The Cisco BPX 8600 series switch offers up to 20 Gbps of high-throughput switching for multiple traffic types data, voice, and video and supports a wide range of interfaces, from Frame Relay to full broadband subscriber interfaces, up to 622 Mbps. You can offer multiple services for LAN, X.25, SNA, IP, Frame Relay, and ATM traffic from a single BPX platform. The Cisco BPX 8600 series supports multiprotocol label switching (MPLS) today, and this functionality can be easily added to any BPX switch already installed in the field.

For More Information

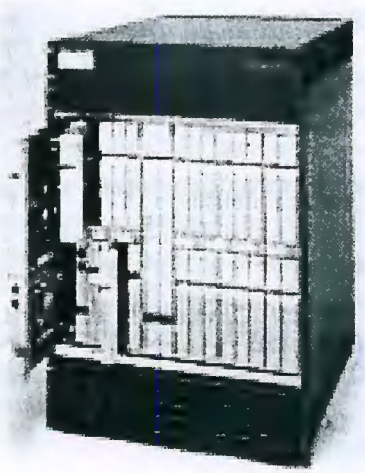
Cisco MGX 8850 ATM Multiservice Switch



The Cisco MGX 8850 ATM Multiservice Switch enables delivery of a complete portfolio of service offerings while scaling from DS0 to OC-48c/STM-16 speeds. It enables service providers to be first to market with the new high-margin voice and data services while maintaining existing services.

The MGX 8850 universal chassis provides a unified ATM architecture that delivers a complete portfolio of differentiated services —from circuit emulation to IP VPNs—all with a single chassis, to enable service providers to easily add new services.

The Cisco MGX 8850 can function in three different modes of operation:

- PXM-1 configuration—Operates as a stand-alone device for narrowband services, or as an integrated edge concentrator for the Cisco BPX 8600 series or the Cisco MGX 8850 PXM-45
- PXM-1E configuration-Operates as a stand alone switch for low density narrowband services and included 1.2 Gbps switch card and PNNI routing
- PXM-45 configuration—Serves as a broadband edge switch and includes the 45 Gbps switch card and broadband ATM modules

Key Features

- Flexible ATM multiservice platform
- Highly scalable—from 1.2 to 45 Gbps of non-blocking throughput in single chassis
- Highest reliability, availability, and serviceability in the industry
- IP VPNs using Cisco IOS software-based Multiprotocol Label Switching (MPLS)
- Market-leading Frame Relay capabilities, with price-per-port leadership and advanced QoS
- High-density Point-to-Point protocol (PPP) for Internet access and aggregation
- Full-featured narrowband ATM for managed data, voice, and video services; high-density broadband ATM for wholesale ATM services
- Circuit Emulation for Private Line replacement
- Highly scalable packet voice gateway providing VoIP, VoATM(AAL1 & AAL2), ATM SVCs, Onboard MPLS

For More Information

See the Cisco MGX 8850 Web site: **http://www.cisco.com/go/mgx8850**

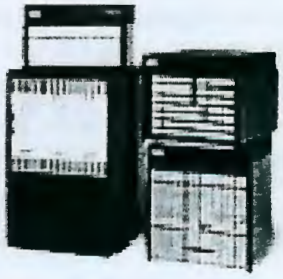
Cisco MGX 8830 ATM Multiservice Switch

The Cisco MGX 8830 Advanced ATM Multiservice Switch extends a full suite of narrowband interfaces and broadband trunking to remote sites with low density and high service mix requirements, using PNNI and MPLS for flexible network and services evolution. The Cisco MGX 8830, with a switching capacity of up to 1.2 Gbps, acts as a standalone switch, and offers a full range of service interfaces.

For More Information

See the Cisco MGX 8830 Series Web site: **http://www.cisco.com/go/mgx8830**

Cisco MGX 8200 Series



Cisco MGX 8230 Edge Concentrator

The Cisco MGX 8230 Edge Concentrator provides the most cost-effective gateway for narrowband services in space and power limited situations. It can acts as a stand-alone gateway or as an edge concentrator for the Cisco BPX 8600, Cisco MGX 8850 with PXM-45, and IGX 8400 series multiservice switches. The MGX 8230 offers a full range of narrowband service interfaces and a switching capacity up to 1.2 Gbps.

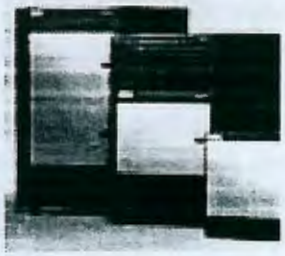
Cisco MGX 8250 Edge Concentrator

The Cisco MGX 8250 is a high-density edge concentrator designed for service providers needing flexibility for aggregation of IP, voice, Frame Relay, circuit emulation, and ATM services. An ATM narrowband edge concentrator, the MGX 8250 can serve as a stand-alone edge concentrator or as a feeder node for the Cisco BPX 8600 series and MGX 8850 switches. The MGX 8250 Edge Concentrator offers up to 1.2 Gbps of IP + ATM switching capacity.

For More Information

See the Cisco MGX 8200 Series Web site: **http://www.cisco.com/go/mgx8200**

Cisco IGX 8400 Series Multiservice WAN Switch



Efficient bandwidth utilization, intelligent QoS management features, and carrier-class reliability make the IGX 8400 series switch the ideal choice for meeting unique Wide-Area Networking (WAN) needs. This series provides the ATM backbone required to deliver data, voice, fax, and video services with guaranteed quality of service (QoS). The IGX 8400 series switch connects to public services for reduced leased-line costs by maximizing the use of these WAN links. Available with 8, 16, or 32 slots, the IGX 8400 series switches offers high flexibility to meet a wide range of Enterprise and Service Provider needs. Tight integration with the broad range of Cisco access products enables you to efficiently and cost-effectively run backbone-to-branch data, voice, fax, and video services between premises. By integrating IOS technology, the Cisco IGX 8400 series switch helps deliver a seamless migration path to technologies such as VoIP and MPLS.

Cisco Long Reach Ethernet Solution

The Cisco Long-Reach Ethernet solution meets the demands of high bandwidth applications while leveraging existing copper wiring infrastructures. Catalyst® 2950 Long-Reach Ethernet (LRE) Series switches enable enterprise and service provider customers to extend intelligent Ethernet services over existing phone and legacy wiring, at distances of up to 5000 feet. Cisco is the only company with the breadth of technologies that allow customers to deliver intelligent network services across any combination of wired and wireless infrastructures.

The Cisco 2950-LRE solution includes the Cisco Catalyst® 2950 LRE switches, the Cisco 575 and 585 LRE Customer Premise Equipment (CPE) devices, and the Cisco LRE POTS Splitter. Each LRE link is terminated with either the Cisco 575 or 585 LRE CPEs, and a POTS splitter is required when POTS traffic coexists with the LRE link over the same line.

Catalyst 2950 LRE Series Intelligent Ethernet Switches

The Cisco Catalyst® 2950 LRE switches are fixed-configuration, stackable models that provide wire-speed LRE and Gigabit Ethernet connectivity for small and midsized networks. The Catalyst 2950 Series is an affordable product line that brings intelligent services, such as enhanced security, high availability and advanced quality of service (QoS), to the network edge-while maintaining the simplicity of traditional LAN switching. When a Catalyst 2950 LRE switch is combined with a Catalyst 3550 Series switch, the solution can enable IP routing from the edge to the core of the network. Embedded in Catalyst 2950 Series switches is the Cisco Cluster Management Suite (CMS) Software, which allows users to simultaneously configure and troubleshoot multiple Catalyst desktop switches using a standard Web browser. In addition to CMS, Cisco Catalyst 2950 LRE switches provide extensive management tools using Simple Network Management Protocol (SNMP) network management platforms such as CiscoWorks for Switched Internetworks.

The Cisco Catalyst 2950 LRE switches consist of the following devices-which are based upon the Enhanced Image (EI) Software for the Catalyst 2950 Series.

- Catalyst 2950ST-24-LRE-24 LRE ports + 2 10/100/1000BASE-T ports + 2 Small Form-Factor Pluggable (SFP) ports (two of the four uplinks active at one time)
- Catalyst 2950ST-8-LRE-8 LRE ports + 2 10/100/1000BASE-T ports + 2 SFP ports (two of the four uplinks active at one time)

The two built-in Gigabit Ethernet SFP ports support 1000BASE-SX and 1000BASE-LX modules. The dual SFP-based and copper Gigabit Ethernet implementation provides customers with tremendous deployment flexibility-allowing customers increased availability with the redundant uplinks. High levels of stack resiliency can also be implemented by deploying dual redundant Gigabit Ethernet uplinks and UplinkFast technologies for high-speed uplink and stack interconnection failover, and Per VLAN Spanning Tree Plus (PVST+) for uplink load balancing.

Cisco 575 and 585 LRE CPE Devices

Each LRE port is terminated in the room with either the Cisco 575 or 585 LRE Customer Premise Equipment (CPE) devices. These compact devices bridge LRE and Ethernet. The 575 CPE has one RJ-45 Ethernet connection and two RJ-11 connectors—one for the wall and one for a telephone. The 585 CPE has four RJ-45 switched Ethernet connections and two RJ-11 connectors and supports 802.1p QoS so that voice and video traffic are prioritized over normal data traffic. Both the Cisco 575 and 585 LRE CPE device can be mounted on or under a desk, or on a wall. They ship with a mount lock-in mechanism and clip-on Ethernet cable guard to discourage theft. It supports voice (Plain Old Telephone Service—POTS) traffic-including ISDN or digital phones-that coexists over the same LRE line by splitting LRE and POTS traffic at the CPE device.

Cisco LRE 48 POTS Splitter

The Cisco LRE 48 POTS Splitter is a high-density, low-cost device that is ideal for building deployments where the PBX system is on-site and POTS traffic must coexist over the same copper wiring as LRE traffic. Unlike "splitterless" building broadband network solutions, the Cisco LRE 48 POTS Splitter ships as a separate, compact form factor to ensure that POTS service is separate, and never compromised by LRE switch reconfigurations or downtime.

The Cisco LRE 48 POTS Splitter supports 48 ports in a 1RU form factor. Each splitter has six RJ-21 connectors-two each for connectivity to the patch panel, the LRE switch(es), and the on-site PBX system.

Key Features

- Performance—Delivers 2-15 Mbps symmetric over existing category 1/2/3 wiring at distances up to 5000 feet. Rate Selection feature automates the process of selecting a data rate for a line for ease of installation and increased robustness.
- Powerful Gigabit Ethernet uplink options—1000BaseT and SFP ports
- Superior control through intelligent services—advanced quality of service and security based on Layer 2 through Layer 4 parameters.
- Multicast support—Multicast VLAN Registration (MVR) and IGMP Snooping.
- Enhanced Cisco IOS Services
- Network Management—Cisco Switch Clustering technology and the advanced, Web-based Cisco Cluster Management Suite (CMS) software deliver easy-to-use configuration and ongoing monitoring and management of up to 16 switches. This software is embedded in the switches and delivers remote management of clustered switches and connected CPE devices through a single IP address

Competitive Products

- Paradyne Networks: BitStorm solution (Etherloop) and ReachDSL products
- Tut Systems: IntelliPOP VDSL
- Extreme Networks: Alpine chassis with FM-8Vi blade (Ethernet over VDSL)
- Huawei: Quidway s3026v

Cisco Building Broadband Service Manager (BBSM) Version 5.2

Cisco Building Broadband Service Manager (BBSM) is an access gateway for public access networks that enables simple, plug-and-play access, end user self-provisioning of services, customizable portal and advertising platforms and Web-based management, reporting and configuration. In addition, multiple automated authentication and billing options are supported, including credit card, RADIUS, property management system and access code.

The Cisco BBSM platform manages Internet access services with no routine IT support, enabling property owners and service providers to offer services in remote and unattended locations. BBSM supports tiered service levels in order to deliver targeted customer offerings. For instance, a hotel can set-up daily network access for a series of meetings providing a variety of bandwidth/pricing options to capture lucrative meeting room revenue opportunities.

The Cisco BBSM has been designed for compatibility with Cisco access-layer LAN products to provide a complete solution that enables service providers or property owners to create, market and operate broadband access services in new vertical markets such as: Hospitality, Higher-Education, and Public Access

Cisco BBSM Hotspot Server Version 1.0

The Cisco Building Broadband Service Manager (BBSM) Hotspot server connects mobile users to broadband services anywhere, anytime. Cisco BBSM Hotspot is a cost effective access management gateway suited for small- to medium-sized public access locations, as well as for visitor access in larger enterprise locations. BBSM Hotspot enables simple plug-and-play connectivity, end user self-provisioning of services, and multiple authentication options.

BBSM Hotspot works with Cisco Local Area Network (LAN) products to provide a complete solution for secure wired and wireless Internet Access for visitors, guests and other temporary users. Use Cisco BBSM Hotspot to manage and operate broadband access services in public hotspots, small hotels, and public overlays on business networks.

For More Information

See the BBSM Web site: **http://www.cisco.com/go/bbsm**

Optical Transport

Optical Transport Products at a Glance

Product	Features	Page
Cisco ONS 15200 Metro DWDM Series	Cisco ONS 15252 and ONS 15201 DWDM solutions • Supports a mixture of point-to-point, hubbed, and meshed traffic patterns (SDH/SONET, Gigabit Ethernet over a range of line rates up to 2.5 Gbit/s) • Modular architecture, capacity may be added channel-by-channel in a highly cost-effective manner • High transmission efficiency for more channels, nodes and greater distances • Compact design	8-3
Cisco ONS 15302/15305 SDH Multiservice CPE & Aggregation Platforms	The Cisco ONS 15302/ONS 15305 Multiservice CPE and aggregation solutions are ultra-compact integrated systems that extend next-generation optical networks (access nodes or CPE): • Low Cost Access or CPE Platform • E1, E3, DS3, 10/100 BaseT Ethernet and GigE • STM-1 (15302) or STM-1/4/16 (15305)	8-3
Cisco ONS 15327 SONET Multiservice CPE & Aggregation Platform	Metro Edge Multiservice Provisioning Platform (MSPP) • Highly cost-efficient for delivering multiservices to the metro edge • Aggregates and switches TDM, 10/100/GigE, data and video services • Very small footprint	8-4
Cisco ONS 15454 SONET and ONS 15454 SDH Platforms	Industry-leading SONET Multi-service Provisioning Platform (MSPP) and SDH MSPP: • Aggregates DS1, DS3, STS-1, OC-3, OC-12, OC-48 • Supports OC-192 and mulitwavelength DWDM optics • Wide range of data interfaces, including 10/100/GigE, data and video	8-4
Cisco ONS 15501 Erbium Doped Fiber Amplifier	• Designed for Enterprise and Service Provider environments • Low-noise, gain flattened C-band optical amplifier • Complements the Cisco ONS 155xx DWDM solution • Capable of extending 100GHz, 32-channel, 2.5Gbps / 10Gbps optical infrastructure over longer distances	8-5
Cisco ONS 15216 and 15501 Optical Transmission Families	Cisco ONS 15216 Metro DWDM Series • Supports 32 ITU-grid wavelengths at 100 GHz spacing and provides unprecedented transport flexibility with optical filtering • Optical Add/Drop Multiplexing (OADM) • Optical Performance Monitoring and Amplification • The ONS 15216 allows carriers to deliver more services per wavelength and more wavelengths per fiber Cisco ONS 15501 Optical Amplifier • Constant flat gain of 17 dB over the 1530nm to 1563nm band simplifies network design. • Metro optimized auto gain control and variable gain • Low noise figure of <6.0 dB allows the use multiple amplifiers in cascade • Input power range of -29 to 0 dBm	8-5
Cisco ONS 15530 Metro DWDM Aggregation Platform	Metro Optical DWDM Multiservice Aggregation Platform • Enables storage and data networking, transparent wavelength services, and legacy applications • ESCON Aggregation up to 40 channels on 1 wavelength • Scales from 2.5Gbps to 10Gbps • Supports wide range of protocols over optical infrastructure • Highly resilient network with flexible topology design options	8-5

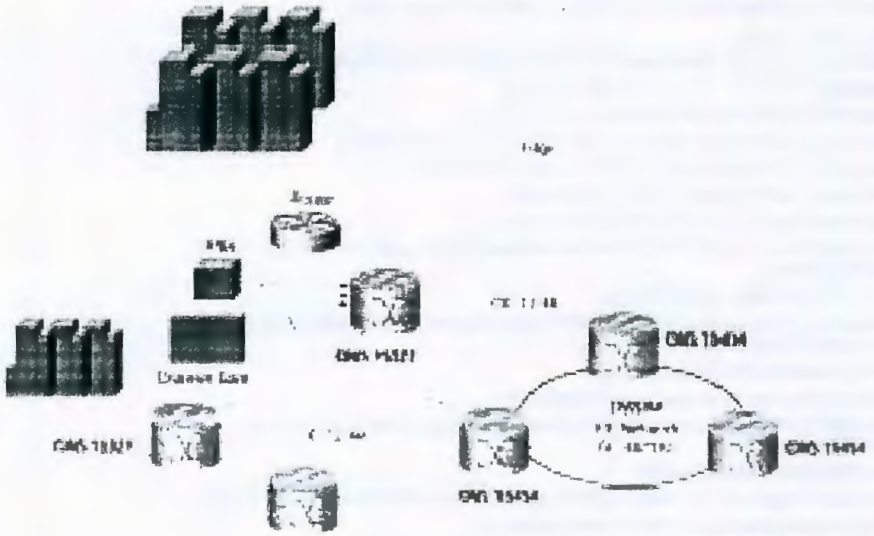
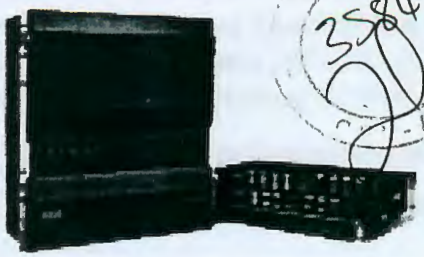
Product	Features	Page
Cisco ONS 15540 Extended Services Platform	Highly modular and scalable next-generation Dense Wave Division Multiplexing (DWDM) platform • Ideal for enterprises and service providers • Delivers the integration of data, storage and metro networking • Ultra-high bandwidth intelligent optical infrastructure • Supports any packet on any wavelength from any platform	8-6
Cisco ONS 15600 Multiservice Switching Platform (SONET/SDH)	The Cisco ONS 15600 MSSP is a true multiservice switch, providing carrier class reliability, availability, serviceability, operations, and management. • Combines the functionality of multiple metro systems including SONET/SDH multiplexers and digital cross-connect network elements • Scalable, easy-to-use platform supports all metrotopologies	8-7
Cisco Transport Manager (CTM 4.x) (Network Management)	Carrier-class element management system • Ideal for service provider and enterprise networks • Supports Cisco ONS 15454/15327/15600 (SONET/SDH), 15540, 15530, 15501, 152xx, 1580Xsystems • Manages fault /performance/configuration/alarm/security/inventory/administrative tasks • Native Circuit/Equipment Provisioning for 15454/15327/15600 SONET/SDH product family • Northbound interfaces include SNMP, TL1 and CORBA • Integrates into OSS/BSS systems • Requires SUN/Solaris/UNIX server and Oracle database	8-8
Cisco 10720 Internet Router	Service provider-class metro access services router • Optimized building block for the next generation metro IP network • Equipped with 24 ports of Ethernet technology for customer access and dynamic packet transport (DPT) technology for metro optical connectivity • Powered by Cisco IOS software and the parallel express forwarding (PXF) architecture • Cost-effective, reliable platform supporting full suite of IP routing protocols • With DPT architecture, enables optimal fiber connectivity as well as features such as IP class of service, TLS, VoIP and VPN services See Chapter 1—Routers for more information on the Cisco 10720 Internet Router	1-49

Sample Metro Optical Transport Solution Overview—Delivering Multiservices to the Edge



Cisco ONS 15200 Optical Metro DWDM Series



The Cisco ONS 15252, 15201, and 15216 are part of the Cisco ONS 15200 Metro DWDM family, the first solution to deliver instant wavelengths to buildings, premises, or PoPs.

The ONS 15252 and 15201 may be used to realize many sub-network topologies and can handle a mixture of point-to-point, hubbed, and meshed traffic patterns. Capacity may be added channel-by-channel in a highly cost-effective manner. Since they feature broadband transponders, a wide range of traffic types may be handled (SONET/SDH, Gigabit Ethernet) over a range of line rates up to 2.5 Gbs. Channel protection options include unprotected, client-protected, and (optical channel) fiber protection. The ONS 15252 is a multi-channel unit and the ONS 15201 is a single channel unit node. Both have exceptionally small footprints and low power consumption.

The Cisco ONS 15216 supercharges wavelength services by supporting up to 32 ITU-grid wavelengths, and provides unprecedented transport flexibility with optical filtering, Optical Add/Drop Multiplexing (OADM), Optical Performance Monitoring and Amplification. It allows service providers to deliver more services per wavelength and more wavelengths per fiber.

The Cisco ONS 15216 optical filter solution enables service providers to deploy point-to-point, bus, and ring networks using the terminal filter multiplexing and demultiplexing and OADM. The Cisco ONS 15216 platform provides an open and flexible solution to combine wavelengths launched by the Cisco ONS 15454, ONS 15252, ONS 15201, and ONS 15540. The Cisco ONS 15216 supercharges wavelength services and extends Cisco's optical leadership to metro regional DWDM.

For More Information

See the ONS 15200 Series Web site: **http://www.cisco.com/go/ons15200**

Cisco ONS 15302/15305 SDH Multiservice CPE & Aggregation Platforms

The Cisco ONS 15302/ONS 15305 Multiservice CPE and Aggregation solutions are ultra-compact integrated systems that offer cost effective solutions with short ROI. These platforms provide native multiservice capabilities (i.e., TDM interfaces, multiplexing and Ethernet data interfaces). These products can be managed under Cisco Transport Manager (CTM), Cisco's unified optical network management system.

The ONS 15302 CPE platform provides the following TDM interfaces—STM-1 uplink (protected or unprotected STM-1 optical uplink, 1+1 MSP, future SNCP) and E1 customer interfaces (12 E1 ports). This product also provides native Ethernet customer access via 4-port 10/100BaseT module that supports full layer 2 capacity, bridging, VLANs, spanning tree, and priority management. An optional WAN module is available for point to multi-point applications.

The ONS 15305 Aggregation platform provides the following TDM interfaces—protected or unprotected optical interfaces (8 port S-1.1 optical module, 2 port S-4.1 optical module, 1 port S-16.1 optical module, 1+1 MSP, SNCP, 2F MS-SPRing for STM-16) and electrical customer interfaces (8 and 63 port E1 modules and a 6 port

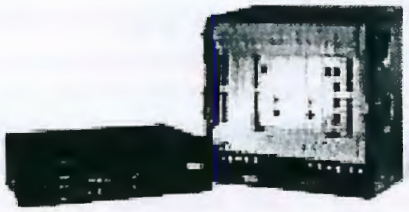
EQS Nº 03/2005 - CN - CPMI - CORREIOS
0608
Doc: 3701

E3/DS3 module). This product also provides native Ethernet customer access via an 8-port 10/100BaseT module and a 2-port GigE module (supports full layer 2 capacity, bridging, VLANs, spanning tree, and priority management). An optional WAN module is available for point to multi-point applications.

For More Information

See the ONS 15302/ONS 15305 web site: **http://www.cisco.com/go/ons15300**

Cisco ONS 15454 and 15327 Multiservice Provisioning Platforms



The Cisco ONS 15454 and ONS 15327 Multi-service Provisioning Platforms (MSPP) are key building blocks in today's optical networks due to their unprecedented transport performance and economics. They offer supercharged transport capability by combining the best of traditional SONET TDM (time division multiplexing) and statistical multiplexing in single units.

The Cisco ONS 15454 aggregates traditional facilities such as DS1, DS3, STS-1, OC-3, OC-12, and OC-48 including multi-wavelength DWDM optics, but it also supports data interfaces for 10/100/GigE, data and video. This enables drastically improved efficiencies in the transport layer and breakthrough cost savings for initial and life cycle deployment. A single ONS 15454 shelf can support combinations of OC-3/c, OC-12/c, OC-48/c, and OC-192.

The new Cisco ONS 15454 SDH MSPP offers an international optical transport solution that combines the best of traditional SDH TDM and statistical multiplexing in a single platform. The Cisco ONS 15454 SDH MSP can aggregate traditional services such as E1, E3, DS3, STM-1, STM-4, STM-16 and STM-64 including multi-wavelength DWDM optics, but is also designed to support data interfaces such as Ethernet/IP.

The Cisco ONS 15327 combines industry-leading bandwidth capacity and service diversity in a very compact footprint, enabling service providers to achieve radical economics at the metro edge. Based on the same technology as the industry leading Cisco ONS 15454, the ONS 15327 supports high optical bandwidth and has the ability to drop a DS1 from an OC-48 stream. With comprehensive STS- and VT-level bandwidth management and integrated data switching, the Cisco ONS 15327 also serves as a digital cross-connect without the need for additional equipment. It aggregates and switches TDM, Ethernet, and ATM services, and can be managed using the Cisco Transport Manager element management system.

See the ONS 15454 SONET Web site: **http://www.cisco.com/go/ons15454**
See the ONS 15454 SDH Web site: **http://www.cisco.com/go/15454sdh**
See the ONS 15327 Web site: **http://www.cisco.com/go/ons15327**

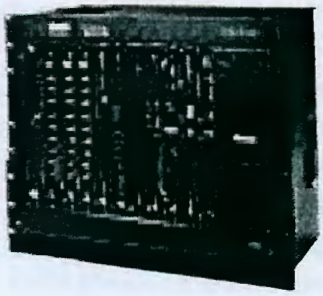
Cisco ONS 15501 Erbium Doped Fiber Amplifier

The Cisco ONS 15501 is a low-noise, gain-flattened C-band optical erbium doped fiber amplifier designed to extend the distance of today's metro high-bandwidth optical network beyond existing optical budget constraints. The Cisco ONS 15501 complements the Cisco ONS 155xx DWDM and Catalyst 6500 solutions, providing customers with the capability to extend their 2.5-Gbps or 10-Gbps optical infrastructures over greater distances. Packaged in a one-rack-unit (1RU) chassis, the Cisco ONS 15501 incorporates features such as 17-dB constant flat gain, automatic gain control, and low noise figure for excellent Optical Signal to Noise Ratio (OSNR) characteristics.

For More Information

See the Cisco ONS 15501 Web site: **http://www.cisco.com/go/ons15501**

Cisco ONS 15530



The Cisco ONS 15530 is a DWDM (dense wavelength division multiplexing) multiservice aggregation platform. The ONS 15530 can be used in applications such as storage networking, data networking, transparent wavelength services, and legacy SONET / SDH / ATM. These features make the ONS 15530 an excellent choice for building a scalable, ultra-high-bandwidth-ready, intelligent optical aggregation and transport infrastructure.

Key Features

- Aggregation—up to 40 ports of ESCON or 8 ports of Fibre Channel, FICON, or Gigabit Ethernet per wavelength, lowering total cost of ownership through bandwidth efficiency
- Scalability—up to 32 wavelengths ranging from 2.5Gbps to 10Gbps for network growth and design flexibility
- Multiservice Interfaces—protocol-independent transponders supporting data rates between 16Mbps to 2.5Gbps for protocols such as ESCON, FICON, Fibre Channel, 2G Fibre Channel, Gigabit Ethernet, SONET/SDH, Digital Video, and other protocols
- Cost-efficient point-to-point fiber trunk protection capability using the Protection Switch Module
- Complete Amplification Solution—Together with ONS 15501 EDFA optical amplifier, the VOA modules enables enterprises and service providers to further expand their optical DWDM networks over greater distances.
- Design Flexibility—can be used to deploy Point-to-point, Hub Ring, or Mesh Ring networks
- Network assurance—through high availability and resilient optical design
- IOS-based—easily integrates into existing Cisco networks

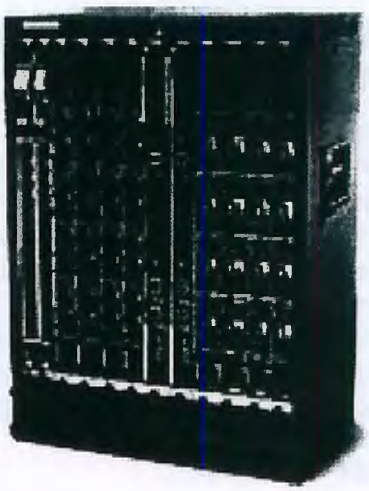
Cisco ONS 15540 Extended Services Platform (ESPx)



The ONS 15540 Extended Services Platform with external cross connect capability (ESPx) is a highly modular, flexible, and scalable next generation dense wave division multiplexer (DWDM) platform that integrates data networking, storage area networking (SAN), time division multiplexing, (TDM) Synchronous Optical Network (SONET) and Synchronous Digital Hierarchy (SDH) technologies over an ultra high bandwidth, intelligent optical infrastructure that can support any packet, over any wavelength on any platform.

- Flexible Multi-Protocol Support—The Cisco ONS 15540 offers both variable rate transparent and fixed rate multi-protocol transponders that feature user selectable small form factor pluggables (SFPs) and support a variety of industry standard data rates between 16Mbps to 2.5Gbps as well as 10Gb Ethernet
- Scalable, flexible, and modular architecture in a high-density compact footprint—Provides superior operational support and network expansion on an as needed basis through its hot swappable modular lines cards, transponders, and optical multiplexers
- Simple Network Consolidation and Comprehensive Multi Service Support provided by the available ONS 15540 2.5GB and 10GbE transponders
- Optical, Service, and Application Level Performance Monitoring—provides industry-leading supports for service level agreements (SLAs)
- High Availability for mission critical networks—Provides 99.999% availability for demanding Managed Network Service Providers and enterprise business continuance applications, with hardware redundancy and automatic protection switching to protect against fiber cuts and equipment failures
- Multi-Service Integration—Transports ESCON, FICON, 1Gb/2GB Fibre Channel for Storage Area Networking (SAN), Fast and Gigabit Ethernet, and 10 Gb Ethernet for data networking, and SONET/SDH at OC-3/STM1, OC-12/STM4, and OC-48/STM12

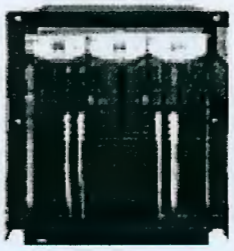
Key Features:

- Compact modular design with external connectorization: External Direct Connect system from Line card to OADMs; Optional cross connect and fiber management system
- Transparent Tuneable Variable data rate Type 1 Transponders: 16Mbps to 622Mbps MM fiber support; 16Mbps to 2.5Gbp SM fiber support; 16 Tuneable transponders support 32 channels for reduced sparing costs; Multi-protocol support for Enterprise
- Tuneable Type 2 Transponders with Multi Protocol Small form Factor Pluggables (SFPs): Variable data rate support between 16Mbps to 2.5Gbps; 16 Tuneable transponders support 32 channels for reduced sparing costs; Multi-protocol SFP Support
- Standards based Management support for SNMP, Ciscoview and Cisco Transport Manager (CTM)
- Protection Switch Module provides highly cost effective solution for fiber trunk protection
- Standards based Optical architecture conforming to ITU G.692 100GHz channel spacing
- This system has been qualified by IBM for Geographically Dispersed Parallel Sysplex (GDPS), and by EMC for Symmetrix Synchronous support as tested in their E-LAB environment

For More Information

See the Cisco ONS 15500 Series Web site: **http://www.cisco.com/go/ons15500**

Cisco ONS 15600 Multiservice Switching Platform



The Cisco ONS 15600 provides unparalleled flexibility in designing next generation metro networks. Fully engineered and optimized for metro networks, the Cisco ONS 15600 MSSP simplifies and revolutionizes bandwidth management in the metro core by allowing service providers to seamlessly integrate their metro core and metro edge networks, while dramatically reducing initial turn up costs. Delivering scalability to 960 Gbps of traffic in a single rack, it complements the market-leading Cisco ONS 15454 Multiservice Provisioning Platform (MSPP) by leveraging its proven architecture and operating software. This allows service providers to dramatically simplify their metro networks and realize immediate cost, space and operational benefits. The Cisco ONS 15600 MSSP provides complete integration of metro core and edgenetworks for service provisioning and network management.

For More Information

See the ONS 15600 Series web site: **http://www.cisco.com/go/ons15600**

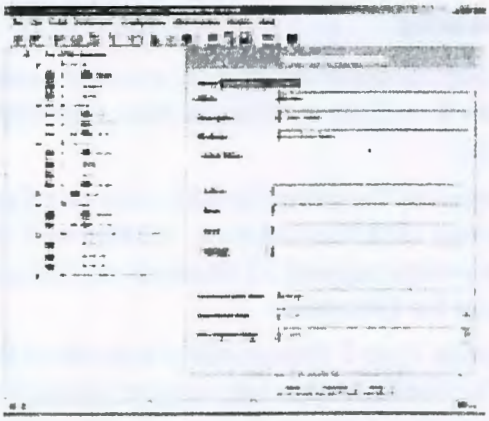
Cisco Transport Manager (CTM 4.x) (Element/Network Management)



Cisco Transport Manager is an integrated optical element management system for Cisco ONS 15000 series optical networking platforms. CTM manages configuration, fault isolation, performance, and security for Cisco optical network elements. With integrated support for SONET, SDH, DWDM and Ethernet, along with open interfaces to operations support systems (OSS), CTM delivers the full power of Cisco's wide range of advanced optical systems to today's network operators and enterprises.

CHAPTER 9

IOS Software & Network Management

Cisco IOS® Software & Network Management Products at a Glance

Product	Features	Page
CiscoWorks for Windows	An entry level suite of integrated network management tools for smaller networks: • Event management and topology mapping application • Includes Cisco's popular CiscoView Element Management Tool	9-2
Cisco IOS Software	Feature-rich network operating system supported on wide range of Cisco products • Provides a common IP fabric, functionality, and command-line interface (CLI) across network infrastructures • Enables a vast array of key routing, multiservice, traffic shaping, security/firewall, and traffic monitoring applications, and a broad variety of network connections	9-4
CiscoWorks Small Network Management Solution	Web-based network management solution designed for small to medium businesses (SMB) • Device auto-discovery using SNMP simplifies setup and reduces startup time • Standards-based, multi-vendor management • Event management and topology mapping application • Includes Cisco's popular CiscoView Element Management Tool	9-11
CiscoWorks Routed WAN Management Solution	A comprehensive set of applications for managing the router elements of a multiservice Enterprise wide-area network. This bundle includes Access Control List Manager, Internetwork Performance Monitor, Resource Manager Essentials, and CiscoView	9-13
CiscoWorks LAN Management Solution	Provides key applications needed to manage Cisco switch-based Enterprise campus networks. This bundle includes Campus Manager, Device Fault Manager, nGenius Real Time Monitor, Resource Manager Essentials, and CiscoView	9-14
CiscoWorks VPN/Security Management Solution	Combines general device management tools for configuring, monitoring, and troubleshooting enterprise networks with powerful security solutions for managing virtual private networks (VPNs), firewalls, and network and host-based intrusion detection systems (IDS). This bundle includes Management and Monitoring Centers, Cisco IDS Host Sensor and Console, Cisco Secure Policy Manager, VPN Monitor, Resource Manager Essentials, and Cisco View	9-16
CiscoWorks Manager IP Telephony Environment Monitor	A suite of telephony management applications that ensures the readiness and manageability of converged networks supporting VoIP and IP telephony traffic and applications. The bundle includes Voice Health Monitor, Default Fault Manager, CiscoView, and Downloadable Modules: IP Phone Information Utility, IP Phone Help Desk Utility, Fault History Manager	9-18
CiscoWorks Voice Manager for Voice Gateways	Enables the management and monitoring of devices used as gateways between analog voice equipment and the data network. • Enhanced capabilities to configure and provision voice ports • Create and modify dial plans on voice-enabled Cisco routers for voice over IP (VoIP), voice over Frame Relay (VoFR), and voice over ATM (VoATM) network deployments	9-19
CiscoWorks QoS Policy Manager (QPM)	Enables centralized administration and automated deployment of bandwidth reservation and prioritization policies for critical network applications • Differentiates services of Web applications, voice traffic, and business-critical applications	9-21
Cisco Ethernet Subscriber Solution Engine	A hardware-based management system for metro access networks that use the Cisco ONT 1000 Gigabit Ethernet Series Optical Network Terminator. • Enables complete remote management and troubleshooting of the customer demarcation point for Ethernet over fiber	9-22
CiscoWorks Hosting Solution Engine	A hardware-based content management solution for e-business operations in Cisco-powered data Centers. This product provides network infrastructure monitoring and Layer 4-7 hosted services configuration and activation.	9-24
CiscoWorks Wireless LAN Solution Engine	A hardware paced wireless LAN management solution that provides template-based configuration with user-defined groups to effectively manage a large number of access points and bridges • Monitors LEAP authentication servers • Enhances security management through mis-configuration detection on access points and bridges	9-23
Cisco Catalyst 6500 Series Network Analysis Modules 1 and 2	NAM is an integrated, network monitoring instrumentation and Web-browser based traffic analysis solution for the Catalyst 6500 based environments. It enable greater visibility into traffic at all layers of the network by providing real time traffic analysis and troubleshooting capabilities.	9-25

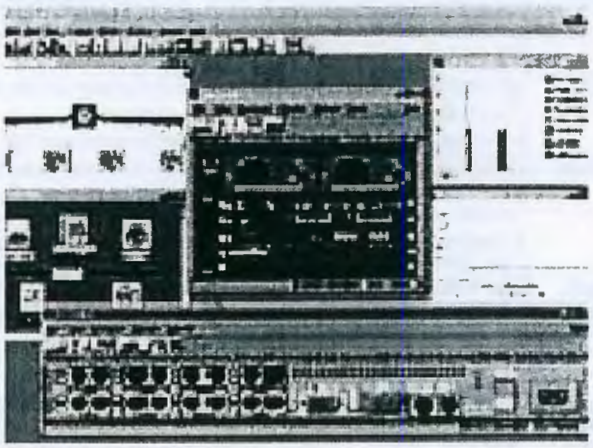
Product	Features	Page
Cisco Secure User Registration Tool (URT)	Provides organizations with increased LAN security by actively identifies users within the network and creates user registration policy bindings that help support mobility and tracking: • Ensures that users are associated with their authorized subnet/VLAN; Addresses the challenges associated with campus user mobility; Supports Web-based authentication for Windows, Macintosh, and Linux client platforms; Secure user access to the VLAN with MAC address-based security option Option to allow multiple users connected to a hub access to a VLAN served by single switch port See Chapter 5—VPN and Security for more information on Cisco Secure User Registration Tool	5-15
Cisco Secure Access Control Server (ACS) for Windows	Controls the authentication, authorization, and accounting (AAA) of users and administrators to network devices and services; Operates as a centralized Remote Access Dial-In User Service (RADIUS) or Terminal Access Controller Access Control System (TACACS+) server; Supports Lightweight Directory Access Protocol (LDAP) user authentication; Data replication and backup services; Flexible user and group policy controls; Support for Cisco 802.11x Catalyst Switch and Wireless solutions; Extensible Authentication Protocol (EAP) enhancements to support Protected EAP (PEAP) for wireless LANs All administrative access is encrypted with SSL See Chapter 5—VPN and Security for more information on CiscoSecure Access Control Server (ACS) for Windows	5-14

CiscoWorks for Windows



CiscoWorks for Windows is a powerful set of network management tools to easily manage your small to medium network or workgroup. It provides information such as dynamic status, statistics, and comprehensive configuration information for Cisco routers, switches, hubs, and access servers. Using the included WhatsUp Gold from Ipswitch, you can also monitor printer, workstations, servers and important non Cisco network services.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks for Windows	• A single solution for managing all resources attached to a small multivendor network • A smaller solution, where centralize management of configurations of a software distribution is not needed • Low-cost network management • Needs to quickly understand basic network connectivity, access individual device configurations and statistics, and troubleshoot problems

Also available for small and medium size customers is the CiscoWorks Small Network Management Solution (Small NMS). Small SNMS includes all the features above and includes CiscoWorks Resource Manager Essentials (Essentials) which provides additional functionality that allows the customer to of build and maintain an up-to-date hardware and software inventory for up to 20 devices in a network.

Key Features

CiscoWorks for Windows provides the following features when used in conjunction with WhatsUp Gold from Ipswitch (included in the CiscoWorks for Windows package):

- Automatic discovery process for networked devices
- Management of network hardware, printers, servers, and workstations
- Customizable monitoring of services such as FTP and HTTP
- Access to extensive data on port status, bandwidth utilization, traffic statistics, protocol information, and other network performance statistics
- Flexible graphing capabilities for quickly recording and analyzing historical data that can be exported to files
- Management Information Base (MIB) compiler and browser for managing third-party SNMP devices
- Tools to simplify device configuration and management for Cisco routers, switches, and access servers
- Threshold management features that can be set for many performance variables to generate an alarm or event notification
- Flexible event notification, including voice, paging, and e-mail notification of user-defined events

CiscoWorks for Windows Components

CiscoWorks for Windows includes the following tools:

- WhatsUp Gold from Ipswitch, Inc.—Provides network discovery, mapping, monitoring, and alarm tracking
- CiscoView—Provides back- and front-panel displays; dynamic, color-coded graphical displays simplify device-status monitoring, device-specific component diagnostics, and application launching
- Threshold Manager—Enhances the ability to set thresholds on Cisco RMON-enabled devices, reducing management overhead and improving troubleshooting capabilities
- StackMaker—Allows users to combine multiple Cisco devices of specific types into a single stack and visually manage them in a single window
- Show Commands—Displays detailed router system and protocol information without requiring the user to remember complex Cisco IOS Software command-line languages or syntax

Specifications

Feature	CiscoWorks for Windows
Hardware Requirements	266 MHz Pentium-based IBM PC or compatible computer 128-MB RAM total 1 GB free hard drive space
Software Requirements	Windows 98, Windows NT 4.0, or Windows 2000 Netscape 4.61, 4.7, 4.76 or Internet Explorer 5.0, 5.1, 5.5

Selected Part Numbers and Ordering Information

CiscoWorks for Windows	
CWW-6.1-WIN	CiscoWorks for Windows 6.1
CWW-6.1-WIN-UP	Upgrade to CWW 6.1 for Windows from CWW 5.0
CWW-6.1-WIN-MR	Maintenance Release: Requires existing CWW 6.0 -June 02

Cisco IOS® Software

Cisco's IOS Software is a feature-rich network operating system that provides network intelligence for the majority of today's Internet and for most of the world's business-critical networking applications.

Supporting Cisco's extensive range of platforms, Cisco IOS Software provides a common IP fabric, functionality and command-line interface (CLI) across network infrastructures. Cisco IOS Software enables a vast array of key routing functions, multi-service capabilities, traffic shaping, connections, security/firewall protection, traffic monitoring, and highly flexible network and product configuration.

Below is an abbreviated list of key capabilities, intelligent network technologies, and architectures enabled by Cisco IOS Software:

- Quality of Service (QoS)
- Converged data, voice, and video over IP
- IP/ATM/Frame Relay network connectivity and scalability features
- Security/firewall/IPSec/access lists
- Traffic monitoring and NetFlow based monitoring, accounting, and billing
- Wide range of routing protocols (including MPLS)
- IPv6
- Multicast

Quality of Service (QoS)

The promise of networking is sharing networked resources among many users and applications for greater productivity and competitive advantage. Cisco IOS quality of services (QoS) capabilities enable complex networks to control and predictably service a variety of applications. Every network needs QoS for optimum efficiency, whether it is for a small business, large enterprise, or a service provider.

QoS expedites the handling of mission-critical applications, while sharing network resources with non-critical applications. QoS also ensures available bandwidth and minimum delays required by time-sensitive multimedia and voice applications. It also gives network managers control over network applications, improves cost-efficiency of WAN connections, and enables advanced differentiated services. QoS technologies are elemental building blocks for other Cisco IOS enabling services—particularly for converged data and voice networks (LAN/WAN + telephony), video conferencing over IP, and IBM networking, and for future business applications in campus, WAN, and service provider networks.

Key QoS Capabilities:

Committed Access Rate (CAR)	Performs two QoS functions: • Bandwidth management through rate limiting, which allows you to control the maximum rate for traffic sent or received on an interface • Packet classification through IP precedence and QoS group setting, which allows you to partition your network into multiple priority levels or classes of service (CoS)
Differentiated Services (DiffServ)	QoS architecture that divides traffic into a small number of classes and provides QoS to large aggregates of traffic by treating some traffic better than the rest (faster handling, more bandwidth on average, lower loss rate on average). This is a statistical preference, not a hard and fast guarantee.
Expedited Forwarding (EF)	Per-Hop Behavior (PHB) in the DiffServ standard, used to create a virtual leased line service.

Integrated Services (IntServ)	A QoS architecture in which each network element is required to identify the coordinated set of QoS control capabilities it provides in terms of the functions it performs, the information it requires, and the information it exports.
Random Early Detection (RED)	Monitors traffic levels on very large networks to prevent congestion and guarantee priority traffic delivery.
Resource Reservation Protocol (RSVP)	A protocol that supports the reservation of resources across an IP network.
Weighted Fair Queueing (WFQ)	Adds new levels of control to previous queuing methods
Weighted Random Early Detection (WRED)	Combines the capabilities of the random early detection (RED) algorithm with IP precedence or the differentiated services code point (DSCP). This combination provides for preferential traffic handling for higher-priority packets.

Key QoS Categories

Classification	• Committed Access Rate (CAR) • Policy Based Routing (PBR) • QoS Policy Propagation Through BGP
Congestion Management	• First in First Out (FIFO) • Priority Queueing (PQ) • Custom Queueing (CQ) • Weighted Fair Queueing (WFQ) • Weighted Random Early Detection (WRED)
Policy and Shaping	• Committed Access Rate (CAR) • Generic Traffic Shaping (GTS) • Frame Relay Traffic Shaping (FRTS)
Link Efficiency Mechanisms	• Compressed Real Time Protocol (CRTP) • Link Fragmentation and Interleaving (LFI) • Data Compression

Converged LAN/WAN and Telephony Networks

A broad range of Cisco products support standards-based voice over packet implementations, including H.323-based Voice over IP (VoIP). These products enable highly efficient, converged IP-based telephony in today's enterprise and service provider networks, thereby eliminating the need for legacy telephone equipment and overlay networks (including PBXs and central office circuit switched network equipment). Furthermore, a single IT organization can now support campus and enterprise requirements—regardless if for data, voice, or video requirements.

In addition, Cisco voice over packet technologies enable businesses and service providers to avoid long distance telephone charges by leveraging their existing data networks, instead of paying for dedicated voice connections and circuits.

Cisco Connectivity and Scalability Solutions

A wide range of access solutions are enabled via Cisco IOS Software including:

- Virtual Private Networking; DSL; Dial Access (including ISDN, modem, fax, voice)
- Frame Relay, X.25
- ATM; VoIP, VoFR, VoATM
- SONET, OC-x/STM-x, Packet-over-SONET
- Broadband Services Aggregation (includes large-scale PPPoE, PPPoA, L2TP tunneling)
- Cable Access Solutions

Security

Cisco's powerful suite of Cisco IOS Software-embedded security and firewall technologies includes:

Digital Signature Standard (DSS) and digital certification	Positively authenticates users or devices
Network Address Translation (NAT) and Port Address Translation (PAT)	Hides private topology and IP addresses from an external network
IPSec	Enables secure communications of data over public networks

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0613
Fls:
3701
Doc:

Time-based Access Control Lists (ACLs)	Implements access lists based on time of day
Password Authentication Protocol (PAP)	Allows a remote node to establish its identity using a two-way handshake
Terminal Access Controller Access Control System Plus (TACACS+) and Remote Access Dial-in User Service (RADIUS)	Gives complete network access security for dial-in connections, for enterprise and service provider applications
Challenge Handshake Authentication Protocol (CHAP)	Allows a remote node to establish its identity using a three-way handshake
Calling Line Identification (CLID)	Uses calling line identification to compare the telephone number of a calling device against a list of known callers
Access Lists	Checks the source address of packets (standard access lists) and checks the source and destination addresses and other parameters (extended access lists)
Context-Based Access Control (CBAC)	Provides secure, application-based stateful filtering for the most popular protocols and a wide variety of advanced applications; available in the Cisco IOS Firewall feature set

Cisco IOS NetFlow

NetFlow technology provides the metering base for a key set of applications including network traffic accounting, usage-based network billing, network planning, network monitoring, outbound marketing, and data mining capabilities for both service provider and enterprise customers. Cisco provides a set of NetFlow applications to collect exported NetFlow data, to perform data volume reduction, and to post-process and display data. Cisco is currently working with a number of partners to provide customers with comprehensive solutions for NetFlow-based billing, planning, and monitoring. NetFlow also provides the measurement base for Cisco's new Internet Quality of Service (QoS) initiatives. NetFlow captures the traffic classification or precedence associated with each flow, enabling differentiated charging based on Quality of Service.

Furthermore, the combination of NetFlow data along with Cisco IOS Software-based routing information can prove key to developing effective security policies and preventive measures for Denial of Service (DoS).

Cisco IOS Routing Services

Cisco IOS Software has long been recognized for its rich support of multiple protocols including IP, Novell IPX, SNA, AppleTalk, DECnet, OSI, and Banyan VINES

IP Routing Protocols

Cisco IOS Software offers the industry's widest variety of enterprise and service provider-class routing protocols, including On Demand Routing (ODR), Routing Information Protocol (RIP), Interior Gateway Routing Protocol (IGRP), Open Shortest Path First (OSPF), IP Multicast, Integrated IS-IS, Enhanced Interior Gateway Routing Protocol (EIGRP), Border Gateway Protocol (BGP), and MPLS

Multi Protocol Label Switching (MPLS)

Cisco IOS MPLS fuses intelligent routing capabilities with the performance of switching. It provides significant benefits to networks with pure IP architectures and those with IP and ATM or a mix of other Layer 2 technologies. MPLS technology is key to implementing scalable Virtual Private Networks (VPNs) and end-to-end QoS, enabling efficient utilization of existing networks to meet growth needs and to rapidly correct link fault and node failure. This technology also helps deliver highly scalable, differentiated IP services with simpler configuration, management, and provisioning for both Internet service providers and end-user customers.

Common MPLS Applications Available with Cisco IOS Software

- Traffic engineering is enabled through MPLS mechanisms that allow traffic to be directed through a specific path, which may not necessarily be the least-expensive path. Network managers can implement policies to ensure optimal traffic distribution and improve overall network utilization
- Guaranteed bandwidth is a value-added enhancement to traditional traffic-engineering mechanisms. MPLS lets service providers deliver guaranteed pipes and bandwidth allocations. Guaranteed bandwidth also allows bookkeeping of quality-of-service (QoS) resources to traffic engineer both premium and best-effort traffic such as voice and data
- Fast reroute (FRR) allows extremely quick recovery if a node or link fails. Such fast recovery prevents end-user applications from timing out and also prevents loss of data
- MPLS VPNs greatly simplify service deployment compared to traditional IP VPNs. As the number of routes and customers increases, MPLS VPNs easily scale, while providing the same level of privacy as Layer 2 technologies. In addition, they can transport non-unique IP addresses across a public domain
- MPLS class-of-service (CoS) capability ensures that important traffic is given the appropriate priority over the network and that latency requirements are met. IP QoS mechanisms can be seamlessly implemented in an MPLS environment

MPLS Mechanisms

Cisco IOS MPLS delivers both traffic engineering (TE) and VPN solutions built on the following mechanisms:

- Cisco AutoBandwidth Allocator: Automatically increases or decreases MPLS TE tunnel bandwidth based on measured traffic load
- Constraint-based Routing Label Distribution Protocol (CR-LDP): A signaling mechanism used to support TE across a MPLS backbone
- Fast Reroute (FRR): Enables quick recovery in case of link failures, which prevents end-user applications from timing out and also prevents loss of data
- Label Distribution Protocol (LDP): Provides communication between edge and core devices. It assigns labels in edge and core devices to establish Label Switched Paths (LSPs) in conjunction with routing protocols such as OSPF, IS-IS, EIGRP, or BGP
- Transmission Control Protocol (TCP): Connection-oriented transport-layer protocol that provides reliable full-duplex data transmission. Part of the TCP/IP protocol stack

IP Multicast and Multicast Solutions

IP Multicast is a bandwidth-conserving technology that reduces traffic by simultaneously delivering a single stream of information to thousands of corporate recipients and homes. Applications that take advantage of multicast technologies include video conferencing, corporate communications, distance learning, and distribution of software, stock quotes, and news.

Multicast technology is key to preventing severe network slowdown and Cisco IOS Multicast is the gateway to Internet broadcasting applications. Internet service providers (ISPs) and content providers use Cisco IOS multicast solutions successfully to host events such as live concerts, radio shows, and football games.

Another application of multicast technologies relates to replacing dedicated point-to-point telephone/voice circuits and specialized bridging and mixing multi-user audio conferencing telephone equipment for "always-on" service (referred to in some industries as "Hoot & Holler" systems). This ability eliminates the need for dedicated, costly, overlay voice networks and point-to-point telephone company circuits, and allows the same capabilities to be implemented over a converged IP network without requiring users to dial in.

Multicast Solutions

Cisco IOS Multicast solutions are classified as Multicast-Lite, Core Multicast, and Enhanced Multicast, and are the building blocks for Internet broadcast. Customers can start with Multicast-Lite, then add more sophisticated interactive communication capabilities, as needed.

- Multicast-Lite provides for one-to-many broadcast capability with no back channel. This solution is eminently suitable for content distribution and broadcasting over the Internet. It does not require setting up of source discovery across domains and autonomous systems. Multicast Lite includes Protocol Independent Multicast version 2 (PIMv2), Internet Group Management Protocol (IGMPv1/v2/v3) or Universal Resource Locator Rendezvous Directory (URD).
- Core Multicast provides interactive, reliable campus multicast for interactive distance learning, corporate videoconferencing, inventory updates, software distribution, and content distribution. Core Multicast includes PIM, IGMP, Cisco Group Management Protocol (CGMP), and now Pragmatic General Multicast (PGM).
- Enhanced Multicast provides interactive Internet Multicast across domains for network gaming, inter-company conferencing, Internet software distribution, and extranet content distribution. Enhanced Multicast includes Multicast Border Gateway Protocol (MBGP) and Multicast Source Discovery Protocol (MSDP) in addition to all the protocols supported in Core Multicast.

Multicast is available across all Cisco IOS Software-based platforms, including Cisco routers and Catalyst family switches. Multicast-supported routing platforms include the following: Cisco 1600, 2500, 2600/2600XM, 3600, 3700, 3800, 7200, 7500, and 12000 series; it also is available on Catalyst 6000 and 8500 platforms.

Multicast Features

Cisco has the greatest depth of experience with IP Multicast in the industry, and offers multicast features such as:

Bi-dir PIM	An extension to the PIM suite of protocols that implements shared sparse trees with bi-directional flow of data.
Cisco Group Management Protocol (CGMP)	Cisco-developed protocol that allows Layer 2 switches to leverage IGMP information on Cisco routers to make Layer 2 forwarding decisions.
Internet Group Management Protocol v2 (IGMP)	Used by IP routers and their immediately connected hosts to communicate multicast group membership states: • Query: IGMP messages originating from the router(s) to elicit multicast group membership information from its connected hosts • Report: IGMP messages originating from the hosts that are joining, maintaining or leaving their membership in a multicast group
Internet Group Management Protocol v3 (IGMP)	Version 3 of IGMP adds support for "source filtering," that is, the ability for a system to report interest in receiving packets only from specific source addresses, or from all but specific source addresses, sent to a particular multicast address.
IGMP Snooping	Requires the LAN switch to examine, or "snoop," some Layer 3 information in the IGMP packet sent from the host to the router. When the switch hears an IGMP Report from a host for a particular multicast group, the switch adds the host's port number to the associated multicast table entry. When it hears an IGMP Leave Group message from a host, it removes the host's port from the table entry.
Inter domain Multicast	Supports inter-domain routing and source discovery across the Internet or across multiple domains comprising an enterprise
Intra domain Multicast	Supports multicast applications within an enterprise campus
Multicast Source Discovery Protocol (MSDP)	A mechanism to connect multiple PIM sparse-mode (SM) domains. MSDP allows multicast sources for a group to be known to all rendezvous point(s) (RPs) in different domains.
Multicast Routing Monitor (MRM)	A management diagnostic tool that provides network fault detection and isolation in a large multicast routing infrastructure
Multi-protocol Extensions for Border Gateway Protocol (MBGP)	Also known as BGP+, MBGP adds capabilities to BGP to enable multicast routing policy throughout the Internet and to connect multicast topologies within and between BGP autonomous systems.
Pragmatic General Multicast (PGM)	A reliable multicast transport protocol for applications that require ordered, duplicate-free, multicast data delivery from multiple sources to multiple receivers. PGM guarantees that a receiver in a multicast group either receives all data packets from transmissions and retransmissions, or can detect unrecoverable data packet loss.
Protocol Independent Multicast (PIM)	A multicast routing architecture that enables IP multicast routing on existing IP networks: • SM = Spare Mode (RFC 2362): Relies upon an explicitly joining method before attempting to send multicast data to receivers of a multicast group. • DM = Dense Mode (Internet Draft Spec): Actively attempts to send multicast data to all potential receivers (flooding) and relies upon their self-pruning (removal from group) to achieve desired distribution.
Unidirectional Link Routing (UDLR) Protocol	A routing protocol that provides a way to forward multicast packets over a physical unidirectional interface (such as a satellite link of high bandwidth) to stub networks that have a back channel
URL Rendezvous Directory (URD)	Directly provides the network with information about the specific source of a content stream. It enables the network to quickly establish the most direct distribution path from the source to the receiver, thus significantly reducing the time and effort required in receiving the streaming media. URD allows an application to identify the source of the content stream through a web page link or web directly.

IPv6

Internet Protocol version 6 (IPv6), most notably offers expanded IP addresses to accommodate the proliferation of Internet devices such as personal computers, personal digital assistants, wireless devices, and new Internet appliances—and the expansion of Internet access, particularly "always-on" connections throughout the world. IPv6 also provides integrated auto-configuration for "plug-and-play" capabilities, enhanced mobility and end-to-end security.

Incorporating IPv6 into Cisco IOS Software further enables growth of the Internet and expansion into new applications and capabilities, while maintaining compatibility with existing Internet services. Cisco's IPv6 solution was first made available in Cisco IOS Software Release 12.2(1)T. Platforms supported include: Cisco 800, 1700, 2500, 2600/2600XM, 3600, 7100, 7200, and 7500 Series Routers, and Cisco AS5300 and AS5400 Universal Access Servers.

For more information

See the Cisco IOS IPv6 Web site: **http://www.cisco.com/go/ipv6**

Cisco IOS Software Release Process

There are three categories of Cisco IOS Software releases: Early Deployment, Major, and General Deployment (GD) releases.

- Early Deployment releases (i.e. T, S, X, E release families)—Provide advanced networking technologies to customers for delivery of leading-edge Internet applications. These offer new software capabilities, new platforms, and interface extensions. Customers for whom receiving a new feature is critical to their competitive advantage will benefit from these releases
- Major releases (i.e. Release 12.2)—Consolidate features, platform support, and functionality from early deployment releases, and emphasize stability. Regular maintenance releases do not introduce new functionality or platform support, but provide continuous improvement and greater quality, leading to general deployment
- General Deployment certification (i.e. Release 12.0) Releases—Have had extensive market exposure in a wide range of network environments and are qualified through extensive metrics that analyze stability, software defect trends, and customer satisfaction surveys. Used for major, business-critical applications

At some point, GD releases are replaced by newer releases with the latest networking technologies. A release retirement process has been established with three principal milestones: End of Sales (EOS), End of Engineering (EOE), and End of Life (EOL).

Cisco Network Management Overview

Cisco is transforming traditional network management by focusing on the strengths of Internet-based architectures for greater accessibility and simplification of network management tools, tasks, and processes. Cisco's network management strategy calls for a Web-based model with the following characteristics:

- Simplification of tools, tasks, and processes
- Web-level integration with NMS platforms and general management products
- Capable of providing end-to-end solutions for managing routers, switches, and access servers
- Creation of a management intranet by integrating discovered device knowledge with CCO and third-party application knowledge

Cisco Network Management Products

The CiscoWorks product line offers a set of solutions designed to manage the enterprise network. These solutions focus on key areas in the network such as; optimization of the wide area network (WAN), administering switch-based local area networks (LAN), securing remote and local virtual private networks, and measuring service level agreements within all types of networks. The expanding CiscoWorks product line offers the flexibility to deploy end-to-end network management when and where it is needed.

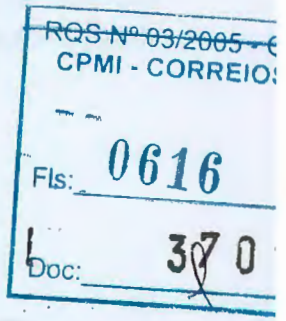
CiscoWorks Small Network Management Solution

CiscoWorks SNMS is a new network management solution aimed at small to medium businesses (SMB), with 20 or fewer switches, routers, hubs and access servers. CiscoWorks SNMS can also monitor non-Cisco IT assets such as servers, applications, services and printers. CiscoWorks SNMS is an ideal solution for companies that need centralized network management to help optimize performance and maximize network productivity.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks Small Network Management Solution	• Simple integrated installation, autodiscovery and automated import of devices using SNMP • Standards-based multi vendor management • Reduce the time and complexity of keeping the networks' configuration, software version and connectivity optimized

Also available for small and medium size customers is the CiscoWorks for Windows (CWW). CWW includes all the features above except for CiscoWorks Resource Manager Essentials (Essentials) which provides additional functionality that allows the customer to of build and maintain an up-to-date hardware and software inventory for up to 20 devices in a network.



Key Features

- Monitors and reports on hardware, configuration, and inventory changes
- Provides a wizard-based approach for managing and deploys configuration changes and software image updates to multiple Cisco devices
- Allows configuration changes to be performed against multiple switches or routers in the network
- Provides software update analysis reports showing prerequisites and impacts of proposed updates
- Provides a comprehensive audit of network changes, showing who changed what, when, and how
- Summarizes syslog events by severity or user criteria for switches, routers, and Cisco IOS and PIX firewalls
- Discovery and mapping wizard displays customizable vector-based graphics and hierarchical maps of networked devices

CiscoWorks Small Network Management Solution Components

CiscoWorks Small Network Management Solution includes the following tools:

- CiscoView 5.3—Provides graphical back and front panel views of Cisco devices; dynamic, color-coded graphical displays to simplify device-status monitoring, device-specific component diagnostics, device configuration, and application launching
- WhatsUp Gold 7.0 from Ipswitch, Inc.—Provides network discovery, mapping, monitoring, and alarm tracking
- Resource Manager Essentials 3.3.2—Resource Manager Essentials (RME) provides tools for building and managing network inventory, deploying configuration and software image changes, archiving configurations, and providing an audit trail of network changes

Important: RME has a device limit of 20 or fewer Cisco devices.

Specifications

Feature	CiscoWorks Small Network Management Solution
Hardware Requirements	2 Pentium III or better-based IBM PC or compatible computer, 256 MB RAM total, 4 GB free hard drive space
Software Requirements	Windows 2000 with SP1 or 2 (Professional or Sever), Netscape 4.77, 4.78 or Internet Explorer 5.5 with Service Pack 1

Selected Part Numbers and Ordering Information

CiscoWorks Small Network Management Solution

CWSNM-1.0-WIN	Small Network Management Solution 1.0 for Windows; includes WhatsUp Gold 7.0, Resource Manager Essentials 3.3.2 (20 Cisco Device restriction), CiscoView 5.3

CiscoWorks Routed WAN Management Solution

The RWAN solution addresses the needs of managing WANs by improving the accuracy, efficiency, and effectiveness of your network administrators and operations staff while increasing the overall availability of your network through proactive planning, deployment, and troubleshooting tools. The CiscoWorks Routed WAN Management Solution provides increased visibility into network behavior, assists in quickly troubleshooting performance bottlenecks, and provides comprehensive tools to easily administer new software and configuration changes for optimizing bandwidth and utilization across expensive and critical links in the network.

When to Sell

Sell This Product	When a Customer Needs These Features
Routed WAN Management Solution	• Optimize router performance by automatically streamlining access control lists, and applying policy-based changes via templates • Understand the responsiveness of WAN connections to determine where bottlenecks are; provides real-time analysis of end-to-end hop delays • Increase network performance by monitoring traffic of protocols, applications, and interface characteristics • A watchdog system to monitor WAN characteristics • An accurate inventory baseline; including memory, slots, software versions, and boot ROMs needed to make decisions • Automate the process of updating device software and configuration • Graphically displays a devices operational status with tools to monitor its activity or change its configurations • Support for secure browser communications and downloads from CiscoView, RME and ACLM via Secure Socket Layer (SSL) or Secure Shell (SSH) protocol

Key Features

- Access Control List Manager—Provides a wizard and policy template-based approach to simplifying the setup, management, and optimization of Cisco IOS Software-based IP and Internetwork Packet Exchange (IPX) traffic filtering and device access control
- Internetwork Performance Monitor—Used to diagnose latency, identify network bottlenecks, and analyze response times
- Resource Manager Essentials—Provides the tools needed to manage Cisco devices. It includes inventory and device change management, network configuration and software image management, network availability, and syslog analysis
- CiscoView—Provides back- and front-panel displays; dynamic, color-coded graphical displays simplify device-status monitoring, device-specific component diagnostics, and application launching
- CiscoWorks Server—Provides the common management desktop services and security across the CiscoWorks family of solutions. It also provides the foundation for integrating with other Cisco and third-party applications
- Support for secure browser communications with CiscoView and RME sessions via Secure Socket Layer (SSL) and Secure Shell (SSH) protocol

Specifications

Feature	Routed WAN Management Solution Requirements
Server	Sun UltraSPARCIII (Sun Blade 1000 Workstation or Sun Fire 280R Workgroup Server) IBM PC compatible with 550-MHz or higher Pentium III processor running (Dual processor system required for hosting multiple management solutions) Microsoft Windows 2000 Server or Professional Edition with Service Pack 2, Solaris 2.8
Client	IBM PC-compatible computer with 300-MHz or higher Pentium processor, Sun Ultra 10, HP9000 Series, IBM RS/6000 Windows NT 4 (Workstation and Server) with Service Pack 6a, Windows 98, 2000 Professional and Server with Service Pack 2; Solaris 2.7, 2.8; HP-UX 11.0; AIX 4.3.3 IBM PC-compatible computer with 300-MHz or higher Pentium processor, Sun Ultra 10, HP9000 Series, IBM RS/6000
Supported Devices	Most Cisco IOS Software routers, access servers, hubs, and switches
Supported Cisco IOS Software Versions	Generally supports Cisco IOS Software Versions 10.3 and above; Catalyst Supervisor code 2.1 and above Note: Some CiscoWorks applications require specific versions of IOS and CAT these releases in order to operate; please see the specific application documentation and release notes for more information.

Selected Part Numbers and Ordering Information[1]

Cisco Routed WAN Management Solution

CWRW-1.2-K9	Routed WAN Management Solution 1.2 for Windows and Solaris platforms; includes Access Control List Manager 1.4, Internetwork Performance Monitor 2.4, Resource Manager Essentials 3.4, CD One 5th Edition (Includes CiscoView 5.4)
CWRW-1.2-P1-K9	Cross Bundle Discount RWAN 1.2 for Windows and Solaris platforms; available to customers who have previously purchased LMS 1.X or LMS 2.X and want to add RWAN
CWRW-1.2-MR-K9	Maintenance kit for customers that purchased RWAN 1.X and now want new device support and code upgrades; kit includes support for Windows and Solaris platforms; includes updates to all components

1. This is only a small subset of all parts available via URL listed under "For More Information." Some parts have restricted access or are not available through distribution channels.

CiscoWorks LAN Management Solution

The CiscoWorks LAN Management Solution consists of operationally focused tools. These tools include fault management, scalable topology views, sophisticated configuration, Layer 2/3 path analysis, voice-supported path trace, traffic monitoring, end-station tracking workflow application servers management, and device troubleshooting capabilities. CiscoWorks LMS combines applications and tools for configuring, monitoring, and troubleshooting the campus network.

When to Sell

Sell This Product	When a Customer Needs These Features
LAN Management Solution	• A set of tools for managing Cisco's award winning Catalyst switches • Time saving user tracking and path trace analysis tools with support of IP phones • Automated process of inventorying network devices, updating device software, and managing configuration to reduce the time and errors involved in network updates • Browser-accessible, graphical tool for configuring and monitoring Cisco device components and operational status • VLAN, ATM, or LANE service management tools • RMON traffic monitoring and analysis capability • Active fault monitoring of Cisco devices

Key Features

- Campus Manager—Web-based applications designed for managing Layer 2 device and connectivity discovery, workflow application server discovery and management, detailed topology views, virtual LAN/LAN Emulation (VLAN/LANE) and ATM configuration, end-station tracking, Layer2/3 path analysis tools, and IP phone user and path information
- Device Fault Manager—Provides real-time fault analysis for Cisco devices, automatically includes Cisco devices into its monitoring environment and applies a Cisco "Best Practices" fault rule to each device
- nGenius Real Time Monitor—Web-enabled multiuser traffic management tool set that provides access to network-wide, real-time RMON information for monitoring, troubleshooting, and maintaining network availability
- Resource Manager Essentials—Provides the tools needed to manage Cisco devices. It includes inventory and device change management, network configuration and software image management, network availability, and syslog analysis
- CiscoView—Provides back- and front-panel displays; dynamic, color-coded graphical displays simplify device-status monitoring, device-specific component diagnostics, and application launching
- CiscoWorks Server—Provides the common management desktop services and security across the CiscoWorks Family of solutions. It also provides the foundation for integrating with other Cisco and third-party applications
- Support for secure browser communications with CiscoView and RME sessions via Secure Socket Layer (SSL) and Secure Shell (SSH) protocol

Selected Part Numbers and Ordering Information[1]

LAN Management Solution	
CWLMS-2.1-K9	LAN Management Solution 2.1 for Windows and Solaris; includes Campus Manager 3.2, Device Fault Manager 1.2, Resource Manager Essentials 3.4, nGenius Real Time Monitor 1.4, CD One 5th Edition (Includes CiscoView 5.4)
CWLMS-2.1-P1-K9	Cross Bundle Discount LMS 2.1 for Windows and Solaris platforms; available to customers who have previously purchased RWAN 1.X and want to add LMS
LAN Management Solution Upgrades	
CWLMS-2.1-UP-K9	Upgrade kit for LMS 1.X customers wanting to upgrade to LMS 2.1; kit includes support for both Windows and Solaris platforms; primary value of this kit is to provide DFM to LMS 1.X customers
CWLMS-2.1-MR-K9	Maintenance kit for customers that purchased LMS 2.0 and want new device support and code updates; kit includes support for both Windows and Solaris platforms; includes updates to all LMS 2.X components (Should not be purchased by LMS 1.X customers)
CWLMS-1.2-MR-K9	Maintenance kit for customers that purchased LMS 1.X and want new device support and code updates to components in the 1.X release train; DFM is not included

1. This is only a small subset of all parts available via URL listed under "For More Information". Some parts have restricted access or are not available through distribution channels. CiscoWorks VPN/Security Management Solution

CiscoWorks VPN/Security Management Solution (VMS), an integral part of the SAFE Blueprint for network security, combines Web-based tools for configuring, monitoring, and troubleshooting enterprise virtual private networks (VPNs), firewalls, and network and host-based intrusion detection systems (IDS). It offers the ability to monitor remote access links, and IPSec based site to site VPN's links. VMS is a Web-based solution that provides a "dashboard" view of critical VPN resources and their performance, VPN hardware and configuration and troubleshooting reports.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks VPN/Security Management Solution	• Complete management of a SAFE infrastructure environment • Configuring and monitoring VPN, PIX, IOS routers, and IDS devices. • Monitoring large remote access, and site-to-site hub and spoke VPNs from a single management console and focus on problem areas and performance.

Key Features

- Management and Monitoring Centers—Supplies the latest in management functionality and multifaceted scalability by offering features such as a consistent user experience, auto update, command and control workflow, and role-based access control. The management and monitoring centers include Management Center for PIX Firewalls, Management Center for IDS Sensors, Management Center for VPN Routers, and Monitoring Center for Security and Management center for PIX Firewalls (downloadable from CCO Software Center Fall 2002)
- VPN Monitor—Allows network administrators to collect, store, and view information on IPSec VPN connections for remote-access or site-to-site VPN terminations. Multiple devices can be viewed from an easy-to-use dashboard that is configured using a Web browser
- Cisco IDS Host Sensor Console—Provides real-time analysis and reaction to network hacking attempts by identifying an attack and preventing access to critical server resources before any unauthorized transactions occur

- Cisco Secure Policy Manager (CSPM)—Provides scalable, powerful policy-based security management system for Cisco firewalls and IPSec VPN routers which allows a customer to define, distribute, enforce, and audit network-wide security policies from a central location
- Resource Manager Essentials (RME)—Provides the tools needed to manage Cisco devices. It includes inventory and device change management, network configuration and software image management, network availability, and syslog analysis
- CiscoView—Provides back- and front-panel displays; dynamic, color-coded graphical displays simplify device-status monitoring, device-specific component diagnostics, and application launching
- CiscoWorks Server—Provides the common management desktop services and security across the CiscoWorks family of solutions. It also provides the foundation for integrating with other Cisco and third-party applications
- Support for secure browser communications with CiscoView and RME sessions via Secure Socket Layer (SSL) and Secure Shell (SSH) protocol

Specifications

Feature	CiscoWorks VPN/Security Management Solution
Server Hardware Requirements	IBM PC-compatible computer with 1-GHz or faster Pentium processor Sun UltraSPARC 60 MP with 440-MHz or faster processor Sun UltraSPARCIII (Sun Blade 1000 Workstation or Sun Fire 280R Workgroup Server)
Server Software Requirements	Windows 2000 Professional, Windows 2000 Server (Service Pack 2) Sun Solaris 2.7, 2.8
Client Hardware Requirements	IBM PC-compatible computer with 300-MHz or faster Pentium Solaris SPARCstation or Sun Ultra 10
Client Software Requirements	Windows 98, Windows NT 4.0, or Windows 2000 Server or Professional Edition with Service Pack 2 Solaris 2.7, 2.8
Browser Requirements	Internet Explorer 6.0 or 5.5 with Service Pack 2, on Windows 2000 Server or Professional Edition, Windows 98, and Windows NT 4.0. Netscape Navigator 4.79, on Windows 2000 Server or Professional Edition and Windows 98. Netscape Navigator 4.76 on Solaris 2.7, 2.8.

Selected Part Numbers and Ordering Information

CiscoWorks VPN/Security Management Solution	
CWVMS-2.1-UR-K9	CiscoWorks VMS 2.1 Windows and Solaris; Includes: Management Center for IDS Sensors, Management Center for VPN Routers, and Monitoring Center for Security, VPN Monitor 1.2, RME 3.4, CSPM 3.1, IDS Host Sensor 2.1, CD One 5th Edition[1]
CWVMS-2.1-WINR-K9	CiscoWorks VMS 2.1 Windows (20-Device Restricted License); Includes: Management Center for IDS Sensors, Management Center for VPN Routers, and Monitoring Center for Security, VPN Monitor 1.2, RME 3.4, CSPM 3.1, IDS Host Sensor 2.1, CD One 5th Edition
CWVMS-2.1-URC-K9	Conversion from CiscoWorks VMS 2.1 for Windows (20-device Restricted License) to Unrestricted License (add Solaris Versions of CV, RME, VPN, and adds an unrestricted license to CSPM for Windows)[1]
CWVMS-2.1-UPGUR-K9	Upgrade from CSPM 2.x (Unrestricted License) to CiscoWorks VMS 2.1 for Windows and Solaris (Unrestricted License)[1]
CWVMS-2.1-WUPGR-K9	Upgrade from CSPM 2.X (Unrestricted License) to CiscoWorks VMS 2.1 for (20-device Restricted License)
CWVMS-2.1-UR-MR-K9	Maintenance release update for VMS 2.0 Windows and Solaris (Unrestricted License)[1]
CWVMS-2.1-R-MR-K9	Maintenance release update for VMS 2.0 Windows Only (20-device Restricted License)

1. Contains Windows-only versions of CSPM and IDS Host Sensor

CiscoWorks IP Telephony Environment Monitor

CiscoWorks IP Telephony Environment Monitor (ITEM) is a bundled suite of management applications that helps ensure the manageability of converged networks that support Cisco IP telephony and IP telephony data applications. ITEM tracks the health of Cisco IP telephony environments by proactively monitoring the Cisco elements that support voice in the network to alert operations personnel of potential problems in order to minimize IP telephony service interruption.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks IP Telephony Environment Monitor	• Network managers who need to effectively manage their converged networks while maintaining high confidence that their IP telephony environments are performing as expected • Network Managers who need to use synthetic traffic (replicating key forms of network activity associated with VoIP and IP telephony) to enable around-the-clock monitoring of key voice elements in the network

Key Features

- Cisco Voice Health Monitor (VHM)—tracks the health of Cisco IP telephony environments by proactively monitoring Cisco voice elements in the network to alert operations personnel to potential problems and helps to minimize IP telephony service in network downtime. VHM leverages and requires the services of DFM while providing sophisticated capabilities of its own to ensure timely information on the health of IP telephony environments
- Cisco Device Fault Manager (DFM)—DFM provides real-time fault detection and determination about the underlying Cisco IP fabric on which the IP telephony implementation executes. DFM reports faults that occur on Cisco network devices, often identifying problems before users of network services realize that a problem exists
- CiscoView—CiscoView is a web-based graphical device-management technology and is the standard for managing Cisco devices, and providing back and front panel displays. Features include: Real-time monitoring of key information relating to device performance, traffic, and usage, with metrics such as utilization percentage, frames transmitted and received, errors, and a variety of other device-specific indicators

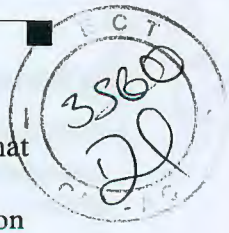
Optional Drop-In Modules

Fault History Manager

Fault History is an optional drop-in module (downloadable from CCO) that provides a web-based tool to access historical fault and alert data from a database. The user has several filtering options that can facilitate the search for specific information.

IP Phone Information Utility

The IP Phone Information Utility is an optional drop-in module (downloadable from CCO) that provides a web-based tool to show detailed information about individual IP telephone. The operator can access the IP phone information by using its extension number, IP address, and/or MAC address. This utility bases its information on the devices created in VHM.



IP Phone Help Desk Utility

The IP Phone Help Desk Utility is an optional applet (downloadable from CCO) that provides a MS Windows 2000 desktop tool to show summary information about individual IP telephone. The help desk operator can access the IP phone information by using its extension number (or can configure the application to search by IP or MAC addresses). This utility requires a connection to an ITEM server running VHM with the IP Phone Information Utility installed.

Gateway Statistics Utility

When available, the Gateway Statistics Utility is an optional drop-in module (downloadable from CCO) that provides a web-based tool to collect performance and behavior statistics about CCM-controlled IP telephony gateways. This statistical information can be subsequently exported for processing by reporting packages for capacity planning and trending information.

Specifications

Feature	CiscoWorks IP Telephony Environment Manager
Server Hardware	IBM PC-compatible with 1 GHz or higher Pentium IV processor
	UNIX (If DFM is on Unix platform; Sun UltraSPARCIII (Sun Blade 1000 Workstation or Sun Fire 280R Workgroup Server)
	(Dual processor system required for hosting multiple management solutions)
Server Software	Windows 2000 Server or Professional Edition with Service Pack 2
	Solaris 2.8
Client	IBM PC-compatible computer with 300 MHz or higher Pentium processor
	Windows NT 4 (Workstation & Server) with Service Pack 6a, Win 98 or Windows 2000 Professional & Server with Service Pack 2
	Windows 98/NT/2000: Netscape v4.77, 4.78, 4.79
	Windows 98/NT/2000: Internet Explorer v5.5 with Service Pack 2, 6.0

Selected Part Numbers and Ordering Information

CiscoWorks IP Telephony Environment Monitor

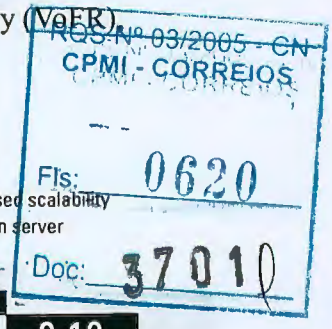
CWITEM-1.3-WIN-K9	CiscoWorks IP Telephony Environment Manager 1.3 for Windows Add-On for existing LMS 2.X and DFM 1.1 customers; includes VHM only
CWITEM-1.3-WIN-UP	CiscoWorks VoIP Health Monitor 1.0 Add-On for existing LMS 2.0 and DFM 1.1 customers; includes VHM only
CWITEM-1.3-MR-K9	Maintenance kit for customers that purchased CiscoWorks VoIP Health Monitor 1.0 and now want the new ITEM 1.3 device support and minor updates; kit includes support for Windows platforms only; includes updates to all components

For More Information

See the CiscoWorks IP Telephony Environment Monitor Web site at:
http://www.cisco.com/go/cwvoip

CiscoWorks Voice Manager for Voice Gateways

CiscoWorks Voice Manager for Voice Gateways (CVM) is a client-server, web-based voice management and reporting solution. The application provides enhanced capabilities to configure and provision voice ports, and create and modify dial plans on voice-enabled Cisco routers for voice over IP (VoIP), voice over Frame Relay (VoFR), and voice over ATM (VoATM) network deployments.



When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks IP Telephony Environment Monitor	• Network managers who need to maintain a distributed network architecture for increased scalability • Network Managers who need to manage multiple customer networks from one common server

Key Features

- Web interface management of voice ports and dial plan generation and management—Create and manage local dial plans and VoIP, VoFR, and VoATM network dial plans
- Report generation—Enhance graphical reporting capabilities with the software provided by an alliance with Telemate.Net (WIndows NT), a leading developer of enterprise information management tools; optional capabilities for enhanced reports, custom report creation, and multiple data source record collection exists.
- Optional capabilities to provide reporting on other data sources such as private branch exchanges (PBXs) and selected firewalls
- CiscoView—CiscoView is a web-based graphical device-management technology and is the standard for managing Cisco devices, and providing back and front panel displays. Features include: Real-time monitoring of key information relating to device performance, traffic, and usage, with metrics such as utilization percentage, frames transmitted and received, errors, and a variety of other device-specific indicators

Specifications

Feature	CiscoWorks Voice Manager for Voice Gateways
Server Hardware Requirements	256 MB of memory; 8-GB available hard disk space CPU running at 450 MHz (for Windows NT) Sun Sparc/Ultra @333 MHz (for Solaris)
Server Software Requirements	Windows NT 4.0 with Service Pack 5 CiscoWorks CD One 4th Edition for Windows NT
Client Hardware Requirements	64 MB of memory CPU running at 300 MHz
Client Software Requirements	Windows 95 running Netscape 4.04 or Internet Explorer 4.01 and 64 MB of virtual memory Windows NT running Netscape 4.04 or Internet Explorer 4.01 and 64 MB of virtual memory Solaris running Netscape 4.04 with Telnet and Java enabled and 64 MB of virtual memory

Selected Part Numbers and Ordering Information[1]

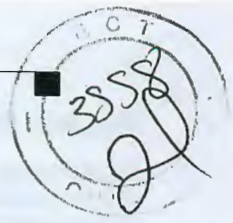
CiscoWorks Voice Manager for Voice Gateways 2.1 9

CWVM-2.1	Voice Manager 2.1 for Windows & Solaris; includes Voice Manager 2.1 and CD One 4th Edition (CiscoView 5.3 and the October 2001 Java patch update)
CWVM-2.1-UPG	Upgrade kit for CWVM 1.X customers wanting to upgrade to CVM 2.1; kit includes support for both Windows and Solaris platforms
CWVM-2.1-UPT	Minor updates to CWVM 2.1 for Windows and Solaris from CWVM 2.X; update includes support for both Windows and Solaris platforms

1. This is only a small subset of all parts available via URL listed under "For More Information". Some parts have restricted access or are not available through distribution channels.

For More Information

See the Voice Manager for Voice Gateways Web site at:
http://www.cisco.com/go/cw2kvm



CiscoWorks QoS Policy Manager

QoS Policy Manager allows you to centrally define and administer IOS and CAT parameters needed for differentiating network traffic. This ensures high availability and predictable performance for business-critical which rely on advanced voice and video services. Cisco QoS Policy Manager (QPM) 3.0 is a key enabler of end-to-end QoS for converged networks. It delivers differentiated services across network infrastructures with converged voice, video, and data applications, simply by taking advantage of Cisco IOS and Catalyst OS Software with built-in QoS mechanisms in LAN and WAN switching and routing equipment.

When to Sell

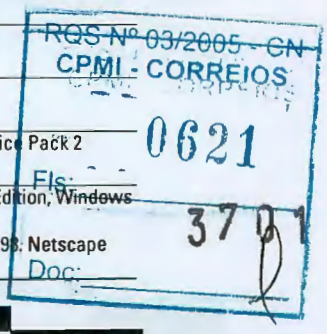
Sell This Product	When a Customer Needs These Features
Cisco QoS Policy Manager	• End-to-end QoS configuration and automated, reliable policy deployment, while eliminating device-by-device command streams • Rules-based policies that combine static and dynamic port applications and host system traffic filters • QoS Policy Manager's services, including congestion management & avoidance, and traffic-shaping • Efficiently translate policies to specific QoS config commands, ensuring consistency across domains • Validate policies prior to deploying them quickly and reliably to LAN and WAN policy domains • Generate Web-based reports on QoS policies deployed in the network

Key Features

- Provides baseline monitoring which profiles traffic by top applications and a small number of classes before QoS deployment
- Validates QoS deployments by obtaining detailed feedback on traffic patterns after QoS at different points in the network
- Provides statistics related to QoS policies which include traffic matching NBAR filters and action statistics
- Supports CBQoSMIB and CAR MIB
- IP Telephony templates provide pre-defined QoS policies that ensure strict priority for voice traffic in Enterprise networks
- Delivers the appropriate service-level to business-critical applications by supporting the extension of IP packet classification to include application signature, Web URLs, and negotiated ports
- Extend security by defining access control policies to permit or deny transport of packets into or out of device interfaces
- Allows QoS policy validation checking, uploading of existing device configuration, previewing configuration changes, incremental ACL updates, and managing policy distribution

Specifications

Feature	Cisco QoS Policy Manager
Server Hardware Requirements	IBM PC-compatible computer with 1-GHz or faster Pentium processor Sun UltraSPARC 60 MP with 440-MHz or faster processor Sun UltraSPARCIII (Sun Blade 1000 Workstation or Sun Fire 280R Workgroup Server)
Server Software Requirements	Windows 2000 Professional, Windows 2000 Server (Service Pack 2) Sun Solaris 2.7, 2.8
Client Hardware Requirements	IBM PC-compatible computer with 300-MHz or faster Pentium Solaris SPARCstation or Sun Ultra 10Complete
Client Software Requirements	Windows 98, Windows NT 4.0, or Windows 2000 Server or Professional Edition with Service Pack 2 Solaris 2.7, 2.8
Browser Requirements	Internet Explorer 6.0 or 5.5 with Service Pack 2, on Windows 2000 Server or Professional Edition, Windows 98, and Windows NT 4.0. Netscape Navigator 4.79, on Windows 2000 Server or Professional Edition and Windows 98. Netscape Navigator 4.76 on Solaris 2.7, 2.8.



Selected Part Numbers and Ordering Information[1]

Cisco QoS Policy Manager

CWQPM-3.0-WINUR-K9	QoS Policy Mgr 3.0 for Windows (Unrestricted License)
CWQPM-3.0-WINR-K9	QoS Policy Mgr 3.0 for Windows (20- Device Restricted License)
CWQPM-3.0-URUP-K9	Upgrade to QPM 3.0 for Windows from QPM 1.x or 2.x to QPM 3.0 unrestricted
CWQPM-3.0-URC-K9	Conversion of a QPM 3.0 20-device restricted usage license to unrestricted device usage license

Cisco Ethernet Subscriber Solution Engine

The Cisco Ethernet Subscriber Solution Engine (ESSE) is a hardware-based management system for metro access networks that use the Cisco ONT 1000 Gigabit Ethernet Series Optical Network Terminator. The Cisco ESSE enables complete remote management and troubleshooting of the customer demarcation point for Ethernet over fiber. Remote management and diagnostics reduce operating expenses and increase profitability by eliminating the need for unnecessary visits to the customer premises. The Cisco ESSE runs on the Cisco 1105, which is one rack unit (1RU) high, enabling you to conveniently deploy the Cisco ESSE on the same rack with the rest of your Cisco metro Ethernet network aggregation equipment.

The Cisco ESSE automatically discovers all Cisco ONT 1000 Gigabit Ethernet Series devices in the metro access network, applies the designated configuration, and instantly begins collecting statistics and management information.

When to Sell

Sell This Product	When a Customer Needs These Features
Cisco Ethernet Subscriber Solution Engine	The Cisco Ethernet Subscriber Solution Engine is ideal for service providers seeking to: • Reduce operating expenses by implementing metro access networks with Ethernet over fiber • Reduce customer onsite visits, which are time-consuming and expensive • Perform complete remote configuration and troubleshooting of the Cisco ONT 1000 Gigabit Ethernet Series

Key Features

- Enables service providers to perform remote control of inventory, configuration, statistics, fault management, and troubleshooting on the Cisco ONT 1000 Gigabit Ethernet Series
- Full Layer 1 and Layer 2 remote configuration and monitoring of Optical Network Terminators
- Access to all Ethernet port registers and statistics on the Cisco ONT 1000 Gigabit Ethernet Series
- Easy identification of ONTs with searchable, user-defined properties such as customer name, VLAN ID, and street address

Selected Part Numbers and Ordering Information[1]

Cisco Ethernet Subscriber Solution Engine

CiscoWorks Wireless LAN Solution Engine

The CiscoWorks WLSE is a specialized, daily operational solution that allows customers to manage the entire Cisco Aironet WLAN infrastructure. It offers powerful, centralized template-based configuration with user-defined device groups to efficiently configure large numbers of access points and bridges. The CiscoWorks WLSE provides centralized firmware updates to facilitate firmware changes throughout the WLAN. It monitors Access Control Server (ACS) authentication servers, supports both Cisco Extensible Authentication Protocol (LEAP) and generic RADIUS servers, and further enhances security management by detecting misconfigurations on access points and bridges. The CiscoWorks WLSE proactively monitors WLAN infrastructures and generates notifications for unavailability and performance degradation. The CiscoWorks WLSE aids in capacity planning by identifying the most used access points, and accelerates troubleshooting by generating client association reports.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks Wireless LAN Solution Engine	The CiscoWorks WLSE is ideal for enterprise customers: • Implementing large-scale Cisco Aironet WLAN infrastructures • Template-based configuration tool which can include a large number of uniform policies for Cisco access points and bridges • Access point and bridge mis-configuration alerts to minimize security vulnerabilities • Proactive fault and performance monitoring of Cisco access points, bridges, LEAP authentication server, and switches connected to the access points

Key Features

- Centralized template-based configuration with hierarchical, user-defined groups
- Plug and play configuration of newly deployed access points and bridges
- Centralized firmware update to facilitate firmware changes
- Access point and bridge misconfiguration alerts to minimize security vulnerabilities
- Proactive monitoring of access points, bridges, ACS authentication servers (both LEAP and generic RADIUS), and the switches connected to the access points
- Configuration and monitoring of virtual LAN (VLAN) and quality of service (QoS) on access points to maximize security and performance
- Access point usage, summary, and client association reports with XML, CSV, and PDF data export
- Secure HTML-based user interface for easy access anywhere
- Upper-layer network management system and operations support system (NMS/OSS) integration with syslog message, SNMP trap, and e-mail notifications

Cisco Catalyst 6500 Series Network Analysis Module 1 and 2(with NAM software version 2.2)

The Cisco Network Analysis Module (NAM) 1 and 2, second generation high performance network analysis modules for the Cisco Catalyst 6500 Series provides network monitoring instrumentation and web-browser based traffic analysis for Catalyst based AVVID environments. The NAM enables network managers to gain application-level visibility into network traffic with the ultimate goal of improving performance, reducing failures, and maximizing returns on network investment. The new NAMs are available in two hardware versions, NAM-1 and NAM-2, to meet diverse network analysis needs in a scalable switching environment running up to gigabit speeds. The NAMs come with an embedded, Web-based traffic analyzer, which provides full scale remote monitoring and troubleshooting capabilities that are accessible through a Web browser.

When to Sell

Sell This Product	When a Customer Needs These Features
Catalyst 6500 Series Network Analysis Module 1 and 2 (with NAM software version 2.2)	• Needs Application-Level visibility built into the network • Provides network managers visibility into all layers of network traffic • Monitoring in a scalable switching environment that supports traffic monitoring in a scalable switching environment • Offers investment protection by interfacing with both the bus and the crossbar switching fabric-based architectures in the Cisco Catalyst 6500 Series

Key Features

- Provides application-level Remote Monitoring (RMON) functions based on RMON2 and other advanced Management Information Bases (MIBs)
- Collects statistics on both data and VoIP streams flowing through the host switch using the Switch Port Analyzer (SPAN) and NetFlow Data Export features of the Cisco Catalyst 6500 Series
- Collects data from remote switches using the remote SPAN (RSPAN) feature of the Cisco Catalyst 6500 and 4000 Series switches
- Easy to deploy and use at LAN aggregation where they can see most of the traffic, at service points where performance is critical and at important access points where quick troubleshooting is required
- Application monitoring can be done using RMON, RMON2, and several extended RMON MIBs, which can detect the applications on the network and provide detailed information about how these applications utilize the bandwidth, which hosts access those applications, and which client/server pairs generate the most traffic
- Performance management provides valuable information about the delays in server responses to client requests

Selected Part Numbers and Ordering Information[1]

CiscoWorks Wireless LAN Solution Engine

CWWLSE-1105-K9	Wireless LAN Solution Engine1.0; includes the Cisco 1105 hardware platform and wireless LAN management software version 1.0

For More Information

See the CiscoWorks Wireless LAN Solution Engine Web site:
http://www.cisco.com/go/wlse

CiscoWorks Hosting Solution Engine

CiscoWOrks Hosting Solution Engine is a network management appliance that monitors, activates, and configures a variety of e-business services in Cisco powered data centers. It provides up-to-date fault and performance information about the network infrastructure and Layer 4-7 network services.

HSE automatically discovers the entire data center infrastructure and instantly begins collecting statistics and management information, providing a current snapshot of the managed environment. HSE provides up-to-date information for operational staff to easily pinpoint the source of a problem. HSE itself is a manageable Cisco device with a full Cisco Discovery Protocol implementation and supports Cisco MIB II.

When to Sell

Sell This Product	When a Customer Needs These Features
CiscoWorks Hosting Solution Engine	• Ideal for enterprise and service providers with e-business data center facilities • Granular user access model to partition network resources for Layer 4-7 services and switch ports, and authorize user group access to individual application services • Robust Layer 4-7 service configuration and service activation of server load balancing devices, including virtual servers, real servers, and content owners and rules

Key Features

- Granular user access to partition network resources for Layer 4-7 services as well as switch ports; authorize user group access to individual application services
- Robust Layer 4-7 service configuration and service activation of content switches
- Monitoring and reporting of SSL Proxy services on Cisco Catalyst 6000 Series with SSL Service Modules and Cisco Content Services Switch
- Flexible fault and performance monitoring of Cisco routers, switches, Cisco PIX® Firewalls, Cisco Content Engines, Cisco Content Switches and L4-7 services
- HTML-based, secure graphic user interface with easy customer view/report personalization and historical data reporting
- Upper layer NMS/OSS integration with SYSLOG, trap, email notifications and historical data XML export

Selected Part Numbers and Ordering Information[1]

Cisco 1105 Hosting Solution Engine

CWHSE1105-1.5-K9	CiscoWorks Hosting Solution Engine; includes 1105 hardware platform with software version 1.5; can be configured for international power cords

1. Some parts have restricted access or are not available through distribution channels. Resellers: For latest part number and pricing info, see the *Distribution Product Reference Guide* at: http://www.cisco.com/dprg (limited country availability).

Cisco Systems

Data Sheet

Cisco Catalyst 6500 Series 10/100 and 10/100/1000 **Ethernet** Interface Modules

As Cisco's premier modular multilayer switch, the Catalyst® 6500 Series delivers secure, converged services from the wiring closet to the core, to the data center, to the WAN edge.

The Cisco Catalyst® 6500 Series provides the broadest selection of 10/100 and 10/100/1000 Ethernet media, inline power options, densities, performance, interoperability, and chassis deployments. Equally suited for basic wiring closets, small campus distribution/core layers, and high performance data centers, Catalyst 6500 10/100 and 10/100/1000Mbps modules scale from 16-ports up to 576-ports in a single Catalyst 6500 chassis. Catalyst 6500 10/100 and 10/100/1000Mbps modules feature include:

- Proven and widely deployed Cisco AVVID wiring closet solution—Establish the Cisco Catalyst 6500 Series as the most widely deployed IP telephony port-enabled campus switch platform
- Choice of media and connector types—Available in copper unshielded twisted-pair (UTP), shielded twisted-pair (STP) using RJ-45 or RJ-21, multimode fiber (62.5/125 micron), and single-mode fiber using MT-RJ 100FX and 10FL
- IP phone and wireless access point support—Support inline power field upgrade (copper only), NIC/Phone auto-detection (phone discovery), and voice VLANs
- Simplified network operation with cable fault detection—Test cabling using Time Domain Reflectometer (TDR) that sends signals down the cable to identify faults in each twisted pair (available for 10/100/1000 copper
- Range of port densities—Available with 16 up to 48 ports per module; with up to 576 10/100/1000Base-TX ports, 288 ports of 100-Base-FX, or 10BASE-FL (per 13-slot chassis configured with 12 interface modules)
- Scalable and predictable performance—Provide a selection of switch fabric connections and throughput: 32 Gbps bandwidth/15 Mpps (Classic interface modules), 256 Gbps bandwidth/30 Mpps (CEF256 interface modules) and 256 Gbps bandwidth/210 Mpps(dCEF256 interface modules)
- IEEE 802.3 triple-speed autonegotiation—Allow switches to negotiate speed (10, 100, and now 1000 Mbps) and duplex mode (half or full) with attached devices
- Superior traffic management—Available with large 1-MB-per-interface buffers and up to 8 transmit queues for traffic prioritization and policing

Doc:

- Operational consistency—Supported in all Catalyst 6500 3-, 6-, 9-, and 13-slot chassis running Cisco IOS® Software and Cisco Catalyst Operating System Software; interoperable with all other interfaces and services modules; and forward-compatible with all Catalyst 6500 supervisor engines
- Maximum network uptime and resiliency—Support Cisco enhanced Per-Virtual LAN (VLAN) Spanning Tree Plus (PVST+) protocol, IEEE 802.1w Rapid Spanning Tree Protocol (RSTP) and IEEE 802.1s Multiple Spanning Tree (MST) protocol, Per-VLAN Rapid Spanning Tree (PVRST) protocol, Hot Standby Router Protocol (HSRP), Virtual Router Redundancy Protocol (VRRP), Cisco EtherChannel®, and IEEE 802.3ad link aggregation for fault-tolerant connectivity
- Extensive management tools—Support CiscoWorks network management platform; Simple Network Management Protocol (SNMP) versions 1, 2, and 3; and four Remote Monitoring (RMON) groups (statistics, history, alarms, and events)

The newest members of the Cisco Catalyst 6500 Series 10/100/1000 product family—the Classic interface module WS-X6148-GE-TX and the CEF256 interface module WS-X6548-GE-TX—provide 10/100/1000 Gigabit network access using standard RJ-45 connectors (Figure 1).

ECT 3548 CPMI - CORREIOS

Cisco Catalyst 6500 Series 10/100 and 10/100/1000 Ethernet Interface Modules with Cisco Inline Power

The Cisco Catalyst 6500 Series delivered the first 10/100BASE-T Ethernet switching modules that provided inline power for converged data and voice traffic. Cisco Catalyst Classic interface modules support voice functionality on each interface port, allowing customers to build campus multiservice data and voice networks for wiring closets with the following features:

- Inline power—Provides 48-volt DC power (for Cisco Inline Power and IEEE 802.3af standard inline power when it becomes available) over standard Category 5 unshielded twisted-pair (UTP) cable up to 100 meters for IP phones and wireless access points
- Phone discovery—Detects the presence of an IP phone and supplies inline power automatically
- Auxiliary VLAN using 802.1Q—Segments IP phones and data endpoints into separate logical networks automatically
- AutoQoS

Cisco Catalyst Inline Power and IEEE 802.3af Inline Power

The Inline Power feature gives network administrators centralized power control. It works over existing Category 5 UTP installations and helps to ensure that building power outages will not affect network telephony connections, providing greater network availability—when Cisco Catalyst 6500 Series switches are configured with uninterruptible power supply (UPS) systems.

10/100 and 10/100/1000 Ethernet interface modules shipping today support the Cisco Inline Power feature or support the IEEE 802.3af standard, or both, allowing 802.3af capability to be added later through an upgrade. The Cisco Catalyst Inline Power feature implementation passes the required domestic and international safety regulations and compliance measures.

Phone Discovery

The Cisco phone discovery feature eases network management burdens by automating the Inline Power feature. With phone discovery, the Cisco Catalyst switch detects the presence of an IP phone and supplies inline power automatically, eliminating the need to manually enable ports for inline power. The phone discovery mechanism is intelligent enough to differentiate between an IP phone and a network interface card (NIC), and will not supply inline power to NICs or other devices not designed to use inline power. With this feature, network administrators can depend on automatic and centralized control of inline power that is safe to deploy and maintain.

Auxiliary VLAN

The unique Auxiliary VLAN feature offered by Cisco provides automatic VLAN configuration for IP phones. It places phones into their own VLANs automatically, simplifying the task of overlaying a voice topology onto a data network. It allows network administrators to easily segment phones into separate logical networks, even though the data and voice infrastructure is physically the same—greatly simplifying the task of managing a multiservice network and identifying and troubleshooting network problems.

The Auxiliary VLAN feature maintains VLAN assignments, even when phones are moved to new locations. When a user plugs a phone into the switch, the switch provides the phone with the necessary VLAN information.

AutoQoS

Network administrators can assign IP phones to separate IP subnets and VLANs to allow separate quality of service (QoS) or security policies for IP phones. By deploying AutoQoS that configures QoS on voice ports automatically, the administrative task of configuring QoS to establish end-to-end traffic prioritization is greatly simplified.

Cisco Catalyst 6500 Series 10/100 and 10/100/1000 Modules

Two classes of Cisco Catalyst 6500 Series 10/100 and 10/100/1000 Ethernet interface modules—Classic and CEF256—provide a choice of speeds and forwarding rates (Table 4).

Classic 10/100 and 10/100/1000 Interface Modules

Suited for wiring closet applications, Classic 10/100 and 10/100/1000 modules use the supervisor's centralized forwarding engine for Layer 3 forwarding, and forward packets up to 15 Mpps.

Capable of operating in the same chassis with Supervisor Engine 1A, Supervisor Engine 2, and Supervisor Engine 720, Classic Series modules do not support distributed forwarding and cannot be upgraded with a Distributed Forwarding Card (DFC).

CEF256 10/100 and 10/100/1000 Interface Modules

Suited for premier wiring closet, distribution and core layers, data-center, and Web-hosting applications, CEF256 10/100 and 10/100/1000 interface modules use the centralized CEF engine located on the supervisor engine's policy feature card (PFC) and forward packets up to 30 Mpps.

Capable of operating in the same chassis with Supervisor Engine 1A, Supervisor Engine 2, and Supervisor Engine 720, CEF256 interface modules can also support distributed forwarding (Table 2).

Table 3 CEF256 10/100 and 10/100/1000 Switch Fabric DFC Upgrade Requirements

Supervisor Engine	Switch Fabric	DFC
Supervisor Engine 2 MSFC2/PFC2	Separate switch fabric module (SFM)	Requires WS-F6K-DFC upgrade
Supervisor Engine 720	Supervisor Engine 720 contains a switch fabric	Requires WS-F6K-DFC3 upgrade; will not work with WS-F6K-DFC3, or WS-F6K-DFC

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

Table 4 provides a comparison of the interface module classes available for 10/100 and 10/100/1000 Ethernet Interface modules.

Table 4 Classic and CEF256 10/100 and 10/100/1000 Interface Module Comparison

Feature	Classic Interface Modules	CEF256 Interface Modules
Performance/ Forwarding Rate (Mpps)	32 Gbps; 15 Mpps per system	256 Gbps; Up to 30 Mpps per system (15 Mpps per slot for slots upgraded with DFC to support distributed forwarding)
Forwarding Engine Architecture	Supervisor engine CPU makes forwarding decision	Centralized CEF engine located on supervisor's PFCx daughter card makes forwarding decision upgradeable to dCEF switching with optional WS-F6K-DFC or WS-F6K-DFC3
Supervisor Engine Supported	Supervisor Engine 1A, Supervisor Engine 2, Supervisor Engine 720	Supervisor Engine 1A, Supervisor Engine 2, Supervisor Engine 720
DFC Upgrade Requirements	Not supported	None integrated; Supervisor Engine 2—WS-F6K-DFC upgrade; SupervisorEngine 720—WS-F6K-DFC3 upgrade
Fabric Connections	32 Gbps shared bus connection (on Supervisor Engine1A, Supervisor Engine 2, and Supervisor Engine 720)	Single 8-Gbps channel connection to switch fabric [on Supervisor Engine 720 or Supervisor Engine 2-MSFC2 with Switch Fabric Module (SFM)] and 32-Gbps shared bus connection
Slot Requirements	Can occupy any slot in any chassis	Can occupy any slot in any chassis
Scheduler	Weighted Round Robin (WRR)	WRR

Cisco Catalyst Classic 10/100/1000 Voice Interface Modules

Suited for wiring closet applications, Cisco Catalyst Classic 10/100/1000 voice interface modules (Table 5) provide access to the desktop through standard RJ-45 connectors with the following operational advantages:

Forwarding architecture—Centralized CEF forwarding

Forwarding performance—Forward packets up to 15 Mpps per system

Fabric connection—Provide a 32-Gbps shared bus connection

Supervisor engine—Work with Supervisor Engine 1A, Supervisor Engine 2, or Supervisor Engine 720

Distributed forwarding upgrade—None; Classic interface modules cannot be upgraded for distributed forwarding

Slot requirements—Can occupy any slot in any Cisco Catalyst 6500 Series chassis

Time Domain Reflectometer (TDR)—Tests cabling by sending signals down the cable to identify faults in each twisted pair

Transmit queue structure—1p2q2t = 1 strict priority queue, 2 round robin queues, 2 thresholds

Receive queue structure—1q2t = 1 round robin queue, 2 thresholds

Table 5 Classic 10/100/1000 Voice Interface Modules

Product	Ports/ Interface/ Connectors	Port Density/ Chassis Model	Maximum Distance/ Cable Type	Inline Power for Voice Availability/ Upgrade Capability
WS-X6148-GE-TX	48-port;10/100/ 1000BASE-TX; RJ-45	576 ports (Cisco Catalyst 6513); 384 ports (Cisco Catalyst 6509)	100 meters; Category 5 cable	Cisco Inline Power; upgradable to 802.3af
WS-X6148V-GE-TX	48-port; 10/100/ 1000BASE-TX; RJ-45	576 ports (Cisco Catalyst 6513); 384 ports (Cisco Catalyst 6509)	100 meters; Category 5 cable	Cisco Inline Power; upgradable to 802.3af

Cisco Catalyst CEF256 10/100/1000 Voice Interface Modules

Suited for wiring closet applications, Cisco Catalyst CEF256 10/100/1000 voice interface modules provide access to the desktop through standard RJ-45 connectors and line-rate 10/100/1000 Ethernet forwarding (Table 6) with the following operational advantages:

Forwarding architecture—Use the central CEF engine located on the supervisor engine

Forwarding performance—Forward packets up to 30 Mpps per system and up to 15 Mpps per slot if upgraded to support distributed forwarding

Fabric connection—Connect to the switch fabric through one 8-Gbps connection and the 32-Gbps shared bus

Supervisor engine—Work with Supervisor Engine 1A, Supervisor Engine 2, or Supervisor Engine720

Distributed forwarding upgrade—Optional; upgrade is required only to perform distributed forwarding; requires a WS-F6K-DFC3 upgrade to operate with a Supervisor Engine 720; requires a WS-F6K-DFC upgrade to operate with a Supervisor Engine2/MFSC2 and a Switch Fabric Module

Slot requirements—Can occupy any slot in any Cisco Catalyst 6500 Series chassis

Time Domain Reflectometer (TDR)—Tests cabling by sending signals down the cable to identify faults in each twisted pair

Transmit queue structure—1p2q2t = 1 priority queue, 2 round robin queues, 1 threshold

Receive queue structure—1q2t = 1 round robin queue, 2 thresholds

Cisco Catalyst Classic 10/100 Copper Voice Modules

Designed for deployment in wiring closets, high-density Cisco Catalyst Classic 10/100 interface modules come with a selection of inline power capabilities and provide line-rate 10/100 Ethernet forwarding with the following operational advantages:

- Voice-ready modules with Cisco Inline Power and upgradable to 802.3af—Available in 48-port RJ-45 and RJ-21 configurations (WS-X6148-RJ45V and WS-X6148-RJ21V)
- Voice-ready modules with Cisco Inline Power and not upgradable to 802.3af—Available in 48-port RJ-45 and RJ-21 configurations (WS-X6348-RJ45V and WS-X6348-RJ21V)
- Voice-capable modules upgradable to Cisco Inline Power or 802.3af—Available in 48-port RJ-45 and RJ-21configurations (WS-X6148-RJ-45 and WS-X6148-RJ-21)

Note: These modules are designed to fully support future upgrades to the IEEE 802.3af inline power standard currently underway, providing maximum investment protection.

Forwarding architecture—Use centralized CEF forwarding

Forwarding performance—Forwards packets up to 15 Mpps per system

Fabric connection—Connect to the switch fabric using a 32-Gbps shared bus connection

Supervisor engine—Work with Supervisor Engine 1A, Supervisor Engine 2, or Supervisor Engine 720

Distributed forwarding upgrade—None; Classic interface modules cannot be upgraded for distributed forwarding

Slot requirements—Can occupy any slot in any Cisco Catalyst 6500 Series chassis

Transmit queue structure—2q2t = two round robin queues and two thresholds

Receive queue structure—1q4t = one round robin queue and four thresholds

Cisco Catalyst CEF256 10/100 Copper Modules

Designed for small campus distribution and core layers and for data-center and Web-hosting applications where voice capability is not required, Cisco Catalyst CEF256 twisted-pair interface modules provide line-rate 10/100 Ethernet forwarding with the following operational advantages:

Forwarding architecture—Use the central CEF engine located on the supervisor engine

Forwarding performance—Forward packets up to 30 Mpps per system and up to 15 Mpps per slot for slots upgraded to support distributed forwarding

Fabric connection—Connect to the switch fabric using a single 8-Gbps switch fabric channel and a 32-Gbps shared bus

Supervisor engine—Work with Supervisor Engine 1A, Supervisor Engine 2, or Supervisor Engine 720

Distributed forwarding upgrade—Only required to perform distributed forwarding; require a WS-F6K-DFC3 upgrade to operate with Supervisor Engine 720; require a WS-F6K-DFC upgrade to operate with Supervisor Engine 2/ MFSC2 and an SFM

Slot requirements—Can occupy any slot in any Cisco Catalyst 6500 Series chassis

Transmit queue structure—1p3q1t = 1 priority queue, 3 round robin queues, 1 threshold

Receive queue structure—1p1q4t = 1 priority queue, 1 round robin queue, 4 thresholds

Catalyst Classic 100FX and 10FL Fiber Interface Modules

Designed for deployment in wiring closets where optical interfaces are required, the Cisco Catalyst Classic fiber interface modules provide 10/100 Ethernet forwarding with the following operational advantages:

Forwarding architecture—Use centralized CEF forwarding

Forwarding performance—Forward packets up to 15 Mpps per system

Fabric connection—Connect to the switch fabric using a 32-Gbps shared bus connection

Supervisor engine—Work with Supervisor Engine 1A, Supervisor Engine 2, or Supervisor Engine 720

Distributed forwarding upgrade—None; Classic interface modules cannot be upgraded for distributed forwarding

Slot requirements—Can occupy any slot in any Cisco Catalyst 6500 Series chassis

Transmit queue structure—2q2t = 2 round robin queues, 2 thresholds

Receive queue structure—1q4t = 1 round robin queue, 4 thresholds

Note: No inline power support for voice is available for 100FX/10FL fiber modules.

Cisco Catalyst CEF256 100FX Fiber Modules

Designed for small campus distribution and core layers and for data-center and Web-hosting applications, Cisco Catalyst dCEF256 fiber interface modules provide line-rate 100FX Ethernet forwarding with the following operational advantages:

Forwarding architecture—Use the central CEF engine located on the supervisor engine

Forwarding performance—Forward packets up to 30 Mpps per system and up to 15 Mpps per slot for slots upgraded to support distributed forwarding

Fabric connection—Connect to the switch fabric using one 8-Gbps connection and the 32-Gbps shared bus

Supervisor engine—Work with Supervisor Engine 1A, Supervisor Engine 2, or Supervisor Engine 720

Distributed forwarding upgrade—Only required to perform distributed forwarding; require a WS-F6K-DFC3 upgrade to operate with Supervisor Engine 720; require a WS-F6K-DFC upgrade to operate with Supervisor Engine 2/MFSC2 and a Switch Fabric Module

Slot requirements—Can occupy any slot in any Cisco Catalyst 6500 Series chassis

Transmit queue structure—1p3q1t = 1 priority queue, 3 round robin queues, 1 threshold

Receive queue structure—1p1q2t = 1 priority queue, 1 round robin queue, 2 thresholds

Note: No inline power support for voice is available for 100FX fiber modules.

Ordering Information—DFC Daughter Cards

Table 12 provides part number information for Catalyst 6500 Series 10/100 and 100/1000 Ethernet interface modules.

Table 12 Catalyst 6500 Series 10/100 and 100/1000 Distributed Forwarding Cards

Part Number	Description
WS-F6K-DFC	Distributed forwarding card
WS-F6K-DFC=	Distributed forwarding card, spare
MEM-DFC-256MB	256-MB DRAM option for DFC
MEM-DFC-256MB=	256-MB DRAM spare option for DFC
MEM-DFC-512MB	512-MB DRAM option for DFC
MEM-DFC-512MB=	512-MB DRAM spare option for DFC

Specifications

Standard Network Protocols

- Ethernet: IEEE 802.3, 10BASE-T
- Fast Ethernet: IEEE 802.3, 100BASE-TX, and 100BASE-FX
- Gigabit Ethernet: 1000BASE-TX
- IEEE 802.1d, IEEE 802.1p, IEEE 802.1q, IEEE 802.1s, IEEE 802.1w, IEEE 802.3x, IEEE 802.3z, IEEE 802.3ab, IEEE 802.3ad

Physical Specification

- Occupies one slot in a Cisco Catalyst 6500 Series chassis
- Dimensions (H x W x D): 1.2 x 14.4 x 16 in. (3.0 x 35.6 x 40.6 cm)

Environmental Conditions

- Operating temperature: 32 to 104 F (0 to 40 C)
- Storage temperature: –40 to 167 F (–40 to 75 C)
- Relative humidity: 10 to 90%, noncondensing
- Operating altitude: –60 to 4000 m

Safety Compliance

- UL 1950
- CSA-C22.2 No. 950
- EN 60950
- IEC 950
- AS/NZS 3260
- IEC 825

Cisco Systems, Inc.

- 100BASE-FX Fast Ethernet: 8/125-micron single-mode fiber: 10-km half or full duplex
- 10BASE-FL Ethernet: 62.5/125-micron multimode fiber: 2-km half or full duplex
- Maximum power: off (maximum power condition not reached); on (maximum power condition reached; no more phones will receive inline power from this module)

Indicators and Interfaces

- Status: green (operational); red (faulty); orange (module booting or running diagnostics)
- Link good: green (port active); orange (disabled); off (not active or not connected); blinking orange (failed diagnostic and disabled)
- 10/100/1000: RJ-45 (female)
- 10/100BASE-TX and 100BASE-TX: RJ-45 (female)
- 100BASE-FX: MT-RJ (female, multimode)
- 100BASE-FX: MT-RJ (female, single mode)
- 10BASE-FL: MT-RJ (female, multimode)

Cisco Technical Support Services

Whether your company is a large organization, a commercial business, or a service provider, Cisco is committed to maximizing the return on your network investment. Cisco offers a portfolio of technical support services to help ensure that your Cisco products operate efficiently, remain highly available, and benefit from the most up-to-date system software.

The Cisco Technical Support Services organization offers the following features, providing network investment protection and minimal downtime for systems running mission-critical applications:

- Provides Cisco networking expertise online and on the telephone
- Creates a proactive support environment with software updates and upgrades as an ongoing integral part of your network operations, not merely a remedy when a failure or problem occurs
- Makes Cisco technical knowledge and resources available to you on demand
- Augments the resources of your technical staff to increase productivity
- Complements remote technical support with onsite hardware replacement

Cisco Technical Support Services include:

- Cisco SMARTnet™ support
- Cisco SMARTnet Onsite support
- Cisco Software Application Services, including Software Application Support and Software Application Support plus Upgrades

Product Overview

This chapter describes the Catalyst 6500 series switches and contains these sections:

- Catalyst 6503 Switch, page 1-2
- Catalyst 6506 Switch, page 1-4
- Catalyst 6509 Switch, page 1-7
- Catalyst 6509-NEB Switch, page 1-11
- Catalyst 6513 Switch, page 1-14
- System Features, page 1-17
- Fan Assembly, page 1-19
- Power Supplies, page 1-24

The Catalyst 6500 series switch chassis are listed in Table 1-1.

Table 1-1 Catalyst 6500 Series Switches

Catalyst 6500 Series Switch	Orientation/Number of Slots
Catalyst 6503	Horizontal 3-slot
Catalyst 6506	Horizontal 6-slot
Catalyst 6509	Horizontal 9-slot
Catalyst 6509-NEB	Vertical 9-slot
Catalyst 6513	Horizontal 13-slot

Doc:

Note In this publication, the term Catalyst 6500 series refers only to the switch chassis listed in Table 1-2. The Catalyst 6000 series switches (Catalyst 6006 switch and Catalyst 6009 switch) are described in a separate publication, the *Catalyst 6000 Series Switches Installation Guide*.

Note Throughout this publication, except where noted, the term *supervisor engine* is used to refer to Supervisor Engine 1, Supervisor Engine 2, and Supervisor Engine 720.

Catalyst 6503 Switch

The Catalyst 6503 switch is a 3-slot horizontally-aligned switch. The Catalyst 6503 switch supports the following:

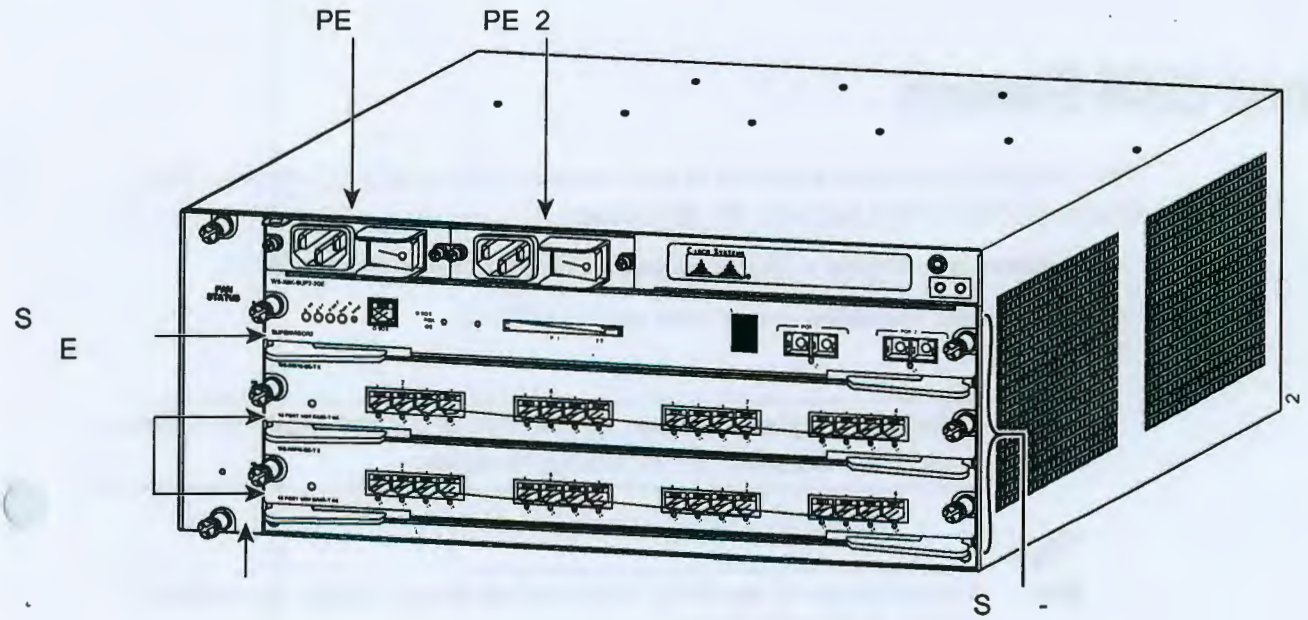
- A supervisor engine with two gigabit interface uplinks and an optional redundant supervisor engine in one of the following configurations:
  - Two supervisor engines, each with no Multilayer Switch Feature Card (MSFC) and no Policy Feature Card (PFC)
  - Two supervisor engines, each configured with a PFC daughter card
  - Two supervisor engines, each configured with both an MSFC and a PFC daughter card

Note The uplink ports are fully functional on the redundant supervisor engine in standby mode.

Note Both supervisor engines in a single chassis must be completely identical.

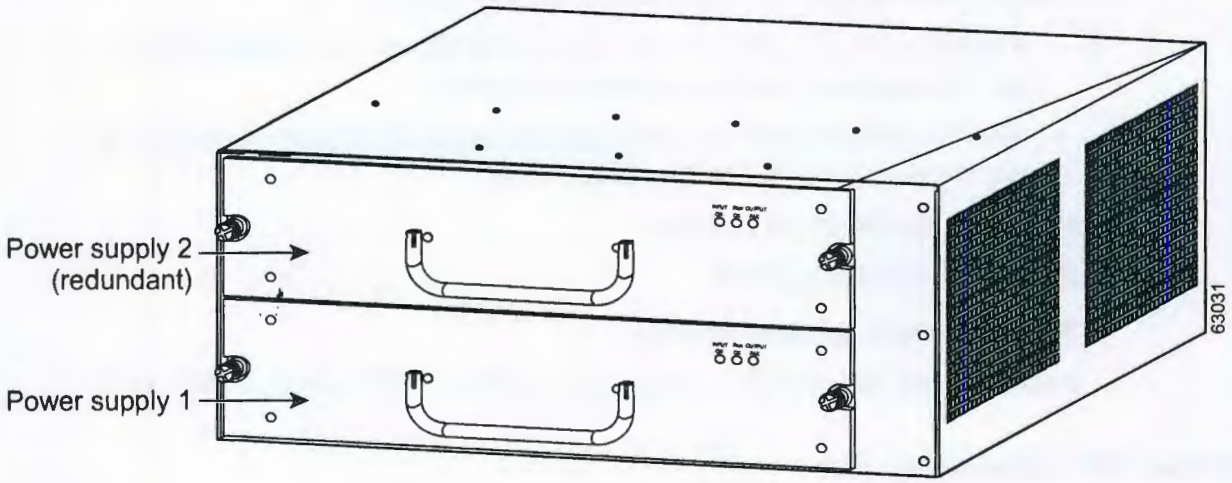
- Up to two hot-swappable Catalyst 6500 series modules:
  - The Switch Fabric Modules (WS-C6500-SFM and WS-X6500-SFM2) are not supported on the Catalyst 6503 switch.
  - The WS-X6816-GBIC 16-port Gigabit Ethernet fabric-enabled module is not supported on the Catalyst 6503 switch.
- Backplane bandwidth of 32 Gbps
- Hot-swappable fan assembly
- Two power entry modules (PEMs)
- Redundant AC-input or DC-input power supplies (950W power supply only)

Figure 1-1 Catalyst 6503 Switch—Front View



RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0638
Doc: 3701

Figure 1-2 Catalyst 6503 Switch—Rear View



Catalyst 6506 Switch

The Catalyst 6506 switch chassis is a 6-slot horizontally-aligned chassis. The Catalyst 6506 switch supports the following:

- A supervisor engine with two Gigabit Ethernet uplink ports (slot 1)
- An optional redundant supervisor engine (slot 2)

Note Supervisor Engine 720 must be installed in chassis slots 5 or 6. Slots 1 and 2 are available for switching modules.

Note The uplink ports are fully functional on the redundant supervisor engine in standby mode.

Both supervisor engines in a single chassis must be completely identical. You can configure the redundant supervisor engines in a Catalyst 6506 switch in one of three configurations:

  - Two supervisor engines, each with no Multilayer Switch Feature Card (MSFC) and no Policy Feature Card (PFC)
  - Two supervisor engines, each configured with a PFC daughter card
  - Two supervisor engines, each configured with both an MSFC and a PFC daughter card

- Up to five additional hot-swappable Catalyst 6500 series switching modules
  - Fabric-enabled module support provided in slots 2–6 (requires Switch Fabric Module)

Note Supervisor Engine 720 has built-in switching fabric and does not require that Switch Fabric Modules be installed in the chassis.

- Hot-swappable fan tray

Note The high capacity fan tray (WS-C6K-6SLOT-FAN2) must be installed when a Supervisor Engine 720 is installed in the chassis.

- Redundant AC-input or DC-input power supplies

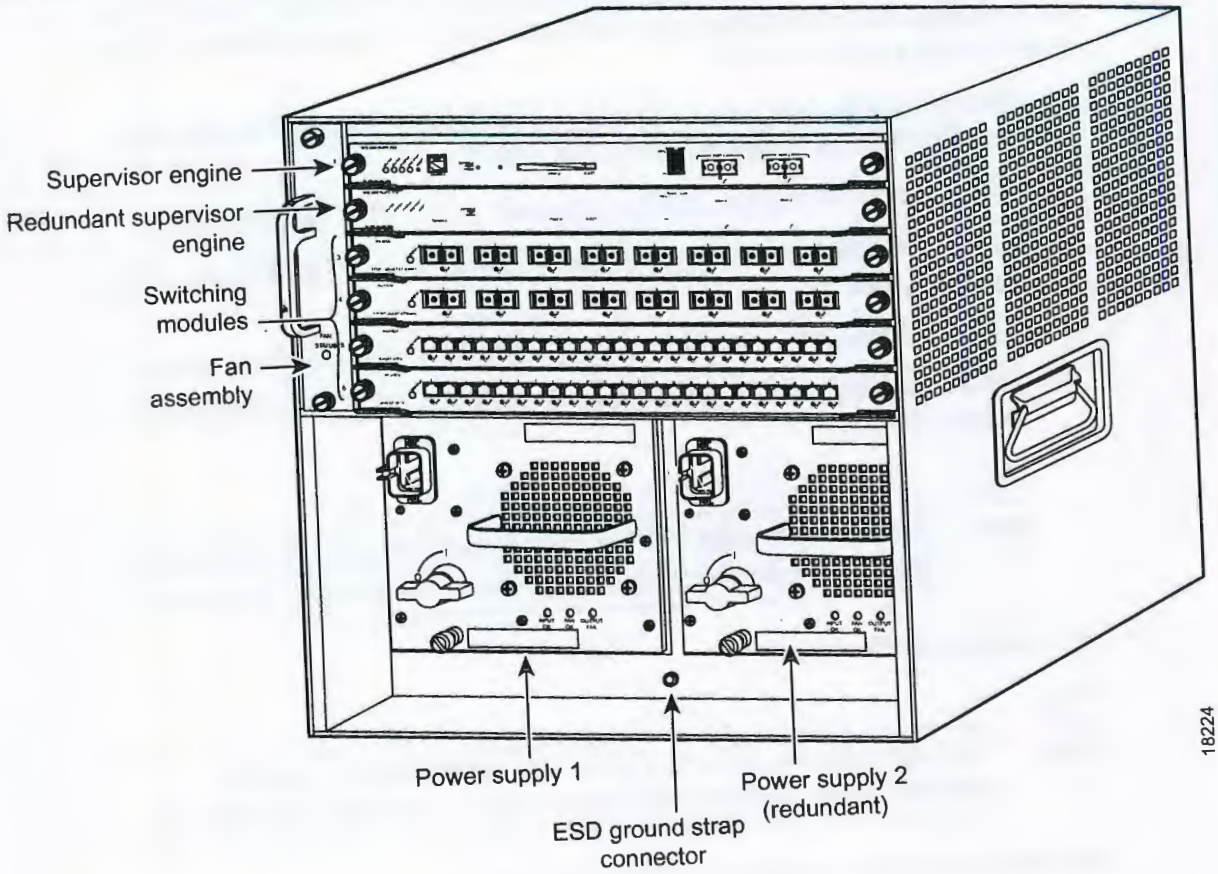
Note When a Supervisor Engine 720 and the high capacity fan tray are installed, you must install 2500 W or higher capacity power supplies in the chassis.

- Backplane bandwidth of 32 Gbps scalable up to 256 Gbps

Note Backplane bandwidth greater than 32 Gbps requires that you install either a Switch Fabric Module or a Supervisor Engine 720 in the switch chassis.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 3701
Doc:

Figure 1-3 Catalyst 6506 Switch



- A Switch Fabric Module (WS-C6500-SFM or WS-X6500-SFM2)
  - The Switch Fabric Module requires Supervisor Engine 2.

Note Switch Fabric Modules are not supported by Supervisor Engine 720.

  - You must install a Switch Fabric Module in either slot 5 or slot 6 of the Catalyst 6506 switch. For redundancy, you can install a standby Switch Fabric Module. The module first installed functions as the primary module. When you install two Switch Fabric Modules at the same time, the module in slot 5 acts as the primary module, and the module in slot 6 acts as the backup. If you reset the module in slot 5, the module in slot 6 becomes the primary module.
  - Mixing an SFM (WS-C6500-SFM) with an SFM2 (WS-X6500-SFM2) in the same Catalyst 6506, Catalyst 6509, or Catalyst 6509-NEB chassis is supported.
  - Fabric-enabled module support is provided in all slots. (A Switch Fabric Module is required.)

Catalyst 6509 Switch

The Catalyst 6509 switch chassis has nine horizontal slots that are numbered from top to bottom. (See Figure 1-4.) Slot 1 is reserved for the supervisor engine, which provides switching, local and remote management, and multiple gigabit uplink interfaces.

Slot 2 can contain an additional supervisor engine, which can act as a backup if the first supervisor engine fails. If a redundant supervisor engine is not required, slot 2 is available for a switching module.

For a detailed description of supervisor engine operation in a redundant configuration, refer to your software configuration guide.

The Catalyst 6509 switch supports the following:

- A supervisor engine with two Gigabit Ethernet uplink ports and an optional redundant supervisor engine

Note Supervisor Engine 720 must be installed in chassis slots 5 or 6. Slots 1 and 2 are available for switching modules.

Note The uplink ports are fully functional on a redundant supervisor engine in standby mode.

Both supervisor engines in a single chassis must be completely identical. You can configure the redundant supervisor engines in a Catalyst 6500 series switch in one of three configurations:

  - Two supervisor engines, each with no MSFC and no PFC
  - Two supervisor engines, each configured with a PFC daughter card
  - Two supervisor engines, each configured with both an MSFC and a PFC daughter card

- Backplane bandwidth scalable up to 256 Gbps

Note Backplane bandwidth greater than 32 Gbps requires that you install a Switch Fabric Module or a Supervisor Engine 720 in the Catalyst 6509-NEB switch chassis.

- A Switch Fabric Module (WS-C6500-SFM or WS-X6500-SFM2)
  - The Switch Fabric Modules require Supervisor Engine 2.
  - You must install the Switch Fabric Module in either slot 5 or slot 6 of the Catalyst 6509-NEB switch. For redundancy, you can install a standby Switch Fabric Module. The module first installed functions as the primary module. When you install two Switch Fabric Modules at the same time, the module in slot 5 acts as the primary module, and the module in slot 6 acts as the backup. If you reset the module in slot 5, the module in slot 6 becomes the primary module.

Catalyst 6513 Switch

The Catalyst 6513 switch chassis has 13 slots. (See Figure 1-6.) Slot 1 is reserved for a Supervisor Engine 2, which provides switching, local and remote management, and multiple gigabit uplink interfaces.

Note The Catalyst 6513 switch requires a Supervisor Engine 2 or Supervisor Engine 720.

Slot 2 can contain an additional Supervisor Engine 2, which can act as a backup if the first supervisor engine fails. If a redundant supervisor engine is not required, slot 2 is available for a switching module.

Note Supervisor Engine 720 must be installed in slots 7 or 8.

For a detailed description of supervisor engine operation in a redundant configuration, refer to your software configuration guide

The Catalyst 6513 switch supports the following:

- A Supervisor Engine 2 with two Gigabit Ethernet uplink ports and an optional redundant Supervisor Engine 2

  Note The uplink ports are fully functional on the redundant Supervisor Engine 2 in standby mode.

  Both supervisor engines in a single chassis must be completely identical. You can configure the redundant supervisor engines in a Catalyst 6500 series switch in one of three configurations:

  - Two supervisor engines, each with no MSFC and no PFC
  - Two supervisor engines, each configured with a PFC daughter card
  - Two supervisor engines, each configured with both an MSFC and a PFC daughter card
- Backplane bandwidth scalable up to 256 Gbps

Note Backplane bandwidth greater than 32 Gbps requires that you install either a Switch Fabric Module or Supervisor Engine 720 in the Catalyst 6513 switch chassis.

- A Switch Fabric Module (supports WS-X6500-SFM2 only)
  - The Switch Fabric Module requires Supervisor Engine 2. Supervisor Engine 1A does not support the Switch Fabric Module.
  - You must install the Switch Fabric Module in slot 7 or slot 8 of the Catalyst 6513 switch. For redundancy, you can install a standby Switch Fabric Module. The module first installed functions as the primary module. When you install two Switch Fabric Modules at the same time, the module in slot 7 acts as the primary module, and the module in slot 8 acts as the backup. If you reset the module in slot 7, the module in slot 8 becomes the primary module.

Note Supervisor Engine 720 has built-in switching fabric and does not require that Switching Fabric Modules be installed in the chassis.

- Up to 12 additional hot-swappable switching modules
  - Fabric-enabled module support provided in all slots (requires a Switch Fabric Module (WS-X6500-SFM2) or Supervisor Engine 720 be installed)
  - Dual Fabric connectivity supported in slots 9–13 (requires a Switch Fabric Module (WS-X6500-SFM2) or Supervisor Engine 720 be installed)
- Hot-swappable fan assembly

Note The high capacity fan tray (WS-C6K-13SLT-FAN2) must be installed when a Supervisor Engine 720 is installed in the chassis.

- Redundant AC-input or DC-input power supplies

System Features

This section describes the hardware features for the Catalyst 6500 series switches. For software descriptions, refer to your software configuration guide. For module descriptions and installation procedures, refer to the *Catalyst 6500 Series Switches Module Installation Guide*.

Port Density

Table 1-2 lists the port densities of the Catalyst 6500 series switches.

Table 1-2 Catalyst 6500 Series Port Density

Architecture	Catalyst 6500 Series Switches
Number of 10 Gigabit Ethernet Ports	2 (3 slots) Catalyst 6503 switch 5 (6 slots) Catalyst 6506 switch 8 (9 slots) Catalyst 6509 switch 12 (13 slots) Catalyst 6513 switch
Number of Gigabit Ethernet Ports	34 (3 slots) Catalyst 6503 switch 82 (6 slots) Catalyst 6506 switch 130 (9 slots) Catalyst 6509 switch 194 (13 slots) Catalyst 6513 switch
Number of 100BASE-FX Ethernet Ports	96 (3 slots) Catalyst 6503 switch 120 (6 slots) Catalyst 6506 switch 192 (9 slots) Catalyst 6509 switch 288 (13 slots) Catalyst 6513 switch
Number of 10/100 Ethernet Ports	96 (3 slots) Catalyst 6503 switch 240 (6 slots) Catalyst 6506 switch 384 (9 slots) Catalyst 6509 switch 576 (13 slots) Catalyst 6513 switch
Number of 10BASE-FL Ethernet Ports	48 (3 slots) Catalyst 6503 switch 120 (6 slots) Catalyst 6506 switch 192 (9 slots) Catalyst 6509 switch 288 (13 slots) Catalyst 6513 switch

Table 1-2 Catalyst 6500 Series Port Density (continued)

Architecture	Catalyst 6500 Series Switches
Number of ATM OC-12 Ports	2 (3 slots) Catalyst 6503 switch 5 (6 slots) Catalyst 6506 switch 8 (9 slots) Catalyst 6509 switch 12 (13 slots) Catalyst 6513 switch
Number of FlexWAN Modules	2 (3 slots) Catalyst 6503 switch 5 (6 slots) Catalyst 6506 switch 8 (9 slots) Catalyst 6509 switch 12 (13 slots) Catalyst 6513 switch

Redundancy

Catalyst 6500 series switches have these redundancy features:

- Ability to house two hot-swappable supervisor engines
- Ability to house two fully redundant, AC-input or DC-input, load-sharing power supplies

Note In certain configurations, the power supplies are not fully redundant. Refer to the "Power Supply Redundancy" section on page 1-29.

- A hot-swappable fan assembly containing multiple fans
- Redundant backplane-mounted clock modules
- Redundant backplane-mounted voltage termination (VTT) modules

Component Hot Swapping

You can hot swap all modules (including the supervisor engine if you have a redundant supervisor engine) and the fan assembly. You can add, replace, or remove modules without interrupting the system power or causing other software or interfaces to shut down.

Fan Assembly

The system fan assembly is located in the chassis and provides cooling air for the supervisor engine and the switching modules. The following figures show the direction of airflow into and out of the switch: Figure 1-7 (Catalyst 6503 switch), Figure 1-8 (Catalyst 6506 switch), Figure 1-9 (Catalyst 6509 switch), Figure 1-10 (Catalyst 6509-NEB switch), and Figure 1-11 (Catalyst 6513 switch). Sensors on the supervisor engine monitor the internal air temperatures. If the air temperature exceeds a preset threshold, the environmental monitor displays warning messages.

Note We recommend that you maintain a minimum air space of 6 inches (15 cm) between walls and the chassis air vents and a minimum horizontal separation of 12 inches (30.5 cm) between two chassis to prevent overheating.

If an individual fan within the assembly fails, the FAN STATUS LED turns red. Individual fans cannot be replaced. To replace a fan assembly, see the "Removing and Replacing the Fan Assembly" section on page 5-35.

Refer to your software configuration guide for information on environmental monitoring.

Power Supplies

Catalyst 6500 series switch power supplies are available in five power ratings:

- 950 W—AC and DC input (PWR-950-AC and PWR-950-DC) (for use with the Catalyst 6503 switch only)
- 1000 W—AC input only (WS-CAC-1000W)
- 1300 W—AC and DC input (WS-CAC-1300W and WS-CDC-1300W)
- 2500 W—AC and DC input (WS-CAC-2500W and WS-CDC-2500W)
- 4000 W—AC input only (WS-CAC-4000W-US1 or WS-CAC-4000W-INT)

950 W Power Supply (PWR-950-AC and PWR-950-DC)

Note The 950 W AC-input and DC-input power supplies can be installed in the Catalyst 6503 switch chassis only. They cannot be installed in any other Catalyst 6500 series switch chassis.

The 950 W power supplies (see Figure 1-12) do not connect directly to source AC but use a power entry module (PEM), located on the front of the chassis, to connect the site power source to the power supply located in the back of the chassis.

The AC-input PEM (shown in Figure 1-13) and DC-input PEM (shown in Figure 1-14) provide an input power connection on the front of the router chassis to connect the site power source to the power supply. You can connect the DC-input power supply to the power source with heavy gauge wiring connected to a terminal block. The wire gauge size is determined by local electrical codes and restrictions.

Note The power cord is not shown in Figure 1-13.

The PEMs have an illuminated power switch (AC-input only), current protection, surge and EMI suppression, and filtering functions.

Figure 1-12 Catalyst 6503 950 W AC- and DC-Input Power Supplies

CPMI - CORREIOS
Fls: 0649
3701
Doc:

1000 W, 1300 W, 2500 W, and 4000 W Power Supplies

The 1000 W, 1300 W, 2500 W, and 4000 W AC-input and DC-input power supplies have the same form factor and designed for use in the Catalyst 6500 series switches.

Note The 1000 W, 1300 W, 2500 W, and 4000 W power supplies have a different form factor and cannot be used in the Catalyst 6503 series switch.

Catalyst 6500 series chassis power supply configurations for the 1000 W, 1300 W, 2500 W and 4000 W power supplies are shown in Table 1-3.

Table 1-3 Catalyst 6500 Series Power Supply Configurations

Catalyst 6500 Series Switch	Power Supply Configurations
Catalyst 6506	1000 W AC-input 1300 W AC- and DC-input 2500 W AC- and DC-input
Catalyst 6509	1300 W AC- and DC-input 2500 W AC- and DC-input 4000 W AC-input
Catalyst 6509-NEB	1300 W AC- and DC-input 2500 W AC- and DC-input 4000 W AC-input
Catalyst 6513	2500 W AC- and DC-input 4000 W AC-input

Catalyst 6500 series switches support redundant AC-input and DC-input power supplies. Unlike the Catalyst 4000 family and Catalyst 5000 family switches, the Catalyst 6500 series switches allow you to mix AC-input and DC-input power supplies in the same chassis.

Many telco organizations require a –48 VDC power supply to accommodate their power distribution systems. From an operational perspective, the DC-input power supply has the same characteristics as the AC-input version.

The AC-input power supply (see Figure 1-15) has a detachable power cord (except for the WS-CAC-4000W) that allows you to connect each power supply to the site power source. You can connect the DC-input power supply (see Figure 1-16) to the power source with heavy gauge wiring connected to a terminal block. The wire gauge size is determined by local electrical codes and restrictions.

Note The power cord is not shown in Figure 1-15.

Note With a fully populated Catalyst 6513 switch, two 2500 W power supplies are not fully redundant. If you run the 2500 W power supply at the low range input (100 to 120 VAC), it is not redundant in a fully populated Catalyst 6509 or Catalyst 6509-NEB switch.

Note The 2500 W AC-input power supply needs 220 VAC to deliver 2500 W of power. When powered with 110 VAC, it delivers only 1300 W. In addition, the power supply needs 16 A, regardless of whether it is plugged into 110 VAC or 220 VAC.

For complete power specifications, see Appendix A, "Technical Specifications."

Figure 1-15 AC-Input Power Supply

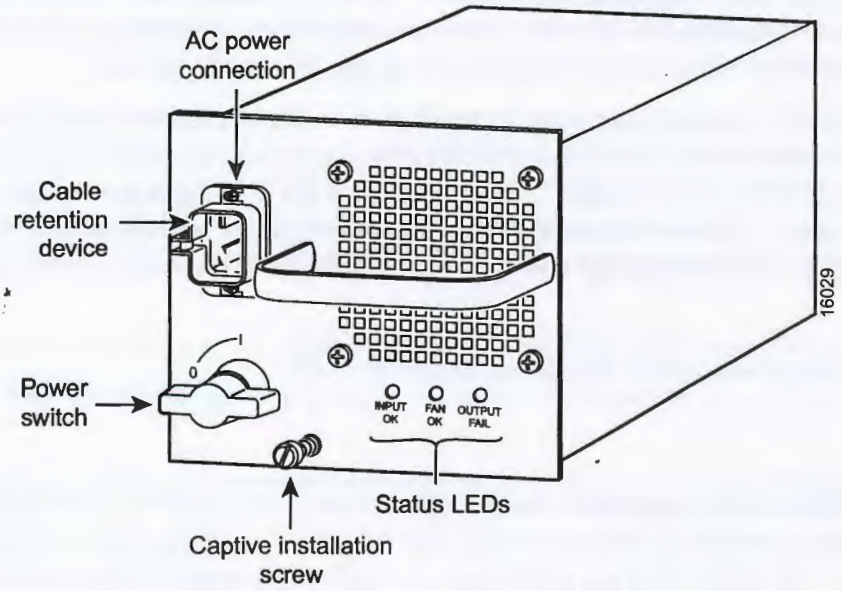

Figure 1-16 DC-Input Power Supply

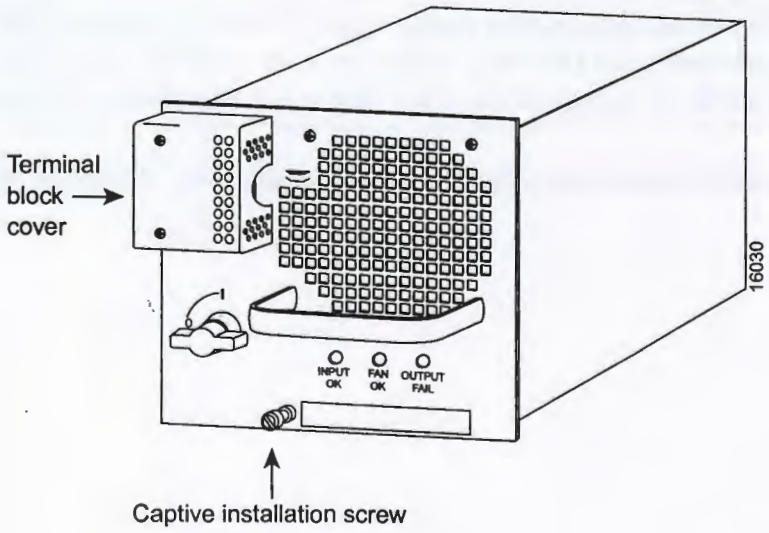

Power Supply Redundancy

Catalyst 6500 series modules have different power requirements. Depending upon the wattage of the power supply, certain switch configurations might require more power than a single power supply can provide. Although the power management feature allows you to power all installed modules with two power supplies, redundancy is not supported in this configuration. Redundant and nonredundant power configurations are summarized in Table 1-4. The effects of changing the power supply configurations are summarized in Table 1-5.

Note For proper load-sharing operation in a redundant power supply configuration, you must install two modules in the chassis. If you fail to install two modules, you might receive spurious OUTPUT FAIL indications on the power supply.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0651
Doc: 3701

Table 1-4 Power Supply Redundancy

If you have two power supplies of	and redundancy is	Then
Equal wattage	Enabled	The total power drawn from both supplies is never greater than the capability of one supply. If one supply malfunctions, the other supply can take over the entire system load. Each power supply provides approximately half of the required power to the system. Load sharing and redundancy are enabled automatically; no software configuration is required.
Unequal wattage	Enabled	Both power supplies come online, but a syslog message displays that the lower wattage power supply will be disabled. If the active power supply fails, the system shuts down. The lower wattage power supply must then be manually turned on. The lower wattage power supply selectively powers up the modules so that the capacity of the power supply is not exceeded.
Equal or unequal wattage	Disabled	The total power available to the system is approximately 167 percent of the lower wattage power supply. The system powers up as many modules as the combined capacity allows. If the higher wattage power supply fails, the lower wattage supply might also shut down due to overcurrent protection, thus preventing damage to the lower wattage power supply.

Table 1-5 Effects of Power Supply Configuration Changes

Configuration Change	Effect
Redundant to nonredundant	• System log and syslog messages are generated. • System power is increased to approximately 167 percent of the lower wattage power supply. • The modules marked as *power-deny* in the **show module** Status field are brought up if there is sufficient power.
Nonredundant to redundant	• System log and syslog messages are generated. • System power is the power capability of the larger wattage supply. • If there is not enough power for all previously powered-up modules, some modules are powered down and marked as *power-deny* in the **show module** Status field.
Equal wattage power supply is inserted with redundancy enabled	• System log and syslog messages are generated. • System power equals the power capability of one supply (both supplies provide approximately one half of the total current). • No change in the module status because the power capability is unchanged.
Equal wattage power supply is inserted with redundancy disabled	• System log and syslog messages are generated. • System power is the combined power capability of both supplies. • The modules marked as *power-deny* in the **show module** Status field are brought up if there is sufficient power.
Higher wattage power supply is inserted with redundancy enabled	• System log and syslog messages are generated. • The system disables the lower wattage power supply; the higher wattage supply powers the system.
Lower wattage power supply is inserted with redundancy enabled	• System log and syslog messages are generated. • The system disables the lower wattage power supply; the higher wattage supply powers the system.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0652
Doc: 3701

Table 1-5 Effects of Power Supply Configuration Changes (continued)

Higher or lower wattage power supply is inserted with redundancy disabled	• System log and syslog messages are generated. • System power is increased to the combined power capability of both supplies. • The modules marked as *power-deny* in the **show module** Status field are brought up if there is sufficient power.
Power supply is removed with redundancy enabled	• System log and syslog messages are generated. • If the power supplies are of equal wattage, there is no change in the module status because the power capability is unchanged. If the power supplies are of unequal wattage and the lower wattage supply is removed, there is no change in the module status. If the power supplies are of unequal wattage and the higher wattage supply is removed, the lower wattage power supply must be manually turned on. (The system had previously turned off the lower wattage power supply.)
Power supply is removed with redundancy disabled	• System log and syslog messages are generated. • System power is decreased to the power capability of one supply. • If there is not enough power for all previously powered-up modules, some modules are powered down and marked as *power-deny* in the **show module** Status field.
System is booted with power supplies of different wattage installed and redundancy enabled	• System log and syslog messages are generated. • The lower wattage supply is disabled.
System is booted with power supplies of equal or different wattage installed and redundancy disabled	• System log and syslog messages are generated. • System power equals the combined power capability of both supplies. • The system powers up as many modules as the combined capacity allows.

You can change the configuration of the power supplies to redundant or nonredundant at any time. If you switch from a redundant to a nonredundant configuration, both power supplies are enabled (even a power supply that was disabled because it was of a lower wattage than the other power supply). If you

change from a nonredundant to a redundant configuration, both power supplies are initially enabled, and if they are of the same wattage, remain enabled. If they are of different wattage, a syslog message displays and the lower wattage supply is disabled.

For additional information about the power management feature and individual module power consumption, refer to your software configuration guide.

Environmental Monitoring of the Power Supply

The environmental monitoring and reporting functions allow you to maintain normal system operation by resolving adverse environmental conditions prior to loss of operation.

The power supplies monitor their own internal temperature and voltages. In the event of excessive internal temperature, the power supply will shut down to prevent damage. When the power supply returns to a safe operating temperature, it will restart. In the event of an abnormal voltage on one or more outputs of the power supplies, the OUTPUT FAIL LED will light. Substantial overvoltage conditions can lead to a power supply shutdown.

The power supply front panel LEDs are described in Table 1-6.

For more information about the environmental monitoring feature, refer to your software configuration guide.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0653
Doc: 3701

Table 1-6 Power Supply Front Panel LEDs

LED	Description
INPUT OK	AC-input power supplies: • Green when the input voltage is OK (85 VAC or greater) • Off when the input voltage falls below 70 VAC or if the power supply shuts down DC-input power supplies: • Green when the input voltage is OK (–40.5 VDC or greater) • Off when the input voltage falls below –33 VDC or if the power supply shuts down
FAN OK	Green when the power supply fan is operating properly. Red when a power supply fan failure is detected.
OUTPUT FAIL	Red when there is a problem with one or more of the DC-output voltages of the power supply

Power Supply Fan Assembly

The power supplies have a built-in fan; air enters the front of the fan (power-input end) and exits through the back. An air dam keeps the airflow separate from the rest of the chassis, which is cooled by the system fan assembly.

Power supply fans are not field-replaceable; the power supply must be replaced. To replace a power supply, see the "Removing and Replacing the 1000 W, 1300 W, 2500 W, and 4000 W Power Supplies" section on page 5-20.

Cisco Catalyst Operating System Software Version 7.1(1) for the Catalyst 6000 and 4000 Series Switches

The Cisco Catalyst Operating System software Version 7.1(1) for the Supervisor Engine supports the Cisco Catalyst 6000 and Catalyst 4000 Series switches.

Hardware Supported

The system software version 7.1(1) supports all cards already previously supported by the Cisco Catalyst Operating System software on the Cisco Catalyst 6000 and Cisco Catalyst 4000 Series Supervisor Engines. In addition, the Catalyst Operating System software release 7.1.1 supports the following additional hardware modules:

Hardware Module	Description	Catalyst 6500 Module	Catalyst 4000 Module
WS-X6501-10GEX4	1-port 10-Gigabit Ethernet Module	X	
WS-X6524-100FX-MM	24-port 100BaseFX Ethernet Module	X	
WS-X4448-GB-RJ45	Catalsyt 4000 Family 48-port 10/100/1000 BASE-T Module		X

The Catalyst Operating System software release 7.1.1 also includes support for the Cisco 7603 Internet Router:

Hardware	Description
Cisco7603	Cisco 7603, 3-slot Chassis

Note: The Cisco 7603 Internet Router supports all Supervisor Engine configurations.

Software Features

The following software features all require Cisco Catalyst Operating System system software 7.1(1) for the Supervisor Engines.

Software Feature	Description	Catalyst 6000 Feature	Catalyst 4000 Feature
IEEE 802.3ad	Link Aggregation Control Protocol, (LACP) is defined in IEEE 802.3ad and allows Cisco switches to manage Ethernet channeling with devices that conform to the 802.3ad specification. LACP is similar to Cisco's proprietary implementation of EtherChannel, Port Aggregation Protocol (PAgP) which allows ports with similar characteristics to form a channel through dynamic negotiation with a partner system.	X	X
EE 802.1w/802.1s	The IEEE 802.1w specification, (Rapid Spanning Tree Protocol) provides for sub-second reconvergence of the Spanning Tree Protocol after failure of one of the uplinks in a bridged environment. 802.1w provides the structure on which the 802.1s feature operates. The IEEE 802.1s specification (MST - multiple Spanning Tree) allows a user to build multiple spanning trees over VLAN trunks. Fast convergence of the MST topology is achieved by using a modified version of the RSTP protocool.	X	X
BPDU Filtering Per Port	With Version 7.1(1) of the Catalyst Operating system, BPDU Filtering can now be applied on a per-port basis. BPDU Filtering (both ingress and egress) can now be enabled on any ports, including non-portfast-enabled and trunk ports.	X	
IGMP Snooping on Private VLANs	IGMP Snooping can be applied on a Private VLAN.	X	
IGMP Snooping Querier	This feature provides the ability to run IGMP Snooping in the absence of a multicast router. The switch then acts as an IGMP Querier.	X	
MP Filtering	IGMP Filtering enables the Catalyst 4000 to filter (permit or deny) IGMP packets by allowing the configuration of profiles of IP multicast groups. A profile consists of one or more ranges of IP multicast addresses which can then be filtered or monitored on a per switch port basis. The monitoring function of IGMP filtering enables administrators to track the time and duration that a port has been a member of an IP multicast group.		X
Option for No VTP	Enables a switch to not only be a non-participant in VTP, but also to drop all VTP traffic (unlike Transparent mode which passes VTP traffic) thus creating a VTP boundary.	X	X

Software Feature	Description	Catalyst 6000 Feature	Catalyst 4000 Feature
Portfast on Trunks	Allows portfast to be configured for trunk/channel ports. On link-up state, the port immediately transitions into Spanning Tree forwarding mode, bypassing listening and learning states. This feature is useful for direct connections to routers or servers.	X	X
Show Port MAC Address	Enables users to view the MAC address for each physical port on the switch from the switch's range of MAC addresses.	X	
Single Device Per Port Enhancement	Enables users to move hosts to different switch ports without the 10 minutes delay duration previously required by the port security feature implementation. The timer values can be set from a 1-minute minimum to 1440 minutes maximum.	X	
SMON-MIB VLAN Stats Support	Per-VLAN statistics (total packets, octets, nucast packets and nucast octets) are provided through the SMON VlanIdStatsTable of the SMON-MIB with Supervisor Engine 2 / MSFC2.	X	
MAC Address Notification	MAC Address Notification allows the network administrator to monitor the MAC addresses that are learned by the switch and those which are aged out or removed from the CAM table. Notifications can be sent to the administrator for both unicast and multicast addresses and include SNMPv2 traps or a history log of the change.		X
Various MIB Support	• CISCO-CATOS-ACL-QOS-MIB Enhancement	X

	• IEEE8023-LAG-MIB	X	X

Orderable Software Images

The following table lists the software versions and applicable ordering information for the Cisco Catalyst 6000 and Catalyst 4000 Series Supervisor Engine software. **Starting with version 7.1(1), The 'non-krypto' images will now be designated as K8 images, denoting weak encryption, where SNMPv3 and Kerberos telnet session data is encrypted.**

Caution: Always back up the switch configuration file before upgrading or downgrading the switch software to avoid losing all or part of the configuration stored in NVRAM. When downgrading switch software, you will lose your configuration. Use the **write network** command or the **copy config tftp** command to back up your configuration to a Trivial File Transfer Protocol (TFTP) server. Use the **copy config flash** command to back up the configuration to a Flash device.

When you enable QoS on the switch, the port buffers are divided into one or more individual queues. Each queue has one or more drop thresholds associated with it. The combination of multiple queues within a buffer, and the drop thresholds associated with each queue, allow the switch to make intelligent decisions when experiencing congestion. Traffic sensitive to jitter and delay variance, such as VoIP packets, can be moved to the head of the queue for transmission, while other less important or less sensitive traffic can be buffered or dropped.

Port Queue and Drop Threshold Types

When QoS is enabled, the multiple queues and drop thresholds on the Ethernet module switch ports are enabled. There are several different configurations of queue types and thresholds, depending on the model of the Ethernet module.

Ingress and egress scheduling are always based on the class-of-service (CoS) value associated with the frame. By default, higher CoS values are mapped to higher queue numbers. CoS 5 traffic, typically associated with VoIP traffic, is mapped to the strict priority queue, if present.

In addition to the different queues, each standard queue has one or more drop thresholds. There are two types of drop thresholds:

- *Tail-drop thresholds*—On ports with tail-drop thresholds, frames of a given CoS value are admitted to the queue until the drop threshold associated with that CoS value is exceeded; subsequent frames of that CoS value are discarded until the threshold is no longer exceeded.

  For example, if CoS 1 is assigned to queue 1, threshold 2, and the threshold 2 watermark is 60 percent, frames with CoS 1 will not be dropped until queue 1 is 60 percent full. All subsequent CoS 1 frames are dropped until the queue is less than 60 percent full.
- *WRED-drop thresholds*—On ports with WRED-drop thresholds, frames of a given CoS value are admitted to the queue based on a random probability designed to avoid buffer congestion. The probability of a frame with a given CoS being admitted to the queue or discarded depends on the weight and threshold assigned to that CoS value.

  For example, if CoS 2 is assigned to queue 1, threshold 2, and the threshold 2 watermarks are 40 percent (low) and 80 percent (high), frames with CoS 2 will not be dropped until queue 1 is at least 40 percent full. As the queue depth approaches 80 percent, frames with CoS 2 have an increasingly higher probability of being discarded rather than being admitted to the queue. When the queue is more than 80 percent full, all CoS 2 frames are dropped until the queue is less than 80 percent full. The frames that the switch discards when the queue level is between the low and high thresholds are picked at random, rather than on a per-flow or FIFO basis. This method works well with protocols such as TCP which are capable of adjusting to periodic packet drops by backing off and adjusting their transmission window size.

When referring to the individual queues and thresholds on a port, a terse nomenclature is used. This terminology describes the number of strict priority queues (if present), the number of standard queues, and the number of tail-drop or WRED thresholds within each of the standard queues. The different queue and threshold types on the Catalyst 6500 Series Ethernet modules are shown in Table 1.

Table 1 Receive and Transmit Port Queue and Drop Threshold Types on Catalyst 6500 Series Ethernet Modules

Port Queue and Drop Threshold Structure with QoS	Description
Receive Queues	
1q4t	One standard queue with four tail-drop thresholds
1p1q4t	One strict-priority queue, one standard queue with four tail-drop thresholds
1p1q0t	One strict-priority queue, one standard queue with one nonconfigurable (100%) tail-drop threshold
1p1q8t	One strict-priority queue, one standard queue with eight configurable WRED-drop thresholds and one nonconfigurable (100%) tail-drop threshold
Transmit Queues	
2q2t	Two standard queues with two tail-drop thresholds per queue
1p2q2t	One strict-priority queue, two standard queues with two WRED-drop thresholds per queue
1p3q1t	One strict-priority queue, three standard queues with one WRED-drop threshold and one nonconfigurable tail-drop threshold per queue
1p2q1t	One strict-priority queue, two standard queues with one WRED-drop threshold and one nonconfigurable (100%) tail-drop threshold per queue

Buffer Sizes, Queues, and Thresholds by Ethernet Module

Table 2 provides the following information for each of the Catalyst 6500 Series Ethernet modules:

- Total buffer size per port (Total buffer size)
- Overall receive buffer size per port (Rx buffer size)
- Overall transmit buffer size per port (Tx buffer size)
- Port receive queue and drop threshold structure (Rx port type)
- Port transmit queue and drop threshold structure (Tx port type)
- Default size of receive buffers per queue with QoS enabled (Rx queue sizes)
- Default size of transmit buffers per queue with QoS enabled (Tx queue sizes)

CHAPTER 6

Configuring EtherChannel

This chapter describes how to use the command-line interface (CLI) to configure EtherChannel on the Catalyst 6500 series switches. The configuration tasks in this chapter apply to Ethernet, Fast Ethernet, and Gigabit Ethernet switching modules and the uplink ports on the supervisor engine.

Note For complete syntax and usage information for the commands used in this chapter, refer to the *Catalyst 6500 Series Command Reference* publication.

This chapter consists of these sections:

- Understanding How EtherChannel Works, page 6-1
- Understanding EtherChannel Frame Distribution, page 6-2
- Port Aggregation Control Protocol and Link Aggregation Control Protocol, page 6-2
- EtherChannel Configuration Guidelines, page 6-3
- Understanding the Port Aggregation Protocol, page 6-5
- Configuring EtherChannel Using PAgP, page 6-7
- Understanding the Link Aggregation Control Protocol, page 6-12
- Configuring EtherChannel Using LACP, page 6-14

Note You can use the commands in the following sections on all Ethernet ports in the Catalyst 6500 series switches.

Understanding How EtherChannel Works

EtherChannel aggregates the bandwidth of up to eight compatibly configured ports into a single logical link. A Catalyst 6500 series switch supports a maximum of 128 EtherChannels. All Ethernet ports on all modules, including those on a standby supervisor engine, support EtherChannel with no requirement that ports be contiguous or on the same module. All ports in each EtherChannel must be the same speed.

Note With software releases 6.3(1) and later, due to the port ID handling by the spanning tree feature, the maximum supported number of EtherChannels is 126 for a 6- or 9-slot chassis and 63 for a 13-slot chassis.

RQS Nº 03/2005 - CN - CORREIOS
Fls: 0667
3701
Doc:

Note The network device to which a Catalyst 6500 series switch is connected may impose its own limits on the number of ports in an EtherChannel.

If a link within an EtherChannel fails, traffic previously carried over the failed link switches to the remaining links within the EtherChannel. Inbound broadcast and multicast packets on one link in an EtherChannel are blocked from returning on any other link of the EtherChannel.

You can configure EtherChannels as trunks. After a channel is formed, configuring any port in the channel as a trunk applies the configuration to all ports in the channel. Identically configured trunk ports can be configured as an EtherChannel.

Understanding EtherChannel Frame Distribution

EtherChannel distributes frames across the links in a channel by reducing part of the binary pattern formed from the addresses in the frame to a numerical value that selects one of the links in the channel.

EtherChannel frame distribution is based on a Cisco-proprietary hashing algorithm. The algorithm is deterministic; given the same addresses and session information, you always hash to the same port in the channel, preventing out-of-order packet delivery.

The address may be a source, a destination, or a combination of two IP addresses, two MAC addresses, or two TCP/UDP port numbers depending on the policy adopted through the **ip**, **mac**, or **session** options of the **set port channel all distribution** command. See the "Configuring EtherChannel Load Balancing" section on page 6-11 for detailed information.

Note The **set port channel all distribution session** command is supported on Supervisor Engine 2 only.

EtherChannel frame distribution is not configurable on all supervisor engines. Enter the **show module** command on a supervisor engine to determine if EtherChannel frame distribution is configurable on your switch. If the display shows the "Sub-Type" to be "L2 Switching Engine I WS-F6020," then EtherChannel frame distribution is not configurable on your Catalyst 6500 series switch; the switch uses source and destination Media Access Control (MAC) addresses.

EtherChannel frame distribution is configurable with all other switching engines. The default is to use source and destination IP addresses.

Port Aggregation Control Protocol and Link Aggregation Control Protocol

Port Aggregation Control Protocol (PAgP) and Link Aggregation Control Protocol (LACP) are two different protocols that allow ports with similar characteristics to form a channel through dynamic negotiation with adjoining switches. PAgP is a Cisco-proprietary protocol that can be run only on Cisco switches and those switches released by licensed vendors. LACP, which is defined in IEEE 802.3ad, allows Cisco switches to manage Ethernet channeling with devices that conform to the 802.3ad specification.

Note MAC address notification settings are ignored on PAgP and LACP EtherChannel ports.

To use PAgP, see the "Understanding the Port Aggregation Protocol" section on page 6-5. To use LACP, see the "Understanding the Link Aggregation Control Protocol" section on page 6-12.

EtherChannel Configuration Guidelines

If improperly configured, some EtherChannel ports are disabled automatically to avoid network loops and other problems. Follow these guidelines to avoid configuration problems.

Note Except where specifically differentiated, these guidelines apply to both PAgP and LACP.

These sections provide EtherChannel configuration guidelines:

- Guidelines for Port Configuration, page 6-3
- Guidelines for VLAN and Trunk Configuration, page 6-4
- EtherChannel Interaction with Other Features, page 6-4

Guidelines for Port Configuration

Follow these port configuration guidelines:

- You can have a maximum of eight compatibly configured ports per EtherChannel; the ports do not have to be contiguous or on the same module.

  Note To configure the EtherChannel across different modules, you must put the ports in the same administrative group using the **set port channel** *port_list admin_group* command.

- All ports in an EtherChannel must use the same protocol; you cannot run two protocols on one module.
- PAgP and LACP are not compatible; both ends of a channel must use the same protocol.

  Note Switches can be configured manually with PAgP on one side and LACP on the other side in the **on** mode.

- You can change the protocol at any time, but this change causes all existing EtherChannels to reset to the default channel mode for the new protocol.
- Configure all ports in an EtherChannel to operate at the same speed and duplex mode (full duplex only for LACP mode).
- Enable all ports in an EtherChannel. If you disable a port in an EtherChannel, it is treated as a link failure and its traffic is transferred to one of the remaining ports in the EtherChannel.
- A port cannot belong to more than one channel group at the same time.
- Ports with different port path costs, set by the **set spantree portcost** command, can form an EtherChannel as long as they are otherwise compatibly configured. Setting different port path costs does not, by itself, make ports incompatible for the formation of an EtherChannel.

RQS Nº 03/2005 - CN - CPMI - CORREIOS
Fls: 0668
Doc:
3791

- PAgP and LACP manage channels differently. When all the ports in a channel get disabled, PAgP removes them from its internal channels list; **show** commands do not display the channel. With LACP, when all the ports in a channel get disabled, LACP does not remove the channel; **show** commands continue to display the channel even though all its ports are down. To determine if a channel is actively sending and receiving traffic with LACP, use the **show port** command to see if the link is up or down.
- LACP does not support half-duplex links. If a port is in active/passive mode and becomes half duplex, the port is suspended (and a syslog message is generated). The port is shown as "connected" using the **show port** command and as "not connected" using the **show spantree** command. This discrepancy is because the port is physically connected but never joined spanning tree. To get the port to join spanning tree, either set the duplex to full or set the channel mode to off for that port.

  With software releases 7.3(1) and later, LACP behavior for half-duplex links has changed and affected ports are no longer suspended. Instead of suspending a port, LACP PDU transmission (if any) is suppressed. If the port is part of a channel, the port is detached from the channel but still functions as a nonchannel port. A syslog message is generated when this condition occurs. Normal LACP behavior is reenabled automatically when the link is set back to full duplex.

Guidelines for VLAN and Trunk Configuration

Follow these VLAN and trunk-related guidelines:

- Assign all ports in an EtherChannel to the same VLAN, or configure them as trunk ports.
- If you configure the EtherChannel as a trunk, configure the same trunk mode on all the ports in the EtherChannel. Configuring ports in an EtherChannel in different trunk modes can have unexpected results.
- An EtherChannel supports the same allowed range of VLANs on all the ports in a trunking EtherChannel. If the allowed range of VLANs is not the same for a port list, the ports do not form an EtherChannel even when set to the **auto** or **desirable** mode with the **set port channel** command.
- Do not configure the ports in an EtherChannel as dynamic VLAN ports. Doing so can adversely affect switch performance.
- Ports with different VLAN cost configurations cannot form a channel.

EtherChannel Interaction with Other Features

Follow these guidelines associated with EtherChannel's interaction with other features:

- An EtherChannel will not form with ports that have different GARP VLAN Registration Protocol (GVRP), GARP Multicast Registration Protocol (GMRP), and QoS configurations.
- An EtherChannel will not form with ports where the port security feature is enabled. You cannot enable the port security feature for ports in an EtherChannel.
- An EtherChannel will not form if one of the ports is a SPAN destination port.
- An EtherChannel will not form if protocol filtering is set differently on the ports.
- Cisco Discovery Protocol (CDP) runs on the physical port even after the port is added to a channel.
- VLAN Trunking Protocol (VTP) and Dual Ring Protocol (DRiP) run on the channel.
- During fast switchover to the standby supervisor engine, all channeling ports are cleared on its channeling configuration and state, and the links are pulled down temporarily to cause partner ports to reset. All ports are reset to the nonchanneling state.

- Ports with different dot1q port types cannot form a channel.
- Ports with different jumbo frame configurations cannot form a channel.
- Ports with different dynamic configurations cannot form a channel.
- During high-availability switchover to the standby supervisor engine, all channeling ports remain operational. Ports are reset only if there are events missing during the switchover.

Note With software releases 6.3(1) and later, a PAgP-configured EtherChannel is preserved even if it contains only one port (this does not apply to LACP-configured EtherChannels). In software releases prior to 6.3(1), traffic was disrupted when you removed a 1-port channel from spanning tree and then added it to spanning tree as an individual port.

Note With software releases 6.3(1) and later, due to the port ID handling by the spanning tree feature, the maximum number of EtherChannels is 126 for a 6- or 9-slot chassis and 63 for a 13-slot chassis.

Understanding the Port Aggregation Protocol

Note Use the information in these sections if you are configuring EtherChannel using PAgP. If you are using LACP, see the "Understanding the Link Aggregation Control Protocol" section on page 6-12.

These sections describe PAgP:

- PAgP Modes, page 6-5
- PAgP Administrative Groups, page 6-6
- PAgP EtherChannel IDs, page 6-7

PAgP Modes

PAgP facilitates the automatic creation of EtherChannels by exchanging packets between Ethernet ports. PAgP packets are exchanged only between ports in **auto** and **desirable** modes. Ports configured in **on** or **off** mode do not exchange PAgP packets. The protocol learns the capabilities of port groups dynamically and informs the other ports. After PAgP identifies correctly matched EtherChannel links, it groups the ports into an EtherChannel. The EtherChannel is then added to the spanning tree as a single bridge port.

EtherChannel includes four user-configurable modes: **on**, **off**, **auto**, and **desirable**. Only **auto** and **desirable** are PAgP modes. You can modify the **auto** and **desirable** modes with the **silent** and **non-silent** keywords. By default, ports are in **auto silent** mode.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0669
Fls: 3701
Doc:

Table 6-1 describes the EtherChannel modes available in PAgP.

Table 6-1 EtherChannel Modes Available in PAgP

Mode	Description
on	Mode that forces the port to channel without PAgP. With the **on** mode, a usable EtherChannel exists only when a port group in **on** mode is connected to another port group in **on** mode.
off	Mode that prevents the port from channeling.
auto	PAgP mode that places a port into a passive negotiating state, in which the port responds to PAgP packets it receives but does not initiate PAgP packet negotiation. (Default)
desirable	PAgP mode that places a port into an active negotiating state, in which the port initiates negotiations with other ports by sending PAgP packets.
silent	Keyword that is used with the **auto** or **desirable** mode when no traffic is expected from the other device to prevent the link from being reported to the Spanning Tree Protocol as down. (Default)
non-silent	Keyword that is used with the **auto** or **desirable** mode when traffic is expected from the other device.

Both the **auto** and **desirable** modes allow ports to negotiate with connected ports to determine if they can form an EtherChannel, based on criteria such as port speed, trunking state, and VLAN numbers.

Ports can form an EtherChannel when they are in different PAgP modes as long as the modes are compatible. For example:

- A port in **desirable** mode can form an EtherChannel successfully with another port that is in **desirable** or **auto** mode.
- A port in **auto** mode can form an EtherChannel with another port in **desirable** mode.
- A port in **auto** mode cannot form an EtherChannel with another port that is also in **auto** mode, because neither port will initiate negotiation.

When configurable, EtherChannel frame distribution can use MAC addresses, IP addresses, and Layer 4 port numbers. You can specify either the source or the destination address or both the source and destination addresses and Layer 4 port numbers. The mode you select applies to all EtherChannels configured on the switch. Use the option that provides the greatest variety in your configuration. For example, if the traffic on a channel is going to a single MAC address only, using source addresses, IP addresses, or Layer 4 port numbers as the basis for frame distribution may provide better frame distribution than selecting MAC addresses as the basis.

PAgP Administrative Groups

Configuring an EtherChannel creates an administrative group, designated by an integer between 1 and 1024, to which the EtherChannel belongs. When an administrative group is created, you can assign an administrative group number or let the next available administrative group number be assigned automatically. Forming a channel without specifying an administrative group number creates a new automatically numbered administrative group. An administrative group may contain a maximum of eight ports.

PAgP EtherChannel IDs

Each EtherChannel is automatically assigned a unique EtherChannel ID. Use the **show channel group** *admin_group* command to display the EtherChannel ID.

Configuring EtherChannel Using PAgP

These sections describe how to configure EtherChannel using PAgP:

- Specifying the EtherChannel Protocol, page 6-7
- Configuring an EtherChannel, page 6-8
- Setting the EtherChannel Port Mode, page 6-8
- Setting the EtherChannel Port Path Cost, page 6-8
- Setting the EtherChannel VLAN Cost, page 6-9
- Configuring EtherChannel Load Balancing, page 6-11
- Displaying EtherChannel Traffic Utilization, page 6-11
- Displaying Outgoing Ports for a Specified Address or Layer 4 Port Number, page 6-12
- Disabling an EtherChannel, page 6-12

Note Before you configure the EtherChannel, see the "EtherChannel Configuration Guidelines" section on page 6-3.

Specifying the EtherChannel Protocol

Note The default protocol is PAgP.

Note You can specify only one protocol, PAgP or LACP, per module.

To specify the EtherChannel protocol, perform this task in privileged mode:

Task	Command
Specify the EtherChannel protocol.	**set channelprotocol [pagp | lacp]** *mod*

This example shows how to specify the PAgP protocol for module 3:

```
Console> (enable) set channelprotocol pagp 3
Channeling protocol set to PAGP for module(s) 3.
Console> (enable)
```

RQS Nº 03/2005 - CN - CORREIOS
0670
Fls:
3701
Doc:

Configuring an EtherChannel

To configure EtherChannel on a group of Ethernet ports, perform this task in privileged mode:

Task	Command
Configure the EtherChannel on the desired ports.	**set port channel** *mod/ports...* [*admin_group*] **set port channel** *mod/ports...* **mode** {**on** | **off** | **desirable** | **auto**} [**silent** | **non-silent**]

This example shows how to configure a seven-port EtherChannel in a new administrative group:

```
Console> (enable) set port channel 2/2-8 mode desirable
Ports 2/2-8 left admin_group 1.
Ports 2/2-8 joined admin_group 2.
Console> (enable)
```

Setting the EtherChannel Port Mode

To set a port's EtherChannel mode, perform this task in privileged mode:

Task	Command
Set a port's EtherChannel mode.	**set port channel** *mod/ports...* [*admin_group*] **set port channel** *mod/port* **mode** {**on** | **off** | **desirable** | **auto**} [**silent** | **non-silent**]

This example shows how to set port 2/1 to **auto** mode:

```
Console> (enable) set port channel 2/1 mode auto
Ports 2/1 channel mode set to auto.
Console> (enable)
```

Setting the EtherChannel Port Path Cost

Note You accomplish this task using a global command that configures both LACP and PAgP.

The channel path cost is achieved by adjusting the port costs of each port belonging to the channel. If you do not specify the cost, it is updated based on the current port costs of the channeling ports. You may address one channel or all channels.

To set the EtherChannel port path cost, perform this task in privileged mode:

	Task	Command
Step 1	Use the administrative group number to display the EtherChannel ID.	**show channel group** *admin_group* or **show lacp-channel group** *admin_key*
Step 2	Use the EtherChannel ID to set the EtherChannel port path cost.	**set spantree channelcost** {*channel_id* | **all**} *cost*

Note When you enter the **set spantree channelcost** command, it does not appear in the configuration file. The command causes a "set spantree portcost" entry to be created for each port in the channel. See the "Configuring the PVST+ Port Cost" section in Chapter 8, "Configuring Spanning Tree," for information on using the **set spantree portcost** command.

This example shows how to set the EtherChannel port path cost for channel ID 768:

```
Console> (enable) show channel group 20
Admin Port  Status     Channel   Channel
group                  Mode      id
----- ----- ---------- --------- --------
  20    1/1 notconnect on            768
  20    1/2 connected  on            768

Admin Port  Device-ID                          Port-ID                   Platform
group
----- ----- -------------------------------- ------------------------- ----------
  20    1/1
  20    1/2  066510644(cat26-lnf(NET25))      2/1                       WS-C6009
Console> (enable)

Console> (enable) set spantree channelcost 768 12
Port(s) 1/1,1/2 port path cost are updated to 31.
Channel 768 cost is set to 12.
Warning:channel cost may not be applicable if channel is broken.
Console> (enable)
```

Setting the EtherChannel VLAN Cost

Note You accomplish this task using a global command that configures both LACP and PAgP.

The EtherChannel VLAN cost feature provides load balancing of VLAN traffic across multiple channels configured with trunking.

You enter the **set spantree channelvlancost** command to set the initial spanning tree costs for all VLANs in the channel. The **set spantree channelvlancost** command provides an alternate cost for some of the VLANs in the channel (assuming you are trunking across the channel). This command allows you to have up to two different spanning tree costs assigned per channel; some VLANs in the channel can have the "vlancost" while the remaining VLANs in the channel have the "cost."

RQS Nº 03/2005 - CN - CPMI - CORREIOS
0671
Fls:
3701
Doc:

The **set spantree channelvlancost** command creates a "set spantree portvlancost" entry to the configuration file for each port in the channel. Once you have entered the **set spantree channelvlancost** command, you must enter the **set spantree portvlancost** command for at least one port in the channel, specifying the VLAN or VLANs that you want associated with each port. The following examples show what occurs when each command is entered:

```
Console> (enable) set spantree channelvlancost 856 10
Port(s) 3/47-48 vlan cost are updated to 16.
Channel 856 vlancost is set to 10.
```

The following commands are added to the configuration file:

- **set spantree portvlancost 3/47 cost 16**
- **set spantree portvlancost 3/48 cost 16**

Now you have to add the desired VLANs to the above created commands by entering the following:

```
Console> (enable) set spantree portvlancost 3/47 cost 16 1-1005
Port 3/47 VLANs 1025-4094 have path cost 19.
Port 3/47 VLANs 1-1005 have path cost 16.
Port 3/48 VLANs 1-1005 have path cost 16.
```

To set the EtherChannel VLAN cost, perform this task in privileged mode:

	Task	Command
Step 1	Use the administrative group number to display the EtherChannel ID.	**show channel group** *admin_group* or **show lacp-channel group** *admin_key*
Step 2	Use the EtherChannel ID to set the EtherChannel VLAN cost.	**set spantree channelvlancost** *channel_id cost*
Step 3	Configure the port cost for the desired VLANs on each port.	**set spantree portvlancost** {*mod/port*} [**cost** *cost*] [*vlan_list*]

This example shows how to set the EtherChannel VLAN cost for channel ID 856:

```
Console> (enable) show channel group 22
Admin Port  Status     Channel   Channel
group                  Mode      id
----- ----- ---------- --------- --------
  22    1/1 notconnect on            856
  22    1/2 connected  on            856

Admin Port  Device-ID                          Port-ID                   Platform
group
----- ----- -------------------------------- ------------------------- ----------
  22    1/1
  22    1/2  066510644(cat26-lnf(NET25))      2/1                        WS-C6009
Console> (enable)

Console> (enable) set spantree channelvlancost 856 10
Port(s) 3/47-48 vlan cost are updated to 16.
Channel 856 vlancost is set to 10.
Console> (enable) set spantree portvlancost 3/47 cost 16 1-1005
Port 3/47 VLANs 1025-4094 have path cost 19.
Port 3/47 VLANs 1-1005 have path cost 16.
Port 3/48 VLANs 1-1005 have path cost 16.
Console> (enable)
```

Configuring EtherChannel Load Balancing

The load-balancing policy (frame distribution) can be based on a MAC address (Layer 2), an IP address (Layer 3), or a port number (Layer 4). These policies can be activated, respectively, by the **mac**, **ip** and **session** keywords. The load balancing can be based solely on the source address (**source** keyword), destination address (**destination** keyword), or both source and destination addresses (**both** keyword).

If a packet does not belong to a selected category, the next lower level category is considered. If the hardware cannot support the frame distribution method selected, a "Feature not supported" error message is displayed.

To configure EtherChannel load balancing, perform this task in privileged mode:

Task	Command
Configure EtherChannel load balancing.	**set port channel all distribution** {**ip** | **mac** | **session**} [**source** | **destination** | **both**]

Note The **set port channel all distribution session** command option is supported on Supervisor Engine 2 only.

This example shows how to configure EtherChannel to use MAC source addresses:

```
Console> (enable) set port channel all distribution mac source
Channel distribution is set to mac source.
Console> (enable)
```

Displaying EtherChannel Traffic Utilization

To display the traffic utilization on the EtherChannel ports, perform this task:

Task	Command
Display traffic utilization.	**show channel traffic**

This example shows how to display traffic utilization on EtherChannel ports:

```
Console> (enable) show channel traffic
ChanId Port  Rx-Ucst Tx-Ucst Rx-Mcst Tx-Mcst Rx-Bcst Tx-Bcst
------ ----- ------- ------- ------- ------- ------- -------
   808  2/16   0.00%   0.00%  50.00%  75.75%   0.00%   0.00%
   808  2/17   0.00%   0.00%  50.00%  25.25%   0.00%   0.00%
   816  2/31   0.00%   0.00%  25.25%  50.50%   0.00%   0.00%
   816  2/32   0.00%   0.00%  75.75%  50.50%   0.00%   0.00%
Console> (enable)
```

Displaying Outgoing Ports for a Specified Address or Layer 4 Port Number

To display the outgoing port used in an EtherChannel for a specific address or Layer 4 port number, perform this task:

Task	Command
Display the outgoing port for a specified address or Layer 4 port number.	**show channel hash** *channel_id src_ip_addr* [*dest_ip_addr*] | *dest_ip_address* | *src_mac_addr* [*dest_mac_addr*] | *dest_mac_addr* | *src_port dest_port* | *dest_port*

This example shows how to display the outgoing port for the specified source and destination IP addresses:

```
Console> (enable) show channel hash 808 172.20.32.10 172.20.32.66
Selected channel port:2/17
Console> (enable)
```

Disabling an EtherChannel

To disable an EtherChannel, perform this task in privileged mode:

Task	Command
Disable an EtherChannel.	**set port channel** *mod/port* **mode off**

This example shows how to disable an EtherChannel:

```
Console> (enable) set port channel 2/2-8 mode off
Ports 2/2-8 channel mode set to off.
Console> (enable)
```

Understanding the Link Aggregation Control Protocol

Note Use the information in these sections if you are configuring EtherChannel using LACP. If you are using PAgP, see the "Understanding the Port Aggregation Protocol" section on page 6-5.

This section contains the following descriptions:

- LACP Modes, page 6-13
- LACP Parameters, page 6-13

LACP Modes

You may manually turn on channeling by setting the port channel mode to **on**, and you may turn off channeling by setting the port channel mode to **off**.

If you want LACP to handle channeling, use the **active** and **passive** channel modes. To start automatic EtherChannel configuration with LACP, you need to configure at least one end of the link to **active** mode to initiate channeling, because ports in **passive** mode passively respond to initiation and never initiate the sending of LACP packets.

Table 6-2 describes the EtherChannel modes available in LACP.

Table 6-2 EtherChannel Modes Available in LACP

Mode	Description
on	Mode that forces the port to channel without LACP. With the **on** mode, a usable EtherChannel exists only when a port group in **on** mode is connected to another port group in **on** mode.
off	Mode that prevents the port from channeling.
passive	LACP mode that places a port into a passive negotiating state, in which the port responds to LACP packets it receives but does not initiate LACP packet negotiation. (Default)
active	LACP mode that places a port into an active negotiating state, in which the port initiates negotiations with other ports by sending LACP packets.

LACP Parameters

The parameters used in configuring LACP are as follows:

- System priority

  Each switch running LACP must be assigned a system priority that can be specified automatically or through the CLI (see the "Specifying the System Priority" section on page 6-15). The system priority is used with the switch MAC address to form the system ID and is also used during negotiation with other systems.

- Port priority

  Each port in the switch must be assigned a port priority that can be specified automatically or through the CLI (see the "Specifying the Port Priority" section on page 6-15). The port priority is used with the port number to form the port identifier. The port priority is used to decide which ports should be put in standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.

- Administrative key

  Each port in the switch must be assigned an administrative key value that can be specified automatically or through the CLI (see the "Specifying an Administrative Key Value" section on page 6-16). The ability of a port to aggregate with other ports is defined with the administrative key. A port's ability to aggregate with other ports is determined by these factors:

  - Port physical characteristics, such as data rate, duplex capability, and point-to-point or shared medium
  - Configuration constraints that you establish

RQS Nº 03/2005 - CN
CPMI - 6-13 OS
0673
Fls:
Doc: 3701

When enabled, LACP always tries to configure the maximum number of compatible ports in a channel, up to the maximum allowed by the hardware (eight ports). If LACP is not able to aggregate all the ports that are compatible (for example, the remote system might have more restrictive hardware limitations), then all the ports that cannot be actively included in the channel are put in hot standby state and are used only if one of the channeled ports fails.

You can configure different channels with ports that have been assigned the same administrative key. For example, if eight ports are assigned the same administrative key, you may configure four ports in a channel using LACP **active** mode and the remaining four ports in a manually configured channel using the **on** mode. An administrative key is meaningful only in the context of the switch that allocates it; there is no global significance to administrative key values.

Configuring EtherChannel Using LACP

These sections describe how to configure EtherChannel using LACP:

- Specifying the EtherChannel Protocol, page 6-14
- Specifying the System Priority, page 6-15
- Specifying the Port Priority, page 6-15
- Specifying an Administrative Key Value, page 6-16
- Changing the Channel Mode, page 6-17
- Specifying the Channel Path Cost, page 6-17
- Specifying the Channel VLAN Cost, page 6-17
- Configuring Channel Load Balancing, page 6-17
- Clearing LACP Statistics, page 6-18
- Displaying EtherChannel Traffic Utilization, page 6-18
- Displaying Outgoing Ports for a Specified Address or Layer 4 Port Number, page 6-18
- Disabling an EtherChannel, page 6-19
- Displaying Spanning Tree-Related Information for EtherChannels, page 6-19

Note Before you configure the EtherChannel, see the "EtherChannel Configuration Guidelines" section on page 6-3.

Specifying the EtherChannel Protocol

Note The default protocol is PAgP.

Note You can specify only one protocol, PAgP or LACP, per module.

To specify the EtherChannel protocol, perform this task in privileged mode:

Task	Command
Specify the EtherChannel protocol.	**set channelprotocol [pagp | lacp]** *mod*

This example shows how to specify the LACP protocol for modules 2 and 3:

```
Console> (enable) set channelprotocol lacp 2,3
Mod 2 is set to LACP protocol.
Mod 3 is set to LACP protocol.
Console> (enable)
```

Use the **show channelprotocol** command to display the protocols for all modules.

Specifying the System Priority

Note Although this command is a global option, the command applies only to modules on which LACP is enabled; it is ignored on modules running PAgP.

The system priority value must be a number in the range of 1 through 65535, where higher numbers represent lower priority. The default priority is 32768.

To specify the system priority, perform this task in privileged mode:

Task	Command
Specify the system priority.	**set lacp-channel system-priority** *value*

This example shows how to specify the system priority as 20000:

```
Console> (enable) set lacp-channel system-priority 20000
LACP system priority is set to 20000
Console> (enable)
```

Use the **show lacp-channel sys-id** command to display the LACP system ID and system priority.

pecifying the Port Priority

The port priority value must be a number in the range of 1 through 255, where higher numbers represent lower priority. The default priority is 128.

To specify the port priority, perform this task in privileged mode:

Task	Command
Specify the port priority.	**set port lacp-channel** *mod/ports* **port-priority** *value*

ROS-Nº 03/2005 - CN
CPMI - 6.15 OS
0674
Fls:
3701
Doc:

This example shows how to specify the port priority as 10 for ports 1/1 to 1/4 and 2/6 to 2/8:

```
Console> (enable) set port lacp-channel 1/1-4,2/6-8 port-priority 10
Port(s) 1/1-4,2/6-8 port-priority set to 10.
Console> (enable)
```

Use the **show lacp-channel group** *admin_key* **info** command to display the port priority.

Specifying an Administrative Key Value

Note When the system or module configuration information stored in NVRAM is cleared, the administrative keys are assigned new values automatically. For modules, each group of four consecutive ports, beginning at the 1st, 5th, 9th and so on, are assigned a unique administrative key. Across the module, ports must have unique administrative keys. After NVRAM is cleared, the channel mode of the ports is set to "passive."

You can specify an administrative key value to a set of ports or the system automatically selects a value if you do not specify the parameter *admin_key*. In both cases, the admin_key value can range from 1 through 1024.

If you choose a value for the administrative key, and this value has already been used in the system, then all the ports originally associated with the previously assigned admin_key value are moved to another automatically assigned value, and the modules and ports that you specified in the command are assigned the admin_key value that you specified.

The maximum number of ports to which an administrative key can be assigned is eight.

The default mode for all ports being assigned the administrative key is passive. However, if the channel was previously assigned a particular mode (see the "Changing the Channel Mode" section on page 6-17), assigning the administrative key will not affect it,and the channel mode that you specified previously is maintained.

To specify the administrative key value, perform this task in privileged mode:

Task	Command
Specify the administrative key value.	**set port lacp-channel** *mod/ports* [*admin_key*]

This example shows how to assign ports 4/1 to 4/4 the same administrative key, with the system picking its value automatically:

```
Console> (enable) set port lacp-channel 4/1-4
Port(s) 4/1-4 are assigned to admin key 96.
Console> (enable)
```

This example shows how to assign ports 4/4 to 4/6 the administrative key 96 (you specify the 96). In this example, the administrative key was previously assigned to another group of ports by the system (see the previous example):

```
Console> (enable) set port lacp-channel 4/4-6 96
Port(s) 4/1-3 are moved to admin key 97.
Port(s) 4/4-6 are assigned to admin key 96.
Console> (enable)
```

This example shows the system response when more than eight ports are assigned the same administrative key value (the request is denied, and no ports are assigned administrative key 123):

```
Console> (enable) set port lacp-port channel 2/1-2,4/1-8 123
No more than 8 ports can be assigned to an admin key.
Console> (enable)
```

Use the **show lacp-channel group** command to display administrative key values for ports.

Changing the Channel Mode

You can change the channel mode for a set of ports that were previously assigned the same administrative key (see the "Specifying an Administrative Key Value" section on page 6-16).

To change the channel mode, perform this task in privileged mode:

Task	Command
Change the channel mode.	**set port lacp-channel** *mod/ports* **mode [on | off | active | passive]**

This example shows how to change the channel mode for ports 4/1 and 4/6, setting it to **on**. The administrative key for ports 4/1 and 4/6 is unchanged.

```
Console> (enable) set port lacp-channel 4/1,4/6 mode on
Port(s) 4/1,4/6 channel mode set to on.
Console> (enable)
```

Use the **show lacp-channel group** *admin_key* command to display the channel mode for ports.

Specifying the Channel Path Cost

You can accomplish this task using a global command that configures both LACP and PAgP. For more information, see the "Setting the EtherChannel Port Path Cost" section on page 6-8.

Specifying the Channel VLAN Cost

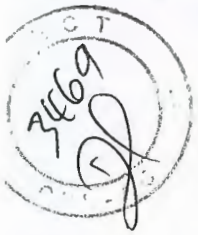
You can accomplish this task using a global command that configures both LACP and PAgP. For more information, see the "Setting the EtherChannel VLAN Cost" section on page 6-9.

Configuring Channel Load Balancing

You can accomplish this task using a global command that configures both LACP and PAgP. For more information, see the "Configuring EtherChannel Load Balancing" section on page 6-11.

RQS Nº 03/2005 - CN - CPMI - CORREIOS
Fls: 0675
Doc: 3701

Clearing LACP Statistics



To clear LACP statistics, perform this task in privileged mode:

Task	Command
Clear LACP statistics.	**clear lacp-channel statistics**

This example shows how to clear LACP statistics:

```
Console> (enable) clear lacp-channel statistics
LACP channel counters are cleared.
Console> (enable)
```

Displaying EtherChannel Traffic Utilization

To display the traffic utilization on the EtherChannel ports, perform this task:

Task	Command
Display traffic utilization.	**show lacp-channel traffic**

This example shows how to display traffic utilization on EtherChannel ports:

```
Console> (enable) show lacp-channel traffic
ChanId Port  Rx-Ucst Tx-Ucst Rx-Mcst Tx-Mcst Rx-Bcst Tx-Bcst
------ ----- ------- ------- ------- ------- ------- -------
   808  2/16   0.00%   0.00%  50.00%  75.75%   0.00%   0.00%
   808  2/17   0.00%   0.00%  50.00%  25.25%   0.00%   0.00%
   816  2/31   0.00%   0.00%  25.25%  50.50%   0.00%   0.00%
   816  2/32   0.00%   0.00%  75.75%  50.50%   0.00%   0.00%
Console> (enable)
```

Displaying Outgoing Ports for a Specified Address or Layer 4 Port Number

To display the outgoing port used in an EtherChannel for a specific address or Layer 4 port number, perform this task:

Task	Command
Display the outgoing port for a specified address or Layer 4 port number.	**show lacp-channel hash** *channel_id src_ip_addr* [*dest_ip_addr*] | *dest_ip_address* | *src_mac_addr* [*dest_mac_addr*] | *dest_mac_addr* | *src_port dest_port* / *dest_port*

This example shows how to display the outgoing port for the specified source and destination IP addresses:

```
Console> (enable) show lacp-channel hash 808 172.20.32.10 172.20.32.66
Selected channel port:2/17
Console> (enable)
```

ECT 3468 CPL AC

Disabling an EtherChannel

To disable an EtherChannel, perform this task in privileged mode:

Task	Command
Disable an EtherChannel.	**set port lacp-channel** *mod/port* **mode off**

This example shows how to disable an EtherChannel:

```
Console> (enable) set port lacp-channel 2/2-8 mode off
Port(s) 2/2-8 channel mode set to off.
Console> (enable)
```

Displaying Spanning Tree-Related Information for EtherChannels

You can display the channel ID and the truncated port list for all ports that are channeling. Ports that are not channeling are identified by their port number.

To display spanning tree-related information for EtherChannels, perform this task:

Task	Command
Display spanning-tree related information for EtherChannels.	**show spantree** *mod/port*

These examples show how to display spanning tree-related information for EtherChannels:

```
Console> show spantree 4/6
Port                     Vlan Port-State    Cost  Priority Portfast   Channel_id
------------------------ ---- ------------- ----- -------- ---------- ----------
 4/6                     1    not-connected     4       32 disabled   0
Console>

Console> show spantree 4/7
Port                     Vlan Port-State    Cost  Priority Portfast   Channel_id
------------------------ ---- ------------- ----- -------- ---------- ----------
4/7-8                    1    blocking          3       32 disabled   770
Console>
```

Cisco Content Switching Module for the Cisco Catalyst 6500 and Cisco 7600 Internet Router

Product Overview

The Cisco Content Switching Module (CSM) is a Cisco Catalyst 6500 line card that balances client traffic to farms of servers, firewalls, SSL devices, caches, or VPN termination devices. The Cisco CSM provides a high-performance, cost-effective load balancing solution for enterprise and Internet Service Provider (ISP) networks. The Cisco CSM meets the demands of high-speed Content Delivery Networks by tracking network sessions and server load conditions in real time and directing each session to the most appropriate server. Fault tolerant Cisco CSM configurations maintain full state information and provide true hitless failover required for mission-critical functions.

The Cisco CSM provides the following key benefits:

- Market-leading performance

  Establishes up to 160,000 Layer 4 connections per second (performance may vary based upon software versions being run) and provides high-speed content switching, while maintaining 1 million concurrent connections.

- Outstanding price/performance value for enterprises and ISPs

  Features a low connection cost and occupies a small footprint. The Cisco CSM slides into a slot in a new or existing Cisco Catalyst 6500 and enables all ports in the Cisco Catalyst 6500 for layer 4 through layer 7 content switching. Multiple Cisco CSMs can be installed in the same Cisco Catalyst 6500.

- Ease of configuration

  Uses the same Cisco IOS Command Line Interface (CLI) that is used to configure the Cisco Catalyst 6500 Switch.

Key Features and Benefits

Firewall Load Balancing

The Cisco CSM allows you to scale firewall protection by distributing traffic across multiple firewalls on a per-connection basis, while ensuring that all packets belonging to a particular connection go through the same firewall. The Cisco CSM supports both stealth and regular firewalls.

URL and Cookie-based Load Balancing

The Cisco CSM allows full regular expression pattern matching for policies based on URLs, cookies, and HTTP header fields. The Cisco CSM supports any URL or cookie format allowing it to load balance existing Web content without requiring URL/cookie format changes.

High Performance

The Cisco CSM performs up to 160,000 new Layer 4 TCP connection setups per second (performance may vary based upon software versions being run). These connections can be spread across 4096 virtual services (16,384 real servers) and all of the ports in a Cisco Catalyst 6500, or they can be focused on a single port. This provides a benefit over competitors who use distributed architectures that require all of the ports to be used in order to gain maximum performance.

Network Configurations

The Cisco CSM supports many different network topology types. A Cisco CSM can operate in a mixed bridged and routed configuration, allowing traffic to flow from the client side to the server side on the same or on different IP subnets.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1
Fls: 0678
Doc: 3701

IP Protocol Support

The Cisco CSM accommodates a wide range of common IP protocols—including TCP, User Datagram Protocol (UDP). Additionally, the Cisco CSM supports higher-level protocols, including Hypertext Transfer Protocol (HTTP), File Transfer Protocol (FTP), Telnet, Dynamic Name Server (DNS), and Simple Mail Transfer Protocol (SMTP). The Cisco CSM also can handle UDP fragments and assemble them, regardless of the order in which they were received.

User Session Stickiness

Whenever encryption or e-commerce is involved, it is important that the end user is consistently directed to the same server—that is, the server where the user's shopping cart is located or the encryption tunnel terminates. The Cisco CSM's User Session Stickiness provides the ability to consistently bring users back to the same server-based on Secure Socket Layer (SSL) session ID, IP address, cookie, or HTTP redirection.

Load Balancing Algorithms

The Cisco CSM supports the following load balancing algorithms:

- Round robin
- Weighted round robin
- Least connections
- Weighted least connections
- Source and/or destination IP hash (subnet mask also configurable)
- URL hashing

Quality of Service

Providing differentiated levels of service to end users is important when generating revenue from content. The Cisco CSM leverages the robust QoS of the Cisco Catalyst 6500, enabling traffic differentiation as follows:

- Correctly prioritizes packets based on Layer 7 rules
- Directs users who are paying more for services to faster or less loaded servers

High Availability

The Cisco CSM continually monitors server and application availability using Health Monitoring probes, Inband health monitoring, return code checking, scriptable health checks and the Dynamic Feedback Protocol (DFP). SNMP server health traps can also be configured to monitor real server, virtual server, and fault tolerant state changes. When a real server or gateway failure occurs, the Cisco CSM redirects traffic to a different location. Servers can be added and removed without disrupting service. Systems can easily be scaled up or down.

Connection Redundancy

Optionally, two Cisco CSMs can be configured in a fault-tolerant configuration to share state information about user sessions and provide connection redundancy. In the event the active Cisco CSM fails, open connections are handled by the standby Cisco CSM without interruption, and users will experience hitless failover—an important requirement for e-commerce sites and sites where encryption is used.

Global Server Load Balancing

Global Server load Balancing (GSLB) is used as a method to enhance the user experience by distributing content geographically for efficient delivery of content and additionally for disaster recovery. The Cisco CSM employs GSLB technology to communicate directly with Cisco Distributed Director in both global and geographical load balanced environments. The Cisco CSM GSLB functionality can be configured to act as an authoritative DNS, which lets it collect load information from other Cisco CSMs in the network. This information is then used to load balance incoming traffic across

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0679
3701
Doc:

the geographically dispersed Cisco CSMs. The Cisco CSM can also interoperate with the Global Site Selector (GSS) by acting as the authoritative DNS and feeding it load information for its virtual IPs. An additional software feature license is required to enable GSLB support in the Cisco CSM.

Specifications

Hardware

Table 21-124: Specifications for the Cisco Content Switching Module

Description	Specification
Configuration limits	256 total VLANs (client and server) 4,000 virtual servers 4,000 server farms 16,000 real servers 4,000 probes 16,000 access control list (ACL)
Performance—connections	1,000,000 concurrent TCP connections 160,000 connection setups per second-Layer 4 [1] 80,000 connection setups per second-Layer 7 [1]
Performance—throughput	4 Gigabits-per-second total combined (client-to-server and server-to-client)
Platform requirements	Native Cisco IOS Software only Multilayer switch feature card—MSFC or MSFC2 Functions as a "classic" line card, not fabric enabled
Physical specifications	Occupies a slot in the Cisco Catalyst 6500 chassis Dimensions (H x W x D): 1.2 x 14.4 x 16 in. (3.0 x 35.6 x 40.6 cm) Weight: 5 lb. (2.27 kg)

CHAPTER 43

Configuring QoS

This chapter describes how to configure quality of service (QoS) on the Catalyst 6500 series switches and includes the configuration information that is required to support Common Open Policy Service (COPS) and Resource ReSerVation Protocol (RSVP).

Note

- For complete syntax and usage information for the commands used in this chapter, refer to the *Catalyst 6500 Series Switch Command Reference* publication.
- For information on using automatic QoS, see Chapter 44, "Using Automatic QoS."

You can configure QoS using one of the following:

- SNMP
- COPS protocol
- RSVP null service template and receiver proxy functionality
- Command-line interface (CLI)

This chapter consists of these sections:

- Understanding How QoS Works, page 43-1
- QoS Default Configuration, page 43-30
- Configuring QoS on the Switch, page 43-34

Understanding How QoS Works

Note

- Throughout this publication and all Catalyst 6500 series documents, the term "QoS" refers to the QoS feature as implemented on the Catalyst 6500 series.
- Supervisor Engine 1 and Supervisor Engine 2 provide policing only for ingress traffic.

Typically, networks operate on a *best-effort* delivery basis, which means that all traffic has equal priority and an equal chance of being delivered in a timely manner. When congestion occurs, all traffic has an equal chance of being dropped.

RQS Nº 03/2005 - CN - CPMI - CORREIOS

Fls: 0683

Doc: 3701

The QoS feature on the Catalyst 6500 series switches selects network traffic, prioritizes it according to its relative importance, and provides priority-indexed treatment through congestion avoidance techniques. Implementing QoS in your network makes network performance more predictable and bandwidth utilization more effective.

QoS sets Layer 2 and Layer 3 values in network traffic to a configured value or to a value based on received Layer 2 or Layer 3 values. IP traffic retains the Layer 3 value when it leaves the switch.

These sections describe QoS:

- QoS Terminology, page 43-2
- Flowcharts, page 43-4
- QoS Feature Set Summary, page 43-9
- Ethernet Ingress Port Marking, Scheduling, Congestion Avoidance, and Classification, page 43-10
- Classification, Marking, and Policing with a Layer 3 Switching Engine, page 43-16
- Classification and Marking with a Layer 2 Switching Engine, page 43-26
- Ethernet Egress Port Scheduling, Congestion Avoidance, and Marking, page 43-27
- QoS Statistics Data Export, page 43-30

QoS Terminology

This section defines some QoS terminology:

- *Packets* carry traffic at Layer 3.
- *Frames* carry traffic at Layer 2. Layer 2 frames carry Layer 3 packets.
- *Labels* are prioritization values that are carried in packets and frames:
  - Layer 2 class of service (CoS) values range between zero for low priority and seven for high priority:

    Layer 2 Inter-Switch Link (ISL) frame headers have a 1-byte User field that carries an IEEE 802.1p CoS value in the three least significant bits.

    Layer 2 802.1Q frame headers have a 2-byte Tag Control Information field that carries the CoS value in the three most significant bits, which are called the User Priority bits.

    Other frame types cannot carry CoS values.

    Note On ports that are configured as ISL trunks, all traffic is in ISL frames. On ports that are configured as 802.1Q trunks, all traffic is in 802.1Q frames except for traffic in the native VLAN.

  - Layer 3 IP precedence values—The IP version 4 specification defines the three most significant bits of the 1-byte Type of Service (ToS) field as IP precedence. IP precedence values range between 0 for low priority and 7 for high priority.

- Layer 3 differentiated services code point (DSCP) values—The Internet Engineering Task Force (IETF) defines the six most significant bits of the 1-byte ToS field as the DSCP. The priority represented by a particular DSCP value is configurable. DSCP values range between 0 and 63 (for more information, see the "Configuring DSCP Value Maps" section on page 43-61).

Note Layer 3 IP packets can carry either an IP precedence value or a DSCP value. QoS supports the use of either value, because DSCP values can be set equal to IP precedence values.

- *Classification* is the selection of traffic to be marked.
- *Marking*, according to RFC 2475, is the process of setting a Layer 3 DSCP value in a packet; in this publication, the definition of marking is extended to include setting Layer 2 CoS values.
- *Scheduling* is the assignment of traffic to a queue. QoS assigns traffic based on CoS values.
- *Congestion avoidance* is the process by which QoS reserves ingress and egress port capacity for traffic with high-priority CoS values. QoS implements congestion avoidance with CoS value-based drop thresholds. A drop threshold is the percentage of buffer utilization at which traffic with a specified CoS value is dropped, leaving the buffer available for traffic with higher-priority CoS values.
- *Policing* is the process by which the switch limits the bandwidth that is consumed by a flow of traffic. Policing can mark or drop traffic.
- Except where specifically differentiated, *Layer 3 switching engine* refers to either of the following:
  - Supervisor Engine 2 with Layer 3 Switching Engine II (Policy Feature Card 2 or PFC2)
  - Supervisor Engine 1 with Layer 3 Switching Engine WS-F6K-PFC (Policy Feature Card or PFC)
- Random early detection (RED) is a drop threshold algorithm.
- Weighted random early detection (WRED) is a drop threshold algorithm.
- Weighted round robin (WRR) is a dequeuing algorithm.
- Deficit weighted round robin (DWRR) is a dequeuing algorithm.

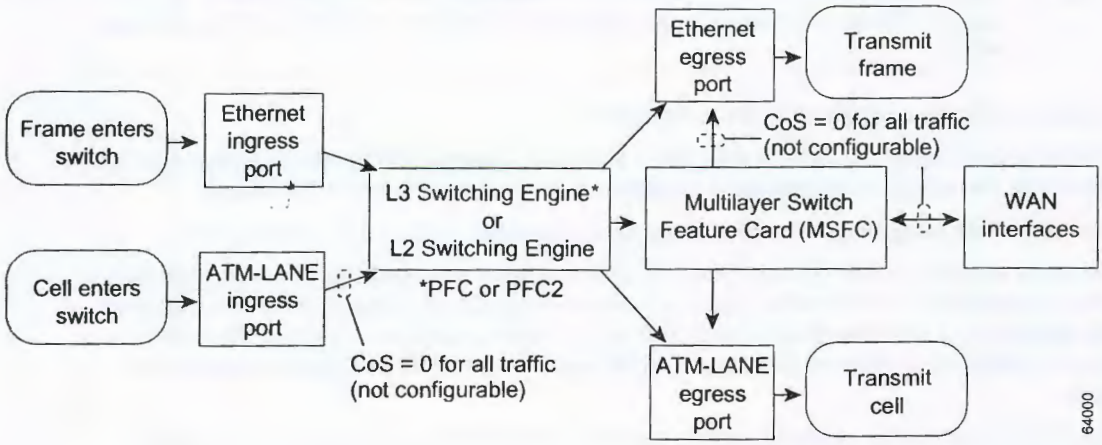
Flowcharts

Figure 43-1 shows how traffic flows through the QoS features; Figure 43-2 through Figure 43-7 show more details of the traffic flow through QoS features.

Figure 43-1 Traffic Flow Through QoS Features



Note

- The PFC can provide Layer 3 switching for ingress WAN traffic. The PFC does not provide QoS for ingress WAN traffic. PFC QoS does not change the ToS byte in WAN traffic.
- Ingress LAN traffic that is Layer 3 switched does not go through the Multilayer Switch Feature Card (MSFC or MSFC2) and retains the CoS value that is assigned by the Layer 3 switching engine.
- Enter the **show port capabilities** command to see the queue structure of a port (for more information, see the "Receive Queues" section on page 43-12 and the "Transmit Queues" section on page 43-27).

ECT 3454

QoS Feature Set Summary

The QoS feature set on your switch is determined by the switching engine on the supervisor engine. Enter the **show module** command for the supervisor engine to display your switching engine configuration. The display shows the "Sub-Type" to be one of the following:

- Supervisor Engine 2 (WS-X6K-SUP2-2GE) with Layer 3 Switching Engine II (WS-F6K-PFC2—Policy Feature Card 2 or PFC2)
- Supervisor Engine 1 (WS-X6K-SUP1A-2GE or WS-X6K-SUP1-2GE) with one of the following:
  - Layer 3 Switching Engine (WS-F6K-PFC—Policy Feature Card or PFC)
  - Layer 2 Switching Engine II (WS-F6020A)
  - Layer 2 Switching Engine I (WS-F6020)

The Layer 3 Switching Engine WS-F6K-PFC and Layer 3 Switching Engine II support similar feature sets. The two Layer 2 switching engines support the same QoS feature set.

These sections describe the QoS feature sets:

- Ethernet Ingress Port Features, page 43-9
- Layer 3 Switching Engine Features, page 43-9
- Layer 2 Switching Engine Features, page 43-10
- Ethernet Egress Port Features, page 43-10
- Single-Port ATM OC-12 Switching Module Features, page 43-10
- Multilayer Switch Feature Card (MSFC or MSFC2), page 43-10

Ethernet Ingress Port Features

With any switching engine, QoS supports classification, marking, scheduling, and congestion avoidance using Layer 2 CoS values at Ethernet ingress ports. Classification, marking, scheduling, and congestion avoidance at Ethernet ingress ports do not use or set Layer 3 IP precedence or DSCP values. With a Layer 3 switching engine, you can configure Ethernet ingress port trust states that can be used by the switching engine to set Layer 3 IP precedence or DSCP values and the Layer 2 CoS value. For more information, see the "Ethernet Ingress Port Marking, Scheduling, Congestion Avoidance, and Classification" section on page 43-10.

Layer 3 Switching Engine Features

With a Layer 3 switching engine, QoS supports classification, marking, and policing using IP, IPX, and Media Access Control (MAC) access control lists (ACLs). ACLs contain access control entries (ACEs) that specify Layer 2, 3, and 4 classification criteria, a marking rule, and policers. Marking sets the Layer 3 IP precedence or DSCP values and the Layer 2 CoS value to either received or configured Layer 2 or Layer 3 values. Policing uses bandwidth limits to either drop or mark nonconforming traffic. For more information, see the "Classification, Marking, and Policing with a Layer 3 Switching Engine" section on page 43-16.

During processing, a Layer 3 switching engine associates a DSCP value with all traffic, including non-IP traffic (for more information, see the "Internal DSCP Values" section on page 43-17).

Layer 2 Switching Engine Features

With a Layer 2 Switching Engine, QoS can classify traffic using Layer 2 destination MAC addresses, VLANs, and marking using Layer 2 CoS values. Classification and marking with a Layer 2 Switching Engine do not use or set Layer 3 IP precedence or DSCP values. For more information, see the "Classification and Marking with a Layer 2 Switching Engine" section on page 43-26.

Ethernet Egress Port Features

With any switching engine, QoS supports Ethernet egress port scheduling and congestion avoidance using Layer 2 CoS values. Ethernet egress port marking sets Layer 2 CoS values and, with a Layer 3 switching engine, Layer 3 DSCP values. For more information, see the "Ethernet Egress Port Scheduling, Congestion Avoidance, and Marking" section on page 43-27.

Single-Port ATM OC-12 Switching Module Features

The ingress interface from a single-port ATM OC-12 switching module is untrusted, and QoS sets CoS to zero in all traffic received from it. With a Layer 3 switching engine, QoS can mark IP traffic that is transmitted to a single-port ATM OC-12 switching module with Layer 3 DSCP values.

Multilayer Switch Feature Card (MSFC or MSFC2)

QoS marks IP traffic that is transmitted to an MSFC with Layer 3 DSCP values. CoS is zero in all traffic that is sent from an MSFC to egress ports.

Note Traffic that is Layer 3 switched does not go through the MFSC and retains the CoS value that is assigned by the Layer 3 switching engine.

Ethernet Ingress Port Marking, Scheduling, Congestion Avoidance, and Classification

These sections describe Ethernet ingress port marking, scheduling, congestion avoidance, and classification:

- Overview, page 43-11
- Marking at Untrusted Ports, page 43-11
- Marking at Trusted Ports, page 43-11
- Ethernet Ingress Port Scheduling and Congestion Avoidance, page 43-12
- Receive Queues, page 43-12
- Ingress Scheduling, page 43-12
- Ingress Congestion Avoidance, page 43-12
- Ethernet Ingress Port Classification Features with a Layer 3 Switching Engine, page 43-15

Overview

The trust state of an Ethernet port determines how it marks, schedules, and classifies received traffic, and whether or not congestion avoidance is implemented. You can configure the trust state of each port with one of these keywords:

- **untrusted** (default)
- **trust-ipprec** (Layer 3 switching engine only—not supported on **1q4t** ports except Gigabit Ethernet)
- **trust-dscp** (Layer 3 switching engine only—not supported on **1q4t** ports except Gigabit Ethernet)
- **trust-cos**

Note

- **1q4t** ports (except Gigabit Ethernet) do not support the **trust-ipprec** and **trust-dscp** port keywords. You must configure a **trust-ipprec** or **trust-dscp** ACL that matches the ingress traffic to apply the **trust-ipprec** or **trust-dscp** trust state.
- On **1q4t** ports (except Gigabit Ethernet), the **trust-cos** port keyword displays an error message, activates receive queue drop thresholds, and—as indicated by the error message—does not apply the **trust-cos** trust state to traffic. You must configure a **trust-cos** ACL that matches the ingress traffic to apply the **trust-cos** trust state.

For more information, see the "Configuring the Trust State of a Port" section on page 43-36.

In addition to the port configuration keywords listed above, with a Layer 3 switching engine, QoS uses **trust-ipprec**, **trust-dscp**, and **trust-cos** ACE keywords. Do not confuse the ACE keywords with the port keywords.

Ports that are configured with the **untrusted** keyword are called untrusted ports. Ports that are configured with the **trust-ipprec**, **trust-dscp**, or **trust-cos** keywords are called trusted ports. QoS implements ingress port congestion avoidance only on ports that are configured with the **trust-cos** keyword.

Ingress port marking, scheduling, and congestion avoidance use Layer 2 CoS values. Ingress port marking, scheduling, and congestion avoidance do not use or set Layer 3 IP precedence or DSCP values.

Marking at Untrusted Ports

QoS marks all frames that are received through untrusted ports with the port CoS value (the default is zero). QoS does not implement ingress port congestion avoidance on untrusted ports: the traffic goes directly to the switching engine.

Marking at Trusted Ports

When an ISL frame enters the switch through a trusted port, QoS accepts the three least significant bits in the User field as a CoS value. When an 802.1Q frame enters the switch through a trusted port, QoS accepts the User Priority bits as a CoS value. QoS marks all traffic that is received in other frame types with the port CoS value.

The port CoS value is configurable for each Ethernet port (for more information, see the "Configuring the CoS Value for a Port" section on page 43-37).

Ethernet Ingress Port Scheduling and Congestion Avoidance

QoS does not implement ingress port congestion avoidance on ports that are configured with the **untrusted**, **trust-ipprec**, or **trust-dscp** keywords: the traffic goes directly to the switching engine.

QoS uses CoS-value-based receive-queue drop thresholds to avoid congestion in traffic entering the switch through a port that is configured with the **trust-cos** keyword (for more information, see the "Configuring the Trust State of a Port" section on page 43-36).

Receive Queues

Enter the **show port capabilities** command to see the queue structure of a port. The command displays one of the following:

- **rx-(1q2t)** indicates one standard queue with one configurable tail-drop threshold and one nonconfigurable tail-drop threshold.
- **rx-(1q4t)** indicates one standard queue with four configurable tail-drop thresholds.
- **rx-(1p1q4t)** indicates one strict-priority queue and one standard queue with four configurable tail-drop thresholds.
- **rx-(1p1q0t)** indicates one strict-priority queue and one standard queue with a nonconfigurable threshold.
- **rx-(1p1q8t)** indicates one strict-priority queue and one standard queue with eight configurable WRED-drop thresholds (on **1p1q8t** ports, the standard queue also has one nonconfigurable tail-drop threshold).

Strict-priority queues are serviced in preference to other queues. QoS services traffic in a strict-priority queue before servicing the standard queue. When QoS services the standard queue, after receiving a packet, it checks for traffic in the strict-priority queue. If QoS detects traffic in the strict-priority queue, it suspends its service of the standard queue and completes service of all traffic in the strict-priority queue before returning to the standard queue.

Ingress Scheduling

QoS schedules traffic through the receive queues based on CoS values. In the **1p1q4t**, **1p1q0t**, and **1p1q8t** default configurations, QoS assigns all traffic with CoS 5 to the strict-priority queue; QoS assigns all other traffic to the standard queue. In the **1q4t** default configuration, QoS assigns all traffic to the standard queue.

Ingress Congestion Avoidance

Note The explanations in this section use default values. You can configure many of the parameters (for more information, see the "Configuring QoS on the Switch" section on page 43-34). All ports of the same type use the same drop-threshold configuration.

If a port is configured with the **trust-cos** keyword, QoS implements CoS-value-based receive-queue drop thresholds to avoid congestion in received traffic.

1q2t ports have this default drop threshold configuration:

- Frames with CoS 0, 1, 2, 3, or 4 go to tail-drop threshold 1, where the switch drops incoming frames when the standard receive-queue buffer is 80 percent full.
- Frames with CoS 5, 6, or 7 go to tail-drop threshold 2, where the switch drops incoming frames when the standard receive-queue buffer is 100 percent full.

1q4t ports have this default drop threshold configuration:

- Using receive-queue tail-drop threshold 1, the switch drops incoming frames with CoS 0 or 1 when the receive-queue buffer is 50 percent or more full.
- Using receive-queue tail-drop threshold 2, the switch drops incoming frames with CoS 2 or 3 when the receive-queue buffer is 60 percent or more full.
- Using receive-queue tail-drop threshold 3, the switch drops incoming frames with CoS 4 or 5 when the receive-queue buffer is 80 percent or more full.
- Using receive-queue tail-drop threshold 4, the switch drops incoming frames with CoS 6 or 7 when the receive-queue buffer is 100 percent full.

1p1q4t ports have this default drop-threshold configuration:

- Frames with CoS 5 go to the strict-priority receive queue (queue 2), where the switch drops incoming frames only when the strict-priority receive-queue buffer is 100 percent full.
- Frames with CoS 0, 1, 2, 3, 4, 6, or 7 go to the standard receive queue as follows:
  - Using standard receive-queue tail-drop threshold 1, the switch drops incoming frames with CoS 0 or 1 when the receive-queue buffer is 50 percent or more full.
  - Using standard receive-queue tail-drop threshold 2, the switch drops incoming frames with CoS 2 or 3 when the receive-queue buffer is 60 percent or more full.
  - Using standard receive-queue tail-drop threshold 3, the switch drops incoming frames with CoS 4 when the receive-queue buffer is 80 percent or more full.
  - Using standard receive-queue tail-drop threshold 4, the switch drops incoming frames with CoS 6 or 7 when the receive-queue buffer is 100 percent full.

1p1q0t ports have this default drop-threshold configuration:

- Frames with CoS 5 go to the strict-priority receive queue (queue 2), where the switch drops incoming frames when the strict-priority receive-queue buffer is 100 percent full.
- Frames with CoS 0, 1, 2, 3, 4, 6, or 7 go to the standard receive queue, which uses a nonconfigurable tail-drop threshold that drops incoming frames when the standard receive-queue buffer is 100 percent full.

1p1q8t ports have this default drop-threshold configuration:

- Frames with CoS 5 go to the strict-priority receive queue (queue 2), where the switch drops incoming frames only when the strict-priority receive-queue buffer is 100 percent full.
- Frames with CoS 0, 1, 2, 3, 4, 6, or 7 go to the standard receive queue, which uses WRED-drop thresholds as follows:
  - Using standard receive-queue drop threshold 1 for incoming frames with CoS 0, the switch starts to drop frames when the receive-queue buffer is 40 percent full and drops all frames with CoS 0 when the receive-queue buffer is 70 percent or more full.
  - Using standard receive-queue drop threshold 2 for incoming frames with CoS 1, the switch starts to drop frames when the receive-queue buffer is 40 percent full and drops all frames with CoS 1 when the receive-queue buffer is 70 percent or more full.

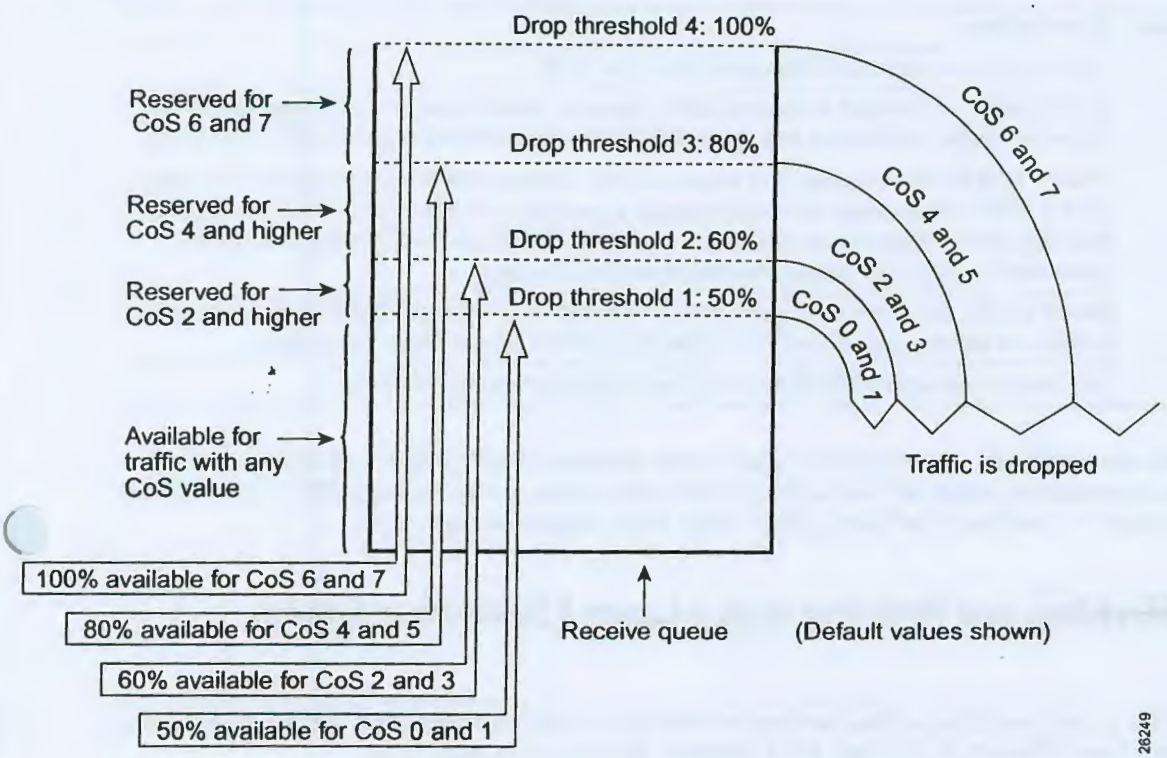
RQS Nº 03/2005 - CN
CPMI - CORREIOS
43-13
0689
Fls:
Doc: 3701

- Using standard receive-queue drop threshold 3 for incoming frames with CoS 2, the switch starts to drop frames when the receive-queue buffer is 50 percent full and drops all frames with CoS 2 when the receive-queue buffer is 80 percent or more full.
- Using standard receive-queue drop threshold 4 for incoming frames with CoS 3, the switch starts to drop frames when the receive-queue buffer is 50 percent full and drops all frames with CoS 3 when the receive-queue buffer is 80 percent or more full.
- Using standard receive-queue drop threshold 5 for incoming frames with CoS 4, the switch starts to drop frames when the receive-queue buffer is 60 percent full and drops all frames with CoS 4 when the receive-queue buffer is 90 percent or more full.
- Using standard receive-queue drop threshold 6 for incoming frames with CoS 6, the switch starts to drop frames when the receive-queue buffer is 60 percent full and drops all frames with CoS 6 when the receive-queue buffer is 90 percent or more full.
- Using standard receive-queue drop threshold 7 for incoming frames with CoS 7, the switch starts to drop frames when the receive-queue buffer is 70 percent full and drops all frames with CoS 7 when the receive-queue buffer is 100 percent or more full.

Note You can configure the standard receive queue to use both a tail-drop and a WRED-drop threshold by mapping a CoS value to the queue or to the queue and a threshold. The switch uses the tail-drop threshold for traffic carrying the CoS values that are mapped only to the queue. The switch uses WRED-drop thresholds for traffic carrying the CoS values that are mapped to the queue and a threshold. See the "1p1q8t Receive Queues" section on page 43-60.

Figure 43-8 shows the drop thresholds for a **1q4t** port. Drop thresholds in other configurations function similarly.

Figure 43-8 Receive-Queue Drop Thresholds



Ethernet Ingress Port Classification Features with a Layer 3 Switching Engine

You can use the **untrusted**, **trust-ipprec**, **trust-dscp**, and **trust-cos** port keywords to classify traffic on a per-port basis for a Layer 3 switching engine to mark.

The **trust-ipprec** and **trust-dscp** keywords are supported only with a Layer 3 switching engine and are not supported on **1q4t** ports except Gigabit Ethernet. On **1q4t** ports (except Gigabit Ethernet), the **trust-cos** port keyword displays an error message, activates receive-queue drop thresholds, and—as indicated by the error message—does not apply the **trust-cos** trust state to traffic. You must configure the **trust-cos** ACL that matches the ingress traffic to apply the **trust-cos** trust state.

In addition to per-port classification, you can create ACEs that classify traffic on a per-packet basis (for IP and IPX traffic, see the "Named IP ACLs" section on page 43-42 and the "Creating or Modifying Named IPX ACLs" section on page 43-46) or on a per-frame basis (for other traffic, see the "Creating or Modifying Named MAC ACLs" section on page 43-47), regardless of the port configuration (see the "Marking Rules" section on page 43-23).

To mark traffic in response to per-port classification, the traffic must match an ACE that contains the **dscp** ACE keyword (see the "Marking Rules" section on page 43-23). In their default configuration, the ACEs in the default ACLs contain the **dscp** ACE keyword. Table 43-1 lists the per-port classifications and the marking rules that they invoke.

Table 43-1 Marking Based on Per-Port Classification

Port Keyword	ACE Keyword	Marking Rule
untrusted	**dscp**	Set internal and egress DSCP as specified in the ACE.
trust-ipprec	**dscp**	For IP traffic, set internal and egress DSCP from the received Layer 3 IP precedence value. For other traffic, set internal and egress DSCP from the received or port Layer 2 CoS value. **Note**—With the **trust-ipprec** port keyword, QoS uses only the IP precedence bits. If traffic with a DSCP value enters the switch through a port that is configured with the **trust-ipprec** port keyword, the three most significant bits of the DSCP value are interpreted as an IP precedence value; QoS ignores the rest of the DSCP value.
trust-dscp	**dscp**	For IP traffic, set internal and egress DSCP from the received Layer 3 DSCP value. For other traffic, set internal and egress DSCP from the received or port Layer 2 CoS value.
trust-cos	**dscp**	Set internal and egress DSCP from the received or port Layer 2 CoS value.

QoS uses configurable mapping tables to set internal and egress DSCP, which is a 6-bit value, from CoS and IP precedence, which are 3-bit values (for more information, see the "Internal DSCP Values" section on page 43-17 and the "Configuring DSCP Value Maps" section on page 43-61).

Classification, Marking, and Policing with a Layer 3 Switching Engine

Note With a Layer 3 switching engine, the Catalyst 6500 series switches provide QoS only for the following frame types: Ethernet_II, Ethernet_802.3, Ethernet_802.2, and Ethernet_SNAP.

These sections describe classification, marking, and policing with a Layer 3 switching engine:

- Internal DSCP Values, page 43-17
- ACLs, page 43-17
- Named ACLs, page 43-18
- Default ACLs, page 43-22
- Marking Rules, page 43-23
- Policers, page 43-24
- PFC2 Policing Decisions, page 43-25
- Attaching ACLs, page 43-26
- Final Layer 3 Switching Engine CoS and ToS Values, page 43-26

Note Classification with a Layer 3 switching engine uses Layer 2, 3, and 4 values. Marking with a Layer 3 switching engine uses Layer 2 CoS values and Layer 3 IP precedence or DSCP values.

ECT 3446 CPI-AT

Internal DSCP Values

These sections describe the internal DSCP values:

- Internal DSCP Sources, page 43-17
- Egress DSCP and CoS Sources, page 43-17

Internal DSCP Sources

During processing, the priority of all traffic (including non-IP traffic) is represented with an internal DSCP value. QoS derives the internal DSCP value from the following:

- For **trust-cos** traffic, from received or port Layer 2 CoS values (traffic from an untrusted port has the port CoS value and if traffic from an untrusted port matches a **trust-cos** ACL, QoS derives the internal DSCP value from the port CoS value)
- For **trust-ipprec** traffic, from received IP precedence values
- For **trust-dscp** traffic, from received DSCP values
- For **untrusted** traffic, from port CoS or configured DSCP values

The trust state of traffic is the trust state of the ingress port unless set otherwise by the matching ACE.

Note A **trust-cos** ACL cannot restore received CoS in traffic from untrusted ports. Traffic from untrusted ports always has the port CoS value.

QoS uses configurable mapping tables to derive the internal 6-bit DSCP value from CoS or IP precedence, which are 3-bit values (see the"Mapping Received CoS Values to Internal DSCP Values" section on page 43-61 or the "Mapping Received IP Precedence Values to Internal DSCP Values" section on page 43-62).

Egress DSCP and CoS Sources

For egress IP traffic, QoS creates a ToS byte from the internal DSCP value (which you can set equal to an IP precedence value) and sends it to the egress port to be written into IP packets. For **trust-dscp** and **untrusted** IP traffic, the ToS byte includes the original 2 least-significant bits from the received ToS byte.

For all egress traffic, QoS uses a configurable mapping table to derive a CoS value from the internal DSCP value that is associated with traffic (see the "Mapping Internal DSCP Values to Egress CoS Values" section on page 43-62). QoS sends the CoS value to Ethernet egress ports for use in scheduling and to be written into ISL and 802.1Q frames.

ACLs

QoS uses ACLs that contain ACEs. The ACEs specify classification criteria, a marking rule, and policers. QoS compares received traffic to the ACEs in ACLs until a match occurs. When the traffic matches the classification criteria in an ACE, QoS marks and polices the packet as specified in the ACE and makes no further comparisons.

There are three ACL types: IP, and with a Layer 3 switching engine, IPX and MAC. QoS compares traffic of each type (IP, IPX, and MAC) only to the corresponding ACL type (see Table 43-2).

ROS Nº 03/2005 - CN
CPMI - CO

Doc:

Table 43-2 Supported Ethertype Field Values

ACL Type	Ethertype Field Value	Protocol
IP	0x0800	IP
IPX	0x8137 and 0x8138	IPX
MAC[1]	0x0600 and 0x0601	XNS
	0x0BAD and 0x0BAF	Banyan VINES
	0x6000-0x6009 and 0x8038-0x8042	DECnet
	0x809b and 0x80f3	AppleTalk

1. QoS MAC ACLs that do not include an ethertype parameter match traffic with any value in the ethertype field, which allows MAC-level QoS to be applied to any traffic except IP and IPX.

QoS supports user-created *named* ACLs, each containing an ordered list of ACEs, and user-configurable *default* ACLs, each containing a single ACE.

Named ACLs

You create a named ACL when you enter an ACE with a new ACL name. You add an ACE to an existing ACL when you enter an ACE with the name of the existing ACL.

You can specify the classification criteria for each ACE in a named ACL. The classification criteria can be specific values or wildcards (for more information, see the "Creating or Modifying ACLs" section on page 43-41).

These sections describe the classification criteria that can be specified in a named ACL:

- IP ACE Layer 3 Classification Criteria, page 43-18
- IP ACE Layer 4 Protocol Classification Criteria, page 43-19
- IP ACE Layer 4 TCP Classification Criteria, page 43-19
- IP ACE Layer 4 UDP Classification Criteria, page 43-20
- IP ACE Layer 4 ICMP Classification Criteria, page 43-20
- IP ACE Layer 4 IGMP Classification Criteria, page 43-21
- IPX ACE Classification Criteria, page 43-21
- MAC ACE Layer 2 Classification Criteria, page 43-22

IP ACE Layer 3 Classification Criteria

You can create IP ACEs that match traffic with specific Layer 3 values by including these Layer 3 parameters (see the "Named IP ACLs" section on page 43-42):

- IP source address and mask, entered as specific values or with the **any** keyword or with the **host** keyword and a host address.
- IP destination address and mask, entered as specific values or with the **any** keyword or with the **host** keyword and a host address.
- DSCP value (0–63) or IP precedence that is specified with a numeric value (0–7) or these keywords:
  - **Network** (IP precedence 7)
  - **Internet** (IP precedence 6)

- **Critical** (IP precedence 5)
- **Flash-override** (IP precedence 4)
- **Flash** (IP precedence 3)
- **Immediate** (IP precedence 2)
- **Priority** (IP precedence 1)
- **Routine** (IP precedence 0)

Note IP ACEs that do not include a DSCP or IP precedence value parameter match all DSCP or IP precedence values.

IP ACE Layer 4 Protocol Classification Criteria

You can create IP ACEs that match specific Layer 4 protocol traffic by including a Layer 4 protocol parameter (see the "IP ACLs for Other Layer 4 Protocols" section on page 43-45). You can specify the protocol numerically (0–255) or with these keywords: **ahp** (51), **eigrp** (88), **esp** (50), **gre** (47), **igrp** (9), **icmp** (1), **igmp** (2), **igrp** (9), **ip** (0), **ipinip** (4), **nos** (94), **ospf** (89), **pcp** (108), **pim** (103), **tcp** (6), or **udp** (17).

Note IP ACEs that do not include a Layer 4 protocol parameter or that include the **ip** keyword match all IP traffic.

IP ACE Layer 4 TCP Classification Criteria

You can create Transmission Control Protocol (TCP) ACEs that match traffic for specific TCP ports by including TCP source and/or destination port parameters (for more information, see the "IP ACEs for TCP Traffic" section on page 43-43). You can specify TCP port parameters numerically (0–65535) or with these keywords:

Keyword	Port		Keyword	Port		Keyword	Port		Keyword	Port
bgp	179		**ftp**	21		**lpd**	515		**telnet**	23
chargen	19		**ftp-data**	20		**nntp**	119		**time**	37
daytime	13		**gopher**	70		**pop2**	109		**uucp**	540
discard	9		**hostname**	101		**pop3**	110		**whois**	43
domain	53		**irc**	194		**smtp**	25		**www**	80
echo	7		**klogin**	543		**sunrpc**	111			
finger	79		**kshell**	544		**tacacs**	49			

Note TCP ACEs that do not include a Layer 4 TCP port parameter match all TCP traffic.

IP ACE Layer 4 UDP Classification Criteria

You can create User Datagram Protocol (UDP) ACEs that match traffic for specific UDP source and/or destination ports by including UDP port parameters (for more information, see the "IP ACEs for UDP Traffic" section on page 43-43). You can specify UDP port parameters numerically (0–65535) or with these keywords:

Keyword	Port		Keyword	Port		Keyword	Port		Keyword	Port
biff	512		echo	7		rip	520		talk	517
bootpc	68		mobile-ip	434		snmp	161		tftp	69
bootps	67		nameserver	42		snmptrap	162		time	37
discard	9		netbios-dgm	138		sunrpc	111		who	513
dns	53		netbios-ns	137		syslog	514		xdmcp	177
dnsix	195		ntp	123		tacacs	49			

Note UDP ACEs that do not include a Layer 4 UDP port parameter match all UDP traffic.

IP ACE Layer 4 ICMP Classification Criteria

You can create Internet Control Management Protocol (ICMP) ACEs that match traffic containing specific ICMP messages by including ICMP types and optionally, ICMP codes (for more information, see the "IP ACEs for ICMP Traffic" section on page 43-44). You can specify ICMP types and codes numerically (0–255) or with these keywords:

Keyword	Type	Code	Keyword	Type	Code
administratively-prohibited	3	13	net-tos-unreachable	3	11
alternate-address[1]	6	—	net-unreachable	3	0
conversion-error	31	0	network-unknown	3	6
dod-host-prohibited	3	10	no-room-for-option	12	2
dod-net-prohibited	3	9	option-missing	12	1
echo	8	0	packet-too-big	3	4
echo-reply	0	0	parameter-problem	12	0
general-parameter-problem[1]	12	—	port-unreachable	3	3
host-isolated	3	8	precedence-unreachable	3	15
host-precedence-unreachable	3	14	protocol-unreachable	3	2
host-redirect	5	1	reassembly-timeout	11	1
host-tos-redirect	5	3	redirect[1]	5	—
host-tos-unreachable	3	12	router-advertisement	9	0
host-unknown	3	7	router-solicitation	10	0
host-unreachable	3	1	source-quench	4	0
information-reply	16	0	source-route-failed	3	5

E C T
2462
CPL - AC

Keyword	Type	Code	Keyword	Type	Code
information-request	15	0	**time-exceeded**[1]	11	—
mask-reply	18	0	**timestamp-reply**	14	0
mask-request	17	0	**timestamp-request**	13	0
mobile-redirect	32	0	**traceroute**	30	0
net-redirect	5	0	**ttl-exceeded**	11	0
net-tos-redirect	5	2	**unreachable**[1]	3	—

1. Matches all code values

Note ICMP ACEs with only a Layer 4 ICMP *type* parameter match all *code* values for that *type* value. ICMP ACEs that do not include any Layer 4 ICMP type and code parameters match all ICMP traffic.

IP ACE Layer 4 IGMP Classification Criteria

You can create IGMP ACEs that match traffic containing specific IGMP messages by including an IGMP type parameter (for more information, see the "IP ACEs for IGMP Traffic" section on page 43-44). You can specify the IGMP type numerically (0–255) or with these keywords: **host-query** (1), **host-report** (2), **dvmrp** (3), **pim** (4), or **trace** (5).

Note QoS does not support IGMP traffic when IGMP snooping is enabled. QoS supports IGMP classification using version 1 four-bit Type fields.

Note IGMP ACEs that do not include a Layer 4 IGMP type parameter match all IGMP traffic.

IPX ACE Classification Criteria

You can create IPX ACEs that match specific IPX traffic by including these parameters (for more information, see the "Creating or Modifying Named IPX ACLs" section on page 43-46):

- IPX source network (-1 matches any network number)
- Protocol, which can be specified numerically (0–255) or with these keywords: **any**, **ncp** (17), **netbios** (20), **rip** (1), **sap** (4), **spx** (5)
- IPX ACEs support the following optional parameters:
  - IPX destination network (-1 matches any network number)
  - If you specify an IPX destination network, IPX ACEs support the following optional parameters: an IPX destination network mask (-1 matches any network number), an IPX destination node, and an IPX destination node mask

ROS Nº 03/2005 - CN
CPMI - 43-21 IOS
Fls: 0693
Doc: 3701

MAC ACE Layer 2 Classification Criteria

You can create MAC ACEs that match specific Ethernet traffic by including these Layer 2 parameters (for more information, see the "Creating or Modifying Named MAC ACLs" section on page 43-47):

- Ethernet source and destination addresses and masks, entered as specific values or with the **any** keyword or with the **host** keyword and a host Ethernet address
- Optionally, an ethertype parameter from this list:
  - 0x809B (or **ethertalk**)
  - 0x80F3 (or **aarp**)
  - 0x6001 (or **dec-mop-dump**)
  - 0x6002 (or **dec-mop-remote-console**)
  - 0x6003 (or **dec-phase-iv**)

QoS MAC ACLs that do not include an ethertype parameter match traffic with any value in the ethertype field, which allows MAC-level QoS to be applied to any traffic except IP and IPX.

Default ACLs

There are three default ACLs, one each for IP, and with a Layer 3 switching engine, IPX and MAC traffic. Each ACL has a single ACE that has a configurable marking rule and configurable policers. The default ACLs have nonconfigurable classification criteria that matches all traffic. QoS compares any traffic with a supported ethertype field value that does not match a named ACL to the default ACLs. Unmatched IP traffic matches the default IP ACL. Unmatched IPX traffic matches the default IPX ACL. Unmatched Ethernet traffic matches the default MAC ACL.

Note All traffic matches an ACE in an ACL (either an ACE in a named ACL or one of the default ACLs) because the default ACLs match all traffic.

ECT 3440 CPI/AC

Marking Rules

Note Marking is not supported for IPX or MAC traffic with a PFC2.

Marking rules specify how QoS marks traffic when the traffic matches the filtering parameters in an ACE (see the "ACE Name, Marking Rule, Policing, and Filtering Syntax" section on page 43-41). QoS supports four marking rules, that are specified with the following four ACE keywords: **trust-dscp**, **trust-ipprec**, **trust-cos**, and **dscp**. Each ACE contains one of the keywords. The marking rules are as follows:

- **trust-dscp** (IP ACLs only)—Instructs QoS to set internal and egress DSCP from received DSCP values (see the "Internal DSCP Values" section on page 43-17).
- **trust-ipprec** (IP ACLs only)—Instructs QoS to set internal and egress DSCP from received IP precedence values.

  Note With the **trust-ipprec** port keyword, QoS uses only the IP precedence bits. If traffic with a DSCP value enters the switch through a port that is configured with the **trust-ipprec** port keyword, the three most significant bits of the DSCP value are interpreted as an IP precedence value; QoS ignores the rest of the DSCP value.

- **trust-cos** (all ACLs except IPX and MAC with a PFC2)—Instructs QoS to set internal and egress DSCP from received or port CoS values. In traffic from ports that are configured with the **trust-cos** keyword, the CoS value is received in ISL and 802.1Q frames; in all other cases, the CoS value is configured on the port (the default is zero).
- **dscp** (all ACLs except IPX and MAC with a PFC2)—Instructs QoS to mark traffic as indicated by the port trust keywords:
  - In IP traffic from ingress ports that are configured with the **trust-dscp** port keyword, the **dscp** ACE keyword instructs QoS to set the internal and egress DSCP values from the received DSCP values. In non-IP traffic, QoS sets the DSCP from the received or port CoS value.
  - In IP traffic from ingress ports that are configured with the **trust-ipprec** port keyword, the **dscp** ACE keyword instructs QoS to set the internal and egress DSCP values from the received IP precedence values. In non-IP traffic, QoS sets the DSCP value from the received or port CoS value.
  - In traffic from ingress ports that are configured with the **trust-cos** port keyword, the **dscp** ACE keyword instructs QoS to set the internal and egress DSCP values from the received or port CoS values.
  - In traffic from ingress ports that are configured with the **untrusted** port keyword, the **dscp** ACE keyword instructs QoS to set the internal and egress DSCP values from the DSCP value in the ACE.

    Note The default configuration of the ACEs in the default ACLs contains the **dscp** ACE keyword, which supports per-port classification of traffic. With the default values, the ACEs in the default ACLs apply DSCP zero to traffic from ingress ports that are configured with the **untrusted** port keyword.

Doc:

QoS uses configurable mapping tables to set the DSCP value, which is 6 bits, from CoS and IP precedence, which are 3-bit values (for more information, see the "Mapping Received CoS Values to Internal DSCP Values" section on page 43-61 and the "Mapping Received IP Precedence Values to Internal DSCP Values" section on page 43-62).

Policers

You can create named policers that specify bandwidth utilization limits, which you can apply to traffic by including the policer name in an ACE (for more information, see the "Creating Policers" section on page 43-38).

Policing uses a token bucket scheme. As packets arrive, the packet size in bytes is added to the bucket level. Every 0.25 ms, a value equal to the token rate is subtracted from the bucket level.

You specify the bandwidth utilization limits as an average rate and a maximum burst size. Packets that exceed these limits are "out of profile." Traffic is in profile as long as it flows in at an average rate and never bursts beyond the burst size.

In each policer, you specify if out-of-profile packets are to be dropped or to have a new DSCP value applied to them (applying a new DSCP value is called "markdown"). Since out-of-profile packets do not retain their original priority, they are not counted as part of the bandwidth that is consumed by in-profile packets.

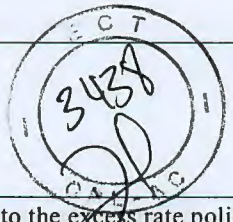
For all policers, QoS uses a configurable table that maps received DSCP values to marked-down DSCP values (for more information, see the "Mapping DSCP Markdown Values" section on page 43-63). When markdown occurs, QoS gets the marked-down DSCP value from the table. You cannot specify a marked-down DSCP value in individual policers.

Note By default, the markdown table is configured so that no markdown occurs; the marked-down DSCP values are equal to the received DSCP values. To enable markdown, configure the table appropriately for your network.

You give each policer a unique name when you create it and then use the name to include the policer in an ACE. The same policer can be used in multiple ACEs.

You can create these policers:

- Microflow—QoS applies the bandwidth limit that is specified in a microflow policer separately to each flow that matches any ACEs that use that particular microflow policer. You can create up to 63 microflow policers.
- Aggregate—QoS applies the bandwidth limits that are specified in an aggregate policer cumulatively to all flows that match any ACEs that use that particular aggregate policer. You can create up to 1023 aggregate policers.
- With a PFC2, you can specify a dual rate aggregate policer with a normal rate and an excess rate:
  - Normal rate—Packets exceeding this rate are marked down.
  - Excess rate—Packets exceeding this rate are either marked down or dropped as specified by the drop indication flag.



Note The drop indication flag applies to the excess rate policer and cannot be set for the normal rate policer. To achieve the effect of a drop indication flag for the normal rate aggregate policer, set the excess rate equal to the normal rate and set the drop indication flag. Alternatively, you can set the normal rate without specifying an excess rate, which automatically sets the excess rate to the normal rate when the drop indicator flag is on.

You can include both a microflow policer and an aggregate policer in each ACE to police a flow based on both its own bandwidth utilization and on its bandwidth utilization combined with that of other flows.

For example, you could create a microflow policer named "group_individual" with bandwidth limits that are suitable for individuals in a group and you could create an aggregate policer named "group_all" with bandwidth limits that are suitable for the group as a whole. You could include both policers in ACEs that match the group's traffic. The combination would affect individuals separately and the group cumulatively.

For ACEs that include both a microflow policer and an aggregate policer, QoS responds to an out-of-profile status from either policer, and as specified by the policer, applies a new DSCP value or drops the packet. If both policers return an out-of-profile status, then if either policer specifies that the packet is to be dropped, it is dropped; otherwise, QoS applies a new DSCP value.

Follow these guidelines when creating policers:

- You can include a microflow policer in IP ACEs. You cannot include a microflow policer in IPX or MAC ACEs. IPX and MAC ACEs support only aggregate policers.
- By default, microflow policers do not affect bridged traffic. To enable microflow policing of bridged traffic, enter the **set qos bridged-microflow-policing** command (for more information, see the "Enabling or Disabling Microflow Policing of Bridged Traffic" section on page 43-52).
- With a Layer 3 Switching Engine II, to do any microflow policing, you must enable microflow policing of bridged traffic.
- With an MSFC, QoS does not apply microflow policers to Multilayer Switching (MLS) candidate frames (MSFC2 does not use candidate and enabler frames).
- To avoid inconsistent results, all ACEs that include the same aggregate policer must use the same ACE keyword: **trust-dscp**, **trust-ipprec**, **trust-cos**, or **dscp**. If the ACE uses the **dscp** keyword, all traffic that matches the ACE must come through ports that are configured with the same port keyword: **trust-dscp**, **trust-ipprec**, **trust-cos**, or **untrusted**. If the ACL is attached to a VLAN, you must configure all ports in the VLAN with the same port keyword.

PFC2 Policing Decisions

With a PFC2, the policing decision consists of two levels:

- Normal Police Level—Set if either the microflow policer or the aggregate normal rate policer returns an out-of-profile decision.
- Excess Police Level—Set if the aggregate excess rate policer returns an out-of-profile decision.

Packets are dropped if the excess rate aggregate policer returns an out-of-profile decision and the drop indication flag is set, or if the microflow policer returns an out-of-profile decision and the drop indication flag is set.

If an excess police level is set, the excess DSCP mapping is used to replace the original DSCP value with a marked-down value. If only a normal police level is set, the normal DSCP mapping is used. The excess police level has precedence for selecting mapping rules when both police levels are set because the excess police level represents the worst out-of-profile transgression.

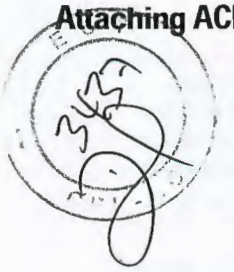
Attaching ACLs



You can configure each port for either port-based QoS (default) or VLAN-based QoS (see the "Enabling Port-Based or VLAN-Based QoS" section on page 43-36) and attach ACLs to the selected interface (see the "Attaching ACLs to Interfaces" section on page 43-50). You can attach up to three named ACLs, one of each type (IP, IPX, and Ethernet) to each port and VLAN.

On ports that are configured for VLAN-based QoS, you can attach named ACLs to the port's VLAN. For a trunk, you can attach named ACLs to any VLANs that are allowed on the trunk as follows:

- On a port that is configured for VLAN-based QoS, traffic that is received through the port is compared to any named ACLs that are attached to the port's VLAN. If you do not attach any named ACLs to the port's VLAN, or if the traffic does not match an ACE in a named ACL, QoS compares the traffic that is received through the port to the default ACLs.
- On a trunk that is configured for VLAN-based QoS, traffic that is received through the port is compared to any named ACLs that are attached to the traffic's VLAN. For traffic in VLANs that have no named ACLs attached, or if the traffic does not match an ACE in a named ACL, QoS compares the traffic to the default ACLs.

On ports that are configured for port-based QoS, you can attach named ACLs to the port as follows:

- On a port that is configured for port-based QoS, traffic that is received through the port is compared to any named ACLs that are attached to the port. If you do not attach any named ACLs to the port, or if the traffic does not match an ACE in a named ACL, QoS compares the traffic that is received through the port to the default ACLs.
- On a trunk that is configured for port-based QoS, traffic in all VLANs that are received through the port is compared to any named ACLs that are attached to the port. If you do not attach any named ACLs to the port, or if the traffic does not match an ACE in a named ACL, QoS compares the traffic that is received through the port to the default ACLs.

Final Layer 3 Switching Engine CoS and ToS Values

With a Layer 3 switching engine, QoS associates CoS and ToS values with traffic as specified by the marking rules and policers in the ACE that the traffic matches (see the "Internal DSCP Values" section on page 43-17). The associated CoS and ToS are used at the Ethernet egress port (see the "Ethernet Egress Port Scheduling, Congestion Avoidance, and Marking" section on page 43-27).

Classification and Marking with a Layer 2 Switching Engine

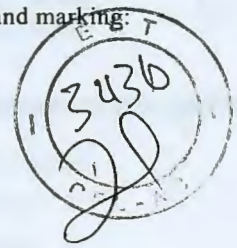
With a Layer 2 Switching Engine, QoS can classify traffic that is addressed to specified MAC address/VLAN pairs to be marked with a configured CoS value (for more information, see the "QoS Terminology" section on page 43-2 and the "Mapping a CoS Value to a Host Destination MAC Address/VLAN Pair" section on page 43-51).

Note Classification and marking with a Layer 2 Switching Engine uses Layer 2 CoS values. Classification and marking with a Layer 2 Switching Engine does not use or set Layer 3 IP precedence or DSCP values.

Ethernet Egress Port Scheduling, Congestion Avoidance, and Marking

These sections describe Ethernet egress port scheduling, congestion avoidance, and marking:

- Overview, page 43-27
- Transmit Queues, page 43-27
- Scheduling and Congestion Avoidance, page 43-28
- Marking, page 43-30



Overview

QoS schedules traffic through the transmit queues based on CoS values and uses CoS-value-based transmit-queue drop thresholds to avoid congestion in traffic that is transmitted from Ethernet ports.

Note Ethernet egress port scheduling and congestion avoidance uses Layer 2 CoS values. Ethernet egress port marking writes Layer 2 CoS values, and for IP traffic, the Layer 3 ToS byte.

Transmit Queues

Enter the **show port capabilities** command to see the queue structure of a port. The command displays one of the following:

- **tx-(2q2t)** indicates two standard queues, each with two configurable tail-drop thresholds.
- **tx-(1p2q2t)** indicates one strict-priority queue and two standard queues, each with two configurable WRED-drop thresholds.
- **tx-(1p3q1t)** indicates one strict-priority queue and three standard queues, each with one configurable WRED-drop threshold (on **1p3q1t** ports, each standard queue also has one nonconfigurable tail-drop threshold).
- **tx-(1p2q1t)** indicates one strict-priority queue and two standard queues, each with one configurable WRED-drop threshold (on **1p2q1t** ports, each standard queue also has one nonconfigurable tail-drop threshold).

All port types have a low-priority and a high-priority standard transmit queue. **1p3q1t** ports have a medium-priority standard transmit queue. **1p2q2t**, **1p3q1t**, and **1p2q1t** ports have a strict-priority transmit queue in addition to the standard queues.

On **2q2t** ports, the default QoS configuration allocates a minimum of 80 percent of the total transmit queue size to the low-priority standard queue and a minimum of 20 percent to the high-priority standard queue.

On **1p2q2t**, **1p3q1t**, and **1p2q1t** ports, the switch services traffic in the strict-priority queue before servicing the standard queues. When the switch is servicing a standard queue, after transmitting a packet, it checks for traffic in the strict-priority queue. If the switch detects traffic in the strict-priority queue, it suspends its service of the standard queue and completes service of all traffic in the strict-priority queue before returning to the standard queue.

On **1p2q2t** ports, the default QoS configuration allocates a minimum of 70 percent of the total transmit queue size to the low-priority standard queue, a minimum of 15 percent to the high-priority standard queue, and a minimum of 15 percent to the strict-priority queue.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0696
Doc: 3701

On **1p3q1t** ports, the transmit queue size is not configurable and is allocated equally among all queues.

On **1p2q1t** ports, the default QoS configuration allocates a minimum of 50 percent of the total transmit queue size to the low-priority standard queue, a minimum of 30 percent to the high-priority standard queue, and a minimum of 20 percent to the strict-priority queue.

Scheduling and Congestion Avoidance

These sections describe scheduling and congestion avoidance:

- 2q2t Ports, page 43-28
- 1p2q2t Ports, page 43-28
- 1p3q1t Ports, page 43-29
- 1p2q1t Ports, page 43-29

Note The explanations in these sections use default values. You can configure many of the parameters (for more information, see the "Configuring QoS on the Switch" section on page 43-34). All ports of the same type use the same drop-threshold configuration.

2q2t Ports

For **2q2t** ports, each transmit queue has two tail-drop thresholds that function as follows:

- Frames with CoS 0, 1, 2, or 3 go to the low-priority transmit queue (queue 1):
  - Using transmit queue 1, tail-drop threshold 1, the switch drops frames with CoS 0 or 1 when the low-priority transmit-queue buffer is 80 percent full.
  - Using transmit queue 1, tail-drop threshold 2, the switch drops frames with CoS 2 or 3 when the low-priority transmit-queue buffer is 100 percent full.
- Frames with CoS 4, 5, 6, or 7 go to the high-priority transmit queue (queue 2):
  - Using transmit queue 2, tail-drop threshold 1, the switch drops frames with CoS 4 or 5 when the high-priority transmit-queue buffer is 80 percent full.
  - Using transmit queue 2, tail-drop threshold 2, the switch drops frames with CoS 6 or 7 when the high-priority transmit-queue buffer is 100 percent full.

1p2q2t Ports

1p2q2t ports have a strict-priority queue and two standard transmit queues. The two standard transmit queues each have two WRED-drop thresholds.

- Frames with CoS 5 go to the strict-priority transmit queue (queue 3), where the switch drops frames only when the buffer is 100 percent full.
- Frames with CoS 0, 1, 2, or 3 go to the low-priority standard transmit queue (queue 1) as follows:
  - Using standard transmit queue 1, WRED-drop threshold 1, the switch drops frames with CoS 0 or 1 when the low-priority transmit-queue buffer is 80 percent full.
  - Using standard transmit queue 1, WRED-drop threshold 2, the switch drops frames with CoS 2 or 3 when the low-priority transmit-queue buffer is 100 percent full.

- Frames with CoS 4, 6, or 7 go to the high-priority standard transmit queue (queue 2) as follows:
  - Using standard transmit queue 2, WRED-drop threshold 1, the switch drops frames with CoS 4 when the high-priority transmit-queue buffer is 80 percent full.
  - Using standard transmit queue 2, WRED-drop threshold 2, the switch drops frames with CoS 6 or 7 when the high-priority transmit-queue buffer is 100 percent full.

1p3q1t Ports

1p3q1t ports have a strict-priority queue and three standard transmit queues. The standard transmit queues each have one WRED-drop threshold and one nonconfigurable tail-drop threshold.

- Frames with CoS 5 go to the strict-priority transmit queue (queue 4), where the switch drops frames only when the buffer is 100 percent full.
- Frames with CoS 0 and 1 go to the low-priority standard transmit queue (queue 1).
- Frames with CoS 2, 3, or 4 go to the medium-priority standard transmit queue (queue 2).
- Frames with CoS 6 or 7 go to the high-priority standard transmit queue (queue 3).

Note You can configure each standard transmit queue to use both a nonconfigurable 100 percent tail-drop threshold and a configurable WRED-drop threshold (see the "1p3q1t Transmit Queues" section on page 43-59). The switch uses tail-drop thresholds for traffic carrying CoS values that are mapped only to a queue. The switch uses WRED-drop thresholds for traffic carrying CoS values that are mapped to a queue and a threshold.

1p2q1t Ports

1p2q1t ports have a strict-priority queue and two standard transmit queues. The standard transmit queues each have one WRED-drop threshold and one nonconfigurable tail-drop threshold.

- Frames with CoS 5 go to the strict-priority transmit queue (queue 3), where the switch drops frames only when the buffer is 100 percent full.
- The standard transmit queues have WRED-drop thresholds as follows:
  - Frames with CoS 0, 1, 2, or 3 go to the low-priority transmit queue (queue 1), where the switch starts to drop frames when the low-priority transmit-queue buffer is 70 percent full and drops all frames with CoS 0, 1, 2, or 3 when the buffer is 100 percent full.
  - Frames with CoS 4, 6, or 7 go to the high-priority transmit queue (queue 2), where the switch starts to drop frames when the high-priority transmit-queue buffer is 70 percent full and drops all frames with CoS 4, 6, or 7 when the buffer is 100 percent full.

Note You can configure each standard transmit queue to use both the tail-drop and the WRED-drop threshold by mapping a CoS value to a queue or to a queue and a threshold. The switch uses tail-drop thresholds for traffic carrying CoS values that are mapped only to a queue. The switch uses WRED-drop thresholds for traffic carrying CoS values that are mapped to a queue and a threshold. See the "1p2q1t Transmit Queues" section on page 43-60.

Marking

When traffic is transmitted from the switch, QoS writes the ToS byte into IP traffic (Layer 3 switching engine only) and the CoS value that was used for scheduling and congestion avoidance into ISL or 802.1Q traffic (for more information, see the "Final Layer 3 Switching Engine CoS and ToS Values" section on page 43-26).

QoS Statistics Data Export

The QoS statistics data export feature generates per-port and per-aggregate policer utilization information and forwards this information in UDP packets to traffic monitoring, planning, or accounting applications. You can enable QoS statistics data export on a per-port or per-aggregate policer basis. The statistics data that is generated per port consists of counts of the input and output packets and bytes. The aggregate policer statistics consists of counts of allowed packets and counts of packets exceeding the policed rate.

The QoS statistics data collection occurs periodically at a fixed interval, but the interval at which the data is exported is configurable. QoS statistics collection is enabled by default, and the data export feature is disabled by default for all ports and all aggregate policers that are configured on the Catalyst 6500 series switch.

Note

- Per-port counter information and utilization statistics are not available for ATM ports.
- The QoS statistics data export feature is completely separate from TopN and NetFlow Data Export and does not interact with either of these features.

For information on configuring QoS statistics data export, see the "Configuring QoS Statistics Data Export" section on page 43-76.

QoS Default Configuration

Table 43-3 shows the QoS default configuration.

Table 43-3 QoS Default Configuration

Feature	Default Value
QoS enable state	Disabled **Note**—With QoS enabled and all other QoS parameters at default values, QoS sets Layer 3 DSCP to 0 and Layer 2 CoS to 0 in all traffic that is transmitted from the switch.
Port CoS value	0
IntraVLAN microflow policing	Disabled

Table 43-3 QoS Default Configuration (continued)

Feature	Default Value
CoS to internal DSCP map (internal DSCP set from CoS values)	CoS 0 = DSCP 0 CoS 1 = DSCP 8 CoS 2 = DSCP 16 CoS 3 = DSCP 24 CoS 4 = DSCP 32 CoS 5 = DSCP 40 CoS 6 = DSCP 48 CoS 7 = DSCP 56
IP precedence to internal DSCP map (internal DSCP set from IP precedence values)	IP precedence 0 = DSCP 0 IP precedence 1 = DSCP 8 IP precedence 2 = DSCP 16 IP precedence 3 = DSCP 24 IP precedence 4 = DSCP 32 IP precedence 5 = DSCP 40 IP precedence 6 = DSCP 48 IP precedence 7 = DSCP 56
Internal DSCP to egress CoS map (egress CoS set from internal DSCP values)	DSCP 0–7 = CoS 0 DSCP 8–15 = CoS 1 DSCP 16–23 = CoS 2 DSCP 24–31 = CoS 3 DSCP 32–39 = CoS 4 DSCP 40–47 = CoS 5 DSCP 48–55 = CoS 6 DSCP 56–63 = CoS 7

Table 43-3 QoS Default Configuration (continued)

Feature	Default Value
1p2q1t transmit-queue port CoS value/drop-threshold mapping	• Transmit queue 1 (standard low priority) WRED-drop threshold: – CoS 0, 1, 2, and 3 – Low WRED threshold: 70% – High WRED-drop threshold: 100% • Transmit queue 2 (standard high priority) WRED-drop threshold: – CoS 4, 6, or 7 – Low WRED threshold: 70% – High WRED-drop threshold: 100% • Transmit queue 3 (strict-priority): CoS 5
With QoS disabled	
Runtime—Port based or VLAN based	VLAN based
Config—Port based or VLAN based	Port based
Port trust state	**trust-cos** (Layer 2 switching engine) **trust-dscp** (Layer 3 switching engine)
Receive-queue drop-threshold percentages	All thresholds set to 100%
Transmit-queue drop-threshold percentages	All thresholds set to 100%
Transmit-queue low-priority/high-priority bandwidth allocation ratio	255:1
Transmit-queue size ratio	• Low priority: 100% • High priority: Not used
CoS value/drop-threshold mapping	Receive-drop threshold 1 and transmit-queue 1/drop threshold 1: CoS 0–7

Configuring QoS on the Switch

These sections describe how to configure QoS on the Catalyst 6500 series switches:

- Enabling QoS, page 43-35
- Enabling Port-Based or VLAN-Based QoS, page 43-36
- Configuring the Trust State of a Port, page 43-36
- Configuring the CoS Value for a Port, page 43-37
- Creating Policers, page 43-38
- Deleting Policers, page 43-40
- Creating or Modifying ACLs, page 43-41
- Attaching ACLs to Interfaces, page 43-50
- Detaching ACLs from Interfaces, page 43-50

- Mapping a CoS Value to a Host Destination MAC Address/VLAN Pair, page 43-51
- Deleting a CoS Value to a Host Destination MAC Address/VLAN Pair, page 43-51
- Enabling or Disabling Microflow Policing of Bridged Traffic, page 43-52
- Configuring Standard Receive-Queue Tail-Drop Thresholds, page 43-52
- Configuring 2q2t Port Standard Transmit-Queue Tail-Drop Thresholds, page 43-53
- Configuring Standard Queue WRED-Drop Thresholds, page 43-53
- Allocating Bandwidth Between Standard Transmit Queues, page 43-55
- Configuring the Receive-Queue Size Ratio, page 43-56
- Configuring the Transmit-Queue Size Ratio, page 43-56
- Mapping CoS Values to Drop Thresholds, page 43-56
- Configuring DSCP Value Maps, page 43-61
- Displaying QoS Information, page 43-64
- Displaying QoS Statistics, page 43-65
- Reverting to QoS Defaults, page 43-66
- Disabling QoS, page 43-66
- Configuring COPS Support, page 43-66
- Configuring RSVP Support, page 43-72
- Configuring QoS Statistics Data Export, page 43-76

Note Some QoS **show** commands support the **config** and **runtime** keywords. Use the **runtime** keyword to display the QoS values that are currently programmed into the hardware. When you disable QoS, the display with the **runtime** keyword is "QoS is disabled." Use the **config** keyword to display values from commands that have been entered but which may not currently be programmed into the hardware (for example, locally configured QoS values that are currently not used because COPS has been selected as the QoS policy source or QoS values that are configured when QoS is disabled).

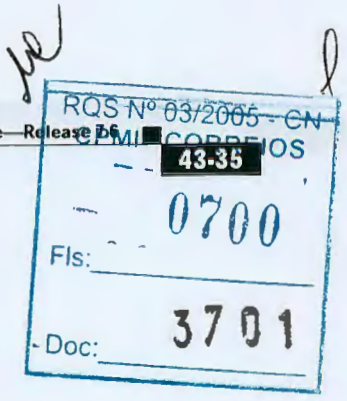
Enabling QoS

To enable QoS, perform this task in privileged mode:

Task	Command
Enable QoS on the switch.	**set qos {enable | disable}**

This example shows how to enable QoS:

```
Console> (enable) set qos enable
QoS is enabled.
Console> (enable)
```



Enabling Port-Based or VLAN-Based QoS

Note The commands in this section are not supported with a Layer 2 Switching Engine.

By default, QoS uses ACLs that are attached to ports. On a per-port basis, you can configure QoS to use ACLs that are attached to a VLAN. To enable VLAN-based QoS on a port, perform this task in privileged mode:

	Task	Command
Step 1	Enable VLAN-based QoS on a port.	**set port qos** *mod/port* {**port-based** | **vlan-based**}
Step 2	Verify the configuration.	**show port qos** *mod/port*

For more information, see the "Attaching ACLs" section on page 43-26.

This example shows how to enable VLAN-based QoS on a port:

```
Console> (enable) set port qos 1/1-2 vlan-based
Hardware programming in progress...
QoS interface is set to vlan-based for ports 1/1-2.
Console> (enable)
```

Changing a port from port-based to VLAN-based QoS detaches all ACLs from the port. Any ACLs that are attached to the VLAN apply to the port immediately (for more information, see the "Attaching ACLs to Interfaces" section on page 43-50).

Configuring the Trust State of a Port

This command configures the trust state of a port (for more information, see the "Ethernet Ingress Port Marking, Scheduling, Congestion Avoidance, and Classification" section on page 43-10). By default, all ports are untrusted.

To configure the trust state of a port, perform this task in privileged mode:

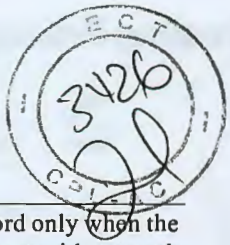
	Task	Command
Step 1	Configure the trust state of a port.	**set port qos trust** {**untrusted** | **trust-cos** | **trust-ipprec** | **trust-dscp**}
Step 2	Verify the configuration.	**show port qos**

Note the following syntax guidelines when configuring the trust state of a port:

- The **trust-ipprec** and **trust-dscp** keywords are supported only with a Layer 3 switching engine.
- **1q4t** ports (except Gigabit Ethernet) do not support the **trust-ipprec** and **trust-dscp** port keywords. You must configure a **trust-ipprec** or **trust-dscp** ACL that matches the ingress traffic to apply the **trust-ipprec** or **trust-dscp** trust state.
- On **1q4t** ports (except Gigabit Ethernet), the **trust-cos** port keyword displays an error message, activates receive-queue drop thresholds, and—as indicated by the error message—does not apply the **trust-cos** trust state to traffic. You must configure a **trust-cos** ACL that matches the ingress traffic to apply the **trust-cos** trust state.

This example shows how to configure port 1/1 with the **trust-cos** keyword:

```
Console> (enable) set port qos 1/1 trust trust-cos
Port 1/1 qos set to trust-cos
Console> (enable)
```



Note Only ISL or 802.1Q frames carry CoS values. Configure ports with the **trust-cos** keyword only when the received traffic is ISL or 802.1Q frames carrying CoS values that you know to be consistent with network policy.

Configuring the CoS Value for a Port

Note Whether or not QoS uses the CoS value that is applied with the **set port qos ...cos** command depends on the trust state of the port and the trust state of the traffic that is received through the port. The **set port qos ... cos** command does not configure the trust state of the port or the trust state of the traffic that is received through the port. To use the CoS value that is applied with the **set port qos ... cos** command, configure a trust-CoS ACL that matches the ingress traffic; or for a port that receives no tagged traffic, configure the port to trust CoS.

Unmarked frames from ports that are configured as trusted and all frames from ports that are configured as untrusted are assigned the CoS value that is specified with this command.

To configure the CoS value for a port, perform this task in privileged mode:

	Task	Command
Step 1	Configure the CoS value for a port.	**set port qos cos** *cos_value*
Step 2	Verify the configuration.	**show port qos**

This example shows how to configure the port CoS value to 3 for port 1/1:

```
Console> (enable) set port qos 1/1 cos 3
Port 1/1 qos cos set to 3
Console> (enable)
```

To revert to the default CoS value for a port, perform this task in privileged mode:

	Task	Command
Step 1	Revert to the default CoS value for a port.	**clear port qos cos**
Step 2	Verify the configuration.	**show port qos**

This example shows how to revert to the default CoS value for port 1/1:

```
Console> (enable) clear port qos 1/1 cos
Port 1/1 qos cos setting cleared.
Console> (enable)
```

Doc:

Creating Policers

Note The commands in this section are not supported with a Layer 2 Switching Engine.

To create a policer, perform this task in privileged mode:

	Task	Command
Step 1	Create a policer.	**set qos policer microflow** *microflow_name* {**rate** *rate*} {**burst** *burst_value*} {**drop** | **policed-dscp**} With PFC or PFC2: **set qos policer aggregate** *aggregate_name* {**rate** *rate*} {**burst** *burst_value*} {**drop** | **policed-dscp**} With PFC2: **set qos policer aggregate** *aggregate_name* {**rate** *rate*} **policed-dscp** {**erate** *erate_value*} {**drop** | **policed-dscp**} **burst** *burst_value* [**eburst** *eburst_value*]
Step 2	Verify the configuration.	**show qos policer** {**config** | **runtime**} {**microflow** | **aggregate** | **all**}

For more information, see the "Policers" section on page 43-24 and the"PFC2 Policing Decisions" section on page 43-25.

The *policer_name* parameter can be up to 31 characters long, is case sensitive, and may include a–z, A–Z, 0–9, the dash character (-), the underscore character (_), and the period character (.). Policer names must start with an alphabetic character (not a digit) and must be unique across all microflow and aggregate policers. You cannot use keywords from any command as a policer name.

The valid values for the *rate* and *erate* parameters are 32 Kbps (entered as 32) to 32 Gbps (entered as 32000000); or to classify all traffic as out of profile, set the *rate* parameter to zero (0). Set the *erate* parameter to a higher value than the *rate* parameter. The PFC1 and PFC2 have the following hardware granularity for rate values:

Rate Value Range	Granularity	Rate Value Range	Granularity
1 to 1024 (1 Mbs)	32768 (32 K)	65537 to 131072 (128 Mbs)	4194304 (4 M)
1025 to 2048 (2 Mbs)	65536 (64 K)	131073 to 262144 (256 Mbs)	8388608 (8 M)
2049 to 4096 (4 Mbs)	131072 (128 K)	262145 to 524288 (512 Mbs)	16777216 (16 M)
4097 to 8192 (8 Mbs)	262144 (256 K)	524289 to 1048576 (1 Gps)	33554432 (32 M)
8193 to 16384 (16 Mbs)	524288 (512 K)	1048577 to 2097152 (2 Gps)	67108864 (64 M)
16385 to 32768 (32 Mbs)	1048576 (1 M)	2097153 to 4194304 (4 Gps)	134217728 (128 M)
32769 to 65536 (64 Mbs)	2097152 (2 M)	4194305 to 8000000 (8 Gps)	268435456 (256 M)

Within each range, QoS programs the hardware with rate values that are multiples of the granularity values.

ECT 3424 CPI AC

The valid values for the *burst* and *eburst* parameters are 1 Kb (entered as 1) to 256 Mb (entered as 256000). When configuring *burst* and *eburst* parameters, note the following:

- The **burst** keyword, the *burst_value* parameter, the optional **eburst** keyword, and the *eburst_value* parameter set the token bucket sizes. To sustain a specific rate, set the token bucket size to be at least the *rate* divided by 4000, because tokens are removed from the bucket every 1/4000th of a second (0.25 ms) and the bucket needs to be at least as large as the burst size to sustain the specified rate.
- If you do not enter the **eburst** keyword and the *eburst_value* parameter, QoS sets both token buckets to the size that is configured with the **burst** keyword and the *burst_value* parameter.
- Because any packet larger than the burst size is considered an out-of-profile packet, make sure that the burst size is greater than or equal to the largest packet size being policed.
- QoS programs the hardware with values that are multiples of 32K (32,768), not with the specific value entered.

Enter either the **drop** keyword to cause all out-of-profile packets to be dropped or the **policed-dscp** keyword to cause all out-of-profile packets with the normal rate to be marked down as specified in the normal markdown DSCP map (for more information, see the "Mapping DSCP Markdown Values" section on page 43-63).

This example shows how to create a microflow policer with a 1-Mbps rate limit and a 10-Mb burst limit that marks down out-of-profile traffic:

```
Console> (enable) set qos policer microflow my-micro rate 1000 burst 10000 policed-dscp
Hardware programming in progress...
QoS policer for microflow my-micro created successfully.
Console> (enable)
```

For PFC2, this example shows how to create an aggregate excess rate policer with a 64-Kbps rate limit and a 128-Kb burst limit that drops traffic exceeding these values:

```
Console> (enable) set qos policer aggregate test rate 64 burst 128 drop
QoS policer for aggregate test created successfully.
Console> (enable) show qos policer config aggregate test
QoS aggregate policers:
QoS aggregate policers:
Aggregate name                 Normal rate (kbps) Burst size (kb) Normal action
------------------------------ ------------------ --------------- -------------
test                                           64             128 policed-dscp
                               Excess rate (kbps) Burst size (kb) Excess action
                               ------------------ --------------- -------------
                                               64             128 drop
                               ACL attached
                               -----------------------------------

Console> (enable)
```

For PFC2, this example shows how to create an aggregate excess rate policer with a 64-Kbps rate limit and a 100-Kb burst limit that will cause all out-of-profile packets to be marked down as specified in the normal markdown DSCP map:

```
Console> (enable) set qos policer aggregate test2 rate 64 burst 100 policed-dscp
QoS policer for aggregate test2 created successfully.
Console> (enable) show qos policer config aggregate test2
QoS aggregate policers:
```

RGS N° 08/2005 - CN
CPMI - CORREIOS
43.39
0702
Fls:
Doc: 3701

```
Aggregate name                   Normal rate (kbps)  Burst size (kb) Normal action
-------------------------------- ------------------  --------------- ------------
test2                                            64             100  policed-dscp
                                 Excess rate (kbps)  Burst size (kb) Excess action
                                 ------------------  --------------- ---------------
                                            8000000             100  policed-dscp
                                 ACL attached
                                 ------------------------------------

Console> (enable)
```

For PFC2, this example shows how to create an aggregate excess rate policer with a 64-Kbps rate limit and a 128-Kb burst limit that will cause traffic that exceeds the normal rate of 64 Kbps and a burst size of 96 Kb to be marked down as specified in the normal markdown DSCP map, and traffic that exceeds 128 Kbps and a burst size of 96 Kb to be dropped:

```
Console> (enable) set qos policer aggregate test3 rate 64 policed-dscp erate 128 drop
burst 96
QoS policer for aggregate test3 created successfully.
Console> (enable) show qos policer config aggregate test3
QoS aggregate policers:
Aggregate name                   Normal rate (kbps)  Burst size (kb) Normal action
-------------------------------- ------------------  --------------- ------------
test3                                            64              96  policed-dscp
                                 Excess rate (kbps)  Burst size (kb) Excess action
                                 ------------------  --------------- ---------------
                                               128              96  drop
                                 ACL attached
                                 ------------------------------------

Console> (enable)
```

Deleting Policers

Note You can only delete policers if they are not attached to any interfaces (for more information, see the "Detaching ACLs from Interfaces" section on page 43-50).

To delete one or all policers, perform this task in privileged mode:

	Task	Command
Step 1	Delete one or all policers.	**clear qos policer** {**microflow** | **aggregate**} {*policer_name* | **all**}
Step 2	Verify the configuration.	**show qos policer** {**config** | **runtime**} {**microflow** | **aggregate** | **all**}

This example shows how to delete the microflow policer named my_micro:

```
Console> (enable) clear qos policer microflow my_micro
my_micro QoS microflow policer cleared.
Console> (enable)
```

Creating or Modifying ACLs

Note The commands in this section are not supported with a Layer 2 Switching Engine.

These sections describe ACL creation and modification:

- ACL Names, page 43-41
- ACE Name, Marking Rule, Policing, and Filtering Syntax, page 43-41
- Named IP ACLs, page 43-42
- Modifying the Default IP ACL, page 43-46
- Creating or Modifying Named IPX ACLs, page 43-46
- Creating or Modifying Named MAC ACLs, page 43-47
- Creating or Modifying the Default IPX and MAC ACLs, page 43-48
- Deleting Named ACLs, page 43-48
- Reverting to Default Values in Default ACLs, page 43-48
- Discarding Uncommitted ACLs, page 43-49
- Committing ACLs, page 43-49

ACL Names

ACL names can be up to 31 characters long, are case sensitive, and may include a–z, A–Z, 0–9, the dash character (-), the underscore character (_), and the period character (.). ACL names must start with an alphabetic character and must be unique across all QoS ACLs of all types. You cannot use keywords from any command as an ACL name.

ACE Name, Marking Rule, Policing, and Filtering Syntax

ACE command syntax is organized as follows:
ACL_command ACL_type_and_name marking_rule policing_rule filtering

For example, in an IP ACE, the command syntax is as follows:

set qos acl ip *acl_name* {**dscp** *dscp_value* | **trust-cos** | **trust-ipprec** | **trust-dscp**} [**microflow** *microflow_name*] [**aggregate** *aggregate_name*] *src_ip_spec* [**precedence** *precedence* | **dscp-field** *dscp*] [**before** *editbuffer_index* | **modify** *editbuffer_index*]

- **set qos acl ip** *acl_name*—Creates a named ACL of the specified type or adds the ACE to the ACL if it already exists. See the "ACL Names" section on page 43-41.
- {**dscp** *dscp_value* | **trust-cos** | **trust-ipprec** | **trust-dscp**}—Selects a marking rule. See the "Marking Rules" section on page 43-23.
- [**microflow** *microflow_name*] [**aggregate** *aggregate_name*]—Optionally configures policing in the ACE. See the "Policers" section on page 43-24.
- *src_ip_spec* [**precedence** *precedence* | **dscp-field** *dscp*]—The rest of the parameters, except the **editbuffer** keywords, configure filtering.

Named IP ACLs

These sections describe creating or modifying IP ACLs:

- Source and Destination IP Addresses and Masks, page 43-42
- Port Operator Parameters, page 43-42
- Precedence Parameter Options, page 43-42
- IP ACEs for TCP Traffic, page 43-43
- IP ACEs for UDP Traffic, page 43-43
- IP ACEs for ICMP Traffic, page 43-44
- IP ACEs for IGMP Traffic, page 43-44
- IP ACLs for Other Layer 4 Protocols, page 43-45
- IP ACEs for Any IP Traffic, page 43-45

Source and Destination IP Addresses and Masks

In IP ACEs, specify the source and destination IP addresses and masks (represented by the *src_ip_spec* and *dest_ip_spec* parameters in the following sections) in the form *ip_address mask*. The mask is mandatory. Use one bits, which need not be contiguous, where you want wildcards.

Use any of the following formats for the address and mask:

- Four-part dotted-decimal 32-bit values
- The keyword **any** as an abbreviation for a wildcard address and wildcard mask of 0.0.0.0 255.255.255.255
- The abbreviation **host** *ip_address* for an address and wildcard mask of *ip_address* 0.0.0.0

Port Operator Parameters

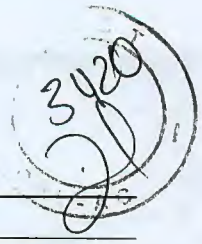
In IP ACEs, the *operator* parameter can be one of the following:

- **lt** (less than)
- **gt** (greater than)
- **eq** (equal)
- **neq** (not equal)
- **range** (with a pair of port parameters)

See the "Layer 4 Operations Configuration Guidelines" section on page 16-23 for restrictions that apply to QoS ACLs.

Precedence Parameter Options

For *precedence* parameter keyword options in IP ACEs, see the "IP ACE Layer 3 Classification Criteria" section on page 43-18.



IP ACEs for TCP Traffic

To create or modify an IP ACE for TCP traffic, perform this task in privileged mode:

	Task	Command
Step 1	Create or modify an IP ACE for TCP traffic.	**set qos acl ip** {*acl_name*} {{**dscp** *dscp_value*} | **trust-cos** | **trust-ipprec** | **trust-dscp**} [**microflow** *microflow_name*] [**aggregate** *aggregate_name*] **tcp** {*src_ip_spec*} [{*operator*} {*port*} [*port*]] {*dest_ip_spec*} [{*operator*} {*port*} [*port*]] [**established**] [**precedence** *precedence_value* | **dscp-field** *dscp*] [**before** *editbuffer_index* | **modify** *editbuffer_index*]
Step 2	Verify the configuration.	**show qos acl info** {**acl_name** | **all**} **editbuffer** [*editbuffer_index*]

For *port* parameter keyword options, see the "IP ACE Layer 4 TCP Classification Criteria" section on page 43-19.

The **established** keyword matches traffic with the ACK or RST bits set.

This example shows how to create an IP ACE for TCP traffic:

```
Console> (enable) set qos acl ip my_IPacl trust-ipprec microflow my-micro aggregate my-agg
tcp any any
my_IPacl editbuffer modified. Use 'commit' command to apply changes.
Console> (enable)
```

IP ACEs for UDP Traffic

To create or modify an IP ACE for UDP traffic, perform this task in privileged mode:

	Task	Command
Step 1	Create or modify an IP ACE for UDP traffic.	**set qos acl ip** {*acl_name*} {{**dscp** *dscp_value*} | **trust-cos** | **trust-ipprec** | **trust-dscp**} [**microflow** *microflow_name*] [**aggregate** *aggregate_name*] **udp** {*src_ip_spec*} [{*operator*} {*port*} [*port*]] {*dest_ip_spec*} [{*operator*} {*port*} [*port*]] [**precedence** *precedence_value* | **dscp-field** *dscp*] [**before** *editbuffer_index* | **modify** *editbuffer_index*]
Step 2	Verify the configuration.	**show qos acl info** {**acl_name** | **all**} **editbuffer** [*editbuffer_index*]

For *port* parameter keyword options, see the "IP ACE Layer 4 UDP Classification Criteria" section on page 43-20.

This example shows how to create an IP ACE for UDP traffic:

```
Console> (enable) set qos acl ip my_IPacl trust-ipprec microflow my-micro aggregate my-agg
udp any any
my_IPacl editbuffer modified. Use 'commit' command to apply changes.
Console> (enable)
```

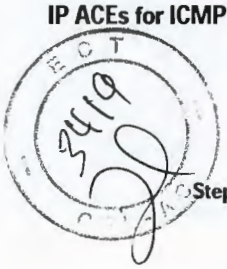
IP ACEs for ICMP Traffic



To create or modify an IP ACE for ICMP traffic, perform this task in privileged mode:

	Task	Command
Step 1	Create or modify an IP ACE for ICMP traffic.	**set qos acl ip** *acl_name* {**dscp** *dscp* | **trust-cos** | **trust-ipprec** | **trust-dscp**} [**microflow** *microflow_name*] [**aggregate** *aggregate_name*] **icmp** *src_ip_spec dest_ip_spec* [*icmp_type* [*icmp_code*] | *icmp_message*] [**precedence** *precedence* | **dscp-field** *dscp*] [**before** *editbuffer_index* | **modify** *editbuffer_index*]
Step 2	Verify the configuration.	**show qos acl info** {**acl_name** | **all**} **editbuffer** [*editbuffer_index*]

For *icmp_code* and *icmp_type* parameter keyword options, see the "IP ACE Layer 4 ICMP Classification Criteria" section on page 43-20.

This example shows how to create an IP ACE for ICMP *echo* traffic:

```
Console> (enable) set qos acl ip my_IPacl trust-ipprec microflow my-micro aggregate my-agg
icmp any any echo
my_IPacl editbuffer modified. Use 'commit' command to apply changes.
Console> (enable)
```

IP ACEs for IGMP Traffic

Note QoS does not support IGMP traffic when IGMP snooping is enabled.

To create or modify an IP ACE for IGMP traffic, perform this task in privileged mode:

	Task	Command
Step 1	Create or modify an IP ACE for IGMP traffic.	**set qos acl ip** *acl_name* {**dscp** *dscp_value* | **trust-cos** | **trust-ipprec** | **trust-dscp**} [**microflow** *microflow_name*] [**aggregate** *aggregate_name*] **igmp** *src_ip_spec dest_ip_spec* [*igmp_type*] [**precedence** *precedence_value* | **dscp-field** *dscp*] [**before** *editbuffer_index* | **modify** *editbuffer_index*]
Step 2	Verify the configuration.	**show qos acl info** {**acl_name** | **all**} **editbuffer** [*editbuffer_index*]

3418

For *igmp_type* parameter keyword options, see the "IP ACE Layer 4 IGMP Classification Criteria" section on page 43-21.

This example shows how to create an IP ACE for IGMP Protocol Independent Multicast (PIM) traffic:

```
Console> (enable) set qos acl ip my_IPacl trust-ipprec microflow my-micro aggregate my-agg
igmp any any pim
my_IPacl editbuffer modified. Use 'commit' command to apply changes.
Console> (enable)
```

IP ACLs for Other Layer 4 Protocols

To create or modify a named IP ACL with additional parameters that match all Layer 4 protocols, perform this task in privileged mode:

	Task	Command
Step 1	Create or modify an IP ACE.	**set qos acl ip** *acl_name* {**dscp** *dscp_value* | **trust-cos** | **trust-ipprec** | **trust-dscp**} [**microflow** *microflow_name*] [**aggregate** *aggregate_name*] *protocol src_ip_spec dest_ip_spec* [**precedence** *precedence_value* | **dscp-field** *dscp*] [**before** *editbuffer_index* | **modify** *editbuffer_index*]
Step 2	Verify the configuration.	**show qos acl info** {**acl_name** | **all**} **editbuffer** [*editbuffer_index*]

For *protocol* parameter keyword options, see the "IP ACE Layer 4 Protocol Classification Criteria" section on page 43-19.

This example shows how to create an IP ACE for IPINIP traffic:

```
Console> (enable) set qos acl ip my_IPacl trust-ipprec microflow my-micro aggregate my-agg
ipinip any any
my_IPacl editbuffer modified. Use 'commit' command to apply changes.
Console> (enable)
```

IP ACEs for Any IP Traffic

To create or modify an IP ACE that matches all IP traffic, perform this task in privileged mode:

	Task	Command
Step 1	Create or modify an IP ACE.	**set qos acl ip** *acl_name* {**dscp** *dscp* | **trust-cos** | **trust-ipprec** | **trust-dscp**} [**microflow** *microflow_name*] [**aggregate** *aggregate_name*] *src_ip_spec* [**precedence** *precedence* | **dscp-field** *dscp*] [**before** *editbuffer_index* | **modify** *editbuffer_index*]
Step 2	Verify the configuration.	**show qos acl info** {**acl_name** | **all**} **editbuffer** [*editbuffer_index*]

CPMI - CORREIOS
0705
Fls:
Doc: 3701

This example shows how to create an IP ACE:

```
Console> (enable) set qos acl ip my_IPacl trust-ipprec microflow my-micro aggregate my-agg
any
my_IPacl editbuffer modified. Use 'commit' command to apply changes.
Console> (enable)
```

Modifying the Default IP ACL

To modify the default IP ACL, perform this task in privileged mode:

	Task	Command
Step 1	Modify the default IP ACL.	**set qos acl default-action ip** {**dscp** *dscp* | **trust-cos** | **trust-ipprec** | **trust-dscp**} [**microflow** *microflow_name*] [**aggregate** *aggregate_name*]
Step 2	Verify the configuration.	**show qos acl info default-action** {**ip** | **ipx** | **mac** | **all**}

For more information, see the "Default ACLs" section on page 43-22.

This example shows how to modify the default IP ACL:

```
Console> (enable) set qos acl default-action ip dscp 5 microflow my-micro aggregate my-agg
QoS default-action for IP ACL is set successfully.
Console> (enable)
```

Creating or Modifying Named IPX ACLs

To create or modify a named IPX ACL, perform this task in privileged mode:

	Task	Command
Step 1	Create or modify a named IPX ACL.	With PFC: **set qos acl ipx** *acl_name* {**dscp** *dscp_value* | **trust-cos**} [**aggregate** *aggregate_name*] *protocol src_net* [*dest_net*[*.dest_node*] [[*dest_net_mask*] *.dest_node_mask*]] [**before** *editbuffer_index* | **modify** *editbuffer_index*] With PFC2: **set qos acl ipx** *acl_name* **aggregate** *aggregate_name protocol src_net* [*dest_net*[*.dest_node*] [[*dest_net_mask*] *.dest_node_mask*]] [**before** *editbuffer_index* | **modify** *editbuffer_index*]
Step 2	Verify the configuration.	**show qos acl info** {**acl_name** | **all**} **editbuffer** [*editbuffer_index*]

The *protocol* parameter can be specified numerically (0–255) or with these keywords: **any**, **ncp** (17), **netbios** (20), **rip** (1), **sap** (4), or **spx** (5).

The *src_net* and *dest_net* parameters are IPX network numbers, entered as up to 8 hexadecimal digits in the range 1 to FFFFFFFE (-1 matches any network number). You do not need to enter leading zeros.

If you specify an IPX destination network, IPX ACEs support the following optional parameters:

- An IPX destination network mask, entered as up to 8 hexadecimal digits in the range 1 to FFFFFFFE (-1 matches any network number). Use one bits, which need not be contiguous, where you want wildcards.
- An IPX destination node, entered as 12 hexadecimal digits (48 bits), formatted as a dotted triplet of four-digit hexadecimal digits each (xxxx.xxxx.xxxx).
- If you specify an IPX destination node, IPX ACEs support an IPX destination node mask, entered as 12 hexadecimal digits (48 bits), formatted as a dotted triplet of four-digit hexadecimal digits each (xxxx.xxxx.xxxx). Use one bits, which need not be contiguous, where you want wildcards.

This example shows how to create an IPX ACE:

```
Console> (enable) set qos acl ipx my_IPXacl trust-cos aggregate my-agg -1
my_IPXacl editbuffer modified. Use 'commit' command to apply changes.
Console> (enable)
```

Creating or Modifying Named MAC ACLs

To create or modify a named MAC ACL, perform this task in privileged mode:

	Task	Command
Step 1	Create or modify a named MAC ACL.	With PFC: **set qos acl mac** *acl_name* {**dscp** *dscp_value* | **trust-cos**} [**aggregate** *aggregate_name*] *src_mac_spec dest_mac_spec* [*ethertype*] [**before** *editbuffer_index* | **modify** *editbuffer_index*] With PFC2: **set qos acl mac** *acl_name* **aggregate** *aggregate_name src_mac_spec dest_mac_spec* [*ethertype*] [**before** *editbuffer_index* | **modify** *editbuffer_index*]
Step 2	Verify the configuration.	**show qos acl info** {**acl_name** | **all**} **editbuffer** [*editbuffer_index*]

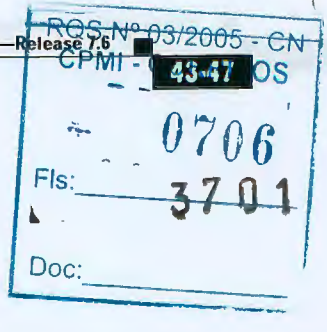
Enter the *src_mac_spec* and *dest_mac_spec* parameters as a MAC address and a mask. Each parameter is 12 hexadecimal digits (48 bits), formatted as dash-separated pairs. Use one bits, which need not be contiguous, where you want wildcards. Use the **any** keyword for a MAC address and mask of 0-0-0-0-0-0 ff-ff-ff-ff-ff-ff. Use the **host** keyword with a MAC address to specify an all-zero mask (*mac_address* 0-0-0-0-0-0).

Enter the *ethertype* parameter as 4 hexadecimal digits (16 bits) prefaced with **0x** (for example, 0x0600) or as a keyword (see the "MAC ACE Layer 2 Classification Criteria" section on page 43-22).

This example shows how to create a MAC ACE:

```
Console> (enable) set qos acl mac my_MACacl trust-cos aggregate my-agg any any
my_MACacl editbuffer modified. Use 'commit' command to apply changes.
Console> (enable)
```

Note QoS MAC ACLs that do not include an ethertype parameter match traffic with any value in the ethertype field, which allows MAC-level QoS to be applied to any traffic except IP and IPX.



Creating or Modifying the Default IPX and MAC ACLs

To create or modify the default IPX or MAC ACL, perform this task in privileged mode:

	Task	Command
Step 1	Create or modify the default IPX or MAC ACL.	With PFC: **set qos acl default-action {ipx | mac} {dscp** *dscp* **| trust-cos} [aggregate** *aggregate_name*] With PFC2: **set qos acl default-action {ipx | mac} aggregate** *aggregate_name*
Step 2	Verify the configuration.	**show qos acl info default-action {ip | ipx | mac | all}**

For more information, see the "Default ACLs" section on page 43-22.

This example shows how to modify the default IPX ACL:

```
Console> (enable) set qos acl default-action ipx dscp 5 aggregate my-agg
QoS default-action for IPX ACL is set successfully.
Console> (enable)
```

Note IPX and MAC ACLs do not support microflow policers.

Deleting Named ACLs

To delete a named ACL, perform this task in privileged mode:

	Task	Command
Step 1	Delete a named ACL.	**clear qos acl** *acl_name* [*editbuffer_index*]
Step 2	Verify the configuration.	**show qos acl info** {*acl_name* | **all**}

This example shows how to delete the ACL named icmp_acl:

```
Console> (enable) clear qos acl icmp_acl 1
ACL icmp_acl ACE# 1 is deleted.
icmp_acl editbuffer modified. Use 'commit' command to apply changes.
Console> (enable)
```

Reverting to Default Values in Default ACLs

To revert to the default values for a default ACL, perform this task in privileged mode:

	Task	Command
Step 1	Revert to the default values for a default ACL.	**clear qos acl default-action {ip | ipx | mac}**
Step 2	Verify the configuration.	**show qos acl info default-action {ip | ipx | mac | all}**

This example shows how to revert to the default values for the default IP ACL:

```
Console> (enable) clear qos acl default-action ip
Hardware programming in progress...
QoS default-action for IP ACL is restored to default setting.
Console> (enable)
```

Discarding Uncommitted ACLs

To discard an uncommitted new ACL or uncommitted changes to an existing ACL, perform this task in privileged mode:

	Task	Command
Step 1	Discard an uncommitted ACL.	**rollback qos acl** {*acl_name* | **all**}
Step 2	If you discarded changes to an existing ACL, verify the configuration.	**show qos acl info** {*acl_name* | **all**}

This example shows how to discard an uncommitted ACL named my_acl:

```
Console> (enable) rollback qos acl my_acl
Rollback for QoS ACL my_acl is successful.
Console> (enable)
```

Note Changes to the default ACLs take effect immediately and cannot be discarded.

Committing ACLs

When you create, change, or delete a named ACL, the changes exist temporarily in an edit buffer in memory. To commit the ACL so that it can be used, perform this task in privileged mode:

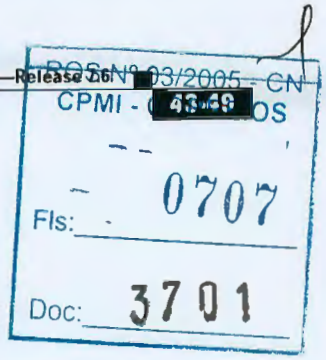
	Task	Command
Step 1	Commit an ACL.	**commit qos acl** *acl_name*
Step 2	Verify the configuration.	**show config qos acl** {*acl_name* | **all**}

This example shows how to commit an ACL named my_acl:

```
Console> (enable) commit qos acl my_acl
Hardware programming in progress...
ACL my_acl is committed to hardware.
Console> (enable)
```

Note When you commit an ACL that has already been attached to interfaces, the new values go into effect immediately. Changes to the default ACLs do not need to be committed.

See the "Configuring and Storing VACLs and QoS ACLs in Flash Memory" section on page 16-55 for information about where QoS ACLs are stored.



Attaching ACLs to Interfaces

Note The commands in this section are not supported with a Layer 2 Switching Engine.

You can attach one ACL of each type to each VLAN and to each port that is configured for port-based QoS. You cannot attach ACLs to a port that is configured for VLAN-based QoS (for more information, see the "Enabling Port-Based or VLAN-Based QoS" section on page 43-36). When an ACL of a particular type (IP, IPX, or Ethernet) is already attached to an interface, attaching a different ACL of the same type detaches the previous ACL.

To attach an ACL to a port or a VLAN, perform this task in privileged mode:

	Task	Command
Step 1	Attach an ACL to an interface.	**set qos acl map** *acl_name* {*mod/port* | *vlan*}
Step 2	Verify the configuration.	**show qos acl map** {**config** | **runtime**} {*acl_name* | *mod/port* | *vlan* | **all**}

This example shows how to attach an ACL named my_acl to port 2/1:

```
Console> (enable) set qos acl map my_acl 2/1
Hardware programming in progress...
ACL my_acl is attached to port 2/1.
Console> (enable)
```

This example shows how to attach an ACL named my_acl to VLAN 4:

```
Console> (enable) set qos acl map my_acl 4
Hardware programming in progress...
ACL my_acl is attached to vlan 4.
Console> (enable)
```

Note The default ACLs do not need to be attached to any interfaces.

Detaching ACLs from Interfaces

Note The commands in this section are not supported with a Layer 2 Switching Engine.

To detach an ACL from a port or a VLAN, perform this task in privileged mode:

	Task	Command
Step 1	Detach an ACL from an interface.	**clear qos acl map** *acl_name* {*mod/port* | *vlan* | **all**}
Step 2	Verify the configuration.	**show qos acl map** {**config** | **runtime**} {*acl_name* | *mod/port* | *vlan* | **all**}

This example shows how to detach an ACL named my_acl from port 2/1:

```
Console> (enable) clear qos acl map my_acl 2/1
Hardware programming in progress...
ACL my_acl is detached from port 2/1.
Console> (enable)
```

This example shows how to detach an ACL named my_acl from VLAN 4:

```
Console> (enable) clear qos acl map my_acl 4
Hardware programming in progress...
ACL my_acl is detached from vlan 4.
Console> (enable)
```

Note The default ACLs cannot be detached from any interfaces.

Mapping a CoS Value to a Host Destination MAC Address/VLAN Pair

Note QoS only supports this command with a Layer 2 Switching Engine.

To map a CoS value to all frames that are destined for a particular host destination MAC address and VLAN number value pair, perform this task in privileged mode:

	Task	Command
Step 1	Map a CoS value to a host destination MAC address/VLAN pair.	**set qos mac-cos** *dest_mac VLAN cos_value*
Step 2	Verify the configuration.	**show qos mac-cos** {*dest_mac* [*vlan*] | **all**}

This example shows how to map CoS 2 to a destination MAC address and VLAN 525:

```
Console> (enable) set qos mac-cos 00-40-0b-30-03-48 525 2
CoS 2 is assigned to 00-40-0b-30-03-48 vlan 525.
Console> (enable)
```

Deleting a CoS Value to a Host Destination MAC Address/VLAN Pair

Note QoS only supports this command with a Layer 2 Switching Engine.

To delete a host destination MAC address and VLAN number value pair CoS assignment, perform this task in privileged mode:

	Task	Command
Step 1	Delete a host destination MAC address and VLAN number value pair CoS assignment.	**clear qos mac-cos** {*dest_mac* [*vlan*] | **all**}
Step 2	Verify the configuration.	**show qos mac-cos** {*dest_mac* [*vlan*] | **all**}

RQS Nº 03/2005 - CN
CPMI - CO
43-51
0708
Fls:
Doc: 3701

This example shows how to delete all CoS assignments to destination MAC addresses and VLANs:

```
Console> (enable) clear qos mac-cos all
All CoS to Mac/Vlan entries are cleared.
Console> (enable)
```

Enabling or Disabling Microflow Policing of Bridged Traffic

Note The commands in this section are not supported with a Layer 2 Switching Engine.

By default, microflow policers affect only Layer 3-switched traffic. To enable or disable microflow policing of bridged traffic on the switch or on specified VLANs, perform one of these tasks in privileged mode:

Task	Command
Enable microflow policing of bridged traffic on the switch or on specified VLANs.	**set qos bridged-microflow-policing** {**enable** | **disable**} *vlan*
Disable microflow policing of bridged traffic on the switch or on specified VLANs.	**set qos bridged-microflow-policing** {**enable** | **disable**} *vlan*
Verify the configuration.	**show qos bridged-microflow-policing runtime** {**config** | **runtime**} *vlan*

Note With Layer 3 Switching Engine II, to do any microflow policing, you must enable microflow policing of bridged traffic.

For more information, see the "Policers" section on page 43-24.

This example shows how to enable microflow policing of traffic in VLANs 1 through 20:

```
Console> (enable) set qos bridged-microflow-policing enable 1-20
QoS microflow policing is enabled for bridged packets on vlans 1-20.
Console> (enable)
```

Configuring Standard Receive-Queue Tail-Drop Thresholds

To configure the standard receive-queue tail-drop thresholds on the switch, perform this task in privileged mode:

Task	Command
Configure the standard receive-queue tail-drop thresholds.	**set qos drop-threshold** *port_type* **rx queue 1** *thr1 thr2 thr3 thr4*

For more information, see the "Receive Queues" section on page 43-12.

QoS maintains separate configurations for **1q2t**, **1q4t**, and **1p1q4t** ports. This command configures the standard queue. Specify queue 1 (the threshold in the strict-priority queue, when present, is not separately configurable; it uses threshold 4 as specified for queue 1).

The thresholds are all specified as percentages ranging from 1–100. A value of 10 indicates a threshold when the buffer is 10 percent full.

This example shows how to configure the standard receive-queue tail-drop thresholds:

```
Console> (enable) set qos drop-threshold 1q4t rx queue 1 20 40 75 100
Receive drop thresholds for queue 1 set at 20% 40% 75% 100%
Console> (enable)
```

Note You cannot configure a drop threshold in a **1p1q0t** receive queue.

Configuring 2q2t Port Standard Transmit-Queue Tail-Drop Thresholds

To configure the standard transmit-queue tail-drop thresholds on all **2q2t** ports, perform this task in privileged mode:

Task	Command
Configure the standard transmit-queue tail-drop thresholds on all **2q2t** ports.	**set qos drop-threshold** *port_type* **tx queue** *q# thr1 thr2*

Queue number 1 is the low-priority transmit queue and queue number 2 is high priority. In each queue, the low-priority threshold number is 1 and the high-priority threshold number is 2.

The thresholds are all specified as percentages ranging from 1–100. A value of 10 indicates a threshold when the buffer is 10 percent full.

This example shows how to configure the low-priority transmit-queue tail-drop thresholds:

```
Console> (enable) set qos drop-threshold 2q2t tx queue 1 40 100
Transmit drop thresholds for queue 1 set at 40%  100%
Console> (enable)
```

Note You cannot configure the tail-drop thresholds in **1p3q1t** transmit queues.

Configuring Standard Queue WRED-Drop Thresholds

1p2q2t, **1p3q1t**, and **1p2q1t** ports have weighted random early detection (WRED)-drop thresholds in their standard transmit queues.

A **1p1q8t** port has WRED-drop thresholds in its standard receive queue.

Note **1p3q1t** (transmit), **1p2q1t** (transmit), and **1p1q8t** (receive) ports also have nonconfigurable tail-drop thresholds (see the "1p3q1t Ports" section on page 43-29).

RQS Nº 03/ 43-53 N
CPMI - CORREIOS
0709
Fls:
3701
Doc:

To configure the standard queue WRED-drop thresholds on all ports of each type, perform this task in privileged mode:

Task	Command
Configure the standard queue WRED-drop thresholds on all ports of a given type.	**set qos wred 1p2q2t [tx] queue** *q#* [*thr1Lo*:]*thr1Hi* [*thr2Lo*:]*thr2Hi* **set qos wred 1p3q1t [tx] queue** *q#* [*thr1Lo*:]*thr1Hi* **set qos wred 1p1q8t queue** *q#* [*thr1Lo*:]*thr1Hi* [*thr2Lo*:]*thr2Hi* [*thr_n_Lo*:]*thr_n_Hi*... [*thr8Lo*:]*thr8Hi* **set qos wred 1p2q1t [tx] queue** *q#* [*thr1Lo*:]*thr1Hi*

When configuring **1p2q2t** ports, note the following:

- Queue 1 is the low-priority standard transmit queue.
- Queue 2 is the high-priority standard transmit queue.
- When configuring each standard transmit queue, note the following:
  - The first percentage that you enter sets the low-priority threshold.
  - The second percentage that you enter sets the high-priority threshold.

When configuring **1p3q1t** ports, note the following:

- Queue 1 is the low-priority standard transmit queue.
- Queue 2 is the medium-priority standard transmit queue.
- Queue 3 is the high-priority standard transmit queue.
- When you configure each standard transmit queue, the single percentage that you enter sets the threshold.

When configuring **1p1q8t** ports, note the following:

- Queue 1 is the single standard receive queue.
- When you configure the single standard receive queue, note the following:
  - The first percentage that you enter sets the lowest-priority threshold.
  - The second percentage that you enter sets the next highest-priority threshold.
  - The eighth percentage that you enter sets the highest-priority threshold.

When configuring **1p2q1t** ports, note the following:

- Queue 1 is the low-priority standard transmit queue.
- Queue 2 is the high-priority standard transmit queue.
- When you configure each standard transmit queue, the single percentage that you enter sets the threshold.

When configuring thresholds, note the following:

- The thresholds are all specified as percentages ranging from 0–100. A value of 10 indicates a threshold when the buffer is 10 percent full.
- You can configure both the low WRED threshold and the high WRED threshold. You must set the low threshold to a lower percentage than the high threshold.
- The low WRED threshold is the traffic level under which no traffic is dropped. The high WRED threshold is the traffic level above which all traffic is dropped. Traffic in the queue between the low and high WRED thresholds has an increasing chance of being dropped as the queue fills. The default low WRED threshold is zero (all traffic has some chance of being dropped).

This example shows how to configure the low-priority transmit-queue WRED-drop thresholds:

```
Console> (enable) set qos wred 1p2q2t queue 1 40:70 70:100
WRED thresholds for queue 1 set to 40:70 and 70:100  on all WRED-capable 1p2q2t ports.
Console> (enable)
```

Note The threshold in the strict-priority queue is not configurable.

Allocating Bandwidth Between Standard Transmit Queues

The switch transmits frames from one standard queue at a time using a weighted-round robin (WRR) algorithm. WRR uses a weight value to decide how much to transmit from one queue before switching to the other. The higher the weight assigned to a queue, the more transmit bandwidth is allocated to it.

To allocate bandwidth between standard transmit queues, perform this task in privileged mode:

Task	Command
Allocate bandwidth between standard transmit queues.	**set qos wrr** *port_type queue1-weight queue2-weight* [*queue3-weight*]

The valid values for the *port_type* parameter are **2q2t**, **1p2q2t**, **1p3q1t**, and **1p2q1t**.

Note **1p2q1t** ports use deficit weighted round robin (DWRR), which transmits from the queues without starving the low-priority queue by keeping track of low-priority queue under-transmission and compensating in the next round.

QoS maintains separate configurations for each port type. This command configures only the standard queues; the strict-priority queue requires no configuration. The valid values for weight range from 1–255.

This example shows how to allocate bandwidth for the **2q2t** ports:

```
Console> (enable) set qos wrr 2q2t 30 70
QoS wrr ratio is set successfully.
Console> (enable)
```

Doc: 3701

Configuring the Receive-Queue Size Ratio

For **1p1q0t** and **1p1q8t** ports, estimate the mix of standard-priority and strict-priority traffic on your network (for example, 85 percent standard-priority traffic and 15 percent strict-priority traffic). Specify queue ratios with the estimated percentages, which must range from 1–99 and together add up to 100.

To configure the receive-queue size ratio, perform this task in privileged mode:

Task	Command
Configure the receive-queue size ratio between receive queue 1 (standard priority) and receive queue 2 (strict priority).	**set qos rxq-ratio** {**1p1q0t** | **1p1q8t**} *queue1-val queue2-val*

This example shows how to configure the receive-queue size ratio:

```
Console> (enable) set qos rxq-ratio 1p1q0t 80 20
QoS rxq-ratio is set successfully.
Console> (enable)
```

Configuring the Transmit-Queue Size Ratio

For **2q2t**, **1p2q2t**, and **1p2q1t** ports, estimate the mix of traffic of various priorities on your network (for example, 75 percent low-priority traffic, 15 percent high-priority traffic, and 10 percent strict-priority traffic). Specify queue ratios with the estimated percentages, which must range from 1–99 and together add up to 100.

To configure the transmit-queue size ratio for each port type, perform this task in privileged mode:

Task	Command
Configure the transmit-queue size ratio.	**set qos txq-ratio** {**2q2t** | **1p2q2t** | **1p2q1t**} *queue1-val queue2-val* [*queue3-val*]

This example shows how to configure the transmit-queue size ratio:

```
Console> (enable) set qos txq-ratio 2q2t 80 20
QoS txq-ratio is set successfully.
Console> (enable)
```

Mapping CoS Values to Drop Thresholds

This command associates CoS values with receive- and transmit-queue drop thresholds. QoS maintains separate configurations for each port type.

These sections describe mapping CoS values to drop thresholds:

- Associating 1q4t/2q2t Ports, page 43-57
- Associating 1q2t/1p2q2t and 1p1q4t/1p2q2t Ports, page 43-57
- Associating 1p1q8t/1p2q1t Ports, page 43-59
- Reverting to CoS Map Defaults, page 43-60

Associating 1q4t/2q2t Ports

On **1q4t/2q2t** ports, you configure the receive queues and the transmit queues with the same command.

To associate CoS values to the drop thresholds on **1q4t/2q2t** ports, perform this task in privileged mode:

	Task	Command
Step 1	Associate a CoS value to a drop threshold.	**set qos map 2q2t tx** *q# thr#* **cos** *coslist*
Step 2	Verify the configuration.	**show qos info config** {**1q4t rx** | **2q2t tx** }

The receive- and transmit-drop thresholds have this relationship:

- Receive queue 1 (standard) threshold 1 = transmit queue 1 (standard low priority) threshold 1
- Receive queue 1 (standard) threshold 2 = transmit queue 1 (standard low priority) threshold 2
- Receive queue 1 (standard) threshold 3 = transmit queue 2 (standard high priority) threshold 1
- Receive queue 1 (standard) threshold 4 = transmit queue 2 (standard high priority) threshold 2

Use the transmit queue and transmit-queue drop-threshold values in this command. This example shows how to associate the CoS values 0 and 1 to both standard receive-queue 1/threshold 1 and standard transmit-queue 1/threshold 1:

```
Console> (enable) set qos map 2q2t tx 1 1 cos 0,1
Qos tx priority queue and threshold mapped to cos successfully.
Console> (enable)
```

Associating 1q2t/1p2q2t and 1p1q4t/1p2q2t Ports

On **1q2t/1p2q2t** and **1p1q4t/1p2q2t** ports, you configure the receive queues and the transmit queues separately.

1q2t Receive Queues

To associate CoS values to **1q2t** receive-queue drop thresholds, perform this task in privileged mode:

	Task	Command
Step 1	Associate a CoS value to a receive-queue drop threshold.	**set qos map 1q2t rx 1 1 cos** *coslist*
Step 2	Verify the configuration.	**show qos info config 1q2t rx**

Threshold 1 is the low-priority threshold. Threshold 2, the high-priority threshold, is not configurable.

This example shows how to associate the CoS value 3 to high-priority threshold 2:

```
Console> (enable) set qos map 1q2t rx 1 1 cos 3
QoS rx priority queue and threshold mapped to cos successfully.
Console> (enable)
```

RQS Nº 03/2005 - CN

Doc: 3701

1p1q4t Receive Queues

To associate CoS values to **1p1q4t** receive-queue drop thresholds, perform this task in privileged mode:

	Task	Command
Step 1	Associate a CoS value to a receive-queue drop threshold.	**set qos map 1p1q4t rx** *q# thr#* **cos** *coslist*
Step 2	Verify the configuration.	**show qos info config 1p1q4t rx**

Queue 1 is the standard queue, and queue 2 is the strict-priority queue.

Threshold numbers range from 1 for low priority to 4 for high priority.

This example shows how to associate the CoS value 5 to strict-priority receive-queue 2/threshold 1:

```
Console> (enable) set qos map 1p1q4t rx 2 1 cos 5
Qos rx strict queue and threshold mapped to cos successfully.
Console> (enable)
```

1p2q2t Transmit Queues

To associate CoS values to the **1p2q2t** transmit-queue drop thresholds, perform this task in privileged mode:

	Task	Command
Step 1	Associate a CoS value to a transmit-queue drop threshold.	**set qos map 1p2q2t tx** *q# thr#* **cos** *coslist*
Step 2	Verify the configuration.	**show qos info config 1p2q2t tx**

Queue 1 is standard low priority, queue 2 is high priority, and queue 3 is strict priority.

Threshold 1 is low priority and threshold 2 is high priority.

This example shows how to associate the CoS value 5 to strict-priority transmit-queue 3/drop threshold 1:

```
Console> (enable) set qos map 1p2q2t tx 3 1 cos 5
Qos tx strict queue and threshold mapped to cos successfully.
Console> (enable)
```

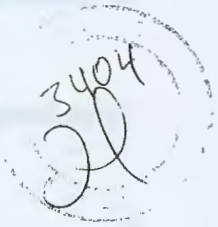
Associating 1p1q0t/1p3q1t Ports

On **1p1q0t/1p3q1t** ports, you configure the receive queues and the transmit queues separately.

1p1q0t Receive Queues

To associate CoS values to **1p1q0t** receive queues, perform this task in privileged mode:

	Task	Command
Step 1	Associate a CoS value to a receive queue.	**set qos map 1p1q0t rx** *q#* **cos** *coslist*
Step 2	Verify the configuration.	**show qos info config 1p1q0t rx**



Queue 1 is the standard queue, and queue 2 is the strict-priority queue.

This example shows how to associate the CoS value 5 to strict-priority receive-queue 2:

```
Console> (enable) set qos map 1p1q0t rx 2 cos 5
QoS queue mapped to cos successfully.
Console> (enable)
```

1p3q1t Transmit Queues

With **1p3q1t** transmit queues, you can associate a CoS value with either the nonconfigurable tail-drop threshold or the configurable WRED-drop threshold as follows:

- To associate a CoS value with the tail-drop threshold, map the CoS value to the queue.
- To associate a CoS value with the WRED-drop threshold, map the CoS value to the queue and threshold.

To associate CoS values to the **1p3q1t** transmit-queue drop thresholds, perform this task in privileged mode:

	Task	Command
Step 1	Associate a CoS value to a transmit-queue drop threshold.	**set qos map 1p3q1t tx** *q#* [*thr#*] **cos** *coslist*
Step 2	Verify the configuration.	**show qos info config 1p3q1t tx**

Queue 1 is the standard low-priority queue, queue 2 is the medium-priority queue, queue 3 is the high-priority queue, and queue 4 is the strict-priority queue.

To map CoS values to the tail-drop threshold, omit the threshold number or enter **0**.

The WRED-drop threshold number is 1.

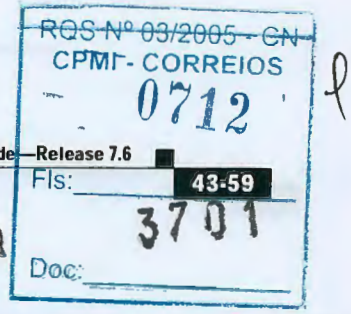
This example shows how to associate the CoS value 0 to transmit-queue 1/drop threshold 1:

```
Console> (enable) set qos map 1p3q1t tx 1 1 cos 0
Qos tx strict queue and threshold mapped to cos successfully.
Console> (enable)
```

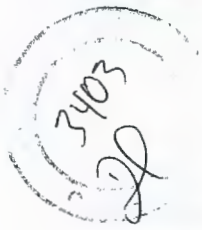
Associating 1p1q8t/1p2q1t Ports

When you configure **1p1q8t/1p2q1t** ports, note the following:

- You configure the receive queues and the transmit queues separately.
- You can associate a CoS value with either the nonconfigurable tail-drop threshold or the configurable WRED-drop threshold:
  - To associate a CoS value with the tail-drop threshold, map the CoS value to the queue.
  - To associate a CoS value with the WRED-drop threshold, map the CoS value to the queue and threshold.



1p1q8t Receive Queues



To associate CoS values to **1p1q8t** receive queues, perform this task in privileged mode:

	Task	Command
Step 1	Associate a CoS value to a receive queue.	**set qos map 1p1q8t rx** *q#* [*thr#*] **cos** *coslist*
Step 2	Verify the configuration.	**show qos info config 1p1q8t rx**

Queue 1 is the standard queue, and queue 2 is the strict-priority queue.

To map CoS values to the tail-drop threshold, omit the threshold number or enter **0**.

The WRED-drop threshold number is 1.

This example shows how to associate the CoS value 5 to strict-priority receive-queue 2:

```
Console> (enable) set qos map 1p1q8t rx 2 cos 5
QoS queue mapped to cos successfully.
Console> (enable)
```

1p2q1t Transmit Queues

To associate CoS values to the **1p2q1t** transmit-queue drop thresholds, perform this task in privileged mode:

	Task	Command
Step 1	Associate a CoS value to a transmit-queue drop threshold.	**set qos map 1p2q1t tx** *q#* [*thr#*] **cos** *coslist*
Step 2	Verify the configuration.	**show qos info config 1p2q1t tx**

Queue 1 is the standard low-priority queue, queue 2 is the standard high-priority queue, and queue 3 is the strict-priority queue.

To map CoS values to the tail-drop threshold, omit the threshold number or enter **0**.

The WRED-drop threshold number is 1.

This example shows how to associate the CoS value 0 to transmit-queue 1/drop threshold 1:

```
Console> (enable) set qos map 1p2q1t tx 1 1 cos 0
Qos tx strict queue and threshold mapped to cos successfully.
Console> (enable)
```

Reverting to CoS Map Defaults

To revert to default CoS value/drop threshold mapping, perform this task in privileged mode:

	Task	Command
Step 1	Revert to CoS map defaults.	**clear qos map** {**1p1q4t rx** | **1p1q0t rx** | **1p2q2t tx** | **2q2t tx** | **1p3q1t tx**}
Step 2	Verify the configuration.	**show qos info config** {**1q4t rx** | **1p1q4t rx** | **1p1q0t rx** | **1p1q8t rx** | **1p2q2t tx** | **2q2t tx** | **1p3q1t tx** | **1p2q1t tx**}

This example shows how to revert to CoS map defaults:

```
Console> (enable) clear qos map lp3q1t tx
Qos map setting cleared.
Console> (enable)
```

Configuring DSCP Value Maps

Note The commands in this section are not supported with a Layer 2 Switching Engine.

These sections describe how DSCP values are mapped to other values:

- Mapping Received CoS Values to Internal DSCP Values, page 43-61
- Mapping Received IP Precedence Values to Internal DSCP Values, page 43-62
- Mapping Internal DSCP Values to Egress CoS Values, page 43-62
- Mapping DSCP Markdown Values, page 43-63

Mapping Received CoS Values to Internal DSCP Values

To map received CoS values to the internal DSCP value (see the "Internal DSCP Values" section on page 43-17), perform this task in privileged mode:

	Task	Command
Step 1	Map received CoS values to internal DSCP values.	**set qos cos-dscp-map** *dscp1 dscp2 dscp3 dscp4 dscp5 dscp6 dscp7 dscp8*
Step 2	Verify the configuration.	**show qos maps** {**config** | **runtime**} [**cos-dscp-map** | **ipprec-dscp-map** | **dscp-cos-map** | **policed-dscp-map**]

Enter 8 DSCP values to which QoS maps received CoS values 0 through 7. This example shows how to map received CoS values to internal DSCP values:

```
Console> (enable) set qos cos-dscp-map 20 30 1 43 63 12 13 8
QoS cos-dscp-map set successfully.
Console> (enable)
```

To revert to default CoS to DSCP value mapping, perform this task in privileged mode:

	Task	Command
Step 1	Revert to CoS value/DSCP value map defaults.	**clear qos cos-dscp-map**
Step 2	Verify the configuration.	**show qos maps** {**config** | **runtime**} [**cos-dscp-map** | **ipprec-dscp-map** | **dscp-cos-map** | **policed-dscp-map**]

This example shows how to revert to CoS-DSCP map defaults:

```
Console> (enable) clear qos cos-dscp-map
QoS cos-dscp-map setting restored to default.
Console> (enable)
```

Doc: 3701

Mapping Received IP Precedence Values to Internal DSCP Values

To map received IP precedence values to the internal DSCP value (see the "Internal DSCP Values" section on page 43-17), perform this task in privileged mode:

	Task	Command
Step 1	Map received IP precedence values to internal DSCP values.	**set qos ipprec-dscp-map** *dscp1 dscp2 dscp3 dscp4 dscp5 dscp6 dscp7 dscp8*
Step 2	Verify the configuration.	**show qos maps** {**config** | **runtime**} [**cos-dscp-map** | **ipprec-dscp-map** | **dscp-cos-map** | **policed-dscp-map**]

Enter 8 internal DSCP values to which QoS maps received IP precedence values 0 through 7. This example shows how to map received IP precedence values to internal DSCP values:

```
Console> (enable) set qos ipprec-dscp-map 20 30 1 43 63 12 13 8
QoS ipprec-dscp-map set successfully.
Console> (enable)
```

To revert to default IP precedence to DSCP value mapping, perform this task in privileged mode:

	Task	Command
Step 1	Revert to IP precedence value to DSCP value map defaults.	**clear qos ipprec-dscp-map**
Step 2	Verify the configuration.	**show qos maps** {**config** | **runtime**} [**cos-dscp-map** | **ipprec-dscp-map** | **dscp-cos-map** | **policed-dscp-map**]

This example shows how to revert to QoS map defaults:

```
Console> (enable) clear qos ipprec-dscp-map
QoS ipprec-dscp-map setting restored to default.
Console> (enable)
```

Mapping Internal DSCP Values to Egress CoS Values

To map internal DSCP values to the egress CoS values that are used for egress port scheduling and congestion avoidance, perform this task in privileged mode:

	Task	Command
Step 1	Map internal DSCP values to egress CoS values.	**set qos dscp-cos-map** *dscp_list:cos ...*
Step 2	Verify the configuration.	**show qos maps** {**config** | **runtime**} [**cos-dscp-map** | **ipprec-dscp-map** | **dscp-cos-map** | **policed-dscp-map**]

For more information, see the "Internal DSCP Values" section on page 43-17 and the "Ethernet Egress Port Scheduling, Congestion Avoidance, and Marking" section on page 43-27.

Enter up to 64 internal DSCP value list/egress CoS value pairs. This example shows how to map internal DSCP values to egress CoS values:

```
Console> (enable) set qos dscp-cos-map 20-25:7 33-38:3
QoS dscp-cos-map set successfully.
Console> (enable)
```

To revert to default DSCP/CoS value mapping, perform this task in privileged mode:

	Task	Command
Step 1	Revert to DSCP value/CoS value map defaults.	**clear qos dscp-cos-map**
Step 2	Verify the configuration.	**show qos maps** {**config** | **runtime**} [**cos-dscp-map** | **ipprec-dscp-map** | **dscp-cos-map** | **policed-dscp-map**]

This example shows how to revert to DSCP-CoS map defaults:

```
Console> (enable) clear qos dscp-cos-map
QoS dscp-cos-map setting restored to default.
Console> (enable)
```

Mapping DSCP Markdown Values

To map DSCP markdown values used by policers, perform this task in privileged mode:

	Task	Command
Step 1	Map DSCP values to markdown DSCP values.	**set qos policed-dscp-map** *dscp_list:markdown_dscp ...*
Step 2	With PFC2, map DSCP values to markdown DSCP values.	**set qos policed-dscp-map** [**normal** | **excess**] *in_profile_dscp_list:policed_dscp ...*
Step 3	Verify the configuration.	**show qos maps** {**config** | **runtime**} [**cos-dscp-map** | **ipprec-dscp-map** | **dscp-cos-map** | **policed-dscp-map**]

For more information, see the "Policers" section on page 43-24.

Enter up to 64 DSCP-value-list/DSCP-value pairs.

This example shows how to map DSCP markdown values:

```
Console> (enable) set qos policed-dscp-map 20-25:7 33-38:3
QoS dscp-dscp-map set successfully.
Console> (enable)
```

This example shows how to map DSCP markdown values for packets exceeding the excess rate:

```
Console> (enable) set qos policed-dscp-map 33:30
QoS normal-rate policed-dscp-map set successfully.
Console> (enable) set qos policed-dscp-map excess-rate 33:30
QoS excess-rate policed-dscp-map set successfully.
Console> (enable)
```

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0714
Fls: 43-63
3701
Doc:

Note Configure marked-down DSCP values that map to CoS values that are consistent with the markdown penalty (see the "Mapping Internal DSCP Values to Egress CoS Values" section on page 43-62).

To revert to default DSCP markdown value mapping, perform this task in privileged mode:

	Task	Command
Step 1	Revert to DSCP markdown map defaults.	**clear qos policed-dscp-map** [**normal-rate** | **excess-rate**]
Step 2	Verify the configuration.	**show qos maps** {**config** | **runtime**} [**cos-dscp-map** | **ipprec-dscp-map** | **dscp-cos-map** | **policed-dscp-map**]

This example shows how to revert to DSCP markdown map defaults:

```
Console> (enable) clear qos policed-dscp-map
QoS dscp-cos-map setting restored to default.
Console> (enable)
```

Note Without the **normal-rate** or the **excess-rate** keywords, the **clear qos policed-dscp-map** command clears only the normal policed-dscp map.

Displaying QoS Information

To display QoS information, perform this task:

Task	Command
Display QoS information.	**show qos info** [**runtime** | **config**]

This example shows how to display the QoS runtime information for port 2/1:

```
Console> show qos info config 2/1
QoS setting in NVRAM:
QoS is enabled
Port 2/1 has 2 transmit queue with 2 drop thresholds (2q2t).
Port 2/1 has 1 receive queue with 4 drop thresholds (1q4t).
Interface type:vlan-based
ACL attached:
The qos trust type is set to untrusted.
Default CoS = 0
Queue and Threshold Mapping:
Queue Threshold CoS
----- --------- ---------------
1     1         0 1
1     2         2 3
2     1         4 5
2     2         6 7
Rx drop thresholds:
Rx drop thresholds are disabled for untrusted ports.
Queue #  Thresholds - percentage (abs values )
-------  ----------------------------------
```

```
1        50% 60% 80% 100%
Tx drop thresholds:
Queue #  Thresholds - percentage (abs values )
-------  ---------------------------------------
1        40% 100%
2        40% 100%
Tx WRED thresholds:
WRED feature is not supported for this port_type.
Queue Sizes:
Queue #  Sizes - percentage (abs values )
-------  ---------------------------------------
1        80%
2        20%
WRR Configuration of ports with speed 1000Mbps:
Queue #  Ratios (abs values )
-------  ---------------------------------------
1        100
2        255
Console> (enable)
```

Displaying QoS Statistics

To display QoS statistics, perform this task:

Task	Command
Display QoS statistics.	**show qos statistics** {*mod*[*/port*] | **l3stats** | **aggregate-policer** [*policer_name*]}

This example shows how to display QoS statistics for port 2/1:

```
Console> (enable) show qos statistics 2/1
On Transmit:Port 2/1 has 2 Queue(s) 2 Threshold(s)
Q #  Threshold #:Packets dropped
---  -----------------------------------------------
1    1:0 pkts, 2:0 pkts
2    1:0 pkts, 2:0 pkts
On Receive:Port 2/1 has 1 Queue(s) 4 Threshold(s)
Q #  Threshold #:Packets dropped
---  -----------------------------------------------
1    1:0 pkts, 2:0 pkts, 3:0 pkts, 4:0 pkts
```

This example shows how to display QoS Layer 3 statistics:

```
Console> (enable) show qos statistics l3stats
QoS Layer 3 Statistics show statistics since last read.
Packets dropped due to policing: 0
IP packets with ToS changed:     0
IP packets with CoS changed:     26
Non-IP packets with CoS changed: 0
Console>
```

This example shows how to display QoS aggregate policer statistics:

```
Console> (enable) show qos statistics aggregate-policer
QoS aggregate-policer statistics:
Aggregate Policer                Packet Count Packets exceed Packets exceed
                                              normal rate    excess rate
-------------------------------- ------------ -------------- -------------
test                                     1000             20
```

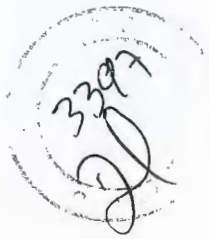
Doc: 3701

Reverting to QoS Defaults



Note Reverting to defaults disables QoS, because QoS is disabled by default.

To revert to QoS defaults, perform this task in privileged mode:

Task	Command
Revert to QoS defaults.	**clear qos config**

This example shows how to revert to QoS defaults:

```
Console> (enable) clear qos config
This command will disable QoS and take values back to factory default.
Do you want to continue (y/n) [n]? y
QoS config cleared.
Console> (enable)
```

Disabling QoS

To disable QoS, perform this task in privileged mode:

Task	Command
Disable QoS on the switch.	**set qos** {**enable** | **disable**}

This example shows how to disable QoS:

```
Console> (enable) set qos disable
QoS is disabled.
Console> (enable)
```

Configuring COPS Support

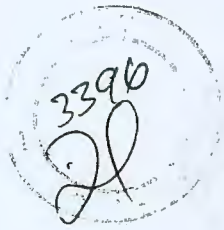
Note The commands in this section are not supported with a Layer 2 Switching Engine.

Note COPS can configure QoS only for IP traffic. Use the CLI or SNMP to configure QoS for all other traffic.

These sections describe configuring COPS support:

- Port ASICs, page 43-67
- Understanding QoS Policy, page 43-67
- Selecting COPS as the QoS Policy Source, page 43-67
- Selecting Locally Configured QoS Policy, page 43-68
- Enabling Use of Locally Configured QoS Policy, page 43-68

- Assigning Port Roles, page 43-69
- Removing Roles from Port ASICs, page 43-69
- Deleting Roles, page 43-70
- Configuring Policy Decision Point Servers, page 43-70
- Deleting the PDP Server Configuration, page 43-70
- Configuring the COPS Domain Name, page 43-71
- Deleting the COPS Domain Name, page 43-71
- Configuring the COPS Communications Parameters, page 43-71



Note Throughout this publication and all Catalyst 6500 series documents, the term *COPS* refers to COPS support as implemented on the Catalyst 6500 series switches.

Port ASICs

Some COPS support features affect all ports that are controlled by a port ASIC. The following sections use the term *per-ASIC* to identify the features that configure all ports on the same port ASIC:

- The port ASICs on Gigabit Ethernet switching modules control up to 4 ports each: 1–4, 5–8, 9–12, and 13–16.
- A port ASIC on 10-Mbps, 10/100-Mbps, and 100-Mbps Ethernet switching modules controls all ports.
- On 10-Mbps, 10/100-Mbps, and 100-Mbps Ethernet switching modules, another set of port ASICs control 12 ports each (1–12, 13–24, 25–36, and 37–48), but COPS cannot configure them.
- Changes to an EtherChannel port apply to all ports in the EtherChannel and to all ports controlled by the ASIC (or ASICs) that control the EtherChannel ports.

Understanding QoS Policy

The term *QoS policy* refers to the QoS values in effect, such as port trust state and which ACLs are applied to ports and VLANs.

Selecting COPS as the QoS Policy Source

QoS uses locally configured QoS values as the default QoS policy source. To select COPS as the QoS policy source, perform this task in privileged mode:

	Task	Command
Step 1	Select COPS as the QoS policy source.	**set qos policy-source {local | cops}**
Step 2	Verify the QoS policy source.	**show qos policy-source**

This example shows how to select COPS as the QoS policy source:

```
Console> (enable) set qos policy-source cops
QoS policy source for the switch set to COPS.
```

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0716
Doc:

```
Console> (enable) show qos policy-source
QoS policy source for the switch set to COPS.
Console> (enable)
```

Selecting COPS as the QoS policy source switches the following values from locally configured values to received COPS values:

- All DSCP maps
- Named and default ACL definitions
- Microflow and aggregate policers
- CoS to queue assignments
- Threshold configuration
- WRR weight and buffer configuration
- Default port CoS and ACL-to-interface attachments

Selecting Locally Configured QoS Policy

To select locally configured QoS policy, perform this task in privileged mode:

	Task	Command
Step 1	Select locally configured QoS policy.	**set qos policy-source {local | cops}**
Step 2	Verify the QoS policy source.	**show qos policy-source**

This example shows how to select locally configured QoS policy:

```
Console> (enable) set qos policy-source local
QoS policy source for the switch set to local.
Console> (enable) show qos policy-source
QoS policy source for the switch set to local.
Console> (enable)
```

Enabling Use of Locally Configured QoS Policy

When enabled, COPS is the default QoS policy source for all ports. You can use locally configured QoS policy on a per-ASIC basis. To enable use of locally configured QoS policy on a port ASIC, perform this task in privileged mode:

	Task	Command
Step 1	Enable use of locally configured QoS policy on a port.	**set port qos policy-source {local | cops}**
Step 2	Verify the QoS policy source for the port.	**show port qos**

This example shows how to enable use of locally configured QoS policy:

```
Console> (enable) set port qos 1/1 policy-source local
QoS policy source set to local on port(s) 1/1-2.
Console> (enable)
```

Assigning Port Roles

COPS does not configure ports using slot number and port number parameters. COPS uses *roles* that you create and assign to port ASICs.

A role is a name that describes the capability of ports (for example, *access* or *mod2_1-4*). QoS supports 64 roles per switch. You can assign more than one role to a port ASIC (for example, *mod2ports1-12* and *access*), with the limitation that the combined length of role names that are assigned to a port ASIC cannot exceed 255 characters.

The role name can be up to 31 characters long, is not case sensitive but may include uppercase and lowercase characters, and may consist of a–z, A–Z, 0–9, the dash character (-), the underscore character (_), and the period character (.). Role names cannot start with the underscore character.

The first assignment of a new role to a port creates the role.

To assign roles to a port ASIC, perform this task in privileged mode:

	Task	Command
Step 1	Assign roles to a port ASIC.	**set port cops** {*mod/port*} **roles** *role1* [*role2*] ...
Step 2	Verify the roles for the port.	**show port cops** [*mod*[*/port*]]

This example shows how to assign two new roles to the ASIC controlling port 2/1:

```
Console> (enable) set port cops 2/1 roles mod2ports1-12 access
New role 'mod2ports1-12' created.
New role 'access' created.
Roles added for port 2/1-12.
Console> (enable)
```

Removing Roles from Port ASICs

To remove a role from a port ASIC, perform this task in privileged mode:

	Task	Command
Step 1	Remove a role from a port ASIC.	**clear port cops** {*mod/port*} {**all-roles** | **roles** *role1* [*role2*] ...}
Step 2	Verify the roles for the port.	**show port cops** [*mod*[*/port*]]

This example shows how to remove a role from a port ASIC:

```
Console> (enable) clear port cops 3/1 roles backbone_port main_port
Roles cleared for port(s) 3/1-4.
Console> (enable)
```

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0717
43-69
Doc:

Deleting Roles

To delete a role (which removes it from all ports), perform this task in privileged mode:

	Task	Command
Step 1	Delete a role.	**clear cops** {**all-roles** | **roles** *role1* [*role2*] ...}
Step 2	Verify the roles for the port.	**show port cops** [*mod*[*/port*]]

This example shows how to delete a role:

```
Console> (enable) clear cops roles backbone_port main_port
Roles cleared.
Console> (enable)
```

Configuring Policy Decision Point Servers

Note COPS and RSVP can use the same policy decision point (PDP) server.

COPS obtains QoS policy from a PDP server. Configure a primary PDP server and optionally, a backup PDP server.

To configure a PDP server, perform this task in privileged mode:

	Task	Command
Step 1	Configure a PDP server.	**set cops server** *ip_address* [*port*] [**primary**] [**diff-serv** | **rsvp**]
Step 2	Verify the PDP server configuration.	**show cops info**

The *ip_address* parameter can be the IP address or the name of the server.

The *port* variable is the PDP server TCP port number.

Use the **diff-serv** keyword to set the address only for COPS.

This example shows how to configure a PDP server:

```
Console> (enable) set cops server my_server1 primary
my_server1 added to the COPS diff-serv server table as primary server.
my_server1 added to the COPS rsvp server table as primary server.
Console> (enable)
```

Deleting the PDP Server Configuration

To delete the PDP server configuration, perform this task in privileged mode:

	Task	Command
Step 1	Delete the PDP server configuration.	**clear cops server** {**all** | *ip_address* [**diff-serv** | **rsvp**]}
Step 2	Verify the PDP server configuration.	**show cops info**

This example shows how to delete the PDP server configuration:

```
Console> (enable) clear cops server all
All COPS diff-serv servers cleared.
All COPS rsvp servers cleared.
Console> (enable)
```

Configuring the COPS Domain Name

PDP servers use a COPS domain name to communicate with policy enforcement point (PEP) devices such as switches. To configure a COPS domain name for the switch, perform this task in privileged mode:

	Task	Command
Step 1	Configure the COPS domain name.	**set cops domain-name** *domain_name*
Step 2	Verify the COPS domain name.	**show cops info**

This example shows how to configure a COPS domain name:

```
Console> (enable) set cops domain-name my_domain
Domain name set to my_domain.
Console> (enable)
```

Deleting the COPS Domain Name

To delete the COPS domain name, perform this task in privileged mode:

	Task	Command
Step 1	Delete the COPS domain name.	**clear cops domain-name**
Step 2	Verify the configuration.	**show cops info**

This example shows how to delete the COPS domain name:

```
Console> (enable) clear cops domain-name
Domain name cleared.
Console> (enable)
```

Configuring the COPS Communications Parameters

To configure the parameters that COPS uses to communicate with the PDP server, perform this task in privileged mode:

	Task	Command
Step 1	Configure the parameters that COPS uses to communicate with the PDP server.	**set cops retry-interval** *initial increment maximum*
Step 2	Verify the configuration.	**show cops info**

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0718
Doc: 3701

Enter the parameters as a number of seconds in the range from 0 to 65535. The value of the *initial* parameter plus the value of the *increment* parameter must not exceed the value of the *maximum* parameter.

This example shows how to configure the parameters that COPS uses to communicate with the PDP server:

```
Console> (enable) set cops retry-interval 15 1 30
Connection retry intervals set.
Console> (enable)
```

Configuring RSVP Support

Note The commands in this section are not supported with a Layer 2 Switching Engine.

These sections describe configuring RSVP null service template and receiver proxy functionality support:

- Enabling RSVP Support, page 43-72
- Disabling RSVP Support, page 43-73
- Enabling Participation in the DSBM Election, page 43-73
- Disabling Participation in the DSBM Election, page 43-73
- Configuring Policy Decision Point Servers, page 43-74
- Deleting the PDP Server Configuration, page 43-74
- Configuring RSVP Policy Timeout, page 43-75
- Configuring RSVP Use of Local Policy, page 43-75

Note Throughout this publication and all Catalyst 6500 series switch documents, the term *RSVP* refers to RSVP null service template and receiver proxy functionality support as implemented on the Catalyst 6500 series switches.

Enabling RSVP Support

To enable RSVP support, perform this task in privileged mode:

	Task	Command
Step 1	Enable RSVP support on the switch.	**set qos rsvp** {**enable** | **disable**}
Step 2	Verify the configuration.	**show qos rsvp info**
Step 3	Display RSVP activity.	**show qos rsvp flow-info**

This example shows how to enable RSVP support:

```
Console> (enable) set qos rsvp enable
RSVP enabled on the switch.
Console> (enable)
```

Disabling RSVP Support

To disable RSVP support, perform this task in privileged mode:

	Task	Command
Step 1	Disable RSVP support on the switch.	**set qos rsvp** {**enable** | **disable**}
Step 2	Verify the configuration.	**show qos rsvp info**

This example shows how to disable RSVP support:

```
Console> (enable) set qos rsvp disable
RSVP disabled on the switch.
Console> (enable)
```

Enabling Participation in the DSBM Election

Catalyst 6500 series switches can serve as the Designated Subnet Bandwidth Manager (DSBM). You can enable participation in the election of the DSBM on a per-port basis.

Note The DSBM is not reelected when additional RSVP devices join the network. To control which device is the DSBM, disable election participation in all devices except the one that you want elected as DSBM. After the DSBM is elected, reenable election participation in other devices, as appropriate for the network configuration.

To enable the participation of a port in the election of the DSBM, perform this task in privileged mode:

	Task	Command
Step 1	Enable the participation of a port in the election of the DSBM.	**set port rsvp** {*mod/port*} **dsbm-election** {**disable** | **enable** *priority*}
Step 2	Verify the configuration of the port.	**show port rsvp** [*mod* | *mod/port*]

The range for the *priority* parameter is from 128 to 255.

This example shows how to enable the participation of ports 2/1 and 3/2 in the election of the DSBM:

```
Console> (enable) set port rsvp 2/1,3/2 dsbm-election enable 232
DSBM enabled and priority set to 232 for ports 2/1,3/2.
Console> (enable)
```

Disabling Participation in the DSBM Election

To disable the participation of a port in the election of the DSBM, perform this task in privileged mode:

	Task	Command
Step 1	Disable the participation of a port in the election of the DSBM.	**set port rsvp** {*mod/port*} **dsbm-election** {**disable** | **enable** *priority*}
Step 2	Verify the configuration.	**show port rsvp show port rsvp** [*mod/port*]

ROS Nº 03/2005 - CN
CPMI - CORREIOS
0719
Fls: 37
43-73
Doc:

This example shows how to disable the participation of port 2/1 in the election of the DSBM:

```
Console> (enable) set port rsvp 2/1 dsbm-election disable
DSBM disabled for port 2/1.
Console> (enable)
```

Configuring Policy Decision Point Servers

Note COPS and RSVP can use the same PDP server.

When the switch is the DSBM, RSVP communicates with a PDP server. Configure a primary PDP server and optionally, a backup PDP server.

To configure a PDP server, perform this task in privileged mode:

	Task	Command
Step 1	Configure a PDP server.	**set cops server** *ip_address* [*port*] [**primary**] [**diff-serv** | **rsvp**]
Step 2	Verify the PDP server configuration.	**show cops info**

The *ip_address* parameter can be the IP address or the name of the server.

The *port* variable is the PDP server TCP port number.

Use the **rsvp** keyword to set the address only for RSVP.

This example shows how to configure a PDP server:

```
Console> (enable) set cops server my_server1 primary rsvp
my_server1 added to the COPS rsvp server table as primary server.
Console> (enable)
```

Deleting the PDP Server Configuration

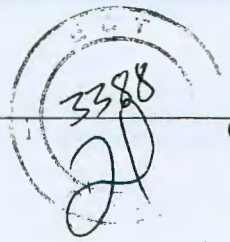
To delete the PDP server configuration, perform this task in privileged mode:

	Task	Command
Step 1	Delete the PDP server configuration.	**clear cops server** {**all** | *ip_address* [**diff-serv** | **rsvp**]}
Step 2	Verify the PDP server configuration.	**show cops info**

Use the **rsvp** keyword to delete only the RSVP address.

This example shows how to delete the PDP server configuration:

```
Console> (enable) clear cops server all
All COPS diff-serv servers cleared.
All COPS rsvp servers cleared.
Console> (enable)
```



Configuring RSVP Policy Timeout

When the switch is the DSBM and communication with the PDP server is lost, the switch continues to function as the DSBM, using cached values, for the period specified by the timeout value; the behavior for new or modified RSVP **path** messages is determined by the RSVP local policy setting.

If communication with the PDP server is not reestablished before the timeout period expires, the switch reverts to the role of the Subnet Bandwidth Manager (SBM) client for all ports and forwards RSVP messages to a newly elected DSBM on the segment. When there is no communication with the PDP server, the switch does not participate in election of the DSBM.

To configure the time that the switch continues to be the DSBM after communication with the PDP server is lost, perform this task in privileged mode:

	Task	Command
Step 1	Configure the RSVP policy timeout.	**set qos rsvp policy-timeout** *timeout*
Step 2	Verify the configuration.	**show qos rsvp info**

Enter the *timeout* parameter as a number of minutes in the range from 0 to 65535 (the default is 30).

This example shows how to configure the RSVP policy timeout:

```
Console> (enable) set qos rsvp policy-timeout 45
RSVP database policy timeout set to 45 minutes.
Console> (enable)
```

Configuring RSVP Use of Local Policy

To configure how RSVP operates after communication with the PDP is lost, perform this task in privileged mode:

	Task	Command
Step 1	Configure how RSVP operates when there is no communication with the PDP server.	**set qos rsvp local-policy** {**forward** | **reject**}
Step 2	Verify the configuration.	**show qos rsvp info**

The **forward** keyword sets the local policy to forward all new or modified RSVP **path** messages. The **reject** keyword sets the local policy to reject all new or modified RSVP **path** messages. This example shows how to change the default local RSVP policy setting to reject all new or modified RSVP **path** messages:

```
Console> (enable) set qos rsvp local-policy reject
RSVP local policy set to reject.
Console> (enable)
```

Note The RSVP local policy is used only until the RSVP policy timeout expires after the connection to the PDP is lost. After the RSVP policy timeout expires, the switch behaves as an SBM client. The RSVP messages pass through the switch unchanged regardless of the RSVP local policy setting. The RSVP local policy setting is not used if the switch never establishes a connection to the PDP.

Configuring QoS Statistics Data Export

These sections describe how to configure the QoS statistics data export feature:

- Enabling QoS Statistics Data Export Globally, page 43-76
- Enabling Per-Port QoS Statistics Data Export, page 43-77
- Enabling Per-Aggregate Policer QoS Statistics Data Export, page 43-78
- Clearing the Aggregate Policer QoS Statistics, page 43-79
- Setting the QoS Statistics Data Export Time Interval, page 43-79
- Configuring the QoS Statistics Data Export Destination Host and UDP Port, page 43-80
- Displaying QoS Statistics Information, page 43-80

Enabling QoS Statistics Data Export Globally

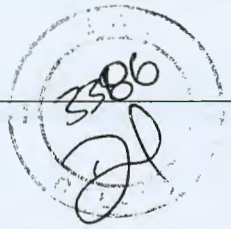
To export QoS statistics data for ports and aggregate policers, you must first configure the feature globally.

To enable QoS statistics data export globally, perform this task in privileged mode:

	Task	Command
Step 1	Enable QoS statistics data export.	**set qos statistics export enable | disable**
Step 2	Verify the configuration.	**show qos statistics export info**

This example shows how to enable QoS statistics data export globally and verify the configuration:

```
Console> (enable) set qos statistics export enable
Export is enabled.
Export destination:172.20.52.3 SYSLOG facility LOG_LOCAL6 (176), severity LOG_DE
BUG (7)
Aggregate policer export is not supported
Console> (enable) show qos statistics export info
Statistics export status and configuration information
-----------------------------------------------------
Export status: enabled
Export time interval: 300
Export destination:172.20.52.3 SYSLOG facility LOG_LOCAL6 (176), severity LOG_DE
BUG (7)
Port    Export
------  --------
 1/1    disabled
 1/2    disabled
 3/1    disabled
 3/2    disabled
 5/1    disabled
 5/2    disabled
 5/3    disabled
 5/4    disabled
<...output truncated...>
Console> (enable)
```



Enabling Per-Port QoS Statistics Data Export

To enable QoS statistics data export on a per-port basis, perform this task in privileged mode:

	Task	Command
Step 1	Enable QoS statistics data export per port.	**set qos statistics export port** *mod/port* **enable | disable**
Step 2	Verify the configuration.	**show qos statistics export info**

Note You must enable QoS statistics data export globally in order for the per-port configuration to take effect.

This example shows how to enable the QoS statistics data export feature per port and verify the configuration:

```
Console> (enable) set qos statistics export port 5/1 enable
Port export enabled on 5/1.
Console> (enable) show qos statistics export info
Statistics export status and configuration information
-----------------------------------------------------
Export status: enabled
Export time interval: 300
Export destination:172.20.52.3 SYSLOG facility LOG_LOCAL6 (176), severity LOG_DE
BUG (7)
Port    Export
------  --------
 1/1    disabled
 1/2    disabled
 3/1    disabled
 3/2    disabled
 5/1    enabled
 5/2    disabled
<output truncated>
Console> (enable)
```

When enabled on a port, QoS statistics data export contains the following fields, separated by the delimiter character:

- Export type ("1" for a port)
- Slot/port
- Number of ingress packets
- Number of ingress bytes
- Number of egress packets
- Number of egress bytes
- Time stamp

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0721
Fls
43-77
Doc: 3701

Enabling Per-Aggregate Policer QoS Statistics Data Export

To enable QoS statistics data export on a per-aggregate policer basis, perform this task in privileged mode:

	Task	Command
Step 1	Enable QoS statistics data export per-aggregate policer.	**set qos statistics export aggregate** *name* {**enable** | **disable**}
Step 2	Verify the configuration.	**show qos statistics export info**

Note You must enable QoS statistics data export globally in order for the per-aggregate policer configuration to take effect.

This example shows how to enable QoS statistics data export for a specific aggregate policer and verify the configuration:

```
Console> (enable) set qos statistics export aggregate ipagg_3 enable
Statistics data export enabled for aggregate policer ipagg_3
Console> (enable) show qos statistics export info
Statistics export status and configuration information
-----------------------------------------------------
Export status: enabled
Export time interval: 300
Export destination:172.20.52.3 SYSLOG facility LOG_LOCAL6 (176), severity LOG_DE
BUG (7)
Port    Export
------  --------
 1/1    disabled
 1/2    disabled
 3/1    disabled
 3/2    disabled
 5/1    enabled
 5/2    disabled
<output truncated>

Aggregate name  Export
--------------  --------
ipagg_3         enabled
Console> (enable)
```

When enabled for a named aggregate policer, QoS statistics data export contains the following fields, separated by the delimiter character:

- Export type ("2" for an aggregate policer)
- Aggregate policer name
- Direction ("in")
- PFC slot number
- Number of in-profile packets
- Number of packets that exceed the CIR
- Number of packets that exceed the PIR
- Time stamp

Clearing the Aggregate Policer QoS Statistics

To clear the aggregate policer QoS statistics, perform this task in privileged mode:

	Task	Command
Step 1	Clear the aggregate policer QoS statistics.	**clear qos statistics aggregate-policer** [*policer_name*]
Step 2	Verify the configuration.	**show qos statistics export info**

This example shows how to clear the QoS aggregate policer statistics for a specific aggregate policer:

```
Console> (enable) clear qos statistics aggregate-policer aggr_1
Aggregate policer 'aggr_1' statistical counters cleared.
```

If you do not specify the aggregate policer, all aggregate policer statistics are cleared:

```
Console> (enable) clear qos statistics aggregate-policer
QoS aggregate policers statistical counters cleared.
```

Setting the QoS Statistics Data Export Time Interval

The default interval at which QoS statistics is exported is 30 seconds. To set the time interval for the QoS statistics data export, perform this task in privileged mode:

	Task	Command
Step 1	Set the time interval for the QoS statistics data export.	**set qos statistics export interval** *interval_seconds*
Step 2	Verify the configuration.	**show qos statistics export info**

This example shows how to set the QoS statistics data export interval and verify the configuration:

```
Console> (enable) set qos statistics export interval 500
Time interval set to 500
Console> (enable) show qos statistics export info
Statistics export status and configuration information
-----------------------------------------------------
Export status: enabled
Export time interval: 500
Export destination:172.20.52.3 SYSLOG facility LOG_LOCAL6 (176), severity LOG_DE
BUG (7)
Port    Export
------  --------
 1/1    disabled
 1/2    disabled
 3/1    disabled
 3/2    disabled
 5/1    enabled
 5/2    disabled
<output truncated>

Aggregate name  Export
--------------  --------
ipagg_3         enabled
Console> (enable)
```

Configuring the QoS Statistics Data Export Destination Host and UDP Port

To configure the QoS statistics data export destination host and UDP port number, perform this task in privileged mode:

	Task	Command
Step 1	Configure the QoS statistics data export destination host and UDP port number.	**set qos statistics export destination** {*host_name* | *ip_address*} [**syslog** [*facility* | *severity*] *port*]
Step 2	Verify the configuration.	**show qos statistics export info**

This example shows how to configure the QoS statistics data export destination host and UDP port number and verify the configuration:

```
Console> (enable) set qos statistics export destination stargate 9996
Statistics data export destination set to stargate port 9996.
Console> (enable) show qos statistics export info
Statistics export status and configuration information
-----------------------------------------------------
Export status: enabled
Export time interval: 500
Export destination:Stargate, UDP port 9996
Port    Export
------  --------
 1/1    disabled
 1/2    disabled
 3/1    disabled
 3/2    disabled
 5/1    enabled
 5/2    disabled
<output truncated>

Aggregate name  Export
--------------  --------
ipagg_3         enabled
Console> (enable)
```

Displaying QoS Statistics Information

To display the QoS statistics per-port and per-aggregate policer packet and byte rates, perform this task in privileged mode:

Task	Command
Display the QoS statistics per-port and per-aggregate policer packet and byte rates.	**show mac** [**utilization**] [*mod*[/*port*]]

This example shows how to display the QoS statistics per-port and per-aggregate policer packet and byte rates:

```
Console> (enable) show mac utilization 1

5 min input/output port rates:

Port  Xmit-Packet-Rate     Xmit-Octet-Rate
----- -------------------- --------------------
1/1                  1343               123432
1/2                  2342               232343
Port  Rcv-Packet-Rate      Rcv-Octet-Rate

CHAPTER 38

Configuring SPAN and RSPAN

This chapter describes how to configure Switched Port Analyzer (SPAN) and Remote SPAN (RSPAN) on the Catalyst 6500 series switches.

Note For complete syntax and usage information for the commands used in this chapter, refer to the *Catalyst 6500 Series Command Reference* publication.

This chapter consists of these sections:

- Understanding How SPAN and RSPAN Works, page 38-1
- SPAN and RSPAN Session Limits, page 38-4
- Configuring SPAN, page 38-5
- Configuring RSPAN, page 38-9

Note To configure SPAN or RSPAN from a network management station (NMS), refer to the NMS documentation (see the "Using CiscoWorks2000" section on page 36-6).

Understanding How SPAN and RSPAN Works

These sections describe the concepts and terminology associated with SPAN and RSPAN configuration:

- SPAN Session, page 38-2
- Destination Port, page 38-2
- Source Port, page 38-2
- Ingress SPAN, page 38-3
- Egress SPAN, page 38-3
- VSPAN, page 38-3
- Trunk VLAN Filtering, page 38-4
- SPAN Traffic, page 38-4

Doc:

SPAN Session

A SPAN session is an association of a destination port with a set of source ports, configured with parameters that specify the monitored network traffic. You can configure multiple SPAN sessions in a switched network. SPAN sessions do not interfere with the normal operation of the switches. You can enable or disable SPAN sessions with command-line interface (CLI) or SNMP commands. When enabled, a SPAN session might become active or inactive based on various events or actions, and this would be indicated by a syslog message. The "Status" field in the **show span** and **show rspan** commands displays the operational status of a SPAN or RSPAN session.

A SPAN or RSPAN destination session remains inactive after system power up until the destination port is operational. An RSPAN source session remains inactive until any of the source ports are operational or the RSPAN VLAN becomes active.

Destination Port

A destination port (also called a *monitor port*) is a switch port where SPAN sends packets for analysis. After a port becomes an active destination port, it does not forward any traffic except that required for the SPAN session. By default, an active destination port disables incoming traffic (from the network to the switching bus), unless you specifically enable the port. If incoming traffic is enabled for the destination port, it is switched in the native VLAN of the destination port. The destination port does not participate in spanning tree while the SPAN session is active. See the caution statement in the "Configuring SPAN from the CLI" section on page 38-6 for information on how to prevent loops in your network topology.

Only one destination port is allowed per SPAN session, and the same port cannot be a destination port for multiple SPAN sessions. A switch port configured as a destination port cannot be configured as a source port. EtherChannel ports cannot be SPAN destination ports.

If the trunking mode of a SPAN destination port is "on" or "nonegotiate" during SPAN session configuration, the SPAN packets forwarded by the destination port have the encapsulation as specified by the trunk type; however, the destination port stops trunking, and the **show trunk** command reflects the trunking status for the port prior to SPAN session configuration.

Source Port

A source port is a switch port monitored for network traffic analysis. The traffic through the source ports can be categorized as ingress, egress, or both. You can monitor one or more source ports in a single SPAN session with user-specified traffic types (ingress, egress, or both) applicable for all the source ports.

You can configure source ports in any VLAN. You can configure VLANs as source ports (*src_vlans*), which means that all ports in the specified VLANs are source ports for the SPAN session.

Source ports are administrative (*Admin Source*) or operational (*Oper Source*) or both. Administrative source ports are the source ports or source VLANs specified during SPAN session configuration. Operational source ports are the source ports monitored by the destination port. For example, when source VLANs are used as the administrative source, the operational source is all the ports in all the specified VLANs.

The operational sources are always active ports. If a port is not in the spanning tree, it is not an operational source. All physical ports in an EtherChannel source are included in operational sources if the logical port is included in the spanning tree.

The destination port, if it belongs to any of the administrative source VLANs, is excluded from the operational source.

You can configure a port as a source port in multiple active SPAN sessions, but you cannot configure an active source port as a destination port for any SPAN session.

If a SPAN session is inactive, the "oper source" field is not updated until the session becomes active.

Trunk ports can be configured as source ports and can be mixed with nontrunk source ports; however, the encapsulation of the packets forwarded by the destination port are determined by the trunk settings of the destination port during SPAN session configuration.

Ingress SPAN

Ingress SPAN copies network traffic received by the source ports for analysis at the destination port.

Egress SPAN

Egress SPAN copies network traffic transmitted from the source ports for analysis at the destination port.

VSPAN

VLAN-based SPAN (VSPAN) is analysis of the network traffic in one or more VLANs. You can configure VSPAN as ingress SPAN, egress SPAN, or both. All the ports in the source VLANs become operational source ports for the VSPAN session. The destination port, if it belongs to any of the administrative source VLANs, is excluded from the operational source. If you add or remove ports from the administrative source VLANs, the operational sources are modified accordingly.

Use the following guidelines for VSPAN sessions:

- Trunk ports are included as source ports for VSPAN sessions, but only the VLANs that are in the Admin source list are monitored, provided these VLANs are active for the trunk.
- For VSPAN sessions with both ingress and egress SPAN configured, the system operates as follows based upon the type of supervisor engine you have:
  - WS-X6K-SUP1A-PFC, WS-X6K-SUP1A-MSFC—Two packets are forwarded by the SPAN destination port if the packets get switched on the same VLAN.
  - WS-X6K-SUP1-2GE, WS-X6K-SUP1A-2GE—Only one packet is forwarded by the SPAN destination port.
- An inband port is not included as Oper source for VSPAN sessions.
- When a VLAN is cleared, it is removed from the source list for VSPAN sessions.
- A VSPAN session is disabled if the Admin source VLANs list is empty.
- Inactive VLANs are not allowed for VSPAN configuration.
- A VSPAN session is made inactive if any of the source VLANs become RSPAN VLANs.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0726
Fls:
Doc: 3701

Trunk VLAN Filtering

Trunk VLAN filtering is analysis of network traffic on a selected set of VLANs on trunk source ports. You can combine trunk VLAN filtering with other source ports that belong to any of the selected VLANs, and you can also use trunk VLAN filtering for RSPAN. Based on the traffic type (ingress, egress, or both), SPAN sends a copy of the network traffic in the selected VLANs to the destination port.

Use trunk VLAN filtering only with trunk source ports. If you combine trunk VLAN filtering with other source ports that belong to VLANs not included in the selected list of filter VLANs, SPAN includes only the ports that belong to one or more of the selected VLANs in the operational sources.

When a VLAN is cleared, it is removed from the VLAN filter list. A SPAN session is disabled if the VLAN filter list becomes empty.

Trunk VLAN filtering is not applicable to VSPAN sessions.

SPAN Traffic

All network traffic, including multicast and bridge protocol data unit (BPDU) packets, can be monitored using SPAN (RSPAN does not support monitoring of BPDU packets). Multicast packet monitoring is enabled by default.

In some SPAN configurations, multiple copies of the same source packet are sent to the SPAN destination port. For example, a bidirectional (both ingress and egress) SPAN session is configured for sources a1 and a2 to a destination port d1. If a packet enters the switch through a1 and gets switched to a2, both incoming and outgoing packets are sent to destination port d1. Both packets would be the same (if a Layer-3 rewrite occurs, the packets are different). For RSPAN sessions with sources distributed in multiple switches, the destination ports might forward multiple copies of the same packet.

SPAN and RSPAN Session Limits

You can configure (and store in NVRAM) a maximum of 30 SPAN sessions in a Catalyst 6500 series switch. See Table 38-1 for the supported combinations of SPAN/RSPAN sessions. You can configure multiple ports or VLANs as sources for each session.

Table 38-1 SPAN and RSPAN Session Limits

SPAN/RSPAN Sessions	Catalyst 6500 Series Switches[1]
rx or **both** SPAN sessions	2
tx SPAN sessions	4
tx, **rx**, or **both** RSPAN source sessions	1
RSPAN destinations	24
Total SPAN sessions	30[2]

1. When an RSPAN source session is configured, it will reduce the limit for **rx** or **both** SPAN sessions by one.
2. 2 **rx** or **both** SPAN sessions + 4 **tx** SPAN sessions + 24 RSPAN destination sessions = 30 total SPAN sessions.

Configuring SPAN

These sections describe how to configure SPAN:

- SPAN Hardware Requirements, page 38-5
- Understanding How SPAN Works, page 38-5
- SPAN Configuration Guidelines, page 38-6
- Configuring SPAN from the CLI, page 38-6

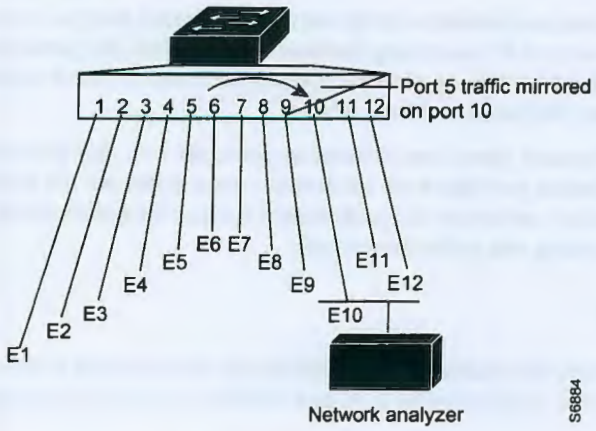
SPAN Hardware Requirements

All Catalyst 6500 series switch supervisor engines support the SPAN feature.

Understanding How SPAN Works

SPAN selects network traffic for analysis by a network analyzer such as a SwitchProbe device or other Remote Monitoring (RMON) probe. SPAN mirrors traffic from one or more source ports on any VLAN, from one or more VLANs, or from the sc0 console interface to a destination port for analysis (see Figure 38-1). In Figure 38-1, all traffic on Ethernet port 5 (the source port) is mirrored to Ethernet port 10. A network analyzer on Ethernet port 10 receives all network traffic from Ethernet port 5 without being physically attached to it.

Figure 38-1 SPAN Configuration



For SPAN configuration, the source ports and the destination port must be on the same switch.

SPAN does not affect the switching of network traffic on source ports; a copy of the packets received or transmitted by the source ports are sent to the destination port.

SPAN Configuration Guidelines

Follow these guidelines when configuring SPAN:

- Use a network analyzer to monitor ports.
- For SPAN source ports, SPAN is not supported with ATM ports; it works with Ethernet 10/100/1000-Mbps ports and 10-Gbps ports.
- When enabled, SPAN uses any previously entered configuration. If you have not entered any configuration commands, SPAN uses default parameters.
- If you specify multiple SPAN source ports, the ports can belong to different VLANs.
- See the "SPAN and RSPAN Session Limits" section on page 38-4.
- RSPAN sessions can coexist with SPAN sessions within the SPAN/RSPAN limits described in the "SPAN and RSPAN Session Limits" section on page 38-4.
- The **inpkts** option is disabled by default. Use the **inpkts** keyword with the **enable** option to allow the SPAN destination port to receive normal incoming traffic. Use the **disable** option to prevent the SPAN destination port from receiving normal incoming traffic.
- When you enable the **inpkts** option, a warning message notifies you that the destination port does not support the Spanning Tree Protocol (STP) and may cause loops if you enable this option.
- Learning is enabled by default. Use the **inpkts** keyword with the **learning** option to enable or disable learning for a specific port.
- You can specify a Multilayer Switch Module (MSM) port as the SPAN source port. However, you cannot specify an MSM port as the SPAN destination port.
- When you configure multiple SPAN sessions, the destination module number/port number must be known to index the particular SPAN session.
- If you do not specify the keyword **create** with the **set span** command and you have only one session, the session will be overwritten. If a matching destination port exists, the particular session will be overwritten (with or without specifying **create**). If you specify the keyword **create** and there is no matching destination port, the session will be created.
- If any VLANs on SPAN source port(s) are blocked by spanning tree, you may see extra packets transmitted on the destination port that were not actually transmitted out the source port(s). The extra packets seen at the destination port are packets sent through the switch fabric to the source port and then blocked by spanning tree at the source port.

Configuring SPAN from the CLI

To configure SPAN, you specify the source, the destination port, the direction of the traffic through the source that you want to mirror to the destination port, and whether or not the destination port can receive packets.

To configure a SPAN port, perform this task in privileged mode:

	Task	Command
Step 1	Configure the SPAN source and destination ports.	**set span** {*src_mod/src_ports* | *src_vlans* | **sc0**} {*dest_mod/dest_port*} [**rx** | **tx** | **both**] [**inpkts** {**enable** | **disable**}] [**learning** {**enable** | **disable**}] [**multicast** {**enable** | **disable**}] [**filter** *vlans...*] [**create**]
Step 2	Verify the SPAN configuration.	**show span**

Caution If the SPAN destination port is connected to another device and you enable reception of incoming packets (using the **inpkts enable** keywords), the SPAN destination port receives traffic for whatever VLAN to which the SPAN destination port belongs. The SPAN destination port does *not* participate in spanning tree for that VLAN. Use caution when using the **inpkts** keyword to avoid creating network loops with the SPAN destination port or assigning the SPAN destination port to an unused VLAN.

This example shows how to configure SPAN so that both transmit and receive traffic from port 1/1 (the SPAN source) is mirrored on port 2/1 (the SPAN destination):

```
Console> (enable) set span 1/1 2/1

Destination      : Port 2/1
Admin Source     : Port 1/1
Oper Source      : Port 1/1
Direction        : transmit/receive
Incoming Packets: disabled
Learning         : enabled
Multicast        : enabled
Filter           : -
```

This example shows how to set VLAN 522 as the SPAN source and port 2/1 as the SPAN destination:

```
Console> (enable) set span 522 2/1

Destination      : Port 2/1
Admin Source     : VLAN 522
Oper Source      : Port 3/1-2
Direction        : transmit/receive
Incoming Packets: disabled
Learning         : enabled
Multicast        : enabled
Filter           : -
Console> (enable)
```

This example shows how to set VLAN 522 as the SPAN source and port 2/12 as the SPAN destination. Only transmit traffic is monitored. Normal incoming packets on the SPAN destination port are allowed.

```
Console> (enable) set span 522 2/12 tx inpkts enable

Destination      : Port 2/12
Admin Source     : VLAN 522
Oper Source      : Port 2/1-2
Direction        : transmit
Incoming Packets: enabled
Learning         : enabled
Multicast        : enabled
Filter           : -
Console> (enable)
```

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0728
Fls:
Doc 5701

This example shows how to set port 3/2 as the SPAN source and port 2/2 as the SPAN destination:

```
Console> (enable) set span 3/2 2/2 tx create

Destination      : Port 2/1
Admin Source     : port 3/1
Oper Source      : Port 3/1
Direction        : transmit/receive
Incoming Packets: disabled
```

```
Destination      : Port 2/2
Admin Source     : port 3/2
Oper Source      : Port 3/2
Direction        : transmit
Incoming Packets: disabled
Learning         : enabled
Multicast        : enabled
Filter           : -
Console> (enable)
```

To disable SPAN, perform this task in privileged mode:

Task	Command
Disable SPAN on the switch.	**set span disable** [*dest_mod/dest_port* | *all*]

This example shows how to disable SPAN on the switch:

```
Console> (enable) set span disable 2/1
This command will disable your span session.
Do you want to continue (y/n) [n]?y
Disabled port 2/1 to monitor transmit traffic of VLAN 522
Console> (enable)
```

Configuring RSPAN

These sections describe how to configure RSPAN:

- RSPAN Hardware Requirements, page 38-9
- Understanding How RSPAN Works, page 38-10
- RSPAN Configuration Guidelines, page 38-10
- Configuring RSPAN, page 38-11
- RSPAN Configuration Examples, page 38-14

RSPAN Hardware Requirements

RSPAN supervisor engine requirements are as follows:

- For source switches—Catalyst 6500 series switch with any of the following:
  - Supervisor Engine 1 and Policy Feature Card (PFC): WS-X6K-SUP1A-PFC
  - Supervisor Engine 1, PFC, and Multilayer Switch Feature Card (MSFC): WS-X6K-SUP1A-MSFC
  - Supervisor Engine 1, PFC, and MSFC2: WS-X6K-S1A-MSFC2
  - Supervisor Engine 2 and PFC2: WS-X6K-S2-PFC2
  - Supervisor Engine 2, PFC2, and MSFC2: WS-X6K-S1A-MSFC2
- For destination or intermediate switches—Any Cisco switch supporting RSPAN VLAN

No third party or other Cisco switches can be placed in the end-to-end path for RSPAN traffic.

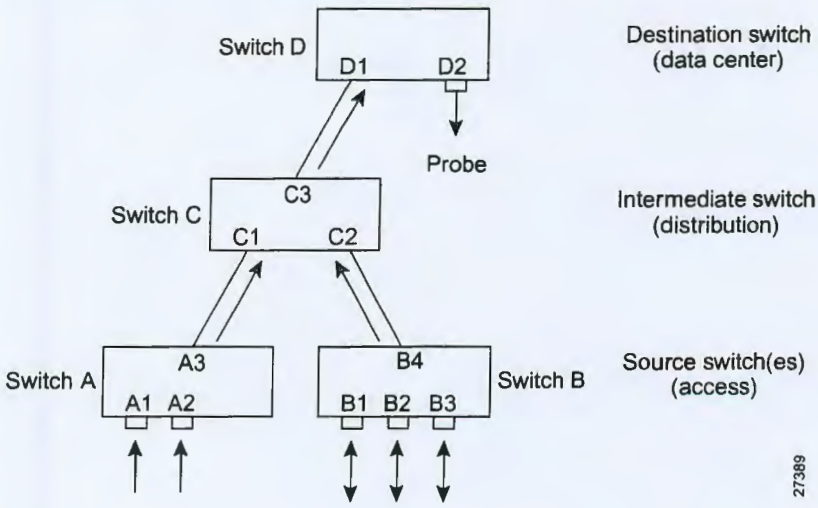
Understanding How RSPAN Works

Note See the "Understanding How SPAN and RSPAN Works" section on page 38-1 for concepts and terminology that apply to both SPAN and RSPAN configuration.

RSPAN has all the features of SPAN (see the "Understanding How SPAN Works" section on page 38-5), plus support for source ports and destination ports distributed across multiple switches, allowing remote monitoring of multiple switches across your network (see Figure 38-2).

The traffic for each RSPAN session is carried over a user-specified RSPAN VLAN that is dedicated for that RSPAN session in all participating switches. The SPAN traffic from the sources, which cannot be in the RSPAN VLAN, is switched to the RSPAN VLAN and then forwarded to destination ports configured in the RSPAN VLAN. The traffic type for sources (ingress, egress, or both) in an RSPAN session can be different in different source switches but is the same for all sources in each source switch for each RSPAN session. Do not configure any ports in an RSPAN VLAN except those selected to carry RSPAN traffic. Learning is disabled on the RSPAN VLAN.

Figure 38-2 RSPAN Configuration



RSPAN Configuration Guidelines

Follow these guidelines when configuring RSPAN:

Tip As RSPAN VLANs have special properties, we recommend that you reserve a few VLANs across your network for use as RSPAN VLANs. Do not assign access ports to these VLANs.

Tip You can apply an output access control list (ACL) to RSPAN traffic to selectively filter specific flows. Specify these ACLs on the RSPAN VLAN in the RSPAN source switches.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0730
Fls: 3701
Doc: 78-14924-01

- All the items in the "SPAN Configuration Guidelines" section on page 38-6 apply to RSPAN.
- RSPAN sessions can coexist with SPAN sessions within the SPAN/RSPAN limits described in the "SPAN and RSPAN Session Limits" section on page 38-4.
- For RSPAN configuration, you can distribute the source ports and the destination port across multiple switches.
- For RSPAN, trunking is required if you have a source switch with all source ports in one VLAN (VLAN 2 for example) and it is connected to the destination switch through an uplink port that is also in VLAN 2. With RSPAN, the traffic is forwarded to remote switches in the RSPAN VLAN. The RSPAN VLAN is configured only on trunk ports and not on access ports.
- The learning option applies to RSPAN destination ports only.
- RSPAN does not support BPDU packet monitoring.
- To optimize bandwidth utilization in the connecting links, you can configure quality of service (QoS) parameters for the RSPAN VLAN in each of the participating source, intermediate, or destination switches.
- Each Catalyst 6500 series switch can source a maximum of one RSPAN session (ingress, egress, or both). When you configure a remote ingress or bidirectional SPAN session in a source switch, the limit for local ingress or bidirectional SPAN sessions is reduced to one. There are no limits on the number of RSPAN sessions carried across the network within the RSPAN session limits (see the "SPAN and RSPAN Session Limits" section on page 38-4).
- RSPAN VLANs cannot be included as sources for port-based RSPAN sessions when source trunk ports have active RSPAN VLANs. Additionally, RSPAN VLANs cannot be sources in VSPAN sessions.
- You can configure any VLAN as an RSPAN VLAN as long as these conditions are met:
  - The same RSPAN VLAN is used for an RSPAN session in all the switches.
  - All participating switches have appropriate hardware and software.
  - No access port (including the sc0 interface) is configured in the RSPAN VLAN.
- If you enable VLAN Trunking Protocol (VTP) and VTP pruning, RSPAN traffic is pruned in the trunks to prevent the unwanted flooding of RSPAN traffic across the network.
- If you enable GARP VLAN Registration Protocol (GVRP) and GVRP requests conflict with existing RSPAN VLANs, you might observe unwanted traffic in the respective RSPAN sessions.
- You can use RSPAN VLANs in Inter-Switch Link (ISL) to dot1q mapping. However, ensure that the special properties of RSPAN VLANs are supported in all the switches to avoid unwanted traffic in these VLANs.

Configuring RSPAN

The first step in configuring an RSPAN session is to select an RSPAN VLAN for the RSPAN session that *does not* exist in any of the switches that will participate in RSPAN. With VTP enabled in the network, you can create the RSPAN VLAN in one switch and VTP propagates it to the other switches in the VTP domain.

Use VTP pruning to get efficient flow of RSPAN traffic, or manually delete the RSPAN VLAN from all trunks that do not need to carry the RSPAN traffic.

Once the RSPAN VLAN is created, you configure the source and destination switches using the **set rspan** command.

Fls:
3701

To configure RSPAN VLANs, perform this task in privileged mode:

	Task	Command
Step 1	Configure RSPAN VLANs.	**set vlan** *vlan* **[rspan]**
Step 2	Verify the RSPAN VLAN configuration.	**show vlan**

This example shows how to set VLAN 500 as an RSPAN VLAN:

```
Console> (enable) set vlan 500 rspan
vlan 500 configuration successful
Console> (enable)
Console> (enable) show vlan
.
display truncated
.
VLAN DynCreated  RSPAN
---- ---------- --------
1    static     disabled
2    static     disabled
3    static     disabled
99   static     disabled
500  static     enabled
Console> (enable)
```

To configure RSPAN source ports, perform this task in privileged mode:

	Task	Command
Step 1	Configure RSPAN source ports. Use this command on each of the source switches participating in RSPAN.	**set rspan source** {*mod/ports...* | *vlans...* | **sc0**} {*rspan_vlan*} **[rx | tx | both] [multicast {enable | disable}] [filter** *vlans...***] [create]**
Step 2	Verify the RSPAN configuration.	**show rspan**

This example shows how to specify ports 4/1 and 4/2 as ingress source ports for RSPAN VLAN 500:

```
Console> (enable) set rspan source 4/1-2 500 rx
Rspan Type      : Source
Destination     : -
Rspan Vlan      : 500
Admin Source    : Port 4/1-2
Oper Source     : None
Direction       : receive
Incoming Packets: -
Learning        : -
Multicast       : enabled
Filter          : -
Console> (enable)
```

To configure RSPAN source VLANs, perform this task in privileged mode:

	Task	Command
Step 1	Configure RSPAN source VLANs. All the ports in the source VLAN become operational source ports.	**set rspan source** {*mod/ports...* | *vlans...* | **sc0**} {*rspan_vlan*} [**rx** | **tx** | **both**] [**multicast** {**enable** | **disable**}] [**filter** *vlans...*] [**create**]
Step 2	Verify the RSPAN configuration.	**show rspan**

This example shows how to specify VLAN 200 as a source VLAN for RSPAN VLAN 500 (selecting the **rx** option makes all the ports in the VLAN ingress ports):

```
Console> (enable) set rspan source 200 500 rx
Rspan Type      : Source
Destination     : -
Rspan Vlan      : 500
Admin Source    : VLAN 200
Oper Source     : None
Direction       : receive
Incoming Packets: -
Learning        : -
Multicast       : enabled
Filter          : -
Console> (enable)
```

To configure RSPAN destination ports, perform this task in privileged mode:

	Task	Command
Step 1	Configure RSPAN destination ports. Use this command on each of the destination switches participating in RSPAN.	**set rspan destination** {*mod/port*} {*rspan_vlan*} [**inpkts** {**enable** | **disable**}] [**learning** {**enable** | **disable**}] [**create**]
Step 2	Verify the RSPAN configuration.	**show rspan**

```
Console> (enable) set rspan destination 3/1 500
Rspan Type      : Destination
Destination     : Port 3/1
Rspan Vlan      : 500
Admin Source    : -
Oper Source     : -
Direction       : -
Incoming Packets: disabled
Learning        : enabled
Multicast       : -
Filter          : -
Console> (enable)
```

To disable RSPAN, perform this task in privileged mode:

Task	Command
Disable RSPAN on the switch.	**set rspan disable source** [*rspan_vlan* | **all**] **set rpsan disable destination** [*mod/port* | **all**]

ROS Nº 03/2005 - CN

Doc:

This example shows how to disable all enabled source sessions:

```
Console> (enable) set rspan disable source all
This command will disable all remote span source session(s).
Do you want to continue (y/n) [n]? y
Disabled monitoring of all source(s) on the switch for remote span.
Console> (enable)
```

This example shows how to disable one source session by *rspan_vlan* number:

```
Console> (enable) set rspan disable source 903
Disabled monitoring of all source(s) on the switch for rspan_vlan 903.
Console> (enable)
```

This example shows how to disable all enabled destination sessions:

```
Console> (enable) set rspan disable destination all
This command will disable all remote span destination session(s).
Do you want to continue (y/n) [n]? y
Disabled monitoring of remote span traffic for all rspan destination ports.
Console> (enable)
```

This example shows how to disable one destination session by *mod/port*:

```
Console> (enable) set rspan disable destination 4/1
Disabled monitoring of remote span traffic on port 4/1.
Console> (enable)
```

RSPAN Configuration Examples

These sections describe how to configure RSPAN:

- Configuring a Single RSPAN Session, page 38-14
- Modifying an Active RSPAN Session, page 38-15
- Adding RSPAN Source Ports in Intermediate Switches, page 38-16
- Configuring Multiple RSPAN Sessions, page 38-16
- Adding Multiple Network Analyzers to an RSPAN Session, page 38-18

Configuring a Single RSPAN Session

This example shows how to configure a single RSPAN session. Figure 38-3 shows an RSPAN configuration; see Table 38-2 for the necessary commands to configure this RSPAN session. Table 38-2 assumes that you have already set up RSPAN VLAN 901 for this session on all the switches using the **set vlan** *vlan* **rspan** command. With VTP enabled in the network, you can create the RSPAN VLAN in one switch and VTP propagates it to the other switches in the VTP domain. Note that in the configuration example shown in Table 38-2, the RSPAN session may be disabled in Switch A or B or both without modifying the configuration in Switch C or Switch D.

Figure 38-3 Single RSPAN Session

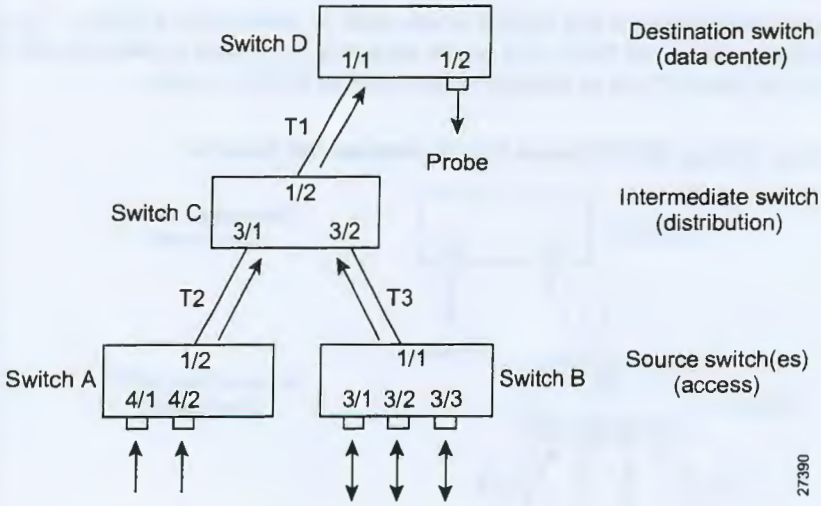

Table 38-2 Configuring a Single RSPAN Session

Switch	Ports	RSPAN VLAN	Direction	RSPAN CLI Commands
A (source)	4/1, 4/2	901	Ingress	**set rspan source 4/1-2 901 rx**
B (source)	3/1, 3/2, 3/3	901	Bidirectional	**set rspan source 3/1-3 901**
C (intermediate)	–	901	–	No RSPAN CLI command needed
D (destination)	1/2	901	–	**set rspan destination 1/2 901**

Modifying an Active RSPAN Session

This example shows how to modify an active RSPAN session. Use Figure 38-3 for reference; see Table 38-3 for the necessary commands to disable an RSPAN session and to add or remove source ports from an RSPAN session.

Table 38-3 Making Modifications to an Active RSPAN Session

Switch	Action	RSPAN CLI Commands
A (source)	Disable the RSPAN session.	**set rspan disable source 901**
B (source)	Remove source port 3/2 from RSPAN session.	**set rspan source 3/1, 3/3 901**
B (source)	Add back source port 3/2 to RSPAN session.	**set rspan source 3/1-3 901**

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0733
Doc: 3701

Adding RSPAN Source Ports in Intermediate Switches

This example shows how to add RSPAN source ports in intermediate switches. Figure 38-4 shows an RSPAN configuration; see Table 38-4 for the necessary commands to configure this RSPAN session. Ports 2/1-2 in Switch C can be configured for the same RSPAN session.

Figure 38-4 Adding RSPAN Source Ports in Intermediate Switches

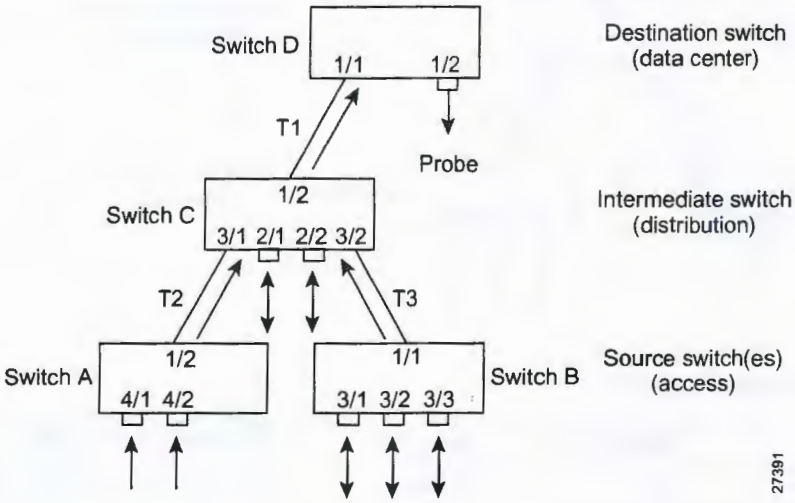

Table 38-4 Adding RSPAN Source Ports in Intermediate Switches

Switch	Ports	RSPAN VLAN	Direction	RSPAN CLI Commands
A (source)	4/1, 4/2	901	Ingress	**set rspan source 4/1-2 901 rx**
B (source)	3/1, 3/2, 3/3	901	Bidirectional	**set rspan source 3/1-3 901**
C (intermediate)	–	901	–	No RSPAN CLI command needed
C (source)	2/1, 2/2	901	Bidirectional	**set rspan source 2/1-2 901**
D (destination)	1/2	901	–	**set rspan destination 1/2 901**

Configuring Multiple RSPAN Sessions

This example shows how to configure multiple RSPAN sessions. Figure 38-5 shows an RSPAN configuration; see Table 38-5 for the necessary configuration commands to configure this RSPAN session. This example is a typical scenario where the monitoring probes would be placed in the data center and source ports in the access switches (other ports in any of the switches can also be configured for RSPAN). If there is no change in the route for SPAN traffic, the destination switch and the intermediate switches need to be configured only once.

In Figure 38-5, two RSPAN sessions are used with RSPAN VLANs 901 (for probe 1) and 902 (for probe 2). The direction of traffic over trunks T1 through T6 is shown only for understanding; the direction of the trunks depends on the STP states of the respective trunks for the RSPAN VLAN(s). You need to configure the RSPAN VLANs in each of the switches for the respective RSPAN sessions. With VTP enabled in the network, you can create the RSPAN VLAN in one switch and VTP propagates it to the other switches in that VTP domain. With VTP disabled, create the RSPAN VLANs in each switch.

Figure 38-5 Configuring Multiple RSPAN Sessions

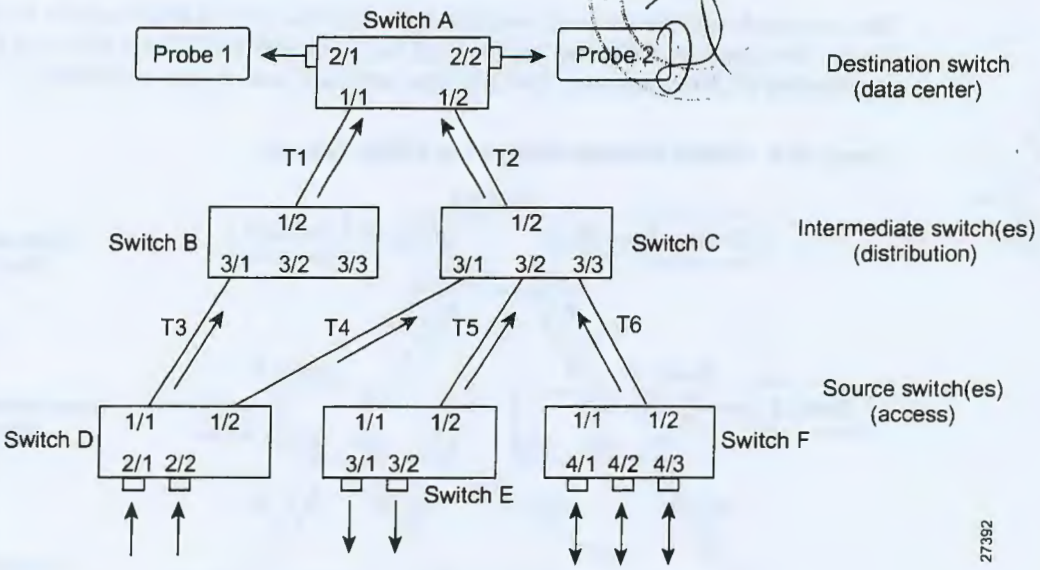

Table 38-5 Configuring Multiple RSPAN Sessions

Switch	Port	RSPAN VLAN(s)	Direction	RSPAN CLI Commands
A (destination)	2/1	901	–	**set rspan destination 2/1 901**
A (destination)	2/2	902	–	**set rspan destination 2/2 902**
B (intermediate)	–	901, 902	–	No RSPAN CLI command needed
C (intermediate)	–	901, 902	–	No RSPAN CLI command needed
D (source)	2/1-2	901	Ingress	**set rspan source 2/1-2 901 rx**
E (source)	3/1-2	901	Egress	**set rspan source 3/1-2 901 tx**
F (source)	4/1-3	901	Both	**set rspan source 4/1-3 902**

Adding Multiple Network Analyzers to an RSPAN Session

You can attach multiple network analyzers (probes) to the same RSPAN session. For example, in Figure 38-6, you can add probe 3 in Switch B to monitor RSPAN VLAN 901 using the **set rspan destination 1/2 901** command. Similarly, you could add source ports to Switch C.

Figure 38-6 Adding Multiple Probes to an RSPAN Session

CHAPTER 8

Configuring Spanning Tree

This chapter describes the IEEE 802.1D bridge Spanning Tree Protocol (STP) and how to use and configure Cisco's proprietary spanning tree protocols, Per VLAN Spanning Tree + (PVST+) and Multi-Instance Spanning Tree Protocol (MISTP), on the Catalyst 6500 series switches.

Note For information on configuring the spanning tree PortFast, UplinkFast, and BackboneFast features, see Chapter 9, "Configuring Spanning Tree PortFast, UplinkFast, BackboneFast, and Loop Guard."

This chapter consists of these sections:

- Understanding How Spanning Tree Protocols Work, page 8-1
- Understanding PVST+ and MISTP Modes, page 8-10
- Understanding Bridge Identifiers, page 8-12
- Understanding How Multiple Spanning Trees Work, page 8-14
- Understanding How BPDU Skewing Works, page 8-22
- Using PVST+, page 8-23
- Using MISTP-PVST+ or MISTP, page 8-29
- Configuring a Root Switch, page 8-38
- Configuring Spanning Tree Timers, page 8-42
- Configuring Multiple Spanning Tree, page 8-44
- Configuring BPDU Skewing, page 8-56

Note For complete syntax and usage information for the commands used in this chapter, refer to the *Catalyst 6500 Series Command Reference* publication.

Understanding How Spanning Tree Protocols Work

This section describes the specific functions that are common to all spanning tree protocols. Cisco's proprietary spanning tree protocols, PVST+ and MISTP, are based on IEEE 802.1D STP. (See the "Understanding PVST+ and MISTP Modes" section on page 8-10 for information about PVST+ and MISTP.) The 802.1D STP is a Layer 2 management protocol that provides path redundancy in a network while preventing undesirable loops. All spanning tree protocols use an algorithm that calculates the best loop-free path through the network.

RQS Nº 03/2005 - CN - CPMI - CORREIOS
0756
Doc: 3701

STP uses a distributed algorithm that selects one bridge of a redundantly connected network as the root of a spanning tree connected active topology. STP assigns roles to each port depending on what the port's function is in the active topology. Port roles are as follows:

- Root—A forwarding port elected for the spanning tree topology
- Designated—A forwarding port elected for every switched LAN segment
- Alternate—A blocked port providing an alternate path to the root port in the spanning tree
- Backup—A blocked port in a loopback configuration

Switches that have ports with these assigned roles are called root or designated switches. For more information, see the "Understanding How a Switch Becomes the Root Switch" section on page 8-3.

In Ethernet networks, only one active path may exist between any two stations. Multiple active paths between stations can cause loops in the network. When loops occur, some switches recognize stations on both sides of the switch. This situation causes the forwarding algorithm to malfunction allowing duplicate frames to be forwarded.

Spanning tree algorithms provide path redundancy by defining a tree that spans all of the switches in an extended network and then forces certain redundant data paths into a standby (blocked) state. At regular intervals, the switches in the network send and receive spanning tree packets that they use to identify the path. If one network segment becomes unreachable, or if spanning tree costs change, the spanning tree algorithm reconfigures the spanning tree topology and reestablishes the link by activating the standby path.

Spanning tree operation is transparent to end stations, which do not detect whether they are connected to a single LAN segment or a switched LAN of multiple segments.

These sections describe the STP:

- Understanding How a Topology is Created, page 8-2
- Understanding How a Switch Becomes the Root Switch, page 8-3
- Understanding How Bridge Protocol Data Units Work, page 8-3
- Spanning Tree Port States, page 8-4

Understanding How a Topology is Created

All switches in an extended LAN participating in a spanning tree gather information about other switches in the network through an exchange of data messages known as bridge protocol data units (BPDUs). This exchange of messages results in the following actions:

- A unique root switch is elected for the spanning tree network topology.
- A designated switch is elected for every switched LAN segment.
- Any loops in the switched network are eliminated by placing redundant switch ports in a backup state; all paths that are not needed to reach the root switch from anywhere in the switched network are placed in STP-blocked mode.

The topology of an active switched network is determined by the following:

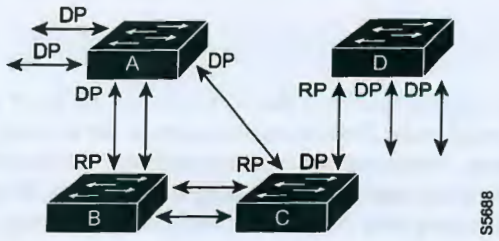
- The unique switch identifier Media Access Control ([MAC] address of the switch) associated with each switch
- The path cost to the root associated with each switch port
- The port identifier (MAC address of the port) associated with each switch port

In a switched network, the root switch is the logical center of the spanning tree topology. A spanning tree protocol uses BPDUs to elect the root switch and root port for the switched network, as well as the root port and designated port for each switched segment.

Understanding How a Switch Becomes the Root Switch

If all switches are enabled with default settings, the switch with the lowest MAC address in the network becomes the root switch. In Figure 8-1, Switch A is the root switch because it has the lowest MAC address. However, due to traffic patterns, number of forwarding ports, or line types, Switch A might not be the ideal root switch. A switch can be forced to become the root switch by increasing the priority (that is, lowering the numerical priority number) on the preferred switch. This action causes the spanning tree to recalculate the topology and make the selected switch the root switch.

Figure 8-1 Configuring a Loop-Free Topology



RP = Root Port
DP = Designated Port

You can change the priority of a port to make it the root port. When the spanning tree topology is based on default parameters, the path between source and destination stations in a switched network might not be ideal. Connecting higher-speed links to a port that has a higher number than the current root port can cause a root-port change. The goal is to make the fastest link the root port.

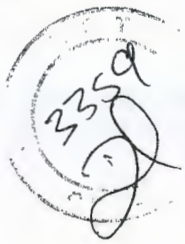
For example, assume that a port on Switch B is a fiber-optic link. Also, another port on Switch B (an unshielded twisted-pair [UTP] link) is the root port. Network traffic might be more efficient over the high-speed fiber-optic link. By changing the Port Priority parameter for the UTP port to a higher priority (lower numerical value) than the fiber-optic port, the UTP port becomes the root port. You could also accomplish this scenario by changing the Port Cost parameter for the UTP port to a lower value than that of the fiber-optic port.

Understanding How Bridge Protocol Data Units Work

BPDUs contain configuration information about the transmitting switch and its ports, including switch and port MAC addresses, switch priority, port priority, and port cost. Each configuration BPDU contains this information:

- The unique identifier of the switch that the transmitting switch believes to be the root switch
- The cost of the path to the root from the transmitting port
- The identifier of the transmitting port

RQS Nº 03/2005 - CN - CPMI - CORREIOS
0737
Fls:
Doc: 3701



The switch sends configuration BPDUs to communicate with and compute the spanning tree topology. A MAC frame conveying a BPDU sends the switch group address to the destination address field. All switches connected to the LAN on which the frame is transmitted receive the BPDU. BPDUs are not directly forwarded by the switch, but the receiving switch uses the information in the frame to calculate a BPDU and, if the topology changes, initiates a BPDU transmission.

A BPDU exchange results in the following:

- One switch is elected as the root switch.
- The shortest distance to the root switch is calculated for each switch.
- A designated switch is selected. This is the switch that is closest to the root switch through which frames will be forwarded to the root.
- A port for each switch is selected. This is the port that provides the best path from the switch to the root switch.
- Ports included in the STP are selected.

Spanning Tree Port States

Topology changes can take place in a switched network due to a link coming up or a link going down (failing). When a switch port transitions directly from nonparticipation in the topology to the forwarding state, it can create temporary data loops. Ports must wait for new topology information to propagate through the switches in the LAN before they can start forwarding frames. Also, they must allow the frame lifetime to expire for frames that have been forwarded using the old topology.

Note With Cisco IOS Release 12.1.(1)E or later on the Multilayer Switch Feature Card (MSFC), the Address Resolution Protocol (ARP) on the STP Topology Change Notification feature ensures that excessive flooding does not occur when the MSFC receives a topology change notification (TCN) from the supervisor engine. The feature causes the MSFC to send ARP requests for all the ARP entries belonging to the VLAN interface where the TCN is received. When the ARP replies come back, the Policy Feature Card (PFC) learns the MAC entries, which were lost as a result of the topology change. Learning the entries immediately following a topology change prevents excessive flooding later. There is no configuration required on the MSFC. This feature works with supervisor engine software release 5.4(2) or later.

At any given time, each port on a switch using a spanning tree protocol is in one of these states:

- Blocking
- Listening
- Learning
- Forwarding
- Disabled

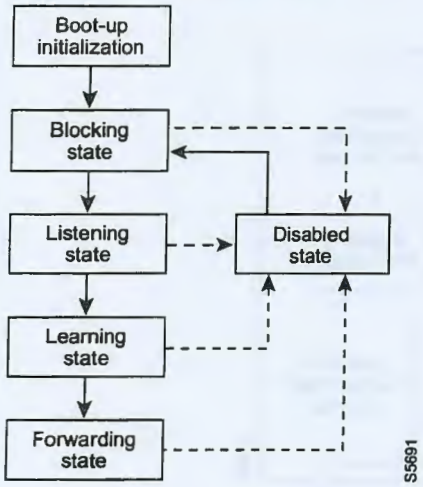
A port moves through these states as follows:

- From initialization to blocking
- From blocking to listening or to disabled
- From listening to learning or to disabled
- From learning to forwarding or to disabled
- From forwarding to disabled

Figure 8-2 illustrates how a port moves through the states.

3388

Figure 8-2 STP Port States



You can modify each port state by using management software, for example, VLAN Trunking Protocol (VTP). When you enable spanning tree, every switch in the network goes through the blocking state and the transitory states of listening and learning at power up. If properly configured, each port stabilizes into the forwarding or blocking state.

When the spanning tree algorithm places a port in the forwarding state, the following occurs:

- The port is put into the listening state while it waits for protocol information that suggests it should go to the blocking state.
- The port waits for the expiration of a protocol timer that moves the port to the learning state.
- In the learning state, the port continues to block frame forwarding as it learns station location information for the forwarding database.
- The expiration of a protocol timer moves the port to the forwarding state, where both learning and forwarding are enabled.

Blocking State

A port in the blocking state does not participate in frame forwarding (see Figure 8-3). After initialization, a BPDU is sent to each port in the switch. A switch initially assumes it is the root until it exchanges BPDUs with other switches. This exchange establishes which switch in the network is really the root. If only one switch resides in the network, no exchange occurs, the forward delay timer expires, and the ports move to the listening state. A switch always enters the blocking state following switch initialization.

RQS Nº 03/2005 - CN
CPMI - CORREIOS

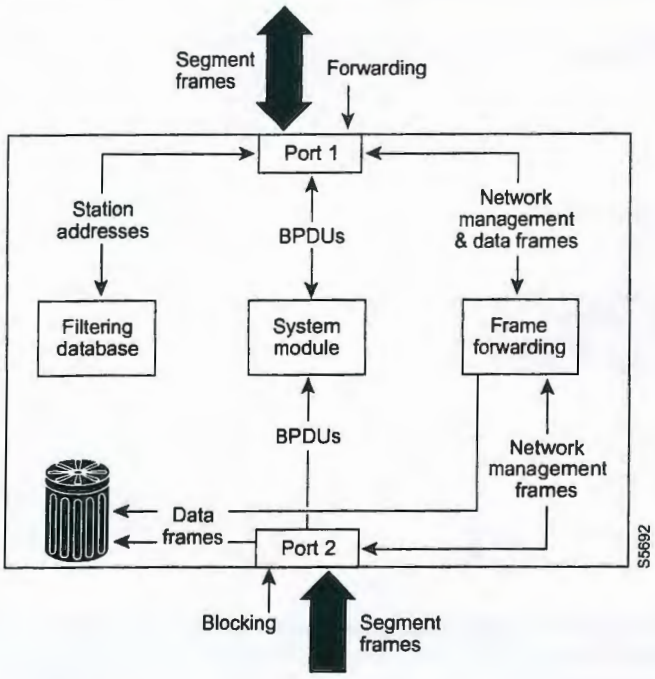
Fls:
Doc: 3701

Figure 8-3 Port 2 in Blocking State



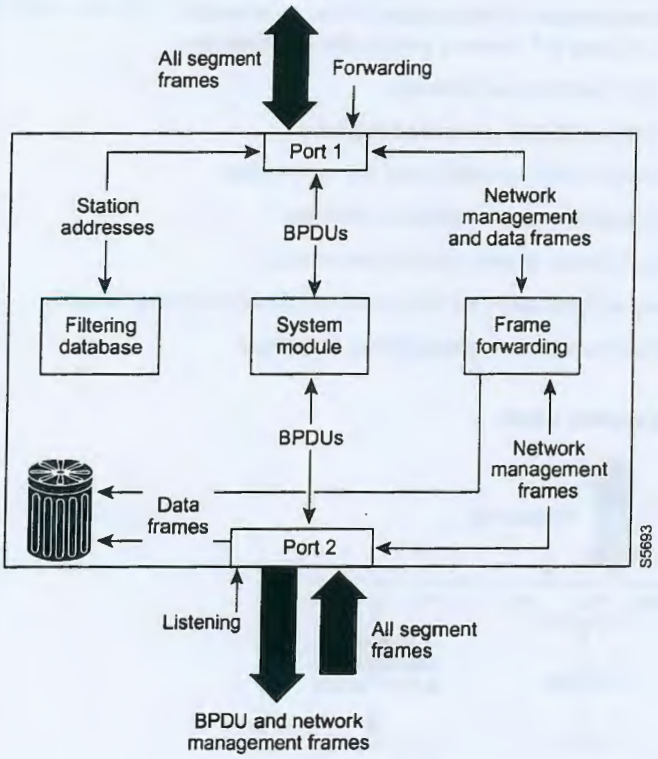
A port in the blocking state performs as follows:

- Discards frames received from the attached segment.
- Discards frames switched from another port for forwarding.
- Does not incorporate station location into its address database. (There is no learning on a blocking port, so there is no address database update.)
- Receives BPDUs and directs them to the system module.
- Does not transmit BPDUs received from the system module.
- Receives and responds to network management messages.

Listening State

The listening state is the first transitional state a port enters after the blocking state. The port enters this state when the spanning tree determines that the port should participate in frame forwarding. Learning is disabled in the listening state. Figure 8-4 shows a port in the listening state.

Figure 8-4 Port 2 in Listening State



A port in the listening state performs as follows:

- Discards frames received from the attached segment.
- Discards frames switched from another port for forwarding.
- Does not incorporate station location into its address database. (There is no learning at this point, so there is no address database update.)
- Receives BPDUs and directs them to the system module.
- Processes BPDUs received from the system module.
- Receives and responds to network management messages.

CPMI - CORREIOS
0739
Fls:
Doc: 3201

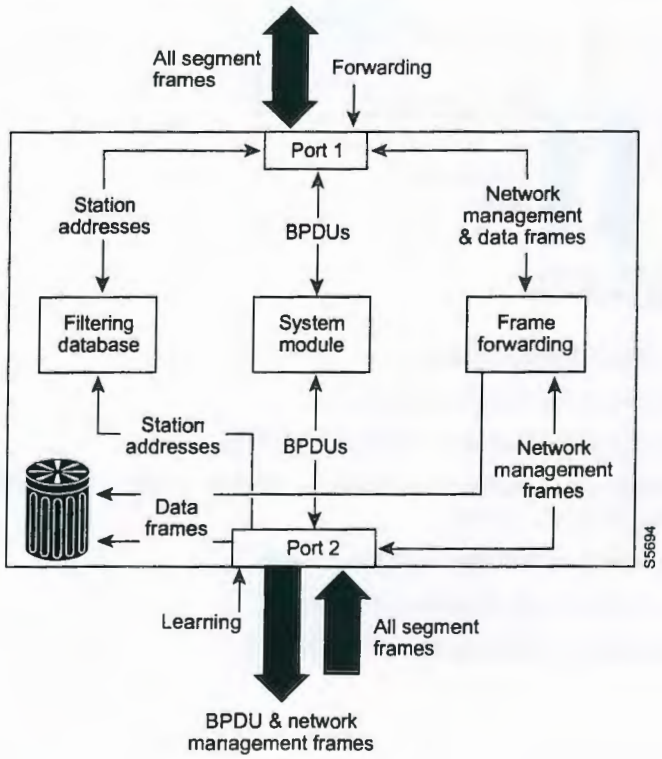
Learning State

A port in the learning state prepares to participate in frame forwarding. The port enters the learning state from the listening state. Figure 8-5 shows a port in the learning state.

A port in the learning state performs as follows:

- Discards frames received from the attached segment.
- Discards frames switched from another port for forwarding.
- Incorporates station location into its address database.
- Receives BPDUs and directs them to the system module.
- Receives, processes, and transmits BPDUs received from the system module.
- Receives and responds to network management messages.

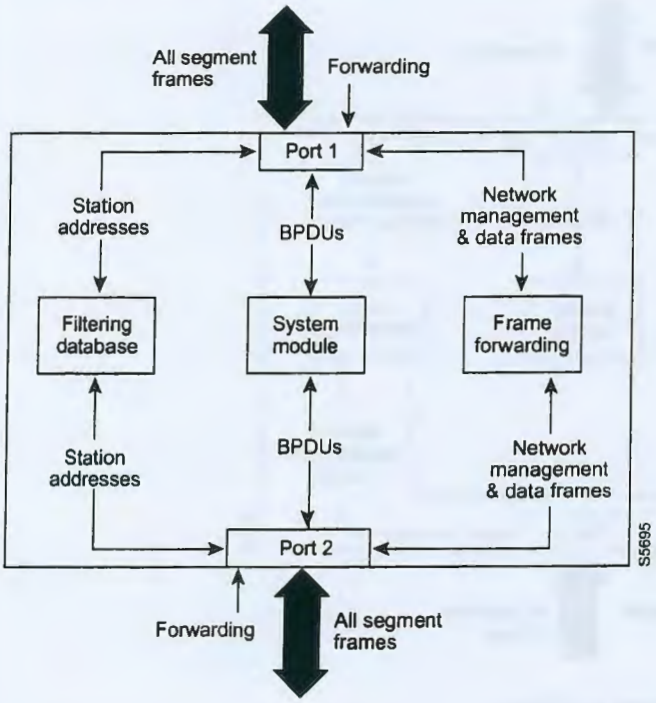
Figure 8-5 Port 2 in Learning State



Forwarding State

A port in the forwarding state forwards frames, as shown in Figure 8-6. The port enters the forwarding state from the learning state.

Figure 8-6 Port 2 in Forwarding State



A port in the forwarding state performs as follows:

- Forwards frames received from the attached segment.
- Forwards frames switched from another port for forwarding.
- Incorporates station location information into its address database.
- Receives BPDUs and directs them to the system module.
- Processes BPDUs received from the system module.
- Receives and responds to network management messages.

Caution Use spanning tree PortFast mode only on ports directly connected to individual workstations to allow these ports to come up and go directly to the forwarding state, instead of having to go through the entire spanning tree initialization process. To prevent illegal topologies, enable spanning tree on ports connected to switches or other devices that forward messages. For more information about PortFast, see Chapter 9, "Configuring Spanning Tree PortFast, UplinkFast, BackboneFast, and Loop Guard."

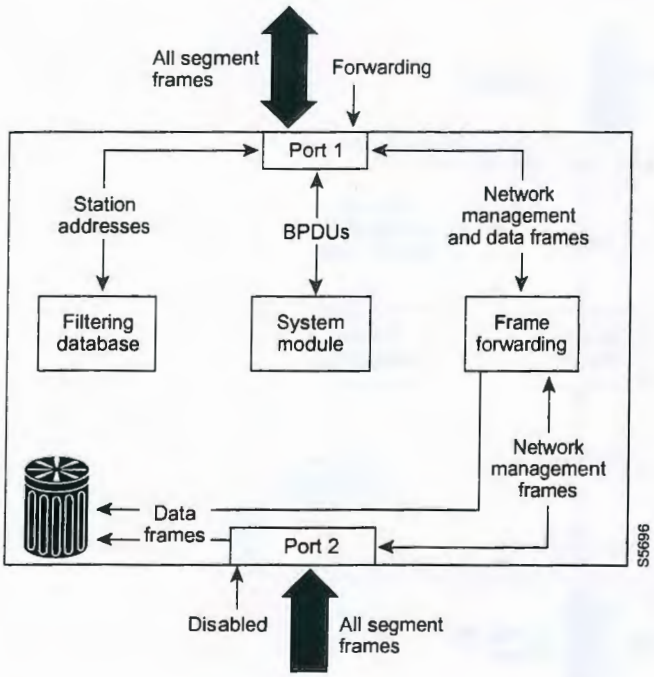
Doc:

Disabled State

A port in the disabled state does not participate in frame forwarding or STP, as shown in Figure 8-7. A port in the disabled state is virtually nonoperational.

Figure 8-7 Port 2 in Disabled State



A disabled port performs as follows:

- Discards frames received from the attached segment.
- Discards frames switched from another port for forwarding.
- Does not incorporate station location into its address database. (There is no learning, so there is no address database update.)
- Receives BPDUs but does not direct them to the system module.
- Does not receive BPDUs for transmission from the system module.
- Receives and responds to network management messages.

Understanding PVST+ and MISTP Modes

Catalyst 6500 series switches provide two proprietary spanning tree modes based on the IEEE 802.1D standard and one mode that is a combination of the two modes:

- Per VLAN Spanning Tree (PVST+)
- Multi-Instance Spanning Tree Protocol (MISTP)
- MISTP-PVST+ (combination mode)

3352

An overview of each mode is provided in this section. Each mode is described in detail in these sections:

- Using PVST+, page 8-23
- Using MISTP-PVST+ or MISTP, page 8-29

Caution If your network currently uses PVST+ and you plan to use MISTP on any switch, you must first enable MISTP-PVST+ on the switch and configure an MISTP instance to avoid causing loops in the network.

PVST+ Mode

PVST+ is the default spanning tree protocol used on all Ethernet, Fast Ethernet, and Gigabit Ethernet port-based VLANs on Catalyst 6500 series switches. PVST+ runs on each VLAN on the switch, ensuring that each VLAN has a loop-free path through the network.

PVST+ provides Layer 2 load balancing for the VLAN on which it runs; you can create different logical topologies using the VLANs on your network to ensure that all the links are used and no link is oversubscribed.

Each PVST+ instance on a VLAN has a single root switch. This root switch propagates the spanning tree information associated with that VLAN to all other switches in the network. This process ensures that the network topology is maintained because each switch has the same knowledge about the network.

MISTP Mode

MISTP is an optional spanning tree protocol that runs on Catalyst 6500 series switches. MISTP allows you to group multiple VLANs under a single instance of spanning tree (an MISTP instance). MISTP combines the Layer 2 load-balancing benefits of PVST+ with the lower CPU load of IEEE 802.1Q.

An MISTP instance is a virtual logical topology defined by a set of bridge and port parameters. When you map VLANs to an MISTP instance, this virtual logical topology becomes a physical topology. Each MISTP instance has its own root switch and a different set of forwarding links, that is, different bridge and port parameters.

Each MISTP instance root switch propagates the information associated with it to all other switches in the network. This process maintains the network topology because it ensures that each switch has the same information about the network.

MISTP builds MISTP instances by exchanging MISTP BPDUs with peer entities in the network. MISTP uses one BPDU for each MISTP instance, rather than one for each VLAN, as in PVST+. Because there are fewer BPDUs in an MISTP network, MISTP networks converge faster with less overhead. MISTP discards PVST+ BPDUs.

An MISTP instance can have any number of VLANs mapped to it, but a VLAN can be mapped only to a single MISTP instance. You can easily move a VLAN (or VLANs) in an MISTP topology to another MISTP instance if it has converged. (However, if ports are added at the same time the VLAN is moved, convergence time is required.)

Doc:

MISTP-PVST+ Mode

MISTP-PVST+ is a transition spanning tree mode that allows you to use the MISTP functionality on Catalyst 6500 series switches while continuing to communicate with Catalyst 5000 and 6500 series switches in your network that use PVST+. A switch using PVST+ mode that is connected to a switch using MISTP mode cannot see the BPDUs of the other switch, a condition that can cause loops in the network. MISTP-PVST+ allows interoperability between PVST+ and pure MISTP because it sees the BPDUs of both modes. To convert your network to MISTP, use MISTP-PVST+ to transition the network from PVST+ to MISTP.

Because MISTP-PVST+ conforms to the limits of PVST+, you cannot configure more VLAN ports on your MISTP-PVST+ switches than on your PVST+ switches.

Understanding Bridge Identifiers

These sections explain how MAC addresses are used in PVST+ and MISTP as unique bridge identifiers:

- MAC Address Allocation, page 8-12
- MAC Address Reduction, page 8-12

MAC Address Allocation

Catalyst 6500 series switches have a pool of 1024 MAC addresses that can be used as bridge identifiers for VLANs running under PVST+ or for MISTP instances. You can use the **show module** command to view the MAC address range.

MAC addresses are allocated sequentially, with the first MAC address in the range assigned to VLAN 1, the second MAC address in the range assigned to VLAN 2, and so on. The last MAC address in the range is assigned to the supervisor engine in-band (sc0) management interface.

For example, if the MAC address range is 00-e0-1e-9b-2e-00 to 00-e0-1e-9b-31-ff, the VLAN 1 bridge ID is 00-e0-1e-9b-2e-00, the VLAN 2 bridge ID is 00-e0-1e-9b-2e-01, the VLAN 3 bridge ID is 00-e0-1e-9b-2e-02, and so forth. The in-band (sc0) interface MAC address is 00-e0-1e-9b-31-ff.

MAC Address Reduction

For Catalyst 6500 series switches that support 4096 VLANs, MAC address reduction allows up to 4096 VLANs running under PVST+ or 16 MISTP instances to have unique identifiers without increasing the number of MAC addresses required on the switch. MAC address reduction reduces the number of MAC addresses required by the STP from one per VLAN or MISTP instance to one per switch. However, because VLANs running under PVST+ and MISTP instances running under MISTP-PVST+ or MISTP are considered logical bridges, each bridge must have its own unique identifier in the network.

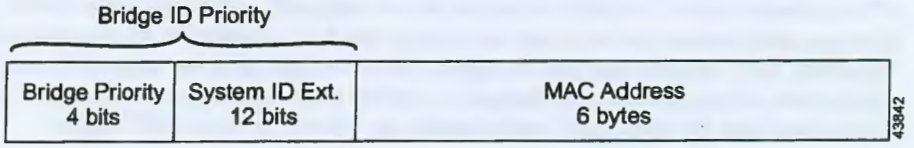
When you enable MAC address reduction, the bridge identifier stored in the spanning tree BPDU contains an additional field called the *system ID extension*. Combined with the bridge priority, the system ID extension functions as the unique identifier for a VLAN or an MISTP instance. The system ID extension is always the number of the VLAN or the MISTP instance; for example, the system ID extension for VLAN 100 is 100, and the system ID extension for MISTP instance 2 is 2.

Figure 8-8 shows the bridge identifier when you do not enable MAC address reduction. The bridge identifier consists of the bridge priority and the MAC address.

Figure 8-8 Bridge Identifier without MAC Address Reduction

Figure 8-9 shows the bridge identifier when you enable MAC address reduction. The bridge identifier consists of the bridge priority, the system ID extension, and the MAC address. The bridge priority and the system ID extension combined are known as the *bridge ID priority*. The bridge ID priority is the unique identifier for the VLAN or the MISTP instance.

Figure 8-9 Bridge Identifier with MAC Address Reduction Enabled



When you enter a **show spantree** command, you can see the bridge ID priority for a VLAN in PVST+ or for an MISTP instance in MISTP or MISTP-PVST+ mode.

This example shows the bridge ID priority for VLAN 1 when you enable MAC address reduction in PVST+ mode. The unique identifier for this VLAN is 32769.

```
Console> (enable) show spantree 1
VLAN 1
Spanning tree mode          PVST+
Spanning tree type          ieee
  .
  .
  .
Bridge ID MAC ADDR          00-d0-00-4c-18-00
Bridge ID Priority          32769  (bridge priority: 32768, sys ID ext: 1)
Bridge Max Age 20 sec   Hello Time 2  sec   Forward Delay 15 sec
```

If you have a Catalyst switch in your network with MAC address reduction enabled, you should also enable MAC address reduction on all other Layer-2 connected switches to avoid undesirable root election and spanning tree topology issues.

When MAC address reduction is enabled, the root bridge priority becomes a multiple of 4096 plus the VLAN ID. With MAC address reduction enabled, a switch bridge ID (used by the spanning-tree algorithm to determine the identity of the root bridge, the lowest being preferred) can only be specified as a multiple of 4096. Only the following values are possible: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440.

Therefore, if another bridge in the same spanning-tree domain does not run the MAC address reduction feature, it could claim and win root bridge ownership because of the finer granularity in the selection of its bridge ID.

Note The MAC address reduction feature is enabled by default on Cisco switches that have 64 MAC addresses (Cisco 7606, CISCO7603, WS-C6503, and WS-C6513).

Understanding How Multiple Spanning Trees Work

The Multiple Spanning Tree (MST) feature is an upcoming (as of this software release) IEEE standard. 802.1s for MST is an amendment to 802.1Q. MST extends the 802.1w Rapid Spanning Tree (RST) algorithm to multiple spanning trees. This extension provides for both rapid convergence and load balancing in a VLAN environment. For a given topology, MST converges faster than PVST+ and MISTP. The MST feature for this release is based on a draft version of the IEEE standard. MST is backward compatible with 802.1D STP, 802.1w, the Rapid Spanning Tree Protocol (RSTP), and the Cisco PVST+ architecture.

MST allows you to build multiple spanning trees over VLAN trunks. You can group and associate VLANs to spanning tree instances. Each instance can have a topology independent of other spanning tree instances. This new architecture provides multiple forwarding paths for data traffic and enables load balancing. Network fault tolerance is improved because a failure in one instance (forwarding path) does not affect other instances (forwarding paths).

In large networks, having different VLAN-spanning tree instance assignments located in different parts of the network makes it easier to administrate and optimally utilize redundant paths. However, a spanning tree instance can exist only on bridges that have compatible VLAN-instance assignments. Therefore, MST requires that you configure a set of bridges with the same MST configuration information, allowing them to participate in a given set of spanning tree instances. Interconnected bridges that have the same MST configuration are referred to as an MST region.

MST uses the modified RSTP version called the Multiple Spanning Tree Protocol (MSTP). The MST feature has these characteristics:

- MST runs a variant of spanning tree called Internal Spanning Tree (IST). IST augments the Common Spanning Tree (CST) information with internal information about the MST region. The MST region appears as a single bridge to adjacent Single Spanning Tree (SST) and MST regions.
- A bridge running MST provides interoperability with single spanning tree bridges as follows:
  - MST bridges run a variant of STP (IST) that augments the Common Spanning Tree (CST) information with internal information about the MST region.
  - IST connects all the MST bridges in the region and appears as a subtree in the CST that encompasses the whole bridged domain. The MST region appears as a virtual bridge to adjacent SST bridges and MST regions.
  - The collection of ISTs in each MST region, the CST that interconnects the MST regions, and the SST bridges define Common and Internal Spanning Tree (CIST). CIST is the same as an IST inside an MST region and the same as CST outside an MST region. The STP, RSTP, and MSTP together elect a single bridge as the root of CIST.
- MST establishes and maintains additional spanning trees within each MST region. These spanning trees are referred to as MST instances (MSTIs). The IST is numbered 0, and the MSTIs are numbered 1,2,3,... and so on. Any given MSTI is local to the MST region that is independent of MSTIs in another region, even if the MST regions are interconnected. MST instances combine with the IST at the boundary of MST regions to become the CST as follows:
  - Spanning tree information for an MSTI is contained in an MSTP record (M-record).

    M-records are always encapsulated within MST BPDUs (MST BPDUs). The original spanning trees computed by MSTP are called M-trees. M-trees are active only within the MST region. M-trees merge with the IST at the boundary of the MST region and form the CST.
- MST provides interoperability with PVST+ by generating PVST+ BPDUs for the non-CST VLANs.

- MST supports some of the PVST+ extensions in MSTP as follows:
  - UplinkFast and BackboneFast are not available in MST mode; they are part of RSTP.
  - PortFast is supported.
  - BPDU filter and BPDU guard are supported in MST mode.
  - Loop guard and root guard are supported in MST. MST preserves the VLAN 1 disabled functionality except that BPDUs are still transmitted in VLAN 1.
  - MST switches behave as if MAC reduction is enabled.
  - For private VLANs (PVLANs), secondary VLANs are mapped to the same instance as the primary.

Follow these guidelines when using MST:

- Do not disable spanning tree on any VLAN in any of the PVST bridges.
- Ensure that all PVST spanning tree root bridges have lower (numerically higher) priority than the CST root bridge.
- Do not use PVST bridges as the root of CST.
- Ensure that trunks carry all of the VLANs mapped to an instance or do not carry any VLANs at all.
- Do not connect switches with access links because access links may partition a VLAN.
- Any MST configuration involving a large number of either existing or new logical VLAN ports should be carried out during the maintenance window. This action should be taken because the complete MST database gets re-initialized for any incremental changes (such as adding new VLANs to instances or moving VLANs across instances).

These sections describe MST:

- Rapid Spanning Tree Protocol, page 8-15
- MST-to-SST Interoperability, page 8-17
- Common Spanning Tree, page 8-18
- MST Instances, page 8-18
- MST Configuration, page 8-18
- MST Region, page 8-19
- Message Age and Hop Count, page 8-20
- MST-to-PVST+ Interoperability, page 8-21

Rapid Spanning Tree Protocol

RSTP significantly reduces the time to reconfigure the active topology of the network when changes to the physical topology or its configuration parameters occur. RSTP selects one switch as the root of a spanning-tree-connected active topology and assigns port roles to individual ports of the switch, depending on whether that port is part of the active topology.

RSTP provides rapid connectivity following the failure of a switch, switch port, or a LAN. A new root port and the designated port on the other side of the bridge transition to forwarding through an explicit handshake between them. RSTP allows switch port configuration so the ports can transition to forwarding directly when the switch reinitializes.

3348
DEL-LAN-05/2005-CN
CORREIOS
Fls: 0743
Doc: 3201

RSTP, specified in 802.1w, supersedes STP specified in 802.1D, while remaining compatible with STP. RSTP provides the structure on which the MST operates. You configure RSTP when you configure the MST feature. For more information, see the "Configuring Multiple Spanning Tree" section on page 8-44.

RSTP provides backward compatibility with 802.1D bridges as follows:

- RSTP selectively sends 802.1D-configured BPDUs and Topology Change Notification (TCN) BPDUs on a per-port basis.
- When a port initializes, the Migration Delay timer starts and RSTP BPDUs are transmitted. While the Migration Delay timer is active, the bridge processes all BPDUs received on that port. RSTP BPDUs are not visible on the port; only version 3 BPDUs are visible.
- If the bridge receives an 802.1D BPDU after a port's Migration Delay timer expires, the bridge assumes it is connected to an 802.1D bridge and starts using only 802.1D BPDUs.
- When RSTP uses 802.1D BPDUs on a port and receives an RSTP BPDU after the migration delay expires, RSTP restarts the Migration Delay timer and begins using RSTP BPDUs on that port.

RSTP Port Roles

RSTP uses the following definitions for port roles:

- Root—A forwarding port elected for the spanning tree topology.
- Designated—A forwarding port elected for every switched LAN segment.
- Alternate—An alternate path to the root bridge to that provided by the current root port.
- Backup—A backup for the path provided by a designated port toward the leaves of the spanning tree. Backup ports can exist only where two ports are connected together in a loopback by a point-to-point link or bridge with two or more connections to a shared LAN segment.
- Disabled—A port that has no role within the operation of spanning tree.

Port roles are assigned as follows:

- A root port or designated port role includes the port in the active topology.
- An alternate port or backup port role excludes the port from the active topology.

RSTP Port States

The port state controls the forwarding and learning processes and provides the values of discarding, learning, and forwarding. Table 8-1 provides a comparison between STP port states and RSTP port states.

Table 8-1 Comparison Between STP and RSTP Port States

Operational Status	STP Port State	RSTP Port State	Port Included in Active Topology
Enabled	Blocking[1]	Discarding[2]	No
Enabled	Listening	Discarding	No
Enabled	Learning	Learning	Yes
Enabled	Forwarding	Forwarding	Yes
Disabled	Disabled	Discarding	No

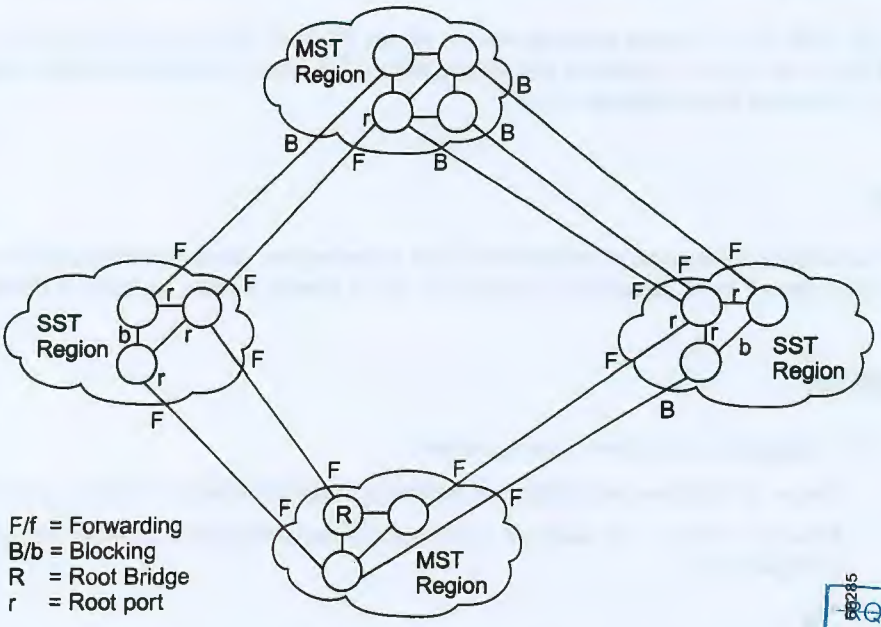
1. IEEE 802.1D port state designation.
2. IEEE 802.1w port state designation. Discarding is the same as blocking in MST.

In a stable topology, RSTP ensures that every root port and designated port transition to forwarding while all alternate ports and backup ports are always in the discarding state.

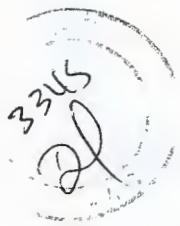
MST-to-SST Interoperability

A virtual bridged LAN may contain interconnected regions of SST and MST bridges. Figure 8-10 shows this relationship.

Figure 8-10 Network with Interconnected SST and MST Regions



ECT-QS Nº 03/2005 - CN
CPMI - CORREIOS
0744
Fls:
Doc: 3701



To the spanning tree protocol running in the SST region, an MST region appears as a single SST or pseudobridge. Pseudobridges operate as follows:

- The same values for root identifiers and root path costs are sent in all BPDUs of all the pseudobridge ports. Pseudobridges differ from a single SST bridge as follows:
  - The pseudobridge BPDUs have different bridge identifiers. This difference does not affect STP operation in the neighboring SST regions because the root identifier and root cost are the same.
  - BPDUs sent from the pseudobridge ports may have significantly different message ages. Because the message age increases by 1 second for each hop, the difference in the message age is in the order of seconds.
- Data traffic from one port of a pseudobridge (a port at the edge of a region) to another port follows a path entirely contained within the pseudobridge or MST region.
- Data traffic belonging to different VLANs may follow different paths within the MST regions established by MST.
- Loop prevention is achieved by either of the following:
  - Blocking the appropriate pseudobridge ports by allowing one forwarding port on the boundary and blocking all other ports.
  - Setting the CST partitions to block the ports of the SST regions.
- A pseudobridge differs from a single SST bridge because the BPDUs sent from the pseudobridge's ports have different bridge identifiers. The root identifier and root cost are the same for both bridges.

Common Spanning Tree

CST (802.1Q) is a single spanning tree for all the VLANs. In a Catalyst 6500 series switch running PVST+, the VLAN 1 spanning tree corresponds to CST. In a Catalyst 6500 series switch running MST, IST (instance 0) corresponds to CST.

MST Instances

This release supports up to 16 instances; each spanning tree instance is identified by an instance ID that ranges from 0 to 15. Instance 0 is mandatory and is always present. Instances 1 through 15 are optional.

MST Configuration

MST configuration has three parts as follows:

- Name—A 32-character string (null padded and null terminated) identifying the MST region.
- Revision number—An unsigned 16-bit number that identifies the revision of the current MST configuration.

Note You must set the revision number when required as part of the MST configuration. The revision number is not incremented automatically each time the MST configuration is committed.

3344

- MST configuration table—An array of 4096 bytes. Each byte, interpreted as an unsigned integer, corresponds to a VLAN. The value is the instance number to which the VLAN is mapped. The first byte that corresponds to VLAN 0 and the 4096th byte that corresponds to VLAN 4095 are unused and always set to zero.

You must configure each byte manually. You can use SNMP or the CLI to perform the configuration.

MST BPDUs contain the MST configuration ID and the checksum. An MST bridge accepts an MST BPDU only if the MST BPDU configuration ID and the checksum match its own MST region configuration ID and checksum. If one value is different, the MST BPDU is treated as an SST BPDU.

When you modify an MST configuration through either a console or Telnet connection, the session exits without committing those changes and the edit buffer locks. Further configuration is impossible until you discard the existing edit buffer and acquire a new edit buffer by entering the **set spantree mst config rollback force** command.

MST Region

Interconnected bridges that have the same MST configuration are referred to as an MST region. There is no limit on the number of MST regions in the network.

To form an MST region, bridges can be either of the following:

- An MST bridge that is the only member of the MST region.
- An MST bridge interconnected by a LAN. A LAN's designated bridge has the same MST configuration as an MST bridge. All the bridges on the LAN can process MST BPDUs.

If you connect two MST regions with different MST configurations, the MST regions do the following:

- Load balance across redundant paths in the network. If two MST regions are redundantly connected, all traffic flows on a single connection with the MST regions in a network.
- Provide an RSTP handshake to enable rapid connectivity between regions. However, the handshaking is not as fast as between two bridges. To prevent loops, all the bridges inside the region must agree upon the connections to other regions. This situation introduces a certain delay. We do not recommend partitioning the network into a large number of regions.

Boundary Ports

A boundary port is a port that connects to a LAN, the designated bridge of which, is either an SST bridge or a bridge with a different MST configuration. A designated port knows that it is on the boundary if it detects an STP bridge or receives an agreement message from an RST or MST bridge with a different configuration.

At the boundary, the role of MST ports do not matter; their state is forced to be the same as the IST port state. If the boundary flag is set for the port, the MSTP Port Role selection mechanism assigns a port role to the boundary and the same state as that of the IST port. The IST port at the boundary can take up any port role except a backup port role.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
0745

Doc: 3701

IST Master

The IST master of an MST region is the bridge with the lowest bridge identifier and the least path cost to the CST root. If an MST bridge is the root bridge for CST, then it is the IST master of that MST region. If the CST root is outside the MST region, then one of the MST bridges at the boundary is selected as the IST master. Other bridges on the boundary that belong to the same region eventually block the boundary ports that lead to the root.

If two or more bridges at the boundary of a region have an identical path to the root, you can set a slightly lower bridge priority to make a specific bridge the IST master.

The root path cost and message age inside a region stay constant, but the IST path cost is incremented and the IST remaining hops are decremented at each hop. Enter the **show spantree mst** command to display the information about the IST master, path cost, and remaining hops for the bridge.

Edge Ports

A port that is connected to a nonbridging device (for example, a host or a router) is an edge port. A port that connects to a hub is also an edge port if the hub or any LAN that is connected by it does not have a bridge. An edge port can start forwarding as soon as the link is up.

MST requires that you configure all ports for each host or router. To establish rapid connectivity after a failure, you need to block the nonedge designated ports of an intermediate bridge. If the port connects to another bridge that can send back an agreement, then the port starts forwarding immediately. Otherwise, the port needs twice the forward delay time to start forwarding again. You must explicitly configure the ports that are connected to the hosts and routers as edge ports while using MST.

Note To configure a port as an edge port, you enable PortFast on that port. When you enter the **show spantree portfast** *mod/port* command, if the designation for a port is displayed as edge, that port is also a PortFast port. For more information see Chapter 9, "Configuring Spanning Tree PortFast, UplinkFast, BackboneFast, and Loop Guard."

To prevent a misconfiguration, the PortFast operation is turned off if the port receives a BPDU. You can display the configured and operational status of Portfast by using the **show spantree mst** *mod/port* command.

Link Type

Rapid connectivity is established only on point-to-point links. You must configure ports explicitly to a host or router. However, cabling in most networks meets this requirement, and you can avoid explicit configuration by treating all full-duplex links as point-to-point links by entering the **set spantree mst link-type** command.

Message Age and Hop Count

IST and MST instances do not use the Message Age and Maximum Age timer settings in the BPDU. IST and MST use a separate hop count mechanism that is very similar to the IP TTL mechanism. You can configure each MST bridge with a maximum hop count. The root bridge of the instance sends a BPDU (or M-record) with the remaining hop count that is equal to the maximum hop count. When a bridge receives a BPDU (or M-record), it decrements the received remaining hop count by one. The bridge

3342
21

discards the BPDU (M-record) and ages out the information held for the port if the count reaches zero after decrementing. The nonroot bridges propagate the decremented count as the remaining hop count in the BPDUs (M-records) they generate.

The Message Age and Maximum Age timer settings in the RST portion of the BPDU remain the same throughout the region, and the same values are propagated by the region's designated ports at the boundary.

MST-to-PVST+ Interoperability

These guidelines apply in a topology where you configure MST switches (all in the same region) to interact with PVST+ switches that have VLANs 1—100 set up to span throughout the network:

- Configure the root for all VLANs inside the MST region. The ports that belong to the MST switch at the boundary simulate PVST+ and send PVST+ BPDUs for all the VLANs. This example shows the ports simulating PVST:

```
Console> (enable) show spantree mst 3
Spanning tree mode          MST
Instance                    3
VLANs Mapped:               31-40

Designated Root             00-10-7b-bb-2f-00
Designated Root Priority    8195  (root priority:8192, sys ID ext:3)
Designated Root Cost        0          Remaining Hops 20
Designated Root Port        1/0

Bridge ID MAC ADDR          00-10-7b-bb-2f-00
Bridge ID Priority          8195  (bridge priority:8192, sys ID ext:3)

Port                    State         Role Cost     Prio Type
----------------------- ------------- ---- -------- ------------------------
 6/1                    forwarding    BDRY    10000   30 P2P,
Boundary(PVST)
 6/2                    blocking      BDRY    20000   32 P2P,
Boundary(PVST)
```

  If you enable loop guard on the PVST+ switches, the ports might change to a loop-inconsistent state when the MST switches change their configuration. To correct the loop-inconsistent state, you must disable and reenable loop guard on that PVST+ switch.

- Do not locate the root for some or all of the VLANs inside the PVST+ side of the MST switch because when the MST switch at the boundary receives PVST+ BPDUs for all or some of the VLANs on its designated ports, root guard sets the port to the blocking state. Do not designate switches with a slower CPU running PVST+ as a switch running MST.

When you connect a PVST+ switch to two different MST regions, the topology change from the PVST+ switch does not pass beyond the first MST region. In this case, the topology changes are only propagated in the instance to which the VLAN is mapped. The topology change stays local to the first MST region and the CAM entries in the other region are not flushed To make the topology change visible throughout other MST regions, you can map that VLAN to IST or connect the PVST+ switch to the two regions through access links.

Understanding How BPDU Skewing Works

BPDU skewing is the difference in time between when the BPDUs are expected to be received by the switch and when the BPDUs are actually received by that switch. Skewing occurs as follows:

- Spanning tree timers lapse.
- Expected BPDUs are not received by the switch.
- Spanning tree detects topology changes.

The skew causes BPDUs to reflood the network to keep the spanning tree topology database current.

The root switch advertises its presence by sending out BPDUs for the configured hello time interval. The nonroot switches receive and process one BPDU during each configured time period. A VLAN may not receive the BPDU as scheduled. If the BPDU is not received on a VLAN at the configured time interval, the BPDU is skewed.

Spanning tree uses the hello time (see the "Configuring the Hello Time" section on page 8-43) to detect when a connection to the root switch exists through a port and when that connection is lost. This feature applies to both PVST+ and MISTP. In MISTP, the skew detection is on a per-instance basis.

BPDU skewing detects BPDUs that are not processed in a regular time frame on the nonroot switches in the network. If BPDU skewing occurs, a syslog message is displayed. The syslog applies to both PVST+ and MISTP.

The number of syslog messages that are generated may impact the network convergence and the CPU utilization of the switch. New syslog messages are not generated as individual messages for every VLAN because the higher the number of syslog messages that are reported, the slower the switching process will be. To reduce the impact on the switch, the syslog messages are as follows:

- Generated 50 percent of the maximum age time (see the "Configuring the Maximum Aging Time" section on page 8-44)
- Rate limited at one for every 60 seconds

Using PVST+

PVST+ is the default spanning tree mode for Catalyst 6500 series switches. These sections describe how to configure PVST+ on Ethernet VLANs:

- Default PVST+ Configuration, page 8-23
- Setting the PVST+ Bridge ID Priority, page 8-24
- Configuring the PVST+ Port Cost, page 8-25
- Configuring the PVST+ Port Priority, page 8-26
- Configuring the PVST+ Default Port Cost Mode, page 8-26
- Configuring the PVST+ Port Cost for a VLAN, page 8-27
- Configuring the PVST+ Port Priority for a VLAN, page 8-28
- Disabling the PVST+ Mode on a VLAN, page 8-28

Default PVST+ Configuration

Table 8-2 shows the default PVST+ configuration.

Table 8-2 PVST+ Default Configuration

Feature	Default Value
VLAN 1	All ports assigned to VLAN 1
Enable state	PVST+ enabled for all VLANs
MAC address reduction	Disabled
Bridge priority	32768
Bridge ID priority	32769 (bridge priority plus system ID extension of VLAN 1)
Port priority	32
Port cost	• Gigabit Ethernet: 4 • Fast Ethernet: 19[1] • FDDI/CDDI: 10 • Ethernet: 100[2]
Default spantree port cost mode	Short (802.1D)
Port VLAN priority	Same as port priority but configurable on a per-VLAN basis in PVST+
Port VLAN cost	Same as port cost but configurable on a per-VLAN basis in PVST+
Maximum aging time	20 seconds
Hello time	2 seconds
Forward delay time	15 seconds

1. If 10/100 Mbps ports autonegotiate or are hard set to 100 Mbps, the port cost is 19.
2. If 10/100 Mbps ports autonegotiate or are hard set to 10 Mbps, the port cost is 100.

Setting the PVST+ Bridge ID Priority

The bridge ID priority is the priority of a VLAN when the switch is in PVST+ mode.

When the switch is in PVST+ mode without MAC address reduction enabled, you can enter a bridge priority value between 0–65535. The bridge priority value you enter also becomes the VLAN bridge ID priority for that VLAN.

When the switch is in PVST+ mode with MAC address reduction enabled, you can enter one of 16 bridge priority values: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, or 61440.

The bridge priority is combined with the system ID extension (that is, the ID of the VLAN) to create the bridge ID priority for the VLAN.

To set the spanning tree bridge priority for a VLAN, perform this task in privileged mode:

	Task	Command
Step 1	Set the PVST+ bridge ID priority for a VLAN.	**set spantree priority** *bridge_ID_priority* [*vlan*]
Step 2	Verify the bridge ID priority.	**show spantree** [*vlan*] **[active]**

This example shows how to set the PVST+ bridge ID priority when MAC address reduction is not enabled (default):

```
Console> (enable) set spantree priority 30000 1
Spantree 1 bridge priority set to 30000.
Console> (enable) show spantree 1
VLAN 1
Spanning tree mode          PVST+
Spanning tree type          ieee
Spanning tree enabled

Designated Root             00-60-70-4c-70-00
Designated Root Priority    16384
Designated Root Cost        19
Designated Root Port        2/3
Root Max Age   14 sec   Hello Time 2 sec   Forward Delay 10 sec

Bridge ID MAC ADDR          00-d0-00-4c-18-00
Bridge ID Priority          30000
Bridge Max Age 20 sec   Hello Time 2 sec   Forward Delay 15 sec

Port                     Vlan Port-State    Cost      Prio Portfast Channel_id
------------------------ ---- ------------ --------- ---- -------- ----------
 1/1                     1    not-connected          4   32 disabled 0
 1/2                     1    not-connected          4   32 disabled 0
 2/1                     1    not-connected        100   32 disabled 0
 2/2                     1    not-connected        100   32 disabled 0
```

This example shows how to set the PVST+ bridge ID priority when MAC reduction is enabled:

```
Console> (enable) set spantree priority 32768 1
Spantree 1 bridge ID priority set to 32769
(bridge priority: 32768 + sys ID extension: 1)
Console> (enable) show spantree 1/1 1
VLAN 1
Spanning tree mode          PVST+
Spanning tree type          ieee
Spanning tree enabled
```

```
Designated Root             00-60-70-4c-70-00
Designated Root Priority    16384
Designated Root Cost        19
Designated Root Port        2/3
Root Max Age   14 sec   Hello Time 2 sec   Forward Delay 10 sec

Bridge ID MAC ADDR          00-d0-00-4c-18-00
Bridge ID Priority          32769 (bridge priority: 32768, sys ID ext: 1)
Bridge Max Age 20 sec   Hello Time 2 sec   Forward Delay 15 sec

Port                     Vlan Port-State    Cost      Prio Portfast Channel_id
------------------------ ---- ------------ --------- ---- -------- ----------
 1/1                     1    not-connected         4   32 disabled 0
 1/2                     1    not-connected         4   32 disabled 0
 2/1                     1    not-connected       100   32 disabled 0
 2/2                     1    not-connected       100   32 disabled 0
```

Configuring the PVST+ Port Cost

You can configure the port cost of switch ports. Ports with lower port costs are more likely to be chosen to forward frames. Assign lower numbers to ports attached to faster media (such as full duplex) and higher numbers to ports attached to slower media.The possible range of *cost* is 1 to 65535. The default differs for different media. Path cost is typically 1000 LAN speed in megabits per second.

To configure the PVST+ port cost for a port, perform this task in privileged mode:

	Task	Command
Step 1	Configure the PVST+ port cost for a switch port.	**set spantree portcost** {*mod/port*} *cost*
Step 2	Verify the port cost setting.	**show spantree** *mod/port*

Note When you enter the **set spantree channelcost** command, it does not appear in the configuration file. The command causes a "set spantree portcost" entry to be created for each port in the channel. See the "Setting the EtherChannel Port Path Cost" section in Chapter 6, "Configuring EtherChannel," for information on using the **set spantree channelcost** command.

This example shows how to configure the PVST+ port cost on a port and verify the configuration:

```
Console> (enable) set spantree portcost 2/3 12
Spantree port 2/3 path cost set to 12.
Console> (enable) show spantree 2/3
VLAN 1
   .
   .
   .
Port                     Vlan Port-State    Cost      Prio Portfast Channel_id
------------------------ ---- ------------ --------- ---- -------- ----------
 1/1                     1    not-connected         4   32 disabled 0
 1/2                     1    not-connected         4   32 disabled 0
 2/1                     1    not-connected       100   32 disabled 0
 2/2                     1    not-connected       100   32 disabled 0
 2/3                     1    forwarding           12   32 disabled 0
 2/4                     1    not-connected       100   32 disabled
```

Configuring the PVST+ Port Priority

You can configure the port priority of switch ports in PVST+ mode. The port with the lowest priority value forwards frames for all VLANs. The possible port priority value is a multiple of 16 from 0 to 240. The default is 32. If all ports have the same priority value, the port with the lowest port number forwards frames.

To configure the PVST+ port priority for a port, perform this task in privileged mode:

	Task	Command
Step 1	Configure the PVST+ port priority for a switch port.	**set spantree portpri** *mod/port priority*
Step 2	Verify the port priority setting.	**show spantree** *mod/port*

This example shows how to configure the PVST+ port priority for a port:

```
Console> (enable) set spantree portpri 2/3 48
Bridge port  2/3 port priority set to 48.
Console> (enable) show spantree 2/3
VLAN 1
   .
   .
   .
Port                     Vlan Port-State    Cost      Prio Portfast Channel_id
------------------------ ---- ------------ --------- ---- -------- ----------
 1/1                     1    not-connected         4   32 disabled 0
 1/2                     1    not-connected         4   32 disabled 0
 2/1                     1    not-connected       100   32 disabled 0
 2/2                     1    not-connected       100   32 disabled 0
 2/3                     1    forwarding           19   48 disabled 0
 2/4                     1    not-connected       100   32 disabled 0
```

This example shows that values that are not multiples of 16 (between the values of 0 to 63) are converted to the nearest multiple of 16:

```
Console> (enable) set spantree portpri 2/3 2
Vlan port priority must be one of these numbers:0, 16, 32, 48, 64, 80,
96, 112, 128, 144,
160, 176, 192, 208, 224, 240
converting 2 to 0 nearest multiple of 16
Bridge port  2/3 port priority set to 0.
```

Configuring the PVST+ Default Port Cost Mode

If any switch in your network is using a port speed of 10 Gb or over and the network is using PVST+ spanning tree mode, all switches in the network must have the same path cost defaults. You can enter the **set spantree defaultcostmode** command to force all VLANs associated with all the ports to have the same port cost default set.

Two default port cost modes are available—short and long.

- The short mode has these parameters:
  - Portcost
  - Portvlancost
  - When uplinkfast is enabled, the actual cost is incremented by 3000

- The long mode has these parameters:
  - Portcost
  - Portvlancost
  - When uplinkfast is enabled, the actual cost is incremented by 10,000,000
  - EtherChannel computes the cost of a bundle using the formula, AVERAGE_COST/NUM_PORT

The default port cost mode is set to short in PVST+ mode. For port speeds of 10 Gb and greater, the default port cost mode must be set to long.

To configure the PVST+ default port cost mode, perform this task in privileged mode:

Task	Command
Configure the PVST+ default port cost mode.	**set spantree defaultcostmode** {**short** | **long**}

This example shows how to configure the PVST+ default port cost mode:

```
Console> (enable) set spantree defaultcostmode long
Portcost and portvlancost set to use long format default values.
Console> (enable)
```

Configuring the PVST+ Port Cost for a VLAN

You can configure the port cost for a port on a per-VLAN basis. Ports with a lower port cost in the VLAN are more likely to be chosen to forward frames. You should assign lower numbers to ports attached to faster media (such as full duplex) and higher numbers to ports attached to slower media. The default cost differs for different media.

You can set a cost value from 1 to 65535.

To configure the PVST+ port VLAN cost for a port, perform this task in privileged mode:

Task	Command
Configure the PVST+ port cost for a VLAN on a port.	**set spantree portvlancost** {*mod/port*} [**cost** *cost*] [*vlan_list*]

Note When you use the **set spantree channelcost** command, it does not appear in the configuration file. The command causes a "set spantree portcost" entry to be created for each port in the channel. See the "Setting the EtherChannel Port Path Cost" section in Chapter 6, "Configuring EtherChannel," for information on using the **set spantree channelcost** command.

This example shows how to configure the PVST+ port VLAN cost on port 2/3 for VLANs 1 through 5:

```
Console> (enable) set spantree portvlancost 2/3 cost 20000 1-5
Port 2/3 VLANs 6-11,13-1005,1025-4094 have path cost 12.
Port 2/3 VLANs 1-5,12 have path cost 20000.
This parameter applies to trunking ports only.
Console> (enable
```

ROS Nº 03/2005 - CN
CPMI - CORREIOS
0749

3701
Doc:

Configuring the PVST+ Port Priority for a VLAN

When the switch is in PVST+ mode, you can set the port priority for a trunking port in a VLAN. The port with the lowest priority value for a specific VLAN forwards frames for that VLAN. The possible port priority value is a multiple of 16 from 0 to 240. The default is 16. If all ports have the same priority value for a particular VLAN, the port with the lowest port number forwards frames for that VLAN.

The port VLAN priority value must be lower than the port priority value.

To configure the port VLAN priority for a port, perform this task in privileged mode:

	Task	Command
Step 1	Configure the PVST+ port priority for a VLAN on a port.	**set spantree portvlanpri** *mod/port priority* [*vlans*]
Step 2	Verify the port VLAN priority.	**show config all**

This example shows how to configure the port priority for VLAN 6 on port 2/3:

```
Console> (enable) set spantree portvlanpri 2/3 16 6
Port 2/3 vlans 6 using portpri 16.
Port 2/3 vlans 1-5,7-800,802-1004,1006-4094 using portpri 32.
Port 2/3 vlans 801,1005 using portpri 4.
This parameter applies to trunking ports only.
Console> (enable) show config all
    .
    .
    .
set spantree portcost    2/12,2/15 19
set spantree portcost    2/1-2,2/4-11,2/13-14,2/16-48 100
set spantree portcost    2/3 12
set spantree portpri     2/1-48 32
set spantree portvlanpri 2/1 0
set spantree portvlanpri 2/2 0
    .
    .
    .
set spantree portvlanpri 2/48 0
set spantree portvlancost 2/1 cost 99
set spantree portvlancost 2/2 cost 99
set spantree portvlancost 2/3 cost 20000 1-5,12
```

Disabling the PVST+ Mode on a VLAN

When the switch is in PVST+ mode, you can disable spanning tree on individual VLANs or all VLANs. When you disable spanning tree on a VLAN, the switch does not participate in spanning tree and any BPDUs received in that VLAN are flooded on all ports.

Caution We do not recommend disabling spanning tree, even in a topology that is free of physical loops. Spanning tree serves as a safeguard against misconfigurations and cabling errors. Do not disable spanning tree in a VLAN without ensuring that there are no physical loops present in the VLAN.

Caution Do not disable spanning tree on a VLAN unless all switches or routers in the VLAN have spanning tree disabled. You cannot disable spanning tree on some switches or routers in a VLAN and leave spanning tree enabled on other switches or routers in the VLAN. If spanning tree remains enabled on the switches and routers, they will have incomplete information about the physical topology of the network. This situation may cause unexpected results.

To disable PVST+, perform this task in privileged mode:

Task	Command
Disable PVST+ mode on a VLAN.	**set spantree disable** *vlans* **[all]**

This example shows how to disable PVST+ on a VLAN:

```
Console> (enable) set spantree disable 4
Spantree 4 disabled.
Console> (enable)
```

Using MISTP-PVST+ or MISTP

The default spanning tree mode on the Catalyst 6500 series switches is PVST+. If you want to use MISTP mode in your network, we recommend you carefully follow the procedures described in the following sections in order to avoid losing connectivity in your network.

When you change the spanning tree mode, the current mode stops, the information collected at runtime is used to build the port database for the new mode, and the new spanning tree mode restarts the computation of the active topology. Information about the port states is lost; however, all of the configuration parameters are preserved for the previous mode. If you return to the previous mode, the configuration is still there.

Note We recommend that if you use MISTP mode, you should configure *all* of your Catalyst 6500 series switches to run MISTP.

To use MISTP mode, you first enable an MISTP instance and then map at least one VLAN to the instance. You must have at least one forwarding port in the VLAN in order for the MISTP instance to be active.

Note Map VLANs to MISTP instances on Catalyst 6500 series switches that are either in VTP server mode or transparent mode only. You cannot map VLANs to MISTP instances on switches that are in VTP client mode.

If you are changing a switch from PVST+ mode to MISTP mode and you have other switches in the network that are using PVST+, you must first enable MISTP-PVST+ mode on each switch on which you intend to use MISTP so that PVST+ BPDUs can flow through the switches while you configure them.

When all switches in the network are configured in MISTP-PVST+, you can then enable MISTP on all of the switches.

These sections describe how to use MISTP-PVST+ or MISTP:

- Default MISTP and MISTP-PVST+ Configuration, page 8-30
- Setting the MISTP-PVST+ Mode or the MISTP Mode, page 8-30
- Configuring an MISTP Instance, page 8-32
- Mapping VLANs to an MISTP Instance, page 8-36
- Disabling MISTP-PVST+ or MISTP, page 8-38

Default MISTP and MISTP-PVST+ Configuration

Table 8-3 shows the default MISTP and MISTP-PVST+ configuration.

Table 8-3 MISTP and MISTP-PVST+ Default Configuration

Feature	Default Value
Enable state	Disabled until a VLAN is mapped to an MISTP instance
MAC address reduction	Disabled
Bridge priority	32768
Bridge ID priority	32769 (bridge priority plus the system ID extension of MISTP instance 1)
Port priority	32 (global)
Port cost	• Gigabit Ethernet: 4 • Fast Ethernet: 19[1] • FDDI/CDDI: 10 • Ethernet: 100[2]
Default port cost mode	Short (802.1D)
Port VLAN priority	Same as port priority but configurable on a per-VLAN basis in PVST+
Port VLAN cost	Same as port cost but configurable on a per-VLAN basis in PVST+
Maximum aging time	20 seconds
Hello time	2 seconds
Forward delay time	15 seconds

1. If 10/100-Mbps ports autonegotiate or are hard set to 100 Mbps, the port cost is 19.
2. If 10/100-Mbps ports autonegotiate or are hard set to 10 Mbps, the port cost is 100.

Setting the MISTP-PVST+ Mode or the MISTP Mode

If you enable MISTP in a PVST+ network, you must be careful to avoid bringing down the network. This section explains how to enable MISTP or MISTP-PVST+ on your network.

Caution If you have more than 6000 VLAN ports configured on your switch, changing from MISTP to either PVST+ or MISTP-PVST+ mode could bring down your network. Reduce the number of configured VLAN ports on your switch to no more than 6000 to avoid losing connectivity.

3332

Caution If you are working from a Telnet connection to your switch, the first time you enable MISTP-PVST+ or MISTP mode, you must do so from the switch console; do not use a Telnet connection through the data port or you will lose your connection to the switch. After you map a VLAN to an MISTP instance, you can Telnet to the switch.

To change from PVST+ to MISTP-PVST+ or MISTP, perform this task in privileged mode:

Task	Command
Set a spanning tree mode.	**set spantree mode** {**mistp** | **pvst+** | **mistp-pvst+**}

This example shows how to set a switch to MISTP-PVST+ mode:

```
Console> (enable) set spantree mode mistp-pvst+
PVST+ database cleaned up.
Spantree mode set to MISTP-PVST+.
Warning!! There are no VLANs mapped to any MISTP instance.
Console> (enable)
```

You can display VLAN-to-MISTP instance mapping information propagated from the root switch at runtime. This display is available only in the MISTP or MISTP-PVST+ mode. When in the PVST+ mode, use the optional keyword **config** to display the list of mappings configured on the local switch.

Note MAC addresses are not displayed when you specify the keyword **config**.

To display spanning tree mapping, perform this task in privileged mode:

	Task	Command
Step 1	Set the spanning tree mode to MISTP.	**set spantree mode mistp**
Step 2	Show the spanning tree mapping.	**show spantree mapping** [**config**]

This example shows how to display the spanning tree VLAN instance mapping in MISTP mode:

```
MISTP/MISTP-PVST+
Console> (enable) set spantree mode mistp
PVST+ database cleaned up.
Spantree mode set to MISTP.
Console> (enable) show spantree mapping
Inst Root Mac          Vlans

Configuring an MISTP Instance

These sections describe how to configure MISTP instances:

- Configuring the MISTP Bridge ID Priority, page 8-32
- Configuring the MISTP Port Cost, page 8-33
- Configuring the MISTP Port Priority, page 8-33
- Configuring the MISTP Port Instance Cost, page 8-34
- Configuring the MISTP Port Instance Priority, page 8-34

Configuring the MISTP Bridge ID Priority

You can set the bridge ID priority for an MISTP instance when the switch is in MISTP or MISTP-PVST+ mode.

The bridge priority value is combined with the system ID extension (the ID of the MISTP instance) to create the bridge ID priority. You can set 16 possible bridge priority values: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440.

To configure the bridge ID priority for an MISTP instance, perform this task in privileged mode:

	Task	Command
Step 1	Configure the bridge ID priority for an MISTP instance.	**set spantree priority** *bridge_ID_priority* [**mistp-instance** *instance*]
Step 2	Verify the bridge ID priority.	**show spantree mistp-instance** *instance* [*mod/port*] **active**

This example shows how to configure the bridge ID priority for an MISTP instance:

```
Console> (enable) set spantree priority 8192 mistp-instance 1
Spantree 1 bridge ID priority set to 8193
(bridge priority: 8192 + sys ID extension: 1)
Console> (enable) show spantree mistp-instance 1
VLAN 1
Spanning tree mode          MISTP
Spanning tree type          ieee
Spanning tree enabled
VLAN mapped to MISTP Instance: 1

Bridge ID MAC ADDR          00-d0-00-4c-18-00
Bridge ID Priority          8193 (bridge priority: 8192, sys ID ext: 1)
Bridge Max Age 20 sec   Hello Time 2 sec   Forward Delay 15 sec

Port                     Vlan Port-State    Cost      Prio Portfast Channel_id
------------------------ ---- ------------ --------- ---- -------- ----------
 1/1                     1    not-connected     20000   32 disabled 0
 1/2                     1    not-connected     20000   32 disabled 0
 2/1                     1    not-connected   2000000   32 disabled 0
 2/2                     1    not-connected   2000000   32 disabled 0
 2/3                     1    forwarding       200000   32 disabled 0
```

Configuring the MISTP Port Cost

You can configure the port cost of switch ports. Ports with lower port costs are more likely to be chosen to forward frames. Assign lower numbers to ports attached to faster media (such as full duplex) and higher numbers to ports attached to slower media. The possible range is 1 to 65535. The default differs for different media. The path cost is typically 1000 divided by the LAN speed in megabits per second.

To configure the port cost for a port, perform this task in privileged mode:

	Task	Command
Step 1	Configure the MISTP port cost for a switch port.	**set spantree portcost** *mod/port cost*
Step 2	Verify the port cost setting.	**show spantree mistp-instance** *instance* [*mod/port*] **active**

This example shows how to configure the port cost on a MISTP instance and verify the configuration:

```
Console> (enable) set spantree portcost 2/12 22222222
Spantree port 2/12 path cost set to 22222222.
Console> (enable) show spantree mistp-instance active
Instance 1
Spanning tree mode          MISTP-PVST+
Spanning tree type          ieee
Spanning tree instance enabled

Designated Root             00-d0-00-4c-18-00
Designated Root Priority    32769 (root priority: 32768, sys ID ext: 1)
Designated Root Cost        0
Designated Root Port        none
VLANs mapped:               6
Root Max Age   20 sec   Hello Time 2 sec   Forward Delay 15 sec

Bridge ID MAC ADDR          00-d0-00-4c-18-00
Bridge ID Priority          32769 (bridge priority: 32768, sys ID ext: 1)
VLANs mapped:               6
Bridge Max Age 20 sec   Hello Time 2 sec   Forward Delay 15 sec

Port                     Inst Port-State    Cost      Prio Portfast Channel_id
------------------------ ---- ------------ --------- ---- -------- ----------
 2/12                    1    forwarding     22222222   40 disabled 0
Console> (enable)
```

Configuring the MISTP Port Priority

You can configure the port priority of ports. The port with the lowest priority value forwards frames for all VLANs. The possible port priority value is a multiple of 16 from 0 to 240. The default is 32. If all ports have the same priority value, the port with the lowest port number forwards frames.

To configure the port priority for a port, perform this task in privileged mode:

	Task	Command
Step 1	Configure the MISTP port priority for a port.	**set spantree portpri** *mod/port*
Step 2	Verify the port priority setting.	**show spantree mistp-instance** *instance* [*mod/port*] **active**

Spanning tree instance enabled

Designated Root             00-d0-00-4c-18-00
Designated Root Priority    32769 (root priority: 32768, sys ID ext: 1)
Designated Root Cost        0
Designated Root Port        none
VLANs mapped:               6
Root Max Age   20 sec   Hello Time 2 sec   Forward Delay 15 sec

Bridge ID MAC ADDR          00-d0-00-4c-18-00
Bridge ID Priority          32769 (bridge priority: 32768, sys ID ext: 1)
VLANs mapped:               6
Bridge Max Age 20 sec   Hello Time 2 sec   Forward Delay 15 sec

Port                     Inst Port-State    Cost      Prio Portfast Channel_id
------------------------ ---- ------------ --------- ---- -------- ----------
 2/12                    1    forwarding     22222222   40 disabled 0
Console> (enable)
```

Configuring the MISTP Port Instance Cost

You can configure the port instance cost for an instance of MISTP or MISTP-PVST+. Ports with a lower instance cost are more likely to be chosen to forward frames. You should assign lower numbers to ports attached to faster media (such as full duplex) and higher numbers to ports attached to slower media. The default cost differs for different media. The possible value for port instance cost is 1–268435456.

To configure the port instance cost for a port, perform this task in privileged mode:

Task	Command
Configure the MISTP port instance cost on a port.	**set spantree portinstancecost** {*mod/port*} [**cost** *cost*] [*instances*]

This example shows how to configure the MISTP port instance cost on a port:

```
Console> (enable) set spantree portinstancecost 2/12 cost 110110 2
Port 2/12 instances 1,3-16 have path cost 22222222.
Port 2/12 instances 2 have path cost 110110.
Console> (enable)
```

Configuring the MISTP Port Instance Priority

You can set the port priority for an instance of MISTP. The port with the lowest priority value for a specific MISTP instance forwards frames for that instance. The possible port instance range is 0–63. The possible port priority value is a multiple of 16 from 0 to 240. If all ports have the same priority value for an MISTP instance, the port with the lowest port number forwards frames for that instance.

To configure the port instance priority on an MISTP instance, perform this task in privileged mode:

Task	Command
Configure the port instance priority on an MISTP instance.	**set spantree portinstancepri** {*mod/port*} *priority* [*instances*]

This example shows how to configure the port instance priority on an MISTP instance and verify the configuration:

```
Console> (enable) set spantree portinstancepri 2/12 10 2
Port 2/12 instances 2 using portpri 10.
Port 2/12 mistp-instance 1,3-16 using portpri 40.
Console> (enable)
```

Enabling an MISTP Instance

You can enable up to 16 MISTP instances. Each MISTP instance defines a unique spanning tree topology. MISTP instance 1, the default instance, is enabled by default; however, you must map a VLAN to it in order for it to be active. You can enable a single MISTP instance, a range of instances, or all instances at once using the **all** keyword.

Note The software does not display the status of an MISTP instance until it has a VLAN with an active port mapped to it.

To enable an MISTP instance, perform this task in privileged mode:

	Task	Command
Step 1	Enable an MISTP instance.	**set spantree enable mistp-instance** *instance* **[all]**
Step 2	Verify the instance is enabled.	**show spantree mistp-instance** [*instance*] **[active]** *mod/port*

Note Enter the **active** keyword to display active ports only.

This example shows how to enable an MISTP instance:

```
Console> (enable) set spantree enable mistp-instance 2
Spantree 2 enabled.

Console> (enable) show spantree mistp-instance 2
Instance 2
Spanning tree mode          MISTP
Spanning tree type          ieee
Spanning tree instance enabled
   .
   .
   .
```

Doc:

Mapping VLANs to an MISTP Instance

When you are using MISTP-PVST+ or MISTP on a switch, you must map at least one VLAN to an MISTP instance in order for MISTP-PVST+ or MISTP to be active. These sections describe how to configure MISTP instances:

- Determining MISTP Instances—VLAN Mapping Conflicts, page 8-37
- Unmapping VLANs from an MISTP Instance, page 8-37

Note See Chapter 11, "Configuring VLANs" for details on using and configuring VLANs.

- You can only map Ethernet VLANs to MISTP instances.
- At least one VLAN in the instance must have an active port in order for MISTP-PVST+ or MISTP to be active.
- You can map as many Ethernet VLANs as you wish to an MISTP instance.
- You cannot map a VLAN to more than one MISTP instance.

Note To use VLANs 1025–4094, you must enable MAC address reduction. See the "Creating Extended-Range VLANs" section on page 11-7 in Chapter 11, "Configuring VLANs" for details on using extended-range VLANs.

To map a VLAN to an MISTP instance, perform this task in privileged mode:

	Task	Command
Step 1	Map a VLAN to an MISTP instance.	**set vlan** *vlan* **mistp-instance** *instance*
Step 2	Verify the VLAN is mapped.	**show spantree mistp-instance** [*instance*] **[active]** *mod/port*

This example shows how to map a VLAN to MISTP instance 1 and verify the mapping:

```
Console> (enable) set vlan 6 mistp-instance 1
Vlan 6 configuration successful
Console> (enable) show spantree mist-instance 1
Instance 1
Spanning tree mode          MISTP-PVST+
Spanning tree type          ieee
Spanning tree instance enabled

Designated Root             00-d0-00-4c-18-00
Designated Root Priority    49153 (root priority: 49152, sys ID ext: 1)
Designated Root Cost        0
Designated Root Port        none
VLANs mapped:               6
Root Max Age   20 sec   Hello Time 2 sec   Forward Delay 15 sec

Bridge ID MAC ADDR          00-d0-00-4c-18-00
Bridge ID Priority          49153 (bridge priority: 49152, sys ID ext: 1)
VLANs mapped:               6
Bridge Max Age 20 sec   Hello Time 2 sec   Forward Delay 15 sec
Port                    Inst Port-State    Cost      Prio Portfast Channel_id
----------------------- ---- ------------- --------- ---- -------- ----------
 2/12                   1    forwarding     22222222   40 disabled 0
```

Determining MISTP Instances—VLAN Mapping Conflicts

A VLAN can only be mapped to one MISTP instance. If you attempt to map a VLAN to more than one instance, all of its ports are set to blocking mode. You can use the **show spantree conflicts** command to determine to which MISTP instances you have attempted to map the VLAN.

This command prints a list of the MISTP instances associated with the VLAN, the MAC addresses of the root switches that are sending the BPDUs containing the VLAN mapping information, and the timers associated with the mapping of a VLAN to an MISTP instance. When only one entry is printed or when all the entries are associated to the same instance, the VLAN is mapped to that instance. If two or more entries in the list are associated with different MISTP instances, the VLAN is in conflict.

To clear up the conflict, you must manually remove the incorrect mapping(s) from the root switch. The remaining entry on the list becomes the official mapping.

To determine VLAN mapping conflicts, perform this task in privileged mode:

Task	Command
Determine VLAN mapping conflicts.	**show spantree conflicts** *vlan*

This example shows there is an attempt to map VLAN 2 to MISTP instance 1 and to MISTP instance 3 on two different switches as seen from a third switch in the topology:

```
Console> (enable) show spantree conflicts 2
Inst MAC               Delay     Time left
---- ----------------- --------- ---------
1    00-30-a3-4a-0c-00 inactive        20
3    00-30-f1-e5-00-01 inactive        10
```

The Delay timer shows the time in seconds remaining before the VLAN joins the instance. The field displays *inactive* if the VLAN is already mapped to an instance (the timer has expired), or if the VLAN is in conflict between instances.

The Time Left timer shows the time in seconds left before the entry expires and is removed from the table. The timer is restarted every time an incoming BPDU confirms the mapping. Entries pertaining to the root switch show *inactive* on the root switch itself.

Unmapping VLANs from an MISTP Instance

The keyword **none** is used to unmap the specified VLANs from the MISTP instances to which they are currently mapped. When you unmap a VLAN from an MISTP instance, the resulting state of all the ports of the VLAN (if the VLAN exists) is *blocking*.

To unmap a VLAN or all VLANs from an MISTP instance, perform this task in privileged mode:

Task	Command
Unmap a VLAN from an MISTP instance.	**set vlan** *vlan* **mistp-instance none**

This example shows how to unmap a VLAN from an MISTP instance:

```
Console> (enable) set vlan 6 mistp-instance none
Vlan 6 configuration successful
```

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0754
Fls:
Doc: 370

Disabling MISTP-PVST+ or MISTP

When the switch is in MISTP mode, you disable spanning tree on an instance, not for the whole switch.

When you disable spanning tree on an MISTP instance, the instance still exists on the switch, all of the VLANs mapped to it have all of their ports forwarding, and the instance BPDUs are flooded.

To disable an MISTP instance, perform this task in privileged mode:

Task	Command
Disable an MISTP instance.	**set spantree disable mistp-instance** *instance* [**all**]

This example shows how to disable an MISTP instance:

```
Console> (enable) set spantree disable mistp-instance 2
MI-STP instance 2 disabled.
```

Configuring a Root Switch

These sections explain how to configure a root switch:

- Configuring a Primary Root Switch, page 8-38
- Configuring a Secondary Root Switch, page 8-39
- Configuring a Root Switch to Improve Convergence, page 8-40
- Using Root Guard—Preventing Switches from Becoming Root, page 8-41

Configuring a Primary Root Switch

You can set a root switch on a VLAN when the switch is in PVST+ mode or on an MISTP instance when the switch is in MISTP mode. You enter the **set spantree root** command to reduce the bridge priority (the value associated with the switch) from the default (32768) to a lower value, which allows the switch to become the root switch.

When you specify a switch as the primary root, the default bridge priority is modified so that it becomes the root for the specified VLANs. Set the bridge priority to 8192. If this setting does not result in the switch becoming a root, modify the bridge priority to be 1 less or the same as the bridge priority of the current root switch. Because different VLANs could potentially have different root switches, the bridge VLAN-priority chosen makes this switch the root for all the VLANs specified. If reducing the bridge priority as low as 1 still does not make the switch the root switch, the system displays a message.

Caution Enter the **set spantree root** command on backbone switches or distribution switches only, not on access switches.

To configure a switch as the primary root switch, perform this task in privileged mode:

Task	Command
Configure a switch as the primary root switch.	**set spantree root** [*vlans*] [**dia** *network_diameter*] [**hello** *hello_time*]

This example shows how to configure the primary root switch for VLANs 1–10:

```
Console> (enable) set spantree root 1-10 dia 4
VLANs 1-10 bridge priority set to 8192
VLANs 1-10 bridge max aging time set to 14 seconds.
VLANs 1-10 bridge hello time set to 2 seconds.
VLANs 1-10 bridge forward delay set to 9 seconds.
Switch is now the root switch for active VLANs 1-6.
Console> (enable)
```

To configure a switch as the primary root switch for an instance, perform this task in privileged mode:

Task	Command
Configure a switch as the primary root switch for an instance.	**set spantree root mistp-instance** *instance* [**dia** *network_diameter*] [**hello** *hello_time*]

This example shows how to configure the primary root switch for an instance:

```
Console> (enable) set spantree root mistp-instance 2-4 dia 4
Instances 2-4 bridge priority set to 8192
VLInstances 2-4 bridge max aging time set to 14 seconds.
Instances 2-4 bridge hello time set to 2 seconds.
Instances 2-4 bridge forward delay set to 9 seconds.
Switch is now the root switch for active Instances 1-6.
Console> (enable)
```

Configuring a Secondary Root Switch

You can set a secondary root switch on a VLAN when the switch is in PVST+ mode or on an MISTP instance when the switch is in MISTP mode.

The **set spantree root secondary** command reduces the bridge priority to 16,384, making it the probable candidate to become the root switch if the primary root switch fails. You can run this command on more than one switch to create multiple backup switches in case the primary root switch fails.

To configure a switch as the secondary root switch, perform this task in privileged mode:

Task	Command
Configure a switch as the secondary root switch.	**set spantree root** [**secondary**] *vlans* [**dia** *network_diameter*] [**hello** *hello_time*]

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0755
Fls:
Doc: 3701

This example shows how to configure the secondary root switch for VLANs 22 and 24:

```
Console> (enable) set spantree root secondary 22,24 dia 5 hello 1
VLANs 22,24 bridge priority set to 16384.
VLANs 22,24 bridge max aging time set to 10 seconds.
VLANs 22,24 bridge hello time set to 1 second.
VLANs 22,24 bridge forward delay set to 7 seconds.
Console> (enable)
```

To configure a switch as the secondary root switch for an instance, perform this task in privileged mode:

Task	Command
Configure a switch as the secondary root switch for an instance.	**set spantree root** [**secondary**] **mistp-instance** *instance* [**dia** *network_diameter*] [**hello** *hello_time*]

This example shows how to configure the secondary root switch for an instance:

```
Console> (enable) set spantree root secondary mistp-instance 2-4 dia 4
Instances 2-4 bridge priority set to 8192
VLInstances 2-4 bridge max aging time set to 14 seconds.
Instances 2-4 bridge hello time set to 2 seconds.
Instances 2-4 bridge forward delay set to 9 seconds.
Switch is now the root switch for active Instances 1-6.
Console> (enable)
```

Configuring a Root Switch to Improve Convergence

By lowering the values for the Hello Time, Forward Delay Timer, and Maximum Age Timer parameters on the root switch, you can reduce the convergence time. For information on configuring these timers, see the "Configuring Spanning Tree Timers" section on page 8-42.

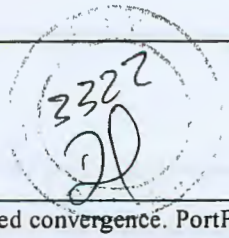
Note Reducing the timer parameters values is possible only if your network has LAN links of 10 Mbps or faster. In a network with links of 10 Mbps or faster, the network diameter can reach the maximum value of 7. With WAN connections, you cannot reduce the parameters.

When a link failure occurs in a bridged network, the network reconfiguration is not immediate. Reconfiguring the default parameters (specified by IEEE 802.1D) for the Hello Time, Forward Delay Timer, and Maximum Age Timer requires a 50-second delay. This reconfiguration time depends on the network diameter, which is the maximum number of bridges between any two end stations.

To speed up convergence, use nondefault parameter values permitted by the 802.1D standard. See Table 8-4 for the nondefault parameters for a reconvergence of 14 seconds.

Table 8-4 Nondefault Parameters

Parameter	Time
Network Diameter (dia)	2
Hello Time	2 seconds
Forward Delay Timer	4 seconds
Maximum Age Timer	6 seconds



Note You can set switch ports in PortFast mode for improved convergence. PortFast mode affects only the transition from disable (link down) to enable (link up) by moving the port immediately to the forwarding state. If a port in the PortFast mode begins blocking, it then goes through listening and learning before reaching the forwarding state. For information about PortFast, see the "Understanding How PortFast Works" section on page 9-2 in Chapter 9, "Configuring Spanning Tree PortFast, UplinkFast, BackboneFast, and Loop Guard."

To configure the spanning tree parameters to improve convergence, perform this task in privileged mode:

	Task	Command
Step 1	Configure the hello time for a VLAN or an MISTP instance.	**set spantree hello** *interval* [*vlan*] **mistp-instance** [*instances*]
Step 2	Verify the configuration.	**show spantree** [*vlan* | **mistp-instance** *instances*]
Step 3	Configure the forward delay time for a VLAN or an MISTP instance.	**set spantree fwddelay** *delay* [*vlan*] **mistp-instance** [*instances*]
Step 4	Verify the configuration.	**show spantree** [*mod/port*] **mistp-instance** [*instances*] [**active**]
Step 5	Configure the maximum aging time for a VLAN or an MISTP instance.	**set spantree maxage** *agingtime* [*vlans*] **mistp-instance** *instances*
Step 6	Verify the configuration.	**show spantree** [*mod/port*] **mistp-instance** [*instances*] [**active**]

This example shows how to configure the spanning tree hello time, Forward Delay Timer, and Maximum Age Timer to 2, 4, and 4 seconds:

```
Console> (enable) set spantree hello 2 100
Spantree 100 hello time set to 7 seconds.
Console> (enable)
Console> (enable) set spantree fwddelay 4 100
Spantree 100 forward delay set to 21 seconds.
Console> (enable)
Console> (enable) set spantree maxage 6 100
Spantree 100 max aging time set to 36 seconds.
Console> (enable)
Console> (enable) set spantree root 1-10 dia 4
VLANs 1-10 bridge priority set to 8192
VLANs 1-10 bridge max aging time set to 14 seconds.
VLANs 1-10 bridge hello time set to 2 seconds.
VLANs 1-10 bridge forward delay set to 9 seconds.
Switch is now the root switch for active VLANs 1-6.
Console> (enable)
```

Using Root Guard—Preventing Switches from Becoming Root

You may want to prevent switches from becoming the root switch. The root guard feature forces a port to become a designated port so that no switch on the other end of the link can become a root switch.

When you enable root guard on a per-port basis, it is automatically applied to all of the active VLANs to which that port belongs. When you disable root guard, it is disabled for the specified port(s). If a port goes into the root-inconsistent state, it automatically goes into the listening state.

To prevent switches from becoming root, perform this task in privileged mode:

	Task	Command
Step 1	Enable root guard on a port.	**set spantree guard** {**root** | **none**} *mod/port*
Step 2	Verify that root guard is enabled.	**show spantree guard** {*mod/port* | *vlan*} {**mistp-instance** *instance* | *mod/port*}

Configuring Spanning Tree Timers

Spanning tree timers affect the spanning tree performance. You can configure the spanning tree timers for a VLAN in PVST+ or an MISTP instance in MISTP mode. If you do not specify a VLAN when the switch is in PVST+ mode, VLAN 1 is assumed, or if you do not specify an MISTP instance when the switch is in MISTP mode, MISTP instance 1 is assumed.

These sections describe how to configure spanning tree timers:

- Configuring the Hello Time, page 8-43
- Configuring the Forward Delay Time, page 8-43
- Configuring the Maximum Aging Time, page 8-44

Caution Exercise care when using these commands. For most situations, we recommend that you use the **set spantree root** and **set spantree root secondary** commands to modify the spanning tree performance parameters.

Table 8-5 describes the switch variables that affect spanning tree performance.

Table 8-5 Spanning Tree Timers

Variable	Description	Default
Hello Time	Determines how often the switch broadcasts its hello message to other switches.	2 seconds
Maximum Age Timer	Measures the age of the received protocol information recorded for a port and ensures that this information is discarded when its age limit exceeds the value of the maximum age parameter recorded by the switch. The timeout value is the maximum age parameter of the switches.	20 seconds
Forward Delay Timer	Monitors the time spent by a port in the learning and listening states. The timeout value is the forward delay parameter of the switches.	15 seconds

Configuring the Hello Time

Enter the **set spantree hello** command to change the hello time for a VLAN or for an MISTP instance. The possible range of *interval* is 1 to 10 seconds.

To configure the spanning tree bridge hello time for a VLAN or an MISTP instance, perform this task in privileged mode:

	Task	Command
Step 1	Configure the hello time for a VLAN or an MISTP instance.	**set spantree hello** *interval* [*vlan*] **mistp-instance** [*instances*]
Step 2	Verify the configuration.	**show spantree** [*vlan* | **mistp-instance** *instances*]

This example shows how to configure the spanning tree hello time for VLAN 100 to 7 seconds:

```
Console> (enable) set spantree hello 7 100
Spantree 100 hello time set to 7 seconds.
Console> (enable)
```

This example shows how to configure the spanning tree hello time for an instance to 3 seconds:

```
Console> (enable) set spantree hello 3 mistp-instance 1
Spantree 1 hello time set to 3 seconds.
Console> (enable)
```

Configuring the Forward Delay Time

Enter the **set spantree fwddelay** command to configure the spanning tree forward delay time for a VLAN. The possible range of *delay* is 4 to 30 seconds.

To configure the spanning tree forward delay time for a VLAN, perform this task in privileged mode:

	Task	Command
Step 1	Configure the forward delay time for a VLAN or an MISTP instance.	**set spantree fwddelay** *delay* [*vlan*] **mistp-instance** [*instances*]
Step 2	Verify the configuration.	**show spantree** [*mod/port*] **mistp-instance** [*instances*] **[active]**

This example shows how to configure the spanning tree forward delay time for VLAN 100 to 21 seconds:

```
Console> (enable) set spantree fwddelay 21 100
Spantree 100 forward delay set to 21 seconds.
Console> (enable)
```

This example shows how to set the bridge forward delay for an instance to 16 seconds:

```
Console> (enable) set spantree fwddelay 16 mistp-instance 1
Instance 1 forward delay set to 16 seconds.
Console> (enable)
```

RQS Nº 03/2005 - CN
CPMI - CORREIOS

Doc: 3701

Configuring the Maximum Aging Time

Enter the **set spantree maxage** command to change the spanning tree maximum aging time for a VLAN or an instance. The possible range of *agingtime* is 6 to 40 seconds.

To configure the spanning tree maximum aging time for a VLAN or an instance, perform this task in privileged mode:

	Task	Command
Step 1	Configure the maximum aging time for a VLAN or an MISTP instance.	**set spantree maxage** *agingtime* [*vlans*] **mistp-instance** *instances*
Step 2	Verify the configuration.	**show spantree** [*mod/port*] **mistp-instance** [*instances*] [**active**]

This example shows how to configure the spanning tree maximum aging time for VLAN 100 to 36 seconds:

```
Console> (enable) set spantree maxage 36 100
Spantree 100 max aging time set to 36 seconds.
Console> (enable)
```

This example shows how to set the maximum aging time for an instance to 25 seconds:

```
Console> (enable) set spantree maxage 25 mistp-instance 1
Instance 1 max aging time set to 25 seconds.
Console> (enable)
```

Configuring Multiple Spanning Tree

These sections describe how to configure MST:

- Enabling Multiple Spanning Tree, page 8-44
- Mapping and Unmapping VLANs to an MST Instance, page 8-53

Enabling Multiple Spanning Tree

To enable and configure MST on the switch, perform these tasks in privileged mode:

	Task	Command
Step 1	Begin in PVST+ mode.	**set spantree mode pvst+ [mistp | pvst+ | mistp-pvst+ | mst]**
Step 2	Display the STP ports.	**show spantree active**
Step 3	Configure the MST region.	**set spantree mst config {[name** *name*] **|** [**revision** *number*] [**commit | rollback | force**]}
Step 4	Verify your configuration.	**show spantree mst config**
Step 5	Map VLANs to the MST instance.	**set spantree mst** *instance* **vlan** *vlan*
Step 6	Commit the new region mapping.	**set spantree mst config commit**

	Task	Command
Step 7	Enable MST.	**set spantree mode mst** [**mistp** | **pvst+** | **mistp-pvst+** | **mst**]
Step 8	Verify your MST configuration.	**show spantree mst config**
Step 9	Verify your MST instance configuration.	**show spantree mst** *instance*
Step 10	Verify your MST module and port configuration.	**show spantree mst** *mod/port*

These examples show how to enable MST:

```
Console> (enable)
Console> (enable) set spantree mode pvst
Spantree mode set to PVST+.
Console> (enable) show spantree active

Configuring the MST Bridge ID Priority

You can set the bridge ID priority for an MST instance when the switch is in MST mode.

The bridge priority value is combined with the system ID extension (the ID of the MST instance) to create the bridge ID priority. You can set 16 possible bridge priority values: 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440.

To configure the bridge ID priority for an MST instance, perform this task in privileged mode:

	Task	Command
Step 1	Configure the bridge ID priority for an MST instance.	**set spantree priority** *bridge_priority* **mst** [*instance*]
Step 2	Verify the bridge ID priority.	**show spantree mst** [*instance* | *mod/port*]

The example shows how to configure the bridge ID priority for an MST instance:

```
Console> (enable) set spantree priority 8192 mst 3
MST Spantree 3 bridge priority set to 8192.
Console> (enable)
Console> (enable) show spantree mst 3
Spanning tree mode          MST
Instance                    3
VLANs Mapped:               31-40

Designated Root             00-10-7b-bb-2f-00
Designated Root Priority    8195  (root priority:8192, sys ID ext:3)
Designated Root Cost        0           Remaining Hops 20
Designated Root Port        1/0

Bridge ID MAC ADDR          00-10-7b-bb-2f-00
Bridge ID Priority          8195  (bridge priority:8192, sys ID ext:3)

Boundary(PVST)
```

Configuring the MST Port Cost

You can configure the port cost of switch ports. Ports with lower port costs are more likely to be chosen to forward frames. Assign lower numbers to ports attached to faster media (such as full duplex) and higher numbers to ports attached to slower media. The possible range is 1 to 65535. The default differs for different media. The path cost is typically 1000 divided by the LAN speed in megabits per second.

To configure the port cost for a port, perform this task in privileged mode:

	Task	Command
Step 1	Configure the MST port cost for a switch port.	**set spantree portcost** *mod/port cost* [**mst**]
Step 2	Verify the port cost setting.	**show spantree mst** [*instance* | *mod/port*]

This example shows how to configure the port cost on an MST instance and verify the configuration:

```
Console> (enable) set spantree portcost 6/1 10000 mst
Spantree port 6/1 path cost set to 10000.
Console> (enable)
Console> (enable) show spantree mst 6/1
Edge Port:       No,   (Configured) Default
Link Type:       P2P,  (Configured) Auto
Port Guard:   Default
Boundary:     Yes (PVST)

Inst State         Role Cost      Prio VLANs
---- ------------- ---- --------- ----------------------------------------
   0 forwarding    ROOT     10000   32 1
   1 forwarding    BDRY     10000   32 2-20
   2 forwarding    BDRY     10000   32 21-30
   3 forwarding    BDRY     10000   32 31-40
   4 forwarding    BDRY     10000   32 41-50
Console> (enable)
```

Configuring the MST Port Priority

You can configure the port priority of ports. The port with the lowest priority value forwards frames for all VLANs. The possible port priority value is a multiple of 16 from 0 to 240. The default is 32. If all ports have the same priority value, the port with the lowest port number forwards frames.

To configure the port priority for a port, perform this task in privileged mode:

	Task	Command
Step 1	Configure the MST port priority for a port.	**set spantree portpri** *mod/port priority* [**mst**]
Step 2	Verify the port priority setting.	**show spantree mst** [*instance* | *mod/port*]

This example shows how to configure the port priority and verify the configuration:

```
Console> (enable) set spantree portpri 6/1 30 mst
Bridge port  6/1 port priority set to 30.
Console> (enable)
Console> (enable) show spantree mst 6/1
Edge Port:        No,  (Configured) Default
Link Type:       P2P,  (Configured) Auto
Port Guard:    Default
Boundary:      Yes (PVST)

Inst State         Role Cost      Prio VLANs
---- ------------- ---- --------- ---------------------------------------
   0 forwarding    ROOT     10000   30 1
   1 forwarding    BDRY     10000   30 2-20
   2 forwarding    BDRY     10000   30 21-30
   3 forwarding    BDRY     10000   30 31-40
   4 forwarding    BDRY     10000   30 41-50
Console> (enable)
```

Configuring the MST Port Instance Cost

You can configure the port instance cost for an instance of MST. Ports with a lower instance cost are more likely to be chosen to forward frames. You should assign lower numbers to ports attached to faster media (such as full duplex) and higher numbers to ports attached to slower media. The default cost differs for different media. The possible value for port instance cost is 1–268435456.

To configure the port instance cost for a port, perform this task in privileged mode:

	Task	Command
Step 1	Configure the MST port instance cost on a port.	**set spantree portinstancecost** *mod/port* [**cost** *cost*] **mst** [*instances*]
Step 2	Verify the path cost for the instances on a port.	**show spantree portinstancecost** *mod/port*

This example shows how to configure the MST port instance cost on a port:

```
Console> (enable) set spantree portinstancecost 6/1 cost 5000 mst 4
Port 6/1 MST Instances 0-3,5-15 have path cost 10000.
Port 6/1 MST Instances 4 have path cost 5000.
Console> (enable)
Console> (enable) show spantree mst 4
Spanning tree mode          MST
Instance                    4
VLANs Mapped:               41-50

Designated Root             00-10-7b-bb-2f-00
Designated Root Priority    32772  (root priority:32768, sys ID ext:4)

Designated Root Cost        0          Remaining Hops 20
Designated Root Port        1/0

Bridge ID MAC ADDR          00-10-7b-bb-2f-00
Bridge ID Priority          32772  (bridge priority:32768, sys ID ext:
4)
```

RQS Nº 03/2005 - CN

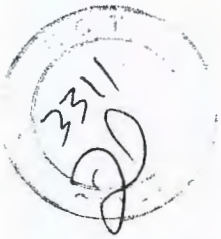
Fls: 0761
Doc: 3701



```
Port                     State         Role Cost     Prio Type
------------------------ ------------- ---- -------- ------------------------
 6/1                     forwarding    BDRY     5000   30 P2P,
Boundary(PVST)
 6/2                     blocking      BDRY    20000   32 P2P,
Boundary(PVST)
Console> (enable)
```

Configuring the MST Port Instance Priority

You can set the port priority for an instance of MST. The port with the lowest priority value for a specific MST instance forwards frames for that instance. The possible port instance range is 0–240. If all ports have the same priority value for an MST instance, the port with the lowest port number forwards frames for that instance.

To configure the port instance priority on an MST instance, perform this task in privileged mode:

	Task	Command
Step 1	Configure the port instance priority on an MST instance.	**set spantree portinstancepri** *mod/port priority* **mst** [*instance*]
Step 2	Verify the port instance priority setting.	**show spantree mst** [*instance* | *mod/port*]

This example shows how to configure the port instance priority on an MST instance and verify the configuration:

```
Console> (enable) set spantree portinstancepri 6/1 16 mst 2
Port 6/1 MST Instances 2 using portpri 16.
Port 6/1 MST Instances 0-1,3-15 using portpri 30.
Console> (enable)
Console> (enable)
Console> (enable) show spantree mst 2
Spanning tree mode          MST
Instance                    2
VLANs Mapped:               21-30

Designated Root             00-10-7b-bb-2f-00
Designated Root Priority    32770  (root priority:32768, sys ID ext:2)

Designated Root Cost        0          Remaining Hops 20
Designated Root Port        1/0

Bridge ID MAC ADDR          00-10-7b-bb-2f-00
Bridge ID Priority          32770  (bridge priority:32768, sys ID ext:
2)

Port                     State         Role Cost     Prio Type
------------------------ ------------- ---- -------- ------------------------
 6/1                     forwarding    BDRY    10000   16 P2P,
Boundary(PVST)
 6/2                     blocking      BDRY    20000   32 P2P,
Boundary(PVST)
Console> (enable)
```

Mapping and Unmapping VLANs to an MST Instance

By default, all VLANS are mapped to IST (instance 0). For an MST instance (MSTI) 1 through 15 to be active, at least one VLAN must be mapped to that MSTI. IST will always be active whether VLANs are mapped to IST or not. MST has separate regions, which prevents VLAN mapping conflicts. Follow these guidelines for mapping and unmapping VLANS to an MST instance:

Note See Chapter 11, "Configuring VLANs" for details on using and configuring VLANs.

- You can only map Ethernet VLANs to MST instances.
- At least one VLAN in the instance must have an active port in order for MST to be active.
- You can map as many Ethernet VLANs as you wish to an MST instance.
- You cannot map a VLAN to more than one MST instance.
- The Hello Time, Maximum Age timer, and Forward Delay timer set for mode and all spanning trees are used globally by MST.

Note To use VLANs 1025–4094, you must enable MAC address reduction. See the "Creating Extended-Range VLANs" section on page 11-7 in Chapter 11, "Configuring VLANs" for details on using extended-range VLANs.

To map a VLAN to an MST instance, perform this task in privileged mode:

	Task	Command
Step 1	Map a VLAN to an MST instance.	**set spantree mst** *instance* **vlan** *vlan*
Step 2	Make the new region mapping effective.	**set spantree mst config commit**
Step 3	Verify the VLAN is mapped.	**show spantree mst** [*instance*] **[active]** *mod/port*

This example shows how to map a VLAN to MST instance 1 and verify the mapping:

```
Console> (enable) show spantree mst config
Current (NVRAM) MST Region Configuration:
Configuration Name:cisco                                    Revision:1

Configuring BPDU Skewing

Commands that support the spanning tree BPDU skewing feature perform these functions:

- Allow you to enable or disable BPDU skewing. The default is disabled.
- Modify the **show spantree summary** output to show if the skew detection is enabled and for which VLANs or PVST+ or MISTP instances the skew was detected.
- Provide a display of the VLAN or PVST+ or MISTP instance and the port affected by the skew including this information:
  - The last skew duration (in absolute time)
  - The worst skew duration (in absolute time)
  - The date and time of the worst duration

To change how spanning tree performs BPDU skewing statistics gathering, enter the **set spantree bpdu-skewing** command. The **bpdu-skewing** command is disabled by default.

To configure the BPDU skewing statistics gathering for a VLAN, perform this task in privileged mode:

	Task	Command
Step 1	Configure BPDU skewing.	**set spantree bpdu-skewing [enable | disable]**
Step 2	Verify the configuration.	**show spantree bpdu-skewing** *vlan* [*mod/port*] **show spantree bpdu-skewing mistp-instance** [*instance*] [*mod/port*]

This example shows how to configure BPDU skewing and view the skewing statistics:

```
Console> (enable) set spantree bpdu-skewing
Usage:set spantree bpdu-skewing <enable|disable>
Console> (enable) set spantree bpdu-skewing enable
Spantree bpdu-skewing enabled on this switch.
Console> (enable)
```

```
Console> (enable) show spantree bpdu-skewing 1
Bpdu skewing statistics for vlan 1
Port     Last Skew ms    Worst Skew ms      Worst Skew Time
------   -------------   -------------   -------------------------
8/2              5869          108370   Tue Nov 21 2000, 06:25:59
8/4              4050          113198   Tue Nov 21 2000, 06:26:04

8/8              4111          113441   Tue Nov 21 2000, 06:26:05
8/10           113522          113522   Tue Nov 21 2000, 06:26:05
8/12             4111          113600   Tue Nov 21 2000, 06:26:05
8/14           113678          113678   Tue Nov 21 2000, 06:26:05
8/16             4111          113755   Tue Nov 21 2000, 06:26:05
8/18           113833          113833   Tue Nov 21 2000, 06:26:05
8/20             4111          113913   Tue Nov 21 2000, 06:26:05
8/22           113917          113917   Tue Nov 21 2000, 06:26:05
8/24             4110          113922   Tue Nov 21 2000, 06:26:05
8/26           113926          113926   Tue Nov 21 2000, 06:26:05
8/28             4111          113931   Tue Nov 21 2000, 06:26:05
Console> (enable)
```

This example shows how to configure BPDU skewing for VLAN 1 on module 8, port 2 and view the skewing statistics:

```
Console> (enable) show spantree bpdu-skewing 1 8/4
Bpdu skewing statistics for vlan 1
Port     Last Skew ms    Worst Skew ms      Worst Skew Time
------   -------------   -------------   -------------------------
8/4              5869          108370   Tue Nov 21 2000, 06:25:59
```

You will receive a similar output when MISTP is running.

The **show spantree summary** command displays if BPDU skew detection is enabled and also lists the VLANs or instances affected in the skew. This example shows the output when using the **show spantree summary** command:

```
Console> (enable) show spantree summary
Root switch for vlans: 1
BPDU skewing detection enabled for the bridge
BPDU skewed for vlans: 1
Portfast bpdu-guard disabled for bridge.
Portfast bpdu-filter disabled for bridge.
Uplinkfast disabled for bridge.
Backbonefast disabled for bridge.

Cisco IOS File System Commands

This chapter describes the basic set of commands used to manipulate files on your routing device using the Cisco IOS File System (IFS) in Cisco IOS Release 12.2.

Commands in this chapter use URLs as part of the command syntax. URLs used in the Cisco IFS contain two parts: a file system or network prefix, and a file identification suffix. The following tables list URL keywords that can be used in the *source-url* and *destination-url* arguments for all commands in this chapter. The prefixes listed below can also be used in the *filesystem* arguments in this chapter.

Table 18 lists common URL network prefixes used to indicate a device on the network.

Table 18 Network Prefixes for Cisco IFS URLs

Prefix	Description
ftp:	Specifies a File Transfer Protocol (FTP) network server.
rcp:	Specifies an remote copy protocol (rcp) network server.
tftp:	Specifies a TFTP server.

Table 19 lists the available suffix options (file indentification suffixes) for the URL prefixes used in Table 18.

Table 19 File ID Suffixes for Cisco IFS URLs

Prefix	Suffix Options
ftp:	[[//[username[:password]@]location]/directory]/filename For example: **ftp://network-config** (*prefix://filename*) **ftp://jeanluc:secret@enterprise.cisco.com/ship-config**
rcp:	rcp:[[//[username@]location]/directory]/filename
tftp:	tftp:[[//location]/directory]/filename

Table 20 lists common URL prefixes used to indicate memory locations on the system.

Doc:

Table 20 File System Prefixes for Cisco IFS URLs

Prefix	Description
bootflash:	Bootflash memory.
disk0:	Rotating disk media.
flash: [*partition-number*]	Flash memory. This prefix is available on most platforms. For platforms that do not have a device named **flash:**, the prefix **flash:** is aliased to **slot0:**. Therefore, you can use the prefix **flash:** to refer to the main Flash memory storage area on all platforms
flh:	Flash load helper log files.
null:	Null destination for copies. You can copy a remote file to null to determine its size.
nvram:	NVRAM. This is the default location for the running-configuration file.
slavebootflash:	Internal Flash memory on a slave RSP card of a router configured with Dual RSPs.
slavenvram:	NVRAM on a slave RSP card.
slaveslot0:	First PCMCIA card on a slave RSP card.
slaveslot1:	Second PCMCIA card on a slave RSP card.
slot0:	First PCMCIA Flash memory card.
slot1:	Second PCMCIA Flash memory card.
xmodem:	Obtain the file from a network machine using the Xmodem protocol.
ymodem:	Obtain the file from a network machine using the Ymodem protocol.

For details about the Cisco IFS, and for IFS configuration tasks, refer to the "Configuring the Cisco IOS File System" chapter in the Release 12.2 *Cisco IOS Configuration Fundamentals Configuration Guide*.

cd

To change the default directory or file system, use the **cd** EXEC command.

cd [*filesystem:*]

Syntax Description		
	filesystem:	(Optional) The URL or alias of the directory or file systems followed by a colon.

Defaults

The initial default file system is **flash:**. For platforms that do not have a physical device named **flash:**, the keyword **flash:** is aliased to the default Flash device.

If you do not specify a directory on a file system, the default is the root directory on that file system.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

For all EXEC commands that have an optional *filesystem* argument, the system uses the file system specified by the **cd** command when you omit the optional *filesystem* argument. For example, the **dir** EXEC command, which displays a list of files on a file system, contain an optional *filesystem* argument. When you omit this argument, the system lists the files on the file system specified by the **cd** command.

Examples

In the following example, the cd command is used to set the default file system to the Flash memory card inserted in slot 0:

```
Router# pwd
bootflash:/
Router# cd slot0:
Router# pwd
slot0:/
```

Related Commands

Command	Description
copy	Copies any file from a source to a destination.
delete	Deletes a file on a Flash memory device.
dir	Displays a list of files on a file system.
pwd	Displays the current setting of the **cd** command.
show file systems	Lists available file systems and their alias prefix names.
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.

configure network

The **configure network** command was replaced by the **copy** {**rcp** | **tftp**} **running-config** command in Cisco IOS Release 11.0. To maintain backward compatibility, the **configure network** command continues to function in Cisco IOS Release 12.2 for most systems, but support for this command may be removed in a future release.

The **copy** {**rcp** | **tftp**} **running-config** command was replaced by the **copy** {**ftp:** | **rcp:** | **tftp:**}[*filename*] **system:running-config** command in Cisco IOS Release 12.1.

The **copy** {**ftp:** | **rcp:** | **tftp:**}[*filename*] **system:running-config** command specifies that a configuration file should be copied from a FTP, rcp, or TFTP source to the running configuration. See the description of the **copy** in this chapter command for more information.

copy

To copy any file from a source to a destination, use the **copy** EXEC command.

copy [**/erase**] *source-url destination-url*

Syntax Description

/erase	(Optional) Erases the destination file system before copying.
source-url	The location URL or alias of the source file or directory to be copied.
destination-url	The destination URL or alias of the copied file or directory.

The exact format of the source and destination URLs varies according to the file or directory location. You may enter either an alias keyword for a particular file or an alias keyword for a file system type (not a file within a type).

Timesaver

Aliases are used to cut down on the amount of typing you need to perform. For example, it is easier to type **copy run start** (the abbreviated form of the **copy running-config startup-config** command) than it is to type **copy system:r nvram:s** (the abbreviated form of the **copy system:running-config nvram:startup-config** command). These aliases also allow you to continue using some of the common commands used in previous versions of Cisco IOS software.

Table 21 shows two keyword shortcuts to URLs.

Table 21 Common Keyword Aliases to URLs

Keyword	Source or Destination
running-config	(Optional) Keyword alias for the **system:running-config** URL. The **system:running-config** keyword represents the current running configuration file. This keyword does not work in **more** and **show file** EXEC command syntaxes.
startup-config	(Optional) Keyword alias for the **nvram:startup-config** URL. The **nvram:startup-config** keyword represents the configuration file used during initialization (startup). This file is contained in NVRAM for all platforms except the Cisco 7000 family, which uses the CONFIG_FILE environment variable to specify the startup configuration. The Cisco 4500 series cannot use the **copy running-config startup-config** command. This keyword does not work in **more** and **show file** EXEC command syntaxes.

The following tables list aliases by file system type. If you do not specify an alias, the router looks for a file in the current directory.

Table 22 lists URL aliases for Special (opaque) file systems. Table 23 lists them for network file systems, and Table 24 lists them for local writable storage.

Doc:

Table 22 URL Prefix Aliases for Special File Systems

Alias	Source or Destination
flh:	Source URL for flash load helper log files.
modem:	Destination URL for loading modem firmware on Cisco 5200 and 5300 Series routers.
nvram:	Router NVRAM. You can copy the startup configuration into or from NVRAM. You can also display the size of a private configuration file.
null:	Null destination for copies or files. You can copy a remote file to null to determine its size.
system:	Source or destination URL for system memory, which includes the running configuration.
xmodem:	Source destination for the file from a network machine that uses the Xmodem protocol.
ymodem:	Source destination for the file from a network machine that uses the Xmodem protocol.

Table 23 URL Prefix Aliases for Network File Systems

Alias	Source or Destination
ftp:	Source or destination URL for an File Transfer Protocol (FTP) network server. The syntax for this alias is as follows: **ftp:**[[[*//username* [*:password*]*@*]*location*]*/directory*]*/filename.*
rcp:	Source or destination URL for a Remote Copy Protocol (rcp) network server. The syntax for this alias is as follows: **rcp:**[[[*//username@*]*location*]*/directory*]*/filename.*
tftp:	Source or destination URL for a TFTP network server. The syntax for this alias is **tftp:**[[*//location*]*/directory*]*/filename.*

Table 24 URL Prefix Aliases for Local Writable Storage File Systems

Alias	Source or Destination
bootflash:	Source or destination URL for boot flash memory.
disk0: and disk1:	Source or destination URL of rotating media.
flash:	Source or destination URL for Flash memory. This alias is available on all platforms. For platforms that lack a flash: device, note that **flash:** is aliased to **slot0:**, allowing you to refer to the main Flash memory storage area on all platforms.
slavebootflash:	Source or destination URL for internal Flash memory on the slave RSP card of a router configured for HSA.
slaveram:	NVRAM on a slave RSP card of a router configured for HSA.
slaveslot0:	Source or destination URL of the first PCMCIA card on a slave RSP card of a router configured for HSA.

3298

Table 24 URL Prefix Aliases for Local Writable Storage File Systems (continued)

Alias	Source or Destination
slaveslot1:	Source or destination URL of the second PCMCIA slot on a slave RSP card of a router configured for HSA.
slot0:	Source or destination URL of the first PCMCIA Flash memory card.
slot1:	Source or destination URL of the second PCMCIA Flash memory card.

Command Modes

EXEC

Command History

Release	Modification
11.3 T	This command was introduced.

Usage Guidelines

You can enter on the command line all necessary source- and destination-URL information and the username and password to use, or you can enter the **copy** command and have the router prompt you for any missing information.

If you enter information, choose one of the following three options: **running-config**, **startup-config**, or a file system alias (see previous tables.) The location of a file system dictates the format of the source or destination URL.

The colon is required after the alias. However, earlier commands not requiring a colon remain supported, but are unavailable in context-sensitive help.

The entire copying process may take several minutes and differs from protocol to protocol and from network to network.

In the alias syntax for **ftp:**, **rcp:**, and **tftp:**, the location is either an IP address or a host name. The filename is specified relative to the directory used for file transfers.

This section contains usage guidelines for the following topics:

- Understanding Invalid Combinations of Source and Destination
- Understanding Character Descriptions
- Understanding Partitions
- Using rcp
- Using FTP
- Storing Images on Servers
- Copying from a Server to Flash Memory
- Verifying Images
- Copying a Configuration File from a Server to the Running Configuration
- Copying a Configuration File from a Server to the Startup Configuration
- Storing the Running or Startup Configuration on a Server
- Saving the Running Configuration to the Startup Configuration

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0768
Fls:
Doc: 3701

- Using CONFIG_FILE, BOOT, and BOOTLDR Environment Variables
- Using the Copy Command with the Dual RSP Feature

Understanding Invalid Combinations of Source and Destination

Some invalid combinations of source and destination exist. Specifically, you cannot copy the following:

- From a running configuration to a running configuration
- From a startup configuration to a startup configuration
- From a device to the same device (for example, the **copy flash: flash:** command is invalid)

Understanding Character Descriptions

Table 25 describes the characters that you may see during processing of the **copy** command.

Table 25 copy Character Descriptions

Character	Description
!	For network transfers, an exclamation point indicates that the copy process is taking place. Each exclamation point indicates the successful transfer of ten packets (512 bytes each).
.	For network transfers, a period indicates that the copy process timed out. Many periods in a row typically mean that the copy process may fail.
O	For network transfers, an uppercase O indicates that a packet was received out of order and the copy process may fail.
e	For Flash erasures, a lowercase e indicates that a device is being erased.
E	An uppercase E indicates an error. The copy process may fail.
V	A series of uppercase Vs indicates the progress during the verification of the image checksum.

Understanding Partitions

You cannot copy an image or configuration file to a Flash partition from which you are currently running. For example, if partition 1 is running the current system image, copy the configuration file or image to partition 2. Otherwise, the copy operation will fail.

You can identify the available Flash partitions by entering the **show file system** EXEC command.

Using rcp

The rcp protocol requires a client to send a remote username upon each rcp request to a server. When you copy a configuration file or image between the router and a server using rcp, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The remote username specified in the **copy** command, if a username is specified.
2. The username set by the **ip rcmd remote-username** global configuration command, if the command is configured.
3. The remote username associated with the current tty (terminal) process. For example, if the user is connected to the router through Telnet and was authenticated through the **username** command, the router software sends the Telnet username as the remote username.
4. The router host name.

For the rcp copy request to process, an account must be defined on the network server for the remote username. If the network administrator of the destination server did not establish an account for the remote username, this command will not run. If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the remote username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

If you are writing to the server, the rcp server must be properly configured to accept the rcp write request from the user on the router. For UNIX systems, add an entry to the .rhosts file for the remote user on the rcp server. Suppose the router contains the following configuration lines:

```
hostname Rtr1
ip rcmd remote-username User0
```

If the router IP address translates to Router1.company.com, then the .rhosts file for User0 on the rcp server should contain the following line:

```
Router1.company.com Rtr1
```

Refer to the documentation for your rcp server for more details.

If you are using a personal computer as a file server, the computer must support the remote shell protocol (rsh).

Using FTP

The FTP protocol requires a client to send a remote username and password upon each FTP request to a server. When you copy a configuration file from the router to a server using FTP, the Cisco IOS software sends the first valid username that it encounters in the following sequence:

1. The username specified in the **copy** command, if a username is specified.
2. The username set by the **ip ftp username** command, if the command is configured.
3. Anonymous.

The router sends the first valid password in the following list:

1. The password specified in the **copy** command, if a password is specified.
2. The password set by the **ip ftp password** command, if the command is configured.
3. The router forms a password username@routername.domain. The variable username is the username associated with the current session, routername is the configured host name, and domain is the domain of the router.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept the FTP write request from the user on the router.

If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

Refer to the documentation for your FTP server for more details.

Use the **ip ftp username** and **ip ftp password** global configuration commands to specify a username and password for all copies. Include the username in the **copy** command if you want to specify a username for that copy operation only.

Storing Images on Servers

Use the **copy** *flash: destination-url* command (for example, **copy flash: tftp:**) to copy a system image or boot image from Flash memory to a network server. Use the copy of the image as a backup copy. Also, use it to verify that the copy in Flash memory is the same as that in the original file.

Copying from a Server to Flash Memory

Use the **copy** *destination-url flash:* command (for example, **copy tftp: flash:**) to copy an image from a server to Flash memory.

On Class B file system platforms, the system provides an option to erase existing Flash memory before writing onto it.

Note Verify the image in Flash memory before booting the image.

Verifying Images

When copying a new image to your router, you should confirm that the image was not corrupted during the copy process. Depending on the destination filesystem type, a checksum for the image file may be displayed when the **copy** command completes. You can verify this checksum by comparing it to the checksum value provided for your image file on Cisco.com.

Caution If the checksum values do not match, do not reboot the router. Instead, reissue the **copy** command and compare the checksums again. If the checksum is repeatedly wrong, copy the original image back into Flash memory *before* you reboot the router from Flash memory. If you have a corrupted image in Flash memory and try to boot from Flash memory, the router will start the system image contained in ROM (assuming booting from a network server is not configured). If ROM does not contain a fully functional system image, the router might not function and will need to be reconfigured through a direct console port connection.

An alternate method for file verification is to use the UNIX 'diff' command. This method can also be applied to file types other than Cisco IOS images. If you suspect that a file is corrupted, copy the suspect file and the original file to a Unix server. (The file names may need to be modified if you try to save the files in the same directory.) Then run the Unix 'diff' command on the two files. If there is no difference, then the file has not been corrupted.

Copying a Configuration File from a Server to the Running Configuration

Use the **copy {ftp: | rcp: | tftp:} running-config** command to load a configuration file from a network server to the running configuration of the router (note that **running-config** is the alias for the **system:running-config** keyword). The configuration will be added to the running configuration as if the commands were typed in the command-line interface (CLI). Thus, the resulting configuration file will be a combination of the previous running configuration and the loaded configuration file, with the loaded configuration file having precedence.

You can copy either a host configuration file or a network configuration file. Accept the default value of *host* to copy and load a host configuration file containing commands that apply to one network server in particular. Enter *network* to copy and load a network configuration file containing commands that apply to all network servers on a network.

Copying a Configuration File from a Server to the Startup Configuration

Use the **copy {ftp: | rcp: | tftp:} nvram:startup-config** command to copy a configuration file from a network server to the router startup configuration. These commands replace the startup configuration file with the copied configuration file.

Storing the Running or Startup Configuration on a Server

Use the **copy system:running-config {ftp: | rcp: | tftp:}** command to copy the current configuration file to a network server using FTP, rcp, or TFTP. Use the **copy nvram:startup-config {ftp: | rcp: | tftp:}** command to copy the startup configuration file to a network server.

The configuration file copy can serve as a backup copy.

Saving the Running Configuration to the Startup Configuration

Use the **copy system:running-config nvram:startup-config** command to copy the running configuration to the startup configuration.

Note Some specific commands might not get saved to NVRAM. You will need to enter these commands again if you reboot the machine. These commands are noted in the documentation. We recommend that you keep a listing of these settings so you can quickly reconfigure your router after rebooting.

If you issue the **copy system:running-config nvram:startup-config** command from a bootstrap system image, a warning will instruct you to indicate whether you want your previous NVRAM configuration to be overwritten and configuration commands to be lost. This warning does not appear if NVRAM contains an invalid configuration or if the previous configuration in NVRAM was generated by a bootstrap system image.

On all platforms except Class A file system platforms, the **copy system:running-config nvram:startup-config** command copies the currently running configuration to NVRAM.

On the Class A Flash file system platforms, the **copy system:running-config nvram:startup-config** command copies the currently running configuration to the location specified by the CONFIG_FILE environment variable. This variable specifies the device and configuration file used for initialization. When the CONFIG_FILE environment variable points to NVRAM or when this variable does not exist (such as at first-time startup), the software writes the current configuration to NVRAM. If the current configuration is too large for NVRAM, the software displays a message and stops executing the command.

When the CONFIG_FILE environment variable specifies a valid device other than **nvram:** (that is, **flash:**, **bootflash:**, **slot0:**, or **slot1:**), the software writes the current configuration to the specified device and filename, and stores a distilled version of the configuration in NVRAM. A distilled version is one that does not contain access list information. If NVRAM already contains a copy of a complete configuration, the router prompts you to confirm the copy.

Using CONFIG_FILE, BOOT, and BOOTLDR Environment Variables

For the Class A Flash file system platforms, specifications are as follows:

- The CONFIG_FILE environment variable specifies the configuration file used during router initialization.
- The BOOT environment variable specifies a list of bootable images on various devices.
- The BOOT environment variable specifies a list of bootable images on various devices.
- The BOOTLDR environment variable specifies the Flash device and filename containing the rxboot image that ROM uses for booting.

RQS N° 03/2005 - CN
CPMI - CORREIOS
0770
Doc: 3701

- Cisco 3600 routers do not use a dedicated boot helper image (rxboot), which many other routers use to help with the boot process. Instead, the BOOTLDR ROM monitor environment variable identifies the Flash memory device and filename that are used as the boot helper; the default is the first system image in Flash memory.

To view the contents of environment variables, use the **show bootvar** EXEC command. To modify the CONFIG_FILE environment variable, use the **boot config** global configuration command. To modify the BOOTLDR environment variable, use the **boot bootldr** global configuration command. To modify the BOOT environment variable, use the **boot system** global configuration command. To save your modifications, use the **copy system:running-config nvram:startup-config** command.

When the destination of a **copy** command is specified by the CONFIG_FILE or BOOTLDR environment variable, the router prompts you for confirmation before proceeding with the copy. When the destination is the only valid image in the BOOT environment variable, the router also prompts you for confirmation before proceeding with the copy.

Using the Copy Command with the Dual RSP Feature

The Dual RSP feature allows you to install two Route/Switch Processor (RSP) cards in a single router on the Cisco 7507 and Cisco 7513 platforms.

On a Cisco 7507 or Cisco 7513 router configured for Dual RSPs, if you copy a file to **nvram:startup-configuration** with automatic synchronization disabled, the system asks if you also want to copy the file to the slave startup configuration. The default answer is **yes**. If automatic synchronization is enabled, the system automatically copies the file to the slave startup configuration each time you use a **copy** command with **nvram:startup-configuration** as the destination.

Examples

The following examples illustrate uses of the **copy** command.

- Copying an Image from a Server to Flash Memory Examples
- Saving a Copy of an Image on a Server Examples
- Copying a Configuration File from a Server to the Running Configuration Example
- Copying a Configuration File from a Server to the Startup Configuration Example
- Copying the Running Configuration to a Server Example
- Copying the Startup Configuration to a Server Example
- Saving the Current Running Configuration Example
- Moving Configuration Files to Other Locations Examples
- Copying an Image from the Master RSP Card to the Slave RSP Card Example

Copying an Image from a Server to Flash Memory Examples

The following three examples use a **copy rcp:**, **copy tftp:**, or **copy ftp:** command to copy an image file from a server to Flash memory:

- Copying an Image from a Server to Flash Memory Example
- Copying an Image from a Server to a Flash Memory Using Flash Load Helper Example
- Copying an Image from a Server to a Flash Memory Card Partition Example

Copying an Image from a Server to Flash Memory Example

This example copies a system image named file1 from the remote rcp server with an IP address of 172.16.101.101 to Flash memory. On Class B file system platforms, the Cisco IOS software allows you to first erase the contents of Flash memory to ensure that enough Flash memory is available to accommodate the system image.

```
Router# copy rcp://netadmin@172.16.101.101/file1 flash:file1

Destination file name [file1]?
Accessing file 'file1' on 172.16.101.101...
Loading file1 from 172.16.101.101 (via Ethernet0): ! [OK]

Erase flash device before writing? [confirm]
Flash contains files. Are you sure you want to erase? [confirm]

Copy 'file1' from server
  as 'file1' into Flash WITH erase? [yes/no] yes
Erasing device... eeee
```

```
Erase flash device before writing? [confirm]
Flash contains files. Are you sure? [confirm]
Copy 'master/igs-bfpx.100-4.3' from TFTP server
as 'master/igs-bfpx.100-4.3' into Flash WITH erase? [yes/no] yes
```

Copying an Image from a Server to a Flash Memory Card Partition Example

The following example copies the file c3600-i-mz from the rcp server at IP address 172.23.1.129 to the Flash memory card in slot 0 of a Cisco 3600 series router, which has only one partition. As the operation progresses, the Cisco IOS software asks you to erase the files on the Flash memory PC card to accommodate the incoming file. This entire operation takes 18 seconds to perform, as indicated at the end of the example.

```
Router# copy rcp: slot0:

PCMCIA Slot0 flash

Partition    Size     Used      Free      Bank-Size  State          Copy Mode
  1          4096K    3068K     1027K     4096K      Read/Write     Direct
  2          4096K    1671K     2424K     4096K      Read/Write     Direct
  3          4096K       0K     4095K     4096K      Read/Write     Direct
  4          4096K    3825K      270K     4096K      Read/Write     Direct

[Type ?<no> for partition directory; ? for full directory; q to abort]
Which partition? [default = 1]

PCMCIA Slot0 flash directory, partition 1:
File  Length    Name/status
  1   3142288   c3600-j-mz.test
[3142352 bytes used, 1051952 available, 4194304 total]
Address or name of remote host [172.23.1.129]?
Source file name? /tftpboot/images/c3600-i-mz
Destination file name [/tftpboot/images/c3600-i-mz]?
Accessing file '/tftpboot/images/c3600-i-mz' on 172.23.1.129...
Connected to 172.23.1.129
Loading 1711088 byte file c3600-i-mz: ! [OK]

Erase flash device before writing? [confirm]
Flash contains files. Are you sure you want to erase? [confirm]

Copy '/tftpboot/images/c3600-i-mz' from server
  as '/tftpboot/images/c3600-i-mz' into Flash WITH erase? [yes/no] yes
Erasing device... eeeeeeeeeeeeeeeeeeeeeeeeeeeeeeee ...erased
Connected to 172.23.1.129
Loading 1711088 byte file c3600-i-mz:
!!!
```

Saving a Copy of an Image on a Server Examples

The following four examples use **copy** commands to copy image files to a server for storage:

- Copy an Image from Flash Memory to an rcp Server Example
- Copy an Image from a Partition of Flash Memory to a Server Example
- Copying an Image from a Flash Memory File System to an FTP Server Example
- Copying an Image from Boot Flash Memory to a TFTP Server Example

Copy an Image from Flash Memory to an rcp Server Example

The following example copies a system image from Flash Memory to an rcp server using the default remote username. Because the rcp server address and filename are not included in the command, the router prompts for it.

```
Router# copy flash: rcp:

IP address of remote host [255.255.255.255]? 172.16.13.110
Name of file to copy? gsxx
writing gsxx - copy complete
```

Copy an Image from a Partition of Flash Memory to a Server Example

The following example copies an image from a particular partition of Flash memory to an rcp server using a remote username of netadmin1.

The system will prompt if there are two or more partitions. If the partition entered is not valid, the process terminates. You have the option to enter a partition number, a question mark (?) for a directory display of all partitions, or a question mark and a number (*?number*) for a directory display of a particular partition. The default is the first partition.

```
Router# configure terminal
Router# ip rcmd remote-username netadmin1
Router# end
Router# copy flash: rcp:
System flash partition information:
Partition   Size     Used    Free    Bank-Size   State       Copy-Mode
    1       4096K    2048K   2048K   2048K       Read Only   RXBOOT-FLH
    2       4096K    2048K   2048K   2048K       Read/Write  Direct
[Type ?<number> for partition directory; ? for full directory; q to abort]
Which partition? [1] 2

System flash directory, partition 2:
File  Length   Name/status
  1   3459720  master/igs-bfpx.100-4.3
[3459784 bytes used, 734520 available, 4194304 total]
Address or name of remote host [ABC.CISCO.COM]?
Source file name? master/igs-bfpx.100-4.3
Destination file name [master/igs-bfpx.100-4.3]?
Verifying checksum for 'master/igs-bfpx.100-4.3' (file # 1)... OK
Copy 'master/igs-bfpx.100-4.3' from Flash to server
as 'master/igs-bfpx.100-4.3'? [yes/no] yes
!!!!...
Upload to server done
Flash copy took 0:00:00 [hh:mm:ss]
```

Copying an Image from a Flash Memory File System to an FTP Server Example

The following example copies the file c3600-i-mz from partition 1 of the Flash memory card in slot 0 to an FTP server at IP address 172.23.1.129.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0772
Fls:
Doc: 3701

```
Router# show slot0: partition 1

PCMCIA Slot0 flash directory, partition 1:
File  Length   Name/status
  1   1711088 c3600-i-mz
[1711152 bytes used, 2483152 available, 4194304 total]

Router# copy slot0:1:c3600-i-mz ftp://myuser:mypass@172.23.1.129/c3600-i-mz
Verifying checksum for '/tftpboot/cisco_rules/c3600-i-mz' (file # 1)...  OK
Copy '/tftpboot/cisco_rules/c3600-i-mz' from Flash to server
  as 'c3700-i-mz'? [yes/no] yes
!!!
```

```
Router# configure terminal
Router(config)# ip rcmd remote-username netadmin1
Router(config)# end

Building configuration...[OK]
Connected to 172.16.101.101
```

Copying the Startup Configuration to a Server Example

The following example copies the startup configuration to a TFTP server:

```
Router# copy nvram:startup-config tftp:

Remote host[]? 172.16.101.101

Name of configuration file to write [rtr2-confg]? <cr>
Write file rtr2-confg on host 172.16.101.101?[confirm] <cr>
![OK]
```

Saving the Current Running Configuration Example

The following example copies the running configuration to the startup configuration. On a Class A Flash file system platform, this command copies the running configuration to the startup configuration specified by the CONFIG_FILE variable.

```
copy system:running-config nvram:startup-config
```

The following example shows the warning that the system provides if you try to save configuration information from bootstrap into the system:

```
Router(boot)# copy system:running-config nvram:startup-config

Warning: Attempting to overwrite an NVRAM configuration written
by a full system image. This bootstrap software does not support
the full configuration command set. If you perform this command now,
some configuration commands may be lost.
Overwrite the previous NVRAM configuration?[confirm]
```

Enter **no** to escape writing the configuration information to memory.

Moving Configuration Files to Other Locations Examples

On some routers, you can store copies of configuration files on a Flash memory device. Five examples follow.

Copying the Startup Configuration to a Flash Memory Device Example

The following example copies the startup configuration file (specified by the CONFIG_FILE environment variable) to a Flash memory card inserted in slot 0:

```
copy nvram:startup-config slot0:router-confg
```

Copying the Running Configuration to a Flash Memory Device Example

The following example copies the running configuration from the router to the Flash memory PC card in slot 0:

```
Router# copy system:running-config slot0:berlin-cfg

Building configuration...
```

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0773
Fls:
Doc 3701

```
5267 bytes copied in 0.720 secs
```

Copying to the Running Configuration from a Flash Memory Device Example

The following example copies the file named ios-upgrade-1 from the Flash memory card in slot 0 to the running configuration:

```
Router# copy slot0:4:ios-upgrade-1 system:running-config

Copy 'ios-upgrade-1' from flash device
  as 'running-config' ? [yes/no] yes
```

Copying to the Startup Configuration from a Flash Memory Device Example

The following example copies the router-image file from the Flash memory to the startup configuration:

```
copy flash:router-image nvram:startup-config
```

Copying a Configuration File from one Flash Device to Another Example

The following example copies the file running-config from the first partition in internal Flash memory to the Flash memory PC card in slot 1. The checksum of the file is verified, and its copying time of 30 seconds is displayed.

```
Router# copy flash: slot1:

System flash

Partition   Size    Used      Free      Bank-Size  State          Copy Mode
  1         4096K   3070K     1025K     4096K      Read/Write     Direct
  2        16384K   1671K    14712K     8192K      Read/Write     Direct

[Type ?<no> for partition directory; ? for full directory; q to abort]
Which partition? [default = 1]

System flash directory, partition 1:
File  Length   Name/status
  1   3142748  dirt/images/mars-test/c3600-j-mz.latest
  2   850      running-config
[3143728 bytes used, 1050576 available, 4194304 total]

PCMCIA Slot1 flash directory:
File  Length   Name/status
  1   1711088  dirt/images/c3600-i-mz
  2   850      running-config
[1712068 bytes used, 2482236 available, 4194304 total]
Source file name? running-config
Destination file name [running-config]?
Verifying checksum for 'running-config' (file # 2)...  OK
Erase flash device before writing? [confirm]
Flash contains files. Are you sure you want to erase? [confirm]

Copy 'running-config' from flash: device
  as 'running-config' into slot1: device WITH erase? [yes/no] yes
Erasing device... eeee
```

Copying an Image from the Master RSP Card to the Slave RSP Card Example

The following example copies the router-image file from the Flash memory card inserted in slot 1 of the master RSP card to slot 0 of the slave RSP card in the same router:

```
copy slot1:router-image slaveslot0:
```

Related Commands

Command	Description
boot config	Specifies the device and filename of the configuration file from which the router configures itself during initialization (startup).
boot system	Specifies the system image that the router loads at startup.
cd	Changes the default directory or file system.
copy xmodem: flash:	Copies any file from a source to a destination.
copy ymodem: flash:	Copies any file from a source to a destination.
delete	Deletes a file on a Flash memory device.
dir	Displays a list of files on a file system.
erase	Erases a file system.
ip rcmd remote-username	Configures the remote username to be used when requesting a remote copy using rcp.
reload	Reloads the operating system.
show bootvar	Displays the contents of the BOOT environment variable, the name of the configuration file pointed to by the CONFIG_FILE environment variable, the contents of the BOOTLDR environment variable, and the configuration register setting.
show (Flash file system)	Displays the layout and contents of a Flash memory file system.
slave auto-sync config	Turns on automatic synchronization of configuration files for a Cisco 7507 or Cisco 7513 router that is configured for Dual RSP Backup.
verify bootflash:	Either of the identical **verify bootflash:** or **verify bootflash** commands replaces the **copy verify bootflash** command. Refer to the **verify** command for more information.

delete

To delete a file from a Flash memory device or NVRAM, use the **delete** EXEC command.

delete *URL* [**/force** | **/recursive**]

Syntax Description

URL	IFS URL of the file to be deleted. Include the filesystem prefix, followed by a colon, and, optionally, the name of a file or directory.
/force	(Optional) Deletes the specified file or directory with prompting you for verification. **Note** Use this keyword with caution: the system will not ask you to confirm the file deletion.
/recursive	(Optional) Deletes all files in the specified directory, as well as the directory itself.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

If you attempt to delete the configuration file or image specified by the CONFIG_FILE or BOOTLDR environment variable, the system prompts you to confirm the deletion. Also, if you attempt to delete the last valid system image specified in the BOOT environment variable, the system prompts you to confirm the deletion.

When you delete a file in Flash memory, the software simply marks the file as deleted, but it does not erase the file. To later recover a "deleted" file in Flash memory, use the **undelete** EXEC command. You can delete and undelete a file up to 15 times.

To permanently delete all files marked "deleted" on a linear Flash memory device, use the **squeeze** EXEC command.

Examples

The following example deletes the file named "test" from the Flash filesystem:

```
Router# delete flash:test
Delete flash:test? [confirm]
```

Related Commands

Command	Description
cd	Changes the default directory or file system.
dir	Displays a list of files on a file system.

Command	Description
show bootvar	Displays the contents of the BOOT environment variable, the name of the configuration file pointed to by the CONFIG_FILE environment variable, the contents of the BOOTLDR environment variable, and the configuration register setting.
squeeze	Permanently deletes Flash files by squeezing a Class A Flash file system.
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.

dir

To display a list of files on a file system, use the **dir** EXEC command.

dir [**/all**] [*filesystem*:][*file-url*]

Syntax Description

/all	(Optional) Lists deleted files, undeleted files, and files with errors.
filesystem:	(Optional) File system or directory containing the files to list, followed by a colon.
file-url	(Optional) The name of the files to display on a specified device. The files can be of any type. You can use wildcards in the filename. A wildcard character (*) matches all patterns. Strings after a wildcard are ignored.

Defaults

The default file system is specified by the **cd** command. When you omit the **/all** keyword, the Cisco IOS software displays only undeleted files.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

Use the **show** (Flash file system) command to display more detail about the files in a particular file system.

Examples

The following is sample output from the **dir** command:

```
Router# dir slot0:

Directory of slot0:/

  1  -rw-     4720148   Aug 29 1997 17:49:36  hampton/nitro/c7200-j-mz
  2  -rw-     4767328   Oct 01 1997 18:42:53  c7200-js-mz
  5  -rw-         639   Oct 02 1997 12:09:32 rally
  7  -rw-         639   Oct 02 1997 12:37:13  the_time

20578304 bytes total (3104544 bytes free)

Router# dir /all slot0:

Directory of slot0:/

  1  -rw-     4720148   Aug 29 1997 17:49:36  hampton/nitro/c7200-j-mz

erase

To erase a file system, use the **erase** EXEC command. The **erase nvram:** command replaces the **write erase** command and the **erase startup-config** command.

erase *filesystem*:

Syntax Description

filesystem:	File system name, followed by a colon. For example, **flash:** or **nvram:**

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

When a file system is erased, none of the files in the file system can be recovered.

The **erase** command can be used on both Class B and Class C Flash file systems only. To reclaim space on Flash file systems after deleting files using the **delete** command, you must use the **erase** command. This command erases all of the files in the Flash file system.

Class A Flash file systems cannot be erased. You can delete individual files using the **delete** EXEC command and then reclaim the space using the **squeeze** EXEC command. You can use the **format** EXEC command to format the Flash file system.

On Class C Flash file systems, space is dynamically reclaimed when you use the **delete** command. You can also use either the **format** or **erase** command to reinitialize a Class C Flash file system.

The **erase nvram:** command erases NVRAM. On Class A file system platforms, if the CONFIG_FILE variable specifies a file in Flash memory, the specified file will be marked "deleted."

Examples

The following example erases the NVRAM, including the startup configuration located there:

```
erase nvram:
```

The following example erases all of partition 2 in internal Flash memory:

```
Router# erase flash:2

System flash directory, partition 2:
File  Length    Name/status
  1   1711088   dirt/images/c3600-i-mz
[1711152 bytes used, 15066064 available, 16777216 total]

Erase flash device, partition 2? [confirm]
Are you sure? [yes/no]: yes
Erasing device... eeee
```

```
Router# erase flash:

System flash partition information:
Partition   Size     Used    Free    Bank-Size   State        Copy-Mode
    1       4096K    2048K   2048K   2048K       Read Only    RXBOOT-FLH
    2       4096K    2048K   2048K   2048K       Read/Write   Direct

[Type ?<no> for partition directory; ? for full directory; q to abort]
Which partition? [default = 2]
```

The system will prompt only if there are two or more read/write partitions. If the partition entered is not valid or is the read-only partition, the process terminates. You can enter a partition number, a question mark (**?**) for a directory display of all partitions, or a question mark and a number (**?***number*) for directory display of a particular partition. The default is the first read/write partition.

```
System flash directory, partition 2:
File  Length    Name/status
  1   3459720   master/igs-bfpx.100-4.3
[3459784 bytes used, 734520 available, 4194304 total]

Erase flash device, partition 2? [confirm] <Return>
```

Related Commands

Command	Description
boot config	Specifies the device and filename of the configuration file from which the router configures itself during initialization (startup).
delete	Deletes a file on a Flash memory device.
more nvram:startup-config	Displays the startup configuration file contained in NVRAM or specified by the CONFIG_FILE environment variable.
show bootvar	Displays the contents of the BOOT environment variable, the name of the configuration file pointed to by the CONFIG_FILE environment variable, the contents of the BOOTLDR environment variable, and the configuration register setting
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.

erase bootflash

The **erase bootflash:** and **erase bootflash** commands have identical functions. See the description of the **erase** command in this chapter for more information.

file prompt

To specify the level of prompting, use the **file prompt** global configuration command.

file prompt [alert | noisy | quiet]

Syntax Description

alert	(Optional) Prompts only for destructive file operations. This is the default.
noisy	(Optional) Confirms all file operation parameters.
quiet	(Optional) Seldom prompts for file operations.

Defaults

alert

Command Modes

Global configuration

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

Use this command to change the amount of confirmation needed for different file operations.

This command affects only prompts for confirmation of operations. The router will always prompt for missing information.

Examples

The following example configures confirmation prompting for all file operations:

```
file prompt noisy
```

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0778
Doc: 3701

format

To format a Class A or Class C Flash file system, use the **format** EXEC command.

Class C Flash File System

format *filesystem1*:

Class A Flash File System

format [**spare** *spare-number*] *filesystem1*: [[*filesystem2*:][*monlib-filename*]]

Caution Reserve a certain number of memory sectors as spares, so that if some sectors fail, most of the Flash memory card can still be used. Otherwise, you must reformat the Flash card when some of the sectors fail.

Syntax Description

spare	(Optional) Reserves spare sectors as specified by the *spare-number* argument when formatting Flash memory.
spare-number	(Optional) Number of the spare sectors to reserve on formatted Flash memory. Valid values are from 0 to 16. The default value is zero.
filesystem1:	Flash memory to format, followed by a colon.
filesystem2:	(Optional) File system containing the monlib file to use for formatting filesystem1 followed by a colon.
monlib-filename	(Optional) Name of the ROM monitor library file (monlib file) to use for formatting the *filesystem1* argument. The default monlib file is the one bundled with the system software. When used with HSA and you do not specify the *monlib-filename* argument, the system takes ROM monitor library file from the slave image bundle. If you specify the *monlib-filename* argument, the system assumes that the files reside on the slave devices.

Defaults

The default monlib file is the one bundled with the system software.

The default number of spare sectors is zero (0).

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

Use this command to format Class A or C Flash memory file systems.

In some cases, you might need to insert a new PCMCIA Flash memory card and load images or backup configuration files onto it. Before you can use a new Flash memory card, you must format it.

Sectors in Flash memory cards can fail. Reserve certain Flash memory sectors as "spares" by using the optional *spare* argument on the **format** command to specify 0 to 16 sectors as spares. If you reserve a small number of spare sectors for emergencies, you can still use most of the Flash memory card. If you specify 0 spare sectors and some sectors fail, you must reformat the Flash memory card, thereby erasing all existing data.

The monlib file is the ROM monitor library. The ROM monitor uses this file to access files in the Flash file system. The Cisco IOS system software contains a monlib file.

In the command syntax, *filesystem1:* specifies the device to format and *filesystem2:* specifies the optional device containing the monlib file used to format *filesystem1:*. If you omit the optional *filesystem2:* and *monlib-filename* arguments, the system formats *filesystem1:* using the monlib file already bundled with the system software. If you omit only *the optional filesystem2:* argument, the system formats *filesystem1:* using the monlib file from the device you specified with the **cd** command. If you omit only the optional *monlib-filename* argument, the system formats *filesystem1:* using the *filesystem2:* monlib file. When you specify both arguments—*filesystem2:* and *monlib-filename*—the system formats *filesystem1:* using the monlib file from the specified device. You can specify *filesystem1:*'s own monlib file in this argument. If the system cannot find a monlib file, it terminates its formatting.

Caution You can read from or write to Flash memory cards formatted for Cisco 7000 series Route Processor (RP) cards in your Cisco 7200 and 7500 series routers, but you cannot boot the Cisco 7200 and 7500 series routers from a Flash memory card formatted for the Cisco 7000 series routers. Similarly, you can read from or write to Flash memory cards formatted for the Cisco 7200 and 7500 series routers in your Cisco 7000 series routers, but you cannot boot the Cisco 7000 series routers from a Flash memory card formatted for the Cisco 7200 and 7500 series routers.

Examples

The following example formats a Flash memory card inserted in slot 0:

```
Router# format slot0:

Running config file on this device, proceed? [confirm]y
All sectors will be erased, proceed? [confirm]y
Enter volume id (up to 31 characters): <Return>
Formatting sector 1 (erasing)
Format device slot0 completed
```

When the console returns to the EXEC prompt, the new Flash memory card is formatted and ready for use.

Related Commands

Command	Description
squeeze	Permanently deletes Flash files by squeezing a Class A Flash file system.
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.

fsck

To check a Class C Flash file system for damage and repair any problems, use the **fsck** EXEC command.

fsck [**/nocrc**] *filesystem*:

Syntax Description		
	/nocrc	(Optional) Omits cyclic redundancy checks (CRCs).
	filesystem:	The file system to check.

Command Modes

EXEC

Command History	Release	Modification
	11.3 AA	This command was introduced.

Usage Guidelines

This command is only valid on Class C Flash file systems.

Examples

The following example checks the Flash file system:

```
Router# fsck flash:

Fsck operation may take a while. Continue? [confirm]
flashfs[4]: 0 files, 2 directories
flashfs[4]: 0 orphaned files, 0 orphaned directories
flashfs[4]: Total bytes: 8128000
flashfs[4]: Bytes used: 1024
flashfs[4]: Bytes available: 8126976
flashfs[4]: flashfs fsck took 23 seconds.
Fsck of flash: complete
```

mkdir

To create a new directory in a Class C Flash file system, use the **mkdir** EXEC command.

mkdir *directory*

Syntax Description

directory	The name of the directory to create.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

This command is only valid on Class C Flash file systems.

If you do not specify the directory name in the command line, the router prompts you for it.

Examples

The following example creates a directory named newdir:

```
Router# mkdir newdir

Mkdir file name [newdir]?
Created dir flash:newdir
Router# dir
Directory of flash:

  2  drwx           0   Mar 13 1993 13:16:21  newdir

8128000 bytes total (8126976 bytes free)
```

Related Commands

Command	Description
dir	Displays a list of files on a file system.
rmdir	Removes an existing directory in a Class C Flash file system.

more

To display a file, use the **more** EXEC command.

more [/ascii | /binary | /ebcdic] *file-url*

Syntax Description

/ascii	(Optional) Displays a binary file in ASCII format.
/binary	(Optional) Displays a file in hex/text format.
/ebcdic	(Optional) Displays a binary file in EBCDIC format.
file-url	The URL of the file to display.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

The **more system:running-config** command displays the same output as the **show running-config** command. The **more nvram:startup-config** command replaces the **show startup-config** command and the **show configuration** command.

You can use this command to display configuration files, as follows:

- The **more nvram:startup-config** command displays the startup configuration file contained in NVRAM or specified by the CONFIG_FILE environment variable. The Cisco IOS software informs you whether the displayed configuration is a complete configuration or a distilled version. A distilled configuration is one that does not contain access lists.
- The **more system:running-config** command displays the running configuration.

These commands show the version number of the software used when you last changed the configuration file.

You can display files on remote systems using the **more** command.

Examples

The following partial sample output displays the configuration file named startup-config in NVRAM:

```
Router# more nvram:startup-config

!
! No configuration change since last restart
! NVRAM config last updated at 02:03:26 PDT Thu Oct 2 1997
!
version 12.1
service timestamps debug uptime
service timestamps log uptime
service password-encryption
service udp-small-servers
service tcp-small-servers
.
```

ROS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0781
Doc: 3701

```
.
.
end
```

The following is partial sample output from the **more nvram:startup-config** command when the configuration file has been compressed:

```
Router# more nvram:startup-config

Using 21542 out of 65536 bytes, uncompressed size = 142085 bytes
!
version 12.1
service compress-config
!
hostname rose
!
.
.
.
```

The following partial sample output displays the running configuration:

```
Router2# more system:running-config

Building configuration...

Current configuration:
!
version 12.1
no service udp-small-servers
no service tcp-small-servers
!
hostname Router2
!
.
.
.
!
end
```

Related Commands

Command	Description
boot config	Specifies the device and filename of the configuration file from which the router configures itself during initialization (startup).
service compress-config	Compresses startup configuration files.
show bootvar	Displays the contents of the BOOT environment variable, the name of the configuration file pointed to by the CONFIG_FILE environment variable, the contents of the BOOTLDR environment variable, and the configuration register setting.

pwd

To show the current setting of the **cd** command, use the **pwd** EXEC command.

pwd

Syntax Description

This command has no arguments or keywords.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

Use the **pwd** command to show which directory or file system is specified as the default by the **cd** command. For all EXEC commands that have an optional *filesystem* argument, the system uses the file system specified by the **cd** command when you omit the optional *filesystem* argument.

For example, the **dir** command contains an optional *filesystem* argument and displays a list of files on a particular file system. When you omit this *filesystem* argument, the system shows a list of the files on the file system specified by the **cd** command.

Examples

The following example shows that the present working file system specified by the **cd** command is slot 0:

```
Router> pwd
slot0:/
```

The following example uses the **cd** command to change the present file system to slot 1 and then uses the **pwd** command to display that present working file system:

```
Router> cd slot1:
Router> pwd
slot1:/
```

Related Commands

Command	Description
cd	Changes the default directory or file system.
dir	Displays a list of files on a file system.

rename

To rename a file in a Class C Flash file system, use the **rename** EXEC command.

rename *url1 url2*

Syntax Description

url1	The original path and filename.
url2	The new path and filename.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

This command is valid only on Class C Flash file systems.

Examples

In the following example, the file named Karen.1 is renamed test:

```
Router# dir

Directory of disk0:/Karen.dir/

  0  -rw-           0   Jan 21 1998 09:51:29  Karen.1
  0  -rw-           0   Jan 21 1998 09:51:29  Karen.2
  0  -rw-           0   Jan 21 1998 09:51:29  Karen.3
  0  -rw-           0   Jan 21 1998 09:51:31  Karen.4
243  -rw-         165   Jan 21 1998 09:53:17  Karen.cur

340492288 bytes total (328400896 bytes free)

Router# rename disk0:Karen.dir/Karen.1 disk0:Karen.dir/test
Router# dir

rmdir

To remove an existing directory in a Class C Flash file system, use the **rmdir** EXEC command.

rmdir *directory*

Syntax Description		
	directory	Directory to delete.

Command Modes

EXEC

Command History	Release	Modification
	11.3 AA	This command was introduced.

Usage Guidelines

This command is valid only on Class C Flash file systems.

Examples

The following example deletes the directory named newdir:

```
Router# dir

Directory of flash:

  2  drwx           0   Mar 13 1993 13:16:21  newdir

8128000 bytes total (8126976 bytes free)
Router# rmdir newdir
Rmdir file name [newdir]?
Delete flash:newdir? [confirm]
Removed dir flash:newdir
Router# dir
Directory of flash:

No files in directory

8128000 bytes total (8126976 bytes free)
```

Related Commands	Command	Description
	dir	Displays a list of files on a file system.
	mkdir	Creates a new directory in a Class C Flash file system.

show configuration

The **show configuration** command is replaced by the **show startup-config** and **more nvram:startup-config** commands. See the description of the **show startup-config** and **more** commands for more information.

show file descriptors

To display a list of open file descriptors, use the **show file descriptors** EXEC command.

show file descriptors

Syntax Description

This command has no arguments or keywords.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

File descriptors are the internal representations of open files. You can use this command to learn if another user has a file open.

Examples

The following is sample output from the **show file descriptors** command:

```
Router# show file descriptors

File Descriptors:

  FD  Position  Open  PID  Path
   0    187392  0001    2  tftp://dirt/hampton/c4000-i-m.a
   1    184320  030A    2  flash:c4000-i-m.a
```

Table 27 describes the significant fields shown in the display.

Table 27 show file descriptors Field Descriptions

Field	Description
FD	File descriptor. The file descriptor is a small integer used to specify the file once it has been opened.
Position	Byte offset from the start of the file.
Open	Flags supplied when opening the file.
PID	Process ID of the process that opened the file.
Path	Location of the file.

show file information

To display information about a file, use the **show file information** EXEC command.

show file information *file-url*

Syntax Description

file-url	The URL of the file to display.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Examples

The following is sample output from the **show file information** command:

```
Router# show file information tftp://dirt/hampton/c2500-j-1.a

tftp://dirt/hampton/c2500-j-1.a:
  type is image (a.out) [relocatable, run from flash]
  file size is 8624596 bytes, run size is 9044940 bytes [8512316+112248+420344]
  Foreign image

Router# show file information slot0:c7200-js-mz

slot0:c7200-js-mz:
  type is image (elf) []
  file size is 4770316 bytes, run size is 4935324 bytes
  Runnable image, entry point 0x80008000, run from ram

Router1# show file information nvram:startup-config

nvram:startup-config:
  type is ascii text
```

Table 28 describes the possible file types.

Table 28 Possible File Types

Types	Description
image (a.out)	Runnable image in a.out format.
image (elf)	Runnable image in elf format.
ascii text	Configuration file or other text file.
coff	Runnable image in coff format.
ebcdic	Text generated on an IBM mainframe.
lzw compression	Lzw compressed file.
tar	Text archive file used by the Channel Interface Processor (CIP).

show file systems

To list available file systems, use the **show file systems** command in EXEC mode.

show file systems

Syntax Description

This command has no arguments or keywords.

Command Modes

EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines

Use this command to learn the alias names (Prefixes) of the file systems your router supports.

Examples

The following is sample output from the **show file systems** command:

```
Router# show file systems

File Systems:

     Size(b)       Free(b)      Type      Flags  Prefixes
           -             -    opaque      rw     null:
           -             -    opaque      rw     system:
           -             -    opaque      ro     xmodem:
           -             -    opaque      ro     ymodem:
           -             -   network      rw     tftp:
           -             -   network      rw     rcp:
           -             -   network      rw     ftp:
*    4194304       4190616     flash      rw     flash:
      131066        129185     nvram      rw     nvram:
           -             -    opaque      wo     lex:
```

Table 29 describes the significant fields shown in the display.

Table 29 show file systems Field Descriptions

Type	Description
Size(b)	Amount of memory in the file system (in bytes).
Free(b)	Amount of free memory in the file system (in bytes).
Type	Type of file system.
Flags	Permissions for file system.
Prefixes	Alias for file system.
disk	The file system is for a rotating medium.
flash	The file system is for a Flash memory device.

Table 29 show file systems Field Descriptions (continued)

Type	Description
network	The file system is a network file system (TFTP, rcp, FTP, and so on).
nvram	The file system is for an NVRAM device.
opaque	The file system is a locally generated "pseudo" file system (for example, the "system") or a download interface, such as brimux.
rom	The file system is for a ROM or EPROM device.
tty	The file system is for a collection of terminal devices.
unknown	The file system is of unknown type.

Table 30 describes file system flags.

Table 30 Possible File System Flags

Flag	Description
ro	The file system is Read Only.
rw	The file system is Write Only.
wo	The file system is Read/Write.

squeeze

To permanently erase files tagged as "deleted" or "error" on Class A Flash file systems, use the **squeeze** command in EXEC mode.

squeeze [**/nolog**] [**/quiet**] *filesystem*:

Syntax Description

/nolog	(Optional) Disables the squeeze log (recovery data) and accelerates the squeeze process.
/quiet	(Optional) Disables status messages during the squeeze process.
filesystem:	The Flash file system, followed by a colon. Typically **flash:** or **slot0:**.

Command Modes

EXEC

Command History

Release	Modification
11.1	This command was introduced.
12.2(1)	This command was implemented in images for the Cisco 2600 and Cisco 3600 series.
12.2(4)XL	This command was implemented in images for the Cisco 1700 series.
12.1(9), 12.0(17)S 12.0(17)ST, 12.2(2), 12.2(2)T, 12.2(2)B, 12.1(9)E	The **/nolog** and **/quiet** keywords were added.

Usage Guidelines

When Flash memory is full, you might need to rearrange the files so that the space used by the files marked "deleted" can be reclaimed. (This "squeeze" process is required for linear Flash memory cards to make sectors contiguous; the free memory must be in a "block" to be usable.)

When you enter the **squeeze** command, the router copies all valid files to the beginning of Flash memory and erases all files marked "deleted." After the squeeze process is completed, you can write to the reclaimed Flash memory space.

Caution After performing the squeeze process you cannot recover deleted files using the **undelete** EXEC mode command.

In addition to removing deleted files, the **squeeze** command removes any files that the system has marked as "error". An error file is created when a file write fails (for example, the device is full). To remove error files, you must use the **squeeze** command.

Rewriting Flash memory space during the squeeze operation may take several minutes.

Using the **/nolog** keyword disables the log for the squeeze process. In most cases this will speed up the squeeze process. However, if power is lost or the Flash card is removed during the squeeze process, all the data on the Flash card will be lost, and the device will have to be reformatted.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
0786
Fls:
3701
Doc:
FR-217

Note Using the **/nolog** keyword makes the squeeze process uninterruptible.

Using the **/quiet** keyword disables the output of status messages to the console during the squeeze process.

If the optional keywords are not used, the progress of squeeze process will be displayed to the console, a log for the process will be maintained, and the squeeze process is interruptible.

On Cisco 2600 or Cisco 3600 series routers, the entire file system needs to be erased once before the **squeeze** command can be used. After being erased once, the **squeeze** command should operate properly on the Flash file system for the rest of the Flash file system's history.

To erase an entire flash file system on a Cisco 2600 or 3600 series router, perform the following steps:

Step 1 If the Flash file system has multiple partitions, enter the **no partition** command to remove the partitions. The reason for removing partitions is to ensure that the entire Flash file system is erased. The **squeeze** command can be used in a Flash file system with partitions after the Flash file system is erased once.

Step 2 Enter the **erase** command to erase the Flash file system.

Examples

In the following example, the file named "config1" is deleted, and then the **squeeze** command is used to reclaim the space used by that file. The **/nolog** option is used to speed up the squeeze process.

```
Router# delete config1
Delete filename [config1]?
Delete slot0:conf? [confirm]
Router# dir slot0:
! Note that the deleted file name appears in square brackets
Directory of slot0:/

    1  -rw-     4300244   Apr 02 2001 03:18:07  c7200-boot-mz.122-0.14
    2  -rw-        2199   Apr 02 2001 04:45:15  [config1]
    3  -rw-     4300244   Apr 02 2001 04:45:23  image
20578304 bytes total (11975232 bytes free)
!20,578,304 - 4,300,244 - 4,300,244 - 2,199 - 385 = 11975232

Router# squeeze /nolog slot0:
%Warning: Using /nolog option would render squeeze operation uninterruptible.
All deleted files will be removed. Continue? [confirm]
Squeeze operation may take a while. Continue? [confirm]

Squeeze of slot0 completed in 291.832 secs .
Router# dir slot0:
Directory of slot0:/

    1  -rw-     4300244   Apr 02 2001 03:18:07  c7200-boot-mz.122-0.14
    2  -rw-     4300244   Apr 02 2001 04:45:23  image

20578304 bytes total (11977560 bytes free)
!20,578,304 - 4,300,244 - 4,300,244 - 256 = 11977560
```

undelete

To recover a file marked "deleted" on a Class A or Class B Flash file system, use the **undelete** EXEC command.

undelete *index* [*filesystem*:]

Syntax Description

index	A number that indexes the file in the **dir** command output.
filesystem:	(Optional) A file system containing the file to undelete, followed by a colon.

Defaults

The default file system is the one specified by the **cd** command.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

For Class A and B Flash file systems, when you delete a file, the Cisco IOS software simply marks the file as deleted, but it does not erase the file. This command allows you to recover a "deleted" file on a specified Flash memory device. You must undelete a file by its index because you could have multiple deleted files with the same name. For example, the "deleted" list could contain multiple configuration files with the name router-config. You undelete by index to indicate which of the many router-config files from the list to undelete. Use the **dir** command to learn the index number of the file you want to undelete.

You cannot undelete a file if a valid (undeleted) file with the same name exists. Instead, you first delete the existing file and then undelete the file you want. For example, if you had an undeleted version of the router-config file and you wanted to use a previous, deleted version instead, you could not simply undelete the previous version by index. You would first delete the existing router-config file and then undelete the previous router-config file by index. You can delete and undelete a file up to 15 times.

On Class A Flash file systems, if you try to recover the configuration file pointed to by the CONFIG_FILE environment variable, the system prompts you to confirm recovery of the file. This prompt reminds you that the CONFIG_FILE environment variable points to an undeleted file. To permanently delete all files marked "deleted" on a Flash memory device, use the **squeeze** EXEC command.

On Class B Flash file systems, you must use the **erase** EXEC command to recover any space taken up by deleted files.

Examples

The following example recovers the deleted file whose index number is 1 to the Flash memory card inserted in slot 0:

```
undelete 1 slot0:
```

verify

To verify the checksum of a file on a Flash memory file system, use the **verify** EXEC command.

verify *filesystem*:[*file-url*]

Syntax Description

filesystem:	Flash memory file system containing the files to list, followed by a colon. Standard file system keywords for this command include **flash:**, **bootflash:**, and **slot0:**.
file-url	(Optional) URL of the file to verify. Generally this consists only of the filename(s), but you may also specify directories (file paths), separated by forward-slashes (/). The files can be of any type. You can use wildcards in the filename. A wildcard character (*) matches all patterns. Strings after a wildcard are ignored.

Defaults

The current working device is the default device.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

This command replaces the **copy verify** and **copy verify flash** commands.

Use the **verify** command to verify the checksum of a file before using it.

Each software image that is distributed on disk uses a single checksum for the entire image. This checksum is displayed only when the image is copied into Flash memory; it is not displayed when the image file is copied from one disk to another.

To display the contents of Flash memory, use the **show flash** command. The Flash contents listing does not include the checksum of individual files. To recompute and verify the image checksum after the image has been copied into Flash memory, use the **verify** command.

Note The verify command only performs a check on the integrity of the file after it has been saved in the file system. It is possible for a corrupt image to be transferred to the router and saved in the file system without detection.
To verify that a Cisco IOS software image was not corrupted while it was transfered to the router, copy the image from where it is stored on your router to a Unix server. Also copy the same image from CCO (Cisco.com) to the same Unix server. (The name may need to be modified if you try to save the image in the same directory as the image that you copied from the router.) Then run a Unix **diff** command on the two Cisco IOS software images. If there is no difference then the image stored on the router has not been corrupted.

Examples

The following example verifies that the file named c7200-js-mz is on the Flash memory card inserted in slot 0:

```
Router# dir slot0:
Directory of slot0:/

  1  -rw-     4720148   Aug 29 1997 17:49:36  hampton/nitro/c7200-j-mz
  2  -rw-     4767328   Oct 01 1997 18:42:53  c7200-js-mz
  5  -rw-         639   Oct 02 1997 12:09:32  rally
  7  -rw-         639   Oct 02 1997 12:37:13  the_time

20578304 bytes total (3104544 bytes free)
tw3-7200-1# verify slot0:
Verify filename []? c7200-js-mz
Verified slot0:
```

The following example also verifies that the file named c7200-js-mz is on the Flash memory card inserted in slot 0:

```
Router# verify slot0:?
slot0:c7200-js-mz  slot0:rally slot0:hampton/nitro/c7200-j-mz  slot0:the_time

Router# verify slot0:c7200-js-mz
Verified slot0:c7200-js-mz
```

CHAPTER 5

Configuring Ethernet VLAN Trunks

This chapter describes how to configure Ethernet VLAN trunks on the Catalyst 6500 series switches.

Note For complete information on configuring VLANs, see Chapter 11, "Configuring VLANs."

Note For complete syntax and usage information for the commands used in this chapter, refer to the *Catalyst 6500 Series Command Reference* publication.

This chapter consists of these sections:

- Understanding How VLAN Trunks Work, page 5-1
- Default Trunk Configuration, page 5-5
- Configuring a Trunk Link, page 5-5
- Example VLAN Trunk Configurations, page 5-9
- Disabling VLAN 1 on Trunks, page 5-23

Understanding How VLAN Trunks Work

These sections describe how VLAN trunks work on the Catalyst 6500 series switches:

- Trunking Overview, page 5-1
- Trunking Modes and Encapsulation Type, page 5-2
- 802.1Q Trunk Configuration Guidelines and Restrictions, page 5-4

Trunking Overview

A trunk is a point-to-point link between one or more Ethernet switch ports and another networking device such as a router or a switch. Trunks carry the traffic of multiple VLANs over a single link and allow you to extend VLANs across an entire network.

Two trunking encapsulations are available on all Ethernet ports:

- Inter-Switch Link (ISL)—ISL is a Cisco-proprietary trunking encapsulation
- IEEE 802.1Q—802.1Q is an industry-standard trunking encapsulation

RGSTN 03/2005 - CN
CPMI - CORREIOS
0792
Fls:
Doc: 3701

You can configure a trunk on a single Ethernet port or on an EtherChannel bundle. For more information about EtherChannel, see Chapter 6, "Configuring EtherChannel."

Ethernet trunk ports support five different trunking modes (see Table 5-1). In addition, you can specify whether the trunk will use ISL encapsulation, 802.1Q encapsulation, or whether the encapsulation type will be autonegotiated.

For trunking to be autonegotiated, the ports must be in the same VLAN Trunking Protocol (VTP) domain. However, you can use the **on** or **nonegotiate** mode to force a port to become a trunk, even if it is in a different domain. For more information on VTP domains, see Chapter 10, "Configuring VTP."

Trunk negotiation is managed by the Dynamic Trunking Protocol (DTP). DTP supports autonegotiation of both ISL and 802.1Q trunks.

Trunking Modes and Encapsulation Type

Note The 10-Gigabit Ethernet Switching Module does not support ISL encapsulation.

Table 5-1 lists the trunking modes used with the **set trunk** command and describes how they function on Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet ports.

Table 5-1 Ethernet Trunking Modes

Mode	Function
on	Puts the port into permanent trunking mode and negotiates to convert the link into a trunk link. The port becomes a trunk port even if the neighboring port does not agree to the change.
off	Puts the port into permanent nontrunking mode and negotiates to convert the link into a nontrunk link. The port becomes a nontrunk port even if the neighboring port does not agree to the change.
desirable	Makes the port actively attempt to convert the link to a trunk link. The port becomes a trunk port if the neighboring port is set to **on**, **desirable**, or **auto** mode.
auto	Makes the port willing to convert the link to a trunk link. The port becomes a trunk port if the neighboring port is set to **on** or **desirable** mode. This is the default mode for all Ethernet ports.
nonegotiate	Puts the port into permanent trunking mode but prevents the port from generating DTP frames. You must configure the neighboring port manually as a trunk port to establish a trunk link.

Table 5-2 lists the encapsulation types used with the **set trunk** command and describes how they function on Ethernet ports. You can use the **show port capabilities** command to determine which encapsulation types a particular port supports.

Table 5-2 Ethernet Trunk Encapsulation Types

Encapsulation	Function
isl	Specifies ISL encapsulation on the trunk link.
dot1q	Specifies 802.1Q encapsulation on the trunk link.
negotiate	Specifies that the port negotiate with the neighboring port to become an ISL (preferred) or 802.1Q trunk, depending on the configuration and capabilities of the neighboring port.

The trunking mode, the trunk encapsulation type, and the hardware capabilities of the two connected ports determine whether a trunk link comes up and the type of trunk the link becomes. Table 5-3 shows the result of the possible trunking configurations.

Table 5-3 Results of Possible Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet Trunk Configurations

1. Using this configuration can result in spanning tree loops and is not recommended.

Note DTP is a point-to-point protocol. However, some internetworking devices might forward DTP frames improperly. To avoid this problem, ensure that trunking is turned **off** on ports connected to non-switch devices if you do not intend to trunk across those links. When manually enabling trunking on a link to a Cisco router, use the **nonegotiate** keyword to cause the port to become a trunk but not generate DTP frames.

802.1Q Trunk Configuration Guidelines and Restrictions

The following configuration guidelines and restrictions apply when using 802.1Q trunks and impose some limitations on the trunking strategy for a network:

- When connecting Cisco switches through an 802.1Q trunk, make sure the native VLAN for an 802.1Q trunk is the same on both ends of the trunk link. If the native VLAN on one end of the trunk is different from the native VLAN on the other end, spanning tree loops might result.
- Disabling spanning tree on the native VLAN of an 802.1Q trunk without disabling spanning tree on every VLAN in the network can cause spanning tree loops. We recommend that you leave spanning tree enabled on the native VLAN of an 802.1Q trunk. If this is not possible, disable spanning tree on every VLAN in the network. Make sure your network is free of physical loops before disabling spanning tree.
- When you connect two Cisco switches through 802.1Q trunks, the switches exchange spanning tree BPDUs on each VLAN allowed on the trunks. The BPDUs on the native VLAN of the trunk are sent untagged to the reserved IEEE 802.1D spanning tree multicast MAC address (01-80-C2-00-00-00). The BPDUs on all other VLANs on the trunk are sent tagged to the reserved Cisco Shared Spanning Tree (SSTP) multicast MAC address (01-00-0c-cc-cc-cd).
- Non-Cisco 802.1Q switches maintain only a single instance of spanning tree (the Mono Spanning Tree, or MST) that defines the spanning-tree topology for all VLANs. When you connect a Cisco switch to a non-Cisco switch through an 802.1Q trunk, the MST of the non-Cisco switch and the native VLAN spanning-tree of the Cisco switch combine to form a single spanning-tree topology known as the Common Spanning Tree (CST).

When you connect a Cisco switch to a non-Cisco switch the CST is always on VLAN 1. The Cisco switch sends an untagged IEEE BDPU (01-80-C2-00-00-00) on VLAN 1 for the CST and on the native VLAN the Cisco switch sends an untagged Cisco BPDU (01-00-0C-CC-CC-CC) which the non-Cisco switch forwards but does not act on (the IEEE BPDU is not forwarded on the native VLAN).

- Because Cisco switches transmit BPDUs to the SSTP multicast MAC address on VLANs other than the native VLAN of the trunk, non-Cisco switches do not recognize these frames as BPDUs and flood them on all ports in the corresponding VLAN. Other Cisco switches connected to the non-Cisco 802.1Q cloud receive these flooded BPDUs. This allows Cisco switches to maintain a per-VLAN spanning tree topology across a cloud of non-Cisco 802.1Q switches. The non-Cisco 802.1Q cloud separating the Cisco switches is treated as a single broadcast segment between all switches connected to the non-Cisco 802.1Q cloud through 802.1Q trunks.
- Make certain that the native VLAN is the same on ALL of the 802.1Q trunks connecting the Cisco switches to the non-Cisco 802.1Q cloud.
- If you are connecting multiple Cisco switches to a non-Cisco 802.1Q cloud, all of the connections MUST be through 802.1Q trunks. You CANNOT connect Cisco switches to a non-Cisco 802.1Q cloud through ISL trunks or through access ports. Doing so will cause the switch to place the ISL trunk port or access port into the spanning tree "port inconsistent" state and no traffic will pass through the port.

Default Trunk Configuration

Table 5-4 shows the default Ethernet trunk configuration.

Table 5-4 Default Ethernet Trunk Configuration

Feature	Default Configuration
Trunk mode	**auto**
Trunk encapsulation	**negotiate**
Allowed VLAN range	VLANs 1–1005, 1025-4094

Configuring a Trunk Link

These sections describe how to configure a trunk link on Ethernet ports and how to define the allowed VLAN range on a trunk:

- Configuring an ISL Trunk, page 5-6
- Configuring an 802.1Q Trunk, page 5-7
- Configuring an ISL/802.1Q Negotiating Trunk Port, page 5-7
- Defining the Allowed VLANs on a Trunk, page 5-8
- Disabling a Trunk Port, page 5-9

Configuring an ISL Trunk

To configure an ISL trunk, perform this task in privileged mode:

	Task	Command
Step 1	Configure an ISL trunk.	**set trunk** *mod/port* [**on** | **desirable** | **auto** | **nonegotiate**] **isl**
Step 2	Verify the trunking configuration.	**show trunk** [*mod/port*]

This example shows how to configure a port as a trunk and how to verify the trunk configuration. This example assumes that the neighboring port is in **auto** mode:

```
Console> (enable) set trunk 1/1 on
Port(s) 1/1 trunk mode set to on.
Console> (enable) 06/16/1998,22:16:39:DTP-5:Port 1/1 has become isl trunk
06/16/1998,22:16:40:PAGP-5:Port 1/1 left bridge port 1/1.
06/16/1998,22:16:40:PAGP-5:Port 1/1 joined bridge port 1/1.
Console> (enable) show trunk
Port      Mode         Encapsulation  Status        Native vlan
--------  -----------  -------------  ------------  -----------
 1/1      on           isl            trunking      1
Port      Vlans allowed on trunk
--------  ---------------------------------------------------------------------
 1/1      1-1005, 1025-4094

Port      Vlans allowed and active in management domain
--------  ---------------------------------------------------------------------
 1/1      1,521-524
Port      Vlans in spanning tree forwarding state and not pruned
--------  ---------------------------------------------------------------------
 1/1
Console> (enable)
```

This example shows how to place a port in **desirable** mode and how to verify the trunk configuration. This example assumes that the neighboring port is in **auto** mode:

```
Console> (enable) set trunk 1/2 desirable
Port(s) 1/2 trunk mode set to desirable.
Console> (enable) 06/16/1998,22:20:16:DTP-5:Port 1/2 has become isl trunk
06/16/1998,22:20:16:PAGP-5:Port 1/2 left bridge port 1/2.
06/16/1998,22:20:16:PAGP-5:Port 1/2 joined bridge port 1/2.
Console> (enable) show trunk 1/2
Port      Mode         Encapsulation  Status        Native vlan
--------  -----------  -------------  ------------  -----------
 1/2      desirable    isl            trunking      1
Port      Vlans allowed on trunk
--------  ---------------------------------------------------------------------
 1/2      1-1005, 1025-4094
Port      Vlans allowed and active in management domain
--------  ---------------------------------------------------------------------
 1/2      1,521-524
Port      Vlans in spanning tree forwarding state and not pruned
--------  ---------------------------------------------------------------------
 1/2
Console> (enable)
```

Configuring an 802.1Q Trunk

To configure an 802.1Q trunk, perform this task in privileged mode:

	Task	Command
Step 1	Configure an 802.1Q trunk.	**set trunk** *mod/port* [**on** | **desirable** | **auto** | **nonegotiate**] **dot1q**
Step 2	Verify the trunking configuration.	**show trunk** [*mod/port*]

This example shows how to configure an 802.1Q trunk and how to verify the trunk configuration:

```
Console> (enable) set trunk 2/9 desirable dot1q
Port(s) 2/9 trunk mode set to desirable.
Port(s) 2/9 trunk type set to dot1q.
Console> (enable) 07/02/1998,18:22:25:DTP-5:Port 2/9 has become dot1q trunk

Console> (enable) show trunk
Port      Mode         Encapsulation  Status        Native vlan
--------  -----------  -------------  ------------  -----------
 2/9      desirable    dot1q          trunking      1

Port      Vlans allowed on trunk
--------  ---------------------------------------------------------------------
 2/9      1-1005, 1025-4094

Port      Vlans allowed and active in management domain
--------  ---------------------------------------------------------------------
 2/9      1,5,10-32,101-120,150,200,250,300,400,500,600,700,800,900,1000

Port      Vlans in spanning tree forwarding state and not pruned
--------  ---------------------------------------------------------------------
 2/9      5,10-32,101-120,150,200,250,300,400,500,600,700,800,900,1000
Console> (enable)
```

Configuring an ISL/802.1Q Negotiating Trunk Port

To configure a trunk port to negotiate the trunk encapsulation type (either ISL or 802.1Q), perform this task in privileged mode:

	Task	Command
Step 1	Configure a port to negotiate the trunk encapsulation type.	**set trunk** *mod/port* [**on** | **desirable** | **auto** | **nonegotiate**] **negotiate**
Step 2	Verify the trunking configuration.	**show trunk** [*mod/port*]

This example shows how to configure a port to negotiate the encapsulation type and how to verify the trunk configuration. This example assumes that the neighboring port is in **auto** mode with encapsulation set to **isl** or **negotiate**.

```
Console> (enable) set trunk 4/11 desirable negotiate
Port(s) 4/11 trunk mode set to desirable.
Port(s) 4/11 trunk type set to negotiate.
```

Console> (enable)
```

Defining the Allowed VLANs on a Trunk

When you configure a trunk port, all VLANs are added to the allowed VLANs list for that trunk. However, you can remove VLANs from the allowed list to prevent traffic for those VLANs from passing over the trunk.

Note When you first configure a port as a trunk, entering the **set trunk** command always adds all VLANs to the allowed VLAN list for the trunk, even if you specify a VLAN range (any specified VLAN range is ignored). To modify the allowed VLANs list, use a combination of the **clear trunk** and **set trunk** commands to specify the allowed VLANs.

To define the allowed VLAN list for a trunk port, perform this task in privileged mode:

	Task	Command
Step 1	Remove VLANs from the allowed VLANs list for a trunk.	**clear trunk** *mod/port vlans*
Step 2	(Optional) Add specific VLANs to the allowed VLANs list for a trunk.	**set trunk** *mod/port vlans*
Step 3	Verify the allowed VLAN list for the trunk.	**show trunk** [*mod/port*]

This example shows how to define the allowed VLANs list to allow VLANs 1–100, VLANs 500–1005, and VLAN 2500 on trunk port 1/1 and how to verify the allowed VLAN list for the trunk:

```
Console> (enable) clear trunk 1/1 101-499
Removing Vlan(s) 101-499 from allowed list.
Port 1/1 allowed vlans modified to 1-100,500-1005.
Console> (enable) set trunk 1/1 2500
Adding vlans 2500 to allowed list.
Port(s) 1/1 allowed vlans modified to 1-100,500-1005,2500.
Console> (enable) show trunk 1/1
Port      Mode         Encapsulation  Status        Native vlan
--------  -----------  -------------  ------------  -----------
 1/1      desirable    isl            trunking      1
Port      Vlans allowed on trunk
--------  ---------------------------------------------------------------------
 1/1      1-100, 500-1005,2500
```

```
Port      Vlans allowed and active in management domain
--------  ---------------------------------------------------------------
 1/1      1,521-524
Port      Vlans in spanning tree forwarding state and not pruned
--------  ---------------------------------------------------------------
 1/1      1,521-524
Console> (enable)
```

3243
21

Disabling a Trunk Port

To turn off trunking on a port, perform this task in privileged mode:

	Task	Command
Step 1	Turn off trunking on a port.	**set trunk** *mod/port* **off**
Step 2	Verify the trunking configuration.	**show trunk** [*mod/port*]

To return a port to the default trunk type and mode for that port type, perform this task in privileged mode:

	Task	Command
Step 1	Return the port to the default trunking type and mode for that port type.	**clear trunk** *mod/port*
Step 2	Verify the trunking configuration.	**show trunk** [*mod/port*]

Example VLAN Trunk Configurations

This section contains example VLAN trunk configurations:

- ISL Trunk Configuration Example, page 5-9
- ISL Trunk Over EtherChannel Link Example, page 5-11
- 802.1Q Trunk Over EtherChannel Link Example, page 5-13
- Load-Sharing VLAN Traffic Over Parallel Trunks Example, page 5-17

ISL Trunk Configuration Example

This example shows how to configure an ISL trunk between two switches and how to limit the allowed VLANs on the trunk to VLAN 1 and VLANs 520–530.

In this example, port 1/1 on Switch 1 is connected to a Fast Ethernet port on another switch. Both ports are in their default state, with the trunk mode set to **auto** (for more information, see the "Default Trunk Configuration" section on page 5-5).

Doc:

Step 1 Configure port 1/1 on Switch 1 as an ISL trunk port by entering the **set trunk** command. By specifying the **desirable** keyword, the trunk is automatically negotiated with the neighboring port (port 1/2 on Switch 2). ISL encapsulation is assumed based on the hardware type.

```
Switch1> (enable) set trunk 1/1 desirable
Port(s) 1/1 trunk mode set to desirable.
Switch1> (enable) 06/18/1998,12:20:23:DTP-5:Port 1/1 has become isl trunk
06/18/1998,12:20:23:PAGP-5:Port 1/1 left bridge port 1/1.
06/18/1998,12:20:23:PAGP-5:Port 1/1 joined bridge port 1/1.
Switch1> (enable)
```

Step 2 Check the configuration by entering the **show trunk** command. The Status field in the screen output indicates that port 1/1 is trunking.

```
Switch1> (enable) show trunk 1/1
Port      Mode         Encapsulation  Status        Native vlan
--------  -----------  -------------  ------------  -----------
 1/1      desirable    isl            trunking      1
Port      Vlans allowed on trunk
--------  ---------------------------------------------------------------------
 1/1      1-1005, 1025-4094
Port      Vlans allowed and active in management domain
--------  ---------------------------------------------------------------------
 1/1      1,521-524
Port      Vlans in spanning tree forwarding state and not pruned
--------  ---------------------------------------------------------------------
 1/1
Switch1> (enable)
```

Step 3 Define the allowed VLAN list for the trunk by entering the **clear trunk** command to remove the VLANs that should not pass traffic over the trunk link.

```
Switch1> (enable) clear trunk 1/1 2-519
Removing Vlan(s) 2-519 from allowed list.
Port 1/1 allowed vlans modified to 1,520-1005.
Switch1> (enable) clear trunk 1/1 531-1005
Removing Vlan(s) 531-1005 from allowed list.
Port 1/1 allowed vlans modified to 1,520-530.
Switch1> (enable) show trunk 1/1
Port      Mode         Encapsulation  Status        Native vlan
--------  -----------  -------------  ------------  -----------
 1/1      desirable    isl            trunking      1
Port      Vlans allowed on trunk
--------  ---------------------------------------------------------------------
 1/1      1,520-530
Port      Vlans allowed and active in management domain
--------  ---------------------------------------------------------------------
 1/1      1,521-524
Port      Vlans in spanning tree forwarding state and not pruned
--------  ---------------------------------------------------------------------
 1/1      1,521-524
Switch1> (enable)
```

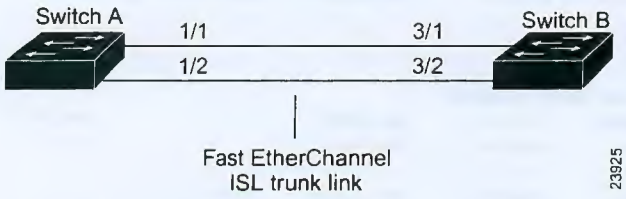
Step 4 Verify connectivity across the trunk by entering the **ping** command.

```
Switch1> (enable) ping switch2
switch2 is alive
Switch1> (enable)
```

ISL Trunk Over EtherChannel Link Example

This example shows how to configure an ISL trunk over an EtherChannel link between two switches. Figure 5-1 shows two switches connected through two 100BASE-TX Fast Ethernet ports.

Figure 5-1 ISL Trunk Over Fast EtherChannel Link



This example shows how to configure the switches to form a two-port EtherChannel bundle and then configure the EtherChannel bundle as an ISL trunk link.

Step 1 Confirm the channeling and trunking status of the switches by entering the **show port channel** and **show trunk** commands.

```
Switch_A> (enable) show port channel
No ports channelling
Switch_A> (enable) show trunk
No ports trunking.
Switch_A> (enable)

Switch_B> (enable) show port channel
No ports channelling
Switch_B> (enable) show trunk
No ports trunking.
Switch_B> (enable)
```

Step 2 Configure the ports on Switch A to negotiate an EtherChannel bundle with the neighboring switch by entering the **set port channel** command. This example assumes that the neighboring ports on Switch B are in EtherChannel **auto** mode. The system logging messages provide information about the formation of the EtherChannel bundle.

```
Switch_A> (enable) set port channel 1/1-2 desirable
Port(s) 1/1-2 channel mode set to desirable.
Switch_A> (enable) %PAGP-5-PORTFROMSTP:Port 1/1 left bridge port 1/1
%PAGP-5-PORTFROMSTP:Port 1/2 left bridge port 1/2
%PAGP-5-PORTFROMSTP:Port 1/2 left bridge port 1/2
%PAGP-5-PORTTOSTP:Port 1/1 joined bridge port 1/1-2
%PAGP-5-PORTTOSTP:Port 1/2 joined bridge port 1/1-2

Switch_B> (enable) %PAGP-5-PORTFROMSTP:Port 3/1 left bridge port 3/1
%PAGP-5-PORTFROMSTP:Port 3/2 left bridge port 3/2
%PAGP-5-PORTFROMSTP:Port 3/2 left bridge port 3/2
%PAGP-5-PORTTOSTP:Port 3/1 joined bridge port 3/1-2
%PAGP-5-PORTTOSTP:Port 3/2 joined bridge port 3/1-2
```

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0797
Fls:
Doc: 3701

Step 3 After the EtherChannel bundle is negotiated, verify the configuration by entering the **show port channel** command.

```
Switch_A> (enable) show port channel
Port  Status      Channel    Channel     Neighbor                  Neighbor
                  mode       status      device                    port
----- ----------- ---------- ----------- ------------------------- ----------
 1/1  connected   desirable  channel     WS-C5000     009979082(Sw  3/1
 1/2  connected   desirable  channel     WS-C5000     009979082(Sw  3/2
----- ----------- ---------- ----------- ------------------------- ----------
Switch_A> (enable)

Switch_B> (enable) show port channel
Port  Status      Channel    Channel     Neighbor                  Neighbor
                  mode       status      device                    port
----- ----------- ---------- ----------- ------------------------- ----------
 3/1  connected   auto       channel     WS-C5500     069003103(Sw  1/1
 3/2  connected   auto       channel     WS-C5500     069003103(Sw  1/2
----- ----------- ---------- ----------- ------------------------- ----------
Switch_B> (enable)
```

Step 4 Configure one of the ports in the EtherChannel bundle to negotiate an ISL trunk by entering the **set trunk** command.

The configuration is applied to all of the ports in the bundle. This example assumes that the neighboring ports on Switch B are configured to use **isl** or **negotiate** encapsulation and are in **auto** trunk mode. The system logging messages provide information about the formation of the ISL trunk.

```
Switch_A> (enable) set trunk 1/1 desirable isl
Port(s) 1/1-2 trunk mode set to desirable.
Port(s) 1/1-2 trunk type set to isl.
Switch_A> (enable) %DTP-5-TRUNKPORTON:Port 1/1 has become isl trunk
%DTP-5-TRUNKPORTON:Port 1/2 has become isl trunk
%PAGP-5-PORTFROMSTP:Port 1/1 left bridge port 1/1-2
%PAGP-5-PORTFROMSTP:Port 1/2 left bridge port 1/1-2
%PAGP-5-PORTTOSTP:Port 1/1 joined bridge port 1/1-2
%PAGP-5-PORTTOSTP:Port 1/2 joined bridge port 1/1-2

Switch_B> (enable) %DTP-5-TRUNKPORTON:Port 3/1 has become isl trunk
%DTP-5-TRUNKPORTON:Port 3/2 has become isl trunk
%PAGP-5-PORTFROMSTP:Port 3/1 left bridge port 3/1-2
%PAGP-5-PORTFROMSTP:Port 3/2 left bridge port 3/1-2
%PAGP-5-PORTTOSTP:Port 3/1 joined bridge port 3/1-2
%PAGP-5-PORTTOSTP:Port 3/2 joined bridge port 3/1-2
```

Step 5 After the ISL trunk link is negotiated, verify the configuration by entering the **show trunk** command.

```
Switch_A> (enable) show trunk
Port      Mode         Encapsulation  Status        Native vlan
--------  -----------  -------------  ------------  -----------
 1/1      desirable    isl            trunking      1
 1/2      desirable    isl            trunking      1

Port      Vlans allowed on trunk
--------  ---------------------------------------------------------------------
 1/1      1-1005, 1025-4094
 1/2      1-1005, 1025-4094

Port      Vlans allowed and active in management domain
--------  ---------------------------------------------------------------------
 1/1      1-5,10,20,50,152,200,300,400,500,521-524,570,850,917,999
 1/2      1-5,10,20,50,152,200,300,400,500,521-524,570,850,917,999
```

```
Port      Vlans in spanning tree forwarding state and not pruned
--------  ---------------------------------------------------------------
 1/1      1-5,10,20,50,152,200,300,400,500,521-524,570,850,917,999
 1/2      1-5,10,20,50,152,200,300,400,500,521-524,570,850,917,999
Switch_A> (enable)

Switch_B> (enable) show trunk
Port      Mode         Encapsulation  Status        Native vlan
--------  -----------  -------------  ------------  -----------
 3/1      auto         isl            trunking      1
 3/2      auto         isl            trunking      1

Port      Vlans allowed on trunk
--------  ---------------------------------------------------------------

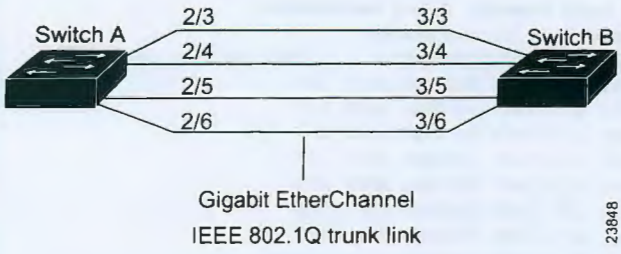
802.1Q Trunk Over EtherChannel Link Example

This example shows how to configure an 802.1Q trunk over an EtherChannel link between two switches. Figure 5-2 shows two switches connected through four 1000BASE-SX Gigabit Ethernet ports.

Figure 5-2 802.1Q Trunk Over EtherChannel Link



This example shows how to configure the switches to form a four-port EtherChannel bundle and then configure the EtherChannel bundle as an 802.1Q trunk link.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0798
Doc: 3701

Step 1 Make sure all ports on both Switch A and Switch B are assigned to the same VLAN by entering the **set vlan** command. This VLAN is used as the 802.1Q native VLAN for the trunk. In this example, all ports are configured as members of VLAN 1.

```
Switch_A> (enable) set vlan 1 2/3-6
VLAN  Mod/Ports
---- ----------------------
1     2/1-6

Switch_A> (enable)

Switch_B> (enable) set vlan 1 3/3-6
VLAN  Mod/Ports
---- ----------------------
1     3/1-6

Switch_B> (enable)
```

Step 2 Confirm the channeling and trunking status of the switches by entering the **show port channel** and **show trunk** commands.

```
Switch_A> (enable) show port channel
No ports channelling
Switch_A> (enable) show trunk
No ports trunking.
Switch_A> (enable)

Switch_B> (enable) show port channel
No ports channelling
Switch_B> (enable) show trunk
No ports trunking.
Switch_B> (enable)
```

Step 3 Configure the ports on Switch A to negotiate an EtherChannel bundle with the neighboring switch by entering the **set port channel** command. This example assumes that the neighboring ports on Switch B are in EtherChannel **auto** mode. The system logging messages provide information about the formation of the EtherChannel bundle.

```
Switch_A> (enable) set port channel 2/3-6 desirable
Port(s) 2/3-6 channel mode set to desirable.
Switch_A> (enable) %PAGP-5-PORTFROMSTP:Port 2/3 left bridge port 2/3
%PAGP-5-PORTFROMSTP:Port 2/4 left bridge port 2/4
%PAGP-5-PORTFROMSTP:Port 2/5 left bridge port 2/5
%PAGP-5-PORTFROMSTP:Port 2/6 left bridge port 2/6
%PAGP-5-PORTFROMSTP:Port 2/4 left bridge port 2/4
%PAGP-5-PORTFROMSTP:Port 2/5 left bridge port 2/5
%PAGP-5-PORTFROMSTP:Port 2/6 left bridge port 2/6
%PAGP-5-PORTFROMSTP:Port 2/3 left bridge port 2/3
%PAGP-5-PORTTOSTP:Port 2/3 joined bridge port 2/3-6
%PAGP-5-PORTTOSTP:Port 2/4 joined bridge port 2/3-6
%PAGP-5-PORTTOSTP:Port 2/5 joined bridge port 2/3-6
%PAGP-5-PORTTOSTP:Port 2/6 joined bridge port 2/3-6

Switch_B> (enable) %PAGP-5-PORTFROMSTP:Port 3/3 left bridge port 3/3
%PAGP-5-PORTFROMSTP:Port 3/4 left bridge port 3/4
%PAGP-5-PORTFROMSTP:Port 3/5 left bridge port 3/5
%PAGP-5-PORTFROMSTP:Port 3/6 left bridge port 3/6
%PAGP-5-PORTFROMSTP:Port 3/4 left bridge port 3/4
%PAGP-5-PORTFROMSTP:Port 3/5 left bridge port 3/5
%PAGP-5-PORTFROMSTP:Port 3/6 left bridge port 3/6
```

```
%PAGP-5-PORTFROMSTP:Port 3/3 left bridge port 3/3
%PAGP-5-PORTTOSTP:Port 3/3 joined bridge port 3/3-6
%PAGP-5-PORTTOSTP:Port 3/4 joined bridge port 3/3-6
%PAGP-5-PORTTOSTP:Port 3/5 joined bridge port 3/3-6
%PAGP-5-PORTTOSTP:Port 3/6 joined bridge port 3/3-6
```

Step 4 After the EtherChannel bundle is negotiated, verify the configuration by entering the **show port channel** command.

```
Switch_A> (enable) show port channel
Port  Status      Channel    Channel     Neighbor                  Neighbor
                  mode       status      device                    port
----- ----------- ---------- ----------- ------------------------- ----------
 2/3  connected   desirable  channel     WS-C4003    JAB023806(Sw  2/3
 2/4  connected   desirable  channel     WS-C4003    JAB023806(Sw  2/4
 2/5  connected   desirable  channel     WS-C4003    JAB023806(Sw  2/5
 2/6  connected   desirable  channel     WS-C4003    JAB023806(Sw  2/6
----- ----------- ---------- ----------- ------------------------- ----------
Switch_A> (enable)

Switch_B> (enable) show port channel
Port  Status      Channel    Channel     Neighbor                  Neighbor
                  mode       status      device                    port
----- ----------- ---------- ----------- ------------------------- ----------
 3/3  connected   auto       channel     WS-C4003    JAB023806(Sw  2/3
 3/4  connected   auto       channel     WS-C4003    JAB023806(Sw  2/4
 3/5  connected   auto       channel     WS-C4003    JAB023806(Sw  2/5
 3/6  connected   auto       channel     WS-C4003    JAB023806(Sw  2/6
----- ----------- ---------- ----------- ------------------------- ----------
Switch_B> (enable)
```

Step 5 Configure one of the ports in the EtherChannel bundle to negotiate an 802.1Q trunk by entering the **set trunk** command. The configuration is applied to all of the ports in the bundle. This example assumes that the neighboring ports on Switch B are configured to use **dot1q** or **negotiate** encapsulation and are in **auto** trunk mode. The system logging messages provide information about the formation of the 802.1Q trunk.

```
Switch_A> (enable) set trunk 2/3 desirable dot1q
Port(s) 2/3-6 trunk mode set to desirable.
Port(s) 2/3-6 trunk type set to dot1q.
Switch_A> (enable) %DTP-5-TRUNKPORTON:Port 2/3 has become dot1q trunk
%DTP-5-TRUNKPORTON:Port 2/4 has become dot1q trunk
%PAGP-5-PORTFROMSTP:Port 2/3 left bridge port 2/3-6
%DTP-5-TRUNKPORTON:Port 2/5 has become dot1q trunk
%PAGP-5-PORTFROMSTP:Port 2/4 left bridge port 2/3-6
%PAGP-5-PORTFROMSTP:Port 2/5 left bridge port 2/3-6
%DTP-5-TRUNKPORTON:Port 2/6 has become dot1q trunk

```

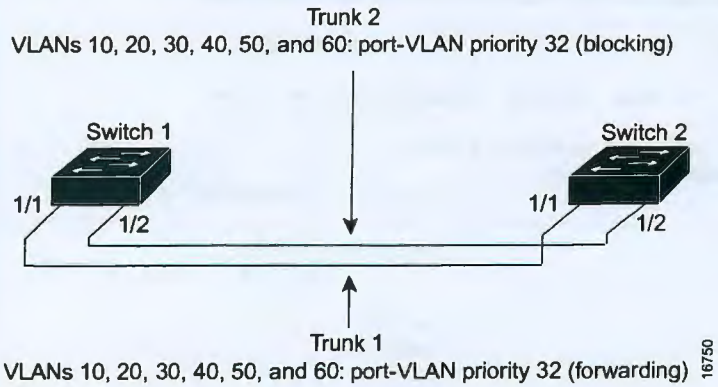
Load-Sharing VLAN Traffic Over Parallel Trunks Example

Using spanning tree port-VLAN priorities, you can load-share VLAN traffic over parallel trunk ports so that traffic from some VLANs travels over one trunk, while traffic from other VLANs travels over the other trunk. This configuration allows traffic to be carried over both trunks simultaneously (instead of keeping one trunk in blocking mode), which reduces the total traffic carried over each trunk while still maintaining a fault-tolerant configuration.

Figure 5-3 shows a parallel trunk configuration between two switches, using the Fast Ethernet uplink ports on the supervisor engine.

Figure 5-3 Parallel Trunk Configuration Before Configuring VLAN-Traffic Load Sharing



By default, the port-VLAN priority for both trunks is equal (a value of 32). STP blocks port 1/2 (Trunk 2) for each VLAN on Switch 1 to prevent forwarding loops. Trunk 2 is not used to forward traffic unless Trunk 1 fails.

This example shows how to configure the switches so that traffic from multiple VLANs is load balanced over the parallel trunks.

Step 1 Configure a VTP domain on both Switch 1 and Switch 2 by entering the **set vtp** command so that the VLAN information configured on Switch 1 is learned by Switch 2. Make sure Switch 1 is a VTP server. You can configure Switch 2 as a VTP client or as a VTP server.

```
Switch_1> (enable) set vtp domain BigCorp mode server
VTP domain BigCorp modified
Switch_1> (enable)

Switch_2> (enable) set vtp domain BigCorp mode server
VTP domain BigCorp modified
Switch_2> (enable)
```

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0800
Fls:
Doc: 3701

Step 2 Create the VLANs on Switch 1 by entering the **set vlan** command. In this example, you see VLANs 10, 20, 30, 40, 50, and 60.

```
Switch_1> (enable) set vlan 10
Vlan 10 configuration successful
Switch_1> (enable) set vlan 20
Vlan 20 configuration successful
Switch_1> (enable) set vlan 30
Vlan 30 configuration successful
Switch_1> (enable) set vlan 40
Vlan 40 configuration successful
Switch_1> (enable) set vlan 50
Vlan 50 configuration successful
Switch_1> (enable) set vlan 60
Vlan 60 configuration successful
Switch_1> (enable)
```

Step 3 Verify the VTP and VLAN configuration on Switch 1 by entering the **show vtp domain** and **show vlan** commands.

```
Switch_1> (enable) show vtp domain
Domain Name                    Domain Index VTP Version Local Mode  Password
------------------------------ ------------ ----------- ----------- ----------
BigCorp                        1            2           server      -

Vlan-count Max-vlan-storage Config Revision Notifications
---------- --------------- --------------- -------------
11         1023            13              disabled

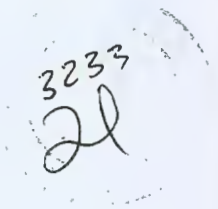
Last Updater    V2 Mode  Pruning  PruneEligible on Vlans
--------------- -------- -------- -------------------------
172.20.52.10    disabled enabled  2-1000
Switch_1> (enable) show vlan
VLAN Name                           Status    Mod/Ports, Vlans
---- ------------------------------ --------- ---------------------------
1    default                        active    1/1-2
                                              2/1-12
                                              5/1-2
10   VLAN0010                       active
20   VLAN0020                       active
30   VLAN0030                       active
40   VLAN0040                       active
50   VLAN0050                       active
60   VLAN0060                       active
1002 fddi-default                   active
1003 token-ring-default             active
1004 fddinet-default                active
1005 trnet-default                  active
.
.
.

Switch_1> (enable)
```

Step 4 Configure the supervisor engine uplinks on Switch 1 as ISL trunk ports by entering the **set trunk** command. Specifying the **desirable** mode on the Switch 1 ports causes the ports on Switch 2 to negotiate to become trunk links (assuming that the Switch 2 uplinks are in the default **auto** mode).

```
Switch_1> (enable) set trunk 1/1 desirable
Port(s) 1/1 trunk mode set to desirable.
Switch_1> (enable) 04/21/1998,03:05:05:DISL-5:Port 1/1 has become isl trunk
```

```
Switch_1> (enable) set trunk 1/2 desirable
Port(s) 1/2 trunk mode set to desirable.
Switch_1> (enable) 04/21/1998,03:05:13:DISL-5:Port 1/2 has become isl trunk
```



Step 5 Verify that the trunk links are up by entering the **show trunk** command.

```
Switch_1> (enable) show trunk 1
Port      Mode         Encapsulation  Status        Native vlan
--------  -----------  -------------  ------------  -----------
 1/1      desirable    isl            trunking      1
 1/2      desirable    isl            trunking      1

Port      Vlans allowed on trunk
--------  ---------------------------------------------------------------------
 1/1      1-1005, 1025-4094
 1/2      1-1005, 1025-4094

Port      Vlans allowed and active in management domain
--------  ---------------------------------------------------------------------
 1/1      1,10,20,30,40,50,60
 1/2      1,10,20,30,40,50,60

Port      Vlans in spanning tree forwarding state and not pruned
--------  ---------------------------------------------------------------------
 1/1
 1/2
Switch_1> (enable)
```

Step 6 Note that when the trunk links come up, VTP passes the VTP and VLAN configuration to Switch 2. Verify that Switch 2 has learned the VLAN configuration by entering the **show vlan** command on Switch 2.

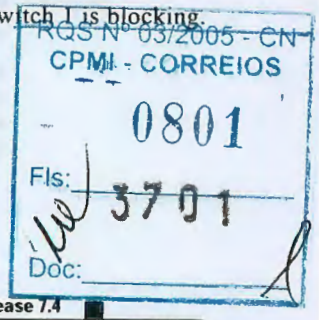
```
Switch_2> (enable) show vlan
VLAN Name                             Status    Mod/Ports, Vlans
---- -------------------------------- --------- -------------------------
1    default                          active
10   VLAN0010                         active
20   VLAN0020                         active
30   VLAN0030                         active
40   VLAN0040                         active
50   VLAN0050                         active
60   VLAN0060                         active
1002 fddi-default                     active
1003 token-ring-default               active
1004 fddinet-default                  active
1005 trnet-default                    active

<...output truncated...>

Switch_2> (enable)
```

Step 7 Note that spanning tree takes one to two minutes to converge. After the network stabilizes, check the spanning tree state of each trunk port on Switch 1 by entering the **show spantree** command.

Trunk 1 is forwarding for all VLANs. Trunk 2 is blocking for all VLANs. On Switch 2, both trunks are forwarding for all VLANs, but no traffic passes over Trunk 2 because port 1/2 on Switch 1 is blocking.



```
Switch_1> (enable) show spantree 1/1
Port      Vlan  Port-State     Cost   Priority  Fast-Start  Group-method
--------- ----  -------------  -----  --------  ----------  ------------

 1/2      30    blocking          19        32   disabled
 1/2      40    blocking          19        32   disabled
 1/2      50    blocking          19        32   disabled
 1/2      60    blocking          19        32   disabled
 1/2      1003  not-connected     19        32   disabled
 1/2      1005  not-connected     19         4   disabled
Switch_1> (enable)
```

Step 8 Divide the configured VLANs into two groups. You might want traffic from half of the VLANs to go over one trunk link and half over the other, or if one VLAN has heavier traffic than the others, you can forward traffic from that VLAN over one trunk and traffic from the other VLANs over the other trunk link.

Note In the following steps, VLANs 10, 20, and 30 (Group 1) are forwarded over Trunk 1, and VLANs 40, 50, and 60 (Group 2) are forwarded over Trunk 2.

Step 9 On Switch 1, change the port-VLAN priority for the Group 1 VLANs on Trunk 1 (port 1/1) to an integer value lower than the default of 32 by entering the **set spantree portvlanpri** command.

```
Switch_1> (enable) set spantree portvlanpri 1/1 1 10
Port 1/1 vlans 1-9,11-1004 using portpri 32.
Port 1/1 vlans 10 using portpri 1.
Port 1/1 vlans 1005 using portpri 4.
Switch_1> (enable) set spantree portvlanpri 1/1 1 20
Port 1/1 vlans 1-9,11-19,21-1004 using portpri 32.
Port 1/1 vlans 10,20 using portpri 1.
Port 1/1 vlans 1005 using portpri 4.
Switch_1> (enable) set spantree portvlanpri 1/1 1 30
Port 1/1 vlans 1-9,11-19,21-29,31-1004 using portpri 32.
Port 1/1 vlans 10,20,30 using portpri 1.
Port 1/1 vlans 1005 using portpri 4.
Switch_1> (enable)
```

Step 10 On Switch 1, change the port-VLAN priority for the Group 2 VLANs on Trunk 2 (port 1/2) to an integer value lower than the default of 32 by entering the **set spantree portvlanpri** command.

```
Switch_1> (enable) set spantree portvlanpri 1/2 1 40
Port 1/2 vlans 1-39,41-1004 using portpri 32.
Port 1/2 vlans 40 using portpri 1.
Port 1/2 vlans 1005 using portpri 4.
```

```
Switch_1> (enable) set spantree portvlanpri 1/2 1 50
Port 1/2 vlans 1-39,41-49,51-1004 using portpri 32.
Port 1/2 vlans 40,50 using portpri 1.
Port 1/2 vlans 1005 using portpri 4.
Switch_1> (enable) set spantree portvlanpri 1/2 1 60
Port 1/2 vlans 1-39,41-49,51-59,61-1004 using portpri 32.
Port 1/2 vlans 40,50,60 using portpri 1.
Port 1/2 vlans 1005 using portpri 4.
Switch_1> (enable)
```

Step 11 On Switch 2, change the port-VLAN priority for the Group 1 VLANs on Trunk 1 (port 1/1) to the same value you configured for those VLANs on Switch 1 by entering the **set spantree portvlanpri** command.

Caution The port-VLAN priority for each VLAN must be equal on both ends of the link.

```
Switch_2> (enable) set spantree portvlanpri 1/1 1 10
Port 1/1 vlans 1-9,11-1004 using portpri 32.
Port 1/1 vlans 10 using portpri 1.
Port 1/1 vlans 1005 using portpri 4.
Switch_2> (enable) set spantree portvlanpri 1/1 1 20
Port 1/1 vlans 1-9,11-19,21-1004 using portpri 32.
Port 1/1 vlans 10,20 using portpri 1.
Port 1/1 vlans 1005 using portpri 4.
Switch_2> (enable) set spantree portvlanpri 1/1 1 30
Port 1/1 vlans 1-9,11-19,21-29,31-1004 using portpri 32.
Port 1/1 vlans 10,20,30 using portpri 1.
Port 1/1 vlans 1005 using portpri 4.
Switch_2> (enable)
```

Step 12 On Switch 2, change the port-VLAN priority for the Group 2 VLANs on Trunk 2 (port 1/2) to the same value you configured for those VLANs on Switch 1 by entering the **set spantree portvlanpri** command.

```
Switch_2> (enable) set spantree portvlanpri 1/2 1 40
Port 1/2 vlans 1-39,41-1004 using portpri 32.
Port 1/2 vlans 40 using portpri 1.
Port 1/2 vlans 1005 using portpri 4.
Switch_2> (enable) set spantree portvlanpri 1/2 1 50
Port 1/2 vlans 1-39,41-49,51-1004 using portpri 32.
Port 1/2 vlans 40,50 using portpri 1.
Port 1/2 vlans 1005 using portpri 4.
Switch_2> (enable) set spantree portvlanpri 1/2 1 60
Port 1/2 vlans 1-39,41-49,51-59,61-1004 using portpri 32.
Port 1/2 vlans 40,50,60 using portpri 1.
Port 1/2 vlans 1005 using portpri 4.
Switch_2> (enable)
```

Note When you have configured the port-VLAN priorities on both ends of the link, the spanning tree converges to use the new configuration.

Step 13 Check the spanning tree port states on Switch 1 by entering the **show spantree** command. The Group 1 VLANs should forward on Trunk 1 and block on Trunk 2. The Group 2 VLANs should block on Trunk 1 and forward on Trunk 2.

Figure 5-4 shows the network after you configure VLAN traffic load sharing.

Figure 5-4 Parallel Trunk Configuration After Configuring VLAN-Traffic Load Sharing

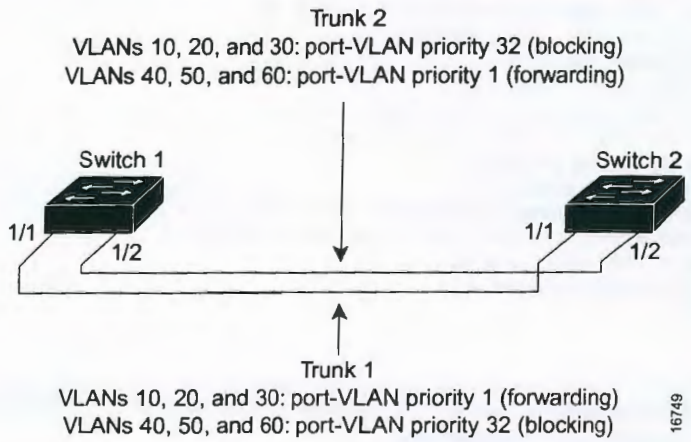

Figure 5-4 shows that both trunks are utilized when the network is operating normally; if one trunk link fails, the other trunk link acts as an alternate forwarding path for the traffic previously traveling over the failed link.

If Trunk 1 fails in the network shown in Figure 5-4, STP reconverges to use Trunk 2 to forward traffic from all the VLANs, as shown in this example:

```
Switch_1> (enable) 04/21/1998,03:15:40:DISL-5:Port 1/1 has become non-trunk

 1/2      1005  not-connected     19         4   disabled
Switch_1> (enable)
```

Disabling VLAN 1 on Trunks

On the Catalyst 6500 series switches, VLAN 1 is enabled by default to allow control protocols to transmit and receive packets across the network topology. However, when VLAN 1 is enabled on trunk links in a large complex network, the impact of broadcast storms increases. Because spanning tree applies to the entire network, spanning tree loops might increase when you enable VLAN 1 on all trunk links. To prevent this scenario, you can disable VLAN 1 on trunk interfaces.

When you disable VLAN 1 on a trunk interface, no user traffic is transmitted and received across that trunk interface, but the supervisor engine continues to transmit and receive packets from control protocols such as Cisco Discovery Protocol (CDP), VTP, Port Aggregation Protocol (PAgP), and DTP.

When a trunk port with VLAN 1 disabled becomes a nontrunk port, it is added to the native VLAN. If the native VLAN is VLAN 1, the port is enabled and added to VLAN 1.

Disabling VLAN 1 on a Trunk Link

To disable VLAN 1 on a trunk interface, perform this task in privileged mode:

	Task	Command
Step 1	Disable VLAN 1 on the trunk interface.	**clear trunk** *mod/port* [*vlan-range*]
Step 2	Verify the allowed VLAN list for the trunk.	**show trunk** [*mod/port*]

This example shows how to disable VLAN 1 on a trunk link and verify the configuration:

```
Console> (enable) clear trunk 8/1 1
Removing Vlan(s) 1 from allowed list.
Port  8/1 allowed vlans modified to 2-1005.
Console> (enable) show trunk 8/1
Port      Mode         Encapsulation  Status        Native vlan
--------  -----------  -------------  ------------  -----------
 8/1      on           isl            trunking      1

Port      Vlans allowed on trunk
--------  ---------------------------------------------------------------------
 8/1      2-1005, 1025-4094

Port      Vlans allowed and active in management domain
--------  ---------------------------------------------------------------------
 8/1      2-6,10,20,50,100,152,200,300,400,500,521,524,570,776,801-802,850,917,9
99,1003,1005

Port      Vlans in spanning tree forwarding state and not pruned
--------  ---------------------------------------------------------------------
 8/1      2-6,10,20,50,100,152,200,300,400,500,521,524,570,776,802,850,917,999,1
003,1005
Console> (enable) show config
```

Cisco Systems

Data Sheet

Cisco Catalyst 6500 Series **Gigabit** Ethernet Modules

The Cisco Catalyst® 6500 Series Switch—the premier modular multilayer switch—delivers secure converged services from the wiring closet to the core, to the data center, to the WAN edge.

Designed to complement the many roles that the Cisco Catalyst 6500 Series plays in a network, Cisco Catalyst 6500 Series Gigabit Ethernet modules offer the broadest selection of media, densities, performance, interoperability, and chassis deployments for enterprises and service providers. *These modules are ideal for* gigabit to the desktop, gigabit uplinks, aggregation of high-density 10/100 interfaces, Metro Ethernet links; and backbone and high-speed server farm or data center connections. The Cisco Catalyst 6500 Series Gigabit Ethernet modules offer the following features:

- Flexible configurations for any deployment—Provide flexible port densities, media choices, and performance speeds for any deployment requirement
- Choice of media and connector type—Available in multimode fiber or single-mode fiber using MT-RJ and modular GBIC and SFP optics supporting station-to-station distances up to 100 km

Note: For information about 10/100/1000 copper interface modules with auto-negotiation, see the Cisco Catalyst 6500 Series 10/100 and 10/100/1000 Ethernet Data Sheet

- High port densities—From 8 up to 16 ports per module, up to 256 ports per system
- Scalable and predictable performance—Provide a selection of switch fabric connections and throughput: 32 Gbps bandwidth/15 Mpps (Classic interface modules), 256 Gbps bandwidth/30 Mpps (CEF256 interface modules), and 256 Gbps bandwidth/210 Mpps (dCEF256 interface modules)
- Operational consistency—Supported in all Catalyst 6500 3-, 6-, 9-, and 13-slot chassis running Cisco IOS® Software and Cisco Catalyst Operating System Software; interoperable with all other interfaces and services modules; and forward-compatible with all Catalyst 6500 supervisor engines
- Maximum network uptime and resiliency—Support Cisco enhanced Per-Virtual LAN (VLAN) Spanning Tree Plus (PVST+) protocol, IEEE 802.1w Rapid Spanning Tree Protocol (RSTP) and IEEE 802.1s Multiple Spanning Tree (MST) protocol, Per-VLAN Rapid Spanning Tree (PVRST) protocol, Hot Standby Router Protocol (HSRP), Virtual Router Redundancy Protocol (VRRP), Cisco EtherChannel®, and IEEE 802.3ad link aggregation for fault-tolerant connectivity

- Superior traffic management—Available with large per-interface buffers and multiple-priority queues for traffic prioritization and policing, allowing for tight service-level agreement (SLA) enforcement
- Extensive management tools—Support CiscoWorks network management platform, Simple Network Management Protocol (SNMP) versions 1, 2, and 3 and four RMON groups (statistics, history, alarms, and events)

Gigabit Ethernet Applications

Gigabit Ethernet interface modules are used in distribution and core layers, and in data-center applications (Table 1).

Table 1 Cisco Catalyst 6500 Series Gigabit Interface Module Applications

Primary Applications	Product Number	Interface Module Class	Ports/ Connector/ Interface	Queues per Port (Tx = Transmit, Rx = Receive)[1]	Buffer Size
Data center and server farm	WS-X6816-GBIC	dCEF256	16, GBIC	Tx–1p2q2t Rx–1p1q4t	512 KB per port
Data center and server farm	WS-X6516A-GBIC	CEF256	16, GBIC	Tx–1p2q2t Rx–1p1q4t	1 MB per port
Base server farm	WS-X6408A-GBIC	Classic	8, GBIC	Tx–1p2q2t Rx–1p1q4t	512 KB per port
Base server farm	WS-X6316-GE-TX	Classic	16, RJ-45, 1000	Tx–1p2q2t Rx–1p1q4t	512 KB per port
Base server farm	WS-X6516-GBIC[1]	CEF256	16, GBIC	Tx–1p2q2t Rx–1p1q4t	512 KB per port
Base server farm	WS-X6416-GBIC	Classic	16, GBIC	Tx–1p2q2t Rx–1p1q4t	512 KB per port
Base server farm	WS-X6416-GE-MT	Classic	16, MT-RJ, MM	Tx–1p2q2t Rx–1p1q4t	512 KB per port

1. **Queues Legend:** 1p2q2t = 1 priority queue, 2 round robin queues, 2 thresholds

Gigabit Ethernet Interface Modules

The Cisco Catalyst 6500 Classic, CEF256, and dCEF26 interface modules provide Gigabit Ethernet with a choice of speeds and forwarding rates.

Classic Interface Modules

Suited for wiring closet applications, Classic interface modules use the supervisor engine for centralized Layer 2 and Layer 3 forwarding, and forward packets up to 15 Mpps over a 32-Gbps shared bus.

Capable of operating in the same chassis with the Cisco Catalyst 6500 Series Supervisor Engine 1A, Supervisor Engine 2, and Supervisor Engine 720, Catalyst Classic interface modules do not support distributed forwarding and cannot be upgraded with a Distributed Forwarding Card (DFC).

Table 2 provides more information about Catalyst Classic interface modules.

CEF256 Interface Modules

Suited for distribution and core layers and for data-center and Web-hosting applications, CEF256 interface modules use the centralized CEF engine located on the supervisor engine's policy feature card (PFC) and forward packets up to 30 Mpps over a dedicated 8-Gbps full-duplex switch fabric connection.

Capable of operating in the same chassis with the Cisco Catalyst 6500 Series Supervisor Engine 1A, Supervisor Engine 2, and Supervisor Engine 720, CEF256 interface modules support distributed forwarding when upgraded with a DFC (Table 2).

Table 2 CEF256 Interface Module Distributed Forwarding Upgrade Requirements

Supervisor Engine	Switch Fabric	Distributed Forwarding Card
Supervisor Engine 2 MSFC2/PFC2	Separate switch fabric module (SFM)	Requires WS-F6K-DFC upgrade
Supervisor Engine 720	Supervisor Engine 720 integrates a 720 Gbps switch fabric *Note:* A Supervisor Engine 720 and an SFM cannot occupy the same chassis	Requires WS-F6K-DFC3 upgrade; will not interoperate with WS-F6K-DFC

dCEF256 Interface Modules

Suited for distribution and core layers, for data-center and Web-hosting applications, and for several high-performance service provider applications, the dCEF256 interface modules use the dCEF engine and tables located on the interface module to perform all forwarding.

dCEF256 interface modules require a Cisco Catalyst 6500 Series Supervisor Engine 720 or a Supervisor Engine 2 with a Multilayer Switch Feature Card 2 (MFSC2) and SFM. Supervisor Engine 720 requires a WS-F6K-DFC3 upgrade; and Supervisor Engine 2-MFSC2 operates with the WS-F6K-DFC supplied with the dCEF256 interface module.

Cisco Catalyst Classic Gigabit Ethernet Copper Interface Modules

Designed for distribution and core layers and for data-center and Web-hosting applications, Cisco Catalyst Classic copper interface modules provide line-rate Gigabit Ethernet forwarding with the following operational advantages:

Forwarding architecture—Use centralized CEF forwarding

Forwarding performance—Forward packets up to 15 Mpps per system

Fabric connection—Provide a 32-Gbps shared bus connection

Supervisor engine—Work with Supervisor Engine 1A, Supervisor Engine 2, or Supervisor Engine 720

Distributed forwarding upgrade—None; Classic interface modules cannot be upgraded for distributed forwarding

Slot requirements—None; can occupy any slot in any Cisco Catalyst 6500 Series chassis

Table 4 Classic Gigabit Ethernet Copper Interface Modules

Product	Ports/Interface/ Connectors	Port Density/ Chassis Model	Maximum Distance/ Cable Type
WS-X6316-GE-TX	16 ports; 1000BASE-T; RJ-45	192 ports (Cisco Catalyst 6513); 128 ports (Cisco Catalyst 6509)	100 meters; Category 5 cable

Cisco Catalyst Classic Gigabit Ethernet Optical Interface Modules

Designed for distribution and core layers and for data-center and Web-hosting applications, Cisco Catalyst Classic optical interface modules provide line-rate Gigabit Ethernet forwarding with the following operational advantages:

Forwarding architecture—Use centralized CEF forwarding

Forwarding performance—Forward packets up to 15 Mpps per system

Optics—Supports hot-pluggable gigabit interface converters (GBICs)

Fabric connection—Provide a 32-Gbps shared bus connection

Supervisor engine—Work with Supervisor Engine 1A, Supervisor Engine 2, or Supervisor Engine 720

Distributed forwarding upgrade—None; Classic interface modules cannot be upgraded for distributed forwarding

Slot requirements—Can occupy any slot in any Cisco Catalyst 6500 Series chassis

Table 5 Classic Gigabit Ethernet Optical Interface Modules

Product	Transceiver Type	Ports/Interface/ Connectors	Port Density/ Chassis Model	Maximum Distance/ Cable Type
WS-X6408A-GBIC	GBIC	8 ports; 1000BASE-SX, -LX/LH, -ZX; SC	96 ports (Cisco Catalyst 6513); 64 ports (Cisco Catalyst 6509)	550 m: 1000BASE-SX 10 km: LX/LH 100 km: ZX
WS-X6416-GBIC	GBIC	16 ports; 1000BASE-SX, -LX/LH, -ZX; SC	192 ports (Cisco Catalyst 6513); 128 ports (Cisco Catalyst 6509)	550 m: 1000BASE-SX 10 km: LX/LH 100 km: ZX
WS-X6416-GE-MT	MT-RJ	16 ports; 1000BASE-SX; MT-RJ	192 ports (Cisco Catalyst 6513); 128 ports (Cisco Catalyst 6509)	550 m: 1000BASE-SX

Cisco Catalyst CEF256 Gigabit Ethernet Optical Interface Modules

Designed for data center and server farm applications, Cisco Catalyst CEF256 optical interface modules provide line-rate Gigabit Ethernet forwarding with the following operational advantages:

Forwarding architecture—Uses the central CEF engine located on the supervisor engine

Forwarding performance—Forwards packets up to 30 Mpps per system and up to 15 Mpps per slot if upgraded to support distributed forwarding

Optics—Supports hot-pluggable GBICs

Fabric connection—Connects to the switch fabric using one 8-Gbps full-duplex connection and the 32-Gbps shared bus

Supervisor engine—Works with Supervisor Engine 1A, Supervisor Engine 2, or Supervisor Engine 720

Distributed forwarding upgrade—Optional; upgrade is required only to perform distributed forwarding; requires a WS-F6K-DFC3 upgrade to operate with Supervisor Engine 720; requires a WS-F6K-DFC upgrade and an SFM to operate with Supervisor Engine 2-MFSC2

Slot requirements—Can occupy any slot in any Catalyst 6500 Series chassis

Port densities—192 ports: Catalyst 6513 chassis; 128 ports: Catalyst 6509 chassis

Note: Supervisor Engine 720 communicates with a CEF256 interface module in 256-Gbps mode. Supervisor Engine 720 and SFM cannot operate in the same chassis.

Table 6 CEF256 Gigabit Ethernet Optical Interface Modules

Product	Transceiver Type	Ports/Interface/ Connectors	Port Density/ Chassis Model	Maximum Distance/ Cable Type
WS-X6516-GBIC	GBIC	16 ports; 1000BASE-SX, -LX/LH, -ZX; SC	192 ports (Cisco Catalyst 6513); 128 ports (Cisco Catalyst 6509)	550 m: 1000BASE-SX 10 km: LX/LH 100 km: ZX
WS-X6516A-GBIC	GBIC	16 ports; 1000BASE-SX, -LX/LH, -ZX; SC	192 ports (Cisco Catalyst 6513); 128 ports (Cisco Catalyst 6509)	550 m: 1000BASE-SX 10 km: LX/LH 100 km: ZX

Cisco Catalyst dCEF256 Gigabit Ethernet Optical Interface Modules

Designed for distribution and core layers and for data-center and Web-hosting applications, Cisco Catalyst dCEF256 optical interface modules provide line-rate Gigabit Ethernet forwarding with the following operational advantages:

Forwarding architecture—Use the dCEF engine and dCEF tables located on the interface module

Forwarding performance—Forward packets up to 24 Mpps per slot when interface modules have dual-fabric connections

Optics—Support hot-pluggable GBICs over single-mode fiber

Fabric connection—Connect using dual 8-Gbps full-duplex serial channel connections to fabric on a Supervisor Engine 720 or a SFM

Supervisor engine—Work with Supervisor Engine 2 with a SFM or Supervisor Engine 720

Distributed forwarding—Include a DFC when operating with Supervisor Engine 2 or a DFC3 when operating with Supervisor Engine 720

Slot requirements—Can occupy any slot in any Cisco Catalyst 6500 Series chassis except the 6513 chassis where they must be installed in slots 9 through 13 (the only slots on the chassis with dual fabric connections)

Ordering Information

Table 9 provides part number information for Catalyst 6500 Series chassis.

Table 9 Catalyst 6500 Series Chassis Part Numbers

Product Number	Description
WS-X6316-GE-TX	16-port Classic Gigabit Ethernet interface module for the Cisco Catalyst 6000 Series switches; RJ-45
WS-X6408-GBIC	8-port Classic Gigabit Ethernet interface module for the Cisco Catalyst 6000 Series switches; requires GBICs
WS-X6408A-GBIC	8-port Classic Gigabit Ethernet interface module for the Cisco Catalyst 6000 Series switches with enhanced QoS; requires GBICs
WS-X6416-GBIC	16-port Classic Gigabit Ethernet interface module for the Cisco Catalyst 6000 Series switches; requires GBICs
WS-X6416-GE-MT	16-port Classic Gigabit Ethernet interface module for the Cisco Catalyst 6000 Series switches; MT-RJ
WS-X6516-GBIC	16-port CEF256 Gigabit Ethernet interface module for the Cisco Catalyst 6500 Series switches with single fabric channel interface; requires GBICs; upgradable to support distributed forwarding through the addition of the distributed forwarding daughter card (WS-F6K-DFC)
WS-F6K-DFC	Distributed forwarding daughter card for CEF26 interface modules
WS-X6816-GBIC	16-port dCEF256 Gigabit Ethernet interface module for the Cisco Catalyst 6500 Series switches with dual fabric channel interfaces and distributed forwarding; requires GBICs
WS-X6816A-GBIC	16-port dCEF256 Gigabit Ethernet interface module for the Cisco Catalyst 6500 Series switches with dual fabric channel interfaces and distributed forwarding; requires GBICs
GLC-SX-MM	1000BASE-SX SFP (multimode only) Dual LC connector
GLC-SX-MM=	1000BASE-SX SFP (multimode only) spare Dual LC connector
GLC-LH-SM	1000BASE-LX SFP (single mode only) Dual LC connector
GLC-ZX-SM	1000BASE-ZX SFP (single mode only) Dual LC connector
WS-G5484	1000BASE-SX SX GBIC (multimode only)
WS-G5485	1000BASE-LX/LH LH GBIC (single mode or multimode)
WS-G5487	1000BASE-ZX ZX GBIC (single mode only)

Specifications

Standard Protocols

- IEEE 802.1d, IEEE 802.1p, IEEE 802.1q, IEEE 802.1s, IEEE 802.1w, IEEE 802.3x, IEEE 802.3z, IEEE 802.3ab, and IEEE 802.3ad,
- 1000BASE-X (GBIC), 1000BASE-SX, 1000BASE-LX/LH, 1000BASE-ZX, CWDM

Physical Specification

- Occupies one slot in the Cisco Catalyst 6500 Series chassis
- Dimensions (H x W x D): 1.2 x 14.4 x 16 in. (3.0 x 35.6 x 40.6 cm)

Environmental Conditions

- Operating temperature: 32 to 104 F (0 to 40 C)
- Storage temperature: –40 to 167 F (–40 to 75 C)
- Relative humidity: 10 to 90%, noncondensing
- Operating altitude: –60 to 4000 m
- Mean time between failure (MTBF): seven years for system configuration

Safety Compliance

Cisco Catalyst 6500 Series Gigabit Ethernet interface modules, when installed in a system, comply with the following compliance and safety standards:

- UL 1950
- CSA C22.2 No.950
- EN 60950
- EN 60825-1
- IEC 60950
- IEC 60825-1
- TS 001
- CE marking
- AS/NZS 3260
- 21CFR1040

EMC Compliance

Cisco Catalyst 6500 Series Gigabit Ethernet modules, when installed in a system, comply with the following EMI standards:

- FCC Part 15 (CFR 47) Class A
- VCCI
- EN55022
- EN55024
- CISPR 22
- CE marking
- AS/NZS 3548

Network Management

- ETHERLIKE-MIB (RFC 1643)
- IF-MIB (RFC 1573)
- Bridge MIB (RFC 1493)
- CISCO-STACK-MIB
- CISCO-VTP-MIB
- CISCO-CDP-MIB

1. Cisco 1000BASE-LX/LH interfaces fully comply with the IEEE 802.3z 1000BASE-LX standard. However, their higher quality allows them to reach 10 km over single-mode fiber versus the 5 km specified in the standard.

Technical Support Services

Whether your company is a large organization, a commercial business, or a service provider, Cisco is committed to maximizing the return on your network investment. Cisco offers a portfolio of technical support services to help ensure that your Cisco products operate efficiently, remain highly available, and benefit from the most up-to-date system software.

The Cisco Technical Support Services organization offers the following features, providing network investment protection and minimal downtime for systems running mission-critical applications:

- Provides Cisco networking expertise online and on the telephone
- Creates a proactive support environment with software updates and upgrades as an ongoing integral part of your network operations, not merely a remedy when a failure or problem occurs
- Makes Cisco technical knowledge and resources available to you on demand
- Augments the resources of your technical staff to increase productivity
- Complements remote technical support with onsite hardware replacement

Cisco Technical Support Services include:

- Cisco SMARTnet™ support
- Cisco SMARTnet Onsite support
- Cisco Software Application Services, including Software Application Support and Software Application Support plus Upgrades

Toolkit: Roll over tools

Feedback | Help

CISCO SYSTEMS

Software Advisor

Major Release 12.2T

Product Family 1751

Releases 12.2(15)T

Feature Set IP/ADSL/VOICE PLUS IPSEC 3DES

Some features are dependent on product model, interface modules (i.e. Line Cards & Port Adapters), and/or require a software feature license.

Your selections are supported by the following

Image Name	DRAM	Flash	Product Number	Options
c1700-k9sv3y7-mz.12.2-15.T	96	16	S17C7VK9-12215T= S17C7VK9-12215T	Search For MIBs Compare Images

AAA Broadcast Accounting
AAA DNIS Map for Authorization
AAA Server Group
AAA Server Group Deadtimer
AAA Server Group Enhancements
AAA Server Groups Based on DNIS
Ability to Disable Xauth for Static IPsec Peers
Accounting of VPDN Disconnect Cause
ACL Authentication of Incoming RSH and RCP
ACL Sequence Numbering
`dditional Vendor-Proprietary RADIUS Attributes
.ddress Resolution Protocol (ARP)
ADSL - Asymmetric Digital Subscriber Line Support
Advanced Encryption Standard (AES)
Always On Dynamic ISDN (AO/DI)
Analog DID (Direct Inward Dial)
Asynchronous Rotary Line Queuing
Asynchronous Serial Traffic Over UDP
ATM-DXI
AutoInstall Using DHCP for LAN Interfaces
Automatic modem configuration
Bandwidth Allocation Control Protocol (BACP)
BGP
BGP 4
BGP 4 Multipath Support
BGP 4 Prefix Filter and In-bound Route Maps
BGP 4 Soft Config
BGP Conditional Route Injection
BGP Hide Local-Autonomous System
BGP Hybrid CLI Support
BGP Link Bandwidth
BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS-VPN
BGP Named Community Lists
BGP Policy Accounting
BGP Prefix-Based Outbound Route Filtering
BGP Soft Reset

BRI QSIG Protocol
Call Admission Control for H.323 VoIP Gateways
Caller ID on Analog Voice Interfaces
CEF on Multipoint GRE Tunnels
CEF/dCEF - Cisco Express Forwarding
CEFv6/dCEFv6 - Cisco Express Forwarding
Certificate Auto-Enrollment
Certificate Enrollment Enhancements
Certificate Security Attribute-Based Access Control
Certification Authority Interoperability (CA)
CGMP - Cisco Group Management Protocol
Challege Handshake Authentication Protocol (CHAP)
Channelized E1 Signaling
Circuit Interface Identification Persistence for SNMP
Cisco Discovery Protocol (CDP)
Cisco Discovery Protocol (CDP) - IPv6 Address Family Support for Neighbor I...
Cisco Discovery Protocol (CDP) over ATM
Class Based Weighted Fair Queuing (CBWFQ)
Class-Based Packet Marking
CLI String Search
CNS Agents SSL Security
NS Configuration Agent
NS Event Agent
CNS Flow-Through Provisioning
Commented IP Access List Entries
Committed Access Rate (CAR)
Compression Control Protocol
CT1/RBS (Robbed Bit Signaling)
CUG Selection Facility Suppress Option
Custom Queueing (CQ)
Customer Profile Idle Timer Enhancements for Interesting Traffic
Default Passive Interface
DF Bit Override Functionality with IPSec Tunnels
DHCP Accounting
DHCP Client
DHCP Client - Dynamic Subnet Allocation API
DHCP Client on WAN Interfaces
DHCP ODAP Server Support
DHCP On Demand Address Pool (ODAP) Manager for non-MPLS VPN pools
DHCP Proxy Client
DHCP Relay Agent Support for Unnumbered Interfaces
DHCP Secured IP Address Assignment
DHCP Server - On Demand Address Pool Manager
DHCP Server - Option to Ignore all BOOTP Requests
HCP Server Options - Import and Autoconfiguration
DHCP Server-Easy IP Phase 2
Dial backup
Dial Peer Enhancements
Dial-on-demand
Dialer Idle Timer Inbound Traffic Configuration
Dialer Persistent
Dialer profiles
Dialer Watch
Dialer Watch Connect Delay
Differentiated Services
Diffserv Compliant WRED
Distinguished Name Based Crypto Maps
DLR Enhancements: PGM RFC-3208 Compliance
DNS based X.25 routing
DNS Lookups over an IPv6 Transport
Double Authentication
Dynamic Multiple Encapsulation for Dial-in over ISDN
Dynamic Multipoint VPN (DMVPN)
E1 R2 Signaling
Easy IP (Phase 1)
Easy VPN Remote
Easy VPN Remote : Multiple Inside Interface Enhancements
Easy VPN Remote Enhancements
Easy VPN Remote: Local-Address Support
Easy VPN Remote: Manual Tunnel Control Enhancement

Easy VPN Server
Encrypted Vendor Specific Attributes
Enhanced IGRP (EIGRP)
Enhanced IGRP Stub Routing
Enhanced ITU-T G.168 Echo Cancellation
Enhanced Local Management Interface (ELMI)
Enhanced Password Security
Enhanced Tracking Support.
Exporting and Importing RSA Keys
Fast Fragmentation (Fast-Switched Fragmented IP Packets)
Fast-Switched Policy Routing
Flow-Based WRED
Frame Relay
Frame Relay Encapsulation
Frame Relay End-to-End Keepalive
Frame Relay Fragmentation (FRF.12)
Frame Relay FRF.9 Payload Compression
Frame Relay PVC Interface Priority Queueing
Frame Relay Router ForeSight
Frame Relay SVC Support (DTE)
Frame Relay Switching
Frame Relay Switching Diagnostics and Troubleshooting
Frame Relay Switching Enhancements: Shaping and Policing
Frame Relay Traffic Shaping (FRTS)
Frame Relay Voice Adaptive Traffic Shaping
FXO Answer and Disconnect Supervision
G.SHDSL Symmetric DSL Support
Gatekeeper Ecosystem Interoperability
Generic Routing Encapsulation (GRE)
Generic Routing Encapsulation (GRE) Tunnel Keepalive
Generic Traffic Shaping (GTS)
GLBP: Gateway Load Balancing Protocol
H.323 Call Redirection Enhancements
H.323 Scalability and Interoperability Enhancements for Gateways
Half bridge/half router for CPP and PPP
Hoot and Holler over IP
HSRP - Hot Standby Router Protocol
HSRP - Hot Standby Router Protocol and IPSec
HSRP support for ICMP Redirects
HTTP 1.1 Web Server
HTTPS - HTTP with SSL 3.0
iBGP Multipath Load Sharing
IEEE 802.1p Support
IEEE 802.1Q VLAN Support
IGMP Version 3
IGMP Version 3 - Explicit Tracking of Hosts, Groups, and Channels
IKE - Initiate Aggressive Mode
IKE Extended Authentication (Xauth)
IKE Mode Configuration
IKE Security Protocol
IKE Shared Secret Using AAA Server
Integrated routing and bridging (IRB)
Interface Alias Long Name Support
Interface Index Display
Interface Range Specification
IP Enhanced IGRP Route Authentication
IP Header Compression Enhancement - PPPoATM and PPPoFR Support
IP Multicast Load Splitting across Equal-Cost Paths
IP Named Access Control List
IP Precedence for GRE Tunnels
IP Routing
IP RTP Priority
IP Summary Address for RIPv2
IP to ATM CoS, per-VC WFQ and CBWFQ
IP-to-ATM CoS
IPSec MIB Support for Cisco IPSec VPN Management
IPsec NAT Transparency
IPSec Network Security
IPSec Through Network Address Translation Support
IPSec Triple DES Encryption (3DES)

Data Sheet

Cisco **1751** Modular Access Router

Cisco 1751 Modular Access Router is ideally suited to help you evolve your organization into an e-Business. It supports e-Business features such as VPNs; secure Internet, intranet, and extranet access with optional firewall technology; broadband DSL and cable connectivity; and multiservice voice/video/data/fax integration. The Cisco 1751 Modular Access Router offers:

- Flexibility to adapt to changing requirements
- Modularity that allows you to individually configure the system to meet specific business needs
- Investment protection with features and performance to support new WAN services such as broadband DSL and cable access, multiservice voice/data integration, and VPNs
- Integration of multiple network functions, including an optional firewall VPN, and data service unit/channel service unit (DSU/CSU) to simplify deployment and management

The Cisco 1751 Router delivers these capabilities with the power of Cisco IOS Software in a modular integrated access solution. The Cisco 1751 Router provides a cost-effective solution to support e-Business applications through a comprehensive feature set including support for:

- Multiservice voice/fax/data integration
- Secure Internet, intranet, and extranet access with VPN and firewall
- Integrated broadband DSL connectivity
- VLAN support (IEEE 802.1Q)

The Cisco 1751 Router, a member of the Cisco 1700 Family, features a modular architecture that enables cost-effective upgrades and additions of WAN and voice interfaces. Integrated network services and functions, such as optional firewall, DSU/CSU, and VPN features, reduce the complexity of deploying and managing e-Business solutions. The Cisco 1751 Router offers investment protection when your business needs it, with a RISC architecture and features to support new technologies and applications such as voice/video/data/fax integration and VPNs. See Figure 2.

Figure 1
The Cisco 1751 Router delivers a versatile e-Business WAN access solution.

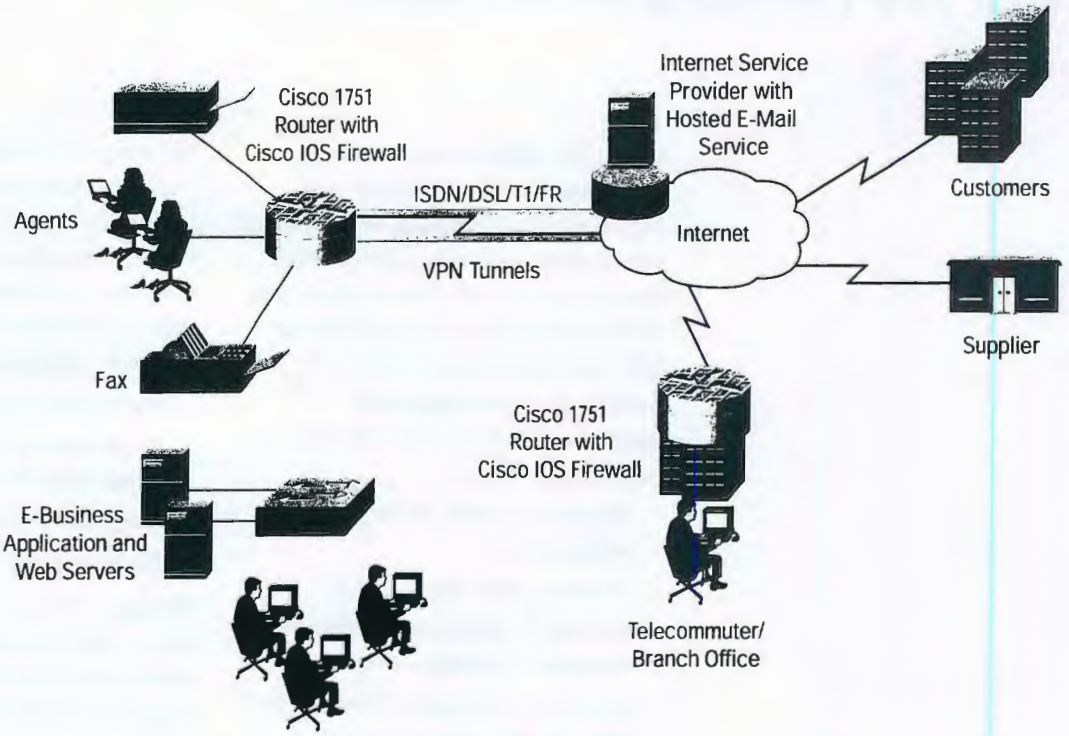
Figure 2
Cisco 1751 Routers provide all necessary capabilities to connect to the Internet and communicate with vendors, customers, and other employees and offices.



The Cisco 1751 Router is available in two models that enable you to easily tailor an access solution to suit your e-Business requirements today and in the future. See Table 1.

Table 1 The Cisco 1751 Modular Access Router

Cisco 1751 Base Model	Includes everything an office needs for data networking now (16 MB Flash, 32 MB DRAM, and Cisco IOS IP software feature set), with a simple upgrade path to full voice functionality. WAN interface cards are available separately.
Cisco 1751-V Multiservice Model	Includes all the features needed for immediate integration of data and voice services with support for up to two voice channels (32 MB Flash and 64 MB DRAM, one DSP (PVDM-256K-4), and Cisco IOS IP Plus Voice feature set). Voice and WAN interface cards are available separately.

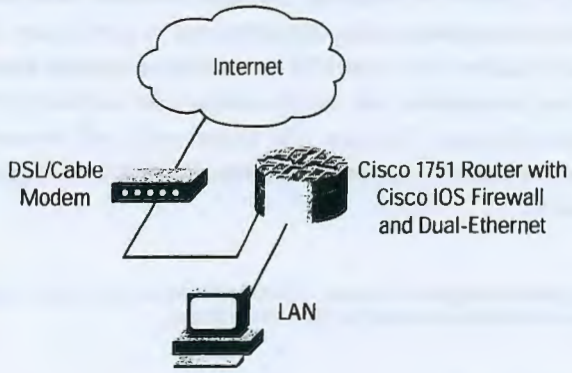
All Cisco 1751 models offer three modular slots for voice and data interface cards, an autosensing 10/100BaseT Fast Ethernet LAN port supporting standards-based IEEE 802.1Q VLAN, a console port, and an auxiliary port. The Cisco 1751 Router supports the same WAN interface cards as the Cisco 1600, 1700, 2600, and 3600 Series routers, and the same voice interface cards and voice-over-IP (VoIP) technology as the Cisco 1700, 2600, and 3600 Series routers. This simplifies support requirements. The WAN interface cards support a wide range of services, including synchronous and asynchronous serial, Integrated Services Digital Network Basic Rate Interface (ISDN BRI), ADSL,

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

3192
21

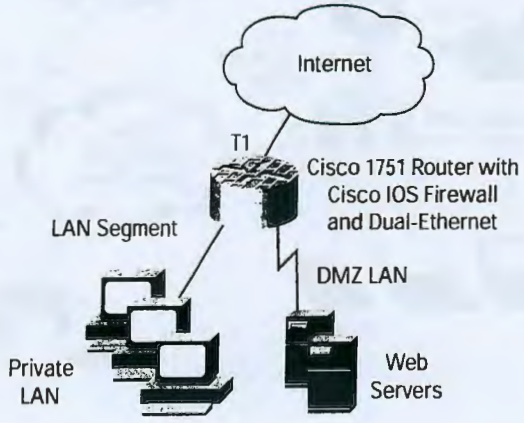
and serial with DSU/CSU options for primary and backup WAN connectivity. The voice interface cards support Foreign Exchange Office (FXO), Foreign Exchange Station (FXS), Network and User Side Voice BRI (ISDN BRI NT/TE), Ear & Mouth (E&M), direct inward dial (DID), and T1/E1 Multiflex VWICs. Additionally, an Ethernet interface card provides the Cisco 1751 Router with dual-Ethernet capability to support the external broadband modem devices. See Figure 3.

Figure 3
Cisco 1751 Router Incorporating Ethernet WAN Interface Card (WIC) Deployed with Broadband Modem



In addition, dual-Ethernet capability on the Cisco 1751 Router enables the creation of perimeter/DMZ (demilitarized zone) LANs to enhance security by physically separating private and public data. See Figure 4.

Figure 4
Cisco 1751 Router Incorporating Ethernet WIC to Deploy Perimeter/DMZ LAN



Combined, these interfaces support a comprehensive set of applications, including multiservice voice/video/data/fax integration, Frame Relay, ISDN BRI, SMDS, X.25, broadband DSL and cable services, and VPNs.

Key Benefits

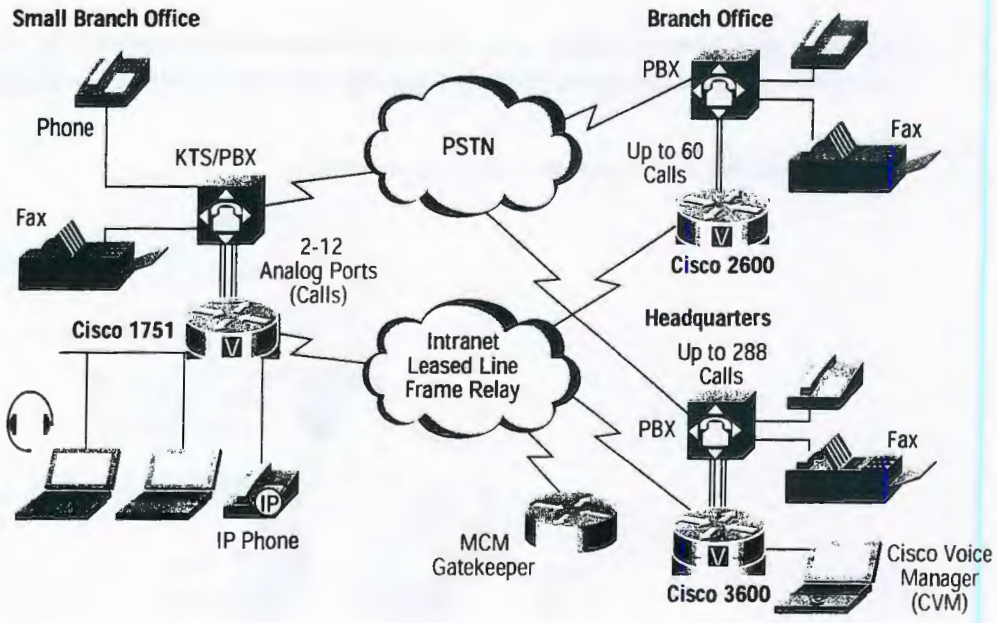
The Cisco 1700 Series routers support the value of end-to-end Cisco network solutions with the following benefits:

Flexibility—The modular Cisco 1751 Router adapts easily to fit the needs of growing businesses. Interchangeable WAN interface cards enable easy additions or changes in WAN technologies without requiring a forklift upgrade of the entire platform. Modular data and voice slots enable users to tailor data and voice services as needed. With the ability to use the same field-upgradable WAN and voice interface cards across multiple Cisco access router platforms, the Cisco 1751 Router reduces requirements for spare parts inventory and support training.

Multiservice Access—For businesses that want to become e-Businesses and incorporate applications that integrate multiservice voice/video/data/fax capabilities now or in the future, the Cisco 1751 Router offers a flexible, cost-effective answer. The Cisco 1751 Router enables network managers to save on long-distance interoffice billing costs. It also interoperates with next-generation voice-enabled applications such as integrated messaging and Web-based call centers. The Cisco 1751 Router works with the existing telephone infrastructure—phones, fax machines, key telephone systems (KTS) units, and PBX (including digital PBXs)—minimizing capital costs. See Figure 5.

Figure 5

Voice/video/data/fax integration. The Cisco 1751 Router integrates data and voice capabilities, significantly lowering toll charges for small- and medium-sized businesses and enterprise small branch offices.



Lower Cost of Ownership—The Cisco 1751 Router provides a complete solution for integrated voice and data access in a single product, eliminating the need to install and maintain a large number of separate devices. You can combine optional functions—including a voice gateway, dynamic firewall, VPN tunnel server, DSU/CSU, ISDN network

Cisco Systems, Inc.

3190
21

termination-1 (NT1) device, and more—to reduce deployment and management costs. This solution can be managed remotely using network management applications such as CiscoWorks2000 and CiscoView or any SNMP-based management tool.

Investment Protection—The Cisco 1751 Router RISC architecture, Cisco IOS Software, and modular slots provide solid investment protection. The Cisco 1751 incorporates services such as multiservice voice/video/data/fax integration, VPNs, and broadband DSL and cable communications to enable today's successful e-Business. An internal expansion slot on the mother- board offers the ability to support hardware-assisted IPSec data encryption at T1/E1 speeds.

For a complete list of Cisco 1751 Router features and benefits, see Table 2.

Table 2 Key Features and Benefits

Features	Benefits
Flexibility	
Full Cisco IOS Software support, including multiprotocol routing (IP, IPX, Apple Talk, IBM/ SNA) and bridging	• Provides the industry's most robust, scalable, and feature-rich internetworking software support using the de facto standard networking software for the Internet and private WANs • Part of the Cisco end-to-end network solution
Integrated Voice and Data Networking	
Cisco 1751 router chassis accepts both WAN and voice interface cards	• Reduces long-distance toll charges by allowing the data network to carry interoffice voice and fax traffic • Works with existing handsets, key units, and PBXs, eliminating the need for a costly phone-equipment upgrade
Modular Architecture	
Accepts an array of WAN and voice interface cards	• Adds flexibility and investment protection
WAN interface cards and voice interface cards are shared with Cisco 1600, 1700, 2600, and 3600 routers	• Reduce cost of maintaining inventory • Lower training costs for support personnel • Protect investments through re-use on various platforms
Autosensing 10/100 Fast Ethernet	• Simplifies migration to Fast Ethernet performance in the office
Expansion Slot on Motherboard	• Allows expandability to support hardware-assisted encryption at T1/E1 speeds • Allows support for future technologies
Dual DSP Slots	• Allow expandability to support additional voice channels
Security	
The Cisco IOS Firewall Feature Set includes context-based access control for dynamic firewall filtering, denial-of-service detection and prevention, Java blocking, real-time alerts, Intrusion Detection System (IDS), and encryption	• Allows internal users to access the Internet with secure, per-application-based, dynamic access control, while preventing unauthorized Internet users from accessing the internal LAN

3 189

Table 2 Key Features and Benefits (Continued)

Features	Benefits
IPSec DES and 3DES	• Enable creation of VPNs by providing industry-standard data privacy, integrity, and authenticity as data traverses the Internet or a shared public network • Supports up to 168-bit encryption
Hardware-Based Encryption Using Optional VPN Module	• Supports wire-speed encryption up to T1/E1 speeds
Device Authentication and Key Management	
IKE, X.509v3 digital certification, and support for certificate enrollment protocol (CEP) with certification authorities (CAs) such as Verisign and Entrust	• Ensure proper identity and authenticity of devices and data • Enable scalability to very large IPSec networks through automated key management
User Authentication	
PAP/CHAP, RADIUS, TACACS+	• Support all leading user identity verification schemes
VPN Tunneling	
IPSec, GRE, L2TP, L2F	• Offer choice of standards-based tunneling methods to create VPNs for IP and non-IP traffic • Allow standards-based IPSec or L2TP client to interoperate with Cisco IOS tunneling technologies • Fully interoperable with public certificate authorities and IPSec standards-based products • Part of the scalable Cisco end-to-end VPN solution portfolio
Cisco Easy VPN client	• Allows the router to act as remote VPN client and have VPN policies pushed down from the VPN concentrator
Cisco Unified VPN Access Server	• Allows the router to terminate remote access VPNs initiated by mobile and remote workers running Cisco VPN client software on PCs; and allows the router to terminate site-site VPNs initiated by IOS routers using the Cisco Easy CPN client feature
Management	
IEEE 802.1Q VLAN Support	• VLANs enable efficient traffic separation, provide better bandwidth utilization, and alleviate scaling issues by logically segmenting the physical LAN infrastructure into different subnets
Manageable via SNMP (CiscoView, CiscoWorks2000), Telnet, and console port	• Allow central monitoring, configuration, and diagnostics for all functions integrated in the Cisco 1751 router, reducing management time and costs
Cisco SDM	• Simplifies router and security configuration through smart wizards to enable customers to quickly and easily deploy, configure and monitor a Cisco access router without requiring knowledge of Cisco IOS Command Line Interface (CLI)

21

Table 2 Key Features and Benefits (Continued)

Features	Benefits
Ease of Use and Installation	
Cisco ConfigMaker, SETUP configuration utility, AutoInstall, color-coded ports/cables, and LED status indicators	• Simplifies and reduces deployment time and costs with graphical LAN/VPN policy configurator; command-line, context-sensitive configuration questions; and straightforward cabling • LEDs allows quick diagnostics and troubleshooting
Network Address Translation (NAT) and Easy IP	• Simplifies deployment and reduces Internet access costs
QoS	
CAR, Policy Routing, WFQ, PQ/CBWFQ, GTS, RSVP, DSCP, cRTP, MLPPP and LFI	• Allocates WAN bandwidth to priority applications for improved performance
Reliability and Scalability	
Cisco IOS Software, dial-on-demand routing, dual-bank Flash memory, scalable routing protocols such as OSPF, EIGRP, and HSRP	• Improves network reliability and enables scalability to large networks
Broadband Connectivity Options	
ADSL and cable connectivity deliver business-class broadband access	• Leverage broadband access technologies like cable and DSL to increase WAN connectivity speeds and reduce WAN access costs • The Cisco 1751 supports ADSL connectivity with ADSL WIC • Cable connectivity with the Cisco 1751 and optional integrated Cisco uBR910 Series Cable DSU deliver business-class broadband access
Device Integration	
Integrated router, voice gateway, firewall, encryption, VPN tunnel server, DSU/CSU, and NT1 in a single device	• Reduce costs and simplifies management

Cisco IOS Technology

Internet and Intranet Access

Cisco IOS Software provides an extensive set of features that make the Cisco 1751 Router ideal for flexible, high-performance communications across both intranets and the Internet:

- Multiprotocol routing (IP, IPX, and AppleTalk), IBM/SNA, and transparent bridging over ISDN, asynchronous serial, and synchronous serial such as leased lines, Frame Relay, SMDS, Switched 56, X.25, and X.25 over ISDN D
- WAN optimization—including dial-on-demand routing (DDR), bandwidth-on-demand (BOD), and OSPF-on-demand circuit, Snapshot routing, compression, filtering, and spoofing to reduce WAN costs

Security

Cisco IOS Software supports an extensive set of basic and advanced network security features, including access control lists (ACLs); user authentication, authorization, and accounting (such as PAP/CHAP, TACACS+, and RADIUS); and data encryption. To increase security, the integrated Cisco IOS Firewall Feature Set protects internal LANs from attacks with context-based access control (CBAC) and Intrusion Detection (IDS), while IPSec tunneling with data encryption standard DES and 3DES encryption provide standards-based data privacy, integrity, and authenticity as data travels through a public network. Additionally, remote management applications, such as Cisco Security Device Manager (SDM), make it easier than ever to deploy and monitor security applications on your Cisco router.

The Cisco 1700 Series routers support the Cisco Easy VPN client feature that allows the routers to act as remote VPN clients. As such, these devices can receive predefined security policies from the headquarters' VPN head-end, thus minimizing configuration of VPN parameters at the remote locations. This solution makes deploying VPN simpler for remote offices with little IT support or for large deployments where it is impractical to individually configure multiple remote devices. While customers wishing to deploy and manage site-to-site VPN would benefit from Cisco Easy VPN client because of its simplification of VPN deployment and management, managed VPN service providers and enterprises who must deploy and manage numerous remote sites and branch offices with IOS routers for VPN will realize the greatest benefit.

The Cisco 1700 Series routers also support the Cisco Unified VPN Access Server feature that allows a Cisco 1700 router to act as a VPN head-end device. In site-to-site VPN environments, the Cisco 1700 router can terminate VPN tunnels initiated by the remote office routers using the Cisco Easy VPN client. Security policies can be pushed down to the remote office routers from the Cisco 1700 Series routers. In addition to terminating site-to-site VPNs, a Cisco 1700 Series router running the Unified VPN Access Server can terminate remote access VPNs initiated by mobile and remote workers running Cisco VPN client software on PCs. This flexibility makes it possible for mobile and remote workers, such as sales people on the road, to access company intranet where critical data and applications exist.

For remote access, VPNs, Layer 2 Forwarding (L2F), and Layer 2 Tunneling Protocol (L2TP) combine with IPSec encryption to provide a secure multiprotocol solution for IP, IPX, and AppleTalk traffic, and more. Mobile users can dial in to a service provider's local point of presence (POP) and data is "tunneled" (or encapsulated inside a second protocol such as IPSec or L2TP) back to the Cisco 1751 router to securely access the corporate network via the Internet.

Cisco IOS Software QoS Features

Through Cisco IOS Software, the Cisco 1751 Router delivers quality of service (QoS) capabilities, including Resource ReSerVation Protocol (RSVP), Weighted Fair Queuing (WFQ), Committed Access Rate (CAR), and IP Precedence. These features enable businesses to prioritize traffic on their networks by user, application, traffic type, and other parameters, to ensure that business-critical data and delay-sensitive voice are appropriately prioritized.

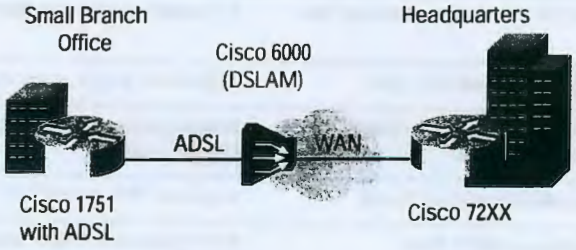
Because the Cisco 1751 Router provides robust voice compression, up to 8 voice calls can occupy a single 64K data channel simultaneously, without compromising data performance. Cisco IOS voice compression technology integrates data and voice traffic to enable efficient use of existing data networks.

Cisco Systems, Inc.
All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

High-Performance Architecture for VPNs and Broadband Service

A robust RISC architecture and Cisco IOS features enable the Cisco 1751 Router to support VPN applications with tunneling and security, as well as DSL, cable, and other broadband access technologies. An internal slot on the Cisco 1751 motherboard supports an optional VPN module that provides hardware-assisted IPSec DES and 3DES encryption at T1/E1 speeds. The Cisco 1751 Router equipped with the WIC-1ADSL supports VPN over ADSL service. See Figure 6. The Cisco 1751 Router with the uBR910 series cable DSU supports business-class broadband cable access. The Ethernet WIC (WIC-1ENET) provides an alternate method of deploying DSL/cable Internet access with the use of an external modem. In some cases, the ISP provides the broadband modem.

Figure 6
The Cisco 1751Router, deployed in conjunction with the ADSL WIC, enables SMB and small branch customers to reap the benefits of ADSL.



Network Management and Ease of Installation

The Cisco 1751 Router supports a range of network-management and ease-of-installation tools:

- The Cisco Security Device Manager (SDM) is an intuitive, web-based device management tool embedded within the Cisco IOS access routers. SDM simplifies router and security configuration through smart wizards to enable customers to quickly and easily deploy, configure and monitor a Cisco access router without requiring knowledge of Cisco IOS Command Line Interface (CLI). For more information visit www.Cisco.com/go/sdm.
- Cisco ConfigMaker is a Windows wizard-based tool designed to configure a small network of Cisco routers, switches, hubs, and other network devices from a single PC. This tool makes it easy to configure value-add security features such as the Cisco IOS Firewall Feature Set, IPSec encryption, and network address translation (NAT); establish VPN policies (including QoS and security); and configure the Dynamic Host Configuration Protocol (DHCP) server.
- CiscoWorks for Windows, a comprehensive network management solution for small to medium sized networks that provides Web-based network monitoring and device configuration management.
- CiscoWorks2000, the industry-leading Web-based network management suite from Cisco, simplifies tasks such as network inventory management and device change, rapid software image deployment, and troubleshooting.
- For service providers, Cisco Service Management (CSM) provides an extensive suite of service management solutions to enable planning, provisioning, monitoring, and billing.

Extending Cisco End-to-End Solutions

As part of the comprehensive Cisco end-to-end networking solution, the Cisco 1700 Series routers enable businesses to extend a cost-effective, seamless network infrastructure to the small branch office. The Cisco 1700 Family of access routers includes the Cisco 1751 Router and Cisco 1721 Router—a modular device optimized for data-only connections. WAN cards work with both devices, as well as with Cisco 1600, 2600, and 3600 Series routers. They are powered by Cisco IOS Software for robust WAN service between branches and central offices in organizations with multiple sites. Both feature RISC-based processors to provide performance for encryption and support for emerging broadband technologies.

The Cisco 1751 Router also shares VoIP technology and analog voice interface cards with Cisco 2600 and 3600 Series routers. This feature provides an end-to-end solution for multiservices communications between offices, simplifying inventory needs and leveraging IT expertise across more devices in an organization.

For a complete list of physical interfaces, see Tables 3, 4, 5, and 6.

Table 3 Physical Interfaces/Architecture

One 10/100 BaseT Fast Ethernet Port (RJ45)	Automatic speed detection; automatic duplex negotiation; VLAN support
One Voice Interface Card Slot	Supports a single voice interface card with two ports per card
Two WAN Interface Card/Voice Interface Card Slots	Supports any combination of up to two WAN interface cards or voice interface cards
Ethernet WAN Interface Cards	Supports PPP and PPPoE; operates in full and half-duplex modes
One Auxiliary (AUX) Port	RJ-45 jack with RS232 interface (plug compatible with Cisco 2500 Series AUX port); asynchronous serial DTE with full modem controls (CD, DSR, RTS, CTS); asynchronous serial data rates up to 115.2 kbps
One Console Port	RJ-45 jack with RS232 interface (plug compatible with Cisco 1000/1600/2500 series console ports); asynchronous serial DTE; transmit/receive rates up to 115.2 kbps (default 9600 bps, not a network data port); no hardware handshaking such as RTS/CTS
One Internal Expansion Slot	Supports hardware-assisted services such as encryption (up to T1/E1)
RISC Processor	Motorola MPC860P PowerQUICC at 48MHz

Table 4 WAN Support

Asynchronous Serial Interfaces on Serial WAN Interface Cards	Interface speed: up to 115.2 Kbps; asynchronous serial protocols: Point-to-Point Protocol (PPP), Serial Line Internet Protocol (SLIP); asynchronous interface; EIA/TIA-232
ISDN WAN Interface Cards	ISDN dialup and ISDN leased line (IDSL) at 64 and 128 Kbps; encapsulation over ISDN leased line; Frame Relay and PPP
ADSL WAN Interface Cards	Supports ATP adaption Layer 5 (AAL5) services and applications; interoperates with Alcatel DSLAM with Alcatel chipset and Cisco 6130/6260 DSLAM with Globespan chipset; ANSI T1.413 issue 2 and ITU 992.1 (G.DMT) compliant

2.

Table 5 WAN Interface Cards for the Cisco 1751 Router

Module	Description
WIC-1T	One serial, async, and sync (T1/E1)
WIC-2T	Two serial, async, and sync (T1/E1)
WIC-2A/S	Two low-speed serial (up to 128 kbps), async, and sync
WIC-1B-S/T	One ISDN BRI S/T
WIC-1B-U	One ISDN BUI U with integrated NT1
WIC-1DSU-56K4	One integrated 56/64-kbps, four-wire DSU/CSU
WIC-1DSU-T1	One integrated T1/fractional T1 DSU/CSU
WIC-1ADSL	One-port ADSL interface
WIC-1ENET	One-port 10BaseT Ethernet Interface
WIC-1SHDSL	One-port G.SHDSL interface
WIC-1AM	One-port V.90 analog modem WIC
WIC-2AM	Two-portV.90 analog modem WIC

Table 6 Voice Interface Cards for the Cisco 1751

VIC-2FXS	Two-port FXS voice/fax interface card for voice/fax network module
VIC-2DID	Two-port DID (direct inward dial) voice/fax interface card
VIC-2FXO	Two-port FXO voice/fax interface card for voice/fax network module
VIC-2FXO-EU	Two-port FXO voice/fax interface card for Europe
VIC-2FXO-MI	Two-port FXO voice/fax interface card with battery reversal detection and Caller ID support (for US, Canada, and others) [enhanced version of the VIC-2FXO]
VIC-2FXO-M2	Two-port FXO voice/fax interface card with battery reversal detection and Caller ID support (for Europe) [enhanced version of the VIC-2FXO-EU]
VIC-2FXO-M3	Two-port FXO voice/fax interface card for Australia
VIC-2E/M	Two-port E&M voice/fax interface card for voice/fax network module
VIC-2BRI-NT/TE	Two-port network Side ISDN BRI interface
VIC-4FXS/DID[1]	Four-port FXS and DID voice/fax interface card
VWIC-1MFT-T1	One-port RJ-48 multiflex trunk - T1
VWIC-2MFT-T1	Two-port RJ-48 multiflex trunk - T1
VWIC-2MFT-T1-DI	Two-port RJ-48 multiflex trunk - T1 with drop and insert
VWIC-1MFT-E1	One-port RJ-48 multiflex trunk - E1
VWIC-2MFT-E1	Two-port RJ-48 multiflex trunk - E1

1. The Cisco 1751 can support three VIC-4FXS/DID cards with a maximum of four ports in DID mode

Voice Implementation Requirements

The Cisco 1751 Modular Access Router supports FXO, FXS, E&M, ISDN BRI VICs, and T1/E1 multiflex V/WICs.

The FXO interface allows an analog connection to the central office of the Public Switched Telephone Network (PSTN). The FXS interface connects basic telephone service phones (home phones), fax machines, key sets, and PBXs through ring voltage and dial tone. The E&M interface allows connection for PBX trunk lines (tie lines). The ISDN-BRI NT/TE VIC is used to connect to the PSTN or a PBX/KTS, whereas the T1/E1 multiflex V/WIC (multiflex V/WIC) supports both data and voice services. The multiservice-ready Cisco 1751-V router version includes all the features needed for immediate integration of data and voice services:

- One DSP—(PVDM-256K-4)
- 32-MB Flash memory
- 64-MB DRAM
- Cisco IOS IP/VOX Plus feature set

VICs and WICs are available separately.

The Cisco 1751 and Cisco 1751-V routers have two DSP module slots on the motherboard and a maximum of eight DSPs are supported per router.

DSP Requirements

Cisco 1751 routers support 3 types of DSP images: high complexity (HC), medium complexity (MC) and Flexi-6. HC and MC are used for analog[1] and BRI (VIC-2BRI-NT/TE) VICs; Flexi-6 is used for T1/E1 VWICs[2] and BRI VIC. MC is introduced in Cisco 1751 starting from Cisco IOS 12.2(8)YN release, which will merge into 12.3(1)T. Therefore, please make sure to use Cisco 12.2(8) YN or later releases when using MC. In addition, starting from 12.2(8)YN release, the default DSP image for BRI VIC is changed from HC to Flexi-6. Table 7 lists the default images for each type of VICs; Table 8 lists IOS support for each DSP image. Table 9 lists the number of channels supported by one DSP (PVDM-256K-4) for each codec type.

Please use the following rules for calculating DSP requirements on the Cisco 1751:

1. For the Early Deployment (ED) releases: Cisco IOS 12.2(2)XK, 12.2(4)XW, 12.2(4)XL, 12.2(4)XM, 12.2(4)YA, 12.2(4)YB, 12.2(8)YL, 12.2(8)YM and 12.2(11)YT, or T train releases prior to 12.3(1)T:

1. Analog VICs include VIC-2FXS, VIC-2FXO, VIC-2FXO-M1, VIC-2FXO-M2, VIC-2FXO-M3, VIC-2FXO-EU, VIC-2E/M, VIC-2DID,VIC-4FXS/DID
2. T1/E1 VWICs include VWIC-1MFT-T1, VWIC-2MFT-T1, VWIC-2MFT-T1-DI, VWIC-1MFT-E1, VWIC-2MFT-E1, VWIC-2MFT-E1-DI, VWIC-1MFT-G703, VWIC-2MFT-G703

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

2

- a. Each 2-port analog VIC requires 1 DSP (PVDM-256K-4)
- b. Each VIC-2BRI-NT/TE requires 2 DSPs (PVDM-256K-8)
- c. For VWICs, refer to Table 9. For example, 12 G.711 digital T1/E1 voice calls require two DSPs; 12 G.729 calls require four DSPs
- d. Total DSP requirement is the sum of a, b and c. The DSP resources can not be shared between analog VICs, BRI VIC and VWICs.

2. For the Early Deployment (ED) releases: Cisco IOS 12.2(8)YN or later (Note: not including 12.2(11)YT) or T train releases 12.3(1)T or later, please always refer to the DSP Calculator in the following link:

   http://www.cisco.com/cgi-bin/Support/DSP/cisco_prodsel.pl

The DSP calculator optimizes the DSP resources for your configuration and suggests CLI configurations.

Table 7 DSP Firmware for each type of VICs

VIC Type	Firmware Support
2-port Analog VICs	HC (default), MC (starting from 12.2(8)YN)
4-port Analog VIC	HC, MC (default, starting from 12.2(8)YN)
VIC-2BRI-NT/TE	HC (default for ED releases prior to 12.2(8)YN or T train releases prior to 12.3(1)T); MC; Flexi-6 (default for ED releases 12.2(8)YN or later or T train releases 12.3(1)T or later);
T1/E1 VWICs	Flexi-6 (default)

Table 8 Cisco IOS support for DSP firmware

Firmware Support	IOS Release Support
HC	In all orderable IOS Releases
MC	ED Releases: Cisco IOS 12.2(8)YN or later [1] T Train Releases: Cisco IOS 12.3(1)T or later
Flexi-6	For T1/E1 VWICs: • ED Releases: Cisco IOS 12.2(4)YB or later [2] • T Train Releases: 6th releases of 12.2T or later For VIC-2BRI-NT/TE: • ED Releases: Cisco IOS 12.2(8)YN or later [3] • T Train Releases: Cisco IOS 12.3(1)T or later

1. It doesn't include Cisco 12.2(11)YT. 12.2(11)YT doesn't support MC.
2. It doesn't include Cisco 12.2(11)YT. 12.2(11)YT doesn't support Flexi-6.
3. It doesn't include Cisco 12.2(11)YT. 12.2(11)YT doesn't support Flexi-6.

Table 9 The number of channels supported by one DSP (PVDM-256K-4) per codec type

		Firmware	
G.711	2	4	6
G.729ab[2] /G.729a	2	4	3
G.726	2	4	3
G.723	2	-	2
G.728	2	-	2
Fax Relay	2	4	3

1. BRI VIC support in Flexi-6 starts from 12.2(8)YN or 12.3(1)T.
2. G.729 and G.729b is not supported in MC or Flexi-6 images.

Table 10 DSP Modules Available on Cisco 1751

Modules	DSPs
PVDM-256K-4	1 DSP Module
PVDM-256K-8	2 DSP Modules
PVDM-256K-12	3 DSP Modules
PVDM-256K-16HD	4 DSP Modules
PVDM-256K-20HD	5 DSP Modules

Cisco IOS Software Feature Sets

The Cisco 1751 Router supports a choice of Cisco IOS Software feature sets. Each feature set requires specific amounts of Flash and DRAM memory in the product. For default memory configurations, please see Table 11.

Table 11 Cisco 1751 Router Memory Defaults and Maximums

Model Number	Default FLASH/Maximum FLASH	Default DRAM/Maximum DRAM
Cisco 1751	16 MB/16 MB	32 MB/96 MB
Cisco 1751-V Multiservice Model	32 MB/32 MB	64 MB/128 MB

The Cisco 1751 Router supports a choice of Cisco IOS Software feature sets with rich data features as well as data/voice features (Table 12). Each feature set requires specific amounts of RAM and Flash memory in the product.

- Cisco IOS IP base feature sets include: NAT, OSPF, RADIUS, and NHRP.
- Plus feature sets contain L2TP, L2F, the Border Gateway Protocol (BGP), IP Mulitcast, Frame Relay SVC, RSVP, the NetWare Link Services Protocol (NLSP), AppleTalk SMRP, the Web Cache Control Protocol (WCCP), and the Network Timing Protocol (NTP).

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

3.180
2

- Encryption is offered in special encryption feature sets (Plus IPSec 56, and Plus IPSec 3DES). The VPN encryption module requires an IOS IP Plus IPSec image.
- DSL support is only in the Plus feature sets.

2.

Other IOS Features Include:

QoS Features

- Frame Relay Fragmentation (FRF.12)
- IP Precedence
- Generic Traffic Shaping (GTS)
- Frame Relay Traffic Shaping (FRTS)
- Weighted Random Early Detection (WRED)
- DSCP Marking
- Compressed RTP
- Multiple Link PPP & Link Fragmentation and Interleaving
- Resourse Reservation Protocol (RSVP)
- Queuing Techniques: Weighted Fair Queuing (WFQ), Priority Queuing (PQ), Low Laterey Queuing (LLQ) and Custom Queuing (CQ)
- Preclassification for IPSec Tunneling

Voice Support

- VoIP
- VoFR
- VoATM
- Fax Pass Through
- Fax Relay
- Modem Pass Through

VoIP Protocol Support

- H.323 V2
- Media Gateway Control Protocol 1.0
- Session Initiation Protocol 2.0

Codec Support

- G.711
- G.729
- G.729a
- G.723.1
- G.726
- G.728

Technical Specifications

Dimensions

- Width: 11.2 in. (28.4 cm)
- Height: 4.0 in. (10.0 cm)
- Depth: 8.7 in. (22.1 cm)
- Weight (minimum): 3.0 lb (1.36 kg)
- Weight (maximum): 3.5 lb (1.59 kg)

Power

- Locking connector on power socket
- External Power Brick
- AC Input Voltage: 100 to 240 VAC
- Frequency: 50 - 60 Hz
- AC Input Current: rated 1 A, measured 0.5 A
- Power Dissipation: 20W (maximum)

Environmental

- Operating Temperature: 32 to 104 F (0 to 40 C)
- Nonoperating Temperature: –4 to 149 F (–20 to 65 C)
- Relative Humidity: 10 to 85% noncondensing operating; 5 to 95% noncondensing, nonoperating

Safety

- Regulatory Approvals
  - UL 1950, 3rd Edition

Service and Support

Leading-edge technology deserves leading-edge support. Service and support for the Cisco 1751 is available on a one-time or an annual contract basis. Support options range from help desk assistance to proactive, onsite consultation. All support contracts include:

- Major Cisco IOS Software updates in protocol, security, bandwidth, and feature improvements
- Full access to Cisco.com for technical assistance, electronic commerce, and product information
- 24-hour-a-day access to the industry's largest dedicated technical support staff

A support contract maximizes the value of your technology investment throughout its lifecycle, ensuring optimum performance and availability. Augment your internal staff's capabilities by taking full advantage of Cisco expertise.

Contact your local sales office for further information.

Overview

The GigaStack GBIC (model WS-X3500-XL) adds port density and high-performance connectivity to supporting switches. When installed in a supporting switch, the GigaStack GBIC supports Gigabit connections in a cascaded stack or point-to-point configuration. The GigaStack GBIC autonegotiates the duplex setting of each port to maximize the bandwidth for your configuration.

Features

This section describes the GigaStack GBIC features:

- Half-duplex stacking using only one GBIC slot for each switch

  Stack up to nine switches to form an independent backbone that can be managed with a single IP address. This stack gives the appearance of a single large switch for network management purposes. For this kind of connectivity, see the "Example 1: Cascaded Stack Connection" section on page 1-9.

- Full-duplex connectivity between two switches

  You can also form a point-to-point link between two switches. The GigaStack GBIC supports one full-duplex link (in a point-to-point configuration) or up to eight half-duplex links (in a stack configuration) to other Gigabit Ethernet devices. For this kind of connectivity, see the "Example 2: Point-to-Point Connection" section on page 1-10.

S.C.T. 4.692 CPMI

- Support for redundant loop configurations in a GigaStack GBIC stack

  For more information, see the "Minimum IOS Release for Redundant Loop Configurations" section on page 1-7 and the "Cascaded Stack Connections with a Redundant Link" section on page 2-12
- Support for IOS Release 12.0(5)XU or later for Catalyst 2900 XL and 3500 XL switches, support for Release 12.1(6)EA2 or later for Catalyst 2950 switches, and support for Release 12.1(4)EA1 or later for Catalyst 3550 multilayer switches
- Management through the Cisco IOS command-line interface (CLI) or the web-based Cluster Management Suite (CMS)
- Field-replaceable

GigaStack GBIC LEDs

Figure 1-1 shows the LED locations on the GigaStack GBIC, and Table 1-1 describes the LED colors and their meanings.

Figure 1-1 GigaStack GBIC LEDs and Ports

Doc:

Table 1-1 GigaStack GBIC LEDs

Color	Meaning
Off	No link.
Green	Link present. This link occurs if there is connectivity with another network device and the GigaStack GBIC port.
Amber	Power-on self-test (POST) failure or use of an incorrect cable.
Flashing amber	Loop detection activated.

GBIC Module Slot LEDs

Figure 1-2 shows the GBIC module slot LED on the front of a supporting switch, and Figure 1-3 shows the GBIC LED location when the GigaStack GBIC is installed in the 1000BASE-X module.

Figure 1-2 GBIC Module Slot LED Location on a Switch

Fls: 0859
Doc: 3701

Figure 1-3 GBIC LED Location on a 1000BASE-X Module

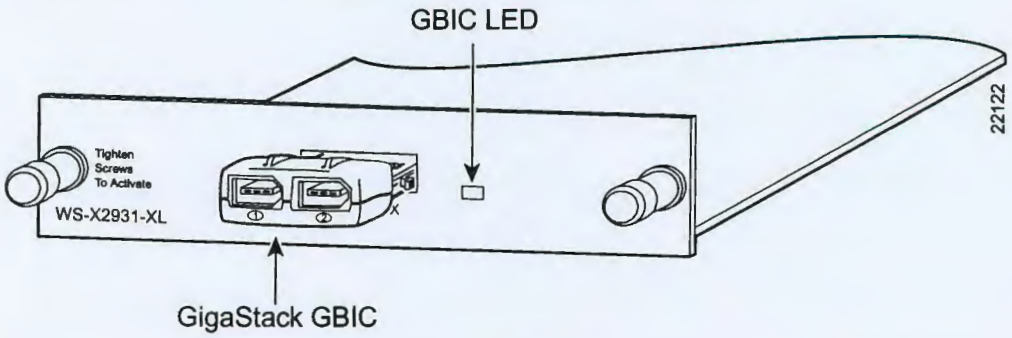

Table 1-2 describes the switch and 1000BASE-X module GBIC slot LED colors and port status.

Table 1-2 Switch and 1000BASE-X Module GBIC Slot LEDs

Color	Meaning
Off	No link, or port was administratively shut down.
Green	Link present.
Flashing green	Activity. Port is transmitting or receiving data.
Alternating green-amber	Link fault. Error frames can affect connectivity, and errors such as excessive collisions, cyclic redundancy check (CRC) errors, and alignment and jabber errors are monitored for a link-fault indication.
Solid amber	Port is blocked by Spanning Tree Protocol (STP) and is not forwarding data. **Note** After a port is reconfigured, the port LED can remain amber for up to 30 seconds as STP checks the switch for possible loops.
Flashing amber	Port is blocked by STP and is sending or receiving packets.

Cabling Guidelines

The GigaStack GBIC uses the following Cisco proprietary cables. See Figure 1-4 and Table 1-3 for more information.

78-6460-04
CPMI - CORREIOS
Fls: 0860
Doc: 3701

4.689

The maximum distance for a GBIC-to-GBIC connection is 1 meter. The GigaStack GBIC requires Cisco proprietary signaling and cabling. For more information about cabling, see Appendix B, "Connectors and Cables."

Figure 1-4 GigaStack GBIC Cables

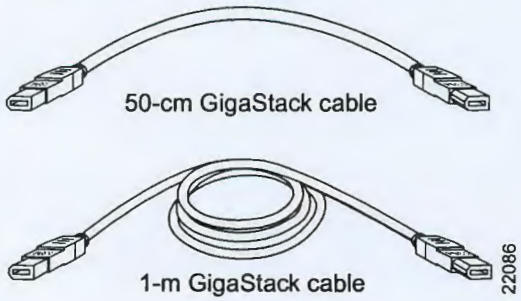

Table 1-3 GigaStack GBIC Cable Part Numbers

Part Number	Cable Length
CAB-GS-50CM	50 cm
CAB-GS-1M	1 m

The 50-cm cable comes with the GigaStack GBIC. You can order additional cables.

Caution Do not use standard IEEE 1394 cables with the GigaStack GBIC. You must use one of the Cisco proprietary cables (CAB-GS-50CM or CAB-GS-1M). If you use any other cable, you will not have connectivity.

Caution Do not use the GigaStack GBIC with standard IEEE 1394 equipment. You might damage the equipment or lose data.

Switches Supporting the GBIC

Refer to the online *GigaStack Gigabit Interface Converter Switch Compatibility Matrix* listed with the GBIC documentation on www.cisco.com for the most current list of products supporting the GBIC.

Caution Installing the GBIC in or connecting it to an unauthorized device might cause damage to the GBIC, the other device, or both.

Table 1-4 lists the switches and the module supporting the GigaStack GBIC.

Table 1-4 Switches and Module Supporting the GigaStack GBIC

Switch Series or Module	Model Number	Description
WS-X2931-XL module for Catalyst 2900 series XL switches	WS-X2931-XL	1 1000BASE-X port[1]
Catalyst 2900 XL switches	Catalyst 2912MF XL	12 100BASE-FX ports and 2 module slots
	Catalyst 2924M XL	24 autosensing 10/100 Ethernet ports and 2 module slots
Catalyst 2950 switches	Catalyst 2950G-12-EI	12 autosensing 10/100 Ethernet ports and 2 GBIC module slots

Switch Series or Module	Model Number	Description
Catalyst 3500 XL switches	Catalyst 3508G XL	8 GBIC module slots
	Catalyst 3512 XL	12 autosensing 10/100 Ethernet ports and 2 GBIC module slots
	Catalyst 3524 XL	24 autosensing 10/100 Ethernet ports and 2 GBIC module slots
	Catalyst 3524 PWR XL	24 autosensing 10/100 inline-power Ethernet ports and 2 GBIC module slots
	Catalyst 3548 XL	48 autosensing 10/100 Ethernet ports and 2 GBIC module slots
Catalyst 3550 switches	Catalyst 3550-12G	2 autosensing 10/100/1000 Ethernet ports and 10 GBIC module slots
	Catalyst 3550-12T	10 autosensing 10/100/1000 Ethernet ports and 2 GBIC module slots
	Catalyst 3550-24-SMI Catalyst 3550-24-EMI	24 autosensing 10/100 Ethernet ports and 2 GBIC module slots
	Catalyst 3550-48-SMI Catalyst 3550-48-EMI	48 autosensing 10/100 Ethernet ports and 2 GBIC module slots

1. The 1000BASE-X module provides one switched 1000-Mbps port in half-duplex, full-duplex, or autonegotiation mode for a GigaStack GBIC. The port supports the IEEE 802.3Z 1000BASE-X standard.

Minimum IOS Release for Redundant Loop Configurations

To ensure support for redundant loop configurations when using the GigaStack GBIC in a cascaded stack configuration, make sure that every switch in the stack is running at least the minimum IOS Release listed in Table 1-5.

RQS N 03/2005 - CN -
CPMI - CORREIOS
0863
Fls:
3701
Doc:

Table 1-5 Minimum IOS Release for Redundant Loop Configurations

Supported Switch	Minimum IOS Release
Modular 2900 XL switches	12.0(5)XU (April 2000)
2950 switches	12.1(6)EA2 (December 2000)
3500 XL switches	12.0(5)XU (April 2000)
3550 multilayer switches	12.1(4)EA1 (May 2001)

Note All switches in a series must run the same software version. For example, if the stack includes only Catalyst 2900 series XL and 3500 series XL switches, they must run Release 12.0(5)XU or later. If the stack includes a mixture of Catalyst 2900 series XL, 3500 series XL, 2950, and 3550 switches, all the 2900 XL and 3500 XL switches must run Release 12.0(5)XW or later, all the Catalyst 2950 switches must run Release 12.1(6)EA2 or later, and all the Catalyst 3550 switches must run Release 12.1(4)EA1 or later.

For more information, see the "Cascaded Stack Connections with a Redundant Link" section on page 2-12. For switch software upgrade information, refer to the release notes for your switch.

CHAPTER 3

Installation

This chapter describes how to install your switch, interpret the power-on self-test (POST), and connect the switch to other devices. Read these topics, and perform the procedures in this order:

- Preparing for Installation, page 3-2
- Verifying Switch Operation, page 3-10
- Installing the Switch in a Rack, page 3-10
- Installing the Switch on a Table, Shelf, or Desk, page 3-22
- Installing the Switch on a Wall, page 3-23
- Installing the GBIC Modules, page 3-26
- Installing and Removing SFP Modules, page 3-28
- Connecting to 10/100 and 10/100/1000 Ports, page 3-32
- Connecting to 100BASE-FX and 1000BASE-SX Ports, page 3-36
- Connecting to an LRE Port, page 3-38
- Connecting to GBIC Module Ports, page 3-44
- Connecting to an SFP Module, page 3-49
- Where to Go Next, page 3-50

Preparing for Installation

This section provides information about these topics:

- Warnings, page 3-2
- EMC Regulatory Statements, page 3-4
- Installation Guidelines, page 3-7
- Verifying Package Contents, page 3-8

Warnings

These warnings are translated into several languages in Appendix D, "Translated Safety Warnings."

Warning **This equipment is to be installed and maintained by service personnel only as defined by AS/NZS 3260 Clause 1.2.14.3 Service Personnel.**

Warning **This unit is intended for installation in restricted access areas. A restricted access area can be accessed only through the use of a special tool, lock and key, or other means of security.**

Warning **Only trained and qualified personnel should be allowed to install or replace this equipment.**

Warning **Read the installation instructions before you connect the system to its power source.**

Warning **Unplug the power cord before you work on a system that does not have an on/off switch.**

4.681

Warning Do not stack the chassis on any other equipment. If the chassis falls, it can cause severe bodily injury and equipment damage.

Warning To comply with safety regulations, mount switches on a wall with the front panel facing up.

Warning If a redundant power system (RPS) is not connected to the switch, install an RPS connector cover on the back of the switch.

Warning The plug-socket combination must be accessible at all times because it serves as the main disconnecting device.

Warning To prevent the switch from overheating, do not operate it in an area that exceeds the maximum recommended ambient temperature of 113°F (45°C). To prevent airflow restriction, allow at least 3 inches (7.6 cm) of clearance around the ventilation openings.

Warning When installing the unit, always make the ground connection first and disconnect it last.

Warning This equipment is intended to be grounded. Ensure that the host is connected to earth ground during normal use.

Warning Before working on equipment that is connected to power lines, remove jewelry (including rings, necklaces, and watches). Metal objects will heat up when connected to power and ground and can cause serious burns or weld the metal object to the terminals.

Doc:

Warning **Do not work on the system or connect or disconnect cables during periods of lightning activity.**

Warning **Ultimate disposal of this product should be handled according to all national laws and regulations.**

Warning **Attach only the Cisco RPS (model PWR300-AC-RPS-N1) to the RPS receptacle.**

Warning **Invisible laser radiation may be emitted from disconnected fibers or connectors. Do not stare into beams or view directly with optical instruments.**

Warning **Class 1 laser product**

Warning **Avoid direct exposure to the laser beam**

EMC Regulatory Statements

This section includes specific regulatory statements about the Catalyst 2950 switches.

U.S.A.

U.S. regulatory information for this product is in the front matter of this manual.

Installation Guidelines

When determining where to place the switch, observe these guidelines.

- Before installing the switch, first verify that the switch is operational by powering it on and running POST. Follow the procedures in the "Verifying Switch Operation" section on page 3-10.
- For 10/100 ports and 10/100/1000 ports, the cable length from a switch to an attached device cannot exceed 328 feet (100 meters).
- For 100BASE-FX ports, the cable length from a switch to an attached device cannot exceed 6562 feet (2 kilometers).
- For 1000BASE-SX ports and 1000BASE-SX Gigabit Interface Converter (GBIC) module ports, the cable length from a switch to an attached device cannot exceed 1804 feet (550 meters).
- For 1000BASE-LX/LH GBIC module ports, the cable length from a switch to an attached device cannot exceed 32,810 feet (10 kilometers).
- For 1000BASE-ZX GBIC module ports, the cable length from a switch to an attached device cannot exceed 328,100 feet (100 kilometers).
- For 1000BASE-T GBIC module ports, the cable length from a switch to an attached device cannot exceed 328 feet (100 meters).
- For Coarse Wave Division Multiplexing (CWDM) GBIC module ports, the cable length from a switch to an attached device cannot exceed 393,719 feet (120 kilometers). For specific cable lengths, refer to the CWDM GBIC module documentation.
- For GigaStack GBIC module ports, the cable length from a switch to an attached device cannot exceed 3 feet (1 meter).
- For Long-Reach Ethernet (LRE) ports, cable-length specifications vary. See the "LRE Port" section on page 2-12.
- Operating environment is within the ranges listed in Appendix A, "Technical Specifications."
- Clearance to front and rear panels meet these conditions:
  - Front-panel LEDs can be easily read.
  - Access to ports is sufficient for unrestricted cabling.
  - Rear-panel AC power connector on switches other than the LRE switches is within reach of an AC power outlet.

ROS - CN
CPMI - CORREIOS

Doc:

- Rear-panel direct current (DC) power connector on the Catalyst 2950G-24-EI-DC switch is within reach of a circuit breaker.
- Front-panel AC power connector on the LRE switches is within reach of an AC power outlet.
- Front-panel DC power connector on the Catalyst 2950ST-24 LRE 997 switch is within reach of a circuit breaker.

- Airflow around the switch and through the vents is unrestricted.
- Temperature around the unit does not exceed 113°F (45°C).

Note If the switch is installed in a closed or multirack assembly, the temperature around it might be greater than normal room temperature.

- Cabling is away from sources of electrical noise, such as radios, power lines, and fluorescent lighting fixtures.

Verifying Package Contents

Note Carefully remove the contents from the shipping container, and check each item for damage. If any item is missing or damaged, contact your Cisco representative or reseller for support. Return all packing materials to the shipping container and save them.

The switch is shipped with these items:

- This *Catalyst 2950 Desktop Switch Hardware Configuration Guide*
- *About the Catalyst 2950 and Catalyst 2955 Documentation*
- AC power cord (not shipped with the Catalyst 2950G-24-EI-DC switch or the Catalyst 2950ST-24 LRE 997 switch)
- Mounting kit containing these items:
  - Four rubber feet for mounting the switch on a table, shelf, or desk
  - Two 19-inch or 24-inch rack-mounting brackets

4.675

  - Six number-8 Phillips flat-head screws for attaching the brackets to the switch
  - Four number-8 Phillips truss-head screws for attaching the brackets to the switch
  - Four number-12 Phillips machine screws for attaching the brackets to a rack
  - One cable guide and one black Phillips machine screw for attaching the cable guide to one of the mounting brackets
  - One RPS connector cover and two number-4 pan-head screws
- DC-switch kit containing these items:
  - One DC terminal block plug (also called a terminal block header)
  - One ground lug
  - Two number-10-32 screws for attaching the ground lug to the switch
  - Two 23-inch rack-mounting brackets (with 1-inch spacing for telco racks)
  - Four number-8 Phillips truss-head screws for attaching the brackets to the switch
  - Two number-12 Phillips machine screws for attaching the brackets to a rack

Note The DC-switch kit ships only with the Catalyst 2950G-24-EI-DC or Catalyst 2950ST-24 LRE 997 switch.

- One RJ-45-to-DB-9 adapter cable
- Product ownership registration card

If you want to connect a terminal to the switch console port, you need to provide an RJ-45-to-DB-25 female DTE adapter. You can order a kit (part number ACS-DSBUASYN=) with that adapter from Cisco.

CPMI 3-9

Doc:

Verifying Switch Operation

Before installing the switch in a rack, on a wall, or on a table or shelf, you should power on the switch and verify that the switch passes POST. See Chapter 1, "Quick Installation," for the steps required to connect a PC to the switch console port and to power on the switch.

After a successful POST, follow these steps:

Step 1 Turn off power to the switch.

Step 2 Disconnect the cables.

Step 3 Determine where you want to install the switch.

Installing the Switch in a Rack

Warning **To prevent bodily injury when mounting or servicing this unit in a rack, you must take special precautions to ensure that the system remains stable. The following guidelines are provided to ensure your safety:**

- This unit should be mounted at the bottom of the rack if it is the only unit in the rack.
- When mounting this unit in a partially filled rack, load the rack from the bottom to the top with the heaviest component at the bottom of the rack.
- If the rack is provided with stabilizing devices, install the stabilizers before mounting or servicing the unit in the rack.

Note Figure 3-1 to Figure 3-20 show the Catalyst 2950-24, 2950G-24-EI-DC, and 2950G-48-EI switches as examples. You can install other Catalyst 2950 switches in a rack as shown in these illustrations.

To install the switch in a 19-, 23-, or 24-inch rack, follow these steps:

1. Attaching the Brackets to the Switch, page 3-11
2. Mounting the Switch in a Rack, page 3-21
3. Attaching the Optional Cable Guide, page 3-22

Note Installing the Catalyst 2950G-48-EI switch in a 23-inch or 24-inch rack requires an optional bracket kit not included with the switch. You can order a kit containing the 23-inch or 24-inch rack-mounting brackets and hardware from Cisco (part number RCKMNT-1RU=).

Attaching the Brackets to the Switch

The bracket orientation and the screws that you use depend on whether you are attaching the brackets to a 19-, 23-, or 24-inch rack. Follow these guidelines:

- When mounting a switch other than a Catalyst 2950G-48-EI switch in a 19-inch rack, use two Phillips flat-head screws to attach the long side of the 19- or 24-inch bracket to the switch. See Figure 3-1, Figure 3-2, and Figure 3-3.
- When mounting a Catalyst 2950G-48-EI switch in a 19-inch rack, use three Phillips flat-head screws to attach the long side of the 19- or 24-inch bracket to the switch. See Figure 3-4, Figure 3-5, and Figure 3-6.
- When mounting a Catalyst 2950G-24-EI-DC or Catalyst 2950ST-24 LRE 997 switch in a 23-inch rack, use two Phillips truss-head screws to attach the 23-inch bracket to the switch. See Figure 3-7, Figure 3-8, and Figure 3-9.
- When mounting a switch other than a Catalyst 2950G-48-EI switch in a 24-inch rack, use two Phillips truss-head screws to attach the 19- or 24-inch bracket to the switch. See Figure 3-10, Figure 3-11, and Figure 3-12.
- When mounting a Catalyst 2950G-48-EI switch in a 24-inch rack, use three Phillips flat-head screws to attach the 24-inch bracket (part number RCKMNT-1RU=) to the switch. See Figure 3-13, Figure 3-14, and Figure 3-15.

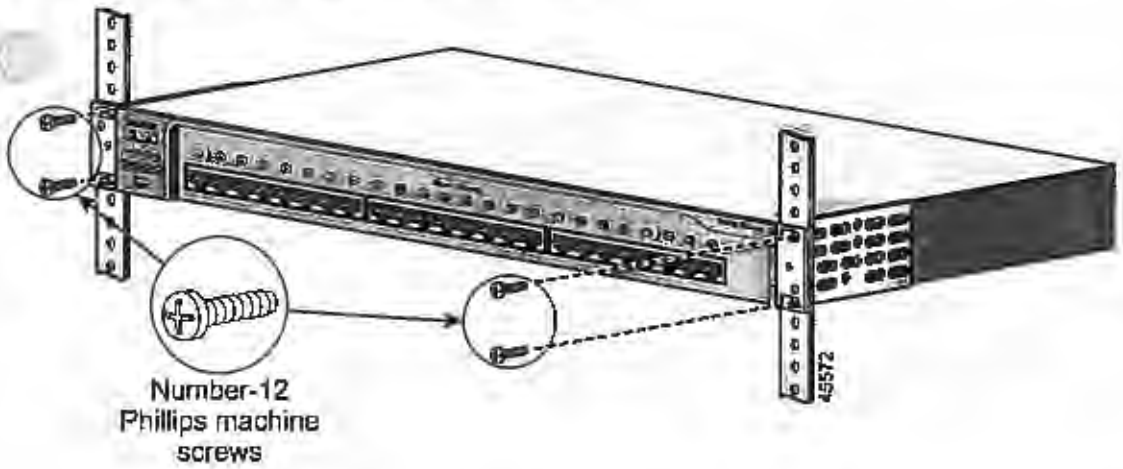
Mounting the Switch in a Rack

After attaching the brackets, use the four Phillips machine screws to securely attach the brackets to the rack, as shown in Figure 3-16.

When installing a switch other than an LRE switch, to prevent the cables from obscuring the switch and other devices in the rack, you can also attach the cable guide to the rack. See the"Attaching the Optional Cable Guide" section for instructions.

Figure 3-16 Mounting the Switch in a Rack



After mounting the switch in the rack, start the terminal-emulation software, and provide power to the switch. See Chapter 1, "Quick Installation" for instructions.

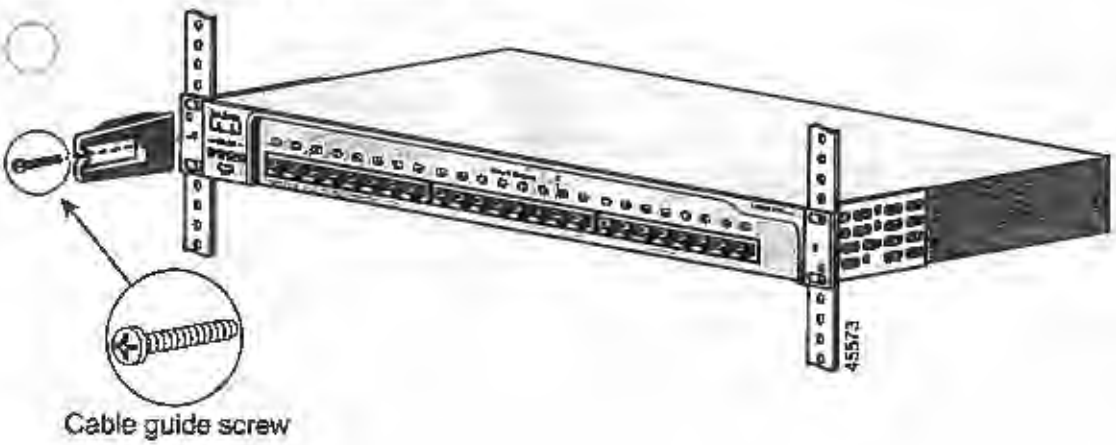
CP EIOS
Fls 0878
Doc 3701

Attaching the Optional Cable Guide

We recommend attaching the cable guide to prevent the cables from obscuring the front panels of the switch and other devices installed in the rack. Use the supplied black Phillips machine screw to attach the cable guide to the left or right bracket, as shown in Figure 3-17.

Note You cannot use the cable guide with Catalyst 2950 LRE switches.

Figure 3-17 Attaching the Cable Guide



Installing the Switch on a Table, Shelf, or Desk

Before placing the switch on a table, shelf, or desk, locate the adhesive strip with rubber feet in the mounting-kit envelope, and attach four rubber feet to the recessed areas on the switch bottom. Place the switch on a table, shelf, or desk near an AC power source or DC-input power source.

Start the terminal-emulation software and provide power to the switch. See Chapter 1, "Quick Installation," for instructions.

Installing the Switch on a Wall

Warning **To comply with safety regulations, mount switches on a wall with the front panel facing up.**

Warning **If a redundant power system (RPS) is not connected to the switch, install an RPS connector cover on the back of the switch.**

You can mount the Catalyst 2950 switch to a wall in a face-up configuration. To attach the switch to a wall, follow the procedures in this section.

1. Attaching the Brackets to the Switch, page 3-23
2. Attaching the RPS Connector Cover, page 3-24
3. Mounting the Switch to a Wall, page 3-25

Attaching the Brackets to the Switch

Use the supplied Phillips flat-head screws to attach a bracket to the switch. Figure 3-18 shows how to attach the bracket to one side of the switch. Follow the same steps to attach the second bracket to the opposite side of the switch.

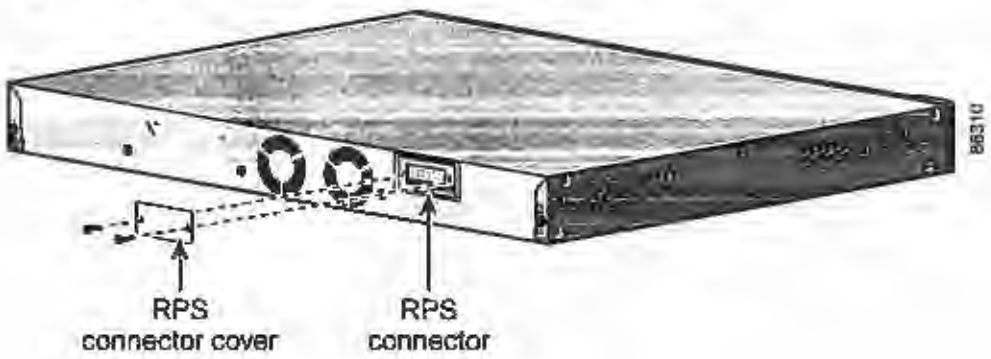
Figure 3-18 Attaching Brackets for Wall-Mounting for the Catalyst 2950 Switch

Attaching the RPS Connector Cover

If you are not using a redundant power system (RPS) with your switch, use two number-4 Phillips pan-head screws to install an RPS connector cover to the back of the switch. (See Figure 3-19.) The pan-head screws are included in the accessory kit.

Warning **If an RPS is not connected to the switch, install an RPS connector cover on the back of the switch.**

Figure 3-19 Attaching the RPS Connector Cover

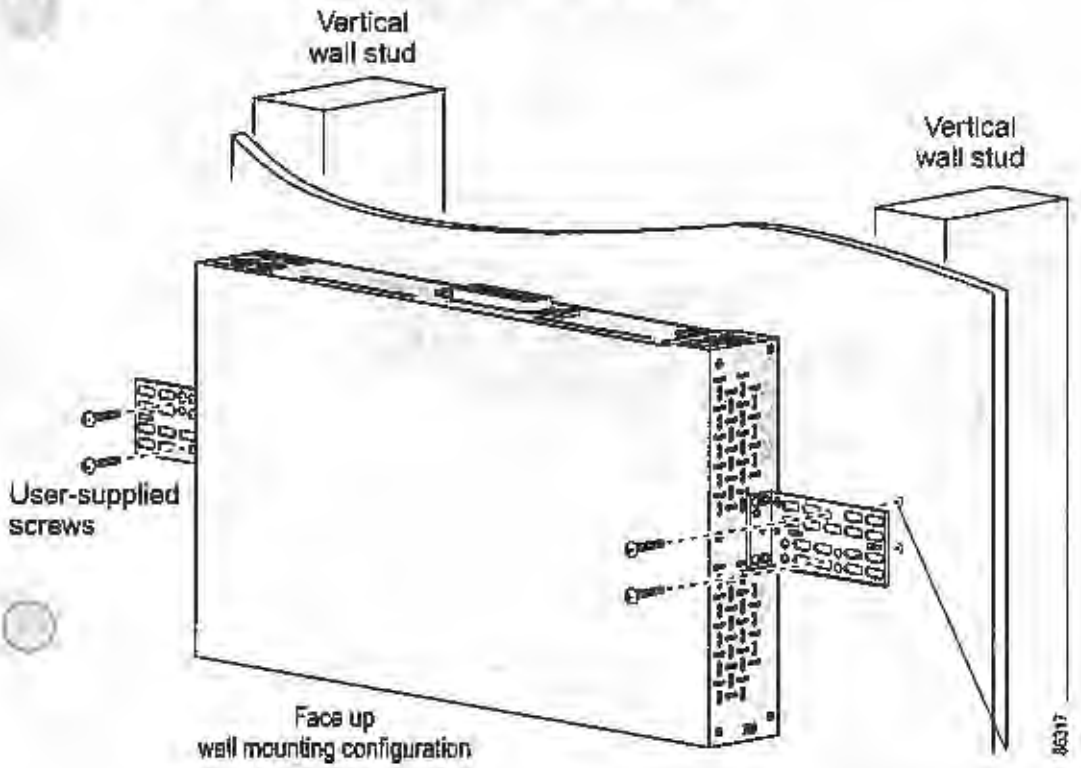


Mounting the Switch to a Wall

Warning **To comply with safety regulations, mount switches on a wall with the front panel facing up.**

For the best support of the switch and cables, make sure the switch is attached securely to a wall stud or to a firmly attached plywood mounting backboard, as shown in Figure 3-20.

Figure 3-20 Mounting a Catalyst 2950 Switch to a Wall



After the switch is mounted on the wall, power the switch as described in Chapter 1, "Quick Installation."

Installing the GBIC Modules

Figure 3-21, Figure 3-22, and Figure 3-23 show how to insert a GBIC module in a GBIC module slot on the switch. For instructions on how to install a CWDM GBIC module in a GBIC module slot, refer to the documentation that came with that GBIC module.

For detailed instructions on installing, removing, and cabling the GBIC module (the 1000BASE-X module, the 1000BASE-T module, the CWDM GBIC module, or the GigaStack module), refer to your GBIC documentation.

Caution To prevent electrostatic-discharge (ESD) damage when installing GBIC modules, follow your normal board and component handling procedures.

Figure 3-21 Installing a 1000BASE-X GBIC Module in a Switch

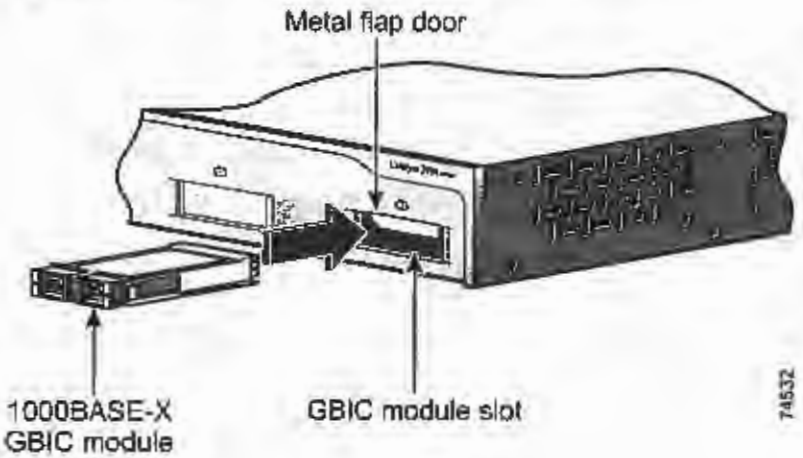


Figure 3-22 Installing a 1000BASE-T GBIC Module in a Switch

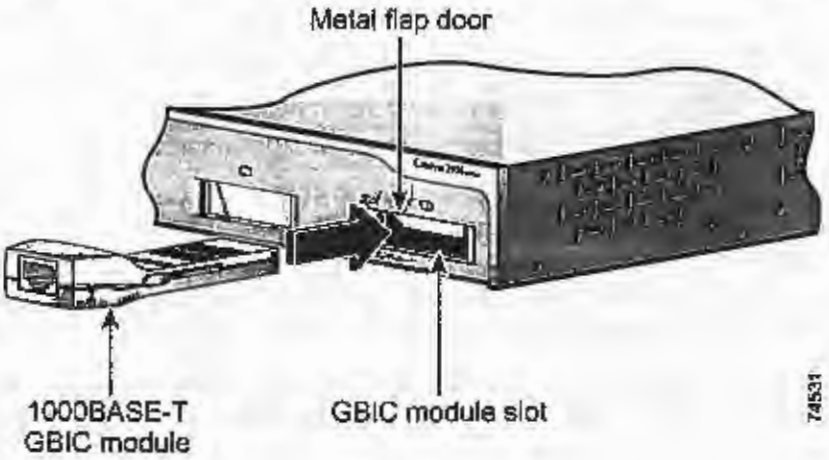

Figure 3-23 Installing a GigaStack GBIC Module in a Switch

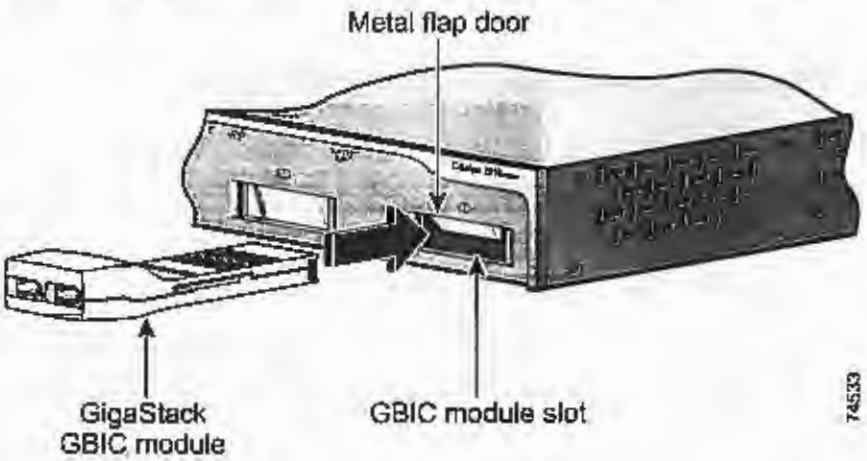

Installing and Removing SFP Modules

These sections describe how to install and remove small-form-factor pluggable (SFP) modules. SFP modules are inserted into SFP module slots on the front of the Catalyst 2950 LRE switches. These field-replaceable modules provide the uplink optical interfaces, laser send (TX) and laser receive (RX).

You can use any combination of SFP modules. Refer to the Catalyst 2950 LRE release notes for the list of SFP modules that the Catalyst 2950 LRE switch supports. Each port must match the wave-length specifications on the other end of the cable, and the cable must not exceed the stipulated cable length for reliable communications. Refer to Table 2-2 for cable stipulations for SFP connections.

Use only Cisco SFP modules on the Catalyst 2950 LRE switch. Each SFP module has an internal serial EEPROM that is encoded with security information. This encoding provides a way for Cisco to identify and validate that the SFP module meets the requirements for the switch.

For detailed instructions on installing, removing, and cabling the SFP module, refer to your SFP module documentation.

Installing SFP Modules into SFP Module Slots

SFP modules use different types of latches for their installation and extraction. Determine which type of latch your SFP module uses before following the installation procedure:

- Figure 3-24 shows an SFP module with a Mylar tab latch.
- Figure 3-25 shows an SFP module with an actuator button latch.
- Figure 3-26 shows an SFP module that has a bale-clasp latch.

Caution We strongly recommend that you do not install or remove the SFP module with fiber-optic cables attached to it because of the potential damage to the cables, the cable connector, or the optical interfaces in the SFP module. Disconnect all cables before removing or installing an SFP module.

Removing and installing an SFP module can shorten its useful life. Do not remove and insert SFP modules more often than is absolutely necessary.

Figure 3-24 SFP Module with a Mylar Tab Latch

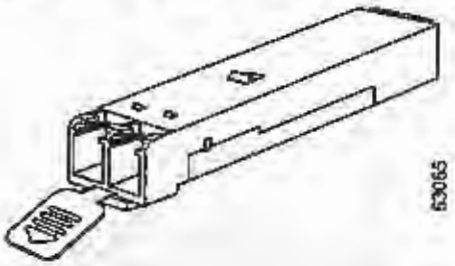

Figure 3-25 SFP Module with an Actuator Button Latch

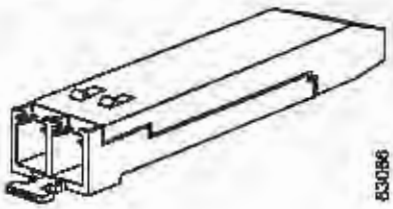

Figure 3-26 SFP Module with a Bale-Clasp Latch

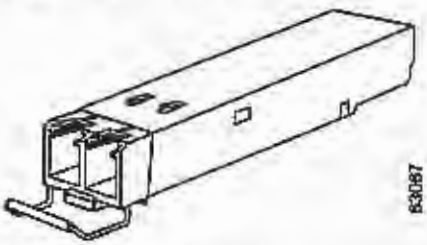


To insert an SFP module into the SFP module slot, follow these steps:

Step 1 Attach an ESD-preventive wrist strap to your wrist and to a bare metal surface on the chassis.

Step 2 Find the send (TX) and receive (RX) markings that identify the top side of the SFP module.

Note On some SFP modules, the send and receive (TX and RX) markings might be replaced by arrows that show the direction of the connection, either send or receive (TX or RX).

Step 3 Align the SFP module in front of the slot opening.

Step 4 Insert the SFP module into the slot until you feel the connector on the module snap into place in the rear of the slot.

Figure 3-27 Installing an SFP Module into an SFP Module Slot

Step 5 Remove the dust plugs from the SFP module optical ports and store them for later use.

Caution Do not remove the dust plugs from the SFP module port or the rubber caps from the fiber-optic cable until you are ready to connect the cable. The plugs and caps protect the SFP module ports and cables from contamination and ambient light.

Step 6 Insert the LC into the SFP module.

Removing SFP Modules from SFP Module Slots

To remove an SFP module from a module receptacle, follow these steps:

Step 1 Attach an ESD-preventive wrist strap to your wrist and to a bare metal surface on the chassis.

Step 2 Disconnect the LC from the SFP module.

Tip For reattachment, note which cable connector plug is send (TX) and which is receive (RX).

Step 3 Insert a dust plug into the optical ports of the SFP module to keep the optical interfaces clean.

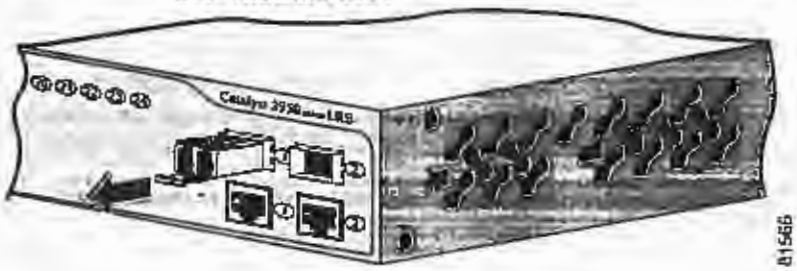
Step 4 Unlock and remove the SFP module, as shown in Figure 3-28, Figure 3-29, and Figure 3-30.

- If the module has a Mylar tab latch, pull the tab straight out so that you remove the SFP module from the port in a parallel direction. Do not twist or pull the tab because you could disconnect it from the SFP module.

Figure 3-28 Using the Mylar Tab Latch to Remove an SFP Module from a Slot

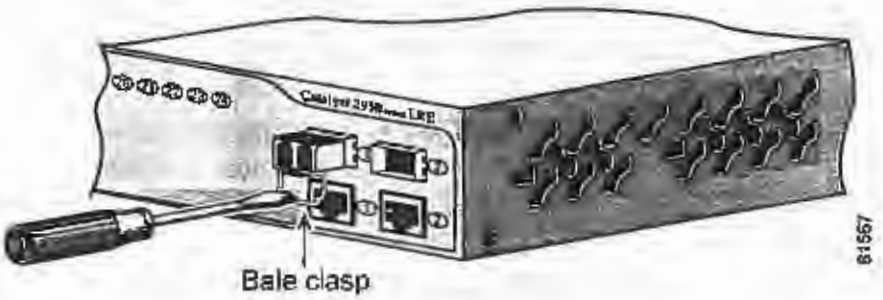
- If the module has an actuator button latch, use your thumb to push inward on the wedge to free the locking pin, and use your index finger to grip the ridge on top of the SFP module. Pull straight out to remove the module.

Figure 3-29 Using the Actuator Button Latch to Remove an SFP Module from an SFP Module Slot



- If the module has a bale-clasp latch, pull the bale out and down to eject the module. If the bale-clasp latch is obstructed and you cannot use your index finger to open it, use a small, flat-blade screwdriver or other long, narrow instrument to open the bale-clasp latch.

Figure 3-30 Removing a Bale-Clasp Latch SFP Module by Using a Flat-Blade Screwdriver



Step 5 Grasp the SFP module between your thumb and index finger, and carefully remove it from the module slot.

Step 6 Place the removed SFP module in an antistatic bag or other protective environment.

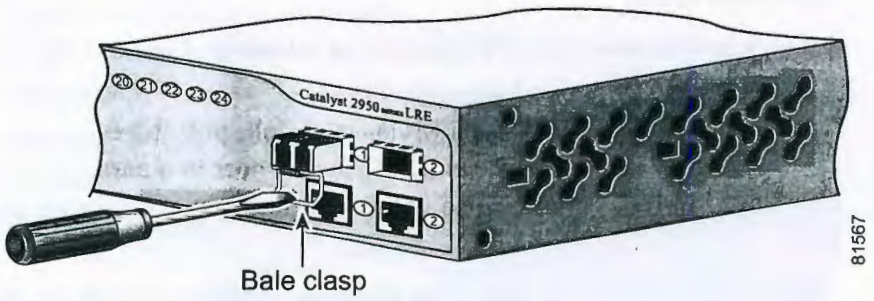
Connecting to 10/100 and 10/100/1000 Ports

The 10/100 ports configure themselves to operate at the speed and duplex settings of attached devices. They operate at 10 or 100 Mbps in half- or full-duplex mode. If the attached devices do not support autonegotiation, you can explicitly set the speed and duplex parameters.

The 10/100/1000 ports configure themselves to operate at the speed setting of attached devices. These ports on Catalyst 2950T-24 switches operate at 10, 100, or 1000 Mbps in full-duplex mode. The 10/100/1000 ports on Catalyst 2950 LRE switches operate at 10 or 100 Mbps in either half- or full-duplex mode and at 1000 Mbps only in full-duplex mode. If the attached devices do not support autonegotiation, you can set the speed.

Figure 3-14 Attaching Brackets on the Catalyst 2950G-48-EI Switch in a 24-Inch Rack (Rear Panel Forward)

Figure 3-30 Removing a Bale-Clasp Latch SFP Module by Using a Flat-Blade Screwdriver



Step 5 Grasp the SFP module between your thumb and index finger, and carefully remove it from the module slot.

Step 6 Place the removed SFP module in an antistatic bag or other protective environment.

Connecting to 10/100 and 10/100/1000 Ports

The 10/100 ports configure themselves to operate at the speed and duplex settings of attached devices.They operate at 10 or 100 Mbps in half- or full-duplex mode. If the attached devices do not support autonegotiation, you can explicitly set the speed and duplex parameters.

The 10/100/1000 ports configure themselves to operate at the speed setting of attached devices. These ports on Catalyst 2950T-24 switches operate at 10, 100, or 1000 Mbps in full-duplex mode. The 10/100/1000 ports on Catalyst 2950 LRE switches operate at 10 or 100 Mbps in either half- or full-duplex mode and at 1000 Mbps only in full-duplex mode. If the attached devices do not support autonegotiation, you can set the speed.

4.651
CPI - AC

Note On the Catalyst 2950 LRE switches, the four input uplink ports are bundled as two logical ports, each consisting of a copper 10/100/1000 port and a fiber-optic SFP module slot, respectively.

Within each logical port, you can use only the copper or the fiber-optic port at one time. If the Catalyst 2950 LRE switch senses more than two connections for both logical ports, by default, the switch chooses the fiber-optic connections over the copper connections.

See the "SFP Module Slots" section on page 2-14 for more information on LRE uplink logical ports.

Connecting devices that do not autonegotiate or devices with manually set speed and duplex parameters can reduce performance or result in link failures between the devices. To maximize performance, choose one of these methods for configuring the ports:

- Let the 10/100 ports autonegotiate both speed and duplex, let the 10/100/1000 ports on the LRE switches autonegotiate both speed and duplex, and let the 10/100/1000 ports on the Catalyst 2950G-24-EI-DC switch only autonegotiate speed.
- Set the speed and duplex parameters on both ends of the connection.

When connecting the ports on the Catalyst 2950G-24-EI-DC and Catalyst 2950ST-24 LRE 997 switches to other devices, follow these guidelines:

Caution To comply with the intrabuilding lightning surge requirements, intrabuilding wiring must be shielded, and the shield for the wiring must be grounded at both ends.

Caution The Catalyst 2950G-24-EI-DC or Catalyst 2950ST-24 LRE 997 switch is suitable only for intrabuilding or nonexposed wiring connections.

Step 2 Insert the other cable end in an RJ-45 connector on the target device.

Step 3 Observe the port status LED.

The LED turns green when the switch and the target device have an established link.

The LED turns amber while Spanning Tree Protocol (STP) discovers the network topology and searches for loops. This process takes about 30 seconds, and then the LED turns green.

If the LED is off, the target device might not be turned on, there might be a cable problem, or there might be a problem with the adapter installed in the target device. See Chapter 4, "Troubleshooting," for solutions to cabling problems.

Step 4 Reconfigure and restart the target device if necessary.

Step 5 Repeat Steps 1 through 4 to connect each port.

Connecting to 100BASE-FX and 1000BASE-SX Ports

The 100BASE-FX and 1000BASE-SX ports operate only in full-duplex mode.

You can connect a 100BASE-FX or 1000BASE-SX port to an SC or ST port on a target device by using one of the MT-RJ fiber-optic patch cables listed in Table 3-1. Use the Cisco part numbers in Table 3-1 to order the patch cables that you need.

Table 3-1 MT-RJ Patch Cables for 100BASE-FX and 1000BASE-SX Connections

Type	Cisco Part Number
1-meter, MT-RJ-to-SC multimode cable	CAB-MTRJ-SC-MM-1M
3-meter, MT-RJ-to-SC multimode cable	CAB-MTRJ-SC-MM-3M
5-meter, MT-RJ-to-SC multimode cable	CAB-MTRJ-SC-MM-5M
1-meter, MT-RJ-to-ST multimode cable	CAB-MTRJ-ST-MM-1M
3-meter, MT-RJ-to-ST multimode cable	CAB-MTRJ-ST-MM-3M
5-meter, MT-RJ-to-ST multimode cable	CAB-MTRJ-ST-MM-5M

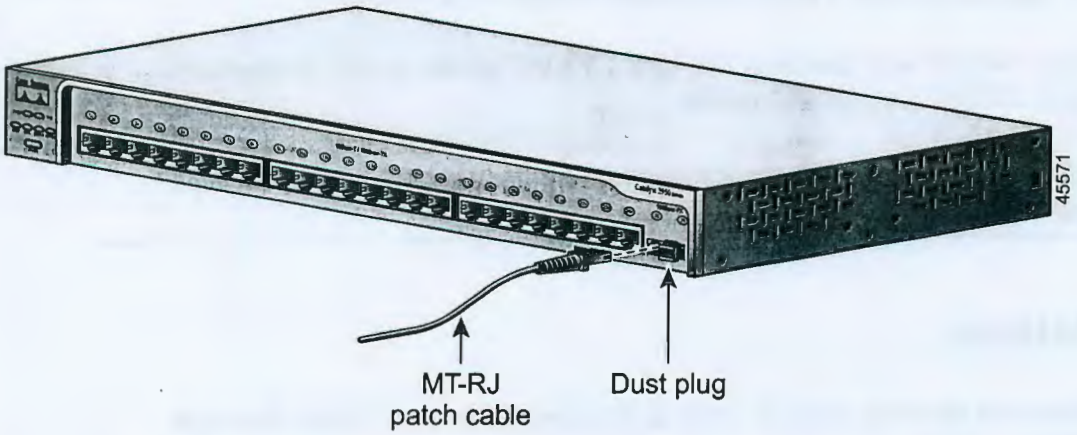
Caution Do not remove the dust plugs from the fiber-optic ports or the rubber caps from the fiber-optic cable until you are ready to connect the cable. The plugs and caps protect the fiber-optic ports and cables from contamination and ambient light.

Follow these steps to connect the switch to a 100BASE-FX or 1000BASE-SX device:

Step 1 Remove the dust plugs from the 100BASE-FX or 1000BASE-SX port and the rubber caps from the MT-RJ patch cable. Store them for future use.

Step 2 Insert the cable in a 100BASE-FX or 1000BASE-SX port. (See Figure 3-34.)

Figure 3-34 Connecting to a 100BASE-FX or 1000BASE-SX Port



Step 3 Insert the other cable end in an SC or ST port on the target device.

Step 4 Observe the port status LED.

The LED turns green when the switch and the target device have an established link.

The LED turns amber while STP discovers the network topology and searches for loops. This process takes about 30 seconds, and then the port LED turns green.

If the LED is off, the target device might not be turned on, there might be a cable problem, or there might be a problem with the adapter installed in the target device. See Chapter 4, "Troubleshooting," for solutions to cabling problems.

CPMI - CORREIOS
Fls: 0886
Doc: 3701

Step 5 Reconfigure and restart the target device if necessary.

Step 6 Repeat Steps 1 through 5 to connect each port.

Connecting to an LRE Port

Depending on the switch model, you can connect the LRE port to up to 8 or up to 24 LRE customer premises equipment (CPE) devices through a patch panel. For information about which LRE CPE devices are supported by the LRE switches, see Table 2-1 on page 2-4.

Note You can connect both Cisco 575 LRE CPE and Cisco 585 LRE CPE devices to your Catalyst 2950ST-8 LRE or Catalyst 2950ST-24 LRE switch.

You can connect only the Cisco 576 LRE CPE 997 device to LRE ports on a Catalyst 2950ST-24 LRE 997 switch.

You can hot swap the CPE devices without powering down the switch or disrupting the other switch ports.

Connection Guidelines

If telephone services, such as voice or Integrated Services Digital Network (ISDN), use the same cabling as the LRE traffic, you must connect the LRE to a plain old telephone service (POTS) splitter. The splitter routes LRE data (high-frequency) and voice (low-frequency) traffic from the telephone line to the switch and private branch exchange (PBX) switch or public switched telephone network (PSTN).

If the other telephone services are connected through a PBX switch, you can use a Cisco LRE 48 POTS Splitter. The PBX routes voice traffic to private telephone networks and the PSTN. For more information about the Cisco LRE 48 POTS Splitter (PS-1M-LRE-48), refer to the *Installation and Warranty Notes for the Cisco LRE 48 POTS Splitter*.

4.645
J

If the installation does not have a PBX, you need to use a homologated POTS splitter to connect to the PSTN. For more information about homologated POTS splitters, contact your Cisco sales representative.

If a connection to a telephone network is not required, you do not need a splitter, and you can connect the switch to the patch panel.

Limitations and Restrictions with POTS Splitters

These limitations and restrictions apply when you use a POTS splitter with Catalyst 2950 LRE switches and Cisco LRE CPE devices:

- The Catalyst 2950ST-8 LRE switch, Catalyst 2950ST-24 LRE switch, Cisco 575 LRE CPE, and Cisco 585 LRE CPE are designed to share lines with analog, ISDN, and digital PBX switch telephones that use the 0 to 700 kHz frequency range.

  Digital telephones connected to digital PBX switches that use frequencies above 700 kHz do not work when sharing a line with LRE signals. Due to the proprietary nature of digital PBX switches, some digital PBX switch services use frequencies above 700 kHz.

- You can use a Cisco LRE 48 POTS Splitter with a Catalyst 2950ST-8 LRE switch, Catalyst 2950ST-24 LRE switch, Cisco 575 LRE CPE, and Cisco 585 LRE CPE. For installation instructions, refer to the *Installation and Warranty Notes for the Cisco LRE 48 POTS Splitter.*

- The Catalyst 2950ST-24 LRE 997 switch and Cisco 576 LRE 997 CPE are designed to share lines with analog and ISDN telephones that use the 0 to 120 kHz frequency range.

- We recommend that *you do not use* a Cisco LRE 48 POTS Splitter with a Catalyst 2950ST-24 LRE 997 switch and a Cisco 576 LRE 997 CPE as shown in Figure 3-35. Only traffic in a specific frequency range can be sent to and from the devices attached to the CPE.

  In Figure 3-35, only traffic from 0 to 120 kHz can pass from a device attached to the CPE, such as a computer or telephone, to the CPE, a splitter, and a switch. In the reverse direction, traffic from 0 to 700 kHz can pass through the switch and splitter to the CPE, but only traffic from 0 to 120 kHz can pass through the CPE to a computer or a telephone.

  For more information, refer to the *Installation and Warranty Notes for the Cisco LRE 48 POTS Splitter.*

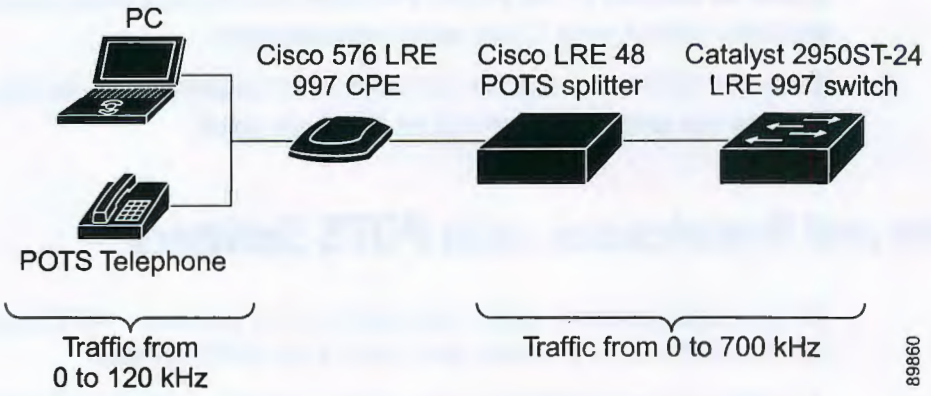
Figure 3-35 Limitations Using a Cisco LRE 48 POTS Splitter with a Catalyst 2950ST-24 LRE 997 Switch and a Cisco 576 LRE 997 CPE



Required Cables

Connecting the LRE port to a patch panel or a POTS splitter requires a male-to-male RJ-21 cable, Category 3 or above. You can order RJ-21 cables from your cable vendor, or you can order these cables from your Cisco sales representative:

- CAB-5-M120M120-5= (Category 5 cable with 90-degree, male-to-male RJ-21 connectors)
- CAB-5-M180M120-5= (Category 5 cable with 120-degree, male-to-male RJ-21 connectors)

The screws that you need to secure the cable to the switch are shipped with the cable. Contact your Cisco sales representative for more information.

U.643

Connecting to a Patch Panel or POTS Splitter

To connect the LRE port to a patch panel or POTS splitter, follow these steps:

Step 1 Connect one end of a cable connected to the wiring trunk to the RJ-21 connector (the LRE port) on the switch. (See Figure 3-36 and Figure 3-37.)

Step 2 Referring to Figure 3-36 and Figure 3-37, secure the cable to the switch:

- For a 90-degree connector, see the top of Figure 3-36 and Figure 3-37.
- For a 12-degree connector, see the bottom of Figure 3-36 and Figure 3-37.

Note The cable tie is not included with the connector and cable assembly.

Step 3 Connect the other end of the cable to the patch panel or POTS splitter.

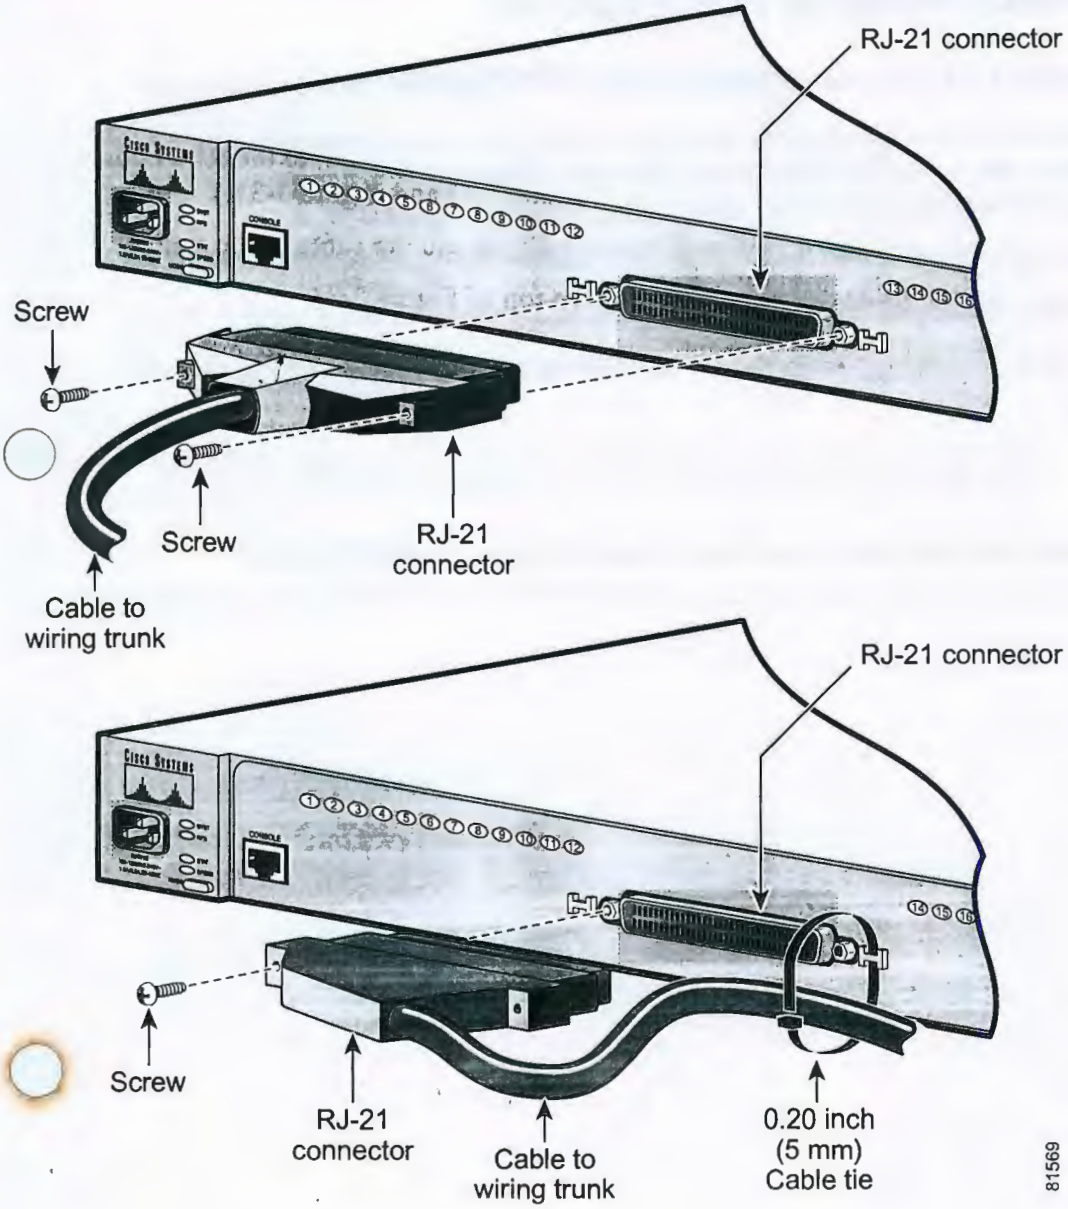

Figure 3-37 Connecting to an LRE Port on a Catalyst 2950ST-24 LRE 997 Switch

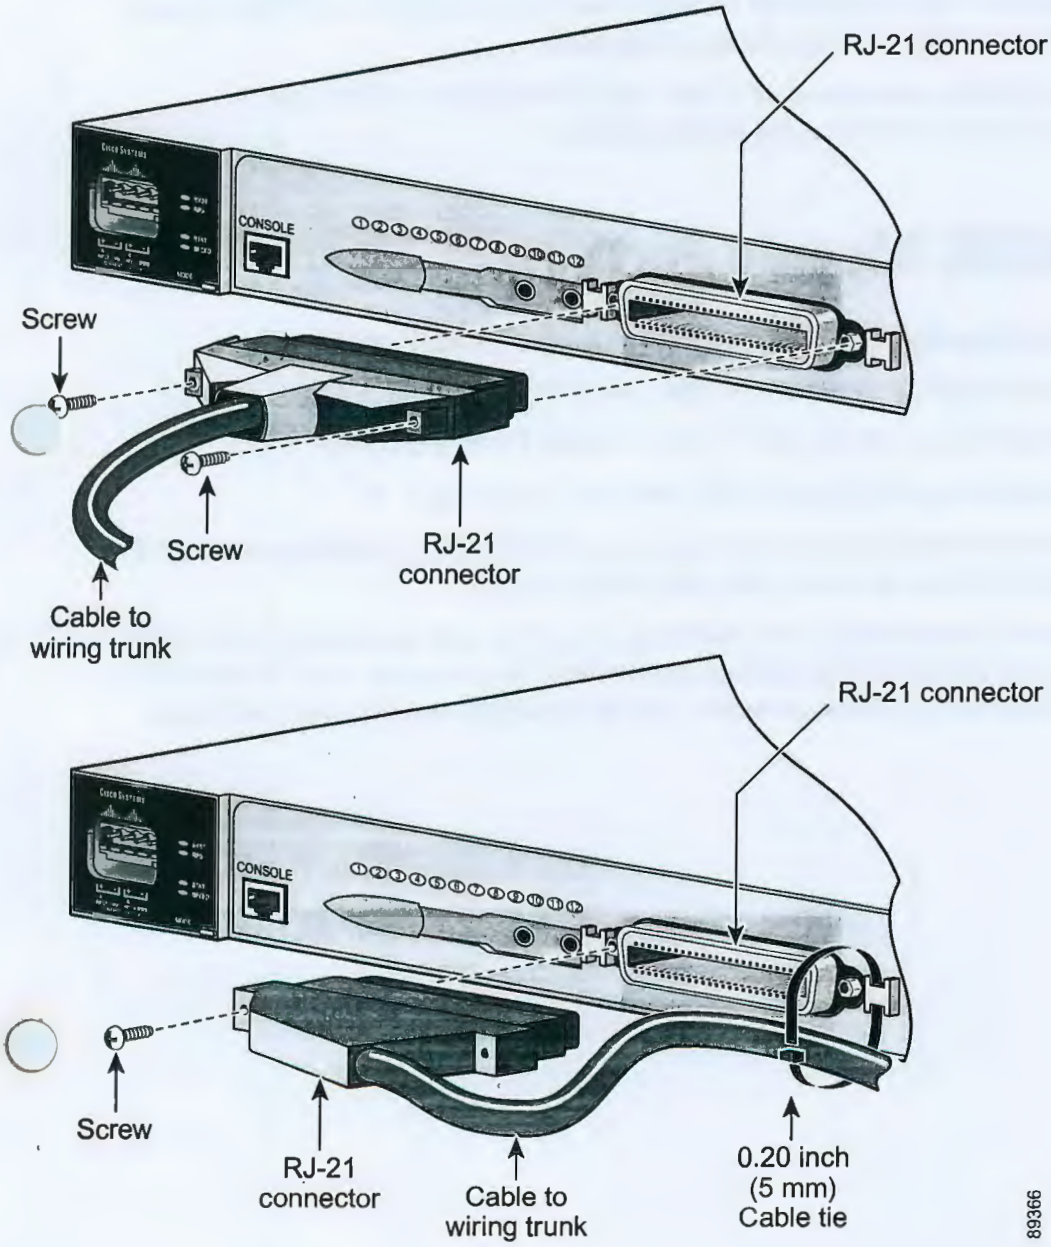

Each LRE port status LED turns on when it establishes a link with a Cisco LRE CPE device. For more information about the LRE link between the switch LRE port and the CPE and about the configuration and management of CPE devices, refer to the switch software configuration guide.

For more information about the Cisco LRE CPE devices, refer to the *Cisco LRE CPE Hardware Installation Guide.*

Connecting to GBIC Module Ports

These sections describe how to connect to a GBIC module port.

- Connecting to 1000BASE-X GBIC Module Ports, page 3-45
- Connecting to 1000BASE-T GBIC Module Ports, page 3-47
- Connecting to GigaStack GBIC Module Ports, page 3-48

For instructions about how to connect to the CWDM GBIC module ports, refer to the documentation that came with that GBIC module.

For detailed instructions about installing, removing, and connecting to the GBIC module (the 1000BASE-X module, the 1000BASE-T module, the CWDM GBIC module, or the GigaStack module), refer to the GBIC module documentation.

ECT

J

When connecting the ports on the Catalyst 2950G-24-EI-DC and Catalyst 2950ST-24 LRE 997 switches to other devices, follow these guidelines:

Caution To comply with the intrabuilding lightning surge requirements, intrabuilding wiring must be shielded, and the shield for the wiring must be grounded at both ends.

Caution The Catalyst 2950G-24-EI-DC or Catalyst 2950ST-24 LRE 997 switch is suitable only for intrabuilding or nonexposed wiring connections.

Connecting to 1000BASE-X GBIC Module Ports

Caution Do not remove the rubber plugs from the GBIC module port or the rubber caps from the fiber-optic cable until you are ready to connect the cable. The plugs and caps protect the GBIC module ports and cables from contamination and ambient light.

After installing the 1000BASE-X GBIC in the GBIC module slot, follow these steps:

Step 1 Remove the rubber plugs from the GBIC module port, and store them for future use.

Step 2 Insert the SC connector in the fiber-optic receptacle (see Figure 3-38).

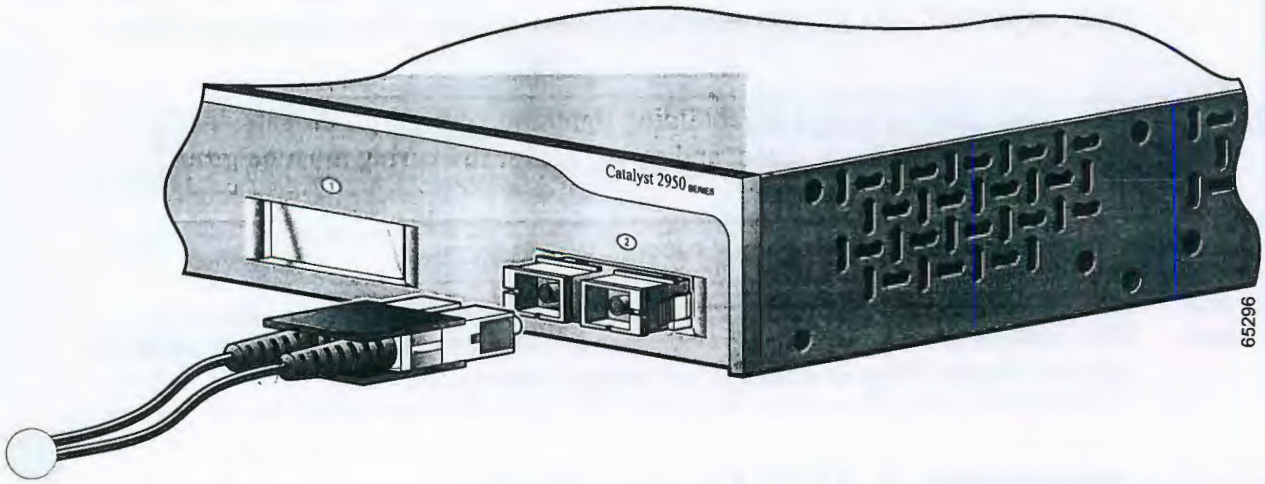
Figure 3-38 Connecting to a 1000 BASE-X GBIC Port



Step 3 Insert the other cable end in a fiber-optic receptacle on a target device.

Step 4 Observe the port status LED.

The LED turns green when the switch and the target device have an established link.

The LED turns amber while STP discovers the network topology and searches for loops. This process takes about 30 seconds, and then the port LED turns green.

If the LED is off, the target device might not be turned on, there might be a cable problem, or there might be problem with the adapter installed in the target device. See Chapter 3, "Troubleshooting," for solutions to cabling problems.

Step 5 Reconfigure and restart the switch or target device if necessary.

Connecting to 1000BASE-T GBIC Module Ports

After installing the 1000BASE-T GBIC in the GBIC module slot, follow these steps:

Caution To prevent ESD damage, follow your normal board and component handling procedures.

Step 1 When connecting to servers, workstations, and routers, insert a four twisted-pair, straight-through cable in the RJ-45 connector. When connecting to switches or repeaters, insert a four twisted-pair, crossover cable (see Figure 3-39).

Note When connecting to a 1000BASE-T device, be sure to use a four twisted-pair, Category 5 cable.

Figure 3-39 Connecting to a 1000BASE-T GBIC Port

0891
Fls:
Doc: 3701

Step 2 Insert the other cable end in an RJ-45 connector on a target device.

Step 3 Observe the port status LED.

The LED turns green when the switch and the target device have an established link.

The LED turns amber while STP discovers the network topology and searches for loops. This process takes about 30 seconds, and then the LED turns green.

If the LED is off, the target device might not be turned on, there might be a cable problem, or there might be a problem with the adapter installed in the target device. See Chapter 3, "Troubleshooting," for solutions to cabling problems.

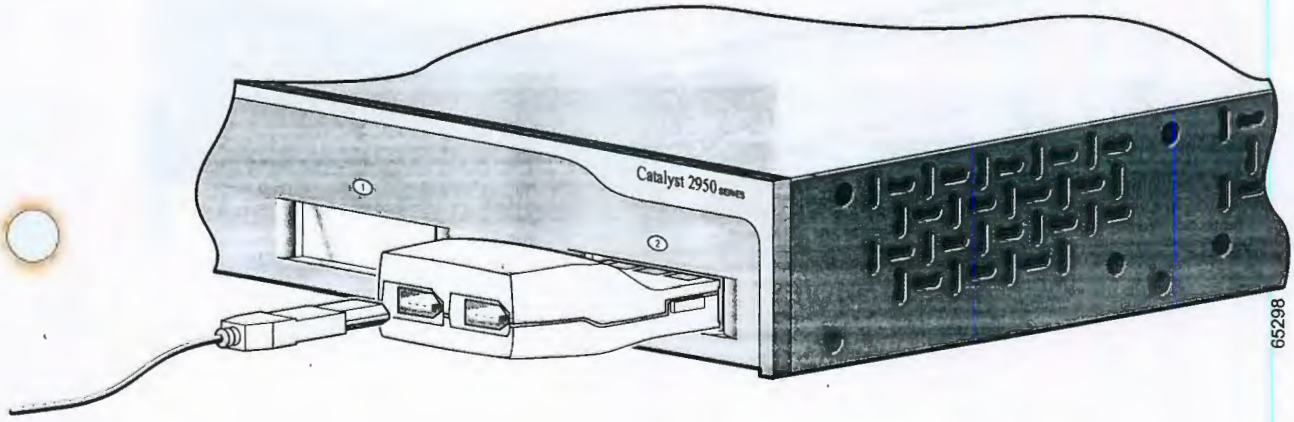
Step 4 Reconfigure and restart the switch or target device, if necessary.

Connecting to GigaStack GBIC Module Ports

After installing the GigaStack GBIC in the GBIC module slot, follow these steps:

Step 1 Insert the GigaStack cable connector in the GBIC (see Figure 3-40).

Figure 3-40 Connecting to a GigaStack GBIC Port



4.635

Step 2 Insert the other cable end in a port on a target device.

Step 3 Observe the port status LED.

The LED turns green when the switch and the target device have an established link.

The LED turns amber while STP discovers the network topology and searches for loops. This process takes about 30 seconds, and then the port LED turns green.

If the LED is off, the target device might not be turned on, there might be a cable problem, or there might be a problem with the adapter installed in the target device. See Chapter 4, "Troubleshooting," for solutions to cabling problems.

Step 4 Reconfigure and restart the switch or target device, if necessary.

Connecting to an SFP Module

This section describes how to connect to an SFP module. For instructions about how to install or remove an SFP module, see the "Installing and Removing SFP Modules" section on page 3-28.

Caution Do not remove the rubber plugs from the SFP module port or the rubber caps from the fiber-optic cable until you are ready to connect the cable. The plugs and caps protect the SFP module ports and cables from contamination and ambient light.

Before connecting to an SFP module, be sure that you understand the port and cabling stipulations in Table 2-2 on page 2-16 and in the "SFP Module Slots" section on page 2-14. See Appendix B, "Connectors and Cables," for information about the LC on the SFP module.

Note Refer to the Catalyst 2950 LRE release notes for the list of supported SFP modules.

Data Sheet

Cisco Catalyst 2950 Series Switches with Cisco **Enhanced** Image Software

Product Overview

Cisco® Catalyst® 2950 Series switches are fixed-configuration, stackable models that provide wire-speed Fast Ethernet and Gigabit Ethernet connectivity for small and medium-sized networks. The Cisco Catalyst 2950 Series is an affordable product line that brings intelligent services, such as enhanced security, high availability and advanced quality of service (QoS), to the network edge—while maintaining the simplicity of traditional LAN switching. When a Cisco Catalyst 2950 Series Switch is combined with a Cisco Catalyst 3550 Series Switch, the solution can enable IP routing from the edge to the core of the network. Embedded in Cisco Catalyst 2950 Series switches is Cisco Cluster Management Suite (CMS) Software, which allows users to simultaneously configure and troubleshoot multiple Cisco Catalyst desktop switches using a standard Web browser. In addition to Cisco CMS Software, Cisco Catalyst 2950 Series switches provide extensive management tools using Simple Network Management Protocol (SNMP) network management platforms such as CiscoWorks.

This product line offers two distinct sets of software features and several configurations to allow small, medium-sized, and enterprise branch offices to select the right combination for the network edge. Cisco Standard Image (SI) Software offers Cisco IOS® Software functioning for basic data, video, and voice services. For networks with requirements for additional security, advanced QoS, and high availability, the Cisco Enhanced Image (EI) Software delivers intelligent services such as rate limiting and security filtering for deployment at the network edge.

The Cisco Catalyst 2950 Series switches consists of the following devices—which are only available with Cisco EI Software for the Cisco Catalyst 2950 Series.

- Catalyst 2950G-48—48 10/100 ports and 2 Gigabit Interface Converter (GBIC)-based Gigabit Ethernet ports
- Catalyst 2950G-24—24 10/100 ports and 2 GBIC ports
- Catalyst 2950G-24-DC—24 10/100 ports, 2 GBIC ports, and DC power
- Catalyst 2950G-12—12 10/100 ports and 2 GBIC ports
- Catalyst 2950T-24—24 10/100 ports and 2 fixed 10/100/1000BASE-T uplink ports
- Catalyst 2950C-24—24 10/100 ports and 2 fixed 100BASE-FX uplink ports

This complete set of switches offers network managers flexibility when selecting a migration path to Gigabit Ethernet. The two built-in Gigabit Ethernet ports on the Cisco Catalyst 2950G-12, 2950G-24, and 2950G-48 accommodate a range of GBIC transceivers, including the Cisco GigaStack® GBIC, as well as 1000BASE-SX, 1000BASE-LX/LH

1000BASE-ZX, 1000BASE-T, and coarse-wave division multiplexing (CWDM) GBICs. The dual GBIC-based Gigabit Ethernet implementation provides customers with tremendous deployment flexibility—allowing customers increased availability with the redundant uplinks. In sum, the configuration permits customers to implement one type of stacking and uplink configuration today, while preserving the option to migrate to another configuration in the future. High levels of stack resiliency can also be implemented by deploying dual-redundant Gigabit Ethernet uplinks, a redundant GigaStack GBIC loopback cable, Cisco UplinkFast and CrossStack UplinkFast technologies for high-speed uplink and stack interconnection failover, and Per-VLAN Spanning Tree Plus (PVST+) for uplink load balancing.

The Cisco Catalyst 2950T-24 Switch offers small and medium-sized enterprises server connectivity and an easy migration path to Gigabit by using the existing copper cabling infrastructure. Implementing Gigabit Ethernet over copper allows network managers to boost network performance and maximize infrastructure investments in Category 5 copper cabling.

Maximum power availability for a converged voice and data network is attainable when a Cisco Catalyst 2950 Series Switch is combined with the Cisco Redundant Power System (RPS) 300 or RPS 675 for protection against internal power supply failures and an uninterruptable power supply (UPS) system to safeguard against power outages.

Other Cisco Catalyst 2950 Series Switches

Cisco Catalyst 2950 Series with Cisco SI Software

The Cisco Catalyst 2950SX-24, 2950-24, and 2950-12 switches are also members of the Cisco Catalyst 2950 Series. They are standalone, fixed-configuration, and managed 10/100 switches providing basic workgroup connectivity for small to medium-sized companies. These wire-speed desktop switches come with Cisco SI Software features and offer Cisco IOS Software functioning for basic data, video, and voice services at the edge of the network.

Cisco Catalyst 2950 Series Long-Reach Ethernet Switches

- *Cisco Catalyst 2950ST-24-LRE*—24 long-reach Ethernet (LRE) ports, 2 fixed 10/100/1000BASE-T ports, and two small form factor pluggable (SFP) ports (2 of the 4 uplinks active at one time)
- *Cisco Catalyst 2950ST-8-LRE*—Eight LRE ports, 2 fixed 10/100/1000BASE-T ports, and two SFP ports (two of the four uplinks active at one time)

The Cisco Catalyst 2950 Series LRE switch solution delivers cost-effective, high-performance broadband access over existing phone wiring in enterprise campus environments and multitenant buildings (hotels, apartment buildings, and office buildings, for example). Cisco Catalyst 2950 Series LRE switches come with Cisco EI Software features, enabling enterprise and service provider customers to extend intelligent services over legacy wiring (Category 1, 2, and 3) to distances up to 5000 feet. Cisco is the only company with technologies that allow customers to deliver intelligent network services across any combination of wired and wireless infrastructures. Refer to the Cisco Catalyst 2950 Series LRE Data Sheet for more information.

Intelligence in the Network

Networks are evolving to address four new developments at the network edge:

- Increase in desktop computing power
- Introduction of bandwidth-intensive applications
- Expansion of highly sensitive data on the network
- Presence of multiple device types, such as IP phones and wireless LAN (WLAN) access points

These new demands are contending for resources with many existing mission-critical applications. As a result, IT professionals must view the edge of the network as critical to the effective management of the delivery of information and applications.

As companies increasingly rely on networks as the strategic business infrastructure, it is more important than ever to ensure high availability, security, scalability, and control. By adding Cisco intelligent functioning to the wiring closet, customers can now deploy network-wide intelligent services that address these requirements in a consistent way, from the desktop to the core and through the WAN.

With Cisco Catalyst switches, Cisco enables companies to fully realize the benefits of adding intelligent services into their networks. Making the network infrastructure highly available to accommodate time-critical needs, scalable to accommodate growth, secure enough to protect confidential information, and capable of differentiating and controlling traffic flows is critical to further optimizing network operations.

Network Security Through Advanced Security Features

Cisco Catalyst 2950 Series switches offer enhanced data security through numerous security features. These features allow customers to enhance LAN security with capabilities to secure network management traffic through the protection of passwords and configuration information; to provide options for network security based on users, ports, and Media Access Control (MAC) addresses; and to enable more immediate reactions to intruder and hacker detection. These security enhancements are available free of charge by downloading the latest software release for the Cisco Catalyst 3550 and 2950 series switches.

Secure Shell (SSH) and SNMPv3 protect information from tampering or eavesdropping by encrypting information being passed along the network, guarding administrative information. Private VLAN Edge isolates ports on a switch, ensuring that traffic travels directly from the entry point to the aggregation device through a virtual path and that it cannot be directed to another port. Local Proxy Address Resolution Protocol (ARP) works in conjunction with Private VLAN Edge to minimize broadcasts and maximize available bandwidth.

Port-based access control parameters (ACPs) restrict sensitive portions of the network by denying packets based on source and destination MAC addresses, IP addresses, or Transmission Control Protocol/User Datagram Protocol (TCP/UDP) ports. ACP lookups are performed in hardware; therefore, forwarding performance is not compromised when implementing this type of security in the network. In addition, time-based access control lists (ACLs) allow configuration of differentiated services based on time periods. ACLs can also be applied to filter traffic based on Differentiated Services Code Point (DSCP) values. Port security provides another means to ensure the appropriate user is on the network by limiting access based on MAC addresses.

For authentication of users with a Terminal Access Controller Access Control System (TACACS+) or Remote Authentication Dial-In User Service (RADIUS) server, 802.1x provides port-level security. In conjunction with a RADIUS server, 802.1x allows for dynamic port-based user authentication, which can be extended to dynamically

CPMI - CORREIOS

Doc: 3701

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

assign a virtual LAN (VLAN) based on a specific user, regardless of where they connect on the network. This intelligent adaptability allows IT departments to offer greater flexibility and mobility to their stratified user populations. By combining access control and user profiles with secure network connectivity, services, and applications, enterprises can more effectively manage user mobility and drastically reduce the overhead associated with granting and managing access to network resources.

With multilayer Cisco Catalyst 2950 Series switches, network managers can implement high levels of console security. Multilevel access security on the switch console and the Web-based management interface prevent unauthorized users from accessing or altering switch configuration. TACACS+ or RADIUS authentication enables centralized access control of the switch and restricts unauthorized users from altering the configuration. Deploying security can be done through Cisco CMS Software security wizards, which ease the deployment of security features that restrict user access to a server, a portion of the network, or the entire network.

Network Control Through Advanced QoS and Rate Limiting

Cisco Catalyst 2950 Series switches offer superior and highly granular QoS based on Layer 2–4 information to ensure that network traffic is classified and prioritized, and that congestion is avoided in the best possible manner. Configuration of QoS is greatly simplified through automatic QoS (auto-QoS), a feature that detects Cisco IP phones and automatically configures switches for the appropriate classification and egress queuing. This optimizes traffic prioritization and network availability without the challenge of a complex configuration.

Cisco Catalyst 2950 Series switches can classify, reclassify, police (determine if the packet is in or out of predetermined profiles and affect actions on the packet), and mark or drop the incoming packets before the packet is placed in the shared buffer. Packet classification allows the network elements to discriminate between various traffic flows and enforce policies based on Layer 2 and Layer 3 QoS fields.

To implement QoS, these switches first identify traffic flows (or packet groups) and classify or reclassify these groups using the DSCP field in the IP packet or the 802.1p class of service (CoS) field in the Ethernet packet. Classification and reclassification can also be based on criteria as specific as the source/destination IP address, source/destination MAC address, or the Layer 4 TCP/UDP ports. At the ingress (incoming port) level, the Cisco Catalyst switches will also perform policing and marking of the packet.

After the packet goes through classification, policing, and marking, it is assigned to the appropriate queue before exiting the switch. Cisco Catalyst 2950 Series switches support four egress (outgoing port) queues per port, which allows the network administrator to be more discriminating and specific in assigning priorities for the various applications on the LAN. At the egress level, the switch performs scheduling, which is a process that determines the order in which the queues are processed. The switches support Weighted Round Robin (WRR) scheduling or strict priority scheduling. The WRR scheduling algorithm ensures that lower priority packets are not entirely starved for bandwidth and are serviced without compromising the priority settings administered by the network manager. Strict priority scheduling ensures that the highest priority packets will always get serviced first, ahead of all other traffic, and that the other three queues will be serviced using WRR best effort.

These features allow network administrators to prioritize mission-critical or bandwidth-intensive traffic, such as enterprise resource planning (ERP) (Oracle, SAP, and so on), voice (IP telephony traffic), and CAD/CAM over less time-sensitive applications such as File Transfer Protocol (FTP) or e-mail (SMTP). For example, it would be highly undesirable to have a large file download destined to one port on a wiring closet switch and have quality implications,

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

ECT 4.629 J

such as increased latency in voice traffic, destined to another port on this switch. This condition is avoided by ensuring that voice traffic is properly classified and prioritized throughout the network. Other applications, such as Web browsing, can be treated as low priority and handled on a best-effort basis.

Cisco Catalyst 2950 Series switches are capable of allocating bandwidth based on several criteria, including MAC source address, MAC destination address, IP source address, IP destination address, and TCP/UDP port number. Bandwidth allocation is essential in network environments that require service-level agreements, or when it is necessary for the network manager to control the bandwidth given to certain users. Cisco Catalyst 2950 Series switches support up to 6 policers per Fast Ethernet port and up to 60 policers on a Gigabit Ethernet port, giving the network administrator granular control of LAN bandwidth.

Network Availability

To provide efficient use of resources for bandwidth-hungry applications like multicasts, Cisco Catalyst 2950 Series switches support Internet Group Management Protocol (IGMP) snooping in hardware. Through the support and configuration of IGMP snooping via Cisco CMS Software, Cisco Catalyst 2950 Series switches deliver outstanding performance and ease of use in administering and managing multicast applications on the LAN.

The IGMP snooping feature allows the switch to "listen in on" the IGMP conversation between hosts and routers. When a switch hears an "IGMP join" request from a host for a given multicast group, the switch adds the host's port number to the group destination address (GDA) list for that group. When the switch hears an "IGMP leave" request, it removes the host's port from the content-addressable memory (CAM) {CAM ACRONYM IS USED TWICE IN DIFFERENT CONTEXTS} table entry.

PVST+ allows users to implement redundant uplinks while distributing traffic loads across multiple links. This is not possible with standard Spanning-Tree Protocol implementations. Cisco UplinkFast technology helps ensure immediate transfer to the secondary uplink, an improvement over the traditional 30-to-60 second convergence time. An additional feature that enhances performance is Voice VLAN, which allows network administrators to assign voice traffic to a VLAN dedicated to IP telephony—simplifying phone installations and providing easier network traffic administration and troubleshooting.

Multicast VLAN Registration (MVR) is designed for applications that use wide-scale deployment of multicast traffic across an Ethernet-ring-based service provider network (for example, the broadcast of multiple television channels over a service-provider network). MVR allows a subscriber on a port to subscribe and unsubscribe to a multicast stream on the network-wide multicast VLAN.

Network Management

Cisco CMS Software is Web-based and embedded in Cisco Catalyst 3550, 2950, 3500 XL, 2900 XL, and 2900 LRE XL series switches. Through Cisco switch clustering technology, users can access Cisco CMS Software with any standard Web browser to manage up to 16 of these switches at once, regardless of their geographic proximity—with the option of using a single IP address for the entire cluster if desired. With the addition of the Cisco Catalyst 3550 Series switches, Cisco CMS Software can now extend beyond routed boundaries for even more flexibility in managing a Cisco cluster.

Cisco CMS Software provides an integrated management interface for delivering intelligent services, such as multilayer switching, QoS, multicast, and security ACLs. Cisco CMS Software allows administrators to take advantage of benefits formerly reserved for only the most advanced networks without having to learn the command-line interface (CLI) or even the details of the technology.

The new Guide Mode in Cisco CMS Software leads the user step-by-step through the configuration of advanced features and provides enhanced online help for context-sensitive assistance. In addition, Cisco AVVID (Architecture for Voice, Video and Integrated Data) wizards provide automated configuration of the switch to optimally support video streaming or videoconferencing, voice over IP (VoIP), and mission-critical applications. These wizards can save hours of time for network administrators, eliminate human errors, and help ensure that the configuration of the switch is optimized for these applications.

Cisco CMS Software supports standards-based connectivity options such as Ethernet, Fast Ethernet, Fast EtherChannel, Gigabit Ethernet, and Gigabit EtherChannel connectivity. Because Cisco switch clustering technology is not limited to a single stack of switches, Cisco CMS Software expands the traditional cluster domain beyond a single wiring closet and saves time and effort for network administrators.

Cisco Catalyst 2950 Series switches can be configured either as command or member switches in a Cisco switch cluster. Cisco CMS Software also allows the network administrator to designate a standby or redundant command switch, which takes the commander duties should the primary command switch fail. Other features include the ability to configure multiple ports and switches simultaneously, to perform software updates across the entire cluster at once, and to clone configurations to other clustered switches for rapid network deployment. Bandwidth graphs and link reports provide useful diagnostic information, and the topology map gives network administrators a quick view of the network status.

In addition to Cisco CMS Software, Cisco Catalyst 2950 Series switches provide extensive management tools using SNMP network management platforms such as CiscoWorks for switched internetworks.

Cisco Catalyst 2950 Series switches deliver a comprehensive set of management tools to provide the required visibility and control in the network (Figure 1). Managed with CiscoWorks, Cisco Catalyst switches can be configured and managed to deliver end-to-end device, VLAN, traffic, and policy management. Coupled with CiscoWorks, Cisco Resource Manager Essentials, a Web-based management tool, offers automated inventory collection, software deployment, easy tracking of network changes, views into device availability, and quick isolation of error conditions.

Product Features and Benefits

Table 1 lists the features and benefits of the Cisco Catalyst 2950 Series switches.

Table 1 Features and Benefits

Feature	Benefit
Availability	
Superior redundancy for fault backup	• IEEE 802.1D Spanning-Tree Protocol support for redundant backbone connections and loop-free networks simplifies network configuration and improves fault tolerance. • Support for Cisco Spanning-Tree Protocol enhancements such as UplinkFast, BackboneFast, and PortFast technologies ensure quick failover recovery, enhancing overall network stability and availability. • IEEE 802.1w Rapid Spanning-Tree Protocol (RSTP) provides rapid convergence of the spanning tree independent of spanning-tree timers. • Cisco CrossStack UplinkFast technology extends UplinkFast to a stack to ensure quick failover recovery, enhancing network stability and availability. • Support for the optional 300-watt or 675-watt redundant Cisco AC power system provides a backup power source for up to 4 or 6 units, respectively, for improved fault tolerance and network uptime. • Redundant stacking connections provide support for a redundant loopback connection for top and bottom switches in an independent stack backplane cascaded configuration. • Command switch redundancy enabled in Cisco CMS Software allows customers to designate a backup command switch that takes over cluster management functions if the primary command switch fails. • Unidirectional link detection (UDLD) and aggressive UDLD features detect and disable unidirectional links on fiber-optic interfaces caused by incorrect fiber-optic wiring or port faults.
Integrated Cisco IOS Software features for bandwidth optimization	• Bandwidth aggregation of up to 4 Gbps (2 ports full duplex) through Cisco Gigabit EtherChannel® technology and up to 16 Gbps (8 ports full duplex) through Fast EtherChannel technology enhances fault tolerance and offers higher-speed aggregated bandwidth between switches, to routers and individual servers. Port Aggregation Protocol (PAgP) is available to simplify configuration. • Per-port broadcast, multicast, and unicast storm control prevents faulty end stations from degrading overall systems performance. • PVST+ allows for Layer 2 load sharing on redundant links to efficiently use the extra capacity inherent in a redundant design. • IEEE 802.1s Multiple Spanning-Tree Protocol (MSTP) allows a spanning tree instance per VLAN, enabling Layer 2 load sharing on redundant links. • VLAN Trunking Protocol (VTP) pruning limits bandwidth consumption on VTP trunks by flooding broadcast traffic only on trunk links required to reach the destination devices. Dynamic Trunking Protocol (DTP) enables dynamic trunk configuration across all ports in the switch. • IGMP snooping provides for fast client joins and leaves of multicast streams and limits bandwidth-intensive video traffic to only the requestors. MVR, IGMP filtering, fast-join, and immediate leave are available as enhancements. • MVR continuously sends multicast streams in a multicast VLAN while isolating the streams from subscriber VLANs for bandwidth and security reasons. • Supports additional frame formats: Ethernet II (tagged and untagged), 802.3 (sequence number protection [SNAP] encapsulated tagged and untagged frames)

Feature	Benefit
Security	
Network-wide security features	• Filtering of incoming traffic flows based on Layer 2–4 ACPs prevents unauthorized data flows. – The following Layer 2 ACPs (or a combination) can be used for security classification of incoming packets: source MAC address, destination MAC address, and 16-bit Ethertype. – The following Layer 3 and Layer 4 fields (or a combination) can be used for security classification of incoming packets: source IP address, destination IP address, TCP source or destination port number, UDP source, or destination port number. ACLs can also be applied to filter based on DSCP values. – Time-based ACLs allow configuration of differentiated services based on time periods. • A private VLAN edge provides security and isolation between ports on a switch, helping to ensure that voice traffic travels directly from its entry point to the aggregation device through a virtual path and that it cannot be directed to a different port. • Support for the 802.1x standard allows users to be authenticated, regardless of which LAN port they are accessing, and provides unique benefits to customers who have a large base of mobile (wireless) users accessing the network. . 802.1x with VLAN assignment allows a dynamic VLAN assignment for a specific user, regardless of where the user is connected. . 802.1x with an ACL assignment allows for specific security policies based on a user, regardless of where the user is connected. . 802.1x with Voice VLAN gives an IP phone access to the Voice VLAN regardless of the authorized or unauthorized state of the port. • 802.1x with port security enables authenticating the port and managing network access for all MAC addresses, including that of the client. • SSH and SNMPv3 provides network security by encrypting administrator traffic during Telnet and SNMP sessions. SSH and the crypto version of SNMPv3 require a special crypto software image due to U.S. export restrictions. • Port Security secures the access to a port based on the MAC address of a user's device. The aging feature removes the MAC address from the switch after a specific timeframe to allow another device to connect to the same port. • MAC Address Notification allows administrators to be notified of new users added or removed from the network. • Spanning-tree root guard (STRG) prevents edge devices not in the network administrator's control from becoming Spanning-Tree Protocol root nodes. • The Spanning-Tree Protocol PortFast/bridge protocol data unit (BPDU) guard feature disables access ports with Spanning-Tree Protocol PortFast-enabled upon reception of a BPDU, and increases network reliability, manageability, and security. • Multilevel security on console access prevents unauthorized users from altering the switch configuration. • TACACS+ and RADIUS authentication enables centralized control of the switch and restricts unauthorized users from altering the configuration. • The user-selectable address-learning mode simplifies configuration and enhances security. • Trusted Boundary provides the ability to trust the QoS priority settings if an IP phone is present and to disable the trust setting in the event that the IP phone is removed, preventing a rogue user from overriding prioritization policies in the network. • IGMP Filtering provides multicast authentication by filtering out nonsubscribers and limiting the number of concurrent multicast streams available per port. • Support for dynamic VLAN assignment through implementation of the VLAN Membership Policy Server (VMPS) client function provides flexibility in assigning ports to VLANs. Dynamic VLAN enables fast assignment of IP addresses. • Cisco CMS Software security wizards ease the deployment of security features for restricting user access to a server, a portion of the network, or the entire network.

Feature	Benefit
QoS	
Overview	• The switches support the aggregate QoS model by enabling classification, policing/metering, and marking functions on a per-port basis at ingress and the queuing/scheduling function at egress. • The switches support configuring QoS ACPs on all ports to ensure proper policing and marking on a per-packet basis using ACPs. Up to 4 ACPs per switch are supported in configuring either QoS ACPs or security filters. • Auto-QoS greatly simplifies the configuration of QoS in VoIP networks by issuing interface and global switch commands that allow the detection of Cisco IP phones, the classification of traffic, and egress queue configuration.
Qos classification support at ingress	• The switches support QoS classification of incoming packets for QoS flows based on Layer 2–4 fields. • The following Layer 2 fields (or a combination) can be used for classifying incoming packets to define QoS flows: source MAC address, destination MAC address, and 16-bit Ethertype. • The switches support identification of traffic based on Layer 3 type of service (ToS) field and DSCP values. • The following Layer 3 and 4 fields (or a combination) can be used to classify incoming packets to define QoS flows: source IP address, destination IP address, TCP source or destination port number, and UDP source or destination port number.
Qos metering/ policing at ingress	• Support for metering/policing of incoming packets restricts incoming traffic flows to a certain rate. • The switches support up to 6 policers per Fast Ethernet port, and 60 policers on a Gigabit Ethernet port. • The switches offer granularity of traffic flows at 1 Mbps on Fast Ethernet ports, and 8 Mbps on Gigabit Ethernet ports.
Qos marking at ingress	• The switches support marking/remarking packets based on state of policers/meters. • The switches support marking/remarking based on the following mappings: from DSCP to 802.1p, and from 802.1p to DSCP. • The switches support 14 widely used DSCP values. • The switches support classifying or reclassifying packets based on default DSCP per port. They also support classification based on DSCP values in the ACL. • The switches support classifying or reclassifying frames based on the default 802.1p value per port. • The switches support 802.1p override at ingress.
QoS scheduling support at egress	• 4 queues per egress port are supported in hardware. • The WRR queuing algorithm ensures that low-priority queues are not starved. • Strict-priority queue configuration via Strict Priority Scheduling ensures that time-sensitive applications such as voice always follow an expedited path through the switch fabric.
Sophisticated traffic management	• The switch supports up to 6 policers per Fast Ethernet port and up to 60 policers on a Gigabit Ethernet port. • The switch offers granularity of traffic flows at 1 Mbps on Fast Ethernet ports and 8 Mbps on Gigabit Ethernet ports. • The switch offers the ability to limit data flows based on MAC source/destination address, IP source/destination address, TCP/UDP port numbers, or any combination of these fields. • The switch offers the ability to manage data flows asynchronously upstream and downstream from the end station or on the uplink.

Feature	Benefit
Management	
Superior manageability	• An embedded Remote Monitoring (RMON) software agent supports 4 RMON groups (history, statistics, alarms, and events) for enhanced traffic management, monitoring, and analysis. • The switch supports all 9 RMON groups through the use of a Cisco SwitchProbe® Analyzer (Switched Port Analyzer [SPAN]) port, permitting traffic monitoring of a single port, a group of ports, or the entire switch from a single network analyzer or RMON probe. • A SPAN port monitors traffic of a single port from a single network analyzer or RMON probe. • Remote Switch Port Analyzer (RSPAN) allows network administrators to locally monitor ports in a Layer 2 switch network from any other switch in the same network. • The Domain Name System (DNS) provides IP address resolution with user-defined device names. • Trivial File Transfer Protocol (TFTP) reduces the cost of administering software upgrades by downloading from a centralized location. • Network Timing Protocol (NTP) provides an accurate and consistent timestamp to all switches within the intranet. • Layer 2 Traceroute eases troubleshooting by identifying the physical path that a packet takes from the source device to a destination device. • Crash Information Support enables a switch to generate a crash file for improved troubleshooting. • Show-interface-capabilities provides information on configuration capabilities of any interface. • The RTTMON **[EXPAND?]** Management Information Base (MIB) allows users to monitor network performance between a Cisco Catalyst switch and a remote device. • Multifunction LEDs per port for port status, half-duplex/full-duplex, 10BASE-T/100BASE-TX/1000BASE-T indication, as well as switch-level status LEDs for system, redundant power supply, and bandwidth utilization, provide a comprehensive and convenient visual management system.

Feature	Benefit
Cisco CMS Software	• Cisco CMS Software allows the user to manage up to 16 interconnected Cisco Catalyst 3550, 2950, 3500 XL, 2900 XL, and 2900 LRE XL series switches without the limitation of being physically located in the same wiring closet, and with the option of using a single IP address for the entire cluster if desired. Full backward compatibility helps ensure that any combination of the above switches can be managed with a Cisco Catalyst 2950 Series switch. • Cisco AVVID wizards use just a few user inputs to automatically configure the switch to optimally handle different types of traffic—voice, video, multicast, or high-priority data. • A security wizard is provided to restrict unauthorized access to servers and networks, and to restrict certain applications on the network. • One-click software upgrades can be performed across the entire cluster simultaneously, and configuration cloning enables rapid deployment of networks. • Cisco CMS Software has been extended to include multilayer feature configurations such as ACPs and QoS parameters. • Cisco CMS Software Guide Mode assists users in the configuration of powerful advanced features by providing step-by-step instructions. • Cisco CMS Software provides enhanced online help for context-sensitive assistance. • An easy-to-use graphical interface provides both a topology map and a front-panel view of the cluster. • Multidevice and multiport configuration capabilities allow network administrators to save time by configuring features across multiple switches and ports simultaneously. • Ability to launch the Web-based management for a Cisco Aironet® Wireless Access Point by simply clicking on its icon in the topology map. • A user-personalized interface allows users to modify polling intervals, table views, and other settings within Cisco CMS Software and to retain these settings the next time they use the software. • Alarm notification provides automated e-mail notification of network errors and alarm thresholds.
Support for CiscoWorks	• Manageable through CiscoWorks network management software on a per-port and per-switch basis provides a common management interface for Cisco routers, switches, and hubs. • SNMP v1, v2, and v3 (non-crypto) and Telnet interface support delivers comprehensive in-band management, and a CLI-based management console provides detailed out-of-band management. • Cisco Discovery Protocol Versions 1 and 2 enable a CiscoWorks network management station to automatically discover the switch in a network topology. • Supported by the CiscoWorks LAN Management Solution.

Feature	Benefit
Ease of use and ease of deployment	• The Cisco GigaStack® GBIC delivers a hardware-based, independent stacking bus with up to a 2-Gbps forwarding rate in a point-to-point configuration, or 1 Gbps of forwarding bandwidth when daisy-chained **[OKAY TERM?]** with up to 9 switches. • Autoconfiguration eases the deployment of switches in the network by automatically configuring multiple switches across a network via a boot **[P?]** server. • Auto-QoS greatly simplifies the configuration of QoS in VoIP networks by issuing interface and global switch commands that allow the detection of Cisco IP phones, the classification of traffic, and egress queue configuration. • Autosensing on each non-GBIC port detects the speed of the attached device and automatically configures the port for 10-, 100-, or 1000-Mbps operation, easing the deployment of the switch in mixed 10, 100, and 1000BASE-T environments. • Autonegotiating on all ports automatically selects half- or full-duplex transmission mode to optimize bandwidth. • Cisco VTP supports dynamic VLANs and dynamic trunk configuration across all switches. • Voice VLAN simplifies telephony installations by keeping voice traffic on a separate VLAN for easier network administration and troubleshooting. • DTP enables dynamic trunk configuration across all ports in a switch. • PAgP automates the creation of Cisco Fast EtherChannel or Gigabit EtherChannel groups, enabling linking to another switch, router, or server. • Link Aggregation Control Protocol (LACP) allows the creation of Ethernet channeling with devices that conform to IEEE 802.3ad. This is similar to Cisco EtherChannel and PAgP. • IEEE 802.3z-compliant 1000BASE-SX, 1000BASE-LX/LH, 1000BASE-ZX, and 1000BASE-T physical interface support through a field-replaceable GBIC module provides customers unprecedented flexibility in switch deployment. • The default configuration stored in Flash memory ensures that the switch can be quickly connected to the network and can pass traffic with minimal user intervention. • The switches support nonstandard Ethernet frame sizes (mini-giants) up to 1542 bytes (configurations with GBIC ports only).

4.619

Feature	Description
Standards	• RMON I and II standards • SNMPv1, v2c, and v3 (planned future support for v3)
Y2K	• Y2K compliant
Connectors and cabling	• 10BASE-T ports: RJ-45 connectors; two-pair Category 3, 4, or 5 unshielded twisted-pair (UTP) cabling • 100BASE-TX ports: RJ-45 connectors; two-pair Category 5 UTP cabling • 1000BASE-T ports: RJ-45 connectors; two-pair Category 5 UTP cabling • 100BASE-FX ports: MT-RJ connectors, 50/125 or 62.5/125 micron multimode fiber-optic cabling • 1000BASE-T, 1000BASE-SX, -LX/LH, -ZX GBIC-based ports: SC fiber connectors, single-mode or multimode fiber • Cisco GigaStack GBIC ports: copper-based Cisco GigaStack cabling • Management console port: 8-pin RJ-45 connector, RJ-45-to-RJ-45 rollover cable with RJ-45-to-DB9 adapter for PC connections; for terminal connections, use RJ-45-to-DB25 female data-terminal-equipment (DTE) adapter (can be ordered separately from Cisco, part number ACS-DSBUASYN=)
MT-RJ patch cables for Cisco Catalyst 2950C-24 Switch	*Type of cable, Cisco part number* • 1-meter, MT-RJ-to-SC multimode cable, CAB-MTRJ-SC-MM-1M • 3-meter, MT-RJ-to-SC multimode cable, CAB-MTRJ-SC-MM-3M • 5-meter, MT-RJ-to-SC multimode cable, CAB-MTRJ-SC-MM-5M • 1-meter, MT-RJ-to-ST multimode cable, CAB-MTRJ-ST-MM-1M • 3-meter, MT-RJ-to-ST multimode cable, CAB-MTRJ-ST-MM-3M • 5-meter, MT-RJ-to-ST multimode cable, CAB-MTRJ-ST-MM-5M
Power connectors	Customers can provide power to a switch by using either the internal power supply or the Cisco RPS 300. The connectors are located at the back of the switch. **Internal power supply connector** • The internal power supply is an autoranging unit. • The internal power supply supports input voltages between 100 and 240 VAC. • The supplied AC power cord should be used to connect the AC power connector to an AC power outlet. **Cisco RPS 675 Connector** • The connector offers connection for an optional Cisco RPS 675 that uses AC input and supplies DC output to the switch. • The connector offers a 675-watt redundant power system that can support six external network devices and provides power to one failed device at a time. • The connector automatically senses when the internal power supply of a connected device fails and provides power to the failed device, preventing loss of network traffic. • Attach only the Cisco RPS 675 (model PWR675-AC-RPS-NI=) to the RPS receptacle with this connector. **Cisco RPS 300 Connector** • The connector offers connection for an optional Cisco RPS 300 that uses AC input and supplies DC output to the switch. • The connector offers a 300-watt redundant power system that can support six external network devices and provides power to one failed device at a time. • The connector automatically senses when the internal power supply of a connected device fails and provides power to the failed device, preventing loss of network traffic. • Attach only the Cisco RPS 300 (model PWR300-AC-RPS-N1) to the RPS receptacle with this connector.

Feature	Description
Indicators	• Per-port status LEDs: link integrity, disabled, activity, speed, and full-duplex indications. • System status LEDs: system, RPS, and bandwidth utilization indications.
Dimensions (H x W x D) and weight	• 1.72 x 17.5 x 9.52 in. (4.36 x 44.5 x 24.18 cm) (Cisco Catalyst 2950T-24, 2950C-24, 2950G-12, and 2950G-24) • 1.72 x 17.5 x 13 in. (4.36 x 44.5 x 33.02 cm) (Cisco Catalyst 2950G-48) • 1.0 rack-unit (RU) high • 6.5 lb (3.0 kg) (Cisco Catalyst 2950T-24, 2950C-24, 2950G-12, and 2950G-24) • 10 lb (4.5 kg) (Cisco Catalyst 2950G-48)
Environmental ranges	• Operating temperature: 32 to 113 F (0 to 45 C) • Storage temperature: –13 to 158 F (–25 to 70 C) • Operating relative humidity: 10 to 85 percent (noncondensing) • Operating altitude: Up to 10,000 ft (3000 m) • Storage altitude: Up to 15,000 ft (4500 m) • Not intended for use on top of desktops or in open office environments
Power requirements	• Power consumption: 30W maximum, 102 BTUs per hour (Cisco Catalyst 2950T-24, 2950C-24, 2950G-12, and 2950G-24) • Power consumption: 45W maximum, 154 BTUs per hour (Cisco Catalyst 2950G-48) • AC input voltage/frequency: 100 to 127/200 to 240 VAC (autoranging); 50 to 60 Hz • DC input voltages for Cisco RPS 300: +12V @ 4.5A
Acoustic noise	• ISO 7770, bystander position—operating to an ambient temperature of 30 C: – WS-C2950-24, WS-C2950-12, WS-C2950C-24, WS-C2950T-24: 46 dBa – WS-C2950G-12, WS-C2950G-24: 46 dBa – WS-C2950G-48: 48 dBa
Predicted mean time between failure (MTBF)	• 482,776 hours (Cisco Catalyst 2950G-12) • 468,884 hours (Cisco Catalyst 2950G-24) • 479,086 hours (Cisco Catalyst 2950G-24-DC) • 159,026 hours (Cisco Catalyst 2950G-48) • 297,144 hours (Cisco Catalyst 2950T-24) • 268,292 hours (Cisco Catalyst 2950C-24)
Fiber-port specifications for Cisco Catalyst 2950C-24 Switch	Fiber-port power levels: • Optical transmitter wavelength: 1300 nm • Optical receiver sensibility: –14 dBm2 • Optical transmitter power: –19 to –14 dBm • Transmit: –19 to –14 dBm

ECT 4.617 J CPL-AS

Feature	Description
Regulatory Agency Approvals	
Safety certifications	• UL 1950/CSA 22.2 No. 950 • IEC 950-EN 60950 • AS/NZS 3260, TS001 • CE Marking
Electromagnetic emissions certifications	• FCC Part 15 Class A • EN 55022: 1998 Class A (CISPR22 Class A) • EN 55024: 1998 (CISPR24) • VCCI Class A • AS/NZS 3548 Class A • CE Marking • CNS 13438 • BSMI Class A • MIC
Network Equipment Building Standards (NEBS) (For WS-C2950G-24-EI-DC only)	• Bellcore • GR-1089-CORE • GR-63-CORE • SR-3580 Level 3
Warranty	• Limited lifetime warranty

Service and Support

The services and support programs described in Table 2 are available as part of the Cisco Desktop Switching Service and Support solution, and are available directly from Cisco and through resellers.

Table 2 Service and Support Programs

Service and Support	Features	Benefits
Advanced Services		
Total Implementation Solutions (TIS)—available direct from Cisco ***Packaged TIS***—available through resellers	• Project management • Site survey and configuration deployment • Installation, text, and cutover • Training • Major moves, adds, and changes • Design review and product staging	• Supplements existing staff • Ensures that functions meet customer needs • Mitigates risk
Technical Support Services		
Cisco SMARTnet® and Cisco SMARTnet Onsite services—available direct from Cisco ***Packaged Cisco SMARTnet service***—available through resellers	• 24x7 access to software updates • Web access to technical repositories • Telephone support through the Cisco Technical Assistance Center (TAC) • Advance replacement of hardware parts	• Enables proactive or expedited issue resolution • Lowers cost of ownership by using Cisco expertise and knowledge • Minimizes network downtime

Data Sheet

Cisco Catalyst 2950 Series Switches with Cisco **Standard** Image Software

Product Overview

The Cisco® Catalyst® 2950SX-24, 2950-24, and 2950-12 switches are members of the Cisco Catalyst 2950 Series and are standalone, fixed-configuration, managed 10/100 switches that provide basic workgroup connectivity for small to medium-sized networks. These wire-speed desktop switches come with Cisco Standard Image (SI) Software features and offer Cisco IOS® functioning for basic data, video, and voice services at the edge of the network. Embedded in all Cisco Catalyst 2950 Series switches is Cisco Cluster Management Suite (CMS) Software, which allows users to simultaneously configure and troubleshoot multiple Cisco Catalyst desktop switches using a standard Web browser.

This product line offers two distinct sets of software features and several configurations to allow small, medium-sized, and enterprise branch offices to select the right combination for the network edge. Cisco SI Software offers Cisco IOS Software functioning for basic data, video, and voice services. For networks that require additional security, advanced quality of service (QoS), and high availability, Cisco Enhanced Image (EI) Software delivers intelligent services such as rate limiting and security filtering for deployment at the network edge. The Cisco Catalyst 2950SX-24, 2950-24, and 2950-12 switches are only available with Cisco SI Software for the Cisco Catalyst 2950 Series.

- Cisco Catalyst 2950SX-24 Switch—24 10/100 ports with 2 fixed 1000BASE-SX uplinks
- Cisco Catalyst 2950-24 Switch—24 10/100 ports
- Cisco Catalyst 2950-12 Switch—12 10/100 ports

These switches provide customers with a choice of connectivity options. While Cisco Catalyst 2950-12 and 2950-24 switches provide 12 and 24 10/100 ports for edge connectivity, respectively, Cisco Catalyst 2950SX-24 switches provide 24 10/100 ports and 2 integrated 1000BASE-SX ports for gigabit uplink connectivity over fiber. With these integrated ports, customers get an extremely cost-effective solution for delivering gigabit speeds using fiber. Dual ports also provide redundancy and increased availability—and a cost-effective means for cascading switches and managing them as a cluster. This switch is ideal for education and government segments, where fiber uplinks are a requirement.

Cisco Catalyst 2950 Series intelligent Ethernet switches with Cisco EI Software are also part of the Cisco Catalyst 2590 Series. These fixed-configuration, stackable models bring intelligent services, such as advanced QoS, enhanced security, and high availability, to the network edge—while maintaining the simplicity of traditional LAN switching. When a Cisco Catalyst

2950 Series Intelligent Ethernet Switch is combined with a Cisco Catalyst 3550 Series Switch, the solution enables IP routing from the edge to the core of the network. Refer to the Cisco Catalyst 2950 Series Switches with Cisco Enhanced Image Software data sheet for more information.

Network Availability with Wire-Speed Performance in Connecting End Stations to the LAN

With a switching fabric of 8.8 Gbps and a maximum forwarding bandwidth of 4.4 Gbps, Cisco Catalyst 2950 Series switches deliver wire-speed performance on all ports in connecting end stations and users to the company LAN. With basic services, these switches support performance-boosting features such as Fast EtherChannel®— offering up high-performance bandwidth between Cisco Catalyst switches, routers, and servers.

Network Security

Cisco Catalyst 2950 Series switches offer enhanced data security through numerous security features. These features allow customers to provide network security based on users or Media Access Control (MAC) addresses. The security enhancements are available free of charge by downloading the latest software release for Cisco Catalyst 2950 Series switches.

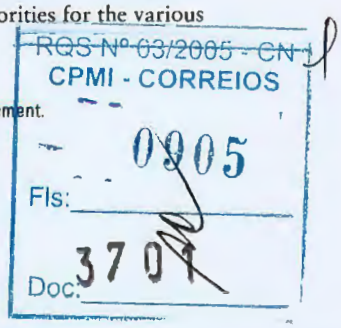
The Private VLAN Edge feature isolates ports on a switch, helping to ensure that traffic travels directly from the entry point to the aggregation device through a virtual path and that it cannot be directed to another port. In addition, for authentication of users with a Terminal Access Controller Access Control System (TACACS+) or a Remote Authentication Dial-In User Service (RADIUS) server, 802.1x provides port-level security. Simple Network Management Protocol Version 3 (SNMPv3) (non-crypto) monitors and controls network devices and manages configurations, performance, collection of statistics, and security.

With the Cisco Catalyst 2950SX-24, 2950-24, and 2950-12 switches, network managers can implement high levels of port and console security. MAC-address-based port-level security prevents unauthorized stations from accessing the switch. Multilevel access security on the switch console and the Web-based management interface prevent unauthorized users from accessing or altering switch configuration, and can be implemented using an internal user database on each switch, or a centrally administrated TACACS+ or RADIUS server. 802.1x, in conjunction with a RADIUS server, allows for dynamic port-based user authentication. In addition, 802.1x can coexist with port security on a per-port basis. Deploying security can be done through Cisco CMS Software security wizards, which ease the deployment of security features that restrict user access to a server or portion of the network, or restrict the applications used in certain areas of the network.

Network Control

The Cisco Catalyst 2950SX-24, 2950-24, and 2950-12 switches deliver LAN-edge QoS, supporting two modes of reclassification. One mode—based on the IEEE 802.1p standard—honors the class-of-service (CoS) value at the ingress point and assigns the packet to the appropriate queue. In the second mode, packets can be reclassified based on a default CoS value assigned to the ingress port by the network administrator. In the case of frames that arrive without a CoS value (such as untagged frames), these switches support classification based on a default CoS value per port assigned by the network administrator. Once the frames have been classified or reclassified using one of the above modes, they are assigned to the appropriate queue at the egress port. These switches support four egress queues, which allow the network administrator to be more discriminating in assigning priorities for the various

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.



applications on the LAN. Strict Priority Scheduling configuration helps ensure that time-sensitive applications (such as voice) always follow an expedited path through the switch fabric. Weighted Round Robin (WRR) scheduling, another significant enhancement, ensures that lower-priority traffic receives attention without comprising the priority settings administered by a network manager. These features allow network administrators to prioritize mission-critical, time-sensitive traffic, such as voice (IP telephony traffic), enterprise resource planning (ERP) (Oracle, SAP, and so on), and CAD/CAM over less time-sensitive applications such as File Transfer Protocol (FTP) or e-mail (SMTP).

Network Availability

To provide efficient use of resources for bandwidth-hungry applications like multicasts, Cisco Catalyst 2950 Series switches support Internet Group Management Protocol (IGMP) snooping in hardware. Through the support and configuration of IGMP snooping via Cisco CMS Software, these switches deliver outstanding performance and ease of use in administering and managing multicast applications on the LAN.

The IGMP snooping feature allows the switch to "listen in on" the IGMP conversation between hosts and routers. When a switch hears an "IGMP join" request from a host for a given multicast group, the switch adds the host's port number to the group destination address (GDA) list for that group. When the switch hears an "IGMP leave" request, it removes the host's port from the content-addressable memory (CAM) table entry.

Multicast VLAN Registration (MVR) is designed for applications that use wide-scale deployment of multicast traffic across an Ethernet-ring-based service provider network (for example, the broadcast of multiple television channels over a service-provider network). MVR allows a subscriber on a port to subscribe and unsubscribe to a multicast stream on the network-wide multicast virtual LAN (VLAN).

Per VLAN Spanning-Tree Plus (PVST+) allows users to implement redundant uplinks while distributing traffic loads across multiple links. This is not possible with standard Spanning-Tree Protocol implementations. Cisco UplinkFast technology helps ensure immediate transfer to the secondary uplink, an improvement over the traditional 30-to-60 second convergence time. An additional feature that enhances performance is Voice VLAN, which allows network administrators to assign voice traffic to a VLAN dedicated to IP telephony—simplifying phone installations and providing easier network traffic administration and troubleshooting.

Network Management

Cisco CMS Software is Web-based and embedded in Cisco Catalyst 3550, 2950, 3500 XL, 2900 XL, and 2900 LRE XL series switches. Through Cisco switch clustering technology, users can access Cisco CMS Software with any standard Web browser to manage up to 16 of these switches at once, regardless of their geographic proximity—with the option of using a single IP address for the entire cluster if desired. With the addition of the Cisco Catalyst 3550 Series switches, Cisco CMS Software can now extend beyond routed boundaries for even more flexibility in managing a Cisco cluster.

Cisco CMS Software supports standards-based connectivity options such as Ethernet, Fast Ethernet, Fast EtherChannel, Gigabit Ethernet, and Gigabit EtherChannel connectivity. Because Cisco switch clustering technology is not limited to a single stack of switches, Cisco CMS Software expands the traditional cluster domain beyond a single wiring closet and saves time and effort for network administrators.

Doc:

Cisco Catalyst 2950 Series switches can be configured either as command or member switches in a Cisco switch cluster. Cisco CMS Software also allows the network administrator to designate a standby or redundant command switch, which takes the commander duties should the primary command switch fail. Other features include the ability to configure multiple ports and switches simultaneously, to perform software updates across the entire cluster at once, and to clone configurations to other clustered switches for rapid network deployment. Bandwidth graphs and link reports provide useful diagnostic information, and the topology map gives network administrators a quick view of the network status.

In addition to Cisco CMS Software, Cisco Catalyst 2950 Series switches provide extensive management tools using SNMP network management platforms such as CiscoWorks for switched internetworks.

Cisco Catalyst 2950 Series switches deliver a comprehensive set of management tools to provide the required visibility and control in the network. Managed with CiscoWorks, Cisco Catalyst switches can be configured and managed to deliver end-to-end device, VLAN, traffic, and policy management. Coupled with CiscoWorks, Cisco Resource Manager Essentials, a Web-based management tool, offers automated inventory collection, software deployment, easy tracking of network changes, views into device availability, and quick isolation of error conditions. Figures 1–3 show Cisco Catalyst 2950 Series switches.

Product Features and Benefits

Table 1 lists the features and benefits of Cisco Catalyst 2950 Series switches.

Table 1 Features and Benefits

Feature	Benefit
Availability	
Superior redundancy for fault backup	• IEEE 802.1D Spanning-Tree Protocol support for redundant backbone connections and loop-free networks simplifies network configuration and improves fault tolerance. • Support for Cisco Spanning-Tree Protocol enhancements such as UplinkFast, BackboneFast, and PortFast technologies ensure quick failover recovery, enhancing overall network stability and availability. • Support for the optional 300-watt or 675-watt redundant Cisco AC power system provides a backup power source for up to 4 or 6 units, respectively, for improved fault tolerance and network uptime. • Unidirectional link detection (UDLD) and aggressive UDLD features detect and disable unidirectional links on fiber-optic interfaces caused by incorrect fiber-optic wiring or port faults.
Integrated Cisco IOS Software features for bandwidth optimization	• Bandwidth aggregation through Cisco EtherChannel technology enhances fault tolerance and offers higher-speed aggregated bandwidth between switches, to routers and individual servers. Port Aggregation Protocol (PAgP) is available to simplify configuration. • Per-port broadcast, multicast, and unicast storm control prevents faulty end stations from degrading overall systems performance. • PVST+ allows for Layer 2 load sharing on redundant links to efficiently use the extra capacity inherent in a redundant design. • VLAN Trunking Protocol (VTP) pruning limits bandwidth consumption on VTP trunks by flooding broadcast traffic only on trunk links required to reach the destination devices. Dynamic Trunking Protocol (DTP) enables dynamic trunk configuration across all ports in the switch. • IGMP snooping provides for fast client joins and leaves of multicast streams and limits bandwidth-intensive video traffic to only the requestors. MVR, IGMP filtering, and fast-join and immediate leave are available as enhancements.

Feature	Benefit
Security	
Network-wide security features	• A private VLAN edge provides security and isolation between ports on a switch, ensuring that voice traffic travels directly from its entry point to the aggregation device through a virtual path and cannot be directed to a different port. • Support for the 802.1x standard allows users to be authenticated regardless of which LAN port they are accessing. It provides unique benefits to customers who have a large base of mobile (wireless) users accessing the network, including: . 802.1x with Voice VLAN to give a Cisco IP Phone access to the voice VLAN regardless of the authorized or unauthorized state of the port. 802.1x with port security for authenticating the port and managing network access for all MAC addresses, including that of the client. • Port Security secures the access to a port based on the MAC address of a user's device. The aging feature removes the MAC address from the switch after a specific timeframe to allow another device to connect to the same port. • MAC Address Notification allows administrators to be notified of new users added or removed from the network. • Multilevel security on console access prevents unauthorized users from altering the switch configuration. • Trusted Boundary provides the ability to trust the QoS priority settings if an IP phone is present and disable the trust setting in the event that the IP phone is removed, thereby preventing a rogue user from overriding prioritization policies in the network.
QoS	
Layer 2 QoS	• Support for reclassifying frames based either on 802.1p CoS value or default CoS value per port assigned by network manager. • 4 queues per egress port supported in hardware. • The WRR scheduling algorithm ensures that low-priority queues are not starved. • Strict priority queue configuration via Strict Priority Scheduling ensures that time-sensitive applications such as voice always follow an expedited path through the switch fabric.

Feature	Benefit
Management	
Superior manageability	• SNMP and Telnet interface support deliver comprehensive in-band management, and a command-line interface (CLI)-based management console provides detailed out-of-band management. • An embedded Remote Monitoring (RMON) software agent supports 4 RMON groups (history, statistics, alarms, and events) for enhanced traffic management, monitoring, and analysis. • A Switched Port Analyzer (SPAN) port can mirror traffic from 1 or many ports to another port for monitoring all 9 RMON groups with an RMON probe or network analyzer. • Trivial File Transfer Protocol (TFTP) reduces the cost of administering software upgrades by downloading from a centralized location. • Network Timing Protocol (NTP) provides an accurate and consistent timestamp to all switches within the intranet. • Layer 2 traceroute eases troubleshooting by identifying the physical path that a packet takes from the source device to a destination device. • Multifunction LEDs per port for port status, half-duplex/full-duplex, 10BASE-T/100BASE-TX/1000BASE-T indication, as well as switch-level status LEDs for system, redundant power supply, and bandwidth utilization, provide a comprehensive and convenient visual management system. • Crash Information support enables the switch to generate a crash file for improved troubleshooting. • Show Interface Capabilities provides information on the configuration capabilities of any interface. • The RTTMON Management Information Base (MIB) allows users to monitor network performance between a Cisco Catalyst switch and a remote device.
Cisco CMS Software	• Cisco CMS Software allows the user to manage up to 16 interconnected Cisco Catalyst 3550, 2950, 3500 XL, 2900 XL, and 2900 LRE XL series switches, without the limitation of being physically located in the same wiring closet, and with the option of using a single IP address for the entire cluster if desired. Full backward compatibility ensures that any combination of the above switches can be managed with a Cisco Catalyst 2950 Series switch. • Cisco AVVID (Architecture for Voice, Video and Integrated Data) wizards use just a few user inputs to automatically configure the switch to optimally handle different types of traffic (voice, video, multicast, or high-priority data). • 1-click software upgrades can be performed across the entire cluster simultaneously, and configuration cloning enables rapid deployment of networks. • Cisco CMS Software Guide Mode assists users in the configuration of powerful advanced features by providing step-by-step instructions. • Cisco CMS Software provides enhanced online help for context-sensitive assistance. • An easy-to-use graphical interface provides both a topology map and front-panel view of the cluster. • Multidevice and multiport configuration capabilities allow network administrators to save time by configuring features across multiple switches and ports simultaneously. • Ability to launch the Web-based management for a Cisco Aironet® Wireless Access Point by simply clicking on its icon in the topology map. • A user-personalized interface allows users to modify polling intervals, table views, and other settings within Cisco CMS Software and to retain these settings the next time they use the software. • Alarm notification provides automated e-mail notification of network errors and alarm thresholds.

Feature	Benefit
Support for CiscoWorks	• Manageable through CiscoWorks network management software on a per-port and per-switch basis providing a common management interface for Cisco routers, switches, and hubs. • SNMP v1, v2, and v3 (non-crypto) and Telnet interface support delivers comprehensive in-band management, and a CLI-based management console provides detailed out-of-band management. • Cisco Discovery Protocol versions 1 and 2 enable a CiscoWorks network management station to automatically discover the switch in a network topology. • Supported by the CiscoWorks LAN Management Solution.
Ease of use and ease of deployment	• Autoconfiguration eases deployment of switches in the network by automatically configuring multiple switches across a network via a bootp server. • Autosensing on each port detects the speed of the attached device and automatically configures the port for 10- or 100- operation, easing the deployment of the switch in mixed 10BASET and 100BASET environments. • Autonegotiating on all ports automatically selects half- or full-duplex transmission mode to optimize bandwidth. • Link Aggregation Control Protocol (LACP) allows the creation of Ethernet channeling with devices that conform to IEEE 802.3ad. This is similar to Cisco EtherChannel and PAgP. • Cisco Discovery Protocol versions 1 and 2 enable a CiscoWorks network management station to automatically discover the switch in a network topology. • Cisco VTP supports dynamic VLANs and dynamic trunk configuration across all switches. • Support for dynamic VLAN assignment through the implementation of the VLAN Membership Policy Server (VMPS) client function provides flexibility in assigning ports to VLANs. • Voice VLAN simplifies telephony installations by keeping voice traffic on a separate VLAN for easier network administration and troubleshooting. • The default configuration stored in Flash memory helps ensure that the switch can be quickly connected to the network and can pass traffic with minimal user intervention.

Product Specifications

Feature	Description
Performance	• 8.8-Gbps switching fabric • Cisco Catalyst 2950-12: 2.4 Gbps maximum forwarding bandwidth • Cisco Catalyst 2950-24: 4.8 Gbps maximum forwarding bandwidth • Cisco Catalyst 2950SX-24: 8.8 Gbps maximum forwarding bandwidth (Forwarding rates based on 64-byte packets) • Cisco Catalyst 2950-12: 1.8-Mpps wire-speed forwarding rate • Cisco Catalyst 2950-24: 3.6-Mpps wire-speed forwarding rate • Cisco Catalyst 2950SX-24: 6.6-Mpps wire-speed forwarding rate • 8-MB packet buffer memory architecture shared by all ports • 16 MB DRAM and 8 MB Flash memory • Configurable up to 8000 MAC addresses

Feature	Description
Power connectors	Customers can provide power to a switch by using either the internal power supply or the Cisco Redundant Power System (RPS) 300. The connectors are located at the back of the switch. **Internal power supply connector** • The internal power supply is an autoranging unit. • The internal power supply supports input voltages between 100 and 240 VAC. • The supplied AC power cord connects the AC power connector to an AC power outlet. **Cisco RPS 675 Connector** • The connector offers connection for an optional Cisco RPS 675 that uses AC input and supplies DC output to the switch. • The connector offers a 675-watt redundant power system that can support six external network devices and provides power to one failed device at a time. • The connector automatically senses when the internal power supply of a connected device fails and provides power to the failed device, preventing loss of network traffic. • Attach only the Cisco RPS 675 (model PWR675-AC-RPS-NI=) to the redundant power supply receptacle with this connector. **Cisco RPS 300 Connector** • The connector offers connection for an optional Cisco RPS 300 that uses AC input and supplies DC output to the switch. • The connector offers a 300-watt redundant power system that can support six external network devices and provides power to one failed device at a time. • The connector automatically senses when the internal power supply of a connected device fails and provides power to the failed device, preventing loss of network traffic. • Only the Cisco RPS 300 (model PWR300-AC-RPS-N1) should be attached to the redundant power supply receptacle.
Indicators	• Per-port status LEDs: link integrity, disabled, activity, speed, and full-duplex indications • System status LEDs: system, RPS, and bandwidth utilization indications
Dimensions (H x W x D) and weight	• 1.72 x 17.5 x 9.52 in. (4.36 x 44.45 x 24.18 cm) • One rack-unit (RU) high (1.72 in./4.36 cm) • 6.5 lb (3.0 kg)
Environmental ranges	• Operating temperature: 32 to 113°F (0 to 45°C) • Storage temperature: –13 to 158°F (–25 to 70°C) • Operating relative humidity: 10 to 85 percent (noncondensing) • Operating altitude: Up to 10,000 ft (3000 m) • Storage altitude: Up to 15,000 ft (4500 m)
Power requirements	• Power consumption: 30W (maximum), 102 BTUs per hour • AC input voltage/frequency: 100 to 127 or 200 to 240 VAC (autoranging), 50 to 60 Hz • DC input voltages for Cisco RPS 300: +12V @ 4.5A
Acoustic noise	• ISO 7770, bystander position—operating to an ambient temperature of 30°C – WS-C2950-24, WS-C2950-12, WS-C2950C-24, WS-C2950T-24: 46 dBa – WS-C2950G-12, WS-C2950G-24: 46 dBa – WS-C2950G-48: 48 dBa
Predicted mean time between failure (MTBF)	• 268,292 hours (Cisco Catalyst 2950-24) • 318,440 hours (Cisco Catalyst 2950-12) • 403,214 hours (Cisco Catalyst 2950SX-24)

Regulatory Agency Approvals	
Safety certifications	• UL 60950/CSA 22.2 No. 950 • IEC 60950/EN 60950 • AS/NZS 3260, TS001 • CE Marking
Electromagnetic emissions certifications	• FCC Part 15 Class A • EN 55022: 1998 (CISPR 22) Class A • EN 55022: 1998 (CISPR 22) • VCCI Class A • AS/NZS 3548 Class A • CE Marking • CNS 13438 Class A • CLEI Code • MIC
Warranty	• Lifetime limited warranty

Service and Support

The services and support programs described in Table 2 are available as part of the Cisco Desktop Switching Service and Support solution, and are available directly from Cisco and through resellers.

Table 2 Service and Support Programs

Service and Support	Features	Benefits
Advanced Services		
Total Implementation Solutions (TIS)—available direct from Cisco ***Packaged TIS***—available through resellers	• Project management • Site survey and configuration deployment • Installation, text, and cutover • Training • Major moves, adds, and changes • Design review and product staging	• Supplements existing staff • Ensures that functions meet customer needs • Mitigates risk
Technical Support Services		
Cisco SMARTnet® and Cisco SMARTnet Onsite services—available direct from Cisco ***Packaged Cisco SMARTnet service***—available through resellers	• 24x7 access to software updates • Web access to technical repositories • Telephone support through the Cisco Technical Assistance Center (TAC) • Advance replacement of hardware parts	• Enables proactive or expedited issue resolution • Lowers cost of ownership by using Cisco expertise and knowledge • Minimizes network downtime

Ordering Information

Model Numbers	Configuration
WS-C2950-12	• 12 10/100 ports • 1 RU standalone, fixed-configuration, managed 10/100 switch • Cisco SI Software
WS-C2950-24	• 24 10/100 ports • 1 RU standalone, fixed-configuration, managed 10/100 switch • Cisco SI Software
WS-C2950SX-24	• 24 10/100 ports with 2 fixed 1000BASE-SX uplinks • 1 RU standalone, fixed-configuration, managed 10/100 switch • Cisco SI Software

Software Advisor

Major Release 12.2T

Product Family 3745

Releases 12.2(15)T

Feature Set IP PLUS IPSEC 3DES

ne features are dependent on product model, interface modules (i.e. Line ards & Port Adapters), and/or require a software feature license.

Your selections are supported by the following

Image Name	DRAM	Flash	Product Number	Options
c3745-ik9s-mz.12.2-15.T	128	32	S374CK9-12215T= S374CK9-12215T	Search For MIBs Compare Images

AAA Broadcast Accounting
AAA DNIS Map for Authorization
AAA Resource Accounting
AAA Server Group
AAA Server Group Deadtimer
AAA Server Group Enhancements
AAA Server Groups Based on DNIS
AAA-PPP-VPDN Non-Blocking
Ability to Disable Xauth for Static IPsec Peers
Accounting of VPDN Disconnect Cause
ACL Authentication of Incoming RSH and RCP
ACL Default Direction
ACL Sequence Numbering
ptive Frame Relay Traffic Shaping for Interface Congestion
Additional Vendor-Proprietary RADIUS Attributes
Address Resolution Protocol (ARP)
ADSL - Asymmetric Digital Subscriber Line Support
Advanced Encryption Standard (AES)
Advanced Voice Busyout (AVBO)
Airline Product Set (ALPS)
Airline Product Set Enhancements (MATIP)
Always On Dynamic ISDN (AO/DI)
Analog Centralized Automatic Message Accounting E911 Trunk
Answer Supervision Reporting
Asynchronous Line Monitoring
Asynchronous Rotary Line Queuing
ATM Cell Loss Priority (CLP) Setting
ATM LANE Fast Simple Server Redundancy Protocol (LANE Fast SSRP)
ATM Multilink PPP Support on Multiple VCs
ATM Subinterface MIB/Traps
ATM SVC Troubleshooting Enhancements
ATM-DXI
AutoInstall Using DHCP for LAN Interfaces
Automatic modem configuration
AutoQoS - VoIP
Bandwidth Allocation Control Protocol (BACP)

ECT 4.601 J CPI-AG

BGP
BGP 4
BGP 4 Multipath Support
BGP 4 Prefix Filter and In-bound Route Maps
BGP 4 Soft Config
BGP Conditional Route Injection
BGP Hide Local-Autonomous System
BGP Hybrid CLI Support
BGP Link Bandwidth
BGP Multipath Load Sharing for Both eBGP and iBGP in an MPLS-VPN
BGP Named Community Lists
BGP Nonstop Forwarding (NSF) Awareness Support
BGP Policy Accounting
BGP Prefix-Based Outbound Route Filtering
BGP Route-Map Policy List Support
BGP Soft Reset
Bidirectional PIM
BIP - BSC to IP Conversion for Automated Teller Machines
Bisync (BSC)
Bridging between IEEE 802.1Q vLANs
Broadcast/Multicast Suppression
BSTUN (Block Serial Tunneling)
Busyout Monitor
Call Admission Control for H.323 VoIP Gateways
Call Release Source Reporting in Gateway-Generated Accounting Records
Caller ID
CEF on Multipoint GRE Tunnels
CEF Support for IP Routing between IEEE 802.1Q vLANs
CEF/dCEF - Cisco Express Forwarding
CEFv6/dCEFv6 - Cisco Express Forwarding
Certificate Auto-Enrollment
Certificate Enrollment Enhancements
Certificate Security Attribute-Based Access Control
Certification Authority Interoperability (CA)
CGMA - Cisco Gateway Management Agent
CGMP - Cisco Group Management Protocol
Challege Handshake Authentication Protocol (CHAP)
Channelized E1 Signaling
Circuit Interface Identification Persistence for SNMP
Cisco Discovery Protocol (CDP)
Cisco Discovery Protocol (CDP) - IPv6 Address Family Support for Neighbor I...
Cisco IOS Telephony Service (ITS) Version 2.0
Cisco IOS Telephony Service (ITS) Version 2.01
Cisco IOS Telephony Service (ITS) Version 2.02
Cisco IOS Telephony Service (ITS) Version 2.1
Class Based Ethernet CoS Matching & Marking (802.1p & ISL CoS)
Class Based Weighted Fair Queuing (CBWFQ)
Class-Based Frame-Relay DE-Bit Matching and Marking
Class-Based Packet Marking
Class-Based Packet Shaping
Class-Based RTP & TCP Header Compression
Classless InterDomain Routing (CIDR) IP Default Gateway
Clear Channel T3/E3 with Integrated CSU/DSU
CLI String Search
ClickStart
CNS Agents SSL Security
CNS Configuration Agent
CNS Event Agent
Commented IP Access List Entries
Committed Access Rate (CAR)
Compression Control Protocol
Conferencing and Transcoding for Voice Gateway Routers
Configurable per ATM-VC Hold Queue size
Configurable Timers in H.225
Connect-Info RADIUS Attribute 77
Content Engine Network Module for Caching and Content Delivery
Control Plane DSCP Support for RSVP
COPS for RSVP
Crashinfo Support
CT1/RBS (Robbed Bit Signaling)

CUG Selection Facility Suppress Option
Custom Queueing (CQ)
Customer Profile Idle Timer Enhancements for Interesting Traffic
Default Passive Interface
DF Bit Override Functionality with IPSec Tunnels
DHCP Client
DHCP Client - Dynamic Subnet Allocation API
DHCP Client on WAN Interfaces
DHCP ODAP Server Support
DHCP On Demand Address Pool (ODAP) Manager for non-MPLS VPN pools
DHCP Option 82 Support for Routed Bridge Encapsulation
DHCP Proxy Client
DHCP Relay - MPLS VPN Support
DHCP Relay Agent Support for Unnumbered Interfaces
DHCP Secured IP Address Assignment
DHCP Server Options - Import and Autoconfiguration
DHCP Server-Easy IP Phase 2
Dial backup
Dial on Demand Authentication Enhancements
Dial Peer Enhancements
Dial-on-demand
Dialer CEF
Dialer Idle Timer Inbound Traffic Configuration
Dialer Persistent
er profiles
er Watch
Dialer Watch Connect Delay
Diffie-Hellman Group 5
Diffserv Compliant WRED
Digital J1 Voice Support
Direct Inward Dial (DID)
Disabling LANE Flush Process
Distinguished Name Based Crypto Maps
Distributed Management Event MIB Persistence
Distributed Management Expression MIB persistence
DLR Enhancements: PGM RFC-3208 Compliance
DLSw (RFC 1795)
DLSw CO features
DLSw V2
DLSw+
DLSw+ Asynchronous TCP Enhancements
DLSw+ Backup Peer Extensions for Encapsulation Types
DLSw+ Border Peer Caching
DLSw+ Enhanced Load Balancing
DLSw+ Ethernet Redundancy
DLSw+ Peer Group Clusters
DLSw+ RSVP Bandwidth Reservation
w+ SNA Type of Service
Sw+ Support For Transporting LLC1 UI Traffic
DNS based X.25 routing
DNS Lookups over an IPv6 Transport
Double Authentication
Down Stream Physical Unit (DSPU) over DLSw+
Downstream PU concentration (DSPU)
DRP Server Agent
DTMF Events Through SIP Signaling
Dynamic Multiple Encapsulation for Dial-in over ISDN
Dynamic Multipoint VPN (DMVPN)
E1 R2 Signaling
Easy IP (Phase 1)
Easy VPN Remote Enhancements
Easy VPN Server
EIGRP Nonstop Forwarding (NSF) Awareness
Encrypted Vendor Specific Attributes
Enhanced Call and IVR Control for Rotary Call Set Ups
Enhanced Codec support for SIP using Dynamic Payloads
Enhanced IGRP (EIGRP)
Enhanced IGRP Stub Routing
Enhanced ITU-T G.168 Echo Cancellation
Enhanced Local Management Interface (ELMI)

RQS Nº 03/2005 - CN

Doc: 3701

Enhanced Password Security
Enhanced Test Command
Enhanced Tracking Support.
Exporting and Importing RSA Keys
Express RTP and TCP Header Compression
Fast Fragmentation (Fast-Switched Fragmented IP Packets)
Fast-Switched Compressed RTP
Fast-Switched Policy Routing
Fast-Switched SRTLB
Fax Relay Packet Loss Concealment
Feature Group D Support
Flow-Based WRED
Frame Relay
Frame Relay - Multilink (MLFR-FRF.16)
Frame Relay 64-bit Counters
Frame Relay Access Support (FRAS) Border Access Node (BAN)
Frame Relay Access Support (FRAS) Boundary Network Node (BNN)
Frame Relay Access Support (FRAS) Dial Backup over DLSW+
Frame Relay Access Support (FRAS) DLCI Backup
Frame Relay Access Support (FRAS) Host
Frame Relay ELMI Address Registration
Frame Relay Encapsulation
Frame Relay End-to-End Keepalive
Frame Relay Fragmentation (FRF.12)
F e Relay Fragmentation with Hardware Compression
F e Relay FRF.9 Payload Compression
Frame Relay IP RTP Priority
Frame Relay Point-Multipoint Wireless
Frame Relay PVC Interface Priority Queueing
Frame Relay Queuing and Fragmentation at the Interface
Frame Relay Router ForeSight
Frame Relay Switching
Frame Relay Switching Diagnostics and Troubleshooting
Frame Relay Switching Enhancements: Shaping and Policing
Frame Relay Traffic Shaping (FRTS)
Frame Relay Tunnel Switching
Frame Relay Voice Adaptive Traffic Shaping
FUNI Support for Routers
FXO Answer and Disconnect Supervision
Gatekeeper Ecosystem Interoperability
Gateway Enhancements to Enable v4-v2 Interworking
Generic Routing Encapsulation (GRE)
Generic Routing Encapsulation (GRE) Tunnel Keepalive
Generic Traffic Shaping (GTS)
GLBP: Gateway Load Balancing Protocol
H.323 Call Redirection Enhancements
H.323 Dual Tone Multifrequency (DTMF) Relay Using Named Telephone Events
H 3 Redundant Zone Support
H.323 Scalability and Interoperability Enhancements for Gateways
H.323 Support for Virtual Interfaces
H.323V4 Gateway Zone Prefix Registration Enhancements
H450.2 & H450.3 Support In IOS
Half bridge/half router for CPP and PPP
Hoot and Holler over IP
HSRP - Hot Standby Router Protocol
HSRP - Hot Standby Router Protocol and IPSec
HSRP over ISL
HSRP support for ICMP Redirects
HSRP support for MPLS VPNs
HTTP 1.1 Web Server
HTTPS - HTTP with SSL 3.0
iBGP Multipath Load Sharing
IEEE 802.1Q ISL VLAN Mapping
IEEE 802.1Q Tunneling
IEEE 802.1Q VLAN Support
IEEE 802.1Q VLAN Trunking
IEEE 802.3x Flow Control
IGMP Fast Leave
IGMP MIB Support Enhancements for SNMP
IGMP Snooping

4.598
CPI-FC

IGMP State Limit
IGMP Version 3
IGMP Version 3 - Explicit Tracking of Hosts, Groups, and Channels
IKE - Initiate Aggressive Mode
IKE Extended Authentication (Xauth)
IKE Mode Configuration
IKE Security Protocol
IKE Shared Secret Using AAA Server
Integrated routing and bridging (IRB)
Inter-Domain Gateway Security Enhancement
Interactive Voice Response (IVR) Version 2.0
Interface Alias Long Name Support
Interface Index Display
Interface Index Persistence
Interface Range Specification
Internal Cause Code Consistency between SIP and H.323
Interworking Signaling Enhancements for H.323 and SIP VoIP
Inverse Multiplexing over ATM (IMA)
IP DSCP marking for Frame-Relay PVC
IP Enhanced IGRP Route Authentication
IP Header Compression Enhancement - PPPoATM and PPPoFR Support
IP Multicast Load Splitting across Equal-Cost Paths
IP Multicast Multilayer Switching (MLS)
IP Multilayer Switching (IP MLS)
'amed Access Control List
recedence Accounting
IP Precedence for GRE Tunnels
IP Routing
IP RTP Priority
IP Summary Address for RIPv2
IP to ATM CoS, per-VC WFQ and CBWFQ
IP-to-ATM CoS
IPSec MIB Support for Cisco IPSec VPN Management
IPsec NAT Transparency
IPSec Network Security
IPSec Through Network Address Translation Support
IPSec Triple DES Encryption (3DES)
IPSec VPN Accounting
IPSec VPN High Availability Enhancements
IPv6 ADSL and Dial Deployment Support
IPv6 Extended Access Control List
IPv6 for Cisco IOS Software
IPv6 ISATAP Tunnel Support
IPv6 Quality of Service
ISDN
ISDN Advice of Charge (AOC)
ISDN Caller ID Callback
N Cause Code Override
ISDN Generic Transparency Descriptor (GTD) for Setup Message
ISDN LAPB-TA
ISDN Leased Line at 128kbps
ISDN Network Side for ETSI Net5 PRI
ISDN NFAS
ISDN Progress Indicator support for SIP using 183 Session Progress
ISDN-NFAS with D Channel Backup
ISL VLAN
IVR: Enhanced Multilanguage Support
L2TP Dial-Out
L2TP Extended Failover
L2TP Layer 2 Tunneling Protocol
L2TP Security
L2TP Tunnel Preservation of IP TOS
LAN Network Manager over DLSw+
LANE dCEF
LANE Optimum Switching
Large Scale Dialout (LSDO)
Layer 2 Forwarding-Fast Switching
Line Printer Daemon (LPD)
Link Fragmentation and Interleaving (LFI) for Frame Relay and ATM Virtual C...

Local Voice Busyout (LVBO)
Lock and Key
Low Latency Queueing (LLQ)
Low Latency Queueing (LLQ) for Frame Relay
Low Latency Queueing (LLQ) with Priority Percentage Support
Low Latency Queuing (LLQ) for IPSEC Encryption Engines
LSDO: L2TP Large-Scale Dial-Out
MAC Address Filtering
Malicious Caller Identification (MCID) Invocation Support for Enterprise Ne...
Manual certificate enrollment (TFTP and cut-and-paste)
MD5 File Validation
Measurement-Based Call Admission Control for SIP
Message Banners for AAA Authentication
MGCP - Media Gateway Control Protocol
MGCP 1.0 Including NCS 1.0 and TGCP 1.0 Profiles
MGCP Based Fax (T.38) and DTMF Relay
MGCP Basic CLASS and Operator Services
MGCP CAS PBX and AAL2 PVC
MGCP Generic Configuration Support for Call Manager (IP-PBX)
MGCP PRI backhaul and T1-CAS support for Call Manager (IP-PBX)
MGCP Standalone Remote Office Support for Call Manager (IP-PBX)
MGCP VoIP Call Admission Control
MGCP VoIP Signaling
Microsoft Point-to-Point Compression (MPPC)
Mobile IP
Mobile IP - Challenge/Response Extestions
Mobile IP - Dynamic DNS and Multiple DHCP Support
Mobile IP - Fastswitching Support on FA
Mobile IP - Generic NAI Support and Home Address Allocation
Mobile IP - HA Accounting
Mobile IP - HA Policy Routing
Mobile IP - HMAC-MD5 support
Mobile IP - IPSec for HA-FA Tunnel
Mobile IP - Mobile Networks
Mobile IP - Mobile Networks Asymmetric Link and Dynamic Network
Mobile IP - Mobile Networks Priority HA Assignment
Mobile IP - Mobile Networks Static Collocated Care of Address
Mobile IP - Mobile Networks Tunnel Templates for Multicast
Mobile IP - NAT Detect
Mobile IP - Private Addressing Support
Mobile IP - Proxy Mobile IP and Proxy CHAP
Mobile IP - Single IDB Tunnel Support
Mobile IP - Support for FA Reverse Tunnelling
Mobile IP - Support NAI Based MNs that are serviced by many HAs
Mobile IP Home Agent (HA) Redundancy
Modem over BRI
Modem PassThrough over Voice over IP
Modem Relay Support on VoIP Platforms
Modem Script and System Script Support in LSDO
Modem User Interface Option
Modular QoS CLI (MQC)
Modular QoS CLI (MQC) - Based Frame Relay Traffic Shaping
Modular QoS CLI (MQC) Three-Level Hierarchical Policer
Modular QoS CLI (MQC) Unconditional Packet Discard
MPLS VPN support for EIGRP between Provider Edge (PE) and Customer Edge (CE...
MS Callback
MS-CHAP Version 1
Multi-Chassis Hunting for Voice over Frame Relay
Multicast BGP (MBGP)
Multicast Music on Hold support for Call Manager (IP-PBX)
Multicast NAT
Multicast Routing Monitor (MRM)
Multicast Source Discovery Protocol (MSDP)
Multicast Subsecond Convergence
Multichassis MultiLink PPP (MMP)
Multiclass Multilink PPP
Multihop VPDN
Multilink PPP
Multilink PPP Enable/Disable via Radius for Preauthentication User
Multiple RSA Keypair Support

ECT 4.596 1

Multiprotocol over ATM (MPOA)
Multiprotocol over ATM for Token Ring (MPOA)
Named Method Lists for AAA Authorization and Accounting
NAT - Static Mapping Support with HSRP for High-Availability
NAT Default Inside Server Enhancement
NAT Stateful Fail-over of Network Address Translation
NAT-Ability to use Routes Maps with Static Translations
NAT-Enhanced H.225/H.245 Forwarding Engine
NAT-Network Address Translation
NAT-Support for NetMeeting Directory (Internet Locator Service - ILS)
NAT-Support for SIP
NAT-Support of H.323v2 Call Signaling (FastConnect)
NAT-Support of H.323v2 RAS
NAT-Support of IP Phone to Cisco Call Manager
NAT-Translation of external IP Addresses only
National ISDN Switch Types for BRI and PRI Interfaces
Native Client Interface Architecture (NCIA) Server
Native Service Point over DLSW+
NBAR - Network-based Application Recognition
NBAR Real-time Transport Protocol Payload Classification
Netflow
NetFlow Aggregation
Netflow Multiple Export Destinations
NetFlow Policy Routing (NPR)
Flow ToS-Based Router Aggregation
Network Side ISDN PRI Signaling, Trunking, and Switching
Network Time Protocol (NTP)
Next Hop Resolution Protocol (NHRP)
NFAS Enhancements
Offload Server Accounting Enhancement
On Demand Routing (ODR)
Optimized PPP Negotiation
OSP Debug Enhancement
OSPF
OSPF ABR type 3 LSA Filtering
OSPF Flooding Reduction
OSPF for IPv6
OSPF Forwarding Address Suppression in Translated Type-5 LSAs
OSPF Inbound Filtering using Route Maps with a Distribute List
OSPF Nonstop Forwarding Awareness
OSPF Not-So-Stubby Areas (NSSA)
OSPF On Demand Circuit (RFC 1793)
OSPF Packet Pacing
OSPF Sham-Link Support for MPLS VPN
OSPF Shortest Paths First Throttling
OSPF Stub Router Advertisement
OSPF Support for Fast Hellos
OSPF Support for Multi-VRF on CE Routers
OSPF Update Packet-Pacing Configurable Timers
Packet Classification Based on Layer3 Packet-Length
Packet Classification using Frame-Relay DLCI Number
PAD Subaddressing
Parse Bookmarks
Parser Cache
Password Authentication Protocol (PAP)
Per-User Configuration
Percentage-Based Policing and Shaping
PIM Dense Mode State Refresh
PIM MIB Extension for IP Multicast
PIM Multicast Scalability
PIM Version 1
PIM Version 2
Policer Enhancement - Multiple Actions
Policy-Based Routing (PBR)
PPP
PPP over ATM
PPP over ATM (IETF-Compliant)
PPP over ATM SVCs
PPP Over Fast Ethernet 802.1Q
PPP over Frame Relay

PRI/Q.931 Signaling Backhaul for Call Agent Applications
Priority Queueing (PQ)
Privilege Command Enhancement
Protocol Translation (PT)
PSTN Fallback
QoS Device Manager (QDM)
QoS for Virtual Private Networks
QoS Packet Marking
QoS Priority Percentage CLI Support
QSIG Protocol Support
Qualified Logical Link Control (QLLC)
RADIUS
RADIUS Attribute 44 (Accounting Session ID) in Access Requests
RADIUS Attribute 66 (Tunnel-Client-Endpoint) Enhancements
RADIUS Attribute 82: Tunnel Assignment Id
RADIUS Attribute Value Screening
RADIUS Centralized Filter Management
RADIUS for Multiple User Datagram Protocol Ports
RADIUS Interim Update at Call Connect
RADIUS Packet of Disconnect
RADIUS Progress Codes
RADIUS Route Download
RADIUS Tunnel Attribute Extensions
RADIUS Tunnel Preference for Load Balancing and Fail-over
Random Early Detection (RED)
Redial Enhancements
Redundant Link Manager (RLM)
Reflexive Access Lists
Remote Source-Route Bridging (RSRB)
Resource Pool Management with Direct Remote Services
Response Time Reporter (RTR)
Response Time Reporter (RTR) enhancements
Reverse Path Forwarding - Source Exists only
Reverse Route Injection (RRI)
RFC 1483 for Token Ring Networks
RGMP - Router-Port Group Management Protocol
RIF Passthru in DLSw+
RIP
RMON events and alarms
Routing Through Dial Strings
RSVP - ATM Quality of Service (QoS) Interworking
RSVP - Resource Reservation Protocol
RSVP Local Policy Support
RSVP Message Authentication
RSVP Refresh Reduction and Reliable Messaging
RSVP Scalability Enhancements
RSVP Support for Frame Relay
RSVP support for LLQ
RSVP Support for RTP Header Compression
RTP Header Compression
SDLC SNRM Timer and Window Size Enhancements
SDLC-to-LAN conversion (SDLLC)
Secure Copy (SCP)
Secure Shell SSH Support over IPv6
Secure Shell SSH Terminal-line access
Secure Shell SSH Version 1 Integrated Client
Secure Shell SSH Version 1 Server Support
Selective Packet Discard (SPD)
Selective Virtual-Access Interface Creation
Service Assurance Agent (SAA) APM Application Performance Monitor
Service Assurance Agent (SAA) DHCP Operation
Service Assurance Agent (SAA) Distribution of Data

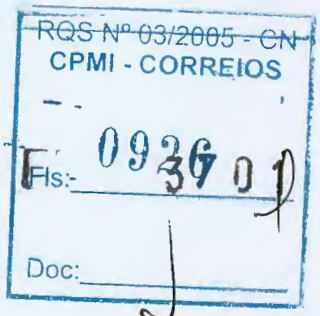
SRST: Survivable Remote Site Telephony Version 2.02



SRST: Survivable Remote Site Telephony Version 2.1
SSRP for LANE
Stack Group Bidding Protocol (SGBP)
Standard IP Access List Logging
Static Cache Entry for IPv6 Neighbor Discovery
Stream Control Transmission Protocol (SCTP)
Stub IP Multicast Routing
STUN (Serial Tunnel)
Subnetwork Bandwidth Manager (SBM)
Switch Port Analyzer (SPAN)
Switch Port Analyzer (SPAN) - Disable Receive Traffic Destination Port
Switch Port Analyzer (SPAN) - Multiple Source Port Selection
Switched Multimegabit Data Service (SMDS)
T.37 Store and Forward Fax
T.37/T.38 Fax Gateway
T.38 Fax Relay for VoIP H.323
Tacacs SENDAUTH function
Tacacs Single Connection
TACACS+
TCL IVR 2.0 Call Initiation and Callback
TCL IVR Disconnect Cause-Code Manipulation
TCP Window Scaling
Time-Based Access Lists Using Time Ranges
Timer and Retry Enhancements for L2TP and L2F
T[illegible] Ring ISL
T[illegible]n Ring LANE
Traffic Policing
Transparent Bridging
Transparent CCS and Frame Forwarding Enhancements
Transparent Common Channel Signaling (T-CCS)
Triggered RIP
Trimble Palisade NTP Synchronization Driver
Trunk Conditioning for FRF.11 and Cisco Trunks
Trusted Root Certification Authority
Trustpoint CLI
Tunnel Endpoint Discovery
Tunnel Type of Service (TOS)
Tunneling of Asynchronous Security Protocols
Turbo Flooding of UDP Datagrams
Two-Rate Policer
UDLR Tunnel ARP and IGMP Proxy
UDP forwarding support of IP Redundancy Virtual Router Group (VRG)
Uni-Directional Link Routing (UDLR)
Unicast Reverse Path Forwarding (uRPF)
User Maximum Links
Using 31-bit Prefixes on IPv4 Point-to-Point Links
V.110 support for Digital Modems
V[illegible] Support

Data Sheet

Cisco Catalyst **6500** Series Switch

The Catalyst 6500 Series sets the new standard for IP communications and application delivery in enterprise campus and service provider networks by maximizing user productivity and enhancing operational control while providing unprecedented investment protection. As Cisco's premier intelligent multilayer modular switch, the Catalyst® 6500 Series delivers secure, converged services, end-to-end, from the wiring closet to the core, to the data center, to the WAN edge.

Ideal for enterprises and service providers seeking to reduce their total cost of ownership, the Cisco Catalyst 6500 Series delivers scalable performance and port density across a range of chassis configurations and LAN/WAN/MAN interfaces. Available in 3-, 6-, 9-, and 13-slot chassis, Cisco Catalyst 6500 Series switches feature an unparalleled range of integrated services modules, including multigigabit network security, content switching, telephony, and network analysis modules.

By taking advantage of a forward-thinking architecture that uses a common set of modules and operating system software across all Cisco Catalyst 6500 Series chassis, the Catalyst 6500 Series delivers a high level of operational consistency that optimizes IT infrastructure usage and enhances return on investment. From 48-port to 576-port 10/100/1000 Ethernet wiring closets to hundreds-of-Mpps network cores supporting up to 192 1-Gbps or 32 10-Gbps trunks, the Cisco Catalyst 6500 Series provides an optimal platform that maximizes network uptime with stateful failover capability between redundant routing and forwarding engines.

With numerous industry-firsts and industry-leading features to its credit, the Catalyst 6500 Series supports three generations of modules that continue to demonstrate the Catalyst 6500 value and Cisco's commitment to innovation. Cisco's new generation of Catalyst 6500 Series modules and Supervisor Engine 720 incorporate 11 new Cisco-developed application specific integrated circuits (ASICs)—extending Cisco's leadership in networking while providing unparalleled investment protection.

Cisco Catalyst 6500 Series Benefits

The Cisco Catalyst 6500 Series provides market-leading services, performance, port densities, and availability with investment protection for enterprise and service provider markets. These include:

- *Maximum network uptime*—With platform, power supply, supervisor engine, switch fabric, and integrated network services redundancy provides one- to three-second stateful failover and delivers application and services continuity in a converged network environment, minimizing disruption of mission-critical data and services
- *Comprehensive network security*—Integrates proven, multigigabit Cisco security solutions, including intrusion detection, firewall, VPN, and SSL into existing networks
- *Scalable performance*—Provides up to 400 Mpps performance with distributed forwarding architecture
- *Forward-Thinking architecture with investment protection*—Supports three generations of interchangeable, hot-swappable modules in the same chassis, optimizing IT infrastructure usage, maximizing return on investment, and reducing total cost of ownership
- *Operational consistency*—Features 3-, 6-, 9-, and 13-slot chassis configurations sharing a common set of modules, Cisco IOS Software, Cisco Catalyst Operating System Software, and network management tools that can be deployed anywhere in the network
- *Unparalleled services integration and flexibility*—Integrates advanced services such as security and content with converged networks, provides the widest range of interfaces and densities, from 10/100 and 10/100/1000 Ethernet to 10 Gigabit and from DS0 to OC-48, and performs in any deployment end to end

Operational Consistency in End-to-End Cisco Catalyst 6500 Series Deployments

- Features 3-, 6-, 9-, and 13-slot chassis configurations that share a common set of modules, software, and network management tools
- Deploys anywhere in the network—from the wiring closet to the core, to the data center, to the WAN edge
- Shares WAN port adapters with Cisco 7xxx router Series for reduced sparing and training costs
- Offers choice of Cisco IOS Software and Cisco Catalyst Operating System Software supported on all supervisor engines, providing smooth migration from Cisco Catalyst 5000 Series and Cisco 7500 Series deployments

Maximum Network Uptime and Network Resiliency

- Provides packet-loss protection and the fastest recovery from network disruption
- Features fast, one- to three-second stateful failover between redundant supervisor engines
- Offers optional, redundant high-performance Cisco Catalyst 6500 Series Supervisor Engine 720, passive backplane, multimodule Cisco EtherChannel® technology, IEEE 802.3ad link aggregation, IEEE 802.1s/w, and Hot Standby Router Protocol/Virtual Router Redundancy Protocol (HSRP/VRRP) high-availability features

Integrated High-performance Security and Network Management

Integrated gigabit-per-second services modules, deployed where external devices would not be feasible, simplify network management and reduce total cost of ownership. These include:

- Gigabit firewall—provides access protection
- High-performance intrusion detection system (IDS)—provides intrusion detection protection
- Gigabit Network Analysis Module—provides a more manageable infrastructure and full Remote Monitoring (RMON) support
- High-performance SSL—provides high-performance, secure e-commerce traffic termination
- Gigabit VPN and standards-based IP Security (IPSec)—support lower cost Internet and intracampus connections

J

Content-and Application-Aware Layers 2 Through 7 Switching Services

- Integrated content switching module (CSM) brings high-performance, feature-rich server and firewall load balancing to the Cisco Catalyst 6500 Series, ensuring a safer and more manageable infrastructure with unprecedented control
- Integrated multigigabit SSL acceleration combined with CSM provides a high-performance e-commerce solution
- Integrated multigigabit firewall and CSM provide a secure, high-performance, data-center solution
- Software features such as Network Based Application Recognition (NBAR) enhance network management and control of bandwidth utilization

Scalable Performance

- Delivers the industry's highest LAN switch performance, 400 Mpps, using the distributed Cisco Express Forwarding dCEF720 platform
- Supports a mix of Cisco Express Forwarding (CEF) implementations and switch fabric speeds for optimal wiring closet, core, data center, and WAN edge deployments, as well as service provider networks

Rich Layer 3 Services

- Multiprotocol Layer 3 routing supports traditional network requirements and provides a smooth transition mechanism in the enterprise
- Provides hardware support for enterprise-class and service-provider-scale routing tables
- Provides IPv6 support in hardware (using Supervisor Engine 720) with an unparalleled high-performance suite of services
- Provides hardware support for large enterprise-class and service-provider-scale routing tables
- Provides MPLS support in hardware to enable VPN services within the enterprise and facilitate smooth integration with new high-speed service provider core infrastructures and Metro Ethernet deployments

Enhanced Data Voice, and Video Services

- Provides integrated IP communications throughout all Cisco Catalyst 6500 Series platforms
- Provides 10/100 and 10/100/1000 line cards, field upgradable with inline power using a daughter card and offering future support for IEEE 802.3af to protect today's investments
- Provides dense T1/E1 and foreign Exchange Station (FXS) voice-over-IP (VoIP) gateway interfaces for public switched telephone network (PSTN) access and traditional phone, fax, and private branch exchange (PBX) connections
- Supports high-performance IP multicast video and audio applications
- Provides integrated management necessary to effectively deploy a scalable enterprise-converged network

Highest Level of Interface Flexibility, Scalability, and Density

- Provides the port densities and interface choices that large mission-critical wiring closets, enterprise core, and distribution networks require
- Supports up to 576 voice 10/100/1000 Gigabit-over-copper ports with inline power per system
- Provides up to 192 Gigabit Ethernet ports

- Features the industry's first 10 Gigabit Ethernet, Channelized OC-48 dense OC-3 Packet over Synchronous Optical Network (SONET) (PoS)
- Provides investment protection by using Cisco 7xxx Series port adapters on the Cisco Catalyst 6500 Series FlexWAN Line Card, supporting T1/E1 through OC-48 WAN interfaces
- Chassis sizes range from 3-slot (Cisco Catalyst 6503 Switch) to 13-slot (Cisco Catalyst 6513 Switch)

High-Speed WAN Interfaces

- Provides high-speed WAN, ATM, and SONET interfaces compatible with other core routers
- Provides single-device management for WAN aggregation and for campus and metro connectivity

Maximum Investment Protection

- Highly flexible modular architecture supports multiple generations of modules that are fully interoperable with each other in the same chassis
- Upgradable supervisor engines can add Layer 3 routing or forwarding capabilities over time
- Cisco IOS Software and Cisco Catalyst Operating System Software are supported across all supervisor engines
- Field-upgradable inline power for 10/100 Mbps and 10/100/1000 Mbps Ethernet modules for "pay as you go" IP telephony and wireless computing
- A steady stream of new services modules adds to the deployment options
- Includes Cisco Catalyst 6500 Series network security, content switching, and voice capabilities
- Future modules will increase performance, port density, and include additional services

Ideal for Metro Ethernet WAN Services

- 802.1Q and 802.1Q tunneling (QinQ) providing point-to-point and multipoint Ethernet services
- EoMPLS in MPLS backbones for superior network scaling providing virtual LAN (VLAN) translation capability
- Layer 2 and Layer 3 QoS enables tiered Ethernet service offerings through rate limiting and traffic shaping
- Superior high-availability features include enhanced Spanning Tree Protocol, IEEE 802.1s, IEEE 802.1w, and Cisco EtherChannel IEEE 802.3ad link aggregation

Deployment Scenarios

The Cisco Catalyst 6500 Series delivers secure converged services for campus, Internet service provider (ISP), metro edge, and research and grid computing networks.

- *Campus networks*—Features 10/100 and 10/100/1000 autosensing modules that provide inline power for the wiring closet, along with robust high availability, security, and manageability features; world-class networking software; high-performance Gigabit and 10 Gigabit interface modules; and network management for the distribution and core

- *Metro edge*—Features edge-, distribution-, and core-layer interfaces for point-to-point and multipoint Ethernet services for metro and inter-metro network deployments with the following features:
  - High-performance 10-Gigabit Ethernet uplinks
  - 802.1Q tunneling
  - Ethernet over MPLS (EoMPLS)
  - Layer 2 and Layer 3 QoS
  - Network Equipment Building Standards (NEBS) compliance
  - Security, high availability, and manageability

System Overview

Modular Architecture

The Cisco Catalyst 6500 Series is a modular system that can grow as customer requirements expand and technology evolves, allowing customers to upgrade and reconfigure systems by adding new modules, replacing existing modules, and adding and redeploying systems. Throughout the Cisco Catalyst 6500 Series, modules are:

- *Configurable*—Separately, simplifying the addition of new services
- *Interoperable*—In the same chassis, providing flexible design options
- *Interchangeable*—Among Cisco Catalyst 6500 Series systems, simplifying sparing and network expansion
- *Hot-swappable*—Without requiring a chassis to be powered off, providing fast upgrade and repair
- *Upgradable*—As newer modules come along, providing investment protection

Cisco Catalyst 6500 Series Hardware-Forwarding Architectures

Cisco Catalyst 6500 Series modules use one of three forwarding technologies, each having a different architecture with different characteristics and capabilities:

- *Cisco Express Forwarding (CEF)*—Scaling to 30 Mpps, this technology uses a central CEF Cisco Express Forwarding engine located on the supervisor engine's policy feature card (PFC) daughter and CEF forwarding tables located on the supervisor engine. The supervisor engine makes all forwarding decisions for all interface modules centrally. For more information see *How Cisco Express Forwarding Works.*
- *Accelerated Cisco Express Forwarding (aCEF)*—Suited for high-performance enterprise environments, this technology uses the aCEF engine and aCEF tables located on the interface module, along with the central CEF engine located on the supervisor engine's PFC daughter card and central CEF forwarding tables located on the supervisor engine. The interface module makes high-volume forwarding decisions locally, and the supervisor engine makes the rest of the forwarding decisions centrally. For more information see *How Accelerated Cisco Express Forwarding (aCEF) Works.*
- *Distributed Cisco Express Forwarding (dCEF)* —Suited for the most demanding environments, this technology uses the dCEF engine located on the interface module's distributed forwarding card (DFC) daughter card and the dCEF table, a local copy of the supervisor engine's central CEF table located on the interface module's DFC. The interface module makes all the forwarding decisions locally, and provides maximum performance and scalability. For more information see *How Distributed Cisco Express Forwarding (dCEF) Works*

Cisco Catalyst 6500 Series Switching Architectures

Cisco developed the following switching architectures for Cisco Catalyst 6500 modules to allow platforms to scale in any deployment:

- 32-Gbps bus—Allowing access to a central shared bus
- 256-Gbps switch fabric—Located on the switch fabric module (SFM)
- 720 Gbps switch fabric—Located on Cisco Catalyst 6500 Series Supervisor Engine 720

Cisco Systems, Inc.

4.581
J

Cisco Catalyst 6500 Series Modules

Cisco Catalyst 6500 Series interfacecmodules support the following forwarding technology and switch fabric combinations:

- *Classic Interface Modules*—Use the centralized CEF engine located on the supervisor engine's PFC, connect to the 32-Gbps switching bus only, and forward packets at up to 15 Mpps
- *CEF256 Interface Modules*—Use the centralized CEF engine located on the supervisor engine's PFC, connect to both the 256-Gbps fabric located on the supervisor engine with a single 8-Gbps full-duplex fabric connection and the 32-Gbps switching bus, and forward packets at up to 30 Mpps
- *dCEF256 Interface Modules*—Use the distributed CEF engine on the DFC (located on the interface module), connect to a 256-Gbps fabric located on the supervisor engine or a Switch Fabric Module with 16-Gbps full-duplex fabric connections, and forward packets at up to 210 Mpps
- *aCEF720 Interface Modules*—Use the accelerated CEF engine on the DFC3 (located on the interface module), connect to the 720-Gbps fabric located on the supervisor engine with 40-Gbps full-duplex fabric connections, and forward packets at up to 400 Mpps, peak performance
- *dCEF720 Interface Modules*—Use the distributed CEF engine on the DFC3 (located on the interface module), connect to the 720-Gbps fabric located on the supervisor engine with dual 20-Gbps full-duplex fabric connections, and forward packets at up to 400 Mpps, sustained performance

Note: All Performance numbers refer to IPv4 forwarding.

Cisco Catalyst 6500 Series Module Types

In the Cisco Catalyst 6500 Series architecture, special-purpose modules perform separate tasks—allowing the feature set to evolve quickly and allowing customers to add new features and enhanced performance by adding new modules. The Cisco Catalyst 6500 Series features the following types of special-purpose modules:

- *Supervisor engines*—Perform the control functions and make the forwarding decisions for packets routed to other networks
- *Ethernet interface modules*—Provide IEEE-standard receive and forwarding interfaces and forward packets within the defined network
- *WAN interface modules*—Provide the receive and forwarding interface at the WAN edge
- *Services modules*—Support multigigabit security, application-aware Layer 4 through 7 content switching, network management, and voice gateway services to traditional phones, fax machines, PBXs, and the PSTN
- *Switch Fabric Modules (SFMs)*—Pass network traffic from interface module to the supervisor engine or to another interface

Cisco Catalyst 6500 Series Supervisor Engines

The supervisor engines for the Cisco Catalyst 6500 Series support different forwarding technologies and achieve different forwarding rates, depending on the configuration of the supervisor engine and the capability of a particular interface module.

Supervisor engines can be configured with optional factory-installed daughter cards—a Policy Feature Card (PFC) providing hardware-based Layer-2 forwarding, and a Multilayer Switch Feature Card (MSFC) providing Layer 3 capabilities.

A supervisor engine performs control operations centrally on processors that run either Cisco IOS Software or Cisco Catalyst Operating System Software while special-purpose application-specific integrated circuits (ASICs) perform bridging and routing (based on Cisco Express Forwarding), QoS marking and policing, and access control. The same ASICs are used on the DFCs, daughter cards that can be installed on certain interface modules to distribute forwarding in a decentralized fashion to achieve system forwarding rates of up to 400 Mpps (Table 2).

For additional information about the following Cisco Catalyst 6500 Series supervisor engines visit: http://www.cisco.com/en/US/products/hw/switches/ps708/products_data_sheets_list.html

- Cisco Catalyst 6500 Series Supervisor Engine 720 Data Sheet
- Cisco Catalyst 6500 Series Supervisor Engine 1A and Supervisor Engine 2 Data Sheet

Table 2 Cisco Catalyst 6500 Supervisor Engines

Feature	Supervisor Engine 1	Supervisor Engine 2	Supervisor Engine 720
Solution and market	Wiring closet	Enterprise distribution, core, and WAN edge; service provider WAN and Internet edge	Enterprise core and data center; service provider metro; wireless; national research networks; grid computing
Fabric architectures supported	Centralized forwarding only—engine located on supervisor engine's PFCx daughter card	Centralized CEF—engine located on supervisor engine's PFCx daughter card; Distributed CEF—engine located on interface module's DFC daughter card	Centralized CEF—engine located on Supervisor Engine 720's PFC3 daughter card; Distributed CEF—engine located on interface module's DFC3 daughter card; Accelerated CEF—engine located on interface module's ASICs
Fabric connections	32-Gbps shared bus connection to modules	16 Gbps per slot; Dual-fabric connection to modules at 8 Gbps full duplex per channel	40 Gbps per slot; Dual-fabric connection to modules at 20 Gbps full duplex per channel
Performance maximum (Mpps)	15 Mpps	210 Mpps	Sustained 400 Mpps—dCEF720 Peak 400 Mpps—aCEF720
DFC modules	Not supported	DFC	DFC3

Ethernet Interface Modules

Cisco Catalyst 6500 Series Ethernet interface modules, designed for wiring closet, distribution and core, and data center applications, as well as service provider and Metro Ethernet environments, use one of the following types of Ethernet interfaces:

- *10/100 Mbps over copper and 10/100/1000 Mbps Ethernet over copper*—For wiring closets providing 10/100- and 10/100/1000-Mbps performance with auto-negotiation and inline power for voice; up to 48 ports/module; includes Classic and CEF256 interface modules.
- *100 Mbps over fiber*—For secure wiring closets and long-haul router and switch interconnects; up to 24 ports per module; includes Classic and CEF256 interface modules.
- *1 Gbps*—For distribution and core layers and for data centers providing 1-Gbps performance in a 48-port module; includes Classic CEF256, and dCEF256 interface modules.
- 10 Gbps—For distribution and core layers providing 10-Gbps performance in 1-port or 2-port module; includes CEF256, aCEF720, and dCEF720 interface modules.

For more information, visit:
http://www.cisco.com/en/US/products/hw/switches/ps708/products_data_sheets_list.html

WAN Interface Modules

The Cisco Catalyst 6500 Series and Cisco 7600 Series support several WAN interfaces using two technologies:

- *FlexWAN module*—Accepts up to two plug-in port adapters that provide numerous WAN/MAN protocols and features
- *Optical Services Module (OSM)*—A dedicated line card that provides several interfaces, including OC-3/STM-1, OC-12/STM-4, OC-48/STM-16, Channelized T3, Channelized OC-12/STM-4 PoS, Gigabit Ethernet, OC-12/STM-4 ATM, and OC-48/STM-16 Dynamic Packet Transport (DPT)

FlexWAN Module

The FlexWAN module fits inside Cisco Catalyst 6500 Series and Cisco 7600 Series systems and uses Cisco 7200 and 7500 Series port adapters for a wide range of WAN/MAN protocols, including Frame Relay, ATM, PoS, Point-to-Point Protocol (PPP), and High-Level Data Link Control (HDLC). Additionally, the FlexWAN module provides media options such as clear channel and Channelized T1/E1, T3/E3, High-Speed Service Interface (HSSI), OC-3 PoS, and ATM.

- For information about the Cisco Catalyst 6500 Series and Cisco 7600 Series FlexWAN Module, visit: http://www.cisco.com/en/US/products/hw/routers/ps368/products_data_sheet09186a00800923bf.html

  Layer 4 Through 7 Services Modules

The Cisco Catalyst 6500 Series offers an extensive set of services modules for Layer 4 through 7 applications, including content services, network monitoring, security, and telephony.

Content Services Modules

- *Content Services Gateway (CSG)*—Enables differentiated billing, user balance enforcement, and activity tracking for customer billing systems. For more information, visit: http://mobiletraining.cisco.com/csg/CSGe_ds_0211.pdf
- *Content Switching Module (CSM)*—Integrates advanced content switching into the Cisco Catalyst 6500 Series to provide high-performance, high-availability load balancing of caches, firewalls, Web servers, and other network devices. For more information, visit: http://www.cisco.com/en/US/products/hw/modules/ps2706/products_data_sheet09186a00800887f3.html

Network Monitoring

- *Network Analysis Module (NAM 1 and 2)*—Provides application-level visibility into the network infrastructure for real-time traffic analysis, performance monitoring, and troubleshooting; performs traffic monitoring with embedded Web-based traffic analyzer. For more information, visit: http://www.cisco.com/en/US/products/hw/modules/ps2706/products_data_sheet09186a00800a2c89.html

Security Services Modules

- *Firewall Services Module (FWSM)*—The FWSM allows any port in the chassis to operate as a firewall port and integrates stateful firewall security inside the network infrastructure. For more information, visit: http://www.cisco.com/en/US/products/hw/modules/ps2706/products_data_sheet09 186a00800c4fe7.html
  Intrusion Detection System Module (IDSM and IDSM-2)—Takes traffic from the switch backplane at wire speed, integrating IDS functions directly into the switch. For more information, visit: http://www.cisco.com/en/US/products/hw/modules/ps2706/products_data_sheet09186a0080092341.html

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

- *IPSec VPN Module (IVSM)*—Provides infrastructure-integrated IPSec VPN services capable of 1.9-Gbps Triple Data Encryption Standard (3DES) performance, 8000 active tunnels, and up to 60 tunnels per second. For more information, visit: http://www.cisco.com/en/US/products/hw/modules/ps2706/products_data_sheet09 186a00800c4fe2.html
- *SSL Services Module (SSM)*—Offloads processor-intensive tasks related to securing traffic with SSL accelerating the performance and increasing the security of Web-enabled applications. For more information, visit: http://www.cisco.com/en/US/products/hw/modules/ps2706/products_data_sheet09186a00800c4fe9.html

Telephony Services Modules

- *Communications Media Module (CMM)*—Provides flexible, high-density T1 and E1 gateways, allowing organizations to connect their existing time-division multiplexing (TDM) networks to their IP communications networks, and providing connectivity to the PSTN. For more information, visit: http://www.cisco.com/en/US/products/hw/modules/ps3115/products_data_sheet09 186a00800e9c1f.html

Switch Fabric Modules

Designed to support distributed forwarding for interface modules that have distributed forwarding capability, the Cisco Catalyst 6500 Series SFM or SFM2, in combination with the Cisco Catalyst 6500 Series Supervisor Engine 2-MSFC2 and DFCs on interface modules, increases available system bandwidth from 32 to 256 Gbps. The SFM/SFM2 supports the Cisco Catalyst 6500 CEF256 and dCEF256 interface modules.

Designed to support new interface modules with 720 Gbps forwarding capabilities, the Supervisor Engine 720's onboard switch fabric increases available bandwidth to 720 Gbps and enables packet forwarding rates up to 400 Mpps. By using auto-sensing and auto-negotiation, the Supervisor 720 switch fabric is fully interoperable with the 8- and 16-Gbps switch fabric interconnections used by the CEF256 and dCEF256 interface modules. When a CEF256 or dCEF256 interface module is detected, the switch fabric will automatically connect those modules by offering 8-16 Gbps of bandwidth to each module, as applicable.

How Cisco Express Forwarding Works

Cisco Express Forwarding (CEF) is a Layer 3 technology that provides increased forwarding scalability and performance to handle many short-duration traffic flows common in today's enterprise and service provider networks. To meet the needs of environments handling large amounts of short-flow, Web-based, or highly interactive types of traffic, CEF forwards all packets in hardware, and maintains its forwarding rate completely independent of the number of flows going though the switch.

On the Cisco Catalyst 6500 Series, the CEF Layer 3 forwarding engine is located centrally on the supervisor engine's PFC2 or PFC3—the same device that performs hardware-based Layer 2 and 3 forwarding, ACL checking, QoS policing and marking, and NetFlow statistics gathering.

Using the routing table that Cisco IOS Software builds to define configured interfaces and routing protocols, the CEF architecture creates CEF tables and downloads them into the hardware-forwarding engine before any user traffic is sent through the switch. The CEF architecture places only the routing prefixes in its CEF tables—the only information it requires to make the Layer 3 forwarding decisions—relying on the routing protocols to do route selection. By performing a simple CEF table lookup, the switch forwards packets at wire-rate, independent of the number of flows transiting the switch.

CEF-based forwarding requirements: Requires a Cisco Catalyst Supervisor Engine 2 or Catalyst Supervisor Engine 720.

How Accelerated Cisco Express Forwarding (aCEF) Works

Accelerated Cisco Express Forwarding (aCEF) technology uses two forwarding engines working together in a master-slave relationship to accelerate high-rate traffic flows through the switch—a central CEF engine located on the Supervisor Engine 720's PFC3 and a scaled-down distributed aCEF engine located on the interface module.

The central PFC3 makes the initial forwarding decision, with the aCEF engine storing the result and making subsequent packet-forwarding decisions locally. aCEF forwarding works like this:

- As in standard CEF forwarding, the central PFC3 is loaded with the necessary CEF information before any user traffic arrives at the switch.
- As traffic arrives on an aCEF720 interface module, the aCEF engine inspects the packet, and finding that no specific packet forwarding information exists, consults the central PFC3.
- The PFC3 makes a hardware-based forwarding decision for this packet (including Layer 2, Layer 3, ACLs, and QoS).
- The aCEF engine stores the forwarding decision results and makes forwarding decisions locally for subsequent packets based on packet-flow history.
- The aCEF engine handles hardware-based Layer 2 and Layer 3 forwarding, ACLs, QoS marking, and NetFlow.
- The central PFC3 processes any forwarding decisions that the interface module's aCEF engine cannot handle.

aCEF-based forwarding requirements: Requires a Cisco Catalyst Supervisor Engine 720 and aCEF720 (WS-X67xx) class modules.

How Distributed Cisco Express Forwarding (dCEF) Works

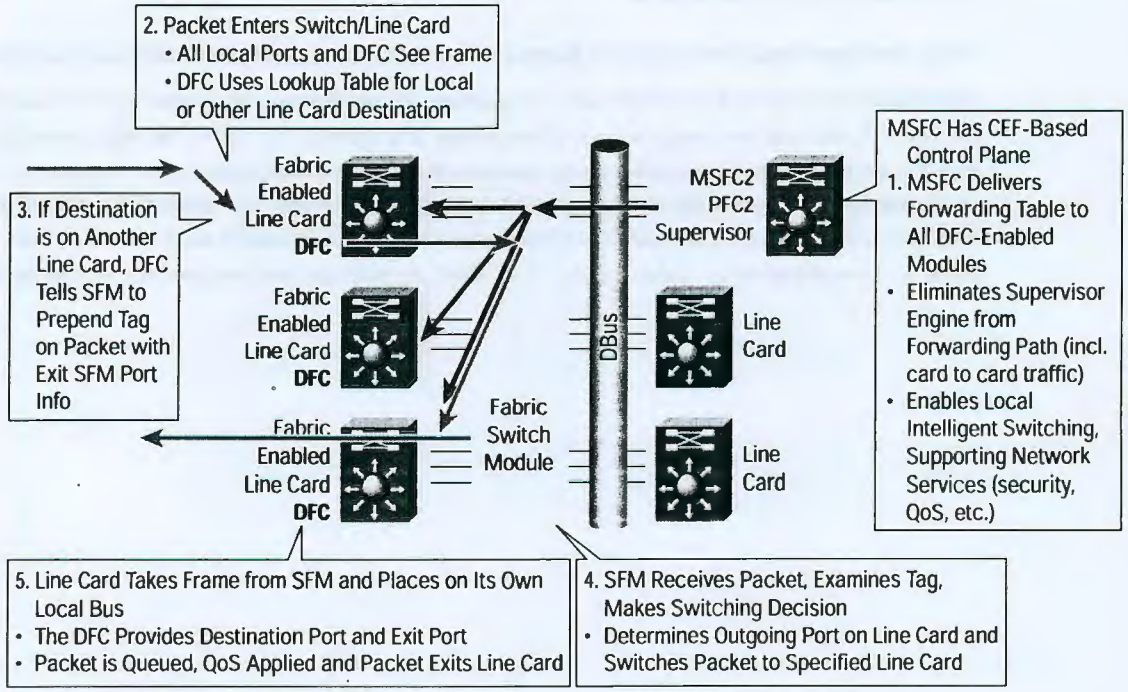
With Distributed Cisco Express Forwarding (dCEF), forwarding engines located on the interface modules make forwarding decisions locally and in parallel, allowing the Cisco Catalyst 6500 Series to achieve the highest forwarding rates in the industry. With dCEF, forwarding occurs on the interface modules in parallel and system performance scales up to 400 Mpps—the aggregate of all forwarding engines working together.

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

Using the same ASIC engine design as the central PFCx, DFCs located on the interface modules forward packets between two ports, directly or across the switch fabric, without involving the supervisor engine. With the DFC, each interface module has a dedicated forwarding engine complete with the full forwarding tables. dCEF forwarding works like this:

- As in standard CEF forwarding, the central PFC3 located on the supervisor engine and the DFC engines located on the interface modules are loaded with the same CEF information derived from the forwarding table before any user traffic arrives at the switch.
- As a packet arrives at an interface module, its DFC engine inspects the packet and uses the information in the CEF table (including Layer 2, Layer 3, ACLs, and QoS) to make a completely hardware-based forwarding decision for that packet.
- The dCEF engine handles all hardware-based forwarding for traffic on that module, including Layer 2 and Layer 3 forwarding, ACLs, QoS policing and marking, and NetFlow.
- Because the DFCs make all the switching decisions locally, the supervisor engine is freed from all forwarding responsibilities and can perform other software-based functions, including routing, management, and network services.

Figure 6
Distributed Cisco Express Forwarding Packet Flow



dCEF-based forwarding requirements: Requires a Cisco Catalyst Supervisor Engine 720 for the dCEF720 interface module; requires either a Catalyst Supervisor Engine 720 or a Catalyst Supervisor Engine 2-MSFC2 and a SFM for the dCEF256 interface module.

Cisco IOS Software and Catalyst Operating System Software

Cisco Catalyst 6500 Series switches offer two operating modes of software, the Cisco Catalyst Operating System Software with optional Cisco IOS Software on the MSFC, and Cisco IOS Software for the supervisor engines. Each operating mode can be deployed at different hierarchies of the network, depending on the network's requirements. These software solutions for the Cisco Catalyst 6500 Series switches provide full Layer 2 through 4 switching and routing functions at high performances.

Today, either of these operating modes can be deployed in an entire network environment, or the operating modes can vary within an environment to meet different requirements. One operating mode is not a replacement for another, but is recommended for varying feature requirements.

- Cisco IOS Software for the Cisco Catalyst 6500 Series
- Cisco Catalyst Operating System Software with optional Cisco IOS Software on the MSFC

Cisco IOS Software for the Cisco Catalyst 6500 Series

Cisco IOS Software for the Cisco Catalyst 6500 Series supervisor engines requires the MSFC on the supervisor engine. It provides integrated multilayer functions in a single image and is optimized for core, distribution, Internet access, and data center deployments. Cisco IOS Software combined with the performance of the Cisco Catalyst 6500 Series offers the necessary features for a high-performance Layer 3-enabled deployment, including support for a distributed architecture with the ability to scale the switch to 400 Mpps throughput. Additionally, Cisco IOS Software provides operational ease of use by offering a single image and configuration file to be deployed across the Cisco Catalyst 6500 Series switches.

Cisco Catalyst Operating System Software with Optional Cisco IOS Software on the MSFC

Cisco Catalyst Operating System Software is the premier software for the wiring closet on Cisco Catalyst 6500 Series switches offering high-performance Layer 2 forwarding. It is optimized to deliver the high availability, enhanced security, and integrated inline power support necessary for mission-critical wiring closet deployments. Cisco Catalyst Operating System Software can also be extended to the distribution and core layers of the network when coupled with Cisco IOS Software on the MSFC, providing robust and advanced Layer 3 and Layer 4 functions. This operating mode is often referred to as "hybrid mode." See Table 3 for software and hardware deployment options.

Cisco IOS Software and Cisco Catalyst Operating System Software Shared Features

All Cisco Catalyst 6500 Series supervisor engines, including the new Supervisor Engine 720, take advantage of the industry-leading software and management capabilities of the Cisco Catalyst 6500 Series. Customers can apply their knowledge of Cisco Catalyst Operating System Software, Cisco IOS Software, CiscoWorks, and other graphical and Web-based network management tools without the need to learn a new command-line interface (CLI) or management system.

Cisco Catalyst 6500 Series Chassis

Cisco Catalyst 6500 Series chassis can be deployed in the wiring closet, the distribution and core layers, the data center, and the WAN edge, providing the power and features required for end-to-end deployment for the enterprise campus, the ISP network, metro, and research computing networks.

Chassis Applications

The Cisco Catalyst 6500 Series provides a selection of chassis, including 3-, 6-, 9-, and 13-slot models with slots arranged horizontally and a 9-slot model with slots arranged vertically, with front-to-back airflow. Typical applications for Cisco Catalyst 6500 Series chassis include:

- *3-slot chassis*—Low-density, wiring-closet chassis sharing interface modules and supervisor engines with larger chassis for common sparing; low-density, high-performance specialized services modules chassis for network security and management; low-density, high-end chassis providing connectivity to the WAN edge
- *6- and 9-slot chassis*—Traditional chassis for the wiring closet, distribution and core, data center, and WAN edge
- *13-slot chassis*—Highest-capacity chassis for Ethernet connectivity, with slots to spare for services modules providing network security and management

Chassis Configuration

All Cisco Catalyst 6500 Series chassis are NEBS Level-3 compliant and use common power supplies. The 6- and 9-slot chassis require a 1000W or 1300W power supply and the 13-slot chassis requires a 2500W or 4000W power supply. The 3-slot chassis requires a 950W power supply. When ordering a Cisco Catalyst 6500 Series switch, use the online Cisco Dynamic Configuration Tool to assist you in selecting the chassis, power supplies, power cables, and fan trays that will meet your requirements. The tool is available at: http://www.cisco.com/appcontent/apollo/configureHomeGuest.html

Power

All Cisco Catalyst 6500 chassis hold up to two load-sharing, fault-tolerant, hot-swappable AC or DC power supplies. Only one supply is required to operate a fully loaded chassis. If a second supply is installed, it operates in a load-sharing capacity. The power supplies are hot-swappable—a failed power supply can be removed without powering off the system.

Cisco Catalyst 6500 Series switch power supplies are available in five power ratings:

- 950W AC input (Cisco Catalyst 6503 chassis)
- 1000W AC input
- 1300W AC and DC input
- 2500W AC and DC input
- 4000W AC input

Table 4 outlines the power requirements and heat dissipation for the three different models of power supplies available for the Cisco Catalyst 6500 Series switch.

Technical Support Services

Whether your company is a large organization, a commercial business, or a service provider, Cisco is committed to maximizing the return on your network investment. Cisco offers a portfolio of technical support services to help ensure that your Cisco products operate efficiently, remain highly available, and benefit from the most up-to-date system software.

The Cisco Technical Support Services organization offers the following features, providing network investment protection and minimal downtime for systems running mission-critical applications:

- Provides Cisco networking expertise online and on the telephone
- Creates a proactive support environment with software updates and upgrades as an ongoing integral part of your network operations, not merely a remedy when a failure or problem occurs
- Makes Cisco technical knowledge and resources available to you on demand
- Augments the resources of your technical staff to increase productivity
- Complements remote technical support with onsite hardware replacement

Cisco Technical Support Services include:

- Cisco SMARTnet™ support
- Cisco SMARTnet Onsite support
- Cisco Software Application Services, including Software Application Support and Software Application Support plus Upgrades

For more information, visit:
http://www.cisco.com/en/US/products/svcs/ps3034/serv_category_home.html

Additional Cisco Catalyst 6500 Series Information

For additional information about the following data sheets that describe Cisco Catalyst 6500 Series, supervisor engines, interface modules, SFM, and services modules, visit:

Preface

This *VPN Client User Guide* tells you how to install, use, and manage the Cisco VPN Client with Cisco Systems products.

Audience

This guide is for users of remote clients who want to set up virtual private network (VPN) connections to a central site. Network administrators can also use this guide for information about configuring and managing VPN connections for remote clients. We assume that you are familiar with the Windows platform and know how to use Windows applications. A network administrator should be familiar with Windows system configuration and management and know how to install, configure, and manage internetworking systems. For information specific to a network administrator, see *VPN Client Administrator Guide*.

Organization

This guide is organized as follows:

Chapter	Title	Description
Chapter 1	Understanding the Cisco VPN Client	Explains briefly what the VPN Client is and how it works.
Chapter 2	Installing the VPN Client	Tells you how to install the VPN Client.
Chapter 3	Configuring the VPN Client	Tells you how to configure the VPN Client, including setting optional parameters.
Chapter 4	Connecting to a Private Network	Tells you how to connect to a private network using the VPN Client and an Internet connection; shows how to get status information on your connection, and how to use auto initiation.
Chapter 5	Managing the VPN Client	Tells you how to manage VPN Client connections, upgrade or uninstall VPN Client software, reconfigure the VPN Client automatically, use the Log Viewer application and set up special features such as Start Before Logon.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls:
Doc: 3701

Chapter	Title	Description
Chapter 6	Enrolling and Managing Certificates	Tells you how to obtain digital certificates to use for authentication and how to manage these certificates on your system.
Appendix A	Copyrights and Licenses	Provides copyright and license information for software that the VPN Client uses.

Terminology

In this user guide, the term Cisco VPN device refers to the following Cisco products:

- Cisco VPN 3000 Series Concentrator
- Cisco Secure PIX Firewall devices
- IOS platform devices, such as the Cisco 7100 Series Routers

Related documentation

The VPN Client includes an extensive online HTML-based help system that you can access through a browser in several ways:

- Click the Help icon on the Cisco Systems VPN Client programs menu (Start > Programs > Cisco Systems VPN Client > Help).
- Press **F1** while using the applications.
- Click the **Help** button on screens that include it.

The *VPN Client Administrator Guide* tells a network administrator how to:

- Configure a VPN 3000 Concentrator for several specific features:
  - Configure a VPN 3000 Concentrator for remote access users
  - Configure VPN Client firewall policy on a VPN 3000 Concentrator
  - Notify remote users of a client update
  - Set up Local LAN Access for the VPN Client
  - Configure the VPN Concentrator to update VPN Client backup servers
  - Set up the VPN Concentrator and the VPN Client for NAT Transparency
  - Configure Entrust Entelligence for the VPN Client
  - Set up authentication using Smart Cards.
- Automate remote user profiles
- Configure auto initiation
- Use the VPN Client command-line interface
- Customize the VPN Client software (text, icons and installation)
- Use the SetMTU application
- Obtain troubleshooting information
- Work with Microsoft Windows Installer

The VPN Client guides are provided on the Cisco VPN 3000 Concentrator's software distribution CD-ROM in PDF format. To view the latest version on the Cisco Web site, go to the following site and click **VPN Client**.

http://www.cisco.com/univercd/cc/td/doc/product/vpn/index.htm.

J

VPN 3000 Series Concentrator Documentation

The *VPN 3000 Concentrator Series Getting Started* guide explains how to unpack and install the VPN Concentrator, and how to configure the minimal parameters. This is known as *Quick Config*.

The *VPN 3000 Series Concentrator Reference Volume I: Configuration* explains how to start and use the VPN Concentrator Manager. It details the Configuration screens and explains how to configure your device beyond the minimal parameters you set during quick configuration.

The *VPN 3000 Series Concentrator Reference Volume II: Administration and Monitoring* provides guidelines for administering and monitoring the VPN Concentrator. It explains and defines all functions available in the Administration and Monitoring screens of the VPN Concentrator Manager. Appendixes to this manual provide troubleshooting guidance and explain how to access and use the alternate command-line interface.

The VPN Concentrator Manager also includes online help that you can access by clicking the **Help** icon on the toolbar in the Manager window.

Other useful books, articles, and websites include:

- *Dictionary of Internetworking Terms and Acronyms*. Cisco Press: 2001
- Kosiur, Dave. *Building and Managing Virtual Private Networks*. Wiley: 1998.
- Sheldon, Tom. *Encyclopedia of Networking*. Osborne/McGraw-Hill: 1998.
- `www.ietf.org` for Internet Engineering Task Force (IETF) Working Group drafts on IP Security Protocol (IPSec).

Conventions

This document uses the following conventions:

Convention	Description
boldface font	User actions and commands are in **boldface**.
italic font	Arguments for which you supply values are in *italics*.
`screen` font	Terminal sessions and information the system displays are in `screen` font.
`boldface screen` font	Information you must enter is in **`boldface screen`** font.

RQS Nº 03/2005 - CN -
CPMI - CORREIOS
Fls: 0952
Doc: 3701

Notes use the following conventions:

Note Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the publication.

Cautions use the following conventions:

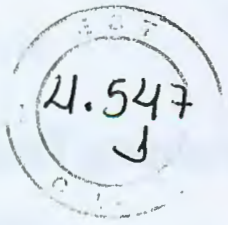
Caution Means *reader be careful*. Cautions alert you to actions or conditions that could result in equipment damage or loss of data.

Data Formats

As you configure and manage the system, enter data in the following formats unless the instructions indicate otherwise:

Type of Data	Format
IP Addresses	IP addresses use 4-byte dotted decimal notation (for example, `192.168.12.34`); as the example indicates, you can omit leading zeros in a byte position.
Subnet Masks and Wildcard Masks	Subnet masks use 4-byte dotted decimal notation (for example, `255.255.255.0`). Wildcard masks use the same notation (for example, `0.0.0.255`); as the example illustrates, you can omit leading zeros in a byte position.
MAC Addresses	MAC addresses use 6-byte hexadecimal notation (for example, `00.10.5A.1F.4F.07`).
Hostnames	Hostnames use legitimate network hostname or end-system name notation (for example, `VPN01`). Spaces are not allowed. A hostname must uniquely identify a specific system on a network.
Text Strings	Text strings use upper- and lower-case alphanumeric characters. Most text strings are case-sensitive (for example, simon and Simon represent different usernames). In most cases, the maximum length of text strings is 48 characters.
Port Numbers	Port numbers use decimal numbers from `0` to `65535`. No commas or spaces are permitted in a number.

Obtaining Documentation



These sections explain how to obtain documentation from Cisco Systems.

World Wide Web

You can access the most current Cisco documentation on the World Wide Web at this URL:

http://www.cisco.com

Translated documentation is available at this URL:

http://www.cisco.com/public/countries_languages.shtml

Documentation CD-ROM

Cisco documentation and additional literature are available in a Cisco Documentation CD-ROM package, which is shipped with your product. The Documentation CD-ROM is updated monthly and may be more current than printed documentation. The CD-ROM package is available as a single unit or through an annual subscription.

Ordering Documentation

You can order Cisco documentation in these ways:

- Registered Cisco.com users (Cisco direct customers) can order Cisco product documentation from the Networking Products MarketPlace:

  http://www.cisco.com/cgi-bin/order/order_root.pl

- Registered Cisco.com users can order the Documentation CD-ROM through the online Subscription Store:

  http://www.cisco.com/go/subscription

- Nonregistered Cisco.com users can order documentation through a local account representative by calling Cisco Systems Corporate Headquarters (California, U.S.A.) at 408 526-7208 or, elsewhere in North America, by calling 800 553-NETS (6387).

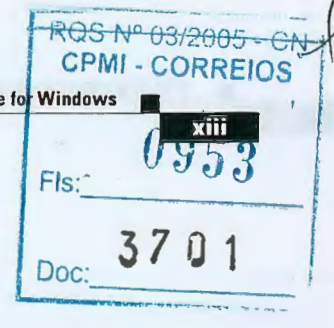
Documentation Feedback

You can submit comments electronically on Cisco.com. In the Cisco Documentation home page, click the **Fax** or **Email** option in the "Leave Feedback" section at the bottom of the page.

You can e-mail your comments to bug-doc@cisco.com.

You can submit your comments by mail by using the response card behind the front cover of your document or by writing to the following address:

Cisco Systems
Attn: Document Resource Connection
170 West Tasman Drive
San Jose, CA 95134-9883



We appreciate your comments.

Obtaining Technical Assistance

Cisco provides Cisco.com as a starting point for all technical assistance. Customers and partners can obtain online documentation, troubleshooting tips, and sample configurations from online tools by using the Cisco Technical Assistance Center (TAC) Web Site. Cisco.com registered users have complete access to the technical support resources on the Cisco TAC Web Site.

Cisco.com

Cisco.com is the foundation of a suite of interactive, networked services that provides immediate, open access to Cisco information, networking solutions, services, programs, and resources at any time, from anywhere in the world.

Cisco.com is a highly integrated Internet application and a powerful, easy-to-use tool that provides a broad range of features and services to help you with these tasks:

- Streamline business processes and improve productivity
- Resolve technical issues with online support
- Download and test software packages
- Order Cisco learning materials and merchandise
- Register for online skill assessment, training, and certification programs

If you want to obtain customized information and service, you can self-register on Cisco.com. To access Cisco.com, go to this URL:

http://www.cisco.com

Technical Assistance Center

The Cisco Technical Assistance Center (TAC) is available to all customers who need technical assistance with a Cisco product, technology, or solution. Two levels of support are available: the Cisco TAC Web Site and the Cisco TAC Escalation Center.

Cisco TAC inquiries are categorized according to the urgency of the issue:

- Priority level 4 (P4)—You need information or assistance concerning Cisco product capabilities, product installation, or basic product configuration.
- Priority level 3 (P3)—Your network performance is degraded. Network functionality is noticeably impaired, but most business operations continue.
- Priority level 2 (P2)—Your production network is severely degraded, affecting significant aspects of business operations. No workaround is available.
- Priority level 1 (P1)—Your production network is down, and a critical impact to business operations will occur if service is not restored quickly. No workaround is available.

The Cisco TAC resource that you choose is based on the priority of the problem and the conditions of service contracts, when applicable.

4.545
J

Cisco TAC Web Site

You can use the Cisco TAC Web Site to resolve P3 and P4 issues yourself, saving both cost and time. The site provides around-the-clock access to online tools, knowledge bases, and software. To access the Cisco TAC Web Site, go to this URL:

http://www.cisco.com/tac

All customers, partners, and resellers who have a valid Cisco service contract have complete access to the technical support resources on the Cisco TAC Web Site. The Cisco TAC Web Site requires a Cisco.com login ID and password. If you have a valid service contract but do not have a login ID or password, go to this URL to register:

http://www.cisco.com/register/

If you are a Cisco.com registered user, and you cannot resolve your technical issues by using the Cisco TAC Web Site, you can open a case online by using the TAC Case Open tool at this URL:

http://www.cisco.com/tac/caseopen

If you have Internet access, we recommend that you open P3 and P4 cases through the Cisco TAC Web Site.

Cisco TAC Escalation Center

The Cisco TAC Escalation Center addresses priority level 1 or priority level 2 issues. These classifications are assigned when severe network degradation significantly impacts business operations. When you contact the TAC Escalation Center with a P1 or P2 problem, a Cisco TAC engineer automatically opens a case.

To obtain a directory of toll-free Cisco TAC telephone numbers for your country, go to this URL:

http://www.cisco.com/warp/public/687/Directory/DirTAC.shtml

Before calling, please check with your network operations center to determine the level of Cisco support services to which your company is entitled: for example, SMARTnet, SMARTnet Onsite, or Network Supported Accounts (NSA). When you call the center, please have available your service agreement number and your product serial number.

CHAPTER 1

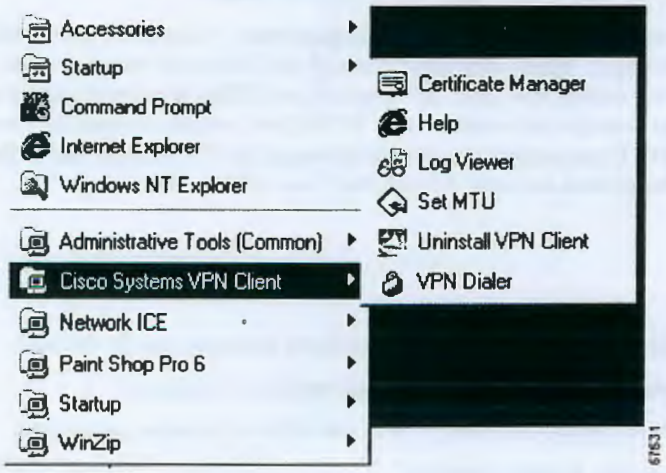
Understanding the Cisco VPN Client

The Cisco VPN Client for Windows (referred to in this user guide as *VPN Client*) is a software program that runs on a Microsoft® Windows®-based PC. The VPN Client on a remote PC, communicating with a Cisco Easy VPN server on an enterprise network or with a service provider, creates a secure connection over the Internet. Through this connection you can access a private network as if you were an on-site user. Thus you have a Virtual Private Network (VPN). The server verifies that incoming connections have up-to-date policies in place before establishing them. Cisco IOS, VPN 3000 Series Concentrators, and PIX central-site servers can all terminate VPN connections from VPN Clients.

As a remote user (low speed or high speed), you first connect to the Internet. Then you use the VPN Client to securely access private enterprise networks through a Cisco VPN server that supports the VPN Client.

The VPN Client comprises the following applications, which you select from the Programs menu:

Figure 1-1 VPN Client Applications as Installed by InstallShield



In logical order of use, the applications are as follows:

- Help—Displays an online manual with instructions on using the applications.
- VPN Dialer—Lets you configure connections to a VPN server and lets you then start your connections.
- Certificate Manager—Lets you enroll for certificates to authenticate your connections to VPN servers.
- Log Viewer—Lets you display events from the log.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0955
Doc: 3701

- Uninstall VPN Client—Lets you safely remove the VPN Client software from your system and retain your connection and certificate configurations.

Note There are two ways to install the VPN Client: through the InstallShield wizard or through the Microsoft Installer. If you install the VPN Client through the Microsoft Installer, the Programs menu shown in Figure 1-1 does not contain the Uninstall application.

- SetMTU—Lets you manually change the size of the maximum transmission unit (see the *VPN Client Administrator Guide*, Chapter 6.)

How the VPN Client Works

The VPN Client works with a Cisco VPN server to create a secure connection, called a tunnel, between your computer and the private network. It uses Internet Key Exchange (IKE) and Internet Protocol Security (IPSec) tunneling protocols to make and manage the secure connection. Some of the steps include:

- Negotiating tunnel parameters—Addresses, algorithms, lifetime, and so on.
- Establishing tunnels according to the parameters.
- Authenticating users—Making sure users are who they say they are, by way of usernames, group names and passwords, and X.509 digital certificates.
- Establishing user access rights—Hours of access, connection time, allowed destinations, allowed protocols, and so on.
- Managing security keys for encryption and decryption.
- Authenticating, encrypting, and decrypting data through the tunnel.

For example, to use a remote PC to read e-mail at your organization, you connect to the Internet, then start the VPN Client and establish a secure connection through the Internet to your organization's private network. When you open your e-mail, the Cisco VPN server uses IPSec to encrypt the e-mail message. It then transmits the message through the tunnel to your VPN Client, which decrypts the message so you can read it on your remote PC. If you reply to the e-mail message, the VPN Client uses IPSec to process and return the message to the private network through the Cisco VPN server.

Connection Technologies

The VPN Client lets you use any of the following technologies to connect to the Internet:

- POTS (Plain Old Telephone Service)—Uses a dial-up modem to connect.
- ISDN (Integrated Services Digital Network)—May use a dial-up modem to connect.
- Cable—Uses a cable modem; always connected.
- DSL (Digital Subscriber Line)—Uses a DSL modem; always connected.

You can also use the VPN Client on a PC with a direct LAN connection.

4.541
J

VPN Client Features

The VPN Client includes the following features:

Program Features

- Complete browser-based context-sensitive HTML-based Help
- Support for VPN 3000 Series Concentrator platforms that run Release 3.0 and above. (VPN Client Release 3.0 and above will not work with Releases 2.x of the VPN 3000 Concentrator.)
- Command-line interface to the VPN Dialer
- Local LAN access—The ability to access resources on a local LAN while connected through a secure gateway to a central-site VPN server (if the central site grants permission)
- Automatic VPN Client configuration option—the ability to import a configuration file
- Log Viewer—An application that collects events for viewing and analysis
- Set MTU size—The VPN Client automatically sets a size that is optimal for your environment. However, you can set the MTU size manually as well. (For instructions on adjusting the MTU size, see the *VPN Client Administrator Guide).*
- Application Launcher—The ability to launch an application or a third-party dialer from the VPN Client.
- Automatic uninstall of the Nortel Networks VPN Client and the 5000 VPN Client software with the InstallShield installation package
- Automatic connection by way of Microsoft Dial-Up Networking or any other third-party remote access dialer
- Software update notifications from the VPN server upon connection
- Ability to launch a location site containing upgrade software from a VPN server notification
- The ability to automatically initiate secure wireless VPN connections seamlessly
- NAT Transparency (NAT-T), which lets the VPN Client and the VPN Concentrator automatically detect when to use IPSec over UDP to work properly in Port Address Translation environments.
- Update of centrally controlled backup server list—the VPN Client learns the backup VPN Concentrator list through connection establishment. This feature is configured on the VPN 3000 Concentrator and pushed to the VPN Client. The addresses show in the VPN Dialer application in the Enable Backup Servers box under Options->Properties->Connections.
- Support for Dynamic DNS (DDNS hostname population)—The VPN Client sends its hostname to the VPN Concentrator during connection establishment. The VPN Concentrator can send the hostname in a DHCP request that can cause a DNS server to update its database to include the new hostname and Client address.

Windows NT, Windows 2000, and Windows XP Features

- Password expiration information when authenticating through a RADIUS server that references an NT user database. When you log in, the VPN Concentrator sends a message that your password has expired and asks you to enter a new one and then confirm it. On pre-Release 3.5 VPN Clients, the prompt asks you to supply a PIN and to verify it. On a 3.5 or above VPN Client, the prompt asks you to enter and verify a password.

ROS Nº 03/2005 - CN
CPMI - 1-3 OS
Fls: 0956
Doc: 3701

- Start Before Logon—The ability to establish a VPN connection before logging on to a Windows NT platform, which includes Windows NT 4.0, Windows 2000, and Windows XP systems.
- Ability to disable automatic disconnect when logging off of a Windows NT platform. This allows for roaming profile synchronization.

IPSec Features

- IPSec tunneling protocol
- Transparent tunneling—IPSec over UDP for NAT and PAT, and IPSec over TCP for NAT, PAT, and firewalls
- IKE key management protocol
- IKE Keepalives—Monitoring the continued presence of a peer and reporting the VPN Client's continued presence to the peer. This lets the VPN Client notify you when the peer is no longer present. Another type of keepalives keeps NAT ports alive.
- Split tunneling—The ability to simultaneously direct packets over the Internet in clear text and encrypted through an IPSec tunnel. The VPN Server supplies a list of networks to the VPN Client for tunneled traffic. You enable split tunneling on the VPN Client and configure the network list on the VPN Server, such as the VPN Concentrator.
- Support for Split DNS—The ability to direct DNS packets in clear text over the Internet to domains served through an external DNS (serving your ISP) or through an IPSec tunnel to domains served by the corporate DNS. The VPN Server supplies a list of domains to the VPN Client for tunneling packets to destinations in the private network. For example, a query for a packet destined for *corporate.com* would go through the tunnel to the DNS that serves the private network, while a query for a packet destined for *myfavoritesearch.com* would be handled by the ISP's DNS. This feature is configured on the VPN Server (VPN Concentrator) and enabled on the VPN Client by default. To use Split DNS, you must also have split tunneling configured.
- LZS data compression, which can benefit modem users

Authentication Features

- User authentication by way of VPN central-site device:
  - Internal through the VPN device's database
  - RADIUS (Remote Authentication Dial-In User Service)
  - NT Domain (Windows NT)
  - RSA (formerly SDI) SecurID or SoftID
- Certificate Manager—An application that lets you manage your identity certificates
- Ability to use Entrust Entelligence certificates
- Ability to authenticate using smart cards with certificates
- Peer Certificate Domain Name Verification—prevents a client from connecting to a invalid gateway by using a stolen but valid certificate and a hijacked IP address. If the attempt to verify the domain name of the peer certificate fails, the client connection also fails.

4.539
J

Firewall Features

- Support for Cisco Secure PIX Firewall platforms that run Release 6.0 and higher

Note Instructions on configuring the VPN Client to interoperate with Cisco Secure PIX Firewall, Release 6.0 and above, are available in *IPSec User Guide for Cisco Secure PIX Firewall.*

- Support for personal firewalls:
  - Cisco Integrated Firewall (CIC)
  - ZoneAlarmPro 2.6.3.57
  - ZoneAlarm 2.6.3.57
  - Zone Integrity
  - BlackIce Agent and BlackIce Defender 2.5
- Centralized Protection Policy—Support for firewall policies pushed to the VPN Client from a VPN Concentrator

VPN Client IPSec Attributes

The VPN Client supports these IPSec attributes:

- Main mode for negotiating phase one of establishing ISAKMP Security Associations (SAs)
- Aggressive mode for negotiating phase one of establishing ISAKMP SAs
- Authentication algorithms:
  - HMAC (Hashed Message Authentication Coding) with MD5 (Message Digest 5) hash function
  - HMAC with SHA-1 (Secure Hash Algorithm) hash function
- Authentication Modes:
  - Preshared Keys
  - X.509 Digital Certificates
- Diffie-Hellman Groups 1(for digital certificates), 2, and 5
- Encryption algorithms:
  - 56-bit DES (Data Encryption Standard)
  - 168-bit Triple-DES
  - AES 128-bit and 256-bit

Note You must be running Release 3.6 of the VPN Client to use the AES encryption algorithm

- Extended Authentication (XAUTH)
- Mode Configuration (also known as ISAKMP Configuration Method)
- Tunnel Encapsulation Mode
- IP compression (IPCOMP) using LZS

CHAPTER 2

Installing the VPN Client

This chapter explains how to install the VPN Client on your PC and includes the following sections:

- Verifying System Requirements
- Gathering Information You Need
- Installing the VPN Client Through InstallShield
- Installing the VPN Client Through Microsoft Windows Installer

To upgrade the VPN Client software, or to uninstall it, see "Managing the VPN Client."

Caution Installing the VPN Client software using InstallShield on Windows NT or Windows 2000 requires Administrator privileges. If you do not have Administrator privileges, you must have someone with Administrator privileges install the product for you.

Installation Applications

You can install the VPN Client on your system through two different applications: InstallShield and Microsoft Windows Installer (MSI). Both applications use installation wizards to walk you through the installation. Installing the VPN Client through InstallShield includes an Uninstall icon in the program group; MSI does not. In the latter case, to manually remove VPN Client applications, you can use the Microsoft Add/Remove Programs utility.

Verifying System Requirements

Verify that your computer meets these requirements:

- Computer with a Pentium®-class processor or greater
- One of the following operating systems:
  - Microsoft®Windows® 95 (OSR2), Windows 98, or Windows 98 (second edition)
  - Windows ME
  - Windows NT® 4.0 (with Service Pack 6, or higher)
  - Windows 2000
  - Windows XP

POS Nº 03/2005 - CN
CPMI - [redacted] OS
0958
Fls:
Doc:
3701

- Microsoft TCP/IP installed. (Confirm via Start > Settings > Control Panel > Network > Protocols or Configuration.)
- 10 MB hard disk space.
- RAM:
  - 16 MB for Windows 95/98
  - 32 MB for Windows NT and Windows ME
  - 64 MB for Windows 2000
  - 128 MB for Windows XP
- To install the VPN Client:
  - CD-ROM drive
  - 3.5 inch high-density diskette drive
  - Administrator privileges if installing on Windows NT or Windows 2000
- To use the VPN Client:
  - Direct network connection (cable or DSL modem and network adapter/interface card)
  - Internal or external modem
  - For Windows 95, Microsoft Dial-Up Networking (DUN) version 1.2 or greater. (DUN 1.3 for Windows 95 is a recommended performance and security upgrade, and it is available as a free download from the Microsoft Web site, www.microsoft.com. Windows 98 includes the DUN 1.3 functionality.)
- To connect using a digital certificate for authentication:
  - A digital certificate signed by one of the following Certificate Authorities (CAs) installed on your PC:

    Baltimore Technologies (www.baltimoretechnologies.com)

    Entrust Technologies (www.entrust.com)

    Microsoft Certificate Services—Windows 2000

    Netscape (Security)

    Verisign, Inc. (www.verisign.com)
  - Or a digital certificate stored on a smart card. The VPN Client supports smart cards via the MS CAPI Interface.

Gathering Information You Need

To configure and use the VPN Client, you may need the information listed in this section.

Ask for this information from the system administrator of the private network you want to access. Your system administrator may have preconfigured much of this data; if so, he or she will tell you which items you need.

- Hostname or IP address of the secure gateway to which you are connecting
- Your IPSec Group Name (for preshared keys)
- Your IPSec Group Password (for preshared keys)
- If authenticating with a digital certificate, the name of the certificate

14.535

- If authenticating through the secure gateway's internal server, your username and password
- If authenticating through a RADIUS server, your username and password
- If authenticating through an NT Domain server, your username and password
- If authenticating through a token vendor, your username and PIN
- If authenticating through a smart card, your smart card, reader, PIN or passcode, and the name of the certificate stored on the smart card
- If you should configure backup server connections, the hostnames or IP addresses of the backup servers

Installing the VPN Client Through InstallShield

To install the VPN Client on your system, follow these steps. We suggest you accept the defaults unless your system administrator has instructed otherwise.

Step 1 Exit all Windows programs, and disable any antivirus software.

Step 2 Insert the Cisco Systems CD-ROM in your system's CD-ROM drive.

Step 3 Choose **Start > Run**. The Run dialog box appears.

Step 4 Enter E:\VPN Client\CD-ROM\InstallShield\setup.exe, where E: is your system's CD-ROM drive.

Step 5 Click **OK**.

Note Cisco does not allow you to install the VPN Client software from a network drive. If you attempt to do so, you receive an error message.

The program displays the Cisco Systems logo and InstallShield Setup window shown in Figure 2-1.

ROS Nº 03/2005 - CN
CPMI - 2-3 OS
Fls: 0959
Doc: 3701

Figure 2-1 Starting InstallShield Installation

Step 6 If the InstallShield Wizard identifies an existing version of the VPN Client, the Cisco 5000 Client, or Nortel Networks Extranet Access Client, it displays a dialog box that asks if you want to uninstall the existing client program. To continue, choose **Yes**.

The VPN Client launches the appropriate uninstall wizard: the Cisco VPN Client uninstall wizard to uninstall a previous version of the VPN Client, the Extranet Access Client wizard program, or the Cisco 5000 wizard. Follow the instructions on the uninstall wizard dialog boxes to automatically uninstall the program and reboot.

Note Having more than one VPN client on your system is not advisable.

After your system reboots, our own Cisco Systems VPN Client Setup wizard resumes.

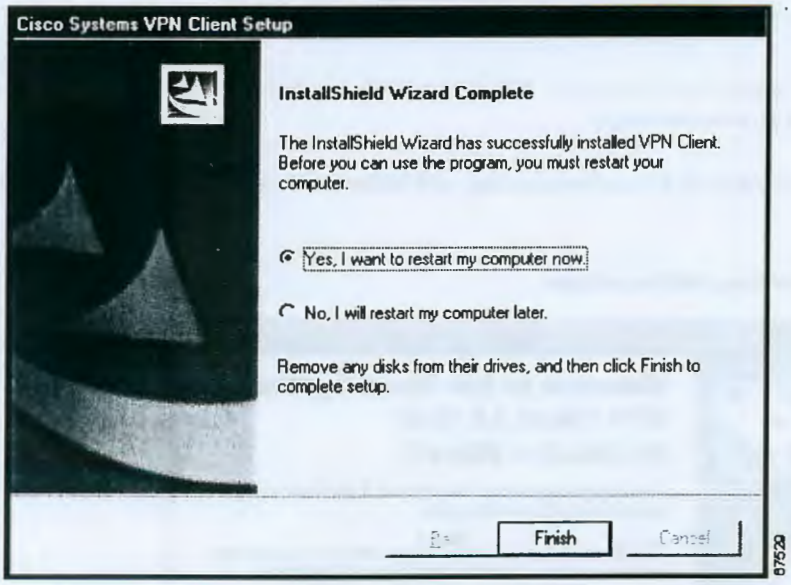
Step 7 Follow the instructions on the screens and enter the following information:

A destination folder for the VPN Client files (or click **Next>** to enter the default location C:\Program Files\Cisco Systems\VPN Client).

Step 8 After you have installed the VPN Client, the InstallShield Wizard displays the following screen. You must restart your computer before you can configure and use the VPN Client. (See Figure 2-2.)

4.533
S

Figure 2-2 Completing InstallShield Installation



- To restart now, click **Finish**. Your system reboots. *Be sure to remove any diskette from the drive before you reboot.*
- To restart later, click the **No** radio button and then click **Finish**. The VPN Client Setup closes. Remember: *you must restart your computer before you can use the VPN Client.*

Installing the VPN Client Through Microsoft Windows Installer

Microsoft Windows Installer (MSI) is available for Windows NT, Windows 2000, and Windows XP. To install the VPN Client using MSI, use the following procedure.

Step 1 Exit all Windows programs, and disable any antivirus software.

Step 2 Remove any VPN client software currently on your system including the following applications:

- IRE/SafeNet Client
- Nortel Networks VPN Client
- Altiga VPN Client
- Cisco VPN 3000 Client
- Cisco VPN 5000 Client
- Cisco VPN Client v3.0 through v3.6

To remove these applications, select **Control Panel > Add/Remove Programs**. Select the application and then click **Add/Remove**. After Windows removes the application, you must reboot your system.

Step 3 Insert the Cisco Systems CD-ROM in your system's CD-ROM drive.

Step 4 Choose **Start > Run**. The Run dialog box appears.

RQS nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0960
3701
Doc:

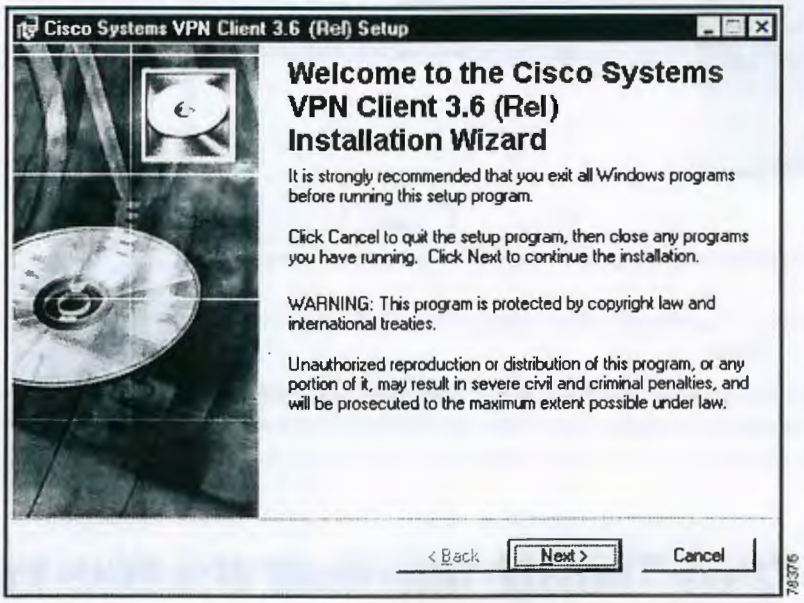
Step 5 Enter E:\VPN Client\CD-ROM\Msi\vpclient_en.exe, where E: is your system's CD-ROM drive.

Step 6 Click **OK**.

Note Cisco does not allow you to install the VPN Client software from a network drive. If you attempt to do so, you receive an error message.

The program displays the Cisco Systems logo and Microsoft Installer Setup window shown in Figure 2-3.

Figure 2-3 Starting MSI Installation

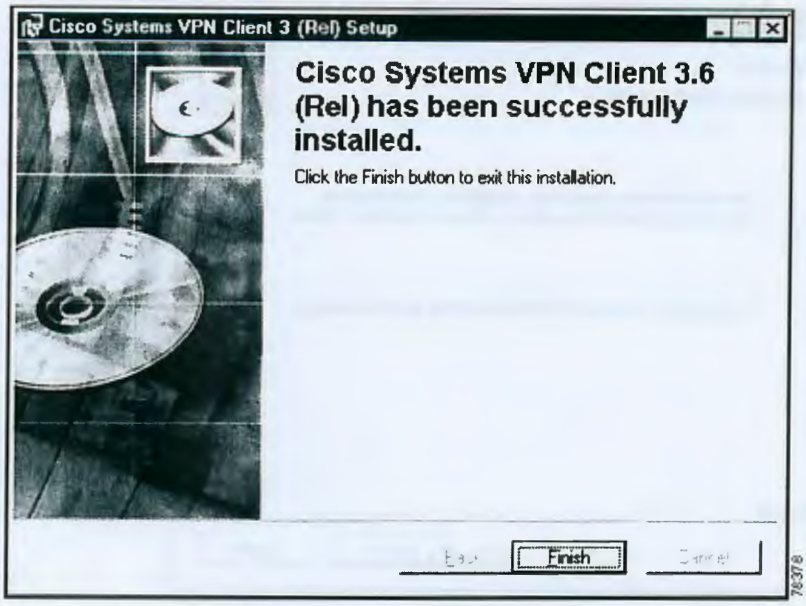


Step 7 Click **Next** to start the installation and then follow the instructions on the dialogs.

MSI installs the VPN Client in the default location C:\Program Files\Cisco Systems\VPN Client. If you want a different destination folder for the VPN Client files, enter the alternative location when prompted to do so.

When the installation has been completed, the installer displays the dialog in Figure 2-4.

Figure 2-4 Completing MSI Installation



Step 8 Click **Finish**. MSI prompts you to restart your system.

Step 9 Click **Yes** to restart your system.

Note If you have not removed the VPN Client 3.6, when you execute the vpnclient_en.exe command or vpnclien_en.msi, a maintenance and repair wizard displays. See Figure 2-5. You do not see these screens when you remove the software through the Add/Remove programs utility.

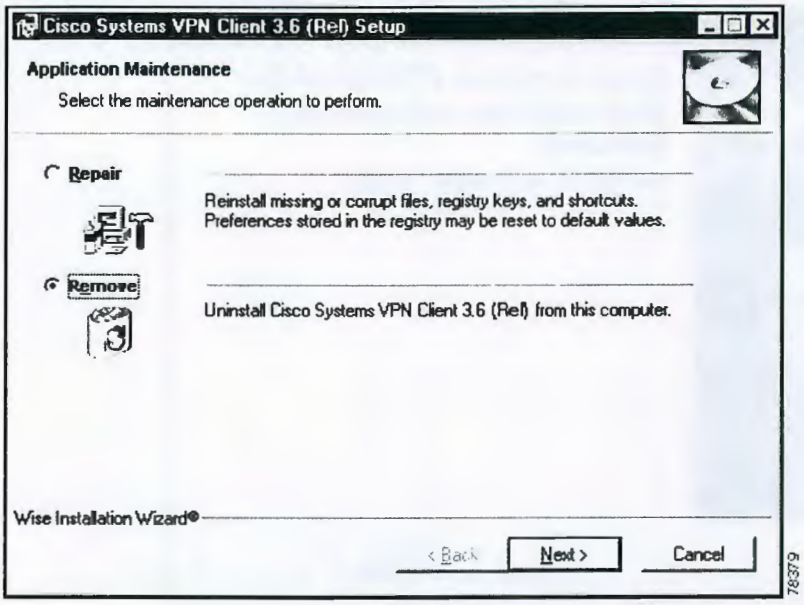
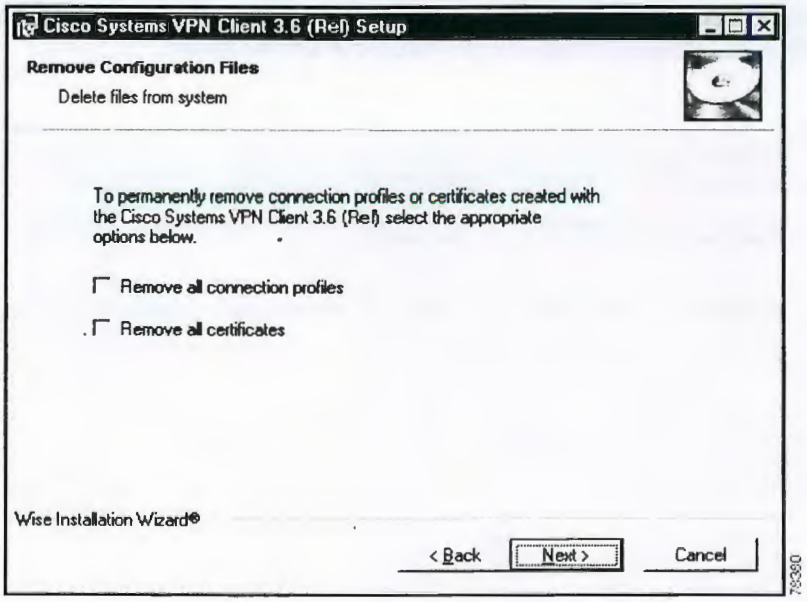
Figure 2-5 Repairing/Removing VPN Client Applications



To remove the VPN Client version 3.6 from your system, follow these steps:

Step 1 Click the **Remove** radio button and then click **Next**. The maintenance wizard displays the Remove Configuration Files dialog. (See Figure 2-6)

Figure 2-6 Removing Cisco VPN Client 3.6

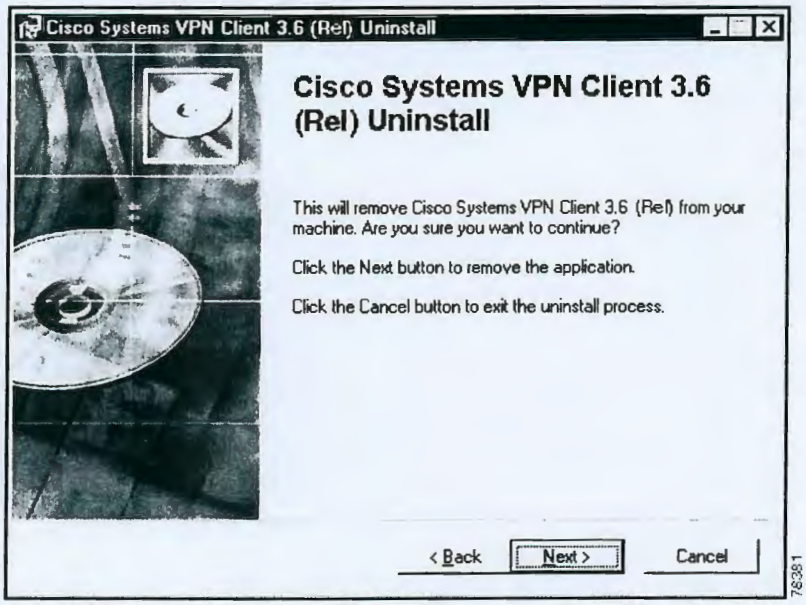


Step 2 If you want to remove your connection profiles and/or certificates, click the box(es) on the dialog. By default, this wizard does not delete these files. To continue, press **Next.** .

The wizard continues and displays the dialog shown in Figure 2-7.

21.529
J

Figure 2-7 Cisco Systems VPN Client 3.6 Uninstall dialog



Step 3 To remove the Cisco VPN Client version 3.6, click **Next**. Or to halt the wizard, click **Cancel**.

When you click Next, the wizard removes the Cisco VPN Client version 3.6. If you elected to remove your connection profiles and/or certificates, these files are also removed; otherwise, these files remain on your system.

When you click Cancel, the wizard prompts you to either Resume or Exit Setup. To stop removal, click **Exit Setup**. If you want to continue the removal, click **Resume**.

What Next?

When the VPN Client software is installed on your PC, to configure it, see "Configuring the VPN Client."

CHAPTER 3

Configuring the VPN Client

This chapter explains how to configure the VPN Client.

To configure the VPN Client, you enter values for a set of parameters known as a *connection entry*. The VPN Client uses a connection entry to identify and connect securely to a specific private network.

Parameters include a name and description for the connection, the name or address of the VPN device (remote server), and information that identifies you to the VPN device.

Note If your system administrator has completely configured your connection entry for you, you can skip this chapter and go directly to "Connecting to a Private Network."

This chapter explains the following configuration tasks:

- How to Get Help
- What Is a Connection Entry?
- How To Create a New Connection Entry
- Setting or Changing Connection Entry Properties
- Changing the VPN Device Address for a Connection Entry

How to Get Help

The VPN Client comes with a complete, context-sensitive, browser-based help system. You can display help in the following ways:

- On the Program Menu, choose **Start > Programs > Cisco Systems VPN Client > Help.** (See Figure 3-1.) This method displays the entire help file beginning with a list of topics.

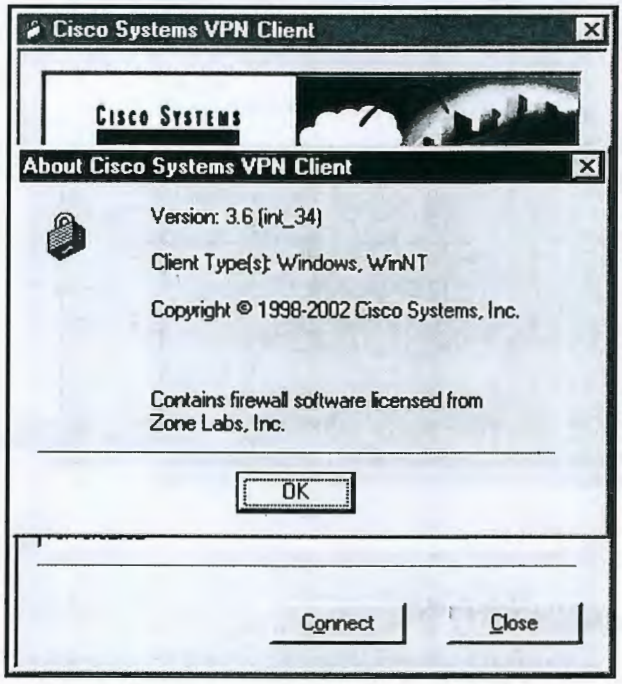
The VPN Client displays the version you are currently using. (See Figure 3-4.)

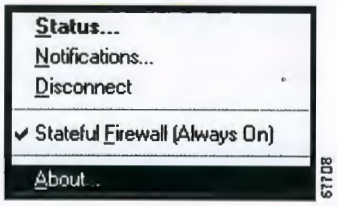
Step 3 After viewing the version number, click **OK**.

Figure 3-4 Displaying the VPN Client Software Version



When you are connected, you can display the software version by clicking **About...** on the menu you display by right clicking the Dialer icon in the system tray.

Figure 3-5 Displaying Version from Menu Available from System Tray



What Is a Connection Entry?

To use the VPN Client, you must create at least one connection entry, which identifies the following information:

- The VPN device (the remote server) to access
- Preshared keys—The IPSec group to which the system administrator assigned you. Your group determines how you access and use the remote network. For example, it specifies access hours, number of simultaneous logins, user authentication method, and the IPSec algorithms your VPN Client uses
- Certificates—The name of the certificate you are using for authentication
- Optional parameters that govern VPN Client operation and connection to the remote network

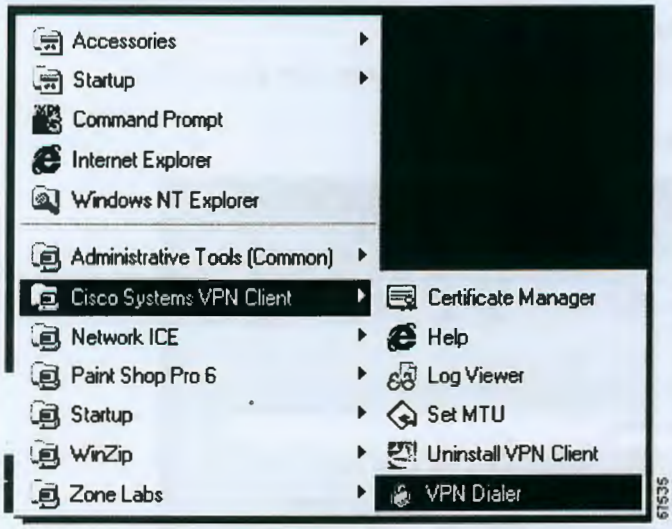
You can create multiple connection entries if you use your VPN Client to connect to multiple networks (though not simultaneously) or if you belong to more than one VPN remote access group.

For connection entry parameters, see "Gathering Information You Need".

How To Create a New Connection Entry

Start the VPN Client by choosing **Start > Programs > Cisco Systems VPN Client > VPN Dialer**.

Figure 3-6 Starting the VPN Dialer



Note If you installed the VPN Client via the Microsoft Windows Installer, the Cisco Systems VPN Client menu does not include the Uninstall VPN Client option.

The VPN Dialer application starts and displays its main dialog box. (See Figure 3-7.)

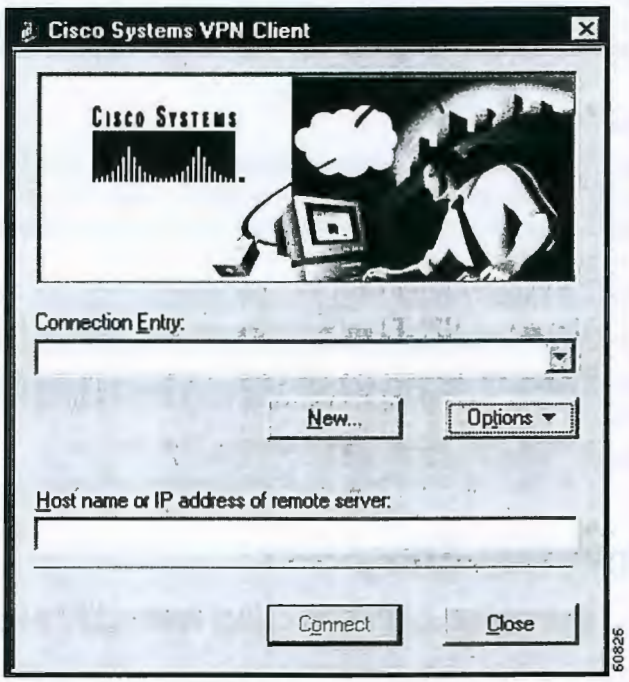
Doc:

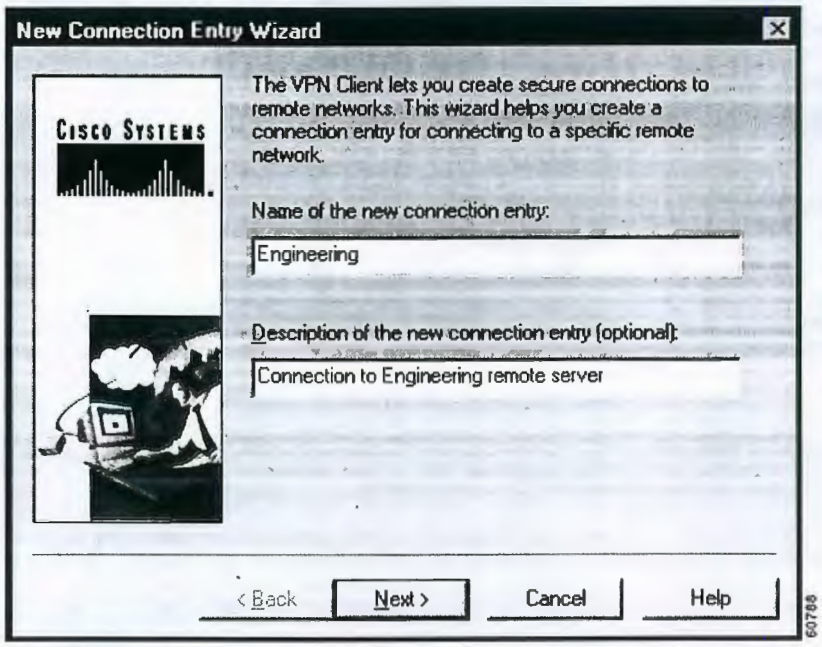
Figure 3-7 VPN Dialer Main Dialog Box



Step 1 At the main dialog, click **New**.

The first New Connection Entry Wizard dialog box appears. (See Figure 3-8.)

Figure 3-8 Entering Name and Description



4.521

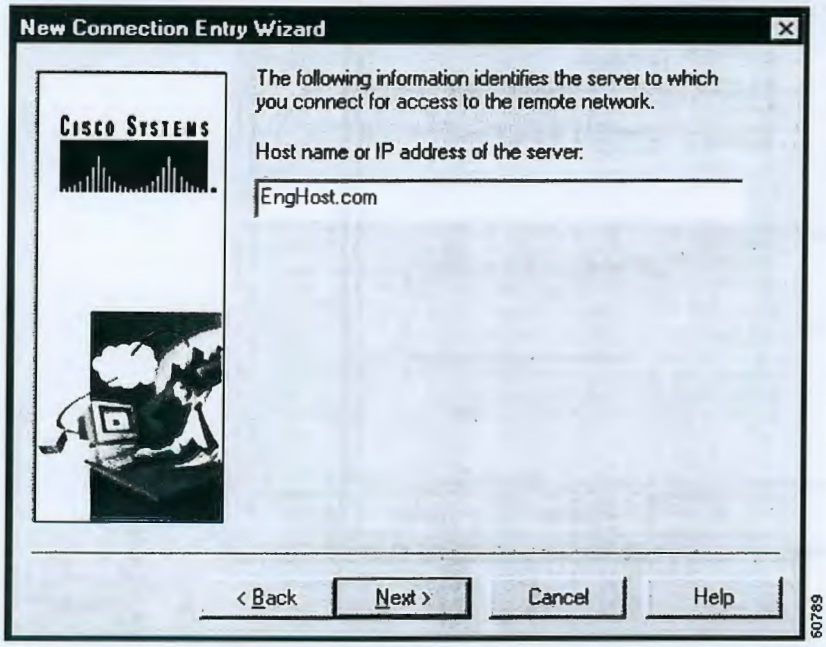
Step 2 Enter a unique name for this new connection. You can use any name to identify this connection, for example, Engineering. This name can contain spaces, and it is not case-sensitive.

Step 3 Enter a description of this connection. This field is optional, but it helps further identify this connection. For example, Connection to Engineering remote server.

Step 4 Click **Next**.

The second New Connection Entry Wizard dialog box appears. (See Figure 3-9.)

Figure 3-9 Identifying Server



Step 5 Enter the hostname or IP address of the remote VPN device you want to access, and click **Next**.

The third New Connection Entry Wizard dialog box appears. (See Figure 3-10.)

hoosing an Authentication Method

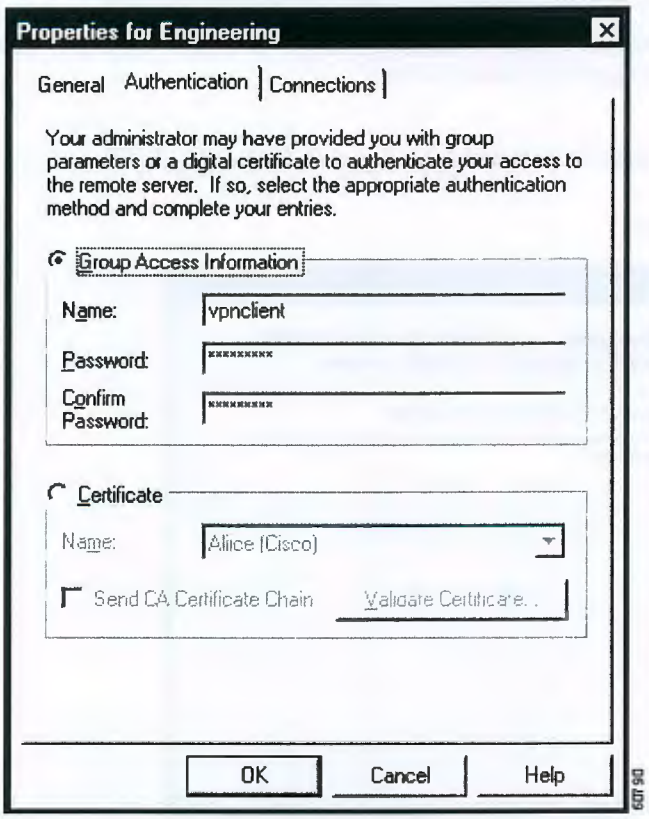
You can connect as part of a group (configured on a VPN device) or by supplying an identity digital certificate.

Group Authentication

For group authentication, perform the following procedure: (See Figure 3-10.)

CPMI - CORREIOS
0966
Fls: 3701
Doc:

Figure 3-10 Group Authentication



Step 1 In the Name field, enter the name of the IPSec group to which you belong. This entry is case-sensitive.

Step 2 In the Password field, enter the password (which is also case-sensitive) for your IPSec group. The field displays only asterisks.

Step 3 Verify your password by entering it again in the Confirm Password field.

Step 4 To continue, click **Next**.

Certificate Authentication

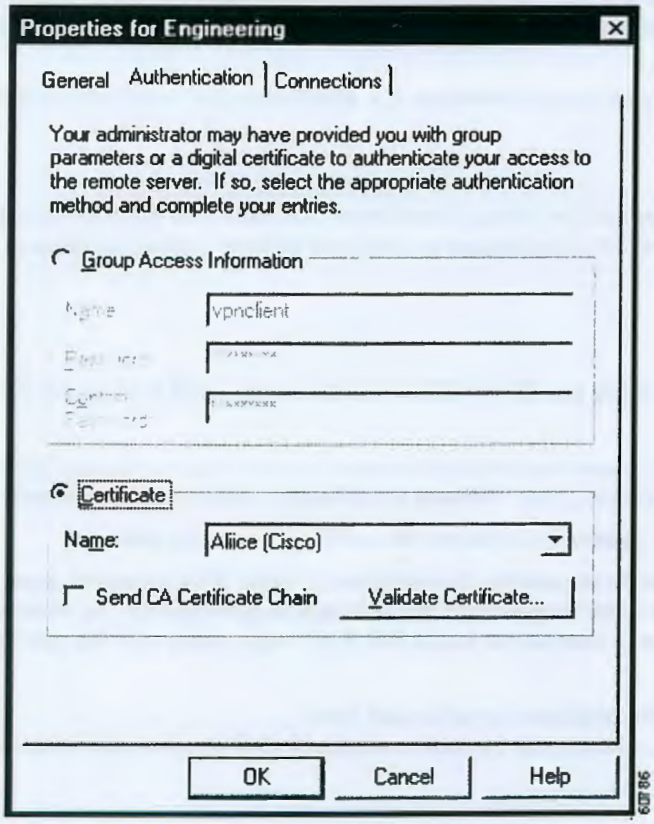
For certificate authentication, perform the following procedure, which varies according the type of certificate you are using:

Step 1 Click the **Certificates** radio button.

Step 2 Choose the name of the certificate you are using from the pull-down menu. (See Figure 3-11.)

If the field says No Certificates Installed and is shaded, then you must first enroll for a certificate before you can use this feature. For information on enrolling for a certificate, see "Enrolling and Managing Certificates" Or, consult your network administrator.

Figure 3-11 Certificate Authentication



Sending a Certificate Authority Certificate Chain

To send CA certificate chains, click **Send CA Certificate Chain**. This parameter is disabled by default.

The CA certificate chain includes all CA certificates in the hierarchy of certificates from the root certificate, which must be installed on the VPN Client, to the identity certificate. This feature enables the a peer VPN Concentrator to trust the VPN Client's identity certificate given the same root certificate, without having all the same subordinate CA certificates actually installed.

Example 3-1 CA Certificate Chains

1. On the VPN Client, you have this chain in the certificate hierarchy:
   - Root Certificate
   - CA Certificate 1
   - CA Certificate 2

EROS Nº 03/2005 - CN
CPM 3-9 REIOS
Fls: 0967
3701
Doc:

- Identity Certificate

2. On the VPN Concentrator, you have this chain in the certificate hierarchy
   - Root Certificate
   - CA Certificate 3
   - Identity Certificate
3. Though the identity certificates are issued by different CA certificates, the VPN Concentrator can still trust the VPN Client's identity certificate, since it has received the chain of certificates installed on the VPN Client PC.

This feature provides flexibility since the intermediate CA certificates don't need to be actually installed on the peer.

Note Certificate chains are not supported for Entrust Entelligence. Therefore the Send CA Certificate Chain checkbox on the Authentication Tab is unchecked and disabled when you select Entelligence Certificate.

Validating a Certificate

Optionally you might want to verify that the certificate you are using is still valid, using the following procedure:

Step 1 To verify the validity of a certificate, click **Validate Certificate...** and enter the password.

If the VPN Dialer prompts for a password to secure the certificate, enter the password.

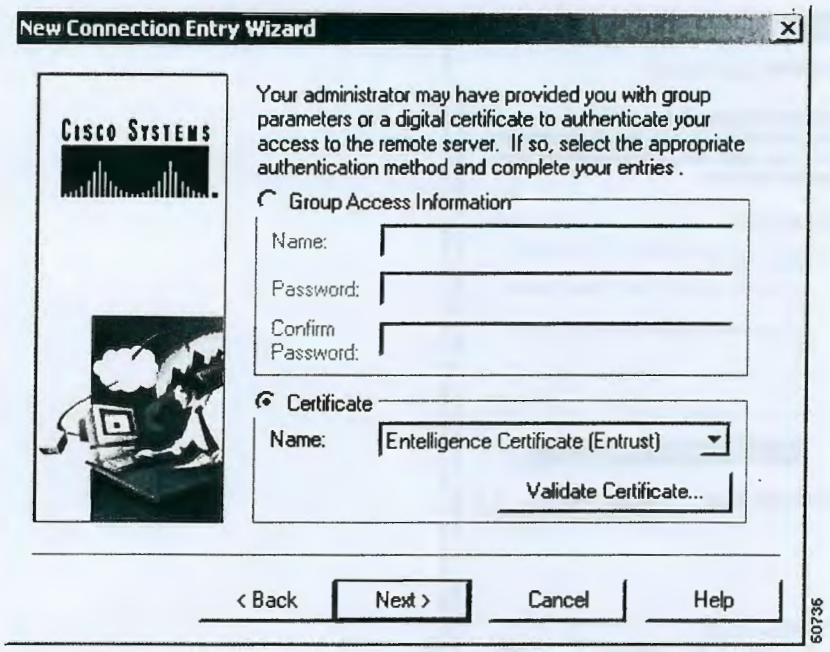
You receive a report letting you know whether the certificate is valid. If the password is not valid, you need to try again. If you do not know the password, see your system administrator. An identity certificate has a public and private key, and a time period within which it is valid. Make sure the certificate is valid before you continue.

Step 2 After you have verified that the certificate is valid, click **Next**.

Configuring an Entrust Certificate for Authentication

If you have an Entrust Entelligence certificate enrolled, the pull-down menu includes the entry "Entelligence Certificate (Entrust)." (See Figure 3-12.)

Figure 3-12 Entrust Entelligence Certificate



An Entrust Entelligence certificate is stored in a *Profile*, which you obtain when you log in to Entrust Entelligence.

Choose **Entelligence Certificate (Entrust)** from the pull-down menu and click **Next**.

For more information about connecting with Entrust Entelligence, see "Connecting with an Entrust Certificate."

Configuring a Connection Entry for a Smart Card

If you are using a smart card or electronic token to authenticate a connection, create a connection entry that defines the certificate provided by the smart card. For example, if you are using ActivCard Gold, an accompanying certificate is in the Microsoft Certificate Store. When you create a new connection entry for using the smart card, select that certificate. (See Figure 3-13.)

4.517

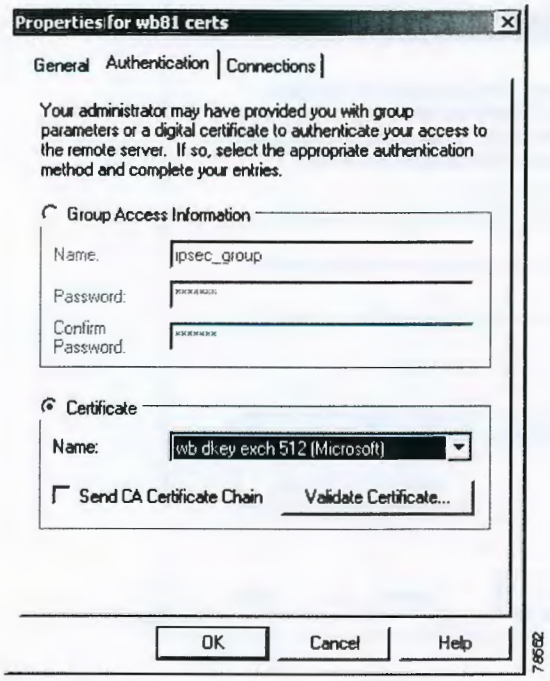
3701
Doc:

Figure 3-13 Creating a Connection Entry for a Smart Card



Smart Cards Supported

The VPN Client supports authentication with digital certificates through a smart card or an electronic token. There are several vendors that provide smart cards and tokens, including the following:

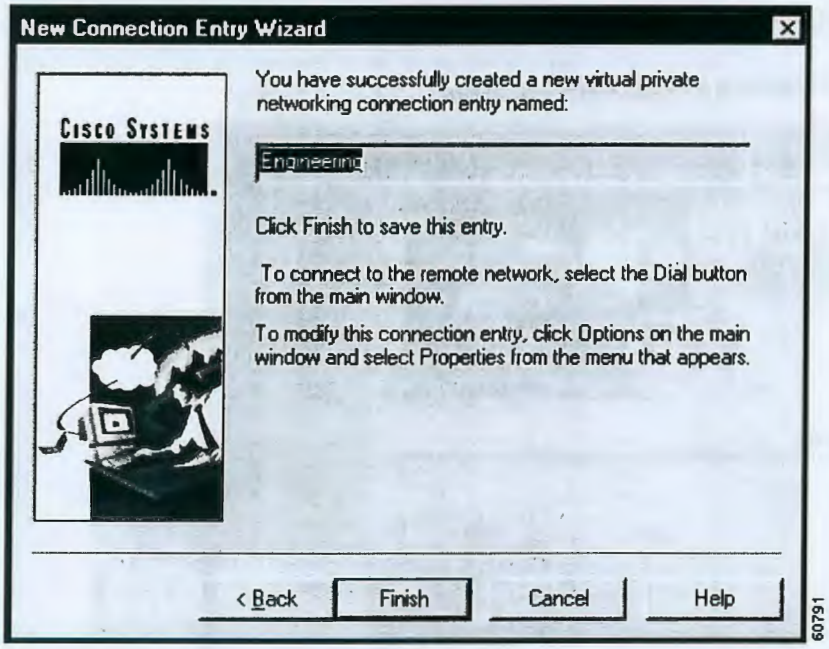
Vendor	Software and Version	Card/Token Tested	Vendor Web site
GemPLUS	GemSAFE Workstation 2.0 or later	GEM195	www.gemplus.com
Activcard	Activcard Gold version 2.0.1 or later	Palmera 32K	www.activcard.com
Aladdin	eToken Runtime Environment (RTE) version 2.6 or later	PRO and R2 tokens	www.ealaddin.com

The VPN Client works only with smart cards and tokens that support CRYPT_NOHASHOID.

Completing the Connection Wizard

After you enter authentication information and click **Next**, the fourth New Connection Entry Wizard dialog box appears. (See Figure 3-14.)

Figure 3-14 Completing the Connection Entry



To complete the connection entry configuration, use the following procedure.

Step 1 Review the connection entry name. If you want to change any previous entries, click **Back** until you get to the desired dialog box.

Step 2 To complete your entry, click **Finish**.

The final New Connection Entry Wizard dialog box closes. Your new connection entry now appears in the Connection Entry drop-down list on the VPN Client's main dialog box.

What Next?

If you need to configure optional connection entry parameters or change parameters for an existing connection entry, continue to the next section.

Otherwise, you can skip to "*Connecting to a Private Network.*"

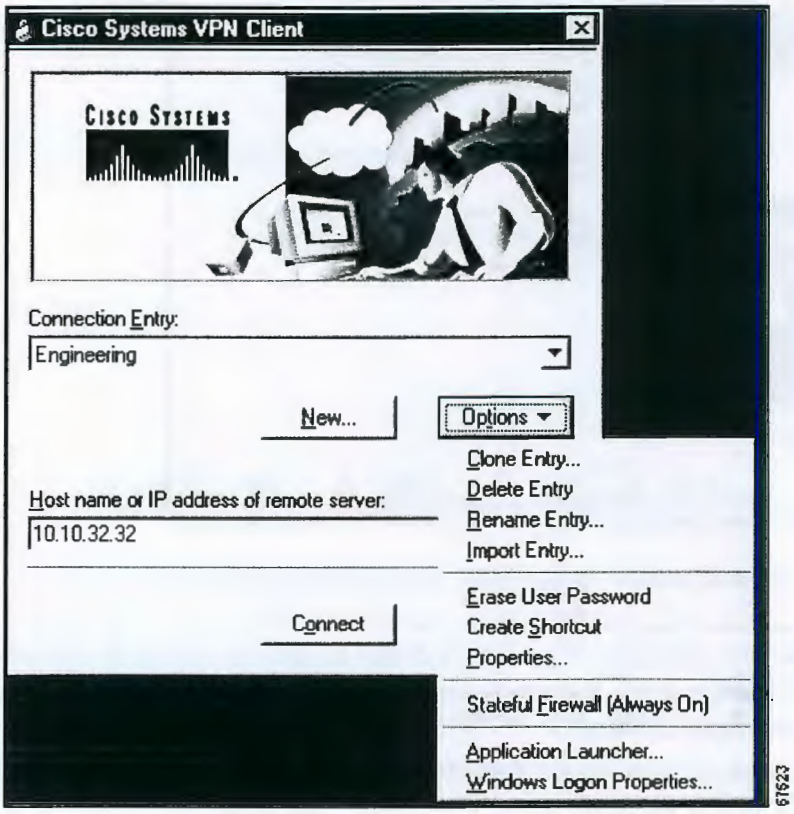
Setting or Changing Connection Entry Properties

To change parameters or to set optional parameters for an existing connection entry, follow these steps:

Step 1 In the VPN Client's main dialog box, click the Connection Entry drop-down menu button and choose the entry you want to configure.

Step 2 Then click **Options** and choose **Properties** from the menu. (See Figure 3-15.)

Figure 3-15 VPN Client Options Menu



The Properties dialog box appears. The fields in this dialog box differ according to the operating system you are using.

- If you are using Microsoft Windows 95, Windows 98, or Windows ME, you see a dialog box that resembles the one in Figure 3-16.
- If you are using Microsoft Windows NT, Windows 2000, or Windows XP, you see the dialog box in Figure 3-17.

Figure 3-16 Connection Entry Properties Dialog Box (Windows 95, Windows 98 and Windows ME)

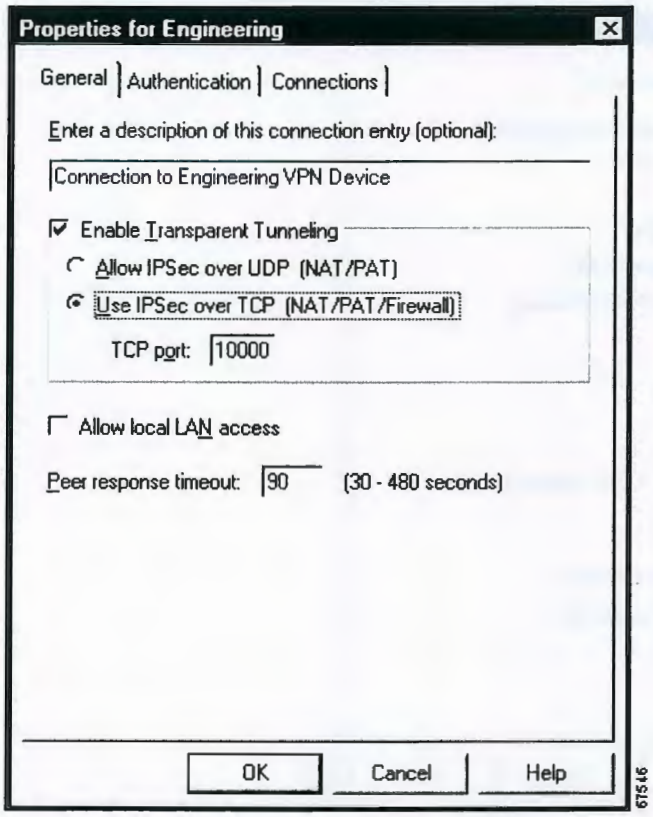
Doc:

Figure 3-17 Connection Entry Properties Dialog Box (Windows NT, Windows 2000, and Windows XP)



Step 3 Click the tab for the parameters you want to change:

- General tab
  - Change the connection entry description
  - Enable transparent tunneling
  - Allow local LAN Access
  - Adjust the peer response time out
  - Log on to Microsoft Network
- Authentication tab
  - Change the group name or group password
  - Change the certificate you want to use
- Connections tab
  - Enable, add, and remove backup server connections
  - Connect to the Internet via Dial-Up Networking

See the appropriate section of this chapter for each tab and parameter.

4.511
J

Step 4 When you have finished setting parameters, click **OK**. The Properties dialog box closes and the VPN Dialer saves your changes.

To discard your changes, click **Cancel**. The Properties dialog box closes and discards all changes.

Changing General Settings

The Properties > General tab lets you set general parameters for this connection entry. (See Figure 3-17.)

Changing Connection Entry Description

To change the description of this connection entry, enter or edit the description field. This field is optional, but it can help you identify this connection.

Enabling Transparent Tunneling

Transparent tunneling allows secure transmission between the VPN Client and a secure gateway through a router serving as a firewall, which may also be performing Network Address Translation (NAT) or Port Address Translations (PAT). Transparent tunneling encapsulates Protocol 50 (ESP) traffic within UDP packets and can allow for both IKE (UDP 500) and Protocol 50 to be encapsulated in TCP packets before they are sent through the NAT or PAT devices and/or firewalls. The most common application for transparent tunneling is behind a home router performing PAT.

The VPN Client also sends keepalives frequently, ensuring that the mappings on the devices are kept active.

Not all devices support multiple simultaneous connections behind them. Some cannot map additional sessions to unique source ports. Be sure to check with your device's vendor to verify whether this limitation exists. Some vendors support Protocol-50 (ESP) Port Address Translation (IPSec passthrough), which might let you operate without enabling transparent tunneling.

To use transparent tunneling, the central-site group in the Cisco VPN device must be configured to support it. For an example, refer to the VPN 3000 Concentrator Manager, Configuration | User Management | Groups | IPSec tab (refer to *VPN 3000 Series Concentrator Reference Volume 1: Configuration* or Help in the VPN 3000 Concentrator Manager browser).

This parameter is enabled by default. To disable this parameter, clear the check. We recommend that you always keep this parameter checked.

Then select a mode of transparent tunneling, over UDP or over TCP. The mode you use must match that used by the secure gateway to which you are connecting. Either mode operates properly through a PAT device. Multiple simultaneous connections might work better with TCP, and if you are in an extranet environment, then in general, TCP mode is preferable. UDP does not operate with stateful firewalls so in this case, you should use TCP.

RQS Nº 03/2005 - CN
CPMI 3-17 EIOS
0971
Fls:
3701
Doc:

Allow IPSec over UDP (NAT/PAT)

To enable **Allow IPSec over UDP**, click the radio button. With UDP, the port number is negotiated. UDP is the default mode.

Use IPSec over TCP (NAT/PAT/Firewall)

To enable **Use IPSec over TCP**, click the radio button. When using TCP, you must also enter the port number for TCP in the TCP port field. This port number must match the port number configured on the secure gateway. The default port number is 10000.

Note When using the VPN Client behind an ESP-aware NAT/Firewall, the port on the NAT/Firewall device may be closed due to the VPN Client's keepalive implementation, called DPD (Dead Peer Detection). When a client is idle, it does not send a keepalive until it sends data and gets no response.

To allow the VPN Client to work through ESP-aware NAT/Firewalls, add the ForceKeepAlives parameter to the *.pcf (profile configuration file) for the affected connection profile. This parameter enables IKE and ESP keepalives for the connection at approximately 20 second intervals.

Use the following syntax when adding this parameter to the [Main] section of any *.pcf file:

ForceKeepAlives=1

For more information, see "Connection Profile Configuration Parameters" in the *VPN Client Administrator Guide*.

Allowing Local LAN Access

The Allow Local LAN Access parameter gives you access to the resources on your local LAN (printer, fax, shared files, other systems) when you are connected through a secure gateway to a central-site VPN device. When this parameter is enabled and your central site is configured to permit it, you can access local resources while connected. When this parameter is disabled, all traffic from your Client system goes through the IPSec connection to the secure gateway.

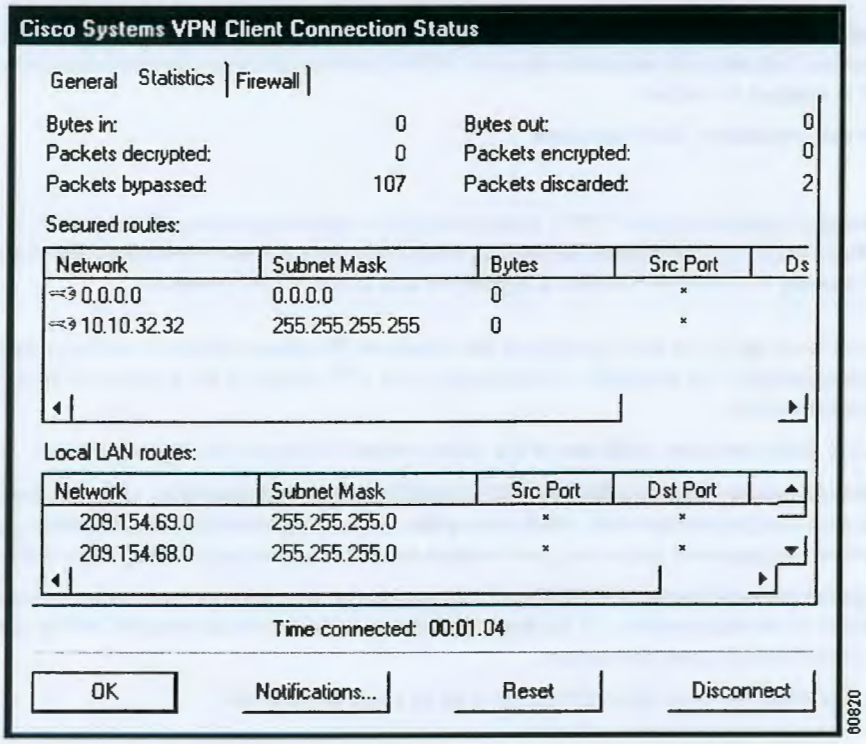
To enable this feature, check **Allow Local LAN Access**; to disable it, clear the check mark from the box. If the local LAN you are using is not secure, you should disable this feature. For example, you would disable this feature when you are using a local LAN in a hotel or airport.

A network administrator at the central site configures a list of networks at the Client side that you can access. You can access up to 10 networks when this feature is enabled. When Allow Local LAN Access is enabled and you are connected to a central site, all traffic from your system goes through the IPSec tunnel except traffic to the networks excluded from doing so (in the network list).

When this feature is enabled and configured on the VPN Client and permitted on the central-site VPN device, you can see a list of the local LANs available by looking on the Statistics tab on the Connection Status dialog box. (See Figure 3-18.)

Note This feature works only on one NIC card, the same NIC card as the tunnel.

Figure 3-18 Local LAN Access



The Local LAN routes section on the Connection Status dialog box lists the IP address and subnet mask of each available network. The Src Port and Dst Port fields are not currently used.

Note While connected, you cannot print or browse the local LAN by name; when disconnected, you can print and browse by name. For more information on this limitation refer to *VPN Client Administrator Guide*, Chapter 1.

Adjusting the Peer Response Timeout Value

The VPN Client uses a keepalive mechanism called Dead Peer Detection (DPD) to check the availability of the VPN device on the other side of an IPSec tunnel. If the network is unusually busy or unreliable, you may need to increase the number of seconds to wait before the VPN Client decides that the peer is no longer active. The default number of seconds to wait before terminating a connection is 90 seconds. The minimum number of seconds you can configure is 30 seconds and the maximum is 480 seconds.

To adjust the setting, enter the number of seconds in the **Peer response timeout** field.

The VPN Client continues to send DPD requests every 5 seconds, until it reaches the number of seconds specified by the Peer response timeout value.

Logging on to Microsoft Network (Windows 95, Windows 98, and Windows ME)

The **Logon to Microsoft Network** parameter registers your PC on the private Microsoft network and lets you browse and use network resources after the VPN Client establishes a secure connection. This parameter is enabled by default.

To disable this parameter, clear the check.

Note This parameter appears only on VPN Clients installed on systems running Windows 95, Windows 98, and Windows ME. For information on logging on to Windows NT and Windows 2000 systems, see the section "Starting a Connection Before Logging on to a Windows NT Platform."

If you do not need or do not have privileges for Microsoft Windows resources on the private network, disable this parameter. For example, if you require only FTP access to the private network, you could disable this parameter.

If you enable this parameter, click one of the radio buttons to choose the logon process:

Use default system logon credentials—Use the Windows logon username and password on your PC to log on to the private network. With this option, you do not need to manually enter your logon username and password each time you connect to the private network. This is the default selection.

Prompt for network logon credentials—The private network prompts you for a username and password to use its resources. If the logon username or password on your PC differs from those on the private network, use this option.

When you are done with the General tab, click **OK** or click another tab.

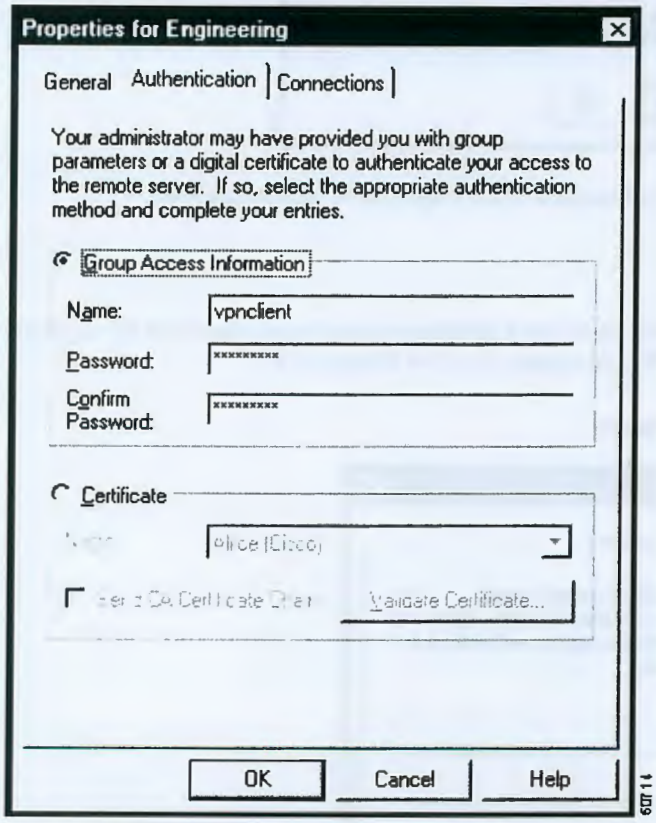
Changing Authentication Settings

The Properties > Authentication tab (see Figure 3-19) lets you change the name or password of the IPSec group to which you are assigned. Your group determines your access to, and use of, the remote network. The group name and password are essential parameters in authenticating you as a user of the remote network.

4.507
1

If you want to choose a different certificate, you also use this screen.

Figure 3-19 Changing Authentication Parameters from the Authentication Tab



Changing Group Name or Group Password

You usually specify a group name and group password when you create a connection entry. However, you can use the Authentication tab to change a group name or group password if your system administrator so instructs you; or to enter the group name and password if the connection entry does not already have them.

In the Name field, enter or edit the group name. This entry is case-sensitive.

In the Password field, enter or edit the group password. This entry is case-sensitive. The field displays only asterisks. Verify your password by entering it again in the Confirm Password field.

If either field is empty when you leave this dialog box, the VPN Client reminds you to enter missing group information. (See Figure 3-20.) To proceed, click **Yes**, or to terminate, click **No**. If you click No, the message closes, which lets you enter the missing information.

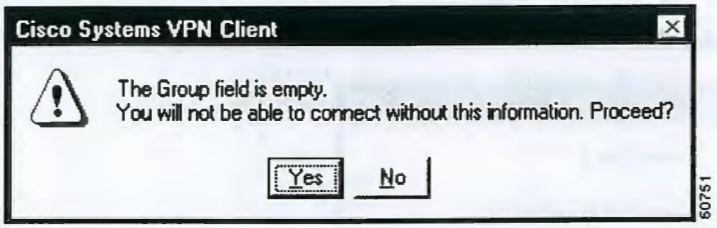
Figure 3-20 Reminder Dialog Box

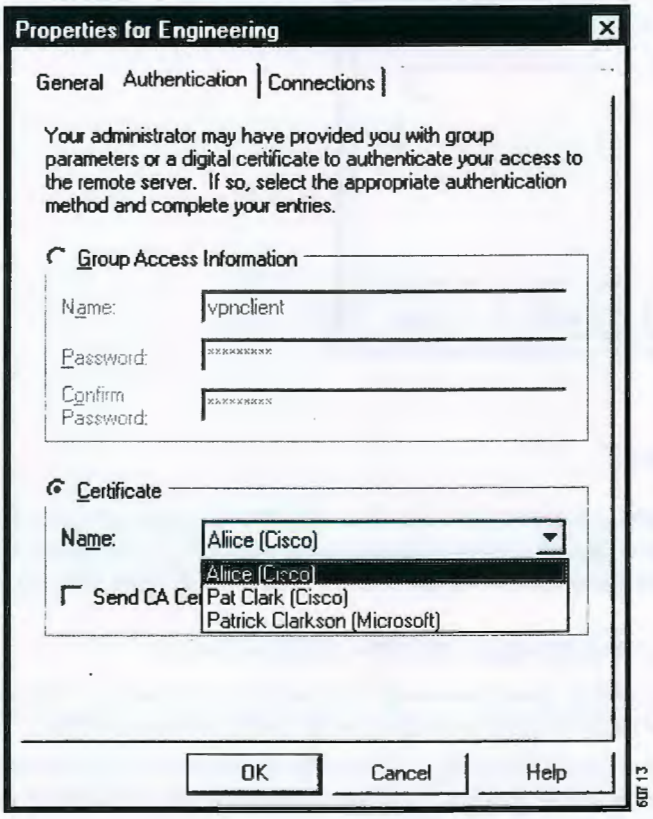


When you are done with the Authentication tab, click **OK** or click another tab.

Choosing a Different Certificate

To choose a different certificate, check the **Certificate** radio button, then click the drop-down menu of certificates installed on your PC and choose one. (See Figure 3-21.)

Figure 3-21 Choosing a Certificate

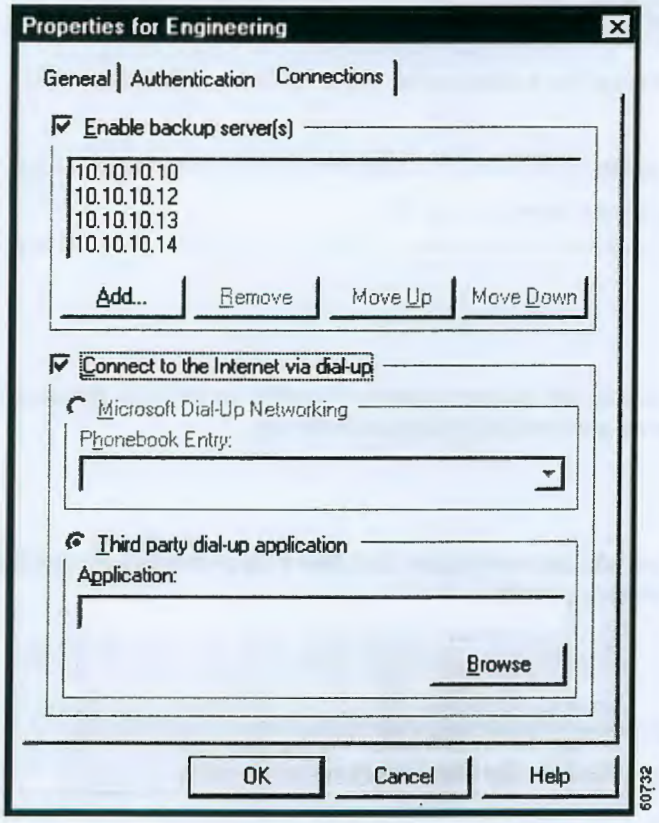


When you are done with the Authentication tab, click **OK** or click another tab.

Changing Connection Settings

The Properties > Connections tab (shown in Figure 3-22) lets you set parameters that govern how you connect to the private network. You can enable and configure backup server connections, and automatically launch a dial-up networking application to connect to the Internet.

Figure 3-22 Changing Parameter Values from the Connections tab



Enabling and Adding Backup Servers

The private network may include one or more backup VPN servers to use if the primary server is not available. Your system administrator tells you whether to enable backup servers. Information on backup servers can download automatically from the VPN Concentrator or you can manually enter this information.

To enable backup servers from the VPN Client, perform the following steps:

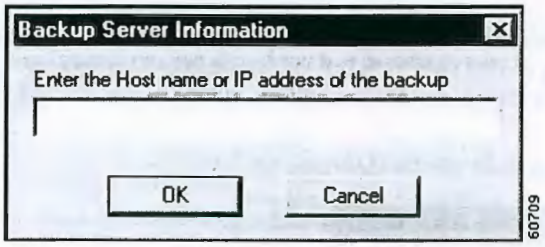
Step 1 Check **Enable backup server(s)**. This is not checked by default.

Step 2 Click **Add** to enter its address.

The Backup Server Information dialog box appears. (See Figure 3-23.)

ROS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0974
3701
Doc:

Figure 3-23 Entering Backup Server Information



Step 3 Enter the hostname or IP address of the backup server. Use a maximum of 255 characters.

Step 4 Click **OK**.

The hostname or IP address appears in the Enable backup server(s) list. (See Figure 3-22.)

Step 5 To add more backup devices, repeat Steps 2, 3, and 4.

Removing Backup Servers

To remove a server from the backup list, choose the server from the list and click **Remove**. *There is no confirmation or undo.* The server name no longer appears in the list.

Changing the Order of the Servers

To reorder the servers in the list, choose a server and click **Move Up** to increase the server's priority or **Move Down** to decrease the server's priority.

Disabling Backup Servers

You can disable using backup servers without removing backup servers from the list.

To disable using backup servers, clear the **Enable backup server(s)** check.

Configuring a Connection to the Internet Through Dial-up Networking

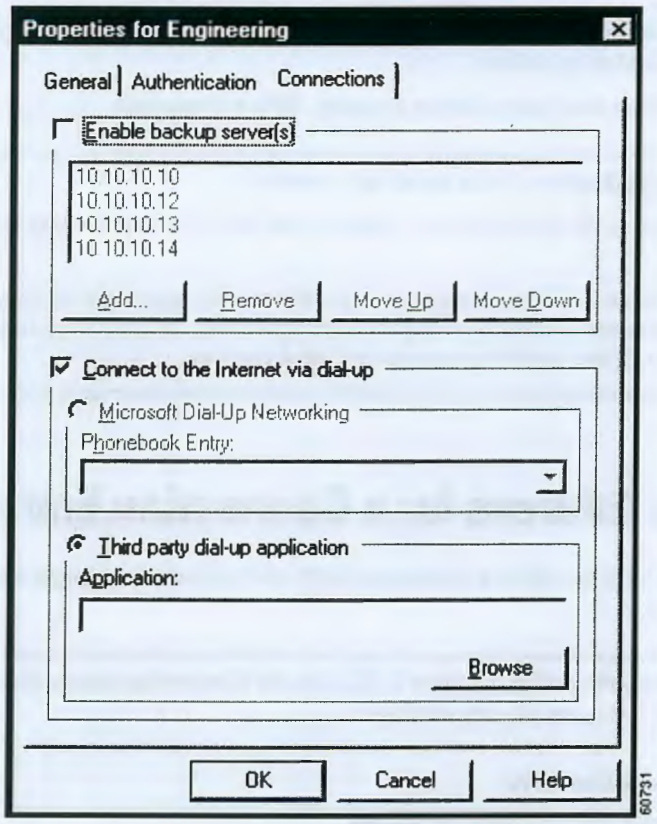
To connect to a private network using a dial-up connection, perform the following two steps:

Step 1 Use a dial-up connection to your Internet service provider (ISP) to connect to the Internet.

Step 2 Use the VPN Client to connect to the private network through the Internet.

To enable and configure this feature, check **Connect to the Internet via dial-up**. This is not checked by default. (See Figure 3-24.)

Figure 3-24 Connecting to the Internet Through Dial-up



You can connect to the Internet using the VPN Dialer application in two different ways:

- Microsoft Dial-up Networking (DUN)
- Third party dial-up program

Microsoft Dial-up Networking

If you have DUN phonebook entries and have enabled Connect to the Internet via dial-up, Microsoft Dial-up Networking is enabled by default. To link a VPN Client connection entry to a Dial-Up Networking phonebook entry, perform the following steps:

Step 1 Click **Microsoft Dial-up Networking** (if it is not already enabled).

Step 2 To link your VPN Client connection entry to a DUN entry, click the down arrow next to the Phonebook entry field and choose an entry from the drop-down menu.

The VPN Client then uses this DUN entry to automatically dial into the Microsoft network before making the VPN connection to the private network.

RQS Nº 03/2005 - CN - CORREIOS
0975
Fls:
3781
Doc:

Third Party Dial-up Program

If you have no DUN phonebook entries and have enabled Connect to the Internet via dial-up, then Third party dial-up application is enabled by default.

To connect to the Internet using a third party dial-up program, follow these steps:

Step 1 Click **Third party dial-up application**, if it is not already enabled.

Step 2 Use **Browse** to enter the name of the program in the **Application** field. This application launches the connection to the Internet.

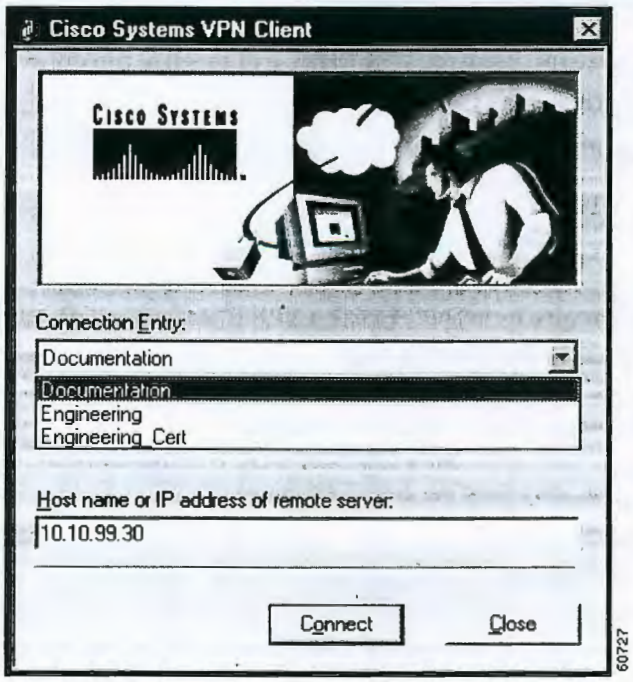
This string you choose or enter here is the pathname to the command that starts the application and the name of the command; for example: c:\isp\ispdialer.exe dialEngineering. Your network administrator might have set this up for you. If not, consult your network administrator.

Changing the VPN Device Address for a Connection Entry

To change the address of the VPN device in a connection entry, and to make the change temporary or permanent, follow these steps:

Step 1 On the VPN Client main dialog box shown in Figure 3-25, click the **Connection Entry** drop-down menu button and choose the entry, if it is not already displayed.

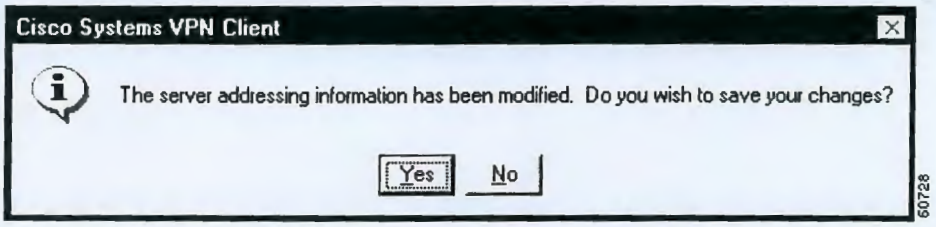
Figure 3-25 Choosing a Connection Entry



Step 2 Edit the address in the Host name or IP address of remote server field.

Step 3 Click **Connect**. The VPN Client displays a confirmation dialog box. (See Figure 3-26.)

Figure 3-26 Confirming Your Changes



Step 4 Click one of the following:

To use this address for the current session only, click **No**. The VPN Client begins connecting to the VPN device, but it does not save the change you have made to the connection entry.

To permanently change the address for this connection entry, click **Yes**. The VPN Client begins connecting to the VPN device, and it saves the new address with the connection entry.

For an explanation of the connection process, see "Connection Procedure".

CHAPTER 4

Connecting to a Private Network

This chapter explains how to connect to a private network with the VPN Client.

We assume you have configured at least one VPN Client connection entry as described in "Configuring the VPN Client." To connect to a private network, you also need the following information:

- ISP logon username and password, if necessary.
- User authentication information:
  - If you are authenticated via the VPN 3000 Concentrator internal server, your username and password.
  - If you are authenticated via a RADIUS server, your username and password.
  - If you are authenticated via an Windows NT Domain server, your username, password, and domain name.
  - If you are authenticated via RSA Data Security (formerly SDI) SecurID or SoftID, your username and PIN.
  - If you use a digital certificate for authentication, the name of the certificate and your username and password. If your private key is password protected for security reasons, you also need this password.

Refer to your entries in "Gathering Information You Need," as you complete the steps described here, which include the following sections:

- Starting the VPN Dialer
- Using the VPN Client to Connect to the Internet via Dial-Up Networking
- Authenticating to Connect to the Private Network
- Connecting with Digital Certificates
- Viewing Connection Status
- Closing the VPN Client
- Disconnecting your VPN Client Connection

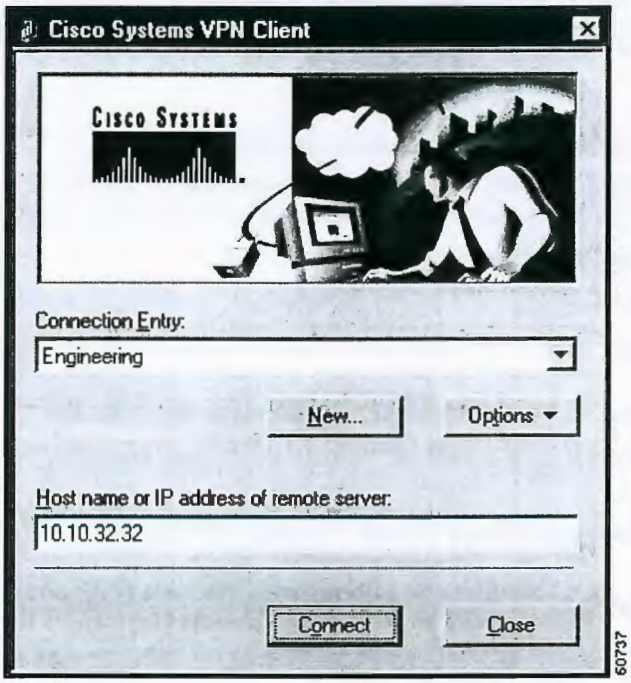
RQS Nº [redacted] - CN
CPMI - CORREIOS
0977
Fls: 3701
Doc:

Starting the VPN Dialer

Step 1 To start the VPN Dialer application, choose **Start > Programs > Cisco Systems VPN Client > VPN Dialer**.

The VPN Dialer displays the VPN Client's main dialog box. (See Figure 4-1.)

Figure 4-1 VPN Dialer Main Dialog Box



Step 2 If necessary, click the **Connection Entry** drop-down menu and choose the desired connection entry.

Connection Procedure

To connect to a private network, perform the following steps:

Step 1 Connect to the Internet, if necessary.

Step 2 Connect to the private network through the Internet.

- Systems with cable or DSL modems are usually connected to the Internet, so no additional action is necessary. Skip to "Authenticating to Connect to the Private Network."
- Systems with modems or ISDN modems must connect to the Internet via Dial-Up Networking:
  - If you connect to the Internet via Dial-up Networking, proceed to "Using the VPN Client to Connect to the Internet via Dial-Up Networking."

- If you must manually connect to the Internet, do it now. When your connection is established, skip to "Authenticating to Connect to the Private Network."
- If your system is already connected to the Internet via Dial-Up Networking, skip to "Authenticating to Connect to the Private Network."

4.498
J

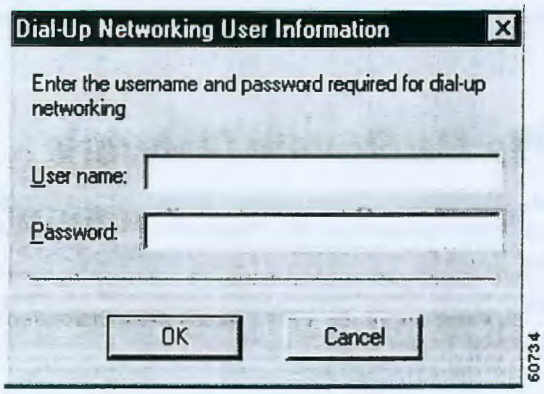
Using the VPN Client to Connect to the Internet via Dial-Up Networking

This section describes how to connect to the Internet via Dial-Up Networking by running only the VPN Client. Your connection entry must be configured with Connect to the Internet via Dial-Up Networking enabled; see "Configuring the VPN Client".

Step 1 Click **Connect** on the VPN Client's main dialog box. (See Figure 4-1.)

If your credentials are not stored in the RAS database, the Dial-up Networking User Information dialog box appears. (See Figure 4-2.) This dialog box varies depending on the version of Windows you are using.

Figure 4-2 Entering User Information



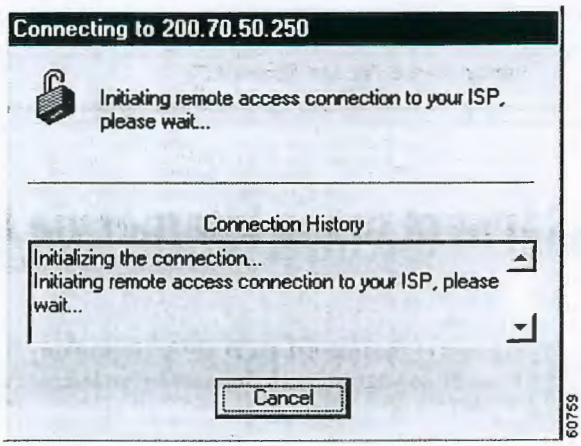
Step 2 Enter your username and password to access your ISP. These entries may be case-sensitive. The Password field displays only asterisks.

Step 3 Click **OK**.

You see the Connection History dialog box. (See Figure 4-3.)

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0978
Fls:
3701
Doc:

Figure 4-3 Confirming Connections to ISP



When the ISP connection is established, a Dial-Up Networking icon appears in the system tray on the Windows task bar. (See Figure 4-4.)

Figure 4-4 Dial-Up Networking task bar Icon

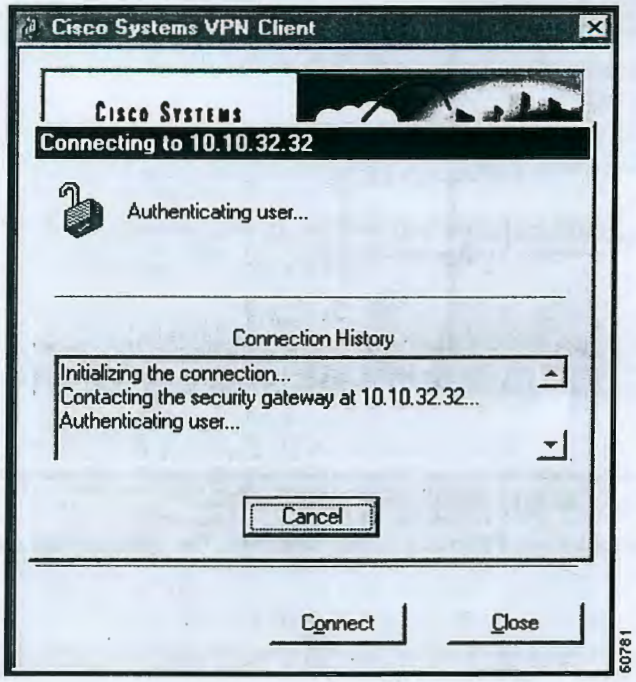
Authenticating to Connect to the Private Network

This section assumes you are connected to the Internet. If you connect using Dial-Up Networking, verify that its icon is visible in the Windows task bar system tray. (See Figure 4-4.) If not, your Dial-Up Networking connection is not active and you need to establish it before continuing.

If you did not do so earlier, click **Connect** on the VPN Client's main dialog box. (See Figure 4-1.)

The VPN Client starts tunnel negotiation and displays the Connection History dialog box. (See Figure 4-5.)

Figure 4-5 Negotiating Dialog Box



The next phase in tunnel negotiation is user authentication.

User Authentication

User authentication means proving that you are a valid user of this private network. User authentication is optional. Your administrator determines whether it is required.

The VPN Client displays a user authentication dialog box that differs according to the authentication that your IPSec group uses. Your system administrator tells you which method to use.

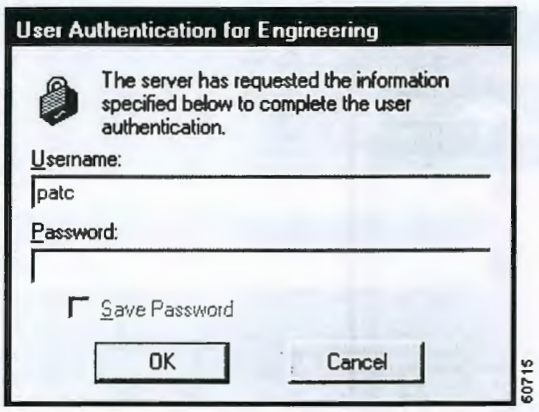
To continue, refer to your entries in "Gathering Information You Need" and go to the appropriate authentication section that follows.

Authenticating Through the VPN Device Internal Server or RADIUS Server

To display the user authentication dialog box, perform the following steps. The title bar identifies the connection entry name.

4.496
RQS Nº 03/2005 - CN - CPMI - CORREIOS
Fls: 0979
Doc: 3701

Figure 4-6 Authenticating Through an Internal or RADIUS Server



Step 1 In the Username field, enter your username. This entry is case-sensitive.

Step 2 In the Password field, enter your password. This entry is case-sensitive. The field displays only asterisks.

Step 3 Click **OK**.

Note If you cannot choose the Save Password option, your administrator does not allow this option. If you can choose this option, be aware that using it might compromise system security, since your password is then stored on your PC and is available to anyone who uses your PC.

If Save Password is checked and authentication fails, your password may be invalid. To eliminate a saved password, click **Options** > **Erase User Password**.

Proceed to the section "Viewing Connection Status."

Authenticating Through a Windows NT Domain

To display the Windows NT Domain user authentication dialog box, perform the following steps. The title bar identifies the connection entry name.

Figure 4-7 Authenticating Through a Windows NT Domain

Step 1 In the Username field, enter your username. This entry is case-sensitive.

Step 2 In the Password field, enter your password. This entry is case-sensitive. The field displays only asterisks.

Step 3 In the Domain field, enter your Windows NT Domain name, if it is not already there.

Step 4 Click **OK**.

Skip to "Viewing Connection Status."

Changing your Password

Your network administrator may have configured your group for RADIUS with Expiry authentication on the VPN 3000 Concentrator. If this feature is in effect and your password has expired, a dialog box prompts you to enter and confirm a new password.

After you have tried unsuccessfully to log in three times, you might receive one of the following login messages:

- Restricted login hours
- Account disabled
- No dial-in permission
- Error changing password
- Authentication failure

These messages let you know the cause of your inability to log in. For help, contact your network administrator.

Doc:

Authenticating Through RSA Data Security (RSA) SecurID (SDI)

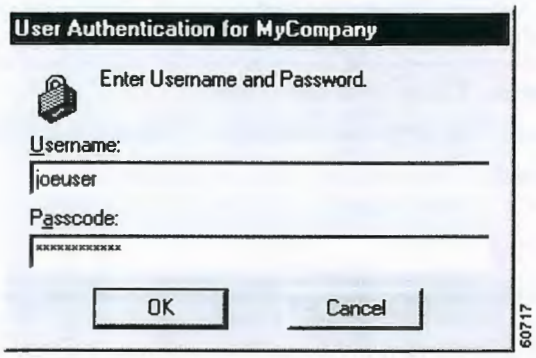
RSA (formerly SDI) SecurID authentication methods include physical SecurID cards and keychain fobs, and PC software called SoftID. SecurID cards also vary: with some cards, the passcode is a combination of a PIN and a cardcode; with others, you enter a PIN on the card and it displays a passcode. Ask your system administrator for the correct procedure.

Authentication via these methods also varies slightly for different operating systems. If you use an RSA method, the VPN Client displays the appropriate RSA user authentication dialog box. The title bar identifies the connection entry name.

RSA User Authentication: SecurID Tokencards (Tokencards, Pinpads, and Keyfobs) and SoftID v1.0 (Windows 95, Windows 98, and Windows ME)

To display an authentication dialog box asking for your username and passcode, perform the following steps. (See Figure 4-8.) If you are using SoftID, it must be running on your PC.

Figure 4-8 Authenticating through RSA



Step 1 In the Username field, enter your username. This entry is case-sensitive.

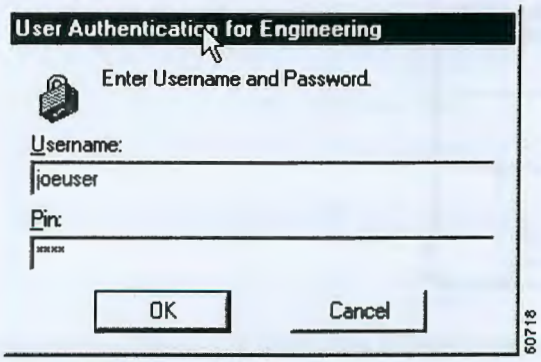
Step 2 In the Passcode field, enter a SecurID code. With SoftID, you can copy this code from the SoftID window and paste it here. Your administrator will tell you what you need to enter here, depending on the type of tokencard you are using.

Step 3 After entering the code, click **OK**.

RSA User Authentication: SoftID v1.x (Windows NT Only) and SoftID v2.0 (All Operating Systems)

If you are using SoftID under Windows NT, the VPN Client displays an authentication dialog box asking for your username and PIN. (See Figure 4-9).

Figure 4-9 Authenticating Through SoftID on Windows NT



Step 1 In the Username field, enter your username. This entry is case-sensitive.

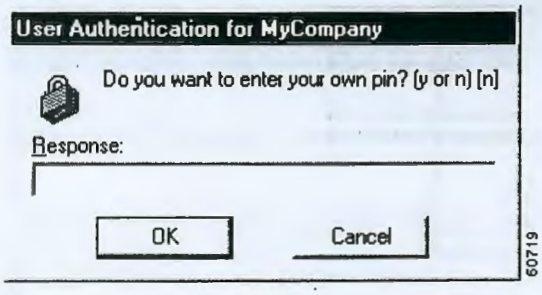
Step 2 In the PIN field, enter your SoftID PIN. The VPN Client gets the passcode from SoftID by communicating directly with SoftID. The SoftID application must be installed but does not have to be running on your PC.

Step 3 After entering the PIN, click **OK**.

RSA New PIN Mode

The first time you authenticate using SecurID or SoftID (all operating systems), or if you are using a new SecurID card, and if the RSA administrator allows you to create your own PIN, the authentication program asks if you want to create your own PIN. (See Figure 4-10.)

Figure 4-10 SecurID New PIN Request

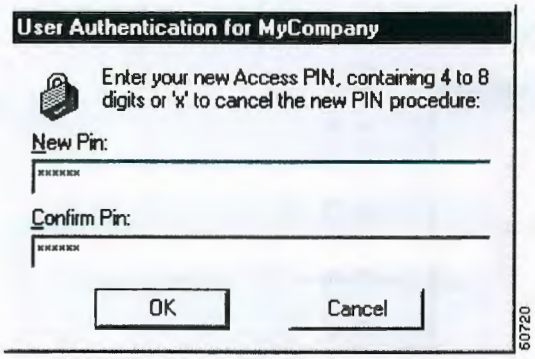


Step 1 Enter your response **y** for yes or **n** for no. No is the default response. Then, click **OK**. What happens next depends on your response.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
0981
Fls:
3701
Doc:

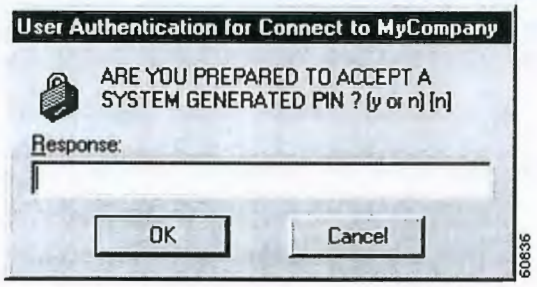
- If you responded yes—Enter your new PIN in the New PIN field and enter it again in the Confirm PIN field. Click **OK**. (See Figure 4-11.)

Figure 4-11 Entering a New PIN Yourself



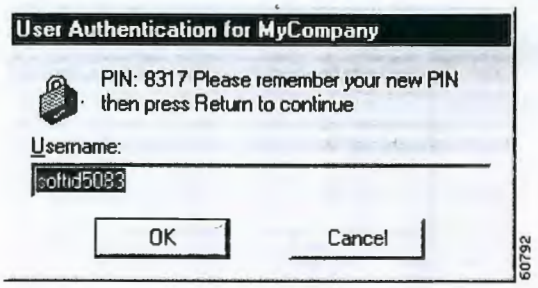
- If you responded no—the authentication program asks if you will accept a system-generated PIN. (See Figure 4-12.)

Figure 4-12 Accepting a PIN from the System



Step 2 To receive a PIN, you must respond **y** for yes and then click **OK**. When you do, the authentication program generates a PIN for you and displays it. (See Figure 4-13.) Be sure to remember your PIN.

Figure 4-13 New PIN Received



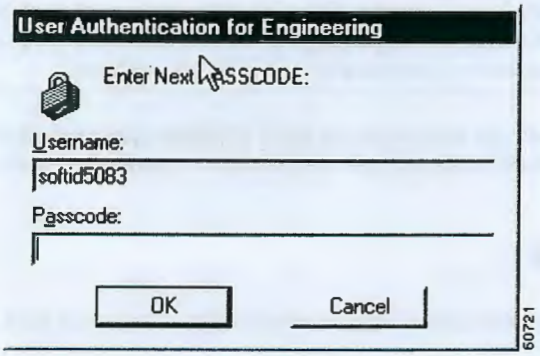
Step 3 To continue, click **OK**.

SecurID Next Cardcode Mode

Sometimes SecurID authentication prompts you to enter the next cardcode from your token card, as in Figure 4-14. SecurID displays this prompt either to resynchronize the token card with the RSA server, or because it noticed several unsuccessful attempts to authenticate with this username.

The SecurID Next Cardcode Mode dialog box might appear. (See Figure 4-14.)

Figure 4-14 Entering the Passcode for SecurID Next Card



In the Passcode field, enter the next code from your token card. This field requires only a cardcode. Do not include your PIN as part of the passcode.

Now continue to "Viewing Connection Status."

Connecting with Digital Certificates

Before you created a connection entry using a digital certificate, you must have already enrolled in a Public Key Infrastructure (PKI), have received approval from the Certificate Authority (CA), and have one or more certificates installed on your system. If this is not the case, then you need to obtain a digital certificate. In many cases, the network administrator of your organization can provide you with a certificate. If not, then you can obtain one by enrolling with a PKI directly using the Certificate Manager application, or you can obtain an Entrust profile through Entrust Entelligence. Currently, we support the following PKIs:

- UniCERT from Baltimore Technologies (www.baltimoretechnologies.com)
- Entrust PKI™ from Entrust Technologies (www.entrust.com)
- Versign (www.verisign.com)
- Microsoft Certificate Services in Microsoft Windows 2000 Server
- Cisco Certificate Store

The websites listed in parentheses in this list contain information about the digital certificates that each PKI provides. The easiest way to enroll in a PKI or import a certificate is to use the Certificate Manager (see "Enrolling and Managing Certificates") or Entrust Entelligence (see Entrust documentation).

RQS Nº 03/2005 - CN - CPMI - CORREIOS
Fls: 0982
Doc: 3701

Note Every time you connect using a certificate, the VPN Client checks to verify that your certificate has not expired. If your certificate is within one month of expiring, the VPN Client displays a message when you attempt to connect or when you use the Properties option. The message displays the certificate common name, the "not before" date, the "not after" date, and the number of days until the certificate expires or since it has expired.

There is one exception to this rule. When you are authenticating with a Microsoft certificate, the VPN Dialer skips the automatic certificate validation process and starts the connection immediately. If there is a problem with the certificate, the connection attempt fails. To obtain information about the failure, look in the connection log file (see "Viewing and Managing the VPN Client Event Log"). To validate the certificate manually, choose Properties > Authentication > Validate Certificate.

What happens when you press **Connect** can depend on the level of private key protection on your certificate. If your certificate is password protected, you are prompted to enter the password.

Connecting with an Entrust Certificate

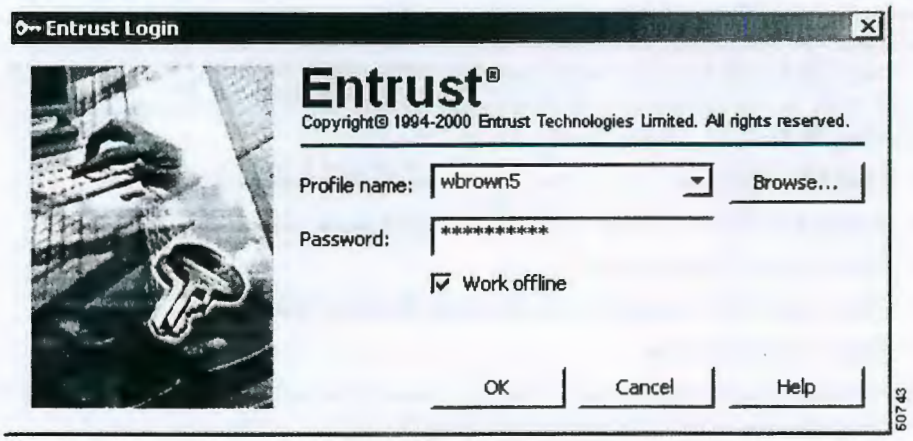
This section provides important information about what to expect when connecting with an Entrust certificate under certain conditions.

Accessing Your Profile

If you are not already logged in, you must log in to Entrust Entelligence to access your Entrust Entelligence certificate profile, using the following procedure:

After you choose **Connect** on the VPN Client main dialog box, the Entrust logon dialog box appears. (See Figure 4-15.)

Figure 4-15 Logging in to Entrust



4.488

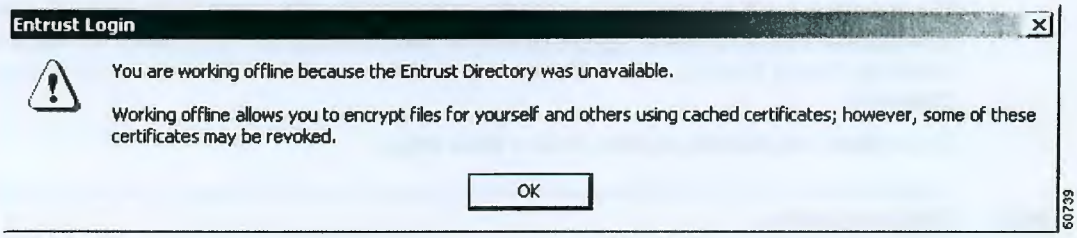
Step 1 Choose a profile name from the pull-down menu.

Your network administrator has previously configured one or more profiles for you through Entrust Entelligence. If the software is installed on your system but there are no profiles available, then you need to get a profile from your network administrator or directly through Entrust. Refer to *Entrust Entelligence Quick Start Guide* for instructions on obtaining a profile. The *VPN Client Administrator Guide* contains supplementary configuration information.

Step 2 After choosing a profile, enter your Entrust password.

Check the Work offline field to use Entrust Entelligence without connecting to the Entrust PKI. If Work offline is checked and you press **OK**, the Entrust wizard displays the message shown in Figure 4-16.

Figure 4-16 Entrust Login Message

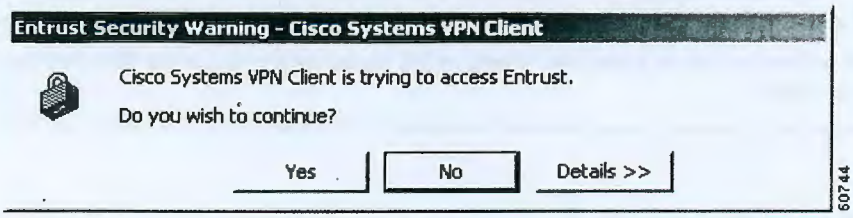


You can ignore this message. Since you are connecting to your organization's private network using an existing certificate profile, you are not interacting with the Entrust PKI. If you see this message, click **OK** to continue.

Step 3 After completing the Entrust Login dialog box (see Figure 4-15), click **OK**.

You may receive a security warning message from Entrust. This warning occurs, for example, when an application attempts to access your Entelligence profile for the first time or when you are logging in after a VPN Client software update. The message happens because Entrust wants to verify that it is acceptable for the VPN Client to access your Entrust profile.

Figure 4-17 Entrust Security Warning



Step 4 At the warning message, click **Yes** to continue.

You can now use your Entrust certificate for authenticating your new connection entry.

Doc: 5701

Entrust Inactivity Timeout

If you have a secure connection and you see a padlock next to the Entelligence icon in the Windows system tray, Entelligence has timed out. However, you have not lost your connection. If you see the Entelligence icon with an X next to it, you are logged out of Entrust, and you did not have a secure connection initially. To make a new connection, start from the beginning (see "Accessing Your Profile").

Using Entrust SignOn and Start Before Logon Together

Entrust SignOn™ is an optional Entrust application that lets you use one login and password to access Microsoft Windows and Entrust applications. This application is similar to *start before logon*, which is a VPN Client feature that enables you to dial in before logging on to Windows NT. For information about start before logon, see "Starting a Connection Before Logging on to a Windows NT Platform".

If you want to use these two features together, you should make sure you have installed Entrust Entelligence with the Entrust SignOn module before installing the VPN Client. For information about installing Entrust SignOn, refer to Entrust documentation and the *VPN Client Administrator Guide*, Chapter 1.

To use these two features together, follow these steps:

Step 1 Start your system.

When the SignOn option is installed, Entrust displays its own Ctrl Alt Delete dialog box.

Step 2 Click **Ctrl Alt Delete**.

The Entrust Options dialog box and the VPN Dialer login dialog box both pop up. The VPN Dialer dialog box is active.

Step 3 To start your VPN connection, click **Connect** on the VPN Dialer main dialog box.

The Entrust login dialog box becomes active.

Step 4 To log in to your Entrust profile, enter your Entrust password.

The VPN Dialer password prompt dialog box becomes active.

Step 5 Enter your VPN dialer username and password.

The VPN Client authenticates your credentials and optionally displays a banner and/or a notification. Respond to the banner or notification as required. Then the Windows NT logon dialog box is active.

Step 6 To complete the connection, enter your Windows NT logon credentials in the Windows logon dialog box and you are done.

Connecting with a Smart Card or Token

The VPN Client supports authentication with digital certificates through a smart card or electronic token. Several vendors provide smart cards and tokens. For an up-to-date list of those that the VPN Client currently supports, see "Smart Cards Supported". Smart card support is provided through Microsoft Cryptographic API (MS CAPI). Any CryptoService provider you use must support signing with CRYPT_NOHASHOID.

Upgrading the VPN Client Software (InstallShield)

Upgrading the VPN Client software using this method retains existing connection entries and their parameters.

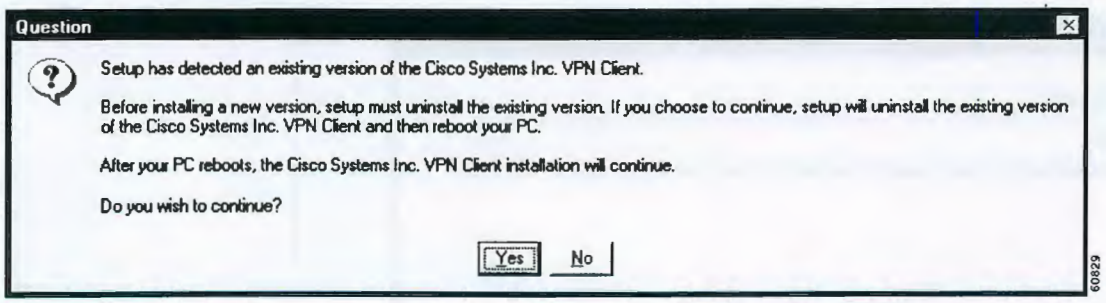
To install an upgrade of the VPN Client over an existing version on your system, use the following procedure, which first uninstalls the existing version, and then reboots your PC and installs the new version.

Step 1 To begin the procedure, follow the instructions in the "Installing the VPN Client Through InstallShield" section in Chapter 2.

When it starts, the installation wizard detects the existing version and asks you to confirm that you want to remove that version and reboot your PC. (See Figure 5-29.)

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls:
Doc: 3701

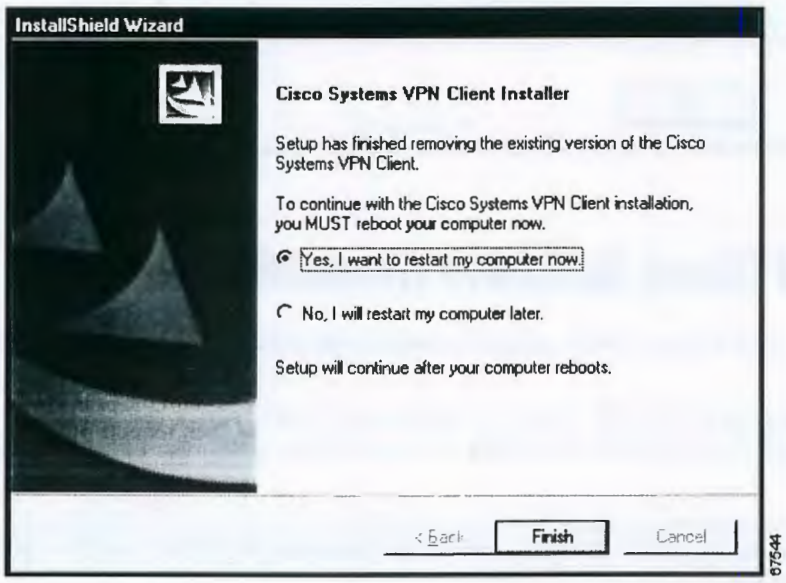
Figure 5-29 Uninstalling an Existing Version



Step 2 To continue, click **Yes**.

The installation program removes the old version and asks you to confirm the system restart. (See Figure 5-30.)

Figure 5-30 Confirming the System Restart



Be sure to remove any diskette from its drive before you restart your system.

If you are installing from diskettes, reinsert Disk 1 after your system restarts and displays the Windows logo screen, but *before* the desktop appears.

Step 3 To restart your system, click **Yes** (the default) and click **Finish**.

The installation wizard restarts your system. Once your system has restarted, installation continues automatically.

Step 4 Follow the instructions as if you were installing for the first time. See "Installing the VPN Client Through InstallShield."

4.440
J

Upgrading the VPN Client Software (MSI)

Upgrading the VPN Client software using this MSI in this recommended way retains existing connection entries and their parameters.

To install an upgrade of the VPN Client over an existing version on your system, use the following procedure.

Step 1 Remove any existing version of the VPN Client software through the Add/Remove available from the Windows Control Panel.

Step 2 Install the VPN Client using the MSI installer (vpnclient_en.msi).

Uninstalling the VPN Client with the Uninstall Application

This option is available only if you have installed the VPN Client via InstallShield. Uninstalling the VPN Client means completely removing all VPN Client software from your computer. For example, if you are changing or upgrading your PC, you might want to uninstall the VPN Client. Also, if you are getting ready to install Cisco VPN Client 3.6 using Microsoft Windows Installer (MSI), you can run the Uninstall application to remove previous versions of the Cisco VPN Client.

Note Do not attempt to uninstall or upgrade the VPN Client software from a mapped network drive.

Before you run the uninstall program, make sure you have closed all of your remote access (Dial-Up Networking) connections and all VPN Client applications. Then use the following procedure. (See Figure 5-31.)

Note If you installed the VPN Client via the Microsoft Windows Installer, the Cisco Systems VPN Client menu does not include the Uninstall VPN Client option.

Step 1 Choose **Start > Programs > Cisco Systems VPN Client > Uninstall VPN Client.**

RQS Nº 03/2005 - CN -

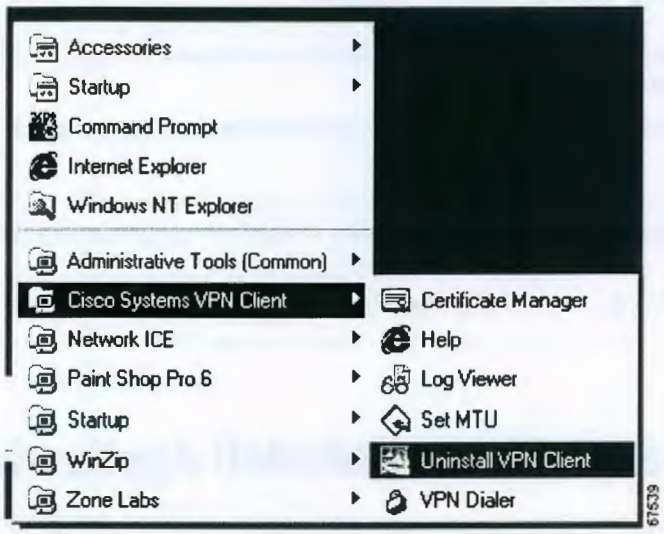
3701
Doc:

Figure 5-31 Running the Uninstall Program



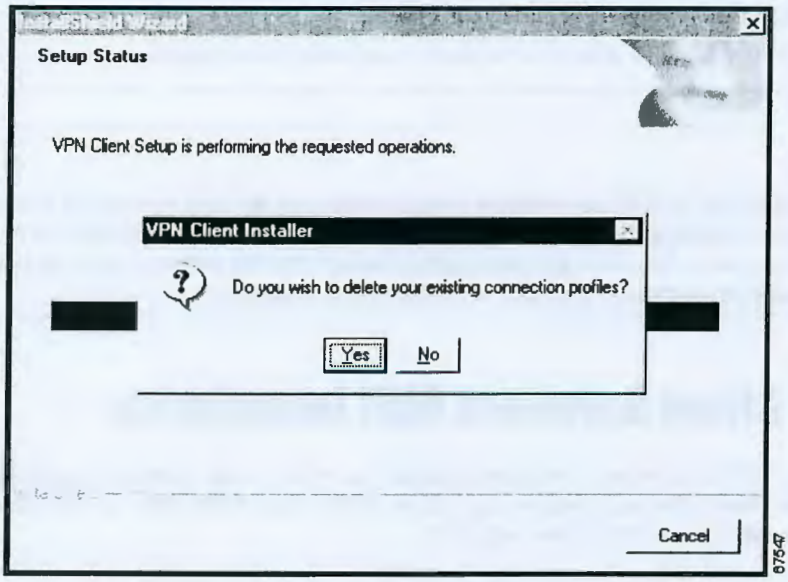
The Uninstall Wizard runs and asks if you want to really want to remove the VPN Client applications. (See Figure 5-32.)

Figure 5-32 Confirming Uninstall

Step 2 To completely remove the VPN Client software from your system, click **Yes**. Otherwise, click **No**.

Next, the Uninstall Wizard asks if you want to delete your connection profiles. (See Figure 5-33.)

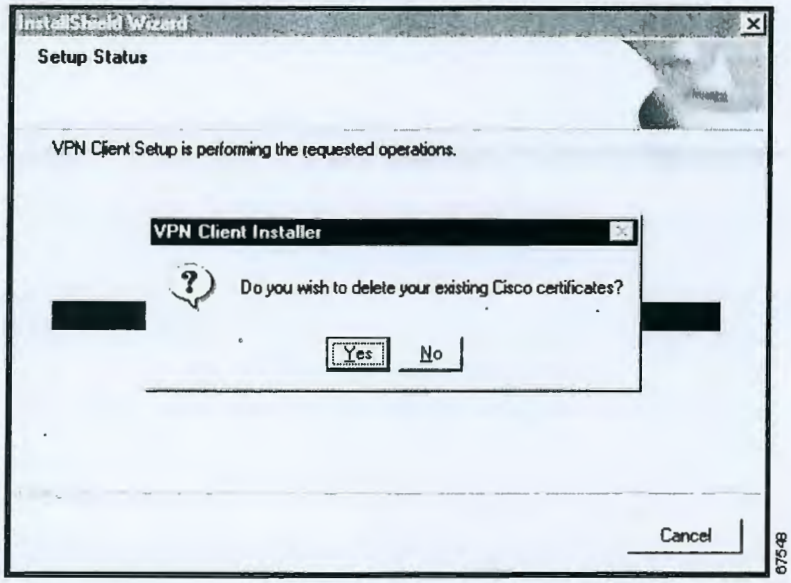
Figure 5-33 Confirming Your Connections



Step 3 To preserve your connection profiles (which contain configured connection entries), click **No**.

Then the Uninstall Wizard asks if you want to delete your certificates. (See Figure 5-34.)

Figure 5-34 Confirming Your Certificates



Step 4 To keep your certificates, click **No**.

Finally, the Uninstall Wizard prompts you to restart your system. To complete the uninstallation, you must restart your system.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
0993
Fls:
Doc: 3701

Step 5 To restart your system, click **Yes** (the default) and then click **Finish**.

The installation program restarts your system.

Be sure to remove any diskette from its drive before you restart your system.

Note When you uninstall the VPN Client software after you have run the Log Viewer and you have clicked yes to remove your certificate and profile directories, the vpnclient.ini and ipseclog.txt files remain on your system. Since these files were generated after you installed the software, they are not removed when you uninstall the software. You have to remove them manually.

Removing the VPN Client Software MSI Installation

To remove the VPN Client when it has been installed via MSI, use the Add/Remove utility available from the Control Panel. You must remove any version of the Cisco VPN Client or any other VPN Client before upgrading the Cisco VPN Client with MSI.

CHAPTER 6

Enrolling and Managing Certificates

This chapter explains how to enroll and manage personal certificates using the Certificate Manager application. Specifically, it describes how to perform the following tasks:

- Obtain personal certificates through enrollment with a Certificate Authority (CA), which is an organization that issues digital certificates that verify that you are who you say you are.

  You can enroll for a certificate in two ways:

  - through the network (*online enrollment)*
  - through a file
- Import certificates
- Manage certificates
  - Viewing
  - Verifying
  - Deleting
  - Exporting
- Manage enrollment requests

This chapter covers the following topics:

- Starting Certificate Manager
- What are Certificate Stores?
- Enrolling for a Certificate
- Managing Personal and CA/RA Certificates
- Managing Enrollment Requests

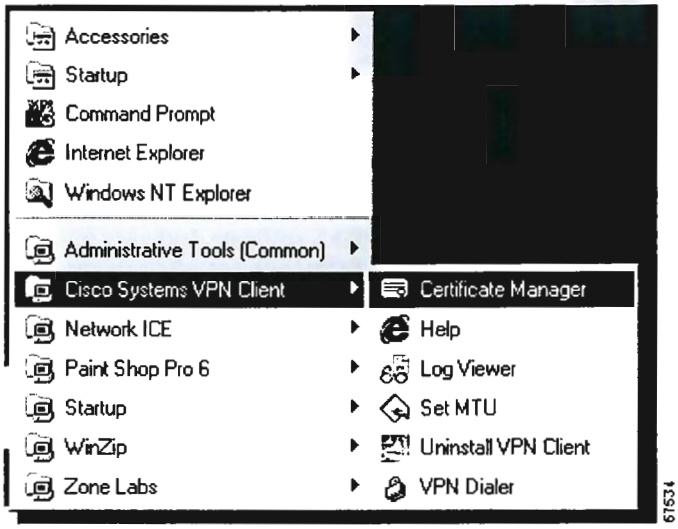
RQS Nº 03/2005 - CN
CPMI - CORREIOS
0994
Fls:
Doc: 3701

Starting Certificate Manager

To get started with certificates, go to the Cisco Systems VPN Client menu (the same menu that you use to start the client, shown in Figure 6-1).

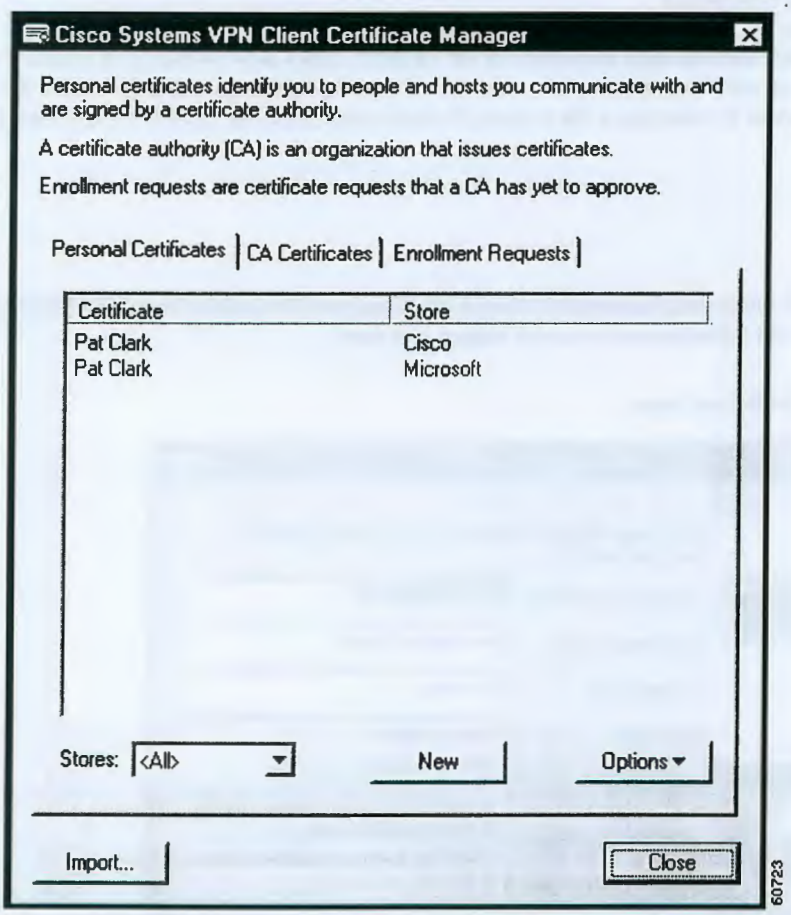
Choose **Start> Programs> Cisco Systems VPN Client> Certificate Manager.**

Figure 6-1 Choosing Certificate Manager



The Certificate Manager window opens. (See Figure 6-2.)

Figure 6-2 Certificate Manager Main Window



What are Certificate Stores?

The Certificate Manager uses the notion of *store* to convey a location in your local file system for storing personal certificates. The major store for the VPN Client is the Cisco store. The Cisco store contains certificates you have enrolled for through the Simple Certificate Enrollment Protocol (SCEP). This application supports several standard enrollment protocols. Your system also includes a Microsoft certificate store that may contain certificates that your organization provides or that you have installed previously. You can manage them just like the certificates in your Cisco store, or you can import them to your Cisco store. New certificates obtained through enrollment or importing go into the Cisco store.

There are two types of Microsoft certificates: certificates for individuals to use and also a Microsoft certificate for your local PC itself. So if several people are using the same PC, each person can have a certificate, and there can also be a certificate for the local system on Windows 2000 and Windows XP. On a Windows 9x system, you can only use it with Internet Explorer version 5.1 SP2.

Microsoft certificates with non-exportable private keys are also available.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0995
Doc:

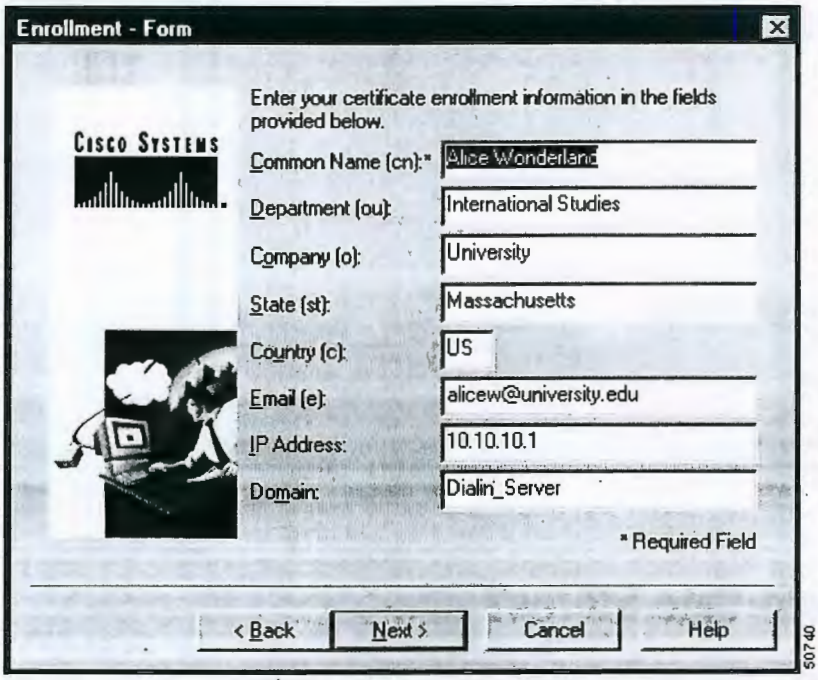
Enrolling for a Certificate

Your system administrator may have already set up your VPN Client with digital certificates. If not, or if you want to add certificates, you can obtain a certificate by enrolling with a Certificate Authority (CA) over the network or by creating a file request. In both cases, you complete the same form (shown in Figure 6-3.)

Enrollment Form

This section describes the information required for filling out the certificate enrollment form. Make sure you have all of the following information before you start.

Figure 6-3 Enrollment Form



- Common Name—Your common name (CN), which is the unique name to use for this certificate. This field is required. The common name can be the name of a person, system, or other entity; it is the most specific level in the identification hierarchy. The common name becomes the name of the certificate; for example, Alice Wonderland.
- Department—The name of the department to which you belong; for example, International Studies. This field correlates to the Organizational Unit (OU). The OU is the same as the Group Name configured in a VPN 3000 Series Concentrator, for example.
- Company—The name of the company or organization (O) to which you belong; for example, University.
- State—The name of your state (ST); for example, Massachusetts.

- Country—The 2-letter country code for your country (C); for example, US. This two-letter country code must conform to ISO 3166 country abbreviations.
- Email—Your email address (e); for example, alicew@university.edu.
- IP Address—The IP address of your system, for example, 10.10.10.1.
- Domain—The Fully Qualified Domain Name of the host for your system; for example, `Dialin_Server`.

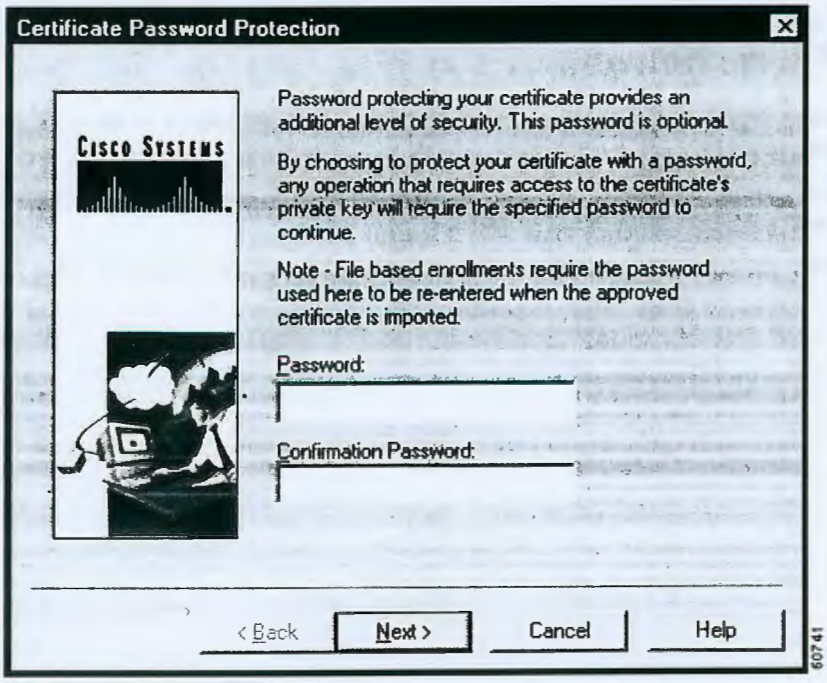
Together, all these fields except IP address and domain comprise your distinguished name (DN).

When you enroll a personal certificate, either you go through a CA from which your system already has a root certificate or you obtain a root certificate from the CA as part of the enrollment process. The CA Certificates tab displays the current list of CA certificates. (See Figure 6-2.)

Starting Enrollment

To begin, click **New** on the Certificate Manager's main screen under the Personal Certificates tab. (See Figure 6-2.) The Certificate Manager prompts you to enter a password for the certificate you are enrolling. (See Figure 6-4.) The password is optional, but we recommend that you use one to protect your private key more effectively. The password can be up to 32 characters in length. Passwords are case sensitive. For example, *sKate8* and *Skate8* are different passwords. This password is called the *personal certificate password*.

Figure 6-4 Protecting a Certificate with a Password



After entering a password, click **Next** to continue. The Certificate Manager lets you choose between enrolling via the network or by creating a file. (See Figure 6-5.) Enrolling via the network is also called *online enrollment*.

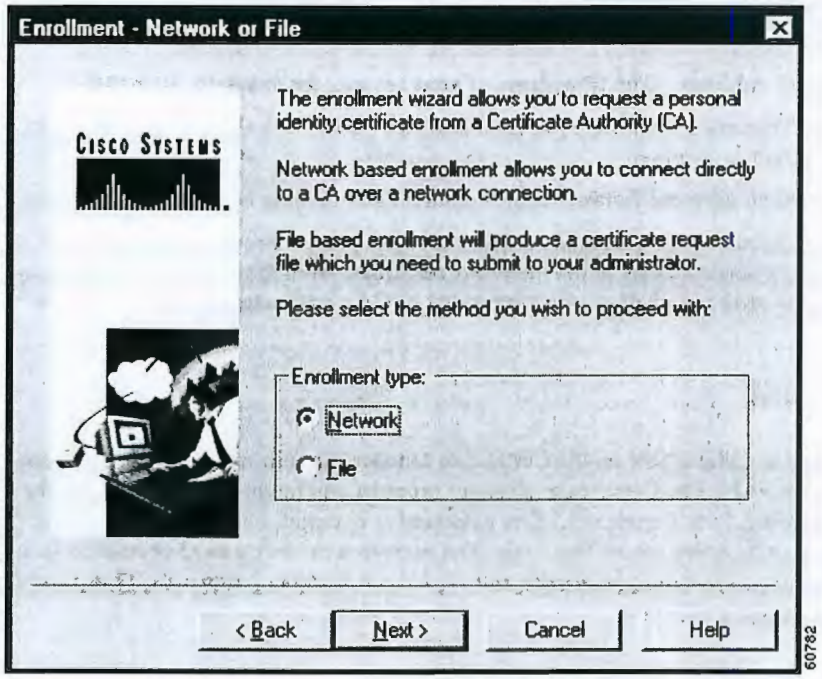
Figure 6-5 Choosing Enrollment Method



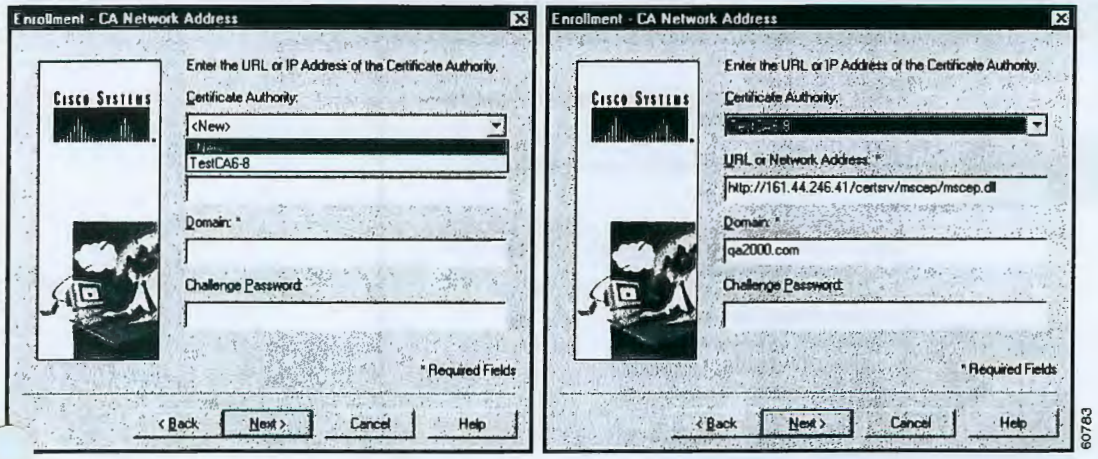
Enrolling Through the Network

To enroll through the network, retrieve a certificate from a CA, and place it in the Cisco store, using the following procedure:

Step 1 Click **Network** and click **Next**. (See Figure 6-5.)

The Certificate Manager asks you to enter the network address of the issuing CA. (See Figure 6-6.)

Figure 6-6 Entering Network Address



Step 2 Choose one of the following procedures:

- Choose an existing Certificate Authority from the drop-down menu.
  - The URL or Network Address and Domain fields are automatically filled.
  - Renter the Challenge password or enter a new password, which you can obtain from the CA or your network administrator.
- Choose **<New>** from the drop-down menu.
  - Enter the URL or Network Address of the CA and the CA's Domain, both of which are required.
  - Some CAs require that you enter a password to access their site. If this is the case, enter the password in the Challenge Password field. You can get the password from the CA or from your network administrator.

Step 3 When you have completed the network address information, click **Next**.

The Certificate Manager displays the enrollment form for you to complete. (See Figure 6-3.)

Step 4 Enter the information you collected before you started the enrollment process. The only field that the Certificate Manager requires is Common Name. However the CA may require some or all of the other fields. Then click **Next**.

After you enter the form, the Certificate Manager displays a summary that looks something like the one in Figure 6-7.

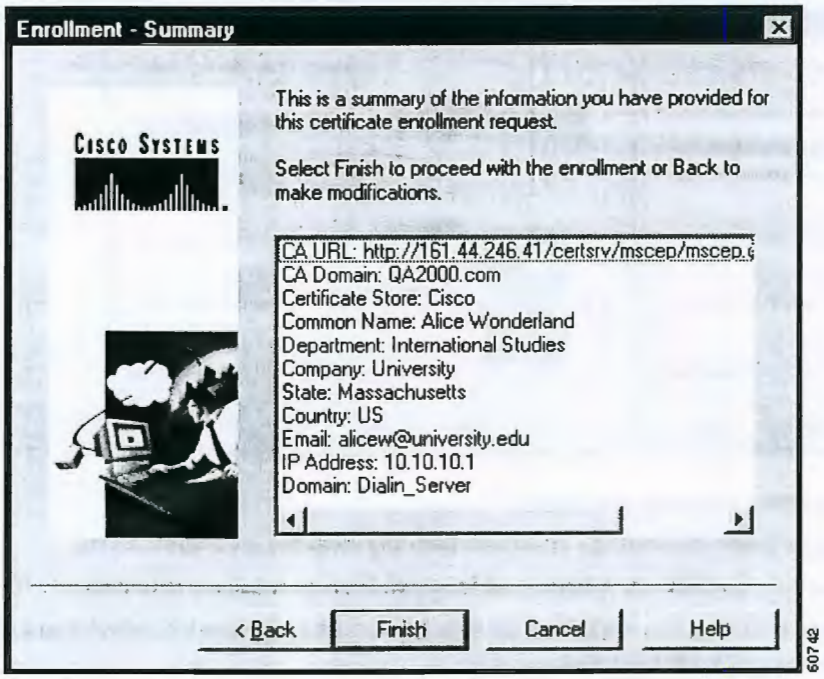
3701
Doc:

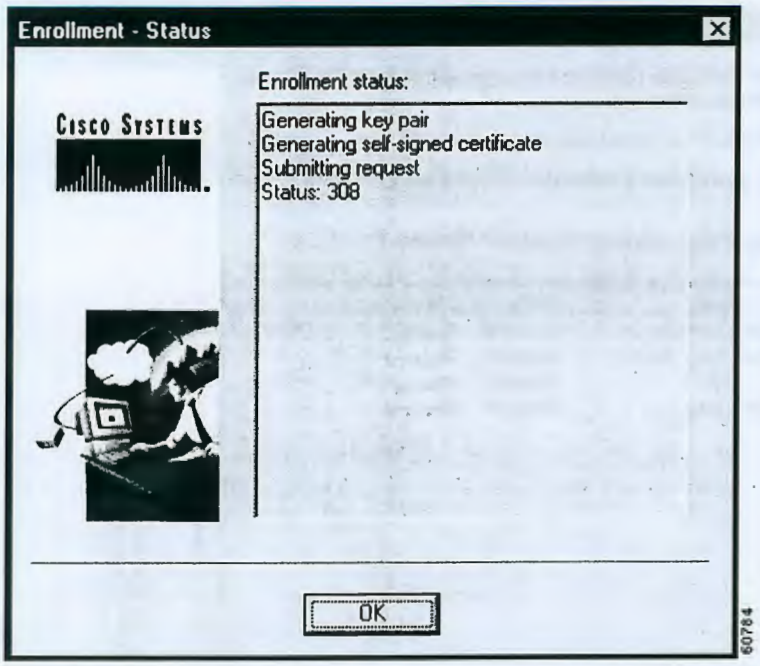
Figure 6-7 Enrollment Summary



Step 5 To complete the enrollment, click **Finish**.

The Certificate Manager displays a status window (shown in Figure 6-8) that lets you monitor the progress of the certificate retrieval. If the enrollment failed, the status window indicates the cause so you can fix the problem and try again.

Figure 6-8 Certificate Status Messages



Step 6 What happens next depends on your CA. (See Figure 6-8):

- Some CAs may provide immediate response. If so, the Enrollment - Status window reflects this fact and displays an OK button.
  - Click **OK** and you see a message that your enrollment succeeded. You can view and manage the certificate under the Personal Certificates tab.
- If the enrollment status is Request pending, your CA does not immediately approve your request and the Enrollment - Status window shows the Suspend button.
  - Click **Suspend**.
  - Your request appears under the Enrollment Requests tab, while you are waiting for the CA to issue the certificate.
  - When the CA issues your certificate, choose the certificate and then choose **Resume** from the Options pull-down menu to complete the enrollment. (See Figure 6-9.)

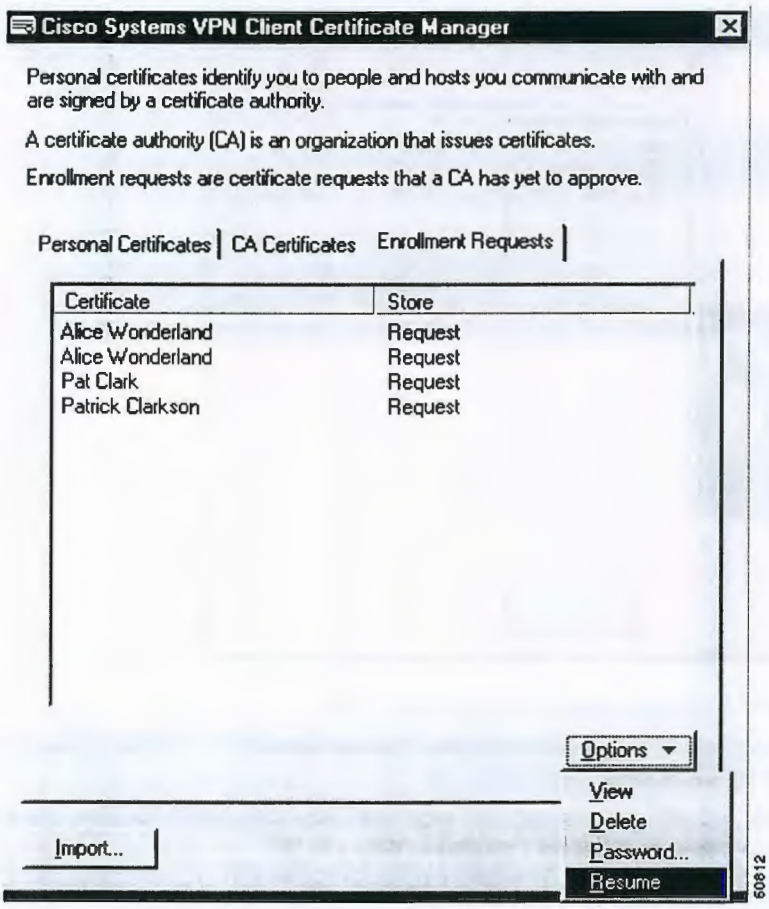
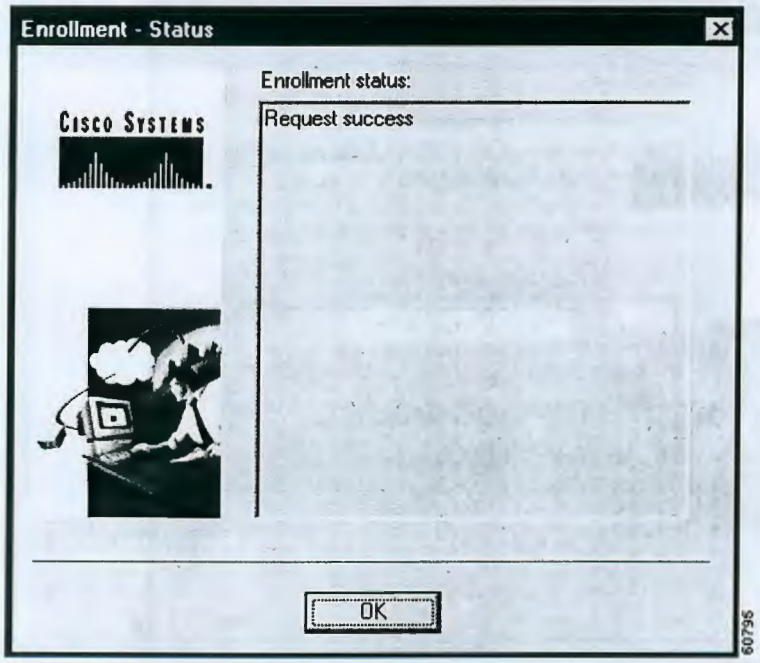
Doc:

Figure 6-9 Resuming Enrollment Request



- After you have obtained the certificate, the status screen updates to show the result. (See Figure 6-10.) After viewing the screen, click **OK**.

Figure 6-10 Receiving Status Update



Enrolling Through a File Request

Alternatively, you can enroll by creating a file using the same form as network enrollment. (See Figure 6-3.) Once you have created a request file, you can either e-mail it to the CA and receive a certificate back or you can access the CA's website and cut and paste the enrollment request in the area that the CA provides.

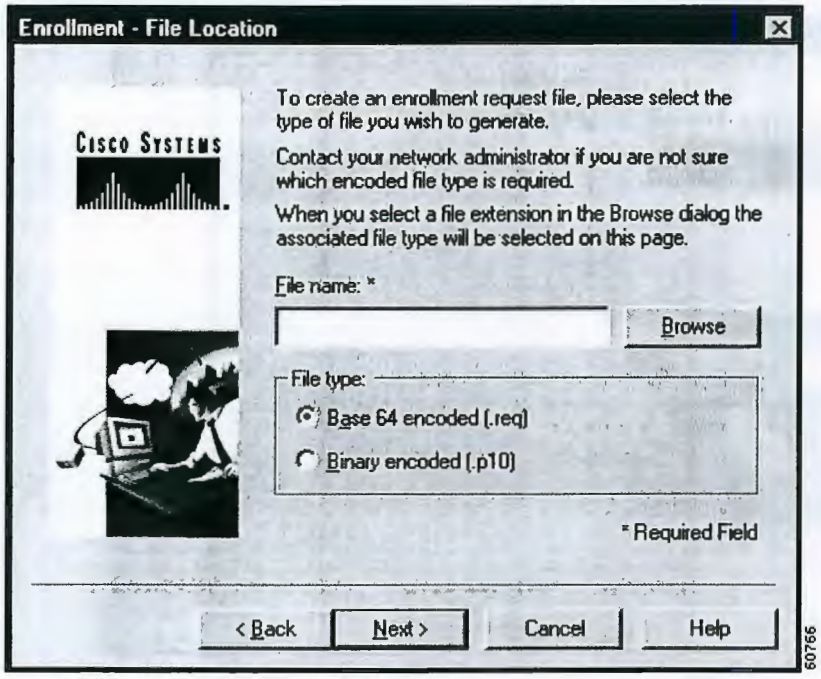
To enroll through a file request, use the following procedure:

Step 1 At the Enrollment - Network or File dialog box. (See Figure 6-5), click **File** and click **Next**.

The Certificate Manager prompts you to choose a file type for your file request and to specify a file name. (See Figure 6-11.)

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 0999
Doc: 3701

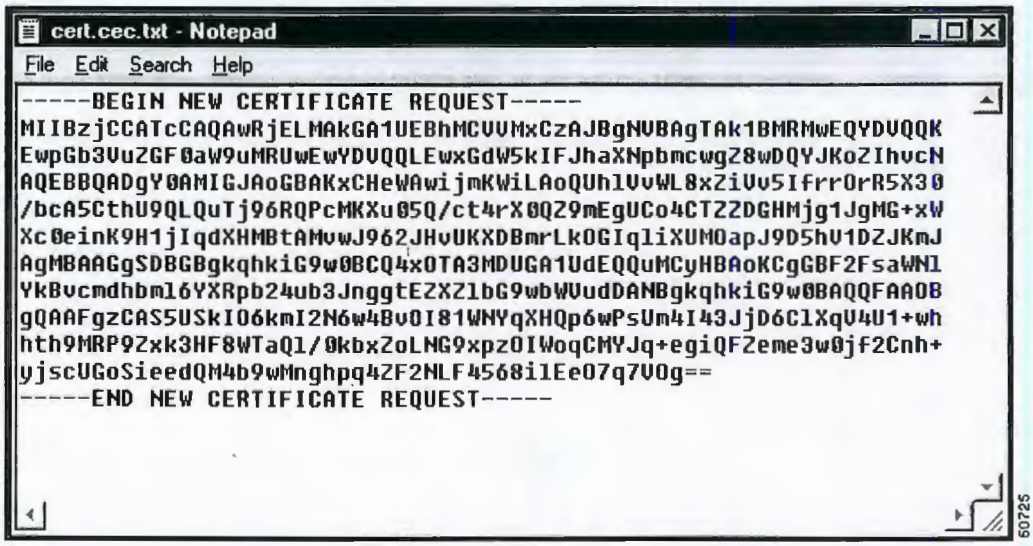
Figure 6-11 Choosing file type and location



Step 2 Click one of the following file types:

- **Binary encoded**—A base-2 PKCS10 file (Public Key Cryptography Standard; for example, an X.509 DER file). You cannot display a binary-encoded file.
- **Base 64 encoded**—An ASCII-encoded PKCS10 file that you can display in text format (for example, the request shown in Figure 6-12). Choose this type when you want to cut and paste the text into the CA website.

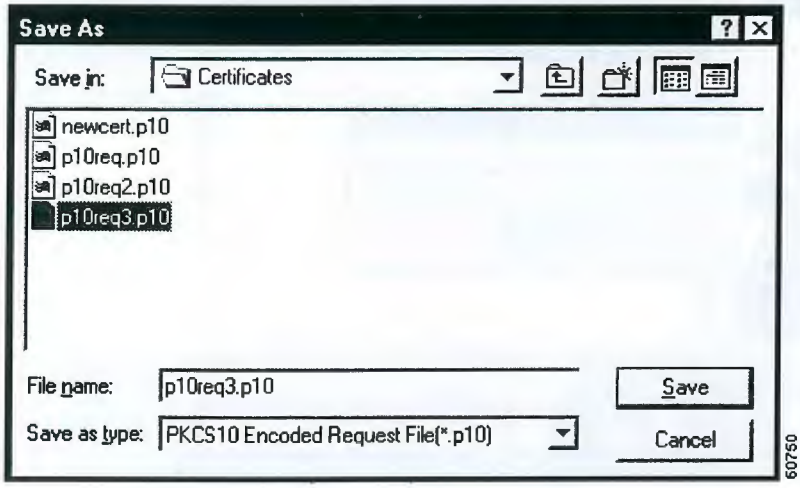
Figure 6-12 A PKCS10 Certificate Request



Step 3 Enter the full pathname for the file request.

When you browse for an appropriate directory for placing the file request, the Certificate Manager shows only the files of the chosen file type. (See Figure 6-13.) You can save your file enrollment requests in the Certificates directory, which is a subdirectory of the directory where the VPN Client is installed.

Figure 6-13 Specifying a Filename



In this example, the complete pathname is C:\Program Files\Cisco Systems\VPN Client\Certificates\p10req3.p10.

Step 4 Complete the form (see the "Enrollment Form" section) and click **Next**.

The Certificate Manager displays the summary screen and a message to let you know that your request succeeded. (See Figure 6-14.)

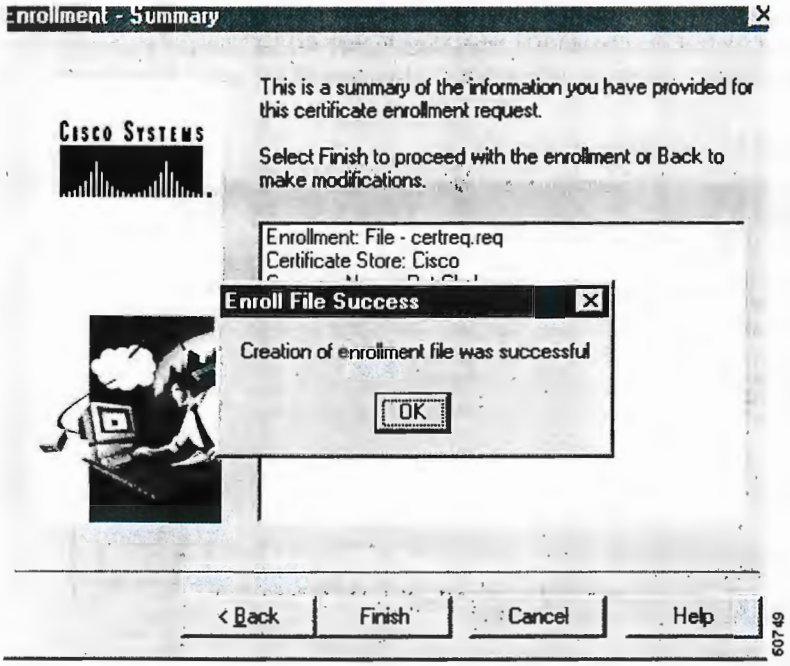
RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1000
Doc: 3701

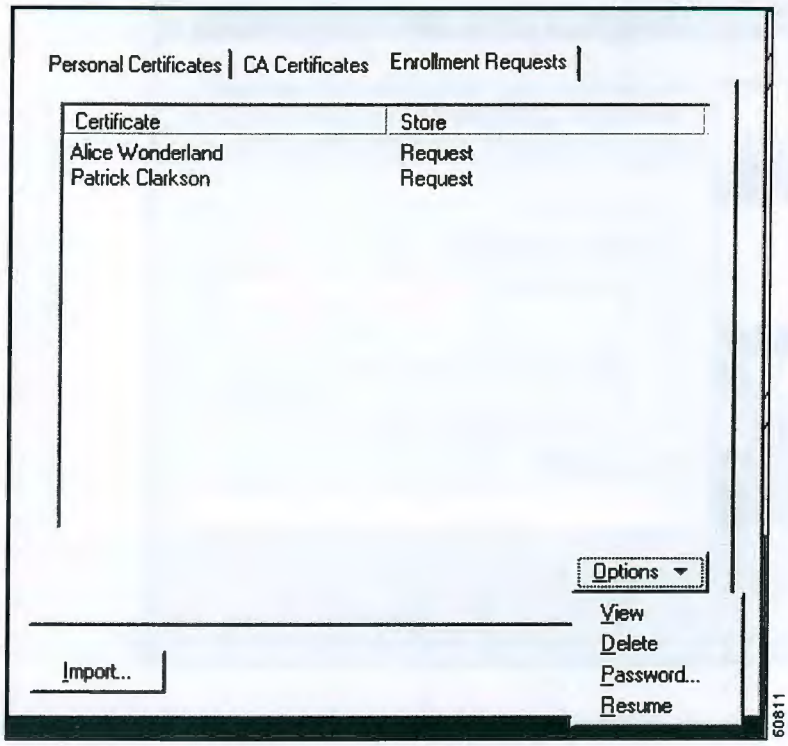
Figure 6-14 Enroll File Success Message



Step 5 Click **OK** on the message screen then click **Finish** on the summary screen.

You can view the file request under the Enrollment Requests tab. (See Figure 6-15.)

Figure 6-15 File Enrollment Requests



Importing a Certificate File

You can import a certificate into the Cisco store from the Microsoft store or from a file. To import a certificate, use the following procedure:

Step 1 On the Certificate Manager main window under the Personal Certificates tab, click **Import**.

The Certificate Manager displays the Import Certificate - Source dialog box. (See Figure 6-16.)

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1001
Doc: 3701

Figure 6-16 Importing a Certificate

Step 2 To import a certificate, do one of the following, depending on where your certificate resides:

- Importing from the Microsoft store—Click **Microsoft certificate** and choose the certificate from the drop-down menu. The certificate must already be in your Microsoft store.
- Importing from a file—Click **File** and enter the pathname of the file into the field.

Step 3 If a password is used to protect this certificate, type the password into the Import Password: field.

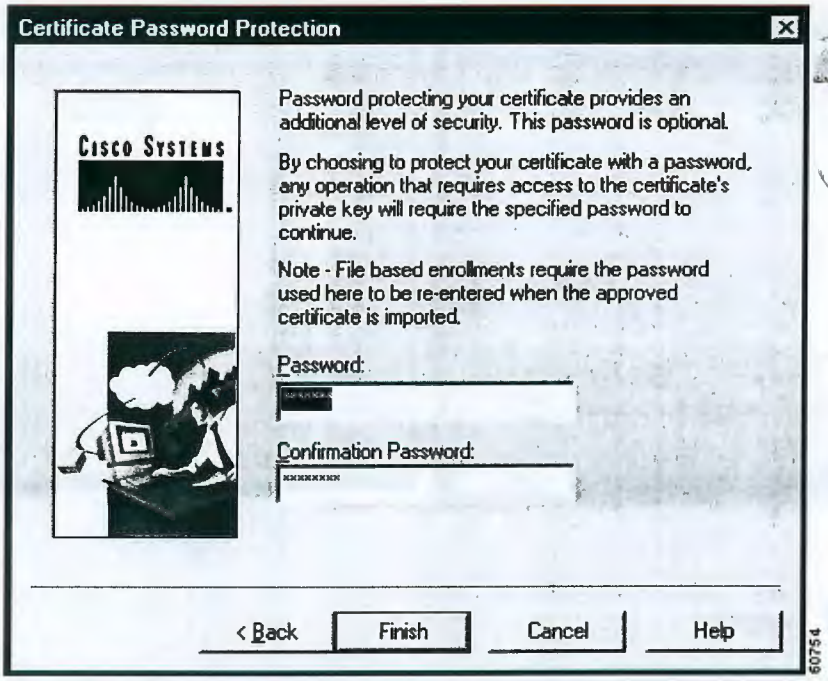
This is the password assigned to protect the certificate's private key.

- If you are importing from the Microsoft store, this password is the one you (or the network administrator) entered during enrollment.
- If you are importing a certificate from a file, this is the password specified when the certificate was exported.

Step 4 Click **Next**.

The Certificate Manager prompts for a password to be stored with the certificate. (See Figure 6-17.)

Figure 6-17 Destination Password for Importing Certificate



Step 5 Type a password into the Password field, and click **Finish**.

This password must exactly match the password given during enrollment (online) or given when exported (if a file), including upper and lower case letters. For example, *sKate8* is not exactly the same as *Skate8*. In online enrollment, this password is kept with the certificate; in file enrollment, this password is not retained.

Managing Personal and CA/RA Certificates

Using the Certificate Manager, you can view a certificate, verify that the certificate is still valid (within the dates assigned to it and has not been revoked), delete a certificate, and export the certificate to a file that you can e-mail. For personal certificates only, you can also change the certificate password. To perform any of these actions, use the Options menu on the main window. (See Figure 6-18.)

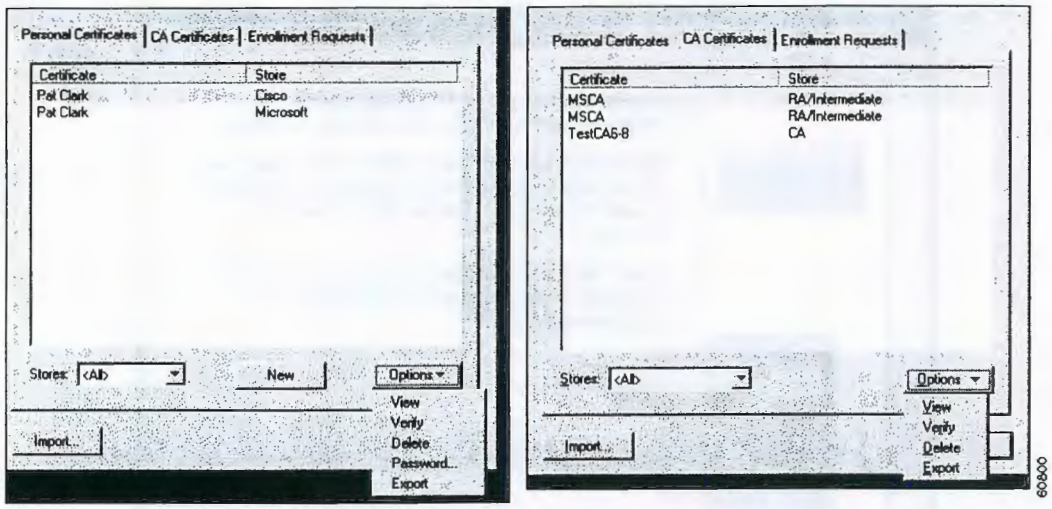
Figure 6-18 Certificate Manager Options Menu



Viewing a Certificate

To display a certificate, choose it in the certificate store, open the Options pull-down menu and choose **View**. Or, you can double-click on the certificate to display it.

Figure 6-19 shows a sample certificate from a Microsoft certificate service provider. This is only an example. Not all certificates are guaranteed to look like this one.

Figure 6-19 Displaying a Certificate

A typical certificate shown in Figure 6-19 contains the following information.

- Common Name—The name of the owner, usually the first name and last name. This field identifies the owner within the Public Key Infrastructure (PKI organization).
- Department—The name of the owner's department, which is same as the Organizational Unit (OU). Note that when connecting to a VPN 3000 Concentrator, the OU should generally match the Group Name configured for the owner in the VPN 3000 Concentrator.
- Company—The organization where the owner is using the certificate.
- State—The state where the owner is using the certificate.
- Country—The two-character country code where the owner's system is located.
- Email—The email address of the owner of the certificate.
- Key Size—The size of the signing key pair in bits; for example, 1024.
- Subject—The fully qualified distinguished name (DN) of certificate's owner. This specific example includes the following parts. Other items may be included, depending on the certificate type. However, these fields are fairly standard.
  - cn is the common name.
  - ou is the organizational unit (department)
  - o is the organization
  - l is the locality (city or town).

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1003
Doc: 3701

  - st is the state or province of the owner.
  - c is the country.
  - e is the email address of the owner.
- Issuer—The fully qualified distinguished name (DN) of the source that provided the certificate. The fields in this example are the same as for Subject.
- Serial Number—A unique identifier used for tracking the validity of the certificate on Certificate Revocation Lists (CRLs).
- Not Before—The beginning date that the certificate is valid.
- Not After—The end date beyond which the certificate is no longer valid.

The next three fields may be used during a connection attempt as part of validation, for example, to make sure that the Subject Alternative IP Address matches the IP Address of the VPN Concentrator.

- Alt Name DNS—The name of the Domain Name Server for the Subject Alternative Name.
- Alt Name Email—The email address of the Subject Alternative Name.
- Alt Name IP Addr—The IP address of the Subject Alternative Name.

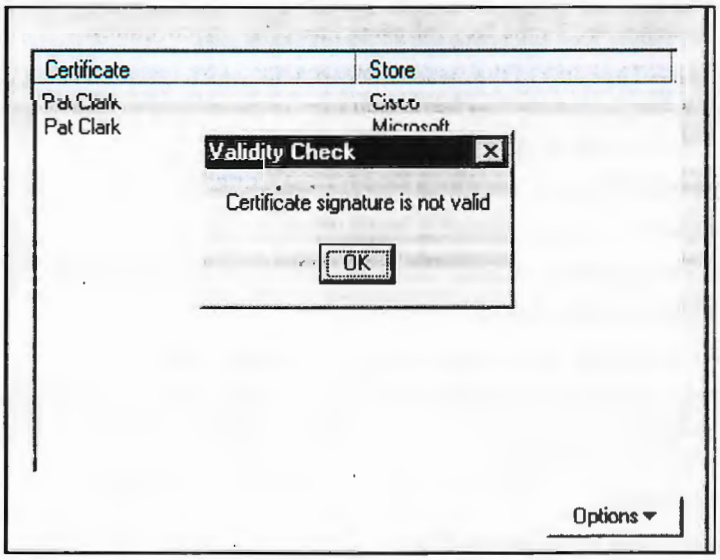
After you have finished viewing the certificate, click **OK** to close it.

Verifying a Certificate

The Certificate Manager provides a quick way for you to check the validity of a certificate; for example, to see if it is within the valid beginning and ending date range. To see if the certificate is valid, choose it in the certificate store, display the Options pull-down menu, and choose **Verify**.

The Certificate Manager displays a message such as the one in Figure 6-20 indicating whether the certificate is still valid.

Figure 6-20 Verifying a Certificate's Validity



ECT 14.436 ECT - AC

The following table shows the messages you might see when you check the validity of your certificate:

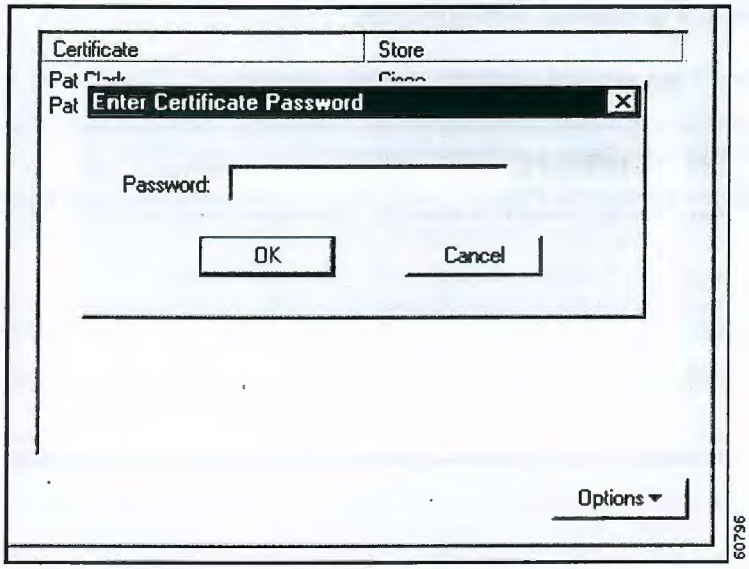
Message	Description
`Certificate is not valid yet`	The current date is prior to the certificate's valid start date. You must wait until the certificate becomes valid.
`Certificate has expired`	The current date is after the certificate's valid end date. You need to enroll for a new certificate.
`Certificate signature is not valid`	You do not have the CA certificate, or the CA certificate that you have may have expired. You might need to download or import the CA certificate.
`Certificate is valid`	You have a working certificate enrolled.

Deleting a Certificate

To delete a certificate, follow this procedure:

Step 1 Choose the certificate in the certificate store, display the Options pull-down menu, and choose **Delete**. If the certificate has a password, the Certificate Manager prompts you to enter it. (See Figure 6-21.)

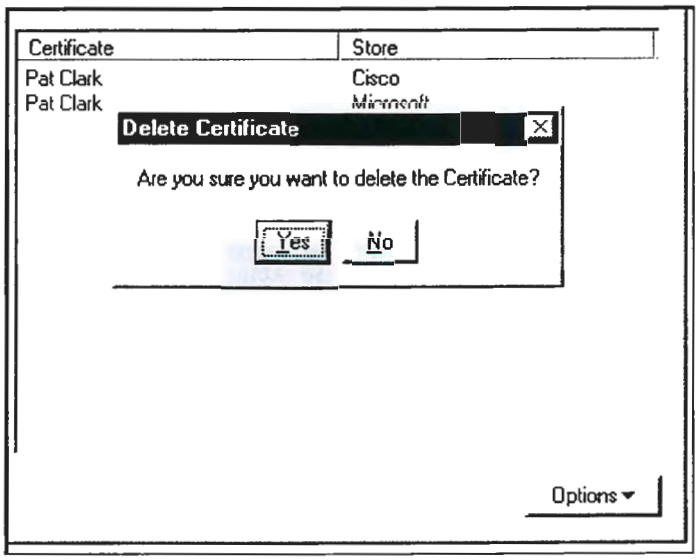
Figure 6-21 Entering Password for Deleting a Certificate



Step 2 In the Password field, type the password given to the certificate during enrollment and click **OK**. Next, the Certificate Manager asks you to confirm. (See Figure 6-22.)

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1004
Doc: 3701

Figure 6-22 Confirming Deletion



Step 3 To complete the deletion, click **Yes**. If you decide not to delete this certificate, click **No**.

Changing the Password on a Personal Certificate

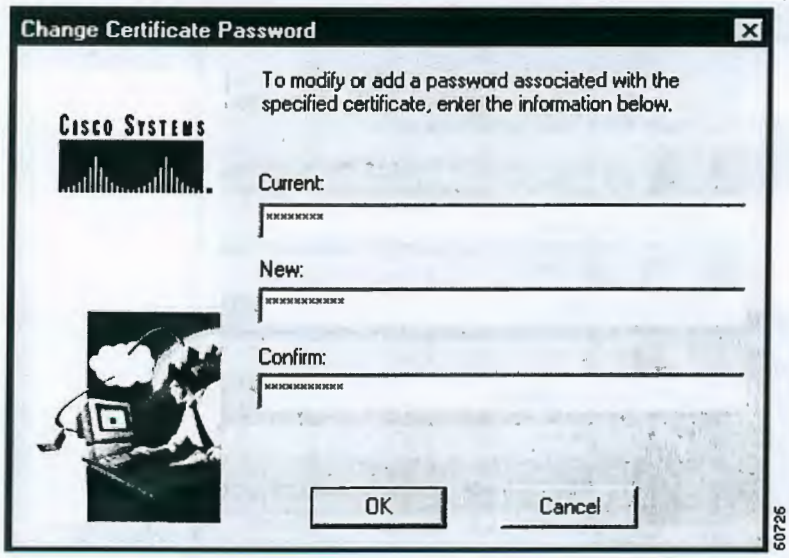
To change the password on a personal certificate, use this procedure:

Step 1 Display the Options pull-down menu and choose **Password...**.

The Certificate Manager displays the Change Certificate Password dialog box. (See Figure 6-23.)

ECT 4.414 J CPL - AC

Figure 6-23 Changing a Certificate Password



Step 2 In the Current field, type the password you are currently using to protect your private key.

Step 3 In the New field, type the new password.

Step 4 In the Confirm field, type the same password again.

Step 5 Click **OK**.

Exporting a Certificate

You may want to export a certificate, primarily for backing up your certificate and private key or moving them to another system. When you export a certificate, you are making a copy of it.

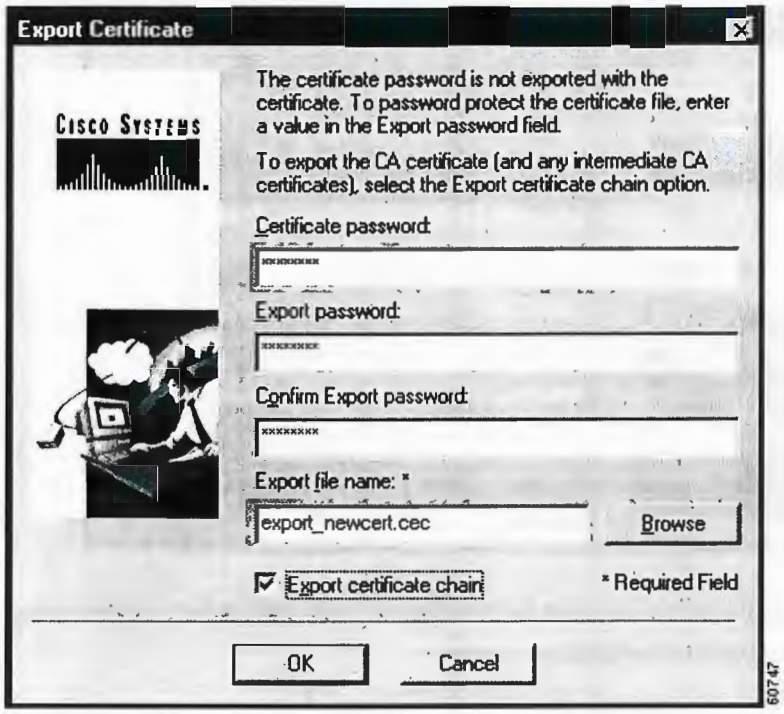
To export a certificate, follow these steps:

Step 1 Display the Options pull-down menu and choose **Export**.

The Certificate Manager displays the Export Certificate dialog box. (See Figure 6-24.)

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1005
Doc: 3701

Figure 6-24 Exporting a Certificate



Step 2 In the Certificate password field, enter the password initiated during enrollment.

The Certificate password protects the certificate in the certificate store (so an unauthorized individual can not use it). This is the password you *optionally* entered when you enrolled for the certificate.

Step 3 In the Export password field, enter an optional password to protect the export file. Then enter it again in the Confirm password field.

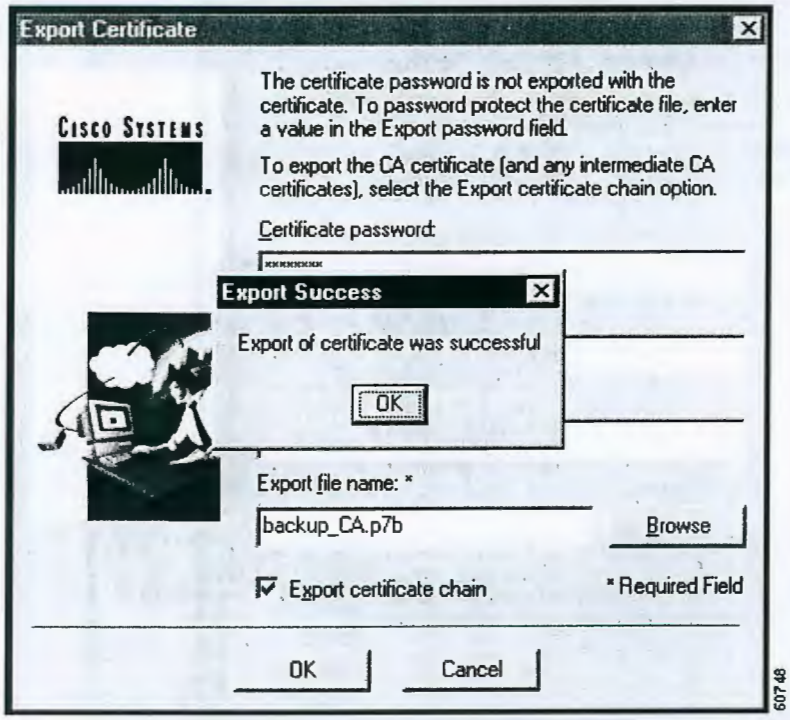
Step 4 In the Export filename field, enter the filename for the exported certificate. Only the filename is required. Use the Browse feature to locate a target directory for the exported certificate.

Step 5 To export the CA and/or RA certificate with your personal certificate, check the **Export certificate chain** option.

Step 6 After completing all the information, click **OK**.

The Certificate Manager displays a message indicating whether your certificate export was successful. (See Figure 6-25.)

Figure 6-25 Export Message



Step 7 To continue, click **OK**.

Managing Enrollment Requests

While a request is pending approval by the CA administration, the Certificate Manager places the enrollment request under the Enrollment Requests tab. You can view, delete, or change the password on any request in the list; or you can resume a network enrollment request. To perform any of these actions, choose the Enrollment Requests tab and click on the Options pull-down menu. (See Figure 6-26.)

APPENDIX A

Copyrights and Licenses

Client Software License Agreement of Cisco Systems

THE SOFTWARE TO WHICH YOU ARE REQUESTING ACCESS IS THE PROPERTY OF CISCO SYSTEMS. THE USE OF THIS SOFTWARE IS GOVERNED BY THE TERMS AND CONDITIONS OF THE AGREEMENT SET FORTH BELOW. BY CLICKING "YES" ON THIS SCREEN, YOU INDICATE THAT YOU AGREE TO BE BOUND BY THE TERMS AND CONDITIONS OF THAT AGREEMENT. THEREFORE, PLEASE READ THE TERMS AND CONDITIONS CAREFULLY BEFORE CLICKING ON "YES". IF YOU DO NOT AGREE TO THE TERMS AND CONDITIONS OF THE AGREEMENT, CLICK "NO" ON THIS SCREEN, IN WHICH CASE YOU WILL BE DENIED ACCESS TO THE SOFTWARE.

Ownership of the Software

1. The software contained in the Cisco Systems VPN Client ("the Software"), to which you are requesting access, is owned or licensed by Cisco Systems and is protected by United States copyright laws, laws of other nations, and/or international treaties.

Grant of License

2. Cisco Systems hereby grants to you the right to install and use the Software on an unlimited number of computers, provided that each of those computers must use the Software only to connect to Cisco Systems products, and subject to export restrictions in paragraph 4 hereof. You may make one copy of the Software for each such computer for the purpose of installing the Software on that computer. The Software is licensed for use only with Cisco Systems products, and for no other use.

Restrictions on Use and Transfer

3. You may also make one copy of the Software solely for backup or archival purposes. To this end, you may transfer the Software to a single set of disks provided you keep the disks solely for backup or archival purposes. You may not use the backup or archival copy of the Software except in conjunction with Cisco Systems products.

RQS Nº 03/2005 - CN

Doc:

4. You may copy and distribute the Software to your third party business partners and customers solely and exclusively for the purposes of accessing your Cisco VPN concentrators and thereby gaining remote access to your secure network. Each such distribution of the Software to a third party must be accompanied by a copy of this Client Software License Agreement. You may not copy or transfer the Software for any purpose, other than as specified in this Agreement, without the express written consent of Cisco. Without intending to limit the foregoing, you shall not post or otherwise make publicly available the Software to any external web site, file server, or other location to which there is unrestricted access.

5. Cisco Systems will not provide end-user support (including Technical Assistance or TAC support) to any third party that receives the Software in accordance with Section 4 hereof. You shall be responsible for providing all support to each such third party. For permitted transfers, you may not export the Software to any country for which the United States requires any export license or other governmental approval at the time of export without first obtaining the requisite license and/or approval. Furthermore, you may not export the Software in violation of any export control laws of the United States or any other country. (For reference purposes only, see the Cisco Encryption Tool Quick Reference Guide currently located at http://www.cisco.com/wwl/export/crypto/tool/stqrg.html.)

6. You may not modify, translate, decompile, disassemble, use for any competitive analysis, reverse engineer, distribute, or create derivative works from, the Software or any accompanying documentation or any copy thereof, in whole or in part.

7. The subject license will terminate immediately if you do not comply with any and all of the terms and conditions set forth herein. Upon termination for any reason, you (the licensee) must immediately destroy the Software, any accompanying documentation, and all copies thereof in your possession. You must also use commercially reasonable efforts to notify the third parties to whom you have distributed the Software that their rights of access and use of the Software have also ceased. Cisco Systems is not liable to you for damages in any form solely by reason of termination of this license.

8. You may not remove or alter any copyright, trade secret, patent, trademark, trade name, logo, product designation or other proprietary and/or other legal notices contained in or on the Software and any accompanying documentation. These legal notices must be retained on any copies of the Software and accompanying documentation made pursuant to paragraphs 2 through 4 hereof.

9. You shall acquire no rights of any kind to any copyright, trade secret, patent, trademark, trade name, logo, or product designation contained in, or relating to, the Software or accompanying documentation and shall not make use thereof except as expressly authorized herein or otherwise authorized in writing by Cisco Systems.

Limitation Of Liabilities

10. INSTALLATION AND USE OF THE SOFTWARE IS ALSO GOVERNED BY A SEPARATE LICENSE AGREEMENT BETWEEN CISCO SYSTEMS AND THE PURCHASER OF THE CISCO SYSTEMS VPN CLIENT PRODUCT. THAT SEPARATE LICENSE AGREEMENT CONTAINS A DESCRIPTION OF ALL WARRANTIES PROVIDED BY CISCO SYSTEMS FOR THE SOFTWARE. CISCO SYSTEMS PROVIDES NO WARRANTIES FOR THE SOFTWARE OTHER THAN THOSE SET FORTH IN THAT AGREEMENT, AND ASSUMES NO LIABILITIES WITH RESPECT TO USE OF THE SOFTWARE BY YOU OR ANY THIRD PARTY.

Q & A

Cisco 1751 Modular Access Router

Product Features and Positioning

Q. What is the ideal environment for the Cisco 1751 router?

A. The Cisco 1751 modular access router is an ideal access solution for small- and medium-sized businesses and small branch offices. The Cisco 1751 is a modular access platform that offers customers secure Internet and intranet access, as well as the capability to implement a variety of applications in the same platform, including voice over IP, virtual-private- network (VPN) access, and business-class Digital Subscriber Line (DSL) access when needed.

In addition to the various functions available on the 1720, the Cisco 1751 provides multiservice integrated voice/data support. By implementing the Cisco 1751 into existing data networks, customers can save on long-distance interoffice phone/fax toll charges while enabling next-generation voice-enabled applications such as integrated messaging and Web-based call centers.

The Cisco 1751 router is particularly suitable for environments that require:

- Modularity, flexibility, and investment protection to upgrade to new services and technologies such as multiservice, VPN, and broadband access now or later
- VPN deployment either now or in the future, with requirements for encryption speeds up to T1/E1 (the Cisco 1751 can encrypt at 512 Kbps using software-based encryption, and at T1/E1 using the VPN hardware-based encryption card inserted on the motherboard)
- Multiservice data/voice/fax integration
- Digital voice support (ISDN NT/TE VIC support, VIC-BRI-NT/TE)
- 10/100 Ethernet LAN
- Dual Ethernet capability (with 10BaseT Ethernet WIC)
- VLAN support (802.1Q))
- The flexibility of one voice and two WAN/voice interface card slots
- Higher number of serial interfaces (up to five, including AUX port)
- Dual ISDN Basic Rate Interface (BRI) connections
- Compression at speeds greater than 128 Kbps
- Support for ADSL and G.SHDSL interface card

ECT 1 4.389 1 CPL - AC

Q. What are the key differences between the Cisco 1751 and the Cisco 1751-V?

A. The Cisco 1751 and 1751-V support the same data and voice functionality. The main difference between these two models is that the Cisco 1751-V is voice ready, i.e. it comes with higher default memory, 1 DSP module and the IOS IP/Voice PLUS image. Table 1 compares the Cisco 1751 and Cisco 1751-V.

Table 1: Feature Comparison of the Cisco 1751 and the Cisco 1751-V

Cisco 1751	Cisco 1751-V
Base version	**Multiservice-ready version**
Includes everything for data networking	Includes all the features needed for *immediate* integration of voice and data
16-MB Flash memory (Non-upgradeable)	32-MB Flash memory (Non-Upgradeable)
32-MB DRAM (on board)	64-MB DRAM (32 MB on board, 32 MB in DRAM DIMM[1] socket)
Cisco IOS IP Software Feature Set	Cisco IOS IP/Voice Plus feature set

Flash memory and DRAM upgrades available separately	Flash memory and DRAM upgrades available separately
WICs available separately	WICs available separately

[1]Double in-line memory module
[2]Digital signal processor

Table 2: Feature Comparison of the Cisco 1751 and Cisco 1750

Feature	Cisco 1751	Cisco 1750
Digital voice support (ISDN BRI VIC and T1/E1 VWICs)	Yes	No
VLAN (IEEE 802.1Q)	Yes	No
Routing performance (64-byte packets)—fast-switching	12,000 pps	8,500 pps
Base models: flash/ DRAM (default)	Cisco 1751: 16/32 Cisco 1751-V: 32/64	Cisco 1750: 4/16 Cisco 1750-2V: 8/32 Cisco 1750-4V: 8/32
No. of PVDM slots	2	1

Q. Is the Cisco 1751 a replacement for the Cisco 1750?

A. The Cisco 1751 is a superior solution when compared to the Cisco 1750 in terms of performance, value and functionality (see Table 2).

Q. Will the Cisco 1750 be discontinued (i.e. EOS)?

A. Yes. Cisco 1750 Router will be end of sale on May 31st 2002. Please refer to the following product bulletin for details: http://www.cisco.com/warp/public/cc/pd/rt/1700/prodlit/1660_pp.htm

ROS Nº 03/2005 - CN
CPMI - CORREIOS

Doc:

We urge the customers to migrate to the Cisco 1751 due to the clear advantages that it offers at the same price oint. The Cisco 1751 Router provides all of the features of the 1750 plus support for; digital voice, VLAN, and reater performance. In addition, the Cisco 1751 Router comes with more memory than the 1750 (both flash nd DRAM), which reduces the overall solution cost when deploying voice and/or security features.

). What are the differences between the Cisco 1600-R series and the Cisco 1700 series router?

. Compared with the Cisco 1600-R series, the Cisco 1700 series offers increased performance, added lexibility with fully modular chasses, and investment protection with support for new services such as DSL, oice over IP (VoIP), and VPNs at similar price points to the Cisco 1600-R. Wherever possible, Cisco ncourages customers to move to the new Cisco 1700 platform to be best positioned for future growth and ervices. Some services (DSL, VoIP) are and will not be supported on the Cisco 1600-R series because of erformance and architecture limitations. Table 3 clarifies the features of the Cisco 1600-R and 1700 series amilies. The Cisco 1600-R series will continue to be available, but Cisco is actively marketing the 1700 series s the next-generation access platform ideal for small- and medium-sized businesses and small branch offices. Most Cisco 1600-R models have a list price of $1495 (US), and an equivalent configuration of the Cisco 1720 s $1595 (US list). For $100, customers get the added benefits of increased performance and the ability to enefit from a broad array of services including VPNs, VoIP, and DSL when needed.

- Secure Internet/intranet access with firewall- and software-based DES and 3DES encryption
- VPN (with optional hardware-based encryption card)
- Multiservice voice with VoIP and Voice over Frame Relay (VoFR)
- ADSL and G.SHDSL
- High-speed LAN (10/100 Ethernet)
- More modularity

Table 3: Key Enhanced Capabilities of Cisco 1751 Series Compared to Cisco 1600-R Series

Feature	Cisco 1600-R Series Modular Access Routers	Cisco 1751 Series Modular Access Routers
WAN slots	1601-R-1604-R: One fixed WAN port plus one modular WAN interface card (WIC) slot 1605-R: One modular WAN interface card (WIC) slot and two 10 Mbps Ethernet ports	Two WAN interface card slots
WAN Interface Cards Supported	Single serial (sync, async): WIC-1T Single ISDN BRI S/T: WIC-1B-S/T Single ISDN BRI U: WIC-1B-U Single serial with integrated 56/64 K DSU: WIC-1DSU-56K4	All Cisco 1600-R series WAN interface cards plus: Dual serial (sync): WIC-2T Dual serial (async/sync): WIC-2A/S Ethernet WIC: WIC-1ENET

Maximum DRAM Memory	24 MB	Cisco1751: 96 MB Cisco1751-V: 128MB

Q. Will the Cisco 1600-R support DSL or VPN or multiservice voice or 10/100 Ethernet or 3DES encryption in the future?

A. No. The Cisco 1600-R series was not designed to support the above technologies.

Q. Should we position Cisco 1700 series to the customer instead of 1600-R?

A. Yes. Always. Please educate the value proposition of the Cisco 1700 series and the applications and services that it can support either now or later. We strongly suggest the sales team to help educate the customer to invest in Cisco 1700 series and avoid the cost of upgrading later.

Q. What is the proper positioning of the Cisco 1700 series, and 2600 series routers?

A. The Cisco 1700 series routers are positioned for small- and medium-sized businesses and small branch offices. Because of its modularity, increased performance, and investment protection capabilities, the Cisco

RQS Nº 05/2005 - CN
CPMI - CORREIOS

Fls.
Doc: 3701

1700 is a strategic platform for small- and medium-sized businesses and small branch offices. The Cisco 2600 series routers are positioned as enterprise-class solutions for enterprise large branch offices, offering rack-mount or wiring-closet environments, internal power supply, and optional redundant power supply. The Cisco 2600 series offers a flexible, modular solution with higher performance; more WAN density such as dual ISDN Primary Rate Interface (PRI), 10 ISDN BRIs, four T1/E1s, 36 async serial interfaces; and support for dial and digital voice with densities ranging from two to 60 calls.

These four router families are positioned as two winning pairs:

- Cisco 1700 series for small and medium-sized businesses and enterprise small branch offices
- Cisco 2600 series for enterprise branch offices

). When would a customer want a Cisco 2600 series router rather than a Cisco 1751 router?

. The Cisco 2600 series is better suited for larger enterprise branch offices that require multiple WAN ports nd, typically, a 19-inch rack-mount enclosure. It provides two WAN interface card slots, plus an additional etwork module slot, which provides higher port densities as well as support for voice services. The key ifferences are highlighted in Table 4.

'ab): Key Differences between Cisco 1751 Router and Cisco 2600 Series Routers

Feature	Cisco 1751	Cisco 2600 Series
Performance (fast-switch 64-byte packets)	12,000 pps	12,000 to 37,000 pps
Performance (IPSec DES-encrypted 256-byte Packets)	512 Kbps	512 Kbps
"Class of Product"	Small/medium business and small enterprise branch office	"Enterprise class"
	Desktop	19-in. rack-mount, ideal for wiring closets
	External power supply	Internal power supply
	No redundant power supply option	Redundant power supply option
	Optional Plus feature sets for enterprise-class software features (IP multicast, RSVP, BGP, and so on)	Enterprise-class software features standard in Base IP, for example, IP multicast, RSVP, BGP
	No enterprise or APPN feature sets	Enterprise and APPN feature sets

	Not NEBS compliant	NEBS compliant
	No Token Ring LAN	Token Ring LAN option
Support for Voice Interface Cards	Yes: supports dual port E&M, FXO, FXS, DID and ISDN BRI NT/TE, T1/E1 Multiflex VWICs	Yes: supports dual-port E&M, FXO, FXS, ISDN BRI-N/T-TE and BRI-ST/TE, digital T1/E-1 packet voice trunk network module, T1/E-1 multiflex WAN/voice interface card (multiflex WAN/voice interface card)
Maximum Voice Interfaces Supported	Analog: 4 ports with 1 WAN slot (up to dual T1/E1 WIC) or 6 ports without WAN access Digital: 24 calls with one channelized T1 or E1 or 12 ports without WAN access	2 to 60 voice calls
Maximum WAN Densities	4 serial, 2 BRI, 4 A/S	10 BRI, 12 A/S, 36 A, 2 PRI, 1 ATM
Maximum LAN Density	2 (one on-board 10/100 and an optional Ethernet WIC)	6 Ethernet
Slots	2 WAN/voice interface cards + 1 voice interface card	2 WAN interface cards + 1 network module
	1 internal expansion slot for VPN hardware encryption card	1 AIM slot for encryption, compression, voice processing, ATM SAR
Voice	Voice-over-IP (VoIP), VoFR	Voice/fax-over-IP capable, VoFR capable
Integrated Dial Capability	Not supported	16 modem or 32 async serial

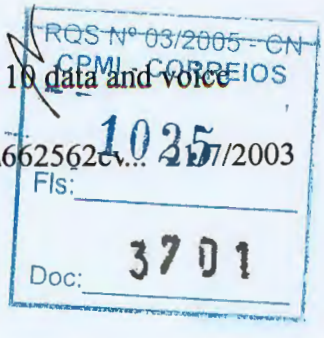
Q. Which Cisco IOS® release is available with the Cisco 1751 at first customer ship (FCS)?

A. At FCS, the Cisco 1751 router shipped with Cisco IOS Release 12.1(5)YB, which is a special release. The Cisco 1751 router will be available on the 12.2T Release train in 12.2(4)T.

Software Feature Sets

Q. What software feature sets are available for the Cisco 1751 router?

A. Twenty-four feature sets are available (see Table 5). This includes 14 data images and 10 data and voice



nages.

able 5: Minimum Memory Requirements and Software Feature Sets for Cisco OS Releases 12.1(5)YB

Check on Cisco Release Notes for the recent software feature sets and minimum memory requirements. http://www.cisco.com/univercd/cc/td/doc/product/software/ios122/122relnt/index.htm

Starting with Cisco IOS Release 12.0, the base feature sets on the 1600/1700 series include some features formerly in the PLUS feature sets: Network Address Translation (NAT), Open Shortest Path First (OSPF), Remote Access Dial-In User Service (RADIUS), and Next Hop Resolution Protocol (NHRP). Plus feature sets contain all the features in their corresponding Base feature sets, plus additional value-added features such as Layer 2 Tunneling Protocol (L2TP), Layer 2 Forwarding (L2F), Border Gateway Protocol (BGP), IP multicast, Frame Relay, Switched Virtual Circuit (SVC), Resource Reservation Protocol (RSVP), PPPoE, NetWare Link Services Protocol (NLSP), AppleTalk Simple Multicast Routing Protocol (SMRP), and Network Timing Protocol (NTP).

Tables 6 through 8 show the features available in the Cisco IOS 1751 feature sets.

AN Functionality

). What types of LANs does the Cisco 1751 router support?

. The Cisco 1751 router supports one autosensing 10/100 Fast Ethernet connection, with one 10/100BaseTX ransceiver (RJ-45 connector). The 10/100BaseTX port can connect to an external 10/100BaseTX hub or switch r directly to a PC Ethernet port (using a crossover cable) using inexpensive, unshielded twisted-pair (UTP) iring.

). Is the 10BaseT Ethernet WIC supported on the 1751?

. Yes, the 10Base T Ethernet WIC is supported on the 1751 to provide dual Ethernet functionality.

). What LAN and routing protocols are supported by the Cisco 1751 router?

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1033
Fls:
Doc: 3701

A. The Cisco 1751 router supports IP, Internetwork Packet Exchange (IPX), AppleTalk routing, IBM Systems Network Architecture (SNA), and transparent bridging. Routing protocols supported include IP Routing Information Protocol (RIP), RIP V.2, Interior Gateway Routing Protocol (IGRP), Enhanced Interior Gateway Routing Protocol (EIGRP), IPX- RIP, OSPF, on-demand OSPF, NHRP, and AppleTalk Routing Table Maintenance Protocol (RTMP). Additionally, Plus feature sets including: BGP, NLSP and AppleTalk Update-Based Routing Protocol (AURP) are supported in Plus feature sets that support IPX and AppleTalk, respectively.

Q. Is it possible to manually set the Fast Ethernet (FE) speed on the Cisco 1751?

A. Yes, this feature was implemented in releases 12.1 and 12.1T. With prior releases, the FE port speed is autonegotiated.

Q. Is ISL or IEEE802.1Q supported on the Cisco 1751?

A. IEEE802.1Q is supported on the Cisco 1751. ISL is not supported. The Cisco 1720 and 1750 do not support VLAN (IEEE 802.1Q or ISL).

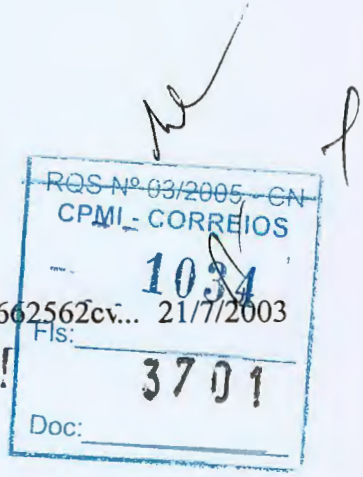
WAN Functionality

Q. What WAN interface cards are available?

A. Available WAN interface cards are shown in Table 9.

Table 9: Available WAN Interface Cards

WAN Interface Card	Interfaces
WIC-1T	1 serial, async and sync (T1/E1)
WIC-2T	2 serial, async and sync (T1/E1)
WIC-2A/S	2 low-speed (up to 128 kbps) serial, async, and sync
WIC-1B-S/T	1 ISDN BRI S/T
WIC-1B-U	1 ISDN BRI U with integrated NT1
WIC-1DSU-56K4	1 integrated 56/64 Kbps 4-wire DSU/CSU
WIC-1DSU-T1	1 integrated T1/fractional T1 DSU/CSU
WIC-1ENET	1 10BaseT Ethernet (only supported in Slot 0)
WIC-1ADSL	1 ADSL
WIC-1SHDSL	1 G.SHDSL



WIC-1AM	1 V.90 modem card
WIC-2AM	2 V.90 modem card

. Are there any WIC slot dependencies with respect to order or maximum number of a certain type?

. All WICs are supported in any slot and in any combination.

. Does the Cisco 1751 router support two ISDN BRI interfaces?

. Yes. The Cisco 1751 router supports two BRI interfaces (dial and ISDN leased line) with two ISDN BRI 'AN interface cards installed in the two WAN interface card slots. Multilink PPP (MP) can combine the four channels to achieve data rates up to 256 Kbps.

. Do the WIC-1T, WIC-2T, and WIC-2A/S WAN interface cards support asynchronous serial when installed the Cisco 1751 router?

. Y The Cisco 1751 router supports asynchronous serial (up to 115.2 Kbps) as well as synchronous serial or e ial WAN interface cards. The onboard aux port also supports asynchronous serial at speeds up to 115.2 bps.

. What WAN protocols does the Cisco 1751 router support?

. Point-to-Point Protocol (PPP), High-Level Data Link Control (HDLC), X.25 Link Access Procedure, alanced (LAPB), Switched Multimegabit Data Service (SMDS), Frame Relay, and IBM/SNA are supported ver permanent or switched digital lines. PPP and Serial Line Internet Protocol (SLIP) are supported over synchronous analog lines.

. Do the serial ports on the Cisco 1751 router support data-communications-equipment (DCE) functionality?

. Yes, the Cisco 1751 router supports DCE (that is, supplies clocking), allowing the Cisco 1751 router to terconnect without requiring a null modem. Also, X.25 packet assembler/disassembler (PAD) functionality is pported. IBM Synchronous Data Link Control (SDLC), bisync, and other serial protocols are supported.

. DSL supported on the Cisco 1751?

. No.

. Will the Cisco 1751 support three WICs?

. The Cisco 1751 can only support two WAN interfaces. The AUX port can be used as another WAN port. If our customer needs greater density, the Cisco 2600 would be the solution.

. Does the Cisco 1751 Router support Modem WIC card?

. Yes. The Cisco 1751 Router supports one and two-port V.90 modem WIC card. Product number is WIC-AM and WIC-2AM. For more details about the Modem WIC, please refer to the following data sheet:

'oice Functionality

. Does Cisco 1751 support Survivable Remote Site Telephony (SRST)?

. Yes. For the detailed information, please refer to the below documents

nnouncement: http://www.cisco.com/cpropart/salestools/cc/pd/rt/1700/prodlit/1601_po.htm

atasheet: http://www.cisco.com/warp/partner/synchronicd/cc/pd/unco/srstl/prodlit/srstd_ds.htm

. What voice interface cards (VICs) are supported on the Cisco 1751?

. The voice interface cards currently supported are given in Table 10.

able 10: Voice Interface Cards Currently Supported

Voice Interface Card	Interfaces
V 2DID	2-port direct inward dial (DID) voice/fax interface card
VIC-2E/M	2-port voice interface card E&M
VIC-2FXO	2-port voice interface card FXO
VIC-2FXS	2-port voice interface card FXS
VIC-2FXO-M1	2-port FXO voice/fax interface card with battery reversal detection and Caller ID support (for U.S. and Canada) [enhanced version of the VIC-2FXO]
VIC-2FXO-M2	2-port FXO voice/fax interface card with battery reversal detection and Caller ID support (for Europe) [enhanced version of the VIC-2FXO-EU]
VIC-2FXO-M3	2-port voice interface card FXO (for Australia)
VIC-2FXO-EU	2-port voice interface card FXO (for Europe)
VIC-2BRI-NT/TE	2-port network side/terminal side ISDN BRI interface
VWIC-1MFT-T1	1-port RJ-48 multiflex trunk - T1
VWIC-2MFT-T1	2-port RJ-48 multiflex trunk - T1
VWIC-2MFT-T1-DI	2-port RJ-48 multiflex trunk - T1 with drop and insert

CPL - AC

. How many DSPs are supported in the 1751?

. The 1751 has 2 DSP module slots on the motherboard, each of which supports the 5 DSP module. This ovides a DSP density of 10 DPS's.

. What are the PVDM/VIC combinations that are supported?

. The supported combinations are shown in Table 11.

able 11: Supported PVDM/VIC Combinations

PVDM	Number of DSPs Supported	VIC Combinations
PVDM-256K-4	1	1 analog VIC
PVDM-2[illegible]-8	2	Up to 2 analog VICs or 1 voice-BRI VIC
PVDM-256K-12	3	Up to 3 analog VICs or 1 analog VIC + 1 voice-BRI VIC
PVDM-256K-16	4	Up to 3 analog VICs or Up to 2 voice-BRI VICs or Up to 2 analog VICs+1 voice-BRIVIC
PVDM-256K-20	5	Up to 3 analog VICs or

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1032
Fls:
Doc: 3701

		Up to 2 voice-BRI VICs or Upto 2 analog VICs+1 voice- BRIVIC or 1 analog VIC+up to 2 voice-BRI VICs

). Are the PVDM-4 (supported in Cisco 1750) supported in Cisco 1751?

.. PVDM-4, 8,12 are not officially supported in the Cisco1751.

). Are the PVDM-256K-4 (supported in Cisco 1751) supported in Cisco 1750?

.. PVDM-256K-4, 8,12 are not officially supported in the Cisco1751.

). Does the 1751 support digital VICs?

.. Yes, the 1751 supports digital VICs. At FCS, the ISDN BRI NT/TE VIC is supported, and 1 or 2 port T1/E1 'WICs are supported in Cisco IOS 12.2(4)YB or later releases.

). Does the Cisco 1751 support the T1/E1 VWICs (i.e. the multi-flex cards)?

.. Yes. From Cisco IOS 12.2(4) YB or later releases. It will roll into 5th 12.2 T train release.

). How many DSPs are required to support the various VICs?

). The analog VICs require 1 DSP/VIC, the ISDN BRI VIC requires 2 DSPs/VIC. For T1/E1 VWICs, it epends on the codec and how many voice channels are used. The number of maximum channels support per)SP is listed in Table 12.

'able 12: Maximum Channels Support per DSP for T1/E1 Multiflex VWICs

Codec	Kbps	Max Channels/DSP (Digital Calls)
G.711	64 (PCM)	6
G.729a	8 (CS-ACELP)	3
G.726	16 (ADPCM)	3
G.723.1	5.3/6.3 (ACELP)	2
G.728	32 (ADPCM/LDCLP)	2

For example, if you are running 12 G.711 digital T1/E1 voice calls, then you will need two DSPs. If these are G.729 calls, then you will need four DSPs.

ECT 21.3701 J CPL-AC

ROS nº 02/0005-CN CPMI - CORREIOS 1038 Fls: 3701 Doc:

SP used for the digital calls and for the analog calls have to be calculated separately and one DSP can support ultiple Codecs concurrently for T1/E1 VWICs.

. Does Cisco 1751 support Caller ID?

. Yes, Cisco 1751 supports Caller ID transmission on FXS, FXO-M1 and FXO-M2 interfaces. It provides aller ID blocking configurable at the source location on FXS, and ability to unblock Caller ID on FXO-M1, I2 interfaces.

. Does Cisco 1751 support analog DID trunk card?

. Yes.

. What does toll reduction or toll bypass mean?

. In most of today's corporate networks, voice networks are separate from data networks. Typically, data etworks are priced by a monthly fixed cost basis and are usually much cheaper than the voice networks. An xample of this is a leased-line environment. In this case, the customer pays for that network, whether data is owing or not. In a typical phone network, charges are incurred on a usage basis. Therefore, phone expenses on iteroffice dialing can be quite expensive, especially since most interoffice calling occurs during "peak" us s hours.

/hen you have the ability to put your interoffice voice calls across a lower-price or fixed-price network with a roduct such as the Cisco 1751 platform, you can avoid the "toll" that is charged by the long-distance carrier, ocal exchange carrier (LEC), or Port, Telephone, and Telegraph (PTT). The voice call then travels over the ime network that your data travels over and avoids going into the Public Switched Telephone Network (PSTN) nd, therefore, does not incur charges.

is easy for companies to figure out the savings that they will get, because they receive accurate monthly eports that describe their costs from their LECs. Any company that does a great deal of interoffice calling will ave more money than one that does more "off-net" PSTN-type calling.

. What do the terms FXO, FXS, and E&M mean?

. The Cisco 1751 router supports FXO, FXS, and E&M voice interface cards. Each type provides a slightly ifferent interface for connecting to different types of equipment.

'or n Exchange Office

'he FXO interface allows an analog connection to be directed at the central office (CO) of the PSTN. This nterface is of value for off-premise extension applications. This is the only voice interface card that will be pproved to connect to off-premise lines. This interface may be used to provide backup over the PSTN or for 'entrex-type operations. This voice interface card needs to be approved by PTTs; it is not available in every ountry. Check the homologation status page at http://wwwin-ng.cisco.com/Eng/MSABU/Eng_Ops/WWW/index.htmfor up-to-date availability information.

'oreign Exchange Station

'he FXS interface allows connection for basic telephone service phones (home phones), fax machines, keysets, nd private branch exchange (PBXs) by providing ring voltage, dial tone, and so on. This interface will be used /here phones are connecting directly to the router. FXS will be very popular for trials because it allows the hones to be plugged directly into the router.

ECT 4.3691 J

CPMI - CORREIOS 1039 Fls: 3701 Doc:

ar and Mouth

he E&M interface allows connection for PBX trunk lines (tie lines). It is a signaling technique for two- and four-wire telephone and trunk interfaces.

. What's the difference between FXO and FXO-M1, FXO-M2?

. VIC-2FXO-M1 and VIC-2FXO-M2 support battery reversal detection and Caller ID. While the regular VIC-FXO doesn't. VIC-2FXO-M1 is for U.S. and Canada, VIC-2FXO-M2 is for Europe.

. Does the Cisco 1751 support three analog VICs, or six analog voice ports?

. Yes. Customers requiring this capability need to order the PVDM-256k-12 module (part number: PVDM-56k-12=), which provides three DSPs.

. Is RAS for H.323 gatekeeper registration supported on the Cisco 1751 platform?

. Yes.

. In VoFR and VoIP environment, there are cases where people using OPX extensions would like to use their message waiting lights at the remote sites. To provide functionality, the 150 V signal must be sensed on the originating end and reproduced on the terminating side. Is the message waiting function supported on the isco 1751?

. The FXS port does not have the ability to provide the voltage levels necessary to perform this function.

. What are the key features when implementing voice on the Cisco 1751?

. Please refer to Cisco 1700 Modular Access Voice Feature Overview

ttp://wwwin.cisco.com/cmc/cc/pd/rt/1700/sales/orwir_st.htm

Cisco IOS Security

. What security functions are available for the Cisco 1751 router?

. Cisco IOS software supports a wide range of security features. Standard features in base feature sets include access control lists (ACLs); authentication, authorization, and accounting (AAA) features such as Password Authentication Protocol/Challenge Handshake Authentication Protocol (PAP/CHAP), TACACS+, RADIUS, and Token Ring; and Lock and Key. Optional features include the Cisco IOS Firewall Feature Set, IP Security (IPSec) encryption, and tunneling protocols such as IPSec, generic routing encapsulation (GRE), L2F, and L2TP.

. Can I use the Cisco 1751 router as a firewall?

. Yes. The Cisco IOS Firewall Feature Set is supported in the Cisco 1751 router. This feature set offers enhanced firewall functionality, including context-based access control (CBAC), which enables securing a network on a per-application basis. Additional firewall security features include Java applet blocking, denial-of-service detection and prevention, and more advanced logging capabilities. For more information, see: ttp://www.cisco.com/warp/partner/synchronicd/cc/cisco/mkt/security/iosfw/index.htmpartner/synchronicd/cc/ci

. Can I encrypt data on the Cisco 1751 router?

CPMI - CORREIOS
1040
Fls:
Doc: 370

. Yes. Two types of encryption technologies are supported: IPSec Data Encryption Standard (DES) 56 and 'Sec Triple DES.

'rocessor

. What is the processor on the Cisco 1751 router?

. The Cisco 1751 router uses a Motorola MPC860P PowerQUICC at 48 MHz. The Cisco 2600 series uses an PC860. The 860P processor of the Cisco 1751 router has an integrated Fast Ethernet controller. This has ıplications on performance, as discussed in the Performance section.

'erformance

. How does the performance of the Cisco 1700 series compare to that of the Cisco 1600-R series?

. As Table 13 shows, the Cisco 1751 router performance is greater than that of the Cisco 1600-R series.

able 13: Performance Comparison of the Cisco 1600-R Series and the Cisco 1751

F ıre	Cisco 1600-R Series	Cisco 1751
Encryption IPSec DES 56 (256-byte packets)	128 Kbps	512 Kbps
Encryption IPSec 3DES (256-byte packets)	Not supported	256 Kbps
Fast Switching (64-byte packets)	2 Mbps (4000 pps)	4.3 Mbps (8400 pps)
Processor Switching (64-byte packets)	300 Kbps (600 pps)	768 Kbps (1500 pps)

. How does the performance of the Cisco 1751 router compare with that of the Cisco 2600 series routers?

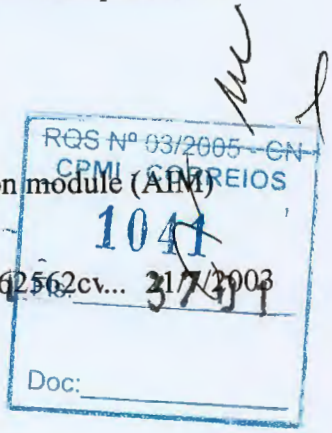
. The Cisco 2600 series router has higher fast-switching performance (12,000 to 37,000 pps for 64-byte ıckets) compared to the Cisco 1751 router (8400 pps). However, the encryption and process switching erformance for both platforms are similar (512 Kbps for IPSec DES 56 encryption with 256 byte packets; 768 bp r 1500 pps for process switching of 64-byte packets).

. Why is the fast-switching performance of the Cisco 1751 router not equal to that of the Cisco 2600 series hen they appear to use the same processor?

. The Cisco 1751 router uses a Motorola MPC860P processor, which is different from the MPC860 processor ı the Cisco 2600 series. The Motorola 860P has an integrated Fast Ethernet controller. This processor uses an bitration scheme that continuously polls for contenders for the Fast Ethernet bus in a round-robin fashion. ontenders are the serial communications controllers (SCCs), Ethernet controller, and cache. This process of ound-robin polling uses up clock cycles, resulting in lower fast-switching performance.

nternal Expansion Slot and Encryption Card

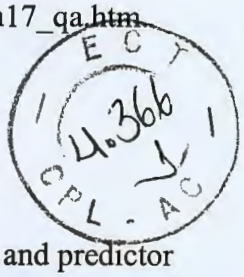
. Can the internal expansion slot of the Cisco 1751 router support the advanced integration module (AIM) xpansion cards (for example, encryption) that is supported on the Cisco 2600 series?



. No. The Cisco 2600 series has an AIM slot that is based on a protocol control information (PCI)-bus chitecture; the Cisco 1751 router, on the other hand, uses a Q-bus to lower cost. Although the expansion cards ı these platforms are not the same, the encryption technology is interoperable and, therefore, creates a ɔmplete Cisco end-to-end solution.

. Does the Cisco 1751 support the 1700 VPN module that accelerates DES and 3DES for IPSec?

. Yes. See VPN Module Q&A at:
tp://wwwin.cisco.com/Mkt/cmc/cc/cisco/mkt/access/1700/internal/vpn17_qa.htmvpn17_qa.htm



ɔmpression

. Does the Cisco 1751 router support compression?

. Yes. Up to 4:1 compression is supported. The Cisco 1751 router supports both Stac and predictor ɔmpression algorithms. Compression performance for the Cisco 1751 router has not been measured yet.

. What compression algorithms are supported on the Cisco 1751 router?

. T WAN interfaces of the Cisco 1751 router support the types of compression algorithms for each of the 'AN encapsulations given in Table 14.

able 14: Compression Algorithms
ıpported on the Cisco 1751 Router

Encapsulation	Compression Algorithm
PPP	Predictor stacker
Frame Relay	Payload
HDLC	Stac
X.25	Payload
L B	Predictor Stac

BM/SNA Features

). What IBM/SNA features are available for Cisco 1751 router?

.. The supported IBM/SNA features on the Cisco 1751 router are equivalent to those supported on the Cisco 600-R, 2500, and 2600 series routers (see Table 15):

'able 15: IBM/SNA Features Supported on the Cisco 1751 Router

STUN	NetBIOS

RQS Nº 03/2005 - CN
CPMI - CORREIOS

SDLC	SNA priority queue
SDLLC	NetView NSP
Bisync	BSTUN native client interface architecture (NCIA) server
DLSW+ (data-link switching plus)	Local acknowledgment
QLLC	RSRB (required for DLSw)
FRAS (BNN, BAN, RFC 1490)	Response time reporter (internetwork performance monitor)
IBM Network Manager/LAN Manager	All CiscoWorks Blue (maps and so on)
DSPU	All Cisco IBM MIBs

ot Token Ring and Advanced Peer-to-Peer Networking (APPN), supported on the Cisco 2500 and 2600 eries, are not supported on Cisco 1600-R series and 1751 routers.

). Will the Cisco 1751 router support Token Ring interfaces?

.. No, there are no plans to support Token Ring on the Cisco 1751 router.

). When do I sell a Cisco 1751 router IBM solution?

.. The Cisco 1751 router is best sold for IBM/SNA opportunities that require:

- One Ethernet/1-5 WAN configuration (including the AUX)
- Modularity/flexibility—The Cisco 1751 series provides two WAN interface card slots, allowing customers to add or change WAN services as needed
- Multiservice voice/data integration now or in the future

). What IBM/SNA software feature sets are available for Cisco 1751 router?

.. IBM/SNA feature sets available for Cisco 1751 router include:

- IP/IPX/AppleTalk/IBM
- IP/ADSL/IPX/AppleTalk/IBM Plus
- IP/ADSL/IPX/AT/IBM/FW/IDS Plus IPSec 56
- IP/ADSL/IPX/AT/IBM/FW/IDS Plus IPSec 3DES

---

ote Use Plus for L2F, L2TP, BGP, NTP, NLSP, RSVP, IP multicast, Frame Relay SVC, and encryption ıpport.

Iemory Architecture

. What memory architecture does the Cisco 1751 router use?

. The Cisco 1751 router uses the run-from-RAM memory architecture.

. What type of DRAM memory does the Cisco 1751 router use?

. The Cisco 1751 router uses synchronous DRAM (SDRAM). The default DRAM is 32 MB fixed onboard for e 1751 model, and 64 MB for the 1751-V model. There is one DIMM slot for adding additional memory in crements of 16, 32, and 64 MB. The maximum DRAM for the 1751 model is 96MB (32 MB onboard plus 64 B DIMM). The maximum DRAM for the 1751-V model is 128MB (64 MB onboard plus 64 MB DIMM).

	Cisco 1751	Cisco 1751-V
Default DRAM (MB)	32	64
Max. DRAM (MB)	96	128

. What type of Flash memory does the Cisco 1751 router use?

. The Cisco 1751 router uses onboard (soldered on the motherboard) flash. The Cisco1751 has 16 MB of ash. The Cisco 1751-V have 32 MB of flash. This is a fixed configuration—it is not upgradeable and there is ot a flash card slot on the motherboard to add more flash.

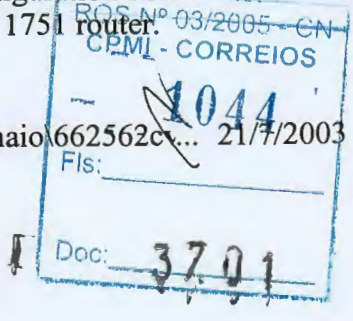
	Cisco 1751	Cisco 1751-V
I ult Flash (MB)	16	32
Max. Flash (MB)	16	32

. What is the flash memory used for?

.. Cisco IOS software and configuration files are stored flash. Also, flash memory allows software upgrades to e downloaded over the WAN or LAN link to be stored in the Mini-Flash card.

. How are software images and configuration files stored in flash?

.. Flash come preprogrammed with Cisco IOS software. Software upgrades and configuration files must be opied using Trivial File Transfer Protocol (TFTP) onto a Mini-Flash card in a Cisco 1751 router.



). Is dual Flash bank supported on Cisco 1751 routers?

. Yes. Dual Flash bank is supported. Although both the Cisco 1751 and Cisco 1751-V support dual flash bank, e recommend that customers requiring dual flash bank purchase the Cisco 1751-V model since it comes with 2 MB flash.

). Does the Cisco 1751 use the same DRAM as the Cisco 1720/1750?

. Yes. However, the Cisco 1751 does not support the 4 and 8 MB DIMM (MEM1700-4D= and MEM1700-D=). In addition there is a new 64MB DIMM available for the Cisco 1751

). Does the Cisco 1751 use the same flash as the Cisco 1720/1750?

. No. The flash in the Cisco 1751 is soldered on the motherboard, and is therefore not upgradeable.

). Can the amount of shared (input/output [I/O]) memory on a Cisco 1751 router be configured?

. Yes. It can be modified using Cisco IOS command-line interface (CLI) and saved as part of the router onfiguration.

'ower Supply

). What type of power supplies does the Cisco 1751 router use?

. The Cisco 1751 router uses one universal power supply that is applicable for all countries. There are no ountry- specific power supplies. The AC input voltage of this universal power supply spans from 100 to 240 ; the frequency from 47 to 64 Hz. (Although this power supply works in all countries, the user still has to ecify the power cord appropriate for a particular country.) The router also has a locking connector on the ower socket to ensure that the power cord remains securely fastened.

ITBF

). What is the mean time between failures (MTBF) for the Cisco 1751 router?

. The predicted MTBF is 514,526 hours. This predicted MTBF includes the chassis and external power supply ut not the WAN interface cards or voice interface cards.

Network Management

). How is the Cisco 1751 router managed?

. Like all Cisco routers, the Cisco 1751 router can be managed via Simple Network Management Protocol SNMP), via a Telnet session, and through a directly connected terminal or PC running terminal emulator oftware.

). Do CiscoView, CiscoWorks2000, and Cisco Voice Manager support Cisco 1751 routers?

. Yes, CiscoView, CiscoWorks2000 and Cisco Voice Manager supported.

). Does Cisco ConfigMaker support Cisco 1751 routers?

RQS Nº 03/2005 - CN - CPMI - CORREIOS
1045
Fls:
3701
Doc:

A. Yes, Cisco ConfigMaker supports Cisco 1751 routers, starting with Release 2.5b.

Q. Does the Cisco 1751 router support Remote Monitoring (RMON)?

A. The Cisco 1751 router supports only RMON lite. RMON lite covers two out of the nine RMON groups, alarms, and events. Full RMON (statistics, history, hosts, hostTopN, matrix, filter, capture) features are available for the Cisco 2500 and 2600 series routers.

Cisco IOS File System Commands

This chapter describes the basic set of commands used to manipulate files on your routing device using the Cisco IOS File System (IFS) in Cisco IOS Release 12.2.

Commands in this chapter use URLs as part of the command syntax. URLs used in the Cisco IFS contain two parts: a file system or network prefix, and a file identification suffix. The following tables list URL keywords that can be used in the *source-url* and *destination-url* arguments for all commands in this chapter. The prefixes listed below can also be used in the *filesystem* arguments in this chapter.

Table 18 lists common URL network prefixes used to indicate a device on the network.

Table 18 Network Prefixes for Cisco IFS URLs

Prefix	Description
ftp:	Specifies a File Transfer Protocol (FTP) network server.
rcp:	Specifies an remote copy protocol (rcp) network server.
tftp:	Specifies a TFTP server.

Table 19 lists the available suffix options (file indentification suffixes) for the URL prefixes used in Table 18.

Table 19 File ID Suffixes for Cisco IFS URLs

Prefix	Suffix Options
ftp:	[[//[username[:password]@]location]/directory]/filename For example: **ftp://network-config** (*prefix://filename*) **ftp://jeanluc:secret@enterprise.cisco.com/ship-config**
rcp:	rcp:[[//[username@]location]/directory]/filename
tftp:	tftp:[[//location]/directory]/filename

Table 20 lists common URL prefixes used to indicate memory locations on the system.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1048
Doc: 3701

Table 20 File System Prefixes for Cisco IFS URLs

Prefix	Description
bootflash:	Bootflash memory.
disk0:	Rotating disk media.
flash: [*partition-number*]	Flash memory. This prefix is available on most platforms. For platforms that do not have a device named **flash:**, the prefix **flash:** is aliased to **slot0:**. Therefore, you can use the prefix **flash:** to refer to the main Flash memory storage area on all platforms
flh:	Flash load helper log files.
null:	Null destination for copies. You can copy a remote file to null to determine its size.
nvram:	NVRAM. This is the default location for the running-configuration file.
slavebootflash:	Internal Flash memory on a slave RSP card of a router configured with Dual RSPs.
slavenvram:	NVRAM on a slave RSP card.
slaveslot0:	First PCMCIA card on a slave RSP card.
slaveslot1:	Second PCMCIA card on a slave RSP card.
slot0:	First PCMCIA Flash memory card.
slot1:	Second PCMCIA Flash memory card.
xmodem:	Obtain the file from a network machine using the Xmodem protocol.
ymodem:	Obtain the file from a network machine using the Ymodem protocol.

For details about the Cisco IFS, and for IFS configuration tasks, refer to the "Configuring the Cisco IOS File System" chapter in the Release 12.2 *Cisco IOS Configuration Fundamentals Configuration Guide*.

cd

To change the default directory or file system, use the **cd** EXEC command.

cd [*filesystem*:]

Syntax Description		
	filesystem:	(Optional) The URL or alias of the directory or file systems followed by a colon.

Defaults

The initial default file system is **flash:**. For platforms that do not have a physical device named **flash:**, the keyword **flash:** is aliased to the default Flash device.

If you do not specify a directory on a file system, the default is the root directory on that file system.

Command Modes

EXEC

Command History	Release	Modification
	11.0	This command was introduced.

Usage Guidelines

For all EXEC commands that have an optional *filesystem* argument, the system uses the file system specified by the **cd** command when you omit the optional *filesystem* argument. For example, the **dir** EXEC command, which displays a list of files on a file system, contain an optional *filesystem* argument. When you omit this argument, the system lists the files on the file system specified by the **cd** command.

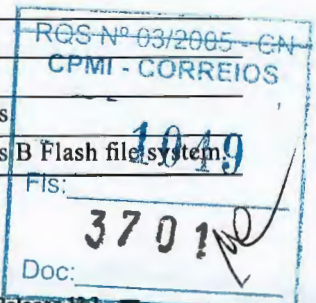
Examples

In the following example, the cd command is used to set the default file system to the Flash memory card inserted in slot 0:

```
Router# pwd
bootflash:/
Router# cd slot0:
Router# pwd
slot0:/
```

Related Commands

Command	Description
copy	Copies any file from a source to a destination.
delete	Deletes a file on a Flash memory device.
dir	Displays a list of files on a file system.
pwd	Displays the current setting of the **cd** command.
show file systems	Lists available file systems and their alias prefix names.
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.



configure network

The **configure network** command was replaced by the **copy** {**rcp** | **tftp**} **running-config** command in Cisco IOS Release 11.0. To maintain backward compatibility, the **configure network** command continues to function in Cisco IOS Release 12.2 for most systems, but support for this command may be removed in a future release.

The **copy** {**rcp** | **tftp**} **running-config** command was replaced by the **copy** {**ftp:** | **rcp:** | **tftp:**}[*filename*] **system:running-config** command in Cisco IOS Release 12.1.

The **copy** {**ftp:** | **rcp:** | **tftp:**}[*filename*] **system:running-config** command specifies that a configuration file should be copied from a FTP, rcp, or TFTP source to the running configuration. See the description of the copy in this chapter command for more information.

copy

To copy any file from a source to a destination, use the **copy** EXEC command.

copy [**/erase**] *source-url destination-url*

Syntax Description

/erase	(Optional) Erases the destination file system before copying.
source-url	The location URL or alias of the source file or directory to be copied.
destination-url	The destination URL or alias of the copied file or directory.

The exact format of the source and destination URLs varies according to the file or directory location. You may enter either an alias keyword for a particular file or an alias keyword for a file system type (not a file within a type).

Timesaver

Aliases are used to cut down on the amount of typing you need to perform. For example, it is easier to type **copy run start** (the abbreviated form of the **copy running-config startup-config** command) than it is to type **copy system:r nvram:s** (the abbreviated form of the **copy system:running-config nvram:startup-config** command). These aliases also allow you to continue using some of the common commands used in previous versions of Cisco IOS software.

Table 21 shows two keyword shortcuts to URLs.

Table 21 Common Keyword Aliases to URLs

Keyword	Source or Destination
running-config	(Optional) Keyword alias for the **system:running-config** URL. The **system:running-config** keyword represents the current running configuration file. This keyword does not work in **more** and **show file** EXEC command syntaxes.
startup-config	(Optional) Keyword alias for the **nvram:startup-config** URL. The **nvram:startup-config** keyword represents the configuration file used during initialization (startup). This file is contained in NVRAM for all platforms except the Cisco 7000 family, which uses the CONFIG_FILE environment variable to specify the startup configuration. The Cisco 4500 series cannot use the **copy running-config startup-config** command. This keyword does not work in **more** and **show file** EXEC command syntaxes.

The following tables list aliases by file system type. If you do not specify an alias, the router looks for a file in the current directory.

Table 22 lists URL aliases for Special (opaque) file systems. Table 23 lists them for network file systems, and Table 24 lists them for local writable storage.

Table 22 URL Prefix Aliases for Special File Systems

Alias	Source or Destination
flh:	Source URL for flash load helper log files.
modem:	Destination URL for loading modem firmware on Cisco 5200 and 5300 Series routers.
nvram:	Router NVRAM. You can copy the startup configuration into or from NVRAM. You can also display the size of a private configuration file.
null:	Null destination for copies or files. You can copy a remote file to null to determine its size.
system:	Source or destination URL for system memory, which includes the running configuration.
xmodem:	Source destination for the file from a network machine that uses the Xmodem protocol.
ymodem:	Source destination for the file from a network machine that uses the Xmodem protocol.

Table 23 URL Prefix Aliases for Network File Systems

Alias	Source or Destination
ftp:	Source or destination URL for an File Transfer Protocol (FTP) network server. The syntax for this alias is as follows: **ftp:**[[[*//username* [*:password*]*@*]*location*]*/directory*]*/filename.*
rcp:	Source or destination URL for a Remote Copy Protocol (rcp) network server. The syntax for this alias is as follows: **rcp:**[[[*//username@*]*location*]*/directory*]*/filename.*
tftp:	Source or destination URL for a TFTP network server. The syntax for this alias is **tftp:**[[*//location*]*/directory*]*/filename.*

Table 24 URL Prefix Aliases for Local Writable Storage File Systems

Alias	Source or Destination
bootflash:	Source or destination URL for boot flash memory.
disk0: and disk1:	Source or destination URL of rotating media.
flash:	Source or destination URL for Flash memory. This alias is available on all platforms. For platforms that lack a flash: device, note that **flash:** is aliased to **slot0:**, allowing you to refer to the main Flash memory storage area on all platforms.
slavebootflash:	Source or destination URL for internal Flash memory on the slave RSP card of a router configured for HSA.
slaveram:	NVRAM on a slave RSP card of a router configured for HSA.
slaveslot0:	Source or destination URL of the first PCMCIA card on a slave RSP card of a router configured for HSA.

ECT copy 4.355 CAL - AC

Table 24 URL Prefix Aliases for Local Writable Storage File Systems (continued)

Alias	Source or Destination
slaveslot1:	Source or destination URL of the second PCMCIA slot on a slave RSP card of a router configured for HSA.
slot0:	Source or destination URL of the first PCMCIA Flash memory card.
slot1:	Source or destination URL of the second PCMCIA Flash memory card.

Command Modes

EXEC

Command History

Release	Modification
11.3 T	This command was introduced.

Usage Guidelines

You can enter on the command line all necessary source- and destination-URL information and the username and password to use, or you can enter the **copy** command and have the router prompt you for any missing information.

If you enter information, choose one of the following three options: **running-config**, **startup-config**, or a file system alias (see previous tables.) The location of a file system dictates the format of the source or destination URL.

The colon is required after the alias. However, earlier commands not requiring a colon remain supported, but are unavailable in context-sensitive help.

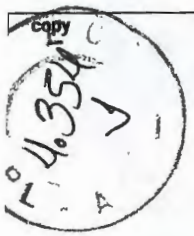
The entire copying process may take several minutes and differs from protocol to protocol and from network to network.

In the alias syntax for **ftp:**, **rcp:**, and **tftp:**, the location is either an IP address or a host name. The filename is specified relative to the directory used for file transfers.

This section contains usage guidelines for the following topics:

- Understanding Invalid Combinations of Source and Destination
- Understanding Character Descriptions
- Understanding Partitions
- Using rcp
- Using FTP
- Storing Images on Servers
- Copying from a Server to Flash Memory
- Verifying Images
- Copying a Configuration File from a Server to the Running Configuration
- Copying a Configuration File from a Server to the Startup Configuration
- Storing the Running or Startup Configuration on a Server
- Saving the Running Configuration to the Startup Configuration

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1051
Fls:
Doc 3701



- Using CONFIG_FILE, BOOT, and BOOTLDR Environment Variables
- Using the Copy Command with the Dual RSP Feature

Understanding Invalid Combinations of Source and Destination

Some invalid combinations of source and destination exist. Specifically, you cannot copy the following:

- From a running configuration to a running configuration
- From a startup configuration to a startup configuration
- From a device to the same device (for example, the **copy flash: flash:** command is invalid)

Understanding Character Descriptions

Table 25 describes the characters that you may see during processing of the **copy** command.

Table 25 copy Character Descriptions

Character	Description
!	For network transfers, an exclamation point indicates that the copy process is taking place. Each exclamation point indicates the successful transfer of ten packets (512 bytes each).
.	For network transfers, a period indicates that the copy process timed out. Many periods in a row typically mean that the copy process may fail.
O	For network transfers, an uppercase O indicates that a packet was received out of order and the copy process may fail.
e	For Flash erasures, a lowercase e indicates that a device is being erased.
E	An uppercase E indicates an error. The copy process may fail.
V	A series of uppercase Vs indicates the progress during the verification of the image checksum.

Understanding Partitions

You cannot copy an image or configuration file to a Flash partition from which you are currently running. For example, if partition 1 is running the current system image, copy the configuration file or image to partition 2. Otherwise, the copy operation will fail.

You can identify the available Flash partitions by entering the **show file system** EXEC command.

Using rcp

The rcp protocol requires a client to send a remote username upon each rcp request to a server. When you copy a configuration file or image between the router and a server using rcp, the Cisco IOS software sends the first valid username it encounters in the following sequence:

1. The remote username specified in the **copy** command, if a username is specified.
2. The username set by the **ip rcmd remote-username** global configuration command, if the command is configured.
3. The remote username associated with the current tty (terminal) process. For example, if the user is connected to the router through Telnet and was authenticated through the **username** command, the router software sends the Telnet username as the remote username.
4. The router host name.

ECT 4.353 1 CPLA

For the rcp copy request to process, an account must be defined on the network server for the remote username. If the network administrator of the destination server did not establish an account for the remote username, this command will not run. If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the remote username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

If you are writing to the server, the rcp server must be properly configured to accept the rcp write request from the user on the router. For UNIX systems, add an entry to the .rhosts file for the remote user on the rcp server. Suppose the router contains the following configuration lines:

```
hostname Rtr1
ip rcmd remote-username User0
```

If the router IP address translates to Router1.company.com, then the .rhosts file for User0 on the rcp server should contain the following line:

```
Router1.company.com Rtr1
```

Refer to the documentation for your rcp server for more details.

If you are using a personal computer as a file server, the computer must support the remote shell protocol (rsh).

Using FTP

The FTP protocol requires a client to send a remote username and password upon each FTP request to a server. When you copy a configuration file from the router to a server using FTP, the Cisco IOS software sends the first valid username that it encounters in the following sequence:

1. The username specified in the **copy** command, if a username is specified.
2. The username set by the **ip ftp username** command, if the command is configured.
3. Anonymous.

The router sends the first valid password in the following list:

1. The password specified in the **copy** command, if a password is specified.
2. The password set by the **ip ftp password** command, if the command is configured.
3. The router forms a password username@routername.domain. The variable username is the username associated with the current session, routername is the configured host name, and domain is the domain of the router.

The username and password must be associated with an account on the FTP server. If you are writing to the server, the FTP server must be properly configured to accept the FTP write request from the user on the router.

If the server has a directory structure, the configuration file or image is written to or copied from the directory associated with the username on the server. For example, if the system image resides in the home directory of a user on the server, specify that user name as the remote username.

Refer to the documentation for your FTP server for more details.

Use the **ip ftp username** and **ip ftp password** global configuration commands to specify a username and password for all copies. Include the username in the **copy** command if you want to specify a username for that copy operation only.

CPMI - CORREIOS
Fls: 1052
3701

Storing Images on Servers

Use the **copy** *flash: destination-url* command (for example, **copy flash: tftp:**) to copy a system image or boot image from Flash memory to a network server. Use the copy of the image as a backup copy. Also, use it to verify that the copy in Flash memory is the same as that in the original file.

Copying from a Server to Flash Memory

Use the **copy** *destination-url flash:* command (for example, **copy tftp: flash:**) to copy an image from a server to Flash memory.

On Class B file system platforms, the system provides an option to erase existing Flash memory before writing onto it.

Note Verify the image in Flash memory before booting the image.

Verifying Images

When copying a new image to your router, you should confirm that the image was not corrupted during the copy process. Depending on the destination filesystem type, a checksum for the image file may be displayed when the **copy** command completes. You can verify this checksum by comparing it to the checksum value provided for your image file on Cisco.com.

Caution If the checksum values do not match, do not reboot the router. Instead, reissue the **copy** command and compare the checksums again. If the checksum is repeatedly wrong, copy the original image back into Flash memory *before* you reboot the router from Flash memory. If you have a corrupted image in Flash memory and try to boot from Flash memory, the router will start the system image contained in ROM (assuming booting from a network server is not configured). If ROM does not contain a fully functional system image, the router might not function and will need to be reconfigured through a direct console port connection.

An alternate method for file verification is to use the UNIX 'diff' command. This method can also be applied to file types other than Cisco IOS images. If you suspect that a file is corrupted, copy the suspect file and the original file to a Unix server. (The file names may need to be modified if you try to save the files in the same directory.) Then run the Unix 'diff' command on the two files. If there is no difference, then the file has not been corrupted.

Copying a Configuration File from a Server to the Running Configuration

Use the **copy {ftp: | rcp: | tftp:} running-config** command to load a configuration file from a network server to the running configuration of the router (note that **running-config** is the alias for the **system:running-config** keyword). The configuration will be added to the running configuration as if the commands were typed in the command-line interface (CLI). Thus, the resulting configuration file will be a combination of the previous running configuration and the loaded configuration file, with the loaded configuration file having precedence.

You can copy either a host configuration file or a network configuration file. Accept the default value of *host* to copy and load a host configuration file containing commands that apply to one network server in particular. Enter *network* to copy and load a network configuration file containing commands that apply to all network servers on a network.

ECT 4.351 J AC

Copying a Configuration File from a Server to the Startup Configuration

Use the **copy {ftp: | rcp: | tftp:} nvram:startup-config** command to copy a configuration file from a network server to the router startup configuration. These commands replace the startup configuration file with the copied configuration file.

Storing the Running or Startup Configuration on a Server

Use the **copy system:running-config {ftp: | rcp: | tftp:}** command to copy the current configuration file to a network server using FTP, rcp, or TFTP. Use the **copy nvram:startup-config {ftp: | rcp: | tftp:}** command to copy the startup configuration file to a network server.

The configuration file copy can serve as a backup copy.

Saving the Running Configuration to the Startup Configuration

Use the **copy system:running-config nvram:startup-config** command to copy the running configuration to the startup configuration.

Note Some specific commands might not get saved to NVRAM. You will need to enter these commands again if you reboot the machine. These commands are noted in the documentation. We recommend that you keep a listing of these settings so you can quickly reconfigure your router after rebooting.

If you issue the **copy system:running-config nvram:startup-config** command from a bootstrap system image, a warning will instruct you to indicate whether you want your previous NVRAM configuration to be overwritten and configuration commands to be lost. This warning does not appear if NVRAM contains an invalid configuration or if the previous configuration in NVRAM was generated by a bootstrap system image.

On all platforms except Class A file system platforms, the **copy system:running-config nvram:startup-config** command copies the currently running configuration to NVRAM.

On the Class A Flash file system platforms, the **copy system:running-config nvram:startup-config** command copies the currently running configuration to the location specified by the CONFIG_FILE environment variable. This variable specifies the device and configuration file used for initialization. When the CONFIG_FILE environment variable points to NVRAM or when this variable does not exist (such as at first-time startup), the software writes the current configuration to NVRAM. If the current configuration is too large for NVRAM, the software displays a message and stops executing the command.

When the CONFIG_FILE environment variable specifies a valid device other than **nvram:** (that is, **flash:**, **bootflash:**, **slot0:**, or **slot1:**), the software writes the current configuration to the specified device and filename, and stores a distilled version of the configuration in NVRAM. A distilled version is one that does not contain access list information. If NVRAM already contains a copy of a complete configuration, the router prompts you to confirm the copy.

Using CONFIG_FILE, BOOT, and BOOTLDR Environment Variables

For the Class A Flash file system platforms, specifications are as follows:

- The CONFIG_FILE environment variable specifies the configuration file used during router initialization.
- The BOOT environment variable specifies a list of bootable images on various devices.
- The BOOT environment variable specifies a list of bootable images on various devices.
- The BOOTLDR environment variable specifies the Flash device and filename containing the rxboot image that ROM uses for booting.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1053
Fls:
3701
Doc:

- Cisco 3600 routers do not use a dedicated boot helper image (rxboot), which many other routers use to help with the boot process. Instead, the BOOTLDR ROM monitor environment variable identifies the Flash memory device and filename that are used as the boot helper; the default is the first system image in Flash memory.

To view the contents of environment variables, use the **show bootvar** EXEC command. To modify the CONFIG_FILE environment variable, use the **boot config** global configuration command. To modify the BOOTLDR environment variable, use the **boot bootldr** global configuration command. To modify the BOOT environment variable, use the **boot system** global configuration command. To save your modifications, use the **copy system:running-config nvram:startup-config** command.

When the destination of a **copy** command is specified by the CONFIG_FILE or BOOTLDR environment variable, the router prompts you for confirmation before proceeding with the copy. When the destination is the only valid image in the BOOT environment variable, the router also prompts you for confirmation before proceeding with the copy.

Using the Copy Command with the Dual RSP Feature

The Dual RSP feature allows you to install two Route/Switch Processor (RSP) cards in a single router on the Cisco 7507 and Cisco 7513 platforms.

On a Cisco 7507 or Cisco 7513 router configured for Dual RSPs, if you copy a file to **nvram:startup-configuration** with automatic synchronization disabled, the system asks if you also want to copy the file to the slave startup configuration. The default answer is **yes**. If automatic synchronization is enabled, the system automatically copies the file to the slave startup configuration each time you use a **copy** command with **nvram:startup-configuration** as the destination.

Examples

The following examples illustrate uses of the **copy** command.

- Copying an Image from a Server to Flash Memory Examples
- Saving a Copy of an Image on a Server Examples
- Copying a Configuration File from a Server to the Running Configuration Example
- Copying a Configuration File from a Server to the Startup Configuration Example
- Copying the Running Configuration to a Server Example
- Copying the Startup Configuration to a Server Example
- Saving the Current Running Configuration Example
- Moving Configuration Files to Other Locations Examples
- Copying an Image from the Master RSP Card to the Slave RSP Card Example

Copying an Image from a Server to Flash Memory Examples

The following three examples use a **copy rcp:**, **copy tftp:**, or **copy ftp:** command to copy an image file from a server to Flash memory:

- Copying an Image from a Server to Flash Memory Example
- Copying an Image from a Server to a Flash Memory Using Flash Load Helper Example
- Copying an Image from a Server to a Flash Memory Card Partition Example

Copying an Image from a Server to Flash Memory Example

This example copies a system image named file1 from the remote rcp server with an IP address of 172.16.101.101 to Flash memory. On Class B file system platforms, the Cisco IOS software allows you to first erase the contents of Flash memory to ensure that enough Flash memory is available to accommodate the system image.

```
Router# copy rcp://netadmin@172.16.101.101/file1 flash:file1

Destination file name [file1]?
Accessing file 'file1' on 172.16.101.101...
Loading file1 from 172.16.101.101 (via Ethernet0): ! [OK]

Erase flash device before writing? [confirm]
Flash contains files. Are you sure you want to erase? [confirm]

Copy 'file1' from server
  as 'file1' into Flash WITH erase? [yes/no] yes
Erasing device... eeee
```

```
Erase flash device before writing? [confirm]
Flash contains files. Are you sure? [confirm]
Copy 'master/igs-bfpx.100-4.3' from TFTP server
as 'master/igs-bfpx.100-4.3' into Flash WITH erase? [yes/no] yes
```

Copying an Image from a Server to a Flash Memory Card Partition Example

The following example copies the file c3600-i-mz from the rcp server at IP address 172.23.1.129 to the Flash memory card in slot 0 of a Cisco 3600 series router, which has only one partition. As the operation progresses, the Cisco IOS software asks you to erase the files on the Flash memory PC card to accommodate the incoming file. This entire operation takes 18 seconds to perform, as indicated at the end of the example.

```
Router# copy rcp: slot0:

PCMCIA Slot0 flash

Partition   Size    Used      Free      Bank-Size  State          Copy Mode
  1         4096K   3068K     1027K     4096K      Read/Write     Direct
  2         4096K   1671K     2424K     4096K      Read/Write     Direct
  3         4096K     0K      4095K     4096K      Read/Write     Direct
  4         4096K   3825K      270K     4096K      Read/Write     Direct

[Type ?<no> for partition directory; ? for full directory; q to abort]
Which partition? [default = 1]

PCMCIA Slot0 flash directory, partition 1:
File  Length    Name/status
  1   3142288   c3600-j-mz.test
[3142352 bytes used, 1051952 available, 4194304 total]
Address or name of remote host [172.23.1.129]?
Source file name? /tftpboot/images/c3600-i-mz
Destination file name [/tftpboot/images/c3600-i-mz]?
Accessing file '/tftpboot/images/c3600-i-mz' on 172.23.1.129...
Connected to 172.23.1.129
Loading 1711088 byte file c3600-i-mz: ! [OK]

Erase flash device before writing? [confirm]
Flash contains files. Are you sure you want to erase? [confirm]

Copy '/tftpboot/images/c3600-i-mz' from server
  as '/tftpboot/images/c3600-i-mz' into Flash WITH erase? [yes/no] yes
Erasing device... eeeeeeeeeeeeeeeeeeeeeeeeeeeeeee ...erased
Connected to 172.23.1.129
Loading 1711088 byte file c3600-i-mz:
!!!
```

Saving a Copy of an Image on a Server Examples

The following four examples use **copy** commands to copy image files to a server for storage:

- Copy an Image from Flash Memory to an rcp Server Example
- Copy an Image from a Partition of Flash Memory to a Server Example
- Copying an Image from a Flash Memory File System to an FTP Server Example
- Copying an Image from Boot Flash Memory to a TFTP Server Example

Copy an Image from Flash Memory to an rcp Server Example

The following example copies a system image from Flash Memory to an rcp server using the default remote username. Because the rcp server address and filename are not included in the command, the router prompts for it.

```
Router# copy flash: rcp:

IP address of remote host [255.255.255.255]? 172.16.13.110
Name of file to copy? gsxx
writing gsxx - copy complete
```

Copy an Image from a Partition of Flash Memory to a Server Example

The following example copies an image from a particular partition of Flash memory to an rcp server using a remote username of netadmin1.

The system will prompt if there are two or more partitions. If the partition entered is not valid, the process terminates. You have the option to enter a partition number, a question mark (?) for a directory display of all partitions, or a question mark and a number (?*number*) for a directory display of a particular partition. The default is the first partition.

```
Router# configure terminal
Router# ip rcmd remote-username netadmin1
Router# end
Router# copy flash: rcp:
System flash partition information:
Partition   Size     Used    Free    Bank-Size   State       Copy-Mode
    1       4096K    2048K   2048K   2048K       Read Only   RXBOOT-FLH
    2       4096K    2048K   2048K   2048K       Read/Write  Direct
[Type ?<number> for partition directory; ? for full directory; q to abort]
Which partition? [1] 2

System flash directory, partition 2:
File  Length   Name/status
  1   3459720  master/igs-bfpx.100-4.3
[3459784 bytes used, 734520 available, 4194304 total]
Address or name of remote host [ABC.CISCO.COM]?
Source file name? master/igs-bfpx.100-4.3
Destination file name [master/igs-bfpx.100-4.3]?
Verifying checksum for 'master/igs-bfpx.100-4.3' (file # 1)... OK
Copy 'master/igs-bfpx.100-4.3' from Flash to server
as 'master/igs-bfpx.100-4.3'? [yes/no] yes
!!!!...
Upload to server done
Flash copy took 0:00:00 [hh:mm:ss]
```

Copying an Image from a Flash Memory File System to an FTP Server Example

The following example copies the file c3600-i-mz from partition 1 of the Flash memory card in slot 0 to an FTP server at IP address 172.23.1.129.

RQS Nº 03/2005 - CN
CPMI - CORREIOS

[1711152 bytes used, 2483152 available, 4194304 total]

Router# copy slot0:1:c3600-i-mz ftp://myuser:mypass@172.23.1.129/c3600-i-mz
Verifying checksum for '/tftpboot/cisco_rules/c3600-i-mz' (file # 1)...  OK
Copy '/tftpboot/cisco_rules/c3600-i-mz' from Flash to server
  as 'c3700-i-mz'? [yes/no] yes
!!!
```

```
Router# configure terminal
Router(config)# ip rcmd remote-username netadmin1
Router(config)# end
Router# copy system:running-config rcp:
Remote host[]? 172.16.101.101

Name of configuration file to write [Rtr2-confg]?
Write file rtr2-confg on host 172.16.101.101?[confirm]
Building configuration...[OK]
Connected to 172.16.101.101
```

Copying the Startup Configuration to a Server Example

The following example copies the startup configuration to a TFTP server:

```
Router# copy nvram:startup-config tftp:

Remote host[]? 172.16.101.101

Name of configuration file to write [rtr2-confg]? <cr>
Write file rtr2-confg on host 172.16.101.101?[confirm] <cr>
![OK]
```

Saving the Current Running Configuration Example

The following example copies the running configuration to the startup configuration. On a Class A Flash file system platform, this command copies the running configuration to the startup configuration specified by the CONFIG_FILE variable.

```
copy system:running-config nvram:startup-config
```

The following example shows the warning that the system provides if you try to save configuration information from bootstrap into the system:

```
Router(boot)# copy system:running-config nvram:startup-config

Warning: Attempting to overwrite an NVRAM configuration written
by a full system image. This bootstrap software does not support
the full configuration command set. If you perform this command now,
some configuration commands may be lost.
Overwrite the previous NVRAM configuration?[confirm]
```

Enter **no** to escape writing the configuration information to memory.

Moving Configuration Files to Other Locations Examples

On some routers, you can store copies of configuration files on a Flash memory device. Five examples follow.

Copying the Startup Configuration to a Flash Memory Device Example

The following example copies the startup configuration file (specified by the CONFIG_FILE environment variable) to a Flash memory card inserted in slot 0:

```
copy nvram:startup-config slot0:router-confg
```

Copying the Running Configuration to a Flash Memory Device Example

The following example copies the running configuration from the router to the Flash memory PC card in slot 0:

```
Router# copy system:running-config slot0:berlin-cfg

Building configuration...
```

```
5267 bytes copied in 0.720 secs
```

Copying to the Running Configuration from a Flash Memory Device Example

The following example copies the file named ios-upgrade-1 from the Flash memory card in slot 0 to the running configuration:

```
Router# copy slot0:4:ios-upgrade-1 system:running-config

Copy 'ios-upgrade-1' from flash device
  as 'running-config' ? [yes/no] yes
```

Copying to the Startup Configuration from a Flash Memory Device Example

The following example copies the router-image file from the Flash memory to the startup configuration:

```
copy flash:router-image nvram:startup-config
```

Copying a Configuration File from one Flash Device to Another Example

The following example copies the file running-config from the first partition in internal Flash memory to the Flash memory PC card in slot 1. The checksum of the file is verified, and its copying time of 30 seconds is displayed.

```
Router# copy flash: slot1:

System flash

Partition   Size    Used      Free      Bank-Size  State          Copy Mode
  1         4096K   3070K     1025K     4096K      Read/Write     Direct
  2        16384K   1671K    14712K     8192K      Read/Write     Direct

[Type ?<no> for partition directory; ? for full directory; q to abort]
Which partition? [default = 1]

System flash directory, partition 1:
File  Length   Name/status
  1   3142748  dirt/images/mars-test/c3600-j-mz.latest

Copy

Copying an Image from the Master RSP Card to the Slave RSP Card Example

The following example copies the router-image file from the Flash memory card inserted in slot 1 of the master RSP card to slot 0 of the slave RSP card in the same router:

```
copy slot1:router-image slaveslot0:
```

Related Commands

Command	Description
boot config	Specifies the device and filename of the configuration file from which the router configures itself during initialization (startup).
boot system	Specifies the system image that the router loads at startup.
cd	Changes the default directory or file system.
copy xmodem: flash:	Copies any file from a source to a destination.
copy ymodem: flash:	Copies any file from a source to a destination.
delete	Deletes a file on a Flash memory device.
dir	Displays a list of files on a file system.
erase	Erases a file system.
ip rcmd remote-username	Configures the remote username to be used when requesting a remote copy using rcp.
reload	Reloads the operating system.
show bootvar	Displays the contents of the BOOT environment variable, the name of the configuration file pointed to by the CONFIG_FILE environment variable, the contents of the BOOTLDR environment variable, and the configuration register setting.
show (Flash file system)	Displays the layout and contents of a Flash memory file system.
slave auto-sync config	Turns on automatic synchronization of configuration files for a Cisco 7507 or Cisco 7513 router that is configured for Dual RSP Backup.
verify bootflash:	Either of the identical **verify bootflash:** or **verify bootflash** commands replaces the **copy verify bootflash** command. Refer to the **verify** command for more information.

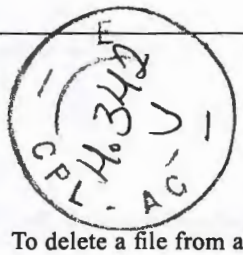
delete



To delete a file from a Flash memory device or NVRAM, use the **delete** EXEC command.

delete *URL* [**/force** | **/recursive**]

Syntax Description

URL	IFS URL of the file to be deleted. Include the filesystem prefix, followed by a colon, and, optionally, the name of a file or directory.
/force	(Optional) Deletes the specified file or directory with prompting you for verification. **Note** Use this keyword with caution: the system will not ask you to confirm the file deletion.
/recursive	(Optional) Deletes all files in the specified directory, as well as the directory itself.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

If you attempt to delete the configuration file or image specified by the CONFIG_FILE or BOOTLDR environment variable, the system prompts you to confirm the deletion. Also, if you attempt to delete the last valid system image specified in the BOOT environment variable, the system prompts you to confirm the deletion.

When you delete a file in Flash memory, the software simply marks the file as deleted, but it does not erase the file. To later recover a "deleted" file in Flash memory, use the **undelete** EXEC command. You can delete and undelete a file up to 15 times.

To permanently delete all files marked "deleted" on a linear Flash memory device, use the **squeeze** EXEC command.

Examples

The following example deletes the file named "test" from the Flash filesystem:

```
Router# delete flash:test
Delete flash:test? [confirm]
```

Related Commands

Command	Description
cd	Changes the default directory or file system.

dir

To display a list of files on a file system, use the **dir** EXEC command.

dir [**/all**] [*filesystem*:][*file-url*]

Syntax Description

/all	(Optional) Lists deleted files, undeleted files, and files with errors.
filesystem:	(Optional) File system or directory containing the files to list, followed by a colon.
file-url	(Optional) The name of the files to display on a specified device. The files can be of any type. You can use wildcards in the filename. A wildcard character (*) matches all patterns. Strings after a wildcard are ignored.

Default

The default file system is specified by the **cd** command. When you omit the **/all** keyword, the Cisco IOS software displays only undeleted files.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

Use the **show** (Flash file system) command to display more detail about the files in a particular file system.

Examples

The following is sample output from the **dir** command:

```
Router# dir slot0:

Directory of slot0:/

  1  -rw-     4720148   Aug 29 1997 17:49:36  hampton/nitro/c7200-j-mz

erase

To erase a file system, use the **erase** EXEC command. The **erase nvram:** command replaces the **write erase** command and the **erase startup-config** command.

erase *filesystem:*

Syntax Description

filesystem:	File system name, followed by a colon. For example, **flash:** or **nvram:**

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

When a file system is erased, none of the files in the file system can be recovered.

The **erase** command can be used on both Class B and Class C Flash file systems only. To reclaim space on Flash file systems after deleting files using the **delete** command, you must use the **erase** command. This command erases all of the files in the Flash file system.

Class A Flash file systems cannot be erased. You can delete individual files using the **delete** EXEC command and then reclaim the space using the **squeeze** EXEC command. You can use the **format** EXEC command to format the Flash file system.

On Class C Flash file systems, space is dynamically reclaimed when you use the **delete** command. You can also use either the **format** or **erase** command to reinitialize a Class C Flash file system.

The **erase nvram:** command erases NVRAM. On Class A file system platforms, if the CONFIG_FILE variable specifies a file in Flash memory, the specified file will be marked "deleted."

Examples

The following example erases the NVRAM, including the startup configuration located there:

```
erase nvram:
```

The following example erases all of partition 2 in internal Flash memory:

```
Router# erase flash:2

System flash directory, partition 2:
File  Length   Name/status
  1   1711088  dirt/images/c3600-i-mz
[1711152 bytes used, 15066064 available, 16777216 total]

Erase flash device, partition 2? [confirm]
Are you sure? [yes/no]: yes
Erasing device... eeee
```

E C
1.4.337-3
CPL - AC

```
Router# erase flash:

System flash partition information:
Partition   Size      Used    Free    Bank-Size   State       Copy-Mode
    1       4096K     2048K   2048K   2048K       Read Only   RXBOOT-FLH
    2       4096K     2048K   2048K   2048K       Read/Write  Direct

[Type ?<no> for partition directory; ? for full directory; q to abort]
Which partition? [default = 2]
```

The system will prompt only if there are two or more read/write partitions. If the partition entered is not valid or is the read-only partition, the process terminates. You can enter a partition number, a question mark (?) for a directory display of all partitions, or a question mark and a number (*?number*) for directory display of a particular partition. The default is the first read/write partition.

```
System flash directory, partition 2:
File  Length    Name/status
  1   3459720   master/igs-bfpx.100-4.3
[3459784 bytes used, 734520 available, 4194304 total]

Erase flash device, partition 2? [confirm] <Return>
```

Related Commands

The **erase bootflash:** and **erase bootflash** commands have identical functions. See the description of the **erase** command in this chapter for more information.

ECT 4.335 J CPL - AC

file prompt

To specify the level of prompting, use the **file prompt** global configuration command.

file prompt [alert | noisy | quiet]

Syntax Description

alert	(Optional) Prompts only for destructive file operations. This is the default.
noisy	(Optional) Confirms all file operation parameters.
quiet	(Optional) Seldom prompts for file operations.

Defaults

alert

Command Modes

Global configuration

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

Use this command to change the amount of confirmation needed for different file operations.

This command affects only prompts for confirmation of operations. The router will always prompt for missing information.

Examples

The following example configures confirmation prompting for all file operations:

```
file prompt noisy
```

format

To format a Class A or Class C Flash file system, use the **format** EXEC command.

Class C Flash File System

format *filesystem1*:

Class A Flash File System

format [**spare** *spare-number*] *filesystem1*: [[*filesystem2*:][*monlib-filename*]]

Caution Reserve a certain number of memory sectors as spares, so that if some sectors fail, most of the Flash memory card can still be used. Otherwise, you must reformat the Flash card when some of the sectors fail.

Syntax Description

spare	(Optional) Reserves spare sectors as specified by the *spare-number* argument when formatting Flash memory.
spare-number	(Optional) Number of the spare sectors to reserve on formatted Flash memory. Valid values are from 0 to 16. The default value is zero.
filesystem1:	Flash memory to format, followed by a colon.
filesystem2:	(Optional) File system containing the monlib file to use for formatting filesystem1 followed by a colon.
monlib-filename	(Optional) Name of the ROM monitor library file (monlib file) to use for formatting the *filesystem1* argument. The default monlib file is the one bundled with the system software. When used with HSA and you do not specify the *monlib-filename* argument, the system takes ROM monitor library file from the slave image bundle. If you specify the *monlib-filename* argument, the system assumes that the files reside on the slave devices.

Defaults

The default monlib file is the one bundled with the system software.

The default number of spare sectors is zero (0).

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

Use this command to format Class A or C Flash memory file systems.

ECT 1 4.333 1 CPL - AC J

In some cases, you might need to insert a new PCMCIA Flash memory card and load images or backup configuration files onto it. Before you can use a new Flash memory card, you must format it.

Sectors in Flash memory cards can fail. Reserve certain Flash memory sectors as "spares" by using the optional *spare* argument on the **format** command to specify 0 to 16 sectors as spares. If you reserve a small number of spare sectors for emergencies, you can still use most of the Flash memory card. If you specify 0 spare sectors and some sectors fail, you must reformat the Flash memory card, thereby erasing all existing data.

The monlib file is the ROM monitor library. The ROM monitor uses this file to access files in the Flash file system. The Cisco IOS system software contains a monlib file.

In the command syntax, *filesystem1:* specifies the device to format and *filesystem2:* specifies the optional device containing the monlib file used to format *filesystem1:*. If you omit the optional *filesystem2:* and *monlib-filename* arguments, the system formats *filesystem1:* using the monlib file already bundled with the system software. If you omit only *the optional filesystem2:* argument, the system formats *filesystem1:* using the monlib file from the device you specified with the **cd** command. If you omit only the optional *monlib-filename* argument, the system formats *filesystem1:* using the *filesystem2:* monlib file. When you specify both arguments—*filesystem2:* and *monlib-filename*—the system formats *filesystem1:* using the monlib file from the specified device. You can specify *filesystem1:*'s own monlib file in this argument. If the system cannot find a monlib file, it terminates its formatting.

Caution You can read from or write to Flash memory cards formatted for Cisco 7000 series Route Processor (RP) cards in your Cisco 7200 and 7500 series routers, but you cannot boot the Cisco 7200 and 7500 series routers from a Flash memory card formatted for the Cisco 7000 series routers. Similarly, you can read from or write to Flash memory cards formatted for the Cisco 7200 and 7500 series routers in your Cisco 7000 series routers, but you cannot boot the Cisco 7000 series routers from a Flash memory card formatted for the Cisco 7200 and 7500 series routers.

Examples

The following example formats a Flash memory card inserted in slot 0:

```
Router# format slot0:

Running config file on this device, proceed? [confirm]y
All sectors will be erased, proceed? [confirm]y
Enter volume id (up to 31 characters): <Return>
Formatting sector 1 (erasing)
Format device slot0 completed
```

When the console returns to the EXEC prompt, the new Flash memory card is formatted and ready for use.

nkdir

To create a new directory in a Class C Flash file system, use the **mkdir** EXEC command.

mkdir *directory*

yntax Description

directory	The name of the directory to create.

ommand Modes

EXEC

ommand History

Release	Modification
11.3 AA	This command was introduced.

Jsage Guidelines

This command is only valid on Class C Flash file systems.

If you do not specify the directory name in the command line, the router prompts you for it.

Examples

The following example creates a directory named newdir:

```
Router# mkdir newdir

Mkdir file name [newdir]?
Created dir flash:newdir
Router# dir
Directory of flash:

  2  drwx           0   Mar 13 1993 13:16:21  newdir

8128000 bytes total (8126976 bytes free)
```

Rela ommands

Command	Description
dir	Displays a list of files on a file system.
rmdir	Removes an existing directory in a Class C Flash file system.

more

To display a file, use the **more** EXEC command.

more [**/ascii** | **/binary** | **/ebcdic**] *file-url*

Syntax Description		
	/ascii	(Optional) Displays a binary file in ASCII format.
	/binary	(Optional) Displays a file in hex/text format.
	/ebcdic	(Optional) Displays a binary file in EBCDIC format.
	file-url	The URL of the file to display.

Command Modes EXEC

Command History	Release	Modification
	11.3 AA	This command was introduced.

Usage Guidelines

The **more system:running-config** command displays the same output as the **show running-config** command. The **more nvram:startup-config** command replaces the **show startup-config** command and the **show configuration** command.

You can use this command to display configuration files, as follows:

- The **more nvram:startup-config** command displays the startup configuration file contained in NVRAM or specified by the CONFIG_FILE environment variable. The Cisco IOS software informs you whether the displayed configuration is a complete configuration or a distilled version. A distilled configuration is one that does not contain access lists.
- The **more system:running-config** command displays the running configuration.

These commands show the version number of the software used when you last changed the configuration file.

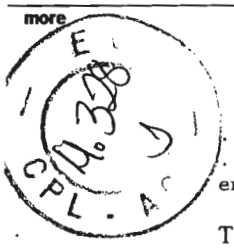
You can display files on remote systems using the **more** command.

Examples

The following partial sample output displays the configuration file named startup-config in NVRAM:

```
Router# more nvram:startup-config

!
! No configuration change since last restart
! NVRAM config last updated at 02:03:26 PDT Thu Oct 2 1997
!
version 12.1
service timestamps debug uptime
service timestamps log uptime
service password-encryption
service udp-small-servers
service tcp-small-servers
.
```



```
end
```

The following is partial sample output from the **more nvram:startup-config** command when the configuration file has been compressed:

```
Router# more nvram:startup-config

Using 21542 out of 65536 bytes, uncompressed size = 142085 bytes
!
version 12.1
service compress-config
!
hostname rose
!
.
.
.
```

The following partial sample output displays the running configuration:

```
Router2# more system:running-config

Building configuration...

Current configuration:
!
version 12.1
no service udp-small-servers
no service tcp-small-servers
!
hostname Router2
!
.
.
.
!
end
```

show bootvar	Displays the contents of the BOOT environment variable, the name of the configuration file pointed to by the CONFIG_FILE environment variable, the contents of the BOOTLDR environment variable, and the configuration register setting.

pwd

To show the current setting of the **cd** command, use the **pwd** EXEC command.

pwd

Syntax Description

This command has no arguments or keywords.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

Use the **pwd** command to show which directory or file system is specified as the default by the **cd** command. For all EXEC commands that have an optional *filesystem* argument, the system uses the file system specified by the **cd** command when you omit the optional *filesystem* argument.

For example, the **dir** command contains an optional *filesystem* argument and displays a list of files on a particular file system. When you omit this *filesystem* argument, the system shows a list of the files on the file system specified by the **cd** command.

Examples

The following example shows that the present working file system specified by the **cd** command is slot 0:

```
Router> pwd
slot0:/
```

The following example uses the **cd** command to change the present file system to slot 1 and then uses the **pwd** command to display that present working file system:

```
Router> cd slot1:
Router> pwd
slot1:/
```

Related Commands

Command	Description

show configuration

The **show configuration** command is replaced by the **show startup-config** and **more nvram:startup-config** commands. See the description of the **show startup-config** and more commands for more information.

show file descriptors

To display a list of open file descriptors, use the **show file descriptors** EXEC command.

show file descriptors

Syntax Description This command has no arguments or keywords.

Command Modes EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines File descriptors are the internal representations of open files. You can use this command to learn if another user has a file open.

Examples The following is sample output from the **show file descriptors** command:

```
Router# show file descriptors

File Descriptors:

  FD  Position  Open  PID  Path
   0    187392  0001    2  tftp://dirt/hampton/c4000-i-m.a
   1    184320  030A    2  flash:c4000-i-m.a
```

Table 27 describes the significant fields shown in the display.

Table 27 show file descriptors Field Descriptions

Field	Description
FD	File descriptor. The file descriptor is a small integer used to specify the file once it has been opened.
Position	Byte offset from the start of the file.
Open	Flags supplied when opening the file.
PID	Process ID of the process that opened the file.
Path	Location of the file.

xamples

The following is sample output from the **show file information** command:

```
Router# show file information tftp://dirt/hampton/c2500-j-1.a

tftp://dirt/hampton/c2500-j-1.a:
  type is image (a.out) [relocatable, run from flash]
  file size is 8624596 bytes, run size is 9044940 bytes [8512316+112248+420344]
  Foreign image

Router# show file information slot0:c7200-js-mz

slot0:c7200-js-mz:
  type is image (elf) []
  file size is 4770316 bytes, run size is 4935324 bytes
  Runnable image, entry point 0x80008000, run from ram

Router1# show file information nvram:startup-config

nvram:startup-config:
  type is ascii text
```

Table 28 describes the possible file types.

Table 28 Possible File Types

Types	Description
image (a.out)	Runnable image in a.out format.
image (elf)	Runnable image in elf format.
ascii text	Configuration file or other text file.
coff	Runnable image in coff format.
ebcdic	Text generated on an IBM mainframe.
lzw compression	Lzw compressed file.
tar	Text archive file used by the Channel Interface Processor (CIP).

show file systems

To list available file systems, use the **show file systems** command in EXEC mode.

show file systems

Syntax Description This command has no arguments or keywords.

Command Modes EXEC

Command History

Release	Modification
11.3 AA	This command was introduced.

Usage Guidelines Use this command to learn the alias names (Prefixes) of the file systems your router supports.

Examples The following is sample output from the **show file systems** command:

```
Router# show file systems

File Systems:

     Size(b)       Free(b)      Type   Flags  Prefixes
           -             -    opaque    rw     null:
           -             -    opaque    rw     system:
           -             -    opaque    ro     xmodem:
           -             -    opaque    ro     ymodem:
           -             -   network    rw     tftp:
           -             -   network    rw     rcp:
           -             -   network    rw     ftp:
*    4194304       4190616     flash    rw     flash:

Table 29 show file systems Field Descriptions (continued)

Type	Description
network	The file system is a network file system (TFTP, rcp, FTP, and so on).
nvram	The file system is for an NVRAM device.
opaque	The file system is a locally generated "pseudo" file system (for example, the "system") or a download interface, such as brimux.
rom	The file system is for a ROM or EPROM device.
tty	The file system is for a collection of terminal devices.
unknown	The file system is of unknown type.

Table 30 describes file system flags.

Table 30 Possible File System Flags

Flag	Description
ro	The file system is Read Only.
rw	The file system is Write Only.
wo	The file system is Read/Write.

ECT 14.319 CPL - AC

squeeze

To permanently erase files tagged as "deleted" or "error" on Class A Flash file systems, use the **squeeze** command in EXEC mode.

squeeze [**/nolog**] [**/quiet**] *filesystem*:

Syntax Description

/nolog	(Optional) Disables the squeeze log (recovery data) and accelerates the squeeze process.
/quiet	(Optional) Disables status messages during the squeeze process.
filesystem:	The Flash file system, followed by a colon. Typically **flash:** or **slot0:**.

Command Modes

EXEC

Command History

Release	Modification
11.1	This command was introduced.
12.2(1)	This command was implemented in images for the Cisco 2600 and Cisco 3600 series.
12.2(4)XL	This command was implemented in images for the Cisco 1700 series.
12.1(9), 12.0(17)S 12.0(17)ST, 12.2(2), 12.2(2)T, 12.2(2)B, 12.1(9)E	The **/nolog** and **/quiet** keywords were added.

Usage Guidelines

When Flash memory is full, you might need to rearrange the files so that the space used by the files marked "deleted" can be reclaimed. (This "squeeze" process is required for linear Flash memory cards to make sectors contiguous; the free memory must be in a "block" to be usable.)

When you enter the **squeeze** command, the router copies all valid files to the beginning of Flash memory and erases all files marked "deleted." After the squeeze process is completed, you can write to the reclaimed Flash memory space.

Caution After performing the squeeze process you cannot recover deleted files using the **undelete** EXEC mode command.

In addition to removing deleted files, the **squeeze** command removes any files that the system has marked as "error". An error file is created when a file write fails (for example, the device is full). To remove error files, you must use the **squeeze** command.

Rewriting Flash memory space during the squeeze operation may take several minutes.

Using the **/nolog** keyword disables the log for the squeeze process. In most cases this will speed up the squeeze process. However, if power is lost or the Flash card is removed during the squeeze process, all the data on the Flash card will be lost, and the device will have to be reformatted.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
1069
Fls:
Doc: 3701

Note Using the **/nolog** keyword makes the squeeze process uninterruptible.

Using the **/quiet** keyword disables the output of status messages to the console during the squeeze process.

If the optional keywords are not used, the progress of squeeze process will be displayed to the console, a log for the process will be maintained, and the squeeze process is interruptible.

On Cisco 2600 or Cisco 3600 series routers, the entire file system needs to be erased once before the **squeeze** command can be used. After being erased once, the **squeeze** command should operate properly on the Flash file system for the rest of the Flash file system's history.

To erase an entire flash file system on a Cisco 2600 or 3600 series router, perform the following steps:

Step 1 If the Flash file system has multiple partitions, enter the **no partition** command to remove the partitions. The reason for removing partitions is to ensure that the entire Flash file system is erased. The **squeeze** command can be used in a Flash file system with partitions after the Flash file system is erased once.

Step 2 Enter the **erase** command to erase the Flash file system.

Examples

In the following example, the file named "config1" is deleted, and then the **squeeze** command is used to reclaim the space used by that file. The **/nolog** option is used to speed up the squeeze process.

```
Router# delete config1
Delete filename [config1]?
Delete slot0:conf? [confirm]
Router# dir slot0:
! Note that the deleted file name appears in square brackets
Directory of slot0:/

    1  -rw-     4300244   Apr 02 2001 03:18:07  c7200-boot-mz.122-0.14
    2  -rw-        2199   Apr 02 2001 04:45:15  [config1]
    3  -rw-     4300244   Apr 02 2001 04:45:23  image
20578304 bytes total (11975232 bytes free)
!20,578,304 - 4,300,244 - 4,300,244 - 2,199 - 385 = 11975232

Router# squeeze /nolog slot0:
%Warning: Using /nolog option would render squeeze operation uninterruptible.
All deleted files will be removed. Continue? [confirm]
Squeeze operation may take a while. Continue? [confirm]

Squeeze of slot0 completed in 291.832 secs .
Router# dir slot0:
Directory of slot0:/

    1  -rw-     4300244   Apr 02 2001 03:18:07  c7200-boot-mz.122-0.14
    2  -rw-     4300244   Apr 02 2001 04:45:23  image

20578304 bytes total (11977560 bytes free)
!20,578,304 - 4,300,244 - 4,300,244 - 256 = 11977560
```

Related Commands

Command	Description
delete	Deletes a file on a Flash memory device.
dir	Displays a list of files on a file system.
undelete	Recovers a file marked "deleted" on a Class A or Class B Flash file system.

undelete

To recover a file marked "deleted" on a Class A or Class B Flash file system, use the **undelete** EXEC command.

undelete *index* [*filesystem:*]

Syntax Description

index	A number that indexes the file in the **dir** command output.
filesystem:	(Optional) A file system containing the file to undelete, followed by a colon.

Defaults

The default file system is the one specified by the **cd** command.

Command Modes

EXEC

Command History

Release	Modification
11.0	This command was introduced.

Usage Guidelines

For Class A and B Flash file systems, when you delete a file, the Cisco IOS software simply marks the file as deleted, but it does not erase the file. This command allows you to recover a "deleted" file on a specified Flash memory device. You must undelete a file by its index because you could have multiple deleted files with the same name. For example, the "deleted" list could contain multiple configuration files with the name router-config. You undelete by index to indicate which of the many router-config files from the list to undelete. Use the **dir** command to learn the index number of the file you want to undelete.

You cannot undelete a file if a valid (undeleted) file with the same name exists. Instead, you first delete the existing file and then undelete the file you want. For example, if you had an undeleted version of the router-config file and you wanted to use a previous, deleted version instead, you could not simply undelete the previous version by index. You would first delete the existing router-config file and then undelete the previous router-config file by index. You can delete and undelete a file up to 15 times.

On Class A Flash file systems, if you try to recover the configuration file pointed to by the CONFIG_FILE environment variable, the system prompts you to confirm recovery of the file. This prompt reminds you that the CONFIG_FILE environment variable points to an undeleted file. To permanently delete all files marked "deleted" on a Flash memory device, use the **squeeze** EXEC command.

On Class B Flash file systems, you must use the **erase** EXEC command to recover any space taken up by deleted files.

Examples

The following example recovers the deleted file whose index number is 1 to the Flash memory card inserted in slot 0:

```
undelete 1 slot0:
```

Related Commands

Command	Description
delete	Deletes a file on a Flash memory device.
dir	Displays a list of files on a file system.
squeeze	Permanently deletes Flash files by squeezing a Class A Flash file system.

erify

To verify the checksum of a file on a Flash memory file system, use the **verify** EXEC command.

verify *filesystem*:[*file-url*]

ntax Description

filesystem:	Flash memory file system containing the files to list, followed by a colon. Standard file system keywords for this command include **flash:**, **bootflash:**, and **slot0:**.
file-url	(Optional) URL of the file to verify. Generally this consists only of the filename(s), but you may also specify directories (file paths), separated by forward-slashes (/). The files can be of any type. You can use wildcards in the filename. A wildcard character (*) matches all patterns. Strings after a wildcard are ignored.

efaults

The current working device is the default device.

ommand Modes

EXEC

ommand History

Release	Modification
11.0	This command was introduced.

sage Guidelines

This command replaces the **copy verify** and **copy verify flash** commands.

Use the **verify** command to verify the checksum of a file before using it.

Each software image that is distributed on disk uses a single checksum for the entire image. This checksum is displayed only when the image is copied into Flash memory; it is not displayed when the image file is copied from one disk to another.

To display the contents of Flash memory, use the **show flash** command. The Flash contents listing does not include the checksum of individual files. To recompute and verify the image checksum after the image has been copied into Flash memory, use the **verify** command.

Note The verify command only performs a check on the integrity of the file after it has been saved in the file system. It is possible for a corrupt image to be transferred to the router and saved in the file system without detection.
To verify that a Cisco IOS software image was not corrupted while it was transfered to the router, copy the image from where it is stored on your router to a Unix server. Also copy the same image from CCO (Cisco.com) to the same Unix server. (The name may need to be modified if you try to save the image in the same directory as the image that you copied from the router.) Then run a Unix **diff** command on the two Cisco IOS software images. If there is no difference then the image stored on the router has not been corrupted.

Examples

The following example verifies that the file named c7200-js-mz is on the Flash memory card inserted in slot 0:

```
Router# dir slot0:
Directory of slot0:/

  1  -rw-     4720148   Aug 29 1997 17:49:36  hampton/nitro/c7200-j-mz
  2  -rw-     4767328   Oct 01 1997 18:42:53  c7200-js-mz
  5  -rw-         639   Oct 02 1997 12:09:32  rally
  7  -rw-         639   Oct 02 1997 12:37:13  the_time

20578304 bytes total (3104544 bytes free)
tw3-7200-1# verify slot0:
Verify filename []? c7200-js-mz
Verified slot0:
```

The following example also verifies that the file named c7200-js-mz is on the Flash memory card inserted in slot 0:

```
Router# verify slot0:?
slot0:c7200-js-mz  slot0:rally slot0:hampton/nitro/c7200-j-mz  slot0:the_time

Router# verify slot0:c7200-js-mz
Verified slot0:c7200-js-mz
```

Related Commands

Command	Description
cd	Changes the default directory or file system.
copy	Copies any file from a source to a destination, use the copy EXEC command.
dir	Displays a list of files on a file system.
pwd	Displays the current setting of the **cd** command.
show file systems	Lists available file systems.

write erase

The **write erase** command is replaced by the **erase nvram:** command. See the description of the **erase** command in this chapter for more information.

write terminal

The **more system:running-config** command replaces the **write terminal** command. See the description of the **more** command in this chapter for more information.

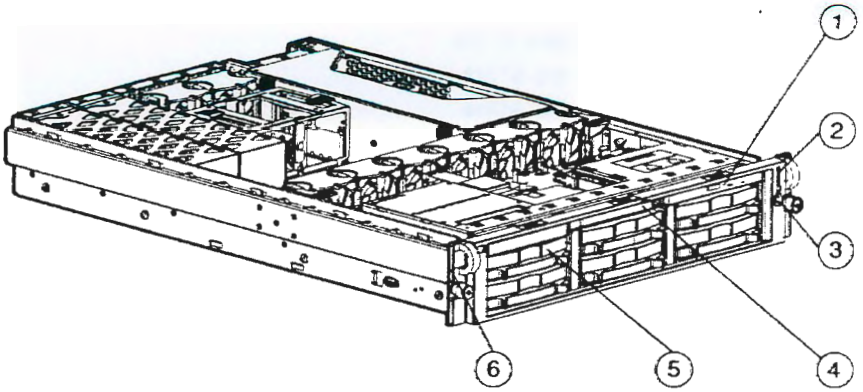
4309 J

Overview



1. 24X Max CD-ROM (with easy front ejection removol)
2. Front LEDs (show server status)
3. Unit Identification button and LED (for easy in rack server identification)
4. 1.44 MB (3.5") Floppy Disk Drive
5. Six 1" Wide Ultro3/Ultra320 SCSI hot plug hard drives and one AIT or 20/40-GB DAT hot plug tape drive
6. 2U form factor

What's New

- The ProLiant DL380 G3 is now available with the latest technologies delivering best-in-class performance
- Intel® Xeon 3.06GHz processors available in two versions to satisfy a variety of applications:
- 3.06 GHz with 512K L2 Cache
- 3.06 GHz with 512K L2 Cache and 1 MB L3 Cache
- 533MHz Front Side Bus
- 1GB (expandable to 12GB on all systems greater than 2.8GHz) of 2-way interleaved PC2100 DDR SDRAM, with Advanced ECC and Online Spare capabilities

Overview

- Windows® 2000 Model
- Integrated Lights-Out (iLO) Management standard on system board
- Five Peer PCI Architecture up to 3.06 GHz processors and a 533MHz Front Side Bus
- ServerWorks GC -LE Chipset
- Integrated Smart Array 5i Plus Controller with optional Battery-Backed Write Cache (BBWC) Enabler option kit
- Three available 64-bit PCI-X slots, including two hot pluggable 100MHz slots and one 133MHz slot
- Two NC7781 PCI-X Gigabit NICs (embedded)
- Support for up to six 1" Wide Ultra3/Ultra320 SCSI hot plug hard drives or for five hot plug hard drives and one AIT hot plug tape drive
- User configurable single/dual channel drive backplane
- Internal hot plug capacity 880.8 GB standard (6 x 146.8 GB 1" HD)
- 00-Watt Hot Plug Power Supply (with optional redundancy)
- Hot Pluggable Fans (with optional redundancy)
- Sliding rails and cable management arm for easy serviceability and in-rack tool-less access to major components
- Automatic Server Recovery (ASR), ROM Based Setup Utility (RBSU), Insight Manager 7, Status LEDs including system health and UID and SmartStart
- Protected by HP Services, including a three-year, Next Business Day, on-site limited Globol warranty and extended Pre-Failure Warranty, which covers processors, memory, and hard drives - Certain restrictions and exclusions apply. Consult the HP Customer Support Center at 1-800-345-1518 for details.

Standard Features

ProLiant Essentials Foundation Pack Software

Insight Manager 7	Insight Manager 7 helps maximize system uptime and performance and reduces the cost of maintaining the IT infrastructure by providing proactive notification of problems before those problems result in costly downtime and reduced productivity. Insight Manager 7 is easy to set up and provides rapid access to detailed fault and performance information gathered by the Management Agents. One-click-access to the Integrated Lights-Out or Remote Insight Lights Out Edition board allows systems administrators to take full graphical control of ProLiant servers in remote locations or lights-out data centers. Finally, Insight Manager 7 in concert with the Version Control Agents and Version Control Repository Manager enables systems administrators to version manage and update system software across groups of ProLiant servers.
SmartStart	SmartStart is a tool that simplifies server setup, providing a rapid way to deploy reliable and consistent server configurations. For more information, please visit the SmartStart Web site at: http://www.hp.com/servers/smartstart SmartStart version supported (minimum): SmartStart 6.0.
Management Agents	The Management Agents form the foundation for HP's Intelligent Manageability strategy. They provide direct, browser-based access to in-depth instrumentation built into HP servers, workstations, desktops, ond portables, and send alerts to Insight Manager 7 and other enterprise management opplications in case of subsystem or environmental failures. For additional information about the Management Agents and other management products from, HP please visit the management website at: http://www.hp.com/servers/manage
ActiveUpdate	ActiveUpdate is a web-based application that keeps IT managers directly connected to HP for proactive notification and delivery of the latest software updates.
ROMPaq, support software, and configuration utilities	The latest software, drivers, and firmware fully optimized and tested for your ProLiant server and options.
Survey Utility and diagnostics utilities	The most advonced configuration analysis, reporting and troubleshooting utilities used by HP and at your fingertips.
Optional ProLiant Essentials Value Packs	Optional software offerings that selectively extend the functionality of an Adaptive Infrastructure to address specific business problems and needs: • Rapid Deployment Pack – an outomated solution for multi-server deployment and provisioning, enabling companies to quickly and easily adapt to changing business demands. • Workload Management Pock – provides easier management of complex environments, improving overall server utilization and enabling Windows 2000 customers for the first time to confidently deploy multiple applications on a single multiprocessor ProLiant Server. • Integrated Lights-Out Advanced Pack – upgrades the Integrated Lights-Out processor to full virtual presence and control with graphical console and virtual media. • Recovery Server Option Pack – entry-level high availability software that will provide reliable protection and increased uptime against server hardware and operating system failures. • Performance Management Pack – a performance management solution that identifies and explains hardware performance bottlenecks on ProLiant servers and attached options enabling users to better utilize their valuable resources.

NOTE: Flexible and volume quantity license kits are availoble for ProLiant Essentials Value Packs. Refer to http://www.hp.com/servers/proliantessentials or the various ProLiant Essentials Value Pack product QuickSpecs for more information.
NOTE: For more information regarding ProLiant Essentials Software, please see the following URL:
http://www.hp.com/servers/proliantessentials
NOTE: These Web sites are available in English only.

Rack Airflow Requirements

- Rack 9000 and 10000 series Cabinets
  The increasing power of new high-performance processor technology requires increased cooling efficiency for rack-mounted servers. The 9000 and 10000 Series Racks provide enhanced airflow for maximum cooling, allowing these racks to be fully loaded with servers using the latest processors.

- Rack 7000 series Cabinets
  When installing a server with processors running at speeds of 550 MHz or greater in Rack 7000 series racks with glass doors (165753-001 (42U), and 163747-001 (22U)), the new processor technology requires the installation of High Airflow Rack Door Inserts (327281-B21 (42U), 327281-B22 (42U 6 pack), or 157847-B21 (22U)) to promote enhanced airflow for maximum cooling.

CAUTION: If a third-party rack is used, observe the following additional requirements to ensure adequate airflow and to prevent damage to the equipment:

- Front and rear doors: If your 42U server rack includes closing front and rear doors, you must allow 830 square inches (5,350 sq cm) of hole evenly distributed from top to bottom to permit adequate airflow (equivalent to the required 64 percent open area for ventilation).
- Side: The clearance between the installed rack component and the side panels of the rack must be a minimum of 2.75 inches (7 cm).

CAUTION: Always use blanking panels to fill all remaining empty front panel U-spaces in the rack. This arrangement ensures proper airflow. Using a rack without blanking panels results in improper cooling that can lead to thermal damage.

NOTE: For additional information, refer to the Setup and Installation Guide or the Documentation CD provided with the server, or to the server documentation located in the Support section at the following URL:
http://www5.compaq.com/products/servers/proliantdl380/index.html
NOTE: This Web site is available in English only.

Rack Kit

Tool-free support for racks with square mounting holes (including Compaq/HP 7000, 9000, 10000 and H9 series), with an adjustment range of 24" - 36".

Telco Rack Support

DL380 G3 Telco Rack Kit:
Support for all 2-post Telco racks requires the use of the standard rack kit and an additional option kit from Rack Solutions (http://www.racksolutions.com/hp)
NOTE: This Web site is available in English only.

HP Factory Express Capabilities

HP Factory Express gives you the flexibility to choose from a full menu of factory capabilities all in one manufacturing facility, in one process, with one touch giving you full control and access to HP's World class manufacturing facility anytime. This approach provides you the speed to deploy your IT needs, with total quality assurance, reliability, and predictability to lower your total cost of ownership by letting HP install, rack, and customize your software and hardware options for you.
NOTE: Factory Express Engineered Solution Level 6 is o custom solutions availoble through Factory Express. Please contact a your local reseller or Account Monager.

Service and Support

HP Services provides a three-year, limited warranty, including Pre-Failure Warranty (coverage of hard drives, memory and processors) fully supported by a worldwide network of resellers and service providers. HP technical assistance is available 7x24, toll free in the United States and Canada. Telephone support services may be covered under warranty or available for an additional fee.

NOTE: Limited Warranty includes 3 year Parts, 3 year Labor, 3-year on-site support.

A full range of Care Pack packaged hardware and software services:

- Installation and start up
- Extended coverage hours and enhanced response times
- System management and performance services
- Availability and recovery services

NOTE: For more information, customer/resellers can contact: http://www.hp.com/services/carepack

Please see the following URL regarding Warranty Information For Your HP Products:
http://www.compaq.com/support/warranty_upgrades/web_statements/176738.html.

For additional information regarding Worldwide Limited Warranty and Technical Support, please see the following URL:
ftp://ftp.compaq.com/pub/supportinformation/ejourney/176738.pdf.
NOTE: These Web sites are available in English only.

NOTE: Certain restrictions and exclusions apply. Consult the HP Customer Support Center at 1-800-345-1518 for details

Redundant Options	DC Power Supply for the DL380 (48V)	268290-B21
	NOTE: The ProLiant DL380 G3 ships standard with a 100-240 volt auto-switching AC power supply. Each 48-volt DC option kit (PN 268290-B21) contains one power supply. Therefore, to convert to redundant DC power supplies, two must be purchased.	

Options

Redundant Options	Hat Plug AC Redundant Pawer Supply Module (NEMA cord)	313054-001
	Hot Plug AC Redundant Power Supply Module (IEC cord)	313054-B21
Management Options	Remote Insight Lights-Out Edition II	227251-001
	NOTE: USB Virtual Media Not Supported.	
	NOTE: The RILOE II USB Virtual Media feature is not supported on the 2.40 and 2.80 GHz versions of the ProLiant DL380 G3 and ProLiant ML370 G3 servers. The RILOE II cannot be used to connect the local client floppy and CD devices as USB virtual devices to the remote server. All other RILOE II features are supported on these servers. The non-USB based RILOE II Virtual Floppy feature is still supported, allowing you to perform functions such as remote ROM upgrades and server deployment. The Virtual Floppy feature requires loading the floppy image in to the RILOE II. For more details, please refer to the user guide of the RILOE II.

Memory

HP ProLiant Model DL380 Generation 3 (G3) 3.06GHz Models

Standard Memory

1 GB PC2100 Registered DDR SDRAM DIMM Memory running at 266MHz comes installed (2 x 512-MB SDRAM)

Standard Memory Plus Optional Memory

Up to 9,216-MB memory is available with the optional installation of PC2100 Registered DDR SDRAM DIMM Memory Option Kit

Standard Memory Replaced with Optional Memory

Up to 12,288-MB of memory is available with the removal of the standard 512-MB of memory and the optional installation of PC2100 Registered DDR SDRAM DIMM Memory Option Kit

NOTE: Chart does not represent all possible configurations.

Memory		Slot					
		1	2	3	4	5	6
Standard	1024MB	512MB	512MB	Empty	Empty	Empty	Empty
Optional	8,960MB	512MB	512MB	2048MB	2048MB	2048MB	2048MB
Maximum	12,288MB	2048MB	2048MB	2048MB	2048MB	2048MB	2048MB

NOTE: In the online spare configuration, the ROM automatically configures the last populated back as the spare memory. If only banks A and B are populated, bank B is the spare bank. If banks A, B, and C are populated, bank C is the spare bank, Online spare memory is configured through RBSU.

Following are memory options available from HP:

- 4096MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (2x 2048 MB) 300682-B21
  NOTE: The 4096MB of Advanced ECC PC2100 DDR Memory kit (300682-B21) can only be used in 3.06GHz and faster models.
- 2048-MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (2x1024MB) 300680-B21
- 1024-MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit 2 x 512MB) 300679-B21
- 512-MB of Advanced ECC PC2100 DDR SDRAM DIMM Memory Kit (2 x 256MB) 300678-B21

HP ProLiant Model DL380 Generation 3 (G3) 2.8GHz and 2.4GHz Models

Standard Memory

512-MB PC2100 Registered DDR SDRAM DIMM Memory running at 200MHz comes installed (2 x 256-MB SDRAM)

Standard Memory Plus Optional Memory

Up to 4,608-MB memory is available with the optional installation of PC2100 Registered DDR SDRAM DIMM Memory Option Kit

Standard Memory Replaced with Optional Memory

Up to 6,144-MB of memory is available with the removal of the standard 256-MB of memory and the optional installation of PC2100 Registered DDR SDRAM DIMM Memory Option Kit

NOTE: Chart does not represent all possible configurations.

TechSpecs

Integrated Smart Array 5i Plus Controller

Data Compatible with all Smart Array Controllers	Yes
Instant Upgrades to other Smart Array Controllers	Yes
Consistent Software Manageability Tools	Yes
PCI-X Bus	64-bit, 100 MHz (integrated on system board)
PCI-X Peak Data Transfer Rate	800 MB/s
SCSI Protocols Supported	Ultra3, Ultra2
SCSI Peak Data Transfer Rate	160 MB/s per channel NOTE: For ProLiant servers having TWO internal drive bays on separate SCSI ports: SCSI Peak Data Transfer Rate is 320 MB/s total; 160 MB/s per channel and Channels is 2.
Channels	2 NOTE: For ProLiant servers having two internal drive bays on separate SCSI ports: SCSI Peak Data Transfer Rate is 320 MB/s total; 160 MB/s per channel and Channels is 2.
SCSI Ports (external/internal)	0/2 NOTE: For ProLiant servers having two internal drive bays on separate SCSI ports: SCSI Peak Data Transfer Rate is 320 MB/s total; 160 MB/s per channel and Channels is 2.
Drives Supported (maximum)	Maximum = total number of drives NOTE: Maximum is the total number of internal drives on each specific ProLiant server.
Cache	64 MB Read and/or Write Cache
Battery-Backed Write Cache	Yes, with installation of Battery-Backed Write Cache Enabler, up to 64MB
RAID Support	0, 1, 1+ 0, 5
Logical Drives (maximum)	Maximum = total number of drives
Online Configuration	Yes
Online Capacity Expansion	Yes
Logical Drive Capacity Extension	Yes
Online Stripe Size Migration	Yes
Online RAID Level Migration	Yes
Online Spare Support	Yes
Automatic Data Recovery	Yes
Drive Roaming	Yes
Redundant Controllers	No

User Group Management

This chapter provides information about setting up and managing user groups in Cisco Secure Access Control Server (Cisco Secure ACS) Appliance version 3.2 to control authorization. Cisco Secure ACS enables you to group network users for more efficient administration. Each user can belong to only one group in Cisco Secure ACS. You can establish up to 500 groups to effect different levels of authorization.

Cisco Secure ACS also supports external database group mapping; that is, if your external user database distinguishes user groups, these groups can be mapped into Cisco Secure ACS. And if the external database does not support groups, you can map all users from that database to a Cisco Secure ACS user group. For information about external database mapping, see Chapter 15, "User Group Mapping and Specification".

Before you configure Group Setup, you should understand how this section functions. Cisco Secure ACS dynamically builds the Group Setup section interface depending on the configuration of your network devices and the security protocols being used. That is, what you see under Group Setup is affected by settings in the Network Configuration and Interface Configuration sections.

This chapter contains the following sections:

- **User Group Setup Features and Functions, page 6-2**—This section is an overview of the features you find within Group Setup.
- **Common User Group Settings, page 6-3**—This section details procedures that you typically would perform regardless of your particular network security configuration.

CPMI - CORREIOS
1096
3701
Fls:
3701
Doc:

- **Configuration-specific User Group Settings, page 6-15**—This section details procedures that you would perform only as applicable to your particular network security configuration.
- **Group Setting Management, page 6-52**—This section includes basic administrative procedures, such as determining the users in a group or renaming a group.

User Group Setup Features and Functions

The Group Setup section of the Cisco Secure ACS HTML interface is the centralized location for operations regarding user group configuration and administration. For information about network device groups (NDGs), see Network Device Group Configuration, page 4-36.

Default Group

If you have not configured group mapping for an external user database, Cisco Secure ACS assigns users who are authenticated by the Unknown User Policy to the Default Group the first time they log in. The privileges and restrictions for the default group are applied to first-time users. If you have upgraded from a previous version of Cisco Secure ACS and kept your database information, Cisco Secure ACS retains the group mappings you configured before upgrading.

Group TACACS+ Settings

Cisco Secure ACS enables a full range of settings for TACACS+ at the group level. If a AAA client has been configured to use TACACS+ as the security control protocol, you can configure standard service protocols, including PPP IP, PPP LCP, ARAP, SLIP, and shell (exec), to be applied for the authorization of each user who belongs to a particular group.

Note You can also configure TACACS+ settings at the user level. User-level settings always override group level settings.

ECT 14268 CPL - AC

Cisco Secure ACS also enables you to enter and configure new TACACS+ services. For information about how to configure a new TACACS+ service to appear on the group setup page, see Protocol Configuration Options for TACACS+, page 3-7.

If you have configured Cisco Secure ACS to interact with a Cisco device-management application, new TACACS+ services may appear automatically, as needed, to support the device-management application. For more information about Cisco Secure ACS interaction with device-management applications, see Support for Cisco Device-Management Applications, page 1-18.

You can use the Shell Command Authorization Set feature to configure TACACS+ group settings. This feature enables you to apply shell commands to a particular user group in the following ways:

- Assign a shell command authorization set, which you have already configured, for any network device.
- Assign a shell command authorization set, which you have already configured, to particular NDGs.
- Permit or deny specific shell commands, which you define, on a per-group basis.

For more information about shell command authorization sets, see Chapter 5, "Shared Profile Components".

Common User Group Settings

This section presents the basic activities you perform when configuring a new user group. This section contains the following procedures:

- Enabling VoIP Support for a User Group, page 6-4
- Setting Default Time-of-Day Access for a User Group, page 6-5
- Setting Callback Options for a User Group, page 6-6
- Setting Network Access Restrictions for a User Group, page 6-7
- Setting Max Sessions for a User Group, page 6-11
- Setting Usage Quotas for a User Group, page 6-13

Enabling VoIP Support for a User Group

Note If this feature does not appear, click **Interface Configuration**, click **Advanced Options**, and then select the **Voice-over-IP (VoIP) Group Settings** check box.

Perform this procedure to enable support for the null password function of VoIP. This enables users to authenticate (session or telephone call) on only the user ID (telephone number).

When you enable VoIP at the group level, all users in this group become VoIP users, and the user IDs are treated similarly to a telephone number. VoIP users do not need to enter passwords to authenticate.

Caution Enabling VoIP disables password authentication and most advanced settings, including password aging and protocol attributes.

To enable VoIP support for a group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select the group you want to configure for VoIP support, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 3 In the Voice-over-IP Support table, select the check box labeled **This is a Voice-over-IP (VoIP) group - and all users of this group are VoIP users**.

Step 4 To save the group settings you have just made, click **Submit**.
For more information, see Saving Changes to User Group Settings, page 6-54.

Step 5 To continue, and specify other group settings, perform other procedures in this chapter, as applicable.

Setting Default Time-of-Day Access for a User Group

Note If this feature does not appear, click **Interface Configuration**, click **Advanced Options**, and then select the **Default Time-of-Day / Day-of-Week Specification** check box.

To define the times during which users in a particular group are permitted or denied access, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 3 In the Default Time-of-Day Access Settings table, select the **Set as default Access Times** check box.

Note You must select the **Set as default Access Times** check box to limit access based on time or day.

Result: Times at which the system permits access are highlighted in green on the day and hour matrix.

Note The default sets accessibility during all hours.

Step 4 In the day and hour matrix, click the times at which you do *not* want to permit access to members of this group.

Tip Clicking times of day on the graph deselects those times; clicking again reselects them.
At any time, you can click **Clear All** to clear all hours, or you can click **Set All** to select all hours.

CPMI 6-5
1098
Fls:
Doc: 3701

Step 5 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 6 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Setting Callback Options for a User Group

Callback is a command string that is passed back to the access server. You can use callback strings to initiate a modem to call the user back on a specific number for added security or reversal of line charges. There are three options, as follows:

- **No callback allowed**—Disables callback for users in this group. This is the default setting.
- **Dialup client specifies callback number**—Allows the dialup client to specify the callback number. The dialup client must support RFC 1570, PPP LCP Extensions.
- **Use Windows Database callback settings (where possible)**—Uses the Microsoft Windows callback settings. If a Windows account for a user resides in a remote domain, the domain in which Cisco Secure ACS resides must have a two-way trust with that domain for the Microsoft Windows callback settings to operate for that user.

To set callback options for a user group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 Select a group from the Group list, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 3 In the Callback table, select one of the following three options:

- No callback allowed
- Dialup client specifies callback number
- Use Windows Database callback settings (where possible)

1426
CPL - AC

Step 4 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 5 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Setting Network Access Restrictions for a User Group

The Network Access Restrictions table in Group Setup enables you to apply network access restrictions (NARs) in three distinct ways:

- Apply existing shared NARs by name.
- Define IP-based group access restrictions to permit or deny access to a specified AAA client or to specified ports on a AAA client when an IP connection has been established.
- Define CLI/DNIS-based group NARs to permit or deny access to either, or both, the calling line ID (CLI) number or the Dialed Number Identification Service (DNIS) number used.

Note You can also use the CLI/DNIS-based access restrictions area to specify other values. For more information, see About Network Access Restrictions, page 5-7.

Typically, you define (shared) NARs from within the Shared Components section so that these restrictions can be applied to more than one group or user. For more information, see Shared Network Access Restrictions Configuration, page 5-9. You must have enabled the Group-Level Shared Network Access Restriction check box on the Advanced Options page of the Interface Configuration section for these options to appear in the Cisco Secure ACS HTML interface.

However, Cisco Secure ACS also enables you to define and apply a NAR for a single group from within the Group Setup section. You must have enabled the Group-Level Network Access Restriction setting under the Advanced Options page of the Interface Configuration section for single group IP-based filter options and single group CLI/DNIS-based filter options to appear in the Cisco Secure ACS HTML interface.

CRMI 6-7
1099
Fls:
3701
Doc:

Note When an authentication request is forwarded by proxy to a Cisco Secure ACS server, any NARs for TACACS+ requests are applied to the IP address of the forwarding AAA server, not to the IP address of the originating AAA client.

To set NARs for a user group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 3 To apply a previously configured shared NAR to this group, follow these steps:

Note To apply a shared NAR, you must have configured it under Network Access Restrictions in the Shared Profile Components section. For more information, see Shared Network Access Restrictions Configuration, page 5-9.

a. Select the **Only Allow network access when** check box.

b. To specify whether one or all shared NARs must apply for a member of the group to be permitted access, select one of the following options:

- All selected shared NARS result in permit
- Any one selected shared NAR results in permit

c. Select a shared NAR name in the Shared NAR list, and then click —> (right arrow button) to move the name into the Selected Shared NARs list.

Tip To view the server details of the shared NARs you have selected to apply, you can click either **View IP NAR** or **View CLID/DNIS NAR**, as applicable.

H.262.1

Step 4 To define and apply a NAR, for this particular user group, that permits or denies access to this group based on IP address, or IP address and port, follow these steps:

Tip You should define most NARs from within the Shared Components section so that the restrictions can be applied to more than one group or user. For more information, see Shared Network Access Restrictions Configuration, page 5-9.

a. In the Per Group Defined Network Access Restrictions section of the Network Access Restrictions table, select the **Define IP-based access restrictions** check box.

b. To specify whether the subsequent listing specifies permitted or denied IP addresses, from the Table Defines list, select either **Permitted Calling/Point of Access Locations** or **Denied Calling/Point of Access Locations**.

c. Select or enter the information in the following boxes:

- **AAA Client**—Select either All AAA Clients or the name of the NDG or the name of the individual AAA client to which to permit or deny access.
- **Port**—Type the number of the port to which to permit or deny access. You can use the wildcard asterisk (*) to permit or deny access to all ports on the selected AAA client.
- **Address**—Type the IP address or addresses to filter on when performing access restrictions. You can use the wildcard asterisk (*).

Note The total number of characters in the AAA Client list and the Port and Src IP Address boxes must not exceed 1024. Although Cisco Secure ACS accepts more than 1024 characters when you add a NAR, you cannot edit the NAR and Cisco Secure ACS cannot accurately apply it to users.

d. Click **Enter**.

Result: The specified the AAA client, port, and address information appears in the NAR Access Control list.

CPMI - CORREIOS
1100
Fls:
3701
Doc:

Step 5 To permit or deny access to this user group based on calling location or values other than an established IP address, follow these steps:

a. Select the **Define CLI/DNIS-based access restrictions** check box.

b. To specify whether the subsequent listing specifies permitted or denied values, from the Table Defines list, select one of the following:

- Permitted Calling/Point of Access Locations
- Denied Calling/Point of Access Locations

c. From the AAA Client list, select either All AAA Clients or the name of the NDG or the name of the particular AAA client to which to permit or deny access.

d. Complete the following boxes:

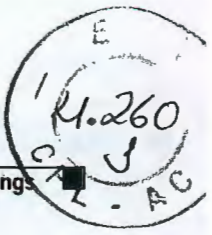
Note You must type an entry in each box. You can use the wildcard asterisk (*) for all or part of a value. The format you use must match the format of the string you receive from your AAA client. You can determine this format from your RADIUS Accounting Log.

- **PORT**—Type the number of the port to which to permit or deny access. You can use the wildcard asterisk (*) to permit or deny access to all ports.
- **CLI**—Type the CLI number to which to permit or deny access. You can use the wildcard asterisk (*) to permit or deny access based on part of the number or all numbers.

Tip This is also the selection to use if you want to restrict access based on other values, such as a Cisco Aironet client MAC address. For more information, see About Network Access Restrictions, page 5-7.

- **DNIS**—Type the DNIS number to restrict access based on the number into which the user will be dialing. You can use the wildcard asterisk (*) to permit or deny access based on part of the number or all numbers.

Tip This is also the selection to use if you want to restrict access based on other values, such as a Cisco Aironet AP MAC address. For more information, see About Network Access Restrictions, page 5-7.



Note The total number of characters in the AAA Client list and the Port, CLI, and DNIS boxes must not exceed 1024. Although Cisco Secure ACS accepts more than 1024 characters when you add a NAR, you cannot edit the NAR and Cisco Secure ACS cannot accurately apply it to users.

e. Click **Enter**.

Result: The information, specifying the AAA client, port, CLI, and DNIS appears in the list.

Step 6 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 7 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

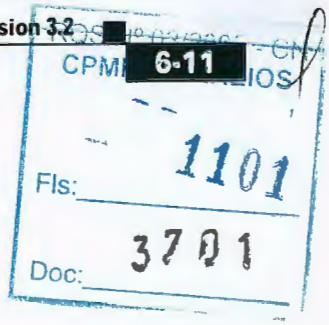
Setting Max Sessions for a User Group

Note If this feature does not appear, click **Interface Configuration**, click **Advanced Options**, and then select the **Max Sessions** check box.

Perform this procedure to define the maximum number of sessions available to a group, or to each user in a group, or both. The settings are as follows:

- **Sessions available to group**—Sets the maximum number of simultaneous connections for the entire group.
- **Sessions available to users of this group**—Sets the maximum number of total simultaneous connections for each user in this group.

Tip As an example, Sessions available to group is set to 10 and Sessions available to users of this group is set to 2. If each user is using the maximum 2 simultaneous sessions, no more than 5 users can log in.



Note A session is any type of connection supported by RADIUS or TACACS+, such as PPP, NAS prompt, Telnet, ARAP, IPX/SLIP.

Note The default setting for group Max Sessions is Unlimited for both the group and the user within the group.

To configure max sessions settings for a user group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 3 In the Max Sessions table, under Sessions available to group, select one of the following options:

- **Unlimited**—Select to allow this group an unlimited number of simultaneous sessions. (This effectively disables Max Sessions.)
- *n*—Type the maximum number of simultaneous sessions to allow this group.

Step 4 In the lower portion of the Max Sessions table, under Sessions available to users of this group, select one of the following two options:

- **Unlimited**—Select to allow each individual in this group an unlimited number of simultaneous sessions. (This effectively disables Max Sessions.)
- *n*—Type the maximum number of simultaneous sessions to allow each user in this group.

Note Settings made in User Setup override group settings. For more information, see Setting Max Sessions Options for a User, page 7-16.

Step 5 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

ECT 14.258 SL - AC

Step 6 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Setting Usage Quotas for a User Group

Note If this feature does not appear, click **Interface Configuration**, click **Advanced Options**, and then select the **Usage Quotas** check box.

Perform this procedure to define usage quotas for members of a group. Session quotas affect each user of a group individually, not the group collectively. You can set quotas for a given period in two ways:

- By total duration of session
- By the total number of sessions

If you make no selections in the Usage Quotas section for a group, no usage quotas are enforced on users assigned to that group, unless you configure usage quotas for the individual users.

Note The Usage Quotas section on the Group Settings page does not show usage statistics.
Usage statistics are available only on the settings page for an individual user. For more information, see Setting User Usage Quotas Options, page 7-18.

When a user exceeds his or her assigned quota, Cisco Secure ACS denies that user access upon attempting to start a session. If a quota is exceeded during a session, Cisco Secure ACS allows the session to continue.

You can reset the usage quota counters for all users of a group from the Group Settings page. For more information about resetting usage quota counters for a whole group, see Resetting Usage Quota Counters for a User Group, page 6-53.

Tip To support time-based quotas, we recommend enabling accounting update packets on all AAA clients. If update packets are not enabled, the quota is updated when the user logs off. If the AAA client through which the user is accessing your

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 3701
Doc:

network fails, the quota is not updated. In the case of multiple sessions, such as with ISDN, the quota is not updated until all sessions terminate. This means that a second channel will be accepted even if the first channel has exhausted the quota for the user.

To set user usage quotas for a user group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 3 To define usage quotas based on duration of sessions, follow these steps:

a. In the Usage Quotas table, select the **Limit each user of this group to** *x* **hours of online time** *per time unit* check box.

b. Type the number of hours to which you want to limit group members in the **to** *x* **hours** box.
Use decimal values to indicate minutes. For example, a value of 10.5 would equal ten hours and 30 minutes.

Note Up to 5 characters are allowed in the to *x* hours box.

c. Select the period for which the quota is effective from the following:

- **per Day**—From 12:01 a.m. until midnight.
- **per Week**—From 12:01 a.m. Sunday until midnight Saturday.
- **per Month**—From 12:01 a.m. on the first of the month until midnight on the last day of the month.
- **Total**—An ongoing count of hours, with no end.

Step 4 To define user session quotas based on number of sessions, follow these steps:

a. In the Usage Quotas table, select the **Limit each user of this group to** *x* **sessions** check box.

ECT 14.256 AL - AC

b. Type the number of sessions to which you want to limit users in the **to *x* sessions** box.

Note Up to 5 characters are allowed in the to *x* sessions box.

c. Select the period for which the session quota is effective from the following:

- **per Day**—From 12:01 a.m. until midnight.
- **per Week**—From 12:01 a.m. Sunday until midnight Saturday.
- **per Month**—From 12:01 a.m. on the first of the month until midnight on the last day of the month.
- **Total**—An ongoing count of session, with no end.

Step 5 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 6 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Configuration-specific User Group Settings

This section details procedures that you perform only as applicable to your particular network security configuration. For instance, if you have no token server configured, you do not have to set token card settings for each group.

This section contains the following procedures:

- Setting Token Card Settings for a User Group, page 6-17
- Setting Enable Privilege Options for a User Group, page 6-18
- Enabling Password Aging for the CiscoSecure User Database, page 6-20
- Enabling Password Aging for Users in Windows Databases, page 6-25
- Setting IP Address Assignment Method for a User Group, page 6-27
- Assigning a Downloadable IP ACL to a Group, page 6-28
- Configuring TACACS+ Settings for a User Group, page 6-29

RQS Nº 03/2005 - CN - CPMI - CORREIOS
1103
Fls:
3701
Doc:

- Configuring a Shell Command Authorization Set for a User Group, page 6-31
- Configuring a PIX Command Authorization Set for a User Group, page 6-33
- Configuring Device-Management Command Authorization for a User Group, page 6-35
- Configuring IETF RADIUS Settings for a User Group, page 6-37
- Configuring Cisco IOS/PIX RADIUS Settings for a User Group, page 6-38
- Configuring Cisco Aironet RADIUS Settings for a User Group, page 6-39
- Configuring Ascend RADIUS Settings for a User Group, page 6-41
- Configuring Cisco VPN 3000 Concentrator RADIUS Settings for a User Group, page 6-42
- Configuring Cisco VPN 5000 Concentrator RADIUS Settings for a User Group, page 6-44
- Configuring Microsoft RADIUS Settings for a User Group, page 6-45
- Configuring Nortel RADIUS Settings for a User Group, page 6-47
- Configuring Juniper RADIUS Settings for a User Group, page 6-49
- Configuring BBSM RADIUS Settings for a User Group, page 6-50

Note When a vendor-specific variety of RADIUS is configured for use by network devices, the RADIUS (IETF) attributes are available because they are the base set of attributes, used as the first 74 attributes for all RADIUS vendors.

The content of these subsections is dynamic and based on two factors as follows:

- For a particular protocol to be listed, a AAA client must be configured to authenticate using that protocol. For more information, see AAA Client Configuration, page 4-11.
- The specific attributes for a particular protocol must be configured for display at the group level. For more information, see Protocol Configuration Options for TACACS+, page 3-7 or Protocol Configuration Options for RADIUS, page 3-11.

Setting Token Card Settings for a User Group

Note If this section does not appear, configure a token server. Then, click **External User Databases**, click **Database Configuration**, and then add the applicable token card server.

Perform this procedure to allow a token to be cached. This means users can use a second B channel without having to enter a second one-time password (OTP).

Caution This option is for use with token caching only for ISDN terminal adapters. You should fully understand token caching and ISDN concepts and principles before implementing this option. Token caching allows you to connect to multiple B channels without having to provide a token for each channel connection. Token card settings are applied to all users in the selected group.

Options for token caching include the following:

- **Session**—You can select Session to cache the token for the entire session. This allows the second B channel to dynamically go in and out of service.
- **Duration**—You can select Duration and specify a period of time to have the token cached (from the time of first authentication). If this time period expires, the user cannot start a second B channel.
- **Session and Duration**—You can select both Session and Duration so that, if the session runs longer than the duration value, a new token is required to open a second B channel. Type a value high enough to allow the token to be cached for the entire session. If the session runs longer than the duration value, a new token is required to open a second B channel.

To set token card settings for a user group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 3 From the Jump To list at the top of the page, choose **Token Cards**.

ECT 14.254 PL-AC
RQS Nº 03/2005 - CN
CPMI - CORREIOS
1104
Fls:
Doc: 3701

Step 4 In the Token Card Settings table, to cache the token for the entire session, select **Session**.

Step 5 Also in the Token Card Settings table, to cache the token for a specified time period (measured from the time of first authentication), follow these steps:

a. Select **Duration**.

b. Type the duration length in the box.

c. Select the unit of measure, either Seconds, Minutes or Hours.

Step 6 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 7 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Setting Enable Privilege Options for a User Group

Note If this section does not appear, click **Interface Configuration** and then click **TACACS+ (Cisco)**. At the bottom of the page in the Advanced Configuration Options table, select the **Advanced TACACS+ features** check box.

Perform this procedure to configure group-level TACACS+ enable parameters. The three possible TACACS+ enable options are as follows:

- **No Enable Privilege**—(default) Select this option to disallow enable privileges for this user group.
- **Max Privilege for Any AAA Client**—Select this option to select the maximum privilege level for this user group for any AAA client on which this group is authorized.
- **Define max Privilege on a per-network device group basis**—Select this option to define maximum privilege levels for an NDG. To use this option, you create a list of device groups and corresponding maximum privilege levels. See your AAA client documentation for information about privilege levels.

ECT 1/4.252 PL - AC

Note To define levels in this manner, you must have configured the option in Interface Configuration; if you have not done so already, click **Interface Configuration**, click **Advanced Settings**, and then select the **Network Device Groups** check box.

If you are using NDGs, this option lets you configure the NDG for enable-level mapping rather than having to do it for each user in the group.

To set enable privilege options for a user group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 3 From the Jump To list at the top of the page, choose **Enable Options**.

Step 4 Do one of the following:

- To disallow enable privileges for this user group, select the **No Enable Privilege** option.
- To set the maximum privilege level for this user group, for any ACS on which this group is authorized, select the **Max Privilege for Any Access Server** option. Then, select the maximum privilege level from the list.
- To define the maximum NDG privilege level for this user group, select the **Define max Privilege on a per-network device group basis** option. Then, from the lists, select the NDG and a corresponding privilege level. Finally, click **Add Association**.

  Result: The association of NDG and maximum privilege level appears in the table.

Step 5 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 6 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Doc: 3701

Enabling Password Aging for the CiscoSecure User Database

The password aging feature of Cisco Secure ACS enables you to force users to change their passwords under one or more of the following conditions:

- After a specified number of days (age-by-date rules)
- After a specified number of logins (age-by-uses rules)
- The first time a new user logs in (password change rule)

Varieties of Password Aging Supported by Cisco Secure ACS

Cisco Secure ACS supports four distinct password aging mechanisms, as follows:

- **EAP-GTC Windows Password Aging**—Users must be in the Windows user database and be using a Microsoft client that supports EAP, such as Windows XP. For information on the requirements and configuration of this password aging mechanism, see Enabling Password Aging for Users in Windows Databases, page 6-25.
- **RADIUS-based Windows Password Aging**—Users must be in the Windows user database and be using the Windows Dial-up Networking (DUN) client. For information on the requirements and configuration of this password aging mechanism, see Enabling Password Aging for Users in Windows Databases, page 6-25.
- **Password Aging for Device-hosted Sessions**—Users must be in the CiscoSecure user database, the AAA client must be running TACACS+, and the connection must use Telnet. You can control the ability of users to change passwords during a device-hosted Telnet session. You can also control whether Cisco Secure ACS propagates passwords changed by this feature. For more information, see Local Password Management, page 8-5.
- **Password Aging for Transit Sessions**—Users must be in the CiscoSecure user database. Users must use a PPP dialup client. Further, the end-user client must have CiscoSecure Authentication Agent (CAA) installed.

Tip The CAA software is available at http://www.cisco.com.

Also, to run password aging for transit sessions, the AAA client can be running either RADIUS or TACACS+; and the AAA client must be using Cisco IOS Release 11.2.7 or later and be configured to send a watchdog accounting packet (aaa accounting new-info update) with the IP address of

ECT 1402501 CEL - AC

the calling station. (Watchdog packets are interim packets sent periodically during a session. They provide an approximate session length in the event that no stop packet is received to mark the end of the session.)

You can control whether Cisco Secure ACS propagates passwords changed by this feature. For more information, see Local Password Management, page 8-5.

Cisco Secure ACS supports password aging using the RADIUS protocol under MS CHAP versions 1 and 2. Cisco Secure ACS does not support password aging over Telnet connections using the RADIUS protocol.

Caution If a user with a RADIUS connection tries to make a Telnet connection to the AAA client during or after the password aging warning or grace period, the change password option does not appear, and the user account is expired.

Password Aging Feature Settings

This section details only the Password Aging for Device-hosted Sessions and Password Aging for Transit Sessions mechanisms. For information on the Windows Password Aging mechanism, see Enabling Password Aging for Users in Windows Databases, page 6-25. For information on configuring local password validation options, see Local Password Management, page 8-5.

The password aging feature in Cisco Secure ACS has the following options:

- **Apply age-by-date rules**—Selecting this check box configures Cisco Secure ACS to determine password aging by date. The age-by-date rules contain the following settings:
  - **Active period**—The number of days users will be allowed to log in before being prompted to change their passwords. For example, if you enter 20, users can use their passwords for 20 days without being prompted to change them. The default Active period is 20 days.
  - **Warning period**—The number of days users will be notified to change their passwords. The existing password can be used, but the Cisco Secure ACS presents a warning indicating that the password must be changed and displays the number of days left before the password expires. For example, if you enter 5 in this box and 20 in the Active period box, users will be notified to change their passwords on the 21st through 25th days.

RQS Nº 03/2005 - CN CPMI - CORREIOS 1106 Fls: 3701 Doc:

- **Grace period**—The number of days to provide as the user grace period. The grace period allows a user to log in once to change the password. The existing password can be used one last time after the number of days specified in the active and warning period fields has been exceeded. Then, a dialog box warns the user that the account will be disabled if the password is not changed, and enables the user to change it. Continuing with the examples above, if you allow a 5-day grace period, a user who did not log in during the active and warning periods would be permitted to change passwords up to and including the 30th day. However, even though the grace period is set for 5 days, a user is allowed only one attempt to change the password when the password is in the grace period. Cisco Secure ACS displays the "last chance" warning only once. If the user does not change the password, this login is still permitted, but the password expires, and the next authentication is denied. An entry is logged in the Failed-Attempts log, and the user must contact an administrator to have the account reinstated.

Note All passwords expire at midnight, not the time at which they were set.

- **Apply age-by-uses rules**—Selecting this check box configures Cisco Secure ACS to determine password aging by the number of logins. The age-by-uses rules contain the following settings:
  - **Issue warning after *x* logins**—The number of the login upon which Cisco Secure ACS begins prompting users to change their passwords. For example, if you enter 10, users are allowed to log in 10 times without a change-password prompt. On the 11th login, they are prompted to change their passwords.

Tip To allow users to log in an unlimited number of times without changing their passwords, type **-1**.

  - **Require change after *x* logins**—The number of the login after which to notify users that they must to change their passwords. Continuing with the previous example, if this number is set to 12, users receive prompts requesting them to change their passwords on their 11th and 12th login attempts. On the 13th login attempt, they receive a prompt telling them

E C T
4.248
L - AC

that they must change their passwords. If users do not change their passwords now, their accounts expire and they cannot log in. This number must be greater than the **Issue warning after *x* login** number.

Tip To allow users to log in an unlimited number of times without changing their passwords, type **-1**.

- **Apply password change rule**—Selecting this check box forces new users to change their passwords the first time they log in.
- **Generate greetings for successful logins**—Selecting this check box enables a Greetings message to display whenever users log in successfully via the CAA client. The message contains up-to-date password information specific to this user account.

The password aging rules are not mutually exclusive; a rule is applied for each check box that is selected. For example, users can be forced to change their passwords every 20 days, and every 10 logins, and to receive warnings and grace periods accordingly.

If no options are checked, passwords never expire.

Unlike most other parameters, which have corresponding settings at the user level, password aging parameters are configured only on a group basis.

Users who fail authentication because they have not changed their passwords and have exceeded their grace periods are logged in the Failed Attempts log. The accounts expire and appear in the Accounts Disabled list.

Before You Begin

- Verify that your AAA client is running the TACACS+ or RADIUS protocol. (TACACS+ only supports password aging for device-hosted sessions.)
- Set up your AAA client to perform authentication *and* accounting using the same protocol, either TACACS+ RADIUS.
- Verify that you have configured your password validation options. For more information, see Local Password Management, page 8-5.
- Set up your AAA client to use Cisco IOS Release 11.2.7 or later and to send a watchdog accounting packet (aaa accounting new-info update) with the IP address of the calling station.

To set password aging rules for a user group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 3 From the Jump To list at the top of the page, choose **Password Aging**.

Result: The Password Aging Rules table appears.

Step 4 To set password aging by date, select the **Apply age-by-date rules** check box and type the number of days for the following options, as applicable:

- Active period
- Warning period
- Grace period

Note Up to 5 characters are allowed in each field.

Step 5 To set password aging by use, select the **Apply age-by-uses rules** check box and type the number of logins for each of the following options, as applicable:

- Issue warning after *x* logins
- Require change after *x* logins

Note UP to 5 characters are allowed in each field.

Step 6 To force the user to change the password on the first login after an administrator has changed it, select the **Apply password change rule** check box.

Step 7 To enable a Greetings message display, select the **Generate greetings for successful logins** check box.

Step 8 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 9 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Enabling Password Aging for Users in Windows Databases

Cisco Secure ACS supports two types of password aging for users in Windows databases. Both types of Windows password aging mechanisms are separate and distinct from the other Cisco Secure ACS password aging mechanisms. For information on the requirements and settings for the password aging mechanisms that control users in the CiscoSecure user database, see Enabling Password Aging for the CiscoSecure User Database, page 6-20.

Note You can run both Windows Password Aging and Cisco Secure ACS Password Aging for Transit Sessions mechanisms concurrently, provided that the users authenticate from the two different databases.

The two types of password aging in Windows databases are as follows:

- **RADIUS-based password aging**—RADIUS-based password aging depends upon the RADIUS AAA protocol to send and receive the password change messages. Requirements for implementing the RADIUS-based Windows password aging mechanism include the following:
  - Communication between Cisco Secure ACS and the AAA client must be using RADIUS.
  - The AAA client must support MS CHAP password aging in addition to MS CHAP authentication.
  - Users must be in a Windows user database.
  - Users must be using the Windows DUN client.
  - You must enable MS CHAP version 1 or MS CHAP version 2, or both, in the Windows configuration within the External User Databases section.

ECT 4.246 J
ROS Nº 03/2005 - CN
CPMI - CORREIOS
1108
6-25
Fls:
3701
Doc:

Tip For information on enabling MS CHAP for password changes, see Configuring Windows Authentication, page 13-22. For information on enabling MS CHAP in System Configuration, see Global Authentication Setup, page 10-11.

- **PEAP password aging**—PEAP password aging depends upon the PEAP(EAP-GTC) or PEAP(EAP-MSCHAPv2) authentication protocol to send and receive the password change messages. Requirements for implementing the PEAP Windows password aging mechanism include the following:
  - The AAA client must support EAP.
  - Users must be in a Windows user database.
  - Users must be using a Microsoft PEAP client, such as Windows XP.
  - You must enable PEAP on the Global Authentication Configuration page within the System Configuration section.

Tip For information about enabling PEAP in System Configuration, see Global Authentication Setup, page 10-11.

  - You must enable PEAP password changes on the Windows Authentication Configuration page within the External User Databases section.

Tip For information about enabling PEAP password changes, see Configuring Windows Authentication, page 13-22.

Users whose Windows accounts reside in "remote" domains (that is, not the domain within which Cisco Secure ACS is running) can only use the Windows-based password aging if they supply their domain names.

The methods and functionality of Windows password aging differ according to which Microsoft Windows operating system you are using, and whether you employ Active Directory (AD) or Security Accounts Manager (SAM). Setting password aging for users in the Windows user database is only one part of the

ECT 4.2441 J AC

larger task of setting security policies in Windows. For comprehensive information on Windows procedures, refer to your Windows system documentation.

Setting IP Address Assignment Method for a User Group

Perform this procedure to configure the way Cisco Secure ACS assigns IP addresses to users in the group. The four possible methods are as follows:

- **No IP address assignment**—No IP address is assigned to this group.
- **Assigned by dialup client**—Use the IP address that is configured on the dialup client network settings for TCP/IP.
- **Assigned from AAA Client pool**—The IP address is assigned by an IP address pool assigned on the AAA client.
- **Assigned from AAA server pool**—The IP address is assigned by an IP address pool assigned on the AAA server.

To set an IP address assignment method for a user group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 3 From the Jump To list at the top of the page, choose **IP Address Assignment**.

Step 4 In the IP Assignment table, do one of the following:

- Select **No IP address assignment**.
- Select **Assigned by dialup client**.
- Select **Assigned from AAA Client pool**. Then, type the AAA client IP pool name.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
1109
Fls: 6.27
Doc: 3701

- Select **Assigned from AAA pool**. Then, select the AAA server IP pool name in the Available Pools list and click —> (right arrow button) to move the name into the Selected Pools list.

Note If there is more than one pool in the Selected Pools list, the users in this group are assigned to the first available pool in the order listed.

Tip To change the position of a pool in the list, select the pool name and click **Up** or **Down** until the pool is in the position you want.

Step 5 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 6 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Assigning a Downloadable IP ACL to a Group

The Downloadable ACLs feature enables you to assign an IP ACL at the group level.

Note You must have established one or more IP ACLs before attempting to assign one. For instructions on how to add a downloadable IP ACL using the Shared Profile Components section of the Cisco Secure ACS HTML interface, see Adding a Downloadable IP ACL, page 5-4.

Tip The Downloadable ACLs table does not appear if it has not been enabled. To enable the Downloadable ACLs table, click **Interface Configuration**, click **Advanced Options**, and then select the **Group-Level Downloadable ACLs** check box.

To assign a downloadable IP ACL to a group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 3 From the Jump To list at the top of the page, choose **Downloadable ACLs**.

Step 4 Under the Downloadable ACLs section, click the **Assign IP ACL** check box.

Step 5 Select an IP ACL from the list.

Step 6 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 7 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Configuring TACACS+ Settings for a User Group

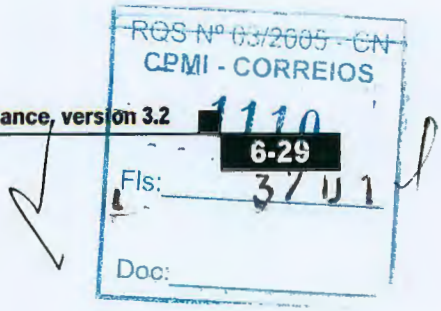
Perform this procedure to configure and enable the service/protocol parameters to be applied for the authorization of each user who belongs to the group. For information on how to configure settings for the Shell Command Authorization Set, see Configuring a Shell Command Authorization Set for a User Group, page 6-31.

Note To display or hide additional services or protocols, click **Interface Configuration**, click **TACACS+ (Cisco IOS)**, and then select or clear items in the group column, as applicable.

To configure TACACS+ settings for a user group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.



E C T
1 4.241 1
L - AC

Step 5 To allow all services to be permitted unless specifically listed and disabled, you can select the **Default (Undefined) Services** check box under the Checking this option will PERMIT all UNKNOWN Services table.

Caution This is an advanced feature and should only be used by administrators who understand the security implications.

Step 6 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 7 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Configuring a Shell Command Authorization Set for a User Group

Use this procedure to specify the shell command authorization set parameters for a group. There are four options:

- **None**—No authorization for shell commands.
- **Assign a Shell Command Authorization Set for any network device**—One shell command authorization set is assigned, and it applies to all network devices.
- **Assign a Shell Command Authorization Set on a per Network Device Group Basis**—Enables you to associate particular shell command authorization sets to be effective on particular NDGs.
- **Per Group Command Authorization**—Enables you to permit or deny specific Cisco IOS commands and arguments at the group level.

Note This feature requires that you have previously configured a shell command authorization set. For detailed steps, see Command Authorization Sets Configuration, page 5-19.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1111
Fls: 6.34
Doc: 3701

To specify shell command authorization set parameters for a user group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 3 From the Jump To list at the top of the page, choose **TACACS+**.

Result: The system displays the TACACS+ Settings table section.

Step 4 Use the vertical scrollbar to scroll to the Shell Command Authorization Set feature area.

Step 5 To prevent the application of any shell command authorization set, select (or accept the default of) the **None** option.

Step 6 To assign a particular shell command authorization set to be effective on any configured network device, follow these steps:

a. Select the **Assign a Shell Command Authorization Set for any network device** option.

b. Then, from the list directly below that option, select the shell command authorization set you want applied to this group.

Step 7 To create associations that assign a particular shell command authorization set to be effective on a particular NDG, for each association, follow these steps:

a. Select the **Assign a Shell Command Authorization Set on a per Network Device Group Basis** option.

b. Select a **Device Group** and a corresponding **Command Set**.

Tip You can select a **Command Set** that will be effective for all **Device Groups**, that are not otherwise assigned, by assigning that set to the <*default*> Device Group.

c. Click **Add Association**.

Result: The associated NDG and shell command authorization set appear in the table.

E C T
14.2391
L - A

Step 8 To define the specific Cisco IOS commands and arguments to be permitted or denied at the group level, follow these steps:

a. Select the **Per Group Command Authorization** option.

b. Under Unmatched Cisco IOS commands, select either **Permit** or **Deny**.

If you select Permit, users can issue all commands not specifically listed. If you select Deny, users can issue only those commands listed.

c. To list particular commands to be permitted or denied, select the **Command** check box and then type the name of the command, define its arguments using standard permit or deny syntax, and select whether unlisted arguments should be permitted or denied.

Caution This is a powerful, advanced feature and should be used by an administrator skilled with Cisco IOS commands. Correct syntax is the responsibility of the administrator. For information on how Cisco Secure ACS uses pattern matching in command arguments, see About Pattern Matching, page 5-19.

Tip To enter several commands, you must click **Submit** after specifying a command. A new command entry box appears below the box you just completed.

onfiguring a PIX Command Authorization Set for a User Group

Use this procedure to specify the PIX command authorization set parameters for a user group. There are three options:

- **None**—No authorization for PIX commands.
- **Assign a PIX Command Authorization Set for any network device**—One PIX command authorization set is assigned, and it applies all network devices.
- **Assign a PIX Command Authorization Set on a per Network Device Group Basis**—Particular PIX command authorization sets are to be effective on particular NDGs.

RQS Nº 03/2005 - CN

Before You Begin

- Ensure that a AAA client has been configured to use TACACS+ as the security control protocol.
- On the TACACS+ (Cisco) page of Interface Configuration section, ensure that the PIX Shell (pixShell) option is selected in the Group column.
- Make sure that you have already configured one or more PIX command authorization sets. For detailed steps, see Command Authorization Sets Configuration, page 5-19.

To specify PIX command authorization set parameters for a user group,

---

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 3 From the Jump To list at the top of the page, choose **TACACS+**.

Result: The system displays the TACACS+ Settings table section.

Step 4 Scroll down to the PIX Command Authorization Set feature area within the TACACS+ Settings table.

Step 5 To prevent the application of any PIX command authorization set, select (or accept the default of) the **None** option.

Step 6 To assign a particular PIX command authorization set to be effective on any configured network device, follow these steps:

a. Select the **Assign a PIX Command Authorization Set for any network device** option.

b. From the list directly below that option, select the PIX command authorization set you want applied to this user group.

Step 7 To create associations that assign a particular PIX command authorization set to be effective on a particular NDG, for each association, follow these steps:

a. Select the **Assign a PIX Command Authorization Set on a per Network Device Group Basis** option.

b. Select a **Device Group** and an associated **Command Set**.

c. Click **Add Association**.

Result: The associated NDG and PIX command authorization set appear in the table.

Note To remove or edit an existing PIX command authorization set association, you can select the association from the list, and then click **Remove Association**.

Configuring Device-Management Command Authorization for a User Group

Use this procedure to specify the device-management command authorization set parameters for a group. Device-management command authorization sets support the authorization of tasks in Cisco device-management applications that are configured to use Cisco Secure ACS for authorization. There are three options:

- **None**—No authorization is performed for commands issued in the applicable Cisco device-management application.
- **Assign a** *device-management application* for any network device—For the applicable device-management application, one command authorization set is assigned, and it applies to management tasks on all network devices.
- **Assign a** *device-management application* on a per Network Device Group Basis—For the applicable device-management application, this option enables you to apply command authorization sets to specific NDGs, so that it affects all management tasks on the network devices belonging to the NDG.

Note This feature requires that you have configured a command authorization set for the applicable Cisco device-management application. For detailed steps, see Command Authorization Sets Configuration, page 5-19.

To specify device-management application command authorization for a user group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 3 From the Jump To list at the top of the page, choose **TACACS+**.

Result: The system displays the TACACS+ Settings table section.

Step 4 Use the vertical scrollbar to scroll to the *device-management application* feature area, where *device-management application* is the name of the applicable Cisco device-management application.

Step 5 To prevent the application of any command authorization set for the applicable device-management application, select the **None** option.

Step 6 To assign a particular command authorization set that affects device-management application actions on any network device, follow these steps:

a. Select the **Assign a** *device-management application* for any network device option.

b. Then, from the list directly below that option, select the command authorization set you want applied to this group.

Step 7 To create associations that assign a particular command authorization set that affects device-management application actions on a particular NDG, for each association, follow these steps:

a. Select the **Assign a** *device-management application* on a per Network Device Group Basis option.

b. Select a **Device Group** and a corresponding **device-management application**.

c. Click **Add Association**.

Result: The associated NDG and command authorization set appear in the table.

Configuring IETF RADIUS Settings for a User Group

These parameters appear only when both the following are true:

- A AAA client has been configured to use one of the RADIUS protocols in Network Configuration.
- Group-level RADIUS attributes have been enabled on the RADIUS (IETF) page in the Interface Configuration section of the HTML interface.

RADIUS attributes are sent as a profile for each user from Cisco Secure ACS to the requesting AAA client. To display or hide any of these attributes, see Protocol Configuration Options for RADIUS, page 3-11. For a list and explanation of RADIUS attributes, see Appendix C, "RADIUS Attributes". For more information about how your AAA client uses RADIUS, refer to your AAA client vendor documentation.

To configure IETF RADIUS attribute settings to be applied as an authorization for each user in the current group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 3 From the Jump To list at the top of the page, choose **RADIUS (IETF)**.

Step 4 For each IETF RADIUS attribute you need to authorize for the current group, select the check box next to the attribute and then define the authorization for the attribute in the field or fields next to it.

Step 5 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 6 To configure the vendor-specific attributes (VSAs) for any RADIUS network device vendor supported by Cisco Secure ACS, see the appropriate section:

- Configuring Cisco IOS/PIX RADIUS Settings for a User Group, page 6-38
- Configuring Cisco Aironet RADIUS Settings for a User Group, page 6-39
- Configuring Ascend RADIUS Settings for a User Group, page 6-41
- Configuring Cisco VPN 3000 Concentrator RADIUS Settings for a User Group, page 6-42

- Configuring Juniper RADIUS Settings for a User Group, page 6-49
- Configuring BBSM RADIUS Settings for a User Group, page 6-50

Step 7 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Configuring Cisco IOS/PIX RADIUS Settings for a User Group

The Cisco IOS/PIX RADIUS parameters appear only when both the following are true:

- A AAA client has been configured to use RADIUS (Cisco IOS/PIX) in Network Configuration.
- Group-level RADIUS (Cisco IOS/PIX) attributes have been enabled in Interface Configuration: RADIUS (Cisco IOS/PIX).

Cisco IOS/PIX RADIUS represents only the Cisco VSAs. You must configure both the IETF RADIUS and Cisco IOS/PIX RADIUS attributes.

Note To hide or display Cisco IOS/PIX RADIUS attributes, see Setting Protocol Configuration Options for Non-IETF RADIUS Attributes, page 3-16. A VSA applied as an authorization to a particular group persists, even when you remove or replace the associated AAA client; however, if you have no AAA clients of this (vendor) type configured, the VSA settings do not appear in the group configuration interface.

ECT 4.2331 3 AC

To configure and enable Cisco IOS/PIX RADIUS attributes to be applied as an authorization for each user in the current group, follow these steps:

Step 1 Before you configure Cisco IOS/PIX RADIUS attributes, be sure your IETF RADIUS attributes are configured properly. For more information about setting IETF RADIUS attributes, see Configuring IETF RADIUS Settings for a User Group, page 6-37.

Step 2 For the Cisco attributes, determine the attributes to be authorized for the group by selecting the check box next to the attribute, and then type the commands (such as TACACS+ commands) to be packed as a RADIUS VSA.

Step 3 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 4 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Configuring Cisco Aironet RADIUS Settings for a User Group

The single Cisco Aironet RADIUS VSA, Cisco-Aironet-Session-Timeout, is a virtual VSA. It acts as a specialized implementation (that is, a remapping) of the IETF RADIUS Session-Timeout attribute (27) to respond to a request from a Cisco Aironet Access Point. You use it to provide a different timeout values when users in a group must be able to connect via both wireless and wired devices. This capability to provide a second timeout value specifically for WLAN connections avoids the difficulties that would arise if you had to use a standard timeout value (typically measured in hours) for a WLAN connection (that is typically measured in minutes). You do not need to use Cisco-Aironet-Session-Timeout if all members of a group will always connect only with a Cisco Aironet Access Point. Rather, use this setting when a group may connect via wired or wireless clients.

For example, imagine a user group's Cisco-Aironet-Session-Timeout set to 600 seconds (10 minutes) and that same user group's IETF RADIUS Session-Timeout set to 3 hours. When a member of this group connects via a VPN, Cisco Secure ACS uses 3 hours as the timeout value. However, if that same user connects via a Cisco Aironet Access Point, Cisco Secure ACS responds to an authentication request from the Aironet AP by sending 600 seconds in the IETF RADIUS Session-Timeout attribute. Thus, with the

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1115
Doc: 3701

Cisco-Aironet-Session-Timeout attribute configured, different session timeout values can be sent depending on whether the end-user client is a wired device or a Cisco Aironet Access Point.

The Cisco-Aironet-Session-Timeout VSA appears on the Group Setup page only when both the following are true:

- A AAA client has been configured to use RADIUS (Cisco Aironet) in Network Configuration.
- The group-level RADIUS (Cisco Aironet) attribute has been enabled in Interface Configuration: RADIUS (Cisco Aironet).

Note To hide or display the Cisco Aironet RADIUS VSA, see Setting Protocol Configuration Options for Non-IETF RADIUS Attributes, page 3-16. A VSA applied as an authorization to a particular group persists, even when you remove or replace the associated AAA client; however, if you have no AAA clients of this (vendor) type configured, the VSA settings do not appear in the group configuration interface.

To configure and enable the Cisco Aironet RADIUS attribute to be applied as an authorization for each user in the current group, follow these steps:

Step 1 Confirm that your IETF RADIUS attributes are configured properly. For more information about setting IETF RADIUS attributes, see Configuring IETF RADIUS Settings for a User Group, page 6-37.

Step 2 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 3 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 4 From the Jump To list at the top of the page, choose **RADIUS (Cisco Aironet)**.

Step 5 In the Cisco Aironet RADIUS Attributes table, select the **[5842\001] Cisco-Aironet-Session-Timeout** check box.

E C T
14.231

Step 6 In the [5842\001] Cisco-Aironet-Session-Timeout box, type the session timeout value (in seconds) that Cisco Secure ACS is to send in the IETF RADIUS Session-Timeout (27) attribute when the AAA client is configured in Network Configuration to use the RADIUS (Cisco Aironet) authentication option. The recommended value is 600 seconds.

For more information about the IETF RADIUS Session-Timeout attribute, see Appendix C, "RADIUS Attributes" or your AAA client documentation.

Step 7 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 8 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Configuring Ascend RADIUS Settings for a User Group

The Ascend RADIUS parameters appear only when both the following are true:

- A AAA client has been configured to use RADIUS (Ascend) or RADIUS (Cisco IOS/PIX) in Network Configuration.
- Group-level RADIUS (Ascend) attributes have been enabled in Interface Configuration: RADIUS (Ascend).

Ascend RADIUS represents only the Ascend proprietary attributes. You must configure both the IETF RADIUS and Ascend RADIUS attributes. Proprietary attributes override IETF attributes.

The default attribute setting displayed for RADIUS is `Ascend-Remote-Addr`.

Note To hide or display Ascend RADIUS attributes, see Setting Protocol Configuration Options for Non-IETF RADIUS Attributes, page 3-16. A VSA applied as an authorization to a particular group persists, even when you remove or replace the associated AAA client; however, if you have no AAA clients of this (vendor) type configured, the VSA settings do not appear in the group configuration interface.

enabled, Cisco Secure ACS determines the values to be sent in outbound RADIUS (Microsoft) attributes and sends them along with the RADIUS (Cisco VPN 3000) attributes, regardless of whether RADIUS (Microsoft) attributes are enabled in the Cisco Secure ACS HTML interface or how those attributes might be configured.

The Microsoft RADIUS attribute configurations appear only when both the following are true:

- A network device has been configured in Network Configuration that uses a RADIUS protocol that supports the Microsoft RADIUS VSA.
- Group-level Microsoft RADIUS attributes have been enabled on the RADIUS (Microsoft) page of the Interface Configuration section.

The following Cisco Secure ACS RADIUS protocols support the Microsoft RADIUS VSA:

- Cisco IOS/PIX
- Cisco VPN 3000
- Ascend

Microsoft RADIUS represents only the Microsoft VSA. You must configure both the IETF RADIUS and Microsoft RADIUS attributes.

Note To hide or display Microsoft RADIUS attributes, see Setting Protocol Configuration Options for Non-IETF RADIUS Attributes, page 3-16. A VSA applied as an authorization to a particular group persists, even when you remove or replace the associated AAA client; however, if you have no AAA clients of this (vendor) type configured, the VSA settings do not appear in the group configuration interface.

To configure and enable Microsoft RADIUS attributes to be applied as an authorization for each user in the current group, follow these steps:

Step 1 Confirm that your IETF RADIUS attributes are configured properly.

For more information about setting IETF RADIUS attributes, see Configuring IETF RADIUS Settings for a User Group, page 6-37.

Step 2 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

E C T
Fl. 2251
CPL AC

Step 3 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 4 From the Jump To list at the top of the page, choose **RADIUS (Microsoft)**.

Step 5 In the Microsoft RADIUS Attributes table, specify the attributes to be authorized for the group by selecting the check box next to the attribute. Where applicable, further define the authorization for that attribute in the field next to it. For more information about attributes, see Appendix C, "RADIUS Attributes", or the documentation for network devices using RADIUS.

Note The MS-CHAP-MPPE-Keys attribute value is autogenerated by Cisco Secure ACS; there is no value to set in the HTML interface.

Step 6 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 7 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Configuring Nortel RADIUS Settings for a User Group

The Nortel RADIUS attribute configurations appear only when both the following are true:

- A network device has been configured in Network Configuration that uses a RADIUS protocol that supports the Nortel RADIUS VSA.
- Group-level Nortel RADIUS attributes have been enabled on the RADIUS (Nortel) page of the Interface Configuration section.

Nortel RADIUS represents only the Nortel VSA. You must configure both the IETF RADIUS and Nortel RADIUS attributes.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1119
Fls:
Doc: 3701

Note To hide or display Nortel RADIUS attributes, see Setting Protocol Configuration Options for Non-IETF RADIUS Attributes, page 3-16. A VSA applied as an authorization to a particular group persists, even when you remove or replace the associated AAA client; however, if you have no AAA clients of this (vendor) type configured, the VSA settings do not appear in the group configuration interface.

To configure and enable Nortel RADIUS attributes to be applied as an authorization for each user in the current group, follow these steps:

Step 1 Confirm that your IETF RADIUS attributes are configured properly.

For more information about setting IETF RADIUS attributes, see Configuring IETF RADIUS Settings for a User Group, page 6-37.

Step 2 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 3 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 4 From the Jump To list at the top of the page, choose **RADIUS (Nortel)**.

Step 5 In the Nortel RADIUS Attributes table, specify the attributes to be authorized for the group by selecting the check box next to the attribute. Where applicable, further define the authorization for that attribute in the field next to it. For more information about attributes, see Appendix C, "RADIUS Attributes", or the documentation for network devices using RADIUS.

Note The MS-CHAP-MPPE-Keys attribute value is autogenerated by Cisco Secure ACS; there is no value to set in the HTML interface.

Step 6 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 7 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

ECT 14.223 CPL - AC

Configuring Juniper RADIUS Settings for a User Group

Juniper RADIUS represents only the Juniper VSA. You must configure both the IETF RADIUS and Juniper RADIUS attributes.

Note To hide or display Juniper RADIUS attributes, see Setting Protocol Configuration Options for Non-IETF RADIUS Attributes, page 3-16. A VSA applied as an authorization to a particular group persists, even when you remove or replace the associated AAA client; however, if you have no AAA clients of this (vendor) type configured, the VSA settings do not appear in the group configuration interface.

To configure and enable Juniper RADIUS attributes to be applied as an authorization for each user in the current group, follow these steps:

Step 1 Confirm that your IETF RADIUS attributes are configured properly.

For more information about setting IETF RADIUS attributes, see Configuring IETF RADIUS Settings for a User Group, page 6-37.

Step 2 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 3 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 4 From the Jump To list at the top of the page, choose **RADIUS (Juniper)**.

Step 5 In the Juniper RADIUS Attributes table, specify the attributes to be authorized for the group by selecting the check box next to the attribute. Where applicable, further define the authorization for that attribute in the field next to it. For more information about attributes, see Appendix C, "RADIUS Attributes", or the documentation for network devices using RADIUS.

Note The MS-CHAP-MPPE-Keys attribute value is autogenerated by Cisco Secure ACS; there is no value to set in the HTML interface.

Doc: 3701

Step 6 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 7 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Configuring BBSM RADIUS Settings for a User Group

BBSM RADIUS represents only the BBSM RADIUS VSA. You must configure both the IETF RADIUS and BBSM RADIUS attributes.

Note To hide or display BBSM RADIUS attributes, see Setting Protocol Configuration Options for Non-IETF RADIUS Attributes, page 3-16. A VSA applied as an authorization to a particular group persists, even when you remove or replace the associated AAA client; however, if you have no AAA clients of this (vendor) type configured, the VSA settings do not appear in the group configuration interface.

To configure and enable BBSM RADIUS attributes to be applied as an authorization for each user in the current group, follow these steps:

Step 1 Confirm that your IETF RADIUS attributes are configured properly.

For more information about setting IETF RADIUS attributes, see Configuring IETF RADIUS Settings for a User Group, page 6-37.

Step 2 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 3 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

Step 4 From the Jump To list at the top of the page, choose **RADIUS (BBSM)**.

Step 5 In the BBSM RADIUS Attributes table, specify the attribute to be authorized for the group by selecting the check box next to the attribute. Where applicable, further define the authorization for that attribute in the field next to it. For more information about attributes, see Appendix C, "RADIUS Attributes", or the documentation for network devices using RADIUS.

Note The MS-CHAP-MPPE-Keys attribute value is autogenerated by Cisco Secure ACS; there is no value to set in the HTML interface.

Step 6 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 7 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Configuring Custom RADIUS VSA Settings for a User Group

User-defined, custom Radius VSA configurations appear only when all the following are true:

- You have defined and configured the custom RADIUS VSAs. (For information about creating user-defined RADIUS VSAs, see Custom RADIUS Vendors and VSAs, page 9-26.)
- A network device has been configured in Network Configuration that uses a RADIUS protocol that supports the custom VSA.
- Group-level custom RADIUS attributes have been enabled on the RADIUS (*Name*) page of the Interface Configuration section.

You must configure both the IETF RADIUS and the custom RADIUS attributes.

To configure and enable custom RADIUS attributes to be applied as an authorization for each user in the current group, follow these steps:

Step 1 Confirm that your IETF RADIUS attributes are configured properly.

For more information about setting IETF RADIUS attributes, see Configuring IETF RADIUS Settings for a User Group, page 6-37.

Step 2 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 3 From the Group list, select a group, and then click **Edit Settings**.

Result: The Group Settings page displays the name of the group at its top.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 112
Doc: 3701

Step 4 From the Jump To list at the top of the page, choose **RADIUS** (*custom name*).

Step 5 In the RADIUS (*custom name*) Attributes table, specify the attributes to be authorized for the group by selecting the check box next to the attribute. Where applicable, further define the authorization for that attribute in the field next to it. For more information about attributes, see Appendix C, "RADIUS Attributes", or the documentation for network devices using RADIUS.

Note The MS-CHAP-MPPE-Keys attribute value is autogenerated by Cisco Secure ACS; there is no value to set in the HTML interface.

Step 6 To save the group settings you have just made, click **Submit**.

For more information, see Saving Changes to User Group Settings, page 6-54.

Step 7 To continue specifying other group settings, perform other procedures in this chapter, as applicable.

Group Setting Management

This section describes how to use the Group Setup section to perform a variety of managerial tasks.

This section contains the following procedures:

- Listing Users in a User Group, page 6-53
- Resetting Usage Quota Counters for a User Group, page 6-53
- Renaming a User Group, page 6-54
- Saving Changes to User Group Settings, page 6-54

E C T
4.219
J

Listing Users in a User Group

To list all users in a specified group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select the group.

Step 3 Click **Users in Group**.

Result: The User List page for the particular group selected opens in the display area.

Step 4 To open a user account (to view, modify, or delete a user), click the name of the user in the User List.

Result: The User Setup page for the particular user account selected appears.

Resetting Usage Quota Counters for a User Group

You can reset the usage quota counters for all members of a group, either before or after a quota has been exceeded.

To reset usage quota counters for all members of a user group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select the group.

Step 3 In the Usage Quotas section, select the **On submit reset all usage counters for all users of this group** check box.

Step 4 Click **Submit** at the bottom of the browser page.

Result: The usage quota counters for all users in the group are reset. The Group Setup Select page appears.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
FIS. 1122
Doc: 3701

Renaming a User Group

To rename a user group, follow these steps:

Step 1 In the navigation bar, click **Group Setup**.

Result: The Group Setup Select page opens.

Step 2 From the Group list, select the group.

Step 3 Click **Rename Group**.

Result: The Renaming Group: *Group Name* page appears.

Step 4 Type the new name in the **Group** field. Group names cannot contain angle brackets (< or >).

Step 5 Click **Submit**.

Note The group remains in the same position in the list. The number value of the group is still associated with this group name. Some utilities, such as the database import utility, use the numeric value associated with the group.

Result: The Select page opens with the new group name selected.

Saving Changes to User Group Settings

After you have completed configuration for a group, be sure to save your work.

To save the configuration for the current group, follow these steps:

Step 1 To save your changes and apply them later, click **Submit**. When you are ready to implement the changes, click **System Configuration**, and then click **Service Control**, and click **Restart**.

Tip To save your changes and apply them immediately, click **Submit + Restart**.

E C T
4.2171
3
C P L - A C

Result: The group attributes are applied and services are restarted. The Edit page opens.

Note Restarting the service clears the Logged-in User Report and temporarily interrupts all Cisco Secure ACS services. This affects the Max Sessions counter.

Step 2 To verify that your changes were applied, select the group and click **Edit Settings**. View the settings.

Data Sheet

Cisco Intrusion Detection System 4200 Series Appliance Sensors

The Cisco Intrusion Detection System (IDS) 4200 appliance sensors are members of the market-leading Cisco IDS Series of products that provide *Pervasive Protection* throughout the network.

Introduction

The Cisco IDS 4200 Series appliance sensors are purpose-built, high-performance network security "appliances" that protect against unauthorized, malicious activity traversing the network, such as attacks by hackers. Cisco IDS sensors analyze traffic in real time, enabling users to quickly respond to security breaches.

Cisco's world-renowned Cisco Countermeasures Research Team (C-CRT) uses a combination of highly innovative and sophisticated detection techniques, including stateful pattern recognition, protocol parsing, heuristic detection, and anomaly detection, that provide comprehensive protection from a variety of both known and unknown cyber threats. Furthermore, Cisco's patent-pending Signature Micro-Engine (SME) technology allows granular customization of sensor signatures, resulting in precisely tuned sensors that minimize the occurrence of "false positives."

When unauthorized activity is detected, the sensor can send alarms to the management console(s) with details of the activity. Additionally, the Cisco IDS Active Response System delivers unparalleled protection by controlling other systems, such as routers, firewalls, and switches, to terminate unauthorized sessions. The installation and management of these turnkey appliances is easy using a wide array of management solutions, including a Web user interface, a command-line interface (CLI), or Cisco's highly scalable CiscoWorks VPN/Security Management solutions (VMS).

Application

The Cisco IDS 4200 Series of appliance sensors includes three products: the Cisco IDS 4210, the Cisco IDS 4235, and the Cisco IDS 4250. The entire Cisco IDS appliance portfolio delivers a broad range of solutions that allow easy integration into many different environments, including enterprise and service provider environments. Each appliance sensor addresses the bandwidth requirements at one of a variety of performance marks, from 45 Mbps to gigabit.

The Cisco IDS 4210 can monitor up to 45 Mbps of traffic and is suitable for T1/E1 and T3 environments.

At 200 Mbps, the Cisco IDS 4235 can be deployed to provide protection in switched environments, on multiple T3 subnets, and with the support of 10/100/1000 interfaces, it can also be deployed on partially utilized gigabit links.

The Cisco IDS 4250 supports unparalleled performance at 500 Mbps and can be used to protect gigabit subnets and traffic traversing switches that are being used to aggregate traffic from numerous subnets.

Sensors can be placed on almost any network segment of the enterprise-wide network where security visibility is required.

Step 7 Select one or more of the **Action** check boxes to specify the actions that you want the sensor to take when detecting a particular attack:

Note Setting actions does not determine whether or not an alarm is logged or sent to an additional destination. See the "Configuring Event Logging" section on page 88 and/or "Adding Remote Hosts" section on page 24 for more information.

- Block—The sensor issues a command to a PIX Firewall or Cisco router. That device then denies the host or network from which the attack originated entry to the monitored network.
- IP Log—The sensor generates an IP session log with information about the attack. An IP session log contains binary data for all packets to and from the source address of the alarm.

Caution Generation of IP logs slows down the performance of the sensor. Use only when necessary.

Caution You do not have to set the action to IP Log to log the alarm. You only need the IP Log action if you want to log the binary packets to an IP log file.

- TCP Reset—The sensor resets the TPC session in which the attack signature was detected.

Note For the alarm to take no actions for that signature, deselect all the check boxes. Some actions are not available for each signature.

Step 8 Add any appropriate comments in the Comments field.

Step 9 In the Signature Name field, enter the signature name.

Step 10 Enter the values for the remaining parameters.

Note You must enter values for the parameters that are required. The other parameters are optional.

Refer to *Cisco Intrusion Detection System Signature Engines Version 3.1* found at the following website for more information on parameter values:

http://www.cisco.com/univercd/cc/td/doc/product/iaabu/csids/csids8/index.htm

Note To reset the form, click **Reset**.

Step 11 Click **OK**.

Result: The custom signature now appears in the Custom Signatures section.

Step 12 To delete the signature that you just created, select the check box, and then click **Delete**.

TCP Connection Signatures

TCP connection signatures are user-configurable signatures based on the transport-layer protocol (TCP) and the port number of the packets being monitored. You can enable/disable signatures, change the severity level or action associated with a signature, and add new TCP connection signatures.

Note The level of traffic logging determines the type of packets that fire TCP connection signatures. By default, only TCP connection requests (SYN packets) fire the alarm. See the "Configuring the Level of Traffic Logging" section on page 74 for more information.

This section includes these topics:

- Configuring TCP Connection Signatures, page 46
- Adding TCP Connection Signatures, page 49

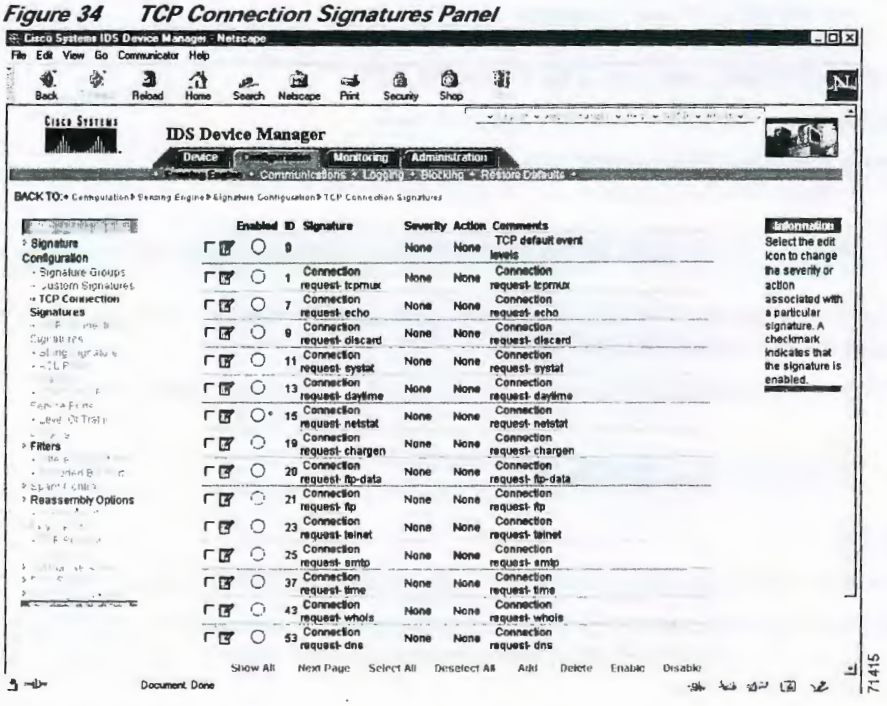
Configuring TCP Connection Signatures

To configure TCP connection signatures, follow these steps:

Step 1 In the IDS Device Manager main window, select **Configuration > Sensing Engine > TCP Connection Signatures**.

Result: The TCP Connection Signatures panel appears.

Figure 34 TCP Connection Signatures Panel



Step 2 Select the signature(s) check box that you want to enable, and then click **Enable**.

Result: The circle is now solid indicating that the signature is enabled.

E C
4.162
1
L - AG

Note Enabling a signature sets the severity for that signature to its default severity level.

Note Show All displays the entire list of TCP connection signatures. Next Page allows you to page through the entire list of TCP connection signatures. The Go to Page list box allows you to page through the entire list of TCP connection signatures by selecting a page in the list box, and then clicking Go to Page. See the "Setting Signature Pagination" section on page 126 for the procedure for setting IDS Device Manager signature pagination.

Step 3 Select the signature(s) check box that you want to disable, and then click **Disable**.

Result: The circle is now clear indicating that the signature is disabled.

Note Disabling a signature sets the severity level for that signature to None.

Step 4 Select the signature(s) check box that you want to delete, and then click **Delete**.

Result: The signature has disappeared from the list.

Step 5 Click the edit icon to change the severity level or action for a TCP connection signature.

Result: The Editing panel appears.

Figure 35 Editing Panel

3701

Step 6 From the Severity list box, select the severity level of the signature:

- None

Note Selecting any value other than None automatically enables the signature. Selecting None disables the signature. If you chose None at this point and want to enable the signature later, you can do so by editing the Severity level again or enabling the signature through the Signature Groups panel. See "Enabling/Disabling/Editing Signatures Within a Group List" section on page 33 for more information.

- Information—Categorizes the attack as not relevant to security. These attacks are shown with a blue icon in the IDS Event Viewer.
- Low—Categorizes the attack as mildly severe. These attacks are shown with a yellow icon in the IDS Event Viewer.
- Medium—Categorizes the attack as moderately sever. These attacks are shown with a orange icon in the IDS Event Viewer.
- High—Categorizes the attack as highly severe. These attacks are shown with a red icon in the IDS Event Viewer.

Step 7 Select one or more of the **Action** check boxes to specify the actions that you want the sensor to take when detecting a particular attack:

Note Setting actions does not determine whether or not an alarm is logged or sent to an additional destination. See the "Configuring Event Logging" section on page 88 and/or "Adding Remote Hosts" section on page 24 for more information.

- Block—The sensor issues a command to a PIX Firewall or Cisco router. That device then denies the host or network from which the attack originated entry to the monitored network.
- IP Log—The sensor generates an IP session log with information about the attack. An IP session log contains binary data for all packets to and from the source address of the alarm.

Caution Generation of IP logs slows down the performance of the sensor. Use only when necessary.

Caution You do not have to set the action to IP Log to log the alarm. You only need the IP Log action if you want to log the binary packets to an IP log file.

- TCP Reset—The sensor resets the TPC session in which the attack signature was detected.

Note For the alarm to take no actions for that signature, deselect all the check boxes. Some actions are not available for each signature.

4.160
3

Step 8 Add any appropriate comments in the Comments field.

Note To reset the form, click **Reset**.

Step 9 Click **OK**.

Adding TCP Connection Signatures

To add TCP connection signatures, follow these steps:

Step 1 In the IDS Device Manager main window, select **Configuration > Sensing Engine > TCP Connection Signatures**.

Result: The TCP Connection Signatures panel appears.

Figure 36 TCP Connection Signatures Panel

Step 2 Click **Add** to add a new TCP connection signature.

Result: The Adding panel appears.

ACL Policy Violation Signatures

ACL policy violation signatures are user-configurable signatures based on access control violations by network devices in the syslog stream.

You can configure two types of ACLs:

- User defined ACLs—Created and updated by users
- IDS defined ACLs—Created and updated by IDS Device Manager device management

There are no default ACL policy violation signatures when you configure a sensor for the first time. You must create ACL policy violation signatures, and you can modify them after you create them.

This section includes these topics:

- Configuring User-Defined ACLs, page 63
- Configuring IDS-Defined ACLs, page 70
- Enabling/Disabling/Deleting ACL Policy Violations Signatures, page 67
- Editing ACL Policy Violations Signatures, page 68

Configuring User-Defined ACLs

To configure user-defined ACLs, follow these steps:

Step 1 Log on to the router and enter enable mode by typing `en` and the enable password.

Step 2 Enter configuration mode by typing:

```
conf t
```

Step 3 Type the following commands:

`logging` *sensor_ip_address*

```
logging trap info
```

where *sensor_ip_address* is the IP address of the command and control interface of the sensor.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
Fls:- 1144
3701
Doc:

Step 4 Exit configuration mode by pressing Ctrl-Z.

Step 5 To make the changes permanent on the router, type:

```
wr mem
```

Step 6 Set the user-defined ACLs on each router to send policy violation information by adding the text string "log" to the end of each line that defines a deny rule. For example:

```
access-list 199 deny tcp host 10.1.1.1 any log
```

This rule denies TCP traffic between host 10.1.1.1 and "any" other host. The string "log" at the end of the deny rule ensures that the policy violation is logged.

Note Rules that do not contain the text string "log" at the end of the line cause the router not to log the policy violation.

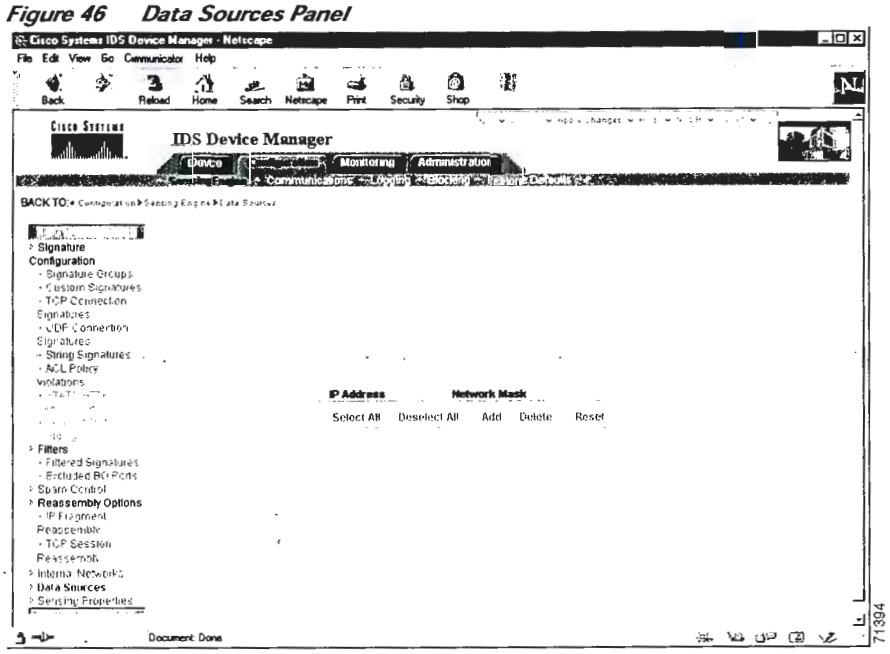
Step 7 To make the changes permanent on the router, type:

```
wr mem
```

Step 8 In the IDS Device Manager main window, select **Configuration > Sensing Engine > Data Sources**.

Result: The Data Sources panel appears.

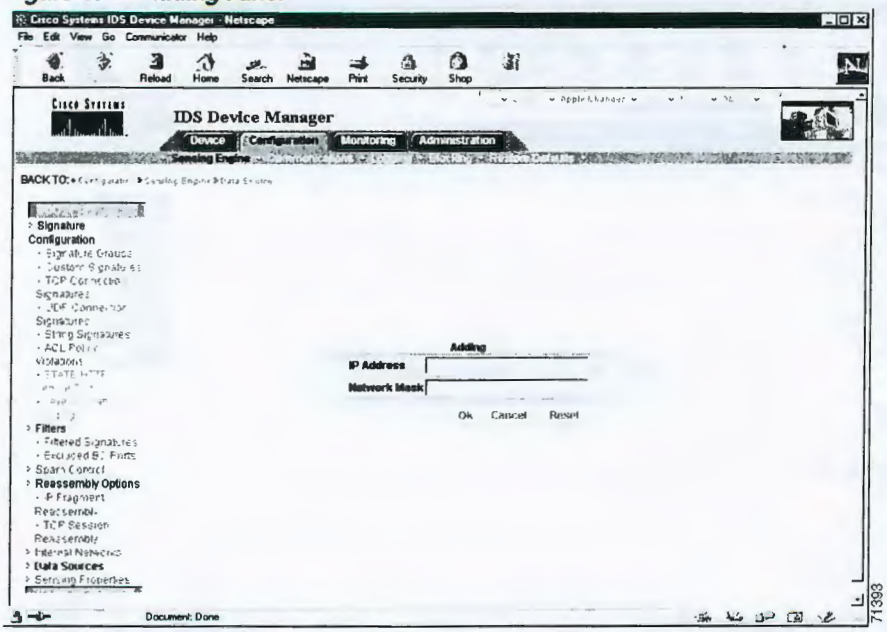
Figure 46 Data Sources Panel



Step 9 Click **Add** to add a data source.

Result: The Adding panel appears.

Figure 47 Adding Panel



Step 10 In the IP Address field, enter the IP address of the router that will publish syslog data to the sensor.

Step 11 In the Network Mask field, enter 255.255.255.255 if it is an IP address.

Note If you are monitoring syslogs from multiple routers on the same network, enter the network address and the netmask rather than the single IP address of each router.

Note To reset the form, click **Reset**.

Step 12 Click **OK**.

Step 13 In the IDS Device Manager main window, select **Configuration > Sensing Engine > ACL Policy Violations**.

Step 14 Result: The ACL Policy Violations panel appears.

RQS Nº 03/2005 - CN

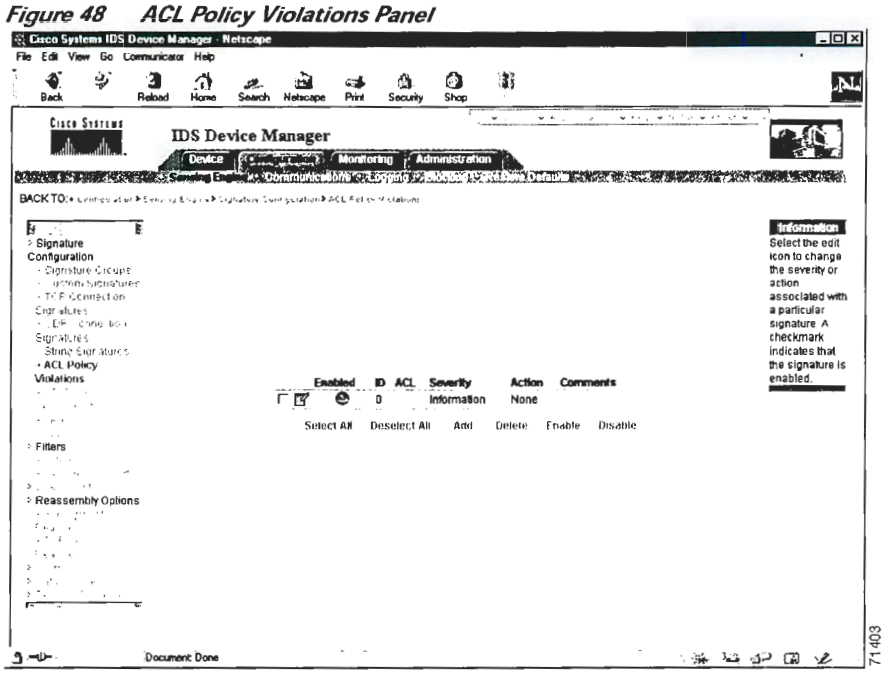
Doc:

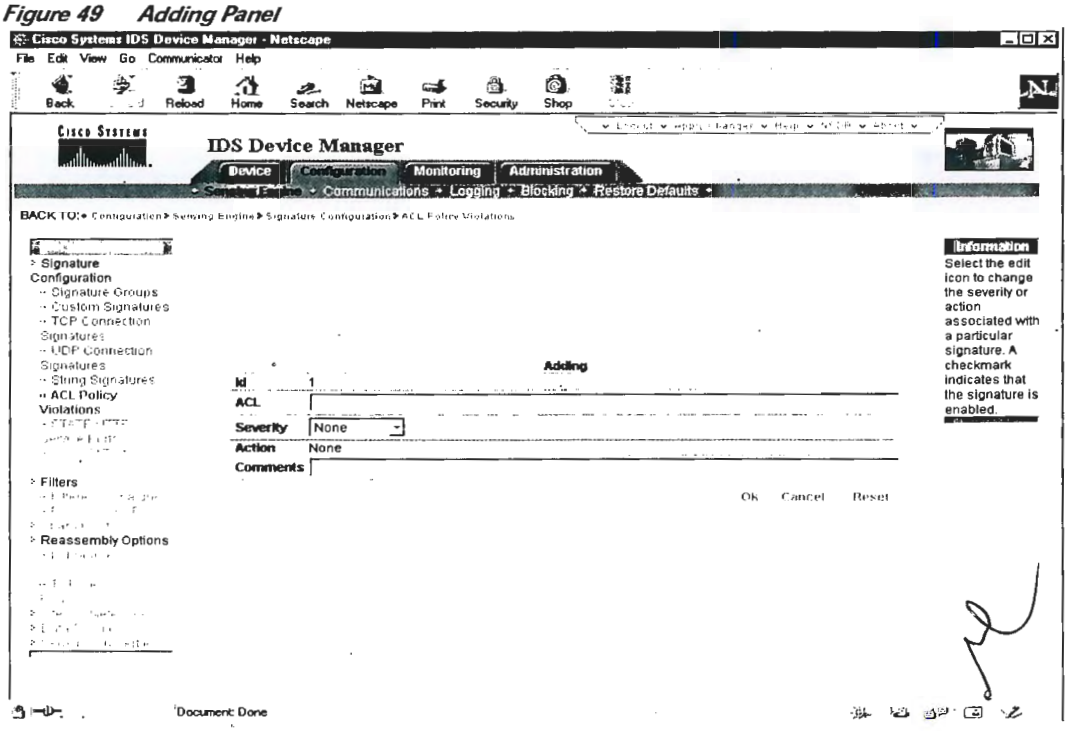
Figure 48 ACL Policy Violations Panel



Step 15 Click **Add** to add a new ACL policy violations signature.

Result: The Adding panel appears.

Figure 49 Adding Panel



Step 16 Enter the name or the number of the new ACL in the ACL field.

E C
4142
CPL - AC

Step 17 From the Severity list box, select the severity level of the signature:

- None

Note Selecting any value other than None automatically enables the signature. Selecting None disables the signature. If you chose None at this point and want to enable the signature later, you can do so by editing the Severity level again or enabling the signature through the Signature Groups panel. See "Enabling/Disabling/Editing Signatures Within a Group List" section on page 33 for more information.

- Information—Categorizes the attack as not relevant to security. These attacks are shown with a blue icon in the IDS Event Viewer.
- Low—Categorizes the attack as mildly severe. These attacks are shown with a yellow icon in the IDS Event Viewer.
- Medium—Categorizes the attack as moderately sever. These attacks are shown with a orange icon in the IDS Event Viewer.
- High—Categorizes the attack as highly severe. These attacks are shown with a red icon in the IDS Event Viewer.

Step 18 Add any appropriate comments in the Comments field.

Note To reset the form, click **Reset**.

Step 19 Click **OK**.

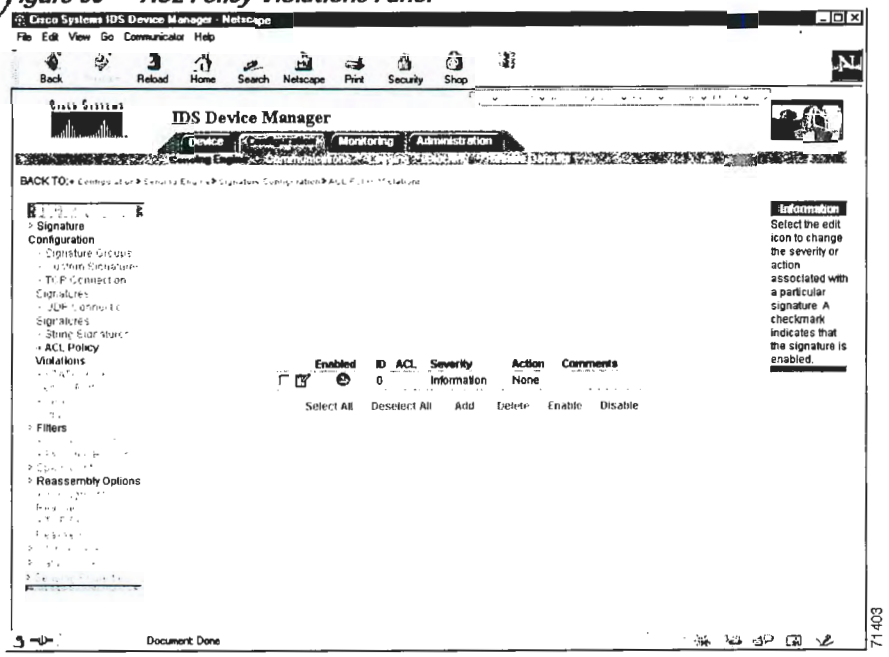
Enabling/Disabling/Deleting ACL Policy Violations Signatures

Step 1 In the IDS Device Manager main window, select **Configuration > Sensing Engine > ACL Policy Violations**.

Step 2 Result: The ACL Policy Violations panel appears.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1146
Doc: 3701

Figure 50 ACL Policy Violations Panel



Step 3 To enable the new ACL policy violations signature, select the signature(s) check box, and then click **Enable**.

Result: The circle is now solid indicating that the signature is enabled.

Note Enabling a signature sets the severity for that signature to its default severity level.

Step 4 To disable the new ACL policy violations signature, select the signature(s) check box, and then click **Disable**.

Result: The circle is now clear indicating that the signature is disabled.

Note Disabling a signature sets the severity level for that signature to None.

Step 5 To delete the new ACL policy violations signature, select the signature(s) check box, and then click **Delete**.

Result: The signature has disappeared from the list.

Editing ACL Policy Violations Signatures

Step 1 In the IDS Device Manager main window, select **Configuration > Sensing Engine > ACL Policy Violations**.

Step 2 Result: The ACL Policy Violations panel appears.

CPMI - CORREIOS
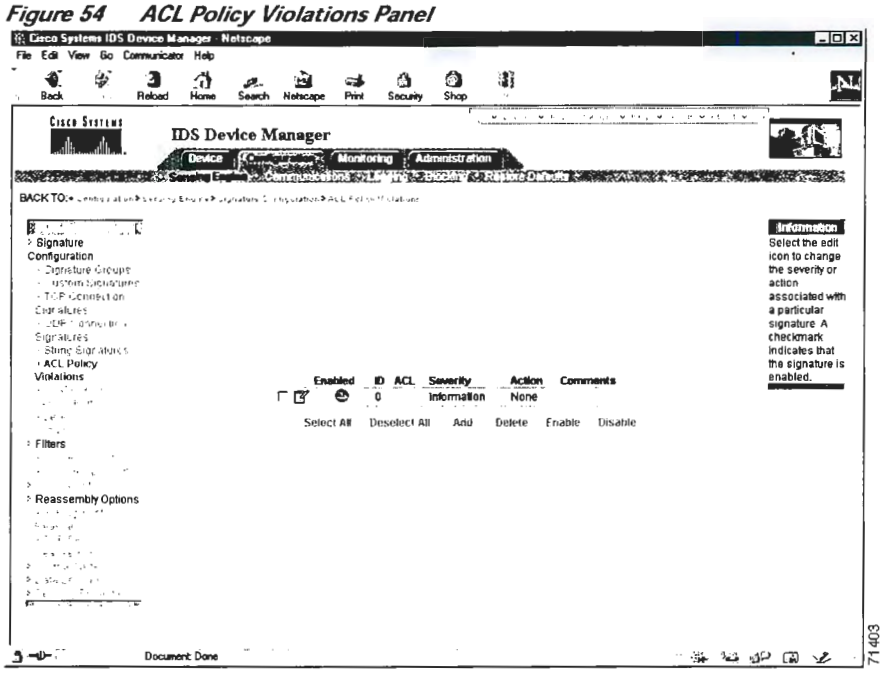
Fls: 1148
Doc: 3701

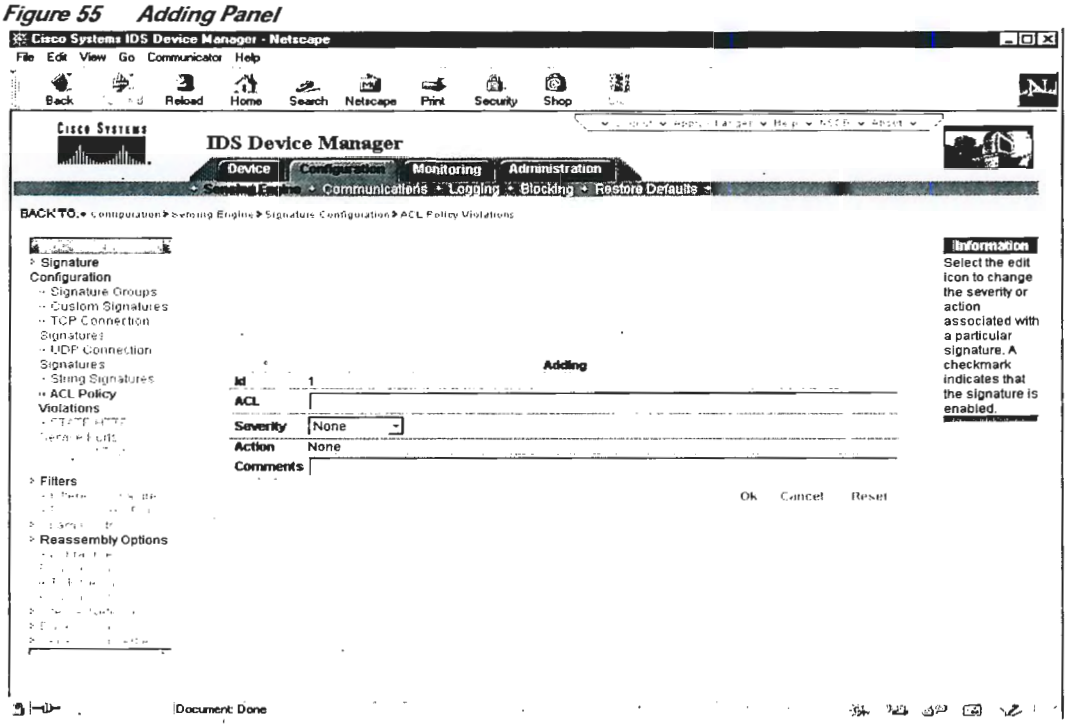
Figure 54 ACL Policy Violations Panel



Step 12 Click **Add** to add a new ACL policy violations signature.

Result: The Adding panel appears.

Figure 55 Adding Panel



Step 13 Enter the name of the new ACL in the ACL field.

Value: IDS_*interface_direction*_0

Note *Interface* is the name of the interface that the sensor is managing. *Direction* is IN/OUT.

Step 14 From the Severity list box, select the severity level of the signature:

- None

Note Selecting any value other than None automatically enables the signature. If you chose None at this point and want to enable the signature later, you can do so by editing the Severity level again or enabling the signature through the Signature Groups panel. See "Enabling/Disabling/Editing Signatures Within a Group List" section on page 33 for more information.

- Information—Categorizes the attack as not relevant to security. These attacks are shown with a blue icon in the IDS Event Viewer.
- Low—Categorizes the attack as mildly severe. These attacks are shown with a yellow icon in the IDS Event Viewer.
- Medium—Categorizes the attack as moderately sever. These attacks are shown with a orange icon in the IDS Event Viewer.
- High—Categorizes the attack as highly severe. These attacks are shown with a red icon in the IDS Event Viewer.

Step 15 Add any appropriate comments in the Comments field.

Step 16 Click **OK**.

Step 17 Repeat Steps 9–13 for the second ACL.

Value: IDS_*interface_direction*_1

Note The sensor device management oscillates between the 0 and 1 ACLs. You need both of them and you must enter them as separate signatures.

Choosing Service Ports for STATE.HTTP Signatures

If you are running a web server on nonstandard HTTP ports, use the Service Ports panel to add those ports.

You need to configure the signatures for the STATE.HTTP engine to specific service ports. For more information on the STATE.HTTP signature engine, refer to the *Cisco Intrusion Detection System Signature Engines Version 3.1* found at the following website:

http://www.cisco.com/univercd/cc/td/doc/product/iaabu/csids/csids8/index.htm

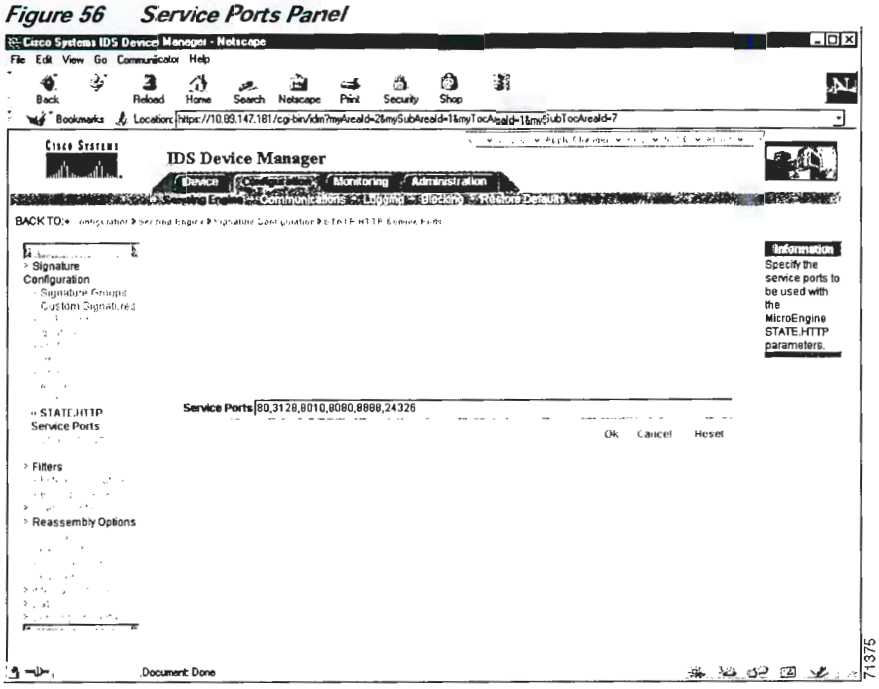
RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1149
3701
Doc:

To choose service ports, follow these steps:

Step 1 In the IDS Device Manager main window, select **Configuration > Sensing Engine > STATE.HTTP Service Ports**.

Result: The STATE.HTTP Service Ports panel appears.

Figure 56 Service Ports Panel



Step 2 In the Service Ports field, enter the service ports (separated by commas) that you want to use with the STATE-HTTP engine.

Default: 80,3128,8010,8080,8888,24326

Note We recommend that you edit the default list to turn off ports that you are sure you are not using. For example, if you are only using port 80, delete the other entries.

Note To reset the form, click **Reset**.

Step 3 Click **OK**.

Configuring the Level of Traffic Logging

Level of Traffic Logging is used in conjunction with the TCP and UDP connection signatures. It configures what type of packets cause the TCP and UDP connection signatures to fire alarms.

To configure the level of traffic logging, follow these steps:

Step 1 In the IDS Device Manager main window, select **Configuration > Sensing Engine > Level of Traffic Logging**.

Result: The Level of Traffic Logging panel appears.

Figure 57 Level of Traffic Logging Panel

Step 2 In the Level of Traffic Logging field, specify the level of traffic you want the sensor to log when TCP and UDP connection signatures are enabled:

- None—Disables logging.

  No TCP or UDP connection signatures will fire even it enabled.

- TCP connection requests and UDP traffic (default).

  The TCP connection signatures that are enabled will fire for SYN packets to the specific port. The UDP connection signatures that are enabled will fire for any UDP packet to those ports.

- TCP connection requests, SYN-ACK, FIN, RST, and UDP traffic.

- TCP SYN-ACK packets from the specified port and UDP traffic.

  Use this option to configure TCP reset action for TCP connection signatures.

Note To reset the form, click **Reset**.

Step 3 Click **OK**.

Doc:

Creating Filters

You can define filters for a sensor to enable and disable alarms that have specific hosts and networks as their source or destination. Defining filters allows you to tune the sensor by reducing the number of false positives. You can also define filters to disable alarms based on a particular traffic flow that traverses the network segment that is being monitored. In this case you are defining traffic flow based on the source and destination that bounds the traffic flow.

You can exclude signatures to disable alarms based on signature ID, IP address, and direction that includes the following:

- Exclude a signature.
- Exclude a source or destination IP address or network.
- Exclude a specific source and destination IP address or network.
- Exclude a specific signature by source and/or destination IP address.
- Exclude a signature based on source and/or destination direction (for example, IN or OUT).

Note CSPM and the IDS Director may have created filters using older configuration formats. The IDS Device Manager reads in and writes out these filters, but you cannot view, edit, or delete them through the IDS Device Manager.

You can also define a set of ports that will be excluded from triggering a Back Orifice 2K TCP alarm. You can configure these TCP ports to exclude alarms from the TCP port BO2K signatures (signatures 3990, 3991, 3992). The UDP ports are unaffected (signatures 4054 and 5044). For more information on these signatures, click **NSDB** on the ToolBar and then click the signatures IDs **3990**, **3991**, and **3992**.

This section includes these topics:

- Configuring Filters, page 76
- Configuring Excluded BO Ports, page 78

Configuring Filters

To configure filters for enabled signatures, follow these steps:

Step 1 In the IDS Device Manager main window, select **Configuration > Sensing Engine > Filters > Filtered Signatures**.

Result: The Filtered Signatures panel appears.

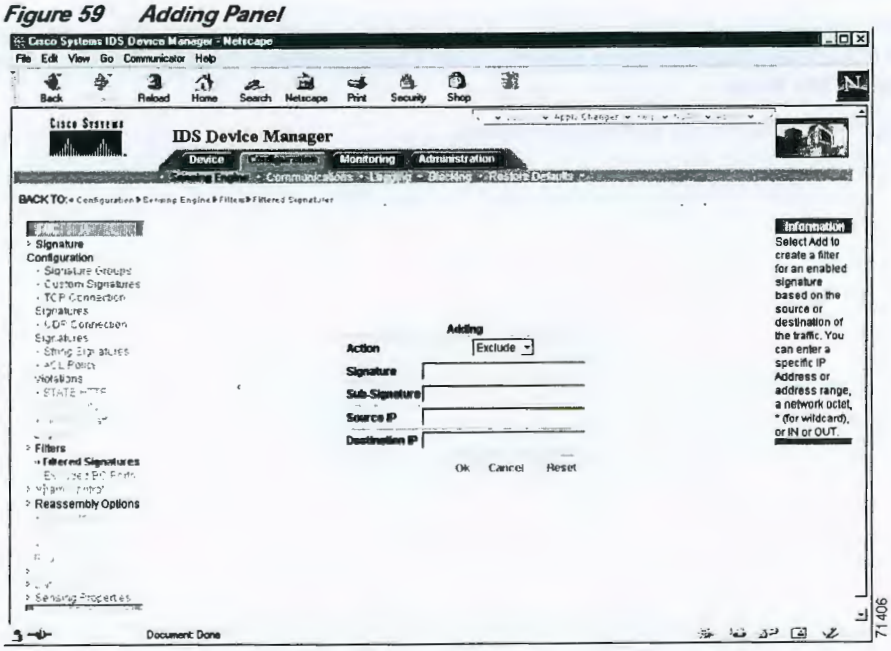
4-132

Figure 58 Filtered Signatures Panel

Step 2 Click **Add** to configure a filter for an enabled signature based on the source or destination of the traffic.

Result: The Adding panel appears.

Figure 59 Adding Panel



Step 3 Select one of the following from the Action list box:

- Include
- Exclude

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1151
Fls: 3701
Doc:

Note Include/exclude specifies whether the identified signature for the source/destination pair should be included or excluded. Includes are used to override excludes. In typical scenarios you exclude all addresses for a given alarm, and then add an include only for those addresses you want the alarm to fire on.

Step 4 In the Signature field, enter the signature that should be included or excluded.

Step 5 In the Sub-Signature field, enter the subsignature (if applicable) of the signature that should be included or excluded.

Note If you enter multiple signatures, the value must be an '*'.

Step 6 In the Source IP field, enter the source IP address of traffic that triggers the signature or subsignature.

Step 7 In the Destination IP field, enter the destination IP address of traffic that triggers the signature or subsignature.

Note To reset the form, click **Reset**.

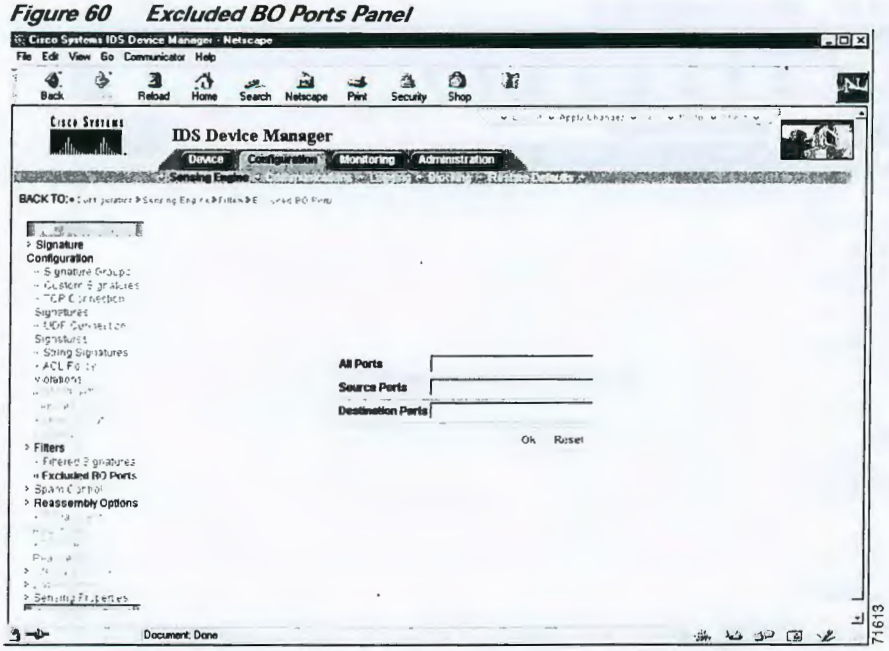
Step 8 Click **OK**.

Configuring Excluded BO Ports

Step 1 In the IDS Device Manager main window, select **Configuration > Sensing Engine > Filters > Excluded BO Ports**.

Result: The Excluded BO Ports panel appears

Figure 60 Excluded BO Ports Panel



Step 2 In the All Ports field, enter the ports that you do not want to trigger BO signatures.

Note Packets moving in either direction on these ports will not trigger BO signatures. The values may be a single port, a range of ports (port-port), or a list of comma-delimited ports and port ranges. Do not use spaces.

Step 3 In the Source Ports field, enter the source ports that you do not want to trigger BO signatures.

Step 4 In the Destination Ports field, enter the destination ports that you do not want to trigger BO signatures.

Step 5 Click **OK**.

Configuring Spam Control

You can limit the number of recipients in email messages.

To configure spam control, follow these steps:

Step 1 In the IDS Device Manager main window, select **Configuration > Sensing Engine > Spam Control**.

Result: The Spam Control panel appears.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1152
Doc: 370

Figure 61 Spam Control Panel

Step 2 In the Max number of Recipients in a Mail Message field, enter a number between 2-65000.

Default: 250

Note To reset the form, click **Reset**.

Step 3 Click OK.

Reassembly Options

You can configure the sensor to reassemble a datagram that has been fragmented over multiple packets. You can specify boundaries that the senor uses to determine how many datagrams, how many fragments per datagram, and how long to wait for more fragments of a datagram. The goal is to ensure that the sensor does not allocate all of its resources to datagrams that cannot be completely reassembled, either because the sensor missed some frame transmissions or because an attack has been launched that is based on generating random fragment datagrams.

You can configure the sensor to only monitor TCP sessions that have been established by a complete three-way handshake. You can also configure how long to wait for the handshake to complete, and how long to keep monitoring a connection where no more packets have been seen. The goal is to prevent the sensor from creating alarms where a valid TCP session has not been established. There are known attacks against IDS systems that try to get the IDS to generate alarms by simply replaying pieces of an attack. The TCP session reassembly feature helps to mitigate these types of attacks against the IDS.

This section includes these topics:

- Configuring IP Fragment Reassembly, page 81
- Configuring TCP Session Reassembly, page 82

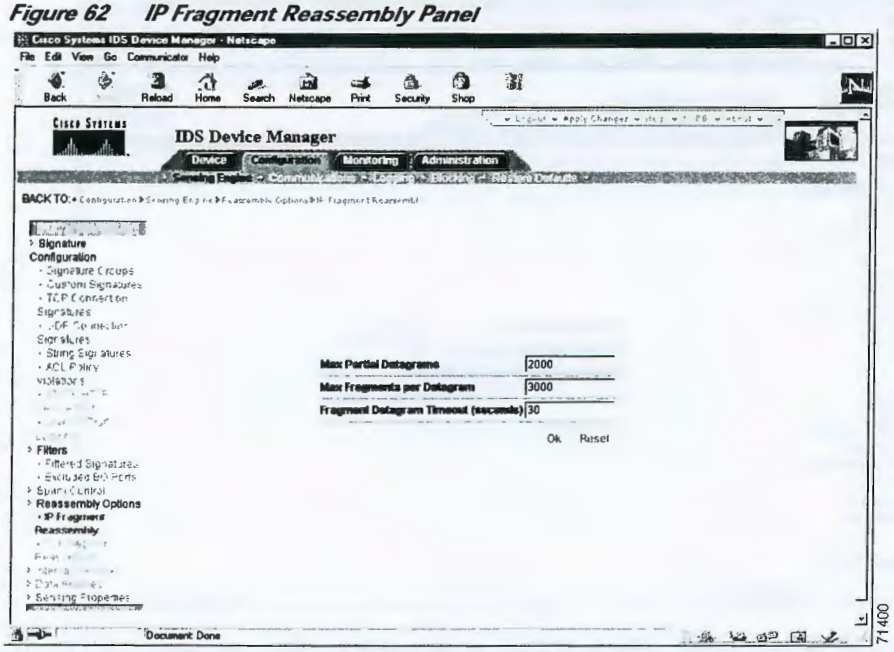
Configuring IP Fragment Reassembly

To configure IP fragment reassembly, follow these steps:

Step 1 In the IDS Device Manager main window, select **Configuration > Sensing Engine > Reassembly Options > IP Fragment Reassembly**.

Result: The IP Fragment Reassembly panel appears.

Figure 62 IP Fragment Reassembly Panel



Step 2 In the Max Partial Datagrams field, enter a numerical value between 1 and 65000 to specify the maximum number of partial datagrams the sensor can attempt to reconstruct at one time.

Default: 2000

Step 3 In the Max Fragments per Datagram field, enter a numerical value between 1 and 3000 to specify the maximum number of fragments that can be accepted into a single datagram.

Default: 3000

Step 4 In the Fragment Datagram Timeout field, enter a numerical value between 1 and 300 to specify the maximum number of seconds that can elapse before the sensor stops keeping track of a particular exchange for which it is trying to reassemble a datagram.

Default: 30

Note To reset the form, click **Reset**.

Step 5 Click **OK**.

RQS Nº 03/2005 - CN - CPMI - CORREIOS
Fls: 1153
Doc: 3701

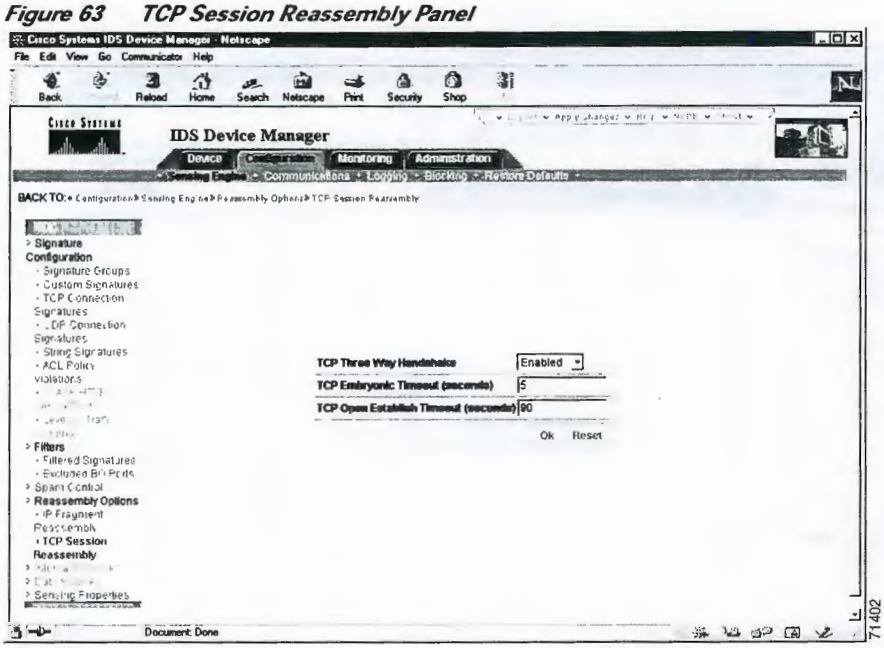
Configuring TCP Session Reassembly

To configure TCP session reassembly, follow these steps:

Step 1 Select **Configuration > Sensing Engine > Reassembly Options > TCP Session Reassembly**.

Result: The TCP Session Reassembly panel appears.

Figure 63 TCP Session Reassembly Panel



Step 2 To specify that the sensor track only sessions for which the three-way handshake is completed, select **Enabled** in the TCP Three Way Handshake list box.

Step 3 In the TCP Embryonic Timeout field, enter a numerical value between 1 and 180 to specify the number of seconds that can elapse before the sensor frees the resources allocated for an initiated, but not fully established, TCP session.

Default: 5

Step 4 In the TCP Open Establish Timeout field, enter a numerical value between 1 and 3600 to specify the number of seconds that can elapse before the sensor frees the resources allocated to a fully established TCP connection when no more packets are being seen for that connection.

Default: 90

Note To reset the form, click **Reset**.

Step 5 Click **OK**.

Configuring Internal Networks

You can identify internal networks for each sensor you manage with the IDS Device Manager. Internal network are networks you consider trusted. Internal networks are handled differently from external networks with regard to alarms and reports.

Internal networks may be represented by a simple IP address (10.1.1.1), a range of IP addresses (10.1.1.1–10.1.1.20), the IP address/bitmask (10.1.1.1/24), or the IP netmask (10.1.1.0 255.255.255.0).

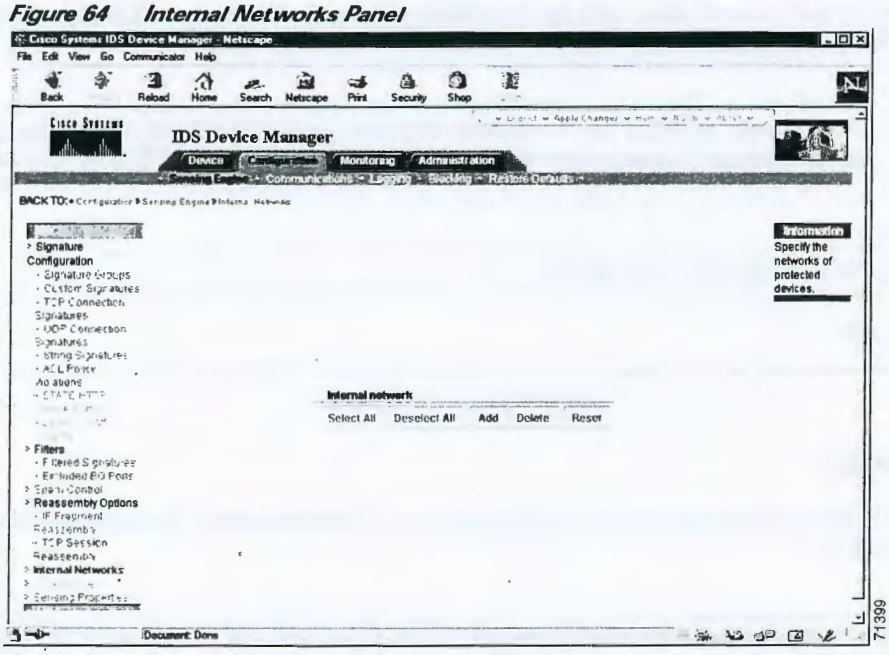
Note Addresses that are configured as internal networks are marked with the keyword IN when the alarm is generated. All other addresses are marked with the keyword OUT. You can use the IN and OUT keywords when creating filters. See the "Creating Filters" section on page 76 for more information.

To identify an internal network, follow these steps:

Step 1 In the IDS Device Manager main window, select **Configuration > Sensing Engine > Internal Networks**.

Result: The Internal Networks panel appears.

Figure 64 Internal Networks Panel

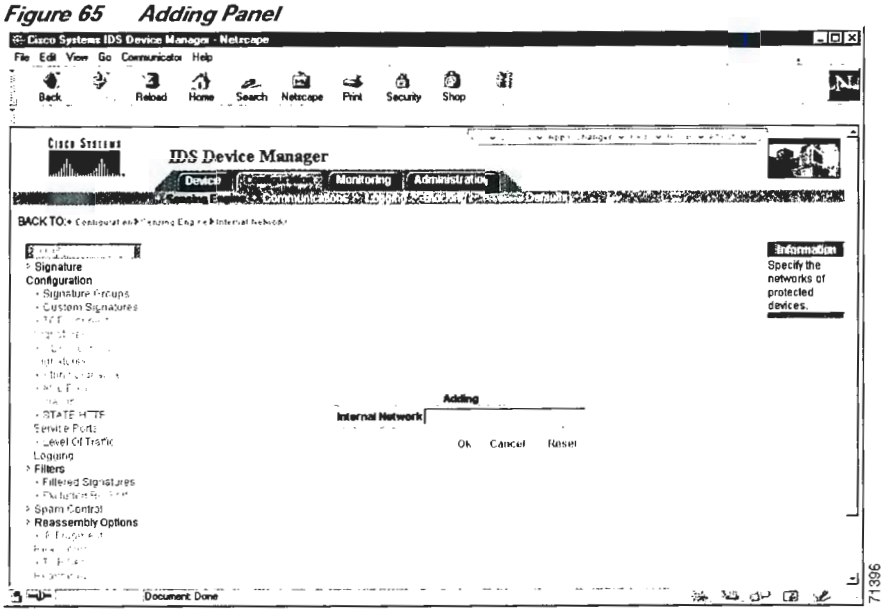


Step 2 Click **Add** to set up the IP addresses for protected devices.

Result: The Adding panel appears.

RDS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1154
3701
Doc:

Figure 65 Adding Panel



Step 3 In the Internal Network field, enter the IP address of the protected device or the beginning of the range of protected devices.

Note For example, to define the 10. network as internal, add 10.0.0.0 as the IP address and 255.0.0.0 as the netmask. To add a single host as internal, add for example, 172.21.10.22 as the IP address.

Note To reset the form, click **Reset**.

Step 4 Click **OK**.

Configuring Data Sources

A Cisco IOS router can publish syslog data to a sensor. You must specify the interface that the Cisco IOS router uses.

Note You must configure data sources when designating ACL policy violation signatures. See the "ACL Policy Violation Signatures" section on page 63 for more information.

Step 1 In the IDS Device Manager main window, select **Configuration > Sensing Engine > Data Sources**.

Result: The Data Sources panel appears.

G-124

Figure 66 Data Sources Panel

Step 2 Click **Add** to add a data source.

Result: The Adding panel appears.

Figure 67 Adding Panel

Step 3 In the IP Address field, enter the IP address of the interface of the router that will publish syslog data to the sensor, or the IP address of a network if multiple routers from the same network will be sending syslog data to the sensor.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1155
3701
Doc:

Step 4 In the Network Mask field, enter 255.255.255.255 if only a single router interface will publish syslog data to the sensor, or enter the netmask if a network was entered in Step 3.

Note To reset the form, click **Reset**.

Step 5 Click **OK**.

Configuring the Sensing Properties

You can use the Sensing Properties panel to specify the following:

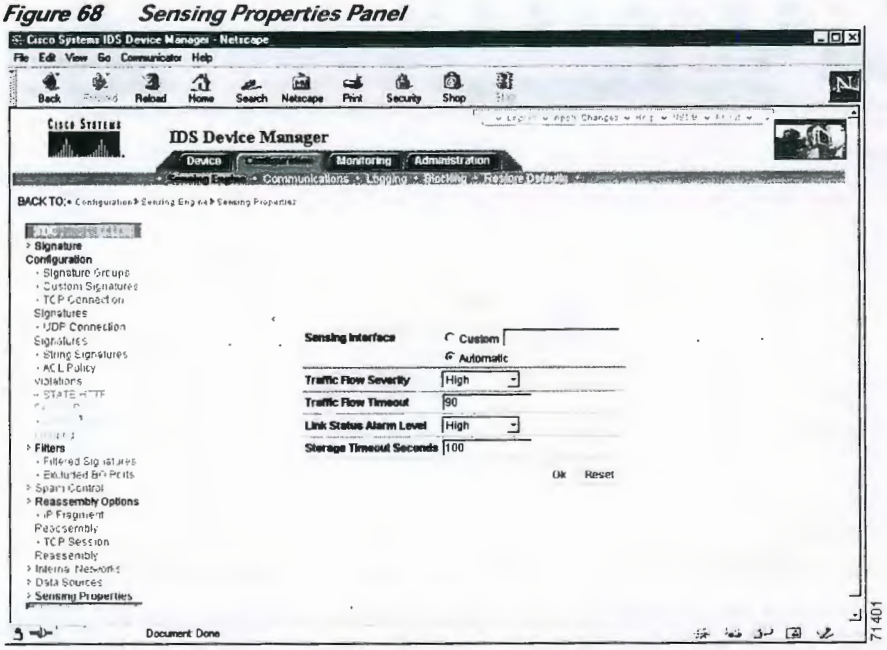
- Which interface to use for sensing.
- The severity of the alarm to generate when the sensing interface stops seeing packets for a specified amount of time.
- The severity of the alarm to generate when the sensing interface is physically disconnected from a switch or hub.
- How long the sensor will store information after no more packets are seen from a certain host.

To configure the sensing properties, follow these steps:

Step 1 In the IDS Device Manager main window, select **Configuration > Sensing Engine > Sensing Properties**.

Result: The Sensing Properties panel appears.

Figure 68 Sensing Properties Panel



Step 2 In the Sensing Interface field, select **Custom** or **Automatic** from the list box.

Note We recommend selecting Automatic, because it allows the sensor to determine the monitoring interface.

Note Select **Custom** if you need to do a manual override of the sensing interface device. You need to know the specific device name for your sensor.

Step 3 In the Traffic Flow Severity field, select the alarm severity level of the traffic flow alerts.

Default: 5

Note The sensor generates the 994 Have Traffic alarm with this severity when the sensing interface sees traffic. It generates the 995 No Traffic alarm with this severity when the sensing interface has not seen any traffic on the sensing interface for Traffic Flow Timeout seconds.

Step 4 In the Traffic Flow Timeout field, enter a numerical value between 0 and 65000 to specify the number of idle seconds before triggering a No Traffic Alert.

Default: 90

Step 5 In the Link Status Alarm Level field, select the alarm severity level of the link status alert.

Default: 5

Note The sensor generates the 995 No Traffic alarm with this severity if the sensing interface is physically disconnected from a switch or hub. The 994 Have Traffic alarm fires when it is reconnected and seeing packets. Currently, the IDS 4210 only has this ability.

Step 6 In the Storage Timeout Seconds field, enter a numerical value between 10 - 600 to specify the number of seconds to wait before deleting stored history, after the host goes silent.

Default: 300

Note To reset the form, click **Reset**.

Step 7 Click **OK**.

Configuring Logging

This section includes the following procedures:

- Configuring Event Logging, page 88
- Exporting Event Logs, page 89
- Configuring Automatic IP Logging, page 91
- Configuring IP Logging, page 92

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1156
3701
Doc:

Configuring Event Logging

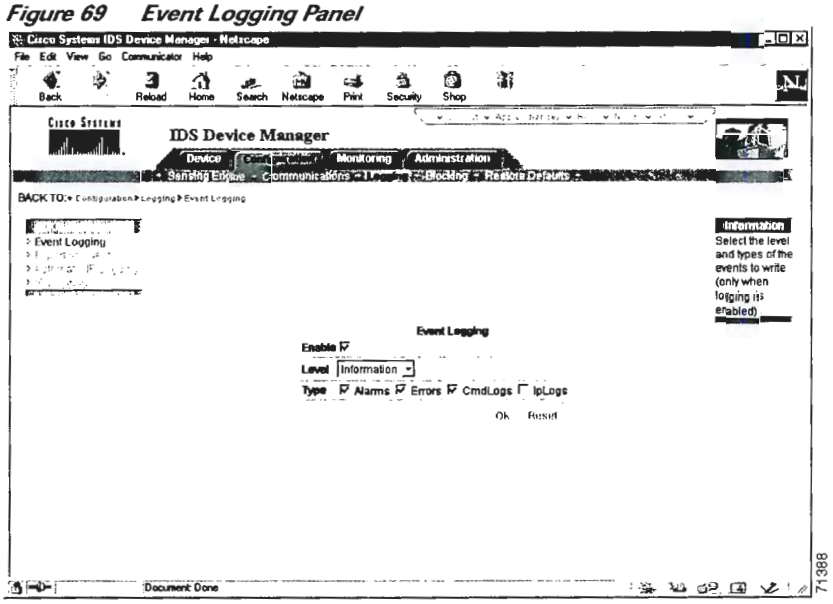
A sensor can generate audit event logs locally on the sensor based on network data streams, or syslog data streams, or both, depending on what the sensor has been configured to watch.

To configure how events will be logged, follow these steps:

Step 1 In the IDS Device Manager main window, select **Configuration > Logging > Event Logging**.

Result: The Event Logging panel appears.

Figure 69 Event Logging Panel



Step 2 Select the **Enable** check box.

Step 3 From the Level list box, select the severity level of the signature:

- Information—Categorizes the attack as not relevant to security. These attacks are shown with a blue icon in the IDS Event Viewer.
- Low—Categorizes the attack as mildly severe. These attacks are shown with a yellow icon in the IDS Event Viewer.
- Medium—Categorizes the attack as moderately sever. These attacks are shown with a orange icon in the IDS Event Viewer.
- High—Categorizes the attack as highly severe. These attacks are shown with a red icon in the IDS Event Viewer.

Step 4 Select one or more of the **Type** check boxes to specify types of events you want to log:

- Alarms
- Errors
- CmdLogs
- IPLogs

E
4.120
L

Note If you select alarm type, all alarms for enabled signatures with severities greater than or equal to the selected level are logged to the /usr/nr/var/log.*timestamp* file. You do not have to select a specific action for the signature.

Note You can only set the Level and Type options after you have enabled event logging. Alarms, Errors, and ComdLogs are written to the event log. IPLogs are stored separately. Select **Monitoring > Logs** to view the log files.

Caution If you select IPLogs, you must also set the severity level to Information. When an alarm occurs for signatures with an action of IPLog, all packets to and from the source address of the alarm are logged in a binary format in the /usr/ne/nr/iplog/iplog.*address.timestamp* files.

Note To reset the form, click **Reset**.

Step 5 Click **OK**.

Exporting Event Logs

You can specify an FTP server that event logs are sent to at regular intervals.

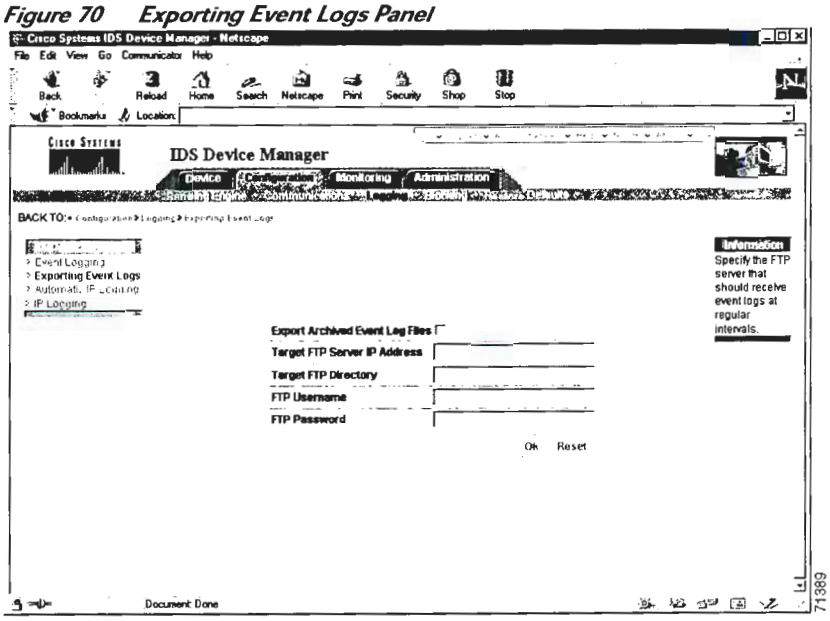
To export event logs, follow these steps:

Step 1 In the IDS Device Manager main window, select **Configuration > Logging > Exporting Event Logs**.

Result: The Exporting Event Logs panel appears.

RQS Nº 03/2005 - CN -
CPMI - CORREIOS
Fls: 115
3701
Doc:

Figure 70 Exporting Event Logs Panel



Step 2 Select the **Export Archived Event Log Files** check box.

Export Archived Event Log Files determines if the logs are automatically exported.

Note If the check box is selected, the sensor checks to see if local event logging has been enabled. If the check box is clear, a warning message is displayed.

Step 3 In the Target FTP Server IP Address field, enter the IP address of the FTP server you want to connect to and to send the logs to.

The following FTP servers support the FTP log export functions:

- Sambar FTP Server Version 5.0 (win32)
- Web-mail Microsoft FTP Service Version 5.0 (win32)
- Serv-U FTP-Server v2.5h for WinSock (win32)
- Solaris 2.8
- HP-UX (HP-UX qdir-5 B.10.20 A 9000/715)
- Windows 2000 (Microsoft ftp server version 5.0)
- Windows NT 4.0 (Microsoft ftp server version 3.0)

Step 4 In the Target FTP Directory field, enter the target directory on the remote FTP server (1 to 128 characters).

Step 5 In the FTP Username field, enter the FTP server login name (1 to 16 characters).

Step 6 In the FTP Password field, enter the FTP server password associated with the login name (1 to 8 characters).

Note To reset the form, click **Reset**.

Step 7 Click **OK**.

Step 8 Verify the event logs are being exported by viewing the messages.sapd file by selecting **Monitoring>Logs>Messages>sapd**.

Note Logs are FTPed every time the current event log is closed and archived. By default, this occurs once a day or when the logs fill up the 104876 bytes allocated to them, whichever comes first.

Configuring Automatic IP Logging

You can configure a sensor to generate an IP session log when the sensor detects an attack. When IP logging is configured as a response action for a signature and the signature is triggered, all packets to and from the source address of the alarm are logged for a specified period of time. You can set the number of minutes events are logged.

Note IP logging requires that event logging be enabled with Information as the severity level and at least IPLogs for the type.

To set the amount of minutes of automatic IP logging, follow these steps:

Step 1 In the IDS Device Manager main window, select **Configuration > Logging > Automatic IP Logging**.

Result: The Automatic IP Logging panel appears.

Figure 71 Automatic IP Logging Panel

Step 2 In the Minutes of IP Logging field, enter the number of minutes you want IP logging to be done (1 to 60).

Default: 15

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls:
Doc: 3701

Note To reset the form, click **Reset**.

Step 3 Click **OK**.

Step 4 Download the logs by selecting **Monitoring > Logs > IP Logs > Archived**.

Note The IP logs are in a binary TCP dump format. To view the contents of the logs, download them to your desktop, and run a tool like Ethereal to view the logged packets. You can download Ethereal from the following website:
www.ethereal.com

Configuring IP Logging

You can configure the sensor to capture all traffic related to the specified hosts. The IP logging option logs all traffic or a list of IP addresses.

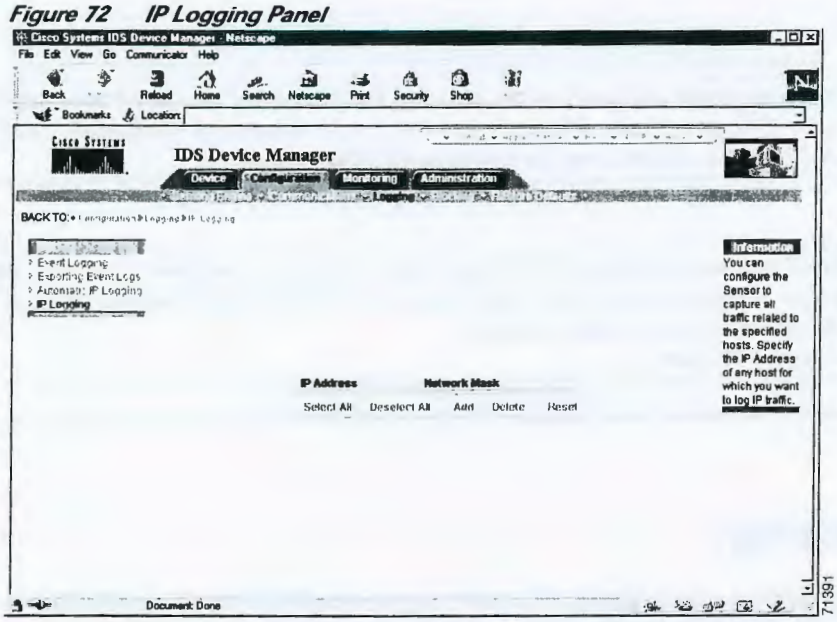
Note IP logging requires that event logging be enabled with Information as the severity level and at least IPLogs for the type.

To generate log files for specific IP addresses, follow these steps:

Step 1 In the IDS Device Manager main window, select **Configuration > Logging > IP Logging**.

Result: The IP Logging panel appears.

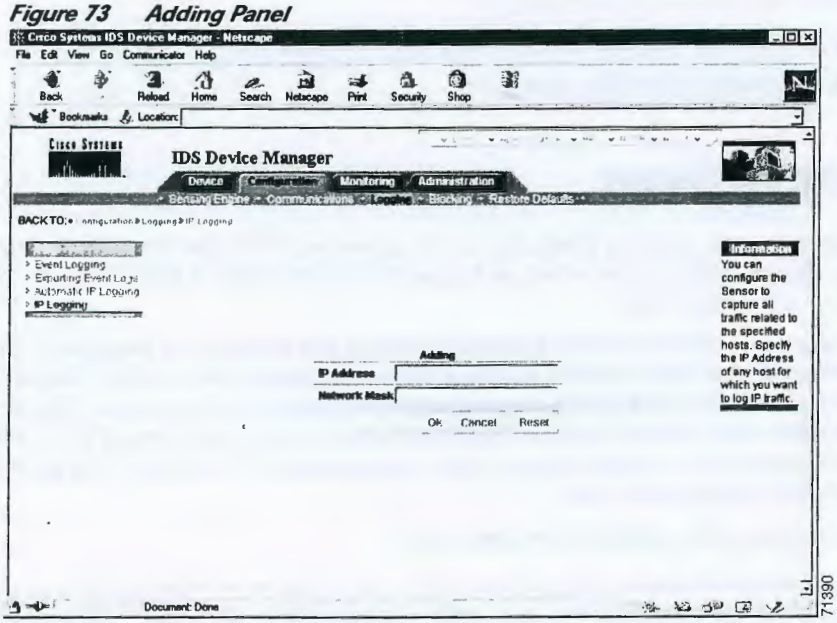
Figure 72 IP Logging Panel



Step 2 Click **Add** to enter IP addresses.

Result: The Adding panel appears.

Figure 73 Adding Panel



Step 3 In the IP Address field, enter the source IP address to log.

Step 4 In the Network Mask field, enter 255.255.255.255 if it is a single IP address, or enter the netmask if it is a network.

Note To reset the form, click **Reset**.

Doc:

Step 5 Click **OK**.

Note The sensor begins logging and creates a log file that can be viewed by selecting Monitoring > Logs > IP Logs > Archived. Logging continues until the address is removed from the IP Logging list. IP Logging slows down the performance of the sensor.

Note The IP logs are in a binary TCP dump format. To view the contents of the logs, download them to your desktop, and run a tool like Ethereal to view the logged packets. You can download Ethereal from the following website:
www.ethereal.com

Configuring Blocking

You can configure a sensor to block an attack by generating ACL rules for publication to a Cisco IOS router, or a Catalyst 6000 family switch, or by generating shun rules on a PIX Firewall.

This section includes the following procedures:

- Setting Up Blocking on the Sensor, page 94
- Blocking with Multiple Sensors, page 101
- Tracking Which Hosts/Networks Are Being Blocked, page 106
- Manual Blocking/Unblocking, page 107

Setting Up Blocking on the Sensor

You can configure your sensor to block an attack by generating ACL rules for publication to a Cisco IOS router, or a Catalyst 6000 family switch, or by generating shun rules on a PIX Firewall. That device is referred to as a blocking device.

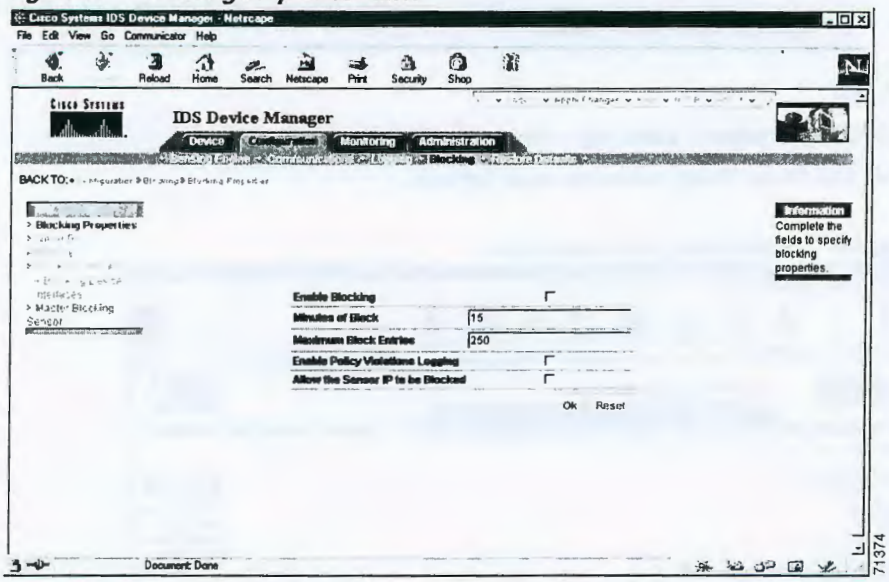
You must tune your sensor to identify hosts and networks that should never be blocked. You may have a trusted network device whose normal, expected behavior appears to be an attack. But such a device should never be blocked. And trusted, internal networks should never be blocked. Proper tuning of signatures reduces the number of false positives and helps ensure proper network operation. Tuning and filtering of signatures prevents the alarms from being generated. If the alarm is not generated, the associated block also does not occur.

To set up blocking on the sensor, follow these steps:

Step 1 In the IDS Device Manager main window, select **Configuration > Blocking > Blocking Properties**.

Step 2 Result: The Blocking Properties panel appears.

Figure 74 Blocking Properties Panel



Step 3 Select the **Enable Blocking** check box to turn blocking on for the sensor.

Step 4 In the Minutes of Block field, enter the number of minutes you want an address to be blocked (1 to 32,767).

Default: 15

Step 5 In the Maximum Block Entries field, enter how many blocks are to be maintained simultaneously (0 to 1000).

Default: 250

Note The number of blocks will not exceed the Maximum Block Entries. If the maximum is reached, new blocks will not occur until existing blocks time out and are removed.

Step 6 Select the **Enable Policy Violations Logging** check box to enable the logging of ACL policy violations on the blocking device (optional).

Note To generate alarms for policy violations, configure a policy violation signature by selecting Configuration > Sensing Engine > ACL Policy Violations. See the "Configuring IDS-Defined ACLs" section on page 70 for more information.

Default: Not selected

Step 7 Do not select the **Allow the Sensor IP to be Blocked** check box unless necessary.

Caution We recommend that you do not allow the sensor to block itself, because it will stop communicating with the managed device. If you can ensure that sensor creating a rule to block its own IP address will not prevent the sensor from accessing the blocking device, you can select this option.

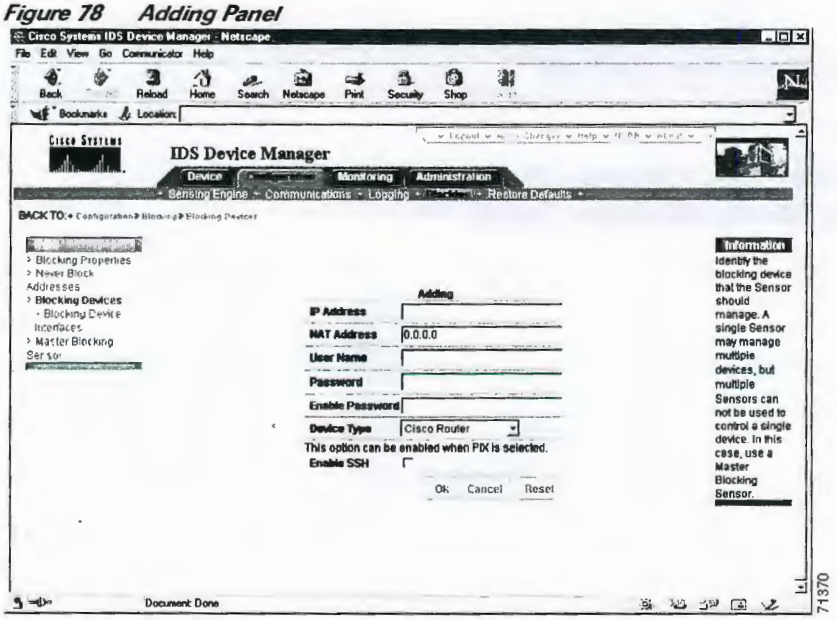
Figure 77 Blocking Devices Panel

Step 16 Click **Add** to add the blocking devices that the sensor will manage.

Step 17 Result: The Adding panel appears.

Figure 78 Adding Panel



Caution A single sensor can manage multiple devices, but multiple sensors cannot be used to control a single device. In this case, use a master blocking sensor. See the "Blocking with Multiple Sensors" section on page 101 for the procedure for setting up a master blocking sensor.

Step 18 In the IP Address field, enter the address of the blocking device.

4.109

Step 19 In the NAT Address field, enter the NAT address of the sensor.

Note This is only necessary when the sensor is connecting to the managed device through another router or firewall that is using NAT translation of the IP address of the sensor. In this case, enter the IP address that the IP address of the sensor is being translated to.

Step 20 In the User Name field, enter the user that Telnets to the blocking device (1 to 16 characters).

Note The user name is optional if no user name is needed to log on to the device.

Step 21 In the Password field, enter the Telnet or SSH password of the blocking device (1 to 16 characters).

Step 22 In the Enable Password field, enter the enable password of the blocking device (1 to 16 characters).

Note The enable password is optional if the user already has enable privileges.

Step 23 In the Device Type field, enter the type of device that will do the blocking (Cisco Router, Catalyst 6000 VACL, PIX).

Step 24 Select the **SSH** check box, if PIX is the Device Type.

Note To reset the form, click **Reset**.

Step 25 Click **OK**.

Note You do not have to designate an interface for the PIX Firewall. If you are using a PIX Firewall, the procedure is complete. You must designate at least one interface for all other devices.

Step 26 Select **Configuration > Blocking > Blocking Device Interfaces**.

Result: The Blocking Device Interfaces panel appears.

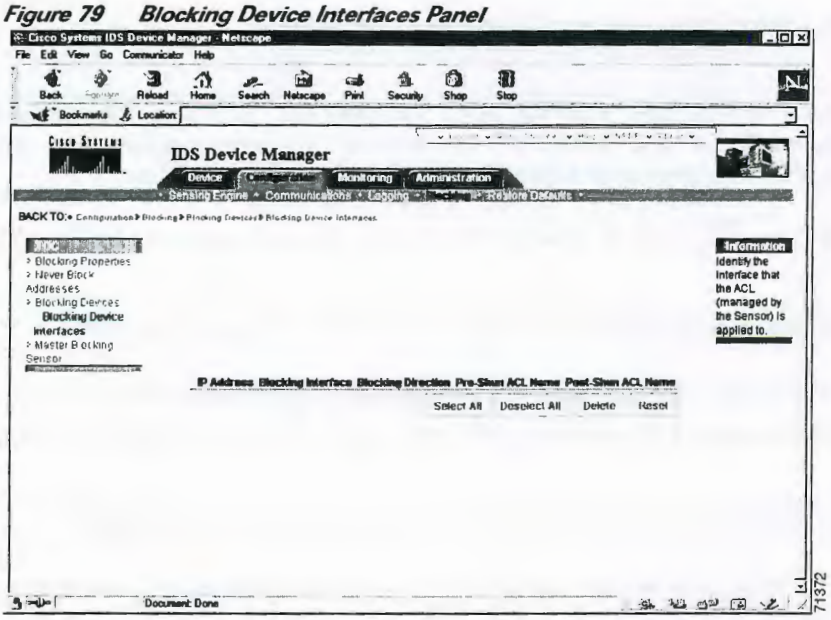
3701
Doc:

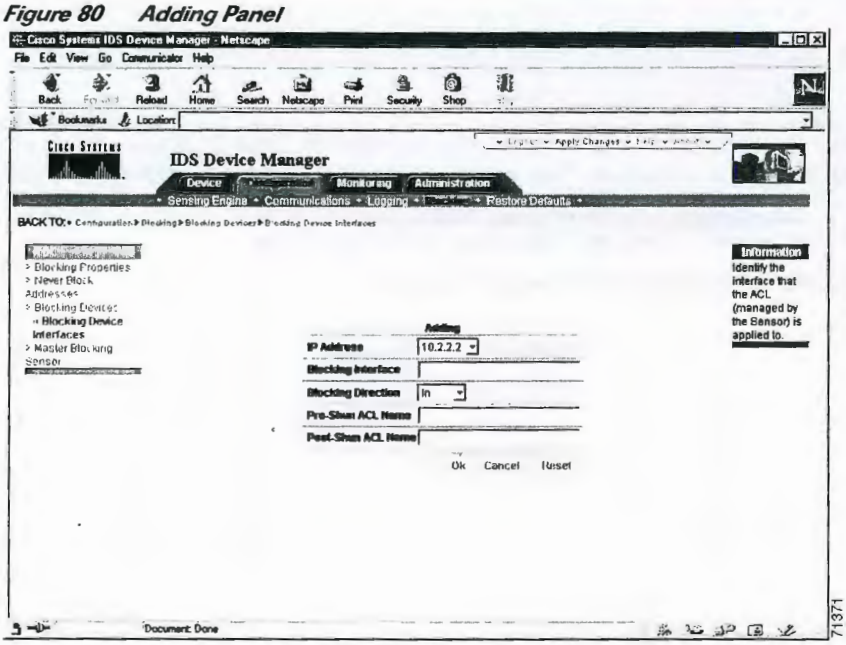
Figure 79 Blocking Device Interfaces Panel



Step 27 Click **Add** to configure the interfaces for each blocking device.

Result: The Adding panel appears.

Figure 80 Adding Panel



Note You cannot configure the interfaces for the PIX Firewall. The blocking direction is not available for Catalyst 6000 VACL devices.

Step 28 In the IP Address field, enter the address of the blocking device.

Step 29 I n the Blocking Interface field, enter the interface on the blocking device that is used for blocking (1 to 32 characters).

Note If you are using Catalyst 6000 family VACLS for blocking, enter the VLAN number.

Step 30 From the Blocking Direction list box, select the direction of the traffic flowing through the interface that should be blocked (in, out).

Step 31 In the Pre Shun ACL Name field, enter the name of the preblock ACL (1 to 64 characters).

Step 32 In the Post Shun ACL Name field, enter the name of the postblock ACL (1 to 64 characters).

Note To reset the form, click **Reset**.

Step 33 Click **OK**.

Note For more information on preshun and postshun ACLS, refer to the *Cisco Intrusion Detection System Sensor Configuration Note Version 3.1* found at the following website: http://www.cisco.com/univercd/cc/td/doc/product/iaabu/csids/csids8/index.htm

Blocking with Multiple Sensors

Multiple sensors can forward blocking requests to a specified master blocking sensor, which controls one or more devices. The sensor that is sending its block requests to the master blocking sensor is referred to as a "blocking forwarding sensor." On the blocking forwarding sensor, you must specify which remote host serves as the master blocking sensor. And on the master blocking sensor you must add the blocking forwarding sensors to its remote host configuration.

Note When using a master blocking sensor only the master blocking sensor is configured to manage the network devices. The blocking forwarding sensors should not be configured to manage network devices.

This section includes these topics:

- Configuring the Master Blocking Sensor, page 101
- Configuring the Blocking Forwarding Sensor, page 103

Configuring the Master Blocking Sensor

To configure the master blocking sensor, follow these steps:

Step 1 In the IDS Device Manager main window, select **Configuration > Communications > Remote Hosts**.

Result: The Remote Hosts panel appears.

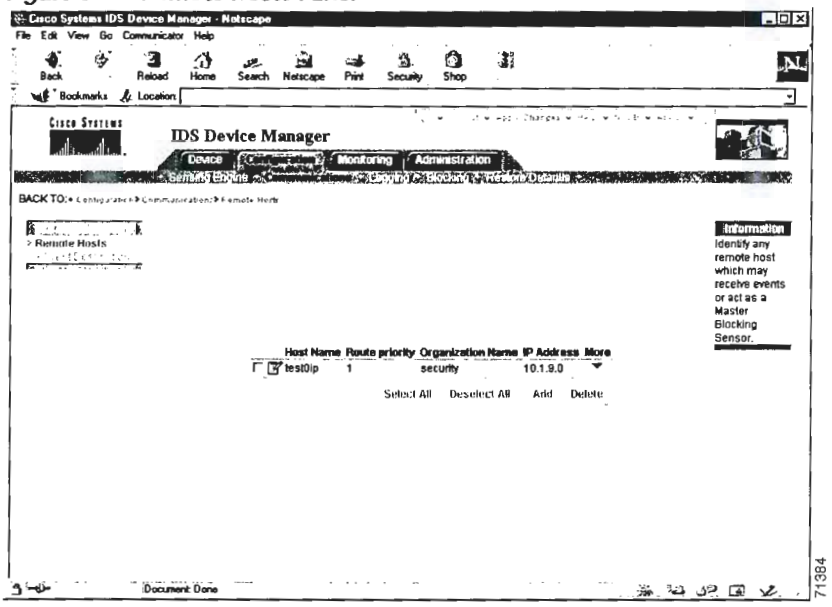
Fls: 1163
3701
Doc:

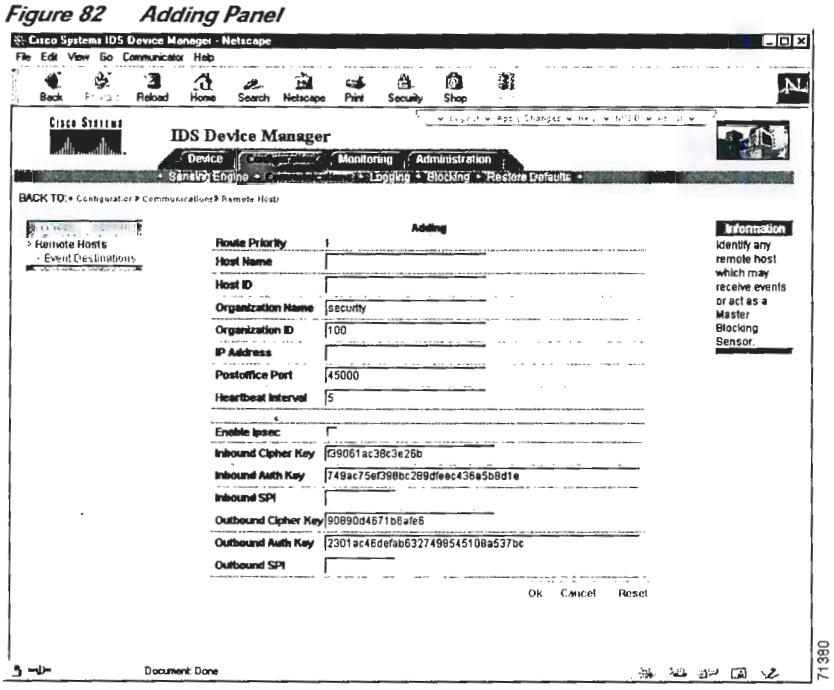
Figure 81 Remote Hosts Panel



Step 2 Click **Add** to add a remote sensor as a blocking forwarding sensor.

Result: The Adding panel appears.

Figure 82 Adding Panel



Step 3 In the Host Name field, enter the name of the blocking forwarding sensor (1 to 256 characters).

Step 4 In the Host ID field, enter the Host ID of the blocking forwarding sensor (1 to 65535).

Step 5 In the Organization Name field, enter the organization name of the blocking forwarding sensor (1 to 256 characters).

Step 6 In the Organization ID field, enter the organization ID of the blocking forwarding sensor (1 to 65535).

Step 7 In the IP Address field, enter the IP address of the blocking forwarding sensor.

Step 8 In the Post Office Port field, enter the Post Office port on the blocking forwarding sensor (1025 to 65535).

Default: 45000

Step 9 In the Heartbeat Interval field, enter the remote Post Office heartbeat interval (1 to 65535).

Default: 5

Step 10 Do not select the **Enable IPSec** check box for the blocking forwarding sensor.

Default: Off

Note You can enable IPSec on the remote host if you are using the Cisco IDS Director or the Cisco Security Policy Manager rather than the IDS Device Manager as your IDS manager. Refer to your IDS manager documentation for the procedure for configuring IPSec. If you want to configure IPSec between two sensors, for instance, between the master blocking sensor and the blocking forwarding sensor, refer to the *Cisco Intrusion Detection System Sensor Configuration Note Version 3.1* for the instructions. The configuration note is found at the following website: http://www.cisco.com/univercd/cc/td/doc/product/iaabu/csids/csids8/index.htm

Note To reset the form, click **Reset**.

Step 11 Click **OK**.

Note Repeat these steps for each blocking forwarding sensor you need to add to the master blocking sensor.

Configuring the Blocking Forwarding Sensor

To configure a blocking forwarding sensor, follow these steps:

Step 1 In the IDS Device Manager main window, select **Configuration** > **Communications** > **Remote Hosts**.

Result: The Remote Hosts panel appears.

Step 4 In the Host ID field, enter the host ID of the master blocking sensor (1 to 65535).

Step 5 In the Organization Name field, enter the organization name of the master blocking sensor (1 to 256 characters).

Step 6 In the Organization ID field, enter the organization ID of the master blocking sensor (1 to 65535).

Step 7 In the IP Address field, enter the IP address of the master blocking sensor.

Step 8 In the Post Office Port field, enter the Post Office port on the master blocking sensor (1025 to 65535).

Default: 45000

Step 9 In the Heartbeat Interval field, enter the remote Post Office heartbeat interval (1 to 65535).

Default: 5

Step 10 Do not select the **Enable IPSec** check box for the master blocking sensor.

Default: Off

Note You should only enable IPSec on the remote host if you are using the Cisco IDS Director or CSPM rather than the IDS Device Manager as your IDS manager.

Note To reset the form, click **Reset**.

Step 11 Click **OK**.

Result: The remote host is added to both the Remote Hosts and the Master Blocking Sensor panels.

Step 12 In the IDS Device Manager main window, select **Configuration > Blocking > Master Blocking Sensor**.

Result: The Master Blocking Sensor panel appears.

Figure 85 Master Blocking Sensor Panel

Doc: 3701

Step 14 Click **Enable**.

Note To reset the form, click **Reset**.

Step 15 Click **OK**.

Note Repeat this procedure on each blocking forwarding sensor.

Tracking Which Hosts/Networks Are Being Blocked

On occasion, you may want to determine which addresses are being blocked. You can see the list of addresses and networks on the Manual Blocking panel. This panel also shows you the current status of devices, which are being managed by the sensor.

To view the list of addresses and networks being blocked, follow these steps:

Step 1 In the IDS Device Manager main windows, select **Administration** > **Manual Blocking**.

Result: The Manual Blocking panel appears

Figure 86 Manual Blocking Panel

You can see a list of all host/network addresses being blocked and the current status of devices.

Manual Blocking/Unblocking

On occasion, you may want to block an address for a short period of time. You can configure the address and the amount of time on the Manual Blocking panel.

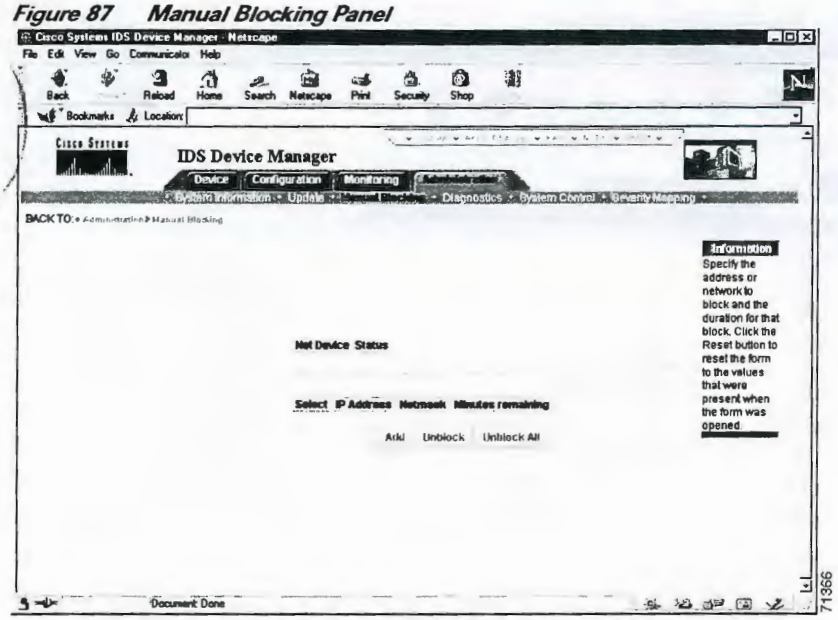
To configure manual blocking, follow these steps:

Step 1 In the IDS Device Manager main windows, select **Administration > Manual Blocking**.

Result: The Manual Blocking panel appears.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1166
Doc: 3701

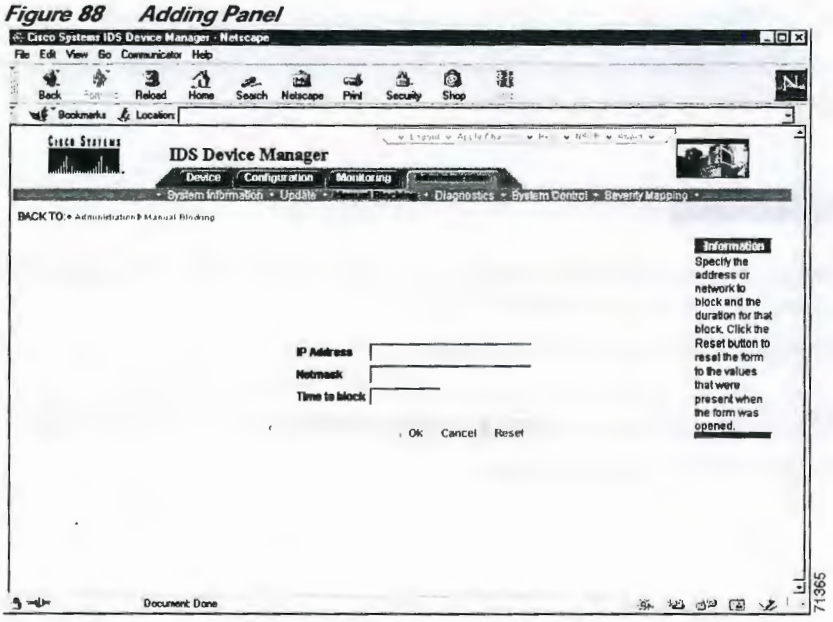
Figure 87 Manual Blocking Panel



Step 2 Click **Add** to add an address.

Result: The Adding panel appears.

Figure 88 Adding Panel



Step 3 In the IP Address field, enter the IP address to be blocked.

Caution If you are blocking a single IP address, leave the netmask field blank. Filling in the netmask prevents the IP address from being blocked on a PIX Firewall.

4.099

Note PIX Firewalls do not block networks.

Step 4 In the Netmask field, enter the netmask address to be blocked.

Step 5 In the Time to block field, enter the number of minutes to block (1-70560).

Note Entering -1 creates a permanent block.

Note To reset the form, click **Reset**.

Step 6 Click **OK**.

Result: The Manual Blocking panel appears showing the minutes for the block. Click **Refresh** in your browser to see the minutes pass.

Figure 89 Monitoring Blocking Panel

Step 7 To cancel the block before the assigned minutes have passed, click **Unblock**.

Monitoring Tasks

This section includes the following procedures:

- Log Files, page 110
- Viewing Log Files, page 112
- Viewing Sensing Interface Statistics, page 116
- Downloading the IDS Event Viewer, page 117

Log Files

This section includes the following topics:

- Event Logs, page 110
- Error and Command Logs, page 111
- IP Session Logs, page 112

Event Logs

Event logs are ASCII files written to the /usr/nr/var directory with the naming convention of log.YYYYMMDDHHMM. Log files capture data on alarms, command, and errors.

Event alarm data are unique because the record format contains optional as well as fixed components.

Fixed alarm data include the following information:

- Which sensor detected the event.
- When the alarm was generated.
- The type of alarm.
- The source and target of the event.

The optional data field contains information that cannot be described by the fixed portion of the alarm record format. This information may be a string associated with an event, or context data that consists of a snapshot of incoming and outgoing TCP traffic (a 256-byte maximum in both directions).

Example 1 shows a typical line written to a log file.

Example 1 Log File Line

```
4,1025294,1998/04/16,16:58:36,1998/04/16,11:58:36,10008,11,100,OUT,OUT,1,2001,0,TCP/IP,
10.1.6.1,10.2.3.5,0,0,0.0.0.0,
```

Each comma-delimited field contains different data. The first field indicates what kind of record was logged. Table 1 maps the initial field of a log file with its corresponding record type.

Table 1 Log File Initial Field Reference Values

Field Values	Record Types
2	Error
3	Command Log
4	Event (alarm)

In the previous table, field value 4 denotes an event record. Table 2 provides a reference for the rest of the fields in Example 1.

Table 2 Log File Field Reference Values

Sample Field Value	Field Type
4	Record Type
1025294	Record ID
1998/04/16	GMT Datestamp
16:58:36	GMT Timestamp
1998/04/16	Local Datestamp
11:58:36	Local Timestamp
10008	Application ID
11	Host ID
100	Organization ID
OUT	Source Direction
OUT	Destination Direction
1	Alarm Level
2001	SigID
0	SubSigID
TCP/IP	Protocol
10.1.6.1	Source IP Address
10.2.3.5	Destination IP Address
0	Source Port
0	Destination Port
0.0.0.0	Router IP Address
phf	String Data
474554206A756E6B2F7068 663F6A756E6B0DZZ	Context Data[1]

1. The context data is encoded in a hexadecimal-ASCII format, which has two characters for each one represented, converted to hexadecimal. For example, the letter "A" is represented as 41. Context may contain bidirectional traffic, that is, both sides of a conversation. The separator for the two sides of the context is the two characters is "ZZ."

Error and Command Logs

Two other types of records, error and command log, are similar in structure to the event record. Both of these record types have the same first eight fields contained in event records (Record Type, Record ID, GMT Date and Timestamp, Local Date and Timestamp, Application ID, Host ID, and Organization ID).

RQS Nº 05/2005 - CN
CPMI - CORREIOS
1168
Fls:
3701
Doc:

An error record type has a ninth field denoting the actual error string generated by a service. The command log record type also contains fields for the source application ID, host ID, and organization ID, in addition to the command string. In both cases, you have a complete record of errors and commands.

Errors are also written to error files specific to each daemon.

IP Session Logs

IP session logs capture all incoming and outgoing TCP packets associated with a specific IP address, and therefore contain binary data. They are written to a /usr/nr/var/iplog directory of the sensor with the naming convention of iplog.source_IP_address.yyyymmddhhmm.

In addition to detecting attack signatures, *packetd* is able to monitor the traffic associated with a specific type of attack. For example, *packetd* can be configured to monitor all packets associated with an IP spoof. The *packetd* daemon creates a separate log file in /usr/nr/var/iplog for each of these monitoring sessions. The name of each session log file is based on the IP address of the attacking host and a time stamp (for example, iplog.10.145.16.152.yyyymmddhhmm). When the IP log file is closed, it is moved to the /usr/nr/var/iplog/new directory.

Viewing Log Files

Log files are stored in the following directories:

- Event logs are stored in the /usr/nr/var directory.
- IP logs are stored in the /usr/nr/var/iplog directory.
- Error logs are stored in the /usr/nr/var/errors directory.

To view and save log files, follow these steps:

Step 1 In the IDS Device Manager main windows, select **Monitoring > Logs > Events > Current**.

Result: The Current panel appears.

Figure 90 Current Panel

Step 2 Click the file name to view the log file.

Result: The log file appears on another browser page if the file is not empty.

Note All log files start out as a certain size and are then filled with data. The percentage used designates the percent of a log file that has been written to so far.

Note If the log file is empty, the browser prompts you to save the file because it cannot open it.

Note You can click the column headers to sort up and down.

Step 3 To save the log file, select **File > Save As** in your browser.

Step 4 To view archived logs, select **Monitoring > Logs > Events > Archived**.

Result: The Archived panel appears.

CPMI - CORREIOS
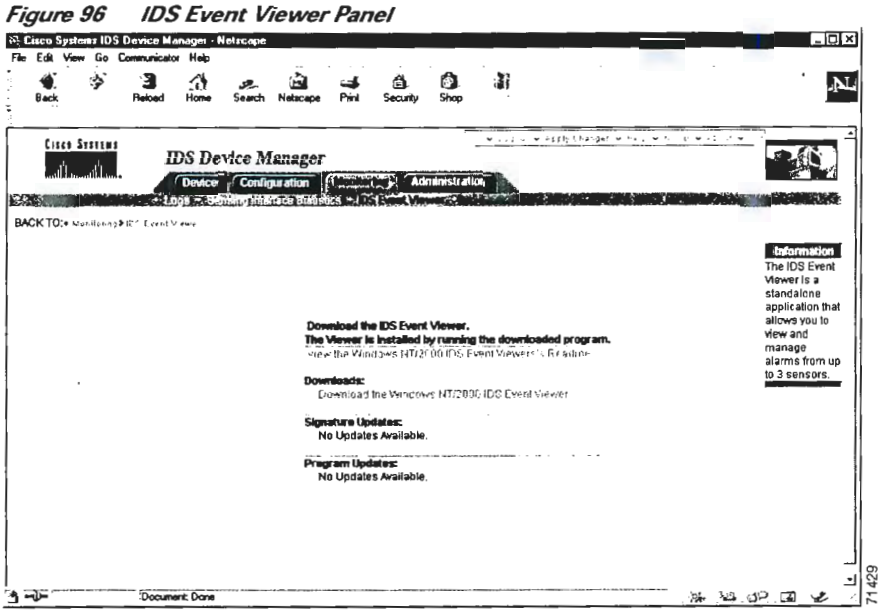
Fls: 1171
Doc: 3701

Figure 96 IDS Event Viewer Panel



Step 2 Click **View the Event Viewer's Readme** to see information on installation, running the IDS Event Viewer, and signatures.

Step 3 Click **Download the Windows NT/2000 IDS Event Viewer** to install the IDS Event Viewer.

Step 4 Copy the executable to the directory of your choice.

Step 5 Install the IDS Event Viewer.

For installation instructions, refer to *Cisco Intrusion Detection System Getting Started Version 3.1* or the *Cisco Intrusion Detection System Event Viewer Configuration Note Version 3.1* found at the following website:
http://www.cisco.com/univercd/cc/td/doc/product/iaabu/csids/csids8/index.htm

Note You can use the IDS Event Viewer to manage up to three sensors.

For more detailed information on configuring and using the IDS Event Viewer, refer to the *Cisco Intrusion Detection System Event Viewer Configuration Note Version 3.1* found at the following website:

http://www.cisco.com/univercd/cc/td/doc/product/iaabu/csids/csids8/index.htm

Administrative Tasks

This section includes the following topics:

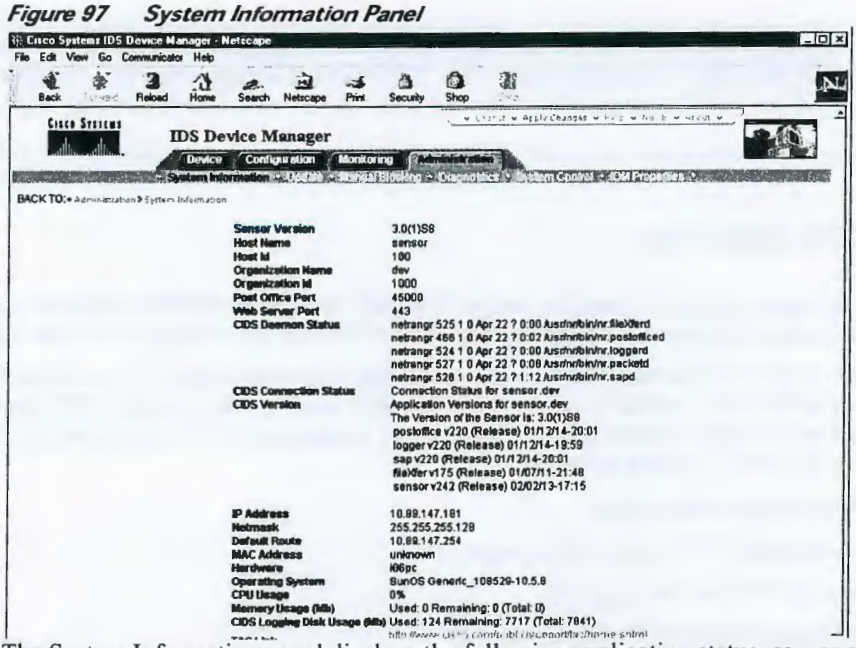
- Viewing System Information, page 119
- Configuring Automatic Updates, page 120
- Running and Viewing Diagnostics, page 122

- Starting and Stopping Processes, page 123
- Setting Up Severity Levels, page 124

Viewing System Information

You can view your system information by selecting **Administration > System Information** in the IDS Device Manager main window (see Figure 97).

Figure 97 System Information Panel



The System Information panel displays the following application status, sensor appliance, and support information:

- Sensor Version
- Host Name
- Host ID
- Organization Name
- Organization ID
- Post Office Port
- Web Server Port
- IP Address
- Netmask
- Default Route
- CSIDS Daemon Status—Displays all the daemons that are running
- CSIDS Connection Status—Displays the Postoffice connection status with remote destinations and connection status with managed devices.
- CSIDS Version—Displays the version of the running daemons

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1172
Doc: 3701

- MAC Address
- Hardware
- Operating System
- CPU usage
- Memory usage (MB)
- CSIDS Logging Disk Space Usage (MB)
- TAC link

Note From this panel, you can tell whether the sensor is communicating with the IDS Event Viewer by what is listed under the CIDS Connection Status line. [Established] indicates that the connection is viable. [SynSent] indicates that the connection is down and the sensor is not communicating with the IDS Event Viewer.

Configuring Automatic Updates

You can configure automatic signature and service pack updates, so that when signatures or service packs are loaded on a central FTP server, they will be downloaded and applied to your sensor.

If the FTP server or the network between the sensor and the server is slow, it is possible for an FTP file transfer timeout for the update to occur. The update FTP session times out after 600 seconds. If this occurs, an error is logged in the errors.idsapply.txt or idsapply.txt if IDS is not running. The update is not attempted when a timeout occurs.

This section includes these topics:

- Increasing the FTP Timeout Value, page 120
- Supported FTP Servers, page 121
- Configuring Automatic Updates, page 121

Increasing the FTP Timeout Value

To increase the timeout, follow these steps:

Step 1 Log in to the sensor as root.

Step 2 Type the following:

```
SAP_FTP_TIMEOUT=1200
export SAP_FTP_TIMEOUT
```

Step 3 Type the following:

```
/usr/nr/bin/idsupdate stop
```

Step 4 Type `idsupdate` to reschedule the updates.

Result: The new updates use 1200 seconds as the FTP timeout value.

Supported FTP Servers

The following FTP servers are supported for updates:

- Sambar FTP Server Version 5.0 (win32)
- Web-mail Microsoft FTP Service Version 5.0 (win32)
- Serv-U FTP-Server v2.5h for WinSock (win32)
- Solaris 2.8
- HP-UX (HP-UX qdir-5 B.10.20 A 9000/715)
- Windows 2000 (Microsoft ftp server version 5.0)
- Windows NT 4.0 (Microsoft ftp server version 3.0)

Note The sensor cannot automatically download signature update and service packs from Cisco.com. You need to download the signature update or service pack to your own FTP server, and then configure the sensor to download them from your FTP server.

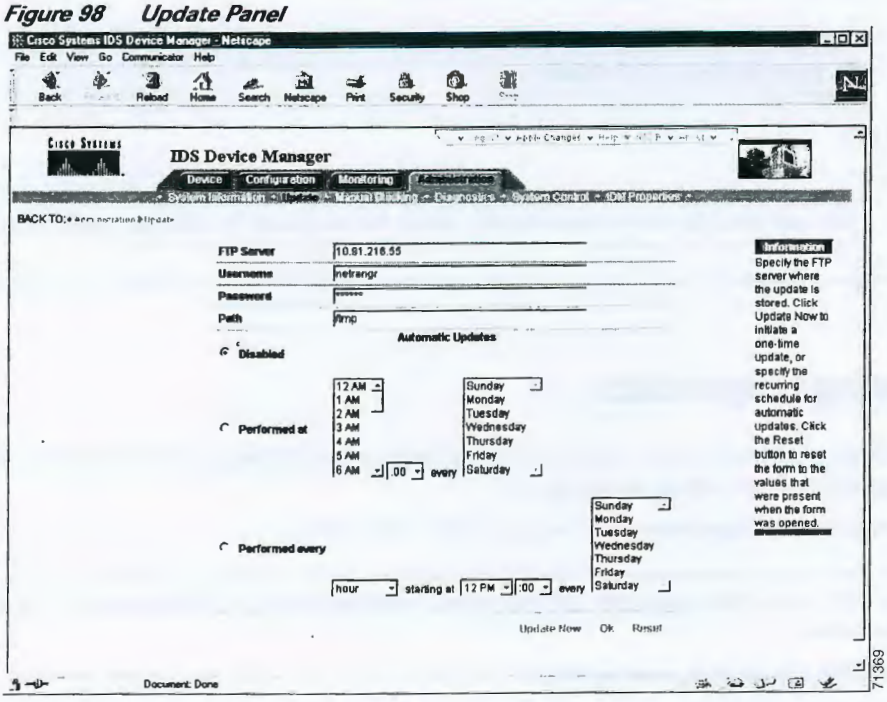
Configuring Automatic Updates

To configure automatic signature and service pack updates, follow these steps:

Step 1 In the IDS Device Manager main window, select **Administration > Update**.

Result: The Update panel appears.

Figure 98 Update Panel



Step 2 In the FTP Server field, enter the IP address of the FTP server to poll for updates.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1173
Fls:
3701
Doc:

Note The sensor does not use DNS so you must enter the IP address and not the name.

Step 3 In the Username field, enter the username to use when logging into the FTP server (1 to 16 characters).

Step 4 In the Password field, enter the username password on the FTP server (1 to 16 characters).

Step 5 In the Path field, enter the path to the directory on the FTP server where the updates are located (1 to 128 characters).

Note The path entered is relative to the directory where you log in. To use an absolute path, add an extra "/" before the directory name.

Step 6 Perform one of the following:

- Select the **Disabled** check box.
- Select the **Performed at** check box.

  Specify the specific times the update mechanism should run by selecting a time and day from the list boxes.

Note You can select multiple times and days. Select times when there is little user activity on the network.

- Select the **Performed every** check box.

  Schedule recurring updates by selecting an hour, time, and day from the list boxes.
- Click **Update Now** to apply the update immediately.

Note To reset the form, click **Reset**.

Step 7 Click **OK**.

Note You can have the sensor immediately check for an update by clicking Update Now.

Running and Viewing Diagnostics

The diagnostics are designed to be used by TAC when troubleshooting a problem on the sensor. Prepare a diagnostics report before contacting TAC.

To run and view diagnostics on the sensor, follow these steps:

Step 1 In the IDS Device Manager main window, select **Administration** > **Diagnostics** in to run diagnostics on the sensor.

Result: The Diagnostics panel appears.

Figure 99 Diagnostics Panel

Step 2 Click **Run Diagnostics** to start the hardware diagnostics

Result: The results are displayed in a report, which includes a list of the installed OS packages.

Warning **This will run diagnostics on the sensor. The command may take several minutes to complete execution.**

Note Every time you click **Run Diagnostics**, you generate a new report.

Step 3 Click **View Last Report** to view the report that was generated the last time the diagnostics were run.

Note Running diagnostics on the sensor takes a while.

Step 4 To save the diagnostics report, select **Menu > Save As** in your browser.

Starting and Stopping Processes

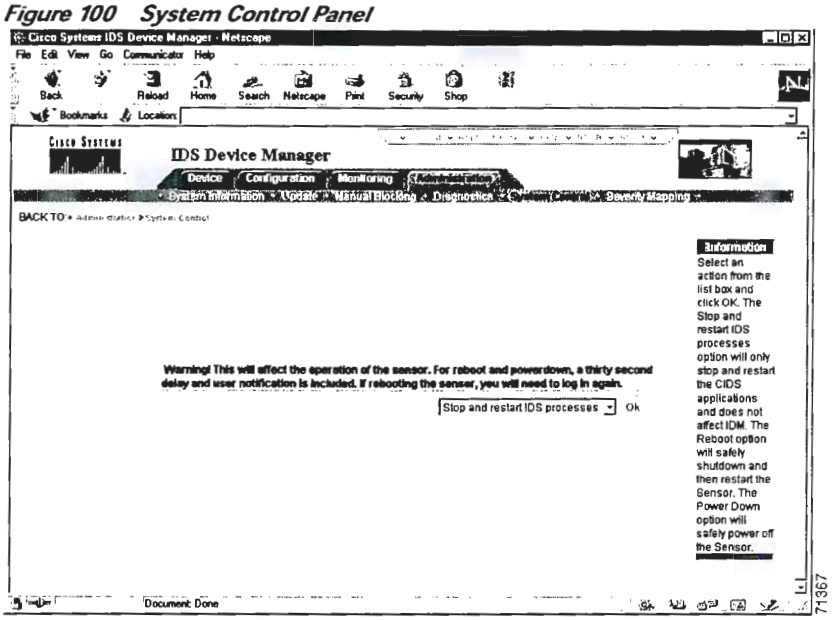
To stop and start IDS Device Manager processes, follow these steps:

Step 1 In the IDS Device Manager main window, select **Administration > System Control**.

Result: The System Control panel appears.

ROS Nº 03/2095 - CN
CPMI - CORREIOS
Fls: 1174
Doc: 3701

Figure 100 System Control Panel



Step 2 Select one of the following actions from the list box:

- Stop and restart IDS processes

  Stop and restart IDS processes only stops and restarts the IDS applications and does not affect the IDS Device Manager.

- Reboot

  Reboot safely shuts down and then restarts the sensor.

- Power Down

  Power Down safely powers off the sensor.

Warning **These actions affect the operation of the sensor. For reboot and power down, a thirty-second delay and user notification are included. If you reboot the sensor, you must log in to the IDS Device Manager after the sensor comes online.**

Step 3 Click **OK**.

Setting Up Severity Levels

You can assign text-based severity levels to Levels 1 though 5. Instead of displaying the numerical value of a severity, you see the text mapping as shown in the following default severity levels:

- 0 = None
- 1 = Information

  Information refers to events that on their own are not considered security relevant, but when combined with other information could be used to develop trends or conduct forensic research. Information alarms are identified by a blue icon in the IDS Event Viewer.

- 2 = Information
- 3 = Low

  Low refers to unusual or suspicious traffic and overt reconnaissance; events that are in violation of the gray area of an RFC. Low alarms are identified by a yellow icon in the IDS Event Viewer.

- 4 = Medium

  Medium refers to denial of service of auto-recoverable services, network and/or service floods, stealth scans, and extremely suspicious traffic. Medium alarms are identified by an orange icon in the IDS Event Viewer.

- 5 = High

  High refers to denial of service that is not automatically recoverable, exploits that result in unauthorized access of any type, and obviously malicious RFC violations. High alarms are identified by a red icon in the IDS Event Viewer.

Note If you change the severity mappings in the IDS Device Manager, you need to also change the corresponding severity mappings in the IDS Event Viewer to maintain consistency.

To map severity levels, follow these steps:

Step 1 In the IDS Device Manager main window, select **Administration>IDM Properties>Severity Mapping**.

Result: The Severity Mapping panel appears.

Figure 101 Severity Mapping Panel

Step 2 Select one of the following values for each of the Level 1 though 5 fields:

- Information
- Low

RQS Nº 03/2005 - CN - CPMI - CORREIOS
1175
Fls:
Doc: 3701

- Medium
- High

Note The severity level must be equal to or greater than the severity level of the previous level. For example, Level 1 must be equal to or have a lower severity level than Level 2.

Note To reset the form, click **Reset**.

Step 3 Click **OK**.

Setting Signature Pagination

You can define the pagination properties for displaying signature pages, which affects the pagination for the lists under the following panels:

- Configuration > Sensing Engine > Signature Groups
- Configuration > Sensing Engine > Custom Signatures
- Configuration > Sensing Engine > TCP Connection Signatures
- Configuration > Sensing Engine > UDP Connection Signatures
- Configuration > Sensing Engine > String Signatures
- Configuration > Sensing Engine > ACL Policy Violations

To define signature pagination, follow these steps:

Step 1 In the IDS Device Manager main window, select **Administration > IDM Properties > Signature Pagination**.

Result: The Signature Pagination panel appears.

Figure 102 Signature Pagination Panel

Step 2 Select one of the following check boxes:

- Pagination Size—Enter the number of signature IDs to display on a page (5 to 1000).

  Default: 15
- Disabled

Note To reset the form, click **Reset**.

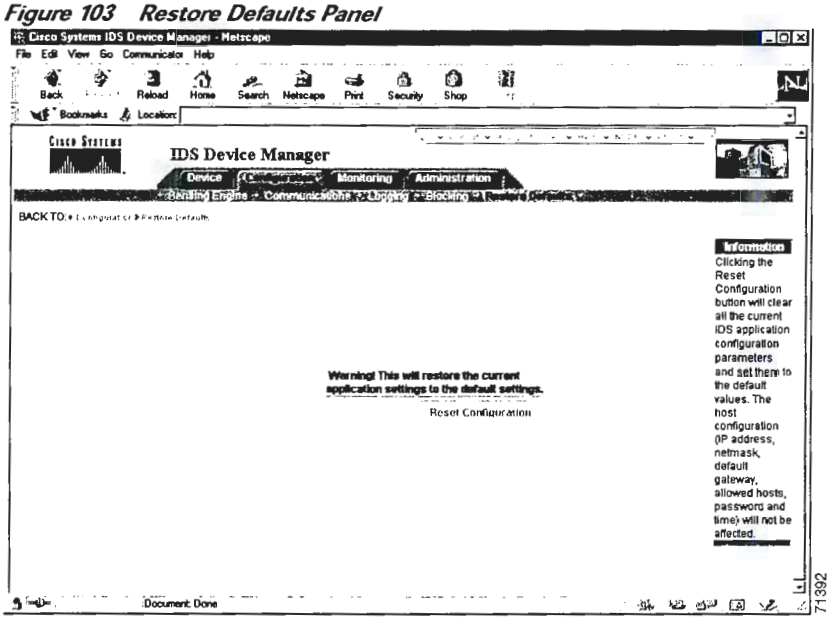
Step 3 Click **OK**.

Restoring Defaults

Select **Configuration > Restore Defaults** to clear all current configurations and restore the factory defaults to the sensor (see Figure 103).

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1176
Doc: 3701

Figure 103 Restore Defaults Panel



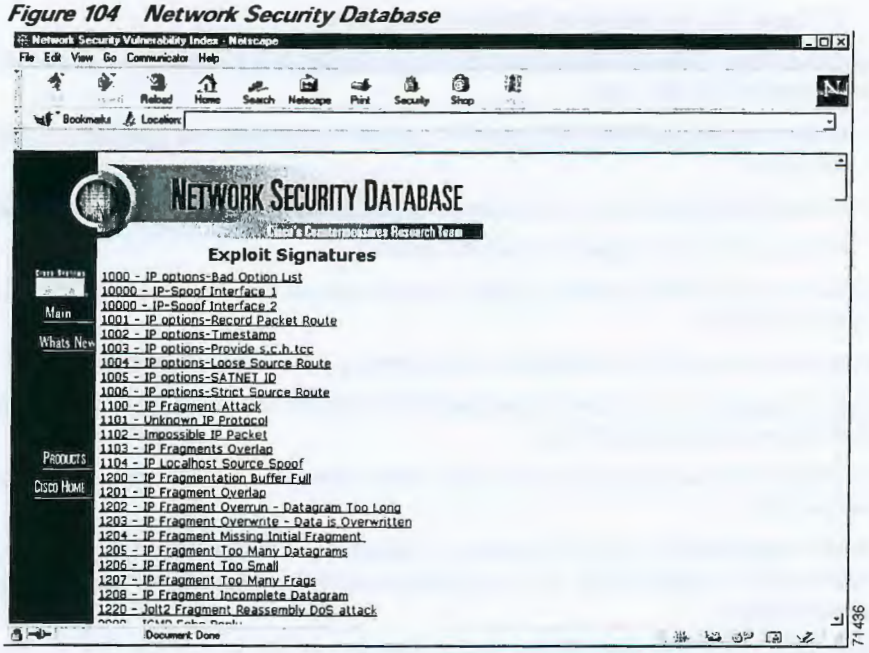
Caution Clicking Reset Configuration clears all the current IDS application configuration parameters and sets them to the default values. The host configuration (IP address, netmask, default gateway, allowed hosts, password, and time) are not affected.

4.079

Viewing the NSDB

Click **NSDB** on the ToolBar to view the Network Security Database (see Figure 104).

Figure 104 Network Security Database



A typical NSDB entry contains the following critical security information:

- Signature Name—The name of the signature appears at the top of the entry. In Figure 105, it is IP Fragment Incomplete Datagram.
- ID—A unique ID for the signature. In Figure 105, it is 1208.
- Sub ID—An optional subsignature ID for the signature. In Figure 105, it is 0, which means there is no subsignature ID.
- Recommended Alarm Level—The alarm level that we recommend you set for that signature. In Figure 105, it is 2.
- Signature Type—The signature type indicates what it affects.
  - Network—Categorizes a vulnerability as being network-based.
  - Host—Categorizes a vulnerability as being host-based.

Note Cisco IDS mainly uses the network classification because at this time no host-based signatures are being developed.

In Figure 105, the Signature Type is Network.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1177
Fls:
3701
Doc:

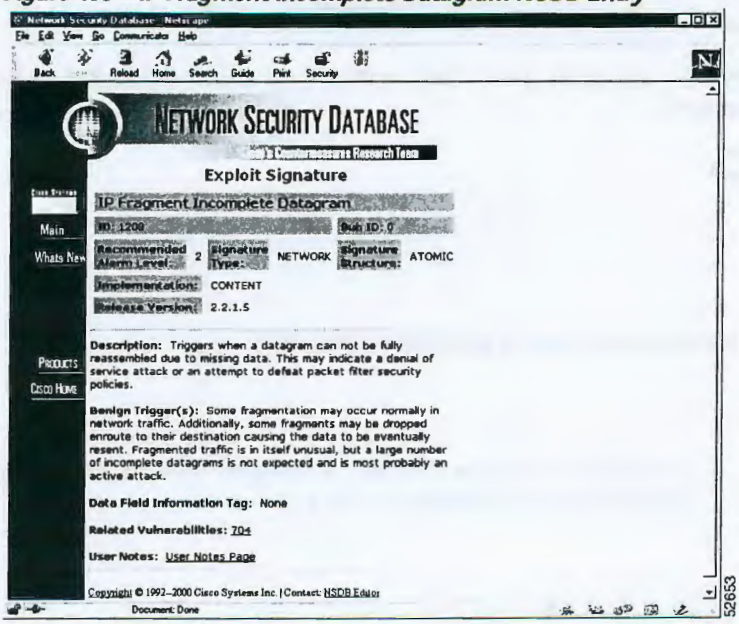
- Signature Structure—Defines how many packets it takes for the sensor to positively identify an alarm condition on the network. There are two signature structure types:
  - Atomic signature—Requires only one packet to be inspected to identify an alarm condition.
  - Composite signature—Requires multiple packets to be inspected to identify an alarm condition.

  In Figure 105, the Signature Structure is Atomic.
- Implementation—The signatures examine the packet headers to identify an alarm condition. There are two implementation types:
  - Content-based signatures—Examine the payload and headers of a packet to identify an alarm condition.
  - Context-based signatures—Evaluate the packet headers to identify an alarm condition.

  In Figure 105, the Implementation is Content.
- Release Version—This number indicates in which release this signature originated. In Figure 105, it is release 2.2.1.5.
- Description—A concise explanation of the signature and what exploits it detects.
- Benign Trigger(s)—A concise explanation of any activity that may appear to be an exploit but are actually normal network activity.
- Data Field Information Tag—Provides a bit of the information used to create a signature, such as an example URL.
- Related Vulnerabilities—Each signature can have zero or more related vulnerabilities. Each vulnerability information page provides background on the vulnerability and a link to any available countermeasures.
- User Notes—The user-defined notes page is an empty template in which you can fill in security information customized to your network security environment.

ECT 4077 U 1

Figure 105 IP Fragment Incomplete Datagram NSDB Entry



Managing Data

For information on setting up, viewing, and managing events from up to three sensors, refer to the *Cisco Intrusion Detection System Event Viewer Configuration Note Version 3.1* found at the following website:

http://www.cisco.com/univercd/cc/td/doc/product/iaabu/csids/csids8/index.htm

Troubleshooting

Use the following sensor commands when troubleshooting issues with TAC:

- If you have difficulty connecting to the sensor through the IDS Device Manager, SSH or Telnet to the sensor and type the following command to check the version and status of the sensor (whether it is running):

  ```
  cidServer version
  ```

Note The server is started automatically at boot, so you do not need to start or stop it during normal use.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1178
Doc: 3701

- If the server is not running, start it by entering the following command:

```
cidServer start
```

- If you are troubleshooting an issue with TAC and you need to stop and start the server, enter the following commands:

```
cidServer stop
cidServer start
```

Glossary

The following list contains terms that are pertinent to Cisco IDS.

Numerals

3DES Triple Data Encryption Standard. A stronger version of DES, which is the default encryption method for SSH v.1.

A

AAA authentication, authorization, and accounting. A Cisco IOS Software and PIX Firewall command for controlling how users can log into a router or a PIX Firewall.

ACE access control entry. An entry in the ACL that describes what action should be taken for a specified address or protocol.

ACK Notification sent from one network device to another to acknowledge that some event occurred (for example, the receipt of a message).

ACL access control list. The means by which access to, and denial of, services is controlled. It is a list of the services available, each with a list of the hosts permitted to use the service.

active ACL The ACL created and maintained by device management (*managed*) and applied to the router block interfaces.

alarm An IDS message that is used internally to indicate a network exploit in progress or a potential security problem occurrence.

attack An assault on system security that derives from an intelligent threat, that is, an intelligent act that is a deliberate attempt (especially in the sense of a method or technique) to evade security services and violate the security policy of a system.

authentication Used to describe the hash key value, usually a 32-byte hexadecimal value.

4075

B

benign trigger A situation in which a signature is fired correctly, but the source of the traffic is nonmalicious.

blocking Refers to the ability of the sensor to use a network device to deny entry to a specific network host or an entire network. See blocking.

C

C & C command and control. Refers to the network interface on a sensor through which it is managed.

cipher key Used to describe the encryption key value. For Data Encryption Standard (DES), a valid encryption key is a 16-byte hexadecimal value.

CiscoFusion Cisco internetworking architecture that "fuses" together the scalability, stability, and security advantages of the latest routing technologies with the performance benefits of ATM and LAN switching, and the management benefits of VLANs. See Cisco IOS.

Cisco IOS Cisco Internetworking Operating System. Cisco Systems software that provides common functionality, scalability, and security for all products under the CiscoFusion architecture. Cisco IOS software allows centralized, integrated, and automated installation and management of internetworks, while ensuring support for a wide variety of protocols, media, services, and platforms. See CiscoFusion.

Cisco Secure Policy Manager Cisco Secure Policy Manager is a scalable, comprehensive security policy management system.

configuration management Configuration management refers to the ability of the IDS manager to remotely manage the configuration of sensors. This ability allows network security personnel to centrally manage all the sensors across an enterprise-wide collection.

control interface When device management (*managed*) opens a Telnet or SSH session with a network routing device, it uses one of the routing interfaces of the device as the remote IP address. This is the control interface.

countermeasure An action, device, procedure, or technique that reduces a threat, a vulnerability, or an attack by eliminating or preventing it, by minimizing the harm it can cause, or by discovering and reporting it so that corrective action can be taken.

D

daemon/service A daemon or service performs a specific function, such as writing log files, analyzing IP traffic, or processing events.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
1179
Fls:
Doc: 3701

DES Data Encryption Standard. A strong encryption method where the strength lies in a 56-bit key rather than an algorithm.

device management Device management refers to the ability of the sensor to interact with network devices. For example, it can dynamically reconfigure the ACLs of a router to block an attacker. Device management is controlled by the *managed* service.

director The director is the UNIX-based IDS manager. A single director can manage and monitor a group of sensors, which enables security personnel to secure a network from a centralized console.

DNS Domain Name System. An Internet-wide host name to IP address mapping. DNS enables you to convert human-readable names into the IP addresses needed for network packets.

DoS Denial of Service. A denial of service attack is an attack whose goal is just to disrupt the operation of a specific system or network.

E

encryption Application of a specific algorithm to data so as to alter the appearance of the data making it incomprehensible to those who are not authorized to see the information.

engine A component of the sensor designed to support many signatures in a certain category. Each engine has parameters that can be used to create new signatures or tune existing signatures.

enterprise network Large and diverse network connecting most major points in a company or other organization. Differs from a WAN in that it is privately owned and maintained.

F

false negative A situation in which a signature is not fired when offending traffic is detected.

false positive A situation in which a signature is fired incorrectly.

filtering router An internetwork router that selectively prevents the passage of data packets according to a security policy.

firewall A security device that protects the perimeter of the network.

fragmentation IP fragmentation involves breaking a single IP packet into multiple segments that are all below the maximum transmission size for the network.

H

HTTP — Hypertext Transfer Protocol. The standard protocol used by websites to convey information to web users. By default, this protocol uses TCP port 80.

HTTPS — An extension to the standard HTTP protocol that provides confidentiality by encrypting the traffic from the website. By default this protocol uses TCP port 443.

I

ICMP — Internet Control Message Protocol. Network layer Internet protocol that reports errors and provides other information relevant to IP packet processing. Documented in RFC 792.

IETF — Internet Engineering Task Force. Task force consisting of over 80 working groups responsible for developing Internet standards. The IETF operates under the auspices of ISOC.

intrusion detection — A security service that monitors and analyzes system events for the purpose of finding, and providing real-time or near real-time warning of, attempts to access system resources in an unauthorized manner.

Intrusion Detection Planning Guide — Describes intrusion detection technology and provides basic design considerations and scenarios for deployment.

IDM — Intrusion Detection System Device Manager. A web-based device manager for sensors. The IDM provides basic configuration and management capability.

IDS MC — Management Center for IDS Sensors. Web-based IDS manager can manage configurations for up to 300 sensors.

IDV — Intrusion Detection System Device Viewer. The IDV provides basic monitoring and reporting capability to complement the web-based IDM.

IP address — 32-bit address assigned to hosts using TCP/IP. An IP address belongs to one of five classes (A, B, C, D, or E) and is written as 4 octets separated by periods (dotted decimal format). Each address consists of a network number, an optional subnetwork number, and a host number. The network and subnetwork numbers together are used for routing, and the host number is used to address an individual host within the network or subnetwork. A subnet mask is used to extract network and subnetwork information from the IP address.

IPSec — IP Security Protocol. A framework of open standards that provides data confidentiality, data integrity, and data authentication between participating peers. IPSec provides these security services at the IP layer. IPSec uses IKE to handle negotiation of protocols and algorithms based on local policy and to generate the encryption and authentication keys to be used by IPSec. IPSec can be used to protect one or more data flows between a pair of hosts, between a pair of security gateways, or between a security gateway and a host.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1180
Doc: 3701

IP spoofing IP spoofing attack occurs when an attacker outside your network pretends to be a trusted user either by using an IP address that is within the range of IP addresses for your network or by using an authorized external IP address that you trust and to which you want to provide access to specified resources on your network. Should an attacker get access to your IPSec security parameters, that attacker can masquerade as the remote user authorized to connect to the corporate network.

ISOC Internet Society. International nonprofit organization, founded in 1992, that coordinates the evolution and use of the Internet. In addition, ISOC delegates authority to other groups related to the Internet, such as the IAB. ISOC is headquartered in Reston, Virginia (United States).

L

logging Logging of security information is performed on two levels: logging of events (such as IDS commands, errors, and alarms), and logging of individual IP session information.

M

manager Used to describe the node managing the IDS sensor, for example one of the following: IDS Director, CSPM, IDM, or IDS MC.

managed Service responsible for managing and monitoring network devices (routers and packet filters

MTU Maximum Transmission Unit. Represents the maximum packet size that a network segment can handle. If a packet is larger than the MTU, the sending host breaks it into multiple frames and then transmits the multiple frames across the network for reassembly at the destination host.

N

network device A router or packet filter, especially one that works with a sensor to block or cut unauthorized connections.

nrConfigure The Java-based tool for centralized configuration management of remote sensors used by the IDS Director.

NSDB Network Security Database. A database of security information that explains the signatures used by your IDS along with the vulnerabilities on which these signatures are based.

P

packetd — Service that provides intrusion detection; *packetd* is used when the sensor itself is capturing packets directly from the network.

PIX Firewall — Private Internet Exchange Firewall. A Cisco network security device that can be programmed to block/enable addresses and ports between networks.

postoffice — The proprietary protocol that maintains communication across a network between IDS services.

R

regular expression — A mechanism by which you can define how to search for a specified sequence of characters in a data stream or file.

RPC — remote-procedure call. Technological foundation of client/server computing. RPCs are procedure calls that are built or specified by clients and are executed on servers, with the results returned over the network to the clients.

RSA — Acronym stands for Rivest, Shamir, and Adelman, the inventors of the technique. Public-key cryptographic system which may be used for encryption and authentication.

S

SA — Security association. An instance of security policy and keying material applied to a data flow.

Security Monitor — Monitoring Center for Security. Provides event collection, viewing, and reporting capability for network devices. Used with the IDS MC.

sensor — The sensor is the intrusion detection engine. It analyzes network traffic, searching for signs of unauthorized activity.

sensor fidelity — A sensor has good fidelity if it does not exhibit false positives or false negatives and exhibits true positives and true negatives and minimized benign triggers. Signature threshold tuning may be necessary to achieve fidelity.

shunning — Shunning refers to the ability of the sensor to use a network device to deny entry to a specific network host or an entire network. See blocking.

signature — A signature distills network information and compares it against a rule set that indicates typical intrusion activity.

signature inspector — The subsystem that inspects aggregate traffic for known signatures.

RQS Nº 05/2005 - CN
CPMI - CORREIOS
Fls: 1181
Doc: 3701

SPAN Switched Port Analyzer. Feature of the Catalyst 5000 switch that extends the monitoring abilities of existing network analyzers into a switched Ethernet environment. SPAN mirrors the traffic at one switched segment onto a predefined SPAN port. A network analyzer attached to the SPAN port can monitor traffic from any of the other Catalyst switched ports.

SPI Security Parameter Index. A 32-bit entity used to uniquely identify an SA at the receiver. Value ranges are 0x100 - 0xffff ffff (numeric).

SSH Secure Shell. A utility that provides a remote secure C & C interface so the sensor can be configured without exposing plain text user names or passwords to the network connecting the remote user to the sensor.

SSL Secure Socket Layer. Encryption technology for the Web used to provide secure transactions, such as the transmission of credit card numbers for e-commerce.

subsignature A more granular representation of a general signature. They typically further define a broad scope signature.

sysconfig-sensor The program used to initialize the sensor and set up communications between it and the IDS manager.

SYN flood Denial of service attack that sends a host more TCP SYN packets (request to synchronize sequence numbers, used when opening a connection) than the protocol implementation can handle

T

TACACS Terminal Access Controller Access Control System. Authentication protocol, developed by the DDN community, that provides remote access authentication and related services, such as event logging. User passwords are administered in a central database rather than in individual routers, providing an easily scalable network security solution.

TACACS+ Terminal Access Controller Access Control System Plus. Proprietary Cisco enhancement to Terminal Access Controller Access Control System (TACACS). Provides additional support for authentication, authorization, and accounting.

TCP Transmission Control Protocol. Connection-oriented transport layer protocol that provides reliable full-duplex data transmission. TCP is part of the TCP/IP protocol stack.

Telnet Standard terminal emulation protocol in the TCP/IP protocol stack. Telnet is used for remote terminal connection, enabling users to log in to remote systems and use resources as if they were connected to a local system. Telnet is defined in RFC 854.

threshold A value, either upper- or lower-bound that defines the maximum/minimum allowable condition before an alarm is sent.

TLS Transport Layer Security. A future IETF protocol to replace SSL.

E
24.069
1
v

traffic analysis	Inference of information from observable characteristics of data flow(s), even when the data is encrypted or otherwise not directly available. Such characteristics include the identities and locations of the source(s) and destination(s), and the presence, amount, frequency, and duration of occurrence.
true negative	A situation in which a signature is not fired when nonoffending traffic is detected.
true positive	A situation in which a signature is fired properly when the offending traffic is detected.

U

UDP	User Datagram Protocol. Connectionless transport layer protocol in the TCP/IP protocol stack. UDP is a simple protocol that exchanges datagrams without acknowledgments or guaranteed delivery, requiring that error processing and retransmission be handled by other protocols. UDP is defined in RFC 768.

V

VACL	VLAN ACL. An ACL that filters all packets (both within a VLAN and between VLANs) that pass through a switch. Also known as a Security ACL.
VLAN	virtual LAN. A logical division of a LAN into different broadcast domains.
vulnerability	One or more attributes of a computer or a network that permit a subject to initiate patterns of misuse on that computer or network.

Obtaining Documentation

The following sections explain how to obtain documentation from Cisco Systems.

World Wide Web

You can access the most current Cisco documentation on the World Wide Web at the following URL:

http://www.cisco.com

Translated documentation is available at the following URL:

http://www.cisco.com/public/countries_languages.shtml

Documentation CD-ROM

Cisco documentation and additional literature are available in a Cisco Documentation CD-ROM package, which is shipped with your product. The Documentation CD-ROM is updated monthly and may be more current than printed documentation. The CD-ROM package is available as a single unit or through an annual subscription.

Ordering Documentation

Cisco documentation is available in the following ways:

- Registered Cisco Direct Customers can order Cisco product documentation from the Networking Products MarketPlace:

  http://www.cisco.com/cgi-bin/order/order_root.pl

- Registered Cisco.com users can order the Documentation CD-ROM through the online Subscription Store:

  http://www.cisco.com/go/subscription

- Nonregistered Cisco.com users can order documentation through a local account representative by calling Cisco corporate headquarters (California, USA) at 408 526-7208 or, elsewhere in North America, by calling 800 553-NETS (6387).

Documentation Feedback

If you are reading Cisco product documentation on Cisco.com, you can submit technical comments electronically. Click **Leave Feedback** at the bottom of the Cisco Documentation home page. After you complete the form, print it out and fax it to Cisco at 408 527-0730.

You can e-mail your comments to bug-doc@cisco.com.

To submit your comments by mail, use the response card behind the front cover of your document, or write to the following address:

Cisco Systems
Attn: Document Resource Connection
170 West Tasman Drive
San Jose, CA 95134-9883

We appreciate your comments.

Obtaining Technical Assistance

Cisco provides Cisco.com as a starting point for all technical assistance. Customers and partners can obtain documentation, troubleshooting tips, and sample configurations from online tools by using the Cisco Technical Assistance Center (TAC) Web Site. Cisco.com registered users have complete access to the technical support resources on the Cisco TAC Web Site.

Cisco.com

Cisco.com is the foundation of a suite of interactive, networked services that provides immediate, open access to Cisco information, networking solutions, services, programs, and resources at any time, from anywhere in the world.

Cisco.com is a highly integrated Internet application and a powerful, easy-to-use tool that provides a broad range of features and services to help you to

- Streamline business processes and improve productivity
- Resolve technical issues with online support

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1183
Doc: 3701

- Download and test software packages
- Order Cisco learning materials and merchandise
- Register for online skill assessment, training, and certification programs

You can self-register on Cisco.com to obtain customized information and service. To access Cisco.com, go to the following URL:

http://www.cisco.com

Technical Assistance Center

The Cisco TAC is available to all customers who need technical assistance with a Cisco product, technology, or solution. Two types of support are available through the Cisco TAC: the Cisco TAC Web Site and the Cisco TAC Escalation Center.

Inquiries to Cisco TAC are categorized according to the urgency of the issue:

- Priority level 4 (P4)—You need information or assistance concerning Cisco product capabilities, product installation, or basic product configuration.
- Priority level 3 (P3)—Your network performance is degraded. Network functionality is noticeably impaired, but most business operations continue.
- Priority level 2 (P2)—Your production network is severely degraded, affecting significant aspects of business operations. No workaround is available.
- Priority level 1 (P1)—Your production network is down, and a critical impact to business operations will occur if service is not restored quickly. No workaround is available.

Which Cisco TAC resource you choose is based on the priority of the problem and the conditions of service contracts, when applicable.

Cisco TAC Web Site

The Cisco TAC Web Site allows you to resolve P3 and P4 issues yourself, saving both cost and time. The site provides around-the-clock access to online tools, knowledge bases, and software. To access the Cisco TAC Web Site, go to the following URL:

http://www.cisco.com/tac

All customers, partners, and resellers who have a valid Cisco services contract have complete access to the technical support resources on the Cisco TAC Web Site. The Cisco TAC Web Site requires a Cisco.com login ID and password. If you have a valid service contract but do not have a login ID or password, go to the following URL to register:

http://www.cisco.com/register/

If you cannot resolve your technical issues by using the Cisco TAC Web Site, and you are a Cisco.com registered user, you can open a case online by using the TAC Case Open tool at the following URL:

http://www.cisco.com/tac/caseopen

If you have Internet access, it is recommended that you open P3 and P4 cases through the Cisco TAC Web Site.

4.065
2

Cisco TAC Escalation Center

The Cisco TAC Escalation Center addresses issues that are classified as priority level 1 or priority level 2; these classifications are assigned when severe network degradation significantly impacts business operations. When you contact the TAC Escalation Center with a P1 or P2 problem, a Cisco TAC engineer will automatically open a case.

To obtain a directory of toll-free Cisco TAC telephone numbers for your country, go to the following URL:

http://www.cisco.com/warp/public/687/Directory/DirTAC.shtml

Before calling, please check with your network operations center to determine the level of Cisco support services to which your company is entitled; for example, SMARTnet, SMARTnet Onsite, or Network Supported Accounts (NSA). In addition, please have available your service agreement number and your product serial number.

This document is to be used in conjunction with the documents listed in the "Related Documentation" section.

CCIP, the Cisco *Powered* Network mark, the Cisco Systems Verified logo, Cisco Unity, Follow Me Browsing, FormShare, Internet Quotient, iQ Breakthrough, iQ Expertise, iQ FastTrack, the iQ Logo, iQ Net Readiness Scorecard, Networking Academy, ScriptShare, SMARTnet, TransPath, and Voice LAN are trademarks of Cisco Systems, Inc.; Changing the Way We Work, Live, Play, and Learn, Discover All That's Possible, The Fastest Way to Increase Your Internet Quotient, and iQuick Study are service marks of Cisco Systems, Inc.; and Aironet, ASIST, BPX, Catalyst, CCDA, CCDP, CCIE

E Q & A
4.063

Cisco Secure Intrusion Detection System

Q. What is the Cisco Secure Intrusion Detection System (IDS)?

A. The Cisco Secure IDS is an enterprise-class, network-based intrusion-detection system. Designed to address the increased requirements for security visibility, denial-of-service (DoS) protection, antihacking detection, and e-commerce business defenses, the Cisco Secure IDS family leads the market in innovative security monitoring solutions. Sensor devices detect unauthorized activity traversing the network, such as attacks by hackers, by analyzing traffic in real time, enabling users to quickly respond to security breaches. When unauthorized activity is detected, Sensors can send alarms to a management console with details of the activity and can control other systems, such as routers, to terminate the unauthorized session(s).

Q. What is a "network-based" IDS?

A. Two basic types of IDSs are on the market today—host-based and network-based systems. The fundamental difference between them is the source of the activity that they monitor and analyze to detect intrusions. Host-based IDSs monitor activity on a host or end system, while network-based IDSs monitor network traffic. Host-based IDSs are used to protect critical network servers or other individual systems containing sensitive information. The implementation of these systems is in the form of small clients or applications. Host-based systems require the use of the resources of a host server—disk space, RAM, and CPU time, a setup that impacts system performance. Intrusions are detected primarily by analyzing operating-system audit trails, application audit trails, and other system activity. Host-based IDSs are ideal if a limited number of critical servers must be protected, but they do not scale well if enterprise-wide solutions are needed.

Network-based IDSs are used to monitor activity on a specific network segment. Whereas a host-based IDS resides on a workstation and shares CPU with other user applications, a network-based solution is a dedicated platform. Network-based IDSs perform a rule-based or expert system analysis of traffic using parameters set up by the security manager, and the signatures, which flag suspicious or attack activity. The systems analyze network packet headers to make security decisions based on source, destination, and packet type. They also analyze packet data to make decisions based on the actual data being transmitted. These systems scale well for network protection because the number of actual workstations, servers, or user systems on the network is not critical—the amount of traffic is what matters. In addition, sensors placed around the globe can be configured to report back to a central site, enabling a small team of security experts to support a large enterprise. The Cisco Secure Intrusion Detection System, a network-based IDS, provides network administrators with enhanced security technology and capabilities to secure their networks.

E C T
4.062
L
S L - D.C.

Q. How does the Cisco Secure Intrusion Detection System fit into the Cisco end-to-end security strategy known as the Cisco SAFE blueprint for secure e-business?

SAFE is a comprehensive security blueprint that tells organizations how to safely engage in e-Business today.

Developed for real-world network deployment, SAFE helps customers compete in the Internet Economy by integrating scalable, high performance security services throughout the e-Business infrastructure. It takes a simplified, modular approach to security in which design, implementation and management processes are all detailed for the customer. The customer can choose from several individual modules, or "building blocks," each designed, tested and proven to address specific e-Business applications, such as electronic commerce or supply chain management. This modular approach gives customers the flexibility to deploy SAFE in stages, allowing organizations to leverage their existing security infrastructure while staying within budget on new e-Business initiatives.

SAFE will help companies prepare for the convergence of data, voice and video over Internet Protocol (IP) based networks. Built on Cisco AVVID—the Architecture for Voice, Video and Integrated Data—SAFE provides companies with a secure, cost-effective migration path to converged networks.

A key advantage of SAFE is that, in an increasingly connected world, where executives are questioning whether securing the perimeter is enough, SAFE delivers answers for fully protecting every access point to the network. Indeed, SAFE is enhanced by a rich ecosystem of programs, products, partners and services—all addressing the key requirements for safeguarding a network: secure connectivity, perimeter security, security monitoring, identity and security management.

The Cisco Secure Intrusion Detection System is a dynamic security component of the SAFE security blueprint which includes ...walls, virtual private networks (VPNs), and authentication products. When used in conjunction with firewalls, encryption, authentication, and active audit, the system allows customers to build and operate secure electronic business environments.

Q. If I already have a firewall, do I really need an IDS?

A. Absolutely. Although an IDS will not replace your firewalls—or other security devices for that matter—it serves a very complementary role and addresses certain risks that firewalls cannot. The primary function of the firewall is to control access to services and hosts based on your site security policy. If a service or connection to a specific host is permitted, firewalls typically permit all such traffic, and they do not inspect the content of the permitted traffic. An example is permitting public access to a Web server on a DMZ. All connection requests to the Hypertext Transfer Protocol (HTTP) port on that Web server will be permitted by the firewall, including malicious traffic directed at the HTTP server to exploit a buffer overflow vulnerability. Although most firewalls will not protect against data/content-driven attacks (for example, buffer overflow), IDSs will. Furthermore, firewalls typically will not protect you against attacks originating from inside your network or entering your environment from other ingress points not protected by firewalls (for example, remote access servers). IDSs can be strategically deployed to monitor activity from internal sources and other network ingress points without impacting your network. Deploying an IDS to complement your firewall(s) will significantly enhance your security posture.

Q. What components are required to deploy Cisco Secure IDS?

A. A Cisco Secure IDS installation consists of the following:

...e installation has at least one management console, which provides a visual alarm display and a remote system configuration utility. Multiple management consoles can be deployed for larger, distributed environments.

- One or more sensors is deployed strategically on your production network(s). The sensors analyze and detect unauthorized activity traversing the network; send alarms back to a central management console; and they can be configured to respond to these events by terminating the offending session(s). Sensors can be configured to send alarms to multiple management consoles simultaneously, allowing deployments to scale in large enterprise environments.

Doc:

Q. What management console options are available for the Cisco Secure IDS?

A. A management console, which provides a visual alarm graphical user interface (GUI) display and a remote system configuration utility, is required for the Cisco Secure IDS. Current offerings include:

- Cisco Secure IDS Director—HP OpenView Network Node Manager "plug-in" that runs on UNIX (Solaris and HP-UX)
- Cisco Secure Policy Manager (v2.2+)—Windows NT-based package

Alarm viewing, analysis and reporting packages are also available from Cisco Security Associates partners (see: http://www.cisco.com/warp/public/778/security/sap/management.html)

Q. What sensor options are available for the Cisco Secure IDS?

A. The current Cisco Secure IDS sensing portfolio includes:

- Catalyst® 6000 IDS Module—Full-featured IDS module that occupies one slot in a Catalyst 6x000 chassis
- Network Sensor appliances—IDS-4230 and IDS-4210 "plug-and-play" appliances

Q. How does the sensor work?

A. Sensors monitor the network traffic by directly "tapping" the line (for example, via a shared-media hub) or by receiving copies of the traffic (for example, Switched Port Analyzer [SPAN] port on a switch) using a passive, promiscuous interface (the "monitoring interface"). The sensor analyzes the captured packets and compares them against a rule set of typical intrusion activity (that is, "si ures"). If the captured packets match a defined intrusion pattern in the rule set, the sensor sends an alarm to the management console and automatically responds (if configured to do so). The alarms are sent out a separate management interface so as not to impede continual packet capture by the monitoring interface.

Q. Where should sensors be installed?

A. Sensors may be placed on almost any network segment of the enterprise-wide network where security visibility is required; for example:

- Internal network segments where critical resources are located
- In front of a firewall
- Behind a firewall
- Behind a dialup modem server
- At extranet connections
- On the DMZ

When deploying sensors, you must install them so that they can "see" the network traffic that you want to monitor. This is typically done with shared-media hubs or SPAN ports on switches.

Q. How do you deploy sensors in a switched environment?

A. h most IDS products on the market today, sensors must be placed on the switch SPAN port to monitor network traffic. This is the case for the Cisco Secure IDS appliance sensors as well. Although the SPAN port can provide access to network traffic, it does have certain limitations (for example, limited number of SPAN sessions, trunked traffic). The Catalyst 6000 IDS Module was designed specifically to address switched environments by integrating the IDS functionality directly into the switch and taking traffic right off the switch backplane.

Q. What kind of a performance impact does the sensor impose on the monitored network?

A. None. Sensors operate by "tapping" the network (for example, via a shared-media hub) or off copies of the packets (for example, via a switch SPAN port). The monitoring interfaces on the sensors are passive and do not source packets onto the network (the one exception is TCP reset packets for automatic response).

4060

Q. Can the sensor itself be attacked and compromised?

A. A properly configured and installed sensor cannot be compromised. The monitoring interface (connected to the production network) cannot be detected, and packets cannot be directed at it. The interface is in promiscuous mode, and has neither a protocol stack nor an IP address bound to it. It is not susceptible to "antisniff" detection techniques. The separate management interface does have an IP address, but Cisco recommends that a separate, isolated management subnet be used to provide connectivity from the management interface on the sensor to the IDS management console. In addition, only a very limited number of services are available from the management interface, and access controls can be configured to allow only designated management systems to connect to the sensor.

Q. What types of attacks does the Cisco Secure IDS detect?

A. The Cisco Secure Intrusion Detection System has the most extensive and comprehensive signature list designed to detect attacks in all of the following categories:

- Exploits—Activity indicative of someone attempting to gain access or compromise systems on your network, such as Back Orifice, failed login attempts, and TCP hijacking
- DoS—Activity indicative of someone attempting to consume bandwidth or computing resources to disrupt normal operations, such as Trinoo, TFN, and SYN floods
- Reconnaissance—Activity indicative of someone probing or mapping your network to identify "targets of opportunity," such as g sweeps and port sweeps; usually a precursor to an actual exploit attempt
- Misuse—Activity indicative of someone attempting to violate corporate policy; this can be detected by configuring the sensor to look for custom text strings in the network traffic; for example, XYZ Corporation could easily configure the Cisco Secure IDS to send an alarm on and eliminate any connection that transmits the phrase "XYZ Confidential" in e-mail or File Transfer Protocol (FTP).

Q. Which protocols can the Cisco Secure IDS monitor?

A. The Cisco Secure Intrusion Detection System can monitor all of the major TCP/IP protocols, including IP, Internet Control Message Protocol (ICMP), TCP, and User Datagram Protocol (UDP). It can also statefully decode application-layer protocols such as FTP, Simple Mail Transfer Protocol (SMTP), HTTP, Domain Name System (DNS), remote procedure call (RPC), NetBIOS, NNTP and Telnet.

Q. Do the Cisco Secure IDS sensors reassemble fragmented packets to detect fragmented attacks?

A. Yes, the IDS-4230, IDS-4210 and the Catalyst 6000 IDS Module all reassemble fragmented packets to detect attacks that use fragmentation to evade the IDS.

Q. Can I create my own signatures?

A. Cisco Secure IDS users can easily create custom string-based signatures for immediate defense from certain attacks, for example, detecting e-mail attachments with the .vbs file extension to identify the I LOVE YOU worm. This same capability can be used to h for data unique to the customer environment. For example, XYZ Corporation could easily configure the Cisco Secure IDS to detect and eliminate any connection that transmits the phrase "XYZ Confidential" in e-mail or FTP.

Q. How difficult is it to install a Cisco Secure IDS sensor?

A. Appliance sensors were designed for technician-level installation, requiring the sensors to be simply plugged into the network, turned on, and configured with several simple initialization parameters. These parameters include standard network items such as IP address, host name, network masks, management console IP address, and so forth. Installation of the Catalyst 6000 IDS Module requires sliding the module into an open chassis slot, configuring the module with the parameters similar to configuration of the appliance, and configuring the switch to recognize the card and send traffic to it. After the sensors are initialized and running, configurations can be modified and pushed to them from Cisco Secure Policy Manager (CSPM) or the Cisco Secure IDS Director.

Copyright © 2000 Cisco Systems, Inc. All Rights Reserved.

Q. How easy is it to replace a sensor that fails?

A. If a sensor (either an appliance or the Catalyst 6000 IDS Module) fails, you simply remove the failed unit and replace it with a new one. Initializing the new unit requires only that you configure it with the same initialization parameters that were configured on the failed unit, such as the IP address, host name, network masks, management console IP address, and so forth. The configuration of the failed unit, which is stored on the CSPM or Cisco Secure IDS Director platform, can be quickly pushed to the new sensor and the sensor is back on line.

Q. How many false positives will the Cisco Secure IDS generate?

A. False positives occur when an IDS mistakenly reports certain benign activity as malicious, requiring human intervention to diagnose the event. Obviously, false positives are undesirable because they consume valuable human resources. Although all IDS products on the market today are subject to false positives, special care is taken when the Cisco Secure IDS signatures are designed in order to minimize the occurrence of false positives, and they are tested extensively to validate the design. The sensors also provides very flexible and easy-to-use "tuning" functionality to allow users to instruct the sensors to not alarm based on certain parameters, such as by signature type and source or destination IP address. A specific example is where an authorized network management system performing node discovery triggers the ping sweep signature. Although ping sweeps can be indicative of malicious reconnaissance activity, this alarm is clearly a false positive because the source is an authorized network management system. To prevent this false positive from reoccurring, the user can configure the sensor to not alarm on ping sweeps from the network management system IP address. With this configuration, however, any other attacks that originate from that device will be disc[illegible]red. Sensor tuning to reduce false positives will probably be required during installation of any new sensor.

Q. Can the sensor detect attacks if the traffic is encrypted, for example IPSecurity (IPSec) or Secure Sockets Layer (SSL)?

A. The Cisco Secure IDS Sensor analyzes both packet header information (context data) and packet data information (content data) to determine if suspicious activity is occurring. Encryption algorithms encrypt the data portion of the packet for confidentiality. Because it can process only what it can "see," the Sensor sensor cannot detect attacks that require inspection of the payload or data fields within a packet. It will, however, still alarm and respond to attacks, which are detected from the unencrypted packet header information. All network-based IDSs suffer this problem. Therefore, in networks carrying encrypted traffic, Sensor placement is critical. To take advantage of their full intrusion-detection capability, the Cisco Secure IDS Sensors should be installed where the traffic has already been decrypted. Otherwise, the Sensor can be placed on an encrypted segment and will detect all but the packet data or payload-based attacks.

Q. How are the Cisco Secure IDS signatures updated?

A. Cisco posts signature updates on Cisco Connection Online (CCO) approximately every 60 days (additional releases may be required in extraordinary situations). Customers with maintenance agreements can download and install the signature updates. Installing the update on the sensor will not overwrite any changes the user may have made in customizing the configuration.

Q. How can the Cisco Secure IDS Sensors respond to stop attacks?

A. In addition to sending alarms, appliance sensors can be configured to automatically respond to attacks by applying access control lists (ACLs) on specified Cisco routers to block all traffic from the attack source or to send out TCP reset packets to break any established connections from the attack source. Response actions are not currently supported in the Catalyst 6000 IDS Module, but will be in the future.

Q. How do the Cisco Secure IDS Sensors and management consoles communicate with each other?

A. Communication between the Cisco Secure IDS Sensors and management consoles is provided by a proprietary, reliable UDP transport protocol that guarantees transmission to intended recipients and maintains connection status with all of the IDS components. All alarm transmissions from the sensor to the management console are acknowledged. If connectivity from the sensor to the management console is disrupted, the sensor will continue to monitor the network, and will queue alarms and retransmit until successful.

E C
4.058
Brent
C P I

Q. How much additional network traffic does the Cisco Secure IDS generate?

A. Because each alarm and acknowledgement is contained in a single UDP packet, there is negligible impact on network traffic.

Q. Are Cisco Secure IDS communications encrypted?

A. IPSec functionality is included on the appliance Sensors to allow customers to encrypt traffic to management consoles with IPSec capabilities, CSPM for example. IPSec is also planned for the Cisco Secure IDS Module in the future.

Q. If I lose connectivity to a remote sensor, can I tell from the management console?

A. Both CSPM and the Cisco Secure IDS Director monitor the health of a Sensor via a continuous heartbeat. If communications with the Sensor are lost for more than one minute (by default), a visual indicator is displayed on the CSPM and Cisco Secure IDS Director, indicating a communications failure with the Sensor. If it is determined that a sensor has failed, it can be quickly replaced with another sensor and the configuration, stored on the CSPM or Cisco Secure IDS Director platform, can be quickly pushed to the new sensor.

Q. Does the Cisco Secure IDS Director require HP OpenView Network Node Manager?

A. Cisco Secure IDS Director does require HP OpenView Network Node Manager, and it does not come with the Director. It must be purchased separately by the customer.

Q. How difficult is it to install the Cisco Secure IDS Director?

A. Installing the Director software on a Solaris or HP-UX platform with HP OpenView Network Node Manager preinstalled is very easy. The install is completely scripted and the user is prompted for a minimal amount of information during the install process. When installed and running, the Director will prompt the user to begin establishing communications with the sensors. As each sensor is contacted, the default configuration parameters are pulled back to the Director and the user is prompted to customize the security policy for that sensor. When the user is finished setting up the new policy parameters, they are stored on the Director and pushed back out to the sensor, where they are immediately enforced.

Q. How many sensors can one Cisco Secure IDS Director manage?

A. Although the technical limit is very large (greater than 1000), Cisco typically recommends a ratio of 20 to 25 ensors per Director for practical reasons. With ratios greater than this, operators can be easily overwhelmed with the volume of information that they may be required to analyze, thereby diminishing the overall effectiveness of the IDS. For deployments larger than 25 sensors, multiple directors can be installed to scale the number of sensors.

Q. Can I have multiple Cisco Secure IDS Directors?

A. The Cisco Secure IDS architecture supports the deployment of multiple director platforms. Sensors can send alarms to multiple directors simultaneously, and directors can forward alarms to other directors, allowing customers to build large, hierarchical management infrastructures.

Q. Besides the GUI, how can the Cisco Secure IDS Director notify me when it receives an alarm?

A. The Cisco Secure IDS Director provides e-mail notification and custom script execution functionality in addition to an iconic alarm display. Taking advantage of HP OpenView functionality, the Director can also send out Simple Network Management Protocol (SNMP) traps with the alarm details.

Q. What skills are required to operate the Cisco Secure IDS?

A. Designing the IDS architecture and analyzing the alarms requires personnel with both security and networking knowledge. This is true for all IDS products on the market today.

Q. Does anyone offer a 24x7 managed IDS service using the Cisco Secure IDS?

A. Yes, numerous managed service providers offer a managed IDS service using the Cisco Secure IDS. These managed service providers include Exodus, AT&T, Counterpane, IBM Emergency Response Services, and NetSolve.

Q. Where can I get more detailed information on CSPM?

A. Information on CSPM can be found at http://www.cisco.com/go/policymanager.

Q. What type of Cisco service and support is provided for the Cisco Secure IDS?

A. The IDS-4230, IDS-4210, and Catalyst 6000 IDS Module sensors are covered by all six levels of SMARTnet™ maintenance. This includes hardware support as well as sensor software upgrades and access to the latest signatures posted on CCO. The Director software is covered by Software Application Support (SAS) and Software Application Support Plus Upgrades (SAU).

Q. Does Cisco offer a host-based intrusion-detection product?

A. No, Cisco has chosen to partner with a select set of vendors who offer a host-based IDS product. These Technology Partners have been signed up through the Cisco Security Associates program; they include the "entercept" product offered by ClickNet Software and the Vigilent product offered by PentaSafe Security Technologies.

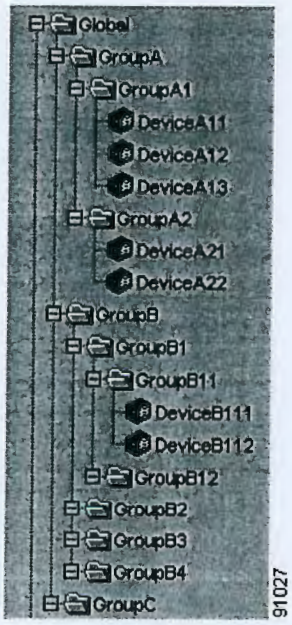
Adding Sensors and Sensor Groups

IDS MC uses a hierarchy of groups and sensors. A group can contain sensors, other groups, or a combination of sensors and groups. When you start IDS MC, you always have at least one active, defined group—the Global group. The IDS MC hierarchy can contain many *levels* of groups and sensors, just as a folder in Windows 2000 can contain many levels of folders and files. Figure 4-1 illustrates an example of the IDS MC hierarchy.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
4-1
Fls: 1194
Doc: 3701

ECT 055 CPL - AC

Figure 4-1 IDS MC Hierarchy Consisting of the Global Group, Groups, and Sensors



Notice the Global group in Figure 4-1.

The IDS MC hierarchy of groups and sensors enables you to configure more than one sensor at a time by configuring an entire group of sensors. Configuring more than one sensor at a time in this way is possible because a sensor can acquire settings from its parent group. A sensor *must*, in fact, acquire settings from its parent group if a parent defines those settings as mandatory. A child cannot override the values for such settings.

This chapter explains how to add groups and sensors to your IDS MC hierarchy and to perform other tasks.

Doc: 3701

Task List for Adding Sensors and Sensor Groups

From the Devices tab, you can add sensors that you want to manage with IDS MC. You can add and delete sensors, and you can add and delete sensor groups. However, you cannot delete the Global group. If you have established settings elsewhere, you can apply them to sensors and groups that you set up from the Devices tab.

For step-by-step procedures on performing a specific task, refer to the corresponding section.

- Adding Sensors to a Sensor Group, page 4-3
- Using SSH in IDS MC and Security Monitor, page 4-8
- Handling Rejected SSH Fingerprints, page 4-11
- Deleting Sensors from a Sensor Group, page 4-13
- Creating Sensor Subgroups, page 4-14
- Deleting Sensor Groups, page 4-16

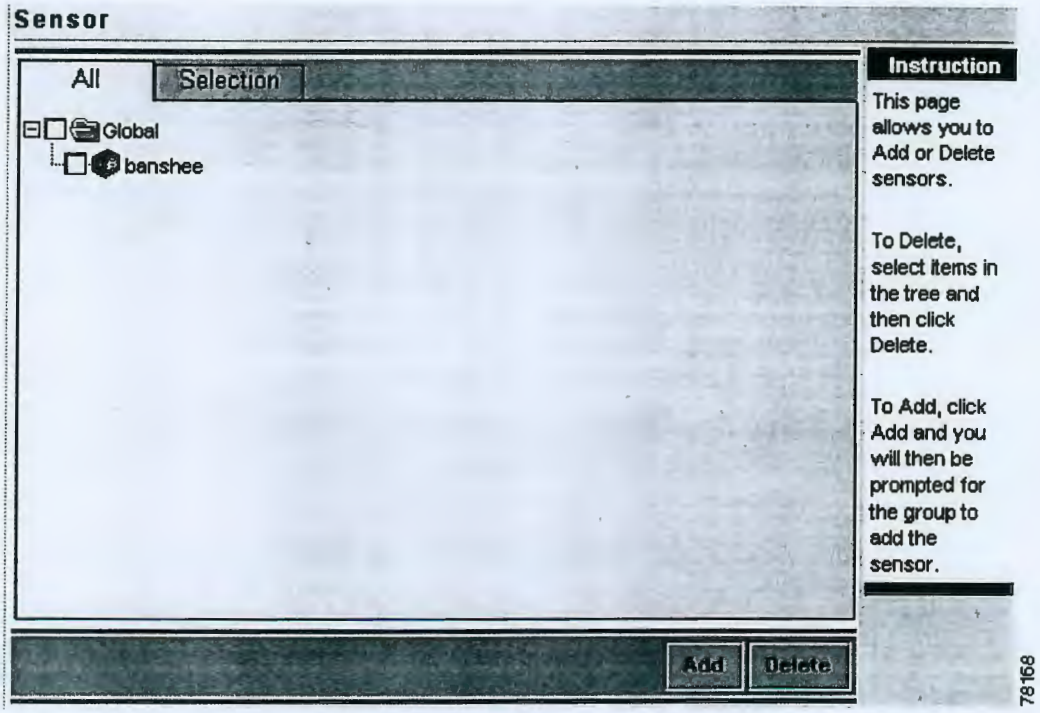
Adding Sensors to a Sensor Group

You can add a sensor to any sensor group, including the Global group.

To add a sensor to a sensor group, follow these steps:

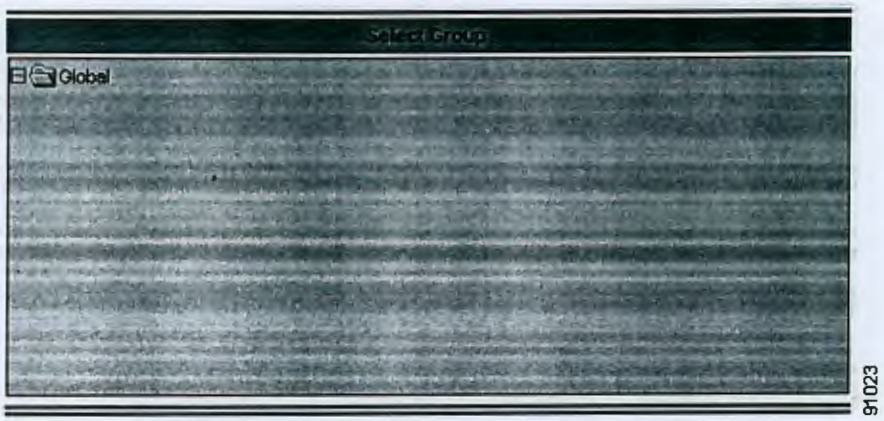
Step 1 Select **Devices > Sensor**.

The Sensor page appears.



Step 2 Click **Add**.

The Select Group page appears.

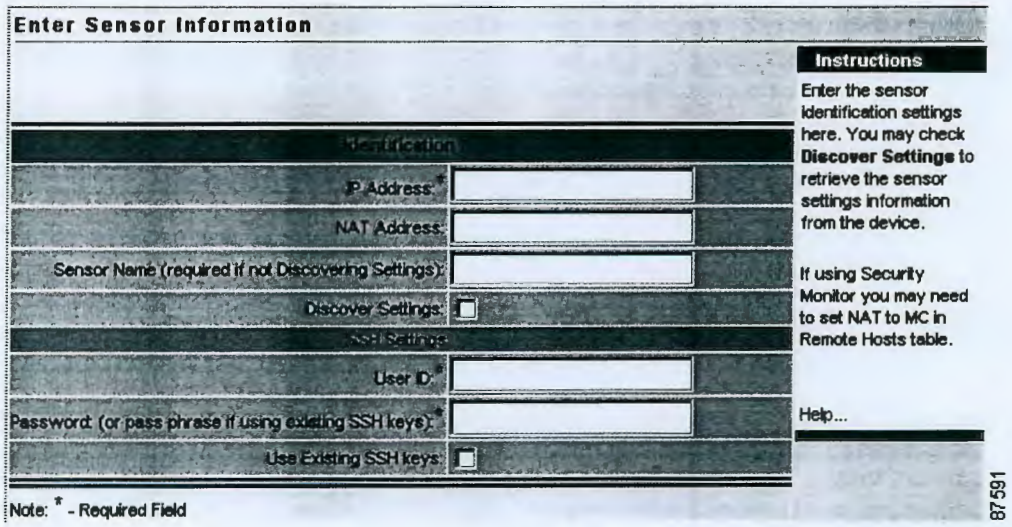


Step 3 Select the group you want to add a sensor to.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
78-15615-01
1197
Fls
Doc
3701

Step 4 Click **Next.**

The Enter Sensor Information page appears.



Step 5 Provide the information required by the Enter Sensor Information page:

a. Enter the IP address of the sensor.

b. Enter the NAT address of the sensor, if there is one.

c. Enter the sensor name.

d. To retrieve sensor settings from the sensor, select the **Discover Settings** check box.

Note If you choose to discover settings, you may have to wait from 30 seconds to several minutes, depending upon the size and complexity of your network and its traffic.

e. Enter the user ID and password for Secure Shell (SSH) communications between your host and the sensor:

- When you are using a sensor appliance, the user ID is **netrangr**, and the password is one that you assign.
- When you are using an IDS module, the user ID is **ciscoids**, and the password is one that you assign.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
4-5
Fls: 1198
Doc: 3701

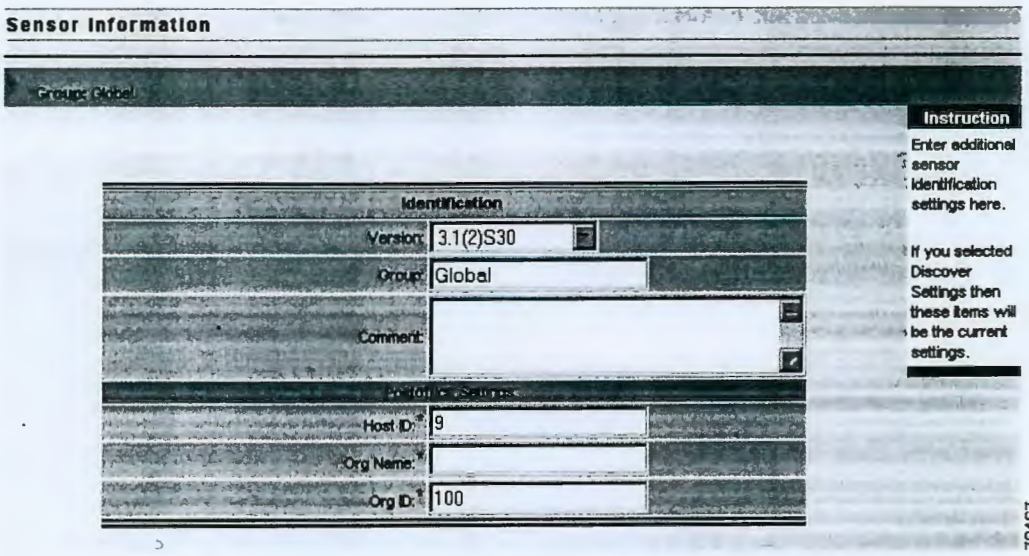
f. If you want to use existing SSH keys, select the check box associated with that option. However, you cannot use SSH keys if you intend to use this sensor as a master blocking sensor.

For more information, see Learn More About the Secure Shell Protocol, page 4-8. Also, see Using SSH in IDS MC and Security Monitor, page 4-8.

Note SSH supports two forms of authentication: password and public key. If you have set up a public key between IDS MC and the sensor, you can use that key by selecting the Use Existing SSH keys check box. If you have not set up the key, or if you do not want to use it, leave the Use Existing SSH keys deselected, and IDS MC will use SSH password authentication.

g. Click **Next**.

The Sensor Information page appears as follows in IDS MC 1.0 *and* in IDS MC 1.1 if the last sensor you added used sensor software version 3.x; a simplified version of this page appears in IDS MC 1.1 if the last sensor you added used sensor software version 4.x.



78-15615-01
ROS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1199
Doc: 3791

E C T
4.050
Jane
PL - AC

Step 6 If you are using IDS MC 1.0 *or* if you are using IDS MC 1.1 and adding a 3.x sensor, provide the following information in the Sensor Information page:

a. Select the version number that you are using from the Version list box. If you have reached this point, the version must be 3.x.

b. Enter a comment (optional).

c. Enter the Host ID (typically the last octet of the IP address of the sensor).

d. Enter the Org Name.

Note Use lowercase letters only in the Org Name field; do not use numbers, symbols, spaces, or capital letters. The Host ID and Org Name are case sensitive with respect to how postoffice processes audit events on the local host. Host names and Org Name values are not passed between different postoffice clients; only the Host ID and Org ID values are passed.

e. Enter the Org ID. The default value is 100.

Note Within a postoffice domain, no sensor or sensor group can have the same Org ID/Host ID pair as another sensor or sensor group.

Step 7 If you are using IDS MC 1.1 *and* you are adding a sensor operating with sensor software 4.x, provide the following information in the Sensor Information page:

a. Select the version number that you are using from the Version list box. The version must be 4.x because you are using IDS MC 1.1.

b. Enter a comment (optional).

Step 8 Click **Finish**.

The Sensor page appears, updated with a record of the sensor you just added.

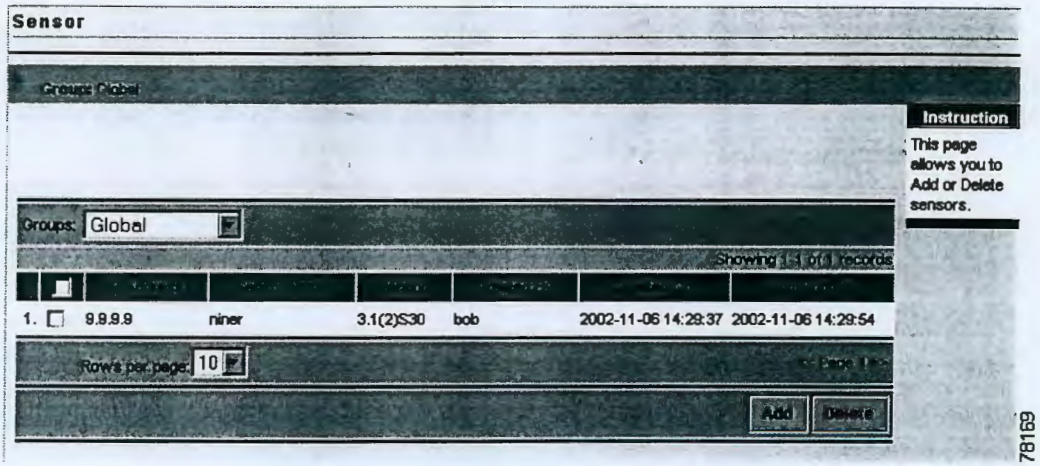
Doc: 3701



Learn More About the Secure Shell Protocol

Secure Shell (SSH) is a protocol for secure remote login and other secure network services over an insecure network. For more information about SSH, see *Designing Network Security* by Merike Kaeo (Indianapolis: Cisco Press, 1999).

Note IDS MC and Security Monitor make SSH available because of the importance of being able to transmit login information (including passwords) in an encrypted form.

The Secure Shell Working Group (SECSH) of the Internet Engineering Task Force (IETF) has the goal of updating and standardizing SSH. More information is available at http://www.ietf.org/html.charters/secsh-charter.html.

More information about using public keys for SSH authentication is available at http://www.chiark.greenend.org.uk/~sgtatham/putty/docs.html.

Using SSH in IDS MC and Security Monitor

IDS MC and Security Monitor support SSH for secure remote login to a sensor. Neither IDS MC nor Security Monitor manages SSH keys, however. The sensor software provides the SSH server, and IDS MC and Security Monitor provide

RQS Nº 03/2005 - CN
CPMI - CORREIOS
78-15615-01
Fls: 1201
Doc: 3701

support for an SSH Windows client—PuTTY. Documentation for PuTTY is available at http://www.chiark.greenend.org.uk/~sgtatham/putty/docs.html. More information about using public keys for SSH authentication is available at http://www.chiark.greenend.org.uk/~sgtatham/putty/docs.html.

Version 1.0 of IDS MC and Security Monitor uses PuTTY 0.51. Version 1.1 of IDS MC and Security Monitor uses PuTTY 0.53b.

Directions for using SSH keys with PuTTY are available at http://www.chiark.greenend.org.uk/~sgtatham/putty/docs.html.

PuTTY's Pageant utility is an SSH authentication agent. We recommend using Pageant to manage your keys in IDS MC. More information on Pageant is available at http://www.chiark.greenend.org.uk/~sgtatham/putty/docs.html.

Sensor appliances running IDS software versions 3.x and later, and IDSMs running IDS software 3.1(1) and later, have a `/usr/nr/.ssh` directory. You must create the authorized_keys file (if it does not exist) and then place that authorized_keys file in the `/usr/nr/.ssh` directory. Finally, you must place your public key in the authorized_keys file.

To use SSH keys in IDS MC or Security Monitor, follow these steps:

Step 1 Use PuttyGen to generate your keys. Instructions are available at http://www.chiark.greenend.org.uk/~sgtatham/putty/docs.html.

Step 2 Copy the public key to the sensor's `~.ssh/authorized_keys` file.

Step 3 Save the private key. We recommend the name `sensorname.key` for the private key and use it in this example.

Caution Guard your private key carefully because of its importance to the security of your network, and back it up to a secure location.

Step 4 Create a session for the sensor and perform the following steps:

a. At a command line prompt, enter **putty**.

b. Enter the hostname when prompted.

c. Click **Protocol SSH**.

d. Select **System > Saved Sessions**.

e. Select **sensorname.key** (the name of the saved session in this example) from the list box.

f. Click **Load**.

   Your saved settings appear in the configuration panel.

g. Click **Connection**.

h. Enter the auto-login username: **netrangr**.

i. Click **session**.

j. Click **SSH**.

k. Enter the private key file for authentication: **sensorname.key**.

l. Enter **save**.

m. Enter **cancel**.

n. Enter **putty@***host name*.

You will be prompted for the passphrase that you generated in Step 1.

Learn More About SSH Fingerprints

SSH fingerprints are described in the following material, which is quoted verbatim from the *PuTTY User Manual* (http://www.chiark.greenend.org.uk/~sgtatham/putty/docs.html). PuTTY is copyright 1997-2001 Simon Tatham.

"If you are using SSH to connect to a server for the first time, you will probably see a message [similar to the following]:

```
"The server's host key is not cached in the registry. You have no
guarantee that the server is the computer you think it is.

"The server's key fingerprint is: ssh-rsa 1024
7b:e5:6f:a7:f4:f9:81:62:5c:e3:1f:bf:8b:57:6c:5a

"If you trust this host, hit Yes to add the key to PuTTY's cache and
carry on connecting.

"If you want to carry on connecting just once, without adding the key
to the cache, hit No.

"If you do not trust this host, hit Cancel to abandon the connection.
```

Doc:

"This is a feature of the SSH protocol. It is designed to protect you against a network attack known as *spoofing*: secretly redirecting your connection to a different computer, so that you send your password to the wrong machine. Using this technique, an attacker would be able to learn the password that guards your login account, and could then log in as . . . you and use the account for [his or her] own purposes.

"To prevent this attack, each server has a unique identifying code, called a *host key*. These keys are created in a way that prevents one server from forging another server's key. So if you connect to a server and it sends you a different host key from the one you were expecting, PuTTY can warn you that the server may have been switched and that a spoofing attack might be in progress.

"PuTTY records the host key for each server you connect to, in the Windows Registry. Every time you connect to a server, it checks that the host key presented by the server is the same host key [that was presented] the last time you connected. If it is not, you will see a warning, and you will have the chance to abandon your connection before you type any private information (such as a password) into it."

Handling Rejected SSH Fingerprints

Several situations can cause an SSH fingerprint to be rejected during the authentication process.

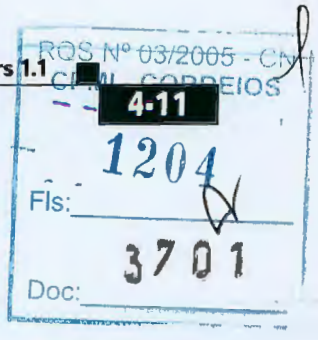
When an SSH fingerprint is rejected, you may see one of the following messages:

- `Error importing configuration files from the sensor: Could not find version in string "Unknown version"`
- `Import failed. Please check the Audit Log for details`

The IDS MC audit log will contain one of the following messages:

- `The SSH fingerprint has changed. Please refer to the documentation for instructions on how to handle rejected fingerprints.`
- *sensorname*: Error executing SSH while importing sensor version from the sensor - Sensor authentication error. Check username, passphrase, and SSH keys.

Note *sensorname* refers to the name of the affected sensor.



E C I
1045
fls
CPL - AC

Caution A rejected SSH fingerprint can indicate a spoofing attack on your network. Benign causes of a rejected SSH fingerprint include a change in a device on your network, such as a network card or an IP address. You can accept the rejected fingerprint, but the security of your network depends on your doing so only after you establish that the rejection is due to benign causes.

To accept a rejected SSH fingerprint, follow these steps:

Step 1 Run the following command:

C:\plink -ssh *userid@ipAddress*

where:

the *userid* is usually **netrangr** for sensor appliances and **ciscoids** for IDSMs.

ipAddress is the IP address to the sensor.

You will see something similar to the following:

```
WARNING -POTENTIAL SECURITY BREACH! The server's host key does not
match the one PuTTY has cached in the registry. This means that either
the server administrator has changed the host key, or you have
actually connected to another computer pretending to be the server.
The new key fingerprint is: 1024
2a:c5:3f:aa:d4:59:82:1d:83:65:58:a1:4e:59:06:bf. If you were expecting
this change and trust the new key, enter "y" to update PuTTY's cache
and continue connecting. If you want to carry on connecting but
without updating the cache, enter "n". If you want to abandon the
connection completely, press Return to cancel. Pressing Return is the
ONLY guaranteed safe choice. Update cached key? (y/n, Return cancels
connection) Connection abandoned.
```

Step 2 Enter **y**.

Step 3 Enter the password of the sensor when prompted.

Step 4 Terminate the session by entering **exit**.

Step 5 Verify that the fingerprint was accepted by running the command again (Steps 1, 3, and 4).

This time you should not get the warning message and update cached key prompt.

Step 6 Verify that you can communicate normally with your sensor by using IDS MC.

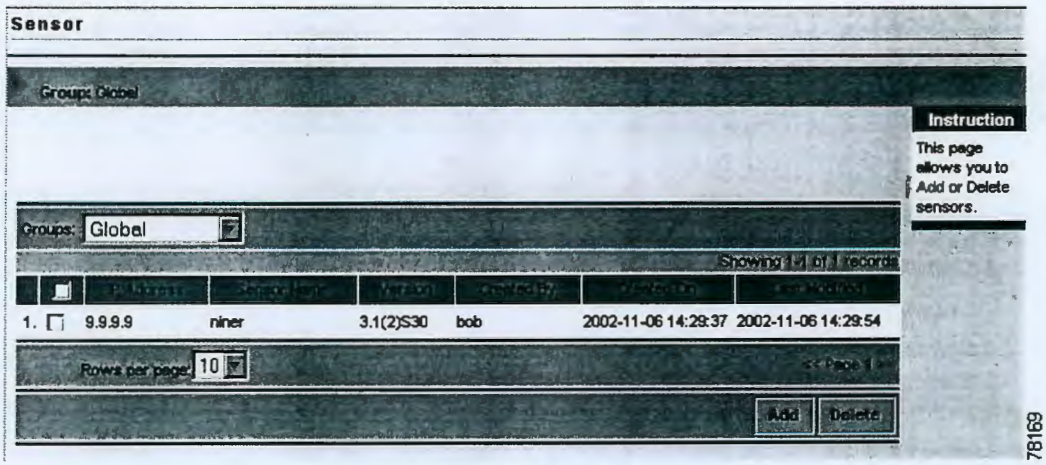
Deleting Sensors from a Sensor Group

You can delete a sensor from any sensor group, including the Global group.

To delete a sensor from a sensor group, follow these steps:

Step 1 Select **Devices > Sensor**.

The Sensor page appears.

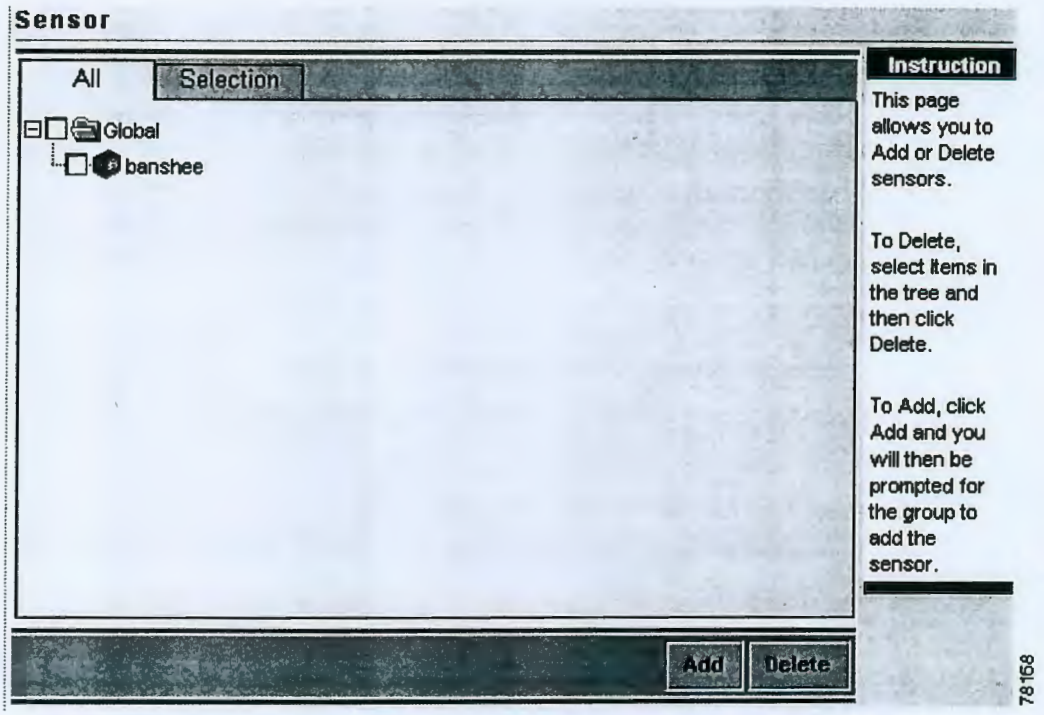


Step 2 In the tree, select the sensor that you want to delete.

Caution If you choose to delete a sensor, IDS MC does not ask you to confirm your choice.

Step 3 Click **Delete**.

The Sensor page appears, updated to show that the sensor was deleted.



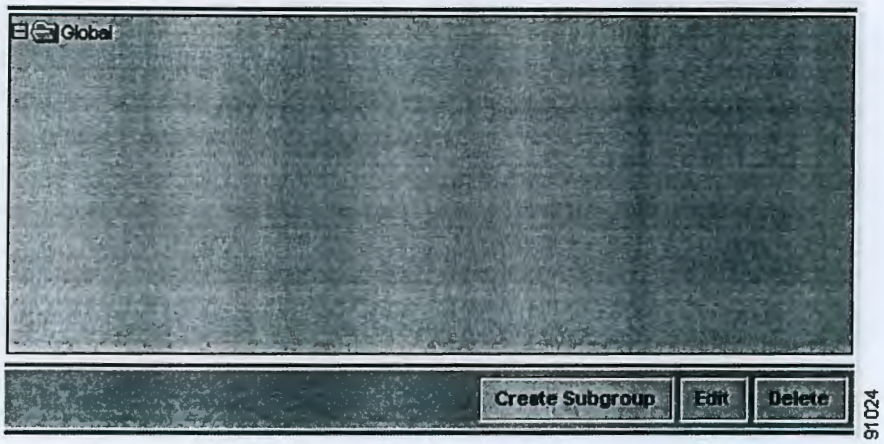
Creating Sensor Subgroups

You can add a subgroup to any sensor group, including the Global group.

To create a sensor subgroup, follow these steps:

Step 1 Select **Devices > Sensor Group**.

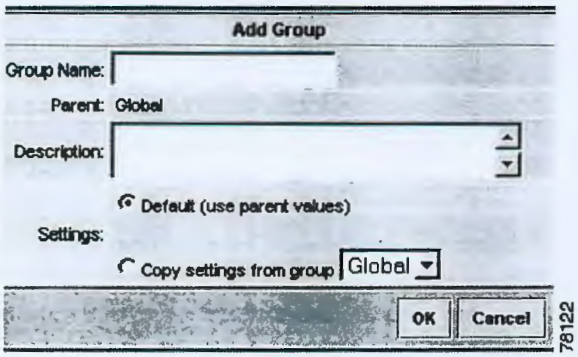
The Sensor Group page appears.



Step 2 In the tree, select the name of the sensor group that you want to add a subgroup to.

Step 3 Click **Create Subgroup**.

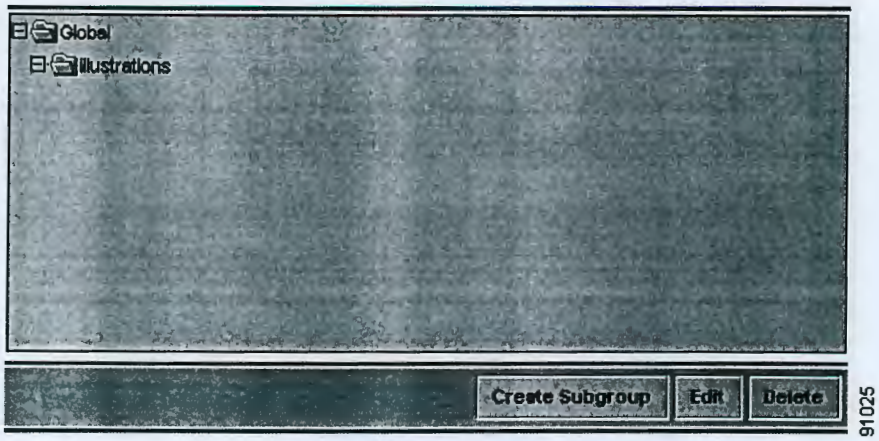
The Add Group page appears.



Step 4 In the Group Name field, enter the name of the subgroup you want to add. Next, select the **Default (use parent values)** radio button, or select the **Copy settings from group** radio button and select the name of the group from the associated list box.

Step 5 Click **OK**.

The Sensor Group page appears, showing the sensor subgroup that you just added.



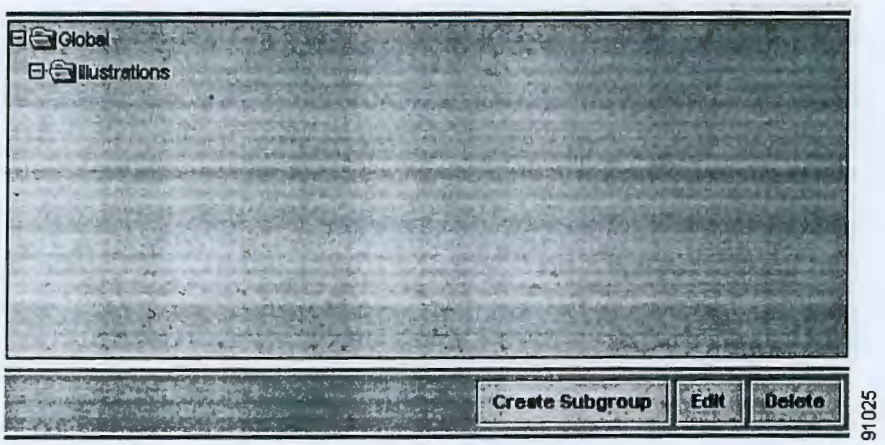
Deleting Sensor Groups

You can delete a subgroup from any sensor group, including the Global group.

To delete a sensor group, follow these steps:

Step 1 Select **Devices > Sensor Group**.

The Sensor Group page appears.



E C I
1.040
Irene
A C

Step 2 In the tree, select the group that you want to delete.

Caution If you choose to delete a sensor group, IDS MC does not ask you to confirm your choice.

Step 3 Click **Delete**.

The Sensor group page appears again, showing the parent of the group you just deleted.

Tuning Sensor Signatures Using Policy Override Settings

Some legitimate network activity, such as some types of network virus scanning, has the same characteristics as an actual attack against the network. To prevent these legitimate activities from being reported as an attack, you can tune attack signature settings on a per-device basis. The purpose of tuning is to reduce the number of *false positives*, or detected attacks that are really expected behavior.

Signature tuning falls into three categories: filtering, blocking, and sensing.

Filtering tuning enables you to override the generation of notifications and audit event records by a sensor. Filtering enables you to define specific overrides to the applied sensor signature for that sensor object. The definition of such overrides enables you to tune the sensor to prevent the generation of alarms and audit event records based on false positives, or expected behaviors on your network that satisfy conditions of an attack signature.

In IDSM 2.5.0, 2.5.0, and later versions, you can also define advanced filtering rules that disable the notification of suspicious behavior based on specific traffic flows across the monitored network segment. These refinements are specified in the Filtering panel, and such filter rules disable the generation of alarms and audit event records for traffic originating from or destined to networks and hosts specified in these filter rules.

Blocking tuning enables you to configure a sensor to override the blocking of specific networks for which monitored traffic is studied by the sensor signature running on that sensor.

For example, your sensor signature may have an attack signature set to block the source of the traffic whenever the signature is encountered. However, you may have a network device that generates that signature as part of the device's expected behavior. By tuning the sensor to ignore that attack signature when the source is the trusted network device, you avoid having alarms generated and traffic blocked for that device. However, you still receive alarms and blocking services for that attack signature if it appears in traffic generated from other devices.

Sensing tuning enables you to configure several parameters associated with attack signatures and the sensor device.

For specific signatures that are available to a sensor running IDSM 2.5.0 and later, you can modify how often you are notified about a particular type of attack based on how often the attack occurs and the amount of time that has transpired since the attack was initially detected.

For a sensor running IDSM 2.2.1.5, 2.5.0, 2.5.0, and later, you can specify which IP-based data streams should be studied based on the ability of the sensor to reassemble a fragmented datagram. For a sensor running IDSM 2.5.0 and later, you can also specify which TCP data streams should be studied based on the ability of the sensor to reassemble the entire session. This prevents *false negatives*, or actual attacks that are missed, due to the inability of the sensor to reconstruct the datagram or session.

Doc 1
C P L - A C

Finally, for a sensor running IDSM 2.5.0 and later, you can identify additional ports that should be considered by an attack signature. Some attack signatures are based on a specific port number. These settings allow you to identify additional ports, such as those used by custom TCP services or those used by well-known services that you have reassigned to another port, that should be monitored by those signatures.

Task List for Signature Tuning

You can perform the following tasks on a Sensor node to tune the applied sensor signature.

- "Defining Sensor-Specific Simple Filter Rules to Override Applied Signature Template Rules" on page 2
- "Defining Sensor-Specific Advanced Filter Rules to Override Applied Signature Template Rules" on page 3
- "Defining Global Policy Overrides for the Blocking of Detected Attacks" on page 4
- "Tuning Signatures Applied to a Sensor" on page 4
- "Specifying IP Fragment Reassembly Options for a Sensor" on page 5
- "Specifying TCP Session Reassembly Options for a Sensor" on page 6
- "Identifying the Packet Capture Device of a Sensor" on page 7
- "Identifying Additional Ports Used by Specific Signatures Applied to a Sensor" on page 7

Defining Sensor-Specific Simple Filter Rules to Override Applied Signature Template Rules

A sensor would normally generate a notification and audit event record when it detects a signature pattern. Signature patterns, identified by the signature set applied to a sensor, identify noteworthy patterns in network activity and/or network packet contents. You can define filter rules that exclude specific network packets and activities from generating these notifications and audit event records based on a specific network or host acting as either the source or destination of the network traffic.

To define a simple filtering rule that overrides applied signature template rules, follow these steps:

Step 1 Click the **Sensor** icon ( ) that represents the sensor for which you want to define a simple filter rule, and then click the **Filtering** tab in the View pane.

Result: The Filtering panel appears in the View pane.

Step 2 Click the **Simple Filtering** tab.

Step 3 To define the filter rule settings, click **Add**.

Result: The Create Filter dialog box appears.

Step 4 To specify the primary signature on which the filter rule should be based, select that signature in the Choose a signature to be excluded box.

Result: The Subsignature to be excluded box lists any valid sub-signature.

Step 5 To specify the sub-signature on which this filter rule should be based, select that sub-signature in the Subsignature to be excluded box.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1214
Fls:
3701
Doc:

E C T
4.036
L - AC

Step 6 To specify the network or host address that is excluded from normal signature evaluation, type that address in the IP Address box, and then press **Tab**.

Step 7 To specify the mask for the network or host network that corresponds to the address specified in the IP Address box, type that value in the **Network Mask** box.

Step 8 To specify how the sensor should interpret this rule, select the role of the IP address in the Address Role box.

Step 9 To accept your changes and close the Create Filter dialog box, click **OK**.

Step 10 To define additional simple filter rules, repeat Step 3 through Step 9 for each rule that you want to define.

Step 11 To accept your changes and close the selected panel, click **OK**.

Step 12 To save any changes that you have made, click **Save** on the File menu.

Defining Sensor-Specific Advanced Filter Rules to Override Applied Signature Template Rules

In addition to defining simple filter rules that prevent alarms based on a particular source or destination, you can define advanced filter rules that prevent alarms based on a particular traffic flow that traverses the monitored network segment. In this case, you define a traffic flow based on the source and destination bounding the traffic flow. As you may expect, any flow restriction rules that you have defined on gateway objects in the Network Topology tree will reduce the number of flows that exist between any source and destination that you specify. However, the sensor will prevent alarms based on any valid traffic flows between that source and destination.

To define a filter rule that overrides the applied signature template rules, follow these steps:

Step 1 Click the **Sensor** icon ( ) that represents the sensor for which you want to define an advanced filter rule, and then click the **Filtering** tab in the View pane.

Result: The Filtering panel appears in the View pane.

Step 2 Click the **Advanced Filtering** tab.

Step 3 To define the filter rule settings, click **Add**.

Result: The Create Filter dialog box appears.

Step 4 To specify the primary signature on which the filter rule should be based, select that signature in the Choose a signature to be excluded box.

Result: The Subsignature to be excluded box lists any valid sub-signature.

Step 5 To specify the sub-signature on which this filter rule should be based, select that sub-signature in the Subsignature to be excluded box.

Step 6 To specify the scope of the source for this filter rule, select that type under Source Address.

Step 7 If you selected an option other than Exclude alarms from any IP address, specify values that match the scope type in the boxes that appear under Destination Address.

Step 8 To specify the scope of the destination for this filter rule, select that type under Source Address.

Step 9 If you selected an option other than Exclude alarms to any IP address, specify values that match the scope type in the boxes that appear under Destination Address.

Step 10 To accept your changes and close the Create Filter dialog box, click **OK**.

E C I
40035
here
A C

Step 11 To define additional advanced filter rules, repeat Step 3 through Step 10 for each rule that you want to define.

Step 12 To accept your changes and close the selected panel, click **OK**.

Step 13 To save any changes that you have made, click **Save** on the File menu.

Defining Global Policy Overrides for the Blocking of Detected Attacks

A sensor can be configured to generate ACL rules and publish them to Managed Devices that block attacks that it detects based on a specific signature pattern. You can prevent specific networks and hosts from ever being blocked by such ACL rules. These networks and hosts are excluded from *all* such rules, despite the settings defined in the signature set applied to the sensor. In other words, these override rules are global for all signatures that the sensor uses to study network traffic.

To specify the networks or hosts that should never be blocked when an attack is detected, follow these steps:

Step 1 Click the **Sensor** icon ( ) that represents the sensor for which you want to define global blocking overrides, and then click the **Blocking** tab in the View pane.

Result: The Blocking panel appears in the View pane.

Step 2 Click the **Never Block Addresses** tab.

Step 3 To define a policy override rule to the block-enabled attack signatures applied to the selected sensor, click **Add**.

Result: A new entry appears in the Never Block Addresses list.

Step 4 To specify the address of the network or host for which you want to override (not apply) any ACL rules that might be generated as the result of the sensor detecting an ongoing attack, type that address in the IP Address box.

Step 5 To specify network mask that corresponds to the address that you specified in the IP Address box, type that value in the Subnet Mask box.

Step 6 For each network or host that you do not want blocked when attacks are detected, repeat Step 3 through Step 5.

Step 7 To accept your changes and close the selected panel, click **OK**.

Step 8 To save any changes that you have made, click **Save** on the File menu.

Tuning Signatures Applied to a Sensor

Specific signatures that are available for a sensor running 2.5.0 IDSM software provide one or two parameters that you can modify to tune how often you are notified about a particular type of attack. This tuning is based on how often an attack occurs and the amount of time that has transpired since the attack was initially detected.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1216
Fls:
3701
Doc:

E C
4.033
CPL - AC

To tune signatures for a sensor, follow these steps:

Step 1 Click the **Sensor** icon ( ) that represents the sensor that you want to tune, and then click the **Sensing** tab in the View pane.

Result: The Sensing panel appears in the View pane.

Step 2 To view the tab where you can specify how often you want to be notified that a specific attack has been detected by the sensor, click the **Signature Tuning Parameters** tab in the Sensing panel.

Step 3 To view the list of editable parameters for a specific signature type, double-click that signature type in the Signature Name box.

Result: The Signature Parameter Editor dialog box appears.

Step 4 To specify how many seconds should transpire after the initial attack that satisfies this signature is detected and before this counter and the threshold value are reset, type that value in the Expiration box.

Step 5 (Optional) To specify the number of times that the sensor can detect the same attack type before issuing an additional notification, type that value in the Threshold box.

Step 6 For each signature that you want to tune, repeat Step 3 through Step 5.

Step 7 To accept your changes and close the selected panel, click **OK**.

Step 8 To save any changes that you have made, click **Save** on the File menu.

Specifying IP Fragment Reassembly Options for a Sensor

For IDSM 2.2.1.5, 2.2.1.6, 2.2.1.7, 2.2.1.8, 2.5.0, 2.5.0, and later, you can specify which IP-based data streams should be studied based on the ability of the sensor to reassemble an entire datagram. In other words, you can specify boundaries that the sensor uses to determine how complete a datagram can be in terms of the reassembly of frames that are transmitted across the physical wire as part of that datagram. The ultimate goal for defining these reassembly settings is to ensure that the sensor does not allocate all its resources to datagrams that cannot be completely reconstructed, either because the sensor missed some frame transmissions or because an attack has been launched that is based on generating random fragmented datagrams.

All reassembly settings work in conjunction to ensure that the sensor has adequate system resources available to study network activities. However, unless you understand the likelihood of fragmented datagrams occurring on your network over a specified period of time, we recommend that you do not modify the default values provided for the IP fragment reassembly settings. However, we recommend two algorithms for determining these values:

- For sensors running IDSM 2.5.0 or later, we recommend that the Maximum Partial Datagrams times the Maximum Fragments Per Datagram remain less than or equal to 5,000.
- For sensors running 2.2.1.5, 2.5.0, or later non-IDSM software versions, we recommend that the Maximum Partial Datagrams times the Maximum Fragments Per Datagram remain less than or equal to 2,000,000.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1217
Doc: 3701

ECT 1.032 CPL - AC

To specify IP fragment reassembly options for a sensor running an applicable IDSM software version, follow these steps:

Step 1 Click the **Sensor** icon ( ) that represents the sensor for which you want to specify IP fragment reassembly options, and then click the **Sensing** tab in the View pane.

Result: The Sensing panel appears in the View pane.

Step 2 To view the tab where you can specify the mapped ports that this sensor should consider, click the **Advanced Sensor Settings** tab in the Sensing panel.

Step 3 To specify that you want the sensor to reassemble IP datagrams, select the **Reassembly Fragments** check box under IP Fragment Reassembly.

Step 4 To specify the maximum number of partial datagrams that the sensor can attempt to reconstruct at one time, type that value in the Maximum Partial Datagrams box.

Step 5 To specify the maximum number of fragments that can be accepted into a single datagram, type that value in the Maximum Fragments Per Datagram box.

Step 6 To specify the maximum number of seconds that can transpire before the sensor stops tracking a particular exchange for which it is trying to reassemble a datagram, type that value in the Fragmented Datagram Timeout box.

Step 7 To accept your changes and close the selected panel, click **OK**.

Step 8 To save any changes that you have made, click **Save** on the File menu.

Specifying TCP Session Reassembly Options for a Sensor

For IDSM 2.5.0 and later, you can specify which TCP data streams should be studied based on the ability of the sensor to reassemble the entire session. Like IP fragment reassembly settings, these settings ensure that valuable system resources are not reserved for sessions that are no longer active.

To specify TCP session reassembly options for a sensor running an applicable IDSM software version, follow these steps:

Step 1 Click the **Sensor** icon ( ) that represents the sensor for which you want to specify TCP session reassembly options, and then click the **Sensing** tab in the View pane.

Result: The Sensing panel appears in the View pane.

Step 2 To view the tab where you can specify the mapped ports that this sensor should consider, click the **Advanced Sensor Settings** tab in the Sensing panel.

Step 3 To specify that the sensor track only sessions for which the three-way handshake is completed, select the **TCP Three Way Handshake** check box.

Step 4 To specify how strict the reassembly requirements are for this sensor when it attempts to reassemble the entire TCP session, select that type in the TCP Strict Reassembly box.

Step 5 To specify the number of seconds that can transpire before the sensor frees the resources allocated to a fully established TCP session, type that value in the TCP Open Establish Timeout box.

Step 6 To specify the number of seconds that can transpire before the sensor frees the resources allocated for an initiated, but not fully established, TCP session, type that value in the TCP Embryonic Timeout box.

E C T
4.033
CPL - A

Step 7 To accept your changes and close the selected panel, click **OK**.

Step 8 To save any changes that you have made, click **Save** on the File menu.

Identifying the Packet Capture Device of a Sensor

You can identify the type of packet capture device that a sensor should use to retrieve network packets that it evaluates against the active sensor signature set configured for the sensor. This packet capture device identifies the type of physical layer driver that should be used to capture network packets. In other words, it identifies the type and speed of the physical network that is attached to the monitoring interface installed in the sensor.

Note This option is not available on line card models of the IDS software, such as IDSM 3.0.

To identify the packet capture device of a sensor, follow these steps:

Step 1 Click the **Sensor** icon ( ) that represents the sensor for which you want to identify a packet capture device, and then click the **Sensing** tab in the View pane.

Result: The Sensing panel appears in the View pane.

Step 2 To specify the packet capture device for this sensor, select the correct type in the Packet Capture Device list.

For non-switch-based sensors, you can specify one of the following values:

- **/dev/spwr0**—Identifies the network type that the sensor is studying as an Ethernet network.
- **/dev/mtok**—Identifies the network type that the sensor is studying as one of the older Token Ring networks operating at 4 or 16 MB transfer rates.
- **/dev/mtok36**—Identifies the network type that the sensor is studying as one of the newer Token Ring networks operating at 4, 16, or 100 MB transfer rates.
- **/dev/ptpci0**—Identifies the network type that the sensor is studying as an FDDI network.
- **/dev/iprb0**—Identifies the device name of the NIC interface used for packet capture.
- **auto**—Selects the device that is the default sniffing device on the appliance.

Step 3 To accept your changes and close the selected panel, click **OK**.

Step 4 To save any changes that you have made, click **Save** on the File menu.

Identifying Additional Ports Used by Specific Signatures Applied to a Sensor

For IDSM 2.5 and later, you can specify additional ports that should be considered by advanced attack signatures that study specific network services (identified by the TCP port used by that network service). These port settings enable you to identify any well-known network service ports that you have reassigned on your internal network, and to identify any custom TCP-based services that you run across your internal networks, that you want the sensor to study for specialized attacks that target these network services.

Data Sheet

CiscoWorks **Security Information Management Solution** 3.1

One of the greatest challenges in enterprise security is managing the flood of alerts generated by a growing number of multivendor security devices and systems. Automation is required to isolate and prioritize the few messages that indicate real security threats.

The key to more effective security automation lies in a software technology known as Security Information Management (SIM). CiscoWorks Security Information Management Solution (CiscoWorks SIMS) is based on technology from netForensics v3.1 and incorporates powerful features for gathering and analyzing the overwhelming amount of security event data that companies are experiencing. Companies can manage their growing security infrastructure and effectively monitor millions of event messages, without additional staff.

With CiscoWorks SIMS, the user has a solution that delivers:

- Complete event monitoring for SAFE and all multivendor security environments
- Real-time event correlation to detect both known and unknown threats
- Advanced visualization for fast and intuitive security monitoring
- Integrated risk assessment to understand the overall vulnerability of any particular asset within the enterprise
- Comprehensive reporting and forensics for all levels of security operations
- Productivity gains and cost reduction

CiscoWorks SIMS delivers these capabilities using the award-winning netForensics software, which is the central component of the solution.

v3.1 collects, analyzes, and correlates security event information from across the enterprise in a series of four distinct phases: normalization, aggregation, correlation, and visualization.

Normalization and Aggregation

In the normalization and aggregation phases, security events are collected from virtually all intrusion detection systems, firewalls, operating systems, applications, and anti-virus systems and transformed into a common easy-to-understand XML format.

Correlation

Formatted records are then correlated using two distinct yet complementary forms of event correlation. The first is a statistical correlation mechanism that relies upon event categorization and threat scoring to determine the threat potential of security-based anomalies. The second is an optional rules-based correlation feature that separates false positive security alarms from potentially significant security incidents by invoking "time aware" security policy rules for each event received.

With statistical correlation, normalized security events are categorized into security incident types by asset or asset group. Incident types can range from a reconnaissance attack, to a virus attack, to a denial of service attack, to name just a few. For each asset a threat score is continuously computed by combining event severity with asset value to determine an overall measurement of security incident potential. The key advantage is the ability to find those anomalies that may go undetected by a rules-based correlation implementation.

Visualization

netForensics v3.1 displays correlated results on a centralized, real-time console with a graphical, Java-based interface that is powerful, intuitive, and user friendly.

The Executive Dashboard provides a real-time, enterprise-level view of security trends and the Real-Time Console facilitates fast isolation of security attacks using real-time correlation and analysis capabilities.

Risk Assessment

In security terms, risk assessment involves understanding the overall vulnerability of any particular asset within the enterprise. Risk is commonly defined as the combination of threat, vulnerability, and value, where:

- Threat is any abnormal traffic or activity directed against a system or asset. netForensics scores each threat type, whether it's a port scan or login failure. These scores are then considered in the overall risk calculation.
- Value is the level of importance (perhaps in dollars) of any particular system or asset. The value is a user-defined variable for each asset in the enterprise.
- Vulnerability is the likelihood that a threat will be successful against a system or asset.

The solution combines each of the above to formulate an overall risk score for each asset within the enterprise, with higher scores indicative of higher asset vulnerabilities. The solution produces a Risk Assessment Report that provides the necessary details behind each asset and its associated risk. By understanding the vulnerability of specific assets within an enterprise, companies can strengthen appropriate security policies.

Summary

As securing the enterprise IT infrastructure becomes more challenging, companies must rely on technology to help assimilate the amount of security event information that flows from an ever-increasing number of security devices and systems. In addition, technology must be used to not only aid organizations in reducing the risk of attacks, but also to help accelerate responses when attacks occur. CiscoWorks SIMS increases the effectiveness of existing security teams and thereby helps achieve a real, measurable ROI.

Devices Supported for Monitoring

Table 1 Event Sources and Versions Supported

Application/Device	Version	netForensics Components
Third-party applications	–	Universal Agent
Historical data	See Syslog File Agent	Batch Agent
Arbor PeakFlow DoS	2.1	Agent for Arbor Peakflow
Check Point FireWall-1	NG, 4.1	Agent for Check Point
Cisco IOS® ACL, FW, IDS	12.2, 12.0	Syslog File Agent
Cisco Secure ACS	3.0	Agent for CSACS
Cisco Secure IDS	4.0, 3.1, 2.5, 2.2	CSIDS Agent/Syslog Agent
Cisco Secure PIX®	6.2, 6.1, 6.0, 5.3, 5.2, 5.1, 5.0	Syslog File Agent
Cisco Secure PIX IDS	6.2, 6.1, 6.0, 5.3, 5.2	Syslog File Agent
Cisco VPN Concentrator	3.1, 2.5.2	Syslog File Agent
CyberGuard Firewall	5.1	Agent for CyberGuard

Overview

CiscoWorks **VPN/Security Management Solution**, Version 2.1

CiscoWorks VPN/Security Management Solution (VMS) is the flagship integrated security management solution from Cisco, and is an integral part of the SAFE blueprint for network security. VMS protects the productivity of organizations, by combining Web-based tools for configuring, monitoring, and troubleshooting enterprise virtual private networks (VPN), firewalls, and network and host-based intrusion detection systems (IDS). CiscoWorks VMS delivers the industry's first robust and scalable foundation and feature set that addresses the needs of small and large-scale VPN and security deployments.

Today's business challenges and resulting security deployments require more scalability than merely supporting a large number of devices. Many customers have limited staffing, yet are asked to manage a myriad of security devices. These customers must manage the security and network infrastructure; frequently update many remote devices; implement change control and auditing when multiple organizations are involved in defining and deploying policies; enhance security without adding more headcount; or roll out remote access VPN to all employees and monitor the VPN service. VMS enables customers to deployment security infrastructures from a small to large environment, using the following multi-faceted scalability features:

- Complete SAFE Coverage
  In order to completely manage a SAFE environment, a network management solution must manage SAFE infrastructure components, support features based upon an appliance or the Cisco IOS® Software, and support the range of management functionality. CiscoWorks VMS is uniquely able to scale across SAFE blueprint components, including firewalls, VPNs, and network- and host-based IDS. CiscoWorks VMS also takes advantage of Cisco Secure Access Control Server (ACS) by using a common ACS logon. CiscoWorks VMS can manage a feature set through an appliance, for example, the Cisco PIX® Firewall, or through the Cisco IOS Software. Scalable management also involves more than configuring devices. CiscoWorks VMS provides the complete range of management with features to configure, monitor, and troubleshoot the network.
- Scalable Foundation
  CiscoWorks VMS implements a foundation with a consistent user experience, which makes it easier to scale management to many devices. CiscoWorks VMS provides users with a consistent GUI, workflow, ACS logon, roles definition, platforms, database engine, installation, and more. An industry-leading feature of this foundation is the Auto Update feature.

RQS Nº 03/2005 - CN

which allows numerous devices to be updated easily and quickly. Auto Update enables devices, even remote and dynamically addressed devices, to periodically "call home" to an update server and "pull" the most current security configurations or the Cisco PIX Operating System. Auto Update is required to effectively scale remote office firewall deployments across intermittent links or dynamic addresses. Prior policy updating methods relied on a "push" model. Although this model works for known devices, it does not work for remote devices with unknown addresses or devices that are not always active. Without Auto Update a more manual process is required to update each remote device. The Auto Update feature provides a dramatic scalability improvement for organizations that want to deploy devices with many remote and local locations. In addition to easier and faster policy updates Auto Update also provides consistent policy deployments.

- Enterprise Operational Integration
  CiscoWorks VMS enables organizations to easily integrate management into their operations. One operational need is to replicate policies to multiple locations. The Smart Rules hierarchy addresses this need, by enabling administrators to define device groups and implement policy inheritance. For example, an administrator can define a device group for the New York sales office and deploy that same policy to all other sales offices quickly and consistently. The Command and Control Workflow feature provides change control and auditing, and is particularly important for customers who have separate groups for network and security operations. The solution includes processes for generating, approving, and deploying configurations. This can enable security operations to define and approve new policies. Network operations can later deploy the new policies during their regular maintenance window. An audit of the changes can be maintained.
- Centralized Role-Based Access Control (RBAC)
  Role-based access control enables organizations to scale access privileges. CiscoWorks VMS conveniently uses a common ACS logon for users, admin, devices, and applications. CiscoWorks VMS enables different groups to have different access rights across different devices and applications.
- Integrated Infrastructure Management
  Scalability requires that multiple components are managed - not just firewalls but also VPNs, network- and host-based IDS, routers, switches, and so on. CiscoWorks VMS not only manages the security infrastructure, but also manages the network infrastructure. Customers benefit from being able to manage these components from one solution. Integrated monitoring is also required to see the larger picture. CiscoWorks VMS provides integrated monitoring of Cisco PIX and Cisco IOS syslogs, and events from network and host-based IDS, along with event correlation.

CiscoWorks VPN/Security Management Solution (VMS) Components

The following table lists CiscoWorks VMS modules and their functions.

Table 1

	VMS Module	Usage
	Management and Monitoring Centers:	
New!	* Management Center for PIX Firewalls	Configures PIX firewalls
New!	* Management Center for IDS Sensors	Configures Network-based IDS
New!	* Management Center for VPN Routers	Configures VPN routers
New!	* Monitoring Center for Security	Monitors network and host-based IDS events, IOS and PIX syslog
New!	* Auto Update Server	Permits configurations to be pulled from update server
New!	* Common Services	Provides a set of common software and services for the Management Centers
	Cisco Secure Policy Manager	Configures PIX firewall, IOS firewall; and VPN
	Cisco IDS Host Sensor and Console	Configures Host-based IDS, to protect critical servers
	VPN Monitor	Monitors IPSec-based site-to-site and remote access VPN
	Resource Manager Essentials	Provides operational management, such as software distribution, change audit, syslog analysis
	CD One/ CiscoView	Provides graphical device management

The following provides a summary of each CiscoWorks VMS module. For more detailed information, consult the data sheets for the individual modules.

Management and Monitoring Centers

The Management and Monitoring Centers are the newest modules in CiscoWorks VMS and are available exclusively within VMS. These centers include the Management Center for PIX Firewalls, Management Center for IDS Sensors, Management Center for VPN Routers, and Monitoring Center for Security. Common Services provides common functionality across the centers. Auto Update Server is used with the Management Center for PIX Firewalls. These centers supply multifaceted scalability by offering features such as a consistent user experience, auto update, command and control workflow, and role-based access control.

Figure 1 shows CiscoWorks VMS displayed as a "drawer" in the CiscoWorks dashboard. In the drawer are folders for the new Management and Monitoring Centers.

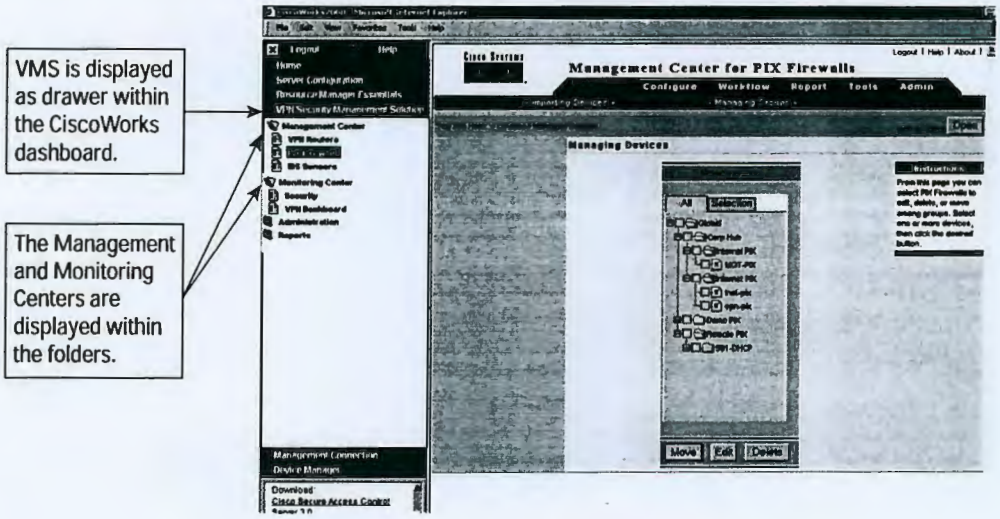
Fls: 1020

Figure 1
CiscoWorks VPN / Security Management Solution



CiscoWorks Management Center for PIX Firewalls

The CiscoWorks Management Center for PIX Firewalls and Auto Update Server enable the large-scale deployment of Cisco PIX Firewalls. The Management Center for PIX Firewalls provides the following features:

- Smart Rules hierarchy and inheritance
- User-defined device and customer groups including nesting
- Global role-based access with administrative privileges per device and customer groups with other CiscoWorks products and Cisco Secure ACS
- Mandatory and default device settings inheritance
- Workflow deployment to device, directory, or Auto Update Server
- Look and feel of Cisco PIX Device Manager but with scalability to thousands of PIX firewalls
- Integration with other CiscoWorks network management software
- Complete SAFE coverage for centralized management of Cisco PIX firewalls, including access control, VPN, IDS, and authentication, authorization, and accounting (AAA)

Smart Rules is an innovative feature that allows common information including access-rules and settings to be inherited for all firewalls in a device or customer group. Smart Rules allows a user to define common rules once, which results in reduced configuration time, fewer administrative errors, and higher device scalability. Using Smart Rules, a user can configure a common rule such as allowing all HTTP traffic once and can apply this rule globally to all firewalls. Smart Rules can also be defined on a device or customer group basis.

CPL - AC

Management Center for IDS Sensors

The Management Center for IDS Sensors is used for the configuration of IDS sensors. Network administrators can use this module to configure network and switch IDS sensors. Many sensors can be quickly configured using group profiles, with the Management Center for IDS Sensors. Additionally, a more powerful signature management feature is included to increase the accuracy and specificity of detection. Some prominent features are:

- Easy-to-use Web-based interface
- Wizards that walk users through common management tasks
- Access to the Network Security Database (NSDB)—Provides meaningful information on alarms for users without IDS security expertise
- Ability to define a hierarchy of sensors containing groups and subgroups; ability to configure multiple sensors concurrently using group profiles
- Support for several hundred sensor deployments from each console
- Use of a robust relational database to store a high volume of data

Management Center for VPN Routers

The Management Center for VPN Routers is used for setup and maintenance of large-scale VPN connections and provides users with a point-and- click interface for setting up and deploying connections. This application is intended for scalable configuration of site-to-site VPN connections in a hub-and-spoke topology for centralized, multidevice configuration and deployment of Internet Key Exchange (IKE) and IP Security (IPSec) tunnel policies on VPN routers.

Major features include:

- Wizard-based interface for the creation of IKE and VPN tunnel policies
- Hierarchical Inheritance and Smart Rules hierarchy to reflect the organizational and common setup of devices and simplified device management
- IKE-KA (IKE Keep Alive) or generic routing encapsulation (GRE) with Open Shortest Path First (OSPF) and Enhanced Interior Gateway Routing Protocol (EIGRP) for failover routing scenarios.
- Centralized RBAC model allows for centralized management of users and accounts

Monitoring Center for Security

The Monitoring Center for Security provides integrated monitoring to reduce the number of security monitoring consoles, reduce the number of events to monitor, and provide a bigger picture of security status.

- Integrated monitoring is used to capture, store, view, correlate and report on events from many of the devices in the SAFE blueprint such as Cisco Network IDS, Switch IDS, Host IDS, firewalls and routers.
- Event correlation is used to identify attacks that are not easily recognizable from a single event. A flexible notification scheme and automated responses to critical events also aid in quick action.
- The event viewer can read both real-time and historical events.
- Events are color-coded and administrators can quickly isolate problems. Administrators can also define thresholds and time periods when rules can be triggered to provide notification.
- On-demand and scheduled reports facilitate ongoing monitoring.

ECT
4018
CPL - AC

Auto Update Server

The Auto Update Server is the first product in the industry that allows users to implement a "pull" model for security and PIX operating system management. Auto Update Server permits remote firewall networks with unprecedented scalability. The Auto Update Server allows Cisco PIX firewalls, when used with the Management Center for PIX Firewalls, to both periodically and automatically contact the update server for any security configuration, Cisco PIX Operating System, and PIX Device Manager (PDM) updates. The Auto Update Server supports the following features:

- Security management of remote Cisco PIX firewalls that use Dynamic Host Control Protocol (DHCP)
- Automated Cisco PIX OS distribution to groups of Cisco PIX firewalls
- Automated Cisco PDM updates to remote firewalls
- Configuration verification at periodic intervals
- Automated replacement of inaccurate or tampered configurations
- New firewalls configured at "boot time" with Cisco.com and the Cisco PIX Management Center

The Auto Update Server is an indispensable component of any large-scale remote Cisco PIX firewall deployment. Auto Update Server is an easy-to-use solution to automatically update all remote or local firewalls with new operating system releases. Cisco is the industry's first vendor to provide this pull model of security policy and operating system management.

Cisco Secure Policy Manager (CSPM)

Cisco Secure Policy Manager is a scalable, powerful policy-based security management system for Cisco firewalls and IPSec VPN routers. CSPM 3.1 introduces several features including support for Windows 2000 Server, Windows 2000 Workstation, improved client/server and network object comment. With Cisco Secure Policy Manager, Cisco customers can define, distribute, enforce, and audit network-wide security policies from a central location. CSPM provides the following capabilities:

- Streamlines the tasks of managing complicated network security elements, such as perimeter access control, Network Address Translation (NAT), and IPSec-based VPNs.
- Dramatically simplifies firewall and VPN deployment in enterprise and service provider networks.
- Provides simple graphical user interface (GUI) allows administrators to visually define high-level security policies for multiple Cisco firewalls and VPN routers. These policies can be distributed throughout the network from a central location, thus completely eliminating the costly, time-consuming practice of manually implementing security configurations on a command-by-command and device-by-device basis.
- Provides basic system auditing functions, including real-time alarm notification and a Web-based reporting system.

Cisco IDS Host Sensor and Console

Cisco IDS Host Sensor and Console provides real-time analysis and reaction to network hacking attempts. The Cisco IDS Host Sensor and Console can stop known and unknown attacks, including NIMDA and the Code Red Worm viruses. Cisco IDS Host Sensor and Console can identify an attack and prevent access to critical server resources before any unauthorized transactions occur. Unlike traditional detection products, Cisco IDS Host Sensor and

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1234
Doc: 3701

All contents are Copyright © 1992–2002 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement.

Console proactively protects the host by evaluating requests to the operating system and the application programming interface (API) before they are processed. Using a blend of "signature" and behavioral techniques, Cisco IDS Host Sensor and Console stops attacks.

Cisco IDS Host Sensor and Console can intercept and validate software calls made into the operating system and kernel. Calls are matched to a constantly updated database of both defined and generic attack behaviors. If an attack is found, preemptive action is automatically taken to protect the system by referencing a policy that is customized to the environment. Actions ranging from "Log Event" to "Terminate Process" are taken. All activity on the host is seen, and is not impaired by encryption, switched data, or reliance on system log information. The attack database consists of the following types of attack recognition capability:

- Individual attack—Protects against single hacking "exploits" by matching known attack behaviors against activity in the system OS or applications, for example, MDAC and GetAdmin
- Generic attack—Protects against a whole category of hacking "exploits" directed against the operating system and applications, covering unknown and known attacks, for example, Buffer Overflow Exploits, Code Red, and so forth
- Resource protection—Prevents malicious access to system resources, including processes, services, registry keys, password files, authentication mechanisms, and so forth
- Shielding and HTTP protocol protection—Provides additional protection for specific applications, for example, IIS Web Server (requires additional license)

CiscoWorks VPN Monitor

CiscoWorks VPN Monitor is a Web-based management tool that allows network administrators to collect, store, and view information on IPSec VPN connections for remote-access or site-to-site VPN terminations. Multiple devices can be viewed from an easy-to-use dashboard that is configured using a Web browser. This dashboard provides the following capabilities:

- Provides data on system resources related to real-time memory usage, percent CPU usage per device, and active tunnel and active sessions. This data simplifies the identification of devices with potential performance problems and devices with the highest usage.
- Enables viewing of current and long-term packet rates and packet dropped percentage which can aid in determining where excess capacity can be tapped or quickly identify bottlenecks and devices throughput problems.
- Enables identification of the devices with most persistent problems through the event log; key device and VPN statistics are evaluated against a set of global and device-specific thresholds, and exceptions are recorded in the event log.
- Provides graphing of key common metrics; device performance comparisons provide a global view of short-term trends in VPN performance, enabling administrators to identify problem areas before they become critical failures.

CiscoWorks Resource Manager Essentials (RME)

CiscoWorks Resource Manager Essentials provides the operational management for the network. CiscoWorks RME allows network managers to perform the following:

- Quickly build a complete network inventory

- Manage device credentials information
- Monitor and report on hardware, software, configuration, and inventory changes
- Manage and deploy configuration changes and software image updates to multiple devices
- Monitor and troubleshoot critical LAN and WAN resources
- Quickly identify devices that can be used for VPNs, if upgraded with the appropriate Cisco IOS Software
- Discover which VPN devices have hardware encryption modules
- Graphically compare configurations of VPN devices
- Isolate IPSec-related problems by running customized Syslog reports

CiscoView (CD One)

The CiscoView graphical device management application provides dynamic status, monitoring, and configuration information for the broad range of Cisco internetworking products. CiscoView provides a physical view of a device chassis, with color-coding of modules and ports enabling administrators to check status. Monitoring capabilities display performance and other statistics. Configuration capabilities allow comprehensive changes to devices, provided that users have the proper security access privileges.

CiscoView features include:

- Real-time monitoring of key information relating to device performance, traffic, and usage, with metrics such as utilization percentage, frames transmitted and received, errors, and a variety of other device-specific indicators.
- Ability to change device configurations such as IP route, virtual LAN (VLAN), and duplex settings
- Multiuser access to a single CiscoView server in a Web-based application

Server Specifications

Server Hardware

- IBM PC-compatible computer with 1GHz or faster Pentium processor,
- Sun UltraSPARC 60 MP with 440 MHz or faster processor
- Sun UltraSPARCIII (Sun Blade 2000 Workstation or Sun Fire 280R Workgroup Server)
- CD-ROM drive
- 10BaseT or faster connection
- 1 GB minimum memory
- 9 GB minimum available disk drive space
- 2 GB virtual memory
- Color monitor with video card capable of 16-bit

Server Operating System

CiscoWorks VMS requires the following operating systems:

- Windows 2000 Professional, Windows 2000 Server (Service Pack 2)
- Sun Solaris 2.7 w Patches:
  - 106327-05 Shared Library Patch for C++
  - 106980-10 Libthread Patch

RQS Nº 03/2005 - CN
CPMI - CORREIOS

- 107636-03 X Input and Output Method Patch
- 107081-11 Motif 1.2.7 and 2.1.1: Runtime Library Patch
- 108376-03 (1) Open Windows 3.6.1 Xsun Patch

- Sun Solaris 2.8 w/Patches:
  - 109742 has been replaced by 108528-13
  - 109322 has been replaced by 108827-15
  - 109279 has been replaced by 108528-13
  - 108991 has been replaced by 108827-15

Client Requirements

Hardware

- IBM PC-compatible computer with 300-MHz or faster Pentium
- Solaris SPARCstation or Sun Ultra 10

Client Operating System

- Windows 98, Windows NT 4.0, or Windows 2000 Server or Professional Edition with Service Pack 2
- Solaris 2.7, 2.8

Client Browser

- Internet Explorer 6.0 or 5.5 with Service Pack 2, on Windows 2000 Server or Professional Edition, Windows 98, and Windows NT 4.0.
- Netscape Navigator 4.79, on Windows 2000 Server or Professional Edition and Windows 98. Netscape Navigator 4.76 on Solaris 2.7, 2.8.

The Management Center for PIX Firewalls, Management Center for VPN Routers, and Auto Update Server are supported on Internet Explorer 6.0 or 5.5, but not on Netscape Navigator. In addition to supporting Internet Explorer The Management Center for IDS and the Monitoring Center for Security are also supported on Netscape Navigator.

Service and Support

CiscoWorks products are eligible for coverage under the Cisco Software Application Service (SAS) program. This service program offers customers contract-based 24x7 access to the Cisco Technical Assistance Center (TAC), full Cisco.com privileges, and software maintenance updates. A Software Application Service contract ensures that customers have easy access to the information and services needed to stay current with newly supported device packages, patches, and minor updates. For further information on service and support offerings, contact your local sales office.

Ordering Information

CiscoWorks VPN/Security Management Solution (VMS) is available for purchase through normal Cisco sales and distribution channels worldwide. CiscoWorks VMS includes all the necessary components needed for an independent installation on a Microsoft Windows or Sun Solaris workstation.

Cisco Systems

Data Sheet

Cisco Catalyst 6500 Series **Intrusion Detection System** (IDSM-2) Services Module

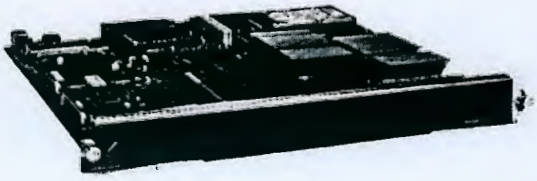
Cisco integrated network security solutions enable organizations to protect productivity gains and reduce operating costs.

The Cisco IDSM-2 is part of the Cisco Intrusion Detection System. It works in concert with the other components to efficiently protect your data infrastructure. With the increased complexity of security threats, achieving efficient network intrusion security solutions is critical to maintaining a high level of protection. Vigilant protection ensures business continuity and minimizes the effect of costly intrusions.

For details on the complete Cisco Intrusion Detection System, go to www.cisco.com/go/ids

Cisco integrated network security solutions enable organizations to protect their connected business assets from threats and increase the operating efficiency of intrusion protection. Among these solutions is the second generation of the Cisco Intrusion Detection System (IDS) module, the IDSM-2, for the widely deployed Cisco Catalyst® chassis. With an installed base in the hundreds of thousands, the Catalyst chassis is a logical platform for additional services such as firewall, virtual private network (VPN) and intrusion detection system (IDS) services. Recognizing the value of this approach, Cisco introduced this second-generation module that provides unique benefits to customers seeking IDS attack protection.

Figure 1
Cisco IDSM-2



Features and Benefits

The Cisco IDSM-2 offers the following features and benefits:

- Cisco is the only vendor to provide an in-switch IDS solution supplying access to the data stream via VLAN access control list (VACL) capture capable of supporting an unlimited number of VLANs
- Transparent operation via passive, promiscuous operation that inspects copies of packets via VACL capture and Switch Port Analyzer/Remote SPAN (RSPAN/SPAN) without exposing the network to performance degradation or downtime if the unit needs maintenance because it is not in the switch-forwarding path

Doc: 3701

All contents are Copyright © 1992–2003 Cisco Systems, Inc. All rights reserved. Important Notices and Privacy Statement

ECT
2003
CPL - AC

- One-rack-unit size takes up only a single slot in the Cisco Catalyst chassis making it an effective platform across all Catalyst chassis, from the 3-slot Catalyst 6503 Switch to the largest chassis available, allowing as many modules to be installed simultaneously as desired providing protection for a greater number of VLANs and traffic
- 500 megabits per second (Mbps) of IDS inspection provides high-speed packet-examination capabilities and allows for more protection of a wider variety of networks and traffic
- Multiple techniques for capture and actions including SPAN/RSPAN as well as VACL capture combined with shunning and TCP resets allows customers to monitor various network segments and traffic while the product provides timely action to mitigate threats
- Uses the same code as the award-winning Cisco IDS network appliances allowing users to standardize on a single management technique and makes installation, training, operation, and support simpler and faster while taking advantage of Cisco IDS comprehensive attack recognition and signature coverage
- Improved management techniques such as support by the Cisco VMS 2.1 security bundle, as well as built-in Cisco IDS Device Manager (IDM) and IDS Event Viewer (IEV) local management capabilities and CLI support make the IDSM-2 easier to manage and more capable of detecting and responding to threats while alerting operators to potential attacks. In addition, the new option makes management of multiple devices across wide and varied networks much simpler

Technical Specifications

Cisco IDSM-2 Part Numbers

WS-SVC-IDS2-BUN-K9

Cisco IDSM-2 Service Part Numbers

CON-xxxx-WS-IDSM2-K9

Service key for "xxxx" in the part number:

- SNT = 8x5xnext business day
- SNTE = 8x5x4 hour service
- SNTP = 24x7x4 hour service
- OS = 8x5xnext business day
- OSE = 8x5x4 hour service onsite
- OSP = 24x7x4 hour service onsite

Form Factor

One rack-unit module uses one slot in the Cisco Catalyst 6500 chassis

LEDs and Switches

Single indicator (LED)

- OFF—no power
- YELLOW—booting up/standby
- GREEN—application is running
- RED—module fault located

Shutdown switch used before removing the module from the chassis.

Hot-Swap Requirements

Module shutdown required before removal

Module insertion/removal never affects the Cisco Catalyst switch

Processor

Pentium 1.13 GHz on main board with IXP on the accelerator

Operating System

Red Hat Linux 6.2

Maximum Number of Modules per Chassis

Unlimited per chassis

Traffic Capture Methods

VACL capture

SPAN

RSPAN

Minimum Code Revision

Release 4.0

Features:

- TCP resets
- IP logging
- SME (Signature Micro Engine)
- IDM
- NTP Synchronization
- Local CLI (Command-line Interface)
- Performance enhancements

Catalyst Supervisor Software Requirements

Catalyst OS 7.5(1) (minimum)

Native Cisco IOS Software Release12.1(19)E

Catalyst Supervisor Hardware Options with IDSM-2

With Catalyst OS 7.5.(1): Supervisor Engine 1A

- Supervisor Engine 1A/PFC2
- Supervisor Engine 1A/MSFC1
- Supervisor Engine 1A/MSFC2
- Supervisor Engine 2
- Supervisor Engine 2/MSFC2

With Native Cisco IOS Software Release 12.1(19)E:

- Supervisor Engine 2/MSFC2

Performance Metrics

600 Mbps with 450-byte packets

Supports up to 5,000 TCP connections per second (new arrivals)

Supports up to 500,000 concurrent connections

100% alarm rate

Catalyst performance not affected by additional VLANs or devices in the Cisco Catalyst chassis

Fabric Enabled

Maximum Number of VLANS (802.1q tagging)

Unlimited

Failover Protection

The IDSM-2 is a passive device that has no disruptive effect on the Cisco Catalyst chassis in the event of failure.

Management

Cisco IDM and IEV are included with IDSM-2.

- Cisco IEV PC-based configuration manager (3 devices)
- Cisco IDM on-board Web browser (1 device)
- Cisco VMS 2.1 with Security Monitor and IDS Management Center v1.1 (minimum 20 devices)

Physical Dimensions

Occupies any slot in the Catalyst 6000 chassis, and as many IDSM-2 modules can be inserted as desired.

Height: 3.0 cm (1.2 in.)

Width: 35.6 cm (14.4 in.)

Depth: 40.6 cm (16 in.)

Weight: 2.27 kg (5 lb)

Operating Environment

Operating temperature: 0 to 40°C (32 to 104.5°F)

Non-operating temperature: -40 to 70°C (-40 to 158°F)

Operating relative humidity: 10 to 90% (noncondensing)

Non-operating relative humidity: 5 to 95% (noncondensing)

Operating and non-operating altitude: sea level to 3050m (10,000 ft.)

Agency Approvals

Emissions

FCC Part 15 (CFR 47) Class A, ICES-003 Class A, EN55022 Class A, CISPR22 Class A, AS/NZS 3548 Class A, VCCI Class A with UTP cables, EN55022 Class B, CISPR22 Class B, AS/NZS 3548 Class B, VCCI Class B with FTP cables

Safety

CE marking according to UL 1950, CSA 22.2 No. 950, EN 60950, IEC 60950, TS 001, AS/NZS 3260

Export Restrictions

Cisco IDSM-2 is classified as a "strong encryption" product and is export restricted. For details see: http://www.cisco.com/wwl/export/crypto/tool/

Caveats

This section includes the following topics:

- Caveat for Operating a 2.2.0 Sensor with a 2.1.1 Director
- Caveats for Operating a 2.2.0 Director with a 2.1.1 Sensor
- Caveats for nrConfigure
- Caveats for the sapd Service
- Caveats for the Security>Advanced>Shunning>Disable Menu Function

Note Refer to the netranger220-readme.txt file bundled with the NetRanger software for last-minute changes and caveats.

Caveat for Operating a 2.2.0 Sensor with a 2.1.1 Director

Operating a 2.2.0 Sensor with a 2.1.1 Director is *not* supported.

Note It is highly recommended that you upgrade to the 2.2.0 Sensor to take advantage of the latest enhancements.

Caveats for Operating a 2.2.0 Director with a 2.1.1 Sensor

If you operate a 2.2.0 Director with a 2.1.1 Sensor, keep the following issues in mind:

- The 2.2.0 Director's nrConfigure adds 2.2.0 tokens to the 2.1.1 Sensor's configuration files. These 2.2.0 tokens will be ignored by the 2.1.1 Sensor.
- The 2.2.0 Director's nrConfigure cannot restart 2.1.1 Sensors due to differences in *postofficed* services. Although the Director does transfer the configuration files, it cannot apply these changes and restart the Sensor. To apply any configuration changes, open a Telnet session to the 2.1.1 Sensor and manually run **nrstop** and **nrstart**.
- If you want to use the 2.2.0 nrConfigure with a 2.1.1 Sensor, you will most likely have to enable the *fileXferd* service on the Sensor.

  To enable this service, Telnet to the Sensor, open the /usr/nr/etc/daemons file in a text editor, either add "nr.fileXferd" to the list of daemons or uncomment the "nr.fileXferd" line, save your changes and exit the editor, and then run **nrstop** and **nrstart** from the command line.
- Certain 2.2.0 Director menu functions have no effect on a 2.1.1 Sensor, including:
  - **Security>Daemons>Restart**
  - **Security>Daemons>Stop**
  - **Security>Daemons>Start**

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1245
Doc: 3701

E C T
1 2007 Jun
C P L - A C

Caveats for nrConfigure

The following are caveats concerning the nrConfigure management tool:

- You can not run more than one copy of the nrConfigure GUI. If this is attempted, error messages will be generated.
- If nrConfigure crashes the first time you start it, you can restart the GUI without further problems.
- nrConfigure may freeze if a remote machine it is trying to configure is not reachable. Make sure that the remote machine is communicating on the network, and try again.

Caveats for the *sapd* Service

If a logfile contains any errors, *sapd* may not load it into the RDBMS, causing *sapd* to fail and generate an error. If this happens, follow these steps:

Step 1 Type `nrstop` to stop the NetRanger services.

Step 2 Type the following command to find the name of the logfile that caused problems:

```
more /usr/nr/var/messages.sapd
```

Step 3 Delete the logfile, mentioned in the messages.sapd file, from the /usr/nr/var/new directory.

Step 4 Type `nrstart` to restart the NetRanger services.

Note When you restart the NetRanger services, it is very likely that you will have duplicate records in your database.

Caveats for the Security>Advanced>Shunning>Disable Menu Function

The **Security>Advanced>Shunning>Disable** menu function keeps the *managed* service from communicating with any routers it is controlling. If you invoke this function and then try to implement manual shunning, your commands will not be passed to the router.

Also, any currently shunned networks or hosts will not be removed from the shun list.

This menu function is normally used to temporarily disable *managed* so you can pass configuration commands to the router safely.

Use the **Security>Advanced>Shunning>Enable** menu function to resume shunning. If you reboot the Sensor, then the temporary disabling of shunning is also reset.

Upgrade Information

This section discusses the following topics:

- Upgrading a Sensor from 2.1.1 to 2.2.0
- Upgrading a Director from 2.1.1 to 2.2.0
- Removed Functionality in NetRanger Version 2.2.0
- Downloading the Sensor and Signature Update

Upgrading a Sensor from 2.1.1 to 2.2.0

If you have an existing 2.1.1 Sensor and would like to upgrade the software to NetRanger version 2.2.0, use Table 1 to guide you in the process.

Table 1 Upgrading a Sensor from 2.1.1 to 2.2.0

Upgrade to 2.2.0, but keep Solaris 2.5.1*		Upgrade to 2.2.0 and upgrade to Solaris 2.6
If you want to keep your configuration files:	**If you want to create new configuration files:**	
1 Refer to Chapter 3, "Installation and Configuration" in the *NetRanger User Guide*. 2 Refer to the "Upgrading Device Management (for Cisco routers)" section of Chapter 3, "Installation and Configuration". 3 Refer to the "Downloading the Sensor and Signature Update" section of these Release Notes. 4 If the Director has also been upgraded and its configuration files changed, use nrConfigure's **Insert Sensor** feature to finalize the configuration.	1 Refer to Chapter 3, "Installation and Configuration" in the *NetRanger User Guide*. 2 Run **sysconfig-sensor** on the Sensor. 3 Run **sysconfig-director** on the Director, and then use nrConfigure's **Add Host** feature to finalize the Sensor upgrade. 4 Refer to the "Downloading the Sensor and Signature Update" section of these Release Notes.	Refer to the "Building a Sensor (Optional)" section of Chapter 3, "Installation and Configuration" in the *NetRanger User Guide*. If you want to upgrade your Sensor hardware, contact your Cisco Sales representative to order a Sensor appliance, which runs on a customized version of Solaris 2.6.

*Solaris 2.5.1 is not year 2000 compliant. Be sure to install the Y2K patches for Solaris 2.5.1.

Upgrading a Director from 2.1.1 to 2.2.0

If you have an existing 2.1.1 Director and would like to upgrade the software to NetRanger version 2.2.0, use Table 2 to guide you in the process.

Note NetRanger on AIX 4.1.x is no longer supported. Contact a Cisco sales representative to migrate to Solaris or HP-based 2.2.0 Director.

Table 2 Upgrading a Director from 2.1.1 to 2.2.0

If your 2.1.1 Director is:			
Sun Solaris SPARC 2.5.1			HP-UX 10.10
Keep Solaris 2.5.1 and keep configuration files*	**Keep Solaris 2.5.1 and create new configuration files***	**Upgrade to Solaris 2.6**	
If you want to keep your configuration files, refer to Chapter 3, "Installation and Configuration" in the *NetRanger User Guide.*	1 Refer to Chapter 3, "Installation and Configuration" in the *NetRanger User Guide.* 2 Run **sysconfig-director** on the Director. 3 Use nrConfigure to finalize the Director configuration. 4 To upgrade and configure 2.1.1 Sensors, refer to Table 1 of these Release Notes.	1 Refer to the "Uninstalling the Director" section of Chapter 3, "Installation and Configuration" in the *NetRanger User Guide.* 2 Upgrade the operating system to Solaris 2.6. 3 Refer to the "Director Installation and Configuration" section of Chapter 3, "Installation and Configuration" in the *NetRanger User Guide.* 4 To upgrade and configure 2.1.1 Sensors, refer to Table 1 of these Release Notes.	1 Refer to the "Uninstalling the Director" section of Chapter 3, "Installation and Configuration" in the *NetRanger User Guide.* 2 Upgrade the operating system to HP-UX 10.20. 3 Refer to the "Director Installation and Configuration" section of Chapter 3, "Installation and Configuration" in the *NetRanger User Guide.* 4 To upgrade and configure 2.1.1 Sensors, refer to Table 1 of these Release Notes.

*Solaris 2.5.1 is not year 2000 compliant. Be sure to install the Y2K patches for Solaris 2.5.1.

Removed Functionality in NetRanger Version 2.2.0

For NetRanger version 2.2.0, NetView for AIX support on the Director and licensing have both been removed.

Downloading the Sensor and Signature Update

The Sensor Update contains updates to the signatures list, the Sensor's intrusion detection software, and the Network Security Database (NSDB). This patch is updated periodically.

To obtain the Sensor Update Patch, follow these steps:

Step 1 If you have not already done so, become a CCO member.

To become a CCO member, access the following URL:

`http://www.cisco.com/register/`

and follow the registration instructions.

Step 2 Access the following URL:

`http://www.cisco.com/cgi-bin/tablebuild.pl/nr22-sensor`

Step 3 Log on with your CCO username and password.

Step 4 Download the latest readme and either the Solaris SPARC or Solaris x86 Sensor Update files.

Step 5 For each file, follow the instructions for downloading. You can download via FTP, HTTP, or e-mail.

Step 6 When you have downloaded all the files, use the FTP facility to transfer them to the Sensor.

Step 7 Follow the instructions in the readme file for installing the Sensor update.

Enhancements

For the 2.2.0 release of NetRanger, the following were a top priority:

- Installation Enhancements
- Support Enhancements
- Usability Enhancements

Installation Enhancements

The following installation enhancement was made for the Sensor:

- **Technician Installation**—The Sensor has been repackaged as a hardware/software appliance with a simplified setup procedure. The technician will first attach the monitoring and control interfaces to the appropriate points on the network. The technician would then temporarily attach a monitor and keyboard to the Sensor and start the initialization script. This script will prompt for several network-related parameters such as IP address, host name, netmask and then several NetRanger-specific parameters such as host and organization. There are a total of seven questions to answer. In a standard deployment, the security office should provide answers for the technician in advance.

On the Director, the following enhancements were made:

- **Simplified install with HP OpenView**—Clearly outlined steps and procedures for configuring OpenView and then installing the NetRanger Director.
- **Interactive Sensor setup wizard**—This new wizard allows the operator to easily connect with a newly installed Sensor. The wizard asks several network-related questions, connects with the new Sensor, and then opens nrConfigure with the default configuration. From this point on the operator can customize the intrusion detection policy and apply it on the new Sensor.
- **Full-featured configuration manager** (see the following section).

Support Enhancements

The following enhancements were made to simplify technical support of NetRanger:

- The Sensor appliances have easy to understand part numbers:
  - NRS-2E (Ethernet)
  - NRS-TR (Token Ring)
  - NRS-2FE (Fast Ethernet)
  - NRS-SFDDI (Single FDDI)
  - NRS-DFDDI (Dual FDDI)
  - Optional -DM suffix on the above part numbers indicates device management option (shunning)
- Device management for all network devices is now bundled in a single option package.
- Sensor migrated to a common platform, with the following characteristics:
  - Single or Dual 400 MHz Processor
  - 100 MHz PCI Bus Monitoring Cards

E C T
4002 June
C P L - A

- **Technology Migration Program**—Cisco provides a Technology Migration Program that allows customers to trade in older hardware for credit against new purchases. There are three 'levels' of trade in. Each level will be given a certain credit for their Sparc-based Sensor and their Pentium-based Sensor. The three levels of trade-in are:
  - — Customers who have purchased WheelGroup products prior to the Cisco acquisition effective April 1, 1998.
  - — Customers that have purchased equipment since the WheelGroup acquisition effective April 1, 1998.
  - — Customers who wish to upgrade from a software-only purchase to the new 2.2.0 appliance.

  These three trade-in deals will be available until April 30, 1999. Contact your Cisco sales representative for details.
- **SmartNet Support** allowing all six levels of Cisco support will be available for the Sensors. Software Application Support with Upgrades will be available for the Director.

Usability Enhancements

The following enhancements were made for product usability:

- The *NetRanger User Guide* was completely reorganized to reflect the new product configuration.
- The nrConfigure tool was changed to offer expanded remote configuration services, including:
  - — Point and click configuration of Sensors
  - — Configuration archival and version control
  - — Sensor recovery tool
  - — Remote signature updates
- The Network Security Database (NSDB), an HTML-based encyclopedia of network security information, is now available.
- Support for Cisco Routers expanded to the following models: Cisco 1600, Cisco 3600, and Cisco 7200.
- Reduced false positive alarm rate by creating a new **RecordOfExcludedNetAddress** token (an enhancement of the previous **RecordOfExcludedAddress** token). The new token allows the user to exclude alarms for entire networks by providing a netmask. The new token also allows the user to exclude alarms based on whether the network address was the source, or destination address for the alarm.

  The **RecordOfExcludedAddress** token is still supported in NetRanger version 2.2.0.
- System error messages about logging, communication, and other NetRanger services, are now graphically represented on the Director's interface. Users can access the Error information in the same way they can access attack Alarm information.
- NetRanger can now log and alarm on policy violations on a Cisco router via the syslogd service. Users can configure the router to send syslogd log files to the Sensor, which can then pass the information to the Director for alarm display.

Fls: 1251
Doc: 3701

New Signatures

NetRanger version 2.2.0 contains the following new signatures:

- **1103 IP Fragments Overlap**—Some implementations of the TCP/IP IP fragmentation re-assembly code do not properly handle overlapping IP fragments. Teardrop is a widely available attack tool that exploits this vulnerability.
- **2153 Smurf**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.
- **2154 Ping of Death Attack**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.
- **3001 TCP Port Sweep**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.
- **3003 TCP Frag SYN Port Sweep**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.
- **3005 TCP FIN Port Sweep**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.
- **3006 TCP Frag FIN Port Sweep**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.
- **3010 TCP High Port Sweep**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.
- **3011 TCP FIN High Port Sweep**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.

- **3012 TCP Frag FIN High Port Sweep**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.
- **3015 TCP Null Port Sweep**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.
- **3016 TCP Frag Null Port Sweep**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.
- **3020 TCP SYN FIN Port Sweep**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.
- **3021 TCP Frag SYN FIN Port Sweep**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.
- **3030 TCP SYN Host Sweep**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.
- **3031 TCP FRAG SYN Host Sweep**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.
- **3032 TCP FIN Host Sweep**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.
- **3033 TCP FRAG FIN Host Sweep**—This triggers when a large number of ICMP Echo Replies are targeted at a machine. They can be from one or many sources. This will catch the attack known as Smurf, described in the related vulnerability page. Because this attack can come from many sources, automatic shunning of individual hosts is not very effective. If only one network is being used to broadcast the replies, the network can be shunned.

Cisco Connection Online

Cisco Connection Online (CCO) is Cisco Systems' primary, real-time support channel. Maintenance customers and partners can self-register on CCO to obtain additional information and services.

Available 24 hours a day, 7 days a week, CCO provides a wealth of standard and value-added services to Cisco's customers and business partners. CCO services include product information, product documentation, software updates, release notes, technical tips, the Bug Navigator, configuration notes, brochures, descriptions of service offerings, and download access to public and authorized files.

CCO serves a wide variety of users through two interfaces that are updated and enhanced simultaneously: a character-based version and a multimedia version that resides on the World Wide Web (WWW). The character-based CCO supports Zmodem, Kermit, Xmodem, FTP, and Internet e-mail, and it is excellent for quick access to information over lower bandwidths. The WWW version of CCO provides richly formatted documents with photographs, figures, graphics, and video, as well as hyperlinks to related information.

You can access CCO in the following ways:

- WWW: http://www.cisco.com
- WWW: http://www-europe.cisco.com
- WWW: http://www-china.cisco.com
- Telnet: cco.cisco.com
- Modem: From North America, 408 526-8070; from Europe, 33 1 64 46 40 82. Use the following terminal settings: VT100 emulation; databits: 8; parity: none; stop bits: 1; and connection rates up to 28.8 kbps.

For a copy of CCO's Frequently Asked Questions (FAQ), contact cco-help@cisco.com. For additional information, contact cco-team@cisco.com.

Note If you are a network administrator and need personal technical assistance with a Cisco product that is under warranty or covered by a maintenance contract, contact Cisco's Technical Assistance Center (TAC) at 800 553-2447, 408 526-7209, or tac@cisco.com. To obtain general information about Cisco Systems, Cisco products, or upgrades, contact 800 553-6387, 408 526-7208, or cs-rep@cisco.com.

Documentation CD-ROM

Cisco documentation and additional literature are available in a CD-ROM package, which ships with your product. The Documentation CD-ROM, a member of the Cisco Connection Family, is updated monthly. Therefore, it might be more current than printed documentation. To order additional copies of the Documentation CD-ROM, contact your local sales representative or call customer service. The CD-ROM package is available as a single package or as an annual subscription. You can also access Cisco documentation on the World Wide Web at http://www.cisco.com, http://www-china.cisco.com, or http://www-europe.cisco.com.

If you are reading Cisco product documentation on the World Wide Web, you can submit comments electronically. Click **Feedback** in the toolbar and select **Documentation**. After you complete the form, click **Submit** to send it to Cisco. We appreciate your comments.

This document is to be used in conjunction with the documents listed in the "Related Documentation" section.

TECHNICAL BRIEF

Cisco Secure Intrusion Detection System Technical Overview

This document provides a technical overview of the components, capabilities, and architecture of the Cisco Secure Intrusion Detection System, formerly known as NetRanger. Intrusion Detection was developed to extend security visibility into the network and monitor the activity of users while they are on the network. The Cisco Secure Intrusion Detection System (IDS) augments Cisco's end-to-end security solution as a dynamic security component by detecting, responding to, and reporting unauthorized activity from data derived directly from the network.

Cisco Secure Intrusion Detection System Components

The Cisco Secure IDS is a real-time intrusion detection security system that includes the Cisco Secure IDS Sensors, stealthy security appliances that act as "sniffers," and the Cisco Secure IDS Director, a centralized management console. The Director collects incoming Sensor data, translates it, and presents it to security personnel in a map-based and intuitive graphical interface. Users can quickly access additional information about the type of attack from the Director's Network Security Database (NSDB). The Director also allows security personnel to manage the configuration of remote Sensors. And finally, the Director can manage Sensor data by exporting it to third-party relational databases.

Specific Information on Cisco Secure Intrusion Detection System Components

- *Sensor*—The Sensor is a network appliance that combines high reliability with installation and maintenance simplicity. Each network segment monitored requires a dedicated Sensor, including the Internet, intranets, and extranets. The Sensor appliance is optimized for specific data rates and interfaces, such as Ethernet (10BaseT), Fast Ethernet (100BaseT), Token Ring (4 and 16 Mbps), and Fiber Distributed Data Interface (FDDI) (Single or Dual mode). It uses an expert rules-based system engine to distill large volumes of IP network traffic into meaningful security events. It features a unique "three-tiered" attack detection capability to pinpoint unauthorized activity, including, Named attacks, General Category attacks, and Extraordinary attacks. The Sensor can also monitor a router's syslogs for security policy violations, log the security data, "kill" active TCP sessions, and dynamically manage a router's access control lists to shun intruders
- *Director*—The Director provides a map-based graphical interface that provides local, centralized or distributed management for up to hundreds of Sensors across a distributed network. The Director was developed to provide an operations-friendly, point-and-click interface for consistent response to security events. It can also perform other important functions: manage data through third-party tools, access a network security database, remotely monitor and manage Sensors, and send event information to a trouble-ticketing system, pager or e-mail to alert security personnel when security events occur
- *Post Office*—The Post Office is the communications architecture that provides robust, reliable, and efficient communications between Cisco Secure IDS Sensors and Cisco Secure IDS Directors. All communication is supported by a proprietary, connectionless-based protocol that can switch between alternate routes to maintain point-to-point connections

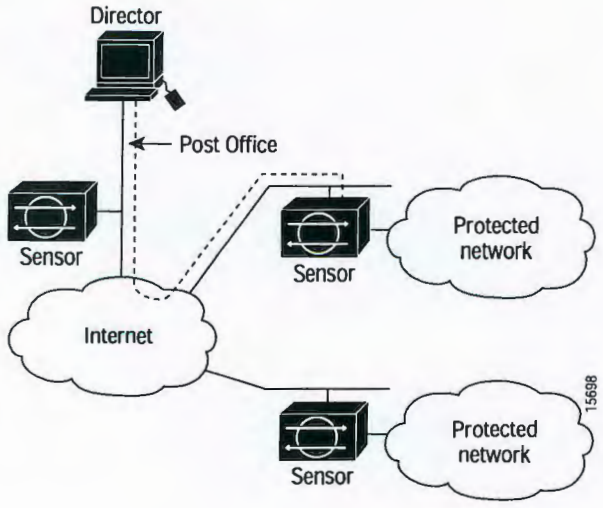
Fls: 1280
Doc: 3701

The relationship between these components is illustrated in Figure 1.

Figure 1 Cisco Secure IDS System Overview



Sensor Capabilities

The capabilities of the Sensor are best described as the following:

- Network sensing
- Attack response
- Device management

Network Sensing

Network sensing involves the real-time intrusion detection monitoring of network packets and syslog data from Cisco routers. The Cisco Secure IDS intrusion detection process captures and analyzes network packets. It not only analyzes single packets, but it retains state on user sessions to detect multiple packet attacks and packet content string matches. The Sensor captures network packets with one of its own interfaces, then reassembles and compares this data against a rule set that indicates typical intrusion activity.

The high performance of the Sensor allows it to scan nearly every packet on a network segment. Therefore, the user is not required to create profiles and omit signatures, which entails constant and extraordinary knowledge of the network to ensure that the correct attack signatures are enabled.

When the Cisco Secure IDS analyzes network data, it looks for patterns of misuse. Patterns can be as simple as an attempt to access a specific port on a specific host, or as complex as sequences of operations distributed across multiple hosts over an arbitrary period of time. The first type of pattern is termed an atomic pattern; the second, a composite pattern.

The Cisco Secure IDS searches for patterns of misuse by examining either the data portion or the header portion of network packets. Content-based attacks derive from the data portion, and context-based attacks derive from the header portion. Table 1 illustrates examples of the types of attacks and patterns that Cisco Secure IDS detects.

Table 1 Types of Patterns and Attacks

	Pattern	
Attack	**Atomic**	**Composite**
Context (header)	• Ping of death • Finger	• Port sweep • SYN attack • TCP hijacking
Content (data)	• MS IE attack • E-mail attacks	Telnet attack

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1201
Doc: 3701

Copyright © 1998 Cisco Systems, Inc. All Rights Reserved.

Another way to look at methodology besides content and context attacks, is via the Cisco Secure IDS's sophisticated and effective "three-tier" attack detection capability. Examples include:

- Named attacks —Single attacks that have specific names or common identities
  - Smurf
  - PHF
  - Land
- General Category attacks—Attacks that keep appearing in new variations with the same basic methodology
  - Impossible IP Packet
  - IP fragmentation
- Extraordinary attacks—Extremely complicated or multi-faceted attacks
  - TCP hijacking
  - E-mail spam

The sophistication of the Cisco Secure IDS's expert system attack detection allows it to detect General Category attacks on-the-fly even as hackers launch new variations to fool security systems. For example there are now many variations of the original named "Land" attack which [illegible] all variations of the general category "Impossible IP Packet." So even as more variations evolve, over time the general category signature will detect them. This attack database is managed, tested, and upgraded by a specialized team that includes some of the industry's most experienced security professionals.

Because a busy network environment can create false positive alarms, the Cisco Secure IDS Sensor can be fine-tuned on a device-by-device basis. For example, if a network management system was constantly creating alarms while pinging the network, the Cisco Secure IDS can be fine-tuned to ignore the specific alarm from that specific address. This capability would not compromise network security because the Cisco Secure IDS would still recognize any other alarms from that address.

Custom Signatures

Users can create custom attack signatures from the Director. These string matching signatures can be used to create a defense for specific new attacks or to detect information unique to the user's environment. For example, the user may be concerned that users are sending unsecured "proprietary" documents across the Internet. A signature can be created to detect all instances of the word "proprietary."

Attack Response

After it detects an attack, a Sensor can respond in the following user-configurable ways:

- Generate an alarm. Alarms are generated by the Sensor, and are typically routed to one or more remote Director systems.
- Log the alarm event. All Sensor log data is written to flat files, which are either event logs or IP session logs.
- Record the session to an IP session log to either gather evidence or an unlawful activity or to record an intruder's knowledge of the network. This capability is commonly used in conjunction with a "fishbowl" or "honeypot" technique where an intruder is vectored into a "safe" network or server that impersonates important applications or information.

Note: IP session logs are written only when a certain event or events occur (for example, a connection request from a specific IP address, or detection of a string such as "Confidential"). When these types of conditions are met, the Sensor can be configured to write every incoming and outgoing packet to an IP session log for a predefined period of time.

- Event logs are continually active, and they can contain alarm, command, and error entries.

Note: Both event and IP session information can be logged locally on a Sensor system as well as remotely on Director systems; exactly what information is sent and where it is sent depends on how each Sensor system is configured.

- "Kill" the session by resetting TCP connections. The Sensor can reset individual TCP connections after an attack to eliminate the threat. Communication between all other connections continues, thereby decreasing the likelihood of denial-of-service problems that can occur after shunning TCP-based attacks.
- Shun the attack and deny network access. This option includes using the Device Management feature described in the next section. Shunning an attack involves reconfiguration and reloading of the security filters or access control list (ACL) of a Cisco router. This type of automated response by the Sensor should be configured only for attack signatures with a low probability of false positive detection, such as an unambiguous SATAN attack. A shun can also be manually executed from the Director system in response to an attack or suspicious activity.

Note: Shunning requires careful review before it is deployed, whether as a set of automatic rules or operational guidelines for staff. In case an alarm is generated from a critical host or network, the Cisco Secure IDS can be configured to never shun that host or network. This safety mechanism prevents denial-of-service attacks using the Cisco Secure IDS infrastructure.

Device Management

Device management is a product feature that allows the Sensor to dynamically reconfigure the ACLs on a Cisco router to shun the source of an attack in real time. This capability greatly enhances the ability of the Sensor to secure a network from external and internal threats and gives the user extensive reach to stop misuse network-wide.

The Sensor (illustrated in Figure 1-2) uses one of its network interface cards (NICs) to monitor traffic, and another interface to execute commands and communicate with the router. This scenario allows the Sensor to dynamically update the ACLs on the router in response to traffic that enters the network.

Currently, the Sensor is packaged to support Ethernet, Fast Ethernet, Token Ring, and FDDI monitoring interfaces. It is important that the Sensor be used on a promiscuous mode hub and not on a switched hub. If used on a switched hub, the Sensor can only "see" traffic if the switch supports a monitoring or Switched Port Analyzer (SPAN) port. The command interface is always Ethernet.

Router Syslog Monitoring

With over two million Cisco routers installed around the world, the ACL is the most prevalent security mechanism used on networks. Because they are used to enforce policy, the Cisco Secure IDS Sensor can monitor their system logs for policy violations and send alarms to the Director.

Figure 2 Example Sensor-Network Device Deployment

Director Capabilities

The Director provides centralized command and control over the Sensors in an organization's network. The software-based Director includes installation wizards for fast and complication-free installation. From a capabilities perspective, a Director monitors and manages Sensors, collects and analyzes network security data, downloads new attack signatures, and facilitates user operation. The Director does not feature onboard reporting, because this could compromise its ability to process critical attack information; consequently, data is exported to third-party database and reporting systems.

Network Security Database

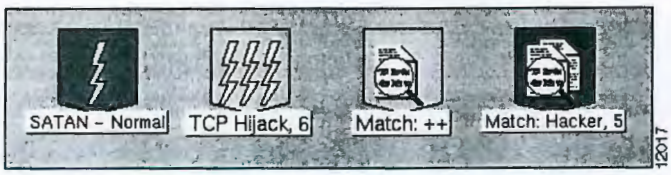
The Director uses a map-based, color icon method of displaying alarms, allowing the user to drill down and pinpoint the exact alarm and analyze its threat potential. The HTML-based Network Security Database is available on the Director to provide an attack description, possible countermeasures, and can be customized to include the specific response procedures for the organization. This scenario ensures response consistency despite staff and shift changes.

Sensor Monitoring

The Director displays real-time security information sent to it by Sensors. This information is presented via icons drawn on one or more network security maps.

Director arranges icons into hierarchical security maps based on the Network Node Management (NNM) user interface of HP OpenView. Users can double-click on an icon to view the next lower "submap" in the hierarchy. The bottom layer of the submap hierarchy contains Alarm and Error icons, as illustrated in Figure 3.

Figure 3 Sample Director Alarm Icons



Each icon, whether it represents a Machine, an Application, or an Alarm, has a state, which is expressed in the form of textual and graphical attributes. The most visible indication of an icon's state is its color. These colors represent states and alarm levels, which are defined in Table 2.

Table 2 Icon Color, State, and Default Alarm Level

Icon Color	Icon State	Default Alarm Level
Green	Normal	1
Yellow	Marginal	2–3
Red	Critical	4–5

An icon's color propagates upward through the submap hierarchy. For instance, an Alarm icon that is defined as "Critical" is red. The application that generates a red alarm will turn red to match the Alarm; in turn, the machine that owns the Application will also turn red.

Every icon in a Director hierarchy also possesses textual attributes, most of which are accessible by the user. Each type of icon (Machine, Application, Alarm) has a different set of attributes.

Sensor Management

The Director can remotely manage the configuration of services on a Sensor. The application responsible for Sensor management is nrConfigure. The signature configuration dialog of nrConfigure is shown in Figure 1-4. Configuring signatures on a remote Sensor is a key method for securing a network with the Cisco Secure IDS.

Sensor Installation

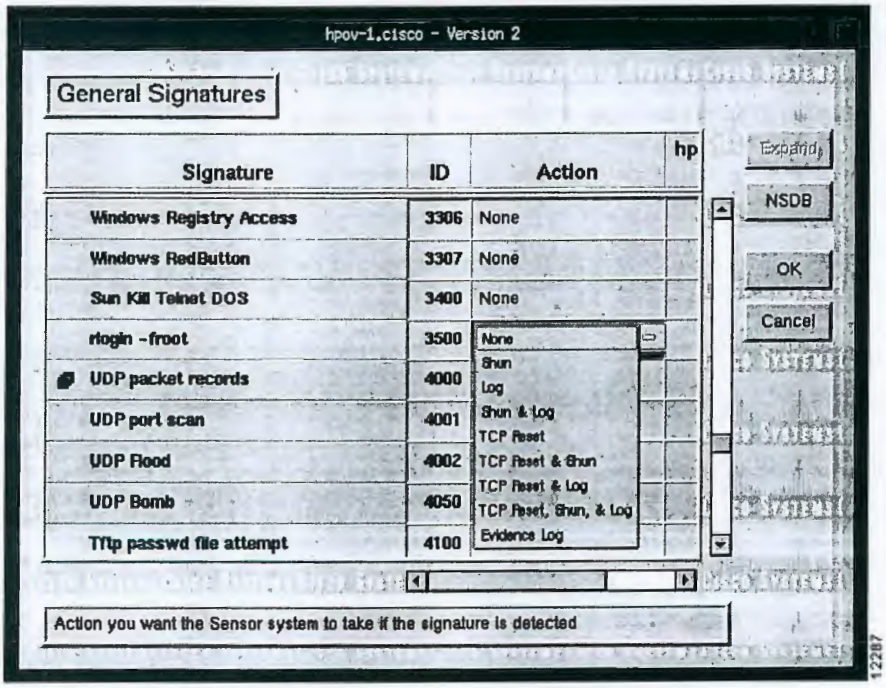
The Sensor can be quickly and easily installed by a technician and requires no special training. The Sensor is simply attached to the network and the technician enters basic network addressing information via a laptop computer. The Director is then programmed to look for the Sensor. When it establishes communications, the Sensor first downloads its configuration, which is stored in the Director's Configuration Librarian as SENSOR X, VERSION 1. The Sensor then begins exporting alarms and can receive commands from the Director. As the Sensor is reconfigured, each configuration is given a new version number.

The Sensor does not require specialized software licensing, and can be moved around the network at will.

Sensor Recovery

If a Sensor goes out of service, an alarm is immediately displayed by the Director. If it is determined that the Sensor has failed, a replacement Sensor can be delivered to the location and quickly installed. The configuration can be quickly restored via the Configuration Librarian in nrConfigure.

Figure 4 Managing Sensor Actions with nrConfigure



nrConfigure is a Java-based tool used for remote Sensor configuration and configuration file management. With this tool, a user can change the configuration files on a remote Sensor, and also manage versions of those configuration files. This functionality allows users to keep current as well as past configurations. At any point, nrConfigure allows a user to "roll back" a Sensor to a previous configuration. Users can easily replicate a specific configuration to one or more Sensors without having to individually configure each one.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1265
Doc: 3701

Copyright © 1998 Cisco Systems, Inc. All Rights Reserved.

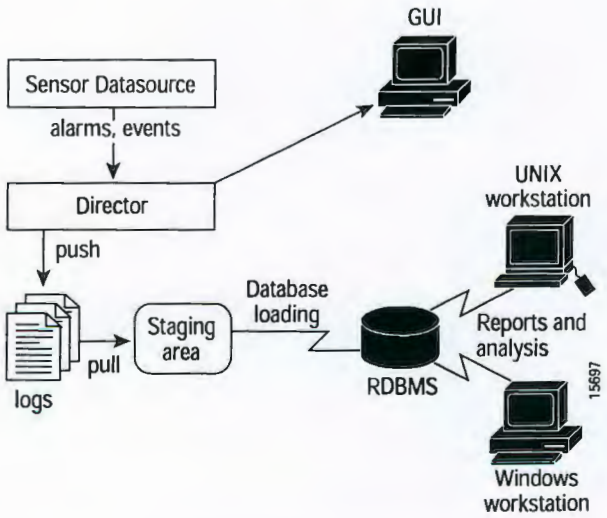
For any given version of a Sensor's configuration, nrConfigure allows users to make changes to the following types of information:

- Communications
- Data management
- Device management
- Director forwarding
- Event processing
- Intrusion detection
- System files
- Collection of Sensor Data

The Director can collect and stage Sensor data using a simple push-pull mechanism: the Cisco Secure IDS writes (pushes) the data into flat files, then stages (pulls) the data into a database. The entire process is illustrated in Figure 5.

Writing to intermediate flat files in this manner provides levels of fault tolerance and performance that cannot be achieved when writing directly to a database. Data throughput in a distributed application such as the Cisco Secure IDS is constrained only by the weakest link in the system. With Cisco Secure IDS's data collection process, data collection is not dependent on (or affected by) database availability or perf nce fluctuations.

Figure 5 Sensor Data Collection



The ctor currently ships with drivers for Oracle and Remedy. However, these drivers can also be configured to write to other databases, such as Sybase and Informix. Example scripts shipped with the Director show how the native bulk load tools of a database can be easily integrated into the Cisco Secure IDS.

The Director also includes a configurable file management capability that automatically archives event and IP logs, either on a Sensor or a Director. Sample file management profiles are provided for both Sensor and Director configurations.

Analysis of Sensor Data

The Director can also analyze Sensor data using third-party tools that provide relational database management, report writing, file management, and trouble-ticketing functionality.

As a foundation for custom reports, the Director includes a set of Sequenced Query Language (SQL) queries that can be easily customized or integrated into any third-party tools.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1266
Doc: 3701

Copyright © 1998 Cisco Systems, Inc. All Rights Reserved.

The third-party data analysis tools can be configured to support individual queries as well as predefined reports. For example, these tools can easily generate reports showing the following:

- All alarms of levels 4 and 5 occurring in the last 30 days
- A graph of Web server activity over the last 24 hours
- A table of all events in the last 30 days in order of increasing alarm levels

Support for User-Defined Actions

The Director can generate user-defined actions. A common action is to notify staff members via e-mail messages or feed data onto third-party devices, such as a printer or database management system. Support for multiple action scripts is also provided.

Post Office Capabilities

Cisco Secure IDS services and hosts communicate with one another through the Post Office, including communication between services on the same host as well as those across a network. All communication is based on a unique three-part address with Organization, Host, and Application identifiers, which uniquely identify each Cisco Secure IDS node.

The proprietary three-part addressing scheme of the Cisco Secure IDS has the following characteristics:

- It can be layered on top of existing network protocols.
- It allows for fault-tolerant connectivity across heterogeneous network architectures.
- It addresses a much larger domain than the current 32-bit IP protocol.

The three-part addressing scheme of the Cisco Secure IDS also serves as the basis for a point-to-point protocol that allows for up to 255 alternate routes between two hosts. This alternate routing protocol automatically switches to the next route whenever the current route fails. It also uses a system heartbeat to detect when a connection to the preferred route can be reestablished. A system error message is generated (and logged) whenever a connection goes down, and any packets that were lost during the state transition are resent.

Another feature that complements alternate routing is the ability to build hierarchies of Sensor and Director systems through the use of message propagation. Instead of broadcasting events from a Sensor onto multiple hosts, information can be sent to a single Director, which can then propagate packets onto other platforms defined in its local configuration files. Sensors can propagate messages to more than one Director, thereby ensuring fault-tolerant communication.

Figure 6 illustrates this concept through a simple hierarchy of Director machines.

In addition to providing performance benefits and fault tolerance, distribution hierarchies can simplify system management. For example, local Director machines might be responsible for monitoring from 9 A.M. to 5 P.M. and then transfer control onto a central Director every evening.

Figure 6 Director Hierarchy Based on Message Propagation

Cisco Secure Intrusion Detection System Architecture

Sensors, Directors, and the Post Office each have separate operational components, called daemons or services. Because each major Cisco Secure IDS function is accomplished by a separate service, the results are a security system that is fast, durable, and scalable.

The services, illustrated in Figure 7, are defined as follows:

- *sensord/packetd*—Both of these services provide intrusion detection. sensord is used when a Sensor is cooperating with a network device that supports copy_to/log_to functions (which sends copies of captured packets to the Sensor); packetd is used when the Sensor itself is capturing packets directly from the network.
- *Loggerd*—This service is the logging facility of the Cisco Secure IDS. It is responsible for writing error, command, and alarm entries to log files on the Sensor.
- *sapd* —This service provides data and file management. It is responsible for moving log files to database staging areas, off-line archives, and other routine processes to prevent file systems from filling up.
- *Postofficed*—This service handles communication between Cisco Secure IDS services and Cisco Secure IDS nodes. As illustrated in Figure 7, when sensord detects unauthorized activity, it signals postofficed; postofficed is then responsible for telling loggerd to start logging, alerting smid on the Director, and communicating orders to a router if the attack is to be shunned.
- *sm*—This service runs on the Director only, and is responsible for translating Sensor data into meaningful information for nrdirmap.
- *nrdirmap*—This service is responsible for displaying various symbols that represent machines, collections of machines, applications, alarms, and errors on the Director graphical interface.
- *eventd*—This service is responsible for maintaining user-defined event notification processes. Users can define what kinds of alarms or other events launch an action, usually an e-mail or pager notification.
- *configd*—This service provides a mechanism through which nrdirmap can interface with other services such as postofficed, sensord, and managed. In other words, commands on the graphical interface can be executed via the underlying configd service.

CHAPTER 6

Configuring Administrative Control Communications

Before Cisco Secure Policy Manager can manage a Managed Device, you must configure a Policy Distribution Point to communicate with that Managed Device. In addition, you must provide the administrative passwords and other connection information required to actually manage that Managed Device. This chapter focuses on the constraints that you must consider when defining the settings that enable this administrative traffic to flow across your network.

The following sections describe device-specific settings that you must configure before you can manage a Managed Device, as well as those settings that enable the generation and distribution of audit event messages, in the form of syslog data streams.

Policy Distribution Panel

The Policy Distribution Point panel is primarily an informational panel. It represents the Policy Distribution Point residing on a Cisco Secure Policy Manager server. The role of the Policy Distribution Point is critical to the operation of the security system. From this panel, you can disable the Policy Distribution Point, which prevents this host from generating and distributing commands to any Managed Devices residing on your network. You can also enable previously disabled Policy Distribution Points.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1271
Doc: 3701

Learn More About Policy Distribution Points

Within the Cisco Secure Policy Manager system, the Policy Distribution Point plays a critical role. This component performs the following tasks:

- It discovers a subset of the existing configuration settings for the Managed Devices that it controls.
- It accepts the intermediate network policies from the Policy Server Point.
- It acts as a distributed component of the security system that *generates* command sets. It translates the intermediate policies into device-specific command sets for each Managed Device that it controls.
- It acts as a distributed component of the security system that *publishes* command sets. It publishes the appropriate generated device-specific command set to each Managed Device that it controls.
- It acts as a distributed component of the security system that *provides feedback* to the system and user. It queries each Managed Device that it controls about the device's status with respect to publishing and discovery attempts, including successes and problems during a publishing attempt and connection problems during discovery.

These command sets can be published securely using secure protocols, such as PIX Secure Telnet, or the Policy Distribution Point can use an IPSec tunnel to publish the command sets securely to the Managed Devices that it controls.

Because each type of Managed Device has its own *control* agent within the Policy Distribution Point component, a Policy Distribution Point can control more than one Managed Device type and multiple Managed Devices of a specific type. For example, a single Policy Distribution Point can control three IOS routers and four PIX Firewalls if configured to do so. However, in scenarios where a Policy Distribution Point controls more than one Managed Device, it is critical to consider the placement of the primary server or secondary server on which the Policy Distribution Point resides in relation to the Managed Devices that you want it to control. In addition, some Managed Devices have restrictions with respect to which interface(s) in the device can be used to configure them. In such cases, considering the limitations of the Managed Device can also help you determine the correct placement of Policy Distribution Points on your network.

Because the Policy Distribution Point component is installed on all Cisco Secure Policy Manager hosts, you can always alter the way that you want to configure your distributed security system. Just as you can enable or disable a Policy

Monitor Point for use as a valid option in configuring your security system, you can also enable or disable a Policy Distribution Point. Cisco Secure Policy Manager uses the selection of a Policy Distribution Point to ensure that the communication between a selected Policy Distribution Point and the Managed Devices that it controls are permitted. The security policies and IPSec Tunnel Groups that enable these communications are automatically generated and maintained by Cisco Secure Policy Manager.

Guidelines for Deploying and Selecting a Policy Distribution Point

The design of your security system deployment should focus on reducing the time required to generate and publish command sets to the Managed Devices residing on your network, as the publishing act temporarily prevents the Managed Device from passing traffic. In addition, this design should focus on quickly monitoring data streams about network activity and detecting and notifying the proper personnel of potential security problems.

You can resolve many issues that can affect your ability to deploy network security policies to Managed Devices by carefully planning the placement of Policy Distribution Points within your network. The benefits of careful planning and placement include the following:

- Administrative connections to the Managed Device are guaranteed by the security policies that are generated by Cisco Secure Policy Manager to enable these connections.
- Connections to Managed Devices are not lost because of changes to the active command set during the publishing operation.
- Distribution of the command sets to the Managed Devices is more secure and the distribution time is reduced.

Because you can have more than one Policy Distribution Point on your network, you must consider the selection of a Policy Distribution Point on a per-Managed Device basis. The best way to make this selection is to understand the scenarios that can be problematic with regard to command distribution and to understand the effects of device-specific changes that you want to make after the initial deployment.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1272
Doc: 3701

Selecting a Policy Distribution Point

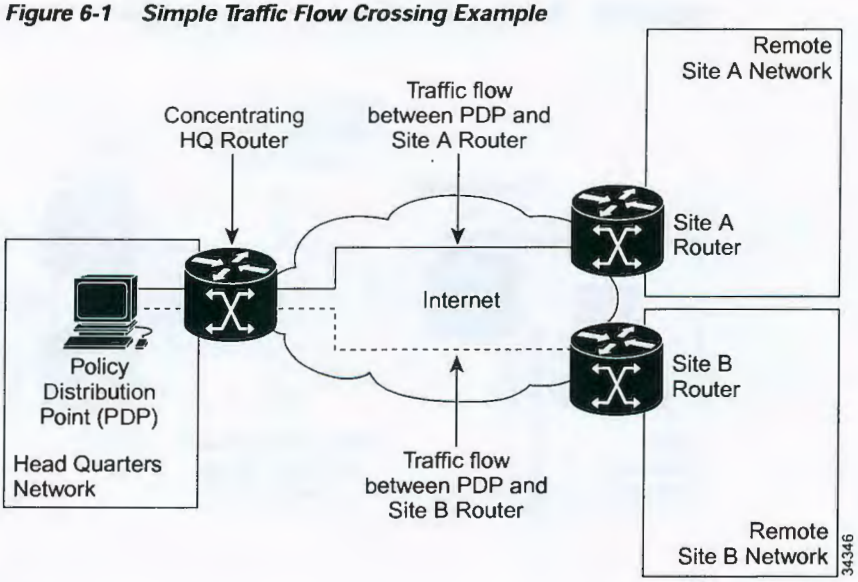
You should not arbitrarily select the Policy Distribution Point to control a Managed Device. When you define global network policies, it is possible in scenarios where you are controlling multiple Managed Devices to effect changes that temporarily disable the required communications between the Policy Distribution Point and one or more Managed Devices that it controls.

The first thing to determine when selecting a Policy Distribution Point is the traffic flows for the communications that occur between the Policy Distribution Point and all the Managed Devices that it controls. Next, you must consider the other Policy Distribution Points on your network and their required traffic flows. It is imperative that these traffic flows do not cross.

When such traffic flows cross, they can only cross at a gateway object, which is referred to as a *concentrating gateway object* for the remainder of this discussion. If that concentrating gateway object is a Managed Device, it identifies a possible point of failure in the publishing of command sets, as the policies managing that gateway object can be altered as well. Since concentrating gateway objects represent points along the path between one or more Managed Devices and a Policy Distribution Point, these concentrating gateway objects can potentially be updated before the farther Managed Devices are provided with command sets that reflect the changes on the concentrating gateway object. This case is most likely to occur if you have enabled automatic publishing of the command sets by selecting Automatic under Command Approval in the Options dialog box (available on the Tools menu) or in the Command panel of a specific Managed Device.

The following example presents a simple topology that identifies crossing traffic flows from a single Policy Distribution Point.

Figure 6-1 Simple Traffic Flow Crossing Example

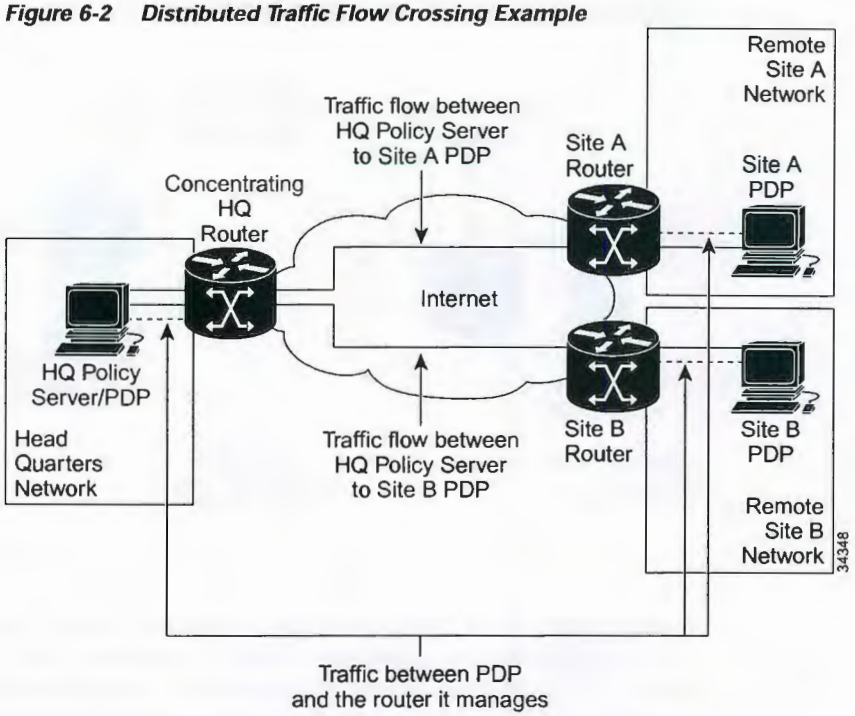


In this example, the HQ Router acts as a concentrating gateway object when the Policy Distribution Point attempts to publish the generated command sets to the routers on Site A or Site B. Therefore, the only way to ensure that the traffic flows to the Site A and Site B routers are not broken is to publish to those outermost Managed Devices *before* you publish to the HQ Router.

You can also have crossing traffic flows in topological scenarios that have multiple Policy Distribution Points, as illustrated in the following example.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1273
Doc: 3701

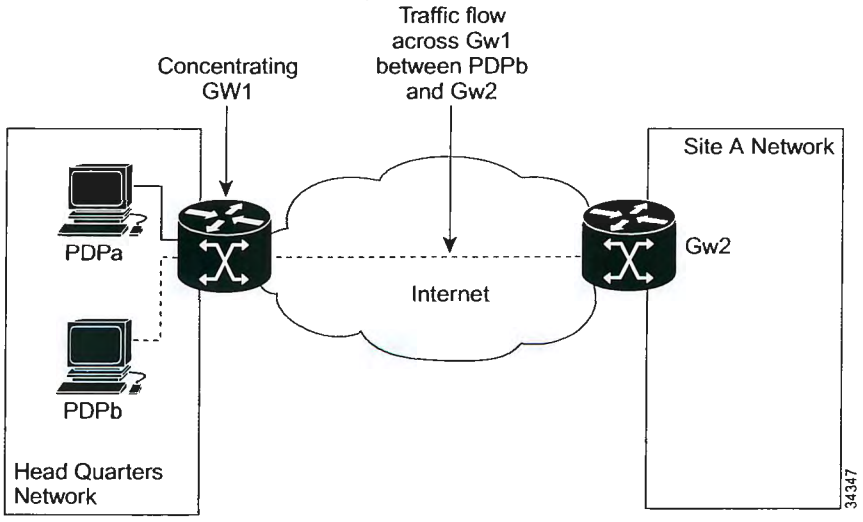
Figure 6-2 Distributed Traffic Flow Crossing Example



In this case, the traffic flows that you must protect against being terminated are the traffic flows between the primary servers and the secondary servers of Cisco Secure Policy Manager. This problem only arises in scenarios where you have a distributed installation type for Cisco Secure Policy Manager.

A third, and unsupported, traffic flow crossing also involves a distributed installation scenario. In this case, two or more Policy Distribution Points publish to different Managed Devices, and one of the Managed Devices acts as the concentrating gateway object. The following example illustrates this crossing traffic flow.

Figure 6-3 Distribution of Two Policy Distribution Points Across a Concentrating Managed Device



In such cases, Cisco Secure Policy Manager does not support the intelligent synchronization of command distribution across such concentrating gateway objects. In this configuration, PDPa is oblivious to the needs of PDPb during the time that PDPb is publishing the generated command set for Gw2. As a result, PDPa could publish command sets that disrupt or disable the ability for PDPb to publish command sets to Gw2.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1274
3701
Doc:

Avoiding Losses of Connectivity between a Policy Distribution Point and a Managed Device

When defining your network topology and making modifications to the Managed Devices on that network, you must also consider the device-specific settings that affect the traffic flows. The following device-specific settings are of particular concern:

- **Administrative interface and IP address changes on a Managed Device.** If you specify a different administrative interface or modify the IP address used for the administrative interface at any time after your initial configuration, you must define a special security policy that enables the old interface to be used to issue the entire command set (because the connection may be lost in the middle once the new interface is configured).
- **Administrative password.** If you specify a different administrative password, such as an enable password, using the Pending Commands option in the Command panel on a Managed Device or using a third-party administrative interface, you must make the corresponding change in the Control panel of the Managed Device in the GUI client before you can publish a new command set to the Managed Device.
- **IP address changes on Cisco Secure Policy Manager hosts.** Any time that you change the IP address used by a host running some component of Cisco Secure Policy Manager or select a different Policy Distribution Point to control a Managed Device (which is effectively a change in the IP address used to manage the Managed Device), you jeopardize the ability of the system to actually publish the command sets to a Managed Device. These addresses are best defined as static IP addresses (not leased via DHCP), and they are best left unmodified.

  If you do modify the IP address that Cisco Secure Policy Manager uses to publish the commands to a Managed Device (the address in the Control panel) or if you select a different Policy Distribution Point to manage a specific Managed Device, you must define an intermediate security policy that allows the network service selected in the Control panel to enable both the old and the new IP addresses. Otherwise, the connection to the Managed Device is broken while the Policy Distribution Point is publishing the command set that changes from the old address to the new address.

- **Routing rules.**Cisco Secure Policy Manager automatically derives the routing rules required to ensure that traffic flows between Policy Distribution Points and the Managed Devices that they manage. If you override a derived routing rule or disable the generation of derived routing rules, you can accidentally cut off the routes used by these required communications.
- **Path restriction rules** (flow restrictions). You must ensure that the traffic flows required for Policy Distribution Point-to-Managed Device communications are not prevented in either direction by a path restriction rule defined on a gateway object.
- **Address hiding and static translation rules on Managed Devices.** You should never define an address hiding rule for a Policy Distribution Point. If you must translate the IP address of a Policy Distribution Point, you must define a one-to-one static translation rule. Any changes to the one-to-one mapping rule have the same effect as modifying the IP address of the Policy Distribution Point. Therefore, you must define a temporary security policy for each Managed Device managed by the Policy Distribution Point that allows that Managed Device to accept the network service used to publish command sets from both the old and new alias addresses of the Policy Distribution Point. For more information on defining these temporary security policies, see the "Learn More About Managed Devices" section on page 6-12.
- **Address hiding and static translation rules on unmanaged gateway objects.** Mapping rules defined on unmanaged gateway objects along a traffic flow between a Managed Device and its Policy Distribution Point translate the IP addresses used to manage the communication and disrupt the traffic flow. You cannot define address translation rules that affect the addresses used for such communications. Therefore, we strongly recommend that you do not define a mapping rule (or have any form of NAT) defined on an unmanaged gateway object residing between your Policy Distribution Point host and the Managed Devices that it manages.

  Unmanaged gateway objects that reside between any Managed Devices and Policy Distribution Points within your Network Topology tree definition cannot have any form of address translation being performed on these unmanaged gateway objects if either the Managed Device or Policy Distribution Point resides upstream from them. Unmanaged gateway objects matching this configuration will guarantee that the generated command sets derived for gateway objects that are managed by Cisco Secure Policy Manager are incorrect. These network services include the network services required for Policy Distribution Point-to-Managed Device communications.

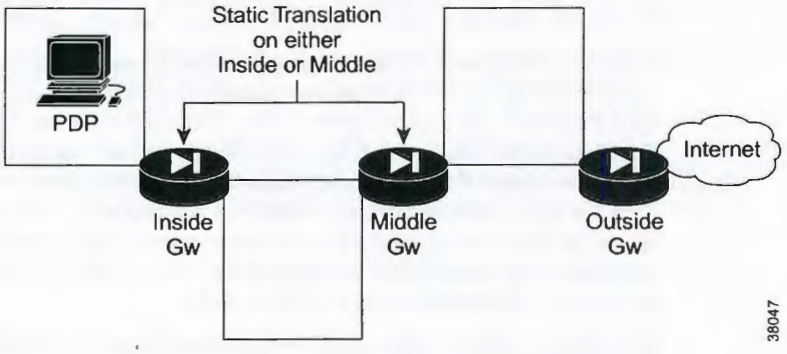
RQS Nº 03/2005 - CN
CPMI - CORREIOS
1275
Fls:
Doc: 3701

Publishing Generated Command Sets: Ordering Restrictions Example

You can construct network topologies for which you should not use automatic command distribution. The problem lies in the order that command sets are downloaded to various Managed Devices. The problem occurs when a Cisco Secure Policy Manager server attempts to publish command sets to an external Managed Device from behind an internal Managed Device that translates the server's real address. In some cases, the automatically downloaded command sets can fail and prevent the download of generated command sets to some Managed Devices in the topology.

The following example assumes that you have a network topology in which you have defined three Cisco Secure PIX Firewalls (called Outside Gw, Middle Gw, and Inside Gw in this example) and that the Cisco Secure Policy Manager host (PDP) that distributes command sets to each of these Managed Devices resides upstream from Inside Gw. Now assume that you have defined a mapping rule on either Middle Gw or Inside Gw that performs a one-to-one static translation for the addresses of PDP.

Figure 6-4 Three PIX Firewall Distribution Ordering Restriction Example



Warning **You cannot define address hiding rules that hide Cisco Secure Policy Manager hosts from the Managed Devices that they are expected to manage. Defining such rules guarantees that the device-specific command sets cannot be published to the Managed Devices for which Cisco Secure Policy Manager is responsible.**

In this case, if you distribute the commands to Inside Gw or Middle Gw before you distribute them to Outside Gw, Outside Gw becomes unreachable by PDP. Even though the command set generated for Outside Gw understands the static translation rule, the command set to be replaced does not. Therefore, Outside Gw does not know to allow administrative updates from the translated PDP address.

Note The automatic command distribution to Outside Gw fails only when a change to the mapping rules occurs on Inside Gw or Middle Gw. In other words, it can occur when you add, delete, or modify an existing mapping rule for the Cisco Secure Policy Manager host, PDP. Once you use the manual distribution method to change the mapping rules, you can return to the automatic distribution method until a similar change occurs.

In this example, if the address of the PDP is not translated on any Managed Devices or it is translated only on Outside Gw, automatic updates would work fine, because in that case order does not matter.

Enabling/Disabling the Policy Distribution Point

You can enable or disable a Policy Distribution Point that resides on a primary or secondary server. If you enable a previously disabled Policy Distribution Point, you can use it to generate and publish device-specific command sets to the Managed Devices on your network. However, if you disable a Policy Distribution Point, you can no longer use it to generate and publish device-specific command sets to any Managed Devices on your network. In fact, a disabled Policy Distribution Point is not a valid option for the Policy Distribution Point box in the Control panel of the Managed Devices that are managed by Cisco Secure Policy Manager.

To enable or disable the Policy Distribution Point, follow these steps:

Step 1 Right-click the **primary server** icon or the **secondary server** icon that represents the server on which the Policy Monitor Point is running.

Step 2 To view the **Policy Distribution** panel, point to **Properties**, and then click **Policy Distribution** on the shortcut menu.

Result: The Policy Distribution panel appears in the View pane.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1276
Doc: 3701

Step 3 To change the availability of the Policy Distribution Point running on this host, select or clear the **Disabled** box under **General Settings**.

When this box is selected, the Policy Distribution Point is disabled. When the box is cleared, the Policy Distribution Point can be used to generate and publish command sets to the Managed Devices residing on your network.

Step 4 To accept your changes and close the selected panel, click **OK**.

Step 5 To save any changes that you have made, click **Save** on the **File** menu.

Control Panel

From the Control panel, you can identify those hosts running the Policy Distribution Point, Policy Monitor Point, and syslog servers that you want to use to control and monitor this Managed Device. You can specify the Telnet and enable passwords required to administer this Managed Device. You can also view the settings for the associated network service (TCP or UDP port) that administrative clients use to communicate with the Managed Device and whether you want to use an IPSec tunnel to encrypt such communications.

Caution If you modify the IP address that Cisco Secure Policy Manager uses to publish the commands to a Managed Device (the address in the Control panel), you must define an intermediate security policy to allow the network service selected on the Control panel to that enables both the old and the new IP addresses. Otherwise, the connection to the Managed Device is broken while the Policy Distribution Point is publishing the command set that changes from the old address to the new address.

Learn More About Managed Devices

The Control panel organizes the configuration settings about communications that occur between a Managed Device and two other types of network objects: Cisco Secure Policy Manager hosts and third-party syslog servers. This Managed Device represents a gateway object over which you have administrative control, and one on which you can use Cisco Secure Policy Manager to enforce global

network policies. A Managed Device accepts commands generated by a Managed Device control agent that resides on either the primary server or a secondary server on which the Policy Distribution Point for the Managed Device resides.

The first setting that you can review is the network service used for communications between the Managed Device and a Cisco Secure Policy Manager host that is acting as the Policy Distribution Point for this Managed Device. By default, for a PIX Firewall, this network service is PIX Secure Telnet, defined as TCP port 1467. For an IOS router, this network service is Telnet, defined as TCP port 23. For an IDS sensor, this network service is postoffice, defined as UDP port 45000. Currently, you cannot reconfigure the port settings associated with these network services. In addition, these network services are the only network services that are valid for downloading network policies to the respective Managed Device.

As part of this general setting, you can specify which IP address, and therefore which interface, should be used to accept communication requests from Cisco Secure Policy Manager hosts.

Note For Managed Devices based on the 4.2.4, 4.2.5, and 4.4.1 versions of the PIX Firewall software, you must specify a Policy Distribution Point that resides upstream from the "inside" interface. This Policy Distribution Point server does not have to reside on the same network, but for security purposes, it must be reachable from the inside interface. In addition, you can use only the PIX Secure Firewall network service to manage the PIX Firewall.

For Managed Devices based on the 5.0 and 5.1 versions of the PIX Firewall software, you must specify a Policy Distribution Point that resides upstream from any interface, except for the "outside" interface. This Policy Distribution Point server does not have to reside on the same network, but for security purposes, it must be reachable from a non-outside interface. In addition, you can use only the PIX Secure Firewall network service to manage the PIX Firewall.

For Managed Devices based on the 5.1 version of the PIX Firewall software, you can specify a Policy Distribution Point server that resides downstream from the "outside" interface using PIX Secure Telnet that is passed through an IPSec tunnel. In other words, you must define an IPSec Tunnel Group definition that has the Policy Distribution Point and the outside interface address of the PIX Firewall as peers in that definition.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1287
Doc: 3701

In any release of the product, Cisco Secure Policy Manager does not support the basic Telnet network service for management of the PIX Firewall.

Next you must specify which Cisco Secure Policy Manager host is responsible for generating and publishing the command sets to the Managed Device. In addition to specifying which host will publish the generated command sets to the Managed Device, you can specify whether you want to encrypt all communications that occur between the Managed Device and the host acting as its Policy Distribution Point. You can define an IPSec tunnel between the Policy Distribution Point and the Managed Device, as well as specify the IPSec Tunnel Template you want to use when defining the IPSec Tunnel Group that supports this communication.

However, modifying the settings of an IPSec Tunnel Group used for Policy Distribution Point-to-Managed Device communications can disable the communications. For more information on how to modify such an IPSec Tunnel Group, see the "Notes for Defining Policy Distribution Point-to-Managed Device Tunnels" section on page 6-14. For guidance on selecting the Policy Distribution Point that will control a Managed Device, see the "Learn More About Policy Distribution Points" section on page 6-2.

Notes for Defining Policy Distribution Point-to-Managed Device Tunnels

The tunnel group that supports this communication, as well as the security policy abstract that enables the tunnel and permits communications between the Managed Device and the Cisco Secure Policy Manager host acting as its Policy Distribution Point, is automatically created and applied to the Cisco Secure Policy Manager host within the Cisco System Folder of the IPSec Tunnel Groups and Security Policy Enforcement branches under the Network Policy tree.

We also recommend that you never reuse an IPSec template that is used for the Policy Distribution Point-to-Managed Device traffic. Instead, you should make copies of the template before you modify any settings. This recommendation exists because if you change any properties of this IPSec template, it would result in the generation of a modified IPSec bootstrap command set for any Managed Devices managed by the Policy Distribution Point for which you modified the template properties.

If you do modify the template used to manage a Managed Device, all attempts to publish the generated command sets to the Managed Devices will fail and the following warning message will appear for each affected Managed Device in the System Inconsistencies panel when you perform a Save and Update operation:

- (ire) Action(s) required: Change bootstrap settings with new PDP-PEP IPSec tunnel settings, then click Approve to publish. (signature=#)

To resolve this warning message, you must manually update the IPSec bootstrap settings for each affected Managed Device (using a non-Cisco Secure Policy Manager administrative interface). After these settings are updated for each affected Managed Device, these warning messages will be resolved when the command sets are published to each Managed Device.

If you accidentally modify this IPSec template, you can perform a Reset operation. You will still receive the warning message identified above; however, this message will be resolved when you publish the generated command set to the affected Managed Device, because the IPSec bootstrap settings have already been defined to resolve this issue.

As a general rule, any modifications to either tunnel peer affects the IPSec bootstrap settings, and, therefore, requires that you manually update the IPSec bootstrap settings for the Managed Device acting as a peer in the generated IPSec Tunnel Group definition under the Cisco Systems Folder of the IPSec Tunnel Groups branch. Examples of such changes include the following:

- Specifying a new Policy Distribution Point for the Managed Device
- Specifying a new IP address for use as the management address for a Managed Device
- Defining a one-to-one static translation for the Policy Distribution Point
- Modifying any interface settings of the Managed Device

Understanding the Policy Distribution Point's Role When Controlling the Managed Device

This section explains the role of the Policy Distribution Point in more detail, and it provides guidelines for selecting the Policy Distribution Point to use for a particular Managed Device. This choice should not be made arbitrarily, because it can affect the ability of Cisco Secure Policy Manager to publish command sets to multiple Managed Devices.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1278
Doc: 3701

Caution If you modify the IP address that Cisco Secure Policy Manager uses to publish the commands to a Managed Device (the address in the Control panel), you must define an intermediate security policy that allows the network service selected in the Control panel to enable both the old and the new IP addresses. Otherwise, the connection to the Managed Device is broken while the Policy Distribution Point is publishing the command set that changes from the old address to the new address. However, you must be especially careful when using mapping rules on the intermediate Managed Devices. For more information on the allowed uses of mapping rules on intermediate Managed Devices, see the "Caution: Using Mapping Rules that Effect Policy Distribution Point Traffic" section on page 6-18.

By default, all communications between the Policy Distribution Point and a PIX Firewall are encrypted using the PIX Secure Telnet network service. However, you can use an IPSec tunnel to encrypt all communications between a Policy Distribution Point and any Managed Device, assuming that the Managed Device supports IPSec tunnels and that the Cisco Secure Policy Manager host acting as the Policy Distribution Point has the Cisco Secure VPN Client software installed and operational. However, if you chose to enable IPSec tunnels for these communications, all administrative clients that you use to connect to the Managed Device must also support IPSec. In addition, you will have to define an IPSec Tunnel Group for those communications and define security policies that permit IPSec-based communications between each administrative client and the Managed Device.

The Control panel also enables you to specify those passwords that are required to administer the Managed Device. For each PIX Firewall, you must specify the enable password. For an IOS router, you must specify both the Telnet and enable passwords. The Policy Distribution Point uses these passwords to authenticate to the Managed Devices before it downloads the derived network policies.

Note You cannot change these passwords in the Control panel. Instead, you must use the Pending Commands option in the Command panel to change these passwords.

While each Managed Device has only a single Policy Distribution Point, you can specify that you want one or more remote hosts to receive the syslog data streams generated by the Managed Device. These hosts can either be a Cisco Secure

Policy Manager host that is acting as a Policy Monitor Point or another host that runs a syslog server. You can select only one Policy Monitor Point, and as many syslog servers as you want.

Note The current release of Cisco Secure Policy Manager does not automatically generate the security policies required to permit this syslog traffic to traverse Managed Devices. You must manually define and apply any security policies required to enable the traversal of such traffic across a Managed Device. If the target syslog server resides on a network that is directly connected to an interface on the Managed Devices, Cisco Secure Policy Manager does generate the command set that is required to ensure that the syslog data streams are sent to that syslog server.

Tips If you chose to send the syslog data streams to a host that runs a third-party syslog server, you must also define that host in the Network Topology tree and add the syslog client/server product type to that host.

By studying and recording audit records based on syslog data streams, the Policy Monitor Point enables you to generate and view reports about network and device activity, as well as generate e-mail and pager-based notifications about specific activities. However, you are not required to specify that you want a Cisco Secure Policy Manager host to monitor these data streams. You can also specify that you want to distribute these data streams to other hosts that run syslog servers. Many administrators use such syslog servers to study audit records for particular usage patterns, and they often run additional scripts to study network activity and generate usage and departmental billing statistics.

Tips Because syslog data streams use UDP and because of the high volume of data that a Managed Device can generate, we strongly recommend that you locate your Policy Monitor Point on the network directly attached to an inside interface of the Managed Device. For very high volume Managed Devices, we recommend that you dedicate a small DMZ network for monitoring purposes. You can do this using an internal router or switch or by installing an additional interface in the Managed Device and attaching the DMZ network directly to

RQS Nº 03/2005 - CN - CPMI - CORREIOS
1279
Fls:
Doc:

the Managed Device. This configuration prevents you from flooding your networks with UDP packets and offers a more reliable connection for syslog data.

Caution: Using Mapping Rules that Effect Policy Distribution Point Traffic

If you define a static translation rule for a Policy Distribution Point, you can cause a temporary command set publishing problem. The problem results because the connection to the Managed Device is broken once the new command set is published to the Managed Device because it effectively changes the address of the Cisco Secure Policy Manager host by which the current command set is being published.

In this case, you have two possible solutions to resolve this temporary problem:

1. Define a temporary policy that allows the administrative network service from the old Policy Distribution Point address to the administrative network interface in the Managed Devices that use that Policy Distribution Point. You only need to define the policy to allow the old IP address because the policy that allows the new IP address is automatically generated and applied in the Cisco System Folder. After you publish the command sets, remove the temporary policy and regenerate/publish the command sets.
2. Another approach is to use the Prologue option in the Command panel for the affected Managed Devices to specify that you want to accept administrative connections manually from the old IP address. After you publish the command sets, you can remove the line and republish.

Task List for the Control Panel

You can perform the following tasks from the Control panel. For step-by-step procedures on performing a specific task, see the corresponding section.

- "Modifying the IP Address Setting used to Manage the Managed Device" section on page 6-20
- "Selecting the Policy Distribution Point that Manages a Managed Device" section on page 6-22
- "Requiring that a Managed Device Use an IPSec Tunnel for Administration" section on page 6-22
- "Selecting the Policy Monitor Point Associated with a Managed Device" section on page 6-24
- "Selecting the Syslog Servers Associated with a Managed Device" section on page 6-24
- "Specifying the Enable Password used to Administer a Managed Device" section on page 6-25
- "Specifying the Telnet Password used to Administer a Managed Device" section on page 6-26

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1280
Doc: 3701

- "Viewing the Associated Network Service on a Managed Device" section on page 6-27
- "Viewing the TCP Port used by the Managed Device for Administrative Purposes" section on page 6-27

Modifying the IP Address Setting used to Manage the Managed Device

You can specify the IP address that a Cisco Secure Policy Manager host acting as a Policy Distribution Point uses to contact the Managed Device for the purpose of publishing the derived network policies and to obtain status about the Managed Device. This IP address must be an IP address assigned to an interface of the Managed Device. This IP address can also be the IP address used by any other administrative tools that you use to review the status of this Managed Device.

Note For Managed Devices based on 4.x and earlier versions of PIX Firewall software, you cannot assign an IP address that is assigned to the outside interface of a PIX Firewall. The IP address must be assigned to the inside interface or one of the perimeter interfaces.

To modify the IP address used to connect to the Managed Device, follow these steps:

Step 1 Right-click the right-click the **PIX Firewall** icon, **IOS Router** icon, or the **Sensor** icon for which you want to modify the IP address used to distribute command sets to that Managed Device.

Step 2 To view the **Control** panel, point to **Properties** and click **Control** on the shortcut menu.

Result: The Control panel appears in the View pane.

Step 3 To change the IP address on which the Managed Device listens for requests from the Policy Distribution Point and other administrative tools, select the new IP address in the **IP Address** box under **General Settings**.

The list of IP addresses available are those IP addresses that are defined for the valid interfaces of this Managed Device. These addresses are defined in the Interfaces panel of the selected Managed Device node. By default, the Control panel uses the first IP address listed under the first interface attached to an upstream network.

Caution If you modify the IP address that Cisco Secure Policy Manager uses to publish the commands to a Managed Device (the address in the Control panel), you must define an intermediate security policy to allow the network service selected on the Control panel to that enables both the old and the new IP addresses. Otherwise, the connection to the Managed Device is broken while the Policy Distribution Point is publishing the command set that changes from the old address to the new address.

Step 4 To accept your changes and close the selected panel, click **OK**.

Step 5 To save any changes that you have made, click **Save** on the **File** menu.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1281
Doc: 3701

Selecting the Policy Distribution Point that Manages a Managed Device

From the Control panel, you can specify the Policy Distribution Point that is used to publish new network policies to the Managed Device. This Policy Distribution Point is responsible for generating and publishing network policies to Managed Devices, such as the PIX Firewall, IOS router, or IDS sensor.

To select the Policy Distribution Point used to publish network policy to the Managed Device, follow these steps:

Step 1 Right-click the **PIX Firewall** icon, **IOS Router** icon, or the **Sensor** icon for which you want to select the associated Policy Distribution Point.

Step 2 To view the **Control** panel, point to **Properties** and click **Control** on the shortcut menu.

Result: The Control panel appears in the View pane.

Step 3 To select the host that is running the Policy Distribution Point that you want to use, click that host name in the **Policy Distribution Point** box under **Policy Distribution**.

This box displays only those primary and/or secondary servers defined under the Network Topology tree that have a Policy Distribution Point client/server product installed on them.

If you installed a standalone Cisco Secure Policy Manager, the Policy Distribution Point resides on that primary server. Otherwise in a distributed installation, it can reside on either a primary or secondary server, depending on which feature sets you chose to install on the various hosts.

Step 4 To accept your changes and close the selected panel, click **OK**.

Step 5 To save any changes that you have made, click **Save** on the **File** menu.

Requiring that a Managed Device Use an IPSec Tunnel for Administration

From the Control panel, you can specify that you want the Cisco Secure Policy Manager host acting as the Policy Distribution Point to use an IPSec tunnel when communicating with the Managed Device, such as a PIX Firewall or IOS router. This tunnel can provide additional authentication, as well

as encryption, for sessions that occur between the Managed Device and the Policy Distribution Point, providing non-repudiation and data integrity for the network policies that are published to the Managed Device.

To require Cisco Secure Policy Manager to use an IPSec tunnel when communicating with the Managed Device, follow these steps:

Step 1 Right-click the **PIX Firewall** icon, **IOS Router** icon, or the **Sensor** icon for which you want to require the use of an IPSec tunnel.

Step 2 To view the **Control** panel, point to **Properties** and click **Control** on the shortcut menu.

Result: The Control panel appears in the View pane.

Step 3 To select the IPSec Tunnel Template definition used to connect to the selected Managed Device, click that template in the **Use secure IPSec with template** box under **Policy Distribution**.

This template must be defined under the IPSec Tunnel Templates branch of the Tools and Services tree. By default, the Policy Distribution Point does not use an IPSec tunnel when communicating with the Managed Device.

Caution For IDS sensors, you can only select IPSec Tunnel Templates that are based on manual keys. IDS sensors do not support IKE.

Step 4 To accept your changes and close the selected panel, click **OK**.

Step 5 To save any changes that you have made, click **Save** on the **File** menu.

Step 6 Before publishing the command set to the Managed Device, you must first configure the Managed Device to accept the IPSec tunnel from the Policy Distribution Point. To configure the Managed Device, refer to the *IPSec Tunnel Implementation* administrator's guide.

Selecting the Policy Monitor Point Associated with a Managed Device

From the Control panel, you can specify the Policy Monitor Point that is used to monitor the syslog data streams generated by the Managed Device, such as a PIX Firewall or IOS router. This Policy Monitor Point studies the syslog data to derive higher-level audit records, such as session records.

To select the Policy Monitor Point used to monitor Managed Device syslog data streams, follow these steps:

Step 1 Right-click the **PIX Firewall** icon or **IOS Router** icon for which you want to select a Policy Monitor Point, point to **Properties**, and click **Control** on the shortcut menu.

Result: The Control panel appears in the View pane.

Step 2 To select the host that is running the Policy Monitor Point that you want to use, click that host name in the **Policy Monitor** box under **Logging**.

This box displays only those primary and/or secondary servers defined under the Network Topology tree that have a Policy Monitor Point client/server product installed on them.

Step 3 To accept your changes and close the selected panel, click **OK**.

Step 4 To save any changes that you have made, click **Save** on the **File** menu.

Selecting the Syslog Servers Associated with a Managed Device

From the Control panel, you can specify one or more syslog servers, in addition to the Cisco Secure Policy Manager host acting as Policy Monitor Point, that you can use to provide additional monitoring of the syslog data streams generated by the Managed Device.

To select the syslog servers used to monitor Managed Device syslog data streams, follow these steps:

Step 1 Right-click the **PIX Firewall** icon or **IOS router** icon for which you want to select an associated syslog server, point to **Properties**, and click **Control** on the shortcut menu.

Result: The Control panel appears in the View pane.

3960
21

Step 2 To select one or more hosts on which syslog servers are running, click those host names in the **Syslog Monitors** box under **Logging**.

This box displays only those hosts defined under the Network Topology tree that have a syslog client/server product installed on them. The host or hosts that you select must have a syslog application capable of processing the data streams. For instructions on installing and configuring these applications, refer to the documentation that came with those products.

Step 3 To accept your changes and close the selected panel, click **OK**.

Step 4 To save any changes that you have made, click **Save** on the **File** menu.

Specifying the Enable Password used to Administer a Managed Device

From the Control panel, you can specify the enable password for the selected Managed Device. The Policy Distribution Point uses this password to authenticate to the Managed Device before it can publish new network policies to that Managed Device.

To specify the enable password used to publish network policies to the Managed Device, follow these steps:

Note All Managed Devices require that you specify the enable password.

Step 1 Right-click the **PIX Firewall** icon, **IOS Router** icon, or the **Sensor** icon for which you want to specify the enable password.

Step 2 To view the **Control** panel, point to **Properties** and click **Control** on the shortcut menu.

Result: The Control panel appears in the View pane.

Step 3 To specify the enable password, type that password in the **Enable password** box under **Authentication**.

The enable password can be up to 16 alphanumeric characters. Also, you can use both uppercase and lowercase characters. This password is case sensitive.

IRQS Nº 03/2005 - CN
CPMI - CORREIOS
1283
Fls:
Doc: 3701

Step 4 To accept your changes and close the selected panel, click **OK**.

Step 5 To save any changes that you have made, click **Save** on the **File** menu.

Specifying the Telnet Password used to Administer a Managed Device

From the Control panel, you can specify the Telnet password for the selected Managed Device. Any administrators who connect to the Managed Device to perform any diagnostic tests must first use this password to authenticate to the Managed Device.

To specify the Telnet password used to authenticate to the Managed Device, follow these steps:

Note Only the IOS router uses (and requires) the Telnet password. However, both the PIX Firewall and the IOS router require that you specify the enable password.

Step 1 Right-click the **PIX Firewall** icon or **IOS Router** icon for which you want to specify the Telnet password.

Step 2 To view the **Control** panel, point to **Properties** and click **Control** on the shortcut menu.

Result: The Control panel appears in the View pane.

Step 3 To specify the Telnet password, type that password in the **Telnet password** box under **Authentication**.

The Telnet password can be up to 16 alphanumeric and special characters; however, you cannot use the question mark, space, or colon in the password. You can use both uppercase and lowercase characters, because this password is case sensitive.

Step 4 To accept your changes and close the selected panel, click **OK**.

Step 5 To save any changes that you have made, click **Save** on the **File** menu.

Viewing the Associated Network Service on a Managed Device

Modifying the network service associated with a Managed Device has no effect on the system or the configuration of that Managed Device. It identifies the network service that Cisco Secure Policy Manager uses to publish the generated command sets to that Managed Device. This network service is also used to return status updates to Cisco Secure Policy Manager about the publishing status.

For an IOS router, this network service is Telnet on (TCP port 23). For a PIX Firewall, this network service is PIX Secure Telnet (TCP 1467). For an IDS sensor, this network service is postoffice (UDP 45000).

Viewing the TCP Port used by the Managed Device for Administrative Purposes

Modifying the port used for the network service associated with a Managed Device has no effect on the system or the configuration of that Managed Device. For an IOS router, this network service is Telnet on (TCP port 23). For a PIX Firewall, this network service is PIX Secure Telnet (TCP 1467). For an IDS sensor, this network service is postoffice (UDP 45000).

IPSec Panel

The IPSec panel appears on a node that has the IPSec Support option enabled on its General panel. The node can be a gateway object or a Cisco Secure Policy Manager host. From the IPSec panel, you can specify the device-specific settings that are used to support different types of IPSec tunnel templates.These settings include the type of DES cipher that this node supports. In addition, you can specify the device-specific settings required to support an IKE authentication scheme when establishing an IPSec session with a valid peer.You must specify these settings if this node is included in an IPSec tunnel group definition that is based on a template that uses IKE as the authentication mechanism. These settings include the type of shared secret and the secret's value. You must specify these device-specific settings for each IKE authentication scheme identified by the templates used in the IPSec tunnel group definitions that identify this node as a peer.

IRQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1284
Doc: 3701

Learn More About IPSec Support on Network Objects

You must enable IPSec support on all IPSec peers before you establish IPSec tunnel groups that consist of those peers. A PIX Firewall, IOS router, Cloud, generic Router, or Cisco Secure Policy Manager host can act as an IPSec peer. Specifying the settings in the IPSec panel for a IPSec-enabled node prepares that node to serve as an endpoint, or peer, in an IPSec tunnel group.

When you want to define a *control channel* tunnel group, which uses IPSec tunnels to communicate between the Policy Distribution Point and a specific Managed Device that supports IPSec, you must bootstrap each IPSec-enabled Managed Device to ensure that it can act as a peer in that IPSec tunnel group definition. While you have to bootstrap the Managed Devices, you do not have to bootstrap the Cisco Secure Policy Manager hosts.

When a Cisco Secure Policy Manager host participates in an IPSec tunnel group, it is used to securely publish generated commands sets to a Managed Device, such as a PIX Firewall or IOS router. However, for a Cisco Secure Policy Manager host to act as an IPSec peer, you must have the Cisco Secure VPN Client software installed and operational on the host that is acting as the Policy Distribution Point that will be participating in the IPSec tunnel.

If this node is not a Cisco Secure Policy Manager host, it must be a gateway object that is capable of participating in an IPSec tunnel. As an IPSec-capable gateway object, the node can participate in two types of tunnels:

- If the gateway object is a Managed Device, it can participate in an IPSec tunnel between the Cisco Secure Policy Manager host that is responsible for generating and publishing the device-specific command sets to that Managed Device.
- Whether the gateway object is managed or not, it can participate in a tunnel between itself and another gateway object, which acts as a peer for a specific IPSec session.

From the IPSec panel associated with a node, you can specify three types of settings related to the use of IPSec by this node:

- The strongest DES cipher that this node can support when encrypting the ESP payload and for encrypting the AH packets
- The use of a certificate authority server by this node
- The details of the pre-shared keys used by this node on a per-peer basis

In addition, you can discover the properties of the certificate currently installed on this node, if you have chosen to use certificates and have previously loaded the certificate on this node during the bootstrap process.

Specifying the DES Cipher

The DES cipher setting allows you to specify the strongest cipher that this node supports for encryption of IPSec session packets. If this node type can support triple DES, you should select that cipher for this value. Because Cisco IPSec products support only DES, and not all version support triple DES, these two ciphers are the only valid ciphers within Cisco Secure Policy Manager.

When you specify triple DES as the strongest cipher, this value does not mean that triple DES will be used by all IPSec Tunnel Groups in which this node is defined as a peer. If the other peers do not support triple DES, this node can still be used with IPSec Tunnel Templates that specify standard DES as the cipher. Cisco Secure Policy Manager uses this DES cipher setting to perform a consistency check to verify that your IPSec Tunnel Group definitions are based on IPSec Tunnel Templates that the peers in the group can support.

For additional information on encryption, ciphers, and how encryption works, refer to the *Cisco Secure Policy Manager Administrator's Guide: IPSec Tunnel Implementation*.

Enabling Certificate Authority Support

If you specify that you want this node to use a certificate authority server for the purpose of refreshing the certificates, Cisco Secure Policy Manager automatically creates and applies a security policy that enables HTTP traffic to pass between this node and the specified certificate authority server. Before you can select a certificate authority server, you must first define that server under the Network Topology tree.

Certificate authority servers use HTTP as the protocol for renewing and validating certificates. They manage data about when the certificates managed by the server expire and the rules for automatically refreshing or issuing new certificates to the network objects that are subscribers to that certificate authority. In addition, certificate authority servers provide support for certificate revocation lists (CRLs), which enable you to specify that certain certificates should not be trusted.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1285
Fls:
Doc: 3701

If at some point the selected network object no longer requires access to this certificate authority server, you must clear the selection in the Trusted Certificate Authority box in the IPSec panel.

Specifying the Type of Secret to Use with IKE

IKE is a protocol that negotiates the parameters required to set up an IPSec tunnel. This negotiation protocol is used to determine the common DES cipher and establish the initial secret keys for the session. In the IPSec panel, you can define the settings for two types of IKE negotiations:

- Negotiations based on a pre-shared secret
- Negotiations based on a certificate

Pre-shared keys offer a simple, yet secure, solution for smaller networks because they do not require the support of a public key infrastructure (PKI). Pre-shared keys enable you to define a common shared secret to be used by two peers that are capable of using IKE to negotiate the settings for a specific IPSec session. Because IKE periodically negotiates new session keys for use when encrypting the network packets of an IPSec session during that session, pre-shared secrets offer a more secure IPSec solution than manual keys, which generate only one pair of session keys. In addition, because pre-shared keys enable you to specify a single secret that is shared between each peer pair, the key administration is also simpler than that of IPSec solutions based on manual keys.

To overcome the day-to-day key administration issues involved in changing pre-shared keys in accordance with a strong organizational security policy, you can also specify that you want an IPSec-enabled network object to use a digital certificate (sometimes referred to as RSA certificate signatures) as the shared secret that peers use to authenticate that network object. In this configuration, the IPSec-enabled network object publishes its public key to its peers, which use that certificate to authenticate that network object.

Unlike pre-shared keys, certificates enable IPSec peers to authenticate using a trusted certificate authority. Because they do not require an IPSec-enabled network object to know a pre-shared secret for each of its peers, digital certificates are more scalable, which means they can support larger enterprise networks. While digital certificates are more technologically complex than pre-shared keys and they require the support of a PKI within your organization (including the purchase of a certificate from a trusted certification authority), they also offer a

more secure method of authentication because the certificates can be configured to expire at which time new certificates can be issued automatically by a certificate authority server.

Discovering Certificate Information

If you have previously configured this node to use a certificate when performing IKE negotiations, you can discover the properties of that certificate by clicking Discover.

This discovery process queries the node about that certificate and retrieves information, such as who issued the certificate, the serial number of the certificate, and the dates for which the certificate is valid.

You can use this information to ensure that you have the proper certificate loaded and to stay abreast of possible problems, such as expiration.

Task List for the IPSec Panel

You can perform the following tasks from the IPSec panel on an IPSec-enabled gateway object, such as a PIX Firewall, IOS router, generic Router, or Cloud, that is defined within the Network Topology tree. In addition, if you have installed Cisco Secure VPN Client software on a Policy Distribution Point that published command sets to a Managed Device, you can perform these tasks from the IPSec panel associated with the Cisco Secure Policy Manager host that acts as that Policy Distribution Point. For step-by-step procedures on performing a specific task, see the corresponding section.

- "Specifying DES Cipher Settings on the IPSec Panel" section on page 6-32
- "Specifying Pre-Shared Secrets for IKE" section on page 6-32
- "Configuring a Certificate" section on page 6-34
- "Discovering Certificate Information" section on page 6-35

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1286
Doc: 3701

Specifying DES Cipher Settings on the IPSec Panel

From the IPSec panel, you can identify the strongest DES cipher that the selected node supports. Cisco Secure Policy Manager uses this information to perform consistency checks that validate that all peers in IPSec Tunnel Group definitions based on IPSec Tunnel Templates that require specific ciphers can support those ciphers.

To specify the strongest DES cipher that this node can support, follow these steps:

Step 1 Right-click the gateway object icon that has IPSec Support enabled in its General panel for which you want to specify the DES cipher support settings, point to **Properties** and click **IPSec** on the shortcut menu.

Result: The IPsec panel appears in the View pane.

Step 2 To specify which DES cipher is supported by this node, click that cipher in the list of ciphers in the **DES Cipher Support** box.

Two types of DES ciphers are available, depending on the type of software that is running on the selected node:

- **DES**—This option identifies that the node can support the standard DES cipher for IPsec-based communications, including the IKE authentication and the ESP payloads. If DES is not supported by the peer, the IPSec session request fails. All peers must, at a minimum, support the standard DES cipher.
- **triple DES**—This option identifies that the node can support the triple DES cipher. If a peer does not support triple DES, a node that supports triple DES can also support the standard DES cipher for the duration of a session.

Step 3 To accept your changes and close the selected panel, click **OK**.

Step 4 To save any changes that you have made, click **Save** on the **File** menu.

Specifying Pre-Shared Secrets for IKE

From the IPSec panel, you can specify a pre-shared secret that is used to perform IKE negotiations between the selected node and its IPSec tunnel group peers. Cisco Secure Policy Manager uses this secret to generate the device-specific commands that enable these pre-shared secrets on this node and its peers. You

only need to specify this secret in this panel, as it is propagated to the IPSec panels for the specified peers. In other words, you only have to specify a shared secret on one of the two peer nodes.

To specify the secrets to share between this node and its peers, follow these steps:

Step 1 Right-click the gateway object icon that has IPSec Support enabled in its General panel for which you want to specify the pre-shared keys to use with peers when negotiating the IPSec sessions based on IKE, point to **Properties** and click **IPSec** on the shortcut menu.

Result: The IPsec panel appears in the View pane.

Step 2 To specify the peer for which you want to define a pre-shared secret between the selected node and that peer, click that peer in the list of available peers in the **Tunnel Peers** box.

Result: The Secret shared with peer label displays the name of the selected peer.

This list contains only those gateway objects and Cisco Secure Policy Manager hosts defined under the Network Topology tree that have the IPSec Support option selected in the General panel.

Step 3 To specify the secret to share between this node and the peer selected in the **Tunnel Peers** box, type that secret in the **Secret shared with peer** box.

This secret identifies a valid secret that can be used by IKE to set up an IPSec tunnel between this node and the selected peer. The minimum length for this secret value is 8 characters and the maximum length is up to 128 alphanumeric characters. You cannot use Tab, Enter, spaces, question marks, or double quotes when defining this shared secret.

Step 4 For each peer that you want to define a pre-shared secret, repeat Steps 5 and 6.

Step 5 To accept your changes and close the selected panel, click **OK**.

Step 6 To save any changes that you have made, click **Save** on the **File** menu.

To generate a new command set that includes the pre-shared secrets required by each peer, you must perform a Save and Update operation.

Configuring a Certificate

From the IPSec panel, you can identify that you want the selected node to be able to communicate with a certificate authority server that is defined under the Network Topology tree. Certificate authority servers use HTTP as the protocol for renewing and validating certificates. They manage data about when the certificates managed by the server expire and the rules for automatically refreshing or issuing new certificates to the network objects that are subscribers to that certificate authority. In addition, certificate authority servers provide support for certificate revocation lists (CRLs), which enable you to specify that certain certificates should not be trusted.

Tips Cisco Secure Policy Manager creates and applies a security policy that permits HTTP traffic to pass between this node and the specified certificate authority server.

To specify the certificate authority server to use for this node, follow these steps:

Step 1 Right-click the gateway object icon that has IPSec Support enabled in its General panel, point to **Properties** and click **IPSec** on the shortcut menu.

Result: The IPsec panel appears in the View pane.

Step 2 To specify which certificate authority server to use with this node, click that server in the list of certificate authority servers in the **Trusted Certificate Authority Server** box.

This value identifies a host defined in the Network Topology tree that has been configured to identify a certificate authority server by adding the Certificate Authority client-server product type to that host.

Step 3 To accept your changes and close the selected panel, click **OK**.

Step 4 To save any changes that you have made, click **Save** on the **File** menu.

Discovering Certificate Information

From the IPSec panel, you can discover specific information about any certificates that are installed on a Managed Device that has the IPSec Support option selected in the General panel for that Managed Device node.

To discover the certificate information, follow these steps:

Step 1 Right-click the **PIX Firewall** icon or **IOS Router** icon that has IPSec Support enabled in its General panel and has a previously configured certificate installed on that Managed Device for which you want to discover the certificate information, point to **Properties** and click **IPSec** on the shortcut menu.

Result: The IPsec panel appears in the View pane.

Step 2 To specify that you want to discover the information about the certificates used by this node, click **Discover**.

Result: The Discovery dialog box appears with the IPSec box selected under the Discovery Selections box.

Step 3 To discover the certificate information and other IPSec settings for this node, click **Discover**.

Result: The Discovery Status box displays the status of the device discovery, including the time remaining before the discovery process aborts its discover attempt. When this process is complete, a message stating "Configuration completed. The configuration attempt was successful" appears. In addition, the Results button appears, which when clicked provides information about the discovery in the Discovery Results dialog box. Specifically, the Discovery Results dialog box should display the following messages:

- IPSec capability detected.
- Triple DES capability detected. (This message only appears if this node supports triple DES.)
- # certificates detected. (Where # is the number of certificates discovered on this node.)

Step 4 To close the **Discovery** dialog box, click **OK**.

Result: The IPSec panel now displays information about each certificate that was discovered. This information is organized on separate subtabs (below the Trusted Certificate Authority box) for each certificate that is discovered.

Step 5 To accept your changes and close the selected panel, click **OK**.

Step 6 To save any changes that you have made, click **Save** on the **File** menu.

AAA

AAA (authentication, authorization, and accounting) uses TACACS+ and RADIUS protocols to seamlessly integrate security features.

Cisco Secure Policy Manager implements AAA to enforce authentication, accounting, and authorization for pass-through and administrative traffic. Pass-through traffic passes from a source through a Managed Device to a destination. Administrative traffic passes from the Cisco Secure Policy Manager host to the Managed Device.

Learn More About AAA

This topic provides an overview of AAA (authentication, authorization, and accounting) and how Cisco Secure Policy Manager uses the TACACS+ and RADIUS protocols to implement AAA. For more information about the AAA architecture, see RFC2904 and RFC2989.

- *Authentication* identifies users before they are permitted access to the network or network services. Authentication provides the method for identifying users, including login and password dialog, challenge and response, messaging support, and depending on the security protocol selected, encryption.
- *Authorization* assembles a set of attribute-value pairs that describe privileges for the identified user. These attribute-value pairs are compared to the information contained in a TACACS+ or RADIUS server database.
- *Accounting* logs the services accessed and the network resources consumed by users. Accounting provides the method for collecting and distributing information such as user identities, start and stop times, executed commands, number of packets, and number of bytes.

Implementing and managing a AAA-based security solution is complicated by the number of network elements and the complexity of the device configuration. However, Cisco Secure Policy Manager integrates AAA to replace tedious device-level configurations with simple, intuitive, high-level AAA security policies. After Cisco Secure Policy Manager is configured to permit AAA, all necessary per-device configurations are generated automatically.

In the Cisco Secure Policy Manager implementation of AAA, you can enforce authentication, accounting, and authorization for pass-through traffic or administrative traffic. Pass-through traffic passes through a Managed Device from a source to a destination. Administrative traffic passes from the Cisco Secure Policy Manager host to the Managed Device. See the following checklists for more information about configuring Cisco Secure Policy Manager to authenticate pass-through and administrative traffic.

- Checklist for Authenticating Pass-Through Traffic, page 6-39. Provides information for configuring Cisco Secure Policy Manager to authenticate pass-through traffic.
- Checklist for Authenticating Administrative Traffic, page 6-37. Provides information for configuring Cisco Secure Policy Manager to authenticate administrative traffic.

Cisco Secure Policy Manager uses AAA servers and authentication proxies (both in the **Network Topology** tree) and policy to support AAA. The AAA server is a host in your topology and runs either TACACS+ or RADIUS services. The authentication proxy is the gateway device that communicates between a client requesting AAA services and the AAA server. Finally, Cisco Secure Policy Manager uses security policies to define which traffic should be authenticated.

Checklist for Authenticating Administrative Traffic

You can specify that a AAA server authenticate administrative traffic between a Policy Distribution Point and the Managed Device that it controls. Using authentication information presented by the Policy Distribution Point, the Managed Device queries the TACACS+ server. A Managed Device will query the TACACS+ servers, in the order they were specified, until an active server is found. If no active server or match for the username is found, the session request is rejected.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1289
Doc: 3701

Note Only TACACS+ servers can authenticate administrative traffic for a Managed Device.

The following checklist outlines the steps required to authenticate administrative traffic. Each step may contain several substeps and should be performed in the order presented. References to the specific tasks for each step are provided as well.

Step 1 Set Up the AAA Server

If you want to authenticate administrative traffic, you must create a AAA server in your network topology with the appropriate services. Then, you can configure the Managed Devices to accept authenticated administrative traffic. This involves performing the following tasks:

1. Adding the AAA server host to the **Network Topology** tree (if it does not appear in the tree).
2. Adding the TACACS+ service to the AAA server host in the **Network Topology** tree.

For more information, see the following references:

1. Creating a Host Node, page 4-67
2. Authentication Server Panel, page 4-70

Step 2 Configure the Managed Device

For each Managed Device that will receive authenticated administrative traffic, specify the AAA server(s) that will authenticate the administrative traffic. Then, manually enter the AAA bootstrap commands.

For more information, see the "AAA" section on page 6-36.

Step 3 Generate the Command Sets

The command sets are automatically generated when you save and update your Cisco Secure Policy Manager configuration.

If Cisco Secure Policy Manager automatically publishes the command sets to the Managed Devices when you click **Save and Update** on the **File** menu, you must disable this feature before generating the command sets.

For more information, see the Cisco *Secure Policy Manager Administrator's Guide: Policy Development and Enforcement*.

Step 4 Publish the Commands to the Managed Device

Publishing the command sets to the Managed Device is a two-step process.

First, you have to bootstrap each Managed Device manually. Because you have configured Cisco Secure Policy Manager to communicate with the Managed Device through authenticated traffic, Cisco Secure Policy Manager will immediately try to do so. However, the Managed Device has not been configured to accept the authenticated traffic. The first step enables the Managed Device to accept the authenticated traffic.

Then, you must publish the command sets to the Managed Device.

We recommend that you perform the following two steps for each Managed Device. Start with the most remote Managed Device and work your way to the closest. In this case, *remote* refers to a Managed Device that is located behind another Managed Device from the point of view of the Policy Distribution Point.

1. Bootstrap the Managed Device.
2. Publish the command set to the Managed Device.

Repeat Step 1 and Step 2 for each Managed Device that will accept authenticated administrative traffic from Cisco Secure Policy Manager.

For more information, see the *Policy Development and Enforcement* administrator's guide.

Checklist for Authenticating Pass-Through Traffic

You can specify that a AAA server authenticate traffic passing through a Managed Device. In this implementation of AAA, a *client* is the source in a security policy abstract that is requesting services through an authentication proxy. An *authentication proxy* is the gateway device that communicates between a client and the AAA server. The *AAA server* is the host that provides TACACS+ or RADIUS services (authentication, authorization, and accounting). The AAA server provides these services as specified by the security policy abstract that contains a Use Authentication node.

The following checklist outlines the steps required to authenticate pass-through traffic. Each step may contain several substeps and should be performed in the order presented. References to the specific tasks for each step are provided as well.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1290
Doc: 3701

Step 1 Set Up the AAA Server

If you want to authenticate pass-through traffic, first you must create a AAA server in your network topology with the appropriate services. Then, you can configure the Managed Devices to accept authenticated administrative traffic. This involves performing the following tasks:

1. Adding the AAA server host to the **Network Topology** tree (if it does not appear in the tree).
2. Adding the TACACS+ or RADIUS service to the AAA server host in the **Network Topology** tree.

For more information, see the following references:

1. Creating a Host Node, page 4-67
2. Authentication Server Panel, page 4-70

Step 2 Configure the Managed Device

You must specify the AAA server(s) that will authenticate pass-through traffic for each Managed Device that will serve as an authentication proxy. Then, manually enter the AAA bootstrap commands.

For more information, see the "AAA" section on page 6-36.

Step 3 Create Policy

Although you have defined the AAA server(s) and AAA parameters for each Managed Device, you have not yet defined the services that will require authentication. The final steps in the process are to create policies that require authentication for selected services, generate the device-specific command sets for those policies, and publish the command sets to the Managed Devices.

For more information, see the *Cisco Secure Policy Manager Administrator's Guide: Policy Development and Enforcement.*

Learn More About the AAA Panel

In Cisco Secure Policy Manager, AAA support (authentication, authorization, and accounting) refers to Managed Devices that use authentication servers (AAA servers), either TACACS+ (see the "Learn More About TACACS+ Authentication Servers" section on page 4-72) or RADIUS (see the "Learn More About RADIUS

Authentication Servers" section on page 4-71), to authenticate users on your network. While Cisco Secure Policy Manager does not manage the services provided by AAA servers (the AAA applications manage those services and the user database), you need to be able to distinguish among the services:

- *Authentication* requires a requesting user to provide a username and password pair that is used to validate that user's identity.
- *Authorization* enables privileges for a requesting user based on profiles that define specific privileges. These profiles and privileges are stored in the AAA server database.

Note The Cisco Secure PIX Firewall does not authorize when using RADIUS.

- *Accounting* logs service requests, providing user-based audit trails.

Users are authenticated against usernames and group profiles stored on the AAA server. Managed Devices are network devices that initiate an authentication request to the AAA server whenever a network service request traverses a Managed Device.

An authentication attempt is denied for one of three reasons: the username is not found in the AAA server database, the requesting user provides the incorrect username/password pair, or the AAA server is unreachable by the Managed Device.

A Cisco Secure PIX Firewall only considers the first AAA server in the list for either type of authentication. In other words, defining multiple servers for a Cisco Secure PIX Firewall has no effect. If for any reason the authentication attempt fails or times out to that first server, the Cisco Secure PIX Firewall rejects that session request.

However, the Cisco router running Cisco Secure Integrated Software and the router running Cisco IOS software both allow authentication attempts to time out. In this case, the AAA server is assumed to be unavailable or down. If the authentication attempt times out, the Cisco router running Cisco Secure Integrated Software or the router running Cisco IOS software contacts the next server in the list. If the username is not found in the AAA server database, the session request is denied.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1291
Doc 3701

Note Before you can enable a Managed Device to use a AAA server, you must create a Host node in the Network Topology tree and add either a TACACS+ or RADIUS client/server product type to that host. In addition, you must bootstrap the Managed Device so that the Policy Distribution Point host can authenticate to and administer it.

In addition, Cisco Secure Policy Manager can use AAA servers to authenticate to a Managed Device when publishing commands to that Managed Device. If you want a Managed Device to authenticate such administrative traffic, use the Control panel of each Managed Device to define the AAA username and password that the Policy Distribution Point should use to authenticate to the TACACS+ server.

Note To use AAA to authenticate IPSec-based traffic flows, you must enable **xauth** in the General panel of the IPSec tunnel template for IPSec tunnel groups.

Virtual Addresses and Cisco Secure PIX Firewall

Cisco Secure PIX Firewall uses virtual addresses during authentication of pass-through traffic. If you use a Cisco Secure PIX Firewall as an authentication proxy, select HTTP, FTP, or Telnet as the protocol that a client should use to initiate AAA services. If you select HTTP or Telnet, Cisco Secure PIX Firewall uses a virtual HTTP or Telnet server to intercept the HTTP or Telnet request during pre-authentication communications with the client and the AAA server.

Cisco Secure Policy Manager generates the necessary commands to permit the authentication traffic between the client and the authentication proxy; however, you must specify a virtual address for the virtual server on the Cisco Secure PIX Firewall.

The virtual address identifies the IP address of the virtual HTTP or Telnet server on the Cisco Secure PIX Firewall. The virtual address is any valid, unused IP address that can be routed to the interface of the Cisco Secure PIX Firewall closest to the requesting client. A virtual HTTP server pre-authenticates a user who is requesting HTTP services. A virtual Telnet server pre-authenticates a user who is requesting Telnet services.

Pre-authentication prevents a request from being prematurely denied. In the following example, the Web Server requires a user to log in before browsing the contents. When the user attempts to browse the address in question, an HTTP request is sent from the client (user's computer). The Cisco Secure PIX Firewall requests a AAA user name and password. The user provides the user name and password, which is sent to the AAA server for authentication. However, because the user name and password are sent as part of the HTTP traffic, they are also sent to the Web Server. If the AAA user name and password do not match the user name and password required to log in to the Web Server, the request fails. The virtual HTTP server solves this problem by intercepting the HTTP traffic for pre-authentication before it can be denied.

Figure 6-5 and the following discussion illustrate how Cisco Secure PIX Firewall uses a virtual HTTP or Telnet server to pre-authenticate a user.

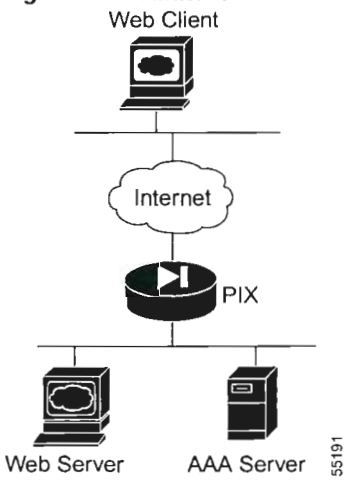
Doc:

Figure 6-5 Authentication of Pass-Through Traffic using a Virtual HTTP Server



For this scenario, the Cisco Secure PIX Firewall has a basic HTTP server built into its framework. This *virtual* server intercepts HTTP requests from any client specified as the source in a security policy with HTTP as the service and Use Authentication as the non-terminal action.A typical sequence of events follows:

1. User browses to Web Server (virtual IP address). The Web Server initiates authentication for pass-through traffic.
2. The virtual HTTP server on the Cisco Secure PIX Firewall intercepts the connection and splits the request into two parts: the AAA request (user name and password) and the HTTP request (address for Web Server).
3. The virtual HTTP server forwards the AAA request to the AAA server. Assuming the user name and password are correct, the AAA server tells the Cisco Secure PIX Firewall to permit the pass-through traffic.
4. The virtual HTTP server sends the HTTP request to the Web Server.
5. The Web Server receives the request for a page, and, knowing that the request requires authentication, sends the authentication request to the client.
6. The user provides the username and password and, assuming it is the correct one for the server, browses like normal.

Note The same concept applies to virtual Telnet servers.

Keep in mind, you should use caution when selecting a virtual address for the virtual HTTP or virtual Telnet server. If a security policy uses the same address as the virtual address and that address is on a less secure side than the destination, you must create a NAT rule to permit the traffic to the Cisco Secure PIX Firewall.

For example, in Figure 6-6, assume that you want the internal server (10.10.10.30) to be known as 30.30.30.30 to the outside world. Cisco Secure Policy Manager will create the virtual HTTP 30.30.30.30 command, but it does not create a static mapping rule to map the internal host to the virtual IP address. The traffic from the Web Server to the Cisco Secure PIX Firewall will not be routed correctly unless you create the following static mapping rule to map the address of the Web Server to the virtual HTTP address:

Figure 6-6 Static Mapping Rule for Virtual Address

Rule	Translate object	via interface(s)	using address	through	with	mask
50	Web Server	outside	30 .30 .30 .30	30 .30 .30 .30		32

Task List for AAA Panel

You can perform the following tasks from the AAA panel on a Managed Device.For step-by-step procedures on performing a specific task, see the corresponding section.

- "Authenticating Pass-Through Traffic Using a AAA Server" section on page 6-47
- "Authenticating Administrative Traffic Using a AAA Server" section on page 6-45

Authenticating Administrative Traffic Using a AAA Server

You can specify that you want a AAA server to authenticate any administrative traffic between a Policy Distribution Point and the Managed Device it controls. Using authentication information presented by the Policy Distribution Point, the

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1293
Doc: 3791

Managed Device queries each TACACS+ server. These TACACS+ servers are queried in order, from top to bottom, until an active server is detected or the list of servers is exhausted. If no match is found, the session request is rejected.

Note Only TACACS+ servers can authenticate administrative traffic for a Managed Device.

To specify which AAA servers should authenticate the administrative traffic used to control the Managed Device, follow these steps:

Step 1 Right-click the **gateway object** icon on which you want to specify the TACACS+ servers to use for authenticating administrative traffic, point to **Properties**, and then click **AAA** on the shortcut menu.

Result: The AAA panel appears in the View pane.

Step 2 To specify the TACACS+ server that you want to use to authenticate administrative traffic, select that server in the **Available AAA Servers** box and click the **Add** button that corresponds to the **AAA servers for device administration** box.

Note You must specify a AAA username and password pair in the **Control** panel of the selected Managed Device. This information is used to authenticate the Policy Distribution Point to the TACACS+ server.

Result: The TACACS+ server appears in the AAA servers for device administration box.

Step 3 To activate the **AAA key for '***hostname***'** box, select the server that you just added in the **AAA servers for device administration** box.

Step 4 To specify the shared secret to be used between the selected Managed Device and the selected AAA server, type that key in the **AAA key for '***hostname***'** box.

This value must contain at least eight alphanumeric character; however, it cannot include ?, ", a tab character, or a carriage return character (the **Enter** key).

Step 5 For each TACACS+ server that you want to add to the **AAA servers for device administration** box, repeat Steps 2 through 4.

Clicking Move Up and Move Down, you can order the servers in the list. Top-down order determines query order.

Step 6 To accept your changes and close the selected panel, click **OK**.

Step 7 To save any changes that you have made, click **Save** on the **File** menu.

Authenticating Pass-Through Traffic Using a AAA Server

You can specify one or more AAA servers defined in the Network Topology tree that you want the selected Managed Device to use to authenticate traffic that passes through it. The Managed Device queries each AAA server using authentication information presented by the requesting user. These AAA servers are queried in order until an active server is detected or the list of servers is exhausted. If no match is found, the session request is rejected.

To specify which AAA servers should be used to authenticate traffic that traverses a Managed Device, follow these steps:

Step 1 Right-click the gateway object icon on which you want to specify the AAA servers to use for authenticating pass-through traffic, point to **Properties**, and then click **AAA** on the shortcut menu.

Result: The AAA panel appears in the View pane.

Step 2 To specify the server that you want to use to authenticate pass-through traffic, select that server in the **Available AAA Servers** box and click the **Add** button that corresponds to the **AAA servers for pass-through traffic** box.

Result: The AAA server appears in the AAA servers for pass-through traffic box.

Step 3 To activate the **AAA key for '***hostname***'** box, select the server that you just added in the **AAA servers for pass-through traffic** box.

Step 4 To specify the shared secret to be used between the selected Managed Device and the selected AAA server, type that key in the **AAA key for '***hostname***'** box.

This value must contain at least eight alphanumeric character; however, it cannot include ?, ", a tab character, or a carriage return character (the **Enter** key).

Step 5 For each AAA server that you want to add to the **AAA servers for pass-through traffic** box, repeat Steps 2 through 4.

Clicking Move Up and Move Down, you can order the servers in the list. Top-down order determines query order.

Step 6 To accept your changes and close the selected panel, click **OK**.

Step 7 To save any changes that you have made, click **Save** on the **File** menu.

Security Monitor Overview

Monitoring Center for Security (Security Monitor) is part of the CiscoWorks family of applications. It runs on a CiscoWorks Server and provides a web-based interface for monitoring a variety of Cisco security devices. Additionally, Security Monitor provides the following features:

- A real-time event viewer
- Event notification
- Event reporting
- Event correlation

Version 1.1 of Security Monitor introduces several new features and supports Cisco Intrusion Detection System Sensors running Cisco Intrusion Detection System software version 4.0.

Web-Based Interface

Security Monitor provides a web-based interface, which allows remote access to the application. When accessing the CiscoWorks Server over an unsecure network, you can use CiscoWorks Server SSL connectivity to secure the session. Refer to the CiscoWorks Common Services documentation for more information about using SSL to connect to the CiscoWorks Server.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1-1
Fls: 1296
Doc: 3701

Supported Devices and Monitored Events

You can monitor security events from the following Cisco devices:

Note The Message Format column describes the protocol used to send event data to Security Monitor.

Device	Monitored Events	Message Format
Cisco Intrusion Detection System Sensor	IDS events	• postoffice (Cisco Intrusion Detectio n System software version 3.x and earlier) • RDEP (Cisco Intrusion Detection System software version 4.0 and later)
Cisco IDS Host Sensor	IDS events	Syslog
Cisco IOS router with: • IOS Firewall • Cisco Intrusion • Detection System software	IDS subsystem events	Syslog or postoffice (syslog recommended)
PIX Firewall	All firewall and IDS events	Syslog

Real-Time Event Viewer

Security Monitor Event Viewer provides a near real-time view of security events as they occur on your network. Near real-time refers to the slight delay that may occur as events are detected by your network devices and then propagated to your Security Monitor server. In most cases, this delay is negligible.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
78-15616-01
Fls: 1297
Doc 3701

E C T
1393
CPV

Event Viewer provides a tabular view of the incoming event data. The data is arranged in a hierarchal tree that allows you to drill down quickly to isolate problems and find trends in the event data. You can sort the view based on the various elements of the data, such as signature name. The ability to drill down and reorder the data provides a basic means to perform real-time event correlation.

Event Viewer also provides access to tools that provide additional security information. You can select groups of events to display as a graph. You can resolve IP addresses within events to hostnames. You can launch the Network Security Database to provide details about a signature. And, for some events, you can display "context" data, such as the traffic that actually triggered the event.

Event Notification

Using Event Rules, you can configure Security Monitor to send e-mail notifications when specific criteria are met. You can also use Event Rules to trigger custom scripts. Security Monitor does not support pager notifications directly; however, you can use pager notifications if you have an e-mail gateway to your paging system.

You can use Event Rules to create simple rules that provide notifications when a single event occurs. However, you gain their main benefit by using logical operators to create complex rules. These operators allow you to correlate the events or conditions that trigger the notification. You can also set thresholds that allow you to specify the number of times the criteria must be met before the notification is triggered. Using thresholds allows you to distinguish between purposeful events and random occurrences.

Event Reporting

Event reporting provides a snapshot view of security events on your network. Report filters, such as dates and event type, allow you to refine the information shown in the report. You can run reports on-demand or schedule them to be run regularly. By default, reports are stored in the database. However, you can export the report to an HTML file or send the report to one or more recipients through e-mail.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1-3
Fls: 1298
Doc:
3701

Event Correlation

Security Monitor supports basic event correlation through the Event Viewer, Event Rule, and Reporting subsystems.

When you start the Security Monitor Event Viewer with the setting to view "All IDS Alarms", you see the IDS alarms from all monitored devices. Reordering the columns in the Event Viewer provides you with a flexible view of event data, and multiple ways to correlate those events. You can then reorder the columns in the Event Viewer to correlate the events by specific attributes, such as source address, signature name, and so on. For example, by grouping the events in the Event Viewer by source address, signature name, and then by device, you can determine which devices detected a specific event from a specific source.

In the same manner, you can filter the reports to provide you with a correlated, snapshot view of your event data. Filter options include source and destination addresses of the events, device detecting the event, signature the event matched, and so on. These reports can be scheduled or produced on-demand, and can include information from all the monitored devices. They can also be run for a specific range of dates to provide a historical view of the data.

Event Rules provide an even more flexible manner of event correlation by allowing you to create logical relationships between the IDS events produced by all monitored devices, and then to send e-mail notifications or run a custom script based on the relationships that you define.

Note Security Monitor does not provide correlation of non-IDS syslog events with IDS events using Event Rules.

New Features in Security Monitor 1.1

The following new features have been added to Security Monitor 1.1:

- Support for Cisco Intrusion Detection System software version 4.0. Cisco Intrusion Detection System software version 4.0 uses RDEP (Remote Data Exchange Protocol), a proprietary HTTP-based protocol, instead of the postoffice protocol.
- The ability to import Cisco Intrusion Detection System Sensor communication settings from a remote Management Center for IDS Sensors (IDS MC) server.
- The ability to graph event viewer data.
- The ability to use view statistics about the subcomponents of sensors running Cisco Intrusion Detection System software version 4.0.

Defining and Viewing Reports

You can access the reporting features that are available in Monitoring Center for Security (Security Monitor) from the Reports tab. You can generate and view reports about network activities monitored by sensors on your network. The reports include summary reports about alarms, sources, destinations, or a specific sensor on your network. By default, all events monitored by a sensor are retained by Security Monitor. Therefore, unless you delete events from the database, you can generate reports based on all recorded activities.

If the desired event is not being generated, verify that the sensor signature setting that corresponds to the event is enabled. Sensors generate events for only those signatures that are enabled. These events are then received by the Security Monitor server.

You can also generate audit reports. The audit reports provide information about system events. The following sections describe the types of reports and how to generate and access reports:

- Understanding the Types of Reports, page 6-2
- Scheduling and Generating Reports, page 6-5
- Viewing Reports, page 6-7
- Exporting a Report, page 6-7
- Deleting Generated Reports, page 6-8
- Editing Report Parameters, page 6-9
- Deleting Scheduled Report Templates, page 6-10

ECT 5264 CPL - AC

Understanding the Types of Reports

You can view two categories of reports in Security Monitor: alarm reports and audit reports. Alarm reports provide information about the events being collected by Security Monitor. Audit reports provide information about Security Monitor system events.

Both types of reports can be generated on-demand or scheduled for a later date and time. You can configure scheduled reports to repeat at regular intervals.

The following sections describe the different report types:

- About Alarm Reports, page 6-2
- About Audit Reports, page 6-4
- About Scheduled Reports, page 6-5

About Alarm Reports

You can generate the following alarm reports in Security Monitor:

- **Security Alarm Source Report**—Summarizes alarms received on the syslog port by the source of the events. For example, if Security Monitor receives alarms from a PIX Firewall, use this report to view the alarm information. Filterable by Event Level, Source IP Address, and Time/Date.
- **Security Alarm Detailed Report**—Provides detailed information for each security alarm received. Filterable by Event Level, Source IP Address, and Time/Date.
- **IDS Top Sources Report**—Reports the specified number of source IP addresses that have generated the most events during a specified time period. Filterable by Date/Time, Top *n*, where *n* is the number of sources, Destination Direction, Destination IP Address, Signature or Signature Category, Sensor, and Event Level.
- **IDS Top Source/Destination Pairs Report**—Reports the specified number of source/destination pairs (that is, connections or sessions) that have generated the most alarms during a specified time period. Filterable by Date/Time, Top *n*, where *n* is the number of source/destination pairs, Signature or Signature Category, Sensor, Event Level, Source Direction, Destination Direction, Source Address, and Destination Address.

- **IDS Top Destinations Report**—Reports the specified number of destination IP addresses that have been targeted for attack during a specified time period. Filterable by Date/Time, Top *n*, where *n* is the number of destinations, Source Direction, Source Address, Signature or Signature Category, Sensor, and Event Level.
- **IDS Top Alarms Report**—Reports the specified number of top alarms, by signature name, that have been generated during a specified time period. Filterable by Date/Time, Top *n*, where *n* is the number of alarms, Source Direction, Destination Direction, Source Address, Destination Address, Signature or Signature Category, Sensor, Event Level, and Signature or Signature Category.
- **IDS Summary Report**—Provides a summary of event information for an organization during a specified time period. Filterable by Date/Time, Organization, Source Direction, Destination Direction, Signature or Signature Category, and Event Level.
- **IDS Alarms by Sensor Report**—Reports logged alarms based on the sensor (Host ID) that detected the event. Filterable by Date/Time, Source Direction, Destination Direction, Source Address, Destination Address, Signature or Signature Category, Sensor, Event Level, and Event Count.
- **IDS Alarms by Hour Report**—Reports alarms in one-hour intervals over the time specified by the user. Filterable by Date/Time, Source Direction, Destination Direction, Source Address, Destination Address, Signature or Signature Category, Sensor, Event Level, and Event Count.
- **IDS Alarms by Day Report**—Reports alarms in one-day intervals over the time specified by the user. Filterable by Date/Time, Source Direction, Destination Direction, Source Address, Destination Address, Signature or Signature Category, Sensor, Event Level, and Event Count.
- **IDS Alarm Source/Destination Pair Report**—Reports logged alarms based on source/destination IP address pairs (that is, connections or sessions). Filterable by Date/Time, Signature or Signature Category, Sensor, Event Level, Alarm Count, Source Direction, Destination Direction, Source Address, and Destination Address.
- **IDS Alarm Source Report**—Reports alarms based on the source IP address that generated the alarm. Filterable by Date/Time, Destination Direction, Destination Address, Signature or Signature Category, Sensor, Event Level, Alarm Count, Source Direction, and Source Address.

ECT 5262 CPL - AC

- **IDS Alarm Report**—Reports logged alarms based on signature names. Filterable by Date/Time, Source Direction, Destination Direction, Source Address, Destination Address, Sensor, Event Level, Event Count, and Signature or Signature Category.
- **IDS Alarm Destination Report**—Reports alarms based on the destination IP address that generated the alarm. Filterable by Date/Time, Source Direction, Source Address, Signature or Signature Category, Sensor, Event Level, Event Count, Destination Direction, and Destination Address.
- **Daily Metrics Report**—Reports event traffic totals, by day, from the selected date until the current date. Reporting occurs in 24-hour intervals, starting at midnight. The report shows events by platform (PIX, IOS, Sensor, RDEP) and event type (IDS or Security).
- **24 Hour Metrics Report**—Reports all alarm traffic from the most recent 24 hours in 15 minute intervals. There are no filters for this report.

About Audit Reports

Audit reports provide information about management server events. If IDS MC and Security Monitor are installed on the same server, the generated audit reports and scheduled audit report templates are shared between the applications.

The following audit reports are available:

- **Subsystem Report**—Reports audit records ordered by the IDS subsystem, which includes systems from IDS MC and Security Monitor and systems common to each. Filterable by Event Severity, Date/Time, and Subsystem.
- **Sensor Version Import Report**—Reports the audit records that are generated when the version identifier of IDS sensor devices is imported into IDS MC. These records indicate success or failure of the import operation. Filterable by Device, Event Severity, and Date/Time.
- **Sensor Configuration Import Report**—Reports the audit records that are generated when you import IDS Sensor configurations into IDS MC. The resulting records can be used to determine success or failure in device configuration import tasks. Filterable by Device, Event Severity, and Date/Time.

Doc: 3791

ECT 1 5261 Comum CPL - AC

- **Sensor Configuration Deployment Report**—Reports records related to IDS sensor configurations deployed to devices using IDS MC. These records indicate successful deployment or provide error messages where appropriate for deployment operations. Filterable by Device, Event Severity, and Date/Time.
- **Console Notification Report**—Reports the console notification records generated by the notification subsystem. Filterable by Event Severity and Date/Time.
- **Audit Log Report**—Reports audit records by the server and application. Unlike the other report templates, this report template provides a broad, non-task-specific view of audit records in the database. Filterable by Task Type, Event Severity, Date/Time, Subsystem, and Applications.

About Scheduled Reports

For each report type that you choose to generate, you can enter a report title, schedule, and notification options. Enter this information in the Schedule Report page when you select **Reports > Generate**. You can run the report immediately, or you can schedule the report to run at a later time, at regular intervals, or both.

If you choose to run the report at a later time, you must specify the date and time that you want the report to run. Additionally, you can schedule the report to run at regular intervals, such as hourly, daily, or weekly. You can edit the report parameters of a scheduled report on the Edit Scheduled Reports page, which you access by selecting Reports > Scheduled. You can also delete scheduled report templates from this page.

Each time a scheduled report is run, it is added to the Completed Report page.

Scheduling and Generating Reports

On the Select Report page, you can select the type of report to generate and define the parameters for the selected report. Based on the scheduling parameters you select, the report runs immediately, at a later time, or at regular intervals.

RQS 6-5 CPMI - CORREIOS 1308 Fls: Doc: 3791

To generate a report, follow these steps:

Step 1 Select **Reports > Generate**.

Result: The Select Report page appears.

Tip In Security Monitor, you can filter which reports appear on the page. From the Report Group list, select **All** to show both alarm and audit reports, **Alarms** to show only alarm reports, or **Audit** to show only audit reports.

Step 2 Select the report type that you want to generate, and then click **Select**.

Result: The Report Filtering page appears.

Step 3 Enter the report parameters for the report type you selected. Then, click **Next**.

Result: The Schedule Report page appears.

Step 4 Enter a name for the report in the Report Title field.

Step 5 Click the **Run Now** or **Schedule for Later** radio button under Schedule Options. If you select Run Now, skip to Step 7. If you select Schedule for Later, specify the following options:

a. Specify the date and time that you want the report to run in the Start Time list boxes. The date is specified by month, day, and year. The time is specified in hours and minutes. The time zone used to determine the time is to the right of the Start Time list boxes.

b. To run the report at regular intervals, select an option in the Repeat every list box. You can schedule the report to run every day, week, weekday, weekend day, hour, or minute.

Step 6 To send an e-mail notification to someone when the report runs, select the **Email report to** check box and enter an e-mail address in the adjacent field. Use commas to separate multiple addresses. Then, click **Finish**.

Result: If you select Run Now, the report runs and you can view the generated report by selecting Reports > View. If you select Schedule for Later, you can view the scheduled report template by selecting Reports > Scheduled.

Viewing Reports

After you generate a report, you can view it.

To view a report, follow these steps:

Step 1 Select **Reports > View.**

Result: The Choose Completed Report page appears.

Tip In Security Monitor, you can filter which reports appear on the page. From the Report Group list, select **All** to show both alarm and audit reports, **Alarms** to show only alarm reports, or **Audit** to show only audit reports.

Step 2 Select the check box corresponding to the title of the report you want to view.

Step 3 To view the selected report, click **View.**

Result: The report appears in the Report page.

Step 4 To view the report in a new browser window, click **Open in Window. . ..**

Result: The report appears in a new browser window.

Exporting a Report

After you generate a report, you can export that report to an HTML file.

To export a report, follow these steps:

Step 1 Select **Reports > View.**

Result: The Choose Completed Report page appears.

Tip In Security Monitor, you can filter which reports appear on the page. From the Report Group list, select **All** to show both alarm and audit reports, **Alarms** to show only alarm reports, or **Audit** to show only audit reports.

RQS 6-7 5 - CN
CPMI - CORREIOS

Fls:
3701
Doc:

ECT 5248 Fls: AC

Step 2 To select the report that you want to export, select the check box corresponding to the report title.

Step 3 Click **Open in Window**.

Result: If you are using Internet Explorer, the report appears in a new browser window; proceed to Step 4. If you are using Netscape Navigator, the Unknown File Type dialog box appears; skip to Step 5.

Step 4 To save the report, select **File > Save As** from the Internet Explorer menu bar. Browse to the location where you want to save the file and enter a filename. Then, click **Save**.

Result: The report is saved using the filename and location you specified.

Skip Step 5.

Step 5 To save the report, click **Save File**. Browse to the location where you want to save the file and enter a filename. Then, click **Save**.

Result: The report is saved using the filename and location you specified.

Deleting Generated Reports

You can delete generated reports. If the report was generated from a scheduled report template, deleting the report does not delete the associated scheduled report template.

To delete a report, follow these steps:

Step 1 Select **Reports > View**.

Result: The Choose Completed Report page appears.

Tip In Security Monitor, you can filter which reports appear on the page. From the Report Group list, select **All** to show both alarm and audit reports, **Alarms** to show only alarm reports, or **Audit** to show only audit reports.

03/2005 - CN
CPMI - CORREIOS

Step 2 Select the check box next to the title of the report you want to delete.

Tip You can delete more than one report at a time. To delete more than one report, select the check boxes next to all reports that you want to delete.

Result: A check mark appears next to each report you selected.

Step 3 To delete the selected report, click **Delete**.

Result: The report is deleted. The report name is removed from the list of available reports.

Editing Report Parameters

You can edit the report parameters or the schedule for a scheduled report template.

To edit the report parameters, follow these steps:

Step 1 Select **Reports > Scheduled**.

Result: The Edit Scheduled Reports page appears.

Tip In Security Monitor, you can filter which reports appear on the page. From the Report Group list, select **All** to show both alarm and audit reports, **Alarms** to show only alarm reports, or **Audit** to show only audit reports.

Step 2 Select the check box corresponding to the title of the report template that you want to edit.

Result: A check mark appears next to the report you selected.

Step 3 To open the selected report template, click **Edit**.

Result: A new page displays the report parameters. Depending on the type of report, the parameters are different.

ECT 5246 Folha 19 CPL - AC

Step 4 Change any report parameters that you want to. To save your changes, click **Finish**.

Result: The changes you made are saved to the report template.

Deleting Scheduled Report Templates

You can delete unwanted scheduled report templates. Deleting a scheduled report template also deletes all associated reports that have already been generated.

To delete a scheduled report template, follow these steps:

Step 1 Select **Reports > Scheduled**.

Result: The Edit Scheduled Reports page appears.

Tip In Security Monitor, you can filter which reports appear on the page. From the Report Group list, select **All** to show both alarm and audit reports, **Alarms** to show only alarm reports, or **Audit** to show only audit reports.

Step 2 Select the check box corresponding to the title of the report you want to delete.

Tip You can delete more than one report template at a time. To do so, select the check boxes corresponding to all the report templates that you want to delete.

Result: A check mark appears next to each report you selected.

Step 3 To delete the report template, click **Delete**.

Result: The selected report template and all associated end reports are deleted.

IDS Device Manager Configuration Tasks

After configuring system information, you are ready to configure signatures, set up blocking, set up automatic signature updates, and restore defaults.

The following sections describe how to configure these options through the Configuration tab:

- Configuring Signatures, page 3-1
- Configuring Blocking, page 3-20
- Configuring Automatic Updates, page 3-35
- Restoring Default Settings, page 3-38

Configuring Signatures

You can create system variables, create event filters, and tune signatures through the Sensing Engine.

The following sections describe how to configure signatures through the Sensing Engine:

- Explaining Signatures, page 3-2
- Configuring Alarm Channel System Variables, page 3-3
- Configuring Alarm Channel Event Filters, page 3-6
- Configuring Virtual Sensor System Variables, page 3-9
- Working with Virtual Sensor Signature Configuration Mode, page 3-12
- Identifying Traffic Oversubscription, page 3-19

Explaining Signatures

Attacks or other misuses of network resources can be defined as network intrusions. Network intrusions can be detected by sensors that use a signature-based technology. A signature is a set of rules that your sensor uses to detect typical intrusive activity, such as denial of service (DoS) attacks. As sensors scan network packets, they use signatures to detect known attacks and respond with actions that you define.

The sensor compares the list of signatures with network activity. When a match is found, the sensor takes an action, such as logging the event or sending an alarm to IDS Event Viewer. Sensors allow you to modify existing signatures and define new ones.

Signature-based intrusion detection can produce false positives because certain normal network activity can be misinterpreted as malicious activity. For example, some network applications or operating systems may send out numerous ICMP messages, which a signature-based detection system might interpret as an attempt by an attacker to map out a network segment. You can minimize false positives by tuning your sensors.

To configure a sensor to monitor network traffic for a particular signature, you must enable the signature. By default, the most critical signatures are enabled when you install IDS Device Manager. When an attack is detected that matches an enabled signature, the sensor generates an alert event (formerly known as an alarm), which is stored in the sensor's event store. The alert events, as well as other events, may be retrieved from the event store by web-based clients. By

ECT 5243 Paulica CPL - AC

default the sensor logs all Informational alarms or higher. If you have added IDS Event Viewer as a destination, the alarm is sent to the IDS Event Viewer database and you can view the alarm in IDS Event Viewer.

Some signatures have subsignatures, that is, the signature is divided into subcategories. When you configure a subsignature, changes made to the parameters of one subsignature apply only to that subsignature. For example, if you edit signature 3050 subsignature 1 and change the severity, the severity change applies to only subsignature 1 and not to 3050 2, 3050 3, and 3050 4.

Built-in signatures are known attack signatures that are included in the sensor software and are enabled by default. You cannot add to or delete from the list of built-in attack signatures. You also cannot rename them. You can tune built-in signatures by adjusting several signature parameters. Built-in signatures that have been modified are called *tuned* signatures.

You can create new signatures, which are called *custom* signatures. Custom signature IDs begin at 20000. You can configure them for any number of things, such as matching of strings on UDP connections, tracking of network floods, and scans. Each signature is created using a signature engine specifically designed for the type of traffic being monitored.

Configuring Alarm Channel System Variables

Alarms are sent to the alarm channel, where they are filtered and aggregated. You cannot select the alarm channel, because there is only one alarm channel in version 4.0.

You can change the value of an alarm channel system variable, but you cannot add variables or delete variables. You also cannot change the name, type, or constraints of a variable.

For all the Sensing Engine panels, you must click the **Save Changes** icon on the Activity bar to apply your new configuration.

You use the system variables when configuring alarm channel event filters. When you want to use the same value within multiple filters, use a variable. When you change the value of a variable, the variables in all the filters are updated. This saves you from having to change the variable repeatedly as you configure alarm filters. See Configuring Alarm Channel Event Filters, page 3-6, for more information.

CPMI CORREIOS
1316
Fls:
3701
Doc:

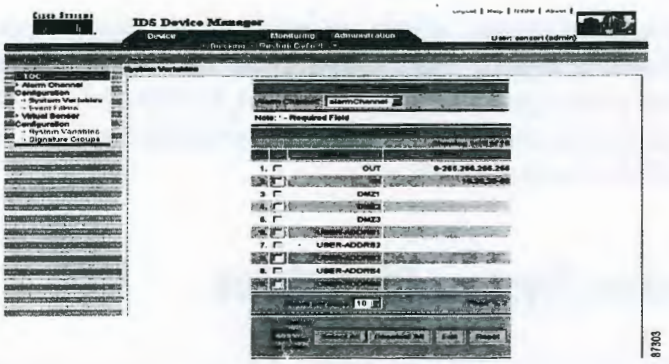
For example, if you had an IP address space that applied to your engineering group and there were no Windows systems in that group, and you were not worried about any Windows-based attacks, you could set up a USER-ADDR1 to be the engineering group's IP address space. You could then use this variable on the Event Filters page to set up the filter to ignore all Windows-based attacks for USER-ADDR1.

To define alarm channel system variables, follow these steps:

Step 1 Select **Configuration > Sensing Engine > Alarm Channel Configuration > System Variables.**

The System Variables page appears.

Figure 3-1 System Variables Page

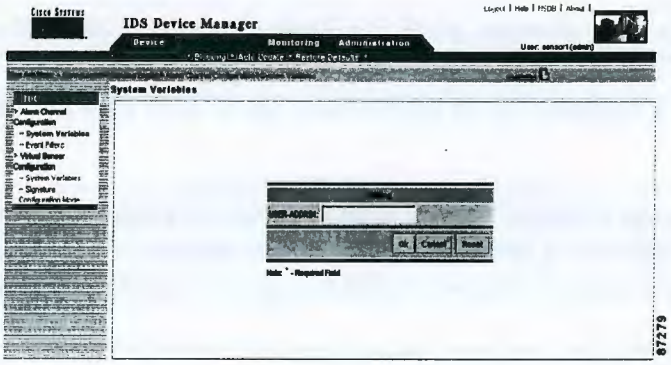


Step 2 Select the check box next to the system variable you want to edit, and then click **Edit.**

The Editing page appears for the variable that you chose.

Note You can edit only one variable at a time. You can adjust the page view using the Rows per page list box at the bottom of the page, or you can move to additional pages of variables by selecting a page from the Page list box.

Figure 3-2 Editing Page



Step 3 Fill in the following values for the following system variables (according to the one that you are editing):

- OUT

  OUT is defined as anything that is not included in IN. You cannot edit this variable. The default is 0–255.255.255.255.

- IN

  IN is a list of all internal IP address spaces. Enter your internal IP addresses.

- DMZ1, DMZ2, and DMZ3

  You can use DMZ to define any valid IP address. These are named DMZ for you to use with filtering signatures that pertain to firewalls.

- USER-ADDRS1, USER-ADDRS2, USER-ADDRS3, USER-ADDRS4, and USER-ADDRS5

  You can use USER-ADDR to define any valid IP address. You can set up a USER-ADDR variable to apply to any group of IP addresses that you want to use a filter on.

- SIG1, SIG2, SIG3, SIG4, and SIG5

  You can use SIG to define popular signatures that you like to exclude for certain addresses.

Note To reset the form, click **Reset**.

Step 4 Click **Ok**.

Note To undo your changes, click the **Undo Changes** icon on the Activity bar.

Step 5 Click the **Save Changes** icon in the Activity bar to save your system variables.

Note A message displays "Configuration update in progress. This page will be unavailable for a few minutes." In a few minutes, click **Alarm Channel Configuration > System Variables** again to see the edited variable in the list.

The new value appears in the Value column.

Step 6 Repeat Steps 2 though 5 to edit additional system variables.

Configuring Alarm Channel Event Filters

You can configure event filters that are based on source and destination addresses for specified signatures. You can use the alarm channel system variables that you defined on the Alarm Channel System Variables page to group addresses for your filters.

For all the Sensing Engine panels, you must click the **Save Changes** icon on the Activity bar to apply your new configuration.

3701
Doc:

Step 3 In the SIGID field, enter the signature IDs of the events to which this filter should be applied.

You can use a list (2001, 2004), or a range (2001–2004), an asterisk (*) for all signatures, or one of the SIG variables if you defined them on the Alarm Channel System Variables page.

Step 4 In the SubSig field, enter the subsignature IDs of the events to which this filter should be applied.

Step 5 In the Exception field, enter the exception (Boolean) to the event filter.

Note If the filter describes an exception to an event filter, you can create a "general case" exclusion rather than adding more specific information.

Step 6 In the SrcAddrs field, enter the source addresses of events to which this filter should be applied.

You can use one of the DMZ or USER-ADDR variables if you defined them on the Alarm Channel System Variables page.

Step 7 In the DestAddrs field, enter the destination addresses of events to which this filter should be applied.

You can use one of the DMZ or USER-ADDR variables if you defined them on the Alarm Channel System Variables page.

Note To reset the form, click **Reset**.

Step 8 Click **Apply to Sensor**.

Note To undo your changes, click the **Undo Changes** icon on the Activity bar.

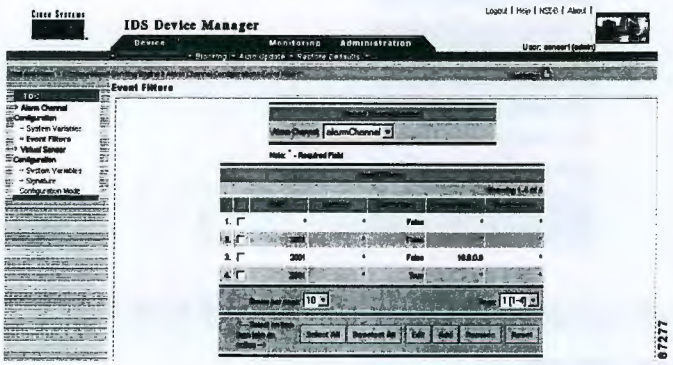
ECT 5237 Paula CPL - AC

Step 9 Click **Saves Changes** on the Activity bar to save your changes.

Note A message displays "Configuration information is not available at this time. Try again in a few minutes." After a few minutes, click **Event Filters** again to see the filter you added.

The filtered signature appears on the Event Filters page.

Figure 3-5 Added Event Filters Page



Step 10 To remove the filter, select the check box next to the signature and click **Remove**.

Configuring Virtual Sensor System Variables

You can change the value of a system variable but you cannot add variables or delete variables. You cannot change the name or type of a variable. You cannot select the virtual sensor, because there is only one virtual sensor in version 4.0.

RQS N 3-9 CN CPMI CORREIOS Fls: 1319 Doc: 3701

To configure the virtual sensor system variables, follow these steps:

Step 1 Select **Configuration > Sensing Engine > Virtual Sensor Configuration > System Variables**.

The System Variables page appears.

Step 3 Fill in the value of the system variable that you want to edit:

Note You can edit only one system variable at a time. You can adjust the page view using the Rows per page list box at the bottom of the page, or you can move to additional pages of variables by selecting a page from the Page list box.

- WEBPORTS

  WEBPORTS has a predefined set of ports where web servers are running, but you can edit the value. This variable affects all signatures that have web ports. The default is 80, 3128, 8000, 8010, 8080, 8888, 24326.

- Ports1, Ports2, Ports3, Ports4

  You can set up a list of ports to apply to particular signatures.

- ADDRS1, ADDRS2, ADDRS3, ADDRS4

  You can set up this variable with a list of addresses to use anywhere you can use IP addresses.

- IPReassembleMaxFrags

  You can define the total number of fragments you want the system to queue. You can define a number between 1000 and 50,000. The default is 10,000.

Note To reset the form, click **Reset**.

Step 4 Click **OK**.

Note To undo your changes, click the **Undo Changes** icon on the Activity bar.

CPMI - 3-11
1320
Fls:
Doc: 3701

Step 5 Click the **Save Changes** icon on the Activity bar to save your system variables.

Note A message displays "Configuration update in progress. This page will be unavailable for a few minutes." After a few minutes, click **Virtual Sensor Configuration > System Variables** to see the edited variable.

The new value appears in the Value column.

Step 6 Repeat Steps 2 though 5 to edit additional system variables.

Working with Virtual Sensor Signature Configuration Mode

The Signature Configuration Mode page displays a list of top level categories of signature groups for the virtual sensor. You can see all the signatures in the list or you can see signatures that are grouped according to their signature engine type. Certain signatures are enabled by default to provide you immediately with a certain level of security. When you modify a built-in signature, it becomes a tuned signature. You can also create signatures, which are called custom signatures.

You cannot select the virtual sensor, because there is only one virtual sensor in version 4.0.

You can display all individual signatures at once by clicking **All Signatures**. If you are looking for a particular signature, click **All Signatures**, and use the browser's search option to find the string you are looking for—the signature ID or the signature name.

You can display the signature list within a group by clicking the group name. Each group displays its enable level (the disabled, partially enabled, or enabled icon). You can enable or disable one, some, or all signatures within the group. To select the signature for enabling or disabling, select the signature check box.

You can tune built-in signatures. To tune a signature, select the check box and click **Edit**. Some signatures have subsignatures, which you can edit individually to have more control over the signature. You can create custom signatures, and then delete one, some, or all custom signatures. To create a custom signature, choose the correct signature engine, and then click Add and configure the signature parameters. For more information on signature engines and their parameters, see Appendix A, "Working With Signature Engines."

A signature can be in multiple groups. Editing a signature in one group, affects it in all groups. For example, if you enable all general attack signatures in the Attack category, it will enable 7107. If you disable the ATOMIC.ARP signature in the Engine category, 7107 will be disabled. Whichever action is the last one, is the one that is applied.

To configure virtual sensor signature groups, follow these steps:

Step 1 Select **Configuration > Sensing Engine > Virtual Sensor Configuration > Signature Configuration Mode**.

The Signature Groups page appears.

Figure 3-8 Signature Groups Page

Step 2 To enable or disable all signatures in a group, select the check box next to the signature group, and then click **Enable** or **Disable**.

Note A clear circle indicates that no signatures in that signature group are enabled. A solid circle indicates that all signatures are enabled. A partial circle indicates that at least one signature in that group is enabled.

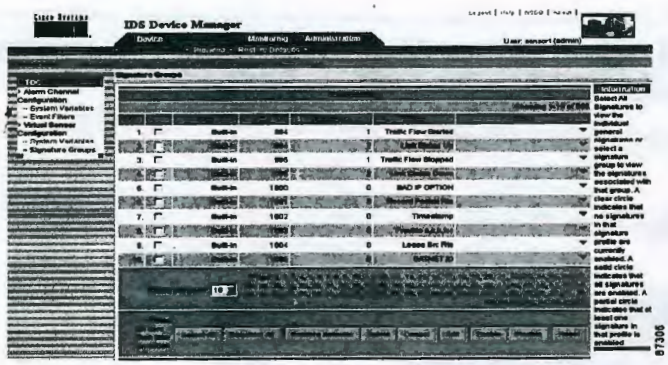
Note Click **Restore Defaults** to return the signature group to its default settings.

Step 3 You can click **All Signatures** to display all the IDS signatures or you can click a signature group name.

The All Signatures page appears.

Note If you select **All** in the Rows per page list box, it can take some time for all signatures to display.

Figure 3-9 All Signatures Page



The All Signatures page contains the following:

- Enabled or Disabled icon
- Signature ID
- Subsignature ID
- Signature name
- Type (built-in, tuned, custom)
- Severity level (Informational, Low, Medium, High)
- Action
- More (lists all the signature parameters; these appear when you edit the signature)

ECT 5231 Paulo PL - AC

Step 4 Select the check box(es) next to the signatures that you want to perform an action on:

Note You can edit only one signature at a time. You can adjust the page view using the Rows per page list box at the bottom of the page, or you can move to additional pages of variables by selecting a page from the Page list box.

- To enable or disable the signature(s), click **Enable** or **Disable**.

Caution Signatures can belong to more than one group. Enabling or disabling signatures in one group also affects those signatures that belong to other groups.

- To restore the defaults to a signature(s), click **Restore Defaults**.
- To delete a signature(s), click **Delete**.

Note You cannot delete built-in or tuned signatures, only custom signatures.

- To edit the signature(s), click **Edit**.

The Editing page appears.

This is where you tune built-in signatures. You can see the definition of each parameter by passing your mouse over the parameter. Some parameters are required (red asterisk), others have menu lists you can choose from, for others you must add text. For a detailed description of signature engines and parameters, see Appendix A, "Working With Signature Engines."

Step 10 Click the **Save Changes** icon on the Activity bar to save your changes.

Note A message displays "Configuration update in progress. This page will be unavailable for a few minutes." Click **Virtual Sensor Configuration > Signature Configuration Mode** to return to the Signature Configuration Mode page. Click **All Signatures** or the relevant signature group to see the tuned signature in the list.

The built-in signature that you edited now shows Tuned in the Type column.

Identifying Traffic Oversubscription

Signature 993 alarms tell you if the sensor is dropping packets and the percentage dropped to help you tune the traffic level you are sending to the sensor. For example, if the alarms show that there is zero or a very small percentage of dropped packets, the sensor is able to monitor the quantity of traffic being sent.

If you are seeing 993 alarms with a higher percentage of dropped packets, your sensor is oversubscribed. When a sensor gets oversubscribed, it can have difficulty in detecting alarms in TCP streams in a nonlinear fashion. The percentage of streams that are affected by the dropped packets is not easy to predict. If you find that you are operating your sensor in an environment where it is oversaturated and you need to continue operating it in that environment, we recommend disabling the TCP3WayHandshake and setting TCPReassemblyMode to loose so that best security is ensured.

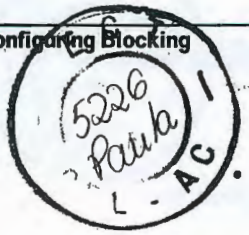
Signature 993, which is part of the signature engine OTHER, has the following configuration parameters:

- MpcInterval in seconds 5 <= MpcInterval <= 2500 (default = 30).

  MpcInterval is the interval between alarms.
- MpcPercentThreshold in percent 0 <= MpcPercentThreshold <= 100 (default = 0).

  MpcPercentThreshold is the percentage of missed packets that must be exceeded to trigger an alarm. A value of 100 percent disables this threshold.

CPMI - 3-19
1324
Fls:
Doc:
5701



- MpcAbsThreshold in packets 0 <= MpcAbsThreshold <= 65535 (default = 0).

  MpcAbsThreshold is the absolute number of missed packets that must be exceeded to trigger an alarm. A value of 65535 disables this threshold.

If either the MpcPercentThreshold or the MpcAbsThreshold is exceeded, the alarm is triggered.

Note If signature 993 is firing with 100 percent packet loss, the sensor is not generating alarms and there is a problem. Make sure that you have the most recent version of the sensor. If you have the most recent version, contact TAC to report the problem.

See OTHER Engine, page A-30, for more information on the OTHER signature engine.

Configuring Blocking

You can configure a sensor to block an attack by generating ACL rules for publication to a Cisco IOS router, or a Catalyst 6500 family switch, or by generating shun rules on a PIX Firewall.

The following sections describe how to set up blocking:

- Configuring Blocking Properties, page 3-21
- Configuring Addresses Never To Block, page 3-22
- Setting Up Logical Devices, page 3-24
- Configuring Blocking Devices, page 3-26
- Configuring Router Blocking Device Interfaces, page 3-28
- Configuring Catalyst 6K Blocking Device Interfaces, page 3-30
- Configuring a Master Blocking Sensor, page 3-31
- Setting Up a Blocking Forwarding Sensors, page 3-33

Configuring Blocking Properties

You set up global blocking properties for the Network Access Controller (NAC) on this page. NAC is responsible for controlling blocking actions on managed devices.

To configure blocking on the sensor, follow these steps:

Step 1 Select **Configuration > Blocking Properties**.

The Blocking Properties page appears.

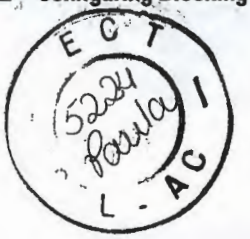
Figure 3-16 Blocking Properties Page

Step 2 Do not select the Allow the Sensor IP to be Blocked check box unless necessary.

Caution We suggest that you do not allow the sensor to block itself, because it will stop communicating with the managed device. You can select this option if you can ensure that if the sensor creates a rule to block its own IP address, it will not prevent the sensor from accessing the blocking device.

Step 3 In the Maximum Block Entries field, enter how many blocks are to be maintained simultaneously (0 to 250).

Note We do not recommend or support setting the maximum block entries higher than 250.



The default value is 100.

Note The number of blocks will not exceed the maximum block entries. If the maximum is reached, new blocks will not occur until existing blocks time out and are removed.

Note To reset the form, click **Reset**.

Step 4 Click **Apply to Sensor** to save your changes.

Configuring Addresses Never To Block

You must tune your sensor to identify hosts and networks that should never be blocked, not even manually, because you may have a trusted network device whose normal, expected behavior appears to be an attack. But such a device should never be blocked, and trusted, internal networks should never be blocked. Properly tuning signatures reduces the number of false positives and helps ensure proper network operations. Tuning and filtering signatures prevents alarms from being generated. If an alarm is not generated, the associated block does not occur.

If you specify a netmask, this is the netmask of the network that should never be blocked. If no netmask is specified, only the IP address you specify will never be blocked.

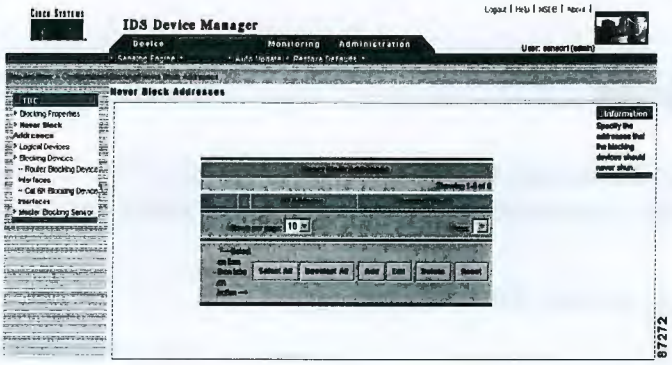
CPMI - CORREIOS

To set up addresses never to be blocked by blocking devices, follow these steps:

Step 1 Select **Configuration > Never Block Addresses.**

The Never Block Addresses page appears.

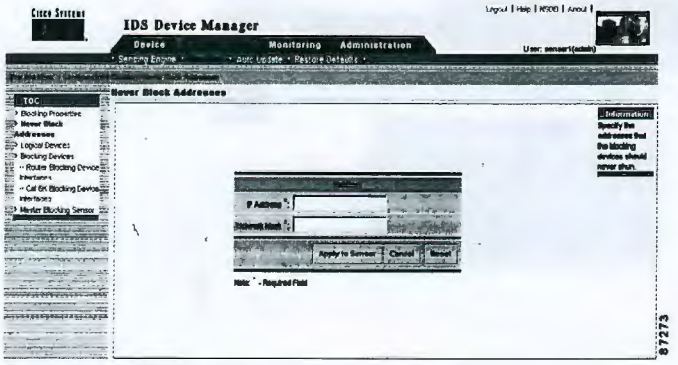
Figure 3-17 Never Block Addresses Page



Step 2 Click **Add** to add addresses that should never be blocked.

The Adding page appears.

Figure 3-18 Adding Page



Step 3 In the IP Address field, enter the IP address of the host that should never be blocked.

DOC Nº 03/2005 - CN
CPMI - CORREIOS
3-23
1326
Fls:
3701
Doc:

Step 4 In the Network Mask field, enter the network mask of the network that should never be blocked.

Note To reset the form, click **Reset**.

Step 5 Click **Apply to Sensor** to save your changes.

Setting Up Logical Devices

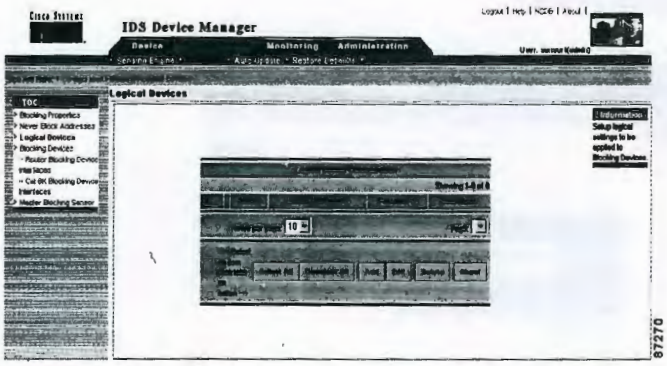
You can add logical devices that the senor will manage. For example, routers that all share the same passwords and usernames can be under one logical device name.

To set up logical devices, follow these steps:

Step 1 Select **Configuration > Logical Devices**.

The Logical Devices Configuration page appears.

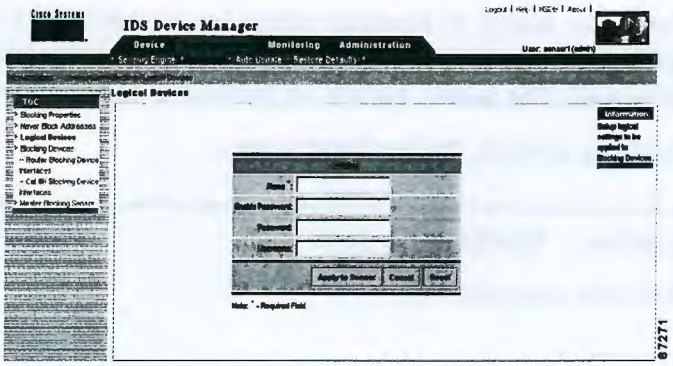
Figure 3-19 Logical Device Configuration Page



Step 2 Click **Add** to add the logical devices that the sensor will manage.

The Adding page appears.

Figure 3-20 Adding Page



Step 3 In the Name field, enter the name of the logical device.

Step 4 In the Enable Password field, enter the enable password for the logical device (1 to 16 characters).

Note If there is no enable password, enter **none**.

Step 5 In the Password field, enter the Telnet or SSH password for the logical device (1 to 16 characters).

Note If there is no password, enter **none**.

Step 6 In the Username field, enter the username for the logical device.

Note If there is no username, enter **none**.

Note To reset the form, click **Reset**.

Step 7 Click **Apply to Sensor** to save your changes.

Configuring Blocking Devices

You can configure your sensor to block an attack by generating ACL rules for publication to a Cisco IOS router, or a Catalyst 6500 switch, or by generating shun rules on a PIX Firewall. The router, switch, or firewall is called a blocking device.

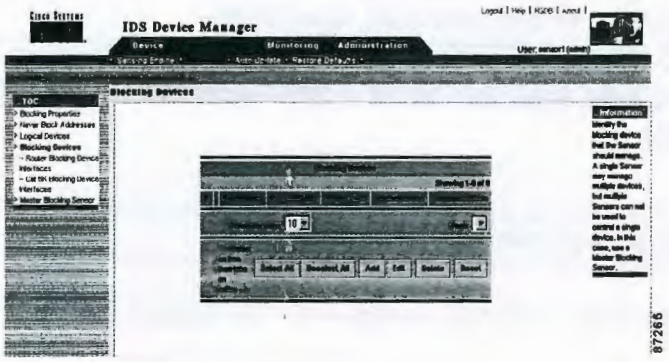
To configure blocking devices, follow these steps:

Step 1 Select **Configuration > Blocking Devices**.

The Blocking Devices page appears.

Caution A single sensor can manage multiple devices, but multiple sensors cannot be used to control a single device. In this case, use a master blocking sensor. See Configuring a Master Blocking Sensor, page 3-31, for more information.

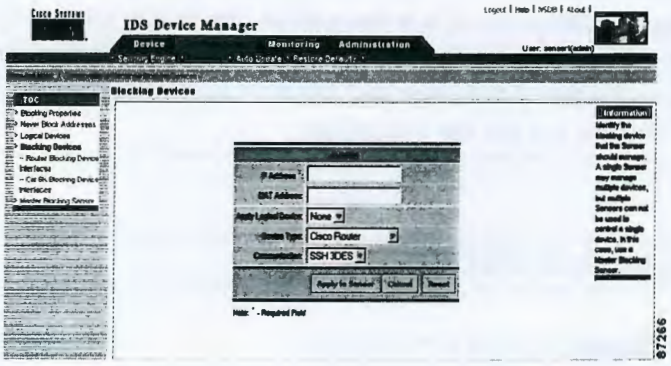
Figure 3-21 Blocking Devices Page



Step 2 Click **Add** to add a blocking device.

The Adding page appears.

Figure 3-22 Adding Page



Step 3 In the IP Address field, enter the IP address of the blocking device.

Step 4 In the NAT Address field, enter the NAT address of the blocking sensor.

Step 5 Select an option from the Apply Logical Device list box.

Note The same logical device can be used for multiple blocking devices. If you do not have logical devices set up, the only option is None.

Step 6 In the Device Type field, enter the type of device that will do the blocking:

- Cisco Router
- Catalyst 6000 VACL
- PIX Firewall

Step 7 In the Enable SSH field, select the type of secure communications you want to enable between the sensor and the blocking device:

- SSH 3DES
- SSH DES
- Telnet

Note Before you can use SSH 3DES or SSH DES, you have to use the **ssh host-key** *ipaddress* to obtain the public key in the correct format so that you can add the host to the known hosts list. Refer to the *Cisco Intrusion Detection System Appliance and Module Installation and Configuration Guide Version 4.0* for the procedure.

Note To reset the form, click **Reset**.

Step 8 Click **Apply to Sensor** to save your changes.

Configuring Router Blocking Device Interfaces

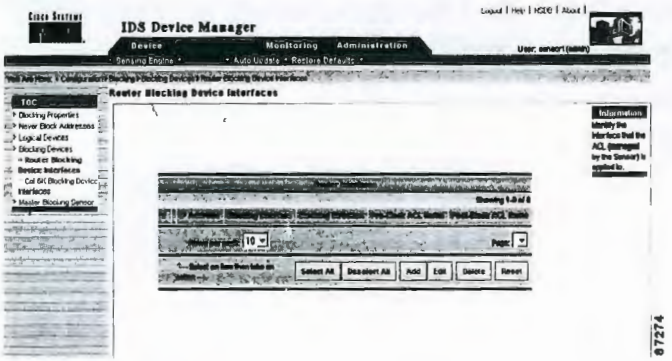
You must configure the blocking interfaces on the router and specify the direction of traffic you want blocked.

To configure the blocking interfaces on a router, follow these steps:

Step 1 Select **Configuration > Router Blocking Device Interfaces**.

The Router Blocking Device Interfaces page appears.

Figure 3-23 Router Blocking Device Interfaces Page



E C T
5216
- AC

Step 2 Click **Add** to configure the blocking interfaces on the router.

The Adding page appears.

Figure 3-24 Adding Panel

Step 3 In the IP Address field, enter the IP address of the router that will be used to block.

Step 4 In the Blocking Interface field, enter the interface on the router that will be used for blocking (1 to 32 characters).

Step 5 From the Blocking Direction list box, select the direction of the traffic through the interface that should be blocked (In, Out).

Step 6 In the Pre-Block ACL Name field, enter the name of the Pre-Block ACL (1 to 64 characters).

Step 7 In the Post-Block ACL Name field, enter the name of the Post-Block ACL (1 to 64 characters).

Note To reset the form, click **Reset**.

Step 8 Click **Apply to Sensor** to save your changes.

Configuring Catalyst 6K Blocking Device Interfaces

You must configure the blocking interfaces on the Catalyst switch and specify which VLAN you want blocked.

To configure the blocking interfaces on a Catalyst switch, follow these steps:

Step 1 Select **Configuration > CAT 6K Blocking Device Interfaces.**

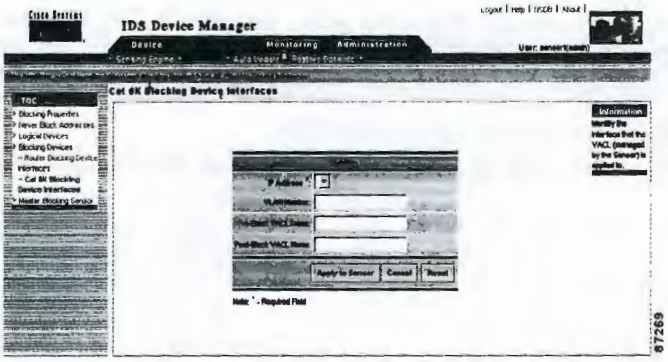
The CAT 6K Blocking Device Interfaces page appears.

Figure 3-25 CAT 6K Blocking Device Interfaces Page

Step 2 Click **Add** to configure the blocking interfaces on the router.

The Adding page appears.

Figure 3-26 Adding Page



E C T
5214
Paula
AC

Step 3 In the IP Address field, enter the IP address of the Catalyst switch that will be used to block.

Step 4 In the VLAN field, enter the VLAN number that the sensor will configure for blocking.

Step 5 In the Pre-Block VACL Name field, enter the name of the Pre-Block VACL (1 to 64 characters).

Step 6 In the Post-Block VACL Name field, enter the name of the Post-Block VACL (1 to 64 characters).

Note To reset the form, click **Reset**.

Step 7 Click **Apply to Sensor** to save your changes.

Configuring a Master Blocking Sensor

Multiple sensors can forward blocking requests to a specified master blocking sensor, which controls one or more devices. The sensor that is sending its block requests to the master blocking sensor is referred to as a "blocking forwarding sensor." On the blocking forwarding sensor, you must specify which remote host serves as the master blocking sensor; on the master blocking sensor you must add the blocking forwarding sensors to its remote host configuration.

Note Only the master blocking sensor is configured to manage the network devices. The blocking forwarding sensor should not be configured to manage network devices.

See Setting Up a Blocking Forwarding Sensors, page 3-33, for the procedure to configure the blocking forwarding sensor.

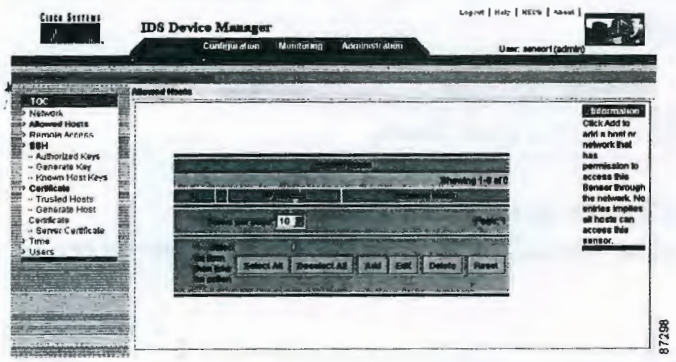
CPMI - CORREIOS
Fls: 1330
Doc: 3701

To configure blocking forwarding sensors to a master blocking sensor, follow these steps:

Step 1 Select **Device > Sensor Setup > Allowed Hosts**.

The Allowed Hosts page appears.

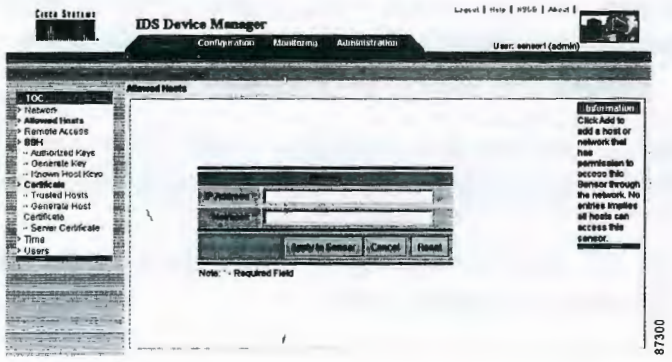
Figure 3-27 Allowed Hosts Page



Step 2 Click **Add** to add a sensor as a blocking forwarding sensor.

The Adding page appears.

Figure 3-28 Adding Page



Step 3 In the IP Addressfield, enter the IP address of the blocking forwarding sensor.

ECT 15212 Paula I L - AC

Step 4 If you are using SSH, the port number is the same port number that the master blocking sensor is using for IDM connections.

Note For example, if you are connecting using https, it is port 443 by default.

Step 5 In the User Name field, enter your IDS Device Manager administrator username.

Step 6 In the Password field, enter your IDS Device Manager administrator password.

Step 7 If you select Use SSH, you have to use the **tls trusted-host ip-address** *ipaddress* command.

Note To reset the form, click **Reset**.

Step 8 Click **Apply to Sensor** to save your changes.

Note Repeat this procedure for each sensor you want to identify as a blocking forwarding sensor.

Setting Up a Blocking Forwarding Sensors

The blocking forwarding sensor sends block requests to the master blocking sensor. On the blocking forwarding sensor, you must specify which remote host serves as the master blocking sensor.

See Configuring a Master Blocking Sensor, page 3-31, for more information on how to set up a master blocking sensor.

5210
Paula
A C

Step 4 In the Netmask field, enter the netmask of the master blocking sensor.

Note To reset the form, click **Reset**.

Step 5 Click **Apply to Sensor** to save your changes.

The master blocking sensor is added to both the Allowed Hosts page and to the Master Blocking Sensor page.

Configuring Automatic Updates

You can configure automatic service pack and signature updates, so that when service pack and signature updates are loaded on a central FTP or SCP server, they will be downloaded and applied to your sensor. The timeout default is 5 minutes.

Note The sensor cannot automatically download service pack and signature updates from Cisco.com. You must download the service pack and signature updates from Cisco.com to your FTP or SCP server, and then configure the sensor to download them from the FTP or SCP server.

See Supported FTP Servers, page 3-37, for a list of supported servers.

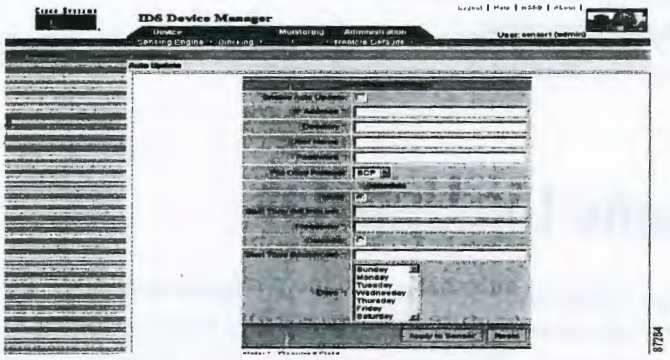
CPMI - CORREIOS
1332
Fls:
Doc: 3701

To configure automatic updates, follow these steps:

Step 1 Select **Configuration > Auto Update**.

The Auto Update page appears.

Figure 3-31 Auto Update Page



Step 2 Select the Enable Auto Update check box to enable automatic updates.

Step 3 In the IP Address field, enter the IP address of the server to poll for updates.

Step 4 In the Directory field, enter the path to the directory on the server where the updates are located (1 to 128 characters).

Step 5 In the Username field, enter the username to use when logging in to the server (1 to 16 characters).

Step 6 In the Password field, enter the username password on the server (1 to 16 characters).

Step 7 In the File Copy Protocol list box, select either **SCP** or **FTP**.

Step 8 For hourly updates, select **Hourly**, and follow these steps:

a. In the Start Time field, enter the time you want the updates to start (hh:mm:ss).

b. In the Frequency field, enter the hour interval at which you want every update to occur (1 to 8760).

For example, if you enter 5, every 5 hours the sensor looks at the directory of files on the server. If there is an available update candidate, it is downloaded and installed. Only one update is installed per cycle even if there are multiple available candidates.

ECT 5208 Rouda AC

Step 9 For calendar updates, select **Calendar**, and follow these steps:

a. In the Start Time field, enter the time you want the updates to start (hh:mm:ss).

b. In the Day field, select the day(s) you want to download updates.

Note To reset the form, click **Reset**.

Step 10 Click **Apply to Sensor** to save your changes.

Supported FTP Servers

The following FTP servers are supported for service pack and signature updates:

- Sambar FTP Server Version 5.0 (win32).
- Web-mail Microsoft FTP Service Version 5.0 (win32).
- Serv-U FTP-Server v2.5h for WinSock (win32).
- Solaris 2.8.
- HP-UX (HP-UX qdir-5 B.10.20 A 9000/715).
- Windows 2000 (Microsoft ftp server version 5.0).
- Windows NT 4.0 (Microsoft ftp server version 3.0).

Note The sensor cannot download service pack and signature updates from Cisco.com. You must download the service pack and signature updates from Cisco.com to your FTP server, and then configure the sensor to download them from your FTP server.

Step 11 Click **OK** to close the **Communications** dialog box.

Step 12 To apply the configuration changes, click the newly created transient version on the **Configuration Versions** window and click **Apply**.

Note Clicking **Cancel** discards any configuration changes.

Configuring Data Management

Note The following section applies to only the version 2.5 Sensor.

IDS data management is handled by a daemon called *sapd*. *sapd* collects log files created in the /usr/nr/var directory by another daemon called *loggerd*. The rate at which *sapd* collects log files (which can be either ASCII event logs or binary IP logs), is controlled by user-configurable thresholds.

The main goals of data management are:

- Collection of data in a fast, fault-tolerant manner
- Staging of that data to industrial-strength relational database management systems or archives.
- Preventing disk systems from filling up

This section includes the following topics:

- Setting Data Collection and Staging
- Setting Triggers
- Setting File Management Viewing Mode

ECT 3195 Paula CPL

Setting Data Collection and Staging

To configure data collection and staging, follow these steps:

Step 1 On the Director interface (NetRanger submap), click the machine icon you want to configure.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 In the currently applied version (in bold), double-click **Data Management**.

The **Data Management** dialog box opens.

Step 4 Click the **Logging** tab.

Step 5 Set the maximum log file size (in bytes) in the **bytes** field.

The default log file size is **300,000** bytes.

Step 6 Set the maximum log file age (in minutes) in the **minutes** field.

The default log file age is **240** minutes.

Note The log file size and log file age both control how fast *sapd* pulls the files from /usr/nr/var. For example, if you set the maximum log file size to 100 kilobytes, and set the maximum age to 30 minutes, then *sapd* pulls the log file in (a) 30 minutes if its file size is less than 100 kilobytes, or (b) sooner, if the file size reaches 100 kilobytes before the 30 minute threshold.

Step 7 Set an alarm's minimum context level (in other words, alarms below a certain severity will not have context data stored in the logfile) in the **Minimum context Level** field.

The default minimum context level is **2**.

Step 8 Click the **Database** tab.

Doc: 3701
Fls: 1337
ROS Nº 03/2005 - CN
CPMI - CORREIOS

ECT
1 5194
Paula
CPL - AC

Step 9 Set up a database account by editing the **User** and **Password** fields for User 1.

Note **User 2** and **Auxiliary 1** through **Auxiliary 3** are normally only used when installing a Remedy ARS Trouble Ticketing System (see "Setting Up a Remedy ARS Trouble Ticketing System" section in Appendix A, "Installing Third-Party RDBMS Tools," for more information).

Step 10 Click **OK** to close the **Data Management** dialog box.

Step 11 To apply the configuration changes, click the newly created transient version on the **Configuration Versions** window and click **Apply**.

Note Clicking **Cancel** discards any configuration changes.

Setting Triggers

The *sapd* daemon bases all its actions on triggers. Each trigger consists of a condition and an action. The condition defines when to launch an action.

To create a sample trigger, follow these steps:

Step 1 On the Director interface (NetRanger submap), click the machine icon you want to configure.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 In the currently applied version (in bold), double-click **Data Management**.

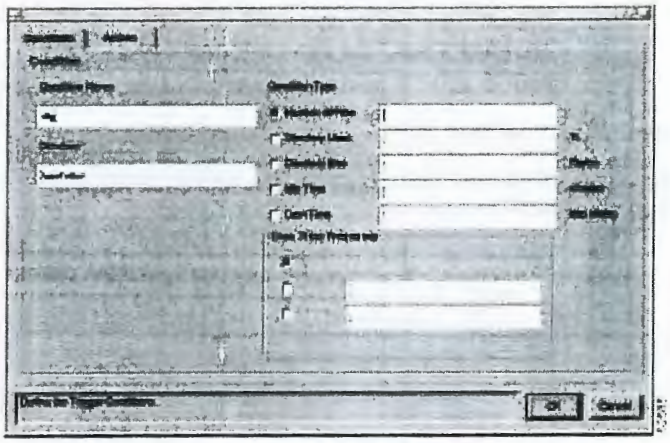
The **Data Management** dialog box opens.

Step 4 Click the **Triggers** tab.

Step 5 Click **Add**.

The **Add New Trigger** dialog box opens (see Figure 6-6).

Figure 6-6 Add New Trigger Dialog Box



Step 6 Type the name of your condition in the **Condition Name** box.

Step 7 Type `/usr/nr/bin` in the **Condition Directory** box.

Step 8 Select the **Number of Files** check box and type `5` in the field next to the check box.

Step 9 Select the **Notify** check box.

Step 10 Click **OK** to close the **Add New Trigger** dialog box.

Doc: 3701
Fls: 1338
CPMI - CORREIOS
RQS Nº 03/2005 - CN

ECT - AC
5192
Paula

Step 11 Click the **Notification** tab.

Step 12 Type a valid e-mail address in the **Notify Person #1** box.

The Director sends notifications to this e-mail address when the number of files in /usr/nr/bin reaches 5.

Step 13 Edit the **Notify Interval** field to change the minimum time between notifications.

The default interval is **60** minutes.

Step 14 Click **OK** to close the **Data Management** dialog box.

Step 15 To apply the configuration changes, click the newly created transient version on the **Configuration Versions** window and click **Apply**.

Note Clicking **Cancel** discards any configuration changes.

Setting File Management Viewing Mode

To set file management viewing mode, follow these steps:

Step 1 On the Director interface (NetRanger submap), click the Director icon.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 Right-click the currently applied version (in bold) and click **Open Folder** (or double-click the version to expand it).

Step 4 Right-click **Data Management** and click **Open**.

The **Data Management** dialog box opens.

Step 5 Click the **General** tab.

Step 6 The default setting is verbose mode. To change the viewing preference to brief, make sure that **Verbose DMP Display** is *not* selected.

Step 7 Click **OK** to close the **Data Management** dialog box.

Step 8 On the **Configuration Versions** window, click the transient folder and click **Apply**.

Step 9 After you set your file management viewing mode, click **Security>Show>Database Info** to display the following information:

- Overall status
- Trigger history and configuration
- Action Configuration
- Directory summary for /usr/nr/var

Configuring Device Management and Shunning

Device management refers to the Sensor's ability to dynamically reconfigure the filters and access control lists on a router to shun an attacker. This functionality is provided by the *managed* daemon. *Shunning* refers to the Sensor's ability to use a network device to deny entry to a specific network host or an entire network.

This section describes the three major tasks involved with using a router to shun an attacker, and includes the following topics:

- Setting Up Device Management
- Setting Up Shunning
- Setting Up Intrusion Detection

Doc: 3701
Fls: 1339

CPL - AC

Setting Up Device Management

To configure device management, follow these steps:

Step 1 On the Director interface (NetRanger submap), click the machine icon you want to configure.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 In the currently applied version (in bold), double-click **Device Management**.

The **Device Management** dialog box opens.

Step 4 Click the **Devices** tab.

Step 5 Click **Add** to add a router to *managed*'s list of network devices.

Enter the following information about the router in the following fields:

- **IP Address**
- **Device Name**
- **Username/Password**
- **Enable Password**
- **NAT IP Address**

Note You must also ensure that the Telnet service is enabled on managed routers. Refer to your router's documentation for more information.

Step 6 Click the **Interfaces** tab.

Step 7 Click **Add**.

ECT 5189 Paula IAC

Step 8 Enter the following information for each interface on the managed network device:

- **IP Address**—The IP address assigned to the router interface.
- **Interface Name**—The name of the router interface (for example, "ethernet0").
- **Direction**—The direction of the network traffic passing through the interface.

Step 9 Click **OK** to close the **Device Management** dialog box.

Step 10 To apply the configuration changes, click the newly created transient version on the **Configuration Versions** window and click **Apply**.

Note Clicking **Cancel** discards any configuration changes.

Setting Up Shunning

After you set up device management, you need to set up shunning.

This section includes the following topics:

- Sensor Already Configured to Use Cisco Router for Shunning
- Configuring a Sensor to Use Cisco Router for Shunning

Doc: 3701
Fls: 1340
CPMI - CORREIOS
ROS Nº 03/2005 - CN

ECT 5188 Paula CPL - AC

Sensor Already Configured to Use Cisco Router for Shunning

If during the final Sensor configuration, you selected **Use Cisco Router for Shunning** on the **Cisco Router Information** window of the **Add Host** dialog box (see "Adding a Host"), then the Sensor's shunning infrastructure is in place, and all you need to do is add specific information:

Step 1 On the Director interface (NetRanger submap), click the machine icon you want to configure.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 In the currently applied version (in bold), double-click **Device Management**.

The **Device Management** dialog box opens.

Step 4 Click the **Shunning** tab.

Step 5 Under **Addresses Never to Shun**, click **Add** to add entries for the local Director, Sensor, and router, at the very minimum.

Step 6 Under **Shunning Servers**, add an entry for the Sensor that will perform shunning.

Step 7 Click **OK** to close the **Device Management** dialog box.

Step 8 To apply the configuration changes, click the newly created transient version on the **Configuration Versions** window and click **Apply**.

Note Clicking **Cancel** discards any configuration changes.

Configuring a Sensor to Use Cisco Router for Shunning

If during the final Sensor configuration, you selected *not* to use a Cisco router for shunning, you need to check whether *managed* is enabled on the Sensor before setting up shunning:

Step 1 On the Director interface (NetRanger submap), click the machine icon you want to configure.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 In the currently applied version (in bold), double-click **Daemons**.

The **Daemons** dialog box opens.

Step 4 Make sure that *managed* is set to **Yes** in the table and click **OK** to close the **Daemons** dialog box.

Step 5 Follow the procedure in "Sensor Already Configured to Use Cisco Router for Shunning" to complete the shunning configuration.

Configuring Policy Violation Logging

This section describes the following topics:

- Policy Violation Logging in the IDS
- Configuring and Monitoring User-Defined ACLs
- Configuring and Monitoring IDS-Defined ACLs

Policy Violation Logging in the IDS

The router's *syslogd* daemon can be configured to send information to a Sensor regarding denied network traffic. The Sensor can then forward this data to the Director, which can then display a policy violation alarm.

Note The Director accepts ACL policy violations from routers running Cisco IOS Release 10.3 and higher.

There are two kinds of ACLs that can be configured to work with the Director:

- User-defined ACLs, which are created and updated by users.
- IDS-defined ACLs, which are created and updated by the *managed* daemon.

This section includes the following topics:

- Configuring and Monitoring User-Defined ACLs
- Configuring and Monitoring IDS-Defined ACLs

Configuring and Monitoring User-Defined ACLs

There are three procedure to follow for configuring and monitoring user-defined ACLs. This section includes the following topics:

- Manually Configuring the Router to Communicate with the Sensor
- Manually Configuring the ACLs to Log Policy Violations
- Configuring the Sensor to Accept syslogd Traffic From the Router

Manually Configuring the Router to Communicate with the Sensor

To manually configure the router to communicate with the Sensor, follow these steps:

Step 1 Log on to the router and enter enable mode by typing `en` and the enable password.

Step 2 Enter configuration mode by typing:

```
conf t
```

Step 3 Type the following commands:

```
logging sensor_ip_address
logging trap info
```

where *sensor_ip_address* is the IP address of the Sensor's command and control interface.

Step 4 Exit configuration mode by pressing Ctrl-Z.

Step 5 To make the changes permanent on the router, type:

```
wr mem
```

Doc:
Fls: 3701
1342
CPMI - CORREIOS
ROS Nº 03/2005 - CN

ECT
5184
Paula
CPL - AC

Manually Configuring the ACLs to Log Policy Violations

To manually configure the ACLs to log policy violations, follow these steps:

Step 1 Set the user-defined ACLs on each router to send policy violation information by adding the text string "log" to the end of each line that defines a deny rule. For example:

```
access-list 199 deny tcp host 10.1.1.1 any log
```

This rule denies TCP traffic between host 10.1.1.1 and "any" other host. The string "log" at the end of the deny rule ensures that the policy violation is logged.

Note All rules not containing the text string "log" at the end of the line will cause the router to not log the policy violation.

Step 2 To make the changes permanent on the router, type:

```
wr mem
```

Configuring the Sensor to Accept *syslogd* Traffic From the Router

To configure the Sensor to accept syslogd traffic from the router, follow these steps:

Step 1 On the Director interface (NetRanger submap), click the Sensor icon.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 In the currently applied version (in bold), double-click **Intrusion Detection**.

The **Intrusion Detection** dialog box opens.

Step 4 Click the **Data Sources** tab.

Step 5 In the **Data Sources** field, make sure that the IP address and netmask of the router sending the syslog information is present.

ECT 5183 Paula CPL AC

Step 6 If this information is not present, click **Add** and then type the IP address and subnet mask in the appropriate fields.

Step 7 Click the **Profile** tab.

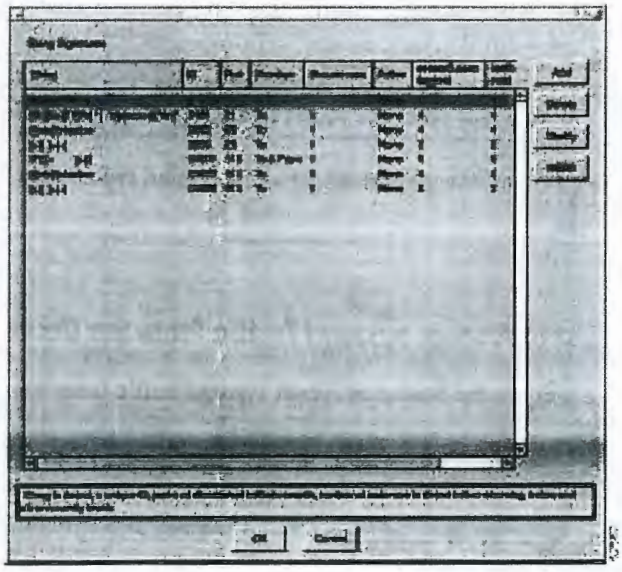
Step 8 Make sure that **Setup Method** is set to **Manual Configuration**.

Step 9 Click **Modify Signature**.

Step 10 Scroll down to the **Security Violations** signature and click **Expand**.

The **Policy Violations** dialog box opens (Figure 6-7).

Figure 6-7 Policy Violations Dialog Box



Step 11 Click **Add** to add the name of the Cisco ACL that sends syslog data to the Sensor.

Step 12 Choose an action from the list in response to the policy violation alarm, and enter the alarm's severity level for each destination.

Step 13 Repeat Steps 11 and 12 for each ACL added.

Step 14 Click **OK** to close the **Policy Violations** dialog box.

Step 15 Click **OK** to close the **Signatures** dialog box.

Step 16 Click **OK** to close the **Intrusion Detection** dialog box.

Step 17 To apply the configuration changes, click the newly created transient version on the **Configuration Versions** window and click **Apply**.

Note Clicking **Cancel** discards any configuration changes.

Configuring and Monitoring IDS-Defined ACLs

Configuring IDS-defined ACLs is similar to configuring user-defined ACLs, except that you can use the Director's utilities to ease setup and monitoring. Also, IDS-defined ACLs are created and updated by the *managed* daemon.

There are three procedures to follow to configure and monitor IDS-defined ACLs. This section includes the following topics:

- Configuring the Router to Communicate with the Sensor
- Configuring the IDS-Defined ACLs to Log Policy Violations
- Configuring the Sensor to Accept syslog Traffic from the Router

Configuring the Router to Communicate with the Sensor

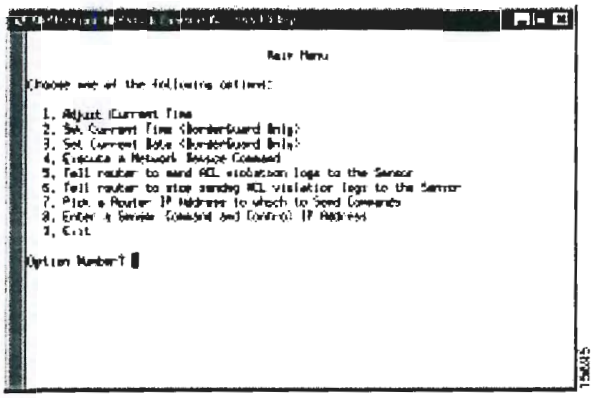
To configure the router to communicate with the Sensor, follow these steps:

Step 1 On the Director interface (NetRanger submap), click the Sensor icon that is to receive the policy violation information from the router.

Step 2 Click **Security>Network Device**.

The **Network Device Utility** window opens. (see Figure 6-8)

Figure 6-8 Network Device Utility Window



Step 3 To command the router to send policy violation information to the Sensor, choose option **5**.

Step 4 When prompted, type the Sensor's IP address, and type `y` to confirm.

Step 5 Read the information and press Enter when prompted.

Step 6 Choose option **9** to exit the **Network Device Utility**.

Doc: 3701
Fls: 1344
CPMI - CORREIOS
RGS Nº 03/2005 - CN

ECT 5180 Paula CPL - AC

Configuring the IDS-Defined ACLs to Log Policy Violations

You can configure the IDS-defined ACLs to log policy violations temporarily or permanently;

This section includes the following topics:

- Temporary Policy Violation Logging
- Permanent Policy Violation Logging

Temporary Policy Violation Logging

To configure the IDS-defined ACLs to log policy violations temporarily, follow these steps:

Step 1 On the Director interface (NetRanger submap), click the Sensor icon that is to receive the policy violations from the router.

Step 2 Click **Security>Advanced>ACL Syslogs>Enable**.

Note To disable ACL logging, click **Security>Advanced>ACL Syslogs>Disable**.

Permanent Policy Violation Logging

To configure the IDS-defined ACLs to log policy violations even after the Sensor restarts/reboots, follow these steps:

Step 1 On the Director interface (NetRanger submap), click the Sensor icon that is to receive the policy violations from the router.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 In the currently applied version (in bold), double-click **Device Management**.

The **Device Management** dialog box opens.

Step 4 Click the **General** tab.

ECT 5179 Pacific CBL AC

Step 5 Click **Enable ACL Logging**.

Step 6 Click **OK**.

Step 7 To apply the configuration changes, click the newly created transient version on the **Configuration Version** window and click **Apply**.

Note Clicking **Cancel** discards any configuration changes.

Configuring the Sensor to Accept syslog Traffic from the Router

To configure the Sensor to accept syslogd traffic from the router, follow these steps:

Step 1 On the Director interface (NetRanger submap), click the Sensor icon that is to receive the policy violations from the router.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 In the currently applied version (in bold), double-click **Device Management**.

The **Device Management** dialog box opens.

Step 4 Click the **Shunning** tab.

Step 5 Make note of the entry under **Cisco ACL Number** (for example, the entry might be "199").

Step 6 Click **OK**.

Step 7 In the newly created version folder in the **Configuration Versions** window, double-click **Intrusion Detection**.

The **Intrusion Detection** dialog box opens.

Step 8 Click the **Data Sources** tab.

Step 9 Under **Data Sources**, ensure that the IP address and netmask of the router sending the syslog information is present.

Step 10 If this information is not present, click **Add** and then type the IP address and subnet mask in the appropriate fields.

Doc: 3701
Fls: 1345
CPMI - CORREIOS
ROS Nº 09/2005 - CN

ECT 5178 Paula CPL - AC

Step 11 Click the **Profile** tab.

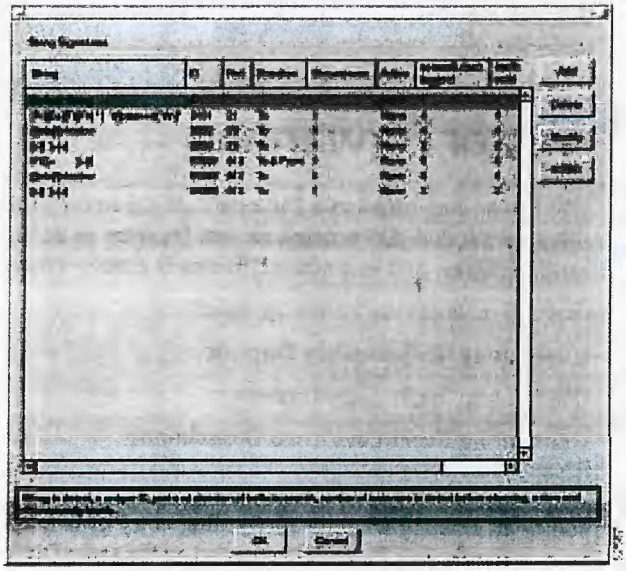
Step 12 Ensure that **Setup Method** is set to **Manual Configuration**.

Step 13 Click **Modify Signatures**.

Step 14 Scroll down to the **Security Violations** signature and click **Expand**.

The **Policy Violations** dialog box opens (Figure 6-9).

Figure 6-9 Policy Violations Dialog Box



Step 15 Click **Add** to add the number of the Cisco ACL from Step 5.

Step 16 Choose an action from the list in response to the policy violation alarm, and enter the alarm's severity level for each destination.

Step 17 Click **Add** to add an ACL whose number is one less than the ACL added in Step 15.

Step 18 When the Director dynamically changes an ACL in response to network activity, it alternates between the two ACLs when applying them.

Step 19 Repeat Steps 15 through 17 for each ACL added.

Step 20 Click **OK** to close the **Policy Violations** dialog box.

Step 21 Click **OK** to close the **Signatures** dialog box.

Step 22 Click **OK** to close the **Intrusion Detection** dialog box.

Step 23 To apply the configuration changes, click the newly created transient version on the **Configuration Versions** window and click **Apply**.

Note Clicking **Cancel** discards any configuration changes.

Configuring Director Forwarding

Director forwarding refers to a Director's ability to forward all errors and alarms it receives to another IDS process on that Director or another Director. Forwarding alarms to a secondary Director is a three-phase task.

This section includes the following topics:

- Configuring the Secondary Director
- Configuring the Primary Director
- Configuring Event Levels and Destinations

Note To modify an existing Director forwarding entry or to add an entry to Director forwarding for an IDS daemon on the same Director, then proceed directly to the "Configuring Event Levels and Destinations" section.

Doc: 3701
Fls: 1346
CPMI - CORREIOS
RGS Nº 03/2005 - CN

ECT 5176 Pauba

Configuring the Secondary Director

The first phase of configuring Director forwarding is to give the secondary Director (the one receiving the forwarded information) information about the primary Director (the one that is forwarding information).

Step 1 On the *secondary Director's* interface (NetRanger submap), click the secondary Director icon.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 Double-click **System Files**.

Step 4 Double-click **Organizations**.

Step 5 If the primary Director is in a different organization than the secondary Director, add the primary Director's organization name and click **OK**.

Step 6 Double-click **Hosts**.

Step 7 Add the primary Director's host name and click **OK**.

Step 8 Double-click **Routes**.

Step 9 Add the following information about the primary Director:

- Host name
- Connection number
- IP address of host

ECT 5175 Paula CPL - AC

- UDP port number used for communication
- A reserved Type column, which should always have **1** as an entry
- Heartbeat

Note The heartbeat is a time interval, in seconds, that *postofficed* uses when transmitting route verification messages. If the heartbeat is set to 5, then *postofficed* waits 5 seconds before transmitting another heartbeat. Furthermore, *postofficed* waits a period of time equal to three times the heartbeat interval for a response. If a response does not return in time, then *postofficed* assumes the route is down and sends an error alarm to the Director.

Step 10 Click **OK**.

Step 11 Double-click **Authorizations**.

Step 12 Make sure that the primary Director has the following permissions at a minimum:

- Get
- Getbulk

Step 13 Click **OK**.

Step 14 To apply the configuration changes, click the newly created transient version on the **Configuration Versions** window and click **Apply**.

Note Clicking **Cancel** discards any configuration changes.

Doc: 3701
Fls: 1347
CPMI - CORREIOS
RGS Nº 03/2005 - CN

ECT 5174 Paula CL-AC

Configuring the Primary Director

The second phase in setting up Director forwarding is to instruct the primary Director to forward information to the secondary Director.

Step 1 On the primary Director's interface (NetRanger submap) click **Security>Configure**.

The **NetRanger Configuration File Management Utility** (nrConfigure) window opens.

Step 2 Click **File>Add Host**.

The **NetRanger Add Host** wizard opens.

Step 3 Read the instructions on the first window of the **Add Host** wizard and click **Next**.

Step 4 Select the organization name to which the secondary Director belongs. If you need to, click **Create** to add an entry for the secondary Director's organization.

Step 5 Type the *secondary Director's* host name, host ID, and host IP address in the appropriate fields.

Step 6 Click **Next**.

The **Host Type** window opens.

Step 7 Select **Forward alarms to secondary Director**.

Step 8 Click **Next**.

Step 9 Click **Finish**.

Configuring Event Levels and Destinations

The final phase of setting up Director forwarding is to configure event levels and daemons receiving the forwarded information. By default, the primary Director forwards all alarm levels to the secondary Director's *smid* daemon.

If you want to change these default settings, or add a new IDS service to which events should be forwarded, do the following:

Step 1 On the *primary Director's* interface, click the *primary Director* icon.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 In the currently applied version (in bold), double-click **Director Forwarding**.

The **Director Forwarding** dialog box opens.

Step 4 Click the **Forwarding** tab.

An entry should exist for *loggerd* for the primary Director. If alarms are being forwarded to a secondary Director, an entry should also exist for *smid* for the secondary Director.

Step 5 To add an IDS daemon to the list of entries, click **Add**. To change an existing entry, select the entry and click **Modify**.

Enter the following information about each daemon:

- **Host**—Select the Director's host name from the drop-down list.
- **Service**—Select the Director daemon to which you want data forwarded.

  Select *loggerd* if you want the Director to receive a duplicate copy of a Sensor's log files. Select *smid* if you want the primary Director to receive duplicate alarms generated by the Sensor to a secondary Director.
- **Minimum Level**—Type the minimum alarm level for alarm data sent to the Director.
- **Commands**—Select **Yes** if you want commands sent to the daemon. Otherwise, select **No**.

Doc: 3701
Fls: 1348
CPMI - CORREIOS
RQS Nº 03/2005 - CN

5172
Paula

- **Errors**—Select **Yes** if you want errors sent to the daemon. Otherwise, select **No**.
- **Alarms**—Select **Yes** if you want alarms sent to the daemon. Otherwise, select **No**.
- **IP Logs**—Select **Yes** if you IP logs sent to the daemon. Otherwise, select **No**.

Step 6 Click **OK** to close the **Director Forwarding** dialog box.

Step 7 To apply the configuration changes, click the newly created transient version on the **Configuration Versions** window and click **Apply**.

Note Clicking **Cancel** discards any configuration changes.

Configuring Event Processing

Event processing is managed by the *eventd* daemon. *eventd* processes alarms sent to it and executes user-defined actions. It is generally intended to accommodate batch or background processes, such as e-mail notification, SNMP trap generation, or other user-defined processes.

This section provides information on setting up basic event processing, and includes the following topics:

- Configuring and Enabling eventd
- Configuring an Event Source to Send Events to eventd

Note For additional details on setting up e-mail notification, SNMP trap generation, or running custom scripts under *eventd*, refer to "Advanced Event Processing Support" in Chapter 9, "Advanced Director Functions."

Configuring and Enabling *eventd*

To configure the event processing infrastructure, follow these steps:

Step 1 On the Director interface (NetRanger submap), click the machine icon whose *eventd* process you want to enable.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 In the currently applied version (in bold), double-click **Event Processing**.

The **Event Processing** dialog box opens.

Step 4 Click the **Applications** tab.

Step 5 Click **Add** to add rows to the listing, and click **Delete** to delete rows from the listing.

Each row has three columns:

- **Script ID**—The ID number is autogenerated by nrConfigure.
- **Severity Level**—Type an alarm severity level here. *eventd* executes the script you specify for each event whose severity level is **greater than or equal** to this severity level, provided that the events meet the timing thresholds that you set (see Step 6).
- **Script Name**—Type the full path and name of the script you want to execute (for example, `/usr/nr/myscript`). If you want to set up e-mail notification, type `/usr/nr/bin/eventd/event` in this field. To generate SNMP traps, type `/usr/nr/bin/nrSnmpTrap` in this field.

Note For additional details on setting up e-mail notification, SNMP trap generation, or running custom scripts under *eventd*, refer to "Advanced Event Processing Support" in Chapter 9, "Advanced Director Functions."

Step 6 Click the **Timing** tab.

This tab controls how often *eventd* executes an action when an event is received.

Doc:
Fls: 3701
1349
ROS Nº 03/2005 - CN
CPMI - CORREIOS

ECT
5170
Paula
CPL - AC

Step 7 Type the following information in the appropriate fields:

- **Consolidation Interval(s)**—The number of seconds in the interval during which *eventd* collects events.
- **Alarm Count Thresholds**—The number of events that must be received in the specified interval to force the execution of an action. This field can contain one or more integer values separated by commas or spaces.

  For example, an entry of "1, 5, 100" would execute an action the first, fifth, and hundredth time an event occurred during the specified interval.

Step 8 Click **OK** to close the **Event Processing** dialog box.

Step 9 On the current transient version of code, double-click **Daemons**.

The **Daemons** dialog box opens.

Step 10 Enable **nr.eventd** by changing its status to **Yes**.

Step 11 Click **OK** to close the **Daemons** dialog box.

Step 12 To apply the configuration changes, click the newly created transient version on the **Configuration Versions** window and click **Apply**.

Note Clicking **Cancel** discards any configuration changes.

Configuring an Event Source to Send Events to *eventd*

After configuring and enabling eventd, you must tell an event source (a Sensor or Director) to send notifications to eventd. The procedure for configuring Sensors and Directors differs.

This section includes the following topics:

- Configuring a Sensor to Send Events to eventd
- Configuring a Director to Send Events to eventd

ECT 5169 Faura CPL AC

Configuring a Sensor to Send Events to eventd

To configure a Sensor to send event notifications to eventd, follow these steps:

Step 1 On the Director interface (NetRanger submap), click a Director icon.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 Double-click **Destinations** under the currently applied version (in bold).

The **Destinations** dialog box opens.

Step 4 Click **Add**.

Step 5 Add the following information in each of the fields:

- **Host**—Type the Sensor's host name.
- **Application**—Type `eventd`.
- **Severity Level**—Type a minimum severity level to send.

  Note This number should match the *lowest* severity entered in the **Applications** tab of the **Event Processing** dialog box.

- **Event Type**—Choose either **IP Logs**, **Errors**, **Commands**, or **Alarms** from the field's drop-down menu.

Step 6 Click **OK** to close the **Destinations** dialog box.

Step 7 To apply the configuration changes, click the newly created transient version on the **Configuration Versions** window and click **Apply**.

Note Clicking **Cancel** discards any configuration changes.

ECT 5168 Paula CPL - AC

Configuring a Director to Send Events to eventd

To configure a Director to send event notifications to eventd, follow these steps:

Step 1 On the Director interface (NetRanger submap), click a Director icon.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 Double-click **Director Forwarding** under the currently applied version (in bold).

The **Director Forwarding** dialog box opens.

Step 4 Click the **Forwarding** tab. (An entry should exist for the primary Director.)

Step 5 Click **Add**.

Step 6 Enter the following information about each Director:

- **Host**—Select the Director's host name from the drop-down list.
- **Service**—Select *eventd*.
- **Minimum Level**—Type a minimum severity level to send.

Note This number should match the **lowest** severity entered in the Applications tab of the **Event Processing** dialog box.

- **Commands**—Select **Yes** if you want commands sent to the Director. Otherwise, select **No**.
- **Errors**—Select **Yes** if you want errors sent to the Director. Otherwise, select **No**.
- **Alarms**—Select **Yes** if you want alarms sent to the Director. Otherwise, select **No**.

Step 7 **IP Logs**—Select **Yes** if you want IP logs sent to the Director. Otherwise, select **No**.

Step 8 Click **OK** to close the **Director Forwarding** dialog box.

Step 9 To apply the configuration changes, click the newly created transient version on the **Configuration Versions** window and click **Apply**.

Note Clicking **Cancel** discards any configuration changes.

Configuring Intrusion Detection

This section describes the following topics:

- Intrusion Detection in the Director
- Setting Up Intrusion Detection
- Advanced Intrusion Detection Settings

Intrusion Detection in the Director

Intrusion Detection is handled by the *packetd* and *sensord* daemons. *packetd* normally operates from a Sensor working in standalone mode (in other words, without a packet filter). *sensord* normally operates on a Sensor working with a packet filter that is forwarding copies of network packets to it.

Doc: 3791
Fls: 1351
CPMI - CORREIOS
RGS Nº 03/2005 - CN

ECT 5166 Paula CPL - AC

Setting Up Intrusion Detection

You have two choices for setting up intrusion detection on a Sensor:

- You can use a *profile-based configuration*, which allows you to use pre-defined profiles for intrusion detection. Using profiles allows for both a fast configuration and fast integration of new signatures during software upgrades.
- You can use a *manual configuration*, which allows you to configure individual signatures, giving you control over almost every aspect of intrusion detection on a Sensor.

This section includes the following topics:

- Setting Up a Profile-Based Configuration
- Setting Up a Manual Configuration

Setting Up a Profile-Based Configuration

To set up a profile-based configuration, follow these steps:

Step 1 On the Director interface (NetRanger submap), click the Sensor icon you want to configure.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 Double-click **Intrusion Detection** under the currently applied version.

The **Intrusion Detection** dialog box opens.

Step 4 Click the **Profile** tab.

Step 5 Fill in the following:

- Select **Profile based Configuration**.
- Under **Signatures to Disable**, disable individual signatures by selecting their check boxes.
- Under **Response**, click either the **Relaxed**, **Moderate**, or **Strong** option.

Step 13 To modify the alarm severity level and the action the Sensor should take, click the signature and click **Modify**. The **Attack Signatures Edit** dialog box opens (Figure 6-13). Make your modifications using this dialog box.

Note Actions other then **None** are not supported for the IDSM.

Doc: 3701
Fls: 1352
CPMI - CORREIOS
ROS Nº 03/2005 - CN

ECT 5164 Paulo CPL - AC

Figure 6-10 Intrusion Detection Dialog Box Profile Tab

Step 5 Select **Manual Configuration.**

The **View Sensor** button becomes the **Modify Signatures** button.

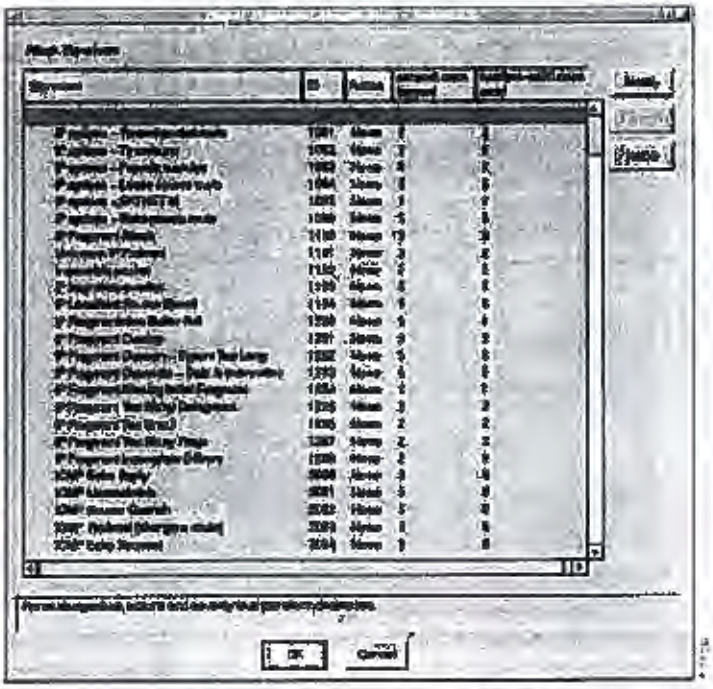
a. To modify Sensor signatures, follow Steps 6 through 10.

b. To modify IDSM signatures, follow Steps 11 through 18.

Step 6 Click **Modify Signatures.**

The **General Signatures** dialog box opens (see Figure 6-11).

Figure 6-11 General Signatures Dialog Box (Sensor)



Step 7 You can configure the action a Sensor takes when a signature detects misuse by clicking any **Action** field and choosing one of the following options from the drop-down list:

- **None**—Take no action.
- **Shun**—Shun the host.
- **Log**—Log the event.
- **Shun & Log**—Shun the host and log the event.
- **TCP Reset**—Close the TCP connection, but leave other connections alone.
- **TCP Reset & Shun**—Reset the TCP connection and shun the host.

Doc: 3701
Fls: 1353
CPMI - CORREIOS
ECT 15162 Paula SAC

- **TCP Reset & Log**—Reset the TCP connection and log the event.
- **TCP Reset, Shun & Log**—Reset the TCP connection, shun the host, and log the event.
- **Evidence Log**—This utility is deprecated and should not be used.

For each Sensor and Director in your organization, you can edit the **Severity Level**.

To find out more information about a signature, click its name in the listing and click **NSDB**. This will provide access to the NSDB through your HTML browser.

Step 8 Click **OK** to save your changes and close the **General Signatures** dialog box.

Step 9 Click **OK** to close the **Intrusion Detection** dialog box.

Step 10 To apply the configuration changes, click the newly created transient version on the **Configuration Versions** window and click **Apply**.

Note Clicking **Cancel** discards any configuration changes.

Step 11 Click **Modify Signatures**.

The **Signatures** dialog box opens.

Step 12 To modify attack signatures, click the **Attack Signatures** tab (see Figure 6-12).

Figure 6-12 Signatures Dialog Box Attack Signatures Tab

Step 13 To modify the alarm severity level and the action the Sensor should take, click the signature and click **Modify**. The **Attack Signatures Edit** dialog box opens (Figure 6-13). Make your modifications using this dialog box.

Note Actions other then **None** are not supported for the IDSM.

Advanced Intrusion Detection Settings

The **Intrusion Detection** dialog box also allows you to set up protected networks, name data sources for the Sensor, exclude patterns, and IP fragment reassembly.

Step 1 On the Director interface (NetRanger submap), click the Sensor icon you want to configure.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 Double-click **Intrusion Detection** under the currently applied version.

The **Intrusion Detection** dialog box opens.

Step 4 Click the **Protected Networks** tab.

Step 5 Click **Add** to enter the address and netmask of the network protected by the Sensor.

Step 6 To set up IP logging, click the **IP Logging Addresses** tab, then click **Add** to add addresses and networks you want the Director to IP log.

Note IP logging involves writing every incoming and outgoing packet to an IP session log with a naming convention of iplog.*Source_IP_Address*, where *Source_IP_Address* is the IP address of the source of the packets.

Step 7 Click the **Data Sources** tab.

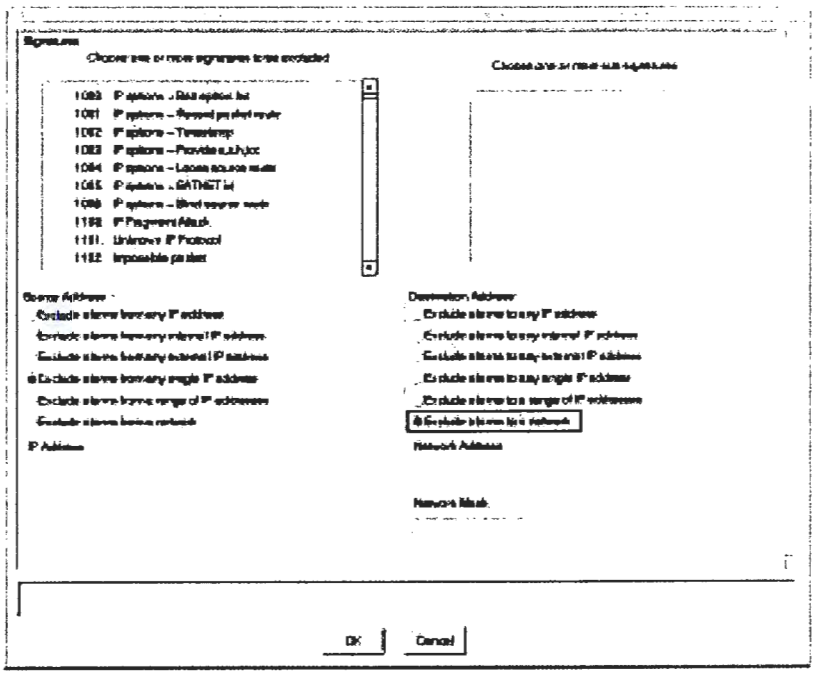
- If the Sensor is in standalone mode (for example, not working with a network device), then type the name of the Sensor's interface card performing packet analysis in the **Name Of Packet Device** field.
- If the Sensor is working with a router or packet filter, click **Add** under **Data Sources** and type the address and netmask of the managed network device.

Step 8 Click the **Excluded Patterns** tab.

Step 9 Click **Add** to set the signature ID, subsignature ID, source IP address or network, and destination IP address or network of any patterns you want to exclude.

The **Add New Enhanced Excludes** dialog box opens (see Figure 6-16).

Figure 6-16 Add New Enhanced Excludes Dialog Box



Step 10 Use the following values for the source/destination fields:

Note Only one of the following exclusions or tasks can be done at a time.

- Exclude alarms from any IP address (Source field = *)
- Exclude alarms from any internal IP address (Source field = *IN*)
- Exclude alarms from any external IP Address (Source field = *OUT*)
- Exclude alarms from a single IP address (Source field = *a.b.c.d*)
- Exclude alarms from a range of IP addresses; enter a starting and ending IP address (Source field =*a1.b1.c1.d1 - a2.b2.c2.d2*)
- Exclude alarms from a network address; enter a network address and a subnet mask (Source field = a.b.c.d/n, where *a.b.c.d* is the IP address and *n* is the number of 1s in the most signification portion of the subnet mask)

Doc: 3701
Fls: 1357
CPMI - CORREIOS
RGS Nº 03/2005 - CN

ECT 5154 Paula AC

Step 11 Click the **IP Reassembly** tab.

Step 12 Select the **Reassemble Fragments** check box.

Step 13 Set the following values for reassembly:

- **Maximum Partial Datagrams**—Maximum number of tokens that are in the process of reassembly at one time (default is 200 for the Sensor and 500 for the IDSM)
- **Maximum Fragments Per Datagram**—Maximum number of fragments that a datagram can have for the purpose of reassembly (default is 2000 for the Sensor and 190 for the IDSM)
- **Fragmented Datagram Timeout**—Ttimeout for the partial fragmented datagrams (default is 3 for the Sensor and 10 for the IDSM)

Step 14 For the IDSM, you can set up TCP Reassembly as follows:

- **TCP Three Way Handshake**—Watch for 3-way handshake related traffic (default is disabled)
- **TCP Strict Reassembly**—Watch the traffic when the receiver has sent an ACK for the TCP connection (default is **No Reassembly**)
  - **No Reassembly**
  - **Loose Reassembly**
  - **Strict Reassembly**
- **TCP Embryonic Timeout**—Timeout for partially open connections (default is 15)
- **TCP Open Establish Timeout**—Timeout for the established connections (default is 90)

Step 15 Click the **Port Mapping** tab (IDSM only)

Step 16 Set the following:

- **TCP HIJACK Ports**—Enter comma-delimited port numbers for ports that you want to be configured for TCP HIJACK
- **TCP SYNFLOOD Ports**—Enter comma-delimited port numbers for ports that you want to be configured for TCP SYNFLOOD

- **TCP Telnet Ports**—Enter comma-delimited port numbers for ports that you want to be configured for TCP Telnet
- **TCP HTTP Ports**—Enter comma-delimited port numbers for ports that you want to be configured for TCP HTTP

Step 17 Click **OK** to close the **Intrusion Detection** dialog box.

Step 18 To apply the configuration changes, click the newly created transient version on the **Configuration Versions** window and click **Apply**.

Note Clicking **Cancel** discards any configuration changes.

Configuring the System Files

The system files contain the information needed for IDS communication. You can access individual components by right-clicking them on the **Configuration Versions** window and clicking **File>Open**.

- **Authorizations**—The **Authorizations** dialog box contains a list of hosts that are able to configure the current machine, and what types of commands they are allowed to run:
  - **Get**—The **get** operation "gets" data related to certain functions, such as a single IP address from a shun list.
  - **GetBulk**—The **getbulk** operation operates like the get operation, but returns a list, such as an entire shun list of IP addresses.
  - **Set**—The **set** operation "sets" a value for a service or function, such as a netmask or IP address.
  - **Unset**—The **unset** operation "unsets" a previously set value.
  - **Exec**—The **exec** operation "executes" an action, such as enabling or disabling shunning.
- **Destinations**—The **Destinations** dialog box contains a listing of editable destinations for events (errors, commands, alarms, IP logs) on each host in the IDS.

Doc: 3701
Fls: 1358
CPMI - CORREIOS
ECT - CPL - AC 5152 Paula

- **Hosts**—The **Hosts** dialog box contains a listing of editable host names, organization IDs, and host IDs in the IDS.
- **Organizations**—The **Organizations** dialog box contains a listing of editable organization names and IDs in the IDS.
- **Routes**—The **Routes** dialog box contains a listing of editable routes in the IDS. The items in the listing include the following:
  - Host name
  - Connection number
  - IP address of host
  - UDP port number used for communication
  - A reserved type column, which should always have **1** as an entry
  - Heartbeat

Note The heartbeat is a time interval that *postofficed* uses when transmitting route verification messages. If the heartbeat is set to 5, then *postofficed* waits 5 seconds before transmitting another heartbeat. Furthermore, *postofficed* waits a period of time equal to three times the heartbeat interval for a response. If a response does not return in time, then *postofficed* assumes the route is down and sends an error alarm to the Director. The default heartbeat interval is 5 seconds, but you can raise this value if your network is congested. This allows a larger window for route verification.

- **Services**—The **Services** dialog box contains a listing of editable service names and service IDs on the IDS.
- **Signature Descriptions**—The **Signature Descriptions** dialog box contains a listing of editable signature names and signature IDs on the IDS.

Setting Up String Matching

This section provides a procedure for setting up corresponding RecordOfStringName and SigOfStringMatch tokens to detect and send alarms on the string "secret" used during a Telnet session.

To set up string match tokens, follow these steps:

Step 1 On the Director interface (NetRanger submap), click a Sensor icon.

Step 2 Click **Security>Configure**.

The **Configuration Versions** window opens.

Step 3 Right-click **Intrusion Detection** and click **Open**.

The **Intrusion Detection** dialog box opens.

Step 4 Click the **Profile** tab.

Step 5 Click **Manual Configuration**, and then click **Modify Signatures**.

The General **Signatures** (Sensor) or **Signatures** (IDSM) dialog box opens.

For the IDSM, click the **Attack Signatures** tab.

Step 6 Scroll down to **Matched Strings** and click it.

Step 7 Click **Expand** to open the **String Signatures** dialog box.

The **String Signatures** dialog box opens (Figure 6-17).

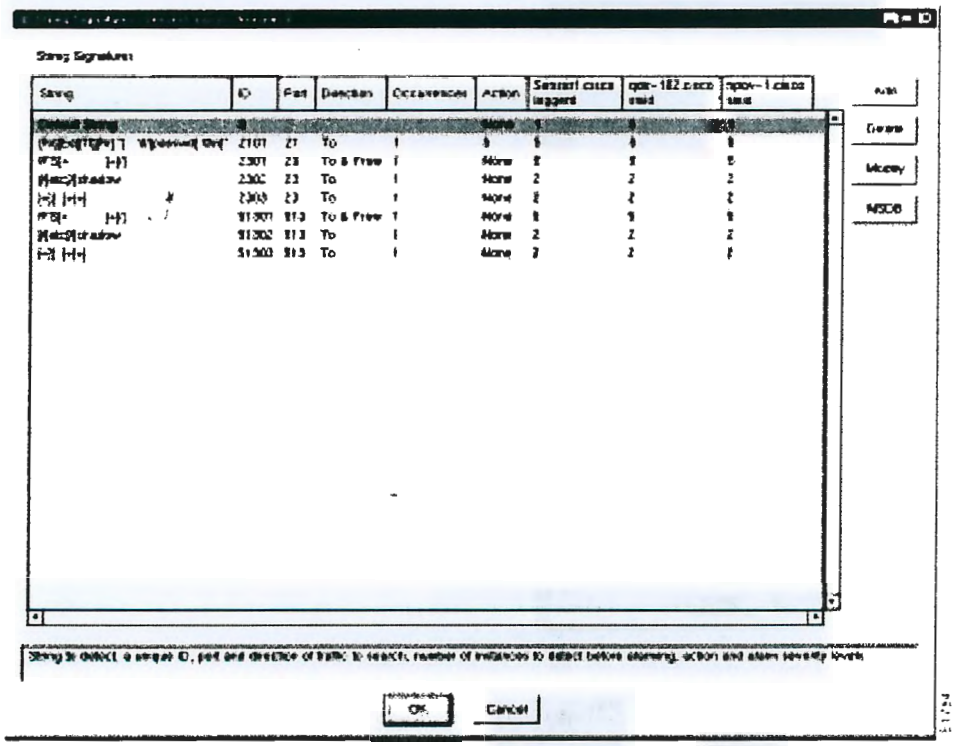
ECT 5150 Paula CPL - AC

Figure 6-17 String Signatures Dialog Box



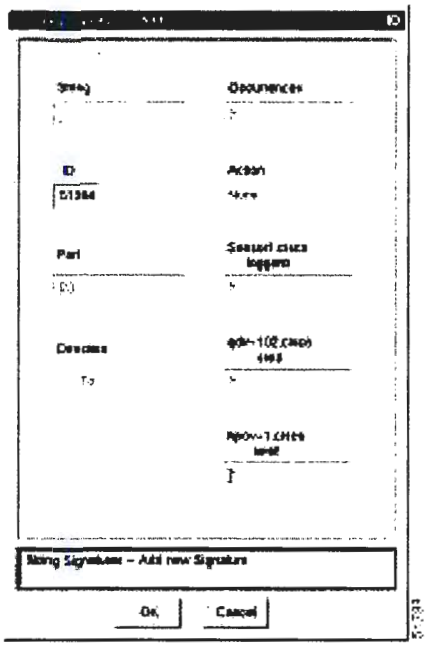
The **String Signatures** dialog box consists of a grid containing the following columns: string to search on, subsignature ID, port to scan, direction of traffic to scan, the number of string matches to allow before triggering an action, the action to trigger, and destinations for the data captured by the signature.

Step 8 Click **Add**.

The **Strings Signature Add** dialog box opens (see Figure 6-18).

FCT 5149 Paula CPL - AG

Figure 6-18 String Signatures Add Dialog Box



Step 9 Type `[Ss]ecret` in the **String** box.

This regular expression detects instances of the strings "Secret" and "secret."

A unique number is automatically generated in the **ID** box.

Step 10 Type `23` in the **Port** box.

TCP Port 23 is the well-known port for Telnet traffic.

Step 11 Click **To & From** in the **Direction** list.

Step 12 Type `1` in the **Occurrences** box.

Step 13 Click **Reset** in the **Action** list.

Step 14 Type `5` in each destination box.

Step 15 Click **OK** to save the new signature.

Step 16 Click **OK** to close the **String Signatures Add** dialog box.

Doc: 3701
Fls: 1360
CPMI - CORREIOS
ROS Nº 03/2005 - CN

E C T
5148
CPL - AC

Step 17 Click **OK** to close the **Intrusion Detection** dialog box.

Step 18 Click **Apply** on the **Configuration Versions** window to apply the new signature.

Each time the Sensor detects the string "secret" or "Secret" during a Telnet session, it now resets the user's TCP connection, and sends level 5 alarms to all destinations.

Running the HP OpenView Database Utility

You can run the HP OpenView Database Utility when you want to delete unwanted IDS alarms or repair database corruption. This section includes the following sections:

- Deleting Alarm Data
- Repairing Database Corruption
- Running the HP OpenView Cleanup Utility for Each Map

Deleting Alarm Data

If you want to delete IDS alarms only and the Director does not appear to be failing, follow these steps:

Step 1 Close down all instances of the HP OpenView user interface.

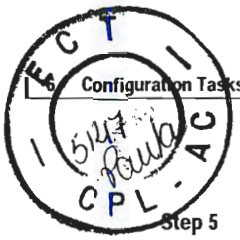
Step 2 Edit the $OV_REGISTRATION/C/nrdirmap file by removing the token `-Initial` from the line that begins with the word `Command`.

Step 3 Start the HP OpenView user interface.

Step 4 Click **Security>Advanced>OpenView Database (danger!)>Delete All Alarm Data**.

This launches the HP OpenView Database utility.

Note If you have multiple maps, use this option individually for each map.



Step 5 When the cleanup utility is finished, shut down the user interface.

Step 6 Put the `-Initial` token back in the nrdirmap registration file.

Step 7 Start up the HP OpenView user interface.

All IDS alarms are deleted from the HP OpenView database without deleting the hosts and applications that already exist.

Note The purpose of editing the nrdirmap registration file is to make sure that nrdirmap (the program that displays IDS data on the HP OpenView maps) is not running while the cleanup utility is running.

Repairing Database Corruption

When you have database corruption, you receive error messages in the errors.nrdirmap.* files similar to the following:

```
entityManager::createApplication, OVwDbGetFieldIntegerValue failed:
NULL field value
```

Note The message may vary slightly, but if the call begins with `OVwDb* failed`, you can assume there is database corruption.

To repair the database corruption, follow these steps:

Step 1 Close down all HP OpenView user interfaces.

Step 2 Run one HP OpenView user interface as user netrangr for a map that contains IDS data.

Note Make sure you have read/write access to the map (look in the lower corner of the map to make sure your access is not read-only).

Doc: 3791
Fls: 1361
ROS Nº 03/2005 - CN
CPMI - CORREIOS

ECT 5146 Paula CPL - AC

Step 3 Click **Security>Advanced>OpenView Database (danger!)>Delete All NetRanger Data**.

This launches the HP OpenView Database Cleanup utility.

The HP OpenView Database Cleanup utility deletes all the IDS data for this map from the HP OpenView database. A window opens telling you what is being deleted. The deletion does not cause problems with nrdirmap (the program that displays IDS data on the HP OpenView maps), because the error messages listed above confirm that nrdirmap has already stopped.

Running the HP OpenView Cleanup Utility for Each Map

If you have only one HP OpenView map with IDS data (you can see how many maps exist by typing `ovwls` from the command line), you do not need to do anything more. If you have more than one corrupted database, you must run the cleanup utility for each individual map.

To run the cleanup utility for each map, follow these steps:

Step 1 On the Director interface (NetRanger submap), to open each map with IDS data, click:

- **Map>Maps>Open/List** if your Director machine has HP OpenView 4.x or 5.x
- **File>Open** if your Director machine has HP OpenView 6x

The **Available Maps** dialog box opens.

Step 2 Click **Security>Advanced>OpenView Database (danger!)>Delete All NetRanger Data** for each of these maps.

The HP OpenView Database utility cleans each map that you select in the **Available Maps** dialog box. When the last map has been cleaned up, the utility reports that it does not need to run any more.

Step 3 Close the HP OpenView user interface.

Step 4 Restart the HP OpenView user interface.

Configuring DVMRP Interoperability

This chapter describes the Distance Vector Multicast Routing Protocol (DVMRP) Interoperability feature. For a complete description of the DVMRP commands in this chapter, refer to the "IP Multicast Routing Commands" chapter of the *Cisco IOS IP Command Reference, Volume 3 of 3: Multicast* publication. To locate documentation of other commands that appear in this chapter, use the command reference master index, or search online.

Cisco routers run Protocol Independent Multicast (PIM), and know enough about DVMRP to successfully forward multicast packets to and receive packets from a DVMRP neighbor. It is also possible to propagate DVMRP routes into and through a PIM cloud. The Cisco IOS software propagates DVMRP routes and builds a separate database for these routes on each router, but PIM uses this routing information to make the packet-forwarding decision. Cisco IOS software does not implement the complete DVMRP.

DVMRP builds a parent-child database using a constrained multicast model to build a forwarding tree rooted at the source of the multicast packets. Multicast packets are initially flooded down this source tree. If redundant paths are on the source tree, packets are not forwarded along those paths. Forwarding occurs until prune messages are received on those parent-child links, which further constrains the broadcast of multicast packets.

DVMRP is implemented in the equipment of many vendors and is based on the public-domain mrouted program. The Cisco IOS software supports dynamic discovery of DVMRP routers and can interoperate with them over traditional media such as Ethernet and FDDI, or over DVMRP-specific tunnels.

To identify the hardware platform or software image information associated with a feature, use the Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the "Identifying Supported Platforms" section in the "Using Cisco IOS Software" chapter.

Basic DVMRP Interoperability Configuration Task List

To configure basic interoperability with DVMRP machines, perform the tasks described in the following sections. The tasks in the first section are required; the tasks in the remaining sections are optional.

- Configuring DVMRP Interoperability (Required)
- Configuring a DVMRP Tunnel (Optional)
- Advertising Network 0.0.0.0 to DVMRP Neighbors (Optional)

For more advanced DVMRP interoperability features, see the section "Advanced DVMRP Interoperability Configuration Task List" later in this chapter.

Configuring DVMRP Interoperability

Cisco multicast routers using PIM can interoperate with non-Cisco multicast routers that use the DVMRP.

PIM routers dynamically discover DVMRP multicast routers on attached networks. Once a DVMRP neighbor has been discovered, the router periodically sends DVMRP report messages advertising the unicast sources reachable in the PIM domain. By default, directly connected subnets and networks are advertised. The router forwards multicast packets that have been forwarded by DVMRP routers and, in turn, forwards multicast packets to DVMRP routers.

You can configure which sources are advertised and which metrics are used by configuring the **ip dvmrp metric** interface configuration command. You can also direct all sources learned via a particular unicast routing process to be advertised into DVMRP.

The mrouted protocol is a public-domain implementation of DVMRP. It is necessary to use mrouted Version 3.8 (which implements a nonpruning version of DVMRP) when Cisco routers are directly connected to DVMRP routers or interoperate with DVMRP routers over an multicast backbone (MBONE) tunnel. DVMRP advertisements produced by the Cisco IOS software can cause older versions of mrouted to corrupt their routing tables and those of their neighbors. Any router connected to the MBONE should have an access list to limit the number of unicast routes that are advertised via DVMRP.

To configure the sources that are advertised and the metrics that are used when DVMRP report messages are sent, use the following command in interface configuration mode:

Command	Purpose
`Router(config-if)# ip dvmrp metric` *metric* `[list` *access-list*`] [`*protocol process-id*`]`	Configures the metric associated with a set of destinations for DVMRP reports.

A more sophisticated way to achieve the same results as the preceding command is to use a route map instead of an access list. Thus, you have a finer granularity of control. To subject unicast routes to route map conditions before they are injected into DVMRP, use the following command in interface configuration mode:

Command	Purpose
`Router(config-if)# ip dvmrp metric` *metric* `[route-map` *map-name*`]`	Subjects unicast routes to route map conditions before they are injected into DVMRP.

Responding to mrinfo Requests

The Cisco IOS software answers mrinfo requests sent by mrouted systems and Cisco routers. The software returns information about neighbors on DVMRP tunnels and all of the interfaces of the router. This information includes the metric (which is always set to 1), the configured TTL threshold, the status of the interface, and various flags. The **mrinfo** EXEC command can also be used to query the router itself, as in the following example:

```
mm1-7kd# mrinfo

  171.69.214.27 (mm1-7kd.cisco.com) [version cisco 11.1] [flags: PMS]:
  171.69.214.27 -> 171.69.214.26 (mm1-r7kb.cisco.com) [1/0/pim/querier]
  171.69.214.27 -> 171.69.214.25 (mm1-45a.cisco.com) [1/0/pim/querier]
  171.69.214.33 -> 171.69.214.34 (mm1-45c.cisco.com) [1/0/pim]
  171.69.214.137 -> 0.0.0.0 [1/0/pim/querier/down/leaf]
```

ECTI 5144 Paula CPAL

```
171.69.214.203 -> 0.0.0.0 [1/0/pim/querier/down/leaf]
171.69.214.18 -> 171.69.214.20 (mm1-45e.cisco.com) [1/0/pim]
171.69.214.18 -> 171.69.214.19 (mm1-45c.cisco.com) [1/0/pim]
171.69.214.18 -> 171.69.214.17 (mm1-45a.cisco.com) [1/0/pim]
```

See the "DVMRP Interoperability Example" section later in this chapter for an example of how to configure a PIM router to interoperate with a DVMRP router.

Configuring a DVMRP Tunnel

The Cisco IOS software supports DVMRP tunnels to the MBONE. You can configure a DVMRP tunnel on a router if the other end is running DVMRP. The software then sends and receives multicast packets over the tunnel. This strategy allows a PIM domain to connect to the DVMRP router in the case where all routers on the path do not support multicast routing. You cannot configure a DVMRP tunnel between two routers.

When a Cisco router runs DVMRP over a tunnel, it advertises sources in DVMRP report messages much as it does on real networks. In addition, the software caches DVMRP report messages it receives and uses them in its Reverse Path Forwarding (RPF) calculation. This behavior allows the software to forward multicast packets received over the tunnel.

When you configure a DVMRP tunnel, you should assign a tunnel an address in the following two cases:

- To enable the sending of IP packets over the tunnel
- To indicate whether the Cisco IOS software should perform DVMRP summarization

You can assign an IP address either by using the **ip address** interface configuration command, or by using the **ip unnumbered** interface configuration command to configure the tunnel to be unnumbered. Either of these two methods allows IP multicast packets to flow over the tunnel. The software will not advertise subnets over the tunnel if the tunnel has a different network number from the subnet. In this case, the software advertises only the network number over the tunnel.

To configure a DVMRP tunnel, use the following commands in interface configuration mode:

	Command	Purpose
Step 1	`Router(config-if)# interface tunnel` *number*	Specifies a tunnel interface in global configuration mode and puts the router into interface configuration mode.
Step 2	`Router(config-if)# tunnel source` *ip-address*	Sets the source address of the tunnel interface. This address is the IP address of the interface on the router.
Step 3	`Router(config-if)# tunnel destination` *ip-address*	Sets the destination adddress of the tunnel interface. This address is the IP address of the mrouted multitask router.
Step 4	`Router(config-if)# tunnel mode dvmrp`	Configures a DVMRP tunnel.
Step 5	`Router(config-if)# ip address` *address mask* or `Router(config-if)# ip unnumbered` *type number*	Assigns an IP address to the interface. or Configures the interface as unnumbered.
Step 6	`Router(config-if)# ip pim [dense-mode | sparse-mode]`	Configures PIM on the interface.
Step 7	`Router(config-if)# ip dvmrp accept-filter` *access-list* `[`*distance* `| ip neighbor-list` *access-list*`]`	Configures an acceptance filter for incoming DVMRP reports.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
IPC-527
Fls: 3705
Doc:

See the "DVMRP Tunnel Example" section later in this chapter for an example of how to configure a DVMRP tunnel.

Advertising Network 0.0.0.0 to DVMRP Neighbors

The mrouted protocol is a public domain implementation of DVMRP. If your router is a neighbor to an mrouted Version 3.6 device, you can configure the Cisco IOS software to advertise network 0.0.0.0 to the DVMRP neighbor. Do not advertise the DVMRP default into the MBONE. You must specify whether only route 0.0.0.0 is advertised or if other routes can also be specified.

To advertise network 0.0.0.0 to DVMRP neighbors on an interface, use the following command in interface configuration mode:

Command	Purpose
`Router(config-if)# ip dvmrp default-information {originate | only}`	Advertises network 0.0.0.0 to DVMRP neighbors.

Advanced DVMRP Interoperability Configuration Task List

Cisco routers run PIM and know enough about DVMRP to successfully forward multicast packets to receivers and receive multicast packets from senders. It is also possible to propagate DVMRP routes into and through a PIM cloud. PIM uses this information; however, Cisco routers do not implement DVMRP to forward multicast packets.

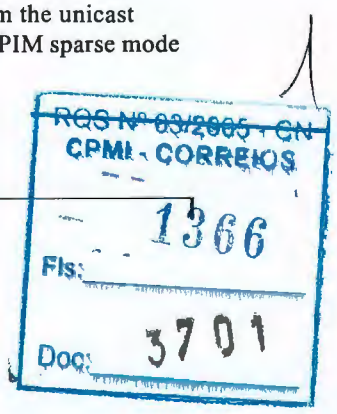
The basic DVMRP interoperability features are described in the section "Basic DVMRP Interoperability Configuration Task List" earlier in this chapter. To configure more advanced DVMRP interoperability features on a Cisco router, perform the optional tasks described in the following sections:

- Enabling DVMRP Unicast Routing (Optional)
- Limiting the Number of DVMRP Routes Advertised (Optional)
- Changing the DVMRP Route Threshold (Optional)
- Configuring a DVMRP Summary Address (Optional)
- Disabling DVMRP Automatic summarization (Optional)
- Adding a Metric Offset to the DVMRP Route (Optional)
- Rejecting a DVMRP Nonpruning Neighbor (Optional)
- Configuring a Delay Between DVRMP Reports (Optional)

Enabling DVMRP Unicast Routing

Because policy for multicast routing and unicast routing requires separate topologies, PIM must follow the multicast topology to build loopless distribution trees. Using DVMRP unicast routing, Cisco routers and mrouted machines exchange DVMRP unicast routes, to which PIM can then reverse path forward.

Cisco routers do not perform DVMRP multicast routing among each other, but they can exchange DVMRP routes. The DVMRP routes provide a multicast topology that may differ from the unicast topology. These routes allow PIM to run over the multicast topology, thereby allowing PIM sparse mode over the MBONE topology.



When DVMRP unicast routing is enabled, the router caches routes learned in DVMRP report messages in a DVMRP routing table. PIM prefers DVMRP routes to unicast routes by default, but that preference can be configured.

DVMRP unicast routing can run on all interfaces, including generic routing encapsulation (GRE) tunnels. On DVMRP tunnels, it runs by virtue of DVMRP multicast routing. This feature does not enable DVMRP multicast routing among Cisco routers. However, if there is a DVMRP-capable multicast router, the Cisco router will do PIM/DVMRP multicast routing interaction.

To enable DVMRP unicast routing, use the following command in interface configuration mode:

Command	Purpose
`Router(config-if)# ip dvmrp unicast-routing`	Enables DVMRP unicast routing.

Limiting the Number of DVMRP Routes Advertised

By default, only 7000 DVMRP routes will be advertised over an interface enabled to run DVMRP (that is, a DVMRP tunnel, an interface where a DVMRP neighbor has been discovered, or an interface configured to run the **ip dvmrp unicast-routing** interface configuration command).

To change this limit, use the following command in global configuration mode:

Command	Purpose
`Router(config)# ip dvmrp route-limit` *count*	Changes the number of DVMRP routes advertised over an interface enabled to run DVMRP.

Changing the DVMRP Route Threshold

By default, 10,000 DVMRP routes may be received per interface within a 1-minute interval. When that rate is exceeded, a syslog message is issued, warning that a route surge might be occurring. The warning is typically used to quickly detect when routers have been misconfigured to inject a large number of routes into the MBONE.

To change the threshold number of routes that trigger the warning, use the following command in global configuration mode:

Command	Purpose
`Router(config)# ip dvmrp routehog-notification` *route-count*	Configures the number of routes that trigger a syslog message.

Use the **show ip igmp interface** EXEC command to display a running count of routes. When the count is exceeded, "*** ALERT ***" is appended to the line.

Configuring a DVMRP Summary Address

You can customize the summarization of DVMRP routes if the default classful automatic summarization does not suit your needs. To summarize such routes, specify a summary address by using the following command in interface configuration mode:

ECT 5141 Paulo CPL AC
RQS Nº 03/2005 - CN CPMI - CORREIOS IPC-529 Fls: 1367 Doc: 3701

Command	Purpose
`Router(config-if)# ip dvmrp summary-address summary-address mask [metric value]`	Specifies a DVMRP summary address.

Note At least one, more-specific route must be present in the unicast routing table before a configured summary address will be advertised.

Disabling DVMRP Automatic summarization

By default, the Cisco IOS software performs some level of DVMRP summarization automatically. Disable this function if you want to advertise all routes, not just a summary. If you configure the **ip dvmrp summary-address** interface configuration command and did not configure the **no ip dvmrp auto-summary** command, you get both custom and automatic summaries.

To disable DVMRP automatic summarization, use the following command in interface configuration mode:

Command	Purpose
`Router(config-if)# no ip dvmrp auto-summary`	Disables DVMRP automatic summarization.

Adding a Metric Offset to the DVMRP Route

By default, the router increments by 1 the metric of a DVMRP route advertised in incoming DVMRP reports. You can change the metric if you want to favor or not favor a certain route. The DVMRP metric is a hop count. Therefore, a very slow serial line of one hop is preferred over a route that is two hops over FDDI or another fast medium.

For example, perhaps a route is learned by Router A and the same route is learned by Router B with a higher metric. If you want to use the path through Router B because it is a faster path, you can apply a metric offset to the route learned by Router A to make it larger than the metric learned by Router B, allowing you to choose the path through Router B.

To change the default metric, use the following command in interface configuration mode:

Command	Purpose
`Router(config-if)# ip dvmrp metric-offset [in | out] increment`	Changes the metric added to DVMRP routes advertised in incoming reports.

Similar to the **metric** keyword in mrouted configuration files, the following is true when using the **ip dvmrp metric-offset** interface configuration command:

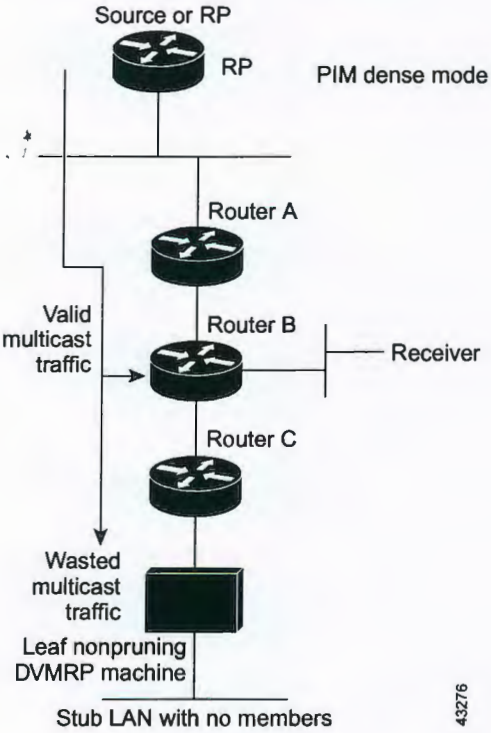
- When you specify the **in** keywordor no keyword, the *increment* value is added to incoming DVMRP reports and is reported in mrinfo replies. The default value for the **in** keyword is 1.
- When you specify the **out** keyword, the *increment* is added to outgoing DVMRP reports for routes from the DVMRP routing table. The default value for the **out** keyword is 0.

ECT 5139 Paula

Rejecting a DVMRP Nonpruning Neighbor

By default, Cisco routers accept all DVMRP neighbors as peers, regardless of their DVMRP capability or lack of. However, some non-Cisco machines run old versions of DVMRP that cannot prune, so they will continuously receive forwarded packets unnecessarily, wasting bandwidth. Figure 91 shows this scenario.

Figure 91 Leaf Nonpruning DVMRP Neighbor

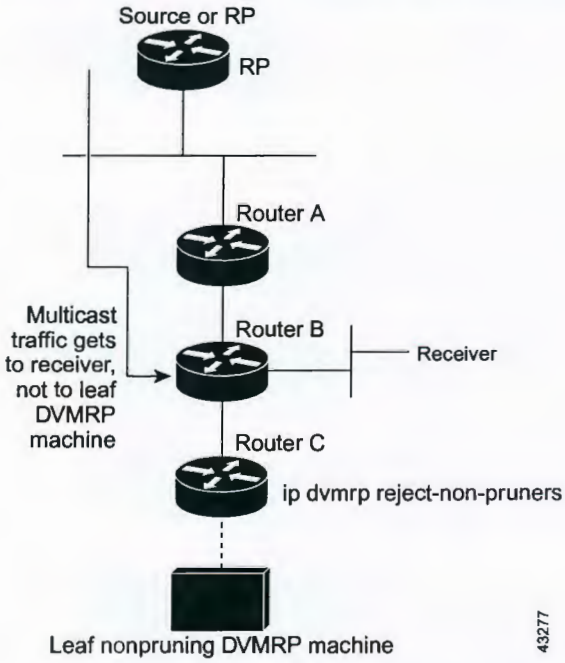


You can prevent a router from peering (communicating) with a DVMRP neighbor if that neighbor does not support DVMRP pruning or grafting. To do so, configure Router C (which is a neighbor to the leaf, nonpruning DVMRP machine) with the **ip dvmrp reject-non-pruners** interface configuration command on the interface to the nonpruning machine. Figure 92 illustrates this scenario. In this case, when the router receives a DVMRP probe or report message without the Prune-Capable flag set, the router logs a syslog message and discards the message.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
IPC-531
Fls: 1369
Doc: 3701

ECT 5138 Paula CPL - AC

Figure 92 Router Rejects Nonpruning DVMRP Neighbor



Note that the **ip dvmrp reject-non-pruners** command prevents peering with neighbors only. If there are any nonpruning routers multiple hops away (downstream toward potential receivers) that are not rejected, then a nonpruning DVMRP network might still exist.

To prevent peering with nonpruning DVMRP neighbors, use the following command in interface configuration mode:

Command	Purpose
`Router(config-if)# ip dvmrp reject-non-pruners`	Prevents peering with nonpruning DVMRP neighbors.

Configuring a Delay Between DVRMP Reports

You can configure an interpacket delay of a DVMRP report. The delay is the number of milliseconds that elapse between transmissions of sets of packets that constitute a report. The number of packets in the set is determined by the *burst* value, which defaults to 2 packets. The *milliseconds* value defaults to 100 milliseconds.

To change the default values of the delay, use the following command in interface configuration mode:

Command	Purpose
`Router(config-if)# ip dvmrp output-report-delay` *`milliseconds`* `[burst]`	Configures an interpacket delay between DVMRP reports.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1370
Doc: 3701

Monitoring and Maintaining DVMRP

To clear routes from the DVMRP routing table, use the following command in EXEC mode:

Command	Purpose
`Router# clear ip dvmrp route { * | route}`	Deletes routes from the DVMRP routing table.

To display entries in the DVMRP routing table, use the following command in EXEC mode:

Command	Purpose
`Router# show ip dvmrp route [name | ip-address | type number]`	Displays the entries in the DVMRP routing table.

DVMRP Configuration Examples

This section provides the following DVMRP configuration examples:

- DVMRP Interoperability Example
- DVMRP Tunnel Example

DVMRP Interoperability Example

The following example configures DVMRP interoperability for configurations when the PIM router and the DVMRP router are on the same network segment. In this example, access list 1 advertises the networks (198.92.35.0, 198.92.36.0, 198.92.37.0, 131.108.0.0, and 150.136.0.0) to the DVMRP router, and access list 2 is used to prevent all other networks from being advertised (the **ip dvmrp metric 0** interface configuration command).

```
interface ethernet 0
 ip address 131.119.244.244 255.255.255.0
 ip pim dense-mode
 ip dvmrp metric 1 list 1
 ip dvmrp metric 0 list 2

access-list 1 permit 198.92.35.0 0.0.0.255
access-list 1 permit 198.92.36.0 0.0.0.255
access-list 1 permit 198.92.37.0 0.0.0.255
access-list 1 permit 131.108.0.0 0.0.255.255
access-list 1 permit 150.136.0.0 0.0.255.255
access-list 1 deny   0.0.0.0 255.255.255.255
access-list 2 permit 0.0.0.0 255.255.255.255
```

DVMRP Tunnel Example

The following example configures a DVMRP tunnel:

```
!

Troubleshooting and Fault Management

This chapter describes basic tasks that you can perform to troubleshoot your system and the network. For detailed troubleshooting procedures and scenarios, refer to the *Internetwork Troubleshooting Guide*. For complete details on all **debug** commands, refer to the *Cisco IOS Debug Command Reference*.

For a complete description of the troubleshooting commands in this chapter, refer to the "Troubleshooting and Fault Management Commands" chapter in "Cisco IOS System Management Commands" part of the Release 12.2 *Cisco IOS Configuration Fundamentals Command Reference*. To locate documentation of other commands that appear in this chapter, use the *Cisco IOS Command Reference Master Index* or search online.

For additional troubleshooting tips, refer to the *Troubleshooting Tools* Tech Tip document on Cisco.com.

To identify hardware or software image support for a specific feature, use Feature Navigator on Cisco.com to search for information about the feature or refer to the software release notes for a specific release. For more information, see the "Identifying Platform Support for Cisco IOS Software Features" section in the "About Cisco IOS Software Documentation" chapter.

Troubleshooting and Fault Management Task List

To manage network faults, you need to discover, isolate, and correct problems. You can discover problems with the system monitoring commands, isolate problems with the system test commands, and resolve problems with other commands, including **debug** commands.

To perform general fault management, perform the tasks described in the following sections:

- Displaying System Information Using show Commands
- Testing Network Connectivity
- Testing Memory and Interfaces
- Logging System Error Messages
- Using Field Diagnostics on Line Cards
- Troubleshooting Specific Line Cards
- Storing Line Card Crash Information
- Creating Core Dumps
- Enabling Debug Operations
- Enabling Conditionally Triggered Debugging
- Using the Environmental Monitor

3701

In addition to the material presented in this chapter, many chapters in the Cisco IOS software configuration guides include fault management tasks specific to certain technologies and features. You can find these tasks in the "Monitoring and Maintaining" sections.

Displaying System Information Using show Commands

To provide information about system processes, the Cisco IOS software includes an extensive list of EXEC commands that begin with the word **show**, which, when executed, display detailed tables of system information. Following is a partial list of system management **show** commands. To display the information described, use the following commands in EXEC mode, as needed:

Command	Purpose
`Router# show c2600`	Displays information about the Cisco 2600 platform, including interrupts, IOS Priority Masks, and IDMA status, for troubleshooting.
`Router# show c7200`	Displays information about the CPU and midplane for the Cisco 7200 series routers.
`Router# show context`	Displays information stored in NVRAM when the router crashes. This command is only useful to your technical support representative. This command is supported on the Cisco 2600 and 7000 series routers.
`Router# show controllers`	Displays information specific to the hardware on a line card.
`Router# show controllers logging`	Displays logging information about a line card.
`Router# show controllers tech-support`	Displays general information about a line for use when reporting a problem.
`Router# show controllers vip` *slot-number* `tech-support`	Displays information about the Versatile Interface Processor (VIP) card for use when reporting a problem
`Router# show diag`	Displays hardware information (including DRAM and static RAM details) for line cards.
`Router# show environment [all | last | table]`	Displays a message indicating whether an environmental warning condition currently exists, the temperature and voltage information, the last measured value from each of the six test points stored in nonvolatile memory, or environmental specifications. Examples of systems that support this command include the Cisco 7000 and the Cisco 12000 series routers.
`Router# show gsr`	Displays hardware information on the Cisco 12000 series Gigabit Switch Router (GSR).
`Router# show gt64010`	Displays all GT64010 internal registers and interrupt status on the Cisco 7200 series routers.
`Router# show memory [`*memory-type*`] [free] [summary]`	Displays memory pool statistics including summary information about the activities of the system memory allocator and a block-by-block listing of memory use.
`Router# show pci {hardware | bridge [`*register*`]}`	Displays information about the peripheral component interconnect (PCI) hardware registers or bridge registers for the Cisco 2600 and 7000 series routers.

E C T
5133
Paula
D L . A C I

Command	Purpose
Router# **show processes** [**cpu**]	Displays information about all active processes.
Router# **show processes memory**	Displays information about memory usage.
Router# **show protocols**	Displays the configured protocols.
Router# **show stacks**	Displays stack usage of processes and interrupt routines, including the reason for the last system reboot. This command is only useful to your technical support representative.
Router# **show subsys** [**class** *class* | **name** *name*]	Displays subsystem information.
Router# **show tcp** [*line-number*]	Displays the status of TCP connections.
Router# **show tcp brief** [**all**]	Displays a concise description of TCP connection endpoints.
Router# **show tdm connections** [**motherboard** | **slot** *number*]	Displays a snapshot of the time-division multiplexing (TDM) bus connection or data memory in a Cisco AS5200 access server.
Router# **show tech-support** [**page**] [**password**]	Displays information about the system for use when reporting a problem.

Refer to specific **show** commands in the tables of configuration commands found throughout the chapters in Cisco IOS software configuration guides. Refer to the Cisco IOS software command reference publications for detailed descriptions of the commands.

Testing Network Connectivity

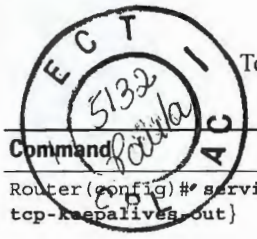
To test basic network connectivity, perform the tasks described in the following sections:

- Configuring the TCP Keepalive Packet Service
- Testing Connections with the ping Command
- Tracing Packet Routes

Configuring the TCP Keepalive Packet Service

The TCP keepalive capability allows a router to detect when the host with which it is communicating experiences a system failure, even if data stops being sent (in either direction). This capability is most useful on incoming connections. For example, if a host failure occurs while the router is communicating with a printer, the router might never notice, because the printer does not generate any traffic in the opposite direction. If keepalives are enabled, they are sent once every minute on otherwise idle connections. If 5 minutes pass and no keepalives are detected, the connection is closed. The connection is also closed if the host replies to a keepalive packet with a reset packet. This will happen if the host crashes and comes back up again.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1375
Doc: 3701



To generate the TCP keepalive packet service, use the following command in global configuration mode:

Command	Purposes
`Router(config)# service {tcp-keepalives-in | tcp-keepalives-out}`	Generates TCP keepalive packets on idle network connections, either incoming connections initiated by a remote host, or outgoing connections initiated by a user.

Testing Connections with the ping Command

As an aid to diagnosing basic network connectivity, many network protocols support an echo protocol. The protocol involves sending a special datagram to the destination host, then waiting for a reply datagram from that host. Results from this echo protocol can help in evaluating the path-to-host reliability, delays over the path, and whether the host can be reached or is functioning.

To invoke the echo protocol, use the following command in either user or privileged EXEC mode:

Command	Purposes
`Router# ping [protocol] {host | address}`	Invokes a diagnostic tool for testing connectivity.

Refer to specific **ping** commands in the tables of configuration commands found throughout the chapters in Cisco IOS software configuration guides. Refer to the Cisco IOS software command reference publications for detailed descriptions of the command.

Tracing Packet Routes

To trace the routes that packets will actually take when traveling to their destinations, use the following command in either user or privileged EXEC mode:

Command	Purposes
`Router# trace [protocol] [destination]`	Traces packet routes through the network (privileged level).

Testing Memory and Interfaces

To test the status memory and interfaces, perform the tasks described in the following sections:

- Testing Flash Memory Status
- Testing System Memory
- Testing Interfaces Statuss

Caution We do not recommend using these **test** commands; they are intended to aid manufacturing personnel in checking system functionality.

Testing Flash Memory Status

To test the status of Flash memory, use the following command in privileged EXEC mode:

Command	Purposes
`Router# test flash`	Tests Flash memory on MCI and envm Flash EPROM interfaces.

Testing System Memory

To diagnose the status of system memory, use the following command in privileged EXEC mode:

Command	Purposes
`ıter# test memory`	Diagnoses Multibus memory, including NVRAM.

Testing Interfaces Status

Caution Do not use this test to diagnose problems with an operational server.

To test the status of the interfaces, use the following command on a nonoperational server in privileged EXEC mode:

Command	Purposes
`Router# test interfaces`	Tests network interfaces.

Logging System Error Messages

By default, routers send **debug** EXEC command output and system error messages to a logging process. The logging process controls the distribution of logging messages to the various destinations, such as the logging buffer, terminal lines, or a UNIX syslog server, depending on your configuration. The process also sends messages to the console. When the logging process is on, the messages are displayed on the console after the process that generated them has finished.

Note The syslog format is compatible with 4.3 Berkeley Standard Distribution (BSD) UNIX.

When the logging process is disabled, messages are sent only to the console. The messages are sent as they are generated, so error and debug output will be interspersed with prompts or output from the command.

You can set the severity level of the messages to control the type of messages displayed for the console and each destination. You can time-stamp log messages or set the syslog source address to enhance real-time debugging and management.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
FC-289
Fls: 1376
Doc: 3701

Refer to the *Cisco IOS Software System Error Messages* publication for detailed information on error messages.

Enabling Message Logging

Message logging is enabled by default. It must be enabled in order to send messages to any destination other than the console.

To disable message logging, use the **no logging on** command. Note that disabling the logging process can slow down the router because a process cannot continue until the messages are written to the console.

To reenable message logging after it has been disabled, use the following command in global configuration mode:

Command	Purposes
`Router(config)# logging on`	Enables message logging.

Enabling Message Logging for a Slave Card

To enable slave VIP cards to log status messages to the console (print the messages to the screen), use the following command in global configuration mode:

Command	Purposes
`Router(config)# service slave-log`	Enables slave message logging.

Setting the Error Message Display Device

If message logging is enabled, you can send messages to specified locations, in addition to the console.

To set the locations that receive messages, use the following commands in global configuration mode, as needed:

Command	Purposes
`Router(config)# logging buffered [size]`	Logs messages to an internal buffer.
`Router(config)# terminal monitor`	Logs messages to a nonconsole terminal.
`Router(config)# logging host`	Logs messages to a UNIX syslog server host.

The **logging buffered** command copies logging messages to an internal buffer. The buffer is circular, so newer messages overwrite older messages after the buffer is full. To display the messages that are logged in the buffer, use the **show logging** EXEC command. The first message displayed is the oldest message in the buffer. To clear the current contents of the buffer, use the **clear logging** privileged EXEC command.

The **terminal monitor** EXEC command locally accomplishes the task of displaying the system error messages to a nonconsole terminal.

The **logging** command identifies a syslog server host to receive logging messages. The *host* argument is the name or Internet address of the host. By issuing this command more than once, you build a list of syslog servers that receive logging messages. The **no logging** command deletes the syslog server with the specified address from the list of syslogs.

Configuring Synchronization of Logging Messages

You can configure the system to synchronize unsolicited messages and **debug** command output with solicited device output and prompts for a specific line. You can identify the types of messages to be output asynchronously based on the level of severity. You can also determine the maximum number of buffers for storing asynchronous messages for the terminal after which messages are dropped.

When synchronous logging of unsolicited messages and **debug** command output is turned on, unsolicited device output is displayed on the console or printed after solicited device output is displayed or printed. Unsolicited messages and **debug** command output is displayed on the console after the prompt for user input is returned. Therefore, unsolicited messages and **debug** command output are not interspersed with solicited device output and prompts. After the unsolicited messages are displayed, the console displays the user prompt again.

To configure for synchronous logging of unsolicited messages and **debug** command output with solicited device output and prompts, use the following commands beginning in global configuration mode:

	Command	Purposes
Step 1	`Router(config)# line [aux | console | vty] beginning-line-number [ending-line-number]`	Specifies the line to be configured for synchronous logging of messages.
Step 2	`Router(config-line)# logging synchronous [level severity-level | all] [limit number-of-buffers]`	Enables synchronous logging of messages.

Enabling Time-Stamps on Log Messages

By default, log messages are not time-stamped. To enable time-stamping of log messages, use either of the following commands in global configuration mode:

Command	Purposes
`Router(config)# service timestamps log uptime`	Enables log time stamps.
or `Router(config)# service timestamps log datetime [msec] [localtime] [show-timezone]`	

Limiting the Error Message Severity Level and Facilities

You can limit the number of messages displayed to the selected device by specifying the severity level of the error message (see Table 16 for level descriptions). To do so, use the following commands in global configuration mode, as needed:

RQS Nº 03/2005 - CN
CPMI - CORREIOS
FC-231
Fls: 3701
Doc:

Command	Purposes
`Router(config)# logging console level`	Limits the number of messages logged to the console.
`Router(config)# logging monitor level`	Limits the number of messages logged to the terminal lines.
`Router(config)# logging trap level`	Limits the number of messages logged to the syslog servers.

If you have enabled syslog messages traps to be sent to a Simple Network Management Protocol (SNMP) network management station with the **snmp-server enable trap** command, you can change the level of messages sent and stored in a history table on the router. You can also change the number of messages that get stored in the history table.

Messages are stored in the history table because SNMP traps are not guaranteed to reach their destination. By default, one message of the level warning and above (see Table 16) is stored in the history table even if syslog traps are not enabled.

To change level and table size defaults, use the following commands in global configuration mode:

	Command	Purposes
Step 1	`Router(config)# logging history level`	Changes the default level of syslog messages stored in the history file and sent to the SNMP server.
Step 2	`Router(config)# logging history size number`	Changes the number of syslog messages that can be stored in the history table.

Note Table 16 lists the level keywords and severity level. For SNMP usage, the severity level values use +1. For example, **emergency** equals 1 not 0 and **critical** equals 3 not 2.

The **logging console** command limits the logging messages displayed on the console terminal to messages with a level number at or below the specified severity level, which is specified by the *level* argument. Table 16 lists the error message *level* keywords and corresponding UNIX syslog definitions in order from the most severe level to the least severe level.

Table 16 Error Message Logging Keywords

Level Keyword	Level	Description	Syslog Definition
emergencies	0	System unusable	LOG_EMERG
alerts	1	Immediate action needed	LOG_ALERT
critical	2	Critical conditions	LOG_CRIT
errors	3	Error conditions	LOG_ERR
warnings	4	Warning conditions	LOG_WARNING
notifications	5	Normal but significant condition	LOG_NOTICE
informational	6	Informational messages only	LOG_INFO
debugging	7	Debugging messages	LOG_DEBUG

The **no logging console** command disables logging to the console terminal.

The default is to log messages to the console at the **debugging** level and those level numbers that are lower, which means all levels. The **logging monitor** command defaults to **debugging** also. The **logging trap** command defaults to the **informational** level.

To display logging messages on a terminal, use the **terminal monitor** EXEC command.

Current software generates the following four categories of error messages:

- Error messages about software or hardware malfunctions, displayed at levels **warnings** through **emergencies**
- Output from the **debug** commands, displayed at the **debugging** level
- Interface up/down transitions and system restart messages, displayed at the **notifications** level
- Reload requests and low-process stack messages, displayed at the **informational** level

Defining the UNIX System Logging Facility

You can log messages produced by UNIX system utilities. To do this, enable this type logging and define the UNIX system facility from which you want to log messages. Table 17 lists the UNIX system facilities supported by the Cisco IOS software. Consult the operator manual for your UNIX operating system for more information about these UNIX system facilities.

To define UNIX system facility message logging, use the following command in global configuration mode:

Command	Purposes
`Router(config)# logging facility facility-type`	Configures system log facilities.

Table 17 Logging Facility Type Keywords

Facility Type Keyword	Description
auth	Indicates the authorization system.
cron	Indicates the cron facility.
daemon	Indicates the system daemon.
kern	Indicates the Kernel.
local0–7	Reserved for locally defined messages.
lpr	Indicates line printer system.
mail	Indicates mail system.
news	Indicates USENET news.
sys9	Indicates system use.
sys10	Indicates system use.
sys11	Indicates system use.
sys12	Indicates system use.
sys13	Indicates system use.
sys14	Indicates system use.
syslog	Indicates the system log.

ECT 5127 Paulo L - A
RQS Nº 03/2005 - CN CPMI - CORREIOS FC-293 Fls: 1378 Doc: 3791

Table 17 Logging Facility Type Keywords (continued)

Facility Type Keyword	Description
user	Indicates user process.
uucp	Indicates UNIX-to-UNIX copy system.

Displaying Logging Information

To display logging information, use the following commands in EXEC mode, as needed:

Command	Purposes
`Router# show logging`	Displays the state of syslog error and event logging, including host addresses, whether console logging is enabled, and other logging statistics.
`Router# show controllers vip slot-number logging`	Displays the state of syslog error and event logging of a VIP card, including host addresses, whether console logging is enabled, and other logging statistics
`Router# show logging history`	Displays information in the syslog history table such as the table size, the status of messages, and the text of the messages stored in the table.

Logging Errors to a UNIX Syslog Daemon

To configure the syslog daemon on a 4.3 BSD UNIX system, include a line such as the following in the /etc/syslog.conf file:

```
local7.debugging /usr/adm/logs/cisco.log
```

The **debugging** keyword specifies the syslog level; see Table 16 for a general description of other keywords. The **local7** keyword specifies the logging facility to be used; see Table 17 for a general description of other keywords.

The syslog daemon sends messages at this level or at a more severe level to the file specified in the next field. The file must already exist, and the syslog daemon must have permission to write to it.

Setting the Syslog Source Address

By default, a syslog message contains the IP address of the interface it uses to leave the router. To set all syslog messages to contain the same IP address, regardless of which interface they use, use the following command in global configuration mode:

Command	Purposes
`Router(config)# logging source-interface type number`	Sets the syslog source address.

E C T

Paula
CPL - AC

Using Field Diagnostics on Line Cards

Each line card on the Cisco 12000 series routers can perform field diagnostic testing to isolate faulty hardware without disrupting normal operation of the system. However, performing field diagnostic testing on a line card does halt all activity on the line card for the duration of the testing. After successful completion of the field diagnostic testing, the Cisco IOS software is automatically reloaded on the line card.

Note The field diagnostic **diag** command must be executed from the Gigabit Route Processor (GRP) main console port.

To perform field diagnostic testing on a line card, use the following command in privileged EXEC mode:

Command	Purposes
`Router# diag slot-number [previous | post | verbose | exit]`	Specifies the line card on which you want to perform diagnostic testing. Optionally, specifies that previous test results are displayed, that only extended power-on self-tests (POST) be performed, that the maximum messages are displayed, or that the Cisco IOS software not be reloaded on the line card after successful completion of the tests. The following prompt is displayed: `Running Diags will halt ALL activity on the requested slot. [confirm]` At the prompt, press **Return** to confirm that you want to perform field diagnostic testing on the specified line card, or type **no** to stop the testing.

To stop field diagnostic testing on a line card, use either of the following commands in privileged EXEC mode:

Command	Purpose

`Router# diag slot-number halt`
 	
or
 	
`Router# no diag slot-number`
	Specifies the line card on which you want to stop diagnostic testing.

Note When you stop the field diagnostic test, the line card remains down (that is, in an unbooted state). In most cases, you stopped the testing because you need to remove the line card or replace the line card. If that is not the case and you want to bring the line card back up (that is, online), you must use the **microcode reload** global configuration command or power cycle the line card.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
FC-295
Fls: 1379
3701
Doc:

Troubleshooting Specific Line Cards

Cisco IOS provides the **execute-on** command to allow you to issue Cisco IOS commands (such as **show** commands) to a specific line card for monitoring and maintenance. For example, you could show which Cisco IOS image is loaded on the card in slot 3 of a Cisco 12012 Gigabit Switch Router (GSR) by issuing the **execute-on slot 3 show version** command. You can also use this command for troubleshooting cards in the dial shelf of Cisco access servers. For complete documentation of this command, refer to the "Troubleshooting" chapter of the Release 12.2 *Cisco IOS Configuration Fundamentals Command Reference*.

Storing Line Card Crash Information

This section explains how to enable storing of crash information for a line card and optionally specify the type and amount of information stored. Technical support representatives need to be able to look at the crash information from the line card to troubleshoot serious problems on the line card. The crash information contains all the line card memory information, including the main memory and transmit and receive buffer information.

Caution Use the **exception linecard** global configuration command only when directed by a technical support representative, and only enable options that the technical support representative requests you to enable.

To enable and configure the crash information options for a line card, use the following command in global configuration mode:

Command	Purpose
`Router(config)# exception linecard {all | slot slot-number} [corefile filename | main-memory size [k | m] | queue-ram size [k | m] | rx-buffer size [k | m] | sqe-register-rx | sqe-register-tx | tx-buffer size [k | m]]`	Specifies the line card for which you want crash information when a line card resets. Optionally, specify the type and amount of memory to be stored.

Creating Core Dumps

When your router crashes, it is sometimes useful to obtain a full copy of the memory image (called a core dump) to identify the cause of the crash. Not all crash types will produce a core dump.

Core dumps are generally useful only to your technical support representative. The core dump file, which is a very large binary file, must be transferred to a Trivial File Transfer Protocol (TFTP), File Transfer Protocol (FTP), or remote copy protocol (rcp) server and subsequently interpreted by technical personnel that have access to source code and detailed memory maps.

Caution Use the **exception** commands only under the direction of a technical support representative. Creating a core dump while the router is functioning in a network can disrupt network operation.

To configure your system to generate core dump files, use the following commands in global configuration mode:

Command	Purpose
`Router(config)# ip ftp password [encrypt-type] password`	(Optional for core dump file transfers using FTP) Specifies the password to be used for FTP connections.
`Router(config)# ip ftp username username`	(Optional for core dump file transfers using FTP) Configures the user name for FTP connections.
`Router(config)# exception protocol {ftp | rcp | tftp}`	Configures the protocol used for core dumps.
`Router(config)# exception flash`	Configures the router for a core dump using a Flash disk.
`Router(config)# exception core-file name`	Specifies the name of the core dump file when your router has generated a core dump file after crashing.
`Router(config)# exception dump ip-address`	Configures the router to dump a core file to a particular server when the router crashes.
`Router(config)# exception memory {fragment size | minimum size}`	Causes the router to create a core dump and reboot when certain memory size parameters are violated.
`ıter(config)# exception spurious-interrupt [number]`	Causes the router to create a core dump and reboot after a specified number of spurious interrupts.

Specifying the Protocol for the Core Dump

To configure the router to generate a core dum, perform the tasks described in the following sections:

- Using TFTP for Core Dumps
- Using FTP for Core Dumps
- Using rcp for Core Dumps
- Using a Flash Disk

Using TFTP for Core Dumps

Due to a limitation of most TFTP applications, the router will dump only the first 16 MB of the core file. Therefore, if your router's main memory is larger than 16 MB, do not use TFTP.

To configure a router for a core dump using TFTP, use the following commands in global configuration mode:

Command	Purpose
`Router(config)# exception protocol tftp`	Specifies that the TFTP protocol should be used for core dumps.
`Router(config)# exception dump ip-address`	Configures the router to dump a core file to a particular server when the router crashes.

For example, the following command configures a router for a core dump using TFTP, where 172.17.92.2 is the IP address of the TFTP server:

```
Router(config)# exception protocol tftp
Router(config)# exception dump 172.17.92.2
```

RQS Nº 03/2005 - CN
CPMI - CORREIOS
FC-297
Fls: 1380
Doc: 3701

The core dump is written to a file named *hostname*-core on the TFTP server, where *hostname* is the name of the router (in the example, the file would be named Router-core). You can change the name of the core file by adding the **exception core-file** *filename* configuration command.

Depending on the TFTP server application used, it may be necessary to create, on the TFTP server, the empty target file to which the router can write the core. Also, make sure that there is enough memory on your TFTP server to hold the complete core dump.

Using FTP for Core Dumps

To configure the router for a core dump using FTP, use the following commands in global configuration mode:

	Command	Purposes
Step 1	`Router(config)# ip ftp username username`	(Optional) Configures the user name for FTP connections.
Step 2	`Router(config)# ip ftp password [type] password`	(Optional) Specifies the password to be used for FTP connections.
Step 3	`Router(config)# exception protocol ftp`	Specifies that FTP should be used for core dump file transfers.
Step 4	`Router(config)# exception dump ip-address`	Configures the router to dump a core file to a particular server when the router crashes.
Step 5	`Router(config)# exception core-file name`	Specifies the name of the core dump file when your router has generated a core dump file after crashing.

The following example configures a router to use FTP to dump a core file named dumpfile to the FTP server at 172.17.92.2 when it crashes.

```
ip ftp username red
ip ftp password blue
exception protocol ftp
exception dump 172.17.92.2
exception core-file dumpfile
```

Using rcp for Core Dumps

You can use rcp to capture a core dump. Enabling rcp on a router is described in the "Configuring a Router to Use rcp" section of the "Configuring Basic File Transfer Services" chapter.

To enable rcp on the router, use the following commands in global configuration mode to capture the core dump:

	Command	Purposes
Step 1	`Router(config)# exception protocol ftp`	Specifies that rcp should be used for core dump file transfers.
Step 2	`Router(config)# exception dump ip-address`	Configures the router to dump a core file to a particular server when the router crashes.

The following example sets 172.17.92.2 as the IP address of the host on which rcp is enabled:

5121 Paula

```
exception protocol rcp
exception dump 172.17.92.2
```

Using a Flash Disk for Core Dumps

Some router platforms support the Flash disk as an alternative to the linear Flash memory or Personal Computer Memory Card Industry Association (PCMCIA) Flash card. The large storage capacity of these Flash disks makes them good candidates for another means of capturing a core dump. To configure a router for a core dump using a Flash disk, use the following command in global configuration mode:

Command	Purpose
Router(config)# **exception flash** [**procmem** |**iomem** | **all**] *device-name*[*:partition-number*] [**erase** | **no_erase**]	Configures the router for a core dump using a flash disk.

The **show flash all** EXEC command will list the devices you can use for the **exception flash** command.

Specifying the Name of the Core Dump File

To specify a filename of a core dump file when the router crashes, use the following command in global configuration mode:

Command	Purpose
Router(config)# **exception core-file** *name*	Specifies the name of the core dump file when your router has generated a core dump file after crashing.

Creating an Exception Memory Core Dump

To cause the router to create a core dump and reboot when certain memory size parameters are violated during the debugging process, use the following commands in global configuration mode:

Command	Purpose
Router(config)# **exception memory fragment** *size*	The minimum contiguous block of memory in the free pool (in bytes).
Router(config)# **exception memory minimum** *size*	The minimum size of the free memory pool (in bytes).

The size parameter is expressed in bytes and is checked every 60 seconds. If you enter a size that is greater than the free memory and the **exception dump** command has been configured, a core dump and router reload is generated after 60 seconds. If the **exception dump** command is not configured, the router reloads without triggering a core dump. The following example configures the router to monitor the free memory. If the memory falls below 250,000 bytes, the core dump is created and the router reloads.

```
exception dump 172.16.92.2
exception core-file memory.overrun
exception memory minimum 250000
```

RQS Nº 03/2005 - CN
CPMI - CORREIOS
FC-299
Fls: 1381
Doc: 3701

Setting a Spurious Interrupt Core Dump

During the debugging process, you can configure the router to create a spurious interrupt core dump and reboot when a specified number of interrupts have occurred.

Caution Use the exception spurious-interrupt global configuration command only when directed by a technical support representative and only enable options requested by the technical support representative.

To enable and configure the crash information for spurious interrupts, use the following command in global configuration mode:

Command	Purpose
`Router(config)# exception spurious-interrupt` *number*	Sets the maximum number of spurious interrupts to include in the core dump before reloading.

The following example configures a router to create a core dump with a limit of two spurious interrupts:

```
exception spurious-interrupt 2
```

Enabling Debug Operations

Your router includes hardware and software to aid in troubleshooting internal problems and problems with other hosts on the network. The **debug** privileged EXEC mode commands start the console display of several classes of network events. The following commands describe in general the system debug message feature. Refer to the *Cisco IOS Debug Command Reference* for all information regarding **debug** commands. Also refer to the *Internetwork Troubleshooting Guide* publication for additional information.

To enable debugging operations, use the following commands:

Command	Purposes
`Router# show debugging`	Displays the state of each debugging option.
`Router# debug ?`	Displays a list and brief description of all the **debug** command options.
`Router# debug` *command*	Begins message logging for the specified **debug** command.
`Router# no debug` *command*	Turns message logging off for the specified **debug** command.

Caution The system gives high priority to debugging output. For this reason, debugging commands should be turned on only for troubleshooting specific problems or during troubleshooting sessions with technical support personnel. Excessive debugging output can render the system inoperable.

You can configure time-stamping of system **debug** messages. Time-stamping enhances real-time debugging by providing the relative timing of logged events. This information is especially useful when customers send debugging output to your technical support personnel for assistance. To enable time-stamping of system **debug** messages, use either of the following commands in global configuration mode:

Command	Purposes

`Router(config)# service timestamps debug uptime`
 	
or
 	
`Router(config)# service timestamps debug datetime [msec] [localtime] [show-timezone]`
	Enables time-stamping of system **debug** messages.

Normally, the messages are displayed only on the console terminal. Refer to the section "Setting the Error Message Display Device" earlier in this chapter to change the output device.

Enabling Conditionally Triggered Debugging

When the Conditionally Triggered Debugging feature is enabled, the router generates debugging messages for packets entering or leaving the router on a specified interface; the router will not generate debugging output for packets entering or leaving through a different interface. You can specify the interfaces explicitly. For example, you may only want to see debugging messages for one interface or subinterface. You can also turn on debugging for all interfaces that meet specified condition. This feature is useful on dial access servers, which have a large number of ports.

Normally, the router will generate debugging messages for every interface, resulting in a large number of messages. The large number of messages consumes system resources, and can affect your ability to find the specific information you need. By limiting the number of debugging messages, you can receive messages related to only the ports you wish to troubleshoot.

Conditionally Triggered Debugging controls the output from the following protocol-specific **debug** commands:

- **debug aaa** {**accounting** | **authorization** | **authentication**}
- **debug dialer** {**events** | **packets**}
- **debug isdn** {**q921** | **q931**}
- **debug modem** {**oob** | **trace**}
- **debug ppp** {**all** | **authentication** | **chap** | **error** | **negotiation** | **multilink events** | **packet**}

Although this feature limits the output of the commands listed, it does not automatically enable the generation of debugging output from these commands. Debugging messages are generated only when the protocol-specific **debug** command is enabled. The **debug** command output is controlled through two processes:

- The protocol-specific **debug** commands specify which protocols are being debugged. For example, the **debug dialer events** command generates debugging output related to dialer events.
- The **debug condition** commands limit these debugging messages to those related to a particular interface. For example, the **debug condition username bob** command generates debugging output only for interfaces with packets that specify a username of bob.

To configure Conditionally Triggered Debugging, perform the tasks described in the following sections:

RQS Nº 03/2005 - CN
CPMI - CORREIOS
FC-301

Doc: 3791

Enabling Protocol-Specific debug Commands
Enabling Conditional Debugging Commands
Specifying Multiple Debugging Conditions

Enabling Protocol-Specific debug Commands

In order to generate any debugging output, the protocol-specific **debug** command for the desired output must be enabled. Use the **show debugging** command to determine which types of debugging are enabled. To display the current debug conditions, use the **show debug condition** command. To enable the desired protocol-specific **debug** commands, use the following commands in privileged EXEC mode :

Command	Purpose
`Router# show debugging`	Determines which types of debugging are enabled.
`Router# show debug condition [condition-id]`	Displays the current **debug** conditions.
`Router# debug protocol`	Enables the desired debugging commands.
`Router# no debug protocol`	Disables the debugging commands that are not desired.

If you do not want output, disable all the protocol-specific **debug** commands.

Enabling Conditional Debugging Commands

If no **debug condition** commands are enabled, all debugging output, regardless of the interface, will be displayed for the enabled protocol-specific **debug** commands.

The first **debug condition** command you enter enables conditional debugging. The router will display only messages for interfaces that meet one of the specified conditions. If multiple conditions are specified, the interface must meet at least one of the conditions in order for messages to be displayed.

To enable messages for interfaces specified explicitly or for interfaces that meet certain conditions, perform the tasks described in the following sections:

- Displaying Messages for One Interface
- Displaying Messages for Multiple Interfaces
- Limiting the Number of Messages Based on Conditions

Displaying Messages for One Interface

To disable debugging messages for all interfaces except one, use the following command in privileged EXEC mode:

Command	Purpose
`Router# debug condition interface interface`	Enables debugging output for only the specified interface.

To reenable debugging output for all interfaces, use the **no debug interface** command.

Displaying Messages for Multiple Interfaces

To enable debugging messages for multiple interfaces, use the following commands in privileged EXEC mode:

	Command	Purposes
Step 1	`Router# debug condition interface interface`	Enables debugging output for only the specified interface
Step 2	`Router# debug condition interface interface`	Enable debugging messages for additional interfaces. Repeat this task until debugging messages are enabled for all desired interfaces.

If you specify more than one interface by entering this command multiple times, debugging output will be displayed for all of the specified interfaces. To turn off debugging on a particular interface, use the **no debug interface** command. If you use the **no debug interface all** command or remove the last **debug interface** command, debugging output will be reenabled for all interfaces.

Limiting the Number of Messages Based on Conditions

The router can monitor interfaces to learn if any packets contain the specified value for one of the following conditions:

- username
- calling party number
- called party number

If you enter a condition, such as calling number, debug output will be stopped for all interfaces. The router will then monitor every interface to learn if a packet with the specified calling party number is sent or received on any interfaces. If the condition is met on an interface or subinterface, **debug** command output will be displayed for that interface. The debugging output for an interface is "triggered" when the condition has been met. The debugging output continues to be disabled for the other interfaces. If, at some later time, the condition is met for another interface, the debug output also will become enabled for that interface.

Once debugging output has been triggered on an interface, the output will continue until the interface goes down. However, the session for that interface might change, resulting in a new username, called party number, or calling party number. Use the **no debug interface** command to reset the debug trigger mechanism for a particular interface. The debugging output for that interface will be disabled until the interface meets one of the specified conditions.

To limit the number of debugging messages based on a specified condition, use the following command in privileged EXEC mode:

Command	Purpose
`Router# debug condition {username username | called dial-string | caller dial-string}`	Enables conditional debugging. The router will display only messages for interfaces that meet this condition.

To reenable the debugging output for all interfaces, enter the **no debug condition all** command.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
FC-303
Fls: 1383
Doc: 3701

Specifying Multiple Debugging Conditions

To limit the number of debugging messages based on more than one condition, use the following commands in privileged EXEC mode:

	Command	Purposes
Step 1	`Router# debug condition {username username | called dial-string | caller dial-string}`	Enables conditional debugging, and specifies the first condition.
Step 2	`Router# debug condition {username username | called dial-string | caller dial-string}`	Specifies the second condition. Repeat this task until all conditions are specified.

If you enter multiple **debug condition** commands, debugging output will be generated if an interface meets at least one of the conditions. If you remove one of the conditions using the **no debug condition** command, interfaces that meet only that condition no longer will produce debugging output. However, interfaces that meet a condition other than the removed condition will continue to generate output. Only if no active conditions are met for an interface will the output for that interface be disabled.

Conditionally Triggered Debugging Configuration Examples

In this example, four conditions have been set by the following commands:

- **debug condition interface serial 0**
- **debug condition interface serial 1**
- **debug condition interface virtual-template 1**
- **debug condition username fred**

The first three conditions have been met by one interface. The fourth condition has not yet been met:

```
Router# show debug condition

Condition 1: interface Se0 (1 flags triggered)
        Flags: Se0
Condition 2: interface Se1 (1 flags triggered)
        Flags: Se1
Condition 3: interface Vt1 (1 flags triggered)
        Flags: Vt1
Condition 4: username fred (0 flags triggered)
```

When any **debug condition** command is entered, debugging messages for conditional debugging are enabled. The following debugging messages show conditions being met on different interfaces as the serial 0 and serial 1 interfaces come up. For example, the second line of output indicates that serial interface 0 meets the username fred condition.

```
*Mar  1 00:04:41.647: %LINK-3-UPDOWN: Interface Serial0, changed state to up
*Mar  1 00:04:41.715: Se0 Debug: Condition 4, username fred triggered, count 2
*Mar  1 00:04:42.963: %LINEPROTO-5-UPDOWN: Line protocol on Interface Serial0, changed
state to up
*Mar  1 00:04:43.271: Vi1 Debug: Condition 3, interface Vt1 triggered, count 1
*Mar  1 00:04:43.271: %LINK-3-UPDOWN: Interface Virtual-Access1, changed state to up
*Mar  1 00:04:43.279: Vi1 Debug: Condition 4, username fred triggered, count 2
*Mar  1 00:04:43.283: Vi1 Debug: Condition 1, interface Se0 triggered, count 3
*Mar  1 00:04:44.039: %IP-4-DUPADDR: Duplicate address 172.27.32.114 on Ethernet 0,
sourced by 00e0.1e3e.2d41
```

```
*Mar  1 00:04:44.283: %LINEPROTO-5-UPDOWN: Line protocol on Interface Virtual-Access1,
changed state to up
*Mar  1 00:04:54.667: %LINK-3-UPDOWN: Interface Serial1, changed state to up
*Mar  1 00:04:54.731: Se1 Debug: Condition 4, username fred triggered, count 2
*Mar  1 00:04:54.735: Vi1 Debug: Condition 2, interface Se1 triggered, count 4
*Mar  1 00:04:55.735: %LINEPROTO-5-UPDOWN: Line protocol on Interface Serial1, changed
state to up
```

After a period of time, the **show debug condition** command displays the revised list of conditions:

```
Router# show debug condition

Condition 1: interface Se0 (2 flags triggered)
        Flags: Se0 Vi1
Condition 2: interface Se1 (2 flags triggered)
        Flags: Se1 Vi1
Condition 3: interface Vt1 (2 flags triggered)
        Flags: Vt1 Vi1
Condition 4: username fred (3 flags triggered)
        Flags: Se0 Vi1 Se1
```

Next, the serial 1 and serial 0 interfaces go down. When an interface goes down, conditions for that interface are cleared.

```
*Mar  1 00:05:51.443: %LINK-3-UPDOWN: Interface Serial1, changed state to down
*Mar  1 00:05:51.471: Se1 Debug: Condition 4, username fred cleared, count 1
*Mar  1 00:05:51.479: Vi1 Debug: Condition 2, interface Se1 cleared, count 3
*Mar  1 00:05:52.443: %LINEPROTO-5-UPDOWN: Line protocol on Interface Serial1, changed
state to down
*Mar  1 00:05:56.859: %LINK-3-UPDOWN: Interface Serial0, changed state to down
*Mar  1 00:05:56.887: Se0 Debug: Condition 4, username fred cleared, count 1
*Mar  1 00:05:56.895: Vi1 Debug: Condition 1, interface Se0 cleared, count 2
*Mar  1 00:05:56.899: Vi1 Debug: Condition 3, interface Vt1 cleared, count 1
*Mar  1 00:05:56.899: Vi1 Debug: Condition 4, username fred cleared, count 0
*Mar  1 00:05:56.903: %LINK-3-UPDOWN: Interface Virtual-Access1, changed state to down
*Mar  1 00:05:57.907: %LINEPROTO-5-UPDOWN: Line protocol on Interface Serial0, changed
state to down
*Mar  1 00:05:57.907: %LINEPROTO-5-UPDOWN: Line protocol on Interface Virtual-Access1,
changed state to down
```

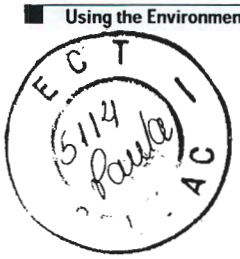
The final **show debug condition** output is the same as the output before the interfaces came up:

```
Router# show debug condition

Condition 1: interface Se0 (1 flags triggered)
        Flags: Se0
Condition 2: interface Se1 (1 flags triggered)
        Flags: Se1
Condition 3: interface Vt1 (1 flags triggered)
        Flags: Vt1
Condition 4: username fred (0 flags triggered)
```

Using the Environmental Monitor

Some routers and access servers have an environmental monitor that monitors the physical condition of the router. If a measurement exceeds acceptable margins, a warning message is printed to the system console. The system software collects measurements once every 60 seconds, but warnings for a given test point are printed at most once every 4 hours. If the temperature measurements are out of specification more than the shutdown, the software shuts the router down (the fan will remain on). The



router must be manually turned off and on after such a shutdown. You can query the environmental monitor using the **show environment** command at any time to determine whether a measurement is out of tolerance. Refer to the *Cisco IOS System Error Messages* publication for a description of environmental monitor warning messages.

On routers with an environmental monitor, if the software detects that any of its temperature test points have exceeded maximum margins, it performs the following steps:

1. Saves the last measured values from each of the six test points to internal nonvolatile memory.
2. Interrupts the system software and causes a shutdown message to be printed on the system console.
3. Shuts off the power supplies after a few milliseconds of delay.

The system displays the following message if temperatures exceed maximum margins, along with a message indicating the reason for the shutdown:

```
Router#
%ENVM-1-SHUTDOWN: Environmental Monitor initiated shutdown
%ENVM-2-TEMP: Inlet temperature has reached SHUTDOWN level at 64(C)
```

Refer to the hardware installation and maintenance publication for your router for more information about environmental specifications.

hp surestore dvd-rom array module

The HP Surestore DVD-ROM Array Module further extends the versatility of HP's tape array solution. It provides DVD and CD reading functionality, and the ability to load software, all in a half-height form factor. This module is offline hot-swappable within an HP Surestore Tape Array 5300 for easy insertion and removal in a racked environment and offers the high performance (40x as a CD-ROM, 10x as a DVD-ROM) information services professionals need.

The HP Surestore Tape Array solutions provide a choice of rack enclosures in different heights to fit almost any data center. Available array modules encompass a wide range of tape drive technologies, as well as DVD-ROM, which can be mixed and matched in a single enclosure. The HP Surestore Tape Array 5300 offers upgrade options to enable SAF-TE remote manageability in a Windows® operating system environment and an additional power supply and fan kit for environments where redundancy is important.

key features/benefits

- **fast:** delivers high data transfer rates (10x for DVD-ROM, 40x for CD-ROM) for performance.
- **manageable:** offline hot-swap capability for easy insertion and removal.
- **flexible:** DVD and CD read functionality in a racked environment.
- **adaptable:** provides a half-height array module for addition to an HP Tape Array 5300.

specifications

Interface	Ultra SCSI LVDS. A fast, narrow, single-ended Ultra SCSI DVD-ROM with max throughput (burst rate) of 20 Mbps. Mounting in a Surestore DVD-ROM rack-ready module enables connection to an LVD SCSI bus for burst rates of 160 Mbps.	
Form Factor	5.25 inch, half-height	
Loading System	Slot disc loading system, long disc eject	
Insertion/Removal	Offline hot-swappable	
Performance	DVD-ROM: CAV 10x	CD-ROM: CAV 40x
Access Time/Seek Time	DVD: average 95 msec	CD: average 80 msec (random average)
Loading Time	Less than 3 sec (the period the disc starts to load and is clamped in the drive)	
Unloading Time	Less than 4 sec (from eject button press to disc unload)	
Disc Read Formats	DVD single layer & dual layer, DVD-R[1], DVD-RW[1], CD-ROM mode 1, XA mode 2, Photo CD (single & multiple session), CD-DA, CD-Extra, CD-R, CD-RW, Video CD	
Operating System Compatibility	Tape Array solutions are compatible with HP Servers running HP-UX, Windows®, Linux, and other industry-leading operating systems and software. For further information on system-specific compatibility visit: www.hp.com/go/connect	
Standard Warranty	3-years, next day[2] unit exchange, system matching on HP systems[3] (internal, external, and rack mountable units).	

[1] DVD-RAM is not supported.

[2] Unit exchange next day is not available in some countries.

[3] The system matching period applies to the host system standard warranty period only. The drive warranty reverts to unit exchange for the remainder of its standard warranty period after the host warranty expires.

Single-System High Availability at the Forefront in Hewlett-Packard's Server Line

EXECUTIVE SUMMARY

A vendor's ability to deliver high availability is key to the vendor's differentiation in the e-commerce world and other venues where downtime is dead time. Other variables such as technical excellence and cost-of-ownership are, of course, also important. However, given the business costs and other costs of a disruption, the pressure from corporate and information technology management, system administrators, and users the overwhelming factor is to have their systems highly available.

Hewlett-Packard has long recognized the need for highly available servers – even before the current industry emphasis on such capability. To provide its customers with the most available servers, HP has followed the guidelines of its internally developed high-availability infrastructure architecture. This infrastructure is modeled in the form of a tree with three main branches, each with three sub-branches. This is no mere theoretical construct; the sub-branches are populated with HP and third-party products that meet the practical, operational high-availability needs of HP customers.

For HP, server high availability is a multifaceted, holistic effort guided by a prime directive that the design-in of high availability into the server software and hardware architecture is fundamental. This principle results in literally hundreds of features and functions in each HP server that are dedicated to providing specific benefits to the server administrator and user.

As a result of HP's ability to implement and deliver on this philosophy, D. H. Brown Associates, Inc. (DHBA) believes that HP's high-availability architecture tree and its component parts provide an industry-leading model for the server community. The model is comprehensive and feature-function rich. This white paper provides an overview of this tree, its branches and sub-branches, and an overview of the component parts and their functionality.

After reading this material, the existing or potential HP server administrator or user, and numerous other interested parties in the IT community, will have a fundamental understanding of HP's high-availability efforts, why they are industry-leading, and what kind of benefits they offer.

INTRODUCTION AND OVERVIEW

A vendor's ability to deliver high availability is key to the vendor's differentiation in the e-commerce world and other venues where downtime is dead time. Other variables such as technical excellence and cost-of-ownership are, of course, also important. However, given the business and other costs of a disruption, the pressure from corporate and information technology management, system administrators, and users the overwhelming factor is to have their systems highly available.

Hewlett-Packard has long recognized the need for highly available servers – even before the current industry emphasis on such capability. To provide its customers with the most available servers, HP has followed the guidelines of its internally developed high-availability architecture infrastructure. This infrastructure is modeled in the form of a tree with three main branches, each with three sub-branches. This is no mere theoretical construct; the sub-branches are populated with HP and third-party products that meet the practical, operational high-availability needs of HP customers.

HP's "always on" vision includes Single-System High Availability (SSHA) and Cluster HA solutions. This white paper focuses on SSHA functionality and solutions.[1] There is, of course, much more to consider in order to provide high availability that is not discussed herein. For example, customers should keep in mind not only the overall HA solutions being offered by HP products (delivering both single-system and cluster HA), but also support services (such as Business Continuity Support or Critical System Support), IT processes support (consulting, disaster-recovery services, etc.), and partnerships with third parties (e.g., Oracle, Cisco, SAP) for fully integrated high-availability solution offerings.

For HP, server high availability is a multifaceted, holistic effort guided by a prime directive that the design-in of high availability into the server software and hardware architecture is fundamental. This principle results in literally hundreds of features and functions in each HP server that are dedicated to providing specific benefits to the server administrator and user.[2]

The conceptual and practical thinking behind the development of the tree components that provide these hundreds of features and functions is detailed in this white paper. After reading this material the existing or potential HP server administrator or user will have a fundamental understanding of HP's high-availability efforts, why they are industry leading, and what kind of benefits they offer.

---

1 MC/ServiceGuard is a specialized software facility that provides clustering and high-availability functionality for HP 9000 computer system products. MC/ServiceGuard is not discussed here.

2 These hundreds of features and functions are examined in detail elsewhere. Information about them is available from HP or DHBA.

ECT 5106 Paiub CPL - AC

HP breaks down its high-availability architecture concept into a tree structure with three main branches. These three main branches are each further broken down into three sub-branches (Figure 1: HP's Tree-Based Server High Availability Architecture). The main branches and sub-branches are:

- Server Fault Avoidance
  - Reliability,
  - Resiliency, and
  - Isolation.
- Server Self-Healing
  - Discover,
  - Resolve, and
  - Recover.
- Server Dynamic Computing
  - Load Balancing,
  - Dynamic Tuning, and
  - Partitioning.

The nine sub-branches are further broken down into multiple component parts per sub-branch as shown in Figure 1. This paper provides an overview of the 33 components made available in the nine sub-branches[3] and examines their administrator and user value.

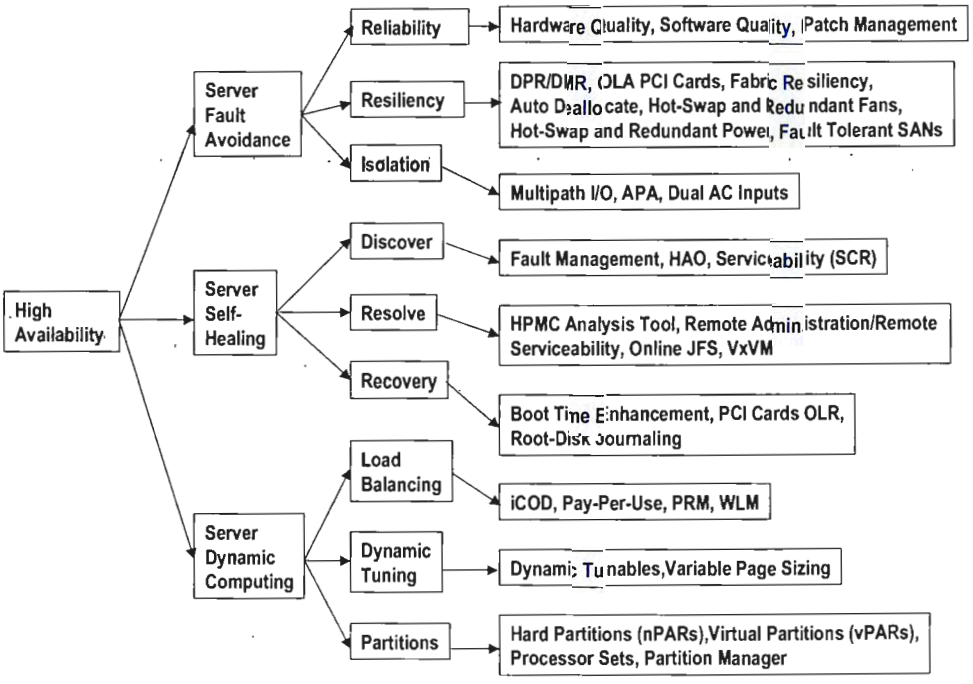

FIGURE 1: HP's Tree-Based Server High Availability Architecture

[3] The number of components will continue to grow.

ECT 5105 Paula ACI

HIGH AVAILABILITY: SERVER FAULT AVOIDANCE

The sole purpose of HP's HA feature set is to address the real causes of customer downtime, as determined by actual field data. HP knows that delivering always-on solutions requires more than just delivering laundry lists of HA features with limited utility, or worse, HA features riddled with so many caveats as to render them useless. The real HA measure is how much uptime is seen by customer applications.

Avoiding faults is critical as the first line of defense to deal with server downtime causes. Crashing a system first, then dealing with recovery is not the optimum solution. Dealing with recovery, while important, should not be a primary HA strategy. Avoiding faults in the first place is key.

The term "failure avoidance" should not be confused with other schemes that provide standby hardware to be swapped in after a system crash has occurred. Sometimes, a server that is described as having 100% hardware redundancy in reality only allows for standby hardware to be swapped in – a less desirable condition. For HP, redundancy means that sufficient resources are available online to restore the system to proper operation without any application interruption.

HP's field data has shown that the primary causes of server hardware and/or software downtime is the following (roughly in order of occurrence):

1. main memory failures,
2. cache failures,
3. power supply failures,
4. I/O card errors,
5. sockets/interconnects,
6. networking/mass storage,
7. software panics,
8. ASIC/Backplane failures, and
9. clock failures.

The top seven items in the above list amount to 98% of downtime causes. Main memory and cache memory amount to about 50% of the fault-generation cases. Knowing this distribution, HP has addressed these failure sources to deliver the maximum availability with the features and functions described in the sections that follow.

ECT 5104 Paula CPL - AC

HIGH AVAILABILITY: SERVER FAULT AVOIDANCE – RELIABILITY

Reliability is the first sub-branch in the Server Fault Avoidance main branch of HP's availability tree. A reliability metric, and there are many, measures failures in a system, both hardware and software related. A highly reliable system has few failures of any hardware or software component (due to either planned or unplanned downtime).

HP pays major attention to its server reliability through robust system-architecture design, careful vendor and component selection, sophisticated manufacturing processes, and elaborate, time-tested software qualification and design processes. At the user production site, both hardware and software techniques work around failed components to reduce maintenance, the number of service calls, and warranty costs.

To better understand HP's reliability work, the next sections examine the issues of hardware and software quality. Then, patch management is detailed.

RELIABILITY – HARDWARE QUALITY

The first step in fault avoidance is using high-quality components in a server design. Toward this end, HP has implemented sophisticated field tracking processes that record and analyze all system and component failures in order to detect trends and provide feedback to allow the HP hardware design laboratory to build more robust future products. As a result of having this data, HP systems have been designed from the ground up to address these detected failure sources.

HP uses a number of hardware quality-ensuring measures designed to deliver reliable, high-quality servers. These measures include,

- a modular architecture to minimize server component count;
- a system design and qualification methodology that pushes the hardware to its maximum while running customer applications;
- provision for extensive component supplier qualification;
- use of high-volume blowers to maintain ASIC and CPU junction temperatures as cool as possible;
- vendor-selection processes that require demonstrated high-quality manufacturing processes, as well as demonstrated high reliability;
- vendor requirements to execute ASIC burn-in tests, which result in ten times the ASIC quality as compared to standard components;[4] and
- boards and systems receive HP burn-in, running customer applications, a process that weeds out early life failures.

[4] In contrast to non-burn-in.

RELIABILITY – SOFTWARE QUALITY

The best way to examine software quality is to directly query the software user. Who knows better than the user what is really going on as far as software quality is concerned? With the goal of going right to the user source for information, HP has conducted software quality studies at the Interex (HP Users Group) meetings.[5] As a result of HP's software quality emphasis, in the three years that the Interex study has been conducted, customer satisfaction with HP software quality and reliability has grown from 70% to 80%.

In a separate, randomized study this year (January 2001), overall satisfaction with HP-UX-based products is very strong with 71% of respondents indicating they are very satisfied, 23% indicating moderate satisfaction, and very few (less than 6%) indicating dissatisfaction.[6]

RELIABILITY – PATCH MANAGEMENT

HP employs a two-stage patch-testing process. When a defect or escalation is reported, it is important to respond quickly (especially if the defect is critical). This necessity for fast response must be balanced with the need for a high-quality patch whose delivery must not be delayed.

Understanding these criteria, HP has two patch models – reactive patch and proactive patch. The former is designed to solve an existing problem with timeliness as the highest priority – fix the problem the first time in a reliable manner and minimize change. There is some risk here since the fix speed may compromise complete patch testing.

A proactive patch is designed for preventive maintenance. With such a patch, reliability (rather than timeliness as is the case with the reactive patch) is most important. A proactive patch is a stable, tested patch. It is planned in advance, issued at defined times, and fully tested. The changes that occur because of the proactive patch are evaluated in advance and fully understood. Risk is minimized by full testing although large proactive patch use may still involve some risk.

A patch is put through a fix-creation process, a peer review, and the standard functional, and reliability testing for the subsystem that involves the patch. HP then releases the patch with a one star rating to indicate that it is for reactive patching only and to use it only if the problem is evident. One star patches are used only when two star or three star patches are not available.

---

[5] The study is conducted annually and the 2001 result included 2,533 participants who spend $9.3 billion on IT products ($3.3 billion on HP products).

[6] World-class performance on surveys such as this exceeds 50% in the very satisfied category, 90% in both the very and moderately satisfied category, and is 10% or less in the dissatisfied category. By far (48%), the primary reason that customers cite for being very satisfied with HP-UX products is high system availability. (HP support comes in second at 18%.)

RQS Nº 03/2005 - CN CORREIOS 1392 Fls: Doc: 3701

ECT 5102 Faulk CPL-AC

A two star patch is a proactive patch that has met certain test criteria but is not fully qualified. It is to be used only when a three star patch is not available. The two star patch's probability of recall is typically 60% lower than that of a one star patch.

The patch then continues to be put through system testing in the HP enterprise patch test center, which duplicates the most common customer environments. Here it is bundled with other patches and the entire set is put through rigorous interoperability tests. This process typically takes five to eight weeks. At the successful conclusion of this testing the patch is rated three stars. Three star patches have 80% fewer recalls than do one star patches.

HIGH AVAILABILITY: SERVER FAULT AVOIDANCE – RESILIENCY

Even the highest quality components can, at some point, fail. Because of this fact, it is important to understand the failure rates of all components, understand the failure modes, and then design HA features to deal with these failure modes to minimize application downtime.

These points are captured in Resiliency, the second sub-branch of Server Fault Avoidance. Resiliency is the ability to keep running in the presence of faults so that applications see no downtime due to hardware or software failures. In a resilient server, work-arounds for problems are developed through a combination of redundant or self-correcting components and software techniques to enable transparent failover to a working component or system.

Good examples of resiliency technology are Dynamic Processor Resilience (DPR) and Dynamic Memory Resilience (DMR). The section that follows explains DPR and DMR. Subsequent sections provide explanations for the other five Figure 1 Resiliency components.

RESILIENCY – DYNAMIC PROCESSOR AND DYNAMIC MEMORY RESILIENCE

Dynamic Processor Resilience (DPR) permits a server to be resilient to the CPU cache errors that are a major contributor to system downtime. In an HP server with DPR, if a CPU generates cache errors at a predetermined, unacceptable rate, the CPU is automatically deconfigured, online. Moreover, to solve the problem, the server can be configured to automatically swap-in a spare CPU.

HP's server CPU caches are protected from single-bit hard errors and random soft errors generated from cosmic rays and other intermittent error-generation sources. Furthermore, the HP CPU has a physical cache layout that reduces the chance of a multi-bit error due to a random cosmic ray strike.[7]

[7] Cosmic ray strikes affect memory arrays by removing the charge on specific cell locations. In many cases, high-energy strikes can affect multiple physically adjacent bits. It is important to make sure (architecturally) that physically adjacent bits do not show up in the same logical cache line. Certain competing systems do not do this.

ECT
I 5101
Paula
C L - AC

While CPU cache-error generation is an issue, main memory failure is the hardware event that causes the most customer downtime. HP addresses this failure mode with four features:

- memory chip spare,
- dynamic memory resilience (DMR),
- hardware memory scrubbing, and
- automatic deconfigure on reboot.

Memory chip spare is the server's ability to continue to run in the face of any single, or multi-bit chip DRAM error. HP server system DRAMS are set up as N+1 per set of 128 DRAMS per memory word since the firm believes this architecture is essential in the design of reliable memory systems. Systems without this functionality may fail at a high rate compared to HP systems with this functionality.[8]

Certain vendors deal with multi-bit SDRAM failures by accepting the fact that they will occur. This means that a scheme is used that supports failure detection, but not correction. This scheme, while it may be acceptable in low-end markets, is a dangerous choice for those customers who bet their business on not having any downtime. Systems based upon this corner cutting are at high risk to fail due to memory problems.

DMR represents the server's ability to online (i.e., while the application is running) deallocate failed memory pages. DMR is similar to DPR in that if a memory location is problematic (i.e., exhibits persistent errors), that memory will be online deallocated with no visible-to-the-user impact. HP believes that, as long as the server is shipped with adequate memory, it is likely that a failed memory will never have to be replaced over the product life. This likelihood results in a significant planned downtime reduction compared to non-DMR systems.

Aiding in this process is the hardware memory scrubber (available in the rp8400 and Superdome servers). The scrubber automatically corrects and clears single-bit errors in every memory line that is read by the CPUs. This is an advantage over most software-based scrubbers, which are limited to scrubbing only that memory which is not locked down by the operating system or an application.

Automatic deconfigure on reboot is the system's ability to dynamically remove failing memory during boot from the available memory pool without halting the entire system.

[8] HP has seen this at customer sites that use both the HP architecture and other architectures.

RESILIENCY – PCI CARDS ON-LINE ADDITION (OLA)

The PCI Cards OLA capability, the second Figure 1 Resiliency component, enables the online addition of PCI I/O cards to HP-UX-based servers designed to support this feature.[9] The server hardware uses a standard per-PCI slot power-control technology combined with operating-system support for the PCI Card OLA feature to allow the addition of a new card without affecting other components or requiring a reboot.

The OLA feature enhances server high availability by reducing both planned and unplanned downtime since the server can still run while an I/O adapter is added and configured. All HP PCI cards (including Gigabit Ethernet, Fibre Channel, SCSI, Term I/O) and their drivers support this feature.

As just noted, OLA can provide additional I/O resources and new I/O technology without a reboot. This means that administrators can add resources on demand, based on workload. As a result, the need for the difficult exact deployment planning of I/O cards in a server is reduced. Additional I/O cards can also increase the server availability by providing alternative failover paths.

RESILIENCY – FABRIC RESILIENCY

Fabric Resiliency is the third component of the Figure 1 Resiliency sub-branch. A fabric ties CPU and memory resources together. Moreover, if the server has partitions,[10] the partitions may share this fabric. If the fabric is not resilient, the server will suffer decreased uptime. Of course, from the server-functionality point-of-view, if the fabric is not resilient, neither are the server partitions. HP addresses fabric resiliency through four technologies:

- highly reliable fabric ASICs,
- redundant and hot-swappable DC-DC converters,
- hardware isolation between crossbar chips, and
- full end-to-end error correction.

HP's fabric backplane ASICs are manufactured and tested with processes that result in a ten-fold reliability increase over comparable ASICs not similarly manufactured with such expensive components and procedures. The result in the field is virtually zero backplane ASIC failure.

The DC-DC converters that power ASICs and other backplane chips are fully redundant and hot swappable.

This further adds to system availability, and significantly reduces shared failure modes between partitions. Only HP provides redundant power for backplane components; others provide redundancy only for clocks, which rarely fail.

---

[9] As of September 2001, this includes N-class, L-class, Superdome, and the newly released rp8400 servers.
[10] Different partition types are discussed later in this white paper.

Copyright 2001 © D.H. Brown Associates, Inc.

ECT 5099 Fls: ACI

The HP server backplane is built from crossbars with point-to-point connections. In a properly configured server, communication traffic in a partition is restricted to that partition so that there is no link sharing. Since each crossbar chip port is independent, the cells of different partitions coexist without affecting each other.

In competing bus-based servers, all domains participate in the communication coherency scheme and share address busses. This means that, in these systems, all domains are linked in some manner and there may be shared failure modes that can contribute to increased, unplanned downtime.

Figure 2 in the Appendix and its associated explanatory text provide a simplified example of both the HP crossbar-based backplane and a competing vendor's bus-based backplane, and how the HP approach provides superior high availability.

RESILIENCY – AUTO-DEALLOCATE

Nearly all HP server hardware is redundant.[11] The result is virtually zero failures that would keep a partitionable system down waiting for parts. If a component or entire subsystem fails self-test, for example, the server will automatically deallocate the faulty hardware, continue to boot, and run the application when the server partition (or server) comes up.

Auto-deallocate applies to CPUs, memory, fabric links, and I/O. Hardware redundancy accommodates PCI card I/O failures, the complete PCI chassis, or the connected cell board. With a properly configured I/O system, there is no failure that causes I/O loss.

RESILIENCY – HOT SWAP AND REDUNDANT FANS

All HP servers have redundant and hot swap fans. This design is fundamental to ensure the best server reliability. Certain HP servers, e.g., Superdome, have such high-capacity fans and blowers that sufficient airflow is provided for all conditions even in the presence of a failure. The new high-density HP rp8400 server is even more sophisticated. It takes a unique approach by adding special CPU fans to keep the CPUs cool even in the small rp8400 form-factor.

Heat is the mortal enemy of components that need to be as reliable as possible, so the heat issue in a high-density system requires special consideration. The rp8400's two-level cooling scheme offers the required cooling capacity at nominal cost. To accomplish this feat, the rp8400 uses turbo-cooler fans that draw air directly into the heat sinks of the critical CPU and cell VLSI chips.

At the extreme server operating-temperature ranges, the turbo-cooler fans maintain internal temperatures well below the design maximums. Under normal ambient operating conditions, turbo-coolers are not required. However, if the

[11] Minor exceptions include clocks and power-control circuitry that rarely fail (rated at a 1% per year failure rate).

Copyright 2001 © D.H. Brown Associates, Inc.

RQS Nº 03/2005 - CN CPMI - CORREIOS Fls: 1394 Doc: 3701

turbo-coolers run, the silicon operates well within its maximum lifetime thermal window. Again, the result is increased overall server-system reliability.

To further improve reliability, manageability software monitors the rp8400 fan speeds, including turbo-cooler fans. This software detects the first slowdown hint associated with fan bearing wear-out. As a result, the system administrator has an early alert (at least 100 hours) to the remote possibility of a turbo-cooler fan failure.

RESILIENCY – HOT SWAP AND REDUNDANT POWER

The front-end power supplies in all HP servers are fully redundant and hot swappable. The Superdome (high end) and rp8400 (midrange) servers also have redundant and hot swappable backplane DC-DC converters. The latter feature fully removes power conversion as a cause of multi-partition crashes. The rp8400 midrange server also has redundancy in many other areas of power conversion. This also contributes to its increased uptime.

RESILIENCY – FAULT TOLERANT SANS

Fault Tolerant SANs are the seventh, and last component of the Figure 1 Resiliency sub-branch. HP uses Fibre Channel technology for its SAN solutions and supports three Fibre Channel topologies – point-to-point, arbitrated loop, and switched-based fabric.

For the arbitrated-loop architecture, HP servers can interoperate with switches or hubs that have the Emulated Private Loop (or Quick Loop) feature. These switches regenerate the signals on each port (unlike passive hubs) and thus can stop bad signals or faults. For the switched fabric topology, links are point-to-point so that faults are inherently isolated.

HP-UX supports multipath I/O in both of the just-described fibre topologies. Such I/O can be used to ensure that there can be redundant links to a target and the target can be reached even if there is a fault in a SAN link or port. In all of these cases, administrators can use the fault tolerant and the multipath I/O technology to configure their SANs for maximum availability.

HIGH AVAILABILITY: SERVER FAULT AVOIDANCE – ISOLATION

Isolation is the third sub-branch of the Server Fault Avoidance branch of the HP high-availability tree. For HP, isolation means, for example, that each Superdome I/O slot has an independent I/O channel or PCI bus. This architectural design supports improved I/O performance since each PCI card can run at its full PCI speed and, at the same time, enjoy fault isolation.

Copyright 2001 © D.H. Brown Associates, Inc.

ECT 5097 Paula CPL - AC

When this capability is coupled with HP's Auto Port Aggregation (APA),[12] Logical Volume Manager (LVM),[13] and AutoPath, then Ethernet network links such as 100BT and Gigabit Ethernet, and mass storage links such as SCSI and FC can provide automatic failover, load balancing, and isolation from card or I/O bus failures. This capability contributes mightily to minimize application downtime.

ISOLATION – MULTIPATH I/O

A multipath I/O feature allows accessibility to a storage device or networking end-node through multiple paths. The access can be simultaneous (in an active-active configuration) or streamlined (in an active-passive configuration).

In a mass storage configuration, a disk LUN (Logical Unit Number) is reached from a controller via various switches or ports (i.e., for Fibre Channel) or via split cables (i.e., for SCSI). In a networking configuration (i.e., switched 100BT and Gigabit Ethernet), connectivity between two hosts may be achieved through various switches, routers, or controllers.

Care must be taken in these architectures to eliminate single-points-of-failure (SPOFs) between two end points. For further fault isolation, each PCI card resides on its own PCI bus. Therefore, all PCI card errors are contained on the card that generated the error and cannot propagate to other I/O cards.

The multipath I/O feature provides failover, load balancing, and failure isolation. Networking and mass-storage products such as APA and LVM provide path-failure detection and failover capabilities. Products such as APA/EMC-Powerpath/XP-Autopath can load balance among various paths. Failure to a path does not disrupt activities on other paths. This isolation is important for delivering high availability, since I/O is inherently error prone.

As an example of the above, consider a configuration wherein the APA product uses two Gigabit Ethernet adapters in an active-standby mode. The network is configured such that the two adapters can be connected to the same or different switches but can reach the same destination servers/clients. If one of the adapters/cables/switches fails due to an error, APA detects the error and can quickly route packets to the other adapter. Thus multiple paths greatly increase the system availability by providing redundancy and complete fault isolation.

[12] Discussed in the next section.

[13] Logical Volume Manager (LVM) is a subsystem for managing file systems and disk-storage spaces that are structured into logical volumes rather than being restricted to the beginning and end points of a physical disk. Logical volumes can be smaller than the disk or disk array on which they reside, or they can include all or part of several disks or disk arrays. Logical volume boundaries are not required to coincide with the boundaries of physical disks when multiple disks or arrays are used.

Copyright 2001 © D.H. Brown Associates, Inc.

RQS Nº 03/2005 - CN CPMI - CORREIOS
Fls: 1395
Doc: 3701

ISOLATION – AUTO PORT AGGREGATION (APA)

Auto Port Aggregation (APA) is an HP kernel-based networking product. It provides link aggregation, or trunking. This capability amounts to aggregation of two or more network physical ports into a single logical port (pipe). APA technology is transparent to higher-level communication protocol layers (e.g., TCP/IP).

APA is a cost effective software solution for upgrading to higher bandwidth while maintaining an existing infrastructure and providing a quick (less than a second), and easy failover mechanism. Links can be aggregated on an active-active basis or an active-standby basis.

Aggregation on an active-active basis helps in load balancing among links. APA can be configured to use several different load-balancing algorithms[14] for outbound traffic (depending on the configuration). Inbound traffic load balancing depends on the support of this feature by the infrastructure switches. Aggregation on an active-passive basis helps in the failover scenario. APA can automatically detect failures and failover to a standby link within one second (with minimal or no application disruption).

Administrators use APA to provide load balancing among similar links and also as a quick transparent failover mechanism. High bandwidths can be achieved by combining several low-bandwidth links together from the existing infrastructure.

ISOLATION – DUAL AC INPUTS

The HP 9000 Superdome server family was the first in the industry to achieve an Uptime Institute certification for fault-tolerant power compliance.[15] The second

[14] *Server-to-Switch: MAC-Based*
This algorithm balances the load by hashing the eight least significant bits of the destination MAC address stored within an Ethernet packet. It then directs the packet to a specific link within an aggregate. This algorithm is most optimal when used in environments that contain no routing between the server and the clients.

Sever-to-Router: IP-Based
This algorithm balances the load by hashing the eight least significant bits of the destination IP address stored within an Ethernet packet. It then directs the packet to a specific link within an aggregate. This algorithm is most optimal when used in environments that contain routers between the server and clients.

Server-to-Server: CPU-Based
Ethernet packets do not contain a CPU ID. For this reason, the CPU-based algorithm makes a separate system call to obtain the originating CPU ID for each thread. It then uses this CPU ID to direct the thread to an Ethernet port assigned to that CPU by the APA software.

Server-to-Server: TCP/UDP Port-Based
This algorithm uses the TCP/UDP source and destination port numbers to distribute traffic across the ports in a Link Aggregate. This algorithm is intended to be used in networking environments where direct Server-to-Server Link Aggregation is needed. However, this algorithm may also be used in place of the MAC, IP, or CPU-based algorithms.

[15] The Uptime Institute developed its fault-tolerant power compliance specification in cooperation with members of the Site Uptime Network and major hardware manufacturers. The Site Uptime Network includes 48 Fortune 500 companies. The specification is available at www.uptimeinstitute.com.

Copyright 2001 © D.H. Brown Associates, Inc.

ECT 5095 Paula CPL - AC

is HP's new rp8400. In fact, these HP server systems are the only currently available servers fully compliant with this standard for dual, fault-tolerant AC inputs. Compliance means that HP's servers can be powered from two fully independent input power sources that do not need to be in-phase.

The tests passed by Superdome and the rp8400 include a variety of power-source conditions that contain abnormal out-of-tolerance voltages, faulted AC power sources, brownout conditions, and more. As required, the Superdome family operates with no data loss and no performance degradation, as initially installed or at its ultimate capacity.

HP believes that as a result of the Uptime Institute's certification, HP's customers can minimize power-fault uncertainty as another step toward decreased unplanned downtime. Server systems lacking such certification may be susceptible to AC faults that allow data loss and hardware and/or performance degradation. In some cases, power-distribution difficulties may be generated for a site's facility-engineering team if the server power source is not as capable as the Uptime Institute requires it to be.

HIGH AVAILABILITY: SERVER SELF-HEALING

HIGH AVAILABILITY: SERVER SELF-HEALING – DISCOVER

As indicated in Figure 1, HP breaks down the Server Self-Healing branch of its high-availability tree into three sub-branches – Discover, Resolve, and Recovery. The Discover sub-branch has three components – Fault Management, High Availability Observatory (HAO), and Serviceability (System Configuration Repository, [SCR]).

The following sections discuss how HP-UX helps administrators discover server problems. They can set hardware monitors using HP Fault Management, which will then alert them to potential problems. They can also have HP proactively discover server problems via the High Availability Observatory (HAO) suite of support software and technologies. Administrators can also discover problems themselves by taking snapshots of their inventory using HP's System Configuration Repository (SCR) tool and analyzing the resultant data.

DISCOVER – FAULT MANAGEMENT

Fault Management is the name given to HP's overall strategy and program to provide a value chain for detecting, notifying, and repairing server problems so that uptime is maximized. Proper Fault Management requires working with hardware and operating-system designers from the beginning of a server design to create hardware and software capabilities and instrumentation points that create the ability to detect and isolate server anomalies.

For example, HP creates monitors to poll server health information or to asynchronously respond to server instrumentation points designed to report problems or faults. Fault Management also implements several methods for maintaining historical event information for trend analysis. Faults that generate errors and warnings are automatically logged to the syslog. Notes and audit information are logged to an event log.

Fault Management provides alerts to potential problems, as well as to occurring problems as soon as they are detected so that administrators can take corrective action. In some cases fault monitors are smart enough to repair or prevent future faults from occurring. Fault Management currently uses the HP Event Monitoring Service (EMS) infrastructure for its notification methodology. EMS enables a wide variety of notification methods (e-mail, SNMP traps, system console, system log, text logfile, TCP/UDP, and OpenView OPC messaging).

Fault Management events can be viewed and browsed directly by the administrator on a functioning server. Alternatively, the administrator can install HP's TopTools Management server and aggregate information from multiple systems in a domain. There is also the option to integrate Fault Management

Copyright 2001 © D.H. Brown Associates, Inc.

ECT 5093 Paula CPL - AC

events with enterprise-management software like HP's OpenView Operations or other enterprise-management software from BMC, Tivoli, Computer Associates, or MicroMuse.

When HP Support is purchased, Fault Management events can be forwarded to the HP Support Organization. HP can then monitor, filter, and "trend" the events and take action on items that need attention. At the premium end of HP's support offering for the ultimate in high availability, services may be acquired from HP's High Availability Observatory (HAO).

HAO provides continuous and proactive IT environment monitoring. HP uses a dedicated, private ISDN network that allows secure information flow between the customer site and HP's Support Organization and provides the HP Support Organization direct access to the customer's server. As part of the HAO implementation, HP installs a Support Node at the customer site, linked securely to HP.

Fault Management, together with its monitors, proactively reviews the health of server components and generates close to real-time events when problems develop. These events can trigger corrective action to enable the server to continue functioning, or they can trigger alerts to administrative personnel.

Fault Management furthers the philosophy of proactive as compared to reactive fault management. One of HP's high-availability goals is to continue to move in the direction of proactive fault management because of its ability to minimize downtime. HP's Fault Management system provides accurate problem diagnosis the first time, as the problem occurs. This results in a substantial decrease in any downtime associated with an event.[16]

DISCOVER – HIGH AVAILABILITY OBSERVATORY (HAO)

The High Availability Observatory (HAO) is a suite of support technologies, tools, and processes that HP provides to its customers with mission-critical applications. These customers include those with Business Continuity Support (UNIX only) or Critical System Support (UNIX or Windows servers). The combination of HAO technology, people, and processes in place provides a total HA solution. HP has quantified that HAO reduces resolution by approximately 40 minutes per case in which it is used.

The HAO consists of an HP-owned Support Node workstation and network router that resides on the customer site, a secure communication link back to HP's Mission Critical Support Center (MCSC), and equipment and software within the MCSC to maintain and analyze information about the customer servers. Configuration and status data from servers, software, and network interconnect devices is collected via the support node and securely transmitted to

[16] Data is available from HP to show this improvement.

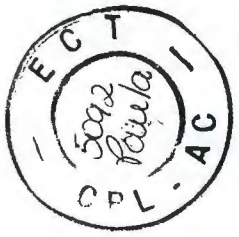
IRQS Nº 03/2005 - CN
CPMI - CORREIOS
1397
Fls:
Doc: 3701



the MCSC. This data is viewed by HP support engineers or securely shared with HP experts to help solve customer problems.

The data is also analyzed at the MCSC to alert HP and the customer of potential issues in their environment (e.g., bad patches or out-of-date firmware revisions). Hardware failure events within the customer mission- critical environment are detected by the HAO and alerts are sent back to HP for action.

DISCOVER – SERVICEABILITY (SYSTEM CONFIGURATION REPOSITORY [SCR])

HP's System Configuration Repository (SCR) is a no-cost tool that enables the collection of periodic or snapshot information about a server to a central database. SCR is a DMI management application. As such, SCR gets all the information it stores from standard APIs supported by HP's DMI service provider. The DMI service provider is SCR's collection agent on a managed node.

SCR accesses the DMI information available about a server and stores it as a snapshot in a central database. It follows the client-server model, i.e, a single server runs SCR and uses DMI to access client nodes. The information captured can be controlled, down to the level of each individual attribute, through the use of filters.

System administrators use SCR for troubleshooting. They can, for example, view their system state and compare it to previous known states (e.g., to determine that the correct state has been restored). System administrators also use SCR to generate system status, inventory, recordkeeping, and planning reports for internal (e.g., for change management) and external use (e.g., for third-party and purchase use).

HIGH AVAILABILITY: SERVER SELF-HEALING – RESOLVE

HP-UX provides capabilities and tools to resolve system problems. Toward this end, the Servicecontrol management-applications suite addresses the centralized configuration, fault, and workload-management requirements of an always-on Internet infrastructure and its servers. As indicated in Figure 1, the Resolve sub-branch of the Server Self-Healing branch has four components. The first of these components is the HPMC Analysis Tool part of the Servicecontrol management applications suite.

RESOLVE – HPMC ANALYSIS TOOL

The HPMC Analysis Tool automatically analyzes all server-stored error-log information after a catastrophic error. It is designed to describe the course of action to take to remedy the problem. This tool is useful for hardware problem diagnosis of those problems whose cause is not apparent through the system logs.

Copyright 2001 © D.H. Brown Associates, Inc.

E C T
5091
Paula
CPL - AC

The idea here is proactive rather than reactive diagnosis to avoid, where possible, of the need for service personnel to run time-consuming diagnostics. This tool is a safety net for those hardware problems that are not automatically detected and corrected by the server itself.

RESOLVE – REMOTE ADMINISTRATION/REMOTE SERVICEABILITY

The second component of the Resolve sub-branch is Remote Administration/ Remote Serviceability. Centralized web-based remote administration for HP-UX is delivered through the Servicecontrol suite of management applications. These applications include Ignite-UX, Software Distributor, System Configuration Repository, Servicecontrol Manager, Fault Management, Secure Web Console/Central Web Console, Partition Manager, System Administration Manager (SAM,) and MC/ServiceGuard.[17] These applications, either directly, or through Servicecontrol Manager integration, provide remote, web-accessible management.

- **Ignite-UX:** Ignite-UX allows remote image-based deployment. It also supports remote management of recovery images by collecting recovery images to a central server and then using them to repair systems remotely. Ignite-UX further provides the ability to ignite (cold install) client systems manually from the Ignite server console or automatically via the `bootsys` command.

  Such client-system installs are known as push installations. Ignite-UX can support multiple push installations in parallel. These parallel operations can, in turn, include multiple operating-system versions. Ignite-UX also provides the capability to ignite clients from a remote system, or ignite the client locally by "pulling" an operating system from an Ignite-UX server.

- **Software Distributor:** Software Distributor allows remote operating system and application installation and update. In addition to its ability to pull software from a central depot, Software Distributor also provides remote-operations features that allow software to be pushed to remote systems (targets) from the local host.

  These features and functions can be used interactively to monitor the results of all Software Distributor commands with the Software Distributor job browser GUI (graphical user interface) or the command line. Finally, Software Distributor can also deploy operating system and applications patches and, later, remotely roll back problematic patches (one at a time).

- **System Configuration Repository:** System Configuration Repository (discussed earlier in this white paper) collects and maintains hardware and software inventories from remote servers to a central repository.

- **Servicecontrol Manager:** Ignite-UX, Software Distributor, and System Configuration Repository applications independently support remote

[17] MC/ServiceGuard is well known and is not further discussed here.

Fls:
Doc: 3701

management. Through the Servicecontrol Manager umbrella, these applications are also available through a browser launched web interface. Other standalone HP-UX management applications are available remotely through Servicecontrol Manager integration. In fact, administrators can integrate and make available remotely (through Servicecontrol Manager's web interface) any standalone command line or X Windows-based application. With ServiceControl Managers' Distributed Tasks Facility (DTF), administrator scripts can be copied and executed across a set of systems easily and securely. ServiceControl Manager also supports a full command-line interface for further scripting of remote and multisystem management.

- **Fault Management:** Automatic rapid detection is a key contributor to high availability. Fault Management provides the framework and monitors to automatically generate events and forwards them to any enterprise-management system (e.g., HP's OpenView) or to a number of other notification methods.

- **Secure Web Console and Central Web Console:** Secure Web Console is a device that can either be embedded in certain HP Servers or attached to the console port for other HP servers. Secure Web Console provides secure web access to a console port through which the administrator gains access to an otherwise unavailable server. This access allows the reboot of a non-responsive system and interaction with the system-boot process. However, remote power-on is not supported.

  Central Web Console provides a console-consolidation capability for other console-access technologies such as terminal servers. With Central Web Console, large numbers of server consoles can be consolidated, managed and accessed from a common web-enabled interface. Central Web Console can use 3-DES encryption to encrypt the terminal-server session for secure access, including across firewalls.

- **Partition Manager:** For highly scalable servers, HP's Partition Manager is a web-enabled management interface for remote management of physical partitions. Once partitions are created all the Servicecontrol products and Servicecontrol Manager can manage each partition individually or together with Partition Manager (discussed later in this white paper).

- **System Administration Manager (SAM):** Running System Administration Manager (SAM) (through Servicecontrol Manager) provides system administrators with the ability to remotely manage server disks, file systems, peripheral devices, kernel configuration, users or groups, printers or plotters, and trusted-systems features. SAM is a GUI supplied with all HP-UX systems. SAM log files allow the tracking of system changes.

RESOLVE – ONLINE JOURNALED FILE SYSTEM (JFS)

Online Journaled File System (JFS), the third component of the Resolve sub-branch, provides the capability to perform system administration on a file system

Copyright 2001 © D.H. Brown Associates, Inc.

ECT 5089 Paulo CPL - AC

while it remains online and user-accessible. These system-administration functions include defragmentation, resizing, and online backup. Such capability allows optimum user-data availability while file-system downtime for maintenance is minimized.

With Online JFS, for example, disk defragmentation is eased. To resolve the fragmentation issue on a mounted file system, a defragmentation utility in Online JFS relocates data to remove unused space from directories, makes small files contiguous, and consolidates free blocks for file-system use.

Online JFS also provides backup capabilities. A snapshot or point-in-time image of a mounted file system may be made to provide a method for creating a backup (of selected files, a complete file system, or incremental backups).

Moreover, with Online JFS, file-system resizing is eased. Since file systems are originally created at a particular size, as system usage evolves the file systems may be too large or too small to accommodate changing usage patterns. Online JFS provides a method of solving these problems while the file systems remain mounted and user-available, e.g., the file system can be expanded or contracted. The fourth component of the Resolve sub-branch, the Veritas Volume Manager (VxVM), discussed in the next section, provides this specific capability.

RESOLVE – VERITAS VOLUME MANAGER (VxVM)

The Veritas Volume Manager allows (among other features) file-system resizing while the file system is mounted and user-available. The list below summarizes the VxVM capabilities.[18]

Veritas Volume Manager (VxVM) Functionality:

- dynamic reconfiguration of mirrors and volumes;
- support for multiple online data snapshots (for high availability and quick recoverability);
- automatic disk discovery (dynamic add of new disk arrays without reboot);
- hot sparing (allows administrator to designate disks in each disk group as spares);
- online relocation (add or replace or relocate disk drives while server is running); and
- disk group split and join (dynamic reorganization of disk groups).

[18] VxVM and the Veritas Cluster Volume Manager are integrated into MC/ServiceGuard.

Doc: 3701

HIGH AVAILABILITY: SERVER SELF-HEALING – RECOVERY

Recovery is the third sub-branch of the Server Self-Healing branch of the HP high-availability tree. To reduce unplanned down time, Recovery has three components provided by HP-UX 11i – Boot Time Enhancement, PCI Cards OLR, and Root Disk Journaling. These components decrease the time it takes to recover after a server or server-component crash.

RECOVERY – BOOT TIME ENHANCEMENT

Single-system boot time is the time interval from the initial power-on or reset of a system (i.e., a clean start state) to the time the system is available for the startup of services available on the network and/or user applications. Minimizing the time required for a server to boot up and become operational has a significant impact on the downtime associated with all single-server planned and unplanned downtime events. In other words, a boot-time reduction directly improves overall server availability while at the same time making planned events that require reboot more manageable.

Three software parts of HP-UX 11i are, or are being tuned to provide improved boot time. These parts are shown in the list below.

HP-UX 11i Boot Time Enhancements:

- ioscan-k option performance enhancement (both kernel optimization and ioscan command improvements);
- multiple SCSI LUN scanning (tuning SCSI LUNs scanning by leaving the target open for multiple LUN scans); and
- parallel I/O device scanning during boot (rather than serial scanning). The implementation is supported by enabling multiple threads early in the boot process.

RECOVERY – PCI CARDS ONLINE RECOVERY (OLR)

PCI Cards Online Recovery (OLR) enables the online replacement of PCI I/O cards on HP-UX-based systems designed to support this feature (i.e., as of September 2001, N-class, L-class, and Superdome). In operation, the server hardware uses the built-in per-PCI slot power-control hardware feature combined with operating-system support for the PCI Card OLR feature. This combination allows the replacement of an existing card without affecting other components or requiring a reboot.

This online-replacement feature allows increased availability since the server remains active while an I/O adapter is replaced. All PCI I/O cards (Gigabit Ethernet, Fibre Channel, SCSI, and 100BT) and their corresponding drivers support this feature. A replacement operation is limited to a like-for-like board replacement (i.e., the new card must be the same product as the replaced card).

Copyright 2001 © D.H. Brown Associates, Inc.

E C T
5087
AC

For those hardware environments where there are redundant link solutions, the I/O card replacement can take place without application impact.

RECOVERY – ROOT-DISK JOURNALING

Root-Disk Journaling, the third component of the Recovery sub-branch, enables fast file-system recovery after a system crash. Journaling, otherwise known as file-system logging, requires committing system writes to a sequential log file. Since the writes are stored on disk, not in system memory, the sequential nature in which they are written speeds up disk-write activity.

Note that VxFS (in JFS) uses a circular intent log. All file-system structure changes, or metadata changes, are written to this intent log in a synchronous manner. The file system periodically flushes these changes out to their corresponding disk blocks.

This journaling decreases the time it takes to recover after a crash (i.e., reduces unplanned downtime). Without such journaling, every block would have to be examined after a crash – a time-intensive process. With the use of an intent log, VxFS can recover from system downtime in a fraction of the time taken when an intent log is not used. The system simply scans the intent log, noting which file-system changes have completed and which had not. In some cases, the file system can roll forward changes to the metadata structures, because the changes were saved in the intent log. This capability adds availability and integrity to the overall file system.

HIGH AVAILABILITY: SERVER DYNAMIC COMPUTING

HIGH AVAILABILITY: SERVER DYNAMIC COMPUTING – LOAD BALANCE

As indicated in Figure 1, the Server Dynamic Computing branch of the high-availability tree has three sub-branches – Load Balance, Dynamic Tuning, and Partitions. The sequel discusses how these three components increase a server's availability.

HP offers several schemes for system load balancing. For example, there is the flexibility to grow compute resources to meet business needs through purchasing more preconfigured (by HP) server capacity or by leasing compute resources. There are also techniques to optimize network bandwidth and load-balance network traffic across multiple similar links. Finally, administrators can focus the appropriate amount of compute resources on specific tasks and define service level agreements to ensure the system will automatically adjust these resources to meet the predefined needs.

HP's availability tree defines four components in the Load Balance sub-branch. These components are Instant Capacity on Demand (iCOD), Pay-Per-Use (PPU),[19] Process Resource Manager (PRM), and Workload Manager (WLM).

LOAD BALANCE – ICOD

Instant Capacity on Demand (iCOD) is an application program that allows the use of capacity already configured in a purchased system. Through iCOD, administrators purchase a specified number of activated processors, and pay a right-to-access fee for a specified number of deactivated processors. These deactivated processors can be activated at the user site, after which activation a fee is paid.

By preloading a system with additional capacity, the administrator enjoys the benefit of being able to add server-processing capacity (without reboot) and without having to pay until it is needed. In addition, there are high-availability benefits. An active processor identified as a potential failure can be automatically deactivated and replaced with an operational inactive processor. This capability allows a system to maintain full capacity and postpones the time when the system needs to be shutdown to replace the failing processor (perhaps until a regularly scheduled maintenance window).

On HP Superdome systems, the number of inactive processors is audited from a system perspective, not a partition perspective. This audit technique allows an administrator to perform load balancing between partitions by deactivating a

[19] Formerly known as Utility Pricing.

E C T
5085
Paula
CPL - AC

previously active, but under-used processor in one partition, and activating a previously inactive processor in another partition. There is no cost to this procedure since the net total of server-active processors does not change.

iCOD is a quick, reliable way to add processing power. Physical addition of processor resources is (in relative terms) both time consuming and error prone, due to the procedure's manual nature. Whenever the server can be rebalanced without touching hardware there is an advantage.

LOAD BALANCE – PAY-PER-USE (PPU)

Pay-Per-Use (PPU) Pricing is an HP pricing model in which the administrator is charged for actual processor usage. The customer site acquires a specific hardware platform and number of processors, and is billed monthly for the actual usage, based on the number of active processors. The billing amounts vary, as processor usage increases or decreases. This billing model is, of course, different from the traditional financing approaches based on fixed payment amounts for the coverage period.

Where iCOD allows an administrator to respond to increasing processing demand by instantly activating and purchasing additional capacity, PPU allows flexibility in both usage directions – increased and decreased. When demand is high, additional processing resources are activated. When demand is low, excess processing resources are deactivated. For customers with a cyclic or unpredictable demand, PPU provides the flexibility to meet requirements without a permanent hardware investment to handle peak usage. PPU also has the high-availability benefit of replacing potentially failing processors with inactive processors (as does iCOD).

LOAD BALANCE – PROCESS RESOURCE MANAGER (PRM)

HP's Process Resource Manager (PRM) is a resource-management tool that allows a system administrator to focus the appropriate amount of server resources where the business at hand requires such resources. HP's PRM manages resources by partitioning a system based on PRM groups. A PRM group is a collection of processes that is assigned system resources. The system administrator assigns applications and users to PRM groups and establishes resource allocations for each group. PRM then manages each group's CPU, disk bandwidth, and memory resources according to the current configuration. The list below summarizes what may be done with PRM.

Process Resource Manager (PRM) Capabilities:

- *System Consolidation* – With HP's PRM, administrators can run multiple, mission-critical applications on a single system.
- *Response Time* – Administrators can improve the response time for critical users and applications through the use of PRM groups and assigned resources.

Copyright 2001 © D.H. Brown Associates, Inc.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1401
Fls:
3701
Doc:

- *Performance Expectations* – Administrators can set and manage user expectations for performance through the use of PRM groups and assigned resources.
- *Budget-Based Sharing* – With HP's PRM, administrators can allocate resources on shared servers based on how much of the server each department funded.
- *Convenient to Use* – Administrators can change the PRM configuration any time – even under load. Also, applications do not require modification to work with PRM.
- *Failover Recovery* – Administrators can ensure that an application package in a ServiceGuard cluster has sufficient resources after a failover.

LOAD BALANCE – WORKLOAD MANAGER (WLM)

HP-UX Workload Manager (WLM) supplements the functionality of HP's Process Resource Manager (PRM) by offering automatic resource-allocation and application-performance management through the use of prioritized service-level objectives (SLOs). The list below summarizes what may be done.

HP-UX Workload Manager (WLM) Capabilities:

- *Define SLOs* – With WLM, administrators can define and set priorities for goal-based and entitlement-based SLOs. Goal-based SLOs can be based on usage or performance. Entitlement-based SLOs allow administrators to specify a workload entitlement without specifying a goal.
- *Assign Multiple, Prioritized SLOs* – Administrators can assign one or more SLOs to a workload. The ability to assign multiple SLOs is helpful for workloads that require more than one SLO to accommodate a "must meet" goal and optional, lower-priority stretch goals.
- *Use GlancePlus Metrics* – For goal-based SLOs, administrators can use various GlancePlus metrics to define SLOs.
- *Assign CPU on a Per-Metric Basis* – WLM can grant a workload a certain amount of CPU as defined by a metric. For example, administrators can give a workload 2% of the CPU for each process in the workload group.
- *Manage Oracle® Instances* – Administrators can control Oracle instances and adjust their CPUs based on a number of factors. These factors include, among others, desired transaction response times, number of users connected, and whether a particular job is active.

HIGH AVAILABILITY: SERVER DYNAMIC COMPUTING – DYNAMIC TUNING

Dynamic Tuning, the third sub-branch on the Server Dynamic Computing Branch of the HP availability architecture tree is an HP-UX capability that provides the ability to change the value of kernel tunables or memory page sizes without system rebuild or reboot. Dynamic Tuning has two components – Dynamic Tunables and Variable Page Setting.

DYNAMIC TUNING – DYNAMIC TUNABLES

Dynamic Tunables on HP-UX 11i provide the capability to change the value of certain kernel tunables without the need for system rebuild or reboot. Dynamic Tunables also provide the ability to ensure that changes to tunables are persistent across reboots.

Dynamic Tunables are supported via HP's System Administration Manager (SAM). As mentioned earlier, SAM is a GUI supplied with all HP-UX systems. Dynamic Tunables are also supported through a command-line interface. In addition, software developers can write software that changes tunable parameters.

Dynamic Tunables provide the ability to minimize downtime due to kernel reconfiguration. This capability increases the availability and productivity of HP 9000 users. Dynamic Tunables also allow easier kernel-configuration manageability by supporting commands and GUIs that align with work practices.

DYNAMIC TUNING – VARIABLE PAGE SIZING

Based on application-program heuristics and size, HP-UX dynamically, and by default, selects appropriately large page sizes for each memory object it accommodates. This use of larger pages conserves translation lookaside buffer (TLB) entries and reduces the occurrence of costly TLB misses. This capability improves the performance of many applications, particularly those with large reference sets and large amounts of contiguous memory (e.g., databases). Such increased performance provides increased availability since jobs complete more quickly.[20]

[20] HP 9000 systems with PA-RISC 2.0 processors support page sizes from 4 KB up to 1 GB in hardware. Starting with the HP-UX 11i release, HP-UX provided general support for variable-sized pages, thus allowing variable page size use on many user objects.

HIGH AVAILABILITY: SERVER DYNAMIC COMPUTING – PARTITIONS

Partitions are the third sub-branch of the Dynamic Computing branch of the HP availability tree. There are four components to this sub-branch – Hard Partitions (nPARs), Virtual Partitions (vPARs), Processor Sets, and Partition Manager.[21] The HP family of partitioning solutions – HP's Partitioning Continuum for Always-On Infrastructure – provides, or will provide, Hard Partitions, Virtual Partitions, and Resource Partitions on an individual HP 9000 server node or within the HyperPlex (HP's 9000 Enterprise Server clustering implementation), as well as other HP server offerings including Superdome and the rp8400.

HP's various partitioning solutions offer the flexibility to execute multiple workloads on the same server while preserving application isolation. In fact, isolation between operating systems and applications is the great benefit of partitioning. Hard Partition (nPARs) hardware and software firewalls work together to provide the highest isolation possible within a server. HP software has been designed to operate completely within an nPAR and prevent any interference with other nPARs. In addition, hardware firewalls filter out all external traffic to ensure that wayward requests do not affect the partition.

In contrast to nPARs, Virtual Partitions (vPARs) allow multiple operating-system instantiations within an nPAR to provide software and application isolation. Each vPAR is isolated to the point that it can be rebooted, patched, and configured independent of all other partition vPARs.

For well-behaved applications, administrators use Processor Sets to assign compute resources to specific applications that run in the same operating-system environment. The Partition Manager configuration tool manages partitioned environments.

PARTITIONS – HARD PARTITIONS (nPARS)

An nPAR may be viewed as corresponding to a single, standalone system. Both Superdome and the rp8400 can be subdivided into partitions, each containing one or (usually) more cells that coherently communicate through the use of a high-bandwidth, low-latency crossbar fabric. Programmable hardware in the cells defines the partition boundaries so that the isolation is maintained from the actions of other partitions. Each partition runs its own independent operating system instance.

Hard partitions may be considered to be roughly equivalent to Sun domains. However the nPAR's architecture has several high-availability advantages. The use of nPARs in high-availability configurations requires the minimization or

[21] The partition concept is discussed in the HP white paper "HP-UX Virtual Partitions (vPARs)," September 2001.

Copyright 2001 © D.H. Brown Associates, Inc.

ECT 5081 Fls: AC

elimination of any possible shared failure modes between partitions. This minimization is not usually possible with Sun domains.

Typically, for example, other vendor-partition schemes use partitions that are involved in each other's coherency scheme. Therefore, any failure can theoretically cause the crash of multiple domains. Examples of this phenomenon include main memory multi-bit errors, cache errors, and backplane-addressing errors. This difficulty stands in contrast to HP systems for which extra care was taken to minimize the number of common components between nPARs, and to maximize the reliability of those that remain.

Also, unlike other systems with domains, the partitions in the rp8400 have hardware dedicated to guarding them from errant transactions generated on failing partitions. A failure in one domain will not affect any other domains. For example, each port on the crossbar chips is fully independent.

The hardware isolation provided by nPARs is ideal for datacenter simplification through server consolidation.[22] This is the case because each nPAR is free to run any operating-system type or version available, be it HP-UX, Windows, or Linux. Management and advanced-availability features are simpler and easier to implement on one larger system than on a group of smaller servers.

nPARs are also a win for product-development teams since they allow small development environments to sit alongside large production systems with complete isolation (thus conserving resources, ensuring high-availability levels, and more). The list below explains what accrues through nPAR use.

nPAR Capabilities and Benefits:

- Increase system usage through isolated hardware.
  - Partition a single physical server into several smaller servers.
  - nPARs have virtually no interaction and can be treated as independent servers.
  - Change capacity when needed by adding or deleting partition components.
- Increase flexibility through multiple, independent HP-UX, Windows, and Linux instances.
- Simplify the data-center.
  - Consolidate multiple servers into one server.
  - Add or change servers without changing the infrastructure or affecting other servers.
  - Capitalize on reliability and availability features offered by larger servers.

[22] DHBA conducts an on-going multi-client study of server consolidation and can provide information concerning this subject.

Copyright 2001 © D.H. Brown Associates, Inc.

RQS Nº 03/2005 - CN CPMI - CORREIOS
Fls: 1403
Doc: 3701

- Provide a server-independent easy upgrade path.
- Use GUI management tools to view the server group as one server.

PARTITIONS – VIRTUAL PARTITIONS (vPARS)

Virtual Partitions (vPARs) may be considered to be roughly equivalent to IBM LPARs. It is often necessary to dynamically create, modify, or delete the isolated operating environments on a running server without interrupting non-related partitions. Toward this end, HP developed HP-UX Virtual Partitions (vPARs). vPARs provide application (including name space) and operating-system isolation that runs on single-server nodes or nPARs (Hard Partitions on Superdome). Available for L3000, N-Class, Superdome, and future server nodes, vPARs are dynamically created using software commands. Each partition runs its own HP-UX 11i operating system (or later) image. Moreover, within each vPAR, up to 64 resource partitions can be created using solutions such as the earlier discussed HP-UX Process Resource Manager and Workload Manager.

vPARs allow an administrator to allocate a system-resource subset to each partition. In general, a vPAR owns a specified amount of memory, a specified CPU pool, and an I/O card set in the server.

In traditional server environments, all CPUs run the same operating-system instance and one or more applications so application or operating-system failures may affect the entire system. Running vPARs can limit the impact of such failures on application availability. For improved single-system availability vPARs allow an administrator to run one application per partition. Should a software failure occur in one partition, the application of that particular partition may be lost, but the rest of the applications on the other partitions continue to run. In fact, even if the operating system panics in one partition, applications running on other vPARs are not affected.

One of the inherent problems in a single system is the difficulty in expanding CPU resources when the demands of the application or multiple applications exceed the server's configuration. Usually the system needs to be shut down and additional CPUs added. With vPARs, a large server could have CPUs dynamically moved from one vPAR to another without bringing down the entire system. Resources can be moved to vPARs with the greatest demands, or removed when they are no longer required.

In a generic HP server without vPARs, the entire server is controlled by a single HP-UX instance. All of the resources (CPU, memory, and disk) are dedicated to the applications running in this single instance. The software stack for this server is traditional and consists of the application(s) talking to the operating system that communicates with the system firmware and hardware.

When vPARs are used the architecture is different. Consider, for example, a server divided into two partitions, each with a hardware subset (CPU, memory,

Copyright 2001 © D.H. Brown Associates, Inc.

ECT 5079 Paula L-AC

disk, etc.). Each vPAR will have its own boot disk, at least one CPU, one LAN connection and enough memory to run HP-UX and the applications intended to be hosted on the vPAR. As mentioned, each vPAR runs its own HP-UX copy (perhaps at different release or patch levels), and each is isolated from software errors, system panics, etc.

The software stack in the vPAR configuration has an application running in each of the two vPARs, each vPAR runs its own operating-system instance, and, importantly, each operating-system instance communicates with a single vPAR Monitor software layer which, in turn, communicates with the server's firmware and hardware.

This additional software layer, the Virtual Partition Monitor (vPAR Monitor), manages the partitioning of the resources, loads kernels, emulates global platform resources, and otherwise creates the illusion for each HP-UX instance that it is on a standalone system with only the resources that have been dedicated to that vPAR. Each HP-UX instance is unaware of the other system hardware while having complete ownership of the hardware resources it is assigned to. Note that the monitor is not involved in accessing I/O hardware or physical memory once it has transferred hardware ownership to a vPAR.

A partition database is at the heart of the monitor and it tracks what resources are associated with which vPAR. When the vPAR Monitor runs, the master database copy is kept in the monitor. All partition database changes are preserved across system reboots.

vPARs actually provide a tool that makes it possible to run multiple workloads. Each workload operates with its own unique operating-system configuration requirements on the same server at the same time. vPARs are also suited to make effective use of underused server nodes. Finally, they are ideal for testing new and/or enhanced products in a production environment. The list below shows what accrues through vPAR use.

vPAR Capabilities and Benefits:

- Increase system usage through partition of a single physical server or hard partition into multiple virtual machines or partitions (for L-Class, N-Class, and Superdome servers).
- Increase flexibility through multiple independent HP-UX instances and dynamic CPU migration across virtual partitions.
- Achieve greater isolation of applications running within separate operating-system instances within a single server, where each instance can be individually reconfigured and rebooted.
- Optimize application performance by adjusting operating-system resources. Tune the kernel differently in each Virtual Partition. This tuning eliminates the problems of trying to coax two different applications into running in the same operating-system environment when each application requires a different kernel parameter set.

Fls: 1404
Doc: 3791

PARTITIONS – PROCESSOR SETS

HP-UX Processor Sets offer a mechanism to manage[23] system-processor resources among multiple workloads, users, and departments within an enterprise. A Processor Set represents an array of processors grouped together for exclusive access to applications assigned to that Processor Set. Processor Sets allow server partitioning into multiple Scheduling Allocation Domains such that workloads running in different Processor Sets do not contend with one another for server processor resources.[24] This capability also aids in server consolidation.

Processor Sets support dynamic-runtime reconfiguration. This means that a new Processor Set may be created, an existing Processor Set may be deleted, and a processor may be dynamically reassigned from one Processor Set to another (with access permissions). To accomplish this chore, the implementation of Processor Sets has a flexible ownership and access-permissions model. Every Processor Set has access-permission values that define who may change a configuration or who can execute the Processor Set workload. A Processor Set owner need not be a super user. This flexibility means that the need to completely rely on the administrator to control the Processor Set configuration and to assign Processor Set workloads is eliminated.

A server with Processor Sets capability is configured with one System Default Processor Set when it is started. All processors are assigned to this Default Processor Set. The Default Processor Set has its access permission set to allow all system users to execute their workload on the Default Processor Set processors. The Default Processor Set always has at least one processor, and is always available to all users and applications.

Processor Sets provide flexibility through set-able Processor Set attributes to allow administrators to control the server behavior. It is possible to anticipate and resolve this issue. For example, what happens if a person with permissions tries to delete a Processor Set that has a currently executing workload?

Processor Sets complement the fair-share scheduling CPU allocation mechanism available with PRM. In some instances it is better to allocate dedicated processors to workload via processor sets rather than using the default PRM scheduling. Processor Sets are integrated with the HP-UX Process Resource Manager. This means that a PRM group can be mapped to a Processor Set for processor resources rather than processor shares.

Processor Sets provide a flexible, lightweight mechanism to manage processor resources among multiple workloads, users, and departments. They allow consolidation of multiple independent applications on a single large server to avoid the need to maintain one server per application model. With their use, a

[23] HP-UX provides an API set to programmatically manage Processor Sets (along with system calls and a command-line program).
[24] Resource management based on Processor Sets is hardware platform-independent and can be used on any HP multi-processor system.

Copyright 2001 © D.H. Brown Associates, Inc.

ECT 5077 Paula CPL - AC

single large server can be shared among multiple departments rather than providing separate servers.

Organizations can have varying workloads depending on time of day, month, or year. As a result, the fact that Processor Sets allow dynamically changed resource allocations to workloads as needed without having to resource plan for the worst-case resource need of every workload is a major Processor Sets advantage.

Processor Sets can be applied to batch-processing workloads. In this scenario, a workload is assigned a Processor Set based on its resource needs. The configuration is changed to meet the needs of the next workload as the first completes. What is more, Processor Sets can provide processor-resource isolation for real-time applications to achieve better throughput response times.

PARTITIONS – PARTITION MANAGER

Partition Manager provides a GUI for managing Superdome servers that support nPARs. Partition Manager makes it easy to perform partition configuration tasks such as creating, modifying, and deleting partitions. Partition Manager also provides configuration and status information about a Superdome server. This information includes such high-availability information as the status of all power and cooling subsystems. In addition, Partition Manager includes automatic fault checking at its start up as well as on demand.

Partition Manager also performs a variety of high-availability-related checks whenever a partition is created or modified. These checks aid the administrator to ensure Superdome and partition availability.

The list below, Partition Manager Hardware Fault Checks, indicates the server hardware fault checks performed. The following list, Partition Manager Partition Fault Checks, indicates the performed partition fault checks. These two lists show that, in a variety of ways, Partition Manager alerts the administrator to situations in which the availability of the server, or a system partition, may be compromised.[25]

Partition Manager Hardware Fault Checks:

- Checks for power or cooling subsystems that contain failed or missing components (such as a failed fan or power supply). In addition to reporting failed or missing components, the checks also report if the subsystem redundancy is not at least N+1.[26] Thus, the administrator is alerted to potential availability problems before server operation is affected.
- Checks for cells with failed processors or memory DIMMs. Superdome systems are designed such that a partition boots using as many of the

[25] Note that all component failures also result in error notification via the chassis log mechanism, which can be monitored via the server's Service Processor user interface.

[26] N+1 indicates that a component can fail without affecting the subsystem operation.

Copyright 2001 © D.H. Brown Associates, Inc.

RQS Nº 03/2005 - CN CPMI - CORREIOS
Fls: 1405
Doc: 3701

resources assigned to it as possible. For example, if a processor has failed, the cell's remaining processors, memory, and I/O are still used. The Partition Manager fault checks help make sure that the administrator is aware that a partition is running with less than its resource complement.[27]

- Checks for failed crossbar ports. Such failures occur infrequently, and are reported via the chassis log mechanism. Here again Partition Manager provides redundancy for the administrator.

Partition Manager Partition Fault Checks:

- Checks for partitions with inactive cells, including an indication of inactivity as a result of incompatible cells within a partition. Proper partition configuration requires that all cells within a partition are compatible (e.g., same processor characteristics and system firmware revision). However, events can occur that break cell compatibility (e.g., upgrading system-firmware in only some cells). Thus, these checks alert the administrator to situations in which a partition is booted with less than its full resource complement.
- Checks for partitions with asymmetric memory configurations. Such a condition is not a failure, but could lead to less than optimal partition performance.
- Checks for cells with less than two working processors and cells with less than eight working memory DIMMs. A partition cannot use a cell if the cell has no working processors or no working memory DIMMs. Thus, the checks for at least two processors and at least eight DIMMs ensure that the cell could suffer a processor or DIMM failure (one DIMM failure results in a deconfiguration of the rank of four DIMMs containing the failed unit) and still be used by the partition. This procedure minimizes the potential loss of partition resources.
- Checks for partitions with less than two core cells. A partition must have at least one working cell that is attached to an I/O chassis with core I/O (such a cell is designated as the partition's core cell at boot time). Therefore, the check for a minimum of two possible core cells in a partition ensures that a partition can boot in the face of a cell, I/O chassis, or I/O card failure.

[27] Failures are also reported via the chassis log so that it is likely that the administrator knows that a failure has occurred. In this regard, the Partition Manager check is redundant.

DISCUSSION AND CONCLUSIONS

High availability is the watchword for HP's server line. Cognizant of this watchword and recognizing that high availability is a key enabler that keeps its IT manager, system administrator, and end-user constituency content,[28] HP has maintained a company-wide effort to design in high availability from the beginning in its server software and hardware.

This design-in has been guided by HP's high-availability infrastructure model. This infrastructure, modeled as a tree architecture, has three main branches (Server Fault Avoidance, Server Self-Healing, and Server Dynamic Computing), each with three sub-branches and multiple components in each sub-branch (33 components in all). The overview of these components provided in this white paper indicates the breadth and depth of what HP makes available to its customers to ensure that highly available servers are a reality.

The effort to improve server availability is never-ending. Although, as this white paper demonstrates, HP is well situated with its current and forthcoming products, the firm cannot and clearly will not reduce its high-availability efforts as high availability continues to grow as an ever more important market differentiator.

HP has shown its ability to implement and deliver the real world, production-worthy components of its guiding high-availability architecture tree. As a result, DHBA believes that HP's efforts are a model for the server industry. The components are comprehensive and feature-rich. Although the hundreds of features and functions that these components deliver are not described here because of lack of space, the overview provided indicates the richness of the offering.

Now that this white paper is complete, DHBA believes that the careful reader (IT manager, system administrator, or end user) will have gained a fundamental understanding of HP's high-availability efforts, why they are industry leading, and what kind of benefits they supply.

[28] Nevertheless, this constituency always seeks ever-higher availability (at lower cost).

Full end-to-end error correction in the HP design means that all fabric data paths are resistant to both random single-bit errors and persistent single-wire "stuck at" faults. The fabric is therefore resilient to any single failure of pin, connector, socket, or soldering.

hp StorageWorks disk system 2100

The feature-packed, worry-free HP StorageWorks Disk System 2100 delivers an industry-leading, high-capacity 1U storage solution. This entry-level, rack-optimized Disk System 2100 features open systems compatibility with HP-UX, MPE/iX, Windows NT®, Windows® 2000, Linux, NetWare, Solaris, and AIX, and offers the industry's lowest cost of entry. And because it's built with the HP commitment to developing dependable products and service, the HP StorageWorks Disk System 2100 ensures data integrity and manageability.

A fully loaded Disk System 2100 holds four 73.4 GB disks for a massive 293.6 GB of high-performance, upgradable storage. It also provides an impressive 160 MB/s transfer speed with built-in Ultra3 SCSI technology, all in a compact 1U package. For "set-it-and-forget-it" storage, your best choice is the HP StorageWorks Disk System 2100.

key features and benefits

- **large storage capacity**—293.6 GB of storage
- **space efficient**—1U of rack space
- **fast**—160 MB/s with built-in Ultra3
- **value for money**—daisy-chain multiple enclosures (up to 3 per HBA) for the cost of competing single-box systems
- **compatible**—works with any SCSI server or workstation
- **hot swap**—disk drives

technical specifications

APPENDIX: HP CROSSBAR-BASED BACKPLANE AND COMPETING BUS-BASED BACKPLANE

Figure 2 provides a simplified example of both the HP crossbar-based backplane (top) and another vendor's bus-based backplane (bottom). This Appendix describes how the HP architecture provides superior high availability.

Consider each system broken into two nPARs as shown in the figure. On the HP system, the crossbar logically separates the two physical partitions to provide performance and isolation. The competitor's shared backplane has all its cells competing for the same electrical bus. In this design, a snoopy bus-coherency scheme requires all transactions to be broadcast to and processed by all system cells. The high-queuing delays and saturation of the shared backplane bus can limit performance scaling.

To understand the reason for the just-made statements, consider a basic read from Cell 1 in Partition 1 of the crossbar-technology diagram to remote memory that resides on Cell 2 of Partition 1 of the crossbar-technology diagram. Partitions 1 and 2 are isolated by hardware firewalls. HP's crossbar switch and directory-coherency scheme allow the request to be sent only to the destination cell with data returning directly to the requesting cell. Remote memory traffic is restricted to the source and destination cells. The coherency directory is checked in the read-requesting cell and generates no additional traffic.

In contrast, for the same read operation, the competitor's shared backplane bus system must broadcast the memory read on the system address bus to all cells in the system to maintain coherency. Each cell must perform a snoop to determine whether or not the data is stored in its CPU cache and send coherency information to the read-requesting cell. Once the coherency data has been reported, the requested memory owner can return the data to the requester on the data bus. As noted above, scaling can be limited by queuing delays in the saturatable common bus. The snoopy coherency-scheme reliability and the need for bus-repeater chips limit availability.

A major weakness of the shared bus is that any failure during the read, either in the bus or during the coherency snoop, will result in crashing all cells in the system. At this point, the best that can be done is to deconfigure the broken hardware and reboot. Alas, downtime is a given in this design and has already occurred.

There is an additional partition-reliability benefit to the HP design. Unlike other snoopy coherency systems that must accept and respond to all coherency requests from all domains, HP server partitions have hardware firewalls. These firewalls are dedicated to guarding the server partitions from errant transactions generated on failing partitions. As a result, a failure in one server partition does not affect any other partitions.

hp delivers performance and flexibility

two Ultra160 LVD SCSI channels on one PCI adapter doubles performance and saves valuable slot space

The HP A6829A PCI Dual-Channel Ultra160 SCSI host bus adapter delivers the performance and flexibility required for today's high-bandwidth servers. The 160 MB/second maximum data transfer rate across each of two independent Ultra160 SCSI buses makes it a perfect match for high-throughput applications such as data mining, streaming video, and scientific modeling. The A6829A adapter's 64-bit PCI interface maximizes the capability of the dual SCSI channels by increasing the throughput on the PCI bus to a maximum of 320 MB/second, preventing a system bottleneck from hindering data flow. This PCI interface doubles the PCI bandwidth from 133 MB/second to 266 MB/second, enabling maximum system throughput for both Ultra160 SCSI channels. This adapter also fits into 32-bit PCI slots, enabling users to qualify a single adapter for all server platforms regardless of the PCI architecture.

Complementing the Ultra160 SCSI offering is the HP A6828A Single-Channel PCI Ultra160 SCSI PCI host bus adapter—perfect for configurations requiring a single channel with all the features and functionality of Ultra160 SCSI.

With Ultra160 low voltage differential (LVD) SCSI technology, extended cable lengths of 12 meters for a fully loaded bus (or 25 meters for point-to-point connections) make this adapter ideal for disk clustering and RAID configurations.

The A6829A and A6828A PCI Ultra160 SCSI host bus adapters deliver superior I/O performance. Ultra160 technology doubles previous Ultra2 SCSI data transfer rates. With two channels, A6829A host adapter delivers up to 320 MB/second bandwidth.

The A6829A and A6828A PCI Ultra160 SCSI host bus adapters support both single-ended (SE) and LVD devices. When a single-ended device is attached, the card defaults to single-ended mode. With Ultra160 LVD devices, the adapter uses LVD mode and can perform at full Ultra160 speeds.

Ultra160 SCSI devices are widely available today. Ultra160 LVD is the industry standard for high performance and low cost. These adapters enable the best speed, compatibility, and technology available today. HP has led the way into Ultra160 LVD SCSI, while many of our competitors have been too slow to move to the latest technologies.

customer benefits

- up to 160 MB/s data transfer rate on two Ultra160 SCSI channels on a single PCI slot
- connect up to 30 SCSI devices (15 per channel)
- advanced multimode I/O supports Ultra160 LVD or legacy SE devices
- extended 12-meter cable length

application areas

Web-based Internet/intranet information distribution and transaction processing requires both fast response times and high availability. The Ultra160 SCSI host bus adapters make the SCSI link fast and reliable.

High productivity client/server systems require high-bandwidth, high-availability poths between the client, server, and data. The A6829A and A6828A with HP MC/Serviceguard and Logical Volume Manager (LVM) provide the high-speed, high-availability link between the server and the data.

Database backup demands very high bandwidth and availability to ensure one-pass backup. This is an ideal application for the HP Ultra160 SCSI adapters.

The A6829A and A6828A Ultra160 SCSI host bus adapters are perfect for solutions requiring high performance connections for voice, video, streaming, multimedia, and high-end applications.

All high-performance mass storage demands high availability and high throughput. The A6829A and A6828A Ultra160 SCSI host bus adapters meet the need.

features	benefits
Ultra160 SCSI host bus adapters	
two high-speed Ultra160 SCSI channels on one PCI card (A6829A)	• saves valuable PCI slots • wide Ultra160 LVD SCSI is the leading edge of SCSI performance and reliability
up to 160 MB/second maximum burst rate on each channel	• high-speed data transfer rates mean faster access to data and files • faster database queries and accesses • faster backup
mc/serviceguard and LVM	• high availability through automatic switchover to alternate adapter path
customer installable hardware and software	• easy customer installation and configuration means less reliance on HP assistance
multimode LVD (low voltage differential) and SE (single ended)	• backwards compatibility to SE enables easy integration with existing environment
long cable lengths	• up to 12 meters with LVD; increased cable length provides greater flexibility in system configuration, especially in clustering and RAID applications
up to 15 devices per channel in a daisy-chain fashion	• meets need for large disk arrays, multiple disks, and JBODs

dual port 100Base-T and dual port wide ultra2 SCSI adapter

The demand for server resources is greater than ever in today's enterprise computing environment. Getting the most functionality, performance, and flexibility out of your computing resources is crucial to meeting this increased demand. The HP Dual-Port 100Base-T and Dual-Port Wide Ultra2 SCSI Adapter card gives you two high-speed network connections and two high-speed mass storage connections, all in a single PCI slot.

product information
» overview & features
» specifications
» information library

Servers supporting images, video, client/server applications, heavy LAN traffic, and databases require greater I/O bandwidth and connectivity. Data reliability, device connectivity, and cable lengths are often the issues with these critical systems. HP's Dual-Port 100Base-T and Dual-Port Wide Ultra2 SCSI Adapter provides impressive I/O bandwidth, high reliability, and 12-meter SCSI cable lengths in one standard PCI adapter. It is perfect for high-connectivity servers demanding high-speed LAN and SCSI connections.

The HP Dual-Port 100Base-T and Dual-Port Wide Ultra2 SCSI Adapter integrates nicely into existing infrastructures providing substantial cost savings. The auto-sense dual 100Base-T adapter can be immediately deployed in a 10Mbps environment. When the environment changes to 100Mbps, the adapter senses the new speed and you instantly have 10X the speed.

Ultra2 LVD SCSI is widespread in the marketplace due to its low power, high speed, and reliability. With the capability to multi-mode, this adapter is backwards compatible with SE (single-ended) SCSI devices.

The flexibility of this adapter is amazing. It can be utilized and integrated in a great variety of environments and solutions.

application areas

Web-based Internet/Intranet Information Distribution and Transaction Processing requires both fast response times and high availability. The HP A5838A LAN/SCSI Card with Auto-Port Aggregation software provides the increased bandwidth. With MC/ServiceGuard the A5838A provides high availability. The 10/100Base-T and LVD technologies improve overall speed and performance.

Client/Server systems require high-bandwidth, high-availability paths between the database servers and the application servers. The HP Auto-Port Aggregation and Ultra2 SCSI solutions are well suited for these popular high-productivity client/server application systems.

Database backup demands very high bandwidth and availability to ensure one-pass backup. This is an ideal application for the HP A5838A LAN/SCSI Card.

Multimedia transmission of voice, video and data requires high bandwidth and reliability. Again, HP A5838A LAN/SCSI Card meets these needs brilliantly, resulting in well-implemented multimedia applications.

features	benefits
A5838A Adapter Card	
Two high-speed Ultra2 SCSI ports and two 10/100Base-T RJ45 ports on one PCI card	• Saves valuable PCI slots by combining storage and LAN solutions onto one card. • Full-bandwidth power of two Wide Ultra2 SCSI and two 100Base-T LAN ports means faster Internet, Intranet, data, file, and application access, especially for multimedia and high-end apps. • Low-cost, high performance: 100Base-T technology is

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1414
Doc: 3701

	lower cost than FDDI or ATM. • Wide Ultra2 LVD SCSI is the leading edge of SCSI performance and reliability.
MC/ServiceGuard support	• High availability through automatic switch-over to alternate path in the event of a path failure.
HP's high power diagnostic, exerciser, and administrative software tools	• Easy customer installation and configuration. • Fast and easy LAN/SCSI management. • Tools compatible with those of LAN/9000.
Customer installable hardware and software	• Easy customer installation and configuration means less reliance on HP assistance.
10/100Base-T (Fast Ethernet)	
MC/ServiceGuard support	• Automatic switch-over to a second LAN path if the first LAN path fails. • High-availability LAN access to HP-UX Enterprise Servers means increased satisfaction and fewer calls to IT management.
Auto-Port Aggregation	• Extends existing Ethernet links into larger bandwidth pipes.
Sustains greater than 80 Mbps with 100Base-T	• Faster Internet, Intranet, data, file, and application access, especially for multimedia and high-end applications, increases end-user productivity and satisfaction.
Auto-sensing of maximum line speed on 10/100Base-T adapters	• Immediate connection to existing 10Mbps links. • Easy migration from 10Mbps Ethernet to 100Mbps Fast Ethernet. • Easy connection of 100Base-T sub-networks to existing 10Mbps Ethernet networks, using 10/100Mbps Ethernet switch.
SNMP support	• Enables remote management.
STM - Support Tools Manager (Exerciser and Verifier)	• Easier, faster management of network testing, exercise, and verification.
Dual Ultra2 SCSI	
Ultra2 LVD SCSI	• Leading edge of performance and reliability.
Up to 80 MB/s max burst rate	• High speed data transfer rates means faster access to data and files. • Faster database queries and accesses. • Faster backup.
SCSI Mirroring support	SCSI Mirroring support
Multimode LVD (Low Voltage Differential) and SE (Single Ended)	• Backwards compatibility to SE enables easy integration with existing environment.
Long cable lengths	• Up to 12 meters with LVD. Increased cable length provides greater flexibility in system configuration, especially in clustering and RAID applications.
Up to 15 devices in a daisy chain fashion	• Meets need for large disk arrays.

ordering information

A5838A	HP 2-Port 100Base-T / 2-Port Ultra2 SCSI Adapter
Option #0D1	Factory Integration
Option #AVN	Release Notes

ordering notes:

ECT 5064 Paula CPL - AC

Supported platforms (max units): Superdome (32), rp8400 (16), rp7410 (15), rp7400 (12), rp5400 series (6), rp2400 series (2). Connects to LVD or SE SCSI peripherals and 10/100BT Ethernet. Requires a SCSI terminator, not included. The terminator attaches to the last device in the SCSI chain. Order the appropriate terminator for that device. For High Density (HD) 68-pin LVD or SE: Order C2364A, for Very High Density (VHDCI) 68-pin LVD or SE: Order C2370A.

restrictions and limitations

- HVD (High Voltage Differential) devices not supported.
- 100Base-FX, 100VG-AnyLAN not supported.
- Internal SCSI connectors not supported.

hp enhances lineup of fibre channel adapters

hp tachlite fibre channel adapters now offer double the performance

It is truly the Information Age. Nothing but the best information management is acceptable for system-wide success. While many think computers process data into information, computers actually spend much more of their time organizing the data and managing the storage of information. This reality has been forming over time, but certainly graphical user interface programs have accelerated the trend, along with web page types of applications.

The early 1990s first saw massive disk farms created specifically to store data in very large disk arrays. Designers of storage systems quickly realized that centralized storage and retrieval of data makes information technology (IT) much more manageable. After all, when even the data that drives a meager spreadsheet on a desktop may be the decision maker for the next corporate merger or venture, it is quickly apparent that this data is too important to trust individuals to back it up regularly.

Storage area networks (SANs) are an emerging methodology for maintaining enterprise-level quantities of data. Data storage management, data integrity, cross-systems storage—all can be ensured by the use of a SAN, while they also ensure data retrieval and storage is quick and transparent to the end user. The appropriate architecture for connecting these gigantic arrays of disks becomes an important part of the decision of how to implement SANs.

benefits of hp tachlite fibre channel host bus adapters (HBAs)

- maximum I/O performance
  - auto-negotiates 2Gb or 1Gb transfer rates (A6795A only)
- superior quality with next-generation functionality:
  - switched fabric capability enabled—supports sophisticated recovery and backup scenarios, eventually without server intervention
  - online add/replace (OLAR) capable
  - increased performance with 66% less CPU utilization for I/O operations
  - full switched fabric support on HP-UX, up to 14 million nodes on a SAN
  - existing Arbitrated Loop supported
- one-stop shopping through HP for SANs, with full support for mission-critical environments

selecting your tachlite fibre channel HBA

- A6795A—PCI 2Gb Fibre Channel adapter
  - Superdome, rp8400, rp7410, rp7400, rp5400 series, rp2400 series
- A5158A—PCI 1Gb Fibre Channel adapter
  - V-class, Itanium™
  - legacy adapter for PCI-based systems
- A6685A—HSC 1Gb Fibre Channel adapter
  - K-class
- A6684A—HSC-eff 1Gb Fibre Channel adapter
  - D-class, R-class

Doc:

fibre channel provides for SAN implementations

The eventual promise of SAN technology is that regardless of where the data originates (Internet or intranet) or where it is processed (on UNIX® or Windows NT® or other operating systems), the economies of scale, ease of operations, data integrity, and performance characteristics of SANs makes them appropriate data storage/delivery architectures.

Therefore, the demand for Storage Area Networks is exploding. Through centralization, tradeoffs are made between ease of management and assurance of recovery, and, for example, more complex SAN wiring topologies.

Storage Area Networks offer flexible pools of secure storage, 100% data availability, and practically infinite scalability.

HP is committed to providing strategic technology for mass storage interconnects to its enterprise customers. For example, HP's Switched Fabric functionality allows up to 14 million nodes to be connected on a SAN. The technology usually chosen to deploy in SAN environments is Fibre Channel, which provides optimum levels of reliability, speed, and distance.

HP's Fibre Channel solution uses a standard SCSI protocol to provide a fast, robust connection to storage devices.

improved performance and investment protection

The HP PCI 2Gb Fibre Channel adapter—A6795A, available on HP-UX 11.0 and later operating systems—for Superdome, rp8400, rp7410, rp7400, rp5400 series, and rp2400 series systems, improves SAN performance and efficiency.

This adapter, also known as Tachlite, enhances HP servers' capabilities in the Storage Area Network. First, the A6795A offers data transfer rates up to 400 megabytes per second (full-duplex), effectively doubling performance over previous-generation Fibre Channel adapters. Next, the 2Gb Fibre Channel adapter auto-negotiates 1Gb or 2Gb transfer rates. This feature allows full legacy support for 1Gb SAN infrastructures, thus protecting your current SAN investment.

optimizes functionality

With all Tachlite adapters, HP delivers Switched Fabric Fibre Channel (FC-SW) functionality to HP-UX. The switched fabric functionality allows HP-UX servers to conveniently participate as a node in SAN environments.

The FC-SW functionality of Tachlite is supported on all current and future PCI platforms and offers the significant benefit of allowing servers to boot across switches. This FC-SW functionality is supported on the HP Surestore Director FC-64, FC switches 6164, 16B, and 8B, Brocade Switch 2800 and 2400, and EMC Connectrix switches.

Tachlite dramatically increases HP servers' SAN performance, resulting in 66% lower CPU utilization during I/O cycles. The new interface offers full support for peripherals and online add/replace (OLAR) in supported versions of the operating system.

HSC (K-, D-, and R-class) Switched Fabric Fibre Channel support is also available with A6685A and A6684A Tachlite adapters.

For more information, please visit the HP Web site:

tachlite features and benefits

features	benefits
2Gb and 1Gb Fibre Channel technology	• highest I/O performance for faster accessibility of databases and media-rich data • increased performance over previous-generation Fibre Channel adapters
full switched fabric Fibre Channel (FC-SW) capability	• support for sophisticated storage area network (SAN) configurations • increases scalability of SAN infrastructure up to 14 million nodes • customization of complex recovery and backup scenarios
online add/replace (OLAR)	• maximizes server uptime with OLAR • no need to bring down server to add new or replace failed adapter
arbitrated loop support	• flexibility to integrate into various SAN configurations
less CPU usage	• minimizes requirements of CPU utilization for I/O to allow for maximum cycles for other operations

hp server connectivity

Gigabit Ethernet LAN

ECT
5059
Paula
CPL - AC

hp invent

comprehensive networking tools for the most demanding mission-critical and enterprise needs

hp Gigabit Ethernet LAN adapters—Gigabit performance at affordable costs

The demand for higher-speed network connections is growing at a tremendous rate in order to keep poce with the speed requirements of applications such as SAP R/3, database backups, medical, CAD/CAM, 3D modeling, animation, video, and more.

Internet data centers process terabytes of data daily. Processing, sharing, and distributing this data requires faster and faster networks.

Intelligent adapters, which take on more of the network processing from the server, are becoming critically important in helping servers cope with the onslaught of traffic running at Gigabit/second speeds. To maximize server CPU efficiency for an effective Gigabit Ethernet implementation, adapters should not only perform TCP/IP checksum, interrupt coalescing, and byte swapping, but also enable the reduction of host data copy operations.

The HP Gigabit Ethernet LAN solutions perform all of these functions and fully support the IEEE 802.3ab and 802.3z standards for Gigabit operations. These high-performance, standards-based, scalable network links allow customers to move large amounts of data quickly while leveraging their existing investments in Ethernet technology.

The HP Gigabit LAN adapters provide 1000 Mbps bandwidth over existing copper wire and fiber-optic cables, meeting the demands of e-commerce and data-intensive businesses that want to preserve their investment in existing Ethernet infrastructures. The 1000Base-T LAN adapter supports bath the CAT 5 and CAT 5e (enhanced) cabling standards. This allows superior investment protection in the existing cabling infrostructure.

The 1000Base-T adapter automatically detects the speed of the associated device as 10-, 100-, or 1000Base-T so it may be deployed immediately in any Ethernet environment. All the Gigabit LAN adapters are based on the same Ethernet standards already widely deployed in the marketplace, and they allow migration from 10 Mbps to 100 Mbps to 1000 Mbps quickly and easily, with fast deployment and minimal training needed.

The Gigabit LAN adapters are also supported with HP Auto Port Aggregation (APA) software, J4240AA. Up to 4 Gigabit Ethernet links can be logically aggregated together to form a single, extremely high-bandwidth channel with one IP address, automatic link failover, and load balancing.

In addition, HP Gigabit Ethernet adapters support HP-UX VLANs (virtual LANs). This solution offers IT managers a powerful tool that simplifies the tasks of building, managing, and securing complex network infrastructures. Physical LANs can be segmented into smaller logical or "virtual" LANS, allowing broadcast traffic to be reduced, thereby improving overall network performance. Now a change to network topology no longer requires those dreaded trips to the wiring closet!

HP-UX VLAN is compliant with host-based IEEE 802.1Q VLAN tagging, IEEE 802.1p (later incorporated in IEEE 802.1D) priority encoding, and IP Type of Service (ToS)-802.1p priority conversion.

Other key features of HP-UX VLAN include:

- IP subnet-based, protocol-based, and port-based VLAN support
- supported on HP-UX 11i v1
- configuration using well-known HP-UX tools—*lanadmin* (CLI) and SAM (GUI)
- 1024 VLANs per NIC port
- designed to work seamlessly with HP high-ovailability products, such as MC/Serviceguard
- no changes to applications required
- preserve VLAN configuration across reboot

If you would like more information regarding HP-UX VLAN functionality, please refer to the "Planning and Implementing VLANs with HP-UX" white paper, located at **www.hp.com/go/vlan**.

customer benefits

- increase network performance—1000 Mbps
- lower networking management costs
- leverage existing Ethernet infrastructures—including widely deployed CAT 5 cabling for 1000Base-T
- maximize CPU efficiency, thus lowering total cost of ownership
- SNMP (MIB-II) support

application areas

- Web-based Internet/intranet information distribution and transaction processing require both fast response times and high availability
- high productivity client/server systems require high-bandwidth, high-availability paths between the client, server, and data
- networking backbones—Gigabit aggregates 10/100Base-T traffic; the Gigabit links can also be aggregated with HP Auto Port Aggregation (APA) to create multi-Gigabit, high-bandwidth backbanes
- database backup demands very high bandwidth and availability to ensure one-pass backup
- solutions requiring high-performance connections for voice, video, streaming, multimedia, and high-end applications
- network-attached storage

features and benefits

features	benefits
1000 Mbps (Gigabit speed)	• high-performance, high-bandwidth Gigabit networking—1000 Mbps • ideal for media-rich data, Internet applications, and high-speed data centers • faster network backups and data access
1000Base-T and 1000Base-SX Ethernet standards (IEEE 802.3ab and IEEE 802.3z)	• seamlessly integrates into existing Ethernet infrastructures • lower cost to implement and manage • leverage current investments in Ethernet and cable infrastructure
auto-negotiation: tri-speed—10, 100, or 1000 Mbps for the 1000Base-T adapter	• flexible, easy to deploy • odopts for growing network bandwidth requirements
CPU offlood (Internet checksum offload, byte swapping, interrupt coalescence and ovoidance)	• increases performance • maximizes server CPU efficiency
HP-UX VLAN (virtual LAN)	• enables logical connectivity separation of a network from physical connectivity • isolates traffic and preserves bondwidth • improves network manogeability and performance
MC/Serviceguard (MCSG) and Auto Port Aggregation (APA) support	• MCSG offers highest levels of high availability • APA can aggregate up to 4 Gigabit links to create a "super" bandwidth connection
Online Addition and Replacement (OLAR)	• server uptime is maximized, since adapters con be added or replaced without the need to bring the system down
up to 550-meter cabling lengths (dependent on cable) for the 1000Base-SX adapter	• ultimate flexibility in data center layouts, backbone implementations, or high-performance client networks
dual DMA channels for simultaneous read ond write; embedded RISC processor	• enhanced performance for every type of networking task—downloading, uploading, file transfers, and intense bi-directional traffic

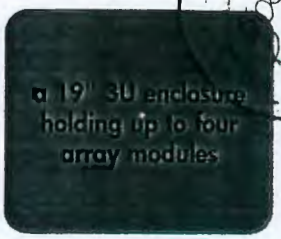
hp invent



The HP Surestore Tape Array 5300 is a 3U rack enclosure that will hold two full-height array modules, four half-height modules, or one full-height and two half-height modules. The enclosure supports HP array modules, including Ultrium 230, Ultrium 215, DLT 80, DLT vs80, DAT 40 (DDS-4), and DAT 24 (DDS-3) tape drives, plus a DVD-ROM. The wide variety and interchangeability of array modules provides a truly flexible solution for use in a variety of different data storage situations.

For IT managers whose environments require added data security and accessibility, the Tape Array 5300 also has an optional upgrade kit—the PSU/fan kit provides a redundant fan and power supply.

key features and benefits

- **expandable:** holds up to four offline hot-swappable array modules on four independent SCSI buses
- **upgradable:** allows you to expand from one to four tape drives as your capacity requirements grow
- **flexible:** supports HP array modules: Ultrium 230, Ultrium 215, DLT 80, DLT vs80, DAT 40 (DDS-4), DAT 24 (DDS-3) and DVD-ROM
- **compact:** stores 800 GB of compressed data per array with four Ultrium 215 drives in 3U of rack space
- **high availability:** maximizes system uptime and performance with optional redundant components
- **rackable:** fits in standard 19" racks from HP, Apex, and Rittal

tape drive comparison

model	form factor	capacity*	performance*
DAT 24m	Half-height	24 GB	7.2 GB/hour
DAT 40m	Half-height	40 GB	21.6 GB/hour
DLT vs80m	Half-height	80 GB	21.6 GB/hour
DLT 80m**	Full-height	80 GB	43.2 GB/hour
Ultrium 215m	Half-height	200 GB	54 GB/hour
Ultrium 230m**	Full-height	200 GB	108 GB/hour

*Capacity and performance are based on 2:1 data compression. Actual compression varies with data type.
** These modules are also compatible with Tape Array 5500.

invent

technical specifications

dimensions (h x w x d)	741 x 445 x 133 mm (29.2 x 17.5 x 5.25 in)
weight	13 kg (28.71 lb)
native capacity	400 GB with four Ultrium 215 drives
compressed capacity	800 GB* with four Ultrium 215 drives
external I/O ports	Eight SCSI ports (one in and one out per half-height drive bay)
power supply/ required	100–127V AC (+/–10%) or 200–240V AC (+/–10%)
operating temperature range	5° to 40°C (41° to 104°F)
storage temperature range	–40° to 70°C (–40° to 158°F)
operating humidity range	20% to 80% RH
non-operating humidity	5% to 95% RH

*Capacities and transfer rates assume 2:1 data compression. Actual compression moy differ because compression varies with data type.

ordering information

C7508A	Tape Array 5300	Four-bay rack enclosure
C7496A	Tape Array PSU/fan kit	Redundant power supply and fan
compatible array modules		
C7456A	DLT 80m	DLT 80 array module (full-height)
C7507A	DLT vs80m	DLT vs80 array module (half-height)
C7470A	Ultrium 230m	Ultrium 230 array module (full-height)
C7492A	Ultrium 215m	Ultrium 215 array module (half-height)

C7499A	DVD-ROM	DVD-ROM array module (half-height)

additional information

target use
Providing a scalable, flexible means of racking standalone products or adding versatile storage capability to a local area network

target audience
IT managers of mid-sized companies who have a rack environment and require a scalable backup solution that supports a variety of tape technologies and DVD-ROM for software loading

what's in the box
Enclosure, mounting rails, rack-mounting kit (for HP & other racks), rack-mounting template, manuals, Surestore CD containing documentation, power cord, power supply unit (PSU), PSU bay filler panel, fan, fan bay filler panel, torx tool, drive bay filler panels, accessory kit

warranty features—hp service and support
3-year, next-day onsite response; system matching on HP rack servers

warranty options
H4618A / H4618E 3-year, same-day, onsite

← Compatibility Mode

HP C Online Help →

About HP C/HP-UX

This manual presents ANSI C as the standard version of the C language. Where certain constructs are not available in compatibility mode, or would work differently, it is noted and the differences are described.

HP C/HP-UX, when invoked in ANSI mode, is a conforming implementation of ANSI C, as specified by American National Standard 9899-1990. This manual uses the terminology of that standard and attempts to explain the language defined by that standard, while also documenting the implementation decisions and extensions made in HP C/HP-UX. It is not the intent of this document to replicate the standard. Thus, you are encouraged to refer to the ndard for any fine points of the language not covered here.

construindo sua infra-estrutura - sempre ativa com servidores **hp**

soluções de servidor de internet poderosas e flexíveis para uma infra-estrutura sempre ativa

hp superdome

O centro de processamento de dados da Internet é o elemento crítico que possibilitará a próxima geração dos negócios. E ao projetar e implementar sua solução de Internet, sua primeira preocupação deve ser encontrar produtos e serviços de tecnologia que sejam construídos corretamente logo na primeira vez. Sua próxima preocupação será assegurar que o que funciona hoje também vai atender as suas necessidades futuras, à medida que novas oportunidades — e novos desafios — se apresentarem.

A infra-estrutura de tecnologia correta é aquela que está sempre ativa onde e como for necessário. Isso é o que a HP pode ajudá-lo a construir — e não há precedentes na indústria.

Os servidores HP Superdome fornecem uma combinação sob medida de tecnologia e serviços. Construída com componentes-chave, tais como as habilidades comprovadas da HP em centros de processamento de dados, sua experiência em e-services e sua força em desenvolvimento de utilitários, sua infra-estrutura sempre ativa fornecerá uma experiência excepcional para os clientes, assegurando a facilidade, velocidade e eficácia.

sua infra-estrutura sempre ativa

Tratando dos inúmeros desafios difíceis que você enfrenta ao construir e gerenciar uma empresa de Internet, a HP fornece:

- HP Superdome Servidores UNIX líderes da indústria
- Blocos de construção de utilitários-somente da HP
- A mais ampla oferta de capacidades de particionamento da indústria, com o "continuum" particionamento da HP
- Itanium™ e capacidade para SOs variados

sempre presente

A HP também está sempre presente para você, desde o primeiro contato. A HP fornece:

- Gerenciamento de soluções de loop fechado
- Avaliações iniciais
- Pré-integração e testes
- Treinamento baseado em necessidades
- Serviços de migração

E asseguramos que sua infra-estrutura funcionará continuamente com:

- Serviços proativos
- Acordos para reparos

uma experiência excepcional para o cliente

A implementação bem-sucedida de um centro de processamento de dados exige muito mais do que tecnologia. É por isso que a infra-estrutura sempre ativa está sempre com você — em todas as etapas do caminho.

- **invente:** facilidade de planejamento e projeto para uma solução que é feita sob medida para se adequar imediatamente aos seus negócios
- **construa:** velocidade de integração e instalação de uma infra-estrutura pronta para funcionar
- **execute:** serviços de missão crítica e tecnologias que possibilitam uma operação contínua, uma capacidade flexível e um gerenciamento eficiente para assegurar a excelência operacional do dia-a-dia
- **evolua:** plano à prova de obsolescência, desenvolvimento de utilitários e cuidado contínuo para atender a suas necessidades por toda a vida de sua empresa

três configurações do hp superdome para atender a suas necessidades

As implementações de grande porte em geral não correspondem às expectativas, como resultado de habilidades inadequadas que são aplicadas nas etapas de projeto e implementação. Com o Superdome, o HP garante a você uma experiência excepcional de computação, através de serviços HP líderes da indústria e parceiros de canal selecionados, disponível em três configurações pré-definidas. Para todas as configurações existem soluções de financiamento disponíveis para atender os seus requisitos orçamentários.

configuração básica

A construção da base correta reduz drasticamente os problemas e acelera o tempo de instalação em produção, de forma que todas as soluções Superdome incluirão a Configuração Básica como base para um desempenho excelente. A Configuração Básica destina-se a empresas cujos aplicativos têm requisitos de disponibilidade de baixa prioridade ou que possuem especialistas em suas equipes para executar e gerenciar seus próprios ambientes de TI.

- Gerenciamento de projetos em loop fechado utilizando metodologias baseadas em processos e medidas para assegurar seu sucesso e satisfação
- Serviços de consultoria para um projeto detalhado de arquitetura para assegurar que esteja correto logo na primeira vez
- Avaliação de habilidades e treinamento específico em Superdome para fornecer à equipe de TI as habilidades necessárias
- Preparação completa do local/ambiente para ajudá-lo a compreender e abordar as exigências de sua localização física
- Integração e testes de fábrica da HP para assegurar que o sistema esteja adequadamente configurado e chegue pronto para funcionar
- Suporte contínuo de centro de respostas, disponível 24 horas por dia, 7 dias por semana, com compromisso de resposta em 4 horas

configuração de sistemas críticos

Para um alto nível de disponibilidade de sistema, a experiência da HP reconhecida pela indústria fornece suporte do tipo missão crítica como base da configuração de Sistemas Críticos.Esta configuração é o nível mínimo de serviço para ambientes de missão crítica. Ela aumenta a prioridade dos serviços reativos e adiciona serviços de suporte proativos com monitoramento da disponibilidade.

sua infra-estrutura sempre ativa potencializa soluções robustas para os principais aplicativos da atualidade

Planejamento de Recursos Corporativos (ERP): A estrutura fundamental para novas áreas de vantagem competitiva: supply chain, e-commerce e desenvolvimento de produtos.
Computação de Missão Crítica: Produtos e soluções de alta disponibilidade para ajudá-lo a obter os níveis de disponibilidade que você precisa para atender a seus clientes.
E-Intelligence: Obtenha o máximo de valor de seus ativos de dados — tanto internos quanto externos — utilizando ferramentas de ponta para análise, business intelligence e aplicativos da HP.
E-commerce: Gerencie os custos de sites de e-commerce, refinando os recursos de computação para atender as necessidades que estão sempre mudando e assegurar que seu site de e-commerce crítico esteja disponível e possua a capacidade que necessita.
Computação Técnica: Os aplicativos de computação técnica nunca conseguem obter poder suficiente. Os níveis extremamente altos de desempenho e capacidade de expansão oferecidos por uma infra-estrutura sempre ativa atendem a essas necessidades de frente.
Consolidação de Sistemas: Reduza os custos, aumente a flexibilidade, a disponibilidade e o desempenho, e melhore o gerenciamento das infra-estruturas de TI com a complexidade reduzida e a disponibilidade ampliada das configurações sempre ativa.

Ela inclui a Configuração Básica, acrescida de:

- Um plano de suporte detalhando os requisitos específicos da conta em questão e o compromisso de resposta do HP
- Engenheiros de Conta Designados
- Análise de Prontidão do Superdome para ajudá-lo a atender a seus requisitos de alta disponibilidade e desempenho
- Tópicos de Consultoria Técnica para seleção
- Diagnóstico remoto de alta velocidade e coleta de dados críticos para acompanhar o desempenho do sistema e prevenir problemas antes que ocorram
- Compromisso de resposta em 6 horas para chamadas de reparo de hardware
- Recuperação de Sistema Prioritário
- Serviços de Recuperação de Negócios (opcional)

configuração de continuidade de negócios

A Configuração de Continuidade de Negócios fornece muito mais do que uma lista de serviços. Ela fornece uma forma diferente de abordagem para o planejamento da disponibilidade. A Continuidade de Negócios é uma colaboração entre a HP e o cliente, criando um plano para abordar de forma pró-ativa todos os elementos do ambiente de TI que afetam a disponibilidade dos negócios. Ela foi projetada e construída tendo como meta a disponibilidade máxima e seu foco é na operação ideal dos negócios. A Continuidade de Negócios fornece serviços proativos sofisticados e o melhor serviço de suporte da indústria.

Ela inclui a Configuração Básica e a de Sistemas Críticos, além de:

- Uma equipe dedicada à conta e um plano personalizado de serviços proativos
- Resposta de prioridade máxima fornecida por especialistas treinados
- Processos de gerenciamento de mudanças altamente detalhados
- Revisões de conta mensais
- O único compromisso de resposta em 4 horas para chamadas de restauração de hardware e software da indústria
- Solução permanente de software dentro de 14 dias

novos sistemas operacionais para a era da internet

O ambiente operacional HP-UX 11i fornece a melhor plataforma para empresas de Internet do tipo sempre ativa.

- **O sistema operacional Microsoft® Windows NT®/Linux mais amigável atualmente**, com um ambiente de desenvolvimento Linux Open Source e suporte a WebGain Studio.
- **A melhor funcionalidade ponta-a-ponta de Internet crítica**, alta disponibilidade de sistema único, capacidade de gerenciamento, segurança e integração UNIX/Windows®
- **Desempenho e capacidade de expansão definitivos** com capacidade sob demanda instantânea, suporte a particionamento físico e virtual, forte desempenho Java™ e capacidade de exponsão para Symmetric Multi-Processing (SMP) de 64 processadores de alto desempenho
- **A melhor proteção e longevidade de investimentos** através de compatibilidade binária com os processadores PA-RISC (64 bits) e Itanium Processor Family (IPF)
- **Três opções de conjuntos de capacidade de gerenciamento HP-UX Service Control** para um controle centralizado e capacidade otimizada eficazes quanto ao custo
- **Três opções de ambientes operacionais completos** feitos sob medida para as necessidades de computação de Internet, corporativas ou de missão crítica

ECT 5037 Folha CPL - AC

visão rápida do hp superdome

recursos	benefícios
disponibilidade	
Adição e substituição on-line de placas de E/S PCI, comportimentos de placas de E/S e células (CPU/memória*) 6 ou 12 ventiladores e 4, 6 ou 12 fontes de alimentação, todos hot swap, incluindo N+1 Verificação e correção de erros em todos os caminhos de CPU e memória Caminhos de dados de E/S com proteção de paridade Fonte de alimentação dupla	Recursos de alta disponibilidade embutidos fornecem níveis superiores de • confiabilidade • capacidade de suporte • capacidade de reparos • disponibilidade de sistema único • disponibilidade de sistemas múltiplos para ajudar a obter o máximo de tempo ativa para aplicativos de missão crítica
até 16 partições físicas (nPartitions)	Fornece capacidade de particionamento físico
HP Virtual Partitions (vPar) até 64	Fornece capacidade de particionamento lógico
Suporte a soluções de cluster local e remoto para projetos de site backup com distância ilimitada	Soluções completas para alta disponibilidade em clusters eliminam os pontos de falha individuais
capacidade	
Nó único: 1 a 64 de 552MHz, 750MHz, 875MHz	Permite expansão de diferentes processadores no mesmo gabinete. A estrutura do servidor superdome também aceitará novos processadores PA-RISC
CPUs de alto desempenho P A-8700+ com 2.25MB de cache on-chip por CPU	
Desempenho de liderança	Seus benchmarks são recordes mundiais e um padrão para a indústria
Capacidade de particionamento (1 a 16 nPartitions) para alocação de recursos, diversos ambientes operacionais ou escalonamento de aplicativos Até 64 partições virtuais	Permite que o gerenciador do sistema otimize a alocação de recursos entre cargas de trabalho concorrentes. Quando utilizondo 16 nPartitions não existe perdas de escalabilidade, pois com 64 CPUs o servidor mantém suas capacidades máximos de memório e slots PCI para proteger os investimentos em hardware
Até 256 GB de memória (512GB previsto para julho 2003) Largura de banda de memória de 64GB/s por gabinete de 64 CPU	Desempenho de subsistema de memória aumentado para o processamento rápido e confiável de aplicativos de alto desempenho
P[illegible]drão da indústria de 64 bits 33MHz (2x) ou 66MHz (4x) [illegible], canais de E/S de 265MB/s (PCI de 33MHz) ou 530MB/s (PCI de 66MHz) Até 192 slots PCI hot swap de E/S (com gabinete para expansão de E/S)	Manipula facilmente aplicativos com muitas operações de I/O e possibilita um escalanamento rápido para acomodar demandas mais altas
Opções de armazenamento incluindo arrays de disco JBOD, Fibre Channel ou HP Surestore; HP AutoRAID, Multiplexador HP Fibre-Channel-to-SCSI, unidades de fita e bibliotecas	Armazenamento flexível de alta capacidade que protege os dadas críticos
conectividade	
Operações básicas de E/S incluindo LAN 10/100Base-T	Capacidade de conexão em rede fácil e pronta para funcionar
Conectividade de rede: para Token Ring, 1000Base-SX, 1000Base-T, 10/100Base-TX, Terminal MUX, PKC, HIPPI, X.25, ATM, Hyperfabric e FDDI	Soluções completas de conectividade ponta-a-ponta para e-services
Conectividade de armazenamento: Ultra2 SCSI, F/W SCSI, Fibre Channel	Grande variedade de opções de conectividade de armazenamento de alta velocidade
Suporte a servidor WAP Nokia	Conectividade para aplicativos sem fio
segurança	
Detecção de invasão baseada no host	Segurança e proteção definitivas contra ataques
Capacidade de rede virtual privada IPSec ponta-a-ponta	Segurança de camada de rede independente de aplicativo
capacidade de gerenciamento	
Estação de Gerenciamento de Suporte	Acesso remoto centralizado a firmware e ferramentas de diagnóstico de varredura, para uso em todos os sistemas Superdome no centro de processamento de dados
Gerenciador de Partições (parmgr)	Interface GUI intuitiva para gerenciar e modificar facilmente todos as partições de um sistema Superdome
Sistema de Gerenciamento de Falhas Estendido	Console para a exibição do status do sistema (local e remoto), restauração do sistema, poder de controle para ligar e desligar
HP WebQoS Peak integrado	Estabiliza o desempenho de sites na Web sob cargas muito pesadas para melhorar a confiabilidade do site e a produção de transações
H[illegible]rvicecontrol Manager integrado	Controle central dos recursos do servidor rápida e eficoz quanto oos custos para o mais alto grau de eficiência na administração do sistema
HP-UX Workload Manager	Primeiro gerenciamento de recursos baseado em metas da indústria UNIX. Reconfigura automaticamente as alocações de CPU, baseado nos objetivos de nível de serviço do cliente (SLOs)
proteção e flexibilidade dos investimentos	
Projetado para atualizações futuras para diversas gerações de PA-RISC e IPF	Proteção superior dos investimentos e longevidade
Licença ilimitado embutida para o sistema operacional de Internet HP-UX 11i; opções de atualização para o Enterprise ou Mission-Critical HP-UX	Opção de escolha entre três ambientes operacionois com todos os componentes básicos de sistema operacional necessários para ombientes de Internet, corporativos ou de missão crítica
Suporte futuro a Windows NT e Linux	Oferece uma seleção de ambientes com transição fócil para a produção na robusta plataforma HP-UX 11i
Seleção de opções integrados de servidor Web: padrão da indústria para um desempenho mais rápido e mais expansível	Focilidade de distribuição para novos sites na Web ou otimizado para sites com alto tráfego
Plataforma de software aberto E-speak para o desenvolvimento e distribuição de e-services	Possibilito a descoberta dinâmica e interação de aplicativos e e-services através da Internet, incluindo capacidades de agenciamento

*Disponível em versões futuras do HP-UX

Extent-Based Allocation

Disk space is allocated in 1024-byte sectors to form logical blocks. VxFS supports logical block sizes of 1024, 2048, 4096, and 8192 bytes. The default block size is 1K for file systems up to 8 GB, 2K for file systems up to 16 GB, 4K for file systems up to 32 GB, and 8K for file systems beyond this size.

An *extent* is defined as one or more adjacent blocks of data within the file system. An extent is presented as an *address-length* pair, which identifies the starting block address and the length of the extent (in file system or logical blocks). VxFS allocates storage in groups of extents rather than a block at a time (as seen in the HFS file system).

Extents allow disk I/O to take place in units of multiple blocks if storage is allocated in consecutive blocks. For sequential I/O, multiple block operations are considerably faster than block-at-a-time operations; almost all disk drives accept I/O operations of multiple blocks.

The Extent allocation only slightly alters the interpretation of addressed blocks from the inode structure compared to block based inodes. HFS file system inode structure contains the addresses of 12 direct blocks, one indirect block, and one double indirect block. An indirect block contains the addresses of other blocks. The HFS indirect block size is 8K and each address is 4 bytes long. HFS inodes therefore can address 12 blocks directly and up to 2048 more blocks through one indirect address.

A VxFS inode is similar to the HFS inode and references 10 direct extents, each of which are pairs of starting block addresses and lengths in blocks. The VxFS inode also points to two indirect address extents, which contain the addresses of other extents:

- The first indirect address extent is used for single indirection; each entry in the extent indicates the starting block number of an indirect data extent.
- The second indirect address extent is used for double indirection; each entry in the extent indicates the starting block number of a single indirect address extent.

Each indirect address extent is 8K long and contains 2048 entries. All indirect data extents for a file must be the same size; this size is set when the first indirect data extent is allocated and stored in the inode. Directory inodes always use an 8K indirect data extent size. Regular file

CPMI - CORREIOS
1439
Fls: 3701
Doc:

inodes also use an 8K default indirect data extent size but allocate the indirect data extents in clusters to simulate larger extents.

Typed Extents

NOTE The information in this section applies to the VxFS Version 3 and 4 disk layout.

In Version 3 and 4, VxFS introduced a new inode block map organization for indirect extents known as *typed extents*. Each entry in the block map has a typed descriptor record containing a type, offset, starting block, and number of blocks.

Indirect and data extents use this format to identify logical file offsets and physical disk locations of any given extent. The extent descriptor fields are defined as follows:

type	Uniquely identifies an extent descriptor record and defines the record's length and format.
offset	Represents the logical file offset in blocks for a given descriptor. Used to optimize lookups and eliminate hole descriptor entries.
starting block	The starting file system block of the extent.
number of blocks	The number of contiguous blocks in the extent.

- Indirect address blocks are fully typed and may have variable lengths up to a maximum and optimum size of 8K. On a fragmented file system, indirect extents may be smaller than 8K depending on space availability. VxFS always tries to obtain 8K indirect extents but resorts to smaller indirects if necessary.
- Indirect Data extents are variable in size to allow files to allocate large, contiguous extents and take full advantage of VxFS's optimized I/O.
- Holes in sparse files require no storage and are eliminated by typed records. A hole is determined by adding the offset and length of a descriptor and comparing the result with the offset of the next record.
- While there are no limits on the levels of indirection, lower levels are expected in this format since data extents have variable lengths.
- This format uses a type indicator that determines its record format and content and accommodates new requirements and functionality

E. C. T. 4885 Paula AC

for future types.

The current typed format is used on regular files only when indirection is needed. Typed records are longer than the previous format and require less direct entries in the inode. Newly created files start out using the old format which allows for ten direct extents in the inode. The inode's block map is converted to the typed format when indirection is needed to offer the advantages of both formats.

Extent Attributes

VxFS allocates disk space to files in groups of one or more extents. HP OnLineJFS also allows applications to control some aspects of the extent allocation. *Extent attributes* are the extent allocation policies associated with a file.

The `setext` and `getext` commands allow the administrator to set or view extent attributes associated with a file, as well as to preallocate space for a file. Refer to Chapter 3 , "Extent Attributes," Chapter 6 , "Application Interface," `setext`(1M), and `getext`(1M) for discussions on how to use extent attributes.

The `vxtunefs` command allows the administrator to set or view the default indirect data extent size. Refer to Chapter 5 , "Performance and Tuning" and `vxtunefs`(1M) for discussions on how to use the indirect data extent size feature.

NOTE `setext` functionality is available only with the optional HP OnLineJFS product.

Fast File System Recovery

The HFS file system relies on full structural verification by the `fsck` utility as the only means to recover from a system failure. For large disk configurations, this utility involves a time consuming process of checking the entire structure, verifying that the file system is intact, and correcting any inconsistencies.

VxFS provides recovery only seconds after a system failure by utilizing a tracking feature called *`intent logging`*. This feature records pending changes to the file system structure in a circular *`intent log`*. During system failure recovery, the VxFS `fsck` utility performs an intent log replay, which scans the intent log and nullifies or completes file system operations that were active when the system failed. The file system can then be mounted without completing a full structural check of the entire file system. The intent log recovery feature is not readily apparent to the user or the system administrator except during a system failure.

Replaying the intent log may not completely recover the damaged file system structure if the disk suffers a hardware failure; such situations may require a complete system check using the `fsck` utility provided with VxFS.

Online System Administration

With the HP OnLineJFS product, a VxFS file system can be defragmented and resized while it remains online and accessible to users. The following sections contain detailed information about these features.

NOTE The online administration features, defragmentation, resizing, and online backup, are available only with the optional HP OnLineJFS product.

Defragmentation

Free resources are initially aligned and allocated to files in the most efficient order possible to provide optimal performance. On an active file system, the original order of free resources is lost over time as files are created, removed, and resized. The file system is spread further and further along the disk, leaving unused gaps or *fragments* between areas that are in use. This process is also known as *fragmentation* and leads to degraded performance because the file system has fewer options when assigning a file to an extent (a group of contiguous data blocks).

The HFS file system uses the concept of *cylinder groups* to limit fragmentation. Cylinder groups are self-contained sections of a file system that indicate free inodes and data blocks. Allocation strategies in HFS attempt to place inodes and data blocks in close proximity. This reduces fragmentation but does not eliminate it.

HP OnLineJFS provides the online administration utility `fsadm` to resolve the problem of fragmentation. The `fsadm` utility defragments a mounted file system by:

- removing unused space from directories
- making all small files contiguous
- consolidating free blocks for file system use

This utility can run on demand and should be scheduled regularly as a `cron` job.

E C T
4881
Paulo

Resizing

A file system is assigned a specific size as soon as it is created; the file system may become too small or too large as changes in file system usage take place over time.

The HFS file system traditionally offers four solutions to address an inadequate small file system:

- Move some users to a different file system.
- Move a subdirectory of the file system to a new file system.
- Copy the entire file system to a larger file system.
- Unmount the file system (offline), extend the volume, extend the file system, then remount the file system.

Most large file systems with too much space try to reclaim the unused space by off-loading the contents of the file system and rebuilding it to a preferable size. The HFS file system requires unmounting the file system and blocking user access during the modification.

When the HP OnLineJFS product is installed, the VxFS utility `fsadm` can expand or shrink a file system without unmounting the file system or interrupting user productivity. However, to expand a file system, the underlying device on which it is mounted must be expandable. LVM facilitates expansion using virtual disks that can be increased in size while in use. The VxFS and LVM packages complement each other to provide online expansion capability.

NOTE

You can only shrink a file system that uses the version 4 disk layout. However, even with the version 4 disk layout, it is sometimes not possible to shrink a file system. When shrinking a version 4 file system, JFS attempts to move extents off the area of the file system being reduced. However, if JFS cannot move extents off the area of the file system being reduced, the shrink will fail.

Doc: 3701

Online Backup

The HP OnLineJFS product provides a method of online backup of data using the *snapshot* feature. An image of a mounted file system instantly becomes an exact read-only copy of the file system at a certain point in time. The original file system is *snapped* while the copy is called the *snapshot*.

When changes are made to the snapped file system, the old data is first copied to the snapshot. When the snapshot is read, data that has not changed is read from the snapped file system. Changed data is read directly from the snapshot.

Backups require one of the following methods:

- copying selected files from the snapshot file system (using `find` and `cpio`)
- backing up the entire file system (using `fscat`)
- initiating a full or incremental backup (using `vxdump`)

For detailed information about performing online backups, see Chapter 4 , "Online Backup."

E C T
4879 Paulo
A C

Application Interface

The VxFS file system conforms to the System V Interface Definition (SVID) requirements and supports user access through the Network File System (NFS). Applications that require performance features not available with other file systems can take advantage of VxFS enhancements that are introduced in this section and covered in detail in Chapter 6 , "Application Interface."

Application Transparency

In most cases, any application designed to run on the HFS file system should run transparently on the VxFS file system.

Expanded Application Facilities

The HP OnLineJFS product provides some facilities frequently associated with commercial applications that make it possible to:

- preallocate space for a file
- specify a fixed extent size for a file
- bypass the system buffer cache for file I/O
- specify the expected access pattern for a file

Since these facilities are provided using VxFS-specific ioctl system calls, most existing UNIX system applications do not use these facilities. The `cp`, `cpio`, and `mv` utilities use these facilities to preserve extent attributes and allocate space more efficiently. The current attributes of a file can be listed using the `getext` command or `ls` command. The facilities can also improve performance for custom applications. For portability reasons, these applications should check what file system type they are using before using these interfaces.

CPMI - CORREIOS
Fls: 1443
Doc: 3701

Extended mount Options

The VxFS file system supports extended `mount` options to specify:

- enhanced data integrity modes
- enhanced performance modes
- temporary file system modes
- improved synchronous writes

See Chapter 5 , "Performance and Tuning" and `mount_vxfs`(1M) for details on the VxFS `mount` options.

Enhanced Data Integrity Modes

NOTE Performance trade-offs are associated with these `mount` options.

The HFS file system is "buffered" in the sense that resources are allocated to files and data is written asynchronously to files. In general, the buffering schemes provide better performance without compromising data integrity.

If a system failure occurs during space allocation for a file, uninitialized data or data from another file may appear in the extended file after reboot. Data written shortly before the system failure may also be lost.

Using blkclear for Data Integrity

In environments where performance is more important than absolute data integrity, the preceding situation is not of great concern. However, VxFS supports environments that emphasize data integrity by providing the `mount -o blkclear` option that ensures uninitialized data does not appear in a file.

Using closesync for Data Integrity

VxFS provides the `mount -o mincache=closesync` option, which is useful in desktop environments with users who are likely to shut off the power on machines without halting them first. In `closesync` mode, only

files that are written during the system crash or shutdown can lose data. Any changes to a file are flushed to disk when the file is closed.

Enhanced Performance Mode

The HFS file system is asynchronous in the sense that structural changes to the file system are not immediately written to disk. File systems are designed this way to provide better performance. However, recent changes to the file system may be lost if a system failure occurs. More specifically, attribute changes to files and recently created files may disappear.

The default logging mode provided by VxFS (`mount -o log`) guarantees that all structural changes to the file system are logged to disk before the system call returns to the application. If a system failure occurs, `fsck` replays any recent changes to preserve all metadata. Recent file data may be lost unless a request was made to `sync` it to disk.

Using delaylog for Enhanced Performance

VxFS provides the `mount -o delaylog` option which increases performance by delaying the logging of some structural changes. However, recent changes may be lost during a system failure. This option provides at least the same level of data accuracy that traditional UNIX file systems provide for system failures, along with fast file system recovery.

Temporary File System Modes

On most UNIX systems, temporary file system directories (such as `/tmp` and `/usr/tmp`) often hold files that do not need to be retained when the system reboots. The underlying file system does not need to maintain a high degree of structural integrity for these temporary directories.

Using tmplog for Temporary File Systems

VxFS provides a `mount -o tmplog` option which allows the user to achieve higher performance on temporary file systems by delaying the logging of most operations.

Improved Synchronous Writes

HP OnLineJFS provides superior performance for synchronous write

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1444
Fls:
Doc: 3701

applications.

The default `datainlog` option to `mount` greatly improves the performance of small synchronous writes.

The `convosync=dsync` option to `mount` improves the performance of applications that require synchronous data writes but not synchronous inode time updates.

NOTE The use of the `convosync=dsync` option violates POSIX semantics.

NOTE The `datainlog` and `convosync` options are available only with the optional HP OnLineJFS product.

E C T
4875
Paula
AC

Enhanced I/O Performance

VxFS provides enhanced I/O performance by applying an aggressive I/O clustering policy.

Enhanced I/O Clustering

I/O clustering is a technique of grouping multiple I/O operations together for improved performance. The VxFS I/O policies provide more aggressive clustering processes than other file systems and offer higher I/O throughput when using large files; the resulting performance is comparable to that provided by raw disk.

Application-Specific Parameters

System administrators can also set application specific parameters on a per-file system basis to improve I/O performance.

- Default Indirect Extent Size

  On disk layout Version 2, this value can be set up to apply to all the indirect extents, provided a fixed extent size is not already set and the file does not already have indirect extents. The Version 3 and 4 disk layout uses typed extents which have variable sized indirects.

- Discovered Direct I/O

  All sizes above this value would be performed as direct I/O.

NOTE The Discovered Direct I/O parameter is available only with the HP OnLineJFS product.

- Maximum Direct I/O Size

  This value defines the maximum size of a single direct I/O.

NOTE The Maximum Direct I/O Size parameter is available only with the HP OnLineJFS product.

Paulo
L - AC

Quotas

VxFS supports the Berkeley Software Distribution (BSD) style user quotas, which allocate per-user quotas and limit the use of two principal resources: files and data blocks. The system administrator can assign quotas for each of these resources. Each quota consists of two limits for each resource:

- The *hard limit* represents an absolute limit on data blocks or files. The user may never exceed the hard limit under any circumstances.
- The *soft limit* is lower than the hard limit and may be exceeded for a limited amount of time. This allows users to temporarily exceed limits as long as they fall under those limits before the allotted time expires.

The system administrator is responsible for assigning hard and soft limits to users. See "Quota Limits" for more information.

Doc:

Access Control Lists

An Access Control List (ACL) stores a series of entries that identify specific users or groups and their access privileges for a directory or file. A file may have its own ACL or may share an ACL with other files. ACLs have the advantage of specifying detailed access permissions for multiple users and groups. Refer to getacl (1M) and `setacl`(1M) for information on viewing and setting ACLs.

NOTE Access control lists require a file system with the version 4 disk layout.

Support for Large Files

VxFS can, theoretically, support files up to two terabytes in size because file system structures are no longer in fixed locations (see Chapter 2 , "Disk Layout"). The maximum size tested and supported on HP-UX 11.x systems is one terabyte. Large files are files larger than two gigabytes in size.

NOTE Be careful when enabling large file capability. Applications and utilities such as backup may experience problems if they are not aware of large files.

Creating a File System with Large Files

You can create a file system with large file capability by entering the following command:

```
# mkfs -F vxfs -o largefiles special_device size
```

Specifying `largefiles` sets the `largefiles` flag, which allows the file system to hold files up to one terabyte in size. Conversely, the default `nolargefiles` option clears the flag and limits files being created to a size of two gigabytes or less:

```
# mkfs -F vxfs -o nolargefiles special_device size
```

NOTE The `largefiles` flag is persistent and stored on disk.

Mounting a File System with Large Files

If a mount succeeds and `nolargefiles` is specified, the file system cannot contain or create any large files. If a mount succeeds and `largefiles` is specified, the file system may contain and create large files.

The `mount` command fails if the specified `largefiles|nolargefiles` option does not match the on-disk flag.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1447
Fls:
3701
Doc:

The `mount` command defaults to match the current setting of the on-disk flag if specified without the `largefiles` or `nolargefiles` option, so it's best not to specify either option. After a file system is mounted, you can use the `fsadm` utility to change mount options.

Managing a File System with Large Files

You can determine the current status of the largefiles flag with any of the following commands:

```
# mount
# mkfs -F vxfs -m  special_device
# fsadm -F vxfs  mount_point
```

You can switch capabilities on a mounted file system with the `fsadm` command:

```
# fsadm -F vxfs -o largefiles|nolargefiles mount_point
```

You cannot switch a file system to `nolargefiles` if it holds large files.

See `mount_vxfs`(1M), `fsadm_vxfs`(1M), and `mkfs_vxfs`(1M).

2 Disk Layout

RQS Nº 03/2005 - CN
CPMI - CORREIOS
41
Fls: 1448
Doc: 3701

Introduction

Three disk layouts are available with the VxFS file system:

Version 2	The Version 2 disk layout was designed to support features such as filesets, dynamic inode allocation, and enhanced security.
Version 3	The Version 3 disk layout encompasses all file system structural information in files, rather than at fixed locations on disk, allowing for greater scalability. Version 3 supports files and file systems up to one terabyte in size.
Version 4	The Version 4 disk layout supports access control lists (ACLs).

NOTE The Version 1 disk layout is not supported on HP-UX.

The following topics are covered in this chapter:

- "Disk Space Allocation"
- "The VxFS Version 1 Disk Layout"
- "Overview"
- "Super-Block"
- "Intent Log"
- "Allocation Unit"
- "The VxFS Version 2 Disk Layout"
  - "Overview"
  - "Basic Layout"
  - "Filesets and Structural Files"
  - "Locating Dynamic Structures"
- "The VxFS Version 3 Disk Layout"
- "The VxFS Version 4 Disk Layout"

When HP-UX 11.1x is installed on a system, new VxFS file systems are created with the Version 4 layout by default. When JFS 3.3 is installed on an HP-UX 11.00 system, new file systems are created with the Version 3 layout by default. Although `mkfs` allows the user to specify

E C T
4867
Disk Layout
Introduction
Paula
A C

other disk layouts, it is generally preferable to use the Version 4 layout for new file systems.

The vxupgrade command can upgrade an existing Version 3 VxFS file system to the Version 4 layout while the file system remains online. vxupgrade can also upgrade a Version 2 file system to the Version 3 layout. See vxupgrade(1M) for details on upgrading VxFS file systems.You cannot downgrade a file system that has been upgraded.

NOTE

You cannot upgrade the root (/) or /usr file systems to Version 4 on an 11.00 system running JFS 3.3. Additionally, we do not advise upgrading the /var or /opt file systems to Version 4 on an 11.00 system. These core file systems are crucial for system recovery. The HP-UX 11.00 kernel and emergency recovery media were built with an older version of JFS that does not recognize the Version 4 disk layout. If these file systems were upgraded to Version 4, your system might have errors booting with the 11.00 kernel as delivered, or booting with the emergency recovery media.

CPMI - CORREIOS
Fls: 1449
Doc 1

Disk Space Allocation

Disk space is allocated by the system in 1024-byte sectors. An integral number of sectors are grouped together to form a logical block. VxFS supports logical block sizes of 1024, 2048, 4096, and 8192 bytes. The default block size is 1024 bytes for file systems less than 3 gigabytes; 2048 bytes for file systems less than 16 gigabytes; 4096 bytes for file systems less than 32 gigabytes; and 8192 bytes for file systems 32 gigabytes or larger. The block size may be specified as an argument to the `mkfs` utility and may vary between VxFS file systems mounted on the same system. VxFS allocates disk space to files in extents. An extent is a set of contiguous blocks.

The VxFS Version 1 Disk Layout

This section describes the VxFS Version 1 disk layout.

NOTE The Version 1 disk layout is not supported on HP-UX.

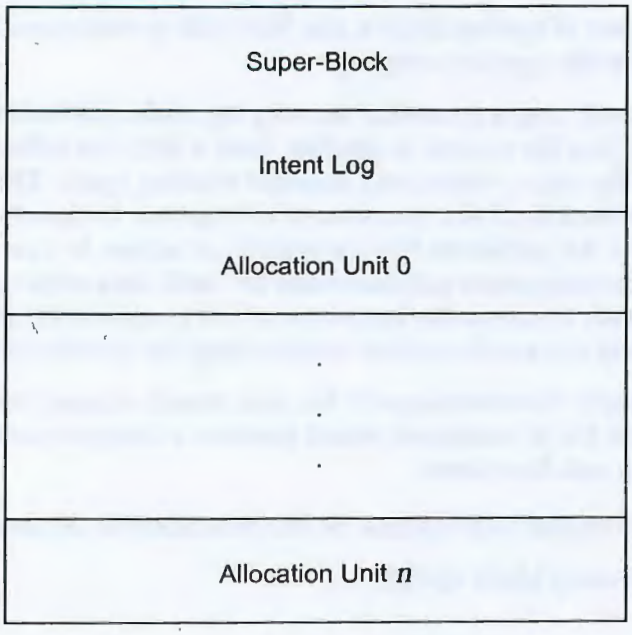
Overview

The VxFS Version 1 disk layout, as shown in Figure 2-1, "VxFS Version 1 Disk Layout" includes:

- the super-block
- the intent log
- one or more allocation units

These elements are discussed in detail in the sections that follow.

Figure 2-1 VxFS Version 1 Disk Layout



RQS Nº 03/2005 - CN
CPMI - CORREIOS
1450
Fls:
3701
Doc:

Super-Block

The super-block contains important information about the file system, such as:

- the file system type
- creation and modification dates
- label information
- information about the size and layout of the file system
- the count of available resources
- the file system disk layout version number

The super-block is always in a fixed location, offset from the start of the file system by 8192 bytes. This fixed location enables utilities to easily locate the super-block when necessary. The super-block is 1024 bytes long.

Copies of the super-block are kept in allocation unit headers: these copies can be used for recovery purposes if the super-block is corrupted or destroyed (see `fsck_vxfs`(1M) for more details).

Intent Log

In the event of system failure, the VxFS file system uses intent logging to guarantee file system integrity.

The *`intent log`* is a circular activity log with a default size of 1024 blocks. If the file system is smaller than 4 MB, the default log size is reduced (by `mkfs_vxfs(1M)`) to avoid wasting space. The intent log contains records of the intention of the system to update a file system structure. An update to the file system structure (a *`transaction`*) is divided into separate sub-functions for each data structure that needs to be updated. A composite log record of the transaction is created, containing the sub-functions constituting the transaction.

For example, the creation of a file that would expand the directory in which the file is contained would produce a transaction consisting of the following sub-functions:

- a free extent map update for the allocation of the new directory block
- a directory block update

E C T
4863
Paulo
I
S

- an inode modification for the directory size change
- an inode modification for the new file
- a free inode map update for the allocation of the new file

VxFS maintains log records in the intent log for all pending changes to the file system structure and ensures that the log records are written to disk in *advance* of the changes to the file system. Once the intent log has been written, the transaction's other updates to the file system can be written in any order. In the event of a system failure, the pending changes to the file system are either nullified or completed by the `fsck` utility. The VxFS intent log generally only records changes to the file system structure. File data changes are not normally logged.

Allocation Unit

An allocation unit is a group of consecutive blocks in a file system that contain a resource summary, free resource maps, inodes, data blocks, and a copy of the super-block. An allocation unit in the VxFS file system is similar in concept to the HFS "cylinder group." Each component of an allocation unit begins on a block boundary. The VxFS Version 1 allocation unit is shown in Figure 2-2, "Allocation Unit Structure."

ROS Nº 03/2005 - CN
CPMI - CORREIOS
1451
Fls:
3701
Doc:

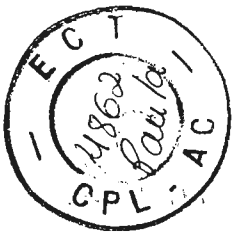


Figure 2-2 **Allocation Unit Structure**

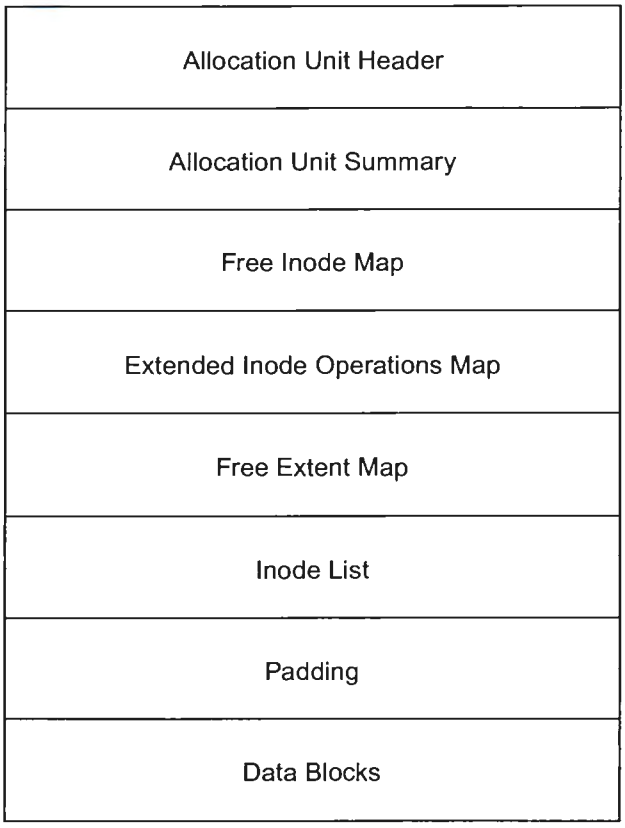

One or more allocation units exist per file system. Allocation units are located immediately after the intent log. The number and size of allocation units can be specified when the file system is made. All of the allocation units, except possibly the last one, are of equal size. If space is limited, the last allocation unit can have a partial set of data blocks to allow use of all remaining blocks.

Allocation Unit Header

The allocation unit header contains a copy of the file system's super-block that is used to verify that the allocation unit matches the super-block of the file system. The super-block copies contained in allocation unit headers can also be used for recovery purposes if the super-block is corrupted or destroyed. The allocation unit header occupies the first block of each allocation unit.

Allocation Unit Summary

The allocation unit summary contains the number of inodes with extended operations pending, the number of free inodes, and the number of free extents in the allocation unit.

Free Inode Map The free inode map is a bitmap that indicates which inodes are free and which are allocated. A free inode is indicated by the bit being on. Inodes zero and one are reserved by the file system; inode two is the inode for the root directory; inode three is the inode for the `lost+found` directory.

Extended Inode Operations Map The extended inode operations map keeps track of inodes on which operations would remain pending for too long to reside in the intent log. The extended inode operations map is in the same format as the free inode map. To prevent the intent log from wrapping and the transaction from getting overwritten, the required operations are stored in the affected inode (if the transaction has not completed, it does not get overwritten, the new log waits and the file system is frozen). This map is then updated to identify the inodes that have extended operations that need to be completed.

Free Extent Map The free extent map is a series of independent 512-byte bitmaps that are each referred to as a free extent map section. Each section is broken down into multiple regions. The first region, of 2048 bits, represents a section of 2048 one-block extents. The second region, of 1024 bits, represents a section of 1024 two-block extents. This regioning continues for all powers of 2 up to the single bit that represents one 2048 block extent.

The file system uses this bitmapping scheme to find an available extent closest in size to the space required. This keeps files as contiguous as possible for faster performance.

Inode List An inode is a data structure that contains information about a file. The VxFS inode size is 256 bytes. Each inode stores information about a particular file such as:

- file length
- link count
- owner and group IDs
- access privileges

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1452
Fls: 3701
Doc:

- time of last access
- time of last modification
- pointers to the extents that contain the file's data

There are up to ten direct extent address size pairs per inode. Each direct extent address indicates the starting block number of a direct extent; direct extent sizes can vary. If all of the direct extents are used, two indirect address extents are available for use in each inode:

- The first indirect address extent is used for single indirection, where each entry in the extent indicates the starting block number of an indirect data extent.
- The second indirect address extent is used for double indirection, where each entry in the extent indicates the starting block number of a single indirect address extent.

Each indirect address extent is 8K long and contains 2048 entries. All indirect data extents for a given file have the same size, which is determined when the file's first indirect data extent is allocated.

The inode list is a series of inodes. There is one inode in the list for every file in the file system.

Padding It may be desirable to align data blocks to a physical boundary. To facilitate this, the system administrator may specify that a gap be left between the end of the inode list and the first data block.

Data Blocks The balance of the allocation unit is occupied by data blocks. Data blocks contain the actual data stored in files and directories.

Disk Layout

- an inode modification for the directory size change
- an inode modification for the new file
- a free inode map update for the allocation of the new file

VxFS maintains log records in the intent log for all pending changes to the file system structure and ensures that the log records are written to disk in *advance* of the changes to the file system. Once the intent log has been written, the transaction's other updates to the file system can be written in any order. In the event of a system failure, the pending changes to the file system are either nullified or completed by the `fsck` utility. The VxFS intent log generally only records changes to the file system structure. File data changes are not normally logged.

Allocation Unit

An allocation unit is a group of consecutive blocks in a file system that contain a resource summary, free resource maps, inodes, data blocks, and a copy of the super-block. An allocation unit in the VxFS file system is similar in concept to the HFS "cylinder group." Each component of an allocation unit begins on a block boundary. The VxFS Version 1 allocation unit is shown in Figure 2-2, "Allocation Unit Structure."

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1453
Fls:
Doc: 3701

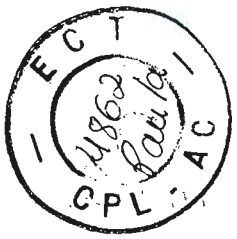

Figure 2-2 **Allocation Unit Structure**

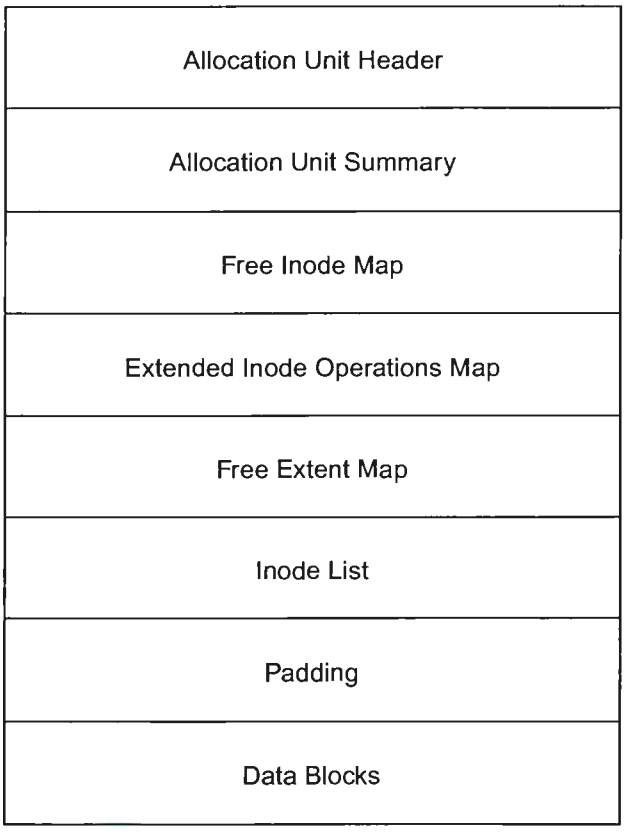

One or more allocation units exist per file system. Allocation units are located immediately after the intent log. The number and size of allocation units can be specified when the file system is made. All of the allocation units, except possibly the last one, are of equal size. If space is limited, the last allocation unit can have a partial set of data blocks to allow use of all remaining blocks.

Allocation Unit Header

The allocation unit header contains a copy of the file system's super-block that is used to verify that the allocation unit matches the super-block of the file system. The super-block copies contained in allocation unit headers can also be used for recovery purposes if the super-block is corrupted or destroyed. The allocation unit header occupies the first block of each allocation unit.

Allocation Unit Summary

The allocation unit summary contains the number of inodes with extended operations pending, the number of free inodes, and the number of free extents in the allocation unit.

Free Inode Map The free inode map is a bitmap that indicates which inodes are free and which are allocated. A free inode is indicated by the bit being on. Inodes zero and one are reserved by the file system; inode two is the inode for the root directory; inode three is the inode for the `lost+found` directory.

Extended Inode Operations Map The extended inode operations map keeps track of inodes on which operations would remain pending for too long to reside in the intent log. The extended inode operations map is in the same format as the free inode map. To prevent the intent log from wrapping and the transaction from getting overwritten, the required operations are stored in the affected inode (if the transaction has not completed, it does not get overwritten, the new log waits and the file system is frozen). This map is then updated to identify the inodes that have extended operations that need to be completed.

Free Extent Map The free extent map is a series of independent 512-byte bitmaps that are each referred to as a free extent map section. Each section is broken down into multiple regions. The first region, of 2048 bits, represents a section of 2048 one-block extents. The second region, of 1024 bits, represents a section of 1024 two-block extents. This regioning continues for all powers of 2 up to the single bit that represents one 2048 block extent.

The file system uses this bitmapping scheme to find an available extent closest in size to the space required. This keeps files as contiguous as possible for faster performance.

Inode List An inode is a data structure that contains information about a file. The VxFS inode size is 256 bytes. Each inode stores information about a particular file such as:

- file length
- link count
- owner and group IDs
- access privileges

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1454
Doc: 3701

- time of last access
- time of last modification
- pointers to the extents that contain the file's data

There are up to ten direct extent address size pairs per inode. Each direct extent address indicates the starting block number of a direct extent; direct extent sizes can vary. If all of the direct extents are used, two indirect address extents are available for use in each inode:

- The first indirect address extent is used for single indirection, where each entry in the extent indicates the starting block number of an indirect data extent.
- The second indirect address extent is used for double indirection, where each entry in the extent indicates the starting block number of a single indirect address extent.

Each indirect address extent is 8K long and contains 2048 entries. All indirect data extents for a given file have the same size, which is determined when the file's first indirect data extent is allocated.

The inode list is a series of inodes. There is one inode in the list for every file in the file system.

Padding It may be desirable to align data blocks to a physical boundary. To facilitate this, the system administrator may specify that a gap be left between the end of the inode list and the first data block.

Data Blocks The balance of the allocation unit is occupied by data blocks. Data blocks contain the actual data stored in files and directories.

The VxFS Version 2 Disk Layout

This section describes the VxFS Version 2 disk layout.

Due to the relatively complex nature of the Version 2 layout, the sections that follow are arranged to cover the following general areas:

- Structural elements of the file system that exist in fixed locations. These elements are discussed in "Basic Layout".
- Structural elements of the file system that do not exist in fixed locations. These elements are discussed in "Filesets and Structural Files".
- The location and use of the various structural elements when the file system is mounted. This is discussed in "Locating Dynamic Structures".

Overview

Many aspects of the Version 1 disk layout are preserved in the Version 2 disk layout. However, the Version 2 layout differs from the Version 1 layout in that it includes support for the following features:

- filesets (sets of files within a file system)
- dynamic inode allocation (allocation of inodes on an as-needed basis)
- enhanced security

The addition of filesets and dynamic allocation of inodes has affected the disk layout in various ways. In particular, many of the file system structures are now located in files (referred to as *structural files*) rather than in fixed disk areas. This provides a simple mechanism for dynamic growth of structures. For example, inodes are now stored in structural files and allocated as needed. In general, file system structures that deal with space allocation are still in fixed disk locations, while most other structures are dynamically allocated and have become clients of the file system's disk space allocation scheme.

The Version 2 disk layout adds BSD-style quota support. The differences include the fileset header structure modification to store a quota inode and preallocation of an internal quotas file.

Basic Layout

This section describes the structural elements of the file system that exist in fixed locations on the disk.

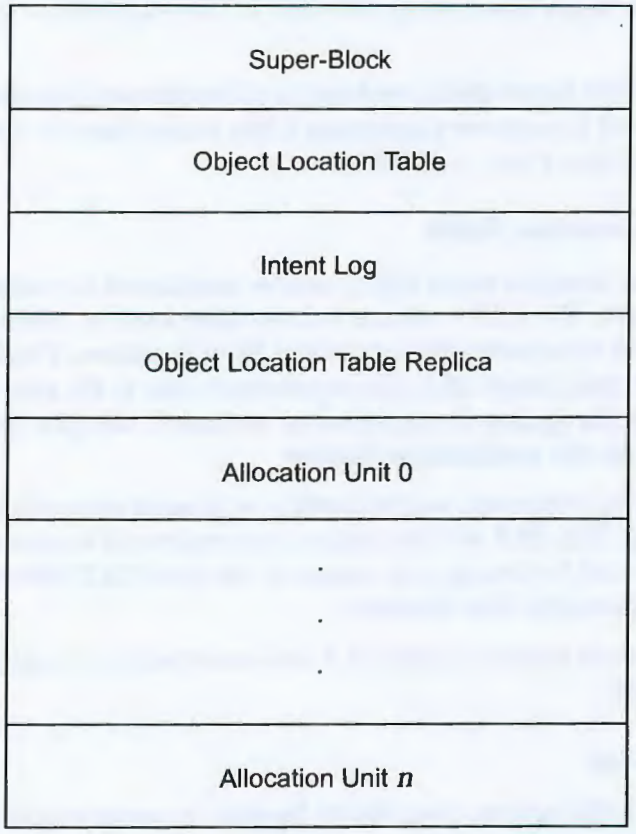
The VxFS Version 2 disk layout is illustrated in Figure 2-3, "VxFS Version 2 Disk Layout" and is composed of:

- the super-block
- the object location table
- the intent log
- a replica of the object location table
- one or more allocation units

These and other elements are discussed in detail in the sections that follow.

E C T
L - AC

Figure 2-3 VxFS Version 2 Disk Layout



Super-Block

The super-block contains important information about the file system, such as

- the file system type
- creation and modification dates
- label information
- information about the size and layout of the file system
- the count of available resources
- the file system disk layout version number
- pointers to the object location table and its replica

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1456
Fls:
Doc: 3701

The super-block is always in a fixed location, offset from the start of the file system by 8192 bytes. This fixed location enables utilities to easily locate the super-block when necessary. The super-block is 1024 bytes long.

Copies of the super-block are kept in allocation unit headers: these copies can be used for recovery purposes if the super-block is corrupted or destroyed (see `fsck_vxfs`(1M)).

Object Location Table

The object location table (OLT) can be considered an extension of the super-block. The OLT contains information used at mount time to locate file system structures that are not in fixed locations. The OLT is typically located immediately after the super-block and is 8K long. However, if a Version 1 file system is upgraded to Version 2, the placement of the OLT depends on the availability of space.

The OLT is replicated and its replica is located immediately after the intent log. The OLT and its replica are separated in order to minimize the potential for losing both copies of the vital OLT information in the event of localized disk damage.

The contents and use of the OLT are described in "Locating Dynamic Structures".

Intent Log

The VxFS file system uses intent logging to guarantee file system integrity in the event of system failure

The *`intent log`* is a circular activity log with a default size of 512 blocks. If the file system is less than 4 MB, the log size will be reduced to avoid wasting space. The intent log contains records of the intention of the system to update a file system structure. An update to the file system structure (a *`transaction`*) is divided into separate sub-functions for each data structure that needs to be updated. A composite log record of the transaction is created that contains the subventions that constitute the transaction.

For example, the creation of a file that would expand the directory in which the file is contained will produce a transaction consisting of the following subventions:

- a free extent map update for the allocation of the new directory block

E C T
21855
Paulo
A C

- a directory block update
- an inode modification for the directory size change
- an inode modification for the new file
- a free inode map update for the allocation of the new file

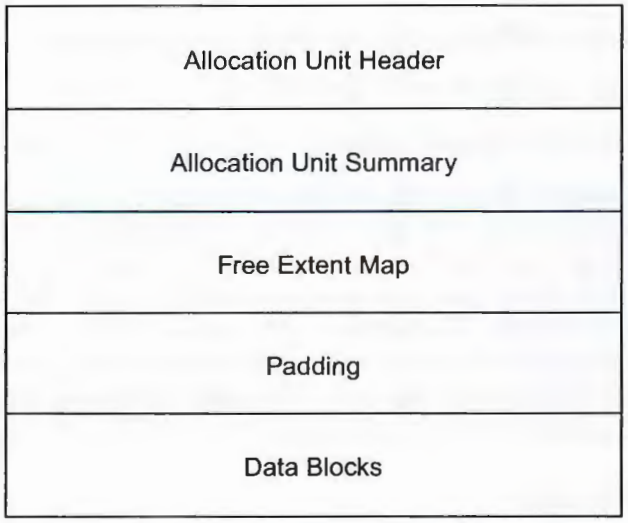
VxFS maintains log records in the intent log for all pending changes to the file system structure, and ensures that the log records are written to disk in *advance* of the changes to the file system. Once the intent log has been written, the transaction's other updates to the file system can be written in any order. In the event of a system failure, the pending changes to the file system are either nullified or completed by the `fsck` utility. The VxFS intent log generally only records changes to the file system structure. File data changes are not normally logged.

Allocation Unit

An allocation unit is a group of consecutive blocks in a file system that contain a resource summary, a free resource map, data blocks, and a copy of the super-block. An allocation unit in the VxFS file system is similar in concept to the HFS "cylinder group." Each component of an allocation unit begins on a block boundary. All of the Version 2 allocation unit components deal with the allocation of disk space. Those components of the Version 1 allocation unit that deal with inode allocation have been relocated elsewhere for Version 2. In particular, the inode list now resides in an inode list file and the inode allocation information now resides in an inode allocation unit (described later). The VxFS Version 2 allocation unit is depicted in Figure 2-4, "Allocation Unit Structure."

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1457
Doc: 3701

Figure 2-4 **Allocation Unit Structure**



One or more allocation units exist per file system. Allocation units are located after the OLT replica. The number and size of allocation units can be specified when the file system is made. All of the allocation units, except possibly the last one, are of equal size. If space is limited, the last allocation unit can have a partial set of data blocks to allow use of all remaining blocks.

Allocation Unit Header The allocation unit header contains a copy of the file system's super-block that is used to verify that the allocation unit matches the super-block of the file system. The super-block copies contained in allocation unit headers can also be used for recovery purposes if the super-block is corrupted or destroyed. The allocation unit header occupies the first block of each allocation unit.

Allocation Unit Summary The allocation unit summary summarizes the resources (data blocks) used in the allocation unit. This includes information such as the number of free extents of each size in the allocation unit.

Free Extent Map The free extent map is a series of independent 512-byte bitmaps that are each referred to as a free extent map section. Each section is broken down into multiple regions. The first region of 2048 bits represents a section of 2048 one-block extents. The second region of 1024 bits represent a section of 1024 two-block extents. This regioning continues for all powers of 2 up to the single bit that represents

one 2048 block extent.

The file system uses this bitmapping scheme to find an available extent closest in size to the space required. This keeps files as contiguous as possible for faster performance.

Padding It may be desirable to align data blocks to a physical boundary. To facilitate this, the system administrator may specify that a gap be left between the end of the free extent map and the first data block. See Chapter 6 , "Application Interface," for additional information on alignment.

Data Blocks The balance of the allocation unit is occupied by data blocks. Data blocks contain the actual data stored in files and directories.

Filesets and Structural Files

This section describes the structural elements of the file system that are not necessarily in fixed locations on the disk.

With the Version 2 layout, many structural elements of the file system are encapsulated in files to allow dynamic allocation of the file system structure. Files that store this file system structural data are referred to as *structural files*. As the file system grows, more space is allocated to the structural files. Structural files are intended for file system use only and are not generally visible to users.

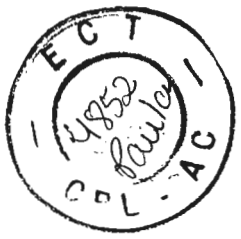
The Version 2 layout supports *filesets*, which are collections of files that exist within a file system. In the current release, each file system contains two filesets:

attribute fileset	A special fileset that stores the structural elements of the file system in the form of structural files. These files are a property of the file system and are not normally visible to the user.
primary fileset	A fileset that contains files that are visible to and accessible by users.

Structural files exist in the attribute fileset only and include thefollowing:

fileset header file	A file that contains a series of fileset headers.
inode list file	A file that contains a series of inodes.

ECT 4853 Fls: 1
ROS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1458
Doc: 3701



inode allocation unit (IAU) file	A file that contains a series of inode allocation units.
current usage table (CUT) file	A file that contains a series of fileset usage entries.
link count table file	A file that contains a link count for each inode in the attribute fileset.
quotas file	A file containing user quota information (for the primary fileset only).

Structural files and their components are discussed in the sections that follow.

Although structural files are contained in the structural fileset, they can "belong" to another fileset. For example, the inode list file for the primary fileset is in the structural fileset, but the structural details that it contains are only applicable to the primary fileset.

Each fileset is defined by structural files as follows:

- an inode list file, which contains the inodes belonging to the fileset
- an inode allocation unit file, which contains a series of inode allocation units
- an entry in the fileset header file, which contains one fileset header per fileset
- an entry in the current usage table file, which contains usage information for each fileset

In addition, the primary fileset has a user quotas file and the structural fileset has a link count table file.

Fileset metadata that cannot be reconstructed using the inode list is replicated to help `fsck` reconstruct the file system in the event of disk damage.

Figure 2-5, "Filesets and Structural Files" shows a fileset and the structural files by which it is defined.

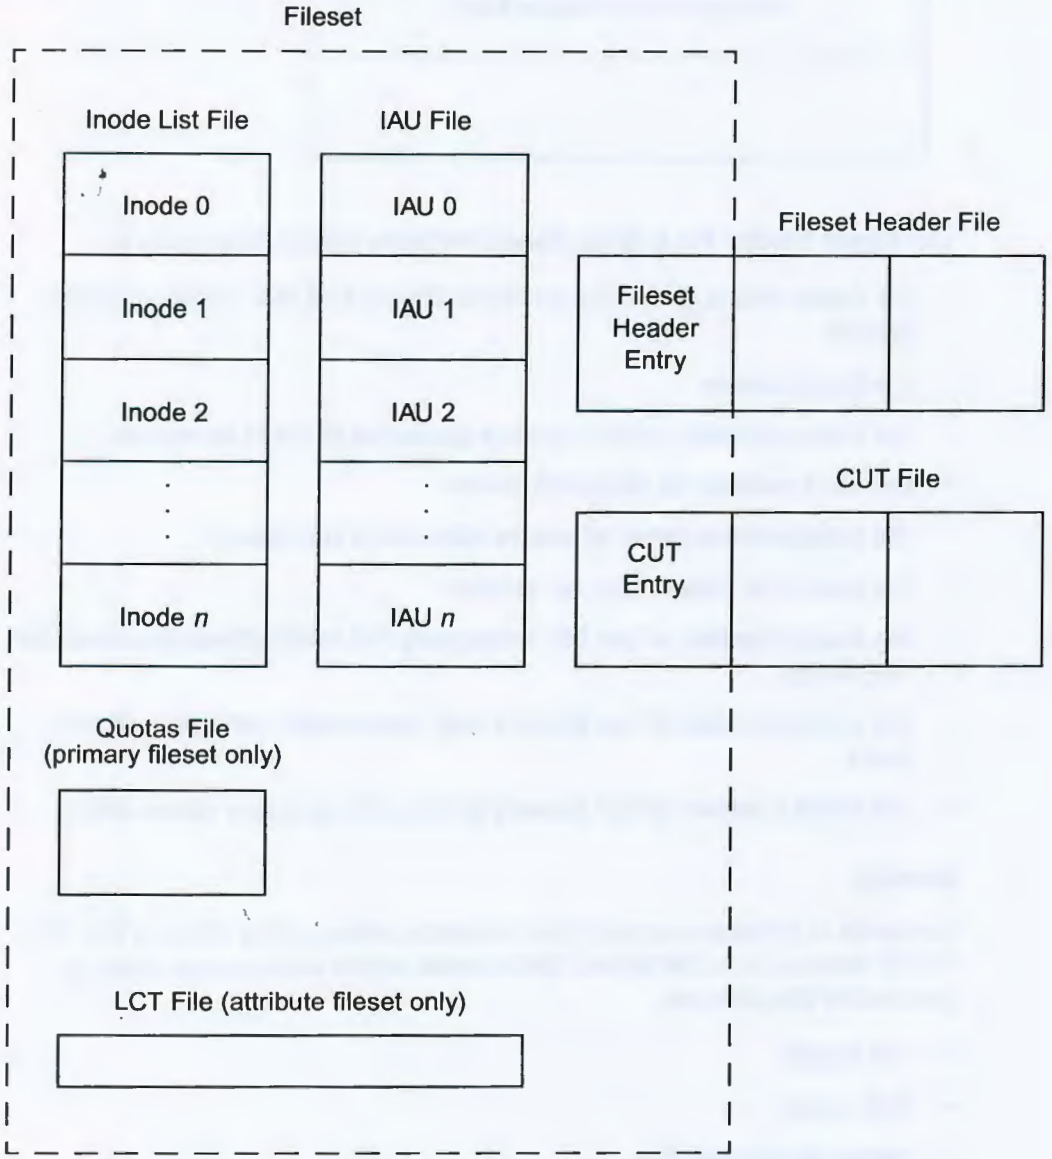
Fileset Header

Each fileset has a header containing information about the fileset's contents and characteristic. All fileset headers are stored in a single fileset header file in the attribute fileset. The fileset header file contains

E C T
485
São Paulo
S

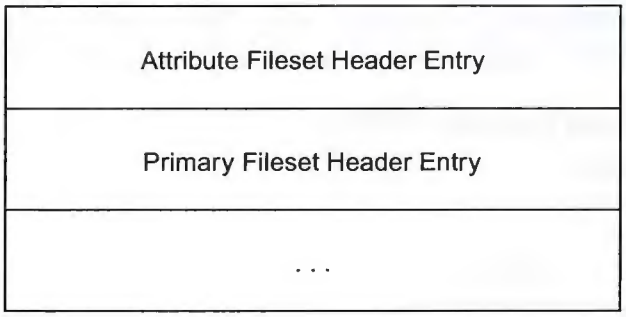
one fileset header per fileset (see Figure 2-6, "Fileset Header File"). Each fileset header entry is one block long. The fileset header file is replicated because fileset headers cannot be rebuilt from other data structures.

Figure 2-5 Filesets and Structural Files



RQS Nº 03/2005 - CN
CPMI - CORREIOS
1459
Fls:
Doc: 3701

Figure 2-6 **Fileset Header File**



The fileset header for a given fileset includes information such as:

- the fileset index (1 for the attribute fileset and 999 for the primary fileset)
- the fileset name
- the inode numbers of the fileset's inode list file and its replica
- the total number of allocated inodes
- the maximum number of inodes allowed in the fileset
- the inode list extent size (in blocks)
- the inode number of the file containing the inode allocation units for the fileset
- the inode number of the fileset's link count table (attribute fileset only)
- the inode number of the fileset's quotas file (primary fileset only)

Inodes

An inode is a data structure that contains information about a file. The VxFS inode size is 256 bytes. Each inode stores information about a particular file such as:

- file length
- link count
- owner and group IDs
- access privileges

E C T
4849

- time of last access
- time of last modification
- pointers to the extents that contain the file's data

There are up to ten direct extent address size pairs per inode. Each direct extent address indicates the starting block number of a direct extent; direct extent sizes can vary. If all of the direct extents are used, two indirect address extents are available for use in each inode. The first indirect address extent is used for single indirection, where each entry in the extent indicates the starting block number of an indirect data extent. The second indirect address extent is used for double indirection, where each entry in the extent indicates the starting block number of a single indirect address extent. Each indirect address extent is 8K long and contains 2048 entries. All indirect data extents for a given file have the same size, which is determined when the file's first indirect data extent is allocated.

Version 2 inodes differ from Version 1 inodes in that they are located in structural files to facilitate *dynamic inode allocation*, which is the allocation of inodes on an as-needed basis. Instead of allocating a fixed number of inodes into the file system, `mkfs` allocates a minimum number of inodes. Additional inodes are later allocated as the file system needs them.

The *inode list* is a series of inodes located in the inode list file. There is one inode in the list for every file in a given fileset. For recovery purposes, the inode list file is referenced by two inodes that point to the *same* set of data blocks. Although the inode addresses are replicated for recovery purposes, the inodes themselves are not.

An *inode extent* is an extent that contains inodes and is 8K long, by default. Inode extents are dynamically allocated to store inodes as they are needed.

Initial Inode List Extents The initial inode list extents contain the inodes first allocated by `mkfs_vxfs(1M)` for each fileset in a file system. During file system use, inodes are allocated as needed and are added into the inode list files for the filesets.

Figure 2-7, "Inode Lists" shows the initial inode list extents allocated for the primary and attribute filesets. Each of these extents contain 32 inodes and is 8K long.

The construction of the primary fileset's inode list resembles that of the

ROS Nº 03/2005 - CN
CPMI - CORREIOS
1460

Doc:
3701

ECT
CPL - AC

VxFS Version 1 file system layout, with the first two inodes reserved and inodes 2 and 3 pre-assigned to the `root` and `lost+found` directories. The structural fileset's inode list is similarly constructed, with certain inodes allocated for specific files and other inodes reserved or unallocated.

There are two initial inode list extents for the attribute fileset. These contain the inodes for all structural files needed to find and set up the file system.

Some of the entries in the structural fileset's inode list are replicas of one another. For example, inodes 4 and 36 both reference copies of the fileset header file. The replicated inodes are used by `fsck_vxfs(1M)` to reconstruct the file system in the event of damage to either one of the replicas. Although the two initial inode list extents belonging to the attribute fileset are logically contiguous, they are physically separated. This helps to ensure the integrity of the replicated information and reduces the chance that localized disk damage might result in complete loss of the file system.

Note that inodes 6 and 38 in the attribute fileset reference the inode list file for the attribute fileset. In a newly created file system, this file contains the two inode extents pictured for the attribute fileset. Likewise, the attribute fileset inodes 7 and 39 reference the inode list file for the primary fileset. In a newly created file system, this file contains the single extent pictured for the primary fileset. All of the unused inodes in the initial extents of the structural inode list are reserved for future use.

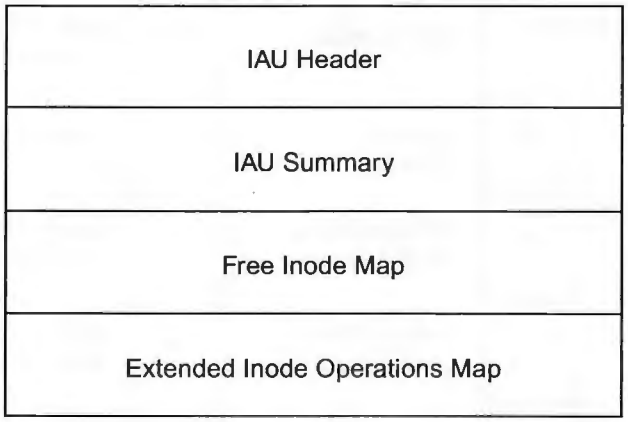
Inode Allocation Unit

An Inode Allocation Unit (IAU) contains inode allocation information for a given fileset. Each fileset contains one or more IAUs, each of which details allocation for a set number of inodes. The number of inodes per IAU varies, depending on the block size being used. One IAU exists for every 16,384 inodes in a fileset with the default block size (1024 bytes). If an IAU is damaged, the information that it contains can be reconstructed by examining the fileset's inode list.

The IAUs for a fileset are stored in sequential order in the fileset's IAU file. The fileset header identifies the attribute fileset inode associated with that fileset's IAU file.

Figure 2-8, "Inode Allocation Unit (IAU) Structure" shows the inode allocation unit structure. All IAU components begin on a block boundary.

Figure 2-8 **Inode Allocation Unit (IAU) Structure**



IAU Header The IAU header verifies that the inode allocation unit matches the fileset. The IAU header occupies the first block of each inode allocation unit. If damaged, the IAU can be reconstructed from inodes and other information.

IAU Summary The IAU summary summarizes the resources used in the IAU. It includes information on the number of free inodes in the IAU and the number of inodes with extended operation sets in the IAU. The IAU summary is 1 block long.

Free Inode Map The free inode map is a bitmap that indicates which inodes are free and which are allocated. A free inode is indicated by the

bit being on. The length of the free inode map is 2K for file systems with 1K or 2K block sizes and is equal to the block size for file systems with larger block sizes.

Extended Inode Operations Map The extended inode operations map keeps track of inodes on which operations would remain pending for too long to reside in the intent log. The extended inode operations map is in the same format as the free inode map. To prevent the intent log from wrapping and the transaction from getting overwritten, the required operations are stored in the affected inode. This map is then updated to identify the inodes that have extended operations that need to be completed. This map allows the `fsck` utility to quickly identify which inodes had extended operations pending at the time of a system failure. The length of the extended inode operations map is 2K for file systems with 1K or 2K block sizes and is equal to the block size for file systems with larger block sizes.

Link Count Table

The link count table (LCT) contains a reference count for each inode in the associated fileset. This reference count is identical to the conventional link field of an inode. Each LCT entry contains the actual reference count for the associated fileset inode. The link count field in an inode itself is set to either 0 or 1, and the actual number of links is stored in the LCT entry for the associated fileset inode.

The link count table can be reconstructed using the inode list, so it is not replicated.

The current layout only uses the LCT for inodes in the attribute fileset. The LCT supports quick updates of the link count for structural fileset inodes.

Current Usage Table

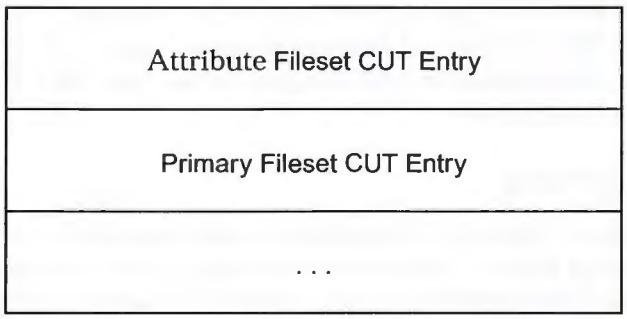
The current usage table (CUT) is a file that contains usage related information for each fileset. The information contained in the CUT changes frequently and is not replicated. The information in the CUT can, however, be reconstructed using the inode list if the CUT is damaged.

The CUT file contains one entry per fileset (see Figure 2-9, "Current Usage Table (CUT) File"). The CUT entry for a given fileset contains information such as the following:

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1462
Fls:
Doc: 3701

- The number of blocks currently used by the fileset.
- The *fileset version number*, which is a 64-bit integer that is guaranteed to be at least as large as the largest inode version number. An *inode version number* is a 64-bit integer that is incremented every time its inode is modified or written to disk and can be used to indicate whether an inode has been modified in any way since the last time it was examined. It is possible to find out which inodes have been modified since a specific time by saving the fileset version number and then later looking for inodes with a larger version number.

Figure 2-9 **Current Usage Table (CUT) File**



Quotas File

VxFS supports BSD-style quotas for users. Quota information is stored in a quotas file. A user quotas file tracks the resources used by each user ID. The quotas file keeps track of soft limits, hard limits, block usage, and inode usage for users within a file system.

Because quotas apply to mountable filesets only, the attribute fileset does not have quotas. However, the primary fileset's quotas file exists as a structural file in the attribute fileset. The primary fileset's user quotas file is referenced by the structural fileset's initial inode list extent.

Locating Dynamic Structures

The existence of dynamic structures in the Version 2 disk layout makes the task of initially locating those structures difficult. The object location table (OLT) contains information needed to initially locate important file system structural elements. In particular, the OLT records the starting

block numbers of the initial inode list extents for the attribute fileset and indicates which inodes within those initial extents reference the fileset header file.

Object Location Table Contents

The OLT is composed of records for the following:

fileset header inodes	This record identifies the inode numbers of the fileset header file and its replica.
initial inode list extent addresses	This record identifies the addresses of the beginning of each of two 8K inode extents. These are the initial inode list extents for the attribute fileset, which contain the inodes for all structural files belonging to the attribute fileset.
current usage table inode	This record identifies the inode number of the file that contains the current usage table.

Mounting and the Object Location Table

At mount time, the object location table provides essential information about the location of key file system components. The super-block plays an important role in locating the OLT, in that it contains pointers to both the OLT and its replica.

Using the OLT, the process of mounting a VxFS Version 2 file system is:

Step 1. Read in the super-block. Validate the super-block and its replicas (located in the allocation unit headers).

Step 2. Read and validate the OLT and its replica at the locations recorded in the super-block.

Step 3. Obtain the addresses of the initial inode list extents for the attribute fileset from the OLT. Read in these initial inode extents.

Step 4. Find the fileset header file, based on the fileset header file inode number recorded in the OLT.

Step 5. Read the contents of the fileset header file. Each fileset header file entry represents a particular fileset and indicates the inode numbers of its inode list file and IAU file. The attribute fileset is set up first so that subsequent references to its inode list can be resolved.

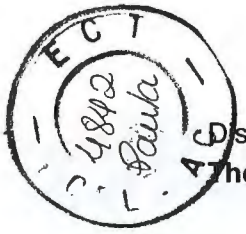
CPMI - CORREIOS
Fls: 1463
Doc:
3701



The VxFS Version 3 Disk Layout

The Version 3 disk layout allows the file system to scale easily to accommodate large files and large file systems.

The Version 1 and 2 disk layouts divided up the file system space into allocation units. The first AU started part way into the file system which caused potential alignment problems depending on where the first AU started. Each allocation unit also had its own summary, bitmaps, and data blocks. Because this AU structural information was stored at the start of each AU, this also limited the maximum size of an extent that could be allocated. By replacing the allocation unit model of previous versions, the need for alignment of allocation units and the restriction on extent sizes was removed.

The VxFS Version 3 disk layout divides the entire file system space into fixed size allocation units. The first allocation unit starts at block zero and all allocation units are a fixed length of 32K blocks. (An exception may be the last AU, which occupies whatever space remains at the end of the file system). Because the first AU starts at block zero instead of part way through the file system as in previous versions, there is no longer a need for explicit AU alignment or padding to be added when creating a file system (see `mkfs_vxfs`(1M)).

The Version 3 file system also moves away from the model of storing AU structural data at the start of an AU and puts all structural information in files. So expanding the file system structures simply requires extending the appropriate structural files. This removes the extent size restriction imposed by the Version 1 and Version 2 layouts.

All Version 3 structural files reside in the *`structural fileset`*, which is similar to the Version 2 attribute fileset. The structural files in the Version 3 disk layout are:

object location table file	Contains the object location table (OLT). As with the Version 2 disk layout, the OLT, which is referenced from the super-block, is used to locate the other structural files.
label file	Encapsulates the super-block and super-block replicas. Although the location of the primary super-block is

E 4841 Paulo

	known, the label file can be used to locate super-block copies if there is structural damage to the file system.
device file	Records device information such as volume length and volume label, and contains pointers to other structural files.
fileset header file	Holds information on a per-fileset basis. This may include the inode of the fileset's inode list file, the maximum number of inodes allowed, an indication of whether the file system supports large files, and the inode number of the quotas file if the fileset supports quotas. When a file system is created, there are two filesets—the *structural fileset* defines the file system structure, the *primary fileset* contains user data.
inode list file	Both the primary fileset and the structural fileset have their own set of inodes stored in an inode list file. Only the inodes in the primary fileset are visible to users. When the number of inodes is increased, the kernel increases the size of the inode list file.
inode allocation unit file	Holds the free inode map, extended operations map, and a summary of inode resources.
log file	Maps the block used by the file system intent log.
extent allocation unit state file	Indicates the allocation state of each AU by defining whether each AU is free, allocated as a whole (no bitmaps allocated), or expanded, in which case the bitmaps associated with each AU determine which extents are

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1464
Fls:
Doc: 3701

	allocated.
extent allocation unit summary file	Contains the AU summary for each allocation unit, which contains the number of free extents of each size. The summary for an extent is created only when an allocation unit is expanded for use.
free extent map file	Contains the free extent maps for each of the allocation units.
quotas file	If the file system supports quotas, there is a quotas file which is used to track the resources allocated to each user.

Figure 2-10, "VxFS Version 3 Disk Layout" shows how the kernel and utilities build information about the structure of the file system. The super-block location is in a known location from which the OLT can be located. From the OLT, the initial extents of the structural inode list can be located along with the inode number of the fileset header file. The initial inode list extents contain the inode for the fileset header file from which the extents associated with the fileset header file are obtained.

As an example, when mounting the file system, the kernel needs to access the primary fileset in order to access its inode list, inode allocation unit, quotas file and so on. The required information is obtained by accessing the fileset header file from which the kernel can locate the appropriate entry in the file and access the required information.

The VxFS Version 4 Disk Layout

The Version 4 disk layout supports Access Control Lists.

The Version 4 disk layout does not include significant physical changes from the Version 3 disk layout. Instead, the policies implemented for Version 4 are different, allowing for performance improvements, file system shrinking, and other enhancements.

ECT 1836 Paulo CPL - AC

Introduction

The VxFS file system allocates disk space to files in groups of one or more adjacent blocks called *extents*. VxFS defines an application interface that allows programs to control various aspects of the extent allocation for a given file (see Chapter 6 , "Application Interface"). The extent allocation policies associated with a file are referred to as *extent attributes*.

The VxFS `getext` and `setext` commands allows users to view or manipulate file extent attributes. In addition, the `vxdump`, `vxrestore`, `mv`, `cp`, and `cpio` commands preserve extent attributes when a file is backed up, moved, copied, or archived.

NOTE

`setext` functionality is available only with the optional HP OnLineJFS product.

The following topics are covered in this chapter:

- "Attribute Specifics"
  - — "Reservation: Preallocating Space to a File"
  - — "Fixed Extent Size"
  - — "Other Controls"
- "Commands Related to Extent Attributes"
  - — "Failure to Preserve Extent Attributes"

Attribute Specifics

The two basic extent attributes associated with a file are its *reservation* and its *fixed extent size*. The user can preallocate space to the file by manipulating a file's reservation; the user can also override the default allocation policy of the file system by setting a fixed extent size.

Other policies determine the way these attributes are expressed during the allocation process. The user can specify that:

- the space reserved for a file must be contiguous
- no allocations should be made for a file beyond the current reservation
- unused reservation should be released when the file is closed
- space should be allocated but no reservation should be assigned
- the file size should be changed to immediately incorporate the allocated space

Some of the extent attributes are persistent and become part of the on-disk information about the file, while other attributes are temporary and lost after the file is closed or the system is rebooted. The persistent attributes are similar to the file's permissions and are actually written in the inode for the file. When a file is copied, moved, or archived, only the persistent attributes of the source file can be preserved in the new file (see "Other Controls" for more information).

In general, the user will only set extent attributes for reservation. Many of the attributes are designed for applications that are tuned to a particular pattern of I/O or disk alignment (see `mkfs_vxfs`(1M) and Chapter 6., "Application Interface" for more information).

Reservation: Preallocating Space to a File

VxFS makes it possible to preallocate space to a file at the time of the request rather than when data is written into the file. This space cannot be allocated to other files in the file system. VxFS prevents any unexpected out-of-space condition on the file system by ensuring that a file's required space will be associated with the file before it is required.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1467
Doc: 3701

Persistent reservation is not released when a file is truncated. The reservation must be cleared or the file must be removed to free reserved space.

Fixed Extent Size

The VxFS default allocation policy uses a variety of heuristics to determine how to make an allocation to a file when a write requires additional space. The policy attempts to balance the two goals of optimum I/O performance through large allocations and minimal file system fragmentation through allocation from space available in the file system that best fits the data.

Setting a fixed extent size overrides the default allocation policies for a file and always serves as a persistent attribute. Be careful to choose an extent size appropriate to the application when using fixed extents. An advantage of VxFS's extent based allocation policies is that they rarely use indirect blocks compared to block based file systems; VxFS eliminates many instances of disk access that stem from indirect references. However, a small extent size can eliminate this advantage.

Files with aggressive allocation sizes tend to be more contiguous and have better I/O characteristics. However, the overall performance of the file system degrades because the unused space fragments free space by breaking large extents into smaller pieces. By erring on the side of minimizing fragmentation for the file system, files may become so non-contiguous that their I/O characteristics would degrade.

Fixed extent sizes are particularly appropriate in the following situations:

- If a file is large and sparse and its write size is fixed, a fixed extent size that is a multiple of the write size can minimize space wasted by blocks that do not contain user data as a result of misalignment of write and extent sizes. (The default extent size for a sparse file is 8K.)
- If a file is large and contiguous, a large fixed extent size can minimize the number of extents in the file.

Custom applications may also use fixed extent sizes for specific reasons, such as the need to align extents to cylinder or striping boundaries on disk.

Other Controls

The auxiliary controls on extent attributes determine:

- whether allocations are aligned
- whether allocations are contiguous
- whether the file can be written beyond its reservation
- whether an unused reservation is released when the file is closed
- whether the reservation is a persistent attribute of the file
- when the space reserved for a file will actually become part of the file

Alignment

Specific alignment restrictions coordinate a file's allocations with a particular I/O pattern or disk alignment (see `mkfs_vxfs`(1M) and Chapter 6 , "Application Interface" for details). Alignment can only be specified if a fixed extent size has also been set. Setting alignment restrictions on allocations is best left to well designed applications.

Contiguity

A reservation request can specify that its allocation remain contiguous (all one extent). Maximum contiguity of a file optimizes its I/O characteristics.

NOTE

Fixed extent sizes or alignment will cause the file system to return an error message reporting insufficient space if no suitably sized (or aligned) extent is available. This may happen even if the file system has plenty of free space and the fixed extent size is large.

Write Operations Beyond Reservation

A reservation request can specify that no allocations can take place after a write operation fills up the last available block in the reservation. This specification can be used in a similar way to `ulimit` to prevent a file's uncontrolled growth.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1468

3701
Doc:

Reservation Trimming

A reservation request can specify that any unused reservation be released when the file is closed. The file is not completely closed until all processes open against the file have closed it.

Reservation Persistence

A reservation request can ensure the reservation does not become a persistent attribute of the file. Unused reservation is discarded when the file is closed.

Including Reservation in the File

A reservation request can make sure the size of the file is adjusted to include the reservation. Normally, the space of the reservation is not included in the file until an extending write operation requires it. A reservation that immediately changes the file size can generate large temporary files. Unlike a `ftruncate` operation that increases the size of a file, this type of reservation does not perform zeroing of the blocks included in the file and limits this facility to users with appropriate privileges. The data that appears in the file may have been previously contained in another file.

E 482/C Paula
L - AC

Commands Related to Extent Attributes

The VxFS commands for manipulating extent attributes are `setext` and `getext`; they allow the user to set up files with a given set of extent attributes or view any attributes that are already associated with a file. See `getext`(1M) and `setext`(1M) for details on using these commands.

NOTE `setext` functionality is available only with the optional HP OnLineJFS product.

The VxFS-specific commands `vxdump` and `vxrestore`, and the `mv`, `cp`, and `cpio` commands, preserve extent attributes when backing up, restoring, moving, or copying files.

Most of these commands include a command line option (`-e`) for maintaining extent attributes on files. This option specifies dealing with a VxFS file that has extent attribute information including reserved space, a fixed extent size, and extent alignment. The extent attribute information may be lost if the destination file system does not support extent attributes, has a different block size than the source file system, or lacks free extents appropriate to satisfy the extent attribute requirements.

The `-e` option takes any of the following keywords as an argument:

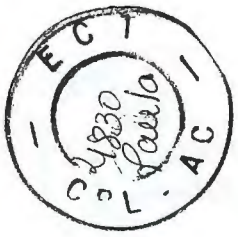
`warn`	Issues a warning message if extent attribute information cannot be maintained (the default)
`force`	Fails the copy if extent attribute information cannot be maintained
`ignore`	Ignores extent attribute information entirely

The commands that move, copy, or archive files (`mv`, `cp` and `cpio`) use the `-e` option with arguments of `ignore`, `warn`, or `force`.

For example, the `mv` command could be used with the `-e` option to produce the following results:

- The `ignore` keyword loses any extent attributes for files.
- The `warn` keyword issues a warning if extent attributes for a file cannot be preserved. Such a situation may take place if the file is moved into a non-VxFS file system; the file would ultimately be moved while the extent attributes would be lost.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1469
Fls:
Doc: 3701



- The `force` keyword issues an error if attributes are lost and the file is not relocated.

  The `ls` command has an `-e` option, which prints the extent attributes of the file.

Failure to Preserve Extent Attributes

Whenever a file is copied, moved, or archived using commands that preserve extent attributes, there is nevertheless the possibility of losing the attributes. Such a failure might occur for three reasons:

- The file system receiving a copied, moved, or restored file from an archive is not a VxFS type. Since other file system types do not support the extent attributes of the VxFS file system, the attributes of the source file are lost during the migration.
- The file system receiving a copied, moved, or restored file is a VxFS type but does not have enough free space to satisfy the extent attributes. For example, consider a 50K file and a reservation of 1 MB. If the target file system has 500K free, it could easily hold the file but fail to satisfy the reservation.
- The file system receiving a copied, moved, or restored file from an archive is a VxFS type but the different block sizes of the source and target file system make extent attributes impossible to maintain. For example, consider a source file system of block size 1024, a target file system of block size 4096, and a file that has a fixed extent size of 3 blocks (3072 bytes). This fixed extent size adapts to the source file system but cannot translate onto the target file system.

The same source and target file systems in the preceding example with a file carrying a fixed extent size of 4 could preserve the attribute; a 4 block (4096 byte) extent on the source file system would translate into a 1 block extent on the target.

On a system with mixed block sizes, a copy, move, or restoration operation may or may not succeed in preserving attributes. It is recommended that the same block size be used for all file systems on a given system.

Electrical Factors

Proper design and installation of a power distribution system for a Superdome server requires specialized skills. Those responsible for this task must have a thorough knowledge and understanding of appropriate electrical codes and the limitations of the power systems for computer and data processing equipment.

In general, a well-designed power distribution system exceeds the requirements of most electrical codes. A good design, when coupled with proper installation practices, produces the most trouble-free operation.

A detailed discussion of power distribution system design and installation is beyond the scope of this document. However, electrical factors relating to power distribution system design and installation must be considered during the site preparation process.

The electrical factors discussed in this section are:

- Computer room safety
- Electrical load requirements (circuit breaker sizing)
- Power quality
- Distribution hardware
- System installation guidelines

Computer Room Safety

Inside the computer room, fire protection and adequate lighting (for equipment servicing) are important safety considerations. Federal and local safety codes govern computer installations.

Fire Protection

The National Fire Protection Association's Standard for the Protection of Electronic Computer Data Processing Equipment, NFPA 75, contains information on safety monitoring equipment for computer rooms.

Most computer room installations are equipped with the following fire protection devices:

- Smoke detectors
- Fire and temperature alarms
- Fire extinguishing system

Additional safety devices are:

- Circuit breakers
- An emergency power cutoff switch
- Devices specific to the geographic location, i.e., earthquake protection

Lighting Requirements for Equipment Servicing

Adequate lighting and utility outlets in a computer room reduce the possibility of accidents during equipment servicing. Safer servicing is also more efficient and, therefore, less costly.

For example, it is difficult to see cable connection points on the hardware if there is not enough light. Adequate lighting reduces the chances of connector damage when cables are installed or removed.

ECT Nº 03/2005 - CN
CPMI - CORREIOS
1470
Fls:
Doc: 3701

The minimum recommended illumination level is 70 foot-candles (756 lumens per square meter) when the light level is measured at 30 inches (76.2 cm) above the floor.

Power Quality

This equipment is designed to operate over a wide range of voltages and frequencies. It has been tested and shown to comply with EMC Specification EN50082. However, damage can occur if these ranges are exceeded. Severe electrical disturbances can exceed the design specifications of the equipment.

Sources of Electrical Disturbances

Electrical disturbances, glitches, affect the quality of electrical power. Common sources of these disturbances are:

- Fluctuations occurring within the facility's distribution system
- Utility service low-voltage conditions (such as sags or brownouts)
- Wide and rapid variations in input voltage levels
- Wide and rapid variations in input power frequency
- Electrical storms
- Large inductive sources (such as motors and welders)
- Faults in the distribution system wiring (such as loose connections)
- Microwave, radar, radio, or cell phone transmissions

Power System Protection

Computer systems can be protected from the sources of many of these electrical disturbances by using:

- A Protective Earth (PE) connection with a wire diameter of at least equal to the current carrying conductors. The neutral conductor must not be used for the PE connection. (The PE wire is GREEN with a YELLOW stripe.)
- A dedicated power distribution system
- Power conditioning equipment
- Over- and under-voltage detection and protection circuits
- Screening to cancel out the effects of undesirable transmissions
- Lightning arresters on power cables to protect equipment against electrical storms

Every precaution has been taken during power distribution system design to provide immunity to power outages of less than one cycle. However, testing cannot conclusively rule out loss of service. Therefore, adherence to the following guidelines provides the best possible performance of power distribution systems for Superdome server equipment:

- Dedicated power source—Isolates server power distribution system from other circuits in the facility.
- Missing-phase and low-voltage detectors—Shuts equipment down automatically when a severe power disruption occurs. For peripheral equipment, these devices are recommended but optional.
- Online uninterruptable power supply (UPS)—Keeps input voltage to devices constant and should be considered if outages of one-half cycle or more are common. Refer to qualified contractors or consultants for each situation.

4976 Paula

Distribution Hardware

This section describes wire selection and the types of raceways (electrical conduits) used in the distribution system. Wire size is dictated by circuit breaker sizing and local safety codes.

Wire Selection

Use copper conductors instead of aluminum, as aluminum's coefficient of expansion differs significantly from that of other metals used in power hardware. Because of this difference, aluminum conductors can cause connector hardware to work loose, overheat, and fail.

Raceway Systems (Electrical Conduits)

Raceways (electrical conduits) form part of the protective ground path for personnel and equipment. Raceways protect the wiring from accidental damage and also provide a heat sink for the wires.

Any of the following types may be used:

- Electrical metallic tubing (EMT) thin-wall tubing
- Rigid (metal) conduit
- Liquidtight with RFI strain relief (most commonly used with raised floors)
- Plenum-grade cables

Building Distribution

All building feeders and branch circuitry should be in rigid metallic conduit with proper connectors (to provide ground continuity). Conduit that is exposed and subject to damage should be constructed of rigid galvanized steel.

The IOX and Superdome are safety grounded through the green (ground) wire in each AC power cord. In the IOX, this ground passes through the AC power cord entry into the XPC and connects internally to the XPC chassis. The XUC chassis and each ICE chassis are grounded through their respective DC power cords from the XPC. Additional safety grounding must be provided for networking equipment.

Power Routing

Power drops and interface cables from the equipment are routed down from the power panel, through a grommet-protected opening (beneath the floor level), and under the floor panels.

Grounding Systems

Superdome servers require two methods of grounding:

- Power distribution safety grounding
- High frequency intercabinet grounding

Power Distribution Safety Grounding

The power distribution safety grounding system consists of connecting various points in the power distribution system to earth ground using green (green/yellow) wire ground conductors. Having these ground connections tied to metal chassis parts that may be touched protects computer room personnel against shock hazard from current leakage and fault conditions.

Power distribution systems consist of several parts. Hewlett-Packard recommends that these parts be solidly interconnected to provide an equipotential ground to all points.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1471
Fls:
Doc: 3791

Main Building Electrical Ground The main electrical service entrance equipment should have an earth ground connection, as required by applicable codes. Connections such as a grounding rod, building steel, or a conductive type cold water service pipe provide an earth ground.

Electrical Conduit Ground To provide a continuous grounding system, all electrical conduits should be made of rigid metallic conduit that is securely connected together or bonded to panels and electrical boxes.

Power Panel Ground Each power panel should be grounded to the electrical service entrance with green (green/yellow) wire ground conductors. The green (green/yellow) wire ground conductors should be sized per applicable codes (based on circuit over current device ratings).

NOTE The green wire ground conductor mentioned above may be a black wire marked with green tape.

Computer Safety Ground Ground all computer equipment with the green (green/yellow) wire included in the branch circuitry. The green (green/yellow) wire ground conductors should be connected to the appropriate power panel and should be sized per applicable codes (based on circuit over current device ratings).

Superdome was approved by regulatory agencies around the world, and therefore requires a ground/protective earth. there are no exclusions to this regulatory approval.

High-frequency grounding between IOX and Superdome is provided by the cabinet-to-cabinet signal cabling. Whenever an IOX is connected to a Superdome cabinet, low-frequency grounding between these two cabinets is provided by a ground strap. This ground strap is shipped with each IOX. Refer to the *I/O Expansion Cabinet Guide* for more detail.

Newtwork-connected Equipment Ground The installation must provide a ground connection for the network equipment. This statement is translated into the following two languages as required:

WARNING **Sweden: Apparaten skall anslutas till jordat uttag, när den ansluts till ett nätverk.**

WARNING **Denmark: Før tilslutning af de øvrige ledere, se medfølgende installationsvejledning.**

System Installation Guidelines

This section contains information about installation practices. Some common pitfalls are highlighted. Both power cable and data communications cable installations are discussed.

Wiring Connections

Expansion and contraction rates vary among different metals. Therefore, the integrity of an electrical connection depends on the restraining force applied. Connections that are too tight compress or deform the hardware and causes it to weaken. This usually leads to high impedance causing circuit breakers to trip.

CAUTION Connections that are too loose have a high resistance that cause serious problems, such as erratic equipment operation. A high resistance connection overheats and sometimes causes fire or high temperatures that can destroy hard-to-replace components such as distribution panels or system bus bars.

Figure 1-17 on page 34 through Figure 1-19 on page 36 illustrate typical cooling system layouts, adapted from the typical cooling system described in Chapter 2.

A high resistance connection overheats and sometimes causes fire or high temperatures that can destroy hard-to-replace components such as distribution panels or system bus bars.

E C
1474
PL - AC

Wiring connections must be properly torqued. Many equipment manufacturers specify the proper connection torque values for their hardware.

Ground connections must only be made on a conductive, nonpainted surface. Lockwashers must be used on all connections to prevent connection hardware from working loose.

Data Communications Cables

Power transformers and heavy foot traffic create high energy fields. Route data communications cables away from these areas. Use shielded data communications cables that meet approved industry standards to reduce the effects of external fields. Data cables that are run externally to a metal fire enclosure must have a minimum fire rating of VW-1 or VW-4 or better.

Environmental Elements

The following environmental elements can affect a Superdome server installation:

- Computer room preparation
- Cooling requirements
- Humidity level
- Air conditioning ducts
- Dust and pollution control
- Electrostatic discharge (ESD) prevention
- Acoustics (noise reduction)
- Zinc whisker control

Computer Room Preparation

The following guidelines are recommended when preparing a computer room for a Superdome server system:

- Locate the computer room away from the exterior walls of the building to avoid the heat gain from windows and exterior wall surfaces.
- When exterior windows are unavoidable, use windows that are double- or triple-glazed and shaded to prevent direct sunlight from entering the computer room.
- Maintain the computer room at a positive pressure relative to surrounding spaces.
- Use a vapor barrier installed around the entire computer room envelope to restrain moisture migration.
- Caulk and vapor seal all pipes and cables that penetrate the envelope.
- Use at least a 12-inch raised floor system for the most favorable room air distribution system (underfloor distribution).
- Ensure a minimum ceiling height of 12 inches between the top of the server and the ceiling. Ensure all ceiling clips are in place.

Cooling Requirements

Air conditioning equipment requirements and recommendations are described in the following sections.

Basic Air Conditioning Equipment Requirements

The cooling capacity of the installed air conditioning equipment for the computer room should be sufficient to offset the computer equipment dissipation loads, as well as any space envelope heat gain. This equipment should include:

- Air filtration
- Cooling or dehumidification
- Humidification
- Reheating
- Air distribution

a. At altitudes up to 3,000 (9,842) meters.
b. System also requires 2400 CFM airflow.

Lighting and personnel must also be included. For example, a person dissipates about 450 BTUs per hour while performing a typical computer room task.

At altitudes above 10,000 feet (3048 m), the lower air density reduces the cooling capability of air conditioning systems. If your facility is located above this altitude, the recommended temperature ranges may need to be modified. For each 1000 feet (305 m) increase in altitude above 10,000 feet (up to a maximum of 15,000 feet), subtract 1.5° F (0.83° C) from the upper limit of the temperature range listed in Table 1-14 on page 31.

Air Conditioning System Guidelines

The following guidelines are recommended when designing an air conditioning system and selecting the necessary equipment:

- The air conditioning system serveing the computer room should be capable of operating 24 hours a day, 365 days a year. It should also be independent of other systems in the building.
- Consider the long-term value of computer system availability, redundant air conditioning equipment, or capacity.
- The system should be capable of handling any future computer system expansion.
- Air conditioning equipment air filters should have a minimum rating of 45% (based on "AShRA Standard 52-76, Dust Spot Efficiency Test").
- Introduce only enough outside air into the system to meet building code requirements (for human occupancy) and to maintain a positive air pressure in the computer room.

Air Conditioning System Types

The following three air conditioning system types are listed in order of preference:

- Complete self-contained package unit(s) with remote condenser(s). These systems are available with u, or down discharge and are usually located in the computer room.
- Chilled water package unit with remote chilled water plant. These systems are available with up or down discharge and are usually located in the computer room.
- Central station air handling units with remote refrigeration equipment. These systems are usually located outside the computer room.

Basic Air Distribution Systems

A basic air distribution system includes supply air and return air.

An air distribution system should be zoned to deliver an adequate amount of supply air to the cooling air intake vents of the computer system equipment cabinets. Supply air temperature should be maintained within the following parameters:

- Ceiling supply system—From 55° F (12.8° C) to 60° F (15.6° C)
- Floor supply system—At least 60° F (15.6° C)

If a ceiling plenum return air system or a ducted ceiling return air system is used, the return air grille(s) in the ceiling should be located directly above the computer equipment cabinets.

The following three types of air distribution system are listed in order of recommendation:

- Underfloor air distribution system—Downflow air conditioning equipment located on the raised floor of the computer room uses the cavity beneath the raised floor as plenum for the supply air.

  Return air from an underfloor air distribution system can be ducted return air (DRA) above the ceiling, as shown in Figure 2-2 on page 48.

  Perforated floor panels (available from the raised floor manufacturer) should be located around the perimeter of the system cabinets. Supply air emitted though the perforated floor panels is then available near the cooling air intake vents of the computer system cabinets.

- Ceiling plenum air distribution system—Supply air is ducted into the ceiling plenum from upflow air conditioning equipment located in the computer room or from an air handling unit (remote).

  The ceiling construction should resist air leakage. Place perforated ceiling panels (with down discharge air flow characteristics) around the perimeter of the system cabinets. The supply air emitted downward from the perforated ceiling panels is then available near the cooling air intake vents of the computer system cabinets.

  Return air should be ducted back to the air conditioning equipment though the return air duct above the ceiling.

- Above ceiling ducted air distribution system—Supply air is ducted into a ceiling diffuser system from upflow air conditioning equipment located in the computer room or from an air handling unit (remote).

  Return air from an above ceiling ducted air distribution system may be ducted return air (DRA) above the ceiling, as shown in Figure 2-4 on page 50, or ceiling plenum return air (CPRA), as shown in Figure 2-3 on page 49.

  Adjust the supply air diffuser system grilles to direct the cooling air downward around the perimeter of the computer system cabinets. The supply air is then available near the cooling air intake vents of the computer system cabinets.

Air Conditioning System Installation

All air conditioning equipment, materials, and installation must comply with any applicable construction codes. Installation of the various components of the air conditioning system must also conform to the air conditioning equipment manufacturer's recommendations.

Figure 2-2 on page 48 illustrates a typical computer room underfloor air distribution system (DRA).

Figure 2-3 on page 49 illustrates a typical computer room ceiling plenum air distribution system (CPRA).

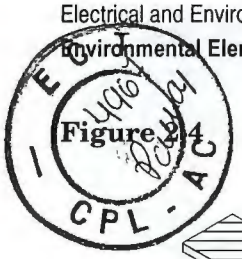

Figure 2-4 Above Ceiling Ducted Air

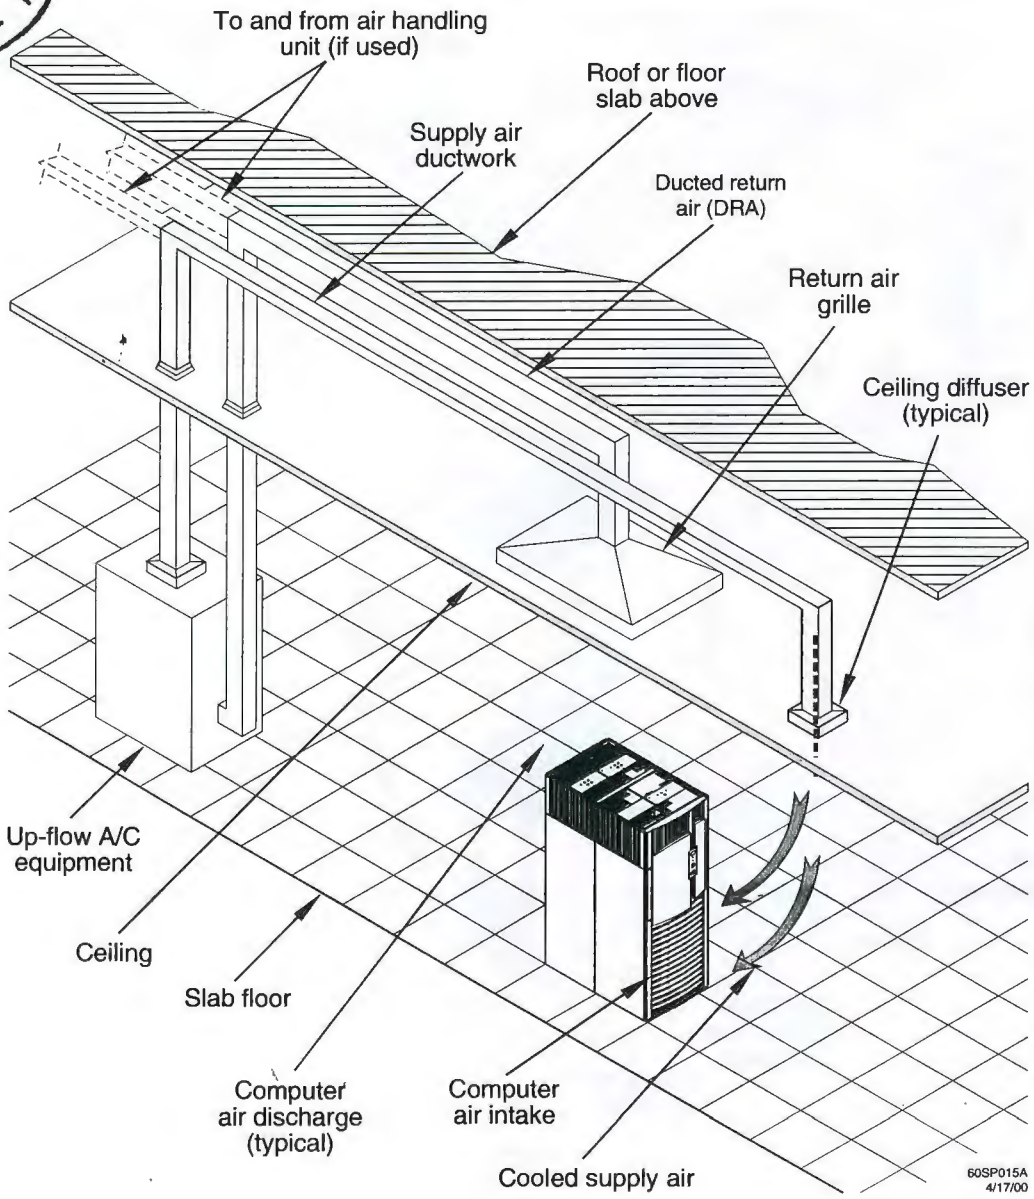

Humidity Level

Maintain proper humidity levels. High humidity causes galvanic actions to occur between some dissimilar metals. This eventually causes a high resistance between connections, leading to equipment failures. High humidity can also have an adverse affect on some magnetic tapes and paper media.

E C T 4966 Fls: 1 Rubrica CPL - AC

CAUTION Low humidity contributes to undesirably high levels of electrostatic charges. This increases the electrostatic discharge (ESD) voltage potential. ESD can cause component damage during servicing operations. Paper feed problems on high-speed printers are usually encountered in low-humidity environments.

Low humidity levels are often the result of the facility heating system and occur during the cold season. Most heating systems cause air to have a low humidity level, unless the system has a built-in humidifier.

Air Conditioning Ducts

Use separate computer room air conditioning duct work. If it is not separate from the rest of the building, it might be difficult to control cooling and air pressure levels. Duct work seals are important for maintaining a balanced air conditioning system and high static air pressure. Adequate cooling capacity means little if the direction and rate of air flow cannot be controlled because of poor duct sealing. Also, the ducts should not be exposed to warm air, or humidity levels may increase.

Dust and Pollution Control

Computer equipment can be adversely affected by dust and microscopic particles in the site environment.

Specifically, disk drives, tape drives, and some other mechanical devices can have bearing failures resulting from airborne abrasive particles. Dust may also blanket electronic components like printed circuit boards causing premature failure due to excess heat and/or humidity build up on the boards. Other failures to power supplies and other electronic components can be caused by metallically conductive particles. These metallic particles are conductive and can short circuit electronic components. Use every effort to ensure that the environment is as dust and particulant free as possible.

Smaller particles can pass though some filters and, over a period of time, possibly cause problems in mechanical parts. Small dust particles can be prevented from entering the computer room by maintaining its air conditioning system at a high static air pressure level.

Other sources of dust, metallic, conductive, abrasive, and/or microscopic particles can be present. Some sources of these particulants are:

- Subfloor shedding
- Raised floor shedding
- Ceiling tile shedding

These pollutants are not always visible to the naked eye. A good check to determine their possible presence is to check the underside of the tiles. The tile should be shiny, galvanized, and free from rust.

The computer room should be kept clean. The following guidelines are recommended:

- Smoking—Establish a no-smoking policy. Cigarette smoke particles are eight times larger than the clearance between disk drive read/write heads and the disk surface.
- Printer—Locate printers and paper products in a separate room to eliminate paper particulate problems.
- Eating or drinking—Establish a no-eating or drinking policy. Spilled liquids can cause short circuits in equipment such as keyboards.
- Tile floors—Use a dust-absorbent cloth mop rather than a dry mop to clean tile floors.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1481
Doc: 3701

Special precautions are necessary if the computer room is near a source of air pollution. Some air pollutants, especially hydrogen sulfide (H2S), are not only unpleasant but corrosive as well. Hydrogen sulfide damages wiring and delicate sound equipment. The use of activated charcoal filters reduces this form of air pollution.

Zinc Particulate Contamination

Metallic particulates can be especially harmful around electronic equipment. This type of contamination may enter the data center environment from a variety of sources, including but not limited to raised floor tiles, worn air conditioning parts, heating ducts, rotor brushes in vacuum cleaners or printer component wear. Because metallic particulates conduct electricity, they have an increased potential for creating short circuits in electronic equipment. This problem is exaggerated by the increasingly dense circuitry of electronic equipment.

Over time, very fine whiskers of pure metal can form on electroplated zinc, cadmium, or tin surfaces. If these whiskers are disturbed, they may break off and become airborne, possibly causing failures or operational interruptions. For over 50 years, the electronics industry has been aware of the relatively rare but possible threat posed by metallic particulate contamination. During recent years, a growing concern has developed in computer rooms where these conductive contaminants are formed on the bottom of some raised floor tiles.

Although this problem is relatively rare, it may be an issue within your computer room. Since metallic contamination can cause permanent or intermittent failures on your electronic equipment, Hewlett-Packard strongly recommends that your site be evaluated for metallic particulate contamination before installation of electronic equipment.

Electrostatic Discharge (ESD) Prevention

Static charges (voltage levels) occur when objects are separated or rubbed together. The voltage level of a static charge is determined by the following factors:

- Types of materials
- Relative humidity
- Rate of change or separation

Table 2-2 lists charge levels based on personnel activities and humidity levels.

Table 2-2 Effect of Humidity on ESD Charge Levels

Personnel Activity[a]	Humidity[b] and Charge Levels (volts)[c]			
	26%	32%	40%	50%
Walking across a linoleum floor	6,150	5,750	4,625	3,700
Walking across a carpeted floor	18,450	17,250	13,875	11,100
Getting up from a plastic chair	24,600	23,000	18,500	14,800

a. Source: B.A.Unger, Electrostatic Discharge Failures of Semiconductor Devices (Bell Laboratories,1981)
b. For the same relative humidity level, a high rate of airflow produces higher static charges than a low airflow rate.
c. Some data in this table has been extrapolated.

E C T
4964
Paulo
CPL - AC

Static Protection Measures

Follow these precautions to minimize possible ESD-induced failures in the computer room:

- Install conductive flooring (conductive adhesive must be used when laying tiles).
- Use conductive wax (if waxed floors are necessary).
- Ensure that all equipment and flooring are properly grounded and are at the same ground potential.
- Use conductive tables and chairs.
- Use a grounded wrist strap (or other grounding method) when handling circuit boards.
- Store spare electronic modules in antistatic containers.
- Maintain recommended humidity level and airflow rates in the computer room.

Acoustics

Computer equipment and air conditioning blowers cause computer rooms to be noisy. Ambient noise level in a computer room can be reduced as follows:

- Dropped ceiling—Cover with a commercial grade of fire-resistant, acoustic rated, fiberglass ceiling tile.
- Sound deadening—Cover the walls with curtains or other sound deadening material.
- Removable partitions—Use foam rubber models for most effectiveness.

Doc:

NOTE

Refer to Appendix C for templates to aid in locating caster contact area and caster/leveling foot centers. Templates are also provided to locate required cutouts for cable routing.

Facility Characteristics

This section contains information about facility characteristics that must be considered for the installation or operation of a Superdome server. Facility characteristics are:

- Floor loading
- Windows
- Altitude effects

Floor Loading

The computer room floor must be able to support the total weight of the installed computer system as well as the weight of the individual cabinets as they are moved into position.

Floor loading is usually not an issue in non-raised-floor installations. The information presented in this section is directed toward raised-floor installations.

NOTE Any floor system under consideration for a Superdome server installation should be verified by an appropriate floor system consultant.

Raised-Floor Loading

Raised-floor loading is a function of the manufacturer's load specification and the positioning of the equipment relative to the raised-floor grid. While Hewlett-Packard cannot assume responsibility for determining the suitability of a particular raised-floor system, information and illustrations are provided for the customer or local agencies to determine installation requirements.

The following guidelines are recommended:

- Because many raised-floor systems do not have grid stringers between floor stands, the lateral support for the floor stands depends on adjacent panels being in place. To avoid compromising this type of floor system while gaining under floor access, remove only one floor panel at a time.
- Larger floor grids (bigger panels) are generally rated for lighter loads.

CAUTION Do not install any raised-floor system until you have carefully examined it to verify that it is adequate to support the appropriate installation.

Floor-Loading Terms

Table 3-1 defines floor-loading terms.

Table 3-1 Floor-Loading Terms

Term	Definition
Dead load	Weight of the raised-panel floor system, including the understructure. Expressed in lb/ft2 (kg/m2).
Live load	Load the floor system can safely support. Expressed in lb/ft2 (kg/m2).

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1484
Fls:
3701
Doc:

Table 3-1 Floor-Loading Terms (Continued)

Term	Definition
Concentrated load	Load a floor panel can support on a 1-in2 (6.45 cm2) area at the panel's weakest point (typically the center of the panel), without the surface of the panel deflecting more than a predetermined amount.
Ultimate load	Maximum load (per floor panel) the floor system can support without failure. Failure expressed by floor panel(s) breaking or bending. Ultimate load is usually stated as load per floor panel.
Rolling load	Load a floor panel can support (without failure) when a wheel of specified diameter and width is rolled across the panel.
Average floor load	Computed by dividing total equipment weight by the area of its footprint. This value is expressed in lb/ft2 (kg/m2).

Average Floor Loading

The average floor load value, defined in Table 3-2, is not appropriate for addressing raised-floor ratings at the floor grid spacing level. However, it is useful for determining floor-loading at the building level, such as the area of solid floor or span of raised-floor tiles covered by the Superdome server footprint.

Typical Raised-Floor Site

This section contains an example of a computer room raised-floor system that is satisfactory for the installation of a Superdome server.

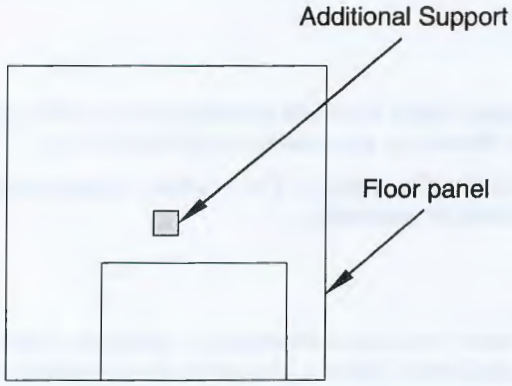
Based on specific information provided by Hewlett-Packard, Tate Access Floors has approved its Series 800 all-steel access floor with bolt-together stringers and 24 in. (61.0 cm) by 24 in. (61.0 cm) floor panels.

Due to the large amount of floor panel material that must be removed for the purpose of routing cables, this particular floor must be braced as shown in Figure 3-1.

E C T
Facility Guidelines
Facility Characteristics
AC

In the event that the flooring is being replaced or a new floor is being installed, Tate Access Floors recommends its Series 1250 all-steel access floor with bolt-together stringers and 24 in. (61.0 cm) by 24 in. (61.0 cm) floor panels be used to support the Superdome installation.

Figure 3-1 Tate Series 800 Floor Bracing



NOTE If the specific floor being evaluated or considered is other than a Tate Series 800 floor, the specific floor manufacturer must be contacted to evaluate the floor being used.

Table 3-2 lists specifications for the Tate Access Floors Series 800 raised-floor system.

Table 3-2 Tate Series 800 Raised-Floor Tile Specifications

Item	Rating
Dead load	7 lb/ft 2 (34.2 kg/m2)
Live load	313 lb/ft 2 (1528.3 kg/m2)
Concentrated load[a]	1250 lb (567 kg)
Ultimate load	4000 lb (1814 kg) per panel
Rolling load	400 lb (181 kg)
Average Tile load	500 lb (227 kg)

a. With 0.08 in (0.2 cm) of span maximum deflection

Windows

Avoid housing computers in a room with windows. Sunlight entering a computer room may cause problems. Magnetic tape storage media is damaged if exposed to direct sunlight. Also, the heat generated by sunlight places an additional load on the cooling system.

Doc: 3701

Space Requirements

This section contains information about space requirements for a Superdome server. This data should be used as the basic guideline for space plan developments. Other factors, such as airflow, lighting, and equipment space requirements, must also be considered.

Delivery Space Requirements

There should be enough clearance to move equipment safely from the receiving area to the computer room. Permanent obstructions, such as pillars or narrow doorways, can cause equipment damage.

Delivery plans should include the possible removal of walls or doors. The physical dimensions for applicable computers and peripheral equipment are summarized in Appendix A.

Operational Space Requirements

Other factors must be considered along with the basic equipment dimensions. Reduced airflow around equipment causes overheating, which can lead to equipment failure. Therefore, the location and orientation of air conditioning ducts, as well as airflow direction, are important. Obstructions to equipment intake or exhaust airflow must be eliminated.

The location of lighting fixtures and utility outlets affects servicing operations. Plan equipment layout to take advantage of lighting and utility outlets. Do not forget to include clearance for opening and closing equipment doors.

Clearance around and above the cabinets must be provided for proper cooling airflow through the equipment.

The service area space requirements, outlined in Appendix C, are minimum dimensions. If other equipment is located so that it exhausts heated air near the cooling air intakes of the computer system cabinets, larger space requirements are needed to keep ambient air intake to the computer system cabinets within the specified temperature and humidity ranges.

Space planning should also include the possible addition of equipment or other changes in space requirements. Equipment layout plans should also include provisions for the following:

- Channels or fixtures used for routing data cables and power cables
- Access to air conditioning ducts, filters, lighting, and electrical power hardware
- Power conditioning equipment
- Cabinets for cleaning materials
- Maintenance area and spare parts

Floor Plan Grid

The floor plan grid is used to plan the location of equipment in the computer room. In addition to its use for planning, the floor plan grid should also be used when planning the locations of the following items:

- Air conditioning vents
- Lighting fixtures
- Utility outlets
- Doors

Facility Guidelines
Space Requirements

- Access areas for power wiring and air conditioning filters
- Equipment cable routing

Copies of the floor plan grid are located in Appendix C.

Equipment Footprint Templates

Equipment footprint templates are provided in Appendix C to show basic equipment dimensions and space requirements for servicing. Be sure to use the appropriate templates for the equipment that is to be installed.

The service areas shown on the template drawings are lightly shaded.

Removable copies of the equipment footprint templates are located in Appendix C. They should be used with the floor plan grid to define the location of the equipment that will be installed in your computer room.

NOTE Photocopying typically changes the scale of drawings copied. If any templates are copied, then all templates and floor plan grids must also be copied.

Fls:
Doc: 65 7 01

Typical Installation Schedule

The following schedule lists the sequence of events for a typical system installation:

- 60 days before installation
  - — Floor plan design completed and mailed to Hewlett-Packard
- 30 days before installation
  - — Primary power and air conditioning installation completed
  - — Telephone and data cables installed
  - — Fire protection equipment installed
  - — Major facility changes completed
  - — Special delivery requirements defined
  - — Site inspection survey completed
  - — Delivery survey completed
  - — Signed copy of the site inspection and delivery survey mailed to Hewlett-Packard
  - — Site inspection and pre-delivery coordination meeting arranged with a Hewlett-Packard representative to review the inspection checklist and arrange an installation schedule.
- 7 days before installation
  - — Final check made with a Hewlett-Packard customer engineer to resolve any last-minute problems

Pre-Installation Survey
Site Inspection

Site Inspection

Table 4-1 contains a sample of the Customer and Hewlett-Packard information required.

Table 4-2 contains a sample site inspection checklist.

IMPORTANT Ensure that the customer is aware of the iCOD email requirements. That is, each bootable partition requires a connection to the internet to send email to notify Hewlett-Packard that the customer has allocated additional CPUs beyond the amount initially purchased. Each bootable partition must be configured to perform this operation.

For more details, go to http://superdome.hp.com and click on the iCOD link.

NOTE Table 4-1 and Table 4-2 are provided as examples only. To ensure use of the current information specific to your site preparation, refer to the Site Readiness Review Section of the Deployment Manager's Handbook.

B Conversion Factors

The conversion factors provided in this appendix are intended to ease data calculation for systems that do not conform specifically to the configurations listed in this Site Preparation Guide.

Listed below are the conversion factors used in this document, as well as additional conversion factors that may be helpful in determining those factors required for site planning.

ROS Nº 03/2005 - CN
CPMI - CORREIOS

Refrigeration

- 1 watt = .86 kcal/h
- 1 watt = 3.413 Btu/h
- 1 watt = 2.843-4 tons
- 1 ton = 200 Btu/min
- 1 ton = 12,000 Btu/h
- 1 ton = 3,517.2 W

- Metric equivalents
  - 1 centimeter = 0.3937 in
  - 1 meter = 3.28 ft
  - 1 meter = 1.09 yds
  - 1 in. = 2.54 cm
  - 1 ft = 0.305 m
  - 1 CFM = 1.7m3/h
- kVA conversions, three ø

  $kVA = V \times A \times \sqrt{3} / 1000$
- kVA conversion, single ø

  $kVA = V \times A / 1000$

C Templates

This appendix contains blank floor plan grids and equipment templates. Combine the necessary number of floor plan grid sheets to create a scaled version of the computer room floor plan.

Figure C-1 illustrates the locations required for the cable cutouts.

Figure C-2 on page 83 illustrates the overall dimensions required for a Superdome 32 Way system.

Equipment Footprint Templates

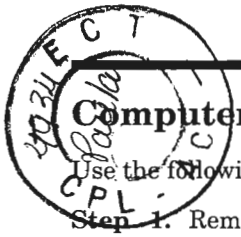
Equipment footprint templates are drawn to the same scale as the floor plan grid (1/4 inch = 1 foot). These templates are provided to show basic equipment dimensions and space requirements for servicing.

The service areas shown on the template drawings are lightly shaded.

The equipment templates should be used with the floor plan grid to define the location of the equipment that will be installed in your computer room.

NOTE Photocopying typically changes the scale of copied drawings. If any templates are copied, then all templates and floor plan grids must also be copied.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1498
Doc: 3701



Computer Room Layout Plan

Use the following procedure to create a computer room layout plan:

Step 1. Remove several copies of the floor plan grid.

Step 2. Cut and join them together (as necessary) to create a scale model floor plan of your computer room.

Step 3. Remove a copy of each applicable equipment footprint template.

Step 4. Cut out each template selected in Step 3; then place it on the floor plan grid created in Step 2.

Step 5. Position pieces until the desired layout is obtained; then fasten the pieces to the grid. Mark locations of computer room doors, air-conditioning floor vents, utility outlets, and so on.

NOTE Attach a reduced copy of the completed floor plan to the site survey located in Chapter 4, "Pre-installation Survey." Hewlett-Packard field engineers use this floor plan during equipment installation.

E Superdome Configurations

Table E-1 shows Superdome power requirements by configuration (i.e. number of cell boards, amount of memory per cell, and number of I/O chassis). This requirement applies to 32-way-capable systems with PA8600 or PA8700 processors.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1507
Doc: 3701

There are two columns of power numbers (Watts). The Power Breaker column shows the power used to size the wall breaker at the installation site. The Typical Power column shows typical power. Typical power numbers are for PA8600 systems and may be used to assess average utility cost of cooling and electrical power. Expect these typical numbers to be about 18% less for PA8700 systems. Table E-1 also shows the recommended breaker sizes for 4-wire and 5-wire sources.

Table E-1 Typical Superdome Configurations

Cell Boards	Memory Per Cell Board	I/O Chassis Modules	Breaker Power[a]	Recommended 3-pole Breaker Size[a,b]	Recommended 4-pole Breaker Size[a,c]	Typical Power	Typical Cooling
Qty.	GBytes	Qty.	Watts	Amps (min.)	Amps (min.)	Watts	BTU/HR
8	16	4	10660	40	25	8460	28,850
8	16	2	9600	40	25	7780	26,530
8	8	4	9220	40	25	7340	25,030
8	8	2	8160	30	20	6660	22,710
8	4	4	8500	35	20	6780	23,120
8	4	2	7440	30	20	6100	20,800
6	16	4	9040	35	20	7140	24,350
6	16	2	7980	30	20	6460	22,030
6	8	4	7960	30	20	6300	21,480
6	8	2	6900	30	20	5620	19,160
6	4	4	7420	30	20	5880	20,050
6	4	2	6360	30	20	5200	17,730
4	16	4	7420	30	20	5820	19,850
4	16	2	6360	30	20	5140	17,530
4	8	4	6700	30	20	5260	17,940
4	8	2	5640	25	20	4580	15,620
4	4	4	6340	30	20	4980	16,980
4	4	2	5280	25	20	4300	14,660
2	16	2	4740	20	20	3820	13,030
2	8	2	4380	20	20	3540	12,070
2	4	2	4200	20	20	3400	11,600

a. These numbers are valid only for the specific configurations shown. Any upgrades may require a change to the breaker size. A 5-wire source utilizes a 4 pole breaker and a 4-wire source utilizes a 3 pole breaker. *The PE (Protective Earth) ground wire is not switched.*

E - T
4915
Paulo
3
A C
I

b. An input power source supplied from a 3-pole plus protective earth (PE), 4-wire system will always be wired as 240 volts phase-to-phase, no neutral or common, plus a PE ground. Three phase input voltage (240VAC) to the equipment is connected phase-to-phase. Examples of 4 wire: 200-volt phase-to-phase, 208-volt phase-to-phase, 240-volt phase-to-phase
c. An input power source supplied from a 4-pole +PE, 5 wire system may be wired as either:

208VAC phase-to-phase voltage with a common, plus a PE ground. Three phase input voltage (208VAC) to the equipment is connected phase-to-phase. The common is *not* connected to the PDCA neutral terminal.

415VAC phase-to-phase voltage with a neutral return, plus a PE ground. Three phase input voltage (230-240VAC) to the equipment is connected phase-to-neutral. The neutral is connected to the PDCA neutral terminal. Examples of 5 wire: 208-volt phase-to-phase, 380-volt phase-to-phase, 415-volt phase-to-phase

HP-UX 11i

HP-UX advances the state of the art in enterprise UNIX®

HP-UX 11i is designed to anticipate and exceed the needs of today's enterprises as the foundation of an adaptable environment—the best enterprise UNIX just got better for both PA-RISC-based and Itanium®-based systems

Business Critical Systems

RQS Nº 03/2005 - CN
CPMI - CORREIOS
invent
Fls: 1510
Doc: 3701

In today's fast-changing world, enterprises need a computing platform that provides leading technologies, robustness, and stability. HP-UX 11i is engineered to provide these qualities.

HP-UX 11i is the best operating system (OS) to power the enterprise:

- #1 rated UNIX® operating system in the industry (DH Brown UNIX OS Review, Gartner and Butler Group—UK)

HP-UX 11i has the robustness, performance scalability, high availability, manageability, and bulletproof security required by business-critical computing.

- Proven 64-bit technology
- Stability for the long haul, even across architectures
- Adapts automatically to changing environments—always flexible
- Highly secure to protect enterprise data from damage or theft
- Most widely used high-availability solutions in the industry

Power on demand to run your enterprise

Designed from the ground up to be the best commercial UNIX operating environment for the enterprise, HP-UX 11i has been the leading enterprise UNIX OS for the last 15 years, and it continues to push the software technology envelope.

Key examples of HP's technological innovation extend the partitioning continuum and the virtual server environment of HP-UX 11i with:

- Adaptive infrastructure that, upon application failover or migration (Serviceguard), automatically adjusts system resources according to defined business priorities (Workload Manager) and can automatically activate additional CPUs when needed
- Hard and soft partitioning
- Native real-time host intrusion detection
- Dynamic code translation technology providing binary compatibility across PA-RISC and Intel® Itanium® architectures

Industry-leading applications

HP-UX 11i supports all the applications that are critical to your business. We have the support of all the key ISV applications and middleware suppliers, such as Oracle®, SAP, I2, PeopleSoft, and SAS. This means that, whatever your need, you'll find an industry-leading application solution supported by HP-UX.

Middleware and application development tools

HP-UX 11i is supported by leading middleware and application development tool providers such as BEA and Rational. Add to that integrated development environments (IDEs) from leading IDE vendors including TogetherSoft, Borland, and Sitraka, and you can count on optimal application performance. HP-UX 11i offers o complete developer ecosystem with Java™, Linux/open source, and a native development environment for faster time to deployment.

The foundation of your enterprise infrastructure

HP-UX 11i offers business-critical necessities at the highest level: the world's best combination of performance, performance scalability, availability, manageability, and security.

- Performance scalability: The efficient support of large numbers of processors provides near-linear performance scalability as processors are added.
- Single-system availability capabilities include online system tuning, online data backup, online component replacement, and automatic detection and de-allocation of at-risk components.
- Multi-system availability capabilities include automatic and bi-directional failover of business-critical data and applications over extended distances.
- Manageability tools provide role-based capability sets, the ability to manage hundreds of servers from a single browser-based console, and automatic re-allocation of system resources.
- Security fortifications include a host firewall and an intrusion-detection facility that can monitor multiple servers simultaneously.

The operating environment for worry-free computing, HP-UX 11i comes as part of four world-class operating environments, all fully integrated and tested by HP. These operating environments, ordered and supported as a single product, feature fast and easy installation and administration:

- The HP-UX 11i Foundation Operating Environment provides capabilities needed by most customers.

HP-UX 11i operating environments: components

HP-UX 11i Foundation Operating Environment

- Network drivers
- HP Apache Web server
- Ignite-UX
- Real-time host intrusion detection
- Java RTE, JDK, and JPI
- CIFS client
- CIFS server
- Servicecontrol Manager
- System Inventory Manager
- HP-UX Kernel Configuration
- Software Distributor-UX
- Netscape LDAP directory server
- PAM Kerberos
- EMS Framework
- Netscape Communicator
- Base VERITAS File System for HP-UX
- Base VERITAS Volume Manager for HP-UX

HP-UX 11i Enterprise Operating Environment (everything in the foundation OE, plus the following)

- Online JFS 3.3
- Mirrordisk/UX
- Process Resource Manager (PRM)
- Glanceplus
- OpenView Performance Agent
- Event Monitoring Services (EMS) HA monitors

HP-UX 11i Mission Critical Operating Environment (everything in the enterprise OE, plus the following)

- Serviceguard
- HP-UX Workload Manager
- Serviceguard NFS toolkit
- Enterprise Cluster Master (ECM) toolkit

- The HP-UX 11i Enterprise Operating Environment adds additional system management and high-availability capabilities.
- The HP-UX Mission Critical Operating Environment provides the highest levels of manageability and high availability, including the world's only goal-based UNIX workload manager.

Hardware platforms: PA-RISC and Intel Itanium architecture

HP-UX 11i supports two industry-leading architectures—PA-RISC and the Intel Itanium architecture.

HP-UX 11i v1 is available to run on PA-RISC. This product and platform are designed to be the workhorse that handles heavy mission-critical processing loads. HP-UX 11i v1 includes the dynamic expansion of storage components, IPv4 and IPv6 (including Mobile IP), the highest levels of security certification, virtual partitioning, workload management, and the highest levels of application availability and scaling.

HP-UX 11i v2 runs on the Intel Itanium architecture. HP and Intel jointly developed this architecture, and it promises new levels of performance and value. Now, all the operating environments are available on HP-UX 11i v2 for true enterprise readiness—and they have the same look and feel as HP-UX 11i v1, available on PA-RISC. HP-UX 11i v2 scales to 64 Intel Itanium processors and runs all the HP high-availability, security, manageability, and Internet-readiness solutions. This architecture design features explicit parallel execution to derive the best possible performance from the steadily increasing number of components in microprocessors.

Architectural compatibility

HP-UX 11i provides unparalleled compatibility across the PA-RISC and Itanium-based server platforms with complete data and application build environment (source code) compatibility. HP-UX 11i v2 even has the built-in capability to execute PA-RISC binaries on the Intel Itanium architecture via Aries dynamic code translation.

Superior Linux compatibility

HP-UX 11i provides Linux API (application programming interface) compatibility, making it easy to develop an application using the popular, economical Linux platform and then deploy it in a mission-critical environment using HP-UX 11i. And with HP-UX 11i on Itanium-based server platforms, Linux compatibility will be extended to include binary compatibility.

Summary

HP-UX 11i is designed to meet, exceed, and anticipate the needs of today's enterprises as the linchpin of an always-on and adaptable infrastructure. It has the robustness, performance scalability, high availability, manageability, and bulletproof security required by business-critical computing. HP-UX 11i is also the only operating system with a clear bridge to the next-generation Intel Itanium architecture, including data, source, and even binary compatibility across the architectures.

HP-UX 11i Foundation Operating Environment content (except where noted as add-on product)

Scalability
- 64 way symmetric multiprocessing scalability
- (up to 128-way by the end of 2003)
- Up to 256 gigabytes of memory
- Increasing to 1 terabyte by end of 2003)
- Terabyte maximum file system and file size
- Increasing to 4 terabytes in 2003)
- Autoport aggregation for higher networking bandwidths (add-on product)[2]
- Dynamic memory page sizing
- Instant capacity on demand (iCOD—add-on product)

Performance
- Support for high-performance PA-RISC processors
- Support for the Intel Itanium Processor Family
- 64N threads for optimal Java performance[1]

Reliability and availability
- Integrated operating environments
- Dynamic processor resilience
- Dynamic memory resilience
- Memory sparing technology
- Online file system administration (Online Journaled File System—add-on product)
- Fast file system recovery (Journaled File System)
- Disk mirroring (Mirrordisk/UX—add-on product)
- System administrator notification of system exception conditions
- Dynamically tunable kernel parameters
- Autoport aggregation for transparent link redundancy (add-on product)[2]
- Serviceguard for automatic application failover (add-on product)
- Highly available SAP and Oracle9*i* RAC environments with Serviceguard extension products (add-on products)
- Serviceguard Manager for centralized cluster management (HP-UX and Linux clusters)
- Toolkits for rapid application deployment (add-on products)
- Dynamic failover to iCOD CPUs
- Geographically Dispersed Clusters including Disaster Tolerant Solutions and Business Continuity Solutions
- Extended Campus Cluster, Metrocluster, and Continentalclusters[2]—all add-on products)

Security
- Hardened kernel
- Trusted users, passwords, disks, file systems, and permissions
- Public Key Infrastructure (PKI) support[2]
- Buffer overflow protection (transparent to applications)
- IPSec—Internet Protocol Security including OSF Application Environment Specification (AES) Encryption and Internet Key Exchange (IKE)
- Real-time host intrusion detection system
- IPFilter host firewall
- Internet daemon services
- Built-in encryption/decryption accelerators
- Netscape directory server LDAP
- LDAP-UX integration with UNIX and Windows® 2000[2]
- AAA (Authentication, Authorization, and Accounting) Server (RADIUS)
- Security Patch Check
- AAA Mobile Server (DIAMETER)
- Common Criteria EAL 4—CAPP Certified
- Pluggable Security modules
- Kerberos server (available for Itanium-based server)
- HP-UX Bastille (secure system lockdown)
- Install-time security lockdown through Bastille[1]
- Secure Shell

Connectivity and interoperability
- Industry-standard TCP/IP
- Web Services Suite
- TCP Wrappers for network activity monitoring
- SLP (Service Location Protocol)
- ARPA Services
- IPv4, IPv6
- WU-FTP (Washington University File Transfer Protocol)
- Mobile IPv4[2]
- Dynamic Host Configuration Protocol v4 and v6 (DHCP)
- Berkeley Internet Name Domain (BIND) 9.2
- Dynamic Name Service (DNS)
- Sendmail 8.11.1
- Common Internet File System (CIFS)
- Internet Express

Web application infrastructure
- HP Apache-based Web Server Suite integrated with additional HP features, including built-in Secure Sockets Layer (SSL); tuned for high performance
- BEA WebLogic Platform 7.0 including the #1 J2EE BEA WebLogic Server
- Oracle 9*i* Application Server[2]

Manageability
- Centralized management console with GUI interface (Servicecontrol Manager)
- Networkable multi-system configuration tracking (System Inventory Manager)
- Online GUI-based dynamic kernel configuration (HP-UX kernel configuration)
- Management of hundreds of remote nodes (Centralized Web Console—add-on product)
- Role-based system administrator capabilities
- Automatic system administrator notification of exception conditions (Event Monitoring Service)
- Hardware-based partitions
- Software-based partitions[2] (HP-UX Virtual Partitions—add-on product)
- Graphical user interface for creating and viewing hard partitions (Partition Manager)
- Allocation of system resources (Process Resource Manager—add-on product)
- Single-system intelligent policy engine that advises or automatically acts to provide goal-based allocation of system resources across Virtual Server Environment technologies (HP-UX Workload Manager—add-on product)
- Automatic OS updates over a network (Ignite-UX)
- Automatic application software updates over a network (Software Distributor-UX)

Linux compatibility
- GNU Tool Chain
- Over 50 Open Source tools
- Application Programming Interface (API) compatibility
- Application Binary Interface (ABI) compatibility[1] (available second half, 2003)
- Scanner to identify problems and recommended changes
- Extensive documentation on Best Practices on Porting to HP-UX 11i accessible online at **www.hp.com/go/LPK**

Application development tools
- COBOL
- Java
- C
- C++
- Fortran

Cross-architectural compatibility
- Source code compatibility (including 32-bit PA-RISC applications)
- Data compatibility
- Aries dynamic code translation technology[1]

4 Online Backup

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1513
Doc: 3701

Introduction

This chapter describes the online backup facility provided with the VxFS file system. The snapshot feature of VxFS can be used to create a snapshot image of a mounted file system, which becomes a duplicate read-only copy of the mounted file system.

NOTE Snapshot file systems are available only with the optional HP OnLineJFS product.

The following topics are covered in this chapter:

- "Snapshot File Systems"
  - — "Snapshot File System Disk Structure"
  - — "How a Snapshot File System Works"
- "Using a Snapshot File System for Backup"
  - — "Creating a Snapshot File System"
  - — "Making a Backup"
- "Performance of Snapshot File Systems"

Snapshot File Systems

The VxFS file system provides a mechanism for taking snapshot images of mounted file systems, which is useful for making backups.The *snapshot file system* is an exact image of the original file system, which is referred to as the *snapped file system*. The snapshot is a consistent view of the file system "snapped" at the point in time the snapshot is made. Selected files can be backed up from the snapshot (using standard utilities such as `cpio` or `cp`) or the entire file system image can be backed up (using the `vxdump` or `fscat` utilities).

The `mount` command is used to create a snapshot file system; there is no `mkfs` step involved. A snapshot file system is always read-only and exists only as long as it and the file system that has been snapped are mounted. A snapped file system cannot be unmounted until any corresponding snapshots are first unmounted. A snapshot file system ceases to exist when unmounted. While it is possible to have multiple snapshots of a file system made at different times, it is not possible to make a snapshot of a snapshot.

This chapter describes the creation of snapshot file systems and gives some examples of backing up all or part of a file system using the snapshot mechanism.

Snapshot File System Disk Structure

A snapshot file system consists of:

- a super-block
- a bitmap
- a blockmap
- data blocks copied from the snapped file system

Figure 4-1, "The Snapshot Disk Structure," shows the disk structure of a snapshot file system.

RQS Nº 03/2005 - CN

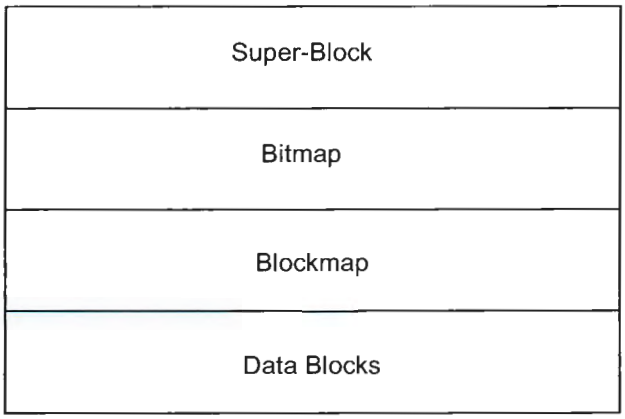
Doc:

Figure 4-1 **The Snapshot Disk Structure**



The super-block is similar to the super-block ofa normal VxFS file system, however, the magic number is different and many of the fields are meaningless.

Immediately following the super-block is the bitmap. The bitmap contains one bit for every block on the snapped file system. Initially, all bitmap entries are zero. A set bit indicates that the appropriate block was copied from the snapped file system to the snapshot. In this case, the appropriate position in the blockmap will reference the copied block,

Following the bitmap is the blockmap. It contains one entryfor each block on the snapped file system. Initially, all entries are zero. When a block is copied from the snapped file system to the snapshot, the appropriate entry in the blockmap is changed to contain the block number on the snapshot file system that holds the data from the snapped file system.

The data blocks used by the snapshot file system are located after the blockmap. These are filled by any data copied from the snapped file system, starting from the front of the data block area.

How a Snapshot File System Works

A snapshot file system is created by mounting an empty disk slice as a snapshot of a currently mounted file system. The bitmap, blockmap and super-block are initialized and then the currently mounted file system is frozen (see "Freeze and Thaw", for a description of the VX_FREEZE ioctl). Once the file system to be snapped is frozen, the snapshot is enabled and mounted and the snapped file system is thawed. The snapshot appears as an exact image of the snapped file system at the time the snapshot

Introduction

The *VERITAS© File System System Administrator's Guide* provides information on the most important aspects of administering a VERITAS File System™ (VxFS©).The VERITAS File System is also known as the Journaled File System, or JFS. This guide also provides information on administering the HP OnLineJFS product, an optional add-on product for HP-UX systems. This document describes JFS 3.3 and OnLineJFS 3.3.

This guide is for system administrators who configure and maintain HP-UX 11.x systems with JFS 3.3, and assumes that you have:

- An understanding of system administration.
- A working knowledge of the HP-UX operating system.
- A general understanding of file systems.

E C T
4897
Paula
I
AC

Organization

- Chapter 1, The VxFS File System,, introduces the features and characteristics of this product.
- Chapter 2, Disk Layout, describes and illustrates the major components of VxFS disk layouts.
- Chapter 3, Extent Attributes, describes the policies associated with allocation of disk space.
- Chapter 4, Online Backup, describes the snapshot backup feature of VxFS.
- Chapter 5, Performance and Tuning, describes VxFS tools that optimize system performance. This section includes information on mount options.
- Chapter 6, Application Interface, describes ways to optimize an application for use with VxFS. This chapter includes details on cache advisories, extent sizes, and reservation of file space.
- Chapter 7, Quotas, describes VxFS methods to limit user access to file and data resources.
- Appendix A, Kernel Messages, lists VxFS kernel error messages in numerical order and provides explanations and suggestions for dealing with these problems.
- The "Glossary" contains a list of terms and definitions relevant to VxFS.

Introduction

VxFS is an extent based, intent logging file system. VxFS is particularly geared toward UNIX environments that require high performance and availability and deal with large volumes of data.

This chapter provides an overview of major VxFS features that are described in detail in later chapters.The following topics are covered in this chapter:

- "JFS and OnLineJFS Feature Comparison"
- "Disk Layout Options"
- "File System Performance Enhancements"
- "Extent-Based Allocation"
- "Extent Attributes"
- "Fast File System Recovery"
- "Online System Administration"
- "Online Backup"
- "Application Interface"
- "Extended mount Options"
- "Enhanced I/O Performance"
- "Quotas"
- "Access Control Lists"
- "Support for Large Files"

JFS 3.3 and OnLineJFS 3.3 Product Availability

HP JFS 3.3 and HP OnLineJFS 3.3 are available for HP-UX 11.00 and later systems. You can download JFS 3.3 for HP-UX 11.00 for free from the HP Software Depot (http://www.software.hp.com), or you can request a free JFS 3.3 CD from the Software Depot. You can purchase HP OnLineJFS 3.3 (product number B3929CA for servers and product number B5118CA for workstations) for HP-UX 11.0 or HP-UX 11i from your HP sales representative. JFS 3.3 is included with HP-UX 11i systems.

JFS and OnLineJFS Feature Comparison

HP-UX supports two separate Journaled File System products: the basic product, JFS, which is built into the HP-UX operating system, and the optional, advanced product, OnLineJFS, which is purchased separately. The following table lists VxFS file system features supported in JFS 3.3 and OnLineJFS 3.3.

Table 1-1 VxFS File System Feature Comparison

Feature	JFS 3.3	OnLineJFS 3.3
extent-based allocation	*	*
extent attributes	*	*
fast file system recovery	*	*
access control list (ACL) support	*	*
enhanced application interface	*	*
enhanced mount options	*	*
improved synchronous write performance	*	*
support for large files (up to one terabyte)	*	*
support for large file systems (up to one terabyte)	*	*
enhanced I/O performance	*	*
support for BSD-style quotas	*	*
unlimited number of inodes	*	*
file system tuning [`vxtunefs`(1M)]	*	*
online administration		*
ability to reserve space for a file and set fixed extent sizes and allocation flags		*
online snapshot file system for backup		*
direct I/O, supporting improved database performance		*
data synchronous I/O		*
DMAPI		*

VxFS supports all UFS file system features and facilities except for the linking, removing, or renaming of "." and ".." directory entries. Such operations may disrupt file system sanity.

Disk Layout Options

Three disk layout formats are available with VxFS:

Version 2

The Version 2 disk layout supports such features as:

- filesets
- dynamic inode allocation

The Version 2 layout is available with optional support for quotas.

Version 3

The Version 3 disk layout offers additional support for:

- files up to one terabyte
- file systems up to one terabyte

Version 4

Version 4 is the latest disk layout with the following additional feature:

- Access Control Lists

See Chapter 2 , "Disk Layout" for a description of the disk layouts.

The following table lists HP-UX Releases with the VxFS versions and disk layouts they support:

Table 1-2 Supported and Default Disk Layouts on HP-UX Releases

HP-UX Release	VxFS Version	Supported Disk Layouts	Default Disk Layout
10.10	2.3	2	2
10.20	3.0	2, 3	3
11.00 with JFS 3.1	3.1	2, 3	3
11.00 with JFS 3.3	3.3	2, 3, 4	3
11i	3.3	2, 3, 4	4

File System Performance Enhancements

The HFS file system uses block based allocation schemes which provide adequate random access and latency for small files but limit throughput for larger files. As a result, the HFS file system is less than optimal for commercial environments.

VxFS addresses this file system performance issue through an alternative allocation scheme and increased user control over allocation, I/O, and caching policies. An overview of the VxFS allocation scheme is covered in the section "Extent-Based Allocation".

VxFs provides the following performance enhancements:

- extent based allocation
- enhanced mount options
- data synchronous I/O
- direct I/O and discovered direct I/O
- caching advisories
- enhanced directory features
- explicit file alignment, extent size, and preallocation controls
- tuneable I/O parameters
- tuneable indirect data extent size

The rest of this chapter along with Chapter 5 , 'Performance and Tuning" and Chapter 6 , "Application Interface" provide more details on some of these features.

Preface

Printing History

The Printing History below identifies the edition dates of this manual. Updates are made to this publication on an unscheduled, *as needed*, basis. The updates will consist of a complete replacement manual and pertinent on-line or CD-ROM documentation.

First Edition ..... November 2002

What's New?

The, *Upgrade Guide,rp5400 Family of Servers*, is new and was developed to provide customers with system maintenance information for those components called customer replaceable units (CRUs). Maintenance of CRUs does not require HP customer engineering services, except when specifically cautioned. The cautions are shown primarily to protect customer product warrantees.

1 Server Overview

The rp5400 family of servers are 1-way to 4-way servers based on the PA-RISC processor architecture. The rp5400 family of servers accommodate up to 16GB of memory and internal peripherals including disks and DVD ROM/Tape. High availability features include HotSwap fans and power supplies, and HotPlug internal disk drives. The supported operating system is HP-UX.

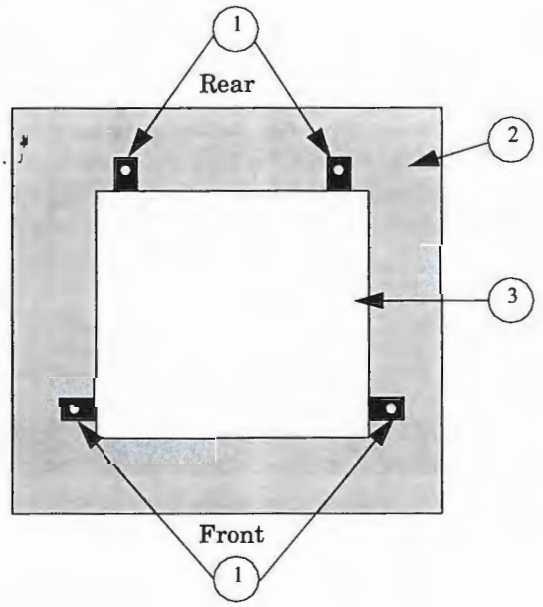
2 Server Unpacking and Installation

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1585
Doc:
3701

Factory Integrated rp54xx Cabinet Installation

A factory integrated server is one in which the rp54xx server and associated components are pre-assembled and shipped from the factory already installed in a Hewlett-Packard E-Series cabinet. Factory integrated systems reduce the amount of time required to set-up and begin server operation.

1. Carefully remove the carton and anti-static bag from the pallet.
2. Remove the front two (2) L-brackets. Retain the 1/2-inch bolts for later use.



1. Shipping L-Bracket
2. Shipping Pallet
3. Cabinet (Top View)

NOTE As viewed from the front, one bracket is located on each side at the base of the cabinet near the front.

3. At the rear of the cabinet:
   a. Open the door.
   b. Remove the anti-tip foot by removing and retaining the two (2) 1/2-inch bolts.

For Shipping: L-brackets are mounted behind anti-tip foot. Same bolts secure both.

   c. Remove the two (2) L-brackets (revealed by removing the anti-tip foot).
4. Remove the two ramps from the pallet and carefully place them into the slots at the front of the pallet.

WARNING **Use extreme care when rolling the racked system down the ramps. A rack containing one rp54xx can weigh up to 418 lbs. Do not stand in front of the ramps when rolling the cabinet off the pallet or injury may occur. All but the smallest configurations require two persons to safely remove the rack from the pallet.**

If anti-tip feet or ballast are not installed or are improperly installed the cabinet can tip. Failure to follow this precaution can cause injury to personnel or damage to equipment.

ROS Nº 03/2005 - CN - CPMI - CORREIOS
1536
Fls:
3701
Doc:

5. Straighten the rollers on the cabinet base, if needed, and carefully roll it down the ramps.

WARNING ***After removing the server from the pallet, Do not move the cabinet unless the anti-tip feet are installed!*** **The cabinet can tip if care is not used. Due to their low ground clearance the feet may catch on irregularities on the floor, thresholds, or ramps.**

Do not move the cabinet without first installing the anti-tip feet. **The cabinet may tip if moved without the anti-tip feet or ballast installed.**

Do not move the cabinet after installing the anti-tip feet unless they are in the fully-raised position. **Once installed, the anti-tip feet must be fully raised to allow ground clearance.**

Because of their low ground clearance, the fully-raised anti-tip feet may need to be removed *temporarily* to clear some obstacles such as door jambs, ramps, and other large irregularities or obstructions on the floor.

If you must temporarily remove the anti-tip feet to clear an obstacle, use extreme caution when moving the cabinet. Always reinstall the anti-tip feet as soon as the obstacle has been cleared.

Lower and secure both the anti-tip feet and the cabinet leveling/stabilizer feet once the cabinet is in place.

Failure to follow these precautions can result in equipment damage or personal injury.

6. Install the front and rear anti-tip feet using the 1/2 inch bolts provided. Ensure that the anti-tip feet are installed in the fully up position in the mounting slots. This will provide maximum ground clearance while moving the cabinet to its final position.
7. Carefully move the cabinet to its installation location.
8. Lower the anti-tip feet to the fully down position and adjust the cabinet leveling feet for best cabinet stability.

Paulo

Receive and Unpack A Non-Integrated Server

WARNING **The typical rp54xx system can weigh up to 68kg (150lbs). *HP recommends using an an approved lifting device.* Lift and move the server in accordance with all local safety regulations. Failure to follow this precaution can cause injury to personnel or damage to equipment.**

Unpacking the server

The following procedure describes the steps involved in unpacking the server, whether to function as a stand-alone Deskside unit, or to be integrated into a cabinet.

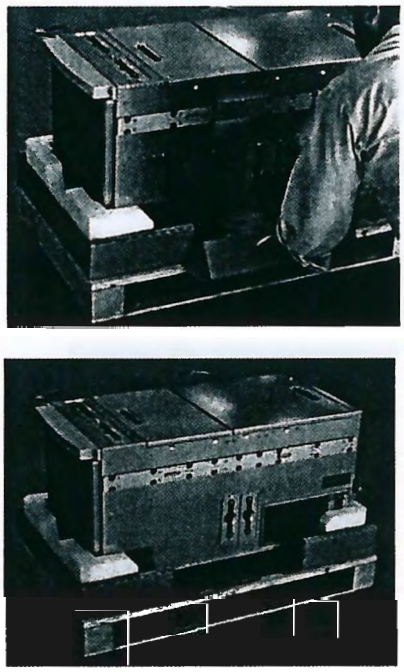
Step 1. Remove the shipping carton and anti-static bag from the server as depicted below.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1537
Fls:
3701
Doc:

NOTE The packaging for rp74xx and rp54xx servers is the same, rp74xx is shown.

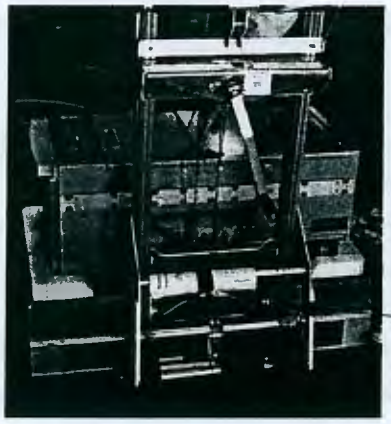
Step 2. If you are moving the server manually, use three people to lift the server from the packing material and pallet. Carefully move the server to the selected location.

Step 3. If you are moving the server by an approved lifting device (such as Genie Lift ™), remove the tear flap from the front lip of the carton bottom to allow access to the server, as illustrated below. Removal of the tear flap will reveal a slot between the bottom of the server and the inside bottom of the cardboard box.



CPL - AC

Step 4. Carefully raise the lift's platform so that it will slide into the slot located ***under*** the center of the server, but ***over*** the top of the pallet.



Lifting Device Platform.

NOTE The server's center of gravity will vary with the hardware configuration, but it is generally located slightly behind the middle of the server.

Step 5. Raise the lifting device platform enough for the server to clear the pallet and packing materials, as show below.

Doc:

Install Deskside Server

The following section describes the installation of a server into a Deskside enclosure for installation in an office environment.

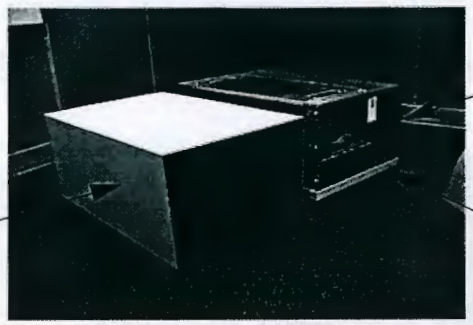
WARNING **The typical rp54xx system can weigh up to 68kg (150lbs). *HP recommends using an approved lifting device.***

- **Lift and move the server in accordance with all local safety regulations.**
- **Do not attempt to lift the server by the plastic handles on the top and side covers.**

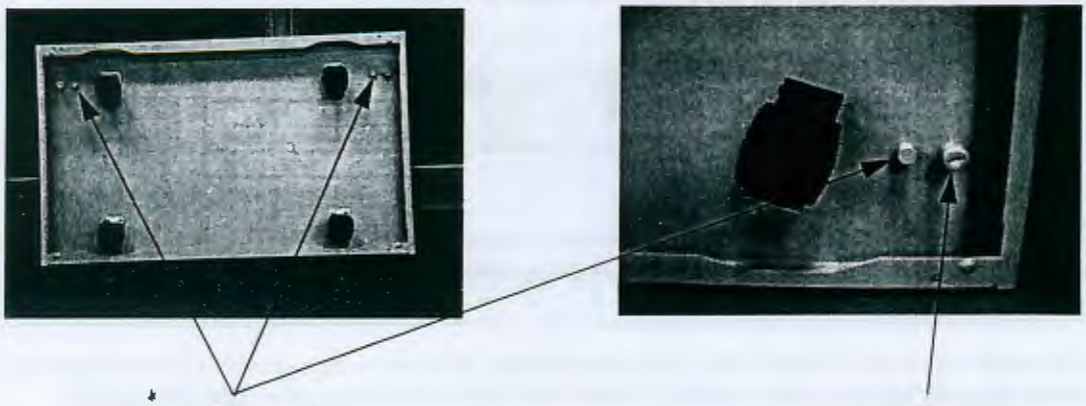
Failure to follow these precautions can cause injury to personnel or damage to equipment.

Step 1. Unpack the server.

Step 2. Unpack the deskside enclosure.



NOTE Ensure that the positioning spring pins in the enclosure base align with the alignment holes in the bottom of the server.



Step 3. Position the server on the wheeled enclosure base.

Step 4. Tighten the two captive screws in the enclosure base to secure the server to the base.

Step 5. Position the enclosure cover (outside skin) over the server and install and tighten the screws to secure it to the base.

NOTE The perforations and the lip of the outside skin should be toward the rear of the server.

WARNING **Stacking rp54xx servers in deskside enclosures is *not* supported.**

Stacking rp54xx servers in deskside enclosures can damage equipment, may cause injury to personnel, and may void your warranty or service contract.

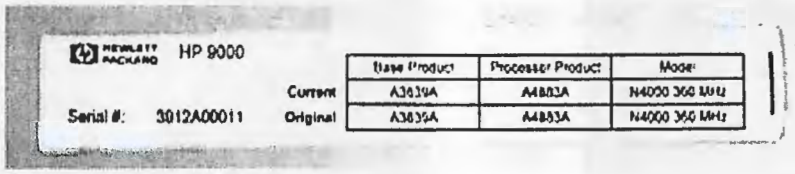
Step 6. Install the Front Bezel.

Step 7. Locate the two pull-tabs. One pull-tab is longer than the other. The shorter pull-tab is blank on both sides. The back of the shorter pull-tab provides a writable surface for Customer use.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
11
1539
Fls: 3701
Doc:

Step 8. Locate the plastic bag containing the label sheet (taped to the server).

Step 9. Remove the label containing serial number, base product, processor product, and model information from the label sheet and apply to the back of the longer pull-tab.



NOTE Pull-tab and label shown above is for an rp74xx server. rp54xx uses the same style label and similar pull-tab.

Step 10. Insert the pull-tabs into the front bezel. Install the longer pull-tab in the left side plastic window in such a way that the rp54xx logo is visible. Install the shorter pull-tab in the right side plastic window with either surface visible. Refer to the diagram above for pull-tab locations.

ECT
CPL 0487 SP - AC

Install Stand-Alone Server in a Cabinet

The following describes how to install the A5556A slide-tray assembly into an approved HP cabinet in preparation for installing an rp54xx server.

This slide-tray assembly can be installed in an HP E-Series cabinet or other HP cabinets approved for rp54xx system installation. To install the A5556A slide-tray assembly in an approved HP equipment cabinet, proceed as follows:

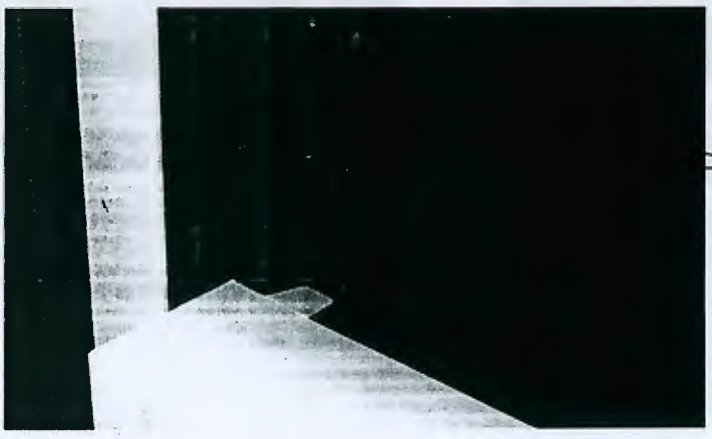
Step 1. Determine what type of cabinet you are installing the slide-tray assembly into.

a. E-Series cabinets have:

- Parchment white, plastic, sectional, side panels
- Black painted vertical frame posts with a partial return flange.

b. Approved, non-E-Series, cabinets have:

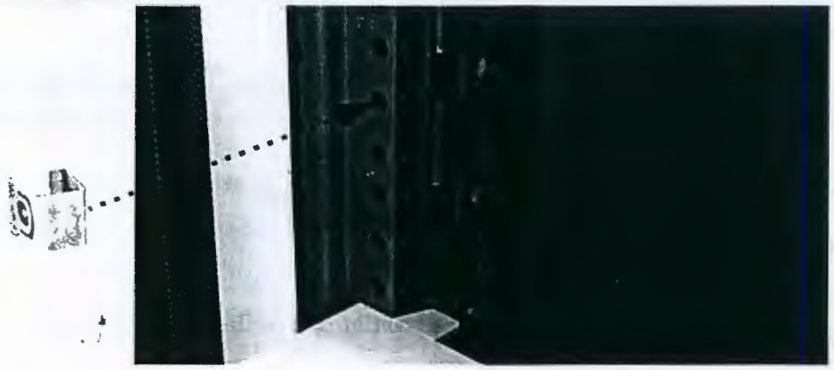
- Single piece metal side panels
- Gray painted verticle frame posts with full return flanges.



Step 2. Note the vertical, rectangular, slots in the return flanges on the vertical mounting posts. Determine into which of these vertical slots the slide/tray kit will be installed. This is done by counting down eight rectangular slots from the top of the cabinet or the bottom of the equipment above.

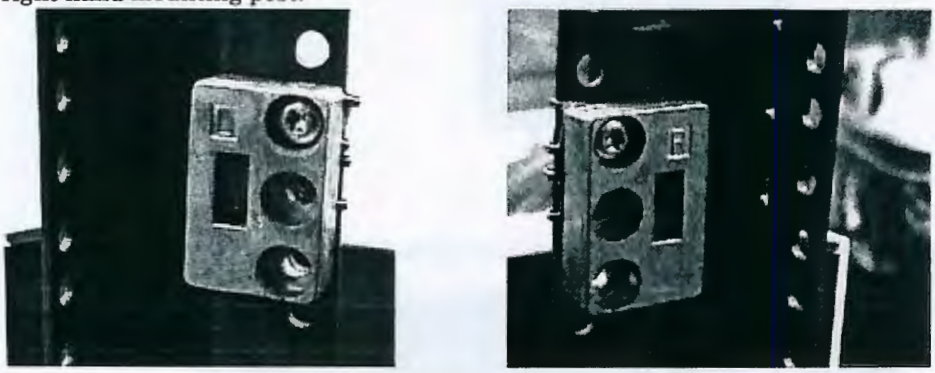
RQS Nº 03/2005 - CN
CPMI - CORREIOS
1540
Fls:
Doc: 3701

Step 3. On the front vertical mounting posts *only*, slide M5 sheet metal nuts onto the posts over the holes immediately adjacent to the vertical slots determined in the previous step. Also place M5 sheet metal nuts on the holes directly above these. Orient the sheet metal nuts so that the threaded portion faces towards the outside of the cabinet. There should now be a total of four (4) sheet metal nuts installed.



Step 4. If the cabinet is a non-E-Series cabinet, discard the left hand and right hand aluminum spacers and two of the M5 x 16 screws with cress-cup washers and proceed to step 12.

Step 5. If the cabinet is an E-Series cabinet, place the hook of the aluminum spacer marked "L" (5183-1864) into the appropriate vertical, rectangular slot on the front, left hand mounting post. The hook points downward. Similarly, place the spacer marked "R" (5183-1863) into the appropriate slot on the right hand mounting post.

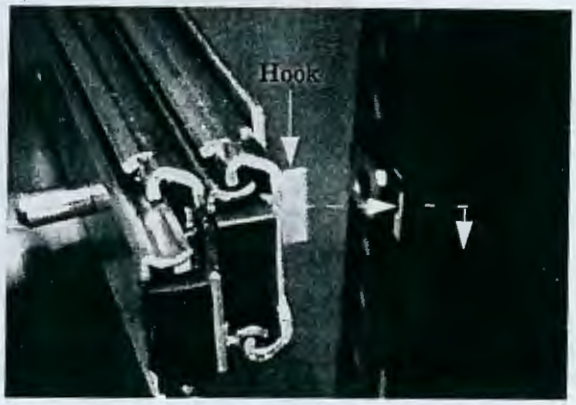


Step 6. Use one M5 x 16 screw with cress-cup washer to attach each spacer to its vertical post. Do this by inserting the screw through the top hole in the spacer, through the mounting rail and tightening it into the sheet metal nut located at that position.

Step 7. Take the left hand slide/bracket assembly (marked 337079-1L) and install it into the left hand vertical mounting posts. This is done by inserting the pin at the rear of the slide's mounting bracket into the 23rd hole in the rear vertical mounting post and inserting the hook at the front of the

F C
24815
Paulo
L - AC

bracket into the vertical, rectangular slot in the aluminum spacer. The slide should be positioned in the cabinet so that it is horizontal and level.



Step 8. Securely fasten the rear of the slide's mounting bracket to the rear vertical mounting post by installing and tightening two of the M5 x 16 screws with cress-cup washers thorough the mounting post, through the slides mounting bracket and into the threaded nuts attached to the mounting bracket.

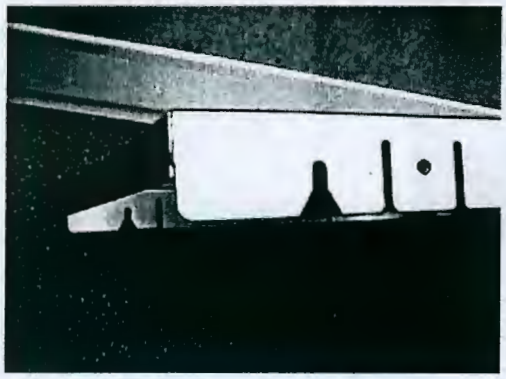
RQS Nº 03/2005 - CN
CPMI - CORREIOS
1541
Fls:
3701
Doc:

Step 9. Fully extend the slide so that it is locked in the fully open position.

Step 10. Use an M5 x 30 screw with a cress cup washer to attach the front of the slide to the vertical mounting post. Insert the screw through the slide, through the center hole of the aluminum spacer, through the vertical mounting post, and tighten into the sheet metal nut located at that position.

Step 11. Use a procedure similar to steps 7 through 10 to install the right hand slide/bracket assembly (marked 337079-1R) and then proceed to step 12.

Step 12. Take the tray and place it onto the pins that extend from the slides' inner members. The slots with wide lead-in guides on the side of the tray fit down onto the slides' pins. The flat part of the tray will be on top, and the mounting holes in the top of the tray will be located to the right of the center of the tray. Slide the tray all the way down on both sides so that the pins reach the top of the slots in the side of the tray.



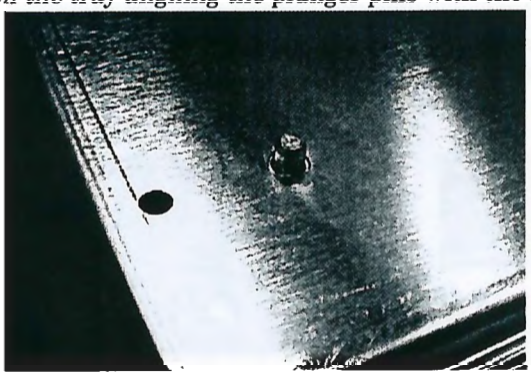
Step 13. Use six, M5 x 12 screws (without washers) to attach the tray to the slides. Three screws are used to attach each slide. Insert the screws through the slides, through the tray and tighten into the threaded nuts located on the inside of the sides of the tray.

3 Pan Head
M5x12 T25 screws
on each side

Step 14. From the bottom of the tray pull the plunger pin down and give it a 1/4 turn to hold it in place.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1542
Fls:
3701
Doc:

Step 15. Position the server on the tray aligning the plunger pins with the alignment holes in the chassis.



Step 16. Release the plunger pins to secure the server.

Paula

Stationary L-Bracket Rail Assembly

rp54xx servers may be installed into E-Series and approved Non- E-Series cabinets using stationary L-bracket rail assembly kits listed below.

NOTE rp54xx servers are supported in Hewlett-Packard E-series and approved Non- E-series Hewlett-Packard cabinets, and approved rail kits.

For information on additional qualified 3rd party cabinets and rail kits, contact the nearest Hewlett-Packard Response Center.

Cabinet Type	Rail Kit Product Number
E-Series HP Cabinet	A5575A
Other Approved HP Cabinet	A5562A

Identifying Approved Non-E-Series HP Cabinets

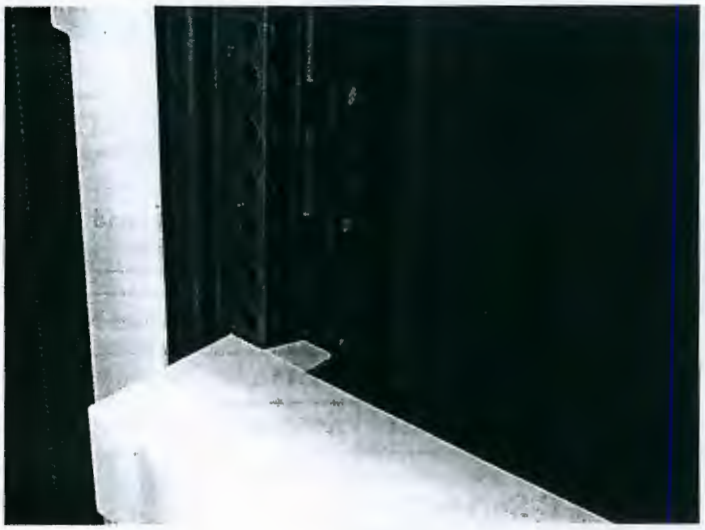
Approved Non- E-Series cabinets have black frames, one piece outside sheet metal skins, a partial return flange, and *requires* the installation of the aluminum spacer blocks, supplied with the rail kits.

Approved Non- E-Series cabinets include the following product numbers: A1883A, A1884A, A1896A, A1897A, C1897A, C2785A, C2786A, and C2787A.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1543
Fls:
Doc: 3701

Identifying E-Series HP Cabinets

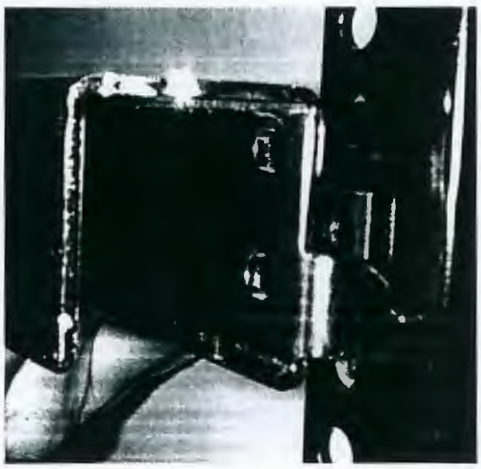
E-Series cabinets have light gray frames, sectioned, plastic outside "skins", a full return flange, and does *not* require the installation of the aluminum spacer block supplied, with the rail kits.



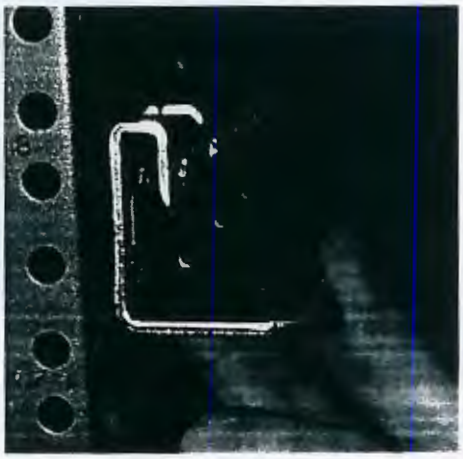
E-Series cabinets include the following product numbers: A5134A, A5136A, A5136A, A4900A, A4901A, A4902A, J1500A, J1502A, and J1502A.

Identifying Static Rail Kit

Hewlett-Packard has currently approved two static rail kits for use in cabinet mounting the rp54xx server. They are illustrated below.



A5562A Kit Rail



A5575A Kit Rail

Installing Stationary Rails

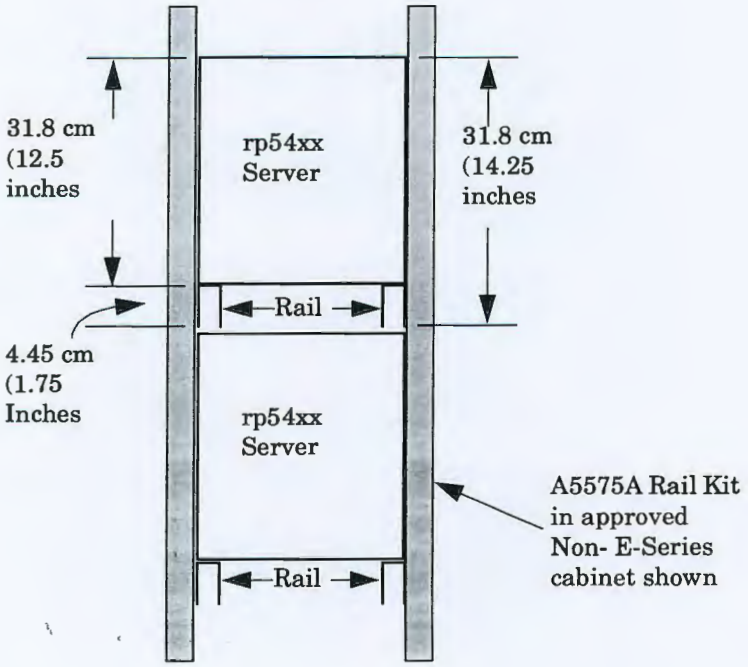
The installation of stationary rails is similar for most cabinet and rail combinations. The key considerations to are:

- Ensure that all safety precautions are read, understood, and observed
- Follow all installation instructions provided with the cabinet and rail kits, and
- Ensure that the rails extend out from the cabinet posts sufficiently to properly and safely support the equipment being installed.

To install an rp54xx server on stationary rails in an approved cabinet proceed as follows:

Step 1. Locate the rail mounting height in the cabinet. Allow for the following space requirements:

- For each rp54xx server, allow 31.8cm (12.5 inches) vertically (7 EIAs or Rack Units (RUs).
- If installing the A5575A rail kit, allow an *additional* vertical 4.45cm (1.75 inches (1 EIA) each set of rails.



Step 2. Install sheet metal nut(s) in the vertical cabinet posts at the required height for the kit being installed:

- Install the first nut either:
  - — 4.45 cm (1.75 Inches) above the top, or
  - — 31.8 cm (12.5 inches) below the bottom of the last server.
- If installing a A5562A rail kit, install the second nut in the next frame hole below the first.

Step 3. Hold the rail in place and insert and tighten the screws.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1544
Fls:
3701
Doc:

For installation of other qualified cabinet and rail combinations refer to the safety precautions and instructions accompanying them.

Paula
CPL - AC

3 Installing Additional Components

RQS Nº 03/2005 - CN
CPMI - CORREIOS
23
1545
Fls:
3701
Doc:

Additional Components

Some internal components are too delicate to be installed in the server prior to shipping. These internal components are shipped with the server, but are packed separately. They can be installed after the cabinet has been unpacked and positioned.

Some of the internal components that are packed separately are not user-installable. To maintain warranty validation, these items *must* be installed by a Hewlett-Packard Customer Engineer.

If you received either (or both) of the components listed below, contact your Hewlett-Packard provider to arrange for installation.

- Central Processing Units (CPUs)
- Power Distribution Units (PDUs)

Installing Memory

Memory Configuration Rules

rp54xx servers have 16 slots (8 DIMM pairs) for memory DIMMs. These slots are numbered 0a/b, 1a/b,... 7a/b. 8 of these slots (4a/b - 7a/b) are disabled on rp5400 servers. rp5450 servers can access all slots. rp5400 and rp5450 servers have DIMM slots located on the System Board.

rp5470 servers install DIMMs using Memory Carriers. The Memory Carriers fit into slots on the System Board.

The following rules govern the installation of memory DIMMs for rp5400, rp5450, and rp5470 servers:

- Memory must be installed in DIMM pairs.
- The capacity of DIMMs within a pair must be the same.
- Install DIMMs with the greatest capacity in the lowest slot numbers.
- Install DIMMs the following slot order: 0a/b, 1a/b, 2a/b, 3a/b, and so on.

Installing rp5400 and/or rp5450 DIMMs

Step 1. Power down and *unplug* the rp54xx server.

CAUTION DC voltages are present when the server is connected to AC power. Do not install or service rp54xx internal components while DC voltage is present. Failure to observe this precaution can result in damage to the server.

Step 2. Loosen the captive T-15 screws that hold the top cover in place, then grasp the strap handle, raise the cover slightly, and pull the cover toward the front of the server to free the cover tabs from the slots in the chassis. The air baffle will be exposed.

Step 3. Make the top of the server accessible for service.

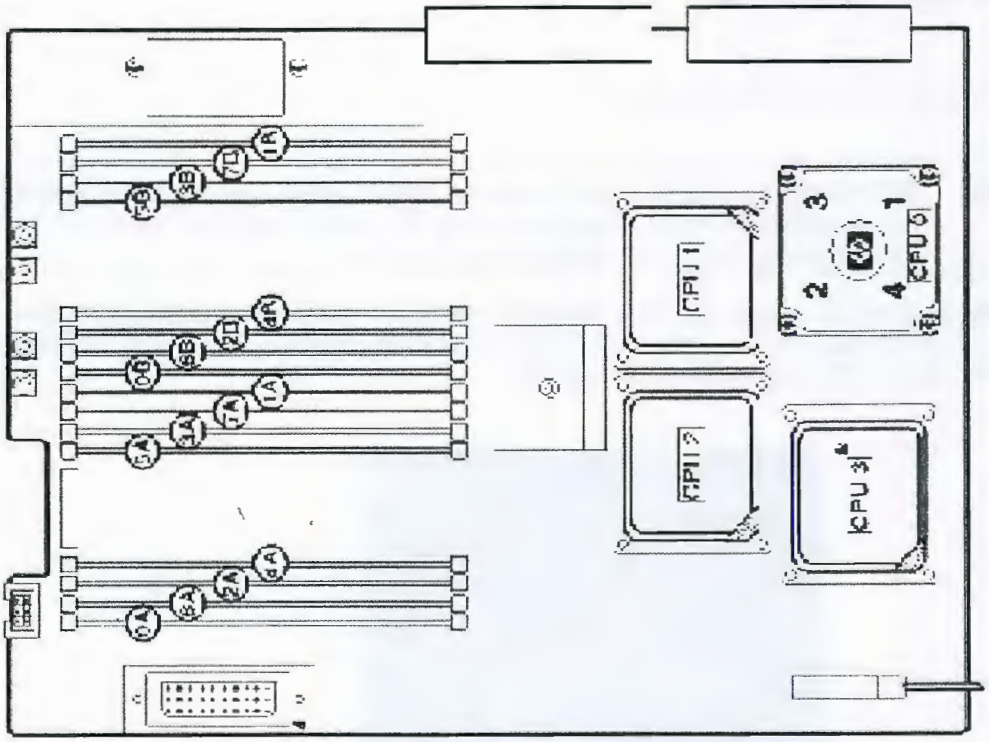
ECT
2805
Paulo
L - AC
ROS Nº 03/2005 - CN
CPMI - CORREIOS
1546
Fls: 3701
Doc:

Step 4. Loosen the captive T-15 screws on the air baffle. Grasp the two handles on the baffle, and lift the baffle remove it.

CAUTION Observe all ElectroStatic Discharge (ESD) precautions Do not touch internal components. Failure to observe ESD precautions can cause damage to components.

Step 5. Observe Electrostatic Discharge (ESD) precautions.

Step 6. Refer to the following graphic for memory slot locations.

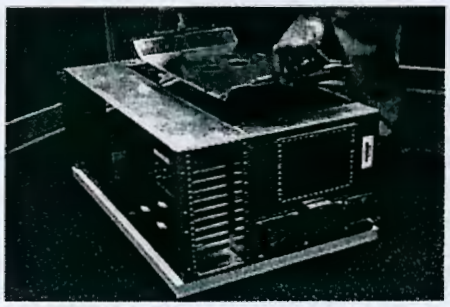


E C T
1803
Paulo
L - AC

Locate the correct DIMM pair slots. Insert the DIMM connectors into the guides until the card snaps firmly in place. It may be necessary to apply downward force using the palm of your hand on the DIMM. Observe the top of the DIMM to make sure one side is not higher than the other.

NOTE It may be necessary to remove PSM 1 when installing a DIMM in slot 0a and PSM 0 when installing a DIMM in slot 1b. If either PSM is removed to install memory, ensure it is re-installed.

Step 7. Replace the air baffle. Tighten the four captive screws to secure the air baffle in place.



Step 8. Replace the top cover. Tighten the four captive screws to secure the top cover in place.

Step 9. For rack configurations, insert the rp54xx server back into the rack.

Step 10. For deskside enclosure configurations, replace the deskside enclosure cover.

Step 11. Power the rp54xx server on.

Step 12. Use the BCH command `in me` to verify the system recognizes the memory that you have just added.

CPMI - CORREIOS
1547
Fls: 3701
Doc:

Installing rp5470 DIMMs

DIMMs for the rp5470 system are installed in memory carriers instead of the system board, as are the other rp54xx systems. However, rp5470 memory carriers are also located on the system board, so the method for opening and closing the system is the same. Procedures for removing and replacing the server top and baffle are listed below, without the pictures shown in the section titled, "*Installing rp5400 and/or rp5450 DIMMs.*" If you wish to reveiw the pictures, please refer to the aforementioned section.

Step 1. Power down and unplug the rp54xx server.

NOTE DC voltages are present when the server is connected to AC power. Do not attempt to install or service: CPUs, Memory, PSMs, the Platform Monitor or PCI I/O cards installed in non-Turbo slots (1-6) while DC voltage is present. Failure to observe this warning may result in damage to the server.

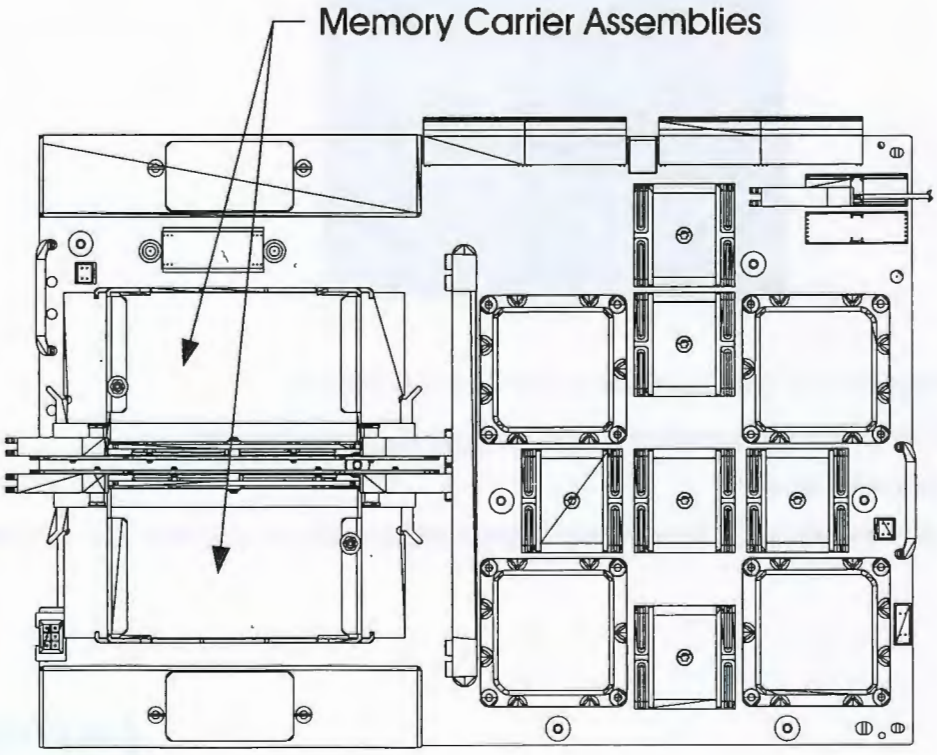
Step 2. Make the top of the server accessible for service.

Step 3. Loosen the captive T-15 screws that hold the top cover in place, then grasp the strap handle, raise the cover slightly, and pull the cover toward the front of the server to free the cover tabs from the slots in the chassis. The air baffle will be exposed.

Step 4. Loosen the four (4) captive T-15 screws on the air baffle. Grasp the two handles on the baffle, and lift and remove the baffle.

Step 5. Observe Electrostatic Discharge (ESD) precautions.

Step 6. Refer to the following graphic for Memory Carrier locations.



a. Locate the Memory Carrier and pull up on the extractor levers on each end of the Memory Carrier to unseat the Memory Carrier from its socket.

b. When the Memory Carrier unseats from the socket, pull it away from the System Board.

c. Loosen the captive screws that secure the DIMM Clip and remove the DIMM Clip from the Memory Carrier.

d. Seat the memory DIMM into its socket on the Memory Carrier.

e. Press the extractor levers on each end of the memory DIMM slot inward until the levers snap into place.

f. Attach the Memory Clip to the Memory Carrier with the DIMM slot markings on the top of the Memory Clip aligned with the DIMM slot markings on the Memory Carrier.

g. Secure the Memory Clip using the captive screws.

h. Seat the Memory Carrier into the appropriate slot on the System Board.

i. Push down on the extractor levers and snap them into place.

Step 7. Replace the air baffle. Tighten the four captive screws to secure the air baffle in place.

Step 8. Replace the top cover. Slide the cover tabs into the slots in the chassis and close the cover. Tighten the two captive screws to secure the top cover in place.

Step 9. For rack configurations, insert the rp54xx server back into the rack.

Step 10. For deskside enclosure configurations, replace the deskside enclosure cover.

Step 11. Power the rp54xx server on.

Step 12. Use the BCH command `in me` to verify the system recognizes the memory that you have just added.

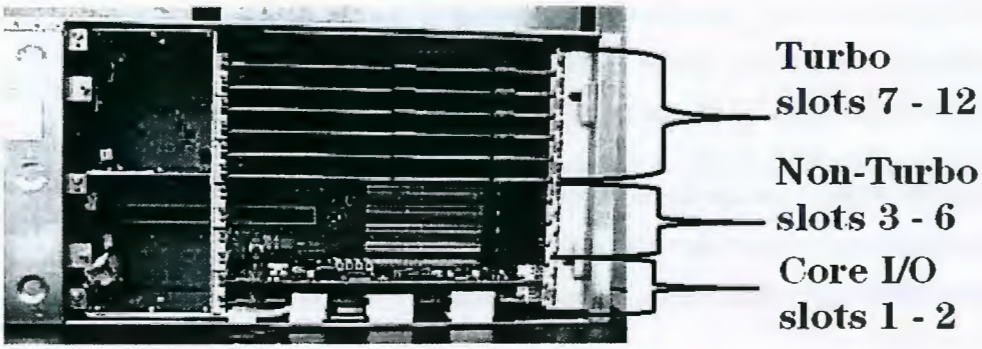
Installing Peripheral Component Interconnect (PCI) Cards

rp54xx servers have a total of 12 PCI I/O slots. Slots 1 and 2 are reserved for the LAN/SCSI and GSP Core I/O cards, leaving 10 PCI I/O slots available for Customer use.

rp5400/rp5450 PCI Card Slots

For rp5400 and rp5450 models, 10 PCI I/O slots consist of Turbo and non-Turbo slots. Server PCI slots are shown below.

rp5400/rp5450 PCI Card Slots



- Slots 1 and 2 are reserved for the rp54xx LAN/SCSI and GSP (Guardian Service Processor) Core I/O cards, respectively. Slots 1 and 2 are non-Turbo slots. Non-Turbo slots share a single 250MB/s PCI bus and are incapable of HotPlug functionality. The server must be turned off prior to removing or installing the LAN/SCSI or GSP cards in these slots.
- Slots 3 - 6 are non-Turbo slots. These four Non-Turbo slots share a single 250MB/s PCI bus, run at 33MHz and support 32 and 64-bit PCI cards. Non-Turbo slots are incapable of HotPlug functionality. The server must be turned off prior to removing or installing PCI cards in these slots.
- Slots 7 - 12 are Turbo slots. Each Turbo slot has a dedicated 250MB/s PCI bus, run at 66MHz and support 32 and 64-bit PCI cards. Turbo slots are HotPlug capable. Below each Turbo slot is a plastic PCI card separator. The PCI card separator has two LEDs and a pull tab on the outer edge. The LED's provide power and status for the slot. The pull tab allows the PCI card to be easily removed.

rp5400 servers have access to slots 1, 2 and 8-12 while rp5450 servers have access to all (1-12) slots.

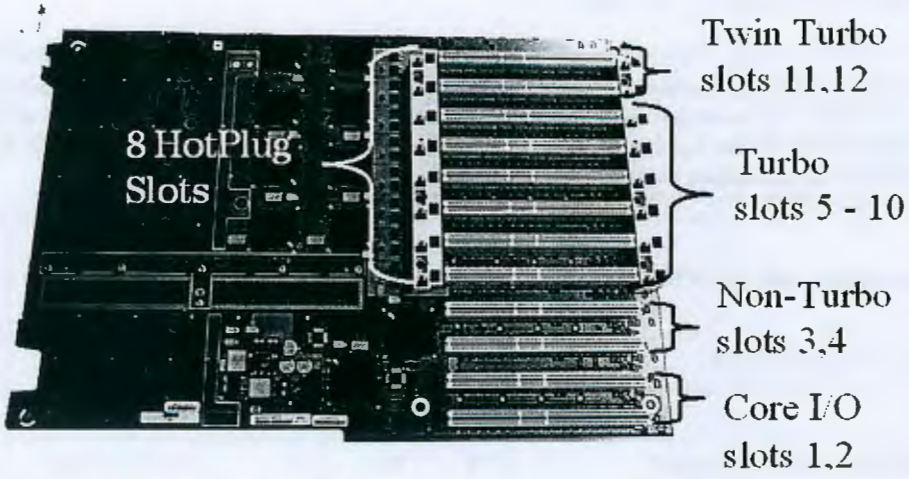
NOTE Slot 3 will become enabled on rp5400 servers with server firmware versions later than 40.48.

A slot 3 enabled label (A5576-84009) is available for rp5400 systems.

F C T
4799
Paula
A C

rp5470 PCI Card Slots

For rp5470 models, the 10 PCI I/O slots consist of Twin Turbo, Turbo, and non-Turbo slots. The following illustration shows the PCI card slot layout.



- Slots 1 and 2 are reserved for the rp54xx LAN/SCSI and GSP (Guardian Service Processor) Core I/O cards, respectively. Slots 1 and 2 are non-Turbo slots. Non-Turbo slots share a single 250MB/s PCI bus and are incapable of HotPlug functionality. The server must be turned off prior to removing or installing the LAN/SCSI or GSP cards in these slots.
- Slots 3 and 4 are non-Turbo slots. These two Non-Turbo slots share a single 250MB/s PCI bus, run at 33MHz and support 32 and 64-bit PCI cards. Non-Turbo slots are incapable of HotPlug functionality. The server must be turned off prior to removing or installing PCI cards in these slots.
- Slots 5 - 10 are Turbo slots. Each Turbo slot has a dedicated 250MB/s PCI bus, run at 66MHz and support 32 and 64-bit PCI cards. Turbo slots are HotPlug capable. Below each Turbo slot is a plastic PCI card separator. The PCI card separator has two LEDs and a pull tab on the outer edge. The LED's provide power and status for the slot. The pull tab allows the PCI card to be easily removed.
- Slots 11 and 12 are Twin Turbo slots. Each Twin Turbo slot has a dedicated 500MB/S PCI bus, runs at 66 MHz, and supports 32- and 64-bit PCI cards. Twin Turbo slots are HotPlug capable. Below each Twin Turbo slot is a plastic PCI card separator. The PCI card separator has two LEDs and a pull tab on the outer edge. The LED's provide power and status for the slot and the pull tab allows the PCI card to be easily removed.

rp5470 servers have access to all (1-12) slots.

PCI I/O Card Installation Restrictions

Restrictions apply regarding the installation of PCI I/O cards which contain a PCI-to-PCI bridge:

- HP-UX boot is currently not supported for cards that contain a PCI-to-PCI bridge.
- HP-UX patches are required when more than one card containing a PCI-to-PCI bridge is installed in non-Turbo slots.

PCI I/O Card Installation Order

The following table shows a standard factory PCI card installation that begins with slot 12. Use this table as a guideline for installing PCI I/O cards in the field.

NOTE A system shipped from the factory may have a different configuration than the same system built in the field. For example: The factory will install the graphics card in slot 12 and add other cards below. In the field, slot 12 may already be occupied by another PCI card. It is acceptable for the graphics card to be installed in any available Turbo slot.

Product Number	Description (all are PCI cards)	Max	Boot	Load Order *	Part Number	Notes
A6150A	Graphics, Graphics Card	1	No	1	A4982-66501	3,8

*In top down order.

Notes:

1. Card contains a PCI-to-PCI bridge.
2. Requires PHKL_20123, PHKL_20629 and PHNE_19826 or their superseded equivalents.
3. Not supported in non-Turbo slots. Install in Turbo slots only.
4. Requires server firmware revision 39.46 or later.
5. Requires HP-UX 11.1
6. Maximum is 7 for HP-UX versions prior to 11.0. Maximum is 10 for HP-UX version 11.1 and later.
7. Requires PHKL_19543 and PHKL_19544 or their superseded equivalents.
8. Requires HP-UX 11.0 Support Plus (IPR) 0006, June 2000 or later. This product to be released 6/00.
9. Not supported in a shared slot (slots 3-4 for rp5470, slots 3-6 for rp5450, not applicable for rp5400).
10. If you are installing ATM 622 cards in an rp5470 configuration, do not install them in slots 3 and 4 (shared slots).
11. Requires 768 MB for first card and 512 MB for each additional card.
12. Not supported in shared slots.
13. Max of 1. Needs USB card for keyboard and mouse.
14. Contains PCI bridge.

Installing a PCI Card

Follow these procedures to install a PCI card.

Step 1. Power down and unplug the rp54xx server.

NOTE DC voltages are present when the server is connected to AC power. Do not attempt to install or service: CPUs, Memory, PSMs, the Platform Monitor or PCI I/O cards installed in non-Turbo slots (1-6) while DC voltage is present. Failure to observe this warning may result in damage to the server.

Step 2. Make the right side of the server accessible for service.

Step 3. Using a Torx 15 screwdriver, loosen the captive screws on the right side panel. This panel has a label which shows which PCI I/O slots are available and the corresponding paths. The PCI I/O slot paths for rp5400, rp5450, and rp5470 are shown below.

Slot	rp5400		rp5450		rp5430/rp5470	
	Slot Type	**Path**	**Slot/Type**	**Path**	**Slot Type**	**Path**
12	**Turbo**	**0/4/0**	**Turbo**	**0/4/0**	**Twin Turbo**	**0/10/0**
11	Turbo	0/7/0	Turbo	0/7/0	Twin Turbo	0/12/0
10	Turbo	0/3/0	Turbo	0/3/0	Turbo	0/8/0
9	Turbo	0/6/0	Turbo	0/6/0	Turbo	0/9/0
8	Turbo	0/2/0	Turbo	0/2/0	Turbo	0/3/0
7	Not Available		Turbo	0/5/0	Turbo[a]	0/1/0
6	Not Available		Shared	0/1/0	Turbo[a]	0/5/0
5	Not Available		Shared	0/1/1	Turbo[a]	0/2/0
4	Not Available		Shared	0/1/2	Shared[a]	0/4/0
3	Not Available[b]		Shared	0/1/3	Shared	0/4/2
2	GSP		GSP		GSP	
1	LAN/SCSI		LAN/SCSI		LAN/SCSI	

a. Slot is NOT AVAILABLE for rp5430.
b. Slot 3 becomes available with server firmware versions later than 40.48.

Step 4. Remove the PCI slot cover from the slot that will receive the PCI card. To remove the PCI slot cover, slide the PCI slot cover away from the server.

Preface

Printing History

The Printing History below identifies the edition dates of this manual. Updates are made to this publication on an unscheduled, *as needed*, basis. The updates will consist of a complete replacement manual and pertinent on-line or CD-ROM documentation.

First Edition ..... November 2002

What's New?

The, *Upgrade Guide, rp5400 Family of Servers*, is new and was developed to provide customers with system maintenance information for those components called customer replaceable units (CRUs). Maintenance of CRUs does not require HP customer engineering services, except when specifically cautioned. The cautions are shown primarily to protect customer product warrantees.

1 Server Overview

The rp5400 family of servers are 1-way to 4-way servers based on the PA-RISC processor architecture. The rp5400 family of servers accommodate up to 16GB of memory and internal peripherals including disks and DVD ROM/Tape. High availability features include HotSwap fans and power supplies, and HotPlug internal disk drives. The supported operating system is HP-UX.

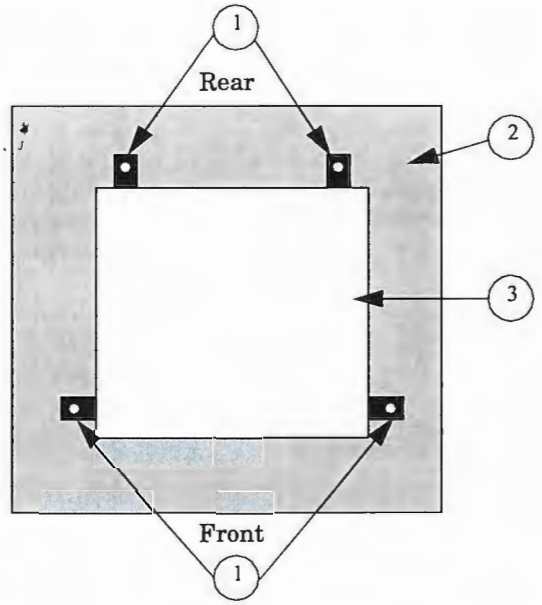
Doc: 3

Factory Integrated rp54xx Cabinet Installation

A factory integrated server is one in which the rp54xx server and associated components are pre-assembled and shipped from the factory already installed in a Hewlett-Packard E-Series cabinet. Factory integrated systems reduce the amount of time required to set-up and begin server operation.

1. Carefully remove the carton and anti-static bag from the pallet.
2. Remove the front two (2) L-brackets. Retain the 1/2-inch bolts for later use.



1. Shipping L-Bracket
2. Shipping Pallet
3. Cabinet (Top View)

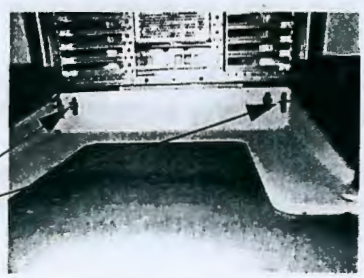
NOTE As viewed from the front, one bracket is located on each side at the base of the cabinet near the front.

E C T
3.4825
Paula
L - AC I

3. At the rear of the cabinet:

   a. Open the door.

   b. Remove the anti-tip foot by removing and retaining the two (2) 1/2-inch bolts.



For Shipping: L-brackets are mounted behind anti-tip foot. Same bolts secure both.

   c. Remove the two (2) L-brackets (revealed by removing the anti-tip foot).

4. Remove the two ramps from the pallet and carefully place them into the slots at the front of the pallet.

WARNING **Use extreme care when rolling the racked system down the ramps. A rack containing one rp54xx can weigh up to 418 lbs. Do not stand in front of the ramps when rolling the cabinet off the pallet or injury may occur. All but the smallest configurations require two persons to safely remove the rack from the pallet.**

If anti-tip feet or ballast are not installed or are improperly installed the cabinet can tip. Failure to follow this precaution can cause injury to personnel or damage to equipment.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1558
Doc: 3701

5. Straighten the rollers on the cabinet base, if needed, and carefully roll it down the ramps.

WARNING ***After removing the server from the pallet, Do not move the cabinet unless the anti-tip feet are installed!*** **The cabinet can tip if care is not used. Due to their low ground clearance the feet may catch on irregularities on the floor, thresholds, or ramps.**

Do not move the cabinet without first installing the anti-tip feet. **The cabinet may tip if moved without the anti-tip feet or ballast installed.**

Do not move the cabinet after installing the anti-tip feet unless they are in the fully-raised position. **Once installed, the anti-tip feet must be fully raised to allow ground clearance.**

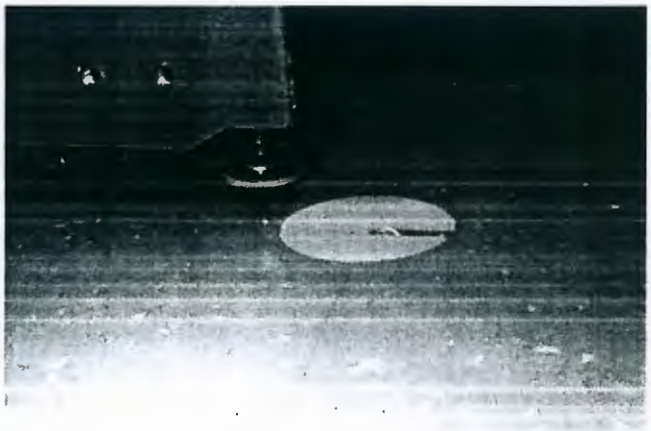
Because of their low ground clearance, the fully-raised anti-tip feet may need to be removed *temporarily* to clear some obstacles such as door jambs, ramps, and other large irregularities or obstructions on the floor.

If you must temporarily remove the anti-tip feet to clear an obstacle, use extreme caution when moving the cabinet. Always reinstall the anti-tip feet as soon as the obstacle has been cleared.

Lower and secure both the anti-tip feet and the cabinet leveling/stabilizer feet once the cabinet is in place.

Failure to follow these precautions can result in equipment damage or personal injury.

6. Install the front and rear anti-tip feet using the 1/2 inch bolts provided. Ensure that the anti-tip feet are installed in the fully up position in the mounting slots. This will provide maximum ground clearance while moving the cabinet to its final position.
7. Carefully move the cabinet to its installation location.
8. Lower the anti-tip feet to the fully down position and adjust the cabinet leveling feet for best cabinet stability.



E C T

Receive and Unpack A Non-Integrated Server

WARNING **The typical rp54xx system can weigh up to 68kg (150lbs). *HP recommends using an an approved lifting device*. Lift and move the server in accordance with all local safety regulations. Failure to follow this precaution can cause injury to personnel or damage to equipment.**

Unpacking the server

The following procedure describes the steps involved in unpacking the server, whether to function as a stand-alone Deskside unit, or to be integrated into a cabinet.

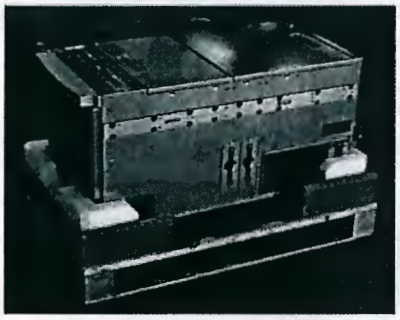
Step 1. Remove the shipping carton and anti-static bag from the server as depicted below.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
1559
Fls:
3701
Doc:

NOTE The packaging for rp74xx and rp54xx servers is the same, rp74xx is shown.

Step 2. If you are moving the server manually, use three people to lift the server from the packing material and pallet. Carefully move the server to the selected location.

Step 3. If you are moving the server by an approved lifting device (such as Genie Lift ™), remove the tear flap from the front lip of the carton bottom to allow access to the server, as illustrated below. Removal of the tear flap will reveal a slot between the bottom of the server and the inside bottom of the cardboard box.



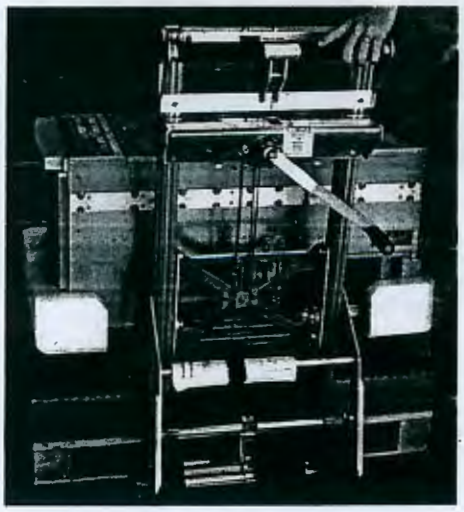
ECT
CPL - AC

Step 4. Carefully raise the lift's platform so that it will slide into the slot located ***under*** the center of the server, but ***over*** the top of the pallet.

Lifting Device Platform.

NOTE The server's center of gravity will vary with the hardware configuration, but it is generally located slightly behind the middle of the server.

Step 5. Raise the lifting device platform enough for the server to clear the pallet and packing materials, as show below.



RQS Nº 03/2005 - CN
CPMI - CORREIOS
1560
Fls: 3701
Doc:

Install Deskside Server

The following section describes the installation of a server into a Deskside enclosure for installation in an office environment.

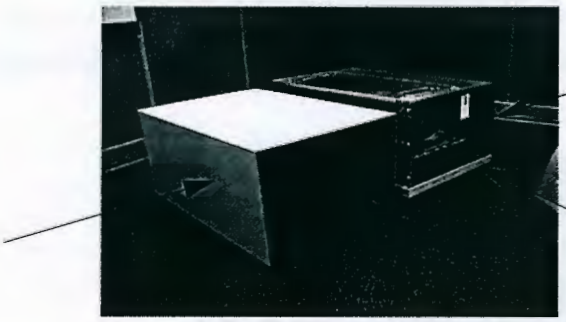
WARNING **The typical rp54xx system can weigh up to 68kg (150lbs). *HP recommends using an approved lifting device.***

- **Lift and move the server in accordance with all local safety regulations.**
- **Do not attempt to lift the server by the plastic handles on the top and side covers.**

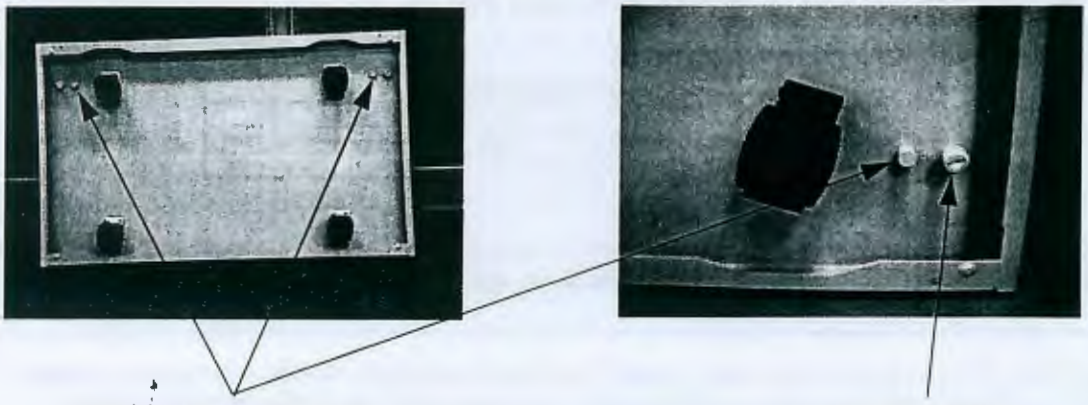
Failure to follow these precautions can cause injury to personnel or damage to equipment.

Step 1. Unpack the server.

Step 2. Unpack the deskside enclosure.



NOTE Ensure that the positioning spring pins in the enclosure base align with the alignment holes in the bottom of the server.



Step 3. Position the server on the wheeled enclosure base.

Step 4. Tighten the two captive screws in the enclosure base to secure the server to the base.

Step 5. Position the enclosure cover (outside skin) over the server and install and tighten the screws to secure it to the base.

NOTE The perforations and the lip of the outside skin should be toward the rear of the server.

WARNING **Stacking rp54xx servers in deskside enclosures is *not* supported.**

Stacking rp54xx servers in deskside enclosures can damage equipment, may cause injury to personnel, and may void your warranty or service contract.

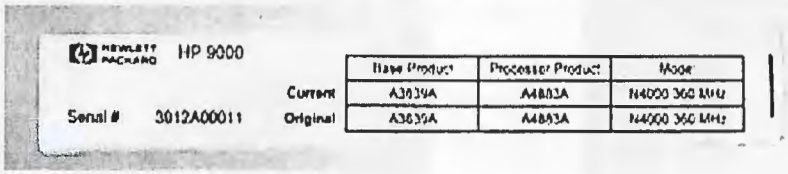
Step 6. Install the Front Bezel.

Step 7. Locate the two pull-tabs. One pull-tab is longer than the other. The shorter pull-tab is blank on both sides. The back of the shorter pull-tab provides a writable surface for Customer use.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1561
Doc: 3701

Step 8. Locate the plastic bag containing the label sheet (taped to the server).

Step 9. Remove the label containing serial number, base product, processor product, and model information from the label sheet and apply to the back of the longer pull-tab.



NOTE Pull-tab and label shown above is for an rp74xx server. rp54xx uses the same style label and similar pull-tab.

Step 10. Insert the pull-tabs into the front bezel. Install the longer pull-tab in the left side plastic window in such a way that the rp54xx logo is visible. Install the shorter pull-tab in the right side plastic window with either surface visible. Refer to the diagram above for pull-tab locations.

E C T
CPL - AC

Install Stand-Alone Server in a Cabinet

The following describes how to install the A5556A slide-tray assembly into an approved HP cabinet in preparation for installing an rp54xx server.

This slide-tray assembly can be installed in an HP E-Series cabinet or other HP cabinets approved for rp54xx system installation. To install the A5556A slide-tray assembly in an approved HP equipment cabinet, proceed as follows:

Step 1. Determine what type of cabinet you are installing the slide-tray assembly into.

a. E-Series cabinets have:

- Parchment white, plastic, sectional, side panels
- Black painted vertical frame posts with a partial return flange.

Vertical,
Rectangular,
Mounting Slots

b. Approved, non-E-Series, cabinets have:

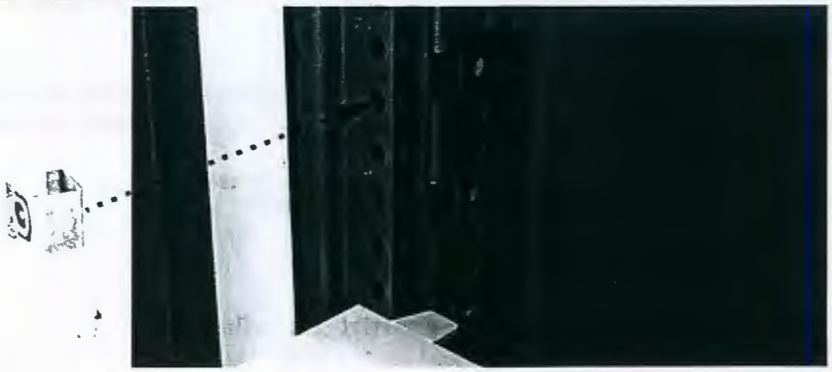
- Single piece metal side panels
- Gray painted verticle frame posts with full return flanges.

Vertical,
Rectangular,
Mounting Slots

Step 2. Note the vertical, rectangular, slots in the return flanges on the vertical mounting posts. Determine into which of these vertical slots the slide/tray kit will be installed. This is done by counting down eight rectangular slots from the top of the cabinet or the bottom of the equipment above.

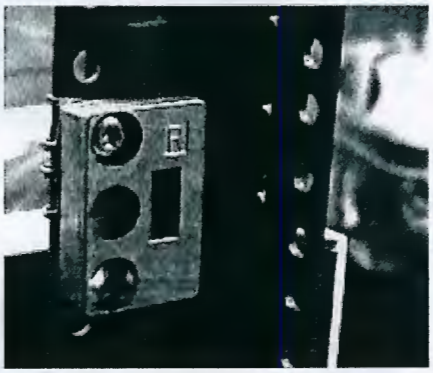
RQS Nº 03/2005 - CN
CPMI - CORREIOS
1562
Fls:
3701
Doc:

Step 3. On the front vertical mounting posts *only*, slide M5 sheet metal nuts onto the posts over the holes immediately adjacent to the vertical slots determined in the previous step. Also place M5 sheet metal nuts on the holes directly above these. Orient the sheet metal nuts so that the threaded portion faces towards the outside of the cabinet. There should now be a total of four (4) sheet metal nuts installed.



Step 4. If the cabinet is a non-E-Series cabinet, discard the left hand and right hand aluminum spacers and two of the M5 x 16 screws with cress-cup washers and proceed to step 12.

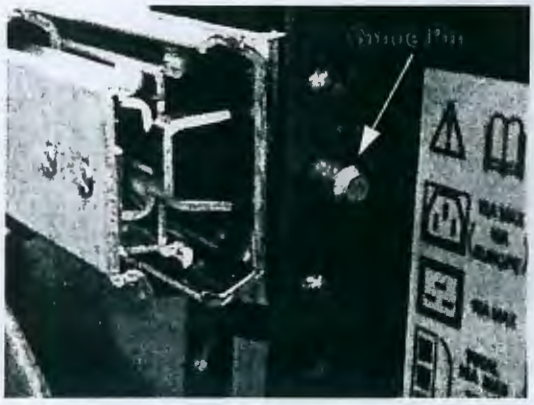
Step 5. If the cabinet is an E-Series cabinet, place the hook of the aluminum spacer marked "L" (5183-1864) into the appropriate vertical, rectangular slot on the front, left hand mounting post. The hook points downward. Similarly, place the spacer marked "R" (5183-1863) into the appropriate slot on the right hand mounting post.

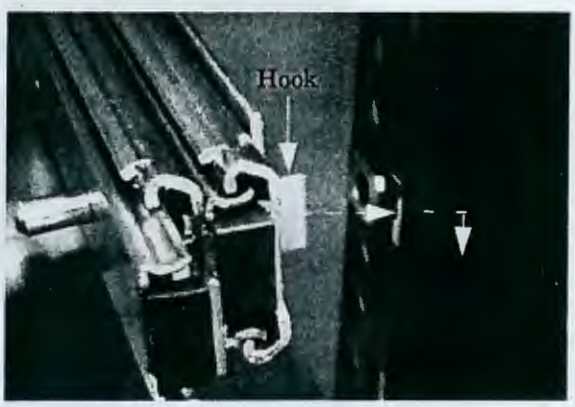


Step 6. Use one M5 x 16 screw with cress-cup washer to attach each spacer to its vertical post. Do this by inserting the screw through the top hole in the spacer, through the mounting rail and tightening it into the sheet metal nut located at that position.

Step 7. Take the left hand slide/bracket assembly (marked 337079-1L) and install it into the left hand vertical mounting posts. This is done by inserting the pin at the rear of the slide's mounting bracket into the 23rd hole in the rear vertical mounting post and inserting the hook at the front of the

bracket into the vertical, rectangular slot in the aluminum spacer. The slide should be positioned in the cabinet so that it is horizontal and level.





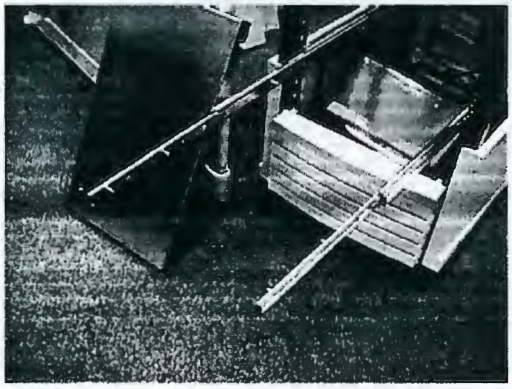
Step 8. Securely fasten the rear of the slide's mounting bracket to the rear vertical mounting post by installing and tightening two of the M5 x 16 screws with cress-cup washers thorough the mounting post, through the slides mounting bracket and into the threaded nuts attached to the mounting bracket.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1563
Fls:
3701
Doc:

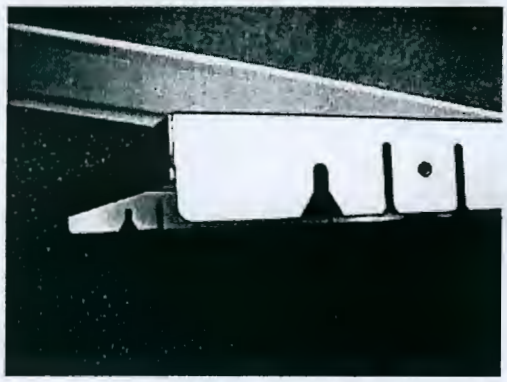
Step 9. Fully extend the slide so that it is locked in the fully open position.

Step 10. Use an M5 x 30 screw with a cress cup washer to attach the front of the slide to the vertical mounting post. Insert the screw through the slide, through the center hole of the aluminum spacer, through the vertical mounting post, and tighten into the sheet metal nut located at that position.

Step 11. Use a procedure similar to steps 7 through 10 to install the right hand slide/bracket assembly (marked 337079-1R) and then proceed to step 12.



Step 12. Take the tray and place it onto the pins that extend from the slides' inner members. The slots with wide lead-in guides on the side of the tray fit down onto the slides' pins. The flat part of the tray will be on top, and the mounting holes in the top of the tray will be located to the right of the center of the tray. Slide the tray all the way down on both sides so that the pins reach the top of the slots in the side of the tray.



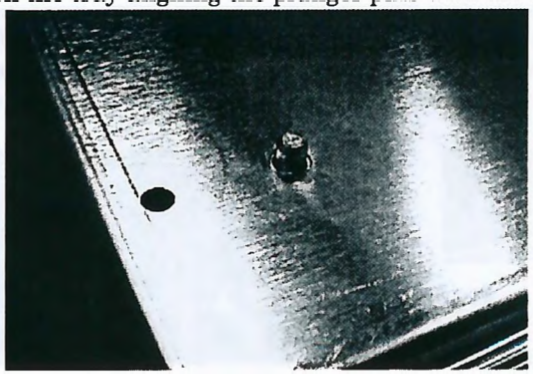
Step 13. Use six, M5 x 12 screws (without washers) to attach the tray to the slides. Three screws are used to attach each slide. Insert the screws through the slides, through the tray and tighten into the threaded nuts located on the inside of the sides of the tray.

3 Pan Head
M5x12 T25 screws
on each side

Step 14. From the bottom of the tray pull the plunger pin down and give it a 1/4 turn to hold it in place.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1564
Fls:
3701
Doc:

Step 15. Position the server on the tray aligning the plunger pins with the alignment holes in the chassis.



Step 16. Release the plunger pins to secure the server.

Stationary L-Bracket Rail Assembly

rp54xx servers may be installed into E-Series and approved Non- E-Series cabinets using stationary L-bracket rail assembly kits listed below.

NOTE rp54xx servers are supported in Hewlett-Packard E-series and approved Non- E-series Hewlett-Packard cabinets, and approved rail kits.

For information on additional qualified 3rd party cabinets and rail kits, contact the nearest Hewlett-Packard Response Center.

Cabinet Type	Rail Kit Product Number
E-Series HP Cabinet	A5575A
Other Approved HP Cabinet	A5562A

Identifying Approved Non-E-Series HP Cabinets

Approved Non- E-Series cabinets have black frames, one piece outside sheet metal skins, a partial return flange, and *requires* the installation of the aluminum spacer blocks, supplied with the rail kits.

Approved Non- E-Series cabinets include the following product numbers: A1883A, A1884A, A1896A, A1897A, C1897A, C2785A, C2786A, and C2787A.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1565
Fls: 3701
Doc:

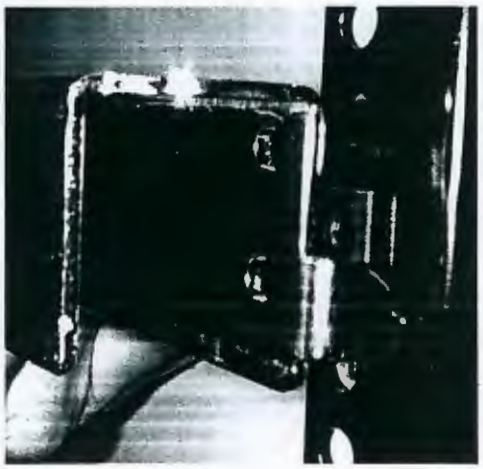
Identifying E-Series HP Cabinets

E-Series cabinets have light gray frames, sectioned, plastic outside "skins", a full return flange, and does *not* require the installation of the aluminum spacer block supplied, with the rail kits.

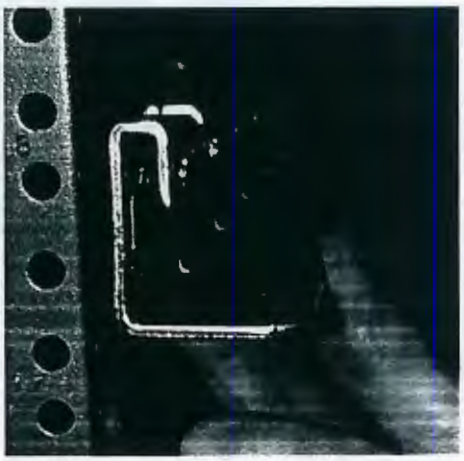
E-Series cabinets include the following product numbers: A5134A, A5136A, A5136A, A4900A, A4901A, A4902A, J1500A, J1502A, and J1502A.

Identifying Static Rail Kit

Hewlett-Packard has currently approved two static rail kits for use in cabinet mounting the rp54xx server. They are illustrated below.



A5562A Kit Rail



A5575A Kit Rail

Installing Stationary Rails

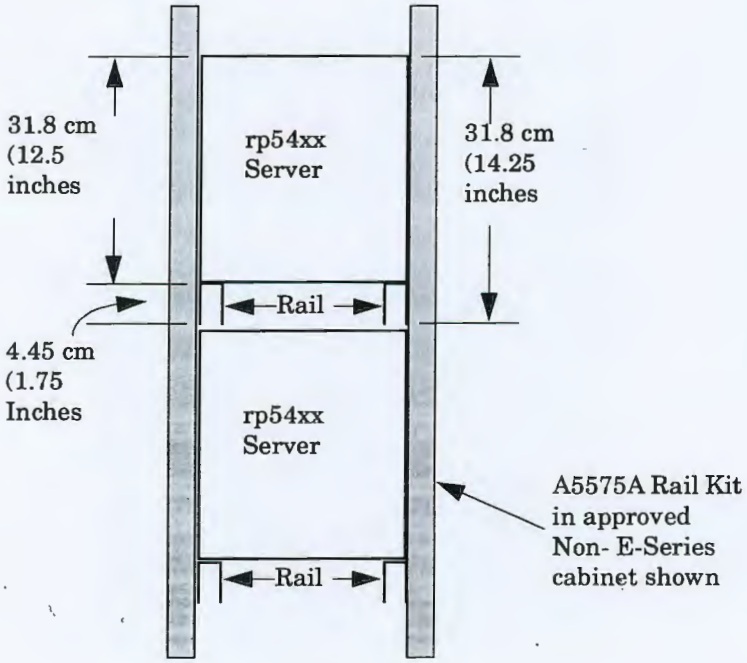
The installation of stationary rails is similar for most cabinet and rail combinations. The key considerations to are:

- Ensure that all safety precautions are read, understood, and observed
- Follow all installation instructions provided with the cabinet and rail kits, and
- Ensure that the rails extend out from the cabinet posts sufficiently to properly and safely support the equipment being installed.

To install an rp54xx server on stationary rails in an approved cabinet proceed as follows:

Step 1. Locate the rail mounting height in the cabinet. Allow for the following space requirements:

- For each rp54xx server, allow 31.8cm (12.5 inches) vertically (7 EIAs or Rack Units (RUs).
- If installing the A5575A rail kit, allow an *additional* vertical 4.45cm (1.75 inches (1 EIA) each set of rails.



Step 2. Install sheet metal nut(s) in the vertical cabinet posts at the required height for the kit being installed:

- Install the first nut either:
  - — 4.45 cm (1.75 Inches) above the top, or
  - — 31.8 cm (12.5 inches) below the bottom of the last server.
- If installing a A5562A rail kit, install the second nut in the next frame hole below the first.

Step 3. Hold the rail in place and insert and tighten the screws.

3 Installing Additional Components

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1567
Fls:
Doc: 3701

Additional Components

Some internal components are too delicate to be installed in the server prior to shipping. These internal components are shipped with the server, but are packed separately. They can be installed after the cabinet has been unpacked and positioned.

Some of the internal components that are packed separately are not user-installable. To maintain warranty validation, these items *must* be installed by a Hewlett-Packard Customer Engineer.

If you received either (or both) of the components listed below, contact your Hewlett-Packard provider to arrange for installation.

- Central Processing Units (CPUs)
- Power Distribution Units (PDUs)

E C T
24805
Paulo
C A L - A C

Installing Memory

Memory Configuration Rules

rp54xx servers have 16 slots (8 DIMM pairs) for memory DIMMs. These slots are numbered 0a/b, 1a/b,... 7a/b. 8 of these slots (4a/b - 7a/b) are disabled on rp5400 servers. rp5450 servers can access all slots. rp5400 and rp5450 servers have DIMM slots located on the System Board.

rp5470 servers install DIMMs using Memory Carriers. The Memory Carriers fit into slots on the System Board.

The following rules govern the installation of memory DIMMs for rp5400, rp5450, and rp5470 servers:

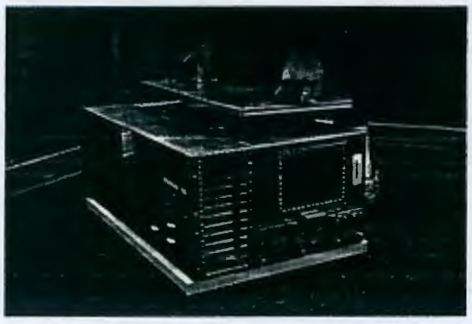
- Memory must be installed in DIMM pairs.
- The capacity of DIMMs within a pair must be the same.
- Install DIMMs with the greatest capacity in the lowest slot numbers.
- Install DIMMs the following slot order: 0a/b, 1a/b, 2a/b, 3a/b, and so on.

Installing rp5400 and/or rp5450 DIMMs

Step 1. Power down and *unplug* the rp54xx server.

CAUTION DC voltages are present when the server is connected to AC power. Do not install or service rp54xx internal components while DC voltage is present. Failure to observe this precaution can result in damage to the server.

Step 2. Loosen the captive T-15 screws that hold the top cover in place, then grasp the strap handle, raise the cover slightly, and pull the cover toward the front of the server to free the cover tabs from the slots in the chassis. The air baffle will be exposed.



Step 3. Make the top of the server accessible for service.

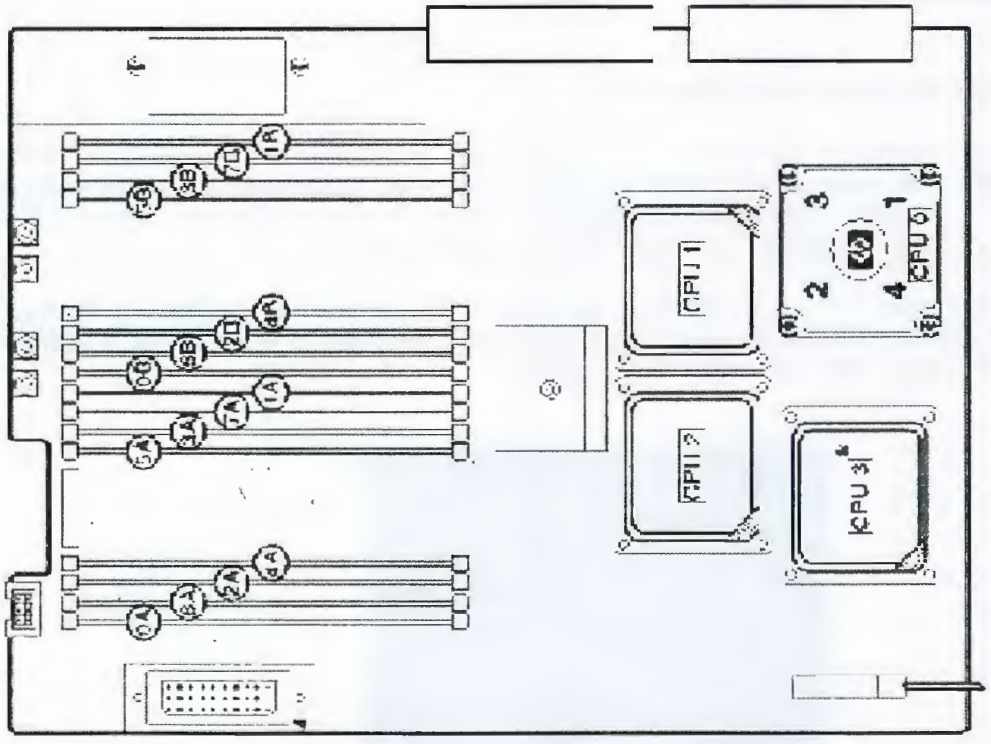
ROS Nº 03/2005 - CN
CPMI - CORREIOS
25
1568
Fls:
3701
Doc:

Step 4. Loosen the captive T-15 screws on the air baffle. Grasp the two handles on the baffle, and lift the baffle remove it.

CAUTION Observe all ElectroStatic Discharge (ESD) precautions Do not touch internal components. Failure to observe ESD precautions can cause damage to components.

Step 5. Observe Electrostatic Discharge (ESD) precautions.

Step 6. Refer to the following graphic for memory slot locations.



Locate the correct DIMM pair slots. Insert the DIMM connectors into the guides until the card snaps firmly in place. It may be necessary to apply downward force using the palm of your hand on the DIMM. Observe the top of the DIMM to make sure one side is not higher than the other.

NOTE It may be necessary to remove PSM 1 when installing a DIMM in slot 0a and PSM 0 when installing a DIMM in slot 1b. If either PSM is removed to install memory, ensure it is re-installed.

Step 7. Replace the air baffle. Tighten the four captive screws to secure the air baffle in place.

Step 8. Replace the top cover. Tighten the four captive screws to secure the top cover in place.

Step 9. For rack configurations, insert the rp54xx server back into the rack.

Step 10. For deskside enclosure configurations, replace the deskside enclosure cover.

Step 11. Power the rp54xx server on.

Step 12. Use the BCH command `in me` to verify the system recognizes the memory that you have just added.

Installing rp5470 DIMMs

DIMMs for the rp5470 system are installed in memory carriers instead of the system board, as are the other rp54xx systems. However, rp5470 memory carriers are also located on the system board, so the method for opening and closing the system is the same. Procedures for removing and replacing the server top and baffle are listed below, without the pictures shown in the section titled, *"Installing rp5400 and/or rp5450 DIMMs."* If you wish to reveiw the pictures, please refer to the aforementioned section.

Step 1. Power down and unplug the rp54xx server.

NOTE DC voltages are present when the server is connected to AC power. Do not attempt to install or service: CPUs, Memory, PSMs, the Platform Monitor or PCI I/O cards installed in non-Turbo slots (1-6) while DC voltage is present. Failure to observe this warning may result in damage to the server.

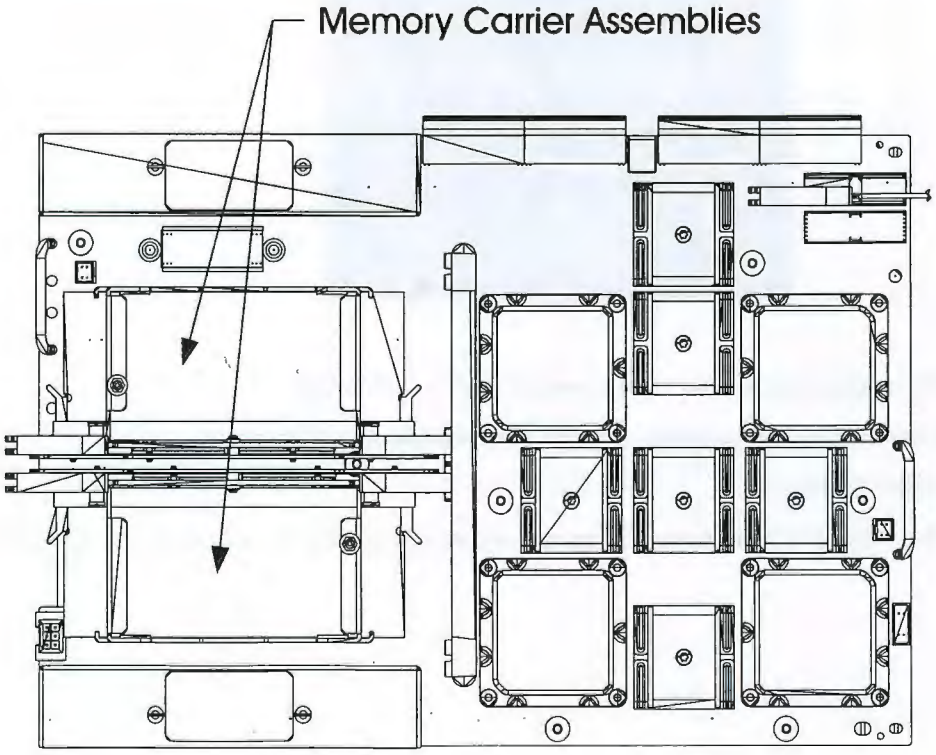
Step 2. Make the top of the server accessible for service.

Step 3. Loosen the captive T-15 screws that hold the top cover in place, then grasp the strap handle, raise the cover slightly, and pull the cover toward the front of the server to free the cover tabs from the slots in the chassis. The air baffle will be exposed.

Step 4. Loosen the four (4) captive T-15 screws on the air baffle. Grasp the two handles on the baffle, and lift and remove the baffle.

Step 5. Observe Electrostatic Discharge (ESD) precautions.

Step 6. Refer to the following graphic for Memory Carrier locations.



a. Locate the Memory Carrier and pull up on the extractor levers on each end of the Memory Carrier to unseat the Memory Carrier from its socket.

b. When the Memory Carrier unseats from the socket, pull it away from the System Board.

c. Loosen the captive screws that secure the DIMM Clip and remove the DIMM Clip from the Memory Carrier.

d. Seat the memory DIMM into its socket on the Memory Carrier.

e. Press the extractor levers on each end of the memory DIMM slot inward until the levers snap into place.

f. Attach the Memory Clip to the Memory Carrier with the DIMM slot markings on the top of the Memory Clip aligned with the DIMM slot markings on the Memory Carrier.

g. Secure the Memory Clip using the captive screws.

h. Seat the Memory Carrier into the appropriate slot on the System Board.

i. Push down on the extractor levers and snap them into place.

Step 7. Replace the air baffle. Tighten the four captive screws to secure the air baffle in place.

Step 8. Replace the top cover. Slide the cover tabs into the slots in the chassis and close the cover. Tighten the two captive screws to secure the top cover in place.

Step 9. For rack configurations, insert the rp54xx server back into the rack.

Step 10. For deskside enclosure configurations, replace the deskside enclosure cover.

Step 11. Power the rp54xx server on.

Step 12. Use the BCH command `in me` to verify the system recognizes the memory that you have just added.

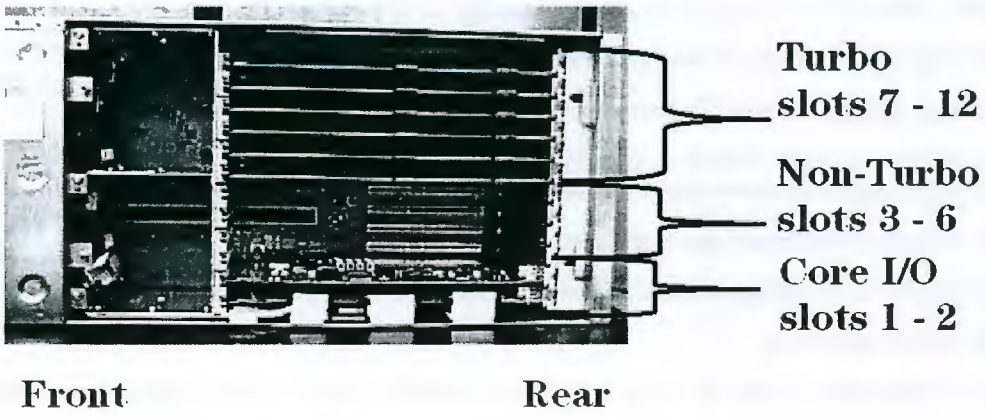
Installing Peripheral Component Interconnect (PCI) Cards

rp54xx servers have a total of 12 PCI I/O slots. Slots 1 and 2 are reserved for the LAN/SCSI and GSP Core I/O cards, leaving 10 PCI I/O slots available for Customer use.

rp5400/rp5450 PCI Card Slots

For rp5400 and rp5450 models, 10 PCI I/O slots consist of Turbo and non-Turbo slots. Server PCI slots are shown below.

rp5400/rp5450 PCI Card Slots



- Slots 1 and 2 are reserved for the rp54xx LAN/SCSI and GSP (Guardian Service Processor) Core I/O cards, respectively. Slots 1 and 2 are non-Turbo slots. Non-Turbo slots share a single 250MB/s PCI bus and are incapable of HotPlug functionality. The server must be turned off prior to removing or installing the LAN/SCSI or GSP cards in these slots.
- Slots 3 - 6 are non-Turbo slots. These four Non-Turbo slots share a single 250MB/s PCI bus, run at 33MHz and support 32 and 64-bit PCI cards. Non-Turbo slots are incapable of HotPlug functionality. The server must be turned off prior to removing or installing PCI cards in these slots.
- Slots 7 - 12 are Turbo slots. Each Turbo slot has a dedicated 250MB/s PCI bus, run at 66MHz and support 32 and 64-bit PCI cards. Turbo slots are HotPlug capable. Below each Turbo slot is a plastic PCI card separator. The PCI card separator has two LEDs and a pull tab on the outer edge. The LED's provide power and status for the slot. The pull tab allows the PCI card to be easily removed.

rp5400 servers have access to slots 1, 2 and 8-12 while rp5450 servers have access to all (1-12) slots.

NOTE Slot 3 will become enabled on rp5400 servers with server firmware versions later than 40.48.

A slot 3 enabled label (A5576-84009) is available for rp5400 systems.

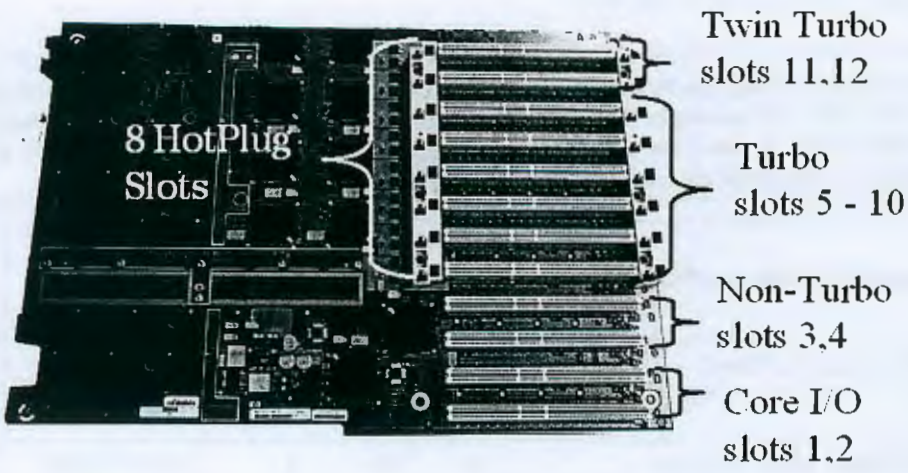
Paula
A C

rp5470 PCI Card Slots

For rp5470 models, the 10 PCI I/O slots consist of Twin Turbo, Turbo, and non-Turbo slots. The following illustration shows the PCI card slot layout.



- Slots 1 and 2 are reserved for the rp54xx LAN/SCSI and GSP (Guardian Service Processor) Core I/O cards, respectively. Slots 1 and 2 are non-Turbo slots. Non-Turbo slots share a single 250MB/s PCI bus and are incapable of HotPlug functionality. The server must be turned off prior to removing or installing the LAN/SCSI or GSP cards in these slots.
- Slots 3 and 4 are non-Turbo slots. These two Non-Turbo slots share a single 250MB/s PCI bus, run at 33MHz and support 32 and 64-bit PCI cards. Non-Turbo slots are incapable of HotPlug functionality. The server must be turned off prior to removing or installing PCI cards in these slots.
- Slots 5 - 10 are Turbo slots. Each Turbo slot has a dedicated 250MB/s PCI bus, run at 66MHz and support 32 and 64-bit PCI cards. Turbo slots are HotPlug capable. Below each Turbo slot is a plastic PCI card separator. The PCI card separator has two LEDs and a pull tab on the outer edge. The LED's provide power and status for the slot. The pull tab allows the PCI card to be easily removed.
- Slots 11 and 12 are Twin Turbo slots. Each Twin Turbo slot has a dedicated 500MB/S PCI bus, runs at 66 MHz, and supports 32- and 64-bit PCI cards. Twin Turbo slots are HotPlug capable. Below each Twin Turbo slot is a plastic PCI card separator. The PCI card separator has two LEDs and a pull tab on the outer edge. The LED's provide power and status for the slot and the pull tab allows the PCI card to be easily removed.

rp5470 servers have access to all (1-12) slots.

PCI I/O Card Installation Restrictions

Restrictions apply regarding the installation of PCI I/O cards which contain a PCI-to-PCI bridge:

- HP-UX boot is currently not supported for cards that contain a PCI-to-PCI bridge.
- HP-UX patches are required when more than one card containing a PCI-to-PCI bridge is installed in non-Turbo slots.

PCI I/O Card Installation Order

The following table shows a standard factory PCI card installation that begins with slot 12. Use this table as a guideline for installing PCI I/O cards in the field.

NOTE A system shipped from the factory may have a different configuration than the same system built in the field. For example: The factory will install the graphics card in slot 12 and add other cards below. In the field, slot 12 may already be occupied by another PCI card. It is acceptable for the graphics card to be installed in any available Turbo slot.

Product Number	Description (all are PCI cards)	Max	Boot	Load Order *	Part Number	Notes
A6150A	Graphics, Graphics Card	1	No	1	A4982-66501	3,8

*In top down order.

Notes:

1. Card contains a PCI-to-PCI bridge.
2. Requires PHKL_20123, PHKL_20629 and PHNE_19826 or their superseded equivalents.
3. Not supported in non-Turbo slots. Install in Turbo slots only.
4. Requires server firmware revision 39.46 or later.
5. Requires HP-UX 11.1
6. Maximum is 7 for HP-UX versions prior to 11.0. Maximum is 10 for HP-UX version 11.1 and later.
7. Requires PHKL_19543 and PHKL_19544 or their superseded equivalents.
8. Requires HP-UX 11.0 Support Plus (IPR) 0006, June 2000 or later. This product to be released 6/00.
9. Not supported in a shared slot (slots 3-4 for rp5470, slots 3-6 for rp5450, not applicable for rp5400).
10. If you are installing ATM 622 cards in an rp5470 configuration, do not install them in slots 3 and 4 (shared slots).
11. Requires 768 MB for first card and 512 MB for each additional card.
12. Not supported in shared slots.
13. Max of 1. Needs USB card for keyboard and mouse.
14. Contains PCI bridge.

Installing a PCI Card

Follow these procedures to install a PCI card.

Step 1. Power down and unplug the rp54xx server.

NOTE DC voltages are present when the server is connected to AC power. Do not attempt to install or service: CPUs, Memory, PSMs, the Platform Monitor or PCI I/O cards installed in non-Turbo slots (1-6) while DC voltage is present. Failure to observe this warning may result in damage to the server.

Step 2. Make the right side of the server accessible for service.

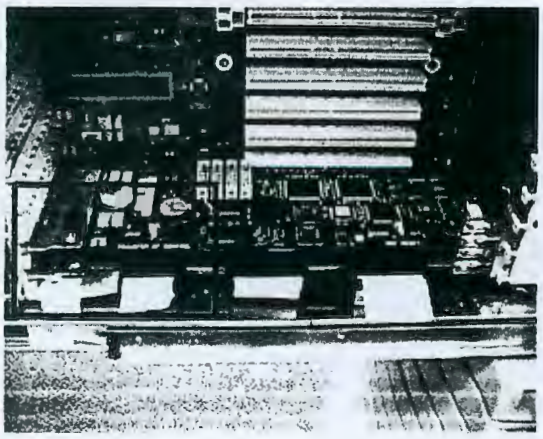
Step 3. Using a Torx 15 screwdriver, loosen the captive screws on the right side panel. This panel has a label which shows which PCI I/O slots are available and the corresponding paths. The PCI I/O slot paths for rp5400, rp5450, and rp5470 are shown below.

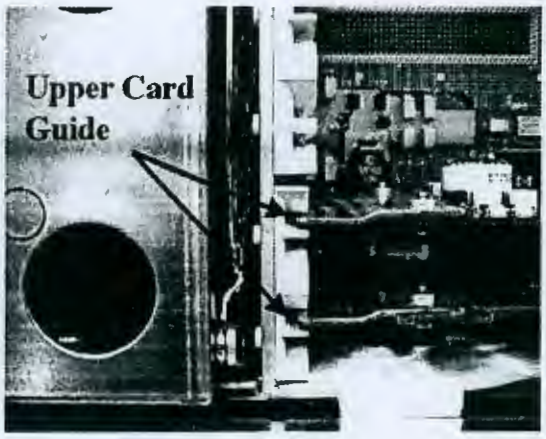
Slot	rp5400		rp5450		rp5430/rp5470	
	Slot Type	**Path**	**Slot/Type**	**Path**	**Slot Type**	**Path**
12	**Turbo**	**0/4/0**	**Turbo**	**0/4/0**	**Twin Turbo**	**0/10/0**
11	Turbo	0/7/0	Turbo	0/7/0	Twin Turbo	0/12/0
10	Turbo	0/3/0	Turbo	0/3/0	Turbo	0/8/0
9	Turbo	0/6/0	Turbo	0/6/0	Turbo	0/9/0
8	Turbo	0/2/0	Turbo	0/2/0	Turbo	0/3/0
7	Not Available		Turbo	0/5/0	Turbo[a]	0/1/0
6	Not Available		Shared	0/1/0	Turbo[a]	0/5/0
5	Not Available		Shared	0/1/1	Turbo[a]	0/2/0
4	Not Available		Shared	0/1/2	Shared[a]	0/4/0
3	Not Available[b]		Shared	0/1/3	Shared	0/4/2
2	GSP		GSP		GSP	
1	LAN/SCSI		LAN/SCSI		LAN/SCSI	

a. Slot is NOT AVAILABLE for rp5430.
b. Slot 3 becomes available with server firmware versions later than 40.48.

Step 4. Remove the PCI slot cover from the slot that will receive the PCI card. To remove the PCI slot cover, slide the PCI slot cover away from the server.

Step 5. Slide the PCI card connectors into the slot, snapping firmly in place. For full length (cards that extend to the left side card guides) PCI cards, use the UPPER card guide.





Step 6. At the rear of the chassis, connect the I/O cable to the card just installed.

Step 7. Replace the right side panel and tighten the captive screws.

Step 8. For rack configurations, insert the rp54xx server back into the rack.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1573
Fls:
3701
Doc:

Step 9. For deskside enclosure configurations, replace the deskside enclosure cover.

Step 10. Power the server on.

Step 11. Use the server firmware `in io` command to verify the PCI cards are recognized by the server. If AUTOBOOT is ON, it will be necessary to interrupt the boot process to get to the server firmware `Main Menu: Enter command or menu >` prompt.

Step 12. Boot HP-UX and run the `ioscan` utility to verify the system recognizes the new PCI card.

Online Addition/Replacement (OLA/R) of PCI I/O cards

Beginning with HP-UX 11i (11.11) rp54xx servers support the on-line addition and replacement of PCI I/O cards. In order for this high availability feature to be fully implemented, the following server requirements must be met:

- rp5400A/rp5450A firmware must be later than 40.26 (rp5400B/rp5450B/rp5470A firmware will support OLA/R upon its release).
- HP-UX operating system must be 11i (11.11) or later.

There is a bit that the HP-UX operating system examines to determine if the server hardware and firmware is capable of OLA/R. This bit is controlled by server firmware. If the bit is ON, OLA/R is possible (when requirements have been met). The bit was mistakenly set to ON for all rp5400 and rp5450 revision A (rp5400A and rp5450A) servers. As a result, HP-UX may incorrectly identify these models as being OLA/R capable. In order to avoid this confusion, verify that the correct level of server firmware is installed.

Installing Graphics

This section explains how to install rp54xx 2D graphics hardware. For a complete graphics solution, three products are required. The products listed below are the only products supported on rp54xx servers.

- A6150A rp54xx Graphics Package
  - — Includes PCI graphics card
  - — Includes PCI USB (Universal Serial Bus) card
- A4983B Keyboard and Mouse Kit
  - — Includes mouse with 114" cable
  - — Includes keyboard with 109" cable
- D8910W (19") or D2847W (21)" Monitor
  - — Includes localized power cord and 75" 15-pin video cable

NOTE rp54xx graphics requires HP-UX 11.0 Support Plus (IPR) 0006, June 2000 or later.

The photo below includes the A6150A, A4983B and D8910W products. The video cable for the monitor is not shown. Black ESD mat not included.

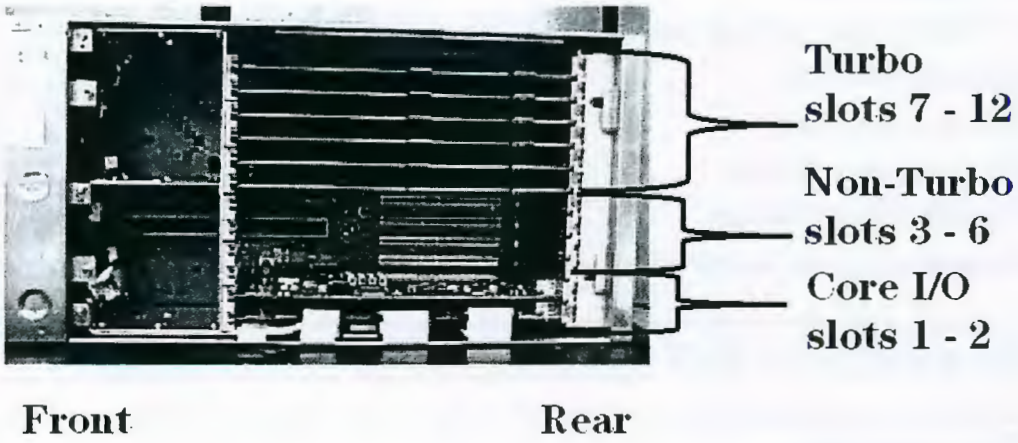
rp54xx servers have a total of 12 PCI I/O slots. Slots 1 and 2 are reserved for the LAN/SCSI and GSP Core I/O cards, leaving 10 PCI I/O slots available for Customer use. These 10 PCI I/O slots consist of Turbo and non-Turbo slots.

rp54xx PCI Slots



- Slots 1 and 2 are reserved for the rp54xx LAN/SCSI and GSP (Guardian Service Processor) Core I/O cards, respectively. Slots 1 and 2 are non-Turbo slots. Non-Turbo slots share a single 250MB/s PCI bus. Non-Turbo slots are incapable of HotPlug functionality. The server must be turned off prior to removing or installing the LAN/SCSI or GSP cards in these slots.
- Slots 3 - 6 are non-Turbo slots. These four Non-Turbo slots share a single 250MB/s PCI bus, run at 33MHz and support 32 and 64-bit PCI cards. Non-Turbo slots are incapable of HotPlug functionality. The server must be turned off prior to removing or installing PCI cards in these slots.
- Slots 7 - 12 are Turbo slots. Each Turbo slot has a dedicated 250MB/s PCI bus, run at 66MHz and support 32 and 64-bit PCI cards. Turbo slots are HotPlug capable. Below each Turbo slot is a plastic PCI card separator. The PCI card separator has two LEDs and a pull tab on the outer edge. The LED's provide power and status for the slot. The pull tab allows the PCI card to be easily removed.

rp5400 servers can access PCI slots 1,2 and 8-12. rp5450/3000 servers can access all PCI slots.

Follow these procedures to install graphics cards.

Step 1. Install HP-UX 11.0 Support Plus (IPR) 0006, June 2000 or later. This step ensures the appropriate HP-UX drivers are installed.

Step 2. Power down and unplug the rp54xx server.

Doc: 3701

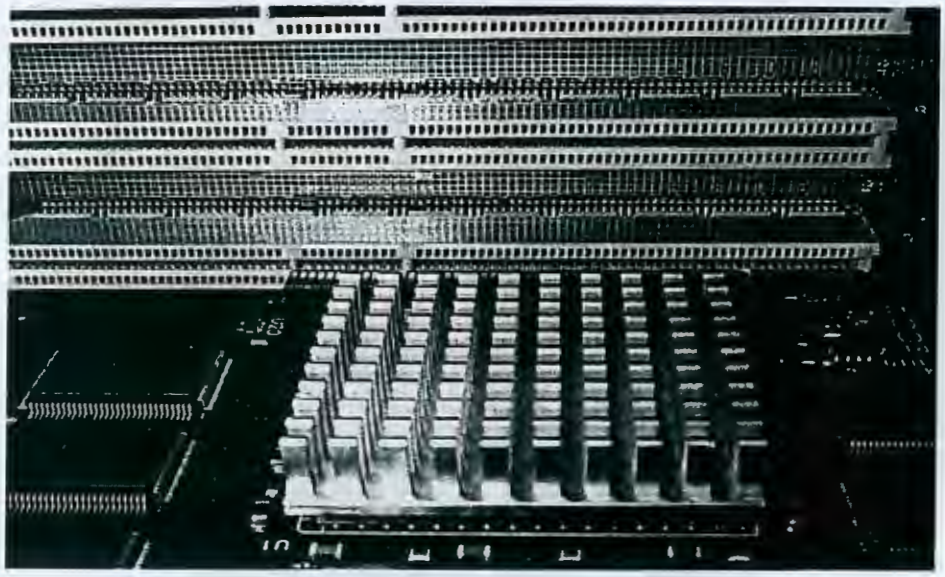
Step 5. Grasp the handle on the right rear panel and remove the panel from the side of the chassis. The 12 PCI slots, numbered 1-12 from bottom to top, will be in view.

Step 6. Remove the PCI slot cover from the slot that will receive the PCI card. To remove the PCI slot cover, slide the PCI slot cover away from the server.

Step 7. Center the graphics card within the space created by removing the PCI I/O slot cover. Slide the card toward the edge connectors. Ensure the edge connectors on the card are in alignment with the connectors of the slot. Apply pressure to the card until it snaps firmly in place. Repeat process for USB card.

NOTE The graphics card must be installed in any Turbo slot while the USB will work in any slot. To reserve Turbo slots for high performance I/O cards, install the USB card in a non-Turbo slot

---



Step 8. At the rear of the chassis, connect the keyboard and mouse cables to the USB card. It does not matter which connector is used for the keyboard or mouse.

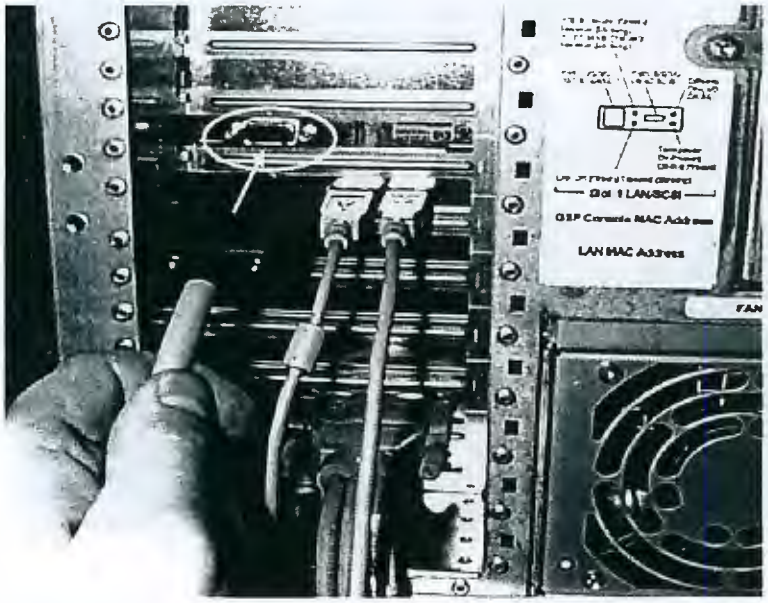
3701
Doc:

Step 9. Connect one end of the 15-pin video cable connector on the graphics card. This connector is labeled "Graphics Display" and "Video Out". Connect the other end of this cable to the graphics monitor.



Step 10. Replace the right side panel and tighten the captive screws.

Step 11. For rack configurations, insert the rp54xx server back into the rack.

Step 12. For deskside enclosure configurations, repalce the deskside enclosure cover.

Step 13. Power the server on.

Step 14. Use the server firmware `in io` command to verify the graphics cards are recognized by the server. If AUTOBOOT is ON, it will be necessary to interrupt the boot process to get to the server firmware `Main Menu: Enter command or menu >` prompt.

Step 15. Boot HP-UX and run the `ioscan` utility to verify the system recognizes the new PCI card.

Step 16. Logon as root and install X/CDE/Motif if not already installed.

Graphics Troubleshooting

This section describes how to troubleshoot common problems encountered during installation or attempted use of graphics. The following system utilities can be used to display or set the graphics configuration:

- `/opt/graphics/common/bin/graphinfo` allows you to display the current graphics configuration and the graphics drivers that are being used.
- `/opt/graphics/common/bin/setmon` allows you to reconfigure the monitor type.
- The `display` menu of the HP-UX System Administration Manager (SAM) utility allows you to configure the X-Server and set the monitor type.

  On-line diagnostics provide information, verify and diagnose coverage for the graphics and USB cards.Off-line diagnostics do not exist for either the graphics or USB card.
- The HP-UX `ioscan` utility can be used to verify the HP-UX operating system recognized the hardware.

Symptom: CDE will not come up.

Step 1. Ensure /dev/crt was created. If not created, use `insf -e` to create.

Step 2. Ensure the system is at run level 3. Use `who -r` to determine run level. Use `init 3` to change to run level 3.

Step 3. Ensure dt is enabled. Use `/usr/dt/bin/dtconfig -e` to enable dt.

Step 4. Ensure /etc/dt/config/Xservers exists. If not, use `/usr/dt/config/dtrc.d/20_graph_conf` to create.

Step 5. Ensure the line: * Local local@console /usr/bin/X11/X :0 is not commented out of the /etc/dt/config/Xservers file.

Step 6. Reboot HP-UX.

Symptom: HP-UX does not recognize the graphics cards. `unknown` appears in the ioscan output for these cards

Step 1. Examine the output of the `swlist` command to ensure the correct version of HP-UX is installed.

Step 2. Update HP-UX as necessary

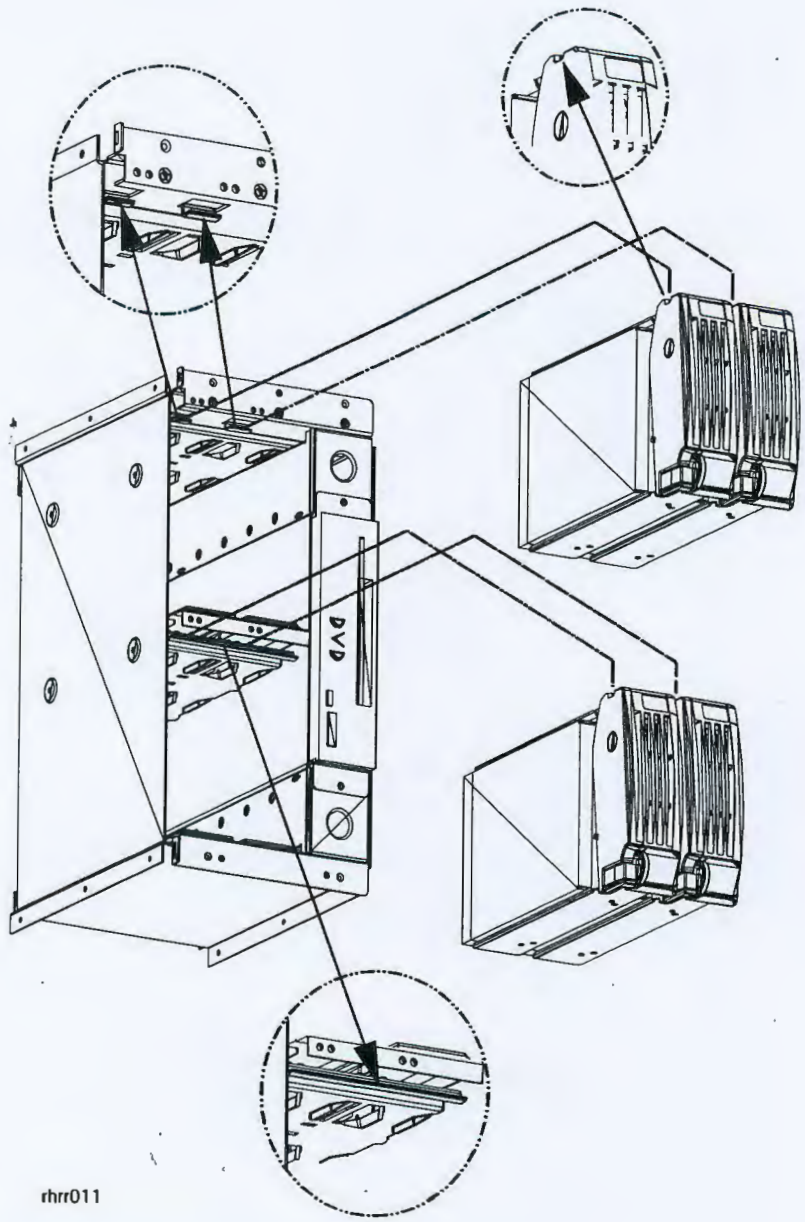
3701
Doc:



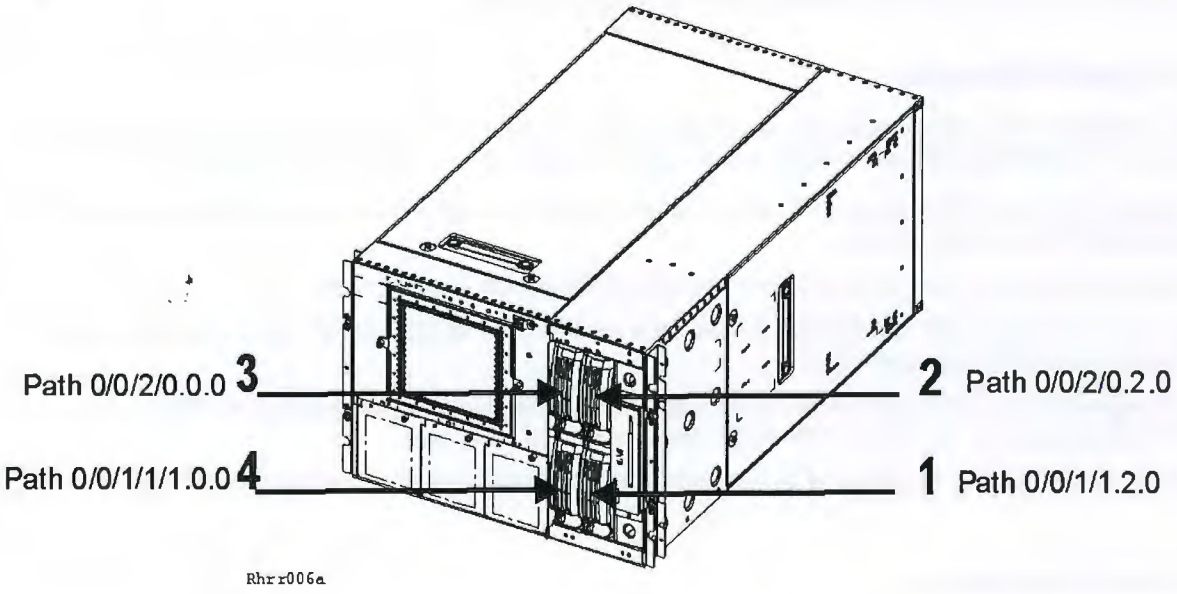
Step 4. Secure the connection by pushing the blue release lever closed.

Step 5. Refer to HP-UX documentation to configure the new disk.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1578
Fls:
Doc: 3701

Installing Disk Drives

rp54xx servers support up to four optional internal hard drives. These drives must be installed in the following sequence:



It is not necessary to shutdown the HP-UX operating system or power off the server to install a new disk. Follow this procedure to add internal hard disk drives to your rp54xx server.

Step 1. If a front bezel is installed on the face of the server, open the right-hand panel to gain access to the disk slots.

Step 2. Remove the disk drive slot cover.

Step 3. Insert the new disk drive into the slot until the rear connectors snap into place in the card guide. As shown in the following graphic, the notches at the top of the disk drives must snap over the small brackets in the disk bay to ensure a firm connection.

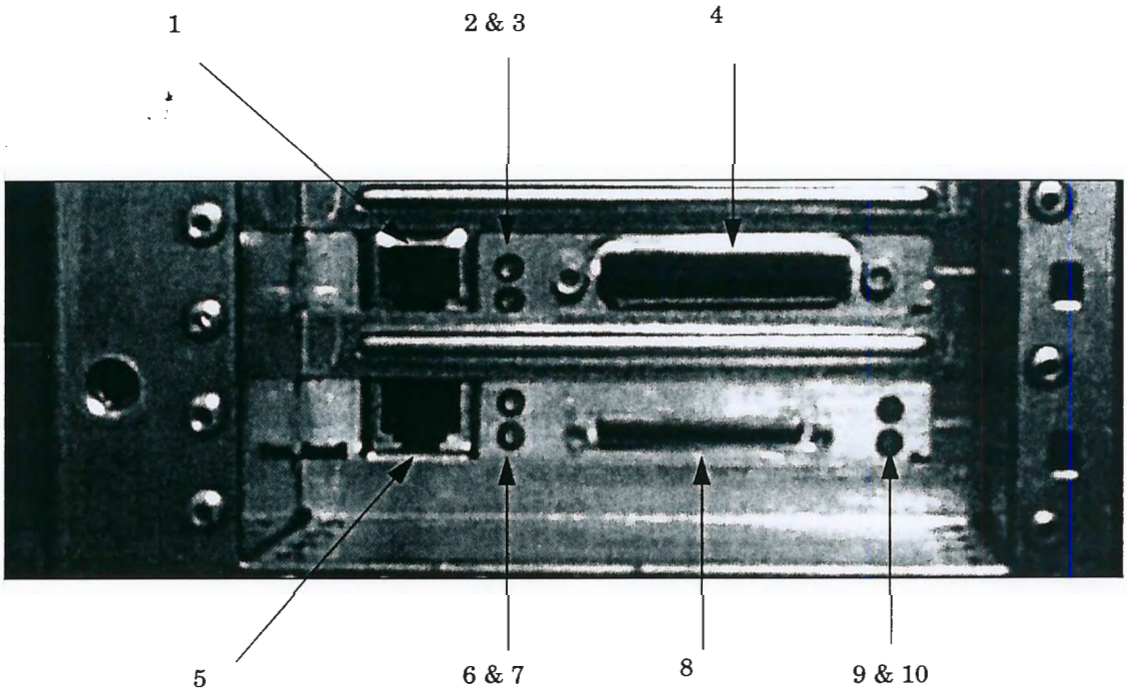
Core I/O Connections

The following paragraphs describe the indicators and connections of the rp54xx Core I/O. Core I/O consists of a LAN/SCSI card in slot 1 (lower slot in graphic) and a Guardian Service Processor (GSP) in slot 2 (upper slot in graphic). There are two versions of GSP, revision A and revision B.

Revision A GSP

The following graphic shows the indicators and connectors for the revision A GSP and LAN/SCSI Core I/O boards.



1. 10-Base-T LAN (RJ-45) Connector
   GSP LAN.
2. Green/Red (Upper LED)
   Green = GSP Power On.
   Flashing Green = LAN Receive.
   Red = Guardian Support Processor Test Failed.
3. Green/Red, (Lower LED)
   Green = Link OK.
   Flashing Green = LAN Transmit.
   Red = Guardian Support Processor Test Failed.
4. Console/UPS/Remote Connector (D-Type 25-Pin female).
   Requires an A5191-63001 "W" adapter cable
5. 10/100 Base-T = Primary LAN (RJ-45) Connection
   Path 0/0/0/0

4.781

6. Green/Yellow (Upper LED)
   Green = 100 Base-T Mode
   Green Blinking = 100 Base-T Receiving
   Amber = 10 Base-T Mode
   Amber Blinking = 10 Base-T Receiving
7. Green (Lower LED)
   Green = Link OK (10/100 Base-T Mode indicated by LED #6)
   Green Blinking = Transmitting
8. Ultra-2 SCSI Connector (68-Pin VHDCI SCSI)
   Path 0/0/1/0
9. SCSI Mode (Green, Upper LED)
   On = Low Voltage Differential (LVD) Mode.
   Off = Single Ended Mode.
10. SCSI Terminator Power (Amber, Lower LED)
    On = Terminator power present
    Off = Terminator power Not present.

Revision B GSP

The following graphic shows the indicators and connectors for the revision B GSP and LAN/SCSI Core I/O boards.

    On = Terminator power present
    Off = Terminator power Not present.

Guardian Service Processor (GSP) Overview

This section provides an overview of the Guardian Service Processor (GSP). The GSP is an always on, dedicated service processor that monitors system power, cooling and configuration, and provides console communications. Power and cooling information is obtained via an interface to the platform monitor card. Configuration information is obtained via connection to the Serial Presence Detect (SPD) bus. The GSP can only be installed in slot 2 and must be present for the server to power up.

The GSP has downloadable firmware which can be updated independent of the HP-UX operating system. GSP firmware updates can occur anytime the GSP is active. If the DC power switch is OFF, the GSP is still operational and GSP firmware updates can still occur. GSP firmware updates may be performed by customers.

If the GSP becomes hung, it is possible to reset the GSP without impacting the server. The GSP may be reset via the GSP RESET button on the right side of the card. The PCI cover panel (right side panel) must first be removed to allow access to the right side if the GSP card.

The GSP has two connectors on the bulkhead. An RJ-45 for LAN connections and a female DB25 connector for RS-232 connections. Attach either a "W" or an "M" cable to the DB25 connector to provide individual output for CONSOLE, REMOTE and UPS.

To access the GSP from the local ASCII console, type control b and the `GSP>` prompt will appear. It may be necessary to type control Ecf first. To exit the GSP, type `GSP>co`.

The GSP was originally a core component of the revision A rp5400 (A5576A) and rp5450 (A5191A) servers. Beginning with introduction of the revision B rp5400 (A5576B), rp5450 (A5191B), and rp5470 servers the GSP became a separate, must order product (A6696A).

There are two revisions of rp54xx GSP: rev A (A6696A) and rev B (A6696B). Both GSPs must be installed in order for the server to power up.

GSP LAN

This LAN is exclusively for LAN console access and is not configurable via HP-UX. The LAN is configured via GSP commands. Hostname, IP, gateway and subnet mask parameters may be set via the `GSP>lc` command. The GSP may also initiate ping via the `GSP>xd` command.

GSP RS-232

The DB25 connector on the GSP is used for RS-232 communications to a local console (via CONSOLE connector), a remote console via modem (REMOTE connector), and a UPS (UPS connector). The baud rate, term type, etc., of the CONSOLE and REMOTE ports are configured via `GSP>ca` command.

The GSP supports VT100 and HPTERM terminal emulation. For correct communications, the GSP and RS-232 device must use the same terminal emulation and baud rates.

GSP Features

The revision A GSP provides a 10 base-T LAN connector for LAN console access and a DB-25 connector to which the A5191-63001 W-cable connects. The W-cable provides REMOTE, UPS, and CONSOLE DB-9 connectors.

Features of the revision A GSP are:

- 10 Base-T LAN connector for revision A GSP

ECT 4.770 CPL AC
ECT CPL AC
ROS Nº 03/2005 CN
CPMI - CORREIOS
1581
Fls:
Doc: 3701

- 10/100 Base-T LAN connector for revision B GSP
- On-board processor dedicated to GSP functions
- Error logging and notification
- Display of system alerts and selftest chassis codes
- Powered by 15 VDC housekeeping power that is present when the front panel switch is off
- Power and configuration monitoring
- RS-232, LAN, REMOTE and WEB console access
- Administrator and user security
- Alphanumeric paging.

There are two revisions of rp54xx GSP: revision A (A6696A) and revision B (A6696B). Due to significant hardware differences between the revision A and B GSP, each GSP requires it's own firmware. Revision A GSP firmware can only be installed in a revision A GSP and revision B GSP firmware can only be installed in a revision B GSP. The hardware differences are necessary to incorporate the embedded web access, 10/100 Base-t LAN, and faster GSP processor.

The GSP provides four types of console access: RS-232, Remote, LAN and Web. Console information is mirrored to all four console types. Refer to *Configure System Console* for more information.

The GSP was originally a core component of the revision A rp5400 (A5576A) and rp5450 (A5191A) servers. Beginning with introduction of the revision B rp5400 (A5576B), rp5450 (A5191B), and rp5470 servers the GSP became a separate, must order product (A6696A).

Revision A GSP

The revision A GSP is identified by product number A6696A and part numbers: A5191-60012, A5191-69012, and A5191-69112.

The revision A GSP requires a "W" cable to be attached to the DB25 connector. The part number of the "W" is A5191-63001. The "W" cable provides female DB9 connectors for CONSOLE, REMOTE and UPS. The maximum supported baud rate for the CONSOLE and REMOTE connectors is 19200 baud and 1200 baud for the UPS.

The paths for the CONSOLE, UPS, and REMOTE are 0/0/4/0.0, 0/0/4/0.1, and 0/0/4/0.2 respectively.

For the rev A GSP, the web console is accomplished by shipping one J3591A Secure Web Console with each rp54xx server. The Secure Web Console can be used in place of an ASCII console to provide console access via a web connection. If you are installing an rp54xx server that does not have an ASCII console, you may use the Secure Web Console as the console. However, you must first configure the Secure Web Console. Refer to *Secure Web Console Installation and Configuration* for more information on SWC Installation/Configuration.

Revision B GSP

The revision B GSP is identified by product number A6696B and part numbers: A6144-60012, A6144-69012, and A6144-69112.

The revision B GSP requires an "M" cable to be attached to the DB25 connector. The part number of the "M" cable is A6144-63001. The "M" cable provides female DB9 connectors for CONSOLE, REMOTE, and UPS. The maximum supported baud rate for the CONSOLE and REMOTE connectors is 38400 baud and 1200 baud for the UPS.

The paths for the CONSOLE, UPS, and REMOTE are 0/0/4/1.0, 0/0/4/1.1 and 0/0/4/1.2 respectively.

ECT
4.777

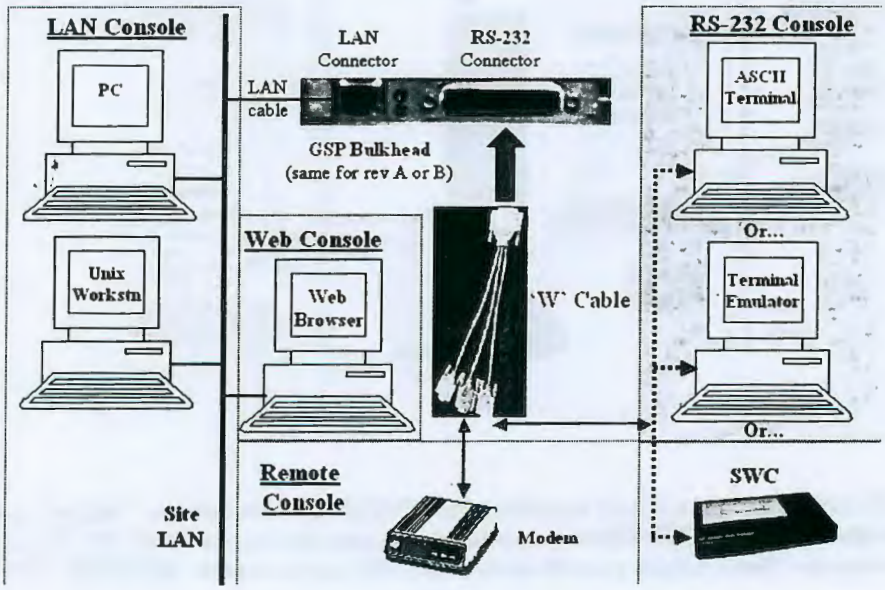
Configure System Consoles

rp54xx servers provide RS-232, REMOTE, LAN and WEB console access. All console access involves the Guardian Service Processor (GSP). rp54xx servers use either a revision A or revision B GSP. Below is an illustration of the console access provided by the revision A GSP.

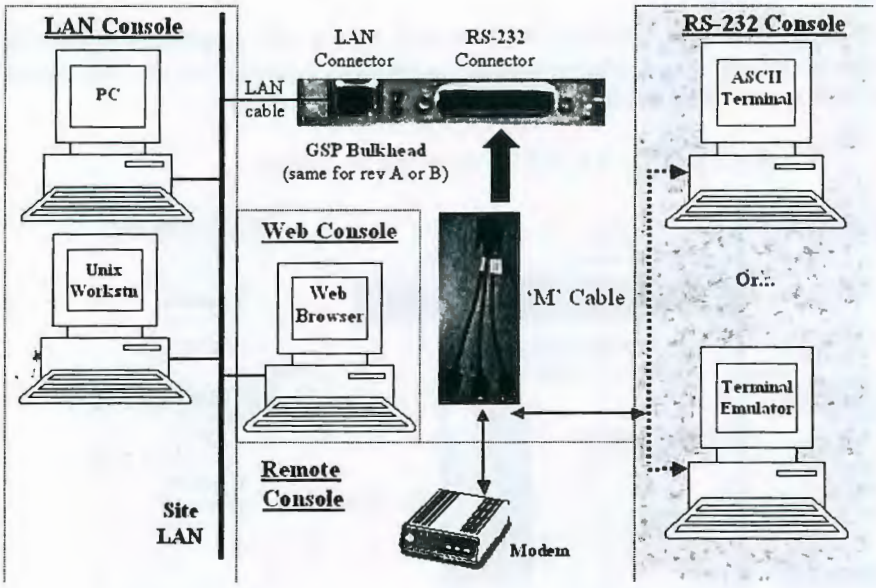
Revision A GSP Console Access



The revision B GSP has embedded web access, eliminating the need for an external Secure Web Console (SWC). Below is an illustration of the console access provided by the revision A GSP.

ROS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1582
Doc: 3701

Revision B GSP Console Access



GSP Cables

Both the revision A and B GSPs provide a DB-25 connector for RS-232 communications. Connect the A5191-63001 W- cable to the revision A GSP DB25 connector or connect the A6144-63001 M-cable to the revision B GSP DB25 connector. These cables provide individual DB9 connectors for REMOTE, UPS and CONSOLE.

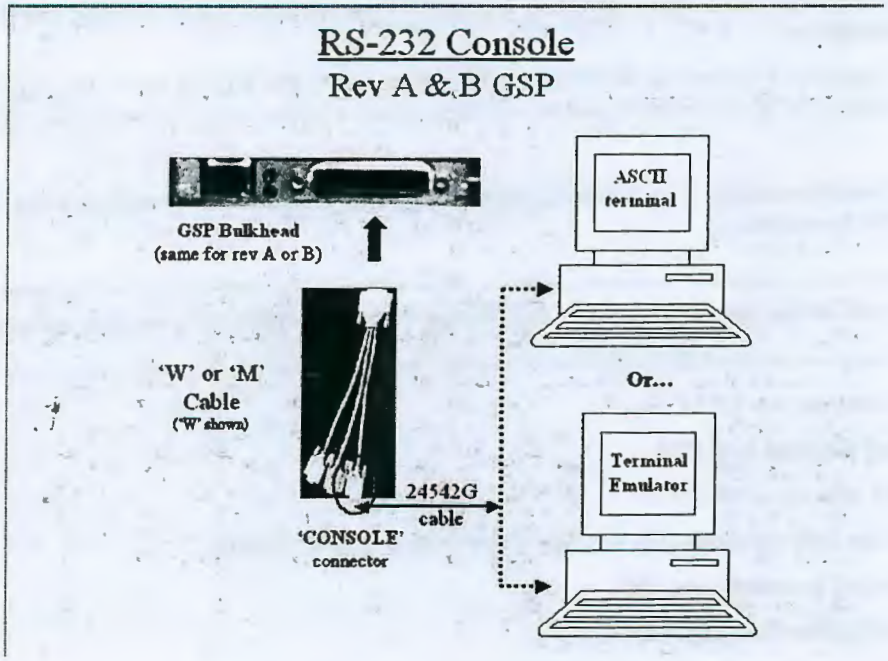
NOTE Use the A5191-63001 W-cable with revision A GSP and A6144-63001 M-cable with revision B GSP *only*. Failure to use the right cable can result in reduced functionality.

The W and M-cables are slightly different. The W-cable has full RS-232 capability on the REMOTE and CONSOLE connectors and partial RS-232 capability on the UPS connector. The M-cable has full RS-232 capability on the REMOTE and UPS connectors and partial RS-232 capability on the CONSOLE connector. The cable change is to be consistent with rp54xx functionality. The cables are different colors to easily tell them apart. The W-cable is gray and has part number A5191-63001. The M-cable is black and has part number A6144-63001.

Configure RS-232 Console

The physical connections for an RS-232 console include attaching the correct cable to the GSP. Next, connect the 24542G cable (supplied) to the CONSOLE connector and the serial port of the ASCII console. A personal computer (PC) running terminal emulation software may be used in place of an ASCII console. Refer to the illustration below for RS-232 console.

ECT
4.775
J.
AC



Step 1. The GSP is located in slot 2 of the rp54xx' rear card cage. Connect the 25-pin end of:

- the A5191-63001 W-cable to the 25-pin connector on the revision A GSP card (A5191-60012) OR
- the A6144-63001 M-cable to the 25-pin connector on the revision B GSP card (A6144-60012)

Step 2. Connect the 9-pin "Console" connector of either the W or M-cable to the 9-pin D-type connector of a 24542G RS-232 cable.

Step 3. Connect the 25-pin end of the 24542G serial cable to the serial/RS232 port on the ASCII console. (RS232 Serial Port labeling may vary depending on manufacturer.)

Step 4. Connect the System Console to input AC power.

Step 5. Turn the System Console AC power switch to ON.

After the physical connections have been made, configure the ASCII console. When using the C1099A Terminal Console, the default settings are recommended. Refer to the C1099A Terminal Console operating manual for instructions on how to obtain default settings.

The HP 700 series console may also be used as an ASCII console. Both the C1099A Terminal Console and S700 consoles support HPterm and VT100 emulations. The emulation of the GSP and ASCII console need not match for communications between them to occur. However, to ensure proper communications, HP recommends the ASCII console and GSP use the same emulation. HP also recommends that other configurable parameters on the GSP match those of the ASCII console. Baud rate, start/stop bits, etc... The default emulation of the GSP is VT100.

Below is a procedure to configure a HP 700 serial console for VT100 emulation.

Doc:

HP 700 Series System Console Configuration

The following describes the steps required to configure the HP 700 series terminal for VT-100 mode for operation with an rp54xx server.

Although any terminal capable of operating in VT-100 mode can be used, the HP700 series terminal is used here as an example because it is fairly common and it's configuration is typical of many terminals currently in use.

HP700 VT-100 Mode Configuration The following procedure outlines the steps to configure the HP700 series terminal for VT100 operation.

NOTE You may use either the arrow keys or the tab key to move between the setting options on the screen.

---

1. Press **[config keys]** function key. **[f8]**
2. Press **[terminal config]** function key. **[f5]**
3. Move to *Terminal ID* and enter "vt100".
4. Move to *Set TermMode* and, using the **[Prev]** and **[Next]** keys, select "EM100".
5. Press the **[config keys]** function key. **[f8]**
6. Press the **[ansi config]** function key. **[f6]**
7. Move to "multipage" and, using the **[Prev]** and **[Next]** keys, select "yes". (Enables screen scrolling).
8. Move to *Backspace Del* and, using the **[Prev]** and **[Next]** keys, select "Backspace/Del".
9. Move to *EM100 ID* and, using the **[Prev]** and **[Next]** keys, select "EM100".

Configure the Asynchronous Values of the GSP

After the ASCII console has been configured and physical connections made, make any necessary changes to the asynchronous values of the GSP.

1. Access the GSP with the ctrl+b entry. The GSP will respond with a `GSP>` prompt.
2. At the GSP prompt, enter the Configure Asynchronous (ca) command:

The ca command will start a series of prompts. Respond to each prompt with the appropriate information.

Example 4-1 CA command

```
Leaving Console Mode - you may lose write access. When Console Mode returns, type
^Ecf to get console write access.

GSP Host Name:  fesrhapgsp

GSP> ca

CA This command allows you to modify the local and remote modem serial
portconfigurations.

Current configuration settings:

Local Console Serial Port bit rate: 9600 bits/s

Local Console Serial Port Flow Control: Software
```

E C T
4.7731
CPL AC

```
Local Console Serial Port Terminal Type: vt100
Remote Console Serial Port Modem Protocol: CCITT  Remote Console Serial Port Modem
bit rate: 19200 bits/s
Remote Console Serial Port Modem Flow Control: Software
Remote Console Serial Port Modem Transmit Configuration Strings: Enabled
Remote Console Serial Port Modem Presence: always connected
Do you want to modify the Local Console Serial Port settings? (Y/[N])
Do you want to modify the Remote Console Serial Port Modem settings? (Y/[N])
GSP Host Name:  fesrhapgsp
```

If necessary, use the GSP help facility by typing `GSP>he`. Once in the help facility, type the command need help with. Use LI for a list of commands.

The following baud rates are recommended for the revision A GSP:

- Console: 19200
- Remote: 19200
- UPS: 1200

The following baud rates are recommended for the revision B GSP:

- Console: 38400
- Remote: 38400
- UPS: 1200

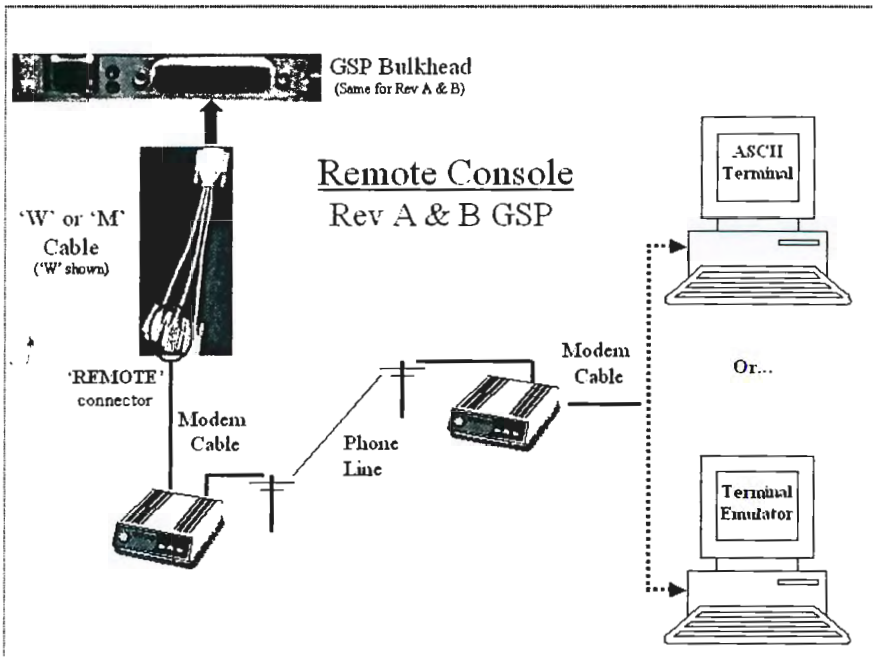
Configure Remote Console

The remote console allows console access via modem connections. Below is an illustration of the REMOTE console.

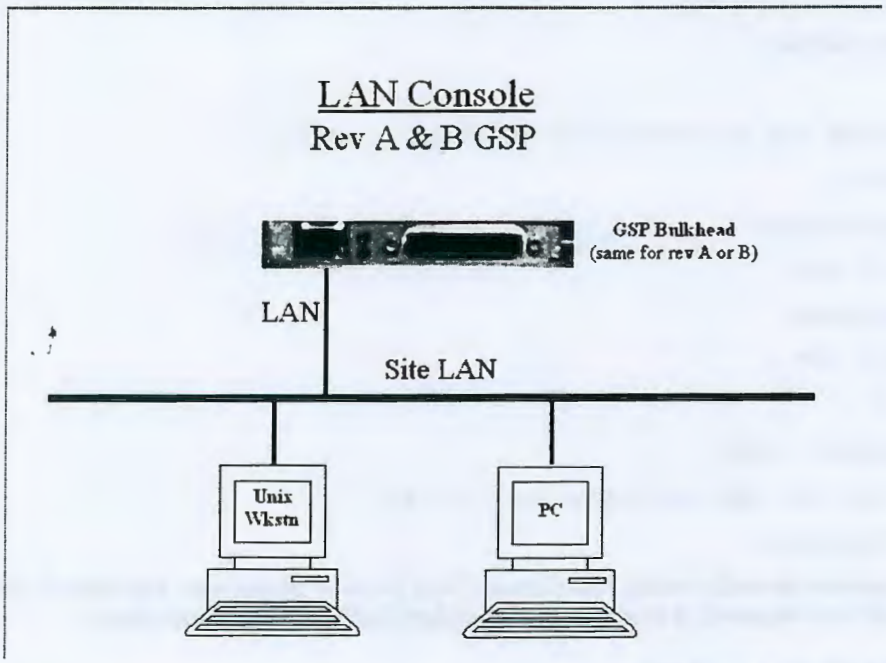


The GSP>ca command is used to configure asynchronous settings for the REMOTE console. Baud rates and emulations should match between the modems, remote ASCII terminal and the GSP. Refer to, "Configure RS232 Console" for information about setting these values.

ECT 4.767/11 CPL AC

Configure the LAN Console

The LAN console allows you to access the console from the LAN using TelNet or http (revision B GSP only) protocols. Below is an illustration of the LAN console.



The configuration of the LAN console of both the revision A and B GSPs may be done from either an ASCII console or the external Secure Web Console. For the revision B GSP, an IP may be assigned via LAN by pinging the LAN from a PC or workstation.

Configuring the GSP LAN Port via an ASCII console

The LAN port of the GSP allows connection via TelNet or http connections. Once the LAN parameters are configured, the console may be accessed via a TelNet connection or via a web browser (revision B GSP only). The default IP of the GSP LAN is 127.0.0.1.

NOTE The GSP has a separate LAN port from the system LAN port. It will need a separate LAN drop, IP address, and networking information from the port used by HP-UX.
Before starting this procedure, you will need to know the following information:

- I.P. address (for GSP)
- Subnet mask
- Gateway address
- Hostname (this is used when messages are logged or printed)

To configure the GSP LAN port, perform the following steps:

1. Access the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the LAN Configuration (lc) command:

```
GSP> lc
```

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1585
Fls:
3701
Doc:

The lc command will start a series of prompts. Respond to each prompt with the appropriate information.

Example 4-2 LC command

```
Leaving Console Mode - you may lose write access. When Console Mode returns, type
^Ecf to get console write access.

GSP Host Name:  fesrhapgsp

GSP> lc

LC This command allows you to modify the LAN configuration.

Current configuration:

MAC Address: 0x00306e050a63

IP Address: 15.8.133.185

GSP Host Name: fesrhapgsp

Subnet Mask: 255.255.248.0

Gateway: 15.8.128.1

Web Console Port Number: 2023

Do you want to modify the LAN configuration? (Y/[N])

GSP Host Name:  fesrhapgsp
```

The revision B GSP introduces a configurable Web Console Port Number parameter. The default value is 2023. Once the GSP LAN is configured, it is accessible via either TelNet or web connections.

Configuring the GSP LAN Port via LAN

The revision B GSP LAN port can be assigned an IP address without using the LAN Configuration (lc) command via an ASCII console. This section describes how to assign the IP address allowing web access. Once web access is accomplished, use the lc command to configure remaining network parameters.

NOTE The GSP LAN port is separate from the system LAN port. It will need a separate LAN drop, IP address, and networking information from the port used by HP-UX.
Before starting this procedure, you will need to know the following information:

- I.P. address (for GSP)
- Subnet mask
- Gateway address
- Hostname (this is used when messages are logged or printed)

To configure the GSP LAN port via LAN, perform the following steps:

NOTE The GSP *must* be on the same subnet as the system being used to remotely configure the LAN port. If it is not, the remote configuration will be unsuccessful.

Step 6. Determine the MAC address of the revision B GSP by examining the GSP MAC address label on the rear of the server.

Step 7. Use the `route add` command to add the I.P address of the GSP and remote system to the router.

Step 8. Use the arp command to add an ARP entry for the IP address using the GSP MAC address.

- For HP-UX systems, the format of the MAC address is 00:30:6e:05:0a:ea
- For MS DOS systems, the format of the MAC address is 00-30-6e-05-0a-ea

Step 9. Use the ping command to assign the I.P address for the GSP.

Step 10. The revision B GSP is now accessible via LAN. Access the GSP and configure remaining network parameters using the LAN Configuration (lc) command:

```
GSP> lc
```

The lc command will start a series of prompts. Respond to each prompt with the appropriate information.

Example 4-3 LAN Configuration from a PC

```

Secure Web Console Installation

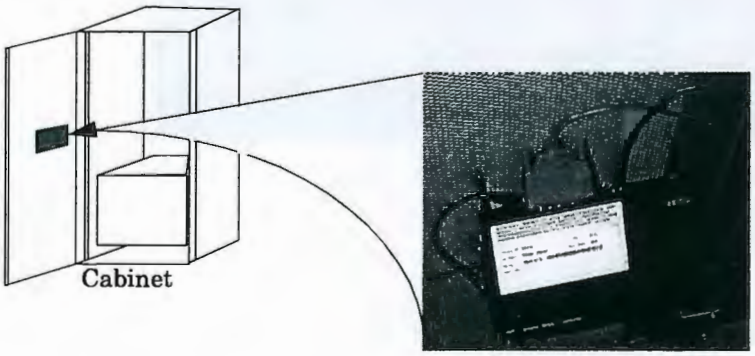
The following section describes installation of the HP Secure Web Console on inside of the rear door of a rack-mounted rp54xx server.

For technical, installation, and configuration instructions for the Secure Web Console, refer to the following URLs on the Internet:

General information:
http://www.hp.com/

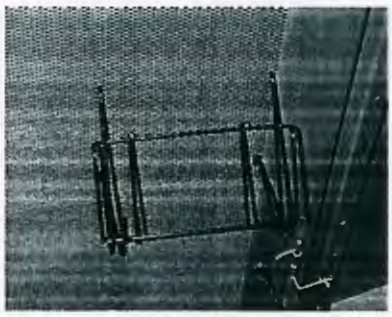
Documentation:
http://www.docs.hp.com

NOTE Either the system console (HP series 700 terminal) or the HP Secure Web Console may be installed on an rp54xx server, but not at the same time. Both console types use the same DB9 type LAN *Console* connector.



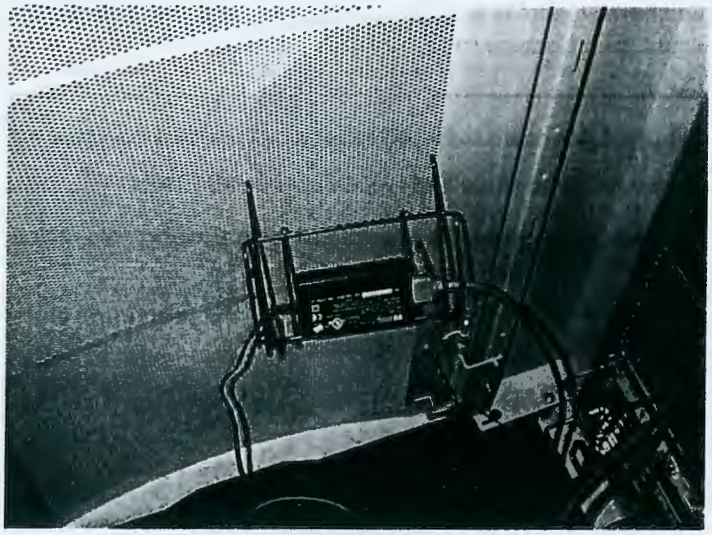
To install the HP Secure Web Console on an rp54xx server, refer to the previous figure and the HP Secure Web Console documentation, then proceed as follows:

Step 1. Install the wire mounting bracket by carefully inserting the two top prongs through the vent grill in the rear door of the cabinet as shown above. Position the bracket toward the hinge side of the door.



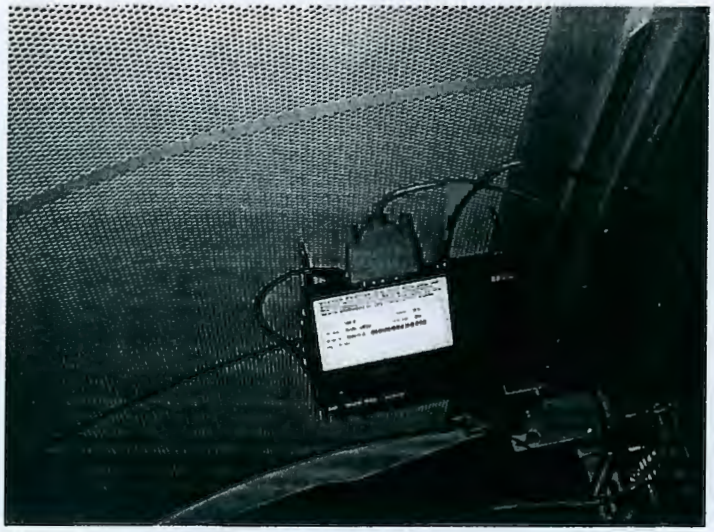
4.763
AC

Step 2. Place the Secure Web Console power supply into the bottom portion of the wire mounting bracket as shown.



Step 3. Connect one end of the power cable to the power supply where indicated.

Step 4. Position the Secure Web Console unit in the mounting bracket.



Step 5. Connect the DC out cable from the power supply to the Secure Web Console.

Step 6. Connect one end of the AC power cord (supplied) to the Secure Web Console power supply.

Step 7. Connect the other end of the AC power cord to an available receptacle.
On a PDU if in a cabinet.
In an available wall outlet if in a Deskside enclosure.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1589
Fls:
3701
Doc:

Step 8. Connect the 9-pin end of the RS-232 cable (Supplied) to the connector labeled CONSOLE on the A5591-63002 "W-type" adapter cable.

CAUTION To prevent unauthorized access to your rp54xx system, do not connect the other end of the serial cable to the Secure Web Console until both the server and the Web Console have both been fully configured.

Step 9. Connect one end of a LAN cable to RJ-45 connector labeled 10-Base-T on the Secure Web Console.

Step 10. Connect the other end of the same LAN cable to your site LAN.

Step 11. Configure the Secure Web Console in accordance with the documentation that was provided with it or refer to http://www.docs.hp.com

Step 12. Once the Web Console has been properly configured, the remaining end of the serial cable between the server and the Web Console may be connected.

E C T
4.761
L - AC

GSP Configurable Parameters

Once a system console is configured, additional GSP parameters may be set. For a complete list use the GSP>he command to access the on-line help facility.

Examples of three configurable parameters follow.

Adding Users

The GSP provides a maximum of 20 users (one administrator and 19 operators). By design, the first user added to the GSP becomes the GSP administrator. Only the GSP administrator can add or remove users or change the GSP configuration.

NOTE Before starting this procedure, you will need to know the following information:

- User's name
- Organization's name
- Login name
- User's password

To add a user, perform the following steps:

1. Access the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the Security options and access control (SO) command:

   GSP> so

3. The first prompt you will see with the so command is for GSP wide parameters:

```
GSP wide parameters are:
Login Timeout: 1 minutes.
. Number of password Faults allowed: 3
. Flow Control Timeout: 5 minutes.
Do you want to modify the GSP wide parameters? (Y / [N]) __
```

   At this point you can modify the GSP wide parameters, or continue with adding users. To add users, respond N for no.

NOTE If this is the first time users are being added, the first user added will be the GSP administrator.

If this is not the first time you are adding users (you are adding additional users), you will need to step through all current users to reach the next available user prompt.

---

4. The next prompt that appears will ask the following question:

   Do you want to modify the user number 1 parameters? (Y/[N]/Q to quit) __

   Follow the series of prompts to enter all the required fields for adding a user.

RQS Nº 03/2005 - CN
CPML - CORREIOS
1590
Fls:
3791
Doc:

CAUTION Be sure to read each prompt carefully and enter the correct response. A missed or incorrect entry could deny entry to that user.

The following is an example of an added user's information:

```
. User's Name: Joe Smith
. Organization's Name: IT Support
. Dial-back configuration: Disabled
. Access Level: Operator
. Mode: multiple
. User's state: enabled
```

For the number 1 user, the Access level is administrator. The Mode entry of single only allows entry for that user one time, then access will be denied. A Mode entry of multiple allows unlimited entries into the GSP.

Removing Users

You can remove (disable) a GSP user with the same Security options and access control (SO) command used to add a user.

To remove a user, perform the following steps:

1. Access the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the Security options and access control (SO) command:

   ```
   GSP> so
   ```

3. The first prompt you will see with the SO command is for GSP-wide parameters:

   ```
   GSP wide parameters are:
   . Login Timeout: 1 minutes.
   . Number of password Faults allowed: 3
   . Flow Control Timeout: 5 minutes.

   Do you want to modify the GSP wide parameters? (Y / [N]) __
   ```

   At this point you can modify the GSP wide parameters, or continue with removing a user. To remove users, respond N for no.

NOTE You will have to step through each user number until you reach the user to be removed.

4. When you access the number of the user to be removed, you must change the data in the prompts for that number.

   It is important that, at a minimum, you need to modify the User's state to Disabled.

4.759

Return the GSP to Default Configurations

The Default Configuration (dc) command is used to reset all or some of the GSP values to the default values. To return GSP values to default configurations, perform the following steps:

1. Access the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the Default Configuration (dc) command:

   ```
   GSP> dc
   ```

3. Follow the prompts for the dc command, and be sure to have the change information available.

CAUTION When the Security configuration is reset, all users are removed, including the GSP administrator. It also disables the remote. Remote must be re-enabled through the main console using the Enable Remote (er) command.

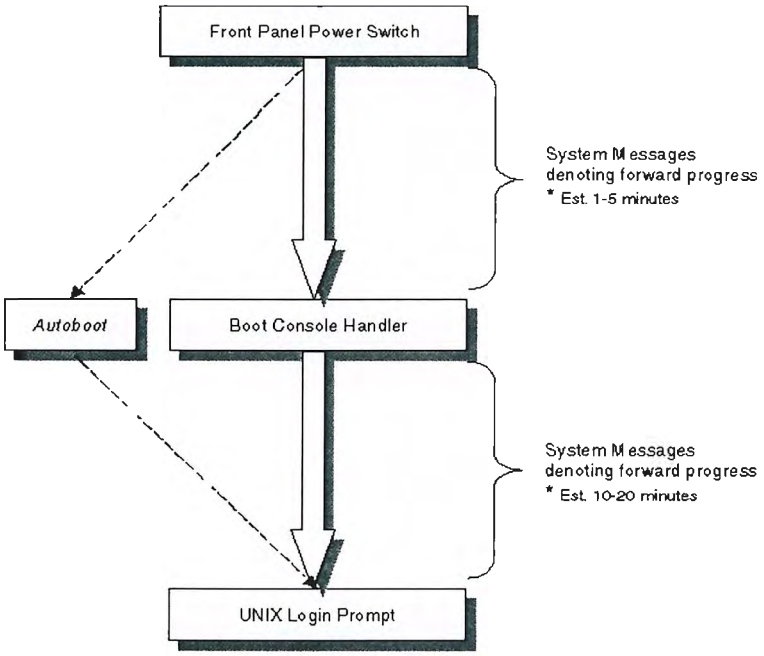
rp54xx Server Boot Process

The length of time an rp54xx server will require to complete the boot process depends on the number of processors and the amount of RAM installed. Average configurations can take more than 20 minutes.

The boot process consists of the following main steps:

Typical Boot Process



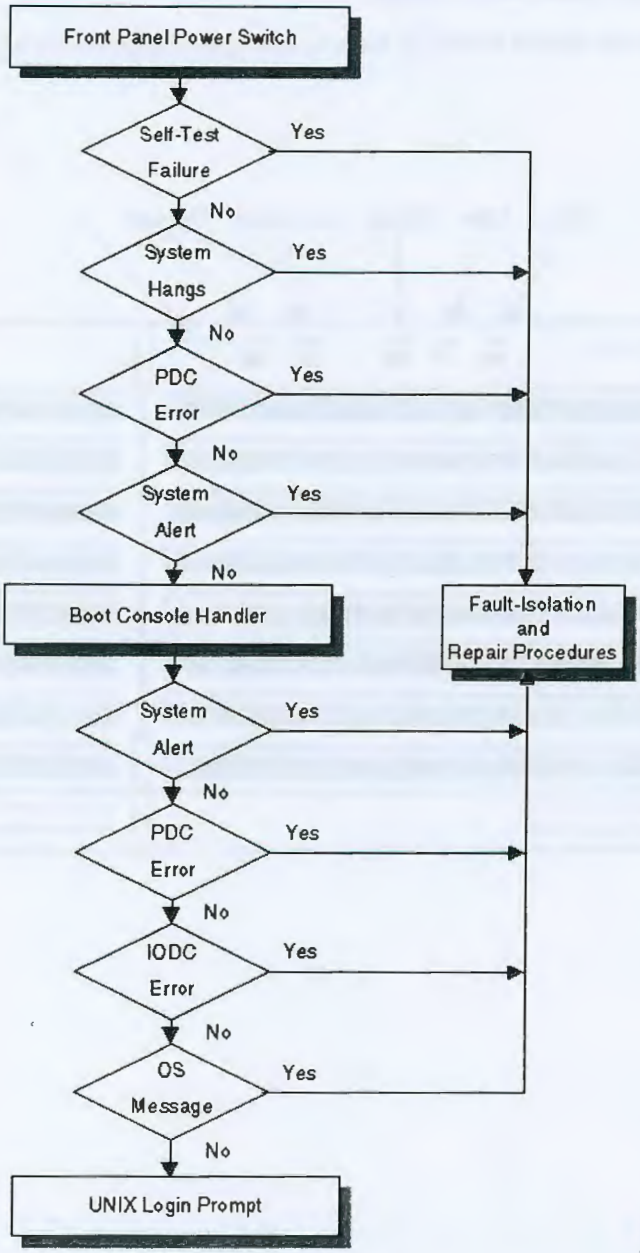
The duration of the full boot process can vary depending on:
- Number of CPUs installed
- Amount of memory installed
- UNIX version installed
- State of the network

All times approximate

E C T
4.757
J 1
A C

During the Boot process a variety of errors or problems can occur as shown below:

Potential Boot Problems



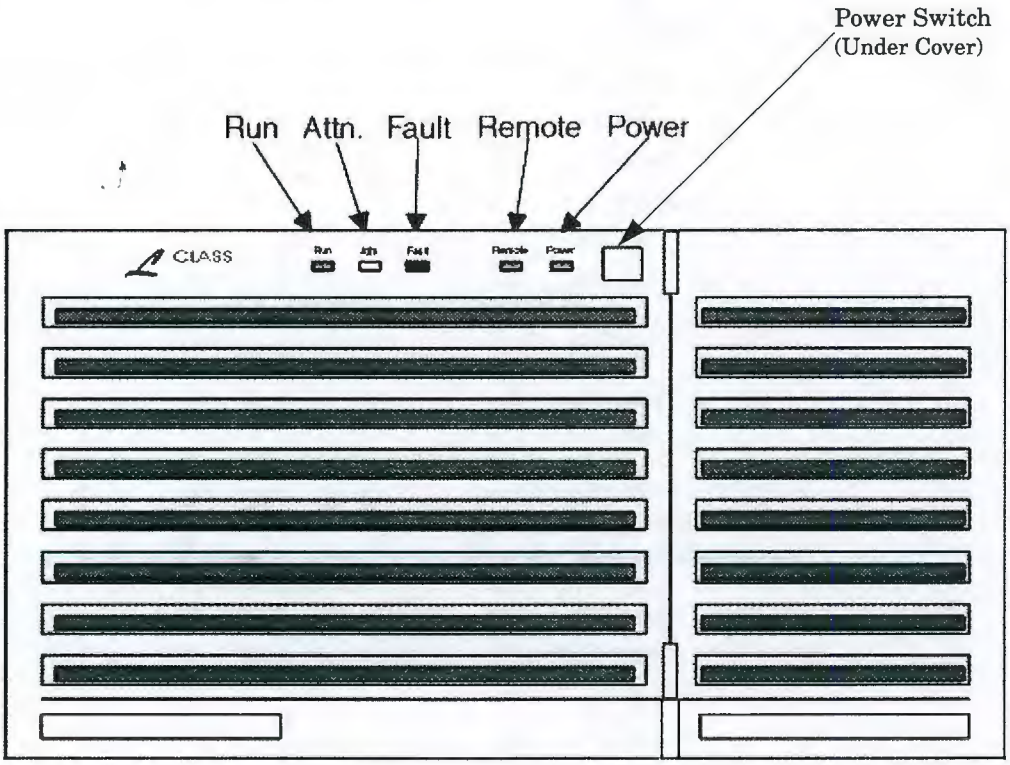
RQS Nº 03/2005 - CN
CPMI - CORREIOS
1592
Fls:
Doc: 3781

Initial Power-up

The following section describes the process of applying power to the rp54xx server and booting the system to the UNIX Login prompt. The amount of time it takes to go through self-test then boot the system will vary widely depending on hardware configuration. The following provides a "typical" procedure. Yours may vary depending on software and hardware installed:

Step 1. Apply AC Power to the system console.

Step 2. Apply power to the rp54xx server by turning the front panel switch to ON.



ECT 4.766 1 8

HotSwap Chassis Fan Replacement

The power to the server does not have to be off to remove or replace a HotSwap Chassis fan. Fan number 0 is located in the front of the server and fan number 1 is located at the rear of the server.

To replace a fan, perform the following steps:

1. Orient the fan assembly to ensure that the chassis outlet connects with the fan assembly. If the fan power connector is covered by the protective cover (see item 1 in the graphic), slide it down to remove it and slide it over the power connection on the other side of the fan. Push the fan firmly into the housing. The fan assembly will plug into the electrical outlet automatically.
2. Check the LED located on the fan.
   - When the fan is functioning normally, the LED is OFF.
   - When the fan fails, the LED is ON.

NOTE when one fan has failed (or is removed from the server), the system automatically puts the remaining fan into high speed mode. The noise level of the server will increase.

3. Replace the HotSwap Chassis fan cover.

The following graphic shows a HotSwap Chassis Fan.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1593
Fls:
Doc: 3701 155

HotSwap Card Cage Fan Removal

The power to the server does not have to be off to remove or replace a HotSwap Card Cage fan. Fans numbered 2, 3, 4, and 5 are located in a four-fan assembly housing located on the left side of the server's side service bay.

CAUTION Running the server for extended periods of time with a cooling fan removed may create hot spots inside the server and shorten component life.

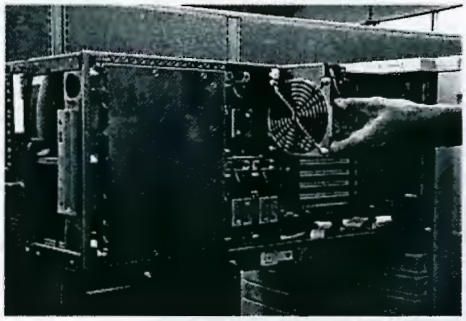
If other fans fail when one fan is removed, the system will halt.

To remove a fan from the server, perform the following step:

Identify the fan to be removed and pull it out of the Side Fan Assembly Housing. It will automatically disconnect from its electrical outlet on the I/O Backplane.

NOTE When one fan has failed (or is removed from the server) during operation, the system automatically puts the remaining fans into high speed mode. The noise level of the server will increase.

The following graphic shows a card cage fan being removed/replaced.



DEC

Doc: 157

HotSwap Power Supply Removal

Up to three power supplies (0 through 2), located across the bottom front of the server, can be installed in the server without removing power.

To remove a power supply from the server, perform the following step:

1. Remove the T-15 mounting screw located to the right of the handle near the top of the power supply.

CAUTION Be careful when pulling the power supply out of the server. It is heavier than it appears.

2. Grasp the handle and pull the power supply out of the server.

The following graphic shows a front and rear view of a HotSwap Power Supply.

4.755 1

Step 3. Several self-test boot progress screens will be displayed and will scroll rapidly up the screen. Some tests may pause for up to one minute while the test completes.
The following examples of the forward progress screens are typical of the screens displayed.

Brief

```

Configuring the Rev A Guardian Service Processor (GSP)

The Rev A Guardian Service Processor (GSP) is a resident processor within the system that allows the local or remote system administrator to monitor and perform administrator functions. This section provides configuration procedures that will instruct you to:

- Configure the LAN port
- Add or delete users (maximum of 20)
- Change the default GSP configuration

Go to the appropriate section for the task that you wish to accomplish.

Configuring the GSP LAN Port

Perform the LAN configuration from the systems local port (either console or the HP secure web console).

NOTE The GSP has a separate LAN port from the system LAN port. It will need a separate LAN drop, IP address, and networking information from the port used by HP-UX.
Before starting this procedure, you will need to know the following information:

- I.P. address (for GSP)
- Subnet mask
- Gateway address
- Hostname (this is used when messages are logged or printed).

To configure the GSP LAN port, perform the following steps:

1. Go into the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the LAN Configuration (lc) command:

```
GSP> lc
```

The lc command will start a series of prompts. Respond to each prompt with the appropriate information.

Adding Users

The GSP can only have a maximum of 20 users (one administrator and 19 operators). By design, the first user added to the GSP becomes the GSP administrator. Only the GSP administrator can add or remove users or change the GSP configuration.

NOTE Before starting this procedure, you will need to know the following information:

- User's name
- Organization's name
- Login name
- User's password

ECT Utilities 4-751 2 CPL - AC

To add a user, perform the following steps:

1. Enter the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the Security options and access control (SO) command:

   GSP> so

3. The first prompt you see with the so command is for GSP-wide parameters:

```
GSP wide parameters are:
Login Timeout: 1 minutes.
. Number of password Faults allowed: 3
. Flow Control Timeout: 5 minutes.
Do you want to modify the GSP wide parameters? (Y / [N]) __
```

   At this point you can modify the GSP-wide parameters or continue adding users. To add users, enter N for no.

NOTE If this is the first time users are being added, the first user added will be the GSP administrator.

If this is not the first time you are adding users (you are adding additional users), you will need to step through all current users to reach the next available user prompt.

4. The next prompt that appears will ask the following question:

   Do you want to modify the user number 1 parameters? (Y/[N]/Q to quit) __

   Follow the series of prompts to enter all the required fields for adding a user.

CAUTION Be sure to read each prompt carefully and enter the correct response. A missed or incorrect entry will deny entry to that user.

The following is an example of an added users information:

```
. User's Name: Joe Smith
. Organization's Name: IT Support
. Dial-back configuration: Disabled
. Access Level: Operator
. Mode: multiple
. User's state: enabled
```

For the number 1 user, the Access level is administrator. The Mode entry of single only allows entry for that user one time, then access will be denied. A Mode entry of multiple allows unlimited entries into the GSP.

Removing Users

You can remove (disable) a GSP user with the same Security options and access control (SO) command used to add a user.

To remove a user, perform the following steps:

1. Enter the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the Security options and access control (SO) command:

   ```
   GSP> so
   ```

3. The first prompt you see with the so command is for GSP-wide parameters:

   ```
   GSP wide parameters are:
   . Login Timeout: 1 minutes.
   . Number of password Faults allowed: 3
   . Flow Control Timeout: 5 minutes.

   Do you want to modify the GSP wide parameters? (Y / [N]) __
   ```

   At this point you can modify the GSP-wide parameters, or continue with removing a user. To remove users, enter N for no.

NOTE You must step through each user number until you reach the user to be removed.

---

4. When you access the number of the user to be removed, you must change the data in the prompts for that number.

   It is necessary that, at a minimum, you modify the User's state to Disabled.

Changing the Default GSP Configuration

This section describes the process of changing GSP default configurations. To change the GSP default configuration, perform the following steps:

1. Enter the GSP with the ctrl+b entry.
2. At the GSP prompt, enter the Default Configuration (dc) command:

   ```
   GSP> dc
   ```

3. Follow the prompts for the dc command, and have the change information available.

CAUTION When the Security configuration is reset, all users are removed, including the GSP administrator. The remote is disabled. The remote must be re-enabled through the main console using the Enable Remote (er) command.

Determine Current System State

To determine the current system state of an rp54xx server, first note the state of all LED indicators on the front panel. Processing this information using the decoders provided can greatly reduce the amount of time required to repair a suspected system fault.

The following procedure lists the tools available to aid you in determining the current system state.

Step 1. Determine if you can get a system prompt and if so, what kind of prompt.

Software System	Screen Prompt
Boot Console Handler (BCH)	`Main Menu: Enter command or menu>`
Guardian Service Processor (GSP)	`GSP>`
Initial System Loader (ISL)	`ISL>`
HP UNIX (HP-UX)	*Prompt varies depending on UNIX state*

Step 2. Decode the Run/Attention/Fault LED States.

Step 3. Decode the PCI I/O LED States.

Step 4. Decode the Fan, Power Supply, and Disk LED States.

Step 5. Decode the GSP LED States.

Step 6. Decode the LAN/SCSI LED States.

E C T
744
L.
AC

Troubleshooting and FRU identification

Once you have determined the current system state, you must troubleshoot the system to determine what the problem symptoms are and what repair actions to take.

Problem Symptoms and Repair Actions

Use this guide to assist you in repairing the system by matching the problem symptom with the appropriate troubleshooting step.

Table 6-1 Problem Symptoms and Repair Actions

Problem or Symptom	Problem Indicators	Normal Functioning Indicators	Troubleshooting Steps	Potential FRUs
No indication of Housekeeping voltage present when AC connected and power switch in Standby position.	Front Panel Power LED OFF when AC is plugged into system.	• Power switch Off. • Front Panel POWER LED should be FLASHING to indicate presence of Housekeeping voltage. • Power LED on GSP board should be lit solid green.	1. AC must be present. Check that PDU is plugged in. 2. Ensure there are 2 working power supplies (1 supply for rp5400). The LED on each supply should be lit. 3. Check for Service processor prompt (CTRL B at console).	• No AC present • Power Supplies • Power Converter • System Board • Display Board

Chassis Code to FRU Decode

This is a guide to identify failing FRUs from System Alerts and Error Chassis Logs. The guide includes the following information:

- Cross-Referencing Chassis Log Errors to rp54xx FRUs
- Interpreting System Alerts
- Interpreting Service Processor Error Chassis Logs

There is a detailed interpretation of Chassis Logs and System Alerts in the *Interpreting Chassis Logs in Detail* guide.

Cross-Referencing Chassis Log Errors to rp54xx FRUs

Use the following table to identify the failing FRU from the Chassis Log information. You can also use the online Error Chassis Log-to-FRU Decoder utility.

1. Read the Chassis Log entry.
2. Match the **SOURCE, SOURCE DETAIL, SOURCE ID,** and **PROBLEM DETAIL** values (see table below) in the Chassis Log entry with the appropriate values in the table.
3. Read the table from left to right.

Use these examples to understand how to identify failing FRUs with the table:

- Power Supply Failure Example
- Processor Failure Example

Table 6-2 Chassis Log Error to FRU Decoder

Chassis Log Field Values and Descriptions from Log Entry					
Source	**Source Detail**	**Source ID**	**Problem Detail**	**FRU**	**Action to Take**

Power Supply Failure Example

```
GSP> sl

SL

Which buffer are you interested in :
Incoming, Activity, Error, Current boot or Last boot ? (I/A/E/C/L) e
e

Do you want to set up filter options on this buffer ? (Y/[N]) n
n

Type + CR and CR to go up (back in time),
Type - CR and CR to go down (forward in time),
Type Q to escape.

Log Entry #   0 :
ALERT LEVEL: 6=Boot possible, pending failure or environmental problem - action required
REPORTING ENTITY TYPE: 2=power monitor - REPORTING ENTITY ID: 00
CALLER ACTIVITY: 4=monitor - CALLER SUBACTIVITY: 04=low voltage power supply
SOURCE: 4=power - SOURCE DETAIL: 4=high voltage DC power - SOURCE ID: 02
PROBLEM DETAIL: A=unexpected - ACTIVITY STATUS: F
Data  0 : Low=00000000 : High=00000000 - type  0 = Data Field Unused
Data  1 : Low=0F152A28 : High=00006303 - type 11 - Timestamp 04/15/1999 21:42:40
```

Problem Analysis

Step 1. Find the Source value. In this example, it is *SOURCE: 4=power*.

Use the **Power** row of the Error Chassis Log-to-FRU Decoder table.

Step 2. Find the Source Detail value. In this example, it is *SOURCE DETAIL: 4=high voltage DC power*.

Use the **High Voltage DC Power** row of the table.

Step 3. Find the Source ID value. In this example, it is *SOURCE ID: 02*.

The failing power supply is Power Supply #2.

Step 4. The Problem Detail for this row is not applicable.

Step 5. The FRU column of the table identifies the FRU as the Power Supply.

The correct action would be to replace Power Supply #2, located in the front of the system.

Processor Failure Example

```
Log Entry #   1 :
ALERT LEVEL: 6=Boot possible, pending failure or environmental problem - action required
REPORTING ENTITY TYPE: 0=system firmware - REPORTING ENTITY ID: 01
CALLER ACTIVITY: 1=test - CALLER SUBACTIVITY: 62=implementation dependent
SOURCE: 1=processor - SOURCE DETAIL: 1=processor general - SOURCE ID: 00
PROBLEM DETAIL: 3=functional failure - ACTIVITY STATUS: 0
Data  0 : Low=00000003 : High=F7000000 - type  0 = Data Field Unused
Data  1 : Low=0F160920 : High=00006303 - type 11 - Timestamp 04/15/1999 22:09:32
```

Problem Analysis

Step 1. Find the Source value. In this example, it is *SOURCE: 1=processor*.

Use the **Processor** row of the Error Chassis Log-to-FRU Decoder table.

Processor #3 is `Stopped:Nonresponding`. Replace Processor #3.

Interpreting System Alerts

System Alerts are reported to the system console when a problem is detected by the Service Processor. These alerts are stored in the Service Processor Error Logs. When this new alert is added to the log file, it will cause the front panel ATTENTION LED to blink.

E C T
Q-436
L.
A C

Interpreting System Alerts

Do one of the following:

1. No response: the alert will time out and the system will continue operating.
2. **A** - Responding with the letter **A** will inform the Service Processor that you have seen the entry. The system will continue to operate.
3. **X** - Responding with the letter **X** will inform the Service Processor to disable all future alert messages. This can be re-enabled with a Service Processor command.

Sample System Alert

```
*************************SYSTEM ALERT*************************************
ALERT LEVEL: 6=Boot possible, pending failure or environmental problem - action required
PROBLEM DETAIL: 4=fan failure - SOURCE ID: 04
SYSTEM NAME: fesrhapgsp

->Choice:a
```

Key FRU Identification Fields for System Alerts

The following fields are used for FRU identification.

Alert Level:	How the problem has affected the system operation.
Source:	What major part of the system the alert is referring to (i.e, platform, memory, processor, etc...).
Source Detail:	What sub-part of the system the alert is referring to (i.e, cabinet fan, DIMM, high voltage DC power, etc...).
Source ID:	Specific FRU referred to in Source and Source Detail (i.e, cabinet fan #4).
Problem Detail:	Specific problem information (i.e, power off, functional failure, etc...).
Timestamp:	When the problem occurred.

The above sample system alert shows the following:

1. The problem does not affect system boot.
2. The problem is with platform cabinet fan #4.
3. The problem is a fan failure. Replace fan #4 to correct the problem.
4. The fan failed on April 15, 1999 at 9:29 PM.

Interpreting Service Processor Error Chassis Logs

Accessing the Service Processor Error Chassis Logs will turn the **ATTENTION** LED, blinking on the front panel, OFF.

Chassis Logs (located in the Service Processor) contain low level logging information related to the following 5 categories:

- Incoming log: Contains all chassis logs coming into the Service Processor.
- Activity log: Contains all chassis logs related to system activity.
- Error log: Contains all error chassis logs.
- Current boot log: Contains all chassis logs associated with the current boot.
- Last boot log: Contains all chassis logs associated with the last boot.

The Error Chassis Logs are the ones you need to look at.

Accessing Error Chassis Logs

Execute the following steps to access the Error Chassis Logs.

1. At the system console prompt, type **CTRL B**
2. Enter the Service Processor Login and Password
3. The screen will display: GSP>

   At the GSP> prompt: type SL and press enter
4. The screen will display:

   `Which buffer are you interested in:`
   `Incoming, Error, Current boot, Last boot? (I/A/E/C/L)`, type **E**, and press enter
5. The screen will display:

   Do you want to set up filter options on this buffer? (Y/[N]), type **N**, and press enter
6. The most recent Error Log Entry (Log Entry #0) will be displayed. A carriage return after this will display the next log entry. Type Q to stop displaying the log entries. The screen will display: GSP>
7. At the GSP> prompt: type CO, and press enter to return to the console screen.

Example of Accessing Error Logs

Here is an example of accessing the Error Logs from the Boot Console Handler (BCH) Main Menu prompt. User input is shown in *ITALICS*.

```
Main Menu: Enter command or menu > type CTRL B
Service Processor login: System Operator
Service Processor password: ****** (password hidden)

            Welcome to HP Guardian Service Processor

Doc:

2. The problem is with fan #4.
3. The problem is a fan failure.
4. The fan failed on April 15, 1999 at 9:29 PM.

In this example, fan #4 should be replaced to correct the problem.

Interpreting Chassis Logs Using the chassis_code.codes File

For chassis logs generated by system firmware (Reporting Entity Type 0), use the chassis_code.codes file for chassis code definitions. Each revision of system firmware (AKA Processor Dependent Code or PDC) has a unique chassis_code.codes file. This file is not part of either the PF_Cxxxxx or PHSS_xxxxx server firmware patches. The chassis_code.codes files appear in the appendices of the *Interpreting Chassis Logs in Detail* guide.

The definition of a PDC reported chassis code is determined by locating either the last four digits of a chassis log or the last three digits of a selftest chassis code in the appropriate chassis_code.codes file. Refer to the *Interpreting Chassis Logs in Detail* guide for definition and examples of selftest chassis codes.

NOTE Be sure to use the appropriate appendix as the PDC for rp5400/rp5450 is different than PDC for rp5470. Using the wrong appendix may result in a mis-interpretation of the chassis code.

To quickly learn the definition of a PDC reported chassis code, follow these four steps:

Step 1. Determine either the last 4 digits of the hex chassis code or the last 3 digits of the selftest chassis code.

Step 2. Go to the appropriate appendix in the *Interpreting Chassis Logs in Detail* guide.

Step 3. Locate the chassis code that matches the last 3 or 4 digits. If viewing via web browser or Adobe Acrobat, use the FIND feature to locate the chassis code.

Step 4. Take action as appropriate.

ECT
CPL - AC

Example 6-1 Chassis Log: Reporting Entity Type = System Firmware

```
Log Entry #   0 :SYSTEM NAME: fesrhapgspDATE: 12/08/2000 TIME: 23:46:22ALERT LEVEL: 6
= Boot possible, pending failure - action requiredSOURCE: 3 = PDHSOURCE DETAIL: 0 =
unknown, no source stated   SOURCE ID: 3PROBLEM DETAIL: 0 = no problem detailCALLER
ACTIVITY: 1 = test   STATUS: 0CALLER SUBACTIVITY: 71 = implementation
dependentREPORTING ENTITY TYPE: 0 = system firmware   REPORTING ENTITY ID:
030x0000306030031710 00000000 000000FE type  0 = Data Field Unused0x5800386030031710
0000640B 08172E16 type 11 = Timestamp 12/08/2000 23:46:22Type CR for next entry, Q CR
to quit.
```

Using the example above:

Step 1. The last 4 digits are 1710.

Step 2. This is an rp5450 so use Appendix B in the *Interpreting Chassis Logs in Detail* guide.

Step 3. Using the FIND feature to look up 1710 in Appendix B, we learn the definition is CC_BOOT_INVALID_SPHYR_SETTINGS.

Step 4. The appropriate action in this example would be to verify the switch settings on the system board are set correctly for the installed CPU's.

Individual Component Remove/Replace Instructions

Each component has instructions for removal followed by instructions for replacement.

Extend the Server out the Front

rp54xx servers are available in two housings: rack-mounted or stand-alone. Access to servers mounted in an HP-supported rack is covered in this section.

NOTE Ensure that there is enough area (Approximately 1.5 meters (4.5 ft) to fully extend the server out the front and work on it.

WARNING **Ensure that all anti-tip features (front and rear anti-tip feet installed; adequate ballast properly placed, etc.) are employed prior to extending the server.**

To extend the server, perform the following steps:

1. Remove the four T-25 screws that fasten the server to the rack.
2. Grasp the server chassis and slowly pull forward. The server is fully extended when the rail clips are locked in place. When fully extended, the top and side service bays are fully accessible.

The following graphic shows the server extended and indicates the rail clip location.

Insert the Server from the Front

rp54xx servers are available in two housings: rack-mounted or stand-alone. Access to servers mounted in an HP-supported rack is covered in this section.

To return the server into the rack, press the rail clips on either side of the server in and push the server into the rack until it stops.

The following graphic shows the server extended and indicates the rail clip location.

Stand-alone Server Cover Removal

The rp54xx server can be ordered as a stand-alone unit. In this configuration, the server has a one-piece protective cover over it and sits on a platform with locking wheels attached.

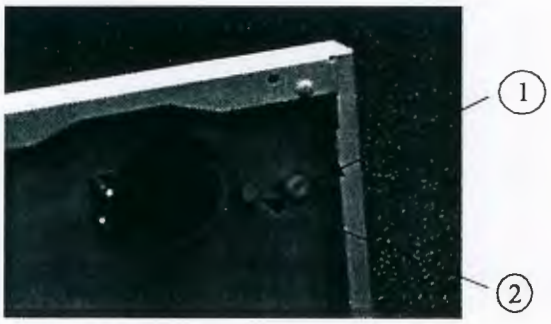
To remove the cover from a stand-alone server, perform the following procedures:

1. Unfasten and remove the screws (with captive washers) located near the bottom edge of both sides of the server cover.
2. Lift the protective cover off of the server and set it aside.

WARNING **The stand-alone server weights 69 kg (150 lbs). Removing the stand-alone server from its platform requires three people or a suitable lifting device. Failure to heed this precaution can result in serious personal injury or destruction of the server.**

To remove the server from its wheeled platform, perform the following procedure:

1. Facing the front of the server, reach under the platform on the right side and unfasten the knurl-knobbed, spring-loaded pin (item 1). The pin will retract when it is free. Perform the same step at the rear of the server. The rear knurl-knobbed, spring-loaded pin is aligned behind the front pin, but at the rear of the server.



2. From the back of the server, reach under the platform, behind the knurl-knobbed, spring-loaded pin, and locate the flat head of the second spring-loaded pin (item 2). This pin is spring-loaded to stay up and keep the server from sliding on the platform. Pull the pin down and twist one quarter turn to the left to lock the pin down and out of the way. Perform the same step at the front of the server.
3. The server is now free from its wheeled platform and can be removed from it.

WARNING **The stand-alone server weights 69 kg (150 lbs). Removing the stand-alone server from its platform requires three people or a suitable lifting device. Failure to heed this precaution can result in serious personal injury or destruction of the server.**

Stand-alone Server Cover Replacement

The rp54xx server can be ordered as a stand-alone unit. In this configuration, the server has a one-piece protective cover over it and sits on a platform with locking wheels attached.

To place the server on its wheeled platform, perform the following procedure:

WARNING **The stand-alone server weights 69 kg (150 lbs). Placing the stand-alone server on its platform requires three people or a suitable lifting device. Failure to heed this precaution can result in serious personal injury or destruction of the server.**

1. Lift the platform and turn both of the spring-loaded, flat-headed pins (item 1) a quarter turn to the right to lock them out of the way before placing the server on the platform.
2. Using a lifting devise or a minimum of three people, lift the server onto the platform. Align the server and platform so that the pins will lock.
3. Reach under the platform, locate the spring-loaded, flat headed pins and turn them one quarter turn to the left to unlock them. Gently slide the server around on the platform until the spring-loaded flat-head pins snap into their holes.
4. Once again, reach under the platform on the right side and fasten both front and back knurl-knobbed, spring-loaded pins (item 2).

To place the cover on a stand-alone server, perform the following procedures:

1. Set the protective cover on the server and align the holes located near the bottom edge of both sides of the server cover.
2. Fasten the screws (with captive washers) through the cover, into the platform.

The following graphic shows the protective cover.

Top Cover Removal

The power to the server does not have to be off to remove the top cover and air baffle. However, operation of the server without the top cover in place can make it susceptible to EMI problems.

Follow the steps listed below to remove the top cover:

1. Loosen the captive T-15 screws that hold the top cover in place.
2. Grasp the strap handles, raise the cover slightly, and pull the cover toward the front of the server to free the cover tabs from the slots in the chassis. The air baffle will be exposed.

Loosen the captive T-15 screws that hold the air baffle in place then lift the air baffle off of the server.

The following graphics show the top service bay cover and the air baffle. The first graphic shows the top service bay cover.

The second shows the air baffle.

Top Cover Replacement

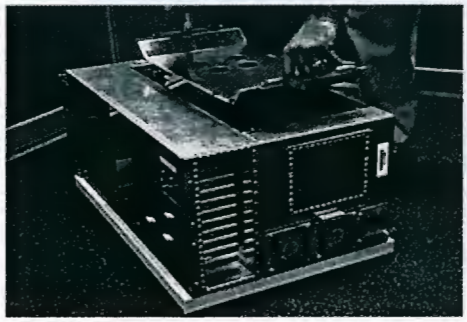
The power to the server does not have to be off to remove or replace the top service bay cover and air baffle. However, operation of the server without the top cover in place can make it susceptible to EMI problems.

Set the air baffle in place over the opening for the top service bay and tighten the captive T-15 screws.

Follow the steps listed below to replace the top cover:

1. Align the tabs on the end of the top cover with the corresponding slots in the chassis and seat the tabs fully into the slots.
2. Seat the top cover in the top of the service bay and tighten the captive T-15 screws that hold the cover in place.

The following graphics show the air baffle and the top service bay cover. The first graphic shows the air baffle.



The second graphic shows the top service bay cover.

ECT 4.698 I 9 AC

Side Cover Removal

The Side Cover protects the side service bay. The power to the server does not have to be off to remove the side cover. However, operation of the server without the side cover in place can make it susceptible to EMI problems.

Loosen the captive T-15 screws that hold the side cover in place, then grasp the strap handle and pull the cover away from the server.

The following graphic shows the side cover with captive screw locations.

Side Cover Replacement

The power to the server does not have to be off to replace the side cover. However, operation of the server without the side cover in place can make it susceptible to EMI problems.

Replace the side cover according to the following steps:

1. Grasp the strap handle and insert the tabbed end of the cover into the server chassis slots on the right side of the side service bay.
2. Push the cover into the side service bay opening and fasten the captive T-15 screws that hold the side cover in place.

The following graphic shows the side cover with captive screw locations.

Front Bezel Removal (Single Piece)

The rp54xx server front bezel is hinged on the left (facing the front of the server). The server does not have to be turned off to open or to completely remove the bezel.

Opening the door provides access to the following components:

- HotPlug Disks (A0, A1, and B0, B1).
- Removable Media (CD-ROM drive, etc.).
- HotSwap Chassis Fan cover.
- HotSwap Chassis Fan 0.
- HotSwap Power Supplies (up to three).

To open the front bezel, grasp the right edge of the bezel and pull out. The bezel will swing away from the chassis.

To remove the entire bezel, perform the following steps:

1. Open the front bezel and swing it to the left as far as possible.
2. Pry the hinge cover, located on the left side of the server, off the chassis.
3. While supporting the bezel, remove the screws that secure the bezel hinge to the left side of the server.
4. Grasp the left side of the bezel and pull it loose.

The following graphic shows the front bezel.

Doc:

Front Bezel Replacement (Single Piece)

The rp54xx server front bezel is hinged on the left (facing the front of the server). The server does not have to be turned off to open or to completely remove the bezel.

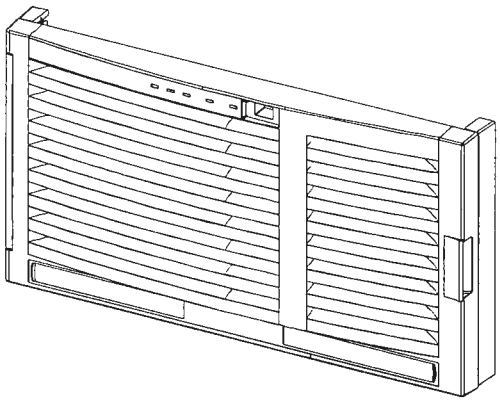
The bezel encloses the following components:

- HotPlug Disks (A0, A1, and B0, B1).
- Removable Media (CD-ROM drive, etc.).
- HotSwap Chassis Fan cover.
- HotSwap Chassis Fan 0.
- HotSwap Power Supplies (up to three).

To attach the bezel, perform the following steps:

1. Screw the bezel hinge to the threaded inserts on the left side of the server.
2. Install the hinge cover by aligning the notch in the top of the cover with the top of the assembly cover and press firmly into place.

   The following graphic shows the front bezel.



Front Bezel Removal (Two Piece)

The rp54xx server front bezel is divided and hinged on the right (facing the front of the server) side to provide a door for Disk Media Bay access. The server does not have to be turned off to open the access door or to completely remove the bezel.

Opening the door provides access to the following components:

- HotPlug Disks (A0, A1, and B0, B1).
- Removable Media (CD-ROM drive, etc.).

Removing the entire bezel provides access to the components listed above and the following:

- HotSwap Chassis Fan cover.
- HotSwap Chassis Fan 0.
- HotSwap Power Supplies (up to three).

To open the Disk Media access door, grasp the right edge of the door and pull out. The door will swing away from the chassis, exposing the Disk Media Bay.

To remove the entire bezel, perform the following steps:

1. Open the Disk Media access door, exposing the plastic bezel pins inserted in the clips at the top and bottom of the Disk Media bay on the left side.
2. Grasp the left side of the bezel and pull it loose.

CAUTION DO NOT try to pull the bezel off of the server at this point. The plastic pins holding the bezel on the right side are inserted in metal clips on the Disk Media bay and if the plastic pins are bent, they will break off.

---

3. Grasp the bezel with both hands and carefully slide the bezel to the left until both plastic pins clear the metal clips on the Disk Media bay.
4. Pull the bezel away from the server and set it aside.

The following graphic shows the front bezel.

Front Bezel Replacement (Two Piece)

The rp54x0 server front bezel is divided and hinged on the right (facing the front of the server) side to provide a door for Disk Media Bay access. The server does not have to be turned off to open the access door or to completely remove the bezel.

The Disk Media Bay door encloses the following components:

- HotPlug Disks (A0, A1, and B0, B1).
- Removable Media (CD-ROM drive, etc.).

The left side of the front bezel encloses the following components:

- HotSwap Chassis Fan cover.
- HotSwap Chassis Fan 0.
- HotSwap Power Supplies (up to three).

To attach the bezel, perform the following steps:

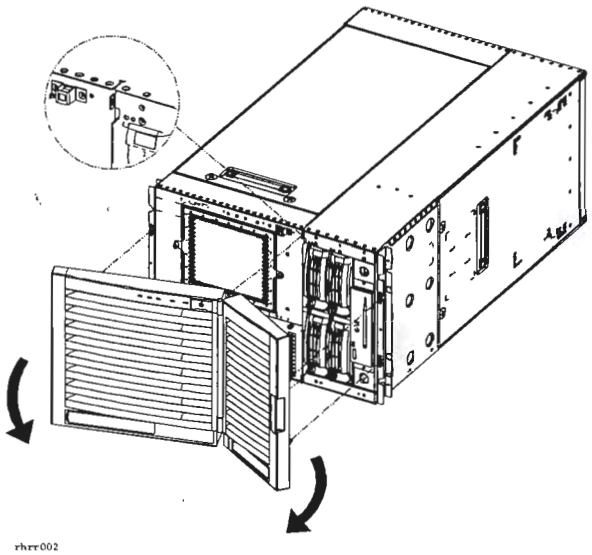
1. Swing the Disk Media access door open so that the plastic pins that go into the metal clips on the Disk Media bay are exposed.

CAUTION The plastic pins holding the bezel on the right side are inserted into metal clips on the Disk Media bay. DO NOT bend the plastic pins or they will break off.

---

2. Holding the bezel with both hands, align the bezel pins with the metal clips on the Disk Media bay and carefully slide the bezel pins into the clips.
3. Attach the left side of the bezel to the server chassis by aligning the bezel pins with the chassis clipsand press the bezel into the chassis until the pins snap into the clips.

   The following graphic shows the front bezel.



rhrr002

4. Swing the Disk Media access door closed and attach it to the right side of the server chassis.

ECT 4.6921 V AC

Core I/O Removal

rp54xx Core I/O functions are contained on the GSP revision A/B and LAN/SCSI cards. Both cards are located on the PCI Backplane in the side service bay. The LAN/SCSI card is in I/O slot 1 and the GSP revision A/B card is in I/O slot 2.

Before removing either of the Core I/O cards from the server, perform the following tasks:

- Power down the server.
- Detach all power cords from the server.

To remove a Core I/O card from the server, perform the following steps:

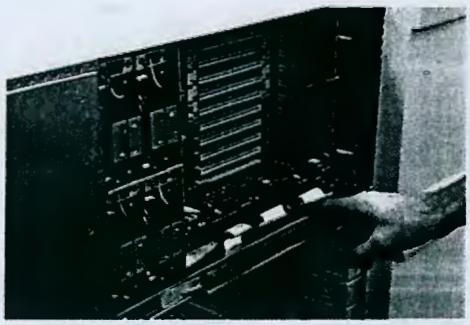
1. Remove all cables attached to the Core I/O card at the rear bulkhead.

NOTE Be sure to label the cables before removing them.

---

2. Disconnect any ribbon cable connectors attached to the Core I/O card in the side service bay.
3. Grasp the edge of the Core I/O card and pull it out of the server.

The following graphic shows both Core I/O cards in the side service bay.



RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1627
Doc: 3701

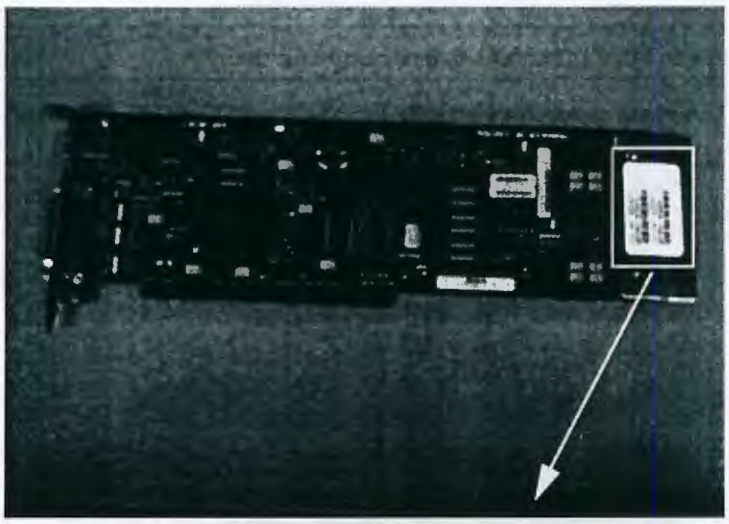
Core I/O Replacement

rp54xx Core I/O functions are contained on the GSP and LAN/SCSI cards. Both cards are located on the PCI Backplane in the side service bay. The LAN/SCSI card is in I/O slot 1 and the GSP card is in slot 2.

Before replacing either of the Core I/O cards, perform the following tasks:

- Power down the server.
- Detach all power cords from the server.

NOTE For revision B GSP only, remove *one* of the MAC address labels and place on the rear of the server as shown in the following graphics.



To replace a Core I/O card, perform the following steps:

ECT 1
24.690
J
CPL - AC

1. Orient the I/O card in its guide and push it into the server until the card connector seats in the I/O Backplane card slot.
2. Connect the I/O cable attached to the I/O card at the rear PCI bulkhead.
3. Connect any ribbon cable connectors attached to the I/O card in the side service bay.

The following graphic shows an I/O card being replaced.

Doc: 3701

PCI Card Separator/Extractor Removal

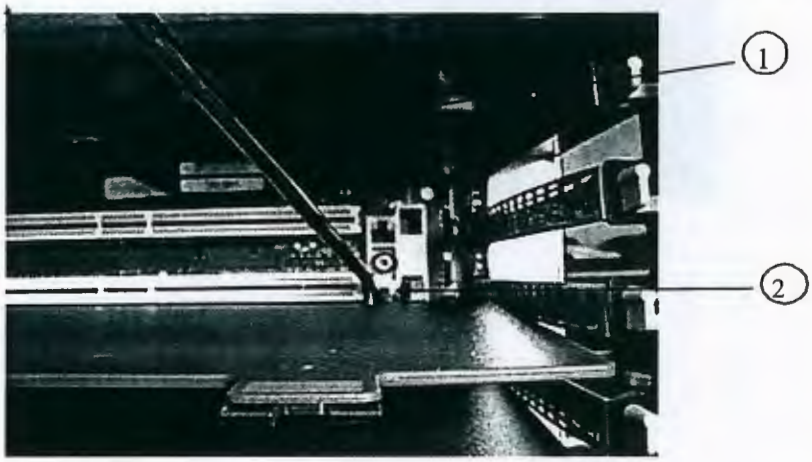
PCI card separator/extractors are located in the Side Service Bay, between the PCI cards. PCI card separator/extractors are plastic cards with two tab handles and two LEDs.

Before removing a PCI card separator/extractor from the server, perform the following tasks:

- Shut down the server.
- Remove the corresponding PCI card.

To remove a PCI card separator/extractor, perform the following steps:

1. Carefully slide a long shaft, medium width, flat blade screw driver (item 1) into the Side Service Bay along the side of the PCI card separator/extractor, and insert it into the slot in the hook tab (item 2).



2. At the point where the PCI card separator/extractor inserts into the PCI backplane connector (item 2), there are two slotted, hook tab connectors on the PCI card separator/extractor, one on either side of the PCI Backplane connector. Press one then the other to disengage the card from the backplane.
3. With the two connection points pressed, slide the PCI card separator/extractor out of the PCI card cage.

PCI Card Separator/Extractor Replacement

PCI card separator/extractors are located in the Side Service Bay on the PCI Backplane, between PCI cards. PCI card separator/extractors are plastic cards with two tab handles and two LEDs.

To replace a PCI card separator/extractor, perform the following steps:

1. Insert the PCI card separator/extractor into the available slot and slide it into the PCI backplane connector.
2. Be sure the two hook tabs on the PCI card separator/extractor insert into the connector blocks on either side of the PCI backplane.

Once you have completed replacement of the PCI card separator/extractor into the server, perform the following tasks:

- Replace the PCI card, if necessary.
- Power up the server.

Doc:

HotPlug Disk Drive Removal

The internal disk drives (up to four) are located at the front right side of the server (as you are facing it). When proper software and hardware procedures are followed, internal disk drives can be removed and replaced while the server is running.

The procedures in this section are in two parts, a HotSwap Software Procedure and a HotPlug Hardware Procedure, for removing the disk from the server.

Before starting these procedures, you must have an up-to-date configuration backup file. Configuration backup is performed by default each time an LVM command changes the LVM configuration. The default backup files path is:

`/etc/lvmconf/base_vg_name.conf.`

The replacement disk drive must be the same product ID as the disk drive that is being replaced.

NOTE HP often uses different manufacturers for disks that have the same product number. The HotSwap and HotPlug procedures will not update the disk drive's internal information to that of the replaced disk drive.

The replacement disk drive will have the same capacity and blocksize as the defective disk because they have the same product number. The only field that can be incorrect is the string specifying the vendor's name. This will not affect the behavior of the LVM. If you desire to update the manufacturer's name, the disks volume group must be deactivated and reactivated.

HotSwap Software Procedure

Perform these software procedural steps to replace a HotPlug disk drive device:

Step 1. Determine whether LVM found the physical volume to be defective when the volume group was activated.

If the volume was defective when the volume group was activated, *vgchange* will generate the following message to the console:

```
WARNING

VGCHANGE: WARNING: COULDN'T ATTACH TO THE VOLUME GROUP PHYSICAL
VOLUME "/DEV/DSK/cXtXdX"

VGCHANGE: WARNING: COULDN'T ATTACH TO THE VOLUME GROUP PHYSICAL
VOLUME "/DEV/DSK/cXtXdX"

THE PATH OF THE PHYSICAL VOLUME REFERS TO A DEVICE THAT DOES NOT
EXIST, OR IS NOT CONFIGURED INTO THE KERNAL.
```

If you are unsure of the status of *vgchange*, check it with the *vgdisplay* command:

#vgdisplay <VG name>

For example:

vgdisplay /dev/vg00

If the disk was defective when the *vgchange* command was entered, the following message will be printed one or more times:

E C T
4.686
1
V
A C

```
WARNING:

VGDISPLAY: WARNING: COULDN'T QUERY PHYSICAL VOLUME "/DEV/DSK/cXtXdX"
THE SPECIFIED PATH DOES NOT CORRESPOND TO PHYSICAL VOLUME ATTACHED TO THE
VOLUME GROUP.

VGDISPLAY: WARNING: COULDN'T QUERY ALL OF THE PHYSICAL VOLUMES.
```

If you see these messages, the disk was defective at the time the volume group was activated. Remove the bad disk as described in step 9 of this procedure, then follow the instructions in for replacing the disk and perform the *HotSwap Procedure for Unattached Physical Volumes* described there.

Otherwise, the disk drive became defective after *vgchange* was run. Proceed to Step 2.

Step 2. Display the names of all the logical volumes on this volume group with the *vgdisplay* command. For example:

```
#vgdisplay /dev/vg00
```

Step 3. Determine which logical volumes have mirrors with the *lvdisplay* command. For example:

```
#lvdisplay /dev/vg00/lvol# | grep -ie "LV Name" -e "Mirror"
```

Step 4. Determine the *pvkey* command status for the mirrored logical volume, again using the *lvdisplay* command with the *-k* option. Compare the output to the *lvdisplay* command with the *-v* option to determine the device file to *pvkey* mapping. For example,

```
# lvdisplay -v -k /dev/vg00/lvol1
--- Logical volumes ---
LV Name                     /dev/vg00/lvol1

   00002 /dev/dsk/c1t6d0     00002 current  /dev/dsk/c2t6d0     00002 current
   00003 /dev/dsk/c1t6d0     00003 current  /dev/dsk/c2t6d0     00003 current
   00004 /dev/dsk/c1t6d0     00004 current  /dev/dsk/c2t6d0     00004 current
   00005 /dev/dsk/c1t6d0     00005 current  /dev/dsk/c2t6d0     00005 current
   00006 /dev/dsk/c1t6d0     00006 current  /dev/dsk/c2t6d0     00006 current
   00007 /dev/dsk/c1t6d0     00007 current  /dev/dsk/c2t6d0     00007 current
   00008 /dev/dsk/c1t6d0     00008 current  /dev/dsk/c2t6d0     00008 current
```

The *pvkey* stuatus (0 or 1 in this example) shown in the first command, maps to the device file names (*/dev/dsk/c1t6d0* or */dev/dsk/c2t6d0*) in the second command under columns *PV1* and *PV2*, respectively.

Step 5. Reduce any logical volumes that have mirror copies on the faulty disk drive so that they no longer mirror onto that disk drive (note the *-A n* option):

```
# lvreduce -m 0 -A n -k <LV name> /dev/dsk/cXtXcX <pvkey#>&
```

ECT 14.684 CPL - AC

(for 1 way mirroring)

OR

```
# lvreduce -m 1 -A n -k <LV name> /dev/dsk/cXtXcX <pvkey#>&
```

(for 2way mirroring)

For example, enter:

```
# lvreduce -m 0 -A n -k /dev/vg00/lvol4 /dev/dsk/c2t4d0 1&
```

The following message will appear:

```
Logical volume /dev/vg00/lvol4 has been successfully reduced.
lvlnboot: Logical Volume has no extents.
```

NOTE It is important to include the ampersand (&) at the end of the command line. Otherwise, the *lvreduce* process will hang, and you will need terminal control to negate the command. Once the 'successfully reduced' message has been generated, manually end the process using the *kill -9* command.

Step 1. Use the *ps* command to find the PID for the *lvreduce* process.

```
# ps -ef | grep lvreduce
```

Step 2. Manually end the process with the *Kill -9* command (It may take several minutes for the process to end.).

```
# kill -9 <PID>
```

Step 3. Repeat steps 4 and 5 for all logical volumes.

Step 4. With all logical volumes reduced, now reduce the volume group using the *vgreduce* command. For example:

```
# vgreduce /dev/vg00 /dev/dsk/c2t6d0
```

CAUTION The *vgreduce* procedure may take a long time to complete. Do NOT terminate this process.

Step 5. Update the disk BDRA using the `lvlnboot` command.

```
# lvlnboot -R
```

Step 6. Proceed to the *HotPlug Hardware Procedure* to remove the bad disk drive from the server.

HotPlug Hardware Procedure

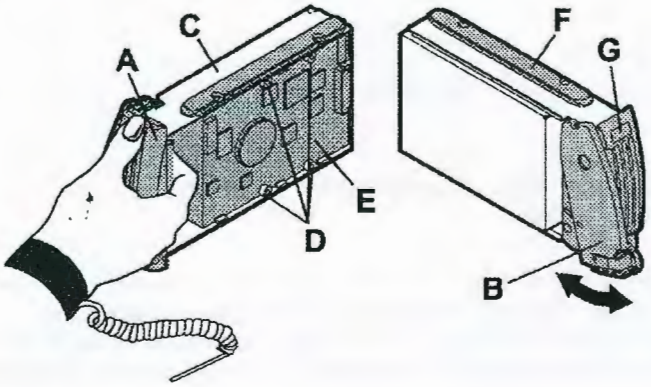
CAUTION Disk Drives can be removed or installed with the server still powered on. This is referred to as a "manual HotPlug".

To remove a disk drive from the server, perform the following step:

ROS Nº 03/2005 - CN
CPMI - CORREIOS
1631
Fls: 3701
Doc:

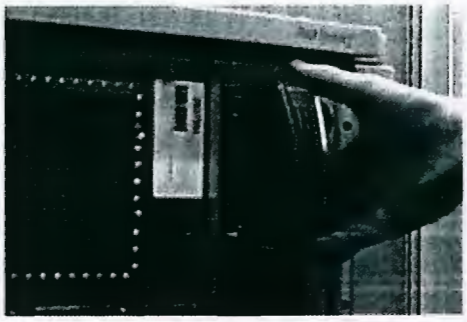
Grasp the tab at the bottom of the cam latch on the selected disk drive, then push the button inside the cam latch and pull the cam latch out and up. The disk drive will unlock. Pull gently until it slides completely free.

The following graphic shows disk features.



A bezel handle
B cam latch
C carrier frame
D standoffs
E circuit board
F insertion guide
G capacity label

The next graphic depicts disk removal/replacement.



HotPlug Disk Drive Replacement

The internal disk drives (up to four) are located at the front right side of the server (as you are facing it). When proper software and hardware procedures are followed, internal disk drives can be removed and replaced while the server is running.

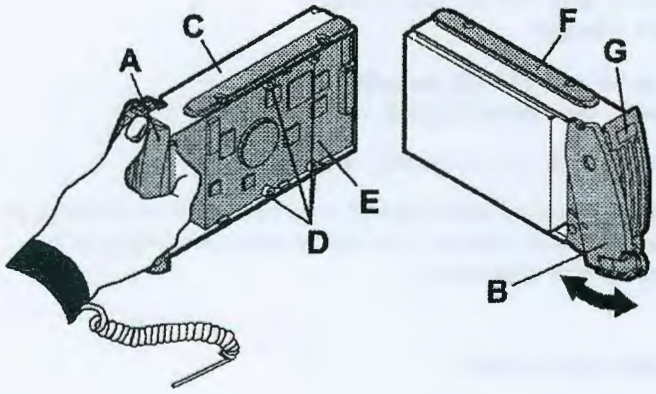
CAUTION Disk Drives can be removed or installed with the server still powered on. This is referred to as a "manual HotPlug".

However, DO NOT replace a HotPlug disk drive until a controlled shutdown of the operating system has been performed.

Hardware HotPlug Procedure

To replace a disk drive in the server, grasp the tab at the bottom of the cam latch on the selected disk drive, push the button inside the cam latch, and pull the cam latch out and up. The disk drive will unlock. Pull gently until it slides completely free.

The following graphic shows disk features.



- **A** bezel handle
- **B** cam latch
- **C** carrier frame
- **D** standoffs
- **E** circuit board
- **F** insertion guide
- **G** capacity label

The next graphic depicts disk removal/replacement.

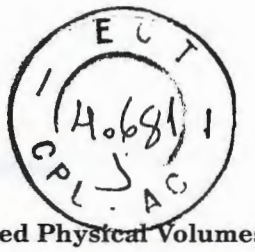
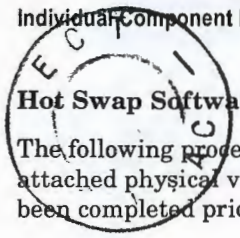
Doc:





Hot Swap Software Procedure for Attached Physical Volumes

The following procedure is an example of how to recover from replacing a disk that was recognized as an attached physical volume. Be sure that all the software procedures in the *Disk Drive Removal* section have been completed prior to starting these steps. This example assumes that the disk was mirrored.

NOTE HP often uses different manufacturers for disks, but assigns the same product number. The hot swap manual procedure will not update disk driver internal information to that of the replaced disk drive.

Step 1. Perform an *ioscan* on the replaced disk drive to ensure that it is accessible (claimed), to double check that it is a proper replacement, and that the device files are present. Refer to the above note.

For example: `# ioscan -fnC disk`

Step 2. Use the following procedure to mirror the root disk:

a. Create the new physical volume using the *pvcreate* command.
For example: `# pvcreate -B /dev/rdsk/cXtXdX`

b. Extend the volume group to include the new physical volume using the *vgextend* command:
For example: `# vgextend /dev/vg00 /dev/dsk/cXtXdX`

c. The *mkboot* command must be run to make the device bootable.
For example:`# mkboot /dev/rdsk/cXtXdX`

d. Use the *mkboot* command again to add the HP-UX auto-file-string.
For example: `# mkboot -a "hpux" /dev/rdsk/cXtXdX`

e. Run *lvlnboot* with the following command: `# lvlnboot -R`

f. Run *lvextend* to put a mirror into the replaced disk drive. It may take several minutes to copy the original copy of the data to the mirrored extents. The logical volume(s) will still be accessible to user applications during this operation.

For example:
```
# lvextend -m 1 <LV name> /dev/dsk/cXtXdX
```
OR
```
# lvextend -m 2 <LV name> /dev/dsk/cXtXdX (for 3 way mirroring)
```

For example:
```
# lvextend -m 1 /dev/vg00/lvol4 /dev/dsk/cXtXdX
```
OR
```
# lvextend -m 1 /dev/vg00/lvol5 /dev/dsk/cXtXdX
```

Repeat this for each logical volume to be mirrored.

Verify that the mirror is bootable and AUTO file is correct.

```
For example:
# lifls -l /dev/rdsk/cXtXdX
```
OR
```
# lifcp /dev/rdsk/cXtXdX:AUTO -
```

ECT 4.680 CPL - AC

g. Verify that the mirroring is set up properly.

For example:

```
# vgdisplay -v /dev/vg00
# lvdisplay /dev/vg00/lol1 - lvol8
# lvlnboot -v /dev/vg00
```

Both disks should list as "Boot Disk" and both should appear in the *lvol* lists.

At this point the system will be fully functional.

Hot Swap Procedure for Unattached Physical Volumes

The following steps are an example of how to replace a HotPlug disk drive for unattached physical volumes. This example assumes the disks are mirrored.

NOTE HP often uses different manufacturers for disks, but assigns the same product number. The hot swap manual procedure will not update disk driver internal information to that of the replaced disk drive.

Step 1. Perform an *ioscan* on the replaced disk drive to ensure that it is accessible (claimed), to double check that it is a proper replacement, and that the device files are present. Refer to the above note.

For example: `# ioscan -fnC disk`

Step 2. Restore the LVM configuration/headers onto the replaced disk drive from your backup of the LVM configuration with the following entry:

```
# vgcfgrestore -n <volume group name> /dev/rdsk/cXtXdX
```

For example: `# vgcfgrestore -n /dev/vg00 /dev/rdsk/cXtXdX`

Step 3. Attach the new disk drive to the active volume group with the following *vgchange* command:

```
# vgchange -A y <volume group name>
```

For example: `# vgchange -A y /dev/vg00`

Step 4. Use the *mkboot* command to make the device bootable.

For example: `# mkboot /dev/rdsk/cXtXdX`

Step 5. Use the *mkboot* command again to add the HP-UX auto-file-string.For example: `# mkboot -a "hpux" /dev/rdsk/cXtXdX`

Step 6. Run *lvlnboot* with the following command: `# lvlnboot -R`

Step 7. Resynchronize the mirrors of the replaced disk drive with the following command. It may take several minutes to copy all the data from the original copy of the data to the mirrored extents. The logical volume(s) are still accessible to users' applications during this command.

```
# vgsync <VG name>
```

For example: `# vgsync /dev/vg00`

At this point the system will be fully functional.

HotSwap Chassis Fan Removal

The power to the server does not have to be off to remove or replace a HotSwap Chassis fan. Fan number 0 is in the front of the server and fan number 1 is at the rear of the server.

To remove a fan from the server, perform the following steps:

1. Check the fan LED located on the fan. If the LED is illuminated, the fan has failed.

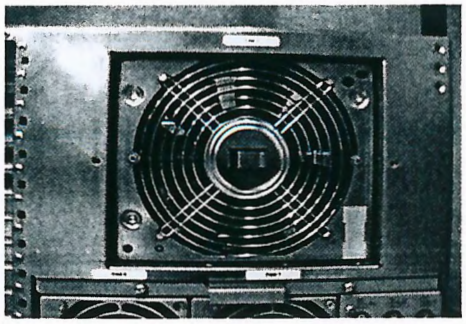
NOTE When one fan has failed (or is removed from the server), the system automatically puts the remaining fan into high speed mode. The noise level of the server will increase.

2. Grasp the fan grill and gently pull toward you. The fan assembly will unplug from the electrical outlet and slide out of the server.

CAUTION Running the server for extended periods of time with a cooling fan removed may create hot spots inside the server and possibly shorten component life.

If the other fan fails when one fan is removed, the system will halt.

The following graphic shows a HotSwap Chassis Fan.



4.762

HotSwap Power Supply Replacement

Up to three power supplies (0 through 2), located across the bottom front of the server, can be installed in the server without removing power.

To replace a power supply, perform the following steps:

CAUTION Be careful when putting the power supply into the server. It is heavier than it appears.

1. Grasp the handle in one hand and support the power supply with the other. Slide the power supply into the server. The Power Supply LED should illuminate immediately.
2. Replace the T-15 mounting screw located to the right of the handle near the top of the power supply.

The following graphic shows a front and rear view of a HotSwap Power Supply.

HotSwap Power Converter Fan Removal

The power to the server does not have to be off to remove or replace a HotSwap Power Converter fan. Fans numbered 6 and 7 are located in the rear of the server.

To remove a fan from the server, perform the following steps:

NOTE When one fan has failed (or is removed from the server), the system automatically puts the remaining fan into high speed mode. The noise level of the server will increase.

1. There are four screws attached to each corner of each fan. Loosen only the captive Torx-head screws located diagonally across the face of the fan (upper left, lower right sides).
2. Grasp the extended screw-heads (or the fan grill) and gently pull toward you. The fan assembly will unplug from the electrical outlet and slide out of the server.

CAUTION Running the server for extended periods of time with a cooling fan removed may create hot spots inside the server and possibly shorten component life.

If the other fan fails when one fan is removed, the system will halt.

The following graphic shows where HotSwap Power Converter Fans are located.

PCI I/O Card Removal

The side service bay contains card slots for ten PCI I/O cards (slots 3 through 12) and two Core I/O cards (slots 1 and 2).

Perform the following tasks prior to removing PCI I/O cards:

- Power down the server.
- Detach all power cords from the server.

To remove a PCI I/O card from the server, perform the following steps:

NOTE Record the location of all PCI cards as they are removed. Replacing them in a diffferent location will require system reconfiguration and could cause boot failure.

---

1. Disconnect the I/O cable attached to the I/O card at the rear PCI bulkhead.
2. Disconnect any ribbon cable connectors attached to the I/O card in the side service bay.
3. Grasp the edge of the I/O card and pull it out of the server.

The following graphic shows an I/O card being removed.

PCI I/O Card Replacement

The side service bay contains card slots for 10 PCI I/O cards (slots 3 through 12) and 2 Core I/O cards (slots 1 and 2).

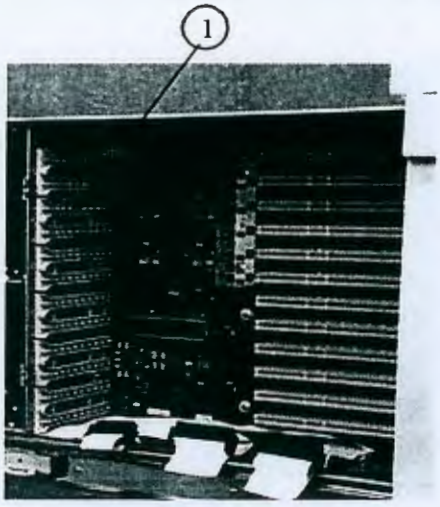
Prior to replacing PCI cards, perform the steps listed below:

- Power down the server.
- Detach all power cords from the server.

To replace a Core or PCI I/O card, perform the following steps:

1. Locate the I/O card guide (item 1) on the outside of the Fan Assembly Housing. Orient the I/O card into its guide slot and push it into the server until the card connector seats in the I/O Backplane card connector.

NOTE Each I/O card guide contains two slots. The top slot is aligned with the I/O Backplane card connector.



2. Connect the I/O cable attached to the I/O card at the rear PCI bulkhead.
3. Connect any ribbon cable connectors attached to the I/O card in the side service bay.

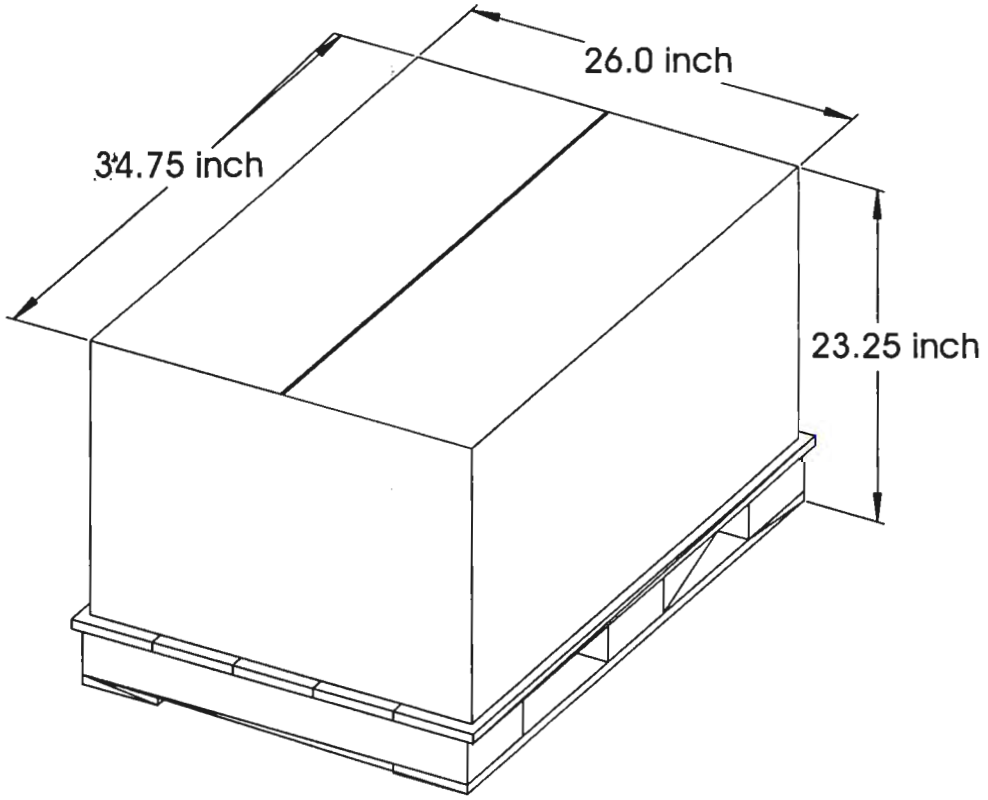
B System Specifications

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1646
Fls:
Doc: 3701

Dimensions

Uncrating Space

rp54xx systems are shipped in boxes on a 34.75 in. x 26 in. (88.25 cm. x 66 cm.) pallet. The combined height of the packaged container and the pallets is 23.25 in. (59 cm.).



rhrr004

Allow a circular area approximately 5 ft. (2 m.) in diameter room for uncrating the system. Allow additional space for temporary storage of the shipping containers and packing materials.

Space Requirements

A minimum access area of 2 ft. (0.7 m.) in all directions is required for serviceability.

ECT
4.738
1
3
L - AC

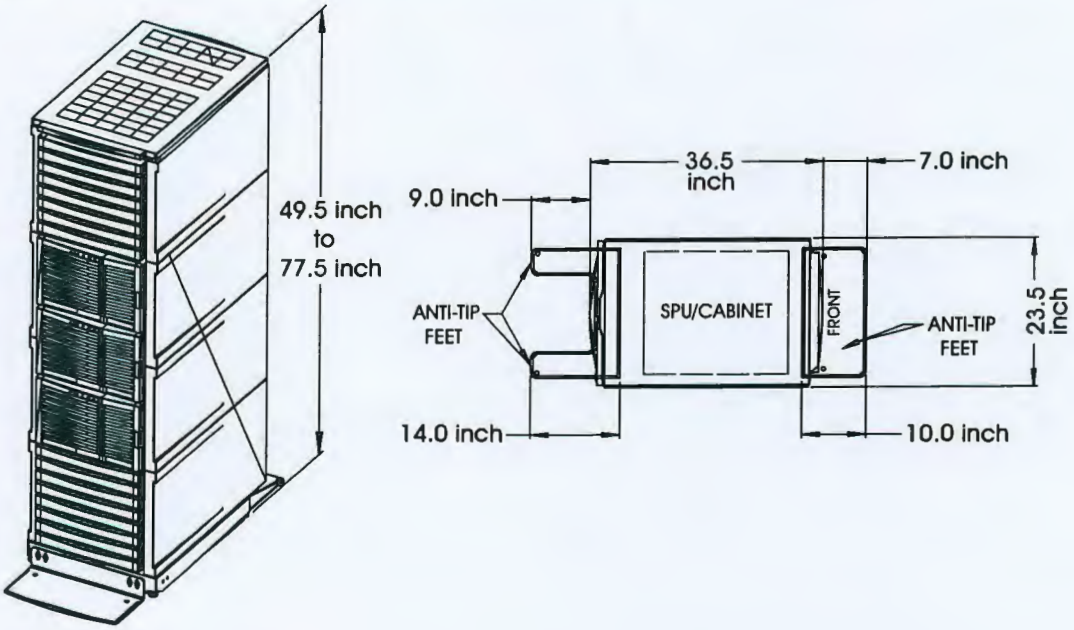
Computer Room Physical Space Requirements

Server

The A5537A, A5538A, or A5539A cabinets in which the server resides is 38.5" deep by 23.5" wide, with heights as follows:

- A5537A 1.2 meter rack - 49.5"
- A5538A 1.6 meter rack - 63.5"
- A5539A 2.0 meter rack - 77.5"

The cabinet anti-tip feet (required for safety) extend the depth an additional 10" in the front and 14" in the back. The minimum standalone physical space for the rp54xx server in a cabinet is shown in the following illustration:



rhrr005

For service access, the server slides on rails 28" beyond the edge of the chassis in the front. An additional minimum of 3' of workspace on all sides is required for servicing the server.

Aisle Space

The minimum aisle space between rows of installed HP rp54xx server/cabinets is 3 feet, front and back, for airflow and serviceability.

Computer Room Unpacking Space

Specify Uncrating Space

rp54xx Systems are shipped in integrated cabinets on a 34.75" (88.25 cm.) x 26" (66 cm.) pallet. The combined height of the packaged container and the pallets are as follows:

- 1.1 meter rack - 60 inches
- 1.6 meter rack - 73 inches
- 2.0 meter rack - 87 inches

Allow room (a circular area approximately 12 feet (3.5 meters) in diameter) for uncrating the system and rolling the cabinet off the pallet on rails. Allow additional space for temporary storage of the shipping containers and packing materials..

FACT
14.736
CPL - AC

Electrical

The HP rp54xx power system is comprised of one, two or three autoranging, 12A/10A/5A, 930W hot-swappable system power supplies, depending on how the system is configured. The maximum power needed by fully-configured server is 1200W. Each power supply requires a dedicated 20A branch circuit.

CAUTION HP does not recommend and does not support the use of "ferro-active" or "ferro-resonant" power correction in conjunction with the rp54xx server. These type of line conditioners represent an older technology that is not compatible with the most recent designs in active PFC power supplies such as those in the HP rp54xx servers. "Ferro-active" or "ferro-resonant" line conditioners may cause an increase in total harmonic distortion and may produce significant and unpredictable voltage regulation anomalies.

Office High Availability Requirements

Server-level Enhanced Power Availability

At the server level, enhanced power availability is achieved through the n+1 hot-swappable power supplies.

One power supply is required for a minimally configured rp54xx system operation and in order to allow the system to boot. If a second power supply is present, one of the two power supplies can fail without the system shutting down. Similarly, two power supplies are required for a more heavily-configured rp54xx server. If a third power supply is present, one of the two power supplies can fail without the system shutting down.

If a third (redundant) power supply is present, all three power supplies become hot-swappable. Any one of the power supplies can fail without affecting system performance, and can be replaced while the system is on-line. Single point of failure is reduced to the local wall circuit or PowerTrust UPS to which the power supply power cords are connected.

Power Protection

Power protection is provided through the use of HP PowerTrust UPSs (Uninterruptible Power Supplies). The only supported models for rp54xx systems are the 3.0kVA and 5.5kVA models. Recommendations for other manufacturers and models are not yet determined.

HP rp54xx server power supplies may be plugged directly into the customer's site UPS. However, customers are advised against plugging the power supply into an HP PowerTrust UPS and then connecting that UPS to the site UPS.

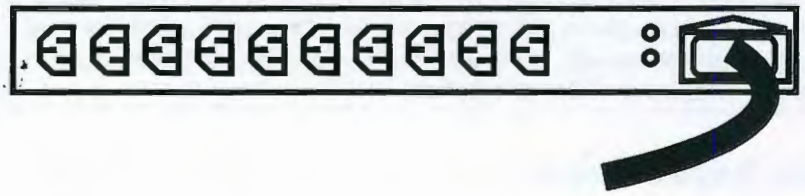
RQS Nº 03/2005 - CN
CPMI - CORREIOS
Fls: 1648
Doc: 3701

Modular PDUs

NOTE The acronym PDU (Power Distribution Unit) in this document refers to the power strips attached to the HP rp54xx cabinet.

Three modular PDUs are available for use with the rp54xx product:

- 20A modular PDU, HP product number E7674A. This PDU has seven C13 outlets and one C19 outlet. Note that if this PDU is used to power the rp54xx server, any other peripherals must have their power supplied by additional PDUs in the cabinet. The PDU power cord (HP part number 8120-6903) has an L6-20P plug which must be plugged into an L6-20R wall or floor receptacle.



- 30A modular PDU, HP product number E7681A (North America) or E7682A (International). This PDU has eight C13 outlets and two C19 outlets, split across two 20A branch circuits (max. 30A available). The PDU power cord has an L6-30 plug.

- 60A modular PDU, HP product number E7683A (North America) or E7667A (International). FINAL DESIGN ON THIS PRODUCT IS NOT YET AVAILABLE.

System Power Requirements

Table B-1 Power Requirements

Requirements	Value	Comments
Nominal input voltage	100-240 VAC	
Frequency range (minimum - maximum)	50 - 60 HZ	
Number of phases	1	
Theoretical maximum current	12.0 A	Per line cord
Maximum inrush current	69.0 A	Per line cord
Ground leakage current (mA)	< 3.6 mA	Per line cord

E C T
4.734
J A C

LAN and Telephone

rp54xx servers provide remote console access via the secure web console, which may be connected to the RS-232 serial port or 10Base-T RJ45 LAN port on the GSP (Guardian Service Processor) card in I/O slot #2. The same connectors may also be used to connect directly to a hard console.

NOTE The RJ45 LAN port should be used ONLY for remote console access and not as a production LAN port.

rp54xx servers may require as many as three unique IP addresses:

- The rp54xx server requires its own IP address.
- The Guardian Service Processor, as a separate network device, has to have its own IP address, gateway, and subnet mask configured at the site in order to be separately addressed. The service processor does not support DHCP, so the IP address must be assigned out of a separate pool from any that are assigned dynamically.
- The remote web console, if used, requires its own IP address.

NOTE Check with your local telephone company to be thatsure the telephone service at the site can accommodate modem/data quality transmission.

Acoustic Safety Standards

The acoustic specifications for the rp54xx server are as follows:

Sound power	7.0 Bels LwA maximum at >31° C
Sound pressure	60 dB maximum at > 31° C
	No prominent tones

ECT
4.732
CPL - AC

Altitude Operation Standards

Maximum Altitude	
Operational	3000 meters above sea level
Non-operational	4572 meters above sea level

Effects of Altitude

Some old models of tape drives, including those supplied by Hewlett-Packard, have vacuum column transport mechanisms that are affected by atmospheric pressure. Adjustments to these mechanisms may be required to compensate for the lower atmospheric pressure at higher altitudes.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1650
Fls:
Doc: 3701

Temperature and Humidity Operating Standards

The following table lists the temperature and humidity specifications for rp54xx servers.

Temperature and Humidity Specifications				
Parameter	**Operational Limits**	**Recommended Operating Range**	**Maximum Rate of Change (per hour)**	**Non-Operating Ranges**
Temperature[a]	5°C to 35°C (41°F to 95°F)[b]	20°C to 25°C (68°F to 77°F)	10°C (50°F) per hour (With tape media) 20°C (68°F) per hour (Without tape media)	-40°C to +70°C (-40°F to +158°F)
Operating Humidity	15 to 80% Relative humidity (Non-condensing) at 35°C (95°F)	40 to 60% Relative humidity (Non-condensing)	30% Per hour Relative humidity (Non-condensing)	90% Relative humidity (Non-condensing) at 65°C (149°F)

a. The rp54xx has been designed to operate within the above specific temperature and relative humidity operational limits. In general, operating any electronic equipment within the recommended ranges of temperature and humidity will produce optimal reliability.
b. Temperature ranges stated above are at sea level. Maximum operating temperature is derated (reduced) by 2°C for each 1000 meters above sea level up to a maximum of 3000 meters.

NOTE Operating ranges refer to the ambient air temperature and humidity measured at the cabinet cooling air intake vents.

Thermal Protection Features

If the cabinet temperature approaches 35°C, thermal protection will be invoked. At 35°C +/- 2°C a warning message will be displayed on the system console. At 40°C +/- 2°C an ungraceful shutdown will occur.

C General Site Preparation Guidelines

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1651
Fls:
Doc: 3701

The following information provides general principles and practices to consider before the installation or operation of an hp server.

Electrical Factors

Proper design and installation of a power distribution system for an hp server requires specialized skills. Those responsible for this task must have a thorough knowledge and understanding of appropriate electrical codes and the limitations of the power systems for computer and data processing equipment.

In general, a well-designed power distribution system exceeds the requirements of most electrical codes. A good design, when coupled with proper installation practices, produces the most trouble-free operation.

A detailed discussion of power distribution system design and installation is beyond the scope of this information. However, electrical factors relating to power distribution system design and installation must be considered during the site preparation process.

The electrical factors discussed in this section are:

- Computer room safety
- Power Consumption
- Electrical load requirements (circuit breaker sizing)
- Power quality
- Distribution hardware
- System installation guidelines

Computer Room Safety

Inside the computer room, fire protection and adequate lighting (for equipment servicing) are important safety considerations. Federal and local safety codes govern computer installations.

Fire Protection

The National Fire Protection Association's Standard for the Protection of Electronic Computer Data Processing Equipment, NFPA 75, contains information on safety monitoring equipment for computer rooms.

Most computer room installations are equipped with the following fire protection devices:

- Smoke detectors
- Fire and temperature alarms
- Fire extinguishing system

Additional safety devices are:

- Circuit breakers
- An emergency power cutoff switch
- Devices specific to the geographic location i.e., earthquake protection

Lighting Requirements for Equipment Servicing

Adequate lighting and utility outlets in a computer room reduce the possibility of accidents during equipment servicing. Safer servicing is also more efficient and, therefore, less costly.

For example, adequate lighting reduces the chances of connector damage when cables are installed or removed.

ECT
4.728
FL - AC

The minimum recommended illumination level is 70 foot-candles (756 lumens per square meter) when the light level is measured at 30 inches (76.2 cm) above the floor.

Power Consumption

When determining power requirements, you must consider any peripheral equipment that will be installed during initial installation or as a later update. Refer to the applicable documentation for such devices to determine the power required to support these devices.

Electrical Load Requirements (Circuit Breaker Sizing)

NOTE Local authority has jurisdiction [LAHJ] and should make the final decision regarding adherence to country- specific electrical codes and guidelines.

It is good practice to derate power distribution systems for one or more of the following reasons:

- To avoid nuisance tripping from load shifts or power transients, circuit protection devices should never be run above 80% of their root-mean-square (RMS) current ratings.
- Safety agencies derate most power connectors to 80% of their RMS current ratings.

Power Quality

The hp server is designed to operate over a wide range of voltages and frequencies. The server is tested and shown to comply with EMC Specification EN50082. However, damage can occur if these ranges are exceeded. Severe electrical disturbances can exceed the design specifications of the equipment.

Sources of Voltage Fluctuations

Voltage fluctuations, sometimes called glitches, affect the quality of electrical power. Common sources of these disturbances are:

- Fluctuations occurring within the facility's distribution system
- Utility service low-voltage conditions (such as sags or brownouts)
- Wide and rapid variations in input voltage levels
- Wide and rapid variations in input power frequency
- Electrical storms
- Large inductive sources (such as motors and welders)
- Faults in the distribution system wiring (such as loose connections)
- Microwave, radar, radio, or cell phone transmissions

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1652
Fls:
Doc: 3701

Power System Protection

The hp server can be protected from the sources of many of these electrical disturbances by using:

- A dedicated power distribution system
- Power conditioning equipment
- Over- and under-voltage detection and protection circuits
- Screening to cancel out the effects of undesirable transmissions
- Lightning arresters on power cables to protect equipment against electrical storms

Precautions have been taken during power distribution system design to provide immunity to power outages of less than one cycle. However, testing cannot conclusively rule out loss of service. Therefore, adherence to the following guidelines provides the best possible performance of power distribution systems for hp computer equipment:

- Dedicated power source—Isolates an hp server power distribution system from other circuits in the facility.
- Missing-phase and low-voltage detectors—Shuts equipment down automatically when a severe power disruption occurs. For peripheral equipment, these devices are recommended but optional.
- Online uninterruptible power supply (UPS)—Keeps input voltage to devices constant and should be considered if outages of one-half cycle or more are common. Refer to qualified contractors or consultants for each situation.

Distribution Hardware

This section describes wire selection and the types of raceways (electrical conduits) used in the distribution system.

Wire Selection

Use copper conductors instead of aluminum, as aluminum's coefficient of expansion differs significantly from that of other metals used in power hardware. Because of this difference, aluminum conductors can cause connector hardware to work loose, overheat, and fail.

Raceway Systems (electrical conduits) [LAHJ]

Raceways (electrical conduits) form part of the protective ground path for personnel and equipment. Raceways protect the wiring from accidental damage and also provide a heatsink for the wires.

Any of the following types may be used:

- Electrical metallic tubing (EMT) thin-wall tubing
- Rigid (metal) conduit
- Liquidtight with RFI shield grounded (most commonly used under raised floors)

Building Distribution

All building feeders and branch circuitry should be in rigid metallic conduit with proper connectors (to provide ground continuity) Conduit that is exposed and subject to damage should be constructed of rigid galvanized steel.

ECT
4.726
CPL - AC

Grounding Systems

An hp server requires two methods of grounding:

- Power distribution safety grounding
- High frequency intercabinet grounding

Power Distribution Safety Grounding [LAHJ]

The power distribution safety grounding system consists of connecting various points in the power distribution system to earth ground using green (green/yellow) wire ground conductors. Having these ground connections tied to metal chassis parts that may be touched by computer room personnel protects them against shock hazard from current leakage and fault conditions.

Power distribution systems consist of several parts. Hewlett-Packard recommends that these parts be solidly interconnected to provide an equipotential ground to all points.

Main Building Electrical Ground The main electrical service entrance equipment should have an earth ground connection, as required by applicable codes. Connections such as a grounding rod, building steel, or a conductive type cold water service pipe provide an earth ground.

Electrical Conduit Ground All electrical conduits should be made of rigid metallic conduit that is securely connected together or bonded to panels and electrical boxes, so as to provide a continuous grounding system.

Power Panel Ground Each power panel should be grounded to the electrical service entrance with green (green/yellow) wire ground conductors. The green (green/yellow) wire ground conductors should be sized per applicable codes (based on circuit over current device ratings).

NOTE The green wire ground conductor mentioned above may be a black wire marked with green tape. [LAHJ]

Computer Safety Ground Ground all computer equipment with the green (green/yellow) wire included in the branch circuitry. The green (green/yellow) wire ground conductors should be connected to the appropriate power panel and should be sized per applicable codes (based on circuit over current device ratings).

Cabinet Performance Grounding (High Frequency Ground)

Signal interconnects between system cabinets require high frequency ground return paths. Connect all cabinets to site ground.

NOTE In some cases power distribution system green (green/yellow) wire ground conductors are too long and inductive to provide adequate high frequency ground return paths. Therefore, a ground strap (customer-supplied) should be used for connecting the system cabinet to the site grounding grid (customer-supplied). When connecting this ground, ensure that the raised floor is properly grounded for high frequency.

Power panels located in close proximity to the computer equipment should also be connected to the site grounding grid. Methods of providing a sufficiently high frequency ground grid are described in the next sections.

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1653

3701
Doc:

Raised Floor "High Frequency Noise" Grounding

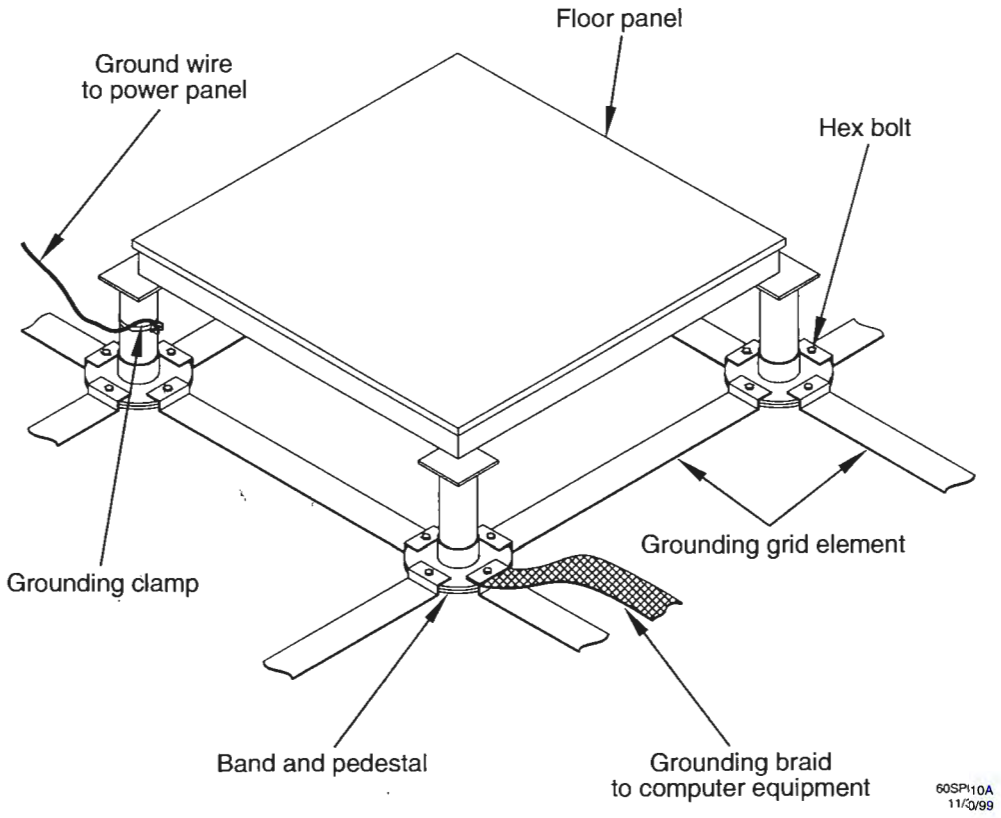
If a raised floor system is used, install a complete signal grounding grid for maintaining equal potential over a broad band of frequencies. The grounding grid should be connected to the equipment cabinet and electrical service entrance ground at multiple connection points using a minimum #6 AWG (16mm2) wire ground conductor. The following figure illustrates a metallic strip grounding system.

Hewlett-Packard recommends the following approaches:

- Excellent—Add a grounding grid to the subfloor. The grounding grid should be made of copper strips mounted to the subfloor. The strips should be 0.032 in. (0.08 cm) thick and a minimum of 3.0 in. (8.0 cm) wide.

  Connect each pedestal to four strips using 1/4 in. (6.0 mm) bolts tightened to the manufacturer's torque recommendation.
- Better - A grounded #6 AWG minimum copper wire grid mechanically clamped to floor pedestals and properly bonded to the building/site ground.
- Good—Use the raised floor structure as a ground grid. In this case, the floor must be designed as a ground grid with bolted down stringers and corrosion resistive plating (to provide low resistance and attachment points for connection to service entrance ground and hp computer equipment). The use of conductive floor tiles with this style of grid further enhances ground performance.

Figure C-1 Raised Floor Metal Strip Ground System



ECT 14.724 J CPL - AC

Equipment Grounding Implementation Details

Connect all Hewlett-Packard equipment cabinets to the site ground grid as follows:

Step 1. Attach one end of each ground strap to the applicable cabinet ground lug.

Step 2. Attach the other end to the nearest pedestal base (raised floor) or cable trough ground point (nonraised floor).

Step 3. Check that the braid contact on each end of the ground strap consists of a terminal and connection hardware (a 1/4-in. (6.0-mm) bolt, nuts, and washers).

Step 4. Check that the braid contact connection points are free of paint or other insulating material and treated with a contact enhancement compound (similar to Burndy Penetrox).

System Installation Guidelines

This section contains information about installation practices. Some common pitfalls are highlighted. Both power cable and data communications cable installations are discussed.

NOTE In domestic installations, the proper receptacles should be installed prior to the arrival of Hewlett-Packard equipment. Refer to the appropriate installation guide for installation procedures.

Wiring Connections

Expansion and contraction rates vary among different metals. Therefore, the integrity of an electrical connection depends on the restraining force applied. Connections that are too tight compress or deform the hardware and causes it to weaken. This usually leads to high impedance preventing circuit breakers from tripping when needed or can contribute to a buildup of high frequency noise.

CAUTION Connections that are too loose or too tight can have a high impedance that cause serious problems, such as erratic equipment operation. A high impedance connection overheats and sometimes causes fire or high temperatures that can destroy hard-to-replace components such as distribution panels or system bus bars.

Wiring connections must be properly torqued. Many equipment manufacturers specify the proper connection torque values for their hardware.

Ground connections must only be made on a conductive, nonpainted surface. When equipment vibration is present, lock washers must be used on all connections to prevent connection hardware from working loose.

Data Communications Cables

Power transformers create high-energy fields in the form of electromagnetic interference (EMI). Heavy foot traffic can create electrostatic discharge (ESD) that can damage electronic components. Route data communications cables away from these areas. Use shielded data communications cables that meet approved industry standards to reduce the effects of external fields.

PROS Nº 03/2005 - CN
CPMI - CORREIOS
1654
Fls:
Doc: 3701

Environmental Elements

The following environmental elements can affect an hp server installation:

- Computer room preparation
- Cooling requirements
- Humidity level
- Air conditioning ducts
- Dust and pollution control
- Electrostatic discharge (ESD) prevention
- Acoustics (noise reduction)

Computer Room Preparation

The following guidelines are recommended when preparing a computer room for an hp server:

- Locate the computer room away from the exterior walls of the building to avoid the heat gain from windows and exterior wall surfaces.
- When exterior windows are unavoidable, use windows that are double or triple glazed and shaded to prevent direct sunlight from entering the computer room.
- Maintain the computer room at a positive pressure relative to surrounding spaces.
- Use a vapor barrier installed around the entire computer room envelope to restrain moisture migration.
- Caulk and vapor seal all pipes and cables that penetrate the envelope.
- Use at least a 12-inch raised floor system for minimum favorable room air distribution system (underfloor distribution).
- Ensure a minimum clearance of 12 inches between the top of the hp server cabinet and the ceiling to allow for return air flow and ensure that all ceiling tiles are in place.
- Allow 18 inches (or local code minimum clearance) from the top of the hp server cabinet to the fire sprinkler heads.

Cooling Requirements

Air conditioning equipment requirements and recommendations are described in the following sections.

Basic Air Conditioning Equipment Requirements

The cooling capacity of the installed air conditioning equipment for the computer room should be sufficient to offset the computer equipment dissipation loads, as well as any space envelope heat gain. This equipment should include:

- Air filtration
- Cooling or dehumidification
- Humidification
- Reheating

ECT 4.726 J CPL - AC

Grounding Systems

An hp server requires two methods of grounding:

- Power distribution safety grounding
- High frequency intercabinet grounding

Power Distribution Safety Grounding [LAHJ]

The power distribution safety grounding system consists of connecting various points in the power distribution system to earth ground using green (green/yellow) wire ground conductors. Having these ground connections tied to metal chassis parts that may be touched by computer room personnel protects them against shock hazard from current leakage and fault conditions.

Power distribution systems consist of several parts. Hewlett-Packard recommends that these parts be solidly interconnected to provide an equipotential ground to all points.

Main Building Electrical Ground The main electrical service entrance equipment should have an earth ground connection, as required by applicable codes. Connections such as a grounding rod, building steel, or a conductive type cold water service pipe provide an earth ground.

Electrical Conduit Ground All electrical conduits should be made of rigid metallic conduit that is securely connected together or bonded to panels and electrical boxes, so as to provide a continuous grounding system.

Power Panel Ground Each power panel should be grounded to the electrical service entrance with green (green/yellow) wire ground conductors. The green (green/yellow) wire ground conductors should be sized per applicable codes (based on circuit over current device ratings).

NOTE The green wire ground conductor mentioned above may be a black wire marked with green tape. [LAHJ]

Computer Safety Ground Ground all computer equipment with the green (green/yellow) wire included in the branch circuitry. The green (green/yellow) wire ground conductors should be connected to the appropriate power panel and should be sized per applicable codes (based on circuit over current device ratings).

Cabinet Performance Grounding (High Frequency Ground)

Signal interconnects between system cabinets require high frequency ground return paths. Connect all cabinets to site ground.

- Allow 18 inches (or local code minimum clearance) from the top of the hp server cabinet to the fire sprinkler heads.

Cooling Requirements

Air conditioning equipment requirements and recommendations are described in the following sections.

Basic Air Conditioning Equipment Requirements

The cooling capacity of the installed air conditioning equipment for the computer room should be sufficient to offset the computer equipment dissipation loads, as well as any space envelope heat gain. This equipment should include:

- Air filtration
- Cooling or dehumidification
- Humidification
- Reheating

EC
4.722
CPL AC

- Air distribution
- System controls adequate to maintain the computer room within specified operating ranges.

Lighting and personnel must also be included. For example, a person dissipates about 450 BTUs per hour while performing a typical computer room task.

At altitudes above 10,000 feet (3048 m), the lower air density reduces the cooling capability of air conditioning systems. If your facility is located above this altitude, the recommended temperature ranges may need to be modified. For each 1000 feet (305 m) increase in altitude above 10,000 feet (up to a maximum of 15,000 feet), subtract 1.5° F (0.83° C) from the upper limit of the temperature range.

Air Conditioning System Guidelines

The following guidelines are recommended when designing an air conditioning system and selecting the necessary equipment:

- The air conditioning system that serves the computer room should be capable of operating 24 hours a day, 365 days a year. It should also be independent of other systems in the building.
- Consider the long-term value of hp server availability, redundant air conditioning equipment or capacity.
- The system should be capable of handling any future hp server expansion.
- Air conditioning equipment air filters should have a minimum rating of 45% (based on "ASHRAE Standard 52-76, Dust Spot Efficiency Test").
- Introduce only enough outside air into the system to meet building code requirements (for human occupancy) and to maintain a positive air pressure in the computer room.

Air Conditioning System Types

The following three air conditioning system types are listed in order of preference:

- Complete self-contained package unit(s) with remote condenser(s). These systems are available with up or down discharge and are usually located in the computer room.
- Chilled water package unit with remote chilled water plant. These systems are available with up or down discharge and are usually located in the computer room.
- Central station air handling units with remote refrigeration equipment. These systems are usually located outside the computer room.

Basic Air Distribution Systems

A basic air distribution system includes supply air and return air.

An air distribution system should be zoned to deliver an adequate amount of supply air to the cooling air intake vents of the hp server equipment cabinets. Supply air temperature should be maintained within the following parameters:

- Ceiling supply system—From 55° F (12.8° C) to 60° F (15.6° C)
- Floor supply system—At least 60° F (15.6° C)

If a ceiling plenum return air system or a ducted ceiling return air system is used, the return air grill(s) in the ceiling should be above the exhaust area or the exhaust row.

The following three types of air distribution system are listed in order of recommendation:

- Underfloor air distribution system—Downflow air conditioning equipment located on the raised floor of the computer room uses the cavity beneath the raised floor as plenum for the supply air.

ROS Nº 03/2005 - CIN
CPMI - CORREIOS
1657
3701
Doc:

Perforated floor panels (available from the raised floor manufacturer) should be located around the front of the system cabinets. Supply air emitted though the perforated floor panels is then available near the cooling air intake vents of the hp server cabinets.

- Ceiling plenum air distribution system—Supply air is ducted into the ceiling plenum from upflow air conditioning equipment located in the computer room or from an air handling unit (remote).

  The ceiling construction should resist air leakage. Place perforated ceiling panels (with down discharge air flow characteristics) around the front of the system cabinets. The supply air emitted downward from the perforated ceiling panels is then available near the cooling air intake vents of the hp server cabinets.

  Return air should be ducted back to the air conditioning equipment though the return air duct above the ceiling.

- Above ceiling ducted air distribution system—Supply air is ducted into a ceiling diffuser system from upflow air conditioning equipment located in the computer room or from an air handling unit (remote).

  Adjust the supply air diffuser system grilles to direct the cooling air downward around the front of the hp server cabinets. The supply air is then available near the cooling air intake vents of the hp server cabinets.

Air Conditioning System Installation

All air conditioning equipment, materials, and installation must comply with any applicable construction codes. Installation of the various components of the air conditioning system must also conform to the air conditioning equipment manufacturer's recommendations.

Air Conditioning Ducts

Use separate computer room air conditioning duct work. If it is not separate from the rest of the building, it might be difficult to control cooling and air pressure levels. Duct work seals are important for maintaining a balanced air conditioning system and high static air pressure. Adequate cooling capacity means little if the direction and rate of air flow cannot be controlled because of poor duct sealing. Also, the ducts should not be exposed to warm air, or humidity levels may increase.

Humidity Level

Maintain proper humidity levels at 40 to 60% RH. High humidity causes galvanic actions to occur between some dissimilar metals. This eventually causes a high resistance between connections, leading to equipment failures. High humidity can also have an adverse affect on some magnetic tapes and paper media.

CAUTION Low humidity contributes to undesirably high levels of electrostatic charges. This increases the electrostatic discharge (ESD) voltage potential. ESD can cause component damage during servicing operations. Paper feed problems on high-speed printers are usually encountered in low-humidity environments.

Low humidity levels are often the result of the facility heating system and occur during the cold season. Most heating systems cause air to have a low humidity level, unless the system has a built-in humidifier.

Dust and Pollution Control

Computer equipment can be adversely affected by dust and microscopic particles in the site environment.

Specifically, disk drives, tape drives, and some other mechanical devices can have bearing failures resulting from airborne abrasive particles. Dust may also blanket electronic components like printed circuit boards causing premature failure due to excess heat and/or humidity build up on the boards. Other failures to power

supplies and other electronic components can be caused by metallically conductive particles, including zinc whiskers. These metallic particles are conductive and can short circuit electronic components. Use every effort to ensure that the environment is as dust and particulate free as possible. See the following heading titled "Metallic Particulate Contamination" for additional details.

Smaller particles can pass though some filters and over a period of time, cause problems in mechanical parts. Small dust particles can be prevented from entering the computer room by maintaining the air conditioning system at a high static air pressure level.

Other sources of dust, metallic, conductive, abrasive, and/or microscopic particles can be present. Some sources of these particulates are:

- Subfloor shedding
- Raised floor shedding
- Ceiling tile shedding

These particulates are not always visible to the naked eye. A good check to determine their possible presence is to check the underside of the tiles. The tile should be shiny, galvanized, and free from rust.

The computer room should be kept clean. The following guidelines are recommended:

- Smoking—Establish a no-smoking policy. Cigarette smoke particles are eight times larger than the clearance between disk drive read/write heads and the disk surface.
- Printer—Locate printers and paper products in a separate room to eliminate paper particulate problems.
- Eating or drinking—Establish a no-eating or drinking policy. Spilled liquids can cause short circuits in equipment such as keyboards.
- Tile floors—Use a dust-absorbent cloth mop rather than a dry mop to clean tile floors.

Special precautions are necessary if the computer room is near a source of air pollution. Some air pollutants, especially hydrogen sulfide (H2S), are not only unpleasant but corrosive as well. Hydrogen sulfide damages wiring and delicate sound equipment. The use of activated charcoal filters reduces this form of air pollution.

Metallic Particulate Contamination

Metallic particulates can be especially harmful around electronic equipment. This type of contamination may enter the data center environment from a variety of sources, including but not limited to raised floor tiles, worn air conditioning parts, heating ducts, rotor brushes in vacuum cleaners or printer component wear. Because metallic particulates conduct electricity, they have an increased potential for creating short circuits in electronic equipment. This problem is exaggerated by the increasingly dense circuitry of electronic equipment.

Over time, very fine whiskers of pure metal can form on electroplated zinc, cadmium, or tin surfaces. If these whiskers are disturbed, they may break off and become airborne, possibly causing failures or operational interruptions. For over 50 years, the electronics industry has been aware of the relatively rare but possible threat posed by metallic particulate contamination. During recent years, a growing concern has developed in computer rooms where these conductive contaminants are formed on the bottom of some raised floor tiles.

Although this problem is relatively rare, it may be an issue within your computer room. Since metallic contamination can cause permanent or intermittent failures on your electronic equipment, Hewlett-Packard strongly recommends that your site be evaluated for metallic particulate contamination before installation of electronic equipment.

Electrostatic Discharge (ESD) Prevention

Static charges (voltage levels) occur when objects are separated or rubbed together. The voltage level of a static charge is determined by the following factors:

- Types of materials
- Relative humidity
- Rate of change or separation

Table C-1 Effect of Humidity on ESD Charge Levels

Personnel Activity[a]	Humidity[b] and Charge Levels (voltages)[c]			
	26%	32%	40%	50%
Person walking across a linoleum floor	**6,150 V**	**5,750 V**	**4,625 V**	**3,700 V**
Person walking across a carpeted floor	18,450 V	17,250 V	13,875 V	11,100 V
Person getting up from a plastic chair	24,600 V	23,000 V	18,500 V	14,800 V

a. Source: B.A. Unger, Electrostatic Discharge Failures of Semiconductor Devices (Bell Laboratories, 1981)
b. For the same relative humidity level, a high rate of airflow produces higher static charges than a low airflow rate.
c. Some data in this table has been extrapolated.

Static Protection Measures

Follow these precautions to minimize possible ESD-induced failures in the computer room:

- Maintain recommended humidity level and airflow rates in the computer room.
- Install conductive flooring (conductive adhesive must be used when laying tiles).
- Use conductive wax if waxed floors are necessary.
- Ensure that all equipment and flooring are properly grounded and are at the same ground potential.
- Use conductive tables and chairs.
- Use a grounded wrist strap (or other grounding method) when handling circuit boards.
- Store spare electronic modules in antistatic containers.

Acoustics

Computer equipment and air conditioning blowers cause computer rooms to be noisy. Ambient noise level in a computer room can be reduced as follows:

- Dropped ceiling—Cover with a commercial grade of fire-resistant, acoustic rated, fiberglass ceiling tile.
- Sound deadening—Cover the walls with curtains or other sound deadening material.
- Removable partitions—Use foam rubber models for most effectiveness.

J
CPL - AC

Facility Characteristics

This section contains information about facility characteristics that must be considered for the installation or operation of an hp server. Facility characteristics are:

- Floor loading
- Windows
- Altitude effects

Floor Loading

The computer room floor must be able to support the total weight of the installed hp server as well as the weight of the individual cabinets as they are moved into position.

Floor loading is usually not an issue in nonraised floor installations. The information presented in this section is directed toward raised floor installations.

NOTE An appropriate floor system consultant should verify any floor system under consideration for an hp server installation.

Raised Floor Loading

Raised floor loading is a function of the manufacturer's load specification and the positioning of the equipment relative to the raised floor grid. While Hewlett-Packard cannot assume responsibility for determining the suitability of a particular raised floor system, it does provide information and illustrations for the customer or local agencies to determine installation requirements.

The following guidelines are recommended:

- Because many raised floor systems do not have grid stringers between floor stands, the lateral support for the floor stands depends on adjacent panels being in place. To avoid compromising this type of floor system while gaining under floor access, remove only one floor panel at a time.
- Larger floor grids (bigger panels) are generally rated for lighter loads.

CAUTION Do not position or install any equipment cabinets on the raised floor system until you have carefully examined it to verify that it is adequate to support the appropriate installation.

Floor Loading Terms

Table C-2 Floor Loading Term Definitions

Term	Definition
Dead load	The weight of the raised panel floor system, including the understructure. Expressed in lb/ft2 (kg/m2).
Live load	The load that the floor system can safely support. Expressed in lb/ft2 (kg/m2).

RQS Nº 03/2005 - CN
CPMI - CORREIOS
1659
Fls:
Doc. 3701

Table C-2 Floor Loading Term Definitions (Continued)

Term	Definition
Concentrated load	The load that a floor panel can support on a 1-in2 (6.45 cm2) area at the panel's weakest point (typically the center of the panel), without the surface of the panel deflecting more than a predetermined amount.
Ultimate load	The maximum load (per floor panel) that the floor system can support without failure. Failure expressed by floor panel(s) breaking or bending. Ultimate load is usually stated as load per floor panel.
Rolling load	The load a floor panel can support (without failure) when a wheel of specified diameter and width is rolled across the panel.
Average floor load	Computed by dividing total equipment weight by the area of its footprint. This value is expressed in lb/ft2 (kg/m2).

Average Floor Loading

The average floor load value is not appropriate for addressing raised floor ratings at the floor grid spacing level. However, it is useful for determining floor loading at the building level, such as the area of solid floor or span of raised floor tiles covered by the hp server footprint.

Typical Raised Floor Site

This section contains an example of a computer room raised floor system that is satisfactory for the installation of an hp server.

Based on specific information provided by Hewlett-Packard, Tate Access Floors has approved its Series 800 all-steel access floor with bolt-together stringers and 24 in. (61.0 cm) by 24 in. (61.0 cm) floor panels.

In the event that the flooring is being replaced or a new floor is being installed, Tate Access Floors recommends its Series 1250 all-steel access floor with bolt-together stringers and 24 in. (61.0 cm) by 24 in. (61.0 cm) floor panels be used to support the hp installation.

NOTE If the specific floor being evaluated or considered is other than a Tate Series 800 floor, the specific floor manufacturer must be contacted to evaluate the floor being used.

The following table lists specifications for the Tate Access Floors Series 800 raised floor system.

Table C-3 Typical Raised Floor Specifications

Item[a]	Rating
Dead load	7 lb/ft 2 (34.2 kg/m2)
Live load	313 lb/ft 2 (1528.3 kg/m2)
Concentrated load[b]	1250 lb (567 kg)

E.C.T.
4.718
1
AC

Table C-3 Typical Raised Floor Specifications (Continued)

Item[a]	Rating
Ultimate load	4000 lb (1814 kg) per panel
Rolling load	400 lb (181 kg)
Average floor load	500 lb (227 kg)

a. From Table C-2 on page 203
b. With 0.08 in (0.2 cm) of span maximum deflection

Windows

Avoid housing computers in a room with windows. Sunlight entering a computer room may cause problems. Magnetic tape storage media is damaged if exposed to direct sunlight. Also, the heat generated by sunlight places an additional load on the cooling system.

RQS Nº 03/2005 - CN
CPMI - CORREIOS

Doc: 3701

Space Requirements

This section contains information about space requirements for an hp server. This data should be used as the basic guideline for space plan developments. Other factors, such as airflow, lighting, and equipment space requirements must also be considered.

Delivery Space Requirements

There should be enough clearance to move equipment safely from the receiving area to the computer room. Permanent obstructions, such as pillars or narrow doorways, can cause equipment damage.

Delivery plans should include the possible removal of walls or doors.

Operational Space Requirements

Other factors must be considered along with the basic equipment dimensions. Reduced airflow around equipment causes overheating, which can lead to equipment failure. Therefore, the location and orientation of air conditioning ducts, as well as airflow direction, are important. Obstructions to equipment intake or exhaust airflow must be eliminated.

The locations of lighting fixtures and utility outlets affect servicing operations. Plan equipment layout to take advantage of lighting and utility outlets. Do not forget to include clearance for opening and closing equipment doors.

Clearance around the cabinets must be provided for proper cooling airflow through the equipment.

If other equipment is located so that it exhausts heated air near the cooling air intakes of the hp server cabinets, larger space requirements are needed to keep ambient air intake to the hp server cabinets within the specified temperature and humidity ranges.

Space planning should also include the possible addition of equipment or other changes in space requirements. Equipment layout plans should also include provisions for the following:

- Channels or fixtures used for routing data cables and power cables
- Access to air conditioning ducts, filters, lighting, and electrical power hardware
- Power conditioning equipment
- Cabinets for cleaning materials
- Maintenance area and spare parts

Floor Plan Grid

A floor plan grid is used to plan the location of equipment in the computer room. In addition to its use for planning, the floor plan grid should also be used when planning the locations of the following items:

- Air conditioning vents
- Lighting fixtures
- Utility outlets
- Doors
- Access areas for power wiring, air conditioning filters and equipment cable routing.

4.734

Typical Installation Schedule

The following schedule lists the sequence of events for a typical system installation:

- 60 days before installation
  - — Floor plan design completed and mailed to Hewlett-Packard (if required to be an HP task)
- 30 days before installation
  - — Primary power and air conditioning installation completed
  - — Telephone and data cables installed
  - — Fire protection equipment installed
  - — Major facility changes completed
  - — Special delivery requirements defined
  - — Site inspection survey completed
  - — Delivery survey completed
  - — A signed copy of the site inspection and delivery survey mailed to Hewlett-Packard
  - — Site inspection and predelivery coordination meeting arranged with a Hewlett-Packard representative to review the inspection checklist and arrange an installation schedule.
- 7 days before installation
  - — Final check made with an Hewlett-Packard site preparation specialist to resolve any last minute problems

NOTE Not all installations follow a schedule like the one noted above. Sometimes, an hp server is purchased through another vendor which can preclude a rigid schedule. Other conditions could also prevent following this schedule. For those situations, consider a milestone schedule.

- Site Preparation - schedule with the customer as soon as possible after the order is placed.
- Site Verification - schedule with the customer a minimum of one to two days before the hp server is scheduled to be installed.

Table C-5 Site Inspection Checklist

Please check either Yes or No. If No, include comment# or date				Comment or Date
Computer room				
No.	Area or condition	Yes	No	
1.	Is there a completed floor plan?			
2.	Is there adequate space for maintenance needs? Front 36 in (91.4 cm) minimum, Rear 36 in (91.4 cm) minimum are recommended clearances.			
3.	Is access to the site or computer room restricted?			
4.	Is the computer room structurally complete? Expected date of completion?			
5.	Is a raised floor installed and in good condition?			
6.	Is the raised floor adequate for equipment loading?			
7.	Are there channels or cutouts for cable routing?			
8.	Is there a remote console telephone line available with an RJ11 jack?			
9.	Is a telephone line available?			
10.	Are customer supplied peripheral cables and LAN cables available and of the proper type?			
11.	Are floor tiles in good condition and properly braced?			
12.	Is floor tile underside shiny or painted? If painted, judge the need for particulate test.			
Power and lighting				
No.	Area or condition	Yes	No	
13.	Are lighting levels adequate for maintenance?			
14.	Are there AC outlets available for servicing needs? (i.e. vacuuming)			
15.	Does the input voltage correspond to equipment specifications?			
15A	Is dual source power used? If so, identify type(s) and evaluate grounding.

Table C-5 Site Inspection Checklist (Continued)

Please check either Yes or No. If No, include comment# or date				Comment or Date
16	Does the input frequency correspond to equipment specifications?			
17.	Are lightning arrestors installed inside the building?			
18.	Is power conditioning equipment installed?			
19.	Is there a dedicated branch circuit for equipment?			
20.	Is the dedicated branch circuit less than 250 feet (72.5 meters)?			
21.	Are the input circuit breakers adequate for equipment loads?			
Safety				
No.	Area or condition	Yes	No	
22.	Is there an emergency power shut-off switch?			
23.	Is there a telephone available for emergency purposes?			
24.	Is there a fire protection system in the computer room?			
25.	Is antistatic flooring installed?			
26.	Are there any equipment servicing hazards (loose ground wires, poor lighting, etc.)?			
Cooling				
No.	Area or condition	Yes	No	
27.	Can cooling be maintained between 20 °C and 55 °C (up to 5000 ft.)? Derate 1 °C/1000 ft. above 5000 ft. and up to 10,000 ft.			
28.	Can temperature changes be held to 10 °C per hour with tape media? Can temperature changes be held to 20 °C per hour without tape media?			
29.	Can humidity level be maintained at 40% to 60% at 35 °C noncondensing?			
30.	Are air conditioning filters installed and clean?			
Storage

Table C-5 Site Inspection Checklist (Continued)

Please check either Yes or No. If No, include comment# or date				Comment or Date
No.	Area or condition	Yes	No	
31.	Are cabinets available for tape and disc media?			
32.	Is shelving available for documentation?			
Training				
No.	Area or Condition			
33	Are personnel enrolled in the System Administrator's Course?			
34	Is on-site training required?

Delivery Survey

The delivery survey forms list delivery or installation requirements. If any of the items on the list apply, enter the appropriate information in the areas provided on the form.

Special instructions or recommendations should be entered on the special instructions or recommendations form. The following list gives examples of special instructions or issues:

- Packaging restrictions at the facility, such as size and weight limitations
- Special delivery procedures
- Special equipment required for installation, such as tracking or hoists
- What time the facility is available for installation (after the equipment is unloaded)
- Special security requirements applicable to the facility, such as security clearance

DELIVERY CHECKLIST

DOCK DELIVERY

Is dock large enough for a semitrailer? Yes _____ No _____

Circle the location of the dock and give street name if different than address.

North

West East

South

STREET DELIVERY

Circle the location of access door and list street name if different than address.

North

West East

South

List height _____ and width _____ of access door.

List special permits (if required) for street delivery.

Permit type: Agency obtained from:

_____ _____

_____ _____
