1 True4 V4 0F BL13 Patch Kit 2 may introduce problems with KZPBA adapters. True4 V4 0F latest qualified Patch Kit=0007 (DUV40FB18AS0007-20020102)

2 C Bit with Multi-path

3. Sites with PowerPath 2.0 or later already running with the D-bit enabled do not require the D-bit to be disabled.
4. D Bit required with PowerPath 1.5.x or earlier.
5. **Tru64 V5.1 latest qualified Patch Kit-0006 (T64V51B20AS0006-20030210).**
6. Tru64 V4.0G latest qualified patch kit-0003 (T64V40GAS0003-20010613).
7. Tru64 V5.1A latest qualified Patch Kit-0004 (T64V51AB21AS0004-20030206).
8. No specific clustering s/w required.
9. ARB Bit only with OpenVMS SCSI Cluster.
10. D Bit with MPIO.
11. A4S bit when sharing AS/400 drives on this port.
12. SC3 Bit allows use of LUNS 0-F.
13. Q Bit for cluster configurations only.
14. C Bit with Veritas DMP.
15. D Bit is not required for VCS 2.0 or later.
16. N-Bit with PCI SCSI.
17. Requires OV/K/0041.3
18. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
19. **Supported with QLogic driver v6.04.02 or v6.05.00.**
20. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set.
21. Requires HP-UX 11.0 Extension Pack release May 1999 or equivalent
22. Symmetrix microcode supported:5266.40.28 or higher, 5566.41.28 or higher, 5267.27.19 or higher, 5567.34.19 or higher.
23. Requires HP-UX 11.0 General Release patch bundle XSWGR1100 B.11.00.47.05 released November 1999 or equivalent.
24. Symmetrix microcode version: 5266.33.23 or higher, 5566.35.23 or higher, 5267.22.15 or higher, 5567.29.15 or higher.
25. Symmetrix 8000 Series & 66/67 support: HP-UX 10.20,11.0,11.10, 11.0 ACE,11.i.
    Symmetrix 8000 Series 5568 support: HP-UX 10.20, 11.0, 11i.
    Symmetrix 8000 Series & 66/67 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01.
    Symmetrix 8000 Series 5568 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
26. Symmetrix 8000 Series & 66/67 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01: Symmetrix 8000 Series 5568 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
27. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
28. C Bit required for VERITAS VxVM DMP functionality.
29. D Bit for multiple vendor platforms; if only NCR hosts, set IMPL flag A010.
30. E Bit: if Windows NT OS is used with TNT, set the FBA Environmental Sense key to 4, else set it to 6.
31. Maximum number of NWFS volumes that can be mounted is 64.
32. D Bit with Cluster.
33. Requires NWPA.NLM V.3.07A update from Novell website
    A4S Bit when using DataBase Extractor. Set this bit on target host port (not on As/400 port).
34. Subject to IBMs limitations per host model.
36. Limited support available for MPARS 3.01.
37. C + D + SCL Bits with SUN Cluster 1.x, 2.x.
38. C + D Bits with Veritas DMP.
39. Enabling the D-bit for DMP is recommended but not required for VxVM 3.1 and higher.
40. Set IMPL flat A010.

26. Symmetrix 8000 Series & 66/67 support: HP-UX 10.20,11.0,11.10, 11.0 ACE.11.i.
    Symmetrix 8000 Series 5568 support: HP-UX 10.20, 11.0, 11i.
    Symmetrix 8000 Series & 66/67 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
    Symmetrix 8000 Series 5568 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
27. Symmetrix 8000 Series & 66/67 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01: Symmetrix 8000 Series 5568 support: MPE/iX 6.0, 6.5, 6.5.02, 7.0, 7.0.01
28. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
29. C Bit required for VERITAS VxVM DMP functionality.
30. Maximum number of NWFS volumes that can be mounted is 64.
31. D Bit with Cluster.
32. Requires NWPA.NLM V.3.07A update from Novell website.
33. ARB Bit only with OpenVMS SCSI Cluster.
34. Open VMS 7.1-2 requires console firmware 5.6 or later and patch VMS712_SCSI-V0300.
35. OpenVMS 7.2-1, 7.2-1H1 FC-SW requires console firmware 5.6 or later and patch VMS721_fibre_SCSI-V0400. Available from http://ftp1.support.compaq.com/public/
36. Subject to IBMs limitations per host model.
37. Limited support available for MPARS 3.01.
38. Open VMS 7.3 FC-SW requires console firmware 5.6 or later and patch VMS73_update-V0100 or patch VMS73_fibre_SCSI-V0200.
39. Open VMS 7.2-2 FC-SW requires console firmware 5.6 or later and patch VMS722_fibre_SCSI-V0100.
40. Enabling the D-bit for DMP is recommended but not required for VxVM 3.1 and higher.
41. N-Bit with PCI SCSI.

Symmetrix DMX Series

Base Connectivity

Do not use a LUN in the CLARiiON DAE2-ATA as a host OS boot device.EMC has qualified the following hosts. No other hosts are supported at this time. Symmetrix models and minimum Enginuity revisions are listed in the footnotes on most tables.EMC supports Symmetrix configured as a boot device for the servers listed below, provided that these requirements are followed. The purpose of these requirements is primarily to ensure the best possible response times for boot/root/swap volumes. For qualified configurations, Where possible, EMC recommends an alternate mirrored boot volume be configured.1. Spindles can be shared on Symm4 or later units only.Do not use a LUN in the CLARiiON DAE2-ATA as a host OS boot device.2. Spindles can be shared if they are larger than 9GB in size.3. For Symmetrix 3000 and 5000 systems, the maximum number of Symmetrix logical volumes per Symmetrix boot port is 32. For Symmetrix 8000 and DMX systems, the following guidelines and recommendations must be adhered to. When using a SAN for boot/swap/page device the operation and performance of the server might be affected by external events that might cause the storage device not to be immediately accessible for periods of time. These events might result in slow response times as observed by the operating system and longer boot times. In some cases it can cause the server to crash (please see comments below for W2K/NT).
EMC recommends designing the distribution and mapping of the boot devices on the SAN in a way that will:
-- Minimize the number of components between the server and the boot storage device.
-- Will not present a load that will exceed the limits of the SAN. Below are some issues that must be considered when designing your SAN. Please refer to EMC Networked Storage Topology Guide ("Networked Storage Design Considerations/Fabric Design Practices" section) for a complete discussion on the topic.
- Sufficient bandwidth on the link between the switch and the storage port
- Sufficient ISLs in case where boot device and server are more than one hop apart
- ISL utilization
Events that could affect the availability of an external storage device:
Fibre Channel and SCSI environments:
-- Lost connection to external storage (pulled or damaged external Fibre/SCSI cable connection).
-- External storage service/upgrade procedures such as in some cases, online microcode upgrades and/or configuration changes.
-- External storage director failures including failed lasers on Fibre Channel directors.
-- External storage power failure.
-- HBA failures.
Fibre Channel environment only:
-- Storage area network failures such as Fibre Channel switches, switch components, and switch power failures.
-- Storage area network service/upgrade procedures such as firmware upgrades or hardware replacements.4. Boot/root and swap from a single host can be on the same channel.5. The boot disk should be high SCSI priority, e.g. SCSI TID 6 (0-7, 8-15: higher priority TID is 7, lowest is 8).6. A dedicated SA or FA is not required for boot devices.7. The Internal Host Boot Device may be mirrored with the External Symmetrix Boot Device to allow redundant pathing. Does not apply to Microsoft Windows.8. The Boot path must not include a hub in the topology.9. The maximum number of boot devices per port is equal to Fanout values listed in Fibre Channel Connectivity table.Windows NT/Windows 2000/2003 Servers (Fibre Channel/SCSI) Boot CAUTION: Microsoft Windows NT uses virtual memory paging files that reside on the boot disk by default. Please refer to the information contained in Microsoft Knowledge Base article Q305547. The article explains how Microsoft supports booting Windows systems through a SAN (storage area network.) Although this article specifically mentions Windows 2000, the information also pertains to Windows NT 4.0 systems booting through a SAN. EMC recommends shutting down the host server during maintenance procedures that could cause the boot disk to become unavailable to the host. If the paging file is unavailable to the operating system for a minimum of 10 seconds, a crash can occur.

Amdahl UTS

Amdahl

Amdahl - Amdahl UTS						
No.	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot
1	Millennium: GS2000A, GS2000C, GS2000E, GS700	Mainframe Bus	Amdahl UTS: 2.1.5, 2.1.7, 4.3.2, 4.3.3, 4.4.0	IBM ESCON	ESCON	N

DG DG/UX

DG

DG - DG DG/UX							
No.	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot	Comments
1	AViiON: AV1400, AV20000 AV25000, AV35000, AV3704, AV3704R, AV3750, AV3800, AV8900 AV8950	PCI	DG DG/UX R4.20MU07[2, 3]	Emulex LP8000-F1[4, 5, 6]	FC-AL, FC-SW	N	See[1]

1. For more information see http://athena.europe.dg.com
2. Symmetrix 8000 Series: 66/67 support at DG/UX 4.11. 5568 support at DG/UX 4.20
3. The release notice for DG/UX (included with the software release at path: "/usr/release/dgux*.rn) lists supported platforms.
4. FC-AL support requires LP8000 BIOS version DB1.60A7 and firmware version DS3.20x4
5. Only the Brocade FC switch connection is supported. Connectrix FC switch is not supported.
6. DG/UX automatically loads the firmware and BIOS onto the Emulex HBA during boot-up as needed. Current DG/UX R4.20MU06 OS supported firmware is V3.20x1 and BIOS V1.4.

EMC NAS

EMC

EMC - EMC NAS						
No	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot
1	Celerra File Server Control Station CS-507 Series[2]	PCI	EMC NAS 5.1.15, 5.1.9	EMC 201-712-900[1]	FC-SW	N

1. A500/550 requires minimum PDC 40.32 or higher
2. Only PowerPath 3.0.1 is supported for DMX series systems
3. FC-AL supported for direct attach only. No support for hubs or Quickloop at this time
4. The Brocade (Brocade, EMC, or HP models) switch port the HBA involved in a FC-SW topology boot process or FC-SW topology dump process is attached to, is required to be locked as G_port when the boot or dump volume resides on the Symmetrix. This can be accomplished by executing the "portCfgGport port_number,1" command from a telnet session on the Brocade switch. The boot device can not be located more than two hops from the initiator involved in the boot process.
5. For direct attached FC-AL boot or dump from a Symmetrix FA port configured for 2 Gbit speed, the Symmetrix auto-negotiation director flag must also be enabled on the FA port. FC-SW 2-Gbit boot and/or dump using A6795A requires Auto-Negotiation flag to be enabled on the switch port the HBA is attached to.
6. PDC firmware 42.09 or higher. Arbitrated Loop (direct attach) or FC-SW
7. Brocade 12000 and EMC ED-12000B do not support boot at this time
8. FC-AL and FC-SW topologies can co-exist on the same server but not on the same HBA, provided that the different topologies are attached to different HBAs.
9. HP-UX 11.0 switched fabric support is enabled with: fabric device driver version B.11.00.03 and higher, minimum operating system level HP/UX 11.0 0990P with [illegible] bundle and dependency patch PHKL_21381 patches may be superceded or have co-dependencies as defined by HP. Symmetrix microcode versions: 5265.49.31, 5566.20.5566.20 latest Symmetrix microcode versions.
10. HP A5158A FC-SW software requirements: FC-AL and FC-SW requires the HP A5158A Tachlite PCI Fibre Channel Adapter. The A5158A FCSW software fabric driver version "AP0301", for HP-UX 11i is now available for download from HP's software depot site http://www.software.hp.com under "drivers". It is referred to as the "hp pci tachyon tl fibre channel adapter", and requires the installation of dependent patch PHKL_22674 prior to installing the fabric driver, patches may be superceded or have co-dependencies as defined by HP.
11. Minimum driver version for SNIA HBA API support with HP-UX 11.0 is B.11.00.10. Minimum driver version for SNIA HBA API support with HP-UX 11.11 is B.11.

12. HP-UX 11.0 minimum driver revision B.11.00.10. HP-UX 11i driver revision B.11.11.09.
13. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC Symmetrix devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set. No additional patches are required for this option in HP-UX 11.0, HP-UX 11.11 and forward, however in HP-UX 10.x the "N" flag option was introduced with the following patches are required to be installed or patches which supercede or replace these in order to configured the logical volumes residing on Symmetrix devices in this manner: For all HP/UX 10.xx versions install the following Bad Block Reallocation Patch Pair: 10.01: PHKL_11294, PHKL_11890, PHCO_11288 (patches may be superseded or have co-dependencies as defined by HP). 10.10: PHKL_11816, PHCO_11817 (patches may be superseded or have co-dependencies as defined by HP). 10.20: PHKL_11086, PHKL_11903, PHCO_10964 (patches may be superseded or have co-dependencies as defined by HP).
14. Symm 6 is qualified with: HP-UX 11i Support Plus Sept '02 bundle = GOLDAPPS11i June '02, GOLDBASE11i June '02 & HWEnable11i Sept '02.
15. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set.
16. The A6795A HBA is capable of supporting both 1 and 2 Gb speeds.
17. Auto-sensing capability on the HBA is permanently enabled. There is no option to disable auto-sensing on the HBA.
18. HP-UX driver requirements: HP-UX 11.0 : A6795A HP PCI Tachyon TL/XL2 Fibre Channel driver B.11.00.10 or later release which supports this HBA. HP-UX 11i : A6684A/A6685A/A5158A/A6795A HP Tachyon TL/XL2 Fibre Channel driver B.11.11.09 or later release which supports this HBA.
19. HP-UX required patches: HP-UX 11.0 ACE: PHKL_23939, HP-UX 11i : PHKL_23626
20. L-Class requires minimum PDC firmware 40.26 or higher.
21. FC-AL supported for direct attach only. No support for hubs or Quickloop at this time
22. Virtual Partitions (VPAR) is supported on the L-class/rp5470 server.
    VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later.
    Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 41.02 or later.
23. VPARS supported in boot environment with HBA supported defined in Base Connectivity table.
24. PDC firmware 41.39 or higher: Arbitrated Loop (direct attach) or FC-SW
25. rp5405, rp5430, rp5470, rp7400: (PA-8700 processors): Initial support with HP-UX 11.0 Sept 2001, 11i Sept 2001.
26. PDC firmware: Arbitrated Loop (direct attach): use 40.19 or higher; Fabric: use 40.26 or higher
27. FC-AL, FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.
28. HP A5158A FC-SW software requirement: FC-AL and FC-SW requires the HP A5158A Tachlite PCI Fibre Channel Adapter. The A5158A FC-SW software fabric driver version "AP0301", for HP-UX 11i is now available for download from HP's software depot site, http://www.software.hp.com under "drivers" . It is referred to as the "hp pci tachyon tl fibre channel adapter", and requires the installation of dependent patch PHKL_22874 prior to installing the fabric driver, patches may be superceded or have co-dependencies as defined by HP.
29. The A6795A HBA is capable of supporting both 1 and 2 Gb speeds. QuickLoop is not supported with Brocade 3200/3800/12000 or EMC DS-16B2. ED-12000B.
30. **rp5405, rp5430, rp5470, rp7400: (PA-8700 processors): Initial support with HP-UX 11.0 Sept 2001, 11i Sept 2001. Symmetrix microcode supported: 5266.40.28 or higher. 5566.41.28 or higher. 5267.27.19 or higher. 5567.34.19 or higher.**
31. **PA-8700 processors: Supports both 11.00 and HP-UX 11i processor 8700+ only supports HP-UX 11i.**
32. **HP A5158A FC-SW is enabled in the March 2000 HWCR bundle XSWHWCR1100.48. Additional patches may be required for support.**
33. **rp5430/5470 requires minimum PDC firmware 41.36 or higher.**
34. **rp5430/5470 required minimum PDC firmware 41.46 or higher.**
    PA-8700 processors: Initial support with HP-UX 11.0 Sept 2001. HP-UX 11i Sept 2001
36. **Minimum driver revision for HP-UX 11i v1.0 (HP-UX 11.11) is PCI/HSC Fibre Channel Driver B.11.11.09. In a (Vpar) environment.**
37. Requires minimum PDC firmware for N-class 40.25 or higher. The rp7400 (PA-8700) requires minimum PDC firmware 41.36 or higher.
38. **Virtual Partitions (VPAR) is supported on the N-class/rp7400 server with 4.x and 5.x Symmetrix models and DMX series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 42.06 or later.**
39. These qualified HBAs for EMC Symmetrix storage in the HP9000 server model and the HP-UX revision installed may co-exist in that same server or the same hard partition. Other supported HBAs not used to attach to the Symmetrix may also co-exist on the same server unless specified by EMC and/or HP.
40. **Minimum driver revision for HP-UX 11i v1.0 (HP-UX 11.11) is PCI/HSC Fibre Channel Driver B.11.11.09.**
41. **rp7400 requires minimum PDC firmware 41.36 or higher.**
42. N-Class: Arbitrated loop boot with PDC rev 40.04 or higher.Fabric boot with PDC rev 40.25 or higher.
43. **rp7400 (PA-8700), rp5470 (PA-8700): initial support with HP-UX 11.0 Sept 2001, 11i Sept 2001.**
44. For rp7405 and rp7410 required minimum PDC firmware is 15.005
45. **Virtual Partitions (VPAR) is supported on the rp7405 server with 4.x and 5.x Symmetrix models. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.02.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 4.0 or later.**
46. **Virtual Partitions (VPAR) is supported on the rp7405/7410 server with 4.x and 5.x Symmetrix models and DMX Series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.02.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 16.009 or later.**
47. **rp7410 requires minimum PDC firmware 16.009 or higher.**
48. **Virtual Partitions (VPAR) is supported on the rp7405/7410 server with 4.x and 5.x Symmetrix models and DMX Series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.02.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 4.0 or later.**
49. Virtual Partitions (VPAR) is supported on the N-class/rp7400 server.
    VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later.
    Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 42.06 or later.
50. Requires PDC firmware N-Class 41.96
51. Requires PDC firmware rp7400 (PA-8700) requires PDC firmware 41.36.
52. PDC firmware 15.05 or higher: Arbitrated Loop (direct attach) or FC-SW
53. **Virtual Partitions (VPAR) is supported on the rp8400 server with 4.x and 5.x Symmetrix models and DMX Series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 4.0 or later.**
54. **Virtual Partitions (VPAR) is supported on the rp8400 server with 4.x and 5.x Symmetrix models and DMX Series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 16.009 or later.**
    rp8400 requires minimum PDC firmware 13.10 or higher.
    Virtual Partitions (VPAR) is supported on the SuperDome server with 4.x and 5.x Symmetrix models and DMX series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.02.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 36.1 or later.
57. **Requires minimum PDC firmware 35.4 and PDHC 7.3 or higher**
58. Requires PDC firmware TSSW 5.3
59. Arbitrated loop boot and fabric boot with PDC rev TSSW 5.3 or higher
60. Requires PDC firmware TSSW 3.2 or higher
61. Arbitrated loop boot with PDC rev TSSW 3.1 or higher. Fabric boot with PDC rev TSSW 3.2 or higher
62. Requires minimum PDC firmware 42.03 or higher
63. D390, R390 require minimum PDC firmware 41.35 or higher
64. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC Symmetrix devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set.
65. FC-AL topology attaches to DMX supported with direct attach only
66. HP-UX 11i v1.0 (HP-UX 11.11) Sept 2002
67. HP-UX 11.0 Sept 2002
68. 512 lun limit per FA port
69. Dx90, Rx90 servers support a maximum of 2 A6684A HBAs. The first must be installed in the turbo slot 10/12 and the second in any HSC slot.
70. The A6685A is not supported in slots 10/0 and 10/8 of the K570 and K580. In the K570 and K580, there are restrictions for the number of A6685A HBA cards supported when graphics cards are installed
71. Requires PDC firmware 41.33 or higher
72. Requires PDC firmware 41.34 or higher
73. Dx90, Rx90 require minimum PDC firmware 41.35 or higher
74. HP-UX 11.00 minimum driver revision B.11.00.06
    HP-UX 11i minimum driver revision B.11.11.06
75. Required dependent FCMS patches are required (patches may be superceded or have co-dependencies as defined by HP): HP-UX 11.0: PHKL_21834 HP-UX 11i: PHKL_24027. These patches must be installed before installing the driver. available at http://us-support2.external.hp.com. HSC Tachlite driver available at http://www.software.hp.com under "drivers" and locate Fibre Channel HSC Tachlite adapter (A6684A or A6685A) For HP-UX 11i, the driver is under "hp tachyon tl fibre channel adapter" which enables support for A6684A/A6685A/A5158A.
76. HP-UX 11.0 switched fabric support is enabled with: fabric device driver version B.11.00.03 and higher; minimum operating system level HP-UX 11.0 990P with March 2000 HW-CR bundle and dependency patch PHKL_21381 patches may be superceded or have co-dependencies as defined by HP.
77. Symm 6 is qualified with: HP-UX 11.00 Support Plus Sept '02 bundle = QPK1100 Sept '02 & HWE1100 Sept '02
78. FCAL on Symm 6 supported by direct attach only
79. Symm6: 512 lun limit per FA port
80. For driver versions refer to Base Connectivity Section

DG – Microsoft Windows 2000						
No.	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot
14	AViiON AV8950R	PCI	Microsoft Windows 2000 Server: SP3[13, 14], SP4	Emulex: LP9802-E[15], LP9802DC-E[1, 15]	FC-AL, FC-SW	N

1. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
2. **Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**
3. Data General servers that are rack-mountable (designated by Data General with an "R") are supported.
4. Booting Windows 2000 systems through ISLs (inter-switch links) in heterogenous fabrics is not currently supported.
5. Booting Windows 2000 systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
6. MSCS cluster configurations are supported. PowerPath 3.0 or greater required.
7. **Qlogic SANSurfer/SANBlade Manager is not supported.**
8. **Qlogic SanBlade Manager is not supported.**
9. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
10. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
11. Data General servers that are rack-mountable (designated with an "R") are supported.
12. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
13. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
14. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.
15. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
16. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3 3 VDC or 5.0 VDC signaling interfaces.
17. The LP9002-E now ships with the LP9002L-E low profile adapter
18. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.62a1. Emulex drivers are available at http://www.emulex.com. For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com. Supports SNIA HBA API.
    NOTE: LP8000/850 HBAs without -EMC label must have minimum rev. dragonfly 2.0 of the Emulex ASIC.
19. Host must be offline for interfamily Symmetrix microcode upgrade.

1. Booting Windows 2000 systems through ISLs (inter-switch links) in heterogenous fabrics is not currently supported
2. Booting Windows 2000 systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
3. MSCS cluster configurations are supported. PowerPath 3.0 or greater required
4. CLARiiON CX200 NOTE: Requires 1 00x3 for direct-connect configurations only.
5. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1. SP2 and SP3 5568 support at Windows 2000 SP1. SP2 and SP3
6. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
7. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3 3 VDC bus power The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces
8. Requires driver 2.20a12, firmware 1 00a4 and bios 1 62a1 Supports SNIA HBA API. Drivers available at http://www.emulex.com
9. If using Dell PERC Controller, requires PERC 3 with OpenManager 3 0 and Array Manager 3.1. The afamgt.sys must be version 2 6 0 3486 (or above)
10. When used with the HP NetServer LC2000, 32 device maximum
11. PowerEdge 2550 supports a maximum of 2 Emulex HBAs at one time and the total PCI power cannot exceed 20 Watts.
12. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII etc.)
13. The LP9002-E now ships with the LP9002L-E low profile adapter
14. Requires driver version 2.20a12 firmware version 3 90a7 and BIOS 1 62a1 Supports SNIA HBA API. Available at http://www.emulex.com.
15. Host must be offline for interfamily Symmetrix microcode upgrade
16. Requires driver 2.20a12, firmware 3 90a7 and BIOS 1 62a1 Emulex drivers are available at http://www emulex com. For Unisys servers use driver 2 11a2 and firmware 3 90a7 available at http://www support unisys.com Supports SNIA HBA API.
    NOTE LP8000/850 HBAs without -EMC label must have minimum rev dragonfly 2 0 of the Emulex ASIC.
17. **Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**
18. The LP8000-EMC HBA has a permanent GBIC and does not have copper cable support
19. Requires driver 8.1.5.20 and bios 1 79 Available at http://www qlogic com Supports SNIA HBA API
20. Not supported with the HP NetServer LC-2000
21. (HHBA-5101BK-01)
22. AHA-2944W is no longer available in distribution channels

1. Booting Windows 2000 systems through ISLs (inter-switch links) in heterogeneous fabrics is not currently supported.
2. Booting Windows 2000 systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
3. MSCS cluster configurations are supported. PowerPath 3.0 or greater required.
4. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
5. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
6. The LP9002-E now ships with the LP9002L-E low profile adapter.
7. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
8. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.
9. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
10. CLARiiON CX200 NOTE. Requires 1.00x3 for direct-connect configurations only
11. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
12. Must use standard PCI 32bit/33MHz slot for SCSI
13. Host must be offline for interfamily Symmetrix microcode upgrade.
14. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.62a1. Emulex drivers are available at http://www.emulex.com. For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com. Supports SNIA HBA API.
    NOTE: LP8000/850 HBAs without -EMC label must have minimum rev. dragonfly 2.0 of the Emulex ASIC.
15. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
16. **Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**
17. (HHBA-5101BK-01)
18. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.

1. Booting Windows 2000 systems through ISLs (inter-switch links) in heterogenous fabrics is not currently supported.
2. Booting Windows 2000 systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
3. MSCS cluster configurations are supported. PowerPath 3.0 or greater required.
4. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
5. The LP9002-E now ships with the LP9002L-E low profile adapter.
6. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
7. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
8. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.
9. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
10. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
11. Includes both Pentium PRO and XEON models
12. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
13. CLARiiON CX200 NOTE: Requires 1.00x3 for direct-connect configurations only.
14. Requires driver 2.20a12, firmware 1.00a4. and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
15. HPQ Proliant ML350 (1GHz) : D04,F04 (11/13/2000) , HPQ Proliant ML350(600,733,800,866,933 MHz) : D02, F04 (11/13/2000).
16. HPQ Proliant servers that are rack-mountable (designated with an "R") are supported.
17. Adaptec AHA2944UW is OEMed by HP as A5252A and A5252B
18. **Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**
19. Requires driver 2.20a12, firmware 3.90a7. and BIOS 1.62a1 Emulex drivers are available at http://www emulex.com. For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com. Supports SNIA HBA API.
    NOTE: LP8000/850 HBAs without -EMC label must have minimum rev. dragonfly 2.0 of the Emulex ASIC.
20. Host must be offline for interfamily Symmetrix microcode upgrade
21. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
22. When used with the HP NetServer LC2000: 32 device maximum.
23. Not supported with the HP LC2000.
24. Not supported with the HP NetServer LC-2000
25. Requires manual intervention on bootup to clear "new hardware found" message box at boot time.
26. Does not support Connectrix DS-16M, DS-32M, or McData ED-5000
27. Requires driver version 2.0.25.44 available at http://h20004.www2.hp.com/keeper_rnotes/bsdmatrix/matrix213991.html
28. The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC, HP part number D6975A, must be ordered separately from HP
29. (HHBA-5101BK-01)
30. This server is equipped with plastic shielding around the PCI slots. Since the PCI slots are 32-bit, this shielding prohibits 64-bit HBAs from properly seating in the PCI slots. To accomodate 64-bit HBAs, this shielding must be removed, or modified to allow the 64-bit HBA to fully seat in the 32-bit slots.
31. Requires STORPort driver version 8.2.2.20, and BIOS 1.34. Available at http://www.qlogic.com. This driver requires Microsoft STORPort hotfix Q817789 available from Microsoft. Refer to: http://support.microsoft.com/default.aspx?scid=kb;[LN];817789
32. Requires driver 8.2.1.20, and bios 1.34. Supports SNIA HBA API. Driver and BIOS available at http://www.qlogic.com.
33. Booting off of an EMC storage array is not currently supported with the HPQ BL20P.
34. BIOS must be obtained from HP at http://h18000.www1.hp.com/products/servers/proliant-bl/p-class/20p/index.html instead of BIOS on Qlogic web site. EMC NVRAM settings must be configured manually. Refer to EMC Fibre Channel documentation for QLogic HBAs for the settings.
35. Dual port PCI-X fibre channel mezzanine card option is embedded. No PCI/PCI-X slots available.
36. BIOS for the BL20p mezzanine card must be obtained from HP. Cannot use BIOS from Qlogic web site. EMC NVRAM settings must be configured manually. Refer to page 2-6 of the Readme document "EMC Fibre Channel with QLogic Host Bus Adapters in the Windows NT/Windows 2000 Environment" found at http://www.qlogic.com for the settings.

1 This HBA is equivalent to the qLogic QLA2310
2. **Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**
3. Symmetrix 8000 Series. 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1. SP2 and SP3.
4. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
5 For IBM xSeries Servers running Windows NT and Windows 2000 with IBM ServerRaid controller 4M, the ServerRaid Driver must be 6.00 or above for use with EMC PowerPath 3.0 and above. IBM driver can be downloaded at: http://www-3.ibm.com/pc/support/site.wss/document.do?lndocid=MIGR-39723
6 This HBA is equivalent to the qLogic QLA2340.
7 Booting Windows 2000 systems through ISLs (inter-switch links) in heterogenous fabrics is not currently supported
8 Booting Windows 2000 systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
9. MSCS cluster configurations are supported. PowerPath 3.0 or greater required
10. Host must be offline for interfamily Symmetrix microcode upgrade.
11 Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com Supports SNIA HBA API.
12. (QLA2200) For IBM xSeries and Netfinity servers only.
13. CLARiiON CX200 NOTE. Requires 1 00x3 for direct-connect configurations only.
14 The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3 3 VDC bus power The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces
15 Requires driver 2.20a12, firmware 1.00a4, and bios 1 62a1 Supports SNIA HBA API Drivers available at http://www.emulex.com
16 Adaptec AHA2944UW is OEMed by HP as A5252A and A5252B
17 QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.)
18. This server only supports 5 Volt HBAs qLogic 22XX family (if applicable), qLogic 23XX family, Emulex LP8000 and Emulex LP850 (if applicable)
19 Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1 62a1. Supports SNIA HBA API Available at http://www.emulex.com
20 The LP9002-E now ships with the LP9002L-E low profile adapter.
21 Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.62a1. Emulex drivers are available at http://www.emulex.com For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com Supports SNIA HBA API
NOTE. LP8000/850 HBAs without -EMC label must have minimum rev dragonfly 2 0 of the Emulex ASIC.
22 For IBM Netfinity and xSeries Intel servers only
23 Not supported with the HP NetServer LC-2000
24 The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support
25 **Qlogic SanBlade Manager is not supported.**
26 **Qlogic SANSurfer/SANBlade Manager is not supported.**
27. Does not support Connectrix DS-16M DS-32M or McData ED-5000
28 Requires manual intervention on bootup to clear "new hardware found" message box at boot time
29 The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC, HP part number D6975A must be ordered separately from HP.
30 Requires driver version 2.0.25.44 available at http://h20004.www2.hp.com/keeper/notes/bsdmatrix/matrix213991.html
31 (HHBA-5101BK-01)

32. Supported by direct attach only
33. **When flashing HBA bios on the HS20 FC Expansion card, you may receive the error message: "Error erasing flash at I/O address 2600 (this is the second port on the HBA)"**

    This is a known issue as the expansion card only has one flashable port. IBM is working to resolve this and this message can be ignored.
34. **This server has a built-in FC-SW and must be direct-attached to the external storage.**
35. **Due to the HS20's embedded FC-SW design, EMC Volume Logix is required to assign LUNS to each individual blade server.**
36. **IBM BIOS 1.34, EMC Approved Qlogic Driver Version 8.2.2.25. Available at http://www.qlogic.com.**
37. **EMC VolumeLogix Software required for multiple BladeServers when direct-attached to EMC Symmetrix storage.**
38. **IBM HS20 Fibre Channel Expansion Card (48P7061)**

1. **Requires driver 8.2.1.20, and bios 1.33 for Stratus ftServers. Supports SNIA HBA API. Available at http://www.qlogic.com.**
2. **Qlogic SANSurfer/SANBlade Manager is not supported.**
3. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3
4. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
5. Supported by direct attach only
6. **Bus Enumeration Issue Causes Problems using SYMCLI SCSI bus enumeration of disks will change depending on cold boot or warm boot. This causes symcli commands to fail because the path is changed and SYMCLI can no longer communicate with the Symmetrix.**

   By "shutdown" and booting system, internal disks are assigned first, followed by Symmetrix disks.
   By "restart" the system, Symmetrix disks are assigned first, followed by internal disks. Drive letter are not changed in both cases.
   The workaround is to perform "symcfg discover" after rebooting.
7. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.62a1. Emulex drivers are available at http://www.emulex.com. For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com. Supports SNIA HBA API.
   NOTE: LP8000/850 HBAs without -EMC label must have minimum rev. dragonfly 2.0 of the Emulex ASIC.
8. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com
9. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
10. Booting Windows 2000 systems through ISLs (inter-switch links) in heterogenous fabrics is not currently supported.
11. Booting Windows 2000 systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
12. MSCS cluster configurations are supported. PowerPath 3.0 or greater required.
13. CLARiiON CX200 NOTE: Requires 1.00x3 for direct-connect configurations only.
14. **Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**
15. QLogic 23xx, and Emulex LP2xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.)
16. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com
17. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
18. The LP9002-E now ships with the LP9002L-E low profile adapter.
19. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
20. Host must be offline for interfamily Symmetrix microcode upgrade.
21. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.63a1. Emulex drivers are available at http://www.emulex.com. Supports SNIA HBA API.
22. **Qlogic SanBlade Manager is not supported.**

23. Windows 2000 Professional is supported as the management workstation
24. CX200 available through selected channels.

1. Booting Windows 2000 systems through ISLs (inter-switch links) in heterogenous fabrics is not currently supported.
2. Booting Windows 2000 systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
3. MSCS cluster configurations are supported. PowerPath 3.0 or greater required.
4. **Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**
5. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
6. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
7. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.
8. 64-bit slots for 3.3v HBAs only.
9. The LP9002-E now ships with the LP9002L-E low profile adapter.
10. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
11. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
12. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.62a1. Emulex drivers are available at http://www.emulex.com. For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com. Supports SNIA HBA API.
    NOTE: LP8000/850 HBAs without -EMC label must have minimum rev. dragonfly 2.0 of the Emulex ASIC.
13. Host must be offline for interfamily Symmetrix microcode upgrade.
14. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
15. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
16. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API Drivers available at http://www.emulex.com.
17. CLARiiON CX200 NOTE: Requires 1.00x3 for direct-connect configurations only.

Stratus

Stratus – Microsoft Windows 2000							
No.	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot	Comments
1	ftServer: 3210[6], 3220[6], 3300[6], 5200[6]	PCI	Microsoft Windows 2000 Advanced Server SP2[4, 5]	QLogic QLA2310F-E-SP[1, 2, 3]	FC-AL, FC-SW	N	
2	ftServer: 3210[6], 3220[6], 3300[6], 5200[6], 5240[6], 6500[6]	PCI	Microsoft Windows 2000 Advanced Server SP3[4, 5, 8, 9]	QLogic QLA2310F-E-SP[1, 2, 3]	FC-AL, FC-SW	N	See[7]

Qlogic SANSurfer/SANBlade Manager is not supported.

2. **Requires driver 8.2.1.20, and bios 1.33 for Stratus ftServers. Supports SNIA HBA API. Available at http://www.qlogic.com.**
3. **FC-AL supported for direct attach only. No support for hubs or Quickloop at this time.**
4. **EMC strongly recommends that HBAs of different vendors not be used in the same host server.**
5. **Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.**
6. **Bus Enumeration Issue Causes Problems using SYMCLI SCSI bus enumeration of disks will change depending on cold boot or warm boot. This causes symcli commands to fail because the path is changed and SYMCLI can no longer communicate with the Symmetrix.**

   By "shutdown" and booting system, internal disks are assigned first, followed by Symmetrix disks.
   By "restart" the system, Symmetrix disks are assigned first, followed by internal disks. Drive letter are not changed in both cases.
   The workaround is to perform "symcfg discover" after rebooting.
7. **Windows 2000 Professional is supported as the management workstation.**
8. **Refer to the Stratus, Bull or NEC documentation for hardware, software and non-storage related setup and configuration.**
9. **Requires Stratus ftServer 1.2.2.x.**
   Requires Microsoft HotFix Q327477. available from Microsoft customer support.
   Requires VxVM 2.7 HotFix 5A. available from http://support.veritas.com/index.htm choose support downloads, choose Volume Manager, choose Volume Manager for Windows 2000. Choose VM2K27HF05aENU 248733.exe Patch - VERITAS Volume Manager 2.7 for Windows 2000 HotFix05a. English Version Size: 5892Kb
   Requires PowerPath 3.0.0 or higher.

1. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
2. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
3. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
4. The LP9002-E now ships with the LP9002L-E low profile adapter
5. Symmetrix 8000 Series' 66/67 support at Windows 2000 SP1, SP2 and SP3. 5568 support at Windows 2000 SP1, SP2 and SP3
6. EMC strongly recommends that HBAs of different vendors not be used in the same host server
7. Hardware and adapters similar to Unisys ES7000-100, ES7000-200
8. **The Libra 18x includes native MCP,and Virtual Machine for MCP (Windows MCPvm) partitions**
9. Requires driver 2.20a12, firmware 3.90a7 and BIOS 1.62a1. Emulex drivers are available at http://www.emulex.com. For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com. Supports SNIA HBA API
   NOTE: LP8000/850 HBAs without -EMC label must have minimum rev. dragonfly 2.0 of the Emulex ASIC
10. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
11. Supported by direct attach only
12. The boot path should be zoned so that the boot device on a FA port should only be visible to one HBA
13. MSCS cluster configurations are supported. PowerPath 3.0 or greater required
14. Requires driver 2.20a12, firmware 1.00a4 and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com
15. Host must be offline for interfamily Symmetrix microcode upgrade
16. **Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**
17. (HHBA-5101BK-01)
18. Cables to be ordered from Fujitsu Services (ICL)
19. Requires driver 8.1.5.20 and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API

Microsoft Windows 2003

EMC recommends shutting down the host server during maintenance procedures that could cause the boot disk to become unavailable to the host. If the paging file is unavailable to the operating system for a minimum of 10 seconds, a crash can occur.Events that could cause a system to crash when booting from external storage are:
1)Lost connection to external storage (pulled or damaged cable connection).
2)External storage service/upgrade procedures such as online microcode upgrades and/or configuration changes.
3)External storage director failures including failed lasers on Fibre Channel directors.
4)External storage power failure.
5)Storage area network failures such as Fibre Channel switches, switch components, and switch power failures.
6)Storage area network service/upgrade procedures such as firmware upgrades or hardware replacements.CAUTION: Microsoft Windows NT uses virtual memory paging files that reside on the boot disk by default. Please refer to the information contained in Microsoft Knowledge Base article Q305547. The article explains how Microsoft supports booting Windows systems through a SAN (storage area network.) Although this article specifically mentions Windows 2000, the information also pertains to Windows NT 4.0 systems booting through a SAN.

9. **QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).**
10. **Qlogic SanBlade Manager is not supported.**
11. **Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.**
12. **Bus Enumeration Issue Causes Problems using SYMCLI SCSI bus enumeration of disks will change depending on cold boot or warm boot. This causes symcli commands to fail because the path is changed and SYMCLI can no longer communicate with the Symmetrix.**

By "shutdown" and booting system, internal disks are assigned first, followed by Symmetrix disks.
By "restart" the system, Symmetrix disks are assigned first, followed by internal disks. Drive letter are not changed in both cases.
The workaround is to perform "symcfg discover" after rebooting.

Unisys

Unisys – Microsoft Windows 2003

1	ES7000/100; ES7000/200; ES7000/230; ES7000/500	PCI	Microsoft Windows 2003: DataCenter[3, 4, 5], Enterprise Edition (Advanced Server)[3, 4, 5], Standard Edition (Server)[3, 4, 5]	Emulex: LP8000-EMC[1, 2], LP9002-E (LP9002L-E)[2], LP9002DC-E[2], LP9802-E[6], LP9802DC-E[6], LP982-E[6]; QLogic: QLA2310F-E-SP[7], QLA2340-E-SP[7], QLA2342-E-SP[7]; Unisys: FCH20111-P64 (LP8000-D1)[2], FCH20113-P64 (LP8000-EMC, LP8000-F1)[2], FCH732213-P64 (LP9002L-F2)[2]	FC-AL, FC-SW	N

1. The LP8000-EMC HBA has a permanent GBIC and does not have copper cable support.
2. Requires STORPort driver version 1.00a15, and firmware 3.90a7. Available at http://www.emulex.com. This driver requires Microsoft STORPort hotfix Q817789 available from Microsoft. Refer to: http://support.microsoft.com/default.aspx?scid=kb;[LN];817789
3. Windows 2003 is only supported on 32-Bit Intel platforms. 64-Bit Itanium systems supported by RPQ only
4. EMC strongly recommends that HBAs of different vendors not be used in the same host server
5. PowerPath is not supported
6. Requires STORPort driver version 1.00a15, and firmware 1.00a4. Available at http://www.emulex.com. This driver requires Microsoft STORPort hotfix Q817789 available from Microsoft Refer to: http://support.microsoft.com/default.aspx?scid=kb;[LN];817789
7. Requires STORPort driver version 8.2.2.20, and BIOS 1.34. Available at http://www.qlogic.com. This driver requires Microsoft STORPort hotfix Q817789 available from Microsoft. Refer to: http://support.microsoft.com/default.aspx?scid=kb;[LN];817789

Microsoft Windows NT

EMC recommends shutting down the host server during maintenance procedures that could cause the boot disk to become unavailable to the host. If the paging file is unavailable to the operating system for a minimum of 10 seconds, a crash can occur.Events that could cause a system to crash when booting from external storage are:
1)Lost connection to external storage (pulled or damaged cable connection).
2)External storage service/upgrade procedures such as online microcode upgrades and/or configuration changes.
3)External storage director failures including failed lasers on Fibre Channel directors.
4)External storage power failure.
5)Storage area network failures such as Fibre Channel switches, switch components, and switch power failures.
6)Storage area network service/upgrade procedures such as firmware upgrades or hardware replacements.CAUTION: Microsoft Windows NT uses virtual memory paging files that reside on the boot disk by default. Please refer to the information contained in Microsoft Knowledge Base article Q305547. The article explains how Microsoft supports booting Windows systems through a SAN (storage area network.) Although this article specifically mentions Windows 2000, the information also pertains to Windows NT 4.0 systems booting through a SAN.NOTE: Windows NT installation will fail immediately after installing Network Services for hosts that use an Intel Network Interface Card (NIC).

Bull

Bull – Microsoft Windows NT						
No.	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot
1	Express 5800: 140Hb, 140Ra4, HV8600. HX4600. MH4500	PCI	Microsoft Windows NT 4.0 SP6A[1, 2]	Emulex: LP8000-EMC[3], LP850-EMC, LP9002-E (LP9002L-E)[5, 7, 8], LP982-E[6]; QLogic QLA2340-E-SP[4, 5]	FC-AL, FC-SW	N

1. Symmetrix 8000 Series: 66/67 support at Windows NT 4.0 SP6A. 5568 support at Windows NT 4.0 SP6A
2. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
3. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support
4. Requires driver 8.1.5.21, and bios 1.34. Available at http://www.qlogic.com. Supports SNIA HBA API.
5. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
6. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
7. The LP9002-E now ships with the LP9002L-E low profile adapter.
8. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.

1. AHA-2944W is no longer available in distribution channels.
2. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
3. Symmetrix 8000 Series: 66/67 support at Windows NT 4.0 SP6A. 5568 support at Windows NT 4.0 SP6A.
4. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
5. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
6. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
7. PowerEdge 2550 supports a maximum of 2 Emulex HBAs at one time and the total PCI power cannot exceed 20 Watts.
8. If using Dell PERC Controller, requires PERC 3 with OpenManager 3.0 and Array Manager 3.1. The afamgt.sys must be version 2.6.0.3486 (or above)..
9. Dell PowerEdge supports a maximum of 2 Emulex HBAs at one time and the total power cannot exceed 20 Watts.
10. Booting Windows NT systems through ISLs (inter-switch links) in heterogeneous fabrics is not currently supported.
11. Booting Windows NT systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
12. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
13. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
14. Requires driver 8.1.5.21, and bios 1.34. Available at http://www.qlogic.com. Supports SNIA HBA API.
15. The LP9002-E now ships with the LP9002L-E low profile adapter.
16. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
17. Requires HBA driver revision 2.09D.
18. (HHBA-5101BK-01)
19. Requires driver version 2.0.25.44 available at http://h20004.www2.hp.com/keeper_notes/bsdmatrix/matrix213991.html
20. The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC, HP part number D6975A, must be ordered separately from HP.
21. Requires manual intervention on bootup to clear "new hardware found" message box at boot time.

1. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
2. Symmetrix 8000 Series: 66/67 support at Windows NT 4.0 SP6A. 5568 support at Windows NT 4.0 SP6A.
3. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
4. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
5. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
6. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
7. For IBM Netfinity and xSeries Intel servers only
8. (QLA2200) For IBM xSeries and Netfinity servers only.
9. Requires driver 8.1.5.21, and bios 1.34. Available at http://www.qlogic.com. Supports SNIA HBA API.
10. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
11. Booting Windows NT systems through ISLs (inter-switch links) in heterogeneous fabrics is not currently supported.
12. Booting Windows NT systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
13. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
14. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
15. The LP9002-E now ships with the LP9002L-E low profile adapter.
16. Requires HBA driver revision 2.09D.
17. The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC, HP part number D6975A, must be ordered separately from HP.
18. Requires manual intervention on bootup to clear "new hardware found" message box at boot time.
19. Requires driver version 2.0.25.44 available at http://h20004.www2.hp.com/keeper rnotes/bsdmatrix/matrix213991.html
20. (HHBA-5101BK-01)
21. Requires Driver revision 4.04
22. Includes both Pentium PRO and XEON models
23. This server is equipped with plastic shielding around the PCI slots. Since the PCI slots are 32-bit, this shielding prohibits 64-bit HBAs from properly seating in the PCI slots. To accomodate 64-bit HBAs, this shielding must be removed, or modified to allow the 64-bit HBA to fully seat in the 32-bit slots.
24. HPQ Proliant servers that are rack-mountable (designated with an "R") are supported
25. Booting Windows NT systems through ISLs (inter-switch links) in heterogeneous fabrics is not currently supported. Booting Windows NT systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
26. Requires BIOS v4.01 rev A (5/17/2002) for use with Emulex HBAs.

1. Booting Windows NT systems through ISLs (inter-switch links) in heterogeneous fabrics is not currently supported.
2. Booting Windows NT systems through ISLs (inter-switch links) via homogeneous fabrics is supported with a maximum of 2 hops.
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. Symmetrix 8000 Series: 66/67 support at Windows NT 4.0 SP6A, 5568 support at Windows NT 4.0 SP6A.
5. Requires driver 8.1.5.21. and bios 1.34. Available at http://www.qlogic.com. Supports SNIA HBA API.
6. Host must be offline for interfamily Symmetrix microcode upgrade.
7. This HBA is equivalent to the qLogic QLA2310.
8. For IBM xSeries Servers running Windows NT and Windows 2000 with IBM ServerRaid controller 4M, the ServerRaid Driver must be 6.00 or above for use with EMC PowerPath 3.0 and above. IBM driver can be downloaded at: http://www-3.ibm.com/pc/support/site.wss/document.do?lndocid=MIGR-39723
9. This HBA is equivalent to the qLogic QLA2340.
10. This server only supports 5 Volt HBAs: qLogic 22XX family (if applicable), qLogic 23XX family, Emulex LP8000, and Emulex LP850 (if applicable).
11. (QLA2200) For IBM xSeries and Netfinity servers only.
12. For IBM Netfinity and xSeries Intel servers only.
13. Requires driver 8.1.5.20, and bios 1.79. Available at http://www.qlogic.com. Supports SNIA HBA API.
14. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
15. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
16. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interfaces.
17. The LP9002-E now ships with the LP9002L-E low profile adapter.
18. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
19. AHA-2944W is no longer available in distribution channels.
20. Cables to be ordered from Fujitsu Services (ICL).
21. It is recommended that the QLogic QLA2340 is not installed in Slot 1.
22. Qlogic SANSurfer/SANBlade Manager is not supported.
23. Qlogic SanBlade Manager is not supported.
24. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
25. Requires HBA driver revision 2.09D.
26. The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC, HP part number D6975A, must be ordered separately from HP.
27. Requires driver version 2.0.25.44 available at http://h20004.www2.hp.com/keeper_rnotes/bsdmatrix/matrix213991.html
28. Requires manual intervention on bootup to clear "new hardware found" message box at boot time.
29. (HHBA-5101BK-01)
30. Adaptec AHA2944UW is OEMed by HP as A5252A and A5252B.

1. Edit config.sys with the following: Files=100 Buffers=99
2. When installing NetWare for fabric boot (when operating system is not installed in the local host) on the Symmetrix, create only one LUN and then perform the install. To install a second server that will be fabric boot, repeat the process by creating one additional LUN and then loading the operating system to it. Continue this process until the desired number of fabric boot servers have been reached. Conditons exist where several LUNs are initially created and you perform your first install. NetWare will sometimes acquire and stripe the operating system across several of the newly created LUNs.
3. To enable failover with fabric boot DOSFAT.NSS must be loaded from the autoexec.ncf. In a failed condition the c:\ partition will not failover correctly but the DOSFAT_C: partition will.
4. NetWare boot support is contingent on migration of the DOS boot partition to an NSS partition. NetWare will warn you of the possibility of data corruption if you convert the DOS boot partition to an NSS partition. The risk of data corruption is during I/O to the C: drive while in the NetWare debugger, or while writing reboot log files during an "Auto Restart After Abend". When you load DOSFAT, please set "Auto Restart After Abend" to 0 to avoid the possibility of data corruption.
5. Maximum number of NWFS volumes that can be mounted is 64.
6. Symmetrix 8000 Series: 66/67 support at NetWare 4.11, 5.x, 5568 support at Netware 5.1.
7. **Supported in "Shared HBA" topology. Single HBA may be zoned to more than one storage array. This included arrays of different types and/or models.**
8. Driver installation with NetWare 5.0 SP6A: Do not load cpqmpk.psm when prompted. At the point when you are to load idecd, ideata and scsihd, toggle to the Control prompt with <Alt-Esc>. Once at the system control, unload nwpa.nlm, then load nwpa.nlm version 3.07a 5/3/01. Once the new nwpa.nlm is loaded, toggle back to the install screen and continue with the install. When install is complete, down the server and copy nwpa.nlm version 3.07a 5/3/01 to the c:\nwserver directory and reboot.
9. PCI-X servers must use single 5 volt PCI slot for Adaptec 2944 family.
10. Symmetrix 8000 Series: 66/67 support at NetWare 5.x, 5568 support at Netware 5.1.
11. Requires driver 6.50v and BIOS 1.34. Driver and documentation available from www.qlogic.com
12. Support for CX600, CX400, FC4500, FC4700, and FC5300. (FC5300 requires copper to Fibre transceiver.)
13. HPQ Proliant servers with ATF and Powerpath requires use of SCSIHD in place of CPQSHD.
14. Requires HBA bios 1.83 and driver 6.50v. Driver and documentation available from www.qlogic.com.
15. **For ATF on Pre CX series, Multipath support or connections to the secondary port are not supported at this time. One path per SP, 2 HBAs per host.**
16. **Novell Storage Services supported.**
17. **PowerPath and ATF supported.**
18. DOS boot device maximum accessible capacity is 2GB. Netware SYS volume must be in LUN 0.
19. Supports FC-AL point-to-point and Fabric switch configurations.
20. Requires driver version 2.02e and firmware 3.90a7.
21. PowerPath not currently supported.
22. PowerEdge 2550 supports a maximum of 2 Emulex HBAs at one time and the total PCI power cannot exceed 20 Watts.
23. **Requires HBA bios 1.83 and driver 6.50v.**
24. Requires NetWare patches: NWPAPT2A and NSS5J.
25. NetWare NSS has 120 LUN per port limitation. If NSS will not be used, 128 LUNs is supported.
26. Requires NWPA.NLM V.3.07A update from Novell website.
27. **Driver installation with NetWare 5.0 SP6A: Do not load cpqmpk.psm when prompted. At the point when you are to load idecd, ideata and scsihd, toggle to the Control prompt with <Alt-Esc>. Once at the system control, unload nwpa.nlm, then load nwpa.nlm version 3.07a 5/3/01. Once the new nwpa.nlm is loaded, toggle back to the install screen and continue with the install. When install is complete, down the server and copy nwpa.nlm version 3.07a 5/3/01 to the c:\nwserver directory and reboot.**
28. **Requires HBA firmware revision 1.83 and HBA driver revision 6.50v, available at http://www.qlogic.com**
    Requires SP4 or higher for NetWare 5.00.
29. Supports FC-AL point-to-point only.
30. AHA-2944W is no longer available in distribution channels.
31. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
32. **Novell 5.00 OS only supports the Host Adapter Module (HAM) driver.**

1. Symmetrix 8000 Series: 66/67 support at NetWare 5.x. 5568 support at Netware 5.1.
2. Symmetrix 8000 Series: 66/67 support at NetWare 4.11, 5.x, 5568 support at Netware 5.1.
3. Maximum number of NWFS volumes that can be mounted is 64.
4. **Supported in "Shared HBA" topology. Single HBA may be zoned to more than one storage array. This included arrays of different types and/or models.**
5. Driver installation with NetWare 5.0 SP6A: Do not load cpqmpk.psm when prompted. At the point when you are to load idecd, ideata and scsihd, toggle to the Control prompt with <Alt-Esc>. Once at the system control, unload nwpa.nlm, then load nwpa.nlm version 3.07a 5/3/01. Once the new nwpa.nlm is loaded, toggle back to the install screen and continue with the install. When install is complete, down the server and copy nwpa.nlm version 3.07a 5/3/01 to the c:\nwserver directory and reboot.
6. PCI-X servers must use single 5 volt PCI slot for Adaptec 2944 family.
7. Edit config.sys with the following: Files=100 Buffers=99
8. When installing NetWare for fabric boot (when operating system is not installed in the local host) on the Symmetrix, create only one LUN and then perform the install. To install a second server that will be fabric boot, repeat the process by creating one additional LUN and then loading the operating system to it. Continue this process until the desired number of fabric boot servers have been reached. Conditions exist where several LUNs are initially created and you perform your first install, NetWare will sometimes acquire and stripe the operating system across several of the newly created LUNs.
9. To enable failover with fabric boot DOSFAT.NSS must be loaded from the autoexec.ncf. In a failed condition the c:\ partition will not failover correctly but the DOSFAT .C: partition will.
10. NetWare boot support is contingent on migration of the DOS boot partition to an NSS partition. NetWare will warn you of the possibility of data corruption if you convert the DOS boot partition to an NSS partition. The risk of data corruption is during I/O to the C: drive while in the NetWare debugger, or while writing reboot log files during an "Auto Restart After Abend". When you load DOSFAT, please set "Auto Restart After Abend" to 0 to avoid the possibility of data corruption.
11. Must use standard PCI 32bit/33MHz slot for SCSI
12. Requires driver 6.50v and BIOS 1.34. Driver and documentation available from www.qlogic.com
13. PowerPath not currently supported.
14. Requires driver version 2.02e and firmware 3.90a7.
15. NetWare NSS has 120 LUN per port limitation. If NSS will not be used, 128 LUNs is supported.
16. Requires NWPA.NLM V.3.07A update from Novell website.
17. Requires HBA bios 1.83 and driver 6.50v. Driver and documentation available from www.qlogic.com.
18. Supports FC-AL point-to-point only.
19. Requires HBA firmware revision 1.83 and HBA driver revision 6.50v, available at http://www.qlogic.com Requires SP4 or higher for NetWare 5.00.
20. AHA-2944W is no longer available in distribution channels.
21. **Novell 5.00 OS only supports the Host Adapter Module (HAM) driver.**
22. **Support for CX600, CX400, FC4500, FC4700, and FC5300. (FC5300 requires copper to Fibre transceiver.)**

1. Maximum number of NWFS volumes that can be mounted is 64.
2. Symmetrix 8000 Series: 66/67 support at NetWare 4.11, 5.x, 5568 support at Netware 5.1.
3. **Supported in "Shared HBA" topology. Single HBA may be zoned to more than one storage array. This included arrays of different types and/or models.**
4. Driver installation with NetWare 5.0 SP6A: Do not load cpqmpk.psm when prompted. At the point when you are to load ideed, ideata and scsihd, toggle to the Control prompt with <Alt-Esc>. Once at the system control, unload nwpa.nlm, then load nwpa.nlm version 3.07a 5/3/01. Once the new nwpa.nlm is loaded, toggle back to the install screen and continue with the install. When install is complete, down the server and copy nwpa.nlm version 3.07a 5/3/01 to the c:\nwserver directory and reboot.
5. Includes both Pentium PRO and XEON models
6. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
7. PCI-X servers must use single 5 volt PCI slot for Adaptec 2944 family.
8. Edit config.sys with the following: Files=100 Buffers=99
9. When installing NetWare for fabric boot (when operating system is not installed in the local host) on the Symmetrix, create only one LUN and then perform the install. To install a second server that will be fabric boot, repeat the process by creating one additional LUN and then loading the operating system to it. Continue this process until the desired number of fabric boot servers have been reached. Conditons exist where several LUNs are initially created and you perform your first install. NetWare will sometimes acquire and stripe the operating system across several of the newly created LUNs.
10. To enable failover with fabric boot DOSFAT.NSS must be loaded from the autoexec.ncf. In a failed condition the c:\ partition will not failover correctly but the DOSFAT_C: partition will.
11. NetWare boot support is contingent on migration of the DOS boot partition to an NSS partition. NetWare will warn you of the possibility of data corruption if you convert the DOS boot partition to an NSS partition. The risk of data corruption is during I/O to the C: drive while in the NetWare debugger, or while writing reboot log files during an "Auto Restart After Abend". When you load DOSFAT, please set "Auto Restart After Abend" to 0 to avoid the possibility of data corruption.
12. This server is equipped with plastic shielding around the PCI slots. Since the PCI slots are 32-bit, this shielding prohibits 64-bit HBAs from properly seating in the PCI slots. To accomodate 64-bit HBAs, this shielding must be removed, or modified to allow the 64-bit HBA to fully seat in the 32-bit slots.
13. Symmetrix 8000 Series: 66/67 support at NetWare 5.x. 5568 support at Netware 5.1.
14. Support for CX600, CX400, FC4500, FC4700, and FC5300. (FC5300 requires copper to Fibre transceiver.)
15. Requires driver 6.50v and BIOS 1.34. Driver and documentation available from www.qlogic.com
16. HPQ Proliant servers with ATF and Powerpath requires use of SCSIHD in place of CPQSHD.
17. HPQ Proliant servers that are rack-mountable (designated with an "R") are supported.
18. **Requires HBA bios 1.83 and driver 6.50v.**
19. Requires HBA bios 1.83 and driver 6.50v. Driver and documentation available from www.qlogic.com.
20. Requires driver version 2.02e and firmware 3.90a7.
21. PowerPath not currently supported.
22. Requires driver version 2.00E or higher and NetWare 5.1 support pack 3 or higher.
23. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
24. (HHBA-5101BK-01)
25. Requires NetWare patches: NWPAPT2A and NSS5J.
26. NetWare NSS has 120 LUN per port limitation. If NSS will not be used, 128 LUNs is supported.
27. Requires NWPA.NLM V.3.07A update from Novell website.
28. AHA-2944W is no longer available in distribution channels.
29. Novell 5.00 OS only supports the Host Adapter Module (HAM) driver
30. Supports FC-AL point-to-point only.

1. Edit config.sys with the following: Files=100 Buffers=99
2. When installing NetWare for fabric boot (when operating system is not installed in the local host) on the Symmetrix, create only one LUN and then perform the install. To install a second server that will be fabric boot, repeat the process by creating one additional LUN and then loading the operating system to it. Continue this process until the desired number of fabric boot servers have been reached. Conditons exist where several LUNs are initially created and you perform your first install, NetWare will sometimes acquire and stripe the operating system across several of the newly created LUNs
3. To enable failover with fabric boot DOSFAT NSS must be loaded from the autoexec.ncf. In a failed condition the c:\ partition will not failover correctly but the DOSFAT C: partition will
4. NetWare boot support is contingent on migration of the DOS boot partition to an NSS partition. NetWare will warn you of the possibility of data corruption if you convert the DOS boot partition to an NSS partition. The risk of data corruption is during I/O to the C: drive while in the NetWare debugger, or while writing reboot log files during an "Auto Restart After Abend". When you load DOSFAT, please set "Auto Restart After Abend" to 0 to avoid the possibility of data corruption.
5. Symmetrix 8000 Series: 66/67 support at NetWare 4.11, 5.x, 5568 support at Netware 5.1.
6. Maximum number of NWFS volumes that can be mounted is 64
7. PCI-X servers must use single 5 volt PCI slot for Adaptec 2944 family
8. Driver installation with NetWare 5.0 SP6A: Do not load cpqmpk.psm when prompted. At the point when you are to load idecd, ideata and scsihd, toggle to the Control prompt with <Alt-Esc>. Once at the system control, unload nwpa.nlm, then load nwpa.nlm version 3.07a 5/3/01. Once the new nwpa.nlm is loaded, toggle back to the install screen and continue with the install. When install is complete, down the server and copy nwpa.nlm version 3.07a 5/3/01 to the c:\nwserver directory and reboot.
9. **Supported in "Shared HBA" topology. Single HBA may be zoned to more than one storage array. This included arrays of different types and/or models.**
10. This server only supports 5 Volt HBAs: qLogic 22XX family (if applicable), qLogic 23XX family, Emulex LP8000, and Emulex LP850 (if applicable).
11. Requires driver 6.50v and BIOS 1.34. Driver and documentation available from www.qlogic.com
12. Support for CX600, CX400, FC4500, FC4700, and FC5300. (FC5300 requires copper to Fibre transceiver.)
13. Requires HBA bios 1.83 and driver 6.50v. Driver and documentation available from www.qlogic.com.
14. Requires driver version 2.02e and firmware 3.90a7.
15. PowerPath not currently supported.
16. HPQ Proliant servers with ATF and Powerpath requires use of SCSIHD in place of CPQSHD.
17. **Host must be offline for interfamily Symmetrix microcode upgrade.**
18. **Requires QLogic driver v6.04.02 or v6.05.00and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
19. **QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.**
20. This HBA is equivalent to the qLogic QLA2310.
21. Requires driver 6.50v, BIOS 1.34 available from Qlogic
22. This HBA is equivalent to the qLogic QLA2340
23. (QLA2200) For IBM xSeries and Netfinity servers only.
24. Symmetrix 8000 Series: 66/67 support at NetWare 5.x; 5568 support at Netware 5.1
25. Requires NetWare patches: NWPAPT2A and NSS5J.
26. This server only supports 5 Volt HBAs: qLogic 22XX family, qLogic 23XX family, Emulex LP8000, and Emulex LP850
27. NetWare NSS has 120 LUN per port limitation. If NSS will not be used, 128 LUNs is supported.
28. Requires NWPA.NLM V.3.07A update from Novell website
29. Supports FC-AL point-to-point only
30. AHA-2944W is no longer available in distribution channels

1. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.

2. **This kernel is limited to 110 devices, not 128.**
3. **Supported with QLogic driver v6.04.02 or v6.05.00.**
4. **The kernel version listed is included in the corresponding standard distributed release.**
5. **QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.**
6. **Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.**
7. **Host must be offline for interfamily Symmetrix microcode upgrade.**
8. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath. Booting from EMC storage arrays is NOT supported with PowerPath.
9. Symmetrix 8000 Series: 66/67 support at Red Hat Kernel v2.4.x or later, 5568 support at Red Hat kernel v2.4.x or later.
10. **FC-AL and FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.**
11. **FC-SW applies only to CX600, CX400, CX200, FC4500, FC4700 and FC5300. FC5300 with FC-SW available from selected channels.**
12. **Requires QLogic driver v6.04.01 (included in 2.4.9-e.24 kernel) and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
13. **Single HBA zoning is required regardless of the switch being utilized.**
14. **This kernel is supported with the Qlogic v6.04.01 driver included in the kernel.**
15. **Requires QLogic driver 4.47.18 driver disk, dd.img-i686.gz and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65**
16. **Only one HBA is qualified for use in the Linux host when booting from the CLARiiON via fabric.**
17. **Optical cables apply to CX600, CX400, CX200, FC4700, FC4500, FC5300 with MIA.**
18. **Access Logic required, direct connect or fabric. (no booting through switch inter-switch links)**
19. **No MirrorView or SnapView used on boot LUNs.**
20. **EMC recommends boot LUN be RAID1 or RAID5. Be sure to monitor the loading on the boot LUN RAID group. Excessive loading on the boot LUN RAID group may degrade boot LUN performance and stability.**
21. **Refer to the Customer Service website or your EMC Service Personnel for the latest documentation.**
22. **Previous versions of the HBA and boot installation guides contained restrictions for boot configurations. All boot configuration information is now listed here and supersedes any found in previous boot documentation.**
23. **For any CLARiiON SP port configured to a host for booting, the maximum number of logical volumes allowed on that port is 32.**
24. **Host must be offline for CLARiiON-licensed (Flare) upgrade and Storage Processor replacement.**

1. **QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.**
2. **Requires QLogic driver v6.04.02 or v6.05.00and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
3. **Host must be offline for interfamily Symmetrix microcode upgrade.**
4. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
5. PowerEdge 2550 supports a maximum of 2 Emulex HBAs at one time and the total PCI power cannot exceed 20 Watts
6. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath. Booting from EMC storage arrays is NOT supported with PowerPath.
7. **This kernel is limited to 110 devices, not 128.**
8. **Supported with QLogic driver v6.04.02 or v6.05.00.**
9. **The kernel version listed is included in the corresponding standard distributed release.**
10. **Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.**
11. **Requires QLogic driver v6.04.02 or v6.05.00 and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
12. **Single HBA zoning is required regardless of the switch being utilized.**
13. **Host must be offline for CLARiiON-licensed (Flare) upgrade and Storage Processor replacement.**
14. Symmetrix 8000 Series 66/67 support at Red Hat Kernel v2.4.x or later. 5568 support at Red Hat kernel v2.4.x or later.
15. **An RPM from Dell may be used to install the QLogic v6.04.02 or v6.05.00 drivers and may be obtained from the QLogic website at http://www.qlogic.com/support/oem_detail_all.asp?oemid=65**
16. FC-AL and FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.
17. FC-SW applies only to CX600, CX400, CX200, FC4500, FC4700 and FC5300. FC5300 with FC-SW available from selected channels.
18. **Requires QLogic driver v6.04.01 (included in 2.4.9-e.24 kernel) and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
19. **This kernel is supported with the Qlogic v6.04.01 driver included in the kernel.**

20. Requires QLogic driver 4.47.18 driver disk, dd.img-i686.gz and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65
21. Only one HBA is qualified for use in the Linux host when booting from the CLARiiON via fabric.
22. Optical cables apply to CX600, CX400, CX200, FC4700, FC4500, FC5300 with MIA.
23. Access Logic required, direct connect or fabric, (no booting through switch inter-switch links)
24. No MirrorView or SnapView used on boot LUNs.
25. EMC recommends boot LUN be RAID1 or RAID5. Be sure to monitor the loading on the boot LUN RAID group. Excessive loading on the boot LUN RAID group may degrade boot LUN performance and stability.
26. Refer to the Customer Service website or your EMC Service Personnel for the latest documentation.
27. Previous versions of the HBA and boot installation guides contained restrictions for boot configurations. All boot configuration information is now listed here and supersedes any found in previous boot documentation.
28. For any CLARiiON SP port configured to a host for booting, the maximum number of logical volumes allowed on that port is 32.

1. **QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.**
2. **Host must be offline for interfamily Symmetrix microcode upgrade.**
3. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath. Booting from EMC storage arrays is NOT supported with PowerPath.
4. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
5. **Requires QLogic driver v6.04.02 or v6.05.00and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
6. **The kernel version listed is included in the corresponding standard distributed release.**
7. **Supported with QLogic driver v6.04.02 or v6.05.00.**
8. **This kernel is limited to 110 devices, not 128.**
9. **Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.**
10. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
11. This server is equipped with plastic shielding around the PCI slots. Since the PCI slots are 32-bit, this shielding prohibits 64-bit HBAs from properly seating in the PCI slots. To accomodate 64-bit HBAs, this shielding must be removed, or modified to allow the 64-bit HBA to fully seat in the 32-bit slots.
12. Includes both Pentium PRO and XEON models
13. HPQ Proliant servers that are rack-mountable (designated with an "R") are supported.
14. **Requires QLogic driver v6.04.02 or v6.05.00 and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
15. Symmetrix 8000 Series: 66/67 support at Red Hat Kernel v2.4.x or later, 5568 support at Red Hat kernel v2.4.x or later.
16. **Host must be offline for CLARiiON-licensed (Flare) upgrade and Storage Processor replacement.**
17. Single HBA zoning is required regardless of the switch being utilized.
18. **This HBA is equivalent to the qLogic QLA2310.**
19. **This HBA is equivalent to the qLogic QLA2340.**
20. **(QLA2200) For IBM xSeries and Netfinity servers only.**
21. Booting off of an EMC storage array is not currently supported with the HPQ BL20P.
22. BIOS must be obtained from HP at http://h18000.www1.hp.com/products/servers/proliant-bl/p-class/20p/index.html instead of BIOS on Qlogic web site. EMC NVRAM settings must be configured manually. Refer to EMC Fibre Channel documentation for QLogic HBAs for the settings.
23. Dual port PCI-X fibre channel mezzanine card option is embedded. No PCI/PCI-X slots available.
24. Requires QLogic driver v6.04.02 and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65
25. **Requires Emulex drivers v4.20Q and firmware v3.90a7. Available from http://www.emulex.com.**
26. **Requires QLogic driver 4.47.18 driver disk, dd.img-i686.gz and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65**
27. **Only one HBA is qualified for use in the Linux host when booting from the CLARiiON via fabric.**
28. **Optical cables apply to CX600, CX400, CX200, FC4700, FC4500, FC5300 with MIA.**
29. **Access Logic required, direct connect or fabric, (no booting through switch inter-switch links)**
30. **No MirrorView or SnapView used on boot LUNs.**
31. **EMC recommends boot LUN be RAID1 or RAID5. Be sure to monitor the loading on the boot LUN RAID group. Excessive loading on the boot LUN RAID group may degrade boot LUN performance and stability.**
32. **Refer to the Customer Service website or your EMC Service Personnel for the latest documentation.**
33. **Previous versions of the HBA and boot installation guides contained restrictions for boot configurations. All boot configuration information is now listed here and supersedes any found in previous boot documentation.**
34. **For any CLARiiON SP port configured to a host for booting, the maximum number of logical volumes allowed on that port is 32.**
35. **FC-AL and FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.**
36. **FC-SW applies only to CX600, CX400, CX200, FC4500, FC4700 and FC5300. FC5300 with FC-SW available from selected channels.**
37. **This kernel is supported with the Qlogic v6.04.01 driver included in the kernel.**
38. **Requires QLogic driver v6.04.01 (included in 2.4.9-e.24 kernel) and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**

1 EMC supports the following filesystems ext2, ext3 reiserfs If there is a customer requirement for a different filesystem, please submit an RPQ
2 Requires QLogic driver v6.04.02 or v6.05.00and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem detail all.asp?oemid=65.
3 This HBA is equivalent to the qLogic QLA2340.
4 Host must be offline for interfamily Symmetrix microcode upgrade.
5 QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.

6. **(QLA2200) For IBM xSeries and Netfinity servers only.**
7. This HBA is equivalent to the qLogic QLA2310.
8. PowerPath v3.02 not supported on this system.
9. This server only supports 5 Volt HBAs: qLogic 22XX family (if applicable), qLogic 23XX family, Emulex LP8000, and Emulex LP850 (if applicable).
10. **This kernel is limited to 110 devices, not 128.**
11. **Supported with QLogic driver v6.04.02 or v6.05.00.**
12. **The kernel version listed is included in the corresponding standard distributed release.**
13. PowerPath v3.0.2 b069 is not supported on this system.
14. This system is supported with Red Hat 2.1 Advanced Server v2.4.9-E.3 and updated with v2.4.9-E.9, E.10, and E.12 RPMs.
15. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath. Booting from EMC storage arrays is NOT supported with PowerPath.
16. **Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.**
17. **Requires Emulex drivers v4.20Q and firmware v3.90a7. Available from http://www.emulex.com.**
18. Symmetrix 8000 Series: 66/67 support at Red Hat Kernel v2.4.x or later, 5568 support at Red Hat kernel v2.4.x or later.
19. **This kernel is supported with PowerPath 3.0.1 on Symmetrix attached hosts only.**
20. Single HBA zoning is required regardless of the switch being utilized.
21. **Requires v6.05 or higher Navisphere host agent/CLI.**
22. **Requires QLogic driver v6.04.02 or v6.05.00 and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
23. **Host must be offline for CLARiiON-licensed (Flare) upgrade and Storage Processor replacement.**
24. **Requires QLogic driver v6.04.01 (included in 2.4.9-e.24 kernel) and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
25. **This kernel is supported with the Qlogic v6.04.01 driver included in the kernel.**
26. **FC-AL and FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.**
27. **FC-SW applies only to CX600, CX400, CX200, FC4500, FC4700 and FC5300. FC5300 with FC-SW available from selected channels.**
28. **Requires QLogic driver 4.47.18 driver disk, dd.img-i686.gz and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65**
29. **Only one HBA is qualified for use in the Linux host when booting from the CLARiiON via fabric.**
30. **Optical cables apply to CX600, CX400, CX200, FC4700, FC4500, FC5300 with MIA.**
31. **Access Logic required, direct connect or fabric, (no booting through switch inter-switch links)**
32. **No MirrorView or SnapView used on boot LUNs.**
33. **EMC recommends boot LUN be RAID1 or RAID5. Be sure to monitor the loading on the boot LUN RAID group. Excessive loading on the boot LUN RAID group may degrade boot LUN performance and stability.**
34. **Refer to the Customer Service website or your EMC Service Personnel for the latest documentation.**
35. **Previous versions of the HBA and boot installation guides contained restrictions for boot configurations. All boot configuration information is now listed here and supersedes any found in previous boot documentation.**
36. **For any CLARiiON SP port configured to a host for booting, the maximum number of logical volumes allowed on that port is 32.**
37. **This server only supports 5 Volt HBAs: qLogic 22XX family, qLogic 23XX family, Emulex LP8000, and Emulex LP850**

1. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
2. **Supported with QLogic driver v6.04.02 or v6.05.00.**
3. **The kernel version listed is included in the corresponding standard distributed release.**
4. **This kernel is limited to 110 devices, not 128.**
5. **QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.**
6. **Host must be offline for interfamily Symmetrix microcode upgrade.**
7. **Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.**
8. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath. Booting from EMC storage arrays is NOT supported with PowerPath.
9. Symmetrix 8000 Series: 66/67 support at Red Hat Kernel v2.4.x or later, 5568 support at Red Hat kernel v2.4.x or later
10. **Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.63a1. Emulex drivers are available at http://www.emulex.com. Supports SNIA HBA API.**
11. **Requires QLogic driver 4.47.18 driver disk, dd.img-i686.gz and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65**
12. **Only one HBA is qualified for use in the Linux host when booting from the CLARiiON via fabric.**
13. **Optical cables apply to CX600, CX400, CX200, FC4700, FC4500, FC5300 with MIA.**
14. **Access Logic required, direct connect or fabric, (no booting through switch inter-switch links)**
15. **No MirrorView or SnapView used on boot LUNs.**
16. **EMC recommends boot LUN be RAID1 or RAID5. Be sure to monitor the loading on the boot LUN RAID group. Excessive loading on the boot LUN RAID group may degrade boot LUN performance and stability.**
17. **Refer to the Customer Service website or your EMC Service Personnel for the latest documentation.**
18. **Previous versions of the HBA and boot installation guides contained restrictions for boot configurations. All boot configuration information is now listed here and supersedes any found in previous boot documentation.**
19. **For any CLARiiON SP port configured to a host for booting, the maximum number of logical volumes allowed on that port is 32.**
20. **This kernel is supported with the Qlogic v6.04.01 driver included in the kernel.**
21. **Host must be offline for CLARiiON-licensed (Flare) upgrade and Storage Processor replacement.**
22. **Requires QLogic driver v6.04.01 (included in 2.4.9-e.24 kernel) and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.**
23. **FC-AL and FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.**
24. **FC-SW applies only to CX600, CX400, CX200, FC4500, FC4700 and FC5300. FC5300 with FC-SW available from selected channels.**
25. **Single HBA zoning is required regardless of the switch being utilized.**

1. Linux v2.4.x Kernels support a maximum of 128 devices per system
2. Symmetrix 8000 Series 66-67 support at Red Hat kernel v2.4.x or later. 5568 support at Red Hat kernel v2.4.x or later
3. Requires QLogic driver v6.04.02 or v6.05.00and BIOS v1.83 for QLA2200F and BIOS v1.34 for QLA2310F, QLA2340-E-SP, and QLA2342-E-SP available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
4. Host must be offline for interfamily Symmetrix microcode upgrade.
5. QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.
6. Requires rev2 sles7upg2418.patch available from ftp://ftp.emc.com/pub/elab/linux
7. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.

8. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
9. HPQ Proliant servers that are rack-mountable (designated with an "R") are supported.
10. This server is equipped with plastic shielding around the PCI slots. Since the PCI slots are 32-bit, this shielding prohibits 64-bit HBAs from properly seating in the PCI slots. To accomodate 64-bit HBAs, this shielding must be removed, or modified to allow the 64-bit HBA to fully seat in the 32-bit slots.
11. Includes both Pentium PRO and XEON models
12. Requires QLogic driver v6.04.02 and BIOS v1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65.
13. Requires QLogic driver v6.04.00 or above.
14. Requires QLogic v6.04.02 driver.
15. Requires rev3_sles8.patch available from ftp://ftp.emc.com/pub/elab/linux.
16. Requires rev1_sles8sp2a.patch for CLARiiON-attached hosts available from ftp://ftp.emc.com/pub/elab/linux.
17. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
18. Requires QLogic driver v6.04.02 and BIOS 1.34 available from http://www.qlogic.com/support/oem_detail_all.asp?oemid=65
19. Single HBA zoning is required regardless of the switch being utilized.

1. For 'UltraEnterprise' servers with PCI I/O board, only the left slot can be utilized due to physical constraints of the Sun PCI/SCSI adapter
2. **EMC required Sun patches for Solaris 8:**
   108528-21 SunOS 5.8: kernel update patch.
   108974-30 SunOS 5.8: data, uata, dad, sd, and scsi patch.
   109657-09 SunOS 5.8: isp driver patch (for X1062A and X1065A HBAs only).
   109885-12 SunOS 5.8: glm driver patch (for X6541A HBA only).
3. EMC required Sun patches for Solaris 7: 106541-24 SunOS 5.7 kernel update patch.106924-11 SunOS 5.7: /kernel/drv/isp and /kernel/drv/sparcvg/isp patch (for X1062A and X1065A HBAs only). 106925-09 SunOS 5.7: glm driver patch (for X5641A HBA only)
4. **EMC required Sun patches for Solaris 9:**
   112233-06 Sun OS 5.9: kernel patch
   112834-02 Sun OS 5.9: patch SCSI
   113277-11 Sun OS 5.9: sd and ssd patch
5. JNI Emerald3 SBUS PCI requires driver version 4.1.4 and fcode 3.9. If PowerPath is installed, minimum revision of 3.0.4 is required for driver version 4.1.4. Supports SNIA HBA API
6. Direct connect only. Hub connection not supported for boot device
7. JNI Emerald4 SBUS and PCI adapters require driver 5.2.1 and Fcode 3.9. Supports SNIA HBA API
8. Requires driver 4.09. The QLA2200F-EMC/QCP2202F-E/QLA2300-E-SP/QLA2340-E-SP/QLA2342-E-SP requires fcode v2.00.06. The QLA2202FS-E requires fcode 2.00.01. Fcode should be loaded on all HBA's at the time of installation. All drivers and fcode can be downloaded from http://www.qlogic.com. Supports SNIA HBA API
9. Requires Emulex Open Boot Version 2.33a0
10.

Requires driver lpfc-SPARC V5.01e. Emulex LP8000-EMC/LP9002-E/LP9002L-E/LP9002C-E/LP9002DC-E/LP9002S-E requires firmware 1.00A4, all available at http://www.emulex.com. Supports SNIA HBA API.

11. Requires Emulex Open Boot Version 1.33a1.
12. Supports Dynamic Reconfiguration for Sun Fire 4800 and 6800 only.Minimum Solaris 8 recommended patch bundle 108528-21.Requires system controller firmware patch 112127-02 or higher.
13. **Supports DR on Sun 12K and 15K.**
14. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
15. Suns QLogic cards are not supported due to proprietary drivers, fcode and firmware Please see http://www.sun.com/service/servicelist/us/detail ww ss hba.html
16. 64-bit HBAs will not fit into the 32-bit slot due to a physical obstruction.
17. EMC required Sun patches for Solaris 2.6:
    105181-34 SunOS 5.6: kernel update patch
    105356-21 SunOS 5.6: /kernel/drv/ssd and /kernel/drv/sd patch.
    105580-19 SunOS 5.6: /kernel/drv/glm patch (for X6541 HBA only).
18. **JNI Tachyon 64 bit HBA: requires Driver revision 2.6.13 and Fcode 13.5.7 and Rev B, C, D, E, G, H and J. If VxVM is installed, version 3.2 or later is required for driver 2.6.13 or later. .(Driver revisions below 2.2.1.EMC will only support FC-AL, not switches.) Supports SNIA HBA API.**
19. **Mixing FC-SW and FC-AL on the same host using JNI HBAs is not supported.**

VMware ESX
Dell

Dell – VMware ESX						
No.	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot
1	PowerEdge 6450	PCI	VMware ESX v1.5.2 patch[2, 3, 4, 5]	QLogic QLA2340-E-SP[1] QLA2342-E-SP[1]	FC-AL, FC-SW	Y
2	PowerEdge 6450	PCI	VMware ESX v1.5.2 patch[3, 4, 5, 6]	QLogic QLA2340-E-SP[7] QLA2342-E-SP[7]	FC-AL, FC-SW	Y
3	PowerEdge 6650	PCI-X	VMware ESX v1.5.2 patch[2, 3, 4, 5]	QLogic QLA2340-E-SP[1] QLA2342-E-SP[1]	FC-AL, FC-SW	Y
4	PowerEdge 6650	PCI-X	VMware ESX v1.5.2 patch[3, 4, 5, 6]	QLogic QLA2340-E-SP[7] QLA2342-E-SP[7]	FC-AL, FC-SW	Y

1. Supported with QLogic driver v6.03.00b6 included in the VMware ESX v1.5.2 kernel and BIOS v1.34.
2. Windows 2000 SP3 and SP4 are qualified to run as Virtual Machines.

3. Path failover and load-balancing are not supported.
4. EMC software will function on neither the VMkernel nor the VMs as the currently-released versions of the SymAPI do not include support for VMware ESX.
5. Supported with VMFS.
6. Windows 2000 SP3 and SP4, Windows NT 4.0, and RedHat 2.1 Advanced Server are qualified to run as Virtual Machines.
7. Supported with QLogic driver v6.04.00-emc included in the VMware ESX v1.5.2 patch 3 release and BIOS v1.34.

4	Proliant DL760 (G2)	PCI-X	VMware ESX v1.5.2 patch3[3, 4, 5, 7]	QLogic: QLA2340-E-SP[8], QLA2342-E-SP[8]	FC-AL, FC-SW	Y
5	Proliant: DL580(G2)[6], DL580(G3)	PCI, PCI-X	VMware ESX v1.5.2 patch2[2, 3, 4, 5]	QLogic: QLA2340-E-SP[1], QLA2342-E-SP[1]	FC-AL, FC-SW	Y
6	Proliant: DL580(G2)[6], DL580(G3)	PCI, PCI-X	VMware ESX v1.5.2 patch3[3, 4, 5, 7]	QLogic: QLA2340-E-SP[8], QLA2342-E-SP[8]	FC-AL, FC-SW	Y

1. Supported with QLogic driver v6.03.00b6 included in the VMware ESX v1.5.2 kernel and BIOS v1.34.
2. Windows 2000 SP3 and SP4 are qualified to run as Virtual Machines.
3. EMC software will function on neither the VMkernel nor the VMs as the currently-released versions of the SymAPI do not include support for VMware ESX.
4. Path failover and load-balancing are not supported.
5. Supported with VMFS.
6. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
7. Windows 2000 SP3 and SP4, Windows NT 4.0, and RedHat 2.1 Advanced Server are qualified to run as Virtual Machines.
8. Supported with QLogic driver v6.04.00-emc included in the VMware ESX v1.5.2 patch 3 release and BIOS v1.34.

1. For configurations with PowerPath 3.0.1 use native names only, and no power devices.
2. GAB disks (membership and service group heartbeat disks) are not supported.
3. Requires minimum microcode level of 5669.45.24 for support of TimeFinder and/or SRDF.
4. If all FC connectivity to the array is lost (without a server shutdown), then after connectivity is restored, the user must execute a vxdctl enable command, before the VCS Oracle 9iRAC service group is brought back online
5. Symmetrix SCSI-3 "PER" volume flag setting required for devices accessible through two or more paths.
6. Veritas MP1 is required for clusters with more than 2 servers
7. Also supports Fujitsu Technology Solutions Inc.
8. The PRIMECLUSTER V3.0 family of software products consists of:
   Cluster Foundation (CF) 1.5, Reliant Monitor Services (RMS) 3.1, Scalable Internet Services (SIS) 2.5, Parallel Application Services (PAS) 1.0, Wizard Tools WT 3.3.
9. FSC requires all patches for Solaris 7 be obtained through FSC in the form of a Solaris 7 PTF patch CD. The current patch CD is Solaris 7 PTF R03051.
10. Symmetrix 8000 Series: 66/67 support: Reliant UNIX 5.44,5.45 Solaris 2.6, 7, 8 or 9. Symmetrix 8000 Series:5568 support: Solaris 8.9.
11. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
12. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
13. 5-64 nodes on special release available via RPQ.
14. For use in US/Europe only. Refer to Fujitsu Base Connectivity information for Asia Pacific/Japan.
15. GDS in combination with SRDF is not supported.
16. The PRIMECLUSTER V4.0 family of software products consists of the following components: Reliant Monitor Services RMS 4.0A, Cluster Foundation CF 4.0A, Wizard Tools WT 4.0A and Application Wizards AW, Scalable Internet Services SIS 4.0A, Parallel Application Services PAS 4.0A, Global File Services GFS 4.0, Global Disk Services GDS 4.0, Global Link Services GLS 4.0
17. GDS requires Fujitsu PCL Fibre Channel driver PFCA2.2.1.

1. For driver versions refer to Base Connectivity Section
2. Can mix HP-UX 11.00 and HP-UX 11i in same cluster all nodes must be MC/SG 11.09, 11.13 or later.
3. Refer to MC/Service Guard Release Notes at www.docs.hp.com for patch requirements
4. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01 The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set.
5. Symm 6 is qualified with: HP-UX 11i Support Plus Sept '02 bundle = GOLDAPPS11i June '02, GOLDBASE11i June '02 & HWEnable11i Sept '02.
6. Volume Managers Supported: LVM
7. Symm6: 512 lun limit per FA port
8. FCAL on Symm 6 supported by direct attach only
9. Volume Managers Supported: LVM VxVM 3.2
10. Volume Managers Supported: LVM, VxVM 3.2, VxVM 3.5
11. Number of nodes supported is dependent upon LVM, SLVM, VxVM, and CVM. Refer to EMC Host Connectivity Guide for HP-UX.
12. Volume Managers Supported: LVM, SLVM
13. HP-UX 11.0 and 11i 64-bit only Oracle RAC9i (9.0.1, 9.2). PowerPath 2.1.x and 3.0 Support. A SAN implementation with ISLs will observe significant delay in failover times if link failures non-contiguous to host HBA occur
14. Volume Managers Supported: LVM, SLVM, VxVM 3.2
15. Volume Managers Supported: LVM, SLVM, VxVM 3.2, VxVM 3.5
16. PA-8700 processors: Initial support with HP-UX 11.0 Sept 2001, HP-UX 11i Sept 2001.
17. Supported in 2-CPU systems only (2-way).
18. Virtual Partitions (VPAR) is supported on the rp8400 server with 4.x and 5.x Symmetrix models and DMX Series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 4.0 or later.
19. Virtual Partitions (VPAR) is supported on the rp7405 server with 4.x and 5.x Symmetrix models. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.02.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 4.0 or later.
20. **Virtual Partitions (VPAR) is supported on the rp7405/7410 server with 4.x and 5.x Symmetrix models and DMX Series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.02.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 4.0 or later.**
21. On HP-UX 11.00 LVM support only – no VxVM
22. Symm 6 is qualified with: HP-UX 11.00 Support Plus Sept '02 bundle = QPK1100 Sept '02 & HWE1100 Sept '02
23. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24, 5568.58.12 or 5x69
24. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26.19s.
25. Review the single attach table for supported PowerPath versions and volume manager restrictions.
26. GAB disks (membership and service group heartbeat disks) are not supported.

V5.x: 255 LUNs/Symmetrix Fibre director port (LUNs 000-0FE valid) on Symmetrix DMX Series, requires OVMS director bit setting, LUN 000 must be mapped to a Symmetrix device. the LUN 000 device can be used as a normal disk device by the Tru64 host.

2. **Tru64 V5.1 latest qualified Patch Kit-0006 (T64V51B20AS0006-20030210).**
3. TruCluster V5.x Persistent Reservation support with 5669 microcode requires minimum 5669.45.24. Symm "PER" Volume flag, and "ubyte[0] = 8" in /etc/ddr.dbase EMC entry. Configurations that cannot support Persistent Reservation must set "ubyte[0] = 25" to enable alternate barrier patch and direct access devices.
4. TruCluster V5.x support with Symmetrix DMX requires minimum microcode version 5669.45.24
5. Tru64 V5 1A latest qualified Patch Kit-0004 (T64V51AB21AS0004-20030206).
6. **Tru64 V5.1B latest qualified Patch Kit 2 (T64V51BB22AS0002-20030415).**
7. **AlphaServer GS1280.ES80,ES47: Minimum Tru64 V5.1B with Patch Kit 1 (T64V51BB1AS0001-20021229)**
8. AlphaServer SC systems have special Tru64 UNIX operating system and AlphaServer SC System Software requirements
9. Requires RPQ
10. **TruCluster v1.6 SCSI requires shared buses with 'Y' cables or HPQ (Compaq) Ultra SCSI hubs DS-DWZZH-03, DS-DWZZH-05. Straight cables used only as interconnects Cables: 038-001-537 (6M), 038-001-538 (12M), 038-001-539(20M).Maximum bus length must not exceed 25 meters. Refer to Symmetrix High Availability Environment Product Guide, P/N 200-999-566, for more details.**
11. **Tru64 V4.0F BL13 Patch Kit 2 may introduce problems with KZPBA adapters. Tru64 V4.0F latest qualified Patch Kit-0007 (DUV40FB18AS0007-20020102).**
12. **Tru64 V4.0G latest qualified patch kit-0003 (T64V40GAS0003-20010613).**
13. **FCA2384(KGPSA-EA): Latest firmware revision 1.00X6**
14. **FCA2384(KGPSA-EA): Minimum firmware revision 1.00X2**

1. Multi-port SCSI or Common SCSI Bus
2. Multi-port SCSI (preferred) or Common SCSI Bus.
3. Fibre Channel HBAs: DCCG141-0000: LP7000e copper DCCG147-0000: LP8000 copper DCCG148-0000: LP8000 fibre
4. Fibre Channel device driver distributed and supported by Bull.
5. AIX 5.1 32/64-bit kernel support.
6. Supported in SMP and LPAR mode

1. IBM Native Fibre Channel drivers with feature code 6227 and with feature code 6228 are supported on the same server. Feature 6228 and 6239 are supported on the same server. Mixed FC-AL and FC-SW are supported on the same server. 6227 filesets: devices.pci.df1000f7.com, devices.pci.df1000f7.diag, devices.pci.df1000f7.rte; 6228 filesets: devices.pci.df1000f7.com, devices.pci.df1000f7.diag, devices.pci.df1000f9.diag, devices.pci.df1000f9.rte; 6239 filesets: devices.pci.df1000f7.com, devices.pci.df1000f7.diag, devices.pci.df1080f9.diag, devices.pci.df1080f9.rte
2. For all PCI-based hosts only: See http://www-1.ibm.com/servers/eserver/pseries/library/hardware_docs/sa38/380538.pdf for appropriate HBA placement guidelines.
3. Requires minimum HACMP IY07313, concurrent resource groups not supported with HACMP 4.3 or 4.3.1; For HACMP 4.4.0 and 4.4.1 concurrent resource groups supported with APAR IY14528. Requires minimum AIX APAR IY08960, IY03872, IY06844. Requires minimum Symmetrix microcode level 5265.48.30.
4. Symmetrix 8000 Series:66/67 support: AIX 4.3.x, 5.1, 5568 support at AIX 4.3.3, 5.1
5. For IBM AIX 4.3.3: requires Oracle RAC9i (9.0.1), HACMP/ES 4.4.x, PowerPath 2.1 or greater is supported. Symmetrix microcode 5566/5567/5568. A SAN implementation with ISLs will observe significant delay in failover times if link failures non-contiguous to host HBA occur. For IBM AIX 5.1:requires Oracle RAC9i (9.2), HACMP/ES 4.4.x, PowerPath 3.0.1 or greater is supported. Symmetrix microcode 5566/5567/5568. A SAN implementation with ISLs will observe significant delay in failover times if link failures non-contiguous to host HBA occur.
6. Requires minimum AIX APAR IY05369. Requires minimum EMC ODM fileset support (4.3.3.0 IBM Fibre Channel interface support for Symmetrix). Supported adapter firmware, 3.22A1.
7. Requires minimum AIX APAR IY08960, IY03872. Requires minimum EMC ODM fileset support (4.3.3.1 IBM Fibre Channel interface support for Symmetrix). Supported adapter firmware, 3.22A1.
8. Requires minimum Symmetrix microcode level 5265.39.25. Requires minimum AIX APAR IY05369. Requires minimum EMC ODM fileset support (4.3.3.0 IBM Fibre Channel interface support for Symmetrix). Supported adapter firmware, 3.22A1.
9. Latest APAR for PSSP 3.2 is IY17872.
10. Latest APAR for PSSP 3.1.1 is IY17870.
11. The following link provides detailed data for all 9076-SP2 models and feature codes: http://www1.ibmlink.ibm.com/cgi-bin/master?request=salesmanual&parms=SMS&xh=NTZH*daEMSRi4n1USenGnN9332&xhi=usa.main%7Csalesmanual%5E&type=D&search=9076&title=T&product
12. Refer to Primus case #1.0 128870403.2749464 for configuration instructions.
13. Requires minimum AIX 4.3.3 with APAR IY22024. Requires PSSP 3.4 with APAR IY32625
14. Requires minimum AIX 4.3.3 with maintenance level 08 and adapter firmware 3.82a1. Requires minimum HACMP IY07313. Concurrent resource groups not supported with HACMP 4.3 or 4.3.1; For HACMP 4.4.0 and 4.4.1 concurrent resource groups supported with APAR IY14528. Requires minimum Symmetrix microcode level 5265.48.30.
15. Requires minimum EMC ODM fileset support (4.3.3.1 IBM Fibre Channel interface support for Symmetrix). Device driver df1000f9 is distributed by IBM.
16. Requires minimum EMC ODM fileset support (4.3.3.1 IBM Fibre Channel interface support for Symmetrix).
17. AIX 5.1 32/64 bit Kernel supported. Minimum PowerPath Version 2.1.2 supported . Requires minimum EMC ODM fileset support 5.0.0.0.
18. Minimum PowerPath 2.1.2 supported
19. AIX 5.1 supported with 32/64-bit kernel. Requires minimum EMC ODM fileset support 5.0.0.0.
20. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24 or 5568.58.12
21. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26.19s
22. AIX 5.1 supported with 32-bit kernel. Requires minimum EMC ODM fileset support 5.0.0.0.
23. IBM 6227 and 6228 adapters are supported on the same server.Mixed FC-AL and FC-SW are supported on the same server.
24. Requires minimum HACMP APAR IY07313. Latest APAR for PSSP 3.1.1 is IY17870. Requires minimum RVSD APAR IY07130.
25. PowerPath is supported with LVM and JFS
26. GAB disks (membership and service group heartbeat disks) are not supported.
27. VxVM and VxFS are not currently supported in this configuration. Please review the Host Attach and Veritas Support sections for current listings of PowerPath, VxVM and VxFS support for Clariion storage arrays.
28. Minimum PowerPath 3.0.2 is supported
29. Requires minimum PSSP 3.4 APAR IY33448
30. See http://www.rs6000.ibm.com/resource/hardware_docs/sa38-0538/380538.pdf for appropriate HBA placement guidelines
31. Requires minimum HBA firmware 3.22A1
32. Requires minimum ODM fileset support (5.0.0.0 EMC Symmetrix Fibre Channel support software).
33. Requires adapter firmware 3.22A1, CLArraryS3.5.1 fileset support. Supports FC4700 with minimum flare code 8.46.xx.
34. IBM 6227 and IBM 6228 adapters are supported on the same server. Mixed FC-AL and FC-SW are supported on the same server. 6227 Filesets: devices.pci.df1000f7.com, devices.pci.df1000f7.diag, devices.pci.df1000f7.rte ; 6228 Filesets: devices.pci.df1000f7.com, devices.pci.df1000f7.diag, devices.pci.df1000f9.diag, devices.pci.df1000f9.rte
35. Requires minimum PSSP APAR IY38509
36. Requires minimum AIX5.1 with maintenance level 03 APAR IY32749
37. AIX 5.1 supported with 32/64 bit kernel
38. AIX 5.1 32/64 bit Kernel supported. Requires minimum EMC ODM fileset support 5.0.0.0
39. Requires minimum HBA firmware 3.82A1

Microsoft Windows 2000

EMC recommends shutting down the host server during maintenance procedures that could cause the boot disk to become unavailable to the host. If the paging file is unavailable to the operating system for a minimum of 10 seconds, a crash can occur.Events that could cause a system to crash when booting from external storage are:
1)Lost connection to external storage (pulled or damaged cable connection).
2)External storage service/upgrade procedures such as online microcode upgrades and/or configuration changes.
3)External storage director failures including failed lasers on Fibre Channel directors.
4)External storage power failure.
5)Storage area network failures such as Fibre Channel switches, switch components, and switch power failures.
6)Storage area network service/upgrade procedures such as firmware upgrades or hardware replacements.CAUTION: Microsoft Windows NT uses virtual memory paging files that reside on the boot disk by default. Please refer to the information contained in Microsoft Knowledge Base article Q305547. The article explains how Microsoft supports booting Windows systems through a SAN (storage area network.) Although this article specifically mentions Windows 2000, the information also pertains to Windows NT 4.0 systems booting through a SAN.

4	AViiON: AV1400, AV2800, AV3800	Microsoft Windows 2000 Advanced Server: SP2[5], SP4	Legato Automated Availability Manager (LAAM) 5.0 (Base)[1, 2, 3]	HA: 4	Emulex: LP8000-EMC[4], LP850-EMC; QLogic: QLA2310F-E-SP, QLA2340-E-SP, QLA2342-E-SP	FC-AL, FC-SW

1. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24, 5568.58.12 or 5x69
2. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26.19s.
3. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24 or 5568.58.12
4. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
5. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
6. Best Practice configurations recommendations for MSCS Clusters are: Single HBA Zoning for each server or for each node in any given cluster, separate FA storage ports for each separate cluster to properly isolate the clusters from each other, use ESN Manager with Single HBA Zoning to provide additional LUN access control.
7. MSCS multi cluster configurations supported. If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN masking with the following minimum microcode: 5267.39, 5567.46, 5568.39.

1. MSCS multi cluster configurations supported. If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN masking with the following minimum microcode: 5267.39, 5567.46, 5568.39
2. Best Practice configurations recommendations for MSCS Clusters are: Single HBA Zoning for each server or for each node in any given cluster, separate FA storage ports for each separate cluster to properly isolate the clusters from each other, use ESN Manager with Single HBA Zoning to provide additional LUN access control.
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24 or 5568.58.12
5. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26.19s.
6. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24, 5568.58.12 or 5x69
7. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
8. PowerEdge 2550 supports a maximum of 2 Emulex HBAs at one time and the total PCI power cannot exceed 20 Watts.
9. Symmetrix 8000 Series only.
10. Oracle Cluster File System not supported for 9i RAC 9.2.0.1.0
. VxVm not supported. PowerPath 3.0 supported.
11. GAB disks (membership and service group heartbeat disks) are not supported.

1. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
2. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24 or 5568.58.12
3. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26.19s.
4. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24, 5568.58.12 or 5x69
5. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
6. MSCS multi cluster configurations supported. If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN masking with the following minimum microcode: 5267.39, 5567.46, 5568.39.
7. Best Practice configurations recommendations for MSCS Clusters are: Single HBA Zoning for each server or for each node in any given cluster, separate FA storage ports for each separate cluster to properly isolate the clusters from each other, use ESN Manager with Single HBA Zoning to provide additional LUN access control.
8. Must use standard PCI 32bit/33MHz slot for SCSI
9. Refer to Microsoft HCL for updated Windows 2000 SCSI clusters (http://www.microsoft.com/hwtest/hcl).
10. GAB disks (membership and service group heartbeat disks) are not supported.

1. MSCS multi cluster configurations supported. If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN masking with the following minimum microcode: 5267.39, 5567.46, 5568.39
2. Best Practice configurations recommendations for MSCS Clusters are. Single HBA Zoning for each server or for each node in any given cluster, separate FA storage ports for each separate cluster to properly isolate the clusters from each other, use ESN Manager with Single HBA Zoning to provide additional LUN access control.
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
4. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24, 5568.58.12 or 5x69
5. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26.19s.
6. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24 or 5568.58.12
7. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
8. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
9. HPQ Proliant servers that are rack-mountable (designated with an "R") are supported
10. Includes both Pentium PRO and XEON models
11. Refer to Microsoft HCL for updated Windows 2000 SCSI clusters (http://www.microsoft.com/hwtest/hcl).
12. Symmetrix 8000 Series: 66/67 support at Windows 2000 SP1, SP2 and SP3 5568 support at Windows 2000 SP1, SP2 and SP3.
13. Requires driver version 2.0.25.44 available at http://h20004.www2.hp.com/keeper_rnotes/bsdmatrix/matrix213991.html
14. The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC HP part number D6975A, must be ordered separately from HP.
15. HP NetServer LC2000 is only supported with two processors Uni-Processor configurations are not supported
16. (HHBA-5101BK-01)
17. Requires QLogic driver v6.04.02 and BIOS v1.34.
18. If no firmware/BIOS/driver is specified, refer to Base Connectivity information for minimum revision details.
19. Requires driver 8.2.1.20, and bios 1.34. Supports SNIA HBA API. Driver and BIOS available at http://www.qlogic.com.
20. Requires STORPort driver version 8.2.2.20, and BIOS 1.34. Available at http://www.qlogic.com. This driver requires Microsoft STORPort hotfix Q817789 available from Microsoft. Refer to. http://support.microsoft.com/default.aspx?scid=kb;[LN];817789
21. Booting off of an EMC storage array is not currently supported with the HPQ BL20P.
22. BIOS must be obtained from HP at http://h18000.www1.hp.com/products/servers/proliant-bl/p-class/20p/index.html instead of BIOS on Qlogic web site. EMC NVRAM settings must be configured manually. Refer to EMC Fibre Channel documentation for QLogic HBAs for the settings
23. GAB disks (membership and service group heartbeat disks) are not supported

1 EMC strongly recommends that HBAs of different vendors not be used in the same host server.
2. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46 24 or 5568.58 12
3 LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26 19s.
4 LAAM (Legato C uster) with SRDF integration requires minimum microcode level 5567 46.24, 5568 58 12 or 5x69
5 This HBA is equivalent to the qLogic QLA2340
6 This HBA is equivalent to the qLogic QLA2310
7. This server only supports 5 Volt HBAs qLogic 22XX family (if applicable), qLogic 23XX family, Emulex LP8000, and Emulex LP850 (if applicable)
8 (QLA2200) For IBM xSeries and Netfinity servers only
9 The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
10 Supported by direct attach only
11. Best Practice configurations recommendations for MSCS Clusters are Single HBA Zoning for each server or for each node in any given cluster, separate FA storage ports for each separate cluster to properly isolate the clusters from each other use ESN Manager with Single HBA Zoning to provide additional LUN access control
12 MSCS multi cluster configurations supported If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN [illegible] minimum microcode: 5267 39 5567 46, 5568 39
13 Refer to Microsoft HCL for updated Windows 2000 SCSI clusters (http www microsoft com hwtest/hcl)
14 Symmetrix 8000 Series only
15 Oracle Cluster F le System not supported for 9i RAC 9.2 0 1 0
VxVM not supported
PowerPath 3 0 supported
16 Oracle Cluster F le System not supported for 9i RAC 9.2 0 1 0
VxVm not supported. PowerPath 3.0 supported
17 GAB disks (membership and service group heartbeat disks) are not supported

18. EMC VolumeLogix Software required for multiple BladeServers when direct-attached to EMC Symmetrix storage.
19. Microsoft Cluster Server (MSCS) is the native cluster service available with Windows 2000 Advanced Server.
20. When flashing HBA bios on the HS20 FC Expansion card, you may receive the error message: "Error erasing flash at I/O address 2600 (this is the second port on the HBA)"

    This is a known issue as the expansion card only has one flashable port. IBM is working to resolve this and this message can be ignored.

1 EMC strongly recommends that HBAs of different vendors not be used in the same host server

2. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.63a1. Emulex drivers are available at http://www.emulex.com. Supports SNIA HBA API.
3. **Bus Enumeration Issue Causes Problems using SYMCLI SCSI bus enumeration of disks will change depending on cold boot or warm boot. This causes symcli commands to fail because the path is changed and SYMCLI can no longer communicate with the Symmetrix.**

   By "shutdown" and booting system, internal disks are assigned first, followed by Symmetrix disks.
   By "restart" the system, Symmetrix disks are assigned first, followed by internal disks. Drive letter are not changed in both cases.
   The workaround is to perform "symcfg discover" after rebooting.
4. **The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.**
5. Supported by direct attach only

1 The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
2 MSCS multi cluster configurations supported. If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN masking with the following minimum microcode: 5267.39, 5567.46, 5568.39
3 Best Practice configurations recommendations for MSCS Clusters are: Single HBA Zoning for each server or for each node in any given cluster, separate FA storage ports for each separate cluster to properly isolate the clusters from each other, use ESN Manager with Single HBA Zoning to provide additional LUN access control
4 EMC strongly recommends that HBAs of different vendors not be used in the same host server
5 Refer to Microsoft HCL for updated Windows 2000 SCSI clusters: http://www.microsoft.com/hwtest/hcl/
6 Supported by direct attach only

Microsoft Windows 2003

EMC recommends shutting down the host server during maintenance procedures that could cause the boot disk to become unavailable to the host. If the paging file is unavailable to the operating system for a minimum of 10 seconds, a crash can occur.Events that could cause a system to crash when booting from external storage are:
1)Lost connection to external storage (pulled or damaged cable connection).
2)External storage service/upgrade procedures such as online microcode upgrades and/or configuration changes.

3)External storage director failures including failed lasers on Fibre Channel directors.
4)External storage power failure.
5)Storage area network failures such as Fibre Channel switches, switch components, and switch power failures.
6)Storage area network service/upgrade procedures such as firmware upgrades or hardware replacements.CAUTION: Microsoft Windows NT uses virtual memory paging files that reside on the boot disk by default. Please refer to the information contained in Microsoft Knowledge Base article Q305547. The article explains how Microsoft supports booting Windows systems through a SAN (storage area network.) Although this article specifically mentions Windows 2000, the information also pertains to Windows NT 4.0 systems booting through a SAN.

1. EMC strongly recommends that HBAs of different vendors not be used in the same host server
2. Tested with Symmetrix 8000 Series, Connectrix ED-1032 3.0.1, and PowerPath 2.0 and above on each node
3. Best Practice configurations recommendations for MSCS Clusters are: Single HBA Zoning for each server or for each node in any given cluster, separate FA storage ports for each separate cluster to properly isolate the clusters from each other, use ESN Manager with Single HBA Zoning to provide additional LUN access control.
4. MSCS multi cluster configurations supported. If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN masking with the following minimum microcode: 5267.39, 5567.46, 5568.39
5. HP LXR-PRO6 support has been discontinued
6. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support
7. V1.0 is only qualified on Windows NT 4.0 SP3

1. Multi-port SCSI preferred
2. Powerpath & ATF supported
3. Maximum number of NWFS volumes that can be mounted is 64
4. Novell Storage Services supported
5. Requires driver 6.50v, BIOS 1.34 available from Qlogic
6. Requires HBA firmware 1.79 and driver 6.50v
7. PowerEdge 2550 supports a maximum of 2 Emulex HBAs at one time and the total PCI power cannot exceed 20 Watts
8. Requires NWPA.NLM V 3.07A update from Novell website

1. Multi-port SCSI (preferred)
2. Powerpath & ATF supported
3. Maximum number of NWFS volumes that can be mounted is 64
4. Novell Storage Services supported
5. HP NetServer LC2000 is only supported with two processors.Uni-Processor configurations are not supported
6. Requires NWPA.NLM V.3.07A update from Novell website.
7. Requires driver 6.50v, BIOS 1.34 available from Qlogic.
8. Requires HBA firmware 1.79 and driver 6.50v.
9. Refer to Microsoft HCL for updated Windows 2000 SCSI clusters (http://www.microsoft.com/hwtest/hcl).
10. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
11. Includes both Pentium PRO and XEON models
12. This server is equipped with plastic shielding around the PCI slots. Since the PCI slots are 32-bit, this shielding prohibits 64-bit HBAs from properly seating in the PCI slots. To accomodate 64-bit HBAs, this shielding must be removed, or modified to allow the 64-bit HBA to fully seat in the 32-bit slots.
13. HPQ Proliant servers that are rack-mountable (designated with an "R") are supported.

1. Requires QLogic driver v6.04.02 and BIOS v1.34
2. Host must be offline for interfamily Symmetrix microcode upgrade.
3. **Supported with QLogic driver v6.04.02.**
4. **Watchdog Timer should be disabled in ocmargs.ora**
5. **OCFS (Oracle Cluster File System) is not supported.**
6. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
7. **Supported with QLogic driver v6.04.02 or v6.05.00.**
8. Configuration information available on EMC PowerLink and Avatar: See the Case Study "Oracle 9i RAC on Linux Red Hat 7.1 and Red Hat 2.1 Advanced Server with CLARiiON Storage Arrays" in the EMC Networked Storage Topology Guide.
9. An RPM from Dell may be used to install the QLogic v6.X driver. RPM may be obtained from the QLogic website.
10. QLogic driver is available with Dell/Oracle CC kit.
11. Oracle Cluster File System v1.0 supported with Linux v2.4.9-E9 through E12.
12. Requires patch p2646914_9202_LINUX.zip (Private Network Fix).
13. requires patch p2632931_9202_LINUX.zip (9.2.0.2 patch set).
14. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath Booting from EMC storage arrays is NOT supported with PowerPath.
15. Driver v6.04.00 or above must be used with Qlogic HBAs for direct attach configurations.
16. OCFS (Oracle Cluster File System) is supported. Requires patch mount-2.11g-6i386.rpm (ocfs mount support).
17. **PowerPath is not supported.**
18. GAB disks (membership and service group heartbeat disks) are not supported.
19. Review single attach VxVM notes for PowerPath and DMP restrictions.
20. When VxVM is used, EMC recommends VxVM 3.2 update 2, VxFS 3.4 update 1 and above
21. **This kernel is supported with the Qlogic v6.04.01 driver included in the kernel.**
22. **FC-AL and FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.**
23. **FC-SW applies only to CX600, CX400, CX200, FC4500, FC4700 and FC5300. FC5300 with FC-SW available from selected channels.**

2. **QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.**
3. **Requires Emulex drivers v4.20Q and firmware v3.90a7. Available from http://www.emulex.com.**
4. **Host must be offline for interfamily Symmetrix microcode upgrade.**
5. **EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.**
6. **Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.**
7. **Must use standard PCI 32bit/33MHz slot for SCSI**

1. Oracle Cluster File System v1.0 supported with Linux v2.4.9-E9 through E12.
2. Requires QLogic driver v6.04.02 and BIOS v1.34
3. Driver v6.04.00 or above must be used with Qlogic HBAs for direct attach configurations.
4. OCFS (Oracle Cluster File System) is supported. Requires patch mount-2.11g-6i386.rpm (ocfs mount support).
5. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath. Booting from EMC storage arrays is NOT supported with PowerPath.
6. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
7. Configuration information available on EMC PowerLink and Avatar: See the Case Study "Oracle 9i RAC on Linux Red Hat 7.1 and Red Hat 2.1 Advanced Server with CLARiiON Storage Arrays" in the EMC Networked Storage Topology Guide.
8. Host must be offline for interfamily Symmetrix microcode upgrade.
9. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
10. **OCFS (Oracle Cluster File System) is not supported.**
11. **Supported with QLogic driver v6.04.02.**
12. **Watchdog Timer should be disabled in ocmargs.ora**
13. **Supported with QLogic driver v6.04.02 or v6.05.00.**
14. Includes both Pentium PRO and XEON models
15. GAB disks (membership and service group heartbeat disks) are not supported.
16. Review single attach VxVM notes for PowerPath and DMP restrictions.
17. When VxVM is used. EMC recommends VxVM 3.2 update 2, VxFS 3.4 update 1 and above.
18. **This kernel is supported with the Qlogic v6.04.01 driver included in the kernel.**
19. **FC-AL and FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.**
20. **FC-SW applies only to CX600, CX400, CX200, FC4500, FC4700 and FC5300. FC5300 with FC-SW available from selected channels.**

1. Single HBA zoning is required regardless of the switch being utilized.
2. Host must be offline for interfamily Symmetrix microcode upgrade.
3. Requires Emulex drivers v4.20Q and firmware v3.90a7. Available from http://www.emulex.com.
4. QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.
5. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
6. Requires Emulex driver v4.20Q and firmware v1.00a4. Available from http://www.emulex.com.
7. Requires rev2 sles7upg2418.patch available from ftp://ftp.emc.com/pub/elab/linux
8. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
9. Must use standard PCI 32bit/33MHz slot for SCSI

1. Update 6.
2. GAB disks (membership and service group heartbeat disks) are not supported.
3. For configurations with PowerPath 3.0.1 use native names only, and no power devices.
4. Symmetrix SCSI-3 "PER" volume flag setting required for devices accessible through two or more paths.
5. Requires minimum microcode level of 5669 45.24 for support of TimeFinder and/or SRDF.
6. If all FC connectivity to the array is lost (without a server shutdown), then after connectivity is restored, the user must execute a vxdctl enable command, before the VCS Oracle 9iRAC service group is brought back online.
7. Veritas MP1 is required for clusters with more than 2 servers
8. 64-bit HBAs will not fit into the 32-bit slot due to a physical obstruction.
9. Requires driver 4.09. The QLA2200F-EMC/QCP2202F-E/QLA2300-E-SP/QLA2340-E-SP/QLA2342-E-SP requires fcode v2.00.06. The QLA2202FS-E requires fcode 2.00.01. Fcode should be loaded on all HBA's at the time of installation. All drivers and fcode can be downloaded from http://www.qlogic.com. Supports SNIA HBA API.
10. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26.19s.
11. For configurations with PowerPath 3.0.1 (or above)use native names only, and no power devices.
12. For all Sun Cluster 3.0 configurations where TimeFinder or SRDF are being used, please refer to the white papers EMC Symmetrix with Sun Cluster 3.0 on Avatar and PowerLink
13. Requires Symmetrix DMX series, ucode revision 5669.44.23 PowerPath 3.0.4 or later, VxVM 3.2. Symmetrix "PER" volume flag for Persistent Reservation support for devices accessible through more than two paths.
14. OPS and RAC configurations running VxVM 3.2 VxVM 3.2 P03.
15. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
16. Requires Sun patch 113277 -09
17. Review single attach VxVM notes for PowerPath and DMP coexistence rules and restrictions.
18. **Requires Symmetrix DMX series, ucode revision 5669.45.24. PowerPath 3.0.4, VxVM 3.5 or later, Symmetrix "PER" volume flag for Persistent Reservation support for devices accessible through more than two paths.**
19. **Requires Symmetrix DMX series, ucode revision 5669.45.24. PowerPath 3.0.4, VxVM 3.2 or 3.5, Symmetrix "PER" volume flag for Persistent Reservation support for devices accessible through more than two paths.**

1. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
2. For the DMX1000 and DMX2000, the only supported board in this configuration is the DMX-FCD8M02. For the DMX800, the only supported boards are the DMX-FE-8M02 and DMX-FE-4M02.
3. "FA Port Sharing" allows any OS/HBA designated with a "Y" (for Yes) to safely share a Symmetrix FA port with any other OS/HBA designated with a "Y" provided all of the following requirements are met (Note: "N" for No means this host cannot share an FA port with any different OS/HBA): 1. ESN Manager is required to prevent sharing Symmetrix devices between Operating Systems on a single FA port. 2. Fanout/Fanin is restricted to the lowest Host/HBA support as called out in this table. Example: Windows 2000 using the QLA2200F, which has a Fanout/ Fanin of 12:1/1:12 and Netware using the QLA2200F, which has a Fanout/Fanin of 6: 1/1:6. The Fanout/Fanin is restricted to 6:1/1:6. 3. See appropriate host matrices for approved drivers, BIOS, firmware, boot and cluster information. 4. Reference the Heterogeneous FA Port Sharing section of Director Bit Information. 5. Microcode level 5x66 and above.
4. Addressable from Data Mover Constrained by the number of targets addressable through a Symmetrix FA port.
5. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
6. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
7. EMC DS-16B2 for "Extended Fabric License" . use minimum 3.0.2f firmware. 1 ISL per quad only.

1. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
2. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
3. EMC strongly recommends that HBAs of different vendors not be used in the same host server
4. The Sun Solaris sd driver is unable to configure a lun addresses greater than 255
5. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
6. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
7. See Switched Fabric Topology Parameters for switch firmware levels.

10	HPQ HP-UX: 11.0 March 2003[11], 11i v1.0 (HP-UX 11.11) Dec 2002[11]	HPQ: A6684A, A6685A	Cisco MDS 9509[32]	12	28	512	512	Y

1. Minimum driver revision for HP-UX 11i v1.0 (HP-UX 11.11) is PCI/HSC Fibre Channel Driver B.11.11.09.
2. Minimum driver revision for HP-UX 11.0 is PCI/HSC Fibre Channel Driver B.11.00.10.
3. Domain value 8 can not be utilized when attaching HP-UX initiators (hba's)
4. minimum firmware revision v3.0.2m or later EMC qualified firmware revision
5. Single initiator zoning recommended.
6. The switch port a hba is attached to which is utilized for HP-UX boot or dump processes must be configured for G_port lock.
7. HP-UX Tachyon TL Fibre Channel Driver patch PHSS_26798 required
8. Execute "ioscan -fn" following zone configuration changes on all affected servers in order for the changes to be recognized by the servers.
9. Boot device can not be located more than two hops from initiator utilized for booting
10. Initiators from servers running HP-UX 11.0 and initiators from servers running HP-UX 11i v1.0 (HP-UX 11.11)may share the same FA port.
11. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set.
12. Maximum LUNs per server 4096
13. The Powerpath path must be removed from the Powerpath configuration for all paths deleted from a zone configuration utilizing non-hardware enforced WWN zoning in order to prevent accessibility to the paths deleted from the zone configuration.
14. Maximum devices per server 2048
15. Maximum of two hops between any two nodes belonging to the same Service Guard Cluster
16. Maximum of 320 visible LUNs per hba supported with HP-UX 11.0 HA configurations
17. Maximum of 512 visible LUNs per hba supported with HP-UX 11i v1.0 (HP-UX 11.11) HA and non-HA configurations
18. Maximum of 512 visible LUNs supported with HP-UX 11.0 non-HA configurations
19. HP-UX initiators currently support only Volume Set Addressing method. Volume Logix required to set Volume Set Addressing for HP-UX initiators if port sharing configured with non-HP-UX initiators
20. minimum firmware revision v2.6.0d or later EMC qualified firmware revision
21. Boot support Minimum fw v4.0.2a
22. minimum firmware revision v4.0.2a or later EMC qualified firmware revision
23. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
24. EMC DS-16B2 for "Extended Fabric License" , use minimum 3.0.2f firmware, 1 ISL per quad only.
25. minimum firmware revision 04.01.00 or later EMC qualified firmware revision
26. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
27. HP-UX Tachyon TL Fibre Channel Driver patch PHSS_26799 required
28. Maximum devices per server 4096
29. Maximum LUNs per server 8192
30. Supported server models: rp7400 PDC 42.06
31. Supported server model: rp7400 PDC 43.08
32. During initial switch configuration, the Persistent FC ID's must be enabled on the Vsan that contains any HPUX HBAs. If Persistent FC IDs are enabled to an existing Vsan containing non HPUX HBAs, the process may be disruptive. See MDS 9000 Family Configuration Guild for details.

1. Open VMS 7.3 FC-SW requires console firmware 5.6 or later and patch VMS73_update-V0100 or patch VMS73_fibre_SCSI-V0200.
2. Open VMS is supported as of April 17, 2000, and requires a minimum Symmetrix microcode level of 5265.48.30, 5266.23.19s, or 5566.26.19s.
3. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
4. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
5. Open VMS 7.2-2 FC-SW requires console firmware 5.6 or later and patch VMS722_fibre_SCSI-V0100.
6. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
7. The 200-561-9XX, and 200-563-9XX FA director familys support a total of 256 LUNs per FA port. (Hewlett Packard Alpha Tru64 supports 255 LUNs.)
8. See Switched Fabric Topology Parameters for switch firmware levels.

1. V5.x: 255 LUNs/Symmetrix Fibre director port (LUNs 000-0FE valid) on Symmetrix DMX Series, requires OVMS director bit setting, LUN 000 must be mapped to a Symmetrix device, the LUN 000 device can be used as a normal disk device by the Tru64 host.
2. **Tru64 V5.1 latest qualified Patch Kit-0006 (T64V51B20AS0006-20030210).**
3. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
4. Requires the Heterogeneous Host Configuration feature in EMC Solutions Enabler SYMCLI Device Masking Component Version 5.x
5. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
6. Tru64 V5.1A latest qualified Patch Kit-0004 (T64V51AB21AS0004-20030206).
7. **Tru64 V5.1B latest qualified Patch Kit 2 (T64V51BB22AS0002-20030415).**
8. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
9. EMC DS-16B2 for "Extended Fabric License", use minimum 3.0.2f firmware, 1 ISL per quad only.
10. KGPSA-CA / Cisco MDS 9xxx: Tru64 host bootup may fail if switch port speed is hard-set to 1 Gb/s. Switch port should be set to Auto-Negotiate.
11. **Tru64 V4.0F BL13 Patch Kit 2 may introduce problems with KZPBA adapters. Tru64 V4.0F latest qualified Patch Kit-0007 (DUV40FB18AS0007-20020102).**
12. **V4.0F, V4.0G: 8 LUNs/Symmetrix Fibre director port (LUNs 000-007 valid).**
13. **If sharing port with Tru64 UNIX V5 hosts, use the Heterogeneous Host Configuration feature in EMC Solutions Enabler SYMCLI Device Masking Component V5.x (minimum 5568 microcode), or use Tru64 UNIX V5 director bit settings (with OVMS director bit set, the resulting LUN 000 array controller device will not be usable as a disk device by the Tru64 hosts).**
14. **Tru64 V4.0G latest qualified patch kit-0003 (T64V40GAS0003-20010613).**

1. For all PCI-based hosts only: See http://www-1.ibm.com/servers/eserver/pseries/library/hardware_docs/sa38/380538.pdf for appropriate HBA placement guidelines.
2. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
3. The 200-561-9XX, and 200-563-9XX FA director familys support a total of 256 LUNs per FA port. (Hewlett Packard Alpha Tru64 supports 255 LUNs.)
4. See Switched Fabric Topology Parameters for switch firmware levels.
5. The IBM 2032-001 is the McData ED-5000.
6. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized
7. IBM SAN FC S08 (8-port) and S16 (16-port). Firmware level is 2.1.3. S08SAN FC switch includes four shortwave optical GBIC ports. and the option to add an additional 4 (8 total) longwave or shortwave ports to the S08. The S08 8-port switch is a single power entry. S16 SAN FC switch includes four shortwave optical GBIC ports, and the option to add an additional 12 (16 total) longwave or sortwave ports to the S16. The S16 is dual-powered. S08 & S16: 1) Shortwave GBIC: Feature Code=2010; 2) Longwave GBIC: Feature Code=2020: 3) Fibre Channel Cable Multimode optical 50.0u, 5m: Feature Code=5805; 4) Fibre Chanel Cable Multimode optical 50.0u, 25m: Feature Code=5825
8. EMC DS-16B2 for "Extended Fabric License" , use minimum 3.0.2f firmware, 1 ISL per quad only.
9. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
10. Fibre Channel device driver distributed and supported by Bull.
11. This is a Brocade Silkworm 2800 (16 ports)
12. Firmware revision levels distributed and supported by Bull. Please see appropriate Bull documentation.
13. This is a Brocade Silkworm 3800 (16 port, 2 Gb/s)
14. This is a Brocade Silkworm 3200 (8 ports, 2 Gb/s)

1. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
2. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
3. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
4. (QLA2200) For IBM xSeries and Netfinity servers only.
5. EMC DS-16B2 for "Extended Fabric License" , use minimum 3.0.2f firmware, 1 ISL per quad only.
6. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
7. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
8. The 200-561-9XX, and 200-563-9XX FA director familys support a total of 256 LUNs per FA port. (Hewlett Packard Alpha Tru64 supports 255 LUNs.)
9. "FA Port Sharing" allows any OS/HBA designated with a "Y" (for Yes) to safely share a Symmetrix FA port with any other OS/HBA designated with a "Y" provided all of the following requirements are met (Note: "N" for No means this host cannot share an FA port with any different OS/HBA): 1. ESN Manager is required to prevent sharing Symmetrix devices between Operating Systems on a single FA port. 2. Fanout/Fanin is restricted to the lowest Host/HBA support as called out in this table. Example: Windows 2000 using the QLA2200F, which has a Fanout/ Fanin of 12:1/1:12 and Netware using the QLA2200F, which has a Fanout/Fanin of 6: 1/1:6. The Fanout/Fanin is restricted to 6:1/1:6. 3. See appropriate host matrices for approved drivers, BIOS, firmware, boot and cluster information. 4. Reference the Heterogeneous FA Port Sharing section of Director Bit Information. 5. Microcode level 5x66 and above.
10. FC-AL direct-connect or McData fabric connect only. Brocade fabric attach is not currently supported.

2	Microsoft Windows 2003: DataCenter[1, 2, 3], Enterprise Edition (Advanced Server)[1, 2, 3] Standard Edition (Server)[1, 2, 3]	Emulex. LP8000-EMC[10], LP9002-E (LP9002L-E), LP9002DC-E, LP9802-E, LP9802DC-E, LP982-E; HPQ. FCA2354 (LP9002), FCA2355 (LP9002DC); IBM 19K1246(QLA2310)[12], 24P0960(QLA2340)[11]; NEC N8803-031 (QLA2310F) QLogic QLA2310F-E-SP, QLA2340-E-SP, QLA2342-E-SP Unisys FCH20111-P64 (LP8000-D1), FCH20113-P64 (LP8000-EMC, LP8000-F1), FCH7J2213-P64 (LP9002L-F2)	Brocade Silkworm: 12000[6], 2400[6], 2800[6], 3200[6], 3800[6], 3900[6], 6400[6]; Cisco MDS: 9216[6], 9509[6]; EMC Connectrix: DS-16B[6, 8], DS-16B2[6, 7], DS-16M[6], DS-16M2[6], DS-24M2[6], DS-32M[6], DS-32M2[6], DS-8B[6], ED-1032[6], ED-12000B[6, 9], ED-140M, ED-64M[6]; McDATA: ED-5000[6], ED-6064[6], ES-3016[6], ES-3032[6], ES-3216[6], ES-3232[6], ES-4500[6]	12	28	256	256	Y

1. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
2. Windows 2003 is only supported on 32-Bit Intel platforms. 64-Bit Itanium systems supported by RPQ only.
3. PowerPath is not supported
4. "FA Port Sharing" allows any OS/HBA designated with a "Y" (for Yes) to safely share a Symmetrix FA port with any other OS/HBA designated with a "Y" provided all of the following requirements are met (Note: "N" for No means this host cannot share an FA port with any different OS/HBA): 1. ESN Manager is required to prevent sharing Symmetrix devices between Operating Systems on a single FA port. 2. Fanout/Fanin is restricted to the lowest Host/HBA support as called out in this table. Example: Windows 2000 using the QLA2200F, which has a Fanout/ Fanin of 12:1/1:12 and Netware using the QLA2200F, which has a Fanout/Fanin of 6: 1/1:6. The Fanout/Fanin is restricted to 6:1/1:6. 3. See appropriate host matrices for approved drivers. BIOS, firmware boot and cluster information. 4. Reference the Heterogeneous FA Port Sharing section of Director Bit Information. 5. Microcode level 5x66 and above.
5. The 200-561-9XX, and 200-563-9XX FA director familys support a total of 256 LUNs per FA port. (Hewlett Packard Alpha Tru64 supports 255 LUNs.)
6. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
7. EMC DS-16B2 for "Extended Fabric License", use minimum 3.0.2f firmware, 1 ISL per quad only.
8. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized
9. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
10. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
11. This HBA is equivalent to the qLogic QLA2340
12. This HBA is equivalent to the qLogic QLA2310

1. All adapters must be the same type except with HP-UX.
2. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
3. Single HBA zoning is required regardless of the switch being utilized.
4. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.
5. Requires Brocade firmware v2.5.1b or later.
6. EMC DS-16B2 for "Extended Fabric License" , use minimum 3.0.2f firmware, 1 ISL per quad only.
7. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
8. Requires Brocade firmware v3. 0. 2a or later.
9. **Supported with QLogic driver v6.04.02 or v6.05.00.**
10. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath. Booting from EMC storage arrays is NOT supported with PowerPath.
11. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
12. Requires Connectrix microcode v2.0.1 or later or v2.2 or later.
13. **Host must be offline for CLARiiON-licensed (Flare) upgrade and Storage Processor replacement.**
14. **Host must be offline for interfamily Symmetrix microcode upgrade.**
15. **QLogic v6.x series drivers and Emulex driver v4.20Q support persistent binding and only support Class 3.**
16. FC-AL direct-connect or McData fabric connect only. Brocade fabric attach is not currently supported.

1. For Switch Firmware levels and other fabric parameters, see Switched Fabric Topology parameters.
2. "FA Port Sharing" allows any OS/HBA designated with a "Y" (for Yes) to safely share a Symmetrix FA port with any other OS/HBA designated with a "Y" provided all of the following requirements are met (Note: "N" for No means this host cannot share an FA port with any different OS/HBA): 1. ESN Manager is required to prevent sharing Symmetrix devices between Operating Systems on a single FA port. 2. Fanout/Fanin is restricted to the lowest Host/HBA support as called out in this table. Example: Windows 2000 using the QLA2200F, which has a Fanout/ Fanin of 12:1/1:12 and Netware using the QLA2200F, which has a Fanout/Fanin of 6: 1/1:6. The Fanout/Fanin is restricted to 6:1/1:6. 3. See appropriate host matrices for approved drivers, BIOS, firmware, boot and cluster information. 4. Reference the Heterogeneous FA Port Sharing section of Director Bit Information. 5. Microcode level 5x66 and above.
3. The Sun Solaris sd driver is unable to configure a lun addresses greater than 255
4. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
5. EMC DS-16B-00 contains multi-mode GBICs (850 nm Fibre Channel) "Extended Fabric License" feature can be utilized. EMC DS-16B-02 contains multi-mode GBICs (1310 nm Fibre Channel) "Extended Fabric License" feature can be utilized.
6. See Switched Fabric Topology Parameters for switch firmware levels.
7. EMC DS-32B2 or ED-12000B for "Extended Fabric License" use minimum 4.0.2a firmware, 1 x L1 or 2 x L2 ports per quad only.
8. EMC DS-16B2 for "Extended Fabric License" , use minimum 3.0.2f firmware, 1 ISL per quad only.
9. No boot support at this time.

1. For driver versions refer to Base Connectivity Section
2. For HP-UX systems only.LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be enabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set
3. On HP-UX 11.00 LVM support only - no VxVM

4. Symm 6 is qualified with: HP-UX 11i Support Plus Sept '02 bundle = GOLDAPPS11i June '02, GOLDBASE11i June '02 & HWEnable11i Sept '02.
5. Symm6: 512 lun limit per FA port
6. FCAL on Symm 6 supported by direct attach only
7. PowerPath 3.0.1, HP-UX 11i, Symm6 support: VxVM 3.2 is supported; VxVM 3.5 currently not supported.
8. Symm 6 is qualified with: HP-UX 11.00 Support Plus Sept '02 bundle = QPK1100 Sept '02 & HWE1100 Sept '02
9. For driver versions, see Hewlett-Packard Base Connectivity table
10. Qualified with: HP-UX 11.00 Support Plus Sept '02 bundle = QPK1100 Sept '02 & HWE1100 Sept '02; HP-UX 11i Support Plus Sept '02 bundle = GOLDAPPS11i June '02, GOLDBASE11i June '02 & HWEnable11i Sept '02.
11. FC-AL topology attaches to DMX supported with direct attach only
12. Supported with HP-UX 11.0, 11i only
13. Sites using VERITAS VxVM, see VERITAS Volume Manager Table.

1. EMC strongly recommends that HBAs of different vendors not be used in the same host server
2. ATF/CDE and PowerPath cannot co-exist in the same server
3. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com
4. (HHBA-5101BK-01)
5. (QLA2200) For IBM xSeries and Netfinity servers only
6. The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC, HP part number D6975A, must be ordered separately from HP.
7. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support

8. This HBA is equivalent to the qLogic QLA2340

Microsoft Windows NT

Microsoft Windows NT			
No.	Operating System	Host Bus Adapter	Application Software
1	Microsoft Windows NT 4.0 SP6A[1]	Emulex: LP8000-EMC[2], LP850-EMC, LP9002-E (LP9002L-E), LP9802-E, LP9802DC-E, LP982-E; HPQ: 176479-B21, A5246A (Agilent HHBA-5000A)[1], D8602A (Agilent HHBA-5101B)[1, 3], D8602B (Agilent HHBA-5101C)[1, 4], KGPSA-CB, KGPSA-CY IBM: 00N6881 (QLA2200)[5], 24P0960(QLA2340)[6] QLogic: QLA2200F-EMC, QLA2310F-E-SP, QLA2340-E-SP, QLA2342-E-SP; Unisys: FCH20111-P64 (LP8000-D1), FCH20113-P64 (LP8000-EMC, LP8000-F1)	PowerPath: 3.0.0, 3.0.1, 3.0.2

1. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
2. The LP8000-EMC HBA has a permanent GBIC and does not have copper cable support.
3. (HHBA-5101BK-01)
4. The HP D8602B Tachlite Fibre Channel HBA does not come standard with a GBIC. An optional shortwave optical GBIC, HP part number D6975A, must be ordered separately from HP.
5. (QLA2200) For IBM xSeries and Netfinity servers only
6. This HBA is equivalent to the qLogic QLA2340

Novell Netware

Novell Netware			
No.	Operating System	Host Bus Adapter	Application Software
1	Novell Netware: 5.00 SP6A[1, 2], 5.10 SP2A[1], 5.10 SP5[1], 5.10 SP6	QLogic: QLA2200F-EMC, QLA2310F-E-SP, QLA2340-E-SP	PowerPath: 2.1.0, 2.1.1
2	Novell Netware: 5.00 SP6A[1, 2], 5.10 SP2A[1], 5.10 SP5[1], 5.10 SP6, 6.0 SP1[1], 6.0 SP2[1], 6.0 SP3	QLogic: QLA2200F-EMC, QLA2310F-E-SP, QLA2340-E-SP	PowerPath 3.0.1

1. Maximum number of NWFS volumes that can be mounted is 64.
2. Requires NWPA.NLM V.3.07A update from Novell website

Red Hat Linux

Red Hat Linux			
No.	Operating System	Host Bus Adapter	Application Software
1	Red Hat Linux 2.1 Advanced Server: v2.4.9-E.10[1, 2], v2.4.9-E.12[1, 2], v2.4.9-E.16; Red Hat Linux 2.1 ES: **v2.4.9-e.12**[1, 2], v2.4.9-e.16[1, 2]	Emulex: LP9002-E (LP9002L-E), LP9802-E, LP9802DC-E, LP982-E; QLogic: QLA2200F-EMC, QLA2310F-E-SP, QLA2340-E-SP, QLA2342-E-SP	PowerPath 3.0.2 b069

1. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath.
   Booting from EMC storage arrays is NOT supported with PowerPath
2. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ.

SuSE Linux

SuSE Linux			
No.	Operating System	Host Bus Adapter	Application Software
1	SuSE Linux SLES 8 v2.4.19-SuSE 175[1, 2]	QLogic: QLA2200F-EMC, QLA2310F-E-SP, QLA2340-E-SP	PowerPath 3.0.3 b065

1. Requires QLogic v6.04.02 driver
2. Requires rev3 sles8.patch available from ftp://ftp.emc.com/pub/elab/linux.

Sun Solaris

Sun Solaris			
No.	Operating System	Host Bus Adapter	Application Software
1	Sun Solaris 2.6	Emulex: LP8000-EMC[1], LP9002-E (LP9002L-E), LP9002S-E, JNI: FC64-1063-EMC, FCE-1063-E, FCE2-1063-E; QLogic: QLA2200F-EMC	PowerPath 3.0.2
2	Sun Solaris 2.6	Emulex: LP8000-EMC[1], LP9002-E (LP9002L-E), LP9002S-E, JNI: FCE-1063-E, FCE2-1063-E; QLogic: QLA2200F-EMC	PowerPath: 3.0.3, 3.0.4, **4.0.0**[2, 3], **4.0.1**[3]
3	Sun Solaris 7	Emulex: LP8000-EMC[1], LP9002-E (LP9002L-E), LP9002DC-E, LP9002S-E; JNI: FC64-1063-EMC, FCE-1063-E, FCE2-1063-E, FCE2-1473-E, FCE2-6412-E, FCX2-6562-E; QLogic: QLA2200F-EMC, QLA2202FS-E, QLA2342-E-SP	PowerPath 3.0.2

1. EAN bit set for 2 Gb FA support
2. Direct connect only, no hubs.
3. Subject to IBMs limitations per host model
4. Sites with PowerPath 2.0 or later already running with the D-bit enabled do not require the D-bit to be disabled.
5. D Bit required with PowerPath 1.5.x or earlier.
6. **Tru64 V5.1B latest qualified Patch Kit 2 (T64V51BB22AS0002-20030415).**
7. Tru64 V5.1A latest qualified Patch Kit-0004 (T64V51AB21AS0004-20030206)
8. **Tru64 V5.1 latest qualified Patch Kit-0006 (T64V51B20AS0006-20030210).**
9. Requires RPQ
10. Open VMS 7.3 FC-SW requires console firmware 5.6 or later and patch VMS73_update-V0100 or patch VMS73_fibre_SCSI-V0200
11. Open VMS 7.2-2 FC-SW requires console firmware 5.6 or later and patch VMS722_fibre_SCSI-V0100
12. OpenVMS 7.2-1, 7.2-1H1 FC-SW requires console firmware 5.6 or later and patch VMS721_fibre_SCSI-V0400 Available from http://ftp1.support.compaq.com/public/
13. Open VMS 7.1-2 requires console firmware 5.6 or later and patch VMS712_SCSI-V0300
14. C + D Bits with Veritas DMP.
15. For HP-UX systems only.LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set
16. A4S bit when sharing AS/400 drives on this port (direct connect only)
17. Requires OV/K/00411 3
18. This kernel is supported with PowerPath v3.0.2 b069. Driver v6.04.00 or above must be used with Qlogic HBAs and Powerpath. Booting from EMC storage arrays is NOT supported with PowerPath
19. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ
20. Requires rev2. sles7upg2418.patch available from ftp://ftp.emc.com/pub/elab/linux
21. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ
22. EMC supports the following filesystems: ext2, ext3, reiserfs. If there is a customer requirement for a different filesystem, please submit an RPQ
23. Requires rev1. sles7.patch available from ftp://ftp.emc.com/pub/elab/linux for CLARiiON attach only
24. Supported with QLogic driver v6.04.02

25. EMC strongly recommends that HBAs of different vendors not be used in the same host server.
26. D Bit for multiple vendor platforms, if only NCR hosts, set IMPL flag A010.
27. E Bit: if Windows NT OS is used with TNT, set the FBA Environmental Sense key to 4, else set it to 6.
28. Limited support available for MPARS 3.01.
29. Maximum number of NWFS volumes that can be mounted is 64.
30. D Bit with Cluster.
31. Requires NWPA.NLM V.3.07A update from Novell website.
32. C Bit required for VERITAS VxVM DMP functionality.
33. Set bit for HP (e.g.: D8602A, D8602B / Agilent (e.g.: HHBA-5101B, HHBA-5101C) controllers only.
34. C + D + SCL Bits with SUN Cluster 1.x, 2.x.
35. C Bit with Sun Cluster 3.0.
36. Enabling the D-bit for DMP is recommended but not required for VxVM 3.1 and higher. The D-bit is not requried for VxVM 3.1 and higher.
37. This host supports only 5 V HBAs.
38. 64-bit HBAs will not fit into the 32-bit slot due to a physical obstruction.
39. D Bit is not required for VCS 2.0 or later.
40. These settings refer to the configuration in the Switch section (see FA Port Sharing column) Note: operating environments that have required director bit settings other than these are not supported.
41. Note: With the introduction of EMC Solution Enabler 5.0, FA ports need not use the 'Heterogeneous FA Port Sharing' flags. Instead, users can use the CLI function 'Heterogeneous Host Configuration' to set the director flags for each initiator.
42. No longer available

1. For Symmetrix 8000 series, 5x66/ 5x67 patch 12160 OR minimum code levels 5267.24, 5567.31, 5266.39, or 5566.40
2. Nortel Optera Metro 5200 VLAN.
3. MSCS multi cluster configurations supported. If multi-clusters using Fibre Channel HBAs are configured to use a single FA port, use ESN Manager for LUN masking with the following minimum microcode: 5267.39, 5567.46, 5568.39.
4. EMC recommends a minimum of 1GB RAM for servers in clusters. EMC requries that servers have a minimum of 512MB or RAM.
5. Refer to Microsoft Windows Cluster table for information on supported host servers and qualified HBAs
6. VLAN Nortel BGS switches with 200 km single mode fiber spool using one of the wavelengths of a Cisco ADVA DWDM configuration.
7. MSCS 1.0 supported Host platforms supported
8. Symmetrix 8000 Series only.
9. See Fibre Channel SRDF Connectivity Options table & Extended Distance Connectivity Devices table.
10. Requires minimum microcode level of 5669.45.24 for Symmetrix DMX storage arrays.
11. Symmetrix DMX series only.
12. Compaq servers that are rack-mountable (designated by Compaq with an "R") are supported.
13. Includes both Pentium PRO and XEON models
14. Booting off of an EMC storage array is not currently supported with the HPQ BL20P.
15. BIOS must be obtained from HP at http://h18000.www1.hp.com/products/servers/proliant-bl/p-class/20p/index.html instead of BIOS on Qlogic web site. EMC NVRAM settings must be configured manually. Refer to EMC Fibre Channel documentation for QLogic HBAs for the settings.
16. PowerEdge 2550 supports a maximum of 2 Emulex HBAs at one time and the total PCI power cannot exceed 20 Watts.
17. Must use standard PCI 32bit/33MHz slot for SCSI

HPQ HP-UX								
No.	Dispersed Cluster	Cluster Software	Max # Nodes	Operating System	Topology	Maximum Distance	Application Software	Comments
4	Legato Automated Availability for EMC SRDF 4.7	Legato LAAM (Legato Cluster): 4.7, 4.8	8	HPQ HP-UX 11.0[2, 3]	FC-SW	60 km	EMC Solutions Enabler 4.2[3]	See[1]
5	Legato Automated Availability for EMC SRDF 5.0 5.0[17]	Legato Automated Availability Manager (LAAM) 5.0 (Base)[17, 18]	8	HPQ HP-UX 11.0[2]	FC-SW[19]	200 km	EMC Solutions Enabler 5.0.1	See[13, 16]

1. See Fibre Channel SRDF Connectivity Options table in Fibre Channel SRDF Connectivity section and Fibre Channel Extended Distance Solutions table in Distance Extension Solutions section.
2. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set.
3. See Legato User Guide Section G: EMC/SRDF Module (http://www.legato.com).
4. See HP Release Notes for further details (http://docs.hp.com)
5. (1 Hop)/ Unlimited (2 Hop)
6. Refer to the HP Release Notes for restrictions.
7. Symmetrix microcode supported:5266.40.28 or higher, 5566.41.28 or higher, 5267.27.19 or higher, 5567.34.19 or higher.
8. Synch. mode only 1 Hop
9. Synch. or Asynch. 2 Hop
10. Refer to MC/Service Guard Release Notes at www.docs.hp.com for patch requirements.
11. Can mix HP-UX 11.00 and HP-UX 11i in same cluster, all nodes must be MC/SG 11.09, 11.13 or later.
12. VLAN Nortel BGS switches with 200 km single mode fiber spool using one of the wavelengths of a Cisco ADVA DWDM configuration.
13. Synch. mode only
14. Multi-Hop
15. Symmetrix microcode version: 5266.33.23 or higher, 5566.35.23 or higher, 5267.22.15 or higher, 5567.29.15 or higher.
16. Asynch. mode requires RPQ.
17. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24 or 5568.58.12
18. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26.19s.
19. Maximum 8 nodes in the topology

12. Asynch. mode requires RPQ.
13. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5567.46.24 or 5568.58.12
14. Maximum 8 nodes in the topology
15. LAAM (Legato Cluster) with SRDF integration requires minimum microcode level 5x66.26.19s
16. Supported with microcode 5x65 and 5x66
17. Supported with Symmetrix 4.8 and 5.0
18. See EMC Release Notes for important configuration information
19. This version does not support Qlogic HBAs
20. Solaris 7 patch 106541-11.
21. Jaycor HBA & driver must set failover parameter to greater than 0
22. The distance quoted are the maximum distances based on direct connection. Any patch panel, low-grade cables, and connectors will reduce the distance. Power measurements are required to determine the possible distance per installation.
23. Multiple RA groups are not supported
24. Supported with microcode versions 5x66, 5x67,5x68
25. Supported with Symmetrix models 4.8, 5.x
26. Supported with Symmetrix 5.x and DMX
27. Supported with 5x67, 5x68,and 5x69 microcode revisions

CLARiiON FC5300 and FC4500

For CLARiiON FC5300 and FC4500 support, look at the FC4700 section and check the footnotes for model/microcode compatibility.

CLARiiON FC4700

Base Connectivity

Do not use a LUN in the CLARiiON DAE2-ATA as a host OS boot device.Do not use a LUN in the CLARiiON DAE2-ATA as a host OS boot device.Windows NT/Windows 2000/2003 Servers (Fibre Channel/SCSI) Boot CAUTION: Microsoft Windows NT uses virtual memory paging files that reside on the boot disk by default. Please refer to the information contained in Microsoft Knowledge Base article Q305547. The article explains how Microsoft supports booting Windows systems through a SAN (storage area network.) Although this article specifically mentions Windows 2000, the information also pertains to Windows NT 4.0 systems booting through a SAN. EMC recommends shutting down the host server during maintenance procedures that could cause the boot disk to become unavailable to the host. If the paging file is unavailable to the operating system for a minimum of 10 seconds, a crash can occur.

DG DG/UX

DG

DG – DG DG/UX							
No.	Host System	Host Bus	Operating System	Host Bus Adapter	Adapter Type	External Boot	Comments
1	AViiON: AV25000, AV35000[8, 9], AV3750	PCI	DG DG/UX R4.20MU07[3, 4]	Emulex LP8000-EMC[14]	FC-AL, FC-SW	N	See[1, 2]
2	AViiON: AV25000, AV35000[8, 9], AV3750	PCI	DG DG/UX R4.20MU07[3, 4]	Emulex LP8000-F1[10, 11, 12, 13]	FC-AL, FC-SW[5, 6, 7]	N	See[1, 2]
3	AViiON: AV25000, AV35000[8, 9], AV3750	PCI	DG DG/UX R4.20MU07[3]	Emulex LP8000-EMC[14]	FC-SW[5, 6, 7]	N	See[15]

1. For more information see http://athena.europe.dg.com
2. Optical cables apply to CX600, CX400, CX200, FC4700, FC4500, FC5300 with MIA.
3. FC4700 is only supported on DG/UX 4.20 MU07.
   Maximum of 2 fabrics, each with a maximum of 4 switches.
   Maximum of 4 FC4700s per fabric.
   Maximum of 16 HBAs per fabric.
   Maximum of 32 HBAs per FC4700 SP.
   Maximum of 6 DG/UX servers per FC4700.
   Maximum of 4 HBAs per AV3750 server (2 per fabric).
   Maximum of 4 HBAs per NUMA block (2 per fabric in non-clustered environments).
   FA4500 may be mixed within the same fabric with FC4700 running Access Logix, but must be separately zoned.
4. The release notice for DG/UX (included with the software release at path: "/usr/release/dgux*.rn) lists supported platforms.
5. DS-8B or DS-16B switches only; qualified with firmware v2.1.4a, v2.2, and v2.3.
6. FC4700 clusters must use FC-SW mode and switches.
7. Support for FC4500, FC4700, and FC5300.
8. ClarAlert is available to support FC4700 on AViiONs. ClarAlert is not compatible with other AViiON management software on the Navisphere management workstation.
9. AViiON 25000/35000 servers are not supported for direct server connections to FC4700.
10. Requires firmware 3.20x4 using the native driver.
11. Only the Brocade FC switch connection is supported. Connectrix FC switch is not supported.
12. FC-AL support requires LP8000 BIOS version DB1.60A7 and firmware version DS3.20x4.
13. DG/UX automatically loads the firmware and BIOS onto the Emulex HBA during boot-up as needed. Current DG/UX R4.20MU06 OS supported firmware is V3.20x1 and BIOS V1.4.
14. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
15. All installations currently require an RPQ with diagrams and revisions noted. Support for Core Array software is frozen at v8.42.10/60 for DG/UX systems.

1. Dx90, Rx90 servers support a maximum of 2 A6684A HBAs. The first must be installed in the turbo slot 10/12 and the second in any HSC slot.
2. With HP-UX 11.0, a failed-over LUN is not automatically restored to its parent SP following LCC removal and replacement on an FC4702 array. After the LCC has powered back up, the LUN can be restored by deactivating and activating the associated volume group using the command 'vgchange -a'. During other types of failover (disabling/reenabling SP ports on switch, etc.), the LUN "is" automatically restored.
3. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set.
4. The Brocade (Brocade, EMC, or HP models) switch port the HBA involved in a FC-SW topology boot process or FC-SW topology dump process is attached to, is required to be locked as G port when the boot or dump volume resides on the Symmetrix. This can be accomplished by executing the "portCfgGport port number,1" command from a telnet session on the Brocade switch.The boot device can not be located more than two hops from the initiator involved in the boot process.
5. See Technical Bulletin T010820 for supported patch levels.
6. Requires minimum PDC firmware 42.10.
7. **Dx90, Rx90 require minimum PDC firmware 41.35 or higher to support boot.**
8. See Technical Bulletin T010820 for LVM supported patch levels.
9. HP-UX 11.0 minimum driver revision B 11.00.06. HP-UX 11i minimum driver revision B.11.11.06.
10. Required dependent FCMS patches are required (patches may be superceded or have co-dependencies as defined by HP): HP-UX 11.0, PHKL_21834 HP-UX 11i: PHKL_23626.NOTE: These patches must be installed before installing the driver, available at http://us-support2.external.hp.com, HSC Tachlite driver available at http://www.software.hp.com, under "drivers" and locate Fibre Channel HSC Tachlite adapter (A6684A or A6685A).For HP-UX 11i, the driver is under "hp tachyon tl fibre channel adapter" which enables support for A6684A/A6685A/A5158A.
11. For HP/UX 10.20 Driver J3630BA is required for A3404A, A3591A/B, A3740A, A6684A and A6685A adapters.
12. Dx90, Rx90 require minimum PDC firmware 41.35 or higher.
13. For HP-UX systems only:LVM Bad block reallocation (BBR) should be disabled and the LVM mechanism for marking blocks defective when a medium error is returned should be disabled for all HP LVM logical volumes residing on EMC Symmetrix devices. This can be accomplished by utilizing the upper case "N" flag when creating the logical volume or with the lvchange command. Examples: lvchange -r N /dev/vg01/lvol1 or lvcreate -r N /dev/vg01. The exception to this rule is if the logical volume is host mirrored using HP Mirror-UX, then this flag should not be set. No additional patches are required for this option in HP-UX 11.0, HP-UX 11.11 and forward. however in HP-UX 10.x the "N" flag option was introduced with the following patches are required to be installed or patches which supercede or replace these in order to configured the logical volumes residing on Symmetrix devices in this manner: For all HP/UX 10.xx versions install the following Bad Block Reallocation Patch Pair: 10.01: PHKL_11294, PHKL_11890, PHCO_11288 (patches may be superseded or have co-dependencies as defined by HP). 10.10: PHKL_11816, PHCO_11817 (patches may be superseded or have co-dependencies as defined by HP). 10.20: PHKL_11086, PHKL_11903, PHCO_10964 (patches may be superseded or have co-dependencies as defined by HP).
14. FC-AL
15. Symm 6 is qualified with: HP-UX 11.00 Support Plus Sept '02 bundle = QPK1100 Sept '02 & HWE1100 Sept '02
16. FC-AL, FC-SW topologies can co-exist on the same server but not on same HBA, provided that different topologies are attached to different HBAs.
17. Qualified with only CX600, CX400, FC4500 and FC4700 with the switches listed in connectivity table, fabric or QuickLoop.
18. Requires minimum PDC firmware 41.33.
19. The A6685A is not supported in slots 10/0 and 10/8 of the K570 and K580. In the K570 and K580, there are restrictions for the number of A6685A HBA cards supported when graphics cards are installed.
20. HP-UX 11.00 minimum driver revision B.11.00.06.
    HP-UX 11i minimum driver revision B.11.11.06.
    HP-UX 10.20 minimum driver revision B.10.20.01.
21. HP-UX 10.20 requires patches (patches may be superceded or have co-dependencies as defined by HP):
    PHKL_16751, PHKL_17590 , PHSS_23581
    NOTE: These patches must be installed before installing the driver, available at http://us-support2.external.hp.com. HSC Tachlite driver available at http://www.software.hp.com, under "drivers" and locate Fibre Channel HSC Tachlite adapter (A6684A or A6685A).
    Depending on the patch level of the system, the following patches may be required:
    PHKL_16957PHKL_21595PHCO_16591PHSS_20999
    PHKL_17858PHKL_21661PHCO_18563PHNE_19936
    PHKL_20611PHKL_23419PHCO_21186
    Installation instructions available at:
    http://www.software.hp.com/cgi-bin/swdepot_parser.cgi/cgi/displayProductInfo.pl?productNumber=A6685A&oper=install
22. Qualified with only CX600, CX400, FC4500 and FC4700 with the switches listed in Table 112 on page 293, fabric or QuickLoop.
23. HP A5158A FC-SW software requirement: FC-AL and FC-SW requires the HP A5158A Tachlite PCI Fibre Channel Adapter. The A5158A FC-SW software fabric driver version "AP0301" for HP-UX 11i is now available for download from HP's software depot site, http://www.software.hp.com under "drivers" . It is referred to as the "hp pci tachyon tl fibre channel adapter", and requires the installation of dependent patch PHKL_22874 prior to installing the fabric driver, patches may be superceded or have co-dependencies as defined by HP.
24. QuickLoop only or direct attach only.
25. **FC-AL boot with PDC rev TSSW 3.2.1, PDC_ENTRY version: 4.3.4.0 or higher.**
    FC-SW boot with PDC rev TSSW 3.2.1 or higher, PDC_ENTRY version: 4.3.4.0 or higher.
26. Virtual Partitions (VPAR) is supported on the N-class/rp7400 server.
    VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later.
    Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B 11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 42.06 or later. Powerpath support on Virtual Partitions has to be RPQed at this time.
27. N-Class: Arbitrated loop boot with PDC rev 40.04 or higher.Fabric boot with PDC rev 40.25 or higher.
28. Boot initialization negotiation at 1 Gb mode for Brocade switches.
    FC-SW - HBA port on the switch must be locked as a "G" port and locked in auto-negotiation mode
    FC-AL direct attach 2-Gbit boot using A6795A is not supported.
    FC-SW 2-Gbit boot and/or dump using A6795A requires Auto-Negotiation flag to be enabled on the switch port the HBA is attached to.
30. FC-AL direct attach boot support only at 1 Gb. Requires the boot device port to be configured for 1 Gb operation.
31. PDC firmware 41.39 or higher. Arbitrated Loop (direct attach) or FC-SW
32. For HP/UX 11.00, minimum driver revision B.11.00.06
33. Switched fabric (FC-SW) first supported on FC4500, requires Core Software 6.32.05 or higher, Navisphere Agent 4.3 or higher, and Access Logix enabled (data access control enabled).
34. Supported with CX600, CX400, FC4700. FC4700-2 supports 1 and 2 Gb modes. Restrictions apply in boot environments.
35. HP-UX 11.0 ACE required patch: PHKL_23939
    HP-UX 11i required patch: PHKL_23626
    NOTE: These patches must be installed before installing the driver
36. HP-UX driver requirements: HP-UX 11.0 , A6795A HP PCI Tachyon TL/XL2 Fibre Channel driver B.11.00.10 or later release which supports this HBA. HP-UX 11i : A6684A/A6685A/A5158A/A6795A HP Tachyon TL/XL2 Fibre Channel driver B.11.11.09 or later release which supports this HBA.
37. Minimum driver version for SNIA HBA API support with HP-UX 11.0 is B.11.00.10. Minimum driver version for SNIA HBA API support with HP-UX 11.11 is B.11.11.09
38. QuickLoop support: HP A5223A/AZ, HP A5224A/AZ using parameters outlined in connectivity table.
    The A6795A HBA is capable of supporting both 1 and 2 Gb speeds
    QuickLoop is not supported with Brocade 3900/12000, or ED-12000B.
    Auto-sensing capability on the HBA is permanently enabled. There is no option to disable auto-sensing on the HBA

    All switch ports participating in the Quickloop must be set to 1 GBit speed.
39. Supported with HP-UX 11i (64-bit only). FC4700-2 minimum code level 8.44.x1
40. For HP/UX 11.00 minimum driver revision B 11.00.06.
    For HP/UX 11i minimum driver revision B 11.11.06.
41. rp5405, rp5430, rp5470, rp7400. (PA-8700 processors): Initial support with HP-UX 11.0 Sept 2001, 11i Sept 2001.
42. QuickLoop support: HP A5223A/AZ, HP A5224A/AZ using parameters outlined in Table 112 on page 293
    The A6795A HBA is capable of supporting both 1 and 2 Gb speeds.
    QuickLoop is not supported with Brocade 3200/3800/12000, DS-16B2 or ED-12000B
    Auto-sensing capability on the HBA is permanently enabled. There is no option to disable auto-sensing on the HBA
43. FC-AL, FC-SW
44. PDC 40.26 or later
45. L-Class requires minimum PDC firmware 40.26 or higher
46. Excludes the rp5470 (PA-8700)
47. Virtual Partitions (VPAR) is supported on the L-class/rp5470 server
    VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later
    Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B 11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 41.02 or later

48. PA-8700 processors: Initial support with HP-UX 11.0 Sept 2001. HP-UX 11i Sept 2001.
49. PDC firmware 15.5 or later
50. Virtual Partitions (VPAR) is supported on the rp7405 server with 4.x and 5.x Symmetrix models. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.02.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 4.0 or later.
51. Requires minimum PDC firmware 16.09 or higher
52. **Virtual Partitions (VPAR) is supported on the rp7405/7410 server with 4.x and 5.x Symmetrix models and DMX Series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.02.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 4.0 or later.**
53. HP A5158A FC-SW software requirements: FC-AL and FC-SW requires the HP A5158A Tachlite PCI Fibre Channel Adapter. The A5158A FCSW software fabric driver version "AP0301", for HP-UX 11i is now available for download from HP's software depot site, http://www.software.hp.com under "drivers". It is referred to as the "hp pci tachyon tl fibre channel adapter", and requires the installation of dependent patch PHKL_22874 prior to installing the fabric driver, patches may be superceded or have co-dependencies as defined by HP.
54. Qualified on FC4500 and later. Requires Access Logix 6.32.11 (FC4500) or 8.42.5x (FC4700) or higher with data access control enabled and Navisphere Agent 5.2 or higher.
55. Fabric SAN boot supported.
56. Requires minimum PDC firmware 42.09
57. Requires minimum PDC firmware 32.2 and PDHC 7.3 or higher
58. HP-UX 11.00 minimum driver revision B.11.00.06
    HP-UX 11i minimum driver revision B.11.11.06.
59. HP-UX required patches: HP-UX 11.0 ACE: PHKL_23939, HP-UX 11i: PHKL_23626
60. Supported with CX600, CX400, FC4500 and FC4700. FC4700-2 supports both 1GB and 2GB modes. Restrictions apply in a boot environment.
61. rp7400 A5158A requires: HP-UX 11i minimum driver version B11.11.06 or higher. HP-UX 11.0 minimum driver version B11.00.06 or higher. rp8400 A5158A requires: HP-UX 11i minimum driver version B11.11.06 or higher
62. Direct attach only
63. Requires PDC firmware rp7400 (PA-8700) requires PDC firmware 41.36
64. HP-UX driver requirements: HP-UX 11.0: A6684A/A6685A/A5158A/A6795A HP PCI Tachyon TL/XL2 Fibre Channel driver B.11.00.10 or later release which supports this HBA.
65. Qualified with only CX600, CX400, FC4500 and FC4700 with the switches listed in connectivity section, fabric or QuickLoop.
66. HP-UX 11.0 minimum driver revision B.11.00.06. HP-UX 11i driver revision B.11.11.06.
67. QuickLoop support: HP A5223A/AZ, HP A5224A/AZ using parameters outlined in connectivity table.
    The A6795A HBA is capable of supporting both 1 and 2 Gb speeds.
    QuickLoop is not supported with Brocade 3200-3800/12000, DS-16B2 or ED-12000B.
    Auto-sensing capability on the HBA is permanently enabled. There is no option to disable auto-sensing on the HBA.
68. Requires minimum PDC firmware 42.06
69. Qualified with only CX600, CX400, FC4500 and FC4700 with the switches listed connectivity table, fabric or QuickLoop.
70. 1GBit Quickloop supported beginning at firmware release v3.0.2h: all switch ports participating in the Quickloop must be set to 1 GBit speed.
71. QuickLoop support: HP A5223A/AZ, HP A5224A/AZ using parameters outlined in connectivity table.
    The A6795A HBA is capable of supporting both 1 and 2 Gb speeds.
    QuickLoop is not supported with Brocade 3900/12000, or ED-12000B
    Auto-sensing capability on the HBA is permanently enabled. There is no option to disable auto-sensing on the HBA.
72. Virtual Partitions (VPAR) is supported on the rp8400 server with the Clariion CX600 and FC4700.
    FC-AL only support, Requires PDC 16.009 or later

    VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later
    Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or
73. Virtual Partitions (VPAR) is supported on the rp8400 server with the Clariion CX600 and FC4700.
    FC-AL only support, Requires PDC 16.009 or later

    VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later
    Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later
74. rp8400 requires minimum PDC firmware 13.10 or higher.
75. Virtual Partitions (VPAR) is supported on the rp8400 server with 4.x and 5.x Symmetrix models and DMX Series. VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later. Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 4.0 or later.
76. 1GBit Quickloop supported beginning at firmware release v3.0.3h, all switch ports participating in the Quickloop must be set to 1 GBit speed.
77. FC-AL for FC4700 requires Base Software or Access Logix 8.42.xx or higher.
78. HP-UX 11i minimum driver revision B.11.11.06.
79. Virtual Partitions (VPAR) is supported on the N-class/rp7400 server
    VPAR supported only with HP-UX 11i v1.0 (HP-UX 11.11) Dec 2001 release or later.
    Requirements: Minimum VPAR product release of A.02.01.00 or later, Partition Manager B.11.11.01.05 or later, Online Diagnostic revision B.11.11.07.23 or later, server PDC firmware 42.06 or later.

HPQ Tru64 UNIX

1. Supported on CX600, CX400 and FC4700-2 only
2. KGPSA-CA/KGPSA-DA(FCA2354). Minimum firmware revision 3.81A4.
3. Identical to KGPSA-DA
4. KGPSA-CA/KGPSA-DA(FCA2354). Latest firmware revision 3.82A1
5. FC4700: Minimum AccessLogix 8.45.5x and Navisphere Manager 6.0.5.4.x
6. **Tru64 V5.1B latest qualified Patch Kit 2 (T64V51BB22AS0002-20030415).**
7. KGPSA-CA and KGPSA-DA(FCA2354) only supported on this server
8. Tru64 UNIX V5.1A minimum requirement for ES45
9. KGPSA-BC: Latest firmware revision 3.20X7
10. KGPSA-BC: Minimum firmware revision 3.03A1
11. Tru64 UNIX V5.1A minimum requirement for DS25.
12. KGPSA-BC/KGPSA-CA supported ONLY
13. **AlphaServer GS1280,ES80,ES47: Minimum Tru64 V5.1B with Patch Kit 1 (T64V51BB1AS0001-20021229)**

1. IBM 6227 and IBM 6228 adapters are supported on the same server. Mixed FC-AL and FC-SW are supported on the same server.
   6227 Filesets: devices.pci/df1000f7.com, devices.pci/df1000f7.diag, devices.pci/df1000f7.rte ;
   6228 Filesets: devices.pci/df1000f7.com, devices.pci/df1000f7.diag, devices.pci/df1000f9.diag, devices.pci/df1000f9.rte
2. Requires adapter firmware 3.22A1, CLArrayS3.4.3.0.x fileset support. Supports FC4700 with minimum Flare code 8.46.xx .
3. Includes support for FC4700, FC4700-2, CX600, CX400.
4. FC-SW and FC-AL are supported on the same server
5. **System/Service processor combined microcode Version 20020920 dated 11/19/2002 or later.**
6. **Minimum AIX 4.3.3 ML9, APAR IY22024**
7. **Minimum Powerpath version 3.0.2. For Powerpath patches 3.0.x, the bootfix.sh script is required for boot support. See the EMC Primus case ID emc58038 for more details and the PowerPath Release Notes for installation**
   Obtain the EMC CLARiiON and AIX Fibre boot document from avatar.eng.emc.com for installation and configuration instructions.
9. **For Powerpath version 3.0.3, minimum CLArray S3.4.3.0.8 version is required.**
10. **Fibre boot when used under AIX 4.3 requires APAR IY42989 which can be obtained from IBM at https://techsupport.services.ibm.com/server/fixes?view=pSeries.**
11. **System microcode CL020407 or later.**
12. **System/Service processor combined microcode Version SST01256/SS010614 dated 10/23/2001 or later.**
13. **System/Service processor combined microcode Version L02113/ag010611 or later.**
14. **System microcode CM020407 or later.**
15. **System microcode MM020407 or later.**
16. **System/Service processor combined microcode Version NAN02066/SC020308 dated 03/29/2002 or later.**
17. **System/Service processor combined microcode Version SPH02254/sh020307 dated 11/20/2002 or later.**
18. The following link provides detailed data for all 9076-SP2 models and feature codes:
    http://www1.ibmlink.ibm.com/cgi-bin/master?request=salesmanual&parms=SMS&xh=NTZH*daEMSRi4n1USenGnN9332&xhi=usa.main%7Csalesmanual%5E&type=D&search=9076&title=T&product
19. AIX 5.1-32/64 bit kernel supported. Requires CLArrayS3.5.1 fileset support.
20. Requires adapter firmware 3.22A1, CLArrayS3.5.1 fileset support. Supports FC4700 with minimum flare code 8.46.xx.
21. **AIX 5.1 ML1, APAR IY21957 or higher.**
22. **For Powerpath version 3.0.3, minimum CLArray S3.5.1.0.6 version is required.**
23. **Fibre boot when used under AIX 5.1 requires APAR IY40885 which can be obtained from IBM at https://techsupport.services.ibm.com/server/fixes?view=pSeries.**
24. IBM 6227 and IBM 6228 adapters are supported on the same server. Mixed FC-AL and FC-SW are supported on the same server.
    6227 Filesets: devices.pci/df1000f7.com, devices.pci/df1000f7.diag, devices.pci/df1000f7.rte ;
    6228 Filesets: devices.pci/df1000f7.com, devices.pci/df1000f7.diag, devices.pci/df1000f9.diag, devices.pci/df1000f9.rte
25. AIX 5.1 supported only with 32-bit kernel.
26. Requires CLARiiON proprietary fibre channel driver version 4.0.5.0 and HBA firmware 3.82a1
27. No support for the CX400 or CX600. Supports FC4500, FC4700, FC4700-2
28. See the EMC price book for vendor ordering information. This HBA is not sold by EMC. The EMC 4.0.5 driver is on UTIL-AIX.
29. The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.
30. Requires CLARiiON proprietary fibre channel driver version 4.0.5.0 and HBA firmware 3.20x4.
31. Requires a host PCI bus capable of supplying 3.3 VDC bus power. PCI slot can be either 3.3 VDC or 5.0 VDC signaling interface.
32. Requires minimum HBA firmware 3.82A1, CLArrayS3.4.3.0.x fileset support. Supports FC4700 with minimum Flare code 8.46.xx .
33. IBM Native Fibre Channel drivers with feature code 6227 and with feature code 6228 are supported on the same server. Feature 6228 and 6239 are supported on the same server. Mixed FC-AL and FC-SW are supported on the same server. 6227 filesets: devices.pci.df1000f7.com, devices.pci.df1000f7.diag, devices.pci.df1000f7.rte; 6228 filesets: devices.pci.df1000f7 com, devices pci.df1000f7.diag, devices.pci.df1000f9.diag, devices.pci.df1000f9.rte; 6239 filesets: devices.pci.df1000f7.com, devices.pci.df1000f7.diag, devices.pci.df1080f9 diag, devices.pci.df1080f9.rte
34. **System/Service processor combined microcode Version CLT02066/ct020307 dated 04/04/2002 or later.**
35. Requires minimum HBA firmware 3.82A1, CLArrayS3.5.1 fileset support. Supports FC4700 with minimum Flare code 8.46.xx .
36. **System/Service processor combined microcode Version RH020413 dated 05/22/2002 or later.**
37. Requires minimum AIX 5.1 maintenance level 02.
38. **System/Service processor combined microcode Version RR020822 dated 09/19/2002 or later.**
39. Requires adapter firmware 3.82A1, CLArrayS3.5.1 fileset support. Supports FC4700 with minimum Flare code 8.46.xx.
40. Requires AIX 5.1 with minimum maintenance level 03 APAR IY32749.
41. **System/Service processor microcode Version RK021120 dated 12/11/2002 or later.**
42. 32-bit kernel support only with AIX 5.1.
43. **Requires minimum HBA firmware 3.82A1. For all PCI-based hosts only: see HBA placement guidelines in the IBM document PCI Adapter Placement Reference SA38-0538-6, available at http://www-1.ibm.com/servers/eserver/pseries/library/hardware_docs/sa38/380538.pdf**
44. **Requires CLArrayS3.5.2.0.6**
45. **Fibre boot when used under AIX 5.2 requires APAR IY41028 which can be obtained from IBM at https://techsupport.services.ibm.com/server/fixes?view=pSeries.**
46. **System/Service processor combined microcode Version RK030206 dated 03/31/2003 or later.**
47. **Minimum microcode levels RH0 20413 dated 05/22/2002 or later.**
48. **Do not use a LUN in the CLARiiON DAE2-ATA as a host OS boot device.**
49. Requires minimum HBA firmware 1.00X5.
50. Requires AIX 5.1 with minimum maintenance level 04 APAR IY44478
51. Requires AIX 5.2 with minimum maintenance level 01 APAR IY44479.

Microsoft Windows 2000

EMC recommends shutting down the host server during maintenance procedures that could cause the boot disk to become unavailable to the host. If the paging file is unavailable to the operating system for a minimum of 10 seconds, a crash can occur.Events that could cause a system to crash when booting from external storage are:

1)Lost connection to external storage (pulled or damaged cable connection).
2)External storage service/upgrade procedures such as online microcode upgrades and/or configuration changes..
3)External storage director failures including failed lasers on Fibre Channel directors.
4)External storage power failure.
5)Storage area network failures such as Fibre Channel switches, switch components, and switch power failures.
6)Storage area network service/upgrade procedures such as firmware upgrades or hardware replacements.CAUTION: Microsoft Windows NT uses virtual memory paging files that reside on the boot disk by default. Please refer to the information contained in Microsoft Knowledge Base article Q305547. The article explains how Microsoft supports booting Windows systems through a SAN (storage area network.) Although this article specifically mentions Windows 2000, the information also pertains to Windows NT 4.0 systems booting through a SAN.

1. Windows 2000 Professional is supported as the management workstation.
2. **Requires driver 8.2.1.20, and bios 1.33 for Stratus ftServers. Supports SNIA HBA API. Available at http://www.qlogic.com.**
3. **Qlogic SANSurfer/SANBlade Manager is not supported.**
4. **For FC-AL, only direct attach is supported.**
5. **RPQ required for CX200.**
6. **FC-SW applies only to CX600, CX400, FC4500, FC4700, and FC5300. FC5300 with FC-SW available from selected channels.**
7. **CLARiiON FC4500 array is also supported for these configurations.**
8. **EMC strongly recommends that HBAs of different vendors not be used in the same host server.**
9. **The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.**
10. **Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. ATF/CDE not supported with driver 2.20a12. For ATF/CDE, use driver 2.11a2. Supports SNIA HBA API. Available at http://www.emulex.com.**

1. Windows 2000 Professional is supported as the management workstation
2. CX200 available through selected channels
3. Optical cables apply to CX600, CX400, CX200, FC4700, FC4500, FC5300 with MIA.
4. Access Logic required, direct connect or fabric, (no booting through switch inter-switch links)
5. If using ATF/CDE with Emulex, requires v2.1.5 or greater. Only Emulex driver 2.11a2 is supported with ATF.
6. If using ATF/CDE with QLogic, requires v2.1.6 or greater.
7. Supports PowerPath 3.0 or greater
8. No MirrorView or SnapView used on boot LUNs.
9. EMC recommends boot LUN be RAID1 or RAID5. Be sure to monitor the loading on the boot LUN RAID group. Excessive loading on the boot LUN RAID group may degrade boot LUN performance and stability
10. Refer to the Customer Service website or your EMC Service Personnel for the latest documentation
11. Previous versions of the HBA and boot installation guides contained restrictions for boot configurations. All boot configuration information is now listed here and supersedes any found in previous boot documentation
12. MSCS cluster configurations are supported with CX600, CX400 and FC4700
13. For any CLARiiON SP port configured to a host for booting, the maximum number of logical volumes allowed on that port is 32.
14. **Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. ATF/CDE not supported with driver 2.20a12. For ATF/CDE, use driver 2.11a2. Supports SNIA HBA API. Available at http://www.emulex.com.**
15. **The LP8000-EMC HBA has a permanent GBIC, and does not have copper cable support.**
16. **FC-SW applies only to CX600, CX400, CX200, FC4500, FC4700 and FC5300. FC5300 with FC-SW available from selected channels.**
17. **CLARiiON FC4500 array is also supported for these configurations.**
18. Requires driver 2.20a12, firmware 1.00a4, and bios 1.62a1. Supports SNIA HBA API. Drivers available at http://www.emulex.com.
19. CLARiiON CX200 NOTE: Requires 1.00x3 for direct-connect configurations only.
20. The Emulex LP9XXX HBA family requires a host PCI bus capable of supplying 3.3 VDC bus power. The PCI slot can use either 3.3 VDC or 5.0 VDC signaling interface.
21. Requires driver 8.2.2.25, and bios 1.34. Supports SNIA HBA API. Available at http://www.qlogic.com.
22. **If using ATF/CDE, requires 2.1.6 or greater.**
23. **PowerPath supported. ATF/CDE not supported.**
24. **EMC strongly recommends that HBAs of different vendors not be used in the same host server.**

25. QLogic 23xx, and Emulex LP9xxx families for use in servers running Pentium II and faster CPUs only (PII, PIII, etc.).
26. Requires driver version 2.20a12, firmware version 3.90a7, and BIOS 1.62a1. Supports SNIA HBA API. Available at http://www.emulex.com.
27. Requires driver 2.20a12, firmware 3.90a7, and BIOS 1.62a1. Emulex drivers are available at http://www.emulex.com. For Unisys servers, use driver 2.11a2 and firmware 3.90a7 available at http://www.support.unisys.com. Supports SNIA HBA API.
NOTE: LP8000/850 HBAs without -EMC label must have minimum rev. dragonfly 2.0 of the Emulex ASIC.

THE INFORMATION IN THIS PUBLICATION IS PROVIDED "AS IS." EMC CORPORATION MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WITH RESPECT TO THE INFORMATION IN THIS PUBLICATION, AND SPECIFICALLY DISCLAIMS IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

Use, copying, and distribution of any EMC software described in this publication requires an applicable software license.

Regulatory Agency Information

Connectrix B Series systems have been extensively tested and certified to meet UL60950, CSA 22.2 No 60950, IEC 60950/EN60950; Safety of Information Technology Equipment including Electrical Business Equipment, FCC Rules Part 15 Subpart B; CISPR22 Class A; European EMC Directive 89/336/EEC on, electromagnetic compatibility.

This class A digital apparatus complies with Canadian ICES-003.

Cet appareil numérique de la classe A est conforme à la norme NMB-003 du Canada.

Warning!
This is a Class A product. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.

Achtung!
Dieses ist ein Gerät der Funkstörgrenzwertklasse A. In Wohnbereichen können bei Betrieb dieses Gerätes Rundfunkstörungen auftreten, in welchen Fällen der Benutzer für entsprechende Gegenmaßnahmen verantwortlich ist.

Attention!
Ceci est un produit de Classe A. Dans un environnement domestique, ce produit risque de créer des interférences radioélectriques, il appartiendra alors à l'utilisateur de prendre les mesures spécifiques appropriées.

この装置は、情報処理装置等電波障害自主規制協議会（ＶＣＣＩ）の基準に基づくクラスＡ情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求されることがあります。

This equipment generates, uses, and may emit radio frequency energy. The equipment has been type tested and found to comply with the limits for a Class A digital device pursuant to Part 15 of FCC rules, which are designed to provide reasonable protection against such radio frequency interference.

Operation of this equipment in a residential area may cause interference in which case the user at his own expense will be required to take whatever measures may be required to correct the interference.

Any modifications to this device - unless expressly approved by the manufacturer - can void the user's authority to operate this equipment under part 15 of the FCC rules.

警告使用者:
這是甲類的資訊產品，在居住的環境中使用時，可能會造成射頻干擾,在這種情況下，使用者會被要求採取某些適當的對策。

Preface

As part of its effort to continuously improve and enhance the performance and capabilities of the EMC product line, EMC periodically releases new versions of the EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B Fabric OS. Therefore, some functions described in this guide may not be supported by all versions of EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B Fabric OS currently in use. For the most up to date information on product features, see your product release notes.

If an EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B feature does not function properly or does not function as described in this guide, please contact the EMC Customer Support Center for assistance.

Audience

This guide is part of the EMC Connectrix *Departmental Switch DS-32B2* and Enterprise Director ED-12000B documentation set, and is intended for use by system administrators during installation and configuration of the DS-32B2 and ED-12000B switches.

Readers of this guide are expected to be familiar with EMC Connectrix *Departmental Switch DS-32B2* and Enterprise Director ED-12000B operating environment.

Organization

Here is an overview of where information is located in this guide.

Chapter 1, *Introducing Web Tools*, provides an overview of Web Tools.

Chapter 2, *Web Tools Requirements*, provides instructions for installing Web Tools.

Chapter 3, *Managing the Fabric*, provides information about configuring and using Web Tools Fabric View.

Chapter 4, *Switch View*, provides information about configuring and using Web Tools Switch View.

Chapter 5, *Port View*, provides information about configuring and using Web Tools Port View.

Appendix A, *Customer Support*, provides the procedure for contacting EMC Corporation when you need help with the EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B.

The *Glossary* provides explanations for terminology used in this manual.

Related Documentation

Other documentation includes:

Conventions Used in this Guide

EMC uses the following conventions for notes, cautions, warnings, and danger notices.

A note presents information that is important, but not hazard-related.

CAUTION

A caution contains information essential to avoid data loss or damage to the system or equipment. The caution may apply to hardware or software.

WARNING

A warning contains information essential to avoid a hazard that can cause severe personal injury, death, or substantial property damage if you ignore the warning.

DANGER

A danger notice contains information essential to avoid a hazard that will cause severe personal injury, death, or substantial property damage if you ignore the message.

Typographical Conventions

EMC uses the following type style conventions in this guide:

Palatino, bold	◆ Dialog box, button, icon, and menu items in procedures ◆ Selections you can make from the user interface, including buttons, icons, options, and field names
Palatino, italic	◆ New terms or unique word usage in text ◆ Command line arguments when used in text ◆ Book titles
`Courier, italic`	Arguments used in examples of command line syntax.

Courier	System prompts and displays and specific filenames or complete paths. For example:
	`working root directory [/user/emc]:`
	`c:\Program Files\EMC\Symapi\db`

Courier, bold	User entry. For example: **`symmpoll -p`**
AVANT GARDE	Keystrokes

Where to Get Help

Obtain technical support by calling your local sales office.

For service, call:

United States:	**(800) 782-4362 (SVC-4EMC)**
Canada:	**(800) 543-4782 (543-4SVC)**
Worldwide:	**(508) 497-7901**

and ask for Customer Support.

If you are located outside the USA, call the nearest EMC office for technical assistance.

Sales and Customer Service Contacts

For the list of EMC sales locations, please access the EMC home page at:

`http://www.emc.com/contact/`

For additional information on the EMC products and services available to customers and partners, refer to the EMC Powerlink website at:

`http://powerlink.emc.com`

Your Comments

Your suggestions will help us continue to improve the accuracy, organization, and overall quality of the user publications. Please send a message to `techpub_comments@emc.com` with your opinions of this guide.

1 Introducing Web Tools

This chapter provides some general information on Web Tools.

Overview

Web Tools provides a graphical interface that allows you to monitor and manage entire fabrics and individual switches and ports from a standard workstation. All switches in the fabric are displayed in the main window of Web Tools, including switches that do not have a Web Tools license. However, only switches that have a Web Tools license installed can be managed through Web Tools. Other switches must be managed through Telnet.

Advantages of Web Tools

Web Tools is an excellent partner to the traditional Telnet commands, and in many ways can provide faster and more effective results than can be achieved strictly through a command line interface.

Below are some of the features that make Web Tools an important part of the switch management and administration process:

- You can use Web Tools from a standard workstation which provides you the advantage of being virtually in front of any fabric, switch, or port.
- Web Tools makes zoning a simple click-and-drag process, rather than forcing you to type IP addresses or port numbers into a configuration.
- Web Tools provides the Advanced Performance Monitoring feature. This feature allows you to view the status and traffic of a switch or port in seconds by easily creating a variety of effective graphs.
- Web Tools is easy and intuitive to use.

Capabilities of Web Tools

Web Tools provides the following information and capabilities:

- Monitoring and managing the entire fabric (see Chapter 3, *Managing the Fabric*).
- Monitoring and managing individual switches (see Chapter 4, *Switch View*).
- Monitoring and managing individual ports (see Chapter 5, *Port View*).

When monitoring and managing the entire fabric, Web Tools allows you to perform the functions described in Table 1-3.

Table 1-1 Web Tools Fabric Functions

View the status of all the switches in the fabric.	See *Using the Switch View* on page 4-2.
Access event logs for entire fabric.	See *Using the Fabric Events View* on page 3-3.
Set up and manage Zoning functions.	See *Administering Zones* on page 3-9.
Access to the Name Server Table.	See *Using the Name Server Table* on page 3-7.
Access Telnet functions.	See *Telnet Interface* on page 4-79.
Use switch beaconing for rapid identification of switches in large fabric environments.	See *Beacon* on page 4-6.

When monitoring and managing individual switches, Web Tools allows you to perform the functions described in Table 1-2.

Table 1-2 Web Tools Switch Functions

View summary information about each switch.	See *Using the Switch View* on page 4-2.
View event logs for individual switches.	See *Events* on page 4-4.
Perform switch configuration and administration.	See *Administrative Interface* on page 4-36, and *About the Switch Information Tab* on page 4-37.
Monitor Switch and port performance.	See *Performance Monitor* on page 4-24.
Use report capability for switch configuration information.	See *About the Extended Fabrics Tab* on page 4-72.

When monitoring and managing individual ports, Web Tools allows you to perform the functions described in Table 1-3.

Table 1-3 Web Tools Individual Port Functions

View the port status.	See *PortStats Tab* on page 5-4.
View information about GBIC (Gigabit Interface Converter)/SFP (small form factor pluggable) Serial IDs.	See *SFP (GBIC) Tab* on page 5-5.
View and manage loop information.	See *Loop Tab* on page 5-8.
View port performance, including frame counts (frames in, frames out) and error counts.	See *Port Information View* on page 5-2.

Switch Explorer

The Switch Explorer View (shown in Figure 1-1) is the first window that appears when you start Web Tools from a the web browser. In the browser, enter the switch name or IP address in the **Location/Address** field and press ENTER.

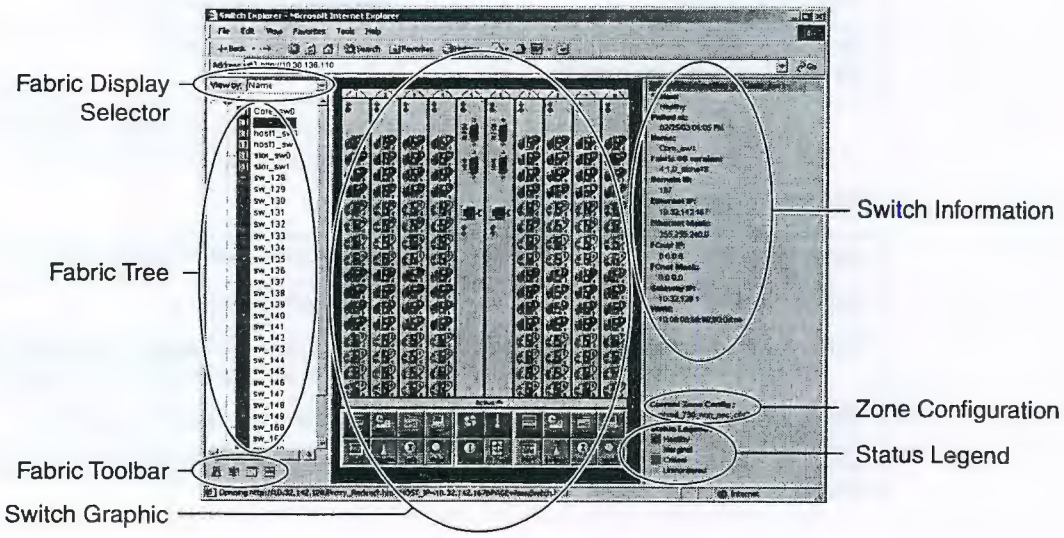

Figure 1-1 Switch Explorer View — ED-12000B Example

In a DS-32B2 display, the switch information, zone configuration, and status legend are located below the switch graphic.

The Switch Explorer View includes:

- **Fabric Display Selector** — Allows you to change the way switches are displayed in the fabric tree. Select from **Name**, **IP**, or **WWN**.
- **Fabric Tree** — Display a navigation menu (down the left side of the window) of icons for all switches in the fabric.

  Refer to *Using the Fabric Tree* on page 1-7 for more information.

  The refresh rate for the fabric tree is approximately 30 seconds.

- **Fabric Toolbar** — Provide easy access to fabric-level administration tasks.

  Refer to *Using the Fabric Tool Bar* on page 3-2.

- **Switch Graphic** — Displays a physical representation of the switch and real-time status information.

  Refer to *Using the Switch View* on page 4-2.

- **Switch Information** — Displays a synopsis of useful information about the selected switch.

  Refer to *Understanding the Switch Information* on page 4-10.

- **Zone Configuration** — Displays the name of the currently enabled Zone configuration. If no Zone configuration is enabled, this field displays none.

  Refer to *Administering Zones* on page 3-9 for more information on zoning.

- **Status Legend** — Explains the meaning of colors that appear in the background of various icons:
  - Green = Healthy
  - Yellow = Marginal (mix of good and faulty readings)
  - Red = Critical (more than two faulty readings)
  - Gray = Unknown or unmonitored

Refresh Rates

Different areas of Web Tools refresh at different rates. Table 1-4 lists the refresh rates for the various panels in Web Tools.

Table 1-4 Web Tools Refresh Rates

Switch Explorer Area	Polling Rate
Fabric Tree	15 seconds
Unreachable Switches in the Fabric Tree	2 minutes
Switch View	15 seconds during normal operation, 30 to 60 seconds during initialization
Switch Information Panel	15 seconds
Name Server	User defined; 15 seconds minimum
Zone Database	15 seconds
Fabric Watch	15 seconds
Performance Monitor	5 to 60 seconds, depending on specific graph

Using the Fabric Tree

The fabric tree contains icons for all switches in the fabric, including any unlicensed switches.

Only switches with a Web Tools license can be managed from Web Tools. To add a license for an unlicensed switch, click the corresponding switch icon in fabric tree to display a license window.

Components of the fabric tree pane are:

- *View by* **menu** — Allows you to change the way switches are displayed in the tree. Select from **Name**, **IP**, or **WWN**.
- **Fabric** — Displays all switches in the fabric. Click the plus sign (+) to display switches within the fabric. To collapse a list of switches that is already open, click the minus sign (-).
- **Switch icons** — Identifies each switch in the fabric. Clicking an icon changes the switch display to the selected switch (assuming that switch is not the one already displayed).

Figure 1-2 Switch Icon

The name associated with a switch icon is taken from the name configured on the **Switch Admin** tab. Refer to *About the Switch Information Tab* on page 4-37 for more information.

- **Segmented Switches** — Displays switches that have lost Fibre Channel connectivity (that is, are segmented from the fabric). These switches can still be administered if the IP connection is valid.

2

Web Tools Requirements

This chapter provides the following information for installing Web Tools.

Requirements

The workstation and the switch must both meet specific requirements for the correct installation and operation of Web Tools.

Switch Requirements

Web Tools v4.1 can be used to manage Connectrix DS-3B2 and ED-12000B switches. Please check the *EMC Support Matrix* for minimum supported firmware revisions.

Web Tools Requirements

For optimum Web Tools performance, the following is recommended:

- When running Web Tools with Internet Explorer 5.5 in a Windows environment, use Java Plug-In version 1.3.1_04 for Windows.
- Clear the cache files for your web browser before using. For instructions on how to clear cache files for Internet Explorer and Netscape Navigator, refer to the *Configuring the Web Browser* on page 2-4.
- In a multiswitch fabric, the video card in the workstation in use should have at least 8 MB of RAM.

If you are experiencing any difficulties in starting Web Tools in a multiswitch fabric configuration, consider disabling any software installed on your desktop system that enables Internet download scanning capability, such as antivirus software.

Web Tools Workstation Requirements

Web Tools is installed on the switch but is displayed in a web browser.

The following items are required on the workstation in order to run Web Tools.

Operating Systems

One of the following operating systems must be installed:

- Solaris 2.7 or 2.8
- Windows NT 4.0, Windows 2000, or Windows XP

RAM (On Windows Operating Systems)

- A minimum of 128 MB RAM for fabrics consisting of 10 or fewer switches.
- A minimum of 256 MB RAM for fabrics consisting of 11 to 15 switches.
- A minimum of 512 MB RAM for fabrics consisting of 16 or more switches.

Disk Space

- A minimum of 5 MB of free disk space.

Web Browsers

One of the following web browsers must be installed:

- Netscape Communicator 4.77 on Solaris

  The Netscape browser running on the Windows operating system is no longer supported for use with Web Tools.

- Internet Explorer 5.5

  Service Pack 2 is recommended.

  The browser must be configured to work with Web Tools. For configuration information, refer to *Configuring the Web Browser* on page 2-4.

For optimum Web Tools performance, EMC recommends you clear the cache files from your web browser before using. For instructions on how to clear cache files for Internet Explorer and Netscape Navigator, refer to *Configuring the Web Browser* on page 2-4.

Java Plug-In

One of the following Java Plug-Ins must be installed on the workstation:

- For Windows NT 4.0, Windows 2000, or Windows XP: Java Plug-In version 1.3.1_04 or later.
- For Solaris: Java Runtime Environment version v1.3.1_04 for Solaris, including any Java Plug-In patches created by Sun for Solaris. Java Runtime Environment v1.3.1_04 is recommended for best results.

Installation

Using Web Tools to manage your fabric requires the following preliminary steps:

1. If not already done, install a supported web browser onto the workstation.
2. Configure the web browser for use with Web Tools.
3. If not already done, install the required Java Plug-In and Java Runtime Environment (JRE) onto the workstation.
4. Install a Web Tools license onto each switch to be managed from Web Tools.

Installing a Web Browser

Install one of the following browsers:

- Netscape Communicator 4.77 for Solaris (available at `http://www.netscape.com`)
- Internet Explorer 5.5 (available at: `http://www.microsoft.com`)

Internet Explorer. 5.5 Service Pack 2 is highly recommended.

Configuring the Web Browser

Specific browser settings are required for the correct operation of Web Tools with either Netscape Commmunicator (Solaris only) or Internet Explorer.

Configuring Netscape Communicator for Solaris

Some browsers use local cache copies of `.jar` files and/or image files to improve performance (depending on the options selected in the browser), which can cause incorrect displays in Web Tools. Any local browser cache must be cleared before invoking Web Tools.

To remove cached files from Netscape Communicator:

1. Select **Edit, Preferences.**
2. Click **Advanced** in the Category box to expand it; then click **Cache.**
3. On the Cache panel, click **Clear Memory Cache.**
4. Click **Clear Disk Cache.**
5. Click **OK.**

6. Exit and relaunch the browser.

Configuring Internet Explorer

Correct operation of Web Tools with Internet Explorer requires clearing the browser cache after installation, and specifying the appropriate settings for browser refresh frequency and process model.

The browser cache must be cleared after the installation of Fabric OS Version 4.1. The browser may use local cache copies of jar files and/or image files to improve performance (depending on options selected in browser), which can cause incorrect display.

To remove cached files from Internet Explorer:

1. Select **Internet Options** from the **Tools** menu.
2. Select the **General** tab.
3. Click **Delete Files** (under **Temporary Internet Files**).
4. Click **OK**, and then exit and relaunch the browser.

Browser pages must be refreshed at every visit to ensure the correct operation of the Switch Admin feature.

To set the refresh frequency:

1. Select **Internet Options** from the **Tools** menu.
2. Select the **General** tab and click **Settings** (under **Temporary Internet Files**).
3. Under **Check for newer versions of stored pages**, select **Every visit to the page.**

   You must select the correct browser process model. Proceed to the next section.

To select the Browser Process Model:

1. Select **Tools, Internet Options**.
2. Select the **Advanced** tab and click to expand the **Browsing** category.

Installing the Java Runtime Environment on Solaris

Web Tools requires Java Runtime Environment (JRE) 1.3.1_04 for Solaris client workstations.

To install the JRE on your Solaris client workstation:

1. Locate the JRE at the following URL:

```
http://java.sun.com/
```

This URL is subject to change without notice.

2. Follow the instructions to install the JRE.
3. Open the `.cshrc` file and set the path to the Java Plug-In executable file. For example:
   - If the JRE is installed on `/opt/j2re1.4.1_01`
   - If Netscape is installed on `/usr/local/communicator/ver_4.77`

   For the Bourne shell, type the following:

```
NPX_PLUGIN_PATH=/opt/j2re1.4.1_01/plugin/sparc/ns4:/
   usr/local/communicator/ver_4.77/plugins
export NPX_PLUGIN_PATH
```

   For the C shell, type the following:

```
setenv NPX_PLUGIN_PATH
   /opt/j2re1.4.1_01/plugin/sparc/ns4:/usr/local/
   communicator/ver_4.77/plugins
```

Installing a Java Patch on Solaris

To install any patches on Solaris:

1. Search for any required patches for your current version of the JRE at the following website:

```
http://java.sun.com/j2se/1.3/install-solaris-patches.
   html
```

   This URL is subject to change without notice.

2. Follow the link to download the patch, and exit the browser when done.
3. Install the patch and reboot the system.

Installing the Java Plug-In on Windows

To determine the version of the Java Plug-In installed on Windows NT 4.0, Windows 2000, or Windows XP, and install if necessary:

1. Access the **Start Menu, Settings, Control Panel, Java Plug-In** *version*. The Java Plug-In Control Panel is displayed.
2. Select the About tab.

3. Determine whether the correct Java Plug-In version is installed, and install if necessary:
   - If the correct version is installed, Web Tools is ready to use.
   - If no Java Plug-In is installed, point the browser towards a switch running Fabric OS v4.x, follow the link to the Sun Microsystems website, download the correct Java Plug-In, then double-click the downloaded file to install the plug-in.
   - If an outdated version is currently installed, uninstall it, relaunch the browser, enter the address of a switch running Fabric OS v4.0 or later. Web Tools will guide you through the steps to download the proper Java Plug-In.

Licensing Web Tools on the Switch

A Web Tools license can be installed either through Telnet or over the web.

To determine whether a license is already installed on a switch, follow the instructions provided under *Launching Web Tools* on page 2-14. If a license is not installed, you will not be able to launch Web Tools; contact your switch supplier to obtain a license key.

Installing a Web Tools License Through Telnet

To install a Web Tools license through Telnet:

1. Log onto the switch by Telnet (Refer to *Accessing the Telnet Interface* on page 4-79 for more information), using an account that has administrative privileges.
2. To determine whether a Web Tools license is already installed on the switch, type **licenseshow** on the Telnet command line.

   A list displays, showing all the licenses currently installed on the switch.

   ```
   switch:admin> licenseshow
   1A1AaAaaaAAAA1a:
   Zoning license
   SES license
   QuickLoop license
   ```

   If the Web Tools license is not included in the list or is incorrect, continue with step 3.
3. Enter the following on the command line:

   ```
   licenseadd <key>
   ```

where **<key>** is the license key. The license key value is case-sensitive, and must be entered exactly as given.

4. Verify the license was added by entering the following on the command line:

   licenseshow

   If the Web Tools license is listed, the feature is available. If the license is not listed, repeat step 3.

The Java Plug-In must also be installed on the client machine to access Web Tools.

Installing Web Tools Through the Web

Launching Web Tools from any non-licensed switch will automatically display the license dialog box. If the fabric already contains at least one licensed switch, you can use Web Tools to view and license other switches from the licensed switch. Launching Web Tools:

To install the first license through the web:

1. Launch the web browser and enter the IP address of the switch in the **Location/Address** field. For example:

   http://123.123.123.123

2. Press ENTER.

   If a license is already installed on the switch, Web Tools launches. If no license is installed, a license dialog displays. You will need to login as an admin user to gain access to the Licensing Screen.

3. If the license dialog displays, follow the instructions provided.

To Install additional Licenses Through the Web

To install additional licenses through the web:

1. Launch the web browser and enter the IP address of the licensed switch in the **Location/Address** field. For example:

   http://123.123.123.123

2. Press ENTER.

   Web Tools opens, displaying the Switch Explorer.

3. Click the icon for the switch you want to license. A licensing window displays.

4. Follow the instructions provided.

Overview of Workstation Setup for Solaris

The Java Plug-In for Solaris enables users to deploy the Java applet and other Java-related components in Netscape Communicator using Java Runtime Environment (JRE) instead of the Java run time bundled with Netscape.

The Java Plug-In may be shipped with the JRE or downloaded separately and installed. Netscape Communicator may come with its default Java Plug-In installed. The default Java Plug-In path is `/usr/dt/appconfig/*netscape/j2pi`.

Users should have basic knowledge of the Solaris system, and have super-user access, for installing the specified Java Plug-In and JRE on Solaris.

For downloading the Java products, users should also have a SUN website access account (free for registration). Download the Java Plug-In compressed binary format, uncompress it, and use `pkgadd` to install it to Solaris.

After installing the Web Tools required Java Plug-In and JRE, you need to set the system environment variables `NPX_PLUGIN_PATH` and `NPX_JRE_PATH` to `.cshrc`, `.profile`, or `.login` file under the user's home directory.

These configuration changes enable Netscape Communicator to use the new installed Java Plug-In and JRE path. If you want to back out and use the Netscape Communicator default Java Plug-In path, remove the two environment variable definitions from the predefined file.

For detailed information, refer to the SUN website:
`http://wwws.sun.com/software/solaris/netscape/jpis/usersguide_java_plugin.html`.

Netscape, the Java Plug-In, and the JRE are not EMC products. Their venders may change their products and URL path locations. For more information, refer to the vendors' website.

Java Plug-In 1.2.2_02, known as Java Plug-In 1.2, Solaris/SPARC, is displayed as Version 1.2.1 in its software license during download. Ignore this during install and accept the license.

Loading Web Tools on Solaris

To set up the user environment to access Web Tools on Solaris:

1. Install the web browser, if necessary.

   Netscape Communication 4.77 is required. The download is available at `http://www.netscape.com/download/archive/client_archive477.html`.

   The recommended installation path is `/usr/de/bin`.

   This installation path will be used for the `MOZILA_HOME` environment variable.

2. Install the Java Runtime Environment. JRE 1.3.1_04 is required.

   The recommended installation path is: `/usr/jrel.3.1_004/`.

3. Install the Java Plug-In. The Java Plug-In 1.2.2_02 is required.

   The download is available at:
   `http://www.sun.com/solaris/netscape/jpis/platforms.html`

   a. Click **Get the Software**.

   b. Go to **Download Java Plug-In 1.2 for Solaris: SPARC platform.**

   c. Download the compressed file in local directory.

   d. Uncompress the download bundle to `SUNWjpi`. For example, `zcat <down_load file> | tar xf-`

   e. Type **su** at the prompt to become super user and input the user password.

   f. Go to the directory where the `SUNWjpi` is located. For example, `cd<directory>.`

   g. Install the Plug-in to the recommended installation path.

      The recommended installation path is `/usr/jrel.2.2_007/plugin/.`

      For example, `pkgadd -d . -a none` opens an interactive session where you are prompted to enter the installation path or `pkgadd -d . SUNWjpi` using the default installation directory.

   h. Locate the file named `javaplugin.so` under the installation directory. This path will be used for he `NPX_PLUGIN_PATH` environment variable.

All the above details can be found at:
http://wwws.sun.com/software/solaris/netscape/jpis/usersguide_java_plugin.html.

4. Install the required patches. The installation requires OS patch for Solaris 7 (download available at JRE 1.2.2_07 download site). Reboot the system after you install the OS patch.

   Solaris 8 already comes with the Java 1.2.2_02 plugin installed as well as a Sun-packaged Netscape version, which are all installed in the `/usr/dt` directory.

   Sun ships (depending on the version) with `/bin/java` linked to `/usr/java`. `/usr/java` is then linked to either `/usr/java1.1` or `/usr/java1.2`.

   The `gunzip` utility is needed to open the Netscape downloaded file. This utility is available at **`sunfreeware.com`**.

   For more information on the installation process, refer to the installation guide for Netscape on Solaris at:

   http://wwws.sun.com/software/solaris/netscape/jpis/usersguide_java_plugin.html

Configuring the Environment for Web Tools on Solaris

To configure the environment of Java Plug-In and JRE for Netscape on Solaris:

1. Set the environment variables `MOZILLA_HOME`, `NPX_PLUGIN_PATH`, `NPX_JRE_PATH`.

   These environmental variables must be set up for each user accessing Web Tools. the paths listed below are recommendations. Use the actual path name where these products are installed on your workstation.

   C Shell:

   Add the following environmental variables to the `.cshrc` file:

   ```
   setenv MOZILLA_HOME /usr/dt/bin/
   setenv NPX_PLUGIN_PATH /usr/jrel.2.2_007/plugin
   setenv NPX_JRE_PATH /usr/jrel.2.2_007
   ```

   You must execute `source .cshrc` or re-login to activate the new environment variables.

You can also directly set these environment variables temporarily on a terminal window by typing the above lines on a command line.

Verify the environment variables by `setenv|grep NPX`.

Bourne Shell:

Add the following environment variables to the `.profile` file in the user home directory:

```
MOZILLA_HOME = /usr/dt/bin
NPX_PLUGIN_PATH= /usr/jrel.2.2_007/plugin
NPX_JRE_PATH= /usr/jrel.2.2_007
export MOZILLA_HOME
export NPX_PLUGIN_PATH
export NPX_JRE_PATH
```

You must re-login to activate the new environment variables.

You can also directly set these environment variables temporarily in a terminal window by entering:

```
set MOZILLA_HOME = /usr/dt/bin
set NPX_PLUGIN_PATH= /usr/jrel.2.2_007/plugin
set NPX_JRE_PATH= /usr/jrel.2.2_007
export MOZILLA_HOME
export NPX_PLUGIN_PATH
export NPX_JRE_PATH
```

Verify the environment variables by `set|grep NPX`.

2. Launch the Control Panel from `/java-plugin-path`, and choose **Advanced** to verify correct plug-in location.
3. Close all Netscape windows and re-launch a new instance of Netscape.
4. Verify the Java Plug-In version used in Netscape:
   - Click **Help** on the right corner of the browser.
   - Select **About Plug-Ins**.

     The currently used Java Plug-In version is shown on Java Plug-In.

The detailed guide is available at the following URL:

`http://www.sun.com/solaris/netscape/jpis/usersguide_java_plugin.html#envir`

Launching Web Tools

You can launch Web Tools once the license is installed on the switch and the Java Plug-In and web browser are installed and configured on the client workstation.

To launch Web Tools:

1. Launch the web browser from your host.
2. Enter the switch name or IP address in the URL field.

   Example: `http://switch name or IP address/`
3. Press ENTER.

   Web Tools opens, displaying the Switch Explorer (shown in Figure 2-1 and Figure 2-2).

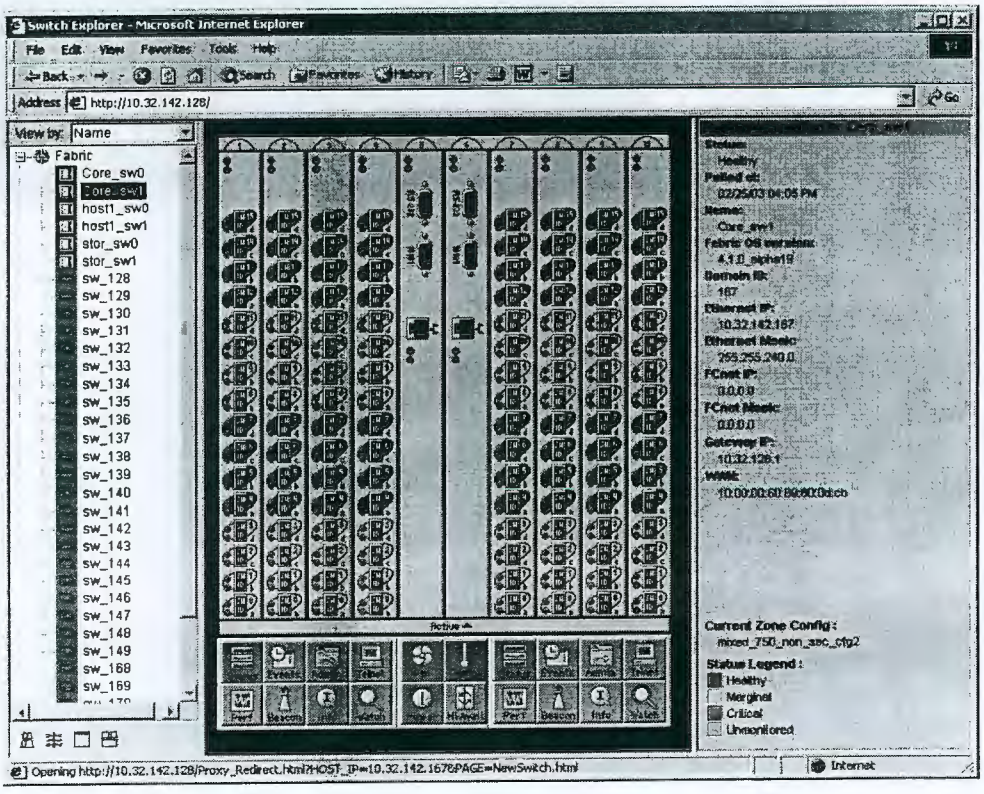

Figure 2-1 Switch Explorer Window for ED-12000B

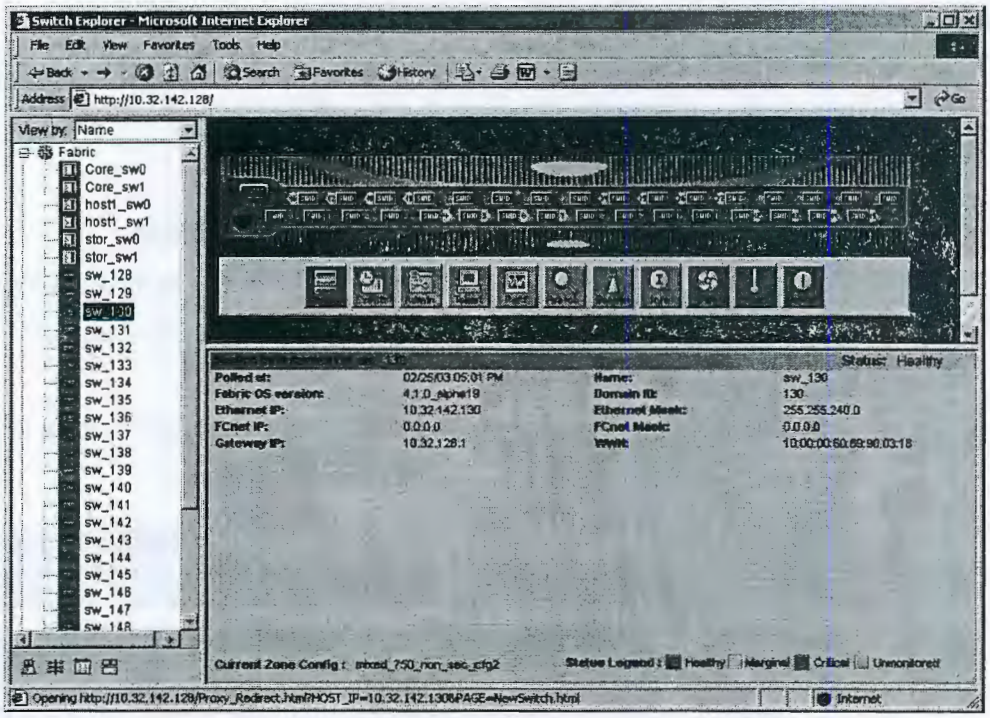

Figure 2-2 Switch Explorer Window for DS-32B2

3

Managing the Fabric

This chapter describes the operations used to manage the fabric through the Switch Explorer View.

Switches can be accessed through different methods, such as through the Telnet, SNMP, and the Web, any of which can occur simultaneously. To verify that modifications are correctly applied, ensure that the switch is modified from only one connection at a time.

Using the Fabric Tool Bar

Figure 3-1 shows the tool bar at the bottom-left corner of the Switch Explorer View.

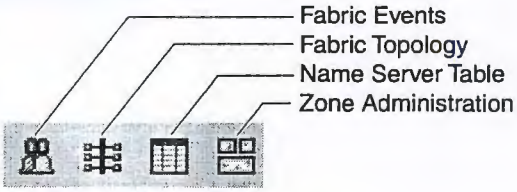

Figure 3-1 **Fabric Toolbar**

The icons and their functions are:

- **Fabric Events** — Opens the Fabric Events View. Refer to *Using the Fabric Events View* on page 3-3.
- **Fabric Topology** — Opens the Fabric Topology View, which summarizes the physical configuration of the fabric from the perspective of the *local* domain (the domain of the selected switch). Refer to *Using the Fabric Topology View* on page 3-5.
- **Name Server** — Opens the Name Server Table View, which provides the name server entries listed in the Simple Name Server database. Refer to *Using the Name Server Table* on page 3-7.
- **Zone Administration** — Opens the Zone Administration View. This button is available only if a Zoning license is installed. If the Zoning license is installed but Zoning is not implemented, this button is grayed-out.

  Refer to *Administering Zones* on page 3-9.

ENMC does not currently support Security. When Security is enabled, Zone administration can be performed only from the Primary FCS Switch.

Using the Fabric Events View

The Fabric Events View provides a running log of events for all switches in the fabric.

To access the Fabric Events View, click the Fabric Events icon at the lower left of the Switch Explorer View. (Refer to Figure 3-1 on page 3-2.)

Figure 3-2 shows a typical Fabric Events View.

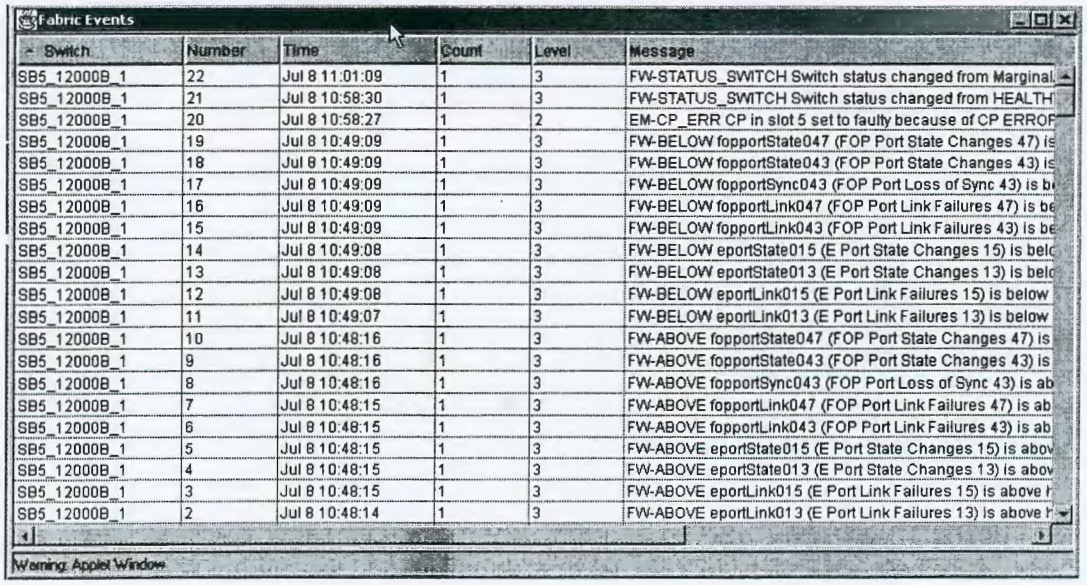

Figure 3-2 Fabric Events View

To sort the events by the items in a particular column, click the column heading. To resize a column, click the line between two columns, hold down the mouse button, and drag the line left or right.

Information in the Fabric Events View includes

- **Switch** — Name of the switch
- **Number** — Event number for the affected switch
- **Time** — Time of the event
- **Count** — Number of consecutive occurrences of the same event

- **Level** — Severity level of the event:
  - 0 — Panic (switch reboots)
  - 1 — Critical
  - 2 — Error
  - 3 — Warning
  - 4 — Information
  - 5 — Debug
- **Message** — Description of the event

Using the Fabric Topology View

The Fabric Topology View summarizes the physical configuration of the fabric from the perspective of the local domain (the domain of the switch entered as a URL in the web browser). This includes information about the destination domains (all other domains in the fabric) and the paths between each destination domain and the local domain.

To access the Fabric Topology View, click the Fabric Topology icon at the lower left of the Switch Explorer View. (Refer to Figure 3-1 on page 3-2.)

Figure 3-3 shows a typical Fabric Topology View.

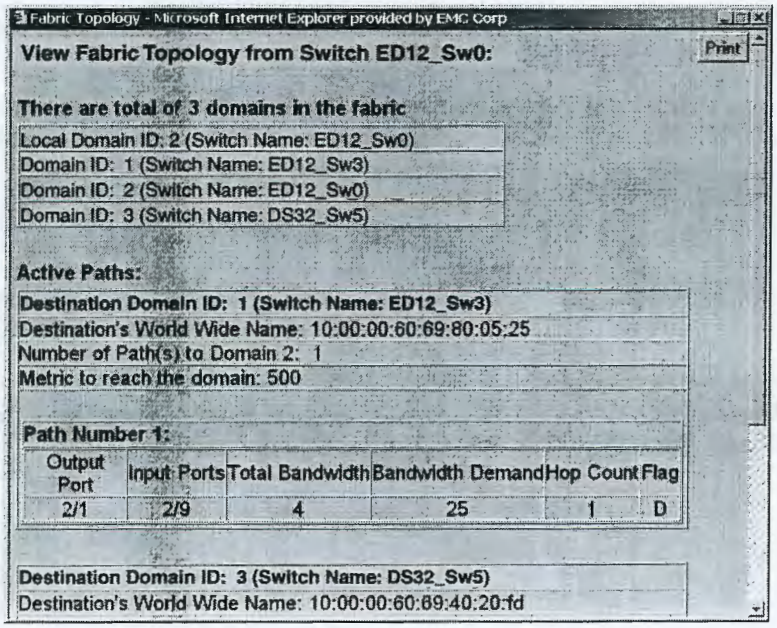

Figure 3-3 Fabric Topology View

Most of the information in the Fabric Topology View is self-explanatory. Some items are:

- **Active Paths** — Information about each destination domain, including information about each of the paths between that domain and the local domain.
- **Metric to Reach the Domain** — Cost of reaching the destination domain.
- **Output Port** — Port to which the incoming frame will be forwarded in order to reach the destination domain.
- **Input Ports** — Input ports that use the corresponding out port to reach the destination domain. This is the same information provided by `portRouteShow` and `uRouteShow`.
- **Total Bandwidth** — Maximum bandwidth of the out port.
- **Bandwidth Demand** — Maximum bandwidth demand by the in ports.

  The bandwidth is the total bandwidth for this path on the out port. The bandwidth demand is the percentage demand for this path from the in ports.
- **Hop Count** — Maximum number of hops to reach the destination domain.
- **Flag** — Always **D**, indicating a dynamic path. A dynamic path is discovered automatically by the FSPF path selection protocol.

Printing a Fabric Topology Report

If you want to print a copy of the Fabric Topology View, click **Print** at the upper right of the view.

Using the Name Server Table

The Name Server Table provides the name server entries listed in the Simple Name Server database. This includes all name server entries for the fabric, not only those that are local to the local domain. Each row in the table represents a different device.

To display the Name Server Table (shown in Figure 3-4), click the Name Server Table icon at the lower left of the Switch Explorer View. (Refer to Figure 3-1 on page 3-2.)

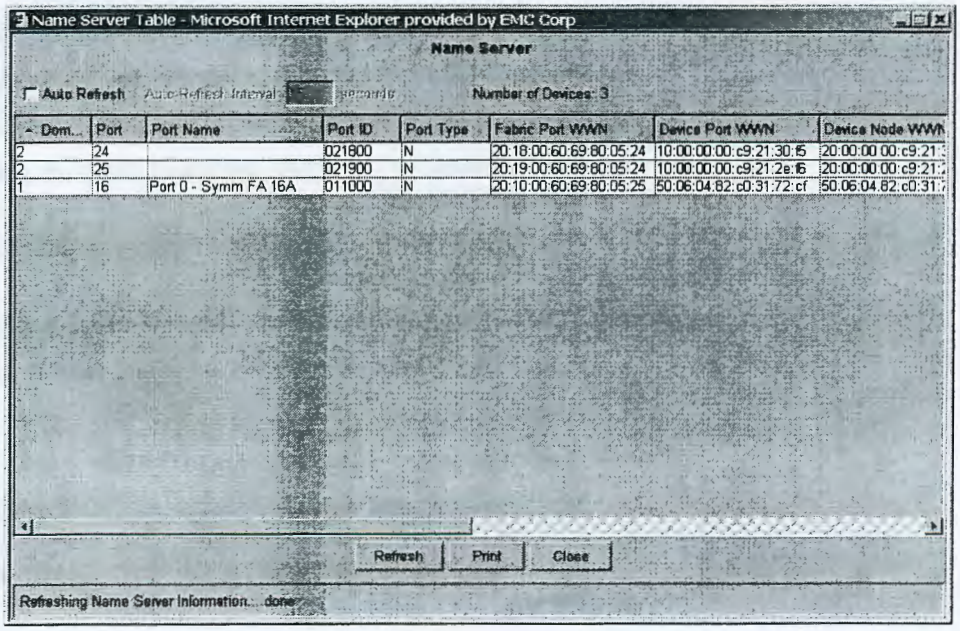

Figure 3-4 Name Server Table View

To sort the events by the items in a particular column, click the column heading. To resize a column, click the line between two columns, hold down the mouse button, and drag the line left or right.

The Name Server Table contains the following information:

- **Domain** — Domain ID of the switch to which the device is connected.
- **Port** — Number of the switch port to which the device is connected.
- **Port Name** — Name of the port.
- **Port ID** — Port ID of the device (24-bit hexadecimal value).
- **Port Type** — Port type of the device (N for fabric direct attached port or NL for fabric direct attached loop port).
- **Fabric Port WWN** — World Wide Name of the fabric port.
- **Device Port WWN** — World Wide Name of the device port.
- **Device Node WWN** — World Wide Name of the device node.
- **Device Name** — Symbolic name of the device assigned through the SCSI INQUIRY command.
- **FC4 Type** — Fibre Channel FC4 layer types supported by the device, such as IP or FCP.
- **COS** — Fibre Channel classes of service supported by the device.
- **Fabric Port Name** — Name of the fabric port in use by the device.
- **Port IP Address** — IP address of the fabric port.
- **Hard Address** — Hard address of the fabric port.
- **Member of Zones** — Zones to which this device belongs. This column is not updated when the table is refreshed. To view updated zoning information, close and reopen the Name Server Table.

Refreshing the Name Server Table View

If the **Auto Refresh** checkbox is checked, the view is refreshed automatically at the Auto Refresh Interval. To enable or disable auto refresh, select the checkbox to add or remove a checkmark. If enabling auto refresh, enter an interval in the **Auto Refresh Interval** field.

To refresh the view immediately, click **Refresh** at the bottom of the view.

Printing the Name Server Table

If you want to print a copy of the Name Server Table, click **Print** at the bottom of the view.

Administering Zones

Zoning enables you to partition your Storage Area Network (SAN) into logical groupings of devices that can access each other. For example, you can partition your SAN into two zones so that your Windows servers and storage do not interact with your UNIX servers and storage.

A zoning license and administrative privileges are required to access the Zone Administration View. If a switch or device is added or removed from the network, it is necessary to save the changes and relaunch the Zone Administration View for the changes to take effect.

This section is intended to describe zoning configurations when using Web Tools specifically. For more detailed information about zoning, refer to the *EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B Zoning Reference Manual.*

Administering Zoning

EMC recommends following these steps to administer zoning:

1. Define zone aliases to establish groupings. This is optional, but can save time.
2. Add zone members.
3. Place zones into one or more zone configurations.
4. Save the new/updated configuration.
5. Enable one of the zone configurations. (Only one configuration can be enabled at a time.)

Accessing Zone Administration

To access Zone Administration:

1. Click the Zone Administration icon at the lower left of the Switch Explorer View. (Refer to Figure 3-1 on page 3-2.)
2. When prompted, enter a name and password and click **OK**:
   - Logging in as **Admin** allows read and write access. The default Admin ID is **admin**.
   - Logging in as User allows only read access. The default User ID is **user**.

Figure 3-5 shows the Zone Administration window.

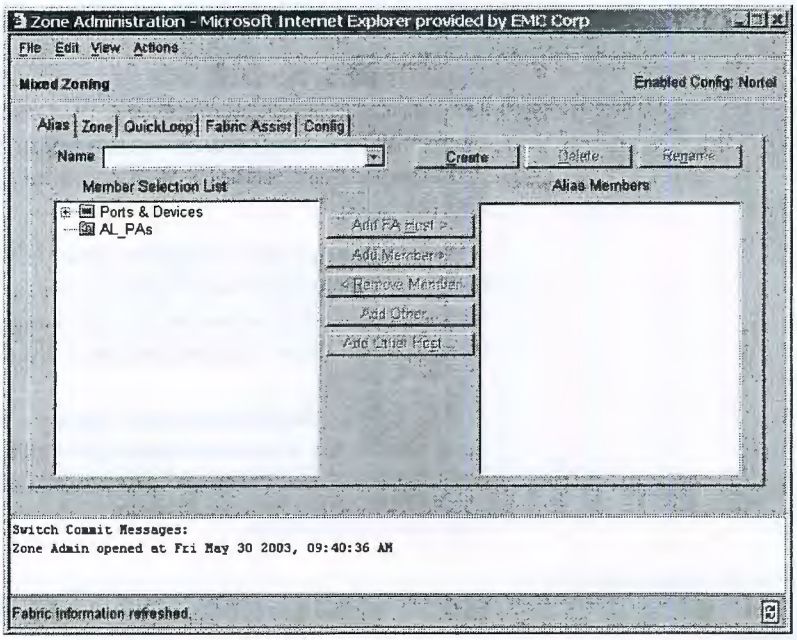

Figure 3-5 Zone Administration Window

The row of tabs (shown in Figure 3-5) provide different displays that allow you to configure:

- **Aliases** — An alias is a logical group of ports, WWNs, or AL_PAs. Creating aliases enables you to configure zones using short names rather than long strings of individual members.

  You can specify members of an alias using the following methods:

  - Switch domain and port area number pair, for example: **2, 20**.
  - WWN (device)
  - QuickLoop AL_PAs (device)

- **Zones** — A zone is a region within the fabric where switches and devices can communicate. A device can communicate only with other devices connected to the fabric within its specified zone.

  You can specify members of a Zone using the following methods:

  - Alias names
  - Switch domain and port area number pair, for example: **2, 20**.
  - WWN (device)

  - QuickLoop AL_PAs (device)
- **QuickLoop** — QuickLoop supports FC-AL devices in a fabric.
- **Fabric Assist** — Fabric Assist is a means of allowing private hosts to communicate with public targets across a switched fabric or in different fabrics.

  This option is not available if you are doing AL_PA zoning. (Refer to *Zoning Schemes* on page 3-11.)
- **Config** — A configuration (config) is a group of zones. Zoning is enabled on a fabric by enabling a specific config.

  You can specify members of a config using the following methods:

  - Zone names
  - QuickLoop names
  - FA (Fabric Assist) zone names

NOTE: Fabric Assist is not currently supported on EMC switches.

Sample Configuration

Table 3-1 shows a sample zoning configuration.

Table 3-1 Sample Zoning Database

Alias	Zone	Config
alias1 = WWN; WWN; WWN		
alias2 = WWN; <domain, portarea>		
alias3 = WWN; <AL_PA>	**zone1** = alias1; alias2; WWN; <domain, portarea>; <ALPA>	
alias4 = WWN; WWN; WWN	**zone2** = alias3, alias4, WWN	**myconfig** = zone1, zone2

Zoning Schemes

Various levels of zoning *schemes* are created to isolate systems that have different operating environments. For example, you can create a zone of all ports connected to UNIX Servers, or another zone of all ports connected to Windows Servers. Zones are created to limit access of devices to other devices connected to the fabric within the same zone.

Zones can be configured dynamically. They can vary in size depending on the number of fabric connected devices, and devices can belong to more than one zone. Because zone members can access only other members of the same zone, a device not included in a zone is not available to members of that zone.

Zoning can only be managed or accessed by the primary FCS switch when security is enabled; the Zoning icon only appears on the primary FCS switch. If security is not enabled, the Zone icon appears in the Fabric Tool bar of every licensed switch.

NOTE: At this time, Secure OS is not supported.

You can configure zoning using any of the schemes listed in Table 3-2. However, EMC recommends WWN zoning only.

Table 3-2 Zoning Schemes

Name	Description
Port Zoning	All aliases, zoning, and configuration file operations must be on ports. Aliases, zones, and configuration files which have objects other than ports cannot be selected or operated on.
WWN Zoning	All aliases, zoning, and configuration file operations must be on WWNs. Aliases, zones, and configuration files which have objects other than WWNs cannot be selected or operated on.
AL_PA Zoning	All aliases, zoning, and configuration file operations must be on AL_PA. Aliases, zones and configuration files which have objects other than AL_PAs cannot be selected or operated on.
Mixed Zoning	In this mode, any object can be selected to be a member of a zone, alias, or configuration file. This mode does not allow specification of a LUN.

To select a zoning scheme, click **View** on the Zone Administration menu bar, and select from the drop-down menu (shown in Figure 3-6).

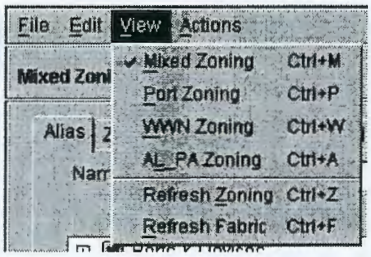

Figure 3-6 **Zone Administration View Menu**

Zoning Method and Hard or Soft Zoning Enforcement

Whether you are using *soft* or *hard* zoning is determined by the way the zone objects are defined:

- In hardware enforced zoning, zone or alias members are defined using <*domain, portarea*> exclusively or WWNs exclusively. That is, using one method or the other, to define all objects in the zoning database.
- In software enforced zoning, zone or alias members can be defined by a mixture of port IDs and WWNs.

Using the File Menu

The options available in the **File Menu** of the Zone Administration window are:

- **Print Summary** — Select to print a zoning configuration report. A window displays both the effective configuration and the defined zoning configuration, if one exists. (Refer to Figure 3-7 on page 3-14.)
- **Close** — Select to close the Zone Administration window.

Viewing the Zone Configuration Summary

To view the configuration summary, select **File, Print Summary** from the Zone Administration window menu bar. This displays a window similar to Figure 3-7 on page 3-14.

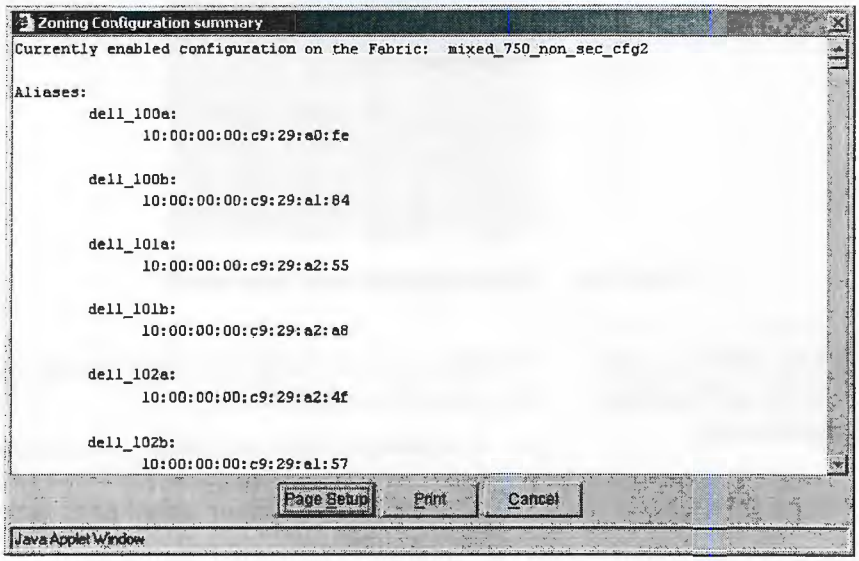

Figure 3-7 Zone Configuration Summary

Using the Edit Menu

The options available in the **Edit Menu** of the Zone Administration window are described in Table 3-3.

Table 3-3 Edit Menu Options

Option	Description
Add WWN	Select to add a WWN across Aliases, Zones or Fabric Assist Zones. A dialog box appears; enter the WWN number.
Delete WWN	Select to delete a WWN across Aliases, Zones or Fabric Assist Zones. A dialog box appears; enter the WWN number.
Replace WWN	Select to replace one WWN with another. A dialog box appears; enter first the WWN number to be replaced, and then the new WWN number.
Search Member	Select to search for a member of a zone. A dialog box appears; Enter any element that appears in the Member Selection List: Domain Name, Port name, Port Area ID, WWN, Device, Zone Name, or Alias Name. Narrow searches by checking one or more of the following boxes: • Match Case • Match Whole Words Only • Wrap around. Check the Wrap around box if you want the search engine to restart after it hits the end of the string. Leave unchecked if you want the search engine to stop once it hits the end of the string; a message appears to indicate the search is complete.

Adding a WWN in the Zoning Database

To add a WWN to the zoning database:

1. Select **Edit, Add a WWN** from the Zone Administration window menu bar.

   This displays an **Add WWN** dialog box.

2. Enter a WWN value in the **WWN** field, and click **OK**.

   An **Add WWN** window appears, listing all the zoning elements that will include the new WWN.

3. Click the item in the list to select or un-select and click **Add** to add the new WWN to all the selected zoning elements.

   The WWN is added to the zoning database and can be used as a member.

This WWN added does not need to currently exist in the Fabric. This procedures enables you to configure a WWN as a member in a Zone Configuration prior to adding that device to the fabric.

Deleting a WWN in the Zoning Database

To delete a WWN from the zoning database:

1. Select **Edit, Delete a WWN** from the Zone Administration window menu bar.

   This displays a **Delete WWN** dialog box.

2. Enter a WWN value in the **WWN** field, and click **OK**.

   A **Delete WWN** window appears, listing all the zoning elements that include the WWN.

3. Click the item in the list to select or unselect and click **Delete** to delete the WWN from all the selected zoning elements.

   The WWN is deleted from the zoning database.

Replacing a WWN in the Zoning Database

This procedure enables you to replace a WWN throughout the zoning database. This is helpful when exchanging out devices in your fabric, and easily maintaining your current configuration:

1. Select **Edit, Replace a WWN** from the Zone Administration window menu bar.

   This displays a **Replace WWN** dialog box.

2. Enter the WWN to be replaced in the **Replace** field.

3. Enter the new WWN in the **By** field, and click **OK**.

A **Replace WWN** window appears, listing all the zoning elements that include the WWN.

4. Click the item in the list to select or unselect and click **Replace** to replace the WWN in all the selected zoning elements.

   The old WWN is replaced in the zoning database by the new WWN, including within any alias or zone where the old WWN was a member.

Searching For a Zone Member

To search for a zone member:

1. Select **Edit, Search Member** from the Zone Administration window menu bar.

   This displays a **Search Member** dialog box (Figure 3-8).

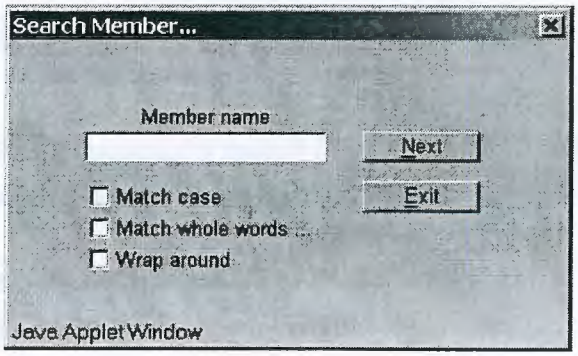

Figure 3-8 **Search Member Dialog Box**

2. Type the zone member name in the **Member name** field.
3. If you want to narrow the search, select one or more checkboxes.
4. Click **Next** to begin the zone member search.

Using the View Menu

The options available in the **View Menu** of the Zone Administration window are described in Table 3-4.

Table 3-4 View Menu Options

Option	Description
Mixed Zoning	Use the Mixed Zoning option when you want various objects to be selected as member of an alias, zone, or configuration file.
Port Zoning	Select the Port Zoning option when you want to include only ports in a group. Grouping zones by port alone is considered "hard zoning".
WWN Zoning	Select the WWN Zoning option when you want to zone by grouping World Wide Names. Grouping zones by WWN alone is considered "hard zoning".
AL_PA Zoning	Select the AL_PA Zoning option when you want to create or manage a zone of devices.
Refresh Zoning	Select the Refresh Zoning option to refresh the zone configuration image with current zone data from switch. Defined Aliases, Zones, QuickLoops and Fabric Assist zones, Configs, and the effective Config can be changed. It affects the Member List in the Alias tab, Zone tab, QuickLoop tab and Fabric Assist tab.
Refresh Fabric	Select the Refresh Fabric option to refresh the fabric image with current data from switch. It affects the Member Selection Tree in Alias tab, Zone tab, QuickLoop tab and Fabric Assist tab. Data can be changed if, for example, the fabric is reconfigured, or devices are removed.

Selecting a Zoning Method

The zoning method you choose determines how members are displayed in the various member selection windows. It also determines whether you are using hard or soft zoning.

Click **View** on the Zone Administration window menu bar, and select one of the following:

- **Mixed Zoning**
- **Port Zoning**
- **WWN Zoning**
- **AL_PA Zoning**

The zoning method you choose determines how members are displayed in the various member selection windows. Refer to *Zoning Schemes* on page 3-11 for more information.

Keep in mind that EMC recommends WWN zoning only.

Refreshing Zoning

To refresh the zoning database (with any saved changes), select **View, Refresh Zoning** from the Zone Administration window.

Any unsaved zoning changes are deleted.

You can display the current zoning database. Refer to *Viewing the Zone Configuration Summary* on page 3-13 for more information.

Refreshing the Fabric

To refresh the fabric (with any saved changes), select **View, Refresh Fabric** from the Zone Administration window.

Any unsaved zoning changes are deleted.

You can display the current zoning database. Refer to *Viewing the Zone Configuration Summary* on page 3-13 for more information.

Using the Actions Menu

The options available in the **Action Menu** of the Zone Administration window are described in Table 3-5.

Table 3-5 Actions Menu Options

Menu Item	Description
Enable Config	Select to save and enable the configuration selected from the Config tab Name field. This command also saves all other configurations in the zoning database.
Disable Zoning	Select to disable the Configuration that is currently enabled. This command also saves all other configurations in the zoning database.
Save Config Only	Select to save all defined zoning configurations. The saved changes will only apply to the defined configurations. Changes can be made to a Configuration that is currently enabled; changes will not appear until the Configuration is disabled and re-enabled.
Clear All	Select to delete all Aliases, Zones, Fabric Assist Zones, and Configurations; the cleared configuration is saved. Any enabled configuration will be disabled.

Enabling a Configuration

Several configurations can reside on a switch at once and you can quickly alternate between configurations. For instance, you may want to have one configuration enabled during the business hours, and another enabled overnight. Only one zone configuration can be enabled at a time.

To create a new configuration, refer to *Creating a Configuration* on page 3-39.

To enable a configuration:

1. Click **View** on the Zone Administration window menu bar, and select a zoning scheme.
2. On the Zone Administration window for the selected zoning scheme, select the **Config** tab.
3. Select **Actions, Enable Config** from the Zone Administration window menu bar.

   The **Enable Config** dialog box (Figure 3-9) appears.

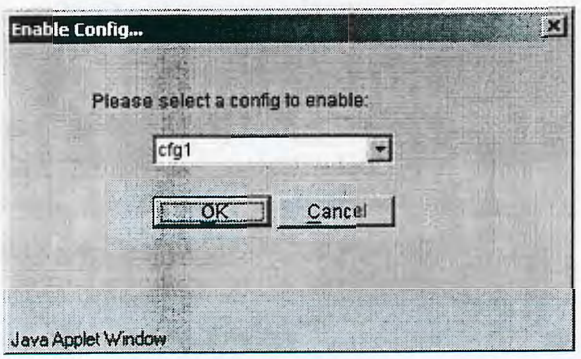

Figure 3-9 **Enable Config Dialog Box**

4. Select the configuration to be enabled from the drop-down menu, and click **OK**.
5. A warning dialog box appears.

   Click **Yes** to enable the selected configuration.

Disabling Zoning

When you disable the active configuration, the Zoning feature is disabled on the fabric and all devices within the fabric can communicate with all other devices. This does not mean that the zoning database is deleted however, only that there is no Configuration active on the fabric.

To disable zoning:

1. Select **Actions, Disable Zoning** from the Zone Administration window menu bar.
2. A warning dialog box appears.

   Click **Yes** to disable the current enabled Configuration.

Saving Changes to an Existing Configuration

To save configuration changes:

1. On the Zone Administration window for the selected zoning scheme, select the **Config** tab.
2. Make desired changes to the Configuration. (Refer to *Creating a Zone* on page 3-27.)

   You can make changes to a Configuration that is currently enabled; changes will not appear until the Configuration is disabled and re-enabled.
3. Select the **Actions, Save Config Only** option.

   The Configuration changes will be saved. Changes will not take effect until the Configuration is re-enabled.

   To enable the configuration, refer to *Enabling a Configuration* on page 3-19.

Clearing the Zoning Database

The following procedure disables any active Configuration and deletes the entire zoning database:

1. Select **Actions, Clear All** from the Zone Administration window menu bar.

CAUTION

This action not only disables zoning on the fabric, but also deletes the entire zoning database.

2. A **Clear All** warning appears.

   Click Yes to disable the current Configuration and delete the zoning database.

Using the Alias Tab

Use the **Alias** tab (shown in Figure 3-10) to create, modify, rename, or delete aliases in the zoning database.

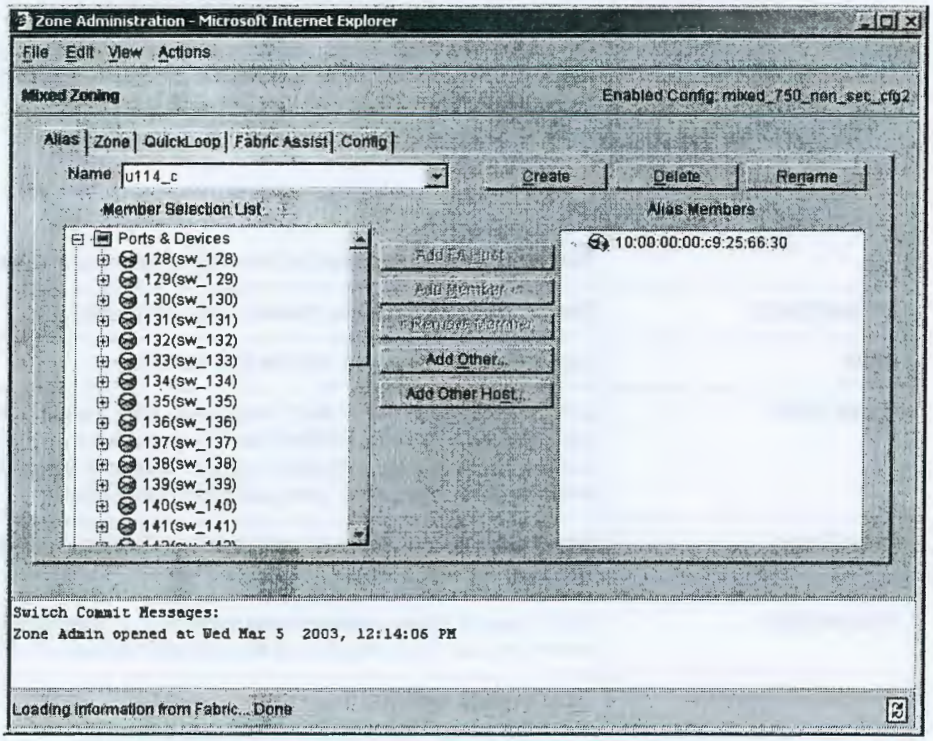

Figure 3-10 Alias Tab in the Zone Administration Window

The fields that appear in the following Alias tab are described in Figure 3-6.

Table 3-6 **Alias Tab Field Descriptions**

Field	Description
Zoning Method	This displays the method you have selected to add members to the zoning database. Choose the Zoning method in the View menu. Valid options are: • Mixed Zoning • Port Zoning • WWN Zoning • AL_PA Zoning The Zoning method determines the information displayed in the Member Selection List.
Enabled Config	This field displays the currently enabled Zone Configuration.
Name	Displays existing alias names from the drop-down menu.
Create Button	Click to create a new alias. A dialog box displays. Enter the name of the new alias. The maximum length allowed is 64 characters. All alias names must be unique and must consist of letters, numbers or the underscore character. Spaces or special characters are not allowed in alias names, and a name cannot start with a number.
Delete Button	Click to delete the alias selected in the Name field. Deleting an alias automatically removes it from all zones, and configs.
Rename Button	Click to rename the alias selected in the Name field. A dialog displays in which you can rename the alias. Renaming an alias automatically renames it in all zones, and configs.
Member Selection List	Select available items from the Member Selection List. In Mixed Zones you can select Ports, WWNs and AL_PAs.
Alias Members	Displays the current members of an Alias.
Add FA Host Button	Click to add a Fabric Assist Host to the member list.
Add Member Button	Click to add a member from the Member Selection List to the Alias Members. You must select a member within Member Selection List for this button to become active. If the item you selected from the member selection list (or at least one of the items you selected) is already a member in the member list, the button is disabled.
Remove Member Button	Click to remove a member from the Alias Members list. You must select a member within Alias Members for this button to become active.
Add Other Button: • **Other** • **Other Port** • **Other WWN** • **Other AL_PA**	Click to add a Port, WWN or AL_PA that is not currently part of the fabric. A dialog box will display for you to type in the host that is not a member of the fabric.

Table 3-6 Alias Tab Field Descriptions (continued)

Field	Description
Add Other Host Button: • **Other Host** • **Other Port Host** • **Other WWN Host**	Click to add a host that is not currently part of the fabric. The button displayed depends on the zoning method that you have selected.
Message area	Displays zoning commit messages on the switch.
QuickHelp Status Bar	Appears at the bottom of the window. Displays information for the current window.

Creating an Alias

To create an alias:

1. Click **View** on the Zone Administration window menu bar, and select a zoning scheme:
   - **Mixed Zoning**
   - **Port Zoning**
   - **WWN Zoning**
   - **AL_PA Zoning**

   The scheme you select determines how members appear in the Member Selection List window. Refer to *Using the View Menu* on page 3-17 for more information.
2. On the Zone Administration window for the selected zoning scheme, make sure the **Alias** tab is selected.
3. Click **Create**.

   The **Create New Alias** dialog box appears.
4. Enter a name for the new alias, and click **OK**.
5. Click on any plus (+) signs in the Member Selection List to view the nested elements.

   The choices available in the Member Selection List depend on the selection made in the **View** Menu.
6. Highlight an element in the Member Selection List that you want to include in your alias.

   The **Add Member** button becomes active.
7. Click **Add Member** or *drag and drop* members into the **Alias Members** window.

8. Repeat steps 5 through 7 to add more elements to your alias.

   Click **Add Other** to include a WWN, port, or QuickLoop (AL_PA) that is not currently a part of the fabric (optional).

Modifying the Members of an Alias

To modify the members of an alias:

1. On the Zone Administration window for the selected zoning scheme, select (if not already selected) the **Alias** tab.
2. From the **Name** drop-down menu, select the alias you want to modify.
3. Highlight an element in the Member Selection List that you want to include in your alias; or, highlight an element in the Alias Members that you want to delete.
4. Click **Add Member** to add an alias member; or, click **Remove Member** to remove an alias member.

Deleting an Alias

To delete an alias:

1. On the Zone Administration window for the selected zoning scheme, select (if not already selected) the **Alias** tab.
2. From the **Name** drop-down menu, select the alias you want to delete.
3. Click **Delete**.

   The **Confirm Deleting Alias** dialog box opens.
4. Click **OK**. The selected alias is deleted from the zoning database.

Renaming an Alias

To rename an alias:

1. On the Zone Administration window for the selected zoning scheme, select (if not already selected) the **Alias** tab.
2. From the **Name** drop-down menu, select the alias you want to rename.
3. Click **Rename**.

   The **Rename an Alias** dialog box appears.
4. Enter a new alias name, and click **OK**.

   The alias is renamed in the zoning database.

Using the Zone Tab

Use the **Zone** tab (shown in Figure 3-11) to create, modify, rename, or delete zones in the zoning database.

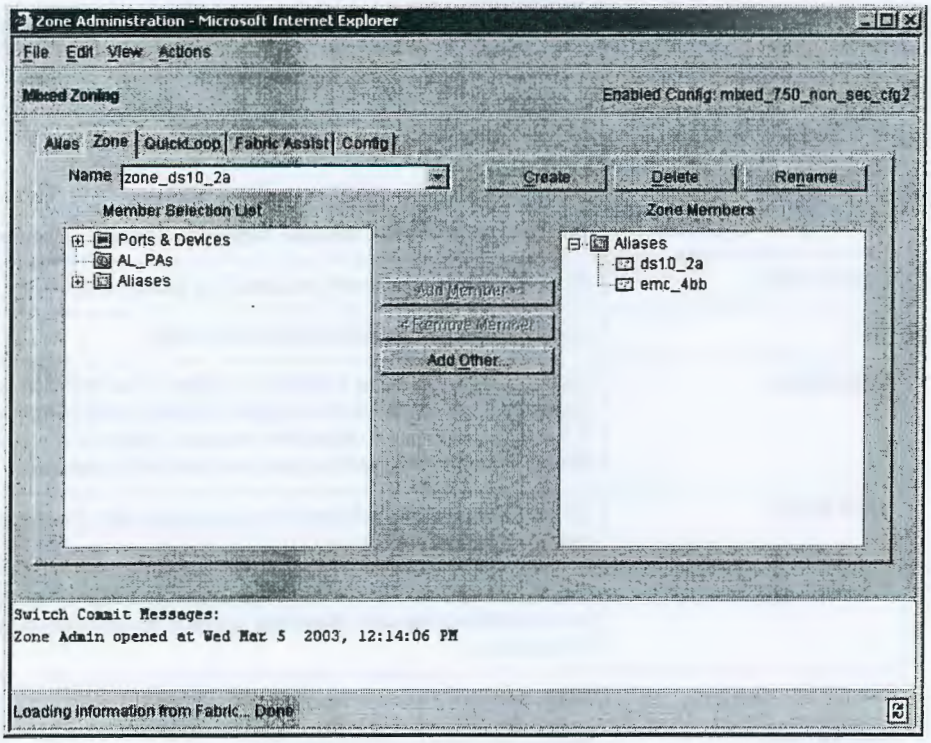

Figure 3-11 Zone Tab in the Zone Administration Window

The **Zone** buttons and fields are described in Table 3-7.

Table 3-7 Zone Tab Field Descriptions

Field	Descriptions
Zoning Method	This displays the method you have selected to add members to the Zoning database. Choose the Zoning method in the View menu. Valid options are: • Mixed Zoning • Port Zoning • WWN Zoning • AL_PA Zoning The Zoning method determines the information displayed in the Member Selection List.
Enabled Config	This field displays the currently enabled Zone Configuration.
Name	Displays existing zones from the drop-down menu.
Create Button	Click to create a new zone. A dialog box displays. Enter the name of the new zone. The maximum length allowed is 64 characters. All zone names must be unique and must consist of letters, numbers or the underscore character. Spaces or special characters are not allowed in zone names, and a name cannot start with a number.
Delete Button	Click to delete the zone selected in the Zone Name field. Deleting a zone automatically removes it from all configs.
Rename Button	Click to rename the Zone selected in the Zone Name field. A dialog box displays in which you can edit the zone name. Renaming a zone in the zone tab automatically renames it in all configurations.
Member Selection List	Select available items from the Member Selection List.
Zone Members	Displays the current members of a zone.
Add Member Button	Click to add a member from the Member Selection List to the Zone Members. You must select a member within Member Selection List for this button to become active. If the item you selected from the member selection list (or at least one of the items you selected) is already a member in the member list, the button is disabled.
Remove Member Button	Click to remove a member from the Zone Members list. You must select a member within Zone Members for this button to become active.
Add Other: • Other Port • Other WWN • Other AL_PA	Click to add a Port, WWN or AL_PA that is not currently part of the fabric. A dialog box will display for you to type in the host that is not a member of the fabric.
Message area	Displays zoning commit messages on the switch.
QuickHelp Status Bar	Appears at the bottom of the window. Displays information for the current window.

Creating a Zone

To create a zone:

1. Click **View** on the Zone Administration window menu bar, and select a zoning scheme:
   - **Mixed Zoning**
   - **Port Zoning**
   - **WWN Zoning**
   - **AL_PA Zoning**

   The scheme you select determines how members appear in the Member Selection List window. Refer to *Using the View Menu* on page 3-17 for more information.
2. Select the **Zone** tab.
3. Click **Create**.

   The **Create New Zone** dialog box appears.
4. Enter a name for the new zone, and click **OK**.
5. Click on any plus (+) signs in the Member Selection List to view the nested elements.

   The choices available in the Member Selection List depend on the selection made in the **View** menu.
6. Highlight an element in the Member Selection List that you want to include in your zone.

   The **Add Member** button becomes active.
7. Click **Add Member** or use *drag and drop* to add zone members. Selected members are moved to the Zone Members Window.
8. Repeat steps 5 through 7 to add more elements to your zone.

   Click **Add Other** to include a WWN, port, or QuickLoop (AL_PA) that is not currently a part of the fabric (optional).

   The new zone appears in the **Name** drop-down list.

Modifying the Members of a Zone

To modify the members of a zone:

1. On the Zone Administration window for the selected zoning scheme, select the **Zone** tab.
2. From the **Name** drop-down menu, select the zone you want to modify.

3. Highlight an element in the Member Selection List that you want to include in your zone; or, highlight an element in the Zone Members that you want to delete.
4. Click **Add Member** to add a zone member; or, click **Remove Member** to remove a zone member.

Deleting an Zone

To delete a zone:

1. On the Zone Administration window for the selected zoning scheme, select the **Zone** tab.
2. From the **Name** drop-down menu, select the zone you want to delete.
3. Click **Delete**.

   The **Confirm Deleting Zone** dialog opens.
4. Click **OK**.

   The selected zone is deleted from the zoning database.

Renaming a Zone

To rename a zone:

1. On the Zone Administration window for the selected zoning scheme, select the **Zone** tab.
2. From the **Name** drop-down menu, select the zone you want to rename.
3. Click **Rename**.

   The **Rename a Zone** dialog box appears.
4. Enter a new zone name, and click **OK**.

   The zone is renamed in the zoning database.

Using the QuickLoop Tab

Use the **QuickLoop** tab (shown in Figure 3-12) to manage QuickLoops in the zoning database. For more information regarding QuickLoops, refer to the *Quick Loop User's Guide*.

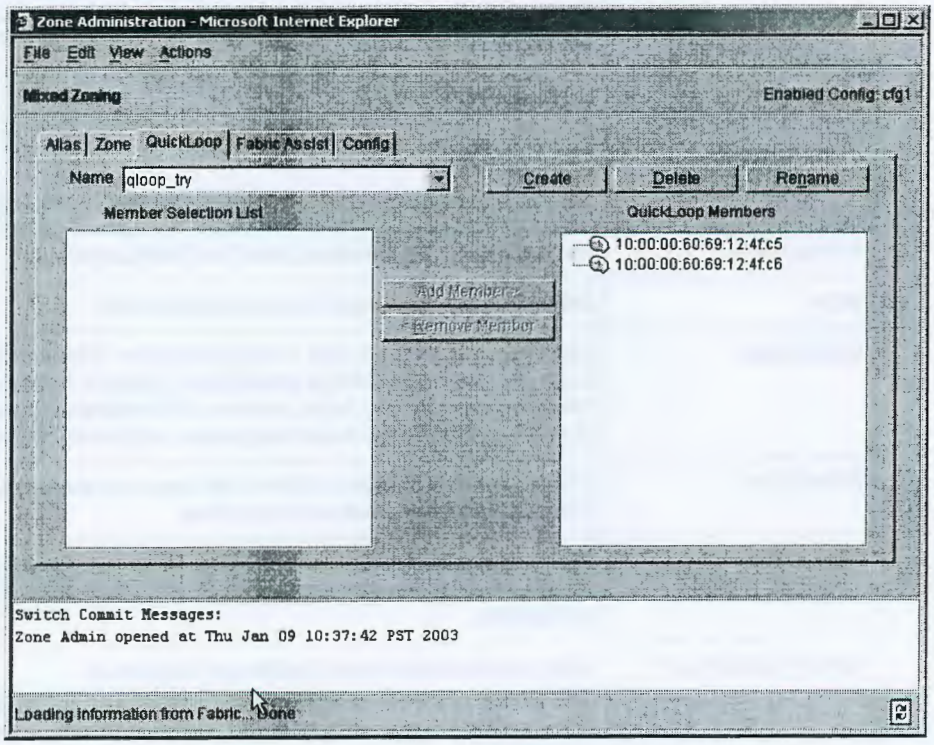

Figure 3-12 QuickLoop Tab in the Zone Administration Window

The QuickLoop tab are described in Table 3-8.

Table 3-8 QuickLoop Tab Field Descriptions

Field	Description
Zoning Method	This displays the method you have selected to add members to the Zoning database. Choose the Zoning method in the View menu. Valid options are: • Mixed Zoning • Port Zoning • WWN Zoning • AL_PA Zoning The Zoning method determines the information displayed in the Member Selection List.
Enabled Config	This field displays the currently enabled Zone Configuration.
Name	Displays existing QuickLoops from this drop-down menu.
Create Button	Click to create a new QuickLoop. A dialog box displays. Enter the name of the new QuickLoop. The maximum length allowed is 64 characters. All QuickLoop names must be unique and must consist of letters, numbers or the underscore character. Spaces or special characters are not allowed in QuickLoop names, and a name cannot start with a number.
Delete Button	Click to delete the QuickLoop selected in the Name drop-down menu. Deleting a QuickLoop automatically removes it from all configurations.
Rename Button	Click to rename the QuickLoop selected in the Name field. A dialog displays in which you can edit the QuickLoop name. Renaming a QuickLoop automatically renames it in all configurations.
Member Selection List	Select available members from the Member Selection List. QuickLoop is not supported on either the SilkWorm 12000 or SilkWorm 3900 switches. However you can manage a QuickLoop from these switches if it is attached to another switch in the fabric.
QuickLoop Members	Displays the current members of a QuickLoop.
Add Member Button	Click to add a member from the Member Selection List to the QuickLoop Members. You must select a member within Member Selection List for this button to become active. If the item you selected from the member selection list (or at least one of the items you selected) is already a member in the member list, the button is disabled.
Remove Member Button	Click to remove a member from the QuickLoop Members list. You must select a member within QuickLoop Members for this button to become active.
Message area	Displays zoning commit messages on the switch.
QuickHelp Status Bar	Appears at the bottom of the window. Displays information for the current window.

Creating a QuickLoop

To create an alias:

1. Click **View** on the Zone Administration window menu bar, and select a zoning scheme:
   - **Mixed Zoning**
   - **Port Zoning**
   - **WWN Zoning**
   - **AL_PA Zoning**

   The scheme you select determines how members appear in the Member Selection List window. Refer to *Using the View Menu* on page 3-17 for more information.
2. Select the **QuickLoop** tab.
3. Click **Create**.

   The **Create New QuickLoop** dialog box appears.
4. Enter a name for the new QuickLoop, and click **OK**.
5. Click on any plus (+) signs in the Member Selection List to view the nested elements.

   The choices available in the Member Selection List depend on the selection made in the **View** menu.

   Highlight an element in the Member Selection List that you want to include in your QuickLoop.

   The **Add Member** button becomes active.

   There is a limit of two members per QuickLoop.

   ---
6. Click **Add Member** or use *drag and drop* to add QuickLoop members. Selected members are moved to the QuickLoop Members Window.
7. Repeat steps 5 through 7 to add more elements to your QuickLoop.

   Click **Add Other** to include a WWN, port, or QuickLoop (AL_PA) that is not currently a part of the fabric (optional).

   The new QuickLoop appears in the **Name** drop-down list.

Modifying the Members of a QuickLoop

To modify the members of a QuickLoop:

1. On the Zone Administration window for the selected zoning scheme, select the **QuickLoop** tab.
2. From the **Name** drop-down menu, select the QuickLoop you want to modify.
3. Highlight an element in the Member Selection List that you want to include in your QuickLoop; or, highlight an element in the QuickLoop Members that you want to delete.
4. Click **Add Member** to add a QuickLoop member; or, click **Remove Member** to remove an QuickLoop member.

Deleting an QuickLoop

To delete a QuickLoop:

1. On the Zone Administration window for the selected zoning scheme, select the **QuickLoop** tab.
2. From the **Name** drop-down menu, select the QuickLoop you want to delete.
3. Click **Delete**.

   The **Confirm Deleting QuickLoop** dialog box opens.
4. Click **OK**.

   The selected QuickLoop is deleted from the zoning database.

Renaming a QuickLoop

To rename a QuickLoop:

1. On the Zone Administration window for the selected zoning scheme, select the **QuickLoop** tab.
2. From the **Name** drop-down menu, select the QuickLoop you want to rename.
3. Click **Rename**.

   The **Rename a QuickLoop** dialog box appears.
4. Enter a new QuickLoop name, and click **OK**.

   The QuickLoop is renamed in the zoning database.

Using the Fabric Assist Tab

NOTE: Fabric Assist is not currently supported.

Use the **Fabric Assist** tab (shown in Figure 3-13) to create and manage Fabric Assist zones. Fabric Assist is a means of allowing private hosts to communicate with public targets across a switched fabric. Fabric Assist also allows private hosts to communicate with public targets that are not resident in the same switched fabric.

Creating a Fabric Assist zone requires a fabric host.

The **Fabric Assist** tab is not available if you selected **View, AL_PA Zoning**.

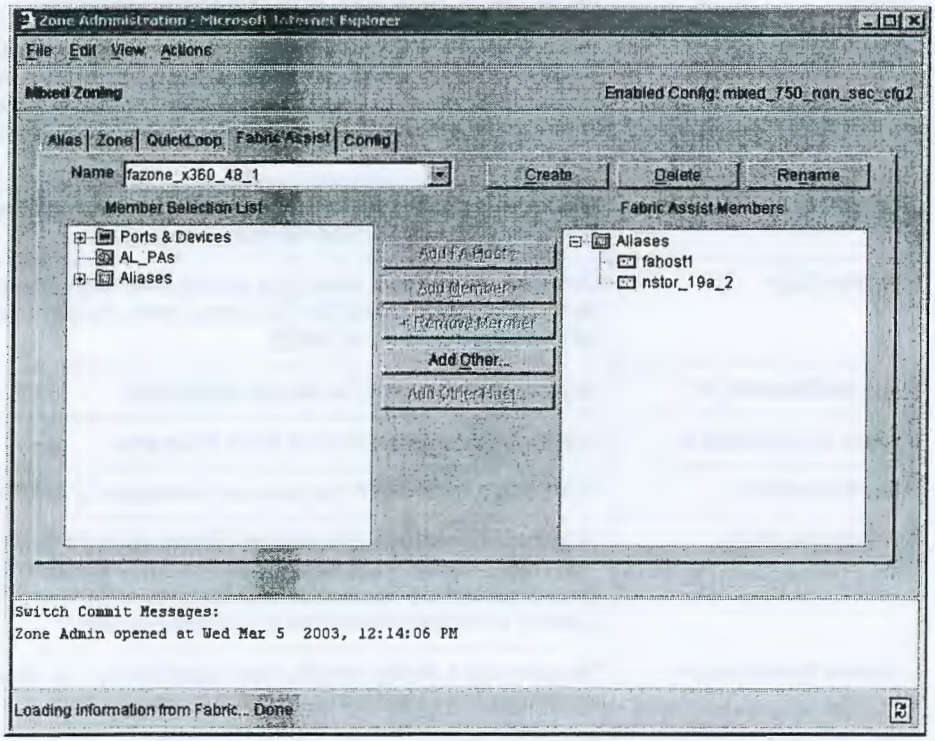

Figure 3-13 Fabric Assist Tab in the Zone Administration Window

The **Fabric Assist** fields are described in Table 3-9.

Table 3-9 Fabric Assist Fields Descriptions

Fields	Descriptions
Zoning Method	This displays the method you have selected to add members to the Zoning database. Choose the Zoning method in the View menu. Valid options are: • Mixed Zoning • Port Zoning • WWN Zoning • AL_PA Zoning The Zoning method determines the information displayed in the Member Selection List.
Enabled Config	This field displays the currently enabled Configuration.
Name	Displays existing Fabric Assist zones from the drop-down menu.
Create Button	Click to create a new Fabric Assist zone. A dialog box displays. Enter the name of the new Fabric Assist zone. The maximum length allowed is 64 characters. All Fabric Assist zone names must be unique and must consist of letters, numbers or the underscore character. Spaces or special characters are not allowed in Fabric Assist zone names, and a name cannot start with a number.
Delete Button	Click to delete the Fabric Assist Zone selected in the Name drop-down menu. Deleting a Fabric Assist Zone automatically removes it from configs.
Rename Button	Click to rename the Fabric Assist Zone selected in the Name drop-down menu. A dialog displays in which you can edit the Fabric Assist name. Renaming a Fabric Assist Zone automatically renames it in all configs.
Member Selection List	Select available items from the Member Selection List.
Fabric Assist Members	Displays the current members of an Fabric Assist zone.
Add FA Host Button	Click to Add a Fabric Assist Host that is not currently part of the fabric.
Add Member Button	Click to add a member from the Member Selection List to the Fabric Assist Members. You must select a member within Member Selection List for this button to become active. If the item you selected from the member selection list (or at least one of the items you selected) is already a member in the member list, the button is disabled.
Remove Member Button	Click to remove a member from the Fabric Assist Members list. You must select a member within Fabric Assist Members for this button to become active.
Add Other Button: • **Other** • **Other Port** • **Other WWN** • **Other AL_PA**	Click to add a Fabric Assist Zone that is not currently part of the fabric. A dialog box will display for you to type in the host that is not a member of the fabric.

Table 3-9 Fabric Assist Fields Descriptions (continued)

Fields	Descriptions
Add Other Host Button: • **Other Host** • **Other Port Host** • **Other WWN Host**	Click to add a host that is not currently part of the fabric. The button displayed depends on the zoning method that you have selected.
Message area	Displays zoning commit messages on the switch.
QuickHelp Status Bar	Appears at the bottom of the window. Displays information for the current window.

Creating a Fabric Assist Zone

To create a Fabric Assist zone:

1. Click **View** on the Zone Administration window menu bar, and select a zoning scheme from among these valid options:
   - **Mixed Zoning**
   - **Port Zoning**
   - **WWN Zoning**

   The scheme you select determines how members appear in the Member Selection List window. Refer to *Using the View Menu* on page 3-17 for more information.
2. Select the **Fabric Assist** tab.
3. Select **Create**.

   The **Create New FA** dialog box appears.
4. Enter a name for the new FA zone, and click **OK**.

   A fabric host is required.
5. Highlight the desired Fabric Assist zone members from the Member Selection List.
6. Click **Add Member**.

   The new members appear in the Fabric Assist Members window.

   The newly created FA zone also appears in the **Config** tab.

Modifying the Members of a Fabric Assist Zone

To modify the members of a Fabric Assist Zone:

1. On the Zone Administration window for the selected zoning scheme, select the **Fabric Assist** tab.
2. From the **Name** drop-down menu, select the Fabric Assist Zone you want to modify.
3. Highlight an element in the Member Selection List that you want to include in your Fabric Assist Zone; or, highlight an element in the Fabric Assist Zone Members that you want to delete.
4. Click **Add Member** to add a Fabric Assist Zone member; or, click **Remove Member** to remove an Fabric Assist Zone member.

Deleting an Fabric Assist Zone

To delete a Fabric Assist Zone:

1. On the Zone Administration window for the selected zoning scheme, select the **Fabric Assist** tab.
2. From the **Name** drop-down menu, select the Fabric Assist Zone you want to delete.
3. Click **Delete**.

   The **Confirm Deleting Fabric Assist Zone** dialog box opens.
4. Click **OK**.

   The selected Fabric Assist Zone is deleted from the zoning database.

Renaming a Fabric Assist Zone

To rename a Fabric Assist Zone:

1. On the Zone Administration window for the selected zoning scheme, select the **Fabric Assist** tab.
2. From the **Name** drop-down menu, select the Fabric Assist Zone you want to rename.
3. Click **Rename**.

   The **Rename a Fabric Assist Zone** dialog box appears.
4. Enter a new Fabric Assist Zone name, and click **OK**.

   The Fabric Assist Zone is renamed in the zoning database.

Using the Config Tab

Use the **Config** tab (shown in Figure 3-14) to create and manage configurations.

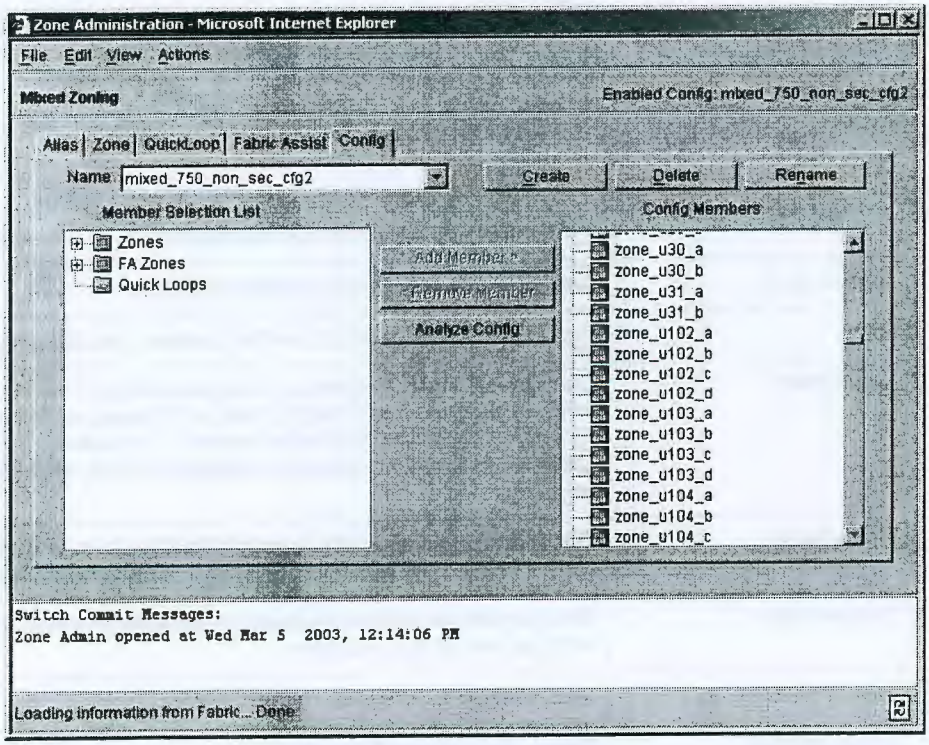

Figure 3-14 Config Tab in the Zone Administration Window

The **Config** tab fields are described in Table 3-10.

Table 3-10 Config Tab Field Descriptions

Field	Description
Zoning Method	This displays the method you have selected to add members to the Zoning database. Choose the Zoning method in the View menu. Valid options are: • Mixed Zoning • Port Zoning • WWN Zoning • AL_PA Zoning The Zoning method determines the information displayed in the Member Selection List.
Enabled Config	This field displays the currently enabled Configuration.
Name	Select an existing configuration from the drop-down menu to display or modify.
Create Button	Click to create a new configuration. A dialog box displays. Enter the name of the new configuration. The maximum length allowed is 64 characters. All configuration names must be unique and must consist of letters, numbers or the underscore character. Spaces or special characters are not allowed in configuration names, and a name cannot start with a number.
Delete Button	Click to delete the configuration selected in the Name drop-down menu. Deleting a configuration does not delete any of the elements contained in that configuration.
Rename Button	Click to rename the configuration selected in the Name drop-down menu. A dialog displays in which you can edit the Config name.
Member Selection List	Select available items from the Member Selection List.
Config Members	Displays the current config members.
Add Member Button	Click to add a member from the Member Selection List to the Config Members. You must select a member within Member Selection List for this button to become active. If the item you selected from the member selection list (or at least one of the items you selected) is already a member in the member list, the button is disabled.
Remove Member Button	Click to remove a member from the Config Members list. You must select a member within Config Members for this button to become active.
Analyze Config Button	Analyzes the configuration that is selected along with it's member zones. A report is created that lists: • SAN components (Ports, WWNs, and AL_PAs) that are not included in the configuration. • SAN components (Ports, WWNs, and AL_PAs) that are contained in the configuration but not in the fabric.
Message area	Displays zoning commit messages on the switch.
QuickHelp Status Bar	Appears at the bottom of the window. Displays information for the current window.

Creating a Configuration

To create a Configuration:

1. Click **View** on the Zone Administration window menu bar, and select a zoning scheme:
   - **Mixed Zoning**
   - **Port Zoning**
   - **WWN Zoning**
   - **AL_PA Zoning**

   The scheme you select determines how members appear in the Member Selection List window. Refer to *Using the View Menu* on page 3-17 for more information.
2. Select the **Config** tab.
3. Select **Create**.

   The **Create New Config** dialog box appears.
4. Enter a name for the new Config, and click **OK**.
5. Click on any plus (+) signs in the Member Selection List to view the nested elements.

   The choices available in the Member Selection List depend on the selection made in the **View** Menu.
6. Highlight an element in the Member Selection List that you want to include in your Config.

   The **Add Member** button becomes active.
7. Click **Add Member** or use *drag and drop* to add Config members. Selected members are moved to the Config Members window.
8. Repeat steps 5 through 7 to add more elements to your Config.
9. Select the **Actions**, **Save Config Only** option.

   The new Config appears in the Name drop-down list. To enable the configuration, refer to *Enabling a Configuration* on page 3-19.

Any changes made to the currently enabled configuration will not appear until the configuration is re-enabled.

Modifying the Members of a Config

To modify the members of a Config, perform the following steps:

1. On the Zone Administration window for the selected zoning scheme, select the **Config** tab.
2. From the **Name** drop-down menu, select the Config you want to modify.
3. Highlight an element in the Member Selection List that you want to include in your Config; or, highlight an element in the Config Members that you want to delete.
4. Click **Add Member** to add a Config member; or, click **Remove Member** to remove an Config member.

   You can make changes to a Configuration that is currently enabled; changes will not appear until the Configuration is disabled and re-enabled.

   ---

5. Select the **Actions, Save Config Only** option.

   The Configuration changes will be saved. Changes will not take effect until the Configuration is re-enabled.

   ---

6. To enable the configuration, refer to *Enabling a Configuration* on page 3-19.

Deleting a Config

To delete a config:

You cannot delete a currently enabled configuration.

---

1. On the Zone Administration window for the selected zoning scheme, select the **Config** tab.
2. From the **Name** drop-down menu, select the Config you want to delete.
3. Click **Delete**.

   The **Confirm Deleting Config** dialog opens.
4. Click **OK**.

   The selected Config is deleted from the Config database.

Renaming a Config

To rename a Config:

1. On the Zone Administration window for the selected zoning scheme, select the **Config** tab.
2. From the **Name** drop-down menu, select the Config you want to rename.
3. Click **Rename**.

   The **Rename a Config** dialog box appears.
4. Enter a new Config name, and click **OK**.

   The Config is renamed in the Config database.

   You can make changes to a Configuration that is currently enabled; changes will not appear until the Configuration is disabled and re-enabled.

   ---
5. Select the **Actions, Save Config Only** option.

   The Configuration changes will be saved. Changes will not take effect until the Configuration is re-enabled.

   ---
6. To enable the configuration, refer to *Enabling a Configuration* on page 3-19.

Creating a Configuration Analysis Report

To create a report:

1. On the Zone Administration window for the selected zoning scheme, select the **Config** tab.
2. From the **Name** drop-down menu, select the Config you want to be analyzed.
3. Click **Analyze Config**.

   An analysis window (shown in Figure 3-15) appears.

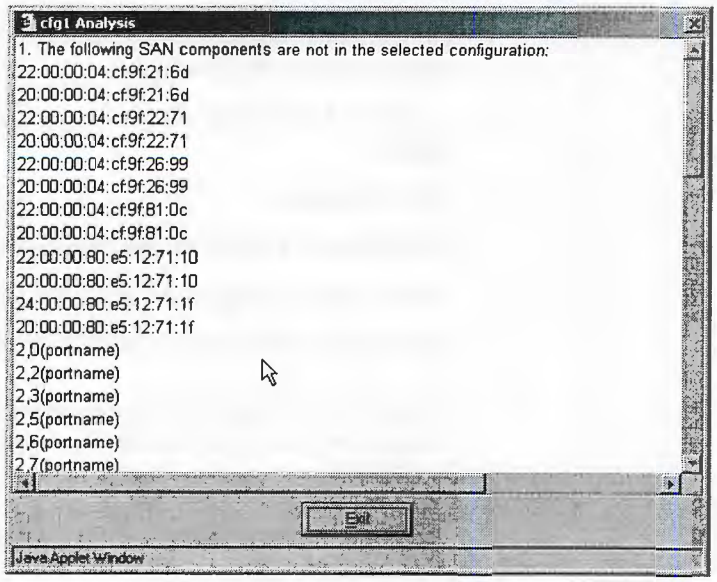

Figure 3-15 Analyze Config Report Example

4. View the configuration analysis. A report is created that lists:
   - SAN components (Ports, WWNs, and AL_PAs) that are not included in the configuration.
   - SAN components (Ports, WWNs, and AL_PAs) that are contained in the configuration but not in the fabric.

4

Switch View

This chapter describes the views and interfaces available through the Switch View of Web Tools.

Using the Switch View

The switch graphic is an interactive real-time display of the selected switch. The displays in Web Tools correspond to the front of the actual switch and its various switch and port LEDs.

Clicking a port displays a **Port Information** window, which contains functional and statistical information.

For the ED-12000B, the active CP is highlighted with an arrow at the bottom of the CP card display.

The Switch Explorer View (shown in Figure 4-1) is the first window that appears when you start Web Tools from a the web browser. In the browser, enter the switch name or IP address in the **Location/Address** field and press ENTER.

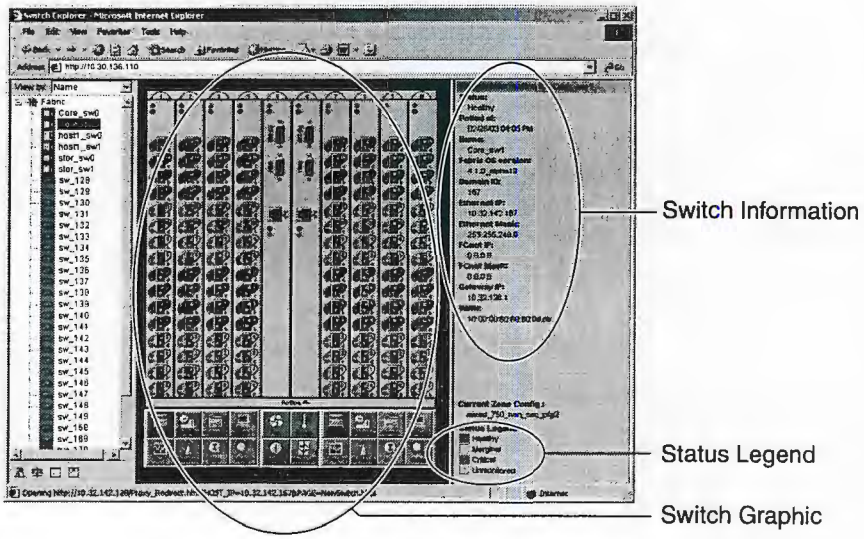

Figure 4-1 Switch Explorer View — ED-12000B Example

Port Icons

Figure 4-2 and Figure 4-3 show typical port icons on the switch graphic.

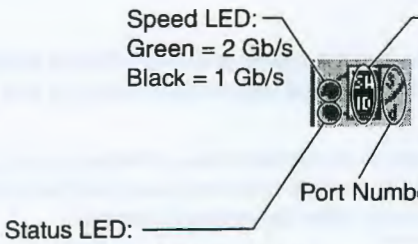

Figure 4-2 ED-12000B Port Icon

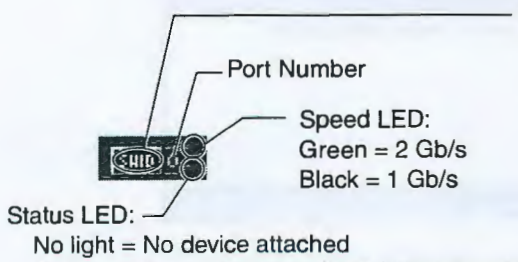

Figure 4-3 DS-32B2 Port Icon

Switch Graphic Toolbar

The buttons below the switch graphic enable you to access various configuration and monitoring functions for the switch. Some of these buttons may require a license key to activate. If the appropriate license key is not installed for a particular feature that button might not appear.

Status

Clicking the **Status** button opens a Switch Status window (Figure 4-4), which describes the overall status of the selected switch.

Switch status is stored as the variable `switchStatus`, and is calculated approximately once per second; however, the initial calculation does not occur until 30-60 seconds after the switch is booted.

The background color of the icon indicates the switch status:

- Green = Healthy
- Yellow = Marginal (mix of good and faulty readings)
- Red = Critical (more than two faulty readings)
- Gray = Unknown or unmonitored

If no data is available from a switch, the most recent background color remains displayed on the icon.

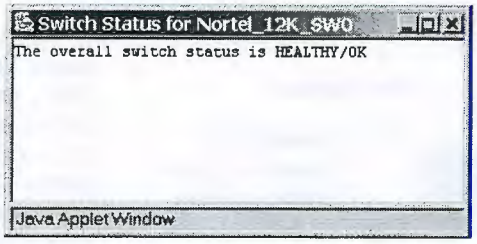

Figure 4-4 **Switch Status Window**

If the status changes while the Switch Status window is open, the information in the window also changes.

Events

Clicking the Events button displays the Switch Events log (Figure 4-5).

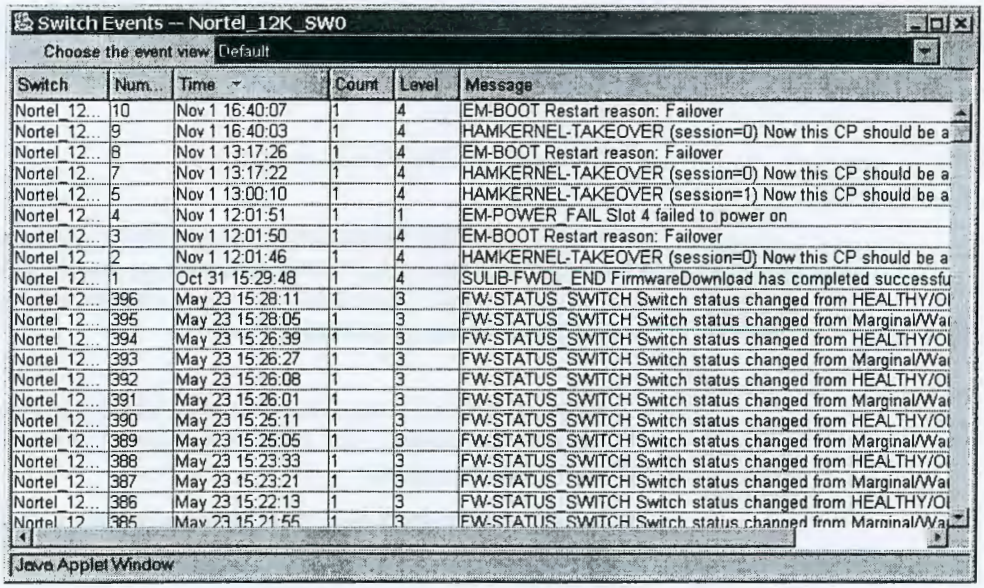

Figure 4-5 Switch Events Log

Contents of the display are:

- **Choose the Event View** — Select the type of event to display:
  - **Default** — Both active and persistent messages.
  - **Active** — Messages saved to RAM, these message are lost over a reboot or power-cycle.
  - **Persistent** — Messages saved to Flash; these messages are persistent and are saved over a reboot or power cycle.

  For more information on the Persistent Error Log feature refer to the *EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B Fabric OS Procedures Manual*.
- **Switch** — Name of the switch, if one has been assigned.
- **Number** — Order of the event.
- **Time** — Date and time the event occurred.
- **Count** — Number of back-to-back occurrences of the same event.
- **Level** — Severity level of the event:
  - 0 = Panic (switch reboots)
  - 1 = Critical

- 2 = Error
- 3 = Warning
- 4 = Information
- 5 = Debug

- **Message** — Description of the event.

Admin

Clicking the **Admin** button and entering the correct password opens a **Switch Administration** window, which provides access to several administrative functions. Refer to *Administrative Interface* on page 4-36 for more information.

Telnet

Clicking the **Telnet** button launches the Fabric OS command line interface for the switch. You must have administrative privileges to access the Telnet option.

For information regarding controlling the switch through the Fabric OS command line, refer to:

- *Telnet Interface* on page 4-79
- *EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B Fabric OS Reference Manual*

Perf

Clicking the **Perf** button launches the Performance Monitor. Refer to *Performance Monitor* on page 4-24 for more information.

Beacon

Clicking the **Beacon** button toggles a beacon on the switch. If the beaconing function is on, this icon shows beams of light. The beaconing function helps to physically locate a switch by sending a signal to the specified switch, resulting in an LED light pattern flashing from side to side on the switch.

Info

Clicking the **Info** button opens a **Switch Information** window, which displays the following information about the switch:

- **WWN** — World Wide Name of the switch
- **Domain ID** — Domain ID of the switch (a unique number that identifies the switch to the fabric and is used in routing frames)
- **Role** — Principal or Subordinate (switch in the fabric)

- **State** — State of the switch: online or offline.
- **Firmware** — Version of firmware loaded on the switch
- **Manufacturer Serial #** — Manufacturer's serial number of the switch
- **Supplier Serial #** — Supplier's serial number of the switch, if applicable
- **Ether IP** — Ethernet IP address
- **Ether NM** — Ethernet mask
- **FC IP** — Fibre Channel IP address, if one exists
- **FC NM** — Fibre Channel Mask, if one exists
- **Gateway** — Gateway address of the switch
- **License ID**— License ID of the switch, required to get license keys for the switch

Watch

Clicking the **Watch** button launches the optional Fabric Watch function (if a Fabric Watch license is installed). Refer to *Fabric Watch* on page 4-11 for more information.

Fan

Clicking the **Fan** button displays a window listing the status of all fans.

The background color of the button indicates the overall status of the fans:

- Green = Healthy
- Yellow = Marginal (mix of good and faulty readings)
- Red = Critical (more than two faulty readings)
- Gray = Unknown or unmonitored

Temp

Clicking the **Temp** button displays a window listing the temperatures in the six slots.

The background color of the button indicates the overall temperature status:

- Green = Healthy
- Yellow = Marginal (mix of good and faulty readings)

- Red = Critical (more than two faulty readings)
- Gray = Unknown or unmonitored

Power

Clicking the **Power** button opens a window that identifies each power supply and shows its operational status.

The background color of the button indicates the overall status of the power:

- Green = Healthy.
- Yellow = Marginal (mix of good and faulty readings).
- Red = Down (more than two faulty readings).
- Gray = Unknown or unmonitored.

Hi Avail

Clicking the **Hi Avail** button and entering a name and password opens an **HA Admin** window (Figure 4-6).

Refer to *High Availability Aministration* on page 4-81 for more information on using this window.

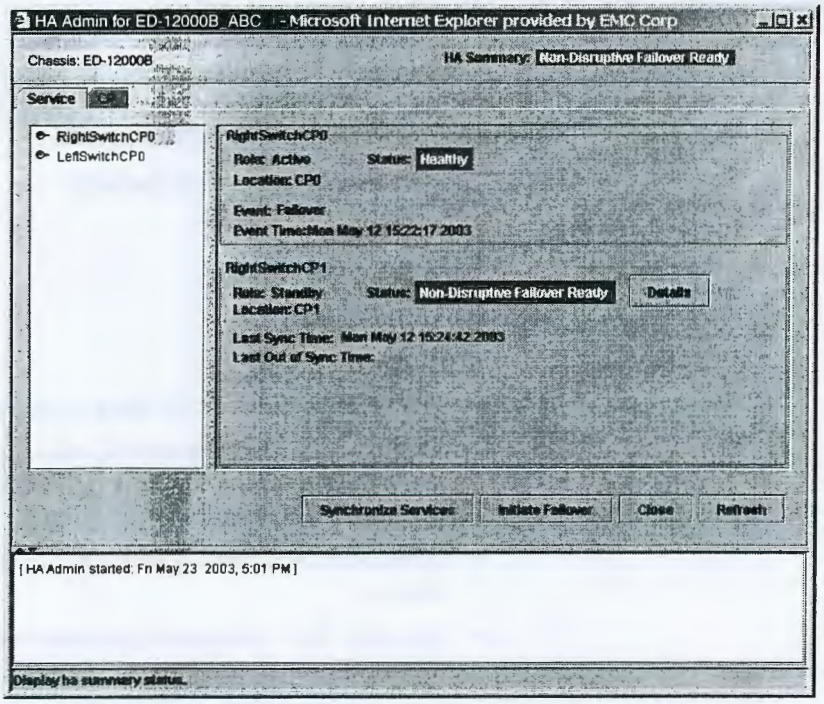

Figure 4-6 HA Admin Window

Understanding the Switch Information

The switch information area of the Switch Explorer View (shown in Figure 4-1 on page 4-2) is located to the right of an ED-12000B graphic and below a DS-32B2 graphic.

The displayed information includes:

- **Status**:
  - **Healthy**.
  - **Marginal**.
  - **Down**.
- **Polled at** — Time of the last successful status check.
- **Name** — Name of the switch, taken from the name configured on the **Switch Admin** tab. Refer to *About the Switch Information Tab* on page 4-37 for more information.
- **Fabric OS version** — Fabric OS version currently installed on the switch.
- **Domain ID** — Domain ID number that uniquely identifies the switch within the fabric.
- **Ethernet IP** — Ethernet IP address.
- **Ethernet Mask** — Ethernet subnetmask.
- **FCnet IP** — Fibre Channel IP address.
- **FCnet Mask** — Fibre Channel subnet mask.
- **Gateway IP** — Gateway IP address.
- **WWN** — World Wide Name, assigned by the switch manufacturer.

Fabric Watch

Fabric Watch is optional software that requires a license and administrative privileges.

Fabric Watch software monitors the performance and status of switches and can alert SAN administrators when problems arise. The real-time alerts from Fabric Watch software help SAN administrators solve problems before they become costly failures.

The Fabric Watch icon appears in Web Tools only when a Fabric Watch license is installed on the switch. SAN managers can configure Fabric Watch software to monitor any of the following:

- Fabric events (such as topology reconfigurations and zone changes)
- Physical switch conditions (such as fan speeds, power supply status, and chassis temperature)
- Port behavior and availability (such as state changes, errors, and performance)
- Small form factor pluggables (SFPs)
- Security events (violations and attempted violations)

For detailed information about Fabric Watch, refer to the *EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B Fabric Watch Reference Manual*.

Accessing Fabric Watch

To access Fabric Watch:

1. Launch Web Tools.
2. Select a switch icon from the Fabric Tree at the left of the Switch Explorer window.
3. Select the **Watch** button (Figure 4-7) below the switch graphic.

Figure 4-7 Fabric Watch Button

4. If prompted, enter an administrative user name and password.

The Fabric Watch View appears, with the **Alarm Notification** tab (described in the following section) selected by default.

Default vs. Custom

Fabric Watch includes default threshold values that you cannot change. Instead, you can configure custom values, then configure Fabric Watch to use those values.

After you configure custom values, you must configure Fabric Watch to run current values, or your settings will not apply.

Fabric Watch Navigation Tree

The Fabric Watch navigation tree displays the classes of elements that you can configure with Web Tools. Click a class to see the appropriate area and element information in the various tabs in the Fabric Watch window. Figure 4-8 shows the Fabric Watch navigation tree.

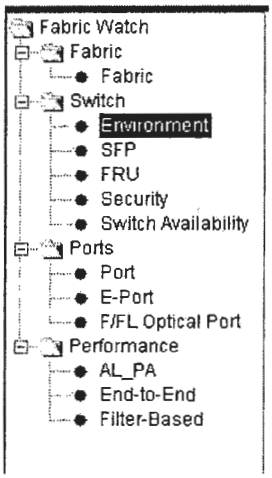

Figure 4-8 Fabric Watch Navigation Tree

Alarm Notification Tab

Use the Alarm Notifications tab of the Fabric Watch software to view the information for all elements of the Fabric, Switch, Ports, or Performance Monitor classes.

The Alarm Notification tab polls current events from fabric watch and refreshes the displayed information according to the threshold configuration.

Figure 4-9 is an example of the Alarm Notification tab.

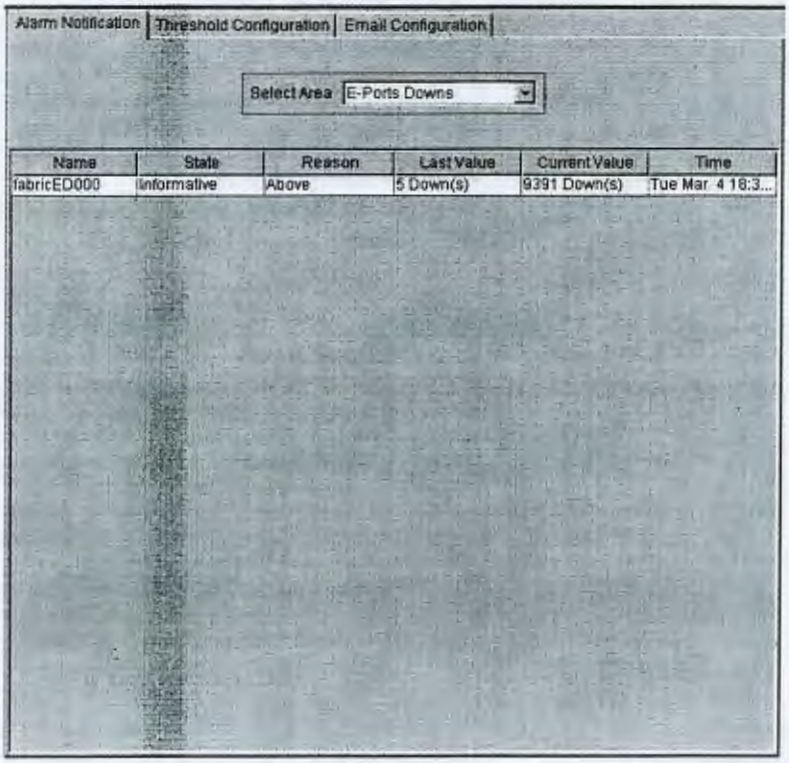

Figure 4-9 Alarm Notification Tab of Fabric Watch

Table 4-1 describes the Alarm Notification fields.

Table 4-1 Alarm Notification Field Descriptions

Field	Description
Selected Area	Displays the configurable areas in the drop-down menu. The items listed will change depending on the item selected in the Navigation tree.
Name	Displays the name of the alarm. The name of the alarm is a combination of the fabric element whose behavior set off the alarm: • Class • Area • Index number
State	Displays the severity of the alarm that governs what kind of traps Fabric Watch employs a response to an event. The State of the alarm can be Informative, Normal, or Faulty.
Reason	Displays the reason that an alarm notification was sent, such as Started, Changed, Exceeded, Below, Above, or In between.
Last Value	Displays the value of a counter (behavior variable) prior to the alarm.
Current Value	Displays the value of the counter (behavior variable) that set off the alarms.
Time	Displays the time and date the notification was sent from the switch.

Threshold Configuration Tab

Use the Threshold Configuration tab to view and configure Fabric Watch thresholds for the Fabric Watch class that you select in the Fabric Watch navigation tree.

Figure 4-10 shows the Area Configuration tab of the Threshold Configuration tab.

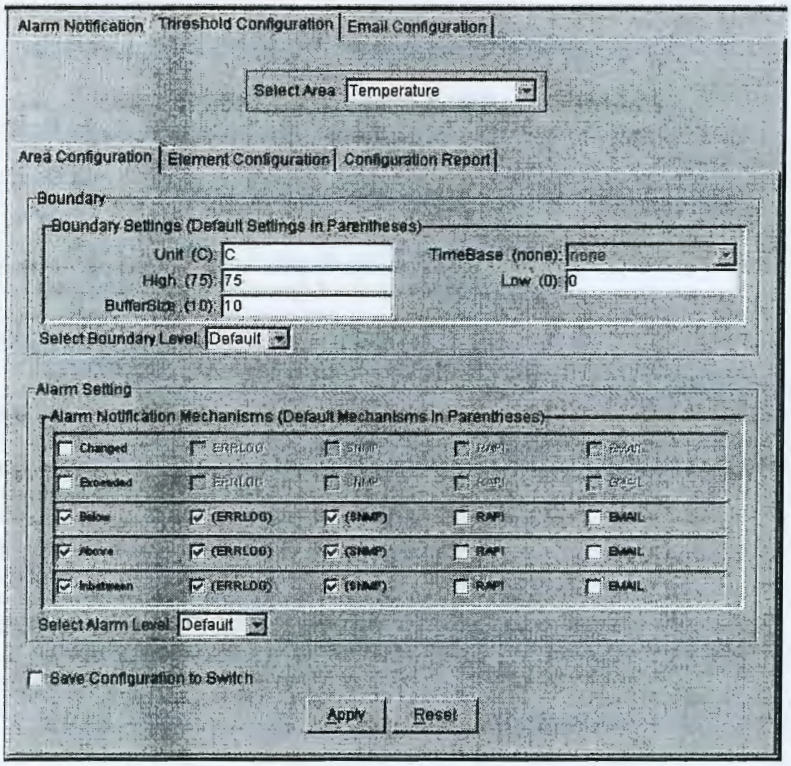

Figure 4-10 **Threshold Configuration Area Configuration Tab**

Table 4-2 lists and describes the components of the Threshold Configuration tab.

Table 4-2 **Threshold Configuration Tab Components**

Component	Description
Select Area pulldown menu	Lists the areas of thresholds that you can configure. The areas that appear in the pulldown menu depend on the class that you select from the Fabric Watch navigation tree.
Area Configuration tab	Provides fields to configure Fabric Watch threshold boundaries and alarms. For more information, refer to *Area Configuration Tab* on page 4-16.
Element Configuration tab	Provides fields to configure Fabric Watch threshold traits. For more information, refer to *Element Configuration Tab* on page 4-17.
Configuration Report tab	Displays the Fabric Watch settings for the class that you select from the Fabric Watch navigation tree. For more information, refer to *Configuration Report Tab* on page 4-18.

Area Configuration Tab

Table 4-3 lists and describes the components of the Area Configuration tab.

Table 4-3 Area Configuration Components

Component	Description
Boundary Partition	
Unit field	Set or display the selected unit values used for the chosen area. Depending on the area of interest, this is figured in units of "downs, reconfigs, errors, changes, logins", etc.
High field	Set or display the number of high boundaries (the highest limit at which an element will not trigger an event) for the selected area.
BufferSize field	Set or display the threshold boundary buffer size of the selected area.
TimeBase pulldown menu	Set or display the basic unit of time in which events are recorded for the selected area. The units available from the pulldown menu are: none, second, minute, hour, or day.
Low field	Set or display the number of low boundaries (the lowest limit at which an element will not trigger an event) for the selected area.
Select Boundary Level pulldown menu	Select either a default or custom setting for the boundary levels from the pulldown menu. The default values are shown in parenthesis.
Alarm Setting Partition	
Alarm Notification Mechanisms checkboxes.	Select Alarm settings for Errorlog, SNMP, RAN, Portlog and Email to be active on the switch side.
Select Alarm Level pulldown menu	Select either a custom or default setting for the alarm level from the pulldown; this setting will be active on the switch side menu.

Element Configuration Tab

Table 4-4 lists and describes the components of the Element Configuration tab.

Table 4-4 Element Configuration Tab Components

Component	Description
Select Element pulldown menu	Use the pulldown menu to chose a specific element to configure.
Status Partition	
Enable radio button	Select the radio button to enable alarms.
Disable radio button	Select the radio button to disable alarms.
Behavior Type Partition	
Triggered radio button	Select the Triggered Behavior mode if you want Fabric Watch to register an event when a variable exceeds a threshold. An event will not be triggered again until the variable falls and exceeds the threshold again.
Continuous radio button	Select Continuous mode if you want Fabric Watch to register an event when a variable exceeds a threshold and continue to register an event for every time interval.
Time Interval Partition	
Time Interval (in secs) pulldown menu	Select the amount of time (in seconds) that you want Fabric Watch to poll for a new event.

Configuration Report Tab

Table 4-5 describes the contents of the Configuration Report tab.

Table 4-5 Threshold Configuration Report Component Descriptions

Component	Description
Configuration for Class	Describes the class that is being reported. The item selected in the Navigation tree appears here.
Begin Area	Describes the current settings configured for the selected area.
Begin Element	Describes the current settings configured for the selected area.
Changed	Displays thresholds that have changed.
Exceeded	Displays thresholds that have been exceeded.
Below	Displays thresholds that have fallen below the configured level.
Above	Displays thresholds that have risen above the configured levels.
In between	Displays thresholds that have are in within the configured level.

Email Configuration Tab

Use the Email Configuration tab to enable and configure Email alarm notifications. A different Email Configuration can be set for each Class. For example, one Email notification can be set for SFPs and another can be set for E-Ports (see the navigation tree).

Figure 4-11 is an example of the Email Configuration tab.

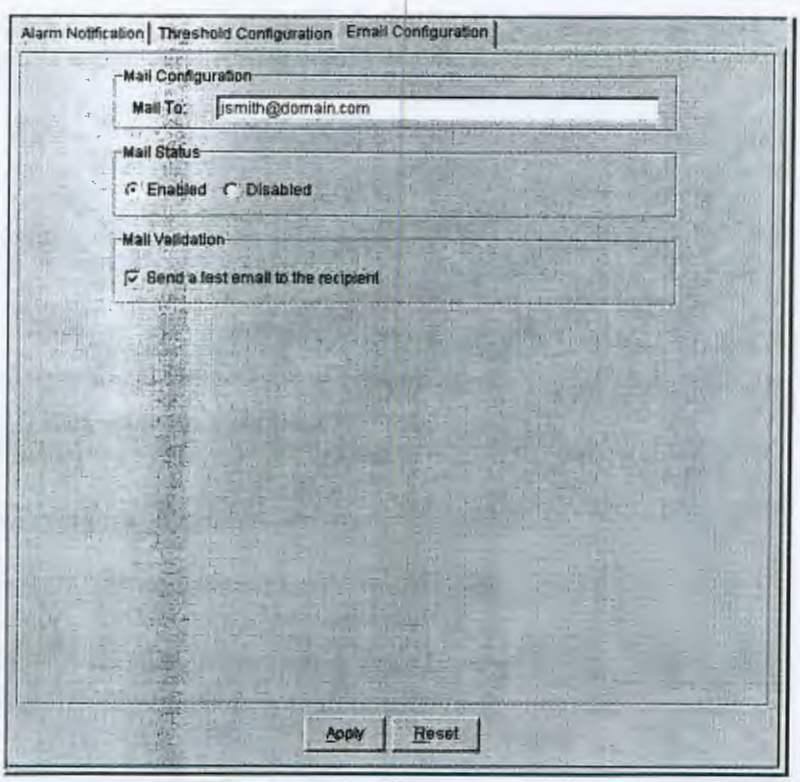

Figure 4-11 **Email Configuration Tab**

Table 4-6 describes the Fabric Watch Email Configuration fields.

Table 4-6 **Email Configuration Field Descriptions**

Field	Description
Mail Configuration	
Mail To:	Enter a valid mail recipient email address.
Mail Status	
Enabled/Disabled	Select the Enabled or Disabled radio button to enable or disable email alarm notifications.
Mail Validation	
Send a test email to the recipient	Check this box to send a validation email.

Using Fabric Watch

To customize Fabric Watch, you must assign custom settings and configure Fabric Watch to use those settings. Fabric Watch lets you monitor:

1. If a value changes.
2. If a value exceeds a limit.
3. If a value exceeds an acceptable range.

To use Fabric Watch, you must:

- Access Fabric Watch.
- Choose elements that you want to monitor.
- Place limits on the acceptable values of those elements and enable the custom limits (configure threshold boundaries).

  This procedure only applies to preceding items 2 and 3.

- Choose if and how Fabric Watch alerts you to errant values and enable your choices (configure alarms).
- Choose if and how frequently Fabric Watch identifies unacceptable values (configure threshold traits).

Configuring Boundary and Alarm Settings

To configure threshold boundaries and alarms, perform the following steps:

1. Access Fabric Watch (refer to *Accessing Fabric Watch* on page 4-11).
2. In the Fabric Watch navigation tree, click the class that you want configure.
3. Click the Threshold Configuration tab.
4. Click the Area Configuration subtab.
5. From the **Select Area** pulldown menu, select the area that you want to configure.
6. Enter custom values in the trait fields (such as Unit, High, and Low) in the Boundary Settings (Default Settings in Parentheses) partition.
7. From the **Select Boundary Level** pulldown menu in the Boundary partition, select **Custom**.

8. In the Alarm Notification Mechanisms (Default Mechanisms in Parentheses) partition, check the events that you want to trigger an alarm. You can choose from the following events:
   - Changed
   - Exceeded
   - Below
   - Above
   - In-Between

   After you click an event, you can select alarms to notify you when the event occurs.
9. Check the checkbox of each alarm that you want to associate with the event(s) that you checked.
10. From the **Select Alarm Level** pulldown menu in the Alarm Setting partition, select **Custom**.
11. Click Apply.

Configuring Your Switch to Run E-mail Alert

To set up the e-mail notification recipient's DNS Server and Domain name:

1. In the Switch Explorer window, click the **Admin** icon.
2. Click the Switch Information tab.
3. In the Email Configuration partition of the Switch Admin window, enter your primary domain name server IP address in the DNS Server 1 field.
4. Enter your secondary Domain Name Server IP address in the DNS Server 2 field.
5. Enter the domain name in the Domain Name field.

Configuring E-Mail Alert Recipients

To configure the Email Alert alarm, perform the following steps:

1. Access Fabric Watch (refer to *Accessing Fabric Watch* on page 4-11).
2. From the Fabric Watch navigation tree, select a class.
3. Click the Email Configuration tab.
4. In the **Mail To:** field, enter the email address of the administrator who receives email alerts.
5. In the Mail Status partition, click the **Enabled** radio button, then click the **Apply** button.

Configuring Threshold Traits

Configure threshold traits to designate if and when Fabric Watch monitors an element.

Enable/Disable Thresholds

Perform the following steps to enable or disable alarms:

1. Access Fabric Watch (refer to *Accessing Fabric Watch* on page 4-11).
2. In the Fabric Watch navigation tree, click the class with the alarms that you want to enable or disable.
3. Click the Threshold Configuration tab.
4. From the **Select Area** pulldown menu, select the area with the alarms that you want to enable or disable.
5. Click the Element Configuration subtab.
6. From the **Select Element** pulldown menu, select the element that you want to enable or disable.
7. In the Status partition, click the **Enabled** or **Disabled** radio button.
8. Click **Apply**. Web Tools enables or disable the element.

Configure Behavior

To configure threshold behavior, perform the following steps:

1. Access Fabric Watch (refer to *Accessing Fabric Watch* on page 4-11).
2. In the Fabric Watch navigation tree, click the class that you want to configure to a different behavior.
3. Click the Threshold Configuration tab.
4. From the **Select Area** pulldown menu, select the area that you want to configure to a different behavior.
5. Click the Element Configuration subtab.
6. From the **Select Element** pulldown menu, select the element that you want to configure to a different behavior.
7. Click the **Triggered** radio button to configure triggered behavior or click the **Continuous** radio button to configure continuous behavior.

If you click the **Continuous** radio button, enter a time interval in the **Time Interval** pulldown menu, or select an interval from the pulldown menu.

---

8. Click Apply.

Viewing an Alarm Configuration Report

To view an alarm configuration report, perform the following steps:

1. Access Fabric Watch (refer to *Accessing Fabric Watch* on page 4-11).
2. Select the Threshold Configuration tab.
3. Select the Configuration Report subtab.
4. Select a previously configured element from the navigation tree (refer to *Configuring Boundary and Alarm Settings* on page 4-20).
5. Select the alarm area report to be viewed from the **Area** drop-down menu.
6. Select the Configuration Report sub tab.

Viewing Alarms

To view alarms, perform the following steps:

1. Access Fabric Watch (refer to *Accessing Fabric Watch* on page 4-11).
2. In the Fabric Watch navigation tree, click the class that you want to check for alarms.
3. Click the Alarm Notification tab.
4. From the **Select Area** pulldown menu, select the area that you want to check for alarms. All alarms for that area appear. For troubleshooting responses to alarms, refer to the Fabric Watch documentation for your firmware.

Performance Monitor

The Performance Monitor graphically displays throughput (megabytes per second) for each port and for the entire switch. Port throughput is the number of bytes received at a port plus the number of bytes transmitted. Switch throughput is the sum of the throughput for all the ports. Performance Monitoring also allows the graphing of traffic based on the Source ID and the Destination ID hardware filtering mechanism.

Performance Monitoring features require a license. For more information about the Performance Monitor, see the *EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B Performance Monitoring User Guide.*

Accessing the Performance Monitor

To access the Performance Monitor:

1. Launch Web Tools, displaying the Switch Explorer.
2. Select the desired switch from the Fabric Tree.

   The Switch View of that switch appears.
3. Click the **Performance** button (Figure 4-12) below the switch graphic.

Figure 4-12 Performance Button

The Performance Monitor appears, as shown in Figure 4-13.

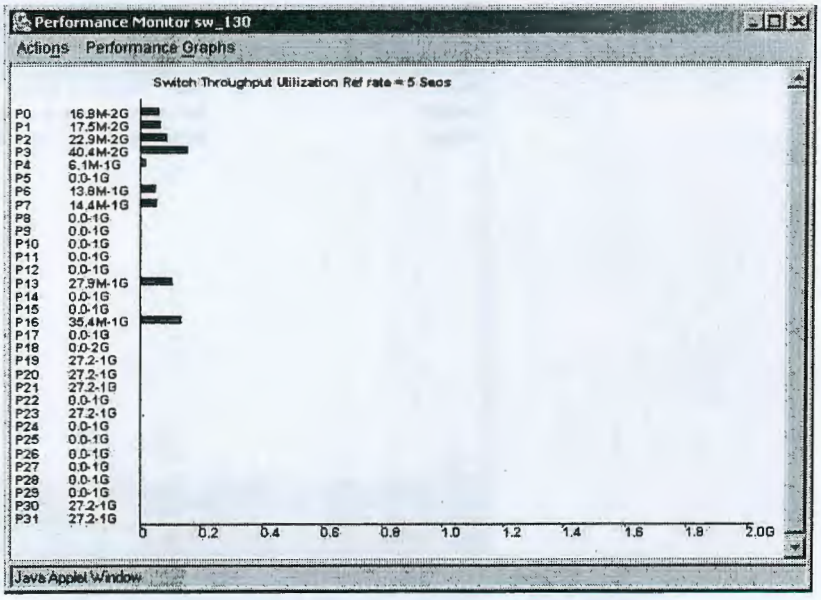

Figure 4-13 **Performance Monitor**

About the Actions Menu

Use the Actions Menu to access the following options:

- Save Current Canvas Configuration
- Display Canvas Configurations
- Display Resource Usage (This option requires a Performance Monitor license)
- Print All Graphs (on a selected canvas)

Display Canvas Configurations Example

An example of the Display Canvas Configurations window is shown in Figure 4-14.

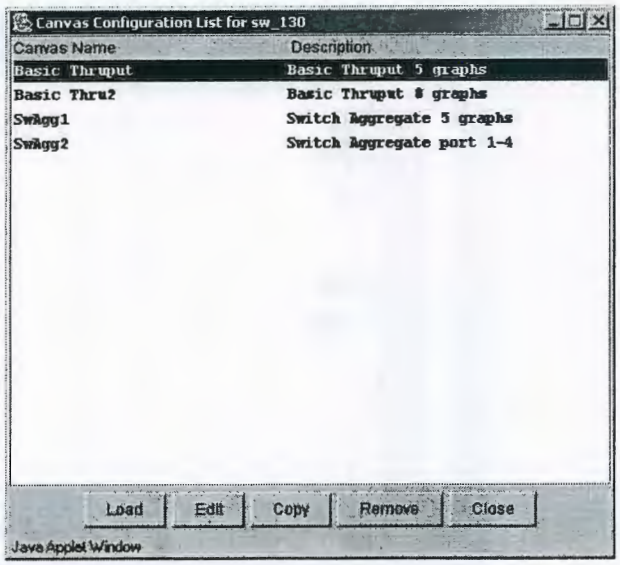

Figure 4-14 **Display Canvas Configuration Example**

Display Canvas Configuration Descriptions

The Display Canvas Configuration Field Descriptions are listed in Table 4-7.

Table 4-7 **Display Canvas Configuration**

Field	Description
Canvas Name	Displays the name of the saved canvas configuration.
Description	Displays the saved description of the canvas.
Load	Select a canvas name from the list, and click the load button to load that canvas.
Edit	Select to edit the highlighted canvas configuration. A dialog box appears, containing the following options: • **Save** - Saves a selected canvas. • **Edit** - Change specifications of a selected graph. • **Add** - Add a graph to a canvas. • **Remove** - Remove a graph from the main canvas. • **Cancel** - Closes the Edit Canvas window.

Table 4-7 Display Canvas Configuration (continued)

Field	Description
Copy	Use to make a copy of a selected canvas and save it to the switch. The copied canvas appears in the list of canvases.
Remove	Use this button to remove a selected canvas from the switch.
Close	Use this button to close this dialog box.

Save Canvas Configuration Example

An example of the Save Canvas Configuration option is shown in Figure 4-15.

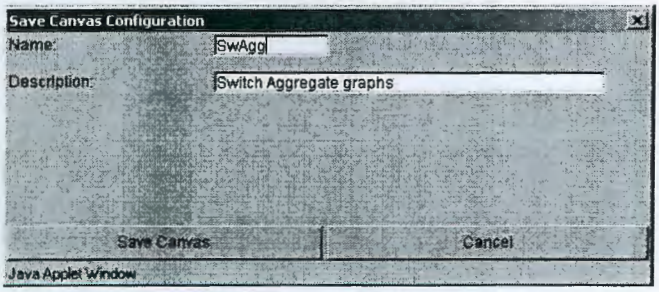

Figure 4-15 Save Canvas Configuration Example

Save Canvas Configuration Descriptions

The Save Canvas Configuration options are displayed in Table 4-8.

Table 4-8 Save Canvas Configuration Descriptions

Field	Description
Name	Enter a name of the canvas to be saved.
Description	Enter a description that will help you remember the information on the canvas.
Save Canvas	Select to save the canvas after entering name and description.
Cancel	Select to exit the Save Canvas Configuration window without saving changes.

Display Resource Usage Example

An example of the Display Resource Usage window is shown in Figure 4-14.

This screen requires a Performance Monitor License to display.

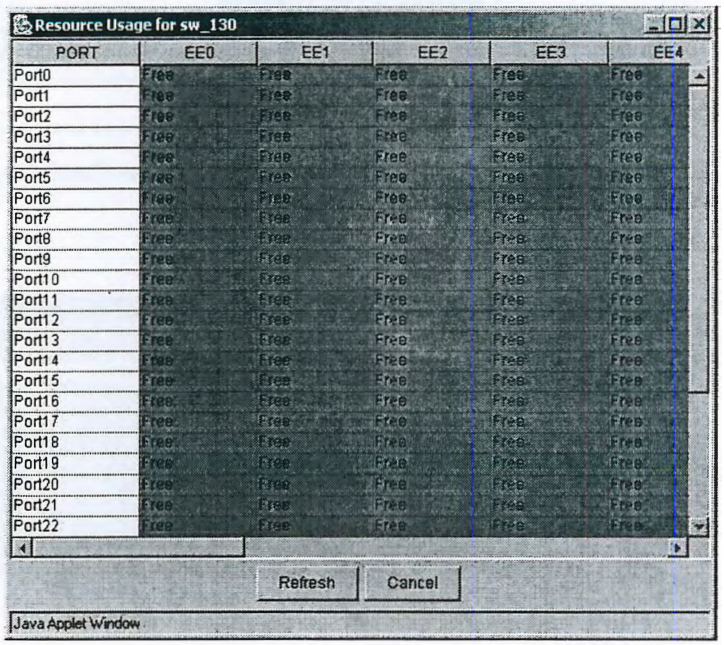

Figure 4-16 Display Resource Usage Example

Display Resource Usage Descriptions

The Display Resource Usage Field Descriptions are listed in Table 4-7.

Table 4-9 Display Resource Usage

Field	Description
Port	This column displays all the ports available for monitoring in the switch.
EE 0-7	Displays the number of End to End Monitors are configured for a particular port. Each port can have a maximum of 8 monitors.
FL24-31	Displays the number of Filter Monitors are configured for a particular port. Each port can have a maximum of 8 monitors.

Print All Graphs

Use the Print All Graphs option in the Actions menu to print all the graphs displayed on the selected canvas configuration. Only one canvas configuration can be opened at a time. Each Canvas Configuration can have a total of eight monitors.

Using the Actions Menu

This section describes using the Actions menu.

Adding a Graph to a Canvas

To add a graph:

1. Access the Performance Monitor functionality. Refer to *Accessing the Performance Monitor* on page 4-24 for more information.
2. Select **Actions, Display Canvas Configurations**.

   The Canvas Configuration List appears. A message `No Canvas configuration to display` will pop up if there are no saved canvas configurations.
3. Highlight the desired canvas in the list.
4. Click **Edit**.

   The Edit Canvas dialog box appears.
5. Click **Add**. A list of graphs will appear and you can click to add a graph to the canvas.

Changing an Existing Graph

To change a graph:

1. Access the Performance Monitor functionality. Refer to *Accessing the Performance Monitor* on page 4-24 for more information.
2. Select **Actions, Display Canvas Configurations**.

   The Canvas Configuration List appears (refer to the example: *Creating a Port Throughput Graph* on page 4-32 if a graph has not yet been created).
3. Select the desired canvas from the list.
4. Click **Edit**.

   The **Edit Graph** dialog box appears.
5. Select the desired graph from the list and click **Edit**. The **Edit** button will only be enabled for the graphs that are configurable or editable.

6. Click **Save** to save the changes and close the **Edit Canvas** dialog box.
7. Click **Cancel** to close the Canvas list window.

Printing Graphs

To print a graph:

1. Access the Performance Monitor functionality. Refer to *Accessing the Performance Monitor* on page 4-24 for more information.
2. Select **Actions, Display Canvas Configurations**.

   The Canvas Configuration List appears (refer to the example: *Creating a Port Throughput Graph* on page 4-32 if a graph has not yet been created).
3. Select the desired graph from the list.
4. Click the **Load Canvas** button.

   The graph appears on the canvas.
5. Repeat to add more graphs to the canvas (add up to 8 graphs).
6. Select the **Actions, Print All Graphs** option.

   The print dialog box appears.
7. Click **Ok**.

About Performance Graphs

The Performance Graphs drop-down menu consists of the following submenus:

- *About Basic Monitoring*
- *About Advanced Monitoring* on page 4-33

About Basic Monitoring

The **Performance Graphs, Basic Monitoring** menu provides the following type of graphs:

- Port Throughput Graph
- Switch Aggregate Throughput Graph
- Blade Aggregate Throughput Graph (ED-12000B Only)
- Switch Throughput Utilization Graph
- Port Error Graph
- Switch Percent Utilization Graph
- Ports SnapShot Error Graph

Basic Monitoring Example

An example of a **Port Throughput Setup** window is shown in Figure 4-17.

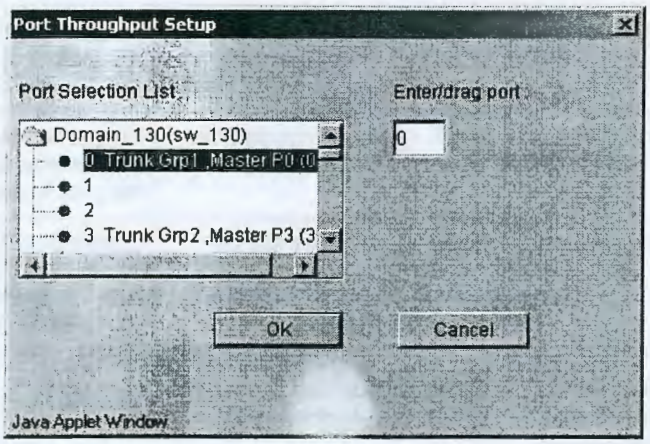

Figure 4-17 Port Throughput Setup Example on a DS-32B2

Basic Monitoring Descriptions

The Basic Monitoring options are described in Table 4-10.

Table 4-10 Basic Monitoring Graph Descriptions

Name of Basic Monitoring Graph	Scope of Graph	Graph Type	Graph Description
Port Throughput Graph	Port	Line	Displays the performance of a port based on four-byte frames received and transmitted. The snapshot rate for this graph is every 15 seconds with a 60 minute lifespan for each snapshot.
Switch Aggregate Throughput Graph	Switch	Line	Displays the aggregate performance of all ports of a switch. The snapshot rate for this graph is every 15 seconds with a 60 minute lifespan for each snapshot.
Blade Aggregate Throughput Graph	Switch	Line	Displays the aggregate performance of all blades of a switch. The snapshot rate for this graph is every 15 seconds with a 60 minute lifespan for each snapshot. Available for the ED-12000B Only.
Switch Throughput Utilization Graph	Switch	Horizontal Bar	Displays the port throughput at the time the sample is taken. The snapshot rate for this graph is every 5 seconds.

Table 4-10 Basic Monitoring Graph Descriptions (continued)

Name of Basic Monitoring Graph	Scope of Graph	Graph Type	Graph Description
Port Error Graph	Port	Line	Displays the CRC error rate over time for a given port. The snapshot rate for this graph is every 15 seconds with a 60 minute lifespan for each snapshot.
Switch Percent Utilization Graph	Switch	Horizontal Bar	Displays the percentage of usage of a chosen switch at the time the sample is taken. The snapshot rate for this graph is every 5 seconds.
Ports SnapShot Error Graph	Switch	Vertical Bar	Displays the CRC error rate between sampling periods for all the ports on a switch. The snapshot rate for this graph is every 15 seconds with a 60 minute lifespan for each snapshot.

Using Basic Performance Monitoring

Creating a Port Throughput Graph

1. Access the Performance Monitor functionality. Refer to *Accessing the Performance Monitor* on page 4-24 for more information.
2. Select the **Performance Graphs** drop-down menu.
3. Select **Performance Graphs, Basic Monitoring**.
4. Select the Port Throughput Graph.
5. The Port Throughput setup window is displayed.
6. Double-click on a switch folder to see available ports.
7. Type or click and drag the selected port number from the Port Selection list to the Enter/Drag Port window.
8. Click **Ok**.

Creating a Snapshot of Port Errors

1. Access the Performance Monitor functionality. Refer to *Accessing the Performance Monitor* on page 4-24 for more information.
2. Select the **Performance Graphs** drop-down menu.
3. Select **Performance Graphs, Basic Monitoring**.
4. Select **Port Snapshot Errors**.

   The Port Snapshot errors graph is displayed on the canvas.
5. Select **Actions, Save Current Canvas Configuration** to save the graphs on the canvas.

About Advanced Monitoring

The (optional) Advanced Monitoring menu provides the following graphs:

- SID/DID Performance Graph
- SCSI Commands Graph
- SCSI vs. IP Graph
- AL_PA Error Graph

Advanced Monitoring Example

An example of the **SCSI Write on a LUN Per Port Setup** window is shown in Figure 4-18.

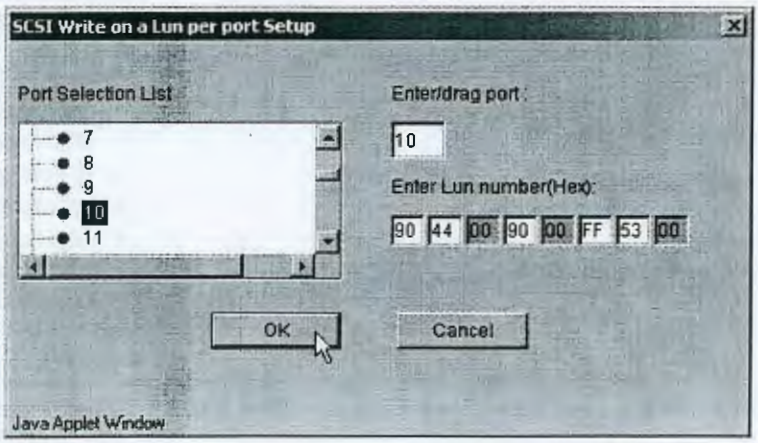

Figure 4-18 SCSI Write on a LUN Per Port Setup Example on a DS-32B2

Only 2 out of 8 fields can be set for LUN masks.

Advanced Monitoring Descriptions

The Advanced Monitoring graphs are described in Table 4-11.

Table 4-11 Advanced Monitor Graph Descriptions

Name of Advanced Monitoring Graph	Scope of Graph	Graph Type	Graph Description
SID/DID Performance Graph	Switch	Line	Charts the traffic between a SID and a DID pair on the switch being managed. The snapshot rate for this graph is every 15 seconds with a 60 minute lifespan for each snapshot. See *Creating a SID/DID Performance Graph* on page 4-35.
SCSI Commands Graph	Switch	Line	Displays the total number of Read/Write commands per second on a given port to a specific LUN. Provides the following choices: • SCSI Read/Write on a LUN per port. • SCSI Read on a LUN per port. • SCSI Write on a LUN per port. • SCSI Read/Write per port. • SCSI Read per port. • SCSI Write per port. The snapshot rate for this graph is every 15 seconds with a 60 minute lifespan for each snapshot.
SCSI vs IP Graph	Switch	Vertical Bar	Shows percentage of SCSI vs. IP frame traffic on each individual port. See *Creating a SCSI vs. IP Traffic Graph* on page 4-35. The snapshot rate for this graph is every 5 seconds.
AL_PA Error Graph	Switch	Line	Displays the CRC error rate over time for a given port and a given AL_PA. The snapshot rate for this graph is every 15 seconds with a 60 minute lifespan for each snapshot.

Using Advanced Performance Monitor

Creating a SID/DID Performance Graph

To create a SID/DID performance graph:

1. Access the Performance Monitor functionality. Refer to *Accessing the Performance Monitor* on page 4-24 for more information.
2. Select the **Performance Graphs** drop-down menu.
3. Select **Performance Graphs, Advanced Monitoring**.
4. Select **SID/DID Performance Graph**.

   The **SID/DID Performance Monitor** setup window appears.
5. Double-click on a folder in the Port Selection List window.

   A drop-down list of ports appear.
6. Type or drag/drop the port that you want to monitor or change.
7. Type or drag/drop the SID/DID that you want to monitor or change.
8. Click **OK**.

Creating a SCSI vs. IP Traffic Graph

To create a SCSI vs. IP Traffic graph:

1. Access the Performance Monitor functionality. Refer to *Accessing the Performance Monitor* on page 4-24 for more information.
2. Select the **Performance Graphs** drop-down menu.
3. Select **Performance Graphs, Advanced Monitoring**.
4. Select **SCSI vs IP Traffic**.

Administrative Interface

The Administrative Interface provides access to the administrative functions though the following tabs:

- Switch Information tab
- Network Config tab
- Upload/Download tab
- SNMP Admin tab
- License Admin tab
- Port Settings tab
- Configure tab
- Routing tab
- Extended Fabric tab
- Trunk Information tab

The Administrative Interface requires administrative privileges. Once an administrative login is entered, administrative privileges remain available until the Web browser is exited.

Accessing the Administrative Interface

To access the Administrative Interface:

1. Launch Web Tools.
2. Select a Switch icon from the Fabric Tree of the Switch Explorer.

   The selected switch appears in the Switch view.
3. Click the **Admin** icon (Figure 4-19) beneath the switch graphic.

Figure 4-19 Admin Icon

   The login dialog box appears.
4. Enter the admin user name and password.
5. Select the desired tab.

For reference information on the specific tabs, refer to the remainder of this chapter.

About the Switch Information Tab

Use the Switch Information tab to manage basic switch setup for items such as switch name, switch domain ID and enabling and disabling the switch. For additional Switch Setting information, refer to *Using the Network Config Tab* on page 4-42.

Switch Information Tab Example

An example of the Switch Information tab is shown in Figure 4-20.

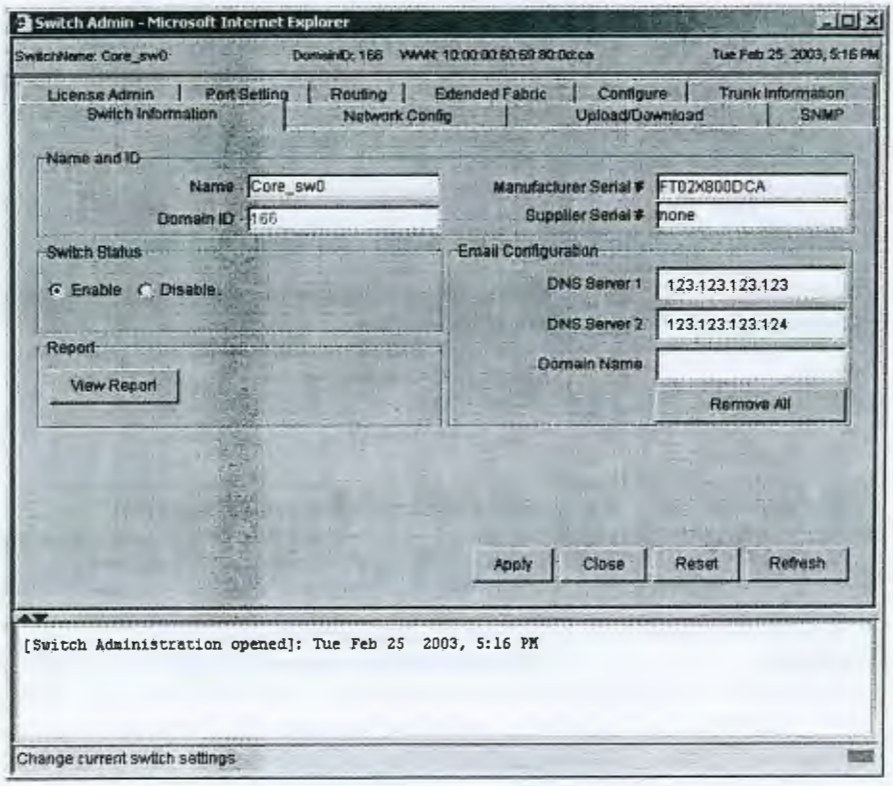

Figure 4-20 Switch Information Tab of the Switch Admin Window

Switch Information Field Descriptions

The Switch Information fields are described in Table 4-12.

Table 4-12 Switch Information Field Descriptions

Field	Description
Name and ID	
Name	Display or modify the current switch name. The switch name can be from 1 to 15 characters in length.
Domain ID	Displays or sets switch domain ID. Domain IDs must be unique within a fabric. Domain ID can only be modified when the switch is disabled. The switch must be disabled to change domainID. To change domain ID, enter new domain ID in this field. Use a number from 1 to 239 for normal operating mode (FCSW compatible) Use a number from 0 to 31 for VC encoded address format mode. Use a number from 97 - 127 for Interop mode.
Manufacturers Serial #	Displays the Manufacturers serial number of the switch (Read only).
Supplier Serial #	Displays the Supplier serial number of the switch, if applicable (Read only).
Switch Status Enable / Disable	Select the Enable radio button to enable the switch, or the Disable radio button to disable the switch.
Report View Report	Click this button to view a report of the selected switch.
Email Configuration	
DNS Server 1	Display or modify the first DNS Server IP address.
DNS Server 2	Display or modify the second DNS Server IP address.
Domain Name	Display or modify the Domain name of the DNS Server.
Remove All	Delete all information configured for Domain name and DNS Servers.

Using the Switch Information Tab

This section describes the functions available on the Switch Information tab.

Enabling/Disabling a Switch

To enable or disable a switch:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Switch Information tab.
4. Select the **(Switch Status) Enable** radio button to enable the switch;
   or, select the **(Switch Status) Disable** radio button to disable the switch.
5. Click **Apply**.

Viewing/Printing a Switch Report

To view or print a report:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Switch Information tab.
4. Click **View Report**.

   A switch report appears.
5. View or print the report using your browser or the **Print Screen** option of your computer.

About the Network Config Tab

Use the Network Config tab of the Administrative interface to manage the IP networking functionality of the switch.

For more detailed information regarding network configuration, refer to the *EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B Fabric OS Procedures Manual* or **configure** command in the *EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B Fabric OS Reference Manual*.

Syslog IP

The Syslog IP represents the IP address of the server that is running the syslog process. The Syslog daemon reads and forwards system messages to the appropriate log files and/or users, depending on the system configuration. When one or more IP addresses are configured,

the switch forwards all error log entries to the syslog on the specified server(s). Up to six servers are supported. Refer to the *EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B Fabric OS Procedures Manual* for more information on configuring the syslog daemon.

Switch Identification

If both the Fibre Channel IP and Ethernet IP are present, the switch is identified by the Fibre Channel IP.

Network Config Tab Example

An example of the Network Config tab is shown in Figure 4-21.

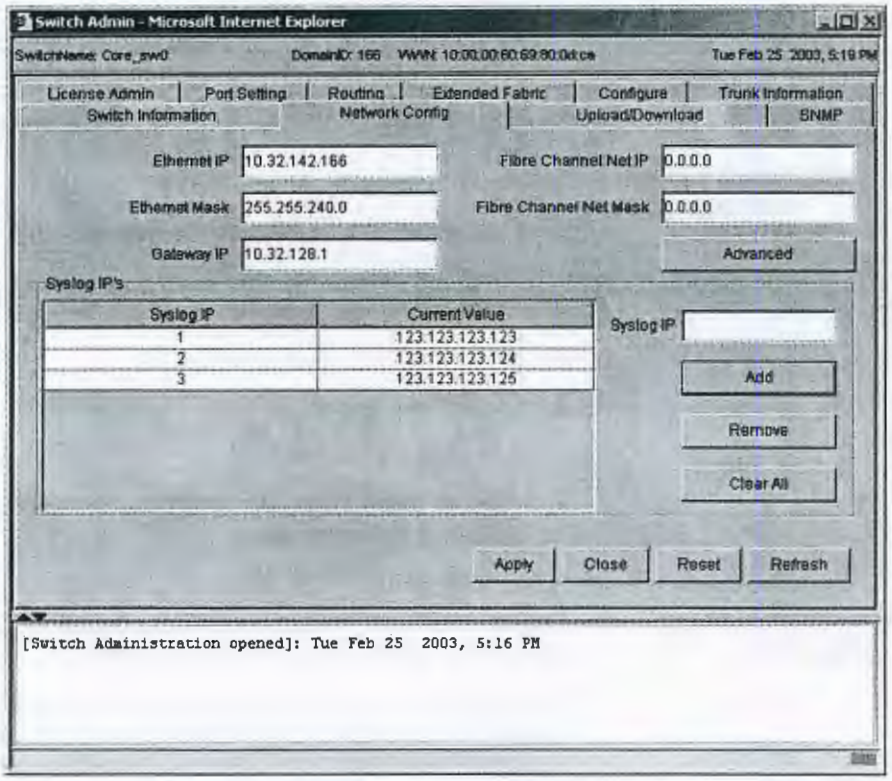

Figure 4-21 Network Configuration Tab of the Switch Admin Window

An example of the Advanced IP Configuration window (ED-12000B only) is shown in Figure 4-22.

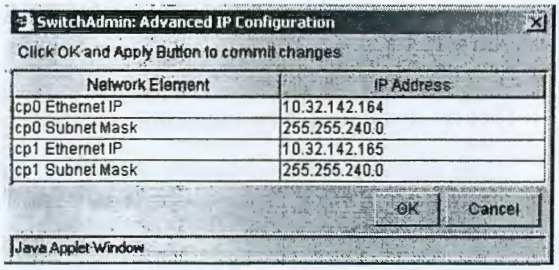

Figure 4-22 **ED-12000B Advanced IP Configuration Window**

Network Config Field Descriptions

The Network Config fields are described in Table 4-13.

Table 4-13 **Network Config Field Descriptions**

Field	Description
Ethernet IP	Displays the Ethernet IP address.
Ethernet Mask	Displays the Ethernet SubnetMask address.
Gateway IP	Displays the Gateway IP address.
Fibre Channel Net IP	Displays the Fibre Channel IP address, if one exists.
Fibre Channel NetMask	Displays the Fibre Channel subnet mask address, if one exists.
Advanced Button	Displays the Advanced IP Configuration window (Figure 4-22). This window displays the IP information configured for each network element (CP1, CP1, Logical Switch 0, and Logical Switch 1) in the ED-12000B. This window is read-only and is only available for the ED-12000B.
Syslog IPs	
Syslog IP window	Displays the currently configured Syslog recipients. Refer to the *EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B Fabric OS Procedures Manual* for more information about configuring the syslog daemon.
Syslog IP Field	Enter any valid IP for a host and click the Add button to configure that IP as a recipient of syslog messages.

Table 4-13 Network Config Field Descriptions (continued)

Field	Description
Add Button	Click the Add button to add the IP specified in the Syslog IP field to the Syslog IP window. You must click the Apply button to make your changes persistent over a switch reboot.
Remove Button	Click the Remove button to delete the IP specified in the Syslog IP field from the Syslog IP window. You must click the Apply button to make your changes persistent over a switch reboot.
Clear All Button	Click the Remove button to delete all the configured Syslog IPs. You must click the Apply button to make your changes persistent over a switch reboot.

Using the Network Config Tab

This section describes the functions available on the Network Config tab.

Configuring an Ethernet IP or FC IP Address

To configure an Ethernet IP or Fibre Channel IP address:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Network Config tab.
4. Select the Ethernet or Fibre Channel IP address you want to configure.

   If both the Fibre Channel IP and Ethernet IP are present, the switch is identified by the Fibre Channel IP.

5. Enter an Ethernet or Fibre Channel address in the appropriate field (for example, 123.123.123.123).
6. Click **Apply**.
7. You must close and re-open Web Tools to continue working.

   When changing either the Ethernet IP/netmask, Gateway IP, Fibre channel net IP/netmask from WebTools - Switch Admin - Network Config panel, there is a normal loss of network connection to the switch while these parameters are updated. If the IP properties have been changed you must close all current windows, and restart Web Tools with the new IP address.

Configuring a Syslog IP Address

To configure a Syslog IP address:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Network Config tab.
4. Enter a non-null IP address in one of the Syslog IP Field (for example, 123.123.123.123).
5. Click **Add**. The configured IP is displayed in the Syslog IP window.
6. Click **Apply**.

About the Upload/Download Tab

Use the Upload/Download tab of the Switch Admin window to complete tasks such as:

- Download firmware
- Upload a Configuration file to the host
- Download the configuration from a host to the switch

You must provide host information for all the upload and download tasks listed above.

Upload/Download Tab Example

An example of the Upload/Download tab is shown in Figure 4-23.

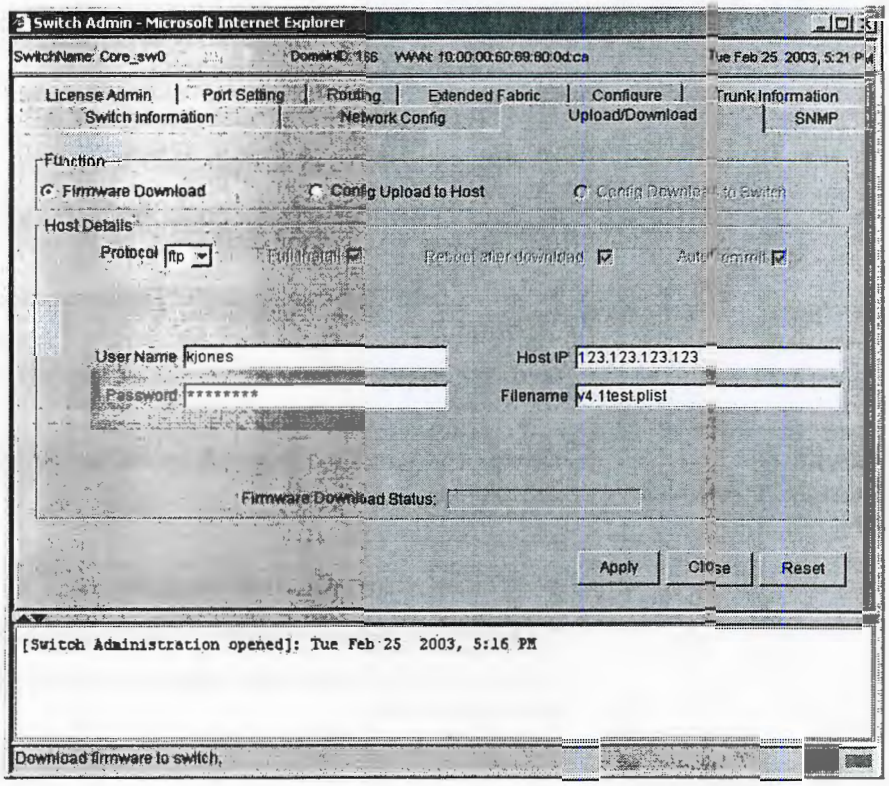

Figure 4-23 Upload/Download Tab of the Switch Admin Window

Upload/Download Field Descriptions

The Upload/Download fields are described in Table 4-14.

Table 4-14 Upload/Download Field Descriptions

Field	Descriptions
Function	
Firmware Download	Select the radio button to download firmware. The Fastboot After Download option becomes enabled. Refer to the **Firmware Download** chapter of the *EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B Fabric OS Procedures Manual* for limitations when changing Fabric OS versions. When installing Fabric OS v4.1, the procedure may vary depending on which version of the Fabric OS you are migrating from.
Config Upload to Host	Select the radio button to upload the configuration file to a specified host. Using this options allows you to save the configuration file to the switch using the specified filename (full path). The Username and Password must be valid for the specified host, and the file path must be read-write capable by the user. The switch must be disabled for this option to be available.
Config Download to Switch	Select the radio button to download a configuration file to the switch. The Config Download option requires that the switch first be disabled; it will be set to the original switch status after the config download is complete. The switch must be disabled for this option to be available.
Host Details	
Protocol	Displays the supported downloading protocol: FTP.
Full Install	This option is a required value for Firmware Download. A full install replaces every file rather than only the delta files.
Reboot After Download	This option is a required value for Firmware Download. This option automatically reboots the switch after the Firmware Download is complete.
AutoCommit	This option is a required value for Firmware Download. This option automatically commits the firmware download to both partitions of a switch or CP in the ED-12000B.
User Name	Enter the User Name who owns the firmware package on the host.
Host IP	Enter the IP address of the host.
Password	Enter the password of the User who owns the firmware package on the host.
Filename	Enter the file name of the firmware package to be downloaded.
Download/Upload Status	Indicates the progress of the firmware download or upload.

Using the Upload/Download Tab

This section describes the functions available on the Upload/Download tab.

Performing a Firmware Download

To download firmware:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Upload/Download tab.
4. Click the **Firmware Download** radio button.
5. Select the FTP transfer protocol from the drop-down menu.

   FTP is the only supported transfer protocol in Fabric OS v4.1.

6. Enter the User Name, Password, and Host IP information.
7. Enter the fully qualified path to the firmware file.
8. Click **Apply**.

Backing Up a Firmware Config File

To back up a firmware config file:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Upload/Download tab.
4. Click the **Config Upload to Host** radio button.
5. Select the FTP transfer protocol from the drop-down menu.

   FTP is the only supported transfer protocol in Fabric OS v4.1.

6. Enter the User Name, Password, and Host IP information.
7. Click **Apply**.

Performing a Config Download to Switch

To download the configuration from the switch:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.

3. Select the Upload/Download tab.
4. Click the **Config Download to Switch** radio button.
5. Select the FTP transfer protocol from the drop-down menu.

   FTP is the only supported transfer protocol in Fabric OS v4.1.

6. Enter the User Name, Password, and Host IP information.
7. Enter the fully qualified path to the config file.
8. Click **Apply**.

About the SNMP Tab

Use the SNMP tab of the Administrative Interface to perform administration of the SNMP Subsystem. Use the SNMP tab to specify the switch community string, location, trap level and trap recipients.

For more detailed information regarding SNMP, refer to the **agtcfgset** command in the *Fabric OS Command Reference*.

Security

Secure OS is not currently supported.

The SNMP tab is affected by the use of Secure Fabric OS; the ACL list will not be visible if security is enabled.

In order for the switches to send SNMP traps, you must first enter the CLI command **snmpmibcapset**. This enables the MIBs on all switches to be monitored.

SNMP Tab Example An example of the SNMP window is shown in Figure 4-24.

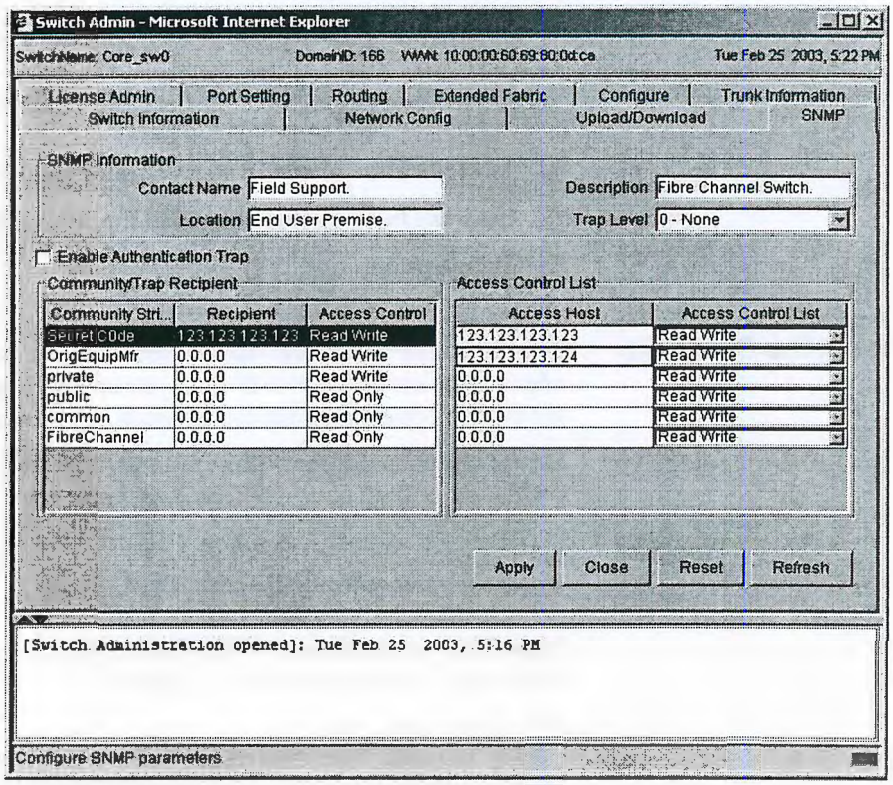

Figure 4-24 SNMP Tab of the Switch Admin Window

SNMP Field Descriptions

The SNMP fields are described in Table 4-15.

Table 4-15 SNMP Field Descriptions

Field	Description
SNMP Information	
Contact Name	Use to display or configure contact information for switch. Default is Field Support. Valid range of values are from 0 to 255 characters.
Description	Use to display or configure system description. Default is Fibre Channel Switch.Valid range of values are from 0 to 255 characters.
Location	Use to display or configure the location of switch. Default is End User Premise.Valid range of values are from 0 to 255 characters.
Trap Level	Use to set the severity level of switch events that will prompt SNMP traps. Default is 0.
Enable Authentication Trap	Check box to enable authentication traps; uncheck box to disable (disable is recommended).
Community/Trap Recipient	
Community String	Displays the community strings that are available. A community refers to a relationship between a group of SNMP managers and an SNMP agent, in which authentication, access control, and proxy characteristics are defined. A maximum of six community strings can be saved to the switch. Valid range of values are from 2 to 16 characters.
Recipient	Displays the IP address of the Trap Recipient. A trap recipient receives the message sent by an SNMP agent to inform the SNMP management station of a critical error.
Permissions	Displays the Read/Write access of a particular community string. READ ONLY access means that a member of a community string has the right to view, but cannot make changes. READ/WRITE access means that a member of a community string can be both viewed and make changes.
Access Control List The fields described below do not display if security is enabled on the switch.	
Access Host	Enter the IP address for the host workstations you want to add to the Access Control List.
Access Control List	Select the control level for the specified Host.

Using the SNMP Tab

This section describes the functions available on the SNMP tab.

Setting Trap Levels

To set trap levels:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the SNMP tab.
4. Select a Trap level from the drop-down menu. The level you select refers to the Event level that will prompt a trap. Refer to *Events* on page 4-4.
5. Click **Apply**.

About the License Admin Tab

Use the License Administration tab to install and remove license keys that are provided to you.

License Admin Tab Example

An example of the License Admin Tab is shown in Figure 4-25.

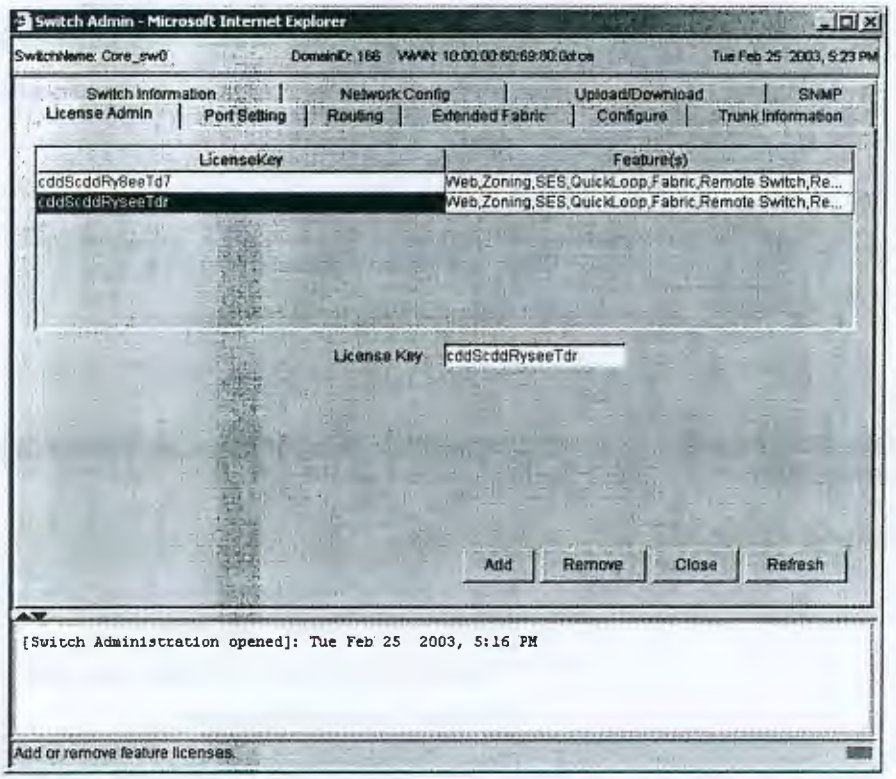

Figure 4-25 License Admin Tab of the Switch Admin Window

License Admin Field Description

The License Admin fields are described in Table 4-16.

Table 4-16 License Admin Field Descriptions

Field	Description
LicenseKey column	Displays a list of license keys currently installed on the switch.
Feature(s) column	Displays a list of the feature names associated with the license keys installed on the switch.
License Key field	Enter a license key to be added or double-click a license key from the LicenseKey column to have it display in this field.
Add	Click to add the specified license.
Remove	Click to remove the specified license.
Close	Click to close the Admin window
Refresh	Click to refresh the information in the window.

Using the License Admin Tab

This section describes the functions available on the License Admin tab.

Adding a License to a Switch

To add a license:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the License Admin tab.
4. Enter a new license key in the License Key field.
5. Click **Add**.

Removing a License From a Switch

To remove a license:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the License Admin tab.
4. Enter the license key to remove, or double-click a license key from the LicenseKey column to have it display in License Key field.

5. Click **Remove**.

About the Port Setting Tab

Use the Port Setting tab of the Administrative interface to perform functions such as: disable/enable ports on the switch, set port speed to 1GB/2GB/Negotiate, enable/disable Trunking, or name a port.

The port speed is displayed as follows:

- **1G** = 1 Gb/s
- **2G** = 2 Gb/s
- **N1** = Negotiated 1 Gb/s
- **N2** = Negotiated 2 Gb/s

Port Settings Tab Example

An example of the Port Settings Tab is shown in Figure 4-26.

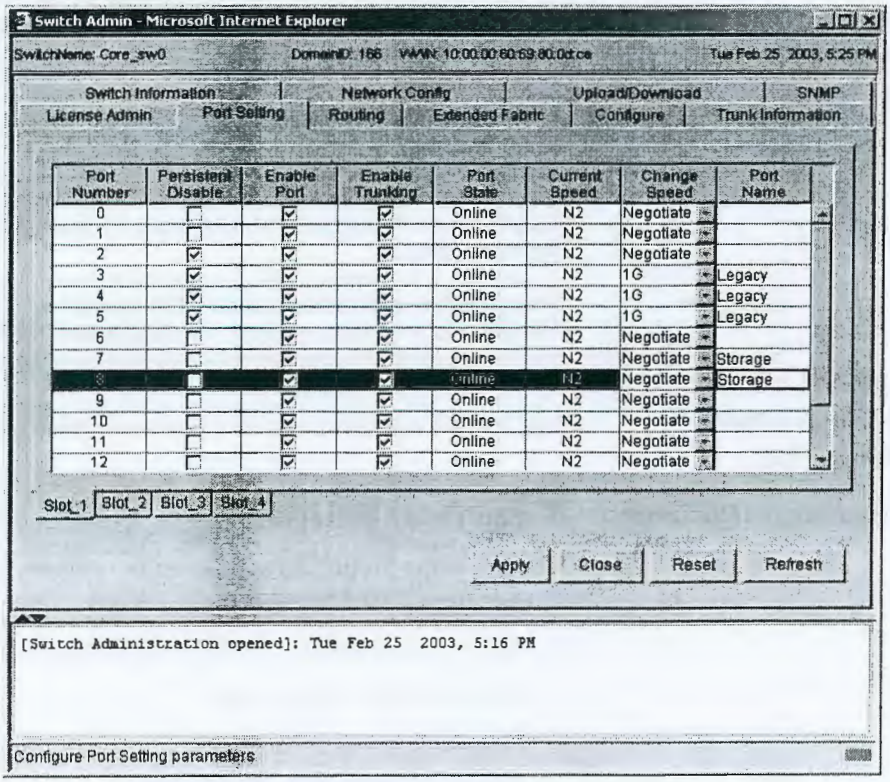

Figure 4-26 Port Settings Tab of the Switch Admin Window

Port Settings Field Descriptions

The Port Setting fields are described in Table 4-17.

Table 4-17 Port Setting Field Descriptions

Field	Description
Port Number	Displays the Port Number.
Persistent Disable	Check this box to disable the port and maintain this state over switch reboot.
Enable Port	Check this box to enable a port. You can check both the Enable Port and the Persistent Disabled boxes. This currently enables the port, but upon a switch reboot the port is disabled.
Enable Trunking	Check this box to enable trunking on a port. Uncheck the box to disable trunking on this port.
Enable Port	Check box to enable the affiliated port. Uncheck box to disable the port.
Port State	Displays the state of the port, such as Online, No Light or No Module.
Current Speed	Displays the speed at which the port is currently set. Valid values are: • 1G - 1 Gbit/sec • 2G - 2 Gbit/sec • N1 - Negotiated 1 Gbit/sec • N2 - Negotiated 2 Gbit/sec
Change Speed	Use to change the port speed. Port speed can be fixed to 1G, 2G, or Negotiate (auto-negotiate). If the speed is set to Negotiate, the subsequent current speed will display the negotiated result.
Port Name	Use optionally to assign a name to a port. The name can be from 0 to 32 characters length. Port names do not need to be unique. The default value is no port name.

Using the Port Setting Tab

This section describes the functions available on the Port Setting tab.

Enabling or Disabling a Port

To enable or disable a port:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Port Setting tab.
4. Check or uncheck the enabled port box that corresponds to the port you wish to enable/disable.
5. Click **Apply**.

6. Check the log at the bottom of the screen for information regarding the switch configuration changes.

Enabling Trunking on a Port

To enable a trunk:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Port Setting tab.
4. Check the **Trunk** box that corresponds to the port you wish to trunk.
5. Click **Apply**.

Configuring Port Speed

To configure the port speed:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Port Setting tab.
4. Select the desired speed for the corresponding port. (Refer to *About the Port Setting Tab* on page 4-53.)
5. Click **Apply**.

Assigning a Name to a Port

You can optionally name a port:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Port Setting tab.
4. Click in the **Name** column; select the field that corresponds to the port you want to name.
5. Enter a name for the port, up to 32 alphanumeric characters. Port names do not need to be unique.
6. Click **Apply**.

Disabling a Port over Reboots

To optionally disable a port, so that it is disabled over reboots:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Port Setting tab.
4. Select the slot and port you want to disable over reboots.
5. Check the **Persistent Disable** checkbox for that port.
6. Click **Apply**.

About the Configure Tab

Use the Configure tab of the Administrative Interface to configure Fabric Parameters, Virtual Channel parameters, Arbitrated Loop parameters, and System Services parameters. For more detailed information regarding the fields available in this tab, refer to the **configure** command in the *Fabric OS Command Reference*.

Many parameter fields and checkboxes within the Configure tab can only be modified if the switch is disabled. If a parameter value is shaded gray, that value is currently read-only. To modify the value, you must first disable the switch.

Configure (Fabric) Tab Example

An example of the Configure (Fabric) Tab is shown in Figure 4-27.

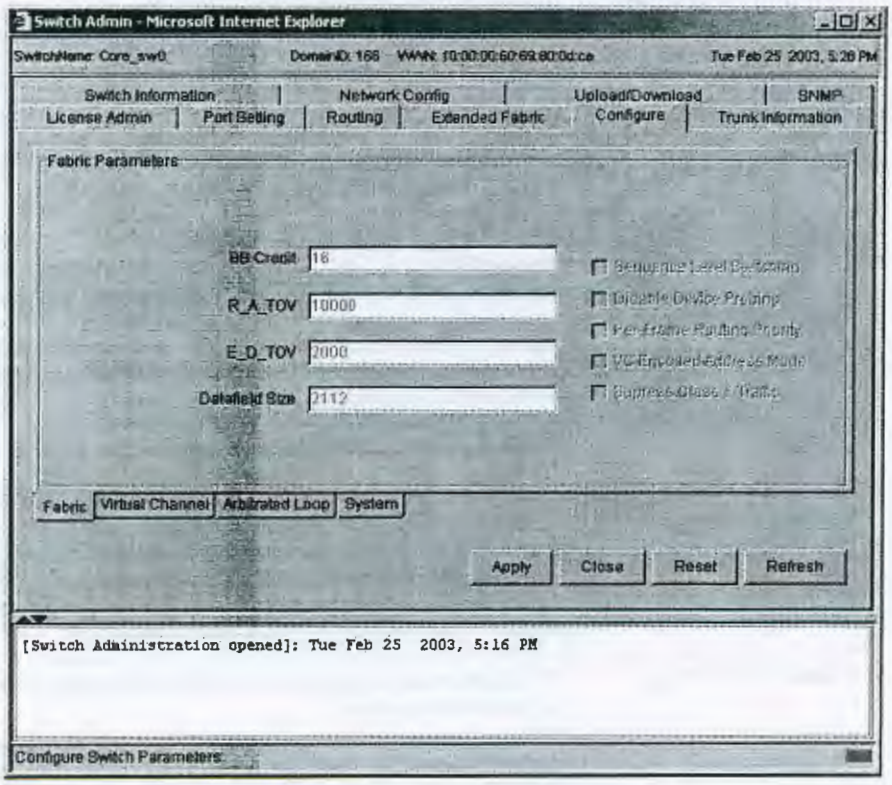

Figure 4-27 Configure (Fabric) Tab of the Switch Admin Window

Configure (Virtual Channel) Tab Example

An example of the Configure (Virtual Channel) Tab is shown in Figure 4-28.

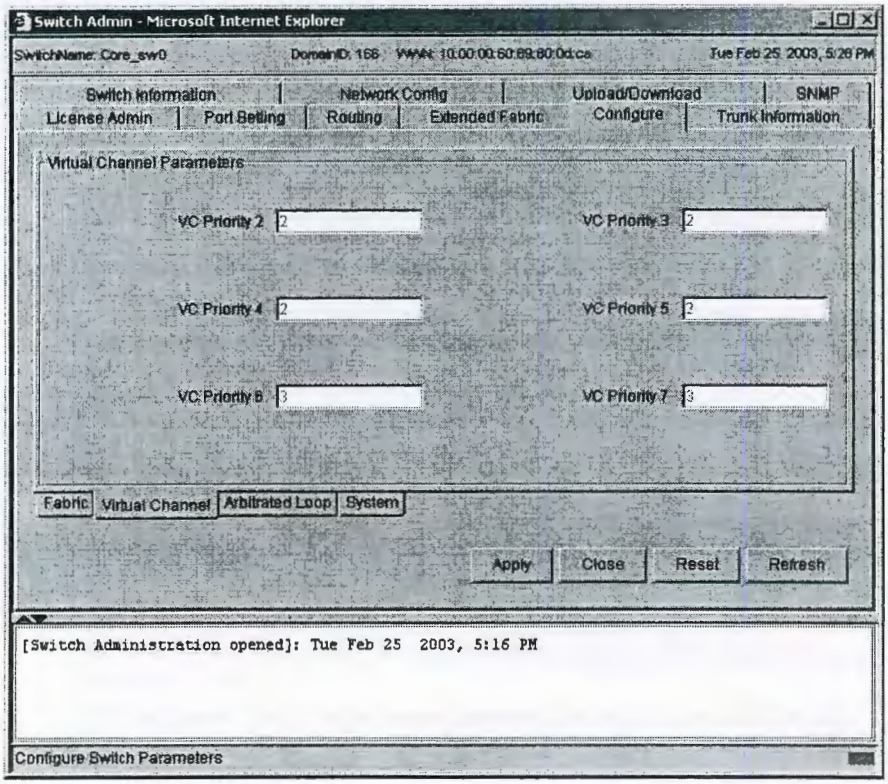

Figure 4-28 Configure (Virtual Channel) Tab of the Switch Admin Window

Configure (Virtual Channel) Field Descriptions

The fields available on the Configure Virtual Channel Tab are described in Table 4-20

Table 4-20 Virtual Channel Field Descriptions

Field	Descriptions
Virtual Channel Parameters	
VC Priority 2 - 7	Enables fine tuning for a specific application by configuring the parameters for eight virtual channels. The default Virtual Channel priorities have already been set for optimal performance; changing the default settings can improve the performance, but can also degrade performance. For default values, refer to Table 4-19.

Configure (Arbitrated Loop) Tab Example

An example of the Configure (Arbitrated Loop) Tab is shown in Figure 4-29.

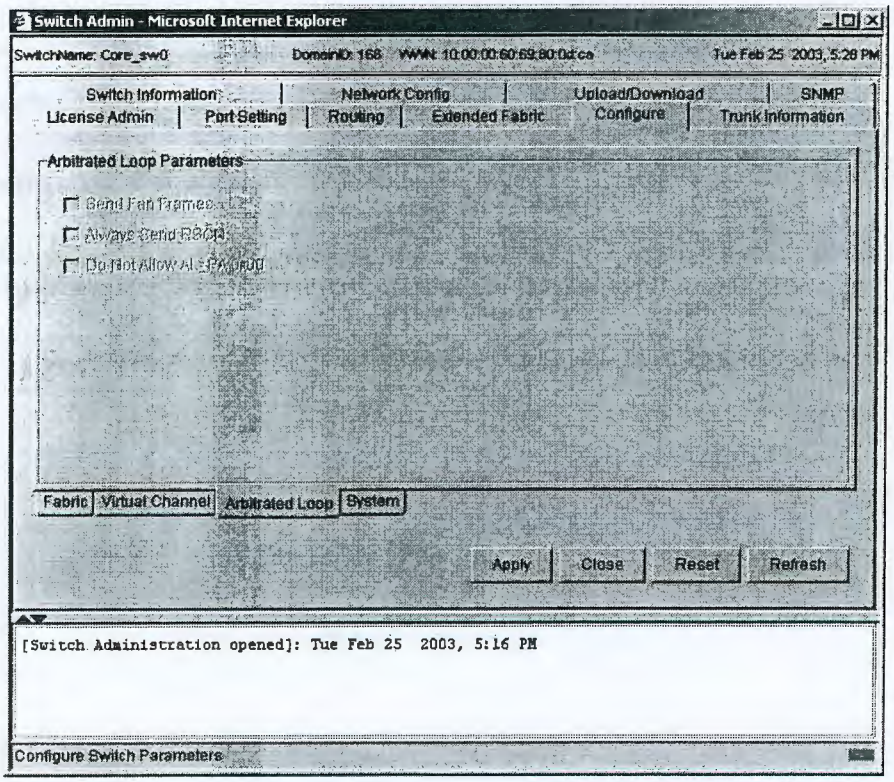

Figure 4-29 Configure (Arbitrated Loop) Tab of the Switch Admin Window

Configure (Arbitrated Loop) Field Descriptions

The fields available on the Configure (Arbitrated Loop) Tab are described in Table 4-21.

Table 4-21 Configure (Arbitrated Loop) Field Descriptions

Field	Descriptions
Arbitrated Loop Parameters	
Send FAN Frames	Specify that Fabric Access Notification frames be sent to public loop devices and notify them of their node ID and address. Default is enabled.
Always Send RCSN	Check this box to issue a Remote State Change notification; following the completion of loop initialization, FL_Ports detect the presence of new devices or the absence of preexisting devices.
Do Not Allow ALPA_0x00	Check box to specify that AL_PA value 0x00 is not allowed.

Configure (System) Tab Example

An example of the Configure (System) Tab is shown in Figure 4-30.

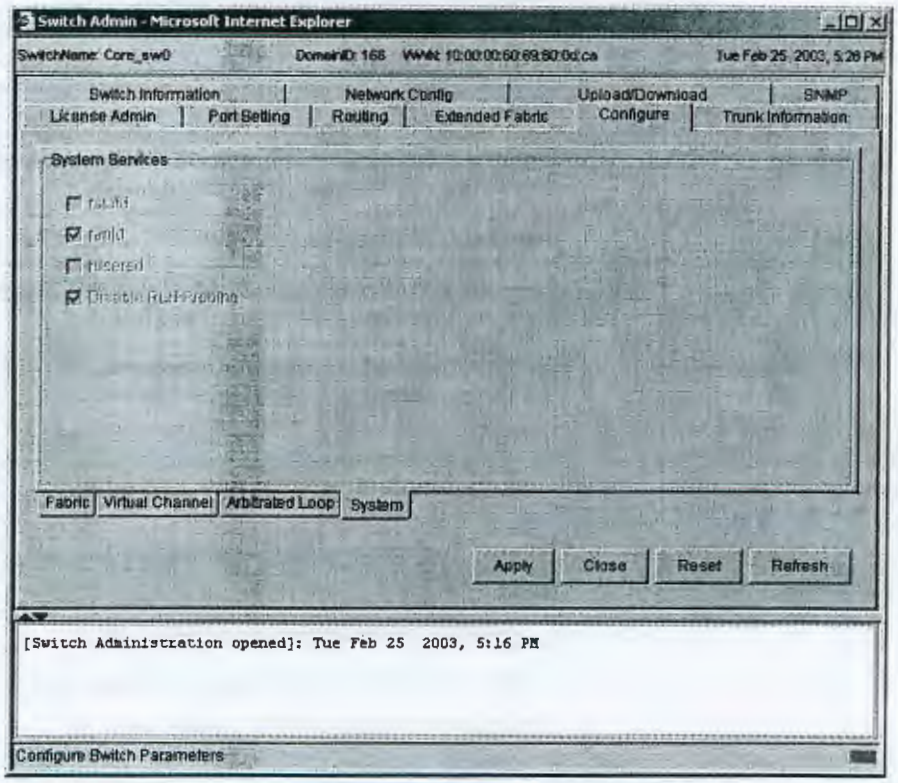

Figure 4-30 Configure (System) Tab of the Switch Admin Window

Configure (System) Field Descriptions

The fields available in the Configure System Tab are described in Table 4-22.

Table 4-22 Configure (System) Field Descriptions

Field	Descriptions
System Parameters	
rstatd	Check box to dynamically enable or disable a server that returns information about system operation information through remote procedure calls.
rapid	Check box to enable rapid system service. Default is enabled.
ruserd	Check box to dynamically enable or disable a server that returns information about the user who is logged into the system through remote procedure calls.
RLS Probing	Check box to enable Read Link Status probing of AL_PAs. Default is enabled.

Using the Configure Tab

This section describes the functions available on the Configure tab.

Configuring FAN Frame Notification Parameters

To configure FAN frame notification parameters:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Switch Information tab.
4. Disable the switch.
5. Click **Apply**.
6. Select the Configure tab.
7. Select the Arbitrated Loop tab.
8. Check or uncheck the **FAN Frame Notification** box in the Arbitrated Loop Parameters section.
9. Click **Apply**.

About the Routing Tab

Use the Routing Tab of the Administrative Interface to perform tasks such as:

- View the Fabric Shortest Path First (FSPF) routing information.
- Add or delete a static route.
- Set the link cost for the selected ports.

If a switch has one or more ISLs attached to itself, and no attached devices, the Routing tab will not display any information.

Navigation Tree

The Routing tab contains a Routing Navigation Tree, from which you can access the specific routing areas. Fields will change depending on the routing interface you have chosen to view. For information regarding using the Routing Tab, refer to *Using the Routing Tab* on page 4-70.

Dynamic Load Sharing

Dynamic Load Sharing (DLS) can be enabled using the Routing tab. DLS refers to a dynamic distribution of traffic over available paths. Enabling this feature allows a path to be discovered automatically by the FSPF path selection protocol. Refer to *Routing (FSPF Route) Field Descriptions* on page 4-67.

In-Order Delivery

In-Order Delivery can be enabled using the Routing tab. Enabling IOD guarantees that frames are either delivered in order or dropped.

Routing (FSPF Route) Tab Example

An example of the Routing (FSPF Route) Tab is shown in Figure 4-31.

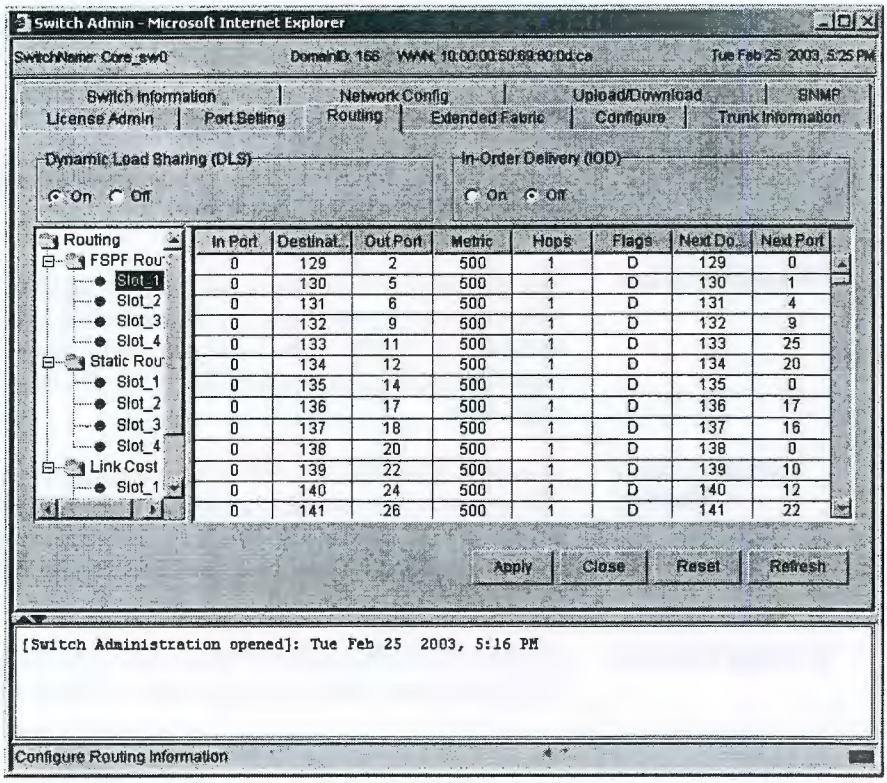

Figure 4-31 Routing (FSPF Route) Tab of the Switch Admin Window

Routing Field Descriptions

Descriptions of the fields available in the Routing Tab are shown in Table 4-23. These fields are displayed for all the routing tabs.

Table 4-23 Routing Field Descriptions

Fields	Descriptions
Dynamic Load Sharing (DLS)	Click the appropriate radio button to turn Dynamic Load Sharing on or off.
In-Order Delivery (IOD)	Click the radio button to turn In-Order Delivery on or off. Enabling IOD guarantees that frames are either delivered in order or dropped
Routing Navigation Tree	Select the item in the Routing Navigation tree to be viewed, either FSPF, Static Route, or Link Cost.

Routing (FSPF Route) Field Descriptions

NOTE: No information appears in the Routing tab if the switch has one of more ISLs attached to itself, and no attached devices.

Select FSFP Route Tab on the Routing Navigation tree to display the fields described in Table 4-24.

Table 4-24 Routing (FSPF Route) Field Descriptions

Field	Description
In Port	Displays the Port number to which you want frames to come in.
Destination	Displays the destination domain ID for the participating static routes for a particular In Port. The destination domain IDs match the outports in the cell.
Out Port	Displays the Out port. It should be within the range of ports that are available for static routes for the current domain. More than one out port can be used for any In port with a different domain id. Each domain id requires an out port.
Metric	Displays the cost of reaching the destination domain.
Hops	Displays the number of hops in the "shortest path" route.
Flags	Displays whether the route is Static (S) or Dynamic (D). Refer to *About the Routing Tab* on page 4-65.
Next Domain	Displays the next domain ID in the routing path. The Next Domain is the switch that the "Out Port" is connected to.
Next Port	Displays the next Port in the routing path. The Next Port is the port number that the "Out Port" is connected to.

Routing (Static Route) Tab Example

An example of the Routing (Static Route) Tab is shown in Figure 4-32.

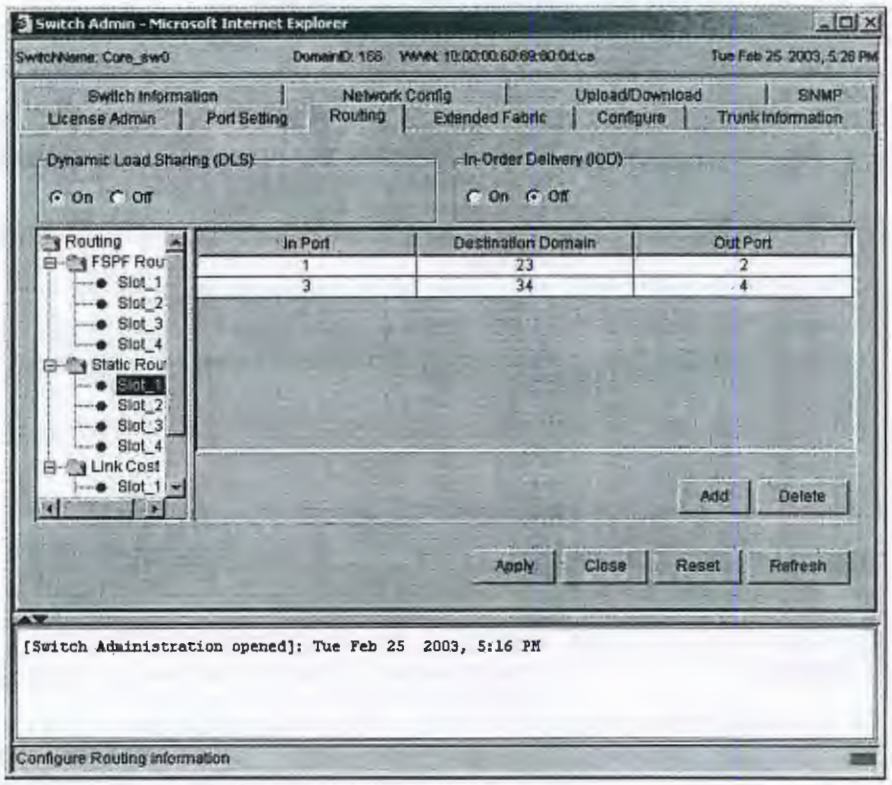

Figure 4-32 Routing (Static Route) Tab of the Switch Admin Window

Routing (Static Route) Field Descriptions

Select Static Route from the Routing Navigation tree to display the fields described in Table 4-25.

Table 4-25 Routing (Static Route) Field Descriptions

Field	Description
In Port	Enter the number of the port to which frames to come in.
Destination Domain	Displays the destination domain ID for the "comma-separated" participating static routes for a particular inport. The destination domain IDs match the outports in the cell.

Table 4-25 Routing (Static Route) Field Descriptions (continued)

Field	Description
Out Port	Enter the Out port. It should be within the range of ports that are available for static routes for the current domain. More than one out port can be used for any In port with a different domain id. Each domain id requires an out port.
Add	Click to create a new static route. A new column appears in the window. The Add button only modifies the static route table, click Apply to apply these changes to the switch.
Delete	Click to delete a selected route. This button is gray-out if no static route is selected.

Routing (Link Cost) Tab Example

An example of the Routing (Link Cost) Tab is shown in Figure 4-33.

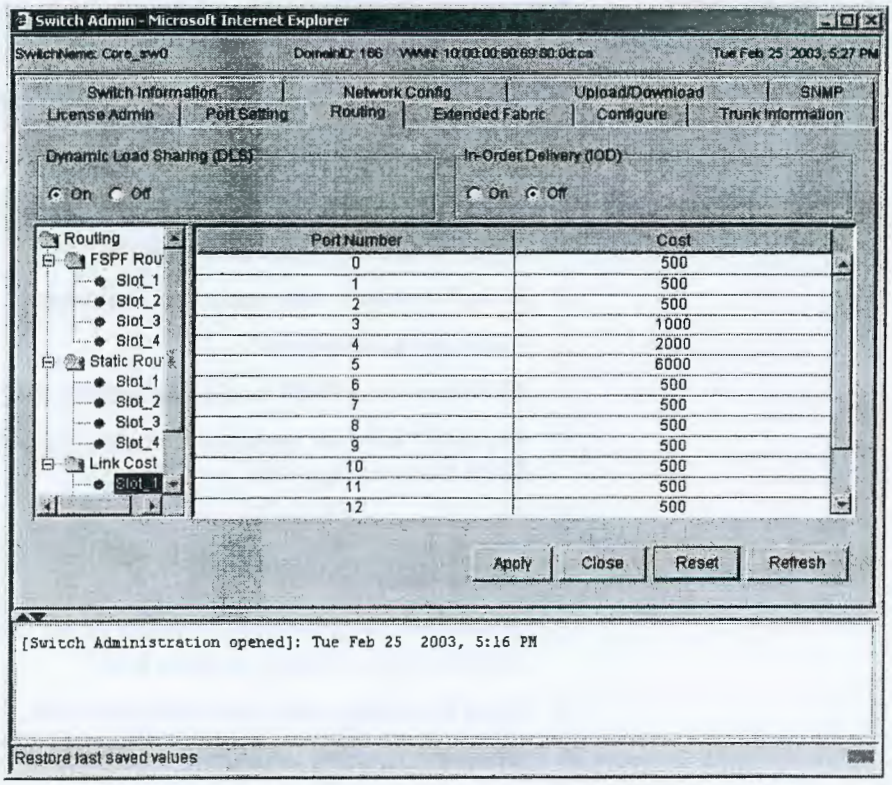

Figure 4-33 Routing (Link Cost) Tab of the Switch Admin Window

Routing (Link Cost) Field Descriptions

Select Link Cost from the Routing Navigation tree to display the fields described in Table 4-26.

Table 4-26 Routing (Link Cost) Field Descriptions

Fields	Descriptions
Port Number	Displays the port number.
Cost	Displays the link cost for the associated port. Select to change the link cost. For a 1 Gbit/sec per second ISL, the default cost is 1000. For a 2 Gbit/sec ISL, the default cost is 500. Valid values for link cost are from 1 to 9999.

Using the Routing Tab

This section describes the functions available on the Routing tab.

Viewing FSPF Routing

For information regarding FSPF, refer to *About the Routing Tab* on page 4-65.

To view FSPF routing:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Routing tab.
4. Click the word **FSFP** on the Navigation tree.

   The FSFP window appears. If no information appears, refer to Table 4-24 on page 4-67.
5. View Hops and Metrics.

Setting up a Static Route

To set up a static route:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Routing tab.
4. Click the words **Static Route** in the Navigation tree.

   The Static Route window appears.
5. Click on a slot number under the static route node in the tree.

6. Click **Add**.

   A new blank line appears in the window.
7. Enter the In Port number for the route.
8. Enter the Destination Domain. The destination domain IDs match the outports in the cell.
9. Enter the Out Port number for the route.
10. Click **OK** to add the static route.
11. Click **Apply**.

Enabling/Disabling Dynamic Load Sharing

For information regarding Dynamic Load Sharing (DLS), refer to *About the Routing Tab* on page 4-65.

To enable or disable dynamic load sharing:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Routing tab.
4. Select the **On** radio button to enable Dynamic Load Sharing; or, select the **Off** radio button to disable Dynamic Load Sharing.
5. Click **Apply**.

Enabling/Disabling In-Order Delivery

For information regarding Dynamic Load Sharing (DLS), refer to *About the Routing Tab* on page 4-65.

To enable or disable in-order delivery:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Routing tab.
4. Highlight a type of routing from the navigation tree.
5. Select the **On** radio button to enable In-Order Delivery; or, select the **Off** radio button to disable In-Order Delivery.
6. Click **Apply**.

Configuring Link Cost

For information regarding Dynamic Load Sharing (DLS), refer to *About the Routing Tab* on page 4-65.

To configure the link cost:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Routing tab.
4. Click **Link Cost** from the navigation tree.
5. Click in the **Link** column that corresponds to the appropriate port.
6. Enter the desired link cost. For a 1 Gb/s ISL, the default cost is 1000. For a 2 Gb/s ISL, the default cost is 500. Valid values for link cost are from 1 to 9999.
7. Click **Apply**.

About the Extended Fabrics Tab

Use the Extended Fabric tab to manage the Extended Fabrics feature. From the Extended Fabric tab you can specify which ports to be configured for distance and at what level. All switches come with L0 and LE (extended normal) settings. An Extended Fabric license allows additional settings of L1 and L2. For ports that are disabled, the rows appear grayed-out in the table within the Extended Fabric tab.

For more detailed information regarding the Extended Fabrics feature, refer to the *EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B Extended Fabrics User's Guide.*

VCXLT Initiation

Enabling Virtual Channel link translation mode allocates enough full-size frame buffers on a particular port to support a long-distance link up to 100km. Refer to the **portcfglongdistance** command in the *Fabric OS Command Reference* for more information.

Note: Support for distances greater than 100 km may be available for certain applications and configurations. Support parameters for extended distance solutions, such as those around DWDM technology, can be obtained from the EMC Support Matrix. Please note that the information found in the EMC Support Matrix specifies support parameters around connectivity. You

should work closely with EMC field personnel and professional services to determine whether application requirements will be met over these extended distances.

Port Speed

The port speed is displayed as follows:

- **1G** = 1 Gb/s
- **2G** = 2 Gb/s
- **N1** = Negotiated 1 Gb/s
- **N2** = Negotiated 2 Gb/s

Long Distance Settings

These values do not require an Extended Fabric license:

- L0 — No long distance setting enabled.
- LE — Extended Normal setting enabled, less than 10 km or 6 miles.

These values require an Extended Fabric license:

- L0.5 — Less than 25 km.
- L1 — Medium long distance setting enabled, less than 50 km or 31 miles.
- L2 — Long distance setting enabled, less than 100 km or 62 miles.
- LD — Dynamic setting.

Extended Fabrics Tab Example

An example of the Extended Fabrics tab is shown in Figure 4-34.

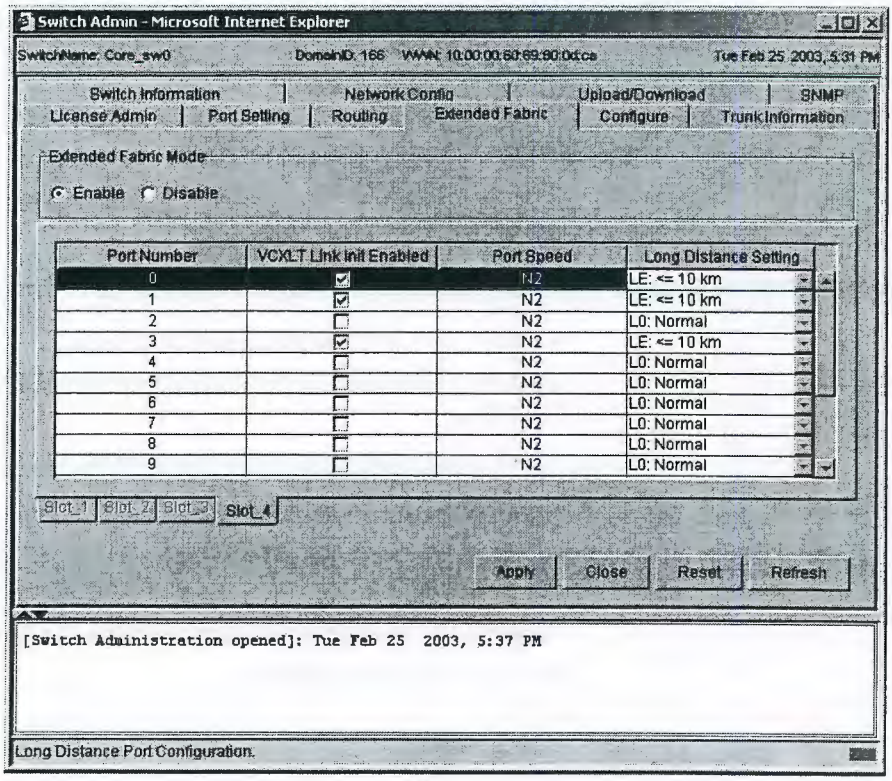

Figure 4-34 Extended Fabric Tab of the Switch Admin Window

Extended Fabric Field Descriptions

The fields available in the Extended Fabrics Tab are described in Table 4-27.

Table 4-27 Extended Fabric Field Descriptions

Fields	Descriptions
Extended Fabric Mode	
Enable	Click the radio button to enable the Extended Fabric mode. The switch must be disabled to enable the Extended Fabric mode.
Disable	Click to disable the Extended Fabric Mode.
Port Number	Displays the port number being used for the Extended Fabric.
VCXLT Link Init Enabled	Check the box to enable Virtual Channel link translation. Refer to *About the Upload/Download Tab* on page 4-43.
Port Speed	Displays the current port speed. The possible port speeds are described in *About the Upload/Download Tab* on page 4-43.
Long Distance Setting	Display or configure the long distance setting. Change by selecting from the drop-down menu. The below values do not require an Extended Fabric license: • L0 - No long distance setting enabled. • LE - Extended Normal setting enabled, less than 10 km or 6 miles. The below values require an Extended Fabric license: • L0.5 - Less than 25 km. • L1 - Medium long distance setting enabled, less than 50 km or 31 miles. • L2 - Long distance setting enabled, less than 100 km or 62 miles. • LD - Dynamic setting.

Using the Extended Fabric Tab

This section describes the functions available on the Extended Fabric tab.

Configuring a Port For Long-Distance

To configure a port for long distance:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Extended Fabric tab.
4. Click the **Enable** radio button.

5. Check the **VCXLT** box.
6. Select the desired distance from the **Long-Distance Setting** drop-down menu.

   Depending on the distance selected, this may require an optional license. For information about the various distances, refer to *About the Upload/Download Tab* on page 4-43.
7. Click **Apply**.

About the Trunk Information Tab

The Trunk Information tab is a read-only tab and has only the Close and Refresh button functions.

- For information regarding enabling Trunking, refer to *Using the Port Setting Tab* on page 4-54.
- For more information regarding Trunking, refer to the EMC *Trunking User's Guide*.

Trunk Information Tab Example

An example of the Trunk Information Tab is shown in Figure 4-35.

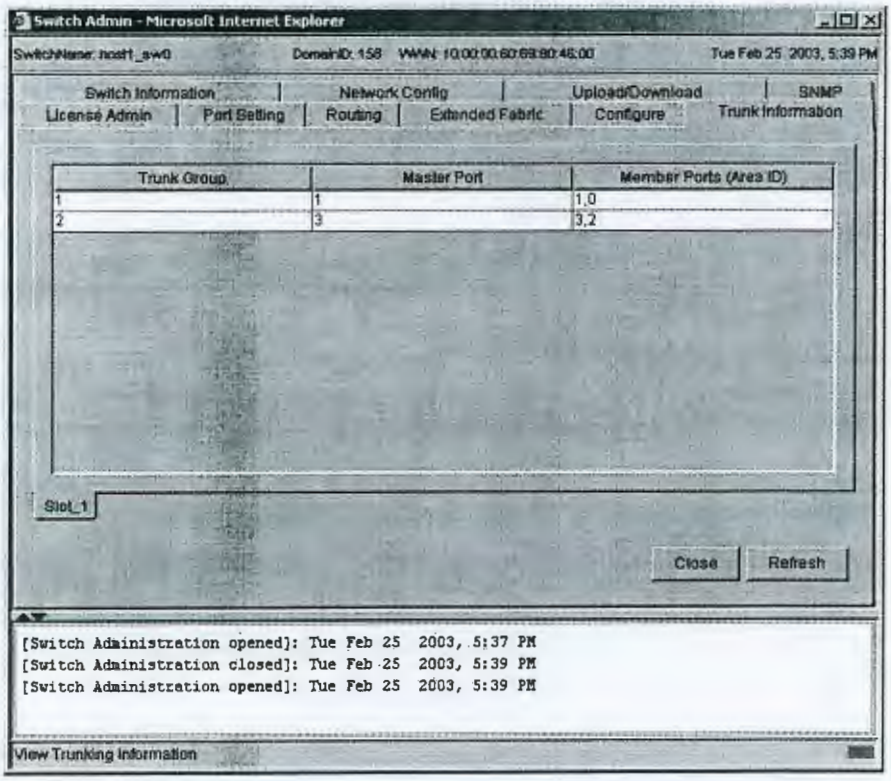

Figure 4-35 Trunk Information Tab of the Switch Admin Window

Trunk Information Field Descriptions

Descriptions of the fields available in the Trunk Information tab are shown in Table 4-28.

Table 4-28 Trunk Information Field Descriptions

Field	Description
Trunk Group	Displays all the Trunking Groups on a switch. All of the ports that are part of the Trunking Group are displayed.
Master Port	Displays whether the trunking port connection is the Master Port connection for this trunking group.
Member Ports (Area ID)	Displays a list of Member Ports. Ports are identified by area ID.

Using the Trunk Information Tab

The Trunk tab is a read-only tab. Trunking is enabled through the Port Setting tab of the Administrative Interface; refer to *Using the Port Setting Tab* on page 4-54.

Accessing the Trunk Information Tab

To access the Trunk Information tab:

1. Access the Switch Admin Window (refer to *Accessing the Administrative Interface* on page 4-36).
2. Enter the admin user name and password.
3. Select the Trunk tab.

Telnet Interface

Accessing the Telnet Interface

To access the Telnet Interface:

1. Launch the web browser.
2. Enter the switch name or IP address in the **Location/Address** field and press ENTER.

Example **http://switch name or IP address/**

Web Tools launches, displaying the Switch Explorer.

3. Click the **Telnet** icon (Figure 4-36) beneath the switch graphic.

Figure 4-36 Telnet Icon

The Telnet Interface displays, as shown in Figure 4-37.

Figure 4-37 The Telnet Interface

Using the Telnet Interface

Up to six Telnet sessions can be running simultaneously on a 4.0 chassis:

- Two sessions for Admin
- Four sessions for User

ESN Manager requires that one Admin Telnet session be available.

High Availability Administration

Use the HA Admin interface to display information about High Availability configuration on a chosen switch.

Accessing the HA Admin Interface

To access the HA Admin interface:

1. Launch the web browser.
2. Enter the switch name or IP address in the **Location/Address** field and press ENTER.

   Example: **`http://switch name or IP address/`**

   Web Tools launches, displaying the Switch Explorer.
3. Click the **Hi Avail** icon (Figure 4-38) beneath the switch graphic.

Figure 4-38 **Hi Avail Icon**

The HA Admin window (Figure 4-39) appears.

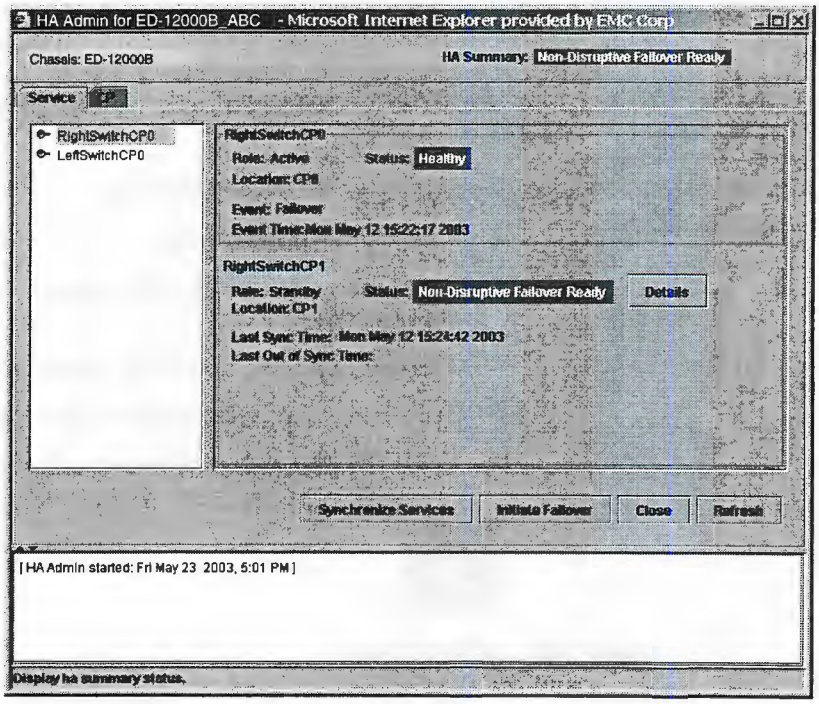

Figure 4-39 HA Admin Window (Displaying Service Tab)

Common Field Descriptions

The common fields available in the HA Admin window are described in Table 4-29.

Table 4-29 HA Admin Common Field and Button Descriptions

Field	Description
Chassis	Displays the switch type.
HA Summary	Displays the HA summary status. Valid values can be: Non-Disruptive Failover Ready Disruptive Failover Ready No Failover
Action Buttons	
Synchronize Services Button	Click this button to begin a synchronization of services on both CPs. Once the services of both CPs are synchronized and there is full redundancy then a non-disruptive failover can be initiated.
Initiate Failover Button	Click this button to initiate a failover from the active CP to the standby CP.
Close Button	Click this button to close the HA Admin page.
Refresh Button	Click this button to refresh the information on this page.

Service Tab Field Descriptions

The fields available in the Service Tab view are described in Table 4-30.

Table 4-30 HA Admin Service Tab Field Descriptions

Field	Description
Logical Switch selection window	This window enables you to select the RightSwitch service view or the LeftSwitch service view. In the ED-12000 chassis, logical switch 0 is the leftswitch, and logical switch 1 is the rightswitch as seen from the cable side of the switch. When you select a Switch Service view, the Service status for that switch is displayed.
Active Service	Displays information for the Active Service. Depending on which service you selected in the Logical Switch window and the current configuration of the CPs, valid values can be: • RightSwitchCP0 • RightSwitchCP1 • LeftSwitchCP0 • LeftSwitchCP1
Role	Indicates if the Service is Active or Standby.

Table 4-30 HA Admin Service Tab Field Descriptions (continued)

Field	Description
Status	Displays the status of the Active Service. Valid values for the Active Service are: • Non-Disruptive Failover Ready • Disruptive Failover Ready • No Failover
Location	Displays the location of the Active CP as CP0 or CP1.
Event	Displays the last event. Valid values for this field are: • Failover • Arbitration
Event Time	Displays the day, date, hour, and year of the last event.
Standby Service	Displays information for the Standby Service. Depending on which switch you selected in the Logical Switch window and the current configuration of the CPs, valid values can be: • RightSwitchCP0 • RightSwitchCP1 • LeftSwitchCP0 • LeftSwitchCP1
Role	Indicates if the Service is Active or Standby.
Status	Displays the status of the Standby Service. Valid values for the Standby Service are: • Non-Disruptive Failover Ready • Disruptive Failover Ready • No Failover
Details Button	Displays whether the CP services are in-sync.
Location	Displays the location of the Standby CP as CP0 or CP1.
Last Sync Time	Displays day, date, hour, and year of the last in-sync time.
Last Out of Sync Time	Displays day, date, hour, and year of last out-of-sync time.

HA Admin CP Tab Example

An example of the HA Admin window (CP Tab) is shown in Figure 4-40.

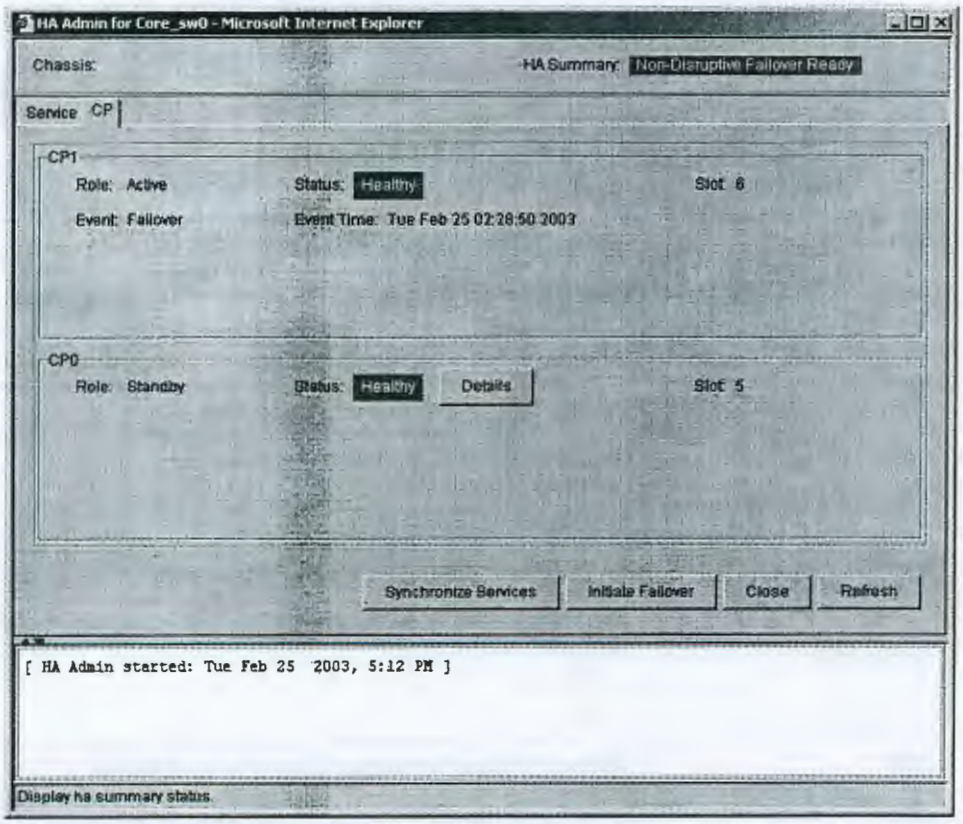

Figure 4-40 HA Admin Window (Displaying CP Tab)

CP Tab Field Descriptions

The fields available in the CP Tab view are described in Table 4-31.

Table 4-31 HA Admin CP Tab Field Descriptions

Field	Description
Active CP (**CP0** or **CP1**)	Displays information for the Active CP. The top CP in this view is always the Active CP. Depending on the current configuration of the CPs this can be: • CP0 • CP1
Role	Displays the Role of the selected CP as the Active or Standby.
Status	Displays the status of the Active CP. Valid values for the Active CP are: • Healthy • Faulty
Slot	Displays the slot of the Active CP as slot 5 or slot 6.
Event	Displays the last event. Valid values for this field are: • Failover • Arbitration
Event Time	Displays the day, date, hour, and year of the last event.
Standby CP (**CP0** or **CP1**)	Displays information for the Standby CP. Depending on the current configuration of the CPs this can be: • CP0 • CP1
Role	Displays the Role of the selected CP as the Active or Standby.
Status	Displays the status of the Standby CP. Valid values for the Standby CP are: • Healthy • Faulty
Details Button	Displays the status of faulty devices.
Slot	Displays the slot of the Active CP as slot 5 or slot 6.

Using HA Admin

This section describes the functions available on the HA Admin window.

Synchronizing Services on the CP

A non-disruptive CP Failover is only possible when all the services have been synchronized. To synchronize the services, verify that the HA Summary field displays **Non-Disruptive Failover Ready**.

- If the HA Summary field displays **Disruptive Failover Ready**, click the Synchronize Services Button and wait for the CPs to complete a synchronization of services, so that a Non-Disruptive Failover is ready.
- Once the HA Summary field displays **Non-Disruptive Failover Ready** a failover can be initiated without disrupting frame traffic on the fabric.

Initiating a CP Failover

To initiate a CP failover:

1. Verify that HA Summary field displays **Non-Disruptive Failover Ready** or **Disruptive Failover Ready**. Refer to *Synchronizing Services on the CP* for more information.
2. Click **Initiate Failover**.

   A non-disruptive failover may take a few minutes to complete. You may loose connection to the switch for a few minutes during the failover, Web Tools will automatically resume the connection after the failover.

5 Port View

This chapter describes the views and interfaces available through the Port View in Web Tools.

Switches can be accessed through different methods, such as through the Telnet, SNMP, and the Web, any of which can occur simultaneously. To verify that modifications are correctly applied, ensure that the switch is modified from only one connection at a time.

Port Information View

The Port Information View displays statistics for the selected port. This information is automatically updated when the view is opened, and is also refreshed periodically while the view remains open.

To access the Port Information View:

1. Launch Web Tools.
2. In the Fabric Tree pane of the Switch Explorer View, click the switch from which you want to extract port information (unless that switch is already displayed).
3. On the switch graphic, click the port for which you want to display information.

   The Port Information View (Figure 5-1) appears.

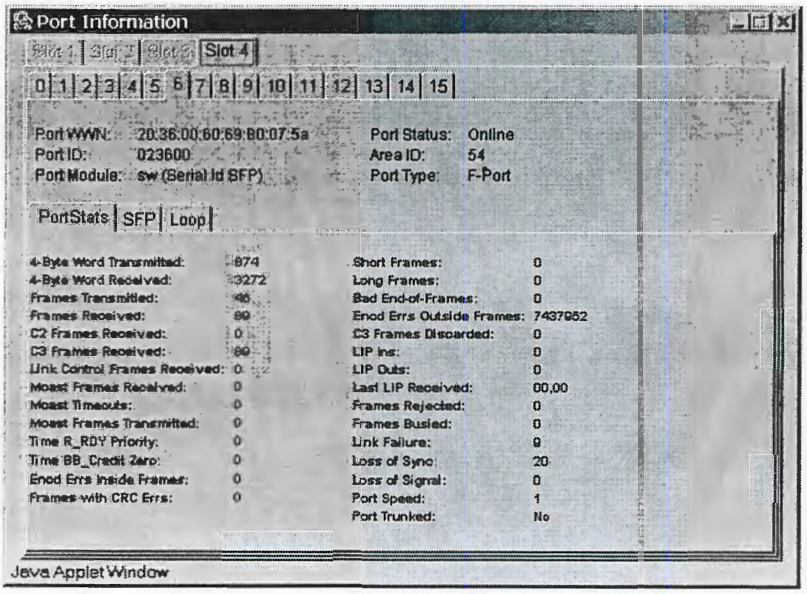

Figure 5-1 Port Information View

The following information appears on all views within the Port Information View:

- Port Name
- Port WWN
- Port ID
- Port Module — Type of SFP (Small form factor pluggable) installed on the port:
  - No SFP present
  - SW — Short wave SFP
  - LW — Long wave SFP
  - CU — Copper SFP
  - SWID — Short wave serial ID SFP
  - LWID — Long wave serial ID SFP
  - CUID — Copper serial ID SFP
- Port Status:
  - No_Module — No SFP module is in this port
  - No_Light — Module is not receiving light
  - No_Sync — Module is receiving light but out of sync
  - In_Sync — Module is receiving light and in sync
  - Laser_Flt — Module signaling a laser fault (defective SFP)
  - Port_Flt — Port is marked faulty (defective SFP, cable, or device)
  - Diag_Flt — Port failed diagnostics
  - Online — Port is up and running
  - Lock_Ref — Port is locking to reference signal
- Area ID — Area ID of the port
- Port Type:
  - E_Port — Switch link port
  - G_Port — Generic port
  - U_Port — Universal port
  - F_Port — Fabric port
  - FL_Port — Fabric loop port
  - L_Port — Loop port

The following tabs, described later, provide various information:

- PortStats
- SFP
- Loop
- Slot (ED-12000B only)

PortStats Tab

The **PortStats** tab (shown in Figure 5-1) provides information about transmission speed, reception speed, and the volume of traffic through the selected port.

Table 5-1 provides a description of the fields on the **PortStats** tab.

Table 5-1 PortStats Tab Field Descriptions

Field	Description
4-Byte Word Transmitted	Number of four-byte words transmitted
4-Byte Word Received	Number of four-byte words received
Frames Transmitted	Number of frames transmitted
Frames Received	Number of frames received
C2 Frames Received	Number of class 2 frames received.
C3 Frames Received	Number of class 3 frames received
Link Control Frames Received	Number of link control frames received
Mcast Frames Received	Number of multicast frames received
Mcast Time-Outs	Number of multicast timeouts
Mcast Frames Transmitted	Number of multicast frames transmitted
Time R_RDY Priority	Number of times R_RDY has priority over frames to be sent
Time BB_Credit Zero	Number of times BB_Credit went to zero
Encd Errs Inside Frames	Number of encoding errors inside frames
Frames With CRC Errs	Number of frames with CRC errors
Short Frames	Number of frames shorter than minimum
Long Frames	Number of frames longer than maximum

Table 5-1 PortStats Tab Field Descriptions (continued)

Bad End-of-Frames	Number of frames with faulty end-of-frames
Encd Errs Outside Frames	Number of frames with encoding errors outside frames
C3 Frames Discarded	Number of class 3 frames discarded
LIP Ins	Number of LIPs received
LIP Outs	Number of times loop initialized by FL_Port
Last LIP Received	Last LIP received: AL_PD, AL_PS
Frames Rejected	Number of F_RJTs sent
Frames Busied	Number of F_BSYs sent
Link Failure	Number of times NOS received/sent
Loss of Sync	Number of times loss of sync occurred
Loss of Signal	Number of times loss of signal occurred
Port Speed	Displays the speed of the port
Port Trunked	Displays whether Trunking is enabled or disabled

SFP (GBIC) Tab

The **SFP** tab (shown in Figure 5-2 on page 5-6) provides information about the about the SFP or GBIC installed in the selected port. The information displayed depends on the type of SFP installed.

All references to SFP also refer to GBICs. The terms are interchangeable.

- Standard SFP Module type (short wave, long wave, copper, etc.)
- Serial ID SFP Module type, plus extended information about capabilities, interfaces, and manufacturer
- Smart Finisar SFP All of the above information, plus SFP active status

If the port does not contain a SFP, or a Serial/Smart GIBC, the following information displays:

```
Not a serial ID GBIC. No GBIC info available.
```

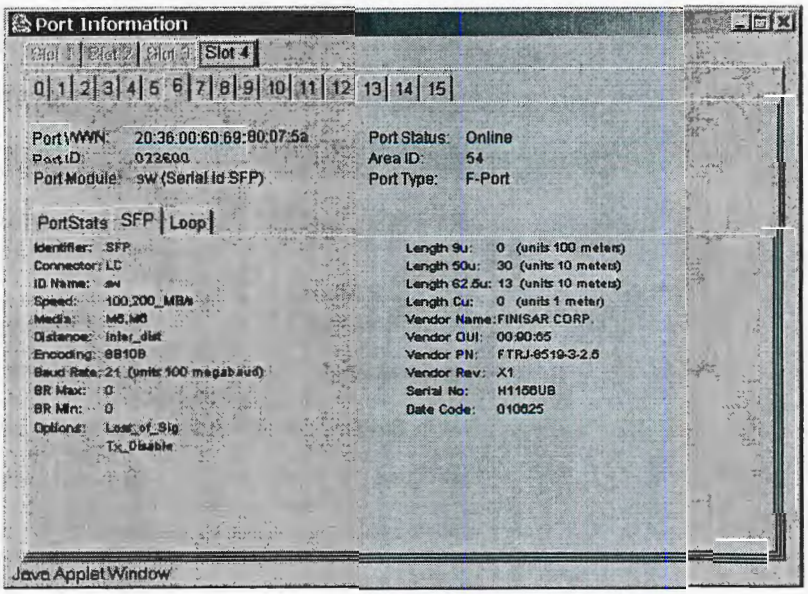

Figure 5-2 **SFP (GBIC) Tab in the Port Information View**

Table 5-2 provides descriptions of the fields on the **SFP** tab.

Table 5-2 **SFP (GBIC) Tab Descriptions**

Field	Description
Identifier	Indicates the type of serial transceiver, which can be SFP or GBIC
Connector	Indicates the external connector type, which can be one of the following: • SC • LC
ID Name	The SFP type, as follows: • -- -No SFP present • SW-Short wave SFP • LW-Long wave SFP • CU — Copper SFP • SWID — Short wave serial ID SFP • LWID — Long wave serial ID SFP • CUID — Copper serial ID SFP
SFP Speed	Indicates the SFP speed, which can be 100, 200, or 400 MB/sec

Table 5-2 SFP (GBIC) Tab Descriptions (continued)

SFP Media	Indicates the transmission media, which can be: • SM — Single mode • M5 — Multi mode, 50u • M6 — Multi mode, 62.5u
SFP Distance	Indicates the length of the fibre channel link, which can be long distance, intermediate distance, or short distance
Encoding	Indicates the serial encoding mechanism, which can be 8B10B
Baud Rate	Nominal baud rate in units of 100 Megabytes
BR Max	Upper limit at which SFP meets its specifications (in units of 1 percent above nominal baud rate)
BR Min	Lower limit at which SFP meets its specifications (in units of 1 percent below nominal baud rate)
Options	May indicate any of the following: • Loss of Signal • Loss of Signal Inverted • Transmission Fault • Transmission Disable
Length 9u	Length of link using single mode fibre
Length 50u	Length of link using 50um multi-mode fibre
Length 625u	Length of link using 62.5um multi-mode fibre
Length Cu	Minimum length of link using copper cable (Symmetrix Supported)
Vendor Name	Name of vendor
Vendor OUI	Unique identifier for vendor
Vendor P/N	Vendor part number (Not EMC part number)
Vendor Rev	Vendor revision number
Serial No.	Vendor serial number
Date Code	Vendor date code
Smart SFP Data (displays only if a smart SFP or GBIC is present):	
Temperature	Module temperature (in Centigrade)

Table 5-2 SFP (GBIC) Tab Descriptions (continued)

Rx Power	Received optical power in micro Watts
Tx Power	Transmitted optical power in micro Watts (longwave only)
Current	Laser diode drive current in mAmps

Loop Tab

The **Loop** tab (shown in Figure 5-3) provides information about any loop on the port, including the following:

- Loop statistics
- Local AL_PA statistics

If the port is not a loop-enabled port, the following information displays:

```
Not an L_Port. No loop info available.
```

Figure 5-3 Loop Tab in the Port Information View

Table 5-3 provides a description of the fields on the **Loop** tab.

Table 5-3 Loop Tab Field Descriptions

FL Port Transfer	Displays number of times FL_Port used transfer state
FL Tenancies	Displays the number of times FL_Port opens loop tenancy
NL Tenancies	Displays the number of times NL_Port opens loop tenancy
Local AL_PA List	Displays list of AL_PAs associated with devices connected to loop

A

Customer Support

This appendix reviews the EMC process for detecting and resolving software problems, and provides essential questions that you should answer before contacting the EMC Customer Support Center.

This appendix covers the following topics:

Overview of Detecting and Resolving Problems

EMC software products are supported directly by the EMC Customer Support Center in the United States.

EMC uses the following process to resolve customer problems with its software products (Figure A-1).

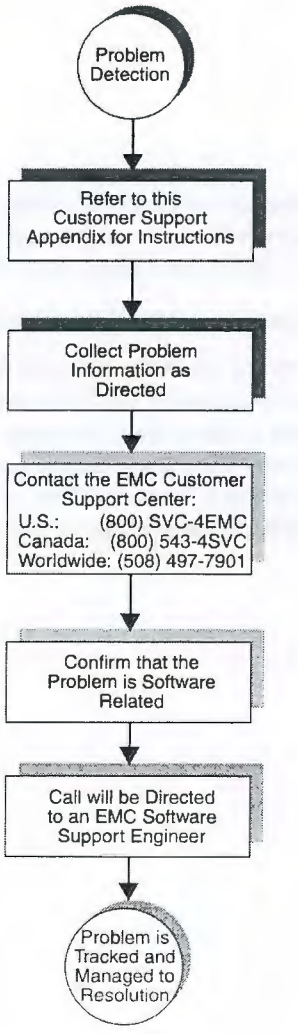

Figure A-1 Problem Detection and Resolution Process

Troubleshooting the Problem

Please perform the relevant diagnostic steps before you contact the EMC Customer Support Center:

1. Read the documentation carefully.
2. Reconstruct the events leading up to the problem and describe them in writing.
3. Run some test cases to reproduce the problem.

If you encounter a problem that requires technical programming or analysis, call the nearest EMC office or contact the EMC Customer Support Center at one of the following numbers:

United States: **(800) 782-4362 (SVC-4EMC)**

Canada: **(800) 543-4782 (543-4SVC)**

Worldwide: **(508) 497-7901**

Please do not request a specific support representative unless one has already been assigned to your particular system problem.

For additional information on EMC products and services available to customers and partners, refer to the EMC Powerlink website at:

```
http://powerlink.EMC.com
```

Before Calling the Customer Support Center

Have the following information available before calling the Customer Support Center or your support representative (if one has been assigned to you):

- ❑ Your company name
- ❑ Your name
- ❑ Your phone number
- ❑ For an existing problem, the problem tracking system ID, if one was previously assigned to the problem by a support representative
- ❑ For an MVS problem, the JESLOG, SYSPRINT, all STDOUT DD members of the server job output and similar output for the client, and the relevant portion of the SYSLOG

Documenting the Problem

If the EMC Customer Support Center requests information regarding the problem, please document it completely, making sure to include the following information:

- ❑ Your company name and address
- ❑ Your name
- ❑ Your telephone number
- ❑ The importance of the problem, so that it can be assigned a priority level

To expedite the processing of your support request, you can photocopy this list and include it with the package.

Reporting a New Problem

For a new problem, please provide the following information:

- ❑ Release level of the software that you are running
- ❑ Software installation parameters
- ❑ Host type on which you are running
- ❑ Operating system you are running and its release number
- ❑ Functions of the software that you are running
- ❑ Whether you can reproduce the problem
- ❑ Previous occurrences of the problem
- ❑ Whether the software has ever worked correctly
- ❑ Time period that the software did work properly
- ❑ Conditions under which the software worked properly
- ❑ Changes to your system between the time the software worked properly and the problem began
- ❑ Exact sequence of events that led to the system error
- ❑ Message numbers and complete text of any messages that the system produced
- ❑ Log file dated near the time the error occurred
- ❑ Results from tests that you have run
- ❑ Other related system output
- ❑ Other information that may help solve the problem

Sending Problem Documentation

Use one of the following methods to send documentation of the problem to the EMC Customer Support Center:

- E-mail
- FTP
- U.S. mail to the following address:

  EMC Customer Support Center
  45 South Street
  Hopkinton, MA 01748-9103

  If the problem was assigned a number or a specific support representative, please include that information in the address as well.

Glossary

The terms in the glossary relate to the switch and Fibre Channel connections. Many of these terms are used in this manual.

Numbers

8b/10b Encoding An encoding scheme that converts each 8-bit byte into 10 bits. Used to balance ones and zeros in high speed transports.

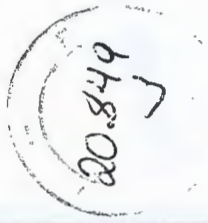
16-Port Card The fibre channel port card provided with ED-12000B. Contains 16 fibre channel ports and the corresponding LEDs indicating port status and speed. See also *Port Card*.

A

Access Control List Enables an organization to bind a specific WWN to a specific switch port or set of ports, preventing a port in another physical location from assuming the identity of a real WWN. May also refer to a list of the read/write access of a particular community string. See also *Device Connection Controls*.

Address Identifier A 24-bit value or 8-bit value used to identify the source or destination of a frame.

Admin Account A login account intended for use by the customer to control switch operation.



Alias An alternate name for an element or group of elements in the fabric. Aliases can be used to simplify the entry of port numbers and WWNs when creating zones.

Alias Address Identifier An address identifier recognized by a port in addition to its standard identifier. An alias address identifier may be shared by multiple ports.

Alias Server A fabric software facility that supports multicast group management.

AL_PA Arbitrated loop physical address. A unique 8-bit value assigned during loop initialization to a port in an arbitrated loop.

ANSI American National Standards Institute. The governing body for Fibre Channel standards in the U.S.A.

API Application programming interface. A defined protocol that allows applications to interface with a set of services.

Arbitrated Loop A shared Fibre Channel transport structured as a loop. Supports up to 126 devices and one fabric attachment. See also *Topology*.

Area Number A number assigned to each potential port location in the ED- 12000B. Used to distinguish ED- 12000B ports that have the same port number but are on different port cards.

ASIC Application-specific integrated circuit.

ATM Asynchronous transfer mode. A transport used for transmitting data over LANs or WANs that transmit fixed-length units of data. Provides any-to-any connectivity, and allows nodes to transmit simultaneously.

Auto-Negotiate Speed Process that allows two devices at either end of a link segment to negotiate common features, speed (e.g., 1 or 2 Gb/s) and functions.

Autosense Process during which a network device automatically senses the speed of another device.

B

Backup FCS Switch Backup fabric configuration server switch. The switch or switches assigned as backup in case the primary FCS switch fails. See also *FCS Switch* and *Primary FCS Switch*.

Bandwidth The total transmission capacity of a cable, link, or system. Usually measured in bps (bits per second). May also refer to the range of transmission frequencies available to a network. See also *Throughput*.

BB_Credit Buffer-to-buffer credit. The number of frames that can be transmitted to a directly connected recipient or within an arbitrated loop. Determined by the number of receive buffers available. See also *Buffer to Buffer Flow Control* and *EE_Credit*.

Beacon When all the port LEDs on a switch are set to flash from one side of the switch to the other, to enable identification of an individual switch in a large fabric. A switch can be set to beacon by Telnet command or through Web Tools.

Beginning Running Disparity The disparity at the transmitter or receiver when the special character associated with an ordered set is encoded or decoded. See also *Disparity*.

BER Bit error rate. The rate at which bits are expected to be received in error. Expressed as the ratio of error bits to total bits transmitted. See also *Error*.

Blade See *16-Port Card*.

Block As applies to Fibre Channel, upper-level application data that is transferred in a single sequence.

Blower Assembly A fan that prevents a switch (or individual elements within a switch) from over heating.

Boot Flash Flash memory that stores the boot code and boot parameters. The processor executes its first instructions from boot flash. Data is cached in RAM.

Boot Monitor Code used to initialize the CP (control processor) environment after powering on. Identifies the amount of memory available and how to access it, and retrieves information about system buses.

Broadcast The transmission of data from a single source to all devices in the fabric, regardless of zoning. See also *Multicast* and *Unicast*.

Buffer to Buffer Flow Control Management of the frame transmission rate in either a point-to-point topology or in an arbitrated loop. See also *BB_Credit*.

C

Cascade The interconnection means through which data flows from one switch to another in a fabric.

Chassis The metal frame in which the switch and switch components are mounted.

Circuit An established communication path between two ports. Consists of two virtual circuits capable of transmitting in opposite directions. See also *Link*.

Class 1 The class of frame-switching service that provides a dedicated connection between two communicating ports (also called connection- oriented service), with acknowledgment of delivery or nondelivery of frames.

Class 2 A connectionless class of frame switching service that includes acknowledgment of delivery or nondelivery of frames.

Class 3 A connectionless frame switching service that does not include acknowledgment of delivery or nondelivery of frames. Can be used to provide a multicast connection between the originator and recipients, with acknowledgment of delivery or nondelivery of frames.

Class F The class of frame switching service for a direct connection between two switches, allowing communication of control traffic between the E_Ports, with notification of delivery or nondelivery of data.

Class of Service A specified set of delivery characteristics and attributes for frame delivery.

CLI Command line interface. Interface that depends entirely on the use of commands, such as through Telnet or SNMP, and does not involve a graphical user interface.

Comma A unique pattern (either 1100000 or 0011111) used in 8b/10b encoding to specify character alignment within a data stream. See also *K28.5*.

Community (SNMP) A relationship between a group of SNMP managers and an SNMP agent, in which authentication, access control, and proxy characteristics are defined. See also *SNMP*.

Compact Flash Flash memory that stores the run time operating system and is used like hard disk storage. Not visible within the processor's memory space. Data is stored in file system format.

Configuration How a system is set up. May refer to hardware or software.

Hardware: The number, type, and arrangement of components that make up a system or network.

Software: The set of parameters that guide switch operation. May include general system parameters, IP address information, domain ID, and other information. Modifiable by any login with administrative privileges.

Connection Initiator A port that has originated a Class 1 dedicated connection and received a response from the recipient.

Connection Recipient A port that has received a Class 1 dedicated connection request and transmitted a response to the originator.

Control Panel Refers to the left-side panel of Web Tools, which accesses fabric-wide functions such as zoning and events.

Core Switch A switch whose main task is to interconnect other switches. See also *Edge Switch*.

CP Card Control processor card. The central processing unit of the ED-12000B, which contains two CP card slots to provide redundancy. Provides ethernet, serial, and modem ports with the corresponding LEDs.

CRC Cyclic redundancy check. A check for transmission errors included in every data frame.

Credit As applies to Fibre Channel, the number of receive buffers available for transmission of frames between ports. See also *BB_Credit* and *EE_Credit*.

Cut-through A switching technique that allows the route for a frame to be selected as soon as the destination address is received. See also *Route*.

D

Data Word Type of transmission word that occurs within frames. The frame header, data field, and CRC all consist of data words. See also *Frame*, *Ordered Set*, and *Transmission Word*.

DB-9 Connector A 9-pin version of the RS-232C port interface. May be either the male or female interface. See also *RS-232 Port*.

dBm, dBW Logarithmic units of power used in electronics. Indicates signal strength in decibels above the reference level, which is 1 milliwatt for dBm, and 1 watt for dBW. An increase of 10 dBm or 10 dBW represents a 10-fold increase in power.

DCE Port A data communications equipment port capable of interfacing between a DTE (data terminal equipment) port and a transmission circuit. DTE devices with an RS-232 (or EIA-232) port interface transmit on pin 3, and receive on pin 2. See also *DTE Port* and *RS-232 Port*.

Defined Zone Configuration The set of all zone objects defined in the fabric. May include multiple zone configurations. See also *Zone Configuration*.

Device A disk, a RAID, or an HBA.

Device Connection Controls Enables organizations to bind an individual device port to a set of one or more switch ports. Device ports are specified by a WWN and typically represent HBAs (servers). See also *Access Control List*.

Disparity The relationship of ones and zeros in an encoded character. Neutral disparity means an equal number of each, positive disparity means a majority of ones, and negative disparity means a majority of zeros.

DLS Dynamic load sharing. Dynamic distribution of traffic over available paths. Allows for recomputing of routes when an Fx_Port or E_Port changes status.

Domain ID As applies to Departmental Switches, a unique number between 1 and 239 that identifies the switch to the fabric and is used in routing frames. Usually automatically assigned by the switch, but can be manually assigned.

DTE Port A data terminal equipment port capable of interfacing to a transmission circuit through a connection to a DCE (data communications equipment) port. DTE devices with an RS-232 (or (EIA-232) port interface transmit on pin 3, and receive on pin 2 in a 9-pin connection (reversed in 25-pin connectors). See also *DCE Port* and *RS-232 Port*.

DWDM Dense wavelength multiplexing. A means to concurrently transmit more than one stream of data through a single fiber by modulating each stream of data on to a different wavelength of light.

E

Edge Switch A switch whose main task is to connect nodes to the fabric. See also *Core Switch*.

E_D_TOV Error detect time-out value. The minimum amount of time a target waits for a sequence to complete before initiating recovery. Can also be defined as the maximum time allowed for a round-trip transmission before an error condition is declared. See also *R_A_TOV*.

E_Port Expansion port. A type of switch port that can be connected to an E_Port on another switch to create an ISL. See also *ISL*.

EE_Credit End-to-end credit. The number of receive buffers allocated by a recipient port to an originating port. Used by Class 1 and 2 services to manage the exchange of frames across the fabric between source and destination. See also *End-to-End Flow Control* and *BB_Credit*.

Effective Zone Configuration The currently enabled configuration of zones. Only one configuration can be enabled at a time. See also *Defined Zone Configuration* and *Zone Configuration*.

EIA Rack A storage rack that meets the standards set by the Electronics Industry Association.

End-to-End Flow Control Governs flow of Class 1 and 2 frames between N_Ports. See also *EE_Credit*.

Error As applies to Fibre Channel, a missing or corrupted frame, time-out, loss of synchronization, or loss of signal (link errors).

ESN Enterprise Storage Network. A storage network implementation that integrates products, technology, and services offering universal data access for every major computing platform, operating system, and application across any combination of SCSI, Ultra SCSI, Fibre Channel, and ESCON technologies.

Exchange The highest level Fibre Channel mechanism used for communication between N_Ports. Composed of one or more related sequences, and can work in one or both directions.

Extended Fabrics A product that runs on Fabric OS and allows creation of a Fibre Channel fabric interconnected over distances of up to 100 kilometers.

F

F_Port Fabric port. A port that is able to transmit under fabric protocol and interface over links. Can be used to connect an N_Port to a switch. See also *FL_Port* and *Fx_Port*.

Fabric A Fibre Channel network containing two or more switches in addition to hosts and devices. May also be referred to as a switched fabric. See also *Topology*, *ESN*, and *Cascade*.

Fabric Access Allows the application to control the fabric directly for functions such as discovery, access (zoning) management, performance, and switch control. Consists of a host-based library that interfaces the application to switches in the fabric over an out-of-band TCP/IP connection or in-band using an IP-capable host bus adapter (HBA).

Fabric Name The unique identifier assigned to a fabric and communicated during login and port discovery.

Failover The act that causes control to pass from one redundant unit to another.

FC-AL-3 The Fibre Channel Arbitrated Loop standard defined by ANSI. Defined on top of the FC-PH standards.

FCIA Fibre Channel Industry Association. An international organization of Fibre Channel industry professionals. Provides oversight of ANSI and industry-developed standards, among other tasks.

FC-FLA The Fibre Channel Fabric Loop Attach standard defined by ANSI.

FCP Fibre Channel Protocol. Mapping of protocols onto the Fibre Channel standard protocols. For example, SCSI FCP maps SCSI-3 onto Fibre Channel.

FC-PH-1, 2, 3 The Fibre Channel Physical and Signalling Interface standards defined by ANSI.

FC-PI The Fibre Channel Physical Interface standard defined by ANSI.

FC-PLDA The Fibre Channel Private Loop Direct Attach standard defined by ANSI. Applies to the operation of peripheral devices on a private loop.

FCS Switch Fabric configuration server switch. One or more designated switches that store and manage the configuration and security parameters for all switches in the fabric. FCS switches are designated by WWN, and the list of designated switches is communicated fabric-wide. See also *Backup FCS Switch* and *Primary FCS Switch*.

FC-SW-2 The second generation of the Fibre Channel Switch Fabric standard defined by ANSI. Specifies tools and algorithms for the interconnection and initialization of Fibre Channel switches in order to create a multi-switch Fibre Channel fabric.

Fibre Channel Transport A protocol service that supports communication between Fibre Channel service providers. See also *FSP*.

FIFO First in, First out. May also refer to a data buffer that follows the first in, first out rule.

Fill Word An IDLE or ARB ordered set that is transmitted during breaks between data frames to keep the Fibre Channel link active.

Firmware The basic operating system provided with the hardware.

Firmware Download The process of loading firmware down from a server into the switch.

Flash Programmable NVRAM memory that maintains its contents.

Flash Partition Two redundant usable areas, called partitions, into which firmware can be downloaded.

FLOGI Fabric Login. The process by which an N_Port determines whether a fabric is present, and if so, exchanges service parameters with it. See also *PLOGI*.

FL_Port Fabric loop port. A port that is able to transmit under fabric protocol and also has arbitrated loop capabilities. Can be used to connect an NL_Port to a switch. See also *F_Port* and *Fx_Port*.

Frame The Fibre Channel structure used to transmit data between ports. Consists of a start-of-frame delimiter, header, any optional headers, the data payload, a cyclic redundancy check (CRC), and an end-of-frame delimiter. There are two types of frames: link control frames (transmission acknowledgements, etc.) and data frames.

FRU Field replaceable unit. A component that can be replaced on site.

FS Fibre Channel Service. A service that is defined by Fibre Channel standards and exists at a well-known address. For example, the Simple Name Server is a Fibre Channel service. See also *FSP*.

FSP Fibre Channel Service Protocol. The common protocol for all fabric services, transparent to the fabric type or topology. See also *FS*.

FSPF Fabric Shortest Path First. A routing protocol for Fibre Channel switches.

Full Duplex A mode of communication that allows the same port to simultaneously transmit and receive frames. See also *Half Duplex*.

Full Fabric The EMC software license that allows multiple E_Ports on a switch, making it possible to create multiple ISLs.

Fx_Port A fabric port that can operate as either an F_Port or FL_Port. See also *F_Port* and *FL_Port*.

G

G_Port Generic port. A port that can operate as either an E_Port or F_Port. A port is defined as a G_Port when it is not yet connected or has not yet assumed a specific function in the fabric.

Gateway Hardware that connects incompatible networks by providing translation for both hardware and software. For example, an ATM gateway can be used to connect a Fibre Channel link to an ATM connection.

GBIC Gigabit interface converter. A removable serial transceiver module that allows gigabaud physical level transport for Fibre Channel and Gigabit Ethernet. GBIC and SFP terms are used interchangeably throughout the documentation, although they are different types of optics and the hardware is not interchangeable. See also *SFP*.

Gb/s Gigabits per second (1,062,500,000 bits/second).

GB/s GigaBytes per second (1,062,500,000 bytes/second).

H

Half Duplex A mode of communication that allows a port to either transmit or receive frames at any time, but not simultaneously (with the exception of link control frames, which can be transmitted at any time). See also *Full Duplex*.

HBA Host bus adapter. The interface card between a server or workstation bus and the Fibre Channel network.

High Availability An attribute of equipment that identifies it as being capable of conducting customer operations well in excess of 99% of the time. Typically, high availability is identified by the number of nines in that percentage. Five nines means the equipment is rated as being capable of conducting customer operations 99.999% of the time without failure.

Host A computer that accesses storage devices over the fabric. May also be referred to as a server. See also *Workstation*.

Hot Pluggable A FRU capability that indicates it may be extracted or installed while customer data is otherwise flowing in the chassis.

Hub A Fibre Channel wiring concentrator that collapses a loop topology into a physical star topology. Nodes are automatically added to the loop when active and removed when inactive.

I

Idle Continuous transmission of an ordered set over a Fibre Channel link when no data is being transmitted, to keep the link active and maintain bit, byte, and word synchronization.

Initiator A server or workstation on a Fibre Channel network that initiates communications with storage devices. See also *Target*.

Integrated Fabric The fabric created by connecting multiple switches with multiple ISL cables, and configuring the switches to handle traffic as a seamless group.

IOD In-order delivery. A parameter that, when set, guarantees that frames are either delivered in order or dropped.

ISL Interswitch link. A Fibre Channel link from the E_Port of one switch to the E_Port of another. See also *E_Port* and *Cascade*.

Isolated E_Port An E_Port that is online but not operational due to overlapping domain IDs or nonidentical parameters (such as E_D_TOVs). See also *E_Port*.

IU Information unit. A set of information as defined by either upper-level process protocol definition or upper-level protocol mapping.

J

JBOD Just a bunch of disks. A number of disks connected in a single chassis to one or more controllers. See also *RAID*.

K

K28.5 A special 10-bit character used to indicate the beginning of a transmission word that performs Fibre Channel control and signaling functions. The first seven bits of the character are the comma pattern. See also *Comma*.

Kernel Flash Flash memory that stores the bootable kernel code and is visible within the processor's memory space. Data is stored as raw bits.

L

L_Port Loop port. A node port (NL_Port) or fabric port (FL_Port) that has arbitrated loop capabilities. An L_Port can be in one of two modes:

- Fabric mode: Connected to a port that is not loop capable, and using fabric protocol.
- Loop mode: In an arbitrated loop and using loop protocol. An L_Port in loop mode can also be in participating mode or nonparticipating mode.

See also *Nonparticipating Mode* and *Participating Mode*.

Latency The period of time required to transmit a frame, from the time it is sent until it arrives.

LED Light-emitting diode. Used to indicate status of elements on switch.

Link As applies to Fibre Channel, a physical connection between two ports, consisting of both transmit and receive fibres. See also *Circuit*.

Link Services A protocol for link-related actions.

LWL Long wavelength. A type of fiber-optic cabling that is based on 1300mm lasers and supports link speeds of 1.0625 Gb/s and 2.125 Gb/s. May also refer to the type of GBIC or SFP. See also *SWL*.

M

Media See *Transceiver*.

MIB Management Information Base. An SNMP structure to help with device management, providing configuration and device information.

Modem Serial Port The upper serial port on the CP card. Can be used to connect the CP card to a country-specific modem. Has a DB-9 connector wired as a ttyS1 DTE device, and can be connected by serial cable to a DCE device. Can be connected to a modem using a standard 9-pin modem cable. A Hayes-compatible modem or Hayes-emulation is required. See also *DCE Port* and *Terminal Serial Port*.

Multicast The transmission of data from a single source to multiple specified N_Ports (as opposed to all the ports on the network). See also *Broadcast* and *Unicast*.

Multimode A fiber-optic cabling specification that allows up to 500 meters for 1 GB Fibre Channel and 300 meters for 2 GB Fibre Channel between devices.

N

N_Port Node port. A port on a node that can connect to a Fibre Channel port or to another N_Port in a point-to-point connection. See also *NL_Port* and *Nx_Port*.

Name Server The term frequently used to indicate Simple Name Server. See also *SNS*.

Node A Fibre Channel device that contains an N_Port or NL_Port.

Negotiate See *Auto-Negotiate Speed* and *Autosense*.

NL_Port Node loop port. A node port that has arbitrated loop capabilities. Used to connect an equipment port to the fabric in a loop configuration through an FL_Port. See also *N_Port* and *Nx_Port*.

Nonparticipating Mode A mode in which an L_Port in a loop is inactive and cannot arbitrate or send frames, but can retransmit any received transmissions. This mode is entered if there are more than 127 devices in a loop and an AL_PA cannot be acquired. See also *L_Port* and *Participating Mode*.

Nx_Port A node port that can operate as either an N_Port or NL_Port.

O

Ordered Set A transmission word that uses 8b/10b mapping and begins with the K28.5 character. Ordered sets occur outside of frames, and include the following items:

Frame delimiters mark frame boundaries and describe frame contents.
Primitive signals indicate events.
Primitive sequences indicate or initiate port states.
Ordered sets are used to differentiate Fibre Channel control information from data frames and to manage the transport of frames.

P

Packet A set of information transmitted across a network. See also *Frame*.

Participating Mode A mode in which an L_Port in a loop has a valid AL_PA and can arbitrate, send frames, and retransmit received transmissions. See also *L_Port* and *Nonparticipating Mode*.

Path Selection The selection of a transmission path through the fabric. EMC switches use the FSPF protocol.

PLOGI Port Login. The port-to-port login process by which initiators establish sessions with targets. See also *FLOGI*.

Point-to-Point A Fibre Channel topology that employs direct links between each pair of communicating entities. See also *Topology*.

Port_Name The unique identifier assigned to a Fibre Channel port. Communicated during login and port discovery.

Port Cage The metal casing extending out of the optical port on the switch, and in which the GBIC or SFP can be inserted.

Port Card A Fibre Channel card that contains optical port interfaces. See also *16-Port Card*.

Port Module A collection of ports in a switch.

POST Power-on self test. A series of tests run by a switch after it is turned on.

Principal Switch The switch that assumes the responsibility to assign Domain IDs. The role of Principle Switch is negotiated after a Build Fabric event.

Primary FCS Switch Primary fabric configuration server switch. The switch that actively manages the configuration and security parameters for all switches in the fabric. See also *Backup FCS Switch* and *FCS Switch*.

Private Device A device that supports arbitrated loop protocol and can interpret 8-bit addresses, but cannot log in to the fabric.

Private Loop An arbitrated loop that does not include a participating FL_Port.

Private NL_Port An NL_Port that communicates only with other private NL_Ports in the same loop and does not log in to the fabric.

Protocol A defined method and a set of standards for communication.

Public Device A device that supports arbitrated loop protocol, can interpret 8-bit addresses, and can log in to the fabric.

Public Loop An arbitrated loop that includes a participating FL_Port, and may contain both public and private NL_Ports.

Public NL_Port An NL_Port that logs into the fabric, can function within either a public or a private loop, and can communicate with either private or public NL_Ports.

Q

Quad A group of four adjacent ports that share a common pool of frame buffers.

R

R_A_TOV Resource allocation time-out value. The maximum time a frame can be delayed in the fabric and still be delivered. See also *E_D_TOV*.

R_RDY Receiver ready. A primitive signal indicating that the port is ready to receive a frame.

RAID Redundant array of independent disks. A collection of disk drives that appear as a single volume to the server and are fault tolerant through mirroring or parity checking. See also *JBOD*.

Remote Fabric A fabric that spans across WANs by using protocol translation (a process also known as tunneling) such as Fibre Channel over ATM or Fiber Channel over IP.

Request Rate The rate at which requests arrive at a servicing entity. See also *Service Rate*.

Root Account A login used for debugging purposes and is not intended for customer use.

Route As applies to a fabric, the communication path between two switches. May also apply to the specific path taken by an individual frame, from source to destination. See also *SFP*.

Routing The assignment of frames to specific switch ports, according to frame destination.

RS-232 Port A port that conforms to a set of EIA (Electrical Industries Association) standards. Used to connect DTE and DCE devices for communication between computers, terminals, and modems. See also *DCE Port* and *DTE Port*.

RSCN Registered state change notification. A switch function that allows notification of fabric changes to be sent from the switch to specified nodes.

S

SAN Storage area network. A network of systems and storage devices that communicate using Fibre Channel protocols. See also *Fabric*.

SCSI Small computer systems interface. A parallel bus architecture and protocol for transmitting large data blocks to a distance of 15-25 meters.

SDRAM Synchronous dynamic random access memory. The main memory for the switch. Used for volatile storage during switch operation. See also *Flash*.

Sequence A group of related frames transmitted in the same direction between two N_Ports.

Service Rate The rate at which an entity can service requests. See also *Request Rate*.

SES A Brocade product that runs on Fabric OS and allows monitoring, configuring, and maintenance of the Departmental Switch family using SCSI 3 Enclosure Services.

SFP Small form factor pluggable. Optical transceiver used to convert signals between optical fiber cables and switches. GBIC and SFP terms are used interchangeably throughout the documentation, although they are different types of optics and the hardware is not interchangeable. See also *GBIC*.

SI Sequence initiative.

SID/DID Source identifier/destination identifier. S_ID is a 3-byte field in the frame header that is used to indicate the address identifier of the N_Port from which the frame was sent.

Single Mode A Fibre Channel optic cabling standard for use with long-wavelength lasers operating in the infrared portion of the spectrum at 1300 nonmeters (nm).

SNMP Simple Network Management Protocol. An Internet management protocol that uses either IP for network-level functions and UDP for transport-level functions, or TCP/IP for both. Can be made available over other protocols, such as UDP/IP, because it does not rely on the underlying communication protocols. See also *Community (SNMP)*.

SNS Simple Name Server. A switch service that stores names, addresses, and attributes for up to 15 minutes, and provides them as required to other devices in the fabric. SNS is defined by Fibre Channel standards and exists at a well-known address. May also be referred to as directory service. See also *FS*.

Subordinate Switch All switches in the fabric other than the principal switch. See also *Principal Switch*.

Switch Hardware that routes frames according to Fibre Channel protocol and is controlled by software.

Switch Name The arbitrary name assigned to a switch.

Switch Port A port on a switch. Switch ports can be E_Ports, F_Ports, or FL_Ports.

SWL Short wavelength. A type of fiber-optic cabling that is based on 850mm lasers and supports link speeds of 1.0625 Gb/s and 2.125 Gb/s. May also refer to the type of GBIC or SFP. See also *LWL*.

T

Target A storage device on a Fibre Channel network. See also *Initiator*.

Terminal Serial Port The lower serial port on the CP card. Receives error messages. Can be used to connect the CP card to a computer terminal. Has a DB-9 connector wires as a ttyS0 DTE device, and can be connected by serial cable to a DCE device. The connector has pins two and three swapped so that a straight-through cable can be used to connected to a terminal. See also *DB-9 Connector*, *DCE Port*, and *Modem Serial Port*.

Throughput The rate of data flow achieved within a cable, link, or system. Usually measured in bps (bits per second). See also *Bandwidth*.

Topology As applies to Fibre Channel, the configuration of the Fibre Channel network and the resulting communication paths allowed. There are three possible topologies:

- Point-to-point — A direct link between two communication ports.
- Switched fabric — Multiple N_Ports linked to a switch by F_Ports.
- Arbitrated loop — Multiple NL_Ports connected in a loop.

Transceiver Device that converts one form of signaling to another for transmission and reception. In fiber optics, it refers to optical and electrical.

Transmission Character A 10-bit character encoded according to the rules of the 8b/10b algorithm.

Transmission Word A group of four transmission characters.

Trap (SNMP) The message sent by an SNMP agent to inform the SNMP management station of a critical error. See also *SNMP*.

Tunneling A technique for enabling two networks to communicate when the source and destination hosts are both on the same type of network, but are connected by a different type of network.

U

U_Port Universal port. A switch port that can operate as a G_Port, E_Port, F_Port, or FL_Port. A port is defined as a U_Port when it is not connected or has not yet assumed a specific function in the fabric.

UDP User Datagram Protocol. A protocol that runs on top of IP and provides port multiplexing for upper-level protocols.

ULP Upper-level Protocol. The protocol that runs on top of Fibre Channel. Typical upper-level protocols are SCSI, IP, HIPPI, and IPI.

ULP_TOV Upper-level time-out value. The minimum time that a SCSI ULP process waits for SCSI status before initiating ULP recovery.

Unicast The transmission of data from a single source to a single destination. See also *Broadcast* and *Multicast*.

User Account A login intended for use by the customer to monitor, but not control, switch operation.

V

VC Virtual circuit. A one-way path between N_Ports that allows fractional bandwidth.

W

Well-Known Address — As pertaining to Fibre Channel, a logical address defined by the Fibre Channel standards as assigned to a specific function, and stored on the switch.

Workstation — A computer used to access and manage the fabric. May also be referred to as a management station or host.

WWN — World Wide Name. An identifier that is unique worldwide. Each entity in a fabric has a separate WWN.

Z

Zone — A set of devices and hosts attached to the same fabric and configured as being in the same zone. Devices and hosts within the same zone have access permission to others in the zone, but are not visible to any outside the zone.

Zone Alias — A name assigned to a device or group of devices in a zone. Aliases can greatly simplify the zone administrative process.

Zone Configuration — A specified set of zones. Enabling a configuration enables all zones in that configuration. See also *Defined Zone Configuration*.

Zone Member — A port, node, WWN, or alias, which is part of a zone.

Zone Schemes — The level of zoning granularity selected. For example, zoning may be done by switch/port, WWN, or a mixture. See also *Zone Configuration*.

Zone Set — See *Zone Configuration*.

Printed July, 2003

EMC believes the information in this publication is accurate as of its publication date. The information is subject to change without notice.

THE INFORMATION IN THIS PUBLICATION IS PROVIDED "AS IS." EMC CORPORATION MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WITH RESPECT TO THE INFORMATION IN THIS PUBLICATION, AND SPECIFICALLY DISCLAIMS IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

Use, copying, and distribution of any EMC software described in this publication requires an applicable software license.

Regulatory Agency Information

EMC Connectrix products have been extensively tested and certified to meet UL60950, CSA 22.2 No 60950, IEC 60950/EN60950; Safety of Information Technology Equipment including Electrical Business Equipment, FCC Rules Part 15 Subpart B; CISPR22 Class A; European EMC Directive 89/336/EEC on, electromagnetic compatibility.

This class A digital apparatus complies with Canadian ICES-003.

Cet appareil numérique de la classe A est conforme à la norme NMB-003 du Canada.

Warning!
This is a Class A product. In a domestic environment this product may cause radio interference in which case the user may be required to take adequate measures.

Achtung!
Dieses ist ein Gerät der Funkstörgrenzwertklasse A. In Wohnbereichen können bei Betrieb dieses Gerätes Rundfunkstörungen auftreten, in welchen Fällen der Benutzer für entsprechende Gegenmaßnahmen verantwortlich ist.

Attention!
Ceci est un produit de Classe A. Dans un environnement domestique, ce produit risque de créer des interférences radioélectriques, il appartiendra alors à l'utilisateur de prendre les mesures spécifiques appropriées.

この装置は、情報処理装置等電波障害自主規制協議会（ＶＣＣＩ）の基準に基づくクラスＡ情報技術装置です。この装置を家庭環境で使用すると電波妨害を引き起こすことがあります。この場合には使用者が適切な対策を講ずるよう要求されることがあります。

This equipment generates, uses, and may emit radio frequency energy. The equipment has been type tested and found to comply with the limits for a Class A digital device pursuant to Part 15 of FCC rules, which are designed to provide reasonable protection against such radio frequency interference.

Operation of this equipment in a residential area may cause interference in which case the user at his own expense will be required to take whatever measures may be required to correct the interference.

Any modifications to this device - unless expressly approved by the manufacturer - can void the user's authority to operate this equipment under part 15 of the FCC rules.

警告使用者:
這是甲類的資訊產品，在居住的環境中使用時，可能會造成射頻干擾,在這種情況下，使用者會被要求採取某些適當的對策。

Chapter 3 Fibre Alliance MIB Object Types

Chapter 4 FCFabric Element MIB Object Types

Figures

Tables

Preface

The EMC Connectrix B Series Management Information Base (MIB) Reference Manual provides information on MIB objects that you may encounter during installation and operation of the DS-16B2, DS-32B2 and ED-12000B.

As part of its effort to continuously improve and enhance the performance and capabilities of the EMC product line, EMC periodically releases new versions of the EMC Connectrix Departmental Switch and Enterprise Director. For the most up-to-date information on product features, see your product release notes.

If a feature in the DS-16B2, DS-32B2, or ED-12000B does not function properly or does not function as described in this manual, please contact the EMC Customer Support Center for assistance.

Audience

The audience for this manual includes Field Technicians and System Administrators.

Organization

Here is an overview of where information is located in this manual:

Chapter 1, *Overview of MIB Support*, provides generaal information on MIB.

Chapter 2, *MIB-II Object Types*, provides information about MIB-II object types.

Chapter 3, *Fibre Alliance MIB Object Types*, provides information about FA-MIB object types.

Chapter 4, *FCFabric Element MIB Object Types*, provides information about FE-MIB object types.

Chapter 5, *FCSwitch MIB Object Types*, provides information about FCSwitch MIB object types.

Chapter 7, *High Availability MIB Object Types*, provides information about HA-MIB object types.

Appendix A, *MIB Functional Groupings*, provides information about how MIB object types can be grouped, according to their function.

Appendix B, *MIB OIDs and Their Matching Object Names*, provides a listing of MIB object names and the corresponding MIB Object ID (OID) asociated with each.

Appendix C, *FA-MIB*, provides information on FA-MIB.

Appendix D, *FE-MIB*, provides information on FE-MIB.

Appendix E, *SW-MIB*, provides information on SW-MIB.

Appendix F, *Customer Support*, provides essential questions that a customer should be prepared to answer when contacting the EMC Customer Support Center.

The *Glossary* defines terminology used in this manual.

The tables within this manual often contain a column labeled Description. This column contains information about those MIB objects that EMC has modified for use or that require additional explanation beyond the scope of the standard MIB explanation. If the Description column contains no information for the MIB object, the standard return values apply.

Related Documentation

Related product information can be found in the following EMC publications:

Conventions Used in this Manual

EMC uses the following conventions for notes, cautions, and warnings.

A note presents information that is important, but not hazard-related.

CAUTION

A caution contains information essential to avoid damage to the system or equipment. The caution may apply to hardware or software.

WARNING

A warning contains information essential to avoid a hazard that can cause severe personal injury, death, or substantial property damage if you ignore the message.

Typographical Conventions

EMC uses the following type style conventions in this document:

Palatino, bold	◆ Dialog box, button, icon, and menu items in text ◆ Selections you can make from the user interface, including buttons, icons, options, and field names
Palatino, italic	◆ New terms or unique word usage in text ◆ Command line arguments when used in text ◆ Book titles
`Courier, italic`	Arguments used in examples of command line syntax.

`Courier`	System prompts and displays and specific filenames or complete paths. For example:
	`working root directory [/user/emc]:`
	`c:\Program Files\EMC\Symapi\db`

`Courier, bold`	◆ User entry. For example: **`symmpoll -p`** ◆ Options in command line syntax
AVANT GARDE	Keystrokes

Where to Get Help

For questions about technical support, call your local sales office or service provider.

If you have a valid EMC service contract, contact EMC Customer Service at:

United States:	**(800) 782-4362 (SVC-4EMC)**
Canada:	**(800) 543-4782 (543-4SVC)**
Worldwide:	**(508) 497-7901**

Follow the voice menu prompts to open a service call and select the applicable product support.

If you are located outside the USA, call the nearest EMC office for technical assistance.

Sales and Customer Service Contacts

For the list of EMC sales locations, please access the EMC home page at:

http://www.emc.com/contact/

For additional information on the EMC products and services available to customers and partners, refer to the EMC Powerlink website at:

http://powerlink.emc.com

Your Comments

Your suggestions will help us continue to improve the accuracy, organization, and overall quality of the user publications. Please send a message to **techpub_comments@EMC.com** with your opinions of this document.

1 Overview of MIB Support

This chapter provides general information on Management Information Bases (MIBs).

Documentation

MIB files

Fabric OS supports the following SNMP MIB files:

- V4_0SW.mib
- V4_0FE.mib
- V4_0TRP.mib
- V4_0FA.mib
- V4_0HA.mib

You can download these files from the Powerlink website:

```
http://www.powerlink.EMC.com
```

To download MIB files:

1. Select **Support**.
2. Select **Document Library.**
3. Select **Connectrix.**
4. Scroll down to the file you want to download.

Important In most cases, the switches' embedded MIBs and traps will already be enabled. To verify that all of the necessary MIBs and traps are enabled, use the `snmpMibCapSet` command. The default settings are:

```
swd55:admin> snmpmibcapset

The SNMP Mib/Trap Capability has been set to support
FE-MIB SW-MIB FA-MIB SW-TRAP FA-TRAP
FA-MIB (yes, y, no, n): [yes] y
SW-TRAP (yes, y, no, n): [yes] y
FA-TRAP (yes, y, no, n): [yes] y
SW-EXTTRAP (yes, y, no, n): [no] y
SB5_12000B_0:admin>
```

For more information on the `snmpMibCapSet` command, refer to the *EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B Fabric OS Reference Manual.*

Enabling MIBs and Traps

The following procedure explains how to enable all MIBs and traps on a managed device in a Symmetrix environment.

To complete this procedure from a Windows-based platform, you must have Microsoft Telnet software installed on the host platform. If you are using a UNIX platform, then start a Telnet session on the switch and skip to step 6.

Enabling the FA-MIB

To enable the MIBs of a managed device:

1. From the Windows **Start** menu, select **Run**.

   The Run dialog box (Figure 1-1) opens.

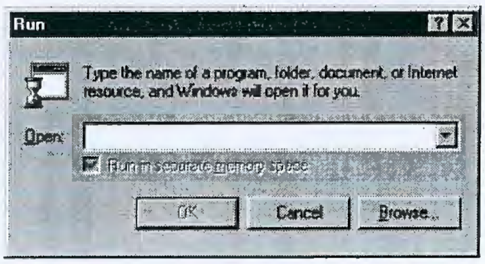

Figure 1-1 Run Dialog Box

2. In the **Open** box, specify **Telnet** and click **OK**.

   The Telnet main window opens.

3. From the **Connect** menu, select **Remote System**.

   The Connect dialog box (Figure 1-2) opens.

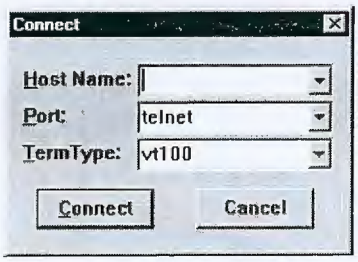

Figure 1-2 Telnet Connect Dialog Box

4. In the **Host Name** box, specify the IP address of the device.

   The IP address should be provided by the customer.

5. Click **Connect**.
6. At the login prompt, enter **admin**.
7. At the Password prompt, enter a password.

   The password should be provided by the customer.

   Telnet connects with the device.
8. Enter the following command:

   snmpMibCapSet

   Output similar to Figure 1-3 displays.

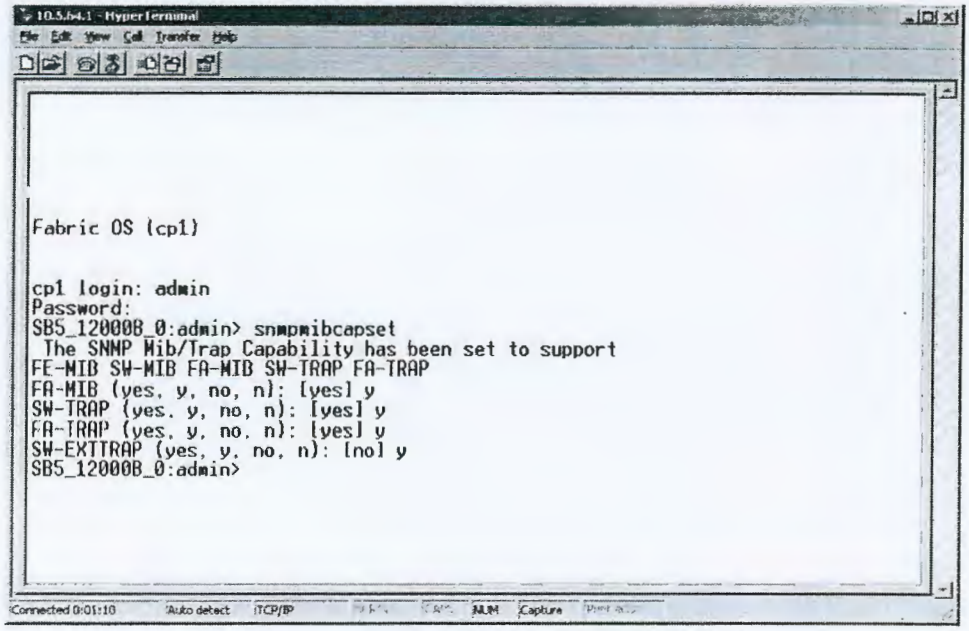

Figure 1-3 Enabling the FA-MIB

For more information on this command, see *Chapter 3, Fibre Alliance MIB Object Types.*

MIB-II File System Organization

Figure 1-4 through 1-7 depict the organization and structure of the MIB-II file system.

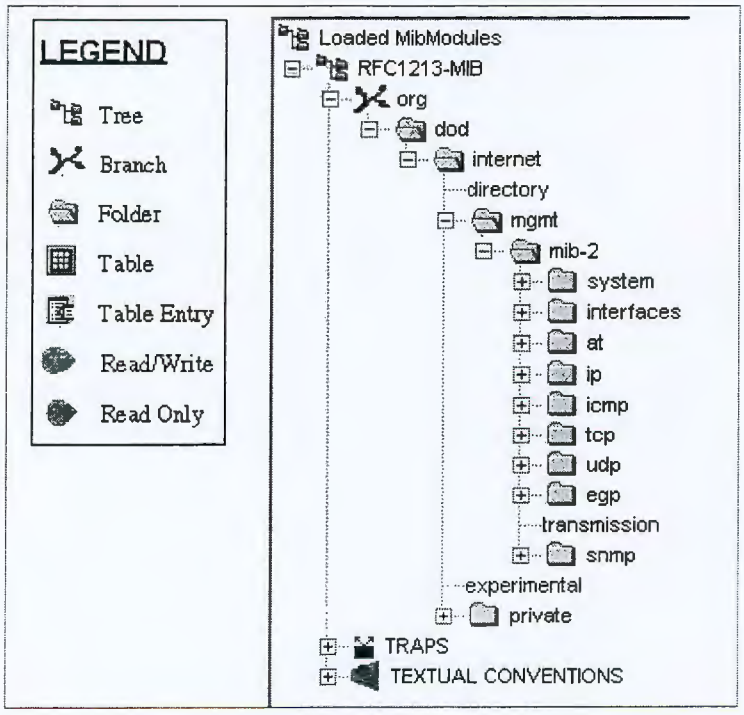

Figure 1-4 MIB-II Overall Tree Structure

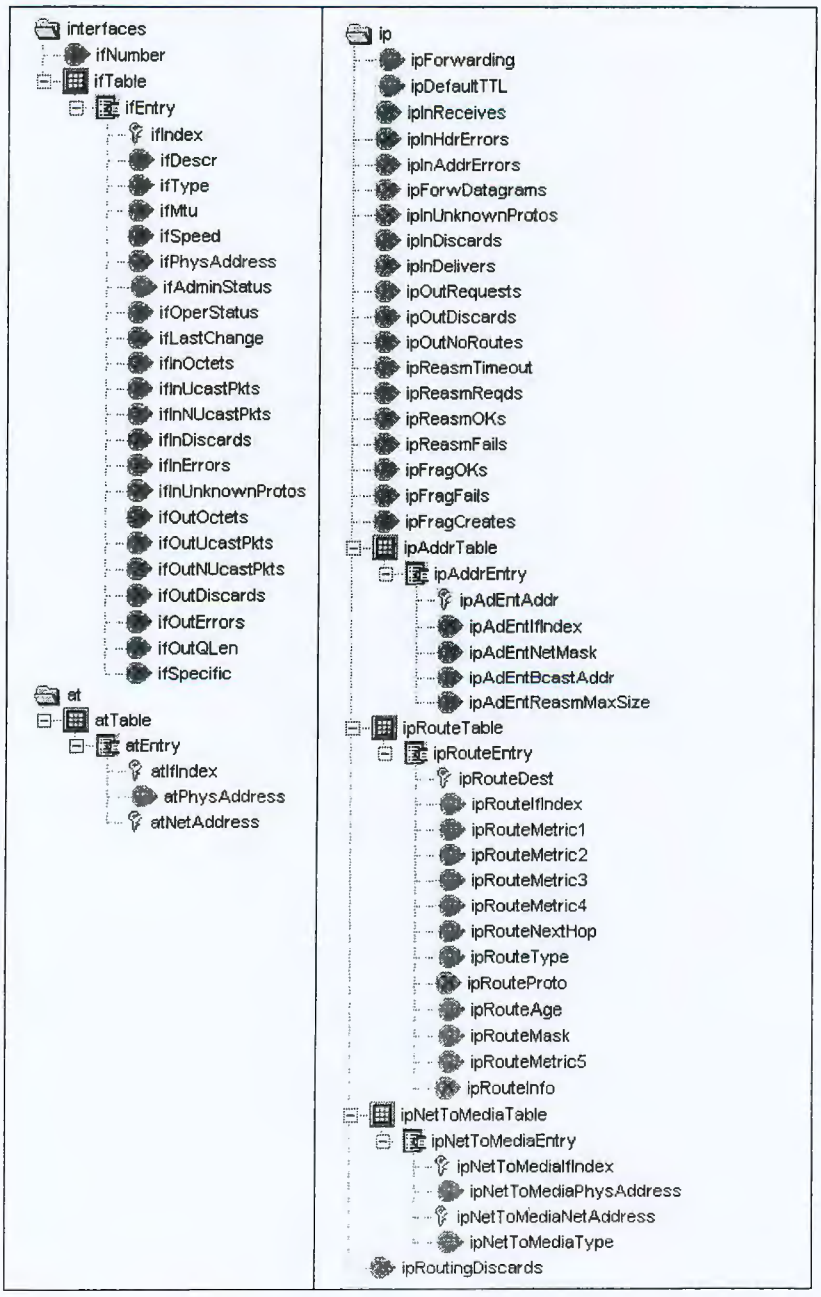

Figure 1-5 Tree Structure for MIB-II System, interfaces, at, and ip Groups

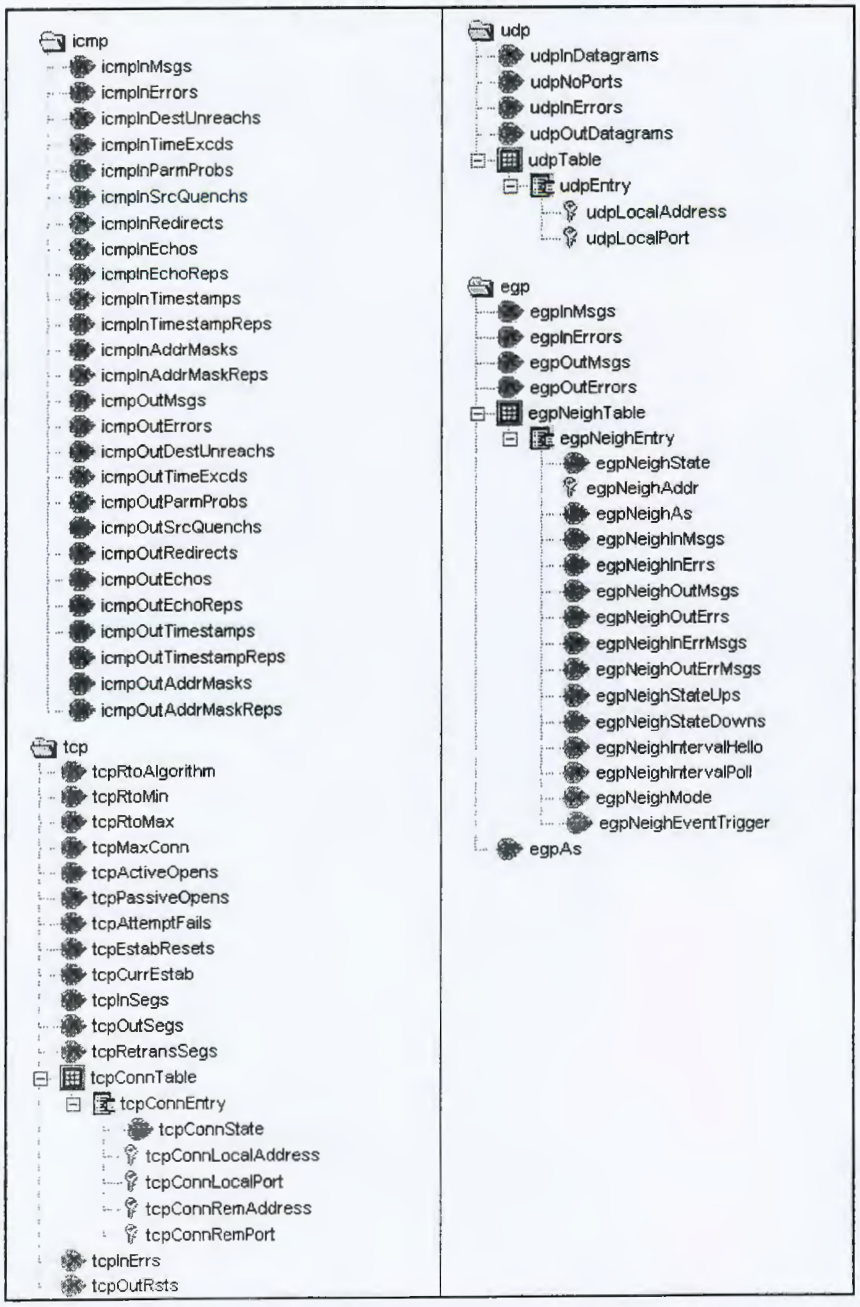

Figure 1-6 Tree Structure for MIB-II icmp, tcp, udp, and egp Groups

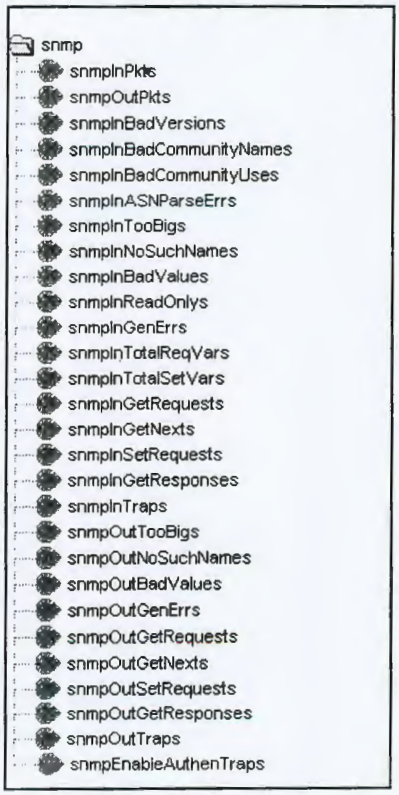

Figure 1-7 Tree Structure for MIB-II snmp Group

Definitions for MIB-II

The following definitions are used for MIB-II.

Table 1-1 **MIB-II Conventions**

Type Definition	Value	Declaration	Description
Display String	Octet String of size 0 to 255		
PhysAddress	Octet String		

Imports

The following objects are imported from RFC1155-SMI:

- mgmt
- NetworkAddress
- IpAddress
- Counter
- Gauge
- TimeTicks

Object Identifiers

- mgmt = { iso org(3) dod(6) internet(1) mgmt(2) }
- directory = { internet 1 }
- experimental = { internet 3 }
- private = { internet 4 }
- enterprises = { private 1 }
- mib-2 = { mgmt 1 }

2 MIB-II Object Types

This chapter provides descriptions and other information specific to MIB-II object types.

System Group

Implementation of the System Group is mandatory for all systems. If an agent is not configured to have a value for any of the System Group variables, a string of length 0 is returned.

sysDescr

OID 1.3.6.1.2.1.1.1

Description A textual description of the entity.

This value should include the full name and version identification of the hardware type, software operating system, and networking software. This must contain only printable ASCII characters.

Default Value = **Fibre Channel Switch**.

Set this value using the **agtcfgSet** Telnet command.

sysObjectID

OID 1.3.6.1.2.1.1.2

Description The vendor's authoritative identification of the network management subsystem contained in the entity.

This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining what kind of box is being managed.

Example:
If vendor **Flintstones, Inc.** was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its **Fred Router**.

Default value =
iso.org.dod.internet.private.enterprises.bcsi.commDev.fibrechannel.fcSwitch.sw

sysUpTime

OID 1.3.6.1.2.1.1.3

Description The time (in hundredths of a second) since the network management portion of the system was last re-initialized.

sysContact

OID 1.3.6.1.2.1.1.4

Description The textual identification of the contact person for this managed node, together with information on how to contact this person.

Default value = **Field Support**.

Set this value using the **agtcfgSet** Telnet command.

sysName

OID 1.3.6.1.2.1.1.5

Description An administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name.

Default value = preassigned name of the switch.

sysLocation

OID 1.3.6.1.2.1.1.6

Description The physical location of this node, (for example, telephone closet, 3rd floor).

Default value = **End User Premise**.

Set this value using the **agtcfgSet** Telnet command.

sysServices

OID 1.3.6.1.2.1.1.7

Description A value that indicates the set of services that this entity primarily offers.

The value is a sum. This sum initially takes the value zero. Then, for each layer, L, in the range 1 through 7, for which this node performs transactions, 2 raised to (L - 1) is added to the sum. For example, a node that primarily performs routing functions has a value of 4 (2^{3-1}). In contrast, a node that is a host and offers application services, has a value of 72 ($2^{4-1} + 2^{7-1}$). Note that in the context of the Internet suite of protocols, values should be calculated accordingly:

Layer functionality
1 = physical. (For example, repeaters)
2 = datalink/subnetwork. (For example, bridges)
3 = internet. (For example, IP gateways)
4 = end-to-end. (For example, IP hosts)
7 = applications. (For example, mail relays)

For systems including OSI protocols, layers 5 and 6 may also be counted. The return value is always **79**.

Interfaces Group

Implementation of the Interfaces group is mandatory for all systems.

ifNumber

OID 1.3.6.1.2.1.2.1

Description The number of network interfaces (regardless of their current state) present on this system.

When running FCIP, the return value is 7 for ED-12000B Directors and 3 for DS-32B2 Switches. The value can be 2 or 3 for all other switch types.

Interfaces Table

The Interfaces table contains information on the entity's interfaces. Each interface is thought of as being attached to a subnetwork. Note that this term should not be confused with *subnet*, which refers to an addressing partitioning scheme used in the Internet suite of protocols.

ifTable

OID 1.3.6.1.2.1.2.2

Description A list of interface entries. The number of entries is given by the value of ifNumber.

The ifDescr for DS-32B2 Switches includes: **lo**, **eth0**, **eth1**, **fc0**, **fc1**, **eth0:1**, and **eth0:2**. The ifDescr for ED-12000B Directors includes: **lo**, **eth0**, and **fc0**.

ifEntry

OID 1.3.6.1.2.1.2.2.1
ifTable.1

Description An interface entry containing objects at the subnetwork layer and below, for a particular interface.

Index ifIndex

ifIndex

OID 1.3.6.1.2.1.2.2.1.1
ifTable.1.1

Description A unique value for each interface.

The values range from **1** through the value of **ifNumber**. The value for each interface must remain constant at least from one re-initialization of the entity's network management system to the next re-initialization.

For example, the number of entries inside the ED-12000B are **1** to **3** for FCIP, otherwise the value is **1** or **2**.

ifDescr

OID 1.3.6.1.2.1.2.2.1.2
ifTable.1.2

Description A textual string containing information about the interface.

For example, ED-12000B: **fei0, lo0, fc0, eth0**.

ifType

OID 1.3.6.1.2.1.2.2.1.3
ifTable.1.3

Description The type of interface, designated by the physical/link protocol(s) immediately below the network layer in the protocol stack.

- **fei0** maps to **6** (ethernet-csmacd).
- **lo0** maps to **24** (softwareLoopback).
- **fc0** maps to **56**.

ifMtu

OID 1.3.6.1.2.1.2.2.1.4
ifTable.1.4

Description The size of the largest datagram that can be sent/received on the interface, specified in octets.

For interfaces that are used to transmit network datagrams, the value is the size of the largest network datagram that can be sent on the interface (these values are different for Fabric OS v4.x).

- **fei0** returns **1500**
- **lo0** returns **3904**
- **fc0** returns **2024**

ifSpeed

OID 1.3.6.1.2.1.2.2.1.5
ifTable.1.5

Description An estimate (in bits per second) of the interface's current bandwidth.

For Fabric OS v4.x, **2 GB** returns.

ifPhysAddress

OID 1.3.6.1.2.1.2.2.1.6
ifTable.1.6

Description The interface's address at the protocol layer immediately below the network layer in the protocol stack.

For interfaces that do not have such an address (for example, a serial line), this object should contain an octet string of zero length.

- **fei0** returns the MAC address of the Ethernet.
- **lo0** returns **null**.
- **fc0** returns the MAC address of the Fibre Channel.

ifAdminStatus

OID 1.3.6.1.2.1.2.2.1.7
ifTable.1.7

Description The desired state of the interface.

The 3 (testing) state indicates that no operational packets can be passed. This object is read-only in Fabric OS v4.x.

ifOperStatus

OID 1.3.6.1.2.1.2.2.1.8
ifTable.1.8

Description The current operational state of the interface.

The 3 (testing) state indicates that no operational packets can be passed.

ifLastChange

OID 1.3.6.1.2.1.2.2.1.9
ifTable.1.9

Description The value of sysUpTime at the time the interface entered its current operational state. If the current state was entered prior to the last re-initialization of the local network management subsystem, then this object contains a zero value.

ifInOctets

OID 1.3.6.1.2.1.2.2.1.10
ifTable.1.10

Description The total number of octets received on the interface, including framing characters.

ifInUcastPkts

OID 1.3.6.1.2.1.2.2.1.11
ifTable.1.11

Description The number of subnetwork-unicast packets delivered to a higher-layer protocol.

ifInNUcastPkts

OID 1.3.6.1.2.1.2.2.1.12
ifTable.1.12

Description The number of non-unicast packets (for example, subnetwork-broadcast or subnetwork-multicast) delivered to a higher-layer protocol.

ifInDiscards

OID 1.3.6.1.2.1.2.2.1.13
ifTable.1.13

Description The number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol.

One possible reason for discarding such a packet could be to free up buffer space.

ifInErrors

OID 1.3.6.1.2.1.2.2.1.14
ifTable.1.14

Description The number of inbound packets that contained errors, which thereby prevented them from being deliverable to a higher-layer protocol.

ifInUnknownProtos

OID 1.3.6.1.2.1.2.2.1.15
ifTable.1.15

Description The number of packets received by way of the interface, that were discarded because of an unknown or unsupported protocol.

ifOutOctets

OID 1.3.6.1.2.1.2.2.1.16
ifTable.1.16

Description The total number of octets transmitted out of the interface, including framing characters.

ifOutUcastPkts

OID 1.3.6.1.2.1.2.2.1.17
ifTable.1.17

Description The total number of packets that were requested, by higher-level protocols, to be transmitted to a subnetwork-unicast address, including those that were discarded or not sent.

ifOutNUcastPkts

OID 1.3.6.1.2.1.2.2.1.18
ifTable.1.18

Description The total number of packets that were requested, by higher-level protocols, to be transmitted to a non-unicast address (for example, a subnetwork-broadcast or subnetwork-multicast), including those that were discarded or not sent.

ifOutDiscards

OID 1.3.6.1.2.1.2.2.1.19
ifTable.1.19

Description The number of outbound packets that were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space.

ifOutErrors

OID 1.3.6.1.2.1.2.2.1.20
ifTable.1.20

Description The number of outbound packets that could not be transmitted because of errors.

ifOutQLen

OID 1.3.6.1.2.1.2.2.1.21
ifTable.1.21

Description The length of the output packet queue (in packets).

ifSpecific

OID 1.3.6.1.2.1.2.2.1.22
ifTable.1.22

Description A reference to MIB definitions specific to the particular media being used to realize the interface.

For example, if the interface is realized by an ethernet, then the value of this object refers to a document defining objects specific to ethernet. If this information is not present, its value should be set to the Object Identifier 0 0, which is a syntactically valid object identifier, and any conferment implementation of ASN.1 and BER must be able to generate and recognize this value.

- fei0 returns null OID
- lo0 returns null OID
- fc0 returns null OID

Address Translation Group

Implementation of the Address Translation group is mandatory for all systems. Note however that this group is deprecated by MIB-II. From MIB-II and onwards, each network protocol group contains its own address translation tables.

Address Translation Table

The Address Translation group contains one table, which is the union across all interfaces of the translation tables for converting a NetworkAddress (for example, an IP address) into a subnetwork-specific address. For lack of a better term, this document refers to such a subnetwork-specific address as a physical address.

Examples of such translation tables are: for broadcast media where ARP is in use, the translation table is equivalent to the ARP cache; or, on an X.25 network where non-algorithmic translation to X.121 addresses is required, the translation table contains the NetworkAddress to X.121 address equivalences.

atTable

OID 1.3.6.1.2.1.3.1

Description The Address Translation tables contain the NetworkAddress to physical address equivalences. Some interfaces do not use translation tables for determining address equivalences (for example, DDN-X.25 has an algorithmic method); if all interfaces are of this type, then the Address Translation table is empty, and therefore has zero entries.

atEntry

OID 1.3.6.1.2.1.3.1.1
atTable.1

Description Each entry contains one NetworkAddress to physical address equivalence.

Index atIfIndex, atNetAddress

atIfIndex

OID 1.3.6.1.2.1.3.1.1.1
atTable.1.1

Description The interface on which this entry's equivalence is effective. The interface identified by a particular value of this index is the same interface as identified by the same value of ifIndex.

atPhysAddress

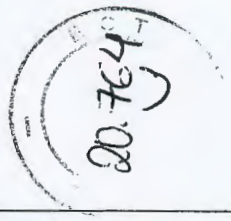
OID 1.3.6.1.2.1.3.1.1.2
atTable.1.2

Description The media-dependent physical address.

atNetAddress

OID 1.3.6.1.2.1.3.1.1.3
atTable.1.3

Description The NetworkAddress (for example, the IP address) corresponding to the media-dependent physical address.



IP Group

Implementation of the IP group is mandatory for all systems.

ipForwarding

OID 1.3.6.1.2.1.4.1

Description The indication of whether this entity is acting as an IP gateway in respect to the forwarding of datagrams received by, but not addressed to, this entity. IP gateways forward datagrams. IP hosts do not (except those source-routed via the host).

ipDefaultTTL

OID 1.3.6.1.2.1.4.2

Description The default value inserted into the Time-To-Live field of the IP header of datagrams originated at this entity, whenever a TTL value is not supplied by the transport layer protocol.

ipInReceives

OID 1.3.6.1.2.1.4.3

Description The total number of input datagrams received from interfaces, including those received in error.

ipInHdrErrors

OID 1.3.6.1.2.1.4.4

Description The number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, and so on.

ipInAddrErrors

OID 1.3.6.1.2.1.4.5

Description The number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (for example, 0.0.0.0) and addresses of unsupported Classes (for example, Class E). For entities which are not IP Gateways and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address.

ipForwDatagrams

OID 1.3.6.1.2.1.4.6

Description The number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP Gateways, this counter will include only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful.

ipInUnknownProtos

OID 1.3.6.1.2.1.4.7

Description The number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol.

ipInDiscards

OID 1.3.6.1.2.1.4.8

Description The number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (for example, for lack of buffer space).

This counter does not include any datagrams discarded while awaiting reassembly.

ipInDelivers

OID 1.3.6.1.2.1.4.9

Description The total number of input datagrams successfully delivered to IP user-protocols (including ICMP).

ipOutRequests

OID 1.3.6.1.2.1.4.10

Description The total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. Note that this counter does not include any datagrams counted in ipForwDatagrams.

ipOutDiscards

OID 1.3.6.1.2.1.4.11

Description The number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (for example, for lack of buffer space).

Note: This counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.

ipOutNoRoutes

OID 1.3.6.1.2.1.4.12

Description The number of IP datagrams discarded because no route could be found to transmit them to their destination.

This counter includes any packets counted in ipForwDatagrams that meet this *no-route* criterion. Note that this includes any datagrams that a host cannot route because all of its default gateways are down.

ipReasmTimeout

OID 1.3.6.1.2.1.4.13

Description The maximum number of seconds which received fragments are held while they are awaiting reassembly at this entity.

ipReasmReqds

OID 1.3.6.1.2.1.4.14

Description The number of IP fragments received which needed to be reassembled at this entity.

ipReasmOKs

OID 1.3.6.1.2.1.4.15

Description The number of IP datagrams successfully re-assembled.

ipReasmFails

OID 1.3.6.1.2.1.4.16

Description The number of failures detected by the IP re-assembly algorithm (for whatever reason, timed out, errors, and so on).

This is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.

ipFragOKs

OID 1.3.6.1.2.1.4.17

Description The number of IP datagrams that have been successfully fragmented at this entity.

ipFragFails

OID 1.3.6.1.2.1.4.18

Description The number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be (for example, because their Don't Fragment flag was set).

ipFragCreates

OID 1.3.6.1.2.1.4.19

Description The number of IP datagram fragments that have been generated as a result of fragmentation at this entity.

IP Address Table

The IP address table contains this entity's IP addressing information.

ipAddrTable

OID 1.3.6.1.2.1.4.20

Description The table of addressing information relevant to this entity's IP addresses.

ipAddrEntry

OID 1.3.6.1.2.1.4.20.1
ipAddrTable.1

Description The addressing information for one of this entity's IP addresses.

Index ipAdEntAddr

ipAdEntAddr

OID 1.3.6.1.2.1.4.20.1.1
ipAddrTable.1.1

Description The IP address to which this entry's addressing information pertains.

ipAdEntIfIndex

OID 1.3.6.1.2.1.4.20.1.2
ipAddrTable.1.2

Description The index value which uniquely identifies the interface to which this entry is applicable. The interface identified by a particular value of this index is the same interface as identified by the same value of ifIndex.

ipAdEntNetMask

OID 1.3.6.1.2.1.4.20.1.3
ipAddrTable.1.3

Description The subnet mask associated with the IP address of this entry. The value of the mask is an IP address with all the network bits set to 1 and all the hosts bits set to 0.

ipAdEntBcastAddr

OID 1.3.6.1.2.1.4.20.1.4
ipAddrTable.1.4

Description The value of the least-significant bit in the IP broadcast address used for sending datagrams on the (logical) interface associated with the IP address of this entry. For example, when the Internet standard all-ones broadcast address is used, the value will be 1. This value applies to both the subnet and network broadcasts addresses used by the entity on this (logical) interface.

ipAdEntReasmMaxSize

OID 1.3.6.1.2.1.4.20.1.5
ipAddrTable.1.5

Description The size of the largest IP datagram which this entity can re-assemble from incoming IP fragmented datagrams received on this interface.

IP Routing Table

The IP routing table contains an entry for each route presently known to this entity.

ipRouteTable

OID 1.3.6.1.2.1.4.21

Description This entity's IP Routing table.

ipRouteEntry

OID 1.3.6.1.2.1.4.21.1
ipRouteTable.1

Description A route to a particular destination.

Index ipRouteDest

ipRouteDest

OID 1.3.6.1.2.1.4.21.1.1
ipRouteTable.1.1

Description The destination IP address of this route.

An entry with a value of 0.0.0.0 is considered a default route. Multiple routes to a single destination can appear in the table, but access to such multiple entries is dependent on the table-access mechanisms defined by the network management protocol in use.

ipRouteIfIndex

OID 1.3.6.1.2.1.4.21.1.2
ipRouteTable.1.2

Description The index value which uniquely identifies the local interface through which the next hop of this route should be reached.

The interface identified by a particular value of this index is the same interface as identified by the same value of ifIndex.

ipRouteMetric1

OID 1.3.6.1.2.1.4.21.1.3
ipRouteTable.1.3

Description The primary routing metric for this route.

The semantics of this metric are determined by the routing-protocol specified in the route's ipRouteProto value. If this metric is not used, its value should be set to **-1**.

ipRouteMetric2

OID 1.3.6.1.2.1.4.21.1.4
ipRouteTable.1.4

Description An alternate routing metric for this route.

The semantics of this metric are determined by the routing-protocol specified in the route's ipRouteProto value. If this metric is not used, its value should be set to **-1**.

ipRouteMetric3

OID 1.3.6.1.2.1.4.21.1.5
ipRouteTable.1.5

Description An alternate routing metric for this route.

The semantics of this metric are determined by the routing-protocol specified in the route's ipRouteProto value. If this metric is not used, its value should be set to **-1**.

ipRouteMetric4

OID 1.3.6.1.2.1.4.21.1.6
ipRouteTable.1.6

Description An alternate routing metric for this route.

The semantics of this metric are determined by the routing-protocol specified in the route's ipRouteProto value. If this metric is not used, its value should be set to **-1**.

ipRouteNextHop

OID 1.3.6.1.2.1.4.21.1.7
ipRouteTable.1.7

Description The IP address of the next hop of this route. (In the case of a route bound to an interface which is realized via a broadcast media, the value of this field is the agent's IP address on that interface.)

ipRouteType

OID 1.3.6.1.2.1.4.21.1.8
ipRouteTable.1.8

Description The type of route. Valid values are:

other (1)	None of the following
invalid (2)	An invalidated route—route to directly
direct (3)	Connected (sub-)network—route to a non-local
indirect (4)	Host/network/sub-network

Setting this object to 2 (invalid) has the effect of invalidating the corresponding entry in the ipRouteTable object. That is, it effectively dissasociates the destination identified with said entry from the route identified with said entry. It is an implementation-specific matter as to whether the agent removes an invalidated entry from the table. Accordingly, management stations must be prepared to receive tabular information from agents that corresponds to entries not currently in use. Proper interpretation of such entries requires examination of the relevant ipRouteType object.

The values direct (3) and indirect (4) refer to the notion of direct and indirect routing in the IP architecture.

ipRouteProto

OID 1.3.6.1.2.1.4.21.1.9
ipRouteTable.1.9

Description The routing mechanism via which this route was learned.

Inclusion of values for gateway routing protocols is not intended to imply that hosts should support those protocols.

ipRouteAge

OID 1.3.6.1.2.1.4.21.1.10
ipRouteTable.1.10

Description The number of seconds since this route was last updated or otherwise determined to be correct.

Older semantics cannot be implied except through knowledge of the routing protocol by which the route was learned.

ipRouteMask

OID 1.3.6.1.2.1.4.21.1.11
ipRouteTable.1.11

Description The mask to be logical-ANDed with the destination address before being compared to the value in the ipRouteDest field. For those systems that do not support arbitrary subnet masks, an agent constructs the value of the ipRouteMask by determining whether the value of the correspondent ipRouteDest field belong to a class-A, B, or C network, and then using one of the following:

mask	network
255.0.0.0	class-A
255.255.0.0	class-B
255.255.255.0	class-C

If the value of the ipRouteDest is 0.0.0.0 (default route), then the mask value is also 0.0.0.0.

All IP routing subsystems implicitly use this mechanism.

ipRouteMetric5

OID 1.3.6.1.2.1.4.21.1.12
ipRouteTable.1.12

Description An alternate routing metric for this route.

The semantics of this metric are determined by the routing protocol specified in the route's ipRouteProto value. If this metric is not used, its value should be set to **-1**.

ipRouteInfo

OID 1.3.6.1.2.1.4.21.1.13
ipRouteTable.1.13

Description A reference to MIB definitions specific to the particular routing protocol which is responsible for this route, as determined by the value specified in the route's ipRouteProto value. If this information is not present, its value should be set to the Object Identifier { 0 0 }, which is a syntactically valid object identifier, and any conferment implementation of ASN.1 and BER must be able to generate and recognize this value.

IP Address Translation Table

The IP address translation table contains the IpAddress to physical address equivalences. Some interfaces do not use translation tables for determining address equivalences.

Example: DDN-X.25 has an algorithmic method); if all interfaces are of this type, then the Address Translation table is empty, and therefore has zero entries.

ipNetToMediaTable

OID 1.3.6.1.2.1.4.22

Description The IP Address Translation table used for mapping from IP addresses to physical addresses.

ipNetToMediaEntry

OID 1.3.6.1.2.1.4.22.1
ipNetToMediaTable.1

Description Each entry contains one IpAddress to physical address equivalence.

Index ipNetToMediaIfIndex, ipNetToMediaNetAddress

ipNetToMediaIfIndex

OID 1.3.6.1.2.1.4.22.1.1
ipNetToMediaTable.1.1

Description The interface on which this entry's equivalence is effective.

The interface identified by a particular value of this index is the same interface as identified by the same value of ifIndex.

ipNetToMediaPhysAddress

OID 1.3.6.1.2.1.4.22.1.2
ipNetToMediaTable.1.2

Description The media-dependent physical address.

ipNetToMediaNetAddress

OID 1.3.6.1.2.1.4.22.1.3
ipNetToMediaTable.1.3

Description The IpAddress corresponding to the media-dependent physical address.

ipNetToMediaType

OID 1.3.6.1.2.1.4.22.1.4
ipNetToMediaTable.1.4

Description The type of mapping.

Additional IP Objects

ipRoutingDiscards

OID 1.3.6.1.2.1.4.23

Description The number of routing entries that were chosen to be discarded even though they are valid. One possible reason for discarding such an entry could be to free-up buffer space for other routing entries.

ICMP Group

Implementation of the ICMP group is mandatory for all systems.

icmpInMsgs

OID 1.3.6.1.2.1.5.1

Description The total number of ICMP messages which the entity received.

This counter includes all ICMP messages counted by icmpInErrors.

icmpInErrors

OID 1.3.6.1.2.1.5.2

Description The number of ICMP messages which the entity received but determined as having ICMP-specific errors (bad ICMP checksums, bad length, and so on).

icmpInDestUnreachs

OID 1.3.6.1.2.1.5.3

Description The number of ICMP Destination Unreachable messages received.

icmpInTimeExcds

OID 1.3.6.1.2.1.5.4

Description The number of ICMP Time Exceeded messages received.

icmpInParmProbs

OID 1.3.6.1.2.1.5.5

Description The number of ICMP Parameter Problem messages received.

icmpInSrcQuenchs

OID 1.3.6.1.2.1.5.6

Description The number of ICMP Source Quench messages received.

icmpInRedirects

OID 1.3.6.1.2.1.5.7

Description The number of ICMP Redirect messages received.

icmpInEchos

OID 1.3.6.1.2.1.5.8

Description The number of ICMP Echo (request) messages received.

icmpInEchoReps

OID 1.3.6.1.2.1.5.9

Description The number of ICMP Echo Reply messages received.

icmpInTimestamps

OID 1.3.6.1.2.1.5.10

Description The number of ICMP Timestamp (request) messages received.

icmpInTimestampReps

OID 1.3.6.1.2.1.5.11

Description The number of ICMP Timestamp Reply messages received.

icmpInAddrMasks

OID 1.3.6.1.2.1.5.12

Description The number of ICMP Address Mask Request messages received.

icmpInAddrMaskReps

OID 1.3.6.1.2.1.5.13

Description The number of ICMP Address Mask Reply messages received.

icmpOutMsgs

OID 1.3.6.1.2.1.5.14

Description The total number of ICMP messages that this entity attempted to send.

Note: This counter includes all those counted by icmpOutErrors.

icmpOutErrors

OID 1.3.6.1.2.1.5.15

Description The number of ICMP messages which this entity did not send due to problems discovered within ICMP such as a lack of buffers. This value should not include errors discovered outside the ICMP layer such as the inability of IP to route the resultant datagram. In some implementations there may be no types of error which contribute to this counter's value.

icmpOutDestUnreachs

OID 1.3.6.1.2.1.5.16

Description The number of ICMP Destination Unreachable messages sent.

icmpOutTimeExcds

OID 1.3.6.1.2.1.5.17

Description The number of ICMP Time Exceeded messages sent.

icmpOutParmProbs

OID 1.3.6.1.2.1.5.18

Description The number of ICMP Parameter Problem messages sent.

icmpOutSrcQuenchs

OID 1.3.6.1.2.1.5.19

Description The number of ICMP Source Quench messages sent.

icmpOutRedirects

OID 1.3.6.1.2.1.5.20

Description The number of ICMP Redirect messages sent. For a host, this object will always be zero, since hosts do not send redirects.

icmpOutEchos

OID 1.3.6.1.2.1.5.21

Description The number of ICMP Echo (request) messages sent.

icmpOutEchoReps

OID 1.3.6.1.2.1.5.22

Description The number of ICMP Echo Reply messages sent.

icmpOutTimestamps

OID 1.3.6.1.2.1.5.23

Description The number of ICMP Timestamp (request) messages sent.

icmpOutTimestampReps

OID 1.3.6.1.2.1.5.24

Description The number of ICMP Timestamp Reply messages sent.

icmpOutAddrMasks

OID 1.3.6.1.2.1.5.25

Description The number of ICMP Address Mask Request messages sent.

icmpOutAddrMaskReps

OID 1.3.6.1.2.1.5.26

Description The number of ICMP Address Mask Reply messages sent.

TCP Group

Implementation of the TCP group is mandatory for all systems that implement the TCP.

Instances of object types that represent information about a particular TCP connection are transient; they persist only as long as the connection in question.

tcpRtoAlgorithm

OID 1.3.6.1.2.1.6.1

Description The algorithm used to determine the time-out value used for retransmitting unacknowledged octets.

tcpRtoMin

OID 1.3.6.1.2.1.6.2

Description The minimum value permitted by a TCP implementation for the retransmission time-out, measured in milliseconds.

More refined semantics for objects of this type depend upon the algorithm used to determine the retransmission time-out. In particular, when the time-out algorithm is 3 (rsre), an object of this type has the semantics of the LBOUND quantity described in RFC 793.

tcpRtoMax

OID 1.3.6.1.2.1.6.3

Description The maximum value permitted by a TCP implementation for the retransmission time-out, measured in milliseconds.

More refined semantics for objects of this type depend upon the algorithm used to determine the retransmission time-out. In particular, when the time-out algorithm is 3 (rsre), an object of this type has the semantics of the UBOUND quantity described in RFC 793.

tcpMaxConn

OID 1.3.6.1.2.1.6.4

Description The limit on the total number of TCP connections the entity can support. In entities where the maximum number of connections is dynamic, this object should contain the value -1.

tcpActiveOpens

OID 1.3.6.1.2.1.6.5

Description The number of times TCP connections have made a direct transition to the SYN-SENT state from the CLOSED state.

tcpPassiveOpens

OID 1.3.6.1.2.1.6.6

Description The number of times TCP connections have made a direct transition to the SYN-RCVD state from the LISTEN state.

tcpAttemptFails

OID 1.3.6.1.2.1.6.7

Description The number of times TCP connections have made a direct transition to the CLOSED state from either the SYN-SENT state or the SYN-RCVD state, plus the number of times TCP connections have made a direct transition to the LISTEN state from the SYN-RCVD state.

tcpEstabResets

OID 1.3.6.1.2.1.6.8

Description The number of times TCP connections have made a direct transition to the CLOSED state from either the ESTABLISHED state or the CLOSE-WAIT state.

tcpCurrEstab

OID 1.3.6.1.2.1.6.9

Description The number of TCP connections for which the current state is either ESTABLISHED or CLOSE- WAIT.

tcpInSegs

OID 1.3.6.1.2.1.6.10

Description The total number of segments received, including those received in error. This count includes segments received on currently established connections.

tcpOutSegs

OID 1.3.6.1.2.1.6.11

Description The total number of segments sent, including those on current connections but excluding those containing only retransmitted octets.

tcpRetransSegs

OID 1.3.6.1.2.1.6.12

Description The total number of segments retransmitted - that is, the number of TCP segments transmitted containing one or more previously transmitted octets.

TCP Connection Table

The TCP connection table contains information about this entity's existing TCP connections.

tcpConnTable

OID 1.3.6.1.2.1.6.13

Description A table containing TCP connection-specific information.

tcpConnEntry

OID 1.3.6.1.2.1.6.13.1
tcpConnTable.1

Description Information about a particular current TCP connection. An object of this type is transient, in that it ceases to exist when (or soon after) the connection makes the transition to the CLOSED state.

Index tcpConnLocalAddress, tcpConnLocalPort, tcpConnRemAddress, tcpConnRemPort

tcpConnState

OID 1.3.6.1.2.1.6.13.1.1
tcpConnTable.1.1

Description The state of this TCP connection. Possible values are:

closed (1)
listen (2)
synSent (3)
synReceived (4)
established (5)
finWait1 (6)
finWait2 (7)
closeWait (8)
lastAck (9)

closing (10)
timeWait (11)
deleteTCB (12)

The SET operation on this variable is not allowed.

The only value that may be set by a management station is deleteTCB (12). Accordingly, it is appropriate for an agent to return a badValue response if a management station attempts to set this object to any other value.

If a management station sets this object to the value delete12 (TCB), then this has the effect of deleting the TCB (as defined in RFC 793) of the corresponding connection on the managed node, resulting in immediate termination of the connection.

As an implementation-specific option, a RST segment may be sent from the managed node to the other TCP endpoint. (Note, however that RST segments are not sent reliably.)

tcpConnLocalAddress

OID 1.3.6.1.2.1.6.13.1.2
tcpConnTable.1.2

Description The local IP address for this TCP connection. In the case of a connection in the listen state which is willing to accept connections for any IP interface associated with the node, the value 0.0.0.0 is used.

tcpConnLocalPort

OID 1.3.6.1.2.1.6.13.1.3
tcpConnTable.1.3

Description The local port number for this TCP connection.

tcpConnRemAddress

OID 1.3.6.1.2.1.6.13.1.4
tcpConnTable.1.4

Description The remote IP address for this TCP connection.

tcpConnRemPort

OID 1.3.6.1.2.1.6.13.1.5
tcpConnTable.1.5

Description The remote port number for this TCP connection.

Additional TCP Objects

tcpInErrs

OID 1.3.6.1.2.1.6.14

Description The total number of segments received in error (for example, bad TCP checksums).

tcpOutRsts

OID 1.3.6.1.2.1.6.15

Description The number of TCP segments sent containing the RST flag.

UDP Group

Implementation of the UDP group is mandatory for all systems which implement the UDP.

udpInDatagrams

OID 1.3.6.1.2.1.7.1

Description The total number of UDP datagrams delivered to UDP users.

udpNoPorts

OID 1.3.6.1.2.1.7.2

Description The total number of received UDP datagrams for which there was no application at the destination port.

udpInErrors

OID 1.3.6.1.2.1.7.3

Description The number of received UDP datagrams that could not be delivered for reasons other than the lack of an application at the destination port.

udpOutDatagrams

OID 1.3.6.1.2.1.7.4

Description The total number of UDP datagrams sent from this entity.

UDP Listener Table

The UDP listener table contains information about this entity's UDP end-points on which a local application is currently accepting datagrams.

udpTable

OID 1.3.6.1.2.1.7.5

Description A table containing UDP listener information.

udpEntry

OID 1.3.6.1.2.1.7.5.1
udpTable.1

Description Information about a particular current UDP listener.

Index udpLocalAddress, udpLocalPort

udpLocalAddress

OID 1.3.6.1.2.1.7.5.1.1
udpTable.1.1

Description The local IP address for this UDP listener. In the case of a UDP listener which is willing to accept datagrams for any IP interface associated with the node, the value 0.0.0.0 is used.

udpLocalPort

OID 1.3.6.1.2.1.7.5.1.2
udpTable.1.2

Description The local port number for this UDP listener.

EGP Group

EMC does not support the EGP Group—therefore, this section, the EGP Neighbor Table, and Additional EGP Objects are not applicable.

Transmission Group

Based on the transmission media underlying each interface on a system, the corresponding portion of the Transmission group is mandatory for that system.

When Internet-standard definitions for managing transmission media are defined, the transmission group is used to provide a prefix for the names of those objects.

Typically, such definitions reside in the experimental portion of the MIB until they are proven, then as a part of the Internet standardization process, the definitions are accordingly elevated and a new object identifier, under the transmission group is defined. By convention, the name assigned is:

```
type Object Identifier ::= { transmission number }
```

where

- `type` is the symbolic value used for the media in the ifType column of the ifTable object.
- `number` is the actual integer value corresponding to the symbol.

SNMP Group

Implementation of the SNMP group is mandatory for all systems which support an SNMP protocol entity. Some of the objects defined below will be zero-valued in those SNMP implementations that are optimized to support only those functions specific to either a management agent or a management station. All of the objects below refer to an SNMP entity, and there may be several SNMP entities residing on a managed node (for example, if the node is acting as a management station).

snmpInPkts

OID 1.3.6.1.2.1.11.1

Description The total number of Messages delivered to the SNMP entity from the transport service.

snmpOutPkts

OID 1.3.6.1.2.1.11.2

Description The total number of SNMP Messages which were passed from the SNMP protocol entity to the transport service.

snmpInBadVersions

OID 1.3.6.1.2.1.11.3

Description The total number of SNMP Messages which were delivered to the SNMP protocol entity and were for an unsupported SNMP version.

snmpInBadCommunityNames

OID 1.3.6.1.2.1.11.4

Description The total number of SNMP Messages delivered to the SNMP protocol entity which used a SNMP community name not known to said entity.

snmpInBadCommunityUses

OID 1.3.6.1.2.1.11.5

Description The total number of SNMP Messages delivered to the SNMP protocol entity which represented an SNMP operation which was not allowed by the SNMP community named in the Message.

snmpInASNParseErrs

OID 1.3.6.1.2.1.11.6

Description The total number of ASN.1 or BER errors encountered by the SNMP protocol entity when decoding received SNMP Messages.

Note: 1.3.6.1.2.1.11.7 is not used.

snmpInTooBigs

OID 1.3.6.1.2.1.11.8

Description The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `tooBig`.

snmpInNoSuchNames

OID 1.3.6.1.2.1.11.9

Description The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `noSuchName`.

snmpInBadValues

OID 1.3.6.1.2.1.11.10

Description The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `badValue`.

snmpInReadOnlys

OID 1.3.6.1.2.1.11.11

Description The total number valid SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `readOnly`.

It is a protocol error to generate an SNMP PDU that contains the value `readOnly` in the error-status field, as such this object is provided as a means of detecting incorrect implementations of the SNMP.

snmpInGenErrs

OID 1.3.6.1.2.1.11.12

Description The total number of SNMP PDUs which were delivered to the SNMP protocol entity and for which the value of the error-status field is `genErr`.

snmpInTotalReqVars

OID 1.3.6.1.2.1.11.13

Description The total number of MIB objects which have been retrieved successfully by the SNMP protocol entity as the result of receiving valid SNMP Get-Request and Get-Next PDUs.

snmpInTotalSetVars

OID 1.3.6.1.2.1.11.14

Description The total number of MIB objects which have been altered successfully by the SNMP protocol entity as the result of receiving valid SNMP Set-Request PDUs.

snmpInGetRequests

OID 1.3.6.1.2.1.11.15

StatusMandatory

Description The total number of SNMP Get-Request PDUs which have been accepted and processed by the SNMP protocol entity.

snmpInGetNexts

OID 1.3.6.1.2.1.11.16

Description The total number of SNMP Get-Next PDUs which have been accepted and processed by the SNMP protocol entity.

snmpInSetRequests

OID 1.3.6.1.2.1.11.17

Description The total number of SNMP Set-Request PDUs which have been accepted and processed by the SNMP protocol entity.

snmpInGetResponses

OID 1.3.6.1.2.1.11.18

Description The total number of SNMP Get-Response PDUs which have been accepted and processed by the SNMP protocol entity.

snmpInTraps

OID 1.3.6.1.2.1.11.19

Description The total number of SNMP Trap PDUs which have been accepted and processed by the SNMP protocol entity.

snmpOutTooBigs

OID 1.3.6.1.2.1.11.20

Description The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is too large.

snmpOutNoSuchNames

OID 1.3.6.1.2.1.11.21

Description The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status is noSuchName.

snmpOutBadValues

OID 1.3.6.1.2.1.11.22

Description The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is `badValue`.

snmpOutGenErrs

OID 1.3.6.1.2.1.11.24

1.3.6.1.2.1.11.23 is not used

Description The total number of SNMP PDUs which were generated by the SNMP protocol entity and for which the value of the error-status field is `genErr`.

snmpOutGetRequests

OID 1.3.6.1.2.1.11.25

Description The total number of SNMP Get-Request PDUs which have been generated by the SNMP protocol entity.

snmpOutGetNexts

OID 1.3.6.1.2.1.11.26

Description The total number of SNMP Get-Next PDUs which have been generated by the SNMP protocol entity.

snmpOutSetRequests

OID 1.3.6.1.2.1.11.27

Description The total number of SNMP Set-Request PDUs which have been generated by the SNMP protocol entity.

snmpOutGetResponses

OID 1.3.6.1.2.1.11.28

Description The total number of SNMP Get-Response PDUs which have been generated by the SNMP protocol entity.

snmpOutTraps

OID 1.3.6.1.2.1.11.29

Description The total number of SNMP Trap PDUs which have been generated by the SNMP protocol entity.

snmpEnableAuthenTraps

OID 1.3.6.1.2.1.11.30

Description Indicates whether the SNMP agent process is permitted to generate authentication-failure traps. The value of this object overrides any configuration information; as such, it provides a means whereby all authentication-failure traps may be disabled. Possible values are:

enabled (1)
disabled (2)

This object is stored in non-volatile memory so that it remains constant between re-initializations of the switch. This value can be changed with the **agtcfgset** Telnet command.

3

Fibre Alliance MIB Object Types

This chapter contains descriptions and other information that is specific to Fibre Alliance MIB (FA-MIB) object types, including the following:

Overview

The object types in FA-MIB are organized into the following groupings:

- Connectivity
- Trap Registration
- Revision Number
- Statistic Set
- Service Set

Refer to Appendix C for the entire FA-MIB.

FA-MIB (FCMGMT-MIB) System Organization of MIB Objects

Figure 3-1 through Figure 3-3 depict the organization and structure of the FA-MIB file system:

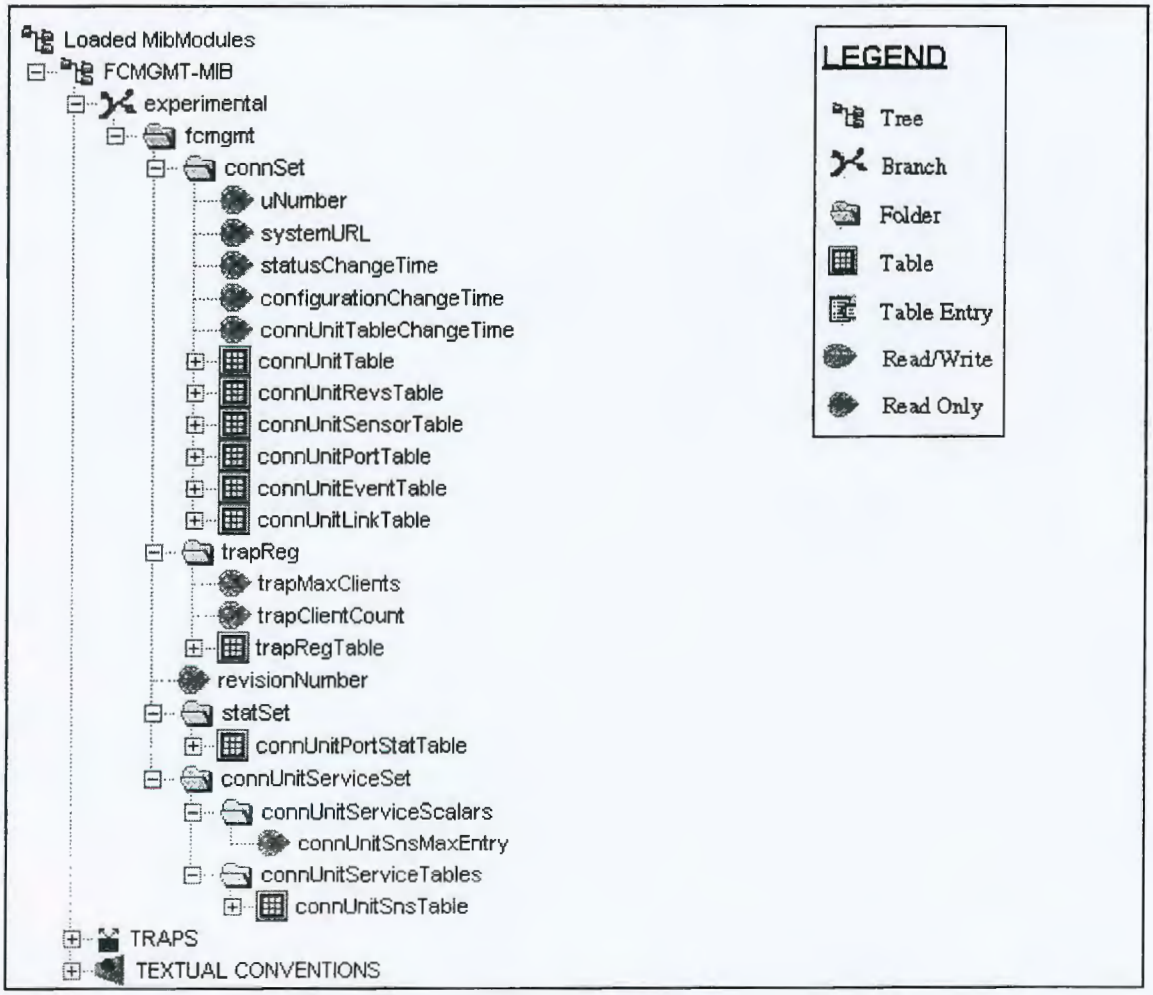

Figure 3-1 FA-MIB Overall Tree Structure

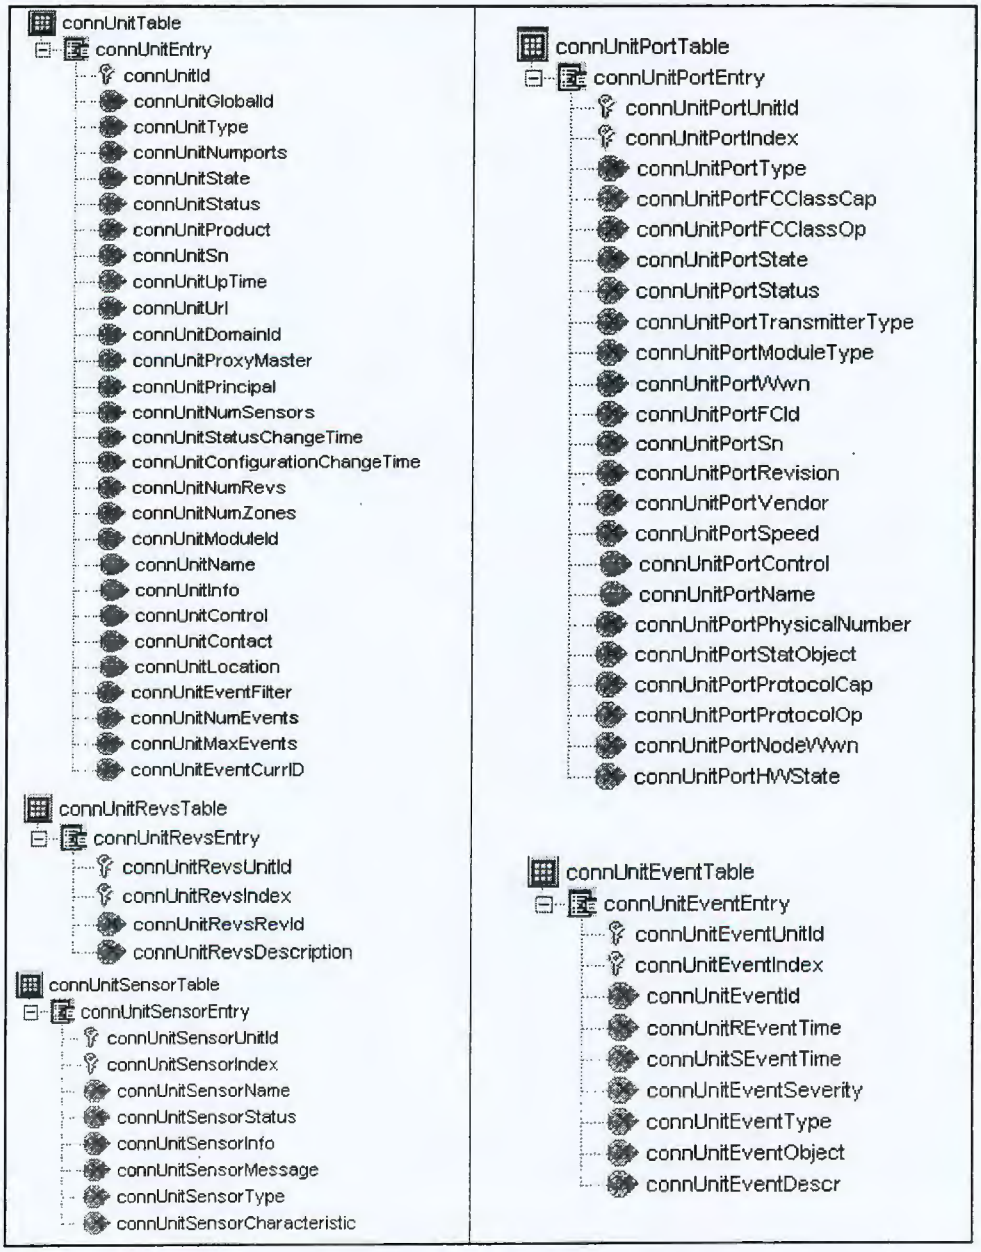

Figure 3-2 Tree Structure for connUnit, connUnitRevs, connUnitSensor, connUnitPort, and connUnitEvent Tables

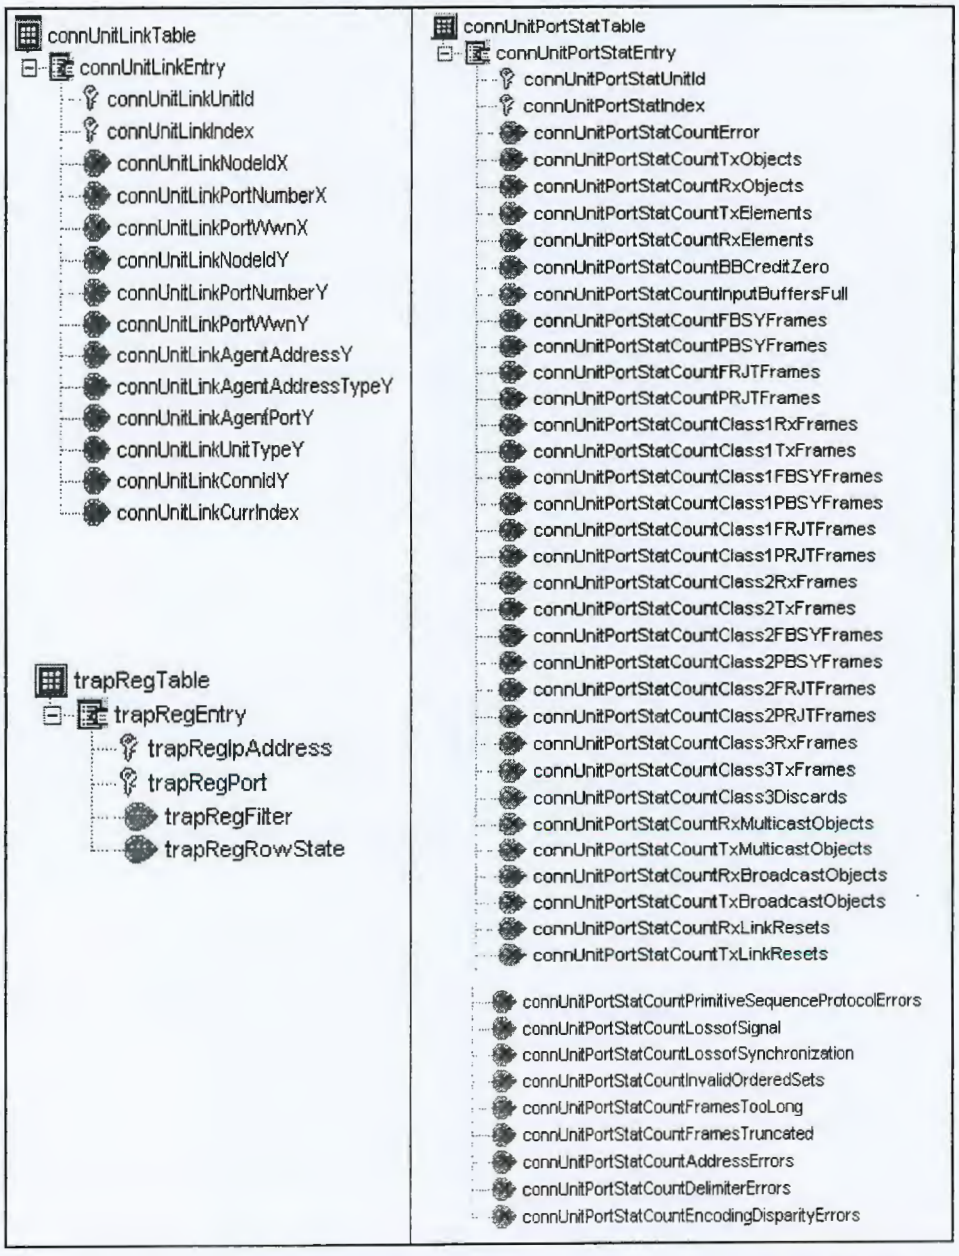

Figure 3-3 Tree Structure for connUnitLink, trapReg, and connUnitPortStat Tables

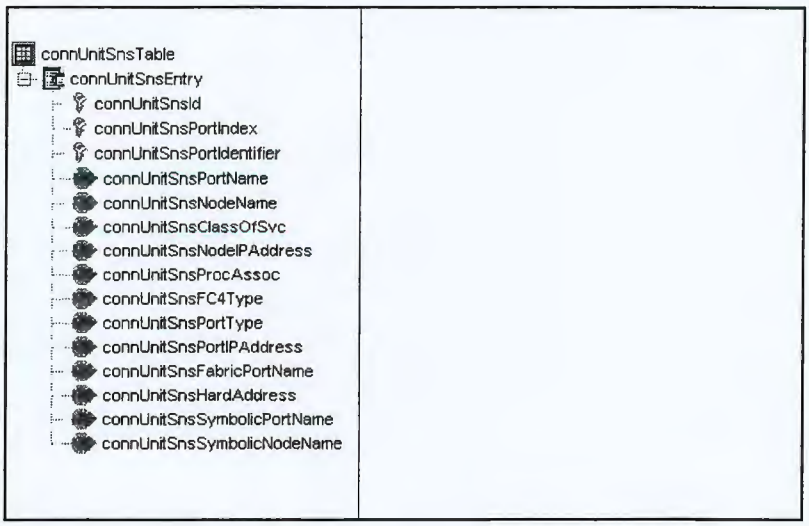

Figure 3-4 Tree Structure for connUnitSns Table

Definitions for FA-MIB (FCMGMT)

The following definitions are used for FA-MIB.

Table 3-1 FA- MIB Definitions

Type Definition	Value	Declaration	Description
FcNameId	Octet String of size 8		
FcGlobalId	Octet String of size 16		
FcEventSeverity	Integer	1 (unknown)	
		2 (emergency)	Emergency status.
		3 (alert)	Alert status.
		4 (critical)	Critical status.
		5 (error)	Error status.
		6 (warning)	Warning status.
		7 (notify)	Notification status.
		8 (info)	Informational status.
		9 (debug)	Debug status.
		10 (mark)	All messages logged.
FcUnitType	Integer	1 (unknown)	
		2 (other)	None of the following.
		3 (hub)	Passive connectivity unit supporting loop protocol.
		4 (switch)	Active connectivity unit supporting multiple protocols.
		5 (gateway)	Unit that converts not only the interface but also encapsulates the frame into another protocol. The assumption is that there is always two gateways connected together. For example, FC <-> ATM.
		6 (converter)	Unit that converts from one interface to another. For example, FC <-> SCSI)
		7 (hba)	Host bus adapter.
		8 (proxy-agent)	Software proxy-agent.
		9 (storage-device)	Disk, cd, tape, and so on.
		10 (host)	Host computer.
		11 (storage-subsystem)	Raid, library, and so on.
		12 (module)	Subcomponent of a system.
		13 (swdriver)	Software driver.
		14 (storage-access-device)	Provides storage management and access for heterogeneous hosts and heterogeneous devices.

Connectivity Group

Connectivity group implementation is mandatory for all systems.

uNumber

OID 1.3.6.1.3.94.1.1

Description The number of connectivity units present on this system (represented by this agent). This can be a count of the boards in a chassis or the number of full boxes in a rack. The connectivity unit is mapped to a switch. uNumber.0 is always set to **1**.

systemURL

OID 1.3.6.1.3.94.1.2

Description The top-level URL of the system. If the URL does not exist, the value is an empty string. The URL format is implementation-dependant and can have keywords embedded that are preceded by a percent sign (for example,%USER). The following are the defined keywords that are recognized and replaced with data during a launch:

USER — Replace with username
PASSWORD — Replace with password
GLOBALI — Replace with global ID
SERIALNO — Replace with serial number
DEFVAL — {""}

The expected value for systemURL.0 is:

"http://{a.b.c.d}"

where {a.b.c.d} is the IP address of the switch if Web Tool license is available.

"" (null)

Connectivity Unit Table

connUnitTable

OID 1.3.6.1.3.94.1.6

Description A list of units under a single SNMP agent. The number of entries is given by the value of uNumber. The value is 1 for stand-alone system.

connUnitEntry

OID 1.3.6.1.3.94.1.6.1
connUnitTable.1

Description A connectivity unit entry containing objects for a particular unit.

Index connUnitId

connUnitId

OID 1.3.6.1.3.94.1.6.1.1
connUnitTable.1.1

Description The unique identification for this connectivity unit among those within this proxy domain:

- The value *must* be unique within the proxy domain because it is the index variable for connUnitTable.
- The value assigned to a given connectivity unit *should* be persistent across agent and unit resets.
- connUnitId *should* be the same as connUnitGlobalId, if connUnitGlobalId is known and stable.

The current implementation of the DS-32B2 and ED-12000B switches treats this ID as a very large (128-bit) integer, starting from 1. Therefore, to specify a particular instance of any columnar variable in the connUnitEntry (such as connUnitType), specify the instance identifier as a 16-octet value. For example, `connUnitType 10.0.0.60.69.4.11.19.0.0.0.0.0.0.0.0`

where the object instance identifier consists of 16 octets, each representing the byte value from high-byte order to low-byte order of this 128-bit integer. This maps to WWN.

connUnitGlobalId

OID 1.3.6.1.3.94.1.6.1.2
connUnitTable.1.2

Description An optional global-scope identifier for this connectivity unit. It *must* be a WWN for this connectivity unit or 16 octets of value zero. The following characteristics are required:

- WWN formats requiring fewer than 16 octets *must* be extended to 16 octets with trailing zero octets.
- If a WWN is used for connUnitId, the same WWN *must* be used for connUnitGlobalId.

The following characteristics are strongly recommended:

- When a nonzero value is provided, this value *should* be persistent across agent and unit resets.
  - It *should* be globally unique.
  - It *should* be one of these FC-PH/PH3 formats:
    - IEEE (NAA=1)
    - IEEE Extended (NAA=2)
    - IEEE Registered (NAA=5)
    - IEEE Registered extended (NAA=6)
- Use of the IEEE formats allows any IEEE-registered vendor to assure global uniqueness independently.

  The following are some references on IEEE WWN formats:

```
http://standards.ieee.org/regauth/oui/tutorials/fibreformat.html
http://standards.ieee.org/regauth/oui/tutorials/fibrecomp_id.html
```

  - If one or more WWNs are associated with the connUnit via other management methods, one of them *should* be used for connUnitGlobalId.
  - If no WWN is specifically assigned to the connUnit, there is some merit, though not a requirement, to using a WWN assigned to (one of) its permanently attached FC/LAN interface(s). This can not risk uniqueness, though.

- As a counterexample, if your agent runs in a host and the host has an HBA, it is quite possible that agent, host, and HBA are all distinct connUnits, so the host and agent can not use the WWN of the HBA.

Example If the hub has a built-in Ethernet port, it might be reasonable for the hub to use its LAN address (prefixed with the appropriate NAA) as its connUnitId. But if the Ethernet is a replaceable PC Card, the hub should have an independent ID.

The EMC implementation maps the switch WWN to the top 8 bytes of this variable and sets the remaining lower 8 bytes to 0. For example, if the switch WWN is 10:00:00:60:69:10:02:18, then SNMP-GET connUnitGlobalId.0.0.0.0.0.0.0.0.0.0.0.0.0.0.1 returns

```
10 00 00 60 69 10 02 18 00 00 00 00 00 00 00 00
```

---

connUnitType

OID 1.3.6.1.3.94.1.6.1.3
connUnitTable.1.3

Description The type of this connectivity unit.

Set to 4 (switch).

---

connUnitNumports

OID 1.3.6.1.3.94.1.6.1.4
connUnitTable.1.4

Description Number of physical ports in the connectivity unit (internal/embedded, external).

To determine the *maximum number of system -supported ports*, do an SNMP GET on swFcPortCapacity.

ED-12000B: 0 to *maximum number of system-supported ports.*
DS-32B2: *return 32 system supported ports.*
DS-16B2: *return 16 system supported ports.*

---

connUnitState

OID 1.3.6.1.3.94.1.6.1.5
connUnitTable.1.5

Description Overall state of the connectivity unit.

Possible values are:

unknown (1):

online (2): Set the state to online.

offline (3): Set the state to offline.

connUnitStatus

OID 1.3.6.1.3.94.1.6.1.6
connUnitTable.1.6

Description Overall status of the connectivity unit.

switchStatus maps directly as follows:

connUnitStatus	switchStatus
1 (unknown)	Unknown
2 (unused)	Unmonitored
3 (ok)	Healthy/ok
4 (warning)	Marginal/Warning
5 (failed)	Down/Failed

connUnitProduct

OID 1.3.6.1.3.94.1.6.1.7
connUnitTable.1.7

Description The connectivity unit vendor's product model name.

This is the same as for sysDescr (set for as many as 79 bytes).

connUnitSn

OID 1.3.6.1.3.94.1.6.1.8
connUnitTable.1.8

Description The serial number for this connectivity unit.

Set to the SSN (which by default is the WWN), but is changeable through Telnet.

connUnitUpTime

OID 1.3.6.1.3.94.1.6.1.9
connUnitTable.1.9

Description The number of centiseconds since the last unit initialization.

Set when connUnitTable is initialized.

connUnitUrl

OID 1.3.6.1.3.94.1.6.1.10
connUnitTable.1.10

Description URL to launch a management application, if applicable. Otherwise empty string. In a standalone unit, this is the same as the top-level URL. This has the same definition as systemURL for keywords.

(Same as systemURL.) The expected value for connUnitURL.0 is: "`http://{a.b.c.d}`" where {a.b.c.d} is the IP address of the switch if Web Tool license is available (null).

connUnitDomainId

OID 1.3.6.1.3.94.1.6.1.11
connUnitTable.1.11

Description 24-bit Fibre Channel address ID of this connectivity unit, right-justified with leading zeros, if required. If this value is not applicable, return all bits set to one.

Set to the switch domain ID (as per FC-SW).

connUnitProxyMaster

OID 1.3.6.1.3.94.1.6.1.12
connUnitTable.1.12

Description A value of yes means this is the proxy master unit for a set of managed units. For example, this could be the only unit with a management card in it for a set of units. A standalone unit should return *yes* for this object.

Set to 3 (yes).

connUnitPrincipal

OID 1.3.6.1.3.94.1.6.1.13
connUnitTable.1.13

Description Indicates whether this connectivity unit is the principal unit within the group of fabric elements. If this value is not applicable, return unknown.

If the switch is principal, this is set to 3 (yes), otherwise, it is set to **2** (no).

connUnitNumSensors

OID 1.3.6.1.3.94.1.6.1.14
connUnitTable.1.14

Description Number of sensors in the connUnitSensorTable.

The value for an ED-12000B is between 0 and 62 (temperature = 40, fan = 12, power supply = 10).

The value for a DS-16B2 is between 0 and 13 (temperature = 6, fan = 3, power supply = 4).

connUnitStatusChangeTime

OID 1.3.6.1.3.94.1.6.1.15
connUnitTable.1.15

Description The sysuptime time stamp (in centiseconds) at which the last status change occurred for any members of the set. In other words, this is the latest time stamp that connUnitStatus or connUnitPortStatus changed.

This is the same as statusChangeTime.

connUnitConfigurationChangeTime

OID 1.3.6.1.3.94.1.6.1.16
connUnitTable.1.16

Description The sysuptime time stamp (in centiseconds) at which the last configuration change occurred for any members of the set. In other words, this is the latest time stamp of flash memory update.This represents a union of change information for connUnitConfigurationChangeTime.

This is the same as configurationChangeTime.

connUnitNumRevs

OID 1.3.6.1.3.94.1.6.1.17
connUnitTable.1.17

Description The number of revisions in the connUnitRevsTable.

Set to 2.

connUnitNumZones

OID 1.3.6.1.3.94.1.6.1.18
connUnitTable.1.18

Description Number of zones defined in connUnitZoneTable.

Set to 0 because the zone table is not supported.

connUnitModuleId

OID 1.3.6.1.3.94.1.6.1.19
connUnitTable.1.19

Description This is a unique ID, persistent between boots, that can be used to group a set of connUnits together into a module. The intended use would be to create a connUnit with a connUnitType of *module* to represent a physical or logical group of connectivity units. Then the value of the group would be set to the value of connUnitId for this *container* connUnit.

connUnitModuleId should be zeros if this connUnit is not part of a module.

Set to WWN.

connUnitName

OID

1.3.6.1.3.94.1.6.1.20
connUnitTable.1.20

Description

A display string containing a name for this connectivity unit. This object value should be persistent between boots.

Set to switchName/sysName.

connUnitInfo

OID

1.3.6.1.3.94.1.6.1.21
connUnitTable.1.21

Description

A display string containing information about this connectivity unit. This object value should be persistent between boots.

Set to sysDescr and Read-only.

connUnitControl

OID

1.3.6.1.3.94.1.6.1.22
connUnitTable.1.22

Description

Controls the addressed connUnit. Each implementation may choose not to allow any or all of these values on a SET.

Cold Start and Warm Start are as defined in MIB-II and are not meant to be a factory reset.

This is similar to swAdmStatus.

- resetConnunitColdStart = fastboot
- resetConnunitWarmStart = fastboot
- offlineConnUnit = disable switch
- onlineConnUnit = enable switch
- default after reboot = unknown

The declaration 1 (unknown) maps to the default value upon rebooting, and 2 (invalid) is not applicable.

Declarations 3 and 4 perform the same operation—a cold boot of the switch.

connUnitContact

OID 1.3.6.1.3.94.1.6.1.23
connUnitTable.1.23

Description Contact information for this connectivity unit.

Displays the same value as in sysContact. Changing the value in this variable causes the value in sysContact to also be changed.

connUnitLocation

OID 1.3.6.1.3.94.1.6.1.24
connUnitTable.1.24

Description Location information for this connectivity unit.

Displays the same value as in sysLocation.

connUnitEventFilter

OID 1.3.6.1.3.94.1.6.1.25
connUnitTable.1.25

Description Defines the event severity that is logged by this connectivity unit. All events of severity less than or equal to connUnitEventFilter are logged in connUnitEventTable.

Returns (debug).

connUnitNumEvents

OID 1.3.6.1.3.94.1.6.1.26
connUnitTable.1.26

Description Number of events currently in the connUnitEventTable.

Returns the number of events that are currently in buffer (0 through 2048).

connUnitMaxEvents

OID 1.3.6.1.3.94.1.6.1.27
connUnitTable.1.27

Description Maximum number of events (2048) that can be defined in the connUnitEventTable.

connUnitEventCurrID

OID 1.3.6.1.3.94.1.6.1.28
connUnitTable.1.28

Description The last used event ID (connUnitEventId).

Maximum is 2147483647 (2^{31}-1).

Connectivity Unit Revisions Table

connUnitRevsTable

OID 1.3.6.1.3.94.1.7

Description Table of the revisions supported by connectivity units managed by this agent.

This table lists the versions of hardware and software elements in the switch.

connUnitRevsEntry

OID 1.3.6.1.3.94.1.7.1
connUnitRevsTable.1

Description Table of the revisions supported by connectivity units managed by this agent.

Index connUnitRevsUnitId, connUnitRevsIndex

Table 3-2 connUnitRevsEntry Objects and Object Types

connUnitRevsUnitId on page 3-20	Octet String
connUnitRevsIndex on page 3-21	Integer
connUnitRevsRevId on page 3-21	Display String
connUnitRevsDescription on page 3-21	Display String

connUnitRevsUnitId

OID 1.3.6.1.3.94.1.7.1.1
connUnitRevsTable.1.1

Description The connUnitId of the connectivity unit that contains this revision table.

connUnitRevsIndex

OID 1.3.6.1.3.94.1.7.1.2
connUnitRevsTable.1.2

Description A unique value among all connUnitRevsEntrys with the same value of connUnitRevsUnitId, in the range between 1 and connUnitNumRevs.

Index 1 returns the hardware version. Index 2 returns the software version.

connUnitRevsRevId

OID 1.3.6.1.3.94.1.7.1.3
connUnitRevsTable.1.3

Description A vendor-specific string identifying a revision of a component of the connUnit indexed by connUnitRevsUnitId.

Index 1 returns the switchType from Telnet command `switchShow`. Index 2 returns the Fabric OS version from Telnet command `version`, for example, v4.1.

connUnitRevsDescription

OID 1.3.6.1.3.94.1.7.1.4
connUnitRevsTable.1.4

Description Description of a component to which the revision corresponds.

Index 1 returns hardware version. Index 2 returns software version.

Connectivity Unit Sensor Table

connUnitSensorTable

OID 1.3.6.1.3.94.1.8

Description Table of the sensors supported by each connectivity unit managed by this agent.

connUnitSensorEntry

OID 1.3.6.1.3.94.1.8.1
connUnitSensorTable.1

Description Each entry contains the information for a specific sensor.

Index connUnitSensorUnitId, connUnitSensorIndex

connUnitSensorUnitId

OID 1.3.6.1.3.94.1.8.1.1
connUnitSensorTable.1.1

Description The connUnitId of the connectivity unit that contains this sensor table.

Set to connUnitId.

connUnitSensorIndex

OID 1.3.6.1.3.94.1.8.1.2
connUnitSensorTable.1.2

Status Mandatory

Description A unique value among all connUnitSensorEntrys with the same value of connUnitSensorUnitId, in the range between 1 and connUnitNumSensor.

connUnitSensorName

OID 1.3.6.1.3.94.1.8.1.3
connUnitSensorTable.1.3

Description A textual identification of the sensor intended for operator use.

Each contains the name of sensor in textual format, such as Temp #1, Fan #2.

connUnitSensorStatus

OID 1.3.6.1.3.94.1.8.1.4
connUnitSensorTable.1.4

Description The status indicated by the sensor.

Possible values are:

- unknown (1)
- other (2)
- ok (3): The sensor indicates okay.
- warning (4): The sensor indicates a warning.
- failed (5): The sensor indicates failure.

connUnitSensorInfo

OID 1.3.6.1.3.94.1.8.1.5
connUnitSensorTable.1.5

Description Miscellaneous static information about the sensor, such as its serial number.

Each contains textual information about the sensor name.

Returns the serial ID if this is for the power supply; otherwise, it returns Null.

connUnitSensorMessage

OID 1.3.6.1.3.94.1.8.1.6
connUnitSensorTable.1.6

Description Status of the sensor as a message. It may also provide more resolution on the sensor indication, for example, cover temperature 1503 K, above nominal operating range.

Each contains the sensor status (and reading if applicable) in textual format.

connUnitSensorType

OID 1.3.6.1.3.94.1.8.1.7
connUnitSensorTable.1.7

Description The type of component being monitored by this sensor.

Possible values are:

unknown (1)
other (2)
battery (3)
fan (4)
power-supply (5)
transmitter (6)
enclosure (7)
board (8)
receiver (9)

The following mapping is for each individual sensor, where applicable:

swSensorType	connUnitSensorType
1 (temperature)	8 (board)
2 (fan)	4 (fan)
3 (power-supply)	5 (power supply)

connUnitSensorCharacteristic

OID 1.3.6.1.3.94.1.8.1.8
connUnitSensorTable.1.8

Description The characteristics being monitored by this sensor.

Possible values are:

unknown (1)
other (2)
temperature (3)
pressure (4)
emf (5)
currentValue (6) (*Current* is a keyword)
airflow (7)
frequency (8)
power (9)
door (10)

The following mapping is for each individual sensor, where applicable:

swSensorType	connUnitSensorCharacteristic
1 (temperature)	3 (temperature)
2 (fan)	7 (airflow)
3 (power-supply)	9 (power)

Connectivity Unit Port Table

connUnitPortTable

OID 1.3.6.1.3.94.1.10

Description Generic information on ports for a specific connUnit.

connUnitPortEntry

OID 1.3.6.1.3.94.1.10.1
connUnitPortTable.1

Description Each entry contains the information for a specific port.

Index connUnitPortUnitId, connUnitPortIndex

connUnitPortUnitId

OID 1.3.6.1.3.94.1.10.1.1
connUnitPortTable.1.1

Description The connUnitId of the connectivity unit that contains this port. Same value as connUnitId.

connUnitPortIndex

OID 1.3.6.1.3.94.1.10.1.2
connUnitPortTable.1.2

Description Numer of physical ports (between 0 and *maximum number of system-supported ports*) in the connectivity unit (internal/embedded, external).

To determine the *maximum number of system-support ports*, do an SNMPGet on swFcPortCapacity.
ED-12000B: 0 to *maximum number of supported ports.*
DS-32B2: *return 32 system supported ports.*

connUnitPortType

OID 1.3.6.1.3.94.1.10.1.3
connUnitPortTable.1.3

Description The port type.

Mapped as:
U_Port — **10** (g-port)
F_Port — **8** (f-port)
FL_Port — **7** (fl-port)
E_Port — **9** (e-port)

connUnitPortFCClassCap

OID 1.3.6.1.3.94.1.10.1.4
connUnitPortTable.1.4

Description Bit mask that specifies the classes of service capability of this port. If this is not applicable, return all bits set to zero.

The bits have the following definitions:

Value	Declaration	Description
Integer	0 (unknown) 1 (class-f) 2 (class-one) 4 (class-two) 8 (class-three) 16 (class-four) 32 (class-five) 64 (class-six)	"Current" is a keyword

For an F or FL port, this value is `0x000C`. For a G or E port, this value is `0x000D`.

connUnitPortFCClassOp

OID 1.3.6.1.3.94.1.10.1.5
connUnitPortTable.1.5

Description Bit mask that specifies the classes of service that are currently operational. If this is not applicable, return all bits set to zero. This object has the same definition as connUnitPortFCClassCap.

For an F_Port or FL_Port, this value is 0x000C. For a G_Port or E_Port, this value is 0x000D.

connUnitPortState

OID 1.3.6.1.3.94.1.10.1.6
connUnitPortTable.1.6

Description The state of the port hardware.

For E, F or FL, the value is online. For U, the value is offline (disabled, testing, faulted).

connUnitPortStatus

OID 1.3.6.1.3.94.1.10.1.7
connUnitPortTable.1.7

Description An overall protocol status for the port.

For E, F or FL, the value is 3 (ok).
For U, the value is 2 (unused) if not faulty with GBIC, 3 (warning) if not faulty but no GBIC, or 5 (failure) if faulty.

connUnitPortTransmitterType

OID 1.3.6.1.3.94.1.10.1.8
connUnitPortTable.1.8

Description The technology of the port transceiver.

For an external FC port, this value should be:
9 (shortwaveNoOFC)
8 (longwaveNoOFC)
6 (copper)

connUnitPortModuleType

OID 1.3.6.1.3.94.1.10.1.9
connUnitPortTable.1.9

Description The module type of the port connector.

For an external FC port with GBIC, this value should be either 6 (gbicSerialId) or **7** (gbicNoSerialId).

For an external FC port without GBIC, this value is set to 8 (gbicNotInstalled).

connUnitPortWwn

OID 1.3.6.1.3.94.1.10.1.10
connUnitPortTable.1.10

Description The World Wide Name of the port if applicable; otherwise, empty string.

This is in IEEE Extended format and the extension contains the internal port number of each port.

The internal port number is 1 less than the port index. For example, if the switch has WWN 10:00:00:60:69:10:02:18, then port numbers 0 and 6 have WWN 20:00:00:60:69:10:02:18 and 20:06:00:60:69:10:02:18, respectively. However, the embedded port has WWN 10:00:00:60:69:10:02:18, the same as the switch.

connUnitPortFCId

OID 1.3.6.1.3.94.1.10.1.11
connUnitPortTable.1.11

Description This is the assigned Fibre Channel ID of this port. This value is expected to be a Big Endian value of 24 bits.

- If this is loop, then it is the ALPA that is connected.
- If this is an E_Port, then it contains only the domain ID left justified, zero filled.
- If this port does not have a Fibre Channel address, return all bits set to 1.

For an F_Port, this is the Fibre Channel ID to which the connected N_Port is assigned.

For an FL_Port, this is the Fibre Channel ID of the FL_Port (ALPA = 0).

For a U_Port or E_Port, this is similar to F_Port.

connUnitPortSn

OID 1.3.6.1.3.94.1.10.1.12
connUnitPortTable.1.12

Description The serial number of the unit (for example, for a GBIC). If this is not applicable, return empty string.

If GBIC is the serial ID, this returns the GBIC part number. Otherwise, it returns a Null value.

connUnitPortRevision

OID 1.3.6.1.3.94.1.10.1.13
connUnitPortTable.1.13

Description The port revision (for example, GBIC).

If GBIC is the serial ID, this returns the GBIC revision number. Otherwise, it returns a Null value.

connUnitPortVendor

OID 1.3.6.1.3.94.1.10.1.14
connUnitPortTable.1.14

Description The port vendor (for example, for a GBIC).

If GBIC is the serial ID, this returns the GBIC vendor name. Otherwise, it returns a Null value.

connUnitPortSpeed

OID 1.3.6.1.3.94.1.10.1.15
connUnitPortTable.1.15

Description The speed of the port in kilobytes per second.

The valid values for the DS-32B2 and ED-12000B switches are 10^5 and 20^5.

connUnitPortControl

OID 1.3.6.1.3.94.1.10.1.16
connUnitPortTable.1.16

Description Controls the addressed connUnit's port. Valid commands are:

- resetConnUnitPort:

  If the addressed connUnit allows this operation to be performed to this port, the addressed port performs a vendor-specific reset operation. Examples of these operations are:

  - The Link Reset protocol
  - The Loop Initialization protocol
  - Resynchronization occurring between the transceiver in the addressed port to the transceiver to which the port is connected.

- bypassConnUnitPort:

  If the addressed connUnit allows this operation to be performed to this port, the addressed port performs a vendor-specific *bypass* operation. Examples of the bypass operations are:

  - Transitioning from online to offline
  - A request (NONPARTICIPATING) command to the Loop Port state machine
  - Removal of the port from an arbitrated loop by a hub

- unbypassConnUnitPort:

  If the addressed connUnit allows this operation to be performed to this port, the addressed port performs a vendor-specific *unbypass* operation. Examples of the unbypass operations are:

  - The Link Failure protocol
  - A request (PARTICIPATING) command to the Loop Port state machine
  - Addition of the port to an arbitrated loop by a hub

- offlineConnUnitPort:

  If the addressed connUnit allows this operation to be performed to this port, the addressed port performs a vendor-specific *offline* operation. Examples of the offline operations are:

  - Disabling a port's transceiver
  - The Link Failure protocol
  - Request (NONPARTICIPATING) command to the Loop Port state machine removal of the port from an arbitrated loop by a hub

- onlineConnUnitPort:

  If the addressed connUnit allows this operation to be performed to this port, the addressed port performs a vendor-specific *online* operation. Examples of the online operations are:

  - Enabling a port's transceiver
  - The Link Failure protocol, request(PARTICIPATING) command to the Loop Port state machine
  - Addition of the port from an arbitrated loop by a hub

  Each implementation may choose not to allow any or all of these values on a SET.

If the Management Station uses in-band communication (FC-IP) with the switch, either of the two following action may result in a loss of in-band communication with the switch:

- Disabling the FC port that is connected to the Management Station
- Disabling the embedded port

Return values are as follows:

- resetConnUnitPort - portDisable (F or E, noop for U)
- bypassConnUnitPort - portDisable (FL_Port)
- unbypassConnUnitPort - portEnable (FL_Port)
- offlineConnUnitPort - portDisable (E, F, FL)
- onlineConnUnitPort - portEnable (U)
- resetConnUnitPortCounters - clear the port stats counter. When rebooted, this defaults to 1 (unknown).

connUnitPortName

OID

1.3.6.1.3.94.1.10.1.17
connUnitPortTable.1.17

Description

A string describing the addressed port.

For an external FC port, this enables the port for the embedded port, thus enabling the switch.

Each Implementation may choose not to allow any or all of the following values on a SET. If the Management Station uses in-band communication (FC-IP) with the switch, either of the two following actions may not be possible in-band:

- Enabling the FC port that is connected to the Management Station
- Enabling the embedded port.

This returns Null and is read-only.

connUnitPortPhysicalNumber

OID 1.3.6.1.3.94.1.10.1.18
connUnitPortTable.1.18

Description The internal port number by which this port is known. In many implementations, this should be the same as connUnitPortIndex. Some implementations may have an internal port representation that is incompatible with the rules for table indices. In that case, provide the internal representation of this port in this object. This value may also be used in the connUnitLinkPortNumberX or connUnitLinkPortNumberY objects of the connUnitLinkTable.

The internal port numbers for the DS-32B2 and ED-12000B switches are 0 to the maximum number of supported ports.

connUnitPortStatObject

OID 1.3.6.1.3.94.1.10.1.19
connUnitPortTable.1.19

Description The OID of the first object of the table that contains the statistics for this particular port. If this has a value of zero, then there are no statistics available for this port. The port type information helps identify the statistics objects that are found in the table. From this point, one would do a `GetNext` to get the next statistics object. When the first part of the OID changes, the end of table is reached.

Mapped to connUnitPortStatFabricUnitId.

connUnitPortProtocolCap

OID 1.3.6.1.3.94.1.10.1.20
connUnitPortTable.1.20

Description The bit mask that specifies the driver-level protocol capability of this port.

If this is not applicable, return all bits set to zero.

The bits have the following definition:

0 = unknown
1 = Loop
2 = Fabric
4 = SCSI
8 = TCP/IP
16 = VI
32 = FICON

connUnitPortProtocolOp

OID 1.3.6.1.3.94.1.10.1.21
connUnitPortTable.1.21

Description The bit mask that specifies the driver-level protocol(s) that are currently operational.

If this is not applicable, return all bits set to zero.

The bits have the following definition:

0 = unknown
1 = Loop
2 = Fabric
4 = SCSI
8 = TCP/IP
16 = VI
32 = FICON

connUnitPortNodeWwn

OID 1.3.6.1.3.94.1.10.1.22
connUnitPortTable.1.22

Description The node World Wide Name of the port if applicable; otherwise, an empty string.

All related ports in within a group should have the same node WWN value. The container is defined as the largest physical entity. For example, all ports on HBAs on a host will have the same Node WWN. All ports on the same storage subsystem will have the same Node WWN.

This is in IEEE Extended format and the extension contains the internal port number of each port.

The internal port number is 1 less than the port index. For example, if the switch has WWN 10:00:00:60:69:10:02:18, then port numbers 0 and 6 have WWN 20:00:00:60:69:10:02:18 and 20:06:00:60:69:10:02:18, respectively. However, the embedded port has WWN 10:00:00:60:69:10:02:18, the same as the switch.

connUnitPortHWState

OID 1.3.6.1.3.94.1.10.1.23
connUnitPortTable.1.23

Description The state of the port as detected by the hardware.

Possible values are:

unknown (1)

failed (2):	Port failed diagnostics (port_flt_state).
bypassed (3):	FCAL bypass, loop only (not used).
active (4):	Connected to a device (light and sync are present).
loopback (5):	Port in ext loopback (loopback state).
txfault (6):	Transmitter fault (bad GBIC).
noMedia (7):	Media not installed (GBIC removed).
linkDown (8):	Waiting for activity—rx sync (light with no sync)

Connectivity Unit Event Table

connUnitEventTable

OID 1.3.6.1.3.94.1.11

Description The table of connectivity unit events. Errors, warnings, and information should be reported in this table.

(v4.xonly) This table contains the 255 most recent event log entries.

connUnitEventEntry

OID 1.3.6.1.3.94.1.11.1
connUnitEventTable.1

Description Each entry contains information on a specific event for the given connectivity unit.

Index connUnitEventUnitId, connUnitEventIndex

connUnitEventUnitId

OID 1.3.6.1.3.94.1.11.1.1
connUnitEventTable.1.1

Description The connUnitId of the connectivity unit that contains this event table.

Same as connUnitId.

connUnitEventIndex

OID 1.3.6.1.3.94.1.11.1.2
connUnitEventTable.1.2

Description Each connectivity unit has its own event buffer. As it wraps, it may write over previous events. This object is an index into the buffer.

EMC recommends that this table be read using `GetNext` to retrieve the initial table.

The management application should read the event table at periodic intervals and then determine if any new entries were added by comparing the last known index value with the current highest index value.

The management application should then update its copy of the event table. If the read interval is too long, it is possible that there may be events that may not be contained in the agent's internal event buffer.

Example An agent may read events 50 through 75.

At the next read interval, connUnitEventCurrID is 189. If the management application tries to read event index 76, and the agent's internal buffer is 100 entries maximum, event index 76 is no longer available.

The index value is an incrementing integer starting from one (1) every time there is a table reset. On table reset, all contents are emptied and all indices are set to zero (0). When an event is added to the table, the event is assigned the next higher integer value than the last item entered in the table. If the index value reaches its maximum value, the next item entered causes the index value to roll over and start at one (1) again.

Mapped to swEventIndex.

connUnitEventId

OID 1.3.6.1.3.94.1.11.1.3
connUnitEventTable.1.3

Description The internal event ID. Incremented for each event, ranging between 0 and connUnitMaxEvents. Not used as table index to simplify the agent implementation. When this reaches the end of the range specified by connUnitMaxEvents, the ID rolls over to start at zero. This value is set back to zero at reset. The relationship of this value to the index is that internal event ID may represent a smaller number than a 32-bit integer (for example, maximum 100 entries) and would only have a value range up to connUnitMaxEvents.

Same as connUnitEventIndex.

connUnitREventTime

OID 1.3.6.1.3.94.1.11.1.4
connUnitEventTable.1.4

Description This is the real time when the event occurred. It has the following format: *DDMMYYYY HHMMSS*

where:

DD=day number
MM=month number
YYYY=year number
HH=hour number
MM=minute number
SS=seconds number

If not applicable, return a Null string.

connUnitSEventTime

OID 1.3.6.1.3.94.1.11.1.5
connUnitEventTable.1.5

Description This is the sysuptime time stamp when the event occurred.

connUnitEventSeverity

OID 1.3.6.1.3.94.1.11.1.6
connUnitEventTable.1.6

Description The event severity level. The mapping between errlog severity level and this variable is:

Error log	FA-MIB
none (0)	unknown (1)
Critical (1)	critical (4)
Error (2)	error (5)

Warning (3)	warning (6)
Informational (4)	info (8)
Debug (5)	debug (9)

Refer to FcEventSeverity in Table 3-1 on page 3-7.

connUnitEventType

OID 1.3.6.1.3.94.1.11.1.7
connUnitEventTable.1.7

Description The type of this event.

Always set to 2 (other).

connUnitEventObject

OID 1.3.6.1.3.94.1.11.1.8
connUnitEventTable.1.8

Description This is used with the connUnitEventType to identify the object to which the event refers. It can be the OID of a connectivity unit or of another object, like connUnitPortStatus[...].

Always set to Null.

connUnitEventDescr

OID 1.3.6.1.3.94.1.11.1.9
connUnitEventTable.1.9

Description The description of the event.

Same as the string shown in the Telnet command `errShow`.

Connectivity Unit Link Table

connUnitLinkTable

OID 1.3.6.1.3.94.1.12

Description A list of links know to this agent from this connectivity unit to other connectivity units.

X = switch data. Y = other end.

Important The link table is intended to organize and communicate any information the agent has, which might assist a management application to discover the connectivity units in the framework and the topology of their interconnect.

The goal is to assist the management application by mapping the elements of the framework in addition to listing them.

With this goal, the agent *should* include as much as it possesses about any links from its own connectivity units to others, including links among its own units.

An agent *should* include partial information about links if it is not able to fully define them in accord with the following structure; however, the information *must* include either a nonzero connUnitNodeId, or a nonzero connUnitPortWwn, for each end of the link. If the agent is able to discover links that do not directly attach to members of its agency, and its discovery algorithm gives some assurance that the links are recently valid, it *may* include these links.

Link information entered by administrative action *may* be included even if not validated directly if the link has at least one endpoint in this agency, but *should not* be included otherwise.

A connectivity unit should fill the table in as best it can. One method is to use the RNID ELS (ANSI document 99-422v0). This allows one to query a port for the information needed for the link table.

This table is accessed either directly, if the management software has an index value, or using `GetNext`. The value of the indexes are not required to be contiguous. Each entry created in this table is assigned an index. This relationship is kept persistent until the entry is

removed from the table or the system is reset. The total number of entries are defined by the size of the table.

For an entry to be considered to be valid, both the X (local) and the Y (remote) need to have one valid value.

connUnitLinkEntry

OID 1.3.6.1.3.94.1.12.1
connUnitLinkTable.1

Description An entry describing a particular link to another.

Index connUnitLinkUnitId, connUnitLinkIndex

connUnitLinkUnitId

OID 1.3.6.1.3.94.1.12.1.1
connUnitLinkTable.1.1

Description The connUnitId of the connectivity unit that contains this link table.

Set to WWN of the local switch.

connUnitLinkIndex

OID 1.3.6.1.3.94.1.12.1.2
connUnitLinkTable.1.2

Description This value is used to create a unique value for each entry in the link table with the same connUnitLinkUnitId. The value can only be reused if it is not currently in use and the value is the next candidate to be used. This value is allowed to wrap at the highest value represented by the number of bits. This value is reset to zero when the system is reset, and the first value to be used is one.

Indexes 1 through *maximum number of ports* are reserved for ISL.

Indexes *maximum number of ports* +1 and above are reserved for end devices and are calculated based on port ID of the end device(s).

connUnitLinkNodeIdX

OID 1.3.6.1.3.94.1.12.1.3
connUnitLinkTable.1.3

Description The node WWN of the unit at one end of the link. If the node WWN is unknown and the node is a connUnit in the responding agent, then the value of this object *must be* equal to its connUnitID.

WWN of the local switch.

connUnitLinkPortNumberX

OID 1.3.6.1.3.94.1.12.1.4
connUnitLinkTable.1.4

Description The port number on the unit specified by connUnitLinkNodeIdX if known, otherwise -1. If the value is nonnegative, then it is equal to connUnitPortPhysicalNumber.

ISL: Physical port # of the E_Port.
Device: Physical port number to which the device is connected.

connUnitLinkPortWwnX

OID 1.3.6.1.3.94.1.12.1.5
connUnitLinkTable.1.5

Description The port WWN of the unit specified by connUnitLinkNodeIdX if known; otherwise 16 octets of binary 0.

WWN of the port to which the device is connected.

connUnitLinkNodeIdY

OID 1.3.6.1.3.94.1.12.1.6
connUnitLinkTable.1.6

Description The node WWN of the unit at the other end of the link. If the node WWN is unknown and the node is a connUnit in the responding SNMP agency, then the value of this object *must be* equal to its connUnitID.

ISL: WWN of the remote switch.
Device: Node name of the device.

connUnitLinkPortNumberY

OID 1.3.6.1.3.94.1.12.1.7
connUnitLinkTable.1.7

Description The port number on the unit specified by connUnitLinkNodeIdY, if known; otherwise `-1`. If the value is nonnegative, then it is equal to connUnitPortPhysicalNumber.

ISL: Physical port number of the remote port.
Device: `-1`.

connUnitLinkPortWwnY

OID 1.3.6.1.3.94.1.12.1.8
connUnitLinkTable.1.8

Description The port WWN on the unit specified by connUnitLinkNodeIdY, if known; otherwise, 16 octets of binary 0.

ISL: WWN of the remote port.
Device: `Port name`.

connUnitLinkAgentAddressY

OID 1.3.6.1.3.94.1.12.1.9
connUnitLinkTable.1.9

Description The address of an FCMGMT MIB agent for the node identified by connUnitLinkNodeIdY, if known; otherwise, 16 octets of binary 0.

ISL: IP address (IPv4).
Device: 0 (Null).

connUnitLinkAgentAddressTypeY

OID 1.3.6.1.3.94.1.12.1.10
connUnitLinkTable.1.10

Description If connUnitLinkAgentAddressY is nonzero, it is a protocol address. ConnUnitLinkAgentAddressTypeY is the address family number assigned by IANA to identify the address format, such as 1 is Ipv4 and 2 is Ipv6.

ISL: Type 2.
Device: 0 (Null).

connUnitLinkAgentPortY

OID 1.3.6.1.3.94.1.12.1.11
connUnitLinkTable.1.11

Description The IP port number for the agent, in case the agent is at a nonstandard SNMP port.

ISL: IP port.
Device: 0 (Null)

connUnitLinkUnitTypeY

OID 1.3.6.1.3.94.1.12.1.12
connUnitLinkTable.1.12

Description Type of the FC connectivity unit as defined in connUnitType.

ISL: Switch device.

End devices (End device types based on an FCP Inquiry):

Storage System	Storage Sub-system	Unknown	Other
Direct Access Sequential Access Write-Once CD-ROM Optical	Medium Changer Array SES	Unknown	Anything else (printer device, processor device, scanner, and so on)

The current implementation of the DS-32B2 and ED-12000B switches does not support hubs.

connUnitLinkConnIdY

OID 1.3.6.1.3.94.1.12.1.13
connUnitLinkTable.1.13

Description This is the Fibre Channel ID of this port. If the connectivity unit is a switch, this is expected to be a Big Endian value of 24 bits. If this is loop, then it is the ALPA that is connected. If this is an E_Port, then it contains only the domain ID. If not any of those, unknown or cascaded loop, return all bits set to 1.

ISL: Port ID of the remote port.
Device: Port ID of the remote port.

connUnitLinkCurrIndex

OID 1.3.6.1.3.94.1.12.1.14
connUnitLinkTable.1.14

Description The last used link index.

Connectivity Unit Port Stat Table

There is one, and only one, statistics table for each individual port. For all objects in statistics table, if the object is not supported by the conn unit, then the high order bit is set to 1 with all other bits set to zero. (For example, the last eight bytes of the returned value might be ...:80 00 00 00 00 00 00 00.)

The high-order bit is reserved to indicate whether the object is supported. All objects start at a value of zero at hardware initialization and continue incrementing until end of 63 bits, and then wrap to zero.

This is the case for all Class 1 frames, and EMC does not support them.

connUnitPortStatTable

OID 1.3.6.1.3.94.4.5

Description A list of statistics for the fabric port types.

connUnitPortStatEntry

OID 1.3.6.1.3.94.4.5.1
connUnitPortStatTable.1

Description An entry describing port statistics.

Index connUnitPortStatUnitId, connUnitPortStatIndex

connUnitPortStatUnitId

OID 1.3.6.1.3.94.4.5.1.1
connUnitPortStatTable.1.1

Description The connUnitId of the connectivity unit that contains this port stat table.

connUnitPortStatIndex

OID 1.3.6.1.3.94.4.5.1.2
connUnitPortStatTable.1.2

Description A unique value among all entries in this table, between 0 and connUnitNumPort[connUnitPortUnitId].

connUnitPortStatCountError

OID 1.3.6.1.3.94.4.5.1.3
connUnitPortStatTable.1.3

Description A count of the errors that have occurred on this port.

connUnitPortStatCountTxObjects

OID 1.3.6.1.3.94.4.5.1.4
connUnitPortStatTable.1.4

Description The number of frames, packets, IOs, etc., that have been transmitted by this port.

A Fibre Channel frame starts with SOF and ends with EOF. FC loop devices should not count frames passed through. This value represents the sum total for all other Tx objects.

connUnitPortStatCountRxObjects

OID 1.3.6.1.3.94.4.5.1.5
connUnitPortStatTable.1.5

Description The number of frames, packets, IOs, etc., that have been received by this port.

A Fibre Channel frame starts with SOF and ends with EOF. FC loop devices should not count frames passed through. This value represents the sum total for all other Rx objects.

connUnitPortStatCountTxElements

OID 1.3.6.1.3.94.4.5.1.6
connUnitPortStatTable.1.6

Description The number of octets or bytes that have been transmitted by this port. One-second periodic polling of the port. This value is saved and compared with the next polled value to compute net throughput.

For Fibre Channel, ordered sets are not included in the count.

connUnitPortStatCountRxElements

OID 1.3.6.1.3.94.4.5.1.7
connUnitPortStatTable.1.7

Description The number of octets or bytes that have been received by this port. One second periodic polling of the port. This value is saved and compared with the next polled value to compute net throughput.

For Fibre Channel, ordered sets are not included in the count.

connUnitPortStatCountBBCreditZero

OID 1.3.6.1.3.94.4.5.1.8
connUnitPortStatTable.1.8

Description The number of transitions in/out of BB_credit zero state. The other side is not providing any credit.

This is a Fibre Channel stat only.

connUnitPortStatCountInputBuffersFull

Not supported

OID 1.3.6.1.3.94.4.5.1.9
connUnitPortStatTable.1.9

Description The number of occurrences when all input buffers of a port were full and outbound buffer-to-buffer credit transitioned to zero. There is no credit to provide to other side.

Return Value: 80 0 0 0 0 0 0 0 (Not supported)

This is a Fibre Channel stat only.

connUnitPortStatCountFBSYFrames

Not supported

OID 1.3.6.1.3.94.4.5.1.10
connUnitPortStatTable.1.10

Description The number of times that FBSY was returned to this port as a result of a frame that could not be delivered to the other end of the link. This occurs if either the Fabric or the destination port is temporarily busy. Port can only occur on SOFc1 frames (the frames that establish a connection).

Return Value: 80 0 0 0 0 0 0 0 (Not supported)

This is a Fibre Channel stat only. This is the sum of all classes. If you cannot keep the by class counters, then keep the sum counters.

connUnitPortStatCountPBSYFrames

OID 1.3.6.1.3.94.4.5.1.11
connUnitPortStatTable.1.11

Description The number of times that PBSY was returned to this port as a result of a frame that could not be delivered to the other end of the link. This occurs if the destination port is temporarily busy. PBSY can only occur on SOFc1 frames (the frames that establish a connection).

This is a Fibre Channel stat only.This is the sum of all classes. If you cannot keep the by class counters, then keep the sum counters.

connUnitPortStatCountFRJTFrames

Not supported.

OID 1.3.6.1.3.94.4.5.1.12
connUnitPortStatTable.1.12

Description The number of times that FRJT was returned to this port as a result of a Frame that was rejected by the fabric.

Return Value: 80 0 0 0 0 0 0 0

This is the total for all classes and is a Fibre Channel stat only.

connUnitPortStatCountPRJTFrames

OID 1.3.6.1.3.94.4.5.1.13
connUnitPortStatTable.1.13

Description The number of times that FRJT was returned to this port as a result of a frame that was rejected at the destination N_port.

This is the total for all classes and is a Fibre Channel stat only.

connUnitPortStatCountClass1RxFrames

OID 1.3.6.1.3.94.4.5.1.14
connUnitPortStatTable.1.14

Description The number of Class 1 frames received at this port.

This is a Fibre Channel stat only.
EMC does not support Class 1 frames.

connUnitPortStatCountClass1TxFrames

OID 1.3.6.1.3.94.4.5.1.15
connUnitPortStatTable.1.15

Description The number of Class 1 frames transmitted out this port.

This is a Fibre Channel stat only.
EMC does not support Class 1 frames.

connUnitPortStatCountClass1FBSYFrames

OID 1.3.6.1.3.94.4.5.1.16
connUnitPortStatTable.1.16

Description The number of times that FBSY was returned to this port as a result of a Class 1 frame that could not be delivered to the other end of the link. This occurs if either the Fabric or the destination port is temporarily busy. FBSY can only occur on SOFc1 frames (the frames that establish a connection).

This is a Fibre Channel stat only.
EMC does not support Class 1 frames.

connUnitPortStatCountClass1PBSYFrames

OID 1.3.6.1.3.94.4.5.1.17
connUnitPortStatTable.1.17

Description The number of times that PBSY was returned to this port as a result of a Class 1 frame that could not be delivered to the other end of the link. This occurs if the destination N_Port is temporarily busy. PBSY can only occur on SOFc1 frames (the frames that establish a connection).

This is a Fibre Channel stat only.
EMC does not support Class 1 frames.

connUnitPortStatCountClass1FRJTFrames

OID 1.3.6.1.3.94.4.5.1.18
connUnitPortStatTable.1.18

Description The number of times that FRJT was returned to this port as a result of a Class 1 frame that was rejected by the fabric.

This is a Fibre Channel stat only.
EMC does not support Class 1 frames.

connUnitPortStatCountClass1PRJTFrames

OID 1.3.6.1.3.94.4.5.1.19
connUnitPortStatTable.1.19

Description The number of times that FRJT was returned to this port as a result of a Class 1 frame that was rejected at the destination N_Port.

This is a Fibre Channel stat only.
EMC does not support Class 1 frames.

connUnitPortStatCountClass2RxFrames

OID 1.3.6.1.3.94.4.5.1.20
connUnitPortStatTable.1.20

Description The number of Class 2 frames received at this port.

This is a Fibre Channel stat only.

connUnitPortStatCountClass2TxFrames (connUnitPortStatTable)

Not supported.

OID 1.3.6.1.3.94.4.5.1.21
connUnitPortStatTable.1.21

Description The number of Class 2 frames transmitted out this port.

Return Value: 80 0 0 0 0 0 0 0

This is a Fibre Channel stat only.

connUnitPortStatCountClass2FBSYFrames (connUnitPortStatTable)

Not supported.

OID 1.3.6.1.3.94.4.5.1.22
connUnitPortStatTable.1.22

Description The number of times that FBSY was returned to this port as a result of a Class 2 frame that could not be delivered to the other end of the link. This occurs if either the Fabric or the destination port is temporarily busy. FBSY can only occur on SOFc1 frames (the frames that establish a connection).

Return Value: 80 0 0 0 0 0 0 0

This is a Fibre Channel stat only.

connUnitPortStatCountClass2PBSYFrames (connUnitPortStatTable)

Not supported.

OID 1.3.6.1.3.94.4.5.1.23
connUnitPortStatTable.1.23

Description The number of times that PBSY was returned to this port as a result of a Class 2 frame that could not be delivered to the other end of the link. This occurs if the destination N_Port is temporarily busy. PBSY can only occur on SOFc1 frames (the frames that establish a connection).

Return Value: 80 0 0 0 0 0 0 0

This is a Fibre Channel stat only.

connUnitPortStatCountClass2FRJTFrames (connUnitPortStatTable)

Not supported.

OID 1.3.6.1.3.94.4.5.1.24
connUnitPortStatTable.1.24

Description The number of times that FRJT was returned to this port as a result of a Class 2 frame that was rejected by the fabric.

Return Value: 80 0 0 0 0 0 0 0

This is a Fibre Channel stat only.

connUnitPortStatCountClass2PRJTFrames

OID 1.3.6.1.3.94.4.5.1.25
connUnitPortStatTable.1.25

Description The number of times that FRJT was returned to this port as a result of a Class 2 frame that was rejected at the destination N_Port.

This is a Fibre Channel stat only.

connUnitPortStatCountClass3RxFrames

OID 1.3.6.1.3.94.4.5.1.26
connUnitPortStatTable.1.26

Description The number of Class 3 frames received at this port.

This is a Fibre Channel stat only.

connUnitPortStatCountClass3TxFrames

OID 1.3.6.1.3.94.4.5.1.27
connUnitPortStatTable.1.27

Description The number of Class 3 frames transmitted out this port.

This is a Fibre Channel stat only.

connUnitPortStatCountClass3Discards

OID 1.3.6.1.3.94.4.5.1.28
connUnitPortStatTable.1.28

Description The number of Class 3 frames that were discarded upon reception at this port. There is no FBSY or FRJT generated for Class 3 frames. They are simply discarded if they cannot be delivered.

This is a Fibre Channel stat only.

connUnitPortStatCountRxMulticastObjects

OID 1.3.6.1.3.94.4.5.1.29
connUnitPortStatTable.1.29

Description The number of multicast frames or packet received at this port.

connUnitPortStatCountTxMulticastObjects

OID 1.3.6.1.3.94.4.5.1.30
connUnitPortStatTable.1.30

Description The number of multicast frames or packet transmitted out this port.

connUnitPortStatCountRxBroadcastObjects

OID 1.3.6.1.3.94.4.5.1.31
connUnitPortStatTable.1.31

Description The number of broadcast frames or packet received at this port.

Return Value: 80 0 0 0 0 0 0 0

connUnitPortStatCountTxBroadcastObjects

OID 1.3.6.1.3.94.4.5.1.32
connUnitPortStatTable.1.32

Description The number of broadcast frames or packet transmitted out this port. On a Fibre Channel loop, count only OPN frames generated.

Return Value: 80 0 0 0 0 0 0 0

connUnitPortStatCountRxLinkResets

OID 1.3.6.1.3.94.4.5.1.33
connUnitPortStatTable.1.33

Description The number of link resets. This is the number of LRs received.

This is a Fibre Channel stat only.

connUnitPortStatCountTxLinkResets

OID 1.3.6.1.3.94.4.5.1.34
connUnitPortStatTable.1.34

Description The number of link resets. This is the number of LRs transmitted.

This is a Fibre Channel stat only.

connUnitPortStatCountNumberLinkResets

OID 1.3.6.1.3.94.4.5.1.35
connUnitPortStatTable.1.35

Description The number of link resets and LIPs detected at this port. The number of times the reset link protocol is initiated. This is the count of the logical resets, a count of the number of primitives.

This is a Fibre Channel stat only.

connUnitPortStatCountRxOfflineSequences

OID 1.3.6.1.3.94.4.5.1.36
connUnitPortStatTable.1.36

Description The number of Offline Primitive OLS received at this port.

This is a Fibre Channel stat only.

connUnitPortStatCountTxOfflineSequences

OID 1.3.6.1.3.94.4.5.1.37
connUnitPortStatTable.1.37

Description The number of Offline Primitive OLS transmitted by this port.

This is a Fibre Channel stat only.

connUnitPortStatCountNumberOfflineSequences

OID 1.3.6.1.3.94.4.5.1.38
connUnitPortStatTable.1.38

Description The number of Offline Primitive sequence received at this port.

Return Value: 80 0 0 0 0 0 0 0

This is a Fibre Channel stat only.

connUnitPortStatCountLinkFailures

OID 1.3.6.1.3.94.4.5.1.39
connUnitPortStatTable.1.39

Description The number of link failures. This count is part of the Link Error Status Block (LESB). (FC-PH 29.8)

This is a Fibre Channel stat only.

connUnitPortStatCountInvalidCRC

OID 1.3.6.1.3.94.4.5.1.40
connUnitPortStatTable.1.40

Description The number of frames received with invalid CRC. This count is part of the Link Error Status Block (LESB). (FC-PH 29.8) Loop ports should not count CRC errors passing through when monitoring.

This is a Fibre Channel stat only.

connUnitPortStatCountInvalidTxWords

OID 1.3.6.1.3.94.4.5.1.41
connUnitPortStatTable.1.41

Description The number of invalid transmission words received at this port. This count is part of the Link Error Status Block (LESB). (FC-PH 29.8)

This is a Fibre Channel stat only.

connUnitPortStatCountPrimitiveSequenceProtocolErrors

OID 1.3.6.1.3.94.4.5.1.42
connUnitPortStatTable.1.42

Description The number of primitive sequence protocol errors detected at this port. This count is part of the Link Error Status Block (LESB). (FC-PH 29.8)

This is a Fibre Channel stat only.

connUnitPortStatCountLossofSignal

OID 1.3.6.1.3.94.4.5.1.43
connUnitPortStatTable.1.43

Description The number of instances of signal loss detected at port. This count is part of the Link Error Status Block (LESB). (FC-PH 29.8)

This is a Fibre Channel stat only.

connUnitPortStatCountLossofSynchronization

OID 1.3.6.1.3.94.4.5.1.44
connUnitPortStatTable.1.44

Description The number of instances of synchronization loss detected at port. This count is part of the Link Error Status Block (LESB). (FC-PH 29.8)

This is a Fibre Channel stat only.

connUnitPortStatCountInvalidOrderedSets

OID 1.3.6.1.3.94.4.5.1.45
connUnitPortStatTable.1.45

Description The number of invalid ordered sets received at port. This count is part of the Link Error Status Block (LESB). (FC-PH 29.8).

This is a Fibre Channel stat only.

connUnitPortStatCountFramesTooLong

OID 1.3.6.1.3.94.4.5.1.46
connUnitPortStatTable.1.46

Description The number of frames received at this port where the frame length was greater than what was agreed to in FLOGI/PLOGI. This could be caused by losing the end-of-frame delimiter.

This is a Fibre Channel stat only.

connUnitPortStatCountFramesTruncated

OID 1.3.6.1.3.94.4.5.1.47
connUnitPortStatTable.1.47

Description The number of frames received at this port where the frame length was less than the minimum indicated by the frame header, normally

24 bytes, but it could be more if the DFCTL field indicates an optional header should have been present.

This is a Fibre Channel stat only.

connUnitPortStatCountAddressErrors

OID 1.3.6.1.3.94.4.5.1.48
connUnitPortStatTable.1.48

Description The number of frames received with unknown addressing. For example, unknown SID or DID. The SID or DID is not known to the routing algorithm.

This is a Fibre Channel stat only.

connUnitPortStatCountDelimiterErrors

OID 1.3.6.1.3.94.4.5.1.49
connUnitPortStatTable.1.49

Description The number of invalid frame delimiters received at this port. An example is a frame with a Class 2 start and a Class 3 at the end.

This is a Fibre Channel stat only.

connUnitPortStatCountEncodingDisparityErrors

OID 1.3.6.1.3.94.4.5.1.50
connUnitPortStatTable.1.50

Description The number of disparity errors received at this port.

This is a Fibre Channel stat only.

The Service Group

Implementation of the Service group is mandatory for all systems.

The Service group contains two subgroups:

- The Connectivity Unit Service Scalers Group
- The Connectivity Unit Service Tables Group

The Connectivity Unit Service Scalers Group

Implementation of the Connectivity Unit Service Scalers group is mandatory for all systems.

connUnitSnsMaxEntry

OID 1.3.6.1.3.94.4.5.1.1

Description The maximum number of entries in the table.

The Connectivity Unit Service Tables Group

Implementation of the Connectivity Unit Service Tables group is mandatory for all systems.

connUnitSnsTable

OID 1.3.6.1.3.94.4.5.2.1

Description This table contains an entry for each object registered with this port in the switch.

connUnitSnsEntry

OID 1.3.6.1.3.94.4.5.2.1.1
connUnitSnsTable.1

Description The Simple Name Server table for the port represented by connUnitSnsPortIndex.

Index connUnitSnsId, connUnitSnsPortIndex, connUnitSnsPortIdentifier

connUnitSnsId

OID 1.3.6.1.3.94.4.5.2.1.1.1
connUnitSnsTable.1.1

Description The connUnitId of the connectivity unit that contains this Name Server table.

connUnitSnsPortIndex

OID 1.3.6.1.3.94.4.5.2.1.1.2
connUnitSnsTable.1.2

Description The physical port number of this SNS table entry. Each physical port has an SNS table with n-1 entries indexed by connUnitSnsPortIdentifier (port address).

connUnitSnsPortIdentifier

OID 1.3.6.1.3.94.4.5.2.1.1.3
connUnitSnsTable.1.3

Description The port identifier for this entry in the SNS table.

connUnitSnsPortName

OID 1.3.6.1.3.94.4.5.2.1.1.4
connUnitSnsTable.1.4

Description The port name for this entry in the SNS table.

connUnitSnsNodeName

OID 1.3.6.1.3.94.4.5.2.1.1.5
connUnitSnsTable.1.5

Description The Node Name for this entry in the SNS table.

connUnitSnsClassOfSvc

OID 1.3.6.1.3.94.4.5.2.1.1.6
connUnitSnsTable.1.6

Description The Classes of Service offered by this entry in the SNS table.

connUnitSnsNodeIPAddress

OID 1.3.6.1.3.94.4.5.2.1.1.7
connUnitSnsTable.1.7

Description The IPv6 formatted address of the node for this entry in the SNS table.

connUnitSnsProcAssoc

OID 1.3.6.1.3.94.4.5.2.1.1.8
connUnitSnsTable.1.8

Description The process associator for this entry in the SNS table.

connUnitSnsFC4Type

OID 1.3.6.1.3.94.4.5.2.1.1.9
connUnitSnsTable.1.9

Description The FC-4 types supported by this entry in the SNS table.

connUnitSnsPortType

OID 1.3.6.1.3.94.4.5.2.1.1.10
connUnitSnsTable.1.10

Description The port type of this entry in the SNS table.

connUnitSnsPortIPAddress

OID 1.3.6.1.3.94.4.5.2.1.1.11
connUnitSnsTable.1.11

Description The IPv6 formatted address of this entry in the SNS table.

connUnitSnsFabricPortName

OID 1.3.6.1.3.94.4.5.2.1.1.12
connUnitSnsTable.1.12

Description The fabric port name of this entry in the SNS table.

connUnitSnsHardAddress

OID 1.3.6.1.3.94.4.5.2.1.1.13
connUnitSnsTable.1.13

Description The hard address of this entry in the SNS table.

connUnitSnsSymbolicPortName

OID 1.3.6.1.3.94.4.5.2.1.1.14
connUnitSnsTable.1.14

Description The symbolic port name of this entry in the SNS table.

connUnitSnsSymbolicNodeName

OID 1.3.6.1.3.94.4.5.2.1.1.15
connUnitSnsTable.1.15

Description The symbolic node name of this entry in the SNS table.

SNMP Trap Registration Group

trapMaxClients

OID 1.3.6.1.3.94.2.1

Description The maximum number of SNMP trap recipients supported by the connectivity unit.

Set to 6.

trapClientCount

OID 1.3.6.1.3.94.2.2

Description The current number of rows in the trap table.

SNMP Trap Registration Table

trapRegTable

OID 1.3.6.1.3.94.2.3

Description A table containing a row for each IP address/port number to which traps are sent.

trapRegEntry

OID 1.3.6.1.3.94.2.3.1
trapRegTable.1

Description Ip/Port pair for a specific client.

Index trapRegIpAddress, trapRegPort

trapRegIpAddress

OID 1.3.6.1.3.94.2.3.1.1
trapRegTable.1.1

Description The IP address of a client registered for traps.

trapRegPort

OID 1.3.6.1.3.94.2.3.1.2
trapRegTable.1.2

Description The UDP port to send traps to for this host. Normally, this would be the standard trap port (162). This object is an index and must be specified to create a row in this table.

Set to 162.

trapRegFilter

OID 1.3.6.1.3.94.2.3.1.3
trapRegTable.1.3

Description This value defines the trap severity filter for this trap host. The connUnit sends to this host traps that have a severity level less than or equal to this value. The default value of this object is Warning.

The mapping between errlog severity level and this variable is:

Error log	FA-MIB
none (0)	unknown (1)
Critical (1)	critical (4)
Error (2)	error (5)
Warning (3)	warning (6)
Informational (4)	info (8)
Debug (5)	debug (9)

This severity applies to all entries. See FcEventSeverity in Table 3-1 on page 3-7.

trapRegRowState

OID 1.3.6.1.3.94.2.3.1.4
trapRegTable.1.4

Description Specifies the state of the row.

Table 3-3 TrapRegRowState for Read/Write

rowDestroy	**READ**: Can never happen.	**WRITE**: Remove this row from the table.
rowInactive	**READ**: Indicates that this row does exist, but that traps are not enabled to be sent to the target.	**WRITE**: If the row does not exist, and the agent allows writes to the trap table, then a new row is created. The values of the optional columns are set to default values. Traps are not enabled to be sent to the target. If the row already exists, then traps are disabled from being sent to the target.
rowActive	**READ**: Indicates that this row exists, and that traps are enabled to be sent to the target.	**WRITE**: If the row does not exist, and the agent allows writes to the trap table, then a new row is created. The values of the optional columns are set to default values. Traps are enabled to be sent to the target. If the row already exists, then traps are enabled to be sent to the target.

This entry always returns rowActive and allows for read-only.

Revision Number Scalar

revisionNumber

OID 1.3.6.1.3.94.3

Description The revision number for this MIB. The format of the revision value is as follows:

0 = High-order major revision number

1 = Low-order major revision number

2 = High-order minor revision number

3 = Low-order minor revision number

The value is stored as an ASCII value. The following is the current value of this object:

0 = 0

1 = 4

2 = 1

3 = 0

This defines a revision of 04.1.0.

Set to 0410.

Unsupported Tables

These tables are not supported:

- Connectivity Unit Port Statistics Hub Table
- Connectivity Unit Port Statistics Fabric Table
- Connectivity Unit Port Statistics SCSI Table
- Connectivity Unit Port Statistics LAN/WAN Table

Related Traps

connUnitStatusChange

Enterprise fcmgmt

Variables connUnitStatus, connUnitState

Description The overall status of the connectivity unit has changed.

Recommended severity level (for filtering): alert.

Generated when connUnitStatus changes. Refer to *connUnitStatus* on page 3-12 for a description of how the value is calculated.

connUnitDeletedTrap

Enterprise fcmgmt

Variables connUnitId

Description A connUnit has been deleted from this agent.

Recommended severity level (for filtering): warning.

Not implemented.

connUnitEventTrap

Enterprise fcmgmt

Variables connUnitEventId, connUnitEventType, connUnitEventObject, connUnitEventDescr

Description An event has been generated by the connectivity unit.

Recommended severity level (for filtering): info.

connUnitSensorStatusChange

Enterprise fcmgmt

Variables connUnitSensorStatus

Description Overall status of the connectivity unit has changed.

connUnitPortStatusChange

Enterprise fcmgmt

Variables connUnitPortStatus, connUnitPortState

Description Overall status of the connectivity unit changed. Recommended severity level (for filtering): alert.

4 FCFabric Element MIB Object Types

This chapter contains descriptions and other information that is specific to Fibre Channel FE MIB (MIB-II branch) object types.

Overview

Fabric OS v4.1 supports only Fibre Channel FE MIB (RFC2837). The object types in FCELEMENT-MIB are organized in the following groupings:

- *Configuration Group* on page 4-10
- *Status Group* on page 4-20
- *Error Group* on page 4-28
- *Accounting Group* on page 4-32
- *Capability Group* on page 4-41

The FE-MIB does not provide E_Port information.

Refer to Appendix D for the entire FE-MIB.

FCFABRIC ELEMENT - MIB System Organization of MIB Objects (FE-MIB)

The following graphics depict the organization and structure of FE-MIB.

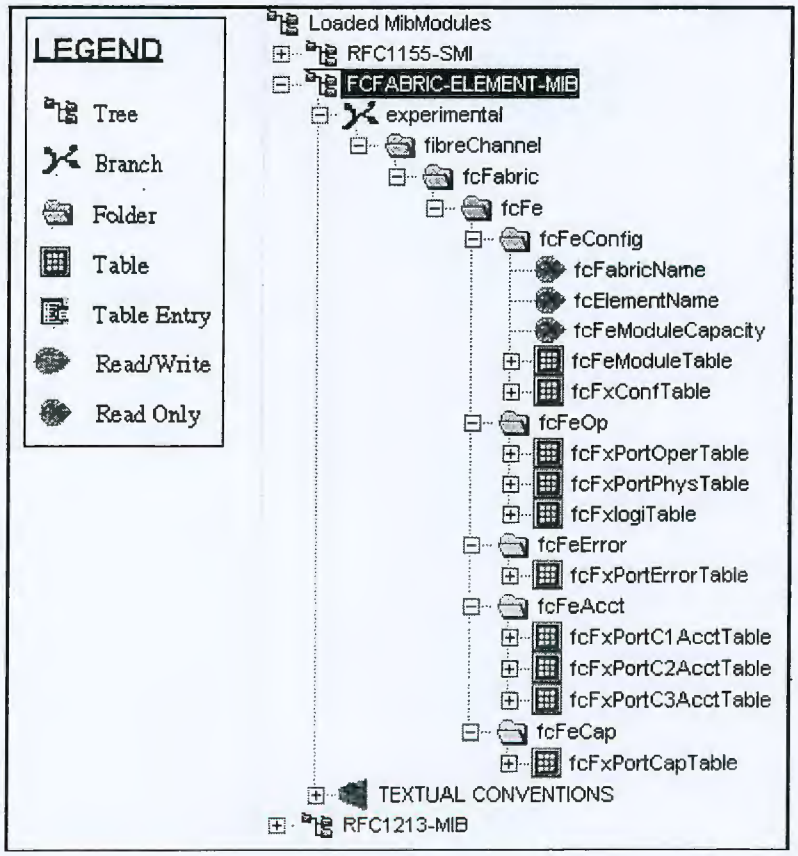

Figure 4-1 FE-MIB Overall Tree Structure

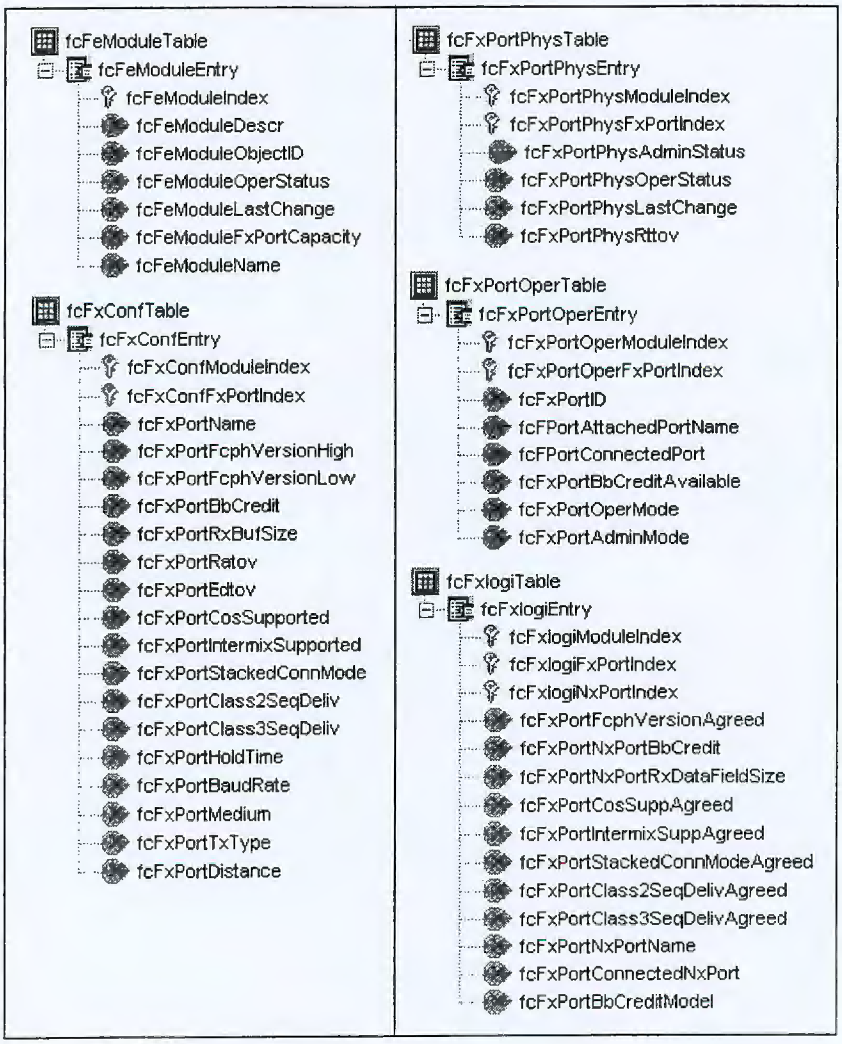

Figure 4-2 Tree Structure for fcFeConfig and fcFeOp Tables

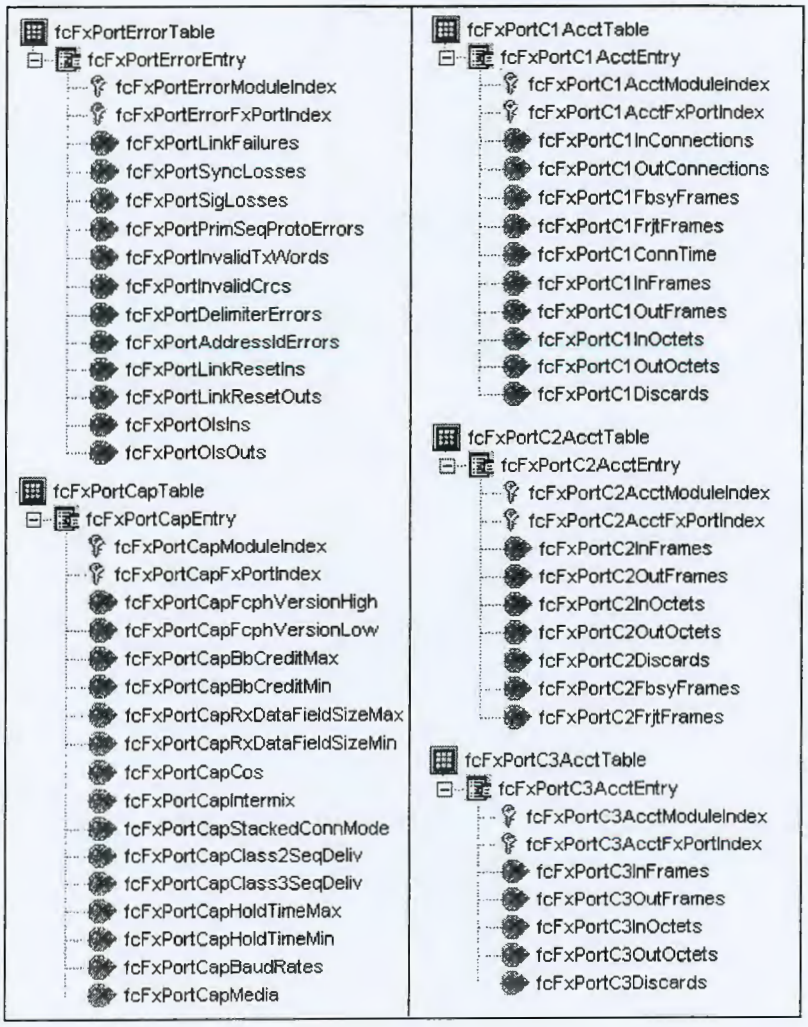

Figure 4-3 Tree Structure for fcFeError, fcFeAcct, and fcFeCap Tables

Definitions for FCFABRIC-ELEMENT MIB (FE-MIB)

The following definitions are used for FE-MIB.

Table 4-1 MIB-II Conventions

Type Definition	Value	Declaration	OID Description
Display String	Octet String of size 0 through 255		
MilliSeconds	Integer from 0 through 2147383647		
MicroSeconds	Integer from 0 through 2147383647		
FcNameId World Wide Name or Fibre Channel Name associated with an FC entity. It is a Network_Destination_ID or Network_Source_ID composed of a value up to 60 bits wide, occupying the remaining 8 bytes while the first nibble identifies the format of the Name_Identifier.	Octet String of size 8	Name_Identifier hex values: 0 (Ignored) 1 (IEEE 48-bit address) 2 (IEEE extended) 3 (Locally assigned) 4 (32-bit IP address)	
FcNameId	Octet String of size 8		
FabricName FcNameId - The Name Identifier of a fabric. Each fabric provides a unique Fabric Name.	Octet String of size 8	IEEE48 Local	
FabricName FcNameId - The Name Identifier associated with a port.	Octet String of size 8	IEEE48 IEEE extended Local	
FcAddressId A 24-bit value unique within the address space of a fabric.	Octet String of size 8	IEEE48 IEEE extended Local	
FcRxDataFieldSize	Integer from 128 through 2112		
FcBbCredit	Integer from 0 through 32767		

Table 4-1 MIB-II Conventions (continued)

Type Definition	Value	Declaration	OID Description
FcphVersion	Integer from 0 through 255		
FcStackedConnMode	Integer from 1 through 3	1 (none) 2 (transparent) 3 (lockedDown)	
FcCosCap	Integer from 1 through 127	bit 0 (Class F) bit 1 (Class 1) bit 2 (Class 2) bit 3 (Class 3) bit 4 (Class 4) bit 5 (Class 5) bit 6 (Class 6) bit 7 (Reserved for future)	
Fc0BaudRate	Integer according through FC-0 Baud Rates	1 (other) 2 (oneEighth) 4 (quarter) 8 (half) 16 (full) 32 (double) 64 (quadruple)	None of the following: 155 Mbaud (12.5 MB/s) 266 Mbaud (25.0 MB/s) 532 Mbaud (50.0 MB/s) 1 Gbaud (100 MB/s) 2 Gbaud (200 MB/s) 4 Gbaud (400 MB/s)
Fc0BaudRateCap	Integer from 0 through 127	bit 0 (other) bit 1 (oneEighth) bit 2 (quarter) bit 3 (half) bit 4 (full) bit 5 (double) bit 6 (quadruple) bit 7 (Reserved for future)	

Table 4-1 MIB-II Conventions (continued)

Type Definition	Value	Declaration	OID Description
Fc0MediaCap	Integer from 0 through 65535	bit 0 (unknown) bit 1 (single mode fibre (sm)) bit 2 (multimode fibre 50 micron (m5)) bit 3 (multimode fibre 62.5 micron (m6)) bit 4 (video cable (tv)) bit 5 (miniature cable (mi)) bit 6 (shielded twisted pair (stp)) bit 7 (twisted wire (tw)) bit 8 (long video (lv)) bits 9-15 (Reserved for future use)	
Fc0Medium	Integer	1 (unknown) 2 (sm) 4 (m5) 8 (m6) 16 (tv) 32 (mi) 64 (stp) 128 (tw) 256 (lv)	
Fc0TxType	Integer	1 (unknown) 2 (longWaveLaser (LL)) 3 (shortWaveLaser (SL)) 4 (longWaveLED (LE)) 5 (electrical (EL)) 6 (shortWaveLaser-noOFC (SN))	
Fc0Distance	Integer	The FC-0 distance range associated with a port transmitter 1 (unknown) 2 (long) 3 (intermediate) 4 (short)	

Table 4-1 MIB-II Conventions (continued)

Type Definition	Value	Declaration	OID Description
FcFeModuleCapacity	Integer from 1 through 256		Returns 1 for all devices.
FcFeFxPortCapacity	Integer from 1 through 256		
FcFeModuleIndex	Integer from 1 through 256		
FcFeFxPortIndex	Integer from 1 through 256		
FcFeNxPortIndex	Integer from 1 through 256		
FcFxPortMode	Integer	1 (unknown) 2 (fPort) 3 (flPort)	
FcBbCreditModel	Integer	1 (regular) 2 (alternate)	

Configuration Group

This group consists of scalar objects and tables. It contains the configuration and service parameters of the fabric element and the FxPorts.

The group represents a set of parameters associated with the fabric element or an FxPort to support its NxPorts.

Important Implementation of this group is mandatory.

fcFeFabricName

OID 1.3.6.1.2.1.75.1.1.1

Description The Name_Identifier of the fabric to which this fabric element belongs.

Returns the WWN of the primary switch in the fabric.

fcFeElementName

OID 1.3.6.1.2.1.75.1.1.2

Description The Name_Identifier of the fabric element.

Returns the WWN of the switch.

fcFeModuleCapacity

OID 1.3.6.1.2.1.75.1.1.3

Description The maximum number of modules in the fabric element, regardless of their current state.

The value for the ED-12000B and DS-32B2 is **1**.

fcFabric Element Module Table

This table contains one entry for each module, information of the modules.

fcFeModuleTable

OID 1.3.6.1.2.1.75.1.1.4

Description A table that contains one entry for each module in the fabric element, and information of the modules.

fcFeModuleEntry

OID 1.3.6.1.2.1.75.1.1.4.1
fcFeModuleTable.1

Description An entry containing the configuration parameters of a module.

Index fcFeModuleIndex

fcFeModuleIndex

OID 1.3.6.1.2.1.75.1.1.4.1.1
fcFeModuleTable.1.1

Description Identifies the module within the fabric element for which this entry contains information. This value is never greater than fcFeModuleCapacity.

fcFeModuleDescr

OID 1.3.6.1.2.1.75.1.1.4.1.2
fcFeModuleTable.1.2

Description A textual description of the module. This value should include the full name and version identification of the module. It should contain printable ASCII characters.

Refer to sysDescr in the *sysDescr* on page 2-2.

fcFeModuleObjectID

OID 1.3.6.1.2.1.75.1.1.4.1.3
fcFeModuleTable.1.3

Description The vendor's authoritative identification of the module. This value may be allocated within the SMI enterprises subtree (`1.3.6.1.4.1`) and provides a straight-forward and unambiguous means for determining what kind of module is being managed.

For example, this object could take the value `1.3.6.1.4.1.99649.3.9` if vendor "Neufe Inc." was assigned the subtree `1.3.6.1.4.1.99649`, and had assigned the identifier `1.3.6.1.4.1.99649.3.9` to its FeFiFo-16 plug-in card.

See sysObjectID in Chapter 2, *MIB-II Object Types*.

fcFeModuleOperStatus

OID 1.3.6.1.2.1.75.1.1.4.1.4
fcFeModuleTable.1.4

Description Indicates the operational status of the module.

fcFeModuleLastChange

OID 1.3.6.1.2.1.75.1.1.4.1.5
fcFeModuleTable.1.5

Description The value of sysUpTime when the module entered its current operational status. A value of zero indicates that the operational status of the module has not changed since the agent last restarted.

fcFeModuleFxPortCapacity

OID 1.3.6.1.2.1.75.1.1.4.1.6
fcFeModuleTable.1.6

Description The number of FxPorts that can be contained within the module. Within each module, the ports are uniquely numbered in the range 1 through fcFeModuleFxPortCapacity. However, the numbers are not required to be contiguous.

The value for the ED-12000B and DS-32B2 is **64**.

fcFeModuleName

OID 1.3.6.1.2.1.75.1.1.4.1.7
fcFeModuleTable.1.7

Description The Name_Identifier of the module.

The return value is the WWN of the switch.

FxPort Table

This table contains one entry for each FxPort and the configuration parameters of the ports.

fcFxPortTable

OID 1.3.6.1.2.1.75.1.1.5

Description A table that contains one entry for each FxPort in the fabric element, configuration, and service parameters of the FxPorts.

fcFxPortEntry

OID 1.3.6.1.2.1.75.1.1.5.1
fcFxPortTable.1

Description An entry containing the configuration and service parameters of an FxPort.

Index FcFxConfModuleIndex, fcFxConfFxPortIndex

fcFxPortIndex

OID 1.3.6.1.2.1.75.1.1.5.1.1
fcFxPortTable.1.1

Description The FxPort within the module, in the range 1 through the value of fcFeModulePortCapacity for the module. The value remains constant for the identified FxPort until the module is reinitialized.

fcFxPortName

OID 1.3.6.1.2.1.75.1.1.5.1.2
fcFxPortTable.1.2

Description The World Wide Name of this FxPort. Each FxPort has a unique WWN within the address space of the fabric.

The return value is the WWN of the port.

FxPort Common Service Parameters

fcFxPortFcphVersionHigh

OID 1.3.6.1.2.1.75.1.1.5.1.3
fcFxPortTable.1.3

Description The highest or most recent version of FC-PH that the FxPort is configured to support.

fcFxPortFcphVersionLow

OID 1.3.6.1.2.1.75.1.1.5.1.4
fcFxPortTable.1.4

Description The lowest or earliest version of FC-PH that the FxPort is configured to support.

fcFxPortBbCredit

OID 1.3.6.1.2.1.75.1.1.5.1.5
fcFxPortTable.1.5

Description The total number of receive buffers available for holding a Class 1 connect request, or Class 2 or Class 3 frames from the attached NxPort. It is for buffer-to-buffer flow control in the direction from the attached NxPort (if applicable) to FxPort.

fcFxPortRxBufSize

OID 1.3.6.1.2.1.75.1.1.5.1.6
fcFxPortTable.1.6

Description The largest Data_Field Size (in octets) for an FT_1 frame that can be received by the FxPort.

fcFxPortRatov

OID 1.3.6.1.2.1.75.1.1.5.1.7
fcFxPortTable.1.7

Description The Resource_Allocation_Timeout value configured for the FxPort. This is used as the time-out value for determining when to reuse an NxPort resource such as a Recovery_Qualifier. It represents E_D_TOV (see next object) plus twice the maximum time that a frame may be delayed within the fabric and still be delivered.

fcFxPortEdtov

OID 1.3.6.1.2.1.75.1.1.5.1.8
fcFxPortTable.1.8

Description The E_D_TOV value configured for the FxPort. The Error_Detect_Timeout value is used as the time-out value for detecting an error condition.

FxPort Class Service Parameters

fcFxPortCosSupported

OID 1.3.6.1.2.1.75.1.1.5.1.9
fcFxPortTable.1.9

Description A value indicating the set of Classes of Service supported by the FxPort.

fcFxPortIntermixSupported

OID 1.3.6.1.2.1.75.1.1.5.1.10
fcFxPortTable.1.10

Description A flag indicating whether the FxPort supports an intermixed dedicated connection.

fcFxPortStackedConnMode

OID 1.3.6.1.2.1.75.1.1.5.1.11
fcFxPortTable.1.11

Description A value indicating the mode of Stacked Connect supported by the FxPort.

fcFxPortClass2SeqDeliv

OID 1.3.6.1.2.1.75.1.1.5.1.12
fcFxPortTable.1.12

Description A flag indicating the FxPort supports the Class 2 sequential delivery.

fcFxPortClass3SeqDeliv

OID 1.3.6.1.2.1.75.1.1.5.1.13
fcFxPortTable.1.13

Description A flag indicating the FxPort supports Class 3 sequential delivery.

Other FxPort Parameters

fcFxPortHoldTime

OID 1.3.6.1.2.1.75.1.1.5.1.14
fcFxPortTable.1.14

Description The maximum time (in microseconds) that the FxPort shall hold a frame before discarding the frame if it is unable to deliver the frame. The value 0 means that the FxPort does not support this parameter.

fcFxPortBaudRate

OID 1.3.6.1.3.42.2.1.1.5.1.16
fcFxPortTable.1.16

Description The FC-0 baud rate of the FxPort.

The ED-12000B does not support this variable+.

fcFxPortMedium

OID 1.3.6.1.3.42.2.1.1.5.1.17
fcFxPortTable.1.17

Description The FC-0 medium of the FxPort.

fcFxPortTxType

OID 1.3.6.1.3.42.2.1.1.5.1.18
fcFxPortTable.1.18

Description The FC-0 transmitter type of the FxPort.

fcFxPortDistance

OID 1.3.6.1.3.42.2.1.1.5.1.19
fcFxPortTable.1.19

Description The FC-0 distance range of the FxPort transmitter.

Status Group

This group consists of tables that contains operational status and established service parameters for the fabric element and the attached NxPorts.

Implementation of this group is mandatory.

FxPort Status Table

This table contains one entry for each FxPort, the operational status, and parameters of the FxPorts.

fcFxPortStatusTable

OID 1.3.6.1.2.1.75.1.2.1

Description A table that contains one entry for each FxPort in the fabric element, and operational status and parameters of the FxPorts.

fcFxPortStatusEntry

OID 1.3.6.1.2.1.75.1.2.1.1
fcFxPortStatusTable.1

Description An entry containing operational status and parameters of an FxPort.

Index fcFxPortOperModuleIndex, fcFxPortOperFxPortIndex

fcFxPortID

OID 1.3.6.1.2.1.75.1.2.1.1.1
fcFxPortStatusTable.1.1

Description The address identifier by which this FxPort is identified within the fabric. The FxPort may assign its address identifier to its attached NxPort(s) during Fabric Login.

fcFxPortBbCreditAvailable

OID 1.3.6.1.2.1.75.1.2.1.1.2
fcFxPortStatusTable.1.2

Description The number of buffers currently available for receiving frames from the attached port in the buffer-to-buffer flow control. The value should be less than or equal to fcFxPortBbCredit.

fcFxPortOperMode

OID 1.3.6.1.2.1.75.1.2.1.1.3
fcFxPortStatusTable.1.3

Description The current operational mode of the FxPort.

fcFxPortAdminMode

OID 1.3.6.1.2.1.75.1.2.1.1.4
fcFxPortStatusTable.1.4

Description The desired operational mode of the FxPort.

FxPort Physical Level Table

This table contains one entry for each FxPort in the fabric element, and the physical level status and parameters of the FxPorts.

fcFxPortPhysTable

OID 1.3.6.1.2.1.75.1.2.2

Description A table that contains one entry for each FxPort in the fabric element, physical level status, and parameters of the FxPorts.

fcFxPortPhysEntry

OID 1.3.6.1.2.1.75.1.2.2.1
fcFxPortPhysTable.1

Description An entry containing physical level status and parameters of an FxPort.

Index fcFxPortPhysModuleIndex, fcFxPortPhysFxPortIndex

fcFxPortPhysAdminStatus

OID 1.3.6.1.2.1.75.1.2.2.1.1
fcFxPortPhysTable.1.1

Description The desired state of the FxPort. A management station may place the FxPort in a desired state by setting this object accordingly. The 3 (testing) state indicates that no operational frames can be passed. When a fabric element initializes, all FxPorts start with fcFxPortPhysAdminStatus in the 2 (offline) state. As the result of either explicit management action or per configuration information accessible by the fabric element, fcFxPortPhysAdminStatus is then changed to either the 1 (online) or 3 (testing) states, or remains in the 2 (offline) state.

fcFxPortPhysOperStatus

OID 1.3.6.1.2.1.75.1.2.2.1.2
fcFxPortPhysTable.1.2

Description The current operational status of the FxPort. The 3 (testing) indicates that no operational frames can be passed.

If cFxPortPhysAdminStatus is 2 (offline), then fcFxPortPhysOperStatus should be 2 (offline).

If fcFxPortPhysAdminStatus is changed to 1 (online), then fcFxPortPhysOperStatus should change to 1 (online) if the FxPort is ready to accept Fabric Login request from the attached NxPort. It should proceed and remain in the 4 (link-failure) state if and only if there is a fault that prevents it from going to the 1 (online) state.

fcFxPortPhysLastChange

OID 1.3.6.1.2.1.75.1.2.2.1.3
fcFxPortPhysTable.1.3

Description The value of sysUpTime at the time the FxPort entered its current operational status. A value of zero indicates that the operational status for FxPort has not changed since the agent last restarted.

fcFxPortPhysRttov

OID 1.3.6.1.2.1.75.1.2.2.1.4
fcFxPortPhysTable.1.4

Description The Receiver_Transmitter_Timeout value of the FxPort. This is used by the receiver logic to detect loss of synchronization.

FxPort Fabric Login Table

This table contains one entry for each FxPort in the fabric element and the service parameters that have been established from the most recent Fabric Login, whether implicit or explicit.

fcFxloginTable

OID 1.3.6.1.2.1.75.1.2.3

Description A table that contains one entry for each FxPort in the fabric element, and Service Parameters established from the most recent Fabric Login, explicit or implicit.

fcFxloginEntry

OID 1.3.6.1.2.1.75.1.2.3.1
fcFxloginTable.1

Description An entry containing service parameters established from a successful Fabric Login.

Index fcFxlogiModuleIndex, fcFxlogiFxPortIndex, fcFxlogiNxPortIndex

fcFxPortNxLoginIndex

OID 1.3.6.1.2.1.75.1.2.3.1.1
fcFxloginTable.1.1

Description The object identifies the associated NxPort in the attachment for which the entry contains information.

fcFxPortFcphVersionAgreed

OID 1.3.6.1.2.1.75.1.2.3.1.2
fcFxloginTable.1.2

Description The version of FC-PH that the FxPort has agreed to support from the Fabric Login.

fcFxPortNxPortBbCredit

OID 1.3.6.1.2.1.75.1.2.3.1.3
fcFxloginTable.1.3

Description The total number of buffers available for holding the Class 1 connect request, or Class 2 or Class 3 frames to be transmitted to the attached NxPort. It is for buffer- to-buffer flow control in the direction from FxPort to NxPort. The buffer-to-buffer flow control mechanism is indicated in the respective fcFxPortBbCreditModel.

fcFxPortNxPortRxDataFieldSize

OID 1.3.6.1.2.1.75.1.2.3.1.4
fcFxloginTable.1.4

Description The receive data field size of the attached NxPort. This is a binary value that specifies the largest data field size for an FT_1 frame that can be received by the NxPort. The value is in number of bytes and ranges from `128` to `2112` inclusive.

fcFxPortCosSuppAgreed

OID 1.3.6.1.2.1.75.1.2.3.1.5
fcFxloginTable.1.5

Description A variable indicating that the attached NxPort has requested the FxPort for the support of classes of services, and the FxPort has granted the request.

fcFxPortIntermixSuppAgreed

OID 1.3.6.1.2.1.75.1.2.3.1.6
fcFxloginTable.1.6

Description A variable indicating that the attached NxPort has requested the FxPort for the support of Intermix and the FxPort has granted the request. This flag is only valid if Class 1 service is supported.

Possible values are:

- yes (1) — The attached NxPort has requested the FxPort for the support of Intermix, and the FxPort has granted the request.
- no (2) — The attached NxPort has not requested the FxPort for the support of Intermix.

fcFxPortStackedConnModeAgreed

OID 1.3.6.1.2.1.75.1.2.3.1.7
fcFxloginTable.1.7

Description A variable Indicating whether the FxPort has agreed to support stacked connect from the Fabric Login. This is only meaningful if Class 1 service has been agreed to.

fcFxPortClass2SeqDelivAgreed

OID 1.3.6.1.2.1.75.1.2.3.1.8
fcFxloginTable.1.8

Description A variable indicating whether the FxPort has agreed to support Class 2 sequential delivery from the Fabric Login. This is only meaningful if Class 2 service is supported.

Possible values are:

- yes (1) — The FxPort has agreed to support Class 2 sequential delivery from the Fabric Login.
- no (2) — The FxPort has not agreed to support Class 2 sequential delivery from the Fabric Login.

fcFxPortClass3SeqDelivAgreed

OID 1.3.6.1.2.1.75.1.2.3.1.9
fcFxloginTable.1.9

Description A flag indicating whether the FxPort has agreed to support Class 3 sequential delivery from the Fabric Login. This is only meaningful if Class 3 service is supported.

Possible values are:

- yes (1) — The FxPort has agreed to support Class 3 sequential delivery from the Fabric Login.
- no (2) — The FxPort has not agreed to support Class 3 sequential delivery from the Fabric Login.

fcFxPortNxPortName

OID 1.3.6.1.2.1.75.1.2.3.1.10
fcFxloginTable.1.10

Description The port name of the attached NxPort, if applicable. If the value of this object is `0000000000000000H`, this FxPort has no NxPort attached to it.

fcFxPortConnectedNxPort

OID 1.3.6.1.2.1.75.1.2.3.1.11
fcFxloginTable.1.11

Description The address identifier of the destination FxPort with which this FxPort is currently engaged in either a Class 1 or loop connection. If the value of this object is `000000H`, this FxPort is not engaged in a connection.

fcFxPortBbCreditModel

OID 1.3.6.1.2.1.75.1.2.3.1.12
fcFxloginTable.1.12

Description Identifies the BB_Credit model used by the FxPort. The regular model refers to the buffer-to-buffer flow control mechanism defined in FC-PH [1] and used between the F_Port and the N_Port. For FL_Ports, the alternate buffer-to-buffer flow control mechanism as defined in FC-AL [4] is used between the FL_Port and any attached NL_Ports.

Error Group

This group consists of tables that contain information about the various types of errors detected. The management station may use the information in this group to determine the quality of the link between the FxPort and its attached NxPort.

Implementation of this group is optional.

FxPort Error Table

This table contains one entry for each FxPort in the fabric element and counters recording numbers of errors detected since the management agent reinitialized.

The first six column objects after the port index corresponds to the counters in the Link ErrorStatus Block.

fcFxPortErrorTable

OID 1.3.6.1.2.1.75.1.3.1

Description A table that contains one entry for each FxPort, and counters that record the numbers of errors detected.

fcFxPortErrorEntry

OID 1.3.6.1.2.1.75.1.3.1.1
fcFxPortErrorTable.1

Description An entry containing error counters of a FxPort.

Index fcFxPortErrorModuleIndex, fcFxPortErrorFxPortIndex

fcFxPortLinkFailures

OID 1.3.6.1.2.1.75.1.3.1.1.1
fcFxPortErrorTable.1.1

Description The number of link failures detected by this FxPort.

fcFxPortSyncLosses

OID 1.3.6.1.2.1.75.1.3.1.1.2
fcFxPortErrorTable.1.2

Description The number of loss-of-synchronization errors detected by the FxPort.

fcFxPortSigLosses

OID 1.3.6.1.2.1.75.1.3.1.1.3
fcFxPortErrorTable.1.3

Description The number of loss-of-signal errors detected by the FxPort.

fcFxPortPrimSeqProtoErrors

OID 1.3.6.1.2.1.75.1.3.1.1.4
fcFxPortErrorTable.1.4

Description The number of primitive sequence protocol errors detected by the FxPort.

fcFxPortInvalidTxWords

OID 1.3.6.1.2.1.75.1.3.1.1.5
fcFxPortErrorTable.1.5

Description The number of invalid transmission word errors detected by the FxPort.

fcFxPortInvalidCrcs

OID 1.3.6.1.2.1.75.1.3.1.1.6
fcFxPortErrorTable.1.6

Description The number of invalid Cyclic Redundancy Checks (CRCs) detected by this FxPort.

fcFxPortDelimiterErrors

OID 1.3.6.1.2.1.75.1.3.1.1.7
fcFxPortErrorTable.1.7

Description The number of delimiter errors detected by this FxPort.

fcFxPortAddressIdErrors

OID 1.3.6.1.2.1.75.1.3.1.1.8
fcFxPortErrorTable.1.8

Description The number of address identifier errors detected by this FxPort.

fcFxPortLinkResetIns

OID 1.3.6.1.2.1.75.1.3.1.1.9
fcFxPortErrorTable.1.9

Description The number of Link Reset Protocol errors received by this FxPort from the attached NxPort.

fcFxPortLinkResetOuts

OID 1.3.6.1.2.1.75.1.3.1.1.10
fcFxPortErrorTable.1.10

Description The number of Link Reset Protocol errors issued by this FxPort to the attached NxPort.

fcFxPortOlsIns

OID 1.3.6.1.2.1.75.1.3.1.1.11
fcFxPortErrorTable.1.11

Description The number of offline sequence errors received by this FxPort.

fcFxPortOlsOuts

OID 1.3.6.1.2.1.75.1.3.1.1.12
fcFxPortErrorTable.1.12

Description The number of offline sequence errors issued by this FxPort.

Accounting Group

The Accounting Group consists of the following tables:

- Class 1 accounting table
- Class 2 accounting table
- Class 3 accounting table

Each table contains accounting information for the FxPorts in the Fabric Element.

Class 1 Accounting Table

fcFxPortC1AccountingTable

OID 1.3.6.1.2.1.75.1.4.1

Description A table that contains, one entry for each FxPort in the Fabric Element, Class 1 accounting information recorded since the management agent has re-initialized.

This object is supported only in Fabric OS v4.x.

fcFxPortC1AccountingEntry

OID 1.3.6.1.2.1.75.1.4.1.1
fcFxPortC1AccountingTable.1

Description An entry containing Class 1 accounting information for each FxPort.

Index fcFeModuleIndex
fcFePortIndex

This object is supported only in Fabric OS v4.x.

fcFxPortC1InFrames

OID 1.3.6.1.2.1.75.1.4.1.1.1
fcFxPortC1AccountingTable.1.1

Description The number of Class 1 frames (other than Class 1 connect-request) received by this FxPort from its attached NxPort.

This object is supported only in Fabric OS v4.x.

fcFxPortC1OutFrames

OID 1.3.6.1.2.1.75.1.4.1.1.2
fcFxPortC1AccountingTable.1.2

Description The number of Class 1 frames (other than Class 1 connect- request) delivered through this FxPort to its attached NxPort.

This object is supported only in Fabric OS v4.x.

fcFxPortC1InOctets

OID 1.3.6.1.2.1.75.1.4.1.1.3
fcFxPortC1AccountingTable.1.3

Description The number of Class 1 frame octets, including the frame delimiters, received by this FxPort from its attached NxPort.

This object is supported only in Fabric OS v4.x.

fcFxPortC1OutOctets

OID 1.3.6.1.2.1.75.1.4.1.1.4
fcFxPortC1AccountingTable.1.4

Description The number of Class 1 frame octets, including the frame delimiters, delivered through this FxPort its attached NxPort.

This object is supported only in Fabric OS v4.x.

fcFxPortC1Discards

OID 1.3.6.1.2.1.75.1.4.1.1.5
fcFxPortC1AccountingTable.1.5

Description The number of Class 1 frames discarded by this FxPort.

This object is supported only in Fabric OS v4.x.

fcFxPortC1FbsyFrames

OID 1.3.6.1.2.1.75.1.4.1.1.6
fcFxPortC1AccountingTable.1.6

Description The number of F_BSY frames generated by this FxPort against Class 1 connect-request.

This object is supported only in Fabric OS v4.x.

fcFxPortC1FrjtFrames

OID 1.3.6.1.2.1.75.1.4.1.1.7
fcFxPortC1AccountingTable.1.7

Description The number of F_RJT frames generated by this FxPort against Class 1 connect-request.

This object is supported only in Fabric OS v4.x.

fcFxPortC1InConnections

OID 1.3.6.1.2.1.75.1.4.1.1.8
fcFxPortC1AccountingTable.1.8

Description The number of Class 1 connections successfully established in which the attached NxPort is the source of the connect- request.

This object is supported only in Fabric OS v4.x.

fcFxPortC1OutConnections

OID 1.3.6.1.2.1.75.1.4.1.1.9
fcFxPortC1AccountingTable.1.9

Description The number of Class 1 connections successfully established in which the attached NxPort is the destination of the connect-request.

This object is supported only in Fabric OS v4.x.

fcFxPortC1ConnTime

OID 1.3.6.1.2.1.75.1.4.1.1.10
fcFxPortC1AccountingTable.1.10

Description The cumulative time that this FxPort has been engaged in Class 1 connection. The amount of time is counted from after a connect-request has been accepted until the connection is disengaged, either by an EOFdt or Link Reset.

Class 2 Accounting Table

fcFxPortC2AccountingTable

OID 1.3.6.1.2.1.75.1.4.2

Description A table that contains, one entry for each FxPort in the Fabric Element, Class 2 accounting information recorded since the management agent has re-initialized.

This object is supported only in Fabric OS v4.x.

fcFxPortC2AccountingEntry

OID 1.3.6.1.2.1.75.1.4.2.1
fcFxPortC2AccountingTable.1

Description An entry containing Class 2 accounting information for each FxPort.

Index fcFeModuleIndex
fcFePortIndex

This object is supported only in Fabric OS v4.x.

fcFxPortC2InFrames

OID 1.3.6.1.2.1.75.1.4.2.1.1
fcFxPortC2AccountingTable.1.1

Description The number of Class 2 frames received by this FxPort from its attached NxPort.

This object is supported only in Fabric OS v4.x.

fcFxPortC2OutFrames

OID 1.3.6.1.2.1.75.1.4.2.1.2
fcFxPortC2AccountingTable.1.2

Description The number of Class 2 frames delivered through this FxPort to its attached NxPort.

This object is supported only in Fabric OS v4.x.

fcFxPortC2InOctets

OID 1.3.6.1.2.1.75.1.4.2.1.3
fcFxPortC2AccountingTable.1.3

Description The number of Class 2 frame octets, including the frame delimiters, received by this FxPort from its attached NxPort.

This object is supported only in Fabric OS v4.x.

fcFxPortC2OutOctets

OID 1.3.6.1.2.1.75.1.4.2.1.4
fcFxPortC2AccountingTable.1.4

Description The number of Class 2 frame octets, including the frame delimiters, delivered through this FxPort to its attached NxPort.

This object is supported only in Fabric OS v4.x.

fcFxPortC2Discards

OID 1.3.6.1.2.1.75.1.4.2.1.5
fcFxPortC2AccountingTable.1.5

Description The number of Class 2 frames discarded by this FxPort.

This object is supported only in Fabric OS v4.x.

fcFxPortC2FbsyFrames

OID 1.3.6.1.2.1.75.1.4.2.1.6
fcFxPortC2AccountingTable.1.6

Description The number of F_BSY frames generated by this FxPort against Class 2 frames.

This object is supported only in Fabric OS v4.x.

fcFxPortC2FrjtFrames

OID 1.3.6.1.2.1.75.1.4.2.1.7
fcFxPortC2AccountingTable.1.7

Description The number of F_RJT frames generated by this FxPort against Class 2 frames.

This object is supported only in Fabric OS v4.x.

Class 3 Accounting Table

fcFxPortC3AccountingTable

OID 1.3.6.1.2.1.75.1.4.3

Description A table that contains, one entry for each FxPort in the Fabric Element, Class 3 accounting information recorded since the management agent has re-initialized.

This object is supported only in Fabric OS v4.x.

fcFxPortC3AccountingEntry

OID 1.3.6.1.2.1.75.1.4.3.1
fcFxPortC3AccountingTable.1

Description An entry containing Class 3 accounting information for each FxPort.

Index fcFeModuleIndex
fcFePortIndex

This object is supported only in Fabric OS v4.x.

fcFxPortC3InFrames

OID 1.3.6.1.2.1.75.1.4.3.1.1
fcFxPortC3AccountingTable.1.1

Description The number of Class 3 frames received by this FxPort from its attached NxPort.

This object is supported only in Fabric OS v4.x.

fcFxPortC3OutFrames

OID 1.3.6.1.2.1.75.1.4.3.1.2
fcFxPortC3AccountingTable.1.2

Description The number of Class 3 frames delivered through this FxPort to its attached NxPort.

This object is supported only in Fabric OS v4.x.

fcFxPortC3InOctets

OID 1.3.6.1.2.1.75.1.4.3.1.3
fcFxPortC3AccountingTable.1.3

Description The number of Class 3 frame octets, including the frame delimiters, received by this FxPort from its attached NxPort.

This object is supported only in Fabric OS v4.x.

fcFxPortC3OutOctets

OID 1.3.6.1.2.1.75.1.4.3.1.4
fcFxPortC3AccountingTable.1.4

Description The number of Class 3 frame octets, including the frame delimiters, delivered through this FxPort to its attached NxPort.

This object is supported only in Fabric OS v4.x.

fcFxPortC3Discards

OID 1.3.6.1.2.1.75.1.4.3.1.5
fcFxPortC3AccountingTable.1.5

Description The number of Class 3 frames discarded by this FxPort.

This object is supported only in Fabric OS v4.x.

Capability Group

This group consists of a table describing information about what each FxPort is inherently capable of operating or supporting. A capability may be used, as expressed in its respective object value in the Configuration group.

Implementation of this group is optional.

FxPort Capability Table

fcFxPortCapTable

OID 1.3.6.1.2.1.75.1.5.1

Description A table that contains one entry for each FxPort, and the capabilities of the port within the fabric element.

fcFxPortCapEntry

OID 1.3.6.1.2.1.75.1.5.1.1
fcFxPortCapTable.1

Description An entry containing the capabilities of a FxPort.

Index fcFxPortCapModuleIndex, fcFxPortCapFxPortIndex

fcFxPortCapFcphVersionHigh

OID 1.3.6.1.2.1.75.1.5.1.1.1
fcFxPortCapTable.1.1

Description The highest or most recent version of FC-PH that the FxPort is capable of supporting.

fcFxPortCapFcphVersionLow

OID 1.3.6.1.2.1.75.1.5.1.1.2
fcFxPortCapTable.1.2

Description The lowest or earliest version of FC-PH that the FxPort is capable of supporting.

fcFxPortCapBbCreditMax

OID 1.3.6.1.2.1.75.1.5.1.1.3
fcFxPortCapTable.1.3

Description The maximum number of receive buffers available for holding a Class 1 connect request, or Class 2 or Class 3 frames from the attached NxPort.

fcFxPortCapBbCreditMin

OID 1.3.6.1.2.1.75.1.5.1.1.4
fcFxPortCapTable.1.4

Description The minimum number of receive buffers available for holdinga Class 1 connect request, or Class 2 or Class 3 frames from the attached NxPort.

fcFxPortCapRxDataFieldSizeMax

OID 1.3.6.1.2.1.75.1.5.1.1.5
fcFxPortCapTable.1.5

Description The maximum size in bytes of the data field in a frame that the FxPort is capable of receiving from its attached NxPort.

fcFxPortCapRxDataFieldSizeMin

OID 1.3.6.1.2.1.75.1.5.1.1.6
fcFxPortCapTable.1.6

Description The minimum size in bytes of the data field in a frame that the FxPort is capable of receiving from its attached NxPort.

fcFxPortCapCos

OID 1.3.6.1.2.1.75.1.5.1.1.7
fcFxPortCapTable.1.7

Description A value indicating the set of classes of service that the FxPort can support.

fcFxPortCapIntermix

OID 1.3.6.1.2.1.75.1.5.1.1.8
fcFxPortCapTable.1.8

Description A flag indicating whether the FxPort is capable of supporting the intermixing of Class 2 and Class 3 frames during a Class 1 connection. This flag is only valid if the port of supports Class 1 service.

Possible values are:

- yes (1) — The FxPort is capable of supporting the intermixing of Class 2 and Class 3 frames during a Class 1 connection.
- no (2) — The FxPort is not capable of supporting the intermixing of Class 2 and Class 3 frames during a Class 1 connection.

fcFxPortCapStackedConnMode

OID 1.3.6.1.2.1.75.1.5.1.1.9
fcFxPortCapTable.1.9

Description A value indicating the mode of Stacked Connect request that the FxPort can support.

fcFxPortCapClass2SeqDeliv

OID 1.3.6.1.2.1.75.1.5.1.1.10
fcFxPortCapTable.1.10

Description A flag indicating whether the FxPort can support Class 2 sequential delivery.

Possible values are:

- yes (1) — The FxPort is capable of supporting Class 2Sequential Delivery.
- no (2) — The FxPort is not capable of supporting Class 2 Sequential Delivery.

fcFxPortCapClass3SeqDeliv

OID 1.3.6.1.2.1.75.1.5.1.1.11
fcFxPortCapTable.1.11

Description A flag indicating whether the FxPort can support Class 3 sequential delivery.

Possible values are:

- yes (1) — The FxPort is capable of supporting Class 3 Sequential Delivery.
- no (2) — The FxPort is not capable of supporting Class 3 Sequential Delivery.

fcFxPortCapHoldTimeMax

OID 1.3.6.1.2.1.75.1.5.1.1.12
fcFxPortCapTable.1.12

Description The maximum holding time (in microseconds) that the FxPort can support.

fcFxPortCapHoldTimeMin

OID 1.3.6.1.2.1.75.1.5.1.1.13
fcFxPortCapTable.1.13

Description The minimum holding time (in microseconds) that the FxPort can support.

5 FCSwitch MIB Object Types

This chapter contains descriptions and other information that is specific to FC Switch MIB (SW-MIB) object types.

Overview

The object types in SW-MIB are organized into the following groupings:

- swSystem
- swFabric
- swActCfg
- swFCport
- swNs
- swEvent
- swFwSystem
- swEndDevice
- swGroup
- sw BlmPerfMnt
- swTrunk

The SW-MIB FCSwitch is organized as follows:

Table 5-1 FCSwitch Organizational Listing

bcsi	enterprises (1588)
Product Lines or Generic Product Information	
	bcsi (1) = Reserved
commDev	bcsi (2) = Communication devices
fibrechannel	commDev (1)
fcSwitch	fibrechannel (1)
sw	fcSwitch (1)
sw28k	fcSwitch (2)
sw21kN24k	fcSwitch (3)
sw20x0	fcSwitch (4)

Refer to Appendix E for the entire SW-MIB.

SW-MIB File System Organization

Figure 5-1 through Figure 5-4 depict the organization and structure of the SW-MIB file system:

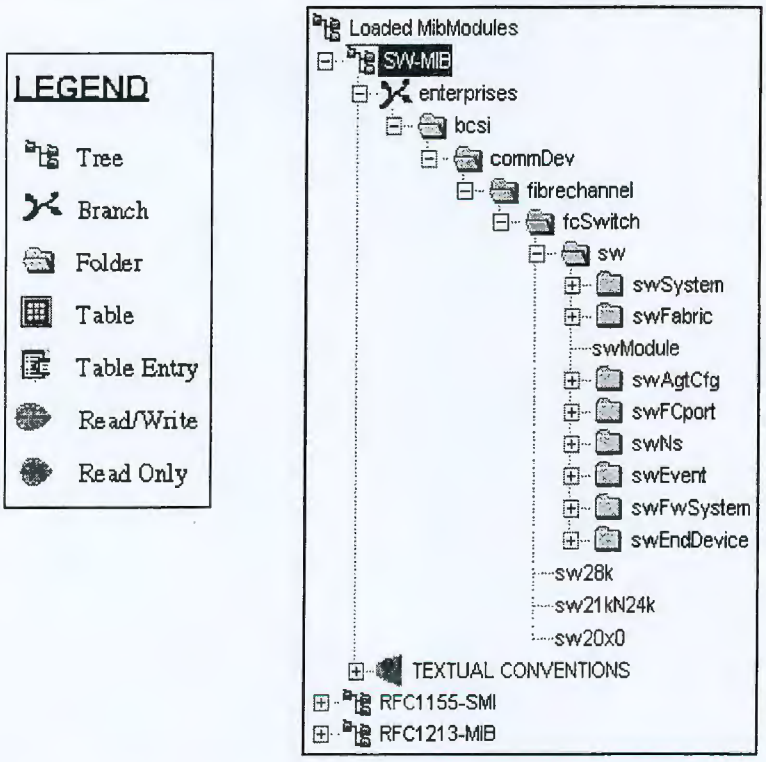

Figure 5-1 SW-MIB Overall Tree Structure

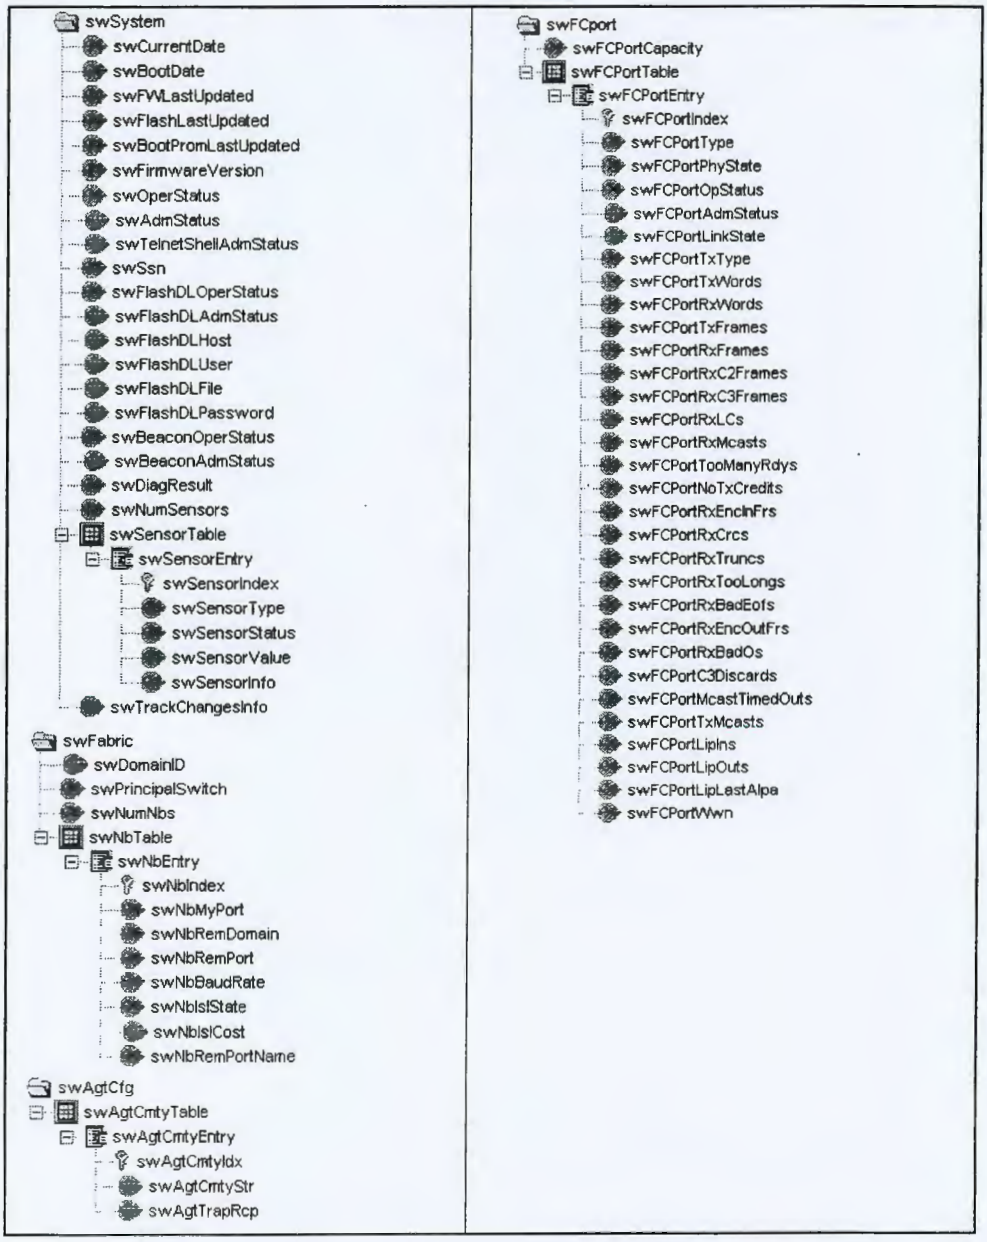

Figure 5-2 Tree Structure for swSystem, swFabric, swAgtCfg, and swFCPort Groups

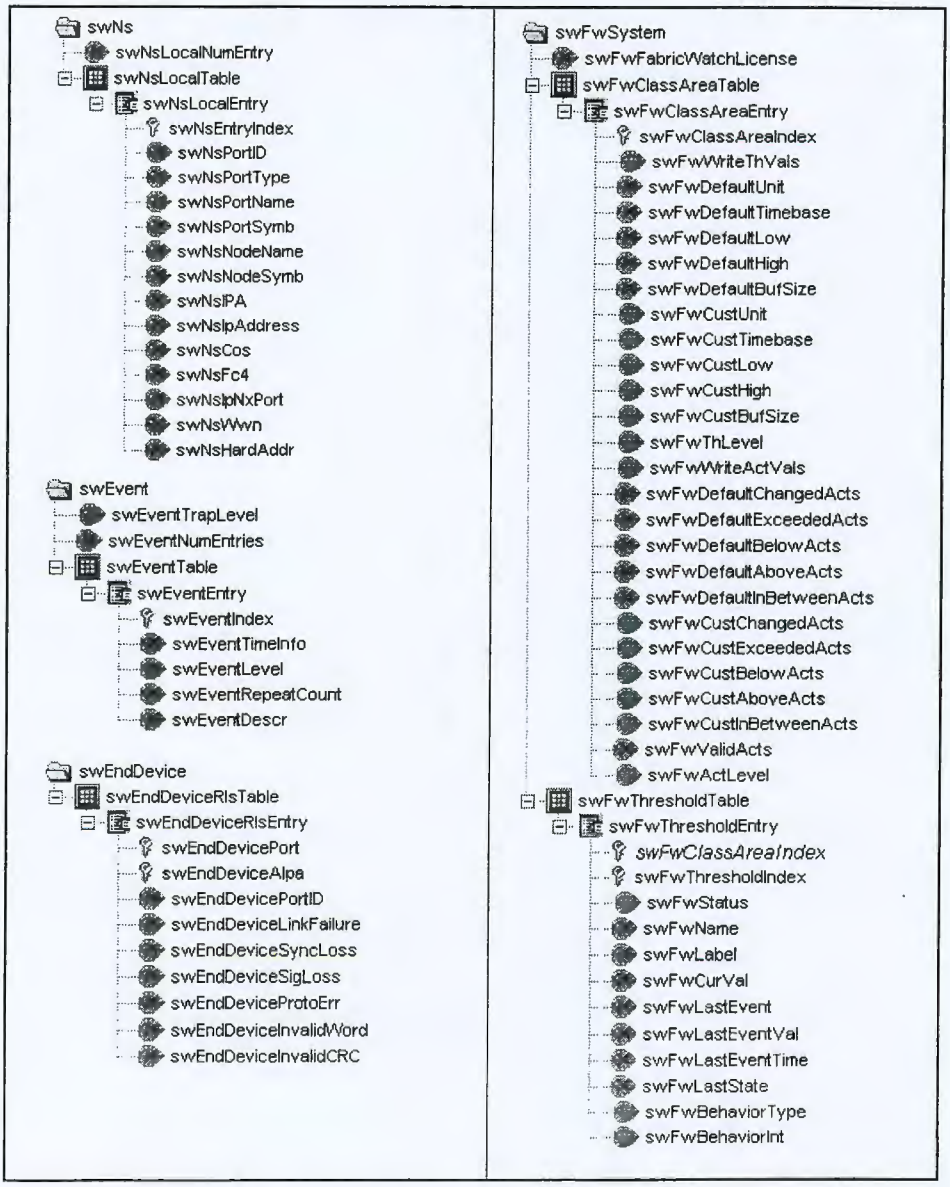

Figure 5-3 Tree Structure for swNs, swEvent, swFwSystem, and swEndDevice Groups

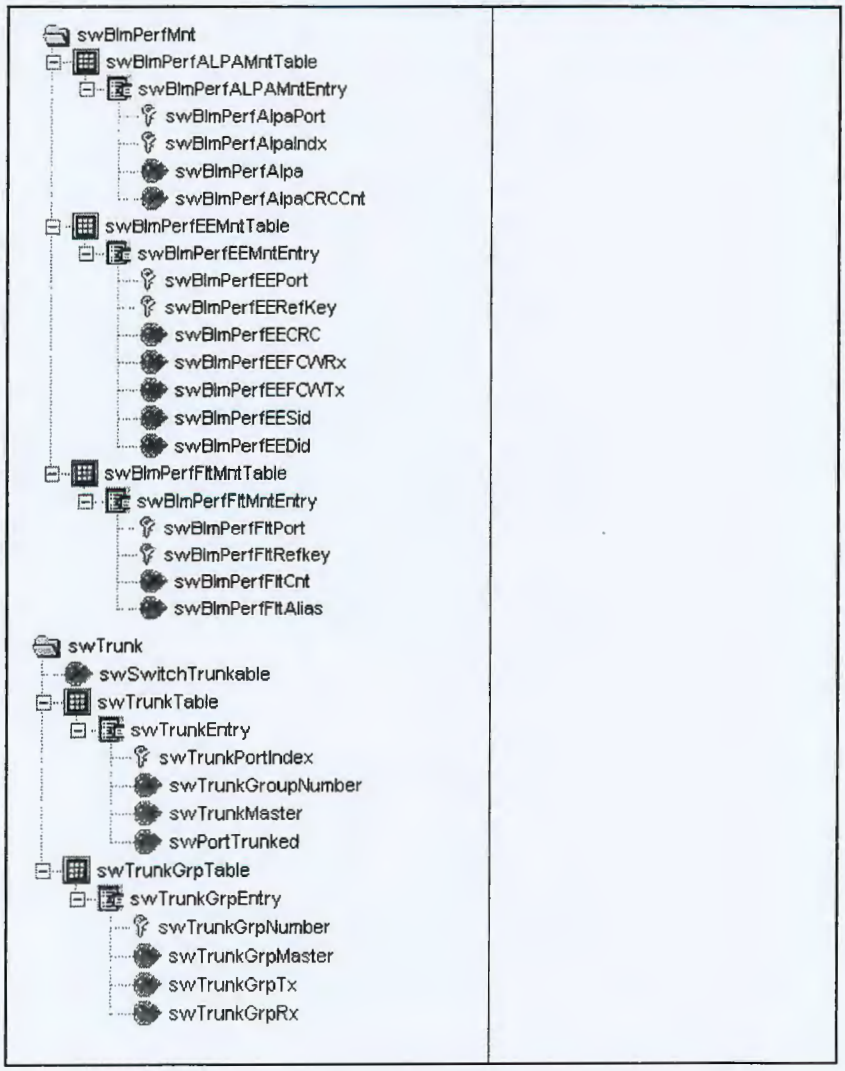

Figure 5-4 Tree Structure for swBlm and swTrunk Groups

Definitions for SW-MIB

The following definitions are used for SW-MIB.

Table 5-2 SW MIB Definitions

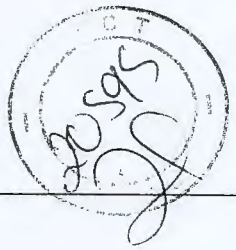
Type Definition	Value	Declaration
Display String	Octet String	
FcWwn	Octet String of size 8	
SwDomainIndex	Integer of size 0 to 239	
SwNbIndex	Integer of size 0 to 2048	
SwSensorIndex	Integer of size 0 to 1024	
SwFwActs	Integer	0 (swFwNoAction) 1 (swFwErrlog) 2 (swFwSnmptrap) 3 (swFwErrlogSnmptrap) 4 (swFwPortloglock) 5 (swFwErrlogPortloglock) 6 (swFwSnmptrapPortloglock) 7 (swFwErrlogSnmptrapPortloglock)
SwFwLevels	Integer	1 (swFwReserved) 2 (swFwDefault) 3 (swFwCustom)
SwFwClassesAreas	Integer	1 (swFwEnvTemp) 2 (swFwEnvFan) 3 (swFwEnvPs) 4 (swFwGbicTemp) 5 (swFwGbicRxp) 6 (swFwGbicTxp) 7 (swFwGbicCurrent) 8 (swFwPortLink) 9 (swFwPortSync) 10 (swFwPortSignal) 11 (swFwPortPe) 12 (swFwPortWords) 13 (swFwPortCrcs)

Table 5-2 SW MIB Definitions (continued)

Type Definition	Value	Declaration
		14 (swFwPortRXPerf) 15 (swFwPortTXPerf) 16 (swFwPortState) 17 (swFwFabricEd) 18 (swFwFabricFr) 19 (swFwFabricDi) 20 (swFwFabricSc) 21 (swFwFabricZc) 22 (swFwFabricFq) 23 (swFwFabricFl) 24 (swFwFabricGs) 25 (swFwEPortLink) 26 (swFwEPortSync) 27 (swFwEPortSignal) 28 (swFwEPortPe) 29 (swFwEPortWords) 30 (swFwEPortCrcs) 31 (swFwEPortRXPerf) 32 (swFwEPortTXPerf) 33 (swFwEPortState) 34 (swFwFCUPortLink) 35 (swFwFCUPortSync) 36 (swFwFCUPortSignal) 37 (swFwFCUPortPe) 38 (swFwFCUPortWords) 39 (swFwFCUPortCrcs) 40 (swFwFCUPortRXPerf) 41 (swFwFCUPortTXPerf) 42 (swFwFCUPortState) 43 (swFwFOPPortLink) 44 (swFwFOPPortSync) 45 (swFwFOPPortSignal) 46 (swFwFOPPortPe) 47 (swFwFOPPortWords) 48 (swFwFOPPortCrcs) 49 (swFwFOPPortRXPerf) 50 (swFwFOPPortTXPerf) 51 (swFwFOPPortState)

Table 5-2 SW MIB Definitions (continued)

Type Definition	Value	Declaration
SwFwWriteVals	Integer	1 (swFwCancelWrite) 2 (swFwApplyWrite)
SwFwTimebase	Integer	1 (swFwTbNone) 2 (swFwTbSec) 3 (swFwTbMin) 4 (swFwTbHour) 5 (swFwTbDay)
SwFwStatus	Integer	1 (disabled) 2 (enabled)
SwFwEvent	Integer	1 (started) 2 (changed) 3 (exceeded) 4 (below) 5 (above) 6 (inBetween)
SwFwBehavior	Integer	1 (triggered) 2 (continuous)
SwFwState	Integer	1 (swFwInformative) 2 (swFwNormal) 3 (swFwFaulty)
SwFwLicense	Integer	1 (swFwLicensed) 2 (swFwNotLicensed)



swTraps

This section contains descriptions and other information that is specific to swTrap types.

The swSsn variable is optional in trap messages. The swGroupName, swGroupType, and swGroupMemPos variables are optional in trap messages in v2.6.x. Each of these optional variables can be set ON/OFF with the **snmpMibCapSet** command.

swFault

Trap Number 1

OID 1.3.6.1.4.1.1588.2.1.1.1.0.1

Enterprise sw

Variables swDiagResult, swSsn

Description A 1 (swFault) is generated whenever the diagnostics detects a fault with the switch. The following are examples of diagnostics.

#TYPE	Switch is faulty.
#SUMMARY	Faulty reason: %d
#ARGUMENTS	0
#SEVERITY	Critical
#TIMEINDEX	1
#STATE	Nonoperational

swSensorScn

This variable was made obsolete by swFabricWatchTrap.

swFCPortScn

Trap Number 3

OID 1.3.6.1.4.1.1588.2.1.1.1.0.3

Enterprise sw

Variables swFCPortOpStatus, swFCPortIndex, swFCPortName, swSsn

Description A 3 (swFCPortScn) is generated whenever an FC_Port changes its operational state. (For instance, the FC_Port goes from on line to off line). The VarBind in the Trap Data Unit shall contain the corresponding instance of the FC_Port's operational status and index.

#TYPE	A Fibre Channel Port changed its operational state.
#SUMMARY	Port Index %d changed state to %d
#ARGUMENTS	1, 0
#SEVERITY	Informational
#TIMEINDEX	1
#STATE	Operational

swEventTrap

Trap Number 4

OID 1.3.6.1.4.1.1588.2.1.1.1.0.4

Enterprise sw

Variables swEventIndex, swEventTimeInfo, swEventLevel, swEventRepeatCount, swEventDescr, swSsn

Description This trap is generated when an event whose level at or below swEventTrapLevel occurs.

#TYPE	A firmware event has been logged.
#SUMMARY	Event %d: %s (severity level %d) - %s
#ARGUMENTS	0, 1, 2, 4
#SEVERITY	Informational
#TIMEINDEX	1
#STATE	Operational

The trap is generated when an entry is created in the Error Log.

swFabricWatchTrap

Trap Number 5

OID 1.3.6.1.4.1.1588.2.1.1.1.0.5

Enterprise sw

Variables

swFwClassAreaIndex on page 5-53

swFwThresholdIndex on page 5-60

swFwName on page 5-61

swFwLabel on page 5-63

swFwLastEvent on page 5-64

swFwLastEventVal on page 5-64

swFwLastEventTime on page 5-64

swFwLastState on page 5-64

swSsn on page 5-18

Description Trap to be sent by Fabric Watch to notify of an event.

#TYPE	Fabric Watch has generated an event.
#SUMMARY	Threshold %s in Class/Area %d at index %d has generated event %d with %d on %s. This event is %d.
#ARGUMENTS	2, 0, 1, 6, 4, 5, 7
#SEVERITY	Warning
#TIMEINDEX	1
#STATE	Operational

swTrackChangesTrap

Trap Number 6

OID 1.3.6.1.4.1.1588.2.1.1.1.0.6

Enterprise sw

Variables swTrackChangesInfo, swSsn

Description Trap to be sent for tracking login/logout/configuration changes.

#TYPE	Track changes has generated a trap.
#SUMMARY	%s
#ARGUMENTS	0
#SEVERITY	Informational
#TIMEINDEX	1
#STATE	Operational

System Group

swCurrentDate

OID 1.3.6.1.4.1.1588.2.1.1.1.1.1

Description The current date and time.

The return string is in the format `ddd MMM DD hh:mm:ss yyyy`
where: *ddd* = day of the week
MMM = month
DD = date
hh = hour
mm = minute
ss = seconds
yyyy = year
Example: `Thu Apr 17 15:16:09 2003`

swBootDate

OID 1.3.6.1.4.1.1588.2.1.1.1.1.2

Description The date and time when the system last booted.

The return string is in the format `ddd MMM DD hh:mm:ss yyyy`
where: *ddd* = day of the week
MMM = month
DD = date
hh = hour
mm = minute
ss = seconds
yyyy = year
Example: `Thu Apr 17 15:16:09 2003`

swFWLastUpdated

OID 1.3.6.1.4.1.1588.2.1.1.1.1.3

Description The date and time when the firmware was last loaded to the switch.

The return string is in the format `ddd MMM DD hh:mm:ss yyyy`
where: *ddd* = day of the week
MMM = month
DD = date
hh = hour
mm = minute
ss = seconds
yyyy = year
Example: `Thu Apr 17 15:16:09 2003`

swFlashLastUpdated

OID 1.3.6.1.4.1.1588.2.1.1.1.1.4

Description The date and time when the firmware was last downloaded or the configuration file was last changed.

The return string is in the format `ddd MMM DD hh:mm:ss yyyy`
where: *ddd* = day of the week
MMM = month
DD = date
hh = hour
mm = minute
ss = seconds
yyyy = year
Example: `Thu Apr 17 15:16:09 2003`

swBootPromLastUpdated

OID 1.3.6.1.4.1.1588.2.1.1.1.1.5

Description The date and time when the BootPROM was last updated.

The return string is in the format `ddd MMM DD hh:mm:ss yyyy`
where: *ddd* = day of the week
MMM = month

DD = date
hh = hour
mm = minute
ss = seconds
yyyy = year
Example: `Thu Apr 17 15:16:09 2003`

swFirmwareVersion

OID 1.3.6.1.4.1.1588.2.1.1.1.1.6

Description The current version of the firmware.

The return value is displayed using the following format:
vM.m.f
Where:
v = The deployment indicator
M = Major version
m = Minor version
f = Software maintenance version
(For example: `2.2.1` (indicating FOS version 2.2.1.))

swOperStatus

OID 1.3.6.1.4.1.1588.2.1.1.1.1.7

Description The current operational status of the switch.

Possible values are:

online (1)	The switch is accessible by an external Fibre Channel port.
offline (2)	The switch is not accessible.
testing (3)	The switch is in a built-in test mode and is not accessible by an external Fibre Channel port.
faulty (4)	The switch is not operational.

swAdmStatus

OID 1.3.6.1.4.1.1588.2.1.1.1.1.8

Description The desired administrative status of the switch. A management station may place the switch in a desired state by setting this object accordingly.

Possible values are:

online (1):	Set the switch to be accessible by an external Fibre Channel port.
offline (2):	Set the switch to be inaccessible.
testing (3):	Set the switch to run the built-in test.
faulty (4):	Set the switch to a "soft" faulty condition.
reboot (5):	Set the chassis to reboot in 1 second.
fastboot (6):	Set the chassis to fastboot in 1 second. Fastboot causes the chassis to boot but skip over the POST.
switchReboot (7):	(ED-1200B only) Set the current director to reboot in 1 second.

The testing (3), faulty (4), and switchReboot (7) values do not apply to the DS-32B2.

When the switch is in faulty state, only two states can be set: faulty and reboot/fastboot/switchReboot.

swTelnetShellAdmStatus

OID 1.3.6.1.4.1.1588.2.1.1.1.1.9

Description The desired administrative status of the Telnet shell.

This variable is not supported in v4.x.

swSsn

OID 1.3.6.1.4.1.1588.2.1.1.1.10

Description The soft serial number of the switch.

By default, the return value is the WWN of the switch.

Flash Administration

The next six objects are related to firmware or configuration file management. The underlying method in the transfer of the firmware or configuration file is based on either FTP or remote shell:

- If a password is provided, then FTP is used.
- If no password is provided, then remote shell is used.

Use one of the following methods to manage the firmware or switch configuration file in the switch Flash:

Method 1 Set swFlashDLHost.0, swFlashDLUser.0, and swFlashDLFile.0 to appropriate host IP address in dot notation (for example, `192.168.1.7`), user name (for example, administrator), and file name of the firmware or configuration file (for example, `/home/fcswh/2.2`), respectively.

Method 2

1. Set swFlashDLPassword.0 to an appropriate value (for example, `secret`) if FTP is the desired method of transfer.
2. Set swFlashDLAdmStatus.0 to `2` (swFwUpgrade), `3` (swCfUpload), or `4` (swCfDownload) accordingly.

swFlashDLOperStatus

OID 1.3.6.1.4.1.1588.2.1.1.1.11

Description The operational status of the Flash.

Possible values are:

unknown (0):

swCurrent (1): The Flash contains the current firmware image or configuration file.

swFwUpgraded (2): The Flash contains the image upgraded from the swFlashDLHost.0.

swCfUploaded (3): The switch configuration file has been uploaded to the host.

swCfDownloaded (4): The switch configuration file has been downloaded from the host.

swFwCorrupted (5): The firmware in the Flash of the switch is corrupted.

swFlashDLAdmStatus

MIB v4.x does not support this variable.

OID 1.3.6.1.4.1.1588.2.1.1.1.12

Description The desired state of the Flash.

The host is specified in swFlashDLHost.0. In addition, the user name is specified in swFlashDLUser.0, and the file name specified in swFlashDLFile.0.

Possible values are:

wCurrent (1): The Flash contains the current firmware image or configuration file.

swCfUpload (3): The switch configuration file is to be uploaded to the host specified.

swCfDownload (4) The switch configuration file is to be downloaded from the host specified.

swFwCorrupted (5): The firmware in the Flash is corrupted. This value is for informational purposes only. However, set of swFlashDLAdmStatus to this value is not allowed.

For more information on the **configUpload** and **configDownload** commands, refer to the *EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B Fabric OS Reference Manual*.

swFlashDLHost

OID 1.3.6.1.4.1.1588.2.1.1.1.1.13

Description The name or IP address (in dot notation) of the host to download or upload a relevant file to the Flash.

swFlashDLUser

OID 1.3.6.1.4.1.1588.2.1.1.1.1.14

Description The user name on the host that is used for downloading or uploading a relevant file, to or from the Flash.

swFlashDLFile

OID 1.3.6.1.4.1.1588.2.1.1.1.1.15

Description The name of the file to be downloaded or uploaded.

swFlashDLPassword

OID 1.3.6.1.4.1.1588.2.1.1.1.1.16

Description The password to be used in for FTP transfer of files in the download or upload operation.

swBeaconOperStatus

OID 1.3.6.1.4.1.1588.2.1.1.1.1.18

Description The current operational status of the switch beacon. When the beacon is on, the LEDs on the front panel of the switch run alternately from left to right and right to left. In this state, the color of the LED is yellow. When the beacon is off, each LED will be in their its regular status indicating color and state.

Possible values are:

on (1)	The LEDs on the front panel of the switch run alternately from left to right and right to left. The color is yellow.
off (2)	Each LED is in its regular status, indicating color and state.

swBeaconAdmStatus

OID 1.3.6.1.4.1.1588.2.1.1.1.19

Description The desired status of the switch beacon. When the beacon is set to on, the LEDs on the front panel of the switch run alternately from left to right and right to left. The color is yellow. When the beacon is set to off, each LED will be in its regular status indicating color and state.

Possible values are:

on (1)	The LEDs on the front panel of the switch run alternately from left to right and right to left. Set the color to yellow.
off (2)	Set each LED to its regular status, indicating color and state.

swDiagResult

OID 1.3.6.1.4.1.1588.2.1.1.1.20

Description The result of the power-on self test (POST) diagnostics.

Possible values are:

sw-ok (1)	The switch is okay.
sw-faulty (2)	The switch has experienced an unknown fault.
sw-embedded-port-fault (3)	The switch has experienced an embedded port fault.

Environment Sensor Table

swNumSensors

OID 1.3.6.1.4.1.1588.2.1.1.1.1.21

Description The number of sensors inside the switch. If no sensor is available, the variable is assigned value -1.

swSensorTable

OID 1.3.6.1.4.1.1588.2.1.1.1.1.22

Description The table of sensor entries.

swSensorEntry

OID 1.3.6.1.4.1.1588.2.1.1.1.1.22.1
swSensorTable.1

Description An entry of the sensor information.

Index swSensorIndex

swSensorIndex

OID 1.3.6.1.4.1.1588.2.1.1.1.1.22.1.1
swSensorTable.1.1

Description The index of the sensor.

Values for the index range from 1 through the value in swNumSensors.

swSensorType

OID 1.3.6.1.4.1.1588.2.1.1.1.1.22.1.2
swSensorTable.1.2

Description The type of sensor.

swSensorStatus

OID 1.3.6.1.4.1.1588.2.1.1.1.22.1.3
swSensorTable.1.3

Description The current status of the sensor.

Possible values are:

unknown (1)	The status of the sensor is unknown.
faulty (2)	The status of the sensor is in a faulty state.
below-min (3)	The sensor value is below the minimal threshold.
nominal (4)	The status of the sensor is in a nominal state.
above-max (5)	The sensor value is above the maximum threshold.
absent (6)	The sensor is missing.

Valid values are:

- For temperature: 3 (below-min), 4 (above-max), and 4 (nominal).
- For fan: 3 (below-min), 4 (nominal)., and 6 (absent).
- For power supply: 2 (faulty), 4 (nominal), and 6 (absent).

swSensorValue

OID 1.3.6.1.4.1.1588.2.1.1.1.22.1.4
swSensorTable.1.4

Description The current value (reading) of the sensor.

The value `-2147483648` represents an unknown quantity.

It also means that the sensor cannot measure the actual value. In 2.0, the temperature sensor value will be in Celsius; the fan value will be in RPM (revolution per minute); and the power supply sensor reading will be unknown.

The value -2147483648 (unknown) indicates the maximum value of integer value 2^{-32}.

---

swSensorInfo

OID 1.3.6.1.4.1.1588.2.1.1.1.1.22.1.5
swSensorTable.1.5

Description Additional displayable information on the sensor. In 2x, it contains the sensor type and number in textual format. For example, `Temp 3` or `Fan 6`.

Return values depend on the configuration of your system.

swTrackChangesInfo

OID 1.3.6.1.4.1.1588.2.1.1.1.1.23

Description Track changes string. For trap only.

If there are no events to track, the default return value is `No event so far`.
If there are events to track, the following are valid return values:

```
Successful login
Unsuccessful login
Logout
Configuration file change from task [name of task]
Track-changes on
Track-changes off
```

swID

OID 1.3.6.1.4.1.1588.2.1.1.1.1.24

Description The number of the logical switch (0 or 1).

swEtherIPAddress

OID 1.3.6.1.4.1.1588.2.1.1.1.1.25

Description The IP address of the Ethernet interface of this logical switch.

swEtherIPMask

OID 1.3.6.1.4.1.1588.2.1.1.1.1.26

Description The IP Mask of the Ethernet interface of this logical switch.

swFCIPAddress

OID 1.3.6.1.4.1.1588.2.1.1.1.1.27

Description The IP address of the FC interface of this logical switch.

swFCIPMask

OID 1.3.6.1.4.1.1588.2.1.1.1.1.28

Description The IP Mask of the FC interface of this logical switch.

Fabric Group

swDomainID

OID 1.3.6.1.4.1.1588.2.1.1.1.2.1

Description The current Fibre Channel domain ID of the switch. To set a new value, the switch (swAdmStatus) must be in offline or testing state.

swPrincipalSwitch

OID 1.3.6.1.4.1.1588.2.1.1.1.2.2

Description Indicates whether the switch is the principal switch as per FC-SW.

Possible values are:

yes(1)

no(2)

Immediate Neighborhood ISL Family Table

swNumNbs

OID 1.3.6.1.4.1.1588.2.1.1.1.2.8

Description The number of inter-switch links (ISLs) in the (immediate) neighborhood.

swNbTable

OID 1.3.6.1.4.1.1588.2.1.1.1.2.9

Description The ISLs in the immediate neighborhood of the switch.

swNbEntry

OID 1.3.6.1.4.1.1588.2.1.1.1.2.9.1
swNbTable.1

Description An entry containing each neighbor ISL parameters.

Index swNbIndex

swNbIndex

OID 1.3.6.1.4.1.1588.2.1.1.1.2.9.1.1
swNbTable.1.1

Description The index for neighborhood entry.

swNbMyPort

OID 1.3.6.1.4.1.1588.2.1.1.1.2.9.1.2
swNbTable.1.2

Description The port that has an ISL to another switch.

This value is the same as the physical port number of the local switch +1.

The valid value for the ED-12000B is 1 through the maximum number of ports.

swNbRemDomain

OID 1.3.6.1.4.1.1588.2.1.1.1.2.9.1.3
swNbTable.1.3

Description This is the Fibre Channel domain on the other end of the ISL.

This is the domain ID of the remote switch. Valid values are 1 through 239 as defined by FCS-SW.

swNbRemPort

OID 1.3.6.1.4.1.1588.2.1.1.1.2.9.1.4
swNbTable.1.4

Description The port index on the other end of the ISL.

This value is the same as the physical port number of the local switch plus 1.

The valid values for the DS-32B2 and ED-12000B switches are 0 through maximum number of ports.

swNbBaudRate

OID 1.3.6.1.4.1.1588.2.1.1.1.2.9.1.5
swNbTable.1.5

Description The baud rate of the ISL.

Possible values are:

other (1)	None of the following
oneEighth (2)	155 Mbaud
quarter (4)	266 Mbaud

half (8)	532 Mbaud
full (16)	1 Gbaud
double (32)	2 Gbaud
quadruple (64)	4 Gbaud

Valid values for the DS-32B2 and ED-12000B switches are 16 (full) and 32 (double).

swNbIslState

OID 1.3.6.1.4.1.1588.2.1.1.1.2.9.1.6
swNbTable.1.6

Description The current state of the ISL.

swNbIslCost

OID 1.3.6.1.4.1.1588.2.1.1.1.2.9.1.7
swNbTable.1.7

Description The current link cost of the ISL. In other words, the cost of a link to control the routing algorithm.

swNbRemPortName

OID 1.3.6.1.4.1.1588.2.1.1.1.2.9.1.8
swNbTable.1.8

Description The WWN of the remote port.

swFabricMemTable

OID 1.3.6.1.4.1.1588.2.1.1.1.2.10

Description This table contains information on the member switches of a fabric. This may not be available on all versions of Fabric OS.

swFabricMemEntry

OID 1.3.6.1.4.1.1588.2.1.1.1.2.10.1
swFabricMemTable.1

Description An entry containing each switch in the fabric.

Index swFabricMemWwn

swFabricMemWwn

OID 1.3.6.1.4.1.1588.2.1.1.1.2.10.1.1
swFabricMemTable.1.1

Description This object identifies the World Wide Name of the member switch.

swFabricMemDid

OID 1.3.6.1.4.1.1588.2.1.1.1.2.10.1.2
swFabricMemTable.1.2

Description This object identifies the domain ID of the member switch.

swFabricMemName

OID 1.3.6.1.4.1.1588.2.1.1.1.2.10.1.3
swFabricMemTable.1.3

Description This object identifies the name of the member switch.

swFabricMemEIP

OID 1.3.6.1.4.1.1588.2.1.1.1.2.10.1.4
swFabricMemTable.1.4

Description This object identifies the Ethernet IP address of the member switch.

swFabricMemFCIP

OID 1.3.6.1.4.1.1588.2.1.1.1.2.10.1.5
swFabricMemTable.1.5

Description This object identifies the Fibre Channel IP address of the member switch.

swFabricMemGWIP

OID 1.3.6.1.4.1.1588.2.1.1.1.2.10.1.6
swFabricMemTable.1.6

Description This object identifies the Gateway IP address of the member switch.

swFabricMemType

OID 1.3.6.1.4.1.1588.2.1.1.1.2.10.1.7
swFabricMemTable.1.7

Description This object identifies the member switch type.

swFabricMemShortVersion

OID 1.3.6.1.4.1.1588.2.1.1.1.2.10.1.8
swFabricMemTable.1.8

Description This object identifies the Fabric OS version of the member switch.

Short version of Fabric OS; for example, it gives v410 for Fabric OS v4.1.x.

SW Agent Configuration Group

swAgtCmtyTable

OID 1.3.6.1.4.1.1588.2.1.1.1.4.11

Description A table that contains one entry for each community and the access control and parameters of the Community.

The table shows all of the community strings (read and write) if it is accessed by the *write* community string. Only *read* community strings appear if the table is accessed by the *read* community string.

In Secure Fabric OS, the community strings can be modified only on the primary switch.

swAgtCmtyEntry

OID 1.3.6.1.4.1.1588.2.1.1.1.4.11.1
swAgtCmtyTable.1

Description An entry containing the community parameters.

Index swAgtCmtyIdx

swAgtCmtyIdx

OID 1.3.6.1.4.1.1588.2.1.1.1.4.11.1.1
swAgtCmtyTable.1.1

Description The SNMPv1 community entry.

The return value for this entry is always a number from 4 to 6.

swAgtCmtyStr

OID 1.3.6.1.4.1.1588.2.1.1.1.4.11.1.2
swAgtCmtyTable.1.2

Description A community string supported by the agent. If a new value is set successfully, it takes effect immediately.

Default values for communities are as follows:

1 Secret Code
2 OrigEquipMfr
3 private
4 public
5 common
6 Fibre Channel

Community strings 1 to 3 are read/write and strings 4 to 6 are read-only. Change the community setting using the `agtcfgSet` Telnet command.

swAgtTrapRcp

OID 1.3.6.1.4.1.1588.2.1.1.1.4.11.1.3
swAgtCmtyTable.1.3

Description The trap recipient associated with the community. If a new value is set successfully, it takes effect immediately.

If not otherwise set, the default IP address for this trap recipient is `0.0.0.0`, and the SNMP trap is not sent for the associated community string.

With a setting of `non-0.0.0.0` IP address, SNMP traps are sent to the host with the associated community string.

Any or all of the trap recipients can be configured to send a trap for the associated community string. The maximum number of trap recipients that can be configured is 6. If no trap recipient is configured, no traps are sent.

The trap recipient IP address should be part of the Access Control List. (Refer to **agtCfgSet** Telnet command.)

The Fibre Channel Port Group

This group contains information about the physical state, operational status, performance and error statistics of each Fibre Channel port on the switch. A Fibre Channel port is one that supports the Fibre Channel protocol, for example, F_Port, E_Port, U_Port, or FL_Port.

swFCPortCapacity

OID 1.3.6.1.4.1.1588.2.1.1.1.6.1

Description The number of Fibre Channel ports on this switch. It includes U_Port, F_Port, FL_Port and any other types of Fibre Channel port.

Fibre Channel Port Table

swFCPortTable

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2

Description A table that contains one entry for each switch port, and configuration and service parameters of the port.

swFCPortEntry

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1
swFCPortTable.1

Description An entry containing the configuration and service parameters of the switch port.

Index swFCPortIndex

swFCPortIndex

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.1
swFCPortTable.1.1

Description The switch port index.

This value is the same as the physical port number of the local switch +1.

The valid values for the DS-32B2 and ED-12000B switches are 0 through maximum number of ports.

swFCPortType

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.2
swFCPortTable.1.2

Description The type of ASIC for the switch port.

The valid value for the DS-32B2 and ED-12000B switches is 4.

swFCPortPhyState

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.3
swFCPortTable.1.3

Description The physical state of the port.

Possible values are:

noCard (1)	No card is present in this switch slot.
noTransceiver (2)	No Transceiver module in this port (Transceiver is the generic name for GBIC, SFP, etc.).
laserFault (3)	The module is signaling a laser fault (defective GBIC)
noLight (4)	The module is not receiving light.
noSync (5)	The module is receiving light but is out of sync.
inSync (6)	The module is receiving light and is in sync.
portFault (7)	The port is marked faulty (defective GBIC, cable, or device).
diagFault (8)	The port failed diagnostics (defective G_Port or FL_Port card or motherboard.
lockRef (9)	Port is locking to the reference signal.

swFCPortOpStatus

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.4
swFCPortTable.1.4

Description The operational status of the port.

Possible values are:

unknown (0)	The port module is physically absent.
online (1)	User frames can be passed.

offline (2)	No user frames can be passed.
testing (3)	No user frames can be passed.
faulty (4)	The port module is physically faulty.

swFCPortAdmStatus

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.5
swFCPortTable.1.5

Description The desired state of the port. A management station may place the port in a desired state by setting this object accordingly.

Possible values are:

online (1)	User frames can be passed.
offline (2)	No user frames can be passed.
testing (3)	No user frames can be passed.
faulty (4)	No user frames can be passed.

In v4.1: The testing (3) state is not supported.

swFCPortLinkState

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.6
swFCPortTable.1.6

Description The link state of the port:

enabled (1)	The port is allowed to participate in the FC-PH protocol with its attached port (or ports if it is in an FC-AL loop).
disabled (2)	The port is not allowed to participate in the FC-PH protocol with its attached ports.
loopback (3)	The port may transmit frames through an internal path to verify the health of the transmitter and receiver path.

When the port's link state changes, its operational status (swFCPortOpStatus) is affected.

swFCPortTxType

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.7
swFCPortTable.1.7

Description The media transmitter type of the port.

Possible values are:

unknown (1)	Cannot determine the port driver.
lw (2)	Long wave laser.
sw (3)	Short wave laser.
ld (4)	Long wave LED.
cu (5)	Copper (electrical).

swFCPortTxWords

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.11
swFCPortTable.1.11

Description The number of Fibre Channel words that the port has transmitted.

swFCPortRxWords

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.12
swFCPortTable.1.12

Description The number of Fibre Channel words that the port has received.

swFCPortTxFrames

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.13
swFCPortTable.1.13

Description The number of Fibre Channel frames that the port has transmitted.

swFCPortRxFrames

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.14
swFCPortTable.1.14

Description The number of Fibre Channel frames that the port has received.

swFCPortRxC2Frames

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.15
swFCPortTable.1.15

Description The number of Class 2 frames that the port has received.

swFCPortRxC3Frames

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.16
swFCPortTable.1.16

Description The number of Class 3 frames that the port has received.

swFCPortRxLCs

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.17
swFCPortTable.1.17

Description The number of Link Control frames that the port has received.

swFCPortRxMcasts

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.18
swFCPortTable.1.18

Description The number of Multicast frames that the port has received.

swFCPortTooManyRdys

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.19
swFCPortTable.1.19

Description The number of times when RDYs exceeds the frames received.

swFCPortNoTxCredits

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.20
swFCPortTable.1.20

Description The number of times when the transmit credit has reached zero.

swFCPortRxEncInFrs

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.21
swFCPortTable.1.21

Description The number of encoding error or disparity error inside frames received.

swFCPortRxCrcs

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.22
swFCPortTable.1.22

Description The number of CRC errors detected for frames received.

swFCPortRxTruncs

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.23
swFCPortTable.1.23

Description The number of truncated frames that the port has received.

swFCPortRxTooLongs

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.24
swFCPortTable.1.24

Description The number of received frames that are too long.

swFCPortRxBadEofs

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.15
swFCPortTable.1.25

Description The number of received frames that have bad EOF delimiter.

swFCPortRxEncOutFrs

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.26
swFCPortTable.1.26

Description The number of encoding error or disparity error outside frames received.

swFCPortRxBadOs

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.27
swFCPortTable.1.27

Description The number of invalid ordered sets received.

swFCPortC3Discards

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.28
swFCPortTable.1.28

Description The number of Class 3 frames that the port has discarded.

swFCPortMcastTimedOuts

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.29
swFCPortTable.1.29

Description The number of multicast frames that have timed out.

swFCPortTxMcasts

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.30
swFCPortTable.1.20

Description The number of multicast frames that have been transmitted.

swFCPortLipIns

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.31
swFCPortTable.1.31

Description The number of loop initializations that have been initiated by loop devices attached.

swFCPortLipOuts

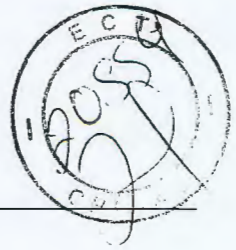
OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.32
swFCPortTable.1.32

Description The number of loop initializations that have been initiated by the port.

swFCPortLipLastAlpa

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.33
swFCPortTable.1.33

Description The Physical Address (AL_PA) of the loop device that initiated the last loop initialization.



swFCPortWwn

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.34
swFCPortTable.1.34

Description The WWN of the Fibre Channel port. The contents of an instance are in the IEEE extended format as specified in FC-PH.

swFCPortSpeed

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.35
swFCPortTable.1.35

Description The desired baud rate for the port.

swFCPortName

OID 1.3.6.1.4.1.1588.2.1.1.1.6.2.1.36
swFCPortTable.1.36

Description A string that indicates the name of the addressed port.

The names should be persistent across switch reboots. Port names do not have to be unique within a switch or within a fabric.

The Name Server Database Group

swNsLocalNumEntry

OID 1.3.6.1.4.1.1588.2.1.1.1.7.1

Description The number of local Name Server entries.

sw Name Server Local Table

swNsLocalTable

OID 1.3.6.1.4.1.1588.2.1.1.1.7.2

Description The table of local Name Server entries.

swNsLocalEntry

OID 1.3.6.1.4.1.1588.2.1.1.1.7.2.1
swNsLocalTable.1

Description An entry from the local Name Server database.

Index swNsEntryIndex

swNsEntryIndex

OID 1.3.6.1.4.1.1588.2.1.1.1.7.2.1.1
swNsLocalTable.1.1

Description The index of the Name Server database entry.

swNsPortID

OID 1.3.6.1.4.1.1588.2.1.1.1.7.2.1.2
swNsLocalTable.1.2

Description The Fibre Channel port address ID of the entry.

swNsPortType

OID 1.3.6.1.4.1.1588.2.1.1.1.7.2.1.3
swNsLocalTable.1.3

Description The type of port for this entry.

Possible values are:

unknown (0)	The type is defined in FC-GS-2.
nPort (1)	The type is defined in FC-GS-2.
nlPort (2)	The type is defined in FC-GS-2.

swNsPortName

OID 1.3.6.1.4.1.1588.2.1.1.1.7.2.1.4
swNsLocalTable.1.4

Description The Fibre Channel WWN of the port entry.

swNsPortSymb

OID 1.3.6.1.4.1.1588.2.1.1.1.7.2.1.5
swNsLocalTable.1.5

Description The contents of a Symbolic Name of the port entry. In FC-GS-2, a Symbolic Name consists of a byte array of 1 through 256 bytes, and the first byte of the array specifies the length of its contents. This object variable corresponds to the contents of the Symbolic Name, with the first byte removed.

swNsNodeName

OID 1.3.6.1.4.1.1588.2.1.1.1.7.2.1.6
swNsLocalTable.1.6

Description The Fibre Channel WWN of the associated node as defined in FC-GS-2.

swNsNodeSymb

OID 1.3.6.1.4.1.1588.2.1.1.1.7.2.1.7
swNsLocalTable.1.7

Description The contents of a Symbolic Name of the node associated with the entry. In FC-GS-2, a Symbolic Name consists of a byte array of 1 through 256 bytes, and the first byte of the array specifies the length of its contents. This object variable corresponds to the contents of the Symbolic Name, with the first byte removed.

swNsIPA

OID 1.3.6.1.4.1.1588.2.1.1.1.7.2.1.8
swNsLocalTable.1.8

Description The Initial Process Associators of the node for the entry as defined in FC-GS-2.

swNsIpAddress

OID 1.3.6.1.4.1.1588.2.1.1.1.7.2.1.9
swNsLocalTable.1.9

Description The IP address of the node for the entry as defined in FC-GS-2. The format of the address is in IPv6.

swNsCos

OID 1.3.6.1.4.1.1588.2.1.1.1.7.2.1.10
swNsLocalTable.1.10

Description The class of services supported by the port.

swNsFc4

OID 1.3.6.1.4.1.1588.2.1.1.1.7.2.1.11
swNsLocalTable.1.11

Description The FC-4s supported by the port as defined in FC-GS-2.

swNsIpNxPort

OID 1.3.6.1.4.1.1588.2.1.1.1.7.2.1.12
swNsLocalTable.1.12

Description The IpAddress of the Nx_port for the entry.

swNsWwn

OID 1.3.6.1.4.1.1588.2.1.1.1.7.2.1.13
swNsLocalTable.1.13

Description The World Wide Name (WWN) of the Fx_port for the entry.

swNsHardAddr

OID 1.3.6.1.4.1.1588.2.1.1.1.7.2.1.14
swNsLocalTable.1.14

Description The 24-bit hard address of the node for the entry.

Event Group

To Map the errLog

Logically, the swEventTable is separate from the error log since it is essentially a view of the error log within a particular time window. The value of swEventIndex shall indicate the event number that has occurred since the switch booted. The values range from 1 through 2147383647 (2^31 - 1).

swEventTrapLevel

OID 1.3.6.1.4.1.1588.2.1.1.1.8.1

Description The swEventTrap level in conjunction with an event's severity level. When an event occurs, if its severity level is at or below the specified numeric value, the agent sends the associated swEventTrap to the configured recipients.

Possible values are:

none (0)
critical (1)
error (2)
warning (3)
informational (4)
debug (5)

For example, if this variable is set to 3 (warning), all error logs of severity 1 (critical), 2 (error), and 3 (warning) are sent as an SNMP trap of swEventTrap, as shown in *swEventTrap* on page 5-11.

swEventNumEntries

OID 1.3.6.1.4.1.1588.2.1.1.1.8.4

Description The number of entries in the Event Table. Valid values vary (from 1 through 2048) for each Fabric OS.

swEventTable

OID 1.3.6.1.4.1.1588.2.1.1.1.8.5

Description The table of event entries.

swEventEntry

OID 1.3.6.1.4.1.1588.2.1.1.1.8.5.1
swEventTable.1

Description An entry of the event table.

Index swEventIndex

swEventIndex

OID 1.3.6.1.4.1.1588.2.1.1.1.8.5.1.1
swEventTable.1.1

Description The index of the event entry.

Logically, the swEventTable is separate from the error log since it is essentially a view of the error log within a particular time window. The value of swEventIndex shall indicate the event number that has occurred since the switch booted. The values range from 1 through 2147383647 (2^{31} minus 1).

swEventTimeInfo

OID 1.3.6.1.4.1.1588.2.1.1.1.8.5.1.2
swEventTable.1.2

Description The date and time when this event occurred.

The return string is displayed using the following format:
ddd MMM DD hh:mm:ss.
Where:
ddd = Day
MMM = Month
DD = Date
hh = Hour

mm = Minute
ss = Seconds
(For example: `Thu Aug 17 15:16:09`.)

swEventLevel

OID 1.3.6.1.4.1.1588.2.1.1.1.8.5.1.3
swEventTable.1.3

Description The severity level of this event entry.

Possible values are:

critical (1)
error (2)
warning (3)
informational (4)
debug (5)

swEventRepeatCount

OID 1.3.6.1.4.1.1588.2.1.1.1.8.5.1.4
swEventTable.1.4

Description The count of consecutive times this particular event has occurred if the most recent event is the same as the previous, this number is incremented by one.

swEventDescr

OID 1.3.6.1.4.1.1588.2.1.1.1.8.5.1.5
swEventTable.1.5

Description A textual description of the event.

For more information about error messages, see *EMC Connectrix Departmental Switch DS-32B2 and Enterprise Director ED-12000B Fabric OS Reference Manual.*

Fabric Watch Group

Fabric Watch subsystem consists of one license scalar and two tables:

- The license scalar, swFwFabricWatchLicense, is used to tell is if the switch has proper license for Fabric Watch.
- One table, *swFwClassAreaTable* on page 5-52, contains classArea information such as threshold unit string, time base, low thresholds, and so on. SwFwClassAreaEntry contains control information for a class/area's threshold.
- The other table, *swFwThresholdTable* on page 5-60, contains individual threshold information such as name, label, last event, and so forth. SwFwThresholdEntry contains the thresholds.

swFwFabricWatchLicense

OID 1.3.6.1.4.1.1588.2.1.1.1.10.1

Description If the Fabric Watch license key is installed on the switch, the return value is swFwLicensed. Otherwise, the value is swFwNotLicensed.

swFwClassAreaTable

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2

Description The table of classes and areas.

swFwClassAreaEntry

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1
swFwClassAreaTable.1

Description An entry of the classes and areas.

Index swFwClassAreaIndex

swFwClassAreaIndex

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.1
swFwClassAreaTable.1.1

Description An index representing the Fabric Watch classArea combination.

swFwWriteThVals

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.2
swFwClassAreaTable.1.2

Description A flag that applies or cancels the configuration value changes.

For a read operation, the return value is always swFwCancelWrite.
The following are the custom configuration variables that can be modified.

```
swFwCustUnit
swFwCustTimebase
swFwCustLow
swFwCustHigh
swFwCustBufSize
```

Changes to these custom configuration variables can be saved by setting this variable to swFwApplyWrite, and they can be removed by setting this variable to swFwCancelWrite.

swFwDefaultUnit

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.3
swFwClassAreaTable.1.3

Description A default unit string name, used to identify the unit of measure for a Fabric Watch classArea combination. For example:

- `C` = environment (class), temperature (area).
- `RPM` = environment (class), fan (area).

swFwDefaultTimebase

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.4
swFwClassAreaTable.1.4

Description A default polling period for the Fabric Watch classArea combination. For example:

- swFwTbMin = port (class), link loss (area).
- swFwTbNone = environment (class), temperature (area).

swFwDefaultLow

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.5
swFwClassAreaTable.1.5

Description A default low-threshold value.

swFwDefaultHigh

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.6
swFwClassAreaTable.1.6

Description A default high-threshold value.

swFwDefaultBufSize

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.7
swFwClassAreaTable.1.7

Description A default buffer-size value.

swFwCustUnit

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.8
swFwClassAreaTable.1.8

Description A customizable unit string name, used to identify the unit of measure for a Fabric Watch classArea combination. For example:

- C = environment (class), temperature (area).
- RPM = environment (class), fan (area).

swFwCustTimebase

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.9
swFwClassAreaTable.1.9

Description A customizable polling period for the Fabric Watch classArea combination. For example:

- swFwTbMin = port (class), link loss (area).
- swFwTbNone = environment (class), temperature (area).

swFwCustLow

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.10
swFwClassAreaTable.1.10

Description A customizable low-threshold value for a Fabric Watch ClassArea combination.

swFwCustHigh

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.11
swFwClassAreaTable.1.11

Description A customizable high-threshold value for a Fabric Watch ClassArea combination.

swFwCustBufSize

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.12
swFwClassAreaTable.1.12

Description A customizable buffer-size value for a Fabric Watch ClassArea combination.

swFwThLevel

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.13
swFwClassAreaTable.1.13

Description A pointer to the current level for classArea values. It is either default or custom.

For a read operation, the return value is either 2 (swFwDefault) or 3 (swFwCustom). 1 (swFwReserved) is obsolete.

If the write operation sets the variable to 2 (swFwDefault), the following default configuration variables are used for the Fabric Watch classArea combination:

swFwDefaultUnit
swFwDefaultTimebase
swFwDefaultLow
swFwDefaultHigh
swFwDefaultBufSize

If the write operation sets the variable to 3 (swFwCustom), the following custom configuration variables are used for the Fabric Watch classArea combination:

swFwCustUnit
swFwCustTimebase
swFwCustLow
swFwCustHigh
swFwCustBufSize

swFwWriteActVals

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.14
swFwClassAreaTable.1.14

Description A variable that applies or cancels the alarm value changes.

For a read operation, the return value is always swFwCancelWrite. The following are the custom alarm variables that can be modified:

swFwCustChangedActs
swFwCustExceededActs

swFwCustBelowActs
swFwCustAboveActs
swFwCustInBetweenActs

Changes to these custom alarm variables can be saved by setting this variable to swFwApplyWrite.

Changes to these custom alarm variables can be removed by setting this variable to swFwCancelWrite.

swFwDefaultChangedActs

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.15
swFwClassAreaTable.1.15

Description Default action matrix for changed event.

swFwDefaultExceededActs

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.16
swFwClassAreaTable.1.16

Description Default action matrix for an exceeded event. The exceeded value may be either above the high threshold or below the low threshold.

swFwDefaultBelowActs

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.17
swFwClassAreaTable.1.17

Description Default action matrix for below event.

swFwDefaultAboveActs

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.18
swFwClassAreaTable.1.18

Description Default action matrix for above event.

swFwDefaultInBetweenActs

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.19
swFwClassAreaTable.1.19

Description Default action matrix for in-between event.

swFwCustChangedActs

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.20
swFwClassAreaTable.1.20

Description Custom action matrix for changed event.

swFwCustExceededActs

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.21
swFwClassAreaTable.1.21

Description Custom action matrix for an exceeded event.

swFwCustBelowActs

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.22
swFwClassAreaTable.1.22

Description Custom action matrix for below event.

swFwCustAboveActs

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.23
swFwClassAreaTable.1.23

Description Custom action matrix for above event.

swFwCustInBetweenActs

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.24
swFwClassAreaTable.1.24

Description Custom action matrix for in-between event.

swFwValidActs

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.25
swFwClassAreaTable.1.25

Description Matrix of valid acts for a classArea.

swFwActLevel

OID 1.3.6.1.4.1.1588.2.1.1.1.10.2.1.26
swFwClassAreaTable.1.26

Description A pointer to the current level for classArea values. It is either default or custom.

For a read operation, the return value is either 2 (swFwDefault) or 3 (swFwCustom). 1 (swFwReserved) is obsolete.

If the write operation sets the variable to 2 (swFwDefault), the following default action matrix variables are used for the Fabric Watch classArea combination:

swFwDefaultChangedActs
swFwDefaultExceededActs
swFwDefaultBelowActs
swFwDefaultAboveActs
swFwDefaultInBetweenActs

If the write operation sets the variable to 3 (swFwCustom), the following custom action matrix variables are used for the Fabric Watch classArea combination:

swFwCustChangedActs
swFwCustExceededActs

swFwCustBelowActs
swFwCustAboveActs
swFwCustInBetweenActs

swFwThresholdTable

OID 1.3.6.1.4.1.1588.2.1.1.1.10.3

Description The table of individual thresholds.

swFwThresholdEntry

OID 1.3.6.1.4.1.1588.2.1.1.1.10.3.1
swFwThresholdTable.1

Description An entry of an individual threshold.

Index swFwClassAreaIndex, swFwThresholdIndex

swFwThresholdIndex

OID 1.3.6.1.4.1.1588.2.1.1.1.10.3.1.1
swFwThresholdTable.1.1

Description Represents the element index of a threshold.

For environment class, the indexes are from 2 through *number of environment sensors+1*. For example, the indexes for environment class temperature area are:

envTemp001: index of 2
envTemp002: index of 3
envTemp003: index of 4
envTemp004: index of 5
envTemp005: index of 6

For port-related classes such as E_Port, the indexes are from 1 through *number of ports*. For example, the indexes for E_Port classlink loss area:

eportLink000: index of 1
eportLink001: index of 2
eportLink002: index of 3
eportLink003: index of 4

eportLink004: index of 5
eportLink005: index of 6
eportLink006: index of 7
eportLink007: index of 8
eportLink008: index of 9
eportLink009: index of 10
eportLink010: index of 11
eportLink011: index of 12
eportLink012: index of 13
eportLink013: index of 14
eportLink014: index of 15
eportLink015: index of 16

swFwStatus

OID 1.3.6.1.4.1.1588.2.1.1.1.10.3.1.2
swFwThresholdTable.1.2

Description A flag that indicates whether a threshold is enabled or disabled.

swFwName

OID 1.3.6.1.4.1.1588.2.1.1.1.10.3.1.3
swFwThresholdTable.1.3

Description Name of the threshold. Table 5-3 contains examples.

Table 5-3 Threshold Names

swFwName	Threshold Name
envFan001	Env Fan 1
envPS002	Env Power Supply 2
envTemp001	Env Temperature 1
gbicTemp001	GBIC Temperature 1
gbicRXP001	GBIC RX power 1
gbicTXP001	GBIC TX power 1
gbicCrnt001	GBIC Current 1
eportCRCs007	E_Port Invalid CRCs 7

Table 5-3 Threshold Names (continued)

eportLink007	E_Port Link Failures 7
eportProtoErr007	E_Port Protocol Errors 7
eportRXPerf007	E_Port RX Performance 7
eportSignal007	E_Port Loss of Signal 7
eportState007	E_Port State Changes 7
eportSync007	E_Port Loss of Sync 7
eportTXPerf007	E_Port TX Performance 7
eportWords007	E_Port Invalid Words 7
fabricDI000	Fabric Domain ID
fabricED000	Fabric E_port down
fabricFL000	Fabric Fabric login
fabricFQ000	Fabric Fabric<->QL
fabricFR000	Fabric Reconfigure
fabricGS000	Fabric GBIC change 0
fabricSC000	Fabric Segmentation
fabricZC000	Fabric Zoning change
fcuportCRCs013	FCU Port Invalid CRCs 13
fcuportLink013	FCU Port Link Failures 13
fcuportProtoErr0	FCU Port Protocol Errors 13
fcuportRXPerf013	FCU Port RX Performance 13
fcuportSignal013	FCU Port Loss of Signal 13
fcuportState013	FCU Port State Changes 13
fcuportSync013	FCU Port Loss of Sync 13
fcuportTXPerf013	FCU Port TX Performance 13
fcuportWords013	FCU Port Invalid Words 13
portCRCs000 Port Invalid CRCs 0	Port Invalid CRCs 0

Table 5-3 Threshold Names (continued)

portLink000	Port Link Failures 0
portProtoErr000	Port Protocol Errors 0
portRXPerf000	Port RX Performance 0
portSignal000	Port Loss of Signal 0
portState000	Port State Changes 0
portSync000	Port Loss of Sync 0
portTXPerf000	Port TX Performance 0
portWords000	Port Invalid Words 0
fopportCRCs013	FOP Port Invalid CRCs 13
fopportLink013	FOP Port Link Failures 13
fopportProtoErr0	FOP Port Protocol Errors 13
fopportRXPerf013	FOP Port RX Performance 13
fopportSignal013	FOP Port Loss of Signal 13
fopportState013	FOP Port State Changes 13
fopportSync013	FOP Port Loss of Sync 13
fopportTXPerf013	FOP Port TX Performance 13
fopportWords013	FOP Port Invalid Words 13

swFwLabel

OID 1.3.6.1.4.1.1588.2.1.1.1.10.3.1.4
swFwThresholdTable.1.4

Description Label of the threshold.

Refer to Table 5-3 on page 5-61.

swFwCurVal

OID 1.3.6.1.4.1.1588.2.1.1.1.10.3.1.5
swFwThresholdTable.1.5

Description Current counter of the threshold.

swFwLastEvent

OID 1.3.6.1.4.1.1588.2.1.1.1.10.3.1.6
swFwThresholdTable.1.6

Description Last event type of the threshold.

swFwLastEventVal

OID 1.3.6.1.4.1.1588.2.1.1.1.10.3.1.7
swFwThresholdTable.1.7

Description Last event value of the threshold.

swFwLastEventTime

OID 1.3.6.1.4.1.1588.2.1.1.1.10.3.1.8
swFwThresholdTable.1.8

Description Last event time of the threshold.

This value is in the same format as in swCurrentDate.

swFwLastState

OID 1.3.6.1.4.1.1588.2.1.1.1.10.3.1.9
swFwThresholdTable.1.9

Description Last event state of the threshold.

swFwBehaviorType

OID 1.3.6.1.4.1.1588.2.1.1.1.10.3.1.10
swFwThresholdTable.1.10

Description A behavior of which the thresholds generate events.

swFwBehaviorInt

OID 1.3.6.1.4.1.1588.2.1.1.1.10.3.1.11
swFwThresholdTable.1.11

Description An integer of which the thresholds generate continuous events.

End Device Group

swEndDeviceRlsTable

OID 1.3.6.1.4.1.1588.2.1.1.1.21.1

Description The table of rls for individual end devices.

By default, no data appears in this table.

swEndDeviceRlsEntry

OID 1.3.6.1.4.1.1588.2.1.1.1.21.1.1
swEndDeviceRlsTable.1

Description An entry of an individual end devices' rls.

Index swEndDevicePort, swEndDeviceAlpa

Since switches start with port 0, the SNMP port number should be the physical port number plus 1. Conversely, SNMP port 3 (for example) translates to port 2.

swEndDevicePort

OID 1.3.6.1.4.1.1588.2.1.1.1.21.1.1.1
swEndDeviceRlsTable.1.1

Description The port of the local switch to which the end device is connected.

swEndDeviceAlpa

OID 1.3.6.1.4.1.1588.2.1.1.1.21.1.1.2
swEndDeviceRlsTable.1.2

Description The ALPA of the end device. The SNMP ALPA number should be the logical ALPA number +1. For example, SNMP ALPA number 0xf0 translates to 0xef.

swEndDevicePortID

OID 1.3.6.1.4.1.1588.2.1.1.1.21.1.1.3
swEndDeviceRlsTable.1.3

Description The Fibre Channel port address ID of the entry.

swEndDeviceLinkFailure

OID 1.3.6.1.4.1.1588.2.1.1.1.21.1.1.4
swEndDeviceRlsTable.1.4

Description Link failure count for the end device.

swEndDeviceSyncLoss

OID 1.3.6.1.4.1.1588.2.1.1.1.21.1.1.5
swEndDeviceRlsTable.1.5

Description Sync loss count for the end device.

swEndDeviceSigLoss

OID 1.3.6.1.4.1.1588.2.1.1.1.21.1.1.6
swEndDeviceRlsTable.1.6

Description Signal loss count for the end device.

swEndDeviceProtoErr

OID 1.3.6.1.4.1.1588.2.1.1.1.21.1.1.7
swEndDeviceRlsTable.1.7

Description Protocol error count for the end device.

swEndDeviceInvalidWord

OID 1.3.6.1.4.1.1588.2.1.1.1.21.1.1.8
swEndDeviceRlsTable.1.8

Description Invalid word count for the end device.

swEndDeviceInvalidCRC

OID 1.3.6.1.4.1.1588.2.1.1.1.21.1.1.9
swEndDeviceRlsTable.1.9

Description Invalid CRC count for the end device.

ASIC Performance Monitoring Group

swBlmPerfALPAMntTable

OID 1.3.6.1.4.1.1588.2.1.1.1.23.1

Description ALPA monitoring counter table.

swBlmPerfALPAMntEntry

OID 1.3.6.1.4.1.1588.2.1.1.1.23.1.1
swBlmPerfALPAMntTable.1

Description ALPA monitoring counter for given ALPA.

Index swEndDevicePort, swEndDeviceAlpa

swBlmPerfAlpaPort

OID 1.3.6.1.4.1.1588.2.1.1.1.23.1.1.1
swBlmPerfALPAMntTable.1.1

Description The port index of the switch.

swBlmPerfAlpaIndx

OID 1.3.6.1.4.1.1588.2.1.1.1.23.1.1.2
swBlmPerfALPAMntTable.1.2

Description The ALPA index. There can be 126 ALPA values.

swBlmPerfAlpa

OID 1.3.6.1.4.1.1588.2.1.1.1.23.1.1.3
swBlmPerfALPAMntTable.1.3

Description The ALPA values. These values range between x'01' and x'EF'(1 to 239). ALPA value x'00' is reserved for FL_Port. If the ALPA device is invalid, then it will have a -1 value.

swBlmPerfAlpaCRCCnt

OID 1.3.6.1.4.1.1588.2.1.1.1.23.1.1.4
swBlmPerfALPAMntTable.1.4

Description The CRC count for given ALPA and port. This monitoring provides information on the number of CRC errors that occurred on the frames destined to each possible ALPA attached to a specific port.

ASIC Performance End-to-End Monitoring Table

swBlmPerfEEMntTable

OID 1.3.6.1.4.1.1588.2.1.1.1.23.2

Description End-to-end monitoring counter table.

swBlmPerfEEMntEntry

OID 1.3.6.1.4.1.1588.2.1.1.1.23.2.1
swBlmPerfEEMntTable.1

Description End-to-end monitoring counter for given port.

Index swBlmPerfEEPort, swBlmPerfEERefKey

swBlmPerfEEPort

OID 1.3.6.1.4.1.1588.2.1.1.1.23.2.1.1
swBlmPerfEEMntTable.1.1

Description This object identifies the port number of the switch.

swBlmPerfEERefKey

OID 1.3.6.1.4.1.1588.2.1.1.1.23.2.1.2
swBlmPerfEEMntTable.1.2

Description The reference number of the counter. This reference is a number assigned when a filter is created. In SNMP Index, start one instead of 0, add one to actual ref key.

swBlmPerfEECRC

OID 1.3.6.1.4.1.1588.2.1.1.1.23.2.1.3
swBlmPerfEEMntTable.1.3

Description End-to-end CRC error for the frames that matched the SID-DID pair.

swBlmPerfEEFCWRx

OID 1.3.6.1.4.1.1588.2.1.1.1.23.2.1.4
swBlmPerfEEMntTable.1.4

Description End-to-End count of fibre channel words (FCW), received by the port, that matched the SID-DID pair.

swBlmPerfEEFCWTx

OID 1.3.6.1.4.1.1588.2.1.1.1.23.2.1.5
swBlmPerfEEMntTable.1.5

Description End-to-End count of fibre channel words (FCW), transmitted by the port, that matched the SID-DID pair.

swBlmPerfEESid

OID 1.3.6.1.4.1.1588.2.1.1.1.23.2.1.6
swBlmPerfEEMntTable.1.6

Description DID info by reference number.

swBlmPerfEEDid

OID 1.3.6.1.4.1.1588.2.1.1.1.23.2.1.7
swBlmPerfEEMntTable.1.7

Description SID info by reference number. SID (source identifier) is a 3-byte field in the frame header used to indicate the address identifier of the N_Port from which the frame was sent.

ASIC Performance Filter-Based Monitoring Table

swBlmPerfFltMntTable

OID 1.3.6.1.4.1.1588.2.1.1.1.23.3

Description Filter-based monitoring counter.

swBlmPerfFltMntEntry

OID 1.3.6.1.4.1.1588.2.1.1.1.23.3.1
swBlmPerfFltMntTable.1

Description Filter-based monitoring counter for given port.

Index swBlmPerfFltPort, swBlmPerfFltRefkey

swBlmPerfFltPort

OID 1.3.6.1.4.1.1588.2.1.1.1.23.3.1.1
swBlmPerfFltMntTable.1.1

Description This object identifies the port number of the switch.

swBlmPerfFltRefkey

OID 1.3.6.1.4.1.1588.2.1.1.1.23.3.1.2
swBlmPerfFltMntTable.1.2

Description The reference number of the filter. This reference number is assigned when a filter is created. In SNMP Index start one instead of 0, add one to actual ref key.

swBlmPerfFltCnt

OID 1.3.6.1.4.1.1588.2.1.1.1.23.3.1.3
swBlmPerfFltMntTable.1.3

Description Statistics of filter-based monitor. Filter-based monitoring provides information about a filter hit count such as:

- Read command
- SCSI or IP traffic
- SCSI Read/Write

swBlmPerfFltAlias

OID 1.3.6.1.4.1.1588.2.1.1.1.23.3.1.4
swBlmPerfFltMntTable.1.4

Description Alias name for the filter.

Trunking Group and Trunking Table

swSwitchTrunkable

OID 1.3.6.1.4.1.1588.2.1.1.1.24.1

Description The trunking status of the switch, whether the switch supports the trunking feature or not.

Possible values are:

No (0)
Yes (8)

swTrunkTable

OID 1.3.6.1.4.1.1588.2.1.1.1.24.2

Description Table to display trunking information for the switch.

swTrunkEntry

OID 1.3.6.1.4.1.1588.2.1.1.1.24.2.1
swTrunkTable.1

Description Entry for the trunking table.

Index swTrunkPortIndex

swTrunkPortIndex

OID 1.3.6.1.4.1.1588.2.1.1.1.24.2.1.1
swTrunkTable.1.1

Description The switch port index.

The value of a port index is 1 higher than the port number labeled on the front panel. For exmaple, port index 1 corresponds to port number 0.

swTrunkGroupNumber

OID 1.3.6.1.4.1.1588.2.1.1.1.24.2.1.2
swTrunkTable.1.2

Description A logical entity that specifies the Group Number to which the port belongs. If this value is `0`, the port is not trunked.

swTrunkMaster

OID 1.3.6.1.4.1.1588.2.1.1.1.24.2.1.3
swTrunkTable.1.3

Description Port number that is the trunk master of the group. The trunk master implicitly defines the group. All ports with the same master are considered to be part of the same group.

swPortTrunked

OID 1.3.6.1.4.1.1588.2.1.1.1.24.2.1.4
swTrunkTable.1.4

Description The current state of trunking for a member port.

Trunking Group Table

swTrunkGrpTable

OID 1.3.6.1.4.1.1588.2.1.1.1.24.3

Description Table to display trunking performance information for the switch.

swTrunkGrpEntry

OID 1.3.6.1.4.1.1588.2.1.1.1.24.3.1
swTrunkGrpTable.1

Description Entry for the trunking group table.

Index swTrunkGrpNumber

swTrunkGrpNumber

OID 1.3.6.1.4.1.1588.2.1.1.1.24.3.1.1
swTrunkGrpTable.1.1

Description This object is a logical entity which specifies the Group Number to which port belongs.

swTrunkGrpMaster

OID 1.3.6.1.4.1.1588.2.1.1.1.24.3.1.2
swTrunkGrpTable.1.2

Description The master port ID for the TrunkGroup.

swTrunkGrpTx

OID 1.3.6.1.4.1.1588.2.1.1.1.24.3.1.3
swTrunkGrpTable.1.3

Description The aggregate value of the transmitted words from this TrunkGroup.

swTrunkGrpRx

OID 1.3.6.1.4.1.1588.2.1.1.1.24.3.1.4
swTrunkGrpTable.1.4

Description The aggregate value of the received words by this TrunkGroup.

6 Entiity MIB Object Types

This chapter contains descriptions and other information specific to Entiity MIB object types.

Overview

The EntityMIB is the MIB module for representing multiple logical entities supported by a single SNMP agent. This MIB is supported only in Fabric OS v4.*x*.

The descriptions of each of the MIB variables in this chapter come directly from the entityMIB itself. The notes that follow the descriptions typically pertain to EMC-specific information and are provided by EMC.

The entityMib objects are divided into the following groups:

- Physical Entity Group
- Logical Entity Group
- Entity Mapping Group
- General Group

Refer to Appendix F for the entire Entity MIB.

Definitions for Entity MIB

Table 6-1 lists the objects or definitions that are imported into the entityMIB, and the modules from which they are imported.

Table 6-1 Objects Imported into the entityMIB

Object	Imported from this module
MODULE-IDENTITY	SNMPv2-SMI
OBJECT-TYPE	
NOTIFICATION-TYPE

PhysicalIndex

Status Current

Description An arbitrary value that uniquely identifies the physical entity. The value should be a small positive integer; index values for different physical entities are not necessarily contiguous.

Syntax Integer (1... 2147483647)

PhysicalClass

Status Current

Description An enumerated value that provides an indication of the general hardware type of a particular physical entity. There are no restrictions as to the number of entPhysicalEntries of each entPhysicalClass, which must be instantiated by an agent.

Syntax Integer

Table 6-2 Possible Values for PhysicalClass

Values	Description
other (1)	The physical entity class is known, but does not match any of the supported values.
unknown (2)	The physical entity class is unknown to the agent.
chassis (3)	The physical entity class is an overall container for networking equipment. Any class of physical entity except a stack may be contained within a chassis, and a chassis may be contained only within a stack.
backplane (4)	The physical entity class is a device for aggregating and forwarding networking traffic, such as a shared backplane in a modular ethernet switch. Note that an agent may model a backplane as a single physical entity, which is actually implemented as multiple discrete physical components (within a chassis or stack).

Table 6-2 Possible Values for PhysicalClass (continued)

Values	Description
container (5)	The physical entity class is capable of containing one ore more removable physical entities, possibly of different types (such as a chassis slot or daughter-card holder). For example, each (empty or full) slot in a chassis will be modeled as a container. Note that all removable physical entities should be modeled within a container entity, such as field-replaceable modules, fans, or power supplies. Note that all known containers, including empty containers, should be modeled by the agent.
powerSupply (6)	The physical entity class is a power-supplying component.
fan (7)	The physical entity class is a fan or other heat-reduction component.
sensor (8)	The physical entity class is a sensor, such as a temperature sensor within a router chassis.
module (9)	The physical entity class is a self-contained sub-system (such as a plug-in card or daughter-card). If it is removable, then it should be modeled within a container entity, otherwise it should be modeled directly within another physical entity (for example, a chassis or another module).
port (10)	The physical entity class is a networking port, capable of receiving or transmitting networking traffic.
stack (11)	The physical entity class is a super-container (possibly virtual), intended to group together multiple chassis entities (such as a stack of multiple chassis entities). A stack may be realized by a virtual cable, a real interconnect cable attached to multiple chassis, or may be comprised of multiple interconnect cables. A stack should not be modeled within any other physical entities, but a stack may be contained within another stack. Only chassis entities should be contained within a stack.

SnmpEngineIdOrNone

Status Current

Description A specially formatted SnmpEngineID string for use with the Entity MIB.

If an instance of an object with syntax SnmpEngineIdOrNone has a non-zero length, then the object encoding and semantics are defined by the SnmpEngineID textual convention (see RFC 2571 [RFC2571]).

If an instance of an object with syntax SnmpEngineIdOrNone contains a zero-length string, then no appropriate SnmpEngineID is associated with the logical entity (that is, SNMPv3 not supported).

Syntax OCTET STRING (SIZE(0..32))
Empty string or SnmpEngineID

Physical Entity Group

entPhysicalTable

OID 1.3.6.1.2.1.47.1.1.1

Status Current

Description This table contains one row per physical entity. (See Figure 6-1.) The table always contains at least one row for an overall physical entity.

This object implemented for Fabric OS v4.1 only.

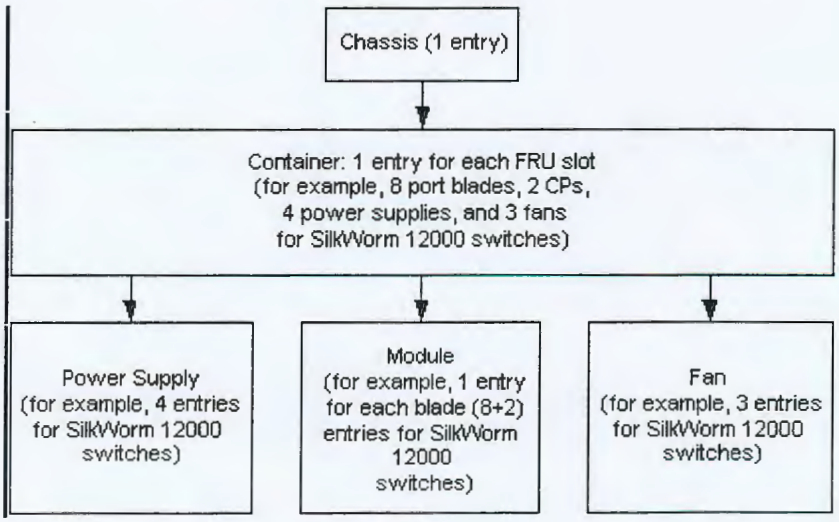

Figure 6-1 entPhysicalTable Containment Hierarchy

entPhysicalEntry

OID 1.3.6.1.2.1.47.1.1.1.1

Status Current

Description Information about a particular physical entity.

Each entry provides objects (entPhysicalDescr, entPhysicalVendorType, and entPhysicalClass) to help an NMS identify and characterize the entry, and objects (entPhysicalContainedIn and entPhysicalParentRelPos) to help an NMS relate the particular entry to other entries in this table.

Index entPhysicalIndex

entPhysicalIndex

OID 1.3.6.1.2.1.47.1.1.1.1.1

Status Current

Description Unique identifier of the physical entity.

entPhysicalDescr

OID 1.3.6.1.2.1.47.1.1.1.1.2

Status Current

Description A textual description of the physical entity (physical name of the entity such as chassis, blade, port, etc.). This object should contain a string that identifies the manufacturer's name for the physical entity and should be set to a distinct value for each version or model of the physical entity.

The name provides the type of the entry and its number (for example, slot 1, power supply, etc.). The description gives the textual description of the type of the entry (for example, power supply, module, etc.)

entPhysicalVendorType

OID 1.3.6.1.2.1.47.1.1.1.1.3

Status Current

Description An indication of the vendor-specific hardware type of the physical entity. Note that this is different from the definition of MIB-II sysObjectID.

An agent should set this object to an enterprise-specific registration identifier value indicating the specific equipment type in detail. The associated instance of entPhysicalClass indicates the general type of hardware device.

If no vendor-specific registration identifier exists for this physical entity, or if the value is unknown by this agent, then the value { 0, 0 } is returned.

Currently, NULL OID { 0, 0 } is returned.

entPhysicalContainedIn

OID 1.3.6.1.2.1.47.1.1.1.1.4

Status Current

Description The value of entPhysicalIndex for the physical entity that "contains" this physical entity. A value of zero indicates this physical entity is not contained in any other physical entity. Note that the set of containment relationships define a strict hierarchy; that is, recursion is not allowed.

In the event a physical entity is contained by more than one physical entity (for example, double-wide modules), this object should identify the containing entity with the lowest value of entPhysicalIndex.

Value 0 for chassis entry. All containers have "ContainedIn" set to 1. All FRUs are contained in their respective slot container entries.

entPhysicalClass

OID 1.3.6.1.2.1.47.1.1.1.1.5

Status Current

Description An indication of the general hardware type of the physical entity.

An agent should set this object to the standard enumeration value that most accurately indicates the general class of the physical entity, or the primary class if there is more than one.

If no appropriate standard registration identifier exists for this physical entity, then the value "`other(1)`" is returned. If the value is unknown by this agent, then the value "`unknown(2)`" is returned.

ED-12000B directors can have the following hierarchy of physical objects:

- Chassis: 1 entry (1 row)
- Container: 1 entry for each FRU slot (8 port blades + 2 CPs + 4 power supplies + 3 fans)
- Module: 8 entries for port blades, 2 entries for CPs, 4 entries for power supplies, and 3 entries for fans.

DS-32B2 switches can have the following hierarchy of physical objects:

- Chassis: 1 entry (1 row)
- Container: 1 entry for each FRU slot (1 switch blade + 2 power supplies + 6 fans)
- Module: 1 entry for switch blade, 0-2 entries for power supplies, and 0-6 entries for fans.

entPhysicalParentRelPos

OID 1.3.6.1.2.1.47.1.1.1.1.6

Status Current

Description An indication of the relative position of this child component among all its *sibling* components. Sibling components are defined as entPhysicalEntries that share the same instance values of each of the entPhysicalContainedIn and entPhysicalClass objects.

For chassis entry, this value is -1. For containers it is the sequential number of the container from the first one. For all FRUs it is always 1.

An NMS can use this object to identify the relative ordering for all sibling components of a particular parent (identified by the entPhysicalContainedIn instance in each sibling entry).

This value should match any external labeling of the physical component if possible. For example, for a container (such as a card slot) labeled as "slot #3", entPhysicalParentRelPos should have the

value "3". Note that the entPhysicalEntry for the module plugged into slot 3 should have an entPhysicalParentRelPos value of "1".

If the physical position of this component does not match any external numbering or clearly visible ordering, then user documentation or other external reference material should be used to determine the parent-relative position. If this is not possible, then the the agent should assign a consistent (but possibly arbitrary) ordering to a given set of sibling components, perhaps based on internal representation of the components.

If the agent cannot determine the parent-relative position for some reason, or if the associated value of entPhysicalContainedIn is 0, then the value "-1" is returned. Otherwise a non-negative integer is returned, indicating the parent-relative position of this physical entity.

Parent-relative ordering normally starts from 1 and continues to *N*, where *N* represents the highest positioned child entity. However, if the physical entities (for example, slots) are labeled from a starting position of zero, then the first sibling should be associated with an entPhysicalParentRelPos value of "0". Note that this ordering may be sparse or dense, depending on agent implementation.

The actual values returned are not globally meaningful, as each parent component may use different numbering algorithms. The ordering is meaningful only among siblings of the same parent component.

The agent should retain parent-relative position values across reboots, either through algorithmic assignment or use of non-volatile storage.

entPhysicalName

OID 1.3.6.1.2.1.47.1.1.1.1.7

Status Current

Description The textual name of the physical entity (physical name of the entity such as chassis, blade, port, etc.). The value of this object should be the name of the component as assigned by the local device and should be suitable for use in commands entered at the device's "console". This might be a text name, such as "console" or a simple component number (for example, port or module number) such as

"1", depending on the physical component naming syntax of the device.

If there is no local name, or this object is otherwise not applicable, then this object contains a zero-length string.

Note that the value of entPhysicalName for two physical entities will be the same in the event that the console interface does not distinguish between them (for example, slot-1 and the card in slot-1).

The name provides the type of the entry and its number (for example, slot 1, power supply, etc.). The description gives the textual description of the type of the entry (for example, power supply, module, etc.)

entPhysicalHardwareRev

OID 1.3.6.1.2.1.47.1.1.1.1.8

Status Current

Description The vendor-specific hardware revision string for the physical entity. The preferred value is the hardware revision identifier actually printed on the component itself (if present).

Note that if revision information is stored internally in a non-printable (for example, binary) format, then the agent must convert such information to a printable format, in an implementation-specific manner.

If no specific hardware revision string is associated with the physical component, or if this information is unknown to the agent, then this object will contain a zero-length string.

Set to empty string.

entPhysicalFirmwareRev

OID 1.3.6.1.2.1.47.1.1.1.1.9

Status Current

Description The vendor-specific firmware revision string for the physical entity.

Note that if revision information is stored internally in a non-printable (for example, binary) format, then the agent must convert such information to a printable format, in an implementation-specific manner.

If no specific firmware programs are associated with the physical component, or if this information is unknown to the agent, then this object will contain a zero-length string.

Set to empty string.

entPhysicalSoftwareRev

OID 1.3.6.1.2.1.47.1.1.1.1.10

Status Current

Description The vendor-specific software revision string for the physical entity.

Note that if revision information is stored internally in a non-printable (for example, binary) format, then the agent must convert such information to a printable format, in an implementation-specific manner.

If no specific software programs are associated with the physical component, or if this information is unknown to the agent, then this object will contain a zero-length string.

Set to empty string.

entPhysicalSerialNum

OID 1.3.6.1.2.1.47.1.1.1.1.11

Status Current

Description The vendor-specific serial number string for the physical entity. The preferred value is the serial number string actually printed on the component itself (if present).

On the first instantiation of a physical entity, the value of entPhysicalSerialNum associated with that entity is set to the correct vendor-assigned serial number, if this information is available to the

agent. If a serial number is unknown or non-existent, the entPhysicalSerialNum will be set to a zero-length string instead.

Note that implementations that can correctly identify the serial numbers of all installed physical entities do not need to provide write access to the entPhysicalSerialNum object. Agents that cannot provide non-volatile storage for the entPhysicalSerialNum strings are not required to implement write access for this object.

Not every physical component will have a serial number, or even need one. Physical entities for which the associated value of the entPhysicalIsFRU object is equal to "false(2)" (for example, the repeater ports within a repeater module), do not need their own unique serial number. An agent does not have to provide write access for such entities, and may return a zero-length string.

If write access is implemented for an instance of entPhysicalSerialNum, and a value is written into the instance, the agent must retain the supplied value in the entPhysicalSerialNum instance associated with the same physical entity for as long as that entity remains instantiated. This includes instantiations across all re-initializations/reboots of the network management system, including those that result in a change of the physical entity's entPhysicalIndex value.

Set to serial number and part number (if available) respectively.

---

entPhysicalMfgName

OID 1.3.6.1.2.1.47.1.1.1.1.12

Status Current

Description The name of the manufacturer of this physical component. The preferred value is the manufacturer name string actually printed on the component itself (if present).

Note that comparisons between instances of the entPhysicalModelName, entPhysicalFirmwareRev, entPhysicalSoftwareRev, and the entPhysicalSerialNum objects, are meaningful only amongst entPhysicalEntries with the same value of entPhysicalMfgName.

If the manufacturer name string associated with the physical component is unknown to the agent, then this object will contain a zero-length string.

Set to empty string.

entPhysicalModelName

OID 1.3.6.1.2.1.47.1.1.1.1.13

Status Current

Description The vendor-specific model name identifier string associated with this physical component. The preferred value is the customer-visible part number, which may be printed on the component itself.

If the model name string associated with the physical component is unknown to the agent, then this object will contain a zero-length string.

Set to serial number and part number (if available) respectively.

entPhysicalAlias

OID 1.3.6.1.2.1.47.1.1.1.1.14

Status Current

Description This object is an alias name for the physical entity as specified by a network manager, and provides a non-volatile handle for the physical entity.

On the first instantiation of a physical entity, the value of entPhysicalAlias associated with that entity is set to the zero-length string. However, agent may set the value to a locally unique default value, instead of a zero-length string.

If write access is implemented for an instance of entPhysicalAlias, and a value is written into the instance, the agent must retain the supplied value in the entPhysicalAlias instance associated with the same physical entity for as long as that entity remains instantiated. This includes instantiations across all re-initializations/reboots of the

network management system, including those which result in a change of the physical entity's entPhysicalIndex value.

Set to empty string.

entPhysicalAssetID

OID 1.3.6.1.2.1.47.1.1.1.1.15

Status Current

Description This object is a user-assigned asset tracking identifier for the physical entity as specified by a network manager, and provides non-volatile storage of this information.

On the first instantiation of a physical entity, the value of entPhysicalAssetID associated with that entity is set to the zero-length string.

Not every physical component will have a asset tracking identifier, or even need one. Physical entities for which the associated value of the entPhysicalIsFRU object is equal to "false(2)" (for example, the repeater ports within a repeater module) do not need their own unique asset tracking identifier. An agent does not have to provide write access for such entities, and may instead return a zero-length string.

If write access is implemented for an instance of entPhysicalAssetID, and a value is written into the instance, the agent must retain the supplied value in the entPhysicalAssetID instance associated with the same physical entity for as long as that entity remains instantiated. This includes instantiations across all re-initializations/reboots of the network management system, including those that result in a change of the physical entity's entPhysicalIndex value.

If no asset tracking information is associated with the physical component, then this object will contain a zero-length string.

Set to empty string.

entPhysicalIsFRU

OID 1.3.6.1.2.1.47.1.1.1.1.16

Status Current

Description The entPhysicalIsFRU object indicates whether this physical entity is considered a field replaceable unit by the vendor. If this object contains the value "true(1)" then this entPhysicalEntry identifies a field replaceable unit. For all entPhysicalEntries representing components that are permanently contained within a field replaceable unit, the value "false(2)" should be returned for this object.

True (1) for FRU entries (port blades, CPs, sensors, power supplies, and fans; False (2) for container and chassis type entries.

entPhysicalContainsTable

OID 1.3.6.1.2.1.47.1.1.1.1.17

Status Current

Description The entPhysicalIsFRU object indicates whether this physical entity is considered a field replaceable unit by the vendor. If this object contains the value "true(1)" then this entPhysicalEntry identifies a field replaceable unit. For all entPhysicalEntries representing components that are permanently contained within a field replaceable unit, the value "false(2)" should be returned for this object.

Logical Entity Group

This section lists the entityLogical MIBs.

entLogicalTable

OID 1.3.6.1.2.1.47.1.2.1

Description This table contains one row per logical entity. For agents that implement more than one naming scope, at least one entry must exist. Agents that instantiate all MIB objects within a single naming scope are not required to implement this table.

entLogicalEntry

OID 1.3.6.1.2.1.47.1.2.1.1

Description Information about a particular logical entity. Entities may be managed by this agent or other SNMP agents (possibly) in the same chassis.

Index entLogicalIndex

entLogicalIndex

OID 1.3.6.1.2.1.47.1.2.1.1.1

Description The value of this object uniquely identifies the logical entity. The value should be a small positive integer; index values for different logical entities are are not necessarily contiguous.

entLogicalDescr

OID 1.3.6.1.2.1.47.1.2.1.1.2

Description A textual description of the logical entity. This object should contain a string that identifies the manufacturer's name for the logical entity, and should be set to a distinct value for each version of the logical entity.

entLogicalType

OID 1.3.6.1.2.1.47.1.2.1.1.3

Description An indication of the type of logical entity. This will typically be the Object Identifier name of the node in the SMI's naming hierarchy that represents the major MIB module, or the majority of the MIB modules, supported by the logical entity. For example:

- a logical entity of a regular host/router -> mib-2
- a logical entity of a 802.1d bridge -> dot1dBridge
- a logical entity of a 802.3 repeater -> snmpDot3RptrMgmt
- If an appropriate node in the SMI's naming hierarchy cannot be identified, the value "mib-2" should be used.

entLogicalCommunity

OID 1.3.6.1.2.1.47.1.2.1.1.4

Description An SNMPv1 or SNMPv2C community-string, which can be used to access detailed management information for this logical entity. The agent should allow read access with this community string (to an appropriate subset of all managed objects) and may also return a community string based on the privileges of the request used to read this object.

Note that an agent may return a community string with read-only privileges, even if this object is accessed with a read-write community string. However, the agent must take care not to return a community string that allows more privileges than the community string used to access this object.

A compliant SNMP agent may wish to conserve naming scopes by representing multiple logical entities in a single default naming scope. This is possible when the logical entities represented by the same value of entLogicalCommunity have no object instances in common. For example, "bridge1" and "repeater1" may be part of the main naming scope, but at least one additional community string is needed to represent "bridge2" and "repeater2".

Logical entities "bridge1" and "repeater1" would be represented by sysOREntries associated with the default naming scope.

For agents not accessible via SNMPv1 or SNMPv2C, the value of this object is the empty string. This object may also contain an empty string if a community string has not yet been assigned by the agent, or no community string with suitable access rights can be returned for a particular SNMP request.

Note that this object is deprecated. Agents that implement SNMPv3 access should use the entLogicalContextEngineID and entLogicalContextName objects to identify the context associated with each logical entity. SNMPv3 agents may return a zero-length string for this object, or may continue to return a community string (for example, tri-lingual agent support).

entLogicalTAddress

OID 1.3.6.1.2.1.47.1.2.1.1.5

Description The transport service address by which the logical entity receives network management traffic, formatted according to the corresponding value of entLogicalTDomain.

For snmpUDPDomain, a TAddress is 6 octets long, the initial 4 octets containing the IP-address in network-byte order and the last 2 containing the UDP port in network-byte order. Consult *Transport Mappings for Version 2 of the Simple Network Management Protocol* (RFC 1906 [RFC1906]) for further information on snmpUDPDomain.

entLogicalTDomain

OID 1.3.6.1.2.1.47.1.2.1.1.6

Description Indicates the kind of transport service by which the logical entity receives network management traffic. Possible values for this object are presently found in the *Transport Mappings for SNMPv2* document (RFC 1906 [RFC1906]).

entLogicalContextEngineID

OID 1.3.6.1.2.1.47.1.2.1.1.7

Description The authoritative contextEngineID that can be used to send an SNMP message concerning information held by this logical entity, to the

address specified by the associated entLogicalTAddress/entLogicalTDomain pair.

This object, together with the associated entLogicalContextName object, defines the context associated with a particular logical entity, and allows access to SNMP engines identified by a contextEngineId and contextName pair.

If no value has been configured by the agent, a zero-length string is returned, or the agent may choose not to instantiate this object at all.

entLogicalContextName

OID 1.3.6.1.2.1.47.1.2.1.1.8

Description The contextName that can be used to send an SNMP message concerning information held by this logical entity, to the address specified by the associated entLogicalTAddress/entLogicalTDomain pair.

This object, together with the associated entLogicalContextEngineID object, defines the context associated with a particular logical entity, and allows access to SNMP engines identified by a contextEngineId and contextName pair.

If no value has been configured by the agent, a zero-length string is returned, or the agent may choose not to instantiate this object at all.

Entity Mapping Group

This section lists the entityMapping MIB.

entLPMappingTable

OID 1.3.6.1.2.1.47.1.3.1

Description This table contains zero or more rows of logical entity to physical equipment associations. For each logical entity known by this agent, there are zero or more mappings to the physical resources that are used to realize that logical entity.

An agent should limit the number and nature of entries in this table such that only meaningful and non-redundant information is returned. For example, in a system that contains a single power supply, mappings between logical entities and the power supply are not useful and should not be included.

Also, only the most appropriate physical component that is closest to the root of a particular containment tree should be identified in an entLPMapping entry.

For example, suppose a bridge is realized on a particular module, and all ports on that module are ports on this bridge. A mapping between the bridge and the module would be useful, but additional mappings between the bridge and each of the ports on that module would be redundant (since the entPhysicalContainedIn hierarchy can provide the same information). If, on the other hand, more than one bridge was utilizing ports on this module, then mappings between each bridge and the ports it used would be appropriate.

Also, in the case of a single backplane repeater, a mapping for the backplane to the single repeater entity is not necessary.

entLPMappingEntry

OID 1.3.6.1.2.1.47.1.3.1.1

Description Information about a particular logical entity to physical equipment association. Note that the nature of the association is not specifically identified in this entry. It is expected that sufficient information exists

in the MIBs used to manage a particular logical entity to infer how physical component information is utilized.

Index entLogicalIndex
entLPPhysicalIndex

entLPPhysicalIndex

OID 1.3.6.1.2.1.47.1.3.1.1.1

Description The value of this object identifies the index value of a particular entPhysicalEntry associated with the indicated entLogicalEntity.

entAliasMappingTable

OID 1.3.6.1.2.1.47.1.3.2

Description This table contains zero or more rows, representing mappings of logical entity and physical component to external MIB identifiers. Each physical port in the system may be associated with a mapping to an external identifier, which itself is associated with a particular logical entity's naming scope. A wildcard mechanism is provided to indicate that an identifier is associated with more than one logical entity.

entAliasMappingEntry

OID 1.3.6.1.2.1.47.1.3.2.1

Description Information about a particular physical equipment, logical entity to external identifier binding. Each logical entity/physical component pair may be associated with one alias mapping. The logical entity index may also be used as a wildcard. (Refer to *entAliasLogicalIndexOrZero* on page 6-23 for details.)

Note that only entPhysicalIndex values that represent physical ports (that is, associated entPhysicalClass value is "port(10)") are permitted to exist in this table.

Index entPhysicalIndex
entAliasLogicalIndexOrZero

entAliasLogicalIndexOrZero

OID 1.3.6.1.2.1.47.1.3.2.1.1

Description The value of this object identifies the logical entity that defines the naming scope for the associated instance of the entAliasMappingIdentifier object.

If this object has a non-zero value, then it identifies the logical entity named by the same value of entLogicalIndex.

If this object has a value of zero, then the mapping between the physical component and the alias identifier for this entAliasMapping entry is associated with all unspecified logical entities. That is, a value of zero (the default mapping) identifies any logical entity that does not have an explicit entry in this table for a particular entPhysicalIndex/entAliasMappingIdentifier pair.

For example, to indicate that a particular interface (such as "physical component 33") is identified by the same value of ifIndex for all logical entities, the following instance might exist:

```
entAliasMappingIdentifier.33.0 = ifIndex.5
```

In the event an entPhysicalEntry is associated differently for some logical entities, additional entAliasMapping entries may exist, for example:

```
entAliasMappingIdentifier.33.0 = ifIndex.6

entAliasMappingIdentifier.33.4 = ifIndex.1

entAliasMappingIdentifier.33.5 = ifIndex.1

entAliasMappingIdentifier.33.10 = ifIndex.12
```

Note that entries with non-zero entAliasLogicalIndexOrZero index values have precedence over any zero-indexed entry. In this example, all logical entities except 4, 5, and 10 associate physical entity 33 with ifIndex.6.

entAliasMappingIdentifier

OID 1.3.6.1.2.1.47.1.3.2.1.2

Description The value of this object identifies a particular conceptual row associated with the indicated entPhysicalIndex and entLogicalIndex pair.

Since only physical ports are modeled in this table, only entries that represent interfaces or ports are allowed. If an ifEntry exists on behalf of a particular physical port, then this object should identify the associated ifEntry. For repeater ports, the appropriate row in the rptrPortGroupTable should be identified instead.

For example, suppose a physical port was represented by entPhysicalEntry.3, entLogicalEntry.15 existed for a repeater, and entLogicalEntry.22 existed for a bridge. Then there might be two related instances of entAliasMappingIdentifier:

```
entAliasMappingIdentifier.3.15 ==
  rptrPortGroupIndex.5.2

entAliasMappingIdentifier.3.22 == ifIndex.17
```

It is possible that other mappings (besides interfaces and repeater ports) may be defined in the future, as required.

Bridge ports are identified by examining the Bridge MIB and appropriate ifEntries associated with each dot1dBasePort, and are thus not represented in this table.

entPhysicalContainsTable

OID 1.3.6.1.2.1.47.1.3.3

Description A table that exposes the container/"containee" relationships between physical entities. This table provides all the information found by constructing the virtual containment tree for a given entPhysicalTable, but in a more direct format.

In the event a physical entity is contained by more than one other physical entity (for example, double-wide modules), this table should include these additional mappings, which cannot be represented in the entPhysicalTable virtual containment tree.

entPhysicalContainsEntry

OID 1.3.6.1.2.1.47.1.3.3.1

Description A single container/"containee" relationship.

Index entPhysicalIndex
entPhysicalChildIndex

entPhysicalChildIndex

OID 1.3.6.1.2.1.47.1.3.3.1.1

Description The value of entPhysicalIndex for the contained physical entity. Through this the containment hierarchy of the physical entities (Figure 6-1 on page 6-6) is displayed.

General Group

This section lists the entityGeneral MIB.

entLastChangeTime

OID 1.3.6.1.2.1.47.1.4.1

Description The value of sysUpTime at the time a conceptual row is created, modified, or deleted in any of the following tables:

- entPhysicalTable
- entLogicalTable
- entLPMappingTable
- entAliasMappingTable
- entPhysicalContainsTable

Entity MIB Trap

This section lists the entityMIBTrap objects.

entConfigChange

OID 1.3.6.1.2.1.47.2.0.1

Status Current

Description An entConfigChange notification is generated when the value of entLastChangeTime changes. It can be utilized by an NMS to trigger logical/physical entity table maintenance polls.

An agent should not generate more than one entConfigChange notification-event in a given time interval (five seconds is the suggested default). A notification-event is the transmission of a single trap or inform PDU to a list of notification destinations.

If additional configuration changes occur within the throttling period, then notification-events for these changes should be suppressed by the agent until the current throttling period expires. At the end of a throttling period, one notification-event should be generated if any configuration changes occurred since the start of the throttling period. In such a case, another throttling period is started right away.

An NMS should periodically check the value of entLastChangeTime to detect any missed entConfigChange notification-events, for example, due to throttling or transmission loss.

Entity MIB Conformance Information

This section lists the entityConformance MIBs.

entityCompliance

OID 1.3.6.1.2.1.47.3.1.1

Status Deprecated

Description The compliance statement for SNMP entities that implement version 1 of the Entity MIB.

Module This module

MANDATORY-GROUPS {
entityPhysicalGroup,
entityLogicalGroup,
entityMappingGroup,
entityGeneralGroup,
entityNotificationsGroup
}

entity2Compliance

OID 1.3.6.1.2.1.47.3.1.2

Status Current

Description The compliance statement for SNMP entities that implement version 2 of the Entity MIB.

Module This module

MANDATORY-GROUPS {
entityPhysicalGroup,
entityPhysical2Group,
entityGeneralGroup,
entityNotificationsGroup
}

Group entityLogical2Group

Description	Implementation of this group is not mandatory for agents that model all MIB object instances within a single naming scope.
Group	entityMappingGroup
Description	Implementation of the entPhysicalContainsTable is mandatory for all agents. Implementation of the entLPMappingTable and entAliasMappingTables are not mandatory for agents that model all MIB object instances within a single naming scope. Note that the entAliasMappingTable may be useful for all agents, however implementation of the entityLogicalGroup or entityLogical2Group is required to support this table.
Object	entPhysicalSerialNum
Access	Not-accessible
Description	Read and write access is not required for agents that cannot identify serial number information for physical entities, or cannot provide non-volatile storage for NMS-assigned serial numbers. Write access is not required for agents that can identify serial number information for physical entities, but cannot provide non-volatile storage for NMS-assigned serial numbers. Write access is not required for physical entities for which the associated value of the entPhysicalIsFRU object is equal to "false(2)".
Object	entPhysicalAlias
Access	Read-only
Description	Write access is required only if the associated entPhysicalClass value is equal to "chassis(3)".
Object	entPhysicalAssetID
Access	Not-accessible
Description	Read and write access is not required for agents that cannot provide non-volatile storage for NMS-assigned asset identifiers. Write access is not required for physical entities for which the associated value of entPhysicalIsFRU is equal to "false(2)".

entityPhysicalGroup

OID 1.3.6.1.2.1.47.3.2.1

Objects entPhysicalDescr,
entPhysicalVendorType,
entPhysicalContainedIn,
entPhysicalClass,
entPhysicalParentRelPos,
entPhysicalName

Status Current

Description The collection of objects that are used to represent physical system components, for which a single agent provides management information.

entityLogicalGroup

OID 1.3.6.1.2.1.47.3.2.2

Objects entLogicalDescr,
entLogicalType,
entLogicalCommunity,
entLogicalTAddress,
entLogicalTDomain

Status Deprecated

Description The collection of objects that are used to represent the list of logical entities for which a single agent provides management information.

entityMappingGroup

OID 1.3.6.1.2.1.47.3.2.3

Objects entLPPhysicalIndex,
entAliasMappingIdentifier,
entPhysicalChildIndex

Status Current

Description The collection of objects that are used to represent the associations between multiple logical entities, physical components, interfaces, and port identifiers for which a single agent provides management information.

entityGeneralGroup

OID 1.3.6.1.2.1.47.3.2.4

Objects entLastChangeTime

Status Current

Description The collection of objects that are used to represent general entity information for which a single agent provides management information.

entityNotificationsGroup

OID 1.3.6.1.2.1.47.3.2.5

Notifications entConfigChange

Status Current

Description The collection of notifications used to indicate Entity MIB data consistency and general status information.

entityPhysical2Group

OID 1.3.6.1.2.1.47.3.2.6

Objects entPhysicalHardwareRev,
entPhysicalFirmwareRev,
entPhysicalSoftwareRev,
entPhysicalSerialNum,
entPhysicalMfgName,
entPhysicalModelName,
entPhysicalAlias,
entPhysicalAssetID,
entPhysicalIsFRU

Status Current

Description The collection of objects that are used to represent physical system components, for which a single agent provides management information. This group augments the objects contained in the entityPhysicalGroup.

entityLogical2Group

OID 1.3.6.1.2.1.47.3.2.7

Objects entLogicalDescr,
entLogicalType,
entLogicalTAddress,
entLogicalTDomain,
entLogicalContextEngineID,
entLogicalContextName

Status Current

Description The collection of objects that are used to represent the list of logical entities for which a single SNMP entity provides management information.

7 High Availability MIB Object Types

This chapter contains descriptions and other information specific to High Availability MIB object types.

Overview

The HA-MIB provides information about the High Availability features of Fabric OS v4.*x*. This MIB is supported only in Fabric OS v4.1.

The HA-MIB has a dependency on the SW MIB. This dependency requires a management application to load the SNMP-FRAMEWORK MIB, then the SW MIB, followed by the Entity MIB before it can load the HA-MIB.

The descriptions of each of the MIB variables in this chapter come directly from the HA-MIB itself.

Table 7-1 lists the objects or definitions that are imported into the HA-MIB, and the modules from which they are imported.

Table 7-1 Objects Imported into the HA-MIB

Object	Imported from this module
MODULE-IDENTITY	SNMPv2-SMI
OBJECT-TYPE	
NOTIFICATION-TYPE	
TimeTicks	
Integer32	
IpAddress	
mib-2	
fibrechannel	SW-MIB
entPhysicalIndex	ENTITY-MIB
entPhysicalName	
DisplayString	SNMPv2-TC
TimeStamp	

Refer to Appendix G for the entire HA-MIB.

High Availability Group

This section describes the MIB objects in the High Availability group.

haStatus

OID 1.3.6.1.4.1.1588.2.1.2.1.1

Description Indicates whether the system is redundant. Possible values are:

redundant (0) — Dual CP with standby CP ready to take over.
nonredundant (1) — Single/Dual CP system with standby CP not available to take over.

FRU Table

fruTable

OID 1.3.6.1.4.1.1588.2.1.2.1.5

Description This table inventories the field replaceable unit (FRU) slots available. This table contains an entry for each entry in the entPhysicalTable that has entPhysicalClass set to "Container (5)" and has a child entry having entPhysicalIsFRU set to "true (1)".

fruEntry

OID 1.3.6.1.4.1.1588.2.1.2.1.5.1

Description An entry for FRU slot in the fruTable

Index entPhysicalIndex

fruClass

OID 1.3.6.1.4.1.1588.2.1.2.1.5.1.1

Description The type of the FRU object that this slot can hold. Possible values are:

other (1)
unknown (2)
chassis (3)
cp (4)
other-CP (5)
switchblade (6)
wwn (7)
powerSupply (8)
fan (9)

fruStatus

OID 1.3.6.1.4.1.1588.2.1.2.1.5.1.2

Description The current status of the FRU object in the slot. Possible values are:

other (1)
unknown (2)
on (3)
off (4)
faulty (5)

fruObjectNum

OID 1.3.6.1.4.1.1588.2.1.2.1.5.1.3

Description The slot number of the blade, and the unit number for everything else.

FRU History Table

fruHistoryTable

OID 1.3.6.1.4.1.1588.2.1.2.1.6

Description This table gives the contents of the entire history log of the FRU events.

fruHistoryEntry

OID 1.3.6.1.4.1.1588.2.1.2.1.6.1

Description An entry in this table represents a particular FRU event.

Index fruHistoryIndex

fruHistoryIndex

OID 1.3.6.1.4.1.1588.2.1.2.1.6.1.1

Description Index of the FRU event in the history table.

fruHistoryClass

OID 1.3.6.1.4.1.1588.2.1.2.1.6.1.2

Description The type of the FRU object related to the event. Possible values are:

other (1)
unknown (2)
chassis (3)
cp (4)
other-CP (5)
switchblade (6)
wwn (7)
powerSupply (8)
fan (9)

fruHistoryObjectNum

OID 1.3.6.1.4.1.1588.2.1.2.1.6.1.3

Description The slot number of the blade, and the unit number for everything else.

fruHistoryEvent

OID 1.3.6.1.4.1.1588.2.1.2.1.6.1.4

Description The type of the FRU event. Possible values are:

added (1)
removed (2)
invalid (3)

fruHistoryTime

OID 1.3.6.1.4.1.1588.2.1.2.1.6.1.5

Description The time at which this event happened.

fruHistoryPartNum

OID 1.3.6.1.4.1.1588.2.1.2.1.6.1.6

Description The EMC part number of the FRU object.

fruHistorySerialNum

OID 1.3.6.1.4.1.1588.2.1.2.1.6.1.7

Description The EMC serial number of the FRU object.

Control Processor (CP) Table

cpTable

OID 1.3.6.1.4.1.1588.2.1.2.1.7

Description This table lists all the Control Processors (CPs) in the system.

cpEntry

OID 1.3.6.1.4.1.1588.2.1.2.1.7.1

Description An entry represents a single CP in the system.

Index entPhysicalIndex

cpStatus

OID 1.3.6.1.4.1.1588.2.1.2.1.7.1.1

Description The current status of the CP. Possible values are:

other (1)
unknown (2)
active (3)
standby (4)
failed (5)

cpIpAddress

OID 1.3.6.1.4.1.1588.2.1.2.1.7.1.2

Description The IP Address of the Ethernet interface of this CP.

cpIpMask

OID 1.3.6.1.4.1.1588.2.1.2.1.7.1.3

Description The IP Mask of the Ethernet interface of this CP.

cpIpGateway

OID 1.3.6.1.4.1.1588.2.1.2.1.7.1.4

Description The IP Address of the IP Gateway for this CP.

cpLastEvent

OID 1.3.6.1.4.1.1588.2.1.2.1.7.1.5

Description The last event related to this CP. Possible values are:

haSync (1) — HA state on both is in sync;
haOutSync (2) — HA state on both is out of sync
cpFaulty (3)
cpHealthy (4)
configChange (5)
failOverStart (6)
failOverDone (7)
firmwareCommit (8)
firmwareUpgrade (9)
other (10)
unknown (11)

haMIBTraps

This section lists the HA-MIB traps.

fruStatusChanged

OID 1.3.6.1.4.1.1588.2.1.2.2.0.1

Objects
entPhysicalName
fruStatus

Status Current

Description This trap is sent when the status of any FRU object changes.

cpStatusChanged

OID 1.3.6.1.4.1.1588.2.1.2.2.0.2

Objects
cpStatus
cpLastEvent
swID
swSsn

Status Current

Description This trap is sent when status of any CP object changes.

The cpLastEvent variable provides the information about the event that occurred.

fruHistoryTrap

OID 1.3.6.1.4.1.1588.2.1.2.2.0.3

Objects
fruHistoryClass
fruHistoryObjectNum
fruHistoryEvent
fruHistoryTime
fruHistoryPartNum
fruHistorySerialNum

Status Current

Description This trap is sent when a FRU is added or removed.

A

MIB Functional Groupings

This appendix provides a function-based listing of MIB objects and the correlation of various objects to a particular function.

Variables

Switch Variables

MIB variables that assist in monitoring or modifying the status/state of switches are in the following tables or groups:

- *Connectivity Unit Table* on page 3-9
- *Connectivity Unit Revisions Table* on page 3-20
- *fcFabric Element Module Table* on page 4-11
- *Flash Administration* on page 5-19

Sensor Variables

MIB variables that assist in monitoring or modifying the status/state of fans, power supply, and temperature are in the following tables or groups:

- *Connectivity Unit Sensor Table* on page 3-22
- *swNumSensors* on page 5-23

Port Variables

MIB variables that assist in monitoring or modifying ports are in the following tables or groups:

- Variables for state and status
  - *Connectivity Unit Port Table* on page 3-26
  - *FxPort Table* on page 4-14
  - *FxPort Status Table* on page 4-20
  - *FxPort Physical Level Table* on page 4-22
  - *FxPort Capability Table* on page 4-41
  - *The Fibre Channel Port Group* on page 5-35
- Variables for statistics and measurement
  - *Connectivity Unit Port Statistics Fabric Table* on page 3-72

    EMC does not support fabric statistics.
  - *FxPort Error Table* on page 4-28

Event Variables

MIB variables that assist in monitoring or modifying events are in the following tables or groups:

- *Connectivity Unit Event Table* on page 3-37
- *Event Group* on page 5-49

ISL and End Device Variables

MIB variables that assist in monitoring or modifying ISL and end devices are in the following tables or groups:

- ISL variables
  - *Connectivity Unit Link Table* on page 3-41
  - *Fabric Group* on page 5-27
- End device variables
  - *Connectivity Unit Link Table* on page 3-41
  - *FxPort Fabric Login Table* on page 4-24
  - *The Name Server Database Group* on page 5-45

SNMP Configuration Variables

MIB variables that assist in configuring SNMP are in the following tables or groups:

- *SNMP Trap Registration Table* on page 3-68
- *SW Agent Configuration Group* on page 5-33
- *Connectivity Unit Link Table* on page 3-41

ASIC Variables

MIB variables that assist in performance monitoring and Trunking for the Bloom chip are in the following tables or groups:

- *ASIC Performance Monitoring Group* on page 5-69
- *ASIC Performance End-to-End Monitoring Table* on page 5-71
- *ASIC Performance Filter-Based Monitoring Table* on page 5-73
- *Trunking Group and Trunking Table* on page 5-75
- *Trunking Group Table* on page 5-77

B

MIB OIDs and Their Matching Object Names

This appendix provides a listing of the v4.1 MIB object names and the corresponding MIB Object ID (OID) associated with each.

MIB OIDs

The following matrix allows you to identify a MIB object name according to its related OID. Reference pages are listed where more information exists.

MIB Object Name	OID	Reference Page
iso	1	
org	1.3	
dod	1.3.6	
internet	1.3.6.1	
directory	1.3.6.1.1

FA-MIB

This appendix contains the FA-MIB v.4.

FA-MIB

```
Title: Fibre Alliance Fibre Channel Management Framework Integration
   MIB
--   Rev 1.5, June 1, 1999.
--
-- Note: This is released for Brocade FOS 2.3
--
-- added FA MIB Version 3.0 last edited on Dec. 18, 2000.

FCMGMT-MIB
-- Last edit date: Nov 10th, 1999

unit.
             It MUST be a WWN for this connectivity unit
             or 16 octets of value zero.
             WWN formats requiring fewer than 16 octets
             MUST be extended to 16 octets with trailing zero octets,
             If a WWN is used for connUnitId,
             the same WWN MUST be used for connUnitGlobalId.
             When a non-zero value is provided,
             it SHOULD be persistent across agent and unit resets.
             It SHOULD be globally unique.
             It SHOULD be one of these FC-PH/PH3 formats:
                IEEE (NAA=1)
                IEEE Extended (NAA=2)
                IEEE Registered (NAA=5).
                IEEE Registered extended (NAA=6).

             Use of the IEEE formats allows any IEEE-registered vendor
             to assure global uniqueness independently.
             The following are some references on IEEE WWN formats:

http://standards.ieee.org/regauth/oui/tutorials/fibreformat.html

http://standards.ieee.org/regauth/oui/tutorials/fibrecomp_id.html

             If one or more WWNs are associated with the connUnit
             via other management methods,
```

```
    one of them SHOULD be used for connUnitGlobalId.
    If there is not a WWN assigned specifically to the connUnit,
    there is some merit, though not a requirement,
    to using a WWN assigned to (one of)
    its permanently attached FC/LAN interface(s).
    This can not risk uniqueness, though.
    As a counterexample, if your
    agent runs in a host and the host has an HBA,
    it is quite possible that agent, host, and HBA
    will all be distinct connUnits, so the host
    and agent can not use the WWN of the HBA.
    Another example:
    If your hub has a built-in Ethernet port, it
    might be reasonable for the hub to use its LAN
    address (prefixed with the appropriate
    NAA) as its connUnitId. But if the
    Ethernet were a replaceable PCCard, the hub
    should have an independent ID."

    DESCRIPTION
        "This object is used to control the addressed
        connUnit.

        NOTE: 'Cold Start' and 'Warm Start'
        are as defined in MIB II and are not meant
        to be a factory reset.

        resetConnUnitColdStart:
            the addressed unit performs
            a 'Cold Start' reset.

        resetConnUnitWarmStart:
            the addressed unit performs
            a 'Warm Start' reset.

        offlineConnUnit:
            the addressed unit puts itself into
            an implementation dependant 'offline' state.
            In general,if a unit is in an offline state,
```

```
                it cannot be used to perform meaningful
                Fibre Channel work.

            onlineConnUnit:
                the addressed unit puts itself into an
                implementation dependant 'online' state.
                In general, if a unit is in an online state,
                it is capable of performing meaningful
                Fibre Channel work.

            NOTE: Each implementation may chose not to allow

            resetConnUnitPortCounters(8)
        }
        ACCESS read-write -- (or maybe write-only)
        STATUS mandatory
        DESCRIPTION
            "This object is used to control the addressed
            connUnit's port. Valid commands are:

            resetConnUnitPort: If the addressed connUnit
                allows this operation to be performed to this
                port, the addressed port performs a
                vendor-specific 'reset' operation. Examples of
                these operations are: the Link Reset protocol,
                the Loop Initialization protocol, or a
                resynchronization occurring between the
                transceiver in the addressed port to the
                transceiver that the port is connected to.

            bypassConnUnitPort: If the addressed connUnit
                allows this operation to be performed to this
                port, the addressed port performs a
                vendor-specific 'bypass' operation. Examples of
                these operations are:
                transitioning from online to offline, a
                request(NON-PARTICIPATING) command to the
                Loop Port state machine, or removal of the
                port from an arbitrated loop by a hub.

            unbypassConnUnitPort: If the addressed connUnit
                allows this operation to be performed to this
                port, the addressed port performs a
                vendor-specific 'unbypass' operation. Examples
                of these operations are:
                the Link Failure protocol, a
```

```
            request(PARTICIPATING) command to the
            Loop Port state machine, or addition of the
            port to an arbitrated loop by a hub.

        offlineConnUnitPort: If the addressed connUnit
            allows this operation to be performed to this
            port, the addressed port performs a
            vendor-specific 'offline' operation. Examples
            of these operations are:
            disabling a port's transceiver, the Link
            Failure protocol, request(NON-PARTICIPATING)
            command to the Loop Port state machine, or
            removal of the port from an arbitrated loop
            by a hub.

        onlineConnUnitPort: If the addressed connUnit
            allows this operation to be performed to this
            port, the addressed port performs a
            vendor-specific 'online' operation. Examples
            of these operations are:
            enabling a port's transceiver, the Link
            Failure protocol, request(PARTICIPATING)
            command to the Loop Port state machine, or
            addition of the port from an arbitrated loop
            by a hub.

        NOTE: Each implementation may chose not to allow
        any or all of these values on a SET. "

        that contains this event table."
    ::= { connUnitEventEntry 1 }

connUnitEventIndex OBJECT-TYPE
    SYNTAX INTEGER (1..2147483647)
    ACCESS read-only
    STATUS mandatory
    DESCRIPTION
        "Each connectivity unit has its own event buffer.
        As it wraps, it may write over previous events.
        This object is an index into the buffer.
        It is recommended that this table be read using
        'getNext's to retrieve the initial table.
        The management application should read the
        event table at periodic intervals and then
```

```
            determine if any new entries were added by
            comparing the last known index value with the
            current highest index value. The management
            application should then update its copy of
            the event table. If the read interval
            is too long, it is possible that there may
            be events that may not be contained in the
            agent's internal event buffer.
            For example, an agent may read events 50-75.
            At the next read interval, connUnitEventCurrID
            is 189.  If the management app tries to read
            event index 76, and the agent's internal buffer
            is 100 entries max, event index 76 will no longer
            be available.
            The index value is an incrementing integer starting
            from one every time there is a table reset.
            On table reset, all contents are emptied and
            all indeces are set to zero. When an
            event is added to the table, the event is
            assigned the next higher integer value than
            the last item entered into the table. If the
            index value reaches its maximum value, the next
            item entered will cause the index value to
            roll over and start at one again."
        ::= { connUnitEventEntry 2 }

    connUnitEventId OBJECT-TYPE
        SYNTAX INTEGER
        ACCESS read-only
        STATUS obsolete
        DESCRIPTION
            "The internal event Id. Incremented for each
            event, ranging between 0 and connUnitMaxEvents.
            Not used as table index to simplify
            the agent implementation. When this
            reaches the end of the range specified by
            connUnitMaxEvents, the Id will roll over to start
            at zero. This value will be set back to zero at
            reset. The relationship of this value to the index
            is that internal event id may represent a smaller
            number than a 32 bit integer (eg max 100 entries)
            and would only have a value range up to
            connUnitMaxEvents."

            ::= { connUnitEventEntry 9 }

    -- The link table
    -- is intended to organize and communicate
    -- any information the agent possesses
    -- which would assist a management application
    -- to discover the CONNECTIVITY UNITS in the
    -- framework and the TOPOLOGY of their interconnect.
    -- That is, the goal is to assist the management
    -- application not only to LIST the elements of the framework,
    -- but to MAP them.

    -- With this goal, the agent SHOULD include
    -- as much as it possesses about any links
    -- from its own connectivity units to others,
    -- including links among its own units.

    -- An agent SHOULD include partial information
    -- about links if it is not able to fully
    -- define them in accord with the following structure;
    -- however, the information MUST include either
    -- a nonzero connUnitNodeId- or a nonzero connUnitPortWwn-
    -- for each end of the link.

    -- If the agent is able to discover links
    -- which do not directly attach to members of its agency
    -- and its discovery algorithm gives some assurance
    -- the links are recently valid, it MAY include these links.

    -- Link information entered by administrative action
    -- MAY be included even if not validated directly
    -- if the link has at least one endpoint in this agency,
    -- but SHOULD NOT be included otherwise.

    -- A connectivity unit should fill the table in as best it can.
    -- One of the methods to fill this in would be to use the RNID
    -- ELS (ANSI document 99-422v0). This allows one to query a
    -- port for the information needed for the link table.

    -- This table is accessed either directly if the management
    -- software has an index value or via GetNexts. The value of
    -- the indexes are not required to be contiguous. Each entry
    -- created in this table will be assigned an index. This
    -- relationship is kept persistent until the entry is removed
    -- from the table or the system is reset. The total number of
    -- entries are defined by the size of the table
```

```
-- For an entry to be considered to be valid, both the X (local)
-- and the Y (remote) need to have one valid value.
