MODELS

HP Ultrium 400 GB Data Cartridge

C7972A, Worldwide

Feature List:

- 200 GB native capacity at 2:1 compression
- Unique red cartridge shell to assist with identification in mixed media vaults
- Superior 'smart grabber' mechanism and mechanical interlock to prevent the leader pin from being pulled inside the tape housing (a key weakness of DLT media). Sensors detect proper connection and prevent leader loss that would ruin the tape.
- Simplified tape path to reduce wear and tear.
- Lowest media cost per GB at launch of *any* tape technology.
- LTO cartridge memory in media to improve access time and provide enhanced media monitoring.
- Improved cartridge robustness and durability

OVERVIEW

Backed by HP's exhaustive media qualification process, the C7972A HP Ultrium 400GB data cartridge supports the launch of the HP StorageWorks Ultrium 460 Tape Drive. Building on the class-leadership of the Linear Tape Open standard, HP Ultrium 2 cartridges provide exceptional reliability with best-in-class high performance; the new format minimizes network interruption by being capable of protecting nearly 216 GB/hour of data (88% faster than SDLT 320) and storing up to 400GB on one piece of media (double the capacity of Ultrium 1 tapes).

Customer Benefits Include:

- high-capacity: supports capacities up to 400 GB
- high-performance: with HP StorageWorks Ultrium 460 tape drive delivers up to 60 MB/sec compressed transfer rate
- reliable: combines the best of proven technologies to offer users improvements in capacity and performance.
- open standard: for use in all HP and non-HP LTO Ultrium 2 products
- easy to use: possesses a distinctive red cartridge shell

KEY FEATURES

- Tested to extremes in HP's media laboratory, to a level of specification unique to Hewlett-Packard. Many of the test procedures required for HP Brand qualification (e.g. load/unload, shoeshine, drop testing and thermal aging) are not required for the Ultrium logo.
- 200 GB (native), 400 GB (2:1)
- Supports transfer speeds of 30 MB/s (native), 60 MB/s (2:1)
- Unique red cartridge shell
- Compatible with all HP and non-HP LTO Ultrium tape products
- LTO Cartridge Memory
- Superior mechanism, tape path and tape engagement
- Durable cartridge designed to minimize wear and debris (important in automation)

PRODUCT HIGHLIGHTS

'ium 2 Tape Technology

Ultrium 2 tape drive technology uses a linear format of 512 tracks, writing eight (8) tracks simultaneously. The data is written in a serpentine pattern; the tape reverses direction after each set of eight tracks is written.

Ultrium formats are open standards. This means that data written on any HP StorageWorks Ultrium 460 tape drive for ProLiants can be interchanged directly with Ultrium 2 tape drives from other vendors.

PRODUCT HIGHLIGHTS *(continued)*

High Reliability

HP ensures the highest level of quality with media specifications that far exceed industry standards.

- HP has 20 custom-built testing chambers that are in use 24 hours per day, 365 days per year.
- It is doubtful if any other media supplier carries out such exhaustive qualification of the drive and media as they are used in the field. This is because no media supplier is exposed to support of hardware in the field and has a vested interest in reducing media-induced hardware issues.
- In 2001, 170,000 different media tests were performed, accounting for 1.3 million test hours.
- HP testing includes procedures like drop testing, load/unload, environmental stress tests and archival simulation that are not required to gain the Ultrium logo.

LTO Ultrium 100/200 GB tape technology uses a "best of breed" technology approach, taking the best features from other tape technologies and combining them into a single new technology without the need for design compromises to accommodate legacy compatibility requirements. Designed for the demanding environment of large-scale libraries, Ultrium 400 GB media is certified for 1 million passes or 100 full back ups and has a 30 year archival storage life.

Compression

LTO-DC is an enhanced version of Advanced Lossless Data Compression (ALDC) hardware compression. Compression is automatically turned "off" if the compressed data would cause an overall expansion in data size.

Compatibility Testing

HP Ultrium 400 GB data cartridges are fully supported and compatible with HP StorageWorks Ultrium tape products. Because HP Ultrium media is Ultrium 2 logo compliant, it may be used with any other non-HP device that bears the Ultrium 2 logo.

Backward Read Compatible

HP Ultrium 400 GB media cannot be read or used to write new data in an Ultrium 1 drive or automation product.

HP Branded Media Specification

HP believes that its test program for HP Ultrium media is the most thorough and comprehensive in the industry. In order to carry the HP Brand, designated cartridges must satisfy an exhaustive battery of additional procedures that relate directly to how the product is used in real life situations when real data and real businesses are at stake. Some of these procedures – e.g. "five corner" environmental interchange, load/unload for automation, ageing simulation and drop testing are not found in the standard logo test. Over 1 million test hours on media and drives per year ensures that HP Ultrium media will always offer maximum reliability even in the most extreme conditions.

Why Buy LTO?

If you have not yet standardized on a large-tape format then LTO Ultrium tape technology is the preferred choice offering

- Highest reliability through no compromise design and innovative features like Data Rate Matching.
- High capacity to meet the challenges of data deluge
- High performance - even on slower hosts
- An industry standard - Linear Tape Open format
- Investment protection - with a four generation roadmap with plans to deliver an 800 GB (native) tape drive by the year 2006

Service and Support

Includes a limited lifetime warranty, fully supported by a worldwide network of resellers and service providers and toll-free 7 x 24 technical phone support during the warranty period.

Warranty

Limited lifetime warranty.

Preface

Printing History

The Printing History below identifies the edition dates of this manual. Updates are made to this publication on an unscheduled, *as needed*, basis. The updates will consist of a complete replacement manual and pertinent on-line or CD-ROM documentation.

First Edition ..... November 2002

What's New?

The, *Upgrade Guide, rp5400 Family of Servers*, is new and was developed to provide customers with system maintenance information for those components called customer replaceable units (CRUs). Maintenance of CRUs does not require HP customer engineering services, except when specifically cautioned. The cautions are shown primarily to protect customer product warrantees.

RQS Nº 03/2005 - CN

1 Server Overview

The rp5400 family of servers are 1-way to 4-way servers based on the PA-RISC processor architecture. The rp5400 family of servers accommodate up to 16GB of memory and internal peripherals including disks and DVD ROM/Tape. High availability features include HotSwap fans and power supplies, and HotPlug internal disk drives. The supported operating system is HP-UX.

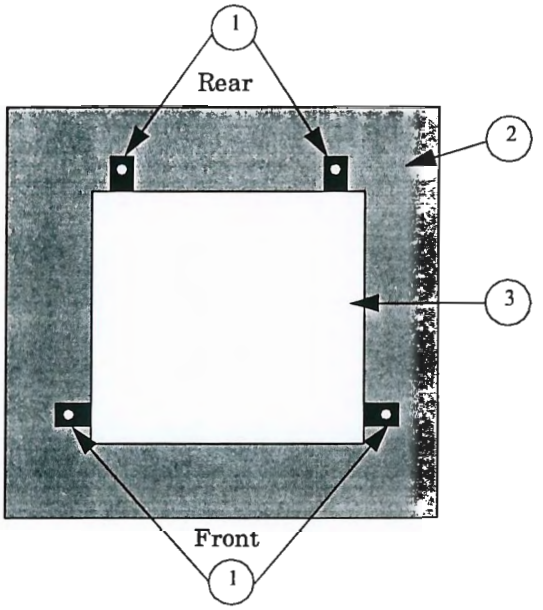
Factory Integrated rp54xx Cabinet Installation

A factory integrated server is one in which the rp54xx server and associated components are pre-assembled and shipped from the factory already installed in a Hewlett-Packard E-Series cabinet. Factory integrated systems reduce the amount of time required to set-up and begin server operation.

1. Carefully remove the carton and anti-static bag from the pallet.
2. Remove the front two (2) L-brackets. Retain the 1/2-inch bolts for later use.



1. Shipping L-Bracket
2. Shipping Pallet
3. Cabinet (Top View)

NOTE As viewed from the front, one bracket is located on each side at the base of the cabinet near the front.

ECT 3.160 2 CPI-AC

3. At the rear of the cabinet:
   a. Open the door.
   b. Remove the anti-tip foot by removing and retaining the two (2) 1/2-inch bolts.

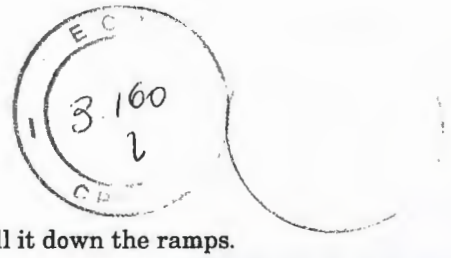
For Shipping: L-brackets are mounted behind anti-tip foot. Same bolts secure both.

   c. Remove the two (2) L-brackets (revealed by removing the anti-tip foot).
4. Remove the two ramps from the pallet and carefully place them into the slots at the front of the pallet.

WARNING **Use extreme care when rolling the racked system down the ramps. A rack containing one rp54xx can weigh up to 418 lbs. Do not stand in front of the ramps when rolling the cabinet off the pallet or injury may occur. All but the smallest configurations require two persons to safely remove the rack from the pallet.**

If anti-tip feet or ballast are not installed or are improperly installed the cabinet can tip. Failure to follow this precaution can cause injury to personnel or damage to equipment.

RGS Nº 03/2005 - CN
CPMI - CORREIOS
0015
Fls:
Doc: 701



5. Straighten the rollers on the cabinet base, if needed, and carefully roll it down the ramps.

WARNING ***After removing the server from the pallet, Do not move the cabinet unless the anti-tip feet are installed!*** **The cabinet can tip if care is not used. Due to their low ground clearance the feet may catch on irregularities on the floor, thresholds, or ramps.**

Do not move the cabinet without first installing the anti-tip feet. **The cabinet may tip if moved without the anti-tip feet or ballast installed.**

Do not move the cabinet after installing the anti-tip feet unless they are in the fully-raised position. **Once installed, the anti-tip feet must be fully raised to allow ground clearance.**

Because of their low ground clearance, the fully-raised anti-tip feet may need to be removed *temporarily* to clear some obstacles such as door jambs, ramps, and other large irregularities or obstructions on the floor.

If you must temporarily remove the anti-tip feet to clear an obstacle, use extreme caution when moving the cabinet. Always reinstall the anti-tip feet as soon as the obstacle has been cleared.

Lower and secure both the anti-tip feet and the cabinet leveling/stabilizer feet once the cabinet is in place.

Failure to follow these precautions can result in equipment damage or personal injury.

---

6. Install the front and rear anti-tip feet using the 1/2 inch bolts provided. Ensure that the anti-tip feet are installed in the fully up position in the mounting slots. This will provide maximum ground clearance while moving the cabinet to its final position.
7. Carefully move the cabinet to its installation location.
8. Lower the anti-tip feet to the fully down position and adjust the cabinet leveling feet for best cabinet stability.

3.159
L

Receive and Unpack A Non-Integrated Server

WARNING **The typical rp54xx system can weigh up to 68kg (150lbs). *HP recommends using an an approved lifting device.* Lift and move the server in accordance with all local safety regulations. Failure to follow this precaution can cause injury to personnel or damage to equipment.**

Unpacking the server

The following procedure describes the steps involved in unpacking the server, whether to function as a stand-alone Deskside unit, or to be integrated into a cabinet.

Step 1. Remove the shipping carton and anti-static bag from the server as depicted below.

ROS Nº 03/2003 - CN
CPMI - CORREIOS
0016
Fls:
Doc:

3.158
L

NOTE The packaging for rp74xx and rp54xx servers is the same, rp74xx is shown.

Step 2. If you are moving the server manually, use three people to lift the server from the packing material and pallet. Carefully move the server to the selected location.

Step 3. If you are moving the server by an approved lifting device (such as Genie Lift ™), remove the tear flap from the front lip of the carton bottom to allow access to the server, as illustrated below. Removal of the tear flap will reveal a slot between the bottom of the server and the inside bottom of the cardboard box.

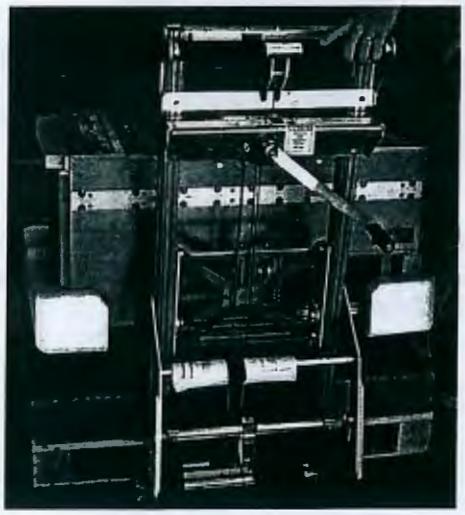
3.157
2

Step 4. Carefully raise the lift's platform so that it will slide into the slot located ***under*** the center of the server, but ***over*** the top of the pallet.

Lifting Device Platform.

NOTE The server's center of gravity will vary with the hardware configuration, but it is generally located slightly behind the middle of the server.

Step 5. Raise the lifting device platform enough for the server to clear the pallet and packing materials, as show below.



RQS Nº 03/2005 - CN
CPMI - CORREIOS
0017
Fls:
3701
Doc:

3.156
2

Install Deskside Server

The following section describes the installation of a server into a Deskside enclosure for installation in an office environment.

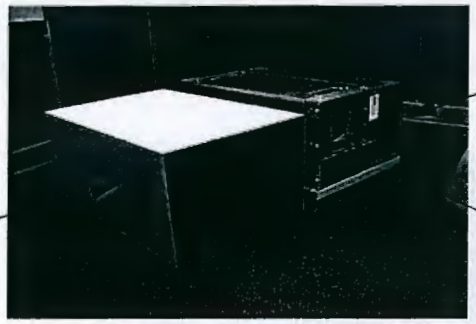
WARNING **The typical rp54xx system can weigh up to 68kg (150lbs). *HP recommends using an approved lifting device.***

- **Lift and move the server in accordance with all local safety regulations.**
- **Do not attempt to lift the server by the plastic handles on the top and side covers.**

Failure to follow these precautions can cause injury to personnel or damage to equipment.

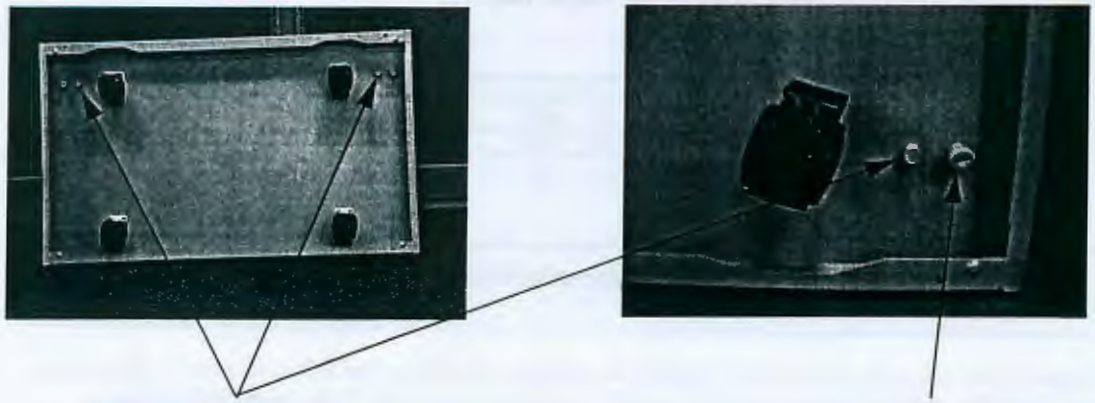
Step 1. Unpack the server.

Step 2. Unpack the deskside enclosure.



NOTE Ensure that the positioning spring pins in the enclosure base align with the alignment holes in the bottom of the server.

3155
2



Step 3. Position the server on the wheeled enclosure base.

Step 4. Tighten the two captive screws in the enclosure base to secure the server to the base.

Step 5. Position the enclosure cover (outside skin) over the server and install and tighten the screws to secure it to the base.

NOTE The perforations and the lip of the outside skin should be toward the rear of the server.

WARNING **Stacking rp54xx servers in deskside enclosures is *not* supported.**

Stacking rp54xx servers in deskside enclosures can damage equipment, may cause injury to personnel, and may void your warranty or service contract.

Step 6. Install the Front Bezel.

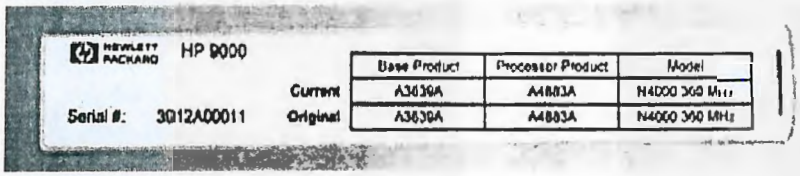
Step 7. Locate the two pull-tabs. One pull-tab is longer than the other. The shorter pull-tab is blank on both sides. The back of the shorter pull-tab provides a writable surface for Customer use.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0018
Fls:
3701
Doc:

3.154
2

Step 8. Locate the plastic bag containing the label sheet (taped to the server).

Step 9. Remove the label containing serial number, base product, processor product, and model information from the label sheet and apply to the back of the longer pull-tab.



NOTE Pull-tab and label shown above is for an rp74xx server. rp54xx uses the same style label and similar pull-tab.

Step 10. Insert the pull-tabs into the front bezel. Install the longer pull-tab in the left side plastic window in such a way that the rp54xx logo is visible. Install the shorter pull-tab in the right side plastic window with either surface visible. Refer to the diagram above for pull-tab locations.

3153
2

Install Stand-Alone Server in a Cabinet

The following describes how to install the A5556A slide-tray assembly into an approved HP cabinet in preparation for installing an rp54xx server.

This slide-tray assembly can be installed in an HP E-Series cabinet or other HP cabinets approved for rp54xx system installation. To install the A5556A slide-tray assembly in an approved HP equipment cabinet, proceed as follows:

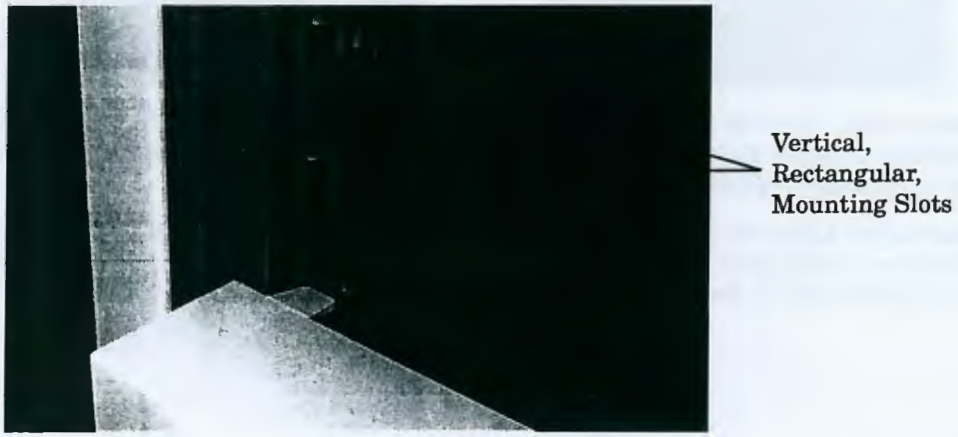
Step 1. Determine what type of cabinet you are installing the slide-tray assembly into.

a. E-Series cabinets have:

- Parchment white, plastic, sectional, side panels
- Black painted vertical frame posts with a partial return flange.

b. Approved, non-E-Series, cabinets have:

- Single piece metal side panels
- Gray painted verticle frame posts with full return flanges.



Step 2. Note the vertical, rectangular, slots in the return flanges on the vertical mounting posts. Determine into which of these vertical slots the slide/tray kit will be installed. This is done by counting down eight rectangular slots from the top of the cabinet or the bottom of the equipment above.

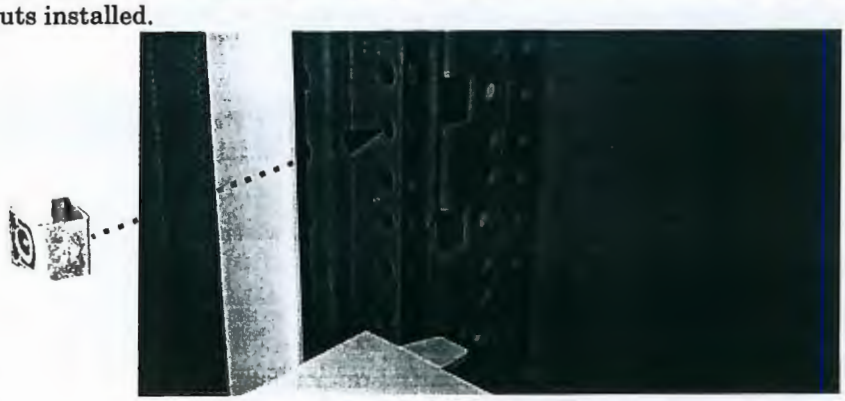
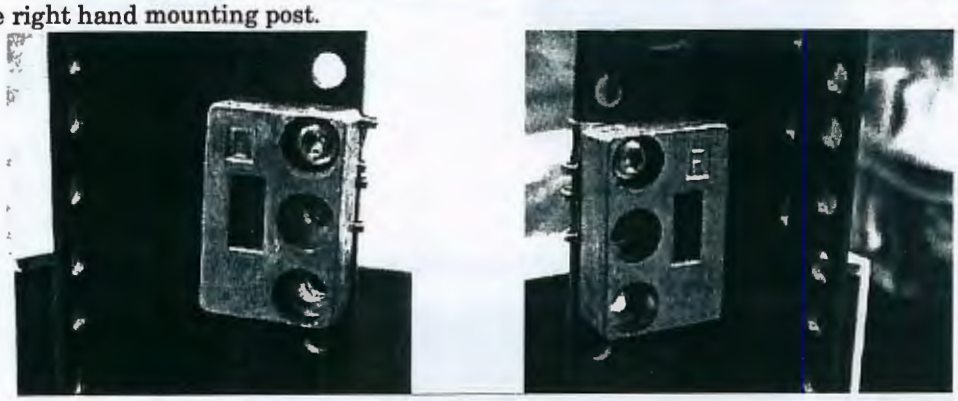
Doc:

Step 3. On the front vertical mounting posts *only*, slide M5 sheet metal nuts onto the posts over the holes immediately adjacent to the vertical slots determined in the previous step. Also place M5 sheet metal nuts on the holes directly above these. Orient the sheet metal nuts so that the threaded portion faces towards the outside of the cabinet. There should now be a total of four (4) sheet metal nuts installed.



Step 4. If the cabinet is a non-E-Series cabinet, discard the left hand and right hand aluminum spacers and two of the M5 x 16 screws with cress-cup washers and proceed to step 12.

Step 5. If the cabinet is an E-Series cabinet, place the hook of the aluminum spacer marked "L" (5183-1864) into the appropriate vertical, rectangular slot on the front, left hand mounting post. The hook points downward. Similarly, place the spacer marked "R" (5183-1863) into the appropriate slot on the right hand mounting post.



Step 6. Use one M5 x 16 screw with cress-cup washer to attach each spacer to its vertical post. Do this by inserting the screw through the top hole in the spacer, through the mounting rail and tightening it into the sheet metal nut located at that position.

Step 7. Take the left hand slide/bracket assembly (marked 337079-1L) and install it into the left hand vertical mounting posts. This is done by inserting the pin at the rear of the slide's mounting bracket into the 23rd hole in the rear vertical mounting post and inserting the hook at the front of the

3151
2

bracket into the vertical, rectangular slot in the aluminum spacer. The slide should be positioned in the cabinet so that it is horizontal and level.

Step 8. Securely fasten the rear of the slide's mounting bracket to the rear vertical mounting post by installing and tightening two of the M5 x 16 screws with cress-cup washers thorough the mounting post, through the slides mounting bracket and into the threaded nuts attached to the mounting bracket.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0020
Doc: 3701

Step 9. Fully extend the slide so that it is locked in the fully open position.

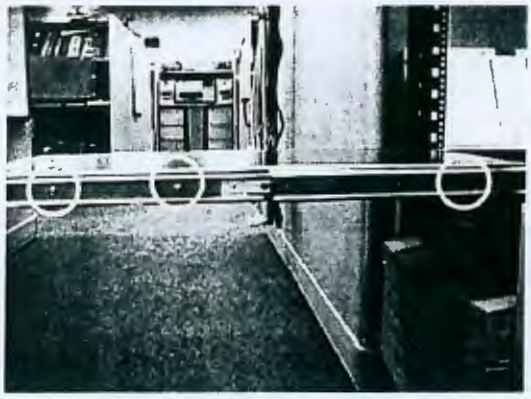
Step 10. Use an M5 x 30 screw with a cress cup washer to attach the front of the slide to the vertical mounting post. Insert the screw through the slide, through the center hole of the aluminum spacer, through the vertical mounting post, and tighten into the sheet metal nut located at that position.

Step 11. Use a procedure similar to steps 7 through 10 to install the right hand slide/bracket assembly (marked 337079-1R) and then proceed to step 12.

3 149
1

Step 12. Take the tray and place it onto the pins that extend from the slides' inner members. The slots with wide lead-in guides on the side of the tray fit down onto the slides' pins. The flat part of the tray will be on top, and the mounting holes in the top of the tray will be located to the right of the center of the tray. Slide the tray all the way down on both sides so that the pins reach the top of the slots in the side of the tray.

Step 13. Use six, M5 x 12 screws (without washers) to attach the tray to the slides. Three screws are used to attach each slide. Insert the screws through the slides, through the tray and tighten into the threaded nuts located on the inside of the sides of the tray.



3 Pan Head
M5x12 T25 screws
on each side

Step 14. From the bottom of the tray pull the plunger pin down and give it a 1/4 turn to hold it in place.

Stationary L-Bracket Rail Assembly

rp54xx servers may be installed into E-Series and approved Non- E-Series cabinets using stationary L-bracket rail assembly kits listed below.

NOTE rp54xx servers are supported in Hewlett-Packard E-series and approved Non- E-series Hewlett-Packard cabinets, and approved rail kits.

For information on additional qualified 3rd party cabinets and rail kits, contact the nearest Hewlett-Packard Response Center.

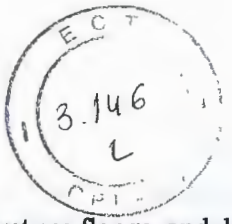
Cabinet Type	Rail Kit Product Number
E-Series HP Cabinet	A5575A
Other Approved HP Cabinet	A5562A

Identifying Approved Non-E-Series HP Cabinets

Approved Non- E-Series cabinets have black frames, one piece outside sheet metal skins, a partial return flange, and *requires* the installation of the aluminum spacer blocks, supplied with the rail kits.

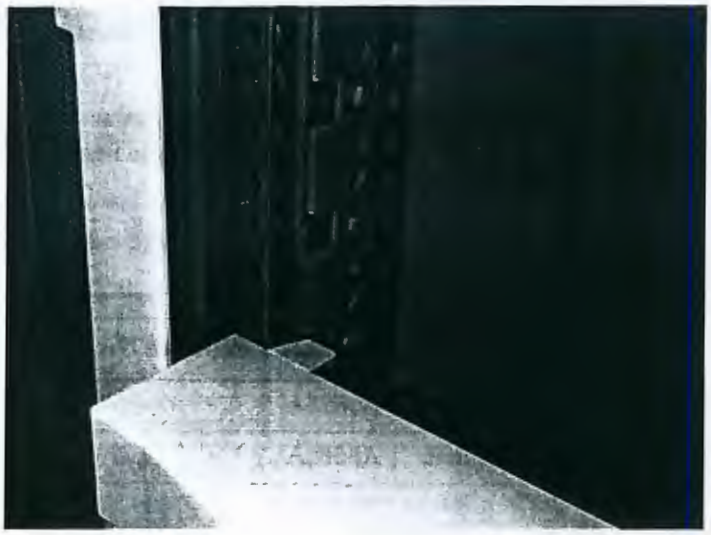
Approved Non- E-Series cabinets include the following product numbers: A1883A, A1884A, A1896A, A1897A, C1897A, C2785A, C2786A, and C2787A.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0022
Doc: 3701



Identifying E-Series HP Cabinets

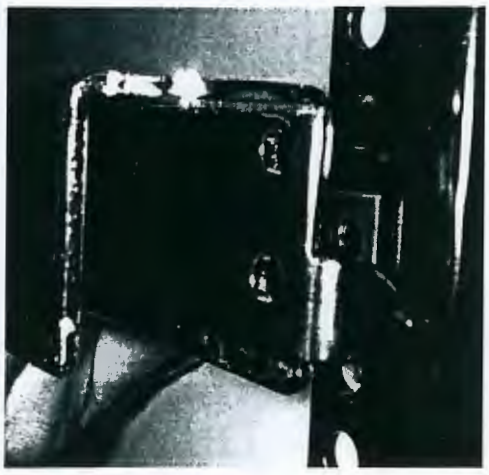
E-Series cabinets have light gray frames, sectioned, plastic outside "skins", a full return flange, and does *not* require the installation of the aluminum spacer block supplied, with the rail kits.



E-Series cabinets include the following product numbers: A5134A, A5136A, A5136A, A4900A, A4901A, A4902A, J1500A, J1502A, and J1502A.

Identifying Static Rail Kit

Hewlett-Packard has currently approved two static rail kits for use in cabinet mounting the rp54xx server. They are illustrated below.



A5562A Kit Rail

A5575A Kit Rail

3145
L

Installing Stationary Rails

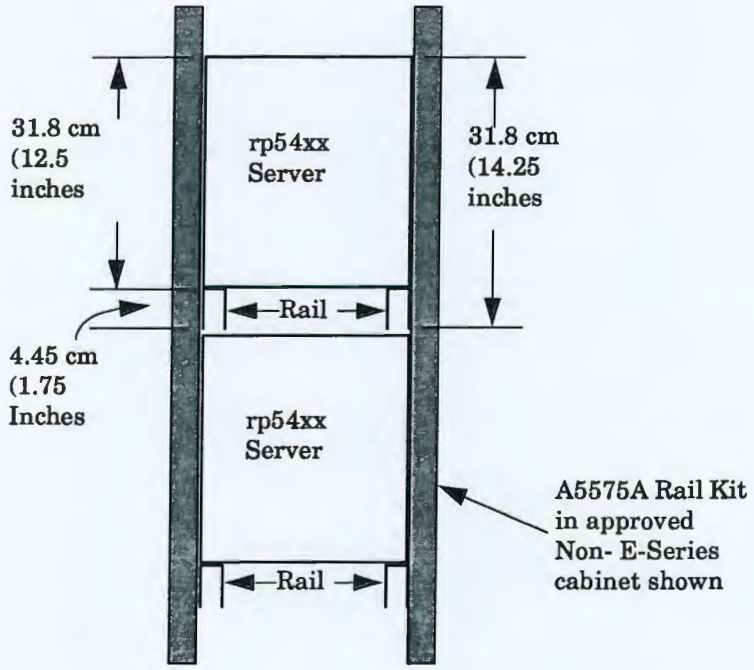
The installation of stationary rails is similar for most cabinet and rail combinations. The key considerations to are:

- Ensure that all safety precautions are read, understood, and observed
- Follow all installation instructions provided with the cabinet and rail kits, and
- Ensure that the rails extend out from the cabinet posts sufficiently to properly and safely support the equipment being installed.

To install an rp54xx server on stationary rails in an approved cabinet proceed as follows:

Step 1. Locate the rail mounting height in the cabinet. Allow for the following space requirements:

- For each rp54xx server, allow 31.8cm (12.5 inches) vertically (7 EIAs or Rack Units (RUs).
- If installing the A5575A rail kit, allow an *additional* vertical 4.45cm (1.75 inches (1 EIA) each set of rails.



Step 2. Install sheet metal nut(s) in the vertical cabinet posts at the required height for the kit being installed:

- Install the first nut either:
  - — 4.45 cm (1.75 Inches) above the top, or
  - — 31.8 cm (12.5 inches) below the bottom of the last server.
- If installing a A5562A rail kit, install the second nut in the next frame hole below the first.

Step 3. Hold the rail in place and insert and tighten the screws.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
0023
Fls:
Doc: 3701

For installation of other qualified cabinet and rail combinations refer to the safety precautions and instructions accompanying them.

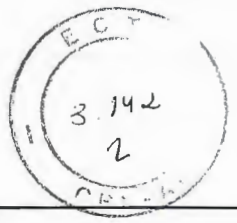
3 Installing Additional Components

ROS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0024
Doc: 3701



Additional Components

Some internal components are too delicate to be installed in the server prior to shipping. These internal components are shipped with the server, but are packed separately. They can be installed after the cabinet has been unpacked and positioned.

Some of the internal components that are packed separately are not user-installable. To maintain warranty validation, these items *must* be installed by a Hewlett-Packard Customer Engineer.

If you received either (or both) of the components listed below, contact your Hewlett-Packard provider to arrange for installation.

- Central Processing Units (CPUs)
- Power Distribution Units (PDUs)

Installing Memory

Memory Configuration Rules

rp54xx servers have 16 slots (8 DIMM pairs) for memory DIMMs. These slots are numbered 0a/b, 1a/b,... 7a/b. 8 of these slots (4a/b - 7a/b) are disabled on rp5400 servers. rp5450 servers can access all slots. rp5400 and rp5450 servers have DIMM slots located on the System Board.

rp5470 servers install DIMMs using Memory Carriers. The Memory Carriers fit into slots on the System Board.

The following rules govern the installation of memory DIMMs for rp5400, rp5450, and rp5470 servers:

- Memory must be installed in DIMM pairs.
- The capacity of DIMMs within a pair must be the same.

  Install DIMMs with the greatest capacity in the lowest slot numbers.
- Install DIMMs the following slot order: 0a/b, 1a/b, 2a/b, 3a/b, and so on.

Installing rp5400 and/or rp5450 DIMMs

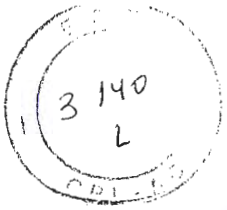
Step 1. Power down and *unplug* the rp54xx server.

CAUTION DC voltages are present when the server is connected to AC power. Do not install or service rp54xx internal components while DC voltage is present. Failure to observe this precaution can result in damage to the server.

Step 2. Loosen the captive T-15 screws that hold the top cover in place, then grasp the strap handle, raise the cover slightly, and pull the cover toward the front of the server to free the cover tabs from the slots in the chassis. The air baffle will be exposed.

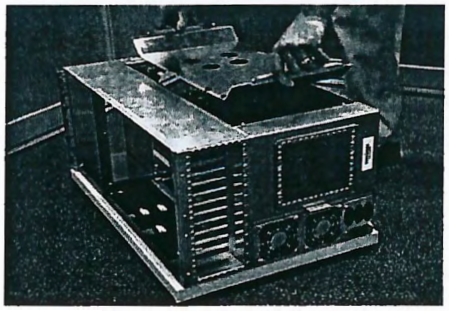
Step 3. Make the top of the server accessible for service.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0025
Fls:
Doc: 3701



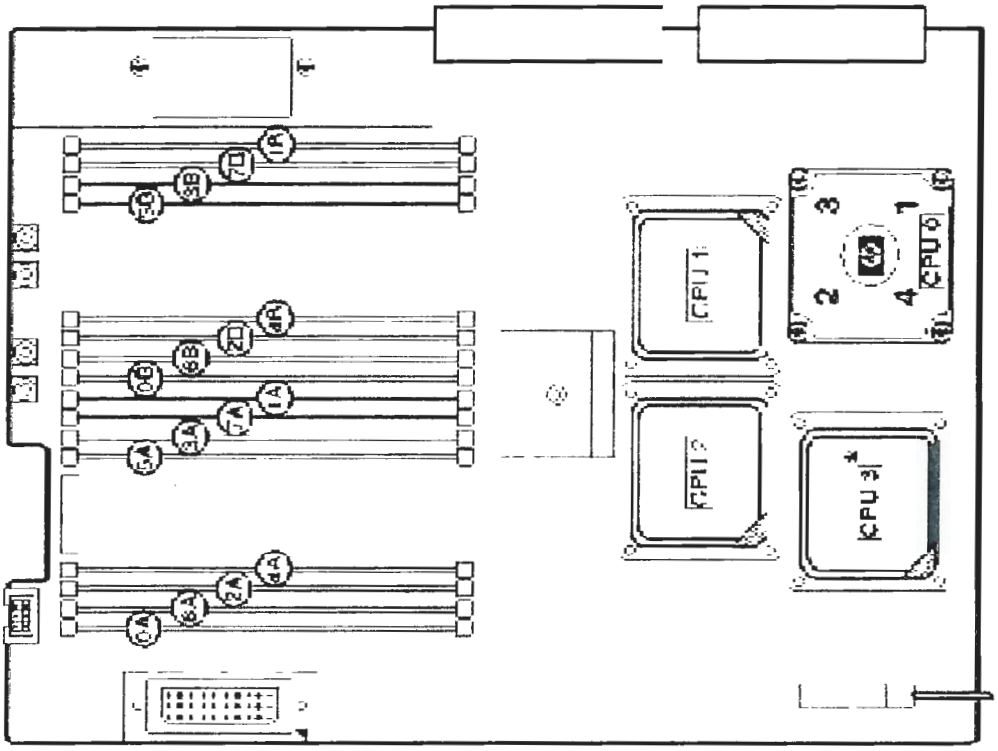
Step 4. Loosen the captive T-15 screws on the air baffle. Grasp the two handles on the baffle, and lift the baffle remove it.

CAUTION Observe all ElectroStatic Discharge (ESD) precautions Do not touch internal components. Failure to observe ESD precautions can cause damage to components.



Step 5. Observe Electrostatic Discharge (ESD) precautions.

Step 6. Refer to the following graphic for memory slot locations.



3139

Locate the correct DIMM pair slots. Insert the DIMM connectors into the guides until the card snaps firmly in place. It may be necessary to apply downward force using the palm of your hand on the DIMM. Observe the top of the DIMM to make sure one side is not higher than the other.

NOTE It may be necessary to remove PSM 1 when installing a DIMM in slot 0a and PSM 0 when installing a DIMM in slot 1b. If either PSM is removed to install memory, ensure it is re-installed.

Step 7. Replace the air baffle. Tighten the four captive screws to secure the air baffle in place.

Step 8. Replace the top cover. Tighten the four captive screws to secure the top cover in place.

Step 9. For rack configurations, insert the rp54xx server back into the rack.

Step 10. For deskside enclosure configurations, replace the deskside enclosure cover.

Step 11. Power the rp54xx server on.

Step 12. Use the BCH command `in me` to verify the system recognizes the memory that you have just added.

Installing rp5470 DIMMs

DIMMs for the rp5470 system are installed in memory carriers instead of the system board, as are the other rp54xx systems. However, rp5470 memory carriers are also located on the system board, so the method for opening and closing the system is the same. Procedures for removing and replacing the server top and baffle are listed below, without the pictures shown in the section titled, *"Installing rp5400 and/or rp5450 DIMMs."* If you wish to reveiw the pictures, please refer to the aforementioned section.

Step 1. Power down and unplug the rp54xx server.

NOTE DC voltages are present when the server is connected to AC power. Do not attempt to install or service: CPUs, Memory, PSMs, the Platform Monitor or PCI I/O cards installed in non-Turbo slots (1-6) while DC voltage is present. Failure to observe this warning may result in damage to the server.

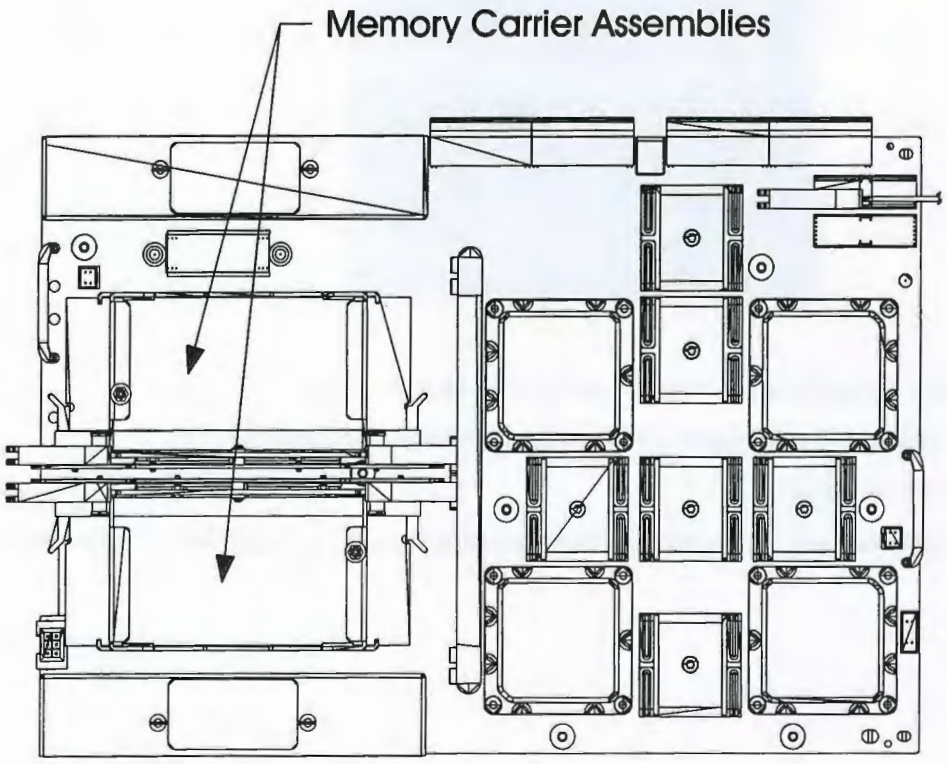
Step 2. Make the top of the server accessible for service.

Step 3. Loosen the captive T-15 screws that hold the top cover in place, then grasp the strap handle, raise the cover slightly, and pull the cover toward the front of the server to free the cover tabs from the slots in the chassis. The air baffle will be exposed.

Step 4. Loosen the four (4) captive T-15 screws on the air baffle. Grasp the two handles on the baffle, and lift and remove the baffle.

Step 5. Observe Electrostatic Discharge (ESD) precautions.

Step 6. Refer to the following graphic for Memory Carrier locations.



3.13.7
2

a. Locate the Memory Carrier and pull up on the extractor levers on each end of the Memory Carrier to unseat the Memory Carrier from its socket.

b. When the Memory Carrier unseats from the socket, pull it away from the System Board.

c. Loosen the captive screws that secure the DIMM Clip and remove the DIMM Clip from the Memory Carrier.

d. Seat the memory DIMM into its socket on the Memory Carrier.

e. Press the extractor levers on each end of the memory DIMM slot inward until the levers snap into place.

f. Attach the Memory Clip to the Memory Carrier with the DIMM slot markings on the top of the Memory Clip aligned with the DIMM slot markings on the Memory Carrier.

g. Secure the Memory Clip using the captive screws.

h. Seat the Memory Carrier into the appropriate slot on the System Board.

i. Push down on the extractor levers and snap them into place.

tep 7. Replace the air baffle. Tighten the four captive screws to secure the air baffle in place.

Step 8. Replace the top cover. Slide the cover tabs into the slots in the chassis and close the cover. Tighten the two captive screws to secure the top cover in place.

Step 9. For rack configurations, insert the rp54xx server back into the rack.

Step 10. For deskside enclosure configurations, replace the deskside enclosure cover.

Step 11. Power the rp54xx server on.

Step 12. Use the BCH command `in me` to verify the system recognizes the memory that you have just added.

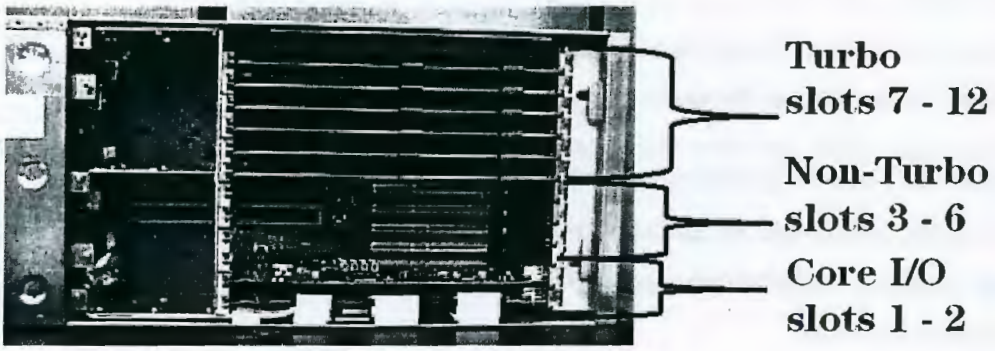
Installing Peripheral Component Interconnect (PCI) Cards

rp54xx servers have a total of 12 PCI I/O slots. Slots 1 and 2 are reserved for the LAN/SCSI and GSP Core I/O cards, leaving 10 PCI I/O slots available for Customer use.

rp5400/rp5450 PCI Card Slots

For rp5400 and rp5450 models, 10 PCI I/O slots consist of Turbo and non-Turbo slots. Server PCI slots are shown below.

rp5400/rp5450 PCI Card Slots



- Slots 1 and 2 are reserved for the rp54xx LAN/SCSI and GSP (Guardian Service Processor) Core I/O cards, respectively. Slots 1 and 2 are non-Turbo slots. Non-Turbo slots share a single 250MB/s PCI bus and are incapable of HotPlug functionality. The server must be turned off prior to removing or installing the LAN/SCSI or GSP cards in these slots.
- Slots 3 - 6 are non-Turbo slots. These four Non-Turbo slots share a single 250MB/s PCI bus, run at 33MHz and support 32 and 64-bit PCI cards. Non-Turbo slots are incapable of HotPlug functionality. The server must be turned off prior to removing or installing PCI cards in these slots.
- Slots 7 - 12 are Turbo slots. Each Turbo slot has a dedicated 250MB/s PCI bus, run at 66MHz and support 32 and 64-bit PCI cards. Turbo slots are HotPlug capable. Below each Turbo slot is a plastic PCI card separator. The PCI card separator has two LEDs and a pull tab on the outer edge. The LED's provide power and status for the slot. The pull tab allows the PCI card to be easily removed.

rp5400 servers have access to slots 1, 2 and 8-12 while rp5450 servers have access to all (1-12) slots.

NOTE Slot 3 will become enabled on rp5400 servers with server firmware versions later than 40.48.

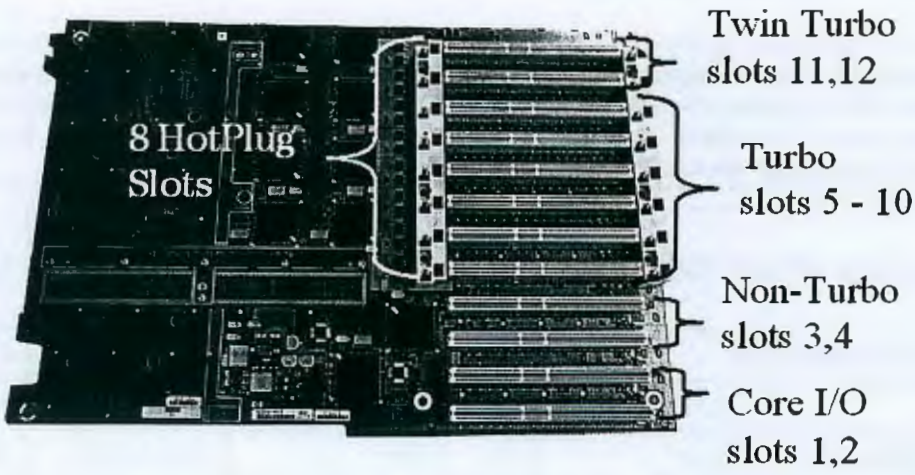
A slot 3 enabled label (A5576-84009) is available for rp5400 systems.

3.135
L

rp5470 PCI Card Slots

For rp5470 models, the 10 PCI I/O slots consist of Twin Turbo, Turbo, and non-Turbo slots. The following illustration shows the PCI card slot layout.

rp5470 PCI Slots



- Slots 1 and 2 are reserved for the rp54xx LAN/SCSI and GSP (Guardian Service Processor) Core I/O cards, respectively. Slots 1 and 2 are non-Turbo slots. Non-Turbo slots share a single 250MB/s PCI bus and are incapable of HotPlug functionality. The server must be turned off prior to removing or installing the LAN/SCSI or GSP cards in these slots.
- Slots 3 and 4 are non-Turbo slots. These two Non-Turbo slots share a single 250MB/s PCI bus, run at 33MHz and support 32 and 64-bit PCI cards. Non-Turbo slots are incapable of HotPlug functionality. The server must be turned off prior to removing or installing PCI cards in these slots.
- Slots 5 - 10 are Turbo slots. Each Turbo slot has a dedicated 250MB/s PCI bus, run at 66MHz and support 32 and 64-bit PCI cards. Turbo slots are HotPlug capable. Below each Turbo slot is a plastic PCI card separator. The PCI card separator has two LEDs and a pull tab on the outer edge. The LED's provide power and status for the slot. The pull tab allows the PCI card to be easily removed.
- Slots 11 and 12 are Twin Turbo slots. Each Twin Turbo slot has a dedicated 500MB/S PCI bus, runs at 66 MHz, and supports 32- and 64-bit PCI cards. Twin Turbo slots are HotPlug capable. Below each Twin Turbo slot is a plastic PCI card separator. The PCI card separator has two LEDs and a pull tab on the outer edge. The LED's provide power and status for the slot and the pull tab allows the PCI card to be easily removed.

rp5470 servers have access to all (1-12) slots.

PCI I/O Card Installation Restrictions

Restrictions apply regarding the installation of PCI I/O cards which contain a PCI-to-PCI bridge:

- HP-UX boot is currently not supported for cards that contain a PCI-to-PCI bridge.
- HP-UX patches are required when more than one card containing a PCI-to-PCI bridge is installed in non-Turbo slots.

PCI I/O Card Installation Order

The following table shows a standard factory PCI card installation that begins with slot 12. Use this table as a guideline for installing PCI I/O cards in the field.

NOTE A system shipped from the factory may have a different configuration than the same system built in the field. For example: The factory will install the graphics card in slot 12 and add other cards below. In the field, slot 12 may already be occupied by another PCI card. It is acceptable for the graphics card to be installed in any available Turbo slot.

Product Number	Description (all are PCI cards)	Max	Boot	Load Order *	Part Number	Notes

*In top down order.

Notes:

1. Card contains a PCI-to-PCI bridge.
2. Requires PHKL_20123, PHKL_20629 and PHNE_19826 or their superseded equivalents.
3. Not supported in non-Turbo slots. Install in Turbo slots only.
4. Requires server firmware revision 39.46 or later.
5. Requires HP-UX 11.1
6. Maximum is 7 for HP-UX versions prior to 11.0. Maximum is 10 for HP-UX version 11.1 and later.
7. Requires PHKL_19543 and PHKL_19544 or their superseded equivalents.
8. Requires HP-UX 11.0 Support Plus (IPR) 0006, June 2000 or later. This product to be released 6/00.
9. Not supported in a shared slot (slots 3-4 for rp5470, slots 3-6 for rp5450, not applicable for rp5400).
10. If you are installing ATM 622 cards in an rp5470 configuration, do not install them in slots 3 and 4 (shared slots).
11. Requires 768 MB for first card and 512 MB for each additional card.
12. Not supported in shared slots.
13. Max of 1. Needs USB card for keyboard and mouse.
14. Contains PCI bridge.

Installing a PCI Card

Follow these procedures to install a PCI card.

Step 1. Power down and unplug the rp54xx server.

NOTE DC voltages are present when the server is connected to AC power. Do not attempt to install or service: CPUs, Memory, PSMs, the Platform Monitor or PCI I/O cards installed in non-Turbo slots (1-6) while DC voltage is present. Failure to observe this warning may result in damage to the server.

Step 2. Make the right side of the server accessible for service.

Step 3. Using a Torx 15 screwdriver, loosen the captive screws on the right side panel. This panel has a label which shows which PCI I/O slots are available and the corresponding paths. The PCI I/O slot paths for rp5400, rp5450, and rp5470 are shown below.

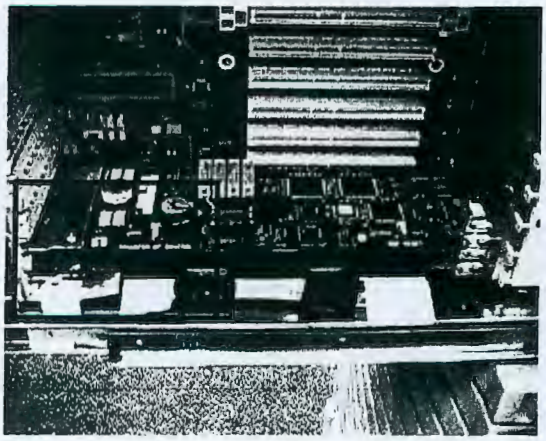
Slot	rp5400		rp5450		rp5430/rp5470	
	Slot Type	**Path**	**Slot/Type**	**Path**	**Slot Type**	**Path**
12	**Turbo**	**0/4/0**	**Turbo**	**0/4/0**	**Twin Turbo**	**0/10/0**
11	Turbo	0/7/0	Turbo	0/7/0	Twin Turbo	0/12/0
10	Turbo	0/3/0	Turbo	0/3/0	Turbo	0/8/0
9	Turbo	0/6/0	Turbo	0/6/0	Turbo	0/9/0
8	Turbo	0/2/0	Turbo	0/2/0	Turbo	0/3/0
7	Not Available		Turbo	0/5/0	Turbo[a]	0/1/0
6	Not Available		Shared	0/1/0	Turbo[a]	0/5/0
5	Not Available		Shared	0/1/1	Turbo[a]	0/2/0
4	Not Available		Shared	0/1/2	Shared[a]	0/4/0
3	Not Available[b]		Shared	0/1/3	Shared	0/4/2
2	GSP		GSP		GSP	
1	LAN/SCSI		LAN/SCSI		LAN/SCSI	

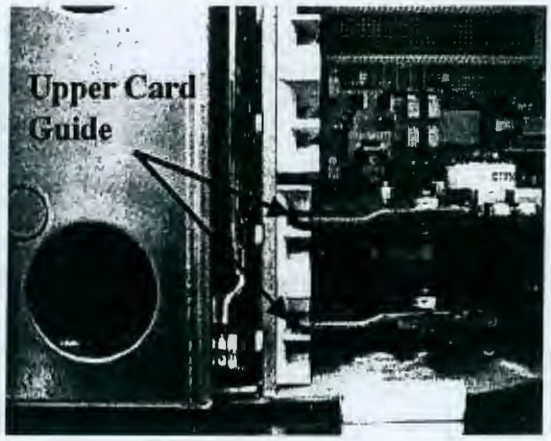
a. Slot is NOT AVAILABLE for rp5430.
b. Slot 3 becomes available with server firmware versions later than 40.48.

Step 4. Remove the PCI slot cover from the slot that will receive the PCI card. To remove the PCI slot cover, slide the PCI slot cover away from the server.

E.C.T. 3.131 2 C.P.I.-A.C.

Step 5. Slide the PCI card connectors into the slot, snapping firmly in place. For full length (cards that extend to the left side card guides) PCI cards, use the UPPER card guide.



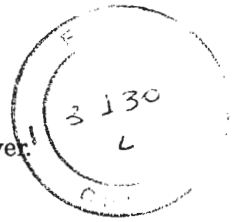


Step 6. At the rear of the chassis, connect the I/O cable to the card just installed.

Step 7. Replace the right side panel and tighten the captive screws.

Step 8. For rack configurations, insert the rp54xx server back into the rack.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0030
Fls:
3701
Doc:



Step 9. For deskside enclosure configurations, replace the deskside enclosure cover.

Step 10. Power the server on.

Step 11. Use the server firmware `in io` command to verify the PCI cards are recognized by the server. If AUTOBOOT is ON, it will be necessary to interrupt the boot process to get to the server firmware `Main Menu: Enter command or menu >` prompt.

Step 12. Boot HP-UX and run the `ioscan` utility to verify the system recognizes the new PCI card.

Online Addition/Replacement (OLA/R) of PCI I/O cards

Beginning with HP-UX 11i (11.11) rp54xx servers support the on-line addition and replacement of PCI I/O cards. In order for this high availability feature to be fully implemented, the following server requirements must be met:

- rp5400A/rp5450A firmware must be later than 40.26 (rp5400B/rp5450B/rp5470A firmware will support OLA/R upon its release).
- HP-UX operating system must be 11i (11.11) or later.

There is a bit that the HP-UX operating system examines to determine if the server hardware and firmware is capable of OLA/R. This bit is controlled by server firmware. If the bit is ON, OLA/R is possible (when requirements have been met). The bit was mistakenly set to ON for all rp5400 and rp5450 revision A (rp5400A and rp5450A) servers. As a result, HP-UX may incorrectly identify these models as being OLA/R capable. In order to avoid this confusion, verify that the correct level of server firmware is installed.

3.129
L-

Installing Graphics

This section explains how to install rp54xx 2D graphics hardware. For a complete graphics solution, three products are required. The products listed below are the only products supported on rp54xx servers.

- A6150A rp54xx Graphics Package
  - — Includes PCI graphics card
  - — Includes PCI USB (Universal Serial Bus) card
- A4983B Keyboard and Mouse Kit
  - — Includes mouse with 114" cable
  - — Includes keyboard with 109" cable
- D8910W (19") or D2847W (21)" Monitor
  - — Includes localized power cord and 75" 15-pin video cable

NOTE rp54xx graphics requires HP-UX 11.0 Support Plus (IPR) 0006, June 2000 or later.

The photo below includes the A6150A, A4983B and D8910W products. The video cable for the monitor is not shown. Black ESD mat not included.

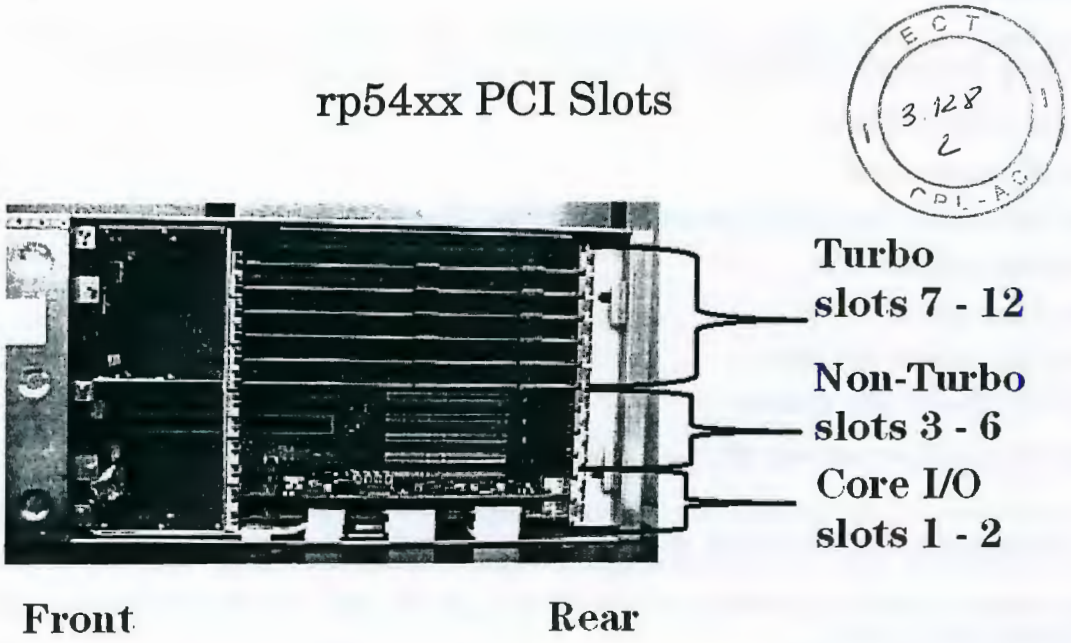
Doc: 2701

rp54xx servers have a total of 12 PCI I/O slots. Slots 1 and 2 are reserved for the LAN/SCSI and GSP Core I/O cards, leaving 10 PCI I/O slots available for Customer use. These 10 PCI I/O slots consist of Turbo and non-Turbo slots.



- Slots 1 and 2 are reserved for the rp54xx LAN/SCSI and GSP (Guardian Service Processor) Core I/O cards, respectively. Slots 1 and 2 are non-Turbo slots. Non-Turbo slots share a single 250MB/s PCI bus. Non-Turbo slots are incapable of HotPlug functionality. The server must be turned off prior to removing or installing the LAN/SCSI or GSP cards in these slots.
- Slots 3 - 6 are non-Turbo slots. These four Non-Turbo slots share a single 250MB/s PCI bus, run at 33MHz and support 32 and 64-bit PCI cards. Non-Turbo slots are incapable of HotPlug functionality. The server must be turned off prior to removing or installing PCI cards in these slots.
- Slots 7 - 12 are Turbo slots. Each Turbo slot has a dedicated 250MB/s PCI bus, run at 66MHz and support 32 and 64-bit PCI cards. Turbo slots are HotPlug capable. Below each Turbo slot is a plastic PCI card separator. The PCI card separator has two LEDs and a pull tab on the outer edge. The LED's provide power and status for the slot. The pull tab allows the PCI card to be easily removed.

rp5400 servers can access PCI slots 1,2 and 8-12. rp5450/3000 servers can access all PCI slots.

Follow these procedures to install graphics cards.

Step 1. Install HP-UX 11.0 Support Plus (IPR) 0006, June 2000 or later. This step ensures the appropriate HP-UX drivers are installed.

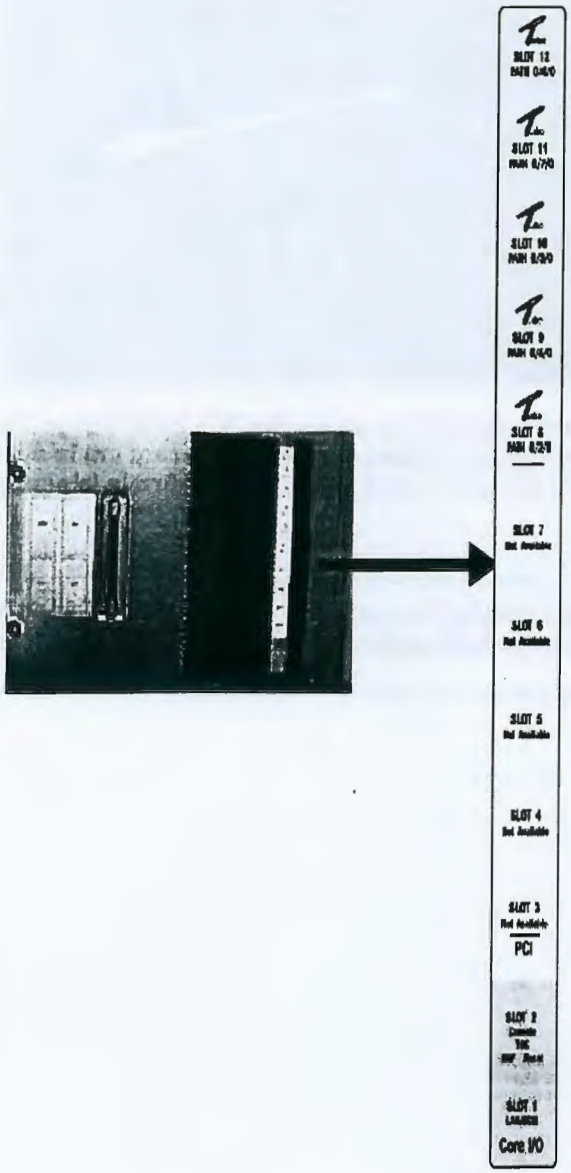
Step 2. Power down and unplug the rp54xx server.

3 127
2.

NOTE DC voltages are present when the server is connected to AC power. Do not attempt to install or service: CPUs, Memory, PSMs, the Platform Monitor or PCI I/O cards installed in non-Turbo slots (1-6) while DC voltage is present. Failure to observe this warning may result in damage to the server.

Step 3. Make the right side of the server accessible for service.

Step 4. Using a Torx 15 screwdriver, loosen the captive screws on the right side panel. This panel has a label which shows which PCI I/O slots are available and the corresponding paths. The label shown below is for an rp5400.



RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0032
Doc: 2701

E.C.T.
3.126
2

Step 5. Grasp the handle on the right rear panel and remove the panel from the side of the chassis. The 12 PCI slots, numbered 1-12 from bottom to top, will be in view.

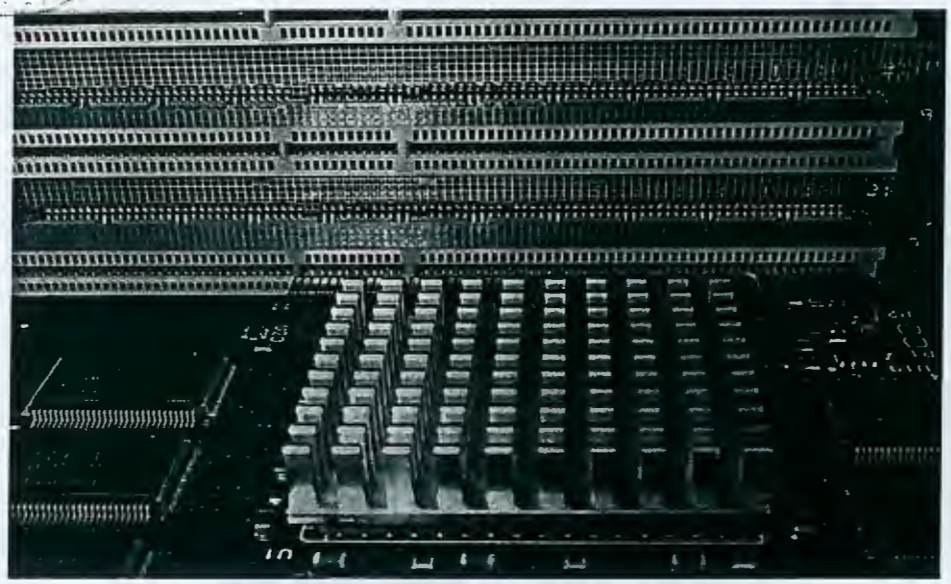
Step 6. Remove the PCI slot cover from the slot that will receive the PCI card. To remove the PCI slot cover, slide the PCI slot cover away from the server.

Step 7. Center the graphics card within the space created by removing the PCI I/O slot cover. Slide the card toward the edge connectors. Ensure the edge connectors on the card are in alignment with the connectors of the slot. Apply pressure to the card until it snaps firmly in place. Repeat process for USB card.

NOTE The graphics card must be installed in any Turbo slot while the USB will work in any slot. To reserve Turbo slots for high performance I/O cards, install the USB card in a non-Turbo slot

---

3.125
2



Step 8. At the rear of the chassis, connect the keyboard and mouse cables to the USB card. It does not matter which connector is used for the keyboard or mouse.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0033
Fls:
Doc: 3701

ECT
3.124
L
CPL-1

Step 9. Connect one end of the 15-pin video cable connector on the graphics card. This connector is labeled "Graphics Display" and "Video Out". Connect the other end of this cable to the graphics monitor.

Step 10. Replace the right side panel and tighten the captive screws.

Step 11. For rack configurations, insert the rp54xx server back into the rack.

Step 12. For deskside enclosure configurations, repalce the deskside enclosure cover.

Step 13. Power the server on.

3.123
L

Step 14. Use the server firmware `in io` command to verify the graphics cards are recognized by the server. If AUTOBOOT is ON, it will be necessary to interrupt the boot process to get to the server firmware `Main Menu: Enter command or menu >` prompt.

Step 15. Boot HP-UX and run the `ioscan` utility to verify the system recognizes the new PCI card.

Step 16. Logon as root and install X/CDE/Motif if not already installed.

Graphics Troubleshooting

This section describes how to troubleshoot common problems encountered during installation or attempted use of graphics. The following system utilities can be used to display or set the graphics configuration:

- `/opt/graphics/common/bin/graphinfo` allows you to display the current graphics configuration and the graphics drivers that are being used.
- `/opt/graphics/common/bin/setmon` allows you to reconfigure the monitor type.
- The `display` menu of the HP-UX System Administration Manager (SAM) utility allows you to configure the X-Server and set the monitor type.

  On-line diagnostics provide information, verify and diagnose coverage for the graphics and USB cards.Off-line diagnostics do not exist for either the graphics or USB card.
- The HP-UX `ioscan` utility can be used to verify the HP-UX operating system recognized the hardware.

Symptom: CDE will not come up.

Step 1. Ensure /dev/crt was created. If not created, use `insf -e` to create.

Step 2. Ensure the system is at run level 3. Use `who -r` to determine run level. Use `init 3` to change to run level 3.

Step 3. Ensure dt is enabled. Use `/usr/dt/bin/dtconfig -e` to enable dt.

Step 4. Ensure /etc/dt/config/Xservers exists. If not, use `/usr/dt/config/dtrc.d/20_graph_conf` to create.

Step 5. Ensure the line: * Local local@console /usr/bin/X11/X :0 is not commented out of the /etc/dt/config/Xservers file.

Step 6. Reboot HP-UX.

Symptom: HP-UX does not recognize the graphics cards. `unknown` **appears in the ioscan output for these cards**

Step 1. Examine the output of the `swlist` command to ensure the correct version of HP-UX is installed.

Step 2. Update HP-UX as necessary

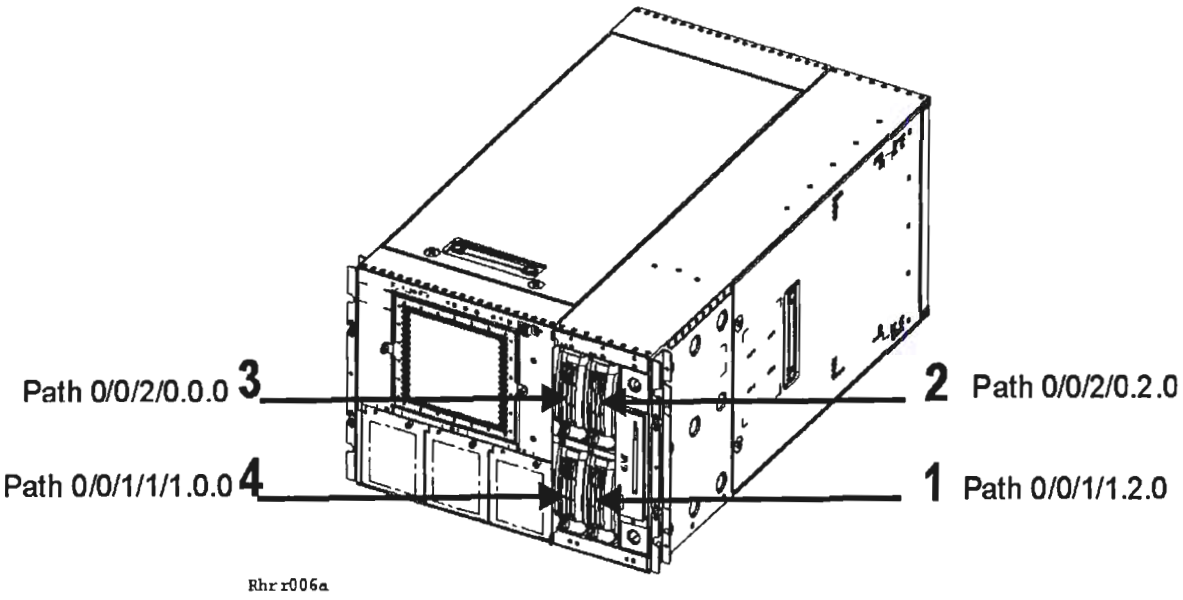
Doc: 2701

Installing Disk Drives

rp54xx servers support up to four optional internal hard drives. These drives must be installed in the following sequence:

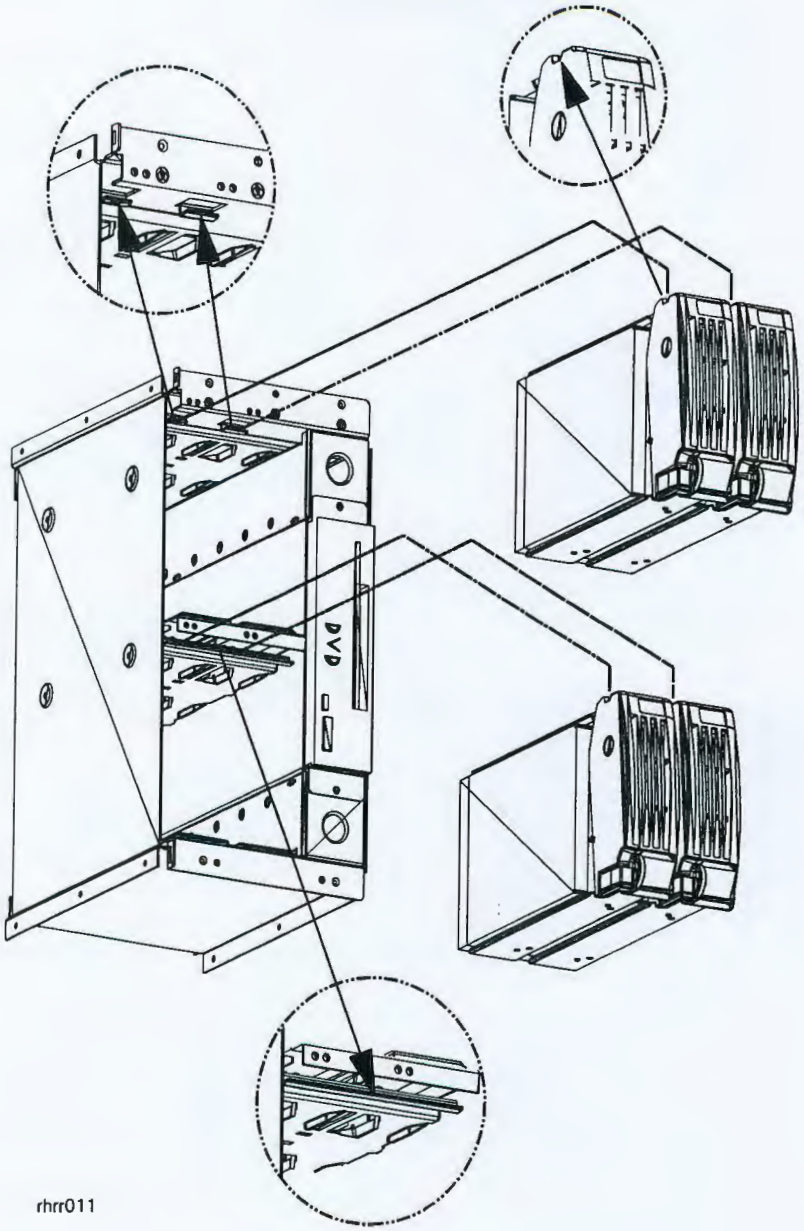


It is not necessary to shutdown the HP-UX operating system or power off the server to install a new disk. Follow this procedure to add internal hard disk drives to your rp54xx server.

Step 1. If a front bezel is installed on the face of the server, open the right-hand panel to gain access to the disk slots.

Step 2. Remove the disk drive slot cover.

Step 3. Insert the new disk drive into the slot until the rear connectors snap into place in the card guide. As shown in the following graphic, the notches at the top of the disk drives must snap over the small brackets in the disk bay to ensure a firm connection.



Step 4. Secure the connection by pushing the blue release lever closed.

Step 5. Refer to HP-UX documentation to configure the new disk.

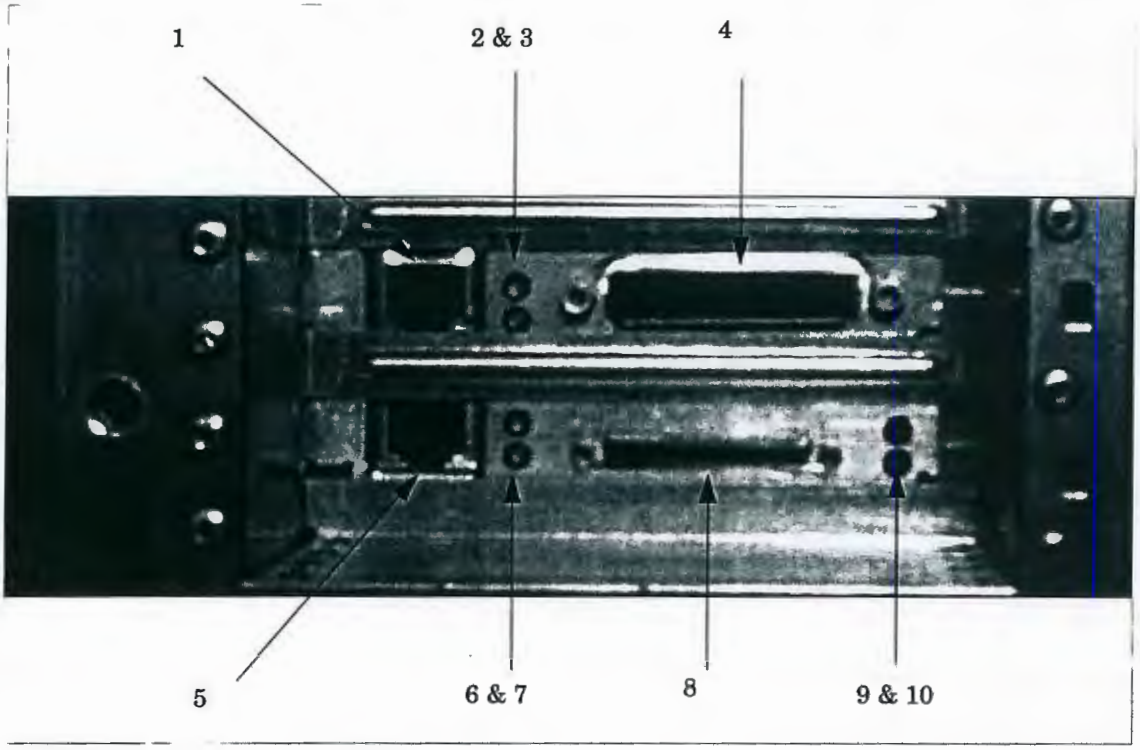
Core I/O Connections

The following paragraphs describe the indicators and connections of the rp54xx Core I/O. Core I/O consists of a LAN/SCSI card in slot 1 (lower slot in graphic) and a Guardian Service Processor (GSP) in slot 2 (upper slot in graphic). There are two versions of GSP, revision A and revision B.

Revision A GSP

The following graphic shows the indicators and connectors for the revision A GSP and LAN/SCSI Core I/O boards.



1. 10-Base-T LAN (RJ-45) Connector
   GSP LAN.
2. Green/Red (Upper LED)
   Green = GSP Power On.
   Flashing Green = LAN Receive.
   Red = Guardian Support Processor Test Failed.
3. Green/Red, (Lower LED)
   Green = Link OK.
   Flashing Green = LAN Transmit.
   Red = Guardian Support Processor Test Failed.
4. Console/UPS/Remote Connector (D-Type 25-Pin female).
   Requires an A5191-63001 "W" adapter cable
5. 10/100 Base-T = Primary LAN (RJ-45) Connection
   Path 0/0/0/0

6. Green/Yellow (Upper LED)
   Green = 100 Base-T Mode
   Green Blinking = 100 Base-T Receiving
   Amber = 10 Base-T Mode
   Amber Blinking = 10 Base-T Receiving
7. Green (Lower LED)
   Green = Link OK (10/100 Base-T Mode indicated by LED #6)
   Green Blinking = Transmitting
8. Ultra-2 SCSI Connector (68-Pin VHDCI SCSI)
   Path 0/0/1/0
9. SCSI Mode (Green, Upper LED)
   On = Low Voltage Differential (LVD) Mode.
   Off = Single Ended Mode.
10. SCSI Terminator Power (Amber, Lower LED)
    On = Terminator power present
    Off = Terminator power Not present.

Revision B GSP

The following graphic shows the indicators and connectors for the revision B GSP and LAN/SCSI Core I/O boards.

    On = Terminator power present
    Off = Terminator power Not present.

Guardian Service Processor (GSP) Overview

This section provides an overview of the Guardian Service Processor (GSP). The GSP is an always on, dedicated service processor that monitors system power, cooling and configuration, and provides console communications. Power and cooling information is obtained via an interface to the platform monitor card. Configuration information is obtained via connection to the Serial Presence Detect (SPD) bus. The GSP can only be installed in slot 2 and must be present for the server to power up.

The GSP has downloadable firmware which can be updated independent of the HP-UX operating system. GSP firmware updates can occur anytime the GSP is active. If the DC power switch is OFF, the GSP is still operational and GSP firmware updates can still occur. GSP firmware updates may be performed by customers.

If the GSP becomes hung, it is possible to reset the GSP without impacting the server. The GSP may be reset via the GSP RESET button on the right side of the card. The PCI cover panel (right side panel) must first be removed to allow access to the right side if the GSP card.

The GSP has two connectors on the bulkhead. An RJ-45 for LAN connections and a female DB25 connector for RS-232 connections. Attach either a "W" or an "M" cable to the DB25 connector to provide individual output or CONSOLE, REMOTE and UPS.

To access the GSP from the local ASCII console, type control b and the GSP> prompt will appear. It may be necessary to type control Ecf first. To exit the GSP, type GSP>co.

The GSP was originally a core component of the revision A rp5400 (A5576A) and rp5450 (A5191A) servers. Beginning with introduction of the revision B rp5400 (A5576B), rp5450 (A5191B), and rp5470 servers the GSP became a separate, must order product (A6696A).

There are two revisions of rp54xx GSP: rev A (A6696A) and rev B (A6696B). Both GSPs must be installed in order for the server to power up.

GSP LAN

This LAN is exclusively for LAN console access and is not configurable via HP-UX. The LAN is configured via GSP commands. Hostname, IP, gateway and subnet mask parameters may be set via the GSP>lc command. The GSP may also initiate ping via the GSP>xd command.

GSP RS-232

The DB25 connector on the GSP is used for RS-232 communications to a local console (via CONSOLE connector), a remote console via modem (REMOTE connector), and a UPS (UPS connector). The baud rate, term type, etc., of the CONSOLE and REMOTE ports are configured via GSP>ca command.

The GSP supports VT100 and HPTERM terminal emulation. For correct communications, the GSP and RS-232 device must use the same terminal emulation and baud rates.

GSP Features

The revision A GSP provides a 10 base-T LAN connector for LAN console access and a DB-25 connector to which the A5191-63001 W-cable connects. The W-cable provides REMOTE, UPS, and CONSOLE DB-9 connectors.

Features of the revision A GSP are:

- 10 Base-T LAN connector for revision A GSP

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0038
Fls:
Doc: 3791

- 10/100 Base-T LAN connector for revision B GSP
- On-board processor dedicated to GSP functions
- Error logging and notification
- Display of system alerts and selftest chassis codes
- Powered by 15 VDC housekeeping power that is present when the front panel switch is off
- Power and configuration monitoring
- RS-232, LAN, REMOTE and WEB console access
- Administrator and user security
- Alphanumeric paging.

There are two revisions of rp54xx GSP: revision A (A6696A) and revision B (A6696B). Due to significant hardware differences between the revision A and B GSP, each GSP requires it's own firmware. Revision A GSP firmware can only be installed in a revision A GSP and revision B GSP firmware can only be installed in a revision B GSP. The hardware differences are necessary to incorporate the embedded web access, 10/100 Base-t LAN, and faster GSP processor.

The GSP provides four types of console access: RS-232, Remote, LAN and Web. Console information is mirrored to all four console types. Refer to *Configure System Console* for more information.

The GSP was originally a core component of the revision A rp5400 (A5576A) and rp5450 (A5191A) servers. Beginning with introduction of the revision B rp5400 (A5576B), rp5450 (A5191B), and rp5470 servers the GSP became a separate, must order product (A6696A).

Revision A GSP

The revision A GSP is identified by product number A6696A and part numbers: A5191-60012, A5191-69012, and A5191-69112.

The revision A GSP requires a "W" cable to be attached to the DB25 connector. The part number of the "W" is A5191-63001. The "W" cable provides female DB9 connectors for CONSOLE, REMOTE and UPS. The maximum supported baud rate for the CONSOLE and REMOTE connectors is 19200 baud and 1200 baud for the UPS.

The paths for the CONSOLE, UPS, and REMOTE are 0/0/4/0.0, 0/0/4/0.1, and 0/0/4/0.2 respectively.

For the rev A GSP, the web console is accomplished by shipping one J3591A Secure Web Console with each rp54xx server. The Secure Web Console can be used in place of an ASCII console to provide console access via a web connection. If you are installing an rp54xx server that does not have an ASCII console, you may use the Secure Web Console as the console. However, you must first configure the Secure Web Console. Refer to *Secure Web Console Installation and Configuration* for more information on SWC Installation/Configuration.

Revision B GSP

The revision B GSP is identified by product number A6696B and part numbers: A6144-60012, A6144-69012, and A6144-69112.

The revision B GSP requires an "M" cable to be attached to the DB25 connector. The part number of the "M" cable is A6144-63001. The "M" cable provides female DB9 connectors for CONSOLE, REMOTE, and UPS. The maximum supported baud rate for the CONSOLE and REMOTE connectors is 38400 baud and 1200 baud for the UPS.

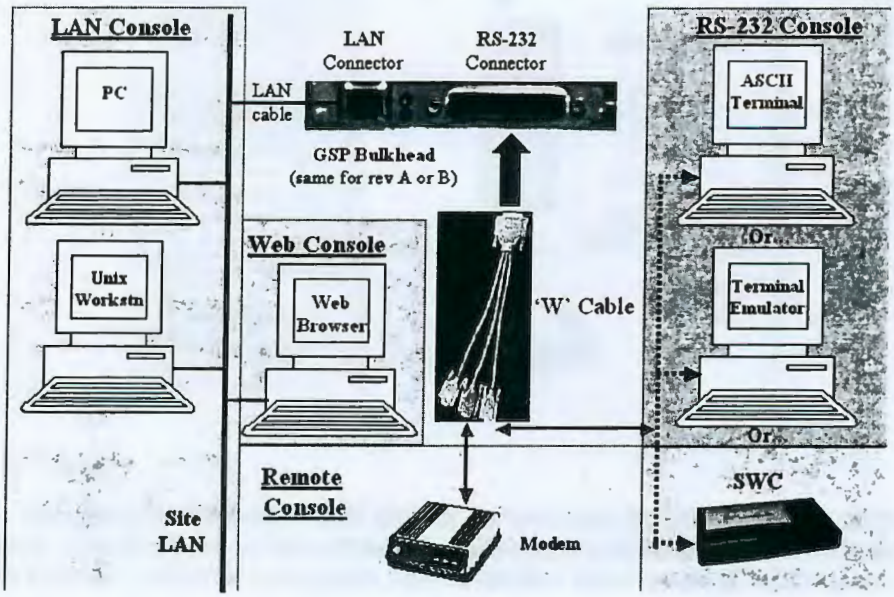
The paths for the CONSOLE, UPS, and REMOTE are 0/0/4/1.0, 0/0/4/1.1 and 0/0/4/1.2 respectively.

ECT 3.113 June

Configure System Consoles

rp54xx servers provide RS-232, REMOTE, LAN and WEB console access. All console access involves the Guardian Service Processor (GSP). rp54xx servers use either a revision A or revision B GSP. Below is an illustration of the console access provided by the revision A GSP.

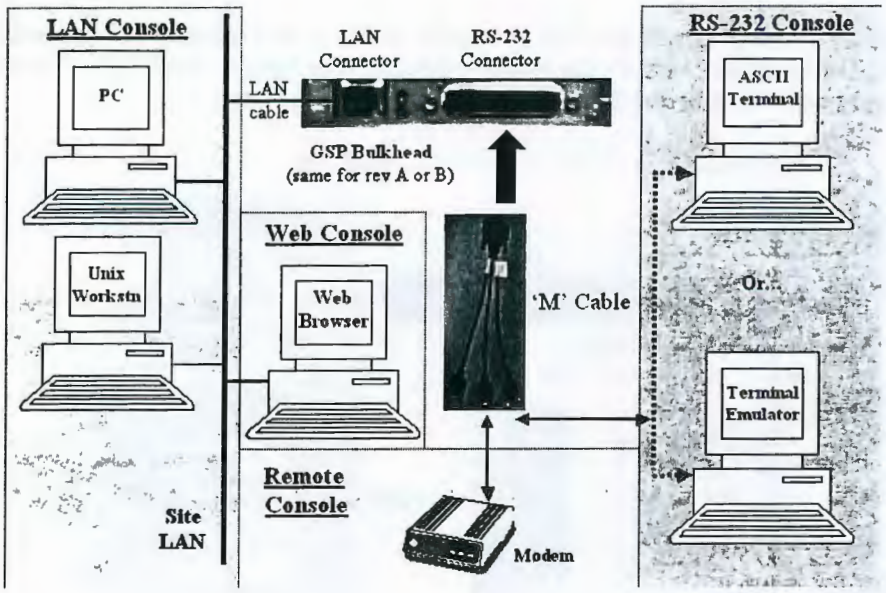
Revision A GSP Console Access



The revision B GSP has embedded web access, eliminating the need for an external Secure Web Console (SWC). Below is an illustration of the console access provided by the revision A GSP.

IRQS Nº 03/2005 - CN
CPMI - CORREIOS
0039
Fls:
3701
Doc:

Revision B GSP Console Access



GSP Cables

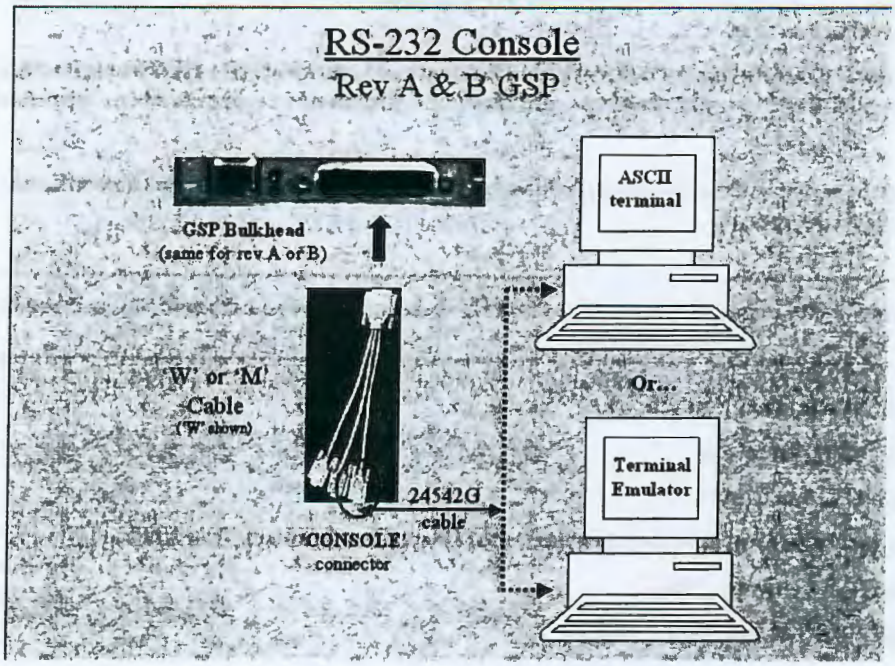
Both the revision A and B GSPs provide a DB-25 connector for RS-232 communications. Connect the A5191-63001 W- cable to the revision A GSP DB25 connector or connect the A6144-63001 M-cable to the revision B GSP DB25 connector. These cables provide individual DB9 connectors for REMOTE, UPS and CONSOLE.

NOTE Use the A5191-63001 W-cable with revision A GSP and A6144-63001 M-cable with revision B GSP *only*. Failure to use the right cable can result in reduced functionality.

The W and M-cables are slightly different. The W-cable has full RS-232 capability on the REMOTE and CONSOLE connectors and partial RS-232 capability on the UPS connector. The M-cable has full RS-232 capability on the REMOTE and UPS connectors and partial RS-232 capability on the CONSOLE connector. The cable change is to be consistent with rp54xx functionality. The cables are different colors to easily tell them apart. The W-cable is gray and has part number A5191-63001. The M-cable is black and has part number A6144-63001.

Configure RS-232 Console

The physical connections for an RS-232 console include attaching the correct cable to the GSP. Next, connect the 24542G cable (supplied) to the CONSOLE connector and the serial port of the ASCII console. A personal computer (PC) running terminal emulation software may be used in place of an ASCII console. Refer to the illustration below for RS-232 console.



Step 1. The GSP is located in slot 2 of the rp54xx' rear card cage. Connect the 25-pin end of:

- the A5191-63001 W-cable to the 25-pin connector on the revision A GSP card (A5191-60012) OR
- the A6144-63001 M-cable to the 25-pin connector on the revision B GSP card (A6144-60012)

Step 2. Connect the 9-pin "Console" connector of either the W or M-cable to the 9-pin D-type connector of a 24542G RS-232 cable.

Step 3. Connect the 25-pin end of the 24542G serial cable to the serial/RS232 port on the ASCII console. (RS232 Serial Port labeling may vary depending on manufacturer.)

Step 4. Connect the System Console to input AC power.

Step 5. Turn the System Console AC power switch to ON.

After the physical connections have been made, configure the ASCII console. When using the C1099A Terminal Console, the default settings are recommended. Refer to the C1099A Terminal Console operating manual for instructions on how to obtain default settings.

The HP 700 series console may also be used as an ASCII console. Both the C1099A Terminal Console and S700 consoles support HPterm and VT100 emulations. The emulation of the GSP and ASCII console need not match for communications between them to occur. However, to ensure proper communications, HP recommends the ASCII console and GSP use the same emulation. HP also recommends that other configurable parameters on the GSP match those of the ASCII console. Baud rate, start/stop bits, etc... The default emulation of the GSP is VT100.

Below is a procedure to configure a HP 700 serial console for VT100 emulation.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0040
Doc: 3701

HP 700 Series System Console Configuration

The following describes the steps required to configure the HP 700 series terminal for VT-100 mode for operation with an rp54xx server.

Although any terminal capable of operating in VT-100 mode can be used, the HP700 series terminal is used here as an example because it is fairly common and it's configuration is typical of many terminals currently in use.

HP700 VT-100 Mode Configuration The following procedure outlines the steps to configure the HP700 series terminal for VT100 operation.

NOTE You may use either the arrow keys or the tab key to move between the setting options on the screen.

---

1. Press **[config keys]** function key. **[f8]**
2. Press **[terminal config]** function key. **[f5]**
3. Move to *Terminal ID* and enter "vt100".
4. Move to *Set TermMode* and, using the **[Prev]** and **[Next]** keys, select "EM100".
5. Press the **[config keys]** function key. **[f8]**
6. Press the **[ansi config]** function key. **[f6]**
7. Move to "multipage" and, using the **[Prev]** and **[Next]** keys, select "yes". (Enables screen scrolling).
8. Move to *Backspace Del* and, using the **[Prev]** and **[Next]** keys, select "Backspace/Del".
9. Move to *EM100 ID* and, using the **[Prev]** and **[Next]** keys, select "EM100".

Configure the Asynchronous Values of the GSP

After the ASCII console has been configured and physical connections made, make any necessary changes to the asynchronous values of the GSP.

1. Access the GSP with the ctrl+b entry. The GSP will respond with a GSP> prompt.
2. At the GSP prompt, enter the Configure Asynchronous (ca) command:

The ca command will start a series of prompts. Respond to each prompt with the appropriate information.

Example 4-1 CA command

```
Leaving Console Mode - you may lose write access. When Console Mode returns, type
^Ecf to get console write access.

GSP Host Name:  fesrhapgsp

GSP> ca

CA This command allows you to modify the local and remote modem serial
portconfigurations.

Current configuration settings:

Local Console Serial Port bit rate: 9600 bits/s

Local Console Serial Port Flow Control: Software
```

3.109
Irene

```
Local Console Serial Port Terminal Type: vt100
Remote Console Serial Port Modem Protocol: CCITT  Remote Console Serial Port Modem
bit rate: 19200 bits/s
Remote Console Serial Port Modem Flow Control: Software
Remote Console Serial Port Modem Transmit Configuration Strings: Enabled
Remote Console Serial Port Modem Presence: always connected
Do you want to modify the Local Console Serial Port settings? (Y/[N])
Do you want to modify the Remote Console Serial Port Modem settings? (Y/[N])
GSP Host Name:  fesrhapgsp
```

If necessary, use the GSP help facility by typing GSP>he. Once in the help facility, type the command need help with. Use LI for a list of commands.

The following baud rates are recommended for the revision A GSP:

- Console: 19200
- Remote: 19200
- UPS: 1200

The following baud rates are recommended for the revision B GSP:

- Console: 38400
- Remote: 38400
- UPS: 1200

RQS Nº 03/2005 - CN

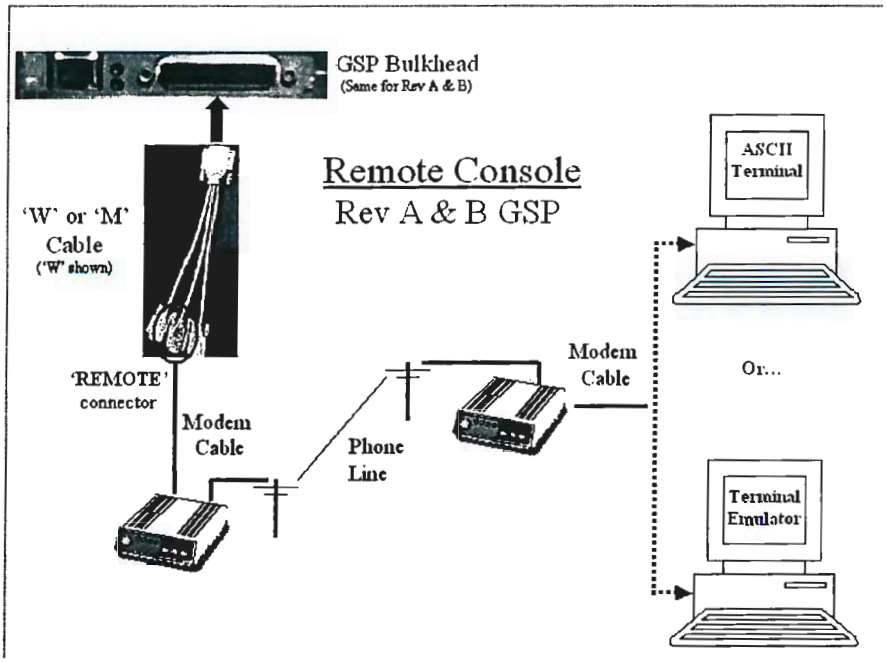
Configure Remote Console

The remote console allows console access via modem connections. Below is an illustration of the REMOTE console.

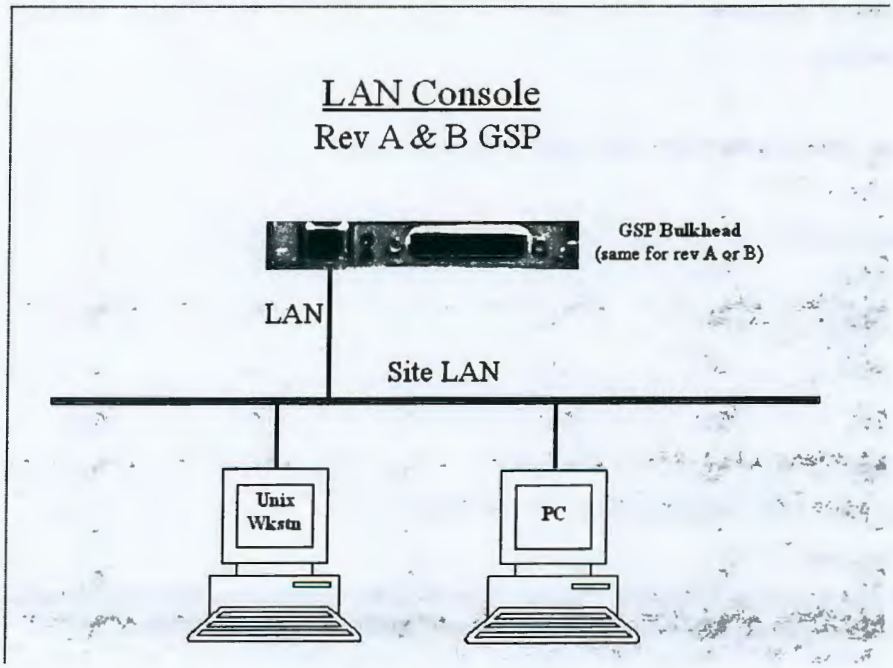


The GSP>ca command is used to configure asynchronous settings for the REMOTE console. Baud rates and emulations should match between the modems, remote ASCII terminal and the GSP. Refer to, "Configure RS232 Console" for information about setting these values.

3.107
frente
CPI - AC

Configure the LAN Console

The LAN console allows you to access the console from the LAN using TelNet or http (revision B GSP only) protocols. Below is an illustration of the LAN console.



The configuration of the LAN console of both the revision A and B GSPs may be done from either an ASCII console or the external Secure Web Console. For the revision B GSP, an IP may be assigned via LAN by pinging the LAN from a PC or workstation.

Configuring the GSP LAN Port via an ASCII console

The LAN port of the GSP allows connection via TelNet or http connections. Once the LAN parameters are configured, the console may be accessed via a TelNet connection or via a web browser (revision B GSP only). The default IP of the GSP LAN is 127.0.0.1.

NOTE The GSP has a separate LAN port from the system LAN port. It will need a separate LAN drop, IP address, and networking information from the port used by HP-UX.
Before starting this procedure, you will need to know the following information:

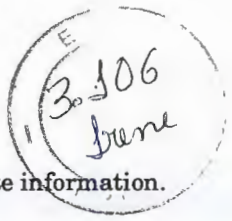
- I.P. address (for GSP)
- Subnet mask
- Gateway address
- Hostname (this is used when messages are logged or printed)

To configure the GSP LAN port, perform the following steps:

1. Access the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the LAN Configuration (lc) command:

```
GSP> lc
```

ROS Nº 03/2005 - CN
CPMI - CORREIOS
0042
Fls:
3701
Doc:



The lc command will start a series of prompts. Respond to each prompt with the appropriate information.

Example 4-2 LC command

```
Leaving Console Mode - you may lose write access. When Console Mode returns, type
^Ecf to get console write access.

GSP Host Name:  fesrhapgsp

GSP> lc

LC This command allows you to modify the LAN configuration.

Current configuration:

MAC Address: 0x00306e050a63

IP Address: 15.8.133.185

GSP Host Name: fesrhapgsp

Subnet Mask: 255.255.248.0

Gateway: 15.8.128.1

Web Console Port Number: 2023

Do you want to modify the LAN configuration? (Y/[N])

GSP Host Name:  fesrhapgsp
```

The revision B GSP introduces a configurable Web Console Port Number parameter. The default value is 2023. Once the GSP LAN is configured, it is accessible via either TelNet or web connections.

Configuring the GSP LAN Port via LAN

The revision B GSP LAN port can be assigned an IP address without using the LAN Configuration (lc) command via an ASCII console. This section describes how to assign the IP address allowing web access. Once web access is accomplished, use the lc command to configure remaining network parameters.

NOTE The GSP LAN port is separate from the system LAN port. It will need a separate LAN drop, IP address, and networking information from the port used by HP-UX.
Before starting this procedure, you will need to know the following information:

- I.P. address (for GSP)
- Subnet mask
- Gateway address
- Hostname (this is used when messages are logged or printed)

To configure the GSP LAN port via LAN, perform the following steps:

NOTE The GSP *must* be on the same subnet as the system being used to remotely configure the LAN port. If it is not, the remote configuration will be unsuccessful.

Step 6. Determine the MAC address of the revision B GSP by examining the GSP MAC address label on the rear of the server.

Step 7. Use the `route add` command to add the I.P address of the GSP and remote system to the router.

3.105 fume

Step 8. Use the arp command to add an ARP entry for the IP address using the GSP MAC address.

- For HP-UX systems, the format of the MAC address is 00:30:6e:05:0a:ea
- For MS DOS systems, the format of the MAC address is 00-30-6e-05-0a-ea

Step 9. Use the ping command to assign the I.P address for the GSP.

Step 10. The revision B GSP is now accessible via LAN. Access the GSP and configure remaining network parameters using the LAN Configuration (lc) command:

```
GSP> lc
```

The lc command will start a series of prompts. Respond to each prompt with the appropriate information.

Example 4-3 LAN Configuration from a PC

```

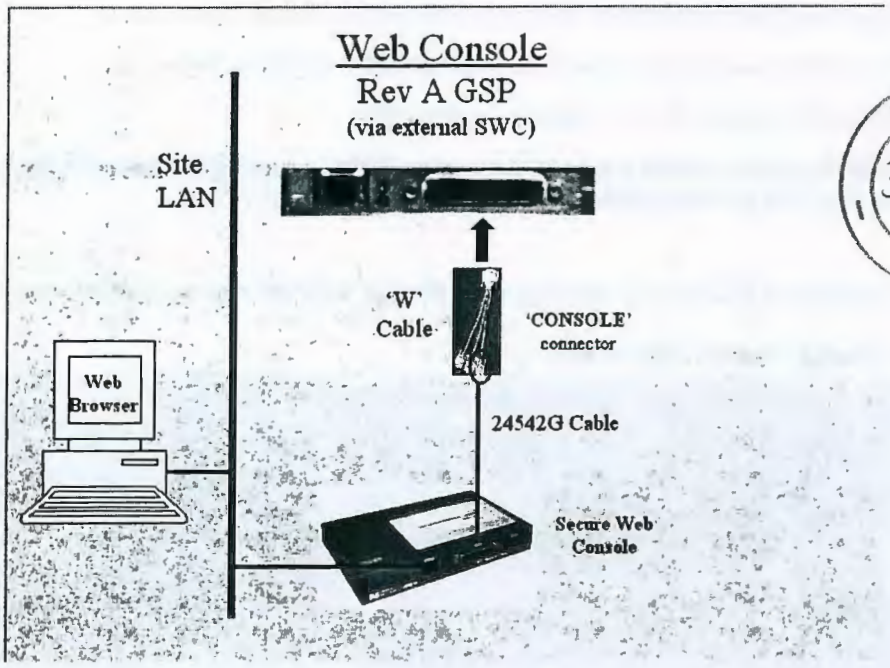
Configure the Web Console

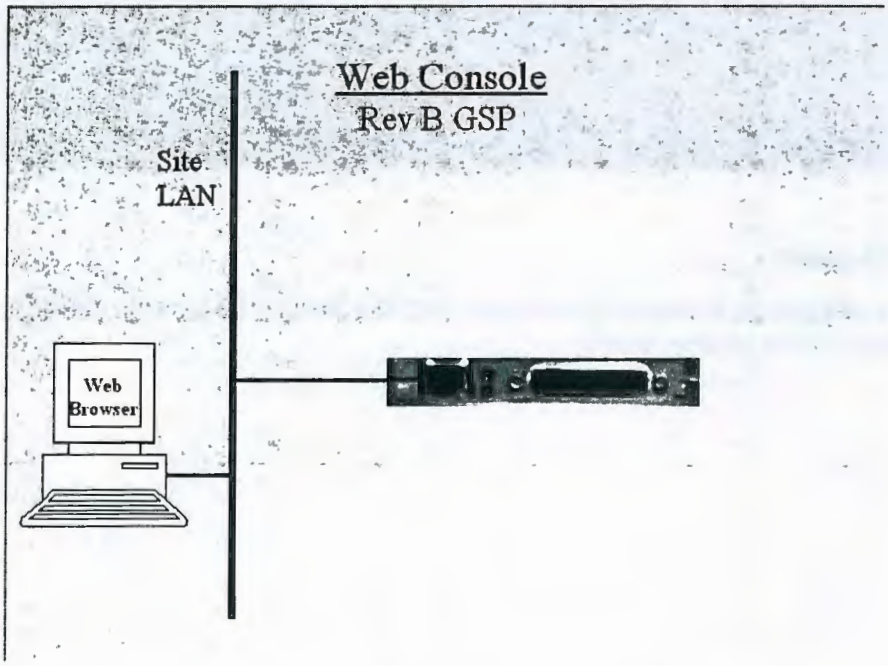
For the revision A GSP, the web console is accomplished via the J3591A Secure Web Console. Below is an illustration of the web console for the revision A GSP.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
0043
Fls:
3701
Doc:

Refer to, "Install a Secure Web Console" for more information on Secure Web Console installation and configuration.



For the revision B GSP, the web console is an embedded feature. The steps to configure a web console are the same as configuring a LAN console. Refer to, "Configure the LAN Console."



Once the LAN has been configured, access the web console by pointing a web browser, on the same subnet, to the IP of the GSP LAN.

Processor Support Module Removal

Processor Support Modules (PSMs) reside on the System Board and are accessed via the Top Service Bay. Looking into the Top Service Bay from the front, PSMs are located on either side of the server, at the front. There can be two PSMs, numbered 0 and 1

To remove a PSM from the server, perform the following steps:

1. Loosen the two captive mounting screws that hold the PSM in place.

NOTE For the rp5470, the mounting screws have been replaced by posts and the air baffle is used to secure the PSM's.

2. Grasp the two captive mounting screws and lift the PSM out of the server.

The following graphic shows a PSM in the server.

HotSwap Power Converter Fan Replacement

The power to the server does not have to be off to remove or replace a HotSwap Power Converter fan. Fans numbered 6 and 7 are located in the rear of the server.

To replace a fan into the server, perform the following steps:

1. Orient the fan assembly so that the electrical plug will connect, then grasp the extended screw-heads (or the fan grill) and gently push the fan assembly into its housing. The fan assembly plug will connect with the electrical outlet in back of the housing.
2. Tighten the captive T-15 screws located diagonally across the face of the fan (upper left, lower right sides).

The following graphic shows where HotSwap Power Converter Fans are located.

3.006

HotSwap Power Converter Fan Removal

The power to the server does not have to be off to remove or replace a HotSwap Power Converter fan. Fans numbered 6 and 7 are located in the rear of the server.

To remove a fan from the server, perform the following steps:

NOTE When one fan has failed (or is removed from the server), the system automatically puts the remaining fan into high speed mode. The noise level of the server will increase.

1. There are four screws attached to each corner of each fan. Loosen only the captive Torx-head screws located diagonally across the face of the fan (upper left, lower right sides).
2. Grasp the extended screw-heads (or the fan grill) and gently pull toward you. The fan assembly will unplug from the electrical outlet and slide out of the server.

CAUTION Running the server for extended periods of time with a cooling fan removed may create hot spots inside the server and possibly shorten component life.

If the other fan fails when one fan is removed, the system will halt.

The following graphic shows where HotSwap Power Converter Fans are located.

HotSwap Power Supply Replacement

Up to three power supplies (0 through 2), located across the bottom front of the server, can be installed in the server without removing power.

To replace a power supply, perform the following steps:

CAUTION Be careful when putting the power supply into the server. It is heavier than it appears.

1. Grasp the handle in one hand and support the power supply with the other. Slide the power supply into the server. The Power Supply LED should illuminate immediately.
2. Replace the T-15 mounting screw located to the right of the handle near the top of the power supply.

The following graphic shows a front and rear view of a HotSwap Power Supply.

ECT 3.008 frente

HotSwap Power Supply Removal

Up to three power supplies (0 through 2), located across the bottom front of the server, can be installed in the server without removing power.

To remove a power supply from the server, perform the following step:

1. Remove the T-15 mounting screw located to the right of the handle near the top of the power supply.

CAUTION Be careful when pulling the power supply out of the server. It is heavier than it appears.

2. Grasp the handle and pull the power supply out of the server.

HotSwap Chassis Fan Replacement

The power to the server does not have to be off to remove or replace a HotSwap Chassis fan. Fan number 0 is located in the front of the server and fan number 1 is located at the rear of the server.

To replace a fan, perform the following steps:

1. Orient the fan assembly to ensure that the chassis outlet connects with the fan assembly. If the fan power connector is covered by the protective cover (see item 1 in the graphic), slide it down to remove it and slide it over the power connection on the other side of the fan. Push the fan firmly into the housing. The fan assembly will plug into the electrical outlet automatically.
2. Check the LED located on the fan.
   - When the fan is functioning normally, the LED is OFF.
   - When the fan fails, the LED is ON.

NOTE when one fan has failed (or is removed from the server), the system automatically puts the remaining fan into high speed mode. The noise level of the server will increase.

3. Replace the HotSwap Chassis fan cover.

The following graphic shows a HotSwap Chassis Fan.

g. Verify that the mirroring is set up properly.

For example:

```
# vgdisplay -v /dev/vg00
# lvdisplay /dev/vg00/lol1 - lvol8
# lvlnboot -v /dev/vg00
```

Both disks should list as "Boot Disk" and both should appear in the *lvol* lists.

At this point the system will be fully functional.

Hot Swap Procedure for Unattached Physical Volumes

The following steps are an example of how to replace a HotPlug disk drive for unattached physical volumes. This example assumes the disks are mirrored.

NOTE HP often uses different manufacturers for disks, but assigns the same product number. The hot swap manual procedure will not update disk driver internal information to that of the replaced disk drive.

Step 1. Perform an *ioscan* on the replaced disk drive to ensure that it is accessible (claimed), to double check that it is a proper replacement, and that the device files are present. Refer to the above note.

For example: `# ioscan -fnC disk`

Step 2. Restore the LVM configuration/headers onto the replaced disk drive from your backup of the LVM configuration with the following entry:

```
# vgcfgrestore -n <volume group name> /dev/rdsk/cXtXdX
```

For example: `# vgcfgrestore -n /dev/vg00 /dev/rdsk/cXtXdX`

Step 3. Attach the new disk drive to the active volume group with the following *vgchange* command:

```
# vgchange -A y <volume group name>
```

For example: `# vgchange -A y /dev/vg00`

Step 4. Use the *mkboot* command to make the device bootable.

For example: `# mkboot /dev/rdsk/cXtXdX`

Step 5. Use the *mkboot* command again to add the HP-UX auto-file-string.For example: `# mkboot -a "hpux" /dev/rdsk/cXtXdX`

Step 6. Run *lvlnboot* with the following command: `# lvlnboot -R`

Step 7. Resynchronize the mirrors of the replaced disk drive with the following command. It may take several minutes to copy all the data from the original copy of the data to the mirrored extents. The logical volume(s) are still accessible to users' applications during this command.

```
# vgsync <VG name>
```

For example: `# vgsync /dev/vg00`

At this point the system will be fully functional.

3.016 June

Hot Swap Software Procedure for Attached Physical Volumes

The following procedure is an example of how to recover from replacing a disk that was recognized as an attached physical volume. Be sure that all the software procedures in the *Disk Drive Removal* section have been completed prior to starting these steps. This example assumes that the disk was mirrored.

NOTE HP often uses different manufacturers for disks, but assigns the same product number. The hot swap manual procedure will not update disk driver internal information to that of the replaced disk drive.

Step 1. Perform an *ioscan* on the replaced disk drive to ensure that it is accessible (claimed), to double check that it is a proper replacement, and that the device files are present. Refer to the above note.

For example: `# ioscan -fnC disk`

Step 2. Use the following procedure to mirror the root disk:

a. Create the new physical volume using the *pvcreate* command.
For example: `# pvcreate -B /dev/rdsk/cXtXdX`

b. Extend the volume group to include the new physical volume using the *vgextend* command:
For example: `# vgextend /dev/vg00 /dev/dsk/cXtXdX`

c. The *mkboot* command must be run to make the device bootable.
For example:`# mkboot /dev/rdsk/cXtXdX`

d. Use the *mkboot* command again to add the HP-UX auto-file-string.
For example: `# mkboot -a "hpux" /dev/rdsk/cXtXdX`

e. Run *lvlnboot* with the following command: `# lvlnboot -R`

f. Run *lvextend* to put a mirror into the replaced disk drive. It may take several minutes to copy the original copy of the data to the mirrored extents. The logical volume(s) will still be accessible to user applications during this operation.

For example:
```
# lvextend -m 1 <LV name> /dev/dsk/cXtXdX
OR
# lvextend -m 2 <LV name> /dev/dsk/cXtXdX (for 3 way mirroring)
```

For example:
```
# lvextend -m 1 /dev/vg00/lvol4 /dev/dsk/cXtXdX
OR
# lvextend -m 1 /dev/vg00/lvol5 /dev/dsk/cXtXdX
```

Repeat this for each logical volume to be mirrored.

Verify that the mirror is bootable and AUTO file is correct.

```
For example:
# lifls -l /dev/rdsk/cXtXdX
OR
# lifcp /dev/rdsk/cXtXdX:AUTO -
```

HotPlug Disk Drive Replacement

The internal disk drives (up to four) are located at the front right side of the server (as you are facing it). When proper software and hardware procedures are followed, internal disk drives can be removed and replaced while the server is running.

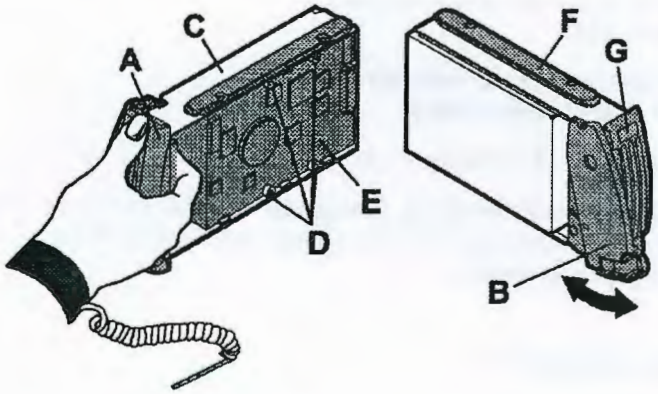
CAUTION Disk Drives can be removed or installed with the server still powered on. This is referred to as a "manual HotPlug".

However, DO NOT replace a HotPlug disk drive until a controlled shutdown of the operating system has been performed.

Hardware HotPlug Procedure

To replace a disk drive in the server, grasp the tab at the bottom of the cam latch on the selected disk drive, push the button inside the cam latch, and pull the cam latch out and up. The disk drive will unlock. Pull gently until it slides completely free.

The following graphic shows disk features.



A bezel handle
B cam latch
C carrier frame
D standoffs
E circuit board
F insertion guide
G capacity label

3.019 June

(for 1 way mirroring)

OR

```
# lvreduce -m 1 -A n -k <LV name> /dev/dsk/cXtXcX <pvkey#>&
```

(for 2way mirroring)

For example, enter:

```
# lvreduce -m 0 -A n -k /dev/vg00/lvol4 /dev/dsk/c2t4d0 1&
```

The following message will appear:

```
Logical volume /dev/vg00/lvol4 has been successfully reduced.
lvlnboot: Logical Volume has no extents.
```

NOTE It is important to include the ampersand (&) at the end of the command line. Otherwise, the *lvreduce* process will hang, and you will need terminal control to negate the command. Once the 'successfully reduced' message has been generated, manually end the process using the *kill -9* command.

Step 1. Use the *ps* command to find the PID for the *lvreduce* process.

```
# ps -ef | grep lvreduce
```

Step 2. Manually end the process with the *Kill -9* command (It may take several minutes for the process to end.).

```
# kill -9 <PID>
```

Step 3. Repeat steps 4 and 5 for all logical volumes.

Step 4. With all logical volumes reduced, now reduce the volume group using the *vgreduce* command. For example:

```
# vgreduce /dev/vg00 /dev/dsk/c2t6d0
```

CAUTION The *vgreduce* procedure may take a long time to complete. Do NOT terminate this process.

Step 5. Update the disk BDRA using the *lvlnboot* command.

lvlnboot -R

Step 6. Proceed to the *HotPlug Hardware Procedure* to remove the bad disk drive from the server.

HotPlug Hardware Procedure

CAUTION Disk Drives can be removed or installed with the server still powered on. This is referred to as a "manual HotPlug".

To remove a disk drive from the server, perform the following step:

3020 June

Step 5. Reduce any logical volumes that have mirror copies on the faulty disk drive so that they no longer mirror onto that disk drive (note the *-A n* option):

```
# lvreduce -m 0 -A n -k <LV name> /dev/dsk/cXtXcX <pvkey#>&
```

ECT Nº 03/2005 - GN
CPMI - CORREIOS
0052
Fls:
Doc: 3701

WARNING:

```
VGDISPLAY: WARNING: COULDN'T QUERY PHYSICAL VOLUME "/DEV/DSK/cXtXdX"
THE SPECIFIED PATH DOES NOT CORRESPOND TO PHYSICAL VOLUME ATTACHED TO THE
VOLUME GROUP.

VGDISPLAY: WARNING: COULDN'T QUERY ALL OF THE PHYSICAL VOLUMES.
```

If you see these messages, the disk was defective at the time the volume group was activated. Remove the bad disk as described in step 9 of this procedure, then follow the instructions in for replacing the disk and perform the *HotSwap Procedure for Unattached Physical Volumes* described there.

Otherwise, the disk drive became defective after *vgchange* was run. Proceed to Step 2.

Step 2. Display the names of all the logical volumes on this volume group with the *vgdisplay* command. For example:

```
#vgdisplay /dev/vg00
```

Step 3. Determine which logical volumes have mirrors with the *lvdisplay* command. For example:

```
#lvdisplay /dev/vg00/lvol# | grep -ie "LV Name" -e "Mirror"
```

Step 4. Determine the *pvkey* command status for the mirrored logical volume, again using the *lvdisplay* command with the *-k* option. Compare the output to the *lvdisplay* command with the *-v* option to determine the device file to *pvkey* mapping. For example,

```
# lvdisplay -v -k /dev/vg00/lvol1
--- Logical volumes ---
LV Name                     /dev/vg00/lvol1

ECT 3.022 June

HotPlug Disk Drive Removal

The internal disk drives (up to four) are located at the front right side of the server (as you are facing it). When proper software and hardware procedures are followed, internal disk drives can be removed and replaced while the server is running.

The procedures in this section are in two parts, a HotSwap Software Procedure and a HotPlug Hardware Procedure, for removing the disk from the server.

Before starting these procedures, you must have an up-to-date configuration backup file. Configuration backup is performed by default each time an LVM command changes the LVM configuration. The default backup files path is:

`/etc/lvmconf/base_vg_name.conf.`

The replacement disk drive must be the same product ID as the disk drive that is being replaced.

NOTE HP often uses different manufacturers for disks that have the same product number. The HotSwap and HotPlug procedures will not update the disk drive's internal information to that of the replaced disk drive.

The replacement disk drive will have the same capacity and blocksize as the defective disk because they have the same product number. The only field that can be incorrect is the string specifying the vendor's name. This will not affect the behavior of the LVM. If you desire to update the manufacturer's name, the disks volume group must be deactivated and reactivated.

HotSwap Software Procedure

Perform these software procedural steps to replace a HotPlug disk drive device:

Step 1. Determine whether LVM found the physical volume to be defective when the volume group was activated.

If the volume was defective when the volume group was activated, *vgchange* will generate the following message to the console:

```
WARNING

VGCHANGE: WARNING: COULDN'T ATTACH TO THE VOLUME GROUP PHYSICAL
VOLUME "/DEV/DSK/cXtXdX"

VGCHANGE: WARNING: COULDN'T ATTACH TO THE VOLUME GROUP PHYSICAL
VOLUME "/DEV/DSK/cXtXdX"

THE PATH OF THE PHYSICAL VOLUME REFERS TO A DEVICE THAT DOES NOT
EXIST, OR IS NOT CONFIGURED INTO THE KERNAL.
```

If you are unsure of the status of *vgchange*, check it with the *vgdisplay* command:

#vgdisplay <VG name>

For example:

vgdisplay /dev/vg00

If the disk was defective when the *vgchange* command was entered, the following message will be printed one or more times:

PCI Card Separator/Extractor Replacement

PCI card separator/extractors are located in the Side Service Bay on the PCI Backplane, between PCI cards. PCI card separator/extractors are plastic cards with two tab handles and two LEDs.

To replace a PCI card separator/extractor, perform the following steps:

1. Insert the PCI card separator/extractor into the available slot and slide it into the PCI backplane connector.
2. Be sure the two hook tabs on the PCI card separator/extractor insert into the connector blocks on either side of the PCI backplane.

Once you have completed replacement of the PCI card separator/extractor into the server, perform the following tasks:

- Replace the PCI card, if necessary.
- Power up the server.

fume

PCI Card Separator/Extractor Removal

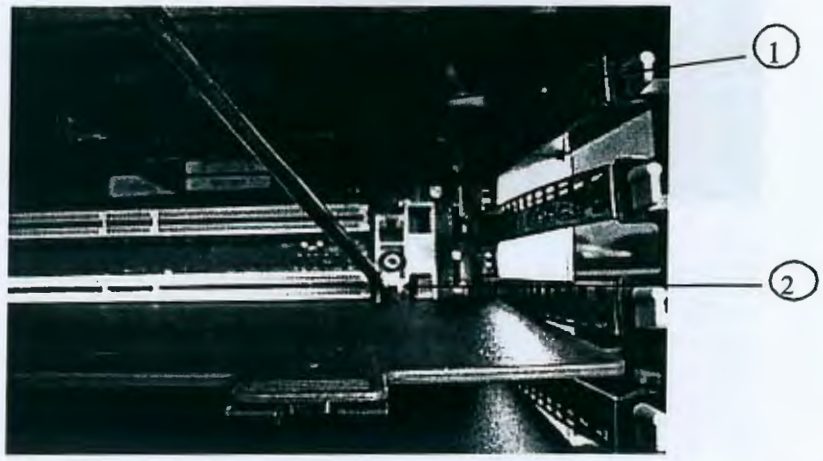
PCI card separator/extractors are located in the Side Service Bay, between the PCI cards. PCI card separator/extractors are plastic cards with two tab handles and two LEDs.

Before removing a PCI card separator/extractor from the server, perform the following tasks:

- Shut down the server.
- Remove the corresponding PCI card.

To remove a PCI card separator/extractor, perform the following steps:

1. Carefully slide a long shaft, medium width, flat blade screw driver (item 1) into the Side Service Bay along the side of the PCI card separator/extractor, and insert it into the slot in the hook tab (item 2).



2. At the point where the PCI card separator/extractor inserts into the PCI backplane connector (item 2), there are two slotted, hook tab connectors on the PCI card separator/extractor, one on either side of the PCI Backplane connector. Press one then the other to disengage the card from the backplane.
3. With the two connection points pressed, slide the PCI card separator/extractor out of the PCI card cage.

Core I/O Replacement

rp54xx Core I/O functions are contained on the GSP and LAN/SCSI cards. Both cards are located on the PCI Backplane in the side service bay. The LAN/SCSI card is in I/O slot 1 and the GSP card is in slot 2.

Before replacing either of the Core I/O cards, perform the following tasks:

- Power down the server.
- Detach all power cords from the server.

NOTE For revision B GSP only, remove *one* of the MAC address labels and place on the rear of the server as shown in the following graphics.

To replace a Core I/O card, perform the following steps:

Core I/O Removal

rp54xx Core I/O functions are contained on the GSP revision A/B and LAN/SCSI cards. Both cards are located on the PCI Backplane in the side service bay. The LAN/SCSI card is in I/O slot 1 and the GSP revision A/B card is in I/O slot 2.

Before removing either of the Core I/O cards from the server, perform the following tasks:

- Power down the server.
- Detach all power cords from the server.

To remove a Core I/O card from the server, perform the following steps:

1. Remove all cables attached to the Core I/O card at the rear bulkhead.

NOTE Be sure to label the cables before removing them.

---

2. Disconnect any ribbon cable connectors attached to the Core I/O card in the side service bay.
3. Grasp the edge of the Core I/O card and pull it out of the server.

The following graphic shows both Core I/O cards in the side service bay.

Front Bezel Replacement (Two Piece)

The rp54xx server front bezel is divided and hinged on the right (facing the front of the server) side to provide a door for Disk Media Bay access. The server does not have to be turned off to open the access door or to completely remove the bezel.

The Disk Media Bay door encloses the following components:

- HotPlug Disks (A0, A1, and B0, B1).
- Removable Media (CD-ROM drive, etc.).

The left side of the front bezel encloses the following components:

- HotSwap Chassis Fan cover.
- HotSwap Chassis Fan 0.
- HotSwap Power Supplies (up to three).

To attach the bezel, perform the following steps:

1. Swing the Disk Media access door open so that the plastic pins that go into the metal clips on the Disk Media bay are exposed.

CAUTION The plastic pins holding the bezel on the right side are inserted into metal clips on the Disk Media bay. DO NOT bend the plastic pins or they will break off.

---

2. Holding the bezel with both hands, align the bezel pins with the metal clips on the Disk Media bay and carefully slide the bezel pins into the clips.
3. Attach the left side of the bezel to the server chassis by aligning the bezel pins with the chassis clipsand press the bezel into the chassis until the pins snap into the clips.

   The following graphic shows the front bezel.

Front Bezel Removal (Two Piece)

The rp54xx server front bezel is divided and hinged on the right (facing the front of the server) side to provide a door for Disk Media Bay access. The server does not have to be turned off to open the access door or to completely remove the bezel.

Opening the door provides access to the following components:

- HotPlug Disks (A0, A1, and B0, B1).
- Removable Media (CD-ROM drive, etc.).

Removing the entire bezel provides access to the components listed above and the following:

- HotSwap Chassis Fan cover.
- HotSwap Chassis Fan 0.
- HotSwap Power Supplies (up to three).

To open the Disk Media access door, grasp the right edge of the door and pull out. The door will swing away from the chassis, exposing the Disk Media Bay.

To remove the entire bezel, perform the following steps:

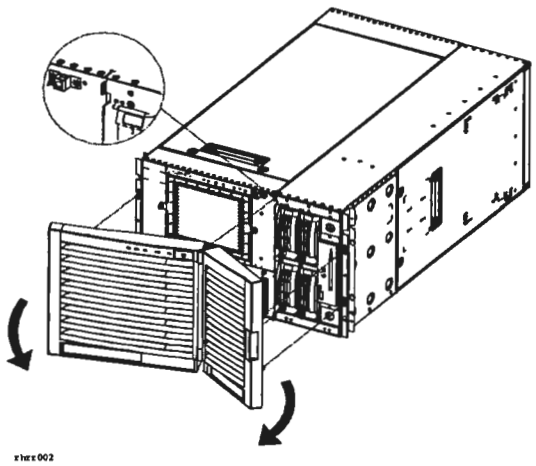
1. Open the Disk Media access door, exposing the plastic bezel pins inserted in the clips at the top and bottom of the Disk Media bay on the left side.
2. Grasp the left side of the bezel and pull it loose.

CAUTION DO NOT try to pull the bezel off of the server at this point. The plastic pins holding the bezel on the right side are inserted in metal clips on the Disk Media bay and if the plastic pins are bent, they will break off.

---

3. Grasp the bezel with both hands and carefully slide the bezel to the left until both plastic pins clear the metal clips on the Disk Media bay.
4. Pull the bezel away from the server and set it aside.

The following graphic shows the front bezel.



3030

Front Bezel Replacement (Single Piece)

The rp54xx server front bezel is hinged on the left (facing the front of the server). The server does not have to be turned off to open or to completely remove the bezel.

The bezel encloses the following components:

- HotPlug Disks (A0, A1, and B0, B1).
- Removable Media (CD-ROM drive, etc.).
- HotSwap Chassis Fan cover.
- HotSwap Chassis Fan 0.
- HotSwap Power Supplies (up to three).

To attach the bezel, perform the following steps:

1. Screw the bezel hinge to the threaded inserts on the left side of the server.
2. Install the hinge cover by aligning the notch in the top of the cover with the top of the assembly cover and press firmly into place.

The following graphic shows the front bezel.

Side Cover Replacement

The power to the server does not have to be off to replace the side cover. However, operation of the server without the side cover in place can make it susceptible to EMI problems.

Replace the side cover according to the following steps:

1. Grasp the strap handle and insert the tabbed end of the cover into the server chassis slots on the right side of the side service bay.
2. Push the cover into the side service bay opening and fasten the captive T-15 screws that hold the side cover in place.

The following graphic shows the side cover with captive screw locations.

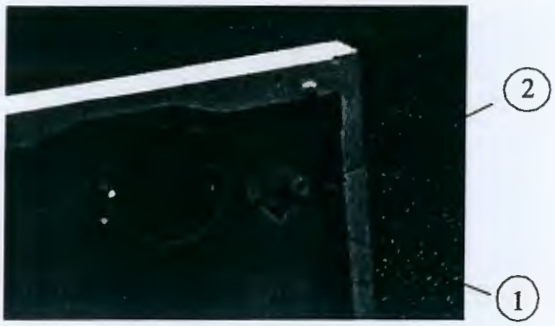
Stand-alone Server Cover Replacement

The rp54xx server can be ordered as a stand-alone unit. In this configuration, the server has a one-piece protective cover over it and sits on a platform with locking wheels attached.

To place the server on its wheeled platform, perform the following procedure:

WARNING **The stand-alone server weights 69 kg (150 lbs). Placing the stand-alone server on its platform requires three people or a suitable lifting device. Failure to heed this precaution can result in serious personal injury or destruction of the server.**

1. Lift the platform and turn both of the spring-loaded, flat-headed pins (item 1) a quarter turn to the right to lock them out of the way before placing the server on the platform.
2. Using a lifting devise or a minimum of three people, lift the server onto the platform. Align the server and platform so that the pins will lock.
3. Reach under the platform, locate the spring-loaded, flat headed pins and turn them one quarter turn to the left to unlock them. Gently slide the server around on the platform until the spring-loaded flat-head pins snap into their holes.
4. Once again, reach under the platform on the right side and fasten both front and back knurl-knobbed, spring-loaded pins (item 2).



To place the cover on a stand-alone server, perform the following procedures:

1. Set the protective cover on the server and align the holes located near the bottom edge of both sides of the server cover.
2. Fasten the screws (with captive washers) through the cover, into the platform.

The following graphic shows the protective cover.

Stand-alone Server Cover Removal

The rp54xx server can be ordered as a stand-alone unit. In this configuration, the server has a one-piece protective cover over it and sits on a platform with locking wheels attached.

To remove the cover from a stand-alone server, perform the following procedures:

1. Unfasten and remove the screws (with captive washers) located near the bottom edge of both sides of the server cover.
2. Lift the protective cover off of the server and set it aside.

WARNING **The stand-alone server weights 69 kg (150 lbs). Removing the stand-alone server from its platform requires three people or a suitable lifting device. Failure to heed this precaution can result in serious personal injury or destruction of the server.**

To remove the server from its wheeled platform, perform the following procedure:

1. Facing the front of the server, reach under the platform on the right side and unfasten the knurl-knobbed, spring-loaded pin (item 1). The pin will retract when it is free. Perform the same step at the rear of the server. The rear knurl-knobbed, spring-loaded pin is aligned behind the front pin, but at the rear of the server.

2. From the back of the server, reach under the platform, behind the knurl-knobbed, spring-loaded pin, and locate the flat head of the second spring-loaded pin (item 2). This pin is spring-loaded to stay up and keep the server from sliding on the platform. Pull the pin down and twist one quarter turn to the left to lock the pin down and out of the way. Perform the same step at the front of the server.
3. The server is now free from its wheeled platform and can be removed from it.

WARNING **The stand-alone server weights 69 kg (150 lbs). Removing the stand-alone server from its platform requires three people or a suitable lifting device. Failure to heed this precaution can result in serious personal injury or destruction of the server.**

Individual Component Remove/Replace Instructions

Each component has instructions for removal followed by instructions for replacement.

Extend the Server out the Front

rp54xx servers are available in two housings: rack-mounted or stand-alone. Access to servers mounted in an HP-supported rack is covered in this section.

NOTE Ensure that there is enough area (Approximately 1.5 meters (4.5 ft) to fully extend the server out the front and work on it.

WARNING **Ensure that all anti-tip features (front and rear anti-tip feet installed; adequate ballast properly placed, etc.) are employed prior to extending the server.**

To extend the server, perform the following steps:

1. Remove the four T-25 screws that fasten the server to the rack.
2. Grasp the server chassis and slowly pull forward. The server is fully extended when the rail clips are locked in place. When fully extended, the top and side service bays are fully accessible.

The following graphic shows the server extended and indicates the rail clip location.

Example 6-1 Chassis Log: Reporting Entity Type = System Firmware

```
Log Entry #   0 :SYSTEM NAME: fesrhapgspDATE: 12/08/2000 TIME: 23:46:22ALERT LEVEL: 6
= Boot possible, pending failure - action requiredSOURCE: 3 = PDHSOURCE DETAIL: 0 =
unknown, no source stated   SOURCE ID: 3PROBLEM DETAIL: 0 = no problem detailCALLER
ACTIVITY: 1 = test   STATUS: 0CALLER SUBACTIVITY: 71 = implementation
dependentREPORTING ENTITY TYPE: 0 = system firmware   REPORTING ENTITY ID:
030x0000306030031710 00000000 000000FE type  0 = Data Field Unused0x5800386030031710
0000640B 08172E16 type 11 = Timestamp 12/08/2000 23:46:22Type CR for next entry, Q CR
to quit.
```

Using the example above:

Step 1. The last 4 digits are 1710.

Step 2. This is an rp5450 so use Appendix B in the *Interpreting Chassis Logs in Detail* guide.

Step 3. Using the FIND feature to look up 1710 in Appendix B, we learn the definition is CC_BOOT_INVALID_SPHYR_SETTINGS.

Step 4. The appropriate action in this example would be to verify the switch settings on the system board are set correctly for the installed CPU's.

3.068
Bruno

2. The problem is with fan #4.
3. The problem is a fan failure.
4. The fan failed on April 15, 1999 at 9:29 PM.

In this example, fan #4 should be replaced to correct the problem.

Interpreting Chassis Logs Using the chassis_code.codes File

For chassis logs generated by system firmware (Reporting Entity Type 0), use the chassis_code.codes file for chassis code definitions. Each revision of system firmware (AKA Processor Dependent Code or PDC) has a unique chassis_code.codes file. This file is not part of either the PF_Cxxxxx or PHSS_xxxxx server firmware patches. The chassis_code.codes files appear in the appendices of the *Interpreting Chassis Logs in Detail* guide.

The definition of a PDC reported chassis code is determined by locating either the last four digits of a chassis log or the last three digits of a selftest chassis code in the appropriate chassis_code.codes file. Refer to the *Interpreting Chassis Logs in Detail* guide for definition and examples of selftest chassis codes.

NOTE Be sure to use the appropriate appendix as the PDC for rp5400/rp5450 is different than PDC for rp5470. Using the wrong appendix may result in a mis-interpretation of the chassis code.

To quickly learn the definition of a PDC reported chassis code, follow these four steps:

Step 1. Determine either the last 4 digits of the hex chassis code or the last 3 digits of the selftest chassis code.

Step 2. Go to the appropriate appendix in the *Interpreting Chassis Logs in Detail* guide.

Step 3. Locate the chassis code that matches the last 3 or 4 digits. If viewing via web browser or Adobe Acrobat, use the FIND feature to locate the chassis code.

Step 4. Take action as appropriate.

Key FRU Identification Fields for Error Chassis Logs

The following fields are for FRU identification.

Alert Level:	How the problem has affected the system operation.
Source:	What major part of the system the alert is referring to (i.e., platform, memory, processor, etc.).
Source Detail:	What sub-part of the system the alert is referring to (i.e., cabinet fan, DIMM, high voltage DC power, etc.).
Source ID:	Specific FRU referred to in Source and Source Detail (i.e., fan #4).
Problem Detail:	Specific problem information (i.e, power off, functional failure, etc.).
Timestamp:	When the problem occurred.

The above sample system alert message shows the following:

1. The problem does not affect booting of the system.

3.070
Irene

Interpreting Service Processor Error Chassis Logs

Accessing the Service Processor Error Chassis Logs will turn the **ATTENTION** LED, blinking on the front panel, OFF.

Chassis Logs (located in the Service Processor) contain low level logging information related to the following 5 categories:

- Incoming log: Contains all chassis logs coming into the Service Processor.
- Activity log: Contains all chassis logs related to system activity.
- Error log: Contains all error chassis logs.
- Current boot log: Contains all chassis logs associated with the current boot.
- Last boot log: Contains all chassis logs associated with the last boot.

The Error Chassis Logs are the ones you need to look at.

Accessing Error Chassis Logs

Execute the following steps to access the Error Chassis Logs.

1. At the system console prompt, type **CTRL B**
2. Enter the Service Processor Login and Password
3. The screen will display: GSP>

   At the GSP> prompt: type SL and press enter
4. The screen will display:

   `Which buffer are you interested in:`
   `Incoming, Error, Current boot, Last boot? (I/A/E/C/L)`, type **E**, and press enter
5. The screen will display:

   Do you want to set up filter options on this buffer? (Y/[N]), type **N**, and press enter
6. The most recent Error Log Entry (Log Entry #0) will be displayed. A carriage return after this will display the next log entry. Type **Q** to stop displaying the log entries. The screen will display: GSP>
7. At the GSP> prompt: type CO, and press enter to return to the console screen.

Example of Accessing Error Logs

Here is an example of accessing the Error Logs from the Boot Console Handler (BCH) Main Menu prompt. User input is shown in *ITALICS*.

```
Main Menu: Enter command or menu > type CTRL B
Service Processor login: System Operator
Service Processor password: ****** (password hidden)

            Welcome to HP Guardian Service Processor
            System Name: fesrhapgsp

fesrhapgsp:
ALERT LEVEL: 6=Boot possible, pending failure or environmental problem - action required
SOURCE: 6=platform - SOURCE DETAIL: 3=cabinet fan
PROBLEM DETAIL: 4=fan failure
GSP>
```

Interpreting System Alerts

Do one of the following:

1. No response: the alert will time out and the system will continue operating.
2. **A** - Responding with the letter **A** will inform the Service Processor that you have seen the entry. The system will continue to operate.
3. **X** - Responding with the letter **X** will inform the Service Processor to disable all future alert messages. This can be re-enabled with a Service Processor command.

Sample System Alert

```
*************************SYSTEM ALERT*************************************
ALERT LEVEL: 6=Boot possible, pending failure or environmental problem - action required
PROBLEM DETAIL: 4=fan failure - SOURCE ID: 04
SYSTEM NAME: fesrhapgsp

```

Key FRU Identification Fields for System Alerts

The following fields are used for FRU identification.

Alert Level:	How the problem has affected the system operation.
Source:	What major part of the system the alert is referring to (i.e, platform, memory, processor, etc...).
Source Detail:	What sub-part of the system the alert is referring to (i.e, cabinet fan, DIMM, high voltage DC power, etc...).
Source ID:	Specific FRU referred to in Source and Source Detail (i.e, cabinet fan #4).
Problem Detail:	Specific problem information (i.e, power off, functional failure, etc...).
Timestamp:	When the problem occurred.

The above sample system alert shows the following:

1. The problem does not affect system boot.
2. The problem is with platform cabinet fan #4.
3. The problem is a fan failure. Replace fan #4 to correct the problem.
4. The fan failed on April 15, 1999 at 9:29 PM.

ECT 3.072 fls

Step 2. The Source Detail, the Source ID, and the Problem Detail values are all not applicable for the Processor row of the table.

Step 3. The FRU column of the table identifies the FRU as a failing processor.

Step 4. The Action column of the table instructs us to use the Info Menu and PR command of the BCH Main Menu to identify the failing processor.

Here is the output of Step 4 in our example:

```
Main Menu: Enter command or menu > in

---- Information Menu -------------------------------------------

     Command                    Description

Power Supply Failure Example

```
GSP> sl

SL

Which buffer are you interested in :
Incoming, Activity, Error, Current boot or Last boot ? (I/A/E/C/L) e
e

Do you want to set up filter options on this buffer ? (Y/[N]) n
n

Type + CR and CR to go up (back in time),
Type - CR and CR to go down (forward in time),
Type Q to escape.

Log Entry #   0 :
ALERT LEVEL: 6=Boot possible, pending failure or environmental problem - action required
REPORTING ENTITY TYPE: 2=power monitor - REPORTING ENTITY ID: 00
CALLER ACTIVITY: 4=monitor - CALLER SUBACTIVITY: 04=low voltage power supply
SOURCE: 4=power - SOURCE DETAIL: 4=high voltage DC power - SOURCE ID: 02
PROBLEM DETAIL: A=unexpected - ACTIVITY STATUS: F
Data  0 : Low=00000000 : High=00000000 - type  0 = Data Field Unused
Data  1 : Low=0F152A28 : High=00006303 - type 11 - Timestamp 04/15/1999 21:42:40
```

Problem Analysis

Step 1. Find the Source value. In this example, it is *SOURCE: 4=power*.

Use the **Power** row of the Error Chassis Log-to-FRU Decoder table.

Step 2. Find the Source Detail value. In this example, it is *SOURCE DETAIL: 4=high voltage DC power*.

Use the **High Voltage DC Power** row of the table.

Step 3. Find the Source ID value. In this example, it is *SOURCE ID: 02*.

The failing power supply is Power Supply #2.

Step 4. The Problem Detail for this row is not applicable.

Step 5. The FRU column of the table identifies the FRU as the Power Supply.

The correct action would be to replace Power Supply #2, located in the front of the system.

Processor Failure Example

```
Log Entry #   1 :
ALERT LEVEL: 6=Boot possible, pending failure or environmental problem - action required
REPORTING ENTITY TYPE: 0=system firmware - REPORTING ENTITY ID: 01
CALLER ACTIVITY: 1=test - CALLER SUBACTIVITY: 62=implementation dependent

Chassis Code to FRU Decode

This is a guide to identify failing FRUs from System Alerts and Error Chassis Logs. The guide includes the following information:

- Cross-Referencing Chassis Log Errors to rp54xx FRUs
- Interpreting System Alerts
- Interpreting Service Processor Error Chassis Logs

There is a detailed interpretation of Chassis Logs and System Alerts in the *Interpreting Chassis Logs in Detail* guide.

Cross-Referencing Chassis Log Errors to rp54xx FRUs

Use the following table to identify the failing FRU from the Chassis Log information. You can also use the online Error Chassis Log-to-FRU Decoder utility.

1. Read the Chassis Log entry.
2. Match the **SOURCE, SOURCE DETAIL, SOURCE ID,** and **PROBLEM DETAIL** values (see table below) in the Chassis Log entry with the appropriate values in the table.
3. Read the table from left to right.

Use these examples to understand how to identify failing FRUs with the table:

- Power Supply Failure Example
- Processor Failure Example

Table 6-2 Chassis Log Error to FRU Decoder

Chassis Log Field Values and Descriptions from Log Entry					
Source	**Source Detail**	**Source ID**	**Problem Detail**	**FRU**	**Action to Take**
1 - Processor	Not Applicable (N/A)	N/A	N/A	Processor	From BCH Main Menu go to the Info Menu and execute the PR command to determine which processor is not functioning.
2 - Processor Cache	Not Applicable (N/A)	N/A	N/A	Processor	From BCH Main Menu go to the Info Menu and execute the PR command to determine which processor is not functioning.

ECT 3.076 Bruno

Table 6-1 Problem Symptoms and Repair Actions (Continued)

Problem or Symptom	Problem Indicators	Normal Functioning Indicators	Troubleshooting Steps	Potential FRUs
Can't boot to ISL.	Console messages indicating problems booting from the primary or alternate boot path.	• Console messages and prompt indicating you are at ISL.	1. Use BCH commands to verify I/O and presence of valid LIF devices. 2. Use BCH "Warn"command to determine if Boot is disabled. 3. Check for IODC tombstones. 4. Check SP chassis error logs.	• Disk Drive • Disk Media Backplane • LAN/SCSI Board • I/O Backplane
...'t boot HP-UX.	HP-UX boot error messages. RUN LED BLINKING.	• HP-UX boot messages. • HP-UX prompt. • RUN LED on SOLID.	1. Check SP chassis error logs. 2. Run ODE diagnostics.	• Processor • Disk Drive • Disk Media backplane • LAN/SCSI • Corrupt HP-UX

Troubleshooting and FRU identification

Once you have determined the current system state, you must troubleshoot the system to determine what the problem symptoms are and what repair actions to take.

Problem Symptoms and Repair Actions

Use this guide to assist you in repairing the system by matching the problem symptom with the appropriate troubleshooting step.

Table 6-1 Problem Symptoms and Repair Actions

Problem or Symptom	Problem Indicators	Normal Functioning Indicators	Troubleshooting Steps	Potential FRUs
No indication of Housekeeping voltage present when AC connected and power switch in Standby position.	Front Panel Power LED OFF when AC is plugged into system.	• Power switch Off. • Front Panel POWER LED should be FLASHING to indicate presence of Housekeeping voltage. • Power LED on GSP board should be lit solid green.	1. AC must be present. Check that PDU is plugged in. 2. Ensure there are 2 working power supplies (1 supply for rp5400). The LED on each supply should be lit. 3. Check for Service processor prompt (CTRL B at console).	• No AC present • Power Supplies • Power Converter • System Board • Display Board

3.080
June

Determine Current System State

To determine the current system state of an rp54xx server, first note the state of all LED indicators on the front panel. Processing this information using the decoders provided can greatly reduce the amount of time required to repair a suspected system fault.

The following procedure lists the tools available to aid you in determining the current system state.

Step 1. Determine if you can get a system prompt and if so, what kind of prompt.

Software System	Screen Prompt
Boot Console Handler (BCH)	`Main Menu: Enter command or menu>`
Guardian Service Processor (GSP)	`GSP>`
Initial System Loader (ISL)	`ISL>`
HP UNIX (HP-UX)	*Prompt varies depending on UNIX state*

Step 2. Decode the Run/Attention/Fault LED States.

Step 3. Decode the PCI I/O LED States.

Step 4. Decode the Fan, Power Supply, and Disk LED States.

Step 5. Decode the GSP LED States.

Step 6. Decode the LAN/SCSI LED States.

Removing Users

You can removedisable) a GSP user with the same Security options and access control (SO) command used to add a user.

To remove a user, perform the following steps:

1. Go into the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the Security options and access control (SO) command:

   ```
   GSP> so
   ```

3. The first prompt you will see with the so command is for GSP wide parameters:

   ```
   GSP wide parameters are:
   . Login Timeout: 1 minutes.
   . Number of password Faults allowed: 3
   . Flow Control Timeout: 5 minutes.

   Do you want to modify the GSP wide parameters? (Y / [N]) __
   ```

   At this point you can modify the GSP wide parameters, or continue with removing a user. To remove users, respond N for no.

NOTE You will have to step through each user number until you reach the user to be removed.

4. When you access the number of the user to be removed, you must change the data in the prompts for that number.

   It is important that, at a minimum, you need to modify the User's state to Disabled.

Changing the Default GSP Configuration

This section describes the process of changing GSP default configurations. To change the GSP default configuration, perform the following steps:

1. Go into the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the Default Configuration (dc) command:

   ```
   GSP> dc
   ```

3. Follow the prompts for the dc command, and be sure to have the change information available.

CAUTION When the Security configuration is reset, all users are removed, including the GSP administrator. It also disables the remote. Remote must be re-enabled through the main console using the Enable Remote (er) command.

3.084
fls

To add a user, perform the following steps:

1. Go into the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the Security options and access control (SO) command:

   GSP> so

3. The first prompt you will see with the so command is for GSP wide parameters:

```
GSP wide parameters are:
Login Timeout: 1 minutes.
. Number of password Faults allowed: 3
. Flow Control Timeout: 5 minutes.
Do you want to modify the GSP wide parameters? (Y / [N]) __
```

   At this point you can modify the GSP wide parameters, or continue with adding users. To add users, respond N for no.

NOTE If this is the first time users are being added, the first user added will be the GSP administrator.

If this is not the first time you are adding users (you are adding additional users), you will need to step through all current users to reach the next available user prompt.

---

4. The next prompt that appears will ask the following question:

   Do you want to modify the user number 1 parameters? (Y/[N]/Q to quit) __

   Follow the series of prompts to enter all the required fields for adding a user.

CAUTION Be sure to read each prompt carefully and enter the correct response. A missed or incorrect entry could deny entry to that user.

An example of an added users information would be:

```
. User's Name: Joe Smith
. Organization's Name: IT Support
. Dial-back configuration: Disabled
. Access Level: Operator
. Mode: multiple
. User's state: enabled
```

For the number 1 user, the Access level is administrator. The Mode entry of single only allows entry for that user one time, then access will be denied. A Mode entry of multiple allows unlimited entries into the GSP.

Configuring the Rev B Guardian Service Processor (GSP)

The Rev B Guardian Service Processor (GSP) is a resident processor within the system that allows the local or remote system administrator to monitor and perform administrator functions. This section provides configuration procedures that will instruct you to:

- Configure the LAN port
- Add or delete users (maximum of 20)
- Change the default GSP configuration

Go to the appropriate section for the task that you wish to accomplish.

Configuring the GSP LAN Port

Perform the LAN configuration from the systems local port (either console or the HP secure web console).

NOTE The GSP has a separate LAN port from the system LAN port. It will need a separate LAN drop, IP address, and networking information from the port used by HP-UX.
Before starting this procedure, you will need to know the following information:

- I.P. address (for GSP)
- Subnet mask
- Gateway address
- Hostname (this is used when messages are logged or printed)

To configure the GSP LAN port, perform the following steps:

1. Go into the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the LAN Configuration (lc) command:

```
GSP> lc
```

The lc command will start a series of prompts. Respond to each prompt with the appropriate information.

Adding Users

The GSP can only have a maximum of 20 users (one administrator and 19 operators). By design, the first user added to the GSP becomes the GSP administrator. Only the GSP administrator can add or remove users or change the GSP configuration.

NOTE Before starting this procedure, you will need to know the following information:

- User's name
- Organization's name
- Login name
- User's password

3.086
June

Removing Users

You can remove (disable) a GSP user with the same Security options and access control (SO) command used to add a user.

To remove a user, perform the following steps:

1. Enter the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the Security options and access control (SO) command:

   ```
   GSP> so
   ```

3. The first prompt you see with the so command is for GSP-wide parameters:

   ```
   GSP wide parameters are:
   . Login Timeout: 1 minutes.
   . Number of password Faults allowed: 3
   . Flow Control Timeout: 5 minutes.

   Do you want to modify the GSP wide parameters? (Y / [N]) __
   ```

   At this point you can modify the GSP-wide parameters, or continue with removing a user. To remove users, enter N for no.

NOTE You must step through each user number until you reach the user to be removed.

4. When you access the number of the user to be removed, you must change the data in the prompts for that number.

   It is necessary that, at a minimum, you modify the User's state to Disabled.

Changing the Default GSP Configuration

This section describes the process of changing GSP default configurations. To change the GSP default configuration, perform the following steps:

1. Enter the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the Default Configuration (dc) command:

   ```
   GSP> dc
   ```

3. Follow the prompts for the dc command, and have the change information available.

CAUTION When the Security configuration is reset, all users are removed, including the GSP administrator. The remote is disabled. The remote must be re-enabled through the main console using the Enable Remote (er) command.

Step 4. When the initial power-up boot process completes in approximately one to five minutes, the BCH main menu will be displayed:

```
---- Main Menu ---------------------------------------------------------------

     Command                              Description
     -------                              -----------
     BOot [PRI|ALT|<path>]                Boot from specified path
     PAth [PRI|ALT|CON|KEY] [<path>]      Display or modify a path
     SEArch [DIsplay|IPL] [<path>]        Search for boot devices

     COnfiguration menu                   Displays or sets boot values
     INformation menu                     Displays hardware information
     SERvice menu                         Displays service commands
     DeBug menu                           Displays debug commands
     MFG menu                             Displays manufacturing commands

     DIsplay                              Redisplay the current menu
     HElp [<menu>|<command>]              Display help for menu or command
     RESET                                Restart the system
----
Main Menu: Enter command or menu >
```

Step 5. To start the boot process using the primary boot path, enter *BO PRI*, at Boot Console Handler BCH main menu prompt and press **<ENTER>**.

NOTE Booting a system to a UNIX login prompt from BCH main menu can take 20 minutes or longer depending on your software and hardware configuration.

Step 6. Once the system reaches the UNIX login prompt the following will be displayed on the console screen:.

```
HP-UX hprfes A.09.04 U 9000/897 (ttyp2)

login:
```

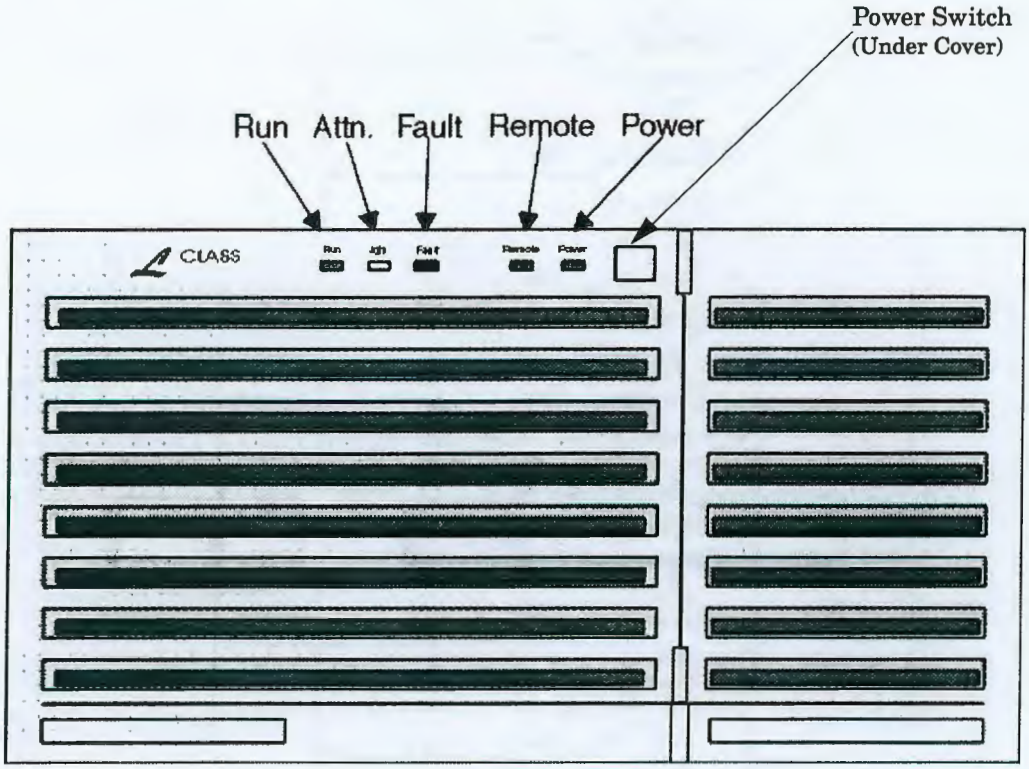
Initial Power-up

The following section describes the process of applying power to the rp54xx server and booting the system to the UNIX Login prompt. The amount of time it takes to go through self-test then boot the system will vary widely depending on hardware configuration. The following provides a "typical" procedure. Yours may vary depending on software and hardware installed:

Step 1. Apply AC Power to the system console.

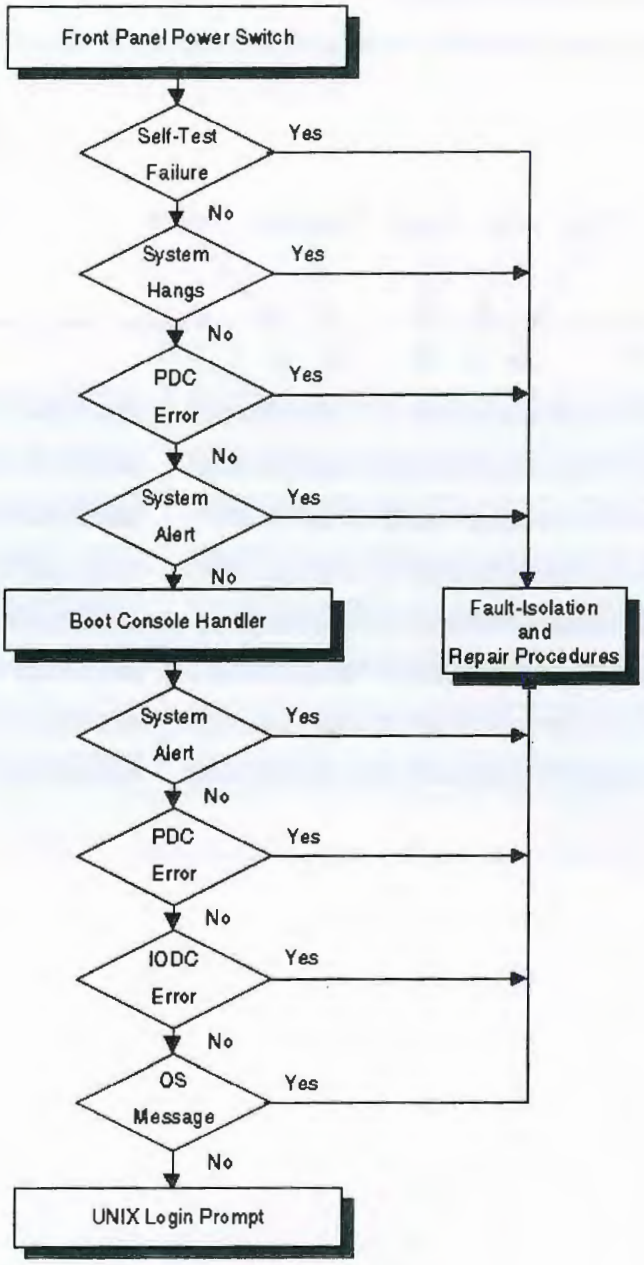
Step 2. Apply power to the rp54xx server by turning the front panel switch to ON.



RQS Nº 03/2005 - CN
CPMI - CORREIOS
0088
Fls:
Doc: 3701

During the Boot process a variety of errors or problems can occur as shown below:

Potential Boot Problems



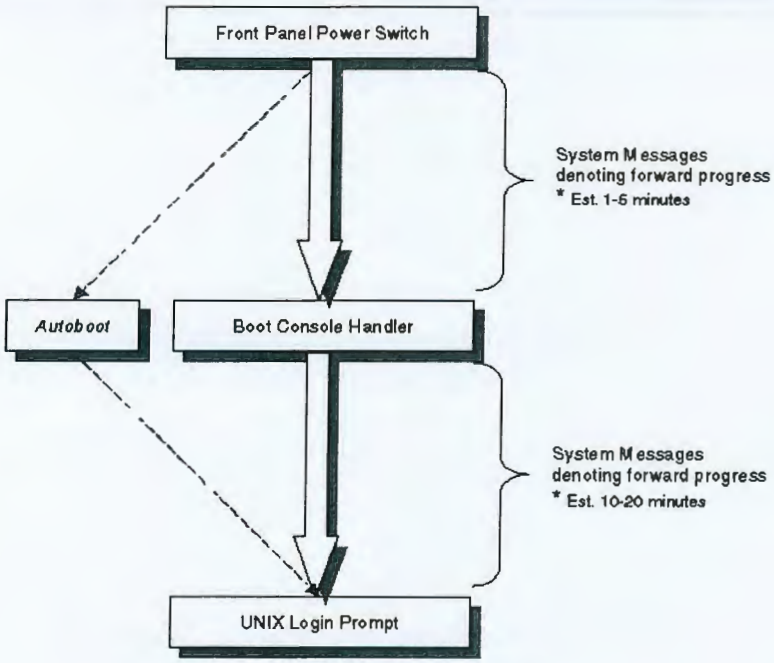
3.094
frente

rp54xx Server Boot Process

The length of time an rp54xx server will require to complete the boot process depends on the number of processors and the amount of RAM installed. Average configurations can take more than 20 minutes.

The boot process consists of the following main steps:

Typical Boot Process



The duration of the full boot process can vary depending on:
- Number of CPUs installed
- Amount of memory installed
- UNIX version installed
- State of the network

All times approximate

Return the GSP to Default Configurations

The Default Configuration (dc) command is used to reset all or some of the GSP values to the default values. To return GSP values to default configurations, perform the following steps:

1. Access the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the Default Configuration (dc) command:

   ```
   GSP> dc
   ```

3. Follow the prompts for the dc command, and be sure to have the change information available.

CAUTION When the Security configuration is reset, all users are removed, including the GSP administrator. It also disables the remote. Remote must be re-enabled through the main console using the Enable Remote (er) command.

3096
fls

CAUTION Be sure to read each prompt carefully and enter the correct response. A missed or incorrect entry could deny entry to that user.

The following is an example of an added user's information:

```
. User's Name: Joe Smith
. Organization's Name: IT Support
. Dial-back configuration: Disabled
. Access Level: Operator
. Mode: multiple
. User's state: enabled
```

For the number 1 user, the Access level is administrator. The Mode entry of single only allows entry for that user one time, then access will be denied. A Mode entry of multiple allows unlimited entries into the GSP.

Removing Users

You can remove (disable) a GSP user with the same Security options and access control (SO) command used to add user.

To remove a user, perform the following steps:

1. Access the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the Security options and access control (SO) command:

   ```
   GSP> so
   ```

3. The first prompt you will see with the SO command is for GSP-wide parameters:

   ```
   GSP wide parameters are:
   . Login Timeout: 1 minutes.
   . Number of password Faults allowed: 3
   . Flow Control Timeout: 5 minutes.

   Do you want to modify the GSP wide parameters? (Y / [N]) __
   ```

   At this point you can modify the GSP wide parameters, or continue with removing a user. To remove users, respond N for no.

NOTE You will have to step through each user number until you reach the user to be removed.

4. When you access the number of the user to be removed, you must change the data in the prompts for that number.

   It is important that, at a minimum, you need to modify the User's state to Disabled.

GSP Configurable Parameters

Once a system console is configured, additional GSP parameters may be set. For a complete list use the GSP>he command to access the on-line help facility.

Examples of three configurable parameters follow.

Adding Users

The GSP provides a maximum of 20 users (one administrator and 19 operators). By design, the first user added to the GSP becomes the GSP administrator. Only the GSP administrator can add or remove users or change the GSP configuration.

NOTE Before starting this procedure, you will need to know the following information:

- User's name
- Organization's name
- Login name
- User's password

To add a user, perform the following steps:

1. Access the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the Security options and access control (SO) command:

   GSP> so
3. The first prompt you will see with the so command is for GSP wide parameters:

```
GSP wide parameters are:
Login Timeout: 1 minutes.
. Number of password Faults allowed: 3
. Flow Control Timeout: 5 minutes.
Do you want to modify the GSP wide parameters? (Y / [N]) __
```

   At this point you can modify the GSP wide parameters, or continue with adding users. To add users, respond N for no.

NOTE If this is the first time users are being added, the first user added will be the GSP administrator.

If this is not the first time you are adding users (you are adding additional users), you will need to step through all current users to reach the next available user prompt.

4. The next prompt that appears will ask the following question:

   Do you want to modify the user number 1 parameters? (Y/[N]/Q to quit) __

   Follow the series of prompts to enter all the required fields for adding a user.

3098

Step 8. Connect the 9-pin end of the RS-232 cable (Supplied) to the connector labeled CONSOLE on the A5591-63002 "W-type" adapter cable.

CAUTION To prevent unauthorized access to your rp54xx system, do not connect the other end of the serial cable to the Secure Web Console until both the server and the Web Console have both been fully configured.

Step 9. Connect one end of a LAN cable to RJ-45 connector labeled 10-Base-T on the Secure Web Console.

Step 10. Connect the other end of the same LAN cable to your site LAN.

Step 11. Configure the Secure Web Console in accordance with the documentation that was provided with it or refer to http://www.docs.hp.com

Step 12. Once the Web Console has been properly configured, the remaining end of the serial cable between the server and the Web Console may be connected.

Secure Web Console Installation

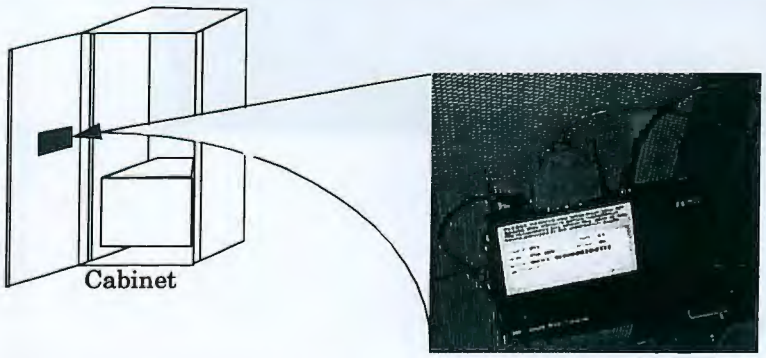
The following section describes installation of the HP Secure Web Console on inside of the rear door of a rack-mounted rp54xx server.

For technical, installation, and configuration instructions for the Secure Web Console, refer to the following URLs on the Internet:

General information:
http://www.hp.com/

Documentation:
http://www.docs.hp.com

NOTE Either the system console (HP series 700 terminal) or the HP Secure Web Console may be installed on an rp54xx server, but not at the same time. Both console types use the same DB9 type LAN *Console* connector.



To install the HP Secure Web Console on an rp54xx server, refer to the previous figure and the HP Secure Web Console documentation, then proceed as follows:

Step 1. Install the wire mounting bracket by carefully inserting the two top prongs through the vent grill in the rear door of the cabinet as shown above. Position the bracket toward the hinge side of the door.

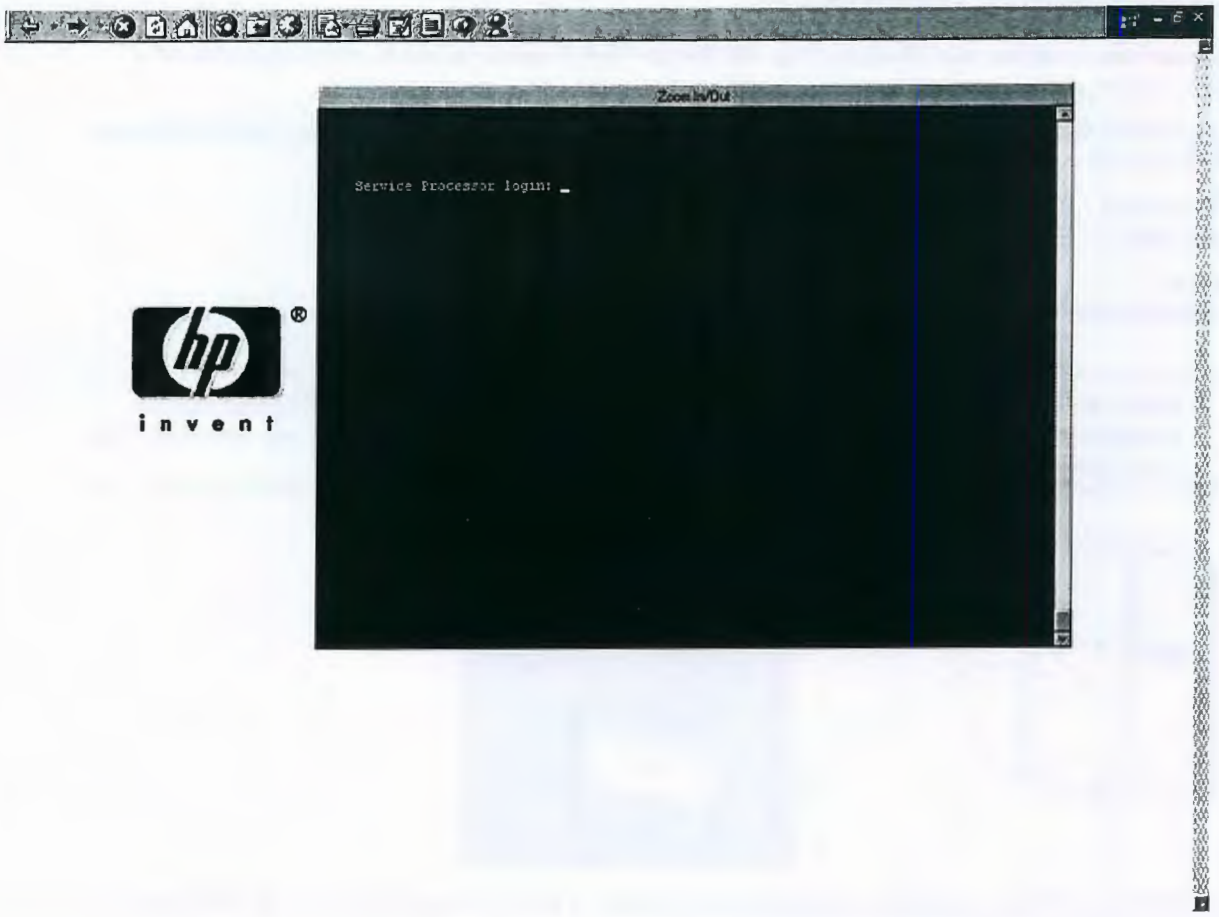
Example 4-6 Combined GSP Browser Window



There is not a separate administration "layer" when using the embedded web access of the revision B GSP. Web console access via the external Secure Web Console required that you first logon to the SWC, then click on ACCESS CONSOLE. User configuration was also performed at the Secure Web Console. However, the revision B GSP web console does not require this additional step. When you point the web browser at the IP of the GSP LAN, you are directly connected to the GSP. The web console part of the GSP employs the same users as the GSP.

PCI I/O Card Removal

The side service bay contains card slots for ten PCI I/O cards (slots 3 through 12) and two Core I/O cards (slots 1 and 2).

Perform the following tasks prior to removing PCI I/O cards:

- Power down the server.
- Detach all power cords from the server.

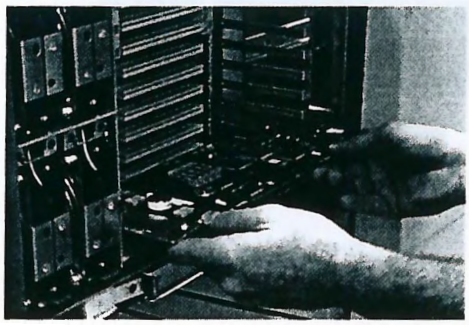
To remove a PCI I/O card from the server, perform the following steps:

NOTE Record the location of all PCI cards as they are removed. Replacing them in a diffferent location will require system reconfiguration and could cause boot failure.

---

1. Disconnect the I/O cable attached to the I/O card at the rear PCI bulkhead.
2. Disconnect any ribbon cable connectors attached to the I/O card in the side service bay.
3. Grasp the edge of the I/O card and pull it out of the server.

The following graphic shows an I/O card being removed.



2.993 June CPL-AS

PCI I/O Card Replacement

The side service bay contains card slots for 10 PCI I/O cards (slots 3 through 12) and 2 Core I/O cards (slots 1 and 2).

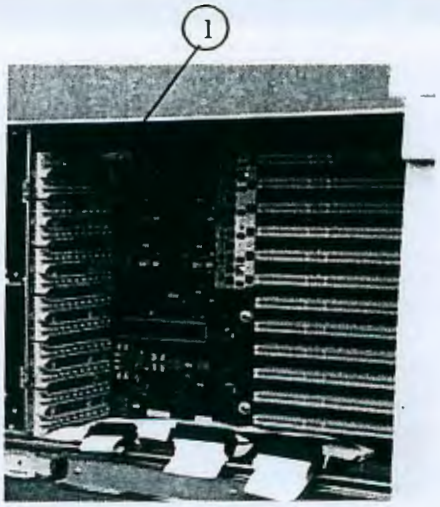
Prior to replacing PCI cards, perform the steps listed below:

- Power down the server.
- Detach all power cords from the server.

To replace a Core or PCI I/O card, perform the following steps:

1. Locate the I/O card guide (item 1) on the outside of the Fan Assembly Housing. Orient the I/O card into its guide slot and push it into the server until the card connector seats in the I/O Backplane card connector.

NOTE Each I/O card guide contains two slots. The top slot is aligned with the I/O Backplane card connector.



2. Connect the I/O cable attached to the I/O card at the rear PCI bulkhead.
3. Connect any ribbon cable connectors attached to the I/O card in the side service bay.

Doc:

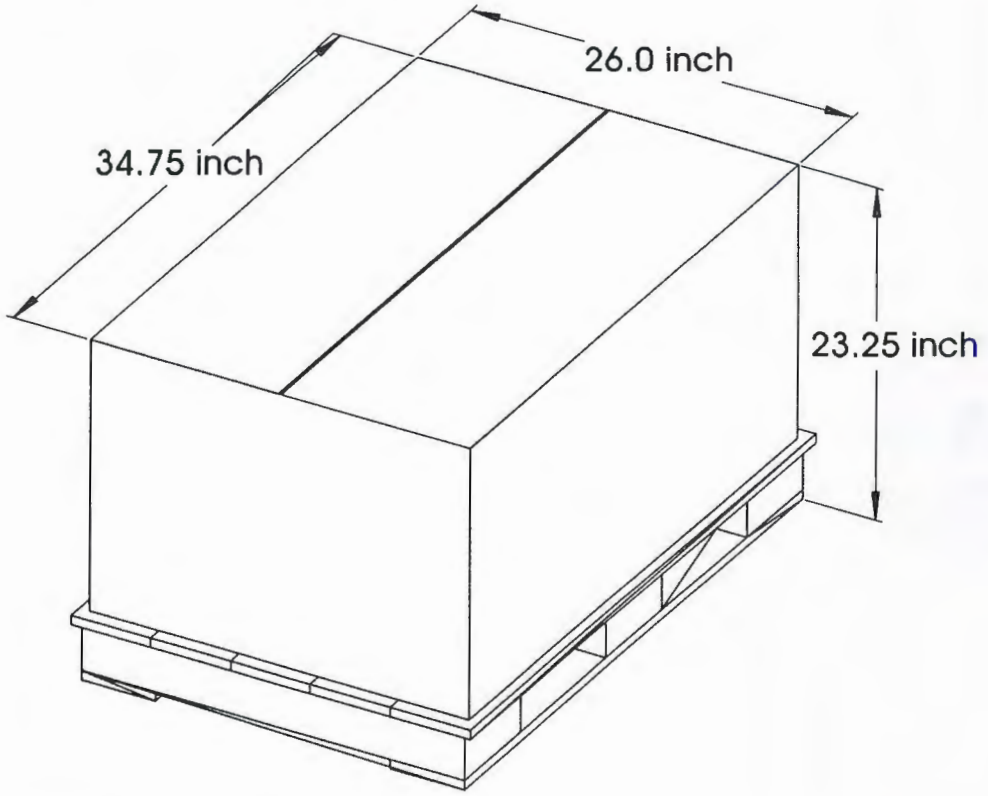
Dimensions

Uncrating Space

rp54xx systems are shipped in boxes on a 34.75 in. x 26 in. (88.25 cm. x 66 cm.) pallet. The combined height of the packaged container and the pallets is 23.25 in. (59 cm.).



rhrr004

Allow a circular area approximately 5 ft. (2 m.) in diameter room for uncrating the system. Allow additional space for temporary storage of the shipping containers and packing materials.

Space Requirements

A minimum access area of 2 ft. (0.7 m.) in all directions is required for serviceability.

2.983
Irene

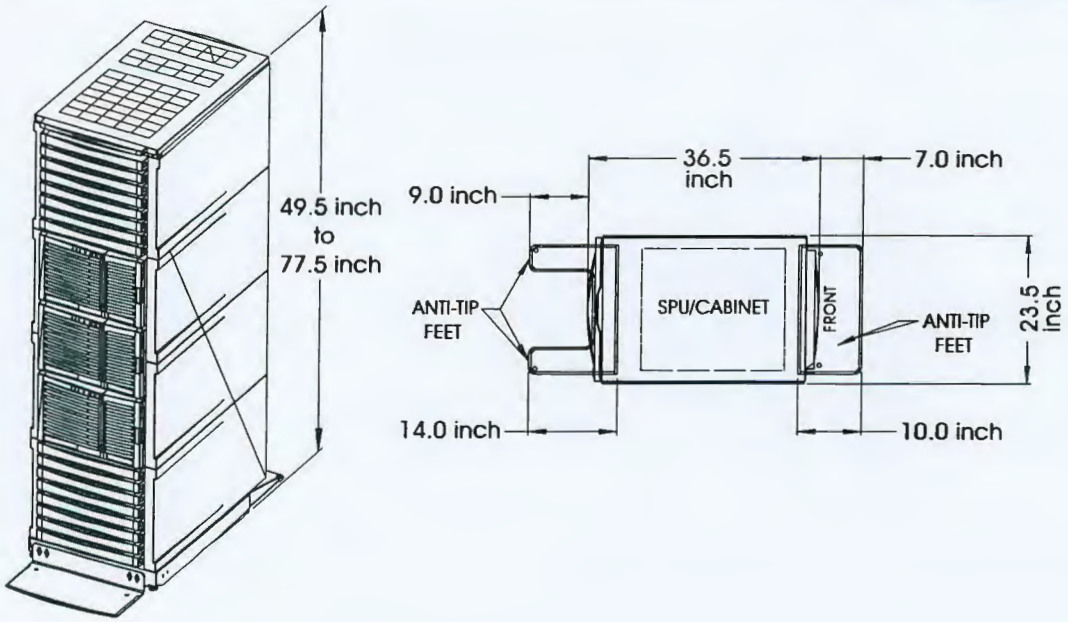
Computer Room Physical Space Requirements

Server

The A5537A, A5538A, or A5539A cabinets in which the server resides is 38.5" deep by 23.5" wide, with heights as follows:

- A5537A 1.2 meter rack - 49.5"
- A5538A 1.6 meter rack - 63.5"
- A5539A 2.0 meter rack - 77.5"

The cabinet anti-tip feet (required for safety) extend the depth an additional 10" in the front and 14" in the back. The minimum standalone physical space for the rp54xx server in a cabinet is shown in the following illustration:



rhrr005

For service access, the server slides on rails 28" beyond the edge of the chassis in the front. An additional minimum of 3' of workspace on all sides is required for servicing the server.

Aisle Space

The minimum aisle space between rows of installed HP rp54xx server/cabinets is 3 feet, front and back, for airflow and serviceability.

Computer Room Unpacking Space

Specify Uncrating Space

rp54xx Systems are shipped in integrated cabinets on a 34.75" (88.25 cm.) x 26" (66 cm.) pallet. The combined height of the packaged container and the pallets are as follows:

- 1.1 meter rack - 60 inches
- 1.6 meter rack - 73 inches
- 2.0 meter rack - 87 inches

Allow room (a circular area approximately 12 feet (3.5 meters) in diameter) for uncrating the system and rolling the cabinet off the pallet on rails. Allow additional space for temporary storage of the shipping containers and packing materials..

2.981

Electrical

The HP rp54xx power system is comprised of one, two or three autoranging, 12A/10A/5A, 930W hot-swappable system power supplies, depending on how the system is configured. The maximum power needed by fully-configured server is 1200W. Each power supply requires a dedicated 20A branch circuit.

CAUTION HP does not recommend and does not support the use of "ferro-active" or "ferro-resonant" power correction in conjunction with the rp54xx server. These type of line conditioners represent an older technology that is not compatible with the most recent designs in active PFC power supplies such as those in the HP rp54xx servers. "Ferro-active" or "ferro-resonant" line conditioners may cause an increase in total harmonic distortion and may produce significant and unpredictable voltage regulation anomalies.

Office High Availability Requirements

Server-level Enhanced Power Availability

At the server level, enhanced power availability is achieved through the n+1 hot-swappable power supplies.

One power supply is required for a minimally configured rp54xx system operation and in order to allow the system to boot. If a second power supply is present, one of the two power supplies can fail without the system shutting down. Similarly, two power supplies are required for a more heavily-configured rp54xx server. If a third power supply is present, one of the two power supplies can fail without the system shutting down.

If a third (redundant) power supply is present, all three power supplies become hot-swappable. Any one of the power supplies can fail without affecting system performance, and can be replaced while the system is on-line. Single point of failure is reduced to the local wall circuit or PowerTrust UPS to which the power supply power cords are connected.

Power Protection

Power protection is provided through the use of HP PowerTrust UPSs (Uninterruptible Power Supplies). The only supported models for rp54xx systems are the 3.0kVA and 5.5kVA models. Recommendations for other manufacturers and models are not yet determined.

HP rp54xx server power supplies may be plugged directly into the customer's site UPS. However, customers are advised against plugging the power supply into an HP PowerTrust UPS and then connecting that UPS to the site UPS.

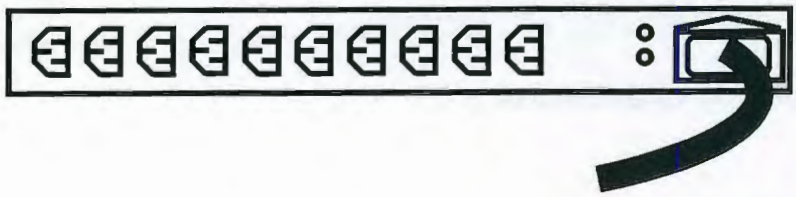
Modular PDUs

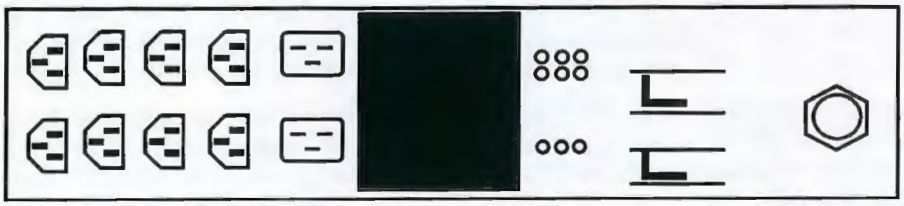
NOTE The acronym PDU (Power Distribution Unit) in this document refers to the power strips attached to the HP rp54xx cabinet.

Three modular PDUs are available for use with the rp54xx product:

- 20A modular PDU, HP product number E7674A. This PDU has seven C13 outlets and one C19 outlet. Note that if this PDU is used to power the rp54xx server, any other peripherals must have their power supplied by additional PDUs in the cabinet. The PDU power cord (HP part number 8120-6903) has an L6-20P plug which must be plugged into an L6-20R wall or floor receptacle.



- 30A modular PDU, HP product number E7681A (North America) or E7682A (International). This PDU has eight C13 outlets and two C19 outlets, split across two 20A branch circuits (max. 30A available). The PDU power cord has an L6-30 plug.



- 60A modular PDU, HP product number E7683A (North America) or E7667A (International). FINAL DESIGN ON THIS PRODUCT IS NOT YET AVAILABLE.

System Power Requirements

Table B-1 Power Requirements

Requirements	Value	Comments
Nominal input voltage	100-240 VAC	
Frequency range (minimum - maximum)	50 - 60 HZ	
Number of phases	1	
Theoretical maximum current	12.0 A	Per line cord
Maximum inrush current	69.0 A	Per line cord
Ground leakage current (mA)	< 3.6 mA	Per line cord

2.979
bene

LAN and Telephone

rp54xx servers provide remote console access via the secure web console, which may be connected to the RS-232 serial port or 10Base-T RJ45 LAN port on the GSP (Guardian Service Processor) card in I/O slot #2. The same connectors may also be used to connect directly to a hard console.

NOTE The RJ45 LAN port should be used ONLY for remote console access and not as a production LAN port.

rp54xx servers may require as many as three unique IP addresses:

- The rp54xx server requires its own IP address.
- The Guardian Service Processor, as a separate network device, has to have its own IP address, gateway, and subnet mask configured at the site in order to be separately addressed. The service processor does not support DHCP, so the IP address must be assigned out of a separate pool from any that are assigned dynamically.
- The remote web console, if used, requires its own IP address.

NOTE Check with your local telephone company to be thatsure the telephone service at the site can accommodate modem/data quality transmission.

0106
Fls:
Doc: 3701

Acoustic Safety Standards

The acoustic specifications for the rp54xx server are as follows:

Sound power	7.0 Bels LwA maximum at >31° C
Sound pressure	60 dB maximum at > 31° C
	No prominent tones

2.975
fls

Altitude Operation Standards

Maximum Altitude	
Operational	3000 meters above sea level
Non-operational	4572 meters above sea level

Effects of Altitude

Some old models of tape drives, including those supplied by Hewlett-Packard, have vacuum column transport mechanisms that are affected by atmospheric pressure. Adjustments to these mechanisms may be required to compensate for the lower atmospheric pressure at higher altitudes.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0107
Doc: 3701

Temperature and Humidity Operating Standards

The following table lists the temperature and humidity specifications for rp54xx servers.

Temperature and Humidity Specifications				
Parameter	**Operational Limits**	**Recommended Operating Range**	**Maximum Rate of Change (per hour)**	**Non-Operating Ranges**
Temperature[a]	5°C to 35°C (41°F to 95°F)[b]	20°C to 25°C (68°F to 77°F)	10°C (50°F) per hour (With tape media) 20°C (68°F) per hour (Without tape media)	-40°C to +70°C (-40°F to +158°F)
Operating Humidity	15 to 80% Relative humidity (Non-condensing) at 35°C (95°F)	40 to 60% Relative humidity (Non-condensing)	30% Per hour Relative humidity (Non-condensing)	90% Relative humidity (Non-condensing) at 65°C (149°F)

a. The rp54xx has been designed to operate within the above specific temperature and relative humidity operational limits. In general, operating any electronic equipment within the recommended ranges of temperature and humidity will produce optimal reliability.

b. Temperature ranges stated above are at sea level. Maximum operating temperature is derated (reduced) by 2°C for each 1000 meters above sea level up to a maximum of 3000 meters.

NOTE Operating ranges refer to the ambient air temperature and humidity measured at the cabinet cooling air intake vents.

Thermal Protection Features

If the cabinet temperature approaches 35°C, thermal protection will be invoked. At 35°C +/- 2°C a warning message will be displayed on the system console. At 40°C +/- 2°C an ungraceful shutdown will occur.

2.973
bene

C General Site Preparation Guidelines

The following information provides general principles and practices to consider before the installation or operation of an hp server.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0108
Fls:
3701
Doc:

Electrical Factors

Proper design and installation of a power distribution system for an hp server requires specialized skills. Those responsible for this task must have a thorough knowledge and understanding of appropriate electrical codes and the limitations of the power systems for computer and data processing equipment.

In general, a well-designed power distribution system exceeds the requirements of most electrical codes. A good design, when coupled with proper installation practices, produces the most trouble-free operation.

A detailed discussion of power distribution system design and installation is beyond the scope of this information. However, electrical factors relating to power distribution system design and installation must be considered during the site preparation process.

The electrical factors discussed in this section are:

- Computer room safety
- Power Consumption
- Electrical load requirements (circuit breaker sizing)
- Power quality
- Distribution hardware
- System installation guidelines

Computer Room Safety

Inside the computer room, fire protection and adequate lighting (for equipment servicing) are important safety considerations. Federal and local safety codes govern computer installations.

Fire Protection

The National Fire Protection Association's Standard for the Protection of Electronic Computer Data Processing Equipment, NFPA 75, contains information on safety monitoring equipment for computer rooms.

Most computer room installations are equipped with the following fire protection devices:

- Smoke detectors
- Fire and temperature alarms
- Fire extinguishing system

Additional safety devices are:

- Circuit breakers
- An emergency power cutoff switch
- Devices specific to the geographic location i.e., earthquake protection

Lighting Requirements for Equipment Servicing

Adequate lighting and utility outlets in a computer room reduce the possibility of accidents during equipment servicing. Safer servicing is also more efficient and, therefore, less costly.

For example, adequate lighting reduces the chances of connector damage when cables are installed or removed.

2.971
Jun

The minimum recommended illumination level is 70 foot-candles (756 lumens per square meter) when the light level is measured at 30 inches (76.2 cm) above the floor.

Power Consumption

When determining power requirements, you must consider any peripheral equipment that will be installed during initial installation or as a later update. Refer to the applicable documentation for such devices to determine the power required to support these devices.

Electrical Load Requirements (Circuit Breaker Sizing)

NOTE Local authority has jurisdiction [LAHJ] and should make the final decision regarding adherence to country- specific electrical codes and guidelines.

It is good practice to derate power distribution systems for one or more of the following reasons:

To avoid nuisance tripping from load shifts or power transients, circuit protection devices should never be run above 80% of their root-mean-square (RMS) current ratings.

- Safety agencies derate most power connectors to 80% of their RMS current ratings.

Power Quality

The hp server is designed to operate over a wide range of voltages and frequencies. The server is tested and shown to comply with EMC Specification EN50082. However, damage can occur if these ranges are exceeded. Severe electrical disturbances can exceed the design specifications of the equipment.

Sources of Voltage Fluctuations

Voltage fluctuations, sometimes called glitches, affect the quality of electrical power. Common sources of these disturbances are:

- Fluctuations occurring within the facility's distribution system
- Utility service low-voltage conditions (such as sags or brownouts)
- Wide and rapid variations in input voltage levels
- Wide and rapid variations in input power frequency

Electrical storms

- Large inductive sources (such as motors and welders)
- Faults in the distribution system wiring (such as loose connections)
- Microwave, radar, radio, or cell phone transmissions

RQS Nº 0082005 - CN
CPMI - CORREIOS
0109
Fls:
Doc: 3701

Power System Protection

The hp server can be protected from the sources of many of these electrical disturbances by using:

- A dedicated power distribution system
- Power conditioning equipment
- Over- and under-voltage detection and protection circuits
- Screening to cancel out the effects of undesirable transmissions
- Lightning arresters on power cables to protect equipment against electrical storms

Precautions have been taken during power distribution system design to provide immunity to power outages of less than one cycle. However, testing cannot conclusively rule out loss of service. Therefore, adherence to the following guidelines provides the best possible performance of power distribution systems for hp computer equipment:

- Dedicated power source—Isolates an hp server power distribution system from other circuits in the facility.
- Missing-phase and low-voltage detectors—Shuts equipment down automatically when a severe power disruption occurs. For peripheral equipment, these devices are recommended but optional.
- Online uninterruptible power supply (UPS)—Keeps input voltage to devices constant and should be considered if outages of one-half cycle or more are common. Refer to qualified contractors or consultants for each situation.

Distribution Hardware

This section describes wire selection and the types of raceways (electrical conduits) used in the distribution system.

Wire Selection

Use copper conductors instead of aluminum, as aluminum's coefficient of expansion differs significantly from that of other metals used in power hardware. Because of this difference, aluminum conductors can cause connector hardware to work loose, overheat, and fail.

Raceway Systems (electrical conduits) [LAHJ]

Raceways (electrical conduits) form part of the protective ground path for personnel and equipment. Raceways protect the wiring from accidental damage and also provide a heatsink for the wires.

Any of the following types may be used:

- Electrical metallic tubing (EMT) thin-wall tubing
- Rigid (metal) conduit
- Liquidtight with RFI shield grounded (most commonly used under raised floors)

Building Distribution

All building feeders and branch circuitry should be in rigid metallic conduit with proper connectors (to provide ground continuity) Conduit that is exposed and subject to damage should be constructed of rigid galvanized steel.

2.969
Fls.

Grounding Systems

An hp server requires two methods of grounding:

- Power distribution safety grounding
- High frequency intercabinet grounding

Power Distribution Safety Grounding [LAHJ]

The power distribution safety grounding system consists of connecting various points in the power distribution system to earth ground using green (green/yellow) wire ground conductors. Having these ground connections tied to metal chassis parts that may be touched by computer room personnel protects them against shock hazard from current leakage and fault conditions.

Power distribution systems consist of several parts. Hewlett-Packard recommends that these parts be solidly interconnected to provide an equipotential ground to all points.

Main Building Electrical Ground The main electrical service entrance equipment should have an earth ground connection, as required by applicable codes. Connections such as a grounding rod, building steel, or a conductive type cold water service pipe provide an earth ground.

Electrical Conduit Ground All electrical conduits should be made of rigid metallic conduit that is securely connected together or bonded to panels and electrical boxes, so as to provide a continuous grounding system.

Power Panel Ground Each power panel should be grounded to the electrical service entrance with green (green/yellow) wire ground conductors. The green (green/yellow) wire ground conductors should be sized per applicable codes (based on circuit over current device ratings).

NOTE The green wire ground conductor mentioned above may be a black wire marked with green tape. [LAHJ]

Computer Safety Ground Ground all computer equipment with the green (green/yellow) wire included in the branch circuitry. The green (green/yellow) wire ground conductors should be connected to the appropriate power panel and should be sized per applicable codes (based on circuit over current device ratings).

Cabinet Performance Grounding (High Frequency Ground)

Signal interconnects between system cabinets require high frequency ground return paths. Connect all cabinets to site ground.

NOTE In some cases power distribution system green (green/yellow) wire ground conductors are too long and inductive to provide adequate high frequency ground return paths. Therefore, a ground strap (customer-supplied) should be used for connecting the system cabinet to the site grounding grid (customer-supplied). When connecting this ground, ensure that the raised floor is properly grounded for high frequency.

Power panels located in close proximity to the computer equipment should also be connected to the site grounding grid. Methods of providing a sufficiently high frequency ground grid are described in the next sections.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0110
Fls:
Doc: 3701

D. 968 here

Raised Floor "High Frequency Noise" Grounding

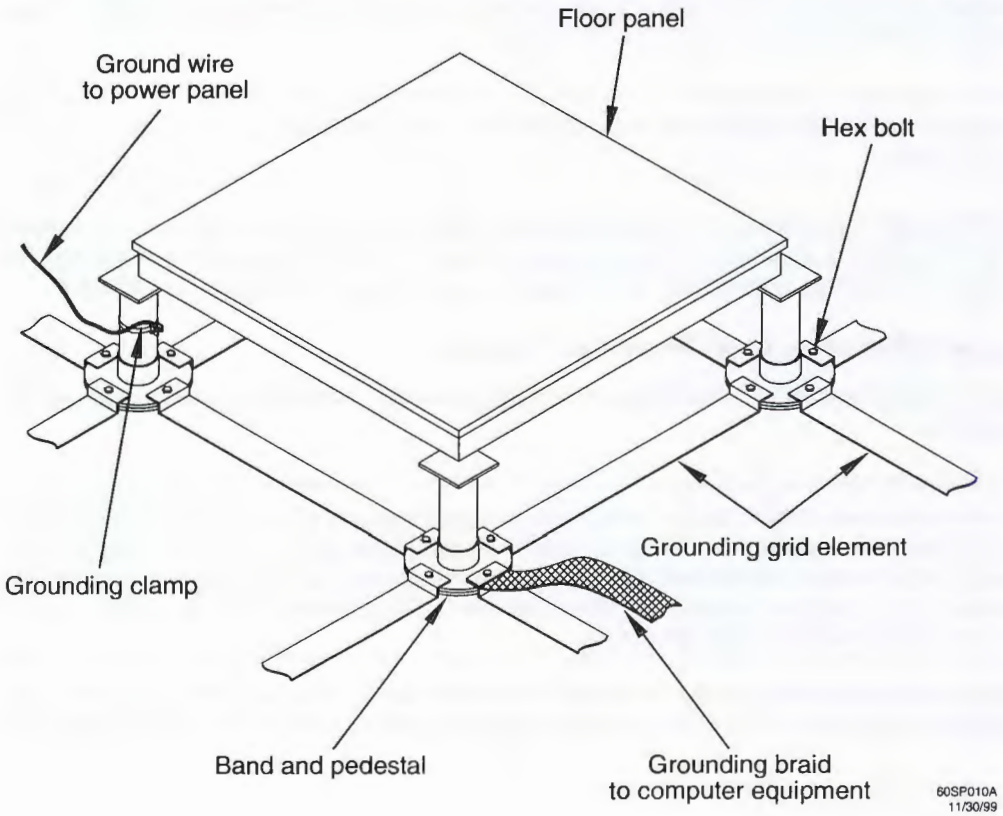
If a raised floor system is used, install a complete signal grounding grid for maintaining equal potential over a broad band of frequencies. The grounding grid should be connected to the equipment cabinet and electrical service entrance ground at multiple connection points using a minimum #6 AWG (16mm2) wire ground conductor. The following figure illustrates a metallic strip grounding system.

Hewlett-Packard recommends the following approaches:

- Excellent—Add a grounding grid to the subfloor. The grounding grid should be made of copper strips mounted to the subfloor. The strips should be 0.032 in. (0.08 cm) thick and a minimum of 3.0 in. (8.0 cm) wide.

  Connect each pedestal to four strips using 1/4 in. (6.0 mm) bolts tightened to the manufacturer's torque recommendation.
- Better - A grounded #6 AWG minimum copper wire grid mechanically clamped to floor pedestals and properly bonded to the building/site ground.
- Good—Use the raised floor structure as a ground grid. In this case, the floor must be designed as a ground grid with bolted down stringers and corrosion resistive plating (to provide low resistance and attachment points for connection to service entrance ground and hp computer equipment). The use of conductive floor tiles with this style of grid further enhances ground performance.

Figure C-1 Raised Floor Metal Strip Ground System



2.967
fls.

Equipment Grounding Implementation Details

Connect all Hewlett-Packard equipment cabinets to the site ground grid as follows:

Step 1. Attach one end of each ground strap to the applicable cabinet ground lug.

Step 2. Attach the other end to the nearest pedestal base (raised floor) or cable trough ground point (nonraised floor).

Step 3. Check that the braid contact on each end of the ground strap consists of a terminal and connection hardware (a 1/4-in. (6.0-mm) bolt, nuts, and washers).

Step 4. Check that the braid contact connection points are free of paint or other insulating material and treated with a contact enhancement compound (similar to Burndy Penetrox).

System Installation Guidelines

This section contains information about installation practices. Some common pitfalls are highlighted. Both power cable and data communications cable installations are discussed.

NOTE In domestic installations, the proper receptacles should be installed prior to the arrival of Hewlett-Packard equipment. Refer to the appropriate installation guide for installation procedures.

Wiring Connections

Expansion and contraction rates vary among different metals. Therefore, the integrity of an electrical connection depends on the restraining force applied. Connections that are too tight compress or deform the hardware and causes it to weaken. This usually leads to high impedance preventing circuit breakers from tripping when needed or can contribute to a buildup of high frequency noise.

CAUTION Connections that are too loose or too tight can have a high impedance that cause serious problems, such as erratic equipment operation. A high impedance connection overheats and sometimes causes fire or high temperatures that can destroy hard-to-replace components such as distribution panels or system bus bars.

Wiring connections must be properly torqued. Many equipment manufacturers specify the proper connection torque values for their hardware.

Ground connections must only be made on a conductive, nonpainted surface. When equipment vibration is present, lock washers must be used on all connections to prevent connection hardware from working loose.

Data Communications Cables

Power transformers create high-energy fields in the form of electromagnetic interference (EMI). Heavy foot traffic can create electrostatic discharge (ESD) that can damage electronic components. Route data communications cables away from these areas. Use shielded data communications cables that meet approved industry standards to reduce the effects of external fields.

3701
Doc:

Environmental Elements

The following environmental elements can affect an hp server installation:

- Computer room preparation
- Cooling requirements
- Humidity level
- Air conditioning ducts
- Dust and pollution control
- Electrostatic discharge (ESD) prevention
- Acoustics (noise reduction)

Computer Room Preparation

The following guidelines are recommended when preparing a computer room for an hp server:

- Locate the computer room away from the exterior walls of the building to avoid the heat gain from windows and exterior wall surfaces.
- When exterior windows are unavoidable, use windows that are double or triple glazed and shaded to prevent direct sunlight from entering the computer room.
- Maintain the computer room at a positive pressure relative to surrounding spaces.
- Use a vapor barrier installed around the entire computer room envelope to restrain moisture migration.
- Caulk and vapor seal all pipes and cables that penetrate the envelope.
- Use at least a 12-inch raised floor system for minimum favorable room air distribution system (underfloor distribution).
- Ensure a minimum clearance of 12 inches between the top of the hp server cabinet and the ceiling to allow for return air flow and ensure that all ceiling tiles are in place.
- Allow 18 inches (or local code minimum clearance) from the top of the hp server cabinet to the fire sprinkler heads.

Cooling Requirements

Air conditioning equipment requirements and recommendations are described in the following sections.

Basic Air Conditioning Equipment Requirements

The cooling capacity of the installed air conditioning equipment for the computer room should be sufficient to offset the computer equipment dissipation loads, as well as any space envelope heat gain. This equipment should include:

- Air filtration
- Cooling or dehumidification
- Humidification
- Reheating

ECT 2.965 fls

- Air distribution
- System controls adequate to maintain the computer room within specified operating ranges.

Lighting and personnel must also be included. For example, a person dissipates about 450 BTUs per hour while performing a typical computer room task.

At altitudes above 10,000 feet (3048 m), the lower air density reduces the cooling capability of air conditioning systems. If your facility is located above this altitude, the recommended temperature ranges may need to be modified. For each 1000 feet (305 m) increase in altitude above 10,000 feet (up to a maximum of 15,000 feet), subtract 1.5° F (0.83° C) from the upper limit of the temperature range.

Air Conditioning System Guidelines

The following guidelines are recommended when designing an air conditioning system and selecting the necessary equipment:

- The air conditioning system that serves the computer room should be capable of operating 24 hours a day, 365 days a year. It should also be independent of other systems in the building.
- Consider the long-term value of hp server availability, redundant air conditioning equipment or capacity. The system should be capable of handling any future hp server expansion.
- Air conditioning equipment air filters should have a minimum rating of 45% (based on "ASHRAE Standard 52-76, Dust Spot Efficiency Test").
- Introduce only enough outside air into the system to meet building code requirements (for human occupancy) and to maintain a positive air pressure in the computer room.

Air Conditioning System Types

The following three air conditioning system types are listed in order of preference:

- Complete self-contained package unit(s) with remote condenser(s). These systems are available with up or down discharge and are usually located in the computer room.
- Chilled water package unit with remote chilled water plant. These systems are available with up or down discharge and are usually located in the computer room.
- Central station air handling units with remote refrigeration equipment. These systems are usually located outside the computer room.

Basic Air Distribution Systems

A basic air distribution system includes supply air and return air.

An air distribution system should be zoned to deliver an adequate amount of supply air to the cooling air intake vents of the hp server equipment cabinets. Supply air temperature should be maintained within the following parameters:

- Ceiling supply system—From 55° F (12.8° C) to 60° F (15.6° C)
- Floor supply system—At least 60° F (15.6° C)

If a ceiling plenum return air system or a ducted ceiling return air system is used, the return air grill(s) in the ceiling should be above the exhaust area or the exhaust row.

The following three types of air distribution system are listed in order of recommendation:

- Underfloor air distribution system—Downflow air conditioning equipment located on the raised floor of the computer room uses the cavity beneath the raised floor as plenum for the supply air.

ECT 2.965 fls
ECT Nº 03/2005 - CN
CPMI - CORREIOS
0112
Fls:
Doc: 3701

Perforated floor panels (available from the raised floor manufacturer) should be located around the front of the system cabinets. Supply air emitted though the perforated floor panels is then available near the cooling air intake vents of the hp server cabinets.

- Ceiling plenum air distribution system—Supply air is ducted into the ceiling plenum from upflow air conditioning equipment located in the computer room or from an air handling unit (remote).

  The ceiling construction should resist air leakage. Place perforated ceiling panels (with down discharge air flow characteristics) around the front of the system cabinets. The supply air emitted downward from the perforated ceiling panels is then available near the cooling air intake vents of the hp server cabinets.

  Return air should be ducted back to the air conditioning equipment though the return air duct above the ceiling.

- Above ceiling ducted air distribution system—Supply air is ducted into a ceiling diffuser system from upflow air conditioning equipment located in the computer room or from an air handling unit (remote).

  Adjust the supply air diffuser system grilles to direct the cooling air downward around the front of the hp server cabinets. The supply air is then available near the cooling air intake vents of the hp server cabinets.

Air Conditioning System Installation

All air conditioning equipment, materials, and installation must comply with any applicable construction codes. Installation of the various components of the air conditioning system must also conform to the air conditioning equipment manufacturer's recommendations.

Air Conditioning Ducts

Use separate computer room air conditioning duct work. If it is not separate from the rest of the building, it might be difficult to control cooling and air pressure levels. Duct work seals are important for maintaining a balanced air conditioning system and high static air pressure. Adequate cooling capacity means little if the direction and rate of air flow cannot be controlled because of poor duct sealing. Also, the ducts should not be exposed to warm air, or humidity levels may increase.

Humidity Level

Maintain proper humidity levels at 40 to 60% RH. High humidity causes galvanic actions to occur between some dissimilar metals. This eventually causes a high resistance between connections, leading to equipment failures. High humidity can also have an adverse affect on some magnetic tapes and paper media.

CAUTION Low humidity contributes to undesirably high levels of electrostatic charges. This increases the electrostatic discharge (ESD) voltage potential. ESD can cause component damage during servicing operations. Paper feed problems on high-speed printers are usually encountered in low-humidity environments.

Low humidity levels are often the result of the facility heating system and occur during the cold season. Most heating systems cause air to have a low humidity level, unless the system has a built-in humidifier.

Dust and Pollution Control

Computer equipment can be adversely affected by dust and microscopic particles in the site environment.

Specifically, disk drives, tape drives, and some other mechanical devices can have bearing failures resulting from airborne abrasive particles. Dust may also blanket electronic components like printed circuit boards causing premature failure due to excess heat and/or humidity build up on the boards. Other failures to power

2.963
fls.

supplies and other electronic components can be caused by metallically conductive particles, including zinc whiskers. These metallic particles are conductive and can short circuit electronic components. Use every effort to ensure that the environment is as dust and particulate free as possible. See the following heading titled "Metallic Particulate Contamination" for additional details.

Smaller particles can pass though some filters and over a period of time, cause problems in mechanical parts. Small dust particles can be prevented from entering the computer room by maintaining the air conditioning system at a high static air pressure level.

Other sources of dust, metallic, conductive, abrasive, and/or microscopic particles can be present. Some sources of these particulates are:

- Subfloor shedding
- Raised floor shedding
- Ceiling tile shedding

These particulates are not always visible to the naked eye. A good check to determine their possible presence is to check the underside of the tiles. The tile should be shiny, galvanized, and free from rust.

The computer room should be kept clean. The following guidelines are recommended:

- Smoking—Establish a no-smoking policy. Cigarette smoke particles are eight times larger than the clearance between disk drive read/write heads and the disk surface.
- Printer—Locate printers and paper products in a separate room to eliminate paper particulate problems.
- Eating or drinking—Establish a no-eating or drinking policy. Spilled liquids can cause short circuits in equipment such as keyboards.
- Tile floors—Use a dust-absorbent cloth mop rather than a dry mop to clean tile floors.

Special precautions are necessary if the computer room is near a source of air pollution. Some air pollutants, especially hydrogen sulfide (H2S), are not only unpleasant but corrosive as well. Hydrogen sulfide damages wiring and delicate sound equipment. The use of activated charcoal filters reduces this form of air pollution.

Metallic Particulate Contamination

Metallic particulates can be especially harmful around electronic equipment. This type of contamination may enter the data center environment from a variety of sources, including but not limited to raised floor tiles, worn air conditioning parts, heating ducts, rotor brushes in vacuum cleaners or printer component wear. Because metallic particulates conduct electricity, they have an increased potential for creating short circuits in electronic equipment. This problem is exaggerated by the increasingly dense circuitry of electronic equipment.

Over time, very fine whiskers of pure metal can form on electroplated zinc, cadmium, or tin surfaces. If these whiskers are disturbed, they may break off and become airborne, possibly causing failures or operational interruptions. For over 50 years, the electronics industry has been aware of the relatively rare but possible threat posed by metallic particulate contamination. During recent years, a growing concern has developed in computer rooms where these conductive contaminants are formed on the bottom of some raised floor tiles.

Although this problem is relatively rare, it may be an issue within your computer room. Since metallic contamination can cause permanent or intermittent failures on your electronic equipment, Hewlett-Packard strongly recommends that your site be evaluated for metallic particulate contamination before installation of electronic equipment.

Electrostatic Discharge (ESD) Prevention

Static charges (voltage levels) occur when objects are separated or rubbed together. The voltage level of a static charge is determined by the following factors:

- Types of materials
- Relative humidity
- Rate of change or separation

Table C-1 Effect of Humidity on ESD Charge Levels

Personnel Activity[a]	Humidity[b] and Charge Levels (voltages)[c]			
	26%	32%	40%	50%
Person walking across a linoleum floor	**6,150 V**	**5,750 V**	**4,625 V**	**3,700 V**
Person walking across a carpeted floor	18,450 V	17,250 V	13,875 V	11,100 V
Person getting up from a plastic chair	24,600 V	23,000 V	18,500 V	14,800 V

a. Source: B.A. Unger, Electrostatic Discharge Failures of Semiconductor Devices (Bell Laboratories, 1981)
b. For the same relative humidity level, a high rate of airflow produces higher static charges than a low airflow rate.
c. Some data in this table has been extrapolated.

Static Protection Measures

Follow these precautions to minimize possible ESD-induced failures in the computer room:

- Maintain recommended humidity level and airflow rates in the computer room.
- Install conductive flooring (conductive adhesive must be used when laying tiles).
- Use conductive wax if waxed floors are necessary.
- Ensure that all equipment and flooring are properly grounded and are at the same ground potential.
- Use conductive tables and chairs.
- Use a grounded wrist strap (or other grounding method) when handling circuit boards.
- Store spare electronic modules in antistatic containers.

Acoustics

Computer equipment and air conditioning blowers cause computer rooms to be noisy. Ambient noise level in a computer room can be reduced as follows:

- Dropped ceiling—Cover with a commercial grade of fire-resistant, acoustic rated, fiberglass ceiling tile.
- Sound deadening—Cover the walls with curtains or other sound deadening material.
- Removable partitions—Use foam rubber models for most effectiveness.

2.961
fls

Facility Characteristics

This section contains information about facility characteristics that must be considered for the installation or operation of an hp server. Facility characteristics are:

- Floor loading
- Windows
- Altitude effects

Floor Loading

The computer room floor must be able to support the total weight of the installed hp server as well as the weight of the individual cabinets as they are moved into position.

Floor loading is usually not an issue in nonraised floor installations. The information presented in this section is directed toward raised floor installations.

NOTE An appropriate floor system consultant should verify any floor system under consideration for an hp server installation.

Raised Floor Loading

Raised floor loading is a function of the manufacturer's load specification and the positioning of the equipment relative to the raised floor grid. While Hewlett-Packard cannot assume responsibility for determining the suitability of a particular raised floor system, it does provide information and illustrations for the customer or local agencies to determine installation requirements.

The following guidelines are recommended:

- Because many raised floor systems do not have grid stringers between floor stands, the lateral support for the floor stands depends on adjacent panels being in place. To avoid compromising this type of floor system while gaining under floor access, remove only one floor panel at a time.
- Larger floor grids (bigger panels) are generally rated for lighter loads.

CAUTION Do not position or install any equipment cabinets on the raised floor system until you have carefully examined it to verify that it is adequate to support the appropriate installation.

Floor Loading Terms

Table C-2 Floor Loading Term Definitions

Term	Definition
Dead load	The weight of the raised panel floor system, including the understructure. Expressed in lb/ft2 (kg/m2).
Live load	The load that the floor system can safely support. Expressed in lb/ft2 (kg/m2).

RDS Nº 03/2005 - CN
CPMI - CORREIOS
0114
Fls:
Doc: 3701

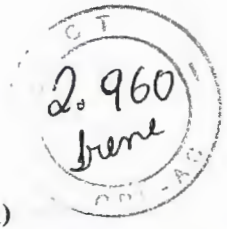

Table C-2 Floor Loading Term Definitions (Continued)

Term	Definition
Concentrated load	The load that a floor panel can support on a 1-in2 (6.45 cm2) area at the panel's weakest point (typically the center of the panel), without the surface of the panel deflecting more than a predetermined amount.
Ultimate load	The maximum load (per floor panel) that the floor system can support without failure. Failure expressed by floor panel(s) breaking or bending. Ultimate load is usually stated as load per floor panel.
Rolling load	The load a floor panel can support (without failure) when a wheel of specified diameter and width is rolled across the panel.
Average floor load	Computed by dividing total equipment weight by the area of its footprint. This value is expressed in lb/ft2 (kg/m2).

Average Floor Loading

The average floor load value is not appropriate for addressing raised floor ratings at the floor grid spacing level. However, it is useful for determining floor loading at the building level, such as the area of solid floor or span of raised floor tiles covered by the hp server footprint.

Typical Raised Floor Site

This section contains an example of a computer room raised floor system that is satisfactory for the installation of an hp server.

Based on specific information provided by Hewlett-Packard, Tate Access Floors has approved its Series 800 all-steel access floor with bolt-together stringers and 24 in. (61.0 cm) by 24 in. (61.0 cm) floor panels.

In the event that the flooring is being replaced or a new floor is being installed, Tate Access Floors recommends its Series 1250 all-steel access floor with bolt-together stringers and 24 in. (61.0 cm) by 24 in. (61.0 cm) floor panels be used to support the hp installation.

NOTE If the specific floor being evaluated or considered is other than a Tate Series 800 floor, the specific floor manufacturer must be contacted to evaluate the floor being used.

The following table lists specifications for the Tate Access Floors Series 800 raised floor system.

Table C-3 Typical Raised Floor Specifications

Item[a]	Rating
Dead load	7 lb/ft 2 (34.2 kg/m2)
Live load	313 lb/ft 2 (1528.3 kg/m2)
Concentrated load[b]	1250 lb (567 kg)

2.959 fls

Table C-3 Typical Raised Floor Specifications (Continued)

Item[a]	Rating
Ultimate load	4000 lb (1814 kg) per panel
Rolling load	400 lb (181 kg)
Average floor load	500 lb (227 kg)

a. From Table C-2 on page 203
b. With 0.08 in (0.2 cm) of span maximum deflection

Windows

Avoid housing computers in a room with windows. Sunlight entering a computer room may cause problems. Magnetic tape storage media is damaged if exposed to direct sunlight. Also, the heat generated by sunlight places an additional load on the cooling system.

Space Requirements

This section contains information about space requirements for an hp server. This data should be used as the basic guideline for space plan developments. Other factors, such as airflow, lighting, and equipment space requirements must also be considered.

Delivery Space Requirements

There should be enough clearance to move equipment safely from the receiving area to the computer room. Permanent obstructions, such as pillars or narrow doorways, can cause equipment damage.

Delivery plans should include the possible removal of walls or doors.

Operational Space Requirements

Other factors must be considered along with the basic equipment dimensions. Reduced airflow around equipment causes overheating, which can lead to equipment failure. Therefore, the location and orientation of air conditioning ducts, as well as airflow direction, are important. Obstructions to equipment intake or exhaust airflow must be eliminated.

The locations of lighting fixtures and utility outlets affect servicing operations. Plan equipment layout to take advantage of lighting and utility outlets. Do not forget to include clearance for opening and closing equipment doors.

Clearance around the cabinets must be provided for proper cooling airflow through the equipment.

If other equipment is located so that it exhausts heated air near the cooling air intakes of the hp server cabinets, larger space requirements are needed to keep ambient air intake to the hp server cabinets within the specified temperature and humidity ranges.

Space planning should also include the possible addition of equipment or other changes in space requirements. Equipment layout plans should also include provisions for the following:

- Channels or fixtures used for routing data cables and power cables
- Access to air conditioning ducts, filters, lighting, and electrical power hardware
- Power conditioning equipment
- Cabinets for cleaning materials
- Maintenance area and spare parts

Floor Plan Grid

A floor plan grid is used to plan the location of equipment in the computer room. In addition to its use for planning, the floor plan grid should also be used when planning the locations of the following items:

- Air conditioning vents
- Lighting fixtures
- Utility outlets
- Doors
- Access areas for power wiring, air conditioning filters and equipment cable routing.

2.957
fls

Typical Installation Schedule

The following schedule lists the sequence of events for a typical system installation:

- 60 days before installation
  - — Floor plan design completed and mailed to Hewlett-Packard (if required to be an HP task)
- 30 days before installation
  - — Primary power and air conditioning installation completed
  - — Telephone and data cables installed
  - — Fire protection equipment installed
  - — Major facility changes completed
  - — Special delivery requirements defined
  - — Site inspection survey completed
  - — Delivery survey completed
  - — A signed copy of the site inspection and delivery survey mailed to Hewlett-Packard
  - — Site inspection and predelivery coordination meeting arranged with a Hewlett-Packard representative to review the inspection checklist and arrange an installation schedule.
- 7 days before installation
  - — Final check made with an Hewlett-Packard site preparation specialist to resolve any last minute problems

NOTE Not all installations follow a schedule like the one noted above. Sometimes, an hp server is purchased through another vendor which can preclude a rigid schedule. Other conditions could also prevent following this schedule. For those situations, consider a milestone schedule.

- Site Preparation - schedule with the customer as soon as possible after the order is placed.
- Site Verification - schedule with the customer a minimum of one to two days before the hp server is scheduled to be installed.

Delivery Survey

The delivery survey forms list delivery or installation requirements. If any of the items on the list apply, enter the appropriate information in the areas provided on the form.

Special instructions or recommendations should be entered on the special instructions or recommendations form. The following list gives examples of special instructions or issues:

- Packaging restrictions at the facility, such as size and weight limitations
- Special delivery procedures
- Special equipment required for installation, such as tracking or hoists
- What time the facility is available for installation (after the equipment is unloaded)
- Special security requirements applicable to the facility, such as security clearance

hp rack-optimized rp5430 and rp5470 servers entry-level UNIX® servers

hp servers product brief

hp rack-optimized servers can help you be always on, always there, always connected

hp servers rp5430 and rp5470: smart, simple, stress-free

hp servers rp5430 and rp5470

In today's economy, whether you're managing your own IT infrastructure or hosting someone else's, you have to operate with a faster time-to-solution, within budgetary constraints, and with the highest standards for customer service and operational efficiency.

To create and run an infrastructure for an always-on business, you need a computing platform that will support the way you—and your customers—do business. The HP Servers rp5430 and rp5470 give your business the fastest—and most reliable—means of succeeding in this new business environment.

The HP Servers rp5430 and rp5470 deliver the proven performance, scalability, and high-availability capabilities of UNIX—without high maintenance requirements and costs. And they give you plenty of room to grow. You can start at a low-price entry point and scale up to the leading 4-way UNIX performance—in the same rack-optimized form factor, without penalty. And with its industry-leading solution partners, HP has developed business solutions surrounding these servers that are tested, easy to deploy, and easy to manage.

With HP Servers rp5430 and rp5470, owning and operating a UNIX server is smart, simple, and stress-free.

smart

HP Servers rp5430 and rp5470 offer leading entry-level server performance, dynamic scalability, and unmatched investment protection—all in a rack-optimized package—making them the smart choice for the most demanding applications.

leading performance—scalable functionality

- industry-leading OLTP performance
- massive bandwidth for I/O-intensive applications
- 7U-height and packed with CPUs, memory, and I/O, plus the ability to scale subsystems without compromise
- rack-optimized to make the best use of valuable data-center floorspace

unparalleled investment protection

- industry's only in-box upgrade from 2-way to 4-way UNIX computing
- built-in growth path to the HP Server rx5670, featuring Intel® Itanium® 2 processors

proven solutions for business-critical computing

2.945 Bruno

simple

hp makes IT easy

With HP Servers rp5430 and rp5470, HP offers a unique combination of solutions designed to help you get started quickly and manage your IT environment effectively.

hp-ux: robust, proven enterprise operating environment for mission-critical applications

- industry-leading performance, scalability, availability, manageability, and security
- pre-packaged, integrated, and production-ready operating environments
- industry-leading Windows® and Linux interoperability
- centralized software updates that are timely, simple, and efficient
- powerful alliances with industry-leading software vendors and systems integrators to deliver robust solutions from e-commerce to enterprise resource planning (ERP) and beyond

leading-edge management capabilities with hp-ux virtual partitions and hp-ux workload manager

- system resource optimization enabling multiple workloads to run simultaneously on the same server, each with their own instance of HP-UX
- improved security and server availabilty through complete software and operating system isolation
- HP-UX Virtual Partitions integrate with HP-UX Workload Manager for the most efficient resource distribution across partitions, in a single server
- base offering complementary with HP-UX 11i for your HP Server rp5470

integrated management capabilities

- HP Servicecontrol Manager and integrated HP Secure Web Console capability for full remote management, including centralized configuration of multiple servers

the right server for today's applications

ERP (supply-chain management)
High availability, leading-edge manageability, and scalable performance support demanding end-to-end enterprise applications.

broadband
The combination of leading performance, I/O throughput, and capacity and high availability with end-to-end solutions delivers more powerful, reliable broadband services.

Internet infrastructure
Highly scalable, reliable, and manageable Web server, caching server, load balancing, e-commerce server, firewalls, or mail server.

e-commerce
Leading performance and I/O bandwidth, in-box scalability, rack-optimized form factor (five per standard 2-meter rack), high availability, and Internet management features.

technical computing
Leading performance and throughput, N+1 redundant components, extensive memory capabilities, and clustering solutions to meet the demands of computation, NFS file serving and product data management, and Web hosting.

flexible financing

- operating leases with a variety of attractive terms
- the Tech Refresh program for cost-effective upgrades to stay on the leading edge of new technology
- bundled Solution Finance program to consolidate and simplify financing arrangements

instant capacity on demand for your hp server rp5470

iCOD

- instant activation of incremental CPU power when you need it
- pay only for the processing power you use

temporary capacity for iCOD

- temporary activation of incremental CPU power for a limited period
- ideal for short-term, predictable processing demands

stress-free

make your business your focus

The HP Servers rp5430 and rp5470 handle the demands of users efficiently and reliably—so you can concentrate on running your business, not managing your IT resources.

high availability for continuous operations

- a rich set of in-box high-availability features
- affordable high-availability clustering solutions based on industry-leading HP MC/Serviceguard
- self-healing capabilities, a first for entry-level servers—proactively avoid faults to improve uptime
- a critical building block for your always-on e-business needs

total solution support

- options ranging from Web-based services to the industry's only 6-hour call-to-repair commitment
- "one-stop" solution support delivered with partners such as Cisco, Oracle®, SAP, i2, Inktomi, and many more

best UNIX server family—top to bottom

The low-cost entry point to the two-way HP Server rp5430 through the more scalable HP Server rp5470 are part of the powerful HP UNIX server line—servers that set the standards for business-critical computing and total cost of ownership. Simple in-chassis upgrades let you move up the line as your business grows. HP UNIX servers provide the hardware foundation for an Internet infrastructure that is always on. Combining leading technology with proactive and reactive services, HP offers complete, end-to-end solutions that include hardware, software, applications, services, support, consulting, and an extensive portfolio of experienced partners, so you can get to market quickly with a single source of expertise. The HP UNIX server family is robust from the top to bottom—from the high-end HP Superdome; through the HP Servers rp8400 and rp7410, the midrange performance and price/performance leaders; and to the scalable entry-level HP Servers rp5430 and rp5470. Rounding out the family are the hyper-dense HP rp2400 series servers for Internet applications and branch offices.

hp servers rp5430 and rp5470 features and benefits at-a-glance

features	benefits
smart	
1–4 (rp5470) or 1–2 (rp5430) 875MHz PA-8700+ CPUs with 2.25 MB on-chip cache per CPU or 750MHz PA-8700 CPUs with 2.25 MB on-chip cache per CPU	Superior performance over comparable systems, with plenty of headroom for growth
Up to 16 GB (rp5470) or up to 8 GB (rp5430) SDRAM memory with advanced ECC protection	Fast and reliable processing power for frequently accessed data
Up to 10 (rp5470) or 6 (rp5430) PCI I/O slots with 3.2 GB/s (rp5470) or 2.3 GB/s (rp5430) I/O bandwidth	Easily handles I/O-intensive applications and allows the system to scale I/O, CPUs, and memory without compromise
Core I/O, including 10/100Base-T LAN with auto speed-sensing, o second 10/100Base-T support LAN, Ultra2 LVD SCSI, and RS-232	Provides easy, ready-to-go networking capabilities
Up to 4 internal 36 GB, 73 GB, or 146 GB Ultra320 SCSI hot-plug high-uptime disks	Store critical data with massive internal capacity
1 internal DVD or DAT drive	Protects critical dato
7U chassis with up to 5 servers per standard 2-meter rack; also available in standalone (pedestal) configuration	Optimizes use of floor space and delivers high-performance density in a racked configuration
Easy in-box upgrades from the rp5430 to the rp5470	Architectural scalability ensures these servers can grow with the business, maximizing flexibility and investment protection
Support of Intel Itanium Processor Family as well as PA-RISC processors	Provides investment protection through dual growth paths
simple	
Built-in unlimited user license for proven 64-bit HP-UX 11i and 11.0	Proven, enterprise UNIX operating system for mission-critical applications
HP Virtual Partitioning for the rp5470	Maximizes usage of computing resources
Integrated HP Secure Web Console and Servicecontrol Manager for full local, Web, and remote control of servers	Provide complete single-system and multisystem administration capabilities, including a range of security features, from any browser-based PC
Flexible financing programs	Make initial ownership and modular growth easy and affordable
Instant capacity on demand (iCOD); temporary capacity for iCOD	Immediate access to CPU power when you need it, either permanently or temporarily
HP global deployment and partner integration services	Offer guaranteed error-free solution deployment to reduce implementation time and cost
HP On-site Solution consolidated manufacturing, streamlined product assembly and testing, and state-of-the-art integration	Ensure superior quality and faster delivery
stress-free	
Error-correcting cache, parity checking on all buses, memory scrubbing and [illegible] de-allocation, dynamic processor resilience, and de-allocation of [illegible]cation processes Dual Ultra 2 SCSI buses and controllers for mirrored storage Hot-swap, redundant power supplies and fans; redundant, hot-plug PCI; Ultra2 SCSI hot-plug disks	Built-in high-availability features deliver superior levels of • error correction, • error containment, • data protection, and • serviceability to help maximize uptime for business-critical workgroups and applications
Integrated Event Monitoring Service (EMS) Built-in fault management system with separate support processor and bus Integrated with HP MC/Serviceguard, HP Toptools for Servers, and enterprise management software such as HP OpenView and CA Unicenter	Provides superior system uptime through constant, proactive fault avoidonce, detection, and notification; monitors power, cooling system hardware, processors, memory, HP-UX resources, and external storage
Pre-tested and pre-integrated workgroup clustering solutions based on HP MC/Serviceguard	Deliver complete, ready-to-go solutions for clustered high availability that eliminate all single points of failure, ot an affordable price
3-yeor on-site service warranty and HP services and support options ranging from Web-based support to mission-critical, 6-hour Call-to-Repair commitment; includes full solution support for hardware and software	Reduce risk through worldwide support for business-critical computing; provide "one-stop shopping" for support through partnerships with Cisco, Oracle, SAP, BroadVision, Inktomi, and others

hp services | SAN environment support | data sheet

storage area network environment support

overview

To meet the needs of IT managers and storage area network (SAN) administrators in maintaining critical SAN environments, HP offers HP SAN Environment Support. Designed to maximize SAN uptime and stability, and minimize interoperability issues, HP SAN Environment Support provides you with a single source for reactive and proactive support for your HP SAN environment and multivendor SAN infrastructure.

With HP SAN Environment Support, you are assigned a SAN-peaked account support engineer (ASE) who proactively works with you to maximize SAN availability and stability. The standard duties of your SAN ASE include regular SAN availability reviews, SAN topology mapping and maintenance, firmware upgrade planning and implementation, plus change management planning and assistance. In addition to these standard activities, your ASE can help you in other ways, including assistance in ongoing use of SAN management software, SAN upgrade planning, direct-connect-to-SAN conversion assistance, and SAN-based back-up planning.

HP SAN Environment Support also provides a single point of contact for reactive HP SAN environment and multivendor SAN infrastructure support. This feature, delivered by HP SAN support experts, eliminates the need for your IT staff to make multiple calls to multiple vendors to resolve interoperability problems. Efficient problem resolution and elimination of finger pointing is facilitated by HP's alliance with Brocade Communications Systems, Inc. Additionally, to accelerate the troubleshooting process, HP has also developed a suite of SAN diagnostic tools.

HP SAN Environment Support provides you with global resources and expertise to supplement your own internal IT staff, enabling them to focus on core business issues.

benefits to you

- Increase business productivity through increased SAN availability.
- Prevent problems from occurring, through regular reviews with an HP SAN expert.
- Reduce the risks and improve the effectiveness of changes by proactively managing changes in your SAN environment.
- Improve SAN stability with firmware upgrade planning and implementation from an HP SAN expert.
- Call on a single source for quick and accurate reactive resolution of complex multi-vendor SAN interoperability problems, with minimum disruption to your users and IT managers.
- Increase the effectiveness of IT staff, so they have more time to focus on core business issues.
- Alleviate the difficulty of recruiting, training, and retaining SAN experts.

table 1. service feature highlights

support team	proactive features	reactive features
• Assigned SAN-peaked ASE • HP Response Center SAN support experts	Prevention of problems and proactively managing changes are preferable to even the fastest crisis response. HP SAN Environment Support offers a comprehensive suite of standard and selectable proactive account services delivered by a SAN-peaked ASE. Standard services include: • Initial SAN assessment • SAN support plan • Maintenance of SAN documentation • Firmware upgrade planning and implementation • Change management planning and assistance • Ongoing participotion in management and administration of the SAN • Mid-year SAN review • Year-end briefing selectable services include: • Assistance in ongoing use of SAN management software • SAN upgrade planning assistance • Direct-connect-to-SAN conversion assistance • SAN-based back-up planning • Additional change management planning and assistance	HP provides you with a single source for HP SAN environment and multivendor SAN infrastructure support, including: • Phone-in assistance from a SAN support expert • SAN troubleshoating and fault isolation • One-stop problem management • SAN fabric OS support • HP SAN diagnostic tools • Support alliance with Brocade Communications Systems, Inc. • Escalation management • Flexible call submittal coverage • Optional 24x365 call submittal

support program specifications

table 2. support team

feature	delivery specification
ASE	Your ASE is your SAN support manager and technical expert. Your ASE serves as a trusted advisor. Working closely with your technical staff and IT management, your ASE provides guidance to help maintain your SAN environment by identifying and delivering the services that best suit your business needs. To help meet your business objectives, your ASE works with you to develop and routinely review a mutually agreed upon SAN support plan. As standard services, your ASE also maintains your SAN topology map, conducts SAN reviews, assists with firmware upgrade planning and implementation for SAN components, provides change management planning and assistance, transfers knowledge of best practices, and also participates in your internal meetings when required.
HP Response Center SAN experts	Our team of industry-leading SAN support experts is available to provide troubleshoating, fault isolation, and problem resolution for multivendor SAN infrastructures.

Fls:
Doc: 3701

table 3. proactive features

feature or service	specifications
standard services	The foundation of HP SAN Environment Support is a suite of services that HP provides to address your high availability SAN needs.
Initial SAN assessment	During the initial assessment, your ASE fully documents your SAN, including SAN topology: firmware levels of hosts, fibre channel switches, and other fibre channel devices; patch levels of hosts; and versions of SAN management software. Based on this information, your ASE assesses the supportability of your SAN. Your ASE identifies any weaknesses within your SAN that could affect availability or supportability and makes recommendations for change. The recommendations and SAN documentation are provided to you in the SAN support plan. If your SAN has recently been implemented using HP's SAN Implementation Service, this activity may not be required. If this is the case, your ASE will advise you regarding additional activities that can be performed in lieu of this service.
SAN support plan	The SAN support plan documents your SAN topology and configurations and the logistics of how support will be delivered to you, and sets clear expectations for the support relationship. Your ASE meets with you to develop your SAN support plan. In the case of an HP mission critical computing or storage environment, your ASE can integrate the SAN support plan into your existing account support plan.
Ongoing maintenance of SAN documentation	Your ASE works with you to maintain an up-to-date snapshot of your SAN. This vital activity supports fault isolation, daily operation, and planning for future growth.
ware upgrade planning and implementation	Your ASE works with you to develop an implementation plan for firmware upgrades on your SAN switches. He or she will identify considerations, pitfalls and recommendations related to your unique SAN environment. For HP and non-HP fibre channel switches covered by an HP support contract, an HP customer engineer (CE) installs the firmware upgrades as agreed to in the implementation plan.
Change management planning and assistance	Your ASE helps minimize risks and possible disruptions when implementing changes to your SAN. Utilizing industry best practices, your ASE helps you avoid the pitfalls that are often associated with changes to your SAN environment.
Ongoing participation in management and administration of the SAN	Your assigned ASE participates and assists in SAN activities, both technical and operational, as you require. Your ASE serves as a trusted advisor for issues that may arise with your SAN.
Mid-year review	Your ASE conducts a mid-year review. Your ASE reviews the status of your SAN for stability, performance, and supportability, including any open issues. The ASE makes any recommendations necessary to ensure that problems do not recur. The work done to date by HP is also reviewed. Your plans for SAN upgrades are addressed, as well as your needs for any additional selectable SAN services.
Annual review	HP provides you with an annual review, based on a report that summarizes the availability of your SAN during the support year and itemizes the technical services and account management activities you received.
Selectable services and activities	In addition to providing standard services, HP SAN Environment Support also offers a range of additional SAN services. These services are designed to improve the ongoing management and availability of your SAN. The duration of each service will vary with the complexity of your SAN and your individual needs. Your ASE can advise on the service deliverables and duration. You are entitled to at least one selectable service. Your ASE may be able to provide more selectable services, depending on the amount of time each service requires. The selectable services include: • Assistance in ongoing use of SAN management software • SAN upgrade planning assistance • Direct-connect-to-SAN conversion assistance • SAN-based back-up planning • Additional change management planning and assistance

Doc: 3701

table 4. reactive support

feature	delivery specifications
Phone-in assistance from a SAN support expert	This feature provides unlimited, toll-free (where available) phone access for authorized callers to the HP Response Center. When your call is received at HP, on HP SAN support engineer quickly responds to gather information about the problem and begins work. With your authorization, the engineer remotely accesses your SAN to run diagnostics. Assistance is available Monday through Friday, excluding HP holidays, during standard HP Response Center hours. Optional coverage is also available 24 hours per day, 365 days per year.
SAN troubleshooting and fault isolation	HP will troubleshoot and fault isolate your HP SAN environment and multivendor SAN infrastructure. (SAN infrastructure is defined to include switches, hubs, bridges, and fibre channel host bus adapters [hbas]). If you have nan-HP hosts or storage devices within your SAN not covered by HP maintenance contracts, troubleshooting and fault isalatian an these products is limited to the identification of interoperability issues related to the host operating system or storage device firmware versions. SANs are camprised of complex combinations of switches, storage devices, hbas, hast operating systems and the variaus settings, device drivers, and firmware acrass these components. Drowing fram its extensive knowledge and experience in these complex environments, HP can effectively troubleshoot problems and moke recommendations regarding which settings or versians yield favorable results. HP SAN support engineers provide netwark troubleshooting and identification of the specific saurce of connectivity problems within the specified SAN infrastructure. Sources of SAN faults are isalated to specific hardware products and network cabling. Traubleshooting covers the following issues: • Identification of connectivity problems related to incorrectly configured fibre channel switches. • Identificatian of cannectivity problems caused by interoperability issues between the fibre channel switch, hba or storage device firmware, host operating systems revisions, or hba drivers. • Identificatian af physical connectivity prablems between two network devices, such as physical infrastructure problems related to cables and hbas. • Identification of problems related to faulty SAN devices, network bandwidth excess utilization, or existing faulty SAN design. For simple design-related performance problems, your ASE can assist as part of the ongoing participation in the management and administration of your SAN.
One-stop problem management	HP acts as a single point of contact to manage problems identified through the fault isolation process. Focusing on your complete HP SAN environment and multivendar SAN infrastructure, HP will take the following actions: • HP will advise on changes needed to remedy interoperability problems between switch, hba or storage device firmware, or host operating system and hba drivers. For HP and non-HP products that are covered under HP's software and hardware maintenance support agreements, HP will implement the necessary changes needed to resolve an interoperability problem. • For SAN infrastructure devices not covered by HP support agreements, HP can act as an agent to deal, on your behalf, with your non-HP SAN product vendars. As your appointed agent under an Agency Agreement, HP will contact the vendor to initiate the necessary action and fallow up with the vendor until the problem is resolved. • For SAN infrastructure products not covered by HP hardware or software support agreements or an Agency Agreement with HP, the HP SAN support engineer will provide you with detailed information on the identified problem device(s) to help you work with your vendor. • If a change is recommended to the firmware version on a storage device or the operating system on a host not covered by HP support agreements, HP will provide you with detailed information to help you work with your vendor.
SAN fabric operating system support	As part of the HP SAN Environment Support troubleshooting process, HP may recommend which version of SAN fabric operating system will yield the most favorable operating results. For fibre channel switches covered by an HP support contract, HP will be able to supply the necessary firmware operating system upgrade. As part of the initial SAN assessment and change management service, HP will also advise you on which versions of host operating systems, device drivers, and storage device firmware will work best with your version of SAN fabric operating system.

HP SAN diagnostic tools	HP's SAN diagnostic tools speed up the troubleshooting process ond improve resolution time by: • Collecting host, hba, operating system, switch, and array configuration information. • Providing a Web-based SAN topology navigator, which enables the support engineer to hierarchically create the complete support environment, including diagramming the physical connection between SAN devices. • Diagramming the physical connection between SAN devices.
Support alliances with Brocade Communications Systems, Inc.	Through the coordinated efforts of HP and Brocade Communications Systems, Inc., support experts, you receive timely, efficient and effective problem resolution. HP is a Premiere Qualified Support Partner for Brocade Communications Systems, Inc. Our SAN experts benefit from each company's extensive SAN interoperability test data, expertise, and resources. HP's service and support alliance with Brocade provides you with the following: • HP engineers with the highest level of training and technical backup support available for Brocade products and SAN fabric OS. • Investments in support laboratory facilities to simulate SAN problems for Brocade SAN devices. • Access to Brocade engineering teams for fast-track backup support and problem resolution, as well as access to Brocade's support databases.
Escalation management	HP has established formal escalation procedures to solve complex SAN problems. Local HP management coordinates problem escalation, rapidly enlisting the skills of key problem-solving experts throughout HP, as well as third-party product vendors for which HP is an Authorized Service Provider. At HP's discretion, the HP Response Center may dispotch an HP engineer to your site to assist with problem resolution. In most cases, resources arrive within one working day, if your site is within 100 miles (160 km) of the nearest primary HP Support Responsible Office.
Flexible electronic call submittal	Authorized callers can submit calls electronically to the HP Response Center, via the HP Electronic Support Center, and request a call back within two hours (or the next business day if after standard hours) or a written electronic response by the next business day.

table 5. related services

feature	delivery specifications
24x365 coverage option	This option provides additional coverage hours for remote assistance for SAN problems. Unlimited, toll-free access to the HP Response Center is available to authorized callers. Assistance is available 24 hours per day, 365 days per year, including weekends and holidays, for all eligible HP products and selected non-HP SAN devices.

additional program features

your responsibilities

As part of HP SAN Environment Support, you must assign a Customer SAN Support Manager. This person works in partnership with the assigned HP ASE to coordinate support activities, prioritize utilization of HP SAN Environment Support, and monitor corresponding responsibilities. In order to speed up the troubleshooting process it is strongly recommended that you provide dial-up access into the SAN to HP engineers.

In order to minimize the risks associated with making changes to the SAN, you must communicate to the HP support team all pending hardware, software, or network changes.

You must designate two people to serve as your authorized callers to HP's Response Centers regarding SAN issues.

coverage boundaries

Your SAN must be operational before SAN Environment Support commences.

For storage devices and hosts within your SAN environment that are not covered by an HP hardware or software support contract, fault isolation and troubleshooting is limited to the identification of interoperability issues related to the host operating system or storage device firmware versions.

For SAN components not covered by an HP hardware or software support agreement, one-stop problem management is only offered on the SAN infrastructure, defined to include switches, hubs, bridges, and fibre channel hbas.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0132
Doc: 3701

This service:

- Is not available for SANs containing non-HP director class fibre channel switches.
- Is offered only for fibre channel-based SANs; it currently does not cover iSCSI SANs
- Is not available for SANs that use switches with copper GBICS
- Is applicable to SANs with up to 256 switch ports and three (3) operating systems.
- Coverage for more complex SANs can be arranged with a custom quotation.

To verify the supportability of your SAN, your ASE will use both HP and Brocade interoperability tests and certification results and configuration matrices. If you wish to employ a component not tested or certified by HP or Brocade, HP may support this component on a "best effort" basis. This will apply only if the given unit was functioning normally when HP mapped the environment and commenced SAN Environment Support. In this case, HP's response will be limited to the following activities, if a previously functioning unit exhibits a condition interfering with the normal operation of the SAN and the customer's business operation:

- Assist and coordinate activities with applicable third party vendors
- Verify fabric connectivity using device-independent commands and feature sets resident in the switches or fabric
- Verify host connectivity using standard OS commands on supported operating systems

While these activities may resolve the problem, HP will not retain accountability for restoring unsupported devices, appliances, or adapters to normal function, nor is HP accountable to resolve issues with unsupported items resulting from a SAN or infrastructure upgrade.

coverage hours

HP SAN Environment Support provides coverage during standard business hours. See Table 5 for more information on 24x365 support availability.

Proactive services are performed during standard business hours.

ordering information

HP SAN Environment Support provides coverage for your SAN environment—not just the devices. The price of the service is determined by the size and complexity of your storage network environment.

HP SAN Environment Support is available for SANs with up to 256 switch ports and three (3) operating systems. Coverage for more complex SANs can be arranged with a custom quotation.

HP SAN Environment Support is usually purchased for a 12-month period, billable in advance, on an annual, quarterly, or monthly basis.

When HP SAN Environment Support is purchased in conjunction with HP hardware and software support services, the coverage hours for HP SAN Environment Support must be equal to or greater than the hardware and software support coverage hours.

Some service features are subject to local availability. Service features may vary according to local resources. To obtain more information or to order HP SAN Environment Support, contact your local HP sales representative.

hp OpenView storage area manager features

HP OpenView Storage Area Manager provides comprehensive, centralized management across distributed, heterogeneous storage networks. The Storage Area Manager product suite includes the following applications: Storage Node Manager, Storage Accountant, Storage Allocater, Storage Builder, and Storage Optimizer.

Among other features, Storage Area Manager provides the following regardless of which application(s) you install and license.

- *Device discovery and mapping.* Storage Area Manager automatically discovers hosts, interconnect devices, bridges, and storage devices in direct attached (Fibre Channel or SCSI) and networked storage (SAN and NAS) environments. Discovered devices are placed in the Resources tree and a device map. Storage Area Manager illustrates the relationship of these devices by displaying their links within each device map.

  If the storage network is using interconnect hardware to support fabric zoning, Storage Area Manager identifies the pre-configured zones and lists them under the Storage Networks node in the Resources tree. Storage Area Manager also creates a corresponding device map of each zone.

- *Event management.* Based on its status inquiries of the storage network and its own processes, Storage Area Manager generates and displays events in the event panel. Framework and discovery-related events are displayed regardless of which applications are installed and licensed. Device status, LUN security, performance, capacity, and billing related events only appear if the applicable application is installed and licensed.

  Storage Area Manager is able to receive SNMP traps from devices that support trap forwarding. You can also configure event triggers to perform certain actions based on event criteria. For example you can configure an event trigger to send e-mail notification to your on-call administrator for all events of a specified severity level.

ECT
2.923
June

Storage Area Manager also provides several features to manage the events that appear in the event panel. You can configure filters so only events that meet the filter's criteria are displayed in the event panel. You can also export all or selected events to a .txt, .csv, or .xml file. Finally, you can configure Storage Area Manager to automatically delete events based on a maximum number or on criteria such as event age, severity level, and category.

- *Manager of Managers.* The Manager of Managers (MoM) enables you to monitor up to 50 storage domains from one console. You can configure MoM to retrieve and display status and event information from each Storage Area Manager management server in your environment. This feature allows Storage Area Manager to easily scale in large, complex storage environments.
- *User authentication and authorization.* When starting Storage Area Manager, a user must login with their unique user name and password. Storage Area Manager user accounts can be configured with different levels of privilege. User accounts with Administrator privilege are able to save changes to the Storage Area Manager database and may perform all Storage Area Manager tasks. User accounts with Guest privilege are only able to view information provided by Storage Area Manager and are not able to save changes. User account privileges apply to tasks conducted both through the user interface and command line user interface.
- *Command Line User Interface (CLUI).* Storage Area Manager provides an extensive CLUI. Nearly all tasks that can be performed in the user interface can also be performed from the CLUI.

Doc 3701

2.922

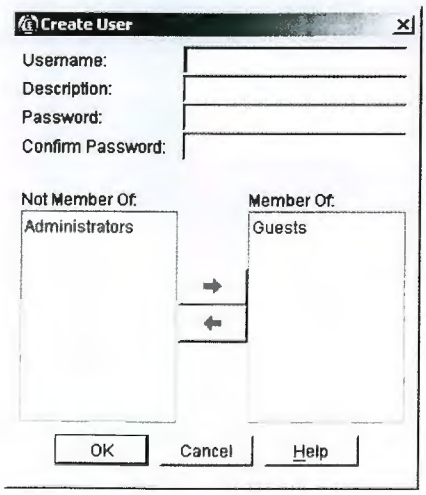
Managing hp OpenView storage area manager users

Storage Area Manager's authentication and authorization feature enables you to create users specific to Storage Area Manager. Each user is assigned to a user group, which determines the tasks that the user can perform within Storage Area Manager.

Members of the Administrators group can perform all tasks including making changes that are saved in the database. Members of the Guests group may view all information presented within Storage Area Manager, but they cannot make changes that are saved to the database.

Adding a user

1. From the **Tools** menu, select **Configure Security**. The Administer Users window appears.
2. Click the **New User** button. The Create User window appears.



3. Enter a user name for this user in the Username box.

E C T
Q. 921
Jure
C.P.I. - C.

4. Enter a description for this user in the Description box. This is an optional field and may not exceed 512 characters.
5. Enter a password for this user in the Password box.
6. Re-enter the password in the Confirm Password box. The Username and Password fields are case-sensitive.
7. Verify that the user group to which this user will be assigned appears in the Member Of box.

   To move a user group to the Member Of box, select it in the Not Member Of box, and click the right arrow button.
8. Click the **OK** button to save changes and close the window.
9. Verify that the user you created appears in the Administer Users window, and click the **Close** button to close the window.

Managing device discovery

Discovery is the process in which Storage Area Manager searches the storage network for devices it supports and then adds them to the database and user interface. When discovered, devices are placed under the appropriate node in the Resources tree and added to the appropriate device map.

Discovery is an ongoing process; however, you must initiate the process after installing Storage Area Manager. Completing the Setup Assistant initiates the discovery process.

Starting device discovery

Storage Area Manager provides two methods for starting device discovery. You can start a comprehensive discovery cycle in which Storage Area Manager attempts contact with each device, or you can start the ongoing discovery process in which Storage Area Manager continuously probes the storage network for changes to the device information stored in its database.

Starting a full discovery cycle

1. From the **Tools** menu, select **Start Comprehensive Discovery**. A confirmation window appears.
2. Click the **OK** button.

Starting the ongoing discovery process

1. From the **Tools** menu, select **Configure**.
2. In the Configuration window's navigation tree, select **Discovery**.
3. Select the **Yes, run discovery** radio button.
4. Click the **OK** button to save changes and close the window.

2. 919
Irene

Stopping device discovery

Device discovery is an ongoing process, however, you can instruct Storage Area Manager to stop the discovery process.

1. From the **Tools** menu, select **Configure**.
2. In the Configuration window's navigation tree, select **Discovery**.
3. Select the **No, do not run discovery** radio button.
4. Click the **OK** button to save changes and close the window.

Setting the device discovery interval

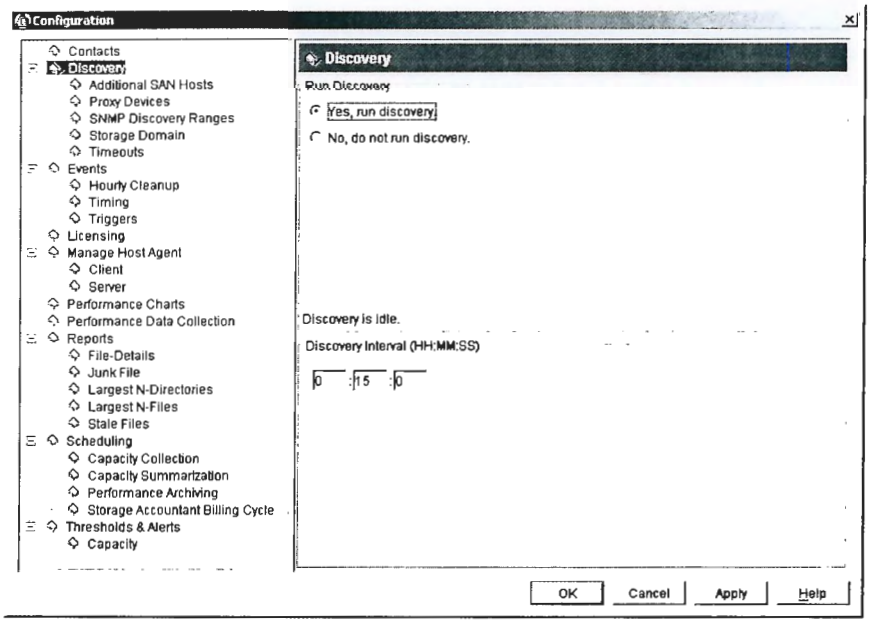
Storage Area Manager contacts each SAN host at a regular interval to obtain any new device discovery information. The default interval is 15 minutes.

Note Setting the discovery interval too low may result in higher levels of network traffic and CPU usage as well as event processing difficulty within Storage Area Manager. Hewlett-Packard recommends setting the interval no lower than the default setting of 15 minutes.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0143
Fls: 7
Doc: 3701

2.918 June

1. From the **Tools** menu, select **Configure**.
2. In the Configuration window's navigation tree, select **Discovery**.



3. Modify the hours, minutes, and seconds fields to the settings you prefer.
4. Click the **OK** button to save changes and close the window.

ECT
2.917
Brent

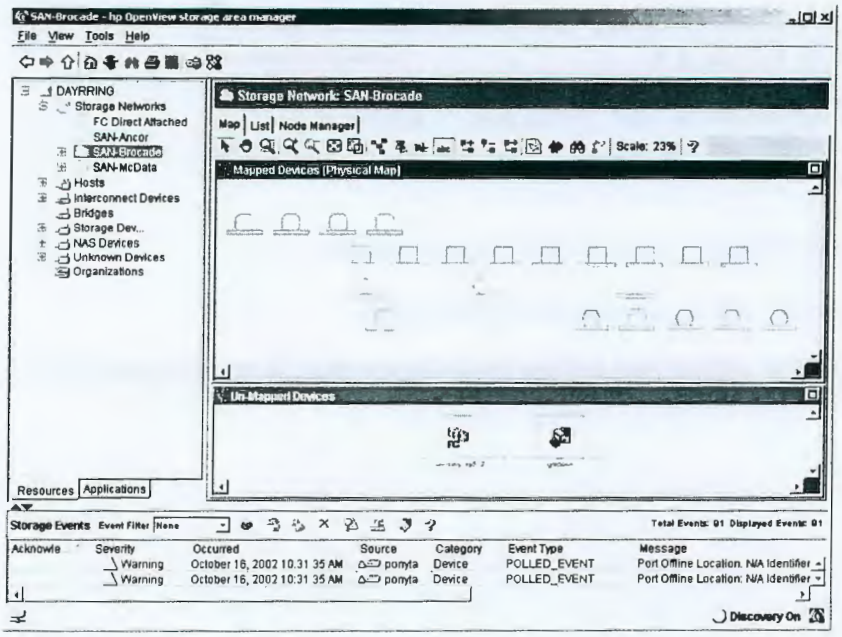
Managing and using device maps

As Storage Area Manager discovers your storage network, it places devices in device maps using default layouts. Storage Area Manager offers many features that allow you to work with the map to customize it to your preferences.

Setting the device map mode

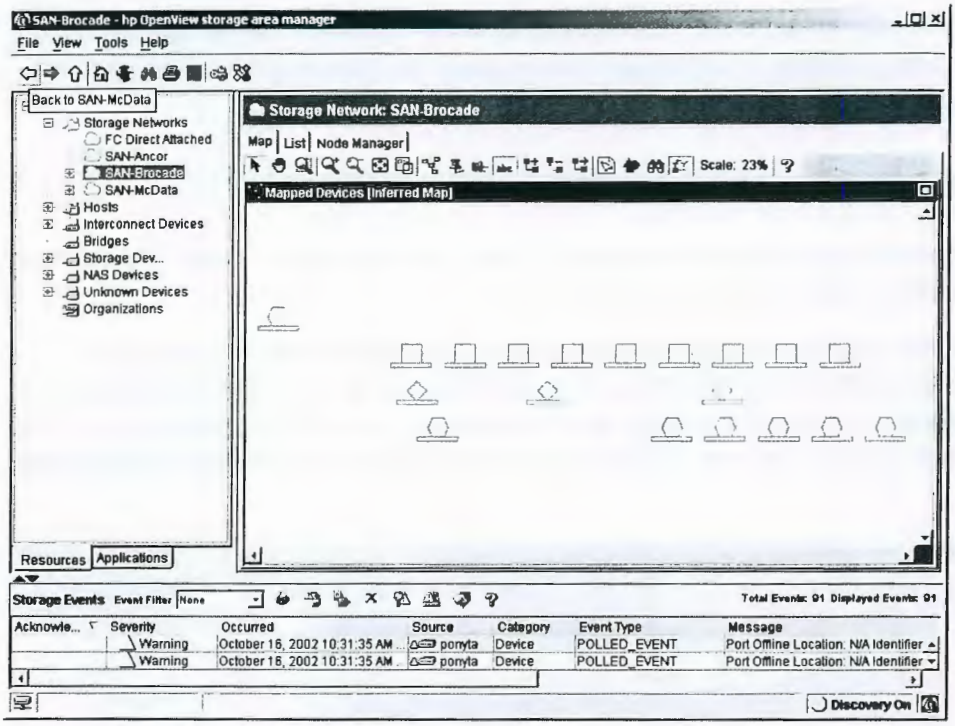
Storage Area Manager provides two device map modes: physical and inferred. The current mode is displayed in a banner at the top of the map.

Devices that appear on physical maps provide enough information that Storage Area Manager is able to establish their identify and connectivity properties. Devices that do not provide sufficient information for Storage Area Map to map them with certainty appear in a node bank at the bottom of the map. Physical maps display physical and user-defined links only.



RQS Nº 03/2005 - CN
CPMI - CORREIOS
0144
Fls: 9
3701
Doc:

Inferred maps display physical and logical devices and all device links together in the same map. Storage Area Manager estimates the connectivity of logical devices by applying its own map rules to the limited information provided by the devices.



You can toggle the currently displayed map between the two modes.

1. Display the device map on which you want to set map mode.
2. Click the **Map Mode** button on the map toolbar to toggle the map between physical and inferred mode.

2.915

Using the layout manager

As Storage Area Manager discovers your storage network, it places devices in device maps. While placing devices in the map, Storage Area Manager also links them using information offered by the devices.

Storage Area Manager uses a default layout when positioning and linking devices; however, the Layout Manager offers additional pre-configured layouts for your device maps:

- **Spring Embedder:** select to position devices in a manner which minimizes link crossings.
- **Uniform Length Edges:** select to position devices so links are of equal length.
- **Radial Tree:** select to position devices in a tree. Branches are determined by device links.
- **Circular:** select to position devices in a circle.
- **Hierarchical:** select to position device types (host, interconnect, and storage) together and in a hierarchy (top-to-bottom, left-to-right, etc.).

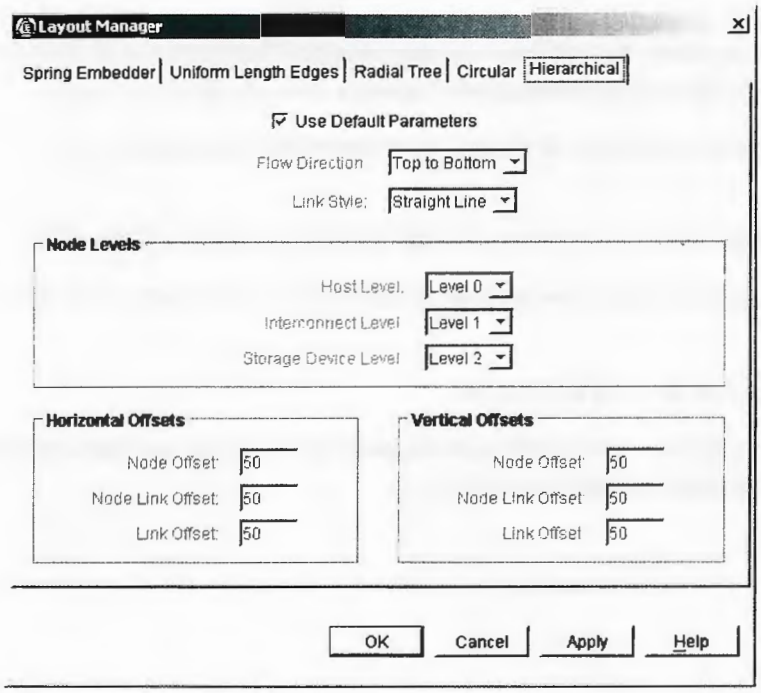
2.914 June

1. Display the map for which you want to change the layout.
2. Click the **Layout Manager** button on the map toolbar. The Layout Manager window appears.



3. Click the appropriate tab for the layout you want.
4. Click the **Apply** button to modify the map.
5. If the map layout is acceptable, click the **OK** button to close the Layout Manager window.

2.913
fune
A.G.

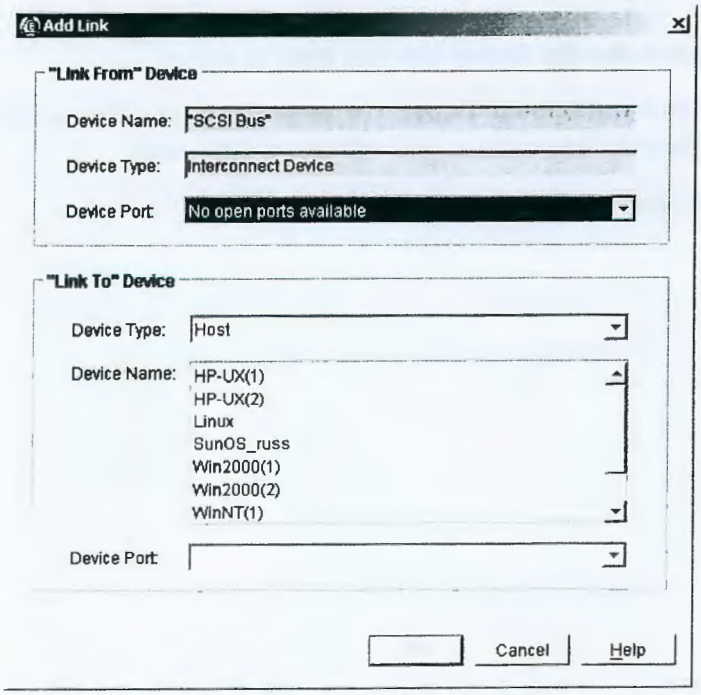
Configuring device links

Upon discovery of the storage network, Storage Area Manager displays the devices it discovers and connects them with either physical or logical links. Device maps include two modes: physical and inferred. Physical map mode displays physical and user-defined links only. Inferred map mode displays all link types.

You can add, move, and remove the links provided by Storage Area Manager.

Adding device links

1. Display the device map which includes the device from which you want to draw the link.
2. Select the icon for the device you want to link to another device.
3. Click the Add Link button on the map toolbar. The Add Link window appears.



4. In the Links From Device section, select the device port from which the link is drawn.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0146
Doc: 3701

2.912
bene

5. In the Links To Device section, select the type of device (host, interconnect, bridge, storage, or unknown) to which you are connecting.
6. Select the device to which the link is connecting.
7. Select the device port to which the link is drawn.
8. Click the **OK** button. A confirmation message appears.
9. Click the **Yes** button to add the device link.

Moving device links

You can only move logical and user-defined links. You cannot move physical links. If you move a logical link, Storage Area Manager redefines it as a user-defined link. However, if the condition that caused the logical link remains, Storage Area Manager returns the logical link as part of the ongoing discovery process.

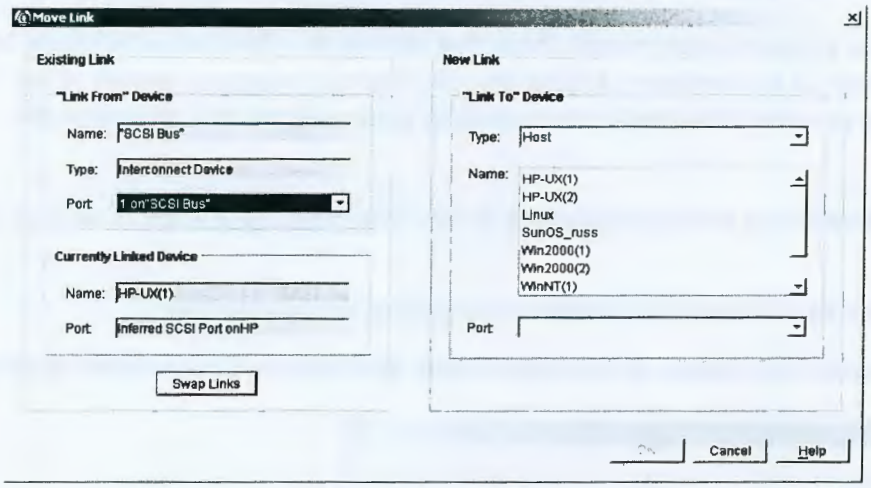
1. Display the device map that includes the device link you want to move.

   When moving links, one "end" of the link will remain the same while the other end is moved. For the next step, select the device icon that will remain the same.

2. Select the device icon that is connected to the link you want to move.

2.911
fls.

3. Click the Move Link button on the map toolbar. The Move Link window appears.



Note You can click the **Swap Links** button to change the "end" of the link that will move. The devices displayed in the Link From Device and Currently Linked boxes will interchange.

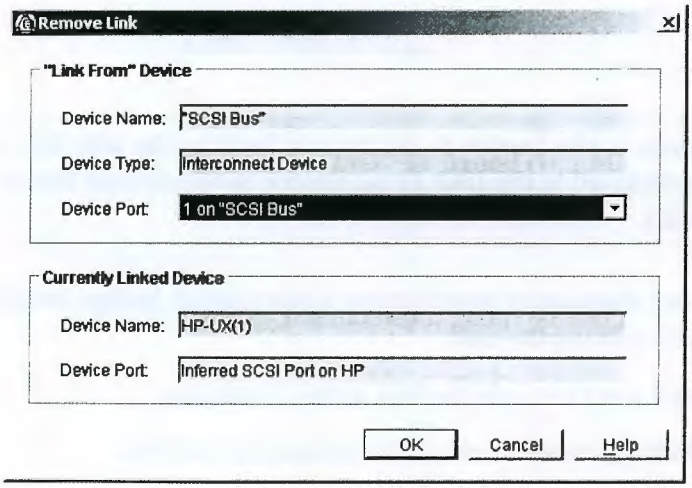
4. In the New Link section, select the type of device (host, interconnect, bridge, storage, or unknown) to which you are moving the link.
5. Select the device to which you want to move the link in the Name box.
6. Select the device port to which you want to move the link in the Port box.
7. Click the **OK** button. A confirmation message appears.
8. Review the information in the message, and click the **Yes** button.

EQS Nº 03/2005 - CN
CPMI - CORREIOS
0147
Fls:
Doc: 3701

Removing device links

You cannot remove physical links (except those that appear in a direct-attached [host to storage device] map). If you remove a logical link, the link may reappear as part of the ongoing discovery process if the factors that resulted in the original link inference still exist.

1. Display the device map which includes the device from which you want to remove the link.
2. Select the icon for the device from which you want to remove the link.
3. Click the Remove Link button on the map toolbar. The Remove Link window appears.



4. In the Links From Device section, select the device port from which you want to remove the link.
5. Verify that you are removing the link you want by reviewing the information in the Currently Linked Device section.
6. Click the **OK** button. A confirmation message appears.
7. Click the **Yes** button if this is the link you want to remove.

2.909
frente

Managing events

As Storage Area Manager monitors the storage network, it displays events in the event panel. Each entry in the event panel displays a corresponding event severity level, the date and time the event occurred, the source of the event, and a brief description of the event. In addition to severity level, events are also defined by their event category.

Once events are displayed in the event panel, Storage Area Manager offers many features that enable you to work with the information displayed.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0148
Fls: 17
Doc: 3701

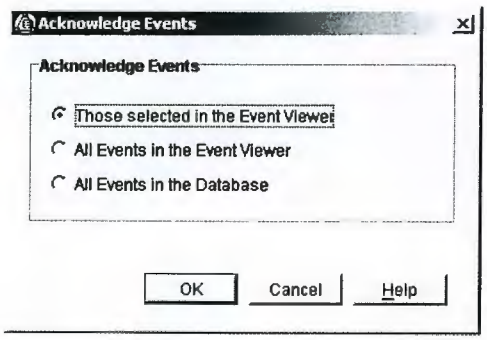
2908
June

Acknowledging events

Storage Area Manager's event management system enables you to acknowledge events that appear in the event panel or are stored in the database.

Note Storage Area Manager may have additional events stored in its database that are not displayed in the event panel. For example, if you apply an event filter to the event panel, then only events meeting the filter's criteria appear in the event panel.

1. If you want to acknowledge only selected events, select the events you want to acknowledge in the event panel.
2. Click the Acknowledge Events button on the event toolbar. The Acknowledge Events window appears.



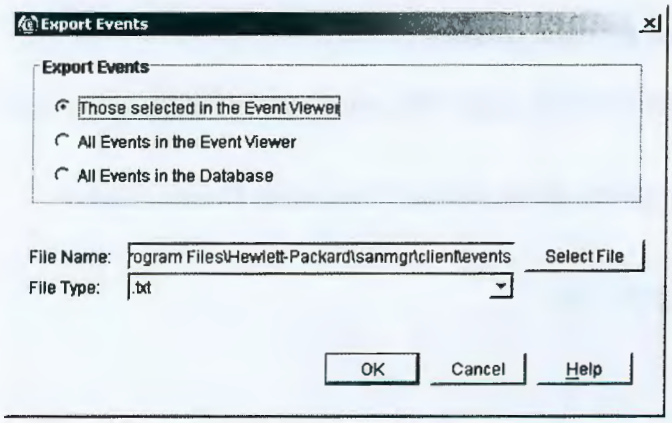
3. Select the appropriate radio button depending on if you want to acknowledge selected events, all events in the event panel, or all events in the database.
4. Click the **OK** button.
5. Verify that the acknowledge event icon appears in the event panel's Acknowledgement column for the appropriate events.

ECT
Q. 907
fune

Exporting events

You can export events to a .txt, .csv, or .xml file. For example, you may want to export events for record-keeping purposes before deleting them from the event panel.

1. If you want to export only selected events, select the events you want to export in the event panel.
2. Click the Export Events button on the event toolbar. The Export Events window appears.



3. Select the appropriate radio button depending on if you want to export selected events, all events in the event panel, or all events in the database.
4. Click the **Select File** button to browse to the location where you want to save the file and to enter a name for the file.
5. Select the file type (.txt, .csv, or .xml) for the exported event file in the File Type box.
6. Click the **OK** button.

Doc: 3701

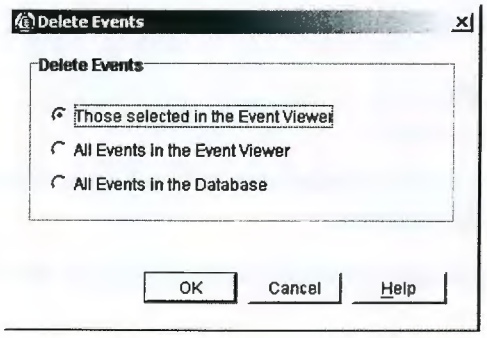
Deleting events

Events are saved in the Storage Area Manager database and contribute significantly to the growing size of the database. In order to manage the number of events in the event panel and the size of the database, you should delete events on a regular basis.

Storage Area Manager offers two methods for deleting events. You can delete events directly from the event panel, or you can configure Storage Area Manager to automatically delete events based on criteria you set.

Deleting events from the event panel

1. If you want to delete only selected events, select the events you want to delete in the event panel.
2. Click the Delete Events button on the event toolbar. The Delete Events window appears.



3. Select the appropriate radio button depending on if you want to delete selected events, all events in the event panel, or all events in the database.
4. Click the **OK** button. A confirmation message appears.
5. Click the **Yes, Delete** button to confirm deletion.

2.905
fls.

Configuring automatic event deletion

You can define rules that Storage Area Manager uses to automatically delete events on an hourly basis. You can define multiple event deletion rules.

For example, you could define a rule to automatically delete all Informational events that are 60 days or older. You could define a second rule to automatically delete all acknowledged events. If an event matches the criteria of either rule, it will be deleted during the next event cleanup cycle.

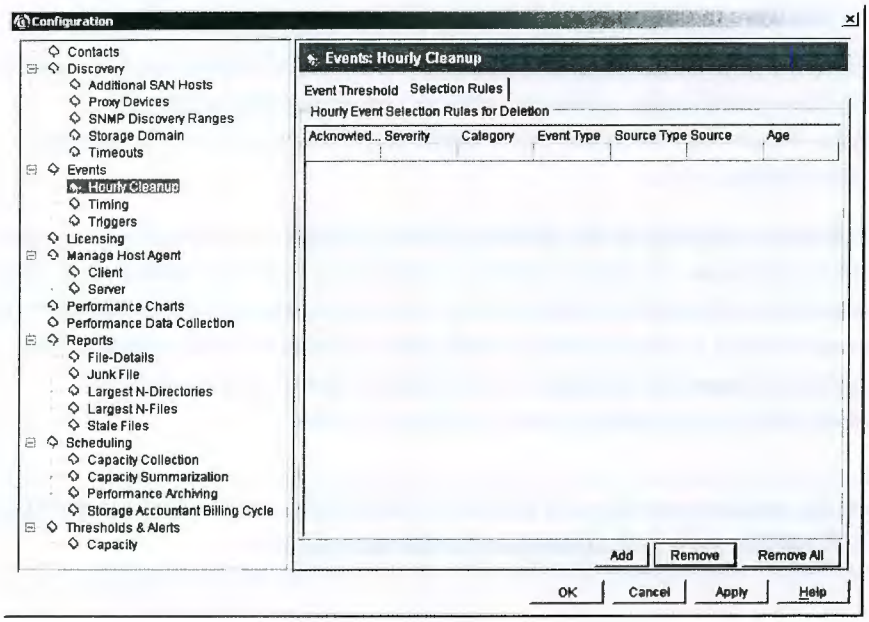
The event cleanup process consists of two phases. If the number of events stored in the database exceeds the maximum number of events threshold, phase 1 is initiated. In this phase, events are automatically deleted based on the criteria set on the Selection Rules tab. If the number of events stored in the database continues to exceed the threshold after phase 1 is complete, then phase 2 is initiated. In this phase, the oldest events are automatically deleted until the maximum event threshold is met.

Note You cannot restore events once they have been deleted. Consider exporting events at regular intervals for record-keeping purposes.

1. From the **Tools** menu, select **Configure**.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0150
Doc: 3701

2. In the Configuration window's navigation tree, expand the **Events** menu, then select **Hourly Cleanup**.



3. Enter the maximum event threshold in the Maximum Number of Events box.
4. Click the **Selection Rules** tab.
5. Click the **Add** button to add a row to the Hourly Event Selection Rules for Deletion table. Each entry represents an event cleanup rule. The cells in each entry define the rule's criteria.

Caution If the table contains a blank row, **all** events are deleted when the hourly cleanup occurs.

6. To define the rule's criteria, click a cell that represents the criteria you want to add, then select the applicable value.

   For example, click the Severity cell, then select the applicable severity level.

2.903
fls

7. Repeat steps 5 and 6 if you want to add another deletion rule to the Hourly Event Selection Rules for Deletion table.
8. Click the **OK** button to save changes and close the window. If the threshold criteria is met, Storage Area Manager performs the cleanup process immediately and then in hourly intervals thereafter.

Adding event filters

Storage Area Manager includes several default event filters to help you manage what you see in the event panel. However, you may want to customize your own event filters. For example, you may want to create an event filter that only displays Critical events for a particular device.

When adding an event filter, each row in the Filter Editor window represents a rule to apply when filtering the event panel. Each rule is defined by a set of criteria. In order for an event to appear in the event panel when this filter is applied, the event must meet all criteria set for a particular rule. For example, if you define an event severity criteria of "Critical" and a source criteria of "Device A", only Critical events for Device A meet the criteria of this rule.

An event filter may also include more than one rule. If an event filter includes more than one rule, then any event that meets the criteria of one or more of the rules will appear in the event panel when this filter is applied. For example, an event filter includes two rules. The first rule defines event severity of Critical as its only criteria. The second rule defines Source criteria of Device A as its only criteria. All events with a Critical event severity and all events from Device A meet the criteria of this event filter.

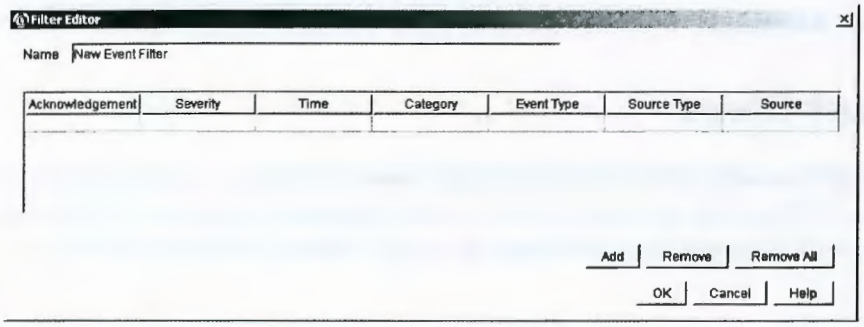
C T
2.902
Irene

1. Click the Event Filters button on the event toolbar.
2. Click the **Add** button. The Filter Editor window appears. A row that represents the filter's first rule is automatically added.



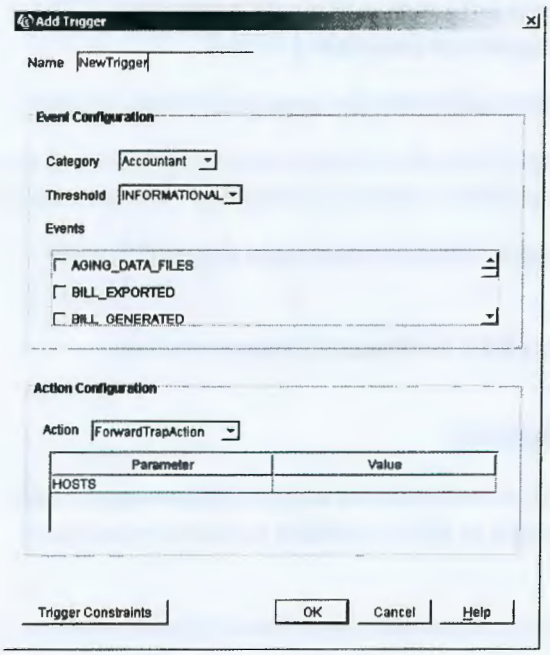
3. Enter a name for this event filter in the Name box.
4. Define the criteria for this event filter by clicking a cell and selecting from the list of options within that cell. For example, click the Severity cell and select the applicable event severity level.
5. Repeat step 4 until you have defined all criteria for this rule (row).
6. Click the **Add** button, and repeat steps 4 and 5 if you want to additional rules to this event filter.
7. Click the **OK** button to save the event filter and close the Filter Editor window.

2.901
fun

Adding event triggers

Event triggers enable you to assign actions to events that meet criteria you specify. Storage Area Manager includes several default event triggers; however, you may want to create additional event triggers that are appropriate for your environment. For example, you can define an event trigger to send e-mail notification to the on-call contact when Critical events occur.

1. Click the Event Triggers button on the event toolbar.
2. Click the **Add** button. The Add Trigger window appears.



3. Enter a name for this event trigger in the Name box. The trigger name may not included white space characters, brackets ({,}), or periods.

   Events are defined by their category (for example, Device), specific type (for example, STATUS_CHANGED_EVENT) and severity level (for example, WARNING). The action defined by this event trigger will initiate when all three event criteria are met.

4. Select the event category you want to include in the Category box.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0152
Fls.
3701
Doc:

5. Select which event severities you want to include in the Threshold box.

   Events for this trigger include the selected severity and above. For example, if you select **INFORMATIONAL**, all event severities are included. However, if you select **MAJOR**, only events with severity levels of Major and Critical are included.

6. Check the checkbox for each event you want to include in the Events box.

   Available events depend on the Category you select. You can check more than one event checkbox.

7. Select which action to initiate for this trigger in the Action box. The parameters displayed in the table below the Action box is based on the action you select. The StoreAction action does not have any parameters associated with it.

8. Click the Value cell next to each Parameter, and enter the appropriate information.

   For example, if you selected ForwardTrapAction in the Action box, click the cell next to HOSTS, and enter the IP address of the host to which you want to forward events.

9. Click the **OK** button to add the event trigger to the list and close the Add Trigger window.

10. Click the **OK** button to save changes and close the Events: Trigger window.

Adding constraints to event triggers

You can constrain an event trigger in order to prevent it from initiating based on certain event criteria. You can also configure exceptions to the constraint based on count and duration of the constraint.

For example, if you configure an event trigger for a source type of interconnect devices, the trigger will initiate for all interconnect devices discovered by Storage Area Manager. However, if you do not want the trigger to act on events contributed by a particular interconnect device (Device A), you could add a constraint that prevents the trigger from acting on events contributed by Device A.

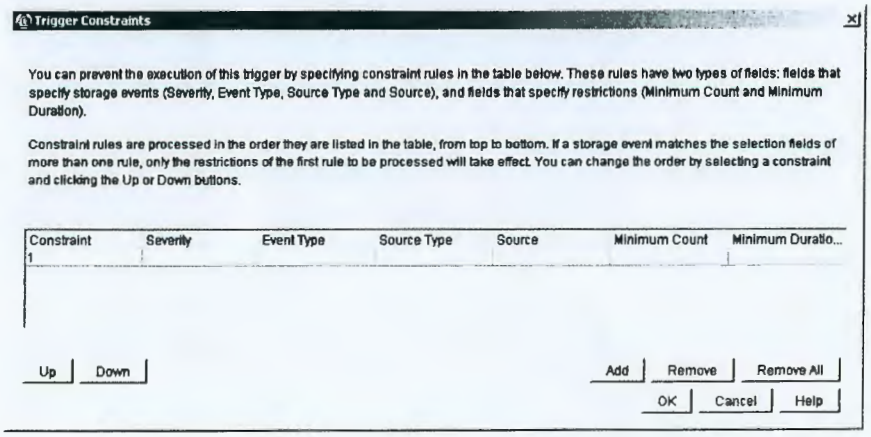
2.899
bene

When adding a constraint, each row in the Trigger Constraints window represents a constraint to apply to the event trigger. Each constraint is defined by a set of criteria. In order for a constraint to take effect, the event that initiated the event trigger must meet all criteria set for the constraint.

An event trigger can include more than one constraint. If a trigger includes more than one constraint, the constraints are applied in the order in which they are listed in the Trigger Constraints window. For example, if an event meets the criteria of two different constraints, the constraint that is listed first in the list is applied

Caution If the first row (rule) in the table is blank and succeeding rows contain rule criteria, this feature interprets the blank row as "always constraint this trigger" and applies it as such. If the first row is blank and no other rows appear for this constraint, then the trigger is not constrained.

1. From the Add Trigger or Edit Trigger window, click the **Trigger Constraints** button. The Trigger Constraints window appears. A row that represents the first constraint is automatically added if the event trigger does not already include a constraint.



2. Click the **Add** button if the table does not already include a blank row.
3. Define the criteria for this constraint by clicking the Severity, Event Type, Source Type, and Source cells and selecting the value you want.

CPMI - CORREIOS
0153
Fls:
Doc: 3701

2.898
Irene

4. If you want to add an exception to this constraint based on the number of times the trigger is constrained, enter a numerical value in the Minimum Count column.

   For example, if the count criteria is 5, the event trigger is constrained the next five times the trigger constraint's criteria is met, initiates the trigger the sixth time the constraint's criteria is met, and then is constrained again for the next five times.

5. If you want to add an exception to this constraint based on how long the trigger is constrained, enter a numerical value (in seconds) in the Minimum Duration column.

   For example, if the duration count is 1800 (30 minutes), the event trigger is constrained for 30 minutes from the time the trigger constraint's criteria is met, initiates the trigger the next time the constraint criteria is met, and then is constrained again for the next 30 minutes.

6. Repeat steps 2 through 5 to add additional rules to this event trigger constraint.

7. Click the **OK** button to add the constraint to the event trigger and close the Trigger Constraints window.

2.897
bene

Managing folders

Storage Area Manager's folder feature enables you add nodes (folders) to the Resources tree and then structure resources under the folder.

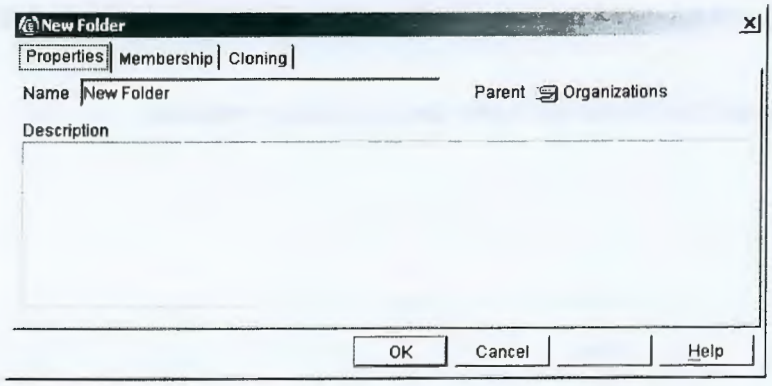
This feature is intended for sizeable storage networks in which many nodes, subnodes, and resources may appear in the Resources tree. You can add a folder to all nodes in the Resources tree except the Domain and Storage Networks nodes. You can also add subfolders under folders that you added previously.

For example, if a storage network contained 100 hosts at three different locations, you could create folders that represent each of the locations and then structure the hosts under the applicable location. When scanning the Resources tree, you would only have to scroll past the three "location" folders rather than all 100 hosts.

A cloning feature enables you to add copies of the folder at the same time you add the original folder. For example, you can create a folder named "Site A" under the Hosts, Interconnect Devices, and Storage Devices node.

Adding folders

1. In the Resources tree, right-click the node or folder under which you want to add a folder, and select **New Folder** from the shortcut menu.



RQS Nº 03/2005 - CN
CPMI - CORREIOS
0154
Fls:
3701
Doc:

2. Enter the folder's name in the Name box.
3. Enter a description for the folder in the Description box.

   If you want to add "clones" of this folder in other Resource tree nodes, continue with step 4. If you want to create this folder only, continue with the next section, "Adding members to folders".
4. Click the **Cloning** tab.
5. Check the **Enable Folder Cloning** checkbox.
6. Check all boxes that represent nodes under which you want to add a clone of this folder.
7. Check the **Replicate Description Fields** checkbox if you want to copy the description you entered on the Properties tab to all cloned folders.

Adding members to folders

1. Click the **Membership** tab.
2. Click the **Add Members** button.
3. Use the Look in drop-down box and Up button to display the node that contains the resource you want to add to the folder's membership.
4. Select the resource you want to add from the Member list. You can select multiple resources.
5. Click the **OK** button to add the resource as a member of the folder and close the Add Members window.
6. Click the **OK** button to add the folder and close the New Folder window.

2.895
Irene

Managing organizations

Organizations enable you to define storage resources as a unique entity. Storage resources can include hosts, bridges, storage devices, interconnect devices, NAS devices, and unknown devices.

Organizations do not necessarily reflect a physical relationship within the storage network. Any storage resource discovered by Storage Area Manager can be added to any organization. A storage resource can be a member of more than one organization.

Once an organization's membership is defined, you can use Storage Builder to view capacity data specific to the organization's membership. (Storage Builder must be installed and licensed.)

You can also use Storage Accountant to add accounts to an organization, which enables Storage Accountant to bill for the storage used by the organization's members. (Storage Accountant must be installed and licensed.)

Implementing in cluster environments

Refer to the following subsection when implementing Storage Area Manager in MSCluster and AIX cluster environments.

Implementing in MSCluster environments

1. Install MS Cluster on both Windows 2000 management servers (servers A and B).
2. Format a share disk for both servers.
3. Install Storage Area Manager 3.0 onto the share disk server A (server B pause). See the *hp OpenView storage area manager 3.0 installation guide* for complete instructions on installing Storage Area Manager.
4. Start MSCluster Admin.
5. Select **Disk Group**, right-click the **Share** disk, then select **move group** from the shortcut menu.
6. Install Storage Area Manager 3.0 onto the share disk of server B.

Note Storage Area Manager must be installed in the same directory on server B as it is on server A.

7. Use MSCluster Admin to create general service resources for Storage Area Manager's services, including:
   - HP OpenView SAM Bridge
   - HP OpenView SAM Embedded DB
   - HP OpenView SAM ManagementServer
8. Start Storage Area Manager on server B.

ECT
2.891
fls
Cpl - A

9. Change the Network Order Binding to use LAN connection before private connection on server A and server B.
   a. From the Windows Start menu, select **Settings**, then select **Control Panel**.
   b. Double-click **Network and Dial-up Connections**.
   c. From the **Advanced** menu, select **Advanced Settings**.
   d. On the Adapters and Bridge tab, ensure that Local Area Connection is listed first in the Connections box.
10. In MSCluster Admin, bring on the general services you created in step 7.
11. Remotely install the Storage Area Manager Host Agent software to each SAN host.
12. Fail over to server A.
13. Start Storage Area Manager on server A.
14. From the **Tools** menu, select **Manage Host Agent**, then select **Update Host Agent Access**.
15. Select all hosts in the managed host list, and click the **Update Access on Selected Hosts** button.

    All hosts should now appear under the Hosts node in the Resources tree.

How hp OpenView storage area manager operates in AIX cluster environments

Requirements

Storage Area Manager requires the following to operate in a cluster environment.

- Each host in the cluster must have one static, non-migrating IP address.
- The IP Address must be accessible by the Storage Area Manager management server.

These requirements necessitate that each AIX host contain a minimum of two and possibly three NIC cards.

Description

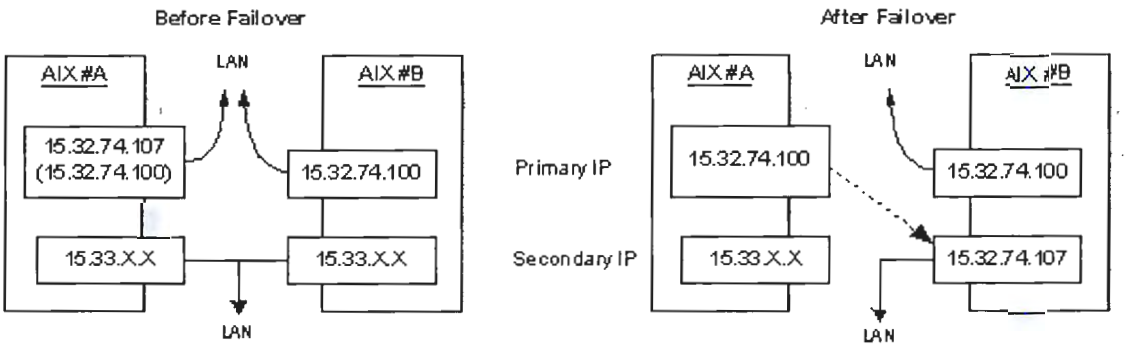

Figure 1 AIX cluster example

From Storage Area Manager's perspective, an AIX cluster is a group of hosts with each host containing a floating IP address in addition to its static IP address. One host in the cluster is a master for the clustered resource. In this example, AIX #A is the master with floating IP address 15.32.74.107.

In addition, AIX clusters require a heartbeat to be transmitted between hosts (illustrated by IP address 15.33.X.X). This heartbeat can be sent by serial connection although that is not recommended.

ECT
2.889
fls.
CPI-AC

Failover

During a failover, the floating IP address assumes ownership of a NIC card, which hides the consumed IP address and exposes the old NIC card's IP address on the host that failed (after it is rebooted).

In figure 1, the IP address 15.32.74.100 is not accessible to Storage Area Manager until after failover and the subsequent reboot occur, at which time the floating address migration enables the old IP address to resume ownership of the NIC card.

This example reflects a single resource failover. In some environments, multiple resources may be simultaneously monitored (for example, a web server on AIX #A and a database on AIX #B). In these configurations, each host acts as a primary and secondary for its peer. Failover can potentially occur in either direction.

Recommendation

In order for the cluster illustrated in figure 1 to satisfy Storage Area Manager's cluster requirements, we recommend that a separate NIC be supplied, which cannot be a failover candidate.

Add the IP address of this separate NIC to the AIX host's commIpAddr.txt file, which is located in the /etc/opt/sanmgr/hostagent/config directory. Storage Area Manager will then identify each host by this new, non-migrating IP address.

hp OpenView storage accountant features

Storage Accountant meters storage space in organization accounts and reports the associated cost at the end of each month. Accounts belong to internal or external organizations. You must install and license Storage Accountant to use its features.

Storage Accountant adds the following features to Storage Area Manager:

- Monthly and interim bill reports. Storage Accountant rolls up daily charges into a monthly bill that is arranged by organization and account. Detailed bills describe the charges for each LUN. Summary bills show only the total charges for each organization and account. Using the Bill Viewer, you can view, export, and print bills for the current (interim) or past billing periods and for all or individual organizations.
- Storage device and service level billing reports. Storage Accountant creates monthly billing reports that are organized by storage device or service level. Summary reports show the total charges for the storage device or service level LUNs in accounts and LUNs not in accounts. Detailed reports show summary information and a LUN-by-LUN description of charges.
- High-level statistics in the Reports tab of the Accountant Home view panel. This view panel allows you to view reports and bill generation information and to configure the billing period.
- Centralized setup functions in the Accounting tab of the Accountant view panel. This view panel provides all the tools you need to set up storage billing. In the Accounting tab, you can click icons to view, create, and add LUNs to service levels; view and create organizations; add organization accounts; and attach LUNs to accounts. You can also view the total number of service levels, organizations, LUNs in service levels, and total storage value that is billed and not billed.
- Service Level, Organization and Account nodes in the Resources tree. Storage Accountant associates LUNs with service levels and then associates the service-rated LUNs with organization accounts. You can view, create, add LUNs to, and maintain service levels and organization accounts from these nodes.

ECT
2.886
Fls.
CPMI - AV

- Audit log of billing transactions and LUN events. A quick look at the audit log will tell you when changes were made to organizations, accounts, service levels, or the billing schedule; if daily usage is being regularly collected; when bills were generated and exported; and if a LUN's status changed. The Audit Log Viewer lets you view, export, and print the audit log.
- Accountant scheduler. The Storage Accountant billing cycle scheduler in the Configuration window lets you specify when the monthly bill is generated, when old bills and audit entries are deleted, and the format and location of exported files.
- CLUI commands. You can use the CLUI to expedite most of the tasks that you can perform in the graphical user interface; for example, adding LUNs to service levels or accounts, creating organizations, removing LUNs from service levels, and generating bills.
- Integration with HP OpenView Internet Usage Manager (IUM). Storage Accountant outputs LUN state data on a monthly basis. This data can then be incorporated into IUM. To enable this functionality, a Hewlett-Packard support representative must complete the integration procedure.
- Exported bills in CSV, HTML, and XML format. Storage Accountant automatically exports monthly bill reports in a format and location that you choose. You can set event triggers that launch a third-party billing application once the report is exported. The details that you need to integrate Storage Accountant bills with other applications are provided in the hp OpenView storage area manager administrator's guide and in Storage Area Manager's document directory (.\client\doc\export_files).
- Monthly and interim bill reports. Storage Accountant rolls up daily charges into a monthly bill that is arranged by organization and account. Detailed bills describe the charges for each LUN. Summary bills show only the total charges for each organization and account. Using the Bill Viewer, you can view, export, and print bills for the current (interim) or past billing periods and for all or individual organizations.

Doc: 3701

Billing basics

Bills are summaries of storage charges to organizations. Bills are produced in two formats:

- Text that is displayed in the Bill Viewer window
- An exportable file that is automatically saved at the end of each billing period

How charges are calculated

Storage Accountant charges are based on the size and price of the LUNs that a Storage Accountant user attaches to an organization's accounts. The price of a LUN depends on its associated service level. The amount charged in a monthly bill is the product of the LUN size and price per GB per hour and the number of hours that the LUN belonged to the account during the billing period.

Charge = LUN size in gigabytes (GB) x price per GB per hour x hours

For example, if organization A has an account with an attached 9-GB LUN whose price is 5 cents per GB per hour, the charge after 20 hours would be 9 GB x $.05/GB/hour x 20 hours, or $9.00.

Storage Accountant records day-to-day changes in the factors that make up the charge and sums up the charges at the end of the billing period.

How charges become bills

At the end of each day, Storage Accountant records all of the day's transactions that affect storage charges; for example, a LUN is added or removed from an account, the service level price is changed, or the LUN is resized. Once a month, these daily records are compiled into a single binary file of usage information, such as LUN 01 used by Account AA from October 1, 2001, 09:27:54, to October 30, 2001, 23:59:59, at a price of $.07/GB/hr. The information in this file is sorted by organization and account to display requested bills in the Bill Viewer and to produce specially formatted files that can be imported by a third-party billing application.

ECT 2.884 Bune

Getting started with billing

Before Storage Accountant can produce bills, you must set up service levels and customer accounts and assign LUNs to them. Figure 2 illustrates the setup steps.

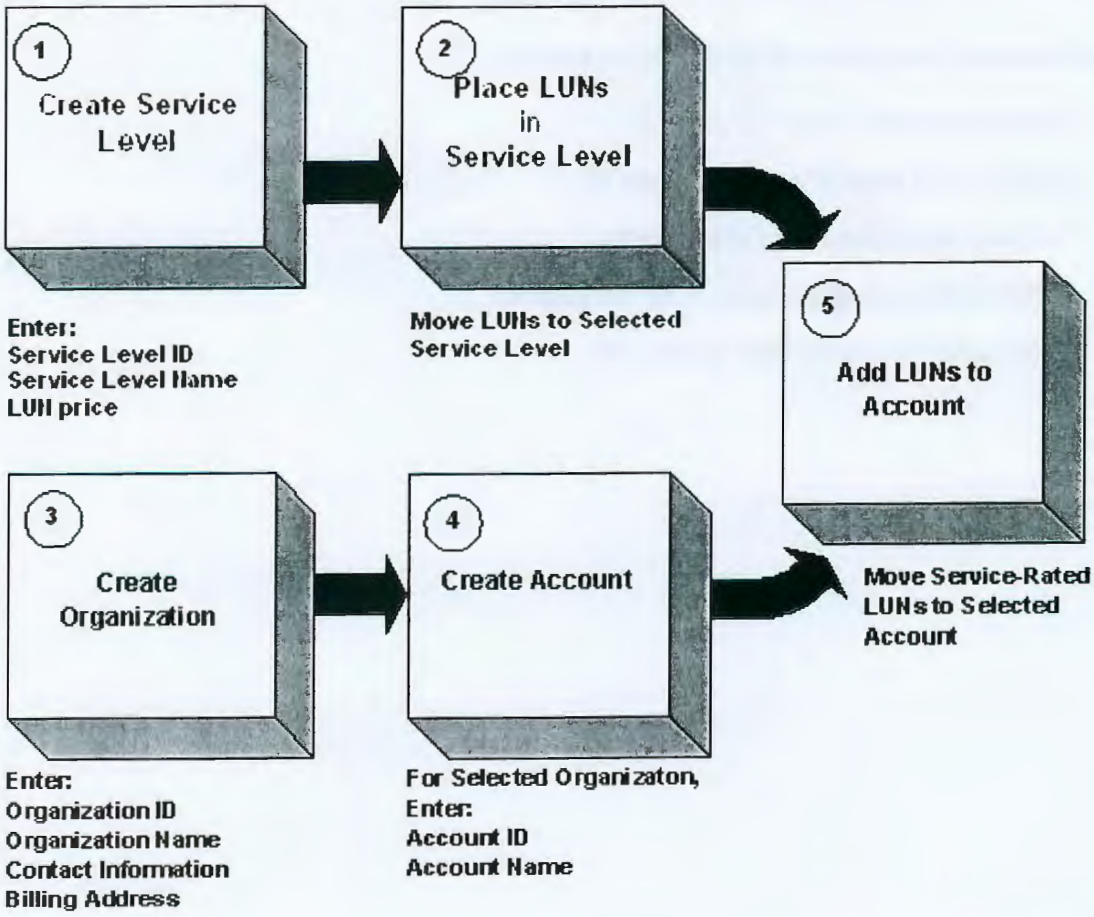

Figure 2 Setting up storage accountant

CPMI - CORREIOS
0161
Fls:
Doc: 3701

2.883
Irene

The arrows in figure 2 indicate necessary sequences. For example, you cannot place LUNs in a service level (step 2) until you create a service level (step 1). Most importantly, you cannot add LUNs to accounts (step 5) until you have completed all the other actions (1, 2, 3, and 4).

Note You do not need to create the organization (step 3) if it already exists in Storage Area Manager.

See the instructions for each setup step as follows:

1. "Creating service levels" on page 45.
2. "Setting LUN service levels" on page 45.
3. "Adding organizations" in online Help.
4. "Adding accounts to organizations" on page 48.
5. "Adding LUNs to accounts" on page 49.

2.882
bene

Service level setup and administration

Service levels determine the price that will be charged for LUN use and typically reflect the relative value of the LUN or LUN service. You need to create service levels and assign LUNs to them so that Storage Accountant can charge for their use.

Creating service levels

Use this procedure to define a service level that you will later associate with specific LUNs.

1. In the Applications tree, expand **Storage Accountant**.
2. Right-click **Service Levels** and select **New Service Level**.
3. Enter data in the New Service Level boxes. Required fields are marked with an asterisk (*).

   For quick entry, accept the automatically generated identifier and enter the service level name and LUN price/GB/hour. Service Level Description is optional.
4. Click **OK** to save the changes and close the window. The new service level appears in the Service Levels view panel and under **Service Levels** in the Applications tree.

The next step is to set LUN service levels.

Setting LUN service levels

Use this procedure to place LUNs in a specified service level. The procedure treats the service level like a bucket that LUNs are added to or removed from. The service level must be previously defined (see "Creating service levels").

1. In the Applications tree, expand **Storage Accountant** and **Service Levels** to reveal the specific service level.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0162
Fls:
3701
Doc:

2. Right-click the service level and select **Add/Remove LUNs** from the shortcut menu. A new window lists all LUNs without a service level on the left and all LUNs that are already associated with the selected service level (but not yet attached to an account) on the right.

Note To select LUNs from a particular storage device, select the device name in the Select Source of LUNs list on the left side of the view panel. Only the LUNs that are in the selected storage device are listed.

3. In the list of LUNs without service levels, select the LUNs that you want to place in this service level and click the **Add** button. The selected LUNs are dimmed in the list on the left and added in blue to the Add List on the right. A green arrow appears in the column beside the moved LUNs in each list, indicating that the addition is pending.

   You can continue selecting LUNs and clicking **Add**. You can also select and remove LUNs from the list on the right. All actions remain pending until you click the **Apply** or **OK** button.

Note Moving large numbers of LUNs will increase the time it takes to apply the changes, about a minute for every 2000 LUNs. During this time, a message window shows the progress of the changes. There is a short delay before the view panel is updated with the changes.

Note For best performance, HP recommends limiting the total number of LUNs in a service level to 2000. If you have more than 2000 LUNs that need to use the same price, you can create an alternate service level with the same price.

4. Click **OK** to save the LUN placements and close the window.

2.880

Deleting service levels

Use this procedure to discontinue an obsolete service level. Any LUNs in the service level will be freed for placement in other service levels. Affected LUNs must be removed from accounts before the service level can be deleted. You cannot delete a service level that has LUNs in use.

1. In the Applications tree, expand **Storage Accountant** and **Service Levels** to reveal the specific service level.
2. If the service level contains LUNs that are in use, remove the LUNs from the accounts that are using them (see page 50).
3. Right-click the service level and select **Delete** from the shortcut menu. A confirmation window shows the name of the service level, the number of affected accounts, and the number of LUNs that will be freed by deleting the service level.
4. Click **OK** to delete the service level and close the window. The service level no longer appears in the Applications tree or the Service Levels view panel.

Q.879 Front

Account setup and administration

Storage is billed by the accounts that belong to organizations. An organization can have many accounts, but must have at least one account to accumulate storage charges.

Adding accounts to organizations

Use this procedure to define an account for an existing organization. If you need to create the organization, complete the procedure "Adding organizations," described in online Help, and then return to this procedure.

1. In the Resources tree, expand **Organizations.**
2. Right-click the organization name and select **New Account** from the shortcut menu. A New Account window shows the organization ID and name and provides places to enter account information. The only required information is the account ID, which Storage Accountant generates for you.
3. If you want to change the automatically generated account ID, clear the **Automatically Generate ID** check box and enter the desired ID in the corresponding text box. The ID must be unique among all accounts in the storage domain.
4. Optionally, enter a name for the account. Account names must be unique within the organization. If you do not enter a name, the account will be identified in the Resources tree by its ID.
5. Click **OK** to add the account and close the window. The new account appears under its respective organization in the Resources tree and in the Accounting tab of the Organizations view panel.

Note The organization will not be charged until you attach LUNs to one of its accounts.

E C T
2.878
- AC

Adding LUNs to accounts

Use this procedure to attach LUNs to an account. If the LUNs are not already attached to a service level, complete the procedure "Setting LUN service levels," described on page 45, and then return to this procedure.

Caution Make sure that LUNs are physically and logically accessible to the organization before you add them to an account. Otherwise, organizations can be charged for LUNs that they cannot use.

1. In the Resources tree, expand **Organizations** and the individual organization that owns the desired account.
2. Right-click the specific account and select **Add/Remove LUNs** from the shortcut menu. A new window lists all available LUNs on the left and all LUNs that are already attached to the account on the right.

Note To select LUNs from a particular storage device or service level, select **Storage Devices** or **Service Levels** in the top box in the left panel. The contents of the second box change accordingly. When you select a specific storage device or service level from the second box, the list of available LUNs will show only the LUNs in that device or service level.

3. In the left box, select the LUN(s) that you want to assign to the selected account and click the **Add** button. The selected LUNs are dimmed in the list on the left and added in blue to the Add List on the right. A green arrow appears in the Status column beside the moved LUNs in each list, indicating that the addition is pending.

   You can continue selecting LUNs and clicking **Add**. You can also select and remove LUNs from the list on the right. All actions remain pending until you click the **Apply** or **OK** button.

Doc:

Note Moving large numbers of LUNs will increase the time it takes to apply the changes, about a minute for every 2000 LUNs. During this time, a message window shows the progress of the changes. There will be a short delay before the view panel is updated with the changes.

For best performance, HP recommends limiting the total number of LUNs in an account to 2000. If you want to assign more than 2000 LUNs to the same organization, assign the LUNs to multiple accounts, and then assign the accounts to the organization.

4. Click **OK** to save the LUN placements and close the window.

Removing LUNs from accounts

Use this procedure to discontinue billing for specific LUNs. Billed hours will stop accumulating at the moment that the LUNs are removed, and the LUNs will be freed for use by other accounts.

1. In the Resources tree, expand **Organizations** and the individual organization that owns the desired account.
2. Right-click the account name and select **Add/Remove LUNs** from the shortcut menu. A new window lists all unattached LUNs on the left and, on the right, all LUNs that are currently attached to the selected account.
3. In the list of LUNs in the account, select the LUN(s) to be removed from the account.
4. Click the **Remove** button. The selected LUNs are dimmed in the list on the right and added in blue to the Remove List on the left. A green left arrow appears in the column beside the moved LUNs in each list, indicating that the removal is pending.

   You can continue selecting LUNs and clicking **Remove**. You can also select and add LUNs from the list on the left. All actions remain pending until you click the **Apply** or **OK** button.

2.876

Note Moving large numbers of LUNs will increase the time it takes to apply the changes, about a minute for every 2000 LUNs. During this time, a message window shows the progress of the changes. There will be a short delay before the view panel is updated with the changes.

5. To save the LUN placements and close the window, click **OK**.

Closing accounts

Use this procedure to discontinue billing for a specified account. Charges will be billed up to the moment that the account is closed. The account will be removed from the Resources tree, and attached LUNs will be automatically freed when the account is closed.

Note Although closed accounts are not deleted from the database, they cannot be reopened. To restore an account, you need to add a new account. Because closed accounts are not deleted, their IDs cannot be reused.

1. In the Resources tree, expand **Organizations** and the individual organization that owns the account.
2. Right-click the name of the account and select **Close** on the shortcut menu. A confirmation window shows the name of the account and the number of LUNs that will be freed by closing the account.
3. Click **OK** to close the account and close the window. The account no longer appears in the Resources tree or the organization's view panel.

Note You can view closed accounts by selecting **Show All Accounts** or **Show Closed Accounts Only** from the Select View box in the view panel for an individual organization.

Doc: 3701

Billing configuration

Billing occurs on a monthly cycle. The billing period starts on the day and hour that a bill is generated for the previous period. The period ends a month later. For example, a bill is generated on June 28 at 23:00 for the period that ended on June 28 at 23:00, and the bill for the new period, June 28 (23:00) through July 28 (23:00), will be generated on July 28 at 23:00. The billing period is the same for all organizations. You can change the billing period.

When bills are generated, copies are automatically exported to a special location for access by a third-party billing application. You can change the format and location of these files to accommodate your billing application. Storage Accountant does not monitor the export directory, so you may want to set up your own procedures for aging and purging these files.

You can set an event trigger that launches a billing application when Storage Accountant bills are generated. Instructions are on page 54.

Setting the billing period

Use this procedure to specify the day and hour that Storage Accountant generates bills and begins a new billing period.

1. Select **Configure** from the **Tools** menu. The Configuration window opens.

Note You can also open the Configuration window from the Storage Accountant Reports view panel.

2. Find **Scheduling** in the Configuration tree and select **Storage Accountant Billing Cycle**.
3. In the Generate bill on box, enter the day of the month that the bill will be generated; for example, 5. The number must be between 1 and 31. The default day is 1, the first day of the month.

ECT
2.874
fls
CPMI - AC

Note If you choose 29, 30, or 31 as the day of the month to generate a bill, during months that have fewer than 29, 30, or 31 days, the bill will be generated on the last day of the month.

4. In the Generate bill at box, enter the time of day (hh:mm) that the bill will be generated; for example, 22:30 (10:30 pm). The default time is 01:30 (1:30 am).

   Text below the editable boxes shows you the date and time that the next bill will be generated and the duration of the next billing period.

5. Click **OK** to save the changes and close the window.

Setting export options

Use this procedure to specify the file format and location for bills that you want to import into a third-party billing application.

1. Select **Configure** from the **Tools** menu.

Note You can also open the Storage Accountant Configuration window from the Storage Accountant Reports view panel.

2. Find **Scheduling** in the Configuration tree and select **Storage Accountant Billing Cycle**.
3. In the Bill Export section of the Configuration window, select **CSV**, **HTML**, and/or **XML** for the Exporter Output Formats. CSV and HTML are selected by default.
4. For Exporter Output Directory, enter the name of the directory where export files will be stored. The default location is <install directory>\managementserver\data\accountant\exporter\reports.
5. Click **OK** to save the changes and close the window.

Doc: 3701

Setting a billing event trigger

After a bill has been generated and exported into the specified directory, an event is generated and recorded in the audit log. This event can be associated with a trigger that will invoke a script to import the newly generated bill into a third-party application. To set this trigger:

1. From the **Tools** menu, select **Configure**.
2. Select **Triggers** under **Events** in the Configuration tree.
3. Click the **Add** button.
4. Enter a name for the event trigger in the Name box. The name cannot include spaces.
5. Select **Storage Accountant** in the Category box.
6. Select **Informational** in the Threshold box.
7. Select **Bill_Exported** in the Events list.

Caution Do not select Bill_Generated, because this event is generated at the beginning of bill generation, and an incomplete or corrupt bill could be imported.

8. Select **Run Command Action** in the Action box.
9. Select **COMMAND** in the Parameter list.
10. Enter a command (including the path) in the Value box next to the COMMAND parameter, for example:
    C:\script.cmd
11. Click the **OK** button to add the trigger to the list and close the Add Trigger window.
12. Click **OK** to save the changes and close the Configuration window.

F C T
2872
fls.

Billing data archiving

Billing data includes bills and the Storage Accountant audit log. The audit log is a record of all billing transactions and system events that affect storage charges. It can help you identify the source of changes or problems in organizations' bills. (See "Viewing the audit log in online Help.) All this billing data accumulates over the months in a growing database. To control the size of the database, Storage Accountant deletes bills and audit log entries that have reached a specified age. You can specify the maximum age of bills and audit log entries according to your priorities for the availability of data versus storage space.

If you need permanent billing records, see "Archiving and restoring bills" on page 56.

Setting the bill retention period

Use this procedure to specify how long bills are kept. Bills are deleted at the end of the next billing period after the specified retention period. Until they are deleted, past bills can be viewed in the Bill Viewer.

1. Select **Configure** from the **Tools** menu.

Note You can also open the Configuration window from the Storage Accountant Reports view panel.

2. Select **Storage Accountant Billing Cycle** under **Scheduling** in the Configuration tree.
3. In the Data Retention section, enter the number of days that you want to keep the monthly bills. The default is 365 days.

Note The audit log lists the files that are purged and the files that will be purged with the next bill.

4. Click **OK** to save the changes and close the window.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0167
Fls:
3701
Doc:

Setting the audit retention period

Use this procedure to specify the maximum age of entries in Storage Accountant's audit log. Entries older than the days specified are automatically deleted from the log.

1. Select **Configure** from the **Tools** menu.

Note You can also open the Configuration window from the Storage Accountant Reports view panel.

2. Find **Scheduling** in the Configuration tree and select **Storage Accountant Billing Cycle**.
3. In the Purge audit log records older than box, enter the number of days that you want to keep entries in the audit log. The default is 365 days.
4. Click **OK** to save the changes and close the window.

Archiving and restoring bills

Use this procedure to make duplicate monthly bills that you can save indefinitely and restore when needed. When you restore a bill that you have archived, you can view, print, or export it just like any other bill.

To archive monthly bills

Once a month, copy the entire contents or just the newest file from the <installdirectory>\managementserver\data\accountant\exporter directory to a secure backup location. Files are named with the start and end times of the billing period separated by an underscore (_); for example, 20010201230000_20010228230000.xml for the month of February 2001.

Note The audit log lists the files that are deleted and the files that will be deleted with the next bill.

ECT 2870 fls

To restore an archived bill to Storage Accountant

1. Copy the desired file from its backup location to <install directory>\managementserver\data\accountant\exporter on the management server. See "File name format" to identify the file for the specified billing period.
2. Execute the CLUI command or open the Bill Viewer to view the restored file. The billing period of the restored file will appear in the Billing Period list.

Note If a restored file is older than Storage Accountant's bill retention period, the file will be deleted when the next bill is generated.

File name format

Bill file names are the times of the first and last daily records that are summarized in the monthly bill. If bills are generated on the first day of the month at 01:00 and daily records are created at 23:00, the bill will include records from the first through the last day of the previous month. Times are specified by year, month, day, hour, minute, and second, and separated by an underscore ("_"), as shown below:

`<yyyymmddhhmmss_yyyymmddhhmmss>.xml`

Where *yyyy* is the year

mm is the month

dd is the day

hh is the hour

mm is the minute

ss is the second

For example, the file corresponding to the billing period January 1, 2001, through January 31, 2001, is named 20010101230000_20010131230000.xml.

The file extension is XML for internal billing files and CSV, HTML, or XML for exported files.

Setting currency preferences

Use this procedure to change the default settings for the number of digits shown to the right of the decimal place in the Accountant user interface. You can change the display settings for cost per hour totals of billed and unbilled storage, service level price, and cost per hour of individual LUNs.

Note The currency settings in this window apply only to the user interface, and do not affect billing calculations or the Bill Viewer.

1. In the Applications tree, select **Storage Accountant** and click the **Accounting** tab.
2. Click the **Configure number of currency digits** button.
3. Use the drop-down lists to specify the number of digits displayed for total costs per hour billed and unbilled, service level price, and cost per hour for individual LUNs.
4. Click **OK** to apply the changes and close the window.

2868
fune

Integrating bills with other applications

Use this procedure to integrate HP OpenView Storage Accountant with a billing application that produces finished customer statements.

1. Set Storage Accountant's export options to the file format and directory location that your billing application will use. See "Setting export options" on page 53.
2. Set up the billing application to retrieve the current bill file from the export location. See "File name format" on page 57 for the bill naming convention.

Note Consider using Storage Area Manager events and action triggers to start up your billing application as soon as Storage Accountant generates the monthly bill. See "Setting a billing event trigger" on page 54.

3. Map billing application fields to the Storage Accountant export file. Although contents vary depending on the format (CSV, HTML, or XML), all export files contain the following information for each active organization:
   - Unique organization identifier
   - Unique account identifier
   - Size of each billed LUN (in GBs)
   - Price of each billed LUN per GB per hour
   - Total charge for each billed LUN
   - Total charge for each account
   - Total organization charge

See the complete specifications for CSV and XML files in "Integrating hp OpenView storage accountant 3.0 with third-party billing applications" (ThirdParty_Billing.pdf). This document and sample CSV and XML files are located in ./client/doc/export_files (where "." represents the directory where Storage Area Manager is installed).

hp OpenView storage builder features

Storage Builder monitors and reports storage capacity in a storage network. It routinely discovers the physical capacity of storage devices and the logical capacity of hosts and NAS devices, and analyzes the information for current usage, past and future usage trends, and threshold notification. You must install and license Storage Builder to use these features.

Storage Builder adds the following features to Storage Area Manager:

- Capacity views of hosts, NAS devices, storage devices, and the domain. For hosts and NAS devices, view panels show used and free file space. For storage devices, view panels show the disk space that is visible to hosts, still unformatted, and spent in overhead.
- Lists of directories, disks, users, volumes, and volume groups on each host. Click any of these labels in the Resources tree to view corresponding capacity data, including file system and logical volume metrics. Select a specific resource to view more information about the individual directory, disk, user, volume, and so on.
- Correlated views of physical and logical space. At the storage device view, you can see how LUN space is distributed to hosts and volumes. At the host view, you can see the LUNs where volumes reside. When logical volume managers are present or when HP-UX volumes map directly to LUNs, a graphical map shows the relationships between volumes and LUNs.
- Past and future usage trends. Click the graph button in Capacity view panels to view a line graph of past and future capacity. Storage Builder predicts future capacity by identifying trends in past capacity. You can turn this feature on or off, and you can select from a wide range of predictive models.
- Capacity thresholds and threshold events. Storage Builder monitors the current and predicted capacity of individual resources for capacity thresholds. If measured capacity exceeds or falls below a specified limit, Storage Builder sends a threshold notification to Storage Area Manager's event panel. Administrators can set thresholds and configure event triggers.

Doc: 3701

Capacity data archiving

Storage Builder routinely summarizes the data that has been collected over several days and then discards the original data. Summaries contain the weighted average, minimum and maximum values, and standard deviation for each measurement that Storage Builder collects. These values enable Storage Builder to display capacity history, predict future capacity, and conserve space in the database.

Summarized data is saved for as long as you want to view historical data, or as long as there is space for the growing database.

Scheduling capacity summaries

Use this procedure to set the schedule for summarizing collected capacity data and for deleting aged summaries. The procedure displays the Configuration window with the current summarization settings in editable text boxes.

1. Select **Configure** from the **Tools** menu.
2. Select **Capacity Summarization** under **Scheduling** in the Configuration tree.
3. To change the minimum number of days that data is kept before it can be summarized, enter a value for Accept measurements for summary after ___ days. Higher values increase the time that unsummarized data is displayed in capacity graphs. The default is 7 days. Collected data is deleted after it is summarized.
4. To change the number of days of collected data that summaries include, enter a value for Summarize collected measurements every ___ days. Higher values increase the interval between summaries in capacity graphs. The default is 7 days.

Note Higher summary intervals also affect the period for which unsummarized data is displayed in capacity graphs. For example, if data must be kept 7 days before it can be summarized and summaries occur every 5 days, some data will be 12 days old before it is summarized.

2857
June
CPI-AC

5. To increase or decrease the number of days that capacity summaries will be kept, enter a value for Keep summary measurements for ___ days. Historical data is displayed in capacity graphs for as long as summaries exist. The default is 365 days.

Note Whenever you want to return settings to the factory settings, click the **Restore Defaults** button.

6. Click the **Apply** button to implement your changes and continue working in the Configuration window, or click **OK** to apply your changes and close the window.

Doc: 3701

Managed directories

Managed directories are directories whose size you want to monitor. When directories are managed, you can view, report, and set thresholds on their size. Directory size in capacity view panels is the sum of the sizes of all files in the directory, excluding subdirectories and their files. To get the size of a directory including its subdirectories and their files, use the Command Line User Interface (CLUI).

You can select directories to manage once Storage Builder has collected file data. Until then, Storage Area Manager's Directories folders and tabs are empty. A Directories folder contains managed directories, not all directories.

Note To view a list of all directories, managed and unmanaged, on a selected host or volume, click the File/Directory detailed list button in the host Capacity tab or the volume Properties tab.

You can view managed directories for a host, a volume, or the whole domain. Figure 4 shows the contents of a managed directories folder for a selected host:

ECT
2855
CPI - AC

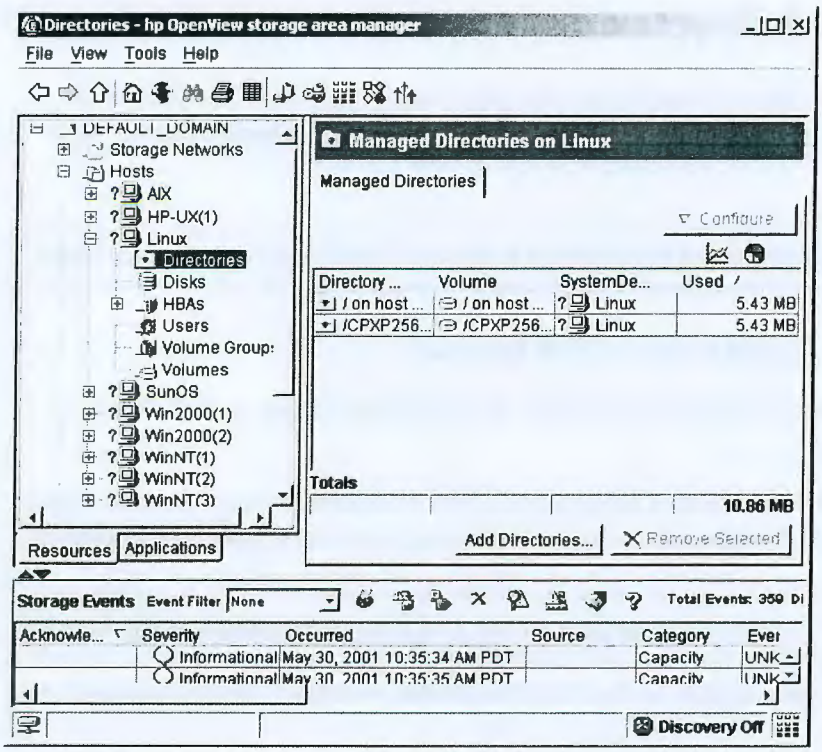

Figure 4 Directories view panel

Click the graph button in managed directory view panels to view directory sizes in the past and predictable future. Click the pie chart button to compare directory sizes. Double-click in a list of managed directories to view the properties of the selected directory, including how much of the volume the directory occupies.

Doc: 3701

Adding managed directories

Use this procedure to select directories whose size you want to monitor. The procedure displays a hierarchical list of all directories and subdirectories on a selected host or NAS device.

Note Volume and file data must be collected before you can complete this procedure.

1. In the Resources tree, expand **Hosts** or **NAS Devices**.
2. Expand the specific host or NAS device where the directories exist, and click the **Directories** subfolder.
3. Click the **Add Directories** button at the bottom of the Managed Directories view panel. The Add Directories window displays a tree of volumes, directories, and subdirectories.

Note If no volumes or directories appear in the Add Directories window, make sure that volume and file data was successfully collected. See the online Help topic "When data is unavailable in the Add Directories window" for troubleshooting steps.

4. In the Add Directories window, select one or more directories to be managed. (Use the Control or Shift key to select multiple directories.)
5. Click **OK** to add the selected directories and close the Add Directories window, or click **Apply** to add the selected directories and leave the window open and make more selections.

FCT 2853 fls CPL-AC

Removing managed directories

Use this procedure to discontinue monitoring selected managed directories. The removed directories will no longer appear in the host or NAS device's directories view panels. Removing a managed directory has no effect on the existence of the directory.

1. In the Resources tree, expand **Hosts** or **NAS Devices**.
2. Expand the specific host or NAS device where the directories exist and click the **Directories** subfolder.
3. Select one or more directories in the Managed Directories view panel. (Use the Control or Shift key to select multiple directories.)
4. Click the **Remove Selected** button to remove the selected directories from the list. Any capacity thresholds on the removed directories will also be removed.

RQS Nº 03/2005 - CN
CPMI - CORREIOS

Fls:
Doc: 3701

Capacity thresholds

Storage Builder causes Storage Area Manager events when storage usage exceeds or falls below specified limits, called thresholds. You can set thresholds on hosts, volumes, volume groups, managed directories, and users. You can make thresholds global for the domain, common to an organization, or specific to a single resource. You can even set thresholds on future usage. Capacity information is evaluated for threshold violations when it is collected.

Note Thresholds apply in parallel, so multiple threshold events can occur on the same resource.

Threshold events identify the resource, the measured or predicted capacity, and the capacity threshold; for example, "Volume /home on host maine.finance.hp.com usage is 90% which exceeds threshold of 80%." They are reported with whatever severity level you select, and, like other events, can trigger other actions, including e-mail messages, log entries, or commands.

Default capacity thresholds cause informational events when used space exceeds 95% on all hosts, NAS devices, volume groups, and volumes in the domain. Thresholds on predicted capacity are off by default.

Note Volume data must be collected before you can set thresholds on volumes and volume groups. Volume and file data must be collected to set thresholds on directories and users.

ECT 2851 Irene

Setting domain thresholds

Use this procedure to set global consumption alerts on all hosts, NAS devices, volumes, volume groups, managed directories, or users in the domain. The procedure displays a list of the current domain-level thresholds and a window for editing a selected threshold or adding a new one. The new settings take effect at the next collection of capacity data.

1. Select **Configure** from the **Tools** menu.
2. Select **Capacity** under **Thresholds & Alerts** in the Configuration tree. The view panel lists the current thresholds.
3. Click the **Domain** tab if not already selected.

Note To filter the list of thresholds, select a type from the Resource Type drop-down list.

4. To change an existing threshold, including a default threshold, select the threshold(s) and click the **Edit** button. Go to "Entering threshold properties" on page 79 to finish setting the threshold.
5. To add a new threshold, click the **New** button and select a resource type from the drop-down list. See "Entering threshold properties" on page 79 to finish setting the threshold.

Setting organization thresholds

Use this procedure to set consumption alerts on the resources that belong to an organization. The procedure displays a list of the organization's existing thresholds and a window for editing a selected threshold or adding a new one. New and edited thresholds take effect at the next collection of capacity data.

1. Select **Organizations** in the Resources tree.
2. Click the **Capacity** tab in the Organizations view panel.
3. Select one or more organizations from the list in the view panel.

0175
Fls: 77
Doc:
3701

4. Click the **Configure** button and select **Thresholds** from the drop-down menu. The Configuration window lists the existing thresholds of the top selected organization.

Note To filter the list of thresholds, select a type from the Resource Type drop-down list.

5. To modify an existing threshold, select the threshold and click the **Edit** button. Go to "Entering threshold properties" on page 79 to finish setting the threshold.
6. To create a threshold, click the **New** button and select a resource type (host, NAS device, volume, volume group, user, or managed directory) from the drop-down list. See "Entering threshold properties" on page 79 to finish setting the threshold.

Setting thresholds on specific resources

Use this procedure to set consumption alerts on capacity-sensitive hosts, NAS devices, volumes, volume groups, managed directories, or users. The procedure displays a list of the resource's existing thresholds and a window for editing a selected threshold or adding a new one. New and edited thresholds take effect at the next collection of capacity data.

1. Select or expand nodes in the Resources tree as needed to select the collective resource:
   - To set a host threshold, select **Hosts**.
   - To set a NAS device threshold, select **NAS Devices**.
   - To set a volume threshold, expand **Hosts** or **NAS Devices**, expand a particular host or NAS device, and select **Volumes**.
   - To set a volume group threshold, expand **Hosts**, expand a particular host, and select **Volume Groups**.
   - To set a managed directory threshold, expand **Hosts** or **NAS Devices**, expand a particular host or NAS device, and select **Directories**.
   - To set a user threshold, expand **Hosts** or **NAS Devices**, expand a particular host or NAS device, and select **Users**.

2.849

2. Click the **Capacity** tab in the view panel.
3. Select one or more resources from the list in the view panel.
4. Click the **Configure** button and select **Thresholds** from the drop-down menu. The Configuration window lists the existing thresholds of the top selected resource.
5. To modify an existing threshold, select the threshold and click the **Edit** button. Go to "Entering threshold properties" on page 79 to finish setting the threshold.
6. To create a threshold, click the **New** button. See "Entering threshold properties" on page 79 to finish setting the threshold

Entering threshold properties

1. Enter or change the threshold name in the Name box of the Edit Threshold window. You can use letters, numbers, special characters, and spaces. You cannot use more than 64 characters or create duplicate names.

Note If at any time you want to reset threshold settings to the factory defaults, click the **Restore Defaults** button.

2. In the Limit box, enter or change the minimum or maximum amount of used space that will cause a threshold event. (**Direction**, the next labeled box in the window, determines whether the limit is a minimum or maximum.) For user and directory limits, select the unit of measure in the adjacent box. All other limits are percentages (space used over total space). The default limit is 95%.
3. Select **Increasing** in the Direction box to cause a threshold event when used space exceeds the limit value, or select **Decreasing** to cause a threshold event when used space falls below the limit value. The default direction is Increasing.
4. Select the severity level of the threshold event in the Severity drop-down list. The default level is Informational.
5. To set or edit a threshold on future consumption, click the **Trending** tab. Then:

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0176
Fls:
Doc:

- Click **Enable Threshold Trending** to toggle the threshold for future capacity on and off. A check in this box activates the other text boxes in this tab.
- If threshold trending is enabled, select the Projection period, the number of months (1 to 12) into the future that Storage Builder will check for threshold violations. An event will occur if predicted consumption passes the threshold limit any time in the projection period.
- If threshold trending is enabled, select the needed confidence that a threshold violation will be detected. Drag the slider toward More Alerts to increase the confidence up to 95% and toward Fewer Alerts to decrease the confidence down to 5%. Greater confidence allows greater ranges of possible values and therefore increases the likelihood of threshold events. For example, if 95% confidence tests all predicted values within 100 bytes of the threshold limit, then 5% confidence would test predicted values within only 10 bytes of the threshold limit.

6. Click **OK** to close the Edit Threshold window.
7. Click **Apply** to save the settings and continue working in the Configuration window, or click **OK** to save the settings and close the window.

2.847

Deleting capacity thresholds

Use this procedure to remove consumption alerts on hosts, NAS devices, volumes, volume groups, managed directories, or users. The procedure displays a list of the current thresholds at three levels: on individual resources, for an organization, and over the domain. You can select and delete any threshold in the list, including a default threshold.

1. Select **Configure** from the **Tools** menu.
2. Select **Capacity** under **Thresholds & Alerts** in the Configuration tree. The view panel lists the current thresholds.
3. Click the tab that describes the scope of the threshold you want to edit:
   - Click **Domain** to edit a threshold on all like resources in the domain.
   - Click **Organization** to edit a threshold on like resources in an organization.
   - Click **Resource** to edit a threshold on a specific resource.
4. Select the threshold(s) that you want to remove.
5. Click the **Delete** button.

Capacity reports

Capacity reports help you track the size of certain files and directories in the storage domain. If file data is being collected, you can produce the following reports:

- Stale files have not been opened in a specified number of days. You can get a list of the stale files on a selected host, NAS device, or volume, or you can get the total number and size of all stale files on all the hosts and NAS devices in the domain.
- Junk files can be identified by specific characters, such as .tmp, in their names. You can get a list of the junk files on a selected host, NAS device, or volume, or you can get the total number and size of all junk files on all the hosts and NAS devices in the domain.
- Largest files is a list of the largest files on a selected host, NAS device, or volume. The list includes each file's location, owner, size, file mode, time created, and last time opened or modified.
- Largest directories lists the file contents of the largest directories on a selected host, NAS device, or volume. Contents include each file's location, owner, size, mode, time created, and last time opened or modified.
- Files/directories detailed list is a list of all files and directories on a selected host, NAS device, or volume. The report includes each file's size, owner, file mode, time created, and last time opened or modified. This report is written to a user-specified file and not displayed.

Capacity reports can be printed and exported using Storage Area Manager buttons.

Note File data collection provides the data for file reports.

You define stale files, junk files, and the largest files and directories. You also choose CSV or XML format for the detailed list of files and directories.

2.845

Setting the file format of detailed file/directory lists

Use this procedure to specify the export format for detailed file/directory reports. This is the only report that lists the contents of directories that are not managed and the only report that is automatically exported and not displayed in the report window. The procedure displays the Configuration window with the current export option.

1. Select **Configure** from the **Tools** menu.
2. Select **File-Detail** under **Reports** in the Configuration tree.
3. Select **CSV** or **XML** format from the Export As drop-down list. Storage Builder will save the file list in this format whenever you click the Export button in a report window. The default is CSV.

Note If you want to reassert the factory report settings, click the **Restore Defaults** button.

4. Click **Apply** to save your settings and continue working in the Configuration window, or click **OK** to save your settings and close the window.

Defining file reports

Use this procedure to set up reports of junk files, stale files, and the largest files or directories in managed directories. The procedure displays the Configuration window with the current report specifications. You can change the existing specifications and add new filters.

1. Select **Configure** from the **Tools** menu.
2. Select the report type—**Junk File**, **Largest N-Directories**, **Largest N-Files**, or **Stale Files**—under **Reports** in the Configuration tree. The view panel displays the current report specifications.
3. Select **HTML**, **CSV**, or **XML** in the Export As drop-down list. Storage Builder will save report data in this format whenever you click the Export button in a report window. The default is HTML.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0178
Fls:
Doc: 3701

Note Whenever you want to restore the factory report settings, click the **Restore Defaults** button.

4. In the Sort By boxes, first select the value and then the order that the files will be sorted by in the report. For the value, you can select the file path, type, size, mode, owner, time created, last time modified, or last time accessed. For the order, select **Descending** (higher-to-lower alphabetical or numerical order) or **Ascending** (lower-to-higher alphabetical or numerical order). The default is to sort files by size in descending order, that is, the largest files at the top of the report.
5. In the box Limit Records Per Volume To, select the number of files to include from the top of the selected order. If the files are in ascending order, the report will list the files with lowest values. If the files are in descending order, the report will list the files with the highest values. You can select from 100 to 1000 per volume. The default is 100.
6. If you are defining the stale files report, enter a number in the Days since last access box. This is the number of days that must pass after a file is last accessed before it can be considered stale.
7. To modify an existing filter, click in the rules' cells and select or enter new values.
   - Click **Inclusive** in the rule's Operation cell to view the selectable options **Inclusive** and **Exclusive**. The default is Inclusive.
   - Click in the rule's Pattern cell to enter text in the cell. Patterns are case sensitive and can include global replacement characters (asterisks) at the beginning or end of the character string. Files with the specified character patterns in their names will be included or excluded from the report as specified. The default patterns for junk files are *tmp* and *temp*. For largest files and directories, the default pattern is *. There is no default filter on stale files.
8. To add a rule, click the **Add** button and modify the contents of the Operation and Pattern cells in the new row.
9. To remove a rule, select the rule and click the **Remove** button, or remove all rules by clicking the **Remove All** button.

E C T
2843
Irene
CPI - AC

10. To move a rule up or down in the execution sequence, click the **Up** or **Down** button. Rules are executed in numerical order.
11. Click **Apply** to save your settings and continue working in the Configuration window, or click **OK** to save your settings and close the window.

hp OpenView storage node manager features

Storage Node Manager is a device status monitoring tool for your storage network. You must install and license Storage Node Manager in order to use these features. Among other features, Storage Node Manager provides:

- Application linking. You can link device-specific applications to Storage Area Manager and then start them from the user interface. An application may be linked to a specific device or device model. Many default device-specific application links are provided with Storage Node Manager.
- Device status monitoring. Storage Node Manager monitors and graphically displays the status of each discovered device in your storage network. Device status is displayed wherever the device is referenced in the user interface, including the Resources tree, device map, and event panel.

  Based on its status inquiries of the storage network, Storage Area Manager generates and displays status-related events as they occur in your storage network.

2840
June

Configuring device-specific application links

Storage Node Manager's application link feature enables you to start another application from a specific device or device model within Storage Area Manager's user interface. The Add Application Link wizard guides you through the steps necessary for linking the application.

Storage Area Manager provides default application links for many of the devices it supports. These defaults are dependent on each device's management application being installed in its default location.

You can add an application link to a specific device or device model. For example, you may want to link a device-management application to a specific hp StorageWorks switch or to all switches of that model in your storage network

Adding an application link to a device

1. From the **Tools** menu, select **Storage Node Manager**, then select **Add Application Link**. The Add Application Link wizard appears.
2. Click the **Next** button to continue. The next wizard panel determines if this application link applies to a specific device or device model.

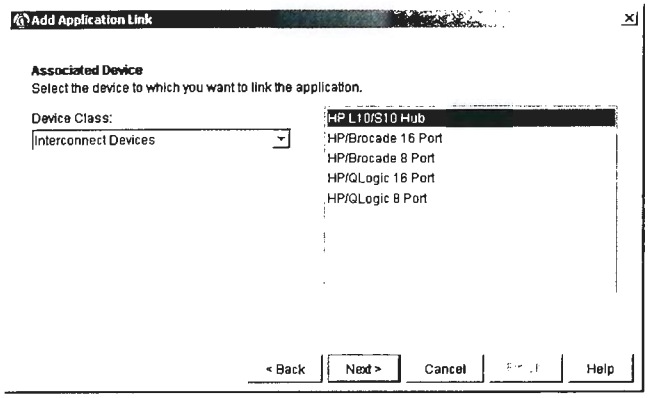
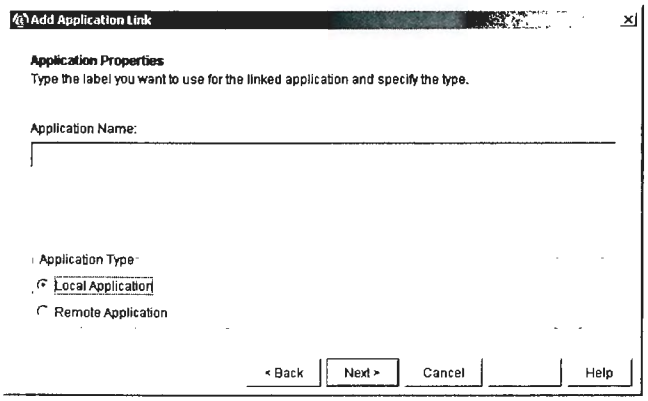
3. Select the **Device** radio button, and click the **Next** button. The wizard's Associated Device panel appears.



4. Select the type of device (interconnect, storage, NAS, bridge, or host) in the Device Class box that represents the device to which you want to link the application.

5. Select the specific device to which you want to link the application in the list box, and click the **Next** button to continue the wizard. The wizard's Application Properties panel appears.

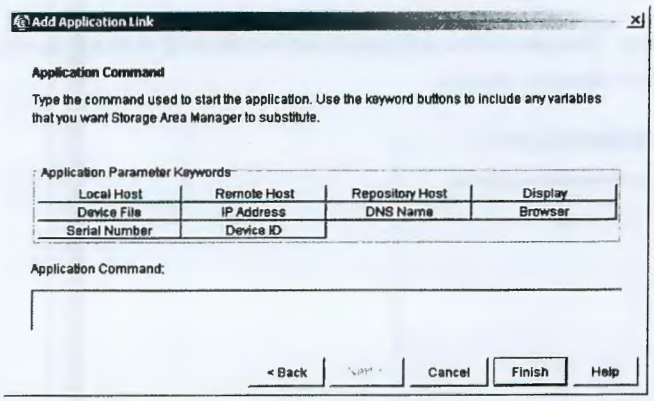


6. Enter the application's name in the Application Name box.

7. Select the **Local Application** radio button if the application you are linking is installed on the host from which you are running Storage Area Manager; otherwise, select the **Remote Application** radio button.

2838

8. Click the **Next** button to continue. The wizard's Application Command panel appears.
9. Enter the command to start the application you are linking in the Application Command box, and click the **Finish** button to add the application link.



You can use the keyword buttons that appear in this panel for variables that you want Storage Area Manager to substitute. See table 1 for a description of each keyword.

Table 1 Device-specific application link keywords

Keyword	Description
Local Host	The system where the management client is running
Remote Host	Provides a list of available hosts
Repository Host	The management server
Display	Sends display to the management client
Device File	Management path
IP Address	IP address of the selected device
Browser	Launches a web browser **Note** If used, must be the first keyword in the command and must be followed by **http://**
Serial Number	Serial number of the selected device
Device ID	Unique ID of the selected device

hp OpenView storage optimizer features

Storage Optimizer monitors and reports the performance of storage network resources. Performance metrics vary by resource, but typical metrics are read and write rates, byte transfer rates, average queue depths, various errors, invalid CRCs and transmission words, link failures, signal losses, received and transmitted bytes and frames, read and write operations, read and write cache hits, and blocks requested. Storage Optimizer can display any metric that a resource supports. You must install and license Storage Optimizer to use its features.

Storage Optimizer adds the following features to Storage Area Manager:

- Performance views of host disks, volumes, HBAs, interconnect devices, storage devices, LUNs, and controllers.
- The ability to view devices in the order of their performance on a common metric. This allows you to compare performance across like devices and to easily identify the top (or bottom) performers. You can limit long lists to the first 5, 10, 15, and so on, up to 100 or all devices.
- Line charts of the performance data that was collected for individual devices over selectable periods of time. You can define your own charts to supplement the charts that Storage Optimizer provides.
- Performance trends. Line charts can show you where performance is likely to be in the near and distant future based on current trends. Using sophisticated statistical models, Storage Optimizer identifies trends that can account for such influences as seasonal variation. You can turn this feature on or off, and you can select from the simplest to the most sensitive predictive models.
- Baselining and automatic thresholds. Using the most sophisticated statistical analysis, Storage Optimizer can establish an extremely accurate baseline of expected performance. At your option, Storage Optimizer will send a threshold event whenever actual performance deviates significantly from the baseline.

2.831

- Data export. The button saves the contents of performance charts in a comma-delimited (CSV) file.
- Secure access to administrator functions. Only administrators can enable/disable the collecting, baselining, and automatic thresholding of performance data, or schedule the summarizing and archiving of performance data.
- Command Line User Interface (CLUI). Run-line commands expedite the viewing and configuring of Storage Optimizer information.
- Support for OpenView Operations and OpenView Reporter queries of the performance database.

Doc: 99

Performance metrics

Storage Optimizer collects performance information on the following resources and their components:

- Host disks, volumes, HBAs, and HBA ports
- Interconnect devices and their ports
- Storage devices and their LUNs, disks, and controllers

The specific metrics that Optimizer collects depend on the resource. Storage Optimizer is designed to display any performance metric that a resource supports. You can view the metrics collected for individual resources by viewing performance data collection in the Configuration window.

Performance data collection is off until you enable collection for selected resources. When collection is enabled, the default is to collect all metrics for hosts and common metrics for storage and interconnect devices.

All metrics

All metrics includes the custom and common metrics that a resource supports. Individual resources provide various custom metrics depending on the model and the manufacturer. Storage Optimizer displays custom (and common) metrics in charts when you select a specific device in the Resources tree.

All metrics is the default choice for performance data collection on hosts and HBAs. There are currently two kinds of host metrics, one provided by the OpenView Operations Performance Agent (OVPA) and the other by OpenView VantagePoint (VP).

OVPA on any host and VP on UNIX hosts support the following metrics for host disks:

- Physical read rate (display default)
- Physical write rate

OVPA and VP on HP-UX hosts support the following metrics for host disks and volumes:

- Physical read rate (display default)
- Logical read and write rates
- Physical write rate

VP on Windows hosts provides the following metrics for host disks and volumes:

- Bytes transferred per second (display default)
- Average queue depth length

For HBAs and HBA ports, Storage Optimizer collects all of the performance metrics in the SNIA library. If an HBA has no SNIA driver or does not support SNIA's performance metrics, there is no Performance tab in the view panel. If the HBA supports any SNIA performance metrics, the Performance tab will display them.

Common metrics

Storage Optimizer attempts to collect a common set of metrics for all storage devices and all interconnect devices. Common metrics allow you to compare the performance of like resources. In fact, Storage Optimizer lists resources in order of their performance on a common metric when you select the collective resource in the Resources tree.

The following common metrics are the default choice when data collection is enabled for a storage or interconnect device. The default metric shown in resource lists is in bold.

Common metrics for interconnect devices:

- **Total errors** (display default)
- Invalid CRCs
- Invalid transmission words
- Link failures
- Primitive sequence protocol errors
- Received bytes and frames
- Signal losses

- Synchronization losses
- Transmitted bytes and frames

Common metrics for ports on interconnect devices:

- **Total errors** (display default)
- CRC errors
- Invalid CRCs
- Invalid transmission words
- Link failures
- Primitive sequence protocol errors
- Received frames
- Signal losses
- Synchronization losses
- Transmitted frames

Common metrics for storage devices:

- **Total operations** (display default)
- Percentage of reads and writes from cache
- Read and write cache hits
- Read and write operations

Common metrics for LUNs:

- **Total operations** (display default)
- Percentage of reads and writes from cache
- Read and write cache hits
- Read and write operations

2.827

Performance data collection

Storage Optimizer collects performance data on selected resources. You select the resource and configure Storage Optimizer to collect all or only the common metrics that the resource supports. Common metrics is the default choice for all but hosts. Metrics can be collected on host disks and volumes, HBAs, HBA ports, storage devices, LUNs, controllers, switches, and switch ports.

Collection schedule

Storage Optimizer collects performance metrics on selected resources and their components every 15 minutes. It holds the data in its memory until the top of the hour, when it summarizes the quarter-hour data into a single hourly value. If the metric is a rate, such as bytes transferred per second, the hourly value is the average of the collected data. If the metric is a count, such as the number of bytes transmitted, the hourly value is the sum of the collected data. The hourly values are stored in Storage Area Manager's database and viewed in performance lists and charts.

Enabling/disabling metrics collection

Use this procedure to start or stop the collection of performance metrics for a selected resource. You can enable collection for all metrics or for only the common metrics that the resource supports. The change will take effect at the next collection cycle.

1. Select **Configure** from the **Tools** menu.
2. Select **Performance Data Collection** from the Configuration tree. The view panel displays a list of the resources that provide performance metrics and the status of collection and baselining for each.

Note If the list is long, you can limit it to a single type of resource. Select **Hosts**, **Interconnect Devices**, or **Storage Devices** from the Device Type list.

RQ3 N° 03/2005 - CN
CPMI - CORREIOS
0188
Fls:
Doc: 3701

3. Select the host or device that needs a collection change.
4. Click the **Edit** button. The Collection/Baselining window opens.
5. Click the **Collection** tab if it is not already selected.
6. Click the **Collect Metrics** check box to toggle collection on or off for the selected resource. When the box is checked, collection is enabled and the window shows the list of metrics being collected. No collection is the default.
7. If collection is enabled (step 6), select the **Collect Common Metrics** or **Collect All Metrics** button to set the scope of metrics collected. The default is to collect common metrics for all resources but hosts. The list in the bottom half of the window shows which metrics are collected at the selected scope. Any common metrics that the device does not support are not listed.
8. Click **OK** to apply your selections and close the Collection/Baselining window.
9. Select another resource and repeat steps 4 through 8, or click **OK** to apply the changes and close the Configuration window.

2.825

Performance data archiving

On a schedule you choose, hourly values are summarized into a daily archive. The default archive schedule is 7 days after the hourly data is created, but you can choose from 1 to the number of days that archives are retained. Reducing 24 values to one for hundreds of collected metrics obviously saves space in the database. Yet other management objectives may require keeping hourly data as long as possible. To establish the hours of peak demand on a volume or switch port, for example, you may need hourly metrics for 2 weeks or more. To get the most precise prediction of LUN operations or any other metric, for another example, you should use a smoothing analysis model, which requires hourly data, the more the better.

Archive retention

You also determine how long performance data is kept in the database. The default retention period is 31 days, but you can select up to 365 days. Again, a balance must be struck between database economy and other management objectives. The more historical data that is available for trend analysis, for example, the more accurate the predictions will be.

Scheduling performance archives

Use this procedure to set the schedule for archiving and summarizing performance data.

1. Select **Configure** from the **Tools** menu.
2. Select **Performance Archiving** below **Scheduling** in the Configuration tree.

Note If at any time you want to restore the schedules to the factory defaults, click the **Restore Defaults** button.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0189
Doc: 3701

3. In the upper text box, enter the number of days that performance data will be saved. You can enter the value or click the up and down arrows to increase or decrease the value one day at a time. Click the **Restore Default Charts** button.

4. In the lower text box, enter the number of days that collected data will be kept before it is summarized. Valid values are 1 to the number of days performance data is kept (see step 3). The default is 7 days.

5. Click **OK** to apply the values and close the Configuration window.

ECT
2.823
Bruna

Performance baselines and automatic thresholds

Storage Optimizer can let you know when selected resources are performing abnormally. Based on a statistical analysis of collected metrics, Storage Optimizer can construct an extremely accurate baseline representing normal performance. If the next collected metric deviates significantly from the baseline value, Storage Optimizer automatically generates a threshold event warning.

Baselining requires hourly data points for twice the selected season length. The default season length is one day, so by default Storage Optimizer requires two days' worth of hourly data to determine the baseline. The more hourly data available, the more reliable the prediction will be.

Note When count data is displayed as rates, the baseline is recalculated for the period displayed in the chart and baseline values do not appear until the 49th hour of the data displayed.

Baseline parameters

Storage Optimizer uses the most sensitive analysis model, called triple exponential smoothing, to calculate the baseline. This model is sensitive to three different variables in the data:

- Baseline sensitivity emphasizes more recent data in calculating the baseline.
- Trend sensitivity emphasizes the upward or downward tendency of the data in calculating the baseline.
- Seasonality sensitivity emphasizes the periodic tendency of the data, that is, the tendency to repeat a pattern of variance over specific periods of time. The length of the period (season) is selectable.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0190
Fls:
3701
Doc:

You can increase or decrease these sensitivities according to the importance of the variables for the device being monitored. In addition, you can set the threshold sensitivity, which determines how much deviation from the baseline is sufficient to cause a threshold warning.

Baseline limitation

The number of metrics that can be baselined depends on the processing resources of the management server. For that reason, Storage Optimizer limits baselining to a portion of the metrics that can be collected on a device and keeps a running balance of the total number of baselines that can be set. When baselining is enabled on a device, Storage Optimizer calculates how many baselines would be needed if the device supported all the baselinable metrics. Baselinable LUN and port metrics are multiplied by the number of LUNs or ports, respectively, on the device. Storage Optimizer then subtracts the number of potential baselines from the total number of baselines available and displays the balance when you view baseline thresholds.

Enabling/disabling baseline thresholds

Use this procedure to enable or disable performance baselining or threshold events for a selected resource. The result is a list of resources that support performance metrics and the status of baselining and thresholding for each.

1. Select **Configure** from the **Tools** menu.
2. Select **Performance Data Collection** from the Configuration tree. The view panel shows the status of collection and baselining for all resources that support performance metrics.

Note If the list is long, you can limit it to a single type of resource. Select **Hosts**, **Interconnect Devices**, or **Storage Devices** from the Device Type drop-down list.

3. Select the resource that you want to change.
4. Click the **Edit** button.

2.821
fls.
CPI - AC

5. Click the **Baselining/Threshold** tab in the Collection/Baselining window.
6. Click the **Enable Baselining** check box to toggle baselining on or off. When the box is checked, baselining is enabled and the Show Events option and baselining parameters are active. Default baselining is off.
7. If baselining is enabled (step 6), click the **Show Events** check box to toggle threshold events in the event panel on or off.
8. If baselining is enabled (step 6), set the baselining parameters as needed. The default values give a small but significant sensitivity to the respective variables: baseline, trend, seasonality, and threshold. Click the right-facing arrows to increase the sensitivity of one or more variables; click the left-facing arrows to decrease the sensitivity. Increasing the threshold sensitivity decreases the likelihood of threshold events.

   Also select the length of the season, a day or a week, from the Season Length drop-down box.
9. Click **OK** to apply your settings and close the Collection/Baselining window.
10. Choose other resources and turn baselining on or off, or click **OK** to close the Configuration window.

Performance charts

Performance charts are line graphs showing the changes in a performance metric (y axis) over time (x axis). The chart in figure 5 shows the number of read operations on a selected LUN between October 4 and October 9, 2002 (the day that the chart was generated), and the number of read operations projected for October 9 to October 13, 2002. The straight line from about October 7 to midday October 8 shows a lapse in the collection of data.

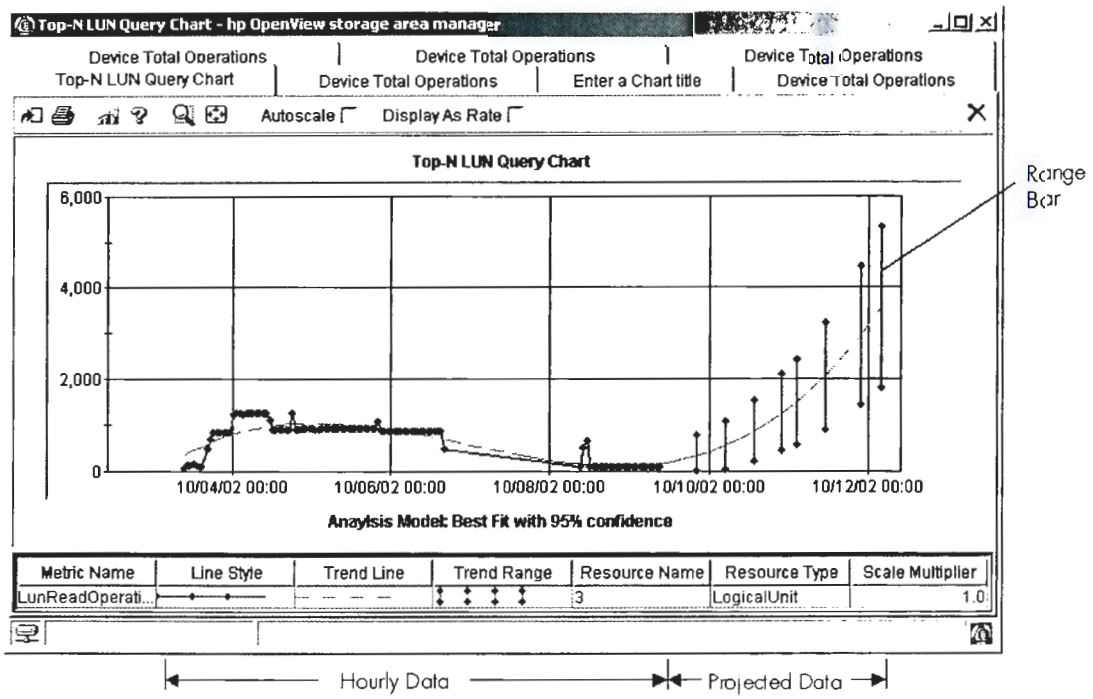

Figure 5 Sample performance chart

ECT 2.819 fls CPI - AC

This chart contains hourly and projected data. Charts can also contain archived data.

- Archived data. Data that is more than 7 days old, by the default archive schedule, is summarized into one data point per day. Rate data is averaged, and count data is added to obtain the daily value. When a chart contains archived data, all data points are presented as daily values.
- Hourly data. Storage Optimizer collects data every 15 minutes, but stores and displays hourly summaries of the collected data. Charts for periods less than the archive schedule contain hourly data and are noticeably denser than charts that contain archived data. Also, for count data, the y values of archived and hourly data points differ because each archived data point is the sum of 24 hourly data points.

Note Displaying count data as rates obscures the difference between archived and hourly data.

- Projected data. When a chart includes trend data, a broken line shadows past data and extends into the future. This line represents a pattern analysis of collected data and the projection of that pattern into the future. Vertical bars along the projected values show the range of possible values based on the required confidence. Greater confidence in the prediction implies greater ranges. The confidence specified for the sample chart is 95%.

  Projections must be interpreted according to the model that is used to make the analysis. The analysis model is indicated at the bottom of the chart. In the example here, the analysis model is best fit. Linear and other nonsmoothing models use archived and hourly data to predict future rate data points. If count data is displayed or if the analysis model is smoothed, only hourly data is used for the prediction.

Managing performance charts

Use this procedure to delete all custom (user-defined) performance charts or to restore all default (factory-defined) performance charts. The procedure displays a list of the custom and default performance charts that are currently available for interconnect or storage devices.

Note To delete individual charts, use the procedure "Deleting performance charts".

1. Select **Configure** from the **Tools** menu.
2. Select **Performance Charts** in the Configuration tree.
3. To restore any factory-defined charts that have been deleted, click the **Restore Defaults** button.
4. To delete all user-defined charts, select the **Remove User-Defined Charts** button.
5. Click **Apply** to accept changes.
6. Click **OK** to close the Performance Charts window.

Deleting performance charts

Use this procedure to delete a factory-defined or user-defined chart that is not needed in your environment.

Note You can restore default charts at any time.

1. Expand **Storage Devices** or **Interconnect Devices** in the Resources tree, depending on which devices the chart was defined for.
2. Select an individual device in the expanded tree.
3. Click the **Performance** tab.
4. Use the right mouse button to select the chart to be deleted, and select **Delete Chart** from the shortcut menu.

2.817
Irene

Restoring default charts

Use this procedure to undelete factory-defined charts for interconnect or storage devices. Any default charts that were previously deleted will return to the list.

Note An administrator can restore all default charts in one action using the Configuration tool.

1. Expand **Storage Devices** or **Interconnect Devices** in the Resources tree, depending on which devices the default charts describe.
2. Select an individual device in the expanded tree.
3. Click the **Performance** tab.
4. Click the **Restore Default Charts** button.

hp OpenView storage allocater features

HP OpenView Storage Allocater controls storage access and provides security by assigning logical units (LUNs) to specific hosts or share groups. Assigned LUNs cannot be accessed by any other hosts. With this application, you can assign, unassign, and reassign storage and related devices from a diverse pool. You must activate and license Storage Allocater to use these features.

Storage Allocater brings the following features to Storage Area Manager:

- *Security groups*. Share groups and associated LUN groups help to streamline storage assignments. Share groups allow hosts to share the same storage devices. Associated LUN groups keep sets of LUNs (for example, stripe sets or mirror sets) together, requiring them to be assigned and unassigned as a unit.
- *Organizational groups*. Host groups and LUN groups allow you to arrange hosts and LUNs into hierarchical groups in the Storage Area Manager user interface.
- *Reports*. Storage Allocater can generate reports that show all LUNs, assigned LUNs, or unassigned LUNs. These reports allow you to quickly view the assignment status of all the LUNs in the current storage domain.
- *System availability*. Storage Allocater provides increased system availability by enabling storage to be assigned, unassigned, and reassigned without reboots.

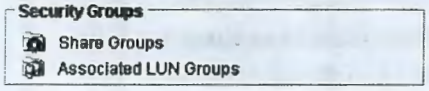
Groups

After activating Storage Allocater you can create security and organizational groups. These groups are optional, but they help you to streamline storage assignments and organize information within the Storage Area Manager user interface

Security groups

Share groups and associated LUN groups are called security groups because their manipulation affects storage access. Unlike organizational groups (page 119), security groups are not hierarchical; security groups cannot be members of other security groups.

When you select Storage Allocater in the Applications tree, the view panel displays the LUN Allocation tab, which contains shortcuts to Storage Allocater's security groups.



Share groups

Share groups allow multiple hosts to share the same storage with read-write access.

Caution When using share groups, you must use an application that preserves data integrity on shared storage. Without this type of application, data corruption may occur.

Share groups operate according to the following rules:

- When you assign or unassign a share group host, all of the storage in the share group is assigned to or unassigned from the host. If all of the storage in a share group cannot be assigned or unassigned, the assignment or unassignment request will fail.
- When you assign or unassign share group storage, it is automatically assigned to or unassigned from each host in the share group. If all of the LUNs in the share group cannot be assigned or unassigned, the assignment or unassignment request will fail.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0195
Fls:
Doc: 370

Associated LUN groups

Associated LUN groups are used for any set of LUNs that needs to be assigned and unassigned as a unit; for example, stripe sets, mirror sets, and sets of LUNs that contain parts of the same database. When a LUN is assigned to an associated LUN group, it cannot be assigned or unassigned as a separate item until it is removed from the associated LUN group. Associated LUN groups use the following rules:

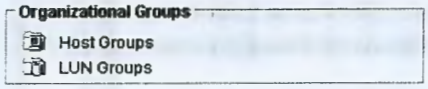
- When you assign an associated LUN group to a host or share group, all of the LUNs in the associated LUN group are assigned to the single host or all of the share group hosts. If all of the LUNs are not successfully assigned, the assignment of the associated LUN group will fail.
- When you unassign an associated LUN group from a host or share group, all of the LUNs in the associated LUN group are unassigned from the affected hosts. If all of the LUNs are not successfully unassigned, the unassignment of the associated LUN group will fail.
- If you add a LUN to an associated LUN group while the associated LUN group is assigned to a host or share group, the newly assigned LUN is automatically assigned to the single host or the hosts in the share group. If the new LUN is not successfully assigned, the assignment of the LUN to the associated LUN group will fail.
- If you unassign a LUN from an associated LUN group that is assigned to a host or share group, the unassigned LUN is automatically unassigned from the affected hosts. If the LUN is not successfully unassigned, the unassignment of the LUN from the associated LUN group will fail.

Tip For detailed rules for using share groups and associated LUN groups, see the "About share groups" and "About associated LUN groups" topics in the Storage Area Manager online help system.

Organizational groups

Host groups and LUN groups are called organizational groups because they are used to organize information in the Storage Area Manager user interface, but manipulation of these groups does not directly affect storage access.

When you select Storage Allocater in the Applications tree, the view panel displays the LUN Allocation tab, which contains shortcuts to Storage Allocater's organizational groups.



Organizational groups allow you to create a hierarchy of groups. When configuring and viewing organizational groups, you may have to expand several group levels in order to select a group. For example, to view the members of the Engineering Servers host group shown here, you would expand the Building A host group.

Tip For detailed rules for using host groups and LUN groups, see the "About host groups" and "About LUN groups" topics in the Storage Area Manager online help system.

Managing assignments

Assignment types

There are three types of assignments in Storage Allocater.

- When you assign items to host groups and LUN groups, the items become part of an organizational structure that is displayed in the Storage Area Manager user interface.
- When you assign storage to a host or share group, the individual or grouped hosts are granted read-write access to the assigned storage.
- When LUNs are grouped into an associated LUN group, they are bound together and must be assigned and unassigned as a unit.

In general, unassignments work the same way as assignments. When you unassign items from an organizational structure, they are removed from that structure, and when you unassign storage from a host or share group, the storage is no longer available to the affected host(s).

Note For instructions on editing Storage Allocater assignments, see the Storage Area Manager online help system.

Assignment rules

Table 2 lists the assignments that can be made in the Storage Allocater user interface.

Table 2 Storage Allocater assignments

	Assignable items				
	LUN	**LUN group**	**Associated LUN group**	**Host**	**Host group**
Hosts	X		X		
Associated LUN groups	X				
Share groups	X		X	X	
LUN groups	X	X			
Host groups				X	X

To edit a host's assignments, right-click the host in the Resources tree and select **LUN Allocation**. To edit a group, right-click the group in the Applications tree and select **Edit Assignment**.

Note For specific instructions on editing assignments, see the Storage Area Manager online help system.

Doc: 3701

Special unassignments

In some cases, usually when a host or share group cannot release LUNs that are in use, a host, LUN, or associated LUN group cannot be unassigned with the **Unassign** command. In these cases, check the involved Windows, Solaris, Linux or AIX hosts and try to solve the issue that prevents the unassignment. For tips on troubleshooting unassignments, see chapter 8. If the item still cannot be unassigned, use the **Special Unassign** command, which requires a reboot of all affected hosts.

The following rules apply to special unassignments:

- The **Special Unassign** command is available when you right-click a host, LUN, or associated LUN group in the Assigned section of the Edit window.
- A special unassignment is not complete until you reboot all the affected hosts. After an affected host is rebooted, a message similar to the following appears in the event panel: `Special unassignment of host <host name> from share group <group name> completed.`
- Before you can assign or re-assign the LUNs that were involved in a special unassignment, you must reboot all the affected hosts.
- Special unassignments are not required on HP-UX hosts, so the **Special Unassign** command is unavailable when you are configuring HP-UX hosts or share groups that contain HP-UX hosts. If a LUN cannot be unassigned from an HP-UX host, follow the instructions on page 206.
- You cannot special unassign hosts from a share group at the same time that LUNs or associated LUN groups are being special unassigned. You must special unassign hosts and storage separately.
- You can use the **Special Unassign** command to unassign the following items:
  - A host from a share group.
  - A LUN from a host, share group, or associated LUN group.
  - An associated LUN group from a host or share group.

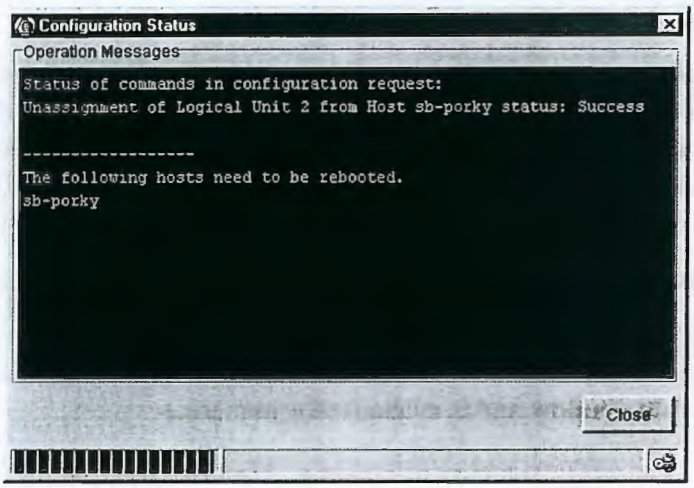
E C T
2.808
fls.
CPI - AC

Using the Special Unassign command

- When you right-click one or more assigned items and select **Special Unassign**, the selected items are dimmed in the list on the right and added in magenta to the Unassign List on the left. A green-and-magenta arrow appears in the Status column beside the moved items in each list, indicating that a special unassignment is pending.
- Until you click the **Apply** button, you can undo a pending special unassignment by selecting an item in the Unassign list and clicking the **Undo** button or by dragging the item from the Unassign List into the Assigned section of the Edit window. Once you apply a special unassign request, you cannot undo the request, and you must reboot the affected hosts.
- When you try to perform a special unassignment, Storage Area Manager first tries a regular unassignment.
  - If the regular unassignment is successful, the item that was unassigned is removed from the Assigned section of the Edit window and is available for immediate assignment elsewhere.
  - If a regular unassignment is not possible, the item remains in the Assigned section of the Edit window, and is listed in magenta text.
- If a host that is involved in a special unassignment is in one or more share groups, the host is listed in magenta text in the Edit Share Group window until it is rebooted.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0198
Fls:
Doc: 3701

- When you click **Apply**, the Configuration Status window opens and reports the status of the requested special unassignment. If hosts need to be rebooted, they are listed in the Configuration Status window and in the event panel. The message in the Configuration Status window is similar to the following:



Note For specific instructions for using the **Special Unassign** command, see the following online help topics: "Special Unassigning Hosts," "Special Unassigning a LUN," and "Special Unassigning Associated LUN Groups."

2.806 June

Assigning LUNs for Windows Clustering

Windows Clustering (Windows 2000)

The following information can be helpful when running Storage Allocater with Windows Clustering:

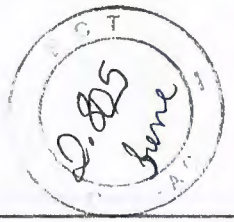
- When a server cluster host is reserving a LUN, the Storage Area Manager user interface may show management paths as down because the reservation of the LUN prevents Storage Allocater from reading the LUN.
- If the quorum disk is not an active resource on a cluster host, the disk may not be displayed in Disk Management.
- Do not unassign a quorum disk from a running cluster's share group. The quorum disk must be accessible to all hosts in the cluster for failover to work.
- For instructions on configuring your HBA drivers for use with clustering, see the documentation that came with your HBA.
- If Windows Clustering is set up before Storage Allocater is activated, use the Storage Allocater Activation wizard to create the server cluster share group.

Setting Up a Server Cluster Share Group

1. Before setting up a server cluster share group, read the Windows 2000 "Server Clusters" online help topics, and pay attention to the required order of attaching, partitioning, and configuring shared disks.
2. Create a share group.
3. Assign the LUNs that will be used by the cluster to the share group.
4. Assign one of the cluster hosts to the share group.

Note For instructions on creating and editing Share Groups, see the "Adding Share Groups" and "Assigning Share Group Members" topics in the Storage Area Manager online help system.

ECT 1.806-0199 CPMI-CORREIOS Fls: 3751 Doc:



5. Follow the steps in the Windows 2000 online help topic "Checklist: Creating a Server Cluster." When using the checklist, note the following guidelines:
   - Partition and format the cluster disks on the host that was assigned to the share group in step 4.
   - All of the shared cluster disks must have the same assigned drive letter on each host in the share group. To accomplish this, assign one host to the share group at a time, configure the drive letters, then unassign the host from the share group and repeat this step for all hosts that will be included in the cluster.
   - When following the procedures in the "Creating a Server Cluster" checklist, only one host at a time should be assigned to the server cluster share group.
6. Install the cluster service on the host in the cluster share group.
7. Add all of the other cluster hosts to the share group.
8. Install the cluster service on all of the other hosts in the cluster share group.
9. Configure Windows Clustering according to the instructions in your Microsoft documentation.

Note You may need to re-apply current service packs after installing Windows Clustering for the first time. See your Microsoft documentation for more information.

Microsoft Cluster Server (Windows NT 4)

The following information is be helpful when running Storage Allocater with Microsoft Cluster Server (MSCS):

- When you repartition a LUN that is on the same virtual bus as the quorum disk, all partitions on the disk may become inaccessible when you commit the changes in Disk Administrator. To access the LUN, reboot the host that did the repartitioning.
- When an MSCS host is reserving a LUN, the Storage Area Manager user interface may show LUNs or management paths as down or offline because the reservation prevents Storage Allocater from reading the LUN.

ECT 2.804 Irene

- If the quorum disk is not an active resource on a cluster host, Cluster Disk (the MSCS disk filter) prevents that host from seeing the disk in Disk Administrator.
- MSCS may not be able to use a disk that is added dynamically to a running host. In some cases, the host must be rebooted for MSCS to begin using the disk. For example, if the quorum disk is unassigned from a host and assigned to the host again, MSCS will not begin using it until you reboot the host.
- For instructions on configuring your HBA drivers for use with MSCS, see the documentation that came with your HBA.
- Storage Allocater LUNs cannot be unassigned from a cluster share group while MSCS is running because the MSCS drivers have an open reference to the LUNs. To unassign these LUNs, use Storage Allocater's **Special Unassign** command. For more information about the **Special Unassign** command, see page 122.
- If MSCS is set up before Storage Allocater is activated, use the Storage Allocater Activation wizard to create the MSCS share group.

Setting Up an MSCS Share Group

1. Create a share group.
2. Assign the LUNs that will be used by the cluster to the share group.
3. Assign one of the cluster hosts to the share group.
4. From the cluster host in the share group, partition and format the cluster storage according to MSCS requirements. See your Microsoft documentation for instructions.
5. Assign the remaining cluster hosts to the share group.

Note For instructions on creating and editing Share Groups, see the "Adding Share Groups" and "Assigning Share Group Members" topics in the Storage Area Manager online help system.

Caution Do not access the shared storage until MSCS is set up.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
0200
Fls:
Doc: 3791

6. For easy identification, configure the drive letters to match on each cluster host.
7. Install MSCS onto all of the share group hosts.
8. Configure MSCS according to the instructions in your Microsoft documentation.

Note You may need to reapply current service packs after installing MSCS for the first time. See your Microsoft documentation for more information.

Assigning LUNs for volume management software

When assigning LUNs for use with volume management software, the following guidelines apply:

- When an assigned LUN is part of a volume set, it cannot be unassigned by Storage Allocater. To unassign a LUN that is in a volume set, remove the LUN from the volume set, and then unassign it from the affected host or share group.
- If storage network LUNs are configured into volume sets before Storage Allocater is activated, use the Storage Allocater Activation wizard to assign the LUNs to the hosts that are using them.
  - If more than one host is accessing a volume set, assign the LUNs and the involved hosts to a share group.
  - For each volume set, assign the LUNs to an associated LUN group, and assign the group to a host or share group.

Note For information about the Storage Allocater Activation wizard, see the *hp OpenView storage area manager installation guide* and online help system.

Assigning LUNs for HP-UX and Solaris VERITAS Volume Manager Storage Administrator

The VERITAS Volume Manager Storage Administrator (VMSA) software stores its configuration information in the required root disk group (rootdg). VMSA requires the presence of at least one LUN in rootdg at all times. The following guidelines apply when using VMSA and Storage Allocater:

- If VMSA is set up and using storage network LUNs in rootdg before Storage Allocater is activated, use the Storage Allocater Activation wizard to assign the LUNs to the VMSA host. If multiple LUNs are used, create an associated LUN group for the LUNs and assign the group to the VMSA host.

Note For information about the Storage Allocater Activation wizard, see the *hp OpenView storage area manager installation guide* and online help system.

Caution If you activate Storage Allocater without assigning the rootdg LUNs with the Storage Allocater Activation wizard, when the VMSA host is rebooted, it will not have access to the rootdg LUNs (since they are not yet assigned), and the VMSA server will not start. To solve this problem, use Storage Allocater to assign the rootdg LUN(s) to the host, and then start the VMSA server manually.

- If possible, do not use storage network LUNs in the rootdg volume group.
- If you need to use storage network LUNs in rootdg, HP recommends including one SCSI-attached disk in rootdg. Because VMSA requires one LUN in rootdg at all times, if you use this configuration, you will be able to remove the storage network LUNs from rootdg and unassign them, as needed.
- As with all volume groups, if you use assigned storage network LUNs in rootdg, you must remove them from rootdg before they can be unassigned.

Caution For Solaris VMSA hosts: If your root disk group contains only storage network LUNs, and you unassign all of the rootdg LUNs with the **Special Unassign** command, VMSA will not load or function properly.

Assigning LUNs for Windows NT stripe and volume sets

About Ftdisk

Ftdisk (Microsoft's striping and volume set driver) is a disk filter driver. Once a LUN is enabled on a machine that is running Ftdisk, the LUN can only be unassigned if Ftdisk is stopped or a special unassignment is completed. This is because Ftdisk does not release its reference to the disk.

To determine if Ftdisk is running, check its status by double-clicking the Devices icon in Control Panel. To avoid unnecessary reboots when assigning LUNs to a host, HP recommends disabling Ftdisk unless you plan to use stripe and volume sets. Disable Ftdisk to prevent it from restarting when the host is rebooted.

When using stripe and volume sets, create an associated LUN group for each set and assign all of the LUNs in the set to the group. Because a stripe or volume set cannot be used unless all of its LUNs are assigned to a host, using associated LUN groups will ensure that all of the necessary LUNs are assigned and unassigned together.

Tip If your stripe and volume sets are configured before Storage Allocater is activated, use the Storage Allocater Activation wizard to assign them to associated LUN groups, and then assign the associated LUN groups to the appropriate host(s).

Configuring stripe and volume sets

You must have Ftdisk enabled if you want to create stripe and volume sets in Disk Administrator or access these sets on a Windows NT host. Ftdisk looks for and attaches to disks when it is loaded—at system startup. If Ftdisk is not enabled when you configure sets, Disk Administrator will enable it and force a reboot.

If LUNs are assigned to a host that already has Ftdisk started, Disk Administrator, which refreshes when it starts up, will let you see them and allow you to go through the motions of creating a set. Because Ftdisk did not find the newly assigned LUNs at system startup, it will not handle the new set(s) properly, and Disk Administrator might quit unexpectedly. Or you may end up with an invalid set that appears to span several LUNs but actually includes just one.

When creating sets, HP recommends the following procedure:

1. Create an associated LUN group that contains the LUNs that will be used to create a stripe or volume set.
2. Assign the associated LUN group to the host that will be used to create the stripe or volume set.

Note For instructions on creating, editing, and assigning associated LUN groups, see the Storage Area Manager online help system.

3. Reboot the host.
4. Create the stripe or volume set. For instructions, see your Windows NT documentation.

Managing LUNs with Windows 2000 dynamic volumes

If you want to create a dynamic volume (for example, a simple, spanned, striped, mirrored, or RAID-5 volume) on Fibre Channel storage, complete the following steps. If you have existing dynamic volumes before Storage Allocater is activated, use the Storage Allocater Activation wizard to assign the volumes to the appropriate associated LUN groups, hosts, and share groups.

1. For dynamic volumes that will span multiple LUNs, assign the LUNs to an associated LUN group. This will prevent the LUNs from being assigned and unassigned separately.
2. Assign the LUN (for simple volumes) or associated LUN group (for spanned, striped, mirrored and RAID-5 volumes) to a host.

Note For instructions on creating, editing, and assigning associated LUN groups, see the Storage Area Manager online help system.

3. If necessary, upgrade the assigned LUNs to dynamic disks.
4. Create the dynamic volume.

Unassigning and reassigning dynamic volumes

If you unassign a LUN or associated LUN group that contains a dynamic volume, when you reassign the LUN or associated LUN group to a host, the dynamic volume might not mount automatically.

Reassign: Same Host

If you unassigned a LUN or associated LUN group that contains a dynamic volume, and then you reassigned it to the host that created the volume, use the following procedure. If you assigned the LUN or associated LUN group to a different host, use the procedure on page 133.

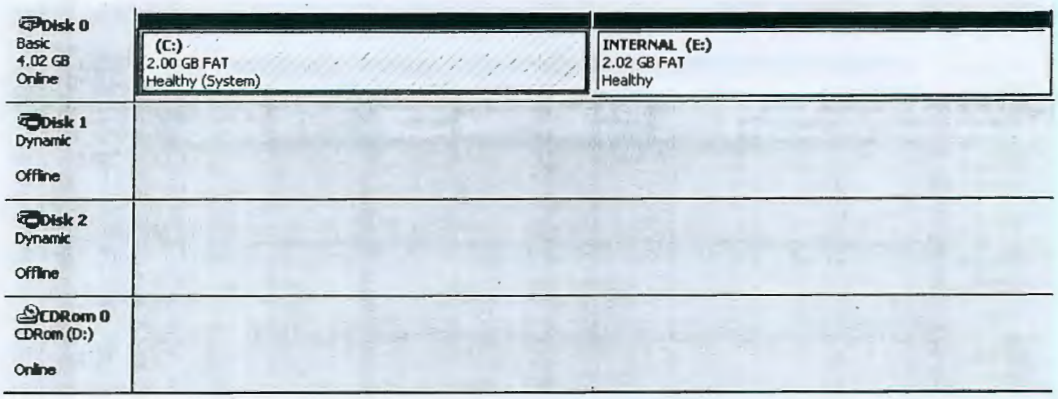
1. To open Disk Management, right-click the My Computer icon and select **Manage**.

2.798 June

2. If you are using Disk Management remotely, right-click **Computer Management (Local)**, click **Connect to another computer**, and then select the computer you want to connect to.

3. In the Computer Management window, expand **Storage** and select **Disk Management**.

   The dynamic disks will be listed with a status of **Offline**.



4. Right-click one of the disks in the volume set and select **Reactivate Disk** in the shortcut menu.

   The dynamic disks will return to **Online** status.

Reassign: Different Host

If you unassigned a LUN or associated LUN group that contains a dynamic volume, and then you reassigned it to a host other than the one that created the volume, use the following procedure.

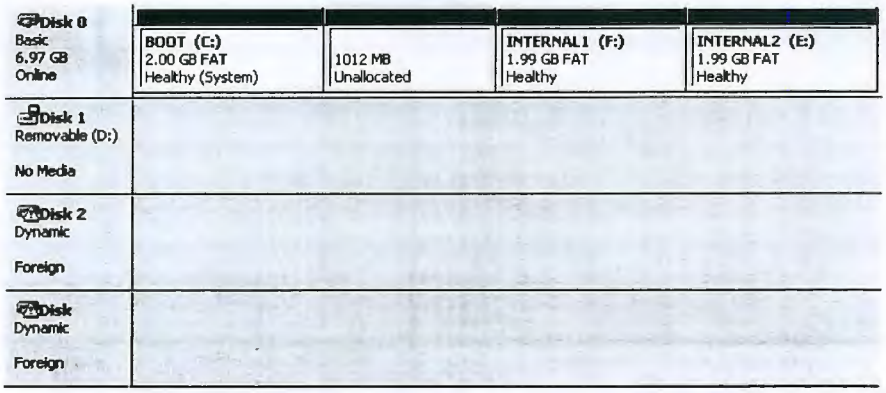
1. To open Disk Management, right-click the My Computer icon and choose **Manage**.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0203
Fls:
Doc: 3701

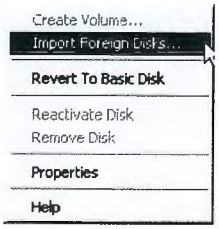
2. If you are using Disk Management remotely, right-click **Computer Management (Local)**, click **Connect to another computer**, and then select the computer you want to connect to.

3. In the Computer Management window, expand **Storage** and select **Disk Management**.

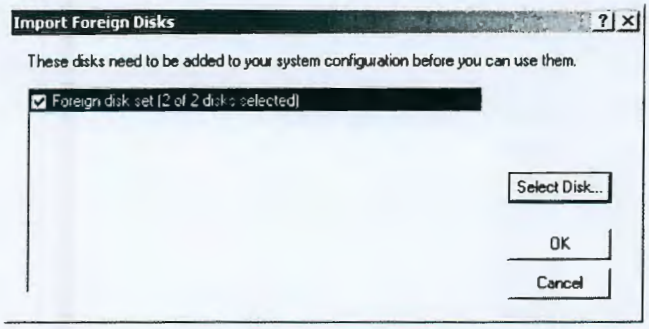
4. The dynamic disks will be listed with a status of **Foreign** because the volume was created by a different host.



5. Right-click one of the disks in the volume set and choose **Import Foreign Disks** in the shortcut menu.

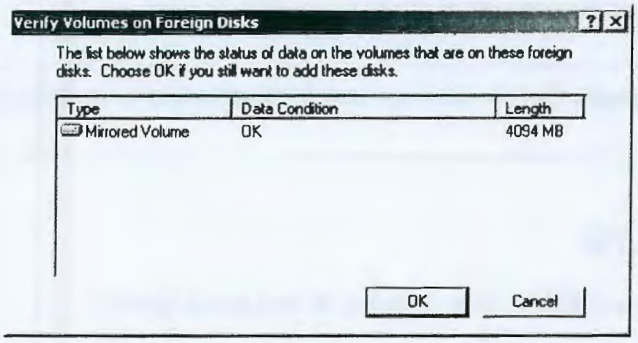


The Import Foreign Disks window appears with the foreign disks selected.



6. Click **OK**.

The Verify Volumes on Foreign Disks window lists the condition of the data on the foreign disks.



7. Click **OK**.

The dynamic disks will return to **Online** status.

Viewing assigned LUNs on HP-UX hosts

When you run **ioscan** on an HP-UX host, only the assigned Fibre Channel LUNs are listed. If no LUNs are assigned to the host, no Fibre Channel LUNs are listed. All of the targets and

ROS Nº 09/2005 - CN
CPMI - CORREIOS
0204
Fls:
3701
Doc:

always listed by their hardware path. In the following example, there are no assigned LUNs.

```
10/1/4/0                    fc                    HP Tachyon TL/TS Fibre Channel Mass Storage Adapter
10/1/4/0.8                      fcp                 FCP Protocol Adapter
10/1/4/0.8.0.255.0                      ext_bus     FCP Device Interface
10/1/4/0.8.0.255.0.0                      target
10/1/4/0.8.0.255.0.2                      target
10/1/4/0.8.0.255.0.3                      target
10/1/4/0.8.0.255.0.4                      target
10/1/4/0.8.0.255.0.5                      target
10/1/4/0.8.0.255.0.6                      target
10/1/4/0.8.0.255.0.7                      target
10/1/4/0.8.0.255.0.8                      target
10/1/4/0.8.0.255.0.9                      target
```

Assigning storage to an HP-UX host

In the Storage Area Manager user interface, assign storage to an HP-UX host.

Note See the Storage Area Manager Online Help system for instructions on assigning storage.

Listing newly assigned LUNs

To list the newly assigned Fibre Channel LUNs, type **ioscan -k** and press **Enter**.

Note When you use the **ioscan -k** command, newly assigned LUNs are listed, but the HP-UX system does not scan for LUNs that have been added to the storage network since the last **ioscan**.

When there are assigned LUNs, running **ioscan** will list the hardware paths to all of the Storage Allocater targets plus the assigned LUNs. For example:

```
10/1/4/0                fc                      HP Tachyon TL/TS Fibre Channel Mass Storage Adapter
10/1/4/0.8                fcp                   FCP Protocol Adapter
10/1/4/0.8.0.255.0                  ext_bus     FCP Device Interface
10/1/4/0.8.0.255.0.0                  target
10/1/4/0.8.0.255.0.2                  target
10/1/4/0.8.0.255.0.3                  target
10/1/4/0.8.0.255.0.3.0                  disk    SEAGATE ST118202 CLAR18
10/1/4/0.8.0.255.0.4                  target
10/1/4/0.8.0.255.0.4.0                  disk    SEAGATE ST118202 CLAR18
10/1/4/0.8.0.255.0.5                  target
10/1/4/0.8.0.255.0.6                  target
10/1/4/0.8.0.255.0.7                  target
10/1/4/0.8.0.255.0.8                  target
10/1/4/0.8.0.255.0.9                  target
```

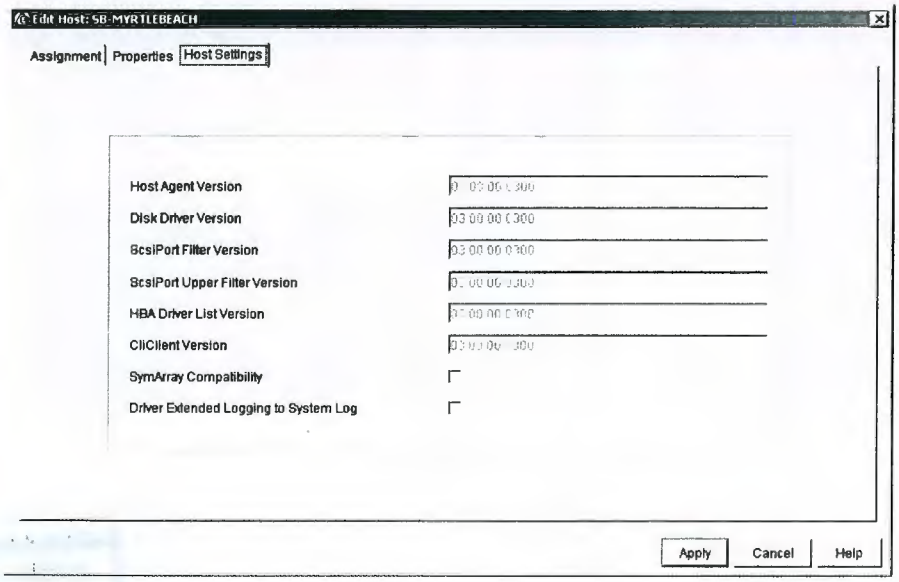
Managing hosts

Modifying Windows NT host settings

Host Settings tab

Use this procedure to edit the registry settings for HP installed services on Windows NT hosts. You can also edit the registry settings with a registry editor, as described on page 139.

1. In the Resources tree, expand **Hosts**.
2. Right-click a Windows NT host and choose **LUN Allocation**.
3. Click the **Host Settings** tab. A window similar to the following appears.



4. To toggle between enabled and disabled status for the SymArray Compatibility, Driver Extended Logging to System Log registry settings, select or clear the corresponding check box.
5. Click **Apply**.
6. Click **Close**.
7. If you changed the SymArray Compatibility setting, reboot the host to activate the changed registry setting.

Registry editor

To edit registry settings with a Windows NT registry editor, run Regedit or Regedt32 and edit the desired settings.

Caution Editing the registry incorrectly may cause serious problems that will require you to reinstall Windows NT. For more information about editing the registry, see your Microsoft documentation.

Table 3 Storage Allocater registry settings

Path:	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\trdisk
Value Name:	SymArrayCompatibility
Value Type:	REG_DWORD
Implicit Default:	0
Purpose:	To modify the behavior of Storage Allocater's TRDISK driver so it gives control of FC60 LUNs to the SymArray (RDAC) driver, whereas normally, TRDISK would control all Fibre Channel disk LUNs. Set this value to 1 to enable SymArrayCompatibility mode, which will allow RDAC failover of FC60 LUNs to work on this host.
Path:	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\trfilter
Value Name:	ExtendedLogging
Value Type:	REG_DWORD
Implicit Default:	0
Purpose:	When ExtendedLogging is enabled, a message indicating that IDs could not be created for pseudo LUNs may be generated and posted to the Windows NT event log every time the SCSI subsystem scans for devices. When ExtendedLogging is disabled, these messages will not appear. Set this value to 1 to enable extended logging.

Moving a host from one management server to another

If you want to move a Storage Allocater host from one management server to another, you must uninstall the Host Agent software from the host, and then reinstall the Host Agent software and activate Storage Allocater from the new management server. This step is required because the Host Agent software is tied to an individual management server that is configured during the installation of the Host Agent software.

1. Unassign all storage from the host and remove the host from any share groups.
2. Detach the host from the storage network.
3. Uninstall the Host Agent software from the host.
4. In the Storage Area Manager Resources tree, right-click the host and select **Delete <host name>** on the shortcut menu.
5. If necessary, connect the host to the same LAN as the new management server, but do not attach it to the storage network.
6. Install the Host Agent software from the new management server and activate Storage Allocater as described in the *hp OpenView storage area manager installation guide.*
7. Attach the host to the storage network.

Managing a "dead" host

If a host goes offline because of a hardware failure and it cannot be brought back online to unassign its storage, use the following procedure to remove the host from the storage network.

1. Detach the host from the storage network.
2. In the Storage Area Manager user interface, right-click the host and choose **Delete <host name>**.
3. When prompted to confirm the deletion, click **Yes**. When the host is deleted, it is removed from the Storage Area Manager database, all of the storage assigned to it is unassigned (which makes it available for assignment to other hosts), and the host is removed from any groups it is assigned to.

Restoring a dead host

- If the host becomes usable, but it is not going to be reattached to the storage network, use the local uninstall procedure to uninstall the Host Agent software from the host. For uninstall instructions, see the *hp OpenView storage area manager installation guide.*
- If the host becomes usable and it is going to be reattached to the storage network and added back into the Storage Area Manager database, then it is not necessary to uninstall the Host Agent software. Just make sure that the host is not attached to the storage network until it has been added back into the Storage Area Manager database via the Ethernet network, and any potential multiple writer situations have been corrected. For more information about multiple-writer situations, see page 196.

Caution Reattaching a host to the storage network is not recommended. If the host is reattached to the storage network before it is added to the database, it will have access to any storage that was unassigned in step 3. If another host already has access to this storage, a multiple-writer situation may occur and cause data corruption.

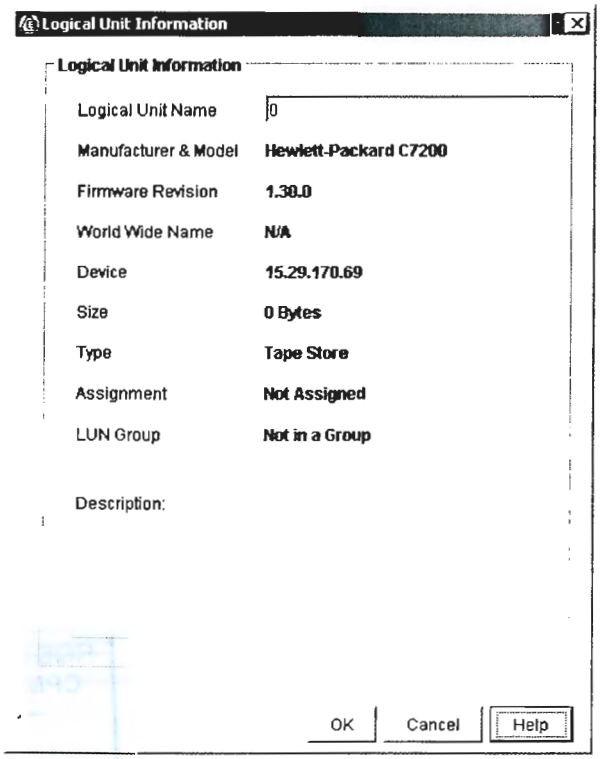
Managing LUNs

Viewing or modifying logical unit information

Use this procedure to view or edit information about a logical unit (LUN).

1. In the Resources tree, expand **Storage Devices** and then a particular storage device.
2. Select **Logical Units** and click the **LUN Allocation** tab.
3. Select a LUN and click the **Edit Selected** button. The Logical Unit Information window appears.



The Logical Unit Information window displays the following items:

- Logical Unit Name: The LUN's name. This name is initially generated by Storage Area Manager, and can be changed in this window.
- The manufacturer and model of the storage device that contains this LUN.
- Firmware Revision: The version of the firmware on the listed LUN.
- The node world wide name of the storage device.
- Device: The name of the storage device that contains this LUN.
- Size: The capacity of the listed LUN.
- Type: The type of storage device that contains the LUN.
- Assignment: The host, associated LUN group, or share group to which the LUN is assigned.
- LUN Group: The LUN group that contains the LUN.
- Description: A description of the LUN.

4. To change the LUN's name, enter a new name in the Logical Unit Name text box
5. To change the LUN's description, enter a new description in the Description box.
6. To close the window and apply any changes to the LUN's name or description, click the **OK** button.

Viewing or deleting missing LUNs

If you are using Storage Allocater, when you delete a storage device from the Storage Area Manager database, use this procedure to delete the storage device's LUNs. If you do not delete the storage device's LUNs, they may be listed in the Edit window even though the device is no longer attached to the storage network.

1. Make sure the storage device is detached from the storage network, and then delete the storage device.
2. Wait a few minutes for the Storage Area Manager database to update.

   Although the storage device has been deleted from the database, its LUNs will still be listed in Storage Allocater's Edit window.
3. Unassign the deleted storage device's LUNs from all hosts and groups.
4. Select **Missing Logical Units** from the **Tools** menu and **Storage Allocater** submenu. The Missing Logical Units window appears with a list of all the missing LUNs and their creation and modification dates.
5. Select the missing LUNs and click the **Delete Selected** button, or click the **Delete All** button.
6. When prompted to confirm the removal of the missing LUNs, click **OK**.

hp OpenView storage allocater interoperability

With FC60 storage arrays

Software for managing storage devices, such as disk arrays and tape libraries, often manages them by issuing SCSI commands to management LUNs on those devices. When Storage Allocater is installed on a storage network, these commands cannot be sent to such a device unless all of the management LUNs are assigned to the host on which the software is running. The same LUNs often represent units of storage as well as management command targets, so it may be necessary to assign storage LUNs to the management host (perhaps temporarily) even though the storage is not needed on that host.

The SM60 software for HP FC60 arrays is an example of such management software. The Universal Xport LUNs from each array must be assigned to a host running the SM60 Agent service. Note that the agent host does not have to be the same host on which you run the SM60 Client GUI, because the client can administer FC60 arrays through remote agents.

FC60: Windows mode

Storage Allocater can be used with HP FC60 storage arrays and the RDAC driver included with the HP Storage Manager 60 software (SM60). SM60 is an application and agent pair that allows you to view and modify the FC60's configuration. The SM60 agent runs as a service (Storage Manager 60 Agent) on any host that is connected to the array.

RDAC is an I/O path failover driver that is installed on all host computers that access the FC60. Typically, a pair of active controllers is located in a storage array. Each logical unit in the array is owned by one controller that provides the I/O path. When a component in the I/O path to the owning controller fails, the RDAC driver transfers ownership of the volumes assigned to that controller to the other controller in the pair, allowing I/O to proceed on the other path, and preventing an I/O failure or interruption.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
0209
Fls:
3701
Doc:

The communication between the SM60 agent and RDAC software and the controllers is done through a special volume (typically LUN 7) called an access volume. Although the access volume is presented as a unit having limited storage capacity, it is designed to handle only configuration command transactions, and cannot be used for standard data storage. The access volumes are listed as **Universal Xport** LUNs in the Storage Area Manager user interface.

For failover or SM60 management to work on any given host, the Universal Xport LUNs must be assigned to that host. HP recommends setting up a share group that includes the storage array controllers' Universal Xport LUNs and all of the hosts that are using that array and RDAC.

Setting Up Storage Allocater with the FC60 and RDAC

To use Storage Allocater with the FC60, complete the following setup procedure after Storage Allocater is installed and activated.

1. Assign all of the Universal Xport LUNs to an associated LUN group.
2. Create a share group.
3. Assign the associated LUN group (from step 1) to the share group.
4. Assign all of the hosts that will access the FC60 to the share group. This includes hosts that are running RDAC or the SM60 agent.

Note For more information about configuring associated LUN groups and share groups, see the Storage Area Manager online help system.

5. On Windows NT hosts only, set the SymArrayCompatibility registry value and reboot.When you use Storage Allocater with RDAC, the SymArrayCompatibility setting is required on all hosts that are connected to the storage array. For more information, see "Modifying Windows NT host settings" on page 138.

Guidelines: Windows NT and Windows 2000

- If the SM60 agent is installed and running before Storage Allocater is activated, the host will start after activation and will not be able to access any LUNs, including the Universal Xport LUNs. To solve this problem, do one of the following:
  - During the initial Storage Area Manager setup, use the Storage Allocater Activation wizard to activate Storage Allocater and assign the Universal Xport LUNs to the host.
  - After activation, assign the Universal Xport LUNs and hosts as described on page 146, and then stop and restart the SM60 agent service. On subsequent reboots, the Universal Xport LUNs will already be assigned, so you do not need to restart the SM60 agent service.
- If all of the Universal Xport LUNs are not assigned to a host that is running the SM60 agent, the agent will not start, and an event will be recorded in the system log.
- If the Universal Xport LUNs and all control/controller LUNs are not assigned to the host(s) that manage the array, Storage Optimizer will not be able to collect performance data from the FC60.

Guidelines: Windows NT Hosts Only:

- When SymArray (the RDAC driver) is used with SymArrayCompatibility enabled, if an FC60 LUN that was not assigned to a host at startup is assigned to the host for the first time, drive letters will not be created automatically for file system volumes or other partitions on the LUN. When you run Disk Administrator, the LUN is listed and displays all partitions on the disk, but no drive letters. Right-click each partition in Disk Administrator and choose **Assign Drive Letter** on the shortcut menu. The assigned drive letter(s) will be persistent across reboots as long as the LUN remains assigned to the host.
- When you assign LUNs to hosts that are using SymArray, you must unassign them with the **Special Unassign** command (page 122).

Doc:

Guidelines: Windows 2000 Hosts Only

- The FC60's access volumes (Universal Xport LUNs) are displayed as **HP Universal Xport** devices in Device Manager.
- When you assign Universal Xport LUNs to a host, the SM60 agent opens a handle to one of the LUNs. Because of this open handle, Storage Area Manager will not allow the LUN to be unassigned. To unassign a Universal Xport LUN, stop the SM60 agent service, and then unassign the LUN.
- When you unassign the last remaining FC60 LUN from a Windows 2000 host, Device Manager may mark the FC60 virtual disk with an exclamation point.

This icon badge can be ignored and will be removed with the next storage assignment or reboot.

FC60: HP-UX mode

The controller firmware for running the FC60 in HP-UX mode automatically creates a 10-megabyte management LUN (LUN 0) on a physical disk in the array. The Array Manager 60 (AM60) software uses this partition to manage the FC60.

Configuring Storage Allocater

When using Storage Allocater with an FC60 that is in HP-UX mode, assign the management LUN to a share group that contains all of the HP-UX hosts that will be used to manage the array. Individual LUNs must be managed from the hosts to which they are assigned.

Tip During the initial Storage Area Manager setup, use the Storage Allocater Activation wizard to activate Storage Allocater and assign the management LUN to a share group containing the appropriate hosts.

Note For instructions on creating and editing share groups, see the Storage Area Manager online help system.

Access to the management LUN controls the ability of AM60 command line utilities, Support Tools Manager (STM), and System Administration Manager (SAM) to display information about the FC60. Each host with access to the management LUN can see all of the FC60 LUNs in AM60, but a host can determine the status of only its assigned LUNs.

Although the management LUN uses just ten megabytes of disk space, HP does not recommend using the remaining disk space for data. In the recommended Storage Allocater/FC60 configuration, the management LUN is dedicated for FC60 management.

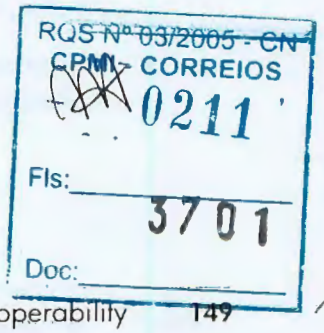
Mounting the Management LUN on an HP-UX Host

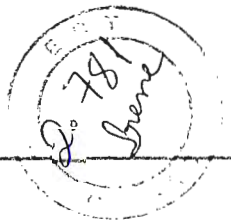
Caution Using the management LUN for data is not recommended.

If you do not want to dedicate an entire disk to FC60 management, HP-UX hosts can use the additional disk space for data. To accomplish this, grow the management LUN to fill the remaining space on the physical disk, and manage LUN access manually. Because HP-UX does not use a presented LUN until it is mounted, the management LUN can be managed by using LVM to mount it on one HP-UX host only. All of the HP-UX hosts in the share group that contains the management LUN will list the management LUN in ioscan, but will not use it if it is not mounted.

Note Do not assign the management LUN to a non-HP-UX host.

Caution Because the management LUN is in a share group, all hosts in the share group are capable of accessing the LUN. If the LUN is mounted on two or more HP-UX hosts, a multiple writer situation will occur and cause data corruption. If you want to use the remaining space on the management LUN for data, and can accept the risk and responsibility associated with managing the LUN manually, this method can be used.





Guidelines: HP-UX Hosts

- When an FC60 is used with Storage Allocater and HP-UX hosts, the **syslog** file on each HP-UX host will contain entries for FC60 LUNs that are not assigned to that host. System Administrators should monitor this file and clear entries as needed.
- If the Universal Xport LUNs and all control/controller LUNs are not assigned to the host(s) that manage the array, Storage Optimizer will not be able to collect performance data from the FC60.

With AIX cfgmgr

When Storage Allocater is installed on an AIX host, cfgmgr is affected in the following ways:

- A backup copy of /usr/sbin/cfgmgr is copied to /usr/sbin/LMcfgmgr. Do not delete the backup copy of cfgmgr.
- Storage Allocater's version of cfgmgr is copied into /usr/sbin/cfgmgr, replacing the original version.
- The system database /etc/security/sysck.cfg is updated.

Storage Allocater's version of cfgmgr is required in order to preserve LUN security on AIX hosts. If you need to install a system patch that will change cfgmgr, do the following:

1. Enter **/opt/sanmgr/hostagent/sbin/trlmcheck -prepatch**
2. Install the system patch that affects cfgmgr.
3. Enter **/opt/sanmgr/hostagent/sbin/trlmcheck -postpatch**
4. Verify that Storage Allocater's version of cfgmgr is running by entering the following command: **strings /sbin/cfgmgr | grep StorageAllocater**
   - If this command produces output, then the Storage Allocater version of cfgmgr is present, and this procedure is complete.
   - If this command does not produce output, the Storage Allocater version of cfgmgr is no longer in the /usr/sbin/cfgmgr directory. Start again with step 3.

With HP-UX ioscan

When Storage Allocater is installed on an HP-UX host, ioscan is affected in the following ways:

- A backup copy of /sbin/ioscan is copied to /sbin/LMscan. Do not delete the backup copy of ioscan.
- Storage Allocater's version of ioscan is copied into /sbin/ioscan, replacing the original version.

Storage Allocater's version of ioscan is required in order to preserve LUN security on HP-UX hosts. If you install a system update, it is possible that Storage Allocater's ioscan could be replaced by the standard version of ioscan. After updating the system software, use the following procedure to verify that Storage Allocater's ioscan is in /sbin/ioscan.

1. Run the following command: **strings /sbin/ioscan | grep StorageAllocater**.
   - If this command produces output, then the Storage Allocater version of ioscan is present, and this procedure is complete.
   - If this command does not produce output, the Storage Allocater version of ioscan is no longer in the /sbin/ioscan directory. Continue with step 2.
2. Back up the standard version of ioscan with the following command: **cp /sbin/ioscan /sbin/LMscan**
3. Use the following command to copy the Storage Allocater version of ioscan to the /sbin/ioscan directory: **cp /opt/sanmgr/hostagent/sbin/ioscan /sbin/ioscan**
4. Run **/sbin/ioscan**

With HP-UX Storage Data Protector and hp StorageWorks virtual arrays

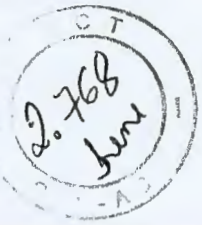
Before running a snapshot backup with hp OpenView Storage Data Protector 5.0 and a va7100, va7400, or va7410, perform the following configuration steps:

1. Using Command View SDM, create a business copy LUN for a "parent" LUN on the storage array.
2. After the business copy LUN is discovered by Storage Area Manager, assign it to the host that will perform the backup. This is the host to which the tape drive is assigned.
3. Configure Storage Data Protector for a new Snapshot backup/HP Surestore VA backup. When configuring Data Protector enable the following items in the Special Options window:
   - Use existing snapshot
   - After a successful session, leave the created snapshot

With Linux device files

For automatic mounting of file systems to work properly, a device that is mapped to a specific controller, bus, target, and LUN on a host must map to the same controller, bus, target, and LUN after the host is rebooted. Due to a limitation in the Linux SCSI subsystem, it is not guaranteed that the controller, bus, target, and LUN for a device will remain the same after a reboot. Because of this limitation, the device file that represented LUN-X before a reboot can map to LUN-Y after a reboot.

Storage Allocater for Linux handles the problem of device file persistence across reboots by creating RUID-based device file names for assigned LUNs. RUIDs provide a unique LUN ID that is independent of the unit's controller, bus, target, and LUN mapping. RUID-based device file names remain the same for a LUN even after a reboot. If you use RUID-based device file names when mounting LUNs on Linux hosts, device file persistence is ensured across reboots.



The following example shows sample commands for mounting partitions of a LUN with the standard disk driver specific device files that exist under the /dev directory:

```
mount /dev/sdd mnt/test4
mount /dev/sdd1 mnt/test5
```

The following example shows sample commands for mounting partitions of a LUN with the RUID-based device file name 931E132CR30008R700010201002R50002037112DB3-0:

```
mount /dev/trdisk/931E132CR30008R700010201002R50002037112DB3-0-1 /mnt/test1
mount /dev/trdisk/931E132CR30008R700010201002R50002037112DB3-0-2 /mnt/test2
mount /dev/trdisk/931E132CR30008R700010201002R50002037112DB3-0-3 /mnt/test3
```

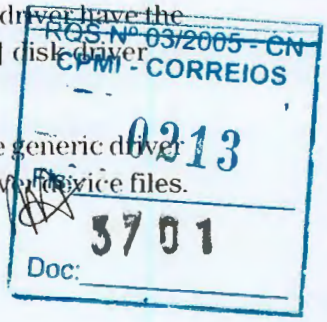
To mount file systems automatically at startup, add them to the **/etc/fstab** file. In the following example, three partitions of a LUN with the RUID-based device file name 931E132CR30008R700010201002R50002037112DB3-0 (shown in bold text) have been added to the fstab file.

```
[root@sb-iso6 trdisk]# cat /etc/fstab
LABEL=/                 /                       ext2    defaults        1 1
LABEL=/boot             /boot                   ext2    defaults        1 2
/dev/fd0                /mnt/floppy             auto    noauto,owner    0 0
none                    /proc                   proc    defaults        0 0
none                    /dev/pts                devpts  gid=5,mode=620  0 0
/dev/sda6               swap                    swap    defaults        0 0
/dev/cdrom              /mnt/cdrom              iso9660 noauto,owner,kudzu,ro 0
0
/dev/trdisk/931E132CR30008R700010201002R50002037112DB3-0-1 /mnt/test1 ext2 rw 0 0
/dev/trdisk/931E132CR30008R700010201002R50002037112DB3-0-2 /mnt/testi2 ext2 rw 0 0
/dev/trdisk/931E132CR30008R700010201002R50002037112DB3-0-3 /mnt/test3 ext2 rw 0 0
/dev/sdd                /mnt/test4              ext2 rw 0 0
/dev/sdd1               /mnt/test5              ext2 rw 0 0
```

About RUID-based device files

On Linux hosts, Storage Allocater filters all of the LUNs seen by the following Linux drivers: **sd** (disk driver), **sg** (generic driver), and **st** (tape driver).

- The RUID-based disk device files created for disk LUNs seen by the disk driver have the same characteristics as the standard **/dev/sd[a-z]** and **/dev/sd[a-z][a-z]** disk driver device files.
- The RUID-based generic device files created for generic LUNs seen by the generic driver have the same characteristics as the standard **/dev/sg[0-255]** generic driver device files.



- The RUID-based tape device files created for tape LUNs seen by the tape driver have the same characteristics as the standard **/dev/st[0-32]** and **/dev/nst[0-32]** tape driver device files.

Since the RUIDs are lengthy for certain LUNs, Storage Allocater uses a compressed form of the RUID to create device file names that fit within 256 characters. Storage Allocater's RUID-based device files are present under three Storage Allocater-specific directories: **/dev/trdisk**, **/dev/trgen**, and **/dev/trtape**. These directories contain the device files for the disk driver, the generic driver, and the tape driver, respectively.

- Any LUN that is seen by the disk or tape driver will also be seen by the generic driver.
- The generic driver may see LUNs that are not seen by the disk or tape driver, for example, media changers.

Device file names: Disk LUNs

For the disk LUNs seen by the disk driver, the **/dev/trdisk** directory contains RUID-based device files in the format <COMPRESSED_RUID>-<PATH_NO>-<PARTITION_NO> where COMPRESSED_RUID is the RUID-based file name, PATH_NO differentiates between multiple paths to the same LUN, and PARTITION_NO is a specific partition on the disk.

If you run the **ls** command under the **/dev/trdisk** directory, 15 partitions and a representation of the entire disk are listed for each Fibre Channel disk. For example:

```
[root@sb-iso4 trdisk]# ls

7541202F001R8000102010050060BR500092519002DR01006C-0

7541202F001R8000102010050060BR500092519002DR01006C-0-9
```

Device file names: Generic LUNs

For generic LUNs seen by the generic driver, which includes disk LUNs and tape LUNs, the **/dev/trgen** directory contains RUID-based device files in the format <COMPRESSED_RUID>-<PATH_NO> where COMPRESSED_RUID is the RUID-based device name and PATH_NO differentiates between multiple paths to the same LUN. There is no partition number for generic device listings because the concept of partitions does not exist for generic LUNs. When dealing with disks, generic device files always refer to the entire disk. For example:

```
[root@sb-iso4 trgen]# ls

7541202F001R8000102010050060BR500092519002DR01006C-0

Doc:

Device file names: Tape LUNs

For tape LUNs seen by the tape driver, the **/dev/trtape** directory contains RUID-based device files in the format [n]<COMPRESSED_RUID>-<PATH_NO> [-<DEVICE_CHARACTERISTICS>] where n is present for tape LUNs with no-rewind functionality, and n is absent for tape LUNs with rewind capability. COMPRESSED_RUID is the RUID-based device name, PATH_NO differentiates between multiple paths to the same LUN, and DEVICE_CHARACTERISTICS pertains to characteristics of the tape LUN.

Each tape LUN is represented by 8 RUID-based device file entries that correspond to the eight minor device numbers a tape device can have. For example:

```
[root@sb-iso4 trtape]# ls
5E09E202R30008R7000102010100E09E6R50009D3F-0
5E09E202R30008R7000102010100E09E6R50009D3F-0-a
5E09E202R30008R7000102010100E09E6R50009D3F-0-1
5E09E202R30008R7000102010100E09E6R50009D3F-0-m
n5E09E202R30008R7000102010100E09E6R50009D3F-0
n5E09E202R30008R7000102010100E09E6R50009D3F-0-a

n5E09E202R30008R7000102010100E09E6R50009D3F-0-m
```

Note

Eight RUID-based device files are created whether or not the corresponding st files exist.

For additional information about the st driver and minor numbers, see the man pages for st.

2.764
fls.

Viewing RUIDs on Linux hosts

After Storage Allocater is activated on a Linux host, and before LUNs are assigned to the host, all of the RUIDs of LUNs seen by the host are listed as DISABLED when you perform a **cat** operation on /proc/trfilter. For example:

```
[root@sb-iso4 /root]# cat /proc/trfilter
 RUID                                                              STATUS
 4741122F00100000000102010050060B0000092519001F00000000005E      DISABLED
 6441042F00100000000102010050060B00000925190009000000000007D     DISABLED
 4441132F00100000000102010050060B0000092519001E00000000005D      DISABLED
 6B413C2F00100000000102010050060B00000925190031000000000072      DISABLED
 7541202F00100000000102010050060B0000092519002D00000000006C      DISABLED
 7B412E2F00100000000102010050060B00000925190023000000000062      DISABLED
 6541052F00100000000102010050060B00000925190008000000000007C     DISABLED
 4141142F00100000000102010050060B00000925190019000000000058      DISABLED
 5041062F00100000000102010050060B0000092519000B000000000049      DISABLED
```

When a LUN is assigned to a Linux host, even if there is no visible path to the LUN, the RUID for that LUN is displayed as ENABLED in the list of RUIDs. This means that the results of a **cat** operation on **/proc/trfilter** may not reflect whether the LUN is visible to the host. If an assigned (enabled) LUN for which no physical path exists is unassigned (disabled), the RUID will be marked as DISABLED, even though the host was never able to access the LUN.

Note When a LUN is assigned to a host, but it is not visible on the host, a message appears in the Storage Area Manager event panel. For more information, see page 194.

Doc:

With Linux tape LUNs

Due to limitations in the Linux SCSI tape subsystem, when you use Storage Allocater to assign and unassign tape LUNs on Linux hosts, RUID device links may not be created immediately in the **/dev/trtape** and **/dev/trgen** directories (it may take about two seconds per LUN for RUID device links to be created).

When you assign a tape library to a Linux host, the media changer always appears as a generic LUN on the Linux host, which means that the RUID-based device file entry for the changer can be found only in the **/dev/trgen** directory, not in the **/dev/trtape** directory.

With Linux 16-byte CDBs

By default, the Linux SCSI subsystem uses 12-byte command descriptor blocks (CDBs). In order to use certain third-party applications, such as Command View SDM for Linux, you must patch the SCSI subsystem to use 16-byte CDBs.

When Storage Allocater is activated on a Linux host, the Storage Allocater drivers are configured for the current CDB setting.

To support 16-byte CDBs, change the value of MAX_COMMAND_SIZE (in the scsi.h file) from 12 to 16 and rebuild the kernel.

If a Linux host's SCSI subsystem is patched for 16-byte CDB support when Storage Allocater is already active, enter the following command before rebooting with the new kernel image: **/opt/sanmgr/hostagent/sbin/trlminstall.sh -postpatch**

With Linux Command View SDM

If Command View SDM is installed on a Linux host after Storage Allocater is activated on the host, see the preceding section, "Storage Allocater interoperability with Linux 16-byte CDBs."

With Solaris HBAs

Adding or upgrading an HBA driver

When you activate Storage Allocater on a Solaris host, the installation edits /etc/driver_classes by changing the default class of the HBA driver from **scsi** to **tran_scsi**. This change is required for Storage Allocater to run properly on Solaris hosts.

Note When you activate Storage Allocater, the fcaw driver (JNI-Sbus) is removed from /etc/driver_classes.

If you install a new HBA driver, or upgrade the HBA driver on a Solaris host, Storage Allocater will not recognize the driver automatically.

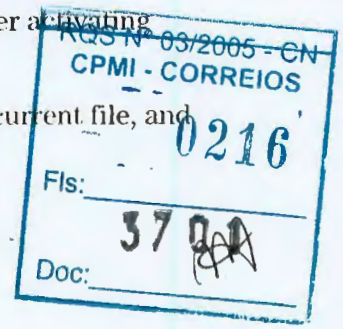
- If you are prompted to reboot after installing or upgrading a Solaris HBA driver, run the **/opt/sanmgr/hostagent/sbin/trlminstall.sh -hbaconf** script and then reboot the Solaris host.
- If you are not prompted to reboot after the HBA driver installation or upgrade, run the **/opt/sanmgr/hostagent/sbin/trlminstall.sh -hbaconf** script and then, if prompted, reboot the host.

HBA driver configuration

When you install and activate Storage Allocater on a Solaris host, the installation and activation process makes entries in the **kernel/drv/<driver_name>.conf** file, where <driver_name> is the name of your HBA driver. Later, if you run the configuration utility that came with your HBA driver, these entries may be overwritten. If this occurs, you will notice that all of the Fibre Channel storage that is assigned to the host will no longer be accessible.

HP recommends backing up the **kernel/drv/<driver_name>.conf** file after activating Storage Allocater and rebooting a Solaris host.

If assigned storage becomes inaccessible, compare the backup file to the current file, and re-enter any settings that were changed by the configuration utility.



With Solaris tape and nondisk devices

Storage Allocater's filter driver does not handle tape and other nondisk devices. To use these devices, you must configure the filter driver to allow nondisk devices to be handled by the appropriate drivers when these LUNs are assigned to Solaris hosts.

1. Open the /kernel/drv/sd_fcst.conf file.

   If LUNs have been assigned to the host, the file will be similar to the following:

```
RUIDS = "dummy"
,"68280475002800000000102020D5553534130383032333936334850202020202020

;

max_luns_per_target=256;
name="sd_fcst" class="tran_scsi"
target=255 lun=0;
```

ECT 2.760 fls

The RUIDs correspond to the LUNs that are assigned to the host. If there are no LUNs assigned to the host, the file is similar to the following:

```
RUIDS = "dummy"
;
max_luns_per_target=256;
name="sd_fcst" class="tran_scsi"
target=255 lun=0;
```

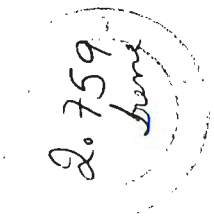
2. To specify a driver to use with a particular class of devices, add a DriverSwitchTable after the semicolon that follows the list of RUIDs, and before the max_luns_per_target entry. For example:

```
RUIDS = "dummy"
;
DriverSwitchTable =
"01", "st",
"0d", "ses";

max_luns_per_target=256;
name="sd_fcst" class="tran_scsi"
target=255 lun=0;
```

The first entry corresponds to a LUN type as reported by the LUN's inquiry page, and the second entry is the installed driver that handles this type of device. In the example in step 2, **01** (tape) is the LUN type and **st** is the magnetic tape driver.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0217
Fls:
Doc: 3701



Possible values include:

00h SBC Direct-access device (magnetic disk)
01h SSC Sequential-access device (magnetic tape)
02h SSC Printer device
03h SPC Processor device
04h SBC Write-once device (some optical disks)
05h MMC CD-ROM device
06h SCSI-2 Scanner device
07h SBC Optical memory device (some optical disks)
08h SMC Medium changer device (jukeboxes)
09h SCSI-2 Communications device
0Ah – 0Bh Defined by ASC IT8 (graphic arts prepress devices)
0Ch SC-2 Storage array controller device (RAID)
0Dh SES Enclosure services device
0Eh RBC Simplified direct-access device (magnetic disk)
0Fh OCRW Optical card reader/writer device

If you install a driver for a class of devices that does not have a standard driver, you must add the driver to this list and reboot the host.

3. In order to allow a nondisk device's driver to handle an assigned LUN, force the nondisk driver to load before Storage Allocater's filter driver by editing the /etc/system file; for example, if a tape drive is assigned to the host, add the lines:

   forceload: drv/st
   forceload: drv/sd_fcst

   This will cause the system to load **st**, the tape device driver, before **sd_fcst**, the Storage Allocater filter driver.

Note If there are no forceload entries in the file, enter the appropriate information at the end of the file. If the forceload: drv/sd_fcst entry already exists, enter the nondisk driver's information above it. If the nondisk driver's entry already exists, enter the sd_fcst information after it.

4. Save the file and reboot the host.

With Solaris Omniback II, Data Protector, and tape libraries

If hp OpenView Storage Data Protector or hp OpenView Omniback II is configured to use a tape library, it installs the medium changer device driver **sst** on each Solaris host. The medium changer device is the robot arm that moves tapes from their storage slots to the tape drive for backup/restore operations, and moves them back when done.

Note To verify that the **sst** driver is installed, look for the file **/kernel/drv/sst**

To configure a Storage Allocater Solaris host so it can use Storage Data Protector or Omniback II with an assigned tape library LUN, perform the following procedure:

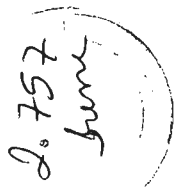
1. Open the /kernel/drv/sd_fcst.conf file.
2. Using the following values, modify the existing DriverSwitchTable. If no DriverSwitchTable exists, add one after the semicolon that follows the list of RUIDs, and before the max_luns_per_target entry:

```
RUIDS = "dummy"
;
DriverSwitchTable =
"01","st",
"08","sst";
max_luns_per_target=256;
name="sd_fcst" class="tran_scsi"
target=255 lun=0;
```

The first entry corresponds to a LUN type as reported by the LUN's inquiry page, and the second entry is the installed driver that handles this type of device. In Step 2, 01 (tape) and 08 (media changer device) are the LUN types, **st** is the magnetic tape driver, and **sst** is the medium changer device driver.

Note When using Storage Data Protector or Omniback II with Storage Allocater, **sst** is the only supported SCSI media changer device driver.

ROS Nº 03/2005 CN
CPMI - CORREIOS
0218
Fls:
3701
Doc:



3. In order to allow the nondisk device drivers **st** and **sst** to handle an assigned tape library, edit the **/etc/system** file to force the drivers to load before Storage Allocater's filter driver (**sd_fcst**). The forceload commands can be added to any section of the **/etc/system** file, but they must be in the following order:

   forceload:drv/st
   forceload:drv/sst
   forceload:drv/sd_fcst

4. Save the file and reboot the host.

With Solaris SecurePath

After Storage Allocater is active on a Solaris host, if you need to run the SecurePath configuration utility (necessary when adding new storage arrays), complete the following procedure:

1. Open the /kernel/drv/sd_fcst.conf file.

2. Using the following values, modify the existing DriverSwitchTable. If no DriverSwitchTable exists, add one after the semicolon that follows the list of RUIDs, and before the max_luns_per_target entry:

```
RUIDS = "dummy"
;
DriverSwitchTable =
"0C","cpqccl";
max_luns_per_target=256;
name="sd_fcst" class="tran_scsi"
target=255 lun=0;
```

   The first entry corresponds to a LUN type as reported by the LUN's inquiry page, and the second entry is the installed driver that handles this type of device. In Step 2, 0C (SCSI processor device) is the LUN type, and **cpqccl** is the SecurePath driver for SCSI processor devices.

3. In order to allow the nondisk device driver **cpqccl** to handle an assigned SCSI processor device, edit the **/etc/system** file to force the driver to load before Storage Allocater's filter driver (**sd_fcst**). The forceload commands can be added to any section of the **/etc/system** file, but they must be in the following order:

   forceload:drv/cpqccl
   forceload:drv/sd_fcst

4. Save the file.
5. Assign the Compaq storage array's controller LUN to the Solaris host.
6. After successfully running the SecurePath configuration utility, run **/opt/sanmgr/hostagent/sbin/trlminstall.sh -hbaconf**, which will cause Storage Allocater to reflect the new changes to the system.
7. Reboot the host.

With Windows NT Disk Administrator

Disk Administrator is the utility provided with Windows NT for managing disk partitions. It discovers the disks and partitions attached to a host only at the time that the program starts running.

Disk Administrator does not hold disks open, and the View → Refresh menu item does not actually detect the addition or removal of storage since the time Disk Administrator started. For this reason, although it is possible to change the storage assignments of a host while Disk Administrator is running, HP does not recommend doing so. For example, if a LUN is unassigned from a host, and the partitions for that LUN are changed in Disk Administrator, the program may encounter unexpected errors or exit abruptly without committing changes.

If a LUN is assigned to a host while a disk is being partitioned in Disk Administrator, the new partitions may display incorrect partition information that belongs to the newly assigned LUN. If this occurs, exit the Disk Administrator application and then start the application again.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0219
Fls:
3701
Doc:

In some cases, LUNs that have been unassigned are still listed in Disk Administrator with "Off-Line" status. This does not mean that the storage is still accessible to the host. The Storage Allocater disk driver maintains these "disks" as placeholders so Disk Administrator and other storage administration software can successfully find the disks that are still assigned.

With Windows NT Performance Monitor

Performance Monitor, an application provided with the Windows NT operating system, is a graphical tool that measures a computer's performance. The Performance Monitor disk filter driver (Diskperf) layers over disk drivers such as Storage Allocater's trdisk. All disk I/O originating in higher-level drivers and applications passes through Diskperf, which collects performance statistics and reports them to the Performance Monitor application.

Potential problems

- The filter driver is not loaded until it is enabled (`diskperf -y`) and the computer is restarted.
- The filter has to attach to the disk before the file system mounts the disk. If the file system mounts the disk first, the filter cannot insert itself between the file system and disk, so none of the file system activity is noted. For this reason, starting the Diskperf driver through Windows control panel (Devices) will not allow you to collect performance information because the file system drivers have already mounted the disk.
- The filter driver only looks for and attaches to disks when it is loaded—at startup. If LUNs are assigned to the host afterwards, the filter driver will not filter them and no performance information can be collected for them. If you want to collect performance information for assigned Fibre Channel LUNs, assign the LUNs and reboot the host.
- Storage Allocater allows you to unassign a LUN from a host with Diskperf loaded, but if you reassign the LUN to the host, Diskperf will not filter it until the host is rebooted.

With Windows NT SCSIPORT

To optimize the interaction of Storage Allocater and SCSIPORT, enter the following registry settings.

Caution Editing the registry incorrectly may cause serious problems that will require you to reinstall Windows NT. For more information about editing the registry, see your Microsoft documentation.

Path:	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Disk
Value Name:	ScanDisconnectedDevices
Value Type:	REG_DWORD
Implicit Default:	0
Recommended Value:	1
Purpose:	Modifies SCSIPORT device scan logic: Set this value to 1 to discover LUNs that exist but return "disconnected" status when queried.
Path:	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Disk
Value Name:	LunRescan
Value Type:	REG_STRING
Implicit Default:	N/A
Recommended Value:	""
Purpose:	Modifies SCSIPORT device scan logic: Set this value to "" (empty string) to cause scans to look for new LUNs on targets that have previously been scanned. Delete this value to skip the rescan behavior.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0220

Doc: 3701

LUNs greater than 7

Windows NT's SCSIPORT driver has a limit of eight LUNs per target (numbers 0–7), which prevents Storage Allocater and other applications and drivers from seeing devices with LUNs greater than 7.

To configure SCSIPORT to support LUNs greater than 7, use the LargeLuns registry setting.

Caution Editing the registry incorrectly may cause serious problems that will require you to reinstall Windows NT. For more information about editing the registry, see your Microsoft documentation.

Path:	HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\<HBA driver name>\Parameters\Device[N]
Value Name:	LargeLuns
Value Type:	REG_DWORD
Implicit Default:	0
Recommended Value:	1
Purpose:	Modifies SCSIPORT device scan logic: Set this value to 1 to scan for LUNs greater than 7.

Note The number N appended to the device name is optional. It identifies the SCSIPORT device instance (adapter) that the setting applies to. Omitting the number applies the setting to all adapters controlled by the HBA driver.

The <HBA driver name> corresponds to the file name of your HBA driver.

Physical and logical space

Storage Builder displays capacity information independently for hosts, NAS devices, and storage devices, but host and device capacity are actually two views of the same space. When you view capacity on a host, you see an analysis of its file systems. File systems are logical space that is physically distributed on various storage and NAS devices. Conversely, when you view capacity on a storage device, you see the physical space that contains parts of various file systems (logical space). In figure 3, matching fill patterns show where the same space appears as logical space on a host or NAS device and as physical space on a storage device.

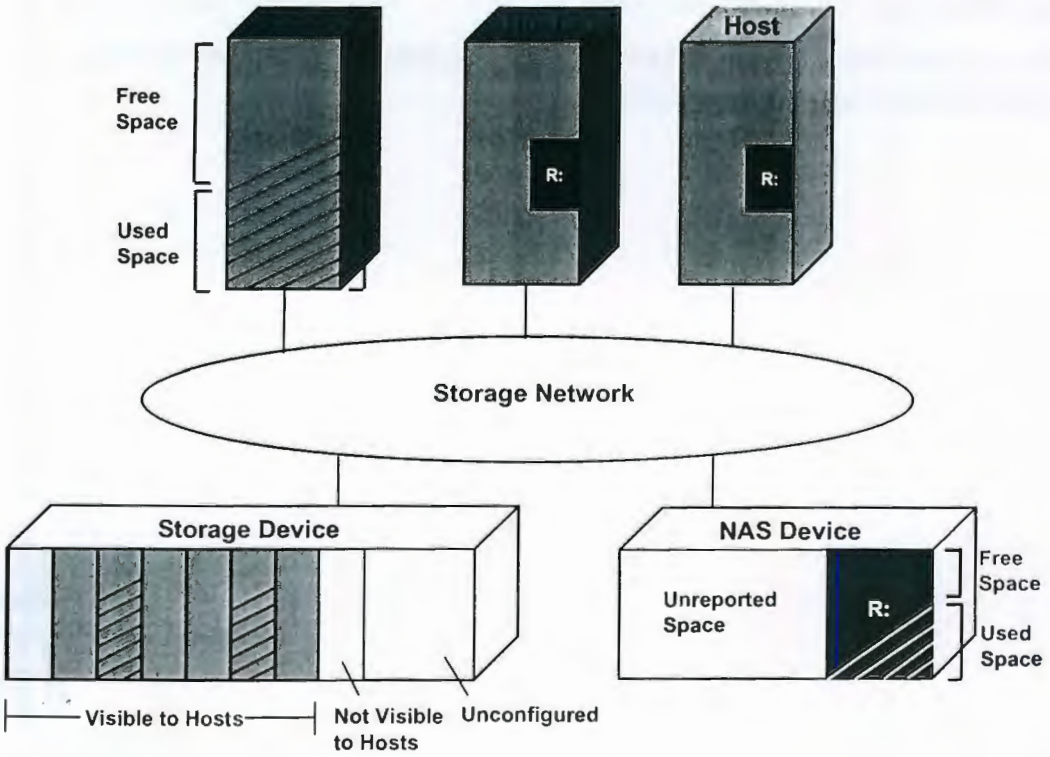

Figure 3 Physical and logical views of storage capacity

ECT 2863 Irene CPL - A

Definition of terms

The terms shown in figure 3 have the following meanings in Storage Builder:

- **Free space** is unused space in a host's or NAS device's file systems. File systems are created on physical space, but their capacity does not equal the size of the assigned physical space. Some physical space is consumed by system overhead. Also, the capacity that you see when you select a host may include file systems that reside on devices not discovered by Storage Area Manager.
- **Used space** is file system space that is occupied by files. You see used space when you select a host or NAS device and view its capacity.
- **Visible to Hosts** denotes disk or LUN space that has a physical path to one or more Storage Area Manager hosts. A host can "see" space that it does not have access to because Storage Allocater or another logical management tool has assigned the space to another host.
- **Not Visible to Hosts** denotes formatted disk or LUN space that is not reported by a Storage Area Manager host. The space may be used by hosts that have no Storage Area Manager Host Agent.
- **Unconfigured space** is raw, unformatted disk space. The term applies specifically to disk arrays, before the space is allocated to LUNs..

About NAS devices

Storage Builder discovers space on a NAS device through host data collection, but the space is reported with the NAS device. Figure 3 shows NAS device space mounted as drive R: on two hosts.

Note NAS device space must be mounted on a UNIX host to be discovered by Storage Builder.

Capacity data collection

Storage Builder collects capacity information about storage devices, NAS devices, hosts, volumes, volume groups, directories, files, and users. All this information is typically collected several times a day and saved for as long as past data is needed, or as long as there is space for the growing database.

Storage Builder collects capacity information about storage devices, NAS devices, hosts, volumes, volume groups, directories, files, and users. Information about storage devices is collected by Storage Area Manager during the discovery cycle. All other capacity information is collected by three Storage Builder collectors deployed with Storage Area Manager Host Agents:

- The volume data collector collects the used and free space in a volume's file systems, the size of the volume, and the association of logical volumes with LUNs and volume groups on the selected host.
- The file data collector collects the size and activity of the files and directories on the selected host. File data must be collected to manage directories, report files, monitor user consumption, and determine the space needed for backups.

Note File data cannot be collected for NAS devices on Windows NT and Windows 2000 systems. NAS device capacity is reported only for volumes that are mounted on UNIX hosts.

- The user data collector identifies the users on the selected host. If the host is a domain controller or NIS (Network Information Name Service) server, all users are identified. Otherwise, only the local users are identified. The capacity associated with user accounts is collected by the file data collector.

ECT 2861 Bene

Scheduling capacity collection

Use this procedure to change Storage Builder's schedules for collecting capacity information on users, files, and volumes.

1. Select **Configure** from the **Tools** menu.

Note To edit the collection schedule for a single host, you may want to select the host in the Resources tree and click the **Configure** button in the host's Capacity view panel.

2. Select **Capacity Collection** under **Scheduling** in the Configuration tree. The Capacity Collection scheduling panel displays a list of hosts and the dates and times of the next scheduled collections on each. You can filter the list by selecting an organization in the Show Organization box.
3. Select the host(s) whose schedule(s) you want to change. (To select multiple hosts, use the Shift or Control key.)
4. Click the **Set Schedule** button at the top of the view panel.
5. Click the tab of the data collector—volume, file, or user data—that you want to change.
6. To enable or disable collection of the selected data, click the **Enable Data Collection** check box. Enabling data collection activates other text boxes in the window.
7. Once collection is enabled, specify the hours of collection as follows:
   - Enter the hour (0 through 24) and the minute (0 through 59) of the first collection of the day in the Start at boxes.
   - For periodic collections until the end of the day, check the Repeat box, and in the box at the right enter the number of hours that will elapse between each collection.
8. In the Collection Days section, select each day of the week that data will be collected. The hours specified in Collection Hours will apply to each day you select.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0223
Fls: 3701
Doc:

Note Whenever you want to return the settings to the factory defaults, click the **Restore Defaults** button.

9. To change another capacity collection schedule for the same host, click its tab and repeat steps 6 through 8.
10. When you are satisfied with the volume, file, and user data schedules, click **OK** in the Edit Collection Schedules window.
11. Click the **Apply** button in the Capacity Collection scheduling panel to implement your schedule changes and continue scheduling collection for other hosts, or click **OK** to apply your changes and close the Configuration window.

Collecting interim capacity data

Use this procedure to pre-empt the collection schedule and collect capacity data immediately on a selected host. The procedure displays the Start Hostagent Data Collection window and allows you to choose which type of data to collect:

Data will appear in Capacity view panels after it is collected and stored in the database. Depending on the amount of data requested and other factors, this may take awhile.

Note If the host or Host Agent is unavailable, or if the capacity data collector is busy when you attempt to start collection, a Storage Builder event will alert you that data collection failed to start. You should check the status of the Host Agent and the Storage Builder data collectors on the specified host.

1. Select **Configure** from the **Tools** menu.
2. Select **Capacity Collection** under **Scheduling** in the Configuration tree. The Capacity Collection scheduling panel displays a list of hosts and the next scheduled collections on each. You can filter the list by selecting an organization in the Show Organization box.
3. Select the host(s) that you want to collect data from. (Use the Shift or Control key to select multiple hosts.)

Doc: 3701

hp OpenView storage area manager bridge

hp OpenView Storage Area Manager Bridge, called the Bridge in the rest of this chapter, is an HTTP server that gives other applications access to Storage Area Manager data and functions (see figure 6). It is automatically installed with Storage Area Manager and runs continuously with other Storage Area Manager services on the management server. You can see the Bridge in Windows' list of services accessed from Control Panel.

With this release (Storage Area Manager 3.0), the Bridge handles requests for consolidated Storage Area Manager data from the following applications:

- hp OpenView Operations (UNIX and Windows)
- hp OpenView Reporter
- hp OpenView Service Desk

Data is returned to the requesting application in XML format.

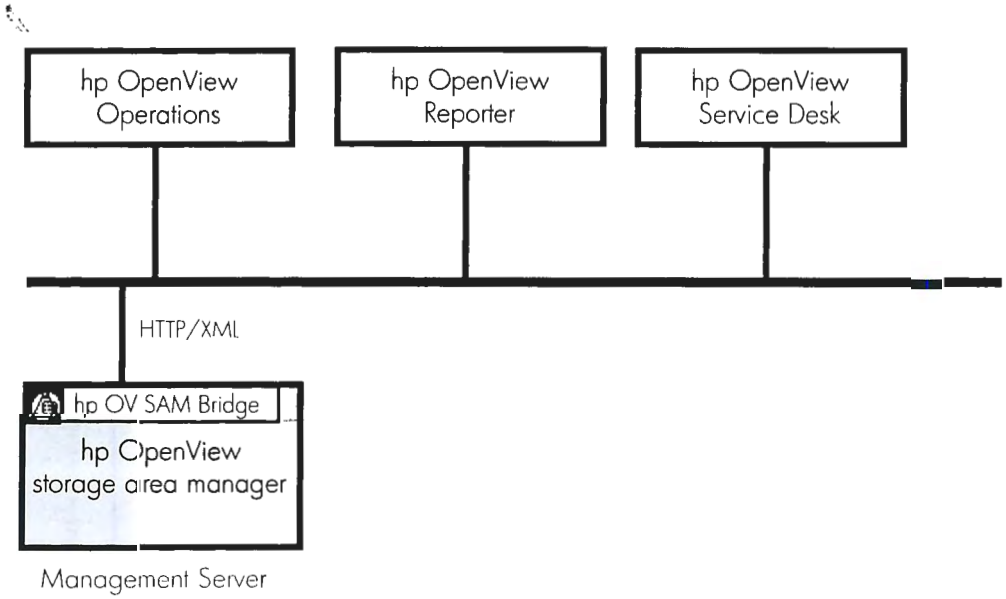

Figure 6 hp OpenView storage area manager Bridge topology

2.750 June

User accounts

Storage Area Manager requires the Bridge, and the applications using it, to log in with a user name and password. HP recommends that you set up a Storage Area Manager user account specifically for the Bridge and supply the user name and password to the person responsible for configuring an application to communicate with Storage Area Manager. A guest (read-only) account is sufficient for the currently supported applications.

If there are multiple management servers (see "Multiple management servers") in your environment, you will need to create the same user account(s) on each.

Creating Bridge user accounts

Select **Configure Security** from the Storage Area Manager **Tools** menu and click the **New User** button to create a user account. For additional information, see the online Help topic "Adding Storage Area Manager users," or click the **Help** button in the Administer Users window.

Multiple management servers

In environments with multiple management servers, one Bridge handles all external requests for all management servers (see figure 7).

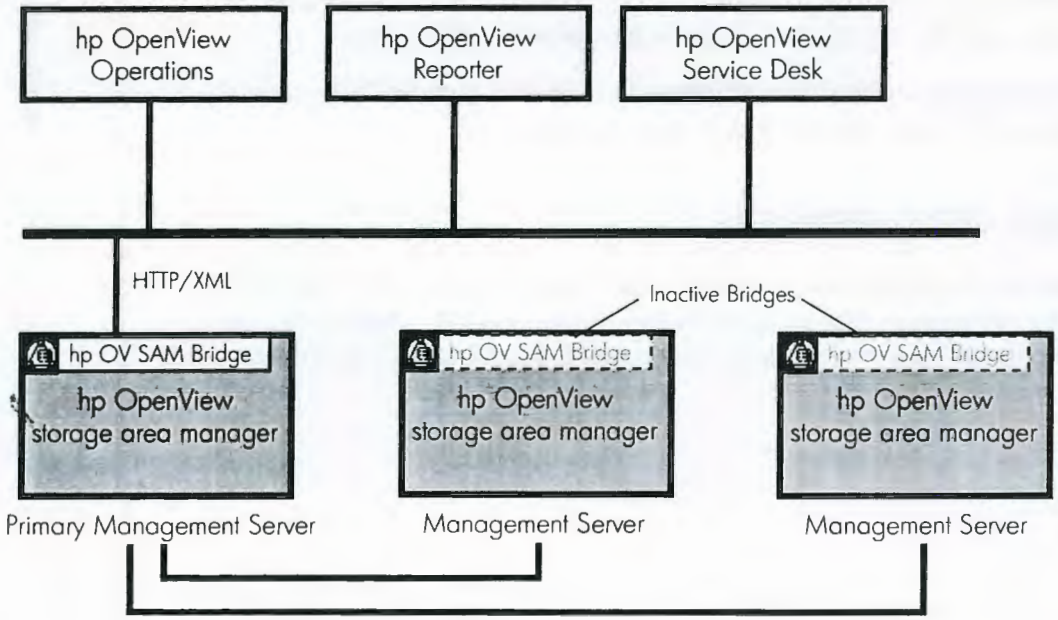

Figure 7 hp OpenView storage area manager Bridge with multiple management servers

After you choose the primary management server, there are three things to do:

1. Authorize the primary management server as a client on the other management servers (see instructions on page 173).
2. Modify the Bridge configuration file on the primary management server (see page 173).
3. Be sure that the Bridge user names and passwords are the same on all management servers (see "User accounts" on page 171).

Authorizing the primary server as a client

Enter the IP address of the primary management server in the authorizedClients.dat file at <install directory>\sanmgr\managementserver\config\ on each management server that the Bridge will contact. See "Allowing access to the management server," in chapter 2 of the *hp OpenView storage area manager installation guide* for complete instructions.

Alternatively, you can use a web browser on the primary management server to connect to the other management servers' GUI download port (http:\\<IPaddress>:8040), and click **Add your client's IP Address to the authorizedClient access list** at the bottom of the page.

Modifying the Bridge configuration file

1. On the primary management server, select Windows **Control Panel** and open **Services**.
2. Select **HP OpenView SAM Bridge** in the list of services, and then select **Stop** from the **Actions** menu.
3. Open the file <installdirectory>\sanmgr\bridge\config\SAMBridge.cfg and find the key `CONFIGURED_MANAGEMENT_SERVER_LIST`.
4. Modify this line so that it contains a comma-separated list of all of the management servers that the Bridge will contact with external requests. The default is "localhost," the Bridge's own management server. Here is an example of a modified line:

   ```
   CONFIGURED_MANAGEMENT_SERVER_LIST = localhost,ms1,ms2,ms3
   ```

   Where *ms1*, *ms2*, and *ms3* are the DNS names or IP addresses of the management servers that will accept requests from the Bridge.

Note Do not include spaces in the list.

5. Return to **Control Panel** and restart the HP OpenView SAM Bridge service.

SSL

The Bridge supports SSL (Secure Sockets Layer) for applications that require encrypted communications. These applications will obtain a server certificate from the Bridge before they trust the Bridge with encrypted information. Configuring the Bridge to use SSL involves the following steps:

1. Create a server keystore and server certificate.
2. Modify the Bridge configuration file. The SSL key must be activated to enable encrypted communication.
3. Establish a method of providing the certificate to external applications.

These steps are described below.

Creating a server keystore and certificate

A script for creating server keystores and certificates is installed with Storage Area Manager. These certificates are valid for one year, after which they can be modified for an extended period or replaced. Refer to the Java "keytool" documentation at http://java.sun.com/j2se/1.3/docs/tooldocs/win32/keytool.html for Windows 2000.

The script takes four parameters when run and prompts for SSL passwords in progress. The result is a server keystore and server certificate, the latter exported and saved as "bridgeServerCertificate.cer."

2.746
Fls.

Procedure

1. Locate the script <installdirectory>\sanmgr\bridge\sbin\createServerCertificate.bat.
2. Run the script, providing the following parameters:
   - [common name] The DNS name of the machine that the Bridge is running on.
   - [locality] The name of the city where the machine is located. Surround multiple-word values with quotation marks(" ").
   - [state] The state or province where the machine is located. You can use the full or abbreviated name.
   - [countrycode] The two-letter country code.

   For example:

   D:\sanmgr\bridge\sbin>createServerCertificate sb-apollo "Santa Barbara" CA US
3. When prompted, enter a keystore password. Applications will use this password to access the keystore. You will need to supply the same value for the `SSL_KEYSTORE_PASSWORD` key in the Bridge configuration file.
4. When prompted, enter a certificate password. Enter a password or, to use the same password as the keystore password, press **Enter**. You will also supply this value for the `SSL_PRIVATE_KEY_PASSWORD` key in the Bridge configuration file.
5. When prompted again for the keystore password, enter the password that you gave in step 3. The script needs this password to export the certificate.

When the script ends, there will be a keystore file (bridgeserver.jks) and a server certificate file (bridgeServerCertificate.cer) at <install directory>/sanmgr/bridge/config/certs.

CPMI - CORREIOS
0227
Fls:
3701
Doc:

Sample run

The following example uses the same password for the keystore and keypass.

```
C:\sanmgr\bridge\sbin>createServerCertificate sb-apollo Santa-Barbara CA
US

When prompted, enter a keystore password and a keypass. The keypass will
protect the private key in the keystore.

Make a note of the keystore and keypass passwords. You will be prompted to
enter the keystore password in order to export the public-key certificate
from the keystore. Both passwords are needed when configuring "Bridge" to
use SSL.

Please wait...

Creating keystore and certificate

Enter keystore password: poseidon

Enter key password for <bridgeserver>

        ( RETURN if same as keystore password):

Exporting the certificate...

You will be prompted to enter the keystore password.

Enter keystore password: poseidon

Certificate stored in file <..\config\certs\bridgeServerCertificate.cer>
```

Modifying the Bridge configuration file

1. On the primary management server, select Windows **Control Panel** and open **Services**.
2. Select **HP OpenView SAM Bridge** in the list of services and then select **Stop** from the **Actions** menu.
3. Open the file <installdirectory>\sanmgr\bridge\config\SAMBridge.cfg.
4. Find the key `SSL` and enter the value **on**, to activate SSL, or **off**, to postpone the implementation of the remaining SSL options. Values are case sensitive.

2.744

5. Find the keys `SSL_KEYSTORE_PASSWORD` and `SSL_PRIVATE_KEY_PASSWORD`, and enter the values that you supplied when you ran the script and created the certificate (see above).
6. Find the key `SSL_ENCRYPTION_LEVEL` and enter one of the following values:
   - **None**. Requests will be authenticated but not encrypted.
   - **Export**. The Bridge will accept requests that use encryption methods with key lengths up to 56 bits.
   - **Full**. The Bridge will accept requests that use encryption methods with key lengths of 128 bits.
   - **Best**. The Bridge will accept requests that use the better encryption method, export or full, that the requesting application supports.
7. Find the `SSL_KEYSTORE_FILE_PATH` and enter the fully qualified path to the keystore file (bridgeserver.jks).
8. Return to **Control Panel** and restart the HP OpenView SAM Bridge service. After the service is started, the Bridge will accept only HTTPS requests.

Distributing server certificates

How external applications obtain a server certificate from the Bridge depends on the application. One way to facilitate the transaction is to establish a shared directory on a file server for every server certificate that is created. Then, whoever is configuring an application to communicate with Storage Area Manager has on hand in the shared directory all the certificates that he or she needs.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0228
Fls:
3681

Changing the default port

The default port for external applications connecting to the Bridge is 8041. If your environment requires it, you can change the port in the Bridge configuration file.

1. On the management server, select Windows **Control Panel** and open **Services**.
2. Select **HP OpenView SAM Bridge** from the list of services, and then select **Stop** from the **Actions** menu.
3. Open the file <installdirectory>\sanmgr\bridge\config\SAMBridge.cfg.
4. Find the key `PORT` and enter the number of the port where the Bridge will be monitoring third-party requests.
5. Return to **Control Panel** and restart the HP OpenView SAM Bridge service.

When the management server stops

Use this procedure to determine if the management server was not running at any time during a specified billing period. Billing information is not collected while a management server is down, and Storage Accountant fills in gaps between data collections based on the previous state. Although no billing transactions can occur while a management server is down, external events can affect an organization's access to billed storage with no corresponding indication in the bill.

A stopped management server may also explain the absence of expected entries, including data collection cycles, in the audit log.

1. On the management server, navigate to <install directory>\sanmgr\managementserver\logs.
2. Look in the logs directory for a series of files named ConJCoreMain0.log and ConJCoreMain0_x.log, where "x" indicates the numerical sequence of the file. A ConJCoreMain0_x.log was created each time the management server started or restarted. ConJCoreMain0.log is the most recent instance, that is, the file that was created when the management server last started.

Note The loggers.prp file specifies the maximum number of ConJCoreMain0_x.log files that will be maintained concurrently. The default is 4.

3. Using Notepad or another basic text editor, open the ConJCoreMain0.log or ConJCoreMain0_x.log file that was created in the specified billing period and examine the beginning of the file for the date and time of Logger Started. This is the date and time that the management server started. For example, "2001.08.17 at 09:41:31.295 Logger Started" indicates that the management server started on August 17, 2001, at 9:41 and 31 seconds am.

4. Open the last ConJCoreMain0_x. file that was created before the file you opened in step 3. Examine the end of the file for the date-time stamp of the last entry. This is the date and time that the management server stopped. For example, "2001.08.13 14:55:25.789" indicates the management server stopped on August 13, 2001, at 2:55 and 26 seconds pm.

5. Repeat steps 3 and 4 for each ConJCoreMain0_x.log file that was created or closed within the specified billing period. The difference between the date and time the logger started in one file and the date and time of the last date-time stamp in the previous file is the period during which the management server was down. In the previous examples, the management server was down from August 13, 2001, 2:55 pm, to August 17, 2001, 9:41 am.

A managed directory has zero used space

Symptom	**Cause**/Solution
A managed directory erroneously appears with 0 (zero) used space or size in the Managed Directories view panel.	**The directory was added using the CLUI but the name was entered with a different case than was used when the directory was created.** Add the directory using the GUI. (See "Adding managed directories" in chapter 3 of this guide.) When you use the CLUI to add the directory, first run **dir** (or its UNIX equivalent) in a command window on the affected host and verify the case that was used when the directory was created. Then add the directory, being careful to match upper and lowercase letters.

2734

Data is unavailable in the Add Directories window

Symptom	**Cause**/Solution
Instead of volumes and directories, you see "data unavailable" in the directory tree.	**Volume or file data has not been collected.** Verify that data collection is scheduled. View the collection schedule for volume and file data. Both must be enabled and have completed at least one cycle before directory information can appear. In addition, volume data must be collected before file data can be collected. If volume data has not been collected, no volumes will appear in the Add Directories window. If volume data has been collected but file data has not, you will also see an error message when you attempt to open a volume in the Add Directories window.
	There was a collection error. Use the default Capacity filter to check the Storage Area Manager event panel for events indicating that collection failed or failed to start on the specified host, that volumes could not be resolved with LUNs, or that LUNs could not be resolved with a host device file. If a collection error occurred, make sure that the host is reachable, that the Host Agent is running, and that the host has access to the management server.
"Network error" appears in the directory tree.	**The client was unable to retrieve the data from the management server.** An error on the management server prevented Storage Builder from processing data that was obtained from the host. There may have been a temporary communication problem between the client and management server. Close the Add Directories window and click the **Add Directories** button again.
A subdirectory does not appear in the directory tree. Also, no files are listed for the parent directory in capacity reports.	**Storage Builder does not have read access to the parent directory.** Make sure the parent directory allows read access.

There is no Capacity tab

Symptom	Cause/Solution
The view panel for collective or specific hosts, storage devices, NAS devices, or organizations contains no Capacity tab.	**hp OpenView Storage Builder was not purchased or installed.** Verify that Storage Builder is installed. Click the **Help** menu and select **About hp OpenView storage area manager**. Make sure that the current Storage Builder version is listed with the other Storage Area Manager applications.
	The Storage Builder license is out of compliance. Verify that the license to use Storage Builder is current. Click the **Tools** menu and select **Configure**, and then select **Licensing** from the Configuration tree. The Licensing view panel lists the current licenses and their expiration dates.
	Storage Builder does not support the selected resource. Verify that Storage Builder supports the specific resource(s). Click the **Help** button and select **Installation Guide Online** to view supported devices in the *hp OpenView storage area manager 3.0 installation guide*.

There is "no data" in a performance list or chart

Symptom	Cause/Solution
"No Data" appears in the metric column of a performance list, or a performance chart is empty and "No Data" appears with the metric name.	**The specified time period is outside the range of collected data.** Verify that data should have been collected during the displayed time period. In performance lists, the time period is identified in the toolbar. In performance charts, the dates on the x-axis identify the time period. If you cannot validate the displayed time period, change the time period to more reliable dates. See "Changing the displayed time period" in the Storage Area Manager online help system.
	Supporting software is not installed or not running. Check Storage Area Manager's event panel for the events "Tool used for collection of performance data on <resource name> is not installed" or "Tool used for collection of performance data... is not running." If either event occurred, troubleshoot the status and configuration of Storage Optimizer's source of performance data on the resource. On a host, for example, make sure that OpenView Performance Agent or VantagePoint is installed and running.
	The resource or path to the resource is down. Check Optimizer-DataCollector.log on the management server for exceptions that indicate a problem communicating with the resource. Troubleshoot the status of the resource, connecting devices, and physical links.
	The management server is in a conflicting state. Check Storage Area Manager's event panel for events that indicate collection or summarization did not occur because a comprehensive discovery was running or because Storage Optimizer was still storing data from a previous collection. Collection will occur at the next scheduled interval.

hp OpenView storage allocater: All platforms

LUNs are not listed in the Available to Assign list

Symptom	Cause/Solution
When editing a host or share group, LUNs are not listed in the Available to Assign list.	**By default, only visible LUNs are listed in the Available to Assign list.** Click the **Find** button, check the **Show All** checkbox, and click **OK**.

Note A LUN is visible to a host when the host has a physical path to the LUN. When editing a share group, a LUN is considered visible if at least one host in the share group has a physical path to the LUN.

Your storage has not been discovered by Storage Area Manager. To verify that the missing LUNs have been discovered, check to see if they are listed under **Storage Devices** in the Resources tree.

- If the storage has not been discovered, choose **Start Comprehensive Discovery** from the **Tools** menu.
- If this does not work, or if you brought the storage online after all of the hosts were started, run the **LUN Discovery** command on at least one host, and then choose **Start Comprehensive Discovery** from the **Tools** menu.

To run the LUN Discovery command, right-click a host and select **LUN Discovery** on the shortcut menu.

Note For more information about adding storage and LUN Discovery, see the "Adding New Devices" and "LUN Discovery" topics in the Storage Area Manager online help system.

Your storage device is not supported with Storage Allocater. Verify that you are using supported storage devices.

Assigned LUNs are not available on a host

If an assigned LUN is not visible to a host, find the cause below that best describes the situation, and then attempt the solution. When this occurs, the following message appears in the event panel: `Host <host name> has one or more LUNs enabled which are not reachable from that host.`

Symptom	**Cause**/Solution
Assigned LUNs are not available on a host.	**The host bus adapter (HBA) or driver are not installed.** Install the HBA or HBA driver.
	SAN-attached storage or other network hardware is turned off. Turn on the drives or network hardware.
	Network cables are not connected properly. Verify all cable connections.
	There is a failure within the Fibre Channel loop. Turn off the Fibre Channel hardware, and then turn on the hardware to reset the Fibre Channel loop.
	The Fibre Channel card has become unseated in the computer. Shut down the computer, and remove and reseat the card.
	The Fibre Channel card, hub, switch, or storage controller is bad. Run device- and vendor-specific diagnostics and replace any bad components.
	The host has not discovered the LUN. Try the following solutions: – Verify that there is a physical path between the host and the storage. – Verify that the storage network is not intentionally configured (with Storage Allocater, fabric zoning, or storage device security) to prevent the host from accessing the LUN. – In the Storage Area Manager user interface, right-click the host and select **LUN Discovery** on the shortcut menu.

Symptom	Cause/Solution
Assigned LUNs are not available on a host (cont'd)	**On Solaris hosts, if some assigned LUNs are not accessible, the sd_fcst .conf file may not be configured to search for all of the LUNs on the storage network.** Change the max_luns_per_target value in the sd_fcst.conf file to the largest number of LUNs that are configured on any disk array on your storage network.

A multiple writer situation is detected

If Storage Allocater detects multiple hosts with access to the same LUN the following message is posted in the event panel: `Logical Unit <logical unit name> is enabled on Host <host name>. Yet the Logical Unit indicates that it is assigned to <host or group name>. This possibly is a multiple writer situation. Storage Area Manager will try to unassign the Logical Unit from the Host.`

Symptom	**Cause**/Solution
Storage Area Manager detects a multiple writer situation.	**Storage Allocater has detected a multiple writer situation.** This occurs in the following situation: 1. A host (Host 1) with assigned LUNs is deleted in the Storage Area Manager user interface and detached from the storage network. Any LUNs that were assigned to the host are now available for assignment. 2. You assign one of the LUNs to a second host (Host 2). 3. Host 1, which still has the Host Agent software installed, is reattached to the storage network and rebooted. At this point, Storage Allocater tries to unassign the LUN from Host 1. One of the following messages is displayed in the event panel: – `<logical unit name> has been removed from <host name>. The multiple writer situation has been resolved.` If this message appears, the LUN has been unassigned from Host 1 and will be assigned to Host 2. – `<logical unit name> has not been removed from <host name>. The multiple writer situation still exists!`

Symptom	Cause/Solution
Storage Area Manager detects a multiple writer situation (cont'd).	4. If the LUN is in use by Host 1 and cannot be unassigned, Storage Allocater posts the following message in the event panel: `Storage Area Manager will attempt to remove Logical Unit <logical unit name> from <host or group name> to resolve the possible multiple writer situation` and tries to unassign the LUN from Host 2. One of the following messages is displayed in the event panel: – `<logical unit name> has been removed from <host or group name>.` The multi-writer scenario has been resolved. If this message appears, the LUN will be assigned to Host 1. – `<logical unit name> has not been removed from <host or group name>. The multiple writer situation still exists!` If Storage Allocater cannot resolve the multiple writer situation, take Host 1 off the storage network, but leave it on the LAN. Reboot Host 1, and the affected LUN will be unassigned from Host 1, and it will remain assigned to Host 2.

hp OpenView storage allocater: Windows

A LUN cannot be unassigned from a Windows host

If a LUN cannot be unassigned, a failure message will appear in the Configuration Status window and in the event panel on the management server.

Symptom	**Cause**/Solution
A LUN unassignment fails.	**There are open files or folders, or volumes on the LUN.** Shut down any applications, services, or third-party drivers that may be holding open files, folders, or a volume.
	The file server is sharing a volume or folder on the LUN. Log off remote clients and stop sharing the volume or folder.
	On a Windows NT host, Ftdisk is running. Try the following solutions: – Use the **Special Mode Unassign** command to unassign the LUN, and restart the host. – Use the Windows Control Panel (Devices) to disable Ftdisk and reboot the host. Note that stripe- and volume-sets will not be accessible with Ftdisk disabled.
	A disk filter is running. Try the following solutions: – Use the **Special Mode Unassign** command to unassign the LUN, and restart the host. – Determine which disk filters are running and deactivate them if they are not being used. Restart the host after deactivating any disk filters.

Symptom	Cause/Solution
A LUN unassignment fails (cont'd).	**A software crash or operating system resource leak can leave open handles to a LUN.** Use the **Special Mode Unassign** command to unassign the LUN, and restart the host.
	A service or SNMP agent is preventing the LUN unassignment. Services are configurable under the Services control panel and SNMP agents are loaded by the SNMP service. Disable unneeded storage-related services and SNMP agents. If a needed service or agent is causing the problem, use the **Special Unassign** command.
	When a nondisk LUN for which no driver can be found is assigned to a Windows 2000 host, a sequence of events can leave the LUN in a state that prevents it from being unassigned. **Note** This state can be determined by viewing the LUN in Device Manager, where its icon will be a yellow question mark with a yellow exclamation point badge on top. Use the **Special Unassign** command to unassign the LUN.

Tip

If you need help discovering why a LUN cannot be unassigned, check the system log for possible messages and retry the operation.

The Process Explorer utility from Sysinternals (www.sysinternals.com) can be helpful in determining why a LUN cannot be unassigned. HP is not responsible for any errors that might arise from using this third-party software.

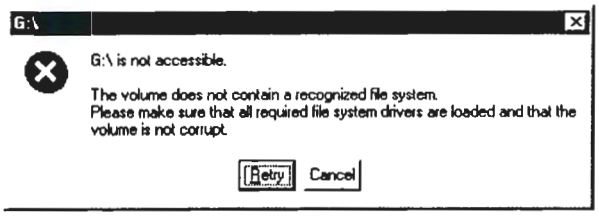
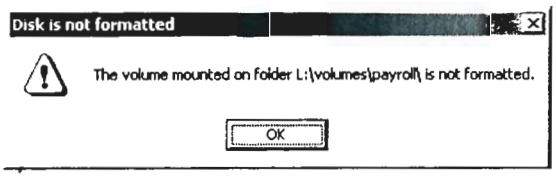
An assigned disk is not accessible

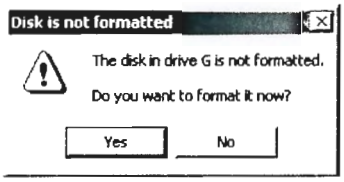
When a LUN is assigned to a Windows host, the volumes on the LUN are listed with drive letters in Windows Explorer or mount points (Windows 2000 only). If a volume is not formatted, one of the following messages appears when you try to access the volume in Windows Explorer.



Windows NT



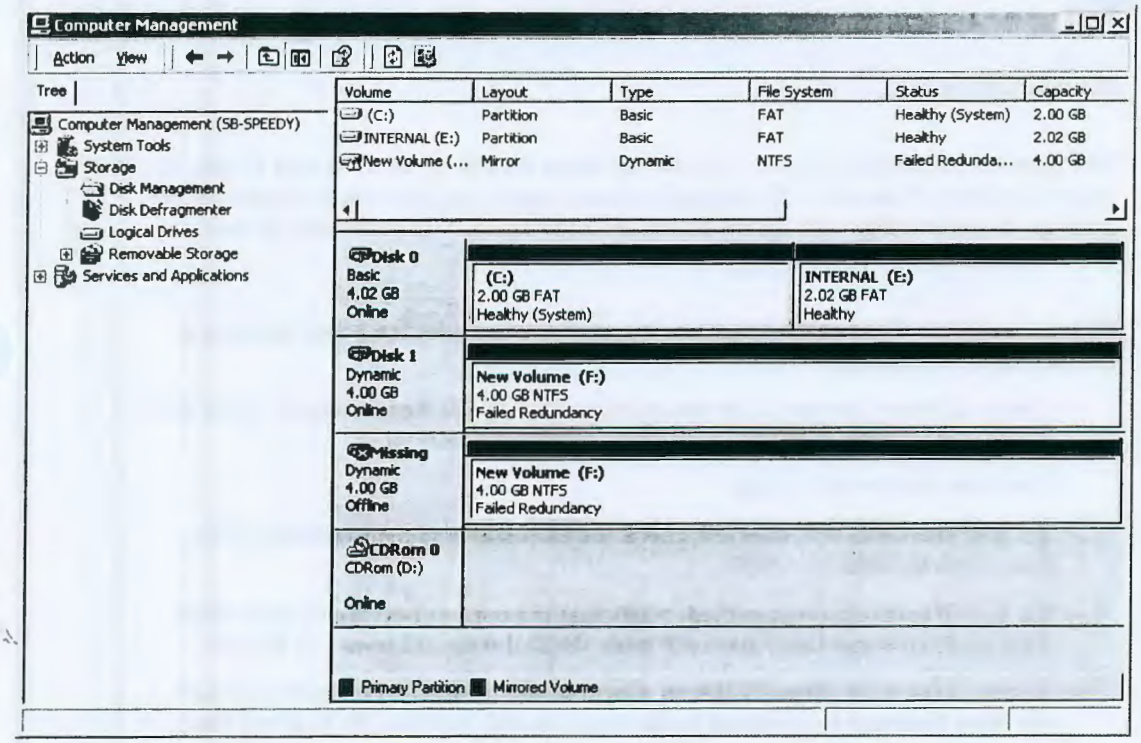
Windows 2000



Windows 2000

Symptom	**Cause**/Solution
One of the dialog boxes shown here appears when you try to access a volume on an assigned LUN.	**The volume is not formatted (does not contain a recognizable file system).** Format the volume. For instructions on formatting volumes in Disk Administrator or Windows 2000 Disk Management, see your Windows documentation.

Dynamic disks are offline (Windows 2000)



Symptom	**Cause**/Solution
When you try to access a dynamic volume on a Windows 2000 host, the volume displays a status of "failed redundancy."	**All of the required disks are not assigned to the host.** Every Fibre Channel LUN that is part of a Windows 2000 dynamic volume should be assigned to an associated LUN group, and the associated LUN group should be assigned to a host.

The SCSI Adapters control panel lists no LUNs (Windows NT)

Symptom	Cause/Solution
The SCSI Adapters Control Panel does not list any storage network devices.	**The system SCSIPORT driver has not updated its list of devices and LUNs.** To trigger a refresh, close the SCSI Adapters control panel, run Disk Administrator on the host, or use the management server to run the **LUN Discovery** command on the host, and then reopen the control panel.
	There is a Fibre Channel network or storage device problem. The following are possible solutions: – Check all Fibre Channel cable connections. If copper cables are used, check the length and possible earth plane differential potentials. – Check the hub/switch status. – If a RAID is connected, check the LUN status and ensure that there are LUNs created on the RAID. – If a switch is connected, verify that the correct port types are being used. Most RAIDs and HBAs use an F port. JBOD drives and some HBAs use an FL port. – If you are using JBODs on a switch, and devices repeatedly go missing, update the drive firmware to the latest public loop-capable version. JBOD drives have exhibited poor recovery behavior after hot-plugging on a switched network. **Caution** Back up all of your data before updating the drive firmware on the JBOD drives.
	The SCSI Adapters control panel can only list 32 devices per adapter. If an adapter has more attached devices than the control panel can list, the adapter will disappear from the adapters list in the control panel. This does not prevent you from using assigned storage. **Note** This is a Windows NT limitation.

hp OpenView storage allocater: HP-UX

Verifying that the daemon is running

To verify that the Storage Allocater daemon is running, type **ps -e | grep TR** and press **Enter**.

If the daemon is running, this command should return the following response:

```
TRAllocater_d
```

For example:

```
sb-c3po# ps -e    |grep TR
 14443 pts/0     0:00 TRAllocater_d
```

If the daemon is not running, check the logfile (**/opt/sanmgr/hostagent/log/lm_daemon.log**) for errors. To start the daemon, type **ioscan** and press **Enter**. If you want to verify that the daemon started successfully, check the logfile.

An assigned LUN is not accessible to an HP-UX host

Symptom	Cause/Solution
An assigned LUN is not accessible to an HP-UX host.	**The LUN is outside the HP-UX addressing ability. If a device is in peripheral device LUN addressing mode and its LUN is greater than 7, HP-UX hosts will be unable to access the LUN.** If possible, put the device into a different addressing mode, for example, volume set addressing mode. **Note** Some arrays call volume set addressing mode "HP-UX mode." **A hardware addressing conflict exists between devices on a loop.** Set all devices on loops to unique hard address IDs. **The assigned LUN is not on the same storage network segment as the HP-UX host.** Unassign the LUN or move it to the same storage network segment.

2.736

Error during mounting: "not a block device"

Symptom	Cause/Solution
When mounting a device, you get the following error message: `mount: /dev/rdsk/disk_name not a block device`	**There was an error in the mount command. This error occurs when you try to mount a disk using the raw device name rather than the block device name.** Enter the correct command: **mount /dev/dsk/<disk_name> /<mount_point>**

Note Always create HFS/VxFS file systems on "raw" device names and mount file systems on "block" device names; for example:

Raw device name: **/dev/rdsk/device**
Block device name: **/dev/dsk/device**

A LUN cannot be unassigned from an HP-UX host

Symptom	Cause/Solution
A LUN unassignment fails.	**The LUN contains a mounted file system that is in use.** Stop any processes that are using the file system, and unmount the file system.
	The LUN is configured to be used with storage management software such as LVM or VERITAS Volume Manager. Storage Allocater cannot notify a third-party storage management application that a particular device needs to be removed from its configuration. To unassign a LUN that is being used with third-party storage management software, manually remove it from the control of third-party storage management software.
	The LUN is in use by an application that accesses it directly. Storage Allocater cannot determine which application is using the disk in question, or how to stop the application's access without interrupting what may be a critical process. To unassign this type of LUN, shut down the program that is using the LUN.

Note If you are using HP AutoPath, uninstall AutoPath, unassign the LUN, and then reinstall AutoPath (if desired).

A Storage Data Protector snapshot backup involving an HP-UX hosts fails

Symptom	**Cause**/Solution
A Data Protector snapshot backup failed.	**The hardware paths to unconfigured LUNs (including inactive snapshot LUNs) were not removed before Storage Allocater was activated.** Kill the TRAllocater_d process and restart it by running **ioscan**. Retry the snapshot backup. For information on configuring snapshot backups, see page 152.

A LUN cannot be unassigned from a Solaris host

Symptom	Cause/Solution
A LUN unassignment fails.	**The LUN contains a mounted file system that is in use.** Stop any processes that are using the file system, unmount the LUN, and then unassign it.
	The LUN is configured to be used with third-party storage management software, such as Solstice DiskSuite or VERITAS Volume Manager. Storage Allocater has no way of telling a third-party storage management application that a particular LUN needs to be removed from its configuration. Before unassigning the LUN, manually remove it from the control of third-party storage management software.
	The LUN is in use by an application that accesses it directly. Storage Allocater has no way of knowing what program is using the disk in question, or how to make it stop without interrupting what may be a critical process. Before unassigning this type of LUN, shut down the program that is using it.
	The LUN you are trying to unassign is a tape drive or other nondisk LUN. To unassign a nondisk LUN from a Solaris host, you must use the **Special Unassign** command (page 122).

2710
Irene

An assigned tape library or nondisk device is not available

Symptom	**Cause**/Solution
An assigned nondisk device is not available on a Solaris host.	**The Storage Allocater filter driver does not handle tape devices and other nondisk devices. To use these devices, you must configure the filter driver to allow nondisk devices to be handled by the appropriate drivers when these LUNs are assigned to Solaris hosts.** Use the procedure on page 160 to configure the filter driver.

Assigned LUNs are suddenly unavailable

Symptom	Cause/Solution
Assigned LUNs that were previously available on a Solaris host become inaccessible.	**The HBA driver's configuration utility has replaced Storage Allocater's settings in the /kernel/drv/<driver_name>.conf file (where driver_name is the name of your HBA driver). Open the backup file that you saved during installation and compare the backup file to the current version.** Re-enter any changes that were made when you ran the HBA configuration utility. For more information, see page 159.

2708
fls

A Host with an Emulex HBA reports errors in the /var/adm/messages log

Symptom	**Cause**/Solution
A host with an Emulex HBA reports type 16 errors in the **/var/adm/messages** log.	**The sd_fcst.conf file is configured to search for too many LUNs.** Use one of the following solutions: – Remove some of the targets on the storage network. – Change the **max_luns_per_target** setting to the largest number of LUNs that is configured on any disk array on your storage network. For more information about the max_luns_per_target setting, see the "Activating Storage Allocater" section in the *hp OpenView storage area manager installation guide.*

Note If you try to assign LUNs to a host that is experiencing errors with an Emulex HBA, you may experience problems with the Host Agent software.

Configuring IP Routing Protocol-Independent Features

This chapter describes how to configure IP routing protocol-independent features. For a complete description of the IP routing protocol-independent commands in this chapter, refer to the "IP Routing Protocol-Independent Commands" chapter of the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols* publication. To locate documentation of other commands in this chapter, use the command reference master index, or search online.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the "Identifying Supported Platforms" section in the "Using Cisco IOS Software" chapter in this book.

Protocol-Independent Feature Task List

Previous chapters addressed configurations of specific routing protocols. To configure optional protocol-independent features, perform any of the tasks described in the following sections:

- Using Variable-Length Subnet Masks (Optional)
- Configuring Static Routes (Optional)
- Specifying Default Routes (Optional)
- Changing the Maximum Number of Paths (Optional)
- Configuring Multi-Interface Load Splitting (Optional)
- Redistributing Routing Information (Optional)
- Filtering Routing Information (Optional)
- Enabling Policy Routing (Optional)
- Managing Authentication Keys (Optional)
- Monitoring and Maintaining the IP Network (Optional)

See the section "IP Routing Protocol-Independent Configuration Examples" at the end of this chapter for configuration examples.

Using Variable-Length Subnet Masks

Enhanced IGRP (EIGRP), Intermediate System-to-Intermediate System (IS-IS) Interdomain Routing Protocol, Open Shortest Path First (OSPF), Routing Information Protocol (RIP) Version 2, and static routes support variable-length subnet masks (VLSMs). With VLSMs, you can use different masks for the same network number on different interfaces, which allows you to conserve IP addresses and more efficiently use available address space. However, using VLSMs also presents address assignment challenges for the network administrator and ongoing administrative challenges.

Refer to RFC 1219 for detailed information about VLSMs and how to correctly assign addresses.

Note Consider your decision to use VLSMs carefully. You can easily make mistakes in address assignments and you will generally find it more difficult to monitor your network using VLSMs.

Note The best way to implement VLSMs is to keep your existing numbering plan in place and gradually migrate some networks to VLSMs to recover address space. See the "Variable-Length Subnet Mask Example" section at the end of this chapter for an example of using VLSMs.

Configuring Static Routes

Static routes are user-defined routes that cause packets moving between a source and a destination to take a specified path. Static routes can be important if the Cisco IOS software cannot build a route to a particular destination. They are useful for specifying a gateway of last resort to which all unroutable packets will be sent.

To configure a static route, use the following command in global configuration mode:

Command	Purpose
`Router(config)# ip route prefix mask {ip-address | interface-type interface-number} [distance] [tag tag] [permanent]`	Establishes a static route.

See the "Overriding Static Routes with Dynamic Protocols Example" section at the end of this chapter for an example of configuring static routes.

The software remembers static routes until you remove them (using the **no** form of the **ip route** global configuration command). However, you can override static routes with dynamic routing information through prudent assignment of administrative distance values. Each dynamic routing protocol has a default administrative distance, as listed in Table 9. If you would like a static route to be overridden by information from a dynamic routing protocol, simply ensure that the administrative distance of the static route is higher than that of the dynamic protocol.

Table 9 Dynamic Routing Protocol Default Administrative Distances

Route Source	Default Distance
Connected interface	0
Static route	1

2691
Paula

Table 9 Dynamic Routing Protocol Default Administrative Distances (continued)

Route Source	Default Distance
Enhanced IGRP (EIGRP) summary route	5
Exterior Border Gateway Protocol (BGP)	20
Internal EIGRP	90
IGRP	100
OSPF	110
IS-IS	115
RIP	120
EIGRP external route	170
Interior BGP	200
Unknown	255

Static routes that point to an interface will be advertised via RIP, IGRP, and other dynamic routing protocols, regardless of whether **redistribute static** router configuration commands were specified for those routing protocols. These static routes are advertised because static routes that point to an interface are considered in the routing table to be connected and hence lose their static nature. However, if you define a static route to an interface that is not one of the networks defined in a **network** command, no dynamic routing protocols will advertise the route unless a **redistribute static** command is specified for these protocols.

When an interface goes down, all static routes through that interface are removed from the IP routing table. Also, when the software can no longer find a valid next hop for the address specified as the address of the forwarding router in a static route, the static route is removed from the IP routing table.

Specifying Default Routes

A router might not be able to determine the routes to all other networks. To provide complete routing capability, the common practice is to use some routers as *smart routers* and give the remaining routers default routes to the smart router. (Smart routers have routing table information for the entire internetwork.) These default routes can be passed along dynamically, or can be configured into the individual routers.

Most dynamic interior routing protocols include a mechanism for causing a smart router to generate dynamic default information that is then passed along to other routers.

Specifying a Default Network

If a router has a directly connected interface onto the specified default network, the dynamic routing protocols running on that device will generate or source a default route. In the case of RIP, the router will advertise the pseudonetwork 0.0.0.0. In the case of IGRP, the network itself is advertised and flagged as an exterior route.

A router that is generating the default for a network also may need a default of its own. One way a router can generate its own default is to specify a static route to the network 0.0.0.0 through the appropriate device.

Paula

To define a static route to a network as the static default route, use the following command in global configuration mode:

Command	Purpose
`Router(config)# ip default-network network-number`	Specifies a default network.

Understanding Gateway of Last Resort

When default information is being passed along through a dynamic routing protocol, no further configuration is required. The system periodically scans its routing table to choose the optimal default network as its default route. In the case of RIP, there is only one choice, network 0.0.0.0. In the case of IGRP, there might be several networks that can be candidates for the system default. The Cisco IOS software uses both administrative distance and metric information to determine the default route (gateway of last resort). The selected default route appears in the gateway of last resort display of the **show ip route** EXEC command.

If dynamic default information is not being passed to the software, candidates for the default route are specified with the **ip default-network** global configuration command. In this usage, the **ip default-network** command takes an unconnected network as an argument. If this network appears in the routing table from any source (dynamic or static), it is flagged as a candidate default route and is a possible choice as the default route.

If the router has no interface on the default network, but does have a route to it, it considers this network as a candidate default path. The route candidates are examined and the best one is chosen, based on administrative distance and metric. The gateway to the best default path becomes the gateway of last resort.

Changing the Maximum Number of Paths

By default, most IP routing protocols install a maximum of four parallel routes in a routing table. Static routes always install six routes. The exception is BGP, which by default allows only one path to a destination.

The range of maximum paths is one to six paths. To change the maximum number of parallel paths allowed, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# maximum-paths maximum`	Configures the maximum number of parallel paths allowed in a routing table.

Configuring Multi-Interface Load Splitting

Multi-interface load splitting allows you to efficiently control traffic that travels across multiple interfaces to the same destination. The **traffic-share min** router configuration command specifies that if multiple paths are available to the same destination, only paths with the minimum metric will be installed in the routing table. The number of paths allowed is never more than six. For dynamic routing protocols,

2689
Paula

the number of paths is controlled by the **maximum-paths** router configuration command. The static route source can always install six paths. If more paths are available, the extra paths are discarded. If some installed paths are removed from the routing table, pending routes are added automatically.

When the **traffic-share min** command is used with the **across-interfaces** keyword, an attempt is made to use as many different interfaces as possible to forward traffic to the same destination. When the maximum path limit has been reached and a new path is installed, the router compares the installed paths. For example, if path X references the same interface as path Y and the new path uses a different interface, path X is removed and the new path is installed.

To configure traffic that is distributed among multiple routes of unequal cost for equal cost paths across multiple interfaces, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# traffic-share min {across-interfaces}`	Configures multi-interface load splitting across different interfaces with equal cost paths.

Redistributing Routing Information

In addition to running multiple routing protocols simultaneously, the Cisco IOS software can redistribute information from one routing protocol to another. For example, you can instruct the software to readvertise IGRP-derived routes using RIP, or to readvertise static routes using the IGRP protocol. Redistributing information from one routing protocol to another applies to all of the IP-based routing protocols.

You also can conditionally control the redistribution of routes between routing domains by defining a method known as *route maps* between the two domains.

The following four tables list tasks associated with route redistribution. Although redistribution is a protocol-independent feature, some of the **match** and **set** commands are specific to a particular protocol.

To define a route map for redistribution, use the following command in global configuration mode:

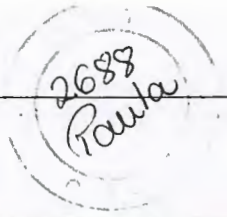
Command	Purpose
`Router(config)# route-map map-tag [permit | deny] [sequence-number]`	Defines any route maps needed to control redistribution.

One or more **match** commands and one or more **set** commands typically follow a **route-map** global configuration command. If there are no **match** commands, then everything matches. If there are no **set** commands, nothing is done (other than the match). Therefore, you need at least one **match** or **set** command.

To define conditions for redistributing routes from one routing protocol into another, use at least one of the following commands in route-map configuration mode, as needed:

Command	Purpose
`Router(config-route-map)# match as-path path-list-number`	Matches a BGP autonomous system path access list.
`Router(config-route-map)# match community-list community-list-number [exact]`	Matches a BGP community list.

POS Nº 03/2005 - CN
CPMI - IPC-357
0257
Fls: 3701
Doc:



Command	Purpose
Router(config-route-map)# **match ip address** {*access-list-number* | *access-list-name*} [...*access-list-number* | ...*access-list-name*]	Matches a standard access list.
Router(config-route-map)# **match metric** *metric-value*	Matches the specified metric.
Router(config-route-map)# **match ip next-hop** {*access-list-number* | *access-list-name*} [*access-list-number* | *access-list-name*]	Matches a next-hop router address passed by one of the access lists specified.
Router(config-route-map)# **match tag** *tag-value* [*tag-value*]	Matches the specified tag value.
Router(config-route-map)# **match interface** *interface-type interface-number* [*interface-type interface-number*]	Matches the specified next hop route out one of the interfaces specified.
Router(config-route-map)# **match ip route-source** {*access-list-number* | *access-list-name*} [*access-list-number* | *access-list-name*]	Matches the address specified by the specified advertised access lists.
Router(config-route-map)# **match route-type** {**local** | **internal** | **external** [**type-1** | **type-2**] | **level-1** | **level-2**}	Matches the specified route type.

One or more **match** commands and one or more **set** commands should follow a **route-map** router configuration command. To define conditions for redistributing routes from one routing protocol into another, use at least one of the following commands in route-map configuration mode as needed:

Command	Purpose
Router(config-route-map)# **set community** {*community-number* [**additive**]} | **none**	Sets the communities attribute.
Router(config-route-map)# **set dampening** *halflife reuse suppress max-suppress-time*	Sets BGP route dampening factors.
Router(config-route-map)# **set local-preference** *number-value*	Assigns a value to a local BGP path.
Router(config-route-map)# **set weight** *weight*	Specifies the BGP weight for the routing table.
Router(config-route-map)# **set origin** {**igp** | **egp** *as-number* | **incomplete**}	Sets the BGP origin code.
Router(config-route-map)# **set as-path** {**tag** | **prepend** *as-path-string*}	Modifies the BGP autonomous system path.
Router(config-route-map)# **set next-hop** *next-hop*	Specifies the address of the next hop.
Router(config-route-map)# **set automatic-tag**	Enables automatic computing of the tag table.
Router(config-route-map)# **set level** {**level-1** | **level-2** | **level-1-2** | **stub-area** | **backbone**}	Specifies the areas in which to import routes.
Router(config-route-map)# **set metric** *metric-value*	Sets the metric value to give the redistributed routes (for any protocol except IGRP or Enhanced IGRP [EIGRP]).
Router(config-route-map)# **set metric** *bandwidth delay reliability loading mtu*	Sets the metric value to give the redistributed routes (for IGRP or EIGRP only).
Router(config-route-map)# **set metric-type** {**internal** | **external** | **type-1** | **type-2**}	Sets the metric type to give redistributed routes.

2687 Paula

Command	Purpose
`Router(config-route-map)# set metric-type internal`	Sets the Multi Exit Discriminator (MED) value on prefixes advertised to Exterior BGP neighbor to match the Interior Gateway Protocol (IGP) metric of the next hop.
`Router(config-route-map)# set tag tag-value`	Sets the tag value to associate with the redistributed routes.

See the "BGP Route Map Examples" section in the "Configuring BGP" chapter for examples of BGP route maps. See the "BGP Community with Route Maps Examples" section in the "Configuring BGP" chapter for examples of BGP communities and route maps.

To distribute routes from one routing domain into another and to control route redistribution, use the following commands in router configuration mode:

	Command	Purpose
ep 1	`Router(config-router)# redistribute protocol [process-id] {level-1 | level-1-2 | level-2} [metric metric-value] [metric-type type-value] [match internal | external type-value] [tag tag-value] [route-map map-tag] [subnets]`	Redistributes routes from one routing protocol to another routing protocol.
Step 2	`Router(config-router)# default-metric number`	Causes the current routing protocol to use the same metric value for all redistributed routes (BGP, OSPF, RIP).
Step 3	`Router(config-router)# default-metric bandwidth delay reliability loading mtu`	Causes the IGRP or Enhanced IGRP (EIGRP) routing protocol to use the same metric value for all non-IGRP redistributed routes.
Step 4	`Router(config-router)# no default-information {in | out}`	Disables the redistribution of default information between IGRP processes, which is enabled by default.

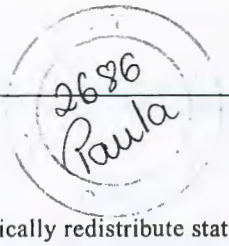
The metrics of one routing protocol do not necessarily translate into the metrics of another. For example, the RIP metric is a hop count and the IGRP metric is a combination of five quantities. In such situations, an artificial metric is assigned to the redistributed route. Because of this unavoidable tampering with dynamic information, carelessly exchanging routing information between different routing protocols can create routing loops, which can seriously degrade network operation.

Understanding Supported Metric Translations

This section describes supported automatic metric translations between the routing protocols. The following descriptions assume that you have not defined a default redistribution metric that replaces metric conversions:

- RIP can automatically redistribute static routes. It assigns static routes a metric of 1 (directly connected).
- BGP does not normally send metrics in its routing updates.

IPC-355
CPML - CORREIOS
0258
Fls: 3701
Doc:



- IGRP can automatically redistribute static routes and information from other IGRP-routed autonomous systems. IGRP assigns static routes a metric that identifies them as directly connected. IGRP does not change the metrics of routes derived from IGRP updates from other autonomous systems.
- Note that any protocol can redistribute other routing protocols if a default metric is in effect.

Filtering Routing Information

To filter routing protocol information performing the tasks in the following sections. The tasks in the first section are required; the tasks in the remaining sections are optional:

- Preventing Routing Updates Through an Interface (Required)
- Controlling the Advertising of Routes in Routing Updates (Optional)
- Controlling the Processing of Routing Updates (Optional)
- Filtering Sources of Routing Information (Optional)

Note When routes are redistributed between OSPF processes, no OSPF metrics are preserved.

Preventing Routing Updates Through an Interface

To prevent other routers on a local network from learning about routes dynamically, you can keep routing update messages from being sent through a router interface. Keeping routing update messages from being sent through a router interface prevents other systems on the interface from learning about routes dynamically. This feature applies to all IP-based routing protocols except BGP.

OSPF and IS-IS behave somewhat differently. In OSPF, the interface address you specify as passive appears as a stub network in the OSPF domain. OSPF routing information is neither sent nor received through the specified router interface. In IS-IS, the specified IP addresses are advertised without actually running IS-IS on those interfaces.

To prevent routing updates through a specified interface, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# passive-interface` *`interface-type interface-number`*	Suppresses the sending of routing updates through the specified interface.

See the "Passive Interface Examples" section at the end of this chapter for examples of configuring passive interfaces.

2685
Paula

Configuring Default Passive Interfaces

In Internet service provider (ISP) and large enterprise networks, many of the distribution routers have more than 200 interfaces. Before the introduction of the Default Passive Interface feature, there were two possibilities for obtaining routing information from these interfaces:

- Configure a routing protocol such as OSPF on the backbone interfaces and redistribute connected interfaces.
- Configure the routing protocol on all interfaces and manually set most of them as passive.

Network managers may not always be able to summarize type 5 link-state advertisements (LSAs) at the router level where redistribution occurs, as in the first possibility. Thus, a large number of type 5 LSAs can be flooded over the domain.

In the second possibility, large type 1 LSAs might be flooded into the area. The Area Border Router (ABR) creates type 3 LSAs, one for each type 1 LSA, and floods them to the backbone. It is possible, however, to have unique summarization at the ABR level, which will inject only one summary route into the backbone, thereby reducing processing overhead.

The prior solution to this problem was to configure the routing protocol on all interfaces and manually set the **passive-interface** router configuration command on the interfaces where adjacency was not desired. But in some networks, this solution meant coding 200 or more passive interface statements. With the Default Passive Interface feature, this problem is solved by allowing all interfaces to be set as passive by default using a single **passive-interface default** command, then configuring individual interfaces where adjacencies are desired using the **no passive-interface** command.

Thus, the Default Passive Interface feature simplifies the configuration of distribution routers and allows the network manager to obtain routing information from the interfaces in large ISP and enterprise networks.

To set all interfaces as passive by default and then activate only those interfaces that need to have adjacencies set, use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	`Router(config)# router` *protocol*	Configures the routing protocol on the network.
Step 2	`Router(config-router)# passive-interface default`	Sets all interfaces as passive by default.
Step 3	`Router(config-router)# no passive-interface` *interface-type*	Activates only those interfaces that need to have adjacencies set.
Step 4	`Router(config-router)# network` *network-address* [*options*]	Specifies the list of networks for the routing process. The *network-address* argument is an IP address written in dotted decimal notation—172.24.101.14, for example.

See the section "Default Passive Interface Example" at the end of this chapter for an example of a default passive interface.

To verify that interfaces on your network have been set to passive, you could enter a network monitoring command such as the **show ip ospf interface** EXEC command, or you could verify the interfaces you enabled as active using a command such as the **show ip interface** EXEC command.

Controlling the Advertising of Routes in Routing Updates

To prevent other routers from learning one or more routes, you can suppress routes from being advertised in routing updates. Suppressing routes in route updates prevents other routers from learning the interpretation of a particular device of one or more routes. You cannot specify an interface name in OSPF. When used for OSPF, this feature applies only to external routes.

To suppress routes from being advertised in routing updates, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# distribute-list {access-list-number | access-list-name} out [interface-name | routing-process | as-number]`	Permits or denies routes from being advertised in routing updates depending upon the action listed in the access list.

Controlling the Processing of Routing Updates

You might want to avoid processing certain routes listed in incoming updates. This feature does not apply to OSPF or IS-IS. To suppress routes in incoming updates, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# distribute-list {access-list-number | access-list-name} in [interface-type interface-number]`	Suppresses routes listed in updates from being processed.

Filtering Sources of Routing Information

Filtering sources of routing information prioritizes routing information from different sources, because some pieces of routing information may be more accurate than others. An *administrative distance* is a rating of the trustworthiness of a routing information source, such as an individual router or a group of routers. In a large network, some routing protocols and some routers can be more reliable than others as sources of routing information. Also, when multiple routing processes are running in the same router for IP, it is possible for the same route to be advertised by more than one routing process. By specifying administrative distance values, you enable the router to intelligently discriminate between sources of routing information. The router will always pick the route whose routing protocol has the lowest administrative distance.

To filter sources of routing information, use the following command in router configuration mode:

Command	Purpose
`Router(config-router)# distance {ip-address {wildcard-mask}} [ip-standard-list] [ip-extended]`	Filters on routing information sources.

There are no general guidelines for assigning administrative distances because each network has its own requirements. You must determine a reasonable matrix of administrative distances for the network as a whole. Table 9 shows the default administrative distance for various routing information sources.

2683
Paula

For example, consider a router using IGRP and RIP. Suppose you trust the IGRP-derived routing information more than the RIP-derived routing information. In this example, because the default IGRP administrative distance is lower than the default RIP administrative distance, the router uses the IGRP-derived information and ignores the RIP-derived information. However, if you lose the source of the IGRP-derived information (because of a power shutdown in another building, for example), the router uses the RIP-derived information until the IGRP-derived information reappears.

For an example of filtering on sources of routing information, see the section "Administrative Distance Examples" later in this chapter.

Note You also can use administrative distance to rate the routing information from routers running the same routing protocol. This application is generally discouraged if you are unfamiliar with this particular use of administrative distance, because it can result in inconsistent routing information, including forwarding loops.

Note The weight of a route can no longer be set with the **distance** command. To set the weight for a route, use a route-map.

Enabling Policy Routing

Policy routing is a more flexible mechanism for routing packets than destination routing. It is a process whereby the router puts packets through a route map before routing them. The route map determines which packets are routed to which router next. You might enable policy routing if you want certain packets to be routed some way other than the obvious shortest path. Possible applications for policy routing are to provide equal access, protocol-sensitive routing, source-sensitive routing, routing based on interactive versus batch traffic, and routing based on dedicated links.

To enable policy routing, you must identify which route map to use for policy routing and create the route map. The route map itself specifies the match criteria and the resulting action if all of the match clauses are met. These steps are described in the following task tables.

To enable policy routing on an interface, indicate which route map the router should use by using the following command in interface configuration mode. All packets arriving on the specified interface will be subject to policy routing. This command disables fast switching of all packets arriving on this interface.

Command	Purpose
`Router(config-if)# ip policy route-map map-tag`	Identifies the route map to use for policy routing.

To define the route map to be used for policy routing, use the following command in global configuration mode:

Command	Purpose
`Router(config)# route-map map-tag [permit | deny] [sequence-number]`	Defines a route map to control where packets are output.

IPC-363
CPMI - CORREIOS
0260
Fls:
Doc: 370011

2682
Paula

To define the criteria by which packets are examined to learn if they will be policy-routed, use either one or both of the following commands in route-map configuration mode. No match clause in the route map indicates all packets.

Command	Purpose
`Router(config-route-map)# match length minimum-length maximum-length`	Matches the Level 3 length of the packet.
`Router(config-route-map)# match ip address {access-list-number | access-list-name} [access-list-number | access-list-name]`	Matches the destination IP address that is permitted by one or more standard or extended access lists.

To set the precedence and specify where the packets that pass the match criteria are output, use the following commands in route-map configuration mode:

	Command	Purpose
Step 1	`Router(config-route-map)# set ip precedence number | name`	Sets the precedence value in the IP header.
Step 2	`Router(config-route-map)# set ip next-hop ip-address [ip-address]`	Specifies the next hop to which to route the packet. (It must be an adjacent router).
Step 3	`Router(config-route-map)# set interface interface-type interface-number [... interface-type interface-number]`	Specifies the output interface for the packet.
Step 4	`Router(config-route-map)# set ip default next-hop ip-address [ip-address]`	Specifies the next hop to which to route the packet, if there is no explicit route for this destination. **Note** Like the **set ip next-hop** command, the **set ip default next-hop** command needs to specify an adjacent router.
Step 5	`Router(config-route-map)# set default interface interface-type interface-number [... interface-type interface-number]`	Specifies the output interface for the packet, if there is no explicit route for this destination.

Note The **set ip next-hop** and **set ip default next-hop** are similar commands but have a different order of operations. Configuring the **set ip next-hop** command causes the system to use policy routing first and then use the routing table. Configuring the **set ip default next-hop** causes the system to use the routing table first and then policy route the specified next hop.

The precedence setting in the IP header determines whether, during times of high traffic, the packets will be treated with more or less precedence than other packets. By default, the Cisco IOS software leaves this value untouched; the header remains with the precedence value it had.

The precedence bits in the IP header can be set in the router when policy routing is enabled. When the packets containing those headers arrive at another router, the packets are ordered for transmission according to the precedence set, if the queueing feature is enabled. The router does not honor the precedence bits if queueing is not enabled; the packets are sent in FIFO order.

2681 Paula

You can change the precedence setting, using either a number or name. The names came from RFC 791, but are evolving. You can enable other features that use the values in the **set ip precedence** route-map configuration command to determine precedence. Table 10 lists the possible numbers and their corresponding name, from least important to most important.

Table 10 IP Precedence Values

Number	Name
0	routine
1	priority
2	immediate
3	flash
4	flash-override
5	critical
6	internet
7	network

The **set** commands can be used with each other. They are evaluated in the order shown in the previous task table. A usable next hop implies an interface. Once the local router finds a next hop and a usable interface, it routes the packet.

To display the cache entries in the policy route cache, use the **show ip cache policy** EXEC command.

If you want policy routing to be fast switched, see the following section "Enabling Fast-Switched Policy Routing."

See the "Policy Routing Example" section at the end of this chapter for an example of policy routing.

Enabling Fast-Switched Policy Routing

IP policy routing can now be fast switched. Prior to fast-switched policy routing, policy routing could only be process switched, which meant that on most platforms, the switching rate was approximately 1000 to 10,000 packets per second. Such rates were not fast enough for many applications. Users that need policy routing to occur at faster speeds can now implement policy routing without slowing down the router.

Fast-switched policy routing supports all of the **match** commands and most of the **set** commands, except for the following restrictions:

- The **set ip default** command is not supported.
- The **set interface** command is supported only over point-to-point links, unless a route cache entry exists using the same interface specified in the **set interface** command in the route map. Also, at the process level, the routing table is consulted to determine if the interface is on a reasonable path to the destination. During fast switching, the software does not make this check. Instead, if the packet matches, the software blindly forwards the packet to the specified interface.

Policy routing must be configured before you configure fast-switched policy routing. Fast switching of policy routing is disabled by default. To have policy routing be fast switched, use the following command in interface configuration mode:

IPC-365
CPMI - CORREIOS
0261
Fls:
3701
Doc:

Command	Purpose
`Router(config-if)# ip route-cache policy`	Enables fast switching of policy routing.

Enabling Local Policy Routing

Packets that are generated by the router are not normally policy routed. To enable local policy routing for such packets, indicate which route map the router should use by using the following command in global configuration mode. All packets originating on the router will then be subject to local policy routing.

Command	Purpose
`Router(config)# ip local policy route-map` *map-tag*	Identifies the route map to use for local policy routing.

Use the **show ip local policy** EXEC command to display the route map used for local policy routing, if one exists.

Enabling NetFlow Policy Routing

NetFlow policy routing (NPR) integrates policy routing, which enables traffic engineering and traffic classification, with NetFlow services, which provide billing, capacity planning, and monitoring information on real-time traffic flows. IP policy routing now works with Cisco Express Forwarding (CEF), distributed CEF (dCEF), NetFlow, and NetFlow flow acceleration.

As quality of service (QoS) and traffic engineering become more popular, so does interest in the ability of policy routing to selectively set IP Precedence and type of service (ToS) bits (based on access lists and packet size), thereby routing packets based on predefined policy. It is important that policy routing work well in large, dynamic routing environments. Hence, distributed support allows customers to leverage their investment in distributed architecture.

NetFlow policy routing leverages the following technologies:

- CEF, which looks at a Forwarding Information Base (FIB) instead of a routing table when switching packets, to address maintenance problems of a demand caching scheme.
- dCEF, which addresses the scalability and maintenance problems of a demand caching scheme.
- NetFlow, which allows accounting, capacity planning, traffic monitoring, and flow-accelerating specific applications.

Following are NPR benefits:

- NPR takes advantage of the new switching services. CEF, dCEF, and NetFlow can now use policy routing.
- Now that policy routing is integrated into CEF, policy routing can be deployed on a wide scale and on high-speed interfaces.

Following are NPR restrictions:

- NPR is only available on Cisco IOS platforms that support CEF.
- Distributed FIB-based policy routing is only available on platforms that support dCEF.
- The Cisco 12000 platform currently is not supported.

2679
Paula

- Policy routing will not be flow accelerated if any match packet-size clause of a route map is configured. Because packet size is not part of a flow definition, a policy routing decision cannot be based on a flow entry.
- The **set ip next-hop verify-availability** route-map configuration command of route-map is not supported in dCEF because dCEF does not support the Cisco Discovery Protocol (CDP) database.

In order for NetFlow policy routing to work, the following features must already be configured:

- CEF, dCEF, or NetFlow
- Policy routing

To configure CEF, dCEF, or NetFlow, refer to the appropriate chapter of the *Cisco IOS Switching Services Configuration Guide*.

NPR is the default policy routing mode. No additional configuration tasks are required to enable policy routing in conjunction with CEF, dCEF, or NetFlow. As soon as one of these features is turned on, packets are automatically subject to policy routing in the appropriate switching path.

There is one new, optional configuration command (**set ip next-hop verify-availability**). This command has the following restrictions:

- It can cause some performance degradation due to CDP database lookup overhead per packet.
- CDP must be enabled on the interface.
- The directly connected next hop must be a Cisco device with CDP enabled.
- It is supported in NetFlow accelerated policy routing, but not available in dCEF, due to the dependency of the CDP neighbor database.

It is assumed that policy routing itself is already configured.

If the router is policy routing packets to the next hop and the next hop happens to be down, the router will try unsuccessfully to use Address Resolution Protocol (ARP) for the next hop (which is down). This behavior will continue forever.

To prevent this situation, you can configure the router to first verify that the next hops of the route map are CDP neighbors of the router before routing to that next hop.

This task is optional because some media or encapsulations do not support CDP, or it may not be a Cisco device that is sending the router traffic.

To configure the router to verify that the next hop is a CDP neighbor before the router tries to policy route to it, use the following command in route-map configuration mode:

Command	Purpose
`uter(config-route-map)# set ip next-hop verify-availability`	Causes the router to confirm that the next hops of the route map are CDP neighbors of the router.

If the command shown is set and the next hop is not a CDP neighbor, the router looks to the subsequent next hop, if there is one. If there is none, the packets simply are not policy routed.

If the command shown is not set, the packets are either policy routed or remain forever unrouted.

If you want to selectively verify availability of only some next hops, you can configure different route-map entries (under the same route map name) with different criteria (using access list matching or packet size matching), and use the **set ip next-hop verify-availability** configuration command selectively.

Doc:

Typically, you would use existing policy routing and NetFlow **show** EXCEC commands to monitor these features. For more information on these **show** commands, refer to the "IP Routing Protocol-Independent Commands" chapter of the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols* publication for policy routing commands and the appropriate chapter of the *Cisco IOS Switching Services Command Reference* publication for NetFlow commands.

To display the route map Inter Processor Communication (IPC) message statistics in the Route Processor (RP) or Versatile Interface Processor (VIP), use the following command in EXEC mode:

Command	Purpose
`Router# show route-map ipc`	Displays the route map IPC message statistics in the RP or VIP.

Managing Authentication Keys

Key management is a method of controlling authentication keys used by routing protocols. Not all protocols can use key management. Authentication keys are available for Director Response Protocol (DRP) Agent, Enhanced IGRP (EIGRP), and RIP Version 2.

Before you manage authentication keys, authentication must be enabled. See the appropriate protocol chapter to learn how to enable authentication for that protocol.

To manage authentication keys, define a key chain, identify the keys that belong to the key chain, and specify how long each key is valid. Each key has its own key identifier (specified with the **key** key chain configuration command), which is stored locally. The combination of the key identifier and the interface associated with the message uniquely identifies the authentication algorithm and Message Digest 5 (MD5) authentication key in use.

You can configure multiple keys with lifetimes. Only one authentication packet is sent, regardless of how many valid keys exist. The software examines the key numbers in order from lowest to highest, and uses the first valid key it encounters. The lifetimes allow for overlap during key changes. Note that the router must know the time. Refer to the Network Time Protocol (NTP) and calendar commands in the "Performing Basic System Management" chapter of the *Cisco IOS Configuration Fundamentals Configuration Guide*.

To manage authentication keys, use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	`Router(config)#key chain` *name-of-chain*	Identifies a key chain.
Step 2	`Router(config-keychain)# key` *number*	Identifies the key number in key chain configuration mode.
Step 3	`Router(config-keychain-key)# key-string` *text*	Identifies the key string in key chain configuration mode.
Step 4	`Router(config-keychain-key)# accept-lifetime` *start-time* `{infinite |` *end-time* `| duration` *seconds*`}]`	Specifies the time period during which the key can be received.
Step 5	`Router(config-keychain-key)# send-lifetime` *start-time* `{infinite |` *end-time* `| duration` *seconds*`}`	Specifies the time period during which the key can be sent.

Use the **show key chain** EXEC command to display key chain information. For examples of key management, see the "Key Management Examples" section at the end of this chapter.

Paula

Monitoring and Maintaining the IP Network

You can remove all contents of a particular cache, table, or database. You also can display specific statistics. The following sections describe each of these tasks.

Clearing Routes from the IP Routing Table

You can remove all contents of a particular table. Clearing a table can become necessary when the contents of the particular structure have become, or are suspected to be, invalid.

To clear one or more routes from the IP routing table, use the following command in EXEC mode:

Command	Purpose
Router# **clear ip route** {*network* [*mask*] | *}	Clears one or more routes from the IP routing table.

Displaying System and Network Statistics

You can display specific statistics such as the contents of IP routing tables, caches, and databases. Information provided can be used to determine resource utilization and solve network problems. You can also display information about node reachability and discover the routing path packets leaving your device are taking through the network.

To display various routing statistics, use the following commands in EXEC mode, as needed:

Command	Purpose
Router# **show ip cache policy**	Displays the cache entries in the policy route cache.
Router# **show ip local policy**	Displays the local policy route map if one exists.
Router# **show ip policy**	Displays policy route maps.
Router# **show ip protocols**	Displays the parameters and current state of the active routing protocol process.
Router# **show ip route** [*address* [*mask*] [**longer-prefixes**]] | [*protocol* [*process-id*]]	Displays the current state of the routing table.
Router# **show ip route summary**	Displays the current state of the routing table in summary form.
Router# **show ip route supernets-only**	Displays supernets.
Router# **show key chain** [*name-of-chain*]	Displays authentication key information.
Router# **show route-map** [*map-name*]	Displays all route maps configured or only the one specified.

IP Routing Protocol-Independent Configuration Examples

The following sections provide routing protocol-independent configuration examples:

- Variable-Length Subnet Mask Example
- Overriding Static Routes with Dynamic Protocols Example
- Administrative Distance Examples
- Static Routing Redistribution Example
- IGRP Redistribution Example
- RIP and IGRP Redistribution Example
- EIGRP Redistribution Examples
- RIP and EIGRP Redistribution Examples
- OSPF Routing and Route Redistribution Examples
- Default Metric Values Redistribution Example
- Route Map Examples
- Passive Interface Examples
- Policy Routing Example
- NetFlow Policy Routing Example
- Key Management Examples

Variable-Length Subnet Mask Example

In the following example, a 14-bit subnet mask is used, leaving two bits of address space reserved for serial line host addresses. There is sufficient host address space for two host endpoints on a point-to-point serial link.

```
interface ethernet 0
 ip address 131.107.1.1 255.255.255.0
! 8 bits of host address space reserved for ethernets

interface serial 0
 ip address 131.107.254.1 255.255.255.252
! 2 bits of address space reserved for serial lines

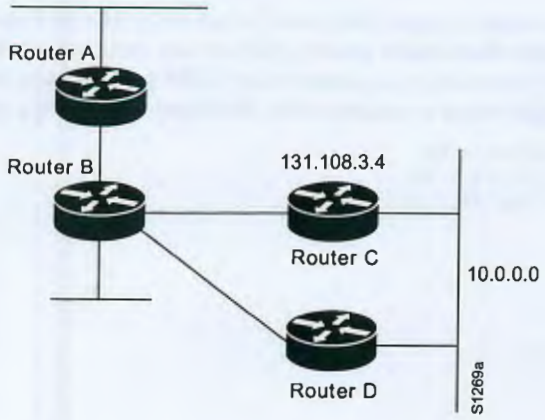
! Router is configured for OSPF and assigned AS 107
router ospf 107
! Specifies network directly connected to the router
 network 131.107.0.0 0.0.255.255 area 0.0.0.0
```

Overriding Static Routes with Dynamic Protocols Example

In the following example, packets for network 10.0.0.0 from Router B (where the static route is installed) will be routed through 131.108.3.4 if a route with an administrative distance less than 110 is not available. Figure 60 illustrates this example. The route learned by a protocol with an administrative distance of less than 110 might cause Router B to send traffic destined for network 10.0.0.0 via the alternate path—through Router D.

```
ip route 10.0.0.0 255.0.0.0 131.108.3.4 110
```

Figure 60 Overriding Static Routes



Administrative Distance Examples

In the following example, the **router igrp** global configuration command sets up IGRP routing in autonomous system 109. The **network** router configuration commands specify IGRP routing on networks 192.31.7.0 and 128.88.0.0. The first **distance** router configuration command sets the default administrative distance to 255, which instructs the router to ignore all routing updates from routers for which an explicit distance has not been set. The second **distance** command sets the administrative distance to 90 for all routers on the Class C network 192.31.7.0. The third **distance** command sets the administrative distance to 120 for the router with the address 128.88.1.3.

```
router igrp 109
 network 192.31.7.0
 network 128.88.0.0
 distance 255
 distance 90 192.31.7.0 0.0.0.255
 distance 120 128.88.1.3 0.0.0.0
```

The following example assigns the router with the address 192.31.7.18 an administrative distance of 100, and all other routers on subnet 192.31.7.0 an administrative distance of 200:

```
distance 100 192.31.7.18 0.0.0.0
distance 200 192.31.7.0 0.0.0.255
```

However, if you reverse the order of these commands, all routers on subnet 192.31.7.0 are assigned an administrative distance of 200, including the router at address 192.31.7.18:

```
distance 200 192.31.7.0 0.0.0.255
distance 100 192.31.7.18 0.0.0.0
```

Assigning administrative distances is a problem unique to each network and is done in response to the greatest perceived threats to the connected network. Even when general guidelines exist, the network manager must ultimately determine a reasonable matrix of administrative distances for the network as a whole.

In the following example, the distance value for IP routes learned is 90. Preference is given to these IP routes rather than routes with the default administrative distance value of 110.

```
router isis
 distance 90 ip
```

Static Routing Redistribution Example

In the example that follows, three static routes are specified, two of which are to be advertised. The static routes are created by specifying the **redistribute static** router configuration command, then specifying an access list that allows only those two networks to be passed to the IGRP process. Any redistributed static routes should be sourced by a single router to minimize the likelihood of creating a routing loop.

```
ip route 192.1.2.0 255.255.255.0 192.31.7.65
ip route 193.62.5.0 255.255.255.0 192.31.7.65
ip route 131.108.0.0 255.255.255.0 192.31.7.65
access-list 3 permit 192.1.2.0
access-list 3 permit 193.62.5.0
!
router igrp 109
 network 192.31.7.0
 default-metric 10000 100 255 1 1500
 redistribute static
 distribute-list 3 out static
```

IGRP Redistribution Example

Each IGRP routing process can provide routing information to only one autonomous system; the Cisco IOS software must run a separate IGRP process and maintain a separate routing database for each autonomous system it services. However, you can transfer routing information between these routing databases.

Suppose the router has one IGRP routing process for network 15.0.0.0 in autonomous system 71 and another for network 192.31.7.0 in autonomous system 109, as the following commands specify:

```
router igrp 71
 network 15.0.0.0
router igrp 109
 network 192.31.7.0
```

To transfer a route to 192.31.7.0 into autonomous system 71 (without passing any other information about autonomous system 109), use the command in the following example:

```
router igrp 71
 redistribute igrp 109
 distribute-list 3 out igrp 109
access-list 3 permit 192.31.7.0
```

RIP and IGRP Redistribution Example

Consider a WAN at a university that uses RIP as an interior routing protocol. Assume that the university wants to connect its WAN to a regional network, 128.1.0.0, which uses IGRP as the routing protocol. The goal in this case is to advertise the networks in the university network to the routers on the regional network. The commands for the interconnecting router are listed in the example that follows:

```
router igrp 109
 network 128.1.0.0
 redistribute rip
 default-metric 10000 100 255 1 1500
 distribute-list 10 out rip
```

2673
Paula

In this example, the **router** global configuration command starts an IGRP routing process. The **network** router configuration command specifies that network 128.1.0.0 (the regional network) is to receive IGRP routing information. The **redistribute** router configuration command specifies that RIP-derived routing information be advertised in the routing updates. The **default-metric** router configuration command assigns an IGRP metric to all RIP-derived routes.

The **distribute-list** router configuration command instructs the Cisco IOS software to use access list 10 (not defined in this example) to limit the number of entries in each outgoing update. The access list prevents unauthorized advertising of university routes to the regional network.

EIGRP Redistribution Examples

Each Enhanced IGRP (EIGRP) routing process provides routing information to only one autonomous system. The Cisco IOS software must run a separate EIGRP process and maintain a separate routing database for each autonomous system it services. However, you can transfer routing information between these routing databases.

Suppose the software has one EIGRP routing process for network 15.0.0.0 in autonomous system 71 and another for network 192.31.7.0 in autonomous system 109, as the following commands specify:

```
router eigrp 71
 network 15.0.0.0
router eigrp 109
 network 192.31.7.0
```

To transfer a route from 192.31.7.0 into autonomous system 71 (without passing any other information about autonomous system 109), use the command in the following example:

```
router eigrp 71
 redistribute eigrp 109 route-map 109-to-71
 route-map 109-to-71 permit
 match ip address 3
 set metric 10000 100 1 255 1500
access-list 3 permit 192.31.7.0
```

The following example is an alternative way to transfer a route to 192.31.7.0 into autonomous system 71. Unlike the previous configuration, this one does not allow you to arbitrarily set the metric.

```
router eigrp 71
 redistribute eigrp 109
 distribute-list 3 out eigrp 109
access-list 3 permit 192.31.7.0
```

IP and EIGRP Redistribution Examples

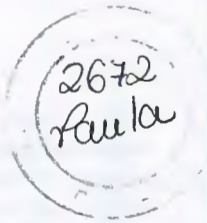
This section provides a simple RIP redistribution example and a complex redistribution example between Enhanced IGRP (EIGRP) and BGP.

Simple Redistribution Example

Consider a WAN at a university that uses RIP as an interior routing protocol. Assume that the university wants to connect its WAN to a regional network, 128.1.0.0, which uses Enhanced IGRP (EIGRP) as the routing protocol. The goal in this case is to advertise the networks in the university network to the routers on the regional network.

The commands for the interconnecting router are listed in the example that follows:

IPC-373
CPMI CORREIOS
Fls: 0265
Doc: 3701



```
router eigrp 109
 network 128.1.0.0
 redistribute rip
 default-metric 10000 100 255 1 1500
 distribute-list 10 out rip
```

In this example, the **router** global configuration command starts an EIGRP routing process. The **network** router configuration command specifies that network 128.1.0.0 (the regional network) is to send and receive EIGRP routing information. The **redistribute** router configuration command specifies that RIP-derived routing information be advertised in the routing updates. The **default-metric** router configuration command assigns an EIGRP metric to all RIP-derived routes.

The **distribute-list** router configuration command instructs the Cisco IOS software to use access list 10 (not defined in this example) to limit the entries in each outgoing update. The access list prevents unauthorized advertising of university routes to the regional network.

Complex Redistribution Example

The most complex redistribution case is one in which *mutual* redistribution is required between an IGP (in this case EIGRP) and BGP.

Suppose that BGP is running on a router somewhere else in autonomous system 1, and that the BGP routes are injected into EIGRP routing process 1. You must use filters to ensure that the proper routes are advertised. The example configuration for router R1 illustrates use of access filters and a distribution list to filter routes advertised to BGP neighbors. This example also illustrates configuration commands for redistribution between BGP and EIGRP.

```
! Configuration for router R1:
router bgp 1
 network 131.108.0.0
 neighbor 192.5.10.1 remote-as 2
 neighbor 192.5.10.15 remote-as 1
 neighbor 192.5.10.24 remote-as 3
 redistribute eigrp 1
 distribute-list 1 out eigrp 1
!
! All networks that should be advertised from R1 are controlled with access lists:
!
access-list 1 permit 131.108.0.0
access-list 1 permit 150.136.0.0
access-list 1 permit 128.125.0.0
!
router eigrp 1
 network 131.108.0.0
 network 192.5.10.0
 redistribute bgp 1
```

OSPF Routing and Route Redistribution Examples

OSPF typically requires coordination among many internal routers, ABRs, and Autonomous System Boundary Routers (ASBRs). At a minimum, OSPF-based routers can be configured with all default parameter values, with no authentication, and with interfaces assigned to areas.

2671
Paula

Three types of examples follow:

- The first examples are simple configurations illustrating basic OSPF commands.
- The second example illustrates a configuration for an internal router, ABR, and ASBRs within a single, arbitrarily assigned, OSPF autonomous system.
- The third example illustrates a more complex configuration and the application of various tools available for controlling OSPF-based routing environments.

Basic OSPF Configuration Examples

The following example illustrates a simple OSPF configuration that enables OSPF routing process 9000, attaches Ethernet interface 0 to area 0.0.0.0, and redistributes RIP into OSPF, and OSPF into RIP:

```
interface ethernet 0
 ip address 130.93.1.1 255.255.255.0
 ip ospf cost 1
!
interface ethernet 1
 ip address 130.94.1.1 255.255.255.0
!
router ospf 9000
 network 130.93.0.0 0.0.255.255 area 0.0.0.0
 redistribute rip metric 1 subnets
!
router rip
 network 130.94.0.0
 redistribute ospf 9000
 default-metric 1
```

The following example illustrates the assignment of four area IDs to four IP address ranges. In the example, OSPF routing process 109 is initialized, and four OSPF areas are defined: 10.9.50.0, 2, 3, and 0. Areas 10.9.50.0, 2, and 3 mask specific address ranges, while area 0 enables OSPF for *all other* networks.

```
router ospf 109
 network 131.108.20.0 0.0.0.255 area 10.9.50.0
 network 131.108.0.0 0.0.255.255 area 2
 network 131.109.10.0 0.0.0.255 area 3
 network 0.0.0.0 255.255.255.255 area 0
!
! Interface Ethernet0 is in area 10.9.50.0:
interface ethernet 0
 ip address 131.108.20.5 255.255.255.0
!
! Interface Ethernet1 is in area 2:
interface ethernet 1
 ip address 131.108.1.5 255.255.255.0
!
! Interface Ethernet2 is in area 2:
interface ethernet 2
 ip address 131.108.2.5 255.255.255.0
!
! Interface Ethernet3 is in area 3:
interface ethernet 3
 ip address 131.109.10.5 255.255.255.0
!
! Interface Ethernet4 is in area 0:
interface ethernet 4
 ip address 131.109.1.1 255.255.255.0
!
```

DOC Nº 03/2005 - CN

```

Each **network** router configuration command is evaluated sequentially, so the specific order of these commands in the configuration is important. The Cisco IOS software sequentially evaluates the address/wildcard-mask pair for each interface. See the "IP Routing Protocols Commands" chapter of the *Cisco IOS IP Command Reference, Volume 2 of 3: Routing Protocols* publication for more information.

Consider the first **network** command. Area ID 10.9.50.0 is configured for the interface on which subnet 131.108.20.0 is located. Assume that a match is determined for interface Ethernet 0. Interface Ethernet 0 is attached to Area 10.9.50.0 only.

The second **network** command is evaluated next. For Area 2, the same process is then applied to all interfaces (except interface Ethernet 0). Assume that a match is determined for interface Ethernet 1. OSPF is then enabled for that interface and Ethernet 1 is attached to Area 2.

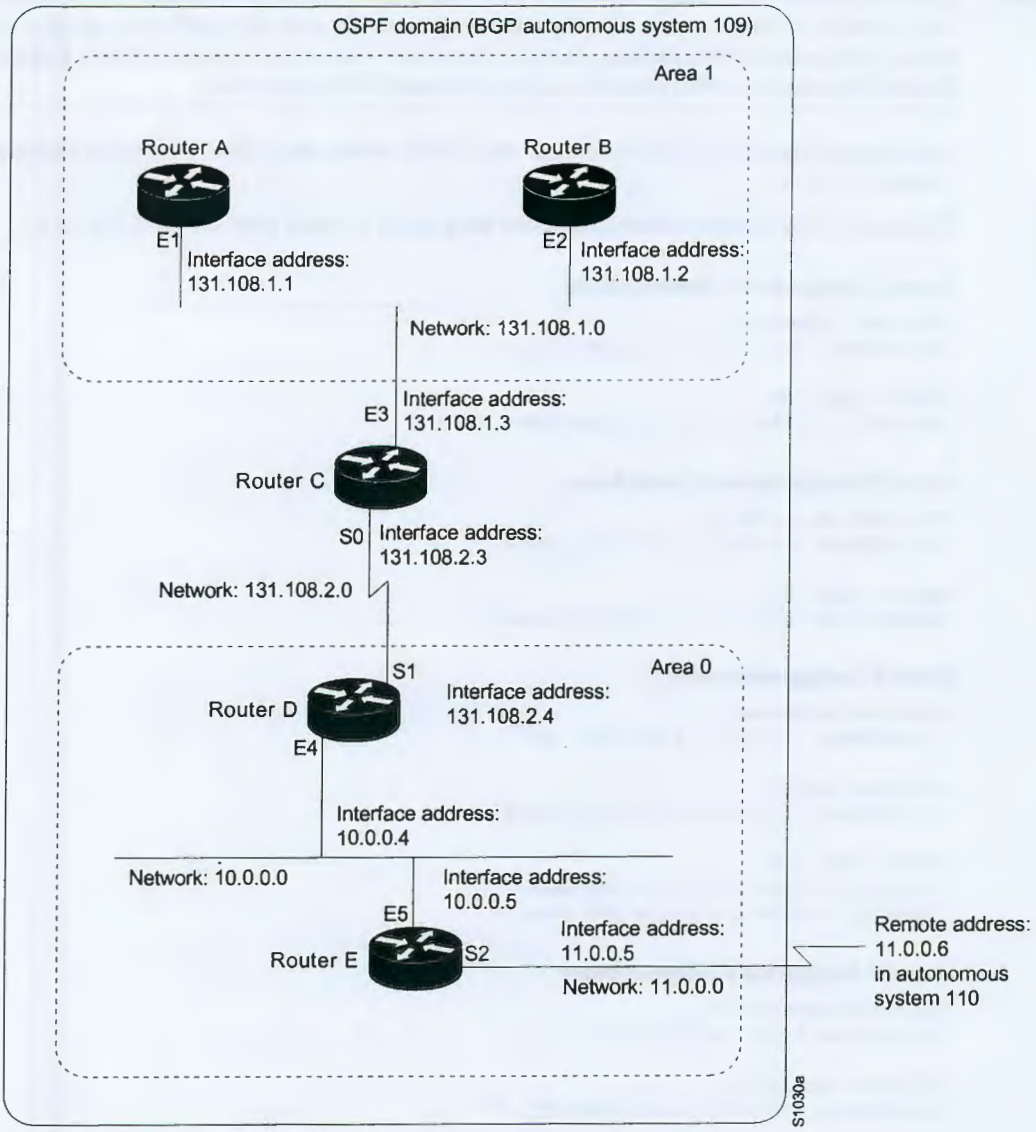
This process of attaching interfaces to OSPF areas continues for all **network** commands. Note that the last **network** command in this example is a special case. With this command, all available interfaces (not explicitly attached to another area) are attached to Area 0.

Internal Router, ABR, and ASBRs Configuration Example

Figure 61 provides a general network map that illustrates a sample configuration for several routers within a single OSPF autonomous system.

2669
Paula

Figure 61 Example OSPF Autonomous System Network Map



In this configuration, five routers are configured in OSPF autonomous system 109:

- Router A and Router B are both internal routers within area 1.
- Router C is an OSPF ABR. Note that for Router C, area 1 is assigned to E3 and Area 0 is assigned to S0.
- Router D is an internal router in area 0 (backbone area). In this case, both **network** router configuration commands specify the same area (area 0, or the backbone area).
- Router E is an OSPF ASBR. Note that BGP routes are redistributed into OSPF and that these routes are advertised by OSPF.

IPC-377
CPMI - CORREIOS
0267
Fls:
Doc: 3701

2668
Paula

Note It is not necessary to include definitions of all areas in an OSPF autonomous system in the configuration of all routers in the autonomous system. You must only define the *directly* connected areas. In the example that follows, routes in Area 0 are learned by the routers in area 1 (Router A and Router B) when the ABR (Router C) injects summary LSAs into area 1.

Autonomous system 109 is connected to the outside world via the BGP link to the external peer at IP address 11.0.0.6.

Following is the example configuration for the general network map shown in Figure 61.

Router A Configuration—Internal Router

```
interface ethernet 1
 ip address 131.108.1.1 255.255.255.0

router ospf 109
 network 131.108.0.0 0.0.255.255 area 1
```

Router B Configuration—Internal Router

```
interface ethernet 2
 ip address 131.108.1.2 255.255.255.0

router ospf 109
 network 131.108.0.0 0.0.255.255 area 1
```

Router C Configuration—ABR

```
interface ethernet 3
 ip address 131.108.1.3 255.255.255.0

interface serial 0
 ip address 131.108.2.3 255.255.255.0

router ospf 109
 network 131.108.1.0 0.0.0.255 area 1
 network 131.108.2.0 0.0.0.255 area 0
```

Router D Configuration—Internal Router

```
interface ethernet 4
 ip address 10.0.0.4 255.0.0.0

interface serial 1
 ip address 131.108.2.4 255.255.255.0

router ospf 109
 network 131.108.2.0 0.0.0.255 area 0
 network 10.0.0.0 0.255.255.255 area 0
```

Router E Configuration—ASBR

```
interface ethernet 5
 ip address 10.0.0.5 255.0.0.0

interface serial 2
 ip address 11.0.0.5 255.0.0.0

router ospf 109
 network 10.0.0.0 0.255.255.255 area 0
 redistribute bgp 109 metric 1 metric-type 1
```

2667
Paula

```
router bgp 109
 network 131.108.0.0
 network 10.0.0.0
 neighbor 11.0.0.6 remote-as 110
```

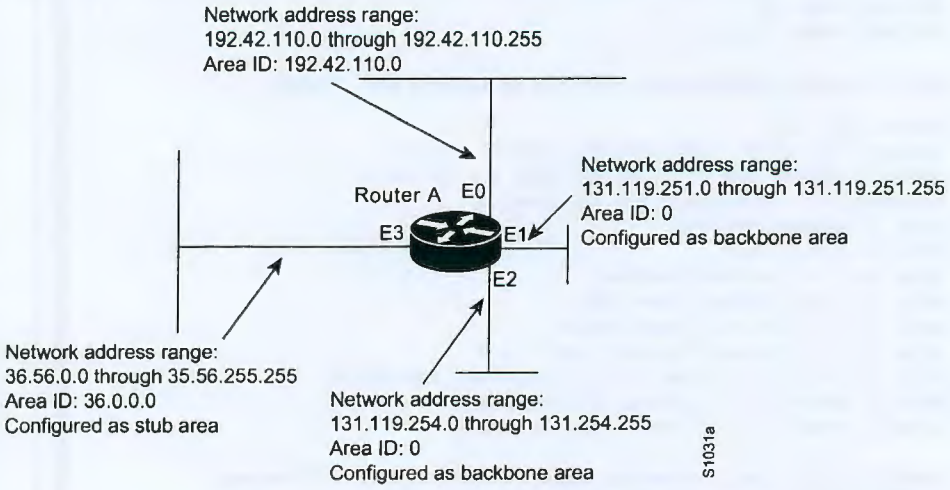
Complex OSPF Configuration Example

The following example configuration accomplishes several tasks in setting up an ABR. These tasks can be split into two general categories:

- Basic OSPF configuration
- Route redistribution

The specific tasks outlined in this configuration are detailed briefly in the following descriptions. Figure 62 illustrates the network address ranges and area assignments for the interfaces.

Figure 62 Interface and Area Specifications for OSPF Configuration Example



The basic configuration tasks in this example are as follows:

- Configure address ranges for Ethernet interface 0 through Ethernet interface 3.
- Enable OSPF on each interface.
- Set up an OSPF authentication password for each area and network.
- Assign link-state metrics and other OSPF interface configuration options.
- Create a *stub area* with area ID 36.0.0.0. (Note that the **authentication** and **stub** options of the **area** router configuration command are specified with separate **area** command entries, but can be merged into a single **area** command.)
- Specify the backbone area (area 0).

Configuration tasks associated with redistribution are as follows:

- Redistribute IGRP and RIP into OSPF with various options set (including **metric-type**, **metric**, **tag**, and **subnet**).
- Redistribute IGRP and OSPF into RIP.

The following is an example OSPF configuration:

 ip ospf dead-interval 80
```

In the following configuration, OSPF is on network 131.119.0.0:

```
router ospf 201
 network 36.0.0.0 0.255.255.255 area 36.0.0.0
 network 192.42.110.0 0.0.0.255 area 192.42.110.0
 network 131.119.0.0 0.0.255.255 area 0
 area 0 authentication
 area 36.0.0.0 stub
 area 36.0.0.0 authentication
 area 36.0.0.0 default-cost 20
 area 192.42.110.0 authentication
 area 36.0.0.0 range 36.0.0.0 255.0.0.0
 area 192.42.110.0 range 192.42.110.0 255.255.255.0
 area 0 range 131.119.251.0 255.255.255.0
 area 0 range 131.119.254.0 255.255.255.0

 redistribute igrp 200 metric-type 2 metric 1 tag 200 subnets
 redistribute rip metric-type 2 metric 1 tag 200
```

In the following configuration IGRP autonomous system 200 is on 131.119.0.0:

```
router igrp 200
 network 131.119.0.0
!
! RIP for 192.42.110
!
router rip
 network 192.42.110.0
 redistribute igrp 200 metric 1
 redistribute ospf 201 metric 1
```

2665
Paula

Default Metric Values Redistribution Example

The following example shows a router in autonomous system 109 using both RIP and IGRP. The example advertises IGRP-derived routes using RIP and assigns the IGRP-derived routes a RIP metric of 10.

```
router rip
 default-metric 10
 redistribute igrp 109
```

Route Map Examples

The examples in this section illustrate the use of redistribution, with and without route maps. Examples from both the IP and Connectionless Network Service (CLNS) routing protocols are given.

The following example redistributes all OSPF routes into IGRP:

```
router igrp 109
 redistribute ospf 110
```

The following example redistributes RIP routes with a hop count equal to 1 into OSPF. These routes will be redistributed into OSPF as external LSAs with a metric of 5, metric a type of type 1, and a tag equal to 1.

```
router ospf 109
 redistribute rip route-map rip-to-ospf
!
route-map rip-to-ospf permit
 match metric 1
 set metric 5
 set metric-type type1
 set tag 1
```

The following example redistributes OSPF learned routes with tag 7 as a RIP metric of 15:

```
router rip
 redistribute ospf 109 route-map 5
!
route-map 5 permit
 match tag 7
 set metric 15
```

The following example redistributes OSPF intra-area and interarea routes with next hop routers on serial interface 0 into BGP with an INTER_AS metric of 5:

```
router bgp 109
 redistribute ospf 109 route-map 10
!
route-map 10 permit
 match route-type internal
 match interface serial 0
 set metric 5
```

The following example redistributes two types of routes into the integrated IS-IS routing table (supporting both IP and CLNS). The first type is OSPF external IP routes with tag 5; these routes are inserted into Level 2 IS-IS link-state packets (LSPs) with a metric of 5. The second type is ISO-IGRP derived CLNS prefix routes that match CLNS access list 2000; these routes will be redistributed into IS-IS as Level 2 LSPs with a metric of 30.

```
router isis
 redistribute ospf 109 route-map 2
```

03/2005 - CN
CPMI - IPC-381
0269
Fls:
Doc:
3701

2664
Paula

```
 redistribute iso-igrp nsfnet route-map 3
!
route-map 2 permit
 match route-type external
 match tag 5
 set metric 5
 set level level-2
!
route-map 3 permit
 match address 2000
 set metric 30
```

With the following configuration, OSPF external routes with tags 1, 2, 3, and 5 are redistributed into RIP with metrics of 1, 1, 5, and 5, respectively. The OSPF routes with a tag of 4 are not redistributed.

```
router rip
 redistribute ospf 109 route-map 1
!
route-map 1 permit
 match tag 1 2
 set metric 1
!
route-map 1 permit
 match tag 3
 set metric 5
!
route-map 1 deny
 match tag 4
!
route map 1 permit
 match tag 5
 set metric 5
```

Given the following configuration, a RIP learned route for network 160.89.0.0 and an ISO-IGRP learned route with prefix 49.0001.0002 will be redistributed into an IS-IS Level 2 LSP with a metric of 5:

```
router isis
 redistribute rip route-map 1
 redistribute iso-igrp remote route-map 1
!
route-map 1 permit
 match ip address 1
 match clns address 2
 set metric 5
 set level level-2
!
access-list 1 permit 160.89.0.0 0.0.255.255
 clns filter-set 2 permit 49.0001.0002...
```

The following configuration example illustrates how a route map is referenced by the **default-information** router configuration command. This type of reference is called *conditional default origination*. OSPF will originate the default route (network 0.0.0.0) with a type 2 metric of 5 if 140.222.0.0 is in the routing table.

```
route-map ospf-default permit
 match ip address 1
 set metric 5
 set metric-type type-2
!
access-list 1 140.222.0.0 0.0.255.255
!
router ospf 109
 default-information originate route-map ospf-default
```

See more route map examples in the sections "BGP Route Map Examples" and "BGP Community with Route Maps Examples" in the "Configuring BGP" chapter.

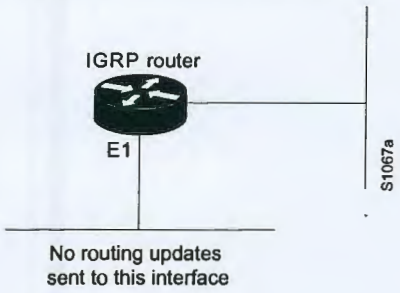
2663
Paula

Passive Interface Examples

The following example sends IGRP updates to all interfaces on network 131.108.0.0 except Ethernet interface 1. Figure 63 shows this configuration.

```
router igrp 109
 network 131.108.0.0
 passive-interface ethernet 1
```

Figure 63 Filtering IGRP Updates



In the following example, as in the first example, IGRP updates are sent to all interfaces on network 131.108.0.0 except Ethernet interface 1. However, in this case a **neighbor** router configuration command is included, which permits the sending of routing updates to specific neighbors. One copy of the routing update is generated per neighbor.

```
router igrp 109
 network 131.108.0.0
 passive-interface ethernet 1
 neighbor 131.108.20.4
```

In OSPF, hello packets are not sent on an interface that is specified as passive. Hence, the router will not be able to discover any neighbors, and none of the OSPF neighbors will be able to see the router on that network. In effect, this interface will appear as a stub network to the OSPF domain. This configuration is useful if you want to import routes associated with a connected network into the OSPF domain without any OSPF activity on that interface.

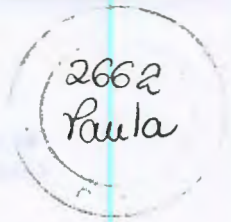
The **passive-interface** router configuration command typically is used when the wildcard specification on the **network** router configuration command configures more interfaces than is desirable. The following configuration causes OSPF to run on all subnets of 131.108.0.0:

```
interface ethernet 0
 ip address 131.108.1.1 255.255.255.0
interface ethernet 1
 ip address 131.108.2.1 255.255.255.0
interface ethernet 2
 ip address 131.108.3.1 255.255.255.0
!
router ospf 109
 network 131.108.0.0 0.0.255.255 area 0
```

If you do not want OSPF to run on 131.108.3.0, enter the following commands:

```
router ospf 109
```

CPMI - CORREIOS
IPC-383
0270
Fls:
Doc: 3701



```
 network 131.108.0.0 0.0.255.255 area 0
 passive-interface ethernet 2
```

Default Passive Interface Example

The following example configures the network interfaces, sets all interfaces running OSPF as passive, then enables serial interface):

```
interface Ethernet0
 ip address 172.19.64.38 255.255.255.0 secondary
 ip address 171.69.232.70 255.255.255.240
 no ip directed-broadcast
!
interface Serial0
 ip address 172.24.101.14 255.255.255.252
 no ip directed-broadcast
 no ip mroute-cache
!
interface TokenRing0
 ip address 140.10.10.4 255.255.255.0
 no ip directed-broadcast
 no ip mroute-cache
 ring-speed 16
!
router ospf 100
 passive-interface default
 no passive-interface Serial0
 network 140.10.10.0 0.0.0.255 area 0
 network 171.69.232.0 0.0.0.255 area 4
 network 172.24.101.0 0.0.0.255 area 4
```

Policy Routing Example

The following example provides two sources with equal access to two different service providers. Packets arriving on asynchronous interface 1 from the source 1.1.1.1 are sent to the router at 6.6.6.6 if the router has no explicit route for the destination of the packet. Packets arriving from the source 2.2.2.2 are sent to the router at 7.7.7.7 if the router has no explicit route for the destination of the packet. All other packets for which the router has no explicit route to the destination are discarded.

```
access-list 1 permit ip 1.1.1.1
access-list 2 permit ip 2.2.2.2
!
interface async 1
 ip policy route-map equal-access
!
route-map equal-access permit 10
 match ip address 1
 set ip default next-hop 6.6.6.6
route-map equal-access permit 20
 match ip address 2
 set ip default next-hop 7.7.7.7
route-map equal-access permit 30
 set default interface null0
```

2661
Fls

NetFlow Policy Routing Example

The following example configures CEF, NetFlow, and NetFlow with flow acceleration. It also configures policy routing to verify that next hop 50.0.0.8 of the route map named test is a CDP neighbor before the router tries to policy route to it.

If the first packet is being policy routed via route map test sequence 10, the subsequent packets of the same flow always take the same route map test sequence 10, not route map test sequence 20, because they all match or pass access list 1 check. Therefore, policy routing can be flow accelerated by bypassing the access list check.

```
ip cef
ip flow-cache feature-accelerate
interface ethernet0/0/1
 ip route-cache flow
 ip policy route-map test
route-map test permit 10
 match ip address 1
 set ip precedence priority
 set ip next-hop 50.0.0.8
 set ip next-hop verify-availability
route-map test permit 20
 match ip address 101
 set interface Ethernet0/0/3
 set ip tos max-throughput
```

Key Management Examples

The following example configures a key chain named trees. In this example, the software will always accept and send willow as a valid key. The key chestnut will be accepted from 1:30 p.m. to 3:30 p.m. and be sent from 2:00 p.m. to 3:00 p.m. The overlap allows for migration of keys or discrepancy in the set time of the router. Likewise, the key birch immediately follows chestnut, and there is a 30-minute leeway on each side to handle time-of-day differences.

```
interface ethernet 0
 ip rip authentication key-chain trees
 ip rip authentication mode md5
!
router rip
 network 172.19.0.0
 version 2
!
key chain trees
 key 1
 key-string willow
 key 2
 key-string chestnut
 accept-lifetime 13:30:00 Jan 25 1996 duration 7200
 send-lifetime 14:00:00 Jan 25 1996 duration 3600
 key 3
 key-string birch
 accept-lifetime 14:30:00 Jan 25 1996 duration 7200
 send-lifetime 15:00:00 Jan 25 1996 duration 3600
```

The following example configures a key chain named trees:

```
key chain trees
 key 1
 key-string willow
 key 2
```

Configuring Passwords and Privileges

Using passwords and assigning privilege levels is a simple way of providing terminal access control in your network.

For a complete description of the commands used in this chapter, refer to the "Password and Privileges Commands" chapter in the *Cisco IOS Security Command Reference*. To locate documentation of other commands that appear in this chapter, use the command reference master index or search online.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the "Identifying Supported Platforms" section in the chapter "Using Cisco IOS Software."

In This Chapter

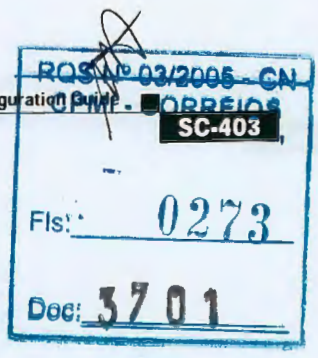
This chapter includes the following sections:

- Protecting Access to Privileged EXEC Commands
- Configuring Multiple Privilege Levels
- Recovering a Lost Enable Password
- Recovering a Lost Line Password
- Configuring Identification Support
- Passwords and Privileges Configuration Examples

rotecting Access to Privileged EXEC Commands

The following tasks provide a way to control access to the system configuration file and privileged EXEC (enable) commands:

- Setting or Changing a Static Enable Password
- Protecting Passwords with Enable Password and Enable Secret
- Setting or Changing a Line Password
- Encrypting Passwords



2658 Paula

Setting or Changing a Static Enable Password

To set or change a static password that controls access to privileged EXEC (enable) mode, use the following command in global configuration mode:

Command	Purpose
`Router(config)# enable password password`	Establishes a new password or change an existing password for the privileged command level.

For examples of how to define enable passwords for different privilege levels, see the section "Multiple Levels of Privileges Examples" at the end of this chapter.

Protecting Passwords with Enable Password and Enable Secret

To provide an additional layer of security, particularly for passwords that cross the network or are stored on a TFTP server, you can use either the **enable password** or **enable secret** commands. Both commands accomplish the same thing; that is, they allow you to establish an encrypted password that users must enter to access enable mode (the default), or any privilege level you specify.

We recommend that you use the **enable secret** command because it uses an improved encryption algorithm. Use the **enable password** command only if you boot an older image of the Cisco IOS software, or if you boot older boot ROMs that do not recognize the **enable secret** command.

If you configure the **enable secret** command, it takes precedence over the **enable password** command; the two commands cannot be in effect simultaneously.

To configure the router to require an enable password, use either of the following commands in global configuration mode:

Command	Purpose
`Router(config)# enable password [level level] {password| encryption-type encrypted-password}`	Establishes a password for a privilege command mode.
or	
`Router(config)# enable secret [level level] {password | encryption-type encrypted-password}`	Specifies a secret password, saved using a non-reversible encryption method. (If enable password and enable secret are both set, users must enter the enable secret password.)

Use either of these commands with the **level** option to define a password for a specific privilege level. After you specify the level and set a password, give the password only to users who need to have access at this level. Use the **privilege level** configuration command to specify commands accessible at various levels.

If you have the **service password-encryption** command enabled, the password you enter is encrypted. When you display it with the **more system:running-config** command, it is displayed in encrypted form.

If you specify an encryption type, you must provide an encrypted password—an encrypted password you copy from another router configuration.

2654
Paula

Note You cannot recover a lost encrypted password. You must clear NVRAM and set a new password. See the section "Recovering a Lost Enable Password" or "Recovering a Lost Line Password" in this chapter if you have lost or forgotten your password.

Setting or Changing a Line Password

To set or change a password on a line, use the following command in global configuration mode:

Command	Purpose
`Router(config)# password` *password*	Establishes a new password or change an existing password for the privileged command level.

Encrypting Passwords

Because protocol analyzers can examine packets (and read passwords), you can increase access security by configuring the Cisco IOS software to encrypt passwords. Encryption prevents the password from being readable in the configuration file.

To configure the Cisco IOS software to encrypt passwords, use the following command in global configuration mode:

Command	Purpose
`Router(config)# service password-encryption`	Encrypts a password.

The actual encryption process occurs when the current configuration is written or when a password is configured. Password encryption is applied to all passwords, including authentication key passwords, the privileged command password, console and virtual terminal line access passwords, and BGP neighbor passwords. The **service password-encryption** command is primarily useful for keeping unauthorized individuals from viewing your password in your configuration file.

Caution The **service password-encryption** command does not provide a high level of network security. If you use this command, you should also take additional network security measures.

Although you cannot recover a lost encrypted password (that is, you cannot get the original password back), you can recover from a lost encrypted password. See the section "Recovering a Lost Enable Password" or "Recovering a Lost Line Password" in this chapter if you have lost or forgotten your password.

Doc:

Configuring Multiple Privilege Levels

By default, the Cisco IOS software command-line interface (CLI) has two levels of access to commands: user EXEC mode (level 1) and privileged EXEC mode (level 15). However, you can configure additional levels of access to commands, called privilege levels, to meet the needs of your users while protecting the system from unauthorized access. Up to 16 privilege levels can be configured, from level 0, which is the most restricted level, to level 15, which is the least restricted level.

Access to each privilege level is enabled through separate passwords, which you specify when configuring the privilege level.

For example, if you want a certain set of users to be able to configure only certain interfaces, but not allow them access to other configuration options, you could create a separate privilege level for only specific interface configuration commands and distribute the password for that level to those users.

The following tasks describe how to configure additional levels of security:

- Setting the Privilege Level for a Command
- Changing the Default Privilege Level for Lines
- Displaying Current Privilege Levels
- Logging In to a Privilege Level

Setting the Privilege Level for a Command

To create a new privilege level and associate commands with that privilege level, use the following commands in beginning in global configuration mode:

	Command	Purpose
Step 1	`Router(config)# privilege mode level level command-string`	Configures the specified privilege level to allow access to the specified command.
Step 2	`Router(config)# enable secret level level {0 |5} password-string`	Sets the password for the specified privilege level. This is the password users will enter after entering the **enable** *level* command to access the specified level. • **0** indicates an unencrypted password string follows; **5** indicates an encrypted password string follows.
Step 3	`Router(config)# exit`	Exists global configuration mode and returns to EXEC mode.
Step 4	`Router# do copy running-config startup-config`	(Optional) Saves the configuration to the startup configuration file in NVRAM. **Note** The **do** keyword allows execution of EXEC commands in configuration mode.

2655
Paula

Changing the Default Privilege Level for Lines

To change the default privilege level for a given line or a group of lines, use the following command in line configuration mode:

Command	Purpose
`Router(config-line)# privilege level` *level*	Specifies a default privilege level for a line.

Displaying Current Privilege Levels

To display the current privilege level you can access based on the password you used, use the following command in EXEC mode:

Command	Purpose
`Router# show privilege`	Displays your current privilege level.

Logging In to a Privilege Level

To log into a router at a specified privilege level, use the following command in EXEC mode:

Command	Purpose
`Router# enable` *level*	Logs in to a specified privilege level.

To exit to a specified privilege level, use the following command in EXEC mode:

Command	Purpose
`Router# disable` *level*	Exits to a specified privilege level.

Recovering a Lost Enable Password

You can restore access to enable mode on a router when the password is lost using one of the three procedures described in this section. The procedure you use depends on your router platform.

You can perform password recovery on most of the platforms without changing hardware jumpers, but all platforms require the configuration to be reloaded. Password recovery can be done only from the console port on the router. Table 26 shows which password recovery procedure to use with each router platform.

Table 26 Platform-Specific Password Recovery Procedures

Password Recovery Procedure	Router Platform
Password Recovery Procedure 1	Cisco 2000 series
	Cisco 2500 series
	Cisco 3000 series
	Cisco 4000 series with 680x0 Motorola CPU
	Cisco 7000 series running Cisco IOS Release 10.0 or later in ROMs installed on the RP card
	IGS series running Cisco IOS Release 9.1 or later in ROMs
Password Recovery Procedure 2	Cisco 1003
	Cisco 1600 series
	Cisco 2600 series
	Cisco 3600 series
	Cisco 4500 series
	Cisco 7100 series
	Cisco 7200 series
	Cisco 7500 series
	IDT Orion-based routers
	Cisco AS5200 and AS5300 platforms

This section includes the following sections:

- Password Recovery Process
- Password Recovery Procedure 1
- Password Recovery Procedure 2

Password Recovery Process

Both password recovery procedures involve the following basic steps:

Step 1 Configure the router to boot up without reading the configuration memory (NVRAM). This is sometimes called the test system mode.

Step 2 Reboot the system.

Step 3 Access enable mode (which can be done without a password if you are in test system mode).

Step 4 View or change the password, or erase the configuration.

Step 5 Reconfigure the router to boot up and read the NVRAM as it normally does.

Step 6 Reboot the system.

2653
Paula

Note Some password recovery requires that a terminal issue a Break signal; you must be familiar with how your terminal or PC terminal emulator issues this signal. For example, in ProComm, the keys Alt-B by default generates the Break signal, and in a Windows terminal you press Break or CTRL-Break. A Windows terminal also allows you to define a function key as a BREAK signal. To do so, select function keys from the Terminal window and define one as Break by entering the characters **^$B (Shift 6, Shift 4**, and uppercase **B**).

Password Recovery Procedure 1

Use this procedure to recover lost passwords on the following Cisco routers:

- Cisco 2000 series
- Cisco 2500 series
- Cisco 3000 series
- Cisco 4000 series with 680x0 Motorola CPU
- Cisco 7000 series running Cisco IOS Release 10.0 or later in ROMs installed on the RP card. The router can be booting Cisco IOS Release 10.0 software in Flash memory, but it needs the actual ROMs on the processor card too.
- IGS series running Cisco IOS Release 9.1 or later in ROMs

To recover a password using Procedure 1, perform the following steps:

Step 1 Attach a terminal or PC with terminal emulation software to the console port of the router.

Step 2 Enter the **show version** command and record the setting of the configuration register. It is usually 0x2102 or 0x102.

The configuration register value is on the last line of the display. Note whether the configuration register is set to enable Break or disable Break.

The factory-default configuration register value is 0x2102. Notice that the third digit from the left in this value is 1, which disables Break. If the third digit is *not* 1, Break is enabled.

Step 3 Turn off the router, then turn it on.

Step 4 Press the **Break** key on the terminal within 60 seconds of turning on the router.

The `rommon>` prompt with no router name appears. If it does not appear, the terminal is not sending the correct Break signal. In that case, check the terminal or terminal emulation setup.

Step 5 Enter **o/r0x42** at the `rommon>` prompt to boot from Flash memory or **o/r0x41** to boot from the boot ROMs.

Note The first character is the letter o, not the numeral zero. If you have Flash memory and it is intact, 0x42 is the best setting. Use 0x41 only if the Flash memory is erased or not installed. If you use 0x41, you can only view or erase the configuration. You cannot change the password.

SC-409
CORREIOS
0276
Fls:
Doc: 3701

Step 6 At the `rommon>` prompt, enter the initialize command to initialize the router.

This causes the router to reboot but ignore its saved configuration and use the image in Flash memory instead. The system configuration display appears.

Note If you normally use the **boot network** command, or if you have multiple images in Flash memory and you boot a non-default image, the image in Flash might be different.

Step 7 Enter **no** in response to the System Configuration Dialog prompts until the following message appears:

```
Press RETURN to get started!
```

Step 8 Press **Return**.

The `Router>` prompt appears.

Step 9 Enter **enable**.

The `Router#` prompt appears.

Step 10 Choose one of the following options:

- To view the password, if it is not encrypted, enter **more nvram:startup-config**.
- To change the password (if it is encrypted, for example), enter the following commands:

```
Router# configure memory
Router# configure terminal
Router(config)# enable secret 1234abcd
Router(config)# ctrl-z
Router# write memory
```

Note The **enable secret** command provides increased security by storing the enable secret password using a non-reversible cryptographic function; however, you cannot recover a lost password that has been encrypted.

Step 11 Enter **configure terminal** at the EXEC prompt to enter configuration mode.

Step 12 Enter **config-register** and whatever value you recorded in Step 2.

Step 13 Press **Ctrl-Z** to quit from the configuration editor.

Step 14 Enter **reload** at the privileged EXEC prompt and enter **write memory** to save the configuration.

Password Recovery Procedure 2

Use this procedure to recover lost passwords on the following routers:

- Cisco 1003
- Cisco 1600 series
- Cisco 2600 series
- Cisco 3600 series
- Cisco 3810
- Cisco 4500 series

2651
Paula

- Cisco 7100 series
- Cisco 7200 series
- Cisco 7500 series
- IDT Orion-Based Routers
- Cisco AS5200 and AS5300 platforms

To recover a password using Procedure 2, perform the following steps:

Step 1 Attach a terminal or PC with terminal emulation software to the console port of the router.

Step 2 Enter **show version** and record the setting of the configuration register. It is usually 0x2102 or 0x102.

The configuration register value is on the last line of the display. Note whether the configuration register is set to enable Break or disable Break.

The factory-default configuration register value is 0x2102. Notice that the third digit from the left in this value is 1, which disables Break. If the third digit is *not* 1, Break is enabled.

Step 3 Turn off the router, then turn it on.

Step 4 Press the **Break** key on the terminal within 60 seconds of turning on the router.

The `rommon>` prompt appears. If it does not appear, the terminal is not sending the correct Break signal. In that case, check the terminal or terminal emulation setup.

Step 5 Enter **confreg** at the `rommon>` prompt.

The following prompt appears:

```
Do you wish to change configuration [y/n]?
```

Step 6 Enter **yes** and press **Return**.

Step 7 Enter **no** to subsequent questions until the following prompt appears:

```
ignore system config info [y/n]?
```

Step 8 Enter **yes**.

Step 9 Enter **no** to subsequent questions until the following prompt appears:

```
change boot characteristics [y/n]?
```

Step 10 Enter **yes**.

The following prompt appears:

```
enter to boot:
```

Step 11 At this prompt, either enter **2** and press **Return** if Flash memory or, if Flash memory is erased, enter **1**. If Flash memory is erased, the Cisco 4500 must be returned to Cisco for service. If you enter **1**, you can only view or erase the configuration. You cannot change the password.

A configuration summary is displayed and the following prompt appears:

```
Do you wish to change configuration [y/n]?
```

Step 12 Enter **no** and press **Return**.

The following prompt appears:

```
rommon>
```

SC-411
CPMI - CORREIOS
0277
Fls:
3701
Doc:

Step 13 Enter **reset** at the rommon prompt or, for Cisco 4500 series and Cisco 7500 series routers, power cycle the router.

Step 14 As the router boots, enter **no** to all the setup questions until the following prompt appears:

```
Router>
```

Step 15 Enter **enable** to enter enable mode.

The `Router#` prompt appears.

Step 16 Choose one of the following options:

- To view the password, if it is not encrypted, enter **more nvram:startup-config**.
- To change the password (if it is encrypted, for example), enter the following commands:

```
Router# configure memory
Router# configure terminal
Router(config)# enable secret 1234abcd
Router(config)# ctrl-z
Router# write memory
```

Note The **enable secret** command provides increased security by storing the enable secret password using a non-reversible cryptographic function; however, you cannot recover a lost password that has been encrypted.

Step 17 Enter **configure terminal** at the prompt.

Step 18 Enter **config-register** and whatever value you recorded in Step 2.

Step 19 Press **Ctrl-Z** to quit from the configuration editor.

Step 20 Enter **reload** at the prompt and enter **write memory** to save the configuration.

Recovering a Lost Line Password

If your router has the nonvolatile memory option, you can accidentally lock yourself out of enable mode if you enable password checking on the console terminal line and then forget the line password. To recover a lost line password, perform the following steps:

Step 1 Force the router into factory diagnostic mode.

See the hardware installation and maintenance publication for your product for specific information about setting the processor configuration register to factory diagnostic mode. Table 27 summarizes the hardware or software settings required by various products to set factory diagnostic mode.

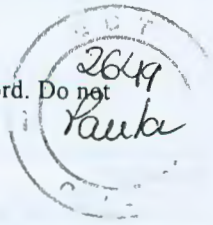
Step 2 Enter **Yes** when asked if you want to set the manufacturers' addresses.

The following prompt appears:

```
TEST-SYSTEM >
```

Step 3 Enter **enable** to enter enable mode:

```
TEST-SYSTEM > enable
```



Step 4 Enter **more nvram:startup-config** to review the system configuration and find the password. Do not change anything in the factory diagnostic mode.

```
TEST-SYSTEM # more nvram:startup-config
```

Step 5 To resume normal operation, restart the router or reset the configuration register.

Step 6 Log in to the router with the password that was shown in the configuration file.

Note All debugging capabilities are turned on during diagnostic mode.

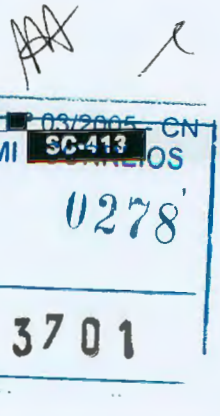
See the hardware installation and maintenance publication for your product for specific information about configuring the processor configuration register for factory diagnostic mode. Table 27 summarizes the hardware or software settings required by the various products to set factory diagnostic mode.

Table 27 Factory Diagnostic Mode Settings for the Configuration Register

Platform	Setting
Modular products	Set jumper in bit 15 of the processor configuration register, then restart; remove the jumper when finished.
Cisco AS5100 Cisco AS5200 Cisco AS5300 Cisco 1600 series Cisco 2500 series Cisco 3000 series Cisco 3600 series Cisco 4000 series Cisco 4500 series Cisco 7000 series Cisco 7100 series Cisco 7200 series Cisco 7500 series	Use the **config-register** command to set the processor configuration register to 0x8000, then initialize and boot the system. Use the **reload** command to restart and set the processor configuration register to 0x2102 when finished.

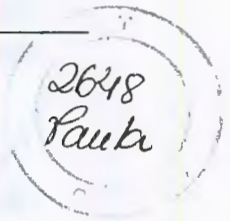
Configuring Identification Support

Identification support allows you to query a Transmission Control Protocol (TCP) port for identification. This feature enables an unsecure protocol, described in RFC 1413, to report the identity of a client initiating a TCP connection and a host responding to the connection. With identification support, you can connect a TCP port on a host, issue a simple text string to request information, and receive a simple text-string reply.



To configure identification support, use the following command in global configuration mode:

Command	Purpose
`Router(config)# ip identd`	Enables identification support.



Passwords and Privileges Configuration Examples

The following sections provide password and privileges configuration examples:

- Multiple Levels of Privileges Examples
- Username Examples

Multiple Levels of Privileges Examples

This section provides examples of using multiple privilege levels to specify who can access different sets of commands. This section includes the following sections:

- Allowing Users to Clear Lines Examples
- Defining an Enable Password for System Operators Examples
- Disabling a Privilege Level Example

Allowing Users to Clear Lines Examples

If you want to allow users to clear lines, you can do either of the following:

- Change the privilege level for the **clear** and **clear line** commands to 1 or "ordinary user level," as follows. This allows any user to clear lines.

```
privilege exec level 1 clear line
```

- Change the privilege level for the **clear** and **clear line** commands to level 2. To do so, use the **privilege level** global configuration command to specify privilege level 2. Then define an enable password for privilege level 2 and tell only those users who need to know what the password is.

```
enable password level 2 pswd2
privilege exec level 2 clear line
```

Defining an Enable Password for System Operators Examples

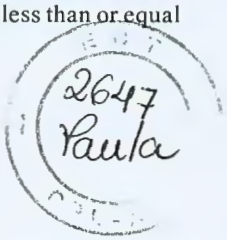
In the following example, you define an enable password for privilege level 10 for system operators and make **clear** and **debug** commands available to anyone with that privilege level enabled.

```
enable password level 10 pswd10
privilege exec level 10 clear line
privilege exec level 10 debug ppp chap
privilege exec level 10 debug ppp error
privilege exec level 10 debug ppp negotiation
```

The following example lowers the privilege level of the **more system:running-config** command and most configuration commands to operator level so that the configuration can be viewed by an operator. It leaves the privilege level of the **configure** command at 15. Individual configuration commands are

displayed in the **more system:running-config** output only if the privilege level for a command has been lowered to 10. Users are allowed to see only those commands that have a privilege level less than or equal to their current privilege level.

```
enable password level 15 pswd15
privilege exec level 15 configure
enable password level 10 pswd10
privilege exec level 10 more system:running-config
```



Disabling a Privilege Level Example

In the following example, the **show ip route** command is set to privilege level 15. To keep all **show ip** and **show** commands from also being set to privilege level 15, these commands are specified to be privilege level 1.

```
privilege exec level 15 show ip route
privilege exec level 1 show ip
privilege exec level 1 show
```

Username Examples

The following sample configuration sets up secret passwords on Routers A, B, and C, to enable the three routers to connect to each other.

To authenticate connections between Routers A and B, enter the following commands:

On Router A:

```
username B password a-b_secret
```

On Router B:

```
username A password a-b_secret
```

To authenticate connections between Routers A and C, enter the following commands:

On Router A:

```
username C password a-c_secret
```

On Router C:

```
username A password a-c_secret
```

To authenticate connections between Routers B and C, enter the following commands:

On Router B:

```
username C password b-c_secret
```

On Router C:

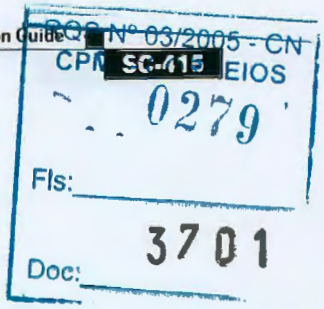
```
username B password b-c_secret
```

For example, suppose you enter the following command:

```
username bill password westward
```

The system displays this command as follows:

```
username bill password 7 21398211
```



The encrypted version of the password is 21398211. The password was encrypted by the Cisco-defined encryption algorithm, as indicated by the "7."

However, if you enter the following command, the system determines that the password is already encrypted and performs no encryption. Instead, it displays the command exactly as you entered it.

```
username bill password 7 21398211
username bill password 7 21398211
```

Configuring Voice Ports

Voice ports are found at the intersections of packet-based networks and traditional telephony networks, and they facilitate the passing of voice and call signals between the two networks. Physically, voice ports connect a router or access server to a line from a circuit-switched telephony device in a PBX or the public switched telephone network (PSTN).

Basic software configuration for voice ports describes the type of connection being made and the type of signaling to take place over this connection. Additional commands provide fine-tuning for voice quality, enable special features, and specify parameters to match those of proprietary PBXs.

This chapter includes the following sections:

- Voice Port Configuration Overview, page 38
- Analog Voice Ports Configuration Task List, page 42
- Configuring Digital Voice Ports, page 56
- Fine-Tuning Analog and Digital Voice Ports, page 80
- Verifying Analog and Digital Voice-Port Configurations, page 99
- Troubleshooting Analog and Digital Voice Port Configurations, page 110

Not all voice-port commands are covered in this chapter. Some are described in the "Configuring Trunk Connections and Conditioning Features" chapter or the "Configuring ISDN Interfaces for Voice" chapter in this configuration guide. The voice-port configuration commands included in this chapter are fully documented in the *Cisco IOS Voice, Video, and Fax Command Reference*.

To identify the hardware platform or software image information associated with a feature in this chapter, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the "Identifying Supported Platforms" section in the "Using Cisco IOS Software" chapter.

Voice Port Configuration Overview

Voice ports on routers and access servers emulate physical telephony switch connections so that voice calls and their associated signaling can be transferred intact between a packet network and a circuit-switched network or device.

For a voice call to occur, certain information must be passed between the telephony devices at either end of the call, such as the devices' on-hook status, the line's availability, and whether an incoming call is trying to reach a device. This information is referred to as signaling, and to process it properly, the devices at both ends of the call segment (that is, those directly connected to each other) must use the same type of signaling.

The devices in the packet network must be configured to convey signaling information in a way that the circuit-switched network can understand. They must also be able to understand signaling information received from the circuit-switched network. This is accomplished by installing appropriate voice hardware in the router or access server and by configuring the voice ports that connect to telephony devices or the circuit-switched network.

The illustrations below show examples of voice port usage.

- In Figure 10, one voice port connects a telephone to the wide-area network (WAN) through the router.
- In Figure 11, one voice port connects to the PSTN and another to a telephone; the router acts like a small PBX.
- Figure 12 shows how two PBXs can be connected over a WAN to provide toll bypass.

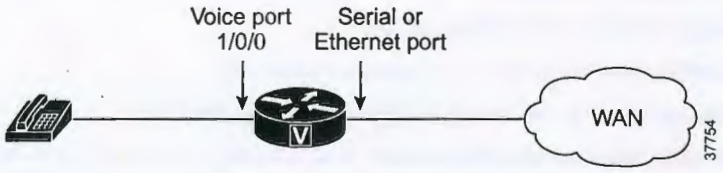

Figure 11 Telephone to PSTN

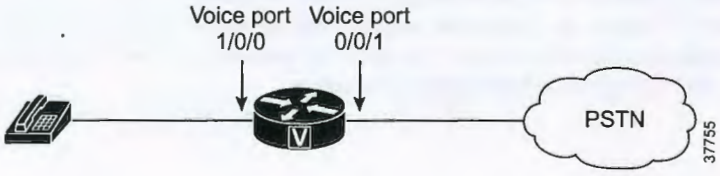

Figure 12 PBX-to-PBX over a WAN

2643
Paula

Cisco provides a variety of Cisco IOS commands for flexibility in programming voice ports to match the physical attributes of the voice connections that are being made. Some of these connections are made using analog means of transmission, while others use digital transmission. Table 4 shows the analog and digital voice-port connection support of the router platforms discussed in this chapter.

Table 4 Analog and Digital Voice-port Support on Cisco Routers and Access Servers

Platform	Analog	Digital
Cisco 803 and 804	Yes	No
Cisco 1750	Yes	No
Cisco 2600 series	Yes	Yes
Cisco 3600 series	Yes	Yes
Cisco MC3810	Yes	Yes
Cisco AS5300	No	Yes
Cisco AS5800	No	Yes
Cisco 7200 series	No	Yes
Cisco 7500 series	No	Yes

Telephony Signaling Interfaces

Voice ports on routers and access servers physically connect the router or access server to telephony devices such as telephones, fax machines, PBXs, and PSTN central office (CO) switches. These devices may use any of several types of signaling interfaces to generate information about on-hook status, ringing, and line seizure.

The router's voice-port hardware and software need to be configured to transmit and receive the same type of signaling being used by the device with which they are interfacing so that calls can be exchanged smoothly between the packet network and the circuit-switched network.

The signaling interfaces discussed in this chapter include foreign exchange office (FXO), foreign exchange station (FXS), and receive and transmit (E&M), which are types of analog interfaces. Some digital connections emulate FXO, FXS, and E&M interfaces, and they are discussed in the second half of this chapter. It is important to know which signaling method the telephony side of the connection is using, and to match the router configuration and voice interface hardware to that signaling method.

The next three illustrations show how the different signaling interfaces are associated with different uses of voice ports. In Figure 13, FXS signaling is used for end-user telephony equipment, such as a telephone or fax machine. Figure 14 shows an FXS connection to a telephone and an FXO connection to the PSTN at the far side of a WAN; this might be a telephone at a local office going over a WAN to a router at headquarters that connects to the PSTN. In Figure 15, two PBXs are connected across a WAN by E&M interfaces. This illustrates the path over a WAN between two geographically separated offices in the same company.

Doc: 3701

Figure 13 FXS Signaling Interfaces

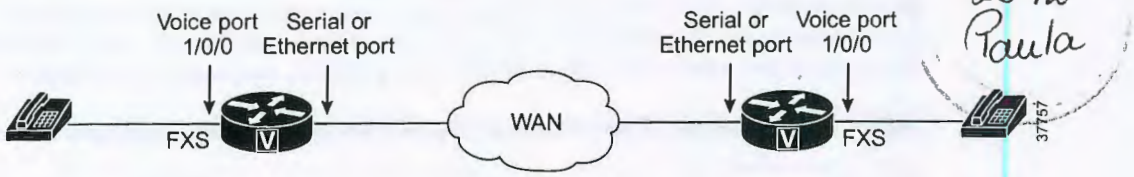

Figure 14 FXS and FXO Signaling Interfaces

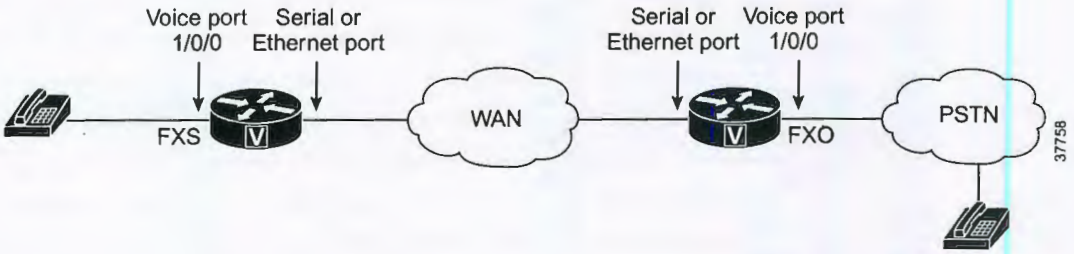

Figure 15 E&M Signaling Interfaces

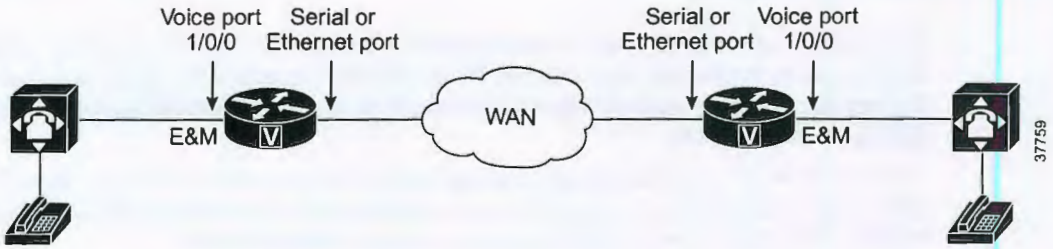

FXS and FXO Interfaces

An FXS interface connects the router or access server to end-user equipment such as telephones, fax machines, or modems. The FXS interface supplies ring, voltage, and dial tone to the station and includes an RJ-11 connector for basic telephone equipment, keysets, and PBXs.

An FXO interface is used for trunk, or tie line, connections to a PSTN CO or to a PBX that does not support E&M signaling (when local telecommunications authority permits). This interface is of value for off-premise station applications. A standard RJ-11 modular telephone cable connects the FXO voice interface card to the PSTN or PBX through a telephone wall outlet.

FXO and FXS interfaces indicate on-hook or off-hook status and the seizure of telephone lines by one of two access signaling methods: loop start or ground start. The type of access signaling is determined by the type of service from the CO; standard home telephone lines use loop start, but business telephones can order ground start lines instead.

2641 Paula

Loop-start is the more common of the access signaling techniques. When a handset is picked up (the telephone goes off-hook), this action closes the circuit that draws current from the telephone company CO and indicates a change in status, which signals the CO to provide dial tone. An incoming call is signaled from the CO to the handset by sending a signal in a standard on/off pattern, which causes the telephone to ring.

Loop-start has two disadvantages, however, that usually are not a problem on residential telephones but that become significant with the higher call volume experienced on business telephones. Loop-start signaling has no means of preventing two sides from seizing the same line simultaneously, a condition known as *glare*. Also, loop start signaling does not provide switch-side disconnect supervision for FXO calls. The telephony switch (the connection in the PSTN, another PBX, or key system) expects the router's FXO interface, which looks like a telephone to the switch, to hang up the calls it receives through its FXO port. However, this function is not built into the router for received calls; it only operates for calls originating from the FXO port.

Another access signaling method used by FXO and FXS interfaces to indicate on-hook or off-hook status to the CO is ground start signaling. It works by using ground and current detectors that allow the network to indicate off-hook or seizure of an incoming call independent of the ringing signal and allow for positive recognition of connects and disconnects. For this reason, ground start signaling is typically used on trunk lines between PBXs and in businesses where call volume on loop start lines can result in glare. See the "Disconnect Supervision Commands" section on page 84 and "FXO Supervisory Disconnect Tone Commands" section on page 87 for voice port commands that configure additional recognition of disconnect signaling.

In most cases, the default voice port command values are sufficient to configure FXO and FXS voice ports.

E&M Interfaces

Trunk circuits connect telephone switches to one another; they do not connect end-user equipment to the network. The most common form of analog trunk circuit is the E&M interface, which uses special signaling paths that are separate from the trunk's audio path to convey information about the calls. The signaling paths are known as the *E-lead* and the *M-lead*. The name *E&M* is thought to derive from the phrase *Ear* and *Mouth* or *rEceive* and *transMit* although it could also come from *Earth* and *Magnet*. The history of these names dates back to the days of telegraphy, when the CO side had a key that grounded the E circuit, and the other side had a sounder with an electromagnet attached to a battery. Descriptions such as *Ear* and *Mouth* were adopted to help field personnel determine the direction of a signal in a wire. E&M connections from routers to telephone switches or to PBXs are preferable to FXS/FXO connections because E&M provides better answer and disconnect supervision.

Like a serial port, an E&M interface has a data terminal equipment/data communications equipment (DTE/DCE) type of reference. In the telecommunications world, the *trunking* side is similar to the DCE, and is usually associated with CO functionality. The router acts as this side of the interface. The other side is referred to as the *signaling* side, like a DTE, and is usually a device such as a PBX. Five distinct physical configurations for the signaling part of the interface (Types I-V) use different methods to signal on-hook/off-hook status, as shown in Table 5. Cisco voice implementation supports E&M Types I, II, III, and V.

The physical E&M interface is an RJ-48 connector that connects to PBX trunk lines, which are classified as either two-wire or four-wire. This refers to whether the audio path is full duplex on one pair of wires (two-wire) or on two pair of wires (four-wire). A connection may be called a four-wire E&M circuit although it actually has six to eight physical wires. It is an analog connection although an analog E&M circuit may be emulated on a digital line. For more information on digital voice port configuration of E&M signaling, see the "DS0 Groups on Digital T1/E1 Voice Ports" section on page 72.

2640
Paula

PBXs built by different manufacturers can indicate on-hook/off-hook status and telephone line seizure on the E&M interface by using any of three types of access signaling that are as follows:

- Immediate-start is the simplest method of E&M access signaling. The calling side seizes the line by going off-hook on its E-lead and sends address information as dual-tone multifrequency (DTMF) digits (or as dialed pulses on Cisco 2600 series routers and Cisco 3600 series routers) following a short, fixed-length pause.
- Wink-start is the most commonly used method for E&M access signaling, and is the default for E&M voice ports. Wink-start was developed to minimize glare, a condition found in immediate-start E&M, in which both ends attempt to seize a trunk at the same time. In wink-start, the calling side seizes the line by going off-hook on its E-lead, then waits for a short temporary off-hook pulse, or "wink," from the other end on its M-lead before sending address information. The switch interprets the pulse as an indication to proceed and then sends the dialed digits as DTMF or dialed pulses.
- In delay-dial signaling, the calling station seizes the line by going off-hook on its E-lead. After a timed interval, the calling side looks at the status of the called side. If the called side is on-hook, the calling side starts sending information as DTMF digits; otherwise, the calling side waits until the called side goes on-hook and then starts sending address information.

Table 5 E&M Wiring and Signaling Methods

E&M Type	E-Lead Configuration	M-Lead Configuration	Signal Battery Lead Configuration	Signal Ground Lead Configuration
I	Output, relay to ground	Input, referenced to ground	—	—
II	Output, relay to SG	Input, referenced to ground	Feed for M, connected to –48V	Return for E, galvanically isolated from ground
III	Output, relay to ground	Input, referenced to ground	Connected to –48V	Connected to ground
V	Output, relay to ground	Input, referenced to –48V	—	—

Analog Voice Ports Configuration Task List

Analog voice port interfaces connect routers in packet-based networks to analog two-wire or four-wire analog circuits in telephony networks. Two-wire circuits connect to analog telephone or fax devices, and four-wire circuits connect to PBXs. Typically, connections to the PSTN CO are made with digital interfaces.

This section describes how to configure analog voice ports and covers the following topics:

- Configuring Codec Complexity for Analog Voice Ports on the Cisco MC3810 with High-Performance Compression Modules, page 47
- Configuring Basic Parameters on Analog FXO, FXS, or E&M Voice Ports, page 48
- Configuring Analog Telephone Connections on Cisco 803 and 804 Routers, page 52

2639
Fls.

Three other sections later in the chapter provide help with fine-tuning and troubleshooting:

- Fine-Tuning Analog and Digital Voice Ports, page 80
- Verifying Analog and Digital Voice-Port Configurations, page 99
- Troubleshooting Analog and Digital Voice Port Configurations, page 110

Prerequisites for Configuring Analog Voice Ports

- Obtain two- or four-wire line service from your service provider or from a PBX.
- Complete your company's dial plan.
- Establish a working telephony network based on your company's dial plan.
- Install at least one other network module or WAN interface card to provide the connection to the network LAN or WAN.
- Establish a working IP and Frame Relay or ATM network. For more information about configuring IP, refer to the *Cisco IOS IP Configuration Guide*, Release 12.2.
- Install appropriate voice processing and voice interface hardware on the router. See the "Configuring Platform-Specific Analog Voice Hardware" section on page 45.

Preparing to Configure Analog Voice Ports

Before configuring an analog voice port, assemble the following information about the telephony connection that the voice port will be making. If connecting to a PBX, it is important to understand the PBX's wiring scheme and timing parameters. This information should be available from your PBX vendor or the reference manuals that accompany your PBX.

- Telephony signaling interface: FXO, FXS, or E&M
- Locale code (usually the country) for call progress tones
- If FXO, type of dialing: DTMF (touch-tone) or pulse
- If FXO, type of start signal: loop-start or ground-start
- If E&M, type: I, II, III, or V
- If E&M, type of line: two-wire or four-wire
- If E&M, type of start signal: wink, immediate, delay-dial

Table 6 should help you determine which hardware and configuration instructions are appropriate for your situation. Table 7 on page 44 shows slot and port numbering, which differs for each of the voice-enabled routers. More current information may be available in the release notes that accompany the Cisco IOS software you are using.

Configuring Platform-Specific Analog Voice Hardware

This section describes the general types of analog voice port hardware available for the router platforms included in this chapter:

- Cisco 800 Series Routers, page 45
- Cisco 1750 Modular Router, page 45
- Cisco 2600 Series and Cisco 3600 Series Routers, page 46
- Cisco MC3810 Multiservice Concentrator, page 46

Note For current information about supported hardware, see the release notes for the platform and Cisco IOS release being used.

Cisco 800 Series Routers

Cisco 803 and Cisco 804 routers support data and voice applications. The data applications on these routers are implemented through the ISDN port, and the voice applications are implemented with ISDN Basic Rate Interface (BRI) through the telephone ports. If a Cisco 803 or 804 router is being used, connect two devices, such as an analog touch-tone telephone, fax machine, or modem through two fixed telephone ports, the gray PHONE 1 and PHONE 2 ports that have RJ-11 connectors. Each device is connected to basic telephone services through the ISDN line.

For more information, refer to the *Cisco 800 Series Routers Hardware Installation Guide*.

Cisco 1750 Modular Router

The Cisco 1750 modular router provides Voice over IP (VoIP) functionality and can carry voice traffic (for example, telephone calls and faxes) over an IP network. To make a voice connection, the router must have a supported VIC installed. The Cisco 1750 router supports two slots for either WAN interface cards (WICs) or VICs and supports one VIC-only slot. For analog connections, two-port VICs are available to support FXO, FXS, and E&M signaling. VICs provide direct connections to telephone equipment (analog phones, analog fax machines, key systems, or PBXs) or to a PSTN.

For more information, refer to the *Cisco 1750 Voice-over-IP Quick Start Guide*.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
VC-45
0285
Fls:
Doc: 3701

Cisco 2600 Series and Cisco 3600 Series Routers

The Cisco 2600 and 3600 series routers are modular, multifunction platforms that combine dial access, routing, local area network-to-local area network (LAN) services, and multiservice integration of voice, video, and data in the same device.

Voice network modules installed in Cisco 2600 series or Cisco 3600 series routers convert telephone voice signals into data packets that can be transmitted over an IP network. The voice network modules have no connectors; VICs installed in the network modules provide connections to the telephone equipment or network. VICs work with existing telephone and fax equipment and are compatible with H.323 standards for audio and video conferencing.

The Cisco 2600 series router can house one network module. In the Cisco 3600 series, the Cisco 3620 router has slots for up to two network modules; the Cisco 3640 router has slots for up to four network modules; and the Cisco 3660 router has slots for up to six network modules. (Typically, one of the slots is used for LAN connectivity.)

For analog telephone connections, low-density voice/fax network modules that contain either one or two VIC slots are installed in the network module slots. Each VIC is specific to a particular telephone signaling interface (FXS, FXO, or E&M); therefore, the VIC determines the type of signaling on that module.

For more information, refer to the following:

- *Cisco 2600 Series Hardware Installation Guide*
- *Cisco 3600 Series Hardware Installation Guide*
- *Cisco Network Module Hardware Installation Guide*

Cisco MC3810 Multiservice Concentrator

To support analog voice circuits, a Cisco MC3810 multiservice concentrator must be equipped with an AVM, which supports six analog voice ports. By installing specific signaling modules known as analog personality modules (APMs), the analog voice ports may be equipped for the following signaling types in various combinations: FXS, FXO, and E&M. For FXS, the analog voice ports use an RJ-11 connector interface to connect to analog telephones or fax machines (two-wire) or to a key system (four-wire). For FXO, the analog voice ports use an RJ-11 physical interface to connect to a CO trunk. For E&M connections, the analog voice ports use an RJ-1CX physical interface to connect to an analog PBX (two-wire or four-wire).

Optional high-performance voice compression modules (HCMs) can replace standard voice compression modules (VCMs) to operate according to the voice compression coding algorithm (codec) specified when the Cisco MC3810 concentrator is configured. The HCM2 provides four voice channels at high codec complexity and eight channels at medium complexity. The HCM6 provides 12 voice channels at high complexity and 24 channels at medium complexity. One or two HCMs can be installed in a Cisco MC3810 multiservice concentrator, but an HCM may not be combined with a VCM in one chassis.

For more information, refer to the *Cisco MC3810 Multiservice Concentrator Hardware Installation Guide*.

Note For current information about supported hardware, see the release notes for the platform and Cisco IOS release being used.

Configuring Codec Complexity for Analog Voice Ports on the Cisco MC3810 with High-Performance Compression Modules

The term *codec* stands for *coder-decoder*. A codec is a particular method of transforming analog voice into a digital bit stream (and vice versa) and also refers to the type of compression used. Several different codecs have been developed to perform these functions, and each one is known by the number of the International Telecommunication Union-Telecommunication Standardization Sector (ITU-T) standard in which it is defined. For example, two common codecs are the G.711 and the G.729 codecs. The various codecs use different algorithms to encode analog voice into digital bit-streams and have different bit rates, frame sizes, and coding delays associated with them. The codecs also differ in the amount of perceived voice quality they achieve. Specialized hardware and software in the digital signal processors (DSPs) perform codec transformation and compression functions, and different DSPs may offer different selections of codecs.

Select the same type of codec as the one that is used at the other end of the call. For instance, if a call was coded with a G.729 codec, it must be decoded with a G.729 codec. Codec choice is configured on dial peers. For more information, see the "Configuring Dial Plans, Dial Peers, and Digit Manipulation" chapter in this configuration guide.

Codec complexity refers to the amount of processing power that a codec compression technique requires: some require more processing power than others. Codec complexity affects call density, which is the number of calls that can take place on the DSP interfaces, which can be HCMs, port adapter DSP farms, or voice cards, depending on the type of router (in this case, the Cisco MC3810 multiservice concentrator). The greater the codec complexity, the fewer the calls that can be handled.

Codec complexity is either medium or high. The difference between medium- and high-complexity codecs is the amount of CPU power necessary to process the algorithm and, therefore, the number of voice channels that can be supported by a single DSP. All medium-complexity codecs can also be run in high-complexity mode, but fewer (usually half as many) channels will be available per DSP.

For details on the number of calls that can be handled simultaneously using each of the codec standards, refer to the entries for the **codec** and **codec complexity** commands in the *Cisco IOS Voice, Video, and Fax Command Reference*.

On a Cisco MC3810 concentrator, only a single codec complexity setting is used, even when two HCMs are installed. The value that is specified in this task affects the choice of codecs available when the **codec** dial-peer configuration command is configured. See the "Configuring Dial Plans, Dial Peers, and Digit Manipulation" chapter in this configuration guide.

Note On the Cisco MC3810 with high-performance compression modules, check the DSP voice channel activity with the **show voice dsp** command. If any DSP voice channels are in the busy state, the codec complexity cannot be changed. When all the DSP channels are in the idle state, changes can be made to the codec complexity selection.

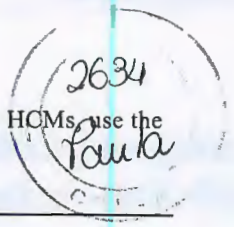
Doc: 3701



To configure codec complexity on the Cisco MC3810 multiservice concentrator using HCMs, use the following commands beginning in privileged EXEC mode:

	Command	Purpose
Step 1	`Router# show voice dsp`	Checks the DSP voice channel activity. If any DSP voice channels are in the busy state, the codec complexity cannot be changed. When all the DSP channels are in the idle state, continue to Step 2.
Step 2	`Router# configure terminal`	Enters global configuration mode.
Step 3	`Router(config)# voice-card 0`	Enters voice-card configuration mode and specifies voice card 0.
Step 4	`Router(config-voicecard)# codec complexity {high | medium}`	(For analog voice ports) Specifies codec complexity based on the codec standard being used. This setting restricts the codecs available in dial peer configuration. All voice cards in a router must use the same codec complexity setting. The keywords are as follows: • **high**—Specifies two voice channels encoded in any of the following formats: G.711ulaw, G.711alaw, G.723.1(r5.3), G.723.1 Annex A(r5.3), G.723.1(r6.3), G.723.1 Annex A(r6.3), G.726(r16), G.726(r24), G.726(r32), G.728, G.729, G.729 Annex B, and fax relay. • **medium**—(default) Specifies four voice channels encoded in any of the following formats: G.711ulaw, G.711alaw, G.726(r16), G.726(r24), G.726(r32), G.729 Annex A, G.729 Annex B with Annex A, and fax relay. **Note** If two HCMs are installed, this command configures both HCMs at once.

Configuring Basic Parameters on Analog FXO, FXS, or E&M Voice Ports

This section describes commands for basic analog voice port configuration. All the data recommended in the "Preparing to Configure Analog Voice Ports" section on page 43 should be gathered before starting this procedure.

If configuring a Cisco MC3810 multiservice concentrator that has HCMs, codec complexity should also be configured, following the steps in the "Configuring Codec Complexity for Analog Voice Ports on the Cisco MC3810 with High-Performance Compression Modules" section on page 47.

Note If you have a Cisco MC3810 multiservice concentrator or Cisco 3660 router, the **compand-type a-law** command must be configured on the analog ports only. The Cisco 2660, 3620, and 3640 routers do not require the configuration of th **compand-type a-law** command, however, if you request a list of commands, the **compand-type a-law** command will display.

2633
Paula

In addition to the basic voice port parameters described in this section, there are commands that allow voice port configurations to be fine tuned. In most cases, the default values for fine-tuning commands are sufficient for establishing FXO and FXS voice port configurations. E&M voice ports are more likely to require some configuration. If it is necessary to change some of the voice port values to improve voice quality or to match parameters on proprietary PBXs to which you are connecting, use the commands in the current section and also in the "Fine-Tuning Analog and Digital Voice Ports" section on page 80.

After the voice-port has been configured, make sure that the ports are operational by following the steps described in the following sections:

- Verifying Analog and Digital Voice-Port Configurations, page 99
- Troubleshooting Analog and Digital Voice Port Configurations, page 110

For more information on these and other voice port commands, see the *Cisco IOS Voice, Video, and Fax Command Reference*.

Note The commands, keywords, and arguments that you are able to use may differ slightly from those presented here, based on your platform, Cisco IOS release, and configuration. When in doubt, use Cisco IOS command help (**command ?**) to determine the syntax choices that are available.

To configure basic analog voice port parameters on Cisco 1750, Cisco 2600 series, Cisco 3600 series, and Cisco MC3810 routers, use the following commands beginning in global configuration mode:

	Command	Purpose

Step 1	**Cisco 1750 and MC3810**
	`Router(config)# voice-port slot/port`
	
	Cisco 2600 and 3600 series
	`Router(config)# voice-port slot/subunit/port`
		Enters voice-port configuration mode.
		The arguments are as follows:
		• *slot*—Specifies the number of the router slot where the voice network module is installed (Cisco 2600 and Cisco 3600 series routers) or the router slot number where the analog voice module is installed (Cisco MC3810 multiservice concentrator).
		• *port*—Indicates the voice port. Valid entries are 0 or 1.
		• *subunit*—Specifies the location of the VIC.
		Note The slash must be entered between *slot* and *port*.
		Valid entries vary by router platform; see Table 7 on page 44 or enter the **show voice port summary** command for available values.

Step 2	**FXO or FXS** `Router(config-voiceport)# signal {loop-start | ground-start}`	Selects the access signaling type to match that of the telephony connection you are making. The keywords are as follows: • **loop-start**—(default) Uses a closed circuit to indicate off-hook status; used for residential loops. • **ground-start**—Uses ground and current detectors; preferred for PBXs and trunks.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
VC-49
0287
Fls:
Doc:
3701

	Command	Purpose
	E&M `Router(config-voiceport)# signal {wink-start | immediate-start | delay-dial}`	The keywords are as follows: • **wink-start**—(default) Indicates that the calling side seizes the line, then waits for a short off-hook *wink* from the called side before proceeding. • **immediate-start**—Indicates that the calling side seizes the line and immediately proceeds; used for E&M tie trunk interfaces. • **delay-dial**—Indicates that the calling side seizes the line and waits, then checks to determine whether the called side is on-hook before proceeding; if not, it waits until the called side is on-hook before sending digits. Used for E&M tie trunk interfaces. **Note** Configuring the **signal** keyword for one voice port on a Cisco 2600 or 3600 series router VIC changes the signal value for both ports on the VIC.
Step 3	`Router(config-voiceport)# cptone locale`	Selects the two-letter locale for the voice call progress tones and other locale-specific parameters to be used on this voice port. Cisco routers comply with the ISO 3166 locale name standards. To see valid choices, enter a question mark (?) following the **cptone** command. The default is **us**.
Step 4	`Router(config-voiceport)# dial-type {dtmf | pulse}`	(FXO only) Specifies the dialing method for outgoing calls.
Step 5	`Router(config-voiceport)# operation {2-wire | 4-wire}`	(E&M only) Specifies the number of wires used for voice transmission at this interface (the audio path only, not the signaling path). The default is 2-wire.
Step 6	`Router(config-voiceport)# type {1 | 2 | 3 | 5}`	(E&M only) Specifies the type of E&M interface to which this voice port is connecting. See Table 5 on page 42 for an explanation of E&M types. The default is 1.

Step 7	**Cisco 1750 Router and 2600 and 3600 Series Routers**
	`Router(config-voiceport)# ring frequency {25 | 50}`
	Cisco MC3810 Multiservice Concentrator
	`Router(config-voiceport)# ring frequency {20 | 30}`
		(FXS only) Selects the ring frequency, in hertz, used on the FXS interface. This number must match the connected telephony equipment and may be country-dependent. If not set properly, the attached telephony device may not ring or it may buzz.
		The keyword default is 25 on the Cisco 1750 router, 2600 and 3600 series routers; and 20 on the Cisco MC3810 multiservice concentrator.

2631
Paula

	Command	Purpose
Step 8	`Router(config-voiceport)# ring number number`	(FXO only) Specifies the maximum number of rings to be detected before an incoming call is answered by the router. The default is 1.
Step 9	`Router(config-voiceport)# ring cadence {[pattern01 | pattern02 | pattern03 | pattern04 | pattern05 | pattern06 | pattern07 | pattern08 | pattern09 | pattern10 | pattern11 | pattern12] | [define pulse interval]}`	(FXS only) Specifies an existing pattern for ring, or it defines a new one. Each pattern specifies a ring-pulse time and a ring-interval time. The keywords and arguments are as follows: • **pattern01** through **pattern12** name pre-set ring cadence patterns. Enter **ring cadence ?** to see ring pattern explanations. • **define** *pulse interval* specifies a user-defined pattern: *pulse* is a number (one or two digits, from 1 to 50) specifying ring pulse (on) time in hundreds of milliseconds, and *interval* is a number (one or two digits from 1 to 50) specifying ring interval (off) time in hundreds of milliseconds. The default is the pattern specified by the cptone locale that has been configured.
Step 10	`Router(config-voiceport)# description string`	Attaches a text string to the configuration that describes the connection for this voice port. This description appears in various displays and is useful for tracking the purpose or use of the voice port. The *string* argument is a character string from 1 to 255 characters in length. The default is that there is no text string (describing the voice port) attached to the configuration.
Step 11	`Router(config-voiceport)# no shutdown`	Activates the voice port. If a voice port is not being used, shut the voice port down with the **shutdown** command.

Configuring Analog Telephone Connections on Cisco 803 and 804 Routers

Multiple devices (analog telephone, fax machine, or modem) can be connected to a Cisco 803 or 804 telephone port. The number of devices that can be connected depends on the ringer equivalent number (REN) of each device that is to be connected. (The REN can usually be found on the bottom of a device.) The REN of the router telephone port is 5, so if the REN of each device to be connected is 1, a maximum of five devices can be connected to that particular telephone port.

These routers support touch-tone analog telephones only; they do not support rotary telephones.

To configure standard features for analog telephone connections on Cisco 803 and 804 routers, use the following commands in global configuration mode:

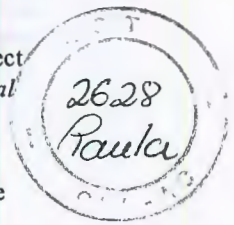
	Command	Purpose
Step 1	`Router(config)# pots country` *country*	Specifies the country to use for country-specific default settings for physical characteristics. Enter **pots country ?** for a list of supported countries and the codes to enter. A default country is not defined.
Step 2	`Router(config)# pots line-type {type1 | type2 | type3}`	(Optional) Specifies the impedance of telephones, fax machines, or modems connected to a Cisco 800 series router. The keywords are as follows: • **type1**—Specifies the resistance used for the POTS connection, typically 600 ohms. • **type2**—Specifies the resistance used for the POTS connection, typically 900 ohms. • **type3**—Specifies the resistance used for the POTS connection, typically 300/400 ohms. The default depends on the country chosen in the **pots country** command.
Step 3	`Router(config)# pots dialing-method {overlap | enblock}`	(Optional) Specifies how the router collects and sends digits dialed on connected telephones, fax machines, or modems. The keywords are as follows: • **overlap**—Tells the router to send each digit dialed in a separate message. • **enblock**—Tells the router to collect all digits dialed and to send the digits in one message. The default depends on the country chosen in the **pots country** command.

ECT 2629 Paula

	Command	Purpose
Step 4	`Router(config)# pots disconnect-supervision {osi | reversal}`	(Optional) Specifies how the router notifies the connected telephones, fax machines, or modems when the calling party has disconnect. The keywords are as follows: • **osi**—(open switching interval) Specifies the duration for which DC voltage applied between tip and ring conductors of a telephone port is removed. • **reversal**—Specifies the polarity reversal of the tip and ring conductors of a telephone port. The default depends on the country chosen in the **pots country** command.
Step 5	`Router(config)# pots encoding {alaw | ulaw}`	(Optional) Specifies the pulse code modulation (PCM) encoding scheme for telephones, fax machines, or modems connected to a Cisco 800 series router. The keywords are as follows: • **alaw**—Specifies the ITU-T PCM encoding scheme used to represent analog voice samples as digital values. • **ulaw**—Specifies the North American PCM encoding scheme used to represent analog voice samples as digital values. The default depends on the country chosen in the **pots country** command.
Step 6	`Router(config)# pots tone-source {local | remote}`	(Optional) Specifies the source of dial, ringback, and busy tones for telephones, fax machines, or modems connected to a Cisco 800 series router. The keywords are as follows: • **local**—(default) Specifies that the router supplies the tones. • **remote**—Specifies that the telephone switch supplies the tones.
ep 7	`Router(config)# pots ringing-freq {20Hz | 25Hz | 50Hz}`	(Optional) Specifies the frequency at which telephones, fax machines, or modems connected to a Cisco 800 series router ring. The keywords are as follows: • **20Hz**—Indicates that connected devices ring at 20 Hz. • **25Hz**—Indicates that connected devices ring at 25 Hz. • **50Hz**—Indicates that connected devices ring at 50 Hz. The default depends on the country chosen in the **pots country** command.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0289
Fls:
Doc: 3701

	Command	Purpose
Step 8	`Router(config)# pots disconnect-time` *interval*	(Optional) Specifies the interval at which the disconnect method is applied if connected telephones, fax machines, or modems fail to detect that a calling party has disconnected. The *interval* argument is the number of milliseconds of the interval and ranges from 50 to 2000. The default depends on the country chosen in the **pots country** command.
Step 9	`Router(config)# pots silence-time` *seconds*	(Optional) Specifies the interval of silence after a calling party disconnects. The *seconds* argument is the number of seconds of the interval and ranges from 0 to 10. The default depends on the country chosen in the **pots country** command.
Step 10	`Router(config)# pots distinctive-ring-guard-time` *milliseconds*	(Optional) Specifies the delay after which a telephone port can be rung after a previous call is disconnected. The *milliseconds* argument is the number of milliseconds of the delay and ranges from 0 to 1000. The default depends on the country chosen in the **pots country** command.



Verifying Analog Telephone Connections on Cisco 803 and 804 Routers

After configuring analog telephone connections, perform the following steps to verify proper operation:

Step 1 Pick up the handset of an attached telephony device and check for a dial tone.

Step 2 Review the configuration using the **show pots status** command, which displays settings of physical characteristics and other information on telephone interfaces.

```
Router# show pots status

Troubleshooting Tip for Cisco 803 and 804 Routers

Check to ensure that all cables are securely connected.

Configuring Digital Voice Ports

The digital voice port commands discussed in this section configure channelized T1 or E1 connections; for information on ISDN connections, see "Configuring ISDN Interfaces for Voice" in this configuration guide.

The T1 or E1 lines that connect a telephony network to the digital voice ports on a router or access server contain channels for voice calls; a T1 line contains 24 full-duplex channels or *timeslots*, and an E1 line contains 30. The signal on each channel is transmitted at 64 kbps, a standard known as digital signal 0 (DS0); the channels are known as DS0 channels. The **ds0-group** command creates a logical voice port (a DS0 group) from some or all of the DS0 channels, which allows you to address those channels easily, as a group, in voice-port configuration commands.

Digital voice ports are found at the intersection of a packet voice network and a digital, circuit-switched telephone network. The digital voice port interfaces that connect the router or access server to T1 or E1 lines pass voice data and signaling between the packet network and the circuit-switched network.

Signaling is the exchange of information about calls and connections between two ends of a communication path. For instance, signaling communicates to the call's end points whether a line is idle or busy, whether a device is on-hook or off-hook, and whether a connection is being attempted. An end point can be a CO switch, a PBX, a telephony device such as a telephone or fax machine, or a voice-equipped router acting as a gateway. There are two aspects to consider about signaling on digital lines: one aspect is the actual information about line and device states that is transmitted, and the second aspect is the method used to transmit the information on the digital lines.

The actual information about line and device states is communicated over digital lines using signaling methods that emulate the methods used in analog circuit-switched networks: FXS, FXO, and E&M.

The method used to transmit the information describes the way that the emulated analog signaling is transmitted over digital lines, which may be *common-channel signaling* (CCS) or *channel-associated signaling* (CAS). CCS sends signaling information down a dedicated channel and CAS takes place within the voice channel itself. This chapter describes CAS signaling, which is sometimes called *robbed-bit signaling* because user bandwidth is *robbed* by the network for signaling. A bit is taken from every sixth frame of voice data to communicate on- or off-hook status, wink, ground start, dialed digits, and other information about the call.

In addition to setting up and tearing down calls, CAS provides the receipt and capture of dialed number identification (DNIS) and automatic number identification (ANI) information, which are used to support authentication and other functions. The main disadvantage of CAS signaling is its use of user bandwidth to perform these signaling functions.

For signaling to pass between the packet network and the circuit-switched network, both networks must use the same type of signaling. The voice ports on Cisco routers and access servers can be configured to match the signaling of most COs and PBXs, as explained in this chapter.

This section discusses the following topics:

- Prerequisites for Configuring Digital Voice Ports, page 57
- Preparing Information to Configure Digital Voice Ports, page 58
- Platform-Specific Digital Voice Hardware, page 60
- Configuring Basic Parameters on Digital T1/E1 Voice Ports, page 63

2625
Paula

Prerequisites for Configuring Digital Voice Ports

Digital T1 or E1 packet voice capability requires specific service, software, and hardware:

- Obtain T1 or E1 service from the service provider or from your PBX.
- Create your company's dial plan.
- Establish a working telephony network based on your company's dial plan.
- Establish a connection to the network LAN or WAN.
- Set up a working IP and Frame Relay or ATM network. For more information about configuring IP, refer to the *Cisco IOS IP Configuration Guide*, Release 12.2.
- Install appropriate voice processing and voice interface hardware on the router. See the "Platform-Specific Digital Voice Hardware" section on page 60.
- (Cisco 2600 and 3600 series routers) For digital T1 packet voice trunk network modules, install Cisco IOS Release 12.0(5)XK, 12.0(7)T, 12.2(1), or a later release. The minimum DRAM memory requirements are as follows:
  - 32 MB, with one or two T1 lines
  - 48 MB, with three or four T1 lines
  - 64 MB, with five to ten T1 lines
  - 128 MB, with more than ten T1 lines

  The memory required for high-volume applications may be greater than that listed. Support for digital T1 packet voice trunk network modules is included in Plus feature sets. The IP Plus feature set requires 8 MB of Flash memory; other Plus feature sets require 16 MB.
- (Cisco 2600 and 3600 series routers) For digital E1 packet voice trunk network modules, install Cisco IOS Release 12.1(2)T, 12.2(1), or a later release. The minimum DRAM memory requirements are:
  - 48 MB, with one or two E1s
  - 64 MB, with three to eight E1s
  - 128 MB, with 9 to 12 E1s

  For high-volume applications, the memory required may be greater than these minimum values. Support for digital E1 packet voice trunk network modules is included in Plus feature sets. The IP Plus feature set requires 16 MB of Flash memory.
- (Cisco MC3810 concentrators) HCMs require Cisco IOS Release 12.0(7)XK or 12.1(2)T, 12.2(1), or a later release.
- (Cisco 7200 and 7500 series routers) For digital T1/E1 voice port adapters, install Cisco IOS Release 12.0(5)XE, 12.0(7)T, 12.2(1), or a later release. The minimum DRAM memory requirement to support T1/E1 high-capacity digital voice port adapters is 64 MB.

The memory required for high-volume applications may be greater than that listed. Support for T1/E1 high-capacity digital voice port adapters is included in Plus feature sets. The IP Plus feature set requires 16 MB of Flash memory.

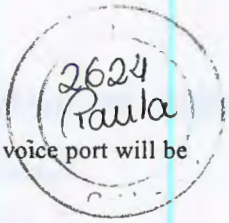
Preparing Information to Configure Digital Voice Ports



Gather the following information about the telephony network connection that the voice port will be making:

- Line interface: T1 or E1
- Signaling interface: FXO, FXS, or E&M. If the interfaces are Primary Rate Interface (PRI) or BRI, see the "Configuring ISDN Interfaces for Voice" chapter in this configuration guide and *Cisco IOS Terminal Services Configuration Guide*.
- Line coding: AMI or B8ZS for T1, and AMI or HDB3 for E1
- Framing format: SF (D4) or ESF for T1, and CRC4 or no-CRC4 for E1
- Number of channels

Table 8 describes voice-port hardware configurations for various platforms. After the controllers have been configured, the **show voice port summary** command can also be used to determine available voice port numbers. If the **show voice port** command and a specific port number is entered, the default voice-port configuration for that port displays.

Table 8 Digital Voice Slot/Port Designations

Router Platform	Voice Hardware	Slot Number	Port Number
Cisco 2600 series	Digital T1/E1 Packet Voice Trunk Network Module (NM-HDV with VWIC-1MFT or VWIC-2MFT) One network module can be installed in a Cisco 2600 series router.	*slot* is the router location of the voice module. 1	*port* is the VWIC location in the network module. 0 to 1
Cisco 3600 series	Digital T1/E1 Packet Voice Trunk Network Module (NM-HDV with VWIC-1MFT or VWIC-2MFT) One network module can be installed in a Cisco 3620 router. A Cisco 3640 router can support three modules, and as many as six can be installed in a Cisco 3660 router.	*slot* is the router location of the voice module. 3620: 0 to 1 3640: 0 to 3 3660: 0 to 5	*port* is the VWIC location in the network module. 0 to 1

```

Platform-Specific Digital Voice Hardware

This section briefly describes digital voice hardware on the following platforms:

- Cisco 2600 series and Cisco 3600 series routers
- Cisco MC3810 multiservice concentrator
- Cisco AS5300 universal access server
- Cisco AS5800 universal access server
- Cisco 7200 series and Cisco 7500 series routers

Note For current information about supported hardware, see the release notes for the platform and Cisco IOS release you are using.

Cisco 2600 Series and Cisco 3600 Series Routers

Digital voice hardware on Cisco 2600 series and Cisco 3600 series modular access routers includes the high-density voice (HDV) network module and the multiflex trunk (MFT) voice/WAN interface card (VWIC). When an HDV is used in conjunction with an MFT and packet voice DSP modules (PVDMs), the HDV module is also called a *digital packet voice trunk network module*. The digital T1 or E1 packet voice trunk network module supports T1 or E1 applications, including fractional use. The T1 version integrates a fully managed data service unit/channel service unit (DSU/CSU), and the E1 version includes a fully managed DSU. The digital T1 or E1 packet voice trunk network module provides per-channel T1 or E1 data rates of 64 or 56 kbps for WAN services (Frame Relay or leased line).

Digital T1 or E1 packet voice trunk network modules for Cisco 2600 and 3600 series routers allow enterprises or service providers, using the voice-equipped routers as customer premise equipment (CPE), to deploy digital voice and fax relay. These network modules receive constant bit-rate telephony information over T1 or E1 interfaces and convert that information to a compressed format so that it can be sent over a packet network. The digital T1 or E1 packet voice trunk network modules can connect either to a PBX (or similar telephony device) or to a CO to provide PSTN connectivity. One digital T1 or E1 packet voice trunk network module can be installed in a Cisco 2600 series router or in a Cisco 3620 router. A Cisco 3640 router can support three network modules, and a Cisco 3660 router can support up to six network modules.

2621
Paula

The MFT VWICs that are used in the packet voice trunk network modules are available in one- and two-port configurations for T1 and for E1, and in two-port configurations with drop-and-insert capability for T1 and E1. MFTs support the following kinds of traffic:

- Data. As WICs for T1 or E1 applications, including fractional data line use, the T1 version includes a fully managed DSU/CSU, and the E1 version includes a fully managed DSU.
- Packet voice. As VWICs included with the digital T1 or E1 packet voice trunk network module to provide connections to PBXs and COs, the MFTs enable packet voice applications.
- Multiplexed voice and data. Some two-port T1 or E1 VWICs can provide drop-and-insert multiplexing services with integrated DSU/CSUs. For example, when used with a digital T1 packet voice trunk network module, drop-and-insert allows 64-kbps DS0 channels to be taken from one T1 and digitally cross-connected to 64-kbps DS0 channels on another T1. Drop and insert, sometimes called TDM cross-connect, uses circuit switching rather than the DSPs that VoIP technology employs. (Drop-and-insert is described in the "Configuring Trunk Connections and Trunk Conditioning Features" chapter in this configuration guide.)

The digital T1 or E1 packet voice trunk network module contains five 72-pin Single In-line Memory Module (SIMM) sockets or banks, numbered 0 through 4, for PVDMs. Each socket can be filled with a single 72-pin PVDM, and there must be at least one packet voice data module (PVDM-12) in the network module to process voice calls. Each PVDM holds three digital signal processors (DSPs), so with five PVDM slots populated, a total of 15 DSPs are provided. High-complexity codecs support two simultaneous calls on each DSP, and medium-complexity codecs support four calls on each DSP. A digital T1 or E1 packet voice trunk network module can support the following numbers of channels:

- When the digital T1 or E1 packet voice trunk network module is configured for high-complexity codec mode, up to six voice or fax calls can be completed per PVDM-12, using the following codecs: G.711, G.726, G.729, G729 Annex A (E1), G.729 Annex B, G.723.1, G723.1 Annex A (T1), G.728, and fax relay.
- When the digital T1 or E1 packet voice trunk network module is configured for medium-complexity codec mode, up to 12 voice or fax calls can be completed per PVDM-12, using the following codecs: G.711, G.726, G.729 Annex A, G.729 Annex B with Annex A, and fax relay.

For more information, refer to the following publications:

- *Cisco 2600 Series Hardware Installation Guide*
- *Cisco 3600 Series Hardware Installation Guide*
- *Cisco Network Module Hardware Installation Guide*
- Cisco IOS Release 12.0(7)T online document *Configuring 1- and 2-Port T1/E1 Multiflex Voice/WAN Interface Cards on Cisco 2600 and 3600 Series Routers*

Cisco MC3810 Multiservice Concentrator

To support a T1 or E1 digital voice interface, the Cisco MC3810 multiservice concentrator must be equipped with a digital voice interface card (DVM). The DVM interfaces with a digital PBX, channel bank, or video codec. It supports up to 24 channels of compressed digital voice at 8 kbps, or it can cross-connect channelized data from user equipment directly onto the router's trunk port for connection to a carrier network.

The DVM is available with a balanced interface using an RJ-48 connector or with an unbalanced interface using Bayonet-Neill-Concelman (BNC) connectors.

Optional HCMs can replace standard VCMs to operate according to the voice compression coding algorithm (codec) specified when the Cisco MC3810 multiservice concentrator is configured. The HCM2 provides 4 voice channels at high codec complexity and 8 channels at medium complexity. The

RQS Nº 03/2005 - CN - CPMI - CORREIOS
VC-61
Fls: 0293
Doc: 3701

HCM6 provides 12 voice channels at high complexity and 24 channels at medium complexity. You can install one or two HCMs in a Cisco MC3810, but an HCM can not be combined with a VCM in the same chassis.

For more information, refer to the following publications:

- *Cisco MC3810 Multiservice Concentrator Hardware Installation Guide*
- *Overview of the Cisco MC3810 Series*
- *Configuring Cisco MC3810 Series Concentrators to Use High-Performance Compression Modules*

Cisco AS5300 Universal Access Server

The Cisco AS5300 Universal Access Server includes three expansion slots. One slot is for either an Octal T1/E1/PRI feature card (eight ports) or a Quad T1/E1/PRI feature card (four ports), and the other two can be used for voice/fax or modem feature cards. Because a single voice/fax feature card (VFC) can support up to 48 (T1) or 60 (E1) voice calls, the Cisco AS5300/Voice Gateway system can support a total of 96 or 120 simultaneous voice calls. The use of VFCs requires Cisco IOS release 12.0.2XH or later.

Cisco AS5300 VFCs are coprocessor cards, each with a powerful reduced instruction set computing (RISC) engine and dedicated, high-performance DSPs to ensure predictable, real-time voice processing. The design couples this coprocessor with direct access to the Cisco AS5300 routing engine for streamlined packet forwarding.

For more information, refer to the following publications:

- *Cisco AS5300 Chassis Installation Guide*
- *Cisco AS5300 Module Installation Guide*

Cisco AS5800 Universal Access Server

The Cisco AS5800 Universal Access Server consists of two primary system components: the Cisco 5814 dial shelf (DS), which holds channelized trunk cards and connects to the PSTN, and the Cisco 7206 router shelf (RS), which holds port adapters and connects to the IP backbone.

The dial shelf acts as the access concentrator by accepting and consolidating all types of remote traffic, including voice, dial-in analog and digital ISDN data, and industry-standard WAN and remote connection types. The dial shelf also contains controller cards voice feature cards, modem feature cards, trunk cards, and dial shelf interconnect cards.

One or two dial shelf controllers (DSCs) provide clock and power control to the dial shelf cards. Each DSC contains a block of logic that is referred to as the common logic and system clocks. This block of logic can use a variety of sources to generate the system timing, including an E1 or T1/T3 input signal from the BNC connector on the DSC's front panel. The configuration commands for the master clock specify the various clock sources and a priority for each source (see the "Clock Sources on Digital T1/E1 Voice Ports" section on page 68).

The Cisco AS5800 voice feature card is a multi-DSP coprocessing board and software package that adds VoIP capabilities to the Cisco AS5800 platform. The Cisco AS5800 voice feature card, when used with other cards such as LAN/WAN and modem cards, provides a gateway for up to 192 packetized voice/fax calls and 360 data calls per card. A Cisco AS5800 can support up to 1,344 voice calls in split-dial-shelf configuration with two 7206VXR router shelves.

Cisco 7200 and Cisco 7500 Series Routers

Cisco 7200 and Cisco 7500 series routers support multimedia routing and bridging with a wide variety of protocols and media types. The Cisco 7000 family versatile interface processor (VIP) is based on a RISC engine optimized for I/O functions. To this engine are attached one or two port adapters or daughter boards, which provide the media-specific interfaces to the network. The network interfaces provide connections between the routers' peripheral component interconnect (PCI) buses and external networks. Port adapters can be placed in any available port adapter slot, in any desired combination.

T1/E1 high-capacity digital voice port adapters for Cisco 7200 and Cisco 7500 series routers allow enterprises or service providers, using the equipped routers as customer premise equipment, to deploy digital voice and fax relay. These port adapters receive constant bit-rate telephony information over T1/E1 interfaces and can convert that information to a compressed format for transmission as voice over IP (VoIP). Two types of digital voice port adapters are supported on Cisco 7200 and Cisco 7500 series routers: two-port high-capacity (up to 48 or 120 channels of compressed voice, depending on codec choice), and two-port moderate capacity (up to 24 or 48 channels of compressed voice). These single-width port adapters incorporate two universal ports configurable for either T1 or E1 connection, for use with high-performance digital signal processors (DSPs). Integrated CSU/DSUs, echo cancellation, and DS0 drop-and-insert functionality eliminate the need for external line termination devices and multiplexers.

For more information, refer to the following publications:

- *Cisco 7200 VXR Installation and Configuration Guide*
- *Cisco 7500 Series Installation and Configuration Guide*
- *Two-Port T1/E1 Moderate-Capacity and High-Capacity Digital Voice Port Adapter Installation and Configuration*

Note For current information about supported hardware, see the release notes for the platform and Cisco IOS release being used.

Configuring Basic Parameters on Digital T1/E1 Voice Ports

This section describes commands for basic digital voice port configuration. Make sure you have all the data recommended in the "Preparing Information to Configure Digital Voice Ports" section on page 58 before starting this procedure.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
VC-63
0294
Fls:
3701
Doc:

The basic steps for configuring digital voice ports are described in the next three sections. They are grouped by the configuration mode from which they are executed, as follows:

- Configuring Codec Complexity for Digital T1/E1 Voice Ports, page 64

  Codec complexity refers to the amount of processing power assigned to codec processing on a voice port. On most router platforms that support codec complexity, codec complexity is selected in voice card configuration mode, although it is selected in DSP interface mode on the Cisco 7200 and 7500 series. The value configured for codec complexity establishes the choice of codecs that are available on the dial peers. See the *Configuring Dial Plans, Dial Peers, and Digit Manipulation* chapter in this configuration guide for more information about configuring dial peers.

- Configuring Controller Settings for Digital T1/E1 Voice Ports, page 67

  Specific line characteristics must be configured to match those of the PSTN line that is being connected to the voice port. These are typically configured in controller configuration mode.

- Configuring Basic Voice Port Parameters for Digital T1/E1 Voice Ports, page 78

  Voice port configuration mode allows many of the basic voice call attributes to be configured to match those of the PSTN or PBX connection being made on this voice port.

In addition to the basic voice port parameters, there are additional commands that allow for the fine-tuning of the voice port configurations or for configuration of optional features. In most cases, the default values for these commands are sufficient for establishing voice port configurations. If it is necessary to change some of these parameters to improve voice quality or to match parameters in proprietary PBXs to which you are connecting, use the commands in the "Fine-Tuning Analog and Digital Voice Ports" section on page 80.

After voice port configuration, make sure the ports are operational by following the steps described in these sections:

- Verifying Analog and Digital Voice-Port Configurations, page 99
- Troubleshooting Analog and Digital Voice Port Configurations, page 110

For more information on voice port commands, refer to the *Cisco IOS Voice, Video, and Fax Command Reference*.

Configuring Codec Complexity for Digital T1/E1 Voice Ports

On the Cisco 2600, 3600, 7200, and 7500 routers, codec complexity can be configured separately for each T1/E1 digital packet voice trunk network module or port adapter. On a Cisco MC3810 multiservice concentrator, only a single codec complexity setting is used, even when two HCMs are installed. The value specified in this task affects the choice of codecs available when the **codec** dial-peer configuration command is configured.

For details on the number of calls that can be handled simultaneously using each of the codec standards, refer to the entries for **codec** and **codec complexity** in the *Cisco IOS Voice, Video, and Fax Command Reference* and to platform-specific product literature.

For more information on codec complexity, see the "Configuring Codec Complexity for Analog Voice Ports on the Cisco MC3810 with High-Performance Compression Modules" section on page 47.

Two configuration task tables are shown below: one for the Cisco 2600 and 3600 series routers and the Cisco MC3810 concentrator, which use voice card configuration mode, and the second for the Cisco 7200 and 7500 series routers, which use DSP interface configuration mode.

2617
Fls:

Cisco 2600 and 3600 Series and Cisco MC3810

This procedure applies to voice ports on digital packet voice trunk network modules on Cisco 2600 series and Cisco 3600 series routers, and to voice ports on HCMs on Cisco MC3810 multiservice concentrators.

Note On Cisco 2600 and 3600 series routers with digital T1/E1 packet voice trunk network modules, codec complexity cannot be configured if DS0 groups are configured. Use the **no ds0-group** command to remove DS0 groups before configuring codec complexity.

Note On the Cisco MC3810 multiservice concentrator with high compression modules, check the DSP voice channel activity with the **show voice dsp** command. If any DSP voice channels are in the busy state, you cannot change the codec complexity. When all of the DSP channels are in the idle state, you can make changes to the codec complexity selection.

To configure codec complexity, use the following commands beginning in privileged EXEC mode:

	Command	Purpose
Step 1	`Router# show voice dsp`	Checks the DSP voice channel activity. If any DSP voice channels are in the busy state, codec complexity cannot be changed. When all of the DSP channels are in the idle state, continue to Step 2.
Step 2	`Router# configure terminal`	Enters global configuration mode.
Step 3	`Router(config)# voice-card` *slot*	Enters voice card configuration mode for the card or cards in the slot specified. For the Cisco 2600 and 3600 series routers, the *slot* argument ranges from 0 to 5. For the Cisco MC3810 multiservice concentrator, *slot* must be 0.
Step 4	`Router(config-voicecard)# codec complexity {high | med}`	Specifies codec complexity based on the codec standard being used. This setting restricts the codecs available in dial peer configuration. All voice cards in a router must use the same codec complexity setting. The keywords are as follows: • **high**—(Optional) Specifies up to six voice or fax calls completed per PVDM-12, using the following codecs: G.711, G.726, G.729, G.729 Annex B, G.723.1, G.723.1 Annex A, G.728, and fax relay. • **med**—(Optional) Supports up to 12 voice or fax calls completed per PVDM-12, using the following codecs: G.711, G.726, G.729 Annex A, G.729 Annex B with Annex A, and fax relay. The default is **med**. **Note** On the Cisco MC3810 multiservice concentrator, this command is valid only with one or more HCMs installed, and voice card 0 must be specified. If two HCMs are installed, this command configures both HCMs at once.

Cisco AS5300 Universal Access Server

Codec support on the Cisco AS5300 universal access server is determined by the capability list on the voice feature card, which defines the set of codecs that can be negotiated for a voice call. The capability list is created and populated when VCWare is unbundled and DSPWare is added to VFC Flash memory. The capability list does not indicate codec preference; it simply reports the codecs that are available. The session application decides which codec to use. Codec support is configured on dial peers rather than on voice ports; see the "Configuring Dial Plans, Dial Peers, and Digit Manipulation" chapter in this configuration guide.

Cisco AS5800 Universal Access Server

Selection of codec support on Cisco AS5800 access servers is made during dial peer configuration. See the "Configuring Dial Plans, Dial Peers, and Digit Manipulation" chapter in this configuration guide.

Cisco 7200 Series and Cisco 7500 Series Routers

On Cisco 7200 series and Cisco 7500 series routers, codec complexity is configured on the DSP interface.

Note Check the DSP voice channel activity using the **show interfaces dspfarm** command. If any DSP voice channels are in the busy state, codec complexity cannot be changed. When all of the DSP channels are in the idle state, changes can be made to the codec complexity selection.

To configure the DSP interface, use the following commands beginning in privileged EXEC mode:

	Command	Purpose
Step 1	`Router# show interfaces dspfarm`	Displays the DSP voice channel activity. If any DSP voice channels are in the busy state, codec complexity cannot be changed. When all of the DSP channels are in the idle state, continue to Step 2.
Step 2	`Router# configure terminal`	Enters global configuration mode.

Step 3	**Cisco 7200 series**
	`Router(config)# dspint dspfarm slot/port`
	Cisco 7500 series
	`Router(config)# dspint dspfarm slot/port-adapter/port`
		Enters DSP interface configuration mode. The arguments are as follows:
		• *slot/port*—Specifies the slot and port numbers of the interface.
		• *adapter/port*—Specifies the adapter and port numbers of the interface.

2615
Fax/Modem

	Command	Purpose
Step 4	`Router(config-dspfarm)# codec {high | med}`	Specifies the codec complexity based on the codec standard being used. The keyword specified for **codec** affects the choice of codecs available when the **codec** dial-peer configuration command is used. The keywords are as follows: • **high**—Supports two voice channels encoded in any of the following formats: G.711, G.726, G.729, G.729 Annex B, G.723.1, G.723.1 Annex A, G.728, and fax relay. • **med**—(default) Supports up to four calls using the following codecs: G.711, G.726, G.729 Annex A, G.729 Annex B with Annex A, and fax relay.
Step 5	`Router(config-dspfarm)# description`	Enters a string to include descriptive text about this DSP interface connection. This information is displayed in the output for **show** commands and does not affect the operation of the interface in any way.

Configuring Controller Settings for Digital T1/E1 Voice Ports

The purpose of configuring controllers for digital T1/E1 voice ports is to match the configuration of the router to the line characteristics of the telephony network connection being made so that voice and signaling can be transferred between them and so that logical voice ports, or DS0 groups, may be established.

Figure 16 shows how a **ds0-group** command gathers some of the DS0 time slots from a T1 line into a group that becomes a single logical voice port, which can later be addressed as a single entity in voice port configurations. Other DS0 groups for voice can be created from the remaining time slots shown in the figure, or the time slots can be used for data or serial pass-through.

Note that all the controller commands in Figure 16 other than **ds0-group** apply to all the time slots in the T1.

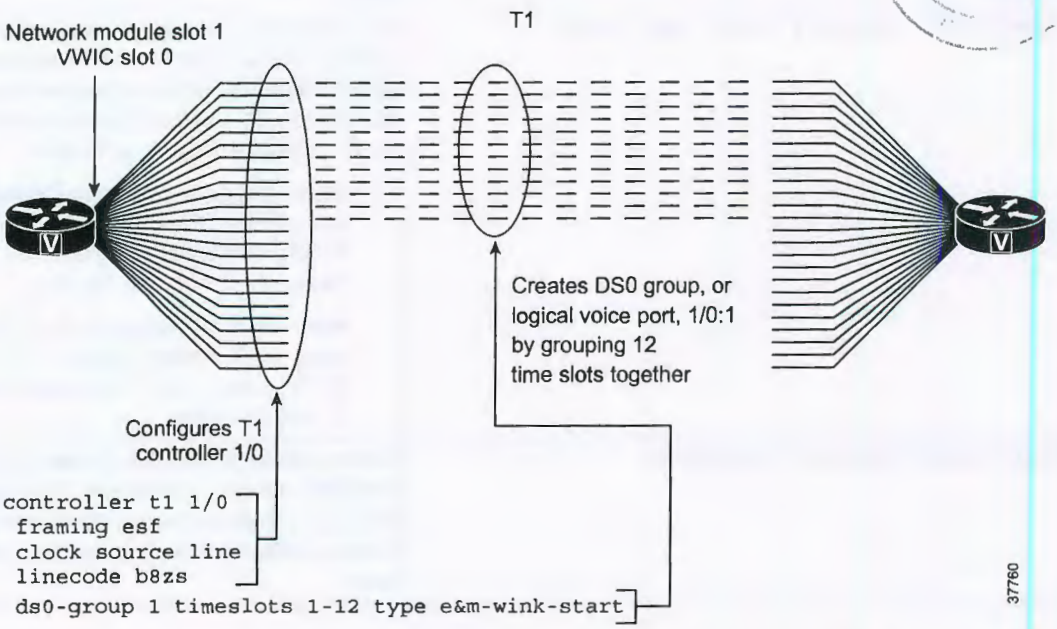
Figure 16 T1 Controller Configuration on Cisco 2600 or 3600 Series Routers



Voice port controller configuration includes setting the parameters described in the following sections:

- Framing Formats on Digital T1/E1 Voice Ports
- Clock Sources on Digital T1/E1 Voice Ports
- Line Coding on Digital T1/E1 Voice Ports
- DS0 Groups on Digital T1/E1 Voice Ports

Another controller command that might be needed, **cablelength**, is discussed in the *Cisco IOS Interface Command Reference*, Release 12.2.

Framing Formats on Digital T1/E1 Voice Ports

The framing format parameter describes the way that bits are robbed from specific frames to be used for signaling purposes. The controller must be configured to use the same framing format as the line from the PBX or CO that connects to the voice port you are configuring.

Digital T1 lines use super frame (SF) or extended super frame (ESF) framing formats. SF provides two-state, continuous supervision signaling, in which bit values of 0 are used to represent on-hook and bit values of 1 are used to represent off-hook. ESF robs four bits instead of two, yet has little impact on voice quality. ESF is required for 64-kbps operation on DS0 and is recommended for Primary Rate Interface (PRI) configurations.

E1 lines can be configured for cyclic redundancy check (CRC4) or no cyclic redundancy check, with an optional argument for E1 lines in Australia.

Clock Sources on Digital T1/E1 Voice Ports

Digital T1/E1 interfaces use timers called *clocks* to ensure that voice packets are delivered and assembled properly. All interfaces handling the same packets must be configured to use the same source of timing so that packets are not lost or delivered late. The timing source that is configured can be external (from the line) or internal to the router's digital interface.

If the timing source is internal, timing derives from the onboard phase-lock loop (PLL) chip in the digital voice interface. If the timing source is line (external), then timing derives from the PBX or PSTN CO to which the voice port is connected. It is generally preferable to derive timing from the PSTN because their clocks are maintained at an extremely accurate level. This is the default setting for the clocks. When two or more controllers are configured, one should be designated as the primary clock source; it will drive the other controllers.

The **line** keyword specifies that the clock source is derived from the active line rather than from the free-running internal clock. The following rules apply to clock sourcing on the controller ports:

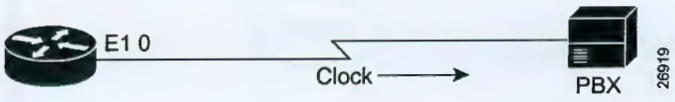
- When both ports are set to line clocking with no primary specification, port 0 is the default primary clock source and port 1 is the default secondary clock source.
- When both ports are set to line and one port is set as the primary clock source, the other port is by default the backup or secondary source and is loop-timed.
- If one port is set to clock source line or clock source line primary and the other is set to clock source internal, the internal port recovers clock from the clock source line port if the clock source line port is up. If it is down, then the internal port generates its own clock.
- If both ports are set to clock source internal, there is only one clock source: internal.

This section describes the five basic timing scenarios that can occur when a digital voice port is connected to a PBX or CO. In all the examples that follow, the PSTN (or CO) and the PBX are interchangeable for purposes of providing or receiving clocking.

- Single Voice Port Providing Clocking—In this scenario, the digital voice hardware is the clock source for the connected device, as shown in Figure 17. The PLL generates the clock internally and drives the clocking on the line. Generally, this method is useful only when connecting to a PBX, key system, or channel bank. A Cisco VoIP gateway rarely provides clocking *to* the CO because CO clocking is much more reliable. The following configuration sets up this clocking method for a digital E1 voice port:

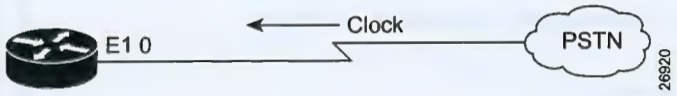
```
controller E1 1/0
 framing crc4
 linecoding hdb3
 clock source internal
 ds0-group timeslots 1-15 type e&m-wink-start
```

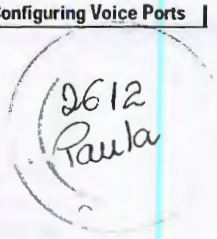
Figure 17 Single Voice Port Providing Clocking



- Single Voice Port Receiving Internal Clocking—In this scenario, the digital voice hardware receives clocking from the connected device (CO telephony switch or PBX) (see Figure 18). The PLL clocking is driven by the clock reference on the receive (Rx) side of the digital line connection.

Figure 18 Single E1 Port Receiving Clocking from the Line





The following configuration sets up this clocking method:

```
controller T1 1/0
 framing esf
 linecoding ami
 clock source line
 ds0-group timeslots 1-12 type e&m-wink-start
```

- Dual Voice Ports Receiving Clocking from the Line—In this scenario, the digital voice port has two reference clocks, one from the PBX and another from the CO, as shown in Figure 19. Because the PLL can derive clocking from only one source, this case is more complex than the two preceding examples.

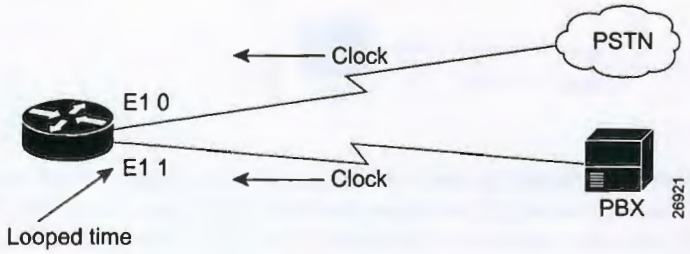
  Before looking at the details, consider the following as they pertain to the clocking method:

  - Looped-time clocking: The voice port takes the clock received on its Rx (receive) pair and regenerates it on its Tx (transmit) pair. While the port receives clocking, the port is not driving the PLL on the card but is "spoofing" (that is, fooling) the port so that the connected device has a viable clock and does not see slips (that is, loss of data bits). PBXs are not designed to accept slips on a T1 or E1 line, and such slips cause a PBX to drop the link into failure mode. While in looped-time mode, the router often sees slips, but because these are controlled slips, they usually do not force failures of the router's voice port.
  - Slips: These messages indicate that the voice port is receiving clock information that is out of phase (out of synchronization). Because the router has only a single PLL, it can experience controlled slips while it receives clocking from two different time sources. The router can usually handle controlled slips because its single-PLL architecture anticipates them.

Note Physical layer issues, such as bad cabling or faulty clocking references, can cause slips. Eliminate these slips by addressing the physical layer or clock reference problems.

In the dual voice ports receiving clocking from the line scenario, the PLL derives clocking from the CO and puts the voice port connected to the PBX into looped-time mode. This is usually the best method because the CO provides an excellent clock source (and the PLL usually requires that the CO provide that source) and a PBX usually must receive clocking from the other voice port.

Figure 19 Dual E1 Ports Receiving Clocking from the Line



The following configuration sets up this clocking method:

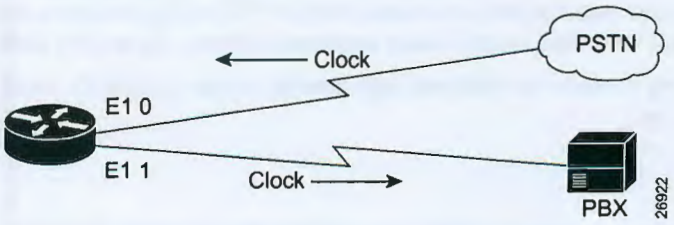
```
controller E1 1/0 << description - connected to the CO
 framing crc4
 linecoding hdb3
 clock source line primary
 ds0-group timeslots 1-15 type e&m-wink-start
!
```

```
controller E1 1/1 << description - connected to the PBX
 framing crc4
 linecoding hdb3
 clock source line
 ds0-group timeslots 1-15 type e&m-wink-start
```

The **clock source line primary** command tells the router to use this voice port to drive the PLL. All other voice ports configured as **clock source line** are then put into an implicit loop-timed mode. If the primary voice port fails or goes down, the other voice port instead receives the clock that drives the PLL. In this configuration, port 1/1 might see controlled slips, but these should not force it down. This method prevents the PBX from seeing slips.

- Dual Voice Ports (One Receives Clocking and One Provides Clocking)—In this scenario, the digital voice hardware receives clocking for the PLL from E1 0 and uses this clock as a reference to clock E1 1 (see Figure 20). If controller E1 0 fails, the PLL internally generates the clock reference to drive E1 1.

Figure 20 Dual E1 ports—One Receiving and One Providing Clocking

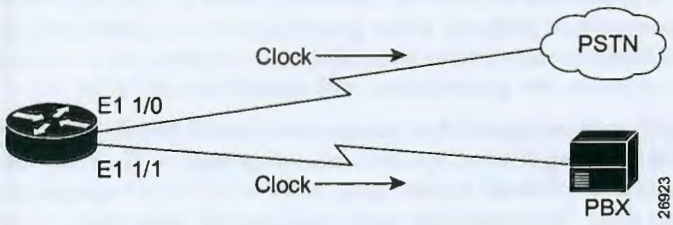


The following configuration sets up this clocking method:

```
controller E1 1/0
 framing crc4
 linecoding hdb3
 clock source line
 ds0-group timeslots 1-15 type e&m-wink-start
!
controller E1 1/1
 framing crc4
 linecoding hdb3
 clock source internal
 ds0-group timeslots 1-15 type e&m-wink-start
```

- Dual Voice Ports (Router Provides Both Clocks)—In this scenario, the router generates the clock for the PLL and, therefore, for both voice ports (see Figure 21).

Figure 21 Dual E1 Ports—both Clocks from the Router



The following configuration sets up this clocking method:

```
controller E1 1/0
 framing crc4
 linecoding hdb3
 clock source internal
 ds0-group timeslots 1-15 type e&m-wink-start
!
controller E1 1/1
 framing esf
 linecoding b8zs
 clock source internal
 ds0-group timeslots 1-15 type e&m-wink-start
```

Line Coding on Digital T1/E1 Voice Ports

Digital T1/E1 interfaces require that line encoding be configured to match that of the PBX or CO that is being connected to the voice port. Line encoding defines the type of framing used on the line.

T1 line encoding methods include alternate mark inversion (AMI) and binary 8 zero substitution (B8ZS). AMI is used on older T1 circuits and references signal transitions with a binary 1, or "mark." B8ZS, a more reliable method, is more popular and is recommended for PRI configurations as well. B8ZS encodes a sequence of eight zeros in a unique binary sequence to detect line-coding violations.

Supported E1 line encoding methods are AMI and high-density bipolar 3 (HDB3), which is a form of zero-suppression line coding.

DS0 Groups on Digital T1/E1 Voice Ports

For digital voice ports, a single command, **ds0-group**, performs the following functions:

- Defines the T1/E1 channels for compressed voice calls.
- Automatically creates a logical voice port.

  The numbering for the logical voice port created as a result of this command is *controller:ds0-group-no*, where *controller* is defined as the platform-specific address for a particular controller. On a Cisco 3640 router, for example, **ds0-group 1 timeslots 1-24 type e&m-wink** automatically creates the voice port 1/0:1 when issued in the configuration mode for controller 1/0. On a Cisco MC3810 universal concentrator, when you are in the configuration mode for controller 0, the command **ds0-group 1 timeslots 1-24 type e&m-wink** creates logical voice port 0:1.

  To map individual DS0s, define additional DS0 groups under the T1/E1 controller, specifying different time slots. Defining additional DS0 groups also creates individual DS0 voice ports.
- Defines the emulated analog signaling method that the router uses to connect to the PBX or PSTN.

  Most digital T1/E1 connections used for switch-to-switch (or switch-to-router) trunks are E&M connections, but FXS and FXO connections are also supported. These are normally used to provide emulated-OPX (Off-Premises eXtension) from a PBX to remote stations. FXO ports connect to FXS ports. The FXO or FXS connection between the router and switch (CO or PBX) must use matching signaling, or calls cannot connect properly. Either ground start or loop start signaling is appropriate for these connections. Ground start provides better disconnect supervision to detect when a remote user has hung up the telephone, but ground start is not available on all PBXs.

  Digital ground start differs from digital E&M because the A and B bits do not track each other as they do in digital E&M signaling (that is, A is not necessarily equal to B). When the CO delivers a call, it *seizes* a channel (goes off-hook) by setting the A bit to 0. The CO equipment also simulates ringing by toggling the B bit. The terminating equipment goes off-hook when it is ready to answer the call. Digits are usually not delivered for incoming calls.

2609
Paula

E&M connections can use one of three different signaling types to acknowledge on-hook and off-hook states: wink start, immediate start, and delay start. E&M wink start is usually preferred, but not all COs and PBXs can handle wink start signaling. The E&M connection between the router and switch (CO or PBX) must match the CO or PBX E&M signaling type, or calls cannot be connected properly.

E&M signaling is normally used for trunks. It is normally the only way that a CO switch can provide two-way dialing with Direct Inward Dialing (DID). In all the E&M protocols, off-hook is indicated by A=B=1 and on-hook is indicated by A=B=0 (robbed-bit signaling). If dial pulse dialing is used, the A and B bits are pulsed to indicate the addressing digits. The are several further important subclasses of E&M robbed-bit signaling:

- E&M Wink Start—Feature Group B

  In the original wink start handshaking protocol, the terminating side responds to an off-hook from the originating side with a short wink (transition from on-hook to off-hook and back again). This wink tells the originating side that the terminating side is ready to receive addressing digits. After receiving addressing digits, the terminating side then goes off-hook for the duration of the call. The originating endpoint maintains off-hook for the duration of the call.

- E&M Wink Start—Feature Group D

  In Feature Group D wink start with wink acknowledge handshaking protocol, the terminating side responds to an off-hook from the originating side with a short wink (transition from on-hook to off-hook and back again) just as in the original wink start. This wink tells the originating side that the terminating side is ready to receive addressing digits. After receiving addressing digits, the terminating side provides another wink (called an *acknowledgment wink*) that tells the originating side that the terminating side has received the dialed digits. The terminating side then goes off-hook to indicate connection. This last indication can be due to the ultimate called endpoint's having answered. The originating endpoint maintains an off-hook condition for the duration of the call.

- E&M Immediate Start

  In the immediate-start protocol, the originating side does not wait for a wink before sending addressing information. After receiving addressing digits, the terminating side then goes off-hook for the duration of the call. The originating endpoint maintains off-hook for the duration of the call.

Note Feature Group D is supported on Cisco AS5300 platforms, and on Cisco 2600, 3600, and 7200 series with digital T1 packet voice trunk network modules. Feature Group D is not supported on E1 or analog voice ports.

To configure controller settings for digital T1/E1 voice ports, use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	**Cisco 7200 and 7500 series** `Router(config)# card type {t1 | e1} slot`	Defines the card as T1 or E1 and stipulates the location. The keywords and arguments are as follows: • **t1 | e1**—Defines the type of card. • *slot*—A value from 0 to 5.

Step 2	**Cisco 2600 and 3600 series, Cisco MC3810, and Cisco 7200 series**
	`Router(config)# controller {t1 | e1} slot/port`
	Cisco AS5300
	`Router(config)# controller {t1 | e1} number`
	Cisco AS5800
	`Router(config)# controller {t1 | e1} shelf/slot/port`
	Cisco 7500 series
	`Router(config)# controller {t1 | e1} slot/port-adapter/slot`
		Enters controller configuration mode.
		The keywords and arguments are as follows:
		• **t1 | e1**—The type of controller.
		• *slot/port*—The backplane slot number and port number for the interface being configured.
		• *number*—The network processor module number; the range is from 0 to 2.
		• *shelf/slot/port*—Indicates the controller ports; the range for *port* is from 0 to 11.

Step 3	**T1**
	`Router(config-controller)# framing {sf | esf}`
	E1
	`Router(config-controller)# framing {crc4 | no-crc4} [australia]`
		Selects frame type for T1 or E1 line.
		The keywords and arguments are as follows:
		T1 lines
		• **sf**—super frame
		• **esf**—extended super frame
		E1 lines
		• **crc4**—Provides 4 bits of error protection.
		• **no-crc4**—Disables **crc4**.
		• **australia**—(Optional) Specifies the E1 frame type used in Australia.
		The default for T1 is **sf**.
		The default for E1 is **crc4**.

2607 Paula

	Command	Purpose
Step 4	`Router(config-controller)# clock source {line [primary | secondary] | internal}`	Configures the clock source. The keywords and arguments are as follows: • **line**—Specifies that the PLL on this port derives clocking from the external source to which the port is connected (generally the CO). • **primary**—(Optional) Specifies that the PLL on this port derives clocking from the external source and puts the other port (generally connected to the PBX) into looped-time mode. Both ports are configured with **line**, but only the port connected to the external source is configured with **primary**. • **secondary**—(Optional) Indicates a backup external source for clocking if the primary clocking shuts down. Configure the **clock source line secondary** command on the controller that has the next-best-known clocking. • **internal**—(Optional) Specifies that the clock is generated from the voice port's internal PLL. For more information about clock sources, see the "Clock Sources on Digital T1/E1 Voice Ports" section on page 68. The default is **line**.

Step 5	**T1 lines**
	`Router(config-controller)# linecode {ami | b8zs}`
	E1 lines
	`Router(config-controller)# linecode {ami | hdb3}`
		Specifies the line encoding to use.
		The keywords are as follows:
		• **ami**—Specifies the alternate mark inversion (AMI) line code type. (T1 and E1)
		• **b8zs**—Specifies the binary 8 zero substitution (B8ZS) line code type. (T1 only)
		• **hdb3**—Specifies the high-density bipolar 3 (HDB3) line code type. (E1 only)
		The default for T1 is **ami**.
		The default for E1 is **hdb3**.

2606 Paula

	Command	Purpose
Step 6	**Cisco 2600 and 3600 Series Routers and Cisco MC3810 Multiservice Concentrators—T1** `Router(config-controller)# ds0-group ds0-group-no timeslots timeslot-list type {e&m-delay-dial | e&m-fgd | e&m-immediate-start e&m-wink-start | ext-sig | fgd-eana | fxo-ground-start | fxo-loop-start | fxs-ground-start | fxs-loop-start}` **Cisco 2600 and 3600 Series Routers and Cisco MC3810 Multservice Concentrators—E1** `Router(config-controller)# ds0-group ds0-group-no timeslots timeslot-list type {e&m-delay-dial | e&m-immediate-start | e&m-melcas-delay | e&m-melcas-immed | e&m-melcas-wink | e&m-wink-start | ext-sig | fgd-eana | fxo-ground-start | fxo-loop-start | fxo-melcas | fxs-ground-start | fxs-loop-start | fxs-melcas | r2-analog | r2-digital | r2-pulse}` **Cisco AS5300 Universal Access Servers—T1** `Router(config-controller)# ds0-group ds0-group-no timeslots timeslot-list [service {data | fax | voice}] [type {e&m-fgb | e&m-fgd | e&m-immediate-start | fxs-ground-start | fxs-loop-start | fgd-eana | fgd-os | r1-itu | sas-ground-start | sas-loop-start | none}]` **Cisco AS5300 Universal Access Servers—E1** `Router(config-controller)# ds0-group ds0-group-no timeslots timeslot-list type {none | p7 | r2-analog | r2-digital | r2-lsv181-digital | r2-pulse}` **Cisco AS5800 Universal Access Servers—T1** `Router(config-controller)# ds0-group ds0-group-no timeslots timeslot-list type {e&m-fgb | e&m-fgd | e&m-immediate-start | fxs-ground-start | fxs-loop-start | fgd-eana | r1-itu | r1-modified | r1-turkey | sas-ground-start | sas-loop-start | none}` **Cisco AS5800 Universal Access Servers E1 Voice Ports** `Router(config-controller)# ds0-group ds0-group-no timeslots timeslot-list type {e&m-fgb | e&m-fgd | e&m-immediate-start | fxs-ground-start | fxs-loop-start | p7 | r2-analog | r2-digital | r2-pulse | sas-ground-start | sas-loop-start | none}` **Cisco 7200 and 7500 Series Series Routers T1 and E1 Voice Ports** `Router(config-controller)# ds0-group ds0-group-no timeslots timeslot-list type {e&m-delay | e&m-immediate | e&m-wink | fxs-ground-start | fxs-loop-start | fxo-ground-start | fxo-loop-start}`	Defines the T1 channels for use by compressed voice calls and the signaling method that the router uses to connect to the PBX or CO. **Note** This step shows the basic syntax and signaling types available with the **ds0-group** command. For the complete syntax, see the *Cisco IOS Voice, Video, and Fax Command Reference*, Release 12.2. The keywords and arguments are as follows: • *ds0-group-no*—Identifies the DS0 group (number from 0 to 23, for T1, or from 0 to 30, for E1). • **timeslots** *timeslot-list*—Specifies the single time slot number, single range of numbers, or multiple ranges of numbers separated by commas. For T1/E1, allowable values are from 1 to 24. Examples are as follows: – 2, 3-5 – 1, 7, 9 – 1-12 • **service**—Indicates the type of calls to be handled by this DS0 group—data, fax, or voice). • **type**—Refers to the signaling type of the telephony connection being made. Types include the following: – **e&m-delay-dial**—Specifies the originating endpoint that sends an off-hook signal and waits for the off-hook signal followed by an on-hook signal from the destination. – **e&m-fgb**—E & M Type II Feature Group B. – **e&m-fgd**—E & M Type II Feature Group D.

2605
Paula

Command	Purpose
	– **e&m-immediate-start**—E & M Immediate Start. – **e&m-melcas-delay**—E&M Mercury Exchange Limited Channel Associated Signaling (MELCAS) delay start signaling support. – **e&m-melcas-immed**—E&M MELCAS immediate start signaling support. – **e&m-melcas-wink**—E&M MELCAS wink start signaling support. – **e&m-wink-start**—The originating endpoint sends an off-hook signal and waits for a – **ext-sig**—For the specified channel, automatically generates the off-hook signal and stays in the off-hook state. – **fgd-eana**—Feature Group D Exchange Access North American. – **fgd-os**—Feature Group D Operator Services. – **fxo-melcas**—MELCAS Foreign Exchange Office signaling support. – **fxs-melcas**—MELCAS Foreign Exchange Station signaling support. – **fxs-ground-start**—FXS Ground Start. – **fxs-loop-start**—FXS Loop Start. – **none**—Null Signaling for External Call Control. – **p7**—Specifies the p7 switch type. – **r1-itu**—R1 ITU – **sas-ground-start**—SAS Ground Start. – **sas-loop-start**—SAS Loop Start. The **r1** and **r2** keywords refer to line signaling, based on international signaling standards. The **r1 itu** keywords are based on signaling standards in countries besides the United States. An "ITU variant" means that there are multiple R1 standards in a particular country but that Cisco supports the ITU variant.
Step 7 `Router(config-controller)# no shutdown`	Activates the controller.

Configuring Basic Voice Port Parameters for Digital T1/E1 Voice Ports

For FXO and FXS connections the default voice-port parameter values are often adequate. However, for E&M connections, it is important to match the characteristics of your PBX, so voice port parameters may need to be reconfigured from their defaults.

Each voice port that you address in digital voice port configuration is one of the logical voice ports that you created with the **ds0-group** command.

Companding (from *compression* and *expansion*), used in Step 4 of the following table, is the part of the PCM process in which analog signal values are logically rounded to discrete scale-step values on a nonlinear scale. The decimal step number is then coded in its binary equivalent prior to transmission. The process is reversed at the receiving terminal using the same nonlinear scale.

Note The commands, keywords, and arguments that you are able to use may differ slightly from those presented here, based on your platform, Cisco IOS release, and configuration. When in doubt, use Cisco IOS command help (**command ?**) to determine the syntax choices that are available.

To configure basic parameters for digital T1/E1 voice ports, use the following commands beginning in global configuration mode.

	Command	Purpose

Step 1	**Cisco 2600 and 3600 Series Routers**
	`Router(config)# voice-port slot/port:ds0-group-no`
	
	Cisco MC3810 Multiseries Concentrators
	`Router(config)# voice-port slot:ds0-group-no`
	
	Cisco AS5300 Universal Access Server
	`Router(config)# voice-port controller:ds0-group-no`
	
	Cisco AS5800 Universal Access Server
	`Router(config)# voice-port shelf/slot/port:ds0-group-no`
	
	Cisco 7200 Series Routers
	`Router(config)# voice-port slot/port-adapter:ds0-group-no`
	
	Cisco 7500 Series Routers
	`Router(config)# voice-port slot/port-adapter/slot:ds0-group-no`
		Enters voice-port configuration mode. The arguments are defined as the following
		• *slot*—Specifies the router location where the network module (Cisco 2600, 3600, and MC3810) or voice port adapter (Cisco AS5300, AS5800, 7200, and 7500) is installed. This is the same number as the controller for the T1/E1 voice port.
		• *port*—Indicates the voice interface card location.
		• *ds0-group-no*—Specifies the logical voice port that was created with the **ds0-group** controller command.
		• *controller*—Indicates the controller for the T1/E1 voice port.
		• *shelf*—Specifies the dial shelf, which is always 0.
		• *port-adapter*—Indicates the port adapter for the voice port.

Step 2	`Router(config-voiceport)# type {1 | 2 | 3 | 5}`	(E&M only) Specifies the type of E&M interface to which this voice port is connected. See Table 5 for an explanation of E&M types. The default is 1.

2603
Paula

	Command	Purpose
Step 3	`Router(config-voiceport)# cptone` *locale*	Selects a two-letter **locale** keyword for the voice call progress tones and other locale-specific parameters to be used on this voice port. Voice call progress tones include dial tone, busy tone, and ringback tone, which vary with geographical region. Other parameters include ring cadence and compand type. Cisco routers comply with the ISO3166 locale name standards; to see valid choices, enter a question mark (?) following the **cptone** command. The default is **us**.
Step 4	`Router(config-voiceport)# compand-type {u-law | a-law}`	(Cisco 2600 and 3600 series routers and Cisco MC3810 multiservice concentrators only) Specifies the companding standard used. This command is used in cases when the DSP is not used, such as local cross-connects, and overwrites the **compand-type** value set by the **cptone** command. The keywords are as follows: • **a-law**—Specifies the ITU-T PCM a-law companding standard used primarily in Europe. The default for E1 is **a-law**. • **u-law**—Specifies the ITU-T PCM mu-law companding standard used in North America and Japan. The default for T1 is **u-law**. **Note** If you have a Cisco MC3810 multiservice concentrator or Cisco 3660 router, the **compand-type a-law** command must be configured on the analog ports only. The Cisco 2660, 3620, and 3640 routers do not require the **compand-type a-law** command configured, however, if you request a list of commands, the **compand-type a-law** command will display.

Step 5	**Cisco 2600 series and 3600 series**
	`Router(config-voiceport)# ring frequency {25 | 50}`
	Cisco MC3810
	`Router(config-voiceport)# ring frequency {20 | 30}`
		(FXS only) Selects the ring frequency, in hertz, used on the FXS interface. This number must match the connected telephony equipment, and can be country-dependent. If not set properly, the attached telephony device may not ring or it may buzz.
		The default is 25 on the Cisco 2600 and 3600 series routers and 20 on the Cisco MC3810 multiservice concentrators.

ECT-2005 - CN
CPMI - CORREIOS
0302
Fls:
3701
Doc:

	Command	Purpose
Step 6	`Router(config-voiceport)# ring number` *number*	(FXO only) Specifies the maximum number of rings to be detected before an incoming call is answered by the router. The default is 1.
Step 7	`Router(config-voiceport)# ring cadence {[pattern01 | pattern02 | pattern03 | pattern04 | pattern05 | pattern06 | pattern07 | pattern08 | pattern09 | pattern10 | pattern11 | pattern12] [define` *pulse interval*`]}`	(FXS only) Specifies an existing pattern for ring, or defines a new one. Each pattern specifies a ring-pulse time and a ring-interval time. The keywords and arguments are as follows: • **pattern01** through **pattern12**—Specifies preset ring cadence patterns. Enter **ring cadence ?** to see ring pattern explanations. • **define** *pulse interval*—Specifies a user-defined pattern as follows: – *pulse* is a number (1 or 2 digits from 1 to 50) specifying ring pulse (on) time in hundreds of milliseconds. – *interval* is a number (1 or 2 digits from 1 to 50) specifying ring interval (off) time in hundreds of milliseconds. The default is the pattern specified by the configured **cptone locale** command.
Step 8	`Router(config-voiceport)# description` *string*	Attaches a text string to the configuration that describes the connection for this voice port. This description appears in various displays and is useful for tracking the purpose or use of the voice port. The *string* argument is a character string from 1 to 255 characters in length. The default is that no description is attached to the configuration.
Step 9	`Router(config-voiceport)# no shutdown`	Activates the voice port.

Fine-Tuning Analog and Digital Voice Ports

Normally, default parameter values for voice ports are sufficient for most networks. Depending on the specifics of your particular network, however, you may need to adjust certain parameters that are configured on voice ports. Collectively, these commands are referred to as voice port tuning commands.

Note The commands, keywords, and arguments that you are able to use may differ slightly from those presented here, based on your platform, Cisco IOS release, and configuration. When in doubt, use Cisco IOS command help (**command ?**) to determine the syntax choices that are available.

2601 Paula

The voice port tuning commands are grouped into these categories and explained in the following sections:

- Auto Cut-Through Command, page 81
- Bit Modification Commands for Digital Voice Ports, page 81
- Calling Number Outbound Commands, page 83
- Disconnect Supervision Commands, page 84
- FXO Supervisory Disconnect Tone Commands, page 87
- Timeouts Commands, page 89
- Timing Commands, page 91
- DTMF Timer Inter-Digit Command for Cisco AS5300 Access Servers, page 92
- Voice Quality Tuning Commands, page 94

Full descriptions of the commands in this section can be found in the *Cisco IOS Voice, Video, and Fax Command Reference*, Release 12.2.

Auto Cut-Through Command

The **auto-cut-through** command allows you to connect to PBXs that do not provide an M-lead response.

To configure auto-cut-through, use the following command in voice-port configuration mode:

Command	Purpose
`Router(config-voiceport)# auto-cut-through`	(E&M only) Enables call completion on a router when a PBX does not provide an M-lead response.

Bit Modification Commands for Digital Voice Ports

The bit modification commands for digital voice ports modify sent or received bit patterns. Different versions of E&M use different ABCD signaling bits to represent idle and seize. For example, North American CAS E&M represents idle as 0XXX and seize as 1XXX, where X indicates that the state of the BCD bits is ignored. In MELCAS E&M, idle is 1101 and seize is 0101. The commands in this section are provided to modify bit patterns to match particular E&M schemes.

To manipulate bit patterns for digital voice ports, use the following commands as necessary, in voice-port configuration mode:

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0303
Fls:
3701
Doc:

	Command	Purpose
Step 1	`Router(config-voiceport)# condition {tx-a-bit | tx-b-bit | tx-c-bit | tx-d-bit} {rx-a-bit | rx-b-bit | rx-c-bit | rx-d-bit} {on | off | invert}`	Manipulates sent or received bit patterns to match expected patterns on a connected device. Repeat the command for each transmit and/or receive bit to be modified, but be careful not to destroy the information content of the bit pattern. The default is that the signaling format is not manipulated (for all transmit or receive A, B, C, and D bits).
		The keywords are as follows: • **on**—Sets the bit to 1 permanently. • **off**—Sets the bit to 0 permanently. • **invert**—Changes the state to the opposite of the original transmit or receive state. **Note** The **show voice port** command reports at the protocol level, and the **show controller** command reports at the driver level. The driver is not notified of any bit manipulation using the **condition** command. As a result, the **show controller** command output does not account for the bit conditioning.
Step 2	`Router(config-voiceport)# define {tx-bits | rx-bits} {seize | idle} {0000 | 0001 | 0010 | 0011 | 0100 | 0101 | 0110 | 0111 | 1000 | 1001 | 1010 | 1011 | 1100 | 1101 | 1110 | 1111}`	(Digital E1 E&M voice ports on Cisco 2600 and 3600 series routers and Cisco MC3810 multiservice concentrators only) Defines specific transmit or receive signaling bits to match the bit patterns required by a connected device for North American E&M and E&M MELCAS voice signaling, if patterns different from the preset defaults are required. Also specifies which bits a voice port monitors and which bits it ignores, if patterns that are different from the defaults are required. See the **define** command for the default signaling patterns as defined in American National Standards Institute (ANSI) and code excited linear prediction compression (CEPT) standards. The keywords are as follows: • **tx-bits**—Indicates the pattern applies to transmit signaling bits.

2599
Paula

	Command	Purpose
		• **rx-bits**—Indicates the pattern applies to receive signaling bits • **seize**—Indicates that the pattern represents line seizure. • **idle**—Indicates that the pattern represents an idle condition. • **0000...1111**—Represents the bit pattern to use.
Step 3	`Router(config-voiceport)# ignore {rx-a-bit | rx-b-bit | rx-c-bit | rx-d-bit}`	(Digital E1 E&M voice ports on Cisco 2600 and 3600 series routers and Cisco MC3810 multiservice concentrators only) Configures the voice port to ignore the specified receive bit for North American E&M or E&M MELCAS, if patterns different from the defaults are required. See the command reference for the default signaling patterns as defined in ANSI and CEPT standards.

Calling Number Outbound Commands

On the Cisco AS5300 universal access server platform, if T1 CAS is configured with the Feature Group-D (FGD)—Exchange Access North American (FGD-EANA) signaling, the automatic number identification (ANI) can be sent for outgoing calls by using the **calling-number outbound** command.

FGD-EANA is a FGD signaling protocol of type EANA, which provides certain call services, such as emergency (USA 911) calls. ANI is an SS7 (Signaling System 7) feature in which a series of digits, analog or digital, are included in the call to identify the telephone number of the calling device. In other words, ANI identifies the number of the calling party. ANI digits are used for billing purposes by Internet service providers (ISPs), among other things. The commands in this section can be issued in voice-port or dial-peer mode, because the syntax is the same.

To configure your digital T1/E1 packet voice trunk network module to generate outbound ANI digits on a Cisco AS5300 universal access server, use the following commands in voice-port configuration mode:

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0304
Fls:
Doc:
3701

	Command	Purpose
Step 1	`Router(config-voiceport)# calling-number outbound range string1 string2`	(Cisco AS5300 universal access server only) Specifies ANI to be sent out when the T1-CAS **fgd-eana** command is configured as signaling type. The *string1* and *string2* arguments are valid E.164 telephone number strings. Both strings must be of the same length and cannot be more than 32 digits long. Only the last four digits are used for specifying the range (*string1* to *string2*) and for generating the sequence of ANI by rotating through the range until *string2* is reached and then starting from *string1* again. If strings are less than four digits in length, then entire strings are used.
Step 2	`Router(config-voiceport)# calling-number outbound sequence [string1] [string2] [string3] [string4] [string5]`	(Cisco AS5300 universal access server only) Specifies ANI to be sent out when the T1-CAS **fgd-eana** command is configured as signaling type. This option configures a sequence of discrete strings (*string1...string5*) to be passed out as ANI for successive calls using the dial peer or voice port. Limit is five (5) strings. All strings must be valid E.164 numbers, up to 32 digits in length.
Step 3	`Router(config-voiceport)# calling-number outbound null`	(Cisco AS5300 universal access server only) Suppresses ANI. No ANI is passed when this voice port is selected.

Disconnect Supervision Commands

PBX and PSTN switches use several different methods to indicate that a call should be disconnected because one or both parties have hung up. The commands in this section are used to configure the router to recognize the type of signaling in use by the PBX or PSTN switch connected to the voice port. These methods include the following:

- Battery reversal disconnect
- Battery denial disconnect
- Supervisory tone disconnect (STD)

Battery reversal occurs when the connected switch changes the polarity of the line in order to indicate changes in call state (such as off-hook or, in this case, call disconnect). This is the signaling looked for when the **battery reversal** command is enabled on the voice port, which is the default configuration.

Battery denial (sometimes called *power denial*) occurs when the connected switch provides a short (approximately 600 ms) interruption of line power to indicate a change in call state. This is the signaling looked for when the **supervisory disconnect** command is enabled on the voice port, which is the default configuration.

Supervisory tone disconnect occurs when the connected switch provides a special tone to indicate a change in call state. Some PBXs and PSTN CO switches provide a 600-millisecond interruption of line power as a supervisory disconnect, and others provide supervisory tone disconnect (STD). This is the signal that the router is looking for when the **no supervisory disconnect** command is configured on the voice port.

2597
Paula

Note In some circumstances, you can use the FXO Disconnect Supervision feature to enable analog FXO ports to monitor call progress tones for disconnect supervision that are returned from a PBX or from the PSTN. For more information, see the "FXO Supervisory Disconnect Tone Commands" section on page 87.

Doc: 3701

2596 Paula

To change parameters related to disconnect supervision, use the following commands as appropriate, in voice-port configuration mode:

	Command	Purpose
Step 1	`Router(config-voiceport)# no battery-reversal`	(Analog only) Enables battery reversal. The default is that battery reversal is enabled. • For FXO ports—Use the **no battery-reversal** command to configure a loop-start voice port not to disconnect when it detects a second battery reversal. The default is to disconnect when a second battery reversal is detected. This functionality is supported on Cisco MC3810 analog voice ports; on Cisco 1750, Cisco 2600 series, and Cisco 3600 series routers, only analog voice ports on VIC-2FXO cards are able to detect battery reversal. – Also use the **no battery-reversal** command when a connected FXO port does not support battery reversal detection. • For FXS ports—Use the **no battery-reversal** command to configure the voice port not to reverse battery when it connects calls. The default is to reverse battery when a call is connected, then return to normal when the call is over, providing positive disconnect. See also the **disconnect-ack** command (Step 7).
Step 2	`Router(config-voiceport)# no supervisory disconnect`	(FXO only) Enables the PBX or PSTN switch to provide STD. By default the **supervisory disconnect** command is enabled.
Step 3	`Router(config-voiceport)# disconnect-ack`	(FXS only) Configures the voice port to return an acknowledgment upon receipt of a disconnect signal. The FXS port removes line power if the equipment on the FXS loop-start trunk disconnects first. This is the default. The **no disconnect-ack** command prevents the FXS port from responding to the on-hook disconnect with a removal of line power.

2595
Paula

FXO Supervisory Disconnect Tone Commands

If the FXO supervisory disconnect tone is configured and a detectable tone from the PSTN or PBX is detected by the digital signal processor (DSP), the analog FXO port goes on-hook. This feature prevents an analog FXO port from remaining in an off-hook state after an incoming call is ended. FXO supervisory disconnect tone enables interoperability with PSTN and PBX systems whether or not they transmit supervisory tones.

Note This feature applies only to analog FXO ports with loop-start signaling on the Cisco 2600 and 3600 series routers and on Cisco MC3810 multiservice concentrators with high-performance compression modules (HCMs).

To configure a voice port to detect incoming tones, you need to know the parameters of the tones expected from the PBX or PSTN. Then create a voice class that defines the tone detection parameters, and, finally, apply the voice class to the applicable analog FXO voice ports. This procedure configures the voice port to go on-hook when it detects the specified tones. The parameters of the tones need to be precisely specified to prevent unwanted disconnects due to detection of nonsupervisory tones or noise.

A supervisory disconnect tone is normally a dual tone consisting of two frequencies; however, tones of only one frequency can also be detected. Use caution if you configure voice ports to detect nondual tones, because unwanted disconnects can result from detection of random tone frequencies. You can configure a voice port to detect a tone with one on/off time cycle, or you can configure it to detect tones in a cadence pattern with up to four on/off time cycles.

Note In the following procedure, the following commands were not supported until Cisco IOS Release 12.2(2)T: **freq-max-deviation**, **freq-max-power**, **freq-min-power**, **freq-power-twist**, and **freq-max-delay**.

RQS Nº 03/2005 - CN
CPMI - CORREIOS

Doc: 3701

To create a voice class that defines the specific tone or tones to be detected and then apply the voice class to the voice port, use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	`Router(config)# voice class dualtone` *tag*	Creates a voice class for defining one tone detection pattern. The range for the tag number is from 1 to 10000. The tag number must be unique on the router. For more information about configuring voice classes, see the "Configuring Dial Plans, Dial Peers, and Digit Manipulation" chapter in this configuration guide.
Step 2	`Router(config-voice-class)# freq-pair` *tone-id frequency-1 frequency-2*	Specifies the two frequencies, in Hz, for a tone to be detected (or one frequency if a nondual tone is to be detected). If the tone to be detected contains only one frequency, enter 0 for *frequency-2*. The arguments are as follows: • *tone-id*—Ranges from 1 to 16. There is no default. • *frequency-1* and *frequency-2*—Ranges from 300 to 3600, or you can enter 0 for *frequency-2*. There is no default. **Note** Repeat this command for each additional tone to be specified.
Step 3	`Router(config-voice-class)# freq-max-deviation` *frequency*	Specifies the maximum frequency deviation that will be detected, in Hz. The *frequency* argument ranges from 10 to 125. The default is 10.
Step 4	`Router(config-voice-class)# freq-max-power` *dBmO*	Specifies the maximum tone power that will be detected, in dBmO. The *dBmO* argument ranges from 0 to 20. The default is 10.
Step 5	`Router(config-voice-class)# freq-min-power` *dBmO*	Specifies the minimum tone power that will be detected, in dBmO. The *dBmO* argument ranges from 10 to 35. The default is 30.
Step 6	`Router(config-voice-class)# freq-power-twist` *dBmO*	Specifies the power difference allowed between the two frequencies, in dBmO. The *dBmO* argument ranges from 0 to 15. The default is 6.
Step 7	`Router(config-voice-class)# freq-max-delay` *time*	Specifies the timing difference allowed between the two frequencies, in 10-millisecond increments. The *time* argument ranges from 10 to 100 (100 ms to 1 s). The default is 20 (200 ms).
Step 8	`Router(config-voice-class)# cadence-min-on-time` *time*	Specifies the minimum tone on time that will be detected, in 10-millisecond increments. The *time* argument ranges from 0 to 100 (0 ms to 1 s).
Step 9	`Router(config-voice-class)# cadence-max-off-time` *time*	Specifies the maximum tone off time that will be detected, in 10-millisecond increments. The *time* argument ranges from 0 to 5000 (0 ms to 50 s).

2593
Paula

	Command	Purpose
Step 10	`Router(config-voice-class)# cadence-list cadence-id cycle-1-on-time cycle-1-off-time cycle-2-on-time cycle-2-off-time cycle-3-on-time cycle-3-off-time cycle-4-on-time cycle-4-off-time`	(Optional) Specifies a tone cadence pattern to be detected. Specify an on time and off time for each cycle of the cadence pattern. The arguments are as follows: • *cadence-id*—Ranges from 1 to 10. There is no default. • *cycle-N-on-time* and *cycle-N-off-time*—Range from 0 to 1000 (0 ms to 10 s). The default is 0.
Step 11	`Router(config-voice-class)# cadence-variation time`	(Optional) Specifies the maximum time that the tone onset can vary from the specified onset time and still be detected, in 10-millisecond increments. The *time* argument ranges from 0 to 200 (0 ms to 2 s). The default is 0.
Step 12	`Router(config-voice-class)# exit`	Exits voice class configuration mode.

Step 13	**Cisco 2600 and 3600 Series Routers**
	`Router(config)# voice-port slot/subunit/port`
	Cisco MC3810 Multiservice Concentrators
	`Router(config)# voice-port slot/port`
		Enters voice-port configuration mode.
		The arguments are as follows:
		• *slot*—Specifies the slot number where the voice network module is installed (Cisco 2600 and Cisco 3600 series routers) or the router slot number where the analog voice module is installed (Cisco MC3810 multiservice concentrators).
		• *subunit*—Specifies the voice interface card (VIC) where the voice port is located.
		• *port*—Identifies the analog voice-port number.

Step 14	`Router(config-voiceport)# supervisory disconnect dualtone {mid-call | pre-connect} voice-class tag`	Assigns an FXO supervisory disconnect tone voice class to the voice port. The keywords are as follows: • **mid-call**—Specifies tone detection during the entire call. • **pre-connect**—Specifies tone detection only during call set-up.
Step 15	`Router(config-voiceport)# supervisory disconnect anytone`	Configures the voice port to disconnect on receipt of any tone.

Timeouts Commands

To change timeouts parameters, use the following commands as appropriate, in voice-port configuration mode:

RQS Nº 03/2005 - CN
CPMI CORREIOS
0307
Fls:
3701
Due:

	Command	Purpose
Step 1	`Router(config-voiceport)# timeouts call-disconnect seconds`	Configures the call disconnect timeout value in seconds. Valid entries range from 0 to 120. The default is 60.
Step 2	`Router(config-voiceport)# timeouts initial seconds`	Sets the number of seconds that the system waits between the caller input of the initial digit and the subsequent digit of the dialed string. If the wait time expires before the destination is identified, a tone sounds and the call ends. The *seconds* argument is the initial timeout duration. A valid entry is an integer from 0 to 120. The default is 10.
Step 3	`Router(config-voiceport)# timeouts interdigit seconds`	Configures the number of seconds that the system waits after the caller has input the initial digit or a subsequent digit of the dialed string. If the timeout ends before the destination is identified, a tone sounds and the call ends. This value is important when using variable-length dial peer destination patterns (dial plans). The *seconds* argument is the interdigit timeout wait time in seconds. A valid entry is an integer from 0 to 120. The default is 10.
Step 4	`Router(config-voiceport)# timeouts ringing {seconds | infinity}`	Specifies the duration that the voice port allows ringing to continue if a call is not answered. The keyword and argument are as follows: • **infinity**—Indicates ringing should continue until the caller goes on hook. • *seconds*—Specifies the number of seconds to allow ringing without answer. The range is from 5 to 60000. The default is 180.
Step 5	`Router(config-voiceport)# timeouts wait-release {seconds | infinity}`	Specifies the duration that a voice port stays in the call-failure state while the Cisco device sends a busy tone, reorder tone, or an out-of-service tone to the port. The keyword and argument are as follows: • **infinity**—Indicates the voice port should not be released as long as the call-failure state remains. • *seconds*—Specifies the number of seconds to allow before the call is released. The range is from 3 to 3600. The default is 30.

2591
Paula

Timing Commands

To change timing parameters, use the following commands as appropriate, in voice-port configuration mode:

	Command	Purpose
Step 1	`Router(config-voiceport)# timing clear-wait` *milliseconds*	(E&M only) Specifies the minimum amount of time between the inactive seizure signal and clearing of the call. Valid entries for the *milliseconds* argument are from 200 to 2000 milliseconds. The default is 400.
Step 2	`Router(config-voiceport)# timing delay-duration` *milliseconds*	(E&M only) Specifies the delay signal duration for delay-dial signaling in milliseconds. Valid entries are from 100 to 5000. The default is 2000.
Step 3	`Router(config-voiceport)# timing delay-start` *milliseconds*	(E&M only) Specifies minimum delay time, in milliseconds, from outgoing seizure to outdial address. Valid entries are from 20 to 2000. The default is 300 for the Cisco 3600 series routers, and 150 for the Cisco MC3810 multiservice concentrators.
Step 4	`Router(config-voiceport)# timing delay-with-integrity` *milliseconds*	(Cisco MC3810 multiservice concentrators E&M ports only) Specifies duration of the wink pulse for the delay dial in milliseconds. Valid entries are from 0 to 5000. The default is 0.
Step 5	`Router(config-voiceport)# timing dial-pulse min-delay` *milliseconds*	Specifies time, in milliseconds, between the generation of wink-like pulses when the type is pulse. Valid entries are from 0 to 5000. The default is 300 for the Cisco 3600 series routers, and 140 for the Cisco MC3810 multiservice concentrators.
Step 6	`Router(config-voiceport)# timing dialout-delay` *milliseconds*	(Cisco MC3810 multiservice concentrators only) Specifies dialout delay, in milliseconds, for the sending digit or cut-through on an FXO trunk or an E&M immediate trunk. Valid entries are from 100 to 5000. The default is 300.
ep 7	`Router(config-voiceport)# timing digit` *milliseconds*	Specifies the DTMF digit signal duration in milliseconds. Valid entries are from 50 to 100. The default is 100.
Step 8	`Router(config-voiceport)# timing guard-out` *milliseconds*	(FXO ports only) Specifies the duration in milliseconds of the guard-out period that prevents this port from seizing a remote FXS port before the remote port detects a disconnect signal. The range is from 300 to 3000. The default is 2000.
Step 9	`Router(config-voiceport)# timing hookflash-out` *milliseconds*	Specifies the duration, in milliseconds, of the hookflash. Valid entries are from 50 to 500. The default is 300.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0308
3701
Doc.
VC-91

	Command	Purpose
Step 10	`Router(config-voiceport)# timing interdigit` *milliseconds*	Specifies the DTMF interdigit duration, in milliseconds. Valid entries are from 50 to 500. The default is 100.
Step 11	`Router(config-voiceport)# timing percentbreak` *percent*	(Cisco MC3810 multiservice concentrators FXO and E&M ports only) Specifies the percentage of the break period for the dialing pulses, if different from the default. The range is from 20 to 80. The default is 50.
Step 12	`Router(config-voiceport)# timing pulse` *pulses-per-second*	(FXO and E&M only) Specifies the pulse dialing rate in pulses per second. Valid entries are from 10 to 20. The default is 20.
Step 13	`Router(config-voiceport)# timing pulse-digit` *milliseconds*	(FXO only) Configures the pulse digit signal duration. The range of the pulse digit signal duration is from 10 to 20. The default is 20.
Step 14	`Router(config-voiceport)# timing pulse-interdigit`	(FXO and E&M only) Specifies pulse dialing interdigit timing in milliseconds. Valid entries are from 100 to 1000. The default is 500.
Step 15	`Router(config-voiceport)# timing wink-duration` *milliseconds*	(E&M only) Specifies maximum wink-signal duration, in milliseconds, for a wink-start signal. Valid entries are from 100 to 400. The default is 200.
Step 16	`Router(config-voiceport)# timing wink-wait` *milliseconds*	(E&M only) Specifies maximum wink-wait duration, in milliseconds, for a wink-start signal. Valid entries are from 100 to 5000. The default is 200.

DTMF Timer Inter-Digit Command for Cisco AS5300 Access Servers

To configure the DTMF timer for Cisco AS5300 access servers, use the following commands beginning in global configuration mode:

	Command	Purpose
Step 1	`Router(config)# controller T1` *number*	Configures a T1 controller and enters controller configuration mode.
Step 2	`Router(config)# ds0-group` *channel-number* `timeslots` *range* `type` *signaling-type* `dtmf dnis`	Configures channelized T1 timeslots, which enables a Cisco AS5300 modem to answer and send an analog call.
Step 3	`Router(config)# cas-custom` *channel*	Customizes E1 R2 signaling parameters for a particular E1 channel group on a channelized E1 line.
Step 4	`Router(conf-ctrl-cas)# dtmf-timer-inter-digit` *milliseconds*	Configures the DTMF inter-digit timer for a DS0 group.

2589
Paula

Verifying DTMF Timer Inter-Digit Command

To verify the DTMF timer, use the following command in EXEC mode:

Command	Purpose
`Router# show running-config`	Displays the configuration information currently running on the terminal.

Voice Activity Detection Commands Related to Voice-Port Configuration Mode

In normal voice conversations, only one person speaks at a time. Today's circuit-switched telephone networks dedicate a bidirectional, 64 kbps channel for the duration of each conversation, regardless of whether anyone is speaking at the moment. This means that, in a normal voice conversation, at least 50 percent of the bandwidth is wasted when one or both parties are silent. This figure can actually be much higher when normal pauses and breaks in conversation are taken into account.

Packet-switched voice networks, on the other hand, can use this "wasted" bandwidth for other purposes when voice activity detection (VAD) is configured. VAD works by detecting the magnitude of speech in decibels and deciding when to cut off the voice from being framed. VAD has some technological problems, however, which include the following:

- General difficulties determining when speech ends
- Clipped speech when VAD is slow to detect that speech is beginning again
- Automatic disabling of VAD when conversations take place in noisy surroundings

VAD is configured on dial peers; by default it is enabled. For more information, see the "Configuring Dial Plans, Dial Peers, and Digit Manipulation" chapter in this configuration guide. Two parameters associated with VAD, music threshold and comfort noise, are configured on voice ports.

If VAD is enabled, use the following commands to adjust parameter values associated with VAD, beginning in voice-port configuration mode:

	Command	Purpose
Step 1	`Router(config-voiceport)# music-threshold` *number*	Specifies the minimal decibel level of music played when calls are put on hold. The decibel level affects how voice activity detection (VAD) treats the music data. Valid entries range from –70 to –30. When used with VAD, if the level is set too high, the remote end hears no music; if it is set too low, there is unnecessary voice traffic. The default is –38.
Step 2	`Router(config-voiceport)# comfort-noise`	This parameter creates subtle background noise to fill silent gaps during calls when VAD is enabled on voice dial peers. If comfort noise is not generated, the resulting silence can fool the caller into thinking the call is disconnected instead of being merely idle. The default is that comfort noise is enabled.

Voice Quality Tuning Commands

The commands in this section configure parameters to improve voice quality. Common voice quality issues include the following:

- Delay in Voice Networks
- Jitter Adjustment
- Echo Adjustment
- Voice Level Adjustment

Delay in Voice Networks

Delay is the time it takes for voice packets to travel between two endpoints. Excessive delay can cause quality problems with real-time traffic such as voice. However, because of the speed of network links and the processing power of intermediate devices, some delay is expected.

When listening to speech, the human ear normally accepts up to about 150 ms of delay without noticing delays. The ITU G.114 standard recommends no more than 150 ms of one-way delay for a normal voice conversation. Once the delay exceeds 150 ms, a conversation is more like a "walkie-talkie" conversation in which one person must wait for the other to stop speaking before beginning to talk.

You can measure delay fairly easily by using ping tests at various times of the day with different network traffic loads. If network delay is excessive, it must be reduced for adequate voice quality.

Several different types of delay combine to make up the total end-to-end delay associated with voice calls:

- Propagation delay—Amount of time it takes the data to physically travel over the media.
- Handling delay—Amount of time it takes to process data by adding headers, taking samples, forming packets, etc.
- Queuing delay—Amount of time lost due to congestion.
- Variable delay or jitter—Amount of time that causes the conversation to break and become unintelligible. Jitter is described in detail below.

Propagation, handling, and queuing delay are not addressed by voice-port commands and fall outside the scope of this chapter.

Jitter Adjustment

Delay can cause unnatural starting and stopping of conversations, but variable-length delays (also known as jitter) can cause a conversation to break and become unintelligible. Jitter is not usually a problem with PSTN calls because the bandwidth of calls is fixed and each call has a dedicated circuit for the duration of the call. However, in VoIP networks, data traffic might be bursty, and jitter from the packet network can become an issue. Especially during times of network congestion, packets from the same conversation can arrive at different interpacket intervals, disrupting the steady, even delivery needed for voice calls. Cisco voice gateways have built-in jitter buffering to compensate for a certain amount of jitter; the **playout-delay** command can be used to adjust the jitter buffer.

Normally, the defaults in effect are sufficient for most networks. However, a small playout delay from the jitter buffer can cause lost packets and choppy audio, and a large playout delay can cause unacceptably high overall end-to-end delay.

2587
Paula

Note Prior to Cisco IOS Release 12.1(5)T, playout delay was configured in voice-port configuration mode. For Cisco IOS Release 12.1(5)T and later releases, in most cases playout delay should be configured in dial-peer configuration mode on the VoIP dial peer that is on the receiving end of the voice traffic that is to be buffered. This dial peer senses network conditions and relays them to the DSPs, which adjust the jitter buffer as necessary. When multiple applications are configured on the gateway, playout delay should be configured in dial-peer configuration mode. When there are numerous dial peers to configure, it might be simpler to configure playout delay on a voice port. If there are conflicting playout delay configurations on a voice port and also on a dial peer, the dial peer configuration takes precedence.

To configure the playout delay jitter buffer, use the following commands beginning in dial-peer or voice-port configuration mode:

	Command	Purpose
Step 1	`Router(config-voiceport)# playout-delay mode {adaptive | fixed}`	Determines the mode in which the jitter buffer will operate for calls on this voice port. The keywords are as follows: • **adaptive**—Adjusts the jitter buffer size and amount of playout delay during a call based on current network conditions. • **fixed**—Defines the jitter buffer size as fixed so that the playout delay does not adjust during a call. A constant playout delay is added. The default is **adaptive**.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0310
Doc: 3701

	Command	Purpose
Step 2	`Router(config-voiceport)# playout-delay {nominal value | maximum value | minimum {default | low | high}}`	Tunes the playout buffer to accommodate packet jitter caused by switches in the WAN. The keywords and arguments are as follows: • **nominal**—Defines the amount of playout delay applied at the beginning of a call by the jitter buffer in the gateway. In fixed mode, this is also the maximum size of the jitter buffer throughout the call. • *value*—Specifies the range that depends on type of DSP and configured codec complexity. For medium codec complexity, the range is from 0 to 150 ms. For high codec complexity and DSPs that do not support codec complexity, the range is from 0 to 250 ms.
		• **maximum** (adaptive mode only)—Specifies the jitter buffer's upper limit (80ms), or the highest value to which the adaptive delay is set. • **minimum** (adaptive mode only)—Specifies the jitter buffer's lower limit (10 ms), or the lowest value to which the adaptive delay is set. • **default**—Specifies 40 ms.

Echo Adjustment

Echo is the sound of your own voice reverberating in the telephone receiver while you are talking. When timed properly, echo is not a problem in the conversation; however, if the echo interval exceeds approximately 25 milliseconds, it is distracting. Echo is controlled by echo cancellers.

In the traditional telephony network, echo is generally caused by an impedance mismatch when the four-wire network is converted to the two-wire local loop. In voice packet-based networks, echo cancellers are built into the low-bit rate codecs and are operated on each DSP.

By design, echo cancellers are limited by the total amount of time they wait for the reflected speech to be received, which is known as an echo trail. The echo trail is normally 32 milliseconds. In Cisco System's voice implementations, echo cancellers are enabled using the **echo-cancel enable** command, and echo trails are configured using the **echo-cancel coverage** command.

To configure parameters related to the echo canceller, use the following commands beginning in voice-port configuration mode:

2585
Paula

	Command	Purpose
Step 1	`Router(config-voiceport)# echo-cancel enable`	Enables the cancellation of voice that is sent and received on the same interface. Echo cancellation coverage must also be configured. The default is that echo cancellation is enabled. **Note** Not valid for four-wire E&M interfaces. Use **no echo-cancel enable** to disable the feature.
Step 2	`Router(config-voiceport)# echo-cancel coverage {8 | 16 | 24 | 32}`	Adjusts the echo canceller by the specified number of milliseconds. The default is 16.
Step 3	`Router(config-voiceport)# non-linear`	Enables nonlinear processing (residual echo suppression) in the echo canceler, which shuts off any signal if no near-end speech is detected. Echo cancelling must be enabled for this feature. The default is that nonlinear processing is enabled.

Voice Level Adjustment

As much as possible, it is desirable to achieve a uniform input decibel level to the packet voice network in order to limit or eliminate any voice distortion due to incorrect input and output decibel levels. Adjustments to levels may be required by the type of equipment connected to the network or by local country-specific conditions.

Incorrect input or output levels can cause echo, as can an impedance mismatch. Too much input gain can cause clipped or fuzzy voice quality. If the output level is too high at the remote router's voice port, the local caller will hear echo. If the local router's voice port input decibel level is too high, the remote side will hear clipping. If the local router's voice port input decibel level is too low, or the remote router's output level is too low, the remote side voice can be distorted at a very low volume and DTMF may be missed.

Use the **input gain** and **output attenuation** commands to adjust voice levels, and the **impedance** command to set the impedance value to match that of the voice circuit to which the voice port connects.

To change parameters related to voice levels, use the following commands as appropriate, in voice-port configuration mode:

	Command	Purpose
Step 1	`Router(config-voiceport)# input gain value`	Specifies, in decibels, the amount of gain to be inserted at the receiver side of the interface, increasing or decreasing the signal. After an input gain setting is changed, the voice call must be disconnected and reestablished before the changes take effect. The *value* argument is any integer from –6 to 14. The default is 0.
Step 2	`Router(config-voiceport)# output attenuation value`	Specifies the amount of attenuation in decibels at the transmit side of the interface, decreasing the signal. A system-wide loss plan can be implemented using the **input gain** and **output attenuation** commands. The default value for this command assumes that a standard transmission loss plan is in effect, meaning that normally there must be –6 dB attenuation between phones. The *value* argument is any integer from –6 to 14. The default is 0.
Step 3	`Router(config-voiceport)# impedance {600c | 600r | 900c | complex1 | complex2}`	Specifies the terminating impedance of a voice port interface, which needs to match the specifications from the specific telephony system to which it is connected. • **600c**—Specifies 600 ohms complex. • **600r**—Specifies 600 ohms real. • **900c**—Specifies 900 ohms complex. • **complex1**—Specifies Complex 1. • **complex2**—Specifies Complex 2. The default is 600r.

	Command	Purpose
Step 4	`Router(config-voiceport)# loss-plan {plan1 | plan2 | plan5 | plan6 | plan7 | plan8 | plan9}`	(Cisco MC3810 multiservice concentrators FXO or FXS analog voice ports only) Specifies the analog-to-digital gain offset loss plan. For definitions of each plan, see the *Cisco IOS Voice, Video, and Fax Command Reference*. The default is the **plan1** keyword.
Step 5	`Router(config-voiceport)# idle-voltage {high | low}`	(Cisco MC3810 multiservice concentrators analog FXS ports only) Specifies the talk-battery (tip-to-ring) voltage condition when the port is idle. The keywords are as follows: • **high**—Specifies that the voltage is high (–48V). • **low**—Specifies that the voltage is low (–24V) and is the default.

Verifying Analog and Digital Voice-Port Configurations

After configuring the voice ports on your router, perform the following steps to verify proper operation:

Step 1 Pick up the handset of an attached telephony device and check for a dial tone.

Step 2 If you have dial tone, check for DTMF detection. If the dial tone stops when you dial a digit, then the voice port is most likely configured properly.

Step 3 To identify port numbers of voice interfaces installed in your router, use the **show voice port summary** command. For examples of the output, see the "show voice port summary Command Examples" section on page 100.

Step 4 To verify voice-port parameter settings, use the **show voice port** command with the appropriate syntax from Table 9. For sample output, see the "show voice port Command Examples" section on page 101.

Table 9 Show Voice Port Command Syntax

Platform	Voice Port Type	Command Syntax
Cisco 1750	Analog	**show voice port** [*slot/port* | **summary**]
Cisco 2600 series Cisco 3600 series	Analog	**show voice port** [*slot/port* | **summary**]
	Digital	**show voice port** [*slot/port:ds0-group-no* | **summary**]
Cisco MC3810	Analog	**show voice port** [*slot/port* | **summary**]
	Digital	**show voice port** [*slot:ds0-group-no* | **summary**]
Cisco AS5300	Digital	**show voice-port** *controller:ds0-group-no*
Cisco AS5800	Digital	**show voice-port** {*shelf/slot/port:ds0-group-no*}
Cisco 7200 series	Digital	**show voice port** {*slot/port-adapter:ds0-group-no*}
Cisco 7500 series	Digital	**show voice port** {*slot/port-adapter/slot:ds0-group-no*}

Doc: 3701

Step 5 For digital T1/E1 connections, to verify the codec complexity configuration, use the **show running-config** command to display the current voice-card setting. If medium complexity is specified, the codec complexity setting is not displayed. If high complexity is specified, the setting codec complexity high is displayed. The following example shows an excerpt from the command output when high complexity has been specified:

```
Router# show running-config
.
.
.
hostname router-alpha

voice-card 0
 codec complexity high
.
.
.
```

Step 6 For digital T1/E1 connections, to verify that the controller is up and that no alarms have been reported, and to display information about clock sources and other controller settings, use the **show controller** command. For output examples, see the "show controller Command Examples" section on page 105.

```
Router# show controller {t1 | e1} controller-number
```

Step 7 To display voice-channel configuration information for all DSP channels, use the **show voice dsp** command. For output examples, see the "show voice dsp Command Examples" section on page 106.

```
Router# show voice dsp
```

Step 8 To verify the call status for all voice ports, use the **show voice call summary** command. For output examples, see the "show voice call summary Command Examples" section on page 107.

```
Router# show voice call summary
```

Step 9 To display the contents of the active call table, which shows all of the calls currently connected through the router or concentrator, use the **show call active voice** command. For output examples, see the "show call active voice Command Example" section on page 107.

```
Router# show call active voice
```

Step 10 To display the contents of the call history table, use the **show call history voice** command. To limit the display to the last calls connected through this router, use the keyword **last** and define the number of calls to be displayed with the argument *number*. To limit the display to a shortened version of the call history table, use the **brief** keyword. For output examples, see the "show call history voice Command Example" section on page 108.

```
Router# show call history voice [last | number | brief]
```

show voice port summary Command Examples

In the following sections, output examples of the following types are shown:

- Cisco 3640 Router Analog Voice Port
- Cisco MC3810 Multiservice Concentrator Digital Voice Port

Cisco 3640 Router Analog Voice Port

The following output is from a Cisco 3640 router:

```
Router# show voice port summary
                                          IN       OUT
PORT    CH SIG-TYPE    ADMIN OPER STATUS    STATUS    EC
====== == ========== ===== ==== ======== ======== ==
2/0/0   -- e&m-wnk     up    dorm idle     idle     y
2/0/1   -- e&m-wnk     up    dorm idle     idle     y
2/1/0   -- fxs-ls      up    dorm on-hook  idle     y
2/1/1   -- fxs-ls      up    dorm on-hook  idle     y
```

Cisco MC3810 Multiservice Concentrator Digital Voice Port

The following output is from a Cisco MC3810 multiservice concentrator:

```
Router# show voice port summary
                                          IN       OUT
PORT    CH SIG-TYPE    ADMIN OPER STATUS    STATUS    EC
====== == ========== ===== ==== ======== ======== ==
0:17    18 fxo-ls      down  down idle     on-hook   y
0:18    19 fxo-ls      up    dorm idle     on-hook   y
0:19    20 fxo-ls      up    dorm idle     on-hook   y
0:20    21 fxo-ls      up    dorm idle     on-hook   y
0:21    22 fxo-ls      up    dorm idle     on-hook   y
0:22    23 fxo-ls      up    dorm idle     on-hook   y
0:23    24 e&m-imd     up    dorm idle     idle      y
1/1     -- fxs-ls      up    dorm on-hook  idle      y
1/2     -- fxs-ls      up    dorm on-hook  idle      y
1/3     -- e&m-imd     up    dorm idle     idle      y
1/4     -- e&m-imd     up    dorm idle     idle      y
1/5     -- fxo-ls      up    dorm idle     on-hook   y
1/6     -- fxo-ls      up    dorm idle     on-hook   y
```

show voice port Command Examples

In the following sections, output examples of the following types are shown:

- Cisco 3600 Series Router Analog E&M Voice Port, page 101
- Cisco 3600 Series Router Analog FXS Voice Port, page 102
- Cisco 3600 Series Router Digital E&M Voice Port, page 103
- Cisco AS5300 Universal Access Server T1 CAS Voice Port, page 103
- Cisco 7200 Series Router Digital E&M Voice Port, page 104

Cisco 3600 Series Router Analog E&M Voice Port

The following output is from a Cisco 3600 series router analog E&M voice port:

```
Router# show voice port 1/0/0

E&M Slot is 1, Sub-unit is 0, Port is 0
 Type of VoicePort is E&M
 Operation State is unknown
 Administrative State is unknown
 The Interface Down Failure Cause is 0
 Alias is NULL
```

```

show voice call summary Command Examples

In the following sections, output examples of the following types are shown:

- Cisco MC3810 Multiservice Concentrator Analog Voice Port
- Cisco 3600 Series Router Digital Voice Port

Cisco MC3810 Multiservice Concentrator Analog Voice Port

The following output is from a Cisco MC3810 multiservice concentrator:

```
Router# show voice call summary

PORT       CODEC    VAD VTSP STATE            VPM STATE
========== ======== === ==================== ========================
1/1        g729r8    y  S_CONNECT            FXSLS_CONNECT
1/2        -         -  -                    FXSLS_ONHOOK
1/3        -         -  -                    EM_ONHOOK
1/4        -         -  -                    EM_ONHOOK
1/5        -         -  -                    FXOLS_ONHOOK
1/6        -         -  -                    FXOLS_ONHOOK
```

Cisco 3600 Series Router Digital Voice Port

The following output is from a Cisco 3600 series router:

```
Router# show voice call summary

PORT       CODEC    VAD VTSP STATE            VPM STATE
========== ======== === ==================== ========================
1/015.1  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.2  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.3  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.4  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.5  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.6  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.7  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.8  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.9  g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.10 g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.11 g729r8    y  S_CONNECT            S_TSP_CONNECT
1/015.12 g729r8    y  S_CONNECT            S_TSP_CONNECT
```

show call active voice Command Example

The following output is from a Cisco 7200 series router:

```
Router# show call active voice

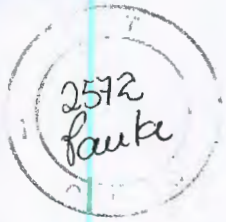
Troubleshooting Analog and Digital Voice Port Configurations

The following sections will assist in analyzing and troubleshooting voice port problems:

- Troubleshooting Chart, page 110
- Voice Port Testing Commands, page 112



Troubleshooting Chart

Table 10 lists some problems you might encounter after configuring voice ports and has some suggested remedies.

Table 10 Troubleshooting Voice Port Configurations

Problem	Suggested Action
No connectivity	Ping the associated IP address to confirm connectivity. If you cannot successfully ping your destination, refer to the *Cisco IOS IP Configuration Guide*.
No connectivity	Enter the **show controller t1** or **show controller e1** command with the controller number for the voice port you are troubleshooting. This will tell you: • If the controller is up. If it is not, use the **no shutdown** command to make it active. • Whether alarms have been reported. • What parameter values have been set for the controller (framing, clock source, line code, cable length). If these values do not match those of the telephony connection you are making, reconfigure the controller. See the "show controller Command Examples" section on page 105 for output.
No connectivity	Enter the **show voice port** command with the voice port number that you are troubleshooting, which will tell you: • If the voice port is up. If it is not, use the **no shutdown** command to make it active. • What parameter values have been set for the voice port, including default values (these do not appear in the output for the **show running-config** command). If these values do not match those of the telephony connection you are making, reconfigure the voice port. See the "show voice port Command Examples" section on page 101 for sample output.
Telephony device buzzes or does not ring	Use the **show voice port** command to confirm that ring frequency is configured correctly. It must match the connected telephony equipment and may be country-dependent.

2571 Paula

Table 10 Troubleshooting Voice Port Configurations (continued)

Problem	Suggested Action
Distorted speech	Use the **show voice port** command to confirm the **cptone** keyword setting (also called *region tone*) is US. Setting a wrong cptone could result in faulty voice reproduction during analog-to-digital or digital-to-analog conversions.
Music on hold is not heard	Reduce the music-threshold level.
Background noise is not heard	Enable the **comfort-noise** command.
Long pauses occur in conversation; like speaking on a walkie-talkie	Overall delay is probably excessive; the standard for adequate voice quality is 150 ms one-way transit delay. Measure delay by using ping tests at various times of the day with different network traffic loads. If delay must be reduced, areas to examine include propagation delay of signals between the sending and receiving endpoints, voice encoding delay, and the voice packetization time for various VoIP codecs.
Jerky or choppy speech	Variable delay, or jitter, is being introduced by congestion in the packet network. Two possible remedies are to: • Reduce the amount of congestion in your packet network. Pings between VoIP endpoints will give an idea of the round-trip delay of a link, which should never exceed 300 ms. Network queuing and dropped packets should also be examined. • Increase the size of the jitter buffer with the **playout-delay** command. (See the "Jitter Adjustment" section on page 94.)
Clipped or fuzzy speech	Reduce input gain. (See the "Voice Level Adjustment" section on page 98.)
Clipped speech	Reduce the input level at the listener's router. (See the "Voice Level Adjustment" section on page 98.)
Volume too low or missed DTMF	Increase speaker's output level or listener's input level. (See the "Voice Level Adjustment" section on page 98.)
Echo interval is greater than 25 ms (sounds like a separate voice)	Configure the **echo-cancel enable** command and increase the value for the **echo-cancel coverage** keyword. (See the "Echo Adjustment" section on page 96.)
Too much echo	Reduce the output level at the speaker's voice port. (See the "Voice Level Adjustment" section on page 98.)

Voice Port Testing Commands

These commands allow you to force voice ports into specific states for testing. They require the use of Cisco IOS Release 12.0(7)XK or 12.1(2)T or a later release, and they apply only to Cisco 2600 and 3600 series routers, and to Cisco MC3810 multiservice concentrators. The following types of voice-port tests are covered:

- Detector-Related Function Tests, page 112
- Loopback Function Tests, page 114
- Tone Injection Tests, page 115
- Relay-Related Function Tests, page 116
- Fax/Voice Mode Tests, page 116

Detector-Related Function Tests

Using the **test voice port detector** command, you are able to force a particular detector into an on or off state, perform tests on the detector, and then return the detector to its original state.

To configure this feature, use the following commands in privileged EXEC mode:

	Command	Purpose

Step 1	**Cisco 2600 and 3600 Series Routers Analog Voice Ports**
	`Router# test voice port slot/subunit/port detector {m-lead | battery-reversal | loop-current | ring | tip-ground | ring-ground | ring-trip} {on | off}`
	
	Cisco 2600 and 3600 Series Routers Digital Voice Ports
	`Router# test voice port slot/port:ds0-group detector {m-lead | battery-reversal | loop-current | ring | tip-ground | ring-ground | ring-trip} {on | off}`
	
	Cisco MC3810 Multiservice Concentrators Analog Voice Ports
	`Router# test voice port slot/port detector {m-lead | battery-reversal | loop-current | ring | tip-ground | ring-ground | ring-trip} {on | off}`
		Identifies the voice port you want to test. Enter a keyword for the detector under test and specify whether to force it to the on or off state.
		
		Note For each signaling type (E&M, FXO, FXS), only the applicable keywords are displayed. The **disable** keyword is displayed only when a detector is in the forced state.

2569 Paula

	Command	Purpose
	Cisco MC3810 Multiservice Concentrators Digital Voice Ports `Router# test voice port slot:ds0-group detector {m-lead | battery-reversal | loop-current | ring | tip-ground | ring-ground | ring-trip} {on | off}`	

Step 2	**Cisco 2600 and 3600 Series Routers Analog Voice Ports**
	`Router# test voice port slot/subunit/port detector {m-lead | battery-reversal | loop-current | ring | tip-ground | ring-ground | ring-trip} disable`
	
	Cisco 2600 and 3600 Series Routers Digital Voice Ports
	`Router# test voice port slot/port:ds0-group detector {m-lead | battery-reversal | loop-current | ring | tip-ground | ring-ground | ring-trip} disable`
	
	Cisco MC3810 Multiservice Concentrators Analog Voice Ports
	`Router# test voice port slot/port detector {m-lead | battery-reversal | loop-current | ring | tip-ground | ring-ground | ring-trip} disable`
	
	Cisco MC3810 Multiservice Concentrators Digital Voice Ports
	`Router# test voice port slot:ds0-group detector {m-lead | battery-reversal | loop-current | ring | tip-ground | ring-ground | ring-trip} disable`
		Identifies the voice port on which you want to end the test. Enter a keyword for the detector under test and the keyword **disable** to end the forced state.
		
		Note For each signaling type (E&M, FXO, FXS), only the applicable keywords are displayed. The **disable** keyword is displayed only when a detector is in the forced state.

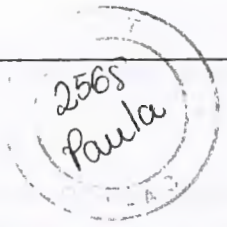
Doc: 3701



Loopback Function Tests

To establish loopbacks on a voice port, use the following commands in privileged EXEC mode:

	Command	Purpose

Step 1	**Cisco 2600 and 3600 Series Routers Analog Voice Ports**
	`Router# test voice port slot/subunit/port loopback {local | network}`
	
	Cisco 2600 and 3600 Series Routers Digital Voice Ports
	`Router# test voice port slot/port:ds0-group loopback {local | network}`
	
	Cisco MC3810 Multiservice Concentrators Analog Voice Ports
	`Router# test voice port slot/port detector loopback {local | network}`
	
	Cisco MC3810 Multiservice Concentrators Digital Voice Ports
	`Router# test voice port slot:ds0-group loopback {local | network}`
		Identifies the voice port you want to test and enters a keyword for the loopback direction.
		
		Note A call must be established on the voice port under test.

Step 2	**Cisco 2600 and 3600 Series Routers Analog Voice Ports**
	`Router# test voice port slot/subunit/port loopback disable`
	
	Cisco 2600 and 3600 Series Routers Digital Voice Ports
	`Router# test voice port slot/port:ds0-group loopback disable`
	
	Cisco MC3810 Multiservice Concentrators Analog Voice Ports
	`Router# test voice port slot/port detector loopback disable`
	
	Cisco MC3810 Multiservice Concentrators Digital Voice Ports
	`Router# test voice port slot:ds0-group loopback disable`
		Identifies the voice port on which you want to end the test and enters the keyword disable to end the loopback.

2567
Paula

Tone Injection Tests

To inject a test tone into a voice port, use the following commands in privileged EXEC mode:

	Command	Purpose

Step 1	**Cisco 2600 and 3600 Series Routers Analog Voice Ports**
	`Router# test voice port slot/subunit/port inject-tone {local | network} {1000hz | 2000hz | 200hz | 3000hz | 300hz | 3200hz | 3400hz | 500hz | quiet}`
	Cisco 2600 and 3600 Series Routers Digital Voice Ports
	`Router# test voice port slot/port:ds0-group inject-tone {local | network} {1000hz | 2000hz | 200hz | 3000hz | 300hz | 3200hz | 3400hz | 500hz | quiet}`
	Cisco MC3810 Multiservice Concentrators Analog Voice Ports
	`Router# test voice port slot/port detector inject-tone {local | network} {1000hz | 2000hz | 200hz | 3000hz | 300hz | 3200hz | 3400hz | 500hz | quiet}`
	Cisco MC3810 Multiservice Concentrators Digital Voice Ports
	`Router# test voice port slot:ds0-group inject-tone {local | network} {1000hz | 2000hz | 200hz | 3000hz | 300hz | 3200hz | 3400hz | 500hz | quiet}`
		Identifies the voice port you want to test and enter keywords for the direction to send the test tone and for the frequency of the test tone.
		Note A call must be established on the voice port under test.

Step 2	**Cisco 2600 and 3600 Series Routers Analog Voice Ports**
	`Router# test voice port slot/subunit/port inject-tone disable`
	Cisco 2600 and 3600 Series Routers Digital Voice Ports
	`Router# test voice port slot/port:ds0-group inject-tone disable`
	Cisco MC3810 Multiservice Concentrators Analog Voice Ports
	`Router# test voice port slot/port detector inject-tone disable`
	Cisco MC3810 Multiservice Concentrators Digital Voice Ports
	`Router# test voice port slot:ds0-group inject-tone disable`
		Identifies the voice port on which you want to end the test and enter the keyword **disable** to end the test tone.
		Note The **disable** keyword is available only if a test condition is already activated.

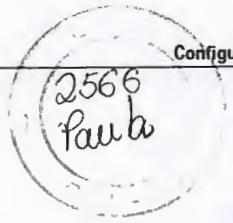
VC-115



Relay-Related Function Tests

To test relay-related functions on a voice port, use the following commands in privileged EXEC mode:

	Command	Purpose

Step 1	**Cisco 2600 and 3600 Series Routers Analog Voice Ports**
	`Router# test voice port slot/subunit/port relay {e-lead | loop | ring-ground | battery-reversal | power-denial | ring | tip-ground} {on | off}`
	Cisco 2600 and 3600 Series Routers Digital Voice Ports
	`Router# test voice port slot/port:ds0-group relay {e-lead | loop | ring-ground | battery-reversal | power-denial | ring | tip-ground} {on | off}`
	Cisco MC3810 Multiservice Concentrators Analog Voice Ports
	`Router# test voice port slot/port detector relay {e-lead | loop | ring-ground | battery-reversal | power-denial | ring | tip-ground} {on | off}`
	Cisco MC3810 Multiservice Concentrators Digital Voice Ports
	`Router# test voice port slot:ds0-group relay {e-lead | loop | ring-ground | battery-reversal | power-denial | ring | tip-ground} {on | off}`
		Identifies the voice port you want to test. Enter a keyword for the relay under test and specify whether to force it to the on or off state.
		Note For each signaling type (E&M, FXO, FXS), only the applicable keywords are displayed. The **disable** keyword is displayed only when a relay is in the forced state.

Step 2	**Cisco 2600 and 3600 Series Routers Analog Voice Ports**
	`Router# test voice port slot/subunit/port relay {e-lead | loop | ring-ground | battery-reversal | power-denial | ring | tip-ground} disable`
	Cisco 2600 and 3600 Series Routers Digital Voice Ports
	`Router# test voice port slot/port:ds0-group relay {e-lead | loop | ring-ground | battery-reversal | power-denial | ring | tip-ground} disable`
	Cisco MC3810 Multiservice Concentrators Analog Voice Ports
	`Router# test voice port slot/port detector relay {e-lead | loop | ring-ground | battery-reversal | power-denial | ring | tip-ground} disable`
	Cisco MC3810 Multiservice Concentrators Digital Voice Ports
	`Router# test voice port slot:ds0-group relay {e-lead | loop | ring-ground | battery-reversal | power-denial | ring | tip-ground} disable`
		Identifies the voice port on which you want to end the test. Enter a keyword for the relay under test, and the keyword **disable** to end the forced state.
		Note For each signaling type (E&M, FXO, FXS), only the applicable keywords are displayed. The **disable** keyword is displayed only when a relay is in the forced state.

Fax/Voice Mode Tests

The **test voice port switch fax** command forces a voice port into fax mode for testing. After you enter this command, you can use the **show voice call** or **show voice call summary** command to check whether the voice port is able to operate in fax mode. If no fax data is detected by the voice port, the voice port remains in fax mode for 30 seconds and then reverts automatically to voice mode.

The **disable** keyword ends the forced mode switch; however, the fax mode ends automatically after 30 seconds. The disable keyword is available only while the voice port is in fax mode.

2565
Paula

To force a voice port into fax mode and return it to voice mode, use the following commands in privileged EXEC mode:

	Command	Purpose

Step 1	**Cisco 2600 and 3600 Series Routers Analog Voice Ports**
	`Router# test voice port slot/subunit/port switch fax`
	
	Cisco 2600 and 3600 Series Routers Digital Voice Ports
	`Router# test voice port slot/port:ds0-group switch fax`
	
	Cisco MC3810 Multiservice Concentrators Analog Voice Ports
	`Router# test voice port slot/port detector switch fax`
	
	Cisco MC3810 Multiservice Concentrators Digital Voice Ports
	`Router# test voice port slot:ds0-group switch fax`
		Identifies the voice port you want to test. Enter the keyword **fax** to force the voice port into fax mode.

Step 2	**Cisco 2600 and 3600 Series Routers Analog Voice Ports**
	`Router# test voice port slot/subunit/port switch disable`
	
	Cisco 2600 and 3600 Series Routers Digital Voice Ports
	`Router# test voice port slot/port:ds0-group switch disable`
	
	Cisco MC3810 Multiservice Concentrators Analog Voice Ports
	`Router# test voice port slot/port detector switch disable`
	
	Cisco MC3810 Multiservice Concentrators Digital Voice Ports
	`Router# test voice port slot:ds0-group switch disable`
		Identifies the voice port on which you want to end the test. Enter the keyword **disable** to return the voice port to voice mode.

Cisco Systems

Data Sheet

CiscoWorks **Campus Manager**

Campus Manager is a key component in the CiscoWorks family of management solutions designed to make Cisco networks the most manageable and available in the industry. Today's networks are critical business assets, and require sophisticated tools for administering, monitoring and configuring Layer 2 services. Designed for enterprise network operations staff, Campus Manager provides powerful tools with built-in network intelligence to reduce the complexity and automate manual tasks associated with maintaining complex physical and logical network infrastructures.

Campus Manager Overview

Campus networks are at the heart of business and mission-critical systems. The requirement to understand, monitor, and react to changing networking conditions drives the need for sophisticated, yet easy-to-use management tools. Campus Manager is part of the LAN Management Solution, part of the broad range of CiscoWorks network management solutions.

New in Version 3.3:

In addition to the rich set of management features already included, the new version of Campus Manager has been enhanced to provide even greater manageability for Cisco networks. New benefits include:

- Improved application performance
- Doubled capacity for tracking end users

Key Campus Manager features include:

- Intelligent discovery and display of Layer 2 networks on browser-accessible topology maps, independent of VTP server
- Configuration of virtual LAN (VLAN)/ LAN Emulation (LANE) and asynchronous transfer mode (ATM) services and assignment of switch ports to those services
- Link and device status display based upon Simple Network Management Protocol (SNMP) polling
- Identification of Layer 2 configuration discrepancies
- Diagnostic tools for connectivity related problems between end stations, and Layer 2 and Layer 3 devices
- Automatic location and correlation of information on users by media access control (MAC), IP address, NT or NetWare Directory Services (NDS) login or UNIX host name, with their physical connections to the switched network
- Visibility and launch point of Cisco CallManager from topology services as well as tracking of phone handset to IP, Mac address, and switch port
- Layer 2 and Layer 3 path trace between source and destination handsets
- Export of topology maps to Visio
- Java plugins to improve graphical user interface (GUI) performance

- Ability to form Custom Groups in Topology View based on criteria like SysLocation, SysName and IP address/ Subnet mask.
- Secure communication between the client browser and Campus applications using Secure Socket Layer (SSL) protocol.

Campus Manager enables administrators to more easily change, monitor, and control network relationships, making them more effective in delivering business-critical and advanced networking services to their users and customers.

Campus Manager is a suite of applications launched from a common "management desktop" used by all Web-based CiscoWorks applications. Campus Manager contains three applications that can be launched from the client's browser:

- Topology Services—This is the principal interface to a variety of large scale topology maps, tabular summaries, reports, and configuration services of the Layer 2 network. A directory-like tree interface lists physical Layer 2 and logical, Virtual Trunking Protocol (VTP), and ATM domain views along with table summaries of the devices and interface associated with these views. This tree structure acts as the launching point for topology maps, discrepancy reporting functions, and configuration services. The integrated VLAN and LANE configuration capabilities, ATM soft permanent virtual circuit (PVC) configuration and diagnostic tools, along with physical and logical configuration discrepancy checking reports and highlighting tools are found within the Topology Services menus. It also supports discovery and display of Cisco Customer Response Applications, and reports on services of these devices.

  Ability to form custom groups based on dynamic and static rules for the group membership. System defined groups and user defined grouping can be created by network administrators and users respectively and allows grouping by developing rules based on criteria such as IP address, subnets, SysLocation, SysName, SysContact, Image Version and hostname. A rules editor allows for creating, editing Topology groups and defines rules for membership.

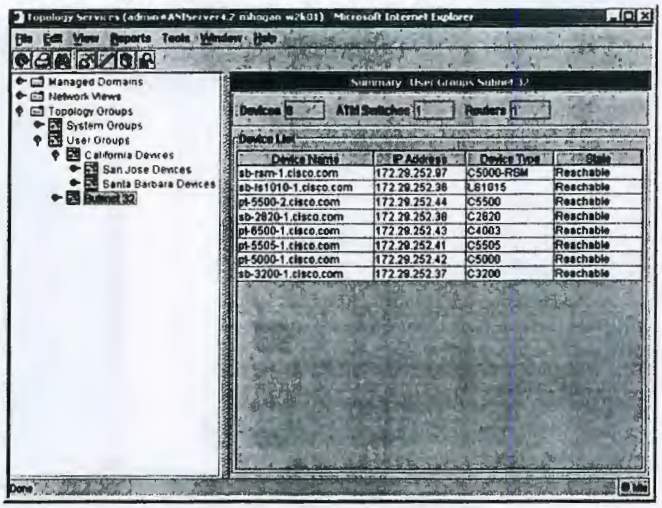
Figure 4
Topology Group in Topology Maps



- User Tracking—Designed to assist in locating end-station connections at the access switch, this application is a useful tool in troubleshooting or connectivity analysis. Through automated acquisition, a table of end-user stations and Layer 2 connection information is constructed. This table can be sorted and queried allowing administrators to easily find users. Users can be identified by name, IP handset, MAC and IP address, as well as the switch port and switch that they are connected, along with VLAN and VTP assignment of the port. Predefined reports, such as duplicate MAC per switch port, or duplicate IP addresses, enable managers to locate mobile users or violations in port policies.

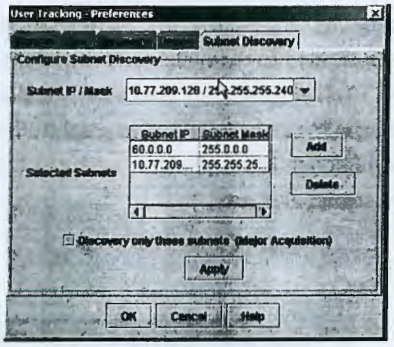
Figure 6
Subnet based acquisition



- Path Analysis—An application for switched network management, this is an extremely powerful tool for connectivity troubleshooting. Path Analysis utilizes User Tracking, topology services, and real-time spanning tree information to determine Layer 2 and Layer 3 connectivity between two end-points, or IP Handsets, in the network. The resulting trace is presented in graphical topology views that illustrate the Layer 2 and Layer 3 devices, path direction and link types, and in tabular formats that provide specific interface, IP address, VLAN, and link type information.

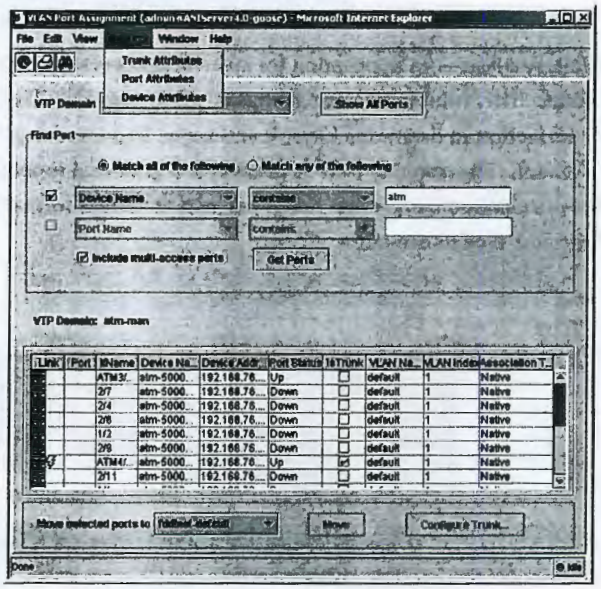
VLAN/LANE Configuration and Port Assignment

Campus Manager provides an easy and graphical means for creating, modifying, or deleting VLANs, LANE elements, or assigning switch ports to VLANs. As VLANs are created or modified, port and user changes are instantly updated and transmitted to the switches, eliminating the need to update and configure each participating switch individually. As VLANs are selected, the table view shows the participating ports, port status, and switch information and the topology map can be launched to graphically highlight participating devices and links of the VLAN connections. Additional map tools allow managers to show spanning-tree states, VTP trunks, switch port links, and existing LANE service elements.

Figure 8
VLAN Port Assignment



Campus Manager 3.3 is a must for switched network management, and is an integral piece of the LAN Management Solution, by providing a broad, comprehensive set of tools for managing and administering the entire LAN environment.

Campus Manager 3.3 Features

Campus Manager provides a variety of functions within Topology Services, User Tracking, Path Analysis and VLAN/LANE port assignment that network managers can use to better understand, monitor, configure, diagnose, and be proactive to network infrastructure changes.

Topology Services

Topology Services provides access to a wide variety of physical and logical topology maps, summary lists of devices, ports, and their network relationships. Topology Services also acts as the launching point for topology-related configuration and diagnostic tools.

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

2558
Fls.

In Campus Manager 3.3, network topology maps can be displayed in a variety of ways from both a flat Layer 2 to abstracted views that better represent and scale to large campus networks. These abstractions are categorized into three different groups: managed domains, network views and topology groups. Managed domains are topological views of logical groups of devices organized around ATM switch fabrics and VTP domains. Network views are physical displays of the network and are organized to provide full and abstracted views, such as LAN edge views, Layer 2 views, unconnected device views, and VTP views. Topology Groups are custom views that are a subset of the entire network based on the group rule defined while creating the view. They are can be two types of groups—system defined groups that are custom views created by admin user and user defined views which are created by CiscoWorks users. Membership to these groups are made via rules that can be evaluated either automatically or upon user request and these groups help in generating custom views that are a subset of the Layer 2 views.

Key features in the Campus Manager topology services include:

- Autodiscovery and display of Cisco switches, routers, and probes using the Cisco Discovery Protocol (CDP) and SNMP
- Display of physical and logical Layer 2 connections within the discovered LAN environment
- Highlighting tools to identify specific classes of devices or links such as switches, route switch modules (RSMs), Fast Ethernet, EtherChannel®, ATM links, Cisco Customer Response Applications, and other relevant Cisco device elements
- Expanded scalability to support more than 2000 Cisco devices
- Display of multilayer switches and components (switching entities and route-processing entities) with the ability to highlight logical relationships between devices, such as flow masks and shortcuts
- Device status indicators on the topology maps based on CDP, ILMI, ELMI, and SNMP availability
- Automated discrepancy reporting during discovery highlights connection problems, link mismatches, and logical misconfigurations
- Graphical interface for creating VLAN and LANE services for Ethernet, Token Ring, and transparent VLANs
- Graphical interface for locating—through search parameters—and assigning switch ports individually or in bulk to a VLAN
- ATM soft PVC configuration and diagnostics

VLAN/LANE Configuration and Port Assignment

Campus Manager provides an easy and graphical means for creating, modifying, or deleting VLANs, LANE elements, or assigning switch ports to VLANs. As VLANs are created or modified, port and user changes are instantly updated and transmitted to the switches, eliminating the need to update and configure each participating switch individually. As VLANs are selected, the table view shows the participating ports, port status, and switch information and the topology map can be launched to graphically highlight participating devices and links of the VLAN connections. Additional map tools allow managers to show spanning-tree states, VTP trunks, switch port links, and existing LANE service elements.

VLAN management services provide:

- Tabular summary views of VLANs shows participating ports, devices, links, and port status information
- Graphical setup of VLANs (including transparent VLANs) and VLAN membership to simplify administration
- Integration of LANE configuration services in VLAN configuration tools for more efficient operational and engineering practices
- A separate interface for administrators to quickly search, using a variety of criteria, and assign selected switch ports, individually or in bulk, to VLANs
- Logical display of VLAN configurations makes it easy to visualize switch connections
- Automated discrepancy reports highlight connection problems and link mismatches
- Automated VLAN membership registration reduces administration and configuration requirements

ATM Management

Campus Manager offers a graphical tool for managing complex ATM networks, simplifying configuration and performance monitoring. ATM networks are displayed on the topology map and the logical VLAN and ATM domain views provide graphical representations of ATM switches and LANE elements. "Drill down" capability allows access to configuration and performance monitoring tools. ATM management functions include:

- Autodiscovery of ATM switches, including switched virtual circuit (SVC) and PVC connections
- Connectivity checking of SVC and PVC connections
- End-to-end virtual circuit path tracing and analysis, which assists in connectivity diagnostics
- LANE troubleshooting and performance analysis
- Quality of service (QoS) templates for simplifying the configuration of typical traffic such as video or constant-bit-rate (CBR)
- Simple configuration of soft PVCs
- ATM remote monitoring (RMON) data collection and analysis

User Tracking

User Tracking automatically locates servers and end-user workstations, and Cisco voice over IP (VoIP) telephone handsets and their connections to Layer 2 Cisco switches. During this discovery process it also tabulates specific connection information about that end station, including:

- VLAN name, type, and VTP domain
- Switch port number, name, and state

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

2556
Paula

- MAC and IP address of the end station and its subnet
- Tabular and sortable listing of all switch port attached end-user workstations, servers and IP handsets
- Last-seen time stamp reflecting last acquisition in which the end station was detected
- User login name passed automatically from the Windows NT Primary Domain Controller or Novell Directory Structure, or from the UNIX host

Campus Manager simplifies the dynamic nature of many business environments by providing a large number of sortable parameters that can be used to locate end-user stations. User Tracking discovers end stations connected to switch ports automatically and provides a means to identify end users, their assigned VLANs, and host station connections. User Tracking also supports voice/data convergence with interfaces to Cisco CallManager for correlating the IP and MAC addresses of discovered VoIP handsets with their assigned phone number and users.

User Tracking provides the following features:

- Enhanced scalability to support 60,000 end stations
- Predefined reports that identify duplicate MAC and IP addresses, ports with multiple MAC addresses and duplicate sysnames.
- IP and MAC addresses of discovered VoIP handsets with their assigned phone number and users
- Tabular and sortable listing of all switch port-attached end-user workstations and IP handsets
- Customized tables for user-defined, detailed reporting
- GUI for user tracking information table configuration to support dynamic/mobile users
- Scheduling managers for automating address change updates
- Easy-to-use search utility box locating users by MAC addresses, IP addresses, DNS host names, switch port labels, and optional voice handsets
- Provides ability to schedule User Tracking. Also exports User Tracking reports.
- Ability to define acquisition based on a subnet range

Path Analysis

Path Analysis is a powerful diagnostic tool for determining the Layer 2 and Layer 3 path between two selected endpoints using Campus Manager-discovered end-station data, VLAN/LANE configuration information, real-time Layer 3 path trace information, and spanning-tree calculations. Displays of path information are available in both topological map and tabular displays. Key Path Analysis features include:

- View the Layer 2 and Layer 3 path information in a map format with traces showing end stations, Layer 2 and 3 devices, route directions, and cut-through paths
- View specific details of the Layer 2 and Layer 3 path, including IP addresses and interfaces traveled, VLAN and VTP domain names, and port speeds and duplex settings
- Perform traces immediately or schedule them
- Perform traces using IP address, DNS name, or by telephone number for voice calls as start/stop points
- Provide Layer 2 and Layer 3 trace information between Cisco voice elements using interfaces to call detail records for specific voice calls
- Provides ability to schedule path traces. Also exports path traces data.

Built on the CiscoWorks Management Server

The CiscoWorks management server provides common resources, such as Web services, discovery, shared databases and database services, and the management desktop. Cisco Management Connection, a service on the CiscoWorks2000 server, delivers a set of tools for integrating applications into the management desktop using Internet-based standards and technologies. These tools allow users to link Web-based management applications to the CiscoWorks family of products and application developers to easily link Web-based applications through a certified registration mechanism. Cisco Management Connection has been used by Cisco and more than 30 network management vendors, including Hewlett-Packard, Computer Associates, Sun Microsystems, and Tivoli Systems to create certified Cisco Management Connections for their applications. This rapid adoption has created an environment in which users can easily build management intranets that link together their favorite Web-based management applications.

Specifications

Server, Client, and Web Browser System Requirements

The server, client and web browser system requirements can be found in the Product Overview documents for the Routed WAN and LAN Management solutions and on Cisco's main on-line documentation site, under each CiscoWorks solution. Please refer to these and other Product Installation documentation for more detailed information on setting up and configuring these solutions.

Supported Cisco Devices

Most Cisco routers, Catalyst® and LightStream switches, as well as Cisco AVVID devices. Contact your Cisco representative for a complete list.

Cisco Systems, Inc.
All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

Supported Cisco IOS Versions

- Cisco IOS® version 10.3 and above
- Catalyst Supervisor code 2.1 and above

Availability

Campus Manager 3.3 is an integral part of multiple CiscoWorks solutions and is not sold as an individual product. For additional information on Campus Manager, see:

CiscoWorks **Campus Manager**

Campus Manager is a key component in the CiscoWorks family of management solutions designed to make Cisco networks the most manageable and available in the industry. Today's networks are critical business assets, and require sophisticated tools for administering, monitoring and configuring Layer 2 services. Designed for enterprise network operations staff, Campus Manager provides powerful tools with built-in network intelligence to reduce the complexity and automate manual tasks associated with maintaining complex physical and logical network infrastructures.

Campus Manager Overview

Campus networks are at the heart of business and mission-critical systems. The requirement to understand, monitor, and react to changing networking conditions drives the need for sophisticated, yet easy-to-use management tools. Campus Manager is part of the LAN Management Solution, part of the broad range of CiscoWorks network management solutions.

New in Version 3.3:

In addition to the rich set of management features already included, the new version of Campus Manager has been enhanced to provide even greater manageability for Cisco networks. New benefits include:

- Improved application performance
- Doubled capacity for tracking end users

Key Campus Manager features include:

- Intelligent discovery and display of Layer 2 networks on browser-accessible topology maps, independent of VTP server
- Configuration of virtual LAN (VLAN)/ LAN Emulation (LANE) and asynchronous transfer mode (ATM) services and assignment of switch ports to those services
- Link and device status display based upon Simple Network Management Protocol (SNMP) polling
- Identification of Layer 2 configuration discrepancies
- Diagnostic tools for connectivity related problems between end stations, and Layer 2 and Layer 3 devices
- Automatic location and correlation of information on users by media access control (MAC), IP address, NT or NetWare Directory Services (NDS) login or UNIX host name, with their physical connections to the switched network
- Visibility and launch point of Cisco CallManager from topology services as well as tracking of phone handset to IP, Mac address, and switch port
- Layer 2 and Layer 3 path trace between source and destination handsets
- Export of topology maps to Visio
- Java plugins to improve graphical user interface (GUI) performance

Paula

- Ability to form Custom Groups in Topology View based on criteria like SysLocation, SysName and IP address/ Subnet mask.
- Secure communication between the client browser and Campus applications using Secure Socket Layer (SSL) protocol.

Campus Manager enables administrators to more easily change, monitor, and control network relationships, making them more effective in delivering business-critical and advanced networking services to their users and customers.

Campus Manager is a suite of applications launched from a common "management desktop" used by all Web-based CiscoWorks applications. Campus Manager contains three applications that can be launched from the client's browser:

- Topology Services—This is the principal interface to a variety of large scale topology maps, tabular summaries, reports, and configuration services of the Layer 2 network. A directory-like tree interface lists physical Layer 2 and logical, Virtual Trunking Protocol (VTP), and ATM domain views along with table summaries of the devices and interface associated with these views. This tree structure acts as the launching point for topology maps, discrepancy reporting functions, and configuration services. The integrated VLAN and LANE configuration capabilities, ATM soft permanent virtual circuit (PVC) configuration and diagnostic tools, along with physical and logical configuration discrepancy checking reports and highlighting tools are found within the Topology Services menus. It also supports discovery and display of Cisco Customer Response Applications, and reports on services of these devices.

  Ability to form custom groups based on dynamic and static rules for the group membership. System defined groups and user defined grouping can be created by network administrators and users respectively and allows grouping by developing rules based on criteria such as IP address, subnets, SysLocation, SysName, SysContact, Image Version and hostname. A rules editor allows for creating, editing Topology groups and defines rules for membership.

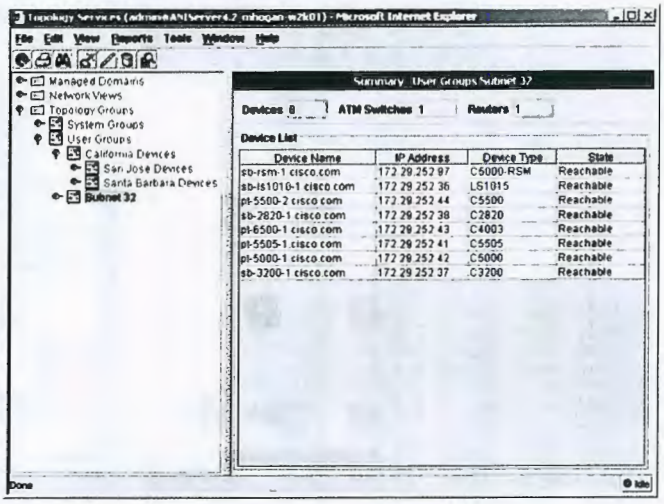
Topology Group in Topology Maps



- User Tracking—Designed to assist in locating end-station connections at the access switch, this application is a useful tool in troubleshooting or connectivity analysis. Through automated acquisition, a table of end-user stations and Layer 2 connection information is constructed. This table can be sorted and queried allowing administrators to easily find users. Users can be identified by name, IP handset, MAC and IP address, as well as the switch port and switch that they are connected, along with VLAN and VTP assignment of the port. Predefined reports, such as duplicate MAC per switch port, or duplicate IP addresses, enable managers to locate mobile users or violations in port policies.

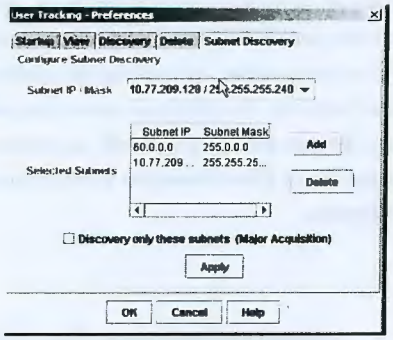
Figure 6
Subnet based acquisition



- Path Analysis—An application for switched network management, this is an extremely powerful tool for connectivity troubleshooting. Path Analysis utilizes User Tracking, topology services, and real-time spanning tree information to determine Layer 2 and Layer 3 connectivity between two end-points, or IP Handsets, in the network. The resulting trace is presented in graphical topology views that illustrate the Layer 2 and Layer 3 devices, path direction and link types, and in tabular formats that provide specific interface, IP address, VLAN, and link type information.

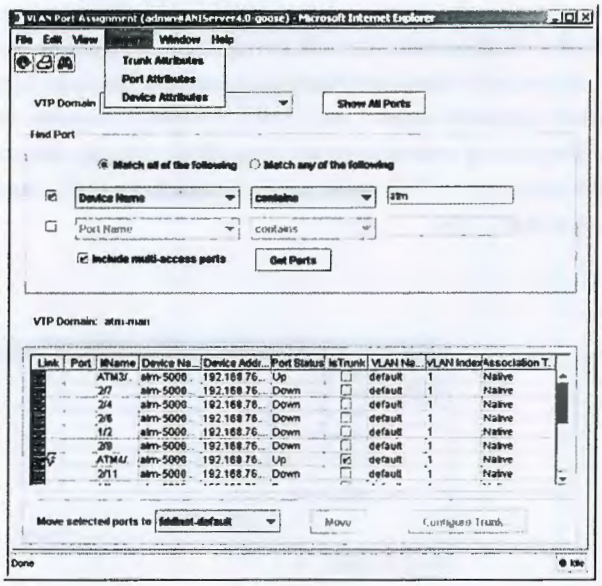
VLAN/LANE Configuration and Port Assignment

Campus Manager provides an easy and graphical means for creating, modifying, or deleting VLANs, LANE elements, or assigning switch ports to VLANs. As VLANs are created or modified, port and user changes are instantly updated and transmitted to the switches, eliminating the need to update and configure each participating switch individually. As VLANs are selected, the table view shows the participating ports, port status, and switch information and the topology map can be launched to graphically highlight participating devices and links of the VLAN connections. Additional map tools allow managers to show spanning-tree states, VTP trunks, switch port links, and existing LANE service elements.

Figure 8
VLAN Port Assignment



Campus Manager 3.3 is a must for switched network management, and is an integral piece of the LAN Management Solution, by providing a broad, comprehensive set of tools for managing and administering the entire LAN environment.

Campus Manager 3.3 Features

Campus Manager provides a variety of functions within Topology Services, User Tracking, Path Analysis and VLAN/LANE port assignment that network managers can use to better understand, monitor, configure, diagnose, and be proactive to network infrastructure changes.

Topology Services

Topology Services provides access to a wide variety of physical and logical topology maps, summary lists of devices, ports, and their network relationships. Topology Services also acts as the launching point for topology-related configuration and diagnostic tools.

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

2547
Paula

In Campus Manager 3.3, network topology maps can be displayed in a variety of ways from both a flat Layer 2 to abstracted views that better represent and scale to large campus networks. These abstractions are categorized into three different groups: managed domains, network views and topology groups. Managed domains are topological views of logical groups of devices organized around ATM switch fabrics and VTP domains. Network views are physical displays of the network and are organized to provide full and abstracted views, such as LAN edge views, Layer 2 views, unconnected device views, and VTP views. Topology Groups are custom views that are a subset of the entire network based on the group rule defined while creating the view. They are can be two types of groups—system defined groups that are custom views created by admin user and user defined views which are created by CiscoWorks users. Membership to these groups are made via rules that can be evaluated either automatically or upon user request and these groups help in generating custom views that are a subset of the Layer 2 views.

Key features in the Campus Manager topology services include:

- Autodiscovery and display of Cisco switches, routers, and probes using the Cisco Discovery Protocol (CDP) and SNMP
- Display of physical and logical Layer 2 connections within the discovered LAN environment
- Highlighting tools to identify specific classes of devices or links such as switches, route switch modules (RSMs), Fast Ethernet, EtherChannel®, ATM links, Cisco Customer Response Applications, and other relevant Cisco device elements
- Expanded scalability to support more than 2000 Cisco devices
- Display of multilayer switches and components (switching entities and route-processing entities) with the ability to highlight logical relationships between devices, such as flow masks and shortcuts
- Device status indicators on the topology maps based on CDP, ILMI, ELMI, and SNMP availability
- Automated discrepancy reporting during discovery highlights connection problems, link mismatches, and logical misconfigurations
- Graphical interface for creating VLAN and LANE services for Ethernet, Token Ring, and transparent VLANs
- Graphical interface for locating—through search parameters—and assigning switch ports individually or in bulk to a VLAN
- ATM soft PVC configuration and diagnostics

VLAN/LANE Configuration and Port Assignment

Campus Manager provides an easy and graphical means for creating, modifying, or deleting VLANs, LANE elements, or assigning switch ports to VLANs. As VLANs are created or modified, port and user changes are instantly updated and transmitted to the switches, eliminating the need to update and configure each participating switch individually. As VLANs are selected, the table view shows the participating ports, port status, and switch information and the topology map can be launched to graphically highlight participating devices and links of the VLAN connections. Additional map tools allow managers to show spanning-tree states, VTP trunks, switch port links, and existing LANE service elements.

VLAN management services provide:

- Tabular summary views of VLANs shows participating ports, devices, links, and port status information
- Graphical setup of VLANs (including transparent VLANs) and VLAN membership to simplify administration
- Integration of LANE configuration services in VLAN configuration tools for more efficient operational and engineering practices
- A separate interface for administrators to quickly search, using a variety of criteria, and assign selected switch ports, individually or in bulk, to VLANs
- Logical display of VLAN configurations makes it easy to visualize switch connections
- Automated discrepancy reports highlight connection problems and link mismatches
- Automated VLAN membership registration reduces administration and configuration requirements

ATM Management

Campus Manager offers a graphical tool for managing complex ATM networks, simplifying configuration and performance monitoring. ATM networks are displayed on the topology map and the logical VLAN and ATM domain views provide graphical representations of ATM switches and LANE elements. "Drill down" capability allows access to configuration and performance monitoring tools. ATM management functions include:

- Autodiscovery of ATM switches, including switched virtual circuit (SVC) and PVC connections
- Connectivity checking of SVC and PVC connections
- End-to-end virtual circuit path tracing and analysis, which assists in connectivity diagnostics
- LANE troubleshooting and performance analysis
- Quality of service (QoS) templates for simplifying the configuration of typical traffic such as video or constant-bit-rate (CBR)
- Simple configuration of soft PVCs
- ATM remote monitoring (RMON) data collection and analysis

User Tracking

User Tracking automatically locates servers and end-user workstations, and Cisco voice over IP (VoIP) telephone handsets and their connections to Layer 2 Cisco switches. During this discovery process it also tabulates specific connection information about that end station, including:

- VLAN name, type, and VTP domain
- Switch port number, name, and state

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

2545 Paula

- MAC and IP address of the end station and its subnet
- Tabular and sortable listing of all switch port attached end-user workstations, servers and IP handsets
- Last-seen time stamp reflecting last acquisition in which the end station was detected
- User login name passed automatically from the Windows NT Primary Domain Controller or Novell Directory Structure, or from the UNIX host

Campus Manager simplifies the dynamic nature of many business environments by providing a large number of sortable parameters that can be used to locate end-user stations. User Tracking discovers end stations connected to switch ports automatically and provides a means to identify end users, their assigned VLANs, and host station connections. User Tracking also supports voice/data convergence with interfaces to Cisco CallManager for correlating the IP and MAC addresses of discovered VoIP handsets with their assigned phone number and users.

User Tracking provides the following features:

- Enhanced scalability to support 60,000 end stations
- Predefined reports that identify duplicate MAC and IP addresses, ports with multiple MAC addresses and duplicate sysnames.
- IP and MAC addresses of discovered VoIP handsets with their assigned phone number and users
- Tabular and sortable listing of all switch port-attached end-user workstations and IP handsets
- Customized tables for user-defined, detailed reporting
- GUI for user tracking information table configuration to support dynamic/mobile users
- Scheduling managers for automating address change updates
- Easy-to-use search utility box locating users by MAC addresses, IP addresses, DNS host names, switch port labels, and optional voice handsets
- Provides ability to schedule User Tracking. Also exports User Tracking reports.
- Ability to define acquisition based on a subnet range

Path Analysis

Path Analysis is a powerful diagnostic tool for determining the Layer 2 and Layer 3 path between two selected endpoints using Campus Manager-discovered end-station data, VLAN/LANE configuration information, real-time Layer 3 path trace information, and spanning-tree calculations. Displays of path information are available in both topological map and tabular displays. Key Path Analysis features include:

- View the Layer 2 and Layer 3 path information in a map format with traces showing end stations, Layer 2 and 3 devices, route directions, and cut-through paths
- View specific details of the Layer 2 and Layer 3 path, including IP addresses and interfaces traveled, VLAN and VTP domain names, and port speeds and duplex settings
- Perform traces immediately or schedule them
- Perform traces using IP address, DNS name, or by telephone number for voice calls as start/stop points
- Provide Layer 2 and Layer 3 trace information between Cisco voice elements using interfaces to call detail records for specific voice calls
- Provides ability to schedule path traces. Also exports path traces data.

Built on the CiscoWorks Management Server

The CiscoWorks management server provides common resources, such as Web services, discovery, shared databases and database services, and the management desktop. Cisco Management Connection, a service on the CiscoWorks2000 server, delivers a set of tools for integrating applications into the management desktop using Internet-based standards and technologies. These tools allow users to link Web-based management applications to the CiscoWorks family of products and application developers to easily link Web-based applications through a certified registration mechanism. Cisco Management Connection has been used by Cisco and more than 30 network management vendors, including Hewlett-Packard, Computer Associates, Sun Microsystems, and Tivoli Systems to create certified Cisco Management Connections for their applications. This rapid adoption has created an environment in which users can easily build management intranets that link together their favorite Web-based management applications.

Specifications

Server, Client, and Web Browser System Requirements

The server, client and web browser system requirements can be found in the Product Overview documents for the Routed WAN and LAN Management solutions and on Cisco's main on-line documentation site, under each CiscoWorks solution. Please refer to these and other Product Installation documentation for more detailed information on setting up and configuring these solutions.

Supported Cisco Devices

Most Cisco routers, Catalyst® and LightStream switches, as well as Cisco AVVID devices. Contact your Cisco representative for a complete list.

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

Supported Cisco IOS Versions

- Cisco IOS® version 10.3 and above
- Catalyst Supervisor code 2.1 and above

Availability

Campus Manager 3.3 is an integral part of multiple CiscoWorks solutions and is not sold as an individual product. For additional information on Campus Manager, see:

PIX LITTER

New Cisco Secure PIX 535 and VPN accelerator card add higher capacity and performance to Cisco Secure PIX Firewall family

FOR PEOPLE WHO LIKE THEIR FIREWALLS BIG AND POWERFUL, WE'D like to introduce you to the Cisco Secure PIX™ 535 Firewall. Delivering carrier-class performance that meets the needs of large enterprise networks as well as service providers, the PIX 535 is definitely the pick of the litter.

Reprinted with permission from *Packet*™ magazine (Volume 13, No. 1), copyright © 2001 by Cisco Systems,Inc. All rights reserved.

2511 Paulo

The newest member of the market-leading Cisco Secure PIX Firewall family has the ability to support more than 500,000 concurrent connections and 1 Gigabit per second of throughput. With this level of performance in a single system, the PIX 535 eliminates the need to load balance multiple standalone firewalls. This capability significantly reduces network complexity without compromising security.

"The Cisco Secure PIX 535 Firewall enables an enterprise to connect to a single, fat pipe in the network that previously was a choke point for security processing," says Dennis Vogel, product manager for the Cisco Secure PIX Firewall family. "The processing power offered in a single PIX 535 will help enterprises keep pace with ever-growing traffic volumes while assuring reliable, consistent security protection across the network."

Playing It SAFE

The PIX 535 provides important safeguards for large corporate networks against vulnerabilities associated with doing business over the Internet. More importantly, it can be implemented as part of the recently announced Cisco SAFE blueprint for secure e-business.

Developed for real-world network deployment, Cisco SAFE helps companies compete in the Internet economy by integrating scalable, high performance security services throughout the e-business infrastructure. It takes a modular approach to security in which design, solution implementation and management processes are all provided in detail. Companies can choose from several individual modules, or "building blocks," each designed, tested and proven to address specific e-business applications, such as electronic commerce or supply chain management. (See "Play It SAFE, Sam," page 67.)

Firewall Tip: Add an IDS

Deploying an intrusion detection system (IDS) to complement your firewall can significantly enhance your security posture. A firewall's primary function is to control access to services and hosts based on your site security policy. If a connection to a specific host is permitted, the firewall may not be configured to inspect the content of the permitted traffic. For example, all connection requests to a Web server in a demilitarized zone (DMZ) may be permitted by a misconfigured firewall, including malicious traffic designed to exploit a buffer overflow vulnerability in an HTTP server. While some firewalls may not protect against data- or content-driven attacks, an IDS will. An IDS analyzes packet datastreams within a network, searching for unauthorized activity. Furthermore, firewalls typically will not protect you against attacks originating from inside your network or entering your environment from a nonfirewalled ingress point, such as a remote access server. IDS appliances can be strategically deployed to monitor activity from internal sources and other network ingress points without impacting your network performance. Today, network administrators have the choice of deploying dedicated IDS appliances such as the Cisco Secure 4210 IDS appliance and the Catalyst® 6000 IDS module, or turning on IDS capabilities inherent in Cisco IOS® routers and PIX firewalls (see "Security Blanket: Weaving Security into the Network Fabric," page 61).

Which PIX Is Right for You?

From the home office to the central office, there's a Cisco Secure PIX Firewall to meet any environment's security and virtual private network (VPN) requirements.

Cisco Secure PIX 506
Remote office or branch office
Throughput: 9 Mbps
Sessions: 1000
CPU: 200MHz
Interfaces: 2

Cisco Secure PIX 515
Small and midsized business
Throughput: 170 Mbps
Sessions: 128,000
CPU: 200MHz
Interfaces: up to 6

Well-Bred Family

The new PIX 535 extends the line of the market-leading Cisco Secure PIX Firewall family. All PIX firewalls offer built-in IP security (IPsec) encryption, allowing secure site-to-site connectivity or deployment of secure, remote-access VPNs. Like other PIX models, the PIX 535 also supports redundant units with stateful failover capabilities to ensure continued secure processing should the primary unit experience a problem.

Booster Shot—the VPN Accelerator Card

The new VPN accelerator card for the Cisco Secure PIX Firewall family improves the performance of VPNs by offloading IPsec encryption functions from the central firewall processor to dedicated hardware. Installed in a PCI slot inside the PIX chassis, the card works transparently and does not require activation commands nor configuration changes. It is quite literally a "plug and play" process.

The VPN accelerator card encrypts data using the Data Encryption Standard (DES) and Triple DES algorithms at speeds up to 100 Mbps. By handling IPsec-related tasks such as hashing, key exchange, and storing security associations, the card frees the PIX main processor and memory for other perimeter security functions. ▲▲

Fools for Security

The Motley Fool recently selected Cisco Secure PIX firewalls to secure its popular financial Web site, Fool.com. The Fool's IT department evaluated several software-based solutions, but decided against them because they were based on general-purpose operating systems. The evaluation team's preference was to go with a robust, hardened, VPN-enabled firewall appliance that wasn't as susceptible to the types of bugs, glitches and vulnerabilities often associated with other firewalls.

"Cisco's PIX is exactly what we wanted," explained Joel Salamone, MIS Director for The Motley Fool. "There is no extraneous software cluttering the operating system that can be exploited." The PIX family's similar management interface and configuration also shortened training time, and guaranteed easier administration. In addition, the number of maximum possible connections running through PIX was more than enough to accommodate the Fool's global network needs. "One of the things we really like about the PIX," said Dwight Gibbs, Chief Technology Officer for The Motley Fool, "is that it enabled us to quickly and inexpensively roll out a VPN linking our offices in the US, UK, and Germany. We can now collaborate securely thanks to the PIX."

Cisco Secure PIX 520
Enterprise
Throughput: 370 Mbps
Sessions: 250,000
CPU: 350 MHz
Interfaces: up to 6

Cisco Secure PIX 525
Large enterprise
Throughput: 370 Mbps
Sessions: 280,000
CPU: 600 MHz
Interfaces: up to 8

Cisco Secure PIX 535
Large enterprise and service provider
Throughput: 1.0 Gbps
Sessions: 500,000
CPU: 1 GHz
Interfaces: up to 8

Cisco Systems

Data Sheet

Cisco PIX **525** Security Appliance

The Cisco PIX® 525 Security Appliance delivers enterprise-class security for medium-to-large enterprise networks in a reliable, purpose-built appliance. Its modular two-rack unit (2RU) design supports up to eight 10/100 Fast Ethernet interfaces or three Gigabit Ethernet interfaces, making it an ideal choice for businesses requiring a resilient, high performance, Gigabit Ethernet-ready solution that provides solid investment protection. Part of the world-leading Cisco PIX Security Appliance Series, the Cisco PIX 525 Security Appliance provides a wide range of rich integrated security services, hardware VPN acceleration capabilities, and powerful remote management capabilities in a cost-effective, highly-resilient solution.

Enterprise-Class Security for Medium-to-Large Enterprise Networks

The Cisco PIX 525 Security Appliance delivers a multilayered defense for large enterprise networks through rich, integrated security services including stateful inspection firewalling, protocol and application inspection, virtual private networking (VPN) in-line intrusion protection and rich multimedia and voice security in a single device. The state-of-the-art Cisco Adaptive Security Algorithm (ASA) provides rich stateful inspection firewall services, tracking the state of all authorized network communications and preventing unauthorized network access.

Enterprise networks benefit from an additional layer of security via intelligent, "application-aware" security services that examine packet streams at Layers 4–7, using inspection engines specialized for many of today's popular applications. Administrators can also easily create custom security policies for firewall traffic by using the flexible access control methods and the more than 100 predefined applications, services, and protocols that Cisco PIX Security Appliances provide.

Market-Leading Voice-over-IP Security Services Protect Next-Generation Converged Networks

Cisco PIX Security Appliances provide market-leading protection for a wide range of voice-over-IP (VoIP) and multimedia standards, allowing businesses to securely take advantage of the many benefits that converged data, voice, and video networks deliver. By combining VPN with the rich stateful inspection firewall services that Cisco PIX Security Appliances provide for these converged networking standards, businesses

can securely extend voice and multimedia services to home office and remote office environments for additional cost savings, improved productivity, and competitive advantage.

Flexible VPN Services Extend Networks Economically to Remote Networks and Mobile Users

Businesses can securely extend their networks across low-cost Internet connections to mobile users, business partners, and remote offices worldwide using the full-featured VPN capabilities provided by the Cisco PIX 525 Security Appliance. Solutions range from standards-based site-to-site VPN leveraging the Internet Key Exchange (IKE) and IP security (IPsec) VPN standards, to the innovative Cisco Easy VPN capabilities found in Cisco PIX Security Appliances and other Cisco security solutions—such as Cisco IOS® routers and Cisco VPN 3000 Series Concentrators. Easy VPN delivers a uniquely scalable, cost-effective, and easy-to-manage remote-access VPN architecture that eliminates the operational costs associated with maintaining remote-device configurations typically required by traditional VPN solutions. Cisco PIX Security Appliances encrypt data using 56-bit Data Encryption Standard (DES), 168-bit Triple DES (3DES), or up to 256-bit Advanced Encryption Standard (AES) encryption. Certain Cisco PIX 525 Security Appliance models have integrated hardware VPN acceleration capabilities, delivering highly scalable, high performance VPN services.

Integrated Intrusion Protection Guards Against Popular Internet Threats

The integrated in-line intrusion-protection capabilities of the Cisco PIX 525 Security Appliance can protect enterprise networks from many popular forms of attacks, including Denial-of-Service (DoS) attacks and malformed packet attacks. Using a wealth of advanced intrusion-protection features, including DNSGuard, FloodGuard, FragGuard, MailGuard, IPVerify and TCP intercept, in addition to looking for more than 55 different attack "signatures," Cisco PIX Security Appliances keep a vigilant watch for attacks, can optionally block them, and can notify administrators about them in real time.

Award-Winning Resiliency Provides Maximum Business Uptime

Select models of Cisco PIX 525 Security Appliances provide stateful failover capabilities that ensure resilient network protection for enterprise network environments. Employing a cost-effective, active-standby, high-availability architecture, Cisco PIX Security Appliances that are configured as a failover pair continuously synchronize their connection state and device configuration data. Synchronization can take place over a high-speed LAN connection, providing another layer of protection through the ability to geographically separate the failover pair. In the event of a system or network failure, network sessions are automatically transitioned between appliances, with complete transparency to users.

Robust Remote-Management Solutions Lower Total Cost of Ownership

The Cisco PIX 525 Security Appliance is a reliable, easy-to-maintain platform that provides a wide variety of methods for configuring, monitoring, and troubleshooting. Management solutions range from centralized, policy-based management tools to integrated, Web-based management to support for remote monitoring protocols such as Simple Network Management Protocol (SNMP) and syslog.

Paula

Administrators can easily manage large numbers of remote Cisco PIX Security Appliances using CiscoWorks VPN/ Security Management Solution (VMS). This suite consists of numerous modules including Management Center for Firewalls, Auto Update Server Software and Security Monitor. This powerful combination provides a highly scalable, next-generation, three-tier management solution that includes the following features:

- Comprehensive configuration and software image management
- Device hierarchy with "Smart Rules"-based configuration inheritance
- Customizable administrative roles and access privileges
- Comprehensive enterprise change management and auditing
- "Touchless" software image management for remote Cisco PIX Security Appliances
- Support for dynamically addressed appliances

Additional integrated event management and inventory solutions are also available as part of the CiscoWorks VMS network management suite.

The Integrated Cisco PIX Device Manager provides an intuitive, Web-based management interface for remotely configuring, monitoring, and troubleshooting a Cisco PIX 525 Security Appliance—without requiring any software (other than a standard Web browser) to be installed on an administrator's computer. A setup wizard is provided for easy installation into any network environment.

Alternatively, through methods including Telnet and Secure Shell (SSH), or out of band through a console port, administrators can remotely configure, monitor, and troubleshoot Cisco PIX Security Appliances using a command-line interface (CLI).

Table 1 Key Product Features and Benefits

Key Features	Benefit
Enterprise-Class Security	
True security appliance	• Uses a proprietary, hardened operating system that eliminates security risks associated with general purpose operating systems • Cisco quality and no moving parts provide a highly reliable security platform
Stateful inspection firewall	• Provides perimeter network security to prevent unauthorized network access • Uses state-of-the-art Cisco ASA for robust stateful inspection firewall services • Provides flexible access-control capabilities for over 100 predefined applications, services and protocols, with the ability to define custom applications and services • Includes numerous application-aware inspection engines that secure advanced networking protocols such as H.323 Version 4, Session Initiation Protocol (SIP), Cisco Skinny Client Control Protocol (SCCP), Real-Time Streaming Protocol (RTSP), Internet Locator Service (ILS), and more • Includes content filtering for Java and ActiveX applets
Easy VPN Server	• Provides remote access VPN concentrator services for a wide variety of Cisco software or hardware-based VPN clients • Pushes VPN policy dynamically to Cisco Easy VPN Remote-enabled solutions upon connection, ensuring the latest corporate security policies are enforced • Extends VPN reach into environments using Network Address Translation (NAT) or Port Address Translation (PAT), via support of Internet Engineering Task Force (IETF) UDP-based draft standard for NAT traversal

Table 1 Key Product Features and Benefits

Key Features	Benefit
Site-to-site VPN	• Supports IKE and IPsec VPN standards • Ensures data privacy/integrity and strong authentication to remote networks and remote users over the Internet • Supports 56-bit DES, 168-bit 3DES and up to 256-bit AES data encryption to ensure data privacy
Intrusion protection	• Provides protection from over 55 different types of popular network-based attacks ranging from malformed packet attacks to DoS attacks • Integrates with Cisco Network Intrusion Detection System (IDS) sensors for the ability to dynamically block/shun hostile network nodes via the firewall
AAA support	• Integrates with popular authentication, authorization, and accounting services via TACACS+ and RADIUS support • Provides tight integration with Cisco Secure Access Control Server (ACS)
X.509 certificate and CRL support	• Supports SCEP-based enrollment with leading X.509 solutions from Baltimore, Entrust, Microsoft, and VeriSign
Integration with leading third-party solutions	• Supports the broad range of Cisco AVVID (Architecture for Voice, Video and Integrated Data) partner solutions that provide URL filtering, content filtering, virus protection, scalable remote management, and more
Robust Network Services/Integration	
Virtual LAN (VLAN)-based virtual interfaces	• Provides increased flexibility when defining security policies and eases overall integration into switched network environments by supporting the creation of logical interfaces based on IEEE 802.1q VLAN tags, and the creation of security policies based on these virtual interfaces • Supports multiple virtual interfaces on a single physical interface through VLAN trunking • Supports multiple VLAN trunks per Cisco PIX Security Appliance • Supports up to 10 VLANs on Cisco PIX 525 Security Appliances
Open Shortest Path First (OSPF) dynamic routing	• Provides comprehensive OSPF dynamic routing services using technology based on world-renowned Cisco IOS Software • Offers improved network reliability through fast route convergence and secure, efficient route distribution • Delivers a secure routing solution in environments using NAT through tight integration with Cisco PIX Security Appliance NAT services • Supports MD5-based OSPF authentication, in addition to plaintext OSPF authentication, to prevent route spoofing and various routing-based DoS attacks • Provides route redistribution between OSPF processes, including OSPF, static, and connected routes • Supports load balancing across equal-cost multipath routes
DHCP server	• Provides DHCP Server services one or more interfaces for devices to obtain IP addresses dynamically • Includes extensions for support of Cisco IP Phones and Cisco SoftPhone IP telephony solutions
DHCP relay	• Forwards DHCP requests from internal devices to an administrator-specified DHCP server, enabling centralized distribution, tracking, and maintenance of IP addresses
NAT/PAT support	• Provides rich dynamic/static NAT and PAT capabilities

2535
Paula

Table 1 Key Product Features and Benefits

Key Features	Benefit
Rich Remote Management Options	
CiscoWorks VPN/ Security Management Solution (CiscoWorks VMS)	• Comprehensive management suite for large scale deployments • Integrates policy management, software maintenance, and security monitoring
PIX Device Manager (PDM)	• Intuitive, Web-based GUI enables simple, secure remote management of Cisco PIX Security Appliances • Provides wide range of informative, real-time, and historical reports which give critical insight into usage trends, performance baselines, and security events
Auto Update	• Provides "touchless" secure remote management of Cisco PIX Security Appliance configuration and software images via a unique push/pull management model • Next-generation secure XML/HTTPS management interface can be leveraged by Cisco and third-party management applications for remote Cisco PIX Security Appliance configuration management, inventory, software image management/deployment and monitoring • Integrates seamlessly with CiscoWorks Management Center for Firewalls and Auto Update Server for robust, scalable remote management of up to 1000 Cisco PIX Security Appliances (per management server)
Cisco PIX CLI	• Allows customers to use existing PIX CLI knowledge for easy installation and management without additional training • Accessible through variety of methods including console port, Telnet, and SSH
Command-level authorization	• Enables businesses to create up to 16 customizable administrative roles/profiles for accessing Cisco PIX Security Appliances (for example, monitoring only, read-only access to configuration, VPN administrator, firewall/NAT administrator, and so on) • Leverages either the internal administrator database or outside sources via TACACS+, such as Cisco Secure ACS
SNMP and syslog support	• Provide remote monitoring and logging capabilities, with integration into Cisco and third-party management applications
Flexible Expansion Capabilities	
Fast Ethernet and Gigabit Ethernet expansion options	• Supports easy installation of additional network interfaces via 3 PCI expansion slots • Supports expansion cards including single-port Fast Ethernet card, 4-port Fast Ethernet card, and single-port Gigabit Ethernet card
Hardware VPN acceleration options	• Delivers high speed VPN services via support of VPN Accelerator Card (VAC) and VPN Accelerator Card+ (VAC+)

License Options

The Cisco PIX 525 Security Appliance is available in three primary models that provide different levels of interface density, failover capabilities, and VPN throughput.

Restricted Software License

The Cisco PIX 525 "Restricted" (PIX 525-R) model provides an excellent value for organizations looking for robust Cisco PIX Security Appliance services with Gigabit Ethernet support, medium interface density, and moderate VPN throughput requirements. It includes 128 MB of RAM and support for up to six 10/100 Fast Ethernet or three Gigabit Ethernet interfaces.

Unrestricted Software License

The PIX 525 "Unrestricted" (PIX 525-UR) model extends the capabilities of the family with support for stateful failover, additional LAN interfaces, and increased VPN throughput via integrated hardware-based VPN acceleration. It includes an integrated VAC or VAC+ hardware VPN accelerator, 256 MB of RAM, and support for up to eight 10/100 Fast Ethernet or three Gigabit Ethernet interfaces. The Cisco PIX 525-UR also adds the ability to share state information with a hot-standby Cisco PIX Security Appliance for resilient network protection.

Failover Software License

The Cisco PIX 525 "Failover" (PIX 525-FO) model is designed for use in conjunction with a PIX 525-UR, providing a cost-effective, high-availability solution. It operates in hot-standby mode acting as a complete redundant system that maintains current session state information. With the same hardware configuration as the Cisco PIX 525-UR, it delivers the ultimate in high availability for a fraction of the price.

Performance Summary

Cleartext throughput: 330 Mbps

Concurrent connections: 280,000

168-bit 3DES IPsec VPN throughput: Up to 155 Mbps with VAC+ or 72 Mbps with VAC

128-bit AES IPsec VPN throughput: Up to 165 Mbps with VAC+

256-bit AES IPsec VPN throughput: Up to 170 Mbps with VAC+

Simultaneous VPN tunnels: 2000

Technical Specifications

Processor: 600-MHz Intel Pentium III Processor

Random access memory: 128 MB or 256 MB of SDRAM

Flash memory: 16 MB

Cache: 256 KB level 2 at 600 MHz

System bus: Single 32-bit, 33-MHz PCI

Environmental Operating Ranges

Operating

Temperature: –25° to 104°F (–5° to 40°C)

Relative Humidity: 5% to 95%, noncondensing

Altitude: 0 to 6500 ft (2000 m)

Shock: 1.14 m/sec (45 in./sec) 1/2 sine input

Vibration: 0.41 Grms2 (3–500 Hz) random input

Acoustic Noise: 45 dBa maximum

Nonoperating

Temperature: –13° to 158°F (–25° to 70°C)

Relative Humidity: 5% to 95%, noncondensing

Altitude: 0 to 15,000 ft (4570 m)

Shock: 30G

Vibration: 0.41 Grms2 (3–500 Hz) random input

Power

Input (per power supply)

Range Line Voltage: 100V to 240V AC or 48V DC to 60V DC

Nominal Line Voltage: 100V to 240V AC or 48V DC to 60V DC

Current: 5–2.5 Amps AC or 12 Amps DC

Frequency: 50 to 60 Hz, single phase

Output

Steady State: 50W

Maximum Peak: 65W

Maximum Heat Dissipation: 410 BTU/hr, full power usage (65W)

Physical Specifications

Dimensions and Weight Specifications

Form factor: 2 RU, standard 19-in. rack mountable

Dimensions (H x W x D): 3.5 x 17.5 x 18.25 in. (8.89 x 44.45 x 46.36 cm)

Weight (one power supply): 32 lb (14.5 kg)

Data Sheet

Firewall Services Module for Cisco Catalyst® 6500 Series and Cisco 7600 Series

The Firewall Services Module (FWSM)—a high-speed, integrated firewall module for Cisco Catalyst® 6500 switches and Cisco 7600 Series routers—provides the fastest firewall data rates in the industry: 5 Gb throughput, 100,000 CPS, and 1M concurrent connections. Up to four FWSMs can be installed in a single chassis providing scalability to 20 GB per chassis. As part of the world-leading Cisco PIX® Firewall family, the FWSM provides large enterprises and service providers with unmatched security, reliability, and performance.

The FWSM leverages Cisco PIX technology and runs the Cisco PIX Operating System (OS), a real-time, hardened, embedded system that eliminates security holes and performance-degrading overhead. At the heart of the system, a protection scheme based on the Adaptive Security Algorithm (ASA) offers stateful connection-oriented firewalling. Using ASA, the FWSM creates a connection table entry for a session flow based on the source and destination addresses, randomized TCP sequence numbers, port numbers, and additional TCP flags. The FWSM controls all inbound and outbound traffic by applying the security policy to these connection table entries.

Figure 1

Major FWSM Benefits

The traditional role of firewalls has changed. Firewalls now do more than protect a corporate network from unauthorized external access. They can also prevent unauthorized users from accessing a particular subnet, workgroup or LAN within a corporate network. FBI statistics indicate that 70 percent of all security problems originate from inside an organization. According to one in five respondents to the FBI's survey, intruders broke into, or tried to break into their corporate networks during the preceding 12 months. And most experts agree that the majority of network break-ins go undetected.

Integrated Module

Installed inside a Cisco Catalyst 6500 Series Switch or Cisco 7600 Internet Router, the FWSM allows any port on the device to operate as a firewall port and integrates stateful firewall security inside the network infrastructure. This becomes especially important where rack space is at a premium. The Cisco Catalyst 6500 truly emerges as the IP services switch of choice for customers requiring intelligent services

such as firewall services, intrusion detection, and virtual private networking (VPN), along with multilayer LAN, WAN, and MAN switching capabilities.

Future Proof

The FWSM can handle up to 5 Gb of traffic, providing unsurpassed performance to meet future requirements without requiring a system overhaul. Up to three additional FWSMs can be added to the Catalyst 6500 to meet growing demands.

Reliability

The FWSM is based on Cisco PIX technology and uses the same time-tested Cisco PIX Operating System, a secure, real-time operating system. The FWSM offers a unique combination of performance and security on the same platform, using proven Cisco PIX technology for inspecting packets.

Lower Cost of Ownership

The FWSM offers the best price/performance of any firewall. Cost of maintenance is included in the SmartNet™ contract of the Cisco Catalyst chassis. Because the FWSM is based on the Cisco PIX Firewall, the cost of training and management is lower, and because it is integrated in the chassis, there are fewer boxes to manage.

Ease of Use

The Cisco PIX Device Manager's intuitive graphical user interface (GUI) can be used to manage and configure the FWSM. The FWSM is supported by the Cisco management framework and by Cisco AVVID (Architecture for Voice, Video and Integrated Data) partners for configuration and monitoring.

FWSM Features

Key Features	Benefits
Performance	• 5 Gbps • 1 million concurrent connections • More than 100,000 connection setup and teardowns/sec
Multiple Interfaces	• Supports up to 100 firewall VLANs—any of the Cisco Catalyst 4000 VLANs can be a firewall VLAN • Understands 802.1q and Inter-Switch Link (ISL) protocols
Cut-through Proxies	Enforces security policies on a per VLAN basis

Key Features	Benefits
Configuration Support	• Console to command-line interface (CLI) • Telnet to the inside interface of the Cisco PIX Firewall • Telnet over IP Security (IPSec) to the outside interface of the Cisco PIX Firewall • Secure Shell Protocol (SSH) to CLI • Secure Sockets Layer (SSL) to Cisco PIX Device Manager
AAA Support	Integrates with popular authentication, authorization, and accounting services via TACACS+ and RADIUS support
NAT/PAT Support	Provides dynamic/static Network Address Translation (NAT) and Port Address Translation (PAT)
Cisco PIX Device Manager (PDM)	• Simple, intuitive, Web-based GUI supports remote firewall management • Wide range of real-time and historical reports providing usage trend, performance baseline, and security event information
Secure Network Management	Secure, Triple Data Encryption Standard (3DES)-encrypted network management access
Access Lists	• Up to 128,000 access lists
URL Filtering	Uses Websense software to check outgoing URL requests with the policies defined on the server
Command Authorization	Allows privilege levels to be assigned to all CLI, and creation of user accounts or login contexts tied to these privilege levels
Object Grouping	Ability to group network objects (e.g., hosts) and services (e.g., ftp and http)
Protection from DoS	• DNS Guard • Flood Defender • Flood Guard • TCP Intercept • Unicast Reverse Path Forwarding • Mail Guard • FragGuard and Virtual Reassembly
Routing	• Static routes • Dynamic; i.e., Routing Interface Protocol (RIP) and Open Shortest Path First (OSPF)
High Availability	Stateful failover—intra and interchassis
Logging	Comprehensive syslogging, FTP, URL, and ACL logging
Additional Protocols	• H.323 V2 • NetBios over IP • RAS Version 2 • RTSP • SIP • XDMCP • Skinny

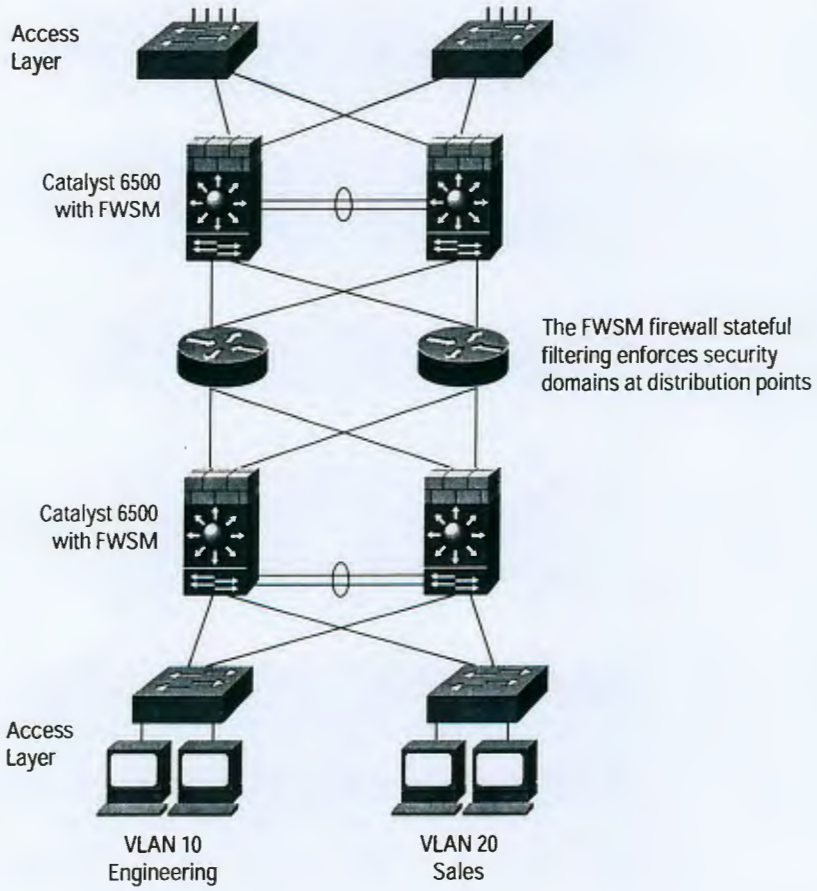
FWSM Deployment

The FWSM can be deployed in topologies serving enterprise campuses and data centers.

Today's Enterprises need more than just perimeter security—they need to connect business partners and provide campus security domains that serve multiple groups within the organizations. The FWSM provides a flexible, cost-effective and performance-based solution by allowing users and administrators to establish security domains with different policies within the organization. Figure 2 shows a campus deployment using stateful filtering to establish separate VLAN-based security domains:

Figure 2
Campus Deployment



Using the FWSM, users can set appropriate policies for different VLANs.

Data Centers also require stateful firewall security solutions to protect data while delivering gigabit performance at the lowest possible cost. Figure 2 shows a data center with redundant FWSMs protecting server data.

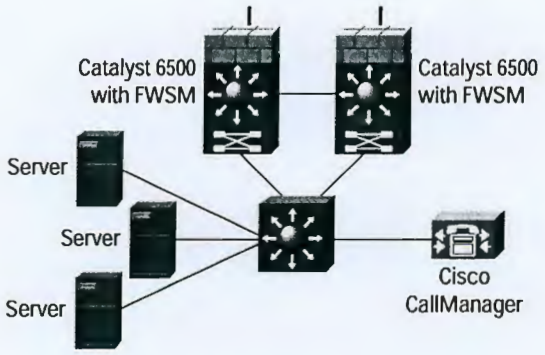
Figure 3
eCommerce Data Center Deployment



The FWSM maximizes capital investment by providing the best price/performance in a firewall and allows customers to replace expensive multiple firewalls that require additional firewall load balancer devices.

Ordering Information

Product Number	Description
WS-SVC-FWM-1-K9	Firewall Service Module for Cisco Catalyst 6500
WS-SVC-FWM-1-K9=	Firewall Service Module for Cisco Catalyst 6500 (spare)
SC-SVC-FWM-1.1-K9	Firewall Module Software for Catalyst 6500
SC-SVC-FWM-1.1-K9=	Firewall Module Software for Catalyst 6500 (spare)

Licensing

No licensing is required for the FWSM.

System Requirements

- Supervisor 2/Multilayer Switch Feature Card 2 (MSFC2)
- Native Cisco IOS® software release 12.1(13)E or higher
- Hybrid CatOS minimum software release 7.5(1)
- Occupies one slot in a Cisco Catalyst 6500 Series Switch or Cisco 7600 Series Internet Router
- Up to four firewall modules in the same chassis

Q & A

Firewall Services Module for the Cisco Catalyst 6500 Series Switch and Cisco 7600 Series Internet Router

Q. What is the Firewall Services Module?

A. The Firewall Services Module (FWSM) is a Catalyst 6500 Series multigigabit firewall module. The FWSM is a fabric-enabled module capable of interacting with both the bus as well as the switch fabric. The FWSM provides stateful firewall functionality in a Cisco Catalyst 6500 Series Switch and Cisco 7600 Series Internet Router.

Q. What are the key features of the FWSM?

A. Key FWSM features:

- High-performance, OC-48 or 5 Gbps throughput, full-duplex firewall functionality
- Includes entire PIX 6.0 software feature set and the following features of PIX 6.2:
  - Command authorization
  - Object grouping
  - ILS/NetMeeting fixup
  - URL filtering enhancement
- 3M pps throughput
- Support for 100 VLANs
- 1M concurrent connections
- LAN failover: active/standby, inter/intra chassis
- Dynamic Routing with OSPF/RIP
- Supports multiple modules per chassis

Q. What is the difference between the Firewall Services Module (FWSM) and the Cisco PIX® Firewall?

A. The FWSM is an integrated module for the Cisco Catalyst 6500 Series Switch and the Cisco 7600 Series Internet Router—unlike the standalone Cisco PIX® Firewall.

The FWSM is based on Cisco PIX technology.

Q. What operating system does the FWSM run?

A. The FWSM and Cisco PIX Firewall run the same operating system: Finesse, the real-time operating system. Finesse, which is a true microkernel, provides software reusability, source-code portability, increased product quality, decreased testing, shorter time to market, and increased return on investment.

Q. What mechanism does the FWSM use to inspect traffic?

A. The FWSM uses the same algorithm for inspection as the Cisco PIX Firewall: Adaptive Security Algorithm (ASA). ASA is a stateful inspection engine that inspects traffic integrity. ASA takes the source and destination addresses and ports, TCP sequence numbers, and additional TCP flags and hashes the IP header information. Hashing works like a fingerprint, creating a code that uniquely identifies the client that initiates the inbound or outbound connection.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0354
Doc: 3791

For further ASA documentation refer to:

http://www.cisco.com/univercd/cc/td/doc/product/iaabu/pix/pix_60/config/intro.htm

Q. What are the feature differences between the Cisco PIX Firewall and the FWSM?

A. The FWSM supports all Cisco PIX Firewall version 6.0 features and select version 6.2 features. The following table lists general differences. For a detailed description of differences, refer to the "Cisco PIX vs. Firewall Module Differences" document (http://www.cisco.com/en/US/products/hw/modules/ps2706/ps4452/index.html).

Q. What is the performance of the FWSM?

A. Aggregate performance is approximately 5 Gbps. The FWSM can support one million concurrent connections with a setup rate of more than 100,000 connections per second.

Q. What are some of the typical deployments for a Catalyst 6500 with FWSM?

A. Cisco Catalyst 6500 Series combined with the FWSM offers the highest performing firewall function to date—allowing corporations to collapse mission critical firewall functions into a switch chassis, reducing the number of discrete firewalls and simplifying the management of multiple firewalls. The FWSM is deployed at the enterprise campus edge and at distribution points.

A. What are the minimum software releases required for the FWSM?

A. The minimum IOS software release is Release 12.1(13)E and the minimum hybrid CatOS software release is 7.5(1)

Q. Is FWSM fabric enabled?

A. Yes. The FWSM is fabric-enabled. It has one connection to the bus and one connection to the switch fabric.

Q. Does the FWSM use Hot Standby Resource Protocol (HSRP) for redundancy?

A. No, primary and redundant FWSMs use the same protocol as the Cisco PIX Firewall for exchanging logical updates and stateful information.

Q. How is traffic sent to the FWSM? Does the module have any external ports?

A. There are no external ports on the FWSM. Some of the virtual LANs (VLANs) carrying traffic are assigned to the FWSM, and traffic on those VLANs is protected by firewalls.

Q. Does the FWSM support redundancy?

A. Stateful firewall failover is available at FCS. The FWSM is designed to work with the PIX stateful failover feature. The FWSM module can be installed in the same or a different Catalyst 6500 Series switch.

Q. Does the FWSM support Routing Protocols?

A. Yes. It supports Open Shortest Path First (OSPF) and Routing Interface Protocol (RIP).

Q. When ordering the FWSM, what product numbers should I use?

A. The product numbers for the FWSM are:

Product Number	Description
WS-SVC-FWM-1-K9	Firewall Service Module for Cisco Catalyst 6500
WS-SVC-FWM-1-K9=	Firewall Service Module for Cisco Catalyst 6500 (spare)
SC-SVC-FWM-1.1-K9	Firewall Module Software for Catalyst 6500
SC-SVC-FWM-1.1-K9=	Firewall Module Software for Catalyst 6500 (spare)

Q. Does the FWSM have any licensing options?

A. No, there are no licensing options with the module, either restricted or unrestricted.

Q. What Triple Data Encryption Standard (3DES) software does the FWSM use?

A. The encryption on the FWSM is used only for network management purposes. You cannot use the 3DES software on the module for remote access or site-to-site tunnel termination.

Q. Is 3DES software included with the module software or do I need to order it separately?

A. 3DES comes bundled with the software image. You do not have to order it separately.

Q. How much Flash and DRAM memory is available on board and can I upgrade the DRAM?

A. The Flash size on the FWSM is 128 MB and the DRAM memory is 1 GB. Memory is not field upgradable.

Q. What certifications are available for the FWSM?

A. We expect to have ICSA certifications by Q4CY02.

Q. Can I terminate remote virtual private networking (VPN) users on the FWSM?

A. No, the FWSM does not provide VPN capabilities.

Cisco Systems, Inc.

RQS Nº 03/2005 - CN
CRMI - CORREIOS
0355
Fls:
3701
Doc:

Q. Can I put multiple modules in the same chassis?

A. Yes, up to four modules per chassis.

Q. Does the FWSM support multicast?

A. The initial release does not support multicast, but multicast support is on the roadmap.

Q. Can I install and run the FWSN with the IPSec VPN accelerator module in the same chassis?

A. No. The IOS images for initial release are incompatible, so the modules cannot be installed in the same chassis.

Q. Does the FWSM support the IDSM Intrusion Detection module?

A. The Firewall Services Module and IDS module can coexist in the same chassis. Since the IDS module is a passive device, VLANs that are firewalled can also be spanned to the IDS module for intrusion detection.

Q. Does the FWSM provide Denial of Service/DDoS detection and management?

A. Thresholds, logging, and settings may be configured based on protocol or address.

Q. What Denial of Service attacks can the FWSM detect?

A. It detects the following attacks:

- ICMP Flood
- UDP Flood
- Ping of Death
- IP Spoofing
- IP Source Route Option

Q. Does the FWSM support the IP source route filter option?

A. IP source route filtering is provided in IOS.

Q. Can the FWSM support URL/HTTP filtering?

A. Yes, in conjunction with web filtering tools like Websense.

Q. What is the default security posture of the FWSM?

A. The FWSM denies all packets in all directions, including pings from the management interface.

Q. Does the FWSM provide high availability active/active support?

A. FWSM provides active/passive support today. Active/active is currently under investigation.

Q. Does the FWSM active/passive redundancy feature provide hitless failover?

A. Yes.

Q. Does the FWSM support traffic shaping?

A. Traffic shaping is supported via the Catalyst 6500 line cards, which provide the VLAN interfaces to the FWSM.

Q. Does the FWSM support QoS mechanisms and rate limiting?

A. Yes, it supports all Catalyst 6500 QoS capabilities.

Q. Does the FWSM support secure out-of-band management?

A. Yes, via IPSec on the management VLAN.

Q. Does FWSM support Traceroute and ping?

A. Yes, if explicitly allowed. Not supported by default.

Q. What application should be used to configure the FWSM and monitor syslog traffic?

A. At initial release, the FWSM is managed via CLI and the Cisco PIX Device Manager (PDM). PDM uses wizard-based menus to guide users through firewall configuration. For more information, visit:

http://www.cisco.com/warp/public/cc/pd/nemnsw/vpdvmn/index.shtml

In addition the FWSM is supported by Cisco AVVID partners.

rt Serial Connector Cables

The following cables are specific to the new dual-serial port WAN interface cards and feature Cisco's new, compact, high-density Smart Serial connector to support a wide variety of electrical interfaces when used with the appropriate transition cable. Two cables are required to support the two ports on the WIC. Each port on a WIC can support a different physical interface (protocol and DTE/DCE).

9: Smart Serial Connector Cables

erface Card	Cable Type	Product Number	Length	Gender

translate lat

To translate a connection request to another protocol connection type when receiving a local-area transport (LAT) request, use the **translate lat** command in global configuration mode. To remove or change the translation request, use the **no** form of this command.

translate lat *incoming-service-name* [*incoming-options*] *protocol outgoing-address* [*outgoing-options*] [*global-options*]

no translate lat *incoming-service-name* [*incoming-options*] *protocol outgoing-address* [*outgoing-options*] [*global-options*]

Syntax Description

incoming-service-name	A LAT service name. When used on the incoming portion of the command, *incoming-service-name* is the name of the service that users specify when trying to make a translated connection. This name can match the name of the final destination resource, but is not required to. This argument is useful when making remote translated connections.
incoming-options	(Optional) An incoming connection request option. For LAT, the only option currently supported is: • **unadvertised**—Prevents service advertisements from being broadcast to the network. This keyword can be useful, for example, when you define translations for many printers, and you do not want these services advertised to other LAT terminal servers. (VMS systems will be able to connect to the service even though it is not advertised.)
protocol outgoing-address	A protocol name followed by an address or host name. Protocol translation choices are: **ppp**, **slip**, **tcp**, and **x25**. **Note** The host name is resolved to an address during configuration, unless you are translating to TCP and use the **host-name** keyword, which allows the host name to be resolved at connection time instead of configuration time. See Table 38 for more information about the **host-name** keyword. Additional keywords that can be entered with the protocol are as follows: • **autocommand**—Specifies an EXEC command for an outgoing connection. The command executes upon connection to a host. You can issue any EXEC command and any switch or host name as an argument to the **autocommand** command. If the string following **autocommand** has one or more spaces as part of the string, you must place quotation marks (" ") around the string.

CPMI TR-155 0361 Fls: 3701 Doc:

	If you want to enable AppleTalk Remote Access (ARA) on an outgoing connection, specify the **autocommand arap** keywords. These keywords are necessary for ARA because ARA does not use addressing, and this option permits you to invoke the ARA string. • **virtual-template**—Associates a virtual template with a virtual access interface. See the **translate lat (virtual access interfaces)** command description for more information.
outgoing-options	(Optional) Outgoing connection request options. Choices depend upon the protocol or command entered. See Table 36, Table 37, Table 38, and Table 39 for more information.
global-options	(Optional) One or more of the following translation options can be used by any connection type: • **access-class** *number*—Allows the incoming call to be used by source hosts that match the access list parameters. The argument *number* is an integer previously assigned to an access list. Standard access list numbers are in the range from1 to 99; expanded standard access lists numbers are in the range 1300 to 1999. • **local**—Allows Telnet protocol negotiations to *not* be translated. • **login**—Requires that the user log in before the outgoing connection is made. This type of login is specified on the virtual terminal lines with the **login** command. • **max-users** *number*—Limits the number of simultaneous users of the translation to *number* (an integer you specify). • **quiet**—Suppresses printing of user-information messages.

Defaults

No default translation parameters

Command Modes

Global configuration

Command History

Release	Modification
10.0	This command was introduced.
12.1	The **no-reset** permanent virtual circuits (PVC) subkeyword was added to support outgoing PVCs.

Usage Guidelines

You define protocol translation connections by supplying a protocol keyword and the address, host name, or service name. A LAT protocol translation command can be as simple as the following example:

```
Router(config)# translate lat LAT-1 X.25 1236672
```

However, the Cisco IOS software provides a broad range of options that support protocol translations in many networking environments. Table 36, Table 37, Table 38, and Table 39 list the **translate lat** translation options by protocol.

You can also use the Cisco IOS command-line interface to help you understand how these keywords are entered. In global configuration mode, begin entering the **translate** command and add a question mark at each portion of the command to display the options available. Some examples follow:

```
Router(config)# translate lat ?

  WORD  LAT service name

Router(config)# translate lat LSVC ?

  autocommand       Associate a command with a translation on this connections
  lat               DEC LAT protocol
  ppp               Virtual async PPP
  slip              Virtual async SLIP
  tcp               TCP/IP Telnet
  unadvertised      Prevent service advertisements from being broadcast to the
                    network
  virtual-template  Associate a virtual template with virtual access interface
  x25               X.25

Router(config)# translate lat LSVC tcp ?

  Hostname or A.B.C.D  IP address

Router(config)# translate lat LSVC tcp 1.1.1.1 ?

  access-class      Allow access list parameters to be used by source hosts
  binary            Negotiate Telnet binary mode on the connection
  host-name         Store the host name rather than its IP address
  local             Allow Telnet protocol negotiations not to be translated
  login             Require that the user log in before the outgoing connection
                    is made
  max-users         Limit the number of simultaneous users of the translation
  multibyte-IAC     Always treat multiple IACs as telnet command
  port              Port Number
  quiet             Suppress printing of user-information messages
  source-interface  Specify source interface
  stream            Treat telnet escape characters as data
```

Note If you plan to translate to X.25 on a permanent virtual circuit (PVC), see the description for the **translate x25** command for important configuration notes.

Table 36 LAT-to-PPP Outgoing Translation Options

Outgoing PPP Translation

ppp {*ip-address* | **ip-pool** [**scope-name** *name*]}

Translates from LAT to virtual asynchronous PPP. Supply an IP address as a standard, four-part dotted decimal IP address.

The **ip-pool** keyword obtains an IP address from a Dynamic Host Configuration Protocol (DHCP) proxy client or a local pool. If the optional **scope-name** keyword is not specified, the address is obtained from a DHCP proxy client. If the **scope-name** keyword is specified, the IP address is obtained from the specified local pool. The **scope-name** keyword can specify a range of IP addresses.

CPMI TR-157 CORREIOS 0362 Fls: Doc 3701

Table 36 LAT-to-PPP Outgoing Translation Options (continued)

Outgoing PPP Connection Request Options

Add any of the following keywords to configure PPP connection requests:

- **authentication** {**pap** | **chap**}—Sets Challenge Handshake Authentication Protocol (CHAP) or Password Authentication Protocol (PAP) authentication for PPP on virtual asynchronous interfaces. If you specify both keywords, order is significant; the system will try to use the first authentication type, then the second.
- **header-compression**—Implements header compression on IP packets only.
- **ipx loopback** *number*—Specifies the loopback interface to be created and permits clients running IPX-PPP to connect through virtual terminal lines on the router. A loopback interface must have been created and configured with a Novell IPX network number before IPX-PPP can work on the virtual terminal line. The virtual terminal line is assigned to the loopback interface.
- **keepalive** *number-of-seconds*—Specifies the interval at which keepalive packets are sent on Serial Line Internet Protocol (SLIP) and PPP virtual asynchronous interfaces. By default, keepalive packets are enabled and sent every 10 seconds. To shut off keepalive packets, use a value of 0. The active keepalive interval is 1 through 32,767 seconds. When you do not change from the default of 10, the keepalive interval does not appear in **more system:running-config** or **show translate** command output.
- **mtu** *bytes*—Sets the interface maximum transmission unit (MTU) of packets that the virtual asynchronous interface supports. The default MTU is 1500 bytes on a virtual asynchronous interface. The acceptable range is from 64 to 1,000,000 bytes.
- **routing**—Permits routing updates between connections. This keyword is required if the destination device is not on a subnet connected to one of the interfaces on the router.
- **use-tacacs**—Uses TACACS to verify PPP authentications for CHAP or PAP on virtual asynchronous interfaces.

Table 37 LAT-to-SLIP Outgoing Translation Options

Outgoing SLIP Translation

slip {*ip-address*| **ip-pool** [**scope-name** *name*]}

Translates from LAT to virtual asynchronous SLIP. Supply an IP address as a standard, four-part dotted decimal IP address.

The **ip-pool** keyword obtains an IP address from a DHCP proxy client or a local pool. If the optional **scope-name** keyword is not specified, the address is obtained from a DHCP proxy client. If the **scope-name** keyword is specified, the IP address is obtained from the specified local pool. The **scope-name** keyword can specify a range of IP addresses.

Note The **slip** argument applies only to outgoing connections; SLIP is not supported on incoming protocol translation connections.

2512 Paula

Table 37 LAT-to-SLIP Outgoing Translation Options (continued)

Outgoing SLIP Connection Request Options

Add any of the following keywords to configure SLIP connection requests:

- **header-compression [passive]**—Implements header compression on IP packets only. The **passive** keyword permits compression on outgoing packets only if incoming TCP packets on the same virtual asynchronous interface are compressed. The default (without the **passive** keyword) permits compression on all traffic.
- **ipx loopback** *number*—Specifies the loopback interface to be created and permits clients running IPX-PPP to connect through virtual terminal lines on the router. A loopback interface must have been created and configured with a Novell IPX network number before IPX-PPP can work on the virtual terminal line. The virtual terminal line is assigned to the loopback interface.
- **keepalive** *number-of-seconds*—Specifies the interval at which keepalive packets are sent on SLIP and PPP virtual asynchronous interfaces. By default, keepalive packets are enabled and sent every 10 seconds. To shut off keepalive packets, use a value of 0. The active keepalive interval is 1 through 32,767 seconds. When you do not change from the default of 10, the keepalive interval does not appear in **more system:running-config** or **show translate** command output.
- **mtu** *bytes*—Sets the interface MTU of packets that the virtual asynchronous interface supports. The default MTU is 1500 bytes on a virtual asynchronous interface. The acceptable range is from 64 to 1,000,000 bytes.
- **routing**—Permits routing updates between connections. This keyword is required if the destination device is not on a subnet connected to one of the interfaces on the router.

Table 38 LAT-to-TCP Outgoing Options

Outgoing TCP Translation

tcp *ip-address*

Translates LAT to TCP/IP Telnet. Supply an IP address as a standard, four-part dotted decimal IP address, the name of an IP host that can be resolved by the DNS, or explicit specification in an **ip host** command (refer to the description for the **host-name** keyword in the "Outgoing TCP Connection Request Options" section).

Outgoing TCP Connection Request Options

Any of the following optional keywords can be used to configure TCP connection requests:

- **binary**—Negotiates Telnet binary mode on the connection.
- **host-name**—Stores the host name rather than its IP address, thereby allowing the host name to be resolved at connection time instead of configuration time. There is also a **rotor** keyword suboption that you can use to modify the behavior of the **host-name** keyword by allowing one of the IP addresses defined by the **ip host** configuration command to be chosen randomly. If one address fails, another one will be tried, and so on until all address choices are exhausted. You can use the **rotor** keyword, therefore, to provide basic load sharing of the IP destinations.
- **multibyte-IAC**—Always treat multiple Interpret as Command (IAC) escape character codes as a Telnet command.
- **port** *number*—For outgoing connections, enter the number of the port to match. The default is port 23 (Telnet).

DOS nº 03/2005 - CN
CPMI TR-159 CORREIOS
Fls: 0363
Doc: 3701

Table 38 LAT-to-TCP Outgoing Options (continued)

- **source-interface** --Specifies the source address used for Telnet connections initiated by the router.
- **stream**—Performs stream processing, which enables a raw TCP stream with no Telnet control sequences. A stream connection does not process or generate any Telnet options, and also prevents Telnet processing of the data stream. This keyword might be useful for connections to ports running the UNIX-to-UNIX Copy Program (UUCP) or other non-Telnet protocols, or to ports connected to printers. For ports connected to printers using Telnet, the **stream** keyword prevents some of the problems associated with using Telnet for printers, such as unusual events happening to carriage returns or line feeds and echoing of data back to VMS systems.

Table 39 LAT-to-X.25 Outgoing Translation Options

Outgoing X.25 Translation

x25 *x.121-address*

Translates LAT to the X.25 protocol. Supply an X.121 address that conforms to the specifications provided in the *CCITT 1984 Red Book*, or the name of an X.25 host that can be resolved by the DNS, or explicit specification in an **x25 host** command.

The address number generally consists of a portion that is administered by the public data network (PDN) and a portion that is locally assigned. You must be sure that the numbers that you assign agree with the addresses assigned to you by the X.25 service provider. The X.121 addresses generally will be subaddresses of the X.121 address for the X.25 network interface.

Outgoing X.25 Connection Request Options

Any of the following optional keywords can be used to configure X.25 connection requests:

- **cud** *c-u-data*—Sends the specified X.25 Call User Data (CUD) text as part of an outgoing call request after the protocol identification bytes.
- **no-reverse**—Specifies that outgoing calls not request the X.25 reverse charge facility, when the interface default is that all outgoing calls are reverse charged.
- **profile** *profile*—Sets the X.3 packet assembler/disassembler (PAD) parameters as defined in the profile created by the **x29 profile** command.
- **pvc** *number* [**interface serial** *number* | **packetsize** *in-size out-size* | **windowsize** *in-size out-size* | **no-reset**]—Specifies that the outgoing connection is actually a PVC. The *number* argument specifies the virtual circuit channel number of the connection, which must be less than the virtual circuits assigned to the switched virtual circuit (SVC).Only one session is allowed per PVC. Use the following optional keywords to further define the connection:
  - **interface serial** *number*—Specifies a PVC interface on which to set up the PVC connection.
  - **packetsize** *in-size out-size*—Specifies the input packet size (*in-size*) and output packet size (*out-size*) for the PVC. Valid packet size values are: 16, 32, 64, 128, 256, 512, 1024, 2048, and 4096.
  - **windowsize** *in-size out-size*—Specifies the packet count for input windows (*in-size*) and output windows (*out-size*) for the outgoing translation. Values of *in-size* and *out-size* range from 1 to 127 and must not be greater than the value set for the **x25 modulo** command. You must specify the same value for *in-size* and *out-size*.
  - **no-reset**—Causes the Cisco router to send a no Reset packet request at startup of a TCP or LAT to permanent virtual circuit (PVC) translation session.

2510 Paula

Table 39 LAT-to-X.25 Outgoing Translation Options (continued)

- **reverse**—Provides reverse charging for X.25 on a per-call rather than a per-interface basis. Requests reverse charges on a specified X.121 address, even if the serial interface is not configured to request reverse charge calls.
- **use-map**—Applies **x25 map pad** command entry options (such as CUD and idle) and facilities (such as packet in, packet out, win in, and win out) to the outgoing protocol translation call. When the **use-map** keyword is specified on the **translate** command, the Destination address and optional PAD Protocol Identification (PID), CUD, and facilities are checked against a configured list of **x25 map pad** entries. If a match is found, the map entry PID, CUD, and facilities are applied to the outgoing protocol translation call. The X.25 map facilities applied to the outgoing translation can be displayed with the **show translation** command throughout the duration of the translation session.

Examples

The following example illustrates incoming LAT to outgoing TCP translations. The **unadvertised** keyword prevents broadcast of service advertisements to other servers in the network. Outgoing translated packets are sent to IP host Host1, TCP port 4005.

```
translate lat pt-printer1 unadvertised tcp Host1 port 4005
```

The following example translates LAT on an incoming line to SLIP on an outgoing line. It uses header compression only if incoming TCP packets on the same interface are compressed.

```
translate lat Service1 slip 10.0.0.4 header-compression
```

The following example first shows how to disable keepalive packets on a PPP line using the **translate lat** command, then shows translated session output from the **show translate** EXEC command indicating keepalive packets have been turned off.

```
translate lat Service2 ppp 172.21.2.2 keepalive 0
.
.
.
Router# show translate

Translate From: LAT Service2
          To:   PPP 172.21.2.2 keepalive 0
          0/0 users active, 0 peak, 0 total, 0 failures
```

Related Commands

Command	Description

translate lat (virtual access interfaces)

When receiving a local-area transport (LAT) connection request to a service name, to set up the Cisco router to automatically translate the request to another outgoing protocol connection type, use the **translate lat** command in global configuration mode. To remove or change the translation request, use the **no** form of this command.

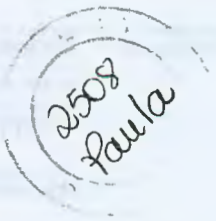
The command syntax that follows shows how to apply a virtual interface template in place of outgoing **translate** options. If you are using virtual templates for protocol translation, all outgoing options are defined in the virtual interface template. Table 40 lists all outgoing options and their corresponding interface configuration commands.

translate lat *incoming-service-name* [*incoming-options*] **virtual-template** *number* [*global-options*]

no translate lat *incoming-service-name* [*incoming-options*] **virtual-template** *number* [*global-options*]

Syntax Description

incoming-service-name	A LAT service name. When used on the incoming portion of the **translate lat** command, *service-name* is the name of the service that users specify when trying to make a translated connection. This name can match the name of the final destination resource, but this match is not required. Such matches can be useful when making remote translated connections.
incoming-options	(Optional) An incoming connection request option. For LAT, the only keyword currently supported is: • **unadvertised**—Prevents service advertisements from being broadcast to the network. This keyword can be useful, for example, when you define translations for many printers, and you do not want these services advertised to other LAT terminal servers. (VMS systems will be able to connect to the service even though it is not advertised.)
virtual-template *number*	Applies the virtual interface template specified by the *number* argument in place of outgoing options.
global-options	(Optional) Translation options that can be used by any connection type and can be one or more of the following: • **access-class** *number*—Allows the incoming call to be used by source hosts that match the access list parameters. The argument *number* is an integer previously assigned to an access list. Standard access list numbers are in the range from1 to 99; expanded standard access lists numbers are in the range 1300 to 1999. • **max-users** *number*—Limits the number of simultaneous users of the translation to *number* (an integer you specify). • **local**—Allows Telnet protocol negotiations to *not* be translated. • **login**—Requires that the user log in before the outgoing connection is made. This type of login is specified on the virtual terminal lines with the **login** command. • **quiet**—Suppresses printing of user-information messages.



Defaults

No default translation parameters

Command Modes

Global configuration

Command History

Release	Modification
10.0	This command was introduced.

Usage Guidelines

You define the protocol translation connections by choosing a protocol keyword and supplying the appropriate address, host name, or service name. The protocol connection information is followed by optional features for that connection, as appropriate. For example, the **binary** keyword is only appropriate with TCP/IP connections. The global options, in general, apply to all the connection types, but there are exceptions.

Rather than specifying outgoing translation options in the **translate** command, configure these options as interface configuration commands under the virtual interface template, then apply the virtual interface template to the **translate** command. Table 40 maps outgoing **translate** command options to interface commands you can configure in the virtual interface template.

Table 40 Mapping Outgoing translate lat Options to Interface Commands

translate lat Command Options	Corresponding Interface Configuration Command
ip-pool	**peer default ip address** {**ip-address** | **dhcp** | **pool** [*poolname*]}
header-compression	**ip tcp header compression** [**on** | **off** | **passive**]
routing	**ip routing** or **ipx routing**
mtu	**mtu**
keepalive	**keepalive**
authentication {**chap** | **pap**}	**ppp authentication** {**chap** | **pap**}
ppp use-tacacs	**ppp use-tacacs**
ipx loopback	**ipx ppp-client loopback** *number*

Examples

The following example configures PPP tunneling from a PC across a LAT network. The remote PC is given the IP address 10.12.118.12 when it dials in. The **unadvertised** keyword prevents broadcast of service advertisements to other servers.

```
interface Virtual-Template1
 ip unnumbered Ethernet0
 peer default ip address 10.12.118.12
 ppp authentication chap
!
translate lat pt-printer1 unadvertised virtual-template 1
```

translate tcp

To translate a connection request to another protocol connection type when receiving a TCP connection request to a particular destination address or host name, use the **translate tcp** command in global configuration mode. To remove or change the translation request, use the **no** form of this command.

translate tcp *incoming-address* [*incoming-options*] *protocol outgoing-address* [*outgoing-options*] [*global-options*]

no translate tcp *incoming-address* [*incoming-options*] *protocol outgoing-address* [*outgoing-options*] [*global-options*]

Syntax Description

incoming-address	Standard IP address in standard, four-part dotted decimal notation. The IP address cannot be in use by other routers, and it should be on a connected subnet.
incoming-options	(Optional) An incoming connection request option. Choices are as follows: • **binary**—Negotiates Telnet binary mode on the Telnet connection. (This was the default in previous versions of the protocol translation software and is set automatically when you enter a **translate** command in the previous format.) • **port** *number*—The number of the port to match for incoming connections. The default is port 23 (Telnet). For outgoing connections, enter the number of the port to use. The default is port 23. • **printer**—Supports local-area transport (LAT) and X.25 printing over a TCP network among multiple sites. This keyword causes the protocol translation software to delay the completion of an incoming Telnet connection until after the outgoing protocol connection (to LAT or X.25) has been successfully established. An unsuccessful outgoing connection attempt results in the TCP connection to the router being refused, rather than being accepted and then closed, which is the default behavior. Note that using this keyword will force the global **quiet** keyword to be applied to the translation. • **stream**—Performs stream processing, which enables a raw TCP stream with no Telnet control sequences. A stream connection does not process or generate any Telnet options, and also prevents Telnet processing of the data stream. This keyword might be useful for connections to ports running the UNIX-to-UNIX Copy Program (UUCP) or other non-Telnet protocols, or to ports connected to printers. For ports connected to printers using Telnet, the **stream** keyword prevents some of the problems associated with using Telnet for printers, such as unusual events happening to carriage returns or line feeds and echoing of data back to VMS systems.

TR-165
CORREIOS

Doc: 3701

protocol outgoing-address	A protocol name followed by an address or host name. Protocol translation choices are: **lat**, **ppp**, **slip**, and **x25**. Additional keywords that can be entered with the protocol are as follows: • **autocommand**—Specifies an EXEC command for an outgoing connection. The command executes upon connection to a host. You can issue any EXEC command and any switch or host name as an argument to the **autocommand** keyword. If the string following **autocommand** has one or more spaces as part of the string, you must place quotation marks (" ") around the string. If you want to enable AppleTalk Remote Access (ARA) on an outgoing connection, specify the **autocommand arap** keywords. These keywords are necessary for ARA because ARA does not use addressing, and this option permits you to invoke the ARA string. • **virtual-template**—Associates a virtual template with a virtual access interface. See the **translate tcp (virtual access interfaces)** command description for more information.
outgoing-options	(Optional) Outgoing connection request options. Choices depend upon the protocol or command entered. See Table 41, Table 42, Table 43, and Table 44 for more information.
global-options	(Optional) One or more of the following translation options can be used by any connection type: • **access-class** *number*—Allows the incoming call to be used by source hosts that match the access list parameters. The argument *number* is an integer previously assigned to an access list. Standard access list numbers are in the range from1 to 99; expanded standard access lists numbers are in the range 1300 to 1999. • **local**—Allows Telnet protocol negotiations to *not* be translated. • **login**—Requires that the user log in before the outgoing connection is made. This type of login is specified on the virtual terminal lines with the **login** command. • **max-users** *number*—Limits the number of simultaneous users of the translation to *number* (an integer you specify). • **quiet**—Suppresses printing of user-information messages. • **swap**—Valid for TCP-to-X.25 translations only, and allows X.3 parameters to be set on the router by the host originating the X.25 call, or by an X.29 profile. This configuration enables incoming and outgoing X.25 connections to be swapped so that the device is treated like a PAD when it accepts a call. By default, the router functions like a PAD for calls that it initiates, and like an X.25 host for calls it accepts. The **swap** keyword allows connections from an X.25 host that wants to connect to the router, and then treats it like a PAD.

Defaults No default translation parameters

Command Modes Global configuration

Command History

Release	Modification
10.0	This command was introduced.
12.1	The **no-reset** permanent virtual circuits (PVCs) subkeyword was added to support outgoing PVCs.

Usage Guidelines

You define protocol translation connections by supplying a protocol keyword and the address, host name, or service name. A TCP protocol translation command can be as simple as the following example:

```
Router(config)# translate tcp 10.1.1.1 X.25 1236672
```

However, the Cisco IOS software provides a broad range of options that support protocol translations in many networking environments. Table 41, Table 42, Table 43, and Table 44 list the **translate tcp** translation options by protocol.

You can also use the Cisco IOS command-line interface to help you understand how these keywords are entered. In global configuration mode, begin entering the **translate** command and add a question mark at each portion of the command to display the options available. Some examples follow:

```
Router(config)# translate tcp ?

  Hostname or A.B.C.D  IP address

Router(config)# translate tcp 1.1.1.1 ?

  autocommand       Associate a command with a translation on this connections
  binary            Negotiate Telnet binary mode on the connection
  lat               DEC LAT protocol
  port              Port Number
  ppp               Virtual async PPP
  printer           Enable non-interactive (implies global quiet)
  slip              Virtual async SLIP
  stream            Enable stream processing
  tcp               TCP/IP Telnet
  virtual-template  Associate a virtual template with virtual access interface
  x25               X.25

Router(config)# translate tcp 1.1.1.1 lat LAT-1 ?

  access-class  Allow access list parameters to be used by source hosts
  local         Allow Telnet protocol negotiations not to be translated
  login         Require that the user log in before the outgoing connection is
                made
  max-users     Limit the number of simultaneous users of the translation
  node          LAT node name
  port          LAT port name
  quiet         Suppress printing of user-information messages
  unadvertised  Prevent service advertisements from being broadcast to the
                network
```

Note If you plan to translate to X.25 on a permanent virtual circuit (PVC), see the description for the **translate x25** command for important configuration notes.

Table 41 TCP-to-LAT Outgoing Options

Outgoing LAT Translation

lat *service-name*

Translates TCP to the LAT protocol.The software must learn the service name through LAT service advertisements before it can use the service.

Outgoing LAT Connection Request Options

Any of the following optional keywords can be used to configure LAT connection requests:

- **node** *name*—Connects to the specified node that offers a LAT service. By default, the connection is made to the highest-rated node that offers the service.
- **port** *name*—Destination LAT port name in the format of the remote system. This parameter is usually ignored in most time-sharing systems, but is used by terminal servers that offer reverse-LAT services.
- **unadvertised**—Prevents LAT service advertisements from being broadcast to the network.

Table 42 TCP-to-PPP Outgoing Options

Outgoing PPP Translation

ppp {*ip-address* / **ip-pool** [**scope-name** *name*]}

Translates from TCP to virtual asynchronous PPP. Supply an IP address as a standard, four-part dotted decimal IP address.

The **ip-pool** keyword obtains an IP address from a Dynamic Host Configuration Protocol (DHCP) proxy client or a local pool. If the **scope-name** keyword is not specified, the address is obtained from a DHCP proxy client. If the **scope-name** keyword is specified, the IP address is obtained from the specified local pool. The **scope-name** keyword can specify a range of IP addresses.

Outgoing PPP Connection Request Options

Any of the following optional keywords can be used to configure PPP connection requests:

- **authentication** {**pap** | **chap**}—Sets Challenge Handshake Authentication Protocol (CHAP) or Password Authentication Protocol (PAP) authentication for PPP on virtual asynchronous interfaces. If you specify both keywords, order is significant; the system will try to use the first authentication type, then the second.
- **header-compression** [**passive**]—Implements header compression on IP packets only. The **passive** keyword permits compression on outgoing packets only if incoming TCP packets on the same virtual asynchronous interface are compressed. The default (without the **passive** keyword) permits compression on all traffic.
- **ipx loopback** *number*—Specifies the loopback interface to be created and permits clients running IPX-PPP to connect through virtual terminal lines on the router. A loopback interface must have been created and configured with a Novell IPX network number before IPX-PPP can work on the virtual terminal line. The virtual terminal line is assigned to the loopback interface.
- **keepalive** *number-of-seconds*—Specifies the interval at which keepalive packets are sent on Serial Line Internet Protocol (SLIP) and PPP virtual asynchronous interfaces. By default, keepalive packets are enabled and sent every 10 seconds. To shut off keepalive packets, use a value of 0. The active keepalive interval is 1 through 32,767 seconds. When you do not change from the default of 10, the keepalive interval does not appear in **more system:running-config** or **show translate** command output.

2502 Paulo

Table 42 TCP-to-PPP Outgoing Options (continued)

- **mtu** *bytes*—Sets the interface maximum transmission unit (MTU) of packets that the virtual asynchronous interface supports. The default MTU is 1500 bytes on a virtual asynchronous interface. The acceptable range is from 64 to 1,000,000 bytes.
- **routing**—Permits routing updates between connections. This keyword is required if the destination device is not on a subnet connected to one of the interfaces on the router.
- **use-tacacs**—Uses TACACS to verify PPP authentications for CHAP or PAP on virtual asynchronous interfaces.

Table 43 TCP-to-SLIP Outgoing Options

Outgoing SLIP Translation

slip {*ip-address* | **ip-pool** [**scope-name** *name*]}

Translates from TCP to virtual asynchronous SLIP. Supply an IP address as a standard, four-part dotted decimal IP address.

The **ip-pool** keyword obtains an IP address from a DHCP proxy client or a local pool. If the optional **scope-name** keyword is not specified, the address is obtained from a DHCP proxy client. If the **scope-name** keyword is specified, the IP address is obtained from the specified local pool. The **scope-name** keyword can specify a range of IP addresses.

Note The **slip** keyword applies only to outgoing connections; SLIP is not supported on incoming protocol translation connections.

Outgoing SLIP Connection Request Options

Any of the following optional keywords can be used to configure SLIP connection requests:

- **header-compression [passive]**—Implements header compression on IP packets only. The **passive** keyword permits compression on outgoing packets only if incoming TCP packets on the same virtual asynchronous interface are compressed. The default (without the **passive** keyword) permits compression on all traffic.
- **ipx loopback** *number*—Specifies the loopback interface to be created and permits clients running IPX-PPP over X.25 to connect through virtual terminal lines on the router. A loopback interface must have been created and configured with a Novell IPX network number before IPX-PPP can work on the virtual terminal line. The virtual terminal line is assigned to the loopback interface.
- **keepalive** *number-of-seconds*—Specifies the interval at which keepalive packets are sent on SLIP and PPP virtual asynchronous interfaces. By default, keepalive packets are enabled and sent every 10 seconds. To shut off keepalive packets, use a value of 0. The active keepalive interval is 1 through 32,767 seconds. When you do not change from the default of 10, the keepalive interval does not appear in **more system:running-config** or **show translate** command output.
- **mtu** *bytes*—Sets the interface MTU of packets that the virtual asynchronous interface supports. The default MTU is 1500 bytes on a virtual asynchronous interface. The acceptable range is from 64 to 1,000,000 bytes.
- **routing**—Permits routing updates between connections. This keyword is required if the destination device is not on a subnet connected to one of the interfaces on the router.

Table 44 TCP-to-X.25 Outgoing Options

Outgoing X.25 Translation

x25 *x.121-address*

Translates TCP to the X.25 protocol. Supply an X.121 address that conforms to the specifications provided in the *CCITT 1984 Red Book*, or the name of an X.25 host that can be resolved by the DNS, or explicit specification in an **x25 host** command.

The address number generally consists of a portion that is administered by the public data network (PDN) and a portion that is locally assigned. You must be sure that the numbers that you assign agree with the addresses assigned to you by the X.25 service provider. The X.121 addresses generally will be subaddresses of the X.121 address for the X.25 network interface.

Outgoing X.25 Connection Request Options

Any of the following optional keywords can be used to configure X.25 connection requests:

- **cud** *c-u-data*—Sends the specified X.25 Call User Data (CUD) text as part of an outgoing call request after the protocol identification bytes.
- **no-reverse**—Specifies that outgoing calls not request the X.25 reverse charge facility, when the interface default is that all outgoing calls are reverse charged.
- **profile** *profile*—Sets the X.3 packet assembler/disassembler (PAD) parameters as defined in the profile created by the **x29 profile** command.
- **pvc** *number* [**interface serial** *number* | **packetsize** *in-size out-size* | **windowsize** *in-size out-size* | **no-reset**]—Specifies that the outgoing connection is actually a PVC. The *number* argument specifies the virtual circuit channel number of the incoming connection, which must be less than the virtual circuits assigned to the switched virtual circuit (SVC).Only one session is allowed per PVC. Use the following optional keywords to further define the connection:
  - **interface serial** *number*—Specifies a PVC interface on which to set up the PVC connection.
  - **packetsize** *in-size out-size*—Specifies the input packet size (*in-size*) and output packet size (*out-size*) for the PVC. Valid packet size values are: 16, 32, 64, 128, 256, 512, 1024, 2048, and 4096.
  - **windowsize** *in-size out-size*—Specifies the packet count for input windows (*in-size*) and output windows (*out-size*) for the outgoing translation. Values of *in-size* and *out-size* range from 1 to 127 and must not be greater than the value set for the **x25 modulo** command. You must specify the same value for *in-size* and *out-size*.
  - **no-reset**—Causes the Cisco router to send a no Reset packet request at startup of a TCP or LAT to PVC translation session.
- **reverse**—Provides reverse charging for X.25 on a per-call rather than a per-interface basis. Requests reverse charges on a specified X.121 address, even if the serial interface is not configured to request reverse charge calls.
- **use-map**—Applies **x25 map pad** command entry options (such as CUD and idle) and facilities (such as packet in, packet out, win in, and win out) to the outgoing protocol translation call. When the **use-map** keyword is specified on the **translate** command, the Destination address and optional PAD Protocol Identification (PID), CUD, and facilities are checked against a configured list of **x25 map pad** command entries. If a match is found, the map entry PID, CUD, and facilities are applied to the outgoing protocol translation call. The X.25 map facilities applied to the outgoing translation can be displayed with the **show translation** command throughout the duration of the translation session.

2500 Paula

Examples

The following example illustrates the use of the TCP incoming protocol **printer** keyword for an incoming TCP connection:

```
translate tcp 172.19.32.250 printer x25 5678
```

The following example permits clients running IPX-PPP to connect through the device virtual terminal lines to a server running PPP:

```
interface loopback0
  no ip address
  ipx network 544
  ipx sap-interval 2000
!
translate tcp 172.21.14.67 port 1234 ppp 10.0.0.2 ipx loopback0
```

translate tcp (virtual access interfaces)

When receiving a TCP connection request to a particular destination address or host name, to set up the Cisco router to automatically translate the request to another outgoing protocol connection type, use the **translate tcp** command in global configuration mode. To remove or change the translation request, use the **no** form of this command.

The command syntax that follows shows how to apply a virtual interface template in place of outgoing **translate** options. If you are using virtual templates for protocol translation, all outgoing options are defined in the virtual interface template.

translate tcp *incoming-address* [*incoming-options*] **virtual-template** *number* [*global-options*]

no translate tcp *incoming-address* [*incoming-options*] **virtual-template** *number* [*global-options*]

Syntax Description

incoming-address	TCP/IP Telnet and a standard IP address or host name. The *ip-address* argument is a standard, four-part dotted decimal IP address or the name of an IP host that can be resolved by the Domain Name System (DNS) or explicit specification in an **ip host** command.
incoming-options	(Optional) Incoming connection request options. These arguments can have the following values: • **binary**—Negotiates Telnet binary mode on the Telnet connection. (This was the default in previous versions of the Cisco IOS software and is set automatically when you enter a **translate** command in the old format.) • **port** *number*—For incoming connections, enter the number of the port to match. The default is port 23 (Telnet). For outgoing connections, enter the number of the port to use. The default is port 23. • **printer**—Supports LAT and X.25 printing over a TCP network among multiple sites. This keyword causes the protocol translation software to delay the completion of an incoming Telnet connection until after the outgoing protocol connection (to LAT or X.25) has been successfully established. An unsuccessful outgoing connection attempt results in the TCP connection to the router being refused, rather than being accepted and then closed, which is the default behavior. Note that using this keyword will force the global **quiet** keyword to be applied to the translation. • **stream**—Performs stream processing, which enables a raw TCP stream with no Telnet control sequences. A stream connection does not process or generate any Telnet options, and also prevents Telnet processing of the data stream. This keyword might be useful for connections to ports running the UNIX-to-UNIX Copy Program (UUCP) or other non-Telnet protocols, or to ports connected to printers. For ports connected to printers using Telnet, the **stream** keyword prevents some of the problems associated with using Telnet for printers, such as unusual events happening to carriage returns or line feeds and echoing of data back to VMS systems.
virtual-template *number*	Applies the virtual interface template specified by the *number* argument in place of outgoing options.

2498 fls

global-options	(Optional) One or more of the following translation options can be used by any connection type: • **access-class** *number*—Allows the incoming call to be used by source hosts that match the access list parameters. The argument *number* is an integer previously assigned to an access list. Standard access list numbers are in the range from1 to 99; expanded standard access lists numbers are in the range 1300 to 1999. • **local**—Allows Telnet protocol negotiations to *not* be translated. • **login**—Requires that the user log in before the outgoing connection is made. This type of login is specified on the virtual terminal lines with the **login** command. • **max-users** *number*—Maximum number of simultaneous users of the translation. • **quiet**—Suppresses printing of user-information messages. • **swap**—Valid for TCP-to-X.25 translations only, and allows X.3 parameters to be set on the router by the host originating the X.25 call, or by an X.29 profile. This configuration enables incoming and outgoing X.25 connections to be swapped so that the device is treated like a PAD when it accepts a call. By default, the router functions like a PAD for calls that it initiates, and like an X.25 host for calls it accepts. The **swap** keyword allows connections from an X.25 host that wants to connect to the router, and then treats it like a PAD.

Defaults

No default translation parameters

Command Modes

Global configuration

Command History

Release	Modification
10.0	This command was introduced.

Usage Guidelines

You define the protocol translation connections by choosing a protocol keyword and supplying the appropriate address, host name, or service name. The protocol connection information is followed by optional features for that connection, as appropriate. For example, the **binary** keyword is only appropriate with TCP/IP connections. The global options, in general, apply to all the connection types, but there are exceptions.

Examples

The following example illustrates the use of the TCP incoming **printer** keyword for an incoming TCP connection:

```
interface Virtual-Template1
 ip unnumbered Ethernet0
 peer default ip address 10.12.108.1
 ppp authentication chap

translate tcp 172.19.32.250 printer Virtual-Template1
```

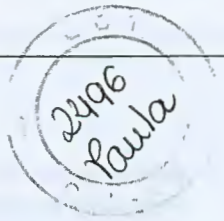
Related Commands

Command	Description
show translate	Displays configured translation sessions.
translate tcp	Translates a TCP connection request automatically to another outgoing protocol connection.
translate x25	Translates an X.25 connection request automatically to another outgoing protocol connection.
x29 access-list	Limits access to the access server from certain X.25 hosts.
x29 profile	Creates a PAD profile script for use by the **translate** command.



translate x25

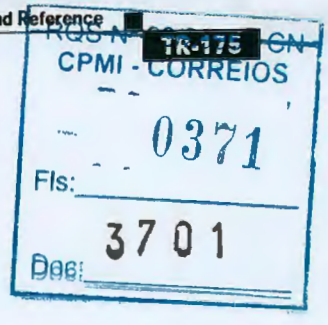
To translate a connection request to another protocol connection type when receiving an X.25 connection request to a particular destination address or host name, use the **translate x25** command in global configuration mode. To remove or change the translation request, use the **no** form of this command.

translate x25 *incoming-address* [*incoming-options* [**pvc** *number* [*pvc-options*]]] *protocol outgoing-address* [*outgoing-options*] [*global-options*]

no translate x25 *incoming-address* [*incoming-options* [**pvc** *number* [*pvc-options*]]] *protocol outgoing-address* [*outgoing-options*] [*global-options*]

Syntax Description

incoming-address	An X.25 and X.121 address that conform to specifications provided in the *CCITT 1984 Red Book*. This address generally consists of a portion that is administered by the PDN and a portion that is locally assigned. You must be sure that the numbers that you assign agree with the addresses assigned to you by the X.25 service provider. The X.121 addresses generally will be subaddresses of the X.121 address for the X.25 network interface. Typically, the interface address will be a 12-digit number. Any additional digits are interpreted as a subaddress. The PDN still routes these calls to the interface, and the Cisco IOS software is responsible for interpreting the extra digits. Do not use the same address on the interface and for translation.
incoming-options	(Optional) An incoming connection request option. Choices are as follows: • **accept-reverse**—Accepts reverse charged calls on an X.121 address even if the serial interface is not configured to accept reverse charged calls. • **cud** *c-u-data*—Specifies the Call User Data (CUD) field to match in the X.25 Incoming Call packet. If not configured, the CUD in the Incoming Call packet must be blank. • **idle** *minutes*—Specifies the number of minutes the virtual circuit is idle. This keyword enables the protocol translation function to clear a switched virtual circuit after a set period of inactivity, where *minutes* is the number of minutes in the period. Calls either originated or terminated are cleared. The maximum value of *minutes* is 255. The default value of *minutes* is zero. • **printer**—Supports local-area transport (LAT) and TCP printing over an X.25 network among multiple sites. Provides an "interlock mechanism" between the acceptance of an incoming X.25 connection and the opening of an outgoing LAT or TCP connection. This keyword causes the Cisco IOS software to delay the call confirmation of an incoming X.25 call request until after the outgoing protocol connection (to TCP or LAT) has been successfully established. An unsuccessful outgoing connection attempt to the router results in the incoming X.25 connection being refused, rather than being accepted and then closed, which is the default behavior. Note that using this keyword will force the global **quiet** keyword to be applied to the translation.



- **profile** *profile*—Sets the X.3 packet assembler/disassembler (PAD) parameters as defined in the profile created by the **x29 profile** command.
- **pvc** *number* [**interface serial** *number* | **packetsize** *in-size out-size* | **windowsize** *in-size out-size*]—Specifies that the outgoing connection is actually a PVC. The *number* argument specifies the virtual circuit channel number of the connection, which must be less than the virtual circuits assigned to the switched virtual circuit (SVC).Only one session is allowed per PVC. Use the following optional keywords to further define the connection:
  - **interface serial** *number*—Specifies a PVC interface on which to set up the PVC connection.
  - **packetsize** *in-size out-size*—Specifies the input packet size (*in-size*) and output packet size (*out-size*) for the PVC. Valid packet size values are as follows: 16, 32, 64, 128, 256, 512, 1024, 2048, and 4096.
  - **windowsize** *in-size out-size*—Specifies the packet count for input windows (*in-size*) and output windows (*out-size*) for the outgoing translation. Values of *in-size* and *out-size* range from 1 to 127 and must not be greater than the value set for the **x25 modulo** command. You must specify the same value for *in-size* and *out-size*.

protocol outgoing-address

A protocol name followed by an address or host name. Protocol translation choices are **lat**, **ppp**, **slip**, and **tcp**.

Note The host name is translated to an address during configuration, unless you are translating to TCP and use the **host-name** keyword, which allows the host name to be resolved at connection time instead of configuration time. See Table 48 for more information about the **host-name** keyword.

Additional keywords that can be entered with the protocol are as follows:

- **autocommand**—Specifies an EXEC command for an outgoing connection. The command executes upon connection to a host. You can issue any EXEC command and any switch or host name as an argument to the **autocommand** keyword. If the string following **autocommand** has one or more spaces as part of the string, you must place quotation marks (" ") around the string. If you want to enable AppleTalk Remote Access (ARA) on an outgoing connection, specify the **autocommand arap** keywords. These keywords are necessary for ARA because ARA does not use addressing, and this option permits you to invoke the ARA string.
- **virtual-template**—Associates a virtual template with a virtual access interface. See the **translate x25 (virtual access interfaces)** command description for more information.

outgoing-options	(Optional) Outgoing connection request option. Choices depend upon the protocol or command entered. See Table 45,Table 46, Table 47, and Table 48 for a list of outgoing protocol translation options.
global-options	(Optional) One or more of the following translation options can be used by any connection type: • **access-class** *number*—Allows the incoming call to be used by source hosts that match the access list parameters. The argument *number* is an integer previously assigned to an access list. Standard access list numbers are in the range from1 to 99; expanded standard access lists numbers are in the range 1300 to 1999. • **local**—Allows Telnet protocol negotiations to *not* be translated. • **login**—Requires that the user log in before the outgoing connection is made. This type of login is specified on the virtual terminal lines with the **login** command. • **max-users** *number*—Limits the number of simultaneous users of the translation to *number* (an integer you specify). • **quiet**—Suppresses printing of user-information messages. • **swap**—Valid for X.25-to-TCP translations only, and allows X.3 parameters to be set on the router by the host originating the X.25 call, or by an X.29 profile. This configuration enables incoming and outgoing X.25 connections to be swapped so that the device is treated like a PAD when it accepts a call. By default, the router functions like a PAD for calls that it initiates, and like an X.25 host for calls it accepts. The **swap** keyword allows connections from an X.25 host that wants to connect to the router, and then treats it like a PAD.

Defaults

No default translation parameters.

Command Modes

                    by the host originating the X.25 call
```

Table 45 X.25-to-LAT Outgoing Options

Outgoing LAT Translation

lat *service-name*

Translates X.25 to the LAT protocol.The software must learn the service name through LAT service advertisements before it can use the service.

Outgoing LAT Connection Request Options

Any of the following optional keywords can be used to configure LAT connection requests:

- **node** *name*—Connects to the specified node that offers a LAT service. By default, the connection is made to the highest-rated node that offers the service.
- **port** *name*—Destination LAT port name in the format of the remote system. This parameter is usually ignored in most time-sharing systems, but is used by terminal servers that offer reverse-LAT services.
- **unadvertised**—Prevents LAT service advertisements from being broadcast to the network.

Table 46 X.25-to-PPP Outgoing Options

Outgoing PPP Translation

ppp {*ip-address* / **ip-pool** [**scope-name** *name*]}

Translates from X.25 to virtual asynchronous PPP. Supply an IP address as a standard, four-part dotted decimal IP address.

The **ip-pool** keyword obtains an IP address from a Dynamic Host Configuration Protocol (DHCP) proxy client or a local pool. If the optional **scope-name** keyword is not specified, the address is obtained from a DHCP proxy client. If the **scope-name** keyword is specified, the IP address is obtained from the specified local pool. The **scope-name** keyword can specify a range of IP addresses.

Outgoing PPP Connection Request Options

Any of the following optional keywords can be used to configure PPP connection requests:

- **authentication** {**pap** | **chap**}—Sets Challenge Handshake Authentication Protocol (CHAP) or Password Authentication Protocol (PAP) authentication for PPP on virtual asynchronous interfaces. If you specify both options, order is significant; the system will try to use the first authentication type, then the second.
- **header-compression**—Configures header compression on IP packets only.
- **ipx loopback** *number*—Specifies the loopback interface to be created and permits clients running IPX-PPP over X.25 to connect through virtual terminal lines on the router. A loopback interface must have been created and configured with a Novell IPX network number before IPX-PPP can work on the virtual terminal line. The virtual terminal line is assigned to the loopback interface.
- **keepalive** *number-of-seconds*—Specifies the interval at which keepalive packets are sent on Serial Line Internet Protocol (SLIP) and PPP virtual asynchronous interfaces. By default, keepalive packets are enabled and sent every 10 seconds. To shut off keepalive packets, use a value of 0. The active keepalive interval is 1 through 32,767 seconds. When you do not change from the default of 10, the keepalive interval does not appear in **more system:running-config** or **show translate** command output.
- **mtu** *bytes*—Sets the interface MTU of packets that the virtual asynchronous interface supports. The default MTU is 1500 bytes on a virtual asynchronous interface. The acceptable range is from 64 to 1,000,000 bytes.
- **routing**—Permits routing updates between connections. This option is required if the destination device is not on a subnet connected to one of the interfaces on the router.
- **use-tacacs**—Uses TACACS to verify PPP authentications for CHAP or PAP on virtual asynchronous interfaces.

Doc: 3701

Table 47 X.25-to-SLIP Outgoing Options

Outgoing SLIP Translation

slip {*ip-address* / **ip-pool** [**scope-name** *name*]}

Translates from X.25 to virtual asynchronous SLIP. Supply an IP address as a standard, four-part dotted decimal IP address.

The **ip-pool** keyword obtains an IP address from a DHCP proxy client or a local pool. If the optional **scope-name** keyword is not specified, the address is obtained from a DHCP proxy client. If the **scope-name** keyword is specified, the IP address is obtained from the specified local pool. The **scope-name** keyword can specify a range of IP addresses.

Note The **slip** argument applies only to outgoing connections; SLIP is not supported on incoming protocol translation connections.

Outgoing SLIP Connection Request Options

Any of the following optional keywords can be used to configure SLIP connection requests:

- **header-compression [passive]**—Implements header compression on IP packets only. The **passive** keyword permits compression on outgoing packets only if incoming TCP packets on the same virtual asynchronous interface are compressed. The default (without the **passive** keyword) permits compression on all traffic.
- **ipx loopback** *number*—Specifies the loopback interface to be created and permits clients running IPX-PPP over X.25 to connect through virtual terminal lines on the router. A loopback interface must have been created and configured with a Novell IPX network number before IPX-PPP can work on the virtual terminal line. The virtual terminal line is assigned to the loopback interface.
- **keepalive** *number-of-seconds*—Specifies the interval at which keepalive packets are sent on SLIP and PPP virtual asynchronous interfaces. By default, keepalive packets are enabled and sent every 10 seconds. To shut off keepalive packets, use a value of 0. The active keepalive interval is 1 through 32,767 seconds. When you do not change from the default of 10, the keepalive interval does not appear in **more system:running-config** or **show translate** command output.
- **mtu** *bytes*—Sets the interface MTU of packets that the virtual asynchronous interface supports. The default MTU is 1500 bytes on a virtual asynchronous interface. The acceptable range is from 64 to 1,000,000 bytes.
- **routing**—Permits routing updates between connections. This keyword is required if the destination device is not on a subnet connected to one of the interfaces on the router.

Table 48 X.25-to-TCP Outgoing Options

Outgoing TCP Translation

tcp *ip-address*

Translates X.25 to TCP/IP Telnet. Supply an IP address as a standard, four-part dotted decimal IP address, or the name of an IP host that can be resolved by the DNS, or explicit specification in an **ip host** command (refer to the description for the **host-name** keyword in the "Outgoing TCP Connection Request Options" section).

Table 48 X.25-to-TCP Outgoing Options (continued)

Outgoing TCP Connection Request Options

Any of the following optional keywords can be used to configure TCP connection requests:

- **binary**—Negotiates Telnet binary mode on the connection.
- **host-name**—Stores the host name rather than its IP address, thereby allowing the host name to be resolved at connection time instead of configuration time. There is also a **rotor** keyword suboption that you can use to modify the behavior of the **host-name** keyword by allowing one of the IP addresses defined by the **ip host** configuration command to be chosen randomly. If one address fails, another one will be tried, and so on until all address choices are exhausted. You can use the **rotor** keyword, therefore, to provide basic load sharing of the IP destinations.
- **multibyte-IAC**—Always treat multiple Interpret as Command (IAC) escape character codes as a Telnet command.
- **port** *number*—For incoming connections, enter the number of the port to match. The default is port 23 (Telnet).
- **source-interface**—Specifies the source address used for Telnet connections initiated by the router.
- **stream**—Performs stream processing, which enables a raw TCP stream with no Telnet control sequences. A stream connection does not process or generate any Telnet options, and also prevents Telnet processing of the data stream. This option might be useful for connections to ports running UNIX-to-UNIX Copy Program (UUCP) or other non-Telnet protocols, or to ports connected to printers. For ports connected to printers using Telnet, the **stream** keyword prevents some of the problems associated with using Telnet for printers, such as unusual events happening to carriage returns or line feeds and echoing of data back to VMS systems.

Protocol Translation and X.25 PVCs Functional Description

This section describes how the protocol translator works with X.25 PVCs. It will help you understand the overall behavior of incoming and outgoing X.25 PVCs associated with a **translate** command, enabling you to correctly configure protocol translator PVCs for your application.

Configuring X.25 PVCs

When the **translate x25** command is configured with a PVC, an attempt is made to create the PVC. The following conditions can cause this attempt to fail:

- The PVCs assignment of the X.25 interface does not include the PVC number in the **translate x25** command.
- The PVC number in the **translate x25** command is already in use.
- An X.25 destination in a **translate x25** command is routed to X.25 over TCP/IP (XOT), Connection Mode Network Service (CMNS), or Annex G, which do not support translated PVCs.

PVC numbers must be unique across an X.25 connection; however, PVC 1 on Serial 1/0 is different (and therefore unique) from PVC 1 on Serial 2/1.

If, once the **translate x25** command is accepted, the X.25 interface on which the PVC is created goes down, the PVC enters an inactive state, the TCP or LAT connection is terminated, but the existing PAD context remains inactive.

An incoming TCP or LAT connection associated with a down outgoing PVC (displaying a "P/Inactive message") will be rejected by the protocol translator.

2490 Paula
RQS N TR-161 CN
CPMI - CORREIOS
0374
Fls:
3701
Doc:

If any X.25 traffic is received while the corresponding TCP or LAT connection is terminated, and if a Data packet is received in state D1, a Reset with a diagnostic message will be displayed, similar to the following:

```
20:17:11.809: Serial2: X.25 O D1 Reset (5) 8 lci 4
20:17:11.809: Cause 29, Diag 113 (Network out of order (PVC)/Remote network problem)
```

The number of outgoing and incoming protocol translation PVCs is limited only by the number of virtual terminal lines supported on the Cisco router. Remember that each protocol translation session uses a virtual terminal line, which lowers the number of virtual terminal lines available for Telnet sessions.

By default, the Cisco router sends a Reset packet with the cause "PVC Network Operational" and diagnostic "Maintenance action" messages at the start of a TCP or LAT to PVC translation session, to announce that the connection is established and that the PVC is able to handle data traffic. To suppress the PVC Reset packet at TCP or LAT session startup, configure the **no-reset** outgoing PVC keyword as shown in the following example:

```
translate tcp 192.168.22.102 port 5 x25 333 pvc 5 no-reset profile tcl
```

Changing or Removing a translate Command PVC Configuration

Removing a **translate** command with an outgoing PVC specified is allowed only when there no active connection is associated with the outgoing PVC. An attempt to remove an active translation results in the following message:

```
Translate: Can't delete/add entry - Connection(s) are currently active
```

For example, if PVC 5 is assigned to a **translate** command as shown in the following example:

```
translate tcp 10.0.155.61 port 5 x25 5 pvc 5 interface Serial2/0
```

And you want PVC 5 to be assigned under an X.25 interface instead of the **translate** command, as shown in the following example:

```
interface serial2/0
  x25 pvc 5 int s4/0 pvc 25
```

Perform the following steps to configure this reassignment:

Step 1 Check whether a PVC is associated with a serial connection using the **show x25** EXEC command, as follows:

```
Router# show x25 vc 5

PVC 5, State:D1, Interface:Serial2/0
   Started ...

   Line:230 vty 4  Location:Host:nmos3m1
    connected to PAD <--> X25
```

Step 2 If the PVC is associated with a TCP connection, terminate the connection by disconnecting the TCP session or by using the **clear line** EXEC command as shown in the following example:

```
Router# clear line vty 4
```

Step 3 Enter configuration mode, delete the **translate** command, and reassign PVC 5 to an interface:

```
Router(config)# no translate tcp 10.0.155.61 port 5 x25 5 pvc 5 interface Serial2/0
Router(config)# interface serial2/0
Router(config-if)# x25 pvc 5 int s4/0 pvc 25
```

translate x25 (virtual access interfaces)

When receiving an X.25 connection request to a particular destination address, to set up the Cisco router to automatically translate the request to another outgoing protocol connection type, use the **translate x25** command in global configuration mode. To remove or change the translation request, use the **no** form of this command.

The command syntax that follows shows how to apply a virtual interface template in place of outgoing **translate x25** options. If you are using virtual templates for protocol translation, all outgoing options are defined in the virtual interface template. Table 49 lists all outgoing options and their corresponding interface configuration commands.

translate x25 *incoming-address* [*incoming-options* [**pvc** *number* [*pvc-options*]]] *protocol outgoing-address* [*outgoing-options*] **virtual-template** *number* [*global-options*]

no translate x25 *incoming-address* [*incoming-options* [**pvc** *number* [*pvc-options*]]] *protocol outgoing-address* [*outgoing-options*] **virtual-template** *number* [*global-options*]

Syntax Description

incoming-address	An X.25 and X.121 address that conform to specifications provided in the *CCITT 1984 Red Book.* This address generally consists of a portion that is administered by the PDN and a portion that is locally assigned. You must be sure that the numbers that you assign agree with the addresses assigned to you by the X.25 service provider. The X.121 addresses generally will be subaddresses of the X.121 address for the X.25 network interface. Typically, the interface address will be a 12-digit number. Any additional digits are interpreted as a subaddress. The PDN still routes these calls to the interface, and the Cisco IOS software is responsible for interpreting the extra digits. Do not use the same address on the interface and for translation.
incoming-options	(Optional) Incoming connection request keywords and arguments, as follows: • **accept-reverse**—Accepts reverse charged calls on an X.121 address even if the serial interface is not configured to accept reverse charged calls. This is an incoming option only. • **cud** *c-u-data*—Specifies the Call User Data (CUD) field to match in the X.25 Incoming Call packet. If not configured, the CUD in the Incoming Call packet must be blank. • **printer**—Supports LAT and TCP printing over an X.25 network among multiple sites. Provides an "interlock mechanism" between the acceptance of an incoming X.25 connection and the opening of an outgoing LAT or TCP connection. The **printer** keyword causes the protocol translation software to delay the call confirmation of an incoming X.25 call request until the outgoing protocol connection (to TCP or LAT) has been successfully established. An unsuccessful outgoing connection attempt to the router results in the incoming X.25 connection being refused, rather than being confirmed and then cleared, which is the default behavior. Note that using this keyword will force the global **quiet** keyword to be applied to the translation.

2488 Paula

If you want to modify the **translate** command and change the PVC number from 5 to 12, follow steps 1 and 2, and modify the **translate** command with PVC 12, as follows:

```
Router(config)# translate tcp 10.0.155.61 port 12 x25 12 pvc 12 interface Serial2/0
```

Understanding the X.25 Address and the PVC Interface Option on a translate Command

The protocol translator locates the X.121 destination address in the X.25 route table to determine the interface on which to establish the PVC. A more up-to-date, simpler approach uses the **translate** command with the **interface** keyword, which ignores the status of the interface by avoiding referencing the X.25 route table.

For example, instead of configuring an **x25 route** command for each translated PVC, and entering a long X.121 address on the **translate** command, as shown this example:

```
x25 route ^32785223344502 interface Serial1/5
translate tcp 10.0.155.61 port 2502 x25 32785223344502 pvc 1
```

You can simply enter one **translate** command that links the IP port number with the X.121 address and specifies the interface on which to establish the PVC, as follows:

```
translate tcp 10.0.155.61 port 2502 x25 2502 pvc 1 interface Serial 1/5
```

This is the recommended approach and should be adopted in place of **translate** commands that cause the destination address to be looked up in the route table.

Examples

The following example shows how to use the **translate** global configuration command to translate from an X.25 PAD to a LAT device on Network A. It is applied to Router-A. The configuration example includes an access list that limits remote LAT access through Router-A to connections from PAD-C. This example typifies the use of access lists in the Cisco IOS software. The first two lines define the scope of access-list 1. The first line specifies that access list 1 will permit all calls from X.121 address 44444. The caret symbol (^) specifies that the first number 4 is the beginning of the address number.The second line of the definition explicitly denies calls from any other number. (Refer to the appendix "Regular Expressions" in the *Cisco IOS Terminal Services Configuration Guide*, Release 12.2, for details concerning the use of special characters in defining X.121 addresses.)

```
! Define X25 access list to only allow pad-c.
x29 access-list 1 permit ^44444
x29 access-list 1 deny .*
!
! Set up translation.
translate x25 1111101 lat LAT-A access-class 1
```

The following example shows a simple X.25-to-TCP **translate x25** command. Packets coming in X.25 address 652365123 arrive via PVC 1 and are translated to TCP packets and sent out IP address 172.16.1.1.

```
translate x25 652365123 pvc 1 tcp 172.16.1.1
```

The following example shows a more complex configuration that calls an X.29 profile and swaps the default PAD operation of the router to that of an X.25 host. The name of the profile is fullpackets.

```
x29 profile fullpackets 2:0 3:0 4:100 7:21
translate x25 217536124 profile fullpackets tcp Host1 port 4006 swap
```

RGS Nº 0 TR-133 CPMI - CORREIOS 0376 Fls: 3701 Doc:

The following example shows the use of the X.25 incoming protocol **printer** keyword for an incoming X.25 connection:

```
translate x25 55555 printer tcp 172.16.1.1
```

The following examples causes the protocol translator to try connecting to IP address 172.16.1.1 and if that failed, to try IP address 172.16.2.1, and so on through all IP addresses listed in the **ip host** command:

```
ip host my-hosts 172.16.1.1 172.16.2.1 172.16.3.1
translate x25 55555 tcp my-hosts host-name
```

The following example uses the **rotor** keyword to cause the protocol translator to randomly choose one of the IP address listed in the **ip host** command and if it fails to connect, to try another IP address, until all are exhausted:

```
ip host my-hosts 172.16.1.1 172.16.2.1 172.16.3.1
translate x25 55555 tcp my-hosts host1 rotor
```

The following example translates X.25 packets to PPP. It enables routing updates between the two connections:

```
translate x25 12345678 ppp 10.0.0.2 routing
```

The following example permits clients running ARA to connect through the virtual terminal lines of the device to an AppleTalk network:

```
appletalk routing
translate x25 12345678 autocommand arap
  arap enable
  arap dedicated
  arap timelimit 45
  arap warningtime 5
  arap noguest
  arap require-manual-password
  arap net-access-list 614
```

The following example specifies IP pooling from a DHCP server named *D-Server1*. It then specifies that incoming TCP traffic be translated to SLIP. The DHCP server will dynamically assign IP addresses on the outgoing sessions.

```
ip address-pool dhcp-proxy-client
ip dhcp-server D-Server1
translate x25 5467835 ppp ip-pool scope-name D-Server1
```

The following example specifies a local IP pool named Pool2 with IP addresses ranging from 172.18.10.10 to 172.18.10.110. It then specifies that incoming X.25 traffic be translated to PPP. The local IP pool Pool2 will be used to dynamically assign IP addresses on the outgoing sessions.

```
ip-pool Pool2 172.18.10.10 172.18.10.110
translate x25 1234567 ppp ip-pool scope-name Pool2
```

The following example shows how to set the idle timer. X.25 calls are cleared if they are idle for the configured time.

```
translate x25 1234 idle 2 lat Service3
```

2484 Paula

- **profile** *profile*—Sets the X.3 PAD parameters as defined in the profile created by the **x29 profile** command.
- **pvc** *number* [**interface serial** *number* | **packetsize** *in-size out-size* | **windowsize** *in-size out-size*]—Specifies that the outgoing connection is actually a PVC. The *number* argument specifies the virtual circuit channel number of the connection, which must be less than the virtual circuits assigned to the switched virtual circuit (SVC).Only one session is allowed per PVC. Use the following optional keywords and arguments to further define the connection:
  - **interface serial** *number*—Specifies a PVC interface on which to set up the PVC connection.
  - **packetsize** *in-size out-size*—Specifies the input packet size (*in-size*) and output packet size (*out-size*) for the PVC. Valid packet size values are as follows: 16, 32, 64, 128, 256, 512, 1024, 2048, and 4096.
  - **windowsize** *in-size out-size*—Specifies the packet count for input windows (*in-size*) and output windows (*out-size*) for the outgoing translation. Values of *in-size* and *out-size* range from 1 to 127 and must not be greater than the value set for the **x25 modulo** command. You must specify the same value for *in-size* and *out-size*.

virtual-template *number*	Applies the virtual interface template specified by the *number* argument in place of outgoing options.
global-options	(Optional) Translation options that can be used by any connection type and can be one or more of the following: • **access-class** *number*—Allows the incoming call to be used by source hosts that match the access list parameters. The argument *number* is an integer previously assigned to an access list. Standard access list numbers are in the range from1 to 99; expanded standard access lists numbers are in the range 1300 to 1999. • **local**—Allows Telnet protocol negotiations to *not* be translated. • **login**—Requires that the user log in before the outgoing connection is made. This type of login is specified on the virtual terminal lines with the **login** command. • **max-users** *number*—Limits the number of simultaneous users of the translation to *number* (an integer you specify). • **quiet**—Suppresses printing of user-information messages. • **swap**—Valid for X.25-to-TCP translations only, and allows X.3 parameters to be set on the router by the host originating the X.25 call, or by an X.29 profile. This keyword allows incoming and outgoing X.25 connections to be swapped so that the device is treated like a PAD when it accepts a call. By default, the router functions like a PAD for calls that it initiates, and like an X.25 host for calls it accepts. The **swap** keyword allows connections from an X.25 host that wants to connect to the router, and then treats it like a PAD.

Defaults

No default translation parameters.

Command Modes

Global configuration

Command History

Release	Modification
10.0	This command was introduced.

Usage Guidelines

You define the protocol translation connections by choosing a protocol keyword and supplying the appropriate address or service name. The protocol connection information is followed by optional features for that connection, as appropriate. The global options, in general, apply to all the connection types, but there are exceptions. The **swap** keyword, for example, is for X.25- to-TCP translations only. See the example for more explanations on how to enter this command.

Rather than specifying outgoing translation options in the **translate** command, configure these options as interface configuration commands under the virtual interface template, then apply the virtual interface template to the **translate** command. Table 49 maps outgoing **translate** command options to interface commands you can configure in the virtual interface template.

Table 49 Mapping Outgoing translate x25 Options to Interface Commands

translate x25 Command Options	Corresponding Interface Configuration Command
ip-pool	**peer default ip address** {**ip-address** | **dhcp** | **pool** [*poolname*]}
header-compression	**ip tcp header compression** [**on** | **off** | **passive**]
routing	**ip routing** or **ipx routing**
mtu	**mtu**
keepalive	**keepalive**
authentication {**chap** | **pap**}	**ppp authentication** {**chap** | **pap**}
ppp use-tacacs	**ppp use-tacacs**
lpx loópback	**ipx ppp-client loopback** *number*

Examples

The following example shows a virtual template with PPP encapsulation specified by default (not explicit). It also specifies CHAP authentication and an X.29 access list.

```
x29 access-list 1 permit ^5555
!
interface Virtual-Template1
 ip unnumbered Ethernet0
 peer default ip address 172.16.2.129
 ppp authentication chap
!
translate x25 5555667 virtual-template 1 access-class 1
```

transport input

To define which protocols to use to connect to a specific line of the router, use the **transport input** command in line configuration mode. To change or remove the protocol. use the **no** form of this command.

transport input {all | lat | mop | nasi | none | pad | rlogin | telnet | v120}

no transport input {all | lat | mop | nasi | none | pad | rlogin | telnet | v120}

Syntax Description

all	Selects all protocols.
lat	Selects the Digital LAT protocol and specifies both incoming reverse LAT and host-initiated connections.
mop	Selects Maintenance Operation Protocol (MOP).
nasi	Select NetWare Access Servers Interface (NASI) as the input transport protocol.
none	Prevents any protocol selection on the line. This makes the port unusable by incoming connections.
pad	Selects X.3 packet assembler/disassembler (PAD) incoming connections.
rlogin	Selects the UNIX rlogin protocol.
telnet	Specifies all types of incoming TCP/IP connections.
v120	Selects the V.120 protocol for incoming asynchronous connections over ISDN.

Defaults

No protocols allowed on the line (**none**).

Command Modes

Line configuration

Command History

Release	Modification
10.0	This command was introduced.
11.1	The **none** keyword was added and became the default. Before Cisco IOS Release 11.1, the default keyword was **all**.

Usage Guidelines

Cisco routers do not accept incoming network connections to asynchronous ports (TTY lines) by default. You must specify an incoming transport protocol or specify the **transport input all** command before the line will accept incoming connections. For example, if you are using your router as a terminal server to make console-port connections to routers or other devices, you will not be able to use Telnet to connect to these devices. You will receive the message "Connection Refused." This behavior is new as of Cisco IOS software Release 11.1. Previous to Release 11.1, the default was the **transport input all** command, and the **all** keyword restored pre-Cisco IOS software Release 11.0 defaults. If you are upgrading to Cisco IOS software Release 11.1(1) or later releases from earlier Cisco IOS software Releases, you must configure the **transport input** {*protocol* | **all**} command, or you will be locked out of your router.

2479 Paula

You can specify one protocol, multiple protocols, all protocols, or no protocols. To specify multiple protocols, enter the keyword for each protocol, separated by a space.

This command can be useful in distributing resources among different types of users, or in making certain that only specific hosts can access a particular port. When using two-step protocol translation, the **transport input** command is useful in controlling exactly which protocols can be translated to other protocols.

Access lists for each individual protocol can be defined in addition to the allowances created by the **transport input** command. Any settings made with the **transport input** command override settings made with the **transport preferred** command.

Examples

The following example sets the incoming protocol to Telnet for virtual terminal lines 0 to 32:

```
line vty 0 32
 transport input telnet
```

Related Commands

Command	Description
transport output	Determines the protocols that can be used for outgoing connections from a line.
transport preferred	Specifies the transport protocol that the Cisco IOS software uses if the user does not specify one when initiating a connection.

transport output

To determine the protocols that can be used for outgoing connections from a line, use the **transport output** command in line configuration mode. To change or remove the protocol, use the **no** form of this command.

transport output {**all** | **lat** | **mop** | **nasi** | **none** | **pad** | **rlogin** | **telnet** | **v120**}

no transport output {**all** | **lat** | **mop** | **nasi** | **none** | **pad** | **rlogin** | **telnet** | **v120**}

Syntax Description

all	Selects all protocols.
lat	Selects the Digital LAT protocol, which is the protocol used most often to connect routers to Digital hosts.
mop	Selects Maintenance Operation Protocol (MOP).
nasi	Selects NetWare Access Server Interface (NASI) as the output transport protocol.
none	Prevents any protocol selection on the line. The system normally assumes that any unrecognized command is a host name. If the protocol is set to **none**, the system no longer makes that assumption. No connection will be attempted if the command is not recognized.
pad	Selects X.3 packet assembler/disassembler (PAD), used most often to connect routers to X.25 hosts.
rlogin	Selects the UNIX rlogin protocol for TCP connections. The rlogin setting is a special case of Telnet. If an rlogin attempt to a particular host has failed, the failure will be tracked, and subsequent connection attempts will use Telnet instead.
telnet	Selects the TCP/IP Telnet protocol. It allows a user at one site to establish a TCP connection to a login server at another site.
v120	Selects the V.120 protocol for outgoing asynchronous connections over ISDN.

Defaults

Telnet

Command Modes

Line configuration

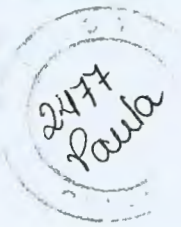
Command History

Release	Modification
10.0	This command was introduced.
11.1	The following keywords were added: • **all** • **lat** • **pad** • **rlogin** • **v120**

Usage Guidelines

You can specify one protocol, multiple protocols, all protocols, or no protocols. To specify multiple protocols, enter the keyword for each protocol, separated by a space.

Any settings made with the **transport output** command override settings made with the **transport preferred** command.



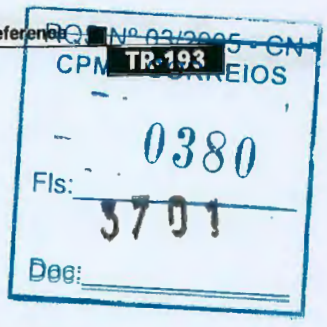
Examples

The following example prevents any protocol selection:

```
transport output none
```

Related Commands

Command	Description
transport input	Defines which protocols to use to connect to a specific line of the router.
transport preferred	Specifies the transport protocol that the Cisco IOS software uses if the user does not specify one when initiating a connection.



transport preferred

To specify the transport protocol that the Cisco IOS software uses if the user does not specify one when initiating a connection, use the **transport preferred** command in line configuration mode. To change or remove the protocol. use the **no** form of this command.

transport preferred {**all** | **lat** | **mop** | **nasi** | **none** | **pad** | **rlogin** | **telnet** | **v120**}

no transport preferred {**all** | **lat** | **mop** | **nasi** | **none** | **pad** | **rlogin** | **telnet** | **v120**}

Syntax Description

all	Selects all recognized protocols.
lat	Selects the Digital LAT protocol, which is the protocol used most often to connect routers to Digital hosts.
mop	Selects Maintenance Operation Protocol (MOP).
nasi	Selects NetWare Access Server Interface (NASI) protocol.
none	Prevents any protocol selection on the line. The system normally assumes that any unrecognized command is a host name. If the protocol is set to **none**, the system no longer makes that assumption. No connection is attempted if the command is not recognized.
pad	Selects X.3 packet assembler/disassembler (PAD), used most often to connect routers to X.25 hosts.
rlogin	Selects the UNIX rlogin protocol for TCP connections. The rlogin setting is a special case of Telnet. If an rlogin attempt to a particular host has failed, the failure will be tracked, and subsequent connection attempts will use Telnet instead.
telnet	Selects the TCP/IP Telnet protocol. It allows a user at one site to establish a TCP connection to a login server at another site.
v120	Selects the asynchronous protocols over ISDN.

Defaults

Telnet

Command Modes

Line configuration

Command History

Release	Modification
10.0	This command was introduced.
11.1	The following keywords were added: • **lat** • **pad** • **rlogin**

Usage Guidelines

Specify the **transport preferred none** command to prevent errant connection attempts.

Any settings made with the **transport input** or **transport output** commands override settings made with the **transport preferred** command.

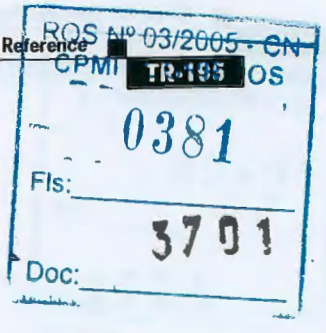
Examples

The following example sets the preferred protocol to Telnet on physical terminal line 1:

```
line tty 1
 transport preferred telnet
```

Related Commands

Command	Description
terminal transport preferred	Specifies the preferred protocol to use for the current session when a command does not specify one.
transport input	Defines which protocols to use to connect to a specific line of the router.
transport output	Determines the protocols that can be used for outgoing connections from a line.



x25 subaddress

To append either a physical port number or a value specified for a line as a subaddress to the X.121 calling address, use the **x25 subaddress** command in line configuration mode. To disable subaddressing, the **no** form of this command.

x25 subaddress {**line** | *number*}

no x25 subaddress {**line** | *number*}

Syntax Description

line	Physical port number for the indicated line to be appended to the X.121 address as the subaddress.
number	Numeric variable assigned to a specific line.

Defaults

No default behavior or values.

Command Modes

Line configuration

Command History

Release	Modification
11.2 F	This command was introduced.

Usage Guidelines

Use the **x25 subaddress line** command to create a unique X.121 calling address by adding either a physical port number or a numeric value for a line as a subaddress to the X.121 calling address.

Examples

The following example shows how to configure subaddressing on virtual terminal lines 10 through 20 by appending the line number as a subaddress to the X.121 calling address:

```
line vty 10 20
x25 subaddress line
```

The following example shows how to configure subaddressing on the first five TTY lines by appending the value 09 as a subaddress to the X.121 calling address of an X.28 connection originating on these lines:

```
line 1 5
x25 subaddress 9
autocommand x28
```

Related Commands

Command	Description
line	Identifies a specific line for configuration and starts the line configuration command collection mode.

A *string sequence* is a two-character capability name followed by an equal sign (=) and the character sequence.

The following example illustrates the capability for homing the cursor:

```
ho=\E[H:
```

The sequence \E represents the ESC character.

Control characters can be represented in *string sequences* by entering a two-character sequence starting with a caret symbol (^), followed by the character to be used as a control character.

The following example illustrates the definition of a control character.

```
bc=^h:
```

In this example, the backspace is entered into the termcap entry as the string sequence as the characters "^h."

A *numeric sequence* is a two-character capability name followed by a number symbol (#) and the number.

The following example represents the number of columns on a screen.

```
co#80:
```

Use the backslash symbol (\ ) to extend the definition to multiple lines. The end of the ttycap termcap entry is specified by a colon terminating a line followed by an end-of-line character and no backslash.

For the definitions of supported Boolean-flag ttycap capabilities, see Table 50. For the definitions of supported string-sequence ttycap capabilities, see Table 51. For the definitions of supported number-sequence ttycap capabilities, see Table 52. For the definitions of supported color-sequence ttycap capabilities, see Table 53.

Table 50 Definitions of ttycap Capabilities: Boolean Flags

Boolean Flag	Description
am	Automatic margin
bs	Terminal can backspace with bs
ms	Safe to move in standout modes
nc	No currently working carriage return
xn	NEWLINE ignored after 80 columns (Concept)
xs	Standout not erased by overwriting (Hewlett-Packard)

Table 51 Definitions of ttycap Capabilities: String Sequences

String Sequence	Description
AL	Add line below with cursor sequence
bc	Backspace if not ^h
bt	Backtab sequence
ce	Clear to end of line
cl	Clear screen, cursor to upper left
cm	Move cursor to row number and column number

2473 Paula
CPMI CORREIOS TR-497 0382 Fls: Doc 3701

Table 51 Definitions of ttycap Capabilities: String Sequences (continued)

String Sequence	Description
cr	Carriage return sequence
cs	Change scrolling region
DL	Delete the line the cursor is on
ei	End insert mode
ho	Home, move cursor to upper left
ic	Character insert
im	Begin insert mode
is	Initialization string (typically tab stop initialization)
ll	Move cursor to lower left corner
md	Turn on bold (extra bright) character attribute
me	Turn off all character attributes
nd	Nondestructive space
nl	Newline sequence
pc	Pad character if not NULL
rc	Restore cursor position
rs	Resets terminal to known starting state
sc	Save cursor position
se	End standout mode (highlight)
so	Start standout mode (highlight)
ta	Tab
te	End programs that use cursor motion
ti	Initialization for programs that use cursor motion
uc	Underline character at cursor
ue	End underline mode
up	Move cursor up
us	Begin underline mode
vb	Visual bell
vs	Visual cursor
ve	Normal cursor

Table 52 Definitions of ttycap Capabilities: Number Sequences

Number Sequence	Description
li	Lines on the screen
co	Columns on the screen
sg	Standout glitch, number of spaces printed when entering or leaving standout display mode
ug	Underline glitch, number of spaces printed when entering or leaving underline mode

Table 53 Definitions of ttycap Capabilities: Color Sequences

Color Sequence	Description
x0	Black
x1	Blue
x2	Red or orange
x3	Pink or purple
x4	Green, which is the default color
x5	Turquoise
x6	Yellow
x7	Gray or white

The ttycap database uses these color sequences to translate IBM directives into screen drawing commands. These color sequences control only foreground terminal colors. They do not control background color, which is configured to black by default.

Examples

The following is an example of a ttycap file. Refer to the chapter "Configuring Dial-In Terminal Services" in the *Cisco IOS Terminal Services Configuration Guide* and the tn3270.examples file in the Cisco ftp@cisco.com directory for more examples.

```
ttycap ttycap1\
d0|vt100|vt100-am|vt100am|dec vt100:do=^J:co#80:li#24:\
cl=50^[[;H^[[2J:bs:am:cm=5^[[%i%d;%dH:nd=2^[[C:up=2^[[A:\
ce=3^[[K:so=2^[[7m:se=2^[[m:us=2^[[4m:ue=2^[[m:md=2^[[1m:\
me=2^[[m:ho=^[[H:xn:sc=^[7:rc=^[8:cs=^[[%i%d;%dr:
```

Related Commands

Command	Description
keymap-type	Specifies the keyboard map for a terminal connected to the line.
terminal-type	Specifies the type of terminal connected to a line.

txspeed

To set the terminal transmit speed (how fast the terminal sends information to the modem), use the txspeed command in line configuration mode. To return to the default setting, use the no form of this command.

txspeed *bps*

no txspeed

Syntax Description

bps	Baud rate, in bits per second (bps).

Defaults

9600 bps

Command Modes

Line configuration

Command History

Release	Modification
10.0	This command was introduced.

Usage Guidelines

Set the speed to match the baud rate of whatever device you have connected to the port. Some baud rates available on devices connected to the port might not be supported on the router. The Cisco IOS software will indicate if the speed you select is not supported.

Examples

The following example sets the transmit speed for line 5 to 2400 bps:

```
line 5
 txspeed 2400
```

Related Commands

Command	Description
rotary-group	Sets the terminal receive speed (how fast the terminal receives information from the modem).
source template	Sets the flow control start character.
terminal txspeed	Sets the terminal transmit speed (how fast the terminal can send information) on the current line and session.

where

To list the open sessions, use the where command in EXEC mode.

where

Syntax Description

This command has no arguments or keywords.

Command Modes

EXEC

Command History

Release	Modification
10.0	This command was introduced in a release prior to Cisco IOS Release 10.0.

Usage Guidelines

The **where** command displays all open sessions associated with the current terminal line.

The **Ctrl^x, where**, and **resume** commands are available with all supported connection protocols.

Examples

The following is sample output from the **where** command:

```
Router# where

Conn Host              Address          Byte   Idle  Conn Name
   1 MATHOM            192.168.7.21        0      0  MATHOM
*  2 CHAPP             172.18.12.19        0      0  CHAPP
```

The asterisk (*) indicates the current terminal session.

Table 54 describes the significant fields shown in the display.

Table 54 where Field Descriptions

Field	Description
Conn	Name or address of the remote host to which the connection is made.
Host	Remote host to which the router is connected through a Telnet session.
Address	IP address of the remote host.
Byte	Number of unread bytes for the user to see on the connection.
Idle	Interval, in minutes, since data was last sent on the line.
Conn Name	Assigned name of the connection.

Related Commands

Command	Description
show sessions	Displays information about open LAT, Telnet, or rlogin connections.

x28

To enter X.28 mode and access an X.25 network or set X.3 packet assembler/disassembler (PAD) parameters, use the **x28** command in EXEC mode. To exit X.28 mode, use the **no** form of this command.

x28 [**escape** *character-string*] [**noescape**] [**nuicud**] [**profile** *file-name*] [**reverse**] [**verbose**]

no x28 [**escape** *character-string*] [**noescape**] [**nuicud**] [**profile** *file-name*] [**reverse**] [**verbose**]

Syntax Description

escape *character-string*	(Optional) Specifies a character string to use to exit X.28 mode and return to EXEC mode. The character string can be any string of alphanumeric characters. The Ctrl key can be used in conjunction with the character string.
noescape	(Optional) Specifies that no escape character string is defined (user cannot return to EXEC mode). On the console line, the **noescape** option is ignored, and the default escape sequence is used (**exit** command).
nuicud	(Optional) Specifies the network user identification (NUI) data to not be placed in the NUI facility of the call request. Instead the data is placed in the Call User Data (CUD) area of the call request packet.
profile *file-name*	(Optional) Specifies using a user-configured profile of X.3 parameters. A profile is created with the **x29 profile** EXEC command.
reverse	(Optional) Specifies reverse charges for outgoing calls made from the local router to the destination device.
verbose	(Optional) Displays optional service signals such as the called DTE address, facility block, and CUD.

Defaults

Disabled. X.28 mode uses standard X.28 command syntax.

Command Modes

EXEC

Command History

Release	Modification
11.2 F	This command was introduced.

Usage Guidelines

If both the **escape** and **noescape** options are not set, the default escape sequence is used (**exit** command).

X.28 mode is identified with an asterisk (*) router prompt. After you enter this mode, the standard X.28 user interface (with the exception of the escape sequence) is available. From this interface, you can configure a PAD device using X.3 parameters, or you can access an X.25 network.

In X.28 mode, you can set PAD command signals using standard or extended command syntax. For example, you can enter the **clr** command or **clear** command to clear a virtual call. A command specified with standard command syntax is merely an abbreviated version of the extended syntax version.

Table 55 lists the commands available in both standard and extended command syntax.

CPMI - TR-203
0385
Fls:
3791
Doc:

Table 55 Available PAD Command Signals

Standard Syntax	Extended Syntax	Description
break		Simulate an asynchronous break.
call		Place a virtual call to a remote device.
clr	**clear**	Clear a virtual call.
command-signal[1]		Specifies a call request without using a standard X.28 command, which is entered with the following syntax: *facilities-x121-address***D***call-user-data*.
help		Display help information. (See Table 57.)
iclr	**iclear**	Request the remote device to clear the call.
int	**interrupt**	Send an Interrupt Packet.
par? **par**	**parameter** **read**	Display the current values of local parameters. (See Table 56.)
prof	**profile** *file-name*	Load a standard or a named profile.
reset		Reset the call.
rpar?	**rread**	Display the current values of remote parameters.
rset?	**rsetread**	Set and then read the values of remote parameters.
set		Change the values of local parameters. (See Table 56.)
set?	**setread**	Change and then read the values of parameters.
stat	**status**	Request the status of a connection.
selection pad		Set up a virtual call.

1. This is an example of issuing a call request command: the **R,G23,P2-234234Duser1** command.

Table 56 lists the different types of parameters you can set using the **set** *parameter-number*:*new-value* PAD command signal from X.28 mode. Refer to the "X.3 PAD Parameters" appendix in the *Cisco IOS Terminal Services Configuration Guide*, Release 12.2 for more complete information about these parameters. See Table 35 in this publication for a list of ASCII characters.

Table 56 Supported X.3 PAD Parameters

Parameter Number	ITU-T Parameter Name	ITU-T X.3 and Cisco Values
1	PAD recall using a character	Minimum value: 0; maximum value: 126; X.28 PAD user emulation mode default: 1. **Note** Not supported by PAD EXEC user interface.
2	Echo	Minimum value: 0; maximum value: 1; PAD EXEC mode and X.28 PAD user emulation mode defaults: 1.
3	Selection of data forwarding character	Minimum value: 0; maximum value: 255; PAD EXEC mode default: 2 (CR); X.28 PAD user emulation mode default: 126 (~).

Table 56 Supported X.3 PAD Parameters (continued)

Parameter Number	ITU-T Parameter Name	ITU-T X.3 and Cisco Values
4	Selection of idle timer delay	Minimum value: 0; maximum value: 255; PAD EXEC mode default: 1; X.28 PAD user emulation mode default: 0.
5	Ancillary device control	Minimum value: 0; maximum value: 2; PAD EXEC mode default: 0; X.28 PAD user emulation mode default: 1.
6	Control of PAD service signals	Minimum value: 0; maximum value: 255; PAD EXEC mode default: 0; X.28 PAD user emulation mode default: 2. **Note** Not supported by PAD EXEC user interface.
7	Action upon receipt of a BREAK signal	Minimum value: 0; maximum value: 31; PAD EXEC mode default: 4; X.28 PAD user emulation mode default: 2.
8	Discard output	Minimum value: 0; maximum value: 1; PAD EXEC mode and X.28 PAD user emulation mode default: 0.
9	Padding after Return	Minimum value: 0; maximum value: 255; PAD EXEC mode and X.28 PAD user emulation mode default: 0.
10	Line folding	Not supported.
11	DTE speed (binary speed of start-stop mode DTE)	Minimum value: 0; maximum value: 18; PAD EXEC mode and X.28 PAD user emulation mode default: 14.
12	Flow control of the PAD by the start-stop DTE	Minimum value: 0; maximum value: 1; PAD EXEC mode default: 0; X.28 PAD user emulation mode default: 1.
13	Line feed insertion (after a Return)	Minimum value: 0; maximum value: 7; PAD EXEC mode and X.28 PAD user emulation mode default: 0.
14	Line feed padding	Minimum value: 0; maximum value: 255; PAD EXEC mode and X.28 PAD user emulation mode default: 0.
15	Editing	Minimum value: 0; maximum value: 1; PAD EXEC mode and X.28 PAD user emulation mode default: 0.
16	Character delete	Minimum value: 0; maximum value: 127; PAD EXEC mode and X.28 PAD user emulation mode default: 127 (DEL).
17	Line delete	Minimum value: 0; maximum value: 127; PAD EXEC mode default: 21 (Ctrl-U); X.28 PAD user emulation mode default: 24 (Ctrl-X).
18	Line display	Minimum value: 0; maximum value: 127; PAD EXEC mode and X.28 PAD user emulation mode default: 18 (Ctrl-R).
19	Editing PAD service signals	Minimum value: 0; maximum value: 126; PAD EXEC mode default: 0; X.28 PAD user emulation mode default: 2. **Note** Not supported by PAD EXEC user interface.

Table 56 Supported X.3 PAD Parameters (continued)

Parameter Number	ITU-T Parameter Name	ITU-T X.3 and Cisco Values
20	Echo mask	Minimum value: 0; maximum value: 255; PAD EXEC mode and X.28 PAD user emulation mode default: 0. **Note** Not supported by PAD EXEC user interface.
21	Parity treatment	Minimum value: 0; maximum value: 4; PAD EXEC mode and X.28 PAD user emulation mode default: 0. **Note** For additional values that can be selected for parameter 21 and to select parity treatment to conform to the French Transpac public switched data network and its technical specification and utilization of networks standards (STUR), refer to the appendix "X.3 PAD Parameters" in the *Cisco IOS Terminal Services Configuration Guide*, Release 12.2.
22	Page wait	Not supported.

Note Abbreviated X.121 addresses are not supported. Such addresses start with a period, are alphanumeric, and are mapped to a full X.121 address by the PAD.

Table 57 lists the options for the X.28 **help** command.

Table 57 X.28 help Options

Command	Description
help	Describes the **help** PAD command.
help command	Displays the list of available PAD command signals.
help parameter	Displays the list of available X.3 PAD parameters.
help parameter *number*	Displays the specified X.3 PAD parameter and its current value.
help list	Lists the available help subjects.
help profiles	Lists available profiles.
help profile *name*	Displays the specified parameter name and current value.
help *any-PAD-command*	Describes the specified PAD command signal.

You can issue call requests from X.28 mode without using standard X.28 commands by using the following command syntax:

*facilities-x121-address***D***call-user-data*

where:

facilities	Applies X.25 facilities to the outgoing call. The hyphen is mandatory.
x121-address	Specifies the address of the remote X.25 device.
D	Facility request code that specifies CUD for the outgoing call.
call-user-data	Specifies the data that accompanies the call request packet sent to the remote X.25 device.

The following rules apply to all call requests parsed in X.28 mode:

- When an X.121 address specified using standard command syntax is followed by an optional CUD field, the call is placed to the X.121 address.
- When standard command syntax is used, one or more facility request codes can be entered, followed by the code value. Additional facility request codes and values also can be entered. Separate each entry with a comma, followed by a dash. An X.121 address and optional CUD can follow this entry.
- If an X.28 command is not entered, a call request is assumed.
- Ensure that the call request begins with a facility code letter, and that it contains a hyphen (-) followed by a string of digits (the X.121 address). The call request can be terminated by an asterisk (*), a "P," or a "D," followed by some data.
- When using extended command syntax is used, the **call** command uses the facility codes and X.121 address as its operand.
- If facility codes are entered without an X.121 address, remember the codes for the next call. When a call is completed, forget the facility codes until they are once again set.

Table 58 shows examples of parsed call requests.

Table 58 Example X.28 Call Requests

Command	Description
123456789	Calls this X.121 address.
123456789*userdata	Calls this X.121 address, with specified data.
123456789Puserdata	Calls this X.121 address, with specified data.
123456789Duserdata	Calls this X.121 address, with specified data.
Nabcd-123456789	Calls this X.121 address, with NUI set to abcd.
Nabcd,R-123456789	Calls 123456789 with NUI of abcd, and with reverse charging.

Examples

The following example uses the ? command to display the optional X.28 keywords:

```
Router# x28 ?

  debug     Turn on Debug Messages for X28 Mode
  escape    Set the string to escape from X28 PAD mode
  noescape  Never exit x28 mode (use with caution)
  nuicud    All calls with NUI, are normal charge with the NUI placed in Call
            User Data
```

2463 fls
RQS Nº 03/2005 - CN
CPMI - CORREIOS
TR-207
0387

3701
Doc:

```
profile    Use a defined X.3 Profile
reverse    All calls default to reverse charge
verbose    Turn on Verbose Messages for X28 Mode
<cr>
```

After you are in X.28 mode, use the **call** PAD signal command to place a virtual call:

```
Router# x28

* call 123456
```

The following example enters X.28 mode with the **x28** EXEC command and configures a PAD with the **set** X.3 parameter command. The **set** command sets the idle time delay to 40 seconds.

```
Router# x28

* set 4:40
```

Related Commands

Command	Description
pad	Logs in to a PAD.

x3

To set X.3 packet assembler/disassembler (PAD) parameters, use the **x3** command in EXEC mode.

x3 *parameter:value*

Syntax Description

parameter:value	Sets the PAD parameters. (See Table 56 in the **x28** command description.)

Defaults

For outgoing connections, the X.3 parameters default to the following:

```
2:1, 3:2, 4:1, 7:4, 16:127, 17:21, 18:19
```

All other parameters default to zero, but can be changed using the **/set** switch keyword with either the **resume** command or the **x3** command.

For incoming PAD connections, the software sends an X.29 SET PARAMETER packet to set only the following parameters:

```
2:0, 4:1, 7:21, 15:0
```

For a complete description of the X.3 PAD parameters, see the appendix titled "X.3 PAD Parameters" in the *Cisco IOS Terminal Services Configuration Guide*.

Command Modes

EXEC

Command History

Release	Modification
11.2	This command was introduced.

Usage Guidelines

You can have several PAD connections open at the same time and switch between them. You can also exit a connection and return to the user EXEC prompt at any point.

To open a new connection, first suspend the current connection by pressing the escape sequence (**Ctrl-Shift-6** then **x [Ctrl^x]** by default) to return to the system command prompt, then open the new connection with the **pad** command.

You can have several concurrent sessions open and switch between them. The number of PAD sessions that can be open is defined by the **session-limit** command.

To switch between sessions you must escape one session and resume a previously opened session. Use the Ctrl^x sequence to escape out of a connection, use the **where** EXEC command to check the connection number, and then use the **resume** command with the connection number to resume the suspended connection. These commands are available with all supported connection protocols.

You can issue any of the following commands to terminate a terminal session:

- **exit**
- **quit**
- **logout**

ROS Nº 03/2005 - CN
CPI TR-209 REIOS
0388
Fls:
Doc: 3701

To display information about packet transmission and X.3 PAD parameter settings, use the **show x25 pad** command.

Examples

The following example shows how to change a local X.3 PAD parameter from a remote X.25 host using X.29 messages, which is a secure way to enable a remote host to gain control of local PAD. The local device is named Router-A. The remote host is named Router-B. The parameters listed in the ParamsIn field are incoming parameters, which are sent by the remote PAD. The parameters listed in the ParamsOut field are parameters sent by the local PAD.

```
Router-A# pad 123456
Trying 123456...Open

Router-B> x3 2:0
Router-B>
Router-A# show x25 pad

tty0, connection 1 to host 123456

Total input: 12, control 3, bytes 35. Queued: 0 of 7 (0 bytes).
Total output: 10, control 3, bytes 64.
Flags: 1,   State: 3,   Last error: 1
 ParamsIn:  1:0, 2:0, 3:0, 4:0, 5:0, 6:0, 7:0,
    8:0, 9:0, 10:0, 11:0, 12:0, 13:0, 14:0, 15:0,
    16:0, 17:0, 18:0, 19:0, 20:0, 21:0, 22:0,
 ParamsOut:  1:1, 2:0, 3:2, 4:1, 5:1, 6:0, 7:21,
    8:0, 9:1, 10:0, 11:14, 12:1, 13:0, 14:0, 15:0,
    16:127, 17:21, 18:18, 19:0, 20:0, 21:0, 22:0,
Router-A#
```

xremote

To prepare the router for manual startup and initiate an XRemote connection, use the **xremote** command in EXEC mode. This command begins the instructions that prompt you through the connection.

xremote

Syntax Description

This command has no arguments or keywords.

Defaults

Disabled

Command Modes

EXEC

Command History

Release	Modification
11.1	This command was introduced.

Usage Guidelines

If you do not use a host computer that supports XDMCP or LAT, you must use manual session startup. Manual session startup involves the following steps:

Step 1 Enable XRemote manually on the router port.

Step 2 Connect to the host computer by using a **telnet**, **lat**, or **rlogin** command, then log in as usual.

Step 3 Set the location of the X display.

Step 4 Start client applications.

Step 5 Return to the EXEC prompt.

Step 6 Enter the **xremote** command to enable XRemote manually again on the server port.

Note In manual operation, the server and X terminal remain in XRemote mode until all clients disconnect or the access server receives a reset request from the X terminal. A session might terminate during startup because you invoked transient X clients that set some parameters (such as **xset** or **xmodmap**) and then disconnected. One session must always be open or the connection resets.

Refer to the *Cisco IOS Terminal Services Configuration Guide* for more information about how to establish XRemote sessions between servers.

ROS Nº 03/2005 - CN
CPMI TR-211 OS
0389
Fls:
Doc: 5791

Examples

The following example starts a manual XRemote session:

```
dialup> xremote
XRemote enabled; your display is dialup:2006
Start your clients and type XRemote again
```

The router replies with a message informing you of your X display location. Use this information to tell the XRemote host the location of your X display server. If no clients are found, you see the following message:

```
No X clients waiting - check that your display is darkstar:2006
```

The following example shows a connection from an X display terminal through a router to a host running client programs:

```
dialup> xremote

XRemote enabled; your display is dialup:2006
Start your clients and type XRemote again

dialup> telnet eureka
Trying EUREKA.NOWHERE.COM (722.18.1.55)... Open

SunOS UNIX (eureka)

login: deal
Password:

Last login: Fri Apr 1 17:17:46 from dialup.nowhere.com
SunOS Release (SERVER+FDDI+DBE.patched) #14: Fri Apr 8 10:37:29 PDT 1994

eureka% setenv DISPLAY dialup:2006
eureka% xterm &
[1] 15439

eureka% logout

[Connection to EUREKA closed by foreign host]

dialup> xremote
Entering XRemote
```

The following procedure shows how an XRemote connection is established for a configuration like the one shown in Figure 2. This example assumes that the administrator has set the display environment variable for the user to identify the X display terminal.

Step 1 From the PCX, MacX, or UNIX machine in Figure 2, the user connects to port 9003 on access server 1. If your administrator has configured a rotary number 7, the user connects to port 10007. For more information about rotary groups, refer to the *Cisco IOS Dial Technologies Configuration Guide*.

Step 2 Access server 1 connects the user to a modem.

Step 3 The modem calls access server 2.

Step 4 The user enters **xremote** at the access server 2 prompt.

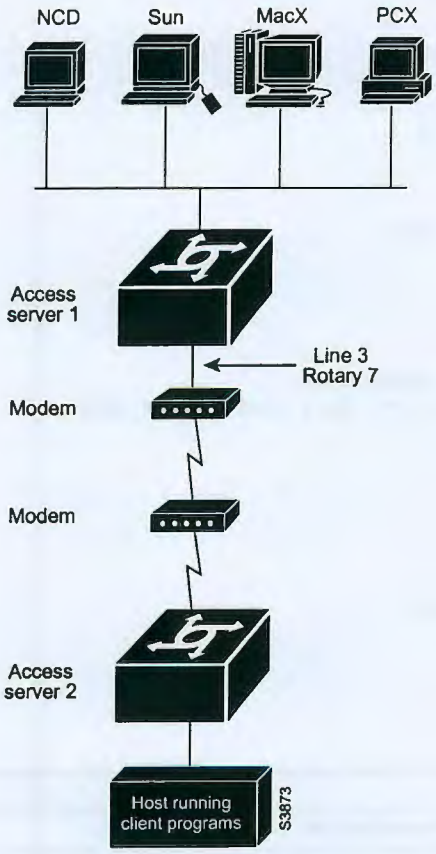
Step 5 The user connects to the host from access server 2 using the **telnet** command.

Step 6 The user starts the X client program that will run on the host and display on the X display server (PCX, MacX, or UNIX host).

Step 7 The user escapes from the host back to the AccessServer2, or logs out if clients were run in the background, and enters the **xremote** command at the AccessServer2 prompt.

You can use the master indexes or search online to find documentation of related commands.

Figure 2 XRemote Session Between Servers



The following example shows how to make an XRemote connection between servers. The number 9016 in the first line of the display indicates a connection to individual line 16. If the administrator had configured a rotary connection, the user would enter 10000 plus the number of the rotary instead of 9016.

```
Router% telnet golden-road 9016

Related Commands

Command	Description
xremote lat	Initiates a DECwindow session over a LAT connection.
xremote xdm	Activates automatic session startup for an XRemote connection.

2455 Paula

xremote lat

To initiate a DECwindow session over a local-area transport (LAT) connection, use the **xremote lat** command in EXEC mode.

xremote lat *service*

Syntax Description

service	Name of the desired LAT service.

Command Modes

EXEC

Command History

Release	Modification
11.2	This command was introduced.

Usage Guidelines

If your host computer supports DECwindows login sessions, you can use automatic session startup to make an XRemote session connection. Once the system administrator at the remote host configures support for DECwindows over LAT, use the **xremote lat** EXEC command to initiate the connection. After you issue this command, the following events occur:

- The XRemote font server down-line loads several initial fonts for the DECwindows login display.
- The terminal displays the DIGITAL logo and DECwindows login box.

Log in to the host. Upon completion of login, more fonts are loaded, and the remote session begins.

Note Because of heavy font usage, DECwindows applications can take longer than expected to start when XRemote is used. Once the application starts, performance and access times should be as expected.

To exit XRemote sessions, you must quit all active X connections, usually with a command supported by your X client system. Usually when you quit the last connection (when all client processes are stopped), XRemote closes and you return to the EXEC prompt. However, your X client system determines how the session closes.

Examples

The following example begins connection with a LAT service named service1:

```
xremote lat service1
```

Related Commands

Command	Description
xremote	Prepares the router for manual startup and initiates an XRemote connection.
xremote xdm	Activates automatic session startup for an XRemote connection.

xremote tftp buffersize

To change the buffer size used for loading font files, use the **xremote tftp buffersize** command in global configuration mode. To restore the buffer size to the default value, use the **no** form of this command.

xremote tftp buffersize *buffersize*

no xremote tftp buffersize

Syntax Description

buffersize	Buffer size in bytes. This is a decimal number in the range from 4096 to 70000 bytes. The default is 70000.

Defaults

70000 bytes

Command Modes

Global configuration

Command History

Release	Modification
10.0	This command was introduced.

Usage Guidelines

When the X terminal requests that a font file be loaded, the Cisco IOS software must first load the font file into an internal buffer before passing it to the X terminal. The default value of 70000 bytes is adequate for most font files, but the size can be increased as necessary for nonstandard font files.

The buffer size can be set as low as 4096 bytes and as large as the available memory on the router will allow. If you are using local-area transport (LAT) font access, you should not lower the buffer size below the default, because the font directory for all of the LAT fonts (created internally) requires 70000 bytes.

This command applies to both TFTP and LAT font access.

Examples

The following example sets the buffer size to 20000 bytes:

```
xremote tftp buffersize 20000
```

2453
Paula

xremote tftp host

To add a specific Trivial File Transfer Protocol (TFTP) font server as a source of fonts for the terminal, use the **xremote tftp host** command in global configuration mode. To remove a font server from the list, use the **no** form of this command.

xremote tftp host *host-name*

no xremote tftp host *host-name*

Syntax Description

host-name	IP address or name of the host containing fonts.

Defaults

No TFTP font server is specified.

Command Modes

Global configuration

Command History

Release	Modification
10.0	This command was introduced.

Usage Guidelines

Each time a new host name is entered, the list in the Cisco IOS software is updated. Font servers are queried in the order of their definition when the X terminal requests a font.

Examples

The following example sets the host named IBM-1 as an XRemote TFTP font server:

```
xremote tftp host IBM-1
```

The following example sets the host with IP address 10.0.0.7 as an XRemote TFTP font server:

```
xremote tftp host 10.0.0.7
```

RQS TR-217 - CN
CPMI - CORREIOS

Fls:
Doc: 3701

xremote tftp retries

To specify the number of retries the font loader will attempt before declaring an error condition, use the **xremote tftp retries** command in global configuration mode. To restore the default retries number, use the **no** form of this command.

xremote tftp retries *retries*

no xremote tftp retries

Syntax Description

retries	(Optional) Number of retries. Acceptable values are decimal numbers in the range from 1 to 15.

Defaults

3 retries

Command Modes

Global configuration

Command History

Release	Modification
10.0	This command was introduced.

Usage Guidelines

Under certain conditions, you might need to increase the number of retries, particularly if the font servers are known to be heavily loaded.

Examples

The following example sets the number of font loader retries to 5:

```
xremote tftp retries 5
```

2451 Paula

xremote xdm

To activate automatic session startup for an XRemote connection, use the **xremote xdm** command in EXEC mode.

xremote xdm [*host-name*]

Syntax Description

host-name	(Optional) Host computer name or IP address.

Command Modes

EXEC

Command History

Release	Modification
11.2	This command was introduced.

Usage Guidelines

If your host computer supports a server running X Display Manager Control Protocol (XDMCP) (such as the xdm program included in X11R4 or later), you can use automatic session startup to make an XRemote session connection using the **xremote xdm** EXEC command.

This command sends an XDMCP session startup request to the host computer. If you do not specify a host name or IP address, a broadcast message is sent to all hosts. The first host to respond by starting up a session is used.

The XRemote (the host) server and X terminal stay in XRemote mode until either the display manager terminates the session or the XRemote server receives a reset request from the X terminal.

To exit XRemote sessions, you must quit all active X connections, usually with a command supported by your X client system. Usually when you quit the last connection (all client processes are stopped), XRemote closes and you return to the EXEC prompt. However, your remote X client system determines how the session closes.

To terminate a session, disconnect from the device on the network using the command specific to that device. Then exit from the EXEC by using the **exit** command.

amples

The following example starts a session with a remote host named host1:

```
xremote xdm host1
```

Related Commands

Command	Description
xremote	Prepares the router for manual startup and initiates an XRemote connection.
xremote lat	Initiates a DECwindow session over a LAT connection.

CiscoWorks **VPN/Security Management** Solution Version 2.2

CiscoWorks VPN/Security Management Solution (VMS) is the flagship integrated security management solution from Cisco, and is an integral part of the SAFE Blueprint from Cisco for network security. CiscoWorks VMS protects the productivity and reduces operating costs for enterprises, by combining Web-based tools for configuring, monitoring, and troubleshooting enterprise VPNs, firewalls, and network and host-based intrusion detection systems (IDS). CiscoWorks VMS delivers the industry's first robust and scalable foundation and feature set that addresses the needs of small and large-scale VPN and security deployments.

Today's business challenges and resulting security deployments require more scalability than merely supporting a large number of devices. Many customers have limited staffing, yet are asked to manage a myriad of security devices. These customers must manage the security and network infrastructure; frequently update many remote devices; implement change control and auditing when multiple organizations are involved in defining and deploying policies; enhance security without adding more headcount; or roll out remote access VPNs to all employees and monitor the VPN service.

CiscoWorks VMS enables customers to deploy security infrastructures from a small to large environment, using the following multifaceted scalability features:

- Complete SAFE Blueprint Coverage

  To completely manage a SAFE environment, a network management solution must manage SAFE infrastructure components, support features based upon an appliance or Cisco IOS® Software, and support a range of management functions. CiscoWorks VMS is uniquely able to scale across SAFE Blueprint components, including firewalls, VPNs, and network- and host-based IDSs. CiscoWorks VMS also takes advantage of Cisco Secure Access Control Server (ACS) by using a common ACS logon. CiscoWorks VMS can manage a feature set through an appliance, for example, the Cisco PIX® Firewall, or through the Cisco IOS Software. Scalable management also involves more than configuring devices. CiscoWorks VMS provides the complete range of management with features to configure, monitor, and troubleshoot the network.

- Scalable Foundation

  CiscoWorks VMS implements a foundation with a consistent user experience, which makes it easier to scale management to many devices. CiscoWorks VMS provides users with a consistent GUI, workflow, ACS logon, roles definition, platforms, database

2449
Paula

engine, installation, and more. An industry-leading feature of this foundation is the Auto Update feature, which allows numerous devices to be updated easily and quickly. Auto Update enables devices, even remote and dynamically addressed devices, to periodically "call home" to an update server and "pull" the most current security configurations or Cisco PIX operating system. Auto Update is required to effectively scale remote office firewall deployments across intermittent links or dynamic addresses. Prior policy updating methods relied on a "push" model. Although this model works for known devices, it does not work for remote devices with unknown addresses or devices that are not always active. Without Auto Update a more manual process is required to update each remote device. The Auto Update feature provides a dramatic scalability improvement for organizations that want to deploy devices with many remote and local locations. In addition to easier and faster policy updates, Auto Update also provides consistent policy deployments.

- Enterprise Operational Integration

  CiscoWorks VMS enables organizations to easily integrate management into their operations. One operational need is to replicate policies to multiple locations. The Smart Rules hierarchy addresses this need, by enabling administrators to define device groups and implement policy inheritance. For example, an administrator can define a device group for the New York sales office and deploy that same policy to all other sales offices quickly and consistently. The Command and Control Workflow feature provides change control and auditing, and is particularly important for customers who have separate groups for network and security operations. The solution includes processes for generating, approving, and deploying configurations. This can help security operations to define and approve new policies. Network operations can later deploy the new policies during their regular maintenance window. An audit of the changes can be maintained.

- Centralized Role-Based Access Control (RBAC)

  Role-based access control enables organizations to scale access privileges. CiscoWorks VMS conveniently uses a common ACS logon for users, administrators, devices, and applications. CiscoWorks VMS enables different groups to have different access rights across different devices and applications.

- Integrated Infrastructure Management

  Scalability requires that multiple components be managed, not just firewalls, but also VPNs, network- and host-based IDSs, routers, and switches. CiscoWorks VMS not only manages the security infrastructure, but also manages the network infrastructure. Customers benefit from being able to manage these components from one solution. Integrated monitoring is also required to see the larger picture. CiscoWorks VMS provides integrated monitoring of Cisco PIX and Cisco IOS syslogs, and events from network and host-based IDSs, along with event correlation.

CiscoWorks VMS Functions

CiscoWorks VMS is launched from the CiscoWorks dashboard and is organized into several functional areas:

- Firewall management
- Auto Update Server
- IDS management, network and host-based
- VPN router management
- Security monitoring
- VPN monitoring
- Operational management

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

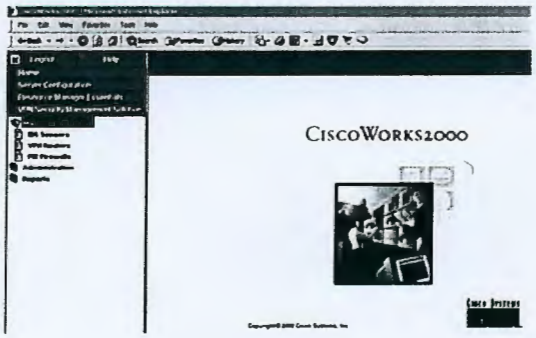
RQS Nº 03/2005 - CN
CPMI - CORREIOS
0396
Fls:
Doc: 3701

2448
Paula

These functional areas supply multifaceted scalability by offering features such as a consistent user experience, auto update, command and control workflow, and role-based access control.

Figure 1 shows CiscoWorks VMS displayed as a "drawer" in the CiscoWorks dashboard.

Figure 1



Firewall Management

CiscoWorks VMS enables the large-scale deployment of Cisco PIX firewalls, by providing the following features:

- Smart Rules hierarchy and inheritance
- User-defined device and customer groups including nesting
- Global role-based access with administrative privileges per device and customer groups with other CiscoWorks products and Cisco Secure ACS
- Mandatory and default device settings inheritance
- Workflow deployment to device, directory, or Auto Update Server
- Look and feel of Cisco PIX Device Manager but with scalability to thousands of PIX firewalls
- Integration with other CiscoWorks network management software
- Complete SAFE Blueprint coverage for centralized management of Cisco PIX firewalls, including access control, VPN, IDS, and authentication, authorization, and accounting (AAA)

Smart Rules is an innovative feature that allows common information including access rules and settings to be inherited for all firewalls in a device or customer group. Smart Rules allows a user to define common rules once, which results in reduced configuration time, fewer administrative errors, and higher device scalability. Using Smart Rules, a user can configure a common rule such as allowing all HTTP traffic once and can apply this rule globally to all firewalls. Smart Rules can also be defined on a device or customer group basis. For specific information on the firewall management functionality of VMS, refer to: http://www.cisco.com/en/US/products/sw/cscowork/ps3992/index.html

Auto Update Server for Firewall Management

CiscoWorks VMS introduces the industry's first firewall Auto Update Server that allows users to implement a "pull" model for security and Cisco PIX operating system management. Auto Update Server permits remote firewall networks with unprecedented scalability. The Auto Update Server allows Cisco PIX firewalls to both periodically and automatically contact the update server for any security configuration, Cisco PIX Operating System, and PIX Device Manager (PDM) updates. The Auto Update Server supports the following features:

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

RQS Nº 03/2005 - CN
CPMI - CORREIOS

2447
Paula

- Security management of remote Cisco PIX firewalls that use Dynamic Host Control Protocol (DHCP)
- Automated Cisco PIX OS distribution to groups of Cisco PIX firewalls
- Automated Cisco PDM updates to remote firewalls
- Configuration verification at periodic intervals
- Automated replacement of inaccurate or tampered configurations
- New firewalls configured at "boot time"

The Auto Update Server is an indispensable component of any large-scale remote Cisco PIX firewall deployment. Auto Update Server is an easy-to-use solution to automatically update all remote or local firewalls with new operating system releases. Cisco is the industry's first vendor to provide this pull model of security policy and operating system management. For specific information on the Auto Update Server component of VMS, refer to: http://www.cisco.com/en/US/products/sw/cscowork/ps3993/index.html

Network-Based IDS Management

Administrators can use CiscoWorks VMS to configure network and switch IDS sensors. Many sensors can be quickly configured using group profiles. Additionally, a more powerful signature management feature is included to increase the accuracy and specificity of detection. Some prominent features are:

- Easy-to-use Web-based interface
- Wizards that lead users through common management tasks
- Access to the Network Security Database (NSDB), which provides meaningful information about alarms for users without IDS security expertise
- Ability to define a hierarchy of sensors containing groups and subgroups, and the ability to configure multiple sensors concurrently using group profiles
- Support for several hundred sensor deployments from each console
- Use of a robust relational database to store a high volume of data

For specific information on the network-based IDS management functionality of VMS, refer to:

http://www.cisco.com/en/US/products/sw/cscowork/ps3990/index.html

Host-Based IDS Management

CiscoWorks VMS provides threat protection for server and desktop computing systems, also known as "endpoints." VMS goes beyond conventional endpoint security solutions by identifying and preventing malicious behavior before it can occur, thereby removing potential known and unknown security risks that threaten enterprise networks and applications. Because CiscoWorks VMS analyzes behavior rather than relying on signature matching, its solution provides robust protection with reduced operational costs. Features of host-based IDS management include:

- Aggregates and extends multiple endpoint security functions by providing host intrusion prevention, distributed firewall, malicious mobile code protection, operating system integrity assurance, and audit log consolidation all within a single agent.
- Provides preventive protection against entire classes of attacks including port scans, buffer overflows, Trojan horses, malformed packets, and e-mail worms.
- Offers "zero update" prevention for known and unknown attacks

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0398
Doc: 3701

- Provides industry-leading protection for UNIX and Windows servers and Windows desktops allowing customers to patch systems on their own schedules.
- Open and extensible architecture offers the capability to define and enforce security according to corporate policy.
- Scalable to thousands of agents per manager to support large enterprise deployments.

For specific information on the host-based IDS management functionality of VMS, refer to: the Management Center for Cisco Security Agents Datasheet.

VPN Router Management

CiscoWorks VMS includes functions for the setup and maintenance of large deployments of VPN connections and provides users with a point-and-click interface for setting up and deploying connections. This application is intended for scalable configuration of site-to-site VPN connections in a hub-and-spoke topology for centralized, multidevice configuration and deployment of Internet Key Exchange (IKE) and IP Security (IPsec) tunneling policies on VPN routers.

Major features include:

- Wizard-based interface for the creation of IKE and VPN tunneling policies.
- Hierarchical inheritance and Smart Rules hierarchy to reflect the organizational and common setup of devices and simplified device management
- IKE-KA (IKE Keepalive) or generic routing encapsulation (GRE) with Open Shortest Path First (OSPF) and Enhanced Interior Gateway Routing Protocol (EIGRP) for failover routing scenarios.
- Centralized role-based access control model allows for centralized management of users and accounts.

For specific information on the VPN router management functionality of VMS, refer to: http://www.cisco.com/en/US/products/sw/cscowork/ps3994/index.html

Security Monitoring

CiscoWorks VMS provides integrated monitoring to reduce the number of security monitoring consoles, reduce the number of events to monitor, and provide a broader view of security status.

- Integrated monitoring is used to capture, store, view, correlate, and report on events from many of the devices in the SAFE Blueprint such as Cisco network IDSs, switch IDSs, host IDSs, firewalls, and routers.
- Event correlation is used to identify attacks that are not easily recognizable from a single event. A flexible notification scheme and automated responses to critical events also aid in quick action.
- The event viewer can read both real-time and historical events.
- Events are color-coded and administrators can quickly isolate problems. Administrators can also define thresholds and time periods when rules can be triggered to provide notification.
- On-demand and scheduled reports facilitate ongoing monitoring.

For specific information on the security monitoring component of VMS, refer to: http://www.cisco.com/en/US/products/sw/cscowork/ps3991/index.html

VPN Monitoring

CiscoWorks VMS offers a Web-based management tool that allows network administrators to collect, store, and view information on IPsec VPN connections for remote-access or site-to-site VPN terminations. Multiple devices can be viewed from an easy-to-use dashboard that is configured using a Web browser. This dashboard provides the following capabilities:

- Provides data on system resources related to real-time memory usage, percent CPU usage per device, and active tunnel and active sessions. This data simplifies the identification of devices with potential performance problems and devices with the highest usage.
- Enables viewing of current and long-term packet rates and packet dropped percentage which can aid in determining where excess capacity can be tapped or quickly identify bottlenecks and device throughput problems.
- Enables identification of the devices with the most persistent problems through the event log; key device and VPN statistics are evaluated against a set of global and device-specific thresholds, and exceptions are recorded in the event log.
- Provides graphing of important common metrics. Device performance comparisons provide a global view of short-term trends in VPN performance, enabling administrators to identify problem areas before they become critical failures.

For specific information on the VPN monitoring component of VMS, refer to: http://www.cisco.com/en/US/products/sw/cscowork/ps2326/index.html

Operational Management

CiscoWorks VMS provides the operational management for the network, allowing network managers to perform the following:

- Quickly build a complete network inventory
- Manage device credentials information
- Monitor and report on hardware, software, configuration, and inventory changes
- Manage and deploy configuration changes and software image updates to multiple devices
- Monitor and troubleshoot critical LAN and WAN resources
- Quickly identify devices that can be used for VPNs, if upgraded with the appropriate Cisco IOS Software
- Discover which VPN devices have hardware encryption modules
- Graphically compare configurations of VPN devices
- Isolate IPsec-related problems by running customized Syslog reports

For specific information on the operational management functionality of VMS, refer to: http://www.cisco.com/en/US/products/sw/cscowork/ps2073/index.html

Server Specifications (Minimum requirements)

Server Hardware

- PC-compatible computer with 1 GHz or faster Pentium processor
- Sun UltraSPARC 60 MP with 440 MHz or faster processor
- Sun UltraSPARCIII (Sun Blade 2000 Workstation or Sun Fire 280R Workgroup Server)

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0400
Fls:
3701
Doc:

- CD-ROM drive
- 100BASE-T or faster connection
- 1 GB RAM
- 9 GB available disk drive space
- 2 GB virtual memory
- Color monitor with video card capable of 16-bit color

Server Operating System

CiscoWorks VMS requires the following operating systems:

- Windows 2000 Professional, Server, and Advanced Server (Service Pack 3)

Note: Support for Advanced Server requires that Terminal Services be turned off.

Sun Solaris 2.8 with patches:

109742 has been replaced by 108528-13

109322 has been replaced by 108827-15

109279 has been replaced by 108528-13

108991 has been replaced by 108827-15

Java Requirements

Sun Java plug-in 1.3.1-b24

Client Requirements

Hardware

- PC-compatible computer with 300 MHz or faster Pentium processor
- Solaris SPARCstation or Sun Ultra 10

Client Operating System

- Windows 2000 Server or Professional Edition with Service Pack 3, or Windows XP SP1 with Microsoft VM.
- Solaris 2.8

Client Browser

- Internet Explorer 6.0 Service Pack 1, on Windows operating systems
- Netscape Navigator 4.79, on Windows 2000 Server or Professional Edition with Service Pack 3, or Windows XP; Netscape Navigator 4.76 on Solaris 2.8

The CiscoWorks Management Center for Firewalls, and CiscoWorks Management Center for VPN Routers, are supported on Internet Explorer 6.0, but not on Netscape Navigator. In addition to supporting Internet Explorer The Management Center for IDS and the Monitoring Center for Security are also supported on Netscape Navigator.

Service and Support

CiscoWorks products are eligible for coverage under the Cisco Software Application Service (SAS) program. This service program offers customers contract-based 24-hour access to the Cisco Technical Assistance Center (TAC), full Cisco.com privileges, and software maintenance updates. A SAS contract ensures that customers have easy access to the information and services needed to stay current with newly supported device packages, patches, and minor updates. For further information about service and support offerings, contact your local sales office.

Ordering Information

CiscoWorks VMS is available for purchase through regular Cisco sales and distribution channels worldwide. CiscoWorks VMS includes all the necessary components needed for an independent installation on a Microsoft Windows or Sun Solaris workstation.

Cisco VPN 3000 Concentrator Series

2442 Paula

Product Overview

The Cisco VPN 3000 Concentrator Series is a best-of-breed, remote-access VPN solution for enterprise-class deployment. A standards-based, easy-to-use VPN client and scalable VPN tunnel termination devices are included as well as a management system that enables corporations to easily install, configure and monitor their remote access VPNs. Incorporating the most-advanced, high-availability capabilities with a unique purpose-built, remote-access architecture, the Cisco VPN 3000 Concentrator allows corporations to build high-performance, scalable, and robust VPN infrastructures to support their mission-critical, remote-access applications. Unique to the industry, it is the only scalable platform to offer components that are field-swappable and can be upgraded by the customer. These components, called Scalable Encryption Processing (SEP) modules, enable users to easily add capacity and throughput. The Cisco VPN 3000 Concentrator supports the widest range of VPN client software implementations, including the Cisco VPN Client, VPN 3002 Hardware Client, the Microsoft Windows 2000 L2TP/IPsec Client and the Microsoft PPTP for Windows 95, Windows 98, Windows NT, and Windows 2000.

The Cisco VPN 3000 Concentrator is available in five different models to support any business:

Cisco VPN 3005 Concentrator

The 3005 is a VPN platform designed for small- to medium-sized organizations with bandwidth requirements up to full-duplex T1/E1 (4Mbps maximum performance) and up to 100 simultaneous sessions. Encryption processing is performed in software. The 3005 does not have built-in upgrade capability.

Cisco VPN 3015 Concentrator

The 3015 is a VPN platform designed for small- to medium-sized organizations with bandwidth requirements up to full-x T1/E1 (4Mbps maximum performance) and up to 100 simultaneous sessions. Like the 3005, encryption processing is performed in software, but the 3015 is also field-upgradeable to models 3030, 3060, and 3080.

Cisco VPN 3030 Concentrator

The 3030 is a VPN platform designed for medium- to large-sized organizations with bandwidth requirements from full T1/E1 through fractional T3 (50 Mbps maximum performance) and up to 1500 simultaneous sessions. Specialized SEP modules perform hardware-based acceleration. The 3030 is field-upgradeable to the 3060. Redundant and non-redundant configurations are available.

Cisco VPN 3060 Concentrator

The 3060 is a VPN platform designed for large organizations demanding the highest level of performance and reliability, with high-bandwidth requirements from fractional T3 through full T3/E3 or greater (100 Mbps maximum performance) and up to 5000 simultaneous sessions. Specialized SEP modules perform hardware-based acceleration. Redundant and non-redundant configurations are available.

Cisco VPN 3080 Concentrator

The 3080 is optimized to support large enterprise organizations that demand the highest level of performance combined with support for up to 10,000 simultaneous remote access sessions. Specialized SEP modules perform hardware-based acceleration. The VPN 3080 is available in a fully redundant configuration only.

Cisco VPN Client

Simple to deploy and operate, the Cisco VPN Client is used to establish secure, end-to-end encrypted tunnels to compliant* Cisco Remote Access VPN devices. This thin design, IPSec-compliant implementation is available via CCO download for use with any compliant* Cisco Remote Access VPN product and is included free of charge with the Cisco VPN 3000 Concentrator. The client can be pre-configured for mass deployments and initial logins require very little user intervention.

Doc:

VPN access policies and configurations are downloaded from the central gateway and pushed to the client when a connection is established, allowing simple deployment and management. The Cisco VPN client provides support for Windows 95, 98, ME, NT 4.0, and 2000.

The Cisco VPN Client is compatible with the following Cisco product versions (compliant Cisco Remote Access products):

- Cisco VPN 3000 Concentrator Release 3.0
- IOS-based platforms (future availability)
- Cisco VPN 5000 Concentrator Release 6.2 and greater (future availability)
- PIX Firewalls Release 6.0 and greater (future availability)

Key Features and Benefits

Cisco VPN 3000 Concentrator Series Features

Table 19-6: Feature Summary for the Cisco VPN 3000 Series

Feature	Cisco 3005	Cisco 3015	Cisco 3030	Cisco 3060	Cisco 3080
Simultaneous Users	100	100	1500	5000	10000
Encryption Throughput	4 Mbps	4 Mbps	50 Mbps	100 Mbps	100 Mbps
Encryption Method	Software	Software	Hardware	Hardware	Hardware
Encryption (SEP) Module	0	0	1	2	4
Redundant SEP	N/A	N/A	Option	Option	Yes
Available Expansion Slots	0	4	3	2	N/A
Upgrade Capability	No	Yes	Yes	N/A	N/A
System Memory	32 MB (fixed)	64 MB	128 MB	256 MB	256 MB
T1 WAN Module	Fixed option	Option	Option	Option	Option
Hardware	1U, Fixed	2U, Scalable	2U, Scalable	2U, Scalable	2U
Dual Power Supply	Single	Option	Option	Option	Yes
Client License	Unlimited	Unlimited	Unlimited	Unlimited	Unlimited

The Cisco VPN 3000 Concentrator Series supports the entire range of enterprise applications.

Product Highlights

- High-Performance, Distributed-Processing Architecture
  - —Cisco SEP modules provide hardware-based encryption, ensuring consistent performance throughout the rated capacity (3030 - 3080).
  - —Large-scale tunneling support provided for IPsec, PPTP and L2TP/IPSec connections.
- Scalability (3015-3080)
  - —Modular design (four expansion slots) provides investment protection, redundancy and a simple upgrade path.
  - —System architecture is designed to supply consistent, high-availability performance.
  - —All digital design provides the highest reliability and 24-hour continuous operation.
  - —Robust instrumentation package provides run-time monitoring and alerts.
  - —Microsoft compatibility offers large-scale client deployment and seamless integration with related systems.
- Security

ECT 24411 Paula

2440 Paula

—Full support of current and emerging security standards allows for integration of external authentication systems and interoperability with third-party products.

—Firewall capabilities through stateless packet filtering and address translation to assure the required security of a corporate LAN.

—User and group level management offers maximum flexibility.

- High Availability

—Redundant subsystems and multi-chassis fail-over capabilities ensure maximum system uptime.

—Extensive instrumentation and monitoring capabilities provide network managers with real-time system status and early-warning alerts.

- Robust Management

—The Cisco VPN 3000 Concentrators can be managed using any standard Web browser (HTTP or HTTPS), as well as by Telnet, Secure Telnet, SSH, and via a console port.

—Configuration and monitoring capability is provided for both the enterprise and the service provider.

—Access levels are configurable by user and groups, allowing easy configuration and maintenance of security policies.

Specifications

Hardware

Table 19-7: Technical Specifications for Cisco VPN 3000 Series

Description	Specification
Processor	Motorola PowerPC Processor
Ports	Console port-Asynchronous serial (DB-9)
Memory	Redundant system images (Flash) Variable memory options (see chart)
Encryption	3005, 3015: Software encryption 3030, 3060, 3080: Hardware encryption
Embedded LAN Interfaces	3005: Two auto-sensing, full-duplex 10/100BaseTX Fast Ethernet (public/untrusted, private/trusted) 3015- 3080: Three auto-sensing, full-duplex 10/100BaseTX Fast Ethernet (public/untrusted, private/trusted and DMZ)
Instrumentation	3005 Front panel: Unit status indicator 3005 Rear panel: Status light-emitting diodes (LED) for Ethernet ports 3015-3080 Front panel: Status LEDs for system, expansion modules, power supplies, Ethernet modules, fan 3015-3080 Rear panel: Status LEDs for Ethernet modules, expansion modules, power supplies 3015-3080:Activity monitor displays number of sessions, aggregate throughput, or CPU utilization; push-button selectable

Software

Table 19-11: Software Requirements for Cisco VPN 3000 Series

Description		Specification
Compatibility	Client Software Compatibility	Cisco VPN Client (IPsec) for Windows 95, 98, ME, NT 4.0 and Windows 2000, including centralized split-tunneling control and data compression
		Cisco VPN 3002 Hardware Client
		Microsoft PPTP/MPPE/MPPC
		Microsoft L2TP/IPsec for Windows 2000
		MovianVPN (Certicom) Handheld VPN Client with ECC
	Tunneling Protocols	IPsec, PPTP, L2TP, L2TP/IPsec, NAT Transparent IPsec
	Encryption/ Authentication	IPsec Encapsulating Security Payload (ESP) using DES/3DES (56/168-bit) with MD5 or SHA, MPPE using 40/128-bit RC4
	Key Management	Internet Key Exchange (IKE)
	Routing Protocols	RIP, RIP2, OSPF, Static, Automatic endpoint discovery, Network Address Translation (NAT), Classless Interdomain Routing (CIDR)
	Third-Party Compatibility	Certicom, iPass Ready, Funk Steel Belted RADIUS certified, NTS TunnelBuilder VPN Client (Mac and Windows), Microsoft Internet Explorer, Netscape Communicator, Entrust, GTE Cybertrust, Baltimore, RSA Keon, Verisign
	High Availability	VRRP protocol for multi-chassis redundancy and fail-over
		Destination pooling for client-based fail-over and connection re-establishment
		Redundant SEP modules (optional), power supplies, and fans (3015 - 3060)
		Redundant SEP modules, power supplies, and fans (3080)

Doc 3701

Description		Specification
Management	Configuration	Embedded management interface is accessible via console port, Telnet, SSH, and Secure HTTP
		Administrator access is configurable for five levels of authorization. Authentication can be performed externally via TACACS+
		Role-based management policy separates functions for service provider and end-user management
	Monitoring	Event logging and notification via e-mail (SMTP)
		Automatic FTP backup of event logs
		SNMP MIB-II support
		Configurable SNMP traps
		Syslog output
		System status
		Session data
		General statistics
Security	Authentication and Accounting Servers	Support for redundant external authentication servers:
		- RADIUS (Remote Authentication Dial-In User Service)
		- Microsoft NT Domain authentication
		- RSA Security Dynamics (SecurID Ready)
		Internal Authentication server for up to 100 users
		TACACS+ Administrative user authentication
		X.509v3 Digital Certificates
		RADIUS accounting
	Internet-Based Packet Filtering	Source and destination IP address
		Port and protocol type
		Fragment protection
		FTP session filtering
	Policy Management	By individual user or group
		- Filter profiles
		- Idle and maximum session timeouts
		- Time and day access control
		- Tunneling protocol and security authorization profiles
		-IP Pool
		Authentication Servers

Data Sheet

Cisco **VPN 3000** Series Concentrator

Introduction

The Cisco® VPN Series 3000 Concentrator allow corporations to take full advantage of the unprecedented cost savings, flexibility, performance, and reliability of remote access VPN connections. Corporations use VPNs to establish secure, end-to-end private network connections over a public networking infrastructure. VPNs have become the logical solution for remote-access connectivity for two main reasons:

• Deploying a remote-access VPN enables corporations to reduce communications expenses by using the local dialup infrastructures of Internet service providers.

• Remote Access VPNs allow mobile workers, telecommuters and day extenders to take advantage of broadband connectivity.

To fully realize the benefits of high-performance, remote-access VPNs, a corporation must deploy a robust, highly available VPN solution, and dedicated VPN devices are optimal for this purpose.

The Cisco VPN 3000 Series Concentrator is a best-in-class, remote-access VPN solution for enterprise-class deployment. A standards-based, asy-to-use VPN client and scalable VPN tunnel termination devices are included, as well as a management system that enables corporations to easily install, configure, and monitor their remote access VPNs. Incorporating the most advanced, high-availability capabilities with a unique purpose-built, remote-access architecture, the Cisco VPN 3000 Concentrator allows corporations to build high-performance, scalable, and robust VPN infrastructures to support their mission-critical, remote-access applications.

Unique to the industry, it is the only scalable platform to offer components that are field-swappable and can be upgraded by the customer. These components, called Scalable Encryption Processing (SEP/SEP-E) modules, enable users to easily add capacity and throughput.

The Cisco VPN 3000 Concentrator supports the widest range of VPN client software implementations, including the Cisco VPN Client, the Microsoft Windows 2000/XP L2TP/IPsec Client, the Microsoft L2TP/IPSec VPN Client for Windows 98, Windows Millennium (ME), Windows NT Workstation 4.0, and Microsoft PPTP.

Five Models

The Cisco VPN 3000 Concentrator is available in five different models:

Cisco VPN 3005 Concentrator

The Cisco VPN 3005 Concentrator is a VPN platform designed for small- to medium-sized organizations with bandwidth requirements up to full-duplex T1/E1 (4 Mbps maximum performance) and up to 100 simultaneous sessions. Encryption processing is performed in software. The Cisco VPN 3005 does not have built-in upgrade capability.

Cisco VPN 3015 Concentrator

The Cisco VPN 3015 Concentrator is a VPN platform designed for small- to medium-sized organizations with bandwidth requirements up to full-duplex T1/E1 (4 Mbps maximum performance) and up to 100 simultaneous sessions. Like the Cisco VPN 3005, encryption processing is performed in software, but the Cisco VPN 3015 is also field-upgradable to the Cisco VPN 3030 and 3060 models.

Cisco VPN 3030 Concentrator

The Cisco VPN 3030 Concentrator is a VPN platform designed for medium to large organizations with bandwidth requirements from full T1/E1 through T3/E3(50 Mbps maximum performance) and up to 1500 simultaneous sessions. Specialized SEP modules perform hardware-based acceleration. The Cisco VPN 3030 is field-upgradeable to the Cisco VPN 3060. Redundant and nonredundant configurations are available.

Cisco VPN 3060 Concentrator

The Cisco VPN 3060 is a VPN platform designed for large organizations demanding the highest level of performance and reliability, with high-bandwidth requirements from fractional T3 through full T3/E3 or greater (100 Mbps maximum performance) and up to 5000 simultaneous sessions. Specialized SEP modules perform hardware-based acceleration. Redundant and nonredundant configurations are available.

Cisco VPN 3080 Concentrator

The Cisco VPN 3080 Concentrator is optimized to support large enterprise organizations that demand the highest level of performance combined with support for up to 10,000 simultaneous remote access sessions. Specialized SEP modules perform hardware-based acceleration. The VPN 3080 is available in a fully redundant configuration only.

Models Comparison

Table 1 The Cisco VPN 3000 Series Supports the Entire Range of Enterprise Applications

	Cisco VPN 3005	Cisco VPN 3015	Cisco VPN 3030	Cisco VPN 3060	Cisco VPN 3080
Simultaneous Users[1]	100	100	1,500	5,000	10,000
Maximum LAN-to-LAN Sessions	100	100	500	1000	1000
Encryption Throughput	4 Mbps	4 Mbps	50 Mbps	100 Mbps	100 Mbps
Encryption Method	Software	Software	Hardware	Hardware	Hardware
Available Expansion Slots	0	4	3	2	2
Encryption (SEP) Module	0	0	1	2	4
Redundant SEP	–	–	Option	Option	Yes
System Memory	32/64 MB (fixed)	128 MB	128/256 MB	256/512 MB	256/512 MB
Hardware Configuration	1U	Fixed 2U	Scalable 2U	Scalable 2U	Fixed 2U
Dual Power Supply	Single	Option	Option	Option	Yes
Client License	Unlimited	Unlimited	Unlimited	Unlimited	Unlimited

1. For planning purposes, a simultaneous user is considered to be a remote access VPN user connected in all tunneling mode—this includes one IKE Security Association and two unidirectional IPsec SAs (Security Associations). For environments with rekeying or split tunneling, we recommend using a VPN remote access load-balancing environment with spare capacity because these particular sessions will use additional system resources that otherwise would be used to support additional users. The Cisco VPN 3000 Series Concentrator supports the entire range of enterprise applications.

Cisco VPN Client

Simple to deploy and operate, the Cisco VPN Client is used to establish secure, end-to-end encrypted tunnels to the Cisco VPN 3000 Concentrator. This thin design, IPsec-compliant implementation is provided with the Cisco VPN 3000 Concentrator and is licensed for an unlimited number of users. The client can be pre-configured for mass deployments and the initial logons require very little user intervention. VPN access policies are created and stored centrally in the Cisco VPN 3000 Concentrator and pushed to the client when a connection is established.

Features and Benefits

Product Highlights

High-Performance, Distributed-Processing Architecture

- Cisco SEP modules provide hardware-based encryption, ensuring consistent performance throughout the rated capacity (Cisco VPN 3030–3080).
- Large-scale tunneling support provided for IPsec, PPTP and L2TP/IPsec connections.

Scalability (Cisco VPN 3015–3060)

- Modular design (four expansion slots) provides investment protection, redundancy and a simple upgrade path.
- System architecture is designed to supply consistent, high-availability performance.
- All digital design provides the highest reliability and 24-hour continuous operation.
- Robust instrumentation package provides run-time monitoring and alerts.
- Microsoft compatibility offers large-scale client deployment and smooth integration with related systems.

Security

- Full support of current and emerging security standards allows for integration of external authentication systems and interoperability with third-party products.
- Firewall capabilities through stateless packet filtering and address translation to ensure the required security of a corporate LAN.
- User and group level management offers maximum flexibility.

High Availability

- Redundant subsystems and multichassis failover capabilities ensure maximum system uptime.
- Extensive instrumentation and monitoring capabilities provide network managers with real-time system status and early-warning alerts.

Robust Management

- The Cisco VPN 3000 Concentrator can be managed using any standard Web browser (HTTP or HTTPS), as well as by Telnet, SSHv1, and using a console port. Files can be accessed through HTTPS, FTP, and SSH Copy (SCP).
- Configuration and monitoring capability is provided for both the enterprise and the service provider.
- Access levels are configurable by user and groups, allowing easy configuration and maintenance of security policies. For larger scale deployments, the VPN 3000 Concentrators are supported in several Cisco network management applications. Those applications include:
  - *IP Solution Center (ISC)*—Provisions site-to-site and remote access VPN services
  - *VPN Monitor*—Monitors and reports on remote access and site-to-site VPN tunnel connections
  - *Resource Manager Essentials (RME)*—Provides operational management features such as software distribution, syslog reporting, inventory management
  - *CiscoView*—Provides real time system status monitoring

Technical Specifications

Hardware

Processor

- Motorola PowerPC Processor

Memory

- Redundant system images (Flash)
- Variable memory options (see chart)

Encryption

- *Cisco VPN 3005, 3015*—Software encryption
- *Cisco VPN 3030–3080*—Hardware encryption

Embedded LAN Interfaces

- *Cisco VPN 3005*—Two autosensing, full-duplex 10/100BASE-TX Fast Ethernet (public/untrusted, private/trusted)
- *Cisco VPN 3015–3080*—Three autosensing, full-duplex 10/100BASE-TX Fast Ethernet (public/untrusted, private/trusted and DMZ)

Instrumentation

- *Cisco VPN 3005 Front panel*—Unit status indicator
- *Cisco VPN 3005 Rear panel*—Status LEDs for Ethernet ports
- *Cisco VPN 3015-3080 Front panel*—Status LEDs for system, expansion modules, power supplies, Ethernet modules, fan
- *Cisco VPN 3015–3080 Rear panel*—Status LEDs for Ethernet modules, expansion modules, power supplies
- *Cisco VPN 3015–3080*—Activity monitor displays number of sessions, aggregate throughput, or CPU utilization; push-button selectable

Software

Client Software Compatibility

- Cisco VPN Client (IPsec) for Windows 98, ME, NT 4.0, 2000, XP, Linux (Intel), Solaris (UltraSparc 32 and 64-bit), and Mac OS X 10.2 (Jaguar), including centralized split-tunneling control and data compression
- Microsoft PPTP/MPPE/MPPC, MSCHAPv1/v2, EAP/ RADIUS pass-through for EAP/TLS and EAP/GTC support
- Microsoft L2TP/IPsec forWindows 2000/XP (including XP DHCP option for route population)
- Microsoft L2TP/IPsec for Windows 98, Windows Millennium (ME), and Windows NT Workstation 4.0
- MovianVPN (Certicom) Handheld VPN Client with ECC
- Netlock (Mac OS 8 & 9) VPN Client

Tunneling Protocols

- IPsec, PPTP, L2TP, L2TP/IPsec, NAT Transparent IPsec, Ratified IPsec/UDP (with auto-detection and fragmentation avoidance), IPsec/TCP
- Support for Easy VPN (client and network extension mode)

Cisco Systems, Inc.
All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0416
Fls:
Doc:

Encryption/Authentication

- IPsec Encapsulating Security Payload (ESP) using DES/3DES (56/168-bit) or AES (128, 192, 256-bit) with MD5 or SHA, MPPE using 40/128-bit RC4

Key Management

- Internet Key Exchange (IKE)
- Diffie-Hellman (DH) Groups 1, 2, 5, 7 (ECDH)

Routing

- RIP, RIP2, OSPF, RRI (Reverse Route Injection), static, automatic endpoint discovery, Network Address Translation (NAT), Classless Interdomain Routing (CIDR)
- IPsec fragmentation policiy control, including support for Path MTU Discovery (PMTUD)
- Interface MTU control

Third-Party Compatibility

- Certicom, iPass Ready, Funk Steel Belted RADIUS certified, NTS TunnelBuilder VPN Client (Macintosh and Windows), Microsoft Internet Explorer, Netscape Communicator, Entrust, Baltimore, SA Keon

High Availability

- VRRP protocol for multi-chassis redundancy and fail-over
- Remote Access Load Balancing clusters
- Destination pooling for client-based fail-over and connection re-establishment
- Redundant SEP modules (optional), power supplies, and fans (Cisco VPN 3015–3080)

Management

Configuration

- Embedded management interface is accessible through console port, Telnet, SSHv1, and Secure HTTP (HTTPS)
- Administrator access is configurable for five levels of authorization. Authentication can be performed externally through TACACS+
- Role-based management policy separates functions for service provider and end-user management

Monitoring

- Event logging and notification through e-mail (SMTP)
- Automatic FTP backup of event logs
- SNMP MIB-II support
- Configurable SNMP traps
- Syslog output
- System status
- Session data (including client assign IP, encryption type connection duration, client OS, version, etc)
- General statistics

Security

Authentication and Accounting Servers

- Support for redundant external authentication servers:
  - RADIUS
  - Kerberos/Active Directory authentication
  - Microsoft NT Domain authentication
  - Microsoft NT Domain authentication with Password Expiration (MSCHAPv2)

RSA Security Dynamics (SecurID Ready), including native support for RSA 5 (Load Balancing, Resiliency)

- User authorization through LDAP or RADIUS
- Internal Authentication server for up to 100 users
- X.509v3 digital certificates (including CRL/LDAP and CRL/HTTP, CRL Caching and Backup CRL Distribution Point support)
- RADIUS accounting
- TACACS+ Administrative user authentication

Internet-Based Packet Filtering

- Source and destination IP address
- Port and protocol type
- Fragment protection
- FTP session filtering
- Site-to-Site Filters and NAT (for overlapping address space)

Policy Management

- By individual user or group
  - Filter profiles (defined internally or externally)
  - Idle and maximum session timeouts
  - Time and day access control
  - Tunneling protocol and security authorization profiles
  - IP Pool
  - Authentication Servers

Certification

- FIPS 140-2 Level 2 (3.6) in process, FIPS 140-1 Level 2 (3.1), VPNC

Ports

- Console port-Asynchronous serial (DB-9)

Cisco VPN 3000 Series Concentrator

A Remote Access VPN Solution

Introduction

The Cisco VPN 3000 Series Concentrator is a family of purpose-built, remote-access Virtual Private Network (VPN) platforms and client software that incorporates high availability, high performance and scalability with the most advanced encryption and authentication techniques available today.

With the Cisco VPN 3000 Series Concentrator, customers can take advantage of the latest VPN technology to vastly reduce their communications expenditures. Unique to the industry, it is the only scalable platform to offer field-swappable and customer-upgradeable components. These components, called Scalable Encryption Processing (SEP) modules, enable users to easily add capacity and throughput.

Cisco customers can choose from a range of VPN 3000 Concentrator models, the specific unit that most suits their needs and applications. The VPN 3000 Series Concentrator includes models to support a range of enterprise customers, from small businesses with 100 or fewer remote-access users to large organizations with up to 10,000 simultaneous remote users. With all versions of the Cisco VPN 3000 Concentrator, the Cisco VPN Client is provided at no additional charge and includes unlimited distribution licensing.

The Cisco VPN 3000 Series Concentrator is available in both non-redundant and redundant configurations, allowing customers to build the most robust, reliable and cost-effective networks possible. In addition, advanced routing capabilities, such as OSPF, RIP, and Network Address Translation (NAT) are available.

Product Highlights

The Cisco VPN 3000 Series Concentrator upports a wide range of Cisco customer applications in both small- and large-sized enterprise network environments.

High-Performance, Distributed-Processing Architecture

- Cisco SEP modules provide hardware-based encryption, which ensures consistent performance throughout the rated capacity (3030–3080)
- Large-scale tunneling support for IPsec, PPTP and L2TP/IPsec connections

Scalability (3015–3060)

- Modular design (four expansion slots) provides investment protection, redundancy and a simple upgrade path (3015–3060)
- System architecture designed to supply consistent, high-availability performance (3015–3080)
- All digital design, which provides the highest reliability and 24-hour continuous operation (3015–3080)

RQS Nº 03/2005 - CN

- Robust instrumentation package for run-time monitoring and alerts (3015–3080)
- Microsoft® compatibility, which offers large-scale client deployment and seamless integration with related systems (3015–3060)

Security

- Full support of current and emerging security standards, including RADIUS, NT Domain Authentication, RSA SecurID, and digital certificates, allows for integration of external authentication systems and interoperability with third-party products
- Advanced packet-filtering capabilities, which provide the required security for your corporate local-area network (LAN)
- User and group-level management for maximum flexibility

High Availability

- Redundant subsystems and multi-chassis fail-over capabilities for maximum system uptime
- Extensive instrumentation and monitoring capabilities, which provide network managers with real-time system status and early-warning alerts

Robust Management

- The Cisco VPN 3000 Concentrator can be managed using any standard Web browser (HTTP or HTTPS), as well as by Telnet, Secure Telnet, SSH, and via a console port
- Configuration and monitoring capability for both the enterprise and the service provider
- Access levels are configured by user and groups, allowing easy configuration and maintenance of security policies

Cisco VPN Client (IPsec)

- Available for Windows 95, 98, ME, NT 4.0, 2000, XP, Linux (Intel), Solaris (UltraSparc-32bit), and MAC OS X 10.1.
- Centrally configurable policy management, such as split tunneling/local LAN access policy, is pushed down from the Cisco VPN 3000 Concentrator.

Availability and Ordering Information

Pricing and ordering information can be located at http://www.cisco.com/univercd/cc/td/doc/pcat/3000.htm/

A wide variety of service plans are available to support the Cisco VPN 3000 Series Concentrator. Some of these programs include:

Annual Support Plans

Extended Warranty, Enhanced Warranty, 7x24 Installation Support, Remote Telephone Support, Rapid Exchange, Software Subscription

Installation Services

Onsite Installation Service

Time and Materials

Repair and Return, Remote Telephone Support (7x24 or M-F/8 -5), Unit Replacement, Software Update, Hardware Configuration

Release Notes for Cisco VPN 3000 Series Concentrator, Release 4.0

CCO Date: April 7, 2003

Part Number 78-15416-01

Introduction

Note You can find the most current documentation for released Cisco VPN 3000 products at http://www.cisco.com or http://cco.cisco.com. These electronic documents might contain updates and changes made after the hard-copy documents were printed.

These release notes are for Cisco VPN 3000 Series Concentrator Release 4.0 software. These release notes describe new features, limitations and restrictions, interoperability notes, and related documentation. They also list issues you should be aware of and the procedures you should follow before loading this release. The

CISCO SYSTEMS

Corporate Headquarters:
Cisco Systems, Inc., 170 West Tasman Drive, San Jose, CA 95134-1706 USA

Copyright © 2003 Cisco Systems, Inc. All rights reserved.

section, "Usage Notes," describes interoperability considerations and other issues you should be aware of when installing and using the VPN 3000 Series Concentrator. Read these release notes carefully prior to installing this release.

Contents

These release notes describe the following topics:

System Requirements, page 2

Upgrading to Release 4.0, page 3

New Features in Release 4.0, page 6

Usage Notes, page 10

Open Caveats for VPN 3000 Series Concentrator, page 16

Caveat Resolved in Release 4.0, page 21

Documentation Updates, page 26

Obtaining Documentation, page 28

Obtaining Technical Assistance, page 30

System Requirements

This section describes the system requirements for Release 4.0.

Hardware Supported

Cisco VPN 3000 Series Concentrator software Release 4.0 supports the following hardware platforms:

- Cisco VPN 3000 Series Concentrators, Models 3005 through 3080
- Altiga Networks VPN Concentrators, Models C10 through C60

Platform Files

Release 4.0 contains two binary files, one for each of two platforms:

- Files beginning with `vpn3000-` support the VPN Concentrator 3015 through 3080 platforms.
- Files beginning with `vpn3005-` support the VPN Concentrator 3005 platform only.

Caution Be sure you install the correct file for the platform you are upgrading.

Upgrading to Release 4.0

This section contains information about upgrading from earlier releases to Release 4.0.

When upgrading VPN 3000 Concentrator releases, you must clear the cache in your browser to ensure that all new screens display correctly when you are managing the VPN Concentrator.

Note You must also log in and click "Save Needed" to add new Release 4.0 parameters to the configuration file. These new Release 4.0 parameters are added to the running configuration immediately, but they are not added to the saved configuration until you click the "Save Needed" or "Save" icon in the VPN Concentrator Manager.

Upgrading to a new version of the VPN 3000 Concentrator software does not automatically overwrite the existing configuration file. Configuration options for new features (for example, IKE proposals) are not automatically saved to the configuration file on an upgrade. The HTML Manager displays "Save Needed" (rather than "Save") to indicate that the configuration needs to be saved. If the configuration is not saved, then on the next reboot, the new configuration options are added again. If you need to send the configuration file to the TAC, save the running configuration to the configuration file first.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
3
Fls: 1
Doc: 3701

Before You Begin

Before you upgrade to this release, *back up your existing configuration to the flash and to an external server.* This ensures that you can return to the previous configuration and software if you need to.

Be aware of the following considerations before you upgrade. These are known product behaviors, and your knowing about them at the beginning of the process should expedite your product upgrade experience. Where appropriate, the number of the caveat documenting the issue appears at the end of the item. See Open Caveats for VPN 3000 Series Concentrator, page 16 for a description of using this number to locate a particular caveat.

Release 4.0 of the VPN 3000 Concentrator software contains several features that interact with corresponding new features in the Release 3.6.x versions of the VPN Client and VPN 3002 Hardware Client software. To get the full benefit of this release you should upgrade your client software as well as your concentrator software. The VPN 3000 Concentrator software, Release 4.0, does operate with VPN Client and VPN 3002 Hardware Client versions 3.0 and higher, but you should upgrade these, too, to take full advantage of the new features.

- To use the VPN Client, Release 3.0 or higher, you *must* upgrade the VPN Concentrator to Release 3.0 or higher. The VPN Client, Release 3.0 or higher, does *not* operate with the VPN 3000 Concentrator version 2.5 or earlier versions.
- Do not update the VPN 3000 Concentrator when the system is under heavy use, as the update might fail (CSCdr61206).
- If you are upgrading from Release 3.0 to Release 3.1 or higher and you are using the "Group Lookup" feature, you must manually set Group Lookup after the upgrade. To enable this feature, go to Configuration | System | General | Authentication and select the Enable check box (CSCdu63961).

Use the following backup procedure to ensure that you have a ready backup configuration.

Backing Up the Existing Configuration to the Flash

1. Go to Administration | File Management | Files.
2. Select the configuration file and click Copy.

3. Enter a name for the backup file (in 8.3 format; for example, name it CON367BK.TST)

You have now backed up the existing configuration to the flash.

Backing Up the Existing Configuration to an External Server

You should also back up the configuration to a server. You can do this in many ways, one of which is to download the file using your Web Browser from the HTML interface (VPN Manager).

You can now upgrade the software with assurance that you can return to your previous firmware using your previous configuration.

Note After upgrading, be sure to clear the cache on your browser. Release 4.0 adds features and enhances HTML page layouts. Clearing your browser cache ensures that everything displays correctly and uses the new features and layout.

Downgrading from Release 4.0

If you need to return to a release prior to Release 4.0, do the following:

Step 1 Reload the firmware for the desired release. (Do not reboot yet.)

Step 2 Rename the existing configuration (for example, rename it as CON367BK.TST).

Step 3 Delete "CONFIG".

Step 4 Copy the previously saved backup file (for example, CON36BKP.TST) to CONFIG. Do not click Save (otherwise, your original CONFIG file will be overwritten with the running configuration).

Step 5 Perform a software reset.

Your prior firmware and image are restored.

New Features in Release 4.0

This section describes the new features in Release 4.0 of the VPN 3000 Series Concentrator. For detailed instructions about how to configure and use these features, see *VPN 3000 Series Concentrator Reference Volume I: Configuration* and *VPN 3000 Series Concentrator Reference Volume II: Administration and Management.*

Hardware Acceleration for Advanced Encryption Standard (AES)

VPN 3000 Concentrator models 3015 and higher now offer an enhanced, scalable encryption processor (SEP-E), that provides hardware support for AES (software support was added in Release 3.6). This feature has no configuration implications. For installation information about the new SEP-E modules, see *Installing SEP or SEP-E Modules in the VPN 3000 Series Concentrator.*

Note The VPN 3000 Concentrator uses *either* SEP or SEP-E modules, not both. Do not install both on the same device. If you install a SEP-E module on a VPN Concentrator that already contains a SEP module, the VPN Concentrator disables the SEP module and uses only the SEP-E module.

512 MB On-Board Memory

You can now upgrade your VPN 3060 or 3080 Concentrator memory to 512 MB.

Note To take advantage of this additional memory, you must also update the VPN Concentrator Manager to Version 4.0 and update the VPN Concentrator Bootcode to Version 4.0.

If your VPN 3000 Concentrator is running low on memory resources, upgrading to 512 MB will help. Symptoms that indicate low memory include the following:

- VPN Concentrator cannot support the necessary number of tunnels.
- VPN Concentrator cannot accept additional connections.
- VPN Concentrator crashes.

To determine the amount of memory currently installed in your VPN Concentrator, use the Monitoring | Status screen. For information about installing memory upgrades and about updating the VPN Concentrator Manager and the VPN Concentrator Bootcode, see *Upgrading Memory to 512 MB in the VPN 3000 Series Concentrator*, included with your memory upgrade kit.

RADIUS User Filters

With Release 4.0, administrators can define remote access user filters in Cisco Secure ACS as download PIX ACLs or as a Cisco vendor-specific RADIUS attribute AV-PAIR (26/9/1), rather than having to define them on each VPN Concentrator. This feature provides limited support for to download inbound access control lists or filters and apply them to a user or group, rather than defining the filters on the VPN Concentrator.

A network administrator can configure the filters on a RADIUS server, rather than on the VPN Concentrator. To provide information about the filter and filter rules, the VPN Concentrator's management system includes a new screen in the monitoring and administration sessions.

Backup LAN-to-LAN

The Backup LAN-to-LAN feature lets you establish redundancy for your LAN-to-LAN connection. Unlike VRRP, which provides a failover for the VPN Concentrator, Backup LAN-to-LAN provides a failover for the connection itself. Although VRRP and Backup LAN-to-LAN are both ways of establishing continuity of service should a VPN Concentrator fail, Backup LAN-to-LAN provides certain advantages that VRRP does not.

- You *can* configure Backup LAN-to-LAN and load balancing on the same device, but you cannot configure VRRP and load balancing on the same VPN Concentrator.
- Redundant Backup LAN-to-LAN peers do not have to be located at the same site. VRRP backup peers cannot be geographically dispersed,

Note This feature does not work in conjunction with VRRP. If you set up a Backup LAN-to-LAN configuration, disable VRRP.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
7
Fls: 0428
Doc: 3701

Native Kerberos Authentication

Release 4.0 supports authentication to Kerberos/Active directory, which is the default authentication mechanism in Windows 2000 and Windows XP. Kerberos is an authentication protocol for use on untrusted networks. The protocol comprises two stages of authentication--the first level is to a key distribution center (KDC), and the second level is between each client and server.

To configure this feature, an administrator must add a Kerberos authentication server on a group basis or add the server to the global authentication servers list and configure such parameters as server IP address, server port, number of retries, and so on. The IPSec group tab includes Kerberos as an authentication type, and statistical displays also include Kerberos authentication statistics.

See the Open Caveats section for information about configuration issues with Active Directory (CSCdz62206) and Linux/UNIX (CSCea20236).

LDAP/RADIUS Authorization

This feature separates user authorization (permissions) from user authentication. It lets certificate users receive permissions by means of LDAP or RADIUS without secondary authentication via XAUTH. It also lets non-certificate users using any type of authentication scheme (Kerberos, NT Domain, SDI, Radius, and Internal) to retrieve these permissions/attributes.

The feature provides a way to configure RADIUS and LDAP authorization servers and event information. The network administrator configures authorization servers on a global system or group basis.

Alerts (Delete with Reason Notifications)

The VPN 3000 Concentrator and the VPN 3002 Hardware Client can send alerts with reasons for disconnects and reboots they initiate to either the VPN Client or Concentrator to which they connect. When a disconnect occurs, the VPN Client displays the disconnect notice and the reason (if available) in the Event log.

The VPN Client can also send alerts regarding disconnects that it initiates, but it does not send a reason.

SNMP Enhancements

With Release 4.0, you can configure a list of particular event identifiers to track, as well as tracking events by class and severity. For more information, see *VPN 3000 Series Concentrator Reference Volume I: Configuration*, Chapter 10, "Events."

Disable LAN-to-LAN Tunnels

With Release 4.0, an administrator can disable a LAN-to-LAN VPN connection without deleting its configuration. This feature can be useful for troubleshooting a connection.

Configurable giaddr for Group-Based DHCP

This feature lets an administrator define a network address on a group basis to be used in DHCP proxy address assignments. To use this feature, DHCP proxy must be enabled on the VPN 3000 Series Concentrator. The administrator enters a network address without a subnet mask under group and user configuration. This address indicates to the DHCP server the scope (that is, the range of available IP addresses on the DHCP server) within which to assign the address.

Memory Conservation Enhancements

Release 4.0 includes modifications to memory structures and allocation algorithms to limit unnecessary memory use.

Memory Statistics Display Enhancements

The VPN 3000 Concentrator and the VPN 3002 Hardware Client now monitor and display memory usage in terms of block size and free and used blocks. The display also includes a new page with detailed statistics.

RQS Nº 03/2005 - CN
CPMI - CORREIOS

Fls:
Doc: 3701

Enhanced Sygate Firewall AYT Support

Release 4.0 includes support for Sygate Personal Firewall, Sygate Personal Firewall Pro, and Sygate Security Agent.

Enhanced PING Command Features

- Admin users who have only read access can now do PING commands, using either the Monitor tab on the GUI or the command-line interface. The PING command also appears, as before, on the Admin tab, accessible to users who have full access privileges. The PING command now shows the reply time in milliseconds and not just "device is available."

Adjustable DPD Timeout

For dead-peer detection (DPD), this feature lets an administrator configure the interval that the Concentrator waits before beginning Keepalive monitoring. This feature applies only to Easy VPN Clients that are using IKE Keepalives.

Usage Notes

This section lists interoperability considerations and other issues to consider before installing and using Release 4.0 of the VPN 3000 Series Concentrator software.

Online Documentation

The online documentation might not be accessible when using Internet Explorer with Adobe Acrobat, Version 3.0.1. To resolve this issue, upgrade to Acrobat 4.0 or higher. The latest version of Adobe Acrobat is available at the Adobe web site: http://www.adobe.com.

Disable Group Lock When Using SDI or NT Domain Authentication

This feature is supported only when using Internal or RADIUS authentication. To ensure that you are using this feature properly please refer to the following URL: http://www.cisco.com/warp/customer/471/altigagroup.html

Password Expiry Does Not Change User Profile for LAN

You must enable Start Before Logon on the VPN Client and possibly may need to make sure that DNS and WINS servers are properly configured (CSCdv73252).

Browser Interoperability Issues

The following sections describe known behaviors and issues with the indicated Web browsers.

VPN 3000 Concentrator Fully Supports Only Netscape and Internet Explorer

Currently, the VPN 3000 Concentrator fully supports only Netscape and Internet Explorer. Using other browsers might cause unacceptable behavior; for example, if you attempt to use an unsupported Web Browser to manage the VPN 3000 Concentrator, clicking any of the links might return you to the login screen. (CSCdx87630).

Internet Explorer 4.x Browser Issues

The following are known issues with Internet Explorer 4.X and the VPN Concentrator Manager (the HTML management interface). To avoid these problems, use the latest version of Internet Explorer.

- If you encounter a script error when you try to save your configuration file using Internet Explorer 4.0, reinstall Internet Explorer 4.0, or upgrade to a later version of Internet Explorer. Reinstalling Internet Explorer fixes the problem.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
11
0430
Fls:
Doc: 3701

- If you plan to upgrade the firmware on multiple VPN Concentrators at the same time from the same PC, use the version of Internet Explorer on the Cisco VPN 3000 software distribution media or newer. Using an earlier version could cause a failure in one or more of the upgrades.
- When connecting to the VPN Concentrator using SSL with Internet Explorer 4.0 (v4.72.2106.8), you might receive a message box saying, "This page contains both secure and non-secure items. Do you want to download the non-secure items?" Select Yes. There really are no *non-secure* items on the page and the problem is with Internet Explorer 4.0. If you upgrade to Internet Explorer 4.0 Service Pack 1 or Service Pack 2, you should not see this error message again.

  After adding a new SSL certificate, you might have to restart the browser to use the new certificate.

VPN Client Used with Zone Labs Integrity Agent Uses Port 5054

VPN Clients, when used with the Zone Labs Integrity Agent, are put into a "restricted state" upon connection to the Integrity Server if a port other than 5054 is used. The restricted state simply means the VPN Client is able to communicate only with the Integrity Server; all other traffic is blocked (CSCdw50994).

Workaround:

Do *one* of the following:

- Configure the VPN Concentrator and the Integrity Server to use port 5054 when communicating with each other.
- Edit the WEB.XML file in the Integrity directory and search for 5054 (the port that Integrity uses/looks for). Change it to 5000, save, and restart the Integrity Server.

Administer Sessions Screen Shows Data for Wrong Group

When an L2TP/IPSec connection is established, authentication should behave as follows:

1. The Tunnel Group is authenticated (using the OU field in the Certificate or using the Base Group).

2. The User should be authenticated (using the authentication method of the tunnel group.
3. The User's Group (as defined by the group delimiter option) should be authenticated.

This all works properly, but in the Administration | Administer Sessions screen, the Tunnel Group displays instead of the User's Group (CSCdy00360).

Long Initialization for SNMP Traps in Releases 3.0, 3.5, and 3.5.1

In Releases 3.0, 3.5, and 3.5.1 of the VPN 3000/3002 products, the SNMP task takes 3-5 minutes to complete initialization after a device reboot. Traps being processed during this interval are queued and sent to the SNMP Management station after SNMP task initialization completes.

However, the cold start trap, normally sent as a result of a device rebooting, is never sent.

In Release 2.5.X, the cold start trap is properly sent to the SNMP Manager after a device reboots (CSCdt01583).

Windows NT Authentication Servers Can't Follow Other Server Types in the a Prioritized Authentication Server List

If an Windows NT server follows a non-NT server in the prioritized authentication server list, and the non-NT server becomes unavailable for some reason, the VPN 3000 Concentrator detects this and falls back to the Windows NT server. If the tunnel being established is PPTP or L2TP, the authentication attempt to the Windows NT server also fails.

Therefore, when configuring PPTP or L2TP connections, do not place Windows NT authentication servers behind other types of servers in the applicable authentication server list (CSCdy07226).

RQS Nº 03/2005 - CN - CPMI - CORREIOS
0431
Fls:
3701
Doc:

Accessing Online Glossary Requires Connection to Cisco.com

The Glossary button at the top of all Help screens tries to contact univercd at www.cisco.com (the Cisco documentation site). This connection requires connectivity to Cisco's main web site. If your PC does not have a corporate Internet connection or your firewall blocks access, the following error appears when you attempt to access the Glossary:

"The page cannot be displayed."

To access the Glossary, you must be connected to www.cisco.com (CSCdy14238).

SNMP Traps VRRP Notifications and cipSecMIBNotifications Are Not Supported

The VPN 3000 Concentrator does not support the VRRPNotifications and cipSecMIBNotifications SNMP traps. You can configure VRRP for these SNMP traps without getting an error message, but the traps themselves are not supported, so no action occurs. The same is true of Cisco IPSec-flow MIB notifications (CSCdx44580).

RSA Allows a CA to Issue Only One Certificate with any DN

The rekey option to renew an SSL certificate from the RSA CA results in a rejection of the request.

The resubmit/renew feature does work with RSA as long as the certificate being rekeyed or renewed is first deleted from the CA database. RSA does not allow a CA to issue more than 1 certificate with any particular DN (CSCdv27743).

Reauthentication on Rekey Interval

If you have enabled the Reauthentication on Rekey feature, the VPN Concentrator prompts users to enter an ID and password during Phase 1 IKE negotiations and also prompts for user authentication whenever a rekey occurs. Reauthentication provides additional security.

If the configured rekey interval is very short, users might find repeated authorization requests inconvenient. In this case, disable reauthentication. To check your VPN Concentrator's configured rekey interval, see the Lifetime Measurement, Data Lifetime, and Time Lifetime fields on the Configuration | System | Tunneling Protocols | IPSec | IKE Proposals | Add or Modify screen.

Note At 85% of the rekey interval, the software client prompts the user to reauthenticate. If the user does not respond within approximately 90 seconds, the VPN Concentrator drops the connection.

VPN 3000 Concentrator Ignores RADIUS Packets Longer Than 4096 Bytes

Some RADIUS Servers exceed the Maximum RADIUS packet size of 4096 bytes. The VPN 3000 Series Concentrator ignores RADIUS packets that exceed this length (CSCdz90027).

Downgrading to Release 3.6 with a Release 4.0 Configuration Deletes Information from LAN-to-LAN Groups

A VPN Concentrator with more than 125 users and groups combined fails to terminate tunnels if the SEPs are not active. This is because a VPN Concentrator with no active SEPs is considered to be a model 3015, and model 3015 supports only 125 users and groups combined.

This condition could unexpectedly arise if a VPN Concentrator with a SEP-E, running Release 4.0, is downgraded to Release 3.6. This would result in the problem, because the Release 3.6 does not support the SEP-E module. The SEP-Es are detected as unknown cards if present when running Release 3.6 code.

If you encounter a situation, for whatever reason, where you are trying to load a configuration with more users than are supported by the model, the following event appears on the console after a reboot:

****

(CSCea51435)

VPN Client Supports Elevated Privileges Using the MSI Installer

Windows Installer 2.0 must be installed on a Windows NT or Windows 2000 PC prior to configuring the PC for a Restricted User with Elevated Privileges When using elevated privileges, the VPN Client program files are created under the specific user, not "ALL" users. (CSCea37900).

Open Caveats for VPN 3000 Series Concentrator

Caveats describe unexpected behavior or defects in Cisco software releases. The following list is sorted by identifier number.

Note If you have an account with CCO, you can use Bug Navigator II to find caveats of any severity for any release. To reach Bug Navigator II on CCO, select Software & Support: Online Technical Support: Software Bug Toolkit or navigate to http://www.cisco.com/cgi-bin/Support/Bugtool/launch_bugtool.pl.

The following problems exist with the VPN 3000 Series Concentrator, Release 4.0.

- CSCds44095

  L2TP over IPSec connections fail if going through a NAT device. During the connection establishment, the VPN Client and the VPN 3000 Concentrator exchange IP addresses. When the client sends what it believes to be the VPN 3000 Concentrator's address (really the NATed address), the VPN 3000 Concentrator releases the connection.

  This is because the address assigned to the interface does not match the address coming in from the client. The same issue exists on the client side. This will not be resolved until the Windows 2000 MS client supports UDP encapsulation.

- CSCdt08303

  When configuring a LAN-to-LAN connection with IOS or PIX, it is important to match the keepalive configuration (both "ON" or both "OFF"). If the keepalive configuration is OFF for the VPN 3000 Concentrator and ON for the IOS device, the tunnel will be established with data.

  IOS tears down the tunnel because the VPN 3000 Concentrator does not respond to IOS style keepalives if keepalives are configured to be OFF for the VPN 3000 Concentrator.

- CSCdw36613

  In some cases, the Zone Labs Integrity Agent may not properly update on the Windows NT version 4.0 operating system while the VPN Client is connected, policy is changed and re-deployed, and the connection is up. Specifically, if you "Block Internet Servers" under the Firewall Security Rules in the Policy and then Deploy that new policy, a PC running Windows NT version 4.0 receives the updated policy, but it might not put the "Block Internet Servers" setting of that policy into effect.

  Workaround:

  Reboot the operating system.

- CSCdx47596

  Due to a Microsoft bug, Windows XP PCs are not capable of receiving a large number of Classless Static Routes (CSR). The VPN 3000 Concentrator limits the number of CSRs that are inserted into a DHCP INFORM message response when configured to do so.

  The VPN 3000 Concentrator limits the number of routes to 28-42, depending on the class.

- CSCdx89348

  The Concentrator may display the following events during a VPN Client connection. These events were found to be due to the client being behind a Linksys Cable/DSL router that was incorrectly modifying the Client's packets, causing them to fail authentication when received by the VPN Concentrator. The problem is more prominent if LZS compression is used.

  Events:

  131500 06/20/2002 17:08:34.300 SEV=4 IPSEC/4 RPT=4632

  IPSec ESP Tunnel Inb: Packet authentication failed, username: gray, SPI:

RQS Nº 03/2005 - CN - CPMI - CORREIOS
17
0433
Fls:
Doc: 3701

4e01db67, Seq Num: 0000850f. Dump of failed hash follows.

Linksys has been notified about the problem.

Workaround:

Although no workaround currently exists, disabling LZS compression on the Concentrator helps reduce the number of events. To disable LZS compression on the Concentrator set the "IPComp" setting on the IPSec tab of the group configuration to "none".

- CSCdy26161

  The Microsoft L2TP/IPSec client for Windows 98, Windows ME, and Windows NT does not connect to the VPN 3000 Concentrator using digital certificates.

  Workaround:

  Use Preshared keys.

- CSCdy27564

  The Assigned IP address for a PIX-501 in Network Extension Mode appears on the VPN 3000 Concentrator as 0.0.0.0 until the first IPSec/Phase 2 rekey takes place. After the Phase 2 rekey completes, the Assigned IP address is correctly set to the PIX-501's private interface network address.

- CSCdz24882

  Using Microsoft Internet Explorer version 5.0, you cannot create a detailed memory report from the Monitoring | System Status | Memory Status | Detailed Memory Report button. The file memory.txt is *not* created. The report does work if the file already exists. You *can* create the file initially if you run a detailed report from the CLI interface. Internet Explorer version 5.5 and Netscape work fine.

- CSCdz83332

  When switching between tabs under the interfaces section of the html-management page, the action may eventually fail.

  If this happens simply go back to the interface summary page and drill back down into the desired interface. Everything will resume working again.

- CSCdz87108

  The LDAP Authorization failure reasons depend on how the LDAP server implements these error codes. RFC 1777-LDAP states that the LDAP server might not return an error code, therefore in those situations the VPN 3000 failure reason is "Invalid response received from server".

  For the case in which the LDAP server *does* return a specific error diagnostic (for example, noSuchAttribute) the VPN 3000 failure reason displays the appropriate string.

- CSCea20236

  Before you use the VPN Concentrator to authenticate a user to a Linux or Unix server running a Kerberos server, follow these steps:

  a. Check the keys available for the user you want to authenticate. Run:

     kadmin.local -q "getprinc *username*"

  b. Make sure that "DES cbc mode with RSA-MD5, Version 5" is one of the available keys. If you do not see "DES cbc mode with RSA-MD5, Version 5", edit the kdc.conf file and add or move des-cbc-md5 selections to the beginning of the supported_enctypes = line. For example:

     [realms]

     MYCOMPANY.COM = {

     master_key_type = des-cbc-crc

     supported_enctypes = des-cbc-md5:normal des-cbc-md5:norealm des-cbc-md5:onlyrealm

     Save the file. Then, restart the krb5kdc, kadmin, and krb524 services.

  c. To create the "DES cbc mode with RSA-MD5" keys, change the users password:

     kadmin.local -q "cpw -pw newpassword *username*"

  Now you should be able to authenticate that user to your Linux/Unix Kerberos 5 server.

- CSCea29828

  HTTP Software Updates sometimes fail with "Software Update Error". Retrying the operation does not update the image.

  Workarounds:

POC Nº 03/2005 - CN
CPMI - [redacted] S
Fls: 0434
Doc: 3701

Do *one* of the following:

- Perform the Software Update using the CLI/telnet interface.
- Reboot the VPN 3000. Performing an HTTP Software Update will now succeed.

- CSCea46018

  When a backup SEP-E fails over to Software, the Activity LED and Status LED stay green, even though the SEP-E is no longer operational.

- CSCea52820

  The text from the Help page for the Monitoring | System Status | Memory Details page in HTML incorrectly refers to "Memory Detail Report". The page is labelled and called: "Detailed Memory Report".

- CSCea52936

  The Help for the SEP-E in the Monitoring | System Status | SEP in-line SEP page is incomplete. In other sections, we make reference to the SEP-E. We should add:

  "AES (SEP-E only)" to the Encryption and Decryption bullet.

  This screen displays status and statistics for a VPN Concentrator SEP (Scalable Encryption Processing) or a SEP-E (Enhanced SEP) module, which performs hardware-based cryptographic functions:

  - Random-number generation.
  - Hash transforms (MD5 and SHA-1) for authentication.
  - Encryption and decryption (DES and Triple-DES).

  The screen shows cumulative data since the system was last booted or reset.

- CSCea69156

  LDAP Authorization to a Microsoft Active Directory LDAP server using authenticated Bind requests is not supported in this release. Only anonymous Binds are currently supported.

Caveat Resolved in Release 4.0

Release 4.0 resolves the following issues:

- CSCdy09630

  The description of the IPSec Backup Servers feature in the VPN 3000 Concentrator Series Reference documentation indicates that it applies only to the VPN3002 Hardware Client. The feature now applies to the Software Client as well. For information about this feature and how to configure it, on the VPN Concentrator, see *VPN Client Administrator Guide*, Chapter 1. For information about how to configure Backup Servers in the VPN Client, see *VPN Client User Guide*.

- CSCdy12056

  If a LAN-to-LAN tunnel between a VPN 3000 Concentrator and an IOS device is misconfigured and repeatedly fails to establish, then the VPN 3000 Concentrator could enter a state where a reboot is required.

  One way to encounter this problem is to try to setup IOS to handle both LAN-to-LAN tunnels and Remote Access tunnels on the same interface, without breaking the IOS interface into V-LANs. This is a misconfiguration and is not supported by IOS, but it can lead to problems with the VPN 3000 Concentrator.

  This configuration is not supported because IOS does not allow the same crypto map to be used to terminate both LAN-to-LAN tunnels and Remote Access tunnels. In addition, IOS only allows one crypto map to be applied per interface.

  Consequently, if both types of tunnels must be terminated on a single physical interface, that interface must be broken out into V-LANs. Dividing the physical interface in this way enables a different crypto map to be applied to each virtual interface. This in turn enables both types of tunnels to be terminated on the same physical interface while maintaining a valid configuration.

- CSCdy26296

  When viewing bandwidth management statistics via the CLI, with Bandwidth Management enabled and multiple users connected, all user sessions scroll through on the screen without the user being prompted to press space to continue or Q to quit.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
21
Fls: 3701
Doc:

- CSCdy28464

  Documentation for the Bandwidth Management feature in Release 3.6.1 refers to a configuration option in which bandwidth aggregation is automatically applied to a LAN-to-LAN connection when a bandwidth reservation policy is applied to a LAN-to-LAN connection. This feature is not available in Release 3.6.1.

  To ensure that bandwidth is always available for a LAN-to-LAN connection via the HTML interface, navigate to Configuration | User Management | Groups. Highlight the LAN-to-LAN group, and select the Assign Bandwidth Policies button. Select the public interface, and next to the Bandwidth Aggregation parameter, enter the amount of bandwidth to reserve from the total available bandwidth for this connection.

  If bandwidth aggregation is not set for a LAN-to-LAN connection, a situation might occur where there is not enough bandwidth available for the tunnel to be established.

- CSCdz48220

  The VPN 3000 Concentrator continually requests the node secret from the RSA server. The RSA server considers these requests as failed login attempts by the RSA server; therefore, the user's account is disabled.

  This problem occurs under the following conditions:

  - The VPN 3000 Concentrator does not have the node secret stored locally.
  - The VPN Client provides an incorrect passcode.

- CSCdz48332

  If you add and delete filters through the GUI interface (Configuration |System |Policy Management | Traffic Management | Filters), there is a very small memory leak for each filter created and deleted.

- CSCdz48402

  The VPN 3000 Concentrator does not consistently send Delete with Reason messages to all the connected clients when you do Reboot *NOW*. The VPN Clients believe they are still connected, but they will eventually disconnect due to the Client's Dead-Peer-Detection mechanism.

- CSCdz53656

  Authorization server statistics are not available in this release.

- CSCdz62206

  If you use Active Directory/Kerberos authentication on the VPN 3000 Concentrator and would like to authenticate to a Windows 2000 or .NET Active Directory server, you *must* change *all* the users' Account options to "Use DES encryption types for this account". This is *required* because the Release 4.0 VPN 3000 Concentrator uses DES encryption, but Windows Active Directory uses RC4.

- CSCdz71450

  When using Active Directory/Kerberos for authentication, if the user types in the username or password incorrectly, the VPN 3000 Concentrator simply ends the connection after the first failure. The user should be prompted three times before failing as it does when using Internal, Radius, or NT Domain authentication methods.

- CSCdz77794

  On the Monitoring | Statistics | Authentication and Monitoring | Statistics | Accounting screens, if you click Reset, then all group-based statistics show up with the Group column=Base Group. In order to show group-based statistics again, click Restore.

- CSCdz78109

  SEP-E to SEP-E failover and SEP-E to software failover are *not* supported in Beta releases.

  New connections are not accepted after SEP-E failover with several calls previously connected and passing data.

- CSCdz79541

  Duplicate of CSCdz85139.

- CSCdz83301

  If a simple password is configured under the OSPF tab, in any of the interface configuration pages, the deleted entry will re-appear even after deleting the password, selecting none for OSPF authentication and clicking apply.

- CSCdz84481

  When a user fails authentication due to a restriction placed on the account at the Active Directory server, the VPN 3000 Concentrator Events do not display the reason for the failure. Some restrictions on the account could be

Account Expired, Account Disabled, Account Locked-Out, Not within Logon Hours and Password Change required. For most of these restrictions you will see the following Events:

124 01/20/2003 11:12:55.590 SEV=10 AUTHDECODE/43 RPT=4

Kerberos: Error type: Client's creds have been revoked

130 01/20/2003 11:12:55.590 SEV=4 AUTH/9 RPT=9 70.139.1.5

Authentication failed: Reason = Invalid response received from server handle = 196, server = 198.133.219.25, user = myuser

- CSCdz85139

  When you add an LDAP Authorization server, the events refer to the server with "type=TACACS+."

- CSCdz87048

  The VPN 3000 Concentrator may leak memory when a VPN Client connects and downloads and ACL User Filter from the RADIUS Server. The amount of memory leaked is closely associated with the size of the actual filter.

- CSCdz87381

  If you externally authenticate Groups and Users to a RADIUS Server, the User filters assigned by the RADIUS Server get corrupted. It is recommended that you authenticate the Groups locally on the Concentrator and the Users externally on a RADIUS Server when utilizing the RADIUS User Filter feature.

- CSCea02122

  RADIUS based user filters are not cleared from the Concentrator when PPTP or L2TP connections are terminated.

- CSCea03407

  Using Netscape version 4.7, under Admin | Admin Sessions, the RADIUS User ACL filters get displayed in a narrow 1 inch wide column with no scroll capabilities. The filters are displayed correctly under Monitoring | Dynamic filters.

- CSCea12148

  If your VPN Concentrator has a SEP-E installed, you might see the following event message when you boot:

CAPI-RSA PKCS1 payload to be decrypted is not in PKCS1 format, bad block type=[0x7][0xb8].

If you receive this event, you will be unable to use HTTPS to manage the VPN Concentrator. To workaround this problem, delete the SSL certificate (from the Administration | Certificate Management screen), then generate a new SSL certificate.

- CSCea13002

  The functionality that allows the administrator to create a network list, from within a LAN-to-LAN configuration page, has changed.

  In previous releases, the user could create a network list from within the LAN-to-LAN configuration page. The new method for creating a network list uses a link on the LAN-to-LAN index page to the network list configuration page.

  This change was resolves a problem with Reverse Route Injection when the network lists are added from within the LAN-to-LAN page. With the previous method, the routes, corresponding to the network lists that were added via the LAN-to-LAN page, were not present in the routing table.

- CSCea16255

  When Strip Realm is disabled, accounting requests should be sent as user name=user. But instead, accounting requests are incorrectly sent with user name=user@realm (Duplicate of CSCea44988).

- CSCea20412

  Using Authentication=RADIUS with Expiry, the VPN Concentrator establishes the tunnel but skips either RADIUS or LDAP authorization.

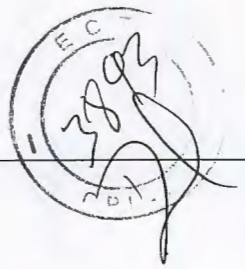
- CSCea24328

  When using Kerberos/Active Directory authentication, if a user types a username with the "@" symbol and Realm using all lowercase for the realm (that is, usernam@mycompany.com instead of username@MYCOMPANY.COM), the following error occurs on the VPN Concentrator, and the Kerberos server status changes to "Not-in-service".

  78 02/19/2003 16:59:49.250 SEV=7 AUTHDBG/76 RPT=8
  Unable to correlate received message with authentication session

  83 02/19/2003 16:59:53.150 SEV=4 AUTH/15 RPT=76
  Server name = 100.136.50.2, type = KERBEROS,
  group = KerberosGroup, status = Not-in-service

RQS Nº 03/2005 - CN
CPMI - CORREIOS
25
0436
Fls:
3701
Doc:



When using Kerberos/Active directory for authenticating, users should enter only their username, username@REALM.COM with Realm all in UPPERCASE letters, or use the Strip Realm setting for the Group on the Concentrator.

- CSCea25668

  Statically assigned filters take precedence over dynamically assigned filters. It should be the other way around.

Documentation Updates

The Cisco VPN 3000 Series Concentrator documentation set has been revised for this release and is available online through Cisco Connection Online (CCO). This section contains any changes and corrections to the documentation that occurred after the documentation was published.

Documentation Changes

The following document requires modifications, reflecting product changes, as noted in the following sections:

- *VPN 3000 Series Concentrator Reference Volume I: Configuration*

Changes to *VPN 3000 Series Concentrator Reference Volume I: Configuration*

Please note the following changes to the Configuration manual.

Syslog Servers Now Supported on Both Windows and UNIX Operating Systems

The VPN 3000 Concentrator now supports syslog servers on both Windows and UNIX (Linux and Solaris) operating system platforms. In *VPN 3000 Series Concentrator Reference Volume I: Configuration,* Chapter 10, "Events," and in the corresponding online Help, the text and the screen captures refer to UNIX syslog servers. This restriction on the type of syslog server operating environment no longer exists.

Inbound Firewall Rules Must Not Limit Traffic to UDP Source Port 4500

In *VPN 3000 Series Concentrator Reference Volume I: Configuration,* Chapter 7, "Tunneling Protocols," make the following change to the note on page 7-35, under Tunneling Protocols | Configuration | System | Tunneling Protocol | IPsec | NAT Transparency area, regarding IPsec over NAT-T:

Note The source port of the client may vary from UDP 4500 especially when traversing a PAT device, so any inbound firewall rules must not specifically limit traffic to a source port of 4500.

VPN 3000 Concentrator Documentation Updates

In addition to these Release Notes, the following documents are new or have been updated for Release 4.0:

- *VPN 3000 Series Concentrator Reference Volume I: Configuration*
- *VPN 3000 Series Concentrator Reference Volume II: Administration and Management*
- *VPN 3000 Series Concentrator Getting Started*
- Online Help

Related Documentation

Service and Support

For service and support for a product purchased from a reseller, contact the reseller, who offers a wide variety of Cisco service and support programs described in "Service and Support" in *Cisco Information Packet* shipped with your product.

Note If you purchased your product from a reseller, you can access CCO as a guest. CCO is Cisco Systems' primary real-time support channel. Your reseller offers programs that include direct access to CCO services.

For service and support for a product purchased directly from Cisco, use CCO.

Software Configuration Tips on the Cisco TAC Home Page

The Cisco TAC home page includes technical tips and configuration information for the VPN 3000 Concentrator and client. Find this information at:

http://www.cisco.com/warp/public/707/#vpn3000.

Obtaining Documentation

Cisco provides several ways to obtain documentation, technical assistance, and other technical resources. These sections explain how to obtain technical information from Cisco Systems.

Cisco.com

You can access the most current Cisco documentation on the World Wide Web at this URL:

http://www.cisco.com/univercd/home/home.htm

You can access the Cisco website at this URL:

http://www.cisco.com

International Cisco websites can be accessed from this URL:

http://www.cisco.com/public/countries_languages.shtml

Documentation CD-ROM

Cisco documentation and additional literature are available in a Cisco Documentation CD-ROM package, which may have shipped with your product. The Documentation CD-ROM is updated regularly and may be more current than printed documentation. The CD-ROM package is available as a single unit or through an annual or quarterly subscription.

Registered Cisco.com users can order a single Documentation CD-ROM (product number DOC-CONDOCCD=) through the Cisco Ordering tool:

http://www.cisco.com/en/US/partner/ordering/ordering_place_order_ordering_tool_launch.html

All users can order monthly or quarterly subscriptions through the online Subscription Store:

http://www.cisco.com/go/subscription

Ordering Documentation

You can find instructions for ordering documentation at this URL:

http://www.cisco.com/univercd/cc/td/doc/es_inpck/pdi.htm

You can order Cisco documentation in these ways:

- Registered Cisco.com users (Cisco direct customers) can order Cisco product documentation from the Networking Products MarketPlace:

  http://www.cisco.com/en/US/partner/ordering/index.shtml

- Nonregistered Cisco.com users can order documentation through a local account representative by calling Cisco Systems Corporate Headquarters (California, U.S.A.) at 408 526-7208 or, elsewhere in North America, by calling 800 553-NETS (6387).

Documentation Feedback

You can submit comments electronically on Cisco.com. On the Cisco Documentation home page, click **Feedback** at the top of the page.

You can e-mail your comments to bug-doc@cisco.com.

You can submit comments by using the response card (if present) behind the front cover of your document or by writing to the following address:

Cisco Systems
Attn: Customer Document Ordering
170 West Tasman Drive
San Jose, CA 95134-9883

We appreciate your comments.

Obtaining Technical Assistance

Cisco provides Cisco.com, which includes the Cisco Technical Assistance Center (TAC) website, as a starting point for all technical assistance. Customers and partners can obtain online documentation, troubleshooting tips, and sample configurations from the Cisco TAC website. Cisco.com registered users have complete access to the technical support resources on the Cisco TAC website, including TAC tools and utilities.

Cisco.com

Cisco.com offers a suite of interactive, networked services that let you access Cisco information, networking solutions, services, programs, and resources at any time, from anywhere in the world.

Cisco.com provides a broad range of features and services to help you with these tasks:

- Streamline business processes and improve productivity
- Resolve technical issues with online support
- Download and test software packages
- Order Cisco learning materials and merchandise

- Register for online skill assessment, training, and certification programs

To obtain customized information and service, you can self-register on Cisco.com at this URL:

http://tools.cisco.com/RPF/register/register.do

Technical Assistance Center

The Cisco TAC is available to all customers who need technical assistance with a Cisco product, technology, or solution. Two types of support are available: the Cisco TAC website and the Cisco TAC Escalation Center. The type of support that you choose depends on the priority of the problem and the conditions stated in service contracts, when applicable.

We categorize Cisco TAC inquiries according to urgency:

- Priority level 4 (P4)—You need information or assistance concerning Cisco product capabilities, product installation, or basic product configuration. There is little or no impact to your business operations.
- Priority level 3 (P3)—Operational performance of the network is impaired, but most business operations remain functional. You and Cisco are willing to commit resources during normal business hours to restore service to satisfactory levels.
- Priority level 2 (P2)—Operation of an existing network is severely degraded, or significant aspects of your business operations are negatively impacted by inadequate performance of Cisco products. You and Cisco will commit full-time resources during normal business hours to resolve the situation.
- Priority level 1 (P1)—An existing network is "down," or there is a critical impact to your business operations. You and Cisco will commit all necessary resources around the clock to resolve the situation.

Cisco TAC Website

The Cisco TAC website provides online documents and tools to help troubleshoot and resolve technical issues with Cisco products and technologies. To access the Cisco TAC website, go to this URL:

http://www.cisco.com/tac

RQS Nº 03/2005 - CN
CPMI - CORREIOS
31
0439
Fls:
Doc: 3701

All customers, partners, and resellers who have a valid Cisco service contract have complete access to the technical support resources on the Cisco TAC website. Some services on the Cisco TAC website require a Cisco.com login ID and password. If you have a valid service contract but do not have a login ID or password, go to this URL to register:

http://tools.cisco.com/RPF/register/register.do

If you are a Cisco.com registered user, and you cannot resolve your technical issues by using the Cisco TAC website, you can open a case online at this URL:

http://www.cisco.com/tac/caseopen

If you have Internet access, we recommend that you open P3 and P4 cases online so that you can fully describe the situation and attach any necessary files.

Cisco TAC Escalation Center

The Cisco TAC Escalation Center addresses priority level 1 or priority level 2 issues. These classifications are assigned when severe network degradation significantly impacts business operations. When you contact the TAC Escalation Center with a P1 or P2 problem, a Cisco TAC engineer automatically opens a case.

To obtain a directory of toll-free Cisco TAC telephone numbers for your country, go to this URL:

http://www.cisco.com/warp/public/687/Directory/DirTAC.shtml

Before calling, please check with your network operations center to determine the Cisco support services to which your company is entitled: for example, SMARTnet, SMARTnet Onsite, or Network Supported Accounts (NSA). When you call the center, please have available your service agreement number and your product serial number.

Obtaining Additional Publications and Information

Information about Cisco products, technologies, and network solutions is available from various online and printed sources.

- The *Cisco Product Catalog* describes the networking products offered by Cisco Systems, as well as ordering and customer support services. Access the *Cisco Product Catalog* at this URL:

http://www.cisco.com/en/US/products/products_catalog_links_launch.html

- Cisco Press publishes a wide range of networking publications. Cisco suggests these titles for new and experienced users: *Internetworking Terms and Acronyms Dictionary, Internetworking Technology Handbook, Internetworking Troubleshooting Guide,* and the *Internetworking Design Guide.* For current Cisco Press titles and other information, go to Cisco Press online at this URL:

  http://www.ciscopress.com

- *Packet* magazine is the Cisco quarterly publication that provides the latest networking trends, technology breakthroughs, and Cisco products and solutions to help industry professionals get the most from their networking investment. Included are networking deployment and troubleshooting tips, configuration examples, customer case studies, tutorials and training, certification information, and links to numerous in-depth online resources. You can access *Packet* magazine at this URL:

  http://www.cisco.com/go/packet

- iQ Magazine is the Cisco bimonthly publication that delivers the latest information about Internet business strategies for executives. You can access iQ Magazine at this URL:

  http://www.cisco.com/go/iqmagazine

- Internet Protocol Journal is a quarterly journal published by Cisco Systems for engineering professionals involved in designing, developing, and operating public and private internets and intranets. You can access the Internet Protocol Journal at this URL:

  http://www.cisco.com/en/US/about/ac123/ac147/about_cisco_the_internet_protocol_journal.html

- Training—Cisco offers world-class networking training. Current offerings in network training are listed at this URL:

  http://www.cisco.com/en/US/learning/le31/learning_recommended_training_list.html

---

This document is to be used in conjunction with the documents listed in the "Related Documentation" section.

Cisco 1751 Modular Access Router

The content in this catalog is updated on a monthly basis—for the most current information please see

http://www.cisco.com/en/US/products/hw/routers/ps221/index.html

Product Overview

The Cisco 1751 Modular Access Router is ideally suited to help you evolve your organization into an e-business. It supports e-business features such as VPNs; secure Internet, intranet, and extranet access with optional firewall technology; and broadband, cable connectivity, and multiservice voice/video/data/fax integration.

The Cisco 1751 router delivers its capabilities with the power of Cisco IOS® Software in a modular integrated access solution. The Cisco 1751 router provides a cost-effective solution to support e-business applications through a comprehensive feature set including support for:

- Multiservice voice/fax/data integration
- Secure Internet, intranet, and extranet access with VPN and firewall
- Integrated broadband DSL connectivity
- VLAN support (IEEE 802.1Q)

The Cisco 1751 router is available in two models that enable you to easily tailor an access solution to suit your e-Business requirements today and in the future. See table below.

Table 18-30: Cisco 1751 Modular Access Routers

Description	Specification
Cisco 1751 Base Model	Includes everything an office needs for data networking now (16 MB Flash, 32 MB DRAM, and Cisco IOS IP software feature set), with a simple upgrade path to full voice functionality. WAN interface cards are available separately.
Cisco 1751-V Multiservice Model	Includes all the features needed for immediate integration of data and voice services with support for up to two voice channels (32 MB Flash and 64 MB DRAM, one DSP, and Cisco IOS IP Plus Voice feature set). Voice and WAN interface cards are available separately.

Key Features and Benefits

Table 18-31: Key Features and Benefits of Cisco 1751

Features	Benefits
Flexibility	
Full Cisco IOS Software support, including multiprotocol routing (IP, IPX, Apple Talk, IBM/SNA) and bridging	Provides the industry's most robust, scalable, and feature-rich internetworking software support using the de facto standard networking software for the Internet and private WANs Part of the Cisco end-to-end network solution
Integrated Voice and Data Networking	
Cisco 1751 router chassis accepts both WAN and voice interface cards	Reduces long-distance toll charges by allowing the data network to carry interoffice voice and fax traffic Works with existing handsets, key units, and PBXs, eliminating the need for a costly phone-equipment upgrade Provides a path to migrate to IP Telephony
Modular Architecture	
Accepts an array of WAN and voice interface cards	Adds flexibility and investment protection

ROS Nº 03/2005 - CN
CPML - CORREIOS
0445
Fls:
3701
Doc:

Features	Benefits
WAN interface cards are shared with Cisco 1600, 1700, 2600, and 3600 routers	Reduce cost of maintaining inventory Lower training costs for support personnel Protects investments through re-use on various platforms
Autosensing 10/100 Fast Ethernet	Simplifies migration to Fast Ethernet performance in the office
Expansion Slot on Motherboard	Allows expandability to support hardware-assisted encryption at T1/E1 speeds Allows support for future technologies
Dual DSP Slots	Allow expandability to support additional voice channels
Security	
The Cisco IOS Firewall Feature Set includes context-based access control for dynamic firewall filtering, denial-of-service detection and prevention, Java blocking, real-time alerts, Intrusion Detection System (IDS), and encryption	Allows internal users to access the Internet with secure, per-application-based, dynamic access control, while preventing unauthorized Internet users from accessing the internal LAN
IPSec DES and 3DES	Enable creation of VPNs by providing industry-standard data privacy, integrity, and authenticity as data traverses the Internet or a shared public network Supports up to 168-bit encryption
Hardware-Based Encryption Using Optional VPN Module	Supports wire-speed encryption up to T1/E1 speeds
Device Authentication and Key Management	
IKE, X.509v3 digital certification, and support for certificate enrollment protocol (CEP) with certification authorities (CAs) such as Verisign and Entrust	Ensure proper identity and authenticity of devices and data Enable scalability to very large IPSec networks through automated key management
User Authentication	
PAP/CHAP, RADIUS, TACACS+	Support all leading user identity verification schemes
VPN Tunneling	
IPSec, GRE, L2TP, L2F	Offer choice of standards-based tunneling methods to create VPNs for IP and non-IP traffic Allow standards-based IPSec or L2TP client to interoperate with Cisco IOS tunneling technologies Fully interoperable with public certificate authorities and IPSec standards-based products Part of the scalable Cisco end-to-end VPN solution portfolio
Cisco Easy-VPN client	Allows the router to act as remote VPN client and have VPN policies pushed down from the VPN concentrator
Cisco Unified VPN Access Server	Allows the router to terminate remote access VPNs initiated by mobile and remote workers running Cisco VPN client software on PCs; and allows the router to terminate site-site VPNs initiated by IOS routers using the Cisco Easy-VPN client feature
Management	
IEEE 802.1Q VLAN Support	VLANs enable efficient traffic separation, provide better bandwidth utilization, and alleviate scaling issues by logically segmenting the physical LAN infrastructure into different subnets.
Manageable via SNMP (CiscoView, CiscoWorks2000), Telnet, and console port	Allow central monitoring, configuration, and diagnostics for all functions integrated in the Cisco 1751 router, reducing management time and costs
Ease of Use and Installation	
Cisco ConfigMaker, SETUP configuration utility, AutoInstall, color-coded ports/cables, and LED status indicators	Simplifies and reduces deployment time and costs with graphical LAN/VPN policy configurator; command-line, context-sensitive configuration questions; and straightforward cabling LEDs allows quick diagnostics and troubleshooting
Network Address Translation (NAT) and Easy IP	Simplifies deployment and reduces Internet access costs
QoS	

Features	Benefits
CAR, Policy Routing, WFQ, PQ/CBWFQ, GTS, RSVP, DSCP, cRTP, MLPP and LFI	Allocates WAN bandwidth to priority applications for improved performance
Reliability and Scalability	
Cisco IOS Software, dial-on-demand routing, dual-bank Flash memory, scalable routing protocols such as OSPF, EIGRP, and HSRP	Improves network reliability and enables scalability to large networks
Broadband Connectivity Options	
ADSL and cable connectivity deliver business-class broadband access	Leverage broadband access technologies like cable and DSL to increase WAN connectivity speeds and reduce WAN access costs The Cisco 1751 supports ADSL connectivity with ADSL WIC Cable connectivity with the Cisco 1751 and optional integrated Cisco uBR910 Series Cable DSU deliver business-class broadband access
Device Integration	
Integrated router, voice gateway, firewall, encryption, VPN tunnel server, DSU/CSU, and NT1 in a single device	Reduce costs and simplifies management

For a complete list of physical interfaces, see tables below.

Table 18-32: Physical Interfaces/Architecture

Description	Specification
One 10/100 Base-T Fast Ethernet Port (RJ45)	Automatic speed detection; automatic duplex negotiation; VLAN support
One Voice Interface Card Slot	Supports a single voice interface card with two ports per card
Two WAN Interface Card/Voice Interface Card Slots	Supports any combination of up to two WAN interface cards or voice interface cards
Ethernet WAN Interface Cards	Supports PPP and PPPoE; operates in full and half-duplex modes
One Auxiliary (AUX) Port	RJ-45 jack with RS232 interface (plug compatible with Cisco 2500 Series AUX port); asynchronous serial DTE with full modem controls (CD, DSR, RTS, CTS); asynchronous serial data rates up to 115.2 kbps
One Console Port	RJ-45 jack with RS232 interface (plug compatible with Cisco 1000/1600/2500 series console ports); asynchronous serial DTE; transmit/receive rates up to 115.2 kbps (default 9600 bps, not a network data port); no hardware handshaking such as RTS/CTS
One Internal Expansion Slot	Supports hardware-assisted services such as encryption (up to T1/E1)
RISC Processor	Motorola MPC860P PowerQUICC at 48MHz

Table 18-33: WAN Support

Description	Specification
Asynchronous Serial Interfaces on Serial WAN Interface Cards	Interface speed: up to 115.2 Kbps; asynchronous serial protocols: Point-to-Point Protocol (PPP), Serial Line Internet Protocol (SLIP); asynchronous interface; EIA/TIA-232
ISDN WAN Interface Cards	ISDN dialup and ISDN leased line (IDSL) at 64 and 128 Kbps; encapsulation over ISDN leased line; Frame Relay and PPP
ADSL WAN Interface Cards	Supports ATP adaption Layer 5 (AAL5) services and applications; interoperates with Alcatel DSLAM with Alcatel chipset and Cisco 6130/6260 DSLAM with Globespan chipset; ANSI T1.413 issue 2 and ITU 992.1 (G.DMT) compliant

Table 18-34: WAN Interface Cards for the Cisco 1751 Router

Module	Description
WIC-1T	One serial, async, and sync (T1/E1)

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0446
Fls: 3
Doc: 3701

Module	Description
WIC-2T	Two serial, async, and sync (T1/E1)
WIC-2A/S	Two low-speed serial (up to 128 kbps), async, and sync
WIC-1B-S/T	One ISDN BRI S/T
WIC-1B-U	One ISDN BUI U with integrated NT1
WIC-1DSU-56K4	One integrated 56/64-kbps, four-wire DSU/CSU
WIC-1DSU-T1	One integrated T1/fractional T1 DSU/CSU
WIC-1ADSL	One-port ADSL interface
WIC-1ENET	One-port 10Base-T Ethernet Interface
WIC-1AM	One-port V.90 analog modem WIC
WIC-2AM	Two-port V.90 analog modem WIC
WIC-1SHDSL	One-port G.SHDSL interface

Table 18-35: Voice Interface Cards for the Cisco 1751 Router

Module	Description
VIC-2FXS	Two-port FXS voice/fax interface card for voice/fax network module
VIC-2DID	Two-port DID (direct inward dial) voice/fax interface card
VIC-2FXO	Two-port FXO voice/fax interface card for voice/fax network module
VIC-2FXO-EU	Two-port FXO voice/fax interface card for Europe
VIC-2FXO-M1	Two-port FXO voice/fax interface card with battery reversal detection and Caller ID support (for US, Canada, and others) [enhanced version of the VIC-2FXO-EU]
VIC-2FXO-M2	Two-port FXO voice/fax interface card with battery reversal detection and Caller ID support (for Europe) [enhanced version of the VIC-2FXO-EU]
VIC-2FXO-M3	Two-port FXO voice/fax interface card for Australia
VIC-2E/M	Two-port E&M voice/fax interface card for voice/fax network module
VIC-2BRI-NT/TE	Two-port network Side ISDN BRI interface
VWIC-1MFT-T1	One-port RJ-48 multiflex trunk—T1
VWIC-2MFT-T1	Two-port RJ-48 multiflex trunk—T1
VWIC-2MFT-T1-D1	Two-port RJ-48 multiflex trunk—T1 with drop and insert
VWIC-1MFT-E1	One-port RJ-48 multiflex trunk—E1
VWIC-2MFT-E1	Two-port RJ-48 multiflex trunk—E1
VWIC-2MFT-E1-D1	Two-port RJ-48 multiflex trunk—E1 with drop and insert
VWIC-1MFT-G703	One-port RJ-48 multiflex trunk—E1 G.703
VWIC-2MFT-G703	Two-port RJ-48 multiflex trunk—E1 G.703

Voice Implementation Requirements

To implement VoX using the Cisco 1751 router, the following table describes the DSP requirements to support their specific voice port configuration. At a minimum, one DSP is required for each analog VIC and two DSPs for each ISDN BRI VIC.

Table 18-36: DSP resources required based on VIC type

VIC	Number of Voice Calls Supported per VIC	Minimum Number of DSPs Required
Analog (VIC-2FXS, VIC-2FXO, VIC2-E/M)	2	1 DSP (PVDM-256K-4 higher)
Digital (VIC-2BRI-NT/TE)	4 (4 B-channels)	2 DSPs (Two PVDM-256K-4 or one PVDM-256K-8 or higher)
One or two port T1/E1 Multiflex VWICs	24 DS0s for T1 card, 30 DS0s for E1 card [1]	Depends on Codec, refer to table below

1. Cisco 1751 Router supports the maximum 30 DS0 channels.

Table 18-37: Maximum Channels Support per DSP for T1/E1 Multiflex VWICs

Codec	Kbps	Max Channels/DSP (Digital Calls)
G.711	64 (PCM)	6
G.729a	8 (CS-ACELP)	3
G.726	16 (ADPCM)	3
G.723.1	5.3/6.3 (ACELP)	2
G.728	32 (ADPCM/LDCLP)	2

The Cisco 1751-V router includes one PVDM-256K-4 (one DSP) which allows support for one analog VIC with no additional DSP requirements. If two analog VICs or one or more digital ISDN VICs are used, then additional DSP resources are needed. The Cisco 1751 router or Cisco 1751-V router has two DSP slots to allow easy expandability to support additional voice channels. For a complete list of DSP modules see table below.

Table 18-38: Cisco 1751 DSP Modules

Module	Description
PVDM-256K-4	4-channel packet voice/fax DSP module (one DSP)
PVDM-256K-8	8-channel packet voice/fax DSP module (two DSPs)
PVDM-256K-12	12-channel packet voice/fax DSP module (three DSPs)
PVDM-256K-16	16-channel packet voice/fax DSP module (four DSPs)
PVDM-256K-20	20-channel packet voice/fax DSP module (five DSPs)

Cisco IOS Software Feature Sets

The Cisco 1751 router supports a choice of Cisco IOS Software feature sets. Each feature set requires specific amounts of Flash and DRAM memory in the product. For default memory configurations, please see table below.

Table 18-42: Cisco 1751 Memory Defaults and Maximums

Model Number	Default FLASH/Maximum FLASH	Default DRAM/Maximum DRAM
Cisco 1751	16 MB/16 MB	32 MB/96 MB
Cisco 1751-V Multiservice Model	32 MB/32 MB	64 MB/128 MB

The Cisco 1751 router supports a choice of Cisco IOS Software feature sets with rich data features as well as data/voice features (see table below). Each feature set requires specific amounts of RAM and Flash memory in the product.

- Cisco IOS IP base feature sets include: NAT, OSPF, RADIUS, and NHRP.
- Plus feature sets contain L2TP, L2F, the Border Gateway Protocol (BGP), IP Multicast, Frame Relay SVC, RSVP, the NetWare Link Services Protocol (NLSP), AppleTalk SMRP, the Web Cache Control Protocol (WCCP), and the Network Timing Protocol (NTP).
- Encryption is offered in special encryption feature sets (Plus IPSec 56, and Plus IPSec 3DES). The VPN encryption module requires an IOS IP Plus IPSec image.
- DSL support is only in the Plus feature sets.

Other IOS Features Include:

QoS Features

- Frame Relay Fragmentation (FRF.12)
- IP Precedence
- Generic Traffic Shaping (GTS)
- Frame Relay Traffic Shaping (FRTS)
- Weighted Random Early Detection (WRED)
- DSCP Marketing
- Compressed RTP
- Multiple Link PPP & Link Fragmentation and Interleaving
- Resource Reservation Protocol (RSVP)
- Queuing Techniques: Weighted Fair Queuing (WFQ), Priority Queuing (PQ), Low Laterey Queuing (LLQ), and Custom Queuing (CQ)
- Preclassification for IPSec Tunneling
- 802.P

Voice Support

- VoIP
- VoFR
- VoATM

Cisco IOS IP Telephony Features

- Survivable Remote Site Telephony 2.0

VoIP Protocol Support

- H.323 V2
- Media Gateway Control Protocol 1.0
- Session Initiation Protocol 2.0

Codec Support

- G.711
- G.729
- G.729a
- G.723.1
- G.726
- G.728

Ordering Information

Product Part Numbers

All part descriptions and part numbers for Cisco products can be accessed using the online Cisco Pricing Tool at http://www.cisco.com/cgi-bin/order/pricing_root.pl

The Cisco Pricing Tool requires a user name and password. If you are not already registered, go to http://www.cisco.com/register and follow the instructions. After you have registered, you can access the Pricing Tool.

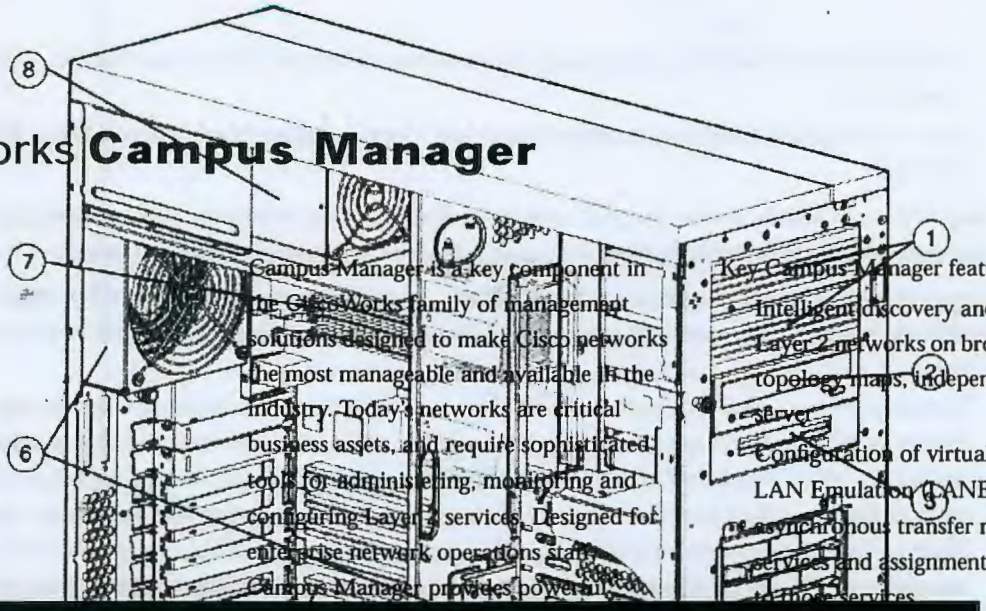
CiscoWorks Campus Manager



Campus Manager is a key component in the CiscoWorks family of management solutions designed to make Cisco networks the most manageable and available in the industry. Today's networks are critical business assets, and require sophisticated tools for administering, monitoring and configuring Layer 2 services. Designed for enterprise network operations staff, Campus Manager provides powerful

[redacted]

business and mission-critical systems. The requirement to understand, monitor, and react to changing networking conditions drives the need for sophisticated, yet easy-to-use management tools. Campus Manager is part of the LAN Management Solution, part of the broad range of CiscoWorks network management solutions.

New in Version 3.3:

In addition to the rich set of management features already included, the new version of Campus Manager has been enhanced to provide even greater manageability for Cisco networks. New benefits include:

- Improved application performance
- Doubled capacity for tracking end users

Key Campus Manager features include:

- Intelligent discovery and display of Layer 2 networks on browser-accessible topology maps, independent of VTP server
- Configuration of virtual LAN (VLAN)/ LAN Emulation (LANE) and asynchronous transfer mode (ATM) services and assignment of switch ports to those services

display based
Management
ng
2 configuration

nnectivity related
stations, and
Layer 2 and Layer 3 devices

- Automatic location and correlation of information on users by media access control (MAC), IP address, NT or NetWare Directory Services (NDS) login or UNIX host name, with their physical connections to the switched network
- Visibility and launch point of Cisco CallManager from topology services as well as tracking of phone handset to IP, Mac address, and switch port
- Layer 2 and Layer 3 path trace between source and destination handsets
- Export of topology maps to Visio
- Java plugins to improve graphical user interface (GUI) performance

Doc:

- Ability to form Custom Groups in Topology View based on criteria like SysLocation, SysName and IP address/ Subnet mask.
- Secure communication between the client browser and Campus applications using Secure Socket Layer (SSL) protocol.

Campus Manager enables administrators to more easily change, monitor, and control network relationships, making them more effective in delivering business-critical and advanced networking services to their users and customers.

Campus Manager is a suite of applications launched from a common "management desktop" used by all Web-based CiscoWorks applications. Campus Manager contains three applications that can be launched from the client's browser:

- Topology Services—This is the principal interface to a variety of large scale topology maps, tabular summaries, reports, and configuration services of the Layer 2 network. A directory-like tree interface lists physical Layer 2 and logical, Virtual Trunking Protocol (VTP), and ATM domain views along with table summaries of the devices and interface associated with these views. This tree structure acts as the launching point for topology maps, discrepancy reporting functions, and configuration services. The integrated VLAN and LANE configuration capabilities, ATM soft permanent virtual circuit (PVC) configuration and diagnostic tools, along with physical and logical configuration discrepancy checking reports and highlighting tools are found within the Topology Services menus. It also supports discovery and display of Cisco Customer Response Applications, and reports on services of these devices.

  Ability to form custom groups based on dynamic and static rules for the group membership. System defined groups and user defined grouping can be created by network administrators and users respectively and allows grouping by developing rules based on criteria such as IP address, subnets, SysLocation, SysName, SysContact, Image Version and hostname. A rules editor allows for creating, editing Topology groups and defines rules for membership.

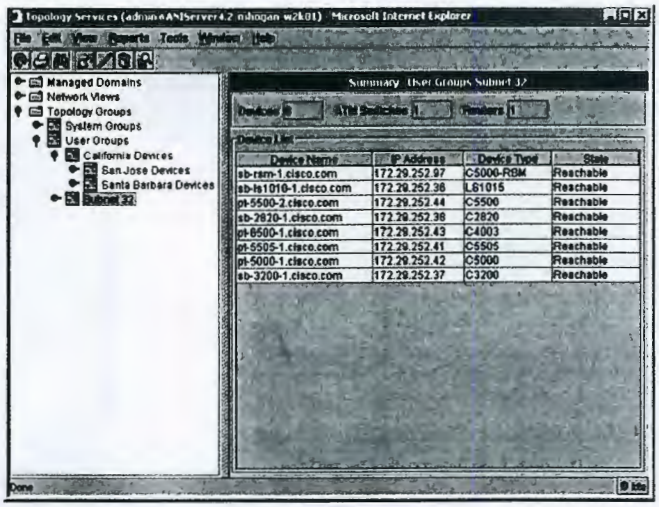
Figure 4
Topology Group in Topology Maps



- User Tracking—Designed to assist in locating end-station connections at the access switch, this application is a useful tool in troubleshooting or connectivity analysis. Through automated acquisition, a table of end-user stations and Layer 2 connection information is constructed. This table can be sorted and queried allowing administrators to easily find users. Users can be identified by name, IP handset, MAC and IP address, as well as the switch port and switch that they are connected, along with VLAN and VTP assignment of the port. Predefined reports, such as duplicate MAC per switch port, or duplicate IP addresses, enable managers to locate mobile users or violations in port policies.

Figure 5
User Tracking

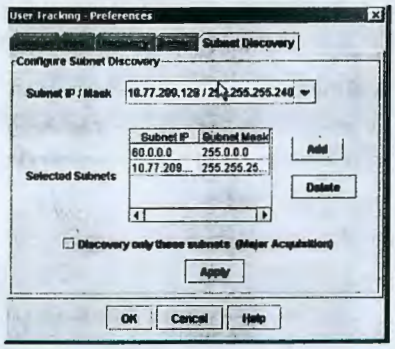
Figure 6
Subnet based acquisition



- Path Analysis—An application for switched network management, this is an extremely powerful tool for connectivity troubleshooting. Path Analysis utilizes User Tracking, topology services, and real-time spanning tree information to determine Layer 2 and Layer 3 connectivity between two end-points, or IP Handsets, in the network. The resulting trace is presented in graphical topology views that illustrate the Layer 2 and Layer 3 devices, path direction and link types, and in tabular formats that provide specific interface, IP address, VLAN, and link type information.

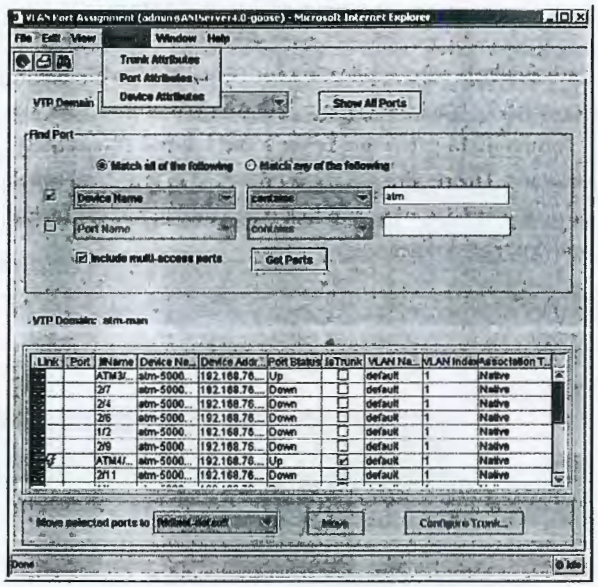
VLAN/LANE Configuration and Port Assignment

Campus Manager provides an easy and graphical means for creating, modifying, or deleting VLANs, LANE elements, or assigning switch ports to VLANs. As VLANs are created or modified, port and user changes are instantly updated and transmitted to the switches, eliminating the need to update and configure each participating switch individually. As VLANs are selected, the table view shows the participating ports, port status, and switch information and the topology map can be launched to graphically highlight participating devices and links of the VLAN connections. Additional map tools allow managers to show spanning-tree states, VTP trunks, switch port links, and existing LANE service elements.

Figure 8
VLAN Port Assignment



Campus Manager 3.3 is a must for switched network management, and is an integral piece of the LAN Management Solution, by providing a broad, comprehensive set of tools for managing and administering the entire LAN environment.

Campus Manager 3.3 Features

Campus Manager provides a variety of functions within Topology Services, User Tracking, Path Analysis and VLAN/LANE port assignment that network managers can use to better understand, monitor, configure, diagnose, and be proactive to network infrastructure changes.

Topology Services

Topology Services provides access to a wide variety of physical and logical topology maps, summary lists of devices, ports, and their network relationships. Topology Services also acts as the launching point for topology-related configuration and diagnostic tools.

Cisco Systems, Inc.
All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

In Campus Manager 3.3, network topology maps can be displayed in a variety of ways from both a flat Layer 2 to abstracted views that better represent and scale to large campus networks. These abstractions are categorized into three different groups: managed domains, network views and topology groups. Managed domains are topological views of logical groups of devices organized around ATM switch fabrics and VTP domains. Network views are physical displays of the network and are organized to provide full and abstracted views, such as LAN edge views, Layer 2 views, unconnected device views, and VTP views. Topology Groups are custom views that are a subset of the entire network based on the group rule defined while creating the view. They are can be two types of groups—system defined groups that are custom views created by admin user and user defined views which are created by CiscoWorks users. Membership to these groups are made via rules that can be evaluated either automatically or upon user request and these groups help in generating custom views that are a subset of the Layer 2 views.

Key features in the Campus Manager topology services include:

- Autodiscovery and display of Cisco switches, routers, and probes using the Cisco Discovery Protocol (CDP) and SNMP
- Display of physical and logical Layer 2 connections within the discovered LAN environment
- Highlighting tools to identify specific classes of devices or links such as switches, route switch modules (RSMs), Fast Ethernet, EtherChannel®, ATM links, Cisco Customer Response Applications, and other relevant Cisco device elements
- Expanded scalability to support more than 2000 Cisco devices
- Display of multilayer switches and components (switching entities and route-processing entities) with the ability to highlight logical relationships between devices, such as flow masks and shortcuts
- Device status indicators on the topology maps based on CDP, ILMI, ELMI, and SNMP availability
- Automated discrepancy reporting during discovery highlights connection problems, link mismatches, and logical misconfigurations
- Graphical interface for creating VLAN and LANE services for Ethernet, Token Ring, and transparent VLANs
- Graphical interface for locating—through search parameters—and assigning switch ports individually or in bulk to a VLAN
- ATM soft PVC configuration and diagnostics

VLAN/LANE Configuration and Port Assignment

Campus Manager provides an easy and graphical means for creating, modifying, or deleting VLANs, LANE elements, or assigning switch ports to VLANs. As VLANs are created or modified, port and user changes are instantly updated and transmitted to the switches, eliminating the need to update and configure each participating switch individually. As VLANs are selected, the table view shows the participating ports, port status, and switch information and the topology map can be launched to graphically highlight participating devices and links of the VLAN connections. Additional map tools allow managers to show spanning-tree states, VTP trunks, switch port links, and existing LANE service elements.

VLAN management services provide:

- Tabular summary views of VLANs shows participating ports, devices, links, and port status information
- Graphical setup of VLANs (including transparent VLANs) and VLAN membership to simplify administration
- Integration of LANE configuration services in VLAN configuration tools for more efficient operational and engineering practices
- A separate interface for administrators to quickly search, using a variety of criteria, and assign selected switch ports, individually or in bulk, to VLANs
- Logical display of VLAN configurations makes it easy to visualize switch connections
- Automated discrepancy reports highlight connection problems and link mismatches
- Automated VLAN membership registration reduces administration and configuration requirements

ATM Management

Campus Manager offers a graphical tool for managing complex ATM networks, simplifying configuration and performance monitoring. ATM networks are displayed on the topology map and the logical VLAN and ATM domain views provide graphical representations of ATM switches and LANE elements. "Drill down" capability allows access to configuration and performance monitoring tools. ATM management functions include:

- Autodiscovery of ATM switches, including switched virtual circuit (SVC) and PVC connections
- Connectivity checking of SVC and PVC connections
- End-to-end virtual circuit path tracing and analysis, which assists in connectivity diagnostics
- LANE troubleshooting and performance analysis
- Quality of service (QoS) templates for simplifying the configuration of typical traffic such as video or constant-bit-rate (CBR)
- Simple configuration of soft PVCs
- ATM remote monitoring (RMON) data collection and analysis

User Tracking

User Tracking automatically locates servers and end-user workstations, and Cisco voice over IP (VoIP) telephone handsets and their connections to Layer 2 Cisco switches. During this discovery process it also tabulates specific connection information about that end station, including:

- VLAN name, type, and VTP domain
- Switch port number, name, and state

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

- MAC and IP address of the end station and its subnet
- Tabular and sortable listing of all switch port attached end-user workstations, servers and IP handsets
- Last-seen time stamp reflecting last acquisition in which the end station was detected
- User login name passed automatically from the Windows NT Primary Domain Controller or Novell Directory Structure, or from the UNIX host

Campus Manager simplifies the dynamic nature of many business environments by providing a large number of sortable parameters that can be used to locate end-user stations. User Tracking discovers end stations connected to switch ports automatically and provides a means to identify end users, their assigned VLANs, and host station connections. User Tracking also supports voice/data convergence with interfaces to Cisco CallManager for correlating the IP and MAC addresses of discovered VoIP handsets with their assigned phone number and users.

User Tracking provides the following features:

- Enhanced scalability to support 60,000 end stations
- Predefined reports that identify duplicate MAC and IP addresses, ports with multiple MAC addresses and duplicate sysnames.
- IP and MAC addresses of discovered VoIP handsets with their assigned phone number and users
- Tabular and sortable listing of all switch port-attached end-user workstations and IP handsets
- Customized tables for user-defined, detailed reporting
- GUI for user tracking information table configuration to support dynamic/mobile users
- Scheduling managers for automating address change updates
- Easy-to-use search utility box locating users by MAC addresses, IP addresses, DNS host names, switch port labels, and optional voice handsets
- Provides ability to schedule User Tracking. Also exports User Tracking reports.
- Ability to define acquisition based on a subnet range

Path Analysis

Path Analysis is a powerful diagnostic tool for determining the Layer 2 and Layer 3 path between two selected endpoints using Campus Manager-discovered end-station data, VLAN/LANE configuration information, real-time Layer 3 path trace information, and spanning-tree calculations. Displays of path information are available in both topological map and tabular displays. Key Path Analysis features include:

- View the Layer 2 and Layer 3 path information in a map format with traces showing end stations, Layer 2 and 3 devices, route directions, and cut-through paths
- View specific details of the Layer 2 and Layer 3 path, including IP addresses and interfaces traveled, VLAN and VTP domain names, and port speeds and duplex settings
- Perform traces immediately or schedule them
- Perform traces using IP address, DNS name, or by telephone number for voice calls as start/stop points
- Provide Layer 2 and Layer 3 trace information between Cisco voice elements using interfaces to call detail records for specific voice calls
- Provides ability to schedule path traces. Also exports path traces data.

Built on the CiscoWorks Management Server

The CiscoWorks management server provides common resources, such as Web services, discovery, shared databases and database services, and the management desktop. Cisco Management Connection, a service on the CiscoWorks2000 server, delivers a set of tools for integrating applications into the management desktop using Internet-based standards and technologies. These tools allow users to link Web-based management applications to the CiscoWorks family of products and application developers to easily link Web-based applications through a certified registration mechanism. Cisco Management Connection has been used by Cisco and more than 30 network management vendors, including Hewlett-Packard, Computer Associates, Sun Microsystems, and Tivoli Systems to create certified Cisco Management Connections for their applications. This rapid adoption has created an environment in which users can easily build management intranets that link together their favorite Web-based management applications.

Specifications

Server, Client, and Web Browser System Requirements

The server, client and web browser system requirements can be found in the Product Overview documents for the Routed WAN and LAN Management solutions and on Cisco's main on-line documentation site, under each CiscoWorks solution. Please refer to these and other Product Installation documentation for more detailed information on setting up and configuring these solutions.

Supported Cisco Devices

Most Cisco routers, Catalyst® and LightStream switches, as well as Cisco AVVID devices. Contact your Cisco representative for a complete list.

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

Supported Cisco IOS Versions

- Cisco IOS® version 10.3 and above
- Catalyst Supervisor code 2.1 and above

Availability

Campus Manager 3.3 is an integral part of multiple CiscoWorks solutions and is not sold as an individual product. For additional information on Campus Manager, see:

Overview of Cisco 3700 Series Routers

Cisco 3700 series routers are modular access routers with LAN and WAN connections that can be configured by means of interchangeable network modules and interface cards.

This chapter describes the features and specifications of the routers and includes the following sections:

- Hardware Features, page 1-1
- Modules, Interface Cards, and Memory, page 1-3
- Memory, page 1-4
- Power Supply Options, page 1-5
- System Specifications, page 1-7
- Regulatory Compliance, page 1-8

Hardware Features

Cisco 3700 series includes the Cisco 3725 and the Cisco 3745 routers, which provide the following features:

- Cisco 3700 compact Flash cards
- Advanced integration module (AIM) slots
- Support for double-width network modules
- Two sockets for synchronized DRAM (SDRAM)
- User-configurable memory (shared memory or processor memory)
- Two FastEthernet ports
- High-speed console and auxiliary ports (up to 115.2 kbps)

Cisco 3725

Cisco 3725 routers include the following additional features:

- High-performance 240-MHz Reduced Instruction Set Computer (RISC) processor
- Up to 256 MB SDRAM
- Up to 128 MB Flash memory
- Two slots for network modules, one of which can accommodate a double-width network module
- Three interface card slots

3	Power supply	8	FastEthernet 0/1 port
4	Auxiliary port	9	Single-width network module slot
5	Console port		

Cisco 3745

Cisco 3745 routers include the following additional features:

- High-performance 350-MHz RISC processor
- Up to 256 MB SDRAM
- Up to 128 MB Flash memory
- Four slots for network modules that can accommodate up to two double-width network modules
- Three interface card slots
- Two Cisco 3700 compact Flash slots (one external and one internal)
- Two AIM slots
- Can be installed in a 19- or 23-inch rack or on a desk
- Supports the Cisco Redundant Power System
- 3 rack units (RU) chassis height

Doc:

- For information about installing DRAM, SDRAM, NVRAM, and Flash memory SIMMs, refer to the following hardware configuration notes:
  - *Upgrading System Memory in Cisco 3700 Series Routers*
  - *Installing Field Replaceable Units in Cisco 3745 Routers*
- For information about installing compact Flash memory cards, refer to the following hardware configuration note:
  - *Installing and Formatting Cisco 2691, Cisco 3631, and Cisco 3700 Compact Flash Memory Cards*

Memory

Cisco 3700 series routers support the following types of memory:

- SDRAM—Serves two functions: It stores the running configuration and routing tables and is used for packet buffering by the network interfaces. Cisco IOS software executes from SDRAM memory.
- NVRAM—Stores the system configuration file and the virtual configuration register. (For more information, see Appendix C, "Configuration Register.")
- Compact Flash memory—Stores the operating system software image. You can increase compact Flash memory by adding Cisco 3700 compact Flash cards. Refer to the *Installing and Formatting Cisco 3631, and Cisco 3700 Compact Flash Memory Cards* document.
- EPROM-based memory—Stores the ROM monitor, which allows you to boot an operating system software image from Flash memory or Cisco Flash.

Table 1-1 and Table 1-2 list processor and memory specifications for Cisco 3700 series routers.

Table 1-1 Cisco 3725 Router Processor and Memory Specifications

Description	Specification
Processor	240-MHz PMC-Sierra RM7061A RISC processor
SDRAM	128 to 256 MB
NVRAM	56 KB
Compact Flash	32, 64, or 128 MB
Boot ROM	512 KB

Table 1-2 Cisco 3745 Router Processor and Memory Specifications

Description	Specification
Processor	350-MHz PMC-Sierra RM7000A RISC processor
SDRAM	128 to 256 MB
NVRAM	152 KB
Compact Flash	32, 64, or 128 MB
Boot ROM	704 KB

Power Supply Options

Table 1-3 lists the power supply options supported by Cisco 3700 series routers. Depending on the configuration specified when you placed your order, your router may not support all of these options.

Table 1-3 Power Supply Options for Cisco 3700 Series Routers

Power Supply Option	Cisco 3725	Cisco 3745
AC input power	Yes	Yes
DC input power	No	Yes
–48V telephony power module provides inline power to IP phones	Yes	Yes
Dual hot-swappable power supplies	No	Yes[1]
Compatible with Cisco Redundant Power System	Yes	Yes

1. Due to increased power consumption in high-temperature environments, a fully loaded Cisco 3745 requires both power supplies when ambient temperature exceeds 40°C. Cisco 3745 routers operating under these conditions do not support the online replacement of power supplies.

Internal –48V Telephony Power Modules

Cisco 3700 series routers provide inline power to IP phones connected to the router through Ethernet Switch Network Modules. This power is supplied by special –48V modules that connect directly to the chassis power supplies in Cisco 3725 and Cisco 3745 routers. A single –48V power module meets the power needs of up to 36 IP phones. A Cisco 3745 router with two –48V power modules installed provides redundant power for up to 36 IP phones. Figure 1-3 and Figure 1-4 show the –48V power modules as they appear when installed in Cisco 3700 series routers.

1 Cisco 90-Day Limited Hardware Warranty Terms

There are special terms applicable to your hardware warranty and various services that you can use during the warranty period. Your formal Warranty Statement, including the warranty applicable to Cisco software, is available on the Cisco Documentation CD and on Cisco.com. Follow these steps to access and download the *Cisco Information Packet* and your warranty document from the CD or from Cisco.com.

1. Launch your browser, and go to this URL:

   http://www.cisco.com/univercd/cc/td/doc/es_inpck/cetrans.htm

   The Warranties and License Agreements page appears.
2. To read the *Cisco Information Packet*, follow these steps:
   a. Click the Information Packet Number field, and make sure that the part number 78-5235-02F0 is highlighted.
   b. Select the language in which you would like to read the document.
   c. Click Go.

      The Cisco Limited Warranty and Software License page from the Information Packet appears.
   d. Read the document online, or click the PDF icon to download and print the document in Adobe Portable Document Format (PDF).

   Note You must have Adobe Acrobat Reader to view and print PDF files. You can download the reader from Adobe's website, http://www.adobe.com.
3. To read translated and localized warranty information about your product, follow these steps:
   a. Enter this part number in the Warranty Document Number field: 78-5236-01C0
   b. Select the language in which you would like to read the document.
   c. Click Go.

      The Cisco warranty page appears.
   d. Review the document online, or click the PDF icon to download and print the document in Adobe Portable Document Format (PDF).

You can also contact the Cisco service and support website for assistance:

http://www.cisco.com/public/Support_root.shtml

Duration of Hardware Warranty

Ninety (90) days.

Replacement, Repair, or Refund Policy for Hardware

Cisco or its service center will use commercially reasonable efforts to ship a replacement part within ten (10) working days after receipt of a Return Materials Authorization (RMA) request. Actual delivery times can vary, depending on the customer location.

Cisco reserves the right to refund the purchase price as its exclusive warranty remedy.

To Receive a Return Materials Authorization (RMA) Number

Contact the company from whom you purchased the product. If you purchased the product directly from Cisco, contact your Cisco Sales and Service Representative.

Complete the information below, and keep it for reference:

Company product purchased from	
Company telephone number	
Product model number	
Product serial number	
Maintenance contract number	

2 Documents, Equipment, and Tools

User Documentation

All the documents described here are available online and on the documentation CD-ROM. To be sure of obtaining the latest information, you should access the online documentation.

To view or print a document in its original page format, access the online document, and click on the PDF icon.

For information about accessing user documentation, see the "Where to Go Next" section on page 20.

Items Included with Cisco 3745 Routers

- Rack-mount brackets; ground lug; power cords
- RJ-45-to-DB-9 adapter cable for console connection
- RJ-45-to-DB-25 adapter cable for modem connection
- Ethernet cables for LAN interface (two)
- *Cisco 2600 Series, 3600 Series, and 3700 Series Regulatory Compliance and Safety Information* document
- *Cisco 3745 Modular Routers Quick Start Guide* (this document)

Items Not Included

Individual items in this list may be required for your particular application:

- Screws for installing the chassis in a rack
- PC running terminal emulation software for administrative access, or modem for remote administrative access
- Cables for WAN and voice interfaces and for additional LAN interfaces
- Tools: Number 2 Phillips screwdriver; ESD-preventive wrist strap

3 Install Chassis

Safety Information

For safety information you need to know before working on your Cisco router, see the *Cisco 2600 Series, 3600 Series, and 3700 Series Regulatory Compliance and Safety Information* document that accompanied this device.

Warning **Only trained and qualified personnel should be allowed to install or replace this equipment.**

Warning **This unit is intended for installation in restricted access areas. A restricted access area can be accessed only through the use of a special tool, lock and key, or other means of security.**

Warning **To prevent personal injury or damage to the chassis, never attempt to lift or tilt the chassis using the handles on modules (such as power supplies, fans, or cards); these types of handles are not designed to support the weight of the unit.**

ECT 382 CPL-AC

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0466
Doc: 3701

Installing the Chassis

You can set the chassis on a desktop or install it in a rack. See the applicable instructions that follow.

Rack-Mounting the Chassis

The standard accessory kit contains brackets for mounting the chassis in a 19-inch rack. You can order an optional accessory kit with brackets and instructions for mounting the chassis in a 23- or 24-inch rack.

You can mount the chassis in the following ways:

- Front panel forward
- Rear panel forward
- Center mount with either front or rear panel forward

Attaching Brackets

Attach the mounting brackets to the chassis as shown in Figure 1, Figure 2, or Figure 3, using the screws provided in the bracket kit. Attach the second bracket to the opposite side of the chassis. Use a number 2 Phillips screwdriver to install the bracket screws.

Note Some 19-inch racks have power strips on the rear vertical rails that block cable access to power supplies. Be sure to choose an orientation that provides unrestricted access to the rear panel.

Figure 1 Bracket Installation—Front Panel Forward

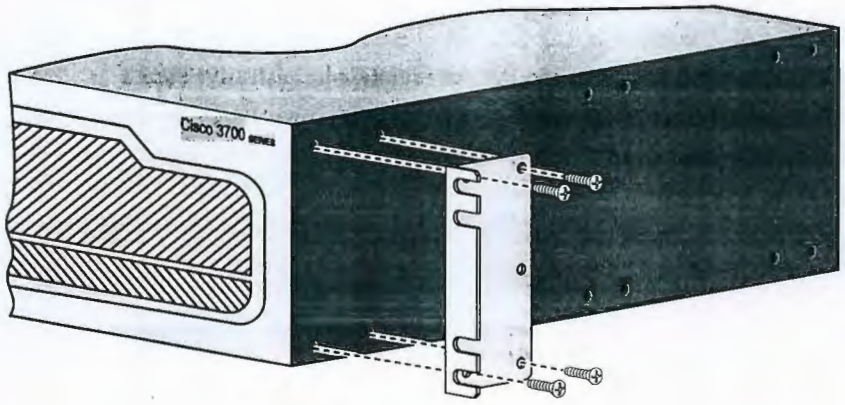

Figure 2 Bracket Installation—Rear Panel Forward

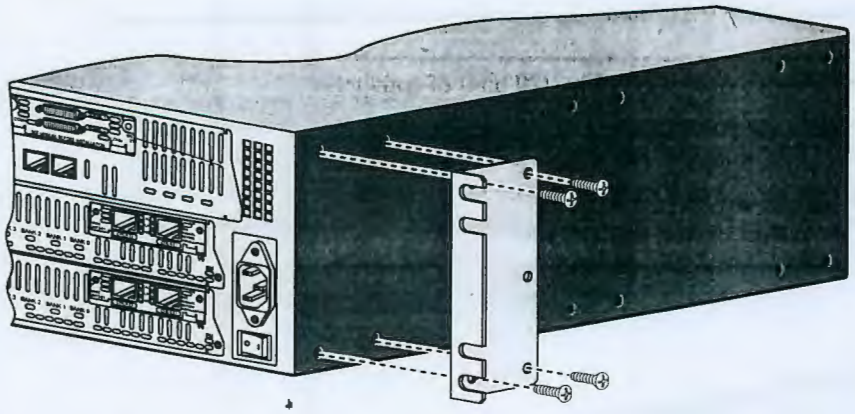

Figure 3 Bracket Installation—Rear Panel Forward, Center-Mount Rack

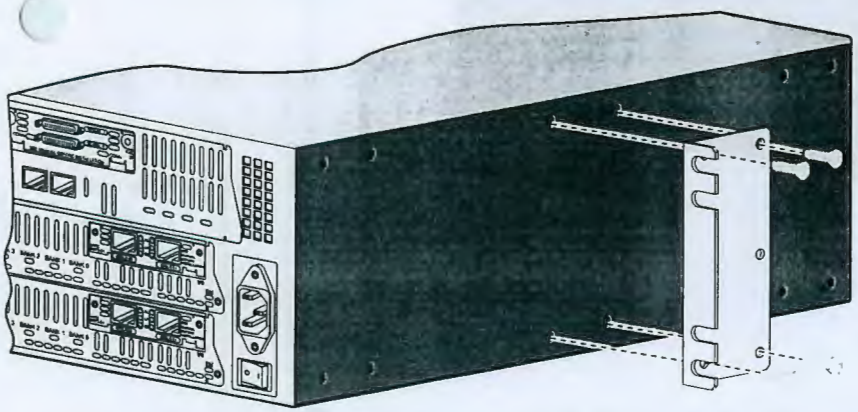


Note The brackets can also be installed with the front panel forward.

Installing the Chassis in a Rack

In the chassis in the rack. Rack-mounting screws are not provided with the router. Use two screws for each side (supplied with the rack).

Installing on a Desktop

Caution If you place the Cisco 3745 on a desktop, do not place anything on top of the router that weighs more than 10 pounds (4.5 kg). Excessive weight on top could damage the chassis.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0467
Doc: 3701

Grounding the Chassis

You must connect the chassis to reliable earth ground using the ground lug (provided) and size AWG 6 (13 mm^2) wire.

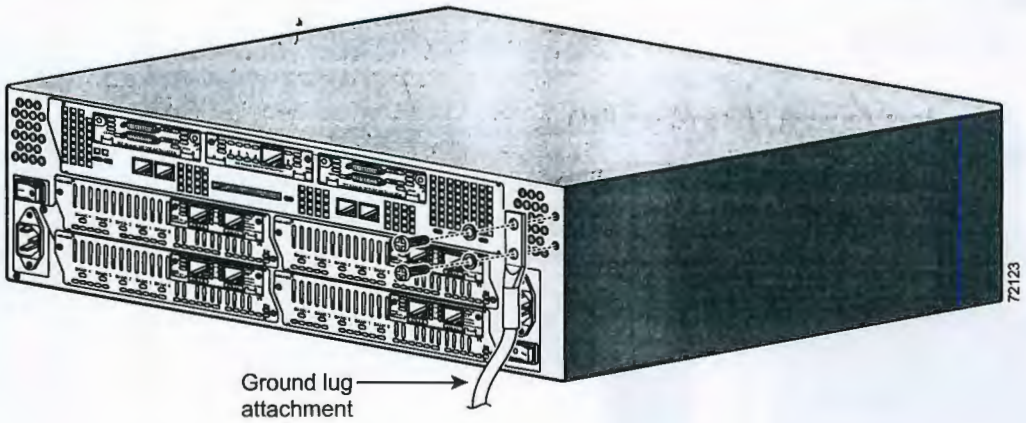
Step 1 Strip one end of the ground wire to expose approximately 0.75 in. (20 mm) of conductor.

Step 2 Use a crimp tool to crimp the ground wire to the ground lug.

Step 3 Attach the ground lug to the chassis as shown in Figure 4. Use a number 2 Phillips screwdriver and the screws supplied with the ground lug. Tighten the screws to a torque of 8 to 10 in-lb (0.9 to 1.1 N-m).

Step 4 Connect the other end of the ground wire to a grounding point at your site.

Figure 4 Required Chassis Ground Connection



4 Connect Cables

Warning **Do not work on the system, or connect or disconnect cables during periods of lightning activity.**

System Management Connections

The connections described in Table 1 provide system management access.

Table 1 System Management Connections

Port	Color	Connected to:	Cable
Console	Light blue	PC or ASCII terminal communication port (usually labeled COM)	RJ-45-to-DB-9 adapter cable
Auxiliary	Black	Modem for remote access	RJ-45-to-DB-25 adapter cable

Power Connections

Connecting Routers to AC Power

If your router uses AC power, connect it to a 15 A, 120 VAC (10 A, 240 VAC) circuit with overcurrent protection.

Note The input voltage tolerance limits for AC power are 85 and 264 VAC.

Warning **AC connected units must have a permanent ground connection in addition to the power cable ground wire. NEBS-compliant grounding satisfies this requirement.**

Warning **This product relies on the building's installation for short-circuit (overcurrent) protection. Ensure that the protective device is rated not greater than:**
15A, 120VAC (10A, 240VAC).

Connecting Routers to DC Power

If your router has a DC-input power supply, follow the directions in this section for proper wiring.

Warning **Before performing any of the following procedures, ensure that power is removed from the DC circuit. To see translations of the warnings that appear in this publication, refer to the *Regulatory Compliance and Safety Information* document that accompanied this device.**

Warning **This product relies on the building's installation for short-circuit (overcurrent) protection. Ensure that the protective device is rated not greater than:**
20A, 60VDC.

Warning **Use copper conductors only.**

Note The installation must comply with the 1996 National Electric Code (NEC) and other applicable codes.

CPMI - CORREIOS
0468
Fls:
3701
Doc:

DC Wiring Requirements

A Cisco 3745 router with a DC-input power supply requires copper wire for the power connections. Table 2 summarizes the wiring requirements.

Table 2 DC Wiring Requirements for Cisco 3745 Routers

Installed Power Supply	DC Input	DC Input Wire Size	Safety Ground Wire Size	Wire Terminal (Lug)	Overcurrent Protection
Nominal 24/48 VDC[1] Identified by the following printed label: 	24 - 36 V, 15 A	AWG 12 (3.0 mm^2)	AWG 12 (3.0 mm^2), minimum	Amp/Tyco No. 52961 or equivalent	20 A maximum
	36 - 60 V, 7 A	AWG 12 or 14 (3.0 or 2.0 mm^2)	AWG 12 (3.0 mm^2), minimum	For AWG 12: Amp/Tyco No. 52961 or equivalent For AWG 14: Molex No. 19099-0017 or equivalent	20 A maximum
Nominal 48 VDC[2] Identified by the following printed label: 	48 - 60 V, 10 A	AWG 14 or 16 (2.0 or 1.2 mm^2)	AWG 14 (2.0 mm^2), minimum	For AWG 14 or 16: Molex No. 19099-0017 or equivalent	20 A maximum

1. The input voltage tolerance limits for nominal 24/48 V power supplies are 18 and 72 VDC.
2. The input voltage tolerance limits for nominal 48 V power supplies are 38 and 72 VDC.

Wiring Procedure for DC Input

To connect the router to a DC power source, perform the following steps:

Step 1 Remove power from the DC circuit. To ensure that power is removed from the DC circuit, locate the circuit breaker for the DC circuit, switch the circuit breaker to the OFF position, and tape the circuit-breaker switch in the OFF position.

Tip Secure all power cabling when installing this unit to avoid disturbing field-wiring connections.

Step 2 Strip the wires to the appropriate length for the terminals. The strip length is 1/8 to 3/16 inch (3 to 5 mm) for Molex number 19073-0009 terminals and for AMP/Tyco number 52961 terminals.

Step 3 Crimp the terminals onto the DC power input wires.

Warning **When stranded wiring is required, use approved wiring terminations, such as closed-loop or spade-type with upturned lugs. These terminations should be the appropriate size for the wires and should clamp both the insulation and conductor.**

Step 4 Remove the plastic cover from the terminal block. Save it for reinstallation after you finish wiring.

Step 5 Connect the DC power input wires to the terminal block as shown in Figure 5 or Figure 6.

Caution Do not overtorque the terminal block screws. The recommended torque is 8.0 ± 0.5 in-lb (0.93 ± 0.05 N-m).

Figure 5 *Terminal Block Connections for Negative Polarity DC Input Power*

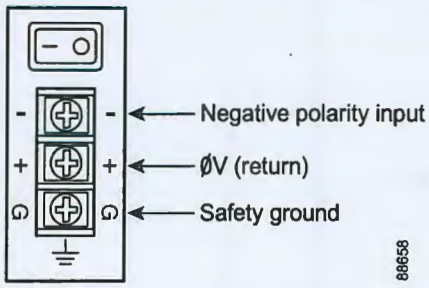

Figure 6 *Terminal Block Connections for Positive Polarity DC Input Power*

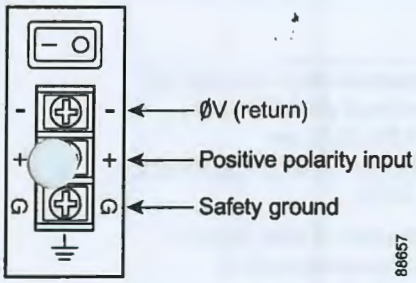

Step 6 Install the plastic cover over the terminal block.

Warning **The safety cover is an integral part of the product. Do not operate the unit without the safety cover installed. Operating the unit without the cover in place will invalidate the safety approvals and pose a risk of fire and electrical hazards.**

Step 7 Secure the wires using cable ties.

Step 8 If your router has a second power supply installed, repeat Step 1 through Step 7 for the second power supply.

Step 9 Turn on power to the DC circuit.

WAN, LAN, and Voice Connections

The connections and cables listed here are described in detail in the following documents:

- *Cisco 3700 Series Hardware Installation Guide*
- *Cisco Network Modules Hardware Installation Guide*
- *Cisco Interface Cards Installation Guide*
- *Cisco Modular Access Router Cable Specifications*

For information about accessing these documents, see the "Where to Go Next" section on page 20.

Table 3 summarizes some typical WAN, LAN, and voice connections for Cisco 3745 routers.

Table 3 WAN, LAN, and Voice Connections

Port or Connection	Port Type, Color	Connected to:	Cable
FastEthernet	RJ-45, yellow,	Ethernet hub or switch	Straight-through Ethernet
T1/E1 WAN	RJ-48C/CA81A, blue	T1 or E1 network	RJ-48 T1
Cisco serial	60-pin D-sub	CSU/DSU and serial network or equipment	Cisco serial transition cable that matches the signaling protocol (EIA/TIA-232, EIA/TIA-449, V.35, X.21, or EIA/TIA-530) and the serial port operating mode (DTE or DCE). See the *Cisco Modular Access Router Cable Specifications* document for information about selecting these cables.
Cisco Smart serial	Cisco Smart compact connector, blue	CSU/DSU and serial network or equipment For WIC-2T and WIC-2A/S only	
DSL	RJ-11C/CA11A, lavender	Network demarcation device for service provider's DSL interface	RJ-11
T1 digital voice	RJ-48C/CA81A, tan	Digital PBX	RJ-48 T1 cable
Analog voice FXS	RJ-11, gray	Telephone, fax	RJ-11
Analog voice FXO	RJ-11, pink	Central office, analog PBX	RJ-11
Analog voice E&M	RJ-11, brown	Analog PBX	RJ-11
BRI S/T WAN (external NT1)	RJ-48C/CA81A, red	NT1 device or private integrated network exchange (PINX)	RJ-48
BRI U WAN (built-in NT1)	RJ-49C/CA-A11, orange	ISDN network	RJ-49
CT1/PRI	T1	External T1 CSU	DB-15 T1 serial cable
CT1/PRI-CSU	T1	RJ-48C/CA81A interface	RJ-48 straight-through
CE1/PRI	E1	E1 network	DB-15 to BNC, DB-15 to DB-15, DB-15 to twinax, or DB-15 to RJ-45
56/64-kbps DSU/CSU	8-pin modular, blue	RJ-48S interface	RJ-48 straight-through

5 Power Up the Router

Checklist for Power-Up

You are ready to power on the Cisco router if the following steps are completed:

- The chassis is securely mounted.
- Power and interface cables are connected.
- Your PC terminal emulation program is configured for 9600 baud, 8 data bits, 1 stop bit, and no parity.
- You have selected passwords for access control.
- You have determined the IP addresses for the Ethernet and serial interfaces.

Front Panel Indicators

The following indicator LEDs provide power, activity, and status information:

- SYS—System status:
  - Blinking green during boot-up—System is booting
  - Continuous green—System booted and OK
  - Blinking green continuing after boot-up—System is in ROM monitor mode
  - Amber—System malfunction
- ACT—Activity:
  - Blinking or continuous green during system activity, such as interrupts and packet transfers
- SYS PS1 or SYS PS2—Chassis power supply number 1 or number 2 status:
  - Off—Powered off, not installed, or faulty
  - Continuous green—Installed and operating
  - Amber—Installed and powered off or faulty
- –48V PS1 or –48V PS2—IP power module number 1 or number 2 status:
  - Off—Faulty or not installed
  - Continuous green—Installed and operating
  - Amber—Installed and powered off or faulty

Power-Up Procedure

Perform this procedure to power up your Cisco router and verify that it goes through its initialization and self-test. When this procedure is finished, the Cisco router is ready to configure.

Note To view the boot sequence through a terminal session, you must have a console connection to the Cisco router before it powers on.

Move the power switch on the chassis power supply, or on both chassis power supplies, to the ON position.

The fan should operate, and the SYS PS LED should be continuous green for each power supply that is in use. The SYS LED should blink while the system boots, and it should be continuous green after the system boots. If this does not happen, see the power-on procedure in the *Cisco 3700 Series Hardware Installation Guide*.

Note If no Cisco IOS image is loaded on the Cisco 3745, the router enters ROMMON mode, and the system LED blinks.

Doc:

Messages begin to appear in your terminal emulation program window.

Caution *Do not press any keys on the keyboard until the messages stop.* Any keys pressed during this time are interpreted as the first command typed when the messages stop, which might cause the router to power off and start over. It takes a few minutes for the messages to stop.

When you see the following messages, the router has booted and is ready for initial configuration. See the following section for initial configuration procedures.

```
        --- System Configuration Dialog ---

At any point you may enter a question mark '?' for help.
Use ctrl-c to abort configuration dialog at any prompt.
Default settings are in square brackets '[]'.

Would you like to enter the initial configuration dialog? [yes/no]:
```

Note If the `rommon 1>` prompt appears, your system has booted in ROM monitor mode. For information on the ROM monitor, see the router rebooting and ROM monitor information in the *Cisco IOS Configuration Fundamentals Configuration Gulde* for your Cisco IOS software release.

You can access this document at the locations described in the "Where to Go Next" section on page 20.

6 Perform Initial Configuration

You can configure your router by using one of the following tools:

- Setup Command Facility. See the "Initial Configuration Using Setup Command Facility" section on page 12.
- Security Device Manager (SDM). See the "Initial Configuration Using Security Device Manager" section on page 14.
- Command-Line Interface (CLI). See the "Initial Configuration Using the CLI (Manual Configuration)" section on page 17.

Note If you need help with the interface and port numbering, see the "Interface Numbering" section on page 18.

Initial Configuration Using Setup Command Facility

This section shows how to prepare the system for communication functions through its Ethernet and WAN interfaces.

For a description of the interface numbering, see the "Interface Numbering" section on page 18.

Note If you make a mistake while using the setup command facility, you can exit and run the facility again. Press Ctrl-c, and type setup at the privileged EXEC mode prompt (`3700#`).

Step 1 To proceed using the setup command facility, enter yes.

```
Would you like to enter the initial configuration dialog? [yes/no]: yes
```

Step 2 When the following messages appear, press Return to enter basic management setup:

```
At any point you may enter a question mark '?' for help.
Use ctrl-c to abort configuration dialog at any prompt.
Default settings are in square brackets '[]'.

Basic management setup configures only enough connectivity
for management of the system, extended setup will ask you
to configure each interface on the system
```

```
Would you like to enter basic management setup? [yes/no]: yes
```

Step 3 Enter a host name for the router (this example uses 3745):

```
Configuring global parameters:

  Enter host name [Router]: 3745

The enable secret is a password used to protect access to privileged EXEC and configuration modes. This
password, after entered, becomes encrypted in the configuration.
```

Step 4 Enter an enable secret password. This password is encrypted (more secure) and cannot be seen when viewing the configuration:

```
Enter enable secret: xxxx

The enable password is used when you do not specify an enable secret password, with some older software
versions, and some boot images.
```

Step 5 Enter an enable password that is different from the enable secret password. This password is *not* encrypted (less secure) and can be seen when viewing the configuration:

```
Enter enable password: xxxx

The virtual terminal password is used to protect access to the router over a network interface.
```

Step 6 Enter the virtual terminal password, which prevents unauthenticated access to the router through ports other than the console port:

```
Enter virtual terminal password: xxxx
```

Step 7 Respond to the following prompts as appropriate for your network:

```
Configure SNMP Network Management? [yes]: yes
    Community string [public]:
```

Step 8 A summary of the available interfaces is displayed:

Note The interface numbering that appears is dependent on the type of Cisco modular router platform and on the installed interface modules and cards.

```
Current interface summary

Controller Timeslots D-Channel Configurable modes Status
T1 3/0     24         23        pri/channelized    Administratively up
T1 3/1     24         23        pri/channelized    Administratively up

Any interface listed with OK? value "NO" does not have a valid configuration

Interface                IP-Address      OK? Method Status                Protocol
FastEthernet0/0          unassigned      NO  unset  up                    down

FastEthernet0/1          unassigned      NO  unset  up                    down
```

Step 9 Select one of the available interfaces for connecting the router to the management network:

```
Enter interface name used to connect to the
management network from the above interface summary: fastethernet0/0
```

Step 10 Respond to the following prompts as appropriate for your network:

```
Configuring interface FastEthernet0/0:
  Use the 100 Base-TX (RJ-45) connector? [yes]:
  Operate in full-duplex mode? [no]: yes
  Configure IP on this interface? [yes]:
    IP address for this interface: 10.1.1.1
    Subnet mask for this interface [255.0.0.0] : 255.255.0.0
    Class A network is 10.0.0.0, 16 subnet bits; mask is /16
```

Step 11 After the following messages appear, press Return to save the basic configuration:

```
The following configuration command script was created:

hostname 3745
enable secret 5 $1$Ksjf$za4T2lb3ARS5d1PHVzW5A0
enable password xxxx
line vty 0 4
password xxxx
snmp-server community public
!
no ip routing

!
interface FastEthernet0/0
no shutdown
media-type 100BaseX
full-duplex
ip address 10.1.1.1 255.255.0.0
!
interface FastEthernet0/1
shutdown
no ip address
!
end

[0] Go to the IOS command prompt without saving this config.
[1] Return back to the setup without saving this config.
[2] Save this configuration to nvram and exit.

Enter your selection [2]: 2

Press RETURN to get started! RETURN
```

Step 12 The user prompt is displayed.

```
3745>
```

When you have completed the basic configuration tasks, your Cisco router is ready to configure for specific functions. See the "Where to Go Next" section on page 20 for information about locating documentation for advanced configuration procedures.

Initial Configuration Using Security Device Manager

Security Device Manager (SDM) is a web-based configuration tool that allows you to configure LAN and WAN interfaces, routing, Network Address Translation (NAT), firewalls, Virtual Private Networks (VPNs), and other features on your router. SDM runs on a PC connected to the router through an Ethernet or FastEthernet interface, and it requires a web browser, either Internet Explorer version 5.5 or later or Netscape version 4.79. SDM is compatible with Microsoft Windows 2000, Windows NT 4.0 (with Service Pack 4), Windows 98, Windows ME, and Microsoft Windows XP.

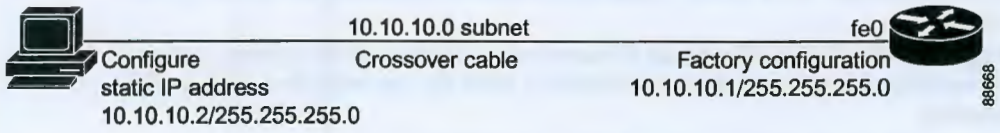
This procedure applies to routers that have the SDM configuration tool preinstalled.

To configure your router by using SDM, first assign an IP address to the Ethernet port of the PC as directed in the "Assign a Static IP Address to the PC" section, and then start SDM as described in the "Start SDM" section on page 15.

Assign a Static IP Address to the PC

Assign a static IP address in the 10.10.10.0 subnet to the Ethernet port of the PC, as shown in Figure 7. The recommended IP address for this interface is 10.10.10.2. The FastEthernet 0/0 interface of the router is preconfigured with the IP address 10.10.10.1.

Figure 7 Initial IP Addresses in the 10.10.10.0 Subnet for SDM



Start SDM

To start SDM and begin the router configuration, perform the following procedure:

Step 1 Connect the Ethernet port of the PC to the FastEthernet 0/0 port of the router, using a crossover cable.

Step 2 Open a web browser on the PC, and enter the following URL:

https://10.10.10.1/flash/sdm.shtml

Note https://... specifies that the Secure Socket Layer (SSL) protocol is used for a secure connection. If SSL is not available, you can use http://... .

Step 3 Enter the username sdm and the password sdm in the dialog box.

Step 4 A window appears informing you that Verisign certifies that this is a Cisco application. Click Yes, or click Grant to accept the certificate and proceed. Additional certificate windows appear if you are using Netscape; click Grant to accept the certificates.

The SDM Launch page appears after a short time. (See Figure 8.) Leave this window open and wait for the next window.

Figure 8 SDM Launch Page

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0472
Fls:
Doc: 3701

Tip If the SDM Launch page does not appear when you enter the URL https://10.10.10.1/flash/sdm.shtml, test the connection between the PC and the router by doing the following:

a. Check that the POWER LED on the router is on and that the ACTIVITY LED is on, indicating an active Ethernet connection between the router and the PC. If the ACTIVITY LED is not on, verify that you are using a crossover cable to connect the PC to the router.

b. If the Launch page still does not appear, verify that the web browser's "work offline" option is disabled. In Internet Explorer, click the File menu, and verify that the "work offline" option is unchecked. In Netscape, the default selection in the File menu is set to "work online."

c. If the Launch page still does not appear, verify that the file sdm.tar is loaded into the router's Flash memory. Open a Telnet session to 10.10.10.1, entering the username sdm and the password sdm. Enter the command show flash to verify that sdm.tar is loaded in Flash memory.

d. If the web page still does not appear, verify that the PC is configured with a static IP address.

Step 5 A window appears with information about the web browser and its settings. This window also informs you that SDM will open in another window. Close this window and wait for the SDM Startup Wizard page to appear.

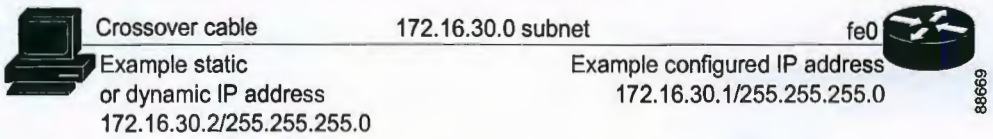
Step 6 When the SDM Startup wizard appears, click Next to begin. Use the wizard to give the router a hostname, to assign a login username and password, to set an enable secret password, and to assign a new LAN IP address to the FastEthernet interface 0/0. You can also configure the router as a Dynamic Host Configuration Protocol (DHCP) server, identify Domain Name System (DNS) and Windows Internet Naming Service (WINS) servers, and make security settings.

Tip Be sure to write down the enable secret password. It is not revealed in the summary window and cannot be recovered.

Step 7 When the Summary window appears, write down the LAN IP address, hostname, login username, and user password that you entered, and click Finish. (You will need this information to reconnect to the router and use SDM to perform additional configuration.)

Step 8 Assign a new IP address to the PC's Ethernet interface; place it on the same subnet as the router's FastEthernet 0/0 port, which you assigned in Step 6 above. (See Figure 9.) If you configured a DHCP server on the router, configure the PC to obtain an IP address automatically. The IP addresses in Figure 9 are examples only.

Figure 9 IP Addresses in the Renumbered Subnet for SDM



Step 9 Open a web browser on the PC, and enter the SDM URL, using the new IP address that you gave the LAN interface: https://*new-IP-address*/flash/sdm.shtml. In the example shown in Figure 9, you would enter `https://172.16.30.1/flash/sdm.shtml`.

Step 10 Enter the username and password that you specified in Step 6 above.

Step 11 When the SDM System Overview window appears, you can use the wizard buttons on the left side of the window to configure other features. Buttons are provided for LAN, WAN, firewall, and VPN configurations.

For more information about SDM, refer to the *Cisco Security Device Manager Troubleshooting Guide* at the following URL, http://www.cisco.com/go/sdm. See the "Obtaining Documentation" section on page 20 for information about accessing this document.

Initial Configuration Using the CLI (Manual Configuration)

This section shows how to bring up a command-line interface (CLI) prompt for configuration using the CLI, and it directs you to the documentation for CLI configuration.

Note To avoid losing work you have completed, be sure to save your configuration occasionally as you proceed. Use the copy running-config startup-config command to save the configuration to NVRAM.

Step 1 To proceed with manual configuration using the CLI, enter no.

```
Would you like to enter the initial configuration dialog? [yes/no]: no
```

Step 2 Press Return to terminate autoinstall and continue with manual configuration.

```
Would you like to terminate autoinstall? [yes] Return
```

Several messages are displayed, ending with a line similar to the following:

```
...
Copyright (c) 1986-2002 by cisco Systems, Inc.
Compiled date time by person
```

Step 3 Press Return to bring up the `Router>` prompt.

```
...
flashfs[4]: Initialization complete.
Router>
```

Step 4 Enter privileged EXEC mode.

```
Router> enable
Router#
```

For configuration using the CLI, refer to the applicable configuration procedures in the *Software Configuration Guide: Cisco 2600 Series, Cisco 3600 Series, and Cisco 3700 Series Routers*. See the "Where to Go Next" section on page 20 for information about accessing this document.

7 Interface Numbering

Each individual interface (port) on a Cisco 3745 router is identified by number as described in the following sections.

WAN and LAN Interface Numbering

The Cisco 3745 router chassis contains the following WAN and LAN interface types:

- 2 built-in FastEthernet LAN interfaces
- 3 slots in which you can install WAN or voice interface cards
- 4 network module slots

The numbering format is:

- *Interface-type Slot-number/Interface-number*

  Two examples are: `FastEthernet 0/0` and `Serial 1/2`.

The slot numbers are as follows:

- 0 for all built-in interfaces
- 0 for all WIC interfaces
- 1 for the lower-right network module slot
- 2 for the lower-left network module slot
- 3 for the upper-right network module slot
- 4 for the upper-left network module slot

If double-width network modules are installed, the network module slots are numbered as follows:

- 2 for the lower double-width slot
- 4 for the upper double-width slot

Interface (port) numbers begin at 0 for each interface type, and continue from right to left and from bottom to top.

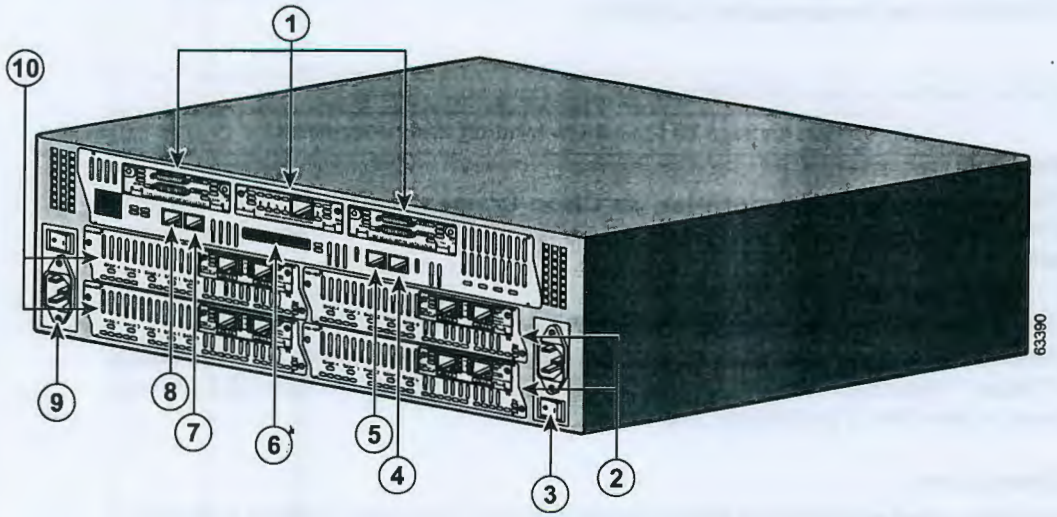
Figure 10 shows the rear panel of the Cisco 3745 with:

- A WIC in each of the three WAN interface card slots
- A single-width network module in each of the four network module slots
- Two AC power supplies

Note The slot number for all WIC interfaces is always 0. (The W0, W1, and W2 slot designations are for physical slot identification only.) Interfaces in the WICs are numbered from right to left, starting with 0/0 for each interface type, regardless of which physical slot the WICs are installed in. Some examples are:

- If physical slot W0 is empty and physical slot W1 contains a 1-port serial WIC, the serial interface in the WIC is numbered Serial 0/0.
- If slot W0 contains a 2-port serial WIC and slot W1 contains a 1-port serial WIC, the serial interfaces in physical slot W0 are numbered Serial 0/0 and Serial 0/1, and the serial interface in physical slot W1 is numbered Serial 0/2.
- If slot W0 contains a 2-port serial WIC and slot W1 contains a 1-port BRI WIC, the serial interfaces in physical slot W0 are numbered Serial 0/0 and Serial 0/1, and the BRI interface in physical slot W1 is numbered BRI 0/0.

Figure 10 Cisco 3745 Rear Panel



1	Interface card slots	6	Cisco 3700 Compact Flash slot
2	Network modules	7	Auxiliary port
3	Power supply	8	Console port
4	FastEthernet 0/0	9	Power supply
5	FastEthernet 0/1	10	Network modules

Voice Interface Numbering

Voice interfaces are numbered differently from the WAN interfaces described in the previous section. Voice interfaces are numbered as follows:

network-module-slot/voice-module-slot/voice-interface

If a 4-channel voice network module is installed in chassis slot 1, the voice interfaces are:

- 1/0/0—Network module slot 1/Voice module slot 0/Voice interface 0
- 1/0/1—Network module slot 1/Voice module slot 0/Voice interface 1
- 1/1/0—Network module slot 1/Voice module slot 1/Voice interface 0
- 1/1/1—Network module slot 1/Voice module slot 1/Voice interface 1

8 Where to Go Next

For additional detailed configuration procedures, refer to the appropriate Cisco 3700 series documentation or Cisco IOS software documentation, available on-line and on the Documentation CD-ROM:

Tip See the "Obtaining Documentation" section on page 20 for help in locating these documents.

To access Cisco 3700 series platform documentation on Cisco Connection Online (CCO):

On the Cisco.com home page at http://www.cisco.com, locate the Technical Documentation tab, and click on "Locate Technical Documentation on Cisco Connection Online." Under the Product Documentation heading, navigate to Modular Access Routers and to the documentation for your router.

To access Cisco IOS software documentation on Cisco Connection Online (CCO):

On the Cisco.com home page at http://www.cisco.com, locate the Technical Documentation tab, and click on "Locate Technical Documentation on Cisco Connection Online." Under the Product Documentation heading, navigate to the Cisco IOS software documentation for the Cisco IOS software release that is installed on your router.

To access documentation on Cisco.com:

For Cisco 3700 series platform documentation, start on Cisco.com at http://www.cisco.com, and select Products & Services > Routers > Cisco 3700 Series Multiservice Platforms > Technical Documentation > *Document type* > *Document.*

For Cisco IOS software documentation, start on Cisco.com at http://www.cisco.com, and select Products & Services > IOS Software > Cisco IOS Software Releases > *Your Cisco IOS software release.*

To get updated information about platform support for features, select Feature Navigator II, if you have an account on Cisco.com. You can also access Feature Navigator II at http://www.cisco.com/go/fn.

9 Obtaining Documentation

Cisco provides several ways to obtain documentation, technical assistance, and other technical resources. These sections explain how to obtain technical information from Cisco Systems.

Cisco.com

You can access the most current Cisco documentation on the World Wide Web at this URL:

http://www.cisco.com/univercd/home/home.htm

You can access the Cisco website at this URL:

http://www.cisco.com

International Cisco websites can be accessed from this URL:

http://www.cisco.com/public/countries_languages.shtml

Documentation CD-ROM

Cisco documentation and additional literature are available in a Cisco Documentation CD-ROM package, which may have shipped with your product. The Documentation CD-ROM is updated regularly and may be more current than printed documentation. The CD-ROM package is available as a single unit or through an annual or quarterly subscription.

Registered Cisco.com users can order a single Documentation CD-ROM (product number DOC-CONDOCCD=) through the Cisco Ordering tool:

http://www.cisco.com/en/US/partner/ordering/ordering_place_order_ordering_tool_launch.html

All users can order monthly or quarterly subscriptions through the online Subscription Store:

http://www.cisco.com/go/subscription

Ordering Documentation

You can find instructions for ordering documentation at this URL:

http://www.cisco.com/univercd/cc/td/doc/es_inpck/pdi.htm

You can order Cisco documentation in these ways:

- Registered Cisco.com users (Cisco direct customers) can order Cisco product documentation from the Networking Products MarketPlace:

  http://www.cisco.com/en/US/partner/ordering/index.shtml
- Nonregistered Cisco.com users can order documentation through a local account representative by calling Cisco Systems Corporate Headquarters (California, U.S.A.) at 408 526-7208 or, elsewhere in North America, by calling 800 553-NETS (6387).

Documentation Feedback

You can submit comments electronically on Cisco.com. On the Cisco Documentation home page, click Feedback at the top of the page.

You can e-mail your comments to bug-doc@cisco.com.

You can submit comments by using the response card (if present) behind the front cover of your document or by writing to the following address:

Cisco Systems
Attn: Customer Document Ordering
170 West Tasman Drive
San Jose, CA 95134-9883

We appreciate your comments.

10 Obtaining Technical Assistance

Cisco provides Cisco.com, which includes the Cisco Technical Assistance Center (TAC) website, as a starting point for all technical assistance. Customers and partners can obtain online documentation, troubleshooting tips, and sample configurations from the Cisco TAC website. Cisco.com registered users have complete access to the technical support resources on the Cisco TAC website, including TAC tools and utilities.

Cisco.com

Cisco.com offers a suite of interactive, networked services that let you access Cisco information, networking solutions, services, programs, and resources at any time, from anywhere in the world.

Cisco.com provides a broad range of features and services to help you with these tasks:

- Streamline business processes and improve productivity
- Resolve technical issues with online support
- Download and test software packages
- Order Cisco learning materials and merchandise
- Register for online skill assessment, training, and certification programs

To obtain customized information and service, you can self-register on Cisco.com at this URL:

http://tools.cisco.com/RPF/register/register.do

RQS Nº 03/2005 - CN
CPMI - CORREIOS
21
0475
Fls:
3701
Doc:

Technical Assistance Center

The Cisco TAC is available to all customers who need technical assistance with a Cisco product, technology, or solution. Two types of support are available: the Cisco TAC website and the Cisco TAC Escalation Center. The type of support that you choose depends on the priority of the problem and the conditions stated in service contracts, when applicable.

We categorize Cisco TAC inquiries according to urgency:

- Priority level 4 (P4)—You need information or assistance concerning Cisco product capabilities, product installation, or basic product configuration. There is little or no impact to your business operations.
- Priority level 3 (P3)—Operational performance of the network is impaired, but most business operations remain functional. You and Cisco are willing to commit resources during normal business hours to restore service to satisfactory levels.
- Priority level 2 (P2)—Operation of an existing network is severely degraded, or significant aspects of your business operations are negatively impacted by inadequate performance of Cisco products. You and Cisco will commit full-time resources during normal business hours to resolve the situation.
- Priority level 1 (P1)—An existing network is "down," or there is a critical impact to your business operations. You and Cisco will commit all necessary resources around the clock to resolve the situation.

Cisco TAC Website

The Cisco TAC website provides online documents and tools to help troubleshoot and resolve technical issues with Cisco products and technologies. To access the Cisco TAC website, go to this URL:

http://www.cisco.com/tac

All customers, partners, and resellers who have a valid Cisco service contract have complete access to the technical support resources on the Cisco TAC website. Some services on the Cisco TAC website require a Cisco.com login ID and password. If you have a valid service contract but do not have a login ID or password, go to this URL to register:

http://tools.cisco.com/RPF/register/register.do

If you are a Cisco.com registered user, and you cannot resolve your technical issues by using the Cisco TAC website, you can open a case online at this URL:

http://www.cisco.com/tac/caseopen

If you have Internet access, we recommend that you open P3 and P4 cases online so that you can fully describe the situation and attach any necessary files.

Cisco TAC Escalation Center

The Cisco TAC Escalation Center addresses priority level 1 or priority level 2 issues. These classifications are assigned when severe network degradation significantly impacts business operations. When you contact the TAC Escalation Center with a P1 or P2 problem, a Cisco TAC engineer automatically opens a case.

To obtain a directory of toll-free Cisco TAC telephone numbers for your country, go to this URL:

http://www.cisco.com/warp/public/687/Directory/DirTAC.shtml

Before calling, please check with your network operations center to determine the Cisco support services to which your company is entitled: for example, SMARTnet, SMARTnet Onsite, or Network Supported Accounts (NSA). When you call the center, please have available your service agreement number and your product serial number.

11 Obtaining Additional Publications and Information

Information about Cisco products, technologies, and network solutions is available from various online and printed sources.

- The *Cisco Product Catalog* describes the networking products offered by Cisco Systems, as well as ordering and customer support services. Access the *Cisco Product Catalog* at this URL:

  http://www.cisco.com/en/US/products/products_catalog_links_launch.html

- Cisco Press publishes a wide range of networking publications. Cisco suggests these titles for new and experienced users: *Internetworking Terms and Acronyms Dictionary, Internetworking Technology Handbook, Internetworking Troubleshooting Guide,* and the *Internetworking Design Guide.* For current Cisco Press titles and other information, go to Cisco Press online at this URL:

  http://www.ciscopress.com

- *Packet* magazine is the Cisco quarterly publication that provides the latest networking trends, technology breakthroughs, and Cisco products and solutions to help industry professionals get the most from their networking investment. Included are networking deployment and troubleshooting tips, configuration examples, customer case studies, tutorials and training, certification information, and links to numerous in-depth online resources. You can access *Packet* magazine at this URL:

  http://www.cisco.com/go/packet

- iQ Magazine is the Cisco bimonthly publication that delivers the latest information about Internet business strategies for executives. You can access iQ Magazine at this URL:

  http://www.cisco.com/go/iqmagazine

- Internet Protocol Journal is a quarterly journal published by Cisco Systems for engineering professionals involved in designing, developing, and operating public and private internets and intranets. You can access the Internet Protocol Journal at this URL:

  http://www.cisco.com/en/US/about/ac123/ac147/about_cisco_the_internet_protocol_journal.html

- Training—Cisco offers world-class networking training. Current offerings in network training are listed at this URL:

  http://www.cisco.com/en/US/learning/le31/learning_recommended_training_list.html

CHAPTER 12

Administrators and Administrative Policy

This chapter addresses the Cisco Secure Access Control Server (Cisco Secure ACS) Appliance version 3.2 features found in the Administration Control section of the HTML interface. It contains the following sections:

- Administrator Accounts, page 12-1
- Access Policy, page 12-11
- Session Policy, page 12-16

Administrator Accounts

This section provides details about Cisco Secure ACS administrators. It contains the following topics:

- About Administrator Accounts, page 12-2
- Administrator Privileges, page 12-2
- Adding an Administrator Account, page 12-6
- Editing an Administrator Account, page 12-8
- Unlocking a Locked Out Administrator Account, page 12-10
- Deleting an Administrator Account, page 12-11

About Administrator Accounts

Administrators are the only users of the Cisco Secure ACS HTML interface. To access the Cisco Secure ACS HTML interface from a browser, you must log in to Cisco Secure ACS using an administrator account.

Note Cisco Secure ACS administrator accounts are unique to Cisco Secure ACS. They are not related to administrator accounts for your network, operating systems, or other software.

In the HTML interface, an administrator can configure any of the features provided in Cisco Secure ACS; however, the ability to access various parts of the HTML interface can be limited by revoking privileges to those parts of the HTML interface that a given administrator is not permitted to access.

For example, you may want to limit access to the Network Configuration section of the HTML interface to the administrators whose responsibilities include network management. To do so, you would select only the Network Configuration privilege for the applicable administrator accounts. For more information about administrator privileges, see Administrator Privileges, page 12-2.

Cisco Secure ACS administrator accounts have no correlation with Cisco Secure ACS user accounts or network user authentication. Cisco Secure ACS stores accounts created for authentication of network service requests and those created for Cisco Secure ACS administrative access in separate internal databases.

Administrator Privileges

You can grant appropriate privileges to each Cisco Secure ACS administrator by assigning privileges on an administrator-by-administrator basis. You control privileges by selecting the options in the Administrator Privileges table on the Add Administrator or Edit Administrator pages. These options are listed below:

- **User and Group Setup**—Contains the following privilege options for the User Setup and Group Setup sections of the HTML interface:
  - **Add/Edit users in these groups**—Enables the administrator to add or edit users and to assign users to groups in the Editable groups list.

- **Setup of these groups**—Enables the administrator to edit the settings for the groups in the Editable groups list.
- **Available Groups**—Lists the user groups for which the administrator *does not* have edit privileges and to which the administrator *cannot* add users.
- **Editable Groups**—Lists the user groups for which the administrator *does* have edit privileges and to which the administrator account *can* add users.

- **Shared Profile Components**—Contains the following privilege options for the Shared Profile Components section of the HTML interface:
  - **Network Access Restriction Sets**—Allows the administrator full access to the Network Access Restriction Sets feature.
  - **Downloadable ACLs**—Allows the administrator full access to the Downloadable PIX ACLs feature.
  - **Create New Device Command Set Type**—Allows the administrator account to be used as valid credentials by another Cisco application for adding new device command set types. New device command set types that are added to Cisco Secure ACS using this privilege appear in the Shared Profile Components section of the HTML interface.
  - **Shell Command Authorization Sets**—Allows the administrator full access to the Shell Command Authorization Sets feature.
  - **PIX Command Authorization Sets**—Allows the administrator full access to the PIX Command Authorization Sets feature.

Note Additional command authorization set privilege options may appear, if other Cisco network management applications, such as CiscoWorks2000, have updated the configuration of Cisco Secure ACS.

- **Network Configuration**—Allows the administrator full access to the features in the Network Configuration section of the HTML interface.

Adding an Administrator Account

Before You Begin

For descriptions of the options available while adding an administrator account, see Administrator Privileges, page 12-2.

To add a Cisco Secure ACS administrator account, follow these steps:

Step 1 In the navigation bar, click **Administration Control**.

Step 2 Click **Add Administrator**.

Result: The Add Administrator page appears.

Step 3 Complete the boxes in the Administrator Details table:

a. In the Administrator Name box, type the login name (up to 32 characters) for the new Cisco Secure ACS administrator account.

b. In the Password box, type the password (up to 32 characters) for the new Cisco Secure ACS administrator account.

c. In the Confirm Password box, type the password a second time.

Step 4 To select all privileges, including user group editing privileges for all user groups, click **Grant All**.

Result: All privilege options are selected. All user groups move to the Editable groups list.

Tip To clear all privileges, including user group editing privileges for all user groups, click **Revoke All**.

Step 5 To grant user and user group editing privileges, follow these steps:

a. Select the desired check boxes under User & Group Setup.

b. To move a user group to the Editable groups list, select the group in the Available groups list, and then click —> (right arrow button).

Result: The selected group moves to the Editable groups list.

c. To remove a user group from the Editable groups list, select the group in the Editable groups list, and then click <— (left arrow button).

Result: The selected group moves to the Available groups list.

d. To move all user groups to the Editable groups list, click >>.

Result: The user groups in the Available groups list move to the Editable groups list.

e. To remove all user groups from the Editable groups list, click <<.

Result: The user groups in the Editable groups list move to the Available groups list.

Step 6 To grant any of the remaining privilege options, in the Administrator Privileges table, select the applicable check boxes.

Step 7 Click **Submit**.

Result: Cisco Secure ACS saves the new administrator account. The new account appears in the list of administrator accounts on the Administration Control page.

RQS Nº 03/2005 - CN

Editing an Administrator Account

You can edit a Cisco Secure ACS administrator account to change the privileges granted to the administrator. You can effectively disable an administrator account by revoking all privileges.

Note You cannot change the name of an administrator account; however, you can delete an administrator account and then create an account with the new name. For information about deleting an administrator account, see Deleting an Administrator Account, page 12-11. For information about creating an administrator account, see Adding an Administrator Account, page 12-6.

For information about administrator privilege options, see Administrator Privileges, page 12-2.

Before You Begin

For descriptions of the options available while editing an administrator account, see Administrator Privileges, page 12-2.

To edit Cisco Secure ACS administrator account privileges, follow these steps:

Step 1 In the navigation bar, click **Administration Control**.

Result: Cisco Secure ACS displays the Administration Control page.

Step 2 Click the name of the administrator account whose privileges you want to edit.

Result: The Edit Administrator *name* page appears, where *name* is the name of the administrator account you just selected.

Step 3 To change the administrator password, follow these steps:

a. In the Password box, double-click the asterisks, and then type the new password (up to 32 characters) for the administrator.

Result: The new password replaces the existing, masked password.

b. In the Confirm Password box, double-click the asterisks, and then type the new administrator password a second time.

Result: The new password is effective immediately after you click Submit in Step 9.

Step 4 If the Reset current failed attempts count check box appears below the Confirm Password box and you want to allow the administrator whose account you are editing to access the Cisco Secure ACS HTML interface, select the **Reset current failed attempts count** check box.

Note If the Reset current failed attempts count check box appears below the Confirm Password box, the administrator cannot access Cisco Secure ACS unless you complete Step 4. For more information about re-enabling an administrator account, see Unlocking a Locked Out Administrator Account, page 12-10.

Step 5 To select all privileges, including user group editing privileges for all user groups, click **Grant All**.

Result: All privilege options are selected. All user groups move to the Editable groups list.

Step 6 To clear all privileges, including user group editing privileges for all user groups, click **Revoke All**.

Result: All privileges options are cleared. All user groups move to the Available groups list.

Step 7 To grant user and user group editing privileges, follow these steps:

a. Under User & Group Setup, select the applicable check boxes.

b. To move all user groups to the Editable groups list, click >>.

Result: The user groups in the Available groups list move to the Editable groups list.

c. To move a user group to the Editable groups list, select the group in the Available groups list, and then click —> (right arrow button).

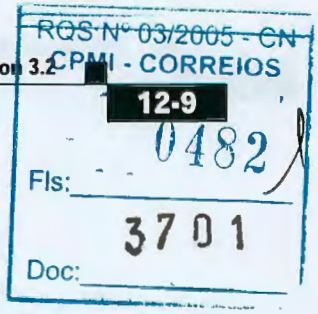
Result: The selected group moves to the Editable groups list.

d. To remove all user groups from the Editable groups list, click <<.

Result: The user groups in the Editable groups list move to the Available groups list.

e. To remove a user group from the Editable groups list, select the group in the Editable groups list, and then click <— (left arrow button).

Result: The selected group moves to the Available groups list.



Step 8 To grant any remaining privilege options, select the applicable check boxes in the Administrator Privileges table.

Step 9 To revoke any remaining privilege options, clear the applicable check boxes in the Administrator Privileges table.

Step 10 Click **Submit**.

Result: Cisco Secure ACS saves the changes to the administrator account.

Unlocking a Locked Out Administrator Account

Cisco Secure ACS disables the accounts of administrators who have attempted to access the Cisco Secure ACS HTML interface and have provided an incorrect password in more successive attempts than is specified on the Session Policy Setup page. Until the failed attempts counter for a disabled administrator account is reset, the administrator cannot access the HTML interface.

For more information about configuring how many successive failed login attempts can occur before Cisco Secure ACS disables an administrator account, see Session Policy, page 12-16.

To reset the failed attempts count for an administrator, follow these steps:

Step 1 In the navigation bar, click **Administration Control**.

Result: Cisco Secure ACS displays the Administration Control page.

Step 2 Click the name of the administrator account whose account you want to re-enable.

Result: The Edit Administrator *name* page appears, where *name* is the name of the administrator account you just selected.

If the Reset current failed attempts count check box appears below the Confirm Password box, the administrator account cannot access the HTML interface.

Step 3 Select the **Reset current failed attempts count** check box.

Step 4 Click **Submit**.

Result: Cisco Secure ACS saves the changes to the administrator account.

Deleting an Administrator Account

You can delete a Cisco Secure ACS administrator account when you no longer need it. We recommend deleting any unused administrator accounts.

To delete a Cisco Secure ACS administrator account, follow these steps:

Step 1 In the navigation bar, click **Administration Control**.

Result: Cisco Secure ACS displays the Administration Control page.

Step 2 In the Administrators table, click the name of the administrator account that you want to delete.

Result: The Edit Administrator *name* page appears, where *name* is the name of the administrator account you just selected.

Step 3 Click **Delete**.

Result: Cisco Secure ACS displays a confirmation dialog box.

Step 4 Click **OK**.

Result: Cisco Secure ACS deletes the administrator account. The Administrators table on the Administration Control page no longer lists the administrator account that you deleted.

Access Policy

The Access Policy feature affects access to the Cisco Secure ACS HTML interface. You can limit access by IP address and by the TCP port range used for administrative sessions. You can also enable secure socket layer (SSL) for access to the HTML interface.

This section contains the following topics:

- Access Policy Options, page 12-12
- Setting Up Session Policy, page 12-16

RQS Nº 03/2005 - CN - CPMI - CORREIOS
12-11
0483
Fls:
3701
Doc:

Access Policy Options

You can configure the following options on the Access Policy Setup page:

- **IP Address Filtering**—Contains the following IP address filtering options:
  - **Allow all IP addresses to connect**—Allow access to the HTML interface from any IP address.
  - **Allow only listed IP addresses to connect**—Allow access to the HTML interface only from IP addresses *inside* the address range(s) specified in the IP Address Ranges table.
  - **Reject connections from listed IP addresses**—Allow access to the HTML interface only from IP addresses *outside* the address range(s) specified in the IP Address Ranges table.
- **IP Address Ranges**—The IP Address Ranges table contains ten rows for configuring IP address ranges. The ranges are always inclusive; that is, the range includes the start and end IP addresses. The IP addresses entered to define a range must differ only in the last octet (Class C format).

  The IP Address Ranges table contains one column of each of the following boxes:
  - **Start IP Address**—Defines the lowest IP address of the range specified in the current row.
  - **End IP Address**—Defines the highest IP address of the range specified in the current row.
- **HTTP Port Allocation**—Contains the following options for configuring TCP ports used for remote access to the HTML interface.
  - **Allow any TCP ports to be used for Administration HTTP Access**—Allow the ports used by administrative HTTP sessions to include the full range of TCP ports.
  - **Restrict Administration Sessions to the following port range From Port *X* to Port *Y***—Restrict the ports used by administrative HTTP sessions to the range specified in the *X* and *Y* boxes, inclusive. The size of the range specified determines the maximum number of concurrent administrative sessions.

Cisco Secure ACS uses port 2002 to start all administrative sessions. You do not need to include port 2002 in the port range. Also, Cisco Secure ACS does not allow you to define an HTTP port range that consists only of port 2002. Your port range must consist of at least one port other than port 2002.

A firewall configured to permit HTTP traffic over the Cisco Secure ACS administrative port range must also permit HTTP traffic through port 2002, because this is the port a web browser must address to initiate an administrative session.

Note We do not recommend allowing administration of Cisco Secure ACS from outside a firewall. If you do choose to allow access to the HTML interface from outside a firewall, keep the HTTP port range as narrow as possible. This can help prevent accidental discovery of an active administrative port by unauthorized users. An unauthorized user would have to impersonate, or "spoof," the IP address of a legitimate host to make use of the active administrative session HTTP port.

- **Secure Socket Layer Setup**—The Use HTTPS Transport for Administration Access check box defines whether Cisco Secure ACS uses secure socket layer protocol to encrypt HTTP traffic between the CSAdmin service and a web browser used to access the HTML interface. When this option is enabled, all HTTP traffic between the browser and Cisco Secure ACS is encrypted, as reflected by the URLs, which begin with HTTPS. Additionally, most browsers include an indicator for when a connection is SSL-encrypted.

  To enable SSL, you must have completed the steps in Installing a Cisco Secure ACS Certificate, page 10-15 and Adding a Certificate Authority Certificate, page 10-18.

Setting Up Access Policy

For information about access policy options, see Access Policy Options, page 12-12.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
12-13
0484
Fls:
Doc: 3701

Before You Begin

If you want to enable SSL for administrative access, before completing this procedure, you must have completed the steps in Installing a Cisco Secure ACS Certificate, page 10-15 and Adding a Certificate Authority Certificate, page 10-18.

To set up Cisco Secure ACS Access Policy, follow these steps:

Step 1 In the navigation bar, click **Administration Control**.

Result: Cisco Secure ACS displays the Administration Control page.

Step 2 Click **Access Policy**.

Result: The Access Policy Setup page appears.

Step 3 To allow remote access to the HTML interface from any IP address, in the IP Address Filtering table, select the **Allow all IP addresses to connect** option.

Step 4 To allow remote access to the HTML interface only from IP addresses *within* a range or ranges of IP addresses, follow these steps:

a. In the IP Address Filtering table, select the **Allow only listed IP addresses to connect** option.

b. For each IP address range from within which you want to allow remote access to the HTML interface, complete one row of the IP Address Ranges table. In the Start IP Address box, type the lowest IP address (up to 16 characters) in the range. In the End IP Address box, type the highest IP address (up to 16 characters) in the range. Use dotted decimal format.

Note The IP addresses entered to define a range must differ only in the last octet.

Step 5 To allow remote access to the HTML interface only from IP addresses *outside* a range or ranges of IP addresses, follow these steps:

a. In the IP Address Filtering table, select the **Reject connections from listed IP addresses** option.

b. For each IP address range from outside which you want to allow remote access to the HTML interface, complete one row of the IP Address Ranges table. Type the lowest IP address (up to 16 characters) in the range in the Start IP Address box. Type the highest IP address (up to 16 characters) in the range in the End IP Address box.

Note The IP addresses entered to define a range must differ only in the last octet.

Step 6 If you want to allow Cisco Secure ACS to use any valid TCP port for administrative sessions, under HTTP Port Allocation, select the **Allow any TCP ports to be used for Administration HTTP Access** option.

Step 7 If you want to allow Cisco Secure ACS to use only a specified range of TCP ports for administrative sessions, follow these steps:

a. Under HTTP Port Allocation, select the **Restrict Administration Sessions to the following port range From Port *X* to Port *Y*** option.

b. In the *X* box type the lowest TCP port (up to 5 characters) in the range.

c. In the *Y* box type the highest TCP port (up to 5 characters) in the range.

Step 8 If you want to enable SSL encryption of administrator access to the HTML interface, under Secure Socket Layer Setup, select the **Use HTTPS Transport for Administration Access** check box.

Note To enable SSL, you must have completed the steps in Installing a Cisco Secure ACS Certificate, page 10-15 and Adding a Certificate Authority Certificate, page 10-18.

Step 9 Click **Submit**.

Result: Cisco Secure ACS saves and begins enforcing the access policy settings.

If you have enabled SSL, at the next administrator login, Cisco Secure ACS begins using HTTPS. Any current administrator sessions are unaffected.

Session Policy

The Session Policy feature controls various aspects of Cisco Secure ACS administrative sessions. This section contains the following topics:

- Session Policy Options, page 12-16
- Setting Up Session Policy, page 12-16

Session Policy Options

You can configure the following options on the Session Policy Setup page:

- **Session idle timeout (minutes)**—Defines the time in minutes that an administrative session must remain idle before Cisco Secure ACS terminates the connection. This parameter applies to the Cisco Secure ACS administrative session in the browser only. It does not apply to an administrator dial-up session.

  An administrator whose administrative session is terminated receives a dialog box asking whether or not the administrator wants to continue. If the administrator chooses to continue, Cisco Secure ACS starts a new administrative session.

- **Respond to Invalid IP Address Connections**—Enables an error message in response to attempts to start a remote administrative session using an IP address that is invalid according to the IP address ranges configured in Access Policy. Disabling this option can help prevent unauthorized users from discovering Cisco Secure ACS.

- **Lock out Administrator after *X* successive failed attempts** —Enables Cisco Secure ACS to lock out an administrator after the number of successive failed login attempts specified in the *X* box. A value of 0 (zero) in the X box allows unlimited successive administrative login failures. If this check box is selected, the X box cannot be set to zero.

Setting Up Session Policy

For information about session policy options, see Session Policy Options, page 12-16.

To setup Cisco Secure ACS Session Policy, follow these steps:

Step 1 In the navigation bar, click **Administration Control**.

Result: Cisco Secure ACS displays the Administration Control page.

Step 2 Click **Session Policy**.

Result: The Session Policy Setup page appears.

Step 3 To define the number of minutes of inactivity after which Cisco Secure ACS ends an administrative session, in the Session idle timeout (minutes) box, type the number of minutes (up to 4 characters).

Step 4 Set the invalid IP address response policy:

a. To configure Cisco Secure ACS to respond with a message when an administrative session is requested from an invalid IP address, select the **Respond to invalid IP address connections** check box.

b. To configure Cisco Secure ACS to send no message when an administrative session is requested from an invalid IP address, clear the **Respond to invalid IP address connections** check box.

Step 5 Set the failed administrative login attempts policy:

a. To enable Cisco Secure ACS to lock out an administrator after a number of successive failed administrative login attempts, select the **Lock out Administrator after *X* successive failed attempts** check box.

b. In the *X* box, type the number of successive failed login attempts after which Cisco Secure ACS locks out an administrator. The *X* box accepts up to 4 characters.

Step 6 Click **Submit**.

Result: Cisco Secure ACS saves and begins enforcing the session policy settings you made.

Cisco Systems

Data Sheet

Cisco Secure **Access Control Server** Solution Engine

The Cisco® Secure Access Control Server (ACS) provides a comprehensive identity networking solution and secure user experience for Cisco intelligent information networks. It is the integration and control layer among all enterprise users, administrators, and the resources of the network infrastructure. The Cisco Secure ACS Solution Engine adds new security improvements, simplified management, and reduced total cost of ownership (TCO) for the operation of the underlying ACS service.

Introduction

The Cisco Secure ACS Solution Engine is a high-performance and highly scalable user and administrative access control solution that operates as a centralized RADIUS or TACACS+ server system for the Cisco 1111 platform. Packaged in a dedicated and secure 1-rack-unit (1-RU) hardened appliance, the Cisco Secure ACS Solution Engine provides a reduced-configuration, plug and play solution, and highly reliable platform with the unique ability to protect existing networking infrastructure through fully Web-based remote-access and configuration capabilities.

The need for security appliances is rapidly increasing in today's IT space. Security, convenience, and ease of installation and troubleshooting are the important advantages of security appliances compared to the many software-based security applications that exist in the marketplace today. The innovative, new, 1-RU, security-hardened Cisco Secure ACS Solution Engine was designed to specifically alleviate the security issue with a closed-device design that makes it substantially more difficult for intruders to penetrate than an open-platform system.

Security appliances provide an all-in-one approach that simplifies product selection, product integration, and ongoing support. By combining all necessary operating system installation and patching with the ACS software service, customers can avoid maintaining software versioning and proliferation of servers, patches, and operating system (OS) maintenance issues. This is particularly important in large networking environments where security solutions are required in remote sites with no IT professionals present to regularly manage and upgrade these solutions. In addition, a security appliance greatly simplifies support and troubleshooting in failure modes, hence enabling quick service restoration (through a one-stop support contact)—an important consideration, especially when the security application is mission-critical, a situation that is true with security authentication, authorization, and accounting (AAA) applications.

Changing network dynamics and increased security threats have influenced new opportunities in access control management solutions. As AAA becomes more relevant and the requirement to

control user access expands beyond just dialup, new trends (including expanded authentication, tracking, and audit management) are emerging that require identity-networking solutions to be pervasive, scalable, and available throughout the network.

Cisco Secure ACS extends access security by combining authentication, user or administrator access, and policy control from a centralized location, allowing for greater flexibility and mobility, increased security, and user productivity gains. As an accounting service, the Cisco Secure ACS Solution Engine reduces IT operations costs by providing detailed reporting and monitoring capabilities of network users' behavior and by keeping a record of every access connection and device configuration change across the entire network.

Cisco Secure ACS provides a centralized identity networking solution and simplified user-management experience across all Cisco devices and security-management applications. Cisco Secure ACS ensures enforcement of assigned policies by allowing network administrators to control:

- Who can log in to the network
- What privileges each user has in the network
- What accounting information is recorded in terms of security audits or account billing
- What access and command controls are enabled for each configuration administrator

Like the Cisco Secure ACS for Windows, the Cisco Secure ACS Solution Engine supports a wide array of access connection types, including wired or wireless LAN, dialup, broadband, content, storage, voice over-IP (VoIP), firewall, and virtual private networks (VPNs).

Cisco Secure ACS Solution Engine Highlights

The Cisco Secure ACS Solution Engine is a highly secure, OS-independent, and dedicated platform that offers a highly manageable access control solution with an increasingly reduced setup and troubleshooting time. The Cisco Secure ACS Solution Engine provides Plug and Play deployment, a highly reliable AAA solution, and increased TCO protection through the high availability and simplified day-to-day operation and management of the Cisco Secure ACS service. It provides the same features and functions as the Cisco Secure ACS for Windows, in a dedicated, security-hardened, application-specific appliance package. Customers with existing Windows-based Cisco Secure ACS deployments can add or upgrade to Cisco Secure ACS Solution Engines without any effect on existing AAA configurations, including remote logging and replication configurations. More information about the latest Cisco Secure ACS features is available from the Cisco Secure ACS for Windows data sheet.

To ensure the high-security posture of the Cisco Secure ACS Solution Engine, additional functions specific to operating and managing the Cisco Secure ACS Solution Engine are provided. Additionally, a Cisco Secure ACS remote agent is available with each Cisco Secure ACS Solution Engine to enable remote logging and Windows authentication. Forwarding all accounting data from the solution engine to a remote agent preserves disk space on the solution engine. It also improves AAA performance by eliminating the frequent and time-consuming disk writes required for local logging on the solution engine. Also, because a Cisco Secure ACS Solution Engine is never a member of a Microsoft Windows domain, the Cisco Secure ACS remote agent establishes the necessary Windows domain trust relationships for Windows-based authentication.

Table 1 lists additional functions provided by the Cisco Secure ACS Solution Engine. These functions are not available from the Cisco Secure ACS for Windows software product.

Table 1 Functions Provided by the Cisco Secure ACS Solution Engine

Hardened underlying operating system	• The Cisco Secure ACS Solution Engine is dedicated to run only the Cisco Secure ACS service, thereby preventing any appliance-based OS changes, additions, or configuration modifications.
Serial console interface	• A serial console interface is provided on the Cisco Secure ACS Solution Engine for initial configuration, subsequent management of IP connections, access to the Cisco Secure ACS HTML interface, and application of upgrade and recovery procedures. • The serial console interface supports both serial line and Telnet connections through which the Cisco Secure ACS service can be reimaged, reloaded, and rebooted, both locally and remotely.
Solution Engine-specific management tools	• Integrated into the existing Cisco Secure ACS HTML interface, Solution Engine-specific management tools provide generic appliance-management capabilities, including backup, recovery, software upgrades, monitoring, maintenance, and troubleshooting functions. • The Cisco Secure ACS HTML interface is accessed though a secured Secure Sockets Layer (SSL)-based connection.
Cisco Secure ACS remote agent	• The Cisco Secure ACS remote agent provides two functions: authentication against Windows domains and remote logging capabilities of user accounting records. • Administrators can provision primary and backup Cisco Secure ACS remote agents in distributed Cisco Secure ACS configurations.
Port-based packet filtering	• The Cisco Secure ACS Solution Engine implements a packet-filtering service to block traffic on all but the necessary Cisco Secure ACS-specific TCP and UDP ports.
Network Timing Protocol (NTP) support	• The Cisco Secure ACS Solution Engine has built-in NTP functions to maintain network timing synchronization and consistency with other Cisco Secure ACS appliances or network devices.

Cisco Secure ACS Solution Engine-Specific Benefits

In addition to the many benefits the Cisco Secure ACS solution brings in controlling user and administrative AAA inside your network, the Cisco Secure ACS Solution Engine, with its 1-RU hardened form factor, adds specific security and operational advantages in the following areas:

- *Security*—With a security-hardened service focused on running exclusively the Cisco Secure ACS service, the solution engine significantly increases the security posture of the Cisco Secure ACS system. All solution engine services and ports not used by the Cisco Secure ACS service are disabled to secure access to the Cisco Secure ACS Solution Engine.
- *Plug and Play solution*—The Cisco Secure ACS Solution Engine provides a record service uptime before starting to configure the Cisco Secure ACS service.
- *Manageability*—With a dedicated, exclusive, and complete Cisco Secure ACS solution, the appliance greatly simplifies manageability and support of the Cisco Secure ACS service while removing the necessity to manage any UNIX or Windows network operating systems.
- *Supportability*—With no external services or applications (other than the Cisco Secure ACS service) allowed to be installed on the solution engine, the support and the day-to-day management of the Cisco Secure ACS Solution Engine are greatly simplified.

CPMI - CORREIOS
0490
Fls:
3701
Doc:

- *Reliability*—Enabling only the services that are required by Cisco Secure ACS allows an increase in overall reliability and security of the Cisco Secure ACS service.
- *TCO*—With a turnkey security-hardened solution engine that is easily deployed, Cisco is able to guarantee full support, maintenance, and serviceability of the overall Cisco Secure ACS system—not just the Cisco Secure ACS software running on various hardware configurations, supported by third-party vendors.
- *Migration from Cisco Secure ACS UNIX*—The Cisco Secure ACS Solution Engine provides a suitable alternative for Cisco Secure ACS UNIX customers not willing to install or manage Cisco Secure ACS on the Windows OS.

System Requirements

Hardware Requirements

The Cisco Secure ACS Solution Engine is available on Cisco 1111 platforms with the following specifications:

- Pentium IV processor, 2.66 GHz
- 1 GB RAM
- 40 GB free disk space
- Two built-in 10/100 Ethernet controllers
- 1 floppy disk drive
- 1 CD-ROM drive

The Cisco Secure ACS remote agent is available in a Windows version that can be installed on a Windows 2000 Server (Windows Domain Controller or Member Server supported).

The computer running Cisco Secure ACS remote agent for Windows must meet the following minimum hardware requirements:

- Pentium III processor, 550 MHz or faster
- 256 MB RAM
- 250 MB free disk space

Ordering Information

The Cisco Secure ACS Solution Engine is available for purchase through normal Cisco sales and distribution channels worldwide. The Cisco Secure ACS Solution Engine is shipped with a preinstalled Cisco Secure ACS Software license.

For More Information

For more information about Cisco Secure ACS, visit: http://www.cisco.com/go/acs.

For specific product functions or technical questions, send e-mail to the Cisco Secure ACS product marketing group at ACS-MKT@cisco.com.

For questions about product ordering, availability, and support contract information, send e-mail to the product marketing group at ciscoworks@cisco.com.

Q & A

Cisco Secure **Access Control Server** Solution Engine

Q. What is Cisco® Secure Access Control Server (ACS) Solution Engine?

A. Cisco Secure ACS Solution Engine is a highly scalable, one-rack-unit (RU), dedicated platform that serves as a high-performance access control server supporting centralized Remote Authentication Dial-In User Service (RADIUS) or Terminal Access Controller Access Control System (TACACS+). Cisco Secure ACS Solution Engine controls the authentication, authorization, and accounting (AAA) for users accessing corporate resources through the network.

Q. What does Cisco Secure ACS Solution Engine do?

A. Cisco Secure ACS Solution Engine enables you to control who can access the network, to authorize what types of network services are available for users or groups of users, and to keep an accounting record of all user actions in the network. The Solution Engine supports access control and accounting for dial-up access servers, firewalls and VPNs, voice-over-IP (VoIP) solutions, content networking, storage networks, and switched and wireless LANs (WLANs). In addition, the AAA framework can be used to manage the administrative roles and groups via TACACS+ and to control how network administrators are able to change, access, and configure the network internally.

Q. Why did Cisco add an Solution Engine to the existing Windows server software packaging for Cisco Secure ACS?

A. The decision to create a dedicated solution engine version of Cisco Secure ACS was made based on several factors:

- Security—The need to create a turnkey security-hardened service focused on running the Cisco Secure ACS service exclusively. The solution engine can remove all extraneous services, block all unused ports, and otherwise prevent all other access to the Cisco Secure ACS server system—dramatically increasing the security posture of Cisco Secure ACS.
- Manageability—Cisco Secure ACS Solution Engine is a dedicated, exclusive service for AAA with no ability to install or run other services or applications. This greatly facilitates the support and day-to-day management of the Cisco Secure ACS system.
- Reliability—By targeting only the operating system services required by Cisco Secure ACS, the solution engine offers greater operational reliability and security for the Cisco Secure ACS system.
- Total cost of ownership—Customers choosing Cisco Secure ACS can optimize their total cost of ownership. Cisco end-to-end support now includes

RQS Nº 03/2005 - CN

Doc: 3701

All contents are Copyright © 1992–2002 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

full support, maintenance, and serviceability of the Cisco Secure ACS system—not just the Cisco Secure ACS software running on various hardware configurations and supported by various third-party vendors.

- Plug and play—Cisco Secure ACS Solution Engine is shipped already installed with Cisco Secure ACS application software, greatly reducing the time it takes to set up and deploy Cisco Secure ACS in your network.
- Migration from Cisco Secure ACS UNIX—Cisco Secure ACS Solution Engine was built and targeted as a suitable migration platform for Cisco Secure ACS for Unix customers not willing to install or manage Cisco Secure ACS on a Windows server.

Q. What are the differences between the Cisco Secure ACS software server and Cisco Secure ACS Solution Engine?

A. Cisco Secure ACS Solution Engine provides the same features and functions of the Cisco Secure ACS Windows version—in a dedicated, security-hardened, application-specific option. The appliance includes features specific to the operation and management of Cisco Secure ACS, and specific software features needed to be customized or removed due to the different underlying system architectures:

Authentication

- Authentication against a Windows domain requires a Cisco Secure ACS remote agent running on a domain controller or member server. The Cisco Secure ACS remote agent is necessary to establish a Windows member or domain controller trust relationship.
- Authentication against an Open Database Connectivity (ODBC) source is not supported. Lightweight Directory Access Protocol (LDAP) authentication can be used instead.
- Authentication against One-Time Password (OTP) directories is performed using the generic RADIUS-based OTP interface on the appliance. Any OTP vendor that provides an RFC-compliant RADIUS interface can interface with Cisco Secure ACS.

User Database Synchronization

- User database synchronization with an ODBC source is not supported. Instead, the administrator can configure Cisco Secure ACS to synchronize its user database with a comma-separated values (CSV) file on a remote File Transfer Protocol (FTP) server.

ODBC Logging

- ODBC logging is not supported. Administrators can use local or remote CSV logging.

Backup/Restore and Appliance Diagnostics

- Backup/restore and gathered appliance diagnostics are performed through a remote FTP server and configured using the current Cisco Secure ACS HTML graphical user interface (GUI).

Q. What additional features are available on Cisco Secure ACS Solution Engine but not available on the Windows version?

A. To ensure the highly secure posture of Cisco Secure ACS Solution Engine, functions specific to operating and managing the appliance have been added:

- Security-hardened underlying operating system.
- Port-based packet filtering, allowing connections only to the ports necessary for Cisco Secure ACS operation.
- Serial console interface for initial configuration, subsequent management of IP connections, Web interface, and application of upgrades and remote reboots. The serial console interface supports both serial line and Telnet connections.

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

- Backup/restore of Cisco Secure ACS data via FTP protocol.
- Recovery procedures.
- NTP (Network Time Protocol) support for maintaining network time consistency with other appliances or network devices.

Q. Are there any additions to the existing Cisco Secure ACS GUI to support Cisco Secure ACS Solution Engine?

A. Yes. New HTML pages specific to Cisco Secure ACS Solution Engine have been added to the Cisco Secure ACS GUI. These pages cover specific features around the operation and management of the solution engine and include:

- Solution Engine configuration page
- Solution Engine remote agent configuration page
- Solution Engine upgrade page
- Solution Engine status page
- Solution Engine diagnostics log view

Q. What ports and protocols access Cisco Secure ACS Solution Engine?

A. Cisco Secure ACS Solution Engine implements a packet filtering service to block the traffic on all but necessary TCP/User Datagram Protocol (UDP) ports. Only the ports listed in Table 1 are open for input traffic:

Table 1 Cisco Secure ACS Solution Engine Ports Usage

Service Name	UDP	TCP
DHCP	68	
RADIUS authentication and authorization (original draft RFC)	1645	
RADIUS accounting (original draft RFC)	1646	
RADIUS authentication and authorization (revised RFC)	1812	
RADIUS accounting (revised draft RFC)	1813	
TACACS+ AAA		49
Replication and RDBMS synchronization		2000
Cisco Secure ACS remote logging		2001
Cisco Secure ACS distributed logging (appliance only)		2003
Hypertext Transfer Protocol (HTTP) administrative access (at login)		2002
Administrative access (after login) port range		Configurable (default 1024-65535)[1]

1. ACS assigns unique port number from the range to each administration session

Cisco Systems, Inc.

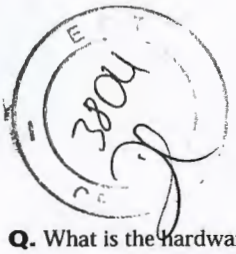
RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0495
Doc: 3701



Q. What is the hardware platform specification for Cisco Secure ACS Solution Engine?

A. Cisco Secure ACS Solution Engine is a security-hardened Cisco Secure ACS server in a dedicated 1-RU box with the following configuration:

- Intel ISP 1100 motherboard with a 2.66-GHz Pentium 4 processor
- 1 GB of RAM
- Two built-in 10/100 Ethernet controllers
- 40-GB IDE hard drive
- One floppy drive
- One CD-ROM drive

Q. How does Cisco Secure ACS Solution Engine authenticate to Windows domains?

A. In general, to authenticate Windows NT 4.0 or Active Directory domain users, you must establish a Windows member or domain controller trust relationship. Since Cisco Secure ACS Solution Engine does not run the necessary Windows server services to establish this trust, an external Cisco Secure ACS remote agent is provided with the appliance solution, allowing the trust relationship to be established. The Cisco Secure ACS remote agent can be installed on member servers, domain controllers, or backup domain controllers. NOTE: The best practice is to install the remote agent on a full Domain Controller (DC), as this would allow it to perform its authentication functions with the least extra configuration requirements.

Q. What is the main purpose of the Cisco Secure ACS remote agent?

A. The Cisco Secure ACS remote agent has dual roles—it enables authentication against Windows domains, and it allows remote logging capabilities of user accounting records.

Q. What operating systems can the Cisco Secure ACS remote agent be installed on?

A. The Cisco Secure ACS remote agent can be installed on a Windows 2000 server (Windows Domain Controller or Member Server supported). A Solaris version of Cisco Secure ACS will be provided in the future for Sun Solaris installations. Please refer to the Cisco Secure ACS remote agent installation guide for the exact operating system versions and service packs supported.

Q. Can a Cisco Secure ACS remote agent and Cisco Secure ACS Windows coexist on the same server?

A. No. The Cisco Secure ACS remote agent cannot be installed on a server that already has Cisco Secure ACS Windows installed.

Q. Can a solution engine be configured to use several remote agents?

A. Yes. A solution engine can be configured to use one or more agents. There is no restriction that the same agent be used for Windows services and logging services. For Windows services, an appliance can point to a primary and backup agent, in the event that the primary agent is unavailable.

Q. Can a Cisco Secure ACS remote agent be shared with multiple solution engines?

A. Yes. The Cisco Secure ACS remote agent can be shared with multiple solution engines. There is no hard limit to the number of Cisco Secure ACS solution engines that can share a single remote agent, but Cisco will support configurations with up to five solution engines sharing a single Cisco Secure ACS remote agent. If user accounting records from multiple Cisco Secure ACS solution engines need to be consolidated and centralized, it is desired that all these solution engines share a single Cisco Secure ACS remote agent.

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

Q. Can I perform local logging on Cisco Secure ACS Solution Engine instead of using the remote logging capability of the Cisco Secure ACS remote agent?

A. Yes. However, local logging on Cisco Secure ACS Solution Engine is constrained in size, forcing log files to be recycled after seven days. The Cisco Secure ACS remote agent provides full, unconstrained logging capability to a remote server.

Q. Are there any differences in the type of Windows databases supported by the Cisco Secure ACS remote agent and the ones supported by Cisco Secure ACS Windows?

A. No. The Cisco Secure ACS remote agent supports the same Windows databases supported by Cisco Secure ACS Windows.

Q. What 802.1X authentication types does the Cisco Secure ACS remote agent support?

A. The Cisco Secure ACS remote agent supports the same 802.1X authentication types available on Cisco Secure ACS for Windows. This includes Extensible Authentication Protocol (EAP)-MD5, EAP-TLS, EAP Cisco Wireless, LEAP, PEAP-EAP-GTC, and PEAP-EAP-MSCHAPv2.

Q. Can a Cisco Secure ACS remote agent be provisioned for Cisco Secure ACS for Windows?

A. No. In its initial release, the Cisco Secure ACS remote agent only operates with Cisco Secure ACS Solution Engine. No communication is possible between a Cisco Secure ACS remote agent and a Cisco Secure ACS service on Windows. However, this limitation does not prevent Cisco Secure ACS Windows and Cisco Secure ACS Solution Engine from operating in the same network environment.

Q. What happens to the standard HTML reports on the solution engine? Do they stay the same?

A. In general, these reports stay the same. The solution engine reports will be constrained in size with no support for multiple rolled over files. The Cisco Secure ACS remote agent will provide full, unconstrained report capability on a remote FTP server.

Q. What happens with third-party software tools, such as backup services from Legato?

A. Cisco Secure ACS Solution Engine is a standalone, dedicated box for running Cisco Secure ACS. There are no interfaces or abilities to add third-party software of any kind to the box. Cisco will investigate third-party extensibility, but at present, nothing can be installed on the Cisco Secure ACS Solution Engine other than Cisco Secure ACS images and patches downloaded via FTP. For Cisco Secure ACS backup, Cisco will create an export file that is automatically exported to an external FTP server. Backup tools can be installed and used to backup the external server.

Q. Can I run Cisco Secure ACS in "mixed mode" (for example, run instances of the Cisco Secure ACS Windows and additional instances of Cisco Secure ACS Solution Engine)?

A. Yes. Cisco will support environments using both Cisco Secure ACS Windows and Cisco Secure ACS Solution Engine.

Q. How is Cisco Secure ACS replication affected with the introduction of Cisco Secure ACS Solution Engine?

A. Cisco Secure ACS replication functions will remain unchanged with the introduction of Cisco Secure ACS Solution Engine. Replication between Cisco Secure ACS Solution Engine and Cisco Secure ACS Windows, as well as replication among Cisco Secure ACS solution engines, will be supported with no impact on any of the solution engines or Windows configurations.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0496

Doc: 3701

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

Q. Are there any restrictions on whether Cisco Secure ACS Windows or Cisco Secure ACS Solution Engine can be a master database in a replicated configuration?

A. No. Cisco Secure ACS Windows or Cisco Secure ACS Solution Engine can be the master databases replicating to Cisco Secure ACS Windows slaves, Cisco Secure ACS Solution Engine slaves, or both Windows and solution engine slaves at the same time.

Q. Are there any changes to single logon and password aging capabilities in Cisco Secure ACS Solution Engine?

A. No. With the appropriate Windows or domain controller trust relationships established with the Cisco Secure ACS remote agent, single logon and password aging capabilities remain unchanged from Cisco Secure ACS Windows version.

Q. How scalable is a Cisco Secure ACS Solution Engine?

A. The Cisco Secure ACS Solution Engine follows, as a minimum, the same scalability performance as a Windows-based Cisco Secure ACS server. Cisco Secure ACS guidelines and performance analysis shows that each Cisco Secure ACS server can support anywhere from 20,000 to 80,000 users per server, and can scale to support in excess of 10,000 devices, depending on configuration, platform, and usage scenarios. The real challenge in scaling a user access control framework is on the back end. Linked to a high-performance back-end database such as Oracle or Sybase, Cisco has deployed Cisco Secure ACS for Windows 2000 and NT in clustered deployments into customers with hundreds of thousands of user records.

Q. What Cisco Secure ACS Solution Engine features enhance Cisco Secure ACS reliability and remote management?

A. The operating system is configured to automatically reboot on system crash. The serial console service is configured to automatically restart if it fails. Cisco Secure ACS software implements the monitor that will restart Cisco Secure ACS services if they fail. The solution engine also provides a remote administrator command line interface (CLI). The CLI supports both serial line and Telnet connections, and the Cisco Secure ACS service can be reimaged, reloaded, upgraded, and rebooted remotely from the CLI interface.

Q. What support is there for LDAP?

A. Support for LDAP on the appliance is identical to present support from the Cisco Secure ACS Software version. Cisco Secure ACS supports user authentication against records kept in a directory server through LDAP. Cisco Secure ACS supports the most popular directory servers, including Novell and Netscape LDAP Servers, through a generic LDAP interface.

Q. Will Cisco Secure ACS Solution Engine allow "single login" for Windows networking?

A. Yes. Cisco Secure ACS can be set up so that a user will only need to enter a user name and password once. This is considered a "single login." The Cisco Secure ACS remote agent is required to be installed on a Windows network server with the necessary trust relationships to the domain defined.

Q. Does Cisco Secure ACS support OTP and token systems?

A. Yes. Cisco Secure ACS can be configured to communicate with token solutions from ActiveCard, Cryptocard, PassGo Technologies, RSA Data Security, Secure Computing, and Vasco. Cisco Secure ACS Solution Engine includes a generic RADIUS interface for expanding OTP coverage to new vendors. Any OTP vendor that provides an RFC-compliant RADIUS interface should work with Cisco Secure ACS Solution Engine.

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

Q. What's new in Cisco Secure ACS Version 3.2 for access control functions and features?

A. Cisco Secure ACS Version 3.2 is a minor update to Cisco Secure ACS Version 3.1. It adds the following main features:

- Cisco Secure ACS Solution Engine support
- EAP-MSCHAPv2 support within the Protected EAP (PEAP) framework (used for both wireless and wired environments)
- Machine-based authentication (through EAP-TLS and EAP-MSCHAPv2)
- PEAP authentication against the internal Cisco Secure ACS database
- EAP-TLS authentication against ODBC databases
- EAP-TLS session resume support
- Accounting support for Cisco Aironet® clients
- LDAP multithreading
- Downloadable access control lists (ACLs) for VPN solutions

Please refer to the Cisco Secure ACS Version 3.2 data sheet for more information about the features and functions introduced in this release.

Q. How is Cisco Secure ACS Solution Engine Version 3.2 licensed?

A. Cisco Secure ACS Solution Engine is licensed per server, with unlimited ports, users, and network access servers. The following solution engine packages will be available for ordering. For exact part numbers, refer to the Cisco Secure ACS Version 3.2 product bulletin at: http://www.cisco.com/go/acs

- Cisco Secure ACS Solution Engine Version 3.2
- Cisco Secure ACS Solution Engine upgrade package—Used for upgrading from software versions of Cisco Secure ACS 3.x or Cisco Secure ACS for UNIX to Cisco Secure ACS Solution Engine Version 3.2

Note: The Cisco Secure ACS Solution Engine upgrade package can be ordered when customers have deployed Cisco Secure ACS for Windows or Cisco Secure ACS for UNIX in their networks and want to upgrade to the solution engine version. Please refer to the Cisco Secure ACS Solution Engine user guide and release notes for supported upgrade paths. Current Cisco Secure ACS software maintenance entitlements do not provide a free upgrade to the Cisco Secure ACS Solution Engine.

Q. Can I upgrade to Cisco Secure ACS Version 3.2 from older software versions of Cisco Secure ACS?

A. Yes. A detailed upgrade procedure will be available to guide you through the required steps to complete an upgrade to Cisco Secure ACS Solution Engine. Please refer to the Cisco Secure ACS Solution Engine user guide for more information about the supported upgrade procedure.

Q. Can I purchase or license a backup solution engine?

A. No. An additional Cisco Secure ACS Solution Engine must be purchased as a separate Cisco Secure ACS server license to be used for recovery and backup purposes. Cisco Secure ACS servers can be run as recovery or failover servers. Because Cisco Secure ACS is a central control service in your network, Cisco highly recommends that customers configure a backup server for failover and recovery.

Q. Does Cisco Secure ACS Solution Engine operating system need to be updated when upgrading the Cisco Secure ACS firmware?

A. No. Future Cisco Secure ACS image upgrades are applied to Cisco Secure ACS Solution Engine without updating or modifying the underlying Cisco Secure ACS Solution Engine operating system.

Q. Do I need to patch the solution engine with newer operating system releases or patches?

A. No. All operating system software updates and patches are handled by Cisco Secure ACS Solution Engine upgrades performed by Cisco. Any operating system patch that requires changes to Cisco Secure ACS Solution Engine will be provided in a new upgrade/patch.

Q. Can Cisco Secure ACS Solution Engine software be upgraded remotely from a CD-ROM?

A. Yes. Cisco Secure ACS Solution Engine supports remote upgrades from CD-ROM without any FTP server posting requirements.

Q. Can Cisco Secure ACS Solution Engine support software image rollback during patch update verification?

A. Yes. Cisco Secure ACS Solution Engine can roll back to previously installed software when a software patch has been applied. This capability is used for debugging and verification purposes.

Q. What is the status of Cisco Secure ACS for UNIX?

A. Cisco Secure ACS for UNIX is expected to be discontinued, at which point an end-of-life, end-of-sale (EOL/EOS) announcement will be made. Cisco will support all existing customers and provide smooth migration paths as the new platforms become available. The EOL/EOS date has not been determined, but Cisco will provide customer support for Cisco Secure ACS for UNIX customers for a period no shorter than 24 months after the EOL/EOS date. At present, no new features or releases are planned for Cisco Secure ACS for UNIX and only critical, Priority 1 bugs will be addressed.

Q. Can I use my current Cisco Secure ACS Windows maintenance contract to get support on Cisco Secure ACS Solution Engine?

A. No. Separate hardware and software contracts need to be purchased for maintenance support on Cisco Secure ACS Solution Engine. Please refer to refer to the Cisco Secure ACS Version 3.2 product bulletin for more information. http:// www.cisco.com/go/acs

Q. How can I obtain a demo of Cisco Secure ACS Solution Engine?

A. Please contact your Cisco account manager, who will be able to arrange for a limited time demo of Cisco Secure ACS Solution Engine.

Q. Where can I find more information on Cisco Secure ACS?

A. For additional product information, visit: http://www.cisco.com/go/acs

For additional information or questions, please send e-mail to the Cisco Secure ACS product marketing group at ACS-MKT@cisco.com.

Supported and Interoperable Devices and Software Tables for Cisco Secure ACS Appliance version 3.2

Revised: July 8, 2003

Because the number of devices that Cisco Secure ACS Appliance version 3.2 interoperates with runs into the hundreds, this device list differs significantly from those of other Cisco products with which you may be familiar. This document lists supported devices and software, that is, those that we have tested against. However, this document also lists devices and software programs that are, to the best of our knowledge, interoperable. Of the hundreds of devices and software programs that Cisco Secure ACS Appliance version 3.2 interoperates with, Cisco officially supports only those that have been tested.

For details regarding other limitations and known problems see *Release Notes for CiscoSecure Access Control Server Appliance Version 3.2*. On Cisco.com, you can find the latest version all documentation by selecting **Products & Services > Security and VPN Software > Cisco Secure Access Control Server Appliance > Technical Documentation**.

Doc:

With regard to third-party RADIUS and TACACS+ clients, Cisco Secure ACS Appliance fully interoperates with devices that adhere to the governing protocols. Also, support for RADIUS and TACACS+ functions depends on device-specific implementation. On a given device, TACACS+ may not be available for user authentication and authorization. Likewise, RADIUS may not be available for administrative authentication and authorization.

For RADIUS these include the following RFCs:

- RFC 2138 - Remote Authentication Dial In User Service (RADIUS)
- RFC 2139 - RADIUS Accounting
- RFC 2865 - Remote Authentication Dial In User Service (RADIUS)
- RFC 2866 - RADIUS Accounting
- RFC 2867 - RADIUS Accounting for Tunnel Protocol Support
- RFC 2868 - RADIUS Attributes for Tunnel Protocol Support
- RFC 2869 - RADIUS Extensions

For details regarding the implementation of vendor-specific attributes (VSAs), see *User Guide for Cisco Secure ACS Appliance Version 3.2*.

Cisco Secure ACS Appliance conforms to the TACACS+ protocol as defined by Cisco Systems in draft 1.77.

The following tables show the devices and software that Cisco Secure ACS Appliance supports or with which it interoperates:

- Table 1, Web Browsers
- Table 2, Device Operating Systems
- Table 3, Routers
- Table 4, Access Devices/Universal Gateways
- Table 5, Cable Devices
- Table 6, Content Networking Devices
- Table 7, Security and VPN Devices
- Table 8, Storage Networking Devices
- Table 9, Switches
- Table 10, Cisco Aironet Software (Access Points for Wireless LAN)
- Table 11, CiscoWorks VMS

- Table 12, PKI/Certificate Servers
- Table 13, Token Servers
- Table 14, LDAP Servers
- Table 15, User Databases
- Table 16, Proxy Support

You can find information about new device support at Cisco.com, http://www.cisco.com.

To ensure full capabilities, the clients you deploy to interoperate with Cisco Secure ACS Appliance should use the most recent operating systems available. Nonetheless, Table 2 provides details on the minimum acceptable client operating system versions.

Table 1 Web Browsers[1]

Program	Versions	Notes
Microsoft Internet Explorer	5.5 for Microsoft Windows - English Language version	Tested
	6.0 for Microsoft Windows - English Language version	Tested
Netscape	7.0 for Microsoft Windows - English Language version	Tested
	7.0 on Solaris 2.7- English Language version	Tested

To use a web browser to access the Cisco Secure ACS HTML interface, you must enable both Java and JavaScript in the browser. Also, the web browser must not be configured to use a proxy server.

Series	Devices Supported	Notes
MDS 9000	MDS 9216, MDS9509	RADIUS interoperability (TACACS+ support in future release)

Table 9 Switches

Series / Devices	Notes
Catalyst 2950/3550	Tested with 3550 and IOS 12.1(12)EA1 RADIUS and TACACS+ interoperability
Catalyst 4000/4500	Tested with Cat4503, CatOS 7.5, and IOS 12.1 RADIUS and TACACS+ interoperability

Table 9 Switches (continued)

Series / Devices	Notes
Catalyst 5000	EOL status
Catalyst 6500	Tested with CatOS 7.5, and IOS 12.1 RADIUS and TACACS+ interoperability

Table 10 Cisco Aironet Software (Access Points for Wireless LAN)

ies	Notes
350	RADIUS interoperability
AP1100	RADIUS interoperability
AP1200	Tested with Aironet 11.23 RADIUS interoperability

Table 11 CiscoWorks VMS

Series	Devices Supported	Notes
IOS/Router MC	Version 1.1	TACACS+ interoperability
PIX MC	Version 1.1	Tested with VMS2.1 TACACS+ interoperability
IDS MC	Version 1.1	TACACS+ interoperability
LMS	—	TACACS+ interoperability (future release)
HSE	Version 1.7	TACACS+ interoperability
WLSE	—	TACACS+ interoperability (future release)

Table 12 PKI/Certificate Servers

Platform	Versions	Notes
Microsoft CA Certificate Server	Windows 2000 Windows 2000 with SP3	Tested

CHAPTER 2 **LAN Switching**

LAN Switching Products at a Glance **2-1**
Cisco LAN and MAN Products Port Matrix **2-2**
Cisco Catalyst 2900 Series **2-3**
Cisco Catalyst 2900 Series XL—Modular Switches **2-4**
Cisco Catalyst 2950 Series Intelligent Ethernet Switches **2-6**
Cisco Catalyst 3500 Series XL **2-10**
Cisco Catalyst 3550 Series Intelligent Ethernet Switches **2-12**
Cisco Catalyst 4500 Series **2-15**
Cisco Catalyst 4000 Series — Fixed Configuration **2-17**
Cisco Catalyst 5000 Family **2-18**
Cisco Catalyst 6500 Family **2-20**
Cisco Catalyst 8500 Multiservice Switch Routers **2-24**

CHAPTER 3 **Wireless LAN Products**

Wireless LAN Products at a Glance (IEEE 802.11b) **3-1**
Sample Wireless LAN Solution Overview—In-Building or Site-to-Site **3-2**
Cisco Aironet 1200 Series Access Points **3-2**
Cisco Aironet 1100 Series Access Points **3-5**
Cisco Aironet 5 GHz 54 Mbps Wireless Client Adapter **3-6**
Cisco Aironet 350 Series Client Adapters **3-8**
Cisco Aironet 350 Series Workgroup Bridge **3-10**
Cisco Aironet 350 Series Wireless Bridge **3-12**
Cisco Aironet Antennas and Accessories **3-14**

CHAPTER 4 **IP Telephony, Video, & Web Collaboration**

Campus IP Telephony, Video, & Web Collaboration at a Glance **4-1**
Cisco 7900 Series IP Phones **4-3**
Cisco CallManager 3.3 **4-4**
Cisco IP Contact Center (IPCC) Enterprise Edition **4-8**
Cisco IPCC Express Edition (Formerly IP ICD) **4-9**
Cisco IP IVR **4-10**
Cisco Unity—Unified Messaging and Voice Mail **4-11**
Cisco Personal Assistant **4-13**
Additional Cisco IP Telephony Applications **4-14**
- Cisco SRS Telephony **4-14**
- Cisco IP Phone Messenger **4-15**
- Cisco IP SoftPhone **4-15**
- Cisco IP Manager Assistant **4-15**
- Cisco Conference Connection **4-16**

Cisco MCS 7800 Series Media Convergence Servers **4-17**
- Cisco MCS 7815I-2000 **4-17**
- Cisco MCS 7825H-2266 **4-17**
- Cisco MCS 7835H-2400 and Cisco MCS 7835I-2400 **4-17**
- Cisco MCS 7845H-2400 and Cisco MCS 7845I-2400 **4-17**

Cisco ICS 7750 Integrated Communications System **4-18**
Cisco IAD 2400 Series Integrated Access Device with IOS Telephony Service (ITS) **4-21**
Cisco Voice Gateways **4-22**
- Cisco VG248 Voice Gateway **4-22**

Cisco IP/VC 3500 Series Videoconferencing Products **4-22**
Cisco IP/TV 3.4 **4-23**

Web Collaboration—Cisco Web Collaboration Option **4-24**
E-Mail Response Management—Cisco E-mail Manager **4-25**
Cisco Emergency Responder **4-25**
Cisco ATA Series of Analog Telephone Adaptors **4-27**

CHAPTER 5 **VPN and Security Products**

VPN and Security Products at a Glance **5-1**
Cisco PIX Firewall Series **5-2**
Cisco IOS Firewall **5-5**
Cisco VPN 3000 Family **5-6**
Cisco Intrusion Detection System Network Sensors **5-8**
Cisco Security Agent **5-10**
Cisco 7100 Series **5-11**
Cisco Secure Access Control Server for Windows **5-14**
Cisco Secure User Registration Tool **5-15**

CHAPTER 6 **Content Networking Products**

Content Networking Products at a Glance **6-1**
Content Networking Overview **6-2**
Cisco Content Engines **6-2**
Cisco CSS 11500 Series Content Services Switches **6-4**
Cisco LocalDirector **6-6**
Cisco Content Distribution Manager 4600 Series **6-7**
Cisco Content Router 4430 **6-9**
Cisco Content Switching Module **6-10**
Cisco SSL Module for Catalyst 6500 **6-11**
Cisco 11000 Series Secure Content Accelerator (SCA 11000) **6-12**
Cisco CTE-1400 Series Content Transformation Engine **6-13**
Cisco DistributedDirector **6-14**
Cisco GSS 4480 Global Site Selector **6-15**

CHAPTER 7 Broadband and Dial Access Products

Broadband and Dial Access Products at a Glance **7-1**
- Remote Dial Access—Data and Voice (VoIP) **7-1**
- Broadband Cable **7-1**
- DSL (Digital Subscriber Line) Access **7-2**
- ATM Multiservice WAN Switching **7-2**
- Long Reach Ethernet **7-3**

Memory Information for Access Routers **7-3**
Cisco AS5350 Universal Gateway **7-3**
Cisco AS5400 Series Universal Gateways **7-6**
Cisco AS5850 Universal Gateway **7-9**
Remote Dial Access Network Management Products **7-11**
- Universal Gateway Manager (UGM) **7-11**
- Cisco Universal Gateway Call Analyzer **7-11**
- Cisco Resource Policy Management System **7-12**

SS7 Signaling & Softswitch Products **7-12**
- Cisco SC2200 Signaling Controller **7-12**
- Cisco PGW 2200 Softswitch **7-12**
- Cisco BTS 10200 Softswitch **7-13**

Additional Remote Dial Access Products **7-13**
Cisco uBR7100 Series Universal Broadband Router **7-13**
Cisco uBR7246VXR Universal Broadband Router **7-15**
Cisco uBR10012 Universal Broadband Router **7-16**
Cisco RF Switch **7-17**
Broadband Cable—Customer Premise Equipment (CPE) **7-19**
- Cisco uBR900 Series Cable Access Routers **7-19**

Remote Cable Access—Network Management Products **7-20**
- Cisco Cable Manager **7-20**
- Cisco Cable Diagnostic Manager **7-20**
- Cisco Broadband Troubleshooter **7-20**
- Cisco Broadband Configurator **7-21**

DSL Remote Access—Customer Premise Equipment (CPE) **7-21**
Broadband Services Aggregation **7-21**
- Cisco 7200 Series **7-22**
- Cisco 7301 Series **7-22**
- Cisco 7400 Series **7-22**
- Cisco 10000 Series **7-22**
- Cisco 6400 Series **7-23**

ATM Multiservice WAN Switching **7-23**
Cisco BPX 8600 Series—Advanced ATM Multiservice Switches **7-23**
Cisco MGX 8850 ATM Multiservice Switch **7-24**
Cisco MGX 8830 ATM Multiservice Switch **7-25**
Cisco MGX 8200 Series **7-25**
- Cisco MGX 8230 Edge Concentrator **7-25**
- Cisco MGX 8250 Edge Concentrator **7-25**

Cisco IGX 8400 Series Multiservice WAN Switch **7-25**
Cisco Long Reach Ethernet Solution **7-26**
- Catalyst 2950 LRE Series Intelligent Ethernet Switches **7-26**
- Cisco 575 and 585 LRE CPE Devices **7-27**
- Cisco LRE 48 POTS Splitter **7-27**

Cisco Building Broadband Service Manager (BBSM) Version 5.2 **7-28**
Cisco BBSM Hotspot Server Version 1.0 **7-29**
Sample LRE Solution Overview—Broadband Internet Access for MxU **7-29**

CHAPTER 8 **Optical Transport**

Optical Transport Products at a Glance **8-1**
Sample Metro Optical Transport Solution Overview— Delivering Multiservices to the Edge **8-2**
Cisco ONS 15200 Optical Metro DWDM Series **8-3**
Cisco ONS 15302/15305 SDH Multiservice CPE & Aggregation Platforms **8-3**
Cisco ONS 15454 and 15327 Multiservice Provisioning Platforms **8-4**
Cisco ONS 15501 Erbium Doped Fiber Amplifier **8-5**
Cisco ONS 15530 **8-5**
Cisco ONS 15540 Extended Services Platform (ESPx) **8-6**
Cisco ONS 15600 Multiservice Switching Platform **8-7**
Cisco Transport Manager (CTM 4.x) (Element/Network Management) **8-8**

CHAPTER 9 **IOS Software & Network Management**

Cisco IOS® Software & Network Management Products at a Glance **9-1**
CiscoWorks for Windows **9-2**
Cisco IOS® Software **9-4**
Quality of Service (QoS) **9-4**
Converged LAN/WAN and Telephony Networks **9-5**
Security **9-5**
Cisco IOS NetFlow **9-6**
Cisco IOS Routing Services **9-6**
IP Routing Protocols **9-6**
Multi Protocol Label Switching (MPLS) **9-6**
IP Multicast and Multicast Solutions **9-8**
IPv6 **9-10**
Cisco IOS Software Release Process **9-10**
Cisco Network Management Overview **9-11**
Cisco Network Management Products **9-11**
CiscoWorks Small Network Management Solution **9-11**
CiscoWorks Small Network Management Solution Components **9-12**
CiscoWorks Routed WAN Management Solution **9-13**
CiscoWorks LAN Management Solution **9-14**
CiscoWorks VPN/Security Management Solution **9-16**
CiscoWorks IP Telephony Environment Monitor **9-18**
CiscoWorks Voice Manager for Voice Gateways **9-19**
CiscoWorks QoS Policy Manager **9-21**
Cisco Ethernet Subscriber Solution Engine **9-22**
CiscoWorks Wireless LAN Solution Engine **9-23**
CiscoWorks Hosting Solution Engine **9-24**
Cisco Catalyst 6500 Series Network Analysis Module 1 and 2(with NAM software version 2.2) **9-25**

Introduction

Cisco Products Quick Reference Guide (CPQRG)

CPQRG Background

The Cisco Products Quick Reference Guide (CPQRG) is a handy, compact reference tool that includes brief product overviews, key features, sample part numbers, and abbreviated technical specifications for many of Cisco's products. The CPQRG is primarily published to support Cisco partners, resellers, sales account teams, and even end-user customers who need a broad, high-level overview of Cisco products, but at that moment do not have access to Cisco's Web site, the Cisco Connection Online (CCO) at **http://www.cisco.com**.

Because this book is only published twice per year, there are likely to be new products, configurations, and part numbers not included in this edition. Note: For the most up-to-date and comprehensive information about Cisco products and solutions, please refer to our on-line information or consult a Cisco representative.

CPQRG Ordering Information

Additional printed copies of this book can be purchased on an as-needed basis or through an annual subscription. To order, see **http://shop.cisco.com/login**.

For questions regarding the CPQRG ordering process, please send an email to **companystore@external.cisco.com**.

For questions, comments or to download an Adobe PDF version of the CPQRG, go to **http://www.cisco.com/go/guide**.

How to Get More Complete Product Information

Cisco Product Catalog	For more comprehensive information on all of Cisco's products, please refer to the Cisco Product Catalog at: http://www.cisco.com/univercd/cc/td/doc/pcat/
Cisco Connection Online (CCO)	For even more complete product and solution information, please go to CCO at http://www.cisco.com. In addition to product, technology, and network solutions support, CCO provides a wealth of information including how to find an authorized representative or partner, how to order products, technical support/customer service, Cisco Corporate news and information, and links to training/events/seminars.

Cisco Systems Overview

Cisco Systems, Inc. is the worldwide leader in networking for the Internet. Cisco's Internet Protocol-based (IP) networking solutions are the foundation of the Internet and most corporate, education, and government networks around the world. Cisco provides the broadest line of solutions for transporting data, voice and video within buildings, across campuses, or around the world.

Today, the Internet and computer networking are an essential part of business, learning and personal communications and entertainment. Virtually all messages or transactions passing over the Internet are carried quickly and securely through Cisco equipment. Cisco solutions ensure that networks both public and private operate with maximum performance, security, and flexibility. In addition, Cisco solutions are the basis for most large, complex networks used by corporations, public institutions, telecommunication companies, and are found in a growing number of medium-sized commercial enterprises.

Cisco was founded in 1984 by a group of computer scientists from Stanford University. Since the company's inception, Cisco engineers have been prominent in advancing the development of IP- the basic language to communicate over the Internet and in private networks. The company's tradition of innovation continues today with Cisco creating leading products and key technologies that will make the Internet more useful and dynamic in the years ahead. These technologies include: advanced routing and switching, voice and video over IP, optical networking, wireless, storage networking, security, broadband, and content networking.

In addition to technology and product leadership, Cisco is recognized as an innovator in how business is conducted. The company has been a pioneer in using the Internet to provide customer support, sell products, offer training, and manage finances. Drawing upon the company's own Internet best practices and core-value of customer focus, Cisco has established the Internet Business Solutions Group (IBSG) dedicated to helping top business leaders transform their own businesses into e-businesses.

As a company, Cisco operates on core values of customer focus and corporate citizenship. The company's philanthropic efforts are committed to helping communities prosper while also encouraging Cisco employees to learn about the needs of the communities where Cisco operates. Also, to help bolster education around the world, the company has founded Cisco Networking Academies in 128 countries dedicated to teaching students to design, build, and maintain computer networks.

Cisco Channel Partner Program

Whether you provide services, solutions or a combination of both, Cisco is committed to your success. The Cisco Channel Partner Program can help partners create a sustainable business model in a fast-changing environment, where customers require value-added services, focused technical expertise, and higher levels of satisfaction. As a Cisco certified partner, you'll have the backing of the Cisco brand, and access to world-class products and service packages, technical support, productivity tools, online training, marketing resources and sales promotions.

The Partner Program integrates the technology focus of each Cisco Partner Specialization, flexible individual career certification requirements, customer satisfaction targets, and pre- and post-sales support capabilities. These elements make up the points-based structure of the overall program requirements. There are three partner certification levels: Gold Certification, Silver Certification, and Premier Certification.

The Partner Program requires every partner to specialize in technology areas as part of the program requirement. You may choose the technology area for Specialization, but must earn a minimum number of Specialization points to become certified. You may decide to be strictly a specialized partner or specialize your organization as a means to achieving certification. Either way, you'll have access to structured training roadmaps, free online technical and sales education and video-on-demand content to build your knowledge and skill level through the Partner E-Learning Connection **http://cisco.partnerelearning.com**

For More Information

See the Channel Partner Program Web Site:
http://www.cisco.com/go/channelprograms
If you are interested in reselling Cisco product without becoming certified or specialized, see **http://www.cisco.com/go/reseller**

Training Cisco University—Offers detailed course material on the latest technical topics throughout the year targeted for Resellers, Partners and Cisco Sales representatives. Also see the Partner E-Learning Connection.	http://www.cisco.com/go/ciscou http://cisco.partnerelearning.com

1. Additional CCO access required for most URLs.

Partner and Reseller Service and Support Offerings

Various partner and reseller service and support programs are available according to certification level and method of purchase from Cisco:

Method of Purchase	Service and Support Offerings
Direct from Cisco (only available to Partners with Direct contracts)	• *System Integrator Support*—System Integrator Support 98 (SIS98) program is designed for Silver and Gold partners who wish to provide their own brand of support to their end customers with back-end support from Cisco – SMARTspares provides partners using SIS98 the opportunity to leverage Cisco's logistics infrastructure to provide their customers with enhanced delivery services. • *Shared Support*—Currently only available in the US, Cisco's Shared Support program is designed for Silver and Gold partners who wish to provide their own brand of support to their end customers while leveraging Cisco's Technical Assistance Center (TAC) and logistics infrastructure • *Cisco Brand Resale*—Program allows partners to provide Cisco's services (SMARTnet, etc.) directly to their end customers
2-Tier (through a Distributor)	• *Packaged Services*—Partners and Resellers may purchase warranty extension, hardware replacement, installation and configuration, technical support, software upgrades, and online services. Several of these services have been bundled together to offer convenient service solutions for Cisco customers.

Packaged Resalable Service Products (only via Distributors/2-Tier):

Product	Description
Maintenance Services	
SMARTnet Maintenance	Provides customers with software maintenance, registered access to CCO, advance replacement of hardware, and technical support required for self-maintenance. SMARTnet maintenance has three delivery options: • SMARTnet 8x5xNBD (Next Business Day)—8 hours/day, 5 days/week, next-business-day hardware replacement • SMARTnet 8x5x4—8 hours/day, 5 days/week, 4-hour hardware replacement • SMARTnet 24x7x4—24 hours/day, 7 days/week, 4-hour hardware replacement Available through resellers and distributors.
SMARTnet Onsite	Provides all the benefits of SMARTnet maintenance, plus one of the following onsite hardware services for repairs: • SMARTnet Onsite 8x5xNBD—8 hours/day, 5 days/week, next-business-day response • SMARTnet Onsite 8x5x4—8 hours/day, 5 days/week, 4-hour response • SMARTnet Onsite 24x7x4—24 hours/day, 7 days/week, 4-hour response Packaged SMARTnet OnSite 24x7x4 provides SMARTnet OnSite 24x7x4 service in a shrink-wrapped package, allowing it to be effectively marketed through resellers.
Cisco Advance Replacement	Advance Replacement offers customers the flexibility to cover their equipment with an advance replacement service only. Cisco Advance Replacement comes with a full year of advance replacement coverage, guest access to the public portion of Cisco Connection Online (CCO), and a single technical support incident. This service is intended to be used by customers who need to supplement service offered by their reseller with a replacement option from Cisco.
Software Application Support plus Upgrades (SASU)	Software Application Support plus Upgrades provides customers with software upgrades and maintenance releases for Cisco Application Software, registered access to Cisco.com plus technical support, for one year. For when a customer needs investment protection on software purchases and/or access to the latest software while eliminating unexpected budget revisions.
Noncontract and Consulting Services	Cisco provides noncontract services at current time-and-materials rates. For more information contact Customer Services at 1-800-553-NETS or 1-415-326-1941.
Startup Services	
Total Implementation Services (TIS)	Cisco Total Implementation Solutions (TIS) is a portfolio of services that deliver the tools, expertise, and resources needed to install, configure, and implement Cisco equipment. TIS is intended to supplement services that resellers provide, either directly or indirectly, to their customers. Product Components: Installation, Configuration, and Implementation. For more information, see http://www.cisco.com/go/tis

For More Information

See the Partner and Reseller Support Services Web page at:
http://www.cisco.com/en/US/products/index.html (CCO login required)

Product Warranty Information

All Cisco hardware and software products are covered for a minimum of 90 days. Some products have a longer or more appropriate coverage, ranging from One-Year to Limited Lifetime warranties. Note that all Warranties are applicable to original owner only and support is subject to product end-of-life terms.

Warranty[1]	Entitlements Description
Cisco Standard 90-day Hardware Warranty, Software Warranty and License Agreement (78-5235-vvrr)	• Advance Replacement shipping within 10 business days from RMA date, within 90 days of original shipment from Cisco or from Cisco Reseller • 90-Day Assurance that the Media SW is delivered is defect-free and the SW conforms to its published specifications • Guest Access to Cisco Connection Online (CCO)
90-Day Limited Hardware Warranty(78-5236-vvrr)	• Advance Replacement shipping within 10 business days from RMA date, within 90 days of original shipment from Cisco or from Cisco Reseller • 90-Day Assurance that the Media SW is delivered is defect-free and the SW conforms to its published specifications • Guest Access to Cisco Connection Online (CCO)
One-Year Limited Hardware Warranty (78-10747-vvrr)	• Advance Replacement shipping within 10 business days from RMA date within One Year of original shipment from Cisco or from Cisco Reseller • 90-Day Assurance that the Media SW is delivered is defect-free and the SW conforms to its published specifications • Guest Access to Cisco Connection Online (CCO)
Limited Lifetime Hardware Warranty (78-6310-vvrr)	• Advance Replacement shipping within 10 business days from RMA date during supported life of the product, starting original ship date from Cisco or Cisco reseller. (fan and power supply warranty limited to 5 years from ship-date) • 90-Day Assurance that the Media SW is delivered is defect-free and the SW conforms to its published specifications • Guest Access to Cisco Connection Online (CCO)
End-User Software License Agreement and Software Warranty (78-3621-vvrr)	• 90-Day Assurance that the Media SW is delivered is defect-free and the SW conforms to its published specifications • End User License Agreement terms • Guest Access to Cisco Connection Online (CCO)
5-Years Limited Hardware and 1-Year Limited Software Warranty (78-13712-vvrr)	• Replacement shipping within 15 business days from RTF date within 5 years from the original ship date from Cisco or Cisco reseller • One-Year SW support includes availability of bug fixes and maintenance releases • Cisco TAC 24x7 support for P1/P2 cases for Five years • Guest Access to Cisco Connection Online (CCO)

1. "vv" and "rr" suffixes of the warranty document numbers represent the revision and version numbers respectively.

For More Information

See the Web site:
http://www.cisco.com/en/US/products/prod_warranties_listing.html

Cisco Capital Financing

Cisco Systems Capital offers a variety of financing and equipment leasing alternatives, both short term and long term, to customers and partners in the United States, Canada, Europe, Asia, Australia, and Latin America. Cisco Capital's financial solutions offer customers the ability to acquire new technologies or refresh existing equipment through flexible, easy-to-use programs.

For More Information

See the Cisco Systems Capital Web site: **http://www.cisco.com/go/CiscoCapital**
Within the United States, call 800 730-4090.

Cisco Authorized Refurbished Equipment (US and Canada Only)

Customers looking for used Cisco equipment can now be assured of the quality and support they come to expect from new Cisco products, through the Cisco Authorized Refurbished Equipment program. Cisco Authorized Refurbished Equipment gives customers a price competitive alternative to buying uncertified and unlicensed products off the secondary market. All equipment sold through this program is labeled "Refurbished by Cisco Systems," indicating that the product is Cisco tested, refurbished, authorized, and supported. The program is limited to certain countries, so interested customers should check with their local Cisco account manager of Cisco authorized reseller for availability.

Resellers: **http://www.cisco.com/go/refurb** (click on "Refurbished Products")

Cisco Services

Cisco Services offers a wide range of services and support to customers, partners and resellers. Through a suite of support services Cisco enables you to improve the overall efficiency of your network operations and network performance, while benefiting from the broad range of Cisco engineering knowledge and experience base, leading practices and innovative, web-based tools.

Cisco Advanced Services (AS) is a comprehensive suite of professional engineering support offerings of Cisco networking solutions delivering the highest levels of availability, quality of service, and security for your specific network needs to realize business return on investment through high performance networking and communications applications enablement. Cisco Technical Support Services (TSS) offer leading-edge services to improve customer productivity, protect customer investment, and maximize operational efficiency. Cisco TSS solutions provide access to highly skilled engineers with technical expertise on multiple disciplines of technology. In addition, Cisco TSS provides you with the online tools and resources, software support and hardware replacement options to address your challenges and provide rapid problem resolution. Key support tools and knowledge provide your staff with the ability to avoid problems, maximize network utility, and expedite problem resolution.

CHAPTER 1

Routers

Routers at a Glance

Product	Features	Page
Cisco IOS® Software	See the Chapter 9—Cisco IOS Software and Network Management for an overview of Cisco IOS Software	9-4
Cisco SOHO Series Secure Broadband Routers	Ethernet, ADSL, ADSL over ISDN, and G.SHDSL Routers for Small Office and Home Ofices • Integrated security of Cisco IOS Software with Stateful Inspection Firewall and software-based 3DES encryption • Easy setup and deployment using Cisco Router Web Set Up Tool (CRWS) • Offers many local and remote debug and troubleshooting features in Cisco IOS Software	1-8
Cisco 800 Series Router	Ethernet, ADSL, ADSL over ISDN, G.SHDSL, ISDN, and serial routers for small remote offices and teleworkers • 1-port Ethernet, 1-port ADSL, ADSL over ISDN or G.SHDSL or 1-port BRI (optional NT1), 1-port serial WAN • 4-port Ethernet hub or 10/100 swithch on most models and 2 analog telephone ports on ISDN models and 4 analog voice ports on 827-4V • Advanced security features including stateful inspection firewall and hardware assisted encryption (830 series) • Toll quality voice with VoIP (Cisco 827-4V) • Dial back up and out-of-band management (Cisco 830 series)	1-9
Cisco 1700 Series Router	Flexible, secure, modular access routers • 1-port autosensing 10/100 Fast Ethernet LAN • Modular slots support a wide variety of WAN and voice interface cards • Supports secure Internet, intranet, and extranet access as well as new WAN applications including VPNs, integrated voice/data (VoIP), and broadband services • VLAN Capability • Supports up to three Ethernet connections with 1FE and 2 ENET WICs	1-11
Cisco 2500 Series Router	Fixed-port configuration access servers • The Cisco AS2509-RJ/AS2511-RJ access/terminal servers provide Ethernet LAN connectivity and enable 8 or 16 (respectively) users/devices via async connections • Ideal for low-density analog telephone line dial access applications via external modems	1-14
Cisco 2600 Series Router	Modular multiservice router • Single or dual LAN (Ethernet, 10/100 Mbps Ethernet, Token Ring and mixed Ethernet options) • Wide variety of interface support, including integrated 16-port switching, high-density analog and digital, voice, Cisco IOS Firewall and VPN, async and sync serial, ISDN, Fractional and channelized T1/E1, Ethernet, analog modems, ADSL, G.SHDSL, switching integration, and ATM support • Shares WAN interface cards and network modules with Cisco 1700, 3600 and 3700 series • Cisco 2610XM, 2620XM, and 2650XM models offer the features of Cisco 2600 with more default memory, capacity, performance and FE support on all models.	1-16
Cisco 3600 Series Router	Modular multiservice high-density access router • 2-, 4-, and 6-slot models • Wide variety of media support including: high density analog and digital voice, Cisco IOS Firewall and VPN, integrated 16-port switching, ADSL, and G.SHDSL, async and sync serial, BRI and PRI ISDN, channelized T1/E1, Ethernet, Fast Ethernet, Token Ring, digital and analog modems, and ATM • Digital and analog voice/fax over IP or Frame Relay or ATM • The Cisco 3640 is no longer orderable. Customers are encouraged to migrate to the Cisco 3700 Series Routers. On an interim basis we have made available the Cisco 3640A as an alternative for customers with configurations not available on the Cisco 3700.	1-22

Product	Features	Page
Cisco 3700 Series Router	Modular multiservice high-density access router • Enable higher levels of application and service integration in enterprise branch offices in a small form factor – Supports integrated firewall, intrusion detection, and VPN capabilities and offloads processing to on-board Advanced Integration Module (AIM) – Combines flexible routing and low density switching in a single platform with new 16 and 36-port EtherSwitch module – Delivers internal in-line power for the EtherSwitch ports for a single platform Branch Office IP Telephony and Voice Gateway – Conserves WAN bandwidth with Content Engine module to combine intelligent caching, content routing and management – Higher performance enables scalable deployment of multiple, concurrent applications • Wide variety of interface support, including integrated 36 and 16-port switching, high-density analog and digital, voice, Cisco IOS Firewall/IDS and VPN, Fractional and channelized T1/E1 and DS-3, Ethernet, Gigabit Ethernet and ADSL. • Shares WAN interface cards and network modules with Cisco 1700, 2600/2600XM, and 3600 series	1-26
Cisco 7100 Series VPN Router	Large branch and central site VPN router, for a dedicated site-to-site VPN solution See Chapter 5—VPN and Security for information on the Cisco 7100 Series VPN Routers	5-11
Cisco 7200 Series Router	WAN-edge router providing intelligent services, modularity, high performance, investment protection, and scalability in a small form factor • Modular 3 RU Chassis • 4- or 6-slot models and choice of system processors for up to 1 Mpps performance • Wide variety of LAN and WAN options, including Ethernet, Fast Ethernet, Gigabit Ethernet, Token Ring, FDDI, serial, ISDN, HSSI, ATM, Packet over SONET, DPT/RPR	1-31
Cisco 7300 Series	Network Edge router with high performance IP services delivered at optical speeds for service providers and enterprise networks • Compact and modular 4 rack unit chassis—4 slots • High performance connectivity—T3 through OC48/STM16 with 3.5 Mpps performance • Built-in Gigabit Ethernet connectivity • Multiprotocol routing: IP, IPX, AppleTalk, DLSw • Compact size, high availability and optimal cooling	1-35
Cisco 7400 Series Router	Highest performance 1 rack unit router in the industry, with a stackable architecture that is designed for service provider and enterprise networks • One port adapter slot, two built-in 10/100/GE Ethernet ports, and a broad range of WAN media interfaces from DS0 to OC3 (40+ port adapters) common with Cisco 7x00-series port adapters • High-density broadband aggregation • Managed CPE for service provider demarcation point • Gigabit Ethernet to Gigabit Ethernet IP services applications platform	1-38
Cisco 7500 Series	High-end services-enabled core and WAN aggregation router for enterprise and service provider applications • 5-, 7-, and 13-slot models • 1-, 2-, or 4-bus models offering 1, 2, or 4 Gbps backplanes • Wide variety of LAN and WAN options including Ethernet, Fast Ethernet, Gigabit Ethernet, Token Ring, FDDI, serial, ISDN, HSSI, ATM, and Packet over SONET	1-40
Cisco 7600 Series	Service provider and high-end enterprise-class router delivering optical WAN and Metropolitan Area Network services with high-touch IP services at the network edge. • Consolidated LAN/WAN/MAN in a single platform • Scalable backplane bandwidth from 32 Gbps to 256 Gbps and performance from 15 Mpps to 30 Mpps • High-volume aggregation of Ethernet traffic (server farms) • Wide range of WAN/MAN interfaces from NxDS0, T1, T3 to OC-48 with line rate services • Ideal for Internet data center, metropolitan aggregation, WAN edge aggregation, and enterprise core applications • Also supports Catalyst 6000 series line cards	1-45
Cisco 10000 Series	Service provider-class edge services router • High-Performance IP, MPLS, and Broadband Services — The Cisco 10000 Series enables service providers to deploy revenue-generating services without worrying about performance degradation • Carrier-Class High Availability — With its carrier-class high availability, the Cisco 10000 Series minimizes costly network outages and maximizing end-customer satisfaction • Application Integration — The Cisco 10000 Series leverages service providers' current investments by enabling leased line and broadband aggregation features on a single platform • Application Flexibility — The Cisco 10000 Series has a broad range of channelized, clear channel, ATM and LAN interfaces. Physical interface speeds from E1/T1 up to OC-48c/STM-16c	1-47

Product	Features	Page
Cisco 10700 Series	Service provider-class metro edge services router • Optimized building block for the next generation metro Ethernet/IP access networks • Equipped with either (24) 10/100 or 4 GbE and 8 FE ports for customer access and OC-48c/STM-16c dynamic packet transport/resilient packet ring (DPT/RPR) technology or Packet Over SONET (POS) for metro optical connectivity • Powered by Cisco IOS 12.0S software and the parallel express forwarding (PXF) architecture • Cost-effective, reliable, high-performance platform supporting full suite of IP/MPLS features and services found in Cisco Internet Routers • With DPT/RPR architecture, enables optimal fiber connectivity as well as features such as IP class of service, VoIP, L2 VPN (EoMPLS and L2TPv3) and L3 VPN (MPLS) services	1-49
Cisco 12000 Series	Premier high-end routing portfolio for service provider backbone and high-speed edge applications. With its unique, modular distributed system architecture, the Cisco 12000 Series Router, is the industry choice for building Carrier IP/MPLS networks with its portfolio of 10Gbps systems and interfaces: • Seven chassis options that fit your scaling and real estate requirements offering the only complete solution for small to large POPs; backbone or edge. • The only platforms supporting backbone—or edge-optimized line cards in the same chassis, maximize the value of line-rate edge applications with 10G uplinks, and sustained line-rate performance as they scale to maximum capacity. • Proven investment protection with simple, field upgrades to higher switching capacities. • The only complete priority packet delivery solution set—the industry's only IP QoS implementation that uniquely enables premium real time IP services such as VoIP and video. • Extensive portfolio of line cards offering leading edge technologies (POS, ATM, DPT/RPR, GbE/FE), support a wide range of networking speeds (from DS1 to OC-192c/STM-64c). • The industry's only high-end router proven (via independent lab testing) to maintain customer connections and network traffic with zero packet loss despite a route processor failure.	1-51
Cisco SN 5400 Series Storage Router	Enables direct access to storage systems anywhere on an IP network. Enables SCSI over IP (iSCSI); the first storage implementation based on IP standards. • Cisco SN 5428: Migrates DAS (Direct Attached Storage) environments to SAN (Storage Area Networks) for small / medium businesses and enterprise workgroups. This is a full function Fibre Channel switch that adds iSCSI, providing very low price per port networked storage configurations.	1-55

Cisco SOHO Series Ethernet, ADSL over ISDN, ADSL and G.SHDSL Routers

The Cisco SOHOseries provides an affordable, secure, multi-user access solution to small office/home office (SOHO) customers while reducing deployment and operational costs for service providers. Through the power of Cisco IOS software technology, the Cisco SOHO 91 Ethernet to Ethernet Router, the SOHO 96 ADSL over ISDN, the SOHO 97 ADSL and SOHO 78 G.SHDSL routers provide superior manageability and reliability.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco SOHO 91	• Ethernet WAN port for use with an external DSL or cable modem with 4-port 10/100 switch, stateful firewall and software based encryption
Cisco SOHO 96	• ADSL modem for use of ADSL over ISDN with 4-port 10/100 switch, stateful firewall and software based encryption
Cisco SOHO 97	• ADSL modem for ADSL over POTS with 4-port 10/100 switch, stateful firewall and software based encryption
Cisco SOHO 78	• 4-port Ethernet Hub and 1 G.SHDSL port with firewall security and Cisco IOS manageability and reliability

Key Features

- Integrated security of Cisco IOS Software with Stateful Inspection Firewall and software-based 3DES encryption (no encryption on the SOHO 78)
- Easy setup and deployment using Cisco Router Web Set Up Tool (CRWS)
- Offers many local and remote debug and troubleshooting features in Cisco IOS Software

Competitive Products

- 3Com: OfficeConnect 810
- Alcatel: Speed Touch Pro Router
- Cayman: 3220H
- Efficient: 5861, 5660
- Lucent: CellPipe 50A
- Netopia: R6100, 4533
- Westel: Wirespeed 36R566
- Zyxel: 641, 782
- Nokia: MW1352
- Linksys: Etherfast models

Cisco 800 Series

The Cisco 800 series router provides enhanced network security and proven reliability through Cisco IOS software, for small offices and telecommuters. It connects users to the Internet or to a corporate LAN via one ADSL, ADSL over ISDN, G.SHDSL, IDSL, ISDN, or serial connection (up to 512 Kbps), or with an Ethernet WAN port connected to an external broadband modem.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 800 Series	• Companies who Cisco IOS-based networks who want to add telecommuters • Service providers who offer value-added services to small offices • VARs who are familiar with Cisco IOS software and want to profitably service small office customers • Ethernet LAN ports and variety of WAN connectivity, including: ISDN BRI, Frame Relay, ADSL, G.SHDSL, async dialup (see Specifications for details)

Key Features

- Fixed configuration support for several types of WAN connections
- Standard security with ACLs, PAT/NAT, PAP/CHAP, MS-CHAP, Lock and Key, and Generic Routing Encapsulation (GRE) tunneling
- Enhanced security with stateful inspection firewall, IPSec encryption (hardware based on Cisco 830s and AES encryption on Cisco 830s)
- Toll quality voice with VoIP on Cisco 827-4V
- Integrated 4-port 10/100 Ethernet Switch on Cisco 830 series
- Bandwidth optimization features such as compression, Bandwidth-on-Demand, Dial-on-Demand, Always-On-Dynamic-ISDN (AODI), and X.25 over D channel (Cisco 801- 804)
- Support for CAPI applications in the European market

Competitive Products

- 3Com: Office Connect Remote 511/521
- Alcatel: Speed Touch Pro Routers
- Ascend: Pipeline 75/85

Cisco 1700 Series

The Cisco 1700 series modular access routers are designed to provide a cost-effective integrated access platform for small and medium-sized businesses and enterprise small branch offices. These Cisco IOS-based routers deliver high-speed network access, comprehensive security features, and multiservice data/voice/video/fax integration to meet the most demanding business requirements. Within the Cisco 1700 series, Cisco 1710 security access routers work with existing broadband modems to provide advanced routing and security functionality, Cisco 1721 modular access routers provide flexible, high-performance data access, and Cisco 1751 and Cisco 1760 modular access routers are optimized for both voice and data traffic, providing a simple and cost-effective path to multi-service networking—today or in the future.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 1710	• Advanced routing and security functionality in one device when connecting to the Internet using a broadband modem • Hardware-assisted 3DES VPN encryption at full T1/E1 speeds
Cisco 1721	• Secure data-only access solution that adapts to customers' evolving network requirements • Support for data applications including VPNs and broadband access services • A broad array of WAN services supported, including Frame Relay, leased line, ADSL, G.SHDSL, ISDN BRI, X.25, SMDS and more • IPSec 3DES VPN encryption at full T1/E1 speeds • IEEE 802.1Q VLAN Support
Cisco 1751	All the above, plus: • Analog and digital voice support in a desk-top form factor • 3 modular slots for WAN and Voice interface cards
Cisco 1760	All the above, plus: • 19" rackmount form factor • 4 slots with 2 WIC/VIC and 2 VIC slots • Multiservice analog and digital voice support • Highest performance multi-service router in the Cisco 1700 family • Higher density analog and digital voice support than Cisco 1751

Key Features

- Support for up to 4 serial interfaces or 2 ISDN BRI; 1 autosensing 10/100 Mbps Fast Ethernet LAN connection; 1 auxiliary (AUX) port for dial-up management or low-speed asynchronous connections (up to 112.5 kbps)
- Flexibility—Cisco 1700 Series supports a diverse set of WAN and Voice Interface Cards that are shared with the 1600 (WAN only), 2600/2600XM, and 3600 series routers enabling field upgradeability to evolve with the needs of growing businesses
- Integrated Device—Cisco 1700 series combines WAN routing, VPN and multiservice access in a single device
- Expansion Slot—Supports optional hardware VPN module for wire-speed IPSec 3DES encryption and can enable future technologies (VPN Module standard on Cisco 1710)
- Integrated Security—The 1700 series supports context-based access control for dynamic firewall filtering, denial-of-service detection and prevention, Java blocking, real-time alerts, Intrusion Detection System (IDS), and encryption.
- IEEE 802.1Q VLAN Support

Cisco 2500 Series

The Cisco 2500 series router has served for years as the most deployed and popular branch office router in the world, and provides low cost routing functionality for data-only applications (no voice support). There are currently two access servers to choose from, 8 or 16 asynchronous ports, each with 1 Ethernet port, for aggregating multiple network elements to provide a single Telnet access point (telemetry application)—or for attaching 8 to 16 external analog or digital modems in environments where T1/E1 digital circuits are not available, but multiple dial-up telephone lines can be leveraged for low cost remote access.

For higher performance requirements, where a wider variety of WAN/LAN interfaces are needed, as well as voice support, refer to Cisco 2600/2600XM/3600 or 1700 series routers.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco AS2509-RJ and AS2511-RJ	• Data-only network requirement • An access server combining a terminal server, protocol translator, console port aggregator, and a router in a single device • One Ethernet LAN and dual serial ports • 8 or 16 asynchronous serial ports with RJ-11 jacks, ideal for attaching 8 to 16 external modems

Key Features

- Proven technology with a full suite of Cisco IOS Software
- Setup with Cisco ConfigMaker, a free tool for configuring a network of routers
- With CiscoWorks for Windows, allows remote management and maintenance from a central location

Specifications

Feature	Cisco AS2509-RJ	Cisco AS2511-RJ
Throughput Performance (pps)	3-5 Kpps (depending on configuration)	3-5 Kpps (depending on configuration)
Memory	8-MB dual Flash bank option (default) 16 MB (max) 16 MB DRAM (default)	Same as Cisco AS2509-RJ
Power Supply	AC, with optional DC or redundant power supply	Same as Cisco AS2509-RJ
Fixed LAN Ports	1-port Ethernet	1-port Ethernet
Fixed WAN Ports	1-port sync serial 8-port async	1-port sync serial 16-port async
Dimensions (H x W x D)	1.75 x 17.5 x 10.56 in.	1.75 x 17.5 x 10.56 in.

Cisco IOS Software and Memory Requirements

To run the Cisco IOS software Feature Packs, you need the amount of memory shown in the following table:

Distribution Part Number	Feature Pack Description	IOS Image Release	Flash Memory Required[2]	DRAM Memory Required
CD25-C-12.0=	IP only	12.0(10) 12.0(7)T	8 MB 8 MB	4 MB 6 MB
CD25-CP-12.0=	IP Plus	12.0(10) 12.0(7)T	8 MB 16 MB	6 MB 8 MB
CD25-CHL-12.0=	IP/FW Plus IPSEC 56	12.0(10) 12.0(7)T	16 MB 16 MB	8 MB 10 MB
CD25-B-12.0=	IP/IPX/AT/DEC	12.0(10) 12.0(7)T	8 MB 16 MB	6 MB 6 MB
CD25-BP-12.0=	IP/IPX/AT/DEC Plus	12.0(10) 12.0(7)T	16 MB 16 MB	6 MB 8 MB
CD25-AP-12.0=	Enterprise Plus	12.0(10) 12.0(7)T	16 MB 16 MB	6 MB 10 MB

1. For users with CCO access, search by IOS feature or release via the *Feature Navigator* at http://www.cisco.com/go/fn
2. Bold numbers indicate that more memory than the default amount is needed to run the Feature Pack.

Selected Part Numbers and Ordering Information[1]

Cisco 2500 Series Access Router Chassis	
CISCO2509-CH	1-port Ethernet AUI, 2-port Serial, 8-port Async Serial, IP s/q
AS2509-RJ-CH	1-port Ethernet AUI (RJ-45), 1-port Serial, 8-port Async Serial, IP s/w
CISCO2511-CH	1-port Ethernet AUI, 2-port Serial, 16-port Async Serial, IP s/w
AS2511-RJ-CH	1-port Ethernet AUI (RJ-45), 1-port Serial, 16-port Async Serial, IP s/w
Cisco 2500 Series Memory Options	
MEM-1X4F=	Cisco 2500 Series, 4 MB Flash Upgrade
MEM-1X8F=	Cisco 2500 Series, 8 MB Flash Upgrade
MEM-1X8D=	Cisco 2500 Series, 8 MB DRAM Upgrade
MEM-1X16D=	Cisco 2500 Series, 16 MB DRAM Upgrade
Cisco 2500 Series Accessories	
ACS-2500RM-19=	Cisco 2500 Series, Rack-Mount Kit, 19 Inches
ACS-2500RM-24=	Cisco 2500 Series, Rack-Mount Kit, 24 Inches
ACS-2500ASYN=	Cisco 2500 AUX/Console Part Cable Kit
ACS-2500RPS=	Cisco 2500 Series, RPS Field Upgrade
Cisco 2500 Series Basic Maintenance	
CON-SNT-PKG4	Packaged SMARTnet (8 x 5 x NBD) for the Cisco AS2509 and AS2511

Cisco 2600 Series

The Cisco 2600 series is an award-winning family of modular multiservice access routers, providing flexible LAN and WAN configurations, multiple security options, voice/data integration, and a range of high performance processors. This range of features make the Cisco 2600 series the ideal branch-office router for today's and tomorrow's customer requirements.

The Cisco 2600 series family of modular routers include the Cisco 2600XM models, the Cisco 2691 and the Cisco 2612 token ring router. These new models deliver extended performance, higher density, enhanced security performance and increased concurrent application support to meet the growing demands of branch offices.

The Cisco 2600XM models are based on the classic Cisco 2600 platform architecture, and extend the performance by as much as 33%. They also increase default platform memory and provide increases in memory capacity at the same price as their Cisco 2600 predecessor.

The highest performing router in the Cisco 2600 family that extends the density of emerging branch office applications, is the Cisco 2691 offering almost twice the performance of the Cisco 2650XM platform while leveraging the same modules from other Cisco 2600, Cisco 3600 and Cisco 3700 Series routers. Compared to the Cisco 2600XM models, the new Cisco 2691 is designed to offer a higher degree of versatility, providing greater throughput for higher density WAN applications, support for high speed interfaces and increased performance to handle new services.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 2691	• Enterprises wanting a higher level of performance for a broadened range of concurrent remote office applications, including unparalleled voice/data integration, Virtual Private Network (VPN) performance, increased bandwidth to support voice and video applications, and the delivery of Web-based applications.
Cisco 2600XM Series	• Enterprises considering the Cisco 2600 for branch office applications should now regard the Cisco 2600XM as the preferential platform for delivering high performing, flexible solutions to branch and remote offices. • High Performance 10/100 Dual Ethernet Router with 3 WIC Slots, 1 NM
Cisco 2651XM	• High performance Dual 10/100 Modular Router with Cisco IOS IP
Cisco 2650XM	• High performance 10/100 Modular Router with Cisco IOS IP
Cisco 2621XM	• Mid Performance Dual 10/100 Ethernet Router with Cisco IOS IP
Cisco 2620XM	• Mid Performance 10/100 Ethernet Router with Cisco IOS IP
Cisco 2611XM	• Dual 10/100 Ethernet Router with Cisco IOS IP
Cisco 2610XM	• 10/100 Ethernet Router with Cisco IOS IP
Cisco 2612	• One Token Ring port and one Ethernet port for mixed LANs and migrating from Token Ring to Ethernet

Key Features

- Integration/manageability—Lowers cost of ownership and improves ease of remote management, providing integrated "branch-in-a-box" networking that combines CSU/DSUs, multiplexors, modems, voice/data gateways, ISDN NT1s, firewalls, VPNs, encryption, and compression devices
- Multiservice voice/data networks—Reduces phone/fax costs between offices; using Cisco IOS software QoS features (such as RSVP, WFQ, CAR, and RED), voice/fax traffic is digitized and encapsulated in Frame Relay or IP packets and consolidated with data traffic

- Enterprise/Provider class solution—Meets the requirements of multiservice enterprises and their managed service CPE providers with high reliability features, multiple WAN connections, and the ability to migrate from data- only to TDM voice and data to packetized voice and data infrastructure
- High-density analog/fax network modules provide the ability to directly connect PSTN and legacy telephony equipment to existing Cisco 2600 and 3600 routers
- An EtherSwitch network module for the Cisco 2600/3600 series with 16 ports of 10/100 Ethernet and one optional 1000BaseT (Gigabit Ethernet) connection, providing a fully integrated Layer 2 (L2) switch with the capability to support both Line Power to Cisco IP phones and current Aironet 802.11 wireless base stations (with the addition of an external power supply). This provides a single box solution for branch offices deploying converged IP telephony, extending data, voice and video by delivering IP routing, Ethernet switching, fixed wireless solutions and voice gateway capabilities
- A wide range of Virtual Private Network modules (VPN) optimize the Cisco 2600 Series platforms for virtual private networks (VPNs) and delivers a rich integrated package of routing, firewall, intrusion-detection, and VPN functions
- The introduction of the WIC-ADSL and WIC-1SHDSL, offers business-class broadband service with scalable performance, flexibility, and security for branch and regional offices
- Content Networking Integration and Branch-Office Routing with router-integrated content-delivery system that combines intelligent caching, content routing and management with robust branch-office routing, WAN bandwidth for branch IP services such as voice over IP (VoIP)

Cisco IOS Software and Memory Requirements[1]

Most Cisco IOS software CD feature packs for the Cisco 2600 series include several selected Cisco IOS releases. To run the latest Cisco IOS Software Feature Packs with version 12.0(7)XK, you need, at a minimum, the amount of memory shown in the following table. Some configurations will require more than the recommended minimum.

Distribution Part Number	Feature Pack Description	IOS Image Release	Flash Memory Required	DRAM Memory Required
Cisco 2612				
CD26-C-12.0.7=	IP only	12.0(7)XK1	8 MB	24 MB
CD26-CP-12.0.7=	IP Plus	12.0(7)XK1	8 MB	40 MB
CD26-CH-12.0.7=	IP/Firewall	12.0(7)XK1	8 MB	32 MB
CD26-CHL-12.0.7=	IP/Firewall Plus IPSec 56	12.0(7)XK1	16 MB	48 MB
CD26-CHK2-12.0.7=	IP/Firewall Plus IPSec 3DES	12.0(7)XK1	16 MB	48 MB
CD26-CK2-12.0.7=	IP Plus IPSec 3DES	12.0(7)XK1	16 MB	40 MB
CD26-CL-12.0.7=	IP Plus IPSec 56	12.0(7)XK1	16 MB	40 MB
CD26-B-12.0.7=	IP/IPX/AT/DEC	12.0(7)XK1	8 MB	32 MB
CD26-BP-12.0.7=	IP/IPX/AT/DEC Plus	12.0(7)XK1	16 MB	40 MB
CD26-BHP-12.0.7=	IP/IPX/AT/DEC/Firewall Plus	12.0(7)XK1	16 MB	48 MB

CISCO2691	High Performance 10/100 Dual Eth Router w/3 WIC Slots,1 NM
CISCO2612	1-port 10BASE-T, 1-port TR, 1 network module slot, 1 AIM slot, 2 WIC slots, IP s/w
CISCO2612-DC	1-port 10BASE-T, 1-port TR, 1 network module slot, 1 AIM slot, 2 WIC slots, DC Power Supply, IP s/w
CISCO2612-RPS	1-port 10BASE-T, 1-port TR, 1 network module slot, 1 AIM slot, 2 WIC slots, RPS adapter, IP s/w
Cisco 2600 Series Voice Gateway Bundles	
CISCO2651XM-V	CISCO2651XM, AIM-VOICE-30, IOS IP Plus, 96D/32F
CISCO2651XM-V-SRST	CISCO2651XM, FL-SRST-MEDIUM, AIM-VOICE-30, IOS IP Plus, 96D/32F

Cisco 2600 Series VPN Bundles

CVPN2600FIPS/KIT=	KIT (Instructions, labels) to configured 2600 for FIPS
C2651XM-2FE/VPN/K9	2651XM/VPN Bundle, AIM-VPN/EP/2FE/IDS FW/IPSec 3 DES, 96DRAM
C2621XM-2FE/VPN/K9	2621XM/VPN Bundle, AIM-VPN/EP/2FE/IOS FW/IPSec 3 DES, 96DRAM
C2611XM-2FE/VPN/K9	2611XM/VPN Bundle, AIM-VPN/EP/2FE/IOS FW/IPSec 3 DES, 96DRAM
C2691-VPN/K9	2691 VPN Bundle,AIM-VPN/EPII, Plus IOS/FW/IPSEC3DES

Cisco 2600 Series DSL Bundles

CISCO2651XM-ADSL	2651XM-ADSL Bundle, WIC-1ADSL, 2FE, IP Plus, 32F/96DRAM
CISCO2621XM-ADSL	2621XM-ADSL Bundle, WIC-1ADSL, 2FE, IP Plus, 32F/96DRAM
CISCO2611XM-ADSL	2611XM-ADSL Bundle, WIC-1ADSL, 2FE, IP Plus, 32F/96DRAM
CISCO2651XM-SHDSL	2651XM-SHDSL Bundle, WIC-1SHDSL, 2FE, IP Plus, 32F/96DRAM
CISCO2621XM-SHDSL	2621XM-SHDSL Bundle, WIC-1SHDSL, 2FE, IP Plus, 32F/96DRAM
CISCO2611XM-SHDSL	2611XM-SHDSL Bundle, WIC-1SHDSL, 2FE, IP Plus, 32F/96DRAM

Cisco 2600/2600XM Series LAN Modules

NM-1E=	1-port 10BASE-T network module
NM-4E=	4-port 10BASE-T network module

Cisco 2600/2600XM and 3600 Series WAN Interface Cards (WICs)

WIC-1B-S/T=	1-port BRI (S/T) WAN Interface Card (Dial and Leased Line)
WIC-1B-U-V2	1-port BRI (U) w/NT-1 WAN Interface Card (Dial and Leased Line)
WIC-1DSU-56K4=	1-port Serial W/ 4-Wire 56/64Kbps DSU/CSU WAN Interface Card
WIC-1DSU-T1=	1-port Serial w/ FrT1/T1 DSU/CSU WAN Interface Card
WIC-1T=	1-port Serial WAN Interface Card
WIC-2T=	2-port Serial WAN Interface Card
WIC-2A/S=	2-port Async/Sync Serial WAN Interface Card
WIC-1ADSL=	1-port ADSL WAN Interface Card
WIC-1SHDSL=	1-port G.SHDSL WAN Interface Card
WIC-1AM=	1-port Analog Modem WAN Interface Card
WIC-2AM=	2-port Analog Modem WAN Interface Card

Cisco 2600/2600XM and 3600 Series Multiflex Voice and WAN Interface Cards[2]

VWIC-1MFT-T1=	1-port RJ-48 Multiflex TrunkT1
VWIC-2MFT-T1=	2-port RJ-48 Multiflex Trunk—T1
VWIC-2MFT-T1-DI=	2-port RJ-48 Multiflex Trunk—T1 With Drop and Insert
VWIC-1MFT-E1=	1-port RJ-48 Multiflex Trunk—E1
VWIC-1MFT-G703=	1-port RJ-48 Multiflex Trunk-G.703
VWIC-2MFT-E1=	2-port RJ-48 Multiflex Trunk—E1
VWIC-2MFT-G703=	2-port RJ-48 Multiflex Trunk-G.703
VWIC-2MFT-E1-DI=	2-port RJ-48 Multiflex Trunk—E1 With Drop and Insert

Cisco 2600/2600XM and 3600 Series Voice/Fax Network Modules and Expansion Modules

NM-1V=	1-slot voice/fax network module
NM-2V=	2-slot voice/fax network module
NM-HDV-1T1-24=	1-port T1 24 channel voice/fax network module
NM-HDV-1T1-24E=	1-port T1 24 enhanced channel voice/fax network module
NM-HDV-2T1-48=	2-port T1 48 channel voice/fax network module
NM-CE-BP-20G-K9=	Content Engine NM-Basic Perf-20GB
NM-CE-BP-40G-K9=	Content Engine NM-Basic Perf-40GB
NM-CE-BP-SCSI-K9=	Content Engine NM-Basic Perf-SCSI Adapter
NM-HDV-1E1-30=	1-port E1 30 channel voice/fax network module
NM-HDV-1E1-30E=	1-port E1 30 enhanced channel voice/fax network module
NM-HDV-2E1-60=	2-port E1 60 channel voice/fax network module
NM-HDV=	High density voice network module, spare (no T1/E1 or DSPs)
NM-HDA-4FXS=	High density analog voice/fax network module with 4 FXS
EM-HDA-8FXS=	8-port FXS voice/fax expansion module
EM-HDA-4FXO=	4-port FXO voice/fax expansion module
DSP-HDA-16	16-channel DSP module for NM-HDA

Cisco 2600/2600XM and 3600 Series ATM Modules

NM-4T1-IMA=	4-port T1 ATM network module with IMA
NM-4E1-IMA=	4-port E1 ATM network module with IMA
NM-8T1-IMA=	8-port T1 ATM network module with IMA
NM-8E1-IMA=	8-port E1 ATM network module with IMA

Cisco 2600/2600XM and 3600 Series EtherSwitch Modules

NM-16ESW=	Sixteen 10BaseT/100BaseTX autosensing ports EtherSwitch
NM-16ESW-PWR=	Sixteen 10BaseT/100BaseTX autosensing ports EtherSwitch with power daughter card

Cisco 2600/2600XM and 3600 Series High-Density Voice/Fax DSP Upgrade Modules

PVDM-12=	12-channel Packet Voice/Fax DSP Module

Cisco 3600 Series

The Cisco 3600 Series is a family of modular, high-performance multiservice access routers for medium and large-sized branch offices and Internet service providers. With over 100 modular interface options (shares modular interfaces with the 2600/2600XM series), the Cisco 3600 Series provides solutions for voice/data integration, virtual private networks (VPNs), dial access, and multiprotocol data routing. Using Cisco's digital and analog voice/fax network modules, the Cisco 3600 Series allows customers to consolidate voice, fax, and data traffic on a single network. Its architecture protects customers' investment in network technology and integrates the functions of several devices into a single, manageable solution. Cisco 3600 VPN and Dial Bundles are also available to also address specific VPN/security, and dial-up remote access server requirements. Customers are encouraged to migrate to the Cisco 3700 Series.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 3620	• Medium-density WAN and dialup connectivity • Medium-density LAN connectivity • Low-density Voice over Data • Low-density ATM connections • Mid-density modem-over-PRI bundles
Cisco 3640A	• High-density WAN and dialup connectivity • Medium- to high-density LAN connectivity • Mid-density Voice over Data • Low- to mid-density ATM connections • Low-density modem-over-BRI bundles • Configurations not available on the Cisco 3700
Cisco 3660	• Very high-density WAN and dialup connectivity • High-density LAN connectivity • Mid-density Voice over Data • Mid-density ATM connections • Mid- to high-density modem-over-PRI and BRI connectivity

Key Features

- Combines dial access, advanced LAN-to-LAN routing services, ATM connectivity, and multiservice integration of voice, video, and data in a single platform
- Modular, scalable design provides performance, scalability, flexibility, and investment protection
- High-density ISDN PRI capabilities
- Preconfigured BRI and PRI modem bundles available
- Support for modem-over-BRI functionality
- Integrated Cisco IOS software (base price includes IP IOS software)
- Full VPN and Firewall support
- ADSL and G.SHDSL support
- ISDN Modem backup

Specifications

Feature	Cisco 3620	Cisco 3640	Cisco 3660
Fixed Ports	None	None	1 or 2 10/100 Fast Ethernet
Network Module Slots	2	4	6
Advanced Integration Module (AIM) Slots	None	None	2
LAN/Combo Modules	See Part Numbers and Ordering Information	Same as Cisco 3620	Same as Cisco 3620
WAN Modules	See Part Numbers and Ordering Information	Same as Cisco 3620	Same as Cisco 3620 (Hardware compression support only through AIM-COMPR4)
ATM Modules	See Part Numbers and Ordering Information	Same as Cisco 3620	Same as Cisco 3620
Voice/Fax Network Modules	See Part Numbers and Ordering Information	Same as Cisco 3620	Same as Cisco 3620
WAN Interface Card (WIC) Modules	See Part Numbers and Ordering Information	Same as Cisco 3620	Same as Cisco 3620
Multiflex Voice/WAN Interface Cards	See Part Numbers and Ordering Information	Same as Cisco 3620	Same as Cisco 3620
Voice Interface Card (VIC) Modules	See Part Numbers and Ordering Information	Same as Cisco 3620	Same as Cisco 3620
Modem Modules	See Part Numbers and Ordering Information	Same as Cisco 3620	Same as Cisco 3620
Performance	40 kpps	50-70 kpps	100-120 kpps
Flash Memory	8 MB (default); 32 MB (max)	Same as Cisco 3620	8 MB (default); 64 MB (max)
DRAM Memory	32 MB (default) 64 MB (max)	32 MB (default) 128 MB (max)	32 MB SDRAM (default) 256 MB SDRAM (max)
Power Supply	AC, DC optional	AC, DC optional	Single or dual AC/DC
Dimensions (HxWxD)	1.75 x 17.5 x 13.5 in.	3.44 x 17.5 x 15 in.	8.7 x 17.5 x 11.8 in.

Cisco IOS Software and Memory Requirements[1]

To run the Cisco IOS Feature Packs, you need the following amount of memory:

Distribution Part Number	Feature Pack Description	IOS Image Release	Flash Memory Required[2]	DRAM Memory Required
Cisco 3620 and 3640				
CD36-C-12.0.7=	IP only	12.0(7)XK	8 MB	32 MB
CD36-CP-12.0.7=	IP Plus	12.0(7)XK	16 MB	48 MB
CD36-CH-12.0.7=	IP/FW	12.0(7)XK	8 MB	32 MB
CD36-CHL-12.0.7=	IP/FW Plus IPSec 56	12.0(7)XK	16 MB	64 MB
CD36-CHK2-12.0.7=	IP/FW Plus IPSec 3DES	12.0(7)XK	16 MB	64 MB
CD36-CK2-12.0.7=	IP/ Plus IPSec 3DES	12.0(7)XK	16 MB	48 MB
CD36-CL-12.0.7=	IP Plus IPSec 56	12.0(7)XK	16 MB	48 MB
CD36-B-12.0.7=	IP/IPX/AppleTalk/DECnet	12.0(7)XK	8 MB	32 MB
CD36-BP-12.0.7=	IP/IPX/AppleTalk/DECnet Plus	12.0(7)XK	16 MB	48 MB
CD36-BHP-12.0.7=	IP/IPX/AT/DEC/FW Plus	12.0(7)XK	16 MB	64 MB
CD36-AP-12.0.7=	Enterprise Plus	12.0(7)XK	16 MB	64 MB

1. For the complete list of IOS Feature Sets, refer to the parts list, via the URL listed under "For More Information". For users with CCO access, search by IOS feature or release via the *Feature Navigator* at http://www.cisco.com/go/fn
2. Bold numbers indicate that more memory than the default amount is needed to run the Feature Pack.

Selected Part Numbers and Ordering Information[1]

Cisco 3600 Series Router Chassis

CISCO3620	2-slot Modular Router-AC Power Supply, IP s/w
CISCO3620-DC	2-slot Modular Router-DC Power Supply, IP s/w
CISCO3620-RPS	2-slot Modular Router, w/ RPS, IP s/w
CISCO3640	4-slot Modular Router-AC Power Supply, IP s/w
CISCO3640-DC	4-slot Modular Router-DC Power Supply, IP s/w
CISCO3640-RPS	4-slot Modular Router, w/ RPS, IP s/w
CISCO3661-DC	10/100 E Cisco 3660 6-slot Modular Router-DC with IP SW
CISCO3661-AC	10/100 E Cisco 3660 6-slot Modular Router-AC with IP SW
CISCO3662-DC	Dual 10/100 E Cisco 3660 6-slot Modular Router-DC with IP SW
CISCO3662-AC	Dual 10/100 E Cisco 3660 6-slot Modular Router-AC with IP SW

Cisco 3600 Series Bundles

3640MBUNDLE-4B-S/T	3640 BRI Dial bundle. Includes 1E2W,12DM, 4 BRI-S/T, IP IOS
3640MBUNDLE-4B-U	3640 BRI Dial bundle. Includes 1E2W,12DM, 4 BRI-U, IP IOS
3640MBUNDLE-8B-S/T	3640 BRI Dial bundle. Includes 1E2W,18DM, 8 BRI-S/T, IP IOS
3640MBUNDLE-8B-U	3640 BRI Dial bundle. Includes 1E2W,18DM, 8 BRI-U, IP IOS
3620MBUNDLE-24DM	3620 PRI Dial bundle. Includes 1FE2CT1-CSU, 24DM, IP IOS
AS3640-T1-48DM	3600 Access Concentrator, 48 MICA Modems, 2 PRI/T1, Ethernet, IP IOS
AS3640-E1-60DM	3600 Access Concentrator, 60 MICA Modems, Ethernet, IP IOS, no PRI

Cisco 2600/2600XM and 3600 Series ATM Modules[2]

Cisco 2600/2600XM and 3600 Series WAN Interface Cards (WICs)[2]

Cisco 2600/2600XM and 3600 Series Multiflex Voice/WAN Interface Cards[2]

Cisco 2600/2600XM and 3600 Series Voice/Fax Network Modules[2]

Cisco 2600/2600XM and 3600 Series High-Density Voice/Fax DSP Upgrade Modules[2]

Cisco 2600/2600XM and 3600 Series Network Modules (International)[2]

Cisco 3600 Series LAN/Combo Network Modules

NM-1E1R2W=	1-port 10BASE-T, 1-port Token Ring, 2 WIC Slots Network Module
NM-1FE1CT1=	1-port 100BASE-TX, 1-port Channelized T1/ISDN-PRI Network Module
NM-1FE1CT1-CSU=	1-port 100BASE-TX, 1-port Channelized T1/ISDN-PRI with CSU Network Module
NM-1FE1CE1B=	1-port 100BASE-TX, 1-port Channelized E1/ISDN-PRI (Balanced) Network Module
NM-1FE1CE1U=	1-port 100BASE-TX, 1-port Channelized E1/ISDN-PRI (Unbalanced) Network Module
NM-1FE2CT1=	1-port 100BASE-TX, 2-port Channelized T1/ISDN-PRI Network Module
NM-1FE2CT1-CSU=	1-port 100BASE-TX, 2-port Channelized T1/ISDN-PRI with CSU Network Module
NM-1FE2CE1B=	1-port 100BASE-TX, 2-port Channelized E1/ISDN-PRI (Balanced) Network Module
NM-1FE2CE1U=	1-port 100BASE-TX, 2-port Channelized E1/ISDN-PRI (Unbalanced) Network Module
NM-1FE2W=	1-port 10/100 Ethernet, 2 WIC Slots Network Module
NM-2FE2W=	2-port 10/100 Ethernet, 2 WIC Slots Network Module
NM-1FE1R2W=	1-port 10/100 Ethernet, 1-port Token Ring, 2 WIC Slots Network Module
NM-2W=	2 WIC Slots Network Module

Cisco 3600 Series Voice Interface (VIC) Cards

VIC-2E/M=	2-port Voice Interface Card—E&M
VIC-2FXO=	2-port Voice Interface Card—FXO
VIC-2FXS=	2-port Voice Interface Card—FXS
VIC-2BRI-S/T-TE=	2-port Voice Interface Card—BRI (S/T user side)
VIC-2DID=	2-port Voice Interface Card—Direct Inward Dial (DID)
VIC-2FXO-EU=	2-port Voice Interface Card—FXO (for Europe)

Cisco 3600 Series WAN Modules

NM-4B-S/T=	4-port BRI (S/T) Module
NM-8B-S/T=	8-port BRI (S/T) Module
NM-4B-U=	4-port BRI (U) w/ NT-1 Module
NM-8B-U=	8-port BRI (U) w/ NT-1 Module
NM-4T=	4-port Serial Module
NM-4A/S=	4-port Async/Sync Serial Module
NM-8A/S=	8-port Async/Sync Serial Module
NM-16A=	16-port Async Module
NM-32A=	32-port Async Module
NM-1CT1=	1-port Channelized T1/ISDN-PRI Module
NM-1CT1-CSU=	1-port Channelized T1/ISDN-PRI w/ CSU Module
NM-2CT1=	2-port Channelized T1/ISDN-PRI Module
NM-2CT1-CSU=	2-port Channelized T1/ISDN-PRI w/ CSU Module
NM-1HSSI=	1-port HSSI Module
NM-COMPR=	Compression Module
NM-VPN/MP=	DES/3DES VPN Encryption NM for the 3620/3640 Mid-Platform

Cisco 3660 AIM Modules

AIM-VPN/HP=	DES/3DES VPN Encryption AIM for 3660 High Performance
AIM-COMPR4=	Data Compression AIM for the 3600 series
AIM-ATM=	ATM SAR Only ATM
AIM-ATM-VOICE-30=	30-Channel T1/E1 Digital Voice Module
AIM-VOICE-30=	SAR and 30-Channel T1/E1 Digital Voice Module

Cisco 3620/40 VPN Module

NM-VPN/MP=	DES/3DES VPN Encryption NM for 3620/3640 Mid Performance

Cisco 3600 Series Modem Modules

NM-6DM=	6-port Digital Modem Module
NM-8AM=	8-port Analog Modem Module
NM-12DM=	12-port Digital Modem Module
NM-16AM=	16-port Analog Modem Module
NM-18DM=	18-port Digital Modem Module
NM-24DM=	24-port Digital Modem Module
NM-30DM=	30-port Digital Modem Module
MICA-6MOD=	6-port Digital Modem Module (Spare)

Cisco 3600 Series Modem Management Technology Licenses[3]

MMTL-3600-6=	Modem Management Technology License (6 modems)
MMTL-3600-12=	Modem Management Technology License (12 modems)
MMTL-3600-18=	Modem Management Technology License (18 modems)
MMTL-3600-24=	Modem Management Technology License (24 modems)
MMTL-3600-30=	Modem Management Technology License (30 modems)
MMTL-3600/2600-8=	Modem Management Technology License (for 8 Analog Modems)
MMTL-3600/2600-16=	Modem Management Technology License (for 16 Analog Modems)

Cisco 3600 Series Memory Options

MEM3600-8FC=	Cisco 3600 Series 8 MB Flash PCMCIA Card
MEM3600-16FC=	Cisco 3600 Series 16MB Flash Card
MEM3600-8FS=	Cisco 3600 Series 8 MB Flash
MEM3600-16FS=	Cisco 3600 Series 16 MB Flash

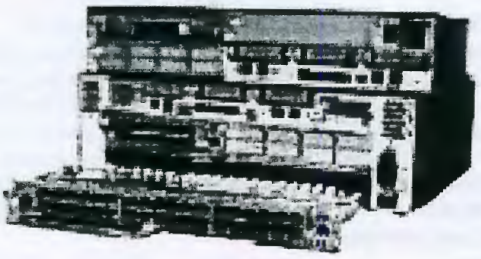
Cisco 3700 Series



The Cisco 3700 Series is a new line of modular routers that enable flexible and scalable deployment of new applications in an integrated branch office access platform. The Cisco 3700 Series is ideal for sites and solutions requiring the highest levels of integration at the branch for branch office IP Telephony, voice gateway, and integrated flexible routing with low-density switching solutions.Integrated security, intrusion detection, and VPN protect the network at the perimeters, while integrated caching conserves WAN bandwidth. The Cisco 3700 Series provides a consolidated service infrastructure and high service density in a compact form factor that enables the incremental incorporation of branch applications.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 3725	• New levels of branch office service density in a compact form factor (2RU) • Integrated Security, intrusion detection, and VPN • Integrated flexible routing and low-density switching (16-or-36 ports) • Flexible incremental and scalable migration to a voice/data converged branch office network – Compatibility with more than 90% of the world's legacy analog and digital TDM PBXs – Survivable Remote Site Telephony (SRST) features that enable centralized call processing with local branch IP Telephony redundancy – Inline power for IP Telephony • Content Networking and Caching integrated for WAN bandwidth conservation
Cisco 3745	Same features as above plus: • New levels of branch office service density in a compact form factor (3RU) • Availability features such as redundant power, online insertion and removable components, and field replaceable components • Increased performance and density

Key Features

- Optimized for multiple high density services
- Versatile High Density Service Module (HDSM) design enhances integrated services options
- Integrated connectivity options free up network module slots
- Optional features enhance availability/resiliency (3745 only): internal redundant power, hot-swappable modules, and field-serviceable components
- Optimized for Integrated IP Telephony: IP phone powered switch, high density voice gateway, flexible WAN routing, and Survivable Remote Site Telephony
- Flexible combination of analog and/or digital voice with scalable port density
- Full support for Cisco IOS voice suite of features
- Platforms performance-tuned for scaling packet voice solutions
- New integrated switching modules (16- and 36-port)
- Common user interface with Catalyst series switches
- Simplified management from a single platform for ease of configuration, deployment, and troubleshooting
- Integrated inline power for wireless access points and IP phones
- GigE connectivity

Digital Packet Voice and Fax Trunk Network Modules	
NM-HDV-1T1-12	High Density Voice Network Module, with 1 VWIC-1MFT-T1 and 1 PVDM-12
NM-HDV-1E1-12	High Density Voice Network Module, with 1 VWIC-1MFT-E1 and 1 PVDM-12
NM-HDV-1E1-30	Single-port, 30-channel E1 voice/fax Network Module (supports 30 channels) of medium complexity VoCoders: G.729a/b, G.726, G.711 and fax or 12 channels of G.726, G.729, G.723.1, G.728, G.729a/b, G.711 and fax)
NM-HDV-1E1-30E	Single-port, enhanced 30-channel E1 voice/fax Network Module (supports 30 channels of high and medium complexity VoCoders: G.729a/b, G.726, G.729, G.728, G.723.1, G.711 and fax)
NM-HDV-2E1-60	Dual-port, 60-channel E1 voice/fax Network Module (supports 60 channels) of medium complexity VoCoders: G.729a/b, G.726,G.711and fax or 30channels of G726, G729, G723.1, G.728, G729a/b, G711 and fax) Supports add/drop multiplexing (drop and insert)
NM-HDV-1T1-24	Single-port, 24-channel T1 voice/fax Network Module (supports 24 channels of medium complexity VoCoders: G.729a/b, G.726, G.711 and fax or 12 channels of G.726, G.729, G.723.1, G.728, G.729a/b, G.711 and fax)
NM-HDV-1T1-24E	Single-port, enhanced 24-channel T1 voice/fax Network Module (supports 24 channels of high and medium complexity VoCoders: G.729a/b, G.726, G.729, G.728, G.723.1, G.711 and fax)
NM-HDV-2T1-48	Dual-port, 48-channel T1 voice/fax Network Module (supports 48 channels) of medium complexity VoCoders:G.729a/b,G.726,G.711 and fax or 24 channels of G726, G729, G723.1, G.728, G729a/b, G711 and fax) Supports add/drop multiplexing (drop and insert)
AIM-ATM-VOICE-30	SAR and 30 Channel T1/E1 Digital Voice module
AIM-VOICE-30	30 Channel T1/E1 Digital Voice module
Analog Packet Voice and Fax Trunk Network Modules	
NM-1V	1-slot voice and fax network module
NM-2V	2-slot voice and fax network module
NM-HDA	High Density Analog Module
Voice Interface Cards	
VIC-2FXS	2-port voice interface card—FXS
VIC-2FXO	2-port voice interface card—FXO
VIC-2FXO-EU	2-port voice interface card—FXO (for Europe)
VIC-2FXO-M1	2-port voice interface card—FXO (with battery reversal, for North America)
VIC-2FXO-M2	2-port voice interface card—FXO (with battery reversal, for Europe)
VIC-2FXO-M3	2-port voice interface card—FXO (for Australia)
VIC-2E/M	2-port voice interface card—E&M
VIC-2DID	2-port voice interface card—DID (Direct Inward Dial)
VIC-2BRI-S/T-TE	2-port voice interface card—BRI (Terminal side)
VIC-2BRI-NT/TE	2-port voice interface card—BRI (Network side)
ATM Network Modules	
NM-4T1-IMA	4-port T1 ATM network module with Inverse Multiplexing over ATM (IMA)
NM-4E1-IMA	4-port E1 ATM network module with IMA
NM-8T1-IMA	8-port T1 ATM network module with IMA
NM-8E1-IMA	8-port E1 ATM network module with IMA
NM-1A-T3	1-port DS3 ATM network module
NM-1A-E3	1-port E3 ATM network module
AIM-ATM	ATM cell processing module
Serial WAN Interface Cards	
WIC-1DSU-T1	One T1 CSU/DSU - Integrated
WIC-2T	2-port High Speed Serial
WIC-2-A/S	2-port Async/Sync Serial
WIC-1DSU-56K4	1-port, four-wire 56/64-Kbps with CSU/DSU
Digital Voice/WAN Interface Cards	
VWIC-1MFT-T1	1-port RJ-48 MultiFlex Trunk—T1
VWIC-2MFT-T1	2-port RJ-48 MultiFlex Trunk—T1
VWIC-2MFT-T1-DI	2-port RJ-48 MultiFlex Trunk—T1 with Drop and Insert
VWIC-1MFT-E1	1-port RJ-48 MultiFlex Trunk—E1
VWIC-2MFT-E1	2-port RJ-48 MultiFlex Trunk—E1
VWIC-2MFT-E1-DI	2-port RJ-48 MultiFlex Trunk—E1 with Drop and Insert Add not for VWICs VIC slots & WIC slots
VWIC-1MFT-G703	1-port RJ-48 MultiFlex Trunk—E1 unstructured
VWIC-2MFT-G703	2-port RJ-48 MultiFlex Trunk—E1 unstructured
ISDN WAN Interface Cards	
WIC-1B-S/T	1-port ISDN BRI
WIC-1B-U	1-port ISDN BRI with NT1

Cisco 7200 Series

The Cisco 7200 Series routers deliver exceptional price/performance, versatility, and feature-richness in a compact form factor. The Cisco 7200 is ideal as a WAN aggregator for the Service Provider (small POP) or enterprise edge, an enterprise WAN gateway, a high-end managed CPE, or as a small core router. The platform also supports sites that require IBM data center connectivity as well as sites that require multifunction capabilities that combine all the above for multiservice voice, video, and data traffic.

A key strength of the Cisco 7200 is its modularity. With a choice of 4- and 6-slot chassis, a selection of processors providing up to 1 Mpps, an extensive range of LAN and WAN interfaces with up to 48 ports per chassis, and single or dual power supplies, the customer can customize their system to achieve the performance, connectivity, and capacity desired. This modularity combined with a low initial price point guarantees both investment protection and maximum return on investment, allowing the customer to upgrade and/or redeploy their Cisco 7200 as their network needs change.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7204VXR	• 4-slot chassis • Modular processor: 225, 400, 900 Kpps (NPE-225, NPE-400, NPE-G1) or 300 Kpps service accelerator (NSE-1) • 1.2 Gbps backplane • MIX-enabled bus for data/voice/video applications
Cisco 7206VXR	• 6-slot chassis • Modular processor: 225, 400, 900 Kpps (NPE-225, NPE-400, NPE-G1) or 300 Kpps service accelerator (NSE-1) • 1.2 Gbps backplane • MIX-enabled bus for data/voice/video applications

Key Features

- Compact Form Factor—Up to six port adapters in a fully modular 3RU form factor. The optional Rack Density System (RDS) allows for up to nine Cisco 7206 routers per rack with front-to-back airflow
- Exceptional Value—As the most powerful single-processor platform, the Cisco 7200 offers customers a superior price/performance ratio supporting high-speed media and high-density configurations with up to 900 Kpps processing at a competitive price point
- Feature Rich—Full support for Cisco IOS software and enhancements for high-performance network services enables the Cisco 7200 to offer industry-leading network services, including: MPLS, broadband aggregation, quality of service (QoS), security, and voice/video/data support
- Connectivity/Flexibility—Provides high port density and an extensive range of LAN and WAN media, the Cisco 7200 dramatically reduces the cost per port and allows for flexible configurations to meet your specific network needs
- Common port adapters—Port adapters are shared with the Cisco 7300, 7400, 7500, and 7600 (w/FlexWAN Module), which simplifies sparing and protects customer investment in interfaces

Specifications

Feature	Cisco 7204VXR	Cisco 7206VXR
Fixed Ports	None	Same as 7204VXR
Expansion Slots	4	6
WAN Port Adapters	DS0 to OC-12	Same as 7204VXR
Processor	RM7K RISC Processor with optional PXF Processor	Same as 7204VXR
Forwarding Rate	Up to 1 Mpps	Same as 7204VXR
Backplane Capacity	1.2 Gbps	Same as 7204VXR
Flash PCMCIA Memory	48 MB (expandable to 256 MB)	Same as 7204VXR
System DRAM Memory	128 MB (expandable to 1 GB)	Same as 7204VXR
Minimum Cisco IOS Release	12.0(1)XE	Same as 7204VXR
Internal Power Supply	AC or DC, dual option	Same as 7204VXR
Redundant Power Supply	Yes, for AC or DC	Same as 7204VXR
Chassis Height	3 RU	Same as 7204VXR
Rack Mountable	Yes, up to 16 per rack	Same as 7204VXR
Dimensions (HxWxD)	5.25 x 16.8 x 17 in.	Same as 7204VXR

Cisco IOS Software and Memory Requirements[1]

To run the Cisco IOS Feature Packs, you need, at a minimum, the amount of memory shown in the following table. Some configurations will require more.

Distribution Part Number	Feature Pack Description	IOS Image Release	Flash Memory Required	DRAM Memory Required
CD72-C-12.1T=	IP	12.1T	16MB	64MB
CD72-CK2-12.1E=	IP IPSEC 3DES	12.1E	16MB	64MB
CD72-CHK2-12.1T=	IP/FW/IDS IPSEC 3DES	12.1T	16MB	64MB
CD72-A-12.1T=	Enterprise	12.1T	16MB	64MB

1. For the complete list of IOS Feature Sets, refer to the parts list, via the URL listed under "For More Information." For users with CCO access, search by IOS feature or release via the *Feature Navigator* at http://www.cisco.com/go/fn

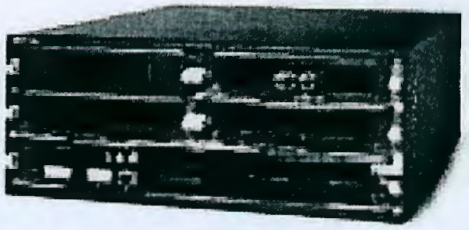
Cisco 7300 Series



The Cisco 7300 Series Routers are optimized for flexible, high performance IP/MPLS services at the network edge, where service providers and enterprises link together. Coupled with powerful network processing, a broad set of interfaces and a compact, modular form factor the Cisco 7300 Series Routers are ideal for intelligent, multi-gigabit network connectivity.

The Cisco 7304 Series Router is ideally applied as a high-end CPE or as an Internet Gateway router. Architected for network High Availability and multi-protocol support, the 7304 supports the broad set of existing Cisco 7000 Series Port Adapters with the new Cisco 7304 Port Adapter Carrier Card.

The Cisco 7301 Series Router is a compact single rack unit router coupled with a broad set of interfaces and Cisco IOS software features. It packs high performance in a space and power efficient form factor that includes a single 7000 Series port adapter slot, 3 on-board Gigabit Ethernet (copper or optical)/Fast Ethernet ports and a new high-speed bus technologies.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7301	• Compact, power efficient 1RU form factor • Three times the performance increase over existing single rack unit routers like the Ciso 7401 • Single 7000 Series Port Adapter Slot
Cisco 7304	• Highly modular price and performance optimized platform, rich in IP services • High performance connectivity—DS-1 through OC48/STM16 with 3.5 Mpps performance • Built-in Gigabit Ethernet connectivity • Multiprotocol routing: IP, IPX, AppleTalk, DLSw • Compact size, high availability and optimal cooling

Key Features

- Cisco 7301: With nearly 1 million-packets-per-second (Mpps) processing performance, the fastest Cisco 1RU general-purpose processor, as of January 2003; 3 fixed 10/100/1000-Mbps ports (RJ-45 or SFP optics) directly on the processor; Full Cisco IOS feature support; Pluggable Gigabit Ethernet optics (SFPs); Up to 1GB of available DRAM; Up to 256MB of removable compact flash memory; Front-back airflow and single sided management
- Cisco 7304: Compact modular form factor with four RU with four port adapter slots per chassis; PXF IP processor hardware-accelerated services such as Cisco Express Forwarding (CEF), NetFlow v8, and Turbo ACL; Offers 3.5Mpps performance for PXF-accelerated services with the NSE-100 Network Services Forwarding Engine; Two Gigabit Ethernet ports per NSE-100; System redundancy: optional dual processors and dual AC or DC power supplies increases network availability

Cisco 7400 Series

With the Cisco 7400, this modular, one-port adapter slot unit leverages over 40 standard 7200/7500 series port adapters. Its compact, stackable architecture is designed for application specific routing deployments, such as broadband services aggregation (PPP/L2TP) and WAN edge connectivity in service provider and enterprise networks. Leveraging Cisco patented technology, the Cisco 7400 series delivers a premium suite of hardware-accelerated network services.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7401ASR-CP	• General WAN edge connectivity in a small form factor, or as managed customer premise equipment (CPE) • Broad range of connectivity options—from DS0 to OC-3 interfaces • Comprehensive management services with remote management, provisioning, trouble shooting and software upgrade • Hardware accelerated services, including: NAT, ACLs, Netflow, CBWFQ, CBWRED, Policing, marking, Hierarchical Traffic Shaping, & VRF lite
Cisco 7401ASR-BB	• Complete broadband subscriber services suite with highest subscribers per rack ratio • One fast LAN interface (FE/GE) and one fast WAN interface (DS3/OC3) • High volume/density of PPP, PPPoE, PPPoA, L2TP tunnel aggregation and termination for broadband services like DSL, Cable, and Wireless

Key Features

- Compact form factor with 1 RU, front-to-back airflow and stackability
- Hardware—accelerated IP network services
- Built-in dual GE connectivity
- Flexible WAN connectivity supporting over 40 interfaces including serial, multichannel, ISDN, Frame Relay, ATM, Packet over SONET (POS), from NxDS0 to OC-3
- Shared port adaptors with the Cisco 7200, 7300, 7500, and 7600 (with FlexWAN Module), which simplifies sparing and protects customer investment in interfaces

Cisco 7500 Series

An essential part of both Enterprise and Service Provider networks, the Cisco 7500 Series routers are the market leader for edge applications, due to its breadth of services, diverse interfaces, reliability, and performance. Since its inception, the Cisco 7500 has seen huge improvements in performance and its ability to scale, most recently with the Route Switch Processor 16 (RSP16) and Versatile Interface Processor 6-80 (VIP6-80) module. This series combines Cisco's proven software technology with exceptional reliability, availability, serviceability, and performance features to meet the requirements of today's most mission-critical networks.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7505	• 5 expansion slots • One CyBus • DS0 to OC-12 connectivity (all platforms)
Cisco 7507	• 7 expansion slots • Dual CyBuses • Redundant power supplies • Diverse set of routing protocols (all platforms)
Cisco 7513	• 13 expansion slots • Dual CyBuses • Redundant power supplies • Diverse set of routing protocols (all platforms)

Key Features

- High-performance switching—Delivers high performance for mission-critical applications by supporting high-speed media and high-density configurations; using the processing capabilities of the Versatile Interface Processors and Cisco Express Forwarding—the Cisco 7500 series system capacity can exceed two million packets per second
- Full support for Cisco IOS software and enhancements for high-performance network services—Performs network services such as quality of service, security, compression, and encryption at high speed; VIP technology extends the performance of these services through distributed IP services
- High port density—Provides high port density and an extensive range of LAN and WAN media; this feature dramatically reduces the cost per port and allows a flexible configuration
- Unmatched interface flexibility—The Cisco 7500 supports a broad selection of Interface Processors (IPs) and Port Adapters (PAs). Port adapters are shared with the Cisco 7200, 7400, and 7600 (with FlexWAN Module)
- High Availability—Enhanced features and capabilities include redundant route processors, power supplies, fans, and software fault isolation with Stateful Switchover and NonStop Forwarding

Versatile Interface Processor Port Adapters (VIP2 and VIP4)

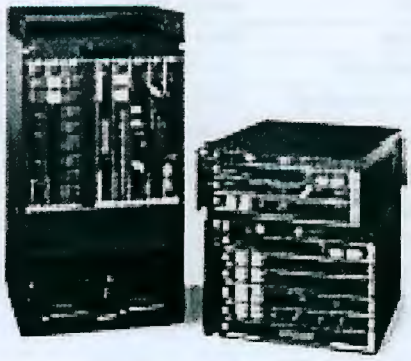
PA-MC-8TE1+=	8 port multichannel T1/E1 8PRI port adapter

1. This is only a small subset of all parts available via URL listed under "For More Information." Some parts have restricted access or are not available through distribution channels.
2. Cisco 7200, 7400 and 7500 share many port adapters. Please see Cisco 7200, 7400 and 7500 Series Port Adapters, page 1-34 for additional part numbers.
3. Cisco 7400 and 7500 share many port adapters. Please see Cisco7400 and 7500 Series Port Adapters, page 1-43 for additional part numbers.

For More Information

See the Cisco 7500 Series Web site: **http://www.cisco.com/go/7500**

Cisco 7600 Series



The Cisco 7600 Series combines optical WAN/MAN networking and high-volume Ethernet aggregation with a focus on line-rate delivery of high-touch IP services in large data centers and at the edge of service provider networks. It provides customers the flexibility of three different form factors: Cisco 7603, 7606, and 7609. As the most scalable system in the industry, each router offers the ability to deliver DS0 to OC-48 WAN connectivity, and 10-Mbps Ethernet to 10-Gigabit Ethernet LAN connectivity into Internet data center, metropolitan aggregation, WAN edge aggregation, and enterprise networking applications.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7603	• 3 slot (horizontal) chassis • 32 Gbps backplane bandwidth • 15 Mpps forwarding rate • NEBs Compliant
Cisco 7606	• 6 slot (horizontal) chassis • 160 Gbps backplane bandwidth • 30 Mpps forwarding rate • NEBs Compliant
Cisco 7609	• 9 slot (vertical) chassis • 256 Gbps backplane bandwidth • 30 Mpps forwarding rate • NEBs Compliant

Key Features

- Hardware accelerated IP services on each Optical Services Module (OSM), delivering up to 6 Mpps per slot
- 15 to 30 Mpps forwarding processor and up to 512 MB DRAM for Internet routing
- Modular and scalable from 32 Gbps to 256 Gbps switch fabric
- One of the widest, most complete ranges of WAN interfaces in the industry, with DS0 to OC-48 connectivity
- Leveraging the FlexWAN Module, 7x00 port adapters are shared with the Cisco 7200, 7300, 7400, and 7500 which simplifies sparing and protects customer investment in interfaces
- Compatible with Catalyst 6500 LAN interfaces, offering 10 Mbps Ethernet to 1 Gbps

Competitive Products

- Redback: SMS-500, SMS-1800
- Juniper: M5, M10, M20, M40
- Unisphere: ERX700, ERX1400
- Extreme: Black Diamond 6808

Cisco 10000 Series

The Cisco 10000 Series is the industry's only edge router that delivers consistent, high performance services for carriers deploying IP, MPLS, and broadband services to DSL and private line customers. Coupled with proven high availability and innovative adaptive network processing technology, the Cisco 10000 Series is uniquely designed to meet the service needs of carriers up to DS3/E3 aggregation speeds.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 10008	• Broadband features including PPP over ATM, PPP over Ethernet, routed bridge encapsulation, and Layer 2 Tunneling Protocol • MPLS, MPLS VPN, and MPLS Quality of Service edge features • Leased line features such as seamless integration from a dedicated access environment (TDM or SONET/SDH) to the ATM core.

Key Features

- Industry-leading high availability—nonstop performance, with a complete set of reliability features for high availability (99.999 percent uptime). Full hardware redundancy, hot-swappable elements, and seamless route processor cutover provide continuous traffic forwarding.
- Lowest total cost of ownership—the Cisco 10000 offers the highest leased-line, ATM, frame, and broadband session densities on a single platform, and its high reliability reduces network downtime and operational expenses
- Broad portfolio of line-rate IP sessions—critical service features, such as QoS, MPLS, Multilink PPP, and ACLs are hardware accelerated to deliver exceptional throughput for every connection

ECT 3726 DSL-AC
Fls: 0537
Doc: 3701
CPMI - CORREIOS
N° 03/2005 - CN

- Industry-leading session density—the Cisco 10000 supports thousands of DS0, DS1/E1 connections, or hundreds of clear-channel DS3 connections on a single platform, providing the highest port density of DS3-and-below interfaces

Cisco 10720 Series

The Cisco 10720 Internet Router is a high-performance router and a principle building block in the metro IP network. It enables service providers to offer innovative and differentiated IP services to their customers at optical speeds. Equipped with Ethernet technology for customer access and the innovative Dynamic Packet Transport (DPT)/RPR (Resilient Packet Ring) technology or Packet over SONET (POS) for metro optical connectivity, the Cisco 10720 allows service providers to offer IP services closer to the user, enabling them to better control admission to network resources. This allows service providers to bypass traditional DS1 and DS3 access options. The dual counter rotating ring technology of DPT is also cost effective, since it uses both rings and can be deployed over dark fiber and still maintain the less than 50ms restoration common in SONET/SDH systems. For multiservice applications, DPT can also be deployed over traditional SONET/SDH ADMs and wavelength division multiplexing (WDM) systems.

The Cisco 10720 is a cost-effective, reliable platform that not only supports the full suite of IP routing protocols such as IS-IS, OSPF and BGP, but also allows advanced IP features to be introduced efficiently, without compromising on performance. Although primarily designed for high-speed Internet services for multitenant and business-park applications in the metro, the Cisco 10720 Internet Router is also suitable for a range of other applications such as: Internet data center applications, intra-POP aggregation, cable multisystem operator (MSO) internetworking, and voice-over-IP (VoIP) aggregation.

RQS Nº 03/2005 - CN - CPMI - CORREIOS 0538 Fls 3701

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 10720 Internet Router	• Any service provider planning to offer high-performance IP services as part of their business strategy by extending IP further out into the network • Any service provider wanting to simplify their current network and implement the simple, scalable, reliable features of DPT technology while maximizing fiber usage • Any customer already using DPT technology in their network, most likely with DPT cards on the 12000 Internet Router • Metro Ethernet Services such as L2 and L3 VPN with FE/GE hand off to the Customer and 50ms restoration over dark fiber using DPT.

Key Features

- Equipped with Redundant Power Supply by default
- SRP specific features—IPS with <50 ms restoration time and SRP MIB support
- Multicast support including PIM SM, PIM DM, MBGP
- L2 VPN—UTI, L2TPv3 and EoMPLS for Layer 2 to Layer 2 LAN extension; L3 VPN MPLS VPN
- QoS—Modular QoS CLI, CAR, WRED, VTMS traffic shaping, and access lists
- Ethernet features—MDI-MDI-X support, 10/100 speed auto-negotiation, HDX-FDX negotiation and time delay reflectometry (TDR) for 10/100BaseTX
- Hot Standby Routing Protocol (HSRP)/Multiple Hot Standby Routing Protocol (MHSRP)
- 64-MB built-in Flash for software and configuration load
- Optical receive power monitoring support on OC-48/STM-16 Interface and GE
- Supported management information bases (MIBs) include SNMP, SRP, SONET, Etherlike, OSPF

Competitive Products (vs. Cisco's Metro IP RPR Solution using the 10720)

• Extreme Summit: 48/Blackdiamond comb for GigE Hub & Spoke • Riverstone: RS3000/RS8600 combo for GigE Hub & Spoke

Specifications

Feature	Cisco 10720
Security Features	Including AAA, RADIUS authentication, TACACS+, and encrypted passwords
Management	Cisco IOS CLI TACACS+ and RADIUS Configuration and administration features including Telnet and Cisco Discovery Protocol (CDP) Serial (aux) and console ports for local and remote administration Remote software download via TFTP and RCP IP over DCC for remote management of the Cisco ONS 15104 OC-48/STM-16 Optical Regenerator, where applicable
Physical Interfaces	Uplink Modules: 2-port single-mode OC-48c/STM16c DPT (SR 2 km (1.2 miles), IR 15 km (9.3 miles), LR1 40km (24 miles) and LR2 80km (50miles) Interface Modules—The Cisco 10720 Internet Router has two dedicated slots for interface modules—modules are not interchangeable or hot swappable: • Upper slot is dedicated for DPT or POS Uplink module equipped with two physical ports of OC-48c/STM16c that provide an aggregate bandwidth of approximately 5 Gbps. The cards are available in two four versions of optics, short reach (SR) and intermediate reach (IR), Long Reach1 (LR1) and Long Reach2 (LR2) with two small form-factor OC-48 ports with LC connectors. • A third option for the upper slot is the CON-AUX module, which is a depopulated uplink card equipped with Console and Auxiliary ports only; this allows the configuration of the 10720 as an "Ethernet Router" allowing the use of one or more of the Ethernet ports in the lower slot for network connectivity • Lower slot is dedicated for 24-port Fast Ethernet module—available in TX (100 m reach), FX-MM (2 km reach) or FX-SM (15 km reach). The TX module is equipped with RJ-45 connectors while the FX-SM and FX-MM modules are equipped with MT-RJ connectors. • Also available is a combination 4 Gigabit Ethernet with Small Form Factor Plug-able (SFP) Optics available in SX 550m and LH 10km plus an additional 8 Ports of Fast Ethernet 10/100 TX Copper ports. The TX and the FX-MM versions of the 24-port Fast Ethernet modules accommodate copper or multimode fiber deployments within MTUs and the FX-SM allows for deployment of the Cisco 10720 Internet Router in a central location covering Ethernet connectivity to buildings for a radius of up to 15 km.

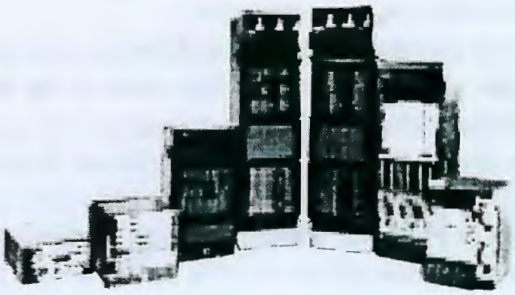
Cisco 12000 Series



The Cisco 12000 Series Internet Router is part of Cisco's family of multimillion packets-per-second (mpps) IP and MPLS routing platforms for building profitable networks in today's communications economy. The Cisco 12000 Series is the premier high-end routing platform for service provider backbone and edge applications, enabling service providers to meet the challenge of building packet networks to satisfy services demand while increasing profitability. The Cisco 12000 Series offers the only portfolio of 10 Gbps per slot systems and interfaces (including Packet over SONET [POS], Dynamic Packet Transport/Resilient Packet Ring [DPT/RPR], and Gigabit Ethernet [GbE]), delivering 10G economies of scale anywhere in the network. The Cisco 12000 Series provides the highest reliability, the richest set of service enablers, the lowest total cost of ownership, and the only proven investment protection, including systems that can be upgraded in the field to increase switching capacity. This innovative combination of features and capabilities enables service providers to build the most competitive IP and MPLS networks.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 12400 Internet Routers (10G)	• 10 Gbps/slot, from 80 to 320 Gbps of non-blocking switching capacity • Support for high-density, high-speed interfaces: ATM, DPT/RPR, POS, GbE/FE ranging from channelized DS3 (to DS1) through OC-192c/STM-64c • 4 10G platforms to choose from: 12416, 320 Gbps, 16 slots, 40 RU; 12410, 200 Gbps, 10 slots, 20 RU; 12406, 120 Gbps, 6 slots, 10 RU; 12404, 80 Gbps, 4 slots, 5 RU • Support for industry-leading QoS/CoS features ideal for peering, transit, POP consolidation, and IDC bandwidth aggregation as well as latency-sensitive applications like voice and video • Support for IP or MPLS forwarding • Support for hundreds of thousands of routes • Proven carrier- class reliability and availability through enhanced features such as Online Insertion and Removal, High Availability (RPR+, NSF and SSO) and APS/MPS
Cisco 12000 Internet Routers (2.5G)	• 2.5 Gbps/slot, from 40 to 80 Gbps switching capacity • Support for high-density, high-speed interfaces: ATM, DPT/RPR, POS, GbE/FE ranging from channelized DS3 (to DS1) through OC-48c/STM-16c • 3 chassis to choose from: 12016, 80 Gbps, 16 slots, 40 RU; 12012, 60 Gbps, 12 slots, 32 RU; 12008, 40 Gbps, 8 slots, 14 RU • The 12016 Internet Router is upgradeable to 320 Gbps via an easy, field-installed switch fabric upgrade kit—no need to pull out existing line cards
Cisco 12000 Manager	• An element management solution to increase service velocity and decrease operation costs

Key Features

- Proven investment protection, offering full forward compatibility for all line cards, and the only high-end system with a modular, replaceable switch fabric for field-installed capacity upgrades
- Only fully distributed system architecture scales to the edge, supporting backbone- or edge-optimized line cards in the same chassis
- Only platform that maximizes the value of line-rate edge applications with 10G uplinks. By deploying Cisco 12000 Series IP Services Engine (ISE) line cards in Cisco 12400 Internet Routers, Service Providers benefit from line cards optimized for edge applications, while removing the bandwidth bottleneck with full 10 Gbps uplinks using cost-effective VSR optics or 10 GbE for intra-POP connections.
- The only complete priority packet delivery solution set
- Industry's only complete IP QoS and congestion control implementation that uniquely enables premium real-time services such as VoIP and video. Its distributed architecture and class of service features such as priority based congestion control (WRED) and dedicated low latency queuing (MDRR), along with virtual output queuing (VoQ), eliminate head of line blocking (HOL) and maintain packet sequence integrity under all conditions
- Non-service—impacting online insertion and removal (OIR) of components (including switch fabric cards) and front accessibility reduce downtime and simplify maintenance
- High availability features such as Cisco Non Stop Forwarding (NSF) and Cisco Stateful Switchover (SSO) eliminate single points of failure, help maintain system performance, and prevent service interruption. With these features, packet forwarding remains uninterrupted before, during and after a route processor switchover on the Cisco 12000 Series. Coupled with OIR, the faulty route processor can be replaced without affecting operation
- Designed for NEBS compliance to meet service provider carrier-class requirements

Competitive Products

4OC48E/POS-SR-SC	Edge 4 Port OC-48c/STM-16c SONET/SDH SR with SC
8OC03/ATM/TS-IR-B	8-port OC03/STM1 ATM IR LC with SC connector
8OC03/ATM/TS-MM-B	8-port OC03/STM1 ATM MM LC with SC Connector
OC12/SRP-IR-SC-B	OC12 SRP IR line card
OC12/SRP-LR-SC-B	OC12 SRP LR line card
OC12/SRP-MM-SC-B	OC12 SRP MM line card
OC12/SRP-XR-SC	OC12 SRP single ring linecard, single mode 1550, XR
OC48/SRP-LR-SC-B=	OC48 SRP Rev-B Line Card, Single Mode, Long Reach
OC48/SRP-SR-SC-B=	OC48 SRP Rev-B Line Card, Single Mode, Short Reach, GSR
OC48E/POS-LR-SC-B=	1 Port OC-48c/STM-16c SONET/SDH 1550nm LR with SC
OC48E/POS-SR-SC-B=	1 Port OC-48c/STM-16c SONET/SDH 1310nm SR with SC, GSR
OC48X/POS-LR-SC	CONCATENATED OC48 WITH EXTENDED FEATURES LONG REACH
OC48X/POS-SR-SC	1 port OC48 POS Extended features
8OC3/POS-MM=	8 port OC3/STM1 SONET/SDH Multi-Mode LC with MTRJ conn Spare
8OC3/POS-SM=	8 port OC3/STM1 SONET/SDH Single-Mode LC with LC conn Spare
1X10GE-LR-SC=	Cisco 12000 1-Port 10GE Card, 1310nm serial, 10km, SC
16OC3/POS-MM=	16 port OC3/STM1 SONET/SDH Multi-Mode LC with MTRJ conn
16OC3/POS-SM=	16 port OC3/STM1 SONET/SDH Single-Mode LC with LC conn Spare
16OC3X/POS-I-LC-B	16 PORT OC3 WITH EXTENDED FEATURES RELEASE B
EPA-GE/FE-BBRD	Cisco 12000 Modular GE Baseboard w/ 1GE and 3 EPA Slots
EPA-3GE-SX/LH-LC	Cisco 12000 3-Port GE Port Adapter for EPA-GE/FE-BBRD
3GE-GBIC-SC	GSR12000 three-port GE line card
GE-GBIC-SC-B	GSR12000 single port Gigabit Ethernet line card
GBIC-SX-MM	1000base-SX GBIC module, multimode,standardized for GSR12000
GBIC-LH-SM	1000base-LH GBIC module,singlemode,standardized for GSR12000
GBIC-ZX-SM	GBIC very long reach GBIC module for the GE line card
6CT3-SMB	Channelized T3 for the GSR
GLC-LH-SM	GE SFP, LC connector LH transceiver
GLC-SX-MM	GE SFP, LC connector SX transceiver
6DS3-SMB-B	6DS3-SMB-B w/ ECC
6E3-SMB	E3 line card, 6 ports
12DS3-SMB-B	12DS3-SMB-B w/ ECC
12E3-SMB	E3 line card, 12 ports
CHOC12/STS3-IR-SC=	Channelized OC-12/STM-4 with four STS-3c/STM-1 POS paths
LC-OC12-DS3	1 port Channelize OC-12 with 12 DS3s
8FE-FX-SC-B	GSR 8-port 100baseFX, SC connector, version B
8FE-TX-RJ45-B	8-port 100baseTX, RJ45 connector type, version B
OC192/POS-IR-SC	1 Port OC192c/STM64c POS, 1550nm IR, SC
OC192/POS-SR-SC	1 Port OC192c/STM64c POS, 1310nm SR, SC
OC192/POS-VSR	1 Port OC192c/STM64c POS, VSR Optics
OC192E/POS-VSR	1 Port OC192c/STM64c POS Edge Card, VSR Optics
OC192E/POS-IR-SC	1 Port OC192c/STM64c POS Edge Card, 1550nm IR, SC
OC192E/POS-SR-SC	1 Port OC192c/STM64c POS Edge Card, 1310nm SR, SC
OC192/SRP-VSR	1 Port OC192c/STM64c SRP Linecard, 850nm VSR, MTP
OC192/SRP-IR-SC	1 Port OC192c/STM64c SRP Linecard, 1550nm IR, SC
OC192/SRP-SR-SC	1 Port OC192c/STM64c SRP Linecard, 1310nm SR, SC

4GE-SFP-LC=	4 port-GE line card for Cisco 12000
Cisco 12000 Series Pluggable Optic Modules	
POM-OC48-LR2-LC	1-port OC-48/STM-16 Pluggable Optic Module, 1550nm SM-LR2 LC
POM-OC48-SR-LC	1-port OC-48/STM-16 Pluggable Optic Module, 1310nm SM-SR LC

Cisco SN 5400 Series Storage Router

The Cisco SN 5400 Series implements the iSCSI protocol to extend access of a Fibre Channel fabric and attached storage devices to IP servers. iSCSI (internet SCSI) combines the benefits of the TCP/IP protocol suite with SCSI, the universal standard for storage access. By utilizing iSCSI, the SN 5400 Series extends a Fibre Channel storage network to lower priced/lower performance servers in a data center and departmental servers located throughout the campus and enterprise. With the SN 5428, access to a Fibre Channel Storage Area Network (SAN) from anywhere on an IP network is as easy as accessing direct attached storage.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco SN 5428	• When a customer is moving from a DAS (Direct Attached Storage) environment to a SAN (Storage Area Network) and they do not already have a Fibre Channel switch, the SN 5428 provides a Fibre Channel switch and iSCSI ports to deliver a one system solution. • When the customer wants only a full function Fibre Channel switch, the SN 5428 is a very cost effective, low latency switch that will perfectly fit a Fibre Channel only implementation • When the customer has block level applications and wants to maintain block level access to shared storage combined with IP/Ethernet for a substantial reduction in attachment costs.

Key Features

- Provides levels of security and access control beyond what is currently available in traditional storage area networks by including layer 2 and layer 3 protection to resist against unauthorized access to your storage resources
- Uses the TCP/IP protocol suite for storage networking which protects your existing investment in storage and networking infrastructure
- Fully integrates existing management and configuration tools
- Based on industry standards, maximizes your investment and enables you to reduce total cost of ownership for the increasing storage demands on your network
- Uniquely provides standard IP networking capabilities to storage environments
- SN 5428: Designed for high-availability providing continuous access to critical data; Extensive security features to protect valuable storage resources; and, Full breadth of iSCSI drivers

CHAPTER 2

LAN Switching

LAN Switching Products at a Glance

Product	Features	Page
Catalyst 2900 Series	Fixed-configuration Ethernet switches • 10/100 auto sensing and auto negotiating interface • Managed	2-3
Catalyst 2948G-L3	Fixed and Modular ports • Gigabit Ethernet over Fiber or Copper • High performance, Cisco Express Forwarding (CEF) Layer 2/3/4 switching up to 48 Mpps • Advanced network control with predictable performance, granular QoS, advanced security, comprehensive management	2-3
Catalyst 2900 Series XL—Modular Switches	Modular 10/100 Ethernet switches • 12 or 24 10/100 ports • 12 100BASE- FX ports (2912MF XL) • Two high-speed module slots accommodating 10/100, 100BASE-FX, Gigabit Ethernet (including 1000BASE-T), and GigaStack GBIC (2912MF XL and 2924M XL only) • Cisco switch clustering enabled • Managed	2-4
Catalyst 2950 Series	Fixed-configuration basic and Intelligent Ethernet 10/100 switches • 12/24/48 10/100 port managed switches with stackable and standalone models • Flexible uplink options: fixed 100Base FX, fixed 1000BaseT, fixed 1000BaseSX, and GBIC-based ports • Industrial-grade, rugged models (Catalyst 2955) for harsh environment deployments • Wire-speed, high performance switch • Models with the Standard Image software (SI) provide Layer 2 Cisco IOS functionality for basic data, voice, and video services at the edge of the network. • Models with the Enhanced Image software (EI) bring Layer 2-4 intelligent services such as advanced Quality of Service, rate limiting, security filtering and multicast management capabilities • Stackable up to 9 switches with Gigastack GBIC • Simplified network management through Cisco Cluster Management Suite up to 16 fixed configuration Catalyst switches	2-6
Catalyst 3500 Series XL	Fixed-configuration 10/100 and Gigabit Ethernet switches • 24 ports with 2 GBIC-based Gigabit Ethernet ports with in-line power(3524-PWR XL) • 8 GBIC-based ports (3508G XL) • Stackable up to 9 switches with GigaStack GBIC • Cisco Switch Clustering capable • Managed	2-10
Catalyst 3550 Series	Fixed-configuration Intelligent Ethernet switches in stackable 10/100, inline power, or Gigabit Ethernet configurations • Network control and bandwidth optimization via advanced Quality of Service (QoS), granular rate-limiting, Access Control Lists (ACLs), and multicast services • Network security through a wide range of authentication methods, data encryption technologies, and access restriction features based on users, ports, and MAC addresses • Network scalability through advanced routing protocols such as EIGRP, OSPF, BGP, and PIM (requires Enhanced Multilayer Software Image (EMI)) • Intelligent adaptability through Cisco Identity Based Networking Services (IBNS) offering greater flexibility and mobility to stratified users	2-12

Product	Features	Page
Catalyst 4500 Series-Modular Configuration (4503, 4506 and 4507R)	Modular, multilayer switch with integrated intelligent services for converged networks in enterprise campus wiring closets, Layer2/Layer3 distribution, and integrated LAN/WAN branch office. • Resilient architecture for mission critical applications • Up to 240 ports of Ethernet, Fast Ethernet or Gigabit Ethernet over Fiber or Copper • High performance, Cisco Express Forwarding (CEF) Layer 2/3/4 switching up to 48 Mpps • Up to 64 Gbps of switching capacity • Advanced network control with predictable performance, granular QoS, advanced security, comprehensive management • Managed	2-15
Catalyst 4000 Series—Fixed Configuration (4908G-L3 and 4912G)	High performance fixed Gigabit Ethernet switch with intelligent enterprise Cisco IOS services	2-17
Catalyst 5000 Family	Modular switch that supports a broad range of interfaces for aggregation of legacy technologies with IP technology • End of Sale Effective June 2003/End of Support effective 2008. For further information please contact your local sales representative	2-18
Catalyst 6500 Family	High-performance, multilayer switch with integrated intelligent services for enterprise campus backbones, server aggregation, or internet data centers • 10/100, 100FX Fast Ethernet, 1000BASE-T, 1000BASE-X, and Gigabit Ethernet modules • Layer 4-7 services • Up to 256 Gbps of switching capacity • Packet throughput scalable to 100+ Mpps • Managed	2-20
Catalyst 8500 Series	High-performance, modular, multimedia switch router • Wire speed, nonblocking IP, IPX, IP multicast Layer 3 switching • Multiple interface options • Managed	2-24

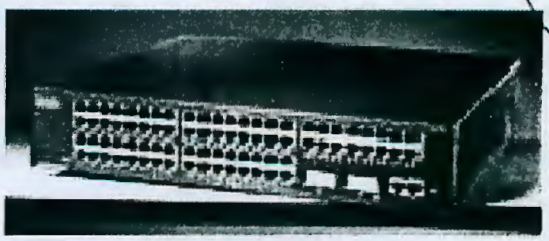
Cisco Catalyst 2900 Series



The Catalyst 2948G and 2980G deliver all the Ethernet switching needed for many small to medium-sized wiring closets in a single system without the need for additional modules, cables or other interconnects. Utilizing the same industry-leading software and functionality of the Catalyst 4000, 5000, and 6000 families, the Catalyst 2948G and 2980G have consistent end-to-end services, which ensure complete interoperability with enterprise Catalyst switches.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 2980G Series	• A single box solution without additional cables, modules or configuration • Up to 80 ports of wire-speed, non-blocking performance with large MTBF reliability • End-to-end VLANs, EtherChannel, multicasting, and security • Mature/proven Catalyst software compatibility in the wiring closet and data center
Catalyst 2948G Series	• The same features as 2980G but up to 48 ports of wire-speed, non-blocking performance
Catalyst 2948G-L3	• High performance CPU with Cisco IOS software • Dedicated 48 ports of 10/100 Mbps and two ports of 1000BASEX Gigabit Ethernet with gigabit Ethernet converter (GBIC) support; all ports support Layer 3 capability

Key Features

- Powerful non-blocking performance with proven Cisco IOS services
- Wire speed 18 Million pps switching throughput
- Intelligent multilayer IOS services (security, multicast, quality of service [QoS])
- Advanced multiple queue QoS architecture
- Security (TACACS+, RADIUS, port lockdown)
- Spanning-Tree Protocol (802.1D) with enhancements (UplinkFast, PortFast) for deterministic/fast failover
- Redundant Power Supply (option)

Competitive Products

Cisco Catalyst 2900 Series XL—Modular Switches

Cisco's Catalyst 2900 Series XL is a full line of modular, 10/100 autosensing Fast Ethernet switches that combine outstanding performance, ease of use, and integrated Cisco IOS software.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 2912MF XL	• All-fiber switch to aggregate Fast Ethernet workgroups over 100BASE-FX connections in small and mid-size campus environments • High-speed uplinks to backbone or server via Fast Ethernet, Gigabit Ethernet
Catalyst 2924M XL	• Any combination of dedicated 10-Mbps or 100-Mbps connections to individual PCs, servers, and other systems or connectivity between existing Ethernet and Fast Ethernet workgroups • The option to easily increase the switch's port density and provide inexpensive high-speed uplinks through bandwidth aggregation (Fast EtherChannel and Gigabit EtherChannel technologies) • Gigabit Ethernet (including 1000BASE-T) modules for high-speed links • Hot swap insertion and removal of modules • Maximum flexibility

Key Features

- Switch fabric of 3.2 Gbps, a forwarding rate of more than 3.0 million packets per second, and a maximum forwarding bandwidth of 1.6 Gbps, delivering wire-speed performance across all 10/100 ports
- Support for IEEE 802.1p protocol for prioritization of mission-critical and time-sensitive applications such as voice and telephony traffic
- Cisco's switch clustering technology enables up to 16 interconnected Catalyst 1900, 2900 XL, and 3500 XL switches, regardless of geographic location, to form a flexible, single IP managed network
- Up to 250 port-based VLANs or ISL/802.1Q trunks
- Network port allows operation in networks with unlimited MAC addresses
- Autoconfiguration of multiple switches on a network from one boot server
- Up to 4 Gbps bandwidth between routers, switches, and servers with Fast EtherChannel and Gigabit EtherChannel technologies

Competitive Products

- 3Com: SuperStack III 3300
- Nortel: BayStack 350 & 450 switches

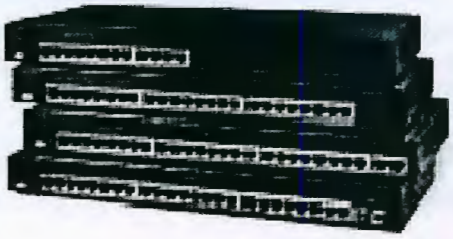
Cisco Catalyst 2950 Series Intelligent Ethernet Switches



The Catalyst 2950 Series with Intelligent Ethernet Switches are fixed-configuration, standalone and stackable models that provide wire-speed Fast Ethernet and Gigabit Ethernet connectivity for small, mid-sized, service provider and industrial networks. The 2950C-24, 2950T-24, 2950G-12-EI, 2950G-24-EI, 2950G-48-EI and 2950G-24-EI-DC are part of an affordable product line that brings intelligent services, such as advanced quality of service, rate-limiting, security filters, and multicast management, to the network edge-while maintaining the simplicity of traditional LAN switching. When a Catalyst 2950 Switch is combined with a Catalyst 3550 Series Switch, the solution is capable of enabling IP routing from the edge to the core of the network. These Intelligent Ethernet Switches come with Enhanced Image (EI) software configuration only.

In addition to the range of Intelligent Ethernet switches, the Catalyst 2950 Series also includes switches with Standard Image (SI) software configuration only. The Cisco Catalyst 2950SX-24, 2950-24 and 2950-12, members of the Cisco Catalyst 2950 Series Switches, are standalone, fixed-configuration, managed 10/100 switches with Gigabit uplinks (2950SX-24 only) providing user connectivity for small to mid-sized networks. These wire-speed desktop switches come with Standard Image (SI) software features and offer Cisco IOS functionality for basic data, video and voice services at the edge of the network.

The Catalyst 2950 Series also includes the Cisco Catalyst 2955T-12, 2955C-12, and 2955S-12. The Cisco Catalyst 2955 are industrial-grade switches that provide Fast Ethernet and Gigabit Ethernet connectivity for deployment in harsh environments. With a range of copper and fiber uplink options, the Catalyst 2955 operates in environments such as industrial networking solutions (industrial Ethernet deployments), intelligent transportation systems (ITSs), and transportation network solutions. It is also suitable for many military and utility market applications where the environmental conditions or suspended solid concentrations exceed the specifications of other commercial switching products.

Embedded in all the products in the Catalyst 2950 Series is the Cisco Cluster Management Suite (CMS) Software, which allows users to simultaneously configure and troubleshoot multiple Catalyst desktop switches using a standard Web browser.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 2950 Series Intelligent Ethernet Switches with Enhanced Image (EI)	• Layer 2/3/4 based services: Advanced QoS, Security, High availability and STP enhancements • Wire-speed performance • Advanced QoS, Security, High availability and STP enhancements • Cisco Cluster Management • Stackable • GBIC based uplink ports for media flexibility
Catalyst 2950G-48-EI	• Ideal for desktop connectivity • High Port Density
Catalyst 2950G-24-EI	• Ideal for desktop connectivity • Medium Port Density
Catalyst 2950G-24-EI-DC	• Ideal for Telco/DCN environments • NEBS compliant • Medium Port Density
Catalyst 2950G-12-EI	• Ideal for desktop connectivity • Low Port density
Catalyst 2950T-24	• High speed uplink flexibility with fixed 10/100/1000BaseT ports • Low price per port
Catalyst 2950C-24	• High speed uplink flexibility over extended distances with fixed 100BASE-FX connections using MT-RJ connectors • Low price per port
Catalyst 2950 Series with Standard Image (SI)	• Wire speed, high performance switches for delivering 10/100 Mbps speed connectivity to desktop PCs, servers and other systems • Layer 2-based QoS and Security features • Cisco Cluster Management • Ideal for desktop connectivity
Catalyst 2950-12	• Low Port density
Catalyst 2950-24	• Medium port density
Catalyst 2950SX-24	• High speed uplinks with 2 fixed 1000BaseSX ports • Medium port density
Catalyst 2955 Series with Enhanced Image (EI)	• Ideal for harsh network environments • Rugged: Implements industrial-grade components, a compact form factor, convection cooling, and relay output signaling. Designed to operate at extreme temperatures and under extreme vibration and shock. • Layer 2/3/4 based services: Advanced QoS, Security, High availability and STP enhancements • Wire-speed performance
Catalyst 2955T-12	• Twelve 10/100 ports and two 10/100/1000BASE-TX (Copper) uplinks
Catalyst 2955C-12	• Twelve 10/100 ports and two 100BASE-FX (Multimode Fiber) uplinks
Catalyst 2955S-12	• Twelve 10/100 ports and two 100BASE-LX (Singlemode Fiber) uplinks

Key Features

- Cisco Cluster Management (CMS) Software offers superior manageability, ease-of-use and ease-of-deployment and enhanced configuration wizards
- Wire-speed performance in connecting end-stations to the LAN
- Catalyst 2950: Ideal for small- and mid-sized networks
- Catalyst 2955: Ideal for harsh network environments
- Sophisticated Multicast Management via IGMP Snooping
- Scalability and high availability features
- Support for Cisco Redundant Power System 300 (RPS 300)
- Switches with Standard Image (SI) include these additional features:
  - Catalyst 2950SX-24 switch provides a cost-effective solution for Gigabit speeds over fiber, offering 2 1000BaseSX uplinks
  - QoS and Security based on Layer 2 information
  - Basic Cisco IOS Services

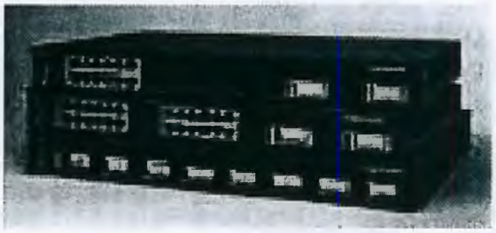
Cisco Catalyst 3500 Series XL



The Cisco Systems Catalyst 3500 series XL is a scalable line of stackable 10/100 and Gigabit Ethernet switches that delivers premium performance, flexibility, and manageability with unparalleled investment protection. This line of low-cost, high-performance switching solutions provides next-generation stackable switching through an independent high-speed stacking bus that preserves valuable desktop ports. Cisco's breakthrough Switch Clustering technology expands the stacking domain beyond a single wiring closet, enabling up to 16 interconnected Catalyst 3550, 2950, 3500 XL, 2950, 2900 XL and 1900 switches—regardless of geographic location—to form a flexible, single IP managed network.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 3524-PWR XL	• A stackable, wire-speed 10/100 and Gigabit Ethernet switch for delivering dedicated 10 or 100 Mbps to individual users and servers • Advanced QoS, high availability, and integrated in-line power enabling easy deployment of IP phones and wireless access points.
Catalyst 3508G XL	• A stackable Gigabit Ethernet switch with eight GBIC-based ports for aggregating a group of Gigabit Ethernet switches and servers through Cisco GigaStack GBICs or standard 1000BASE-X GBICs • Dedicated, high-speed Gigabit Ethernet performance

Key Features

- 10.8 Gbps switch fabric, up to 8 Mpps forwarding rate, and maximum forwarding bandwidth of 5.4 Gbps across all 10/100 ports
- Built-in Gigabit Ethernet ports accommodate a range of GBIC transceivers, including the Cisco GigaStack GBIC, 1000BASE-T, 1000BASE-SX and 1000BASE-LX/LH GBICs, and 1000BASE-ZX extended reach GBIC
- Low-cost, 2-port Cisco GigaStack GBIC offers a range of configurable stacking and performance options by delivering 1-Gbps connectivity in a daisy-chained connection or up to 2-Gbps in a dedicated, switch-to-switch connection
- Support for IEEE 802.1p technology for prioritization of mission-critical and time-sensitive application such as voice and telephony traffic
- 3524-PWR XL provides in-line power to IP phones and other devices

Competitive Products

Cisco Catalyst 3550 Series Intelligent Ethernet Switches

The Cisco Catalyst 3550 Series Intelligent Ethernet Switches is a line of enterprise-class, stackable, multilayer switches that provide high availability, scalability, security and control to enhance the operation of the network. With a range of Fast Ethernet and Gigabit Ethernet configurations, the Catalyst 3550 Series can serve as both a powerful access layer switch for medium enterprise wiring closets and as a backbone switch for small networks. Now customers can deploy network-wide intelligent services, such as advanced quality of service, rate-limiting, Cisco security access control lists, multicast management, and high-performance IP routing—while maintaining the traditional LAN switching.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 3550 Series	• Enterprise-class intelligent services such as ACLs, advanced QoS, and rate-limiting • Cisco Cluster Management
Catalyst 3550-48-EMI (Enhanced Multilayer Software Image)	• High performance advanced IP routing • High Port Density • Ideal as a powerful access layer switch for a medium enterprise wiring closet with routed uplinks
Catalyst 3550-48-SMI (Standard Multilayer Software Image)	• High Port Density • Ideal for a powerful access layer switch for a medium enterprise wiring closet • Basic IP routing
Catalyst 3550-24-EMI (Enhanced Multilayer Software Image)	• High performance advanced IP routing • Medium Port Density • Ideal for a powerful access layer switch for a medium enterprise wiring closet with routed uplinks
Catalyst 3550-24-SMI (Standard Multilayer Software Image)	• Medium Port Density • Ideal for a powerful access layer switch for a medium enterprise wiring closet • Basic IP routing
Catalyst 3550-24PWR-EMI (Enhanced Multilayer Software Image)	• High performance advanced IP routing • Medium Port Density • Integrated inline power to Cisco IP telephones and Cisco wireless LAN access points • Ideal for a powerful access layer switch for a medium enterprise wiring closet with routed uplinks
Catalyst 3550-24PWR-SMI (Standard Multilayer Software Image)	• Medium Port Density • Integrated inline power to Cisco IP telephones and Cisco wireless LAN access points • Ideal for a powerful access layer switch for a medium enterprise wiring closet • Basic IP routing
Catalyst 3550-24-DC-SMI (Standard Multilayer Software Image)	• Medium Port Density • DC powered, NEBS level 3 compliant • Basic IP routing
Catalyst 3550-24-FX-SMI (Standard Multilayer Software Image)	• Medium Port Density • Ideal for 100FX aggregation • Basic IP routing
Catalyst 3550-12G	• High performance IP routing • Gigabit Ethernet aggregation using fiber • Ideal for stack aggregation, server aggregation, or as a backbone switch in a mid-sized network
Catalyst 3550-12T	• High performance advanced IP routing • Gigabit Ethernet aggregation using Category 5 copper cabling • Ideal for stack aggregation, server aggregation, or as a backbone switch in a mid-sized network
CD-3550-EMI	• High performance advanced IP routing • EMI upgrade kit for standard versions of the Catalyst 3550-24, 3550-24 PWR, 3550-24-DC, 3550-24-FX, and 3550-48 switches

Key Features

- Network control and bandwidth optimization via advanced Quality of Service (QoS), granular rate-limiting, Access Control Lists (ACLs), and multicast services
- Network security through a wide range of authentication methods, data encryption technologies, and access restriction features based on users, ports, and MAC addresses
- Network scalability through advanced routing protocols such as EIGRP, OSPF, BGP, and PIM (requires Enhanced Multilayer Software Image (EMI))
- Intelligent adaptability through Cisco Identity Based Networking Services (IBNS) offering greater flexibility and mobility to stratified users
- Lower Total Cost of Ownership (TCO) for IP Telephony and Wireless LAN deployments through integrated inline power (Catalyst 3550-24 PWR only)
- Easy switch configuration and deployment of advanced services through the embedded Cluster Management Suite (CMS) Software
- Stackable up to 9 switches with the Gigastack GBIC

Competitive Products

- Extreme Networks: Summit5i, Summit 24/48, Summit 48i
- Foundry: FastIron 4802
- Nortel: BPS 2000

WS-C3550-48-SMI	Catalyst 3550-48 multilayer switch with 48 10/100 ports and 2 GBIC-based Gigabit Ethernet ports; SMI installed
WS-C3550-48-EMI	Catalyst 3550-48 multilayer switch with 48 10/100 ports and 2 GBIC-based Gigabit Ethernet ports; EMI installed
WS-C3550-24-SMI	Catalyst 3550-24 multilayer switch with 24 10/100 ports and 2 GBIC-based Gigabit Ethernet ports; SMI installed
WS-C3550-24-EMI	Catalyst 3550-24 multilayer switch with 24 10/100 ports and 2 GBIC-based Gigabit Ethernet ports; EMI installed
WS-C3550-24PWR-SMI	Catalyst 3550-24 multilayer switch with 24 10/100 ports and 2 GBIC-based Gigabit Ethernet ports; integrated inline power; SMI installed
WS-C3550-24PWR-EMI	Catalyst 3550-24 multilayer switch with 24 10/100 ports and 2 GBIC-based Gigabit Ethernet ports; integrated inline power; EMI installed
WS-C3550-24-DC-SMI	Catalyst 3550-24-DC multiplayer switch with 24 10/100 ports and 2 GBIC-based Gigabit Ethernet ports; SMI installed; DC-powered
WS-C3550-24-FX-SMI	Catalyst 3550-24-FX multilayer switch with 24100FX multimode fiber ports and 2 GBIC-based Gigabit Ethernet ports; SMI installed
WS-C3550-12G	10 GBIC-based Gigabit Ethernet ports and 2 10/100/1000 ports; EMI installed
WS-C3550-12T	10-10/100/1000BaseT ports and 2 GBIC-based Gigabit Ethernet ports; EMI installed
CD-3550-EMI=	EMI upgrade kit for the standard versions of the Catalyst 3550-24, 3550-48, 3550-24PWR, 3550-24-DC, and 3550-24-FX

Gigabit Interface Converters (GBICs)

WS-X3500-XL	GigaStack Stacking GBIC and 50 cm cable
WS-G5484=	1000BaseSX GBIC-short wavelength GBIC (multimode fiber only)
WS-G5486=	1000BaseLX/LH GBIC-long wavelength/long haul GBIC (single or multimode fiber)
WS-G5487=	1000BaseZX GBIC-extended reach GBIC (single mode fiber only)
WS-G5483=	1000BaseT GBIC-Gigabit Ethernet over Copper GBIC

Redundant Power System (RPS)

PWR675-AC-RPS-N1=	675W Redundant Power Supply with 1 connector cable
VAB-RPS-1414=	1.2 meter cable for Cisco RPS 300 to external device connection

Cables/Accessories and Redundant Power Supply

CAB-RPS-1614=	1 RPS 675 connector cable 16/14
RCKMNT-3550-1.5RU=	Rack mount kit for the Catalyst 3550-12T and 3550-12G switches
RCKMNT-1RU=	Rack mount kit for the Catalyst 3550-24, 3550-48, 3550-24PWR, 3550-24-DC, and 3550-24-FX switches

Packaged SMARTnet 8x5xNBD Maintenance Contract for Two-Tier Customers

CON-SNT-PKG9	Packaged SMARTnet 8x5xNBD for the WS-C3550-12T and WS-C3550-12G
CON-SNT-PKG4	Packaged SMARTnet 8x5xNBD for the WS-C3550-24-SMI and WS-C3550-24PWR-SMI
CON-SNT-PKG5	Packaged SMARTnet 8x5xNBD for the WS-C3550-24-DC-SMI
CON-SNT-PKG6	Packaged SMARTnet 8x5xNBD for the WS-C3550-24-EMI, WS-C3550-24PWR-SMI and WS-C3550-48-SMI
CON-SNT-PKG7	Packaged SMARTnet 8x5xNBD for the WS-C3550-48-EMI and WS-C3550-24-FX-SMI

Cisco Catalyst 4500 Series

The Cisco Catalyst 4500 Series integrates nonblocking Layer 2/3/4 switching with optimal control, enabling business resilience for enterprise and metropolitan Ethernet customers deploying Internet-based business applications. A next generation Catalyst 4000 Series platform, the Cisco Catalyst 4500 Series includes three new chassis: Catalyst 4507R (7-slot: redundant Supervisor IV capable), Catalyst 4506 (6-slot) and Catalyst 4503 (3-slot). A key component of Cisco AVVID (Architecture for Voice, Video and Integrated Data), the Catalyst 4500 extends control to Enterprise wiring closets, branch office and Layer 3 distribution points. A variety of network infrastructure solutions are enabled by the Catalyst 4500 Series of switches including: Cisco IOS Network Services, IP Telephony, 10/100/1000 to the desktop, Wireless LAN, NetFlow Services and Metro Ethernet Switching.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 4507R	• When network resiliency via redundant Supervisor Engines is crucial to customer success • Port density up to 240-10/100, 100-FX, or 10/100/1000BASE-T with modular investment protection • Layer 2 and Layer 3 Cisco Express Forwarding (CEF)-based switching up to 64 Gbps, 48 Mpps
Catalyst 4506	• Port density up to 240-10/100, 100-FX, or 10/100/1000BASE-T with modular investment protection • Layer 2 and Layer 3 Cisco Express Forwarding (CEF)-based switching up to 64 Gbps, 48 Mpps
Catalyst 4503	• Port density up to 96-10/100, 100-FX, or 10/100/1000BASE-T with modular investment protection • Layer 2 and Layer 3 Cisco Express Forwarding (CEF)-based switching up to 28 Gbps, 21 Mpps

Note: Compatible sparing between Catalyst 4507R, 4506, and 4503 chassis provides investment protection with common power supplies and switching line cards. The Catalyst 4500 series also leverages the same feature set with identical software code base along with the same enterprise functionality as the Catalyst 6500 Series in the wiring closet, delivering a consistent end-to-end solution.

Key Features

- Supervisor II
  - Catalyst 4500/6500 Series CatOS Software, single IPQ—Address Management, and security (TACACS+, port lockdown, RADIUS, Kerberos)
  - Enterprise VLANs (4,096) with 802.1Q support on all ports, 16,000 MAC Addresses, and Spanning-Tree Protocol (802.1D) enhancements (UplinkFast, PortFast, and BackboneFast) for deterministic/fast failover
  - Fast and Gigabit EtherChannel aggregation (up to 8 Gbps full duplex), load balancing and failover on every port, and port filtering
- Supervisor IV
  - Capable of 1+1 redundancy in a 4507R (Single Supervisor only in Catalyst 4506 and 4503)
  - Optional NetFlow Services Card Support
  - Integrated Layer 2/3/4 CEF based switching at 64Gbps and 48Mpps
  - Feature rich and proven Cisco IOS Software
  - Port based enhanced QOS with multiple queues (16k input; 16k output), bandwidth management, policing and Access Control Lists (16k input ACL entries; 16k output entries)
  - Enterprise VLANs (4,000) with 802.1Q and ISL support on all ports, 32,000 MAC Addresses, and Spanning-Tree Protocol (802.1D), 802.3w, 802.3s

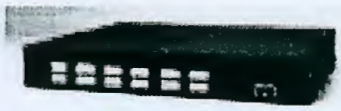
Cisco Catalyst 4000 Series — Fixed Configuration



Cisco offers two dedicated Gigabit Ethernet fixed configuration switches; the Catalyst 4908G-L3 and the Catalyst 4912G. The Catalyst 4908G-L3 Switch is a fixed configuration Layer 3 Ethernet switch featuring wire-speed switching for IP, IPX and IP Multicast. It provides the high performance required for midsize campus backbones with optimum port density.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 4908G	• Cost effective dedicated Gigabit Ethernet Layer 3 backbone solution ideal for deployment in midsize networks for those customers who need wire speed Layer 3 performance but do not require Gigabit Ethernet density over 8 ports.
Catalyst 4912G	• Advanced wirespeed, non-blocking Layer 2 Gigabit Ethernet performance with intelligent Cisco IOS services and high-speed connections to workstations or servers; flexible Gigabit Interface Converter (GBIC) interfaces on all ports

Key Features

- Catalyst 4908G-L3:
  - 8 ports of 1000BASE x Gigabit Ethernet with GBIC support; Layer 3 switching and routing of IP, IPX and IP Multicast with wire speed Layer 2 switching for non routable protocols; Gigabit Etherchannel capability on every port
- Catalyst 4912G:
  - Wire-speed performance with 24 Gbps of dedicated bandwidth for nonblocking Gigabit Ethernet concentration, broad Gigabit EtherChannel availability, and GBIC flexibility on fiber port interfaces covering a wide range of cabling distances

Cisco Catalyst 5000 Family

On October 4, 2002, Cisco Systems announced the end of sale for the Cisco Catalyst 5000 and 5500 series of modular switches, including all related Cisco Catalyst 5000 and 5500 series chassis and modules. The Cisco Catalyst 5000 and 5500 series chassis and modules will be orderable through June 30, 2003.

The Catalyst 5000 family features a Gigabit Ethernet and ATM-ready platform offering users high-speed trunking technologies, including Fast EtherChannel and OC-12 ATM. This series also provides a redundant architecture, dynamic VLANs, complete intranet services support, and media-rate performance with a broad variety of interface modules.

Migration Options

	When a Customer Needs These Features
Catalyst 6500 with Sup2/msfc2	• High Performance L3 wiring closet, data centre, or core feature sets • Integrated L2-7 Serices Modules • Layer 3 Routing Capabilities • Scalability to 256 Gbps • Hardware based QoS and ACLs • IOS software
Catalyst 6500 with Sup2/pfc2	• High Performance L2 wiring closet, data centre or core feature sets • Scalability to 256 Gbps • Hardware based QoS and ACLs
Catalyst 6500 with sup1A-2GE	• Low cost of entry wiring closet solution • Scalability to 32Gbps • Basic security and L2 QoS capabilities • L2 Stateful failover capabilities

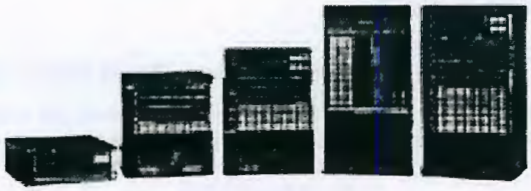
Cisco Catalyst 6500 Family



The Catalyst 6500 Family delivers highly available secure converged network services for the Enterprise and Service Provider networks. Designed to address the increased requirements for gigabit scalability, high-availability, rich services, and multilayer switching in backbone, distribution, and wiring closet topologies as well as datacenter environments, the Catalyst 6500 Family delivers exceptional scalability and price/performance, supporting a wide range of interface densities, performance, and integration of powerful service modules. The Catalyst Family delivers a wide range of intelligent switching solutions, enabling corporate intranets, extranets, and the internet for multimedia, mission-critical data, and voice applications.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 6500 Series	• A highly scalable platform that meets requirements for a dynamic environment including very high multilayer switching performance with high Fast Ethernet and Gigabit Ethernet port densities
Catalyst 6500 Family Solutions	• Enterprise campus distribution and core—With industry-leading port densities, performance, and high availability solutions • Enterprise Server Farm—For Gigabit wire-speed access to mission-critical server farms • High-capacity wiring closets—In very large deployments, the Catalyst 6000 family delivers advanced Layer 2, 3, and 4 switching in wiring closets • Value wiring closets where basic L2 QoS and ACL capabilities are required in addition to 2-3 Sec L2 Stateful failover • WAN/LAN/MAN integration—Single integrated platform simplifies network design, decreases rack space requirements, and decreases overall administration costs • Advanced, integrated hardware based firewall, content switching, intrusion detection, and network analysis capabilities • Service Provider Networks—For all dynamic environments including e-commerce, web hosting, and co-location facilities

Key Features

- Application-aware networking with multilayer switching intelligence and support for CiscoAssure policy networking
- High-availability features deliver maximum uptime for mission-critical application support
- Extensive Quality of Service (QOS) features to support mission-critical applications
- Scalable performance to 210 Mpps
- Maximum 10/100 Ethernet port density: 96 (3-slot chassis), 240 (6-slot chassis), 384 (9-slot chassis), and 576 (13-slot chassis)
- Maximum Gigabit Ethernet port density: 32 (3-slot chassis), 82 (6-slot chassis), 130 (9-slot chassis), and 194 (13-slot chassis)

Cisco Catalyst 8500 Multiservice Switch Routers

The Catalyst 8500 family multiservice switch routers integrate multiservice ATM switching with wire-speed multiprotocol routing for Gigabit Ethernet and Fast Ethernet into a single platform that also supports advanced Cisco IOS services for QoS and security. This family delivers enterprise MAN/WAN and Service Provider multiservice edge solutions with scalable performance, lower cost of ownership, and offer multiple interface options in a modular chassis. The Catalyst 8500 series consists of the modular Catalyst 8510 (10-Gbps, 5-slot) switch and the modular Catalyst 8540 (40-Gbps, 13-slot) switch. Both switches implement Cisco IOS Software to provide a variety of network services including reliability, security, management, and QoS with CiscoAssure policy networking.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 8540 and Catalyst 8510	• Integrated 10/100 FE, GE, and ATM • Flexible ATM interfaces (T1/E1, IMA, DS3/E3, OC-3, OC-12, and OC-48) • Frame relay and circuit emulation services • Wire-speed performance • Multiservice MAN/WAN applications • Multiservice Edge solutions • Voice, data, and video solutions • MPLS VPN

Key Features

- Ideal for integrated multiservice ATM switching with wire-speed multiprotocol routing for gigabit Ethernet (L3eATM or Layer 3 enabled ATM)
- Ideal for aggregating multiprotocol traffic from multiple wiring closets or from workgroup switches such as the Catalyst 5000 or distribution/server aggregation switches such as the Catalyst 6000 Family
- Provides nonblocking routing for IP, IPX, and IP multicast while also offering wire-speed Layer 2 switching for nonroutable protocols such as NetBIOS and DECnet local-area transport (LAT)
- Aggregate throughput of up to 24 million packets per second (pps) for non-blocking, wirespeed Layer 3 switching

Competitive Products

- Foundry: Big Iron
- Lucent: PSAX 1250 and 2300
- Marconi: ASX 1000, 1200, and 4000
- Alcatel: Omniswitch

Wireless LAN Products

Wireless LAN Products at a Glance (IEEE 802.11b)

Product	Features	Page
Cisco Aironet 1200 Series Access Points	• Offers investment protection and a smooth migration path to future technologies through a dual band radio design • Delivers an enterprise class security solution with the IEEE 802.11x-based Cisco Wireless Security Suite • Industry-leading security, network management, throughput and software feature set • Support for both line power over Ethernet and local power	3-2
Cisco Aironet 1100 Series Access Point	• Single 802.11b radio, upgradable to 802.11g • Provides end-to-end solution support for Intelligent Network Services • Delivers an enterprise class security solution with the IEEE 802.11x-based Cisco Wireless Security Suite • Support for both line power over Ethernet and local power • Cost effective, yet feature-rich	3-5
Cisco Aironet 5 GHz 54 Mbps Wireless LAN Client Adapter	• IEEE 802.11a-compliant CardBus adapter that operates in the UNII-1 and UNII-2 bands • Complements the Cisco Aironet 1200 Series 802.11a Access Point, providing a solution that combines performance and mobility with the security and manageability that enterprises require	3-6
Cisco Aironet 350 Series Client Adapters	• Superior range and throughput • Secure network communications • World mode for international roaming • PCMCIA card and PCI form factors • IEEE 802.11b	3-8
Cisco Aironet 350 Series Workgroup Bridge	• Driverless installation of up to eight Ethernet-enabled devices • Optimum wireless performance and range • Standards-based centralized security • IEEE 802.11b	3-10
Cisco Aironet 350 Series Wireless Bridge	• High-speed, high-power radios, delivering building-to-building links of up to 25 miles (40.2 km) • A metal case for durability and plenum rating • Supports both point-to-point and point-to-multipoint configurations • Broad range of support antennas • Simplified installation, improved performance, and upgradeable firmware, ensuring investment protection • IEEE 802.11b	3-12
Cisco Aironet Antennas and Accessories	• A wide array of options • FCC-approved directional and omni-directional antennas • Low-loss cable, mounting hardware, and other accessories available	3-14
CiscoWorks Wireless LAN Solution Engine	A hardware-based wireless LAN management solution that provides template-based configuration with user-defined groups to effectively manage a large number of access points and bridges. • Monitors LEAP authentication servers • Enhances security management through mis-configuration detection on access points and bridges	9-23

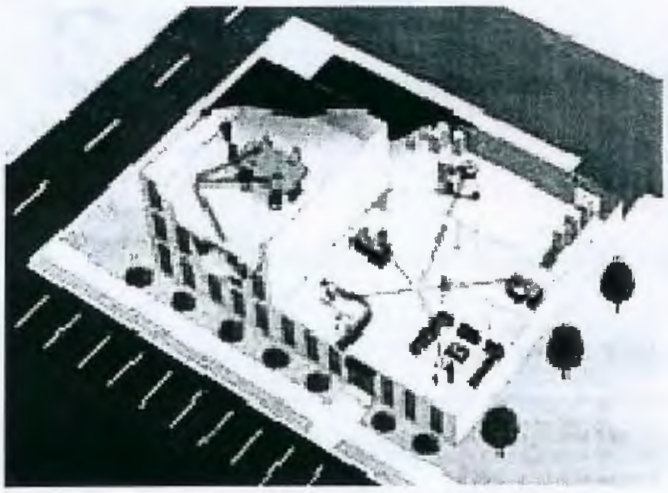
Sample Wireless LAN Solution Overview—In-Building or Site-to-Site



Enterprise, Small/Medium Business Applications

Service common areas for mobile workers
Support employees working in multiple offices
Cost effective, quick network deployment for temporary or leased offices

Sample Vertical Markets

Healthcare, retail, government
Public Access
Multiple Tenant/Dwelling Units
Airports, Hotels, Convention Centers
Education: K-12 and Universities

Cisco Aironet 1200 Series Access Points

The Cisco Aironet 1200 Series Access Point sets the enterprise standard for next-generation high performance secure, manageable, and reliable wireless local-area networks (WLANs) while also providing investment protection because of its upgrade capability and compatibility with current standards. The modular design of the Cisco Aironet 1200 supports IEEE 802.11a and 802.11b technologies in both single-and dual-mode operation. You can configure the Cisco Aironet 1200 to meet customer-specific requirements at the time of purchase and then reconfigure and upgrade the product in the field as these requirements evolve.

The Cisco Aironet 1200 Series protects current and future network infrastructure investments. Compliant with IEEE 802.11a and 802.11b standards, The 802.11a radio supports data rates of up to 54 Mbps and eight non-overlapping channels that offer high performance as well as maximum capacity and scalability. The 802.11b radio provides data rates up to 11 Mbps and three non-overlapping channels to support widely deployed 802.11b clients. The Mini-PCI form factor of the 802.11b radio allows for upgrade to higher-speed 2.4 GHz technologies such as the draft IEEE 802.11g standard.The Cisco Aironet 1200 Series extends end-to-end intelligent networking to the wireless access point with support for enterprise-class virtual LANs (VLANs) and quality of service (QoS). An ideal choice for enterprise installations, the Cisco Aironet 1200 Series can manage up to 16 VLANs, which allows customers to differentiate LAN policies and services, such as security and QoS, for different users. Traffic to and from wireless clients with varying security capabilities can be segregated into VLANs with varying security policies.

Wireless LAN security is a primary concern. The Cisco Aironet 1200 Series secures the enterprise network with a scalable and manageable system featuring the award-winning Cisco Wireless Security Suite. Based on the 802.11x standard for port-based network access, the Cisco Wireless Security Suite takes advantage of the Extensible Authentication Protocol (EAP) framework for user-based authentication.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 1200 Series Access Point	• IT Professionals or business executives want mobility within the enterprise to increase productivity, as an addition or alternative to wired networks. • Business owners or IT directors need flexibility for frequent LAN wiring changes, either throughout the site or in selected areas. • Any company whose site is not conducive to LAN wiring because of building or budget limitations, such as older buildings, leased space or temporary sites.

Key Features

- Offers investment protection because of its upgrade capability and compatibility with current standards
- Delivers an enterprise class security solution with the IEEE 802.11x-based Cisco Wireless Security Suite
- Industry-leading security, network management, and software feature set
- Support for both inline power over Ethernet or local power
- Simultaneous support for both IEEE 802.11b and IEEE 802.11a

Specifications

Feature	Cisco Aironet 1200 Series Access Points with 802.11a radio installed	With 802.11b radio installed	With both 802.11a and 802.11b radio installed
Data Rates Supported	6, 9, 12, 18, 24, 36, 48, 54 Mbps	1, 2, 5.5, and 11 Mbps	Same as 802.11a and 802.11b combined
Uplink	Autosensing 802.3 10/100BaseT Ethernet	Autosensing 802.3 10/100BaseT Ethernet	Same as 802.11a and 802.11b combined
Form Factor	CardBus (32-bit)	Mini-PCI	Same as 802.11a and 802.11b combined
Frequency Band	5.15 to 5.35 GHz (FCC UNII 1 and UNII 2), 5.15 to 5.25 GHz (TELEC),5.15 to 5.25 GHz (Singapore),5.25 to 5.35 GHz (Taiwan)	2.412 to 2.462 GHz (FCC),2.412 to 2.472 GHz (ETSI),2.412 to 2.484 GHz (TELEC),2.412 to 2.462 GHz (MII),2.422 to 2.452 GHz (Israel)	Same as 802.11a and 802.11b combined
Wireless Medium	Orthogonal Frequency Division Multiplexing (OFDM)	Direct Sequence Spread Spectrum (DSSS)	Same as 802.11a and 802.11b combined
Modulation	(OFDM subcarrier);BPSK @ 6 and 9 Mbps; QPSK @ 12 and 18 Mbps; 16-QAM @ 24 and 36 Mbps;64-QAM @ 48 and 54 Mbps	DBPSK @1 Mbps; DQPSK @ 2 Mbps; CCK @ 5.5 and 11 Mbps	Same as 802.11a and 802.11b combined
Operating Channels	FCC: 8;TELEC (Japan): 4; Singapore: 4; Taiwan: 4	ETSI: 13; Israel: 7; North America: 11; TELEC (Japan): 14; MII: 11	Same as 802.11a and 802.11b combined
Nonoverlapping Channels	Eight (FCC only); Four (Japan, Singapore, Taiwan)	Three	Eleven
Available Transmit Power Settings[1]	40 mW (16 dBm);20 mW (13 dBm);10 mW (10 dBm);5 mW (7 dBm); Maximum power setting will vary according to individual country regulations.	100 Mw (20 dBm); 5 Mw (17 dBm); 30 mW (15 dBm); 20 mW (13 dBm); 5 mW (7 dBm); 1 mW (0 dBm); Maximum power setting will vary according to individual country regulations	Same as 802.11a and 802.11b combined
Range (typical @ maximum power setting, 2.2 dBi gain diversity dipole antenna)	Omni directional Antenna: Indoor: 60 ft (18m)@ 54 Mbps, 130 ft (40m) @ 18 Mbps, 170 ft (52m) @ 6 Mbps; Outdoor: 100 ft (30m) @ 54 Mbps, 600 ft (183m) @ 18 Mbps, 1000 (304m) ft @ 6 Mbps; Patch Antenna: Indoor: 70 ft (21m) @ 54 Mbps, 150 ft (45m) @ 18 Mbps, 200 ft (61m) @ 6 Mbps; Outdoor: 120 ft (36m) @ 54 Mbps, 700 ft (213m) @ 18 Mbps; 1200 ft (355m) @ 6 Mbps	Indoor:130 ft (40m) @ 11 Mbps; 350 ft (107m) @ 1 Mbps Outdoor: 800 ft (244m) @ 11 Mbps; 2000 ft (610m) @ 1Mbps	Same as 802.11a and 802.11b combined
SMTP Compliance	MIB I and MIB II	MIB I and MIB II	MIB I and MIB II
Antenna	Integrated 6 dBi diversity patch (55 degree horizontal, 55 degree vertical beamwidths, 5 dBi diversity omnidirectional with 360 degree horizontal and 40 degree vertical beamwidths	Two RP-TNC connectors (antennas optional, none supplied with unit)	5 GHz: Integrated 6 dBi diversity patch (55 degree horizontal, 55 degree vertical beamwidths, 5 dBi diversity omnidirectional with 360 degree horizontal and 40 vertical beamwidths; 2.4 GHz: Two RP-TNC connectors (antennas optional, none supplied with unit)

Cisco Aironet 1100 Series Access Points

The Cisco Aironet® 1100 Series Access Point provides a secure, affordable, and easy-to-use wireless LAN solution that combines mobility and flexibility with the enterprise-class features required by networking professionals.

Taking advantage of the Cisco Wireless Security Suite for the strongest enterprise security available and of Cisco IOS® Software for ease-of-use and familiarity, the Cisco Aironet 1100 Series Access Point delivers manageability, performance, investment protection, and scalability in a cost-effective package with a low total cost of ownership. The Cisco Aironet 1100 Series features a single, upgradable 802.11b radio, integrated diversity dipole antennas, and an innovative mounting system for easy installation in a variety of locations and orientations.

The first access point based on Cisco IOS Software, the Cisco Aironet 1100 Series extends end-to-end intelligent networking to the wireless access point. Cisco command-line interface (CLI) allows customers to quickly and consistently implement extended capabilities available in Cisco IOS Software. Customers can manage and standardize their networks using tools they have developed internally for their Cisco routers and switches.

Enterprise-class features including virtual LANs (VLANs), quality of service (QoS), and proxy mobile Internet Protocol (IP) make the Cisco Aironet 1100 Series ideal for enterprise installations. The Cisco Aironet 1100 Series also supports standard Cisco Aironet features such as hot-standby and load balancing, allowing enterprises to implement intelligent, reliable network services.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 1100 Series Access Point	• A cost-effective and upgradable WLAN solution that combines the mobility and flexibility of a WLAN solution with the enterprise-class features required by a business LAN. Want an off the shelf WLAN solution that does not require simultaneous dual band operation, or the additional range offered by high-gain antennas.

Key Features

- Single 802.11b radio, upgradable to 802.11g
- Provides end-to-end solution support for Intelligent Network Services
- Variety of mounting options
- Cost effective, yet feature-rich

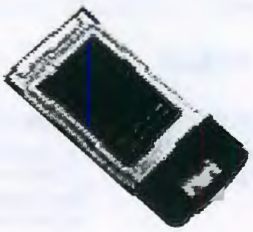
Cisco Aironet 5 GHz 54 Mbps Wireless Client Adapter



The Cisco Aironet® 5 GHz 54 Mbps Wireless LAN client adapter is an Institute of Electrical and Electronic Engineers (IEEE) 802.11a-compliant CardBus adapter that operates in the UNII-1 and UNII-2 bands. The client adapter complements the Cisco Aironet 1200 Series 802.11a Access Point, providing a solution that combines performance and mobility with the security and manageability that enterprises require.

Wireless LAN client adapters can increase productivity by enabling mobile users to have network and Internet access anywhere within a building that is equipped with a wireless network infrastructure. Wireless client adapters connect a variety of devices to a wireless network either in ad hoc peer-to-peer mode or in infrastructure mode with access points. With this client adapter, you can quickly add new employees to a network, support temporary workgroups, or enable Internet access in conference rooms or other meeting spaces. And the Cisco Aironet client solution is easy to use, making the benefits of wireless mobility completely transparent.

With Cisco, you can confidently deploy a wireless solution that provides robust enterprise-class security. All Cisco Aironet products feature the award-winning Cisco Wireless Security Suite, which is based on the IEEE 802.11x standard for port-based network access.

ECT 3687 20 ABL-AC

The Cisco Wireless Security Suite takes advantage of the Extensible Authentication Protocol (EAP) framework for user-based authentication. It supports a variety of 802.11x authentication types including EAP Cisco Wireless (LEAP) and EAP-Transport Layer Security (EAP-TLS).

The Cisco Aironet Client Utility (ACU), with an intuitive graphical user interface, provides an easy way to configure, monitor, and manage the Cisco Aironet 5 GHz Wireless LAN Client Adapter. The ACU includes site-survey tools that present easy-to-understand detailed graphical information to assist in the placement of access points. Profile Manager allows you to create specific profile settings for various environments, such as the office or home, making it simple for telecommuters and business travelers to move from one environment to another.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 5 GHz 54Mbps Wireless LAN Client Adapters	• Industry leading security: IEEE 802.11x support, including LEAP and EAP-TLS, for mutual authentication and dynamic per-user, per session WEP keys • Multiple transmit power settings (20 mW/(13 dBm), 10 mW/(10 dBm), and 5 mW (7 dBm) • End-to-end Cisco branded solution

Key Features

- IEEE 802.11a-compliant CardBus adapter that operates in the UNII-1 and UNII-2 bands
- Complements the Cisco Aironet 1200 Series 802.11a Access Point, providing a solution that combines performance and mobility with the security and manageability that enterprises require

Specifications

Feature	Cisco Aironet 5 GHz 54 Mbps Wireless Client Adapter
Form Factor	CardBus Type II
Interface	32-bit CardBus (PCI)
Operational voltage	3.3 V (+/- 0.33 V)
LED	Status (green) and Activity (amber)
Data Rates Supported	6, 9, 12, 18, 24, 36, 48, 54 Mbps (configurable as fixed or auto selecting to extend range)
Network Standard	IEEE 802.11a
Frequency Band	5.15 to 5.35 GHz (FCC UNII 1 and UNII 2); 5.15 to 5.25 GHz (TELEC); 5.15 to 5.25 GHz (Singapore); 5.25 to 5.35 GHz (Taiwan)
Network architecture type	Infrastructure, star topology
Media Access Protocol	Carrier sense multiple access with collision avoidance (CSMA/CA)
Wireless Medium	Orthogonal Frequency Division Multiplexing (OFDM)
Modulation	(OFDM sub-carrier); BPSK @ 6 and 9 Mbps; QPSK @ 12 and 18 Mbps; 16-QAM @ 24 and 36 Mbps; 64-QAM @ 48 and 54 Mbps
Operating Channels	FCC: 8 channels (UNII-1 4 channels and UNII-2 4 channels); 4 channels for Japan, Singapore, and Taiwan
Available Transmit Power Settings[1]	20 mW (13 dBm);10 mW (10 dBm); 5 mW (7 dBm) Maximum power setting will vary according to individual country regulations.
Current steady state (typical)	Transmit: 520 mA; Receive: 580 mA; Sleep: 20 mA
Range	Omni directional Antenna: Indoor: 60 ft (18m)@ 54 Mbps, 130 ft (40m) @ 18 Mbps, 170 ft (52m) @ 6 Mbps Outdoor: 100 ft (30m) @ 54 Mbps, 600 ft (183m) @ 18 Mbps, 1000 (304m) @ 6 Mbps Patch Antenna: Indoor: 70 ft (21m) @ 54 Mbps, 150 ft (45m) @ 18 Mbps, 200 ft (61m) @ 6 Mbps Outdoor: 120 ft (36m) @ 54 Mbps, 700 ft (213m) @ 18 Mbps, 1200 ft (355m) @ 6 Mbps
Power Management	3 levels of power consumption available, including: CAM (Constantly Awake Mode), Fast PSP (Power Save Mode), Max PSP (Maximum Power Savings)
Antenna	Integrated 5dBi gain patch antenna

Cisco Aironet 350 Series Client Adapters

Wireless client adapters are the key to adding mobility and flexibility to an enterprise—increasing productivity by enabling users to have network and Internet access anywhere within a building without the limitation of wires. The Cisco Aironet 350 Series 802.11b Client Adapters are a complement to Aironet 350 Series infrastructure devices, providing an enterprise-ready solution that combines mobility with the performance, security, and manageability that people have come to expect from Cisco. Wireless client adapters connect a variety of devices to a wireless network either in ad hoc peer-to-peer mode or in infrastructure mode with Access Points. Available in PC Card (PCMCIA) and Peripheral Component Interconnect (PCI) form factors, Cisco Aironet 350 Series Client Adapters quickly connect desktop and mobile computing devices wirelessly to all network resources. With this product, you can instantly add new employees to the network, support temporary workgroups, or enable Internet access in conference rooms or other meeting spaces.

Cisco Aironet 350 Series Client Adapters deliver superior range, reliability, and performance for business users needing information access anytime, anywhere. Combined with Cisco Aironet unique security services, this product ensures that business-critical information is secure. Most importantly, the Cisco client solution is easy to use, making the benefits of wireless mobility completely transparent.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 350 Series Client Adapters	• IT Professionals or business executives want mobility within the enterprise to increase productivity, as an addition or alternative to wired networks. • Business owners or IT directors need flexibility for frequent LAN wiring changes, either throughout the site or in selected areas. • Any company whose site is not conducive to LAN wiring because of building or budget limitations, such as older buildings, leased space or temporary sites.

Key Features

- Superior range and throughput for IEEE 802.11b networks
- Secure network communications
- World mode for international roaming
- Full-featured utilities for easy configuration and management
- Compliance with the IEEE 802.11b high-rate standard
- Support for all popular operating systems

Specifications

Feature	Cisco Aironet 350 Series Client Adapters
Data Rates Supported	1, 2, 5.5, and 11 Mbps
Network Standard	IEEE 802.11b
System Interface	AIR-PCM35x: PC Card (PCMCIA) Type II AIR-PCI 35x: peripheral component interconnect (PCI) Bus
Frequency Band	2.4 to 2.4897 GHz
Network Architecture Types	Infrastructure and ad hoc
Wireless Medium	Direct Sequence Spread Spectrum (DSSS)
Media Access Protocol	Carrier sense multiple access with collision avoidance (CSMA/CA)
Modulation	DBPSK @1 Mbps; DQPSK @ 2 Mbps; CCK @ 5.5 and 11 Mbps
Operating Channels	North America: 11; ETSI: 13; Japan: 14
Nonoverlapping Channels	Three
Receive Sensitivity	1 Mbps: -94 dBm 2 Mbps: -91 dBm 5.5 Mbps: -89 dBm 11 Mbps: -85 dBm
Delay Spread	1 Mbps: 500 ns; 2 Mbps: 400 ns; 5.5 Mbps: 300 ns; 11 Mbps: 140 ns
Available Transmit Power Settings[1]	100 mW (20 dBm); 50 mW (17 dBm); 30 mW (15 dBm); 20 mW (13 dBm); 5 mW (7 dBm); 1 mW (0 dBm)
Range (typical)	Indoor: 130 ft (40 m) @ 11 Mbps; 350 ft (107 m) @ 1 Mbps Outdoor: 800 ft (244 m) @ 11 Mbps; 2000 ft (610 m) @ 1 Mbps
Compliance	Operates license free under FCC Part 15 and complies as a Class B device; complies with DOC regulations; complies with ETS 300.328, FTZ 2100, and MPT 1349 standards
Operating Systems Supported	Windows 95, 98, NT 4.0, 2000, ME, XP, CE 2.11, CE 3.0, Mac OS 9.x, and Linux
Antenna	AIR-PCM35x: Integrated diversity dipoles AIR-LMC35x: Two MMCX connectors (antennas optional, none supplied with unit) AIR-PCI35x: External, removable 2.2 dBi Dipole with RP-TNC Connector
Encryption Key Length	128-bit
Authentication Type	EAP-Cisco Wireless LEAP
Status Indicators	Link Status and Link Activity
Dimensions (W x D x H)	AIR-PCM35x: 2.13 in. (5.4 cm) x 4.37 in. (11.1 cm) x 0.1 in. (0.3 cm) AIR-LMC35x: 2.13 in. (5.4 cm) x 3.31 in. (8.4 cm) x 0.1 in. (0.3 cm) AIR-PCI35x: 6.6 in. (16.8 cm) x 3.9 in. (9.8 cm) x .5 in. (1.3 cm)
Weight	AIR-PCM35x: 1.6 oz (45g) AIR-LMC35x: 1.4 oz (40g) AIR-PCI35x: 4.4 oz (125g)
Environmental	AIR-PCM35x and AIR-LMC35x: -22° to 158° F (-30° to 70° C) AIR-PCI35x: 32° to 131° F (0° to 55° C) 10 to 90% (noncondensing)
Input Power Requirements	+5 VDC =/- 5%
Typical Power Consumption (at 100 mW transmit power setting)	Transmit: 450 mA; Receive: 270 mA; Sleep mode: 15 mA

1. Maximum power setting will vary according to individual country regulations.

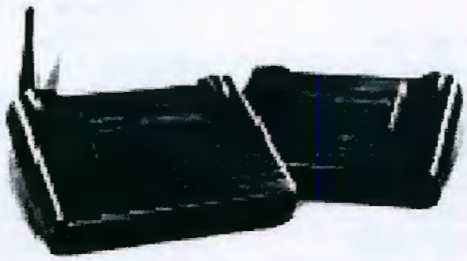
Cisco Aironet 350 Series Workgroup Bridge



Designed to meet the needs of remote workgroups, satellite offices, and mobile users, the Cisco Aironet 350 Series Workgroup Bridge brings the freedom and flexibility of wireless connectivity to any Ethernet-enabled device. The 802.11b workgroup bridge quickly connects up to eight Ethernet-enabled laptops or other portable computers to a wireless LAN (WLAN), providing a link from these devices to any Cisco Aironet Access Point (AP) or Wireless Bridge (line-of-sight).

Any Ethernet-ready device, including printers, copiers, PCs, point-of-sale devices, or monitoring equipment, can be placed directly at the point of work using the workgroup bridge—without the expense or delay of cabling. For temporary classrooms or temporary office space, the workgroup bridge provides flexible, easy network access for up to eight devices through the use of a standard eight-port Ethernet hub. Equipment can be easily moved as workgroups change in number or location, lowering facilities costs.

The Cisco Aironet 350 Series Workgroup Bridge supports Wired Equivalent Privacy (WEP) security architecture and provides up to 128-bit encryption. The Cisco Aironet security architecture is based upon an IEEE 802.11x standard utilizing the Extensible Authentication Protocol (EAP), an open standard that enables wireless manufacturers and RADIUS server vendors to independently develop interoperable hardware and software. For authentication of devices attached to the workgroup, a username and password may be stored in the workgroup bridge in either static or dynamic memory. When authenticated, the workgroup bridge receives a single-session, single-user encryption key from the Remote Access Dial-In User Service (RADIUS) server via the associated AP. With this centralized and standards-based architecture, wireless security scales to meet the requirements of any enterprise.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 350 Series Workgroup Bridge	• Connectivity to a network for remote workgroups located in an area that may be difficult or not practical for wiring. • Supports up to eight Ethernet-based devices (with use of Ethernet hub)

ANATEL 3683 22

Key Features

- Driverless installation of up to eight Ethernet-enabled devices
- Optimum wireless performance and range
- Standards-based centralized security
- Two versions for a range of application requirements
- Full-featured utilities and robust management

Receive Sensitivity	1 Mbps: -94 dBm; 2 Mbps: -91 dBm; 5.5 Mbps: -89 dBm; 11 Mbps: -85 dBm
Delay Spread	1 Mbps: 500 ns; 2 Mbps: 400 ns; 5.5 Mbps: 300 ns; 11 Mbps: 140 ns
Available Transmit Power Settings[1]	100 mW (20 dBm); 50 mW (17 dBm); 30 mW (15 dBm); 20 mW (13 dBm); 5 mW (7 dBm); 1 mW (0 dBm)
Range (typical)	Indoor: 130 ft (40 m) @ 11 Mbps; 350 ft (107 m) @ 1 Mbps Outdoor: 800 ft (244 m) @ 11 Mbps; 2000 ft (610 m) @ 1 Mbps
Compliance	Operates license free under FCC Part 15 and complies as a Class B device; complies with DOC regulations; complies with EN 300.328 standards
SNMP Compliance	MIB I and MIB II
Antenna	AIR-WGB352C: One nonremovable 2.2-dBi dipole AIR-WGB352R: Two RP-TNC connectors (antennas optional, none supplied with unit)
Encryption Key Length	AIR-WGB352x: 128-bit
Remote Configuration Support	Telnet, HTTP, FTP, TFTP, and SNMP
Dimensions (W x D x H)	6.30 in. (16 cm) x 4.72 in. (12 cm) x 1.45 in. (3.7 cm)
Weight	12.3 oz (350g)
Environmental	Temperature: 32° to 122° F (0° to 50° C); 10 to 90% (Noncondensing)
Input Power Requirements	North American: 120 VAC @ 60 Hz; Universal: 90 to 264 VAC @ 47 to 63 Hz

1. Maximum power setting will vary according to individual country regulations.

Selected Part Numbers and Ordering Information[1]

Cisco Aironet 350 Series Wireless Bridge

The Cisco Aironet 350 Series Wireless Bridge enables high-speed long-range outdoor links between buildings and is ideal for installations subject to plenum rating and harsh environments. It is designed to meet the requirements of even the most challenging applications. The 802.11b wireless bridge delivers high data rates and superior throughput for data-intensive, line-of-sight applications. The bridges connect hard-to-wire sites, noncontiguous floors, satellite offices, school or corporate campus settings, temporary networks, and warehouses. They can be configured for point-to-point or point-to-multipoint applications and allow multiple sites to share a single, high-speed connection to the Internet. For functional flexibility, the wireless bridge may also be configured as an access point.

The Cisco Aironet 350 Series Wireless Bridge features an extended operating temperature range of -20° to 55° C, allowing for placement outdoors in a NEMA enclosure or in harsh indoor environments such as warehouses and factories. With a durable metal case, the Cisco Aironet 350 Series Wireless Bridge is UL 2043 certified, and designed to achieve plenum rating as defined by various municipal fire codes.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Aironet 350 Series Ethernet Bridge	• Any company who needs to connect sites into a single LAN, even when separated by obstacles such as freeways, railroads and bodies of water that are normally inaccessible via cabling. • Business owners who want a low-cost, easy-to-deploy solution for connecting line-of-sight networks located in different buildings. • Business owners or IT directors who want multiple buildings on a campus to share a single high-speed line to the Internet.

Key Features

- High-speed (11-Mbps), high-power (100-mW) radios, delivering building-to-building links of up to 25 miles (40.2 km)
- A metal case for durability and plenum rating and an extended operating temperature rating for harsh environments
- Supports both point-to-point and point-to-multipoint configurations
- Broad range of supported antennas
- Simplified installation, improved performance, and upgradeable firmware, ensuring investment protection

Specifications

Feature	Cisco Aironet 350 Series Wireless Bridge
Data Rates Supported	1, 2, 5.5, and 11 Mbps
Frequency Band	2.4 to 2.497 GHz
Wireless Medium	Direct Sequence Spread Spectrum (DSSS)
Media Access Protocol	Carrier sense multiple access with collision avoidance (CSMA/CA)
Modulation	DBPSK @1 Mbps DQPSK @ 2 Mbps CCK @ 5.5 and 11 Mbps
Operating Channels	North America: 11; ETSI: 13; Japan: 14
Nonoverlapping Channels	Three
Receive Sensitivity	1 Mbps: -94 dBm; 2 Mbps: -91 dBm; 5.5 Mbps: -89 dBm; 11 Mbps: -85 dBm
Delay Spread	1 Mbps: 500 ns; 2 Mbps: 400 ns; 5.5 Mbps: 300 ns; 11 Mbps: 140 ns
Available Transmit Power Settings[1]	100 mW (20 dBm); 50 mW (17 dBm); 30 mW (15 dBm); 20 mW (13 dBm); 5 mW (7 dBm); 1 mW (0 dBm)
Range (typical, contingent upon antenna selected)	18 miles (28.9 km) @ 11 Mbps Up to 25 miles (40.2 km) @ 2 Mbps
Compliance	Operates license-free under FCC Part 15 and complies as a Class B device; complies with DOC regulations; complies with ETS 300.328, FTZ 2100, and MPT 1349 standards; complies with UL 2043 (The use of this device in a system operating either partially or completely outdoors may require the user to obtain a license for the system according to the Canadian regulations. For further information, contact your local industry Canada office.)
SNMP Compliance	MIB I and MIB II
Antenna	Two RP-TNC connectors (antennas optional, none supplied with unit)
Encryption Key Length	128-bit
Security	128-bit WEP in bridge mode IEEE 802.11x (includes EAP and RADIUS) in AP mode
Status Indicators	Three indicators on the top panel provide information concerning association status, operation, error/warning, firmware upgrade, and configuration, network/modem, and radio status
Automatic Configuration Support	BOOTP and DHCP
Remote Configuration Support	Telnet, HTTP, FTP, TFTP, and SNMP
Local Configuration	Direct console port (with supplied serial cable)
Bridging Protocol	Spanning Tree
Dimensions	6.74 x 6.25 x 1.31 in. (17.1 x 15.9 x 3.3 cm)
Weight	1.43 lbs (.648 kg)
Environmental	Temperature: -4× to 131× F (-20× to 55× C) 10 to 90% (noncondensing)
Enclosure	Metal case (for plenum rating); UL 2043 certified
Input Power Requirements	24VDC 10% to 60 VDC (Ethernet line power)

1. Maximum power setting will vary according to individual country regulations

Cisco Aironet Antennas and Accessories

Every wireless Local Area Network (LAN) deployment is different. When engineering an in-building solution, varying facility sizes, construction materials, and interior divisions raise a host of transmission and multipath considerations. When implementing a building-to-building solution, distance, physical obstructions between facilities, and number of transmission points involved must be considered.

Cisco is committed to providing not only the best access points, client adapters, and bridges in the industry—it is also committed to providing a complete solution for any wireless LAN deployment. That is why Cisco has the widest range of antennas, cable, and accessories available from any wireless manufacturer.

With the Cisco FCC-approved directional and omnidirectional antennas, low-loss cable, mounting hardware, and other accessories, installers can customize a wireless solution that meets the requirements of even the most challenging applications.

Key Features

- Client Adapter Antennas—Cisco Aironet wireless client adapters come complete with standard antennas that provide sufficient range for most applications at 11 Mbps. To extend the transmission range for more specialized applications, a variety of optional, higher-gain antennas are provided that are compatible with selected client adapters
- Access Point Antennas—Cisco Aironet access point antennas are compatible with all Cisco RP-TNC-equipped access points. The antennas are available with different gain and range capabilities, beam widths, and form factors. Coupling the right antenna with the right access point allows for efficient coverage in any facility, as well as better reliability at higher data rates
- Bridge Antennas—Cisco Aironet bridge antennas allow for extraordinary transmission distances between two or more buildings. Available in directional configurations for point-to-point transmission and omnidirectional configuration for point-to-multipoint implementations, Cisco has a bridge antenna for every application
- Low-loss cable extends the length between any Cisco Aironet bridge and the antenna. With a loss of 6.7 dB per 100 feet (30m), low-loss cable provides installation flexibility without a significant sacrifice in range

Specifications

Client Adapter Antennas

Feature	AIR-ANT3351
Description	POS diversity dipole[1]
Application	Indoor diversity antenna[2] to extend the range of Aironet LMC client adapters
Approximate Indoor Range at 1 Mbps[3]	350 ft (107m)
Approximate Indoor Range at 11 Mbps[3]	100 ft. (51 m)
Cable Length	5 ft. (1.5m)
Dimensions	Base: 7 x 2 in. (18 x 5 cm) Height: 8 in. (20 cm)
Weight	9.2 oz. (261g)

1. A type of low-gain (2.2 dBi) antenna consisting of two (often internal) elements.
2. A ratio of decibels to an isotropic antenna that is commonly used to measure antenna gain. The greater the dBi value, the higher the gain and, as such, the more acute the angle of coverage.
3. All range estimations are based on an integrated client adapter antenna associating with an access point under ideal indoor conditions. The distances referenced here are approximations and should be used for estimation only.

Access Point Antennas

Feature	AIR-ANT5959	AIR-ANT3195	AIR-ANT2012	AIR-ANT3213
Description	Diversity omni-directional ceiling mount	3 dBi Patch Wall Mount Antenna	Diversity patch wall mount	Pillar mount diversity omni
Application	Indoor unobtrusive antenna, best for ceiling mount. Excellent throughput and coverage solution in high multipath cells and dense.	Indoor/Outdoor directional antenna	Indoor/Outdoor, unobtrusive medium range antenna	Indoor, unobtrusive medium-range antenna
Approximate Indoor Range at 1 Mbps[1]	350 ft. (105m)	Access Point: 271 ft. (82m) Bridge: .5 miles (.9 km)	547 ft. (167m)	497 ft. (151m)
Approximate Indoor Range at 11 Mbps[1]	130 ft. (45m)	Access Point: 80 ft. (24m) Bridge: 950 ft. (290m)	167 ft. (51m)	142 ft. (44m)
Cable Length	3 ft. (0.91m)	12 ft.	3 ft. (0.91m)	3 ft. (0.91m)
Dimensions	5.3 x 2.8 x 09. in. (13.5 x 7.1 x 2.3 cm)	4 x 5 in. (9.7 x 13 cm)	4.78 x 6.66 x .82 in. (12.14 x 16.92 x 2.08 cm)	10 x 1 in. (25.4 x 2.5 cm)
Weight	0.3 lbs. (0.14kg)	4.9 oz. (139g)	9.6 oz. (272g)	1 lb. (460g)

1. All range estimations are based on an integrated client adapter antenna associating with an access point under ideal indoor conditions. The distances referenced here are approximations and should be used for estimation only.

Access Point Antennas (cont.)

Feature	AIR-ANT1728	AIR-ANT4941	AIR-ANT3549	AIR-ANT1729
Description	High gain omnidirectional ceiling mount	2.2 dBi dipole antenna	Patch wall mount	Patch wall mount
Application	Indoor medium-range antenna, typically hung from crossbars of drop ceilings	Indoor omni-directional coverage	Indoor, unobtrusive, long-range antenna (may also be used as a medium-range bridge antenna)	Indoor, unobtrusive, medium-range antenna (may also be used as a medium-range bridge antenna)
Approximate Indoor Range at 1 Mbps[1]	497 ft. (151m)	350 ft.	Access Point: 700 ft. (213m) Bridge: 2.0 miles (3.2 km)	Access Point: 542 ft. (165m) Bridge: 1.1 miles (1.8 km)
Approximate Indoor Range at 11 Mbps[1]	142 ft. (44m)	130 ft.	Access Point: 200 ft. (61m) Bridge: 3390 ft. (1032m)	Access Point: 155 ft. (47m) Bridge: 1900 ft. (580m)
Cable Length	3 ft. (0.91m)	N/A	3 ft. (0.91m)	3 ft. (0.91m)
Dimensions	Length: 9 in. (22.86 cm) Diameter: 1 in. (2.5 cm)	5.5 in.	5 x 5 in. (12.4 x 12.4 cm)	4 x 5 in. (9.7 x 13 cm)
Weight	4.6 oz. (131g)	1.1 oz.	5.3 oz. (150g)	4.9 oz. (139g)

1. All range estimations are based on an integrated client adapter antenna associating with an access point under ideal indoor conditions. The distances referenced here are approximations and should be used for estimation only.

Bridge Antennas

Feature	AIR-ANT2506	AIR-ANT4121	AIR-ANT1949	AIR-ANT3338
Description	Omnidirectional Mast mount	High-gain omnidirectional Mast mount	Yagi mast mount	Solid dish
Application	Outdoor short-range point-to-multipoint applications	Outdoor medium-range point-to-multipoint applications	Outdoor medium-range directional connections	Outdoor long-range directional connections
Approximate Indoor Range at 1 Mbps[1]	5000 ft. (1525m)	4.6 miles (7.4 km)	6.5 miles (10.5 km)	25 miles (40 km)
Approximate Indoor Range at 11 Mbps[1]	1580 ft. (480m)	1.4 miles (2.3 km)	2.0 miles (3.3 km)	11.5 miles (18.5 km)
Cable Length	3 ft. (0.91m)	1 ft. (0.30m)	1.5 ft. (0.46m)	2 ft. (0.61m)
Dimensions	Length: 13 in. (33 cm) Diameter: 1 in. (2.5 cm)	Length: 40 in. (101 cm) Diameter: 1.3 in. (3 cm)	Length: 18 in. (46 cm) Diameter: 3 in. (7.6 cm)	Diameter 24 in. (61 cm)
Weight	6 oz. (17g)	1.5 lb. (0.68 kg)	1.5 lb. (0.68 kg)	11 lb. (5 kg)

1. All range estimations are based on an integrated client adapter antenna associating with an access point under ideal indoor conditions. The distances referenced here are approximations and should be used for estimation only.

Low-Loss/Ultra Low-Loss Antenna Cable

Feature	AIR-CAB020LL-R	AIR-CAB050LL-R	AIR-CAB100ULL-R	AIR-CAB150ULL-R
Cable Length	20 ft. (6m)	50 ft. (15m)	100 ft. (30m)	150 ft. (46m)
Transmission Loss	1.3 dB	3.4 dB	4.4 dB	6.6 dB

Cisco Aironet Accessories

Feature	AIR-ACC2537-060	AIR-ACC3354	AIR-ACC2662
Description	60 in. (152 cm) bulkhead extender	Lightning arrestor	Yagi articulating mount
Application	Flexible antenna cable that extends access point cabling typically within an enclosure	Helps prevent damage due to lightning-induced surges or static electricity	Adds swiveling capability to mast-mounted yagi antennas

CHAPTER 4

IP Telephony, Video, & Web Collaboration

Campus IP Telephony, Video, & Web Collaboration at a Glance

Product	Features	Page
Cisco IP Phones IP 7900 Series	An exciting, distinctively stylish, and pure Voice over IP phone portfolio to meet the wide range of business communication needs at affordable prices • Display-based technology provides ease-of-use • Integrated inline power and 2-port Ethernet Switch provides end-to-end infrastructure integration • Rich application environment enabled by open APIs based on XML	4-3
Cisco CallManager 3.3	• The software-based call processing and call control component of Cisco's IP Telephony solution • Resides on Cisco Media Convergence Servers (MCS), Cisco ICS7750, or selected third-party servers (CallManager 3.3)	4-4
CiscoWorks IP Telephony Environment Monitor	A suite of management applications that helps ensure the readiness and manageability of converged networks that are supporting VoIP and IP telephony traffic and applications. The bundle includes: • Voice Health Monitor • Default Fault Manager • CiscoView • CCO Downloadable Modules: – IP Phone Information Utility – IP Phone Help Desk Utility. – Fault History Manager	9-18
Cisco IP Contact Center (IPCC) Enterprise Edition	Cisco IP Contact Center (IPCC) Enterprise Edition delivers intelligent call routing, network-to-desktop CTI, and multi-channelmedia contact management to contact center agents over an IP network. It includes several applications, including the following: • CallManager • Cisco Intelligent Contact Manager (ICM) • Cisco IP IVR/-IP Queue Manager	4-8
Cisco IP IVR	Cisco IP IVR, a new world interactive voice response (IVR) solution, provides a feature-rich foundation for the creation of an IP-based IVR that is open and expandable. Cisco IP IVR has the following key features: • Provides a multimedia (voice/data/Web) IP-empowered application-generation environment • Can be deployed anywhere in the IP network • Offers Web-based activation and administration	4-10
Cisco IP Contact Center Express Edition (Formerly IP ICD)	• Cisco IPCC Express is a software-based ACD, IVR, and CTI application for mid-sized contact centers with Cisco IP Telephony networks based on Cisco AVVID. • Cisco IPCC Express is an open systems platform allowing ease of configuration. • It has a graphically driven workflow editor providing a common interface for creating interactions, or call flows, and creates business logic between IVR and ACD functions.	4-9
Cisco Unity—Unified Messaging and Voice Mail	Voicemail and unified messaging system delivers all messages into single inbox for access via phone, email or Internet	4-11
Cisco Personal Assistant	Software application allows users to browse voicemail, dial by name, and conference from any phone using voice commands instead of telephone keypad via speech recognition	4-13
IP Telephony Applications	• Cisco Survivable Remote Site (SRS) Telephony Software—IOS software that runs on local branch office router provides IP Telephony backup redundancy for IP phones in that office when IP phones detect that WAN is down or/and CallManager is unreachable • Cisco IP Phone Messenger—sends Instant Messages (IM) between Cisco IP Phones and Lotus Sametime or MS Messenger desktop IM clients • Cisco IP SoftPhone—Windows-based application for PC, allows users to make and receive calls from PC without a dedicated phone • Cisco Conference Connection (CCC)—enables enterprises to bring geographically dispersed employees and customers together to facilitate meetings and collaboration. CCC provides a cost-effective and time-efficient method of doing business without the hassle of travel.	4-14

Product	Features	Page
Cisco MCS 7800 Series Media Convergence Servers	High availability server platform for Cisco IP telephony systems • Turnkey solution, includes CallManager or other software • For large- and medium-sized enterprise IP telephony deployments	4-17
Cisco ICS 7750 Integrated Communications System	• A branch office/midmarket business with standalone IP telephony needs from 35-500 users • An end-user customer or partner who wants a single "box" (or platform) IP telephony solution to ease deployment and/or to standardize on voice configurations across multiple sites • An existing multiservice data network customer who wants to add IP telephony functionality to create a converged network solution	4-18
Cisco IAD 2400 Series Integrated Access Device[1]	Business class fixed-configuration Integrated Access Device (IAD) • Delivers packet or TDM voice and data over single WAN uplink • IOS Telephony Service (ITS) provides local IAD-based call processing to offer key switch functionality, ideal for small offices (5-24 phones) • IP-based keyswitch functionality, ideal for small offices (5-20 phones) who do not need Cisco CallManager capabilities • Supports standard phones and IP phones on a single platform • 8 FXS/16 FXS/16FXS+8FXO analog voice ports and 1 T1 digital voice port models • WAN Interfaces: T1- PPP, FR, ATM and DSL-ADSL and G.SHDSL	4-18
Cisco Voice Gateways[2]	The Cisco VG248 dedicated voice gateway provides connectivity between IP networks and legacy telephony systems/PSTN • Support various types of interfaces, including T1 and E1 • Fully manageable by Cisco CallManager, a CLI interface via Telnet, or via SNMP	4-22
Cisco IP/VC 3500 Series Videoconferencing Products	• Videoconferencing over IP solution • Cost-effective, easy-to-manage • Translates between H.323 and H.320 systems • Management and Quality of Service	4-22
Cisco IP/TV 3400 Series Video Servers	• High-quality video communications over enterprise networks • Support live and scheduled video, video on demand • Enable training, corporate communications, business TV, and distance learning	4-23
Cisco Web Collaboration Option	• Web-based collaboration, • Share any Windows desktop application • Ideal for both sales- and service-oriented customer service organizations	4-24
Cisco E-mail Manager	• Automates the process of tracking and responding to inbound email. • Automatically assigns email requests to the most appropriate agent • Graphical rules engine makes it easy to define custom rules for the processing of email	4-25
Cisco Emergency Responder	• Works with Cisco CallManager to automatically provide E9-1-1 features in North America, and is compatible with any emergency number including 112 in Europe, 999 in UK, and 000 in Australia. • Dynamically tracks the location of IP phones, routes emergency calls to the appropriate E9-1-1 network, and provides the current location information to E9-1-1 call center dispatchers. • Provides real-time alert notifications to on-site or contracted security groups, to facilitate a timely response to emergency situations.	4-25
Cisco ATA Series of Analog Telephone Adaptors	Turns any analog telephone into an IP telephone. Each of the two voice ports supports independent telephone numbers, providing two separate lines. • Interoperable with multiple standards including H.323, SIP, MGCP and SCCP • Enables analog devices, such as phones and fax machines, to support Voice over IP services by converting the analog signal into an IP signal	4-27
Cisco CTE-1400 Series Content Transformation Engine	Transforms Web content for display and interaction on small screen mobile devices and IP Telephones • Supports a broad range of devices • Transforms existing content • GUI/Console Administrative Tool	6-13

1. IP Keyswitch capabilities also available with 2600/2600XM and 3600 series routers; see IP Keyswitch Web site: http://www.cisco.com/go/keyswitch
2. Cisco's full line of multiservice routers also provide analog and digital voice gateway functionality through use of network modules and voice interface cards. Please see the 1700, 2600XM, 3600, 7200, 5x00 series in Chapter 1—Routers, as well as Chapter 7—Access Products.

Cisco 7900 Series IP Phones

Cisco IP Phones provide unmatched levels of integrated business functionality and converged communications beyond today's conventional voice systems. The Cisco IP Phone7960G "manager set" addresses the communication needs of the professional, with a high or busy amount of phone traffic. The Cisco IP Phone 7940G "business set" addresses the communication needs of a transaction type worker, in a office cubicle environment, who conducts medium to high telephone traffic. The Cisco IP Phone 7912G, 7910G+SW, 7910G, and 7905G "basic sets" address the communication needs of a cubicle worker who conducts low to medium telephone traffic. The Cisco IP Phone 7902G "entry set" addresses voice communication needs of a lobby, lab, manufacturing floor, and other areas where only a minimal amount of features are required. Cisco IP Phone Expansion Module 7914 extends the Cisco IP Phone 7960G with additional buttons and LCD, increasing the total number of buttons to 20 with one module, or 34 with two modules. Cisco IP Conference Station 7935, a high-quality hands-free conference station, is designed for use on desktops and offices and in small to medium-sized conference rooms.

Key Features

- Dynamic soft keys make the telephone simpler to use by presenting calling options based on context
- Open APIs using XML to deliver applications to the display
- Automatic phone discovery, VLAN configuration, and registration
- Quality of Service (QoS) is provided via support of 802.1pq, in addition to configurable DIFFSERV and TOS
- Voice-activity detection, silence suppression, comfort-noise generation, and error concealment
- G.711a, G.711u, G.729ab audio-compression coder-decoders (codecs)
- Software upgrade support via Trivial File Transfer Protocol (TFTP) server
- Microsoft NetMeeting enabled—features such as application sharing and video conferencing are available simply by pressing a button on your Cisco IP telephone
- Integrated Ethernet Switch supporting Ethernet connectivity for a downstream PC
- Integrated Inline power support allows the phone to receive power over the LAN
- A hearing-aid-compatible handset

Cisco CallManager 3.3

Cisco CallManager call-processing software extends enterprise telephony features and capabilities to enterprise LANs and packet telephony network devices such as IP phones, media processing devices, voice-over-IP (VoIP) gateways, and multimedia applications. Additional data, voice, and video services such as unified messaging, multimedia conferencing, collaborative contact centers, and interactive multimedia response systems interact with the IP telephony solution through CallManager's open telephony application programming interfaces (API). Cisco CallManager is installed on the Cisco Media Convergence Server (MCS) and selected third-party servers. It ships with a suite of integrated voice applications and utilities, including the Cisco Attendant Console—a software-only manual attendant console; a conferencing application; and administrative reporting tools. For more VoIP network management features, see the CiscoWorks Manager IP Telephony Environment Monitor, page 9-18.

Cisco CallManager version 3.3 provides a scalable, distributable, and highly available enterprise IP telephony call-processing solution. Multiple servers are clustered and managed as a single entity; yielding scalability of up to 30,000 users per cluster. By interlinking multiple clusters, system capacity can be increased to as many as one million users in a 100-site system. Clustering aggregates the power of multiple,

distributed Cisco CallManagers, enhancing the scalability and accessibility of the servers to phones, gateways, and applications. Triple call-processing server redundancy improves overall system availability.

The benefit of this distributed architecture is improved system availability and scalability. Call admission control ensures that voice quality of service (QoS) is maintained across constricted WAN links, and automatically diverts calls to alternative Public Switched Telephone Network (PSTN) routes when WAN bandwidth is not available. A Web-browsable interface to the configuration database enables remote device and system configuration.

Key Features

- Cisco CallManager includes a suite of integrated voice applications that perform voice conferencing and manual attendant console functions, eliminating the need for special-purpose voice processing hardware
- Supplementary and enhanced services such as hold, transfer, forward, conference, multiple line appearances, automatic route selection, speed dial, last-number redial, and other features are extended to IP phones and gateways
- Capabilities enhancements are achieved though software upgradeability, avoiding expensive hardware costs traditional to legacy PBX systems
- Cisco CallManager Attendant Console—This Web-enabled application supports the traditional role of a manual attendant console and allows the attendant to quickly accept and dispatch calls to enterprise users. An integrated directory service provides traditional busy lamp field (BLF) and direct station select (DSS) functions for any line in the system. It monitors the state of every line in the system without requiring hardware-based line monitoring devices, thereby saving costs
- Software-only applications such as the Cisco Interactive Voice Response system, Cisco IP Contact Center, Cisco Automated Attendant, and Cisco SoftPhone are applications that interact with the CallManager through telephony APIs

Specifications

Feature	Cisco CallManager 3.3[1]
Platforms	Media Convergence Server (MCS) Integrated Communications Server (ICS-7750) Selected third-party servers
Pre-Installed Software	Cisco CallManager version 3.3 (call processing and call-control application) Cisco CallManager version 3.3 configuration database (contains system and device configuration information, including dial plan) Cisco CallManager Administration software Cisco Conference Bridge Cisco Attendant Console Bulk Administration Tool (BAT) CDR Analysis and Reporting (CAR) tool Real Time Monitoring Tool RTMT

Feature	Cisco CallManager 3.3[1]
Summary of Administrative Features	Application discovery and registration to SNMP manager
	Automated Alternate Routing Groups
	Bulk Administration
	Call Back
	Call Detail Records (CDR)
	Call forward reason code delivery
	Centralized, replicated configuration database, distributed Web-based management viewers
	Configurable and default ringer WAV files per phone
	Configuration database API
	Database automated change notification
	Date/time display format configurable per phone
	Debug information to common syslog file
	Device addition through wizards
	Device downloadable feature upgrades—Phones, hardware transcoder resource, hardware conference bridge resource, VoIP gateway resource
	Device groups and pools for large system management
	Device mapping tool-IP address to MAC address
	Distinctive ring per line
	Dynamic Host Configuration Protocol (DHCP) block IP assignment-phones and gateways
	Dialed number translation table (inbound/outbound translation)
	Dialed Number Identification Service (DNIS)
	Enhanced 911 service
	H.323-compliant interface to H.323 clients, gateways, and gatekeepers
	Individual line Call Waiting Alert Configuration
	JTAPI 1.2 computer telephony interface
	LDAP version 3 directory interface to selected vendor's LDAP directories
	• Active Directory
	• Netscape Directory Server
	Manager Assistant
	Mappable softkeys
	MGCP signaling and control to selected Cisco VoIP gateways
	Multilevel Administration Access (MLA)
	Native supplementary services support to Cisco H.323 gateways
	Network Specific Facilities Paperless phone DNIS-display driven button labels on phones
	Performance monitoring SNMP statistics from applications to SNMP manager or to operating system
	Performance Monitor
	QoS statistics recorded per call
	Q.SIG Support
	Redirected DNIS (RDNIS), inbound, outbound (to H.323 devices)
	Select specified line appearance to ring; Select specified phone to ring
	Single CDR per cluster
	Single point system/device configuration
	Sortable component inventory list by device, user, or line
	System event reporting-to common syslog or operating system event viewer
	TAPI 2.1 computer telephony interface
	Time-zone configurable per phone
	XML API into IP phones (794X/6X)
	Zero cost automated phone moves; Zero cost phone adds

Feature	Cisco CallManager 3.3[1]
Summary of User Features	Answer/answer release
	Auto-answer/[2]intercom
	Call connection
	Call coverage
	Call forward-all (off-net/on-net); Call forward-busy; Call forward-no answer
	Call hold/retrieve
	Call park/pickup; Call pickup group-universal
	Call status per line (state, duration, number)
	Call waiting/retrieve
	Calling Line Identification (CLID); Calling party name identification (CNID)
	Calling Line Identifiation Restriction (CLIR)
	Direct inward dial (DID; Direct outward dial (DOD)
	Directory dial from phone-corporate, [2]personal
	Directories-missed, placed, received calls list stored on selected IP phones
	Distinctive ring (on-net vs. off-net); Distinctive ring per phone
	Drop last conference party (ad-hoc conferences)
	Extension mobility support
	Hands-free, full-duplex speakerphone
	HTML help access from phone
	Last number redial (off-net/on-net)
	Message waiting indication
	Multiparty conference-Ad-hoc with add-on, Meet-me
	Multiple line appearances per phone
	Music-on-hold
	Mute capability from speakerphone and handset
	On-hook dialing
	Operator attendant-Web-browser interface, loop key notification, logon/logoff, busy/available, left/right hand access, headphone access, busy lamp field, direct station select, drag and drop transfer, call status (state, duration, and number)
	Privacy
	Real-time QoS statistics through http browse to phone
	Recent dial list-calls to phone, calls from phone, auto-dial, and edit dial
	Single button data collaboration on SoftPhone-chat, whiteboard, and app sharing
	Single directory number, multiple phones-bridged line appearances
	Speed dial-multiple speed dials per phone
	Station volume controls (audio, ringer)
	Transfer-with consultation hold
	User-configured speed dial and call forward through Web access
	Web services access from phone
	Wideband audio codec support—proprietary 16-bit resolution, 16 kHz sampling rate codec

Cisco IP Contact Center (IPCC) Enterprise Edition

Cisco IP Contact Center (IPCC) Enterprise Edition delivers intelligent contact routing, call treatment, network-to-desktop computer telephony integration (CTI), and multi-channel contact management over an IP infrastructure. By combining multi-channel automatic call distributor (ACD) functionality with IP telephony in a unified solution, Cisco IPCC Enterprise enables companies to rapidly deploy a distributed contact center infrastructure.

Cisco IPCC Enterprise Edition segments customers, monitors resource availability, and delivers each contact to the most appropriate resource anywhere in the enterprise. The software profiles each customer using contact-related data such as dialed number and calling line ID, caller-entered digits, data submitted on a Web form, and information obtained from a customer profile database lookup. At the same time, the system knows which resources are available to meet the customer's needs based on real-time conditions (agent skills and availability, interactive voice response [IVR] status, queue lengths, and so on) continuously gathered from various contact center components.

Cisco IPCC Enterprise provides a state of the art VoIP contact center solution that allows seamless integration of inbound and outbound voice applications with Internet applications including real-time chat, Web collaboration and e-mail. This integration allows for unified capabilities, enabling a single agent to support multiple interactions simultaneously regardless of the communications channel the customer has chosen. Since each interaction is unique and may require individualized service, Cisco provides contact center solutions to manage each interaction based on virtually any contact attribute.

Furthermore, Cisco can bridge the gap between TDM and IP infrastructures, providing a seamless integration of voice, chat, e-mail, and Web collaboration applications over both of these technology platforms. This allows companies to preserve the value of their existing investments in call center products such as ACDs, IVRs, PBXs, etc. while leveraging Cisco's wide range of solutions to support the same contact center requirements in a converged network environment.

Key Features[1]

- Full Scalability from less than a hundred to thousands of seats
- Multi-channel interaction—Web collaboration with chat and callback, email, voice mail and fax routing
- Multi-site Contact Centers support; CRM Integration
- Cradle-to-grave contact call detail records
- Common agent and supervisor desktops across all Cisco customer interaction management products
- Pre-defined and custom historical reports; Real-time reports integrated in the agent and supervisor desktops
- Support for custom call treatment for calls in queue includes support for music in queue and custom messaging
- Standard screen pop allows any caller-entered information to be popped to the agent
- Full support for agent/supervisor interaction via chat
- Ability to pre-define agent-supervisor messages

Cisco IPCC Express Edition (Formerly IP ICD)

Cisco IPCC Express Edition is an inexpensive, easy-to-install, and easy-to-use automatic call distributor (ACD) for enterprise organizations. It is seamlessly integrated with all other customer response applications, including Cisco IP Interactive Voice Response (IP IVR) and Cisco IP Automated Attendant (IP AA). Key benefits of IPCC Express include: it provides a low-cost, entry-level ACD that is easy to install, administer, and use; it supports multimedia (voice, data, and Web) access when used with Cisco IP IVR; it provides complete customization tools for call flow scripts; and it supports seamless integration with Cisco customer response applications.

Cisco IPCC Express is available as two packages: Cisco IPCC Express Standard and Cisco IPCC Express Enhanced. The Standard version is priced for entry-level users, allowing you to capture opportunities in the small and medium-size business market segment. The Enhanced version offers a full-featured ACD for entry- to mid-size contact centers. The Enhanced version also provides a migration pathway to Cisco IP Contact Center (IPCC), Cisco's premier contact center product.

Key Features[1]

- Browser-based Cisco IPCC Express administration is fully integrated with Cisco CallManager browser-based administration
- Cradle-to-grave contact call detail records
- Standard screen allows any caller-entered information to be popped to the agent
- Pre-defined or custom historical reports
- Real-time reports within the agent and supervisor desktops
- Common agent and supervisor desktops across all Cisco customer interaction management products including Cisco IPCC Express Standard, Enhanced and Cisco IP Contact Center Enterprise (formerly IPCC)
- Localization
- Full support for agent/supervisor interaction via chat; Ability to pre-define agent-supervisor messages
- Full IP call queue points and prompt; Collect voice interaction capabilities
- Optional Automatic Speech Recognition (ASR) and Text to Speech (TTS) capabilities
- Support for custom call treatment such as music for calls in queue

Cisco IP IVR

Cisco IP IVR, an interactive voice response (IVR) solution, provides a feature rich foundation for the creation of an IP-based Cisco IP IVR that is open and expandable. Written in Java to provide customer flexibility, IVR includes the following features:

- Multimedia (voice/data/Web) IP-empowered application-generation environment
- Support for optional Automated Speech Recognition (ASR) and Text-to-Speech (TTS)
- Support for VoiceXML
- Multiple Language support
- Cisco IP IVR can be located in anywhere the IP network
- Offers web-based activation and administration
- Flows (the IP IVR applications) are stored in an industry standard LDAP directory
- Cisco IP IVR is sold with Cisco CallManager and can be co-resident on the same server as CallManager or can function on a separate, dedicated media convergence servers (MCSs) or Cisco-approved customer provided server
- Packages available to scale up to 60 ports
- Cisco IP IVR offers enhanced scalability

Cisco Unity—Unified Messaging and Voice Mail

Cisco Unity is a powerful Unified Communications server that provides advanced, convergence-based communication services and integrates them with the desktop applications business professionals use everyday, improving customer service and productivity. Designed for enterprise-scale organizations, Cisco Unity delivers unified messaging that gives subscribers the ability to access and manage messages and calls from anywhere, at any time, regardless of device or media type. Subscribers can listen to e-mail over the telephone, check voice messages from the Internet, and if a fax server is present, forward faxes to any local fax machine. Cisco Unity voice messaging features robust automated attendant functionality that includes intelligent routing, and easily customizable call screening and message notification options. Cisco Unity supports localized versions in multiple languages and supports multiple languages on a single system.

Cisco Unity's optional digital networking module enables connectivity to other Cisco Unity servers at the same site via the LAN or remotely via WAN. Digital networking gives users the ability to send subscriber-to-subscriber messages anywhere in the world.

Cisco Unity supports both Cisco CallManager and leading legacy telephone systems—even simultaneously—to help smooth the transition to IP telephony and protect existing infrastructure investments. Built on a scalable platform, it uses streaming media and an intuitive HTML browser-style system administration interface. Costs are minimized when Cisco Unity's server architecture is truly unified with an organization's data network.

Key Features

- Architecture allows IT staff to set one back-up procedure, one message storage policy, and one security policy
- Enhanced scalability allows up to 72 ports per server; up to 7,500 subscribers per server; or a total of 250,000 users in an Exchange environment or 100,000 users in a Domino environment
- Support for Exchange 2000/Active Directory as the single message store and directory; AMIS-A and VPIM interoperability for Exchange systems
- Enhanced networking for large deployments—support for complex TDM telephone networks (multiple dialing domains)
- Support for multiple CCM clusters; ability to light Message Waiting Indicators
- With Exchange/Domino off-line, utilizes pre-MTA queue to take messages and give basic message access; Support for Lotus Domino as the single message store
- Fault-tolerant system tools—robust security, file replication, event logging, and optional software RAID levels 0-5
- Support for Windows 2000[1] in a mixed/native mode
- Unity Inbox/VMI (Visual Messaging Interface) is an Internet Explorer-based voice mail inbox providing unified messaging
- Unity Bridge provides advanced message interchange functionality with legacy Avaya/Octel voice mail systems—unlocking proprietary networking to deliver open standards-based IP migration

1. Unity will not support Windows NT on the Unity server, although it can be installed into an NT environment.

Cisco Personal Assistant

Cisco Personal Assistant streamlines communications with personal call rules, speech recognition, and productivity services for IP phones. As an integral part of Cisco AVVID (Architecture for Voice, Video and Integrated Data), it interoperates with Cisco CallManager and scales to meet the present and future needs of your employees. Users can access voice mail, dial by name, and conference from any telephone using speech recognition instead of the telephone keypad. The Web-based and telephone user administration interfaces allow users to forward and screen calls in advance or in real time. The phone services enable users to check e-mail, voice mail, calendar, and personal contact information using the large, pixel-based LCD and interactive soft keys on the Cisco IP Phone 7940 or 7960.

Key Features

- Ubiquitous Access: Cisco Personal Assistant with Speech Recognition and IP Phone Productivity Services integrate with Cisco CallManager, Cisco Unity, and Microsoft Exchange within Cisco AVVID to streamline communications
- Automatic Speech Recognition (ASR): Speech recognition interface allows users to utilize simple voice commands to perform tasks such as retrieval, replying, recording, and deletion of voice messages; Entries can be dialed from personal address books or the corporate enterprise Lightweight Directory Access Protocol (LDAP) directory; Users can synchronize their Microsoft Exchange contact lists with their personal address books for quick name-dialing and ad-hoc group conferencing; Access to sensitive features such as voice mail is controlled by user authentication
- Manage Inbound and Outbound Calls (Rules-Based Routing): Using a Web interface to create rules, users can forward and screen calls based on caller identification, time of day, and meeting schedules; With "follow me," a special rule that uses speech recognition, users can forward all calls to a phone number immediately; Users can activate sets of pre-created rules from any telephone
- CalendarView: Users can keep track of appointments right on the IP phone, directly from the Microsoft Exchange server with no synchronization necessary. In addition, users can choose to be notified of an upcoming event on the phone display or by pager
- MailView: Cisco Personal Assistant presents users with access to e-mail and Cisco Unity voice-mail messages in the inboxes on the corporate messaging server. Users can access messages from a conference room, lobby phone, or colleague's phone, as well as their own. Any operation performed on the messages using MailView is automatically reflected in Microsoft Exchange and Cisco Unity; Cisco Personal Assistant interfaces with Microsoft Exchange and IMAP 4 message stores for MailView features.

Specifications

Additional Cisco IP Telephony Applications

Cisco SRS Telephony

Survivable Remote Site Telephony (SRS Telephony) provides key backup telephony functions at remote branch office routers if connectivity to the centrally-located Cisco CallManager fails (i.e. WAN link is interrupted). In this case the SRS Telephony-enabled router will take over and provide basic telephony service (including off-net calls to 911). Introduced in Cisco IOS Release 12.1.5YD, the application is ideal for enterprise organizations looking to cost-effectively deploy IP telephony in their branch office location. Cisco IOS Release 12.2(13)T added SRS Telephony 2.0 features on Cisco 1751, 1760, 2600, 2600 XM, 2691, 3600, 3725/3745, IAD 2400, Catalyst 4000 AGM, and Cisco 7200 series of routers. SRS Telephony 2.1 features are available in 12.2(11)YT on Cisco 1751, 1760, 2650, 2600XM, 2691, 3640/3640A, 3660, and Cisco 3725/3745 routers.

SRS Telephony 2.0 features: Huntstop support; Music/Tone on Hold; Class of Restriction; Distinctive Ringing; Global forwarding to voicemail across PSTN during Cisco CallManager fallback; TCL based simple AA and IVR on local gateway (SRS Telephony router); Transfer across H323 network of Cisco endpoints; Alias lists for single number to be designated for unregistered phones

SRS Telephony 2.1 features: International language support; Call forward no-answer/busy to Unity server with Personal Greeting; Cisco 7914 and 7935 support; VG248 support

For More Information

See the Cisco SRS Telephony Web site: **http://www.cisco.com/go/srs**

3663

Cisco IP Phone Messenger

The Cisco IP Phone Messenger (IPPM) is a productivity application, providing enhanced, real-time collaboration for Cisco AVVID IP Communications systems. Cisco IPPM extends the benefits of Instant Messaging and Presence to Cisco CallManager networks, allowing users to send and receive instant messages on Cisco 7940 and 7960 IP phones. Cisco IPPM interworks with IBM Lotus Sametime and MSN Messenger clients and supports the IETF SIMPLE (RFC-3428) protocol for instant messaging and presence. IPPM 1.1 requires Cisco CallManager release 3.2 or later and is supported on the Cisco 7825 and 7835 Series Media Convergence Servers.

Cisco IP SoftPhone

Cisco IP SoftPhone 1.3 is a PC based application that allows you to use your phone extension from wherever you connect to your corporate IP network, even over the Internet when using a VPN client.

It's dual mode operation allows you to either control a physical IP phone, or perform all the functions of a phone in standalone mode using your PC's soundcard or a USB audio handset or headset.

Cisco IP Manager Assistant[1]

Cisco IP Manager Assistant is a tool that allows an assistant to provide call coverage for up to five managers simultaneously. When a user is configured as an IPMA manager, they are associated with a primary and secondary assistant. The configured manager is always logged onto the service and selects the preferred assistant from the 7960 services menu. Features available to the manager are initiated from softkeys on the manage's phone. Assistant user features are initiated and managed from a PC-based application named the Assistant Console.

Doc:

1. IP Manager Assistant is available as part of Cisco CallManager 3.3 for no additional charge.

Key Features

- Manager tools: 7960 IP phone—selection of assistant from pre-configured list; Divert All, Immediate Divert, Transfer to Voice Mail, Intercept, DND, SetWatch, Assistant Watch, Call Filtering feature invocation; display of toggled feature status for Divert All, Filtering, DND, Assistant Watch and Assistant availability; speed dial and line appearance configuration for intercom functionality; Manager Desktop—secure, browser-based access to configuration for default assistant assignment, Divert All target, Immediate Divert target and filter list (CLID) configuration.
- Admin Assistant Tools: 7960 IP Phone/7914 line extender—speed dial and line appearance configuration for intercom functionality; 7960 IP phone—invocation of new softkey features including Transfer to Voice Mail and Immediate Divert, speed dial to manager's intercom line; Assistant Console application—Windows application installed on assistant PC. GUI consistent with CallManager Attendant Console application. User-sizable application window and panes

Specifications

Feature	Cisco IP Manager Assistant
Platform	Media Convergence Server (MCS)
Software Compatibility	Cisco CallManager version 3.3 Assistant Console Application—Microsoft Windows 98, NT desktop, ME, 2000 Desktop and XP

Cisco Conference Connection

Cisco Conference Connection (CCC) is designed for small to medium enterprises and remote offices of larger enterprises. Cisco Conference Connection facilitates relevant participation regardless of location, enables faster decisions, and eliminates travel cost and time and disruptions caused by requirements for a physical conference room presence. Typical applications include service calls, project management, sales reviews, corporate announcements, customer and employee training, and other business meetings. This application is ideal for enterprieses trying to increase productivity while reducing expense. Simple web-based interface enables employees to manage their conference schedules and eliminates the service charges to conference service providers.

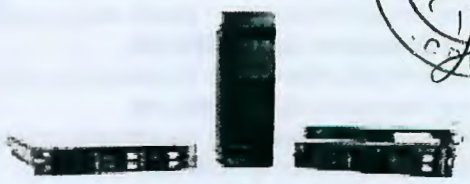
Cisco MCS 7800 Series Media Convergence Servers

Cisco MCS 7815I-2000



The Cisco MCS 7815I-2000 provides an entry level tower server equipped with an Intel Pentium™ 4 2000MHz processor, 40GB ATA hard drive and single non-hot swap power supply. An optional tape backup is available on some models of the MCS 7815I-2000.

Cisco MCS 7825H-2266

The Cisco MCS 7825H-2266 provides an entry level rack mount server that occupies only one rack mounting space. This server is equipped with an Intel Pentium™ 4 2266MHz processor, 40GB ATA hard drive and a single non-hot swap power supply. An optional tape backup is available on some models of the MCS 7825H-2266.

Cisco MCS 7835H-2400 and Cisco MCS 7835I-2400

These Cisco MCS platforms provide a highly available mid-level rack mounted server solution that is equipped with an Intel Prestonia Xeon™ 2400MHz processor, up to six hot-swap Small Computer Systems Interface (SCSI) hard disks, a Redundant Array of Independent Disks (RAID) 1/0 Controller, hot swap fans and redundant hot swap power supplies. An optional tape backup is available for some models of the MCS 7835H-2400 and MCS 7835I-2400.

Cisco MCS 7845H-2400 and Cisco MCS 7845I-2400

These Cisco MCS platforms provide a powerful and highly reliable high level rack mounted server solution that is equipped with two Intel Prestonia Xeon™ 2400MHz processors, up to six hot-swap SCSI hard disks, RAID 1/0 controller, redundant hot swap fans and redundant hot swap power supplies. An optional tape backup is available for some models of the MCS 7845H-2400 and MCS 7845I-2400.

Cisco ICS 7750 Integrated Communications System

The Cisco Integrated Communications System (ICS) 7750 is a versatile IP telephony and services solution that brings the benefits of converged IP services to midmarket businesses and enterprise branch offices. Call processing, voice applications, voice gateways and multiservice IP routing are integrated within the system chassis to deliver true convergence while enhancing system manageability. The modular system architecture enables expansion of call processing redundancy, voice gateway capacity, routing capacity, and IP services to deliver system availability and scalability. The ICS 7750 offers quick and cost-effective deployment of powerful applications including unified messaging, integrated Web call centers, and data/voice collaboration.

The Cisco ICS 7750 includes Cisco CallManager software, and combines an IOS-based multiservice router/voice gateway, application servers running core voice applications, Web-based management, and seamless connectivity to Cisco Catalyst switches.

Cisco Systems also offers four Cisco ICS 7750 voice packages for convenient and cost-effective entry points for customers to deploy IP telephony solutions in their LAN networks. These ICS voice packages are pre-configured to simplify ordering of the necessary voice components including voice mail for a mid-market business or branch site.

When to Sell

Sell This Product	When a Customer Needs These Features
ICS 7750 Integrated Communications System	• A branch office/midmarket business with standalone IP telephony needs from 35-500 users • An end-user customer or partner who wants a single "box" (or platform) IP telephony solution to ease deployment and/or to standardize on voice configurations across multiple sites • An existing multiservice data network customer who wants to add IP telephony functionality to create a converged network solution

Key Features

- Integrated Functionality (includes CallManager for call-processing, multiservice router/voice gateway, Web-based management, and core voice applications)
- Modular chassis architecture features 6 universal slots with hot swapability
- Modular industry-proven Cisco IOS-based Multiservice Route Processor (MRP) delivers data routing and voice trunking; ensures end-to-end QoS
- Industry-leading selection of WAN Interfaces
- World wide selection of voice interfaces
- Optional redundant power supply and uninterruptible power supply
- Optional integrated voice applications including Unity voice/unified messaging, IVR, contact center
- Integrated Web/GUI-based system management tool for simple monitoring and troubleshooting; Console and Telnet access to CLI system management
- Automated inventory, discovery, and configuration of desktop devices and applications
- Automated fault management, auto-notification of problems via e-mail or pager
- Compatible with SNMP-based management tools including CiscoWorks 2000
- N+1 CallManager clustering enables a backup Cisco CallManager to improve system availability

Specifications

Feature	Cisco ICS 7750
System Switch Processor	Fixed slot card; 10/100BaseT autosensing data switch; Two-port RJ-45 connectors; Included with each ICS 7750 system
System Alarm Processor	Fixed slot card; Two serial ports; One console port; Resource Cards; Included with each ICS 7750 system
System Processing Engine	Universal slot card; Intel Pentium III 700 MHz CPU;1 GB SRAM; 40 GB hard disk drive
Multiservice Route Processor	Universal slot card; Standard memory: 64 MB DRAM (max.128 MB); Memory upgrade (option): 16, 32, 64 MB DRAM; Standard flash memory: 16 MB Flash SIMM (max. 80 MB); Flash upgrade (options): 16, 32, 64 MB Flash; modular voice/WAN interface (VWIC) card slots per card; Advanced data networking feature support, including: VPN, IPSec 56 and 3DES, Firewall
Dimensions and Weight (HxWxD)	15.75 x 17.25 x 12.5 in. (40.005 x 43.815 x 31.75 cm)Basic configuration-1 MRP, 1 SPE, 1 SSP, 1 SAP (a total of 4 cards = 2 fixed cards + 2 universal cards) and 1 power supply): 42 lb (18.9 kg)
Mounting Options	19 in rack-mount; Standalone

Cisco IAD 2400 Series Integrated Access Device with IOS Telephony Service (ITS)[1]

The Cisco IAD 2400 Series integrated access devices (IADs) combine data, voice, and video services over IP and ATM networks to provide cost-effective and efficient means of delivering high-speed Internet and voice services to small- and medium-sized business customers—all in a small (1 RU) system. When configured with optional ITS software, the IAD 2400 is ideal for delivering converged LAN IP telephony in small office environments (5-20 phones) that do not require CallManager functionality.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco IAD 2400 Series	Business-class, fully integrated access device • IOS Telephony Service (ITS), ideal for small offices (5-20 phones) that do not need Cisco CallManager capabilities • Support for standard phones and IP phones on a single platform • 8 FXS/16 FXS/16FXS+8FXO analog voice ports and 1 T1 digital voice port models • T1-PPP, FR, HDLC, ATM, ADSL and G.shdsl WAN interfaces

Key Features

- Combines high-speed Internet access and toll-quality voice services on single IOS-based platform (ITS introduced in Cisco IOS Release 12.1(5)YD)
- Offers TDM, VoIP, and VoATM (AAL2) on a single platform
- Seamless migration of customers from TDM-based GR-303 to packet-based GR-303 networks or to call agent-based networks
- Automated remote installation and configuration enabled via Simple Network-enabled Auto Provisioning (SNAP) and the Cisco Configuration Express tool

Competitive Products

- Adtran: TA850, TA750, TA600
- Carrier Access: Adit 600
- Coppercom: MXR 400
- RAD: LA-110, LA-140

1. IP Keyswitch capabilities also available with 2600 and 3600 series routers; see IP Keyswitch Web site: http://www.cisco.com/go/keyswitch

Cisco Voice Gateways

Voice Gateways interface directly to PBXs or public telephone networks to carry voice traffic across IP networks—by converting IP calls to standard telephony calls and vice versa. They provide connectivity between packet telephony and legacy telephony such as PSTN, PBX, fax machines, and other devices.

Cisco's full line of multiservice routers can also add analog and digital voice gateway functionality through the use of network modules and voice interface cards[1], such as the Catalyst 6000 Family FXS Analog Interface Module.

Cisco offers the Cisco VG248 dedicated voice gateway.

Cisco VG248 Voice Gateway

The Cisco VG248 Voice Gateway is a 1 unit high rack mountable device allowing 48 analog devices (phones, fax machines & modems) to be used with Cisco Call Manager. It enables organizations with large numbers of analog phones (hotels, universities, hospitals, etc.) to deploy IP Telephony while maintaining the investment in legacy handsets. The analog lines are full featured (caller id, message waiting lights, feature codes) and the price per port is competitive with a legacy PBX.

The VG248 will generate SMDI for the attached analog ports allowing connection to a Cisco Call Manager network through legacy voicemail systems. It shares existing SMDI based voicemail systems between the Cisco Call Manager and the legacy PBX.

Cisco IP/VC 3500 Series Videoconferencing Products

The IP/VC 3500 series is for enterprises and service providers who want a reliable, easy-to-manage, cost-effective network infrastructure for videoconferencing over their IP networks. They consist of the IP/VC 3511 Multipoint Control Unit (MCU, also known as a "video bridge"), the IP/VC 3521 and 3526 H.320 to H.323 Gateways and the IP/VC 3540-Series Videoconferencing System. The Cisco IP/VC product family works with H.323-standards-based videoconference client devices from a variety of vendors and integrates with legacy H.320 networks.

- The Cisco IP/VC 3511 Multipoint Control Unit (MCU) is a 1RU stack/rack-mount system enabling adhoc videoconferences between three or more endpoints. Multiple participants in multiple locations attend the same meeting with real-time interactivity. It is suitable for small to medium enterprises and remote branch offices in larger enterprises
- The IP/VC 3521 and the IP/VC 3526 Videoconferencing Gateways are also 1RU stack/rack-mount systems that translate between H.320 and H.323 protocols. The IP/VC 3521 provides up to four BRI interfaces and the IP/VC 3526 provides one ISDN T1/E1 PRI interface

1. Please see the 1700, 2600, 3600, 7200, 5x00 series in Chapter 1—Routers, Chapter 7—Access Products.

C T 3655 1 - AC

- The IP/VC 3540 Videoconferencing System integrates multipoint control units and gateways I onto a single platform for cost-effective deployment of IP-centric videoconferencing networks. In addition, the IP/VC 3540 platform offers T.120 data conferencing through an optional collaboration server. Customers can add the Rate Matching module which enhances the video composition of any multipoint conference. Enhanced features such as Rate Matching, a number of robust Continuous Presence formats and audio transcoding are available
- The Multimedia Conference Manager (MCM) software is part of Cisco IOS Software and available across a wide range of Cisco router platforms, including the Cisco 2600/2600XM, 3600, 3700, and 7200 series. As a gatekeeper/proxy, it enables network managers to control and secure bandwidth and priority settings for H.323 videoconferencing services

Cisco IP/TV 3.4

Cisco IP/TV® 3.4 delivers a complete, highly scalable, bandwidth-efficient solution for high-quality video communications over enterprise networks. Cisco IP/TV supports live video, scheduled video, video on demand (VOD), synchronized presentations and screen captures, and a wide range of video management functions. The solution enables a broad spectrum of applications for enterprise communications including training, corporate communications, business TV, and distance learning.

Cisco IP/TV 3.4 are purchased as Cisco IP/TV 3400 Series Server appliances or software for third party servers. The Cisco IP/TV 3400 Series servers contain pre-configured software, preinstalled capture cards, network interface cards, and device drivers. The Cisco IP/TV 3400 Series includes the IP/TV 3412 Control Server, the IP/TV 3425 and 3425A Broadcast Servers, the IP/TV 3432 Archive Server, and the IP/TV 3417 Video Starter System. This product family offers a range of choices to best suit large-scale enterprise applications, performance requirements, and bandwidth availability.

Web Collaboration—Cisco Web Collaboration Option

The Cisco Web Collaboration Option enables businesses to combine the personal value of human interaction with the information value of the Web-creating a powerful environment for driving increased sales, exceptional service, and customer satisfaction.

The Cisco Web Collaboration Option allows you to add "click-for-help" buttons on your Web site that enable customers to interact with your contact center agents over the Web while conducting a voice conversation (PSTN or Voice over IP [VoIP]) or text chat. Contact center agents and callers can share Web pages-including personalized or dynamically generated pages, complete forms in a collaborative fashion, and share any Windows desktop application using nothing more than a Web browser. By facilitating effective, personalized assistance designed to greatly enhance the customer experience, the Cisco Web Collaboration Option is an ideal solution for both sales- and service-oriented contact centers.

The Cisco Web Collaboration Option can be deployed in a pure IP environment or can be seamlessly integrated with your organization's existing telephony infrastructure to provide automated, blended delivery of phone and Web-based inquiries.

E-Mail Response Management—Cisco E-mail Manager

Cisco E-Mail Manager is a comprehensive, enterprise-class solution for managing high volumes of customer inquiries submitted to your company mailboxes or Web site. Based on customizable business rules, Cisco E-Mail Manager accelerates the response process by automatically directing messages to the right agent or support team, categorizing and prioritizing messages, suggesting relevant response templates, and, if desired, sending automated replies. A full-featured, browser-based interface provides your agents with the productivity tools and knowledge resources they need to provide fast, accurate and personalized responses to your customers. Cisco E-Mail Manager gives managers the queue management, reporting and outbound marketing tools they need to ensure that desired service standards are met, gain valuable insight into customer needs and generate new revenue opportunities.

Whether you are building a customer support system from the ground up or integrating with existing organizational structures and legacy systems, Cisco E-Mail Manager's uniquely flexible, extensible and scalable design delivers a cost-effective, easy-to-implement strategy for building customer relationships over the Internet.

Cisco Emergency Responder

Cisco Emergency Responder revolutionizes enterprise telephony support for E9-1-1 in North America, E1-1-2 in Europe, and other emergency telephone services across the globe. Traditional PBX E9-1-1 implementations in North America support "automatic location identification" of emergency callers through daily manual database update processes, which limit the frequency of location updates and increase the likelihood of update errors. The Cisco Emergency Responder software application works with Cisco CallManager to automatically track the location of Cisco IP phones in enterprise campuses, route emergency calls to an appropriate public safety answering point (PSAP), and provide the location of the caller to the Public Safety Answering Point (PSAP).

Cisco ER performs these functions without requiring tedious manual database updates after phone moves/adds/changes, which significantly reduces the time, headcount, and costs associated with traditional PBX E9-1-1 maintenance. While some vendors may automate location updates, they still require manual PBX configuration changes to trigger the updates. The Cisco ER solution, when coupled with the automated phone moves/adds/changes features in Cisco CallManager, is the first in the industry to completely automates the phone move process while maintaining E9-1-1 and location data integrity.

In addition, Cisco ER can use email/pager messaging, telephone calls, and auto-refreshing webpage updates to notify on-site security operations personnel and third-party agencies of emergency calls in progress.

RQS Nº 03/2005 - CPMI - CORREIOS
0574
Fls:
Doc: 37

Key Features

- Meets and exceeds traditional E9-1-1 requirements
- Automates all user and phone moves, adds, and changes; Enables users and phones to move an unlimited number of times per day
- Avoids the expense and burden of daily PS-ALI record uploads
- Avoids daily error-prone documentation and database updates
- Enables quicker and more effective emergency response from onsite personnel and public agencies
- Provides configuration auditing to facilitate responsible change management and investigative or legal processes
- Provides call history logs for capacity planning, management of emergency call abuse, and incident documentation
- Compatible with any emergency number

Specifications

Feature	Cisco Emergency Responder
Supported Platform	Cisco Media Convergence Server, MCS-7835-1266 and MCS-7825-1133
System Capacity	A single Cisco Emergency Responder server supports 10,000 phones and 30,000 Ethernet switch ports. Additional scalability parameters include 500 Emergency Response Locations (ERLs)- locations that can be uniquely identified to a Public Safety Answering Point (PSAP)- as well as 500 manually entered endpoints such as analog or proprietary phones or H.323 clients. Cisco recommends a second Emergency Responder server to form a fully redundant Cisco Emergency Responder Group with the same capacity and increased availability compared with a single Cisco Emergency Responder server. Larger campuses and distributed systems are supported via a network of Cisco Emergency Responder groups called a Cisco Emergency Responder Cluster.
Configurable Elements	
Cisco CallManager	Call routing and digit manipulation to forward user-initiated emergency calls and PSAP return calls to and from Cisco Emergency Responder as appropriate
Cisco Emergency Responder	System administration interface-for access to all configuration components or oversight of outsourced vendors LAN administration interface-for IT LAN group or an outsourced vendor Emergency Response Location (ERL) administration interface-for IT telecom group or an outsourced vendor
Other Components	Configure e-mail account on a Simple Mail Transfer Protocol (SMTP) Internet mail server for use by Cisco Emergency Responder Configure an email-to-pager gateway, or use an email paging service Configure a PS-ALI transfer application provided by the PS-ALI database service provider (often requires a dialup modem connection) Provision an E9-1-1 capable voice trunk (Centralized Automated Message Accounting [CAMA] or Primary Rate Interface [PRI]) through a local exchange carrier
Supported Switches[1]	Cisco Catalyst 2950, 3500, 3550, 4000, 4500, 6500 Series

1. Check for updates on CCO, and following is list of tested switch platforms at time of printing

Selected Part Numbers and Ordering Information[1]

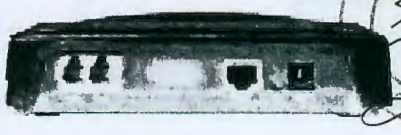
Cisco ATA Series of Analog Telephone Adaptors



The Cisco ATA 186 and 188 Analog Telephone Adaptors bring analog telephones into the networked world. The Cisco ATA series of products address the low-end product portfolio need by targeting the enterprise, business local services, small-office environment and the emerging managed voice services market. These cost effective handset-to-Ethernet adaptors enable analog devices, such as phones and fax machines, to support voice-over-IP (VoIP) services. The Cisco ATA 186 is equipped with, and a single RJ-45 Ethernet port. The Cisco ATA 188 has two RJ-11 voice ports and two RJ-45 ports. The internal Ethernet switch allows for a direct connection to a 10/100BASE-T Ethernet network and connectivity to a co-located PC or other Ethernet-based device via the RJ-45 ports.

Both models ship with a bootload image and must be upgraded to a signaling firmware image available on Cisco.com before deployment. Cisco ATAs can be configured[1] to use the standards-based Voice over IP (VoIP) protocols H.323, Session Initiation Protocol (SIP), Media Gateway Control Protocol (MGCP) and Skinny Client Control Protocol (SCCP).

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco ATA Series of Analog Telephone Adaptors	• Enable analog devices, such as phones and fax machines, to support Voice over IP services by converting the analog signal into an IP signal • Continue use of existing analog phones with IP network

Key Features

- Auto-provisioning with Trivial File Transfer Protocol (TFTP) provisioning servers
- Automatic assignment of IP address, network route IP, and subnet mask via Dynamic Host Configuration Protocol (DHCP)
- Optional web configuration through built-in Web server
- Optional touch-tone telephone keypad configuration with voice prompt
- Administration password to protect configuration and access
- Advanced pre-processing to optimize full-duplex voice compression
- High performance line-echo cancellation eliminates noise and echo
- Voice activity detection (VAD) and comfort noise generation (CNG) save bandwidth by delivering voice, not silence
- Dynamic network monitoring to reduce jitter artifacts such a packet loss

CHAPTER 5

VPN and Security Products

VPN and Security Products at a Glance

Product	Features	Page
Cisco PIX Firewall	Market-leading, purpose-built appliances which provide broad range of integrated security services • Robust stateful inspection firewalling with application awareness • Highly scalable remote access and site-to-site VPN • Intrusion protection with for real-time response to network attacks • Award-winning stateful failover for enterprise-class resiliency	5-2
Cisco IOS Firewall	• Tightly integrated with IOS VPN and advanced routing technologies • Stateful packet filtering via context-based access control (CBAC) • Inline Intrusion detection for real-time response to network attacks • Dynamic, network-to network, per-user authentication and authorization via TACACS+ and RADIUS	5-5
Firewall Blade for Catalyst 6500	Firewall Module is a high performance integrated stateful firewall solution for Catalyst 6500 family of switches with performance exceeding 5GB. It is based on proven PIX technology while providing the following benefits to the customers • Investment protection • Low cost of ownership • Ease of use • Operational Consistency • Scalability See the Catalyst 6500 Series Switch in Chapter 2: LAN Switching, page 2-20 , for more information	2-20
Cisco VPN 3000 Family	Remote access Virtual Private Network platform • Has models for all size companies, from small to large enterprise organizations • Reduces communications expenditures • Enables users to easily add capacity and throughput	5-6
Cisco IDS Network Sensor	Network-based, real-time intrusion detection system capable of monitoring an entire enterprise network: • Distributed intrusion detection system capable of directing and forwarding alarms between local, regional, and headquarters-based monitoring consoles • Scalable architecture to allow the deployment of large numbers of sensors in order to provide comprehensive security coverage in large networks with performance requirements from T1 to gigabit environments • Cisco IDS Module enables customers to perform both security monitoring and switching functions within the same chassis • CTR (Cisco Threat Response) delivers patented adaptive scan techniques to minimize false alarms	5-8
Cisco Security Agent	The Cisco Security Agent provides threat protection for desktop and server computing systems by identifying and preventing malicious activity. By acting on threats or attacks before they can occur, Cisco Security Agent removes known and unknown security risks to enterprise networks and applications: • The Cisco Security Agent aggregates and extends multiple endpoint security functions by providing host intrusion prevention, distributed firewall, malicious mobile code protection, operating system integrity assurance, and audit log consolidation all within a single agent package • Protects against know and unknown attacks on both servers and desktops	5-10
Cisco 7100 Series	Large branch and central site VPN router • Comprehensive suite of VPN services, including encryption, tunneling, firewall, and bandwidth management • Embedded I/O for ease of deployment • Service module slot for IPSec and PPTP encryption coprocessing • Dedicated Site-to-Site VPN router	5-11

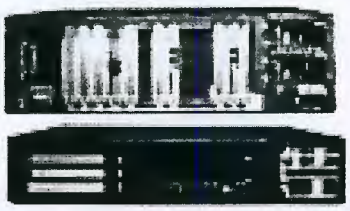
Product	Features	Page
Cisco Secure Access Control Server (ACS) for Windows	Controls the authentication, authorization, and accounting (AAA) of users and administrators network devices and services • Operates as a centralized Remote Access Dial-In User Service (RADIUS) or Terminal Access Controller Access Control System (TACACS+) server • Supports LDAP user authentication • Data replication and backup services • Flexible user and group policy controls • Support for Cisco 802.11x Catalyst Switch and Wireless solutions • Extensible Authentication Protocol (EAP) enhancements to support Protected EAP (PEAP) for wireless LANs • All administrative access is encrypted with SSL	to 5-14
Cisco Secure User Registration Tool (URT)	Identifies users within the network and creates user registration policy bindings that help support mobility and tracking: • Ensures that users are associated with their authorized subnet/VLAN • Addresses the challenges associated with campus user mobility • Supports Web-based authentication for Windows, Macintosh, and Linux client platforms • Secure user access to the VLAN with MAC address-based security option • Option to allow multiple users connected to a hub to access a VLAN served by a single switch port	5-15
CiscoWorks VPN/Security Management Solution	Combines general device management tools for configuring, monitoring, and troubleshooting enterprise networks with powerful security solutions for managing virtual private networks (VPNs), firewalls, and network and host-based intrusion detection systems (IDS). This bundle includes: Management and Monitoring Centers, Cisco IDS Host Sensor and Console, Cisco Secure Policy Manager, VPN Monitor, Resource Manager Essentials, and Cisco View See Chapter 9—Cisco IOS Software and Network Management for more information on CiscoWorks VPN/Security Management Solution	9-16
Cisco 806, 1700, 2600, 3600, 7200, 7400 and SOHO 70 Series	Wide variety of modular router platforms with options for IOS-based and hardware-enabled VPN and security support. See individual product pages and Cisco IOS Firewall Feature Set (page 5-5).	1-1

Cisco PIX Firewall Series



The world-leading Cisco PIX® Firewall Series of purpose-built security appliances provides robust, enterprise-class, integrated network security services, including stateful inspection firewalling, virtual private networking (VPN), intrusion protection, and much more-in cost-effective, easy-to-deploy solutions. Ranging from compact, "plug-and-play" desktop firewalls for small and home offices to carrier-class gigabit firewalls for the most demanding enterprise and service-provider environments, Cisco PIX Firewalls provide robust security, performance, and reliability for network environments of all sizes.

When to Sell

Sell This Product	When a Customer Needs These Features
PIX 501	• Small Office / Home Office desktop integrated security appliance • Up to 10 Mbps of firewall throughput and 3 Mbps of 3DES VPN throughput[1] • Hardware VPN client (Easy VPN Remote) • VPN concentrator services (Easy VPN Server) for up to 5 remote users • Integrated four port 10/100 Mbps switch
PIX 506E	• Remote Office / Branch Office desktop integrated security appliance • Up to 20 Mbps of firewall throughput and 16 Mbps of 3DES VPN throughput[1] • Hardware VPN client (Easy VPN Remote) • VPN concentrator services (Easy VPN Server) for up to 25 remote users • Maximum of two 10BASE-T Ethernet interfaces • OSPF dynamic routing support

Sell This Product	When a Customer Needs These Features
PIX 515E	• Small-to-Medium Business (SMB) integrated security appliance • Up to 188 Mbps of firewall throughput[1] • Up to 140 Mbps of 3DES/AES-256 VPN throughput[1] using hardware acceleration (integrated in select models, optional for others) • VPN concentrator services (Easy VPN Server) for up to 2,000 remote users • Up to six 10/100 FE interfaces • VLAN trunking (802.1q tag-based) and OSPF dynamic routing support • Active/standby stateful failover support
PIX 525	• Enterprise-class integrated security appliance • Up to 330 Mbps of firewall throughput[1] • Up to 155 Mbps of 3DES/AES-256 VPN throughput[1] using hardware acceleration (integrated in select models, optional for others) • VPN concentrator services (Easy VPN Server) for up to 2,000 remote users • Gigabit Ethernet support; Up to eight 10/100 FE or three Gigabit Ethernet interfaces • VLAN trunking (802.1q tag-based) and OSPF dynamic routing support • Active/standby stateful failover support
PIX 535	• Carrier class large enterprise and service provider firewall appliance • Up to 1.7 Gbps of firewall throughput[1] • Up to 440 Mbps of 3DES/AES-256 VPN throughput using hardware acceleration (integrated in select models, optional for others) • VPN concentrator services (Easy VPN Server) for up to 2,000 remote users • Gigabit Ethernet throughput; Up to ten 10/100 FE or nine Gigabit Ethernet interfaces • VLAN trunking (802.1q tag-based) and OSPF dynamic routing support • Redundant, hot-swappable power supplies • Active/standby stateful failover support

1. At 1400-byte packets

Key Features

- Security—Purpose-built firewall appliance with a proprietary, hardened operating system
- Performance—Stateful inspection firewall capable of up to 500,000 concurrent connections and 1.7 Gbps of throughput (at 1400-byte packets on Cisco PIX 535 Firewalls)
- High availability—Award-winning, active/standby stateful failover model provides enterprise-class, cost-effective resiliency
- Virtual Private Networking (VPN)—Supports both standards-based IPsec and L2TP/PPTP-based VPN services
- Optional PIX VPN Accelerator Card+—Scales 3DES/AES-256 VPN throughput up to 440 Mbps, using specialized co-processors designed for accelerating encryption operations
- Free software Cisco VPN Client provides secure connectivity across a broad range of platforms including Windows, Mac OS X, Linux and Solaris
- Network Address Translation (NAT) and Port Address Translation (PAT)—Conceals internal IP addresses and expands network address space
- Denial-of-Service (DoS) Attack Protection—Protects the firewall, internal servers and clients from disruptive hacking attempts
- OSPF dynamic routing support for improved network reliability and performance
- VLAN trunking (802.1q tag) support for simplified deployment in switched network environments
- Web-Based PIX Device Manager (PDM)—For simplified configuration and usage reports
- Auto Update, SSH, SNMP, TFTP, HTTPS, and telnet for remote management
- Support from two 10/100 Ethernet interfaces up to nine Gigabit Ethernet interfaces

Cisco IOS Firewall

The Cisco IOS Firewall enriches Cisco IOS Software security capabilities, integrating robust firewall functionality and intrusion detection for every network perimeter. When combined with Cisco IOS IPSec software and other Cisco IOS Software-based technologies such as L2TP tunneling and quality of service (QoS), it provides a complete, integrated virtual private network solution. Because it is available for a wide range of Cisco routers, it gives customers the flexibility to choose a solution that meets their bandwidth, LAN/WAN density, and multiservice requirements, while benefiting from advanced security.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco IOS Firewall	• An integrated firewall solution with powerful security and multiprotocol routing all on the same platform • Scalability options from the Cisco 800 up to the Cisco 7500 and the Catalyst 6000 • Low cost solution where high performance is not a requirement • For secure extranet and intranet perimeters and Internet connectivity for branch and remote offices • Secure remote access or data transfer via a Cisco IOS Software-based VPN solution • Real-time (inline) integrated intrusion detection system (IDS) to complement firewall or existing IDS (Cisco Secure IDS) • Security and access to the network on a per-user basis

Key Features

- Context-based access control (CBAC) provides secure, stateful, application-based filtering, supporting the latest protocols and advanced applications
- Intrusion detection for real-time inline monitoring, interception, and response to network misuse
- Dynamic, per-user authentication/authorization for LAN, WAN, and VPN clients
- Graphical configuration and management via the ConfigMaker Security Wizard and Cisco Secure Policy Manager (CSPM)
- Provides strong perimeter security for a complete Cisco IOS Software-based VPN solution, including IPSec, QoS, and tunnelling for a wide range of Cisco routers

Competitive Products

- Lucent (Ascend): SecureAccess Firewall
- Nokia: IP400 Series
- Nortel: BaySecure Firewall-1
- Same competitors as PIX so they are also Checkpoint, Linksys, Nokia, Netscreen, etc.

Specifications

Feature	Cisco IOS Firewall
Supported Network Interfaces	All network interfaces on supported platforms
Supported Platforms	Cisco 1720, 2600/2600XM, 3600, 7100, and 7200 series router platforms (supports full feature set) Cisco 800, UBR900, 1600, and 2500 series router platforms include all firewall features with exception of intrusion detection and authentication proxy
Simultaneous Sessions	No maximum; dependent on platform, network connection, and traffic

Part Numbers and Ordering Information

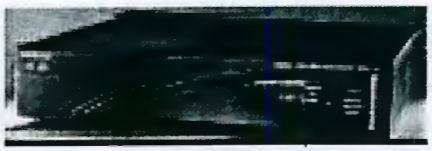
Cisco VPN 3000 Family



The Cisco VPN 3000 Concentrator Series—A family of purpose-built, remote access Virtual Private Network (VPN) platforms that incorporates high availability, high performance and scalability with the most advanced encryption and authentication techniques available today. Customers can greatly reduce costs by leveraging their ISPs' infrastructure and eliminate costly leased lines. This series supports small offices as well as large organizations with up to 10,000 simultaneous remote users per unit. With load balancing configured, multiple units can be clustered to enable unlimited remote access users. It also supports the widest range of VPN clients including Certicom MovianVPN client, Microsoft 2000 L2TP/IPsec Client, and Microsoft PPTP for Windows 95/98/ME/NT/2000/XP.

The Cisco VPN 3002 Hardware Client—Combines the best capabilities of a software client with the reliability and stability of a dedicated hardware platform, and scales to tens of thousands of users. It sets up connections to a variety of Cisco VPN concentrators, including the VPN 3000 series and PIX firewalls.

When to Sell

Sell This Product	When a Customer Needs These Features
VPN 3005 and 3015 Concentrators	• A fixed configuration device designed for small- to medium-sized organizations with bandwidth requirements up to full-duplex T1/E1 (4 Mbps maximum performance) and up to 100 simultaneous remote access sessions • Encryption processing is performed in software • VPN 3015 is field-upgradable to the Cisco VPN 3030 and 3060 models and for redundancy
VPN 3030 and 3060 Concentrators	• VPN 3030 is for medium- to large-sized organizations with bandwidth requirements from full T1/E1 through T3/E3 (50 Mbps max. performance) and up to 1500 simultaneous sessions; field-upgradeable to the Cisco VPN 3060 • VPN 3060 is for large organizations, with high-performance, high-bandwidth requirements from fractional T3 through full T3/E3 or greater (100 Mbps max. performance) and up to 5000 simultaneous remote access sessions • Both have specialized SEP modules to perform hardware-based acceleration
VPN 3080 Concentrator	• Optimized to support large enterprise organizations that demand the highest level of performance combined with support for up to 10,000 simultaneous remote access sessions • Specialized SEP modules perform hardware-based acceleration
VPN 3000 Client	• Establishes secure, end-to-end encrypted tunnels to the Cisco VPN 3000 Concentrator and other Cisco Easy VPN compliant devices. • Provided at no charge, installs on PCs and is available for Windows, MAC OS X and Linux/Solaris environments
VPN 3002 Hardware Client	• Emulates the software client in hardware • Ideal for mixed operating system environments and where corporation does not own/control remote PC or for very large applications requiring large number of devices due to ease of deployment, upgradability & scalability

Key Features

- Cisco VPN 3000 Concentrators Series
  - Support for industry standard IPSec DES/3DES/AES and Cisco IPSec/NAT for VPN Access through Port Address Translation firewalls
  - Unlimited-use license for Cisco VPN Client distribution included at no cost with multiple OS support including Windows, MAC OS X, Linux and Solaris; also integrates with Zone Alarms personal firewall
  - Supports standard authentication: RADIUS, SDI Tokens, and Digital Certificates
  - VPN load balancing allows for multiple units to cluster as a single shared pool
- Cisco VPN 3002 Hardware Client supports up to 253 users/stations per VPN 3002
  - Works with most operating systems including Windows, Linux, Solaris, and MAC OS X
  - Auto-upgrade capability automates upgrades with no user intervention required
  - Client technology employs push policy and automatic address assignment from the central site concentrator, enabling virtually unlimited scalability

Client License	Unlimited	Unlimited	Unlimited	Unlimited	Unlimited
LAN-to-LAN Connections (internal user database)	100	100	500	1000	1000
Dimensions (HxWXD)	1.75 x 17.5 x 11.5 in.	3.5 x 17.5 x 14.5 in.	3.5 x 17.5 x 14.5 in.	3.5 x 17.5 x 14.5 in.	3.5 x 17.5 x 14.5 in.

Cisco VPN 3002 Hardware Client

Feature	VPN 3002 Hardware Client
Hardware Processor	Motorola PowerPC processor; Dual flash image architecture
Network Interfaces	CPVN3002-K9: One Public 10/100Mbps RJ-45 Ethernet Interface and One Private Port 10/100Mbps RJ-45 Ethernet Interface CVPN3002-8E-K9: One Public 10/100Mbps RJ-45 Ethernet Interface and Eight Private Port 10/100Mbps RJ-45 Ethernet Interfaces via AUTO-MDIX switch
Physical Dimensions	1.967 x 8.6 x 6.5 in. (5 x 8.6 x 16.51 cm)
Power Supply	External AC Operation: 100-240V at 50/60 Hz with universal power factor correction; 4 foot cord included and international "pigtail" power cord selection
Tunneling Protocol Support	IPsec with IKE key management
Monitoring & Configuration	Event logging; SNMP MIB-II support Embedded management interface is accessible via console port or local web browser; SSH/SSL
Encryption Algorithms, Key Management & Authentication Algorithms	56-bit DES (IPsec); 168-bit Triple DES (IPsec); AES 128 & 256-bit (IPsec)
Authentication and Accounting Servers	Support for redundant external authentication servers including RADIUS Microsoft NT Domain authentication, X.509v3 Digital Certs (PKC7-PKCS10)
Configuration Modes	Client Mode—acts as client, receives random IP address from Concentrator Pool; Uses NAPT to hide stations 3002; Network behind 3002 is unroutable; few configuration parameters Network Extension Mode—acts as site-to-site device; Uses NAPT to hide stations only to Internet (stations visible to central site); Network behind 3002 is routable; additional configuration parameters

Cisco Intrusion Detection System Network Sensors

Cisco integrated network security solutions enable organizations to protect productivity gains and reduce operating costs. The Cisco Intrusion Protection is designed to efficiently protect your data and information infrastructure. Cisco delivers four four critical elements for efficient intrusion protection system which are:

- Accurate threat detection—Cisco Intrusion Detection System Version 4.0 (Cisco IDS 4.0) delivers the first step in providing a secure environment by comprehensively detecting all potential threats
- Intelligent threat investigation—Cisco Threat Response technology virtually eliminates false alarms, and automatically determines which threats need immediate attention to avoid costly intrusions.
- Ease of management—Browser-based tools simplify the user interaction, while providing powerful analytical tools that allow for a rapid and efficient response to threats.
- Flexible deployment options—A range of high-availability devices provide the flexible backbone for creating the secure and efficient intrusion protection system.

The current Cisco IDS sensing portfolio includes the following sensor appliances: IDS 4210, IDS 4235, IDS 4250, and IDS 4250-XL. Additionally, Cisco IDS delivers network protecting that is integrated into the Catalyst 6500 switch with the Intrusion Detection System Module (IDSM-2).

ECT 3641

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco IDS Network Sensors	• Cisco network IDS appliances are network-based, real-time intrusion detection systems capable of monitoring an entire enterprise network • Performance requirements from 45 Mbps to 1 Gbps • The Cisco IDS Module enables customers to perform both security monitoring and switching functions within the same chassis • A robust, 24 hour x 7 day-a-week monitoring and response system with the latest attack detection capabilities • A distributed intrusion detection system capable of directing and forwarding alarms between local, regional, and headquarters-based monitoring consoles • A scalable architecture to allow the deployment of large numbers of sensors in order to provide comprehensive security coverage in large network environments. • An intrusion detection system designed to integrate smoothly with existing network management tools and practices • Automated false alarm reduction capabilities • Integration of full featured IDS protection into the Cisco Catalyst 6500 chassis

Key Features

- High-Speed Performance including support for full line rate gigabit environments
- Easy Installation and Setup; Remote Configuration Capability
- Fault-Tolerant Communications
- Comprehensive Attack Database
- Custom User-Defined Signatures; Automatic Signature Updates
- Notification actions
- Ability to Monitor 802.1q (trunked) traffic
- Secure web-based embedded device management and event monitoring
- Comprehensive IDS Anti-Evasion Techniques
- Cisco IOS-like CLI for full featured IDS management capabilities

Cisco Security Agent

The next-generation Cisco Security Agent network security software provides threat protection for server and desktop computing systems, also known as "endpoints." The Cisco Security Agent goes beyond conventional host and desktop security solutions by identifying and preventing malicious behavior before it can occur, thereby removing potential known and unknown ("Day Zero") security risks that threaten enterprise networks and applications. The Cisco Security Agent aggregates and extends multiple endpoint security functions by providing host intrusion prevention, distributed firewall, malicious mobile code protection, operating system integrity assurance, and audit log consolidation all within a single agent package.

The Cisco Security Agent analyzes behavior rather than relying on signature matching, its solution provides robust protection with reduced operational costs. Customers require robust endpoint security that prevents security attacks from affecting the network and critical applications.

As a key component of the SAFE blueprint for secure e-business, the Cisco Security Agent provides unprecedented endpoint protection that enables businesses to participate in e-commerce securely and take advantage of the Internet economy.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Security Agent	• Host intrusion protection, distributed firewall, malicious mobile code protection, operating system hardening, file integrity and/or audit log consolidation. The Cisco Security Agent provides all of these features in one integrated package • Protection against both known and unknown attacks • Protection for servers and/or desktops/laptops • A solution that is scalable to protect thousands of servers and desktops for large enterprise deployments

Key Features

- Provides industry-leading protection for Unix and Windows servers
- Open, extensible architecture offers the capability to define and enforce security according to corporate policy

Cisco 7100 Series

The Cisco 7100 series VPN router is a high-end, integrated VPN solution that melds high-speed, industry-leading routing with a comprehensive suite of advanced site-to-site VPN services. The Cisco 7100 series VPN router integrates key features of VPNs—tunneling, data encryption, security, firewall, advanced bandwidth management, and service-level validation—to deliver self-healing, self-defending, VPN platforms that cost-effectively accommodate remote-office and extranet connectivity using public data networks. The Cisco 7100 series VPN router offers specific hardware configurations optimized for VPN applications and network topologies. Optional WAN and embedded Fast Ethernet interfaces combined with high-performance routing and rich VPN services provide turnkey VPN routing solutions.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco 7120	• Entry-level Cisco 7100 Series Router designed for large branch or central site VPN with VPN services throughput of up to 50 Mbps • Designed primarily for site-to-site VPN deployments with incidental remote access requirements
Cisco 7140	• High-end site-to-site VPN platform for central site VPN applications with VPN services throughput up to 140 Mbps • Provides superior routing and VPN services performance for central site environments, as well as dual power supplies for increased solution reliability

Key Features

- Comprehensive suite of VPN services—tunneling, data encryption, security, firewall, quality of service, and service level validation—integrated with industry leading routing
- High performance RISC processor delivering high-speed, scalable VPN services and routing throughput and extensive memory for reliable, high-speed VPN services delivery
- Dual autosensing 10/100BASE-T Fast Ethernet ports for connectivity to the corporate LAN; the Cisco 7120 Series also has an integrated 4-port T1/E1 serial WAN interface
- Integrated Services Module (ISM) is included for support up to 2000 simultaneous tunneling sessions with 90 Mbps encryption performance and Windows 95/98/NT4.0 and Windows 2000 compatibility for remote access; an optional Integrated Services Adapter (ISA) may be installed in the Cisco 7140 to provide dual encryption acceleration performance up to 3000 tunnels and 140 Mbps 3DES encryption throughput

Cisco Secure Access Control Server for Windows

Cisco Secure ACS is a highly scalable, high-performance access control server that operates as a centralized Remote Access Dial-In User Service (RADIUS) or Terminal Access Controller Access Control System (TACACS+) server system. Cisco Secure ACS controls the authentication, authorization, and accounting (AAA) of users and administrators accessing corporate resources through the network. Cisco Secure ACS greatly reduces the administrative and management burden involved in scaling user and network administrative access to your network. Cisco Secure ACS centralizes the administration of user access controls globally to ensure enforcement of assigned policies.

ACS 3.1 provides support for the latest security architecture for Wireless authentication. It also includes SSL server authentication and encryption for administrative login.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Secure Access Control Server (ACS) for Windows	• Centrally manage who can log in to the network from wired or wireless connections • Privileges each user has in the network • Accounting information recorded in terms of security audits or account billing • What access and command controls are enabled for each configuration administrator • Virtual VSA for Aironet rekey • Secure server authentication and encryption • Simplified firewall access and control through Dynamic Port Assignment • Same User AAA services

Key Features

- PEAP support—Provides a new, secure client-server authentication method for wireless networks; Provides new support for one-time token authentication, password change/aging and powerful extensibility of end-user databases such as LDAP, NDS, and ODBC.
- SSL support for administrative access—Administrative access via the Web GUI can be secured with SSL, both certificate-based and encrypted tunnel support
- CHPASS improvements—Allows privileged users control over whether network administrators can change passwords during TACACS+ AAA client-hosted Telnet sessions
- Improved IP pool addressing mechanism—Includes a new, efficient algorithm for allocating IP addresses
- Device search mechanism—Allows users to search for a configured AAA device based on the device name, IP address, type (RADIUS or TACACS+), or device group
- Improved PKI support—Provides a more secure PKI authentication scheme by verifying the user's certificate authority stored in the remote LDAP directory against the one provided by the client

ECT 3635 21

- EAP proxy enhancements—Extends EAP (LEAP, PEAP, or EAP-transport layer security [TLS]) proxy to other RADIUS or external databases using standard RADIUS proxy
- Integration with Cisco's security management software applications—Provides a consolidated administrative TACACS+ control framework for many Cisco security management tools such as CiscoWorks VPN/Security Management Solution (VMS)

Competitive Products

- Funk: Steel Belted RADIUS
- Lucent/Avaya: Security Management Server (LSMS)
- Nortel: Preside RADIUS Server (OEM of Funk product)

Specifications

Feature	Cisco Secure Access Control Server (ACS) for Windows
Platform	Windows 2000 Server must meet the following minimum hardware requirements:Pentium processor, 550 MHz or faster; Minimum resolution of 256 colors at 800 x 600 lines
RAM	256 MB required; more if you are running your database on the same machine
Disk Drive	250 MB of disk space; more if you are running yoru database on the same machine
Software Requirements[1]	Cisco Secure ACS Server uses an English-language version of Windows 2000 Server. For specific types of service packs supported, refer to online documentation.The Windows server that runs Cisco Secure ACS must have a compatible browser installed. Cisco Secure ACS was tested with English-language versions of the following browsers on Microsoft Windows operating systems: Microsoft Internet Explorer 5.5 and 6.0, Netscape Communicator 6.2
Platform Requirements	Cisco IOS Software 11.2 or higher on Cisco Routing Solutions

1. Beginning with Cisco Secure ACS Version 3.1, Cisco Secure ACS on a Windows NT 4.0 server is no longer supported. For information about upgrading the operating system of a server running Cisco Secure ACS, see the Installation Guide for Cisco Secure ACS for Windows Server, Version 3.1

Selected Part Numbers and Ordering Information[1]

Cisco Secure Access Control Server (ACS) for Windows

CSACS-3.1-WIN-K9	Cisco Secure ACS 3.1 for Windows
CSACS-3.1-WINUP-K9	Upgrade to CSACS 3.1 for Windows from ACS versions 1.x, 2.x, 3.0 and Cisco Secure ACS for Unix version 2.x

Cisco Secure User Registration Tool

Cisco Secure URT is a virtual LAN (VLAN) assignment service that provides LAN security by actively identifying and authenticating users and then associating them only to the specific network services and resources they need through dynamic VLAN assignments to Cisco Catalyst® Switch networks. URT v2.5 introduces many innovative features, including a Web-based logon from Windows, Macintosh, and Linux clients, RADIUS and Lightweight Directory Access Protocol (LDAP) authentication, and a secure link between the client and the VLAN Policy Server (VPS). It also includes a security feature based on the Media Access Control (MAC) address that prevents users from accessing the network if they are not using authorized machines. Web based LAN authentication allows for user mobility within the LAN environment.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Secure User Registration Tool (URT)	• Web-based LAN authentication for Windows, Macintosh, and Linux client platforms—ideal for mobile users within the LAN environment • Extended security to protect user access to the logon VLAN from unregistered PCs through MAC-based security option • RADIUS authentication and accounting support • Multiple user access per port

Key Features

- Web Client Logon Interface—Supports customizable Web-based authentication for Windows, Macintosh, and Linux client platforms
- MAC-Based Security Option—Provides extended security to protect user access to the logon VLAN from unregistered PCs
- RADIUS Authentication and Accounting Support—RADIUS authentication is offered for Web logon
- Secure Link Between Cisco Secure URT Client and VPS Server—Security authentication and data encryption have been added to URT v2.5 to enable a more secure connection from the user
- LDAP Support (Active Directory and NDS directories)—Cisco Secure URT v2.5 supports Windows' Active Directory and Novell's NDS LDAP servers
- Multiple Users Per Port—Previous versions of Cisco Secure URT support only a single user logon on a single port
- Display of Windows NT Groups—The URT Administrator interface is enhanced to display the users belonging to a Windows NT group
- MAC Address Events History—With URT v2.5 MAC-address-based logon/logoff events are added as an option and reported to the history events tool

Specifications

Feature	Cisco Secure User Registration Tool (URT)
Server Requirements	Windows 2000 (SP2) server, professional, and Windows XP Professional-Min H/W (Pentium III, 512MB DRAM, 65 MB of disk space)
Browser for Web Login	Netscape version 4.79 and 6.2; IE version 5.5 (SP2) or 6.0
Client Software Requirements	Windows 98 (2ndE), Windows NT4 Workstation/Server (SP6A), Windows 2000 (SP2) Professional/server, Windows XP Professional, Windows XP Home (Web Client Only), Mac OS 10.1 (Web client only), Linux Redhat/ SuSE/ Mandrake/ VA (Web Client only)-Min H/W for Web client (Pentium II, 256MB DRAM, 65 MB of disk space), Min H/W for traditional client (Pentium II, 64MB DRAM, 1MB of disk space)
Supported Cisco Products (latest tested version)	1900 series (1912, 1924), v9.00.05; C2800 series (2822, 2828), v9.00.05; C2900XL series (2908XL, 2916XL, 2912XL, 2912LRE-XL, 2924XL, 2924LRE-XL), v12.0(5)WC3b; C2948GL3 series (2948GL3, 4232) v12.0(18)W5(22b); C2950 series, v12.1.6.EA2c; C3500XL series (3508XL, 3512XL, 3524XL, 3548XL, 3550XL), v12.0(5)WC3b; C3550 series, v12.1.8.EA1c; C4000 series (4003, 4006, 4912g), v7.1(2); C5000 series (2900, 2926, 2948, 5000, 5002, 5500, 5505, 5509), v6.3(5); C6000 series (6006, 6009, 6506, 6509, 6513), v7.1(3)

Selected Part Numbers and Ordering Information[1]

Cisco Secure User Registration Tool (URT)

URT-2.5-K9	Starter Kit: includes one (1) User Registration Tool 2.5 Software license, and one (1) Cisco 1101 VLAN Policy Server (VPS) appliance
URT-2.5-UP	Software only; upgrades customers from URT 2.X to 2.5; includes upgrade for both URT Admin Server and Cisco 1100 VPS appliance
URT-1101-HW-K9	Hardware Only; Cisco 1101 VPS appliance; additional appliance needed for backup, use in distributed deployments, or deployments requiring Web logon capabilities

CHAPTER 6

Content Networking Products

Content Networking Products at a Glance

Product	Features	Page
Cisco Content Engine 500 Series	Content services edge delivery platform for Enterprise networks • Functions as edge node device in an Application and Content Networking (ACN) system • Responsible for delivery of cached or distributed content to the end-user • Enables customers to rapidly deliver strategic applications to branch personnel including web application and content acceleration, content filtering and business video • Lays the foundation for advanced services such as e-learning and point of sale video delivery.	6-2
Cisco Content Engine 7300 Series	Content services platform for Enterprise data center and Service Provider networks • Offers premium hosting services • Caching capabilities optimize Web site performance and WAN bandwidth utilization • Offers transparent and Internet proxy caching, Content Filtering and ECDN capabilities in a single platform • Accelerates both HTTP and streaming media file formats	6-2
Content Engine Network Modules	Content services edge delivery network module for 2600, 3600, 3700 branch routers • Functions as edge node device in an Application and Content Networking (ACN) system • Enables delivery of new applications and services via a Cisco branch router with no performance degradation of core routing services • Allows rapid delivery of strategic applications to branch personnel including web application and content acceleration, content filtering and business video	6-2
Cisco 11500 Series Content Services Switches	Next-generation intelligent platform for Web site and e-commerce optimization • Provides an intelligent, distributed architecture to scale for today's e-business infrastructure • Offers Adaptive Session Redundancy (ASR)—a new industry standard in stateful failover • Delivers the greatest flexibility of any content switch in its class for customizing combinations of ports, performance, and services	6-4
Cisco LocalDirector	Integrated hardware and software solution for load balancing across servers • Allows many servers to appear as one server for high availability and easy scalability • Secure real-time embedded operating system	6-6
Cisco Content Distribution Manager 4600 Series	Content networking policy and management device • Central control over acquisition and distribution of content, including live and video on demand video, over IP networks • Intuitive web-based GUI provides integrated, easy-to-use management over caching and content delivery functions such as multicast replication, intelligent cache bypass and bandwidth management • Roles based access control securely enables multiple administrators and content publishers across the organization	6-7
Cisco Content Router 4430	Integrated global load balancing solution for content delivery networks • Solves distributed server site selection problems • Uses HTTP (CR-4430) to redirect a client to the best site on the Internet based on network delay • Transparently redirection redirects end user requests to the end user and works with any IP application • Extremely fast site-selection algorithm is optimized for high performance Web-style transactions	6-9
Content Switching Module (CSM) for the Catalyst 6500 Series Switches	Line card for Catalyst 6500 • Balances client traffic across multiple servers within server farms • URL and Cookie-based load balancing • High-performance—200,000 new Layer 4 TCP connection setups per second	6-11
Cisco SSL Module for Catalyst 6500	• Offloads SSL encryption and decryption • Scalable performance • Stickyness	6-11

Product	Features	Page
Cisco 11000 Series Secure Content Accelerator (SCA 11000)	Appliance-based SSL solution • Offloads SSL encryption/decryption from Web servers • Supports 200 new SSL connections and 900 sustained SSL sessions per second • Interoperates with the CSS 11000 for intelligent load balancing of SSL traffic	6-12
Cisco CTE-1400 Series Content Transformation Engine	Transforms Web and XML-based applications for display and interaction on IP Telephones, PDAs, WAP Phones and other non PC devices • Supports a broad range of end devices • Transforms existing applications • Design Studio GUI Application	6-13
Cisco DistributedDirector	Global Internet service scaling solution • Solves distributed server site selection problems. Enables a set of distributed servers to be seen as a single virtual server • Uses DNS to redirect a client to the best site on the Internet based on a variety of options • Configurable as authoritative Domain Name Services (DNS) caching name server and/or HTTP Session Redirector on a per-domain basis	6-14
Cisco GSS 4480 Global Site Selector	Global site selection for distributed data centers • Delivers global load balancing for multiple data centers • Offloads Domain Named System (DNS) servers by doing DNS resolution • Scales to support hundreds of data centers or server load balancers (SLBs)	6-15

Content Networking Overview

Cisco Content Networking solutions are designed to optimize the delivery of content to end users. To accomplish this, Cisco offers solutions for both data center and edge delivery with industry-leading products in both categories.

In the data center, Cisco Content Switching, or L4-7 Switching, solutions optimize any size network to dynamically enable faster responses to Web requests and decrease network bandwidth congestion. Content switching, or intelligent load balancing, insures high levels of content availability and security, and leverages investment in Cisco IP infrastructure.

Cisco's Application and Content Networking (ACN) System allows enterprises to accelerate mission critical web applications such as Siebel and SAP, block viruses and inappropriate web sites and deliver business video, while laying the foundation for advanced services such as e-learning and point of sale video delivery. For Service Providers, the Cisco ACN System represents a highly profitable, new revenue opportunity by enhancing the customer/user Web experience and significantly accelerating the delivery of rich Web applications, content and streaming media.

Cisco Content Engines

Within Cisco's content-networking solutions portfolio, the Cisco Application and Content Networking System (ACNS) Software enables a variety of services that optimize delivery of Web applications and content from the network edge to ensure enhanced speed, availability, and performance for users. ACNS Software combines the technologies of transparent caching and enterprise content-delivery network (ECDN) for accelerated delivery of Web objects, files, and streaming media from a single intelligent edge appliance, the Cisco Content Engine (CE).

The Cisco ECDN solution provides a platform that delivers immediate benefits from entry-level applications such as content and business application acceleration and URL filtering, while laying the foundation for advanced services such as business video and e-learning.

When to Sell

Sell This Product	When a Customer Needs These Features
Content Engine 7325	• Ultra high-end content delivery capabilities for advanced applications such as streaming media, e-learning, and corporate communications
Content Engine 7305	• High-end content delivery capabilities for advanced applications such as streaming media, e-learning, and corporate communications
Content Engine 565	• Mid-range branch office and datacenter cache ideal for transparent caching, URL filtering, and edge content delivery
Content Engine 510	• Entry-level transparent caching and URL filtering capabilities along with limited content delivery
Content Engine Network Modules	• Router-integrated caching and content delivery network modules for 2600, 3600, 3700 branch access routers

Key Features

- Caching—Provides accelerated content delivery, WAN bandwidth cost savings, and protection vs. uncontrollable bottlenecks
- Content Filtering—Enables administrators to block, monitor, and report on end users' access to non-business and objectionable content (uses N2H2 Internet Filtering Protocol, Secure Computing SmartFilter, or Websense Enterprise Software)
- Content Delivery—Use in conjunction with Cisco Content Distribution Manager to enable rich media e-learning and corporate communications; deliver new premium hosting services such as on-demand content delivery and streaming media; and, to scale Web sites

Competitive Products

- Blue Coat: Blue Coat Server Accelerator 700 and 7000 Series and Blue Coat Systems Director
- Network Appliance: NetCache C1200/2100/6100 Series Appliances and Content Director
- Volera: Excelerator, Media Excelerator, Secure Excelerator

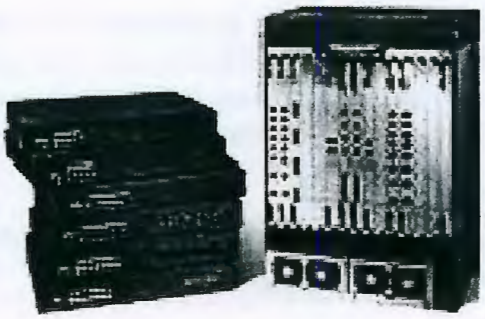
Cisco CSS 11500 Series Content Services Switches



The Cisco CSS 11500 Series Content Services Switch is suitable for both enterprises and service providers seeking to reduce data center costs, boost e-business application performance, offer enhanced services, ensure online transaction integrity, and provide the best possible online experience for customers, business partners, and internal workers.

The Cisco CSS 11500 is available in three models—the standalone Cisco CSS 11501, the three-slot Cisco CSS 11503 and the six-slot Cisco CSS 11506. Both the CSS 11503 and CSS 11506 systems take advantage of the same high-performance, modular architecture and use the same set of I/O, Secure Sockets Layer (SSL), and session accelerator modules. Also, all three systems operate with the same WebNS software, enabling the Cisco CSS 11501, 11503 and 11506 to offer industry-leading content switching functionality within three compact, hardware platforms.

When to Sell

Sell This Product	When a Customer Needs These Features
CSS 11501	• Standalone, fixed-configuration switching platform with up to 8 Fast Ethernet ports and 1 optional Gigabit Ethernet port • Cost-effective server, cache, and firewall load balancing • Complex Web applications requiring high-level URL and cookie switching
CSS 11503	• Compact, high-performance, modular content switching platform with up to 32 Fast Ethernet ports or up to six Gigabit Ethernet ports • Cost-effective server, cache, and firewall load balancing • Integrated SSL capabilities for secure transactions • Complex Web applications requiring high-level URL and cookie switching
CSS 11506	• Compact, high-performance, modular content switching platform with up to 32 Fast Ethernet ports or up to six Gigabit Ethernet ports • Cost-effective server, cache, and firewall load balancing • Integrated SSL capabilities for secure transactions • Complex Web applications requiring high-level URL and cookie switching

Key Features

- Introduces an intelligent, distributed architecture to meet the real-world scaling requirements of today's e-business infrastructure
- Improves site availability and transaction integrity by introducing Adaptive Session Redundancy (ASR)—a new industry standard in stateful failover
- Delivers the greatest flexibility of any content switch in its class for customizing combinations of ports, performance, and services
- Scales secured transaction performance through support of an integrated, high-capacity Secure Sockets Layer (SSL) module (WebNS 5.20)
- Protects investment by enabling upgrades of performance, ports, and services through modularity

Competitive Products

- Alteon/Nortel: ACEdirector and 700 Series
- F5 Networks: Big/IP and LAN switch Partners
- Foundry Networks: ServerIron
- Radware: Web Server Director (WSD)
- Resonate: Central Dispatch and Global Dispatch

Cisco LocalDirector

The Cisco Local Director Series offers a high-availability, integrated hardware and software solution that intelligently balances the load of user traffic across multiple TCP/IP application servers. Cisco Local Director tracks network sessions and server load conditions in real time, directing each session to the most appropriate server. All physical servers appear as one virtual server, requiring only a single IP address and a single URL for an entire server farm.

A key component of a content delivery network, Cisco Local Director accelerates content delivery by routing client requests to the best Web server at the Web site of origin. Cisco Local Director supports critical content routing protocols such as Dynamic Feedback Protocol (DFP) and the Boomerang Control Protocol (BCP), which ensure seamless content delivery network integration and reduced deployment costs. Layer 4-7 content load balancing guarantees that the correct client is routed to an optimized content location. The accelerated server load balancing (ASLB) feature works with the Cisco Catalyst 6000 and 6500 Series switches to accelerate scaling of TCP sessions and help to protect against Flash crowds—sudden traffic surges that can overwhelm a web site.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco LocalDirector	• Load balancing across multiple TCP/IP application servers • High availability Internet services such as e-commerce, Web content, and e-mail • High availability Intranet services for employees, customers, and suppliers

Key Features

- HTTP redirect sticky enables client-to-server persistence, regardless of SSL and shopping-cart configurations, to improve site availability
- Hot-standby and stateful failover mechanisms ensures high availability by eliminating all points of failure for the data center
- Transparent support for all common TCP/IP Internet services, including User Datagram Protocol (UDP), accommodates a wide range of applications and communications needs (Web, File Transfer Protocol [FTP], Telnet, Domain Name System [DNS], and Simple Mail Transfer Protocol [SMTP]) without special software configuration
- SSL and cookie sticky ensures completion of complex transactions in proxy server environments
- Client-assigned load balancing provides QoS mechanism by allowing traffic to be directed to servers based on source IP address
- High-performance hardware supports six Fast Ethernet (Cisco Local Director 417) or two Fast Ethernet plus two Gigabit Ethernet (Cisco Local Director 417G) interfaces
- Network Address Translation (NAT) allows unregistered IP addresses on servers without router assistance

- Simple setup in 10 commands offers simple setup for typical configurations, with little disruption to existing network configuration and no changes to network addresses
- Integrated security capability effectively protects server farms from unauthorized access by filtering based on client IP address and service

Cisco Content Distribution Manager 4600 Series

The Cisco Content Distribution Manager (CDM) configures network and device policy settings for edge node Content Engines (CE). Used to accelerate web content and save network bandwidth in a content networking architecture, the CDM can be easily integrated into existing network infrastructures. Deployed in an Enterprise or Service Provider Internet or extranet environment, the Cisco CDM and CEs provide transparent on-demand rich media streaming and static file delivery to standard PCs.

Cisco Enterprise Content Delivery Networks (ECDNs) allow service providers and enterprises to distribute rich media content closer to their target customers overcoming issues such as network bandwidth availability, distance or latency obstacles, origin server scalability, and congestion issues during peak usage periods. The ECDN solution enables content delivery services for web hosting, streaming, e-commerce, e-learning, corporate communications, and mission critical e-business applications.

When to Sell

Sell This Product	When a Customer Needs These Features
CDM 4630	• Low-cost early deployment, or small enterprise network trials, proof of concept, and pilot programs
CDM 4650	• Medium and large enterprise networks, supports up to 1000 Cisco Content Engines
CDM 4670	• Service provider deployment, supports thousands of Cisco Content Engines

Key Features

- Complete CDN solution with Cisco Content Router and Cisco Content Engines
- Central control over delivery of high-bandwidth content, live and video-on-demand over any IP network
- Easy-to-use management capabilities through a Web-based GUI; services include previewing and scheduling replication of media to edge devices, bandwidth and content management
- Automatically generates thumbnail reference images and sample Web pages for integration with corporate extranet, intranet, and Internet sites
- One URL per media file provides seamless integration into any Web site
- Integrates with standards for Web multimedia presentation, including HTML/DHTML, eXtensible Markup Language (XML) and SMIL
- Secure and fault-tolerant file transfer using Secure Socket Layer (SSL) encryption for secure media transfers
- Channel configuration for media distribution to any number of discrete audiences using "distribution lists"
- Host content for a variety of customers within a single CDN
- Ability to create multiple virtual CDNs addressing targeted media distribution
- Content registration in cache logs for billing capabilities

Competitive Products

- Cacheflow: Client and Server Accelerators
- Inktomi: Traffic Server
- Network Appliance: ContentDirector

Cisco Content Router 4430

The Cisco Content Router 4430 (CR 4430) is a compact, high-performance solution for enabling premium Web services over public or private networks. Featuring either Cisco Enterprise Content-Delivery Network (ECDN) or Content Router 1.1 Software, customers can transparently route user Web browsers to the optimal content engine for file delivery.

With its patented routing technology, the Cisco CR 4430 provides redundancy, scalability, and performance enhancements for network Web sites in either an enterprise or public service provider network. Using Hypertext Transfer Protocol (HTTP)-based re-direction, the Cisco CR 4430 can redirect users over the public network or behind the security of a corporate firewall, making it a vital component of the Cisco end-to-end Content Networking Solution.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Content Router 4430	• When a customer needs to support a Cisco Enterprise Content Delivery Network with HTTP redirection • Supports resiliency for ECDNs when used with a Cisco CSS 11500 content services switch • Up to five Cisco CR 4430s can be deployed in an ECDN network to provide greater network availability and performance

Key Features

- Uses HTTP to redirect a client to the best site on the Internet based on network delay
- Transparent redirection to the end user and works with any IP application
- Easy configuration through a Cisco IOS-style command-line interface
- Redundant configurations, multiple CRs can be deployed at the origin site to provide fail-over and load scaling

Specifications

Feature	Cisco Content Router CR4430
Network Interface Card	10/100BASE-TX
Processor	600- MHz PIII
RAM	1 GB
Internal Storage	18 GB
Rack Units	1
Dimensions (HxWXD)	1.72 x 17.50 x 14.13 in.
Weight	12.5 lbs.

Cisco Content Switching Module

The Cisco Content Switching Module (CSM) is a Catalyst 6500 line card that balances client traffic to farms of servers, firewalls, SSL devices, or VPN termination devices. The CSM provides a high-performance, cost-effective load balancing solution for enterprise and Internet Service Provider (ISP) networks. The CSM meets the demands of high-speed Content Delivery Networks, tracking network sessions and server load conditions in real time and directing each session to the most appropriate server. Fault tolerant CSM configurations maintain full state information and provide true hitless failover required for mission-critical functions.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Content Switching Module	• An integrated load balancing solution featuring Cisco's Catalyst 6500 • Load balancing for the highest traffic sights • Support for up to 1,000,000 concurrent TCP connections

Key Features

- Market-leading performance—Establishes up to 200,000 Layer 4 connections per second and provides high-speed content switching, while maintaining 1 million concurrent connections
- Outstanding price/performance value for large data centers and ISPs—Features a low connection cost and occupies a small footprint. The CSM slides into a slot in a new or existing Catalyst 6500 and enables all ports in the Catalyst 6500 for layer 4 through layer 7 content switching. Multiple CSMs can be installed in the same Catalyst 6500
- Uses the same Cisco IOS Command Line Interface (CLI) that is used to configure the Catalyst 6500 Switch

Competitive Products

- Alteon/Nortel: ACEdirector and 700 Series
- Radware: Web Server Director (WSD)
- F5 Networks: Big/IP and LAN switch Partners
- Foundry Networks: ServerIron
- Resonate: Central Dispatch and Global Dispatch

Specifications

Feature	Cisco Content Switching Module (CSM)
Configuration Limits	256 total VLANs (client and server); 4000 virtual servers; 4000 server farms; 16,000 real servers; 4000 probes; 16,000 access control list (ACL0 items
Connections	1,000,000 concurrent TCP connections 200,000 connection setups per second-Layer 4
Throughput	4 Gigabits-per-second total combined (client-to-server and server-to-client) throughput
Catalyst Switch Platform Requirements	Cisco IOS Software only—Catalyst Operating System is not supported Functions as a bus enabled line card—not fabric enabled Multilayer switch feature card-MSFC or MSFC2

Cisco SSL Module for Catalyst 6500

The SSL Services Module is an integrated service module for the Cisco Catalyst® 6500 Series that offloads the processor-intensive tasks related to securing traffic with Secure Sockets Layer (SSL) and increases the number of secure connections supported by a Web site.

When to Sell

Sell This Product	When a Customer Needs These Features
SSL Module for Catalyst 6500	• An integrated SSL encryption/decryption solution featuring Cisco's Catalyst 6500 • Scalable SSL processing: 2,500 connection setups/second per module-10,000 per Chassis fully-populated with SSL modules

Key Features

- Server SSL offload—performs all SSL-related tasks, allowing servers to handle high-speed clear text traffic
- Scalable performance—provides a simple means of addressing increased performance requirements by installing additional SSL modules in a Catalyst 6500 switch
- Stickyness—maintains persistence even when clients request new session IDs, in Integrated Mode with Content Switching Module (CSM)
- Certificate optimization—provides cost savings by requiring only a single certificate copy vs. a copy for each server subject to customer and certificate authority agreement

Competitive Products

- F5 Networks eCommerce 540
- Nortel/Alteon iSD 410 SSL Accelerator

Specifications

Feature	Cisco SSL Module for Catalyst 6500
System Capacity and Performance	2500 connection setups/sec per module-10K per chassis; 60K concurrent client connections-240K per chassis; 300 Mbps bulk rate encryption-1.2 Gbps per chassis; 256 key pairs; 256 key certificates; Up to 2K key sizes;256 proxy servers
Scalability	Up to four SSL modules in the same Catalyst 6500
Integration with Server Load Balancing	Tightly integrated in the Cisco Catalyst 6500 Switch with the CSM

Cisco 11000 Series Secure Content Accelerator (SCA 11000)

The Cisco 11000 Series Secure Content Accelerator (SCA 11000) is an appliance-based solution that increases the number of secure connections supported by a Web site by offloading the processor-intensive tasks related to securing traffic with SSL. Available in two versions, the SCA 11000 simplifies security management and allows Web servers to process more requests for content and handle more e-transactions.

Key Features

- Offloads all encryption, decryption, and secure process for a Web site, freeing Web servers to perform essential Web tasks and eliminating the need for SSL server software
- Boosts e-commerce site performance up to 50 times through dedicated SSL processing hardware—supports 200 or 800 new SSL connections per second
- Centralizes and manages the widest range of digital certificates to ensure complete independence from the Web server
- Provides linear scalability and fault tolerance—interoperates with the Cisco 11500 series Content Services Switches (CSS 11500) for intelligent load balancing of SSL traffic
- Works with any Web server platform to provide SSL support for any Web site
- Installs quickly and easily with very low maintenance—no special software required on Web servers or Cisco 11500 series switches

Specifications

Cisco CTE-1400 Series Content Transformation Engine

The Cisco CTE 1400 Series Content Transformation Engine provides customers with a high-performance, appliance-based solution that delivers real business applications and Internet content to a variety of devices including Wireless Application Protocol (WAP) phones, personal digital assistants (PDAs), Blackberry pagers, Cisco IP Phones and other non PC devices. Examples of applications that can be transformed include e-mail, CRM/SFA applications, intranets, maps, directions, and corporate directories as well as many vertical applications in healthcare, retail, finance, hospitality and education. The Content Transformation Engine (CTE) is a 1 Rack Unit appliance optimized to perform the task of converting HTML and XML applications to a format appropriate for devices with unique display requirements. In addition, the solution recognizes specific Web-enabled devices such as IP Phones, PDAs and mobile phones, and customizes the delivery of information to give users the right form of data, to suit their devices characteristics, capability as well as the usage model.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco CTE-1400 Series Content Transformation Engine	• Quickly and easily transform applications to extend them to a variety of new devices. • Low total cost of ownership (TCO) • Immediate results for a rapid return on investment • Self-contained appliance optimized for transformation

Key Features

- Self-contained appliance for content transformation; includes DesignStudio for defining transformation rules
- Seamlessly transforms content as it moves from server to the target device, leaving the server and underlying data unchanged; Reformats data into all major Markup Languages
- Supports Cisco's AVVID architecture, including transformation for Cisco IP telephony
- Low total cost of ownership

Cisco DistributedDirector[1]

DistributedDirector provides dynamic, transparent, and scalable Internet traffic load distribution between multiple geographically-dispersed servers. DistributedDirector is a global Internet service-scaling solution that utilizes Cisco IOS software and leverages routing table information, delay characteristics, and other information to make "network intelligent" load distribution and site selection decisions.

DistributedDirector transparently redirects end-user service requests to the closest responsive server, which increases access performance and reduces transmission costs. Users need only a single subdomain name or URL-embedded hostname for accessing a distributed set of servers, thus providing the appearance of a single virtual server.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Distributed Director	• Load distribution across geographically/topologically dispersed TCP/IP servers • High availability for dispersed mission-critical applications • Data center redundancy and failover

Key Features

- Transparent distribution of all IP Services (TCP and UDP), including HTTP, FTP, Telnet, and Gopher; provides global scalability for all IP-based network services
- Improves access performance by redirecting to the topologically closest server
- Calculates client-to-server round-trip times in real time; redirects clients to server with lowest client-to-server link latency, maximizing end-to-end performance
- Redirects clients only to responsive servers, resulting in maximized availability
- Cisco IOS Software & standard command line interface for device configuration
- Transparently add and remove distributed servers, simplifying maintenance
- Supports multiple domains; cost-effective IP service scalability solution

Competitive Products

- Alteon Networks: ACEdirector and Web Switches with WebOS GLSB
- F5 Labs: 3DNS
- Foundry Networks: ServerIron Switch with Internet IronWare
- Resonate, Inc.: Global Dispatch
- RND Networks, Inc.: Web Server Director - Network Proximity (WSD-NP)

For More Information

See the DistributedDirector Web site at **http://www.cisco.com/go/dd**

1. DistributedDirector is available in Cisco IOS software for 2600/2600XM, 3600, and 7200 series routers, starting on release 12.2(4)T Enterprise Plus feature sets; Dedicated routers may be recommended for DistributedDirector to meet performance targets of both routing and load balancing; If no dedicated hardware platform is available for running DistributedDirector, it is recommended customers use the Configurable DD Cache feature (available in 12.2(8)T) to limit the memory DistributedDirector may consume for DNS caching; To take advantage of enhanced caching capabilities, routers should be configured with additional DRAM (128MB or more)

Cisco GSS 4480 Global Site Selector

The Cisco GSS 4480 is a networking product that globally load balances distributed data centers. The Cisco GSS 4480 acts as the cornerstone of multisite disaster recovery plans in deployments of Cisco's market-leading content switches. Customers deploying new Cisco content switches such as the Cisco CSS 11500 Content Services Switch and the Content Switching Module (CSM) for the Cisco Catalyst ® 6500 Series switches or have already deployed legacy switches such as the Cisco CSS 11000 and Cisco Local Directors can benefit from the new levels of traffic management and centralized command and control provided by the Cisco GSS 4480.

Key Features

- Provides resilient architecture critical for disaster recovery and multisite Web applications deployments
- Offers flexible heterogeneous support for all Cisco SLBs and DNS-capable networking products
- Provides centralized command and control of DNS resolution process for direct and precise control of global load-balancing process
- Offers site persistence for e-commerce applications
- Offers a unique DNS race feature-The Cisco GSS 4480 can in real time direct content consumers to the closest data center
- Supports a Web-based graphical user interface (GUI) and DNS wizard to simplify the DNS command and control

CHAPTER 7

Broadband and Dial Access Products

Broadband and Dial Access Products at a Glance

Remote Dial Access—Data and Voice (VoIP)

Product[1]	Features	Page
Cisco AS5350 Series Universal Gateways	• High performance, 1RU, universal gateway • Universal Port technology for multiple data, voice, and fax services on any port at any time • 2,4, & 8 CT1/7 CE1/PRI configurations for 48 to 240 channels • Supports broad range of async/ISDN/VoIP/wireless protocols • Two 10/100 Ethernet ports, two 8 Mbps serial backhaul ports • Two 8 Mbps serial backhaul ports • Cisco SS7 signaling gateway interoperability • Flexible, redundant backhaul methods	7-3
Cisco AS5400 Series Universal Gateways	• High performance, 2RU, universal gateway • Universal Port technology for multiple data, voice, and fax services on any port at any time • Two models: Cisco AS5400HPX and Cisco AS5400 • 8 to 16 CT1/CE1/PRI or 1 T3 configuration for 192 to 648 channels • Low power and high availability design • Supports a broad range of async/ISDN/VoIP/fax/wireless protocols • Cisco SS7 signaling gateway interoperability • Flexible, redundant backhaul methods	7-6
Cisco AS5850 Universal Gateway	The highest density universal gateway in the marketplace • Supporting up to 5 x CT3s, 96 T1s or 86 E1s of multiple data, voice, and fax services on any port at any time • Constant density regardless of codec type, ECAN or VAD settings • Extensive high availability features • TDM grooming capability	7-9
Remote Dial Access Network Management	Suite of network management products for configuration, troubleshooting, and maintenance of Cisco dial access and VoIP solutions	7-11
SS7 Signaling & Softswitch Products	• Cisco PGW 2200 Softswitch—Call Agent providing signaling and call control functionality for PSTN Gateway and transit applications in international markets • Cisco BTS 10200 Softswitch—MGCP-based softswitch for large-scale Voice over IP and ATM applications	7-12

1. For Cisco 2509 and 2511 Access Servers, see page 1-14.

Broadband Cable

Product	Features	Page
Headend and Distribution Hub Equipment		
Cisco uBR7100 Series Universal Broadband Router	Entry-level, fixed-configuration CMTS and integrated router for lower-density residential and MxU customers serviced by Tier 2/Tier 3 cable operators or ISPs. • Choice of four DOCSIS- and EuroDOCSIS-qualified, fixed-configuration models that include: Cisco uBR7111, Cisco uBR7111E, Cisco uBR7114, and Cisco uBR7114E • Integrated upconverter/modulator on the cable interface • Embedded dual 10/100 BaseT Ethernet network interface • Additional network interface with a variety of LAN and WAN options • Supports up to 1,000[1] data customers	7-13
Cisco uBR7246VXR Universal Broadband Router	• Modular, standards-based communications-grade CMTS and integrated router for high-growth broadband cable deploymentsSupports up to 8,000 subscribers and offers a large variety of LAN and WAN interface options and processors	7-15

Product	Features	Page
Cisco uBR10012 Universal Broadband Router	Highest-capacity communications-grade CMTS and integrated router on the market today that delivers the services, performance, scale, and carrier-class reliability large cable operators and ISPs demand • High-performance aggregation platform that uses Parallel Express Forwarding technology • Eight cable line cards that include support for Cisco Universal Broadband Router (uBR) line cards and the Cisco 5X20 Broadband Processing Engine (BPE) • Four network interfaces that include support for 1 Gbps over Gigabit Ethernet, 622 Mbps over OC-12 Packet over SONET, and OC-48-Dynamic Packet Transport (DPT) Interface Module Set • Cisco uBR10012 supports up to 80,0001 subscribers	7-16
Cisco RF Switch	• Exceeds PacketCable Availability Requirements • Enables a fully redundant CMTS with no single point of failure; works with the Cisco uBR7246VXR and uBR10012 • Maximizes density with more than 250 MCX-type connector	7-17
Customer Premise Equipment (CPE)		
Cisco uBR900 Series Cable Access Router	Integrated DOCSIS-based cable modem and router with hardware accelerated IPSec VPN tunneling support that includes: • Cisco uBR925 with 4 Ethernet, 1 CATV, 1 USB and 2 FXS ports that support telecommuter and small office DOCSIS-based data, VoIP, and VPN services • Cisco uBR905 with 4 Ethernet and 1 CATV port that supports DOCSIS-based data and VPN services	7-19

1. Numbers are for reference only. Actual numbers for specific systems will vary depending on network/service loading, traffic, and other parameters.

DSL (Digital Subscriber Line) Access

Product	Features	Page
DSL Access CPE[1]	Wide variety of Cisco router-based DSL CPE solutions for business-class to small office applications	7-21
Broadband Services Aggregation	• Cisco 6400 Series Router—ATM switching core, with up to 48,000 subscriber sessions per chassis • Cisco 7200 Series Router—Up to 16000 broadband sessions on a 3 RU platform, including aggregation of PPP, PPPoE, and PPPoA • Cisco 7301 Series Router—1 RU Broadband Aggregation Router that is capable of delivering up to 16000 sessions per chassis • Cisco 7400 Series Router—1 RU broadband optimized appliance that delivers up to 8,000 sessions per chassis • Cisco 10000 Series Router—A carrier-class router that supports up to 32,000 broadband sessions with 99.999 percent system uptime	7-21

1. For ADSL, ISDN, and IDSL small office/home office (SOHO) customer premise equipment (CPE), see Chapter 1: Routers

ATM Multiservice WAN Switching

Product	Features	Page
Cisco BPX 8600 Series Switches	• Large-scale Advanced ATM switch for service provider and large enterprise applications • Narrowband and broadband services in a single, highly reliable platform using a multishelf architecture with intelligent call processing for Frame Relay and ATM switched virtual circuits (SVCs) • 20 Gbps of high-throughput switching for multiple traffic types data, voice, and video	7-23
Cisco MGX 8850 Series Advanced ATM Multiservice Switches	• Multiservice switch, scales from DS0 to OC-48c/STM-16 speeds • Serves as a stand-alone device for narrowband services, an integrated edge concentrator or a broadband edge switch when equipped with 45 Gbps switch card and broadband ATM modules	7-24
Cisco MGX 8830 Series Multiservice Switches	• Multiservice switch scales from from DS0 to OC-3c/STM-1 speeds • A standalone switch with narrowband interfaces and broadband trunking to remote sites with low density and high service mix requirements with 1.2 Gbps switch fabric	7-25
Cisco IGX 8400 Series Multiservice WAN Switches	• ATM-based WAN switching, connects to public services for reduced leased-line costs • Available with 8, 16, or 32 slots	7-25
Cisco MGX 8200 Series Multiservice Gateways	• Edge concentrators family provide a cost-effective narrowband multiservice solution for low to mid-band ATM and Frame Relay aggregation with QoS management features	7-25

Long Reach Ethernet

Product	Features	Page
Cisco Catalyst 2950 LRE XL Switches	Fixed configuration Ethernet switches for delivering converged voice, video, and data services over existing category 1/2/3 wiring for the MxU and enterprise markets. • 12- or 24-port 1RU switchesystems with four 10/100 ports, deliver Ethernet traffic (up to 15 Mbps) over standard copper cabling (up to 5000 feet); ideal for MxU broadband Internet access • Co-exists with POTS and ISDN traffic on the same line and compatible with ADSL • Advanced quality of service for supporting converged voice, video, and data services	7-26
Cisco LRE CPE Devices	• Cisco 575 LRE CPE—Compact, includes one RJ-45 Ethernet connection and two RJ-11 connectors (for telephone) • Cisco 585 LRE CPE—Compact, includes four RJ-45 switched Ethernet connections and two RJ-11 connectors (for telephone). Supports 802.1p QoS	7-27
Cisco LRE POTS Splitter	• Cisco LRE 48 POTS Splitter—48 ports in 1RU. Ensures that POTS service is separate, and never compromised by LRE switch reconfiguration or downtime	7-27
Cisco Broadband Building Service Manager	• Server system enables automated online activation, integrated billing, tiered service levels • Ideal for any form of broadband access technology, including Ethernet, LRE, Cable access, DSL, Wireless, or Fiber	7-28

Cisco AS5350 Universal Gateway

The Cisco AS5350 Universal Gateway is the only one-rack-unit gateway supporting two-, four-, or eight-port T1/seven-port E1 configurations that provides universal port data, voice, and fax services on any port at any time. The Cisco AS5350 Universal Gateway offers high performance and high reliability in a compact, modular design. This cost-effective platform is ideally suited for Internet service providers (ISPs) and enterprise companies that require innovative universal services.

The Cisco AS5350 Universal Gateway eliminates the need for switches and routers to create a point-of-presence (POP) or "POP-in-a-box" solution. The Cisco AS5350 Universal Gateway has three primary universal gateway configurations: two Channelized T1(CT1)/Channelized E1(CE1)s, four CT1/CE1s, and eight CT1/seven CE1s . It also includes integrated signaling link termination (SLT) functionality for direct connection to a SS7/C7 signaling gateway.

The Cisco AS5350 Universal Gateway comes two high-speed serial ports are provided to support Frame Relay, Point-to-Point Protocol (PPP), and High-Level Data Link Control (HDLC) backhaul. All backhaul interfaces support Hot Standby Router Protocol (HSRP), and all cards and the fan tray are hot-swappable for carrier-class resiliency. The Cisco AS5350 Universal Gateway is the only access server in this form factor that offers universal port capability with these high-availability features.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco AS5350	• 2 to 8 channelized CT1/7 CE1/PRI compact and modular universal • High-performance modem, ISDN, and voice call termination • Universal port services (data, voice, fax)

Key Features

- 1 RU modular high-performance 2 to 8 channelized CT1/7 CE1/PRI system
- Universal Gateway—which supports multiple data, voice, and fax services on any port at any time
- Ideal for Tier 2/3 ISPs and enterprises requiring innovative universal services
- Feature cards: 2, 4, or 8 CT1/7 E1/PRI feature cards (ISDN calls terminated on the card); 60 or 108 channel Universal Port feature card
- Two 10/100BaseT autosensing Ethernet LAN ports
- Two 8 MB serial WAN ports for Frame Relay, HDLC, or PPP WAN backhaul
- Carrier Class Resiliency: All feature cards and fan tray are hot swappable, modem and voice DSP are pooled and can be configured as spares, AC internal power supply with dual fans, Redundant LAN/WAN backhaul ports, Thermal management and environmental monitoring, ETSI/NEBS Level 3 compliant
- Cisco SS7 signaling gateway interoperability

Feature Card Slots	Three slots
Egress Ports	Two 10/100-MB Ethernet ports Two 8-Mbps serial ports T1/E1 DS1 trunk feature cards
LAN Protocols	IP, IPX, AppleTalk, DECNet, ARA, NetBEUI, bridging, HSRP, 802.1Q
WAN Protocols	Frame Relay, PPP, HDLC (leased line)
Routing Protocols	RIP, RIPv2, OSPF, IGRP, EIGRP, BGPv4, IS-IS, AT-EIGRP, IPX-EIGRP, Next Hop Resolution Protocol (NHRP), AppleTalk Update-Based Routing Protocol (AURP)
QoS Protocols	IP Precedence, Resource Reservation Protocol (RSVP), Weighted Fair Queuing (WFQ), Weighted Random Early Detection (WRED), Multichassis Multilink PPP (MMP) fragmentation and interleaving, 802.1P
Access Protocols	PPP, Serial Line Internet Protocol (SLIP), TCP Clear, IPXCP, ATCP, ARA, NBFCP, NetBIOS over TCP/IP, NetBEUI over PPP, protocol translation (PPP, SLIP, ARA, X.25, TCP, local-area transport [LAT], Telnet), and Xremote
Bandwidth Optimization	Multilink PPP (MP), MLP, TCP/IP header compression, Bandwidth Allocation Control Protocol (BACP), bandwidth on demand, nonfacility-associated signaling (NFAS), traffic shaping
Voice Compression	G.711, G.723.1, (5.3K and 6.3K), G.726, G.729ab, G.Clear, GSM-FR
DSP Voice Features	Echo cancellation, programmable up to 128 ms Transparent transcoding between A-law and mu-law encoding Voice activity detection, silence suppression, comfort noise generation Fixed and adaptive jitter buffering Call progress tone detection and generation - Dial tone, busy, ring-back, congestion, and re-order tones with local country variants DTMF, Multifrequency (MF) Continuity Testing (COT)

Feature	Cisco AS5350
Voice and Fax Signaling Protocols	H.323v2, H.323/v3, H.323v4, SIP, MGCP 1.0, TGCP 1.0, Voice Extensible Markup Language (VoiceXML), Real-Time Streaming Protocol (RTSP), Extended Simple Mail Transfer Protocol (ESMTP) T.38 real-time fax relay T.37 fax store and forward Fax detection Fax and modem passthrough Open Settlements Protocol (OSP) Media Recording Control Protocol (MRCP) Text to Speech (TTS) Servers Automatic Speech Recognition (ASR) Servers
SS7	Integrated SLT functionality
Network Security	RADIUS or TACACS+ PAP or CHAP authentication Local user/password database DNIS, CLID, call-type preauthentication Inbound/outbound traffic filtering (including IP, IPX, AppleTalk, bridged traffic) Network Address Translation (NAT) Dynamic access lists SNMPv2, SNMPv3
Virtual Private Networking	IP Security (IPSec) Policy enforcement (RADIUS or TACACS+) L2TP, Layer 2 Forwarding (L2F), and generic routing encapsulation (GRE) tunnels Firewall security and intrusion detection QoS features (committed access rate [CAR], Random Early Detection [RED], IP Precedence, policy-based routing)
Channelized T1	Robbed-bit signaling; Loop Start, Immediate Start, and Wink Start Protocols
Channelized E1	CAS, PRI, E1 R1, E1 R2, leased line, Frame Relay, G.703, G.704
ISDN Protocols Supported	Sync mode PPP, V.120, V.110 at rates up to 38400 bps Network- and User-side ISDN NFAS with backup D-channel QSIG, Feature Group B, Feature Group D DoVBS
Modem Protocols Supported	V.90 or V.92 standard supporting rates of 56000 to 28000 in 1333 bps increments V.92 Modem on Hold V.44 Compression Fax out (transmission) Group 3, standards EIA 2388 Class 2 and EIA 592 Class 2.0, at modulations V.33, V.17, V.29, V.27ter, and V.21 K56Flex at 56000 to 32000 in 2000 -bps increments ITU-T V.34 Annex 12 at 33600 and 31200 bps and many others
Wireless Protocols Supported	V.110, V.120
Full Cisco IOS Support	IP Plus and Enterprise Plus feature sets
Console and Auxiliary Ports	Asynchronous serial (RJ-45)
Chassis	Dimensions (H x W x D): 1.75 x 17.5 x 20.5 in. Weight (fully loaded): 22 lbs. (10 kg)

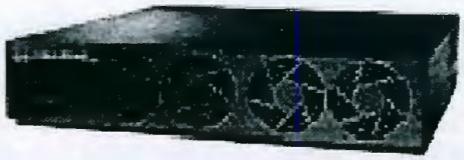
Cisco AS5400 Series Universal Gateways



Cisco AS5400 Series Universal Gateways offer unparalleled capacity in only two rack units (2RUs) and provides universal port data, voice and fax services on any port at any time. High-density (up to 1 CT3), low power consumption (7.2A at 48 VDC per CT3), and universal port digital signal processors (DSPs) make Cisco AS5400 Series Universal Gateways ideal for many network deployment architectures, especially colocation environments and mega points of presence (POPs).

The Cisco AS5400 Series consists of two models, the Cisco AS5400 and the Cisco AS5400HPX. The gateways share the same architecture; the primary difference is the processing capability of the two platforms. The Cisco AS5400 offers unparalled dial capacity and scalability for MLPPP, L2TP, and V.120 sessions, whereas the Cisco AS5400HPX provides enhanced performance for processor intensive voice and fax applications.

Cisco AS5400 Series support a wide range of IP-based value-added services such as high-volume Internet access, regional/branch-office connectivity, corporate virtual private networks (VPNs), mobile wireless solutions, long distance for Internet service providers (ISPs), international wholesale long distance, distributed prepaid calling, Signaling System 7 (SS7) interconnect, and enhanced voice services.

C T 360 C P L - A S

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco AS5400HPX	• High density in a small footprint (16 CT1/CE1 or 1 CT3) • Universal port services (data, voice, fax) • Enhanced performance for processor intensive voice and fax applications • Compact form factor—easy to add capacity as the network grows • Low power per port • High performance async/ISDN/VoIP/wireless • T.38 real-time fax relay, T.37 fax store and forward, fax detection, unified communications • Flexible redundant backhaul methods
Cisco AS5400	• Async/ISDN/Wireless data to 1 CT3 • Universal port services (data, voice, fax) or voice only services to 16 CT1/CE1

Key Features

- The Industry's only 2RU, CT3-capable universal gateway on the market with hot-swappable cards, internal redundant power supply
- Universal Gateway which provides universal port data, voice, and fax services on any port at any time
- Feature cards: 8 or 16 CT1/CE1 feature cards; 60 or 108 channel Universal Port feature card; All feature cards and fan trays are hot-swappable
- Redundant 10/100 Ethernet ports and redundant 8 Mbps serial backhaul ports for Frame Relay, HDLC or PPP WAN Backhaul
- One fast console port for local administrative access; one auxiliary port for remote administrative access
- Redundant LAN/WAN backhaul ports
- ETSI/NEBS Level 3 compliant
- AC or DC power supply with dual fans
- Cisco SS7 signaling gateway interoperability

ECT 3608

Cisco AS5850 Universal Gateway

The Cisco AS5850 Universal Gateway is a high-density, carrier-class gateway, offering unparalleled capacity and high availability. The Cisco AS5850 is specifically designed to meet the demands of large, innovative service providers, supporting up to five channelized T3s (CT3s), 96 T1s or 86 E1s of data, voice, and fax services on any port at any time. It offers high availability features such as hot-swap on all cards, load-sharing and redundant hot-swappable power supplies, redundant route processing cards and call admission control to ensure 99.999-percent availability.

The Cisco AS5850 supports a wide range of IP-based value-added services such as high-volume Internet access, corporate virtual private networks (VPNs), long distance for Internet service providers (ISPs), international wholesale long distance, distributed prepaid calling, Signaling System 7 (SS7) interconnect, and managed voice services such as hosted IP telephony, managed IP-PBX, multiservice VPNs, and IP contact centers.

Using the rich set of Cisco IOS Software features and Signaling System 7 (SS7) interconnection, service providers can quickly provision their network for new services to meet the rapidly changing demands of the communications provider marketplace.

As a highly flexible voice gateway, the Cisco AS5850 supports any coder-decoder (CODEC) at 100-percent capacity simplifying network engineering. An open programmable architecture streamlines rapid voice service creation with H.323, Session Initiation Protocol (SIP) or Media Gateway Control Protocol (MGCP).

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco AS5850	• Supporting up to 5 x CT3s, 96 T1s or 86 E1s of multiple data, voice, and fax services on any port at any time • Service provider or IP-focused installations • Highly available single system with multiple redundancy • Wholesale dial/voice, retail dial/voice, TDM grooming or wireless applications

Key Features

- High scalability—up to 3360 ports in a 14 RU chassis and provides for 6 times growth in same chassis
- Hot-swap redundant power supplies and power feeds
- Redundant DSPs and RSC
- Thermal/Power management and redundant fans
- DSP Resource Recovery Feature
- Supports H.323v2, H.323v3, H.323v4, SIP and MGCP 1.0
- Application-specific support including AOL and Prodigy traffic
- WAN optimization including routing filters, snapshot routine, dial-on-demand routing ASAP
- ETSI/NEBS Level 3 compliant
- Cisco SS7 signaling gateway interoperability

Remote Dial Access Network Management Products

Universal Gateway Manager (UGM)

Network management applications and tools are critical for the successful deployment and operations of voice or data services. The Cisco Universal Gateway Manager (UGM) is an element management system for Cisco AS5000 Universal Gateways. The Cisco UGM enables network operators and administrators to efficiently deploy, manage and maintain Cisco AS5000 Universal Gateways supporting Voice over IP, managed voice, PSTN gateway, and dial access services.

Key Features

- Enables the efficient deployment and configuration of Cisco AS5000 Universal Gateways
- Monitors the operational status of Cisco AS5000 Universal Gateways and their subcomponents so that corrective action can be taken quickly
- Supports the rapid reconfiguration of Cisco AS5000 Universal Gateways for network or service changes
- Collects and presents a wide range of performance-related statistics for monitoring gateway and network efficiency
- Co-resides with Cisco MGC Node Manager (MNM) for Cisco PGW 2200 PSTN Gateway node management
- Provides interfaces to support its integration with existing network management applications

For More Information

See the Cisco Universal Gateway Manager Web site: **http://www.cisco.com/go/ugm**

Cisco Universal Gateway Call Analyzer

The Cisco Universal Gateway Call Analyzer (UGCA) tool monitors and troubleshoots Cisco AS5000 universal gateways that support dialup services. The Cisco Universal Gateway Call Analyzer complements other network management system (NMS) applications, adding call-level analysis capabilities that are not available with standard NMS applications.

Maintaining high call-success rates and quality connections are key challenges for any dial service provider. These metrics directly affect customer satisfaction and are fundamental indicators of network performance and efficiency. Numerous issues may cause service degradation, which may be rapid or may occur slowly. While public switched telephone network (PSTN) issues are frequently the source of problems, they are especially difficult to identify.

Cisco AS5000 universal gateways collect the detailed call-characteristic data needed to detect and diagnose issues that affect service. The Cisco Universal Gateway Call Analyzer is the window into this data, providing analysis and reporting features through an intuitive Web interface.

For More Information

See the Cisco Universal Gateway Call Analyzer Web site: **http://www.cisco.com/go/ugca**

Cisco Resource Policy Management System

Wholesalers face a challenge when delivering service level agreements (SLAs) on a common network, especially when providing a range of services for different customers. The Cisco Resource Policy Management System (RPMS) is a software tool that provides policy management of platform resources. With Cisco RPMS, wholesalers are able to offer a variety of services to a variety of customers on a single set of gateways. Cisco RPMS offers not only effective resource management but the capability to build and deliver flexible service models that fit customers' unique requirements. Cisco RPMS can grow to support a wholesaler's changing needs, scaling as the network expands and delivering the services that customers demand, including wholesale dial, access to virtual private network (VPN) services.

SS7 Signaling & Softswitch Products

Cisco AS5x00 series products interoperate with various SS7 and Softswitch products, including the Cisco SC2200 Signaling Controller, the Cisco PGW 2200 Softswitch and the Cisco BTS 10200 Softswitch.

Cisco SC2200 Signaling Controller

Please see PGW 2200 Softswitch.

Cisco PGW 2200 Softswitch

The Cisco PGW 2200 provides the signaling and call control functionality that enables service providers (SPs) to bridge the boundary between the legacy PSTN and today's new world packet networks. Combined with Cisco's award winning media gateways, the PGW 2200 is the catalyst for PSTN Gateway solutions enabling dial offload, transit, business voice, H.323 and SIP based applications. The PGW 2200 leverages its protocol library of 90+ SS7/C7 variants to enable interconnect worldwide. In signaling mode the PGW adds SS7/C7 to the AS5X00 gateways, giving service providers around the world a proven cost-saving and reliable solution for connecting VoIP and Internet Dial Access solutions to the PSTN. SS7 signaling allows service providers to enter into new markets, optimize their networks for both voice and data traffic, and save drastically on monthly interconnect fees.

ECT 3604

Cisco BTS 10200 Softswitch

The Cisco BTS 10200 Softswitch provides call-control intelligence for establishing, maintaining, routing, and terminating voice calls. The Cisco BTS 10200 Softswitch also serves as an interface to enhanced service and application platforms. Leveraging the power of packet networks while seamlessly operating with legacy circuit switched infrastructures, the Cisco BTS 10200 Softswitch empowers service providers and carriers to gracefully transition to packet-based technology. Implementing the Cisco BTS 10200 Softswitch ensures rapid service deployment, carrier-grade reliability, service flexibility, scalability to millions of subscribers, and cost savings through investment optimization and operational efficiencies.

For More Information

See SS7 Signaling & Softswitch Products Web site:
http://www.cisco.com/en/US/products/hw/vcallcon/index.html

Additional Remote Dial Access Products

- In addition to the AS5350/AS5400/AS5850 series access gateways, the Cisco 2600/3600 series routers (see pages 1-16 and 1-22) also support dial-up, data, and voice access via network and modem modules, and voice interface cards
- For sites that require access via multiple external analog modems, the AS2509/AS2511-RJ access servers (see page 1-14) and 2600 series routers (see page 1-16) are ideal for low-density, dial applications
- For small office ISDN connectivity, see Cisco 800 series routers (see page 1-9)

Cisco uBR7100 Series Universal Broadband Router

The Cisco uBR7100 Series is a complete, compact, easy-to-use product that enables cost-effective, high-speed Internet access in the hospitality multidwelling (MDU) and multitenant (MTU) market space using the coaxial cable already in a building. The product requires exceptionally low capital investment and minimal setup time to provide online Internet access and support residential voice services. For Tier 2 or Tier 3 cable operators, it is the industry's most cost-effective, feature-rich CMTS and integrated router. The Cisco uBR7111 and Cisco uBR7114 models are CableLabs qualified to DOCSIS 1.0 specifications. The Cisco uBR7111E and Cisco uBR7114E models are tComLabs qualified to EuroDOCSIS 1.0 specifications. The Cisco uBR7111 and Cisco uBR7111E contain one downstream port and one upstream port. The Cisco uBR7114 and Cisco uBR7114E contain one downstream port and four upstream ports. All models support bidirectional or telco-return traffic.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco uBR7100 Series	• For MxU customers: the Cisco uBR7100 Series enables high-value Internet and residential voice services over a DOCSIS or EuroDOCSIS cable infrastructure • For cable operators: the Multi-tenant/dwelling Unit (MxU) market represents an untapped opportunity to expand broadband cable service. Given the small subscriber base of a typical MxU setting, the challenge has been to deliver robust services quickly and cost-effectively for an accelerated break-even point and a quicker return on investment—enabled by the Cisco uBR7100 Series

Key Features

- Complete package that includes a combined router and CMTS with an integrated upconverter, and embedded Network Interface
- Standards-based: DOCSIS 1.0 and DOCSIS 1.1-based; EuroDOCSIS models available
- Reliable operation to ensure the system remains online
- Uses Cisco IOS Software

Specifications

Feature	Cisco uBR7111 and uBR7114	Cisco uBR7111E and uBR7114E
Memory	Flash: 48 MB; System: 128 MB	Flash: 48 MB; System: 128 MB

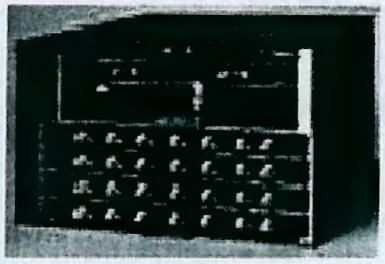
Cisco uBR7246VXR Universal Broadband Router



The Cisco uBR7246VXR-a member of the Cisco uBR7200 Series-combines the functionality of a CMTS with an advanced router. The Cisco uBR7246VXR provides a single, multiservice, scalable platform that gives cable companies and ISPs the ability to deliver IP data and VoIP services to DOCSIS or EuroDOCSIS-compliant cable modems and set-top boxes. The Cisco uBR7246VXR is CableLabs qualified to DOCSIS 1.1, as well as PacketCable 1.0 specifications. The product is also tComLabs qualified to EuroDOCSIS 1.1 specifications.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco uBR7246VXR	• Positioned for high-growth cable deployments • Flexible port expansion for multiservice deployment options • Supports up to 8,000 subscribers per chassis with 3.2 Gbps back plane • 4 line card slots, 2 port adapter slots, 1 I/O controller slot, 1 NPE slot, and 1 clock card slot for VoIP

Key Features

- Standards-based—Supports DOCSIS/EuroDOCSIS 1.0 and DOCSIS 1.1
- Modularity allows for customized configuration per plant characteristics for optimization of topology and network bandwidth
- Cisco IOS Software—Delivers proven stability and offers advanced features such as multiprotocol routing, tunneling, bandwidth management, QoS, guaranteed service levels, service-level monitoring and many CPE management options
- Ease of management and upgrades—Supports online insertion and removal of components to allow seamless upgrades of port adapters, line cards, and power supplies without service interruption. Provides single, centralized point of administration for remote devices

Cisco uBR10012 Universal Broadband Router

The Cisco uBR10012 Universal Broadband Router is a new class of CMTS, that handles the volume, capacity, and complexity of large cable headends or distribution hubs. It combines the revenue-generating features and stability of the market-leading Cisco uBR7200 Series with an architecture that is optimized for aggregation and virtually limitless future growth. The Cisco uBR10012 goes beyond the traditional "carrier class" definition, to deliver the highest level of service availability and capacity of any production CMTS available today. It employs a mix of distributed, centralized, and parallel processing to enable consistently high, real-world performance. The Cisco uBR10012 is CableLabs qualified to DOCSIS 1.0 and DOCSIS 1.1 specifications. The product is also tComLabs qualified to EuroDOCSIS 1.0 specifications.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco uBR10012	• High-end throughput, capacity, and service handling for a mix of IP data, voice, and video services over cable—supporting a wide variety of applications, media, session types, subscriber profiles, and access devices • Support for advanced feature sets, varying QoS requirements, service-level differentiations, and transport strategies (MPEG, IP, multicast, unicast, broadcast) that include implementing flow control to various cable CPE devices

Key Features

- Highest-capacity CMTS that leverages the proven stability of the industry-standard Cisco uBR7200 Series, the highly scalable architecture of the Cisco 10000 Internet Router, and feature-rich Cisco IOS Software
- Multiservice support, optimized to provide high throughput and accelerated processing using PXF technology; exceptional throughput on each connection in the chassis is achieved
- Standards-based design, support includes DOCSIS 1.0 and DOCSIS 1.1
- Reliability—Designed to eliminate single points of failure and allow technicians to swap out cards online; architected to provide redundancy throughout the system that includes redundant processing engines, bus interconnects, and power supplies

- Secure, scalable choices protect your investment and ensure current and future business growth can be accommodated; the architecture supports planned system and network expansion, including scaling IP services forwarding capacity, increasing connection speeds and densities, and extensive route scaling techniques

Specifications

Feature	Cisco uBR10012
Modular Slots	8 slots for cable line cards 4 slots for LAN/WAN interfaces 2 slots for Performance Routing Engines (PREs) 2 slots for Timing Communication and Control Plus (TCC+) modules
Supported Cards	Cable line cards that include: Cisco uBR line cards with a Cisco Line Card Processor (LCP2) and Cisco 5X20 BPE Timing, Communications, and Control Plus (TCC+) card Gigabit Ethernet (GE) network uplink card OC-12 Packet Over SONET (POS) network uplink card OC-48 DPT Interface
Processor Type	Parallel Express Forwarding (PXF)
Flash Memory	48 MB (default); 128 MB (maximum)
DRAM Memory	512 DRAM (default)
Software Supported	Minimum software requirement: Cisco IOS Software Release 12.2(11)BC1 minimum for the Cisco 5X20 BPE, Cisco IOS Software Release 12.2(13)BC minimum for the Cisco OC-48 DPT Interface
Power Supply	DC, AC
Hot-Swappable	Yes
Backplane Capacity	51.2 Gbps
Physical Dimensions (H x W x D)	Height: 31.25 in. (79.4 cm)—18 rack units (RU) Width: 17.2 in. (43.7 cm) Depth: 22.75 in. (57.8) Mounting: 19 in. rack mountable (front or rear), 2 units per 7 ft. rack Note: Mounting in 23 in. racks is possible with optional third-party hardware
Weight	Weight: 235 lb (106.6 kg) fully configured chassis

Cisco RF Switch

The Cisco RF Switch works with the Cisco uBR10002 and uBR7246VXR Universal Broadband Router to provide a fully redundant DOCSIS system that enables cable service providers to achieve PacketCable system availability, minimize service disruptions, and simplify operations. The Cisco RF Switch is part of Cisco's newest high-availability N+1 solution set. In combination with the Cisco uBR10012 and uBR7246VXR, the Cisco RF Switch enables a fully redundant CMTS with no single point of failure. The product maximizes density with more than 250 MCX-type connectors that interface the Cisco uBR10012 and the cable plant. The Cisco RF Switch contains RF combiners/splitters, RF switch logic, and RF switch drivers. The product offers ten upstream switch modules, three downstream switch modules, an Ethernet controller module, an AC or DC power supply, and color coding, preterminated cabling.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco RF Switch	As cable service providers enter the VoIP market, high availability (24x7 service) for broadband cable IP services is becoming a requirement. The Cisco RF Switch enables cable service providers to achieve PacketCable system availability, minimize service disruptions, and simplify operations.

ECT 3600
PROCESSO 03/2005 - CN
CPMI - CORREIOS
0600
Fls:
Doc: 3701

Key Features

- Front-panel serviceability with module Hot Swap capability that eliminates downtime for RF paths
- Modular upstream and downstream capacity with ten upstream, three downstream, and one blank slot that optimizes the serviceability of the CMTS; each of the 14 modules represent a port on a cable line card. Each switch module contains seven working or "active" inputs, plus one protect or "standby" input and seven protected outputs. Inputs are connections from the Cisco uBR10012 and uBR7246VXR to the Cisco RF Switch. Outputs are connections from the Cisco RF Switch to the HFC plant
- Fully passive working path; hardware components do not affect data and VoIP services
- Active components only in protect path; servicing of protect cards offer no disruption to data and VoIP services
- Position-sensing latching relays; robust design maintains operation during power disruptions
- Flexible, external design with more than 250 connectors—unmatched port density
- N+1 redundancy

Specifications

Feature	Cisco RF Switch
Input Power Requirements	• AC: 100 to 240 VAC, 50 or 60 Hz, operating range: 90 to 254 VAC • DC: -48 to -60 VDC, operating range: -40.5 to –72 VDC, 200 mVpp ripple/noise
Environmental	• Operational temperature range: 0 to +40°C • Operating temperature range: -5 to +55°C
Unit Control	• 10BaseT Ethernet—SNMP • Switching time from active (working) to standby (protect): 150 mS maximum after SNMP command • Cisco uBR10012 and uBR7246VXR
Connectors	• RF connectors: MCX • AC power: IEC320 type • DC power: Three terminal block • Ethernet: RJ-45 • RS-232 Bus: 9-pin male D
Reliability	• 41,000 MTBF @ +50°C as calculated by Bellcore 5, 80 percent confidence factor
Physical	• Dimensions (H x W x D): 19 x 15.5 x 5.25 in. (842 x 384 x 132 mm) • Weight: 36 lbs
Input Power Requirements	• AC: 100 to 240 VAC, 50 or 60 Hz, operating range: 90 to 254 VAC • DC: -48 to -60 VDC, operating range: -40.5 to –72 VDC, 200 mVpp ripple/noise

Feature	Cisco RF Switch
Environmental	• Operational temperature range: 0 to +40°C • Operating temperature range: -5 to +55°C
RF requirements	• Input/output impedance: 75 ohms • Maximum RF input power: +15 dBm (63.75 dBmV) • Switch type: Electro-mechanical, absorptive for working path, non-absorptive on the protect path • Switch setting time per switch module: 20 ms maximum • Downstream frequency range: 54 to 860 MHz • Typical downstream insertion loss: +/-1.1 dB from CMTS to cable plant; +/- 2.1 dB from protect to cable plant; 5.5 dB from working to output; 8.0 dB from protect to output • Downstream insertion loss flatness: +/- 1.1 dB from CMTS to cable plant; +/- 2.1 dB from protect to cable plant • Downstream output return loss: >15.0dB at <450 MHz, > 12.0 dB at >= 450 MHz • Downstream input return loss: >15.0 dB • Downstream isolation: > 60 dB from channel to channel in working mode; > 52 dB from CMTS to protect when in protect mode • Upstream frequency range: 5 to 70 MHz • Typical upstream insertion loss: 4.1 dB from cable plant to CMTS; 5.2 dB from cable plant to protect • Upstream insertion loss flatness: +/- 0.4 dB from cable plant to CMTS, +/- 0.6 dB from cable plant to protect • Upstream input return loss:> 16 dB • Upstream isolation: > 60 dB from channel to channel in working mode; > 60 dB from CMTS to protect when in protect mode • Protect mode: CMTS return loss >10 dB, cable plant return loss: >10dB

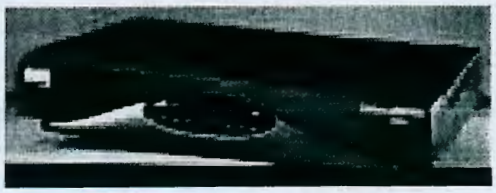
Broadband Cable—Customer Premise Equipment (CPE)[1]

Cisco uBR900 Series Cable Access Routers



The Cisco uBR900 Series Cable Access Routers provide commercial services for cable operators, allowing them to expand their broadband service offerings. Both the Cisco uBR905 and Cisco uBR925 support IP data transmission over a cable plant and offer hardware-accelerated IPSec VPN support.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco uBR905 Cable Access Router Cisco uBR925 Cable Access Router	• Data-only broadband services (or voice separately via Ethernet) • High-speed, secure remote tunneling via hardware accelerated IPSec VPN • Two voice (VoIP) connections via RJ-11 ports • Data broadband services, router functionality, and VPN support • Easy-to-manage solution for telecommuters and small offices

1. Cisco VoIP Residential CPE Partner Program—To help drive deployment of residential VoIP services to market, Cisco offers a program that identifies low-cost residential VoIP modems that have passed interoperability testing with Cisco. Cable service providers should contact their sales representatives for vendors, models, pricing and volume discount opportunities.

RQS Nº 03/2005 - CN
CPMI - CORREIOS

Remote Cable Access—Network Management Products

Cisco Cable Manager

Cisco Cable Manager is a client/server application that helps cable service providers deploy, maintain, monitor and troubleshoot cable equipment on an HFC network. The product manages DOCSIS and EuroDOCSIS-compliant CMTS and CPE, providing both operations center visibility, as well as technician access.

Cisco Cable Diagnostic Manager

Cisco Cable Diagnostic Manager is a web-based tool to help Customer Service Representatives at cable companies better handle subscriber calls and determine where problems reside in the network. Cisco Cable Diagnostic Manager provides status summary for the network neighborhood and fiber node, status on the DOCSIS or EuroDOCSIS-certified cable modem, as well as status on the Cisco CMTS products: Cisco uBR10012, uBR7200 Series, and uBR7100 Series.

Cisco Broadband Troubleshooter

Cisco Broadband Troubleshooter provides an efficient tool to help network operations center (NOC) personnel and field technicians detect, diagnose, and isolate problems between the cable plant and connected DOCSIS CPE devices. The product allows a technician to characterize upstream and downstream trouble patterns and quickly identify "flapping" CPE devices that are experiencing persistent connectivity problems. Operators can quickly discern CPE connectivity impairments by identifying noise, attenuation, provisioning, and packet-corruption issues.

3596

Cisco Broadband Configurator

Cisco Broadband Configurator is a GUI-based tool designed to collect information needed to generate and download configuration files for DOCSIS or EuroDOCSIS cable modems and set-top boxes. There are two versions of the tool: a free, web-based version accessible via Cisco.com, and a stand-alone Java-based desktop version. Cisco Broadband Configurator enables point and click configuration of CPE values for RF, class of service, vendor information, SNMP parameters, BPI, TFTP, telco-return attributes, and CPE data.

For More Information

See the Cable Manager Web site: **http://www.cisco.com/go/cablemgr**
See the Cisco Cable Troubleshooter Web site:
http://www.cisco.com/go/troubleshooter

DSL Remote Access—Customer Premise Equipment (CPE)

Cisco offers the industry's broadest array of business-class DSL (G.SHDSL and ADSL) CPE solutions, from Enterprise to branch office, to Small Office/Home Office (SOHO) applications. Cisco's CPE solutions offer the choice of key features including Firewall, VPN, and Voice-over DSL support. And, Cisco's industry leading IOS-based capabilities enable QoS, policy management, and standardized set-up and configuration. Cisco CPE Products include:

- Cisco SOHO Series Ethernet, ADSL over ISDN, ADSL and G.SHDSL RoutersRouters (page 1-8)
- Cisco 800 Series Routers (page 1-9)
- G.SHDSL WAN Interface Cards (WICs) for 1700, 2600/2600XM, 3600 Series (see Chapter 1: Routers)
- Cisco IAD 2400 Series (w/G.SHDSL) (page 4-21)

Broadband Services Aggregation

The Cisco broadband aggregation portfolio includes the Cisco 6400 Broadband Aggregator, Cisco 7200 Series Router, the Cisco 7400 Series Internet Router, and the Cisco 10000 Series Internet Router. This portfolio covers all possible broadband aggregation markets. The Cisco 6400 and Cisco 10000 Series routers are carrier class broadband aggregation routers designed to provide high-density, high-performance services while maintaining the high-availability standards of large-scale carrier deployments. The Cisco 7200,Cisco 7301and Cisco 7400 Series routers cover the ISP and retail space by providing a dense, feature-rich platform but only taking a small footprint in the network.

- Cisco 7400: Highest density PPP aggregation per rack-unit
- Cisco 7301: Highest Density PPP aggregation per rack-unit
- Cisco 7200: Most versatile platform
- Cisco 6400: Only platform offering ATM switching and broadband aggregation
- Cisco 10000: Highest availability on a carrier-class integrated edge router

RQS Nº 03/2005 - CN
CPMI - CORREIOS

Doc: 3701

With this portfolio, Cisco can address the broadest set of requirements in terms of form factor, density, performance and scale, and offer customers a unique level of choice, with products optimized for any customer deployment.

Cisco 7200 Series

When ordered with the Cisco IOS 7200 Series Broadband User Services License (part number FR-BUS72), the 7200 delivers scaled PPP, RBE, and L2TP sessions and tunnels in addition to rich IP services. It enables service providers to provision broadband Internet access and supports all of the popular access technologies deployed today, including DSL, Cable, Wireless, and Dial Access. It is ideal for medium-density applications and is capable of handling up to 16000 subscribers in a single chassis. The 7200 is a modular platform with a choice of processing engines and a wide variety of WAN and LAN port adapters, including T1/E1, DS3, OC-3, Fast Ethernet, and Gigabit Ethernet. See page 1-31 for more information on the 7200 series.

Cisco 7301 Series

When ordered as 7301-BB-8K and 7301-BB-16K the Cisco 7301 Series Router provides a compact, high-performance single-rack-unit (1RU) router coupled with a broad set of interfaces and Cisco IOS® Software features, which makes it ideal for Broadband applications. The Cisco is capable of handling up to 16,000 simultaneous sessions and allowing for a pay-as-you-grow "rack and stack" architecture.

Cisco 7400 Series

When ordered as a part number 7401ASR-BB, the 7400 series provides high-performance broadband services aggregation like the 7200, but in a low-power one rack unit (1 RU) form factor. It offers one port adapter (PA) slot supporting over 40 standard 7200 series PAs, including T1/E1, DS3, OC-3, Fast Ethernet, and Gigabit Ethernet; making it ideal for small- and medium-density applications. See page 1-38 for more information on the 7400 series.

Cisco 10000 Series

With recent enhancements, the Cisco 10000 is the industry's only integrated edge router that delivers highly available, line-rate performance without compromises for service providers deploying IP services to broadband, leased line, ATM, and frame relay customers. With 99.999 percent uptime, the platform delivers high-performance broadband features including support for 32,000 (61,500 in the future) broadband subscribers, hardware-accelerated PPP over Ethernet and PPP over ATM, routed bridge encapsulation and 1483 routing. See page 1-47 for more information on the 10000 series.

Cisco 6400 Series

The Cisco 6400 is designed for use in high-availability environments such as service provider central offices, and corporate premises; and aggregates access media (DSL, cable, wireless, and dial) to serve as the intelligent equal access point, allowing multiple operating companies and service providers access to end users. It includes switch, router, and line card redundancy.

The Cisco 6400 is a high-performance service gateway that enables the delivery of network services, VPNs, and voice- and entertainment-driven traffic over any access media. ATM interfaces connect the Cisco 6400 to dial access servers, DSLAMs, and Cisco IP DSL Switches; ATM and packet interfaces connect to the network core.

Key Features

- Session scalability and modular design—The Cisco 6400 represents a quantum leap in session scalability, capable of scaling from 2000 subscribers in its entry level configuration to 96,000 subscribers in a full configuration.
- Routing and VPN scalability—Using the Cisco 6400, service providers can simultaneously route end-user traffic over secure, independent pathways exceeding 1000 different domains or end destinations, with an aggregate throughput of over 2.4 Gbps forwarding capacity for handling even the most bandwidth-intensive broadband traffic.

For More Information

See the 6400 series Web site: **http://www.cisco.com/go/6400**

ATM Multiservice WAN Switching

Cisco BPX 8600 Series—Advanced ATM Multiservice Switches

The Cisco BPX 8600 series is standards-based ATM switch with advanced IP and ATM capabilities. Designed to meet the demanding, high-traffic needs of a public service provider or large private enterprise, the BPX switch delivers high-performance ATM switching, multiservice adaptation and aggregation for all types of user traffic. Proven in the world's largest ATM and Frame Relay networks, the BPX 8600 enables service providers and large enterprises to meet skyrocketing network demands.
