500[6]**	PCI	**Microsoft Windows 2000 Advanced Server SP3[4, 5, 8, 9]**	**QLogic QLA2310F-E-SP[1, 2, 3]**	**FC-AL, FC-SW**	**N**	**See[7]**

1. **Qlogic SANSurfer/SANBlade Manager is not supported.**
2. **Requires driver 8.2.1.20, and bios 1.33 for Stratus ftServers. Supports SNIA HBA API. Available at http://www.qlogic.com.**
3. **FC-AL supported for direct attach only. No support for hubs or Quickloop at this time.**
4. **EMC strongly recommends that HBAs of different vendors not be used in the same host server.**
5. **Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.**
6. **Bus Enumeration Issue Causes Problems using SYMCLI SCSI bus enumeration of disks will change depending on cold boot or warm boot. This causes symcli commands to fail because the path is changed and SYMCLI can no longer communicate with the Symmetrix.**

By "shutdown" and booting system, internal disks are assigned first, followed by Symmetrix disks.

By "restart" the system, Symmetrix disks are assigned first, followed by internal disks. Drive letter are not changed in both cases. The workaround is to perform "symcfg discover" after rebooting.

7. Windows 2000 Professional is supported as the management workstation.
8. Requires Stratus ftServer 1.2.2.x.
   Requires Microsoft HotFix Q327477. available from Microsoft customer support.
   Requires VxVM 2.7 HotFix 5A. available from http://support.veritas.com/index.htm choose support downloads, choose Volume Manager, choose Volume Manager for Windows 2000. Choose VM2K27HF05aENU 248733.exe Patch – VERITAS Volume Manager 2.7 for Windows 2000 HotFix05a, English Version Size: 5892Kb
   Requires PowerPath 3.0.0 or higher.
9. Refer to the Stratus, Bull or NEC documentation for hardware, software and non-storage related setup and configuration.

1. Supported via RPQ and only one of the two ports can be used.
2. Requires BIOS version 1.31 and HBA driver 2.20b (native on Windows 2000 Advanced Server CD-ROM).
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.
5. MSCS cluster configurations are supported. PowerPath 3.0 or greater required.
6. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.62a1. Emulex drivers are available at http://www.emulex.com. For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com. Supports SNIA HBA API.
   NOTE: LP8000/850 HBAs without -EMC label must have minimum rev. dragonfly 2.0 of the Emulex ASIC.
7. The boot path should be zoned so that the boot device on a FA port should only be visible to one HBA.
8. Supported by direct attach only
9. HP OEMs Adaptec AHA-2944UW AS A52524 AND A5252B.
10. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
11. Hardware and adapters similar to Unisys ES7000-100, ES7000-200.
12. **The Libra 18x includes native MCP,and Virtual Machine for MCP (Windows MCPvm) partitions**
13. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
14. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
15. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
16. Adaptec AHA2944UW is OEMed by HP as A5252A and A5252B.
17. Symmetrix 5567 code is required to support Ultra2 LVD SCSI director (DP3-U2SD4L).
18. Requires BIOS version 3.10.0 and driver 4.10.4002 set V 1.02
    Adaptec AHA-2944UW has been OEM'ed by HP as A5252A and A5252B.
19. Cables to be ordered from Fujitsu Services (ICL).
21. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
22. Host must be offline for interfamily Symmetrix microcode upgrade.
23. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.

Microsoft Windows 2003

EMC recommends shutting down the host server during maintenance procedures that could cause the boot disk to become unavailable to the host. If the paging file is unavailable to the operating system for a minimum of 10 seconds, a crash can occur.Events that could cause a system to crash when booting from external storage are:
1)Lost connection to external storage (pulled or damaged cable connection).
2)External storage service/upgrade procedures such as online microcode upgrades and/or configuration changes.
3)External storage director failures including failed lasers on Fibre Channel directors.
4)External storage power failure.
5)Storage area network failures such as Fibre Channel switches, switch components, and switch power failures.
6)Storage area network service/upgrade procedures such as firmware upgrades or hardware replacements.CAUTION: Microsoft Windows NT uses virtual memory paging files that reside on the boot disk by default. Please refer to the information contained in Microsoft Knowledge Base article Q305547. The article explains how Microsoft supports booting Windows systems through a SAN (storage area network.) Although this article specifically mentions Windows 2000, the information also pertains to Windows NT 4.0 systems booting through a SAN.

11. **QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).**
12. **Bus Enumeration Issue Causes Problems using SYMCLI SCSI bus enumeration of disks will change depending on cold boot or warm boot. This causes symcli commands to fail because the path is changed and SYMCLI can no longer communicate with the Symmetrix.**

By "shutdown" and booting system, internal disks are assigned first, followed by Symmetrix disks.
By "restart" the system, Symmetrix disks are assigned first, followed by internal disks. Drive letter are not changed in both cases.
The workaround is to perform "symcfg discover" after rebooting.

7. Requires STORPort driver version 8.2.2.20, and BIOS 1.34. Available at http://www.qlogic.com. This driver requires Microsoft STORPort hotfix Q817789 available from Microsoft. Refer to: http://support.microsoft.com/default.aspx?scid=kb;[LN];817789

Microsoft Windows NT

EMC recommends shutting down the host server during maintenance procedures that could cause the boot disk to become unavailable to the host. If the paging file is unavailable to the operating system for a minimum of 10 seconds, a crash can occur.Events that could cause a system to crash when booting from external storage are:
1)Lost connection to external storage (pulled or damaged cable connection).
2)External storage service/upgrade procedures such as online microcode upgrades and/or configuration changes.
3)External storage director failures including failed lasers on Fibre Channel directors.
4)External storage power failure.
5)Storage area network failures such as Fibre Channel switches, switch components, and switch power failures.
6)Storage area network service/upgrade procedures such as firmware upgrades or hardware replacements.CAUTION: Microsoft Windows NT uses virtual memory paging files that reside on the boot disk by default. Please refer to the information contained in Microsoft Knowledge Base article Q305547. The article explains how Microsoft supports booting Windows systems through a SAN (storage area network.) Although this article specifically mentions Windows 2000, the information also pertains to Windows NT 4.0 systems booting through a SAN.NOTE: Windows NT installation will fail immediately after installing Network Services for hosts that use an Intel Network Interface Card (NIC).

Bull

Bull – Microsoft Windows NT						
No.	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot
1	Express 5800: 140Hb, 140Ra4, HV8600, HX4600, MH4500	PCI	Microsoft Windows NT 4.0 SP6A[4, 5]	Emulex: LP7000E-EMC, LP8000-EMC[6], LP850-EMC. QLogic: QLA2200F-EMC[7], QLA2202F-EMC[7]	FC-AL, FC-SW	N
2	Express 5800: HV8600, HX4600, MH4500	PCI	Microsoft Windows NT 4.0 SP6A[4, 5]	Adaptec AHA-2944UW[1, 2, 3]	FWD	N

1. Driver for Adaptec available at: http://www.adaptec.com/worldwide/support/suppbyproduct.html?cat=/Technology/SCSI+Host+Adapters&fromPage=driverindex
2. Requires Legacy PCI slot (not available on new servers.)
3. Requires BIOS version 2.20 and driver version 2.12s4.
4. Symmetrix 8000 Series: 66/67 support at Windows NT 4.0 SP6A. 5568 support at Windows NT 4.0 SP6A.
5. EMC strongly recommends that HBAs of different vendors not be used in the same host server
6. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support
7. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.

1 BusLogic Driver available at http://www.mylex.com/support/prodoctgd/index.html
2 Requires HBA driver 5.01 and HBA BIOS 5.96F
3 Symmetrix 8000 Series 6G/67 support at Windows NT 4.0 SP6A, 5568 support at Windows NT 4.0 SP6A
4 EMC strongly recommends that HBAs of different vendors not be used in the same host server
5 Data General servers that are rack-mountable (designated with an "R") are supported
6 Adaptec AHA-2944UW driver v2.12s4 and BIOS 2.11.0
7 Data General servers that are rack-mountable (designated by Data General with an "R") are supported
8 Requires BIOS version 2.20 and driver version 2.12s4
9 Driver for Adaptec available at http://www.adaptec.com/worldwide/support/suppbyproduct.html?cat=/Technology/SCSI+Host+Adapters&fromPage=driverindex
10 Requires Legacy PCI slot (not available on new servers.)
11 AHA-2944W is no longer available in distribution channels.
12 Requires HBA driver 2.36 and HBA BIOS 6.26 available at http://www.qlogic.com

13. Requires HBA driver 1.3.00 and HBA BIOS 1.26, available at http://www.qlogic.com
14. Dual port fibre Channel controller.
15. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
16. Booting Windows NT systems through ISLs (inter-switch links) in heterogeneous fabrics is not currently supported.
17. Booting Windows NT systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
18. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
19. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
20. Requires HBA driver revision 2.13a4 and firmware 3.30a7. Supports SNIA HBA API. Emulex drivers are available at http://www.emulex.com
21. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
22. Requires driver 8.1.5.21, and bios 1.34. Available at http://www.qlogic.com. Supports SNIA HBA API.
23. Qlogic SanBlade Manager is not supported.
24. Qlogic SANSurfer/SANBlade Manager is not supported.
25. The LP9002-E now ships with the LP9002L-E low profile adapter
26. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.

1 Requires HBA driver 5.01 and HBA BIOS 5.06F
2 BusLogic Driver available at: http://www.mylex.com/support/productgd/index.html
3 EMC strongly recommends that HBAs of different vendors not be used in the same host server
4 Symmetrix 8000 Series. 66/67 support at Windows NT 4.0 SP6A. 5568 support at Windows NT 4.0 SP6A
5 Dell PowerEdge supports a maximum of 2 Emulex HBAs at one time and the total power cannot exceed 20 Watts
6 PowerEdge 2550 supports a maximum of 2 Emulex HBAs at one time and the total PCI power cannot exceed 20 Watts.
7 Driver for Adaptec available at: http://www.adaptec.com/worldwide/support/suppbyproduct.html?cat=/Technology/SCSI+Host+Adapters&fromPage=driverinde
8. Requires Legacy PCI slot (not available on new servers.)
9. Requires BIOS version 2.20 and driver version 2.12s4
10 Adaptec AHA-2944UW driver v2.12s4 and BIOS 2.11.0
11 AHA-2944W is no longer available in distribution channels
12 Requires HBA driver 2.36 and HBA BIOS 6.26 available at http://www.qlogic.com

13. Requires HBA driver 1.3.00 and HBA BIOS 1.26. available at http://www.qlogic.com
14. Booting Windows NT systems through ISLs (inter-switch links) in heterogeneous fabrics is not currently supported.
15. Booting Windows NT systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
16. If using Dell PERC Controller, requires PERC 3 with OpenManager 3.0 and Array Manager 3.1. The afamgt.sys must be version 2.6.0.3486 (or above)..
17. Dual port fibre Channel controller.
18. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
19. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
20. Requires driver version 2.20a12. firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
21. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
22. Requires driver 8.1.5.21, and bios 1.34. Available at http://www.qlogic.com. Supports SNIA HBA API.
23. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
24. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
25. Requires HBA driver revision 2.09D
26. Requires driver version 2.0.25.44 available at http://h20004.www2.hp.com/keeper_rnotes/bsdmatrix/matrix213991.html
27. (HHBA-5101BK-01)
28. Requires manual intervention on bootup to clear "new hardware found" message box at boot time.
29. The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC, HP part number D6975A, must be ordered separately from HP.
30. The LP9002-E now ships with the LP9002L-E low profile adapter
31. Requires HBA BIOS revision 1.37 and HBA driver revision 6.16. available at http://www.qlogic.com. Note that EMC will support driver version 7.02.01 for RPQ only. Supports SNIA HBA API.

1 BusLogic Driver available at: http://www.mylex.com/support/productgd/index.html
2 Requires HBA driver 5.01 and HBA BIOS 5.96F
3 Symmetrix 8000 Series. 66/67 support at Windows NT 4.0 SP6A, 5568 support at Windows NT 4.0 SP6A.
4 EMC strongly recommends that HBAs of different vendors not be used in the same host server.
5 Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
6. Includes both Pentium PRO and XEON models
7 This server is equipped with plastic shielding around the PCI slots. Since the PCI slots are 32-bit, this shielding prohibits 64-bit HBAs from properly seating in the PCI slots. To accomodate 64-bit HBAs, this shielding must be removed, or modified to allow the 64-bit HBA to fully seat in the 32-bit slots.
8. Adaptec AHA-2944UW driver v2.12s4 and BIOS 2.11.0.
9 Requires BIOS version 2.20 and driver version 2.12s4
10 Requires Legacy PCI slot (not available on new servers.)
11 Driver for Adaptec available at: http://www.adaptec.com/worldwide/support/supportproduct.html?cat=/Technology/SCSI+Host+Adapters&fromPage=driverindex
12 AHA-2944W is no longer available in distribution channels
13 Requires HBA driver 2.36 and HBA BIOS 6.26, available at http://www.qlogic.com
14 Requires HBA driver 1.3.00 and HBA BIOS 1.26, available at http://www.qlogic.com
15 AHA-2944UW has been OEM'ed as HP A5252A and A5252B
16 (Adaptec AHA-2944UW)
17 Requires HBA driver revision 2.09D
18 Requires HBA BIOS revision 1.37 and HBA driver revision 6.16, available at http://www.qlogic.com. Note that EMC will support driver version 7.02.01 for RPQ only. Supports SNIA HBA API

19. Requires manual intervention on bootup to clear "new hardware found" message box at boot time.
20. The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC, HP part number D6975A, must be ordered separately from HP.
21. Requires driver version 2.0.25.44 available at http://h20004.www2.hp.com/keeper_rnotes/bsdmatrix/matrix213991.html
22. (HHBA-5101BK-01)
23. Booting Windows NT systems through ISLs (inter-switch links) in heterogeneous fabrics is not currently supported.
24. Booting Windows NT systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
25. HPQ Proliant servers that are rack-mountable (designated with an "R") are supported.
26. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
27. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
28. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
29. Dual port fibre Channel controller.
30. Booting Windows NT systems through ISLs (inter-switch links) in heterogeneous fabrics is not currently supported. Booting Windows NT systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
31. Requires HBA driver revision 2.13a4 and firmware 3.30a7. Supports SNIA HBA API. Emulex drivers are available at http://www.emulex.com
32. Requires driver 8 1.5.21, and bios 1.34. Available at http://www.qlogic.com. Supports SNIA HBA API.
33. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
34. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
35. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
36. Requires Driver revision 4.04.
37. Adaptec AHA-2944UW driver v2.12s4 and BIOS 2.20.
38. PCI-X servers must use single 5 volt PCI slot for Adaptec 2944 family.
39. Requires BIOS version 2.20 and driver version 2.20b (native on Windows 2000 Advanced Server CD-ROM).
40. Requires BIOS v4.01 rev A (5/17/2002) for use with Emulex HBAs.

1. BusLogic Driver available at: http://www.mylex.com/support/productgd/index.html
2. Requires HBA driver 5.01 and HBA BIOS 5.96F.
3. Symmetrix 8000 Series: 66/67 support at Windows NT 4.0 SP6A, 5568 support at Windows NT 4.0 SP6A.
4. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
5. For IBM xSeries Servers running Windows NT and Windows 2000 with IBM ServerRaid controller 4M, the ServerRaid Driver must be 6.00 or above for use with EMC PowerPath 3.0 and above. IBM driver can be downloaded at: http://www-3.ibm.com/pc/support/site.wss/document.do?lndocid=MIGR-39723
6. This server only supports 5 Volt HBAs: qLogic 22XX family (if applicable), qLogic 23XX family, Emulex LP8000, and Emulex LP850 (if applicable).
7. Requires BIOS version 2.20 and driver version 2.12s4.
8. Driver V2.12S1 is required for Adaptec AHA-2944UW to work in IBM Netfinity 5000 and 7000-M10.
9. Requires Legacy PCI slot (not available on new servers.)
10. Driver for Adaptec available at: http://www.adaptec.com/worldwide/support/suppbyproduct.html?cat=/Technology/SCSI+Host+Adapters&fromPage=driverindex
11. Adaptec AHA-2944UW driver v2.12s4 and BIOS 2.11.0.
12. AHA-2944UW has been OEM'ed as HP A5252A and A5252B
13. Trimetra XtraSERVER Windows NT Additions package BN553205
14. AHA-2944W is no longer available in distribution channels.
15. Requires HBA driver 2.36 and HBA BIOS 6.26, available at http://www.qlogic.com
16. Requires HBA driver 1.3.00 and HBA BIOS 1.26, available at http://www.qlogic.com
17. Booting Windows NT systems through ISLs (inter-switch links) in heterogeneous fabrics is not currently supported.
18. Booting Windows NT systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
19. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
20. Dual port fibre Channel controller.
21. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
22. (QLA2200) For IBM xSeries and Netfinity servers only.
23. For IBM Netfinity and xSeries Intel servers only.
24. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
25. Requires HBA driver revision 2.13a4 and firmware 3.30a7. Supports SNIA HBA API. Emulex drivers are available at http://www.emulex.com
26. Requires driver 8.1.5.21, and bios 1.34. Available at http://www.qlogic.com. Supports SNIA HBA API.
27. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
28. Qlogic SANSurfer/SANBlade Manager is not supported
29. Qlogic SanBlade Manager is not supported.
30. Cables to be ordered from Fujitsu Services (ICL).
31. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
32. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
33. It is recommended that the QLogic QLA2340 is not installed in Slot 1.
34. Host must be offline for interfamily Symmetrix microcode upgrade
35. This HBA is equivalent to the qLogic QLA2310
36. This HBA is equivalent to the qLogic QLA2340
37. (Adaptec AHA-2944UW)
38. Requires HBA driver revision 2.09D
39. Requires HBA BIOS revision 1.37 and HBA driver revision 6.16, available at http://www.qlogic.com. Note that EMC will support driver version 7.02.01 for RPQ only. Supports SNIA HBA API.
40. Requires manual intervention on bootup to clear "new hardware found" message box at boot time.
41. Requires driver version 2.0.25.44 available at http://h20004.www2.hp.com/keeper_rnotes/bsdmatrix/matrix213991.html
42. The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC, HP part number D6975A, must be ordered separately from HP.
43. (HHBA-5101BK-01)
44. Requires NCR WorldMark Server and driver revision 4.15 or higher.
45. BIOS 2.20.0, driver 2.21 (4.0.1431) arc78xx.sys
46. The LP9002-E now ships with the LP9002L-E low profile adapter.

1. BusLogic Driver available at: http://www.mylex.com/support/productgd/index.html
2. Requires HBA driver 5.01 and HBA BIOS 5.96F.
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. Symmetrix 8000 Series: 66/67 support at Windows NT 4.0 SP6A, 5568 support at Windows NT 4.0 SP6A.

5. Driver for Adaptec available at: http://www.adaptec.com/worldwide/support/suppbyproduct.html?cat=/Technology/SCSI+Host+Adapters&fromPage=driverindex
6. Requires Legacy PCI slot (not available on new servers.)
7. Requires BIOS version 2.20 and driver version 2.12s4.
8. AHA-2944W is no longer available in distribution channels.
9. Requires HBA driver 2.36 and HBA BIOS 6.26, available at http://www.qlogic.com
10. Requires HBA driver 1.3.00 and HBA BIOS 1.26, available at http://www.qlogic.com
11. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
12. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
13. Dual port fibre Channel controller.
14. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
15. Requires driver 8.1.5.21, and bios 1.34. Available at http://www.qlogic.com. Supports SNIA HBA API.
16. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
17. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
18. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.63a1. Emulex drivers are available at http://www.emulex.com. Supports SNIA HBA API.

1. Symmetrix 8000 Series: 66/67 support at Windows NT 4.0 SP6A, 5568 support at Windows NT 4.0 SP6A
2. EMC strongly recommends that HBAs of different vendors not be used in the same host server
3. Servers are not supported on Symmetrix 5.0.
4. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
5. Supported by Unisys only
6. Used in clustered environments only
7. Cables to be ordered from Fujitsu Services (ICL)
8. Booting Windows NT systems through ISLs (inter-switch links) in heterogeneous fabrics is not currently supported
9. Booting Windows NT systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops
10. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.62a1. Emulex drivers are available at http://www.emulex.com. For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com. Supports SNIA HBA API
    NOTE: LP8000/850 HBAs without -EMC label must have minimum rev. dragonfly 2.0 of the Emulex ASIC
11. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API

1. Limited support available from NCR – requires RPQ
2. Limited support available for MPARS 3.01.
3. Symmetrix 8000 Series & 66/67 support at MPRAS 3.02, Windows 2000 SP2.
4. Dual-port SCSI is not offered on the 4700
5. Qualified by NCR.
6. Requires package: PKERN302, PS MBAS302
7. BIOS requires driver version 1.08 and BIOS version 1.76, available at http://www.qlogic.com
8. Requires driver version 1.08 and BIOS version 1.76, available at http://www.qlogic.com. Packages PKERN302 and PS MBAS302 available from NCR.
9. Requires package PSCSI302 Ver.02.10.10.09 or higher available from NCR.

NEC UX4800

1. Supports FC-AL point-to-point only
2. When installing NetWare for fabric boot (when operating system is not installed in the local host) on the Symmetrix, create only one LUN and then perform the install. To install a second server that will be fabric boot, repeat the process by creating one additional LUN and then loading the operating system to it. Continue this process until the desired number of fabric boot servers have been reached. Conditions exist where several LUNs are initially created and you perform your first install, NetWare will sometimes acquire and stripe the operating system across several of the newly created LUNs
3. NetWare boot support is contingent on migration of the DOS boot partition to an NSS partition. NetWare will warn you of the possibility of data corruption if you convert the DOS boot partition to an NSS partition. The risk of data corruption is during I/O to the C: drive while in the NetWare debugger, or while writing reboot log files during an "Auto Restart After Abend". When you load DOSFAT, please set "Auto Restart After Abend" to 0 to avoid the possibility of data corruption.
4. Requires HBA bios 1.83 and driver 6.50v. Driver and documentation available from www.qlogic.com.
5. Maximum number of NWFS volumes that can be mounted is 64
6. Driver installation with NetWare 5.0 SP6A. Do not load cpqmpk.psm when prompted. At the point when you are to load idecd, ideata and scsihd, toggle to the Control prompt with <Alt-Esc>. Once at the system control, unload nwpa.nlm, then load nwpa.nlm version 3.07a 5/3/01. Once the new nwpa.nlm is loaded, toggle back to the install screen and continue with the install. When install is complete down the server and copy nwpa.nlm version 3.07a 5/3/01 to the c:\nwserver directory and reboot
7. **Supported in "Shared HBA" topology. Single HBA may be zoned to more than one storage array. This included arrays of different types and/or models.**
8. Edit config.sys with the following: Files=100 Buffers=99
9. To enable failover with fabric boot DOSFAT NSS must be loaded from the autoexec.ncf. In a failed condition the c:\ partition will not failover correctly but the DOSFAT C: partition will
10. AHA-2944W is no longer available in distribution channels
11. Symmetrix 8000 Series, 66/67 support at NetWare 4.11, 5.x, 5568 support at Netware 5.1
12. Requires driver 6.50v and BIOS 1.34. Driver and documentation available from www.qlogic.com
13. EMC strongly recommends that HBAs of different vendors not be used in the same host server
14. Symmetrix 8000 Series 66/67 support at NetWare 5.x. 5568 support at Netware 5.1
15. Novell 5.00 OS only supports the Host Adapter Module (HAM) driver
16. Requires BIOS rev 6.26 and driver rev 1.27 available at http://www.qlogic.com
17. Requires Legacy PCI slot (not available on new servers.)
18. AHA-2944UW has been OEM'ed as HP A5252A and A5252B
19. Requires BIOS v2.20 and driver version 7.30S1
20. Driver for Adaptec available at http://www.adaptec.com/worldwide/support/supportbyproduct.html?cat=/Technology/SCSI+Host+Adapters&fromPage=driverindex
21. Requires driver version 2.02e and firmware 3.90a7
22. PowerPath not currently supported.
23. PowerEdge 2550 supports a maximum of 2 Emulex HBAs at one time and the total PCI power cannot exceed 20 Watts.

24. DOS boot device maximum accessible capacity is 2GB. Netware SYS volume must be in LUN 0.
25. Supports FC-AL point-to-point and Fabric switch configurations.
26. Netware 5.1 SP4 and 6.0 SP1 require driver 8.1 and BIOS 2.20. Requires "SCAN ALL LUNS" in AUTOEXEC.NCF just before the Mount All statement.
27. Adaptec AHA-2944UW requires HAM driver version 7.30s1 and BIOS 2.20. The driver is available on the EMC intranet (http://iqweb.lss.emc.com).
28. EMC engineering recommends that customers do not combine or share a Netware SYS volume and data volumes on the same Symmetrix logical device.
29. Consult the EMC customer support center for a detailed Netware Symmetrix boot installation procedure.
30. Requires SP4 on Netware 5.1.
31. Requires "SCAN ALL LUNs" in AUTOEXEC.NCF just before the "Mount All" statement.
32. Requires NWPA.NLM V.3.07A update from Novell website.
33. NetWare NSS has 120 LUN per port limitation. If NSS will not be used, 128 LUNs is supported.
34. PCI-X servers must use single 5 volt PCI slot for Adaptec 2944 family.
35. Requires NetWare patches: NWPAPT2A and NSS5J.
36. **Support for CX600, CX400, FC4500, FC4700, and FC5300. (FC5300 requires copper to Fibre transceiver.)**

1. Symmetrix 8000 Series: 66/67 support at NetWare 5.x, 5568 support at Netware 5.1.
2. Requires BIOS rev 6.26 and driver rev 1.27, available at http://www.qlogic.com
3. Novell 5.00 OS only supports the Host Adapter Module (HAM) driver.
4. Maximum number of NWFS volumes that can be mounted is 64.
5. Symmetrix 8000 Series: 66/67 support at NetWare 4.11, 5.x, 5568 support at Netware 5.1.
6. Requires BIOS v2.20 and driver version 7.30S1.
7. Requires Legacy PCI slot (not available on new servers.)
8. AHA-2944UW has been OEM'ed as HP A5252A and A5252B
9. Driver for Adaptec available at: http://www.adaptec.com/worldwide/support/suppbyproduct.html?cat=/Technology/SCSI+Host+Adapters&fromPage=driverindex
10. AHA-2944W is no longer available in distribution channels.
11. **Supported in "Shared HBA" topology. Single HBA may be zoned to more than one storage array. This included arrays of different types and/or models.**
12. Driver installation with NetWare 5.0 SP6A. Do not load cpqmpk.psm when prompted. At the point when you are to load idecd, ideata and scsihd, toggle to the Control prompt with <Alt-Esc>. Once at the system control, unload nwpa.nlm, then load nwpa nlm version 3.07a 5/3/01. Once the new nwpa nlm is loaded, toggle back to the install screen and continue with the install. When install is complete, down the server and copy nwpa.nlm version 3.07a 5/3/01 to the c:\nwserver directory and reboot
13. Edit config.sys with the following: Files=100 Buffers=99
14. When installing NetWare for fabric boot (when operating system is not installed in the local host) on the Symmetrix, create only one LUN and then perform the install. To install a second server that will be fabric boot, repeat the process by creating one additional LUN and then loading the operating system to it. Continue this process until the desired number of fabric boot servers have been reached. Conditions exist where several LUNs are initially created and you perform your first install, NetWare will sometimes acquire and stripe the operating system across several of the newly created LUNs.
15. To enable failover with fabric boot DOSFAT NSS must be loaded from the autoexec.ncf. In a failed condition the c:\ partition will not failover correctly but the DOSFAT C: partition will.
16. NetWare boot support is contingent on migration of the DOS boot partition to an NSS partition. NetWare will warn you of the possibility of data corruption if you convert the DOS boot partition to an NSS partition. The risk of data corruption is during I/O to the C: drive while in the NetWare debugger, or while writing reboot log files during an "Auto Restart After Abend". When you load DOSFAT, please set "Auto Restart After Abend" to 0 to avoid the possibility of data corruption.
17. Must use standard PCI 32bit/33MHz slot for SCSI
18. DOS boot device maximum accessible capacity is 2GB. Netware SYS volume must be in LUN 0.
19. Adaptec AHA-2944UW requires HAM driver version 7.30s1 and BIOS 2.20. The driver is available on the EMC intranet (http://iqweb.lss.emc.com).
20. EMC engineering recommends that customers do not combine or share a Netware SYS volume and data volumes on the same Symmetrix logical device.
21. Consult the EMC customer support center for a detailed Netware Symmetrix boot installation procedure
22. Requires SP4 on Netware 5.1
23. Requires "SCAN ALL LUNs" in AUTOEXEC.NCF just before the "Mount All" statement
24. Netware 5.1 SP4 and 6.0 SP1 require driver 8.1 and BIOS 2.20. Requires "SCAN ALL LUNS" in AUTOEXEC.NCF just before the Mount All statement
25. (Adaptec AHA-2944UW)
26. Requires HBA bios 1.83 and driver 6.50v. Driver and documentation available from www.qlogic.com
27. Requires driver 6.50v and BIOS 1.34. Driver and documentation available from www.qlogic.com
28. Requires driver version 2.02e and firmware 3.90a7
29. PowerPath not currently supported.
30. PCI-X servers must use single 5 volt PCI slot for Adaptec 2944 family.
31. Requires NWPA NLM V.3.07A update from Novell website
32. NetWare NSS has 120 LUN per port limitation. If NSS will not be used, 128 LUNs is supported
33. Supports FC-AL point-to-point only

34. Requires HBA firmware revision 1.83 and HBA driver revision 6.50v, available at http://www.qlogic.com
Requires SP4 or higher for NetWare 5.00.
35. **Support for CX600, CX400, FC4500, FC4700, and FC5300. (FC5300 requires copper to Fibre transceiver.)**

1 AHA-2944W is no longer available in distribution channels
2 Driver for Adaptec available at http://www.adaptec.com/worldwide/support/suppbyproduct.html?cat="Technology'SCSI+Host+Adapters&fromPage=driverinde
3 Requires BIOS v2.20 and driver version 7.30S1.
4 AHA-2944UW has been OEM'ed as HP A5252A and A5252B
5 Requires Legacy PCI slot (not available on new servers)
6 Novell 5.00 OS only supports the Host Adapter Module (HAM) driver

7. Symmetrix 8000 Series: 66/67 support at NetWare 4.11, 5.x. 5568 support at Netware 5.1.
8. Maximum number of NWFS volumes that can be mounted is 64.
9. Netware 5.1 SP4 and 6.0 SP1 require driver 8.1 and BIOS 2.20. Requires "SCAN ALL LUNS" in AUTOEXEC.NCF just before the "Mount All" statement.
10. (Adaptec AHA-2944UW)
11. Requires BIOS rev 6.26 and driver rev 1.27, available at http://www.qlogic.com
12. Supports FC-AL point-to-point only.
13. When installing NetWare for fabric boot (when operating system is not installed in the local host) on the Symmetrix, create only one LUN and then perform the install. To install a second server that will be fabric boot, repeat the process by creating one additional LUN and then loading the operating system to it. Continue this process until the desired number of fabric boot servers have been reached. Conditons exist where several LUNs are initially created and you perform your first install, NetWare will sometimes acquire and stripe the operating system across several of the newly created LUNs.
14. NetWare boot support is contingent on migration of the DOS boot partition to an NSS partition. NetWare will warn you of the possibility of data corruption if you convert the DOS boot partition to an NSS partition. The risk of data corruption is during I/O to the C: drive while in the NetWare debugger, or while writing reboot log files during an "Auto Restart After Abend". When you load DOSFAT, please set "Auto Restart After Abend" to 0 to avoid the possibility of data corruption.
15. Requires HBA bios 1.83 and driver 6.50v. Driver and documentation available from www.qlogic.com.
16. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
17. This server is equipped with plastic shielding around the PCI slots. Since the PCI slots are 32-bit, this shielding prohibits 64-bit HBAs from properly seating in the PCI slots. To accomodate 64-bit HBAs, this shielding must be removed, or modified to allow the 64-bit HBA to fully seat in the 32-bit slots.
18. Includes both Pentium PRO and XEON models
19. Driver installation with NetWare 5.0 SP6A: Do not load cpqmpk.psm when prompted. At the point when you are to load idecd, ideata and scsihd, toggle to the Control prompt with <Alt-Esc>. Once at the system control, unload nwpa.nlm, then load nwpa.nlm version 3.07a 5/3/01. Once the new nwpa.nlm is loaded, toggle back to the install screen and continue with the install. When install is complete, down the server and copy nwpa.nlm version 3.07a 5/3/01 to the c:\nwserver directory and reboot.
20. **Supported in "Shared HBA" topology. Single HBA may be zoned to more than one storage array. This included arrays of different types and/or models.**
21. Edit config.sys with the following: Files=100 Buffers=99
22. To enable failover with fabric boot DOSFAT.NSS must be loaded from the autoexec.ncf. In a failed condition the c:\ partition will not failover correctly but the DOSFAT C: partition will.
23. Symmetrix 8000 Series: 66/67 support at NetWare 5.x, 5568 support at Netware 5.1.
24. (HHBA-5101BK-01)
25. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
26. Requires driver version 2.00E or higher and NetWare 5.1 support pack 3 or higher.
27. Requires driver 6.50v and BIOS 1.34. Driver and documentation available from www.qlogic.com.
28. Requires NetWare patches: NWPAPT2A and NSS5J.
29. HPQ Proliant servers that are rack-mountable (designated with an "R") are supported.
30. Requires driver version 2.02e and firmware 3.90a7.
31. PowerPath not currently supported.
32. DOS boot device maximum accessible capacity is 2GB. Netware SYS volume must be in LUN 0.
33. Adaptec AHA-2944UW requires HAM driver version 7.30s1 and BIOS 2.20. The driver is available on the EMC intranet (http://iqweb.lss.emc.com).
34. EMC engineering recommends that customers do not combine or share a Netware SYS volume and data volumes on the same Symmetrix logical device. Consult the EMC customer support center for a detailed Netware Symmetrix boot installation procedure.
35. Requires SP4 on Netware 5.1.
37. Requires "SCAN ALL LUNs" in AUTOEXEC.NCF just before the "Mount All" statement.
38. Requires NWPA.NLM V.3.07A update from Novell website.
39. NetWare NSS has 120 LUN per port limitation. If NSS will not be used, 128 LUNs is supported.
40. PCI-X servers must use single 5 volt PCI slot for Adaptec 2944 family.
41. HP NetServer LC2000 is only supported with two processors.Uni-Processor configurations are not supported
42. **Support for CX600, CX400, FC4500, FC4700, and FC5300. (FC5300 requires copper to Fibre transceiver.)**

1. Supports FC-AL point-to-point only.
2. When installing NetWare for fabric boot (when operating system is not installed in the local host) on the Symmetrix, create only one LUN and then perform the install. To install a second server that will be fabric boot, repeat the process by creating one additional LUN and then loading the operating system to it. Continue this process until the desired number of fabric boot servers have been reached. Conditons exist where several LUNs are initially created and you perform your first install, NetWare will sometimes acquire and stripe the operating system across several of the newly created LUNs.
3. NetWare boot support is contingent on migration of the DOS boot partition to an NSS partition. NetWare will warn you of the possibility of data corruption if you convert the DOS boot partition to an NSS partition. The risk of data corruption is during I/O to the C: drive while in the NetWare debugger, or while writing reboot log files dunng an "Auto Restart After Abend". When you load DOSFAT, please set "Auto Restart After Abend" to 0 to avoid the possibility of data corruption.
4. Requires HBA bios 1.83 and driver 6.50v. Driver and documentation available from www.qlogic.com.
5. Maximum number of NWFS volumes that can be mounted is 64.
6. This server only supports 5 Volt HBAs: qLogic 22XX family (if applicable), qLogic 23XX family, Emulex LP8000, and Emulex LP850 (if applicable).
7. Driver installation with NetWare 5.0 SP6A: Do not load cpqmpk.psm when prompted. At the point when you are to load idecd, ideata and scsihd, toggle to the Control prompt with <Alt-Esc>. Once at the system control, unload nwpa.nlm, then load nwpa.nlm version 3.07a 5/3/01. Once the new nwpa.nlm is loaded, toggle back to the install screen and continue with the install. When install is complete, down the server and copy nwpa.nlm version 3.07a 5/3/01 to the c:\nwserver directory and reboot.
8. **Supported in "Shared HBA" topology. Single HBA may be zoned to more than one storage array. This included arrays of different types and/or models.**
9. Edit config.sys with the following: Files=100 Buffers=99
10. To enable failover with fabric boot DOSFAT.NSS must be loaded from the autoexec.ncf. In a failed condition the c:\ partition will not failover correctly but the DOSFAT C: partition will.
11. AHA-2944W is no longer available in distribution channels.
12. Symmetrix 8000 Series: 66/67 support at NetWare 4.11, 5.x, 5568 support at Netware 5.1.
13. Requires NetWare patches: NWPAPT2A and NSS5J.
14. Requires driver 6.50v and BIOS 1.34. Driver and documentation available from www.qlogic.com
15. Requires driver version 2.02e and firmware 3.90a7
16. PowerPath not currently supported.
17. DOS boot device maximum accessible capacity is 2GB. Netware SYS volume must be in LUN 0.
18. Novell 5.00 OS only supports the Host Adapter Module (HAM) driver
19. Adaptec AHA-2944UW requires HAM driver version 7.30s1 and BIOS 2.20. The driver is available on the EMC intranet (http://iqweb.lss.emc.com).
20. EMC engineering recommends that customers do not combine or share a Netware SYS volume and data volumes on the same Symmetrix logical device.
21. Consult the EMC customer support center for a detailed Netware Symmetrix boot installation procedure
22. Requires SP4 on Netware 5.1.
23. Requires "SCAN ALL LUNs" in AUTOEXEC.NCF just before the "Mount All" statement
24. Requires BIOS v2.20 and driver version 7.30S1.
25. AHA-2944UW has been OEM'ed as HP A5252A and A5252B
26. Requires Legacy PCI slot (not available on new servers)
27. Netware 5.1 SP4 and 6.0 SP1 require driver 8.1 and BIOS 2.20. Requires "SCAN ALL LUNS" in AUTOEXEC.NCF just before the Mount All statement.
28. Driver for Adaptec available at: http://www.adaptec.com/worldwide/support/suppbyproduct.html?cat=/Technology/SCSI+Host+Adapters&fromPage=driverindex
29. PCI-X servers must use single 5 volt PCI slot for Adaptec 2944 family
30. Requires NWPA.NLM V.3.07A update from Novell website
31. NetWare NSS has 120 LUN per port limitation. If NSS will not be used, 128 LUNs is supported.
32. Requires BIOS rev 6.26 and driver rev 1.27 available at http://www.qlogic.com
33. HPQ Proliant servers with ATF and Powerpath requires use of SCSIHD in place of CPQSHD.
34. (QLA2200) For IBM xSeries and Netfinity servers only.
35. Requires driver 6.50v, BIOS 1.34 available from Qlogic.
36. This HBA is equivalent to the qLogic QLA2310.
37. This HBA is equivalent to the qLogic QLA2340.
38. **Support for CX600, CX400, FC4500, FC4700, and FC5300. (FC5300 requires copper to Fibre transceiver.)**

1 Requires Emulex driver 4.20Q driver disk and BIOS 1.61a1 available from http://www.emulex.com/ts/docoem/framemc.htm
2 **Supported with QLogic driver v6.04.02 or v6.05.00.**
3 **The kernel version listed is included in the corresponding standard distributed release.**
4 EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
5 This kernel is limited to 110 devices, not 128
6 **QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.**
7 **Host must be offline for interfamily Symmetrix microcode upgrade.**
8 Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com
9

This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and PowerPath.
Booting from EMC storage arrays is NOT supported with PowerPath.

10. Only one HBA is qualified for use in the Linux host when booting from the CLARiiON via fabric.
11. Install with driver provided by RedHat 7.2 Installer and upgrade to the EMC-approved driver after installation.
12. Requires QLogic driver 4.47.18 and BIOS 1.83.
13. **Requires QLogic driver v6.04.02 or v6.05.00and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
14. Requires QLogic driver 4.47.18 driver disk, dd.img-i686.gz and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65
15. **Requires QLogic driver v6.04.02 or v6.05.00 and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
16. Symmetrix 8000 Series: 66/67 support at Red Hat Kernel v2.4.x or later. 5568 support at Red Hat kernel v2.4.x or later.
17. Linux v2.4.x Kernels support a maximum of 128 devices per system.
18. When used with the HP NetServer LC2000: 32 device maximum
19. **Host must be offline for CLARiiON-licensed (Flare) upgrade and Storage Processor replacement.**
20. **Single HBA zoning is required regardless of the switch being utilized.**
21. **FC-SW applies only to CX600, CX400, CX200, FC4500, FC4700 and FC5300. FC5300 with FC-SW available from selected channels.**
22. **Requires QLogic driver v6.04.01 (included in 2.4.9-e.24 kernel) and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
23. **FC-AL and FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.**
24. **This kernel is supported with the Qlogic v6.04.01 driver included in the kernel.**
25. **Optical cables apply to CX600, CX400, CX200, FC4700, FC4500, FC5300 with MIA.**
26. **Access Logic required, direct connect or fabric. (no booting through switch inter-switch links)**
27. **No MirrorView or SnapView used on boot LUNs.**
28. **EMC recommends boot LUN be RAID1 or RAID5. Be sure to monitor the loading on the boot LUN RAID group. Excessive loading on the boot LUN RAID group may degrade boot LUN performance and stability.**
29. **Refer to the Customer Service website or your EMC Service Personnel for the latest documentation.**
30. **Previous versions of the HBA and boot installation guides contained restrictions for boot configurations. All boot configuration information is now listed here and supersedes any found in previous boot documentation.**
31. **For any CLARiiON SP port configured to a host for booting, the maximum number of logical volumes allowed on that port is 32.**

1. **Host must be offline for interfamily Symmetrix microcode upgrade.**
2. **Requires QLogic driver v6.04.02 or v6.05.00and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
3. **QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.**
4. This kernel is limited to 110 devices, not 128.
5. **The kernel version listed is included in the corresponding standard distributed release.**
6. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
7. Supported with QLogic driver v6.04.02 or v6.05.00.
8. Install with driver provided by RedHat 7.2 Installer and upgrade to the EMC-approved driver after installation.
9. Requires QLogic driver 4.47.18 and BIOS 1.83.
10. PowerEdge 2550 supports a maximum of 2 Emulex HBAs at one time and the total PCI power cannot exceed 20 Watts.
11. Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.
12. Requires Emulex driver 4.20Q driver disk and BIOS 1.61a1 available from http://www.emulex.com/ts/docoem/framemc.htm
13. Requires QLogic driver 4.47.18 driver disk, dd.img-i686.gz and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65
14. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath.
    Booting from EMC storage arrays is NOT supported with PowerPath.
15. Linux v2.4.x Kernels support a maximum of 128 devices per system.
16. When used with the HP NetServer LC2000: 32 device maximum.
17. If using Dell PERC Controller, requires PERC 3 with OpenManager 3.0 and Array Manager 3.1. The afamgt.sys must be version 2.6.0.3486 (or above)..
18. Single HBA zoning is required regardless of the switch being utilized.
19. **Requires QLogic driver v6.04.02 or v6.05.00 and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
20. Only one HBA is qualified for use in the Linux host when booting from the CLARiiON via fabric
21. 8 LUNs supported. 2-node AL connection only.
22. Symmetrix 8000 Series: 66/67 support at Red Hat Kernel v2.4.x or later, 5568 support at Red Hat kernel v2.4.x or later.
23. **Host must be offline for CLARiiON-licensed (Flare) upgrade and Storage Processor replacement.**
24. **An RPM from Dell may be used to install the QLogic v6.04.02 or v6.05.00 drivers and may be obtained from the QLogic website at http://www.qlogic.com/support/oem_detail_all.asp?oemid=65**
25. **Requires QLogic driver v6.04.01 (included in 2.4.9-e.24 kernel) and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
26. **FC-AL and FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.**
27. **FC-SW applies only to CX600, CX400, CX200, FC4500, FC4700 and FC5300. FC5300 with FC-SW available from selected channels.**
28. **This kernel is supported with the Qlogic v6.04.01 driver included in the kernel.**
29. **Optical cables apply to CX600, CX400, CX200, FC4700, FC4500, FC5300 with MIA.**
30. **Access Logic required. direct connect or fabric, (no booting through switch inter-switch links)**
31. **No MirrorView or SnapView used on boot LUNs.**
32. **EMC recommends boot LUN be RAID1 or RAID5. Be sure to monitor the loading on the boot LUN RAID group.**
    Excessive loading on the boot LUN RAID group may degrade boot LUN performance and stability.
33. **Refer to the Customer Service website or your EMC Service Personnel for the latest documentation.**
34. **Previous versions of the HBA and boot installation guides contained restrictions for boot configurations. All boot configuration information is now listed here and supersedes any found in previous boot documentation.**
35. For any CLARiiON SP port configured to a host for booting, the maximum number of logical volumes allowed on that port is 32.

1. This kernel is limited to 110 devices, not 128.
2. Install with driver provided by RedHat 7.2 Installer and upgrade to the EMC-approved driver after installation.
3. Requires QLogic driver 4.47.18 and BIOS 1.83.
4. **Host must be offline for interfamily Symmetrix microcode upgrade.**
5. **Requires QLogic driver v6.04.02 or v6.05.00and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
6. **QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.**
7. **Supported with QLogic driver v6.04.02 or v6.05.00.**
8. **The kernel version listed is included in the corresponding standard distributed release.**
9. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
10. Includes both Pentium PRO and XEON models
11. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
12. HPQ Proliant servers that are rack-mountable (designated with an "R") are supported.
13. This server is equipped with plastic shielding around the PCI slots. Since the PCI slots are 32-bit, this shielding prohibits 64-bit HBAs from properly seating in the PCI slots. To accomodate 64-bit HBAs, this shielding must be removed, or modified to allow the 64-bit HBA to fully seat in the 32-bit slots.
14. Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.
15. Requires Emulex driver 4.20Q driver disk and BIOS 1.61a1 available from http://www.emulex.com/ts/docoem/framemc.htm
16. Requires QLogic driver 4.47.18 driver disk, dd.img-i686.gz and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65
17. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath. Booting from EMC storage arrays is NOT supported with PowerPath.
18. This system is supported with Red Hat 2.1 Advanced Server v2.4.9-E.3 and updated with v2.4.9-E.9, E.10, and E.12 RPMs.
19. Requires v6.05 or higher Navisphere host agent/CLI.
20. **Requires QLogic driver v6.04.02 or v6.05.00 and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
21. Only one HBA is qualified for use in the Linux host when booting from the CLARiiON via fabric.
22. Symmetrix 8000 Series: 66/67 support at Red Hat Kernel v2.4.x or later. 5568 support at Red Hat kernel v2.4.x or later.
23. **This kernel is supported with PowerPath 3.0.1 on Symmetrix attached hosts only.**
24. Single HBA zoning is required regardless of the switch being utilized.
25. **Host must be offline for CLARiiON-licensed (Flare) upgrade and Storage Processor replacement.**
26. Linux v2.4.x Kernels support a maximum of 128 devices per system
27. When used with the HP NetServer LC2000: 32 device maximum
28. 8 LUNs supported; 2-node AL connection only.
29. **The LP9002-E now ships with the LP9002L-E low profile adapter.**
30. **The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.**
31. **This HBA is equivalent to the qLogic QLA2310.**
32. **This HBA is equivalent to the qLogic QLA2340.**
33. **(QLA2200) For IBM xSeries and Netfinity servers only.**
34. Booting off of an EMC storage array is not currently supported with the HPQ BL20P
35. Requires QLogic driver v6.04.02 and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65
36. BIOS must be obtained from HP at http://h18000.www1.hp.com/products/servers/proliant-bl/p-class/20p/index.html instead of BIOS on Qlogic web site. EMC NVRAM settings must be configured manually. Refer to EMC Fibre Channel documentation for QLogic HBAs for the settings.
37. Dual port PCI-X fibre channel mezzanine card option is embedded. No PCI/PCI-X slots available
38. **Requires Emulex drivers v4.20Q and firmware v3.90a7. Available from http://www.emulex.com.**
39. **Optical cables apply to CX600, CX400, CX200, FC4700, FC4500, FC5300 with MIA.**
40. **Access Logic required, direct connect or fabric. (no booting through switch inter-switch links)**
41. **No MirrorView or SnapView used on boot LUNs.**
42. **EMC recommends boot LUN be RAID1 or RAID5. Be sure to monitor the loading on the boot LUN RAID group. Excessive loading on the boot LUN RAID group may degrade boot LUN performance and stability.**
43. Refer to the Customer Service website or your EMC Service Personnel for the latest documentation.
44. Previous versions of the HBA and boot installation guides contained restrictions for boot configurations. All boot configuration information is now listed here and supersedes any found in previous boot documentation.
45. For any CLARiiON SP port configured to a host for booting, the maximum number of logical volumes allowed on that port is 32.
46. **Requires QLogic driver v6.04.01 (included in 2.4.9-e.24 kernel) and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65**
47. **This kernel is supported with the Qlogic v6.04.01 driver included in the kernel.**
48. **FC-AL and FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.**
49. **FC-SW applies only to CX600, CX400, CX200, FC4500, FC4700 and FC5300. FC5300 with FC-SW available from selected channels.**

1. This kernel is limited to 110 devices, not 128.
2. Install with driver provided by RedHat 7.2 Installer and upgrade to the EMC-approved driver after installation.
3. Requires QLogic driver 4.47.18 and BIOS 1.83.
4. **Host must be offline for interfamily Symmetrix microcode upgrade.**
5. **Requires QLogic driver v6.04.02 or v6.05.00and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
6. **QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.**
7. **The kernel version listed is included in the corresponding standard distributed release.**
8. **Supported with QLogic driver v6.04.02 or v6.05.00.**
9. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
10. PowerPath v3.02 not supported on this system.
11. PowerPath v3.0.2 b069 is not supported on this system.
12. This system is supported with Red Hat 2.1 Advanced Server v2.4.9-E.3 and updated with v2.4.9-E.9, E.10, and E.12 RPMs.
13. This server only supports 5 Volt HBAs: qLogic 22XX family (if applicable), qLogic 23XX family, Emulex LP8000, and Emulex LP850 (if applicable).
14. Requires Emulex driver 4.20Q driver disk and BIOS 1.61a1 available from http://www.emulex.com/ts/docoem/framemc.htm
15. Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.
16. Requires QLogic driver 4.47.18 driver disk, dd.img-i686.gz and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65
17. **Requires Emulex drivers v4.20Q and firmware v3.90a7. Available from http://www.emulex.com.**
18. Symmetrix 8000 Series. 66/67 support at Red Hat Kernel v2.4.x or later. 5568 support at Red Hat kernel v2.4.x or later.
19. **This kernel is supported with PowerPath 3.0.1 on Symmetrix attached hosts only.**
20. Single HBA zoning is required regardless of the switch being utilized
21. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath. Booting from EMC storage arrays is NOT supported with PowerPath.
22. **The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.**
23. **The LP9002-E now ships with the LP9002L-E low profile adapter.**
24. This HBA is equivalent to the qLogic QLA2310
25. **(QLA2200) For IBM xSeries and Netfinity servers only.**
26. **This HBA is equivalent to the qLogic QLA2340.**
27. **Requires v6.05 or higher Navisphere host agent/CLI.**
28. **Requires QLogic driver v6.04.02 or v6.05.00 and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
29. Only one HBA is qualified for use in the Linux host when booting from the CLARiiON via fabric.
30. **Host must be offline for CLARiiON-licensed (Flare) upgrade and Storage Processor replacement.**
31. **Requires QLogic driver v6.04.01 (included in 2.4.9-e.24 kernel) and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
32. **FC-AL and FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.**
33. **FC-SW applies only to CX600, CX400, CX200, FC4500, FC4700 and FC5300. FC5300 with FC-SW available from selected channels.**
34. **This kernel is supported with the Qlogic v6.04.01 driver included in the kernel.**
35. **Optical cables apply to CX600, CX400, CX200, FC4700, FC4500, FC5300 with MIA.**
36. **Access Logic required, direct connect or fabric. (no booting through switch inter-switch links)**
37. **No MirrorView or SnapView used on boot LUNs.**
38. **EMC recommends boot LUN be RAID1 or RAID5. Be sure to monitor the loading on the boot LUN RAID group. Excessive loading on the boot LUN RAID group may degrade boot LUN performance and stability.**
39. **Refer to the Customer Service website or your EMC Service Personnel for the latest documentation.**
40. **Previous versions of the HBA and boot installation guides contained restrictions for boot configurations. All boot configuration information is now listed here and supersedes any found in previous boot documentation.**
41. **For any CLARiiON SP port configured to a host for booting, the maximum number of logical volumes allowed on that port is 32.**
42. **This server only supports 5 Volt HBAs: qLogic 22XX family, qLogic 23XX family, Emulex LP8000, and Emulex LP850**

1. Requires Emulex driver 4.20Q driver disk and BIOS 1.61a1 available from http://www.emulex.com/ts/docoem/framemc.htm
2. **Supported with QLogic driver v6.04.02 or v6.05.00.**
3. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
4. **The kernel version listed is included in the corresponding standard distributed release.**
5. This kernel is limited to 110 devices, not 128.
6. **QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.**
7. **Host must be offline for interfamily Symmetrix microcode upgrade.**
8. Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com
9. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath. Booting from EMC storage arrays is NOT supported with PowerPath
10. Only one HBA is qualified for use in the Linux host when booting from the CLARiiON via fabric
11. Install with driver provided by RedHat 7.2 Installer and upgrade to the EMC-approved driver after installation.
12. Requires QLogic driver 4.47.18 and BIOS 1.83
13. **Requires QLogic driver v6.04.02 or v6.05.00and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
14. Requires QLogic driver 4.47.18 driver disk, dd img-i686.gz and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65
15. **Requires QLogic driver v6.04.02 or v6.05.00 and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
16. Symmetrix 8000 Series 66/67 support at Red Hat Kernel v2.4.x or later, 5568 support at Red Hat kernel v2.4.x or later
17. Linux v2.4.x Kernels support a maximum of 128 devices per system
18. When used with the HP NetServer LC2000: 32 device maximum
19. **Single HBA zoning is required regardless of the switch being utilized.**
20. **Host must be offline for CLARiiON-licensed (Flare) upgrade and Storage Processor replacement.**
21. **Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.63a1. Emulex drivers are available at http://www.emulex.com. Supports SNIA HBA API.**
22. **This kernel is supported with the Qlogic v6.04.01 driver included in the kernel.**

23. Requires QLogic driver v6.04.01 (included in 2.4.9-e.24 kernel) and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
24. Optical cables apply to CX600, CX400, CX200, FC4700, FC4500, FC5300 with MIA.
25. Access Logic required, direct connect or fabric, (no booting through switch inter-switch links)
26. No MirrorView or SnapView used on boot LUNs.
27. EMC recommends boot LUN be RAID1 or RAID5. Be sure to monitor the loading on the boot LUN RAID group. Excessive loading on the boot LUN RAID group may degrade boot LUN performance and stability.
28. Refer to the Customer Service website or your EMC Service Personnel for the latest documentation.
29. Previous versions of the HBA and boot installation guides contained restrictions for boot configurations. All boot configuration information is now listed here and supersedes any found in previous boot documentation.
30. For any CLARiiON SP port configured to a host for booting, the maximum number of logical volumes allowed on that port is 32.
31. FC-AL and FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.
32. FC-SW applies only to CX600, CX400, CX200, FC4500, FC4700 and FC5300. FC5300 with FC-SW available from selected channels.

1. Challenge not supported by SGI as part of SGI-ware program.
2. Symmetrix 8000 Series: 66/67 support at IRIX 6.5.10, 5568 support at IRIX 6.5.13 except for Challenge series.
3. I/Os will fail if a SCSI cable is temporarily disconnected.
4. I/Os will immediately fail if a device becomes not ready. This is an SGI bug.
5. Requires SGI patch set 10/1/98.
6. FC-AL supports 128 LUNs per adapter. LUN skipping is permitted, however, LUN 0 must exist for each adapter.
7. SGI has replaced this adapter with the QLogic 2200 card. New installs should order part number PCI-FC-1P-OPT-A for PCI, or XT-FC-1P-OPT-A for XIO from SGI. This adapter does not require a copper to optical MIA.
8. Requires copper to optical MIA. Contact Methode Electronics at 800-323-6858 (P/N MDB-9-6-1) or Gadzoox Microsystems at 410-838-2108 (P/N MDM1063TC-G).
9. SCSI supports targets 1-15. LUNs 0-7. LUN skipping is permitted, however, LUN 0 must exist for each target.

1. Symmetrix 8000 Series, 66/67 support at Red Hat Kernel v2.4.x or later, 5568 support at Red Hat kernel v2.4.x or later.
2. Host must be offline for interfamily Symmetrix microcode upgrade.
3. Requires QLogic driver v6.04.02 or v6.05.00and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
4. QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.
5. Requires rev1 sles7.patch available from ftp://ftp.emc.com/pub/elab/linux for CLARiiON attach only.
6. Supported with QLogic driver v6.04.02.
7. The kernel version listed is included in the corresponding standard distributed release.
8. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
9. Linux v2.4.x Kernels support a maximum of 128 devices per system.

10. Requires rev2_sles7upg2418.patch available from ftp://ftp.emc.com/pub/elab/linux
11. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ
12. Single HBA zoning is required regardless of the switch being utilized.
13. Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.
14. Requires Emulex drivers v4.20Q and firmware v3.90a7. Available from http://www.emulex.com.
15. Requires QLogic driver v6.04.02 and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
16. Requires QLogic v6.04.02 driver.
17. Requires QLogic driver v6.04.00 or above.
18. Requires rev3 sles8.patch available from ftp://ftp.emc.com/pub/elab/linux.
19. Requires QLogic driver v6.04.02 and BIOS v1.83 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
20. Requires QLogic driver v6.04.02 and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65
21. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
22. Requires rev1 sles8sp2a.patch for CLARiiON-attached hosts available from ftp://ftp.emc.com/pub/elab/linux.
23. Requires QLogic driver v6.04.02 and BIOS 1.83 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65

1. Symmetrix 8000 Series: 66/67 support at Red Hat Kernel v2.4.x or later. 5568 support at Red Hat kernel v2.4.x or later.
2. **QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.**
3. **Requires QLogic driver v6.04.02 or v6.05.00and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
4. **Host must be offline for interfamily Symmetrix microcode upgrade.**
5. Supported with QLogic driver v6.04.02
6. **The kernel version listed is included in the corresponding standard distributed release.**
7. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
8. Requires rev1 sles7.patch available from ftp://ftp.emc.com/pub/elab/linux for CLARiiON attach only.
9. Linux v2.4.x Kernels support a maximum of 128 devices per system.
10. Single HBA zoning is required regardless of the switch being utilized
11. **PowerEdge 2550 supports a maximum of 2 Emulex HBAs at one time and the total PCI power cannot exceed 20 Watts.**
12. **Requires rev2 sles7upg2418.patch available from ftp://ftp.emc.com/pub/elab/linux**
13. **EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ**
14. **Requires Emulex drivers v4.20Q and firmware v3.90a7. Available from http://www.emulex.com.**
15. **Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.**
16. **Requires QLogic driver v6.04.02 and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
17. **Requires QLogic driver v6.04.00 or above.**
18. **Requires QLogic v6.04.02 driver.**
19. **Requires rev3_sles8.patch available from ftp://ftp.emc.com/pub/elab/linux.**
20. **Requires QLogic driver v6.04.02 and BIOS v1.83 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
21. **Requires QLogic driver v6.04.02 and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65**
22. **Requires rev1_sles8sp2a.patch for CLARiiON-attached hosts available from ftp://ftp.emc.com/pub/elab/linux.**
23. **EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.**
24. **Requires QLogic driver v6.04.02 and BIOS 1.83 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65**

1 Linux v2.4.x Kernels support a maximum of 128 devices per system
2 Symmetrix 8000 Series: 66/67 support at Red Hat Kernel v2.4.x or later. 5568 support at Red Hat kernel v2.4.x or later.

3. Host must be offline for interfamily Symmetrix microcode upgrade.
4. QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.
5. Requires Emulex drivers v4.20Q and firmware v3.90a7. Available from http://www.emulex.com.
6. Single HBA zoning is required regardless of the switch being utilized.
7. Requires rev1 sles7.patch available from ftp://ftp.emc.com/pub/elab/linux for CLARiiON attach only.
8. Supported with QLogic driver v6.04.02.
9. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
10. Requires QLogic driver v6.04.02 or v6.05.00and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
11. The kernel version listed is included in the corresponding standard distributed release.
12. Must use standard PCI 32bit/33MHz slot for SCSI
13. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ
14. Requires rev2 sles7upg2418.patch available from ftp://ftp.emc.com/pub/elab/linux
15. Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.
16. Requires QLogic driver v6.04.02 and BIOS v1.83 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
17. Requires QLogic v6.04.02 driver.
18. Requires rev3 sles8.patch available from ftp://ftp.emc.com/pub/elab/linux.
19. Requires QLogic driver v6.04.00 or above.
20. Requires QLogic driver v6.04.02 and BIOS 1.83 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65
21. Requires rev1 sles8sp2a.patch for CLARiiON-attached hosts available from ftp://ftp.emc.com/pub/elab/linux.
22. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.

1. Symmetrix 8000 Series: 66/67 support at Red Hat Kernel v2.4.x or later, 5568 support at Red Hat kernel v2.4.x or later.
2. QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.
3. Requires QLogic driver v6.04.02 or v6.05.00and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
4. Host must be offline for interfamily Symmetrix microcode upgrade.
5. Supported with QLogic driver v6.04.02.
6. The kernel version listed is included in the corresponding standard distributed release.
7. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
8. Requires rev1 sles7.patch available from ftp://ftp.emc.com/pub/elab/linux for CLARiiON attach only.
9. Includes both Pentium PRO and XEON models
10. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
11. Linux v2.4.x Kernels support a maximum of 128 devices per system.
12. HPQ Proliant servers that are rack-mountable (designated with an "R") are supported.
13. This server is equipped with plastic shielding around the PCI slots. Since the PCI slots are 32-bit, this shielding prohibits 64-bit HBAs from properly seating in the PCI slots. To accomodate 64-bit HBAs, this shielding must be removed, or modified to allow the 64-bit HBA to fully seat in the 32-bit slots.
14. Requires rev2 sles7upg2418.patch available from ftp://ftp.emc.com/pub/elab/linux
15. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ
16. Single HBA zoning is required regardless of the switch being utilized.
17. Requires Emulex drivers v4.20Q and firmware v3.90a7. Available from http://www.emulex.com.
18. Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.
19. Requires QLogic driver v6.04.02 and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
20. Requires QLogic v6.04.02 driver.
21. Requires rev3 sles8.patch available from ftp://ftp.emc.com/pub/elab/linux.
22. Requires QLogic driver v6.04.00 or above.
23. Requires QLogic driver v6.04.02 and BIOS v1.83 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
24. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
25. Requires rev1_sles8sp2a.patch for CLARiiON-attached hosts available from ftp://ftp.emc.com/pub/elab/linux.
26. Requires QLogic driver v6.04.02 and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65
27. Requires QLogic driver v6.04.02 and BIOS 1.83 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65

1 Linux v2.4.x Kernels support a maximum of 128 devices per system
2 Symmetrix 8000 Series: 66/67 support at Red Hat Kernel v2.4.x or later, 5568 support at Red Hat kernel v2.4.x or later.
3

Requires QLogic driver v6.04.02 or v6.05.00and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
4. QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.
5. Host must be offline for interfamily Symmetrix microcode upgrade.
6. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
7. Supported with QLogic driver v6.04.02.
8. The kernel version listed is included in the corresponding standard distributed release.
9. Requires rev1 sles7.patch available from ftp://ftp.emc.com/pub/elab/linux for CLARiiON attach only.
10. This server only supports 5 Volt HBAs: qLogic 22XX family (if applicable), qLogic 23XX family, Emulex LP8000, and Emulex LP850 (if applicable).
11. (QLA2200) For IBM xSeries and Netfinity servers only.
12. This HBA is equivalent to the qLogic QLA2310.
13. This HBA is equivalent to the qLogic QLA2340.
14. Requires rev2 sles7upg2418.patch available from ftp://ftp.emc.com/pub/elab/linux
15. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ
16. Requires Emulex drivers v4.20Q and firmware v3 90a7. Available from http://www.emulex.com.
17. Single HBA zoning is required regardless of the switch being utilized.
18. Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.
19. Requires QLogic driver v6.04.02 and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
20. Requires QLogic driver v6.04.00 or above.
21. Requires QLogic v6.04.02 driver.
22. Requires rev3 sles8.patch available from ftp://ftp.emc.com/pub/elab/linux.
23. Requires QLogic driver v6.04.02 and BIOS v1.83 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
24. Requires QLogic driver v6.04.02 and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65
25. Requires rev1 sles8sp2a.patch for CLARiiON-attached hosts available from ftp://ftp.emc.com/pub/elab/linux.
26. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
27. Requires QLogic driver v6.04.02 and BIOS 1.83 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65

1	Super P3TDL3[5] S2DL3[5]	PCI	SuSE Linux SLES 7 updated with SuSE v2.4.18 rpm[6, 7]	QLogic QLA2310F-E-SP[2, 3, 4], QLA2340-E-SP[2, 3, 4]	FC-AL, FC-SW	N	See[1]
2	Super P3TDL3[5] S2DL3[5]	PCI	SuSE Linux SLES 8 SP2a (v2.4.19-SuSE.304)[12, 13]	QLogic QLA2310F-E-SP[2, 3, 14, 15], QLA2340-E-SP[2, 3, 14, 15]	FC-AL, FC-SW	N	See[1]
3	Super P3TDL3[5] S2DL3[5]	PCI	SuSE Linux SLES 8 v2.4.19-SuSE.175[9, 10, 11]	QLogic QLA2310F-E-SP[2, 3, 8] QLA2340-E-SP[2, 3, 8]	FC-AL, FC-SW	N	See[1]

1. Linux v2 4.x Kernels support a maximum of 128 devices per system
2. Host must be offline for interfamily Symmetrix microcode upgrade.
3. QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.
4. Requires QLogic driver v6.04.02 or v6.05.00and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
5. 64-bit slots for 3.3v HBAs only.
6. Requires rev2 sles7upg2418.patch available from ftp://ftp.emc.com/pub/elab/linux
7. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ
8. Requires QLogic driver v6.04.02 and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
9. Requires QLogic v6.04.02 driver.
10. Requires rev3 sles8.patch available from ftp://ftp.emc.com/pub/elab/linux.
11. Requires QLogic driver v6.04.00 or above
12. Requires rev1 sles8sp2a.patch for CLARiiON-attached hosts available from ftp://ftp.emc.com/pub/elab/linux.
13. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
14. Single HBA zoning is required regardless of the switch being utilized.
15. Requires QLogic driver v6.04.02 and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65

   105181-34 SunOS 5.6. kernel update patch
   105356-21 SunOS 5.6: /kernel/drv/ssd and /kernel/drv/sd patch
   105580-19 SunOS 5.6. /kernel/drv/glm patch (for X6541 HBA only)
4. Symmetrix 8000 Series · 66/67 support at Solaris 2.6, 7 8,9: 5568 support at Solaris 2.6,7,8,9
5. EMC required Sun patches for Solaris 7: 106541-24 SunOS 5.7: kernel update patch.106924-11 SunOS 5.7: /kernel/drv/isp and /kernel/drv/sparcvg/isp patch (for X1062A and X1065A HBAs only). 106925-09 SunOS 5.7 glm driver patch (for X5641A HBA only).
6. **EMC required Sun patches for Solaris 8:**
   108528-21 SunOS 5.8: kernel update patch.
   108974-30 SunOS 5.8: data, uata, dad, sd, and scsi patch.
   109657-09 SunOS 5.8: isp driver patch (for X1062A and X1065A HBAs only).
   109885-12 SunOS 5.8: glm driver patch (for X6541A HBA only).
7. For 'UltraEnterprise' servers with PCI I/O board only the left slot can be utilized due to physical constraints of the Sun PCI/SCSI adapter
8. **JNI Tachyon 32 bit HBA: requires Driver revision 2.6.13, Fcode 13.5.7, adapter RevRev H. If VxVM is installed, version 3.2 or later is required for driver revision 2.6.13 or later. (Driver revisions below 2.2.1.EMC will only support FC-AL. not switches.) Supports SNIA HBA API.**
9. Direct connect only Hub connection not supported for boot device
10. **JNI Tachyon 64 bit HBA: requires Driver revision 2.6.13 and Fcode 13.5.7 and Rev B, C, D, E, G, H and J. If VxVM is installed, version 3.2 or later is required for driver 2.6.13 or later. .(Driver revisions below 2.2.1.EMC will only support FC-AL, not switches.) Supports SNIA HBA API.**
11. **Mixing FC-SW and FC-AL on the same host using JNI HBAs is not supported.**
12. JNI Emerald3 SBUS, PCI requires driver version 4 1 4 and fcode 3 9 If PowerPath is installed, minimum revision of 3.0 4 is required for driver version 4 1 4 or later. Supports SNIA HBA API

13. Disconnecting and reconnecting the SCSI cable on an active system will reduce I/O transfer rate due to negotiation issues. Host is not capable of WDTR after link recovery.
14. Requires N-bit for PCI SCSI interface to support PowerPath.
15. This host supports only 5 V HBAs.
16. 64-bit HBAs will not fit into the 32-bit slot due to a physical obstruction.
17. **JNI Tachyon PCI adapter requires Driver version 2.6.13. If VxVM is installed, version 3.2 or later is required for driver 2.6.13 or later. Supports SNIA API.**
18. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
19. Requires driver lpfc-SPARC V5.01e. Emulex LP8000-EMC/LP9002-E/LP9002L-E/LP9002C-E/LP9002DC-E/LP9002S-E requires firm-ware 3.90A7, LP9802-E requires firmware 1.00A4, all available at http://www.emulex.com. Supports SNIA HBA API.
20. Requires Emulex Open Boot Version 1.33a1.
21. Suns QLogic cards are not supported due to proprietary drivers, fcode and firmware. Please see http://www.sun.com/service/servicelist/us/detail_ww_ss_hba.html
22. Requires driver 4.09. The QLA2200F-EMC/QCP2202F-E/QLA2300-E-SP/QLA2340-E-SP/QLA2342-E-SP requires fcode v2.00.06. The QLA2202FS-E requires fcode 2.00.01. fcode should be loaded on all HBA's at the time of installation. All drivers and fcode can be downloaded from http://www.qlogic.com. Supports SNIA HBA API.
23. Supports Dynamic Reconfiguration for Sun Fire 4800 and 6800 only.Mimimum Solaris 8 recommended patch bundle 108528-21.Requires system controller firmware patch 112127-02 or higher.
24. Requires Emulex Open Boot Version 2.33a0.
25. JNI Emerald4 SBUS and PCI adapters require driver 5.2.1 and Fcode 3.9. Supports SNIA HBA API.
26. **Supports DR on Sun 12K and 15K.**
27. **EMC required Sun patches for Solaris 9:**
    112233-06 Sun OS 5.9: kernel patch
    112834-02 Sun OS 5.9: patch SCSI
    113277-11 Sun OS 5.9: sd and ssd patch

1. EMC does not support this HBA; supported by Unisys ONLY
2. Symm5 & 66/67 support via RPQ(5x67)(UnixWare)
3. Not supported on a Symmetrix 8000 Series, no plans for support.
4. Also ClearPath VX14xx Styles.
5. Also ClearPath VX13xx Styles.

VMware ESX
Dell

Dell – VMware ESX						
No	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot
1	PowerEdge 6450	PCI	VMware ESX v1.5.2 patch2[2, 3, 4, 5]	QLogic: QLA2340-E-SP[1], QLA2342-E-SP[1]	FC-AL, FC-SW	Y
2	PowerEdge 6450	PCI	VMware ESX v1.5.2 patch3[3, 4, 5, 7]	QLogic: QLA2340-E-SP[6], QLA2342-E-SP[6]	FC-AL, FC-SW	Y
3	PowerEdge 6650	PCI-X	VMware ESX v1.5.2 patch2[2, 3, 4, 5]	QLogic: QLA2340-E-SP[1], QLA2342-E-SP[1]	FC-AL, FC-SW	Y
4	PowerEdge 6650	PCI-X	VMware ESX v1.5.2 patch3[3, 4, 5, 7]	QLogic: QLA2340-E-SP[6], QLA2342-E-SP[6]	FC-AL, FC-SW	Y

1. Supported with QLogic driver v6.03.00b6 included in the VMware ESX v1.5.2 kernel and BIOS v1.34.
2. Windows 2000 SP3 and SP4 are qualified to run as Virtual Machines.
3. Path failover and load-balancing are not supported.
4. Supported with VMFS.
5. EMC software will function on neither the VMkernel nor the VMs as the currently-released versions of the SymAPI do not include support for VMware ESX.
6. Supported with QLogic driver v6.04.00-emc included in the VMware ESX v1.5.2 patch 3 release and BIOS v1.34.
7. Windows 2000 SP3 and SP4, Windows NT 4.0, and RedHat 2.1 Advanced Server are qualified to run as Virtual Machines.

3	xSeries x445	PCI, PCI-X	VMware ESX v1.5.2 patch2[2, 3, 4, 5]	QLogic: QLA2340-E-SP[1], QLA2342-E-SP[1]	FC-AL, FC-SW	Y
4	xSeries x445	PCI, PCI-X	VMware ESX v1.5.2 patch3[3, 4, 5, 7]	QLogic: QLA2340-E-SP[6], QLA2342-E-SP[6]	FC-AL, FC-SW	Y

1. Supported with QLogic driver v6.03.00b6 included in the VMware ESX v1.5.2 kernel and BIOS v1.34.
2. Windows 2000 SP3 and SP4 are qualified to run as Virtual Machines.
3. Path failover and load-balancing are not supported.
4. EMC software will function on neither the VMkernel nor the VMs as the currently-released versions of the SymAPI do not include support for VMware ESX.
5. Supported with VMFS.
6. Supported with QLogic driver v6.04.00-emc included in the VMware ESX v1.5.2 patch 3 release and BIOS v1.34.
7. Windows 2000 SP3 and SP4, Windows NT 4.0, and RedHat 2.1 Advanced Server are qualified to run as Virtual Machines.

Clustered Host

EMC has qualified the following clustered hosts. No other clustered hosts are supported at this time. NOTE: Please refer to the appropriate vendor Base Connectivity table(s) for more information concerning HBA driver, firm-ware, cables, operating system requirements and other special notes.

1. Additional Fujitsu Safe Series software qualified in the high availability cluster environment, and associated patch requirement (must be obtained from Fujitsu): Fujitsu SafeFile 1.2: 910738-05 Fujitsu SafeFile 1.3 910879-04 Fujitsu SafeDisk 1.2.1: 910721-06. Note: Fujitsu SafeDisk software should not be used for mirroring Symmetrix devices. Fujitsu SafeLink 2.0: 910743-07, 910766-03
2. Patches required (must be obtained from Fujitsu): 910697-01, 910714-01, 910708-11, 910734-01.
3. SafeCluster 2.0 requires patch 910910-05 and 110916-03 for Solaris 8. Patches required (must be obtained from Fujitsu).
4. Additional Fujitsu Safe Series software qualified in the high availability cluster environment, and associated patch requirement (must be obtained from Fujitsu): Fujitsu SafeFile 1.3 910879-04, Fujitsu SafeFile 1.3.1 911353-02, Fujitsu SafeDisk/Global 2.0 910920-05, Fujitsu SafeDisk/Global 2.1 911418-02, Fujitsy SafeDisk 2.0 910926-05, Fujitsu SafeLink 2.0 910743-07, 910766-03
5. Disconnecting and reconnecting the SCSI cable on an active system will reduce I/O transfer rate due to negotiation issues. Host is not capable of WDTR after link recovery.
6. Requires N-bit for PCI SCSI interface.
7. Additional Fujitsu Safe Series software qualified in the high availability cluster environment, and associated patch requirement (must be obtained from Fujitsu): Fujitsu SafeFile 1.1: 910232-18 Fujitsu SafeDisk 1.1: 910315-08, 910432-01. Note: Fujitsu SafeDisk software should not be used for mirroring Symmetrix devices.
8. Patches required (must be obtained from Fujitsu): 910389-02, 910426-02, 910465-01, 910709-07.
9. For use in Asia Pacific/Japan only. Refer to Fujitsu Siemens Base Connectivity information for US/Europe.
10. The PRIMECLUSTER V4.0 family of software products consists of the following components: Reliant Monitor Services RMS 4.0A, Cluster Foundation CF 4.0A, Wizard Tools WT 4.0A and Application Wizards AW, Scalable Internet Services SIS 4.0A, Parallel Application Services PAS 4.0A, Global File Services GFS 4.0, Global Disk Services GDS 4.0, Global Link Services GLS 4.0
11. GDS in combination with SRDF is not supported.
12. GDS requires Fujitsu PCL Fibre Channel driver PFCA2.2.1.

1. Y-Cables Not Supported
2. Multi-port SCSI.
3. PowerPath is not supported on any RM400C or RM400E model. DRAID is supported on Reliant UNIX 5.43.C20 and above.
4. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
5. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
6. V5.45A30 QS and higher supports upto 4096 LUNs. FC switch support starts with Reliant UNIX V5.45A20 and higher.
7. Symmetrix 8000 Series: 66/67 support: Reliant UNIX 5.44,5.45 Solaris 2.6, 7, 8 or 9. Symmetnx 8000 Series:5568 support: Solaris 8.9.
8. Fast-Wide SCSI is a default setting. Ultra-Wide can be enabled through software. Refer to the latest Symmetrix Open Systems Environment Product Guide, P/N 200-999-563.
9. PowerPath support requires version 1.5.0.f1c2 with patch 1.5.0.3.Patch.B09 and patch 1.5.0.5.Patch.B13. Also supports PowerPath v2.0, 2.1.

1 Refer to MC/Service Guard Release Notes at www.docs.hp.com for patch requirements.
2 On HP-UX 11.00 LVM support only – no VxVM
3 For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set
4. Can mix HP-UX 11.00 and HP-UX 11i in same cluster all nodes must be MC/SG 11.09, 11.13 or later
5. Symmetrix microcode version 5266 33.23 or higher, 5566.35.23 or higher, 5267.22.15 or higher, 5567.29.15 or higher
6 LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26.19s.
7 A4800A and A5159A HBAs are both capable of Ultra 1 speeds, but ship from HP with a default setting of FWD. Symmetrix is supported at Ultra 1 speeds with both these HBAs. Ultra 1 can be enabled in the V-Class, N-Class, and L-Class A-Class and Superdome PDC firmware. V-Class supports the A4800A Only

HP e3000 MPE SYSTEMS – The above note applies but only includes the A-Class and N-Class Servers The HP e3000 A-Class does not support the dual port HBA A5159A.
8 PDC firmware V2200, 2250: Arbitrated loop and fabric, use TSSW 5.3 or higher V2500, 2600: Arbitrated loop, use TSSW 3.1 or higher. Fabric, use TSSW 3.2 or higher
9 Volume Managers Supported LVM
10. Minimum OS version is HP-UX 11.0 990P
11 Symmetrix 5567 code is required to support Ultra2 LVD SCSI director (DF3-U2SD4L).
12 Number of nodes supported is dependent upon LVM, SLVM, VxVM, and CVM Refer to EMC Host Connectivity Guide for HP-UX.
13. HP-UX 11i supported with MC/Service Guard 11.09 only
14 HP-UX 11.0 and 11i 64-bit only Oracle RAC9i (9.0.1, 9.2) PowerPath 2.1.x and 3.0 Support A SAN implementation with ISLs will observe significant delay in failover times if link failures non-contiguous to host HBA occur
15 PA-8700 processors Initial support with HP-UX 11.0 Sept 2001, HP-UX 11i Sept 2001.
16 Virtual Partitions (VPAR) is supported on the L-class/rp5470 server
VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later
Requirements Minimum VPAR product release of A.02.01.00 or later Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 36.1 or later, Symmetrix microcode supported 5266.33.23 or higher, 5566.41.26 or higher, 5267.27.19 or higher, 5567.34.19 or higher
17 rp5405, rp5430, rp5470, rp7400 (PA-8700 processors) Initial support with HP-UX 11.0 Sept 2001, 11i Sept 2001 Symmetrix microcode supported 5266.33.23 or higher, 5566.41.26 or higher, 5267.27.19 or higher, 5567.34.19 or higher
18 For driver versions refer to Base Connectivity Section
19 **Virtual Partitions (VPAR) is supported on the SuperDome server with 4.x and 5.x Symmetrix models and DMX series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.02.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 36.1 or later.**
20 For driver versions, see Hewlett-Packard Base Connectivity table

21. Virtual Partitions (VPAR) is supported on the N-class/rp7400 server with 4.x and 5.x Symmetrix models. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 42.06 or later.
22. GAB disks (membership and service group heartbeat disks) are not supported.
23. VCS supported with LVM only
24. Symmetrix microcode supported:5266.40.28 or higher, 5566.41.28 or higher. 5267.27.19 or higher, 5567.34.19 or higher.
25. Volume Managers Supported. LVM, VxVM 3.2
26. HP A5158A FC-SW is enabled in the March 2000 HWCR bundle XSWHWCR1100.48. Additional patches may be required for support.
27. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later
Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or
28. Please refer to the MC/Service Guard Release Notice for patch requirements
29. **Virtual Partitions (VPAR) is supported on the rp8400 server with 4.x and 5.x Symmetrix models and DMX Series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 16.009 or later.**
30. rp8400 requires minimum PDC firmware 13.10 or higher.
31. Minimum OS revision is HP-UX 11.0 990P
32. **rp5405, rp5430, rp5470, rp7400: (PA-8700 processors): Initial support with HP-UX 11.0 Sept 2001, 11i Sept 2001.**
33. Symmetrix 8000 Series & 66/67 support: HP-UX 10.20,11.0,11.10, 11.0 ACE,11.i, MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01: Symmetrix 8000 Series 5568 support: HP-UX 10.20, 11.0, 11i, MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
34. VCS supported with LVM or VxVM and PowerPath. Refer to Table HP single section for supported versions.
35. Volume Managers Supported. LVM, SLVM
36. These qualified HBAs for EMC Symmetrix storage in the HP9000 server model and the HP-UX revision installed may co-exist in that same server or the same hard partition. Other supported HBAs not used to attach to the Symmetrix may also co-exist on the same server unless specified by EMC and/or HP.
37. T600 only
38. Volume Managers Supported. LVM, SLVM, VxVM 3.2
39. MC/Service Guard 11.13 and 11.14 LVM only
40. D, R Class only
41. Initial support for fabric is enabled with fabric device driver version B.11.00.03; minimum operating system level HP/UX 11.0 990P with March 2000 HW-CR bundle and dependency patch PHKL_21381; Symmetrix microcode versions 5265.49.31, 5266.20, 5566.22. Please refer to the Base Connectivity section for the latest driver and OS support.
42. **Virtual Partitions (VPAR) is supported on the rp7405/7410 server with 4.x and 5.x Symmetrix models and DMX Series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.02.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 4.0 or later.**
43. For rp7405 and rp7410 required minimum PDC firmware is 15.005
44. Volume Managers Supported: LVM, SLVM, VxVM 3.2, VxVM 3.5
45. Volume Managers Supported: LVM, VxVM 3.2, VxVM 3.5
46. Supported in 2-CPU systems only (2-way)
47. Virtual Partitions (VPAR) is supported on the rp7405 server with 4.x and 5.x Symmetrix models. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.02.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 4.0 or later.
48. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24 or 5568.58.12
49. Virtual Partitions (VPAR) is supported on the rp8400 server with 4.x and 5.x Symmetrix models and DMX Series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 4.0 or later
50. **Virtual Partitions (VPAR) is supported on the N-class/rp7400 server with 4.x and 5.x Symmetrix models and DMX series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 42.06 or later.**
51. Virtual Partitions (VPAR) is supported on the N-class/rp7400 server with 4.x and 5.x Symmetrix models. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 42.06 or later. Powerpath support on Virtual Partitions has to be RPQ'ed at this time.
52. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24, 5568.58.12 or 5x69
53. Review the single attach table for supported PowerPath versions and volume manager restrictions.

HPQ MPE/ix

HPQ

HPQ – HPQ MPE/ix						
No.	Host System	Operating System	Cluster Software	Max # Nodes	Host Bus Adapter	Adapter Type
1	e3000 900 Series	HPQ MPE/ix 7.5[6, 7, 8, 9]	HPQ ClusterIX[1]	HA: 2, OPS: 2, RAC: 2	HPQ 28696A	FWD
2	e3000 900 Series	HPQ MPE/ix 6.5.02, 7.0.01[2, 3], 7.5[6, 7, 8, 9]	HPQ ClusterIX[1]	HA: 2	HPQ 28696A	FWD
3	e3000 N-Class (N4000)	HPQ MPE/ix 7.0.01[2, 3]	HPQ ClusterIX[1]	HA: 2	HPQ: A5149A[5], A5150A[5]	U2 LVD
4	e3000 A-Class	HPQ MPE/ix 7.0.01[2, 3]	HPQ ClusterIX[1]	HA: 2	HPQ A4800A[4]	UWD
5	e3000 N-Class (N4000)	HPQ MPE/ix 7.0.01[2, 3]	HPQ ClusterIX[1]	HA: 2	HPQ: A4800A[4], A5159A[4]	UWD

1. ClusterIX has the following limitations: Requires operator invervention (it is not fully automated); Does not support the boot volume, only user volumes; Does not support data sharing; Is not supported on mirrored disks (using MPE MirrorIX).
2. Symmetrix 8000 Series & 66/67 support: HP-UX 10.20,11.0,11.10, 11.0 ACE,11.i.
Symmetrix 8000 Series 5568 support: HP-UX 10.20, 11.0, 11i
Symmetrix 8000 Series & 66/67 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01:
Symmetrix 8000 Series 5568 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
3. Symmetrix 8000 Series & 66/67 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01: Symmetrix 8000 Series 5568 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
4. A4800A and A5159A HBAs are both capable of Ultra 1 speeds, but ship from HP with a default setting of FWD. Symmetrix is supported at Ultra 1 speeds with both these HBAs. Ultra 1 can be enabled in the V-Class, N-Class, and L-Class. A-Class and Superdome PDC firmware. V-Class supports the A4800A Only.

   HP e3000 MPE SYSTEMS – The above note applies but only includes the A-Class and N-Class Servers. The HP e3000 A-Class does not support the dual port HBA A5159A.
5. Symmetrix 5567 code is required to support Ultra2 LVD SCSI director (DP3-U2SD4L).
6. Symmetrix 8000 Series & 66/67 support:HP-UX 10.20, 11.0, 11.0 ACE, 11i
Symmetrix 8000 Series 5568 support: HP-UX 10.20, 11.0, 11i
Symmetrix 8000 Series & 66/67 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
Symmetrix 8000 Series 5568 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
7. Symmetrix 8000 Series & 66/67 support.
MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01, 7.5
Symmetrix 8000 Series 5568 support:
MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01, 7.5
8. LDEV1, the boot volume, has no size limit in MPE/iX 7.5. The 4GB limit that existed in previous releases has been eliminated.
9. Requires Symmetrix microcode
5266.40.28 or higher
5566.40.27 or higher
5267.25.17 or higher
5567.32.16 or higher
5568.34.14 or higher

1 Tru64 V4.0G latest qualified patch kit-0003 (T64V40GAS0003-20010613)
2 TruCluster v1.6 SCSI requires shared buses with 'Y' cables or HPQ (Compaq) Ultra SCSI hubs DS-DWZZH-03, DS-DWZZH-05. Straight cables used on interconnects are 038-001-537 (6M), 038-001-538 (12M), 038-001-539(20M). Maximum bus length must not exceed 25 meters. Refer to Symmetrix High Availability Environment Product Guide P/N 200-999-566 for more details.
3 KZPSA-BB [FWD] has been discontinued by HPQ (Compaq)
4 Tru64 V4.0F BL13 Patch Kit 2 may introduce problems with KZPBA adapters. Tru64 V4.0F latest qualified Patch Kit-0007 (DUV40FB18AS0007-20010102)
5 TruCluster V5.x Persistent Reservation support requires minimum 5567.33.18, Symm "PER" Volume flag, minimum V5.1 Patch Kit-0003 (BL17) and "ubyte[0] = 8" in /etc/ddr.dbase EMC entry. Configurations that cannot support Persistent Reservation must set "ubyte[0] = 25" to enable alternate barrier patch and direct access devices. PowerPath 2.1.0 does not support

Persistent Reservation, alternate barrier must be enabled or upgrade to minimum PowerPath 2.1.1. Configurations with TimeFinder BCV devices in the cluster must set "ubyte[0] = 25" to enable alternate barrier.

6. V5.x: 255 LUNs/Symmetrix Fibre director port (LUNs 000-0FE valid) on Symmetrix 8000 Series, requires OVMS director bit setting (minimum 5265.48.30 or 5566.26.19), LUN 000 must be mapped to gatekeeper device, the LUN 000 array controller device will not be usable by the Tru64 host.
7. **Tru64 V5.1 latest qualified Patch Kit-0006 (T64V51B20AS0006-20030210).**
8. Tru64 V5.1A latest qualified Patch Kit-0004 (T64V51AB21AS0004-20030206).
9. AlphaServer SC systems have special Tru64 UNIX operating system and AlphaServer SC System Software requirements.
10. Requires RPQ
11. **Tru64 V5.1B latest qualified Patch Kit 2 (T64V51BB22AS0002-20030415).**
12. **AlphaServer GS1280,ES80,ES47: Minimum Tru64 V5.1B with Patch Kit 1 (T64V51BB1AS0001-20021229)**
13. **FCA2384(KGPSA-EA): Latest firmware revision 1.00X6**
14. **FCA2384(KGPSA-EA): Minimum firmware revision 1.00X2**

1 Fibre Channel HBAs, DCCG141-0000: LP7000e copper DCCG147-0000: LP8000 copper DCCG148-0000, LP8000 fibre
2 Fibre Channel device driver distributed and supported by Bull
3. Multi-port SCSI or Common SCSI Bus
4 Multi-port SCSI (preferred) or Common SCSI Bus
5 Mixed FC-AL and FC-SW are supported on the same server.
6 MSKG0008-0000 = Brocade® Silkworm® 2800.
7 Supported in SMP and LPAR mode.
8. AIX 5.1 32/64-bit kernel support.

1 For all PCI-based hosts only: See http://www-1.ibm.com/servers/eserver/pseries/library/hardware_docs/sa38/380538.pdf for appropriate HBA placement guidelines.
2 Symmetrix 8000 Series:66/67 support AIX 4.3.x, 5.1. 5568 support at AIX 4.3.3, 5.1
3 For IBM AIX 4.3.3: requires Oracle RAC9i (9.0.1). HACMP/ES 4.4.x. PowerPath 2.1 or greater is supported. Symmetrix microcode 5566/5567/5568. A SAN implementation with ISLs will observe significant delay in failover times if link failures non-contiguous to host HBA occur. For IBM AIX 5.1: requires Oracle RAC9i (9.2). HACMP/ES 4.4.x. PowerPath 3.0.1 or greater is supported. Symmetrix microcode 5566/5567/5568. A SAN implementation with ISLs will observe significant delay in failover times if link failures non-contiguous to host HBA occur.
4 Symmetrix 5567 code is required to support Ultra2 LVD SCSI director (DP3-U2SD4L).
5 Mixed FC-AL and FC-SW are supported on the same server.
6 HBA and driver available exclusively as EMC Fibre Channel Interface V2.0 for AIX Platforms. Latest PTF package (V2.0.0.3_PTF.tar.Z) can be downloaded from the EMC FTP server at ftp://ftp.emc.com/pub/elab/aix/EMC-FC-Kit
7 Requires minimum HACMP IY07313, concurrent resource groups not supported with HACMP 4.3 or 4.3.1. For HACMP 4.4.0 and 4.4.1 concurrent resource groups supported with APAR IY14528. Requires minimum AIX APAR IY08960, IY03872, IY06844. Requires minimum Symmetrix microcode level 5265.48.30
8 IBM Native Fibre Channel drivers with feature code 6227 and with feature code 6228 are supported on the same server. Feature 6228 and 6239 are supported on the same server. Mixed FC-AL and FC-SW are supported on the same server. 6227 filesets: devices.pci.df1000f7.com, devices.pci.df1000f7.diag, devices.pci.df1000f7.rte; 6228 filesets: devices.pci.df1000f7.com, devices.pci.df1000f7.diag, devices.pci.df1000f9.diag, devices.pci.df1000f9.rte. 6239 filesets: devices.pci.df1000f7.com, devices.pci.df1000f7.diag, devices.pci.df1080f9.diag, devices.pci.df1080f9.rte
9 Requires minimum Symmetrix microcode level 5265.48.30. Requires minimum AIX APAR IY08960, IY03872. Requires minimum EMC ODM fileset support (4.3.3.1 IBM Fibre Channel interface support for Symmetrix). Supported adapter firmware, 3.22A1.
10 Requires minimum Symmetrix microcode level 5265.39.25. Requires minimum AIX APAR IY05369. Requires minimum EMC ODM fileset support (4.3.3.0 IBM Fibre Channel interface support for Symmetrix). Supported adapter firmware, 3.22A1.
11 RS/6000 nodes only, 8 nodes. RS/6000 SP nodes only, 32 nodes, mix RS/6000 and RS/6000 SP in same cluster: 8 nodes.
12 Latest APAR for PSSP 2.4 is IY17776.
13 Latest APAR for PSSP 3.2 is IY17872.
14 Latest APAR for PSSP 3.1.1 is IY17670.
15 Latest APAR for PSSP 2.2 is IY15360.
16 Requires minimum EMC ODM fileset support (4.3.3.1 IBM Fibre Channel interface support for Symmetrix). Device driver df1000f9 is distributed by IBM.
17 Requires minimum AIX 4.3.3 with maintenance level 08 and adapter firmware 3.82a1. Requires minimum HACMP IY07313. Concurrent resource groups not supported with HACMP 4.3 or 4.3.1. For HACMP 4.4.0 and 4.4.1 concurrent resource groups supported with APAR IY14528. Requires minimum Symmetrix microcode level 5265.48.30.
18 The following link provides detailed data for all 9076-SP2 models and feature codes: http://www1.ibmlink.ibm.com/cgi-bin/master?request=salesmanual&parms=SMS&xh=NTZH*daEMSRi4n1USenGnN9332&xhr=usa main%7Csalesmanual%5E&type=D&search=9076&title=7&product
19 These feature codes are supported: 2054 Power 3 High Node, 2055 SP expansion I/O, 2056 375 MHz Power 3 thin node, 2057 375 MHz Power 3 wide node, 2058 375 MHz Power 3 high node.
20 Requires PowerPath version 2.0.2 or higher

21. RVSD 3.2 supported with IBM 6227/6228 host bus adapter.
22. Channel configurations: multi-port SCSI preferred or common SCSI bus.
23. AIX 5.1 supported with 32/64-bit kernel. Requires minimum EMC ODM fileset support 5.0.0.0.
24. AIX 5.1 32/64 bit Kernel supported. Minimum PowerPath Version 2.1.2 supported . Requires minimum EMC ODM fileset support 5.0.0.0.
25. Minimum PowerPath 2.1.2 supported.
26. AIX 5.1 supported with 32-bit kernel. Requires minimum EMC ODM fileset support 5.0.0.0.
27. AIX 5.1 only supported with 32-bit kernel. Minimum PowerPath Version 2.1.2 supported. Requires minimum EMC ODM fileset support 5.0.0.0.
28. Refer to Primus case #1.0.128870403.2749464 for configuration instructions.
29. Requires minimum AIX 4.3.3 with APAR IY22024, Requires PSSP 3.4 with APAR IY32625
30. Requires minimum EMC ODM fileset support (4.3.3.1 IBM Fibre Channel interface support for Symmetrix).
31. Requires minimum PSSP 3.4 APAR IY33448.
32. Feature codes supported: 2054: Power 3 High Noise, 2055: SP expansion I/O, 2056: 375 MHz Power 3 thin node, 2057: 375 MHz Power 3 wide node. 2058: 375 MHz Power 3 high node.
33. IBM 6227 and 6228 adapters are supported on the same server.Mixed FC-AL and FC-SW are supported on the same server.
34. Requires minimum HACMP APAR IY07313. Latest APAR for PSSP 3.1.1 is IY17870. Requires minimum RVSD APAR IY07130.
35. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567 46.24 or 5568.58.12
36. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26.19s.
37. GAB disks (membership and service group heartbeat disks) are not supported.
38. VxVM and VxFS are not currently supported in this configuration. Please review the Host Attach and Veritas Support sections for current listings of PowerPath, VxVM and VxFS support for Clariion storage arrays.
39. Minimum PowerPath 3.0.2 is supported.
40. PowerPath is supported with LVM and JFS
41. Requires minimum PSSP APAR IY38509
42. Minimum Powerpath version 3.0.3 is supported.
43. Requires minimum AIX5.1 with maintenance level 03 APAR IY32749
44. PSSP 3.5 supports a 32 or 64 bit kernel
45. Requires adapter firmware 3.22A1, CLArrayS3.5.1 fileset support. Supports FC4700 with minimum flare code 8.46.xx.
46. Requires minimum ODM fileset support (5.0.0.0 EMC Symmetrix Fibre Channel support software).
47. See http://www.rs6000.ibm.com/resource/hardware_docs/sa38-0538/380538.pdf for appropriate HBA placement guidelines
48. Requires minimum HBA firmware 3.22A1.
49. IBM 6227 and IBM 6228 adapters are supported on the same server. Mixed FC-AL and FC-SW are supported on the same server.
    6227 Filesets: devices.pci/df1000f7.com, devices.pci/df1000f7.diag, devices.pci/df1000f7.rte ;
    6228 Filesets: devices.pci/df1000f7.com, devices.pci/df1000f7.diag, devices.pci/df1000f9.diag. devices.pci/df1000f9.rte
50. AIX 5.1 supported with 32/64 bit kernel.
51. Requires minimum HBA firmware 3.82A1.
52. AIX 5.1 32/64 bit Kernel supported. Requires minimum EMC ODM fileset support 5.0.0.0.

IBM DYNIX/ptx

IBM

IBM – IBM DYNIX/ptx							
No.	Host System	Operating System	Cluster Software	Max # Nodes	Host Bus Adapter	Adapter Type	Comments
1	xSeries NUMA-Q 2000	IBM DYNIX/ptx 4.6.1[4, 5]	IBM ptx/Cluster: 2.3.0, 2.3.1	HA: 2, OPS: 2	IBM: IOC-210-52 (LP6500)[7, 8], IOC-210-54 (LP7000E-N1)[8]	FC-AL, FC-SW

10	xSeries NUMA-Q 2000	IBM DYNIX/ptx: 4.4.6[4, 5], 4.4.7[4, 5], 4.4.8[4, 5]	IBM ptx/Cluster 2.1.1	HA: 2, OPS: 2	IBM IOC-210-52 (LP6500)[7, 8]	FC-SW	
11	Symmetry: 2000, 5000	IBM DYNIX/ptx 4.2.4	IBM ptx/Cluster 1.2.2	OPS: 2	IBM: QCIC-E, QCIC-W-CTLR-01	FWD	See[1, 2]
12	Symmetry: 2000, 5000	IBM DYNIX/ptx: 4.4.6, 4.4.7, 4.4.8	IBM ptx/Cluster 2.1.1	OPS: 2	IBM: QCIC-E, QCIC-W-CTLR-01	FWD	See[1, 2]

1. These clustered hosts require Symmetrix Host Adapter model OSD4-SW, WSD4-SW, DP-USD4-SW, or DP-WSD4-SW. Symmetrix gatekeeper devices cannot be configured to shared SCSI busses for DYNIX/ptx 4.2.x. Only configure gatekeepers to private SCSI busses.
2. Common SCSI Bus.
3. Multi-port SCSI.
4. Can support up to 4-node clusters for DYNIX/ptx 4.6.0 and later, for both HA and OPS.
5. Can support up to 4-node clusters without SVM for DYNIX/ptx 4.4.5 and later, but only 2-node clusters with SVM shared disk groups
6. FC to SCSI Bridge and firmware v1.5.5
7. EMC DP3-FCD4 supported on DYNIX/ptx 4.4.8, 4.4.9, 4.4.10, 4.5.2, 4.5.3, and 4.6.1 only. Requires minimum 5x67 microcode 5567.34.19A, or 5568.27.12A.
8. EMC DP3-FCD42G and EMC DP3-FCD42GS supported on DYNIX/ptx 4.4.8, 4.4.9 and 4.4.10 only.
9. Not supported on the EMC DP3-FCD4 or on the DP3-FCD42G(S).

Microsoft Windows 2000

EMC recommends shutting down the host server during maintenance procedures that could cause the boot disk to become unavailable to the host. If the paging file is unavailable to the operating system for a minimum of 10 seconds, a crash can occur.Events that could cause a system to crash when booting from external storage are:
1)Lost connection to external storage (pulled or damaged cable connection).
2)External storage service/upgrade procedures such as online microcode upgrades and/or configuration changes.
3)External storage director failures including failed lasers on Fibre Channel directors.
4)External storage power failure.
5)Storage area network failures such as Fibre Channel switches, switch components, and switch power failures.
6)Storage area network service/upgrade procedures such as firmware upgrades or hardware replacements.CAUTION: Microsoft Windows NT uses virtual

memory paging files that reside on the boot disk by default. Please refer to the information contained in Microsoft Knowledge Base article Q305547. The article explains how Microsoft supports booting Windows systems through a SAN (storage area network.) Although this article specifically mentions Windows 2000, the information also pertains to Windows NT 4.0 systems booting through a SAN.

1	AViiON: AV1400, AV2800, AV3800	Microsoft Windows 2000 Advanced Server: SP2[3], SP3[3], SP4. Microsoft Windows 2000: Datacenter SP4, Server SP4	Microsoft MSCS[1, 2]	HA: 2	QLogic QLA2200F-EMC	FC-AL
2	AViiON: AV1400, AV2800, AV3800	Microsoft Windows 2000 Advanced Server: SP2[3], SP4	Legato Automated Availability Manager (LAAM) 5.0 (Base)[5, 6]	HA: 4	QLogic QLA2200F-EMC	FC-AL
3	AViiON: AV1400, AV2800, AV3800	Microsoft Windows 2000 Advanced Server: SP2[3], SP3[3], SP4. Microsoft Windows 2000: Datacenter SP4, Server SP4	Microsoft MSCS[1, 2]	HA: 2	Emulex: LP7000E-EMC, LP8000-EMC[4], LP850-EMC; QLogic: QLA2300F-E-SP, QLA2310F-E-SP, QLA2340-E-SP, QLA2342-E-SP	FC-AL, FC-SW
4	AViiON: AV1400, AV2800, AV3800	Microsoft Windows 2000 Advanced Server: SP2[3], SP4	Legato Automated Availability Manager (LAAM) 5.0 (Base)[5, 6]	HA: 4	Emulex: LP7000E-EMC, LP8000-EMC[4], LP850-EMC; QLogic: QLA2300F-E-SP, QLA2310F-E-SP, QLA2340-E-SP, QLA2342-E-SP	FC-AL, FC-SW

1. Best Practice configurations recommendations for MSCS Clusters are: Single HBA Zoning for each server or for each node in any given cluster, separate FA storage ports for each separate cluster to properly isolate the clusters from each other, use ESN Manager with Single HBA Zoning to provide additional LUN access control.
2. MSCS multi cluster configurations supported. If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN masking with the following minimum microcode: 5267.39, 5567.46, 5568.39
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
5. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24 or 5568.58.12
6. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26.19s.

1. Requires Legacy PCI slot (not available on new servers.)
2. MSCS multi cluster configurations supported. If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN masking with the following minimum microcode: 5267.39, 5567.46, 5568.39
3. Refer to Microsoft HCL for updated Windows 2000 SCSI clusters (http://www.microsoft.com/hwtest/hcl).
4. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
5. Best Practice configurations recommendations for MSCS Clusters are: Single HBA Zoning for each server or for each node in any given cluster, separate FA storage ports for each separate cluster to properly isolate the clusters from each other, use ESN Manager with Single HBA Zoning to provide additional LUN access control.
6. PowerEdge 2550 supports a maximum of 2 Emulex HBAs at one time and the total PCI power cannot exceed 20 Watts.
7. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
8. Symmetrix 8000 Series only.
9. Oracle Cluster File System not supported for 9i RAC 9.2.0.1.0
. VxVm not supported. PowerPath 3.0 supported.
10. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24 or 5568.58.12
11. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26.19s.
12. GAB disks (membership and service group heartbeat disks) are not supported.

1. (Adaptec AHA-2944UW)
MSCS multi cluster configurations supported. If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN masking with the following minimum microcode: 5267.39, 5567.46, 5568.39.
3. Refer to Microsoft HCL for updated Windows 2000 SCSI clusters (http://www.microsoft.com/hwtest/hcl).
4. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
5. Requires Legacy PCI slot (not available on new servers.)
6. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
7. Includes both Pentium PRO and XEON models
8. HPQ Proliant servers that are rack-mountable (designated with an "R") are supported.
9. Best Practice configurations recommendations for MSCS Clusters are: Single HBA Zoning for each server or for each node in any given cluster, separate FA storage ports for each separate cluster to properly isolate the clusters from each other, use ESN Manager with Single HBA Zoning to provide additional LUN access control.
10. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
11. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
12. The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC, HP part number D6975A, must be ordered separately from HP.
13. Requires driver version 2.0.25.44 available at http://h20004.www2.hp.com/keeper_rnotes/bsdmatrix/matrix213991.html
14. (HHBA-5101BK-01)
15. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.
16. HP NetServer LC2000 is only supported with two processors. Uni-Processor configurations are not supported
17. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26.19s.
18. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24 or 5568.58.12
19. Requires QLogic driver v6.04.02 and BIOS v1.34.
20. If no firmware/BIOS/driver is specified, refer to Base Connectivity information for minimum revision details.
21. Host must be offline for interfamily Symmetrix microcode upgrade.
22. Requires driver 8.2.1.20, and bios 1.34. Supports SNIA HBA API. Driver and BIOS available at http://www.qlogic.com.
23. Requires STORPort driver version 8.2.2.20, and BIOS 1.34. Available at http://www.qlogic.com. This driver requires Microsoft STORPort hotfix Q817789 available from Microsoft. Refer to: http://support.microsoft.com/default.aspx?scid=kb:[LN];817789
24. Booting off of an EMC storage array is not currently supported with the HPQ BL20P.
25. BIOS must be obtained from HP at http://h18000.www1.hp.com/products/servers/proliant-bl/p-class/20p/index.html instead of BIOS on Qlogic web site. EMC NVRAM settings must be configured manually. Refer to EMC Fibre Channel documentation for QLogic HBAs for the settings.
26. GAB disks (membership and service group heartbeat disks) are not supported.

1. Requires Legacy PCI slot (not available on new servers.)
2. MSCS multi cluster configurations supported. If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN masking with the following minimum microcode: 5267.39, 5567.46, 5568.39.
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. Refer to Microsoft HCL for updated Windows 2000 SCSI clusters (http://www.microsoft.com/hwtest/hcl).
5. This server only supports 5 Volt HBAs: qLogic 22XX family (if applicable), qLogic 23XX family, Emulex LP8000, and Emulex LP850 (if applicable).
6. Best Practice configurations recommendations for MSCS Clusters are: Single HBA Zoning for each server or for each node in any given cluster, separate FA storage ports for each separate cluster to properly isolate the clusters from each other, use ESN Manager with Single HBA Zoning to provide additional LUN access control.
7. Supported by direct attach only
8. This HBA is equivalent to the qLogic QLA2310.
9. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
10. (QLA2200) For IBM xSeries and Netfinity servers only.
11. Symmetrix 8000 Series only.
12. Oracle Cluster File System not supported for 9i RAC 9.2.0.1.0
. VxVm not supported. PowerPath 3.0 supported.
13. Oracle Cluster File System not supported for 9i RAC 9.2.0.1.0.
VxVM not supported.
PowerPath 3.0 supported.
14. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24 or 5568.58.12
15. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26.19s.
16. This HBA is equivalent to the qLogic QLA2340.
17. GAB disks (membership and service group heartbeat disks) are not supported.
18. **Microsoft Cluster Server (MSCS) is the native cluster service available with Windows 2000 Advanced Server.**
19. **When flashing HBA bios on the HS20 FC Expansion card, you may receive the error message: "Error erasing flash at I/O address 2600 (this is the second port on the HBA)"**

This is a known issue as the expansion card only has one flashable port. IBM is working to resolve this and this message can be ignored.
EMC VolumeLogix Software required for multiple BladeServers when direct-attached to EMC Symmetrix storage.

1. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
2. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.63a1. Emulex drivers are available at http://www.emulex.com. Supports SNIA HBA API.
   Bus Enumeration Issue Causes Problems using SYMCLI SCSI bus enumeration of disks will change depending on cold boot or warm boot. This causes symcli commands to fail because the path is changed and SYMCLI can no longer communicate with the Symmetrix.

   By "shutdown" and booting system, internal disks are assigned first, followed by Symmetrix disks.
   By "restart" the system, Symmetrix disks are assigned first, followed by internal disks. Drive letter are not changed in both cases.
   The workaround is to perform "symcfg discover" after rebooting.
4. **The LP8000–EMC HBA has a permanent GBIC, and does not have copper cable support.**
5. Supported by direct attach only

1. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
2. Best Practice configurations recommendations for MSCS Clusters are: Single HBA Zoning for each server or for each node in any given cluster, separate FA storage ports for each separate cluster to properly isolate the clusters from each other, use ESN Manager with Single HBA Zoning to provide additional LUN access control.
3. MSCS multi cluster configurations supported. If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN masking with the following minimum microcode: 5267.39, 5567.46, 5568.39.
4. EMC strongly recommends that HBAs of different vendors not be used in the same host server
   Refer to Microsoft HCL for updated Windows 2000 SCSI clusters (http://www.microsoft.com/hwtest/hcl).
   Supported by direct attach only

Microsoft Windows 2003

EMC recommends shutting down the host server during maintenance procedures that could cause the boot disk to become unavailable to the host. If the paging file is unavailable to the operating system for a minimum of 10 seconds, a crash can occur.Events that could cause a system to crash when booting from external storage are:
1)Lost connection to external storage (pulled or damaged cable connection).
2)External storage service/upgrade procedures such as online microcode upgrades and/or configuration changes.
3)External storage director failures including failed lasers on Fibre Channel directors.
4)External storage power failure.
5)Storage area network failures such as Fibre Channel switches, switch components, and switch power failures.
6)Storage area network service/upgrade procedures such as firmware upgrades or hardware replacements.CAUTION: Microsoft Windows NT uses virtual memory paging files that reside on the boot disk by default. Please refer to the information contained in Microsoft Knowledge Base article Q305547. The article explains how Microsoft supports booting Windows systems through a SAN (storage area network.) Although this article specifically mentions Windows 2000, the information also pertains to Windows NT 4.0 systems booting through a SAN.

1. HP LXR-PRO8 support has been discontinued.
2. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
   Tested with Symmetrix 8000 Series, Connectrix ED-1032 3.0.1, and PowerPath 2.0 and above on each node.
   EMC strongly recommends that HBAs of different vendors not be used in the same host server.
5. V1.0 is only qualified on Windows NT 4.0 SP3.
6. MSCS multi cluster configurations supported. If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN masking with the following minimum microcode: 5267.39, 5567.46, 5568.39
7. Best Practice configurations recommendations for MSCS Clusters are: Single HBA Zoning for each server or for each node in any given cluster, separate FA storage ports for each separate cluster to properly isolate the clusters from each other, use ESN Manager with Single HBA Zoning to provide additional LUN access control.

1. Multi-port SCSI (preferred) or Common SCSI Bus.
2. Requires Legacy PCI slot (not available on new servers.)
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. MSCS multi cluster configurations supported. If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN masking with the following minimum microcode: 5267.39, 5567.46, 5568.39.
5. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
6. Includes both Pentium PRO and XEON models
7. This server is equipped with plastic shielding around the PCI slots. Since the PCI slots are 32-bit, this shielding prohibits 64-bit HBAs from properly seating in the PCI slots. To accomodate 64-bit HBAs, this shielding must be removed, or modified to allow the 64-bit HBA to fully seat in the 32-bit slots.
8. HP LXR-PRO8 support has been discontinued.
9. Best Practice configurations recommendations for MSCS Clusters are: Single HBA Zoning for each server or for each node in any given cluster, separate FA storage ports for each separate cluster to properly isolate the clusters from each other, use ESN Manager with Single HBA Zoning to provide additional LUN access control
10. Tested with Symmetrix 8000 Series, Connectrix ED-1032 3.0.1, and PowerPath 2.0 and above on each node.
11. V1.0 is only qualified on Windows NT 4.0 SP3.
12. HPQ Proliant servers that are rack-mountable (designated with an "R") are supported.
13. The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC, HP part number D6975A, must be ordered separately from HP. (HHBA-5101BK-01)
14. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
15. Refer to Microsoft HCL for updated Windows 2000 SCSI clusters (http://www.microsoft.com/hwtest/hcl).

1. Multi-port SCSI (preferred) or Common SCSI Bus
2. Requires Legacy PCI slot (not available on new servers.)
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. MSCS multi cluster configurations supported. If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN masking with the following minimum microcode: 5267.39, 5567.46, 5568.39.
5. Multi-port SCSI.
6. V1.0 is only qualified on Windows NT 4.0 SP3.
   HP LXR-PRO8 support has been discontinued.
7. Best Practice configurations recommendations for MSCS Clusters are: Single HBA Zoning for each server or for each node in any given cluster, separate FA storage ports for each separate cluster to properly isolate the clusters from each other, use ESN Manager with Single HBA Zoning to provide additional LUN access control.
8. Tested with Symmetrix 8000 Series, Connectrix ED-1032 3.0.1, and PowerPath 2.0 and above on each node.
9. The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC, HP part number D6975A, must be ordered separately from HP.
10. (HHBA-5101BK-01)
11. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.

1. HP LXR-PRO8 support has been discontinued
2. Tested with Symmetrix 8000 Series, Connectrix ED-1032 3.0.1, and PowerPath 2.0 and above on each node
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server
4. MSCS multi cluster configurations supported. If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN masking with the following minimum microcode: 5267.39, 5567.46, 5568.39
5. Best Practice configurations recommendations for MSCS Clusters are: Single HBA Zoning for each server or for each node in any given cluster, separate FA storage ports for each separate cluster to properly isolate the clusters from each other, use ESN Manager with Single HBA Zoning to provide additional LUN access control
6. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.63a1. Emulex drivers are available at http://www.emulex.com. Supports SNIA HBA API.
7. **Bus Enumeration Issue Causes Problems using SYMCLI SCSI bus enumeration of disks will change depending on cold boot or warm boot. This causes symcli commands to fail because the path is changed and SYMCLI can no longer communicate with the Symmetrix.**

By "shutdown" and booting system, internal disks are assigned first, followed by Symmetrix disks.
By "restart" the system, Symmetrix disks are assigned first, followed by internal disks. Drive letter are not changed in both cases.
The workaround is to perform "symcfg discover" after rebooting.

1. Multi-port SCSI (preferred).
2. Requires driver 1.27, BIOS 6.26 available at http://www.qlogic.com/support/oem_detail_all.asp?oemid=42,20
3. Maximum number of NWFS volumes that can be mounted is 64.
4. Requires Legacy PCI slot (not available on new servers.)
5. Requires driver 7.30s1, BIOS 2.20. The driver is available from Adaptec.
6. Netware 5.1 SP4 and 6.0 SP1 require driver 8.1 and BIOS 2.20. Requires "SCAN ALL LUNS" in AUTOEXEC.NCF just before the Mount All statement.
7. Requires NWPA.NLM V.3.07A update from Novell website.
8. PowerEdge 2550 supports a maximum of 2 Emulex HBAs at one time and the total PCI power cannot exceed 20 Watts.
9. Requires driver 4.15g, BIOS 1.39.
10. Powerpath & ATF supported.
11. Novell Storage Services supported.
12. Requires driver 6.50v, BIOS 1.34 available from Qlogic.
13. Requires HBA firmware 1.79 and driver 6.50v.
14. EMC strongly recommends that HBAs of different vendors not be used in the same host server

HPQ – Novell Netware							
No.	Host System	Operating System	Cluster Software	Max # Nodes	Host Bus Adapter	Adapter Type	Comments
19	**Proliant DL380(G3)**	**Novell Netware: 5.00 SP6A[5, 6], 5.10 SP2A[5], 5.10 SP5[5, 17, 18], 5.10 SP6**	**Novell Netware Cluster Services Server (NCS) v1.01 SP4**	HA: 4	**QLogic QLA1041D[8]**	UWD	**See[1]**

1. Multi-port SCSI (preferred).
2. Requires driver 7.30s1. BIOS 2.20. The driver is available from Adaptec.
3. Requires Legacy PCI slot (not available on new servers.)
4. Netware 5.1 SP4 and 6.0 SP1 require driver 8.1 and BIOS 2.20. Requires "SCAN ALL LUNS" in AUTOEXEC.NCF just before the Mount All statement.
5. Maximum number of NWFS volumes that can be mounted is 64
6. Requires NWPA.NLM V.3.07A update from Novell website.
7. HPQ Proliant servers that are rack-mountable (designated with an "R") are supported.
8. Requires driver 1.27. BIOS 6.26 available at http://www.qlogic.com/support/oem_detail_all.asp?oemid=42,20
9. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
10. Includes both Pentium PRO and XEON models
11. This server is equipped with plastic shielding around the PCI slots. Since the PCI slots are 32-bit, this shielding prohibits 64-bit HBAs from properly seating in the PCI slots. To accomodate 64-bit HBAs, this shielding must be removed, or modified to allow the 64-bit HBA to fully seat in the 32-bit slots.
12. Requires driver 4.15g. BIOS 1.39.
13. (HHBA-5101BK-01)
14. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
15. Requires driver 2.00E or higher available at http://h20004.www2.hp.com/keeper rnotes/bsdmatrix/matrix51745.html.
16. (Adaptec AHA-2944UW)
17. Powerpath & ATF supported.
18. Novell Storage Services supported.
19. Requires driver 6.50v, BIOS 1.34 available from Qlogic.
20. Requires HBA firmware 1.79 and driver 6.50v.
21. HP NetServer LC2000 is only supported with two processors Uni-Processor configurations are not supported
22. Refer to Microsoft HCL for updated Windows 2000 SCSI clusters (http://www.microsoft.com/hwtest/hcl).

1. Multi-port SCSI (preferred).
2. Requires driver 7.30s1, BIOS 2.20. The driver is available from Adaptec
3. Requires Legacy PCI slot (not available on new servers.)
4. Netware 5.1 SP4 and 6.0 SP1 require driver 8.1 and BIOS 2.20. Requires "SCAN ALL LUNS" in AUTOEXEC.NCF just before the Mount All statement
5. Maximum number of NWFS volumes that can be mounted is 64
6. Requires driver 1.27. BIOS 6.26 available at http://www.qlogic.com/support/oem_detail_all.asp?oemid=42,20

7. Requires NWPA.NLM V.3.07A update from Novell website.
8. This server only supports 5 Volt HBAs: qLogic 22XX family (if applicable), qLogic 23XX family, Emulex LP8000, and Emulex LP850 (if applicable).
9. Requires driver 4.15g, BIOS 1.39.
10. Powerpath & ATF supported.
11. Novell Storage Services supported.
12. Requires driver 6.50v, BIOS 1.34 available from Qlogic.
13. Requires HBA firmware 1.79 and driver 6.50v.
14. EMC strongly recommends that HBAs of different vendors not be used in the same host server.

1. Host must be offline for interfamily Symmetrix microcode upgrade.
2. Requires QLogic driver v6.04.02 and BIOS v1.34
3. **Supported with QLogic driver v6.04.02 or v6.05.00.**
4. **Watchdog Timer should be disabled in ocmargs.ora**
5. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
6. **Supported with QLogic driver v6.04.02.**
7. An RPM from Dell may be used to install the QLogic v6.X driver. RPM may be obtained from the QLogic website.
8. QLogic driver is available with Dell/Oracle CC kit.
9. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath. Booting from EMC storage arrays is NOT supported with PowerPath.
10. OCFS (Oracle Cluster File System) is supported. Requires patch mount-2.11g-6i386.rpm (ocfs mount support).
11. Oracle Cluster File System v1.0 supported with Linux v2.4.9-E9 through E12.
12. Driver v6.04.00 or above must be used with Qlogic HBAs for direct attach configurations.
13. GAB disks (membership and service group heartbeat disks) are not supported.
14. Review single attach VxVM notes for PowerPath and DMP restrictions.
15. When VxVM is used, EMC recommends VxVM 3.2 update 2, VxFS 3.4 update 1 and above.
16. **FC-AL and FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.**
17. **FC-SW applies only to CX600, CX400, CX200, FC4500, FC4700 and FC5300. FC5300 with FC-SW available from selected channels.**
18. **This kernel is supported with the Qlogic v6.04.01 driver included in the kernel.**

1. Multi-port SCSI.
2. SCSI supports targets 1-15, LUNs 0-7. LUN skipping is permitted. however, LUN 0 must exist for each target.
3. FC-AL supports 128 LUNs per adapter. LUN skipping is permitted however, LUN 0 must exist for each adapter.

1. Single HBA zoning is required regardless of the switch being utilized.
2. **Host must be offline for interfamily Symmetrix microcode upgrade.**
3. **Requires Emulex drivers v4.20Q and firmware v3.90a7. Available from http://www.emulex.com.**
4. **QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.**
5. **EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.**
6. **Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.**
7. **Requires rev2 sles7upg2418.patch available from ftp://ftp.emc.com/pub/elab/linux**
8. **EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ**
9. **Must use standard PCI 32bit/33MHz slot for SCSI**

1. Multi-port SCSI.
2. No OPS support for Solaris 7.
3. This host supports only 5 V HBAs.
4. 64-bit HBAs will not fit into the 32-bit slot due to a physical obstruction.
5. In other words, pkginfo -l VRTSvcs should report 1.1.1 1999101416
6. GAB disks (membership and service group heartbeat disks) are not supported.
7. Disk Reservation Agent with PowerPath 2.0.3 only.
8. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
9. PowerPath 2.0 and above with native name only, no hub.
10. Powerpath requires V2.0.2 or later.
11. Automatic remote failover is not supported at this time.
12. Symm Socket/Smart Heartbeat is not supported at this time.
13. VRTS VxVM 3.0.4 or 3.1 required. DMP must be disabled.
14. Requires TSBdctrl V1.2
15. PowerPath not supported.
16. FC64: Hub supports up to 7 connections; PowerPath supported.
17. Veritas VxVM 3.0.4 or higher can be used. DMP must be enabled.
18. Requires Cluster Perfect Patch PB00042-01, PowerPath 3.0.2 or later.
19. Requires driver 4.09. The QLA2200F-EMC/QCP2202F-E/QLA2300-E-SP/QLA2340-E-SP/QLA2342-E-SP requires fcode v2.00.06. The QLA2202FS-E requires fcode 2.00.01. Fcode should be loaded on all HBA's at the time of installation. All drivers and fcode can be downloaded from http://www.qlogic.com. Supports SNIA HBA API.
20. **Requires Symmetrix 8000 Series, PowerPath 3.0.4 or later, VxVM 3.2, and microcode minimum 5567.46.24 – 5567.49.27, or 5568.52.18 or later. Symmetrix "PER" volume flag for Persistent Reservation support for devices accessible through more than two paths.**
21. For all Sun Cluster 3.0 configurations where TimeFinder or SRDF are being used. please refer to the white papers EMC Symmetrix with Sun Cluster 3.0 on Avatar and PowerLink.
22. OPS and RAC configurations running VxVM 3.2 VxVM 3.2 P03.
23. For clustered pairs of more than 2 nodes, see the Sun Cluster 3.0 Configuration Guide.
24. Requires MicroCode 5567.35.20 or higher.Volumes Should be enabled to support SCSI persistence (set PER flag for each volume).
25. OPS and RAC configurations running VxVM 3.2 VxVM 3.2 P03.
26. Channel configurations: multi-port SCSI preferred or common SCSI bus.
27. Supported with PowerPath 3.x configurations only. Native Names only, no Power Devices.Requires Symmetrix 8000 Series. PowerPath 3.0.1 or later, VxVM 3.5.
28. Supported with PowerPath 3.x configurations only. Native Names only, no Power Devices. Requires Symmetrix 8000 Series. PowerPath 3.0.1 or later, VxVM 3.5.
29. Supported with PowerPath 3.x configurations only. Native Names only, no Power Devices. Requires Symmetrix 8000 Series, PowerPath 3.0.1 or later, VxVM 3.5.SCSI-3 Persistent Group Reserve support requires minimum microcode 5567.42.23A or later. Symmetrix "PER" volume flag setting required for devices accessible through more than 2 paths.
30. Requires Sun patch 113277-09.
31. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26.19s.
32. For configurations with PowerPath 3.0.1 use native names only, and no power devices.
33. Update 6.
34. Veritas MP1 is required for clusters with more than 2 servers
35. Symmetrix SCSI-3 "PER" volume flag setting required for devices accessible through two or more paths.
36. Requires Symmetrix 8000 Series and minimum microcode of (5567.50.28 or later) or (5568.54.20 or later).
37. If all FC connectivity to the array is lost (without a server shutdown), then after connectivity is restored, the user must execute a vxdctl enable command, before the VCS Oracle 9iRAC service group is brought back online.
38. SRDF and/or Timefinder by RPQ only
39. Please review Veritas support pages for latest patch information.
40. **Requires Symmetrix 8000 Series, PowerPath 3.0.4 or later, VxVM 3.5 or later, and microcode minimum 5567.46.24 – 5567.49.27, or 5568.52.18 or later. Symmetrix "PER" volume flag for Persistent Reservation support for devices accessible through more than two paths.**

Fibre Connectivity: Hub

Please refer to the fibre channel cables and connectors reference file: EPIc_FibreCablesConnectors.pdf.Please refer to the Base Connectivity Interoperability Application for details concerning kernel versions, minimum driver and BIOS / firmware revisions.

DG DG/UX

DG DG/UX									
No	Operating System	Host Bus Adapter	Hub	Fanin	Fanout	Luns/Storage Port	Luns/HBA	Luns/Loop	Comments
1	DG DG/UX, R4.20MU06, R4.20MU07	Emulex LP8000-F1	EMC DP3-FCD8[2]	1	4	128	256	128	See[1]
2	DG DG/UX, R4.20MU06, R4.20MU07	Emulex LP8000-F1	Vixel Rapport, 1000, 2000	4	4	128	256	128	See[1]

1. All adapters must be the same type except with HP-UX.
2. 8-port adapter (Model DP3-FCD8) splits the Symmetrix director into two 4-port hubs. Symmetrix still operates with only 2 ports per director. This 8-port adapter supports both FC-AL and FC-SW connections. Cascading of hubs on the same 8-port adapter to other 8-port adapters or to other EMC-qualified hubs is not supported at this time. To connect a switch to this adapter only the lowest connector of each hub can be used

HPQ HP-UX

HPQ HP-UX								
No.	Operating System	Host Bus Adapter	Hub	Fanin	Fanout	Luns/Storage Port	Luns/HBA	Luns/Loop
1	HPQ HP-UX: 11.0[1, 2], 11.0 990P[1, 2], 11.0 ACE[1, 2], 11i v1.0 (HP-UX 11.11)[1, 2, 13, 14], 11i v1.5 (HP-UX 11.20)[2, 15]	HPQ: A3404A, A3591A, A3591B, A3636A, A3740A, A5158A, A6684A, A6685A, A6795A	EMC DP3-FCD8[3, 4, 16, 17]	1	4[11]	128, 256[6, 7, 8, 9, 10]	320[12], 512	128
2	HPQ HP-UX: 11.0[1, 2], 11.0 990P[1, 2], 11.0 ACE[1, 2], 11i v1.0 (HP-UX 11.11)[1, 2, 13, 14], 11i v1.5 (HP-UX 11.20)[2, 15]	HPQ: A3404A, A3591A, A3591B, A3636A, A3740A, A5158A, A6684A, A6685A, A6795A	HPQ: A3724A/AZ[3, 4] A4839A/AZ[3, 4]	4	4[11]	128, 256[6, 7, 8, 9, 10]	320[12], 512	1280[5]

1. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set.
2. In HP and MC/ServiceGuard environments, the maximum number of active devices per server is 1024 for mid-range and high-end servers. This high device count is questionable for low-end servers (D/R-Class), and so remains at 768 for them (not counting alternate path LUNs for PV/Links or EMC PowerPath). Maximum limitations per server (subject to server and resources): HP-UX 10.20 768 devices, 1536 LUNs; HP-UX 11.0 2400 devices, 4800 LUNs; HP-UX 11i 4096 devices, 8096 LUNs; HP-UX 11i Version 1.5 (11.20) 4096 devices, 8096 LUNs.
3. 2 Gb speed and autonegotiation on target ports must be disabled when connected to hubs.
4. All adapters must be the same type except with HP-UX
5. Using ESN Manager.
6. Requires microcode level 5566.29 or higher.
7. 256 LUN support: HP-UX 10.20 requires patch PHKL_23259 or patches superceded by or having co-dependencies as defined by HP. HP-UX 11.0 requires patch PHKL_21607 or patches superceded by or having co-dependencies as defined by HP.
8. For HP-UX 11.0 of June 2000 or higher release is required (patch bundle XSWHWCR1100B.11.00.49.3 or XSWGR1100B.11.00.49.3 or later released patch bundle).
9. The 200-561-9XX, and 200-563-9XX FA director familys support a total of 256 LUNs per FA port. (Hewlett Packard Alpha Tru64 supports 255 LUNs.)
10. Symmetrix 8000 Series
11. Hub loop supports 4 HBAs and 8 Symmetrix ports.
12. In an HA environment, with HP-UX 11i, 512 LUNs per HBA are allowed.
13. Symmetrix microcode version: 5266.33.23 or higher, 5566.35.23 or higher, 5267.22.15 or higher, 5567.29.15 or higher. See Single section for minimum microcode required.
14. Non-HA, single initiator only. PowerPath not supported.
16. No cascading (of an FA port to a hub, or an FA port to another FA port). No conecting a hub to a switch (direct-connect only). Homogeneous hosts/HBAs/OS required. No remote boot from Symmetrix allowed. Minimum Symmetrix micrecode version 5566.23.18 required. Only one single PowerPath or PVLinks path per "side" of FA maximum. For PVLinks,primary and alternate paths must reside on different FA boards. In the HP-UX multi-initator environment ESN Manager may be neccessary to block LUN visibility between initiators connected to the same "side" of the FA (on the same loop), if such a restricted environment is desired by the customer.
17. 8-port adapter (Model DP3-FCD8) splits the Symmetrix director into two 4-port hubs. Symmetrix still operates with only 2 ports per director. This 8-port adapter supports both FC-AL and FC-SW connections. Cascading of hubs on the same 8-port adapter to other 8-port adapters or to other EMC-qualified hubs is not supported at this time. To connect a switch to this adapter only the lowest connector of each hub can be used.

1. All adapters must be the same type except with HP-UX.
2. (QLA2200) For IBM xSeries and Netfinity servers only.
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. 8-port adapter (Model DP3-FCD8) splits the Symmetrix director into two 4-port hubs. Symmetrix still operates with only 2 ports per director. This 8-port adapter supports both FC-AL and FC-SW connections. Cascading of hubs on the same 8-port adapter to other 8-port adapters or to other EMC-qualified hubs is not supported at this time. To connect a switch to this adapter only the lowest connector of each hub can be used.
5. No switch support on the HP A5246A.
6. The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC, HP part number D6975A, must be ordered separately from HP.
7. (HHBA-5101BK-01)
8. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
9. DP3-FCD8 only

Novell Netware

Novell Netware

1. Fanout represents the maximum initiators (host adapters) per Symmetrix port. Fanin represents the number of Symmetrix ports visible to a single initiator (host adapter). In arbitrated loop environments, these numbers represent the maximum initiators per loop. In switch environments, these numbers are achieved through Zoning. For further details on Fanin/Fanout, see Connectrix Enterprise Storage Network Planning Guide or EMC Networked Storage Topology Guide.
2. Maximum number of NWFS volumes that can be mounted is 64.
3. DP3-FCD8 only
4. NetWare 5.00 NSS has a 120 LUNs per port limitation. If NSS is used, the maximum LUNs per Symm-Port/HBA is 120/120.
5. 8-port adapter (Model DP3-FCD8) splits the Symmetrix director into two 4-port hubs. Symmetrix still operates with only 2 ports per director. This 8-port adapter supports both FC-AL and FC-SW connections. Cascading of hubs on the same 8-port adapter to other 8-port adapters or to other EMC-qualified hubs is not supported at this time. To connect a switch to this adapter only the lowest connector of each hub can be used.
6. (HHBA-5101BK-01)
7. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
8. Requires NWPA.NLM V.3.07A update from Novell website.

Red Hat Linux

Red Hat Linux

1 For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
2 Addressable from Data Mover. Constrained by the number of targets addressable through a Symmetrix FA port.
3 The 200-561-9XX, and 200-563-9XX FA director familys support a total of 256 LUNs per FA port (Hewlett Packard Alpha Tru64 supports 255 LUNs.)
4. "FA Port Sharing" allows any OS/HBA designated with a "Y" (for Yes) to safely share a Symmetrix FA port with any other OS/HBA designated with a "Y" provided all of the following requirements are met (Note, "N" for No means this host cannot share an FA port with any different OS/HBA): 1 ESN Manager is required to prevent sharing Symmetrix devices between Operating Systems on a single FA port. 2 Fanout/Fanin is restricted to the lowest Host/HBA support as called out in this table. Example. Windows 2000 using the QLA2200F, which has a Fanout/ Fanin of 12:1/1:12 and Netware using the QLA2200F, which has a Fanout/Fanin of 6: 1/1:6 The Fanout/Fanin is restricted to 6.1/1.6. 3. See appropriate host matrices for approved drivers, BIOS. firmware boot and cluster information 4. Reference the Heterogeneous FA Port Sharing section of Director Bit Information 5. Microcode level 5x66 and above
5 EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized
6 EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware. 1 x L1 or 2 x L2 ports per quad only
7 Symmetrix 8000 Series
8 EMC DS-16B2 for "Extended Fabric License" use minimum 3.0.2f firmware 1 ISL per quad only

1. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
2. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
5. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
6. See Switched Fabric Topology Parameters for switch firmware levels.
7. The 200-561-9XX, and 200-563-9XX FA director familys support a total of 256 LUNs per FA port. (Hewlett Packard Alpha Tru64 supports 255 LUNs.)

65	HPQ HP-UX: 11.0[21], 11i v1.0 (HP-UX 11.11)[21]	HPQ: A5158A, A6684A, A6685A	EMC Connectrix ED-140M	1	12	256	512	N	

1. Maximum of two hops between any two nodes of a SG cluster. Boot device cannot be more than 2 hops from initiator. Symmetrix microcode version: 5266.33.23 or higher, 5566.35.23 or higher, 5267.22.15 or higher, 5567.29.15 or higher. For the Inrange FC9000, single switch only. Connectrix ED-1032 requires Connectrix microcode 3.00.01 or later.
2. Switched fabric cannot use domain 8. Execute ioscan -fn following zone configuration changes on all affected servers so that the changes will be recognized. When using soft zoning (WWN) with PowerPath, if you remove a path from the zone configuration, you must remove this path from PowerPath in order to prevent accessibility to this path.
3. For HP-UX 11.0 of June 2000 or higher release is required (patch bundle XSWHWCR1100B.11.00.49.3 or XSWGR1100B.11.00.49.3 or later released patch bundle).
4. Heterogeneous storage attachments are supported in a Fibre Channel fabric configuration provided the different storage types are isolated in different fabric zones. Shared fabric and shared server are allowed with heterogeneous storage.
5. The 200-561-9XX, and 200-563-9XX FA director familys support a total of 256 LUNs per FA port. (Hewlett Packard Alpha Tru64 supports 255 LUNs.)
6. Requires microcode level 5566.29 or higher.
7. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
8. 256 LUN support: HP-UX 10.20 requires patch PHKL_23259 or patches superceded by or having co-dependencies as defined by HP. HP-UX 11.0 requires patch PHKL_21607 or patches superceded by or having co-dependencies as defined by HP.
9. For Fabric Switches, EMC recommends single initiator WWN zoning, but will support both WWN and port-, single-, or multi-initiator zoning.
10. More LUNs/port may be available via RPQ depending on configuration.
11. Fabric support at firmware version 2.1.3 and above.
12. Buil DCCG148-0000 = LP8000E fiber.
13. Symmetrix 8000 Series
14. Maximum of 512 visible LUNs per hba supported with HP-UX 10.20 non-HA configurations
15. Maximum of 512 visible LUNs per hba supported with HP-UX 11.0 non-HA configurations
16. Maximum of 320 visible LUNs per hba supported with HP-UX 10.20 HA configurations.
17. Maximum of 320 visible LUNs per hba supported with HP-UX 11.0 HA configurations.
18. If Fanin/Fanout are greater than 4:1/1:4.: HP-UX 10.20 requires patch PHKL_23259 or patches superceded by or having co-dependencies as defined by HP. HP-UX 11.0 requires patch PHKL_21607 or patches superceded by or having co-dependencies as defined by HP.
19. "FA Port Sharing" allows any OS/HBA designated with a "Y" (for Yes) to safely share a Symmetrix FA port with any other OS/HBA designated with a "Y" provided all of the following requirements are met (Note: "N" for No means this host cannot share an FA port with any different OS/HBA): 1. ESN Manager is required to prevent sharing Symmetrix devices between Operating Systems on a single FA port. 2. Fanout/Fanin is restricted to the lowest Host/HBA support as called out in this table. Example: Windows 2000 using the QLA2200F, which has a Fanout/ Fanin of 12:1/1.12 and Netware using the QLA2200F, which has a Fanout/Fanin of 6: 1/1:6. The Fanout/Fanin is restricted to 6:1/1:6. 3. See appropriate host matrices for approved drivers, BIOS, firmware, boot and cluster information. 4. The director bits must be set according to each initiator's required settings by using the Heterogeneous Host Configuration feature in the EMC Solutions Enabler SYMCLI Device masking component Version 5.x. 5. Microcode level 5568 and above.
20. In HP and MC/ServiceGuard environments, the maximum number of active devices per server is 1024 for mid-range and high-end servers. This high device count is questionable for low-end servers (D/R-Class), and so remains at 768 for them (not counting alternate path LUNs for PV/Links or EMC PowerPath). Maximum limitations per server (subject to server and resources): HP-UX 10.20 768 devices, 1536 LUNs; HP-UX 11.0 2400 devices, 4800 LUNs; HP-UX 11i 4096 devices, 8096 LUNs; HP-UX 11i Version 1.5 (11.20) 4096 devices, 8096 LUNs.
21. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples. lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set.
22. Requires a minimum HP-UX 10.20 TFC or a minimum HP-UX 11.0 99OP, or 11i. HP-UX versions may be mixed in the same logical quick loop.
23. Minimum Symmetrix microcode 5265.42, 5266.22, 5267.22, 5566.22, 5567.29 .
24. QuickLoop and fabric intermixing on the same switch is allowed. Requires firmware rev v2.2.1a. QuickLoop must use port zoning.
25. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
26. Firmware v3 0 2a or later is required for 2 Gb or auto sensing support with the DS-16B2 and Brocade 3200/3800 switches. Minimum of 5568-3414 microcode is required for 2 Gb/auto negotiation support on Symmetrix.
27. EMC DS-16B2 for "Extended Fabric License" use minimum 3.0.2f firmware, 1 ISL per quad only
28. Maximum of 512 visible LUNs per hba supported with HP-UX 11i v1 0 (HP-UX 11.11) HA and non-HA configurations
29. Supported at minimum firmware version 2.00 01
30. No boot support at this time.
31. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only
32. HP-UX 11.0 switched fabric support is enabled with: fabric device driver version B.11.00.03 and higher, minimum operating system level HP/ UX 11.0 99OP with March 2000 HW-CR bundle Refer to Base Connectivity table for additional information.
33. Symmetrix microcode version 5266 33.23 or higher, 5566.35.23 or higher, 5267.22 15 or higher, 5567.29 15 or higher
34. See Single section for minimum microcode required.
35. In an HA environment with HP-UX 11i, 512 LUNs per HBA are allowed
36. Supports FC-AL only
37. Maximum of two hops between any two nodes of a SG cluster. Boot device cannot be more than 2 hops from initiator. Symmetrix microcode version. 5266.33.23 or higher, 5566.35 23 or higher, 5267.22.15 or higher, 5567.29 15 or higher
38. Domain value 8 can not be utilized when attaching HP-UX initiators (hba's)
39. Solution Enabler 5.0 or later on the host for heterogeneous FA port sharing
40. Requires microcode level 5568.23 or later.
41. Minimum Symmetrix microcode 5560 22 5567 29.
42. In FC-AL mode support 1280 LUNs/loop
43. Maximum of two hops between any two nodes of a SG cluster Bool device cannot be more than 2 hops from initiator. Symmetrix microcode version. 5566.35.23 or higher, 5567.29 15 or Higher
44. Boot support Minimum fw v4 0.2a
45. The switch port a hba is attached to which is utilized for HP-UX boot or dump processes must be configured for G port lock
46. Single initiator zoning recommended
47. Maximum LUNs per server 8192
48. Boot device can not be located more than two hops from initiator utilized for booting
49. Maximum of two hops between any two nodes belonging to the same Service Guard Cluster
50. HP-UX Tachyon TL Fibre Channel Driver patch PHSS_26799 required

51. Execute "ioscan -fn" following zone configuration changes on all affected servers in order for the changes to be recognized by the servers.
52. Initiators from servers running HP-UX 11.0 and initiators from servers running HP-UX 11i v1.0 (HP-UX 11i) may share the same FA port.
53. Maximum devices per server 4096
54. The Powerpath path must be removed from the Powerpath configuration for all paths deleted from a zone configuration utilizing non-hardware enforced WWN zoning in order to prevent accessibility to the paths deleted from the zone configuration.
55. Firmware v2.5.1b or later required
56. minimum firmware revision v3.0.2rn or later EMC qualified firmware revision
57. For D- and K-Class only: HP-UX 11.0 with PHKL_21834. HP A3404A. FC-AL only with switch TL mode.
58. T-port mode only. Port zoning only. Single switch only.
59. EMC supports both 8-port (A5667A) and 16-port (A5624A) versions.
60. HP A5624A and A5667A Fibre Channel switches are supported with Brocade firmware levels 1.3.0, 2.1.9d, 2.1.9F and 2.4.1, switched fabric cascading requires 2.1.9F firmware or higher.
61. Brocade QuickLoop.
62. Cascading of up to 2 switches and 2 hubs with QuickLoop.
63. Connectrix DS-16B and HP A5624A switches each support up to 16 HBAs. 24 Symmetrix FA ports maximum in a QuickLoop, but only 4 from any one cluster.
64. Non-HA, single initiator only. PowerPath not supported.
65. Switch is for Enhanced Private Loop (EPL) not Fabric.
66. EPL (Enhanced Private Loop) loop supports up to 8 HBAs and 16 Symmetrix ports (max of 24 port connections), but only 4 from any one cluster.
67. During initial switch configuration, the Persistent FC ID's must be enabled on the Vsan that contains any HPUX HBAs. If Persistent FC IDs are enabled to an existing Vsan containing non HPUX HBAs, the process may be disruptive. See MDS 9000 Family Configuration Guild for details.

1. For compatibility with Connectrix ED-1032, requires Connectrix microcode 2.2 or later (KGPSA-BC) or 2.2.0 (KGPSA-CA).
2. Open VMS is supported as of April 17, 2000, and requires a minimum Symmetrix microcode level of 5265.48.30, 5266.23.19s. or 5566.26.19s.
3. OpenVMS 7.2-1, 7.2-1H1 FC-SW requires console firmware 5.6 or later and patch VMS721_fibre_SCSI-V0400. Available from http://ftp1.support.compaq.com/public/
4. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
5. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
6. The 200-561-9XX, and 200-563-9XX FA director familys support a total of 256 LUNs per FA port. (Hewlett Packard Alpha Tru64 supports 255 LUNs.)
7. Open VMS 7.3 FC-SW requires console firmware 5.6 or later and patch VMS73_update-V0100 or patch VMS73_fibre_SCSI-V0200.
8. 16-port Fibre Channel board.
9. 8-port Fibre Channel board.
10. Open VMS 7.2-2 FC-SW requires console firmware 5.6 or later and patch VMS722_fibre_SCSI-V0100.
11. See Switched Fabric Topology Parameters for switch firmware levels.
12. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
13. EMC DS-16B2 for "Extended Fabric License" , use minimum 3.0.2f firmware, 1 ISL per quad only.
14. Symmetrix 8000 Series
    The KGPSA-BC will not boot if the Brocade 12000/Connectrix ED-12000B port speed is set to auto-negotiate. Set the port speed to 1 Gb.

1. Tru64 V4.0F BL13 Patch Kit 2 may introduce problems with KZPBA adapters. Tru64 V4.0F latest qualified Patch Kit-0007 (DUV40FB18AS0007-20020102).
2. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
3. V4.0F, V4.0G: 8 LUNs/Symmetrix Fibre director port (LUNs 000-007 valid).
4. If sharing port with Tru64 UNIX V5 hosts, use the Heterogeneous Host Configuration feature in EMC Solutions Enabler SYMCLI Device Masking Component V5.x (minimum 5568 microcode), or use Tru64 UNIX V5 director bit settings (with OVMS director bit set, the resulting LUN 000 array controller device will not be usable as a disk device by the Tru64 hosts).
5. V5.x: 255 LUNs/Symmetrix Fibre director port (LUNs 000-0FE valid) on Symmetrix 8000 Series, requires OVMS director bit setting (minimum 5265.48.30 or 5566.26.19), LUN 000 must be mapped to gatekeeper device, the LUN 000 array controller device will not be usable by the Tru64 host.
6. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
7. Requires the Heterogeneous Host Configuration feature in EMC Solutions Enabler SYMCLI Device Masking Component Version 5.x
8. **Tru64 V5.1 latest qualified Patch Kit-0006 (T64V51B20AS0006-20030210).**
9. Tru64 V4.0G latest qualified patch kit-0003 (T64V40GAS0003-20010613).
10. Tru64 V5.1A latest qualified Patch Kit-0004 (T64V51AB21AS0004-20030206).
11. The 200-561-9XX, and 200-563-9XX FA director familys support a total of 256 LUNs per FA port. (Hewlett Packard Alpha Tru64 supports 255 LUNs.)
12. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
13. EMC DS-16B2 for "Extended Fabric License" , use minimum 3.0.2f firmware, 1 ISL per quad only.
14. **Tru64 V5.1B latest qualified Patch Kit 2 (T64V51BB22AS0002-20030415).**
15. KGPSA-CA / Cisco MDS 9xxx: Tru64 host bootup may fail if switch port speed is hard-set to 1 Gb/s. Switch port should be set to Auto-Negotiate.

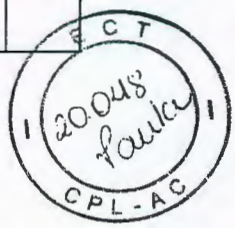
1. For all PCI-based hosts only: See http://www-1.ibm.com/servers/eserver/pseries/library/hardware_docs/sa38/380538.pdf for appropriate HBA placement guidelines.
2. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
   The IBM 2032-001 is the McData ED-5000.
   IBM SAN FC S08 (8-port) and S16 (16-port). Firmware level is 2.1.3. S08SAN FC switch includes four shortwave optical GBIC ports, and the option to add an additional 4 (8 total) longwave or shortwave ports to the S08. The S08 8-port switch is a single power entry. S16 SAN FC switch includes four shortwave optical GBIC ports, and the option to add an additional 12 (16 total) longwave or sortwave ports to the S16. The S16 is dual-powered. S08 & S16: 1) Shortwave GBIC: Feature Code=2010; 2) Longwave GBIC: Feature Code=2020, 3) Fibre Channel Cable Multimode optical 50.0u, 5m: Feature Code=5805; 4) Fibre Chanel Cable Multimode optical 50.0u, 25m: Feature Code=5825.
5. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
6. See Switched Fabric Topology Parameters for switch firmware levels
7. The 200-561-9XX, and 200-563-9XX FA director familys support a total of 256 LUNs per FA port (Hewlett Packard Alpha Tru64 supports 255 LUNs.)
8. All adapters must be the same type except with HP-UX
9. Bull DCCG148-0000 = LP8000E fiber
10. Fibre Channel device driver distributed and supported by Bull.
11. MSKG0008-0000 = Brocade Silkworm 2800.
12. This is a Brocade Silkworm 2800 (16 ports)
13. Firmware revision levels distributed and supported by Bull. Please see appropriate Bull documentation
14. Symmetrix 8000 Series
15. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware. 1 x L1 or 2 x L2 ports per quad only.
16. No longer available
17. EMC DS-16B2 for "Extended Fabric License" , use minimum 3.0.2f firmware, 1 ISL per quad only.
18. "FA Port Sharing" allows any OS/HBA designated with a "Y" (for Yes) to safely share a Symmetrix FA port with any other OS/HBA designated with a "Y" provided all of the following requirements are met (Note: "N" for No means this host cannot share an FA port with any different OS/HBA): 1. ESN Manager is required to prevent sharing Symmetrix devices between Operating Systems on a single FA port. 2. Fanout/Fanin is restricted to the lowest Host/HBA support as called out in this table. Example: Windows 2000 using the QLA2200F, which has a Fanout/ Fanin of 12:1/1:12 and Netware using the QLA2200F which has a Fanout/Fanin of 6: 1/1:6. The Fanout/Fanin is restricted to 6:1/1:6. 3. See appropriate host matrices for approved drivers, BIOS, firmware, boot and cluster information. 4. Reference the Heterogeneous FA Port Sharing section of Director Bit Information. 5. Microcode level 5x66 and above.

IBM DYNIX/ptx

IBM DYNIX/ptx								
No.	Operating System	Host Bus Adapter	Switch	Fanin	Fanout	Luns/Storage Port	Luns/HBA	Port sharing
1	IBM DYNIX/ptx: 4.4.6[3], 4.4.7[3], 4.4.8[3], 4.5.2[3], 4.5.3[3], 4.6.1[3]	IBM: IOC-210-52 (LP6500)[1] IOC-210-54 (LP7000E-N1)[1]	Brocade Silkworm 2800[2, 4]; EMC Connectrix DS-16B[2, 4, 5]; Sequent: FCS-0006-01[2], FCS-0008-01[2], FCS-0016-02[2], FCS-0016-05[2]	15	15	158, Symmetrix 8xxx Series: 256 (200-563	256	N

1 EMC DP3-FCD42G and EMC DP3-FCD42GS supported on DYNIX/ptx 4 4.8, 4.4.9 and 4.4.10 only
2. The 200-561-9XX. and 200-563-9XX FA director familys support a total of 256 LUNs per FA port. (Hewlett Packard Alpha Tru64 supports 255 LUNs.)
3. For DYNIX/ptx 4.4.x connected to Brocade 2xxx, EMC, FCS-xxxx families of switches, configure the following DYNIX/ptx OS parameters: fabric.ops.mode.vcEncode: 1, route.delayReroute: 1, route.stickyRoutes: 1, xlative.ModeDisable: 1.
4. Only supported with IBM xSeries host that does not have an internal switch installed. Requires firmware 2.1.7 or 2.2.1.
5. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.



IBM OS/400

1. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
2. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
3. The 200-561-9XX, and 200-563-9XX FA director familys support a total of 256 LUNs per FA port. (Hewlett Packard Alpha Tru64 supports 255 LUNs.)
4. Symmetrix 8000 Series
5. "FA Port Sharing" allows any OS/HBA designated with a "Y" (for Yes) to safely share a Symmetrix FA port with any other OS/HBA designated with a "Y" provided all of the following requirements are met (Note: "N" for No means this host cannot share an FA port with any different OS/HBA): 1. ESN Manager is required to prevent sharing Symmetrix devices between Operating Systems on a single FA port. 2. Fanout/Fanin is restricted to the lowest Host/HBA support as called out in this table. Example: Windows 2000 using the QLA2200F, which has a Fanout/ Fanin of 12:1/1:12 and Netware using the QLA2200F, which has a Fanout/Fanin of 6: 1/1:6. The Fanout/Fanin is restricted to 6:1/1:6. 3. See appropriate host matrices for approved drivers, BIOS, firmware, boot and cluster information. 4. Reference the Heterogeneous FA Port Sharing section of Director Bit Information. 5. Microcode level 5x66 and above.
6. EMC DS-16B2 for "Extended Fabric License", use minimum 3.0.2f firmware, 1 ISL per quad only.
7. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
8. T-port mode only. Port zoning only. Single switch only.
9. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
10. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
11. (QLA2200) For IBM xSeries and Netfinity servers only.
12. See Switched Fabric Topology Parameters for switch firmware levels.
13. FC-AL direct-connect or McData fabric connect only. Brocade fabric attach is not currently supported.

1. PowerPath is not supported.
2. Windows 2003 is only supported on 32-Bit Intel platforms. 64-Bit Itanium systems supported by RPQ only.
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. The 200-561-9XX, and 200-563-9XX FA director familys support a total of 256 LUNs per FA port. (Hewlett Packard Alpha Tru64 supports 255 LUNs.)
5. Symmetrix 8000 Series
6. "FA Port Sharing" allows any OS/HBA designated with a "Y" (for Yes) to safely share a Symmetrix FA port with any other OS/HBA designated with a "Y" provided all of the following requirements are met (Note: "N" for No means this host cannot share an FA port with any different OS/HBA): 1. ESN Manager is required to prevent sharing Symmetrix devices between Operating Systems on a single FA port. 2. Fanout/Fanin is restricted to the lowest Host/HBA support as called out in this table. Example: Windows 2000 using the QLA2200F, which has a Fanout/ Fanin of 12:1/1:12 and Netware using the QLA2200F, which has a Fanout/Fanin of 6: 1/1:6. The Fanout/Fanin is restricted to 6:1/1:6. 3. See appropriate host matrices for approved drivers, BIOS, firmware, boot and cluster information. 4. Reference the Heterogeneous FA Port Sharing section of Director Bit Information. 5. Microcode level 5x66 and above.
7. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
8. EMC DS-16B2 for "Extended Fabric License", use minimum 3.0.2f firmware. 1 ISL per quad only.
9. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
10. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware. 1 x L1 or 2 x L2 ports per quad only.
11. T-port mode only. Port zoning only. Single switch only.
12. See Switched Fabric Topology Parameters for switch firmware levels.
13. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
14. This HBA is equivalent to the qLogic QLA2340
15. This HBA is equivalent to the qLogic QLA2310

1. (QLA2200) For IBM xSeries and Netfinity servers only.
2. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
3. T-port mode only. Port zoning only. Single switch only.
4. The 200-561-9XX, and 200-563-9XX FA director familys support a total of 256 LUNs per FA port. (Hewlett Packard Alpha Tru64 supports 255 LUNs.)
5. Symmetrix 8000 Series
6. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
7. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
8. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
9. EMC DS-16B2 for "Extended Fabric License" , use minimum 3.0.2f firmware, 1 ISL per quad only.
10. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
11. "FA Port Sharing" allows any OS/HBA designated with a "Y" (for Yes) to safely share a Symmetrix FA port with any other OS/HBA designated with a "Y" provided all of the following requirements are met (Note: "N" for No means this host cannot share an FA port with any different OS/HBA): 1. ESN Manager is required to prevent sharing Symmetrix devices between Operating Systems on a single FA port. 2. Fanout/Fanin is restricted to the lowest Host/HBA support as called out in this table. Example: Windows 2000 using the QLA2200F, which has a Fanout/ Fanin of 12:1/1:12 and Netware using the QLA2200F, which has a Fanout/Fanin of 6: 1/1:6. The Fanout/Fanin is restricted to 6:1/1:6. 3. See appropriate host matrices for approved drivers, BIOS, firmware, boot and cluster information. 4. Reference the Heterogeneous FA Port Sharing section of Director Bit Information. 5. Microcode level 5x66 and above.
12. See Switched Fabric Topology Parameters for switch firmware levels.

1. Refer to Table 71 on page 202 for single-vendor and mixed-vendor switched fabrics and supported switch firmware.
2. Extended Fabric software license is bundled into DS-xB models. Optional Extended Fabric software license for all DS-xB switches ordered after July 4, 2001 require chargeable model DSBXFAB-0D.
3. Maximum number of NWFS volumes that can be mounted is 64
4. FC4700, FC4500, and FC5300.
5. CX600 and CX400
6. NetWare 5.00 NSS has a 120 LUNs per port limitation. If NSS is used, the maximum LUNs per Symm-Port/HBA is 120/120
7. Fanout represents the maximum initiators (host adapters) per Symmetrix port. Fanin represents the number of Symmetrix ports visible to a single initiator (host adapter). In arbitrated loop
environments, these numbers represent the maximum initiators per loop. In switch environments, these numbers are achieved through Zoning. For further details on Fanin/Fanout, see Connectrix
Enterprise Storage Network Planning Guide or EMC Networked Storage Topology Guide.
8. "FA Port Sharing" allows any OS/HBA designated with a "Y" (for Yes) to safely share a Symmetrix FA port with any other OS/HBA designated with a "Y" provided all of the following requirements are met (Note: "N" for No means this host cannot share an FA port with any different OS/HBA)
   1. ESN Manager is required to prevent sharing Symmetrix devices between Operating Systems on a single FA port
   2. Fanout/Fanin is restricted to the lowest Host/HBA support as called out in this table. Example: Windows 2000 using the QLA2200F, which has a Fanout/Fanin of 12:1/1:12 and NetWare
   using the QLA2200F, which has a Fanout/Fanin of 6: 1/1:6. The Fanout/Fanin is restricted to 6:1/1:6
   3. See appropriate host matrices for approved drivers, BIOS, firmware, boot and cluster information
   4. Reference the Heterogeneous FA Port Sharing section of Director Bit Information, Table 138 on page 345
   5. Microcode level 5x66 and above
9. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized
10. EMC DS-16B2 for "Extended Fabric License" , use minimum 3.0.2f firmware, 1 ISL per quad only
11. ED-64 and ED-1032 not supported for FC5300.
12. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only

13. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
14. Fanout represents the maximum initiators (host adapters) per Symmetrix port. Fanin represents the number of Symmetrix ports visible to a single initiator (host adapter). In arbitrated loop environments, these numbers represent the maximum initiators per loop. In switch environments, these numbers are achieved through Zoning. For further details on Fanin/Fanout, see Connectrix Enterprise Storage Network Planning Guide or EMC Networked Storage Topology Guide.
15. NetWare 5.00 NSS has a 120 LUNs per port limitation. If NSS is used, the maximum LUNs per Symm-Port/HBA is 120/120.
16. "FA Port Sharing" allows any OS/HBA designated with a "Y" (for Yes) to safely share a Symmetrix FA port with any other OS/HBA designated with a "Y" provided all of the following requirements are met (Note: "N" for No means this host cannot share an FA port with any different OS/HBA): 1. ESN Manager is required to prevent sharing Symmetrix devices between Operating Systems on a single FA port. 2. Fanout/Fanin is restricted to the lowest Host/HBA support as called out in this table. Example: Windows 2000 using the QLA2200F, which has a Fanout/ Fanin of 12:1/1:12 and Netware using the QLA2200F, which has a Fanout/Fanin of 6: 1/1:6. The Fanout/Fanin is restricted to 6:1/1:6. 3. See appropriate host matrices for approved drivers, BIOS, firmware, boot and cluster information. 4. Reference the Heterogeneous FA Port Sharing section of Director Bit Information. 5. Microcode level 5x66 and above.
17. Requires NWPA.NLM V.3.07A update from Novell website.
18. See Switched Fabric Topology Parameters for switch firmware levels.
19. **(QLA2200) For IBM xSeries and Netfinity servers only.**
20. **For IBM Netfinity and xSeries Intel servers only.**
21. **This HBA is equivalent to the qLogic QLA2310.**
22. **This HBA is equivalent to the qLogic QLA2340.**

1. All adapters must be the same type except with HP-UX.
2. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
3. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
4. **Supported with QLogic driver v6.04.02 or v6.05.00.**
5. Single HBA zoning is required regardless of the switch being utilized.
6. "FA Port Sharing" allows any OS/HBA designated with a "Y" (for Yes) to safely share a Symmetrix FA port with any other OS/HBA designated with a "Y" provided all of the following requirements are met (Note: "N" for No means this host cannot share an FA port with any different OS/HBA): 1. ESN Manager is required to prevent sharing Symmetrix devices between Operating Systems on a single FA port. 2. Fanout/Fanin is restricted to the lowest Host/HBA support as called out in this table. Example: Windows 2000 using the QLA2200F, which has a Fanout/ Fanin of 12:1/1:12 and Netware using the QLA2200F, which has a Fanout/Fanin of 6: 1/1:6. The Fanout/Fanin is restricted to 6:1/1:6. 3. See appropriate host matrices for approved drivers, BIOS, firmware, boot and cluster information. 4. Reference the Heterogeneous FA Port Sharing section of Director Bit Information. 5. Microcode level 5x66 and above.
7. Requires Brocade firmware v2.5.1b or later.
8. Requires Brocade firmware v3. 0. 2a or later.
9. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
10. EMC DS-16B2 for "Extended Fabric License" , use minimum 3.0.2f firmware. 1 ISL per quad only.
11. Requires Connectrix microcode v2.0.1 or later or v2.2 or later.
12. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only
13. See Switched Fabric Topology Parameters for switch firmware levels.
14. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath. Booting from EMC storage arrays is NOT supported with PowerPath.
15. NetWare 5.00 NSS has a 120 LUNs per port limitation. If NSS is used, the maximum LUNs per Symm-Port/HBA is 120/120.
16. Fanout represents the maximum initiators (host adapters) per Symmetrix port. Fanin represents the number of Symmetrix ports visible to a single initiator (host adapter). In arbitrated loop environments, these numbers represent the maximum initiators per loop. In switch environments, these numbers are achieved through Zoning. For further details on Fanin/Fanout, see Connectrix Enterprise Storage Network Planning Guide or EMC Networked Storage Topology Guide.
17. FC-AL direct-connect or McData fabric connect only. Brocade fabric attach is not currently supported.

1. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
2. Symmetrix 8000 Series
3. The 200-561-9XX, and 200-563-9XX FA director familys support a total of 256 LUNs per FA port. (Hewlett Packard Alpha Tru64 supports 255 LUNs.)
4. "FA Port Sharing" allows any OS/HBA designated with a "Y" (for Yes) to safely share a Symmetrix FA port with any other OS/HBA designated with a "Y" provided all of the following requirements are met (Note: "N" for No means this host cannot share an FA port with any different OS/HBA): 1. ESN Manager is required to prevent sharing Symmetrix devices between Operating Systems on a single FA port. 2. Fanout/Fanin is restricted to the lowest Host/HBA support as called out in this table. Example: Windows 2000 using the QLA2200F, which has a Fanout/ Fanin of 12:1/1:12 and Netware using the QLA2200F, which has a Fanout/Fanin of 6: 1/1:6. The Fanout/Fanin is restricted to 6:1/1:6. 3. See appropriate host matrices for approved drivers, BIOS, firmware, boot and cluster information. 4. Reference the Heterogeneous FA Port Sharing section of Director Bit information. 5. Microcode level 5x66 and above.
5. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
6. EMC DS-16B2 for "Extended Fabric License" , use minimum 3.0.2f firmware, 1 ISL per quad only.
7. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
8. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
9. T-port mode only. Port zoning only. Single switch only.
10. See Switched Fabric Topology Parameters for switch firmware levels.
11. No boot support at this time.

1. **Tru64 V5.1 latest qualified Patch Kit-0006 (T64V51B20AS0006-20030210).**
2. Tru64 V5.1A latest qualified Patch Kit-0004 (T64V51AB21AS0004-20030206).
3. EAN bit set for 2 Gb FA support
4. Direct connect only, no hubs.
5. These settings refer to the configuration in the Switch section (see FA Port Sharing column) Note: operating environments that have required director bit settings other than these are not supported.
6. Note: With the introduction of EMC Solution Enabler 5.0, FA ports need not use the 'Heterogeneous FA Port Sharing' flags. Instead, users can use the CLI function 'Heterogeneous Host Configuration' to set the director flags for each initiator.
7. C Bit required for VERITAS VxVM DMP functionality.
8. C Bit with Veritas DMP.
9. D Bit is not required for VCS 2.0 or later.
10. Sites with PowerPath 2.0 or later already running with the D-bit enabled do not require the D-bit to be disabled.
11. C + D Bits with Veritas DMP.
12. D Bit required with PowerPath 1.5.x or earlier.
13. Requires OV/K/0041.3
14. No longer available
15. A4S bit when sharing AS/400 drives on this port (direct connect only).
16. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set.
17. Requires HP-UX 11.0 Extension Pack release May 1999 or equivalent.
18. Symmetrix microcode supported:5266.40.28 or higher, 5566.41.28 or higher, 5267.27.19 or higher, 5567.34.19 or higher.
19. Requires HP-UX 11.0 General Release patch bundle XSWGR1100 B.11.00.47.05 released November 1999 or equivalent.
20. Symmetrix microcode version: 5266.33.23 or higher, 5566.35.23 or higher, 5267.22.15 or higher, 5567.29.15 or higher.
21. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
22. V Bit for HP/Agilent controllers only
23. D Bit for multiple vendor platforms; if only NCR hosts, set IMPL flag A010.
24. E Bit: if Windows NT OS is used with TNT, set the FBA Environmental Sense key to 4, else set it to 6.
25. Maximum number of NWFS volumes that can be mounted is 64.
26. D Bit with Cluster.
27. Requires NWPA.NLM V.3.07A update from Novell website.
28. Open VMS 7.1-2 requires console firmware 5.6 or later and patch VMS712_SCSI-V0300.
29. OpenVMS 7.2-1, 7.2-1H1 FC-SW requires console firmware 5.6 or later and patch VMS721_fibre_SCSI-V0400. Available from http://ftp1.support.compaq.com/public/
30. Subject to IBMs limitations per host model.
31. Limited support available for MPARS 3.01.
32. Open VMS 7.3 FC-SW requires console firmware 5.6 or later and patch VMS73_update-V0100 or patch VMS73_fibre_SCSI-V0200.
33. Open VMS 7.2-2 FC-SW requires console firmware 5.6 or later and patch VMS722_fibre_SCSI-V0100.
34. C + D + SCL Bits with SUN Cluster 1.x, 2.x.
35. Enabling the D-bit for DMP is recommended but not required for VxVM 3.1 and higher. The D-bit is not required for VxVM 3.1 and higher.
36. Note: In a heterogeneous FA port sharing environment using VxVM 3.1 or higher, D-bit should be disabled.
37. C Bit with Sun Cluster 3.0.
38. VCM for Volume Logix configurations only
39. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath. Booting from EMC storage arrays is NOT supported with PowerPath.
40. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
41. **Supported with QLogic driver v6.04.02 or v6.05.00.**
42. Requires rev2_sles7upg2418.patch available from ftp://ftp.emc.com/pub/elab/linux
43. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ
44. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
45. Supported with QLogic driver v6.04.02.
46. Requires rev1_sles7.patch available from ftp://ftp.emc.com/pub/elab/linux for CLARiiON attach only.

1. Tru64 V4.0F BL13 Patch Kit 2 may introduce problems with KZPBA adapters. Tru64 V4.0F latest qualified Patch Kit-0007 (DUV40FB18AS0007-20020102).
2. Tru64 V4.0G latest qualified patch kit-0003 (T64V40GAS0003-20010613)
3. VCM for Volume Logix configurations only
4. **Tru64 V5.1 latest qualified Patch Kit-0006 (T64V51B20AS0006-20030210).**
5. Tru64 V5.1A latest qualified Patch Kit-0004 (T64V51AB21AS0004-20030206)
6. C Bit required for VERITAS VxVM DMP functionality
7. C Bit with Veritas DMP
8. D Bit is not required for VCS 2.0 or later
9. C + D Bits with Veritas DMP
10. Sites with PowerPath 2.0 or later already running with the D-bit enabled do not require the D-bit to be disabled.
11. D Bit required with PowerPath 1.5.x or earlier
12. H Bit for FC-AL topology
13. Requires OV/K/0041.3
14. **Supported with QLogic driver v6.04.02 or v6.05.00.**
15. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
16. Supported with QLogic driver v6.04.02
17. Requires rev1_sles7.patch available from ftp://ftp.emc.com/pub/elab/linux for CLARiiON attach only.
18. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
19. No longer available
20. A4S bit when sharing AS/400 drives on this port (direct connect only)
21. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set.
22. Requires HP-UX 11.0 Extension Pack release May 1999 or equivalent
    Symmetrix microcode supported:5266.40.26 or higher, 5566.41.28 or higher, 5267.27.19 or higher, 5567.34.19 or higher.
    Requires HP-UX 11.0 General Release patch bundle XSWGR1100 B.11.00.47.05 released November 1999 or equivalent.
23. Symmetrix microcode version: 5266.33.23 or higher, 5566.35.23 or higher, 5267.22.15 or higher, 5567.29.15 or higher.
26. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
27. VCM for VCM configurations only
28. Set bit for HP (e.g.: D8602A, D8602B / Agilent (e.g.: HHBA-5101B, HHBA-5101C) controllers only.
29. D Bit for multiple vendor platforms; if only NCR hosts, set IMPL flag A010
30. E Bit: if Windows NT OS is used with TNT, set the FBA Environmental Sense key to 4, else set it to 6.
31. Maximum number of NWFS volumes that can be mounted is 64.
32. D Bit with Cluster
33. E Bit with MPE/ix 5.5, 6.0, 6.5, 6.5 02
34. Requires NWPA.NLM V.3.07A update from Novell website.
35. Open VMS 7.1-2 requires console firmware 5.6 or later and patch VMS712_SCSI-V0300.
36. OpenVMS 7.2-1, 7.2-1H1 FC-SW requires console firmware 5.6 or later and patch VMS721_fibre_SCSI-V0400. Available from http://ftp1.support.compaq.com/public/
37. Limited support available for MPARS 3.01
38. Open VMS 7.3 FC-SW requires console firmware 5.6 or later and patch VMS73_update-V0100 or patch VMS73_fibre_SCSI-V0200.
39. Open VMS 7.2-2 FC-SW requires console firmware 5.6 or later and patch VMS722_fibre_SCSI-V0100.
40. C Bit with Multi-path.
41. Enabling the D-bit for DMP is recommended but not required for VxVM 3.1 and higher. The D-bit is not required for VxVM 3.1 and higher.
42. C + D + SCL Bits with SUN Cluster 1.x, 2.x.

23	**SUN Solaris** Sun Cluster	AS/400 Secondary Port (Used from UNIX host to view AS/400 devices.) (A4S)[18], Common Serial Number (C)[31, 32, 33], Disable Queue Reset on Unit Attention (D)[17, 31, 32, 33], Enable Hard Addressing (H), Enable Point-to-point (PP), Enable Volume Set Addressing (V), Tagged Command (T), Unique World Wide Name (UWN)

No.	Operating Environment	Bits to Set
24	Windows 2000[25], Windows NT	AS/400 Secondary Port (Used from UNIX host to view AS/400 devices.) (A4S)[18], Common Serial Number (C)[19], Disable Queue Reset on Unit Attention (D)[26], Enable Hard Addressing (H), Enable Point-to-point (PP), Enable Volume Set Addressing (V)[27], Port as Disk Array (A)[27], Tagged Command (T), Unique World Wide Name (UWN)

1. Tru64 V4.0F BL13 Patch Kit 2 may introduce problems with KZPBA adapters. Tru64 V4.0F latest qualified Patch Kit-0007 (DUV40FB18AS0007-20020102).
2. **Tru64 V5.1 latest qualified Patch Kit-0006 (T64V51B20AS0006-20030210).**
3. Tru64 V4.0G latest qualified patch kit-0003 (T64V40GAS0003-20010613).
4. Tru64 V5.1A latest qualified Patch Kit-0004 (T64V51AB21AS0004-20030206).
5. OpenVMS 7.2-1, 7.2-1H1 FC-SW requires console firmware 5.6 or later and patch VMS721 fibre SCSI-V0400. Available from http://ftp1.support.compaq.com/public/
6. E bit - Optional.
7. C Bit with Veritas DMP.
8. D Bit is not required for VCS 2.0 or later
9. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
10. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
11. EMC DS-16B2 for "Extended Fabric License" , use minimum 3.0.2f firmware, 1 ISL per quad only.
12. VCM for Volume Logix configurations only
13. Requires OV/K/0041.3
14. **Supported with QLogic driver v6.04.02 or v6.05.00.**
15. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
16. No longer available
17. D Bit with PowerPath.
18. A4S bit when sharing AS/400 drives on this port (direct connect only).
19. C Bit required for VERITAS VxVM DMP functionality.
20. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set. Requires HP-UX 11.0 Extension Pack release May 1999 or equivalent.
22. Symmetrix microcode supported:5266.40.28 or higher, 5566.41.28 or higher, 5267.27.19 or higher, 5567.34.19 or higher.
23. Requires HP-UX 11.0 General Release patch bundle XSWGR1100 B.11.00.47.05 released November 1999 or equivalent.
24. Symmetrix microcode version: 5266.33.23 or higher, 5566.35.23 or higher, 5267.22.15 or higher, 5567.29.15 or higher.
25. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
26. D Bit - Optional with PowerPath
27. A + V bits for Tachlite (D8602A)
28. Maximum number of NWFS volumes that can be mounted is 64.
29. D Bit with Cluster.
30. Requires NWPA.NLM V.3.07A update from Novell website.
31. C + D Bits with Veritas DMP.
32. Enabling the D-bit for DMP is recommended but not required for VxVM 3.1 and higher. The D-bit is not required for VxVM 3.1 and higher.
33. C + D + SCL Bits with SUN Cluster 1.x, 2.x.

19	**SUN Solaris**	AS/400 Secondary Port (Used from UNIX host to view AS/400 devices.) (A4S)[7], Common Serial Number (C)[35, 36, 37], Disable Queue Reset on Unit Attention (D)[2, 3], Enable Sunapee (SCL), Negotiate Reset (N)[11]
20	Windows 2000 5568 SCSI[19]. Windows NT 5568 SCSI	AS/400 Secondary Port (Used from UNIX host to view AS/400 devices.) (A4S)[7], Common Serial Number (C)[20], Disable Queue Reset on Unit Attention (D)[2, 3]

1. **Tru64 V5.1 latest qualified Patch Kit-0006 (T64V51B20AS0006-20030210).**
2. Sites with PowerPath 2.0 or later already running with the D-bit enabled do not require the D-bit to be disabled.
3. D Bit required with PowerPath 1.5.x or earlier.
4. C Bit with Multi-path.
5. Tru64 V5.1A latest qualified Patch Kit-0004 (T64V51AB21AS0004-20030206).
6. D Bit with MPIO.
7. A4S bit when sharing AS/400 drives on this port.
8. SC3 Bit allows use of LUNS 0-F.
9. C Bit with Veritas DMP.
10. D Bit is not required for VCS 2.0 or later.
11. N-Bit with PCI SCSI.
12. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set.
13. Requires HP-UX 11.0 Extension Pack release May 1999 or equivalent.
14. Symmetrix microcode supported:5266.40.28 or higher, 5566.41.28 or higher. 5267.27.19 or higher, 5567.34.19 or higher.
15. Requires HP-UX 11.0 General Release patch bundle XSWGR1100 B 11.00.47.05 released November 1999 or equivalent.
16. Symmetrix microcode version: 5266.33.23 or higher, 5566.35.23 or higher, 5267.22.15 or higher. 5567.29.15 or higher.
17. Symmetrix 8000 Series & 66/67 support: HP-UX 10.20,11.0,11.10, 11.0 ACE,11.i.
    Symmetrix 8000 Series 5568 support: HP-UX 10.20, 11.0, 11i.
    Symmetrix 8000 Series & 66/67 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01:
    Symmetrix 8000 Series 5568 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
18. Symmetrix 8000 Series & 66/67 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01: Symmetrix 8000 Series 5568 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
19. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
20. C Bit required for VERITAS VxVM DMP functionality
21. D Bit for multiple vendor platforms; if only NCR hosts, set IMPL flag A010.
    E Bit: if Windows NT OS is used with TNT, set the FBA Environmental Sense key to 4, else set it to 6.
    Maximum number of NWFS volumes that can be mounted is 64.
24. D Bit with Cluster.
25. Requires NWPA.NLM V.3.07A update from Novell website.
26. No specific clustering s/w required.
27. ARB Bit only with OpenVMS SCSI Cluster.
28. Open VMS 7.1-2 requires console firmware 5.6 or later and patch VMS712_SCSI-V0300.
29. OpenVMS 7.2-1, 7.2-1H1 FC-SW requires console firmware 5.6 or later and patch VMS721_fibre_SCSI-V0400. Available from http://ftp1.support.compaq.com/public/
30. A4S Bit when using DataBase Extractor. Set this bit on target host port (not on As/400 port).
31. Subject to IBMs limitations per host model.
32. Limited support available for MPARS 3.01.
33. Open VMS 7.3 FC-SW requires console firmware 5.6 or later and patch VMS73_update-V0100 or patch VMS73_fibre_SCSI-V0200.
34. Open VMS 7.2-2 FC-SW requires console firmware 5.6 or later and patch VMS722_fibre_SCSI-V0100.
35. C + D Bits with Veritas DMP
36. C + D + SCL Bits with SUN Cluster 1.x, 2.x.
37. Enabling the D-bit for DMP is recommended but not required for VxVM 3.1 and higher.
